Assume $Y$ is a normal integral affine scheme. We will show $Y^{\prime} \rightarrow Y$ is an isomorphism by an application of Morphisms, Lemma 28.49.5. Namely, $Y^{\prime}$ is reduced because $X$ is reduced (Morphisms of Spaces, Lemma 54.45.6). The morphism $Y^{\prime} \rightarrow Y$ is integral by the theorem cited above. Since $Y$ is decent and $X \rightarrow Y$
is separated, we see that $X$ is decent too; to see this use Decent Spaces, Lemmas 55.15 .2 and 55.15.5. By assumption (5), Morphisms of Spaces, Lemma 54.45.7, and Decent Spaces, Lemma 55.18.1 we see that every generic point of an irreducible component of $\left|Y^{\prime}\right|$ maps to $\xi$. On the other hand, since $Y^{\prime}$ is the relative spectrum of $f_{*} \mathcal{O}_{X}$ we see that the scheme theoretic fibre $Y_{\xi}^{\prime}$ is the spectrum of $H^{0}\left(X_{\xi}, \mathcal{O}\right)$ which is equal to $\kappa(\xi)$ by assumption. Hence $Y^{\prime}$ is an integral scheme with function field equal to the function field of $Y$. This finishes the proof.

### 63.27. Extending properties from an open

0875 In this section we collect a number of results of the form: If $f: X \rightarrow Y$ is a flat morphism of algebraic spaces and $f$ satisfies some property over a dense open of $Y$, then $f$ satisfies the same property over all of $Y$.
0876 Lemma 63.27.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $V \subset Y$ be an open subspace. Assume
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is of finite type and flat over $Y$,
(3) $V \rightarrow Y$ is quasi-compact and scheme theoretically dense,
(4) $\left.\mathcal{F}\right|_{f^{-1} V}$ is of finite presentation.

Then $\mathcal{F}$ is of finite presentation.
Proof. It suffices to prove the pullback of $\mathcal{F}$ to a scheme surjective and étale over $X$ is of finite presentation. Hence we may assume $X$ is a scheme. Similarly, we can replace $Y$ by a scheme surjective and étale and over $Y$ (the inverse image of $V$ in this scheme is scheme theoretically dense, see Morphisms of Spaces, Section 54.17 ). Thus we reduce to the case of schemes which is More on Flatness, Lemma 37.11.1.

0877 Lemma 63.27.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $V \subset Y$ be an open subspace. Assume
(1) $f$ is locally of finite type and flat,
(2) $V \rightarrow Y$ is quasi-compact and scheme theoretically dense,
(3) $\left.f\right|_{f^{-1} V}: f^{-1} V \rightarrow V$ is locally of finite presentation.

Then $f$ is of locally of finite presentation.
Proof. The proof is identical to the proof of Lemma 63.27.1 except one uses More on Flatness, Lemma 37.11.2.

0878 Lemma 63.27.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is flat and locally of finite type. Let $V \subset Y$ be an open subspace such that $|V| \subset|Y|$ is dense and such that $X_{V} \rightarrow V$ has relative dimension $\leq d$. If also either
(1) $f$ is locally of finite presentation, or
(2) $V \rightarrow Y$ is quasi-compact,
then $f: X \rightarrow Y$ has relative dimension $\leq d$.
Proof. We may replace $Y$ by its reduction, hence we may assume $Y$ is reduced. Then $V$ is scheme theoretically dense in $Y$, see Morphisms of Spaces, Lemma 54.17.7. By definition the property of having relative dimension $\leq d$ can be checked
on an étale covering, see Morphisms of Spaces, Sections 54.32. Thus it suffices to prove $f$ has relative dimension $\leq d$ after replacing $X$ by a scheme surjective and étale over $X$. Similarly, we can replace $Y$ by a scheme surjective and étale and over $Y$. The inverse image of $V$ in this scheme is scheme theoretically dense, see Morphisms of Spaces, Section 54.17. Since a scheme theoretically dense open of a scheme is in particular dense, we reduce to the case of schemes which is More on Flatness, Lemma 37.11.3.

0B4J Lemma 63.27.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is flat and proper. Let $V \rightarrow Y$ be an open subspace with $|V| \subset|Y|$ dense such that $X_{V} \rightarrow V$ is finite. If also either $f$ is locally of finite presentation or $V \rightarrow Y$ is quasi-compact, then $f$ is finite.

Proof. By Lemma 63.27 .3 the fibres of $f$ have dimension zero. By Morphisms of Spaces, Lemma 54.33 .6 this implies that $f$ is locally quasi-finite. By Morphisms of Spaces, Lemma 54.48.1 this implies that $f$ is representable. We can check whether $f$ is finite étale locally on $Y$, hence we may assume $Y$ is a scheme. Since $f$ is representable, we reduce to the case of schemes which is More on Flatness, Lemma 37.11 .4

0879 Lemma 63.27.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $V \subset Y$ be an open subspace. If
(1) $f$ is separated, locally of finite type, and flat,
(2) $f^{-1}(V) \rightarrow V$ is an isomorphism, and
(3) $V \rightarrow Y$ is quasi-compact and scheme theoretically dense, then $f$ is an open immersion.

Proof. Applying Lemma 63.27 .2 we see that $f$ is locally of finite presentation. Applying Lemma 63.27.3 we see that $f$ has relative dimension $\leq 0$. By Morphisms of Spaces, Lemma 54.33 .6 this implies that $f$ is locally quasi-finite. By Morphisms of Spaces, Lemma 54.48.1 this implies that $f$ is representable. By Descent on Spaces, Lemma 61.10.12 we can check whether $f$ is an open immersion étale locally on $Y$. Hence we may assume that $Y$ is a scheme. Since $f$ is representable, we reduce to the case of schemes which is More on Flatness, Lemma 37.11.5.

### 63.28. Blowing up and flatness

087A Instead of redoing the work in More on Flatness, Section 37.28 we prove an analogue of More on Flatness, Lemma 37.28 .5 which tells us that the problem of finding a suitable blowup is often étale local on the base.

087B Lemma 63.28.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $\varphi: W \rightarrow X$ be a quasi-compact separated étale morphism. Let $U \subset X$ be a quasi-compact open subspace. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be a finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}) \cap \varphi^{-1}(U)=\emptyset$. Then there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$ such that
(1) $V(\mathcal{J}) \cap U=\emptyset$, and
(2) $\varphi^{-1}(\mathcal{J}) \mathcal{O}_{W}=\mathcal{I} \mathcal{I}^{\prime}$ for some finite type quasi-coherent ideal $\mathcal{I}^{\prime} \subset \mathcal{O}_{W}$.

Proof. Choose a factorization $W \rightarrow Y \rightarrow X$ where $j: W \rightarrow Y$ is a quasi-compact open immersion and $\pi: Y \rightarrow X$ is a finite morphism of finite presentation (Lemma 63.25.4. Let $V=j(W) \cup \pi^{-1}(U) \subset Y$. Note that $\mathcal{I}$ on $W \cong j(W)$ and $\mathcal{O}_{\pi^{-1}(U)}$
glue to a finite type quasi-coherent sheaf of ideals $\mathcal{I}_{1} \subset \mathcal{O}_{V}$. By Limits of Spaces, Lemma 57.9 .8 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I}_{2} \subset \mathcal{O}_{Y}$ such that $\left.\mathcal{I}_{2}\right|_{V}=\mathcal{I}_{1}$. In other words, $\mathcal{I}_{2} \subset \mathcal{O}_{Y}$ is a finite type quasi-coherent sheaf of ideals such that $V\left(\mathcal{I}_{2}\right)$ is disjoint from $\pi^{-1}(U)$ and $j^{-1} \mathcal{I}_{2}=\mathcal{I}$. Denote $i: Z \rightarrow Y$ the corresponding closed immersion which is of finite presentation (Morphisms of Spaces, Lemma 54.28.12). In particular the composition $\tau=\pi \circ i: Z \rightarrow X$ is finite and of finite presentation (Morphisms of Spaces, Lemmas 54.28.2 and 54.43.4).

Let $\mathcal{F}=\tau_{*} \mathcal{O}_{Z}$ which we think of as a quasi-coherent $\mathcal{O}_{X}$-module. By Descent on Spaces, Lemma 61.5.7 we see that $\mathcal{F}$ is a finitely presented $\mathcal{O}_{X}$-module. Let $\mathcal{J}=$ $\mathrm{Fit}_{0}(\mathcal{F})$. (Insert reference to fitting modules on ringed topoi here.) This is a finite type quasi-coherent sheaf of ideals on $X$ (as $\mathcal{F}$ is of finite presentation, see More on Algebra, Lemma 15.6.4). Part (1) of the lemma holds because $|\tau|(|Z|) \cap|U|=\emptyset$ by our choice of $\mathcal{I}_{2}$ and because the 0th fitting ideal of the trivial module equals the structure sheaf. To prove $(2)$ note that $\varphi^{-1}(\mathcal{J}) \mathcal{O}_{W}=\operatorname{Fit}_{0}\left(\varphi^{*} \mathcal{F}\right)$ because taking fitting ideals commutes with base change. On the other hand, as $\varphi: W \rightarrow X$ is separated and étale we see that $(1, j): W \rightarrow W \times_{X} Y$ is an open and closed immersion. Hence $W \times_{Y} Z=V(\mathcal{I}) \amalg Z^{\prime}$ for some finite and finitely presented morphism of algebraic spaces $\tau^{\prime}: Z^{\prime} \rightarrow W$. Thus we see that

$$
\begin{aligned}
\operatorname{Fit}_{0}\left(\varphi^{*} \mathcal{F}\right) & =\operatorname{Fit}_{0}\left(\left(W \times_{Y} Z \rightarrow W\right)_{*} \mathcal{O}_{W \times_{Y} Z}\right) \\
& =\operatorname{Fit}_{0}\left(\mathcal{O}_{W} / \mathcal{I}\right) \cdot \operatorname{Fit}_{0}\left(\tau_{*}^{\prime} \mathcal{O}_{Z^{\prime}}\right) \\
& =\mathcal{I} \cdot \operatorname{Fit}_{0}\left(\tau_{*}^{\prime} \mathcal{O}_{Z^{\prime}}\right)
\end{aligned}
$$

the second equality by More on Algebra, Lemma 15.6 .4 translated in sheaves on ringed topoi. Setting $\mathcal{I}^{\prime}=\operatorname{Fit}_{0}\left(\tau_{*}^{\prime} \mathcal{O}_{Z^{\prime}}\right)$ finishes the proof of the lemma.
087C Theorem 63.28.2. Let $S$ be a scheme. Let $B$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $X$ be an algebraic space over $B$. Let $\mathcal{F}$ be $a$ quasi-coherent module on $X$. Let $U \subset B$ be a quasi-compact open subspace. Assume
(1) $X$ is quasi-compact,
(2) $X$ is locally of finite presentation over $B$,
(3) $\mathcal{F}$ is a module of finite type,
(4) $\mathcal{F}_{U}$ is of finite presentation, and
(5) $\mathcal{F}_{U}$ is flat over $U$.

Then there exists a $U$-admissible blowup $B^{\prime} \rightarrow B$ such that the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ is an $\mathcal{O}_{X \times{ }_{B} B^{\prime}-m o d u l e ~ o f ~ f i n i t e ~ p r e s e n t a t i o n ~ a n d ~ f l a t ~ o v e r ~} B^{\prime}$.
Proof. Choose an affine scheme $V$ and a surjective étale morphism $V \rightarrow X$. Because strict transform commutes with étale localization (Divisors on Spaces, Lemma 58.7 .2 it suffices to prove the result with $X$ replaced by $V$. Hence we may assume that $X \rightarrow B$ is representable (in addition to the hypotheses of the lemma).

Assume that $X \rightarrow B$ is representable. Choose an affine scheme $W$ and a surjective étale morphism $\varphi: W \rightarrow B$. Note that $X \times{ }_{B} W$ is a scheme. By the case of schemes (More on Flatness, Theorem 37.28.7) we can find a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{W}$ such that (a) $|V(\mathcal{I})| \cap\left|\varphi^{-1}(U)\right|=\emptyset$ and (b) the strict transform of $\left.\mathcal{F}\right|_{X \times_{B} W}$ with respect to the blowing up $W^{\prime} \rightarrow W$ in $\mathcal{I}$ becomes flat over $W^{\prime}$ and is a module of finite presentation. Choose a finite type sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{B}$ as in Lemma 63.28.1. Let $B^{\prime} \rightarrow B$ be the blowing up of $\mathcal{J}$. We claim that this blow up works. Namely, it is clear that $B^{\prime} \rightarrow B$ is $U$-admissible by our choice of ideal
$\mathcal{J}$. Moreover, the base change $B^{\prime} \times{ }_{B} W \rightarrow W$ is the blowup of $W$ in $\varphi^{-1} \mathcal{J}=\mathcal{I I}^{\prime}$ (compatibility of blowup with flat base change, see Divisors on Spaces, Lemma 58.6.3). Hence there is a factorization

$$
W \times_{B} B^{\prime} \rightarrow W^{\prime} \rightarrow W
$$

where the first morphism is a blowup as well, see Divisors on Spaces, Lemma 58.6.10). The restriction of $\mathcal{F}^{\prime}$ (which lives on $B^{\prime} \times_{B} X$ ) to $W \times_{B} B^{\prime} \times{ }_{B} X$ is the strict transform of $\left.\mathcal{F}\right|_{X \times_{B} W}$ (Divisors on Spaces, Lemma 58.7.2) and hence is the twice repeated strict transform of $\left.\mathcal{F}\right|_{X \times_{B} W}$ by the two blowups displayed above (Divisors on Spaces, Lemma 58.7.7). After the first blow up our sheaf is already flat over the base and of finite presentation (by construction). Whence this holds after the second strict transform as well (since this is a pullback by Divisors on Spaces, Lemma 58.7.4). Thus we see that the restriction of $\mathcal{F}^{\prime}$ to an étale cover of $B^{\prime} \times_{B} X$ has the desired properties and the theorem is proved.

### 63.29. Applications

087D In this section we apply the result on flattening by blowing up.
087E Lemma 63.29.1. Let $S$ be a scheme. Let $B$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $X$ be an algebraic space over $B$. Let $U \subset B$ be a quasi-compact open subspace. Assume
(1) $X \rightarrow B$ is of finite type and quasi-separated, and
(2) $X_{U} \rightarrow U$ is flat and locally of finite presentation.

Then there exists a $U$-admissible blowup $B^{\prime} \rightarrow B$ such that the strict transform of $X$ is flat and of finite presentation over $B^{\prime}$.

Proof. Let $B^{\prime} \rightarrow B$ be a $U$-admissible blowup. Note that the strict transform of $X$ is quasi-compact and quasi-separated over $B^{\prime}$ as $X$ is quasi-compact and quasiseparated over $B$. Hence we only need to worry about finding a $U$-admissible blowup such that the strict transform becomes flat and locally of finite presentation. We cannot directly apply Theorem 63.28.2 because $X$ is not locally of finite presentation over $B$.

Choose an affine scheme $V$ and a surjective étale morphism $V \rightarrow X$. (This is possible as $X$ is quasi-compact as a finite type space over the quasi-compact space $B$.) Then it suffices to show the result for the morphism $V \rightarrow B$ (as strict transform commutes with étale localization, see Divisors on Spaces, Lemma 58.7.2). Hence we may assume that $X \rightarrow B$ is separated as well as finite type. In this case we can find a closed immersion $i: X \rightarrow Y$ with $Y \rightarrow B$ separated and of finite presentation, see Limits of Spaces, Proposition 57.11.7.

Apply Theorem63.28.2 to $\mathcal{F}=i_{*} \mathcal{O}_{X}$ on $Y / B$. We find a $U$-admissible blowup $B^{\prime} \rightarrow$ $B$ such that that strict transform of $\mathcal{F}$ is flat over $B^{\prime}$ and of finite presentation. Let $X^{\prime}$ be the strict transform of $X$ under the blowup $B^{\prime} \rightarrow B$. Let $i^{\prime}: X^{\prime} \rightarrow Y \times{ }_{B} B^{\prime}$ be the induced morphism. Since taking strict transform commutes with pushforward along affine morphisms (Divisors on Spaces, Lemma 58.7.5 , we see that $i_{*}^{\prime} \mathcal{O}_{X^{\prime}}$ is flat over $B^{\prime}$ and of finite presentation as a $\mathcal{O}_{Y \times_{B} B^{\prime} \text {-module. Thus } X^{\prime} \rightarrow B^{\prime}}$ is flat and locally of finite presentation. This implies the lemma by our earlier remarks.

0B4K Lemma 63.29.2. Let $S$ be a scheme. Let $B$ be a quasi-compact and quasiseparated algebraic space over $B$. Let $X$ be an algebraic space over $S$. Let $U \subset B$ be a quasi-compact open subspace. Assume
(1) $X \rightarrow B$ is proper, and
(2) $X_{U} \rightarrow U$ is finite locally free.

Then there exists a $U$-admissible blowup $B^{\prime} \rightarrow B$ such that the strict transform of $X$ is finite locally free over $B^{\prime}$.

Proof. By Lemma 63.29.1 we may assume that $X \rightarrow B$ is flat and of finite presentation. After replacing $B$ by a $U$-admissible blow up if necessary, we may assume that $U \subset B$ is scheme theoretically dense. Then $f$ is finite by Lemma 63.27.4 Hence $f$ is finite locally free by Morphisms of Spaces, Lemma 54.44.6.

087F Lemma 63.29.3. Let $S$ be a scheme. Let $\varphi: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Assume $\varphi$ is of finite type with $B$ quasi-compact and quasi-separated. Let $U \subset B$ be a quasi-compact open subspace such that $\varphi^{-1} U \rightarrow U$ is an isomorphism. Then there exists a $U$-admissible blowup $B^{\prime} \rightarrow B$ such that $U$ is scheme theoretically dense in $B^{\prime}$ and such that the strict transform $X^{\prime}$ of $X$ is isomorphic to an open subspace of $B^{\prime}$.

Proof. As the composition of $U$-admissible blowups is $U$-admissible (Divisors on Spaces, Lemma 58.8 .2 we can proceed in stages. Pick a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{B}$ with $|B| \backslash|U|=|V(\mathcal{I})|$. Replace $B$ by the blowup of $B$ in $\mathcal{I}$ and $X$ by the strict transform of $X$. After this replacement $B \backslash U$ is the support of an effective Cartier divisor $D$ (Divisors on Spaces, Lemma 58.6.4). In particular $U$ is scheme theoretically dense in $B$ (Divisors on Spaces, Lemma 58.2.4). Next, we do another $U$-admissible blowup to get to the situation where $X \rightarrow B$ is flat and of finite presentation, see Lemma 63.29.1. Note that $U$ is still scheme theoretically dense in $B$. Hence $X \rightarrow B$ is an open immersion by Lemma 63.27.5.

The following lemma says that a modification can be dominated by a blowup.
087G Lemma 63.29.4. Let $S$ be a scheme. Let $\varphi: X \rightarrow B$ be a proper morphism of algebraic spaces over $S$. Assume $B$ quasi-compact and quasi-separated. Let $U \subset B$ be a quasi-compact open subspace such that $\varphi^{-1} U \rightarrow U$ is an isomorphism. Then there exists a $U$-admissible blowup $B^{\prime} \rightarrow B$ which dominates $X$, i.e., such that there exists a factorization $B^{\prime} \rightarrow X \rightarrow B$ of the blowup morphism.

Proof. By Lemma 63.29.3 we may find a $U$-admissible blowup $B^{\prime} \rightarrow B$ such that the strict transform $X^{\prime}$ is an open subspace of $B^{\prime}$ and $U$ is scheme theoretically dense in $B^{\prime}$. Since $X^{\prime} \rightarrow B^{\prime}$ is proper we see that $\left|X^{\prime}\right|$ is closed in $\left|B^{\prime}\right|$. As $U \subset B^{\prime}$ is dense $X^{\prime}=B^{\prime}$.

### 63.30. Chow's lemma

088P In this section we prove some variants of Chow's lemma. Since we have yet to define projective morphisms of algebraic spaces, the statements will involve representable proper morphisms, rather than projective ones.

088Q Lemma 63.30.1. Let $S$ be a scheme. Let $Y$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $U \rightarrow X_{1}$ and $U \rightarrow X_{2}$ be open immersions of
algebraic spaces over $Y$ and assume $U, X_{1}, X_{2}$ of finite type and separated over $Y$. Then there exists a commutative diagram

of algebraic spaces over $Y$ where $X_{i}^{\prime} \rightarrow X_{i}$ is a $U$-admissible blowup, $X_{i}^{\prime} \rightarrow X$ is an open immersion, and $X$ is separated and finite type over $Y$.
Proof. Throughout the proof all the algebraic spaces will be separated of finite type over $Y$. This in particular implies these algebraic spaces and the morphisms between them will be quasi-compact and quasi-separated. We will use that if $U \rightarrow W$ is an immersion of such spaces over $Y$, then the scheme theoretic image $Z$ of $U$ in $W$ is a closed subspace of $W$ and $U \rightarrow Z$ is an open immersion, $U \subset Z$ is scheme theoretically dense, and $|U| \subset|Z|$ is dense. See Morphisms of Spaces, Lemma 54.17 .7

Let $X_{12} \subset X_{1} \times_{Y} X_{2}$ be the scheme theoretic image of $U \rightarrow X_{1} \times_{Y} X_{2}$. We claim the projections $p_{i}: X_{12} \rightarrow X_{i}$ induce isomorphisms $p_{i}^{-1}(U) \rightarrow U$. Namely, $p_{i}: X_{12} \rightarrow X_{i}$ is separated and $U \rightarrow X_{12}$ is a section of $p_{i}$. Hence $U \rightarrow p_{i}^{-1}(U)$ is a closed immersion (Morphisms of Spaces, Lemma 54.4.6) as well as scheme theoretically dense whence an isomorphism. Choose a $U$-admissible blowup $X_{i}^{i} \rightarrow$ $X_{i}$ such that the strict transform $X_{12}^{i}$ of $X_{12}$ is isomorphic to an open subspace of $X_{i}^{i}$, see Lemma 63.29.3. Let $\mathcal{I}_{i} \subset \mathcal{O}_{X_{i}}$ be the corresponding finite type quasicoherent sheaf of ideals. Recall that $X_{12}^{i} \rightarrow X_{12}$ is the blowup in $p_{i}^{-1} \mathcal{I}_{i} \mathcal{O}_{X_{12}}$. Let $X_{12}^{\prime}$ be the blowup of $X_{12}$ in $p_{1}^{-1} \mathcal{I}_{1} p_{2}^{-1} \mathcal{I}_{2} \mathcal{O}_{X_{12}}$. We obtain a commutative diagram

where all the morphisms are $U$-admissible blowing ups. Choose a finite type quasicoherent sheaf of ideals $\mathcal{J}_{i}$ on $X_{i}^{i}$ extending the pull back of $\mathcal{I}_{1-i}$ to $X_{12}^{i}$ (see Limits of Spaces, Lemma 57.9.8. Let $X_{i}^{\prime} \rightarrow X_{i}^{i}$ be the blowing up in $\mathcal{J}_{i}$. By construction $X_{12}^{\prime} \subset X_{i}^{\prime}$ is an open subspace and the diagram

is commutative with vertical arrows blowing ups and horizontal arrows open immersions. Note that $X_{12}^{\prime} \rightarrow X_{1}^{\prime} \times_{Y} X_{2}^{\prime}$ is an immersion and proper (use that $X_{12}^{\prime} \rightarrow X_{12}$ is proper and $X_{12} \rightarrow X_{1} \times_{Y} X_{2}$ is closed and $X_{1}^{\prime} \times_{Y} X_{2}^{\prime} \rightarrow X_{1} \times_{Y} X_{2}$ is separated and apply Morphisms of Spaces, Lemma 54.39.6. Thus $X_{12}^{\prime} \rightarrow X_{1}^{\prime} \times_{Y} X_{2}^{\prime}$ is a closed immersion. It follows that if we define $X$ by glueing $X_{1}^{\prime}$ and $X_{2}^{\prime}$ along the common open subspace $X_{12}^{\prime}$, then $X \rightarrow Y$ is of finite type and separated (details omitted). As compositions of $U$-admissible blowups are $U$-admissible blowups (Divisors on Spaces, Lemma 58.8.2 the lemma is proved.

088R Lemma 63.30.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $U \subset X$ be an open subscheme. Assume
(1) $U$ is quasi-compact,
(2) $Y$ is quasi-compact and quasi-separated,
(3) there exists an immersion $U \rightarrow \mathbf{P}_{Y}^{n}$ over $Y$,
(4) $f$ is of finite type and separated.

Then there exists a commutative diagram

where $X^{\prime} \rightarrow X$ is a $U$-admissible blowup, $X^{\prime} \rightarrow \bar{X}^{\prime}$ is an open immersion, and $\bar{X}^{\prime} \rightarrow Y$ is a proper and representable morphism of algebraic spaces.

Proof. Let $Z \subset \mathbf{P}_{Y}^{n}$ be the scheme theoretic image of the immersion $U \rightarrow \mathbf{P}_{Y}^{n}$. Since $U \rightarrow \mathbf{P}_{Y}^{n}$ is quasi-compact we see that $U \subset Z$ is a (scheme theoretically) dense open subspace (Morphisms of Spaces, Lemma 54.17.7). Apply Lemma 63.30.1 to find a diagram

with properties as listed in the statement of that lemma. Since $Z^{\prime} \rightarrow Z \rightarrow Y$ is proper we see that $Z^{\prime} \subset \bar{X}^{\prime}$ is closed (see Morphisms of Spaces, Lemma 54.39.6). After replacing $\bar{X}^{\prime}$ by a further $U$-admissible blowup we may assume that $U$ is scheme theoretically dense in $\bar{X}^{\prime}$ (details omitted; use Divisors on Spaces, Lemmas 58.6.4 and 58.2.4. It follows that $Z^{\prime}=\bar{X}^{\prime}$ and the lemma is proved.

088S Lemma 63.30.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ separated, of finite type, and $Y$ Noetherian. Then there exists a commutative diagram

where $X^{\prime} \rightarrow X$ is a $U$-admissible blowup for some dense open $U \subset X$, the morphism $X^{\prime} \rightarrow \bar{X}^{\prime}$ is an open immersion, and $\bar{X}^{\prime} \rightarrow Y$ is a proper and representable morphism of algebraic spaces.

Proof. By Limits of Spaces, Lemma 57.13 .3 there exists a dense open subspace $U \subset X$ and an immersion $U \rightarrow \mathbf{A}_{Y}^{n}$ over $Y$. Composing with the open immersion $\mathbf{A}_{Y}^{n} \rightarrow \mathbf{P}_{Y}^{n}$ we obtain a situation as in Lemma 63.30 .2 and the result follows.

088T Remark 63.30.4. In Lemma 63.30 .2 the morphism $\bar{X}^{\prime} \rightarrow Y$ is a composition

$$
\bar{X}^{\prime} \rightarrow Z \rightarrow \mathbf{P}_{Y}^{n} \rightarrow Y
$$

where $b: \bar{X}^{\prime} \rightarrow Z$ is a $U$-admissible blowing up (in particular $\left.b\right|_{U}: U \rightarrow b(U)$ is an isomorphism onto an open subspace of $Z)$ and where $Z \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion. This is immediate from the proof. It follows that the morphism $\bar{X}^{\prime} \rightarrow Y$ obtained in the statement of Lemma 63.30.3 has a factorization of this type as well.

The following result is Knu71, IV Theorem 3.1]. Note that the immersion $X^{\prime} \rightarrow$ $\mathbf{P}_{Y}^{n}$ is quasi-compact, hence can be factored as $X^{\prime} \rightarrow \bar{X}^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ where the first morphism is an open immersion and the second morphism a closed immersion (Morphisms of Spaces, Lemma 54.17.7).

088U Lemma 63.30.5 (Chow's lemma). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ separated of finite type, and $Y$ separated and Noetherian. Then there exists a commutative diagram

where $X^{\prime} \rightarrow X$ is a $U$-admissible blowup for some dense open $U \subset X$ and the morphism $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is an immersion.

Proof. In this first paragraph of the proof we reduce the lemma to the case where $Y$ is of finite type over $\operatorname{Spec}(\mathbf{Z})$. We may and do replace the base scheme $S$ by $\operatorname{Spec}(\mathbf{Z})$. We can write $Y=\lim Y_{i}$ as a directed limit of separated algebraic spaces of finite type over $\operatorname{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition 57.8.1 and Lemma 57.5.7. For all $i$ sufficiently large we can find a separated finite type morphism $X_{i} \rightarrow Y_{i}$ such that $X=Y \times_{Y_{i}} X_{i}$, see Limits of Spaces, Lemmas 57.7.1 and 57.6.8 Let $\eta_{1}, \ldots, \eta_{n}$ be the generic points of the irreducible components of $|X|$ ( $X$ is Noetherian as a finite type separated algebraic space over the Noetherian algebraic space $Y$ and therefore $|X|$ is a Noetherian topological space). By Limits of Spaces, Lemma 57.5 .2 we find that the images of $\eta_{1}, \ldots, \eta_{n}$ in $\left|X_{i}\right|$ are distinct for $i$ large enough. We may replace $X_{i}$ by the scheme theoretic image of the (quasi-compact, in fact affine) morphism $X \rightarrow X_{i}$. After this replacement we see that the images of $\eta_{1}, \ldots, \eta_{n}$ in $\left|X_{i}\right|$ are the generic points of the irreducible components of $\left|X_{i}\right|$, see Morphisms of Spaces, Lemma 54.16.3 Having said this, suppose we can find a diagram

where $X_{i}^{\prime} \rightarrow X_{i}$ is a $U_{i}$-admissible blowup for some dense open $U_{i} \subset X_{i}$ and the morphism $X_{i}^{\prime} \rightarrow \mathbf{P}_{Y_{i}}^{n}$ is an immersion. Then the strict transform $X^{\prime} \rightarrow X$ of $X$ relative to $X_{i}^{\prime} \rightarrow X_{i}$ is a $U$-admissible blowing up where $U \subset X$ is the inverse image of $U_{i}$ in $X$. Because of our carefuly chosen index $i$ it follows that $\eta_{1}, \ldots, \eta_{n} \in|U|$ and $U \subset X$ is dense. Moreover, $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is an immersion as $X^{\prime}$ is closed in $X_{i}^{\prime} \times_{X_{i}} X=X_{i}^{\prime} \times_{Y_{i}} Y$ which comes with an immersion into $\mathbf{P}_{Y}^{n}$. Thus we have reduced to the situation of the following paragraph.

Assume that $Y$ is separated of finite type over $\operatorname{Spec}(\mathbf{Z})$. Then $X \rightarrow \operatorname{Spec}(\mathbf{Z})$ is separated of finite type as well. We apply Lemma 63.30 .3 to find a diagram

where $X^{\prime} \rightarrow X$ is a $U$-admissible blowup for some dense open $U \subset X$ and $X^{\prime} \rightarrow \bar{X}^{\prime}$ is an open immersion and $\bar{X}^{\prime} \rightarrow \operatorname{Spec}(\mathbf{Z})$ is representable and proper. In fact, by Remark 63.30.4 we see that $\bar{X}^{\prime} \rightarrow \operatorname{Spec}(\mathbf{Z})$ can be factored as

$$
\bar{X}^{\prime} \rightarrow Z \rightarrow \mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})
$$

where the first morphism is a $U$-admissible blowing up, the second morphism is a closed immersion, and the third morphism is the structure morphism. Note that $Z$ has an ample invertible sheaf, namely $\left.\mathcal{O}_{\mathbf{P}^{n}}(1)\right|_{Z}$. Hence $\bar{X}^{\prime} \rightarrow Z$ is a H-projective morphism by Morphisms, Lemma 28.42.15. It follows that $\bar{X}^{\prime} \rightarrow \operatorname{Spec}(\mathbf{Z})$ is H projective by Morphisms, Lemma 28.42.8. Thus there exists a closed immersion $\bar{X}^{\prime} \rightarrow \mathbf{P}_{\operatorname{Spec}(\mathbf{Z})}^{n}$. It follows that the diagonal map $X^{\prime} \rightarrow Y \times \mathbf{P}_{\operatorname{Spec}(\mathbf{Z})}^{n}=\mathbf{P}_{Y}^{n}$ is an immersion and we win.

### 63.31. Variants of Chow's Lemma

089K In this section we prove a number of variants of Chow's lemma dealing with morphisms between non-Noetherian algebraic spaces. The Noetherian versions are Lemma 63.30.3 and Lemma 63.30.5.

089L Lemma 63.31.1. Let $S$ be a scheme. Let $Y$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $f: X \rightarrow Y$ be a separated morphism of finite type. Then there exists a commutative diagram

where $X^{\prime} \rightarrow X$ is proper surjective, $X^{\prime} \rightarrow \bar{X}^{\prime}$ is an open immersion, and $\bar{X}^{\prime} \rightarrow Y$ is proper and representable morphism of algebraic spaces.

Proof. By Limits of Spaces, Proposition 57.11.7 we can find a closed immersion $X \rightarrow X_{1}$ where $X_{1}$ is separated and of finite presentation over $Y$. Clearly, if we prove the assertion for $X_{1} \rightarrow Y$, then the result follows for $X$. Hence we may assume that $X$ is of finite presentation over $Y$.
We may and do replace the base scheme $S$ by $\operatorname{Spec}(\mathbf{Z})$. Write $Y=\lim _{i} Y_{i}$ as a directed limit of quasi-separated algebraic spaces of finite type over $\operatorname{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition57.8.1. By Limits of Spaces, Lemma57.7.1 we can find an index $i \in I$ and a scheme $X_{i} \rightarrow Y_{i}$ of finite presentation so that $X=Y \times{ }_{Y_{i}} X_{i}$. By Limits of Spaces, Lemma 57.6 .8 we may assume that $X_{i} \rightarrow Y_{i}$ is separated. Clearly, if we prove the assertion for $X_{i}$ over $Y_{i}$, then the assertion holds for $X$. The case $X_{i} \rightarrow Y_{i}$ is treated by Lemma 63.30.3.

089M Lemma 63.31.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ separated of finite type, and $Y$ separated and quasicompact. Then there exists a commutative diagram

where $X^{\prime} \rightarrow X$ is proper surjective morphism and the morphism $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is an immersion.

Proof. By Limits of Spaces, Proposition 57.11.7 we can find a closed immersion $X \rightarrow X_{1}$ where $X_{1}$ is separated and of finite presentation over $Y$. Clearly, if we prove the assertion for $X_{1} \rightarrow Y$, then the result follows for $X$. Hence we may assume that $X$ is of finite presentation over $Y$.

We may and do replace the base scheme $S$ by $\operatorname{Spec}(\mathbf{Z})$. Write $Y=\lim _{i} Y_{i}$ as a directed limit of quasi-separated algebraic spaces of finite type over $\operatorname{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition 57.8.1. By Limits of Spaces, Lemma 57.5.7 we may assume that $Y_{i}$ is separated for all $i$. By Limits of Spaces, Lemma 57.7.1 we can find an index $i \in I$ and a scheme $X_{i} \rightarrow Y_{i}$ of finite presentation so that $X=Y \times_{Y_{i}} X_{i}$. By Limits of Spaces, Lemma 57.6 .8 we may assume that $X_{i} \rightarrow Y_{i}$ is separated. Clearly, if we prove the assertion for $X_{i}$ over $Y_{i}$, then the assertion holds for $X$. The case $X_{i} \rightarrow Y_{i}$ is treated by Lemma 63.30.5.

### 63.32. Grothendieck's existence theorem

089N In this section we discuss Grothendieck's existence theorem for algebraic spaces. Instead of developing a theory of "formal algebraic spaces" we temporarily develop a bit of language that replaces the notion of a "coherent module on a Noetherian adic formal space".
Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Below we will consider inverse systems $\left(\mathcal{F}_{n}\right)$ of coherent $\mathcal{O}_{X}$-modules such that
(1) $\mathcal{F}_{n}$ is annihilated by $\mathcal{I}^{n}$, and
(2) the transition maps induce isomorphisms $\mathcal{F}_{n+1} / \mathcal{I}^{n} \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$.

A morphism $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ of such inverse systems is simply a compatible system of morphisms $\alpha_{n}: \mathcal{F}_{n} \rightarrow \mathcal{G}_{n}$. Let us denote the category of these inverse systems with $\operatorname{Coh}(X, \mathcal{I})$. We will develop some theory regarding these systems that will parallel to the corresponding results in the case of schemes, see Cohomology of Schemes, Sections 29.22, 29.23, and 29.24 .

Functoriality. Let $f: X \rightarrow Y$ be a morphism of Noetherian algebraic spaces over a scheme $S$, and let $\mathcal{J} \subset \mathcal{O}_{Y}$ be a quasi-coherent sheaf of ideals. Set $\mathcal{I}=f^{-1} \mathcal{J} \mathcal{O}_{X}$. In this situation there is a functor

$$
f^{*}: \operatorname{Coh}(Y, \mathcal{J}) \longrightarrow \operatorname{Coh}(X, \mathcal{I})
$$

which sends $\left(\mathcal{G}_{n}\right)$ to $\left(f^{*} \mathcal{G}_{n}\right)$. Compare with Cohomology of Schemes, Lemma 29.23.1. If $f$ is étale, then we may think of this as simply the restriction of the system to $X$, see Properties of Spaces, Equation 53.25.1.1.

Étale descent. Let $S$ be a scheme. Let $U_{0} \rightarrow X$ be a surjective étale morphism of Noetherian algebraic spaces. Set $U_{1}=U_{0} \times_{X} U_{0}$ and $U_{2}=U_{0} \times_{X} U_{0} \times_{X} U_{0}$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Set $\mathcal{I}_{i}=\left.\mathcal{I}\right|_{U_{i}}$. In this situation we obtain a diagram of categories

$$
\operatorname{Coh}(X, \mathcal{I}) \longrightarrow \operatorname{Coh}\left(U_{0}, \mathcal{I}_{0}\right) \Longrightarrow \operatorname{Coh}\left(U_{1}, \mathcal{I}_{1}\right) \Longrightarrow \operatorname{Coh}\left(U_{2}, \mathcal{I}_{2}\right)
$$

an the first arrow presents $\operatorname{Coh}(X, \mathcal{I})$ as the homotopy limit of the right part of the diagram. More precisely, given a descent datum, i.e., a pair $\left(\left(\mathcal{G}_{n}\right), \varphi\right)$ where $\left(\mathcal{G}_{n}\right)$ is an object of $\operatorname{Coh}\left(U_{0}, \mathcal{I}_{0}\right)$ and $\varphi: \operatorname{pr}_{0}^{*}\left(\mathcal{G}_{n}\right) \rightarrow \operatorname{pr}_{1}^{*}\left(\mathcal{G}_{n}\right)$ is an isomorphism in $\operatorname{Coh}\left(U_{1}, \mathcal{I}_{1}\right)$ satisfying the cocycle condition in $\operatorname{Coh}\left(U_{2}, \mathcal{I}_{2}\right)$, then there exists a unique object $\left(\mathcal{F}_{n}\right)$ of $\operatorname{Coh}(X, \mathcal{I})$ whose associated canonical descent datum is isomorphic to $\left(\left(\mathcal{G}_{n}\right), \varphi\right)$. Compare with Descent on Spaces, Definition 61.3.3. The proof of this statement follows immediately by applying Descent on Spaces, Proposition 61.4.1 to the descent data $\left(\mathcal{G}_{n}, \varphi_{n}\right)$ for varying $n$.

089P Lemma 63.32.1. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals.
(1) The category $\operatorname{Coh}(X, \mathcal{I})$ is abelian.
(2) Exactness in $\operatorname{Coh}(X, \mathcal{I})$ can be checked étale locally.
(3) For any flat morphism $f: X^{\prime} \rightarrow X$ of Noetherian algebraic spaces the functor $f^{*}: \operatorname{Coh}(X, \mathcal{I}) \rightarrow \operatorname{Coh}\left(X^{\prime}, f^{-1} \mathcal{I} \mathcal{O}_{X^{\prime}}\right)$ is exact.

Proof. Proof of (1). Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X$. Set $U_{1}=U_{0} \times_{X} U_{0}$ and $U_{2}=U_{0} \times_{X} U_{0} \times_{X} U_{0}$ as in our discussion of étale descent above. The categories $\operatorname{Coh}\left(U_{i}, \mathcal{I}_{i}\right)$ are abelian (Cohomology of Schemes, Lemma 29.22 .2 and the pullback functors are exact functors $\operatorname{Coh}\left(U_{0}, \mathcal{I}_{0}\right) \rightarrow \operatorname{Coh}\left(U_{1}, \mathcal{I}_{1}\right)$ and $\operatorname{Coh}\left(U_{1}, \mathcal{I}_{1}\right) \rightarrow \operatorname{Coh}\left(U_{2}, \mathcal{I}_{2}\right)$ (Cohomology of Schemes, Lemma 29.23.1. The lemma then follows formally from the description of $\operatorname{Coh}(X, \mathcal{I})$ as a category of descent data. Some details omitted; compare with the proof of Groupoids, Lemma 38.14.6.

Part (2) follows immediately from the discussion in the previous paragraph. In the situation of (3) choose a commutative diagram

where $U^{\prime}$ and $U$ are affine schemes and the vertical morphisms are surjective étale. Then $U^{\prime} \rightarrow U$ is a flat morphism of Noetherian schemes (Morphisms of Spaces, Lemma 54.29.5 whence the pullback functor $\operatorname{Coh}\left(U, \mathcal{I} \mathcal{O}_{U}\right) \rightarrow \operatorname{Coh}\left(U^{\prime}, \mathcal{I} \mathcal{O}_{U^{\prime}}\right)$ is exact by Cohomology of Schemes, Lemma 29.23.1. Since we can check exactness in $\operatorname{Coh}\left(X, \mathcal{O}_{X}\right)$ on $U$ and similarly for $X^{\prime}, U^{\prime}$ the assertion follows.

08B3 Lemma 63.32.2. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. $A \operatorname{map}\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ is surjective in $\operatorname{Coh}(X, \mathcal{I})$ if and only if $\mathcal{F}_{1} \rightarrow \mathcal{G}_{1}$ is surjective.

Proof. We can check on an affine étale cover of $X$ by Lemma 63.32.1. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.22.3.

Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. There is a functor
08B4
(63.32.2.1)

$$
\operatorname{Coh}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Coh}(X, \mathcal{I}), \quad \mathcal{F} \longmapsto \mathcal{F}^{\wedge}
$$

which associates to the coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the object $\mathcal{F}^{\wedge}=\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)$ of $\operatorname{Coh}(X, \mathcal{I})$.
08B5 Lemma 63.32.3. The functor 63.32.2.1) is exact.
Proof. It suffices to check this étale locally on $X$, see Lemma 63.32.1. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.22.5.

08B6 Lemma 63.32.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Set $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$. Then

$$
\lim H^{0}\left(X, \mathcal{H} / \mathcal{I}^{n} \mathcal{H}\right)=\operatorname{Mor}_{\operatorname{Coh}(X, \mathcal{I})}\left(\mathcal{F}^{\wedge}, \mathcal{G}^{\wedge}\right)
$$

Proof. Since $\mathcal{H}$ is a sheaf on $X_{\text {étale }}$ and since we have étale descent for objects of $\operatorname{Coh}(X, \mathcal{I})$ it suffices to prove this étale locally. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.22.6.

We introduce the setting that we will focus on throughout the rest of this section.
08B7 Situation 63.32.5. Here $A$ is a Noetherian ring complete with respect to an ideal I. Also $f: X \rightarrow \operatorname{Spec}(A)$ is a finite type separated morphism of algebraic spaces and $\mathcal{I}=I \mathcal{O}_{X}$.

In this situation we denote

$$
C o h_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)
$$

be the full subcategory of $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$ consisting of those coherent $\mathcal{O}_{X}$-modules whose scheme theoretic support is proper over $\operatorname{Spec}(A)$. Similarly, we let

$$
C o h_{\text {support proper over } A}(X, \mathcal{I})
$$

be the full subcategory of $\operatorname{Coh}(X, \mathcal{I})$ consisting of those objects $\left(\mathcal{F}_{n}\right)$ such that the scheme theoretic support of $\mathcal{F}_{1}$ is proper over $\operatorname{Spec}(A)$. Since the support of a quotient module is contained in the support of the module, it follows that 63.32.2.1) induces a functor

08B8 (63.32.5.1) $C o h_{\text {support proper over } A}\left(\mathcal{O}_{X}\right) \longrightarrow C o h_{\text {support proper over } A}(X, \mathcal{I})$
Our first result is that this functor is fully faithful.
08B9 Lemma 63.32.6. In Situation 63.32.5. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Assume that the intersection of the scheme theoretic supports of $\mathcal{F}$ and $\mathcal{G}$ is proper over $\operatorname{Spec}(A)$. Then the map

$$
\operatorname{Mor}_{\operatorname{Coh}\left(\mathcal{O}_{X}\right)}(\mathcal{F}, \mathcal{G}) \longrightarrow \operatorname{Mor}_{\operatorname{Coh}(X, \mathcal{I})}\left(\mathcal{F}^{\wedge}, \mathcal{G}^{\wedge}\right)
$$

coming from 63.32.2.1) is a bijection. In particular, 63.32.5.1) is fully faithful.
Proof. Let $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{F})$. This is a coherent $\mathcal{O}_{X}$-module because its restriction of schemes étale over $X$ is coherent by Modules, Lemma 17.19.4. By Lemma 63.32 .4 the map

$$
\lim _{n} H^{0}\left(X, \mathcal{H} / \mathcal{I}^{n} \mathcal{H}\right) \rightarrow \operatorname{Mor}_{\operatorname{Coh}(X, \mathcal{I})}\left(\mathcal{G}^{\wedge}, \mathcal{F}^{\wedge}\right)
$$

is bijective. Let $i: Z \rightarrow X$ be the scheme theoretic support of $\mathcal{H}$. It is clear that $Z$ is a closed subspace contained in the intersection of the scheme theoretic supports of $\mathcal{F}$ and $\mathcal{G}$. Hence $Z \rightarrow \operatorname{Spec}(A)$ is proper by assumption. Write $\mathcal{H}=i_{*} \mathcal{H}^{\prime}$ for some coherent $\mathcal{O}_{Z}$-module $\mathcal{H}^{\prime}$. We have $i_{*}\left(\mathcal{H}^{\prime} / I^{n} \mathcal{H}^{\prime}\right)=\mathcal{H} / I^{n} \mathcal{H}$. Hence we obtain

$$
\begin{aligned}
\lim _{n} H^{0}\left(X, \mathcal{H} / \mathcal{I}^{n} \mathcal{H}\right) & =\lim _{n} H^{0}\left(Z, \mathcal{H}^{\prime} / \mathcal{I}^{n} \mathcal{H}^{\prime}\right) \\
& =H^{0}\left(Z, \mathcal{H}^{\prime}\right) \\
& =H^{0}(X, \mathcal{H}) \\
& =\operatorname{Mor}_{C o h\left(\mathcal{O}_{X}\right)}(\mathcal{F}, \mathcal{G})
\end{aligned}
$$

the second equality by the theorem on formal functions functions (Cohomology of Spaces, Lemma 56.20.6). This proves the lemma.

08BA Remark 63.32.7. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_{X}$ be quasi-coherent sheaves of ideals. Let $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ be a morphism of $\operatorname{Coh}(X, \mathcal{I})$. Given an affine scheme $U=\operatorname{Spec}(A)$ and a surjective étale morphism $U \rightarrow X$ denote $I, K \subset A$ the ideals corresponding to the restrictions $\left.\mathcal{I}\right|_{U},\left.\mathcal{K}\right|_{U}$. Denote $\alpha_{U}: M \rightarrow N$ of finite $A^{\wedge}$-modules which corresponds to $\left.\alpha\right|_{U}$ via Cohomology of Schemes, Lemma 29.22.1. We claim the following are equivalent
(1) there exists an integer $t \geq 1$ such that $\operatorname{Ker}\left(\alpha_{n}\right)$ and $\operatorname{Coker}\left(\alpha_{n}\right)$ are annihilated by $\mathcal{K}^{t}$ for all $n \geq 1$,
(2) for any (or some) affine open $\operatorname{Spec}(A)=U \subset X$ as above the modules $\operatorname{Ker}\left(\alpha_{U}\right)$ and $\operatorname{Coker}\left(\alpha_{U}\right)$ are annihilated by $K^{t}$ for some integer $t \geq 1$.
If these equivalent conditions hold we will say that $\alpha$ is a map whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. To see the equivalence we refer to Cohomology of Schemes, Remark 29.23.2.

08BB Lemma 63.32.8. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$ and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}-$ module, $\left(\mathcal{F}_{n}\right)$ an object of $\operatorname{Coh}(X, \mathcal{I})$, and $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{G}^{\wedge}$ a map whose kernel and cokernel are annihilated by a power of $\mathcal{I}$. Then there exists a unique (up to unique isomorphism) triple $(\mathcal{F}, a, \beta)$ where
(1) $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module,
(2) $a: \mathcal{F} \rightarrow \mathcal{G}$ is an $\mathcal{O}_{X}$-module map whose kernel and cokernel are annihilated by a power of $\mathcal{I}$,
(3) $\beta:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{F}^{\wedge}$ is an isomorphism, and
(4) $\alpha=a^{\wedge} \circ \beta$.

Proof. The uniqueness and étale descent for objects of $\operatorname{Coh}(X, \mathcal{I})$ and $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$ implies it suffices to construct $(\mathcal{F}, a, \beta)$ étale locally on $X$. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.23.3.
08BC Lemma 63.32.9. In Situation 63.32.5. Let $\mathcal{K} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $X_{e} \subset X$ be the closed subspace cut out by $\mathcal{K}^{e}$. Let $\mathcal{I}_{e}=\mathcal{I} \mathcal{O}_{X_{e}}$. Let $\left(\mathcal{F}_{n}\right)$ be an object of $C o h_{\text {support proper over } A}(X, \mathcal{I})$. Assume
(1) the functor $C_{\text {oh }}^{\text {support proper over } A}\left(\mathcal{O}_{X_{e}}\right) \rightarrow \operatorname{Coh}_{\text {support proper over } A}\left(X_{e}, \mathcal{I}_{e}\right)$ is an equivalence for all $e \geq 1$, and
(2) there exists an object $\mathcal{H}$ of $C_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)$ and a map $\alpha$ : $\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{H}^{\wedge}$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. Then $\left(\mathcal{F}_{n}\right)$ is in the essential image of 63.32.5.1.

Proof. During this proof we will use without further mention that for a closed immersion $i: Z \rightarrow X$ the functor $i_{*}$ gives an equivalence between the category of coherent modules on $Z$ and coherent modules on $X$ annihilated by the ideal sheaf of $Z$, see Cohomology of Spaces, Lemma 56.11.8. In particular we think of

$$
\operatorname{Coh}_{\text {support proper over } A}\left(\mathcal{O}_{X_{e}}\right) \subset C o h_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)
$$

as the full subcategory of consisting of modules annihilated by $\mathcal{K}^{e}$ and

$$
\operatorname{Coh}_{\text {support proper over } A}\left(X_{e}, \mathcal{I}_{e}\right) \subset C o h_{\text {support proper over } A}(X, \mathcal{I})
$$

as the full subcategory of of objects annihilated by $\mathcal{K}^{e}$. Moreover (1) tells us these two categories are equivalent under the completion functor 63.32.5.1).

Applying this equivalence we get a coherent $\mathcal{O}_{X}$-module $\mathcal{G}_{e}$ annihilated by $\mathcal{K}^{e}$ corresponding to the system $\left(\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}\right)$ of $\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})$. The maps $\mathcal{F}_{n} / \mathcal{K}^{e+1} \mathcal{F}_{n} \rightarrow \mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}$ correspond to canonical maps $\mathcal{G}_{e+1} \rightarrow \mathcal{G}_{e}$ which induce isomorphisms $\mathcal{G}_{e+1} / \mathcal{K}^{e} \mathcal{G}_{e+1} \rightarrow \mathcal{G}_{e}$. We obtain an object $\left(\mathcal{G}_{e}\right)$ of the category $C o h_{\text {support proper over }} A(X, \mathcal{K})$. The map $\alpha$ induces a system of maps

$$
\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n} \longrightarrow \mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}
$$

whence maps $\mathcal{G}_{e} \rightarrow \mathcal{H} / \mathcal{K}^{e} \mathcal{H}$ (by the equivalence of categories again). Let $t \geq 1$ be an integer, which exists by assumption (2), such that $\mathcal{K}^{t}$ annihilates the kernel and cokernel of all the maps $\mathcal{F}_{n} \rightarrow \mathcal{H} / \mathcal{I}^{n} \mathcal{H}$. Then $\mathcal{K}^{2 t}$ annihilates the kernel and cokernel of the maps $\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n} \rightarrow \mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}$ (details omitted; see Cohomology of Schemes, Remark 29.23.2. Whereupon we conclude that $\mathcal{K}^{4 t}$ annihilates the kernel and the cokernel of the maps

$$
\mathcal{G}_{e} \longrightarrow \mathcal{H} / \mathcal{K}^{e} \mathcal{H}
$$

(details omitted; see Cohomology of Schemes, Remark 29.23.2. We apply Lemma 63.32 .8 to obtain a coherent $\mathcal{O}_{X}$-module $\mathcal{F}$, a map $a: \mathcal{F} \rightarrow \mathcal{H}$ and an isomorphism $\beta:\left(\mathcal{G}_{e}\right) \rightarrow\left(\mathcal{F} / \mathcal{K}^{e} \mathcal{F}\right)$ in $\operatorname{Coh}(X, \mathcal{K})$. Working backwards, for a given $n$ the triple $\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}, a \bmod \mathcal{I}^{n}, \beta \bmod \mathcal{I}^{n}\right)$ is a triple as in the lemma for the morphism $\alpha_{n} \bmod \mathcal{K}^{e}:\left(\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}\right) \rightarrow\left(\mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}\right)$ of $\operatorname{Coh}(X, \mathcal{K})$. Thus the uniqueness in Lemma 63.32 .8 gives a canonical isomorphism $\mathcal{F} / \mathcal{I}^{n} \mathcal{F} \rightarrow \mathcal{F}_{n}$ compatible with all the morphisms in sight.

To finish the proof of the lemma we still have to show that the scheme theoretic support of $\mathcal{F}$ is proper over $A$. By construction the kernel of $a: \mathcal{F} \rightarrow \mathcal{H}$ is annihilated by a power of $\mathcal{K}$. Hence the support of this kernel is contained in the support of $\mathcal{G}_{1}$. Since $\mathcal{G}_{1}$ is an object of $C o h_{\text {support proper over } A}\left(\mathcal{O}_{X_{1}}\right)$ we see this is proper over $A$. Combined with the fact that the support of $\mathcal{H}$ is proper over $A$ we conclude that the support of $\mathcal{F}$ is proper over $A$ (some details omitted).

08BD Lemma 63.32.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable proper morphism of Noetherian algebraic spaces over $S$. Let $\mathcal{J}, \mathcal{K} \subset \mathcal{O}_{Y}$ be quasi-coherent sheaves of ideals. Assume $f$ is an isomorphism over $V=Y \backslash V(\mathcal{K})$. Set $\mathcal{I}=$ $f^{-1} \mathcal{J} \mathcal{O}_{X}$. Let $\left(\mathcal{G}_{n}\right)$ be an object of $\operatorname{Coh}(Y, \mathcal{J})$, let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module, and let $\beta:\left(f^{*} \mathcal{G}_{n}\right) \rightarrow \mathcal{F}^{\wedge}$ be an isomorphism in $\operatorname{Coh}(X, \mathcal{I})$. Then there exists a map

$$
\alpha:\left(\mathcal{G}_{n}\right) \longrightarrow\left(f_{*} \mathcal{F}\right)^{\wedge}
$$

in $\operatorname{Coh}(Y, \mathcal{J})$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$.

Proof. Since $f$ is a proper morphism we see that $f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{Y}$-module (Cohomology of Spaces, Lemma 56.19.2. Thus the statement of the lemma makes sense. Consider the compositions

$$
\gamma_{n}: \mathcal{G}_{n} \rightarrow f_{*} f^{*} \mathcal{G}_{n} \rightarrow f_{*}\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)
$$

Here the first map is the adjunction map and the second is $f_{*} \beta_{n}$. We claim that there exists a unique $\alpha$ as in the lemma such that the compositions

$$
\mathcal{G}_{n} \xrightarrow{\alpha_{n}} f_{*} \mathcal{F} / \mathcal{J}^{n} f_{*} \mathcal{F} \rightarrow f_{*}\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)
$$

equal $\gamma_{n}$ for all $n$. Because of the uniqueness and étale descent for $\operatorname{Coh}(Y, \mathcal{J})$ it suffices to prove this étale locally on $Y$. Thus we may assume $Y$ is the spectrum of a Noetherian ring. As $f$ is representable we see that $X$ is a scheme as well. Thus we reduce to the case of schemes, see proof of Cohomology of Schemes, Lemma 29.23 .5

08BE Theorem 63.32.11 (Grothendieck's existence theorem). In Situation 63.32.5 the functor 63.32.5.1) is an equivalence.

Proof. We will use the equivalence of categories of Cohomology of Spaces, Lemma 56.11 .8 without further mention in the proof of the theorem. By Lemma 63.32.6 the functor is fully faithful. Thus we need to prove the functor is essentially surjective.

Consider the collection $\Xi$ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_{X}$ such that the statement holds for every object $\left(\mathcal{F}_{n}\right)$ of $\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})$ annihilated by $\mathcal{K}$. We want to show (0) is in $\Xi$. If not, then since $X$ is Noetherian there exists a maximal quasi-coherent sheaf of ideals $\mathcal{K}$ not in $\Xi$, see Cohomology of Spaces, Lemma 56.12.1. After replacing $X$ by the closed subscheme of $X$ corresponding to $\mathcal{K}$ we may assume that every nonzero $\mathcal{K}$ is in $\Xi$. Let $\left(\mathcal{F}_{n}\right)$ be an object of Coh $_{\text {support proper over }}(X, \mathcal{I})$. We will show that this object is in the essential image, thereby completing the proof of the theorem.

Apply Chow's lemma (Lemma 63.30.5) to find a proper surjective morphism $f$ : $Y \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that $Y$ is H-quasiprojective over $A$. Note that $Y$ is a scheme and $f$ representable. Choose an open immersion $j: Y \rightarrow Y^{\prime}$ with $Y^{\prime}$ projective over $A$, see Morphisms, Lemma 28.42.12, Let $T_{n}$ be the scheme theoretic support of $\mathcal{F}_{n}$. Note that $\left|T_{n}\right|=\left|T_{1}\right|$, hence $T_{n}$ is proper over $A$ for all $n$ (Morphisms of Spaces, Lemma 54.39.7). Then $f^{*} \mathcal{F}_{n}$ is supported on the closed subscheme $f^{-1} T_{n}$ which is proper over $A$ (by Morphisms of Spaces, Lemma 54.39 .4 and properness of $f$ ). In particular, the composition $f^{-1} T_{n} \rightarrow Y \rightarrow Y^{\prime}$ is closed (Morphisms, Lemma 28.41.7). Let $T_{n}^{\prime} \subset Y^{\prime}$ be the corresponding closed subscheme; it is contained in the open subscheme $Y$ and equal to $f^{-1} T_{n}$ as a closed subscheme of $Y$. Let $\mathcal{F}_{n}^{\prime}$ be the coherent $\mathcal{O}_{Y^{\prime}}$-module corresponding to $f^{*} \mathcal{F}_{n}$ viewed as a coherent module on $Y^{\prime}$ via the closed immersion $f^{-1} T_{n}=T_{n}^{\prime} \subset Y^{\prime}$. Then $\left(\mathcal{F}_{n}^{\prime}\right)$ is an object of $\operatorname{Coh}\left(Y^{\prime}, I \mathcal{O}_{Y^{\prime}}\right)$. By the projective case of Grothendieck's existence theorem (Cohomology of Schemes, Lemma 29.22 .9 there exists a coherent $\mathcal{O}_{Y^{\prime}}$-module $\mathcal{F}^{\prime}$ and an isomorphism $\left(\mathcal{F}^{\prime}\right)^{\wedge} \cong\left(\mathcal{F}_{n}^{\prime}\right)$ in $\operatorname{Coh}\left(Y^{\prime}, I \mathcal{O}_{Y^{\prime}}\right)$. Let $Z^{\prime} \subset Y^{\prime}$ be the scheme theoretic support of $\mathcal{F}^{\prime}$. Since $\mathcal{F}^{\prime} / I \mathcal{F}^{\prime}=\mathcal{F}_{1}^{\prime}$ we see that $Z^{\prime} \cap V\left(I \mathcal{O}_{Y^{\prime}}\right)=T_{1}^{\prime}$ set-theoretically. The structure mor$\operatorname{phism} p^{\prime}: Y^{\prime} \rightarrow \operatorname{Spec}(A)$ is proper, hence $p^{\prime}\left(Z^{\prime} \cap\left(Y^{\prime} \backslash Y\right)\right)$ is closed in $\operatorname{Spec}(A)$. If nonempty, then it would contain a point of $V(I)$ as $I$ is contained in the radical of $A$ (Algebra, Lemma 10.95.6). But we've seen above that $Z^{\prime} \cap\left(p^{\prime}\right)^{-1} V(I)=T_{1}^{\prime} \subset Y$
hence we conclude that $Z^{\prime} \subset Y$. Thus $\left.\mathcal{F}^{\prime}\right|_{Y}$ is supported on a closed subscheme of $Y$ proper over $A$.
Let $\mathcal{K}$ be the quasi-coherent sheaf of ideals cutting out the reduced complement $X \backslash U$. By Cohomology of Spaces, Lemma 56.19 .2 the $\mathcal{O}_{X}$-module $\mathcal{H}=f_{*} \mathcal{F}^{\prime}$ is coherent and by Lemma 63.32 .10 there exists a morphism $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{H}^{\wedge}$ in the category $C o h_{\text {support proper over } A}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. Let $Z_{0} \subset X$ be the scheme theoretic support of $\mathcal{H}$. It is clear that $\left|Z_{0}\right| \subset f\left(\left|Z^{\prime}\right|\right)$. Hence $Z_{0} \rightarrow \operatorname{Spec}(A)$ is proper (Morphisms of Spaces, Lemma 54.39.7). Thus $\mathcal{H}$ is an object of $\operatorname{Coh}_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)$. Since each of the sheaves of ideals $\mathcal{K}^{e}$ is an element of $\Xi$ we see that the assumptions of Lemma 63.32 .9 are satisfied and we conclude.

08BF Remark 63.32.12 (Unwinding Grothendieck's existence theorem). Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$. Picture:

In this situation we consider systems $\left(\mathcal{F}_{n}, \varphi_{n}\right)$ where
(1) $\mathcal{F}_{n}$ is a coherent $\mathcal{O}_{X_{n}}$-module,
(2) $\varphi_{n}: i_{n}^{*} \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ is an isomorphism, and
(3) $\operatorname{Supp}\left(\mathcal{F}_{1}\right)$ is proper over $S_{1}$.

Theorem 63.32.11 says that the completion functor

$$
\begin{array}{ccc}
\text { coherent } \mathcal{O}_{X} \text {-modules } \mathcal{F} \\
\text { with support proper over } A
\end{array} \longrightarrow \begin{gathered}
\text { systems }\left(\mathcal{F}_{n}\right) \\
\text { as above }
\end{gathered}
$$

is an equivalence of categories. In the special case that $X$ is proper over $A$ we can omit the conditions on the supports.

### 63.33. Grothendieck's algebraization theorem

0 A 00 This section is the analogue of Cohomology of Schemes, Section 29.24 . However, this section is missing the result on algebraization of deformations of proper algebraic spaces endowed with ample invertible sheaves, as a proper algebraic space which comes with an ample invertible sheaf is a scheme. Our first result is a translation of Grothendieck's existence theorem in terms of closed subschemes and finite morphisms.

08BG Lemma 63.33.1. Let $A$ be a Noetherian ring complete with respect to an ideal I. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$. Suppose given a commutative diagram

of algebraic spaces with cartesian squares. Assume that
(1) $Z_{1} \rightarrow X_{1}$ is a closed immersion, and
(2) $Z_{1} \rightarrow S_{1}$ is proper.

Then there exists a closed immersion of algebraic spaces $Z \rightarrow X$ such that $Z_{n}=$ $Z \times{ }_{S} S_{n}$ for all $n \geq 1$. Moreover, $Z$ is proper over $S$.

Proof. Let's write $j_{n}: Z_{n} \rightarrow X_{n}$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of $j_{n}$ to $X_{1}$ is $j_{1}$. Thus Limits of Spaces, Lemma 57.15 .5 shows that $j_{n}$ is a closed immersion. Set $\mathcal{F}_{n}=j_{n, *} \mathcal{O}_{Z_{n}}$, so that $j_{n}^{\sharp}$ is a surjection $\mathcal{O}_{X_{n}} \rightarrow \mathcal{F}_{n}$. Again using that the squares are cartesian we see that the pullback of $\mathcal{F}_{n+1}$ to $X_{n}$ is $\mathcal{F}_{n}$. Hence Grothendieck's existence theorem, as reformulated in Remark 63.32.12, tells us there exists a map $\mathcal{O}_{X} \rightarrow \mathcal{F}$ of coherent $\mathcal{O}_{X}$-modules whose restriction to $X_{n}$ recovers $\mathcal{O}_{X_{n}} \rightarrow \mathcal{F}_{n}$. Moreover, the support of $\mathcal{F}$ is proper over $S$. As the completion functor is exact (Lemma 63.32.3) we see that $\mathcal{O}_{X} \rightarrow \mathcal{F}$ is surjective. Thus $\mathcal{F}=\mathcal{O}_{X} / \mathcal{J}$ for some quasi-coherent sheaf of ideals $\mathcal{J}$. Setting $Z=V(\mathcal{J})$ finishes the proof.

0A01 Lemma 63.33.2. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$. Suppose given a commutative diagram

of algebraic spaces with cartesian squares. Assume that
(1) $Y_{1} \rightarrow X_{1}$ is a finite morphism, and
(2) $Y_{1} \rightarrow S_{1}$ is proper.

Then there exists a finite morphism of algebraic spaces $Y \rightarrow X$ such that $Y_{n}=$ $Y \times_{S} S_{n}$ for all $n \geq 1$. Moreover, $Y$ is proper over $S$.

Proof. Let's write $f_{n}: Y_{n} \rightarrow X_{n}$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of $f_{n}$ to $X_{1}$ is $f_{1}$. Thus Lemma 63.9 .12 shows that $f_{n}$ is a finite morphism. Set $\mathcal{F}_{n}=f_{n, *} \mathcal{O}_{Y_{n}}$. Using that the squares are cartesian we see that the pullback of $\mathcal{F}_{n+1}$ to $X_{n}$ is $\mathcal{F}_{n}$. Hence Grothendieck's existence theorem, as reformulated in Remark 63.32.12, tells us there exists a coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ whose restriction to $X_{n}$ recovers $\mathcal{F}_{n}$. Moreover, the support of $\mathcal{F}$ is proper over $S$. As the completion functor is fuly faithful (Theorem 63.32.11) we see that the multiplication maps $\mathcal{F}_{n} \otimes_{\mathcal{O}_{x_{n}}} \mathcal{F}_{n} \rightarrow \mathcal{F}_{n}$ fit together to give an algebra structure on $\mathcal{F}$. Setting $Y=\underline{\operatorname{Spec}}_{X}(\mathcal{F})$ finishes the proof.

0A4Z Lemma 63.33.3. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X, Y$ be algebraic spaces over $S$. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$ and $Y_{n}=Y \times_{S} S_{n}$. Suppose given a compatible
system of commutative diagrams

Assume that
(1) $X \rightarrow S$ is proper, and
(2) $Y \rightarrow S$ is separated of finite type.

Then there exists a unique morphism of algebraic spaces $g: X \rightarrow Y$ over $S$ such that $g_{n}$ is the base change of $g$ to $S_{n}$.

Proof. The morphisms $\left(1, g_{n}\right): X_{n} \rightarrow X_{n} \times_{S} Y_{n}$ are closed immersions because $Y_{n} \rightarrow S_{n}$ is separated (Morphisms of Spaces, Lemma 54.4.7). Thus by Lemma 63.33 .1 there exists a closed subspace $Z \subset X \times{ }_{S} Y$ proper over $S$ whose base change to $S_{n}$ recovers $X_{n} \subset X_{n} \times{ }_{S} Y_{n}$. The first projection $p: Z \rightarrow X$ is a proper morphism (as $Z$ is proper over $S$, see Morphisms of Spaces, Lemma 54.39.6) whose base change to $S_{n}$ is an isomorphism for all $n$. In particular, $p: Z \rightarrow X$ is quasi-finite on an open subspace of $Z$ containing every point of $Z_{0}$ for example by Morphisms of Spaces, Lemma 54.33.7. As $Z$ is proper over $S$ this open neighbourhood is all of $Z$. We conclude that $p: Z \rightarrow X$ is finite by Zariski's main theorem (for example apply Lemma 63.25 .3 and use properness of $Z$ over $X$ to see that the immersion is a closed immersion). Applying the equivalence of Theorem 63.32.11 we see that $p_{*} \mathcal{O}_{Z}=\mathcal{O}_{X}$ as this is true modulo $I^{n}$ for all $n$. Hence $p$ is an isomorphism and we obtain the morphism $g$ as the composition $X \cong Z \rightarrow Y$. We omit the proof of uniqueness.

### 63.34. Regular immersions

06BL This section is the analogue of Divisors, Section 30.18 for morphisms of algebraic spaces. The reader is encouraged to read up on regular immersions of schemes in that section first.

In Divisors, Section 30.18 we defined four types of regular immersions for morphisms of schemes. Of these only three are (as far as we know) local on the target for the étale topology; as usual plain old regular immersions aren't. This is why for morphisms of algebraic spaces we cannot actually define regular immersions. (These kinds of annoyances prompted Grothendieck and his school to replace original notion of a regular immersion by a Koszul-regular immersions, see BGI71, Exposee VII, Definition 1.4].) But we can define Koszul-regular, $H_{1}$-regular, and quasiregular immersions. Another remark is that since Koszul-regular immersions are not preserved by arbitrary base change, we cannot use the strategy of Morphisms of Spaces, Section 54.3 to define them. Similarly, as Koszul-regular immersions are not étale local on the source, we cannot use Morphisms of Spaces, Lemma 54.22.1 to define them either. We replace this lemma instead by the following.

06BM Lemma 63.34.1. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the target. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Consider commutative diagrams

where $V$ is a scheme and $V \rightarrow Y$ is étale. The following are equivalent
(1) for any diagram as above the projection $X \times_{Y} V \rightarrow V$ has property $\mathcal{P}$, and
(2) for some diagram as above with $V \rightarrow Y$ surjective the projection $X \times_{Y} V \rightarrow$ $V$ has property $\mathcal{P}$.
If $X$ and $Y$ are representable, then this is also equivalent to $f$ (as a morphism of schemes) having property $\mathcal{P}$.
Proof. Let us prove the equivalence of (1) and (2). The implication (1) $\Rightarrow(2)$ is immediate. Assume

are two diagrams as in the lemma. Assume $V \rightarrow Y$ is surjective and $X \times{ }_{Y} V \rightarrow V$ has property $\mathcal{P}$. To show that (2) implies (1) we have to prove that $X \times_{Y} V^{\prime} \rightarrow V^{\prime}$ has $\mathcal{P}$. To do this consider the diagram

By our assumption that $\mathcal{P}$ is étale local on the source, we see that $\mathcal{P}$ is preserved under étale base change, see Descent, Lemma 34.18.2. Hence if the left vertical arrow has $\mathcal{P}$ the so does the middle vertical arrow. Since $U \times{ }_{X} U^{\prime} \rightarrow U^{\prime}$ is surjective and étale (hence defines an étale covering of $U^{\prime}$ ) this implies (as $\mathcal{P}$ is assumed local for the étale topology on the target) that the left vertical arrow has $\mathcal{P}$.
If $X$ and $Y$ are representable, then we can take $\operatorname{id}_{Y}: Y \rightarrow Y$ as our étale covering to see the final statement of the lemma is true.

Note that "being a Koszul-regular (resp. $H_{1}$-regular, resp. quasi-regular) immersion" is a property of morphisms of schemes which is fpqc local on the target, see Descent, Lemma 34.19.30. Hence the following definition now makes sense.

06BN Definition 63.34.2. Let $S$ be a scheme. Let $i: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $i$ is a Koszul-regular immersion if $i$ is representable and the equivalent conditions of Lemma 63.34.1 hold with $\mathcal{P}(f)=" f$ is a Koszul-regular immersion".
(2) We say $i$ is an $H_{1}$-regular immersion if $i$ is representable and the equivalent conditions of Lemma 63.34.1 hold with $\mathcal{P}(f)=" f$ is an $H_{1}$-regular immersion".
(3) We say $i$ is a quasi-regular immersion if $i$ is representable and the equivalent conditions of Lemma 63.34.1 hold with $\mathcal{P}(f)=" f$ is a quasi-regular immersion".
06BP Lemma 63.34.3. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. We have the following implications: $i$ is Koszul-regular $\Rightarrow i$ is $H_{1}$-regular $\Rightarrow i$ is quasi-regular.

Proof. Via the definition this lemma immediately reduces to Divisors, Lemma 30.18.2.

09RW Lemma 63.34.4. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Assume $X$ is locally Noetherian. Then $i$ is Koszul-regular $\Leftrightarrow i$ is $H_{1}$-regular $\Leftrightarrow i$ is quasi-regular.
Proof. Via Definition 63.34 .2 (and the definition of a locally Noetherian algebraic space in Properties of Spaces, Section 53.7) this immediately translates to the case of schemes which is Divisors, Lemma 30.18.3.

09RX Lemma 63.34.5. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a Koszul-regular, $H_{1-}$ regular, or quasi-regular immersion of algebraic spaces over $S$. Let $X^{\prime} \rightarrow X$ be a flat morphism of algebraic spaces over $S$. Then the base change $i^{\prime}: Z \times{ }_{X} X^{\prime} \rightarrow X^{\prime}$ is a Koszul-regular, $H_{1}$-regular, or quasi-regular immersion.
Proof. Via Definition 63.34.2 (and the definition of a flat morphism of algebraic spaces in Morphisms of Spaces, Section 54.29) this lemma reduces to the case of schemes, see Divisors, Lemma 30.18.4

09RY Lemma 63.34.6. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Then $i$ is a quasi-regular immersion if and only if the following conditions are satisfied
(1) $i$ is locally of finite presentation,
(2) the conormal sheaf $\mathcal{C}_{Z / X}$ is finite locally free, and
(3) the map 63.6.1.2 is an isomorphism.

Proof. Follows from the case of schemes (Divisors, Lemma 30.18.5) via étale localization (use Definition 63.34.2 and Lemma 63.6.2).

09RZ Lemma 63.34.7. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be immersions of algebraic spaces over $S$. Assume that $Z \rightarrow Y$ is $H_{1}$-regular. Then the canonical sequence of Lemma 63.5.6

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

is exact and (étale) locally split.
Proof. Since $\mathcal{C}_{Z / Y}$ is finite locally free (see Lemma 63.34 .6 and Lemma 63.34.3) it suffices to prove that the sequence is exact. It suffices to show that the first map is injective as the sequence is already right exact in general. After étale localization on $X$ this reduces to the case of schemes, see Divisors, Lemma 30.18.6.

A composition of quasi-regular immersions may not be quasi-regular, see Algebra, Remark 10.68 .8 . The other types of regular immersions are preserved under composition.
09S0 Lemma 63.34.8. Let $S$ be a scheme. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of algebraic spaces over $S$.
(1) If $i$ and $j$ are Koszul-regular immersions, so is $j \circ i$.
(2) If $i$ and $j$ are $H_{1}$-regular immersions, so is $j \circ i$.
(3) If $i$ is an $H_{1}$-regular immersion and $j$ is a quasi-regular immersion, then $j \circ i$ is a quasi-regular immersion.

Proof. Immediate from the case of schemes, see Divisors, Lemma 30.18.7.
09S1 Lemma 63.34.9. Let $S$ be a scheme. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of algebraic spaces over $S$. Assume that the sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

of Lemma 63.5.6 is exact and locally split.
(1) If $j \circ i$ is a quasi-regular immersion, so is $i$.
(2) If $j \circ i$ is a $H_{1}$-regular immersion, so is $i$.
(3) If both $j$ and $j \circ i$ are Koszul-regular immersions, so is $i$.

Proof. Immediate from the case of schemes, see Divisors, Lemma 30.18.8.
09S2 Lemma 63.34.10. Let $S$ be a scheme. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of algebraic spaces over $S$. Assume $X$ is locally Noetherian. The following are equivalent
(1) $i$ and $j$ are Koszul regular immersions,
(2) $i$ and $j \circ i$ are Koszul regular immersions,
(3) $j \circ i$ is a Koszul regular immersion and the conormal sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

is exact and locally split.
Proof. Immediate from the case of schemes, see Divisors, Lemma 30.18.9.

### 63.35. Pseudo-coherent morphisms

06BQ This section is the analogue of More on Morphisms, Section 36.42 for morphisms of schemes. The reader is encouraged to read up on pseudo-coherent morphisms of schemes in that section first.

The property "pseudo-coherent" of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 36.42.10 and 36.42 .13 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 54.22.1 we may define the notion of a pseudo-coherent morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.42 when the algebraic spaces in question are representable.

06BR Definition 63.35.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is pseudo-coherent if the equivalent conditions of Morphisms of Spaces, Lemma 54.22.1 hold with $\mathcal{P}=$ "pseudo-coherent".
(2) Let $x \in|X|$. We say $f$ is pseudo-coherent at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is pseudo-coherent.

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

06BS Lemma 63.35.2. A flat base change of a pseudo-coherent morphism is pseudocoherent.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.3

06BT Lemma 63.35.3. A composition of pseudo-coherent morphisms is pseudo-coherent.
Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.4
06BU Lemma 63.35.4. A pseudo-coherent morphism is locally of finite presentation.
Proof. Immediate from the definitions.
06BV Lemma 63.35.5. A flat morphism which is locally of finite presentation is pseudocoherent.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.6

06BW Lemma 63.35.6. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces pseudocoherent over a base algebraic space $B$. Then $f$ is pseudo-coherent.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.7.

06BX Lemma 63.35.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $Y$ is locally Noetherian, then $f$ is pseudo-coherent if and only if $f$ is locally of finite type.
Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.9

### 63.36. Perfect morphisms

06BY This section is the analogue of More on Morphisms, Section 36.43 for morphisms of schemes. The reader is encouraged to read up on perfect morphisms of schemes in that section first.

The property "perfect" of morphisms of schemes is étale local on the source-andtarget. To see this use More on Morphisms, Lemmas 36.43.10 and 36.43 .13 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 54.22 .1 we may define the notion of a perfect morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.43 when the algebraic spaces in question are representable.
06BZ Definition 63.36.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is perfect if the equivalent conditions of Morphisms of Spaces, Lemma 54.22.1 hold with $\mathcal{P}=$ "perfect".
(2) Let $x \in|X|$. We say $f$ is perfect at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is perfect.
Note that a perfect morphism is pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

06C0 Lemma 63.36.2. A flat base change of a perfect morphism is perfect.
Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.43.3.
06C1 Lemma 63.36.3. A composition of perfect morphisms is perfect.
Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.43.4

06C2 Lemma 63.36.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is flat and perfect, and
(2) $f$ is flat and locally of finite presentation.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.43.5.
63.37. Local complete intersection morphisms

06C3 This section is the analogue of More on Morphisms, Section 36.44 for morphisms of schemes. The reader is encouraged to read up on local complete intersection morphisms of schemes in that section first.

The property "being a local complete intersection morphism" of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 36.44 .12 and 36.44 .13 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 54.22.1 we may define the notion of a local complete intersection morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.44 when the algebraic spaces in question are representable.

06C4 Definition 63.37.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is a Koszul morphism, or that $f$ is a local complete intersection morphism if the equivalent conditions of Morphisms of Spaces, Lemma 54.22 .1 hold with $\mathcal{P}(f)=" f$ is a local complete intersection morphism".
(2) Let $x \in|X|$. We say $f$ is Koszul at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is a local complete intersection morphism.
In some sense the defining property of a local complete intersection morphism is the result of the following lemma.

06C5 Lemma 63.37.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over $S$. Let $P$ be an algebraic space smooth over $Y$. Let $U \rightarrow X$ be an étale morphism of algebraic spaces and let $i: U \rightarrow P$ an immersion of algebraic spaces over $Y$. Picture:

Then $i$ is a Koszul-regular immersion of algebraic spaces.

Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow P \times_{Y} V$. Set $U^{\prime}=U \times_{P} W$, which is a scheme étale over $U$. We have to show that $U^{\prime} \rightarrow W$ is a Koszulregular immersion of schemes, see Definition 63.34.2. By Definition 63.37.1 above the morphism of schemes $U^{\prime} \rightarrow V$ is a local complete intersection morphism. Hence the result follows from More on Morphisms, Lemma 36.44.3.

It seems like a good idea to collect here some properties in common with all Koszul morphisms.
06C6 Lemma 63.37.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over $S$. Then
(1) $f$ is locally of finite presentation,
(2) $f$ is pseudo-coherent, and
(3) $f$ is perfect.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.44.4.

Beware that a base change of a Koszul morphism is not Koszul in general.
06C7 Lemma 63.37.4. A flat base change of a local complete intersection morphism is a local complete intersection morphism.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.44.6.

06C8 Lemma 63.37.5. A composition of local complete intersection morphisms is a local complete intersection morphism.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.44.7.

06C9 Lemma 63.37.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is flat and a local complete intersection morphism, and
(2) $f$ is syntomic.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.44.8.

06CA Lemma 63.37.7. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$. Assume that both $p$ and $q$ are flat and locally of finite presentation. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset|X|$ is the set of points where $f$ is Koszul. Moreover, for any morphism of algebraic spaces $Z^{\prime} \rightarrow Z$, if $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$ by $Z^{\prime} \rightarrow Z$, then $U\left(f^{\prime}\right)$ is the inverse image of $U(f)$ under the projection $X^{\prime} \rightarrow X$.

Proof. This lemma is the analogue of More on Morphisms, Lemma 36.44 .14 and in fact we will deduce the lemma from it. By Definition 63.37.1 the set $\{x \in|X|$ : $f$ is Koszul at $x\}$ is open in $|X|$ hence by Properties of Spaces, Lemma 53.4.8 it corresponds to an open subspace $U(f)$ of $X$. Hence we only need to prove the final statement.

Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow W \times_{Z} Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Finally, choose a scheme $W^{\prime}$ and a surjective étale morphism $W^{\prime} \rightarrow W \times_{Z} Z^{\prime}$. Set $V^{\prime}=W^{\prime} \times_{W} V$ and $U^{\prime}=W^{\prime} \times_{W} U$, so that we obtain surjective étale morphisms $V^{\prime} \rightarrow Y^{\prime}$ and $U^{\prime} \rightarrow X^{\prime}$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 53.15.7). Note that by definition $U(f)$ is the image in $|X|$ of the set $T$ of points in $U$ where the morphism of schemes $U \rightarrow V$ is Koszul. Similarly, $U\left(f^{\prime}\right)$ is the image in $\left|X^{\prime}\right|$ of the set $T^{\prime}$ of points in $U^{\prime}$ where the morphism of schemes $U^{\prime} \rightarrow V^{\prime}$ is Koszul. Now, by construction the diagram

is cartesian (in the category of schemes). Hence the aforementioned More on Morphisms, Lemma 36.44 .14 applies to show that $T^{\prime}$ is the inverse image of $T$. Since $\left|U^{\prime}\right| \rightarrow\left|X^{\prime}\right|$ is surjective this implies the lemma.

06CB Lemma 63.37.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over $S$. Then $f$ is unramified if and only if $f$ is formally unramified and in this case the conormal sheaf $\mathcal{C}_{X / Y}$ is finite locally free on $X$.

Proof. This follows from the corresponding result for morphisms of schemes, see More on Morphisms, Lemma 36.44.15, by étale localization, see Lemma 63.13.11. (Note that in the situation of this lemma the morphism $V \rightarrow U$ is unramified and a local complete intersection morphism by definition.)

06CC Lemma 63.37.9. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of algebraic spaces over $S$. Assume that $Z \rightarrow Y$ is a local complete intersection morphism. The exact sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

of Lemma 63.5.6 is short exact.
Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow U \times_{X} Y$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow V \times_{Y} Z$. By Lemma 63.13.11 the morphisms $W \rightarrow V$ and $V \rightarrow U$ are formally unramified. Moreover the sequence $i^{*} \mathcal{C}_{Y / X} \rightarrow$ $\mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0$ restricts to the corresponding sequence $i^{*} \mathcal{C}_{V / U} \rightarrow \mathcal{C}_{W / U} \rightarrow$ $\mathcal{C}_{W / V} \rightarrow 0$ for $W \rightarrow V \rightarrow U$. Hence the result follows from the result for schemes (More on Morphisms, Lemma 36.44.16) as by definition the morphism $W \rightarrow V$ is a local complete intersection morphism.

### 63.38. When is a morphism an isomorphism?

05X7 More generally we can ask: "When does a morphism have property $\mathcal{P}$ ?" A more precise question is the following. Suppose given a commutative diagram

of algebraic spaces. Does there exist a monomorphism of algebraic spaces $W \rightarrow Z$ with the following two properties:
(1) the base change $f_{W}: X_{W} \rightarrow Y_{W}$ has property $\mathcal{P}$, and
(2) any morphism $Z^{\prime} \rightarrow Z$ of algebraic spaces factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ has property $\mathcal{P}$.
In many cases, if $W \rightarrow Z$ exists, then it is an immersion, open immersion, or closed immersion.
The answer to this question may depend on auxiliary properties of the morphisms $f$, $p$, and $q$. An example is $\mathcal{P}(f)=$ " $f$ is flat" which we have discussed for morphisms of schemes in the case $Y=S$ in great detail in the chapter "More on Flatness", starting with More on Flatness, Section 37.20 .

05X8 Lemma 63.38.1. Consider a commutative diagram

of algebraic spaces. Assume that $p$ is locally of finite type and closed. Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is unramified.

Proof. By Morphisms of Spaces, Lemma 54.37 .10 there exists an open subspace $U(f) \subset X$ which is the set of points where $f$ is unramified. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 53.4.8 with underlying set of points

$$
|W|=|Z| \backslash|p|(|X| \backslash|U(f)|)
$$

i.e., $z \in|Z|$ is a point of $W$ if and only if $f$ is unramified at every point of $X$ above $z$. Note that this is open because we assumed that $p$ is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 53.4.9 that $W$ has the desired universal property.
05X9 Lemma 63.38.2. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is locally of finite type,
(2) $p$ is closed, and
(3) $p_{2}: X \times_{Y} X \rightarrow Z$ is closed.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is unramified and universally injective.

Proof. After replacing $Z$ by the open subspace found in Lemma 63.38.1 we may assume that $f$ is already unramified; note that this does not destroy assumption (2) or (3). By Morphisms of Spaces, Lemma 54.37.9we see that $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is an open immersion. This remains true after any base change. Hence by Morphisms of Spaces, Lemma 54.19 .2 we see that $f_{Z^{\prime}}$ is universally injective if and only if the base change of the diagonal $X_{Z^{\prime}} \rightarrow\left(X \times_{Y} X\right)_{Z^{\prime}}$ is an isomorphism. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 53.4.8) with underlying set of points

$$
|W|=|Z| \backslash\left|p_{2}\right|\left(\left|X \times_{Y} X\right| \backslash \operatorname{Im}\left(\left|\Delta_{X / Y}\right|\right)\right)
$$

i.e., $z \in|Z|$ is a point of $W$ if and only if the fibre of $\left|X \times_{Y} X\right| \rightarrow|Z|$ over $z$ is in the image of $|X| \rightarrow\left|X \times_{Y} X\right|$. Then it is clear from the discussion above that the restriction $p^{-1}(W) \rightarrow q^{-1}(W)$ of $f$ is unramified and universally injective.

Conversely, suppose that $f_{Z^{\prime}}$ is unramified and universally injective. In order to show that $Z^{\prime} \rightarrow Z$ factors through $W$ it suffices to show that $\left|Z^{\prime}\right| \rightarrow|Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 53.4.9. Hence it suffices to prove the result when $Z^{\prime}$ is the spectrum of a field. Denote $z \in|Z|$ the image of $\left|Z^{\prime}\right| \rightarrow|Z|$. The discussion above shows that

$$
\left|X_{Z^{\prime}}\right| \longrightarrow\left|\left(X \times_{Y} X\right)_{Z^{\prime}}\right|
$$

is surjective. By Properties of Spaces, Lemma 53.4.3 in the commutative diagram

the vertical arrows are surjective. It follows that $z \in|W|$ as desired.

## 05XA

Lemma 63.38.3. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is locally of finite type,
(2) $p$ is universally closed, and
(3) $q: Y \rightarrow Z$ is separated.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is a closed immersion.

Proof. We will use the characterization of closed immersions as universally closed, unramified, and universally injective morphisms, see Lemma 63.12.9. First, note that since $p$ is universally closed and $q$ is separated, we see that $f$ is universally
closed, see Morphisms of Spaces, Lemma54.39.6. It follows that any base change of $f$ is universally closed, see Morphisms of Spaces, Lemma 54.9.3. Thus to finish the proof of the lemma it suffices to prove that the assumptions of Lemma 63.38.2 are satisfied. The projection $\mathrm{pr}_{0}: X \times_{Y} X \rightarrow X$ is universally closed as a base change of $f$, see Morphisms of Spaces, Lemma 54.9.3. Hence $X \times_{Y} X \rightarrow Z$ is universally closed as a composition of universally closed morphisms (see Morphisms of Spaces, Lemma 54.9.4). This finishes the proof of the lemma.

05XB Lemma 63.38.4. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is locally of finite presentation,
(2) $p$ is flat,
(3) $p$ is closed, and
(4) $q$ is locally of finite type.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is flat.

Proof. By Lemma 63.20.6 the set

$$
A=\{x \in|X|: X \text { flat at } x \text { over } Y\}
$$

is open in $|X|$ and its formation commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 53.4.8) with underlying set of points

$$
|W|=|Z| \backslash|p|(|X| \backslash A)
$$

i.e., $z \in|Z|$ is a point of $W$ if and only if the whole fibre of $|X| \rightarrow|Z|$ over $z$ is contained in $A$. This is open because $p$ is closed. Since the formation of $A$ commutes with arbitrary base change it follows that $W$ works.

05XC Lemma 63.38.5. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is locally of finite presentation,
(2) $p$ is flat,
(3) $p$ is closed,
(4) $q$ is locally of finite type, and
(5) $q$ is closed.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is surjective and flat.

Proof. By Lemma 63.38.4 we may assume that $f$ is flat. Note that $f$ is locally of finite presentation by Morphisms of Spaces, Lemma 54.28.9. Hence $f$ is open, see Morphisms of Spaces, Lemma 54.29.6. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 53.4.8 with underlying set of points

$$
|W|=|Z| \backslash|q|(|Y| \backslash|f|(|X|))
$$

in other words for $z \in|Z|$ we have $z \in|W|$ if and only if the whole fibre of $|Y| \rightarrow|Z|$ over $z$ is in the image of $|X| \rightarrow|Y|$. Since $q$ is closed this set is open in $|Z|$. The morphism $X_{W} \rightarrow Y_{W}$ is surjective by construction. Finally, suppose that $X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is surjective. In order to show that $Z^{\prime} \rightarrow Z$ factors through $W$ it suffices to show that $\left|Z^{\prime}\right| \rightarrow|Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 53.4.9. Hence it suffices to prove the result when $Z^{\prime}$ is the spectrum of a field. Denote $z \in|Z|$ the image of $\left|Z^{\prime}\right| \rightarrow|Z|$. By Properties of Spaces, Lemma 53.4 .3 in the commutative diagram

the vertical arrows are surjective. It follows that $z \in|W|$ as desired.
05XD Lemma 63.38.6. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is locally of finite presentation,
(2) $p$ is flat,
(3) $p$ is universally closed,
(4) $q$ is locally of finite type,
(5) $q$ is closed, and
(6) $q$ is separated.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is an isomorphism.

Proof. By Lemma 63.38.5 there exists an open subspace $W_{1} \subset Z$ such that $f_{Z^{\prime}}$ is surjective and flat if and only if $Z^{\prime} \rightarrow Z$ factors through $W_{1}$. By Lemma 63.38.3 there exists an open subspace $W_{2} \subset Z$ such that $f_{Z^{\prime}}$ is a closed immersion if and only if $Z^{\prime} \rightarrow Z$ factors through $W_{2}$. We claim that $W=W_{1} \cap W_{2}$ works. Certainly, if $f_{Z^{\prime}}$ is an isomorphism, then $Z^{\prime} \rightarrow Z$ factors through $W$. Hence it suffices to show that $f_{W}$ is an isomorphism. By construction $f_{W}$ is a surjective flat closed immersion. In particular $f_{W}$ is representable. Since a surjective flat closed immersion of schemes is an isomorphism (see Morphisms, Lemma 28.26.1) we win. (Note that actually $f_{W}$ is locally of finite presentation, whence open, so you can avoid the use of this lemma if you like.)

06CE Lemma 63.38.7. Consider a commutative diagram

of algebraic spaces. Assume that
(1) $p$ is flat and locally of finite presentation,
(2) $p$ is closed, and
(3) $q$ is flat and locally of finite presentation,

Then there exists an open subspace $W \subset Z$ such that a morphism $Z^{\prime} \rightarrow Z$ factors through $W$ if and only if the base change $f_{Z^{\prime}}: X_{Z^{\prime}} \rightarrow Y_{Z^{\prime}}$ is a local complete intersection morphism.

Proof. By Lemma 63.37.7 there exists an open subspace $U(f) \subset X$ which is the set of points where $f$ is Koszul. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 53.4 .8 with underlying set of points

$$
|W|=|Z| \backslash|p|(|X| \backslash|U(f)|)
$$

i.e., $z \in|Z|$ is a point of $W$ if and only if $f$ is Koszul at every point of $X$ above $z$. Note that this is open because we assumed that $p$ is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 53.4.9 that $W$ has the desired universal property.

### 63.39. Exact sequences of differentials and conormal sheaves

06 CD In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to composable morphisms of algebraic spaces.

In the sequences below each of the maps are as constructed in either Lemma 63.7 .6 or Lemma 63.13.8. Let $S$ be a scheme. Let $g: Z \rightarrow Y$ and $f: Y \rightarrow X$ be morphisms of algebraic spaces over $S$.
(1) There is a canonical exact sequence

$$
g^{*} \Omega_{Y / X} \rightarrow \Omega_{Z / X} \rightarrow \Omega_{Z / Y} \rightarrow 0
$$

see Lemma 63.7.8. If $g: Z \rightarrow Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 63.17.11.
(2) If $g$ is formally unramified, then there is a canonical exact sequence

$$
\mathcal{C}_{Z / Y} \rightarrow g^{*} \Omega_{Y / X} \rightarrow \Omega_{Z / X} \rightarrow 0
$$

see Lemma 63.13.13. If $f \circ g: Z \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 63.17.12.
(3) if $g$ and $f \circ g$ are formally unramified, then there is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow g^{*} \Omega_{Y / X} \rightarrow 0
$$

see Lemma 63.13.14 If $f: Y \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 63.17.13.
(4) if $g$ and $f$ are formally unramified, then there is a canonical exact sequence

$$
g^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

see Lemma 63.13.15. If $g: Z \rightarrow Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 63.37.9.

## CHAPTER 64

## Pushouts of Algebraic Spaces

0AHT

### 64.1. Introduction

0 AHU The goal of this chapter is to discuss pushouts in the category of algebraic spaces. This can be done with varying assumptions. A fairly general pushout construction is given in TT13: one of the morphisms is affine and the other is a closed immersion. We discuss a particular case of this in Section 64.2 where we assume one of the morphisms is affine and the other is a thickening, a situation that often comes up in deformation theory.

In Sections 64.3 and 64.4 we discuss diagrams

where $f$ is a quasi-compact and quasi-separated morphism of algebraic spaces, $Z \rightarrow X$ is a closed immersion of finite presentation, the map $f^{-1}(Z) \rightarrow Z$ is an isomorphism, and $f$ is flat along $f^{-1}(Z)$. In this situation we glue quasi-coherent modules on $X \backslash Z$ and $Y$ (in Section 64.3 to quasi-coherent modules on $X$ and we glue algebraic spaces over $X \backslash Z$ and $Y$ (in Section 64.4) to algebraic spaces over $X$.

In Section 64.5 we discuss how proper birational morphisms of Noetherian algebraic spaces give rise to coequalizer diagrams in algebraic spaces in some sense.

### 64.2. Pushouts in the category of algebraic spaces

07SW This section is analogue of More on Morphisms, Section 36.11. We first prove a general result on colimits and algebraic spaces. To do this we discuss a bit of notation. Let $S$ be a scheme. Let $\mathcal{I} \rightarrow(S c h / S)_{f p p f}, i \mapsto X_{i}$ be a diagram (see Categories, Section 4.14. For each $i$ we may consider the small étale site $X_{i, \text { étale }}$. For each morphism $i \rightarrow j$ of $\mathcal{I}$ we have the morphism $X_{i} \rightarrow X_{j}$ and hence a pullback functor $X_{j, \text { étale }} \rightarrow X_{i, \text { étale }}$. Hence we obtain a pseudo functor from $\mathcal{I}^{o p p}$ into the 2-category of categories. Denote

$$
\lim _{i} X_{i, \text { étale }}
$$

the 2 -limit (see insert future reference here). What does this mean concretely? An object of this limit is a system of étale morphisms $U_{i} \rightarrow X_{i}$ over $\mathcal{I}$ such that for
each $i \rightarrow j$ in $\mathcal{I}$ the diagram

is cartesian. Morphisms between objects are defined in the obvious manner. Suppose that $f_{i}: X_{i} \rightarrow T$ is a family of morphisms such that for each $i \rightarrow j$ the composition $X_{i} \rightarrow X_{j} \rightarrow T$ is equal to $f_{i}$. Then we get a functor $T_{\text {étale }} \rightarrow \lim X_{i, \text { étale }}$. With this notation in hand we can formulate our lemma.

07SX Lemma 64.2.1. Let $S$ be a scheme. Let $\mathcal{I} \rightarrow(S c h / S)_{\text {fppf }}, i \mapsto X_{i}$ be a diagram as above. Assume that
(1) $X=$ colim $X_{i}$ exists in the category of schemes,
(2) $\coprod X_{i} \rightarrow X$ is surjective,
(3) if $U \rightarrow X$ is étale and $U_{i}=X_{i} \times_{X} U$, then $U=\operatorname{colim} U_{i}$ in the category of schemes, and
(4) the functor $X_{\text {étale }} \rightarrow \lim X_{i, \text { étale }}$ is an equivalence.

Then $X=\operatorname{colim} X_{i}$ in the category of algebraic spaces over $S$ also.
Proof. Let $Z$ be an algebraic space over $S$. Suppose that $f_{i}: X_{i} \rightarrow Z$ is a family of morphisms such that for each $i \rightarrow j$ the composition $X_{i} \rightarrow X_{j} \rightarrow Z$ is equal to $f_{i}$. We have to construct a morphism of algebraic spaces $f: X \rightarrow Z$ such that we can recover $f_{i}$ as the composition $X_{i} \rightarrow X \rightarrow Z$. Let $W \rightarrow Z$ be a surjective étale morphism of a scheme to $Z$. For each $i$ set $U_{i}=W \times{ }_{Z, f_{i}} X_{i}$ and denote $h_{i}: U_{i} \rightarrow W$ the projection. Then $U_{i} \rightarrow X_{i}$ forms an object of $\lim X_{i, \text { étale }}$. By assumption (4) we can find an étale morphism $U \rightarrow X$ and (functorial) isomorphisms $U_{i}=X_{i} \times{ }_{X} U$. By assumption (3) there exists a morphism $h: U \rightarrow W$ such that the compositions $U_{i} \rightarrow U \rightarrow W$ are $h_{i}$. Let $g: U \rightarrow Z$ be the composition of $h$ with the map $W \rightarrow Z$. To finish the proof we have to show that $g: U \rightarrow Z$ descends to a morphism $X \rightarrow Z$. To do this, consider the morphism $(h, h): U \times_{X} U \rightarrow W \times_{Z} W$. Composing with $U_{i} \times_{X_{i}} U_{i} \rightarrow U \times_{X} U$ we obtain $\left(h_{i}, h_{i}\right)$ which factors through $W \times_{Z} W$. Since $U \times{ }_{X} U$ is the colimit of the schemes $U_{i} \times{ }_{X_{i}} U_{i}$ by (3) we see that ( $h, h$ ) factors through $W \times_{Z} W$. Hence the two compositions $U \times_{X} U \rightarrow U \rightarrow W \rightarrow Z$ are equal. Because each $U_{i} \rightarrow X_{i}$ is surjective and assumption (2) we see that $U \rightarrow X$ is surjective. As $Z$ is a sheaf for the étale topology, we conclude that $g: U \rightarrow Z$ descends to $f: X \rightarrow Z$ as desired.

07SY Lemma 64.2.2. Let $S$ be a scheme. Let $X \rightarrow X^{\prime}$ be a thickening of schemes over $S$ and let $X \rightarrow Y$ be an affine morphism of schemes over $S$. Let $Y^{\prime}=Y \amalg_{X} X^{\prime}$ be the pushout in the category of schemes (see More on Morphisms, Lemma 36.11.3). Then $Y^{\prime}$ is also a pushout in the category of algebraic spaces over $S$.

Proof. This is an immediate consequence of Lemma 64.2.1 and More on Morphisms, Lemmas 36.11.3, 36.11.4, and 36.11.6.

07VX Lemma 64.2.3. Let $S$ be a scheme. Let $X \rightarrow X^{\prime}$ be a thickening of algebraic spaces over $S$ and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$.

Then there exists a pushout

in the category of algebraic spaces over $S$. Moreover $Y^{\prime}=Y \amalg_{X} X^{\prime}$ is a thickening of $Y$ and

$$
\mathcal{O}_{Y^{\prime}}=\mathcal{O}_{Y} \times{ }_{f_{*} \mathcal{O}_{X}} f_{*}^{\prime} \mathcal{O}_{X^{\prime}}
$$

as sheaves on $Y_{\text {étale }}=\left(Y^{\prime}\right)_{\text {étale }}$.
Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Set $U=$ $V \times_{Y} X$. This is a scheme affine over $V$ with a surjective étale morphism $U \rightarrow X$. By More on Morphisms of Spaces, Lemma 63.9 .6 there exists a $U^{\prime} \rightarrow X^{\prime}$ surjective étale with $U=U^{\prime} \times_{X^{\prime}} X$. In particular the morphism of schemes $U \rightarrow U^{\prime}$ is a thickening too. Apply More on Morphisms, Lemma 36.11.3 to obtain a pushout $V^{\prime}=V \amalg_{U} U^{\prime}$ in the category of schemes.

We repeat this procedure to construct a pushout

in the category of schemes. Consider the morphisms

$$
U \times_{X} U \rightarrow U \rightarrow V^{\prime}, \quad U^{\prime} \times_{X^{\prime}} U^{\prime} \rightarrow U^{\prime} \rightarrow V^{\prime}, \quad V \times_{Y} V \rightarrow V \rightarrow V^{\prime}
$$

where we use the first projection in each case. Clearly these glue to give a morphism $t^{\prime}: R^{\prime} \rightarrow V^{\prime}$ which is étale by More on Morphisms, Lemma 36.11.6. Similarly, we obtain $s^{\prime}: R^{\prime} \rightarrow V^{\prime}$ étale. The morphism $j^{\prime}=\left(t^{\prime}, s^{\prime}\right): R^{\prime} \rightarrow V^{\prime} \times_{S} V^{\prime}$ is unramified (as $t^{\prime}$ is étale) and a monomorphism when restricted to the closed subscheme $V \times_{Y} V \subset R^{\prime}$. As $V \times_{Y} V \subset R^{\prime}$ is a thickening it follows that $j^{\prime}$ is a monomorphism too. Finally, $j^{\prime}$ is an equivalence relation as we can use the functoriality of pushouts of schemes to construct a morphism $c^{\prime}: R^{\prime} \times_{s^{\prime}, V^{\prime}, t^{\prime}} R^{\prime} \rightarrow R^{\prime}$ (details omitted). At this point we set $Y^{\prime}=U^{\prime} / R^{\prime}$, see Spaces, Theorem 52.10.5.
We have morphisms $X^{\prime}=U^{\prime} / U^{\prime} \times_{X^{\prime}} U^{\prime} \rightarrow V^{\prime} / R^{\prime}=Y^{\prime}$ and $Y=V / V \times_{Y} V \rightarrow$ $V^{\prime} / R^{\prime}=Y^{\prime}$. By construction these fit into the commutative diagram

Since $Y \rightarrow Y^{\prime}$ is a thickening we have $Y_{\text {étale }}=\left(Y^{\prime}\right)_{\text {étale }}$, see More on Morphisms of Spaces, Lemma 63.9.6. The commutativity of the diagram gives a map of sheaves

$$
\mathcal{O}_{Y^{\prime}} \longrightarrow \mathcal{O}_{Y} \times_{f_{*} \mathcal{O}_{X}} f_{*}^{\prime} \mathcal{O}_{X^{\prime}}
$$

on this set. By More on Morphisms, Lemma 36.11 .3 this map is an isomorphism when we restrict to the scheme $V^{\prime}$, hence it is an isomorphism.

To finish the proof we show that the diagram above is a pushout in the category of algebraic spaces. To see this, let $Z$ be an algebraic space and let $a^{\prime}: X^{\prime} \rightarrow Z$ and $b: Y \rightarrow Z$ be morphisms of algebraic spaces. By Lemma 64.2 .2 we obtain a unique morphism $h: V^{\prime} \rightarrow Z$ fitting into the commutative diagrams

The uniqueness shows that $h \circ t^{\prime}=h \circ s^{\prime}$. Hence $h$ factors uniquely as $V^{\prime} \rightarrow Y^{\prime} \rightarrow Z$ and we win.

In the following lemma we use the fibre product of categories as defined in Categories, Example 4.30.3.

07VY Lemma 64.2.4. Let $S$ be a base scheme. Let $X \rightarrow X^{\prime}$ be a thickening of algebraic spaces over $S$ and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Let $Y^{\prime}=Y \amalg_{X} X^{\prime}$ be the pushout (see Lemma 64.2.3). Base change gives a functor

$$
F:\left(\text { Spaces } / Y^{\prime}\right) \longrightarrow(\text { Spaces } / Y) \times_{\left(\text {Spaces } / Y^{\prime}\right)}\left(\text { Spaces } / X^{\prime}\right)
$$

given by $V^{\prime} \longmapsto\left(V^{\prime} \times_{Y^{\prime}} Y, V^{\prime} \times_{Y^{\prime}} X^{\prime}, 1\right)$ which sends $\left(S c h / Y^{\prime}\right)$ into $(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}$ $\left(S c h / X^{\prime}\right)$. The functor $F$ has a left adjoint

$$
G:(\text { Spaces } / Y) \times_{\left(\text {Spaces } / Y^{\prime}\right)}\left(\text { Spaces } / X^{\prime}\right) \longrightarrow\left(\text { Spaces } / Y^{\prime}\right)
$$

which sends the triple $\left(V, U^{\prime}, \varphi\right)$ to the pushout $V \amalg_{\left(V \times_{Y} X\right)} U^{\prime}$ in the category of algebraic spaces over $S$. The functor $G$ sends $(S c h / Y) \times{ }_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right)$ into (Sch/ $Y^{\prime}$ ).

Proof. The proof is completely formal. Since the morphisms $X \rightarrow X^{\prime}$ and $X \rightarrow Y$ are representable it is clear that $F$ sends $\left(S c h / Y^{\prime}\right)$ into $(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right)$.
Let us construct $G$. Let $\left(V, U^{\prime}, \varphi\right)$ be an object of the fibre product category. Set $U=U^{\prime} \times{ }_{X^{\prime}} X$. Note that $U \rightarrow U^{\prime}$ is a thickening. Since $\varphi: V \times_{Y} X \rightarrow U^{\prime} \times{ }_{X^{\prime}} X=$ $U$ is an isomorphism we have a morphism $U \rightarrow V$ over $X \rightarrow Y$ which identifies $U$ with the fibre product $X \times_{Y} V$. In particular $U \rightarrow V$ is affine, see Morphisms of Spaces, Lemma 54.20.5. Hence we can apply Lemma 64.2 .3 to get a pushout $V^{\prime}=V \amalg_{U} U^{\prime}$. Denote $V^{\prime} \rightarrow Y^{\prime}$ the morphism we obtain in virtue of the fact that $V^{\prime}$ is a pushout and because we are given morphisms $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ agreeing on $U$ as morphisms into $Y^{\prime}$. Setting $G\left(V, U^{\prime}, \varphi\right)=V^{\prime}$ gives the functor $G$.
If $\left(V, U^{\prime}, \varphi\right)$ is an object of $(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right)$ then $U=U^{\prime} \times{ }_{X^{\prime}} X$ is a scheme too and we can form the pushout $V^{\prime}=V \amalg_{U} U^{\prime}$ in the category of schemes by More on Morphisms, Lemma 36.11.3. By Lemma 64.2.2 this is also a pushout in the category of schemes, hence $G$ sends $(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right)$ into $\left(S c h / Y^{\prime}\right)$.
Let us prove that $G$ is a left adjoint to $F$. Let $Z$ be an algebraic space over $Y^{\prime}$. We have to show that

$$
\operatorname{Mor}\left(V^{\prime}, Z\right)=\operatorname{Mor}\left(\left(V, U^{\prime}, \varphi\right), F(Z)\right)
$$

where the morphism sets are taking in their respective categories. Let $g^{\prime}: V^{\prime} \rightarrow Z$ be a morphism. Denote $\tilde{g}$, resp. $\tilde{f}^{\prime}$ the composition of $g^{\prime}$ with the morphism $V \rightarrow V^{\prime}$, resp. $U^{\prime} \rightarrow V^{\prime}$. Base change $\tilde{g}$, resp. $\tilde{f}^{\prime}$ by $Y \rightarrow Y^{\prime}$, resp. $X^{\prime} \rightarrow Y^{\prime}$ to get a morphism $g: V \rightarrow Z \times_{Y^{\prime}} Y$, resp. $f^{\prime}: U^{\prime} \rightarrow Z \times_{Y^{\prime}} X^{\prime}$. Then $\left(g, f^{\prime}\right)$ is an element of the
right hand side of the equation above (details omitted). Conversely, suppose that $\left(g, f^{\prime}\right):\left(V, U^{\prime}, \varphi\right) \rightarrow F(Z)$ is an element of the right hand side. We may consider the composition $\tilde{g}: V \rightarrow Z$, resp. $\tilde{f}_{\tilde{\prime}^{\prime}}: U^{\prime} \rightarrow Z$ of $g$, resp. $f$ by $Z \times_{Y^{\prime}} X^{\prime} \rightarrow Z$, resp. $Z \times_{Y^{\prime}} Y \rightarrow Z$. Then $\tilde{g}$ and $\tilde{f}^{\prime}$ agree as morphism from $U$ to $Z$. By the universal property of pushout, we obtain a morphism $g^{\prime}: V^{\prime} \rightarrow Z$, i.e., an element of the left hand side. We omit the verification that these constructions are mutually inverse.

07VZ Lemma 64.2.5. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$. Assume that $A, B, C, D$ and $A, B, E, F$ form cartesian squares and that $B \rightarrow D$ is surjective étale. Then $C, D, E, F$ is a cartesian square.

Proof. This is formal.
07W0 Lemma 64.2.6. In the situation of Lemma 64.2.4 the functor $F \circ G$ is isomorphic to the identity functor.

Proof. We will prove that $F \circ G$ is isomorphic to the identity by reducing this to the corresponding statement of More on Morphisms, Lemma 36.11.4.

Choose a scheme $Y_{1}$ and a surjective étale morphism $Y_{1} \rightarrow Y$. Set $X_{1}=Y_{1} \times_{Y} X$. This is a scheme affine over $Y_{1}$ with a surjective étale morphism $X_{1} \rightarrow X$. By More on Morphisms of Spaces, Lemma 63.9.6 there exists a $X_{1}^{\prime} \rightarrow X^{\prime}$ surjective étale with $X_{1}=X_{1}^{\prime} \times_{X^{\prime}} X$. In particular the morphism of schemes $X_{1} \rightarrow X_{1}^{\prime}$ is a thickening too. Apply More on Morphisms, Lemma 36.11 .3 to obtain a pushout $Y_{1}^{\prime}=Y_{1} \amalg_{X_{1}} X_{1}^{\prime}$ in the category of schemes. In the proof of Lemma 64.2 .3 we constructed $Y^{\prime}$ as a quotient of an étale equivalence relation on $Y_{1}^{\prime}$ such that we get a commutative diagram

07W1

where all squares except the front and back squares are cartesian (the front and back squares are pushouts) and the northeast arrows are surjective étale. Denote $F_{1}, G_{1}$ the functors constructed in More on Morphisms, Lemma 36.11.4 for the
front square. Then the diagram of categories

is commutative by simple considerations regarding base change functors and the agreement of pushouts in schemes with pushouts in spaces of Lemma 64.2.2.
Let $\left(V, U^{\prime}, \varphi\right)$ be an object of $($ Spaces $/ Y) \times_{\left(\text {Spaces } / Y^{\prime}\right)}\left(\right.$ Spaces $\left./ X^{\prime}\right)$. Denote $U=$ $U^{\prime} \times_{X^{\prime}} X$ so that $G\left(V, U^{\prime}, \varphi\right)=V \amalg_{U} U^{\prime}$. Choose a scheme $V_{1}$ and a surjective étale morphism $V_{1} \rightarrow Y_{1} \times_{Y} V$. Set $U_{1}=V_{1} \times_{Y} X$. Then

$$
U_{1}=V_{1} \times_{Y} X \longrightarrow\left(Y_{1} \times_{Y} V\right) \times_{Y} X=X_{1} \times_{Y} V=X_{1} \times_{X} X \times_{Y} V=X_{1} \times_{X} U
$$

is surjective étale too. By More on Morphisms of Spaces, Lemma 63.9.6 there exists a thickening $U_{1} \rightarrow U_{1}^{\prime}$ and a surjective étale morphism $U_{1}^{\prime} \rightarrow X_{1}^{\prime} \times X_{X^{\prime}} U^{\prime}$ whose base change to $X_{1} \times_{X} U$ is the displayed morphism. At this point $\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right)$ is an object of $\left(S c h / Y_{1}\right) \times{ }_{\left(S c h / Y_{1}^{\prime}\right)}\left(S c h / X_{1}^{\prime}\right)$. In the proof of Lemma 64.2.3 we constructed $G\left(V, U^{\prime}, \varphi\right)=V \amalg_{U} U^{\prime}$ as a quotient of an étale equivalence relation on $G_{1}\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right)=V_{1} \amalg_{U_{1}} U_{1}^{\prime}$ such that we get a commutative diagram

07W2

where all squares except the front and back squares are cartesian (the front and back squares are pushouts) and the northeast arrows are surjective étale. In particular

$$
G_{1}\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right) \rightarrow G\left(V, U^{\prime}, \varphi\right)
$$

is surjective étale.
Finally, we come to the proof of the lemma. We have to show that the adjunction mapping $\left(V, U^{\prime}, \varphi\right) \rightarrow F\left(G\left(V, U^{\prime}, \varphi\right)\right)$ is an isomorphism. We know $\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right) \rightarrow$ $F_{1}\left(G_{1}\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right)\right)$ is an isomorphism by More on Morphisms, Lemma 36.11.4. Recall that $F$ and $F_{1}$ are given by base change. Using the properties of 64.2 .6 .2 and Lemma 64.2 .5 we see that $V \rightarrow G\left(V, U^{\prime}, \varphi\right) \times_{Y^{\prime}} Y$ and $U^{\prime} \rightarrow G\left(V, U^{\prime}, \varphi\right) \times_{Y^{\prime}} X^{\prime}$ are isomorphisms, i.e., $\left(V, U^{\prime}, \varphi\right) \rightarrow F\left(G\left(V, U^{\prime}, \varphi\right)\right)$ is an isomorphism.

08KV Lemma 64.2.7. Let $S$ be a base scheme. Let $X \rightarrow X^{\prime}$ be a thickening of algebraic spaces over $S$ and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Let $Y^{\prime}=Y \amalg_{X} X^{\prime}$ be the pushout (see Lemma 64.2.3). Let $V^{\prime} \rightarrow Y^{\prime}$ be a morphism of
algebraic spaces over $S$. Set $V=Y \times_{Y^{\prime}} V^{\prime}, U^{\prime}=X^{\prime} \times_{Y^{\prime}} V^{\prime}$, and $U=X \times_{Y^{\prime}} V^{\prime}$. There is an equivalence of categories between
(1) quasi-coherent $\mathcal{O}_{V^{\prime}}$-modules flat over $Y^{\prime}$, and
(2) the category of triples $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$ where
(a) $\mathcal{G}$ is a quasi-coherent $\mathcal{O}_{V}$-module flat over $Y$,
(b) $\mathcal{F}^{\prime}$ is a quasi-coherent $\mathcal{O}_{U^{\prime}}$-module flat over $X$, and
(c) $\varphi:(U \rightarrow V)^{*} \mathcal{G} \rightarrow\left(U \rightarrow U^{\prime}\right)^{*} \mathcal{F}^{\prime}$ is an isomorphism of $\mathcal{O}_{U}$-modules.

The equivalence maps $\mathcal{G}^{\prime}$ to $\left(\left(V \rightarrow V^{\prime}\right)^{*} \mathcal{G}^{\prime},\left(U^{\prime} \rightarrow V^{\prime}\right)^{*} \mathcal{G}^{\prime}\right.$, can $)$. Suppose $\mathcal{G}^{\prime}$ corresponds to the triple $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$. Then
(a) $\mathcal{G}^{\prime}$ is a finite type $\mathcal{O}_{V^{\prime}}$-module if and only if $\mathcal{G}$ and $\mathcal{F}^{\prime}$ are finite type $\mathcal{O}_{Y}$ and $\mathcal{O}_{U^{\prime}}$-modules.
(b) if $V^{\prime} \rightarrow Y^{\prime}$ is locally of finite presentation, then $\mathcal{G}^{\prime}$ is an $\mathcal{O}_{V^{\prime}}$-module of finite presentation if and only if $\mathcal{G}$ and $\mathcal{F}^{\prime}$ are $\mathcal{O}_{Y}$ and $\mathcal{O}_{U^{\prime}}$-modules of finite presentation.

Proof. A quasi-inverse functor assigns to the triple $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$ the fibre product

$$
\left(V \rightarrow V^{\prime}\right)_{*} \mathcal{G} \times_{\left(U \rightarrow V^{\prime}\right)_{*} \mathcal{F}}\left(U^{\prime} \rightarrow V^{\prime}\right)_{*} \mathcal{F}^{\prime}
$$

where $\mathcal{F}=\left(U \rightarrow U^{\prime}\right)^{*} \mathcal{F}^{\prime}$. This works, because on affines étale over $V^{\prime}$ and $Y^{\prime}$ we recover the equivalence of More on Algebra, Lemma 15.5.13. Details omitted.

Parts (a) and (b) reduce by étale localization (Properties of Spaces, Section 53.29) to the case where $V^{\prime}$ and $Y^{\prime}$ are affine in which case the result follows from More on Algebra, Lemmas 15.5 .12 and 15.5 .14 .

07W3 Lemma 64.2.8. In the situation of Lemma 64.2.6. If $V^{\prime}=G\left(V, U^{\prime}, \varphi\right)$ for some triple $\left(V, U^{\prime}, \varphi\right)$, then
(1) $V^{\prime} \rightarrow Y^{\prime}$ is locally of finite type if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are locally of finite type,
(2) $V^{\prime} \rightarrow Y^{\prime}$ is flat if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are flat,
(3) $V^{\prime} \rightarrow Y^{\prime}$ is flat and locally of finite presentation if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are flat and locally of finite presentation,
(4) $V^{\prime} \rightarrow Y^{\prime}$ is smooth if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are smooth,
(5) $V^{\prime} \rightarrow Y^{\prime}$ is étale if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are étale, and
(6) add more here as needed.

If $W^{\prime}$ is flat over $Y^{\prime}$, then the adjunction mapping $G\left(F\left(W^{\prime}\right)\right) \rightarrow W^{\prime}$ is an isomorphism. Hence $F$ and $G$ define mutually quasi-inverse functors between the category of spaces flat over $Y^{\prime}$ and the category of triples $\left(V, U^{\prime}, \varphi\right)$ with $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ flat.
Proof. Choose a diagram 64.2.6.1 as in the proof of Lemma 64.2.6.
Proof of $(1)-(5)$. Let $\left(V, U^{\prime}, \varphi\right)$ be an object of $($ Spaces $/ Y) \times_{\left(\text {Spaces } / Y^{\prime}\right)}\left(\right.$ Spaces $\left./ X^{\prime}\right)$. Construct a diagram 64.2.6.2 as in the proof of Lemma 64.2.6. Then the base change of $G\left(V, U^{\prime}, \varphi\right) \rightarrow Y^{\prime}$ to $Y_{1}^{\prime}$ is $G_{1}\left(V_{1}, U_{1}^{\prime}, \varphi_{1}\right) \rightarrow Y_{1}^{\prime}$. Hence (1) - (5) follow immediately from the corresponding statements of More on Morphisms, Lemma 36.11 .6 for schemes.

Suppose that $W^{\prime} \rightarrow Y^{\prime}$ is flat. Choose a scheme $W_{1}^{\prime}$ and a surjective étale morphism $W_{1}^{\prime} \rightarrow Y_{1}^{\prime} \times_{Y^{\prime}} W^{\prime}$. Observe that $W_{1}^{\prime} \rightarrow W^{\prime}$ is surjective étale as a composition of surjective étale morphisms. We know that $G_{1}\left(F_{1}\left(W_{1}^{\prime}\right)\right) \rightarrow W_{1}^{\prime}$ is an isomorphism
by More on Morphisms, Lemma 36.11 .6 applied to $W_{1}^{\prime}$ over $Y_{1}^{\prime}$ and the front of the diagram (with functors $G_{1}$ and $F_{1}$ as in the proof of Lemma 64.2.6). Then the construction of $G\left(F\left(W^{\prime}\right)\right.$ ) (as a pushout, i.e., as constructed in Lemma 64.2.3) shows that $G_{1}\left(F_{1}\left(W_{1}^{\prime}\right)\right) \rightarrow G(F(W))$ is surjective étale. Whereupon we conclude that $G(F(W)) \rightarrow W$ is étale, see for example Properties of Spaces, Lemma 53.15.3. But $G(F(W)) \rightarrow W$ is an isomorphism on underlying reduced algebraic spaces (by construction), hence it is an isomorphism.

### 64.3. Formal glueing of quasi-coherent modules

0AEP This section is the analogue of More on Algebra, Section 15.70 In the case of morphisms of schemes, the result can be found in the paper by Joyet Joy96; this is a good place to start reading. For a discussion of applications to descent problems for stacks, see the paper by Moret-Bailly MB96. In the case of an affine morphism of schemes there is a statement in the appendix of the paper FR70 but one needs to add the hypothesis that the closed subscheme is cut out by a finitely generated ideal (as in the paper by Joyet) since otherwise the result does not hold. A generalization of this material to (higher) derived categories with potential applications to nonflat situations can be found in [Bha14, Section 5].

We start with a lemma on abelian sheaves supported on closed subsets.
0AEQ Lemma 64.3.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ closed subspace such that $f^{-1} Z \rightarrow Z$ is integral and universally injective. Let $\bar{y}$ be a geometric point of $Y$ and $\bar{x}=f(\bar{y})$. We have

$$
\left(R f_{*} Q\right)_{\bar{x}}=Q_{\bar{y}}
$$

in $D(A b)$ for any object $Q$ of $D\left(Y_{\text {étale }}\right)$ supported on $\left|f^{-1} Z\right|$.
Proof. Consider the commutative diagram of algebraic spaces

By Cohomology of Spaces, Lemma 56.8.4 we can write $Q=R i_{*}^{\prime} K^{\prime}$ for some object $K^{\prime}$ of $D\left(f^{-1} Z_{\text {étale }}\right)$. By Morphisms of Spaces, Lemma 54.50 .5 we have $K^{\prime}=$ $\left(f^{\prime}\right)^{-1} K$ with $K=R f_{*}^{\prime} K^{\prime}$. Then we have $R f_{*} Q=R f_{*} R i_{*}^{\prime} K^{\prime}=R i_{*} R f_{*}^{\prime} K^{\prime}=$ $R i_{*} K$. Let $\bar{z}$ be the geometric point of $Z$ corresponding to $\bar{x}$ and let $\bar{z}^{\prime}$ be the geometric point of $f^{-1} Z$ corresponding to $\bar{y}$. We obtain the result of the lemma as follows

$$
Q_{\bar{y}}=\left(R i_{*}^{\prime} K^{\prime}\right)_{\bar{y}}=K_{\bar{z}^{\prime}}^{\prime}=\left(f^{\prime}\right)^{-1} K_{\bar{z}^{\prime}}=K_{\bar{z}}=R i_{*} K_{\bar{x}}=R f_{*} Q_{\bar{x}}
$$

The middle equality holds because of the description of the stalk of a pullback given in Properties of Spaces, Lemma 53.18.9.

0AER Lemma 64.3.2. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ closed subspace such that $f^{-1} Z \rightarrow Z$ is integral and universally injective. Let $\bar{y}$ be a geometric point of $Y$ and $\bar{x}=f(\bar{y})$. Let $\mathcal{G}$ be an abelian sheaf on $Y$. Then the map of two term complexes

$$
\left(f_{*} \mathcal{G}_{\bar{x}} \rightarrow\left(f \circ j^{\prime}\right)_{*}\left(\left.\mathcal{G}\right|_{V}\right)_{\bar{x}}\right) \longrightarrow\left(\mathcal{G}_{\bar{y}} \rightarrow j_{*}^{\prime}\left(\left.\mathcal{G}\right|_{V}\right)_{\bar{y}}\right)
$$

induces an isomorphism on kernels and an injection on cokernels. Here $V=Y \backslash$ $f^{-1} Z$ and $j^{\prime}: V \rightarrow Y$ is the inclusion.

Proof. Choose a distinguished triangle

$$
\left.\mathcal{G} \rightarrow R j_{*}^{\prime} \mathcal{G}\right|_{V} \rightarrow Q \rightarrow \mathcal{G}[1]
$$

n $D\left(Y_{\text {étale }}\right)$. The cohomology sheaves of $Q$ are supported on $\left|f^{-1} Z\right|$. We apply $R f_{*}$ and we obtain

$$
\left.R f_{*} \mathcal{G} \rightarrow R f_{*} R j_{*}^{\prime} \mathcal{G}\right|_{V} \rightarrow R f_{*} Q \rightarrow R f_{*} \mathcal{G}[1]
$$

Taking stalks at $\bar{x}$ we obtain an exact sequence

$$
0 \rightarrow\left(R^{-1} f_{*} Q\right)_{\bar{x}} \rightarrow f_{*} \mathcal{G}_{\bar{x}} \rightarrow\left(f \circ j^{\prime}\right)_{*}\left(\left.\mathcal{G}\right|_{V}\right)_{\bar{x}} \rightarrow\left(R^{0} f_{*} Q\right)_{\bar{x}}
$$

We can compare this with the exact sequence

$$
0 \rightarrow H^{-1}(Q)_{\bar{y}} \rightarrow \mathcal{G}_{\bar{y}} \rightarrow j_{*}^{\prime}\left(\left.\mathcal{G}\right|_{V}\right)_{\bar{y}} \rightarrow H^{0}(Q)_{\bar{y}}
$$

Thus we see that the lemma follows because $Q_{\bar{y}}=R f_{*} Q_{\bar{x}}$ by Lemma 64.3.1.
0AES Lemma 64.3.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism. Let $\bar{x}$ be a geometric point of $X$ and let $\operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right) \rightarrow X$ be the canonical morphism. For a quasicoherent module $\mathcal{G}$ on $Y$ we have

$$
f_{*} \mathcal{G}_{\bar{x}}=\Gamma\left(Y \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right), p^{*} \mathcal{F}\right)
$$

where $p: Y \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right) \rightarrow Y$ is the projection.
Proof. Observe that $f_{*} \mathcal{G}_{\bar{x}}=\Gamma\left(\operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right), h^{*} f_{*} \mathcal{G}\right)$ where $h: \operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right) \rightarrow X$. Hence the result is true because $h$ is flat so that Cohomology of Spaces, Lemma 56.10.1 applies.

0AET Lemma 64.3.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $i: Z \rightarrow X$ be a closed immersion of finite presentation. Let $Q \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ be supported on $|Z|$. Let $\bar{x}$ be a geometric point of $X$ and let $I_{\bar{x}} \subset \mathcal{O}_{X, \bar{x}}$ be the stalk of the ideal sheaf of $Z$. Then the cohomology modules $H^{n}\left(Q_{\bar{x}}\right)$ are $I_{\bar{x}}$-power torsion (see More on Algebra, Definition 15.69.1).

Proof. Choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that $\bar{x}$ lifts to a geometric point $\bar{u}$ of $U$. Then we can replace $X$ by $U, Z$ by $U \times_{X} Z, Q$ by the restriction $\left.Q\right|_{U}$, and $\bar{x}$ by $\bar{u}$. Thus we may assume that $X=\operatorname{Spec}(A)$ is affine. Let $I \subset A$ be the ideal defining $Z$. Since $i: Z \rightarrow X$ is of finite presentation, the ideal $I=\left(f_{1}, \ldots, f_{r}\right)$ is finitely generated. The object $Q$ comes from a complex of $A$-modules $M^{\bullet}$, see Derived Categories of Spaces, Lemma 62.4.2 and Derived Categories of Schemes, Lemma 35.3.5. Since the cohomology sheaves of $Q$ are supported on $Z$ we see that the localization $M_{f}^{\bullet}$ is acyclic for each $f \in I$. Take $x \in H^{p}\left(M^{\bullet}\right)$. By the above we can find $n_{i}$ such that $f_{i}^{n_{i}} x=0$ in $H^{p}\left(M^{\bullet}\right)$ for each $i$. Then with $n=\sum n_{i}$ we see that $I^{n}$ annihilates $x$. Thus $H^{p}\left(M^{\bullet}\right)$ is $I$-power torsion. Since the ring map $A \rightarrow \mathcal{O}_{X, \bar{x}}$ is flat and since $I_{\bar{x}}=I \mathcal{O}_{X, \bar{x}}$ we conclude.

0AEU Lemma 64.3.5. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ be a closed subspace. Assume $f^{-1} Z \rightarrow Z$ is an isomorphism and that $f$ is flat in every point of $f^{-1} Z$. For any $Q$ in $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ supported on $\left|f^{-1} Z\right|$ we have $L f^{*} R f_{*} Q=Q$.

Proof. We show the canonical map $L f^{*} R f_{*} Q \rightarrow Q$ is an isomorphism by checking on stalks at $\bar{y}$. If $\bar{y}$ is not in $f^{-1} Z$, then both sides are zero and the result is true. Assume the image $\bar{x}$ of $\bar{y}$ is in $Z$. By Lemma 64.3.1 we have $R f_{*} Q_{\bar{x}}=Q_{\bar{y}}$ and since $f$ is flat at $\bar{y}$ we see that

$$
\left(L f^{*} R f_{*} Q\right)_{\bar{y}}=\left(R f_{*} Q\right)_{\bar{x}} \otimes_{\mathcal{O}_{X, \bar{x}}} \mathcal{O}_{Y, \bar{y}}=Q_{\bar{y}} \otimes_{\mathcal{O}_{X, \bar{x}}} \mathcal{O}_{Y, \bar{y}}
$$

Thus we have to check that the canonical map

$$
Q_{\bar{y}} \otimes_{\mathcal{O}_{X, \bar{x}}} \mathcal{O}_{Y, \bar{y}} \longrightarrow Q_{\bar{y}}
$$

is an isomorphism in the derived category. Let $I_{\bar{x}} \subset \mathcal{O}_{X, \bar{x}}$ be the stalk of the ideal sheaf defining $Z$. Since $Z \rightarrow X$ is locally of finite presentation this ideal is finitely generated and the cohomology groups of $Q_{\bar{y}}$ are $I_{\bar{y}}=I_{\bar{x}} \mathcal{O}_{Y, \bar{y}}$-power torsion by Lemma 64.3.4 applied to $Q$ on $Y$. It follows that they are also $I_{\bar{x}}$-power torsion. The ring map $\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{Y, \bar{y}}$ is flat and induces an isomorphism after dividing by $I_{\bar{x}}$ and $I_{\bar{y}}$ because we assumed that $f^{-1} Z \rightarrow Z$ is an isomorphism. Hence we see that the cohomology modules of $Q_{\bar{y}} \otimes_{\mathcal{O}_{X, \bar{x}}} \mathcal{O}_{Y, \bar{y}}$ are equal to the cohomology modules of $Q_{\bar{y}}$ by More on Algebra, Lemma 15.70 .2 which finishes the proof.

0AEV Situation 64.3.6. Here $S$ is a base scheme, $f: Y \rightarrow X$ is a quasi-compact and quasi-separated morphism of algebraic spaces over $S$, and $Z \rightarrow X$ is a closed immersion of finite presentation. We assume that $f^{-1}(Z) \rightarrow Z$ is an isomorphism and that $f$ is flat in every point $x \in\left|f^{-1} Z\right|$. We set $U=X \backslash Z$ and $V=Y \backslash f^{-1}(Z)$. Picture

In Situation 64.3.6 we define $Q \operatorname{Coh}(Y \rightarrow X, Z)$ as the category of triples $(\mathcal{H}, \mathcal{G}, \varphi)$ where $\mathcal{H}$ is a quasi-coherent sheaf of $\mathcal{O}_{U}$-modules, $\mathcal{G}$ is a quasi-coherent sheaf of $\mathcal{O}_{Y}$-modules, and $\varphi:\left.f^{*} \mathcal{H} \rightarrow \mathcal{G}\right|_{V}$ is an isomorphism of $\mathcal{O}_{V}$-modules. There is a canonical functor

0AEW

$$
\begin{equation*}
Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \longrightarrow Q \operatorname{Coh}(Y \rightarrow X, Z) \tag{64.3.6.1}
\end{equation*}
$$

which maps $\mathcal{F}$ to the $\operatorname{system}\left(\left.\mathcal{F}\right|_{U}, f^{*} \mathcal{F}\right.$, can $)$. By analogy with the proof given in the affine case, we construct a functor in the opposite direction. To an object $(\mathcal{H}, \mathcal{G}, \varphi)$ we assign the $\mathcal{O}_{X}$-module

0AEX

$$
\begin{equation*}
\operatorname{Ker}\left(\left.j_{*} \mathcal{H} \oplus f_{*} \mathcal{G} \rightarrow\left(f \circ j^{\prime}\right)_{*} \mathcal{G}\right|_{V}\right) \tag{64.3.6.2}
\end{equation*}
$$

Observe that $j$ and $j^{\prime}$ are quasi-compact morphisms as $Z \rightarrow X$ is of finite presentation. Hence $f_{*}, j_{*}$, and $\left(f \circ j^{\prime}\right)_{*}$ transform quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 54.11.2). Thus the module 64.3.6.2 is quasi-coherent.

0AEY Lemma 64.3.7. In Situation 64.3.6. The functor 64.3.6.2 is right adjoint to the functor 64.3.6.1).

Proof. This follows easily from the adjointness of $f^{*}$ to $f_{*}$ and $j^{*}$ to $j_{*}$. Details omitted.

0AEZ Lemma 64.3.8. In Situation 64.3.6. Let $X^{\prime} \rightarrow X$ be a flat morphism of algebraic spaces. Set $Z^{\prime}=X^{\prime} \times_{X} Z$ and $Y^{\prime}=X^{\prime} \times_{X} Y$. The pullbacks $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow$ $Q \operatorname{Coh}\left(\mathcal{O}_{X^{\prime}}\right)$ and $Q \operatorname{Coh}(Y \rightarrow X, Z) \rightarrow Q \operatorname{Coh}\left(Y^{\prime} \rightarrow X^{\prime}, Z^{\prime}\right)$ are compatible with the functors 64.3.6.2) and 64.3.6.1.

Proof. This is true because pullback commutes with pullback and because flat pullback commutes with pushforward along quasi-compact and quasi-separated morphisms, see Cohomology of Spaces, Lemma 56.10.1.

0AF0 Proposition 64.3.9. In Situation 64.3.6 the functor 64.3.6.1) is an equivalence with quasi-inverse given by 64.3.6.2.).

Proof. We first treat the special case where $X$ and $Y$ are affine schemes and where the morphism $f$ is flat. Say $X=\operatorname{Spec}(R)$ and $Y=\operatorname{Spec}(S)$. Then $f$ corresponds to a flat ring map $R \rightarrow S$. Moreover, $Z \subset X$ is cut out by a finitely generated ideal $I \subset R$. Choose generators $f_{1}, \ldots, f_{t} \in I$. By the description of quasi-coherent modules in terms of modules (Schemes, Section 25.7), we see that the category $Q \operatorname{Coh}(Y \rightarrow X, Z)$ is canonically equivalent to the category Glue $(R \rightarrow$ $S, f_{1}, \ldots, f_{t}$ ) of More on Algebra, Remark 15.70 .10 such that the functors (64.3.6.1) and $\sqrt[64.3 .6 .2]{ }$ correspond to the functors Can and $H^{0}$. Hence the result follows from More on Algebra, Proposition 15.70 .15 in this case.

We return to the general case. Let $\mathcal{F}$ be a quasi-coherent module on $X$. We will show that

$$
\alpha: \mathcal{F} \longrightarrow \operatorname{Ker}\left(\left.\left.j_{*} \mathcal{F}\right|_{U} \oplus f_{*} f^{*} \mathcal{F} \rightarrow\left(f \circ j^{\prime}\right)_{*} f^{*} \mathcal{F}\right|_{V}\right)
$$

is an isomorphism. Let $(\mathcal{H}, \mathcal{G}, \varphi)$ be an object of $Q \operatorname{Coh}(Y \rightarrow X, Z)$. We will show that

$$
\beta: f^{*} \operatorname{Ker}\left(\left.j_{*} \mathcal{H} \oplus f_{*} \mathcal{G} \rightarrow\left(f \circ j^{\prime}\right)_{*} \mathcal{G}\right|_{V}\right) \longrightarrow \mathcal{G}
$$

and

$$
\gamma: j^{*} \operatorname{Ker}\left(\left.j_{*} \mathcal{H} \oplus f_{*} \mathcal{G} \rightarrow\left(f \circ j^{\prime}\right)_{*} \mathcal{G}\right|_{V}\right) \longrightarrow \mathcal{H}
$$

are isomorphisms. To see these statements are true it suffices to look at stalks. Let $\bar{y}$ be a geometric point of $Y$ mapping to the geometric point $\bar{x}$ of $X$.

Fix an object $(\mathcal{H}, \mathcal{G}, \varphi)$ of $Q \operatorname{Coh}(Y \rightarrow X, Z)$. By Lemma 64.3.2 and a diagram chase (omitted) the canonical map

$$
\operatorname{Ker}\left(\left.j_{*} \mathcal{H} \oplus f_{*} \mathcal{G} \rightarrow\left(f \circ j^{\prime}\right)_{*} \mathcal{G}\right|_{V}\right)_{\bar{x}} \longrightarrow \operatorname{Ker}\left(j_{*} \mathcal{H}_{\bar{x}} \oplus \mathcal{G}_{\bar{y}} \rightarrow j_{*}^{\prime} \mathcal{G}_{\bar{y}}\right)
$$

is an isomorphism.
In particular, if $\bar{y}$ is a geometric point of $V$, then we see that $j_{*}^{\prime} \mathcal{G}_{\bar{y}}=\mathcal{G}_{\bar{y}}$ and hence that this kernel is equal to $\mathcal{H}_{\bar{x}}$. This easily implies that $\alpha_{\bar{x}}, \beta_{\bar{x}}$, and $\beta_{\bar{y}}$ are isomorphisms in this case.

Next, assume that $\bar{y}$ is a point of $f^{-1} Z$. Let $I_{\bar{x}} \subset \mathcal{O}_{X, \bar{x}}$, resp. $I_{\bar{y}} \subset \mathcal{O}_{Y, \bar{y}}$ be the stalk of the ideal cutting out $Z$, resp. $f^{-1} Z$. Then $I_{\bar{x}}$ is a finitely generated ideal, $I_{\bar{y}}=I_{\bar{x}} \mathcal{O}_{Y, \bar{y}}$, and $\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{Y, \bar{y}}$ is a flat local homomorphism inducing an isomorphism $\mathcal{O}_{X, \bar{x}} / I_{\bar{x}}=\mathcal{O}_{Y, \bar{y}} / I_{\bar{y}}$. At this point we can bootstrap using the diagram
of categories

Namely, as in the first paragraph of the proof we identify

$$
\operatorname{Glue}\left(\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{Y, \bar{y}}, f_{1}, \ldots, f_{t}\right)=Q \operatorname{Coh}\left(\operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}}\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right), V\left(I_{\bar{x}}\right)\right)
$$

The right vertical functor is given by pullback, and it is clear that the inner square is commutative. Our computation of the stalk of the kernel in the third paragraph of the proof combined with Lemma 64.3.3 implies that the outer square (using the curved arrows) commutes. Thus we conclude using the case of a flat morphism of affine schemes which we handled in the first paragraph of the proof.

0AFJ Lemma 64.3.10. In Situation 64.3.6 the functor $R f_{*}$ induces an equivalence between $D_{Q C o h,\left|f^{-1} Z\right|}\left(\mathcal{O}_{Y}\right)$ and $D_{Q C o h,|Z|}\left(\mathcal{O}_{X}\right)$ with quasi-inverse given by $L f^{*}$.
Proof. Since $f$ is quasi-compact and quasi-separated we see that $R f_{*}$ defines a functor from $D_{Q C o h,\left|f^{-1} Z\right|}\left(\mathcal{O}_{Y}\right)$ to $D_{Q C o h,|Z|}\left(\mathcal{O}_{X}\right)$, see Derived Categories of Spaces, Lemma 62.6.1. By Derived Categories of Spaces, Lemma 62.5.4 we see that $L f^{*}$ maps $D_{Q C o h,|Z|}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h,\left|f^{-1} Z\right|}\left(\mathcal{O}_{Y}\right)$. In Lemma 64.3 .5 we have seen that $L f^{*} R f_{*} Q=Q$ for $Q$ in $D_{Q C o h,\left|f^{-1} Z\right|}\left(\mathcal{O}_{Y}\right)$. By the dual of Derived Categories, Lemma 13.7 .2 to finish the proof it suffices to show that $L f^{*} K=0$ implies $K=0$ for $K$ in $D_{Q C o h,|Z|}\left(\mathcal{O}_{X}\right)$. This follows from the fact that $f$ is flat at all points of $f^{-1} Z$ and the fact that $f^{-1} Z \rightarrow Z$ is surjective.

0AF1 Lemma 64.3.11. In Situation 64.3.6 there exists an fpqc covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ refining the family $\{U \rightarrow X, Y \rightarrow X\}$.

Proof. For the definition and general properties of fpqc coverings we refer to Topologies, Section 33.8. In particular, we can first choose an étale covering $\left\{X_{i} \rightarrow X\right\}$ with $X_{i}$ affine and by base changing $Y, Z$, and $U$ to each $X_{i}$ we reduce to the case where $X$ is affine. In this case $U$ is quasi-compact and hence a finite union $U=U_{1} \cup \ldots \cup U_{n}$ of affine opens. Then $Z$ is quasi-compact hence also $f^{-1} Z$ is quasi-compact. Thus we can choose an affine scheme $W$ and an étale morphism $h: W \rightarrow Y$ such that $h^{-1} f^{-1} Z \rightarrow f^{-1} Z$ is surjective. Say $W=\operatorname{Spec}(B)$ and $h^{-1} f^{-1} Z=V(J)$ where $J \subset B$ is an ideal of finite type. By Pro-étale Cohomology, Lemma 51.5.1 there exists a localization $B \rightarrow B^{\prime}$ such that points of $\operatorname{Spec}\left(B^{\prime}\right)$ correspond exactly to points of $W=\operatorname{Spec}(B)$ specializing to $h^{-1} f^{-1} Z=V(J)$. It follows that the composition $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}(B)=W \rightarrow Y \rightarrow X$ is flat as by assumption $f: Y \rightarrow X$ is flat at all the points of $f^{-1} Z$. Then $\left\{\operatorname{Spec}\left(B^{\prime}\right) \rightarrow\right.$ $\left.X, U_{1} \rightarrow X, \ldots, U_{n} \rightarrow X\right\}$ is an fpqc covering by Topologies, Lemma 33.8.2

In Situation 64.3.6 we consider the category $\operatorname{Spaces}(X \rightarrow Y, Z)$ of commutative diagrams of algebraic spaces over $S$ of the form

where both squares are cartesian. There is a canonical functor
0AF3

$$
\begin{equation*}
\operatorname{Spaces} / X \longrightarrow \operatorname{Spaces}(Y \rightarrow X, Z) \tag{64.4.0.1}
\end{equation*}
$$

which maps $X^{\prime} \rightarrow X$ to the morphisms $U \times_{X} X^{\prime} \leftarrow V \times_{X} X^{\prime} \rightarrow Y \times_{X} X^{\prime}$.
0AF4 Lemma 64.4.1. In Situation 64.3.6 the functor 64.4.0.1. restricts to an equivalence
(1) from the category of algebraic spaces affine over $X$ to the full subcategory of $\operatorname{Spaces}(Y \rightarrow X, Z)$ consisting of $\left(U^{\prime} \leftarrow V^{\prime} \rightarrow Y^{\prime}\right)$ with $U^{\prime} \rightarrow U, V^{\prime} \rightarrow V$, and $Y^{\prime} \rightarrow Y$ affine,
(2) from the category of closed immersions $X^{\prime} \rightarrow X$ to the full subcategory of $\operatorname{Spaces}(Y \rightarrow X, Z)$ consisting of $\left(U^{\prime} \leftarrow V^{\prime} \rightarrow Y^{\prime}\right)$ with $U^{\prime} \rightarrow U, V^{\prime} \rightarrow V$, and $Y^{\prime} \rightarrow Y$ closed immersions, and
(3) same statement as in (2) for finite morphisms.

Proof. The category of algebraic spaces affine over $X$ is equivalent to the category of quasi-coherent sheaves $\mathcal{A}$ of $\mathcal{O}_{X}$-algebras. The full subcategory of $\operatorname{Spaces}(Y \rightarrow$ $X, Z)$ consisting of $\left(U^{\prime} \leftarrow V^{\prime} \rightarrow Y^{\prime}\right)$ with $U^{\prime} \rightarrow U, V^{\prime} \rightarrow V$, and $Y^{\prime} \rightarrow Y$ affine is equivalent to the category of algebra objects of $Q \operatorname{Coh}(Y \rightarrow X, Z)$. In both cases this follows from Morphisms of Spaces, Lemma 54.20.7 with quasi-inverse given by the relative spectrum construction (Morphisms of Spaces, Definition 54.20.8) which commutes with arbitrary base change. Thus part (1) of the lemma follows from Proposition 64.3.9.
Fully faithfulness in part (2) follows from part (1). For essential surjectivity, we reduce by part (1) to proving that $X^{\prime} \rightarrow X$ is a closed immersion if and only if both $U \times_{X} X^{\prime} \rightarrow U$ and $Y \times_{X} X^{\prime} \rightarrow Y$ are closed immersions. By Lemma 64.3.11 $\{U \rightarrow X, Y \rightarrow X\}$ can be refined by an fpqc covering. Hence the result follows from Descent on Spaces, Lemma 61.10.15.
For (3) use the argument proving (2) and Descent on Spaces, Lemma 61.10.21.
0AF5 Lemma 64.4.2. In Situation 64.3.6 the functor 64.4.0.1 reflects isomorphisms.
Proof. By a formal argument with base change, this reduces to the following question: A morphism $a: X^{\prime} \rightarrow X$ of algebraic spaces such that $U \times_{X} X^{\prime} \rightarrow U$ and $Y \times_{X} X^{\prime} \rightarrow Y$ are isomorphisms, is an isomorphism. The family $\{U \rightarrow X, Y \rightarrow X\}$ can be refined by an fpqc covering by Lemma 64.3.11. Hence the result follows from Descent on Spaces, Lemma 61.10.13.

0AF6 Lemma 64.4.3. In Situation 64.3.6 the functor 64.4.0.1) is fully faithful on algebraic spaces separated over X. More precisely, it induces a bijection

$$
\operatorname{Mor}_{X}\left(X_{1}^{\prime}, X_{2}^{\prime}\right) \longrightarrow \operatorname{Mor}_{\text {Spaces }(Y \rightarrow X, Z)}\left(F\left(X_{1}^{\prime}\right), F\left(X_{2}^{\prime}\right)\right)
$$

whenever $X_{2}^{\prime} \rightarrow X$ is separated.

Proof. Since $X_{2}^{\prime} \rightarrow X$ is separated, the graph $i: X_{1}^{\prime} \rightarrow X_{1}^{\prime} \times_{X} X_{2}^{\prime}$ of a morphism $X_{1}^{\prime} \rightarrow X_{2}^{\prime}$ over $X$ is a closed immersion, see Morphisms of Spaces, Lemma 54.4.6. Moreover a closed immersion $i: T \rightarrow X_{1}^{\prime} \times_{X} X_{2}^{\prime}$ is the graph of a morphism if and only if $\mathrm{pr}_{1} \circ i$ is an isomorphism. The same is true for
(1) the graph of a morphism $U \times_{X} X_{1}^{\prime} \rightarrow U \times_{X} X_{2}^{\prime}$ over $U$,
(2) the graph of a morphism $V \times_{x} X_{1}^{\prime} \rightarrow V \times_{X} X_{2}^{\prime}$ over $V$, and
(3) the graph of a morphism $Y \times_{x} X_{1}^{\prime} \rightarrow Y \times_{x} X_{2}^{\prime}$ over $Y$.

Moreover, if morphisms as in (1), (2), (3) fit together to form a morphism in the category $\operatorname{Spaces}(Y \rightarrow X, Z)$, then these graphs fit together to give an object of $\operatorname{Spaces}\left(Y \times_{X}\left(X_{1}^{\prime} \times_{X} X_{2}^{\prime}\right) \rightarrow X_{1}^{\prime} \times_{X} X_{2}^{\prime}, Z \times_{X}\left(X_{1}^{\prime} \times_{X} X_{2}^{\prime}\right)\right)$ whose triple of morphisms are closed immersions. The proof is finished by applying Lemmas 64.4.1 and 64.4.2

### 64.5. Coequalizers and glueing

0AGF Let $X$ be a Noetherian algebraic space and $Z \rightarrow X$ a closed subscheme. Let $X^{\prime} \rightarrow X$ be the blowing up in $Z$. In this section we show that $X$ can be recovered from $X^{\prime}, Z_{n}$ and glueing data where $Z_{n}$ is the $n$th infinitesimal neighbourhood of $Z$ in $X$.

0AGG Lemma 64.5.1. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$. Assume $B$ Noetherian, $g$ proper and surjective, and $X \rightarrow B$ separated of finite type. Let $R=Y \times_{X} Y$ with projection morphisms $t, s: R \rightarrow Y$. There exists a coequalizer $X^{\prime}$ of $s, t: R \rightarrow Y$ in the category of algebraic spaces separated over $B$. The morphism $X^{\prime} \rightarrow X$ is a finite universal homeomorphism.

Proof. Denote $h: R \rightarrow X$ the given morphism. The sheaves

$$
g_{*} \mathcal{O}_{Y} \quad \text { and } \quad h_{*} \mathcal{O}_{R}
$$

are coherent $\mathcal{O}_{X}$-algebras (Cohomology of Spaces, Lemma 56.19.2). The $X$-morphisms $s, t$ induce $\mathcal{O}_{X}$-agebra maps $s^{\sharp}, t^{\sharp}$ from the first to the second. Set

$$
\mathcal{A}=\text { Equalizer }\left(s^{\sharp}, t^{\sharp}: g_{*} \mathcal{O}_{Y} \longrightarrow h_{*} \mathcal{O}_{R}\right)
$$

Then $\mathcal{A}$ is a coherent $\mathcal{O}_{X}$-algebra and we can define

$$
X^{\prime}={\underline{\operatorname{Spec}_{X}}}_{X}(\mathcal{A})
$$

as in Morphisms of Spaces, Definition 54.20.8. By Morphisms of Spaces, Remark 54.20 .9 and functoriality of the $\underline{\text { Spec construction there is a factorization }}$

$$
Y \longrightarrow X^{\prime} \longrightarrow X
$$

and the morphism $g^{\prime}: Y \rightarrow X^{\prime}$ equalizes $s$ and $t$. Since $\mathcal{A}$ is a coherent $\mathcal{O}_{X}$-module it is clear that $X^{\prime} \rightarrow X$ is a finite morphism of algebraic spaces. Since the surjective morphism $g: Y \rightarrow X$ factors through $X^{\prime}$ we see that $X^{\prime} \rightarrow X$ is surjective.
To check that $X^{\prime} \rightarrow X$ is a universal homeomorphism, it suffices to check that it is universally injective (as we've already seen that it is universally surjective and
universally closed). To check this it suffices to check that $\left|X^{\prime} \times_{X} U\right| \rightarrow|U|$ is injective, for all $U \rightarrow X$ étale, see More on Morphisms of Spaces, Lemma 63.3.6. It suffices to check this in all cases where $U$ is an affine scheme (minor detail omitted). Since the construction of $X^{\prime}$ commutes with étale localization, we may replace $U$ by $X$. Hence it suffices to check that $\left|X^{\prime}\right| \rightarrow|X|$ is injective when $X$ is moreover an affine scheme. First observe that $|Y| \rightarrow\left|X^{\prime}\right|$ is surjective, because $g^{\prime}: Y \rightarrow X^{\prime}$ is proper by Morphisms of Spaces, Lemma 54.39.6 (hence the image is closed) and $\mathcal{O}_{X^{\prime}} \subset g_{*}^{\prime} \mathcal{O}_{Y}$ by construction. Thus if $x_{1}, x_{2} \in\left|X^{\prime}\right|$ map to the same point in $|X|$, then we can lift $x_{1}, x_{2}$ to points $y_{1}, y_{2} \in|Y|$ mapping to the same point of $|X|$. Then we can find an $r \in|R|$ with $s(r)=y_{1}$ and $t(r)=y_{2}$, see Properties of Spaces, Lemma 53.4.3. Since $g^{\prime}$ coequalizes $s$ and $t$ we conclude that $x_{1}=x_{2}$ as desired.

To prove that $X^{\prime}$ is the coequalizer, let $W \rightarrow B$ be a separated morphism of algebraic spaces over $S$ and let $a: Y \rightarrow W$ be a morphism over $B$ which equalizes $s$ and $t$. We will show that $a$ factors in a unique manner through the morphism $g^{\prime}: Y \rightarrow X^{\prime}$. We will first reduce this to the case where $W \rightarrow B$ is separated of finite type by a limit argument (we recommend the reader skip this argument). Since $Y$ is quasi-compact we can find a quasi-compact open subspace $W^{\prime} \subset W$ such that a factors through $W^{\prime}$. After replacing $W$ by $W^{\prime}$ we may assume $W$ is quasi-compact. By Limits of Spaces, Lemma 57.10.1 we can write $W=\lim _{i \in I} W_{i}$ as a cofiltered limit with affine transition morphisms with $W_{i}$ of finite type over $B$. After shrinking $I$ we may assume $W_{i} \rightarrow B$ is separated as well, see Limits of Spaces, Lemma 57.6.8. Since $W=\lim W_{i}$ we have $a=\lim a_{i}$ for some morphisms $a_{i}: Y \rightarrow W_{i}$. If we can prove $a_{i}$ factors through $g^{\prime}$ for all $i$, then the same thing is true for $a$. This proves the reduction to the case of a finite type $W$.

Assume we have $a: Y \rightarrow W$ equalizing $s$ and $t$ with $W \rightarrow B$ separated and of finite type. Consider

$$
\Gamma \subset X \times_{B} W
$$

the scheme theoretic image of $(g, a): Y \rightarrow X \times{ }_{B} W$. Since $g$ is proper we conclude $Y \rightarrow \Gamma$ is surjective and the projection $p: \Gamma \rightarrow X$ is proper, see Morphisms of Spaces, Lemma 54.39.8. Since both $g$ and $a$ equalize $s$ and $t$, the morphism $Y \rightarrow \Gamma$ also equalizes $s$ and $t$.

We claim that $p: \Gamma \rightarrow X$ is a universal homeomorphism. As in the proof of the corresponding fact for $X^{\prime} \rightarrow X$, it suffices to show that $p$ is universally injective. By More on Morphisms of Spaces, Lemma 63.3.6 it suffices to check $\left|\Gamma \times{ }_{X} U\right| \rightarrow|U|$ is injective for every $U \rightarrow X$ étale. It suffices to check this for $U$ affine (minor details omitted). Taking scheme theoretic image commutes with étale localization (Morphisms of Spaces, Lemma 54.16.3). Hence we may replace $X$ by $V$ and we conclude it suffices to show that $|\Gamma| \rightarrow|X|$ is injective. If $\gamma_{1}, \gamma_{2} \in|\Gamma|$ map to the same point in $|X|$, then we can lift $\gamma_{1}, \gamma_{2}$ to points $y_{1}, y_{2} \in|Y|$ mapping to the same point of $|X|$ (by surjectivity of $Y \rightarrow \Gamma$ we've seen above). Then we can find an $r \in|R|$ with $s(r)=y_{1}$ and $t(r)=y_{2}$, see Properties of Spaces, Lemma 53.4.3). Since $Y \rightarrow \Gamma$ coequalizes $s$ and $t$ we conclude that $\gamma_{1}=\gamma_{2}$ as desired.

As a proper universal homeomorphism the morphism $p$ is finite (see for example More on Morphisms of Spaces, Lemma 63.25.5). We conclude that

$$
\Gamma=\underline{\operatorname{Spec}}\left(p_{*} \mathcal{O}_{\Gamma}\right) .
$$

Since $Y \rightarrow \Gamma$ equalizes $s$ and $t$ the map $p_{*} \mathcal{O}_{\Gamma} \rightarrow g_{*} \mathcal{O}_{Y}$ factors through $\mathcal{A}$ and we obtain a morphism $X^{\prime} \rightarrow \Gamma$ by functoriality of the Spec construction. We can compose this morphism with the projection $q: \Gamma \rightarrow W$ to get the desired morphism $X^{\prime} \rightarrow W$. We omit the proof of uniqueness of the factorization.

We will work in the following situation.
0AGH Situation 64.5.2. Let $S$ be a scheme. Let $X \rightarrow B$ be a separated finite type morphism of algebraic spaces over $S$ with $B$ Noetherian. Let $Z \rightarrow X$ be a closed immersion and let $U \subset X$ be the complementary open subspace. Finally, let $f$ : $X^{\prime} \rightarrow X$ be a proper morphism of algebraic spaces such that $f^{-1}(U) \rightarrow U$ is an isomorphism.

0AGI Lemma 64.5.3. In Situation 64.5.2 let $Y=X^{\prime} \amalg Z$ and $R=Y \times_{X} Y$ with projections $t, s: R \rightarrow Y$. There exists a coequalizer $X_{1}$ of $s, t: R \rightarrow Y$ in the category of algebraic spaces separated over $B$. The morphism $X_{1} \rightarrow X$ is a finite universal homeomorphism, an isomorphism over $U$ and $Z \rightarrow X$ lifts to $X_{1}$.

Proof. Existence of $X_{1}$ and the fact that $X_{1} \rightarrow X$ is a finite universal homeomorphism is a special case of Lemma 64.5.1. The formation of $X_{1}$ commutes with étale localization on $X$ (see proof of Lemma 64.5.1). Thus the morphisms $X_{n} \rightarrow X$ are isomorphisms over $U$. It is immediate from the construction that $Z \rightarrow X$ lifts to $X_{1}$.

In Situation 64.5 .2 for $n \geq 1$ let $Z_{n} \subset X$ be the $n$th order infinitesimal neighbourhood of $Z$ in $X$, i.e., the closed subscheme defined by the $n$th power of the sheaf of ideals cutting out $Z$. Consider $Y_{n}=X^{\prime} \amalg Z_{n}$ and $R_{n}=Y_{n} \times_{X} Y_{n}$ and the coequalizer

$$
R_{n} \longrightarrow Y_{n} \longrightarrow X_{n} \longrightarrow X
$$

as in Lemma 64.5.3. The maps $Y_{n} \rightarrow Y_{n+1}$ and $R_{n} \rightarrow R_{n+1}$ induce morphisms
0AGJ (64.5.3.1)

$$
X_{1} \rightarrow X_{2} \rightarrow X_{3} \rightarrow \ldots \rightarrow X
$$

Each of these morphisms is a universal homeomorphism as the morphisms $X_{n} \rightarrow X$ are universal homeomorphisms.
0AGK Lemma 64.5.4. In 64.5.3.1) for all $n$ large enough, there exists an $m$ such that $X_{n} \rightarrow X_{n+m}$ factors through a closed immersion $X \rightarrow X_{n+m}$.

Proof. Let's look a bit more closely at the construction of $X_{n}$ and how it changes as we increase $n$. We have $X_{n}=\underline{\operatorname{Spec}}\left(\mathcal{A}_{n}\right)$ where $\mathcal{A}_{n}$ is the equalizer of $s_{n}^{\sharp}$ and $t_{n}^{\sharp}$ going from $g_{n, *} \mathcal{O}_{Y_{n}}$ to $h_{n, *} \mathcal{O}_{R_{n}}$. Here $g_{n}: Y_{n}=X^{\prime} \amalg Z_{n} \rightarrow X$ and $h_{n}: R_{n}=$ $Y_{n} \times_{X} Y_{n} \rightarrow X$ are the given morphisms. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the coherent sheaf of ideals corresponding to $Z$. Then

$$
g_{n, *} \mathcal{O}_{Y_{n}}=f_{*} \mathcal{O}_{X^{\prime}} \times \mathcal{O}_{X} / \mathcal{I}^{n}
$$

Similarly, we have a decomposition

$$
R_{n}=X^{\prime} \times_{X} X^{\prime} \amalg X^{\prime \prime} \times_{X} Z_{n} \amalg Z_{n} \times_{X} Z_{n}
$$

Denote $f_{n}: X^{\prime} \times_{X} Z_{n} \rightarrow X$ the restriction of $f$ and denote

$$
\mathcal{A}=\operatorname{Equalizer}\left(f_{*} \mathcal{O}_{X^{\prime}} \longrightarrow(f \times f)_{*} \mathcal{O}_{X^{\prime} \times_{X} X^{\prime}}\right)
$$

Then we see that

$$
\mathcal{A}_{n}=\operatorname{Equalizer}\left(\mathcal{A} \times \mathcal{O}_{X} / \mathcal{I}^{n} \longrightarrow f_{n, *} \mathcal{O}_{X^{\prime} \times{ }_{X} Z_{n}}\right)
$$

We have canonical maps

$$
\mathcal{O}_{X} \rightarrow \ldots \rightarrow \mathcal{A}_{3} \rightarrow \mathcal{A}_{2} \rightarrow \mathcal{A}_{1}
$$

of coherent $\mathcal{O}_{X}$-algebras. The statement of the lemma means that for $n$ large enough there exists an $m \geq 0$ such that the image of $\mathcal{A}_{n+m} \rightarrow \mathcal{A}_{n}$ is isomorphic to $\mathcal{O}_{X}$.

Since $X_{n} \rightarrow X$ is an isomorphism over $U$ we see that the kernel of $\mathcal{O}_{X} \rightarrow \mathcal{A}_{n}$ is supported on $|Z|$. Since $X$ is Noetherian, the sequence of kernels $\mathcal{J}_{n}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow\right.$ $\mathcal{A}_{n}$ ) stabilizes (Cohomology of Spaces, Lemma 56.12.1). Say $\mathcal{J}_{n_{0}}=\mathcal{J}_{n_{0}+1}=\ldots=$ $\mathcal{J}$. By Cohomology of Spaces, Lemma 56.12.2 we find that $\mathcal{I}^{t} \mathcal{J}=0$ for some $t \geq 0$. On the other hand, there is an $\mathcal{O}_{X}$-algebra map $\mathcal{A}_{n} \rightarrow \mathcal{O}_{X} / \mathcal{I}^{n}$ and hence $\mathcal{J} \subset \mathcal{I}^{n}$ for all $n$. By Artin-Rees (Cohomology of Spaces, Lemma 56.12.3) we find that $\mathcal{J} \cap \mathcal{I}^{n} \subset \mathcal{I}^{n-c} \mathcal{J}$ for some $c \geq 0$ and all $n \gg 0$. We conclude that $\mathcal{J}=0$.

Pick $n \geq n_{0}$ as in the previous paragraph. Then $\mathcal{O}_{X} \rightarrow \mathcal{A}_{n}$ is injective. Hence it now suffices to find $m \geq 0$ such that the image of $\mathcal{A}_{n+m} \rightarrow \mathcal{A}_{n}$ is equal to the image of $\mathcal{O}_{X}$. Observe that $\mathcal{A}_{n}$ sits in a short exact sequence

$$
0 \rightarrow \operatorname{Ker}\left(\mathcal{A} \rightarrow f_{n, *} \mathcal{O}_{X^{\prime} \times_{X} Z_{n}}\right) \rightarrow \mathcal{A}_{n} \rightarrow \mathcal{O}_{X} / \mathcal{I}^{n} \rightarrow 0
$$

and similarly for $\mathcal{A}_{n+m}$. Hence it suffices to show

$$
\operatorname{Ker}\left(\mathcal{A} \rightarrow f_{n+m, *} \mathcal{O}_{X^{\prime} \times X_{X} Z_{n+m}}\right) \subset \operatorname{Im}\left(\mathcal{I}^{n} \rightarrow \mathcal{A}\right)
$$

for some $m \geq 0$. To do this we may work étale locally on $X$ and since $X$ is Noetherian we may assume that $X$ is a Noetherian affine scheme. Say $X=\operatorname{Spec}(R)$ and $\mathcal{I}$ corresponds to the ideal $I \subset R$. Let $\mathcal{A}=\widetilde{A}$ for a finite $R$-algebra $A$. Let $f_{*} \mathcal{O}_{X^{\prime}}=\widetilde{B}$ for a finite $R$-algebra $B$. Then $R \rightarrow A \subset B$ and these maps become isomorphisms on inverting any element of $I$.
Note that $f_{n, *} \mathcal{O}_{X^{\prime} \times{ }_{X} Z_{n}}$ is equal to $f_{*}\left(\mathcal{O}_{X^{\prime}} / I^{n} \mathcal{O}_{X^{\prime}}\right)$ in the notation used in Cohomology of Spaces, Section 56.20. By Cohomology of Spaces, Lemma 56.20 .4 we see that there exists a $c \geq 0$ such that

$$
\operatorname{Ker}\left(B \rightarrow \Gamma\left(X, f_{*}\left(\mathcal{O}_{X^{\prime}} / I^{n+m+c} \mathcal{O}_{X^{\prime}}\right)\right)\right.
$$

is contained in $I^{n+m} B$. On the other hand, as $R \rightarrow B$ is finite and an isomorphism after inverting any element of $I$ we see that $I^{n+m} B \subset \operatorname{Im}\left(I^{n} \rightarrow B\right)$ for $m$ large enough (can be chosen independent of $n$ ). This finishes the proof as $A \subset B$.
0AGL Remark 64.5.5. The meaning of Lemma 64.5 .4 is the the system $X_{1} \rightarrow X_{2} \rightarrow$ $X_{3} \rightarrow \ldots$ is essentially constant with value $\bar{X}$. See Categories, Definition 4.22.1.

## Groupoids in Algebraic Spaces

### 65.1. Introduction

0438 This chapter is devoted to generalities concerning groupoids in algebraic spaces. We recommend reading the beautiful paper KM97] by Keel and Mori.

A lot of what we say here is a repeat of what we said in the chapter on groupoid schemes, see Groupoids, Section 38.1. The discussion of quotient stacks is new here.

### 65.2. Conventions

0439 The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.
We continue our convention to label projection maps starting with index 0 , so we have $\mathrm{pr}_{0}: X \times_{S} Y \rightarrow X$ and $\mathrm{pr}_{1}: X \times_{S} Y \rightarrow Y$.

### 65.3. Notation

043A Let $S$ be a scheme; this will be our base scheme and all algebraic spaces will be over $S$. Let $B$ be an algebraic space over $S$; this will be our base algebraic space, and often other algebraic spaces, and schemes will be over $B$. If we say that $X$ is an algebraic space over $B$, then we mean that $X$ is an algebraic space over $S$ which comes equipped with structure morphism $X \rightarrow B$. Moreover, we try to reserve the letter $T$ to denote a "test" scheme over $B$. In other words $T$ is a scheme which comes equipped with a structure morphism $T \rightarrow B$. In this situation we denote $X(T)$ for the set of $T$-valued points of $X$ over $B$. In a formula:

$$
X(T)=\operatorname{Mor}_{B}(T, X)
$$

Similarly, given a second algebraic space $Y$ over $B$ we set

$$
X(Y)=\operatorname{Mor}_{B}(Y, X)
$$

Suppose we are given algebraic spaces $X, Y$ over $B$ as above and a morphism $f: X \rightarrow Y$ over $B$. For any scheme $T$ over $B$ we get an induced map of sets

$$
f: X(T) \longrightarrow Y(T)
$$

which is functorial in the scheme $T$ over $B$. As $f$ is a map of sheaves on $(S c h / S)_{f p p f}$ over the sheaf $B$ it is clear that $f$ determines and is determined by this rule. More
generally, we use the same notation for maps between fibre products. For example, if $X, Y, Z$ are algebraic spaces over $B$, and if $m: X \times_{B} Y \rightarrow Z \times_{B} Z$ is a morphism of algebraic spaces over $B$, then we think of $m$ as corresponding to a collection of maps between $T$-valued points

$$
X(T) \times Y(T) \longrightarrow Z(T) \times Z(T)
$$

And so on and so forth.
Finally, given two maps $f, g: X \rightarrow Y$ of algebraic spaces over $B$, if the induced maps $f, g: X(T) \rightarrow Y(T)$ are equal for every scheme $T$ over $B$, then $f=g$, and hence also $f, g: X(Z) \rightarrow Y(Z)$ are equal for every third algebraic space $Z$ over $B$. Hence, for example, to check the axioms for an group algebraic space $G$ over $B$, it suffices to check commutativity of diagram on $T$-valued points where $T$ is a scheme over $B$ as we do in Definition 65.5.1 below.

### 65.4. Equivalence relations

043B Please refer to Groupoids, Section 38.3 for notation.
043C Definition 65.4.1. Let $B \rightarrow S$ as in Section 65.3. Let $U$ be an algebraic space over $B$.
(1) A pre-relation on $U$ over $B$ is any morphism $j: R \rightarrow U \times{ }_{B} U$ of algebraic spaces over $B$. In this case we set $t=\operatorname{pr}_{0} \circ j$ and $s=\operatorname{pr}_{1} \circ j$, so that $j=(t, s)$.
(2) A relation on $U$ over $B$ is a monomorphism $j: R \rightarrow U \times_{B} U$ of algebraic spaces over $B$.
(3) A pre-equivalence relation is a pre-relation $j: R \rightarrow U \times_{B} U$ such that the image of $j: R(T) \rightarrow U(T) \times U(T)$ is an equivalence relation for all schemes $T$ over $B$.
(4) We say a morphism $R \rightarrow U \times{ }_{B} U$ of algebraic spaces over $B$ is an equivalence relation on $U$ over $B$ if and only if for every $T$ over $B$ the $T$-valued points of $R$ define an equivalence relation on the set of $T$-valued points of $U$.

In other words, an equivalence relation is a pre-equivalence relation such that $j$ is a relation.
043D Lemma 65.4.2. Let $B \rightarrow S$ as in Section 65.3. Let $U$ be an algebraic space over B. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation. Let $g: U^{\prime} \rightarrow U$ be a morphism of algebraic spaces over $B$. Finally, set

$$
R^{\prime}=\left(U^{\prime} \times_{B} U^{\prime}\right) \times_{U \times_{B} U} R \xrightarrow{j^{\prime}} U^{\prime} \times_{B} U^{\prime}
$$

Then $j^{\prime}$ is a pre-relation on $U^{\prime}$ over $B$. If $j$ is a relation, then $j^{\prime}$ is a relation. If $j$ is a pre-equivalence relation, then $j^{\prime}$ is a pre-equivalence relation. If $j$ is an equivalence relation, then $j^{\prime}$ is an equivalence relation.
Proof. Omitted.
043E Definition 65.4.3. Let $B \rightarrow S$ as in Section 65.3. Let $U$ be an algebraic space over $B$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation. Let $g: U^{\prime} \rightarrow U$ be a morphism of algebraic spaces over $B$. The pre-relation $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times_{B} U^{\prime}$ is called the restriction, or pullback of the pre-relation $j$ to $U^{\prime}$. In this situation we sometimes write $R^{\prime}=\left.R\right|_{U^{\prime}}$.

043F Lemma 65.4.4. Let $B \rightarrow S$ as in Section 65.3. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation of algebraic spaces over $B$. Consider the relation on $|U|$ defined by the rule

$$
x \sim y \Leftrightarrow \exists r \in|R|: t(r)=x, s(r)=y .
$$

If $j$ is a pre-equivalence relation then this is an equivalence relation.
Proof. Suppose that $x \sim y$ and $y \sim z$. Pick $r \in|R|$ with $t(r)=x, s(r)=y$ and pick $r^{\prime} \in|R|$ with $t\left(r^{\prime}\right)=y, s\left(r^{\prime}\right)=z$. We may pick a field $K$ such that $r$ and $r^{\prime}$ can be represented by morphisms $r, r^{\prime}: \operatorname{Spec}(K) \rightarrow R$ with $s \circ r=t \circ r^{\prime}$. Denote $x=t \circ r, y=s \circ r=t \circ r^{\prime}$, and $z=s \circ r^{\prime}$, so $x, y, z: \operatorname{Spec}(K) \rightarrow U$. By construction $(x, y) \in j(R(K))$ and $(y, z) \in j(R(K))$. Since $j$ is a pre-equivalence relation we see that also $(x, z) \in j(R(K))$. This clearly implies that $x \sim z$.

The proof that $\sim$ is reflexive and symmetric is omitted.

### 65.5. Group algebraic spaces

043G Please refer to Groupoids, Section 38.4 for notation.
043H Definition 65.5.1. Let $B \rightarrow S$ as in Section 65.3.
(1) A group algebraic space over $B$ is a pair $(G, m)$, where $G$ is an algebraic space over $B$ and $m: G \times_{B} G \rightarrow G$ is a morphism of algebraic spaces over $B$ with the following property: For every scheme $T$ over $B$ the pair $(G(T), m)$ is a group.
(2) A morphism $\psi:(G, m) \rightarrow\left(G^{\prime}, m^{\prime}\right)$ of group algebraic spaces over $B$ is a morphism $\psi: G \rightarrow G^{\prime}$ of algebraic spaces over $B$ such that for every $T / B$ the induced map $\psi: G(T) \rightarrow G^{\prime}(T)$ is a homomorphism of groups.

Let $(G, m)$ be a group algebraic space over the algebraic space $B$. By the discussion in Groupoids, Section 38.4 we obtain morphisms of algebraic spaces over $B$ (identity) $e: B \rightarrow G$ and (inverse) $i: G \rightarrow G$ such that for every $T$ the quadruple $(G(T), m, e, i)$ satisfies the axioms of a group.

Let $(G, m),\left(G^{\prime}, m^{\prime}\right)$ be group algebraic spaces over $B$. Let $f: G \rightarrow G^{\prime}$ be a morphism of algebraic spaces over $B$. It follows from the definition that $f$ is a morphism of group algebraic spaces over $B$ if and only if the following diagram is commutative:

043I Lemma 65.5.2. Let $B \rightarrow S$ as in Section 65.3. Let $(G, m)$ be a group algebraic space over $B$. Let $B^{\prime} \rightarrow B$ be a morphism of algebraic spaces. The pullback $\left(G_{B^{\prime}}, m_{B^{\prime}}\right)$ is a group algebraic space over $B^{\prime}$.
Proof. Omitted.

### 65.6. Properties of group algebraic spaces

06P5 In this section we collect some simple properties of group algebraic spaces which hold over any base.

06P6 Lemma 65.6.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. Then $G \rightarrow B$ is separated (resp. quasi-separated, resp. locally separated) if and only if the identity morphism $e: B \rightarrow G$ is a closed immersion (resp. quasi-compact, resp. an immersion).
Proof. We recall that by Morphisms of Spaces, Lemma 54.4.7 we have that $e$ is a closed immersion (resp. quasi-compact, resp. an immersion) if $G \rightarrow B$ is separated (resp. quasi-separated, resp. locally separated). For the converse, consider the diagram

It is an exercise in the functorial point of view in algebraic geometry to show that this diagram is cartesian. In other words, we see that $\Delta_{G / B}$ is a base change of $e$. Hence if $e$ is a closed immersion (resp. quasi-compact, resp. an immersion) so is $\Delta_{G / B}$, see Spaces, Lemma 52.12.3 (resp. Morphisms of Spaces, Lemma 54.8.3. resp. Spaces, Lemma 52.12.3.

### 65.7. Examples of group algebraic spaces

06 P 7 If $G \rightarrow S$ is a group scheme over the base scheme $S$, then the base change $G_{B}$ to any algebraic space $B$ over $S$ is an group algebraic space over $B$ by Lemma 65.5.2. We will frequently use this in the examples below.

043J Example 65.7.1 (Multiplicative group algebraic space). Let $B \rightarrow S$ as in Section 65.3 Consider the functor which associates to any scheme $T$ over $B$ the group $\Gamma\left(T, \mathcal{O}_{T}^{*}\right)$ of units in the global sections of the structure sheaf. This is representable by the group algebraic space

$$
\mathbf{G}_{m, B}=B \times_{S} \mathbf{G}_{m, S}
$$

over $B$. Here $\mathbf{G}_{m, S}$ is the multiplicative group scheme over $S$, see Groupoids, Example 38.5.1.
043K Example 65.7.2 (Roots of unity as a group algebraic space). Let $B \rightarrow S$ as in Section 65.3. Let $n \in \mathbf{N}$. Consider the functor which associates to any scheme $T$ over $B$ the subgroup of $\Gamma\left(T, \mathcal{O}_{T}^{*}\right)$ consisting of $n$th roots of unity. This is representable by the group algebraic space

$$
\mu_{n, B}=B \times_{S} \mu_{n, S}
$$

over $B$. Here $\mu_{n, S}$ is the group scheme of $n$th roots of unity over $S$, see Groupoids, Example 38.5.2.

043L Example 65.7.3 (Additive group algebraic space). Let $B \rightarrow S$ as in Section 65.3. Consider the functor which associates to any scheme $T$ over $B$ the group $\Gamma\left(T, \mathcal{O}_{T}\right)$ of global sections of the structure sheaf. This is representable by the group algebraic space

$$
\mathbf{G}_{a, B}=B \times_{S} \mathbf{G}_{a, S}
$$

over $B$. Here $\mathbf{G}_{a, S}$ is the additive group scheme over $S$, see Groupoids, Example 38.5.3.

043M Example 65.7.4 (General linear group algebraic space). Let $B \rightarrow S$ as in Section 65.3 Let $n \geq 1$. Consider the functor which associates to any scheme $T$ over $B$ the group

$$
\operatorname{GL}_{n}\left(\Gamma\left(T, \mathcal{O}_{T}\right)\right)
$$

of invertible $n \times n$ matrices over the global sections of the structure sheaf. This is representable by the group algebraic space

$$
\mathrm{GL}_{n, B}=B \times_{S} \mathrm{GL}_{n, S}
$$

over $B$. Here $\mathbf{G}_{m, S}$ is the general linear group scheme over $S$, see Groupoids, Example 38.5.4.

043N Example 65.7.5. Let $B \rightarrow S$ as in Section 65.3. Let $n \geq 1$. The determinant defines a morphisms of group algebraic spaces

$$
\operatorname{det}: \mathrm{GL}_{n, B} \longrightarrow \mathbf{G}_{m, B}
$$

over $B$. It is the base change of the determinant morphism over $S$ from Groupoids, Example 38.5.5.

0430 Example 65.7.6 (Constant group algebraic space). Let $B \rightarrow S$ as in Section 65.3 Let $G$ be an abstract group. Consider the functor which associates to any scheme $T$ over $B$ the group of locally constant maps $T \rightarrow G$ (where $T$ has the Zariski topology and $G$ the discrete topology). This is representable by the group algebraic space

$$
G_{B}=B \times_{S} G_{S}
$$

over $B$. Here $G_{S}$ is the constant group scheme introduced in Groupoids, Example 38.5.6.

### 65.8. Actions of group algebraic spaces

043P Please refer to Groupoids, Section 38.10 for notation.
043Q Definition 65.8.1. Let $B \rightarrow S$ as in Section 65.3. Let $(G, m)$ be a group algebraic space over $B$. Let $X$ be an algebraic space over $B$.
(1) An action of $G$ on the algebraic space $X / B$ is a morphism $a: G \times{ }_{B} X \rightarrow X$ over $B$ such that for every scheme $T$ over $B$ the map $a: G(T) \times X(T) \rightarrow$ $X(T)$ defines the structure of a $G(T)$-set on $X(T)$.
(2) Suppose that $X, Y$ are algebraic spaces over $B$ each endowed with an action of $G$. An equivariant or more precisely a $G$-equivariant morphism $\psi: X \rightarrow Y$ is a morphism of algebraic spaces over $B$ such that for every $T$ over $B$ the map $\psi: X(T) \rightarrow Y(T)$ is a morphism of $G(T)$-sets.

In situation (1) this means that the diagrams
043R

are commutative. In situation (2) this just means that the diagram

commutes.
06P8 Definition 65.8.2. Let $B \rightarrow S, G \rightarrow B$, and $X \rightarrow B$ as in Definition 65.8.1. Let $a: G \times{ }_{B} X \rightarrow X$ be an action of $G$ on $X / B$. We say the action is free if for every scheme $T$ over $B$ the action $a: G(T) \times X(T) \rightarrow X(T)$ is a free action of the group $G(T)$ on the set $X(T)$.
06P9 Lemma 65.8.3. Situation as in Definition 65.8.2. The action a is free if and only if

$$
G \times_{B} X \rightarrow X \times_{B} X, \quad(g, x) \mapsto(a(g, x), x)
$$

is a monomorphism of algebraic spaces.
Proof. Immediate from the definitions.

### 65.9. Principal homogeneous spaces

04 TV This section is the analogue of Groupoids, Section 38.11. We suggest reading that section first.

04TW Definition 65.9.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(G, m)$ be a group algebraic space over $B$. Let $X$ be an algebraic space over $B$, and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on $X$.
(1) We say $X$ is a pseudo $G$-torsor or that $X$ is formally principally homogeneous under $G$ if the induced morphism $G \times_{B} X \rightarrow X \times_{B} X,(g, x) \mapsto$ $(a(g, x), x)$ is an isomorphism.
(2) A pseudo $G$-torsor $X$ is called trivial if there exists an $G$-equivariant isomorphism $G \rightarrow X$ over $B$ where $G$ acts on $G$ by left multiplication.
It is clear that if $B^{\prime} \rightarrow B$ is a morphism of algebraic spaces then the pullback $X_{B^{\prime}}$ of a pseudo $G$-torsor over $B$ is a pseudo $G_{B^{\prime}}$-torsor over $B^{\prime}$.
04TX Lemma 65.9.2. In the situation of Definition 65.9.1.
(1) The algebraic space $X$ is a pseudo $G$-torsor if and only if for every scheme $T$ over $B$ the set $X(T)$ is either empty or the action of the group $G(T)$ on $X(T)$ is simply transitive.
(2) A pseudo $G$-torsor $X$ is trivial if and only if the morphism $X \rightarrow B$ has a section.
Proof. Omitted.
04TY Definition 65.9.3. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(G, m)$ be a group algebraic space over $B$. Let $X$ be a pseudo $G$-torsor over $B$.
(1) We say $X$ is a principal homogeneous space, or more precisely a principal homogeneous $G$-space over $B$ if there exists a fpqc covering ${ }^{1}\left\{B_{i} \rightarrow B\right\}_{i \in I}$ such that each $X_{B_{i}} \rightarrow B_{i}$ has a section (i.e., is a trivial pseudo $G_{B_{i}}$-torsor).

[^176](2) Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. We say $X$ is a $G$-torsor in the $\tau$ topology, or a $\tau G$-torsor, or simply a $\tau$ torsor if there exists a $\tau$ covering $\left\{B_{i} \rightarrow B\right\}_{i \in I}$ such that each $X_{B_{i}} \rightarrow B_{i}$ has a section.
(3) If $X$ is a $G$-torsor, then we say that it is quasi-isotrivial if it is a torsor for the étale topology.
(4) If $X$ is a $G$-torsor, then we say that it is locally trivial if it is a torsor for the Zariski topology.

We sometimes say "let $X$ be a $G$-principal homogeneous space over $B$ " to indicate that $X$ is an algebraic space over $B$ equipped with an action of $G$ which turns it into a principal homogeneous space over $B$. Next we show that this agrees with the notation introduced earlier when both apply.

04TZ Lemma 65.9.4. Let $S$ be a scheme. Let $(G, m)$ be a group algebraic space over $S$. Let $X$ be an algebraic space over $S$, and let $a: G \times{ }_{S} X \rightarrow X$ be an action of $G$ on $X$. Then $X$ is a G-torsor in the fppf-topology in the sense of Definition 65.9.3 if and only if $X$ is a $G$-torsor on $(S c h / S)_{\text {fppf }}$ in the sense of Cohomology on Sites, Definition 21.5.1.
Proof. Omitted.

### 65.10. Equivariant quasi-coherent sheaves

043S Please compare with Groupoids, Section 38.12 .
043T Definition 65.10.1. Let $B \rightarrow S$ as in Section 65.3. Let $(G, m)$ be a group algebraic space over $B$, and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on the algebraic space $X$ over $B$. An $G$-equivariant quasi-coherent $\mathcal{O}_{X}$-module, or simply a equivariant quasi-coherent $\mathcal{O}_{X}$-module, is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module, and $\alpha$ is a $\mathcal{O}_{G \times{ }_{B} X}$-module map

$$
\alpha: a^{*} \mathcal{F} \longrightarrow \operatorname{pr}_{1}^{*} \mathcal{F}
$$

where $\operatorname{pr}_{1}: G \times_{B} X \rightarrow X$ is the projection such that
(1) the diagram

is a commutative in the category of $\mathcal{O}_{G \times{ }_{B} G \times_{B} X^{-} \text {-modules, and }}$
(2) the pullback

$$
\left(e \times 1_{X}\right)^{*} \alpha: \mathcal{F} \longrightarrow \mathcal{F}
$$

is the identity map.
For explanation compare with the relevant diagrams of Equation 65.8.1.1.
Note that the commutativity of the first diagram guarantees that $\left(e \times 1_{X}\right)^{*} \alpha$ is an idempotent operator on $\mathcal{F}$, and hence condition (2) is just the condition that it is an isomorphism.

[^177]043 U Lemma 65.10.2. Let $B \rightarrow S$ as in Section 65.3. Let $G$ be a group algebraic space over $B$. Let $f: X \rightarrow Y$ be a $G$-equivariant morphism between algebraic spaces over $B$ endowed with $G$-actions. Then pullback $f^{*}$ given by $(\mathcal{F}, \alpha) \mapsto\left(f^{*} \mathcal{F},\left(1_{G} \times f\right)^{*} \alpha\right)$ defines a functor from the category of $G$-equivariant sheaves on $X$ to the category of quasi-coherent $G$-equivariant sheaves on $Y$.

Proof. Omitted.

### 65.11. Groupoids in algebraic spaces

043V Please refer to Groupoids, Section 38.13 for notation.
043W Definition 65.11.1. Let $B \rightarrow S$ as in Section 65.3 .
(1) A groupoid in algebraic spaces over $B$ is a quintuple $(U, R, s, t, c)$ where $U$ and $R$ are algebraic spaces over $B$, and $s, t: R \rightarrow U$ and $c: R \times_{s, U, t} R \rightarrow R$ are morphisms of algebraic spaces over $B$ with the following property: For any scheme $T$ over $B$ the quintuple

$$
(U(T), R(T), s, t, c)
$$

is a groupoid category.
(2) A morphism $f:(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoids in algebraic spaces over $B$ is given by morphisms of algebraic spaces $f: U \rightarrow U^{\prime}$ and $f$ : $R \rightarrow R^{\prime}$ over $B$ with the following property: For any scheme $T$ over $B$ the maps $f$ define a functor from the groupoid category $(U(T), R(T), s, t, c)$ to the groupoid category $\left(U^{\prime}(T), R^{\prime}(T), s^{\prime}, t^{\prime}, c^{\prime}\right)$.

Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Note that there are unique morphisms of algebraic spaces $e: U \rightarrow R$ and $i: R \rightarrow R$ over $B$ such that for every scheme $T$ over $B$ the induced map $e: U(T) \rightarrow R(T)$ is the identity, and $i$ : $R(T) \rightarrow R(T)$ is the inverse of the groupoid category. The septuple ( $U, R, s, t, c, e, i)$ satisfies commutative diagrams corresponding to each of the axioms (1), (2)(a), $(2)(\mathrm{b}),(3)(\mathrm{a})$ and $(3)(\mathrm{b})$ of Groupoids, Section 38.13 . Conversely given a septuple with this property the quintuple $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $B$. Note that $i$ is an isomorphism, and $e$ is a section of both $s$ and $t$. Moreover, given a groupoid in algebraic spaces over $B$ we denote

$$
j=(t, s): R \longrightarrow U \times_{B} U
$$

which is compatible with our conventions in Section 65.4 above. We sometimes say "let ( $U, R, s, t, c, e, i$ ) be a groupoid in algebraic spaces over $B$ " to stress the existence of identity and inverse.
043X Lemma 65.11.2. Let $B \rightarrow S$ as in Section 65.3. Given a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$ the morphism $j: R \rightarrow U \times_{B} U$ is a pre-equivalence relation.

Proof. Omitted. This is a nice exercise in the definitions.
043Y Lemma 65.11.3. Let $B \rightarrow S$ as in Section 65.3. Given an equivalence relation $j: R \rightarrow U \times{ }_{B} U$ over $B$ there is a unique way to extend it to a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$.

Proof. Omitted. This is a nice exercise in the definitions.

043Z Lemma 65.11.4. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. In the commutative diagram

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry.

0450 Lemma 65.11.5. Let $B \rightarrow S$ be as in Section 65.3. Let $(U, R, s, t, c, e, i)$ be a groupoid in algebraic spaces over $B$. The diagram

04P3 (65.11.5.1)

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

Proof. The commutativity of the diagram follows from the axioms of a groupoid. Note that, in terms of groupoids, the top left vertical arrow assigns to a pair of morphisms $(\alpha, \beta)$ with the same target, the pair of morphisms $\left(\alpha, \alpha^{-1} \circ \beta\right)$. In any groupoid this defines a bijection between Arrows $\times_{t, \mathrm{Ob}, t}$ Arrows and Arrows $\times_{s, \mathrm{Ob}, t}$ Arrows. Hence the second assertion of the lemma. The last assertion follows from Lemma 65.11.4.

### 65.12. Quasi-coherent sheaves on groupoids

0440 Please compare with Groupoids, Section 38.14 .
0441 Definition 65.12.1. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. A quasi-coherent module on $(U, R, s, t, c)$ is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{U}$-module, and $\alpha$ is a $\mathcal{O}_{R}$-module map

$$
\alpha: t^{*} \mathcal{F} \longrightarrow s^{*} \mathcal{F}
$$

such that
(1) the diagram

is a commutative in the category of $\mathcal{O}_{R \times_{s, U, t} R}$-modules, and
(2) the pullback

$$
e^{*} \alpha: \mathcal{F} \longrightarrow \mathcal{F}
$$

is the identity map.
Compare with the commutative diagrams of Lemma 65.11.4
The commutativity of the first diagram forces the operator $e^{*} \alpha$ to be idempotent. Hence the second condition can be reformulated as saying that $e^{*} \alpha$ is an isomorphism. In fact, the condition implies that $\alpha$ is an isomorphism.

077 W Lemma 65.12.2. Let $S$ be a scheme, let $(U, R, s, t, c)$ be a groupoid scheme over S. If $(\mathcal{F}, \alpha)$ is a quasi-coherent module on ( $U, R, s, t, c)$ then $\alpha$ is an isomorphism.

Proof. Pull back the commutative diagram of Definition 65.12 .1 by the morphism $(i, 1): R \rightarrow R \times_{s, U, t} R$. Then we see that $i^{*} \alpha \circ \alpha=s^{*} e^{*} \alpha$. Pulling back by the morphism ( $1, i$ ) we obtain the relation $\alpha \circ i^{*} \alpha=t^{*} e^{*} \alpha$. By the second assumption these morphisms are the identity. Hence $i^{*} \alpha$ is an inverse of $\alpha$.

0442 Lemma 65.12.3. Let $B \rightarrow S$ as in Section 65.3. Consider a morphism $f$ : $(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoid in algebraic spaces over $B$. Then pullback $f^{*}$ given by

$$
(\mathcal{F}, \alpha) \mapsto\left(f^{*} \mathcal{F}, f^{*} \alpha\right)
$$

defines a functor from the category of quasi-coherent sheaves on $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ to the category of quasi-coherent sheaves on ( $U, R, s, t, c$ ).
Proof. Omitted.
077X Lemma 65.12.4. Let $B \rightarrow S$ be as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. The category of quasi-coherent modules on ( $U, R, s, t, c$ ) has colimits.

Proof. Let $i \mapsto\left(\mathcal{F}_{i}, \alpha_{i}\right)$ be a diagram over the index category $\mathcal{I}$. We can form the colimit $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ which is a quasi-coherent sheaf on $U$, see Properties of Spaces, Lemma 53.28.7. Since colimits commute with pullback we see that $s^{*} \mathcal{F}=\operatorname{colim} s^{*} \mathcal{F}_{i}$ and similarly $t^{*} \mathcal{F}=\operatorname{colim} t^{*} \mathcal{F}_{i}$. Hence we can set $\alpha=\operatorname{colim} \alpha_{i}$. We omit the proof that $(\mathcal{F}, \alpha)$ is the colimit of the diagram in the category of quasi-coherent modules on ( $U, R, s, t, c$ ).

06 VZ Lemma 65.12.5. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over B. If s, t are flat, then the category of quasi-coherent modules on ( $U, R, s, t, c$ ) is abelian.

Proof. Let $\varphi:(\mathcal{F}, \alpha) \rightarrow(\mathcal{G}, \beta)$ be a homomorphism of quasi-coherent modules on ( $U, R, s, t, c$ ). Since $s$ is flat we see that

$$
0 \rightarrow s^{*} \operatorname{Ker}(\varphi) \rightarrow s^{*} \mathcal{F} \rightarrow s^{*} \mathcal{G} \rightarrow s^{*} \operatorname{Coker}(\varphi) \rightarrow 0
$$

is exact and similarly for pullback by $t$. Hence $\alpha$ and $\beta$ induce isomorphisms $\kappa$ : $t^{*} \operatorname{Ker}(\varphi) \rightarrow s^{*} \operatorname{Ker}(\varphi)$ and $\lambda: t^{*} \operatorname{Coker}(\varphi) \rightarrow s^{*} \operatorname{Coker}(\varphi)$ which satisfy the cocycle condition. Then it is straightforward to verify that $(\operatorname{Ker}(\varphi), \kappa)$ and $(\operatorname{Coker}(\varphi), \lambda)$ are a kernel and cokernel in the category of quasi-coherent modules on $(U, R, s, t, c)$. Moreover, the condition $\operatorname{Coim}(\varphi)=\operatorname{Im}(\varphi)$ follows because it holds over $U$.

### 65.13. Crystals in quasi-coherent sheaves

077 Y Let $(I, \Phi, j)$ be a pair consisting of a set $I$ and a pre-relation $j: \Phi \rightarrow I \times I$. Assume given for every $i \in I$ a scheme $X_{i}$ and for every $\phi \in \Phi$ a morphisms of schemes $f_{\phi}: X_{i^{\prime}} \rightarrow X_{i}$ where $j(\phi)=\left(i, i^{\prime}\right)$. Set $X=\left(\left\{X_{i}\right\}_{i \in I},\left\{f_{\phi}\right\}_{\phi \in \Phi}\right)$. Define a crystal in quasi-coherent modules on $X$ as a rule which associates to every $i \in \operatorname{Ob}(\mathcal{I})$ a quasicoherent sheaf $\mathcal{F}_{i}$ on $X_{i}$ and for every $\phi \in \Phi$ with $j(\phi)=\left(i, i^{\prime}\right)$ an isomorphism

$$
\alpha_{\phi}: f_{\phi}^{*} \mathcal{F}_{i} \longrightarrow \mathcal{F}_{i^{\prime}}
$$

of quasi-coherent sheaves on $X_{i^{\prime}}$. These crystals in quasi-coherent modules form an additive category $C Q C(X))^{2}$. This category has colimits (proof is the same as the proof of Lemma 65.12.4. If all the morphisms $f_{\phi}$ are flat, then $C Q C(X)$ is abelian (proof is the same as the proof of Lemma 65.12.5). Let $\kappa$ be a cardinal. We say that a crystal in quasi-coherent modules $\mathcal{F}$ on $X$ is $\kappa$-generated if each $\mathcal{F}_{i}$ is $\kappa$-generated (see Properties, Definition 27.23.1).

077 Z Lemma 65.13.1. In the situation above, if all the morphisms $f_{\phi}$ are flat, then there exists a cardinal $\kappa$ such that every object $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$ of $C Q C(X)$ is the directed colimit of its $\kappa$-generated submodules.

Proof. In the lemma and in this proof a submodule of $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$ means the data of a quasi-coherent submodule $\mathcal{G}_{i} \subset \mathcal{F}_{i}$ for all $i$ such that $\alpha_{\phi}\left(f_{\phi}^{*} \mathcal{G}_{i}\right)=\mathcal{G}_{i^{\prime}}$ as subsheaves of $\mathcal{F}_{i^{\prime}}$ for all $\phi \in \Phi$. This makes sense because since $f_{\phi}$ is flat the pullback $f_{\phi}^{*}$ is exact, i.e., preserves subsheaves. The proof will be a variant to the proof of Properties, Lemma 27.23 .3 . We urge the reader to read that proof first.
We claim that it suffices to prove the lemma in case all the schemes $X_{i}$ are affine. To see this let

$$
J=\coprod_{i \in I}\left\{U \subset X_{i} \text { affine open }\right\}
$$

and let

$$
\begin{aligned}
\Psi= & \coprod_{\phi \in \Phi}\left\{(U, V) \mid U \subset X_{i}, V \subset X_{i^{\prime}} \text { affine open with } f_{\phi}(U) \subset V\right\} \\
& \amalg \coprod_{i \in I}\left\{\left(U, U^{\prime}\right) \mid U, U^{\prime} \subset X_{i} \text { affine open with } U \subset U^{\prime}\right\}
\end{aligned}
$$

endowed with the obvious map $\Psi \rightarrow J \times J$. Then our $(\mathcal{F}, \alpha)$ induces a crystal in quasi-coherent sheaves $\left(\left\{\mathcal{H}_{j}\right\}_{j \in J},\left\{\beta_{\psi}\right\}_{\psi \in \Psi}\right)$ on $Y=(J, \Psi)$ by setting $\mathcal{H}_{(i, U)}=\left.\mathcal{F}_{i}\right|_{U}$

[^178]for $(i, U) \in J$ and setting $\beta_{\psi}$ for $\psi \in \Psi$ equal to the restriction of $\alpha_{\phi}$ to $U$ if $\psi=(\phi, U, V)$ and equal to id $:\left.\left.\left(\left.\mathcal{F}_{i}\right|_{U^{\prime}}\right)\right|_{U} \rightarrow \mathcal{F}_{i}\right|_{U}$ when $\psi=\left(i, U, U^{\prime}\right)$. Moreover, submodules of $\left(\left\{\mathcal{H}_{j}\right\}_{j \in J},\left\{\beta_{\psi}\right\}_{\psi \in \Psi}\right)$ correspond 1-to-1 with submodules of $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$. We omit the proof (hint: use Sheaves, Section 6.30). Moreover, it is clear that if $\kappa$ works for $Y$, then the same $\kappa$ works for $X$ (by the definition of $\kappa$-generated modules). Hence it suffices to proof the lemma for crystals in quasicoherent sheaves on $Y$.

Assume that all the schemes $X_{i}$ are affine. Let $\kappa$ be an infinite cardinal larger than the cardinality of $I$ or $\Phi$. Let $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$ be an object of $C Q C(X)$. For each $i$ write $X_{i}=\operatorname{Spec}\left(A_{i}\right)$ and $M_{i}=\Gamma\left(X_{i}, \mathcal{F}_{i}\right)$. For every $\phi \in \Phi$ with $j(\phi)=\left(i, i^{\prime}\right)$ the map $\alpha_{\phi}$ translates into an $A_{i^{\prime}}$-module isomorphism

$$
\alpha_{\phi}: M_{i} \otimes_{A_{i}} A_{i^{\prime}} \longrightarrow M_{i^{\prime}}
$$

Using the axiom of choice choose a rule

$$
(\phi, m) \longmapsto S\left(\phi, m^{\prime}\right)
$$

where the source is the collection of pairs $\left(\phi, m^{\prime}\right)$ such that $\phi \in \Phi$ with $j(\phi)=\left(i, i^{\prime}\right)$ and $m^{\prime} \in M_{i^{\prime}}$ and where the output is a finite subset $S\left(\phi, m^{\prime}\right) \subset M_{i}$ so that

$$
m^{\prime}=\alpha_{\phi}\left(\sum_{m \in S\left(\phi, m^{\prime}\right)} m \otimes a_{m}^{\prime}\right)
$$

for some $a_{m}^{\prime} \in A_{i^{\prime}}$.
Having made these choices we claim that any section of any $\mathcal{F}_{i}$ over any $X_{i}$ is in a $\kappa$-generated submodule. To see this suppose that we are given a collection $\mathcal{S}=\left\{S_{i}\right\}_{i \in I}$ of subsets $S_{i} \subset M_{i}$ each with cardinality at most $\kappa$. Then we define a new collection $\mathcal{S}^{\prime}=\left\{S_{i}^{\prime}\right\}_{i \in I}$ with

$$
S_{i}^{\prime}=S_{i} \cup \bigcup_{\left(\phi, m^{\prime}\right), j(\phi)=\left(i, i^{\prime}\right), m^{\prime} \in S_{i^{\prime}}} S\left(\phi, m^{\prime}\right)
$$

Note that each $S_{i}^{\prime}$ still has cardinality at most $\kappa$. Set $\mathcal{S}^{(0)}=\mathcal{S}, \mathcal{S}^{(1)}=\mathcal{S}^{\prime}$ and by induction $\mathcal{S}^{(n+1)}=\left(\mathcal{S}^{(n)}\right)^{\prime}$. Then set $S_{i}^{(\infty)}=\bigcup_{n \geq 0} S_{i}^{(n)}$ and $\mathcal{S}^{(\infty)}=\left\{S_{i}^{(\infty)}\right\}_{i \in I}$. By construction, for every $\phi \in \Phi$ with $j(\phi)=\left(i, i^{\prime}\right)$ and every $m^{\prime} \in S_{i^{\prime}}^{(\infty)}$ we can write $m^{\prime}$ as a finite linear combination of images $\alpha_{\phi}(m \otimes 1)$ with $m \in S_{i}^{(\infty)}$. Thus we see that setting $N_{i}$ equal to the $A_{i}$-submodule of $M_{i}$ generated by $S_{i}^{(\infty)}$ the corresponding quasi-coherent submodules $\widetilde{N}_{i} \subset \mathcal{F}_{i}$ form a $\kappa$-generated submodule. This finishes the proof.

0780 Lemma 65.13.2. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. If $s, t$ are flat, then there exists a set $T$ and a family of objects $\left(\mathcal{F}_{t}, \alpha_{t}\right)_{t \in T}$ of $Q \operatorname{Coh}(U, R, s, t, c)$ such that every object $(\mathcal{F}, \alpha)$ is the directed colimit of its submodules isomorphic to one of the objects $\left(\mathcal{F}_{t}, \alpha_{t}\right)$.
Proof. This lemma is a generalization of Groupoids, Lemma 38.15 .6 which deals with the case of a groupoid in schemes. We can't quite use the same argument, so we use the material on "crystals of quasi-coherent sheaves" we developed above.
Choose a scheme $W$ and a surjective étale morphism $W \rightarrow U$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow W \times_{U, s} R$. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow R \times_{t, U} W$. Consider the collection of schemes

$$
I=\left\{W, W \times_{U} W, V, V^{\prime}, V \times_{R} V^{\prime}\right\}
$$

and the set of morphisms of schemes

$$
\Phi=\left\{\operatorname{pr}_{i}: W \times_{U} W \rightarrow W, V \rightarrow W, V^{\prime} \rightarrow W, V \times_{R} V^{\prime} \rightarrow V, V \times_{R} V^{\prime} \rightarrow V^{\prime}\right\}
$$

Set $X=(I, \Phi)$. Recall that we have defined a category $C Q C(X)$ of crystals of quasi-coherent sheaves on $X$. There is a functor

$$
Q \operatorname{Coh}(U, R, s, t, c) \longrightarrow C Q C(X)
$$

which assigns to $(\mathcal{F}, \alpha)$ the sheaf $\left.\mathcal{F}\right|_{W}$ on $W$, the sheaf $\left.\mathcal{F}\right|_{W \times_{U} W}$ on $W \times_{U} W$, the pullback of $\mathcal{F}$ via $V \rightarrow W \times_{U, s} R \rightarrow W \rightarrow U$ on $V$, the pullback of $\mathcal{F}$ via $V^{\prime} \rightarrow R \times_{t, U} W \rightarrow W \rightarrow U$ on $V^{\prime}$, and finally the pullback of $\mathcal{F}$ via $V \times_{R} V^{\prime} \rightarrow$ $V \rightarrow W \times_{U, s} R \rightarrow W \rightarrow U$ on $V \times_{R} V^{\prime}$. As comparison maps $\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}$ we use the obvious ones (coming from associativity of pullbacks) except for the map $\phi=\operatorname{pr}_{V^{\prime}}: V \times_{R} V^{\prime} \rightarrow V^{\prime}$ we use the pullback of $\alpha: t^{*} \mathcal{F} \rightarrow s^{*} \mathcal{F}$ to $V \times_{R} V^{\prime}$. This makes sense because of the following commutative diagram

The functor displayed above isn't an equivalence of categories. However, since $W \rightarrow$ $U$ is surjective étale it is faithfu $\left.\right|^{3}$. Since all the morphisms in the diagram above are flat we see that it is an exact functor of abelian categories. Moreover, we claim that given $(\mathcal{F}, \alpha)$ with image $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$ there is a 1-to-1 correspondence between quasi-coherent submodules of $(\mathcal{F}, \alpha)$ and $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$. Namely, given a submodule of $\left(\left\{\mathcal{F}_{i}\right\}_{i \in I},\left\{\alpha_{\phi}\right\}_{\phi \in \Phi}\right)$ compatibility of the submodule over $W$ with the projection maps $W \times_{U} W \rightarrow W$ will guarantee the submodule comes from a quasi-coherent submodule of $\mathcal{F}$ (by Properties of Spaces, Proposition 53.31.1) and compatibility with $\alpha_{\mathrm{pr}_{V^{\prime}}}$ will insure this subsheaf is compatible with $\alpha$ (details omitted).
Choose a cardinal $\kappa$ as in Lemma 65.13.1 for the system $X=(I, \Phi)$. It is clear from Properties, Lemma 27.23 .2 that there is a set of isomorphism classes of $\kappa$-generated crystals in quasi-coherent sheaves on $X$. Hence the result is clear.

### 65.14. Groupoids and group spaces

0443 Please compare with Groupoids, Section 38.16 .

[^179]0444 Lemma 65.14.1. Let $B \rightarrow S$ as in Section 65.3. Let $(G, m)$ be a group algebraic space over $B$ with identity $e_{G}$ and inverse $i_{G}$. Let $X$ be an algebraic space over $B$ and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on $X$ over $B$. Then we get a groupoid in algebraic spaces $(U, R, s, t, c, e, i)$ over $B$ in the following manner:
(1) We set $U=X$, and $R=G \times_{B} X$.
(2) We set $s: R \rightarrow U$ equal to $(g, x) \mapsto x$.
(3) We set $t: R \rightarrow U$ equal to $(g, x) \mapsto a(g, x)$.
(4) We set $c: R \times_{s, U, t} R \rightarrow R$ equal to $\left((g, x),\left(g^{\prime}, x^{\prime}\right)\right) \mapsto\left(m\left(g, g^{\prime}\right), x^{\prime}\right)$.
(5) We set $e: U \rightarrow R$ equal to $x \mapsto\left(e_{G}(x), x\right)$.
(6) We set $i: R \rightarrow R$ equal to $(g, x) \mapsto\left(i_{G}(g), a(g, x)\right)$.

Proof. Omitted. Hint: It is enough to show that this works on the set level. For this use the description above the lemma describing $g$ as an arrow from $v$ to $a(g, v)$.

0445 Lemma 65.14.2. Let $B \rightarrow S$ as in Section 65.3. Let $(G, m)$ be a group algebraic space over $B$. Let $X$ be an algebraic space over $B$ and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on $X$ over $B$. Let $(U, R, s, t, c)$ be the groupoid in algebraic spaces constructed in Lemma 65.14.1. The rule $(\mathcal{F}, \alpha) \mapsto(\mathcal{F}, \alpha)$ defines an equivalence of categories between $G$-equivariant $\mathcal{O}_{X}$-modules and the category of quasi-coherent modules on $(U, R, s, t, c)$.

Proof. The assertion makes sense because $t=a$ and $s=\operatorname{pr}_{1}$ as morphisms $R=$ $G \times_{B} X \rightarrow X$, see Definitions 65.10.1 and 65.12.1. Using the translation in Lemma 65.14.1 the commutativity requirements of the two definitions match up exactly.

### 65.15. The stabilizer group algebraic space

0446 Please compare with Groupoids, Section 38.17. Given a groupoid in algebraic spaces we get a group algebraic space as follows.

0447 Lemma 65.15.1. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. The algebraic space $G$ defined by the cartesian square

is a group algebraic space over $U$ with composition law $m$ induced by the composition law c.

Proof. This is true because in a groupoid category the set of self maps of any object forms a group.

Since $\Delta$ is a monomorphism we see that $G=j^{-1}\left(\Delta_{U / B}\right)$ is a subsheaf of $R$. Thinking of it in this way, the structure morphism $G=j^{-1}\left(\Delta_{U / B}\right) \rightarrow U$ is induced by either $s$ or $t$ (it is the same), and $m$ is induced by $c$.
0448 Definition 65.15.2. Let $B \rightarrow S$ as in Section 65.3 . Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. The group algebraic space $j^{-1}\left(\Delta_{U / B}\right) \rightarrow U$ is called the stabilizer of the groupoid in algebraic spaces $(U, R, s, t, c)$.

In the literature the stabilizer group algebraic space is often denoted $S$ (because the word stabilizer starts with an "s" presumably); we cannot do this since we have already used $S$ for the base scheme.

0449 Lemma 65.15.3. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$, and let $G / U$ be its stabilizer. Denote $R_{t} / U$ the algebraic space $R$ seen as an algebraic space over $U$ via the morphism $t: R \rightarrow U$. There is a canonical left action

$$
a: G \times_{U} R_{t} \longrightarrow R_{t}
$$

induced by the composition law $c$.
Proof. In terms of points over $T / B$ we define $a(g, r)=c(g, r)$.

### 65.16. Restricting groupoids

044A Please refer to Groupoids, Section 38.18 for notation.
044B Lemma 65.16.1. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $g: U^{\prime} \rightarrow U$ be a morphism of algebraic spaces. Consider the following diagram

where all the squares are fibre product squares. Then there is a canonical composition law $c^{\prime}: R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime} \rightarrow R^{\prime}$ such that $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is a groupoid in algebraic spaces over $B$ and such that $U^{\prime} \rightarrow U, R^{\prime} \rightarrow R$ defines a morphism $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ of groupoids in algebraic spaces over $B$. Moreover, for any scheme $T$ over $B$ the functor of groupoids

$$
\left(U^{\prime}(T), R^{\prime}(T), s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U(T), R(T), s, t, c)
$$

is the restriction (see Groupoids, Section 38.18) of $(U(T), R(T), s, t, c)$ via the map $U^{\prime}(T) \rightarrow U(T)$.

Proof. Omitted.
044C Definition 65.16.2. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $g: U^{\prime} \rightarrow U$ be a morphism of algebraic spaces over $B$. The morphism of groupoids in algebraic spaces $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ constructed in Lemma 65.16.1 is called the restriction of $(U, R, s, t, c)$ to $U^{\prime}$. We sometime use the notation $R^{\prime}=\left.R\right|_{U^{\prime}}$ in this case.

044D Lemma 65.16.3. The notions of restricting groupoids and (pre-) equivalence relations defined in Definitions 65.16.2 and 65.4.3 agree via the constructions of Lem$\operatorname{mas} 65.11 .2$ and 65.11.3.

Proof. What we are saying here is that $R^{\prime}$ of Lemma 65.16.1 is also equal to

$$
R^{\prime}=\left(U^{\prime} \times_{B} U^{\prime}\right) \times_{U \times{ }_{B} U} R \longrightarrow U^{\prime} \times_{B} U^{\prime}
$$

In fact this might have been a clearer way to state that lemma.

### 65.17. Invariant subspaces

044 E In this section we discuss briefly the notion of an invariant subspace.
044F Definition 65.17.1. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over the base $B$.
(1) We say an open subspace $W \subset U$ is $R$-invariant if $t\left(s^{-1}(W)\right) \subset W$.
(2) A locally closed subspace $Z \subset U$ is called $R$-invariant if $t^{-1}(Z)=s^{-1}(Z)$ as locally closed subspaces of $R$.
(3) A monomorphism of algebraic spaces $T \rightarrow U$ is $R$-invariant if $T \times_{U, t} R=$ $R \times_{s, U} T$ as algebraic spaces over $R$.

For an open subspace $W \subset U$ the $R$-invariance is also equivalent to requiring that $s^{-1}(W)=t^{-1}(W)$. If $W \subset U$ is $R$-invariant then the restriction of $R$ to $W$ is just $R_{W}=s^{-1}(W)=t^{-1}(W)$. Similarly, if $Z \subset U$ is an $R$-invariant locally closed subspace, then the restriction of $R$ to $Z$ is just $R_{Z}=s^{-1}(Z)=t^{-1}(Z)$.
044G Lemma 65.17.2. Let $B \rightarrow S$ as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$.
(1) If $s$ and $t$ are open, then for every open $W \subset U$ the open $s\left(t^{-1}(W)\right)$ is $R$-invariant.
(2) If $s$ and $t$ are open and quasi-compact, then $U$ has an open covering consisting of $R$-invariant quasi-compact open subspaces.
Proof. Assume $s$ and $t$ open and $W \subset U$ open. Since $s$ is open we see that $W^{\prime}=s\left(t^{-1}(W)\right)$ is an open subspace of $U$. Now it is quite easy to using the functorial point of view that this is an $R$-invariant open subset of $U$, but we are going to argue this directly by some diagrams, since we think it is instructive. Note that $t^{-1}\left(W^{\prime}\right)$ is the image of the morphism

$$
A:=t^{-1}(W) \times_{\left.s\right|_{t-1}(W)}, U, t, t \xrightarrow{\mathrm{pr}_{1}} R
$$

and that $s^{-1}\left(W^{\prime}\right)$ is the image of the morphism

$$
B:=R \times_{s, U,\left.s\right|_{t}-1(W)} t^{-1}(W) \xrightarrow{\mathrm{pr}_{0}} R .
$$

The algebraic spaces $A, B$ on the left of the arrows above are open subspaces of $R \times_{s, U, t} R$ and $R \times_{s, U, s} R$ respectively. By Lemma 65.11.4 the diagram

is commutative, and the horizontal arrow is an isomorphism. Moreover, it is clear that $\left(\operatorname{pr}_{1}, c\right)(A)=B$. Hence we conclude $s^{-1}\left(W^{\prime}\right)=t^{-1}\left(W^{\prime}\right)$, and $W^{\prime}$ is $R$ invariant. This proves (1).
Assume now that $s, t$ are both open and quasi-compact. Then, if $W \subset U$ is a quasicompact open, then also $W^{\prime}=s\left(t^{-1}(W)\right)$ is a quasi-compact open, and invariant
by the discussion above. Letting $W$ range over images of affines étale over $U$ we see (2).

### 65.18. Quotient sheaves

044 H Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation over $B$. For each scheme $S^{\prime}$ over $S$ we can take the equivalence relation $\sim_{S^{\prime}}$ generated by the image of $j\left(S^{\prime}\right): R\left(S^{\prime}\right) \rightarrow U\left(S^{\prime}\right) \times U\left(S^{\prime}\right)$. Hence we get a presheaf

044I (65.18.0.1)

$$
\begin{array}{rlc}
(\text { Sch } / S)_{f p p f}^{o p p} & \longrightarrow & \text { Sets } \\
S^{\prime} & \longmapsto U\left(S^{\prime}\right) / \sim_{S^{\prime}}
\end{array}
$$

Note that since $j$ is a morphism of algebraic spaces over $B$ and into $U \times{ }_{B} U$ there is a canonical transformation of presheaves from the presheaf (65.18.0.1) to $B$.
044J Definition 65.18.1. Let $B \rightarrow S$ and the pre-relation $j: R \rightarrow U \times_{B} U$ be as above. In this setting the quotient sheaf $U / R$ associated to $j$ is the sheafification of the presheaf 65.18 .0 .1 ) on $(S c h / S)_{f p p f}$. If $j: R \rightarrow U \times_{B} U$ comes from the action of a group algebraic space $G$ over $B$ on $U$ as in Lemma 65.14.1 then we denote the quotient sheaf $U / G$.

This means exactly that the diagram

$$
R \longrightarrow U \longrightarrow U / R
$$

is a coequalizer diagram in the category of sheaves of sets on $(S c h / S)_{f p p f}$. Again there is a canonical map of sheaves $U / R \rightarrow B$ as $j$ is a morphism of algebraic spaces over $B$ into $U \times{ }_{B} U$.

044K Remark 65.18.2. A variant of the construction above would have been to sheafify the functor

$$
\begin{array}{clc}
(\text { Spaces } / B)_{f p p f}^{\text {opp }} & \longrightarrow & \text { Sets, } \\
X & \longmapsto U(X) / \sim_{X}
\end{array}
$$

where now $\sim_{X} \subset U(X) \times U(X)$ is the equivalence relation generated by the image of $j: R(X) \rightarrow U(X) \times U(X)$. Here of course $U(X)=\operatorname{Mor}_{B}(X, U)$ and $R(X)=$ $\operatorname{Mor}_{B}(X, R)$. In fact, the result would have been the same, via the identifications of (insert future reference in Topologies of Spaces here).
044L Definition 65.18.3. In the situation of Definition 65.18.1. We say that the prerelation $j$ has a quotient representable by an algebraic space if the sheaf $U / R$ is an algebraic space. We say that the pre-relation $j$ has a representable quotient if the sheaf $U / R$ is representable by a scheme. We will say a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$ has a representable quotient (resp. quotient representable by an algebraic space if the quotient $U / R$ with $j=(t, s)$ is representable (resp. an algebraic space).
If the quotient $U / R$ is representable by $M$ (either a scheme or an algebraic space over $S$ ), then it comes equipped with a canonical structure morphism $M \rightarrow B$ as we've seen above.

The following lemma characterizes $M$ representing the quotient. It applies for example if $U \rightarrow M$ is flat, of finite presentation and surjective, and $R \cong U \times_{M} U$.
044M Lemma 65.18.4. In the situation of Definition 65.18.1. Assume there is an algebraic space $M$ over $S$, and a morphism $U \rightarrow M$ such that
(1) the morphism $U \rightarrow M$ equalizes $s, t$,
(2) the map $U \rightarrow M$ is a surjection of sheaves, and
(3) the induced map $(t, s): R \rightarrow U \times_{M} U$ is a surjection of sheaves.

In this case $M$ represents the quotient sheaf $U / R$.
Proof. Condition (1) says that $U \rightarrow M$ factors through $U / R$. Condition (2) says that $U / R \rightarrow M$ is surjective as a map of sheaves. Condition (3) says that $U / R \rightarrow M$ is injective as a map of sheaves. Hence the lemma follows.

The following lemma is wrong if we do not require $j$ to be a pre-equivalence relation (but just a pre-relation say).

046 O Lemma 65.18.5. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-equivalence relation over $B$. For a scheme $S^{\prime}$ over $S$ and $a, b \in U\left(S^{\prime}\right)$ the following are equivalent:
(1) a and b map to the same element of $(U / R)\left(S^{\prime}\right)$, and
(2) there exists an fppf covering $\left\{f_{i}: S_{i} \rightarrow S^{\prime}\right\}$ of $S^{\prime}$ and morphisms $r_{i}: S_{i} \rightarrow$ $R$ such that $a \circ f_{i}=s \circ r_{i}$ and $b \circ f_{i}=t \circ r_{i}$.
In other words, in this case the map of sheaves

$$
R \longrightarrow U \times_{U / R} U
$$

is surjective.
Proof. Omitted. Hint: The reason this works is that the presheaf 65.18.0.1 in this case is really given by $T \mapsto U(T) / j(R(T))$ as $j(R(T)) \subset U(T) \times U(T)$ is an equivalence relation, see Definition 65.4.1.

046P Lemma 65.18.6. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$ and $g: U^{\prime} \rightarrow U$ a morphism of algebraic spaces over $B$. Let $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times_{B} U^{\prime}$ be the restriction of $j$ to $U^{\prime}$. The map of quotient sheaves

$$
U^{\prime} / R^{\prime} \longrightarrow U / R
$$

is injective. If $U^{\prime} \rightarrow U$ is surjective as a map of sheaves, for example if $\left\{g: U^{\prime} \rightarrow U\right\}$ is an fppf covering (see Topologies on Spaces, Definition60.4.1), then $U^{\prime} / R^{\prime} \rightarrow U / R$ is an isomorphism of sheaves.

Proof. Suppose $\xi, \xi^{\prime} \in\left(U^{\prime} / R^{\prime}\right)\left(S^{\prime}\right)$ are sections which map to the same section of $U / R$. Then we can find an fppf covering $\mathcal{S}=\left\{S_{i} \rightarrow S^{\prime}\right\}$ of $S^{\prime}$ such that $\left.\xi\right|_{S_{i}},\left.\xi^{\prime}\right|_{S_{i}}$ are given by $a_{i}, a_{i}^{\prime} \in U^{\prime}\left(S_{i}\right)$. By Lemma 65.18 .5 and the axioms of a site we may after refining $\mathcal{T}$ assume there exist morphisms $r_{i}: S_{i} \rightarrow R$ such that $g \circ a_{i}=s \circ r_{i}$, $g \circ a_{i}^{\prime}=t \circ r_{i}$. Since by construction $R^{\prime}=R \times_{U \times_{S} U}\left(U^{\prime} \times_{S} U^{\prime}\right)$ we see that $\left(r_{i},\left(a_{i}, a_{i}^{\prime}\right)\right) \in R^{\prime}\left(S_{i}\right)$ and this shows that $a_{i}$ and $a_{i}^{\prime}$ define the same section of $U^{\prime} / R^{\prime}$ over $S_{i}$. By the sheaf condition this implies $\xi=\xi^{\prime}$.

If $U^{\prime} \rightarrow U$ is a surjective map of sheaves, then $U^{\prime} / R^{\prime} \rightarrow U / R$ is surjective also. Finally, if $\left\{g: U^{\prime} \rightarrow U\right\}$ is a fppf covering, then the map of sheaves $U^{\prime} \rightarrow U$ is surjective, see Topologies on Spaces, Lemma 60.4.4.

044N Lemma 65.18.7. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $g: U^{\prime} \rightarrow U$ a morphism
of algebraic spaces over $B$. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ to $U^{\prime}$. The map of quotient sheaves

$$
U^{\prime} / R^{\prime} \longrightarrow U / R
$$

is injective. If the composition

is a surjection of fppf sheaves then the map is bijective. This holds for example if $\left\{h: U^{\prime} \times_{g, U, t} R \rightarrow U\right\}$ is an fppf-covering, or if $U^{\prime} \rightarrow U$ is a surjection of sheaves, or if $\left\{g: U^{\prime} \rightarrow U\right\}$ is a covering in the fppf topology.

Proof. Injectivity follows on combining Lemmas 65.11.2 and 65.18.6. To see surjectivity (see Sites, Section 7.12 for a characterization of surjective maps of sheaves) we argue as follows. Suppose that $T$ is a scheme and $\sigma \in U / R(T)$. There exists a covering $\left\{T_{i} \rightarrow T\right\}$ such that $\left.\sigma\right|_{T_{i}}$ is the image of some element $f_{i} \in U\left(T_{i}\right)$. Hence we may assume that $\sigma$ if the image of $f \in U(T)$. By the assumption that $h$ is a surjection of sheaves, we can find an fppf covering $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ and morphisms $f_{i}: T_{i} \rightarrow U^{\prime} \times_{g, U, t} R$ such that $f \circ \varphi_{i}=h \circ f_{i}$. Denote $f_{i}^{\prime}=\operatorname{pr}_{0} \circ f_{i}: T_{i} \rightarrow U^{\prime}$. Then we see that $f_{i}^{\prime} \in U^{\prime}\left(T_{i}\right)$ maps to $g \circ f_{i}^{\prime} \in U\left(T_{i}\right)$ and that $g \circ f_{i}^{\prime} \sim_{T_{i}} h \circ f_{i}=f \circ \varphi_{i}$ notation as in 65.18.0.1). Namely, the element of $R\left(T_{i}\right)$ giving the relation is $\mathrm{pr}_{1} \circ f_{i}$. This means that the restriction of $\sigma$ to $T_{i}$ is in the image of $U^{\prime} / R^{\prime}\left(T_{i}\right) \rightarrow U / R\left(T_{i}\right)$ as desired.
If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 60.4.4. If $U^{\prime} \rightarrow U$ is surjective, then also $h$ is surjective as $s$ has a section (namely the neutral element $e$ of the groupoid scheme).

### 65.19. Quotient stacks

044 O In this section and the next few sections we describe a kind of generalization of Section 65.18 above and Groupoids, Section 38.20 . It is different in the following way: We are going to take quotient stacks instead of quotient sheaves.
Let us assume we have a scheme $S$, and algebraic space $B$ over $S$ and a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$. Given these data we consider the functor

044P

$$
\begin{array}{rlc}
(S c h / S)_{f p p f}^{o p p} & \longrightarrow & \text { Groupoids } \\
S^{\prime} & \longmapsto & \left(U\left(S^{\prime}\right), R\left(S^{\prime}\right), s, t, c\right)
\end{array}
$$

By Categories, Example 4.36.1 this "presheaf in groupoids" corresponds to a category fibred in groupoids over $(S c h / S)_{f p p f}$. In this chapter we will denote this

$$
[U / p R] \rightarrow(S c h / S)_{f p p f}
$$

where the subscript ${ }_{p}$ is there to distinguish from the quotient stack.
044Q Definition 65.19.1. Quotient stacks. Let $B \rightarrow S$ be as above.
(1) Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. The quotient stack

$$
p:[U / R] \longrightarrow(S c h / S)_{f p p f}
$$

of ( $U, R, s, t, c$ ) is the stackification (see Stacks, Lemma 8.9.1) of the category fibred in groupoids $[U / p R]$ over $(S c h / S)_{\text {fppf }}$ associated to 65.19.0.1).
(2) Let $(G, m)$ be a group algebraic space over $B$. Let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on an algebraic space over $B$. The quotient stack

$$
p:[X / G] \longrightarrow(S c h / S)_{f p p f}
$$

is the quotient stack associated to the groupoid in algebraic spaces $\left(X, G \times{ }_{B}\right.$ $X, s, t, c)$ over $B$ of Lemma 65.14.1.

Thus $[U / R]$ and $[X / G]$ are stacks in groupoids over $(S c h / S)_{f p p f}$. These stacks will be very important later on and hence it makes sense to give a detailed description. Recall that given an algebraic space $X$ over $S$ we use the notation $\mathcal{S}_{X} \rightarrow(S c h / S)_{f p p f}$ to denote the stack in sets associated to the sheaf $X$, see Categories, Lemma 4.37.6 and Stacks, Lemma 8.6.2.

044R Lemma 65.19.2. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ as in Definition 65.19.1 (1). There are canonical 1-morphisms $\pi: \mathcal{S}_{U} \rightarrow[U / R]$, and $[U / R] \rightarrow \mathcal{S}_{B}$ of stacks in groupoids over $(S c h / S)_{f p p f}$. The composition $\mathcal{S}_{U} \rightarrow \mathcal{S}_{B}$ is the 1-morphism associated to the structure morphism $U \rightarrow B$.

Proof. During this proof let us denote $\left[U /{ }_{p} R\right]$ the category fibred in groupoids associated to the presheaf in groupoids 65.19.0.1). By construction of the stackification there is a 1-morphism $[U / p R] \rightarrow[U / R]$. The 1-morphism $\mathcal{S}_{U} \rightarrow[U / R]$ is simply the composition $\mathcal{S}_{U} \rightarrow[U / p R] \rightarrow[U / R]$, where the first arrow associates to the scheme $S^{\prime} / S$ and morphism $x: S^{\prime} \rightarrow U$ over $S$ the object $x \in U\left(S^{\prime}\right)$ of the fibre category of $[U / p R]$ over $S^{\prime}$.
To construct the 1-morphism $[U / R] \rightarrow \mathcal{S}_{B}$ it is enough to construct the 1-morphism $[U / p R] \rightarrow \mathcal{S}_{B}$, see Stacks, Lemma 8.9.2. On objects over $S^{\prime} / S$ we just use the map

$$
U\left(S^{\prime}\right) \longrightarrow B\left(S^{\prime}\right)
$$

coming from the structure morphism $U \rightarrow B$. And clearly, if $a \in R\left(S^{\prime}\right)$ is an "arrow" with source $s(a) \in U\left(S^{\prime}\right)$ and target $t(a) \in U\left(S^{\prime}\right)$, then since $s$ and $t$ are morphisms over $B$ these both map to the same element $\bar{a}$ of $B\left(S^{\prime}\right)$. Hence we can map an arrow $a \in R\left(S^{\prime}\right)$ to the identity morphism of $\bar{a}$. (This is good because the fibre category $\left(\mathcal{S}_{B}\right)_{S^{\prime}}$ only contains identities.) We omit the verification that this rule is compatible with pullback on these split fibred categories, and hence defines a 1-morphism $\left[U /{ }_{p} R\right] \rightarrow \mathcal{S}_{B}$ as desired.

We omit the verification of the last statement.
044S Lemma 65.19.3. Assumptions and notation as in Lemma 65.19.2. There exists a canonical 2-morphism $\alpha: \pi \circ s \rightarrow \pi \circ t$ making the diagram

2-commutative.
Proof. Let $S^{\prime}$ be a scheme over $S$. Let $r: S^{\prime} \rightarrow R$ be a morphism over $S$. Then $r \in R\left(S^{\prime}\right)$ is an isomorphism between the objects $s \circ r, t \circ r \in U\left(S^{\prime}\right)$. Moreover, this construction is compatible with pullbacks. This gives a canonical 2-morphism
$\alpha_{p}: \pi_{p} \circ s \rightarrow \pi_{p} \circ t$ where $\pi_{p}: \mathcal{S}_{U} \rightarrow[U / p R]$ is as in the proof of Lemma 65.19.2. Thus even the diagram

is 2-commutative. Thus a fortiori the diagram of the lemma is 2 -commutative.
04M7 Remark 65.19.4. In future chapters we will use the ambiguous notation where instead of writing $\mathcal{S}_{X}$ for the stack in sets associated to $X$ we simply write $X$. Using this notation the diagram of Lemma 65.19.3 becomes the familiar diagram

In the following sections we will show that this diagram has many good properties. In particular we will show that it is a 2-fibre product (Section 65.21) and that it is close to being a 2-coequalizer of $s$ and $t$ (Section 65.22).

### 65.20. Functoriality of quotient stacks

04Y3 A morphism of groupoids in algebraic spaces gives an associated morphism of quotient stacks.

046Q Lemma 65.20.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $f:(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be a morphism of groupoids in algebraic spaces over $B$. Then $f$ induces a canonical 1-morphism of quotient stacks

$$
[f]:[U / R] \longrightarrow\left[U^{\prime} / R^{\prime}\right] .
$$

Proof. Denote $\left[U /{ }_{p} R\right]$ and $\left[U^{\prime} /{ }_{p} R^{\prime}\right]$ the categories fibred in groupoids over the base site $(S c h / S)_{\text {fppf }}$ associated to the functors $\sqrt[65.19 .0 .1]{ }$. It is clear that $f$ defines a 1-morphism $\left[U /{ }_{p} R\right] \rightarrow\left[U^{\prime} / p R^{\prime}\right]$ which we can compose with the stackyfication functor for $\left[U^{\prime} / R^{\prime}\right]$ to get $\left[U /{ }_{p} R\right] \rightarrow\left[U^{\prime} / R^{\prime}\right]$. Then, by the universal property of the stackyfication functor $[U / p R] \rightarrow[U / R]$, see Stacks, Lemma 8.9.2 we get $[U / R] \rightarrow\left[U^{\prime} / R^{\prime}\right]$.

Let $B \rightarrow S$ and $f:(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be as in Lemma 65.20.1. In this situation, we define a third groupoid in algebraic spaces over $B$ as follows, using the language of $T$-valued points where $T$ is a (varying) scheme over $B$ :
(1) $U^{\prime \prime}=U \times_{f, U^{\prime}, t^{\prime}} R^{\prime}$ so that a $T$-valued point is a pair $\left(u, r^{\prime}\right)$ with $f(u)=$ $t^{\prime}\left(r^{\prime}\right)$,
(2) $R^{\prime \prime}=R \times_{f \circ s, U^{\prime}, t^{\prime}} R^{\prime}$ so that a $T$-valued point is a pair $\left(r, r^{\prime}\right)$ with $f(s(r))=$ $t^{\prime}\left(r^{\prime}\right)$,
(3) $s^{\prime \prime}: R^{\prime \prime} \rightarrow U^{\prime \prime}$ is given by $s^{\prime \prime}\left(r, r^{\prime}\right)=\left(s(r), r^{\prime}\right)$,
(4) $t^{\prime \prime}: R^{\prime \prime} \rightarrow U^{\prime \prime}$ is given by $t^{\prime \prime}\left(r, r^{\prime}\right)=\left(t(r), c^{\prime}\left(f(r), r^{\prime}\right)\right)$,
(5) $c^{\prime \prime}: R^{\prime \prime} \times_{s^{\prime \prime}, U^{\prime \prime}, t^{\prime \prime}} R^{\prime \prime} \rightarrow R^{\prime \prime}$ is given by $c^{\prime \prime}\left(\left(r_{1}, r_{1}^{\prime}\right),\left(r_{2}, r_{2}^{\prime}\right)\right)=\left(c\left(r_{1}, r_{2}\right), r_{2}^{\prime}\right)$.

The formula for $c^{\prime \prime}$ makes sense as $s^{\prime \prime}\left(r_{1}, r_{1}^{\prime}\right)=t^{\prime \prime}\left(r_{2}, r_{2}^{\prime}\right)$. It is clear that $c^{\prime \prime}$ is associative. The identity $e^{\prime \prime}$ is given by $e^{\prime \prime}(u, r)=(e(u), r)$. The inverse of $\left(r, r^{\prime}\right)$ is given by $\left(i(r), c^{\prime}\left(f(r), r^{\prime}\right)\right)$. Thus we do indeed get a groupoid in algebraic spaces over $B$.

Clearly the maps $U^{\prime \prime} \rightarrow U$ and $R^{\prime \prime} \rightarrow R$ define a morphism $g:\left(U^{\prime \prime}, R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}\right) \rightarrow$ $(U, R, s, t, c)$ of groupoids in algebraic spaces over $B$. Moreover, the maps $U^{\prime \prime} \rightarrow U^{\prime}$, $\left(u, r^{\prime}\right) \mapsto s^{\prime}\left(r^{\prime}\right)$ and $R^{\prime \prime} \rightarrow U^{\prime},\left(r, r^{\prime}\right) \mapsto s^{\prime}\left(r^{\prime}\right)$ show that in fact $\left(U^{\prime \prime}, R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}\right)$ is a groupoid in algebraic spaces over $U^{\prime}$.

04Y4 Lemma 65.20.2. Notation and assumption as in Lemma 65.20.1. Let $\left(U^{\prime \prime}, R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}\right)$ be the groupoid in algebraic spaces over $B$ constructed above. There is a 2-commutative square

which identifies $\left[U^{\prime \prime} / R^{\prime \prime}\right]$ with the 2-fibre product.
Proof. The maps $[f]$ and $[g]$ come from an application of Lemma 65.20.1 and the other two maps come from Lemma 65.19.2 (and the fact that ( $U^{\prime \prime}, R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}$ ) lives over $\left.U^{\prime}\right)$. To show the 2-fibre product property, it suffices to prove the lemma for the diagram

of categories fibred in groupoids, see Stacks, Lemma 8.9.3. In other words, it suffices to show that an object of the 2 -fibre product $\mathcal{S}_{U} \times{ }_{\left[U^{\prime} / p R^{\prime}\right]}[U / p R]$ over $T$ corresponds to a $T$-valued point of $U^{\prime \prime}$ and similarly for morphisms. And of course this is exactly how we constructed $U^{\prime \prime}$ and $R^{\prime \prime}$ in the first place.

In detail, an object of $\mathcal{S}_{U} \times{ }_{\left[U^{\prime} / p R^{\prime}\right]}[U / p R]$ over $T$ is a triple $\left(u^{\prime}, u, r^{\prime}\right)$ where $u^{\prime}$ is a $T$-valued point of $U^{\prime}, u$ is a $T$-valued point of $U$, and $r^{\prime}$ is a morphism from $u^{\prime}$ to $f(u)$ in $\left[U^{\prime} / R^{\prime}\right]_{T}$, i.e., $r^{\prime}$ is a $T$-valued point of $R$ with $s^{\prime}\left(r^{\prime}\right)=u^{\prime}$ and $t^{\prime}\left(r^{\prime}\right)=f(u)$. Clearly we can forget about $u^{\prime}$ without losing information and we see that these objects are in one-to-one correspondence with $T$-valued points of $R^{\prime \prime}$.

Similarly for morphisms: Let $\left(u_{1}^{\prime}, u_{1}, r_{1}^{\prime}\right)$ and $\left(u_{2}^{\prime}, u_{2}, r_{2}^{\prime}\right)$ be two objects of the fibre product over $T$. Then a morphism from $\left(u_{2}^{\prime}, u_{2}, r_{2}^{\prime}\right)$ to $\left(u_{1}^{\prime}, u_{1}, r_{1}^{\prime}\right)$ is given by $(1, r)$ where $1: u_{1}^{\prime} \rightarrow u_{2}^{\prime}$ means simply $u_{1}^{\prime}=u_{2}^{\prime}$ (this is so because $\mathcal{S}_{U}$ is fibred in sets), and $r$ is a $T$-valued point of $R$ with $s(r)=u_{2}, t(r)=u_{1}$ and moreover $c^{\prime}\left(f(r), r_{2}^{\prime}\right)=r_{1}^{\prime}$. Hence the arrow

$$
(1, r):\left(u_{2}^{\prime}, u_{2}, r_{2}^{\prime}\right) \rightarrow\left(u_{1}^{\prime}, u_{1}, r_{1}^{\prime}\right)
$$

is completely determined by knowing the pair $\left(r, r_{2}^{\prime}\right)$. Thus the functor of arrows is represented by $R^{\prime \prime}$, and moreover the morphisms $s^{\prime \prime}, t^{\prime \prime}$, and $c^{\prime \prime}$ clearly correspond to source, target and composition in the 2-fibre product $\mathcal{S}_{U} \times_{\left[U^{\prime} / p R^{\prime}\right]}[U / p R]$.

### 65.21. The 2 -cartesian square of a quotient stack

04M8 In this section we compute the Isom-sheaves for a quotient stack and we deduce that the defining diagram of a quotient stack is a 2 -fibre product.

044V Lemma 65.21.1. Assume $B \rightarrow S$, $(U, R, s, t, c)$ and $\pi: \mathcal{S}_{U} \rightarrow[U / R]$ are as in Lemma 65.19.2. Let $S^{\prime}$ be a scheme over $S$. Let $x, y \in \operatorname{Ob}\left([U / R]_{S^{\prime}}\right)$ be objects of the quotient stack over $S^{\prime}$. If $x=\pi\left(x^{\prime}\right)$ and $y=\pi\left(y^{\prime}\right)$ for some morphisms $x^{\prime}, y^{\prime}: S^{\prime} \rightarrow U$, then

$$
\operatorname{Isom}(x, y)=S^{\prime} \times{ }_{\left(y^{\prime}, x^{\prime}\right), U \times_{S} U} R
$$

as sheaves over $S^{\prime}$.
Proof. Let $\left[U /{ }_{p} R\right]$ be the category fibred in groupoids associated to the presheaf in groupoids 65.19.0.1) as in the proof of Lemma 65.19.2. By construction the sheaf $\operatorname{Isom}(x, y)$ is the sheaf associated to the presheaf $\operatorname{Isom}\left(x^{\prime}, y^{\prime}\right)$. On the other hand, by definition of morphisms in $[U / p R]$ we have

$$
\operatorname{Isom}\left(x^{\prime}, y^{\prime}\right)=S^{\prime} \times{ }_{\left(y^{\prime}, x^{\prime}\right), U \times_{S} U} R
$$

and the right hand side is an algebraic space, therefore a sheaf.

04M9 Lemma 65.21.2. Assume $B \rightarrow S$, $(U, R, s, t, c)$, and $\pi: \mathcal{S}_{U} \rightarrow[U / R]$ are as in Lemma 65.19.2. The 2-commutative square

of Lemma 65.19.3 is a 2-fibre product of stacks in groupoids of $(S c h / S)_{f p p f}$.
Proof. According to Stacks, Lemma 8.5.6 the lemma makes sense. It also tells us that we have to show that the functor

$$
\mathcal{S}_{R} \longrightarrow \mathcal{S}_{U} \times_{[U / R]} \mathcal{S}_{U}
$$

which maps $r: T \rightarrow R$ to $(T, t(r), s(r), \alpha(r))$ is an equivalence, where the right hand side is the 2-fibre product as described in Categories, Lemma 4.31.3. This is, after spelling out the definitions, exactly the content of Lemma 65.21.1. (Alternative proof: Work out the meaning of Lemma 65.20 .2 in this situation will give you the result also.)

044W Lemma 65.21.3. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ are as in Definition 65.19.1 (1). For any scheme $T$ over $S$ and objects $x, y$ of $[U / R]$ over $T$ the sheaf Isom $(x, y)$ on $(S c h / T)_{\text {fppf }}$ has the following property: There exists a fppf covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that $\left.\operatorname{Isom}(x, y)\right|_{\left(S c h / T_{i}\right)_{f p p f}}$ is representable by an algebraic space.

Proof. Follows immediately from Lemma 65.21.1 and the fact that both $x$ and $y$ locally in the fppf topology come from objects of $\mathcal{S}_{U}$ by construction of the quotient stack.

### 65.22. The 2 -coequalizer property of a quotient stack

04 MA On a groupoid we have the composition, which leads to a cocycle condition for the canonical 2-morphism of the lemma above. To give the precise formulation we will use the notation introduced in Categories, Sections 4.27 and 4.28 .
044 Lemma 65.22.1. Assumptions and notation as in Lemmas 65.19.2 and 65.19.3. The vertical composition of

is the 2 -morphism $\alpha \star i d_{c}$. In a formula $\alpha \star i d_{c}=\left(\alpha \star i d_{p r_{0}}\right) \circ\left(\alpha \star i d_{p r_{1}}\right)$.
Proof. We make two remarks:
(1) The formula $\alpha \star \mathrm{id}_{c}=\left(\alpha \star \mathrm{id}_{\mathrm{pr}_{0}}\right) \circ\left(\alpha \star \mathrm{id}_{\mathrm{pr}_{1}}\right)$ only makes sense if you realize the equalities $\pi \circ s \circ \mathrm{pr}_{1}=\pi \circ s \circ c, \pi \circ t \circ \mathrm{pr}_{1}=\pi \circ s \circ \mathrm{pr}_{0}$, and $\pi \circ t \circ \mathrm{pr}_{0}=\pi \circ t \circ c$. Namely, the second one implies the vertical composition o makes sense, and the other two guarantee the two sides of the formula are 2 -morphisms with the same source and target.
(2) The reason the lemma holds is that composition in the category fibred in groupoids $[U / p R]$ associated to the presheaf in groupoids 65.19.0.1 comes from the composition law $c: R \times_{s, U, t} R \rightarrow R$.
We omit the proof of the lemma.
Note that, in the situation of the lemma, we actually have the equalities $s \circ \mathrm{pr}_{1}=s \circ c$, $t \circ \operatorname{pr}_{1}=s \circ \operatorname{pr}_{0}$, and $t \circ \operatorname{pr}_{0}=t \circ c$ before composing with $\pi$. Hence the formula in the lemma below makes sense in exactly the same way that the formula in the lemma above makes sense.
044 U Lemma 65.22.2. Assumptions and notation as in Lemmas 65.19.2 and 65.19.3. The 2-commutative diagram of Lemma 65.19 .3 is a 2-coequalizer in the following sense: Given
(1) a stack in groupoids $\mathcal{X}$ over $(S c h / S)_{\text {fppf }}$,
(2) a 1-morphism $f: \mathcal{S}_{U} \rightarrow \mathcal{X}$, and
(3) a 2-arrow $\beta: f \circ s \rightarrow f \circ t$
such that

$$
\beta \star i d_{c}=\left(\beta \star i d_{p r_{0}}\right) \circ\left(\beta \star i d_{p r_{1}}\right)
$$

then there exists a 1-morphism $[U / R] \rightarrow \mathcal{X}$ which makes the diagram

2-commute.

Proof. Suppose given $\mathcal{X}, f$ and $\beta$ as in the lemma. By Stacks, Lemma 8.9.2 it suffices to construct a 1-morphism $g:[U / p R] \rightarrow \mathcal{X}$. First we note that the 1-morphism $\mathcal{S}_{U} \rightarrow[U / p R]$ is bijective on objects. Hence on objects we can set $g(x)=f(x)$ for $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)=\operatorname{Ob}([U / p R])$. A morphism $\varphi: x \rightarrow y$ of $[U / p R]$ arises from a commutative diagram

Thus we can set $g(\varphi)$ equal to the composition

The vertical arrow is the result of applying the functor $f$ to the canonical morphism $y \circ h \rightarrow y$ in $\mathcal{S}_{U}$ (namely, the strongly cartesian morphism lifting $h$ with target $y$ ). Let us verify that $f$ so defined is compatible with composition, at least on fibre categories. So let $S^{\prime}$ be a scheme over $S$, and let $a: S^{\prime} \rightarrow R \times_{s, U, t} R$ be a morphism. In this situation we set $x=s \circ \mathrm{pr}_{1} \circ a=s \circ c \circ a, y=t \circ \mathrm{pr}_{1} \circ a=s \circ \mathrm{pr}_{0} \circ a$, and $z=t \circ \mathrm{pr}_{0} \circ a=t \circ \mathrm{pr}_{0} \circ c$ to get a commutative diagram

in the fibre category $\left[U /{ }_{p} R\right]_{S^{\prime}}$. Moreover, any commutative triangle in this fibre category has this form. Then we see by our definitions above that $f$ maps this to a commutative diagram if and only if the diagram

is commutative which is exactly the condition expressed by the formula in the lemma. We omit the verification that $f$ maps identities to identities and is compatible with composition for arbitrary morphisms.

### 65.23. Explicit description of quotient stacks

04 MB In order to formulate the result we need to introduce some notation. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ are as in Definition 65.19.1(1). Let $T$ be a scheme over $S$. Let
$\mathcal{T}=\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fppf covering. A $[U / R]$-descent datum relative to $\mathcal{T}$ is given by a system $\left(u_{i}, r_{i j}\right)$ where
(1) for each $i$ a morphism $u_{i}: T_{i} \rightarrow U$, and
(2) for each $i, j$ a morphism $r_{i j}: T_{i} \times_{T} T_{j} \rightarrow R$
such that
(a) as morphisms $T_{i} \times_{T} T_{j} \rightarrow U$ we have

$$
s \circ r_{i j}=u_{i} \circ \operatorname{pr}_{0} \quad \text { and } \quad t \circ r_{i j}=u_{j} \circ \mathrm{pr}_{1}
$$

(b) as morphisms $T_{i} \times_{T} T_{j} \times_{T} T_{k} \rightarrow R$ we have

$$
c \circ\left(r_{j k} \circ \operatorname{pr}_{12}, r_{i j} \circ \operatorname{pr}_{01}\right)=r_{i k} \circ \operatorname{pr}_{02}
$$

A morphism $\left(u_{i}, r_{i j}\right) \rightarrow\left(u_{i}^{\prime}, r_{i j}^{\prime}\right)$ between two $[U / R]$-descent data over the same covering $\mathcal{T}$ is a collection $\left(r_{i}: T_{i} \rightarrow R\right)$ such that
$(\alpha)$ as morphisms $T_{i} \rightarrow U$ we have

$$
u_{i}=s \circ r_{i} \quad \text { and } \quad u_{i}^{\prime}=t \circ r_{i}
$$

( $\beta$ ) as morphisms $T_{i} \times_{T} T_{j} \rightarrow R$ we have

$$
c \circ\left(r_{i j}^{\prime}, r_{i} \circ \mathrm{pr}_{0}\right)=c \circ\left(r_{j} \circ \mathrm{pr}_{1}, r_{i j}\right)
$$

There is a natural composition law on morphisms of descent data relative to a fixed covering and we obtain a category of descent data. This category is a groupoid. Finally, if $\mathcal{T}^{\prime}=\left\{T_{j}^{\prime} \rightarrow T\right\}_{j \in J}$ is a second fppf covering which refines $\mathcal{T}$ then there is a notion of pullback of descent data. This is particularly easy to describe explicitly in this case. Namely, if $\alpha: J \rightarrow I$ and $\varphi_{j}: T_{j}^{\prime} \rightarrow T_{\alpha(i)}$ is the morphism of coverings, then the pullback of the descent datum $\left(u_{i}, r_{i i^{\prime}}\right)$ is simply

$$
\left(u_{\alpha(i)} \circ \varphi_{j}, r_{\alpha(j) \alpha\left(j^{\prime}\right)} \circ \varphi_{j} \times \varphi_{j^{\prime}}\right)
$$

Pullback defined in this manner defines a functor from the category of descent data over $\mathcal{T}$ to the category of descend data over $\mathcal{T}^{\prime}$.

044X Lemma 65.23.1. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ are as in Definition 65.19.1 (1). Let $\pi: \mathcal{S}_{U} \rightarrow[U / R]$ be as in Lemma65.19.2. Let $T$ be a scheme over $S$.
(1) for every object $x$ of the fibre category $[U / R]_{T}$ there exists an fppf covering $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ such that $f_{i}^{*} x \cong \pi\left(u_{i}\right)$ for some $u_{i} \in U\left(T_{i}\right)$,
(2) the composition of the isomorphisms

$$
\begin{gathered}
\pi\left(u_{i} \circ p r_{0}\right)=p r_{0}^{*} \pi\left(u_{i}\right) \cong p r_{0}^{*} f_{i}^{*} x \cong p r_{1}^{*} f_{j}^{*} x \cong p r_{1}^{*} \pi\left(u_{j}\right)=\pi\left(u_{j} \circ p r_{1}\right) \\
\text { are of the form } \pi\left(r_{i j}\right) \text { for certain morphisms } r_{i j}: T_{i} \times_{T} T_{j} \rightarrow R
\end{gathered}
$$

(3) the system $\left(u_{i}, r_{i j}\right)$ forms a $[U / R]$-descent datum as defined above,
(4) any $[U / R]$-descent datum $\left(u_{i}, r_{i j}\right)$ arises in this manner,
(5) if $x$ corresponds to $\left(u_{i}, r_{i j}\right)$ as above, and $y \in \mathrm{Ob}\left([U / R]_{T}\right)$ corresponds to $\left(u_{i}^{\prime}, r_{i j}^{\prime}\right)$ then there is a canonical bijection

$$
\operatorname{Mor}_{[U / R]_{T}}(x, y) \longleftrightarrow\left\{\begin{array}{c}
\text { morphisms }\left(u_{i}, r_{i j}\right) \rightarrow\left(u_{i}^{\prime}, r_{i j}^{\prime}\right) \\
\text { of }[U / R] \text {-descent data }
\end{array}\right\}
$$

(6) this correspondence is compatible with refinements of fppf coverings.

Proof. Statement (1) is part of the construction of the stackyfication. Part (2) follows from Lemma 65.21.1. We omit the verification of (3). Part (4) is a translation of the fact that in a stack all descent data are effective. We omit the verifications of (5) and (6).

### 65.24. Restriction and quotient stacks

046R In this section we study what happens to the quotient stack when taking a restriction.

046S Lemma 65.24.1. Notation and assumption as in Lemma 65.20.1. The morphism of quotient stacks

$$
[f]:[U / R] \longrightarrow\left[U^{\prime} / R^{\prime}\right]
$$

is fully faithful if and only if $R$ is the restriction of $R$ via the morphism $f: U \rightarrow U^{\prime}$.
Proof. Let $x, y$ be objects of $[U / R]$ over a scheme $T / S$. Let $x^{\prime}, y^{\prime}$ be the images of $x, y$ in the category $\left[U^{\prime} /^{\prime} R\right]_{T}$. The functor $[f]$ is fully faithful if and only if the map of sheaves

$$
\operatorname{Isom}(x, y) \longrightarrow \operatorname{Isom}\left(x^{\prime}, y^{\prime}\right)
$$

is an isomorphism for every $T, x, y$. We may test this locally on $T$ (in the fppf topology). Hence, by Lemma 65.23.1 we may assume that $x, y$ come from $a, b \in$ $U(T)$. In that case we see that $x^{\prime}, y^{\prime}$ correspond to $f \circ a, f \circ b$. By Lemma 65.21.1 the displayed map of sheaves in this case becomes

$$
T \times_{(a, b), U \times_{B} U} R \longrightarrow T \times_{f \circ a, f \circ b, U^{\prime} \times_{B} U^{\prime}} R^{\prime} .
$$

This is an isomorphism if $R$ is the restriction, because in that case $R=\left(U \times_{B}\right.$ $U) \times_{U^{\prime} \times{ }_{B} U^{\prime}} R^{\prime}$, see Lemma 65.16 .3 and its proof. Conversely, if the last displayed map is an isomorphism for all $T, a, b$, then it follows that $R=\left(U \times{ }_{B} U\right) \times{ }_{U^{\prime} \times{ }_{B} U^{\prime}} R^{\prime}$, i.e., $R$ is the restriction of $R^{\prime}$.

046T Lemma 65.24.2. Notation and assumption as in Lemma 65.20.1. The morphism of quotient stacks

$$
[f]:[U / R] \longrightarrow\left[U^{\prime} / R^{\prime}\right]
$$

is an equivalence if and only if
(1) $(U, R, s, t, c)$ is the restriction of $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ via $f: U \rightarrow U^{\prime}$, and
(2) the map

is a surjection of sheaves.
Part (2) holds for example if $\left\{h: U \times_{f, U^{\prime}, t^{\prime}} R^{\prime} \rightarrow U^{\prime}\right\}$ is an fppf covering, or if $f: U \rightarrow U^{\prime}$ is a surjection of sheaves, or if $\left\{f: U \rightarrow U^{\prime}\right\}$ is an fppf covering.
Proof. We already know that part (1) is equivalent to fully faithfulness by Lemma 65.24 .1 . Hence we may assume that (1) holds and that $[f]$ is fully faithful. Our goal is to show, under these assumptions, that $[f]$ is an equivalence if and only if (2) holds. We may use Stacks, Lemma 8.4 .8 which characterizes equivalences.

Assume (2). We will use Stacks, Lemma 8.4 .8 to prove $[f]$ is an equivalence. Suppose that $T$ is a scheme and $x^{\prime} \in \operatorname{Ob}\left(\left[U^{\prime} / R^{\prime}\right]_{T}\right)$. There exists a covering $\left\{g_{i}: T_{i} \rightarrow T\right\}$ such that $g_{i}^{*} x^{\prime}$ is the image of some element $a_{i}^{\prime} \in U^{\prime}\left(T_{i}\right)$, see Lemma 65.23.1. Hence we may assume that $x^{\prime}$ is the image of $a^{\prime} \in U^{\prime}(T)$. By the assumption that $h$ is a surjection of sheaves, we can find an fppf covering $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ and morphisms $b_{i}: T_{i} \rightarrow U \times_{g, U^{\prime}, t^{\prime}} R^{\prime}$ such that $a^{\prime} \circ \varphi_{i}=h \circ b_{i}$. Denote $a_{i}=\operatorname{pr}_{0} \circ b_{i}: T_{i} \rightarrow U$. Then we see that $a_{i} \in U\left(T_{i}\right)$ maps to $f \circ a_{i} \in U^{\prime}\left(T_{i}\right)$
and that $f \circ a_{i} \cong_{T_{i}} h \circ b_{i}=a^{\prime} \circ \varphi_{i}$, where $\cong_{T_{i}}$ denotes isomorphism in the fibre category $\left[U^{\prime} / R^{\prime}\right]_{T_{i}}$. Namely, the element of $R^{\prime}\left(T_{i}\right)$ giving the isomorphism is $\mathrm{pr}_{1} \circ b_{i}$. This means that the restriction of $x$ to $T_{i}$ is in the essential image of the functor $[U / R]_{T_{i}} \rightarrow\left[U^{\prime} / R^{\prime}\right]_{T_{i}}$ as desired.

Assume $[f]$ is an equivalence. Let $\xi^{\prime} \in\left[U^{\prime} / R^{\prime}\right]_{U^{\prime}}$ denote the object corresponding to the identity morphism of $U^{\prime}$. Applying Stacks, Lemma 8.4.8 we see there exists an fppf covering $\mathcal{U}^{\prime}=\left\{g_{i}^{\prime}: U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ such that $\left(g_{i}^{\prime}\right)^{*} \xi^{\prime} \cong[f]\left(\xi_{i}\right)$ for some $\xi_{i}$ in $[U / R]_{U_{i}^{\prime}}$. After refining the covering $\mathcal{U}^{\prime}$ (using Lemma 65.23.1) we may assume $\xi_{i}$ comes from a morphism $a_{i}: U_{i}^{\prime} \rightarrow U$. The fact that $[f]\left(\xi_{i}\right) \cong\left(g_{i}^{\prime}\right)^{*} \xi^{\prime}$ means that, after possibly refining the covering $\mathcal{U}^{\prime}$ once more, there exist morphisms $r_{i}^{\prime}: U_{i}^{\prime} \rightarrow R^{\prime}$ with $t^{\prime} \circ r_{i}^{\prime}=f \circ a_{i}$ and $s^{\prime} \circ r_{i}^{\prime}=\operatorname{id}_{U^{\prime}} \circ g_{i}^{\prime}$. Picture

Thus $\left(a_{i}, r_{i}^{\prime}\right): U_{i}^{\prime} \rightarrow U \times_{g, U^{\prime}, t^{\prime}} R^{\prime}$ are morphisms such that $h \circ\left(a_{i}, r_{i}^{\prime}\right)=g_{i}^{\prime}$ and we conclude that $\left\{h: U \times_{g, U^{\prime}, t^{\prime}} R^{\prime} \rightarrow U^{\prime}\right\}$ can be refined by the fppf covering $\mathcal{U}^{\prime}$ which means that $h$ induces a surjection of sheaves, see Topologies on Spaces, Lemma 60.4.4.

If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 60.4.4. If $U^{\prime} \rightarrow U$ is surjective, then also $h$ is surjective as $s$ has a section (namely the neutral element $e$ of the groupoid in algebraic spaces).

04ZN Lemma 65.24.3. Notation and assumption as in Lemma 65.20.1. Assume that

is cartesian. Then

is a 2-fibre product square.
Proof. Applying the inverse isomorphisms $i: R \rightarrow R$ and $i^{\prime}: R^{\prime} \rightarrow R^{\prime}$ to the (first) cartesian diagram of the statement of the lemma we see that

is cartesian as well. By Lemma 65.20 .2 we have a 2 -fibre square

where $U^{\prime \prime}=U \times_{f, U^{\prime}, t^{\prime}} R^{\prime}$ and $R^{\prime \prime}=R \times_{f \circ s, U^{\prime}, t^{\prime}} R^{\prime}$. By the above we see that $(t, f): R \rightarrow U^{\prime \prime}$ is an isomorphism, and that

$$
R^{\prime \prime}=R \times_{f \circ s, U^{\prime}, t^{\prime}} R^{\prime}=R \times_{s, U} U \times_{f, U^{\prime}, t^{\prime}} R^{\prime}=R \times_{s, U, t} \times R
$$

Explicitly the isomorphism $R \times_{s, U, t} R \rightarrow R^{\prime \prime}$ is given by the rule $\left(r_{0}, r_{1}\right) \mapsto$ $\left(r_{0}, f\left(r_{1}\right)\right)$. Moreover, $s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}$ translate into the maps

$$
R \times_{s, U, t} R \rightarrow R, \quad s^{\prime \prime}\left(r_{0}, r_{1}\right)=r_{1}, \quad t^{\prime \prime}\left(r_{0}, r_{1}\right)=c\left(r_{0}, r_{1}\right)
$$

and

$$
\begin{aligned}
c^{\prime \prime}:\left(R \times_{s, U, t} R\right) \times_{s^{\prime \prime}, R, t^{\prime \prime}}\left(R \times_{s, U, t} R\right) & \longrightarrow \\
\left(\left(r_{0}, r_{1}\right),\left(r_{2}, r_{3}\right)\right) & \longmapsto\left(c\left(r_{0}, r_{2}\right), r_{3}\right) .
\end{aligned}
$$

Precomposing with the isomorphism

$$
R \times_{s, U, s} R \longrightarrow R \times_{s, U, t} R, \quad\left(r_{0}, r_{1}\right) \longmapsto\left(c\left(r_{0}, i\left(r_{1}\right)\right), r_{1}\right)
$$

we see that $t^{\prime \prime}$ and $s^{\prime \prime}$ turn into $\mathrm{pr}_{0}$ and $\mathrm{pr}_{1}$ and that $c^{\prime \prime}$ turns into $\mathrm{pr}_{02}: R \times_{s, U, s}$ $R \times_{s, U, s} R \rightarrow R \times_{s, U, s} R$. Hence we see that there is an isomorphism $\left[U^{\prime \prime} / R^{\prime \prime}\right] \cong$ $\left[R / R \times_{s, U, s} R\right]$ where as a groupoid in algebraic spaces $\left(R, R \times_{s, U, s} R, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}\right)$ is the restriction of the trivial groupoid ( $U, U$, id, id, id) via $s: R \rightarrow U$. Since $s: R \rightarrow U$ is a surjection of fppf sheaves (as it has a right inverse) the morphism

$$
\left[U^{\prime \prime} / R^{\prime \prime}\right] \cong\left[R / R \times_{s, U, s} R\right] \longrightarrow[U / U]=\mathcal{S}_{U}
$$

is an equivalence by Lemma 65.24.2. This proves the lemma.

### 65.25. Inertia and quotient stacks

06PA The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 8.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.33
06PB Lemma 65.25.1. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ as in Definition 65.19.1 (1). Let $G / U$ be the stabilizer group algebraic space of the groupoid $(U, R, s, t, c, e, i)$, see Definition 65.15.2. Set $R^{\prime}=R \times_{s, U} G$ and set
(1) $s^{\prime}: R^{\prime} \rightarrow G,(r, g) \mapsto g$,
(2) $t^{\prime}: R^{\prime} \rightarrow G,(r, g) \mapsto c(r, c(g, i(r)))$,
(3) $c^{\prime}: R^{\prime} \times_{s^{\prime}, G, t^{\prime}} R^{\prime} \rightarrow R^{\prime},\left(\left(r_{1}, g_{1}\right),\left(r_{2}, g_{2}\right) \mapsto\left(c\left(r_{1}, r_{2}\right), g_{1}\right)\right.$.

Then $\left(G, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is a groupoid in algebraic spaces over $B$ and

$$
\mathcal{I}_{[U / R]}=\left[G / R^{\prime}\right] .
$$

i.e., the associated quotient stack is the inertia stack of $[U / R]$.

Proof. By Stacks, Lemma 8.8.5 it suffices to prove that $\mathcal{I}_{[U / p R]}=\left[G / p R^{\prime}\right]$. Let $T$ be a scheme over $S$. Recall that an object of the inertia fibred category of $[U / p R]$ over $T$ is given by a pair $(x, g)$ where $x$ is an object of $[U / p R]$ over $T$ and $g$ is an automorphism of $x$ in its fibre category over $T$. In other words, $x: T \rightarrow U$ and $g: T \rightarrow R$ such that $x=s \circ g=t \circ g$. This means exactly that $g: T \rightarrow G$.

A morphism in the inertia fibred category from $(x, g) \rightarrow(y, h)$ over $T$ is given by $r: T \rightarrow R$ such that $s(r)=x, t(r)=y$ and $c(r, g)=c(h, r)$, see the commutative diagram in Categories, Lemma 4.33.1. In a formula

$$
h=c(r, c(g, i(r)))=c(c(r, g), i(r))
$$

The notation $s(r)$, etc is a short hand for $s \circ r$, etc. The composition of $r_{1}$ : $\left(x_{2}, g_{2}\right) \rightarrow\left(x_{1}, g_{1}\right)$ and $r_{2}:\left(x_{1}, g_{1}\right) \rightarrow\left(x_{2}, g_{2}\right)$ is $c\left(r_{1}, r_{2}\right):\left(x_{1}, g_{1}\right) \rightarrow\left(x_{3}, g_{3}\right)$.
Note that in the above we could have written $g$ in stead of $(x, g)$ for an object of $\mathcal{I}_{[U / p R]}$ over $T$ as $x$ is the image of $g$ under the structure morphism $G \rightarrow U$. Then the morphisms $g \rightarrow h$ in $\mathcal{I}_{[U / p R]}$ over $T$ correspond exactly to morphisms $r^{\prime}: T \rightarrow R^{\prime}$ with $s^{\prime}\left(r^{\prime}\right)=g$ and $t^{\prime}\left(r^{\prime}\right)=h$. Moreover, the composition corresponds to the rule explained in (3). Thus the lemma is proved.

06PC Lemma 65.25.2. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ as in Definition 65.19.1 (1). Let $G / U$ be the stabilizer group algebraic space of the groupoid $(U, R, s, t, c, e, i)$, see Definition 65.15.2. There is a canonical 2-cartesian diagram

of stacks in groupoids of $(S c h / S)_{f p p f}$.
Proof. By Lemma 65.24.3 it suffices to prove that the morphism $s^{\prime}: R^{\prime} \rightarrow G$ of Lemma 65.25.1 isomorphic to the base change of $s$ by the structure morphism $G \rightarrow U$. This base change property is clear from the construction of $s^{\prime}$.

### 65.26. Gerbes and quotient stacks

06PD In this section we relate quotient stacks to the discussion Stacks, Section 8.11 and especially gerbes as defined in Stacks, Definition 8.11.4 The stacks in groupoids occurring in this section are generally speaking not algebraic stacks!
06PE Lemma 65.26.1. Notation and assumption as in Lemma 65.20.1. The morphism of quotient stacks

$$
[f]:[U / R] \longrightarrow\left[U^{\prime} / R^{\prime}\right]
$$

turns $[U / R]$ into a gerbe over $\left[U^{\prime} / R^{\prime}\right]$ if $f: U \rightarrow U^{\prime}$ and $\left.R \rightarrow R^{\prime}\right|_{U}$ are surjective maps of fppf sheaves. Here $\left.R^{\prime}\right|_{U}$ is the restriction of $R^{\prime}$ to $U$ via $f: U \rightarrow U^{\prime}$.

Proof. We will verify that Stacks, Lemma 8.11 .3 properties (2) (a) and (2) (b) hold. Property (2)(a) holds because $U \rightarrow U^{\prime}$ is a surjective map of sheaves (use Lemma 65.23.1 to see that objects in $\left[U^{\prime} / R^{\prime}\right]$ locally come from $\left.U^{\prime}\right)$. To prove (2)(b) let $x, y$ be objects of $[U / R]$ over a scheme $T / S$. Let $x^{\prime}, y^{\prime}$ be the images of $x, y$ in the category $\left[U^{\prime} /{ }^{\prime} R\right]_{T}$. Condition (2)(b) requires us to check the map of sheaves

$$
\operatorname{Isom}(x, y) \longrightarrow \operatorname{Isom}\left(x^{\prime}, y^{\prime}\right)
$$

on $(S c h / T)_{f p p f}$ is surjective. To see this we may work fppf locally on $T$ and assume that come from $a, b \in U(T)$. In that case we see that $x^{\prime}, y^{\prime}$ correspond to $f \circ a, f \circ b$. By Lemma 65.21.1 the displayed map of sheaves in this case becomes

$$
T \times_{(a, b), U \times_{B} U} R \longrightarrow T \times_{f \circ a, f \circ b, U^{\prime} \times_{B} U^{\prime}} R^{\prime}=T \times\left._{(a, b), U \times_{B} U} R^{\prime}\right|_{U}
$$

Hence the assumption that $\left.R \rightarrow R^{\prime}\right|_{U}$ is a surjective map of fppf sheaves on $(S c h / S)_{f p p f}$ implies the desired surjectivity.
06PF Lemma 65.26.2. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. Endow $B$ with the trivial action of $G$. The morphism

$$
[B / G] \longrightarrow \mathcal{S}_{B}
$$

(Lemma 65.19.2) turns $[B / G]$ into a gerbe over $B$.
Proof. Immediate from Lemma 65.26 .1 as the morphisms $B \rightarrow B$ and $B \times{ }_{B} G \rightarrow B$ are surjective as morphisms of sheaves.

### 65.27. Quotient stacks and change of big site

04WW We suggest skipping this section on a first reading. Pullbacks of stacks are defined in Stacks, Section 8.12.
04WX Lemma 65.27.1. Suppose given big sites $S_{c h_{f p p f}}$ and $S_{\text {S }}^{\prime}{ }_{f p p f}^{\prime}$. Assume that $S_{\text {ch }}^{\text {fppf }}$ is contained in $S c h_{f p p f}^{\prime}$, see Topologies, Section 33.10. Let $S \in \mathrm{Ob}\left(\right.$ Sch $\left._{\text {fppf }}\right)$. Let $B, U, R \in \operatorname{Sh}\left((S c h / S)_{\text {fppf }}\right)$ be algebraic spaces, and let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $f:\left(S c h^{\prime} / S\right)_{f p p f} \rightarrow(S c h / S)_{\text {fppf }}$ the morphism of sites corresponding to the inclusion functor $u: S c h_{f p p f} \rightarrow S c h_{f p p f}^{\prime}$. Then we have a canonical equivalence

$$
\left[f^{-1} U / f^{-1} R\right] \longrightarrow f^{-1}[U / R]
$$

of stacks in groupoids over $\left(S c h^{\prime} / S\right)_{\text {fppf }}$.
Proof. Note that $f^{-1} B, f^{-1} U, f^{-1} R \in S h\left(\left(S c h^{\prime} / S\right)_{f p p f}\right)$ are algebraic spaces by Spaces, Lemma 52.15.1 and hence $\left(f^{-1} U, f^{-1} R, f^{-1} s, f^{-1} t, f^{-1} c\right)$ is a groupoid in algebraic spaces over $f^{-1} B$. Thus the statement makes sense.
The category $u_{p}[U / p R]$ is the localization of the category $u_{p p}\left[U /{ }_{p} R\right]$ at right multiplicative system $I$ of morphisms. An object of $u_{p p}\left[U /{ }_{p} R\right]$ is a triple

$$
\left(T^{\prime}, \phi: T^{\prime} \rightarrow T, x\right)
$$

where $T^{\prime} \in \mathrm{Ob}\left(\left(S c h^{\prime} / S\right)_{f p p f}\right), T \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right), \phi$ is a morphism of schemes over $S$, and $x: T \rightarrow U$ is a morphism of sheaves on $(S c h / S)_{f p p f}$. Note that the morphism of schemes $\phi: T^{\prime} \rightarrow T$ is the same thing as a morphism $\phi: T^{\prime} \rightarrow u(T)$, and since $u(T)$ represents $f^{-1} T$ it is the same thing as a morphism $T^{\prime} \rightarrow f^{-1} T$. Moreover, as $f^{-1}$ on algebraic spaces is fully faithful, see Spaces, Lemma 52.15.2, we may think of $x$ as a morphism $x: f^{-1} T \rightarrow f^{-1} U$ as well. From now on we will make such identifications without further mention. A morphism

$$
\left(a, a^{\prime}, \alpha\right):\left(T_{1}^{\prime}, \phi_{1}: T_{1}^{\prime} \rightarrow T_{1}, x_{1}\right) \longrightarrow\left(T_{2}^{\prime}, \phi_{2}: T_{2}^{\prime} \rightarrow T_{2}, x_{2}\right)
$$

of $u_{p p}[U / p R]$ is a commutative diagram

and such a morphism is an element of $I$ if and only if $T_{1}^{\prime}=T_{2}^{\prime}$ and $a^{\prime}=\mathrm{id}$. We define a functor

$$
u_{p p}\left[U /{ }_{p} R\right] \longrightarrow\left[f^{-1} U / p f^{-1} R\right]
$$

by the rules

$$
\left(T^{\prime}, \phi: T^{\prime} \rightarrow T, x\right) \longmapsto\left(x \circ \phi: T^{\prime} \rightarrow f^{-1} U\right)
$$

on objects and

$$
\left(a, a^{\prime}, \alpha\right) \longmapsto\left(\alpha \circ \phi_{1}: T_{1}^{\prime} \rightarrow f^{-1} R\right)
$$

on morphisms as above. It is clear that elements of $I$ are transformed into isomorphisms as ( $\left.f^{-1} U, f^{-1} R, f^{-1} s, f^{-1} t, f^{-1} c\right)$ is a groupoid in algebraic spaces over $f^{-1} B$. Hence this functor factors in a canonical way through a functor

$$
u_{p}\left[U /{ }_{p} R\right] \longrightarrow\left[f^{-1} U / p f^{-1} R\right]
$$

Applying stackification we obtain a functor of stacks

$$
f^{-1}[U / R] \longrightarrow\left[f^{-1} U / f^{-1} R\right]
$$

over $\left(S c h^{\prime} / S\right)_{f p p f}$, as by Stacks, Lemma 8.12.11 the stack $f^{-1}[U / R]$ is the stackification of $u_{p}[U / p R]$.
At this point we have a morphism of stacks, and to verify that it is an equivalence it suffices to show that it is fully faithful and that objects are locally in the essential image, see Stacks, Lemmas 8.4.7 and 8.4.8. The statement on objects holds as $f^{-1} R$ admits a surjective étale morphism $f^{-1} W \rightarrow f^{-1} R$ for some object $W$ of $(S c h / S)_{\text {fppf }}$. To show that the functor is "full", it suffices to show that morphisms are locally in the image of the functor which holds as $f^{-1} U$ admits a surjective étale morphism $f^{-1} W \rightarrow f^{-1} U$ for some object $W$ of $(S c h / S)_{f p p f}$. We omit the proof that the functor is faithful.

### 65.28. Separation conditions

0453 This really means conditions on the morphism $j: R \rightarrow U \times{ }_{B} U$ when given a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$. As in the previous section we first formulate the corresponding diagram.
0454 Lemma 65.28.1. Let $B \rightarrow S$ be as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $G \rightarrow U$ be the stabilizer group algebraic space. The commutative diagram

the two left horizontal arrows are isomorphisms and the right square is a fibre product square.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry.
0455 Lemma 65.28.2. Let $B \rightarrow S$ be as in Section 65.3. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $G \rightarrow U$ be the stabilizer group algebraic space.
(1) The following are equivalent
(a) $j: R \rightarrow U \times{ }_{B} U$ is separated,
(b) $G \rightarrow U$ is separated, and
(c) $e: U \rightarrow G$ is a closed immersion.
(2) The following are equivalent
(a) $j: R \rightarrow U \times_{B} U$ is locally separated,
(b) $G \rightarrow U$ is locally separated, and
(c) $e: U \rightarrow G$ is an immersion.
(3) The following are equivalent
(a) $j: R \rightarrow U \times_{B} U$ is quasi-separated,
(b) $G \rightarrow U$ is quasi-separated, and
(c) $e: U \rightarrow G$ is quasi-compact.

Proof. The group algebraic space $G \rightarrow U$ is the base change of $R \rightarrow U \times{ }_{B} U$ by the diagonal morphism $U \rightarrow U \times_{B} U$, see Lemma 65.15.1. Hence if $j$ is separated (resp. locally separated, resp. quasi-separated), then $G \rightarrow U$ is separated (resp. locally separated, resp. quasi-separated). See Morphisms of Spaces, Lemma 54.4.4. Thus (a) $\Rightarrow(\mathrm{b})$ in (1), (2), and (3).
Conversely, if $G \rightarrow U$ is separated (resp. locally separated, resp. quasi-separated), then the morphism $e: U \rightarrow G$, as a section of the structure morphism $G \rightarrow U$ is a closed immersion (resp. an immersion, resp. quasi-compact), see Morphisms of Spaces, Lemma 54.4.7. Thus (b) $\Rightarrow$ (c) in (1), (2), and (3).
If $e$ is a closed immersion (resp. an immersion, resp. quasi-compact) then by the result of Lemma 65.28.1 (and Spaces, Lemma 52.12.3, and Morphisms of Spaces, Lemma 54.8.3 we see that $\Delta_{R / U \times{ }_{B} U}$ is a closed immersion (resp. an immersion, resp. quasi-compact). Thus (c) $\Rightarrow$ (a) in (1), (2), and (3).

## More on Groupoids in Spaces

### 66.1. Introduction

04P5 This chapter is devoted to advanced topics on groupoids in algebraic spaces. Even though the results are stated in terms of groupoids in algebraic spaces, the reader should keep in mind the 2-cartesian diagram

04P6
(66.1.0.1)

where $[U / R]$ is the quotient stack, see Groupoids in Spaces, Remark 65.19.4. Many of the results are motivated by thinking about this diagram. See for example the beautiful paper KM97 by Keel and Mori.

### 66.2. Notation

04P7 We continue to abide by the conventions and notation introduced in Groupoids in Spaces, Section 65.3 .

### 66.3. Useful diagrams

04P8 We briefly restate the results of Groupoids in Spaces, Lemmas 65.11.4 and 65.11.5 for easy reference in this chapter. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. In the commutative diagram

04P9

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

The diagram

0451
(66.3.0.3)

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

### 66.4. Properties of groupoids

044 Y This section is the analogue of More on Groupoids, Section 39.5. The reader is strongly encouraged to read that section first.

The following lemma is the analogue of More on Groupoids, Lemma 39.5.4.
044Z Lemma 66.4.1. Let $B \rightarrow S$ be as in Section 66.2. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $\tau \in\{$ fppf, étale, smooth, syntomic $\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is $\tau$-local on the target (Descent on Spaces, Definition 61.9.1). Assume $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology. Let $W \subset U$ be the maximal open subspace such that $s^{-1}(W) \rightarrow W$ has property $\mathcal{P}$. Then $W$ is $R$-invariant (Groupoids in Spaces, Definition 65.17.1).

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 61.9.3. In Diagram $\sqrt[66.3 .0 .2]{ }$ let $W_{1} \subset R$ be the maximal open subscheme over which the morphism $\operatorname{pr}_{1}: R \times_{s, U, t} R \rightarrow R$ has property $\mathcal{P}$. It follows from the aforementioned Descent on Spaces, Lemma 61.9.3 and the assumption that $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology that $t^{-1}(W)=W_{1}=s^{-1}(W)$ as desired.

06R4 Lemma 66.4.2. Let $B \rightarrow S$ be as in Section 66.2. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $G \rightarrow U$ be its stabilizer group algebraic space. Let $\tau \in\{f p p f$, étale, smooth, syntomic $\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is $\tau$-local on the target. Assume $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology. Let $W \subset U$ be the maximal open subspace such that $G_{W} \rightarrow W$ has property $\mathcal{P}$. Then $W$ is $R$-invariant (see Groupoids in Spaces, Definition 65.17.1).

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 61.9.3. The morphism

$$
G \times_{U, t} R \longrightarrow R \times_{s, U} G, \quad(g, r) \longmapsto\left(r, r^{-1} \circ g \circ r\right)
$$

is an isomorphism of algebraic spaces over $R$ (where o denotes composition in the groupoid). Hence $s^{-1}(W)=t^{-1}(W)$ by the properties of $W$ proved in the aforementioned Descent on Spaces, Lemma 61.9.3.

### 66.5. Comparing fibres

04PA This section is the analogue of More on Groupoids, Section 39.6. The reader is strongly encouraged to read that section first.
0452 Lemma 66.5.1. Let $B \rightarrow S$ be as in Section 66.2. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $K$ be a field and let $r, r^{\prime}: \operatorname{Spec}(K) \rightarrow R$ be morphisms such that $t \circ r=t \circ r^{\prime}: \operatorname{Spec}(K) \rightarrow U$. Set $u=s \circ r, u^{\prime}=s \circ r^{\prime}$ and denote $F_{u}=\operatorname{Spec}(K) \times_{u, U, s} R$ and $F_{u^{\prime}}=\operatorname{Spec}(K) \times_{u^{\prime}, U, s} R$ the fibre products. Then $F_{u} \cong F_{u^{\prime}}$ as algebraic spaces over $K$.
Proof. We use the properties and the existence of Diagram 66.3.0.2. There exists a morphism $\xi: \operatorname{Spec}(K) \rightarrow R \times_{s, U, t} R$ with $\operatorname{pr}_{0} \circ \xi=r$ and $c \circ \xi=r^{\prime}$. Let $\tilde{r}=\operatorname{pr}_{1} \circ \xi: \operatorname{Spec}(K) \rightarrow R$. Then looking at the bottom two squares of Diagram $\sqrt{66.3 .0 .2}$ ) we see that both $F_{u}$ and $F_{u^{\prime}}$ are identified with the algebraic space $\operatorname{Spec}(K) \times_{\tilde{r}, R, \mathrm{pr}_{1}}\left(R \times_{s, U, t} R\right)$.
Actually, in the situation of the lemma the morphisms of pairs $s:(R, r) \rightarrow(U, u)$ and $s:\left(R, r^{\prime}\right) \rightarrow\left(U, u^{\prime}\right)$ are locally isomorphic in the $\tau$-topology, provided $\{s: R \rightarrow$ $U\}$ is a $\tau$-covering. We will insert a precise statement here if needed.

### 66.6. Restricting groupoids

04 RM In this section we collect a bunch of lemmas on properties of groupoids which are inherited by restrictions. Most of these lemmas can be proved by contemplating the defining diagram

04RN
(66.6.0.1)

of a restriction. See Groupoids in Spaces, Lemma 65.16.1.
04RP Lemma 66.6.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $g: U^{\prime} \rightarrow U$ be a morphism of algebraic spaces over $B$. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $g$.
(1) If $s, t$ are locally of finite type and $g$ is locally of finite type, then $s^{\prime}, t^{\prime}$ are locally of finite type.
(2) If $s, t$ are locally of finite presentation and $g$ is locally of finite presentation, then $s^{\prime}, t^{\prime}$ are locally of finite presentation.
(3) If $s, t$ are flat and $g$ is flat, then $s^{\prime}, t^{\prime}$ are flat.
(4) Add more here.

Proof. The property of being locally of finite type is stable under composition and arbitrary base change, see Morphisms of Spaces, Lemmas 54.23 .2 and 54.23 .3 . Hence (1) is clear from Diagram 66.6.0.1). For the other cases, see Morphisms of Spaces, Lemmas 54.28.2, 54.28.3, 54.29.3, and 54.29.4.

### 66.7. Properties of groups over fields and groupoids on fields

06 DW The reader is advised to first look at the corresponding sections for groupoid schemes, see Groupoids, Section 38.7 and More on Groupoids, Section 39.9 .

06DX Situation 66.7.1. Here $S$ is a scheme, $k$ is a field over $S$, and $(G, m)$ is a group algebraic spaces over $\operatorname{Spec}(k)$.

06DY Situation 66.7.2. Here $S$ is a scheme, $B$ is an algebraic space, and $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $B$ with $U=\operatorname{Spec}(k)$ for some field $k$.

Note that in Situation 66.7.1 we obtain a groupoid in algebraic spaces

06DZ

$$
\begin{equation*}
(\operatorname{Spec}(k), G, p, p, m) \tag{66.7.2.1}
\end{equation*}
$$

where $p: G \rightarrow \operatorname{Spec}(k)$ is the structure morphism of $G$, see Groupoids in Spaces, Lemma 65.14.1. This is a situation as in Situation 66.7.2. We will use this without further mention in the rest of this section.

06E0 Lemma 66.7.3. In Situation 66.7.2 the composition morphism c: $R \times_{s, U, t} R \rightarrow R$ is flat and universally open. In Situation 66.7.1 the group law $m: G \times_{k} G \rightarrow G$ is flat and universally open.

Proof. The composition is isomorphic to the projection map $\operatorname{pr}_{1}: R \times_{t, U, t} R \rightarrow R$ by Diagram 66.3.0.3). The projection is flat as a base change of the flat morphism $t$ and open by Morphisms of Spaces, Lemma 54.6.6. The second assertion follows immediately from the first because $m$ matches $c$ in 66.7.2.1.

Note that the following lemma applies in particular when working with either quasiseparated or locally separated algebraic spaces (Decent Spaces, Lemma 55.13.2.

08BH Lemma 66.7.4. In Situation 66.7.2 assume $R$ is a decent space. Then $R$ is a separated algebraic space. In Situation 66.7.1 assume that $G$ is a decent algebraic space. Then $G$ is separated algebraic space.

Proof. We first prove the second assertion. By Groupoids in Spaces, Lemma 65.6.1 we have to show that $e: S \rightarrow G$ is a closed immersion. This follows from Decent Spaces, Lemma 55.12.5.

Next, we prove the second assertion. To do this we may replace $B$ by $S$. By the paragraph above the stabilizer group scheme $G \rightarrow U$ is separated. By Groupoids in Spaces, Lemma 65.28.2 the morphism $j=(t, s): R \rightarrow U \times_{S} U$ is separated. As $U$ is the spectrum of a field the scheme $U \times_{S} U$ is affine (by the construction of fibre products in Schemes, Section 25.17). Hence $R$ is separated, see Morphisms of Spaces, Lemma 54.4.9.

06E1 Lemma 66.7.5. In Situation 66.7.2. Let $k \subset k^{\prime}$ be a field extension, $U^{\prime}=$ $\operatorname{Spec}\left(k^{\prime}\right)$ and let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $U^{\prime} \rightarrow U$. In
the defining diagram

all the morphisms are surjective, flat, and universally open. The dotted arrow $R^{\prime} \rightarrow R$ is in addition affine.

Proof. The morphism $U^{\prime} \rightarrow U$ equals $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$, hence is affine, surjective and flat. The morphisms $s, t: R \rightarrow U$ and the morphism $U^{\prime} \rightarrow U$ are universally open by Morphisms, Lemma 28.23.4. Since $R$ is not empty and $U$ is the spectrum of a field the morphisms $s, t: R \rightarrow U$ are surjective and flat. Then you conclude by using Morphisms of Spaces, Lemmas 54.5.5, 54.5.4, 54.6.4, 54.20.5. 54.20 .4 54.29.4 and 54.29.3.

06E2 Lemma 66.7.6. In Situation 66.7.2. For any point $r \in|R|$ there exist
(1) a field extension $k \subset k^{\prime}$ with $k^{\prime}$ algebraically closed,
(2) a point $r^{\prime}: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow R^{\prime}$ where $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is the restriction of $(U, R, s, t, c)$ via $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$
such that
(1) the point $r^{\prime}$ maps to $r$ under the morphism $R^{\prime} \rightarrow R$, and
(2) the maps $s^{\prime} \circ r^{\prime}, t^{\prime} \circ r^{\prime}: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ are automorphisms.

Proof. Let's represent $r$ by a morphism $r: \operatorname{Spec}(K) \rightarrow R$ for some field $K$. To prove the lemma we have to find an algebraically closed field $k^{\prime}$ and a commutative diagram

where $s, t: k \rightarrow K$ are the field maps coming from $s \circ r$ and $t \circ r$. In the proof of More on Groupoids, Lemma 39.9.5 it is shown how to construct such a diagram.

06E3 Lemma 66.7.7. In Situation 66.7.2. If $r: \operatorname{Spec}(k) \rightarrow R$ is a morphism such that $s \circ r, t \circ r$ are automorphisms of $\operatorname{Spec}(k)$, then the map

$$
R \longrightarrow R, \quad x \longmapsto c(r, x)
$$

is an automorphism $R \rightarrow R$ which maps e to $r$.
Proof. Proof is identical to the proof of More on Groupoids, Lemma 39.9.6.

06E4 Lemma 66.7.8. In Situation 66.7.2 the algebraic space $R$ is geometrically unibranch. In Situation 66.7.1 the algebraic space $G$ is geometrically unibranch.
Proof. Let $r \in|R|$. We have to show that $R$ is geometrically unibranch at $r$. Combining Lemma 66.7.5 with Descent on Spaces, Lemma 61.8.1 we see that it suffices to prove this in case $k$ is algebraically closed and $r$ comes from a morphism $r: \operatorname{Spec}(k) \rightarrow R$ such that $s$ or and $t$ or are automorphisms of $\operatorname{Spec}(k)$. By Lemma 66.7 .7 we reduce to the case that $r=e$ is the identity of $R$ and $k$ is algebraically closed.

Assume $r=e$ and $k$ is algebraically closed. Let $A=\mathcal{O}_{R, e}$ be the étale local ring of $R$ at $e$ and let $C=\mathcal{O}_{R \times_{s, U, t} R,(e, e)}$ be the étale local ring of $R \times_{s, U, t} R$ at $(e, e)$. By More on Algebra, Lemma 15.79 .4 the minimal prime ideals $\mathfrak{q}$ of $C$ correspond 1-to-1 to pairs of minimal primes $\mathfrak{p}, \mathfrak{p}^{\prime} \subset A$. On the other hand, the composition law induces a flat ring map

Note that $\left(c^{\sharp}\right)^{-1}(\mathfrak{q})$ contains both $\mathfrak{p}$ and $\mathfrak{p}^{\prime}$ as the diagrams

commute by 66.3 .0 .2 ). Since $c^{\sharp}$ is flat (as $c$ is a flat morphism by Lemma 66.7.3), we see that $\left(c^{\sharp}\right)^{-1}(\mathfrak{q})$ is a minimal prime of $A$. Hence $\mathfrak{p}=\left(c^{\sharp}\right)^{-1}(\mathfrak{q})=\mathfrak{p}^{\prime}$.

In the following lemma we use dimension of algebraic spaces (at a point) as defined in Properties of Spaces, Section 53.8. We also use the dimension of the local ring defined in Properties of Spaces, Section 53.9 and transcendence degree of points, see Morphisms of Spaces, Section 54.32 .

06FD Lemma 66.7.9. In Situation 66.7.2 assume s,t are locally of finite type. For all $r \in|R|$
(1) $\operatorname{dim}(R)=\operatorname{dim}_{r}(R)$,
(2) the transcendence degree of $r$ over $\operatorname{Spec}(k)$ via s equals the transcendence degree of $r$ over $\operatorname{Spec}(k)$ via $t$, and
(3) if the transcendence degree mentioned in (2) is 0 , then $\operatorname{dim}(R)=\operatorname{dim}\left(\mathcal{O}_{R, \bar{r}}\right)$.

Proof. Let $r \in|R|$. Denote $\operatorname{trdeg}(r / s k)$ the transcendence degree of $r$ over $\operatorname{Spec}(k)$ via $s$. Choose an étale morphism $\varphi: V \rightarrow R$ where $V$ is a scheme and $v \in V$ mapping to $r$. Using the definitions mentioned above the lemma we see that

$$
\operatorname{dim}_{r}(R)=\operatorname{dim}_{v}(V)=\operatorname{dim}\left(\mathcal{O}_{V, v}\right)+\operatorname{trdeg}_{s(k)}(\kappa(v))=\operatorname{dim}\left(\mathcal{O}_{R, \bar{r}}\right)+\operatorname{trdeg}(r / s k)
$$

and similarly for $t$ (the second equality by Morphisms, Lemma 28.28.1). Hence we see that $\operatorname{trdeg}(r / s k)=\operatorname{trdeg}(r / t k)$, i.e., (2) holds.
Let $k \subset k^{\prime}$ be a field extension. Note that the restriction $R^{\prime}$ of $R$ to $\operatorname{Spec}\left(k^{\prime}\right)$ (see Lemma 66.7 .5 is obtained from $R$ by two base changes by morphisms of fields.

Thus Morphisms of Spaces, Lemma 54.33 .3 shows the dimension of $R$ at a point is unchanged by this operation. Hence in order to prove (1) we may assume, by Lemma 66.7.6, that $r$ is represented by a morphism $r: \operatorname{Spec}(k) \rightarrow R$ such that both $s \circ r$ and $t \circ r$ are automorphisms of $\operatorname{Spec}(k)$. In this case there exists an automorphism $R \rightarrow R$ which maps $r$ to $e$ (Lemma 66.7.7). Hence we see that $\operatorname{dim}_{r}(R)=\operatorname{dim}_{e}(R)$ for any $r$. By definition this means that $\operatorname{dim}_{r}(R)=\operatorname{dim}(R)$.

Part (3) is a formal consequence of the results obtained in the discussion above.
06FE Lemma 66.7.10. In Situation 66.7.1 assume $G$ locally of finite type. For all $g \in|G|$
(1) $\operatorname{dim}(G)=\operatorname{dim}_{g}(G)$,
(2) if the transcendence degree of $g$ over $k$ is 0 , then $\operatorname{dim}(G)=\operatorname{dim}\left(\mathcal{O}_{G, \bar{g}}\right)$.

Proof. Immediate from Lemma 66.7.9 via 66.7.2.1.
06FF Lemma 66.7.11. In Situation 66.7.2 assume $s, t$ are locally of finite type. Let $G=\operatorname{Spec}(k) \times_{\Delta, \operatorname{Spec}(k) \times_{B} \operatorname{Spec}(k), t \times s} R$ be the stabilizer group algebraic space. Then we have $\operatorname{dim}(R)=\operatorname{dim}(G)$.
Proof. Since $G$ and $R$ are equidimensional (see Lemmas 66.7.9 and 66.7.10 it suffices to prove that $\operatorname{dim}_{e}(R)=\operatorname{dim}_{e}(G)$. Let $V$ be an affine scheme, $v \in V$, and let $\varphi: V \rightarrow R$ be an étale morphism of schemes such that $\varphi(v)=e$. Note that $V$ is a Noetherian scheme as $s \circ \varphi$ is locally of finite type as a composition of morphisms locally of finite type and as $V$ is quasi-compact (use Morphisms of Spaces, Lemmas 54.23.2 54.38.8, and 54.28.5 and Morphisms, Lemma 28.15.6). Hence $V$ is locally connected (see Properties, Lemma 27.5.5 and Topology, Lemma 5.8.6). Thus we may replace $V$ by the connected component containing $v$ (it is still affine as it is an open and closed subscheme of $V$ ). Set $T=V_{\text {red }}$ equal to the reduction of $V$. Consider the two morphisms $a, b: T \rightarrow \operatorname{Spec}(k)$ given by $a=\left.s \circ \varphi\right|_{T}$ and $b=\left.t \circ \varphi\right|_{T}$. Note that $a, b$ induce the same field map $k \rightarrow \kappa(v)$ because $\varphi(v)=e!$ Let $k_{a} \subset \Gamma\left(T, \mathcal{O}_{T}\right)$ be the integral closure of $a^{\sharp}(k) \subset \Gamma\left(T, \mathcal{O}_{T}\right)$. Similarly, let $k_{b} \subset \Gamma\left(T, \mathcal{O}_{T}\right)$ be the integral closure of $b^{\sharp}(k) \subset \Gamma\left(T, \mathcal{O}_{T}\right)$. By Varieties, Proposition 32.25 .1 we see that $k_{a}=k_{b}$. Thus we obtain the following commutative diagram

As discussed above the long arrows are equal. Since $k_{a}=k_{b} \rightarrow \kappa(v)$ is injective we conclude that the two morphisms $a$ and $b$ agree. Hence $T \rightarrow R$ factors through $G$. It follows that $R_{r e d}=G_{r e d}$ in an open neighbourhood of $e$ which certainly implies that $\operatorname{dim}_{e}(R)=\operatorname{dim}_{e}(G)$.

### 66.8. Group algebraic spaces over fields

0B8D There exists a nonseparated group algebraic space over a field, namely $\mathbf{G}_{a} / \mathbf{Z}$ over a field of characteristic zero, see Examples, Section 88.41. In fact any group scheme over a field is separated (Lemma 66.7.4) hence every nonseparated group algebraic
space over a field is nonrepresentable. On the other hand, a group algebraic space over a field is separated as soon as it is decent, see Lemma 66.7.4. In this section we will show that a separated group algebraic space over a field is representable, i.e., a scheme.

0B8E Lemma 66.8.1. Let $k$ be a field with algebraic closure $\bar{k}$. Let $G$ be a group algebraic space over $k$ which is separated ${ }^{11}$. Then $G_{\bar{k}}$ is a scheme.

Proof. By Spaces over Fields, Lemma 59.7 .2 it suffices to show that $G_{K}$ is a scheme for some field extension $K / k$. Denote $G_{K}^{\prime} \subset G_{K}$ the schematic locus of $G_{K}$ as in Properties of Spaces, Lemma 53.12.1. By Properties of Spaces, Proposition 53.12.3 we see that $G_{K}^{\prime} \subset G_{K}$ is dense open, in particular not empty. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow G$. By Varieties, Lemma 32.12 .2 if $K$ is an algebraically closed field of large enough transcendence degree, then $U_{K}$ is a Jacobson scheme and every closed point of $U_{K}$ is $K$-rational. Hence $G_{K}^{\prime}$ has a $K$-rational point and it suffices to show that every $K$-rational point of $G_{K}$ is in $G_{K}^{\prime}$. If $g \in G_{K}(K)$ is a $K$-rational point and $g^{\prime} \in G_{K}^{\prime}(K)$ a $K$-rational point in the schematic locus, then we see that $g$ is in the image of $G_{K}^{\prime}$ under the automorphism

$$
G_{K} \longrightarrow G_{K}, \quad h \longmapsto g\left(g^{\prime}\right)^{-1} h
$$

of $G_{K}$. Since automorphisms of $G_{K}$ as an algebraic space preserve $G_{K}^{\prime}$, we conclude that $g \in G_{K}^{\prime}$ as desired.

0B8F Lemma 66.8.2. Let $k$ be a field. Let $G$ be a group algebraic space over $k$. If $G$ is separated and locally of finite type over $k$, then $G$ is a scheme.

Proof. This follows from Lemma 66.8.1, Groupoids, Lemma 38.8.6, and Spaces over Fields, Lemma 59.7.7.

0B8G Proposition 66.8.3. Let $k$ be a field. Let $G$ be a group algebraic space over $k$. If $G$ is separated, then $G$ is a scheme.

Proof. This lemma generalizes Lemma 66.8.2 (which covers all cases one cares about in practice). The proof is very similar to the proof of Spaces over Fields, Lemma 59.7 .7 used in the proof of Lemma 66.8 .2 and we encourage the reader to read that proof first.
By Lemma 66.8.1 the base change $G_{\bar{k}}$ is a scheme. Let $K / k$ be a purely transcendental extension of very large transcendence degree. By Spaces over Fields, Lemma 59.7 .5 it suffices to show that $G_{K}$ is a scheme. Let $K^{\text {perf }}$ be the perfect closure of $K$. By Spaces over Fields, Lemma 59.7.1 it suffices to show that $G_{K^{\text {perf }}}$ is a scheme. Let $K \subset K^{\operatorname{perf}} \subset \bar{K}$ be the algebraic closure of $K$. We may choose an embedding $\bar{k} \rightarrow \bar{K}$ over $k$, so that $G_{\bar{K}}$ is the base change of the scheme $G_{\bar{k}}$ by $\bar{k} \rightarrow \bar{K}$. By Varieties, Lemma 32.12 .2 we see that $G_{\bar{K}}$ is a Jacobson scheme all of whose closed points have residue field $\bar{K}$.

Since $G_{\bar{K}} \rightarrow G_{K^{\text {perf }}}$ is surjective, it suffices to show that the image $g \in\left|G_{K^{\text {perf }}}\right|$ of an arbitrary closed point of $G_{\bar{K}}$ is in the schematic locus of $G_{K}$. In particular, we

[^180]may represent $g$ by a morphism $g: \operatorname{Spec}(L) \rightarrow G_{K^{\text {perf }}}$ where $L / K^{\text {perf }}$ is separable algebraic (for example we can take $L=\bar{K}$ ). Thus the scheme
\[

$$
\begin{aligned}
T & =\operatorname{Spec}(L) \times_{G_{K \text { perf }}} G_{\bar{K}} \\
& =\operatorname{Spec}(L) \times_{\operatorname{Spec}\left(K^{\text {perf }}\right)} \operatorname{Spec}(\bar{K}) \\
& =\operatorname{Spec}\left(L \otimes_{K^{\text {perf }}} \bar{K}\right)
\end{aligned}
$$
\]

is the spectrum of a $\bar{K}$-algebra which is a filtered colimit of algebras which are finite products of copies of $\bar{K}$. Thus by Groupoids, Lemma 38.7.13 we can find an affine open $W \subset G_{\bar{K}}$ containing the image of $g_{\bar{K}}: T \rightarrow G_{\bar{K}}$.
Choose a quasi-compact open $V \subset G_{K^{\text {perf }}}$ containing the image of $W$. By Spaces over Fields, Lemma 59.7 .2 we see that $V_{K^{\prime}}$ is a scheme for some finite extension $K^{\prime} / K^{\text {perf }}$. After enlarging $K^{\prime}$ we may assume that there exists an affine open $U^{\prime} \subset V_{K^{\prime}} \subset G_{K^{\prime}}$ whose base change to $\bar{K}$ recovers $W$ (use that $V_{\bar{K}}$ is the limit of the schemes $V_{K^{\prime \prime}}$ for $K^{\prime} \subset K^{\prime \prime} \subset \bar{K}$ finite and use Limits, Lemmas 31.3.8 and 31.3.10). We may assume that $K^{\prime} / K^{\text {perf }}$ is a Galois extension (take the normal closure Fields, Lemma 9.15 .3 and use that $K^{\text {perf }}$ is perfect). Set $H=\operatorname{Gal}\left(K^{\prime} / K^{\text {perf }}\right)$. By construction the $H$-invariant closed subscheme $\operatorname{Spec}(L) \times{ }_{G_{K^{\text {perf }}}} G_{K^{\prime}}$ is contained in $U^{\prime}$. By Spaces over Fields, Lemmas 59.7.3 and 59.7.4 we conclude.

### 66.9. No rational curves on groups

0AEK In this section we prove that there are no nonconstant morphisms from $\mathbf{P}^{1}$ to a group algebraic space locally of finite type over a field.
0AEL Lemma 66.9.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $f: X \rightarrow Y$ and $g: X \rightarrow Z$ be morphisms of algebraic spaces over $B$. Assume
(1) $Y \rightarrow B$ is separated,
(2) $g$ is surjective, flat, and locally of finite presentation,
(3) there is a scheme theoretically dense open $V \subset Z$ such that $\left.f\right|_{g^{-1}(V)}$ : $g^{-1}(V) \rightarrow Y$ factors through $V$.
Then $f$ factors through $g$.
Proof. Set $R=X \times_{Z} X$. By (2) we see that $Z=X / R$ as sheaves. Also (2) implies that the inverse image of $V$ in $R$ is scheme theoretically dense in $R$ (Morphisms of Spaces, Lemma 54.29.11). The we see that the two compositions $R \rightarrow X \rightarrow Y$ are equal by Morphisms of Spaces, Lemma 54.17.8. The lemma follows.

0AEM Lemma 66.9.2. Let $k$ be a field. Let $n \geq 1$ and let $\left(\mathbf{P}_{k}^{1}\right)^{n}$ be the $n$-fold self product over $\operatorname{Spec}(k)$. Let $f:\left(\mathbf{P}_{k}^{1}\right)^{n} \rightarrow Z$ be a morphism of algebraic spaces over $k$. If $Z$ is separated of finite type over $k$, then $f$ factors as

$$
\left(\mathbf{P}_{k}^{1}\right)^{n} \xrightarrow{\text { projection }}\left(\mathbf{P}_{k}^{1}\right)^{m} \xrightarrow{\text { finite }} Z .
$$

Proof. We may assume $k$ is algebraically closed (details omitted); we only do this so we may argue using rational points, but the reader can work around this if she/he so desires. In the proof products are over $k$. The automorphism group algebraic space of $\left(\mathbf{P}_{k}^{1}\right)^{n}$ contains $G=\left(\mathrm{GL}_{2, k}\right)^{n}$. If $C \subset\left(\mathbf{P}_{k}^{1}\right)^{n}$ is a closed subvariety (in particular irreducible over $k$ ) which is mapped to a point, then we can apply More on Morphisms of Spaces, Lemma 63.25.7 to the morphism

$$
G \times C \rightarrow G \times Z, \quad(g, c) \mapsto(g, f(g \cdot c))
$$

over $G$. Hence $g(C)$ is mapped to a point for $g \in G(k)$ lying in a Zariski open $U \subset G$. Suppose $x=\left(x_{1}, \ldots, x_{n}\right), y=\left(y_{1}, \ldots, y_{n}\right)$ are $k$-valued points of $\left(\mathbf{P}_{k}^{1}\right)^{n}$. Let $I \subset\{1, \ldots, n\}$ be the set of indices $i$ such that $x_{i}=y_{i}$. Then

$$
\{g(x) \mid g(y)=y, g \in U(k)\}
$$

is Zariski dense in the fibre of the projection $\pi_{I}:\left(\mathbf{P}_{k}^{1}\right)^{n} \rightarrow \prod_{i \in I} \mathbf{P}_{k}^{1}$ (exercise). Hence if $x, y \in C(k)$ are distinct, we conclude that $f$ maps the whole fibre of $\pi_{I}$ containing $x, y$ to a single point. Moreover, the $U(k)$-orbit of $C$ meets a Zariski open set of fibres of $\pi_{I}$. By Lemma 66.9.1 the morphism $f$ factors through $\pi_{I}$. After repeating this process finitely many times we reach the stage where all fibres of $f$ over $k$ points are finite. In this case $f$ is finite by More on Morphisms of Spaces, Lemma 63.25 .6 and the fact that $k$ points are dense in $Z$ (Spaces over Fields, Lemma 59.9.2).

0AEN Lemma 66.9.3. Let $k$ be a field. Let $G$ be a separated group algebraic space locally of finite type over $k$. There does not exist a nonconstant morphism $f: \mathbf{P}_{k}^{1} \rightarrow G$ over $\operatorname{Spec}(k)$.
Proof. Assume $f$ is nonconstant. Consider the morphisms

$$
\mathbf{P}_{k}^{1} \times_{\operatorname{Spec}(k)} \ldots \times_{\operatorname{Spec}(k)} \mathbf{P}_{k}^{1} \longrightarrow G, \quad\left(t_{1}, \ldots, t_{n}\right) \longmapsto f\left(g_{1}\right) \ldots f\left(g_{n}\right)
$$

where on the right hand side we use multiplication in the group. By Lemma 66.9.2 and the assumption that $f$ is nonconstant this morphism is finite onto its image. Hence $\operatorname{dim}(G) \geq n$ for all $n$, which is impossible by Lemma 66.7 .10 and the fact that $G$ is locally of finite type over $k$.

### 66.10. The finite part of a morphism

04PB Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. For an algebraic space or a scheme $T$ over $S$ consider pairs $(a, Z)$ where

04PC (66.10.0.1)

$$
\begin{aligned}
& a: T \rightarrow Y \text { is a morphism over } S \\
& Z \subset T \times_{Y} X \text { is an open subspace } \\
& \text { such that }\left.\operatorname{pr}_{0}\right|_{Z}: Z \rightarrow T \text { is finite. }
\end{aligned}
$$

Suppose $h: T^{\prime} \rightarrow T$ is a morphism of algebraic spaces over $S$ and ( $a, Z$ ) is a pair over $T$. Set $a^{\prime}=a \circ h$ and $Z^{\prime}=\left(h \times \operatorname{id}_{X}\right)^{-1}(Z)=T^{\prime} \times_{T} Z$. Then the pair $\left(a^{\prime}, Z^{\prime}\right)$ satisfies (1), (2) over $T^{\prime}$. This follows as finite morphisms are preserved under base change, see Morphisms of Spaces, Lemma 54.43.5. Thus we obtain a functor

04PD (66.10.0.2)

$$
\begin{array}{ccc}
(X / Y)_{\text {fin }}: \quad(S c h / S)^{\text {opp }} & \longrightarrow & \text { Sets } \\
T & \longmapsto & \{(a, Z) \text { as above }\}
\end{array}
$$

For applications we are mainly interested in this functor $(X / Y)_{\text {fin }}$ when $f$ is separated and locally of finite type. To get an idea of what this is all about, take a look at Remark 66.10.6.

04PE Lemma 66.10.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then we have
(1) The presheaf $(X / Y)_{\text {fin }}$ satisfies the sheaf condition for the fppf topology.
(2) If $T$ is an algebraic space over $S$, then there is a canonical bijection

$$
\operatorname{Mor}_{S h\left((S c h / S)_{f p p f}\right)}\left(T,(X / Y)_{\text {fin }}\right)=\{(a, Z) \text { satisfying 66.10.0.1\} }
$$

Proof. Let $T$ be an algebraic space over $S$. Let $\left\{T_{i} \rightarrow T\right\}$ be an fppf covering (by algebraic spaces). Let $s_{i}=\left(a_{i}, Z_{i}\right)$ be pairs over $T_{i}$ satisfying 66.10.0.1 such that we have $\left.s_{i}\right|_{T_{i} \times{ }_{T} T_{j}}=\left.s_{j}\right|_{T_{i} \times{ }_{T} T_{j}}$. First, this implies in particular that $a_{i}$ and $a_{j}$ define the same morphism $T_{i} \times{ }_{T} T_{j} \rightarrow Y$. By Descent on Spaces, Lemma 61.6.2 we deduce that there exists a unique morphism $a: T \rightarrow Y$ such that $a_{i}$ equals the composition $T_{i} \rightarrow T \rightarrow Y$. Second, this implies that $Z_{i} \subset T_{i} \times_{Y} X$ are open subspaces whose inverse images in $\left(T_{i} \times_{T} T_{j}\right) \times_{Y} X$ are equal. Since $\left\{T_{i} \times_{Y} X \rightarrow T \times_{Y} X\right\}$ is an fppf covering we deduce that there exists a unique open subspace $Z \subset T \times_{Y} X$ which restricts back to $Z_{i}$ over $T_{i}$, see Descent on Spaces, Lemma 61.6.1. We claim that the projection $Z \rightarrow T$ is finite. This follows as being finite is local for the fpqc topology, see Descent on Spaces, Lemma 61.10.21.

Note that the result of the preceding paragraph in particular implies (1).
Let $T$ be an algebraic space over $S$. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say "pair" we mean a pair satisfying conditions 66.10.0.1

Let $v: T \rightarrow(X / Y)_{f i n}$ be a natural transformation. Choose a scheme $U$ and a surjective étale morphism $p: U \rightarrow T$. Then $v(p) \in(X / Y)_{f i n}(U)$ corresponds to a pair $\left(a_{U}, Z_{U}\right)$ over $U$. Let $R=U \times_{T} U$ with projections $t, s: R \rightarrow U$. As $v$ is a transformation of functors we see that the pullbacks of $\left(a_{U}, Z_{U}\right)$ by $s$ and $t$ agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair $(a, Z)$ over $T$.

Conversely, let $(a, Z)$ be a pair over $T$. Let $U \rightarrow T, R=U \times_{T} U$, and $t, s: R \rightarrow U$ be as above. Then the restriction $\left.(a, Z)\right|_{U}$ gives rise to a transformation of functors $v: h_{U} \rightarrow(X / Y)_{\text {fin }}$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $\left.s^{*}(a, Z)\right|_{U}$ and $\left.t^{*}(a, Z)\right|_{U}$ are equal, we see that $v$ coequalizes the two maps $h_{t}, h_{s}: h_{R} \rightarrow h_{U}$. Since $T=U / R$ is the fppf quotient sheaf by Spaces, Lemma 52.9 .1 and since $(X / Y)_{\text {fin }}$ is an fppf sheaf by (1) we conclude that $v$ factors through a map $T \rightarrow(X / Y)_{\text {fin }}$.

We omit the verification that the two constructions above are mutually inverse.
04PF Lemma 66.10.2. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$. If $j$ is an open immersion, then there is a canonical injective map of sheaves $j:\left(X^{\prime} / Y\right)_{\text {fin }} \rightarrow(X / Y)_{\text {fin }}$.

Proof. If $(a, Z)$ is a pair over $T$ for $X^{\prime} / Y$, then $(a, j(Z))$ is a pair over $T$ for $X / Y$.

04PG Lemma 66.10.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is locally of finite type. Let $X^{\prime} \subset X$ be the maximal open subspace over which $f$ is locally quasi-finite, see Morphisms of Spaces, Lemma54.33.7. Then $(X / Y)_{f i n}=\left(X^{\prime} / Y\right)_{f i n}$.

Proof. Lemma 66.10 .2 gives us an injective map $\left(X^{\prime} / Y\right)_{\text {fin }} \rightarrow(X / Y)_{\text {fin }}$. Morphisms of Spaces, Lemma 54.33.7 assures us that formation of $X^{\prime}$ commutes with base change. Hence everything comes down to proving that if $Z \subset X$ is a open subspace such that $\left.f\right|_{Z}: Z \rightarrow Y$ is finite, then $Z \subset X^{\prime}$. This is true because a finite morphism is locally quasi-finite, see Morphisms of Spaces, Lemma 54.43.8.

04PH Lemma 66.10.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $T$ be an algebraic space over $S$, and let $(a, Z)$ be a pair as in 66.10.0.1. If $f$ is separated, then $Z$ is closed in $T \times_{Y} X$.

Proof. A finite morphism of algebraic spaces is universally closed by Morphisms of Spaces, Lemma 54.43.9. Since $f$ is separated so is the morphism $T \times_{Y} X \rightarrow T$, see Morphisms of Spaces, Lemma 54.4.4. Thus the closedness of $Z$ follows from Morphisms of Spaces, Lemma 54.39.6.

04PI Remark 66.10.5. Let $f: X \rightarrow Y$ be a separated morphism of algebraic spaces. The sheaf $(X / Y)_{\text {fin }}$ comes with a natural map $(X / Y)_{f i n} \rightarrow Y$ by mapping the pair $(a, Z) \in(X / Y)_{f i n}(T)$ to the element $a \in Y(T)$. We can use Lemma 66.10.4 to define operations

$$
\star_{i}:(X / Y)_{f i n} \times_{Y}(X / Y)_{f i n} \longrightarrow(X / Y)_{f i n}
$$

by the rules

$$
\begin{aligned}
& \star_{1}:\left(\left(a, Z_{1}\right),\left(a, Z_{2}\right)\right) \longmapsto\left(a, Z_{1} \cup Z_{2}\right) \\
& \star_{2}:\left(\left(a, Z_{1}\right),\left(a, Z_{2}\right)\right) \longmapsto\left(a, Z_{1} \cap Z_{2}\right) \\
& \star_{3}:\left(\left(a, Z_{1}\right),\left(a, Z_{2}\right)\right) \longmapsto\left(a, Z_{1} \backslash Z_{2}\right) \\
& \star_{4}:\left(\left(a, Z_{1}\right),\left(a, Z_{2}\right)\right) \longmapsto\left(a, Z_{2} \backslash Z_{1}\right) .
\end{aligned}
$$

The reason this works is that $Z_{1} \cap Z_{2}$ is both open and closed inside $Z_{1}$ and $Z_{2}$ (which also implies that $Z_{1} \cup Z_{2}$ is the disjoint union of the other three pieces). Thus we can think of $(X / Y)_{\text {fin }}$ as an $\mathbf{F}_{2}$-algebras (without unit) over $Y$ with multiplication given by $s s^{\prime}=\star_{2}\left(s, s^{\prime}\right)$, and addition given by

$$
s+s^{\prime}=\star_{1}\left(\star_{3}\left(s, s^{\prime}\right), \star_{4}\left(s, s^{\prime}\right)\right)
$$

which boils down to taking the symmetric difference. Note that in this sheaf of algebras $0=\left(1_{Y}, \emptyset\right)$ and that indeed $s+s=0$ for any local section $s$. If $f: X \rightarrow Y$ is finite, then this algebra has a unit namely $1=\left(1_{Y}, X\right)$ and $\star_{3}\left(s, s^{\prime}\right)=s\left(1+s^{\prime}\right)$, and $\star_{4}\left(s, s^{\prime}\right)=(1+s) s^{\prime}$.
04PJ Remark 66.10.6. Let $f: X \rightarrow Y$ be a separated, locally quasi-finite morphism of schemes. In this case the sheaf $(X / Y)_{f i n}$ is closely related to the sheaf $f_{!} \mathbf{F}_{2}$ (insert future reference here) on $Y_{\text {étale }}$. Namely, if $V \rightarrow Y$ is étale, and $s \in \Gamma\left(V, f_{!} \mathbf{F}_{2}\right)$, then $s \in \Gamma\left(V \times_{Y} X, \mathbf{F}_{2}\right)$ is a section with proper support $Z=\operatorname{Supp}(s)$ over $V$. Since $f$ is also locally quasi-finite we see that the projection $Z \rightarrow V$ is actually finite. Since the support of a section of a constant abelian sheaf is open we see that the pair $(V \rightarrow Y, \operatorname{Supp}(s))$ satisfies 66.10.0.1. In fact, $\left.f_{!} \mathbf{F}_{2} \cong(X / Y)_{\text {fin }}\right|_{Y_{\text {etale }}}$ in this case which also explains the $\mathbf{F}_{2}$-algebra structure introduced in Remark 66.10.5.
04PK Lemma 66.10.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The diagonal of $(X / Y)_{f i n} \rightarrow Y$

$$
(X / Y)_{f i n} \longrightarrow(X / Y)_{f i n} \times_{Y}(X / Y)_{f i n}
$$

is representable (by schemes) and an open immersion and the "absolute" diagonal

$$
(X / Y)_{f i n} \longrightarrow(X / Y)_{f i n} \times(X / Y)_{f i n}
$$

is representable (by schemes).
Proof. The second statement follows from the first as the absolute diagonal is the composition of the relative diagonal and a base change of the diagonal of $Y$ (which is representable by schemes), see Spaces, Section 52.3 . To prove the first assertion we have to show the following: Given a scheme $T$ and two pairs ( $a, Z_{1}$ ) and $\left(a, Z_{2}\right)$ over $T$ with identical first component satisfying 66.10.0.1 there is an open subscheme $V \subset T$ with the following property: For any morphism of schemes $h: T^{\prime} \rightarrow T$ we have

$$
h\left(T^{\prime}\right) \subset V \Leftrightarrow\left(T^{\prime} \times_{T} Z_{1}=T^{\prime} \times_{T} Z_{2} \text { as subspaces of } T^{\prime} \times_{Y} X\right)
$$

Let us construct $V$. Note that $Z_{1} \cap Z_{2}$ is open in $Z_{1}$ and in $Z_{2}$. Since $\left.\mathrm{pr}_{0}\right|_{Z_{i}}: Z_{i} \rightarrow T$ is finite, hence proper (see Morphisms of Spaces, Lemma 54.43.9) we see that

$$
\left.\left.E=\left.\operatorname{pr}_{0}\right|_{Z_{1}}\left(Z_{1} \backslash Z_{1} \cap Z_{2}\right)\right)\left.\cup \operatorname{pr}_{0}\right|_{Z_{2}}\left(Z_{2} \backslash Z_{1} \cap Z_{2}\right)\right)
$$

is closed in $T$. Now it is clear that $V=T \backslash E$ works.
04QE Lemma 66.10.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Suppose that $U$ is a scheme, $U \rightarrow Y$ is an étale morphism and $Z \subset U \times_{Y} X$ is an open subspace finite over $U$. Then the induced morphism $U \rightarrow(X / Y)_{\text {fin }}$ is étale.

Proof. This is formal from the description of the diagonal in Lemma 66.10.7 but we write it out since it is an important step in the development of the theory. We have to check that for any scheme $T$ over $S$ and a morphism $T \rightarrow(X / Y)_{\text {fin }}$ the projection map

$$
T \times_{(X / Y)_{f i n}} U \longrightarrow T
$$

is étale. Note that

$$
T \times_{(X / Y)_{f i n}} U=(X / Y)_{f i n} \times \times_{\left((X / Y)_{f i n} \times{ }_{Y}(X / Y)_{f i n}\right)}\left(T \times_{Y} U\right)
$$

Applying the result of Lemma 66.10 .7 we see that $T \times{ }_{(X / Y)_{f i n}} U$ is represented by an open subscheme of $T \times_{Y} U$. As the projection $T \times_{Y} U \rightarrow T$ is étale by Morphisms of Spaces, Lemma 54.38.4 we conclude.

04QF Lemma 66.10.9. Let $S$ be a scheme. Let

be a fibre product square of algebraic spaces over $S$. Then

is a fibre product square of sheaves on $(S c h / S)_{f p p f}$.

Proof. It follows immediately from the definitions that the sheaf $\left(X^{\prime} / Y^{\prime}\right)_{f \text { in }}$ is equal to the sheaf $Y^{\prime} \times_{Y}(X / Y)_{f i n}$.

04QG Lemma 66.10.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is separated and locally quasi-finite, then there exists a scheme $U$ étale over $Y$ and a surjective étale morphism $U \rightarrow(X / Y)_{\text {fin }}$ over $Y$.

Proof. Note that the assertion makes sense by the result of Lemma 66.10.7 on the diagonal of $(X / Y)_{f i n}$, see Spaces, Lemma 52.5.10. Let $V$ be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. By Lemma 66.10 .9 the morphism $\left(V \times_{Y} X / V\right)_{\text {fin }} \rightarrow(X / Y)_{f i n}$ is a base change of the map $V \rightarrow Y$ and hence is surjective and étale, see Spaces, Lemma 52.5.5. Hence it suffices to prove the lemma for $\left(V \times_{Y} X / V\right)_{\text {fin }}$. (Here we implicitly use that the composition of representable, surjective, and étale transformations of functors is again representable, surjective, and étale, see Spaces, Lemmas 52.3.2 and 52.5.4, and Morphisms, Lemmas 28.10.2 and 28.36 .3 ) Note that the properties of being separated and locally quasi-finite are preserved under base change, see Morphisms of Spaces, Lemmas 54.4.4 and 54.27.4 Hence $V \times_{Y} X \rightarrow V$ is separated and locally quasi-finite as well, and by Morphisms of Spaces, Proposition 54.47 .2 we see that $V \times_{Y} X$ is a scheme as well. Thus we may assume that $f: X \rightarrow Y$ is a separated and locally quasi-finite morphism of schemes.

Pick a point $y \in Y$. Pick $x_{1}, \ldots, x_{n} \in X$ points lying over $y$. Pick an étale neighbourhood $a:(U, u) \rightarrow(Y, y)$ and a decomposition

$$
U \times_{S} X=W \amalg \coprod_{i=1, \ldots, n} \coprod_{j=1, \ldots, m_{j}} V_{i, j}
$$

as in More on Morphisms, Lemma 36.30.5. Pick any subset

$$
I \subset\left\{(i, j) \mid 1 \leq i \leq n, 1 \leq j \leq m_{i}\right\}
$$

Given these choices we obtain a pair $(a, Z)$ with $Z=\bigcup_{(i, j) \in I} V_{i, j}$ which satisfies conditions 66.10.0.1. In other words we obtain a morphism $U \rightarrow(X / Y)_{\text {fin }}$. The construction of this morphism depends on all the things we picked above, so we should really write

$$
U\left(y, n, x_{1}, \ldots, x_{n}, a, I\right) \longrightarrow(X / Y)_{f i n}
$$

This morphism is étale by Lemma 66.10.8.
Claim: The disjoint union of all of these is surjective onto $(X / Y)_{f i n}$. It is clear that if the claim holds, then the lemma is true.

To show surjectivity we have to show the following (see Spaces, Remark 52.5.2): Given a scheme $T$ over $S$, a point $t \in T$, and a map $T \rightarrow(X / Y)_{f i n}$ we can find a datum $\left(y, n, x_{1}, \ldots, x_{n}, a, I\right)$ as above such that $t$ is in the image of the projection map

$$
U\left(y, n, x_{1}, \ldots, x_{n}, a, I\right) \times_{(X / Y)_{f i n}} T \longrightarrow T
$$

To prove this we may clearly replace $T$ by $\operatorname{Spec}(\overline{\kappa(t)})$ and $T \rightarrow(X / Y)_{\text {fin }}$ by the composition $\operatorname{Spec}(\overline{\kappa(t)}) \rightarrow T \rightarrow(X / Y)_{\text {fin }}$. In other words, we may assume that $T$ is the spectrum of an algebraically closed field.

Let $T=\operatorname{Spec}(k)$ be the spectrum of an algebraically closed field $k$. The morphism $T \rightarrow(X / Y)_{f i n}$ is given by a pair $(T \rightarrow Y, Z)$ satisfying conditions 66.10.0.1. Here is a picture:

Let $y \in Y$ be the image point of $T \rightarrow Y$. Since $Z$ is finite over $k$ it has finitely many points. Thus there exist finitely many points $x_{1}, \ldots, x_{n} \in X$ such that the image of $Z$ in $X$ is contained in $\left\{x_{1}, \ldots, x_{n}\right\}$. Choose $a:(U, u) \rightarrow(Y, y)$ adapted to $y$ and $x_{1}, \ldots, x_{n}$ as above, which gives the diagram

Since $k$ is algebraically closed and $\kappa(y) \subset \kappa(u)$ is finite separable we may factor the morphism $T=\operatorname{Spec}(k) \rightarrow Y$ through the morphism $u=\operatorname{Spec}(\kappa(u)) \rightarrow$ $\operatorname{Spec}(\kappa(y))=y \subset Y$. With this choice we obtain the commutative diagram:

We know that the image of the left upper arrow ends up in $\coprod V_{i, j}$. Recall also that $Z$ is an open subscheme of $\operatorname{Spec}(k) \times_{Y} X$ by definition of $(X / Y)_{\text {fin }}$ and that the right hand square is a fibre product square. Thus we see that

$$
Z \subset \coprod_{i=1, \ldots, n} \coprod_{j=1, \ldots, m_{j}} \operatorname{Spec}(k) \times_{U} V_{i, j}
$$

is an open subscheme. By construction (see More on Morphisms, Lemma 36.30.5) each $V_{i, j}$ has a unique point $v_{i, j}$ lying over $u$ with purely inseparable residue field extension $\kappa(u) \subset \kappa\left(v_{i, j}\right)$. Hence each $\operatorname{scheme} \operatorname{Spec}(k) \times_{U} V_{i, j}$ has exactly one point. Thus we see that

$$
Z=\coprod_{(i, j) \in I} \operatorname{Spec}(k) \times_{U} V_{i, j}
$$

for a unique subset $I \subset\left\{(i, j) \mid 1 \leq i \leq n, 1 \leq j \leq m_{i}\right\}$. Unwinding the definitions this shows that

$$
U\left(y, n, x_{1}, \ldots, x_{n}, a, I\right) \times_{(X / Y)_{f i n}} T
$$

with $I$ as found above is nonempty as desired.
04QH Proposition 66.10.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is separated and locally of finite type. Then $(X / Y)_{\text {fin }}$ is an algebraic space. Moreover, the morphism $(X / Y)_{f i n} \rightarrow Y$ is étale.
Proof. By Lemma 66.10.3 we may replace $X$ by the open subscheme which is locally quasi-finite over $Y$. Hence we may assume that $f$ is separated and locally quasi-finite. We will check the three conditions of Spaces, Definition 52.6.1. Condition (1) follows from Lemma 66.10.1. Condition (2) follows from Lemma 66.10.7.

Finally, condition (3) follows from Lemma 66.10.10. Thus $(X / Y)_{\text {fin }}$ is an algebraic space. Moreover, that lemma shows that there exists a commutative diagram

with horizontal arrow surjective and étale and south-east arrow étale. By Properties of Spaces, Lemma 53.15 .3 this implies that the south-west arrow is étale as well.

04QI Remark 66.10.12. The condition that $f$ be separated cannot be dropped from Proposition 66.10.11. An example is to take $X$ the affine line with zero doubled, see Schemes, Example 25.14.3, $Y=\mathbf{A}_{k}^{1}$ the affine line, and $X \rightarrow Y$ the obvious map. Recall that over $0 \in Y$ there are two points $0_{1}$ and $0_{2}$ in $X$. Thus $(X / Y)_{\text {fin }}$ has four points over 0 , namely $\emptyset,\left\{0_{1}\right\},\left\{0_{2}\right\},\left\{0_{1}, 0_{2}\right\}$. Of these four points only three can be lifted to an open subscheme of $U \times_{Y} X$ finite over $U$ for $U \rightarrow Y$ étale, namely $\emptyset,\left\{0_{1}\right\},\left\{0_{2}\right\}$. This shows that $(X / Y)_{\text {fin }}$ if representable by an algebraic space is not étale over $Y$. Similar arguments show that $(X / Y)_{\text {fin }}$ is really not an algebraic space. Details omitted.

04QJ Remark 66.10.13. Let $Y=\mathbf{A}_{\mathbf{R}}^{1}$ be the affine line over the real numbers, and let $X=\operatorname{Spec}(\mathbf{C})$ mapping to the $\mathbf{R}$-rational point 0 in $Y$. In this case the morphism $f: X \rightarrow Y$ is finite, but it is not the case that $(X / Y)_{\text {fin }}$ is a scheme. Namely, one can show that in this case the algebraic space $(X / Y)_{f i n}$ is isomorphic to the algebraic space of Spaces, Example 52.14 .2 associated to the extension $\mathbf{R} \subset \mathbf{C}$. Thus it is really necessary to leave the category of schemes in order to represent the sheaf $(X / Y)_{f i n}$, even when $f$ is a finite morphism.

04RI Lemma 66.10.14. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is separated, flat, and locally of finite presentation. In this case
(1) $(X / Y)_{\text {fin }} \rightarrow Y$ is separated, representable, and étale, and
(2) if $Y$ is a scheme, then $(X / Y)_{\text {fin }}$ is (representable by) a scheme.

Proof. Since $f$ is in particular separated and locally of finite type (see Morphisms of Spaces, Lemma 54.28 .5 we see that $(X / Y)_{f i n}$ is an algebraic space by Proposition 66.10.11. To prove that $(X / Y)_{f i n} \rightarrow Y$ is separated we have to show the following: Given a scheme $T$ and two pairs $\left(a, Z_{1}\right)$ and $\left(a, Z_{2}\right)$ over $T$ with identical first component satisfying 66.10.0.1 there is a closed subscheme $V \subset T$ with the following property: For any morphism of schemes $h: T^{\prime} \rightarrow T$ we have

$$
h \text { factors through } V \Leftrightarrow\left(T^{\prime} \times_{T} Z_{1}=T^{\prime} \times_{T} Z_{2} \text { as subspaces of } T^{\prime} \times_{Y} X\right)
$$

In the proof of Lemma 66.10 .7 we have seen that $V=T^{\prime} \backslash E$ is an open subscheme of $T^{\prime}$ with closed complement

$$
\left.\left.E=\left.\operatorname{pr}_{0}\right|_{Z_{1}}\left(Z_{1} \backslash Z_{1} \cap Z_{2}\right)\right)\left.\cup \operatorname{pr}_{0}\right|_{Z_{2}}\left(Z_{2} \backslash Z_{1} \cap Z_{2}\right)\right) .
$$

Thus everything comes down to showing that $E$ is also open. By Lemma 66.10.4 we see that $Z_{1}$ and $Z_{2}$ are closed in $T^{\prime} \times_{Y} X$. Hence $Z_{1} \backslash Z_{1} \cap Z_{2}$ is open in $Z_{1}$. As $f$ is flat and locally of finite presentation, so is $\left.\mathrm{pr}_{0}\right|_{Z_{1}}$. This is true as $Z_{1}$ is an open subspace of the base change $T^{\prime} \times_{Y} X$, and Morphisms of Spaces, Lemmas 54.28.3 and Lemmas 54.29.4. Hence $\left.\mathrm{pr}_{0}\right|_{Z_{1}}$ is open, see Morphisms of

Spaces, Lemma 54.29.6. Thus $\left.\left.\operatorname{pr}_{0}\right|_{Z_{1}}\left(Z_{1} \backslash Z_{1} \cap Z_{2}\right)\right)$ is open and it follows that $E$ is open as desired.

We have already seen that $(X / Y)_{\text {fin }} \rightarrow Y$ is étale, see Proposition 66.10.11 Hence now we know it is locally quasi-finite (see Morphisms of Spaces, Lemma 54.38.5) and separated, hence representable by Morphisms of Spaces, Lemma 54.48.1 The final assertion is clear (if you like you can use Morphisms of Spaces, Proposition 54.47.2.

Variant: Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\sigma: Y \rightarrow X$ be a section of $f$. For an algebraic space or a scheme $T$ over $S$ consider pairs $(a, Z)$ where

04RQ (66.10.14.1)

$$
\begin{gathered}
a: T \rightarrow Y \text { is a morphism over } S, \\
Z \subset T \times_{Y} X \text { is an open subspace } \\
\text { such that } \mathrm{pr}_{0} \mid Z: Z \rightarrow T \text { is finite and } \\
\left(1_{T}, \sigma \circ a\right): T \rightarrow T \times Y \text { factors through } Z .
\end{gathered}
$$

We will denote $(X / Y, \sigma)_{f i n}$ the subfunctor of $(X / Y)_{f i n}$ parametrizing these pairs.
04RR Lemma 66.10.15. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\sigma: Y \rightarrow X$ be a section of $f$. Consider the transformation of functors

$$
t:(X / Y, \sigma)_{f i n} \longrightarrow(X / Y)_{f i n}
$$

defined above. Then
(1) $t$ is representable by open immersions,
(2) if $f$ is separated, then $t$ is representable by open and closed immersions,
(3) if $(X / Y)_{\text {fin }}$ is an algebraic space, then $(X / Y, \sigma)_{f i n}$ is an algebraic space and an open subspace of $(X / Y)_{\text {fin }}$, and
(4) if $(X / Y)_{\text {fin }}$ is a scheme, then $(X / Y, \sigma)_{f i n}$ is an open subscheme of it.

Proof. Omitted. Hint: Given a pair $(a, Z)$ over $T$ as in 66.10.0.1 the inverse image of $Z$ by $\left(1_{T}, \sigma \circ a\right): T \rightarrow T \times_{Y} X$ is the open subscheme of $T$ we are looking for.

### 66.11. Finite collections of arrows

04RS Let $\mathcal{C}$ be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 38.13 this corresponds to a septuple (Ob, Arrows, $s, t, c, e, i$ ).

Using this data we can make another groupoid $\mathcal{C}_{\text {fin }}$ as follows:
(1) An object of $\mathcal{C}_{\text {fin }}$ consists of a finite subset $Z \subset$ Arrows with the following properties:
(a) $s(Z)=\{u\}$ is a singleton, and
(b) $e(u) \in Z$.
(2) A morphism of $\mathcal{C}_{f i n}$ consists of a pair $(Z, z)$, where $Z$ is an object of $\mathcal{C}_{\text {fin }}$ and $z \in Z$.
(3) The source of $(Z, z)$ is $Z$.
(4) The target of $(Z, z)$ is $t(Z, z)=\left\{z^{\prime} \circ z^{-1} ; z^{\prime} \in Z\right\}$.
(5) Given $\left(Z_{1}, z_{1}\right),\left(Z_{2}, z_{2}\right)$ such that $s\left(Z_{1}, z_{1}\right)=t\left(Z_{2}, z_{2}\right)$ the composition $\left(Z_{1}, z_{1}\right) \circ\left(Z_{2}, z_{2}\right)$ is $\left(Z_{2}, z_{1} \circ z_{2}\right)$.

We omit the verification that this defines a groupoid. Pictorially an object of $\mathcal{C}_{\text {fin }}$ can be viewed as a diagram

To make a morphism of $\mathcal{C}_{f i n}$ you pick one of the arrows and you precompose the other arrows by its inverse. For example if we pick the middle horizontal arrow then the target is the picture

Note that the cardinalities of $s(Z, z)$ and $t(Z, z)$ are equal. So $\mathcal{C}_{f i n}$ is really a countable disjoint union of groupoids.

### 66.12. The finite part of a groupoid

04RT In this section we are going to use the idea explained in Section 66.11 to take the finite part of a groupoid in algebraic spaces.
Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let ( $U, R, s, t, c, e, i$ ) be a groupoid in algebraic spaces over $B$. Assumption: The morphisms $s, t$ are separated and locally of finite type. This notation and assumption will we be fixed throughout this section.

Denote $R_{s}$ the algebraic space $R$ seen as an algebraic space over $U$ via $s$. Let $U^{\prime}=\left(R_{s} / U, e\right)_{\text {fin }}$. Since $s$ is separated and locally of finite type, by Proposition 66.10 .11 and Lemma 66.10.15, we see that $U^{\prime}$ is an algebraic space endowed with an étale morphism $g: U^{\prime} \rightarrow U$. Moreover, by Lemma 66.10.1 there exists a universal open subspace $Z_{\text {univ }} \subset R \times_{s, U, g} U^{\prime}$ which is finite over $U^{\prime}$ and such that $\left(1_{U^{\prime}}, e \circ g\right)$ : $U^{\prime} \rightarrow R \times_{s, U, g} U^{\prime}$ factors through $Z_{\text {univ }}$. Moreover, by Lemma 66.10.4 the open subspace $Z_{\text {univ }}$ is also closed in $R \times_{s, U^{\prime}, g} U$. Picture so far:

Let $T$ be a scheme over $B$. We see that a $T$-valued point of $Z_{\text {univ }}$ may be viewed as a triple $(u, Z, z)$ where
(1) $u: T \rightarrow U$ is a $T$-valued point of $U$,
(2) $Z \subset R \times_{s, U, u} T$ is an open and closed subspace finite over $T$ such that $\left(e \circ u, 1_{T}\right)$ factors through it, and
(3) $z: T \rightarrow R$ is a $T$-valued point of $R$ with $s \circ z=u$ and such that $\left(z, 1_{T}\right)$ factors through $Z$.
Having said this, it is morally clear from the discussion in Section 66.11 that we can turn $\left(Z_{u n i v}, U^{\prime}\right)$ into a groupoid in algebraic spaces over $B$. To make sure will define the morphisms $s^{\prime}, t^{\prime}, c^{\prime}, e^{\prime}, i^{\prime}$ one by one using the functorial point of view. (Please don't read this before reading and understanding the simple construction in Section 66.11.)

The morphism $s^{\prime}: Z_{\text {univ }} \rightarrow U^{\prime}$ corresponds to the rule

$$
s^{\prime}:(u, Z, z) \mapsto(u, Z)
$$

The morphism $t^{\prime}: Z_{\text {univ }} \rightarrow U^{\prime}$ is given by the rule

$$
t^{\prime}:(u, Z, z) \mapsto(t \circ z, c(Z, i \circ z)) .
$$

The entry $c(Z, i \circ z)$ makes sense as the map $c(-, i \circ z): R \times_{s, U, u} T \rightarrow R \times_{s, U, t \circ z} T$ is an isomorphism with inverse $c(-, z)$. The morphism $e^{\prime}: U^{\prime} \rightarrow Z_{\text {univ }}$ is given by the rule

$$
e^{\prime}:(u, Z) \mapsto\left(u, Z,\left(e \circ u, 1_{T}\right)\right)
$$

Note that this makes sense by the requirement that $\left(e \circ u, 1_{T}\right)$ factors through $Z$. The morphism $i^{\prime}: Z_{\text {univ }} \rightarrow Z_{\text {univ }}$ is given by the rule

$$
i^{\prime}:(u, Z, z) \mapsto(t \circ z, c(Z, i \circ z), i \circ z) .
$$

Finally, composition is defined by the rule

$$
c^{\prime}:\left(\left(u_{1}, Z_{1}, z_{1}\right),\left(u_{2}, Z_{2}, z_{2}\right)\right) \mapsto\left(u_{2}, Z_{2}, z_{1} \circ z_{2}\right) .
$$

We omit the verification that the axioms of a groupoid in algebraic spaces hold for $\left(U^{\prime}, Z_{u n i v}, s^{\prime}, t^{\prime}, c^{\prime}, e^{\prime}, i^{\prime}\right)$.

A final piece of information is that there is a canonical morphism of groupoids

$$
\left(U^{\prime}, Z_{u n i v}, s^{\prime}, t^{\prime}, c^{\prime}, e^{\prime}, i^{\prime}\right) \longrightarrow(U, R, s, t, c, e, i)
$$

Namely, the morphism $U^{\prime} \rightarrow U$ is the morphism $g: U^{\prime} \rightarrow U$ which is defined by the rule $(u, Z) \mapsto u$. The morphism $Z_{\text {univ }} \rightarrow R$ is defined by the rule $(u, Z, z) \mapsto z$. This finishes the construction. Let us summarize our findings as follows.

04RU Lemma 66.12.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c, e, i)$ be a groupoid in algebraic spaces over $B$. Assume the morphisms $s, t$ are separated and locally of finite type. There exists a canonical morphism

$$
\left(U^{\prime}, Z_{u n i v}, s^{\prime}, t^{\prime}, c^{\prime}, e^{\prime}, i^{\prime}\right) \longrightarrow(U, R, s, t, c, e, i)
$$

of groupoids in algebraic spaces over $B$ where
(1) $g: U^{\prime} \rightarrow U$ is identified with $\left(R_{s} / U, e\right)_{f i n} \rightarrow U$, and
(2) $Z_{\text {univ }} \subset R \times_{s, U, g} U^{\prime}$ is the universal open (and closed) subspace finite over $U^{\prime}$ which contains the base change of the unit $e$.

Proof. See discussion above.

### 66.13. Étale localization of groupoid schemes

04RJ In this section we prove results similar to [KM97, Proposition 4.2]. We try to be a bit more general, and we try to avoid using Hilbert schemes by using the finite part of a morphism instead. The goal is to "split" a groupoid in algebraic spaces over a point after étale localization. Here is the definition (very similar to KM97, Definition 4.1]).
04RK Definition 66.13.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$ Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. Let $u \in|U|$ be a point.
(1) We say $R$ is split over $u$ if there exists an open subspace $P \subset R$ such that
(a) $\left(U, P,\left.s\right|_{P},\left.t\right|_{P},\left.c\right|_{P \times_{s, U, t} P}\right)$ is a groupoid in algebraic spaces over $B$,
(b) $\left.s\right|_{P},\left.t\right|_{P}$ are finite, and
(c) $\{r \in|R|: s(r)=u, t(r)=u\} \subset P$.

The choice of such a $P$ will be called a splitting of $R$ over $u$.
(2) We say $R$ is quasi-split over $u$ if there exists an open subspace $P \subset R$ such that
(a) $\left(U, P,\left.s\right|_{P},\left.t\right|_{P},\left.c\right|_{P \times_{s, U, t} P}\right)$ is a groupoid in algebraic spaces over $B$,
(b) $\left.s\right|_{P},\left.t\right|_{P}$ are finite, and
(c) $e(u) \in|P|^{2}$.

The choice of such a $P$ will be called a quasi-splitting of $R$ over $u$.
Note the similarity of the conditions on $P$ to the conditions on pairs in 66.10.0.1). In particular, if $s, t$ are separated, then $P$ is also closed in $R$ (see Lemma 66.10.4.
Suppose we start with a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$ and a point $u \in|U|$. Since the goal is to split the groupoid after étale localization we may as well replace $U$ by an affine scheme (what we mean is that this is harmless for any possible application). Moreover, the additional hypotheses we are going to have to impose will force $R$ to be a scheme at least in a neighbourhood of $\{r \in|R|: s(r)=u, t(r)=u\}$ or $e(u)$. This is why we start with a groupoid scheme as described below. However, our technique of proof leads us outside of the category of schemes, which is why we have formulated a splitting for the case of groupoids in algebraic spaces above. On the other hand, we know of no applications but the case where the morphisms $s, t$ are also flat and of finite presentation, in which case we end up back in the category of schemes.
04RL Situation 66.13.2. (Assumptions for splitting.) Let $S$ be a scheme. Let ( $U, R, s, t, c$ ) be a groupoid scheme over $S$. Let $u \in U$ be a point. Assume that
(1) $s, t: R \rightarrow U$ are separated,
(2) $s, t$ are locally of finite type,
(3) the set $\{r \in R: s(r)=u, t(r)=u\}$ is finite, and
(4) $s$ is quasi-finite at each point of the set in (3).

Note that assumptions (3) and (4) are implied by the assumption that the fibre $s^{-1}(\{u\})$ is finite, see Morphisms, Lemma 28.20.7.
04RV Situation 66.13.3. (Assumptions for quasi-splitting.) Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $u \in U$ be a point. Assume that
(1) $s, t: R \rightarrow U$ are separated,
(2) $s, t$ are locally of finite type, and

[^181](3) $s$ is quasi-finite at $e(u)$.

It turns out that for applications to the existence theorems for algebraic spaces the case of quasi-splittings is sufficient. In fact, it is for us somehow a more natural case to consider, as in the stacks project there are no finiteness conditions on the diagonal of an algebraic space, hence the assumption that $\{r \in R: s(r)=u, t(r)=u\}$ is finite need not hold even for a presentation $X=U / R$ of an algebraic space $X$.

03FM Lemma 66.13.4. Assumptions and notation as in Situation 66.13.2. Then there exists an algebraic space $U^{\prime}$, an étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime}: \operatorname{Spec}(\kappa(u)) \rightarrow$ $U^{\prime}$ lying over $u: \operatorname{Spec}(\kappa(u)) \rightarrow U$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ splits over $u^{\prime}$.

Proof. Let $f:\left(U^{\prime}, Z_{\text {univ }}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ be as constructed in Lemma 66.12.1. Recall that $R^{\prime}=R \times{ }_{\left(U \times{ }_{S} U\right)}\left(U^{\prime} \times_{S} U^{\prime}\right)$. Thus we get a morphism $\left(f, t^{\prime}, s^{\prime}\right)$ : $Z_{\text {univ }} \rightarrow R^{\prime}$ of groupoids in algebraic spaces

$$
\left(U^{\prime}, Z_{u n i v}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)
$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times{ }_{s, U, g} U^{\prime}$ is open and $R^{\prime} \rightarrow R \times_{s, U, g} U^{\prime}$ is étale (as a base change of $\left.U^{\prime} \rightarrow U\right)$ we see that $Z_{\text {univ }} \rightarrow R^{\prime}$ is an open immersion. By construction the morphisms $s^{\prime}, t^{\prime}: Z_{\text {univ }} \rightarrow U^{\prime}$ are finite. It remains to find the point $u^{\prime}$ of $U^{\prime}$.

We think of $u$ as a morphism $\operatorname{Spec}(\kappa(u)) \rightarrow U$ as in the statement of the lemma. Set $F_{u}=R \times_{s, U} \operatorname{Spec}(\kappa(u))$. The set $\{r \in R: s(r)=u, t(r)=u\}$ is finite by assumption and $F_{u} \rightarrow \operatorname{Spec}(\kappa(u))$ is quasi-finite at each of its elements. Hence we can find a decomposition into open and closed subschemes

$$
F_{u}=Z_{u} \amalg \text { Rest }
$$

for some scheme $Z_{u}$ finite over $\kappa(u)$ whose support is $\{r \in R: s(r)=u, t(r)=u\}$. Note that $e(u) \in Z_{u}$. Hence by the construction of $U^{\prime}$ in Section $66.12\left(u, Z_{u}\right)$ defines a $\operatorname{Spec}(\kappa(u))$-valued point $u^{\prime}$ of $U^{\prime}$.

We still have to show that the set $\left\{r^{\prime} \in\left|R^{\prime}\right|: s^{\prime}\left(r^{\prime}\right)=u^{\prime}, t^{\prime}\left(r^{\prime}\right)=u^{\prime}\right\}$ is contained in $\left|Z_{u n i v}\right|$. Pick any point $r^{\prime}$ in this set and represent it by a morphism $r^{\prime}: \operatorname{Spec}(k) \rightarrow$ $R^{\prime}$. Denote $z: \operatorname{Spec}(k) \rightarrow R$ the composition of $r^{\prime}$ with the map $R^{\prime} \rightarrow R$. Since $\kappa(u)=\kappa\left(u^{\prime}\right)$, and since $s^{\prime}\left(r^{\prime}\right)=u^{\prime}, t\left(r^{\prime}\right)=u^{\prime}$ no information is lost by considering the point $z$ rather than the point $r^{\prime}$, i.e., we can recover $r^{\prime}$ from the point $z$. For example $z$ is an element of the set $\{r \in R: s(r)=u, t(r)=u\}$ by our assumption on $r^{\prime}$. The composition $s \circ z: \operatorname{Spec}(k) \rightarrow U$ factors through $u$, so we may think of $s \circ z$ as a morphism $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(\kappa(u))$. Hence we can consider the triple

$$
\left(s \circ z, Z_{u} \times{ }_{\operatorname{Spec}(\kappa(u)), s \circ z} \operatorname{Spec}(k), z\right)
$$

where $Z_{u}$ is as above. This defines a $\operatorname{Spec}(k)$-valued point of $Z_{u n i v}$ above whose image under the map $Z_{\text {univ }} \rightarrow R^{\prime}$ is the point $r^{\prime}$ by the relationship between $z$ and $r^{\prime}$ mentioned above. This finishes the proof.

04RW Lemma 66.13.5. Assumptions and notation as in Situation 66.13.3. Then there exists an algebraic space $U^{\prime}$, an étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime}: \operatorname{Spec}(\kappa(u)) \rightarrow$ $U^{\prime}$ lying over $u: \operatorname{Spec}(\kappa(u)) \rightarrow U$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ is quasi-split over $u^{\prime}$.

Proof. The proof is almost exactly the same as the proof of Lemma 66.13.4 Let $f:\left(U^{\prime}, Z_{\text {univ }}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ be as constructed in Lemma 66.12.1. Recall that $R^{\prime}=R \times_{\left(U \times{ }_{S} U\right)}\left(U^{\prime} \times_{S} U^{\prime}\right)$. Thus we get a morphism $\left(f, t^{\prime}, s^{\prime}\right): Z_{u n i v} \rightarrow R^{\prime}$ of groupoids in algebraic spaces

$$
\left(U^{\prime}, Z_{u n i v}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)
$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times_{s, U, g} U^{\prime}$ is open and $R^{\prime} \rightarrow R \times_{s, U, g} U^{\prime}$ is étale (as a base change of $\left.U^{\prime} \rightarrow U\right)$ we see that $Z_{\text {univ }} \rightarrow R^{\prime}$ is an open immersion. By construction the morphisms $s^{\prime}, t^{\prime}: Z_{\text {univ }} \rightarrow U^{\prime}$ are finite. It remains to find the point $u^{\prime}$ of $U^{\prime}$.
We think of $u$ as a morphism $\operatorname{Spec}(\kappa(u)) \rightarrow U$ as in the statement of the lemma. Set $F_{u}=R \times_{s, U} \operatorname{Spec}(\kappa(u))$. The morphism $F_{u} \rightarrow \operatorname{Spec}(\kappa(u))$ is quasi-finite at $e(u)$ by assumption. Hence we can find a decomposition into open and closed subschemes

$$
F_{u}=Z_{u} \amalg \text { Rest }
$$

for some scheme $Z_{u}$ finite over $\kappa(u)$ whose support is $e(u)$. Hence by the construction of $U^{\prime}$ in Section $66.12\left(u, Z_{u}\right)$ defines a $\operatorname{Spec}(\kappa(u))$-valued point $u^{\prime}$ of $U^{\prime}$. To finish the proof we have to show that $e^{\prime}\left(u^{\prime}\right) \in Z_{\text {univ }}$ which is clear.

Finally, when we add additional assumptions we obtain schemes.
04RX Lemma 66.13.6. Assumptions and notation as in Situation 66.13.2. Assume in addition that $s, t$ are flat and locally of finite presentation. Then there exists a scheme $U^{\prime}$, a separated étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime} \in U^{\prime}$ lying over $u$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ splits over $u^{\prime}$.
Proof. This follows from the construction of $U^{\prime}$ in the proof of Lemma 66.13.4 because in this case $U^{\prime}=\left(R_{s} / U, e\right)_{f i n}$ is a scheme separated over $U$ by Lemmas 66.10 .14 and 66.10.15

04RY Lemma 66.13.7. Assumptions and notation as in Situation 66.13.3. Assume in addition that $s, t$ are flat and locally of finite presentation. Then there exists a scheme $U^{\prime}$, a separated étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime} \in U^{\prime}$ lying over $u$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ is quasi-split over $u^{\prime}$.

Proof. This follows from the construction of $U^{\prime}$ in the proof of Lemma 66.13.5 because in this case $U^{\prime}=\left(R_{s} / U, e\right)_{f i n}$ is a scheme separated over $U$ by Lemmas 66.10 .14 and 66.10.15

In fact we can obtain affine schemes by applying an earlier result on finite locally free groupoids.

04RZ Lemma 66.13.8. Assumptions and notation as in Situation 66.13.2. Assume in addition that $s, t$ are flat and locally of finite presentation and that $V$ is affine. Then there exists an affine scheme $U^{\prime}$, an étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime} \in U^{\prime}$ lying over $u$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ splits over $u^{\prime}$.

Proof. Let $U^{\prime} \rightarrow U$ and $u^{\prime} \in U^{\prime}$ be the étale morphism of schemes we found in Lemma 66.13.6 Let $P \subset R^{\prime}$ be the splitting of $R^{\prime}$ over $u^{\prime}$. By More on Groupoids, Lemma 39.8 .1 the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are flat and locally of finite presentation. They are finite by assumption. Hence $s^{\prime}, t^{\prime}$ are finite locally
free, see Morphisms, Lemma 28.45.2. In particular $t\left(s^{-1}\left(u^{\prime}\right)\right)$ is a finite set of points $\left\{u_{1}^{\prime}, u_{2}^{\prime}, \ldots, u_{n}^{\prime}\right\}$ of $U^{\prime}$. Choose a quasi-compact open $W \subset U^{\prime}$ containing each $u_{i}^{\prime}$. As $U$ is affine the morphism $W \rightarrow U$ is quasi-compact (see Schemes, Lemma 25.19.2. The morphism $W \rightarrow U$ is also locally quasi-finite (see Morphisms, Lemma 28.36.6 and separated. Hence by More on Morphisms, Lemma 36.31 .2 (a version of Zariski's Main Theorem) we conclude that $W$ is quasi-affine. By Properties, Lemma 27.29 .5 we see that $\left\{u_{1}^{\prime}, \ldots, u_{n}^{\prime}\right\}$ are contained in an affine open of $U^{\prime}$. Thus we may apply Groupoids, Lemma 38.24 .1 to conclude that there exists an affine $P$-invariant open $U^{\prime \prime} \subset U^{\prime}$ which contains $u^{\prime}$.
To finish the proof denote $R^{\prime \prime}=\left.R\right|_{U^{\prime \prime}}$ the restriction of $R$ to $U^{\prime \prime}$. This is the same as the restriction of $R^{\prime}$ to $U^{\prime \prime}$. As $P \subset R^{\prime}$ is an open and closed subscheme, so is $\left.P\right|_{U^{\prime \prime}} \subset R^{\prime \prime}$. By construction the open subscheme $U^{\prime \prime} \subset U^{\prime}$ is $P$-invariant which means that $\left.P\right|_{U^{\prime \prime}}=\left(\left.s^{\prime}\right|_{P}\right)^{-1}\left(U^{\prime \prime}\right)=\left(\left.t^{\prime}\right|_{P}\right)^{-1}\left(U^{\prime \prime}\right)$ (see discussion in Groupoids, Section 38.19 so the restrictions of $s^{\prime \prime}$ and $t^{\prime \prime}$ to $\left.P\right|_{U^{\prime \prime}}$ are still finite. The sub groupoid scheme $\left.P\right|_{U^{\prime \prime}}$ is still a splitting of $R^{\prime \prime}$ over $u^{\prime \prime}$; above we verified (a), (b) and (c) holds as $\left\{r^{\prime} \in R^{\prime}: t^{\prime}\left(r^{\prime}\right)=u^{\prime}, s^{\prime}\left(r^{\prime}\right)=u^{\prime}\right\}=\left\{r^{\prime \prime} \in R^{\prime \prime}: t^{\prime \prime}\left(r^{\prime \prime}\right)=\right.$ $\left.u^{\prime}, s^{\prime \prime}\left(r^{\prime \prime}\right)=u^{\prime}\right\}$ trivially. The lemma is proved.

04S0 Lemma 66.13.9. Assumptions and notation as in Situation 66.13.3. Assume in addition that $s, t$ are flat and locally of finite presentation and that $U$ is affine. Then there exists an affine scheme $U^{\prime}$, an étale morphism $U^{\prime} \rightarrow U$, and a point $u^{\prime} \in U^{\prime}$ lying over $u$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ of $R$ to $U^{\prime}$ is quasi-split over $u^{\prime}$.
Proof. The proof of this lemma is literally the same as the proof of Lemma 66.13.8 except that "splitting" needs to be replaced by "quasi-splitting" (2 times) and that the reference to Lemma 66.13.6, needs to be replaced by a reference to Lemma 66.13 .7

## CHAPTER 67

## Bootstrap

### 67.1. Introduction

046B In this chapter we use the material from the preceding sections to give criteria under which a presheaf of sets on the category of schemes is an algebraic space. Some of this material comes from the work of Artin, see Art69b, Art70, Art73, Art71b, Art71a, Art69a, Art69c, and Art74. However, our method will be to use as much as possible arguments similar to those of the paper by Keel and Mori, see KM97.

### 67.2. Conventions

046C The standing assumption is that all schemes are contained in a big fppf site $S_{c c_{f p p f}}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 67.3. Morphisms representable by algebraic spaces

02YP Here we define the notion of one presheaf being relatively representable by algebraic spaces over another, and we prove some properties of this notion.

02YQ Definition 67.3.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F, G$ be presheaves on $S c h_{f p p f} / S$. We say a morphism $a: F \rightarrow G$ is representable by algebraic spaces if for every $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and any $\xi: U \rightarrow G$ the fiber product $U \times_{\xi, G} F$ is an algebraic space.

Here is a sanity check.
03BN Lemma 67.3.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then $f$ is representable by algebraic spaces.

Proof. This is formal. It relies on the fact that the category of algebraic spaces over $S$ has fibre products, see Spaces, Lemma 52.7.3
$03 Y 0$ Lemma 67.3.3. Let $S$ be a scheme. Let

be a fibre square of presheaves on $(S c h / S)_{\text {fppf }}$. If a is representable by algebraic spaces so is $a^{\prime}$.
Proof. Omitted. Hint: This is formal.
02YR Lemma 67.3.4. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be representable by algebraic spaces. If $G$ is a sheaf, then so is $F$.

Proof. (Same as the proof of Spaces, Lemma 52.3.5.) Let $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ be a covering of the site $(S c h / S)_{\text {fppf }}$. Let $s_{i} \in F\left(T_{i}\right)$ which satisfy the sheaf condition. Then $\sigma_{i}=a\left(s_{i}\right) \in G\left(T_{i}\right)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_{i}=\left.\sigma\right|_{T_{i}}$. By assumption $F^{\prime}=h_{T} \times_{\sigma, G, a} F$ is a sheaf. Note that $\left(\varphi_{i}, s_{i}\right) \in F^{\prime}\left(T_{i}\right)$ satisfy the sheaf condition also, and hence come from some unique $\left(\mathrm{id}_{T}, s\right) \in F^{\prime}(T)$. Clearly $s$ is the section of $F$ we are looking for.

05LA Lemma 67.3.5. Let $S$ be a scheme contained in $S_{\text {Lch }}^{\text {fppf }}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be representable by algebraic spaces. Then $\Delta_{F / G}: F \rightarrow F \times{ }_{G} F$ is representable by algebraic spaces.

Proof. (Same as the proof of Spaces, Lemma 52.3.6) Let $U$ be a scheme. Let $\xi=\left(\xi_{1}, \xi_{2}\right) \in\left(F \times_{G} F\right)(U)$. Set $\xi^{\prime}=a\left(\xi_{1}\right)=a\left(\xi_{2}\right) \in G(U)$. By assumption there exist an algebraic space $V$ and a morphism $V \rightarrow U$ representing the fibre product $U \times{ }_{\xi^{\prime}, G} F$. In particular, the elements $\xi_{1}, \xi_{2}$ give morphisms $f_{1}, f_{2}: U \rightarrow V$ over $U$. Because $V$ represents the fibre product $U \times_{\xi^{\prime}, G} F$ and because $\xi^{\prime}=a \circ \xi_{1}=a \circ \xi_{2}$ we see that if $g: U^{\prime} \rightarrow U$ is a morphism then

$$
g^{*} \xi_{1}=g^{*} \xi_{2} \Leftrightarrow f_{1} \circ g=f_{2} \circ g
$$

In other words, we see that $U \times_{\xi, F \times{ }_{G} F} F$ is represented by $V \times_{\Delta, V \times V,\left(f_{1}, f_{2}\right)} U$ which is an algebraic space.

The proof of Lemma 67.3 .6 below is actually slightly tricky. Namely, we cannot use the argument of the proof of Spaces, Lemma 52.11 .3 because we do not yet know that a composition of transformations representable by algebraic spaces is representable by algebraic spaces. In fact, we will use this lemma to prove that statement.

02YS Lemma 67.3.6. Let $S$ be a scheme contained in $S_{c h} h_{f p p f}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be representable by algebraic spaces. If $G$ is an algebraic space, then so is $F$.

Proof. We have seen in Lemma 67.3.4 that $F$ is a sheaf.
Let $U$ be a scheme and let $U \rightarrow G$ be a surjective étale morphism. In this case $U \times{ }_{G} F$ is an algebraic space. Let $W$ be a scheme and let $W \rightarrow U \times{ }_{G} F$ be a surjective étale morphism.

First we claim that $W \rightarrow F$ is representable. To see this let $X$ be a scheme and let $X \rightarrow F$ be a morphism. Then

$$
W \times_{F} X=W \times_{U \times{ }_{G} F} U \times_{G} F \times_{F} X=W \times_{U \times{ }_{G} F}\left(U \times_{G} X\right)
$$

Since both $U \times_{G} F$ and $G$ are algebraic spaces we see that this is a scheme.
Next, we claim that $W \rightarrow F$ is surjective and étale (this makes sense now that we know it is representable). This follows from the formula above since both $W \rightarrow$
$U \times_{G} F$ and $U \rightarrow G$ are étale and surjective, hence $W \times_{U \times{ }_{G} F}\left(U \times_{G} X\right) \rightarrow U \times_{G} X$ and $U \times_{G} X \rightarrow X$ are surjective and étale, and the composition of surjective étale morphisms is surjective and étale.
Set $R=W \times_{F} W$. By the above $R$ is a scheme and the projections $t, s: R \rightarrow W$ are étale. It is clear that $R$ is an equivalence relation, and $W \rightarrow F$ is a surjection of sheaves. Hence $R$ is an étale equivalence relation and $F=W / R$. Hence $F$ is an algebraic space by Spaces, Theorem 52.10.5.

03XY Lemma 67.3.7. Let $S$ be a scheme. Let $a: F \rightarrow G$ be a map of presheaves on $(S c h / S)_{\text {fppf }}$. Suppose $a: F \rightarrow G$ is representable by algebraic spaces. If $X$ is an algebraic space over $S$, and $X \rightarrow G$ is a map of presheaves then $X \times_{G} F$ is an algebraic space.

Proof. By Lemma 67.3.3 the transformation $X \times_{G} F \rightarrow X$ is representable by algebraic spaces. Hence it is an algebraic space by Lemma 67.3.6.
$03 Y 1$ Lemma 67.3.8. Let $S$ be a scheme. Let

$$
F \xrightarrow{a} G \xrightarrow{b} H
$$

be maps of presheaves on $(S c h / S)_{\text {fppf }}$. If $a$ and $b$ are representable by algebraic spaces, so is $b \circ a$.

Proof. Let $T$ be a scheme over $S$, and let $T \rightarrow H$ be a morphism. By assumption $T \times_{H} G$ is an algebraic space. Hence by Lemma 67.3.7 we see that $T \times_{H} F=$ $\left(T \times_{H} G\right) \times_{G} F$ is an algebraic space as well.
046D Lemma 67.3.9. Let $S$ be a scheme. Let $F_{i}, G_{i}:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets, $i=1,2$. Let $a_{i}: F_{i} \rightarrow G_{i}, i=1,2$ be representable by algebraic spaces. Then

$$
a_{1} \times a_{2}: F_{1} \times F_{2} \longrightarrow G_{1} \times G_{2}
$$

is a representable by algebraic spaces.
Proof. Write $a_{1} \times a_{2}$ as the composition $F_{1} \times F_{2} \rightarrow G_{1} \times F_{2} \rightarrow G_{1} \times G_{2}$. The first arrow is the base change of $a_{1}$ by the map $G_{1} \times F_{2} \rightarrow G_{1}$, and the second arrow is the base change of $a_{2}$ by the map $G_{1} \times G_{2} \rightarrow G_{2}$. Hence this lemma is a formal consequence of Lemmas 67.3 .8 and 67.3 .3 .

0AMN Lemma 67.3.10. Let $S$ be a scheme. Let $a: F \rightarrow G$ and $b: G \rightarrow H$ be transformations of functors $(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Assume
(1) $\Delta: G \rightarrow G \times_{H} G$ is representable by algebraic spaces, and
(2) $b \circ a: F \rightarrow H$ is representable by algebraic spaces.

Then a is representable by algebraic spaces.
Proof. Let $U$ be a scheme over $S$ and let $\xi \in G(U)$. Then

$$
U \times_{\xi, G, a} F=\left(U \times_{b(\xi), H, b \circ a} F\right) \times \times_{(\xi, a),\left(G \times_{H} G\right), \Delta} G
$$

Hence the result using Lemma 67.3.7.
07WE Lemma 67.3.11. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$. Let $F$ be a presheaf of sets on $(S c h / S)_{\text {fppf }}$. Assume
(1) $F$ is a sheaf for the Zariski topology on $(S c h / S)_{f p p f}$,
(2) there exists an index set $I$ and subfunctors $F_{i} \subset F$ such that
(a) each $F_{i}$ is an fppf sheaf,
(b) each $F_{i} \rightarrow F$ is representable by algebraic spaces,
(c) $\coprod F_{i} \rightarrow F$ becomes surjective after fppf sheafification.

Then $F$ is an fppf sheaf.
Proof. Let $T \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and let $s \in F(T)$. By $(2)(c)$ there exists an fppf covering $\left\{T_{j} \rightarrow T\right\}$ such that $\left.s\right|_{T_{j}}$ is a section of $F_{\alpha(j)}$ for some $\alpha(j) \in I$. Let $W_{j} \subset T$ be the image of $T_{j} \rightarrow T$ which is an open subscheme Morphisms, Lemma 28.25 .9 . By (2)(b) we see $F_{\alpha(j)} \times{ }_{F,\left.s\right|_{W_{j}}} W_{j} \rightarrow W_{j}$ is a monomorphism of algebraic spaces through which $T_{j}$ factors. Since $\left\{T_{j} \rightarrow W_{j}\right\}$ is an fppf covering, we conclude that $F_{\alpha(j)} \times{ }_{F,\left.s\right|_{W_{j}}} W_{j}=W_{j}$, in other words $\left.s\right|_{W_{j}} \in F_{\alpha(j)}\left(W_{j}\right)$. Hence we conclude that $\coprod F_{i} \rightarrow F$ is surjective for the Zariski topology.

Let $\left\{T_{j} \rightarrow T\right\}$ be an fppf covering in $(S c h / S)_{f p p f}$. Let $s, s^{\prime} \in F(T)$ with $\left.s\right|_{T_{j}}=\left.s^{\prime}\right|_{T_{j}}$ for all $j$. We want to show that $s, s^{\prime}$ are equal. As $F$ is a Zariski sheaf by (1) we may work Zariski locally on $T$. By the result of the previous paragraph we may assume there exist $i$ such that $s \in F_{i}(T)$. Then we see that $\left.s^{\prime}\right|_{T_{j}}$ is a section of $F_{i}$. By (2)(b) we see $F_{i} \times{ }_{F, s^{\prime}} T \rightarrow T$ is a monomorphism of algebraic spaces through which all of the $T_{j}$ factor. Hence we conclude that $s^{\prime} \in F_{i}(T)$. Since $F_{i}$ is a sheaf for the fppf topology we conclude that $s=s^{\prime}$.
Let $\left\{T_{j} \rightarrow T\right\}$ be an fppf covering in $(S c h / S)_{\text {fppf }}$ and let $s_{j} \in F\left(T_{j}\right)$ such that $\left.s_{j}\right|_{T_{j} \times{ }_{T} T_{j^{\prime}}}=\left.s_{j^{\prime}}\right|_{T_{j} \times{ }_{T} T_{j^{\prime}}}$. By assumption (2)(b) we may refine the covering and assume that $s_{j} \in F_{\alpha(j)}\left(T_{j}\right)$ for some $\alpha(j) \in I$. Let $W_{j} \subset T$ be the image of $T_{j} \rightarrow T$ which is an open subscheme Morphisms, Lemma 28.25.9. Then $\left\{T_{j} \rightarrow W_{j}\right\}$ is an fppf covering. Since $F_{\alpha(j)}$ is a sub presheaf of $F$ we see that the two restrictions of $s_{j}$ to $T_{j} \times_{W_{j}} T_{j}$ agree as elements of $F_{\alpha(j)}\left(T_{j} \times_{W_{j}} T_{j}\right)$. Hence, the sheaf condition for $F_{\alpha(j)}$ implies there exists a $s_{j}^{\prime} \in F_{\alpha(j)}\left(W_{j}\right)$ whose restriction to $T_{j}$ is $s_{j}$. For a pair of indices $j$ and $j^{\prime}$ the sections $\left.s_{j}^{\prime}\right|_{W_{j} \cap W_{j^{\prime}}}$ and $\left.s_{j^{\prime}}^{\prime}\right|_{W_{j} \cap W_{j^{\prime}}}$ of $F$ agree by the result of the previous paragraph. This finishes the proof by the fact that $F$ is a Zariski sheaf.

### 67.4. Properties of maps of presheaves representable by algebraic spaces

046E Here is the definition that makes this work.
03XZ Definition 67.4.1. Let $S$ be a scheme. Let $a: F \rightarrow G$ be a map of presheaves on $(S c h / S)_{f p p f}$ which is representable by algebraic spaces. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which
(1) is preserved under any base change, and
(2) is fppf local on the base, see Descent on Spaces, Definition 61.9.1.

In this case we say that $a$ has property $\mathcal{P}$ if for every scheme $U$ and $\xi: U \rightarrow G$ the resulting morphism of algebraic spaces $U \times_{G} F \rightarrow U$ has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

The definition above applies ${ }^{1}$ for example to the properties of being "surjective", "quasi-compact", "étale", "flat", "separated", "(locally) of finite type", "(locally) quasi-finite", "(locally) of finite presentation", "proper", and "a closed immersion". In other words, $a$ is surjective (resp. quasi-compact, étale, flat, separated, (locally) of finite type, (locally) quasi-finite, (locally) of finite presentation, proper, a closed immersion) if for every scheme $T$ and map $\xi: T \rightarrow G$ the morphism of algebraic spaces $T \times_{\xi, G} F \rightarrow T$ is surjective (resp. quasi-compact, étale, flat, separated, (locally) of finite type, (locally) quasi-finite, (locally) of finite presentation, proper, a closed immersion).

Next, we check consistency with the already existing notions. By Lemma 67.3.2 any morphism between algebraic spaces over $S$ is representable by algebraic spaces. And by Morphisms of Spaces, Lemma 54.5.3 (resp. 54.8.7, 54.38.2, 54.29.5, 54.4.12, 54.23 .4 , 54.27.6, 54.28.4 54.39.2 54.12.1) the definition of surjective (resp. quasicompact, étale, flat, separated, (locally) of finite type, (locally) quasi-finite, (locally) of finite presentation, proper, closed immersion) above agrees with the already existing definition of morphisms of algebraic spaces.

Some formal lemmas follow.
046F Lemma 67.4.2. Let $S$ be a scheme. Let $\mathcal{P}$ be a property as in Definition 67.4.1. Let

be a fibre square of presheaves on $(S c h / S)_{f p p f}$. If a is representable by algebraic spaces and has $\mathcal{P}$ so does $a^{\prime}$.

Proof. Omitted. Hint: This is formal.
046G Lemma 67.4.3. Let $S$ be a scheme. Let $\mathcal{P}$ be a property as in Definition 67.4.1. and assume $\mathcal{P}$ is stable under composition. Let

$$
F \xrightarrow{a} G \xrightarrow{b} H
$$

be maps of presheaves on $(S c h / S)_{\text {fppf }}$. If $a, b$ are representable by algebraic spaces and has $\mathcal{P}$ so does $b \circ a$.

Proof. Omitted. Hint: See Lemma 67.3.8 and use stability under composition.
046H Lemma 67.4.4. Let $S$ be a scheme. Let $F_{i}, G_{i}:(S c h / S)_{f p p f}^{\text {opp }} \rightarrow$ Sets, $i=1,2$. Let $a_{i}: F_{i} \rightarrow G_{i}, i=1,2$ be representable by algebraic spaces. Let $\mathcal{P}$ be a property as in Definition 67.4 .1 which is stable under composition. If $a_{1}$ and $a_{2}$ have property $\mathcal{P}$ so does $a_{1} \times a_{2}: F_{1} \times F_{2} \longrightarrow G_{1} \times G_{2}$.

Proof. Note that the lemma makes sense by Lemma 67.3.9. Proof omitted.

[^182]0AM1 Lemma 67.4.5. Let $S$ be a scheme. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a transformation of functors representable by algebraic spaces. Let $\mathcal{P}, \mathcal{P}^{\prime}$ be properties as in Definition 67.4.1. Suppose that for any morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ we have $\mathcal{P}(f) \Rightarrow \mathcal{P}^{\prime}(f)$. If a has property $\mathcal{P}$, then a has property $\mathcal{P}^{\prime}$.

Proof. Formal.
04S1 Lemma 67.4.6. Let $S$ be a scheme. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be sheaves. Let $a: F \rightarrow G$ be representable by algebraic spaces, flat, locally of finite presentation, and surjective. Then $a: F \rightarrow G$ is surjective as a map of sheaves.

Proof. Let $T$ be a scheme over $S$ and let $g: T \rightarrow G$ be a $T$-valued point of $G$. By assumption $T^{\prime}=F \times{ }_{G} T$ is an algebraic space and the morphism $T^{\prime} \rightarrow T$ is a flat, locally of finite presentation, and surjective morphism of algebraic spaces. Let $U \rightarrow T^{\prime}$ be a surjective étale morphism, where $U$ is a scheme. Then by the definition of flat morphisms of algebraic spaces the morphism of schemes $U \rightarrow T$ is flat. Similarly for "locally of finite presentation". The morphism $U \rightarrow T$ is surjective also, see Morphisms of Spaces, Lemma 54.5.3. Hence we see that $\{U \rightarrow T\}$ is an fppf covering such that $\left.g\right|_{U} \in G(U)$ comes from an element of $F(U)$, namely the map $U \rightarrow T^{\prime} \rightarrow F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 7.12.1.

### 67.5. Bootstrapping the diagonal

046I
$03 Y 2$ Lemma 67.5.1. Let $S$ be a scheme. If $F$ is a presheaf on $(S c h / S)_{f p p f}$. The following are equivalent:
(1) $\Delta_{F}: F \rightarrow F \times F$ is representable by algebraic spaces,
(2) for every scheme $T$ any map $T \rightarrow F$ is representable by algebraic spaces, and
(3) for every algebraic space $X$ any map $X \rightarrow F$ is representable by algebraic spaces.
Proof. Assume (1). Let $X \rightarrow F$ be as in (3). Let $T$ be a scheme, and let $T \rightarrow F$ be a morphism. Then we have

$$
T \times_{F} X=\left(T \times_{S} X\right) \times_{F \times F, \Delta} F
$$

which is an algebraic space by Lemma 67.3 .7 and (1). Hence $X \rightarrow F$ is representable, i.e., (3) holds. The implication (3) $\Rightarrow(2)$ is trivial. Assume (2). Let $T$ be a scheme, and let $(a, b): T \rightarrow F \times F$ be a morphism. Then

$$
F \times_{\Delta_{F}, F \times F} T=T \times_{a, F, b} T
$$

which is an algebraic space by assumption. Hence $\Delta_{F}$ is representable by algebraic spaces, i.e., (1) holds.

In particular if $F$ is a presheaf satisfying the equivalent conditions of the lemma, then for any morphism $X \rightarrow F$ where $X$ is an algebraic space it makes sense to say that $X \rightarrow F$ is surjective (resp. étale, flat, locally of finite presentation) by using Definition 67.4.1.
Before we actually do the bootstrap we prove a fun lemma.

046J Lemma 67.5.2. Let $S$ be a scheme. Let

be a cartesian diagram of sheaves on $(S c h / S)_{f p p f}$, so $E=H \times_{G} F$. If
(1) $g$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation, and
(2) $a$ is representable by algebraic spaces, separated, and locally quasi-finite then $b$ is representable (by schemes) as well as separated and locally quasi-finite.
Proof. Let $T$ be a scheme, and let $T \rightarrow G$ be a morphism. We have to show that $T \times{ }_{G} H$ is an algebraic space, and that the morphism $T \times{ }_{G} H \rightarrow T$ is separated and locally quasi-finite. Thus we may base change the whole diagram to $T$ and assume that $G$ is a scheme. In this case $F$ is an algebraic space. Let $U$ be a scheme, and let $U \rightarrow F$ be a surjective étale morphism. Then $U \rightarrow F$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 54.38 .7 and 54.38.8 By Lemma 67.3.8 $U \rightarrow G$ is surjective, flat and locally of finite presentation also. Note that the base change $E \times{ }_{F} U \rightarrow U$ of $a$ is still separated and locally quasi-finite (by Lemma 67.4.2. Hence we may replace the upper part of the diagram of the lemma by $E \times_{F} U \rightarrow U$. In other words, we may assume that $F \rightarrow G$ is a surjective, flat morphism of schemes which is locally of finite presentation. In particular, $\{F \rightarrow G\}$ is an fppf covering of schemes. By Morphisms of Spaces, Proposition 54.47 .2 we conclude that $E$ is a scheme also. By Descent, Lemma 34.35.1 the fact that $E=H \times_{G} F$ means that we get a descent datum on $E$ relative to the fppf covering $\{F \rightarrow G\}$. By More on Morphisms, Lemma 36.39.1 this descent datum is effective. By Descent, Lemma 34.35.1 again this implies that $H$ is a scheme. By Descent, Lemmas 34.19.5 and 34.19.22 it now follows that $b$ is separated and locally quasi-finite.

Here is the result that the section title refers to.
046K Lemma 67.5.3. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Assume that
(1) the presheaf $F$ is a sheaf,
(2) there exists an algebraic space $X$ and a map $X \rightarrow F$ which is representable by algebraic spaces, surjective, flat and locally of finite presentation.
Then $\Delta_{F}$ is representable (by schemes).
Proof. Let $U \rightarrow X$ be a surjective étale morphism from a scheme towards $X$. Then $U \rightarrow X$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 54.38.7 and 54.38.8. By Lemma 67.4.3 the composition $U \rightarrow F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation also. Thus we see that $R=U \times{ }_{F} U$ is an algebraic space, see Lemma 67.3.7. The morphism of algebraic spaces $R \rightarrow U \times_{S} U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism, see Morphisms of Spaces, Lemma 54.10.2. Since $U \rightarrow F$ is locally of finite presentation, both morphisms $R \rightarrow U$ are locally of finite presentation, see Lemma 67.4.2. Hence $R \rightarrow U \times{ }_{S} U$ is locally of finite type (use Morphisms of Spaces, Lemmas 54.28.5
and 54.23.6. Altogether this means that $R \rightarrow U \times_{S} U$ is a monomorphism which is locally of finite type, hence a separated and locally quasi-finite morphism, see Morphisms of Spaces, Lemma 54.27.10.
Now we are ready to prove that $\Delta_{F}$ is representable. Let $T$ be a scheme, and let $(a, b): T \rightarrow F \times F$ be a morphism. Set

$$
T^{\prime}=\left(U \times_{S} U\right) \times_{F \times F} T
$$

Note that $U \times{ }_{S} U \rightarrow F \times F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation by Lemma 67.4.4 Hence $T^{\prime}$ is an algebraic space, and the projection morphism $T^{\prime} \rightarrow T$ is surjective, flat, and locally of finite presentation. Consider $Z=T \times{ }_{F \times F} F$ (this is a sheaf) and

$$
Z^{\prime}=T^{\prime} \times_{U \times_{S} U} R=T^{\prime} \times_{T} Z .
$$

We see that $Z^{\prime}$ is an algebraic space, and $Z^{\prime} \rightarrow T^{\prime}$ is separated and locally quasifinite by the discussion in the first paragraph of the proof which showed that $R$ is an algebraic space and that the morphism $R \rightarrow U \times{ }_{S} U$ has those properties. Hence we may apply Lemma 67.5 .2 to the diagram

and we conclude.
Here is a variant of the result above.
0AHV Lemma 67.5.4. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Let $X$ be a scheme and let $X \rightarrow F$ be representable by algebraic spaces and locally quasi-finite. Then $X \rightarrow F$ is representable (by schemes).

Proof. Let $T$ be a scheme and let $T \rightarrow F$ be a morphism. We have to show that the algebraic space $X \times_{F} T$ is representable by a scheme. Consider the morphism

$$
X \times_{F} T \longrightarrow X \times_{\operatorname{Spec}(\mathbf{Z})} \operatorname{Spec}(A)
$$

Since $X \times_{F} T \rightarrow T$ is locally quasi-finite, so is the displayed arrow (Morphisms of Spaces, Lemma 54.27.8). On the other hand, the displayed arrow is a monomorphism and hence separated (Morphisms of Spaces, Lemma 54.10.3). Thus $X \times{ }_{F} T$ is a scheme by Morphisms of Spaces, Proposition 54.47.2.

### 67.6. Bootstrap

03XV We warn the reader right away that the result of this section will be superseded by the stronger Theorem 67.10.1. On the other hand, the theorem in this section is quite a bit easier to prove and still provides quite a bit of insight into how things work, especially for those readers mainly interested in Deligne-Mumford stacks.

In Spaces, Section 52.6 we defined an algebraic space as a sheaf in the fppf topology whose diagonal is representable, and such that there exist a surjective étale morphism from a scheme towards it. In this section we show that a sheaf in the fppf topology whose diagonal is representable by algebraic spaces and which has an étale surjective covering by an algebraic space is also an algebraic space. In other words, the category of algebraic spaces is an enlargement of the category of
schemes by those fppf sheaves $F$ which have a representable diagonal and an étale covering by a scheme. The result of this section says that doing the same process again starting with the category of algebraic spaces, does not lead to yet another category.

Another motivation for the material in this section is that it will guarantee later that a Deligne-Mumford stack whose inertia stack is trivial is equivalent to an algebraic space, see Algebraic Stacks, Lemma 76.13.2.

Here is the main result of this section (as we mentioned above this will be superseded by the stronger Theorem 67.10.1).

03Y3 Theorem 67.6.1. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Assume that
(1) the presheaf $F$ is a sheaf,
(2) the diagonal morphism $F \rightarrow F \times F$ is representable by algebraic spaces, and
(3) there exists an algebraic space $X$ and a map $X \rightarrow F$ which is surjective, and étale.
Then $F$ is an algebraic space.
Proof. We will use the remarks directly below Definition 67.4.1 without further mention. In the situation of the theorem, let $U \rightarrow X$ be a surjective étale morphism from a scheme towards $X$. By Lemma $67.3 .8 U \rightarrow F$ is surjective and étale also. Hence the theorem boils down to proving that $\Delta_{F}$ is representable. This follows immediately from Lemma 67.5.3. On the other hand we can circumvent this lemma and show directly $F$ is an algebraic space as in the next paragraph.

Let $U$ be a scheme, and let $U \rightarrow F$ be surjective and étale. Set $R=U \times{ }_{F} U$, which is an algebraic space (see Lemma 67.5.1). The morphism of algebraic spaces $R \rightarrow$ $U \times{ }_{S} U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism). Moreover, since $U \rightarrow F$ is étale, we see that $R \rightarrow U$ is étale, by Lemma 67.4.2. In particular, we see that $R \rightarrow U$ is locally quasi-finite, see Morphisms of Spaces, Lemma 54.38.5. We conclude that also $R \rightarrow U \times{ }_{S} U$ is locally quasi-finite by Morphisms of Spaces, Lemma 54.27.8. Hence Morphisms of Spaces, Proposition 54.47 .2 applies and $R$ is a scheme. Hence $F=U / R$ is an algebraic space according to Spaces, Theorem 52.10.5.

### 67.7. Finding opens

04S2 First we prove a lemma which is a slight improvement and generalization of Spaces, Lemma 52.10.2 to quotient sheaves associated to groupoids.

046M Lemma 67.7.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism. Assume
(1) the composition

has an open image $W \subset U$, and
(2) the resulting map $h: U^{\prime} \times_{g, U, t} R \rightarrow W$ defines a surjection of sheaves in the fppf topology.
Let $R^{\prime}=\left.R\right|_{U^{\prime}}$ be the restriction of $R$ to $U$. Then the map of quotient sheaves

$$
U^{\prime} / R^{\prime} \rightarrow U / R
$$

in the fppf topology is representable, and is an open immersion.
Proof. Note that $W$ is an $R$-invariant open subscheme of $U$. This is true because the set of points of $W$ is the set of points of $U$ which are equivalent in the sense of Groupoids, Lemma 38.3 .4 to a point of $g\left(U^{\prime}\right) \subset U$ (the lemma applies as $j$ : $R \rightarrow U \times_{S} U$ is a pre-equivalence relation by Groupoids, Lemma 38.13.2). Also $g: U^{\prime} \rightarrow U$ factors through $W$. Let $\left.R\right|_{W}$ be the restriction of $R$ to $W$. Then it follows that $R^{\prime}$ is also the restriction of $\left.R\right|_{W}$ to $U^{\prime}$. Hence we can factor the map of sheaves of the lemma as

$$
U^{\prime} / R^{\prime} \longrightarrow W /\left.R\right|_{W} \longrightarrow U / R
$$

By Groupoids, Lemma 38.20 .6 we see that the first arrow is an isomorphism of sheaves. Hence it suffices to show the lemma in case $g$ is the immersion of an $R$-invariant open into $U$.

Assume $U^{\prime} \subset U$ is an $R$-invariant open and $g$ is the inclusion morphism. Set $F=U / R$ and $F^{\prime}=U^{\prime} / R^{\prime}$. By Groupoids, Lemma 38.20.5 or 38.20.6 the map $F^{\prime} \rightarrow F$ is injective. Let $\xi \in F(T)$. We have to show that $T \times_{\xi, F} F^{\prime}$ is representable by an open subscheme of $T$. There exists an fppf covering $\left\{f_{i}: T_{i} \rightarrow T\right\}$ such that $\left.\xi\right|_{T_{i}}$ is the image via $U \rightarrow U / R$ of a morphism $a_{i}: T_{i} \rightarrow U$. Set $V_{i}=s_{i}^{-1}\left(U^{\prime}\right)$. We claim that $V_{i} \times_{T} T_{j}=T_{i} \times_{T} V_{j}$ as open subschemes of $T_{i} \times_{T} T_{j}$.
As $a_{i} \circ \mathrm{pr}_{0}$ and $a_{j} \circ \mathrm{pr}_{1}$ are morphisms $T_{i} \times_{T} T_{j} \rightarrow U$ which both map to the section $\left.\xi\right|_{T_{i} \times_{T} T_{j}} \in F\left(T_{i} \times_{T} T_{j}\right)$ we can find an fppf covering $\left\{f_{i j k}: T_{i j k} \rightarrow T_{i} \times_{T} T_{j}\right\}$ and morphisms $r_{i j k}: T_{i j k} \rightarrow R$ such that

$$
a_{i} \circ \operatorname{pr}_{0} \circ f_{i j k}=s \circ r_{i j k}, \quad a_{j} \circ \operatorname{pr}_{1} \circ f_{i j k}=t \circ r_{i j k}
$$

see Groupoids, Lemma 38.20.4. Since $U^{\prime}$ is $R$-invariant we have $s^{-1}\left(U^{\prime}\right)=t^{-1}\left(U^{\prime}\right)$ and hence $f_{i j k}^{-1}\left(V_{i} \times_{T} T_{j}\right)=f_{i j k}^{-1}\left(T_{i} \times_{T} V_{j}\right)$. As $\left\{f_{i j k}\right\}$ is surjective this implies the claim above. Hence by Descent, Lemma 34.9.2 there exists an open subscheme $V \subset T$ such that $f_{i}^{-1}(V)=V_{i}$. We claim that $V$ represents $T \times{ }_{\xi, F} F^{\prime}$.
As a first step, we will show that $\left.\xi\right|_{V}$ lies in $F^{\prime}(V) \subset F(V)$. Namely, the family of morphisms $\left\{V_{i} \rightarrow V\right\}$ is an fppf covering, and by construction we have $\left.\xi\right|_{V_{i}} \in F^{\prime}\left(V_{i}\right)$. Hence by the sheaf property of $F^{\prime}$ we get $\left.\xi\right|_{V} \in F^{\prime}(V)$. Finally, let $T^{\prime} \rightarrow T$ be a morphism of schemes and that $\left.\xi\right|_{T^{\prime}} \in F^{\prime}\left(T^{\prime}\right)$. To finish the proof we have to show that $T^{\prime} \rightarrow T$ factors through $V$. We can find a fppf covering $\left\{T_{j}^{\prime} \rightarrow T^{\prime}\right\}_{j \in J}$ and morphisms $b_{j}: T_{j}^{\prime} \rightarrow U^{\prime}$ such that $\left.\xi\right|_{T_{j}^{\prime}}$ is the image via $U^{\prime} \rightarrow U / R$ of $b_{j}$. Clearly, it is enough to show that the compositions $T_{j}^{\prime} \rightarrow T$ factor through $V$. Hence we may assume that $\left.\xi\right|_{T^{\prime}}$ is the image of a morphism $b: T^{\prime} \rightarrow U^{\prime}$. Now, it is enough to show that $T^{\prime} \times_{T} T_{i} \rightarrow T_{i}$ factors through $V_{i}$. Over the scheme $T^{\prime} \times_{T} T_{i}$ the restriction of $\xi$ is the image of two elements of $(U / R)\left(T^{\prime} \times_{T} T_{i}\right)$, namely $a_{i} \circ \operatorname{pr}_{1}$, and $b \circ \mathrm{pr}_{0}$, the second of which factors through the $R$-invariant open $U^{\prime}$. Hence by Groupoids, Lemma 38.20 .4 there exists a covering $\left\{h_{k}: Z_{k} \rightarrow T^{\prime} \times_{T} T_{i}\right\}$ and morphisms $r_{k}: Z_{k} \rightarrow R$ such that $a_{i} \circ \mathrm{pr}_{1} \circ h_{k}=s \circ r_{k}$ and $b \circ \mathrm{pr}_{0} \circ h_{k}=t \circ r_{k}$. As $U^{\prime}$ is an $R$-invariant open the fact that $b$ has image in $U^{\prime}$ then implies that each
$a_{i} \circ \mathrm{pr}_{1} \circ h_{k}$ has image in $U^{\prime}$. It follows from this that $T^{\prime} \times_{T} T_{i} \rightarrow T_{i}$ has image in $V_{i}$ by definition of $V_{i}$ which concludes the proof.

### 67.8. Slicing equivalence relations

046L In this section we explain how to "improve" a given equivalence relation by slicing. This is not a kind of "étale slicing" that you may be used to but a much coarser kind of slicing.

0489 Lemma 67.8.1. Let $S$ be a scheme. Let $j: R \rightarrow U \times{ }_{S} U$ be an equivalence relation on schemes over $S$. Assume $s, t: R \rightarrow U$ are flat and locally of finite presentation. Then there exists an equivalence relation $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times{ }_{S} U^{\prime}$ on schemes over $S$, and an isomorphism

$$
U^{\prime} / R^{\prime} \longrightarrow U / R
$$

induced by a morphism $U^{\prime} \rightarrow U$ which maps $R^{\prime}$ into $R$ such that $s^{\prime}, t^{\prime}: R \rightarrow U$ are flat, locally of finite presentation and locally quasi-finite.

Proof. We will prove this lemma in several steps. We will use without further mention that an equivalence relation gives rise to a groupoid scheme and that the restriction of an equivalence relation is an equivalence relation, see Groupoids, Lemmas 38.3.2, 38.13.3, and 38.18.3.

Step 1: We may assume that $s, t: R \rightarrow U$ are locally of finite presentation and Cohen-Macaulay morphisms. Namely, as in More on Groupoids, Lemma 39.7.1 let $g: U^{\prime} \rightarrow U$ be the open subscheme such that $t^{-1}\left(U^{\prime}\right) \subset R$ is the maximal open over which $s: R \rightarrow U$ is Cohen-Macaulay, and denote $R^{\prime}$ the restriction of $R$ to $U^{\prime}$. By the lemma cited above we see that
is surjective. Since $h$ is flat and locally of finite presentation, we see that $\{h\}$ is a fppf covering. Hence by Groupoids, Lemma 38.20 .6 we see that $U^{\prime} / R^{\prime} \rightarrow U / R$ is an isomorphism. By the construction of $U^{\prime}$ we see that $s^{\prime}, t^{\prime}$ are Cohen-Macaulay and locally of finite presentation.

Step 2. Assume $s, t$ are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a point of finite type. By More on Groupoids, Lemma 39.11.4 there exists an affine scheme $U^{\prime}$ and a morphism $g: U^{\prime} \rightarrow U$ such that
(1) $g$ is an immersion,
(2) $u \in U^{\prime}$,
(3) $g$ is locally of finite presentation,
(4) $h$ is flat, locally of finite presentation and locally quasi-finite, and
(5) the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are flat, locally of finite presentation and locally quasi-finite.
Here we have used the notation introduced in More on Groupoids, Situation 39.11.1.
Step 3. For each point $u \in U$ which is of finite type choose a $g_{u}: U_{u}^{\prime} \rightarrow U$ as in Step 2 and denote $R_{u}^{\prime}$ the restriction of $R$ to $U_{u}^{\prime}$. Denote $h_{u}=s \circ \mathrm{pr}_{1}: U_{u}^{\prime} \times{ }_{g_{u}, U, t} R \rightarrow U$.

Set $U^{\prime}=\coprod_{u \in U} U_{u}^{\prime}$, and $g=\amalg g_{u}$. Let $R^{\prime}$ be the restriction of $R$ to $U$ as above. We claim that the pair $\left(U^{\prime}, g\right)$ works ${ }^{2}$. Note that

$$
\begin{aligned}
R^{\prime} & =\coprod_{u_{1}, u_{2} \in U}\left(U_{u_{1}}^{\prime} \times_{g_{u_{1}}, U, t} R\right) \times_{R}\left(R \times_{s, U, g_{u_{2}}} U_{u_{2}}^{\prime}\right) \\
& =\coprod_{u_{1}, u_{2} \in U}\left(U_{u_{1}}^{\prime} \times_{g_{u_{1}}, U, t} R\right) \times_{h_{u_{1}}, U, g_{u_{2}}} U_{u_{2}}^{\prime}
\end{aligned}
$$

Hence the projection $s^{\prime}: R^{\prime} \rightarrow U^{\prime}=\amalg U_{u_{2}}^{\prime}$ is flat, locally of finite presentation and locally quasi-finite as a base change of $\amalg h_{u_{1}}$. Finally, by construction the morphism $h: U^{\prime} \times_{g, U, t} R \rightarrow U$ is equal to $\amalg h_{u}$ hence its image contains all points of finite type of $U$. Since each $h_{u}$ is flat and locally of finite presentation we conclude that $h$ is flat and locally of finite presentation. In particular, the image of $h$ is open (see Morphisms, Lemma 28.25.9) and since the set of points of finite type is dense (see Morphisms, Lemma 28.16.7) we conclude that the image of $h$ is $U$. This implies that $\{h\}$ is an fppf covering. By Groupoids, Lemma 38.20.6 this means that $U^{\prime} / R^{\prime} \rightarrow U / R$ is an isomorphism. This finishes the proof of the lemma.

### 67.9. Quotient by a subgroupoid

04S3 We need one more lemma before we can do our final bootstrap. Let us discuss what is going on in terms of "plain" groupoids before embarking on the scheme theoretic version.
Let $\mathcal{C}$ be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 38.13 this corresponds to a quintuple (Ob, Arrows, $s, t, c$ ). Suppose we are given a subset $P \subset$ Arrows such that ( $\mathrm{Ob}, P,\left.s\right|_{P},\left.t\right|_{P},\left.c\right|_{P}$ ) is also a groupoid and such that there are no nontrivial automorphisms in $P$. Then we can construct the quotient groupoid ( $\overline{\mathrm{Ob}}, \overline{\mathrm{Arrows}}, \bar{s}, \bar{t}, \bar{c}$ ) as follows:
(1) $\overline{\mathrm{Ob}}=\mathrm{Ob} / P$ is the set of $P$-isomorphism classes,
(2) $\overline{\text { Arrows }}=P \backslash$ Arrows $/ P$ is the set of arrows in $\mathcal{C}$ up to pre-composing and post-composing by arrows of $P$,
(3) the source and target maps $\bar{s}, \bar{t}: P \backslash$ Arrows $/ P \rightarrow \mathrm{Ob} / P$ are induced by $s, t$,
(4) composition is defined by the rule $\bar{c}(\bar{a}, \bar{b})=\overline{c(a, b)}$ which is well defined. In fact, it turns out that the original groupoid ( Ob , Arrows, $s, t, c$ ) is canonically isomorphic to the restriction (see discussion in Groupoids, Section 38.18) of the groupoid ( $\overline{\mathrm{Ob}}, \overline{\mathrm{Arrows}}, \bar{s}, \bar{t}, \bar{c}$ ) via the quotient map $g: \mathrm{Ob} \rightarrow \overline{\mathrm{Ob}}$. Recall that this means that

$$
\text { Arrows }=\mathrm{Ob} \times_{g, \overline{\mathrm{Ob}, \bar{t}}} \overline{\operatorname{Arrows}} \times_{\bar{s}, \overline{\mathrm{Ob}}, g} \mathrm{Ob}
$$

which holds as $P$ has no nontrivial automorphisms. We omit the details.
The following lemma holds in much greater generality, but this is the version we use in the proof of the final bootstrap (after which we can more easily prove the more general versions of this lemma).

[^183]04S4 Lemma 67.9.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $P \rightarrow R$ be monomorphism of schemes. Assume that
(1) $\left(U, P,\left.s\right|_{P},\left.t\right|_{P},\left.c\right|_{P \times_{s, U, t} P}\right)$ is a groupoid scheme,
(2) $\left.s\right|_{P},\left.t\right|_{P}: P \rightarrow U$ are finite locally free,
(3) $\left.j\right|_{P}: P \rightarrow U \times_{S} U$ is a monomorphism.
(4) $U$ is affine, and
(5) $j: R \rightarrow U \times_{S} U$ is separated and locally quasi-finite,

Then $U / P$ is representable by an affine scheme $\bar{U}$, the quotient morphism $U \rightarrow \bar{U}$ is finite locally free, and $P=U \times_{\bar{U}} U$. Moreover, $R$ is the restriction of a groupoid scheme $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ on $\bar{U}$ via the quotient morphism $U \rightarrow \bar{U}$.

Proof. Conditions (1), (2), (3), and (4) and Groupoids, Proposition 38.23 .8 imply the affine scheme $\bar{U}$ representing $U / P$ exists, the morphism $U \rightarrow \bar{U}$ is finite locally free, and $P=U \times_{\bar{U}} U$. The identification $P=U \times_{\bar{U}} U$ is such that $\left.t\right|_{P}=\operatorname{pr}_{0}$ and $\left.s\right|_{P}=\mathrm{pr}_{1}$, and such that composition is equal to $\mathrm{pr}_{02}: U \times_{\bar{U}} U \times_{\bar{U}} U \rightarrow U \times_{\bar{U}} U$. A product of finite locally free morphisms is finite locally free (see Spaces, Lemma 52.5.7 and Morphisms, Lemmas 28.45.4 and 28.45.3. To get $\bar{R}$ we are going to descend the scheme $R$ via the finite locally free morphism $U \times_{S} U \rightarrow \bar{U} \times_{S} \bar{U}$. Namely, note that

$$
\left(U \times_{S} U\right) \times_{\left(\bar{U} \times{ }_{S} \bar{U}\right)}\left(U \times_{S} U\right)=P \times_{S} P
$$

by the above. Thus giving a descent datum (see Descent, Definition 34.30.1) for $R / U \times{ }_{S} U / \bar{U} \times{ }_{S} \bar{U}$ consists of an isomorphism

$$
\varphi: R \times_{\left(U \times_{S} U\right), t \times t}\left(P \times_{S} P\right) \longrightarrow\left(P \times_{S} P\right) \times_{s \times s,\left(U \times_{S} U\right)} R
$$

over $P \times{ }_{S} P$ satisfying a cocycle condition. We define $\varphi$ on $T$-valued points by the rule

$$
\varphi:\left(r,\left(p, p^{\prime}\right)\right) \longmapsto\left(\left(p, p^{\prime}\right), p^{-1} \circ r \circ p^{\prime}\right)
$$

where the composition is taken in the groupoid category $(U(T), R(T), s, t, c)$. This makes sense because for $\left(r,\left(p, p^{\prime}\right)\right)$ to be a $T$-valued point of the source of $\varphi$ it needs to be the case that $t(r)=t(p)$ and $s(r)=t\left(p^{\prime}\right)$. Note that this map is an isomorphism with inverse given by $\left(\left(p, p^{\prime}\right), r^{\prime}\right) \mapsto\left(p \circ r^{\prime} \circ\left(p^{\prime}\right)^{-1},\left(p, p^{\prime}\right)\right)$. To check the cocycle condition we have to verify that $\varphi_{02}=\varphi_{12} \circ \varphi_{01}$ as maps over
$\left(U \times{ }_{S} U\right) \times{ }_{\left(\bar{U} \times{ }_{S} \bar{U}\right)}\left(U \times{ }_{S} U\right) \times{ }_{\left(\bar{U} \times{ }_{S} \bar{U}\right)}\left(U \times{ }_{S} U\right)=\left(P \times{ }_{S} P\right) \times{ }_{s \times s,\left(U \times{ }_{S} U\right), t \times t}\left(P \times{ }_{S} P\right)$
By explicit calculation we see that

$$
\begin{array}{cccc}
\varphi_{02} & \left(r,\left(p_{1}, p_{1}^{\prime}\right),\left(p_{2}, p_{2}^{\prime}\right)\right) & \mapsto & \left(\left(p_{1}, p_{1}^{\prime}\right),\left(p_{2}, p_{2}^{\prime}\right),\left(p_{1} \circ p_{2}\right)^{-1} \circ r \circ\left(p_{1}^{\prime} \circ p_{2}^{\prime}\right)\right) \\
\varphi_{01} & \left(r,\left(p_{1}, p_{1}^{\prime}\right),\left(p_{2}, p_{2}^{\prime}\right)\right) & \mapsto & \left(\left(p_{1}, p_{1}^{\prime}\right), p_{1}^{-1} \circ r \circ p_{1}^{\prime},\left(p_{2}, p_{2}^{\prime}\right)\right) \\
\varphi_{12} & \left(\left(p_{1}, p_{1}^{\prime}\right), r,\left(p_{2}, p_{2}^{\prime}\right)\right) & \mapsto & \left.\left(p_{1}, p_{1}^{\prime}\right),\left(p_{2}, p_{2}^{\prime}\right), p_{2}^{-1} \circ r \circ p_{2}^{\prime}\right)
\end{array}
$$

(with obvious notation) which implies what we want. As $j$ is separated and locally quasi-finite by (5) we may apply More on Morphisms, Lemma 36.39.1 to get a scheme $\bar{R} \rightarrow \bar{U} \times{ }_{S} \bar{U}$ and an isomorphism

$$
R \rightarrow \bar{R} \times_{\left(\bar{U} \times{ }_{S} \bar{U}\right)}\left(U \times_{S} U\right)
$$

which identifies the descent datum $\varphi$ with the canonical descent datum on $\bar{R} \times{ }_{\left(\bar{U} \times{ }_{S} \bar{U}\right)}$ $\left(U \times{ }_{S} U\right)$, see Descent, Definition 34.30.10.
Since $U \times_{S} U \rightarrow \bar{U} \times_{S} \bar{U}$ is finite locally free we conclude that $R \rightarrow \bar{R}$ is finite locally free as a base change. Hence $R \rightarrow \bar{R}$ is surjective as a map of sheaves on
$(S c h / S)_{\text {fppf }}$. Our choice of $\varphi$ implies that given $T$-valued points $r, r^{\prime} \in R(T)$ these have the same image in $\bar{R}$ if and only if $p^{-1} \circ r \circ p^{\prime}$ for some $p, p^{\prime} \in P(T)$. Thus $\bar{R}$ represents the sheaf

$$
T \longmapsto \overline{R(T)}=P(T) \backslash R(T) / P(T)
$$

with notation as in the discussion preceding the lemma. Hence we can define the groupoid structure on $(\bar{U}=U / P, \bar{R}=P \backslash R / P)$ exactly as in the discussion of the "plain" groupoid case. It follows from this that $(U, R, s, t, c)$ is the pullback of this groupoid structure via the morphism $U \rightarrow \bar{U}$. This concludes the proof.

### 67.10. Final bootstrap

04S5 The following result goes quite a bit beyond the earlier results.
04S6 Theorem 67.10.1. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Any one of the following conditions implies that $F$ is an algebraic space:
(1) $F=U / R$ where $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $S$ such that $s, t$ are flat and locally of finite presentation, and $j=(t, s): R \rightarrow$ $U \times{ }_{S} U$ is an equivalence relation,
(2) $F=U / R$ where $(U, R, s, t, c)$ is a groupoid scheme over $S$ such that $s, t$ are flat and locally of finite presentation, and $j=(t, s): R \rightarrow U \times_{S} U$ is an equivalence relation,
(3) $F$ is a sheaf and there exists an algebraic space $U$ and a morphism $U \rightarrow F$ which is which is representable by algebraic spaces, surjective, flat and locally of finite presentation,
(4) $F$ is a sheaf and there exists a scheme $U$ and a morphism $U \rightarrow F$ which is which is representable (by algebraic spaces or schemes), surjective, flat and locally of finite presentation,
(5) $F$ is a sheaf, $\Delta_{F}$ is representable by algebraic spaces, and there exists an algebraic space $U$ and a morphism $U \rightarrow F$ which is surjective, flat, and locally of finite presentation, or
(6) $F$ is a sheaf, $\Delta_{F}$ is representable, and there exists a scheme $U$ and a morphism $U \rightarrow F$ which is surjective, flat, and locally of finite presentation.

Proof. Trivial observations: (6) is a special case of (5) and (4) is a special case of (3). We first prove that cases (5) and (3) reduce to case (1). Namely, by bootstrapping the diagonal Lemma 67.5.3 we see that (3) implies (5). In case (5) we set $R=U \times_{F} U$ which is an algebraic space by assumption. Moreover, by assumption both projections $s, t: R \rightarrow U$ are surjective, flat and locally of finite presentation. The map $j: R \rightarrow U \times{ }_{S} U$ is clearly an equivalence relation. By Lemma 67.4 .6 the map $U \rightarrow F$ is a surjection of sheaves. Thus $F=U / R$ which reduces us to case (1).

Next, we show that (1) reduces to (2). Namely, let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$ such that $s, t$ are flat and locally of finite presentation, and $j=(t, s): R \rightarrow U \times_{S} U$ is an equivalence relation. Choose a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow U$. Let $R^{\prime}=\left.R\right|_{U^{\prime}}$ be the restriction of $R$ to $U^{\prime}$. By Groupoids in Spaces, Lemma 65.18.6 we see that $U / R=U^{\prime} / R^{\prime}$. Since $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are also flat and locally of finite presentation (see More on Groupoids in Spaces, Lemma 66.6.1 this reduces us to the case where $U$ is a scheme. As $j$ is an equivalence relation we see that $j$ is a monomorphism. As $s: R \rightarrow U$ is locally
of finite presentation we see that $j: R \rightarrow U \times_{S} U$ is locally of finite type, see Morphisms of Spaces, Lemma 54.23.6. By Morphisms of Spaces, Lemma 54.27.10 we see that $j$ is locally quasi-finite and separated. Hence if $U$ is a scheme, then $R$ is a scheme by Morphisms of Spaces, Proposition 54.47.2. Thus we reduce to proving the theorem in case (2).

Assume $F=U / R$ where $(U, R, s, t, c)$ is a groupoid scheme over $S$ such that $s, t$ are flat and locally of finite presentation, and $j=(t, s): R \rightarrow U \times{ }_{S} U$ is an equivalence relation. By Lemma 67.8.1 we reduce to that case where $s, t$ are flat, locally of finite presentation, and locally quasi-finite. Let $U=\bigcup_{i \in I} U_{i}$ be an affine open covering (with index set $I$ of cardinality $\leq$ than the size of $U$ to avoid set theoretic problems later - most readers can safely ignore this remark). Let ( $\left.U_{i}, R_{i}, s_{i}, t_{i}, c_{i}\right)$ be the restriction of $R$ to $U_{i}$. It is clear that $s_{i}, t_{i}$ are still flat, locally of finite presentation, and locally quasi-finite as $R_{i}$ is the open subscheme $s^{-1}\left(U_{i}\right) \cap t^{-1}\left(U_{i}\right)$ of $R$ and $s_{i}, t_{i}$ are the restrictions of $s, t$ to this open. By Lemma 67.7.1 (or the simpler Spaces, Lemma 52.10 .2 the map $U_{i} / R_{i} \rightarrow U / R$ is representable by open immersions. Hence if we can show that $F_{i}=U_{i} / R_{i}$ is an algebraic space, then $\coprod_{i \in I} F_{i}$ is an algebraic space by Spaces, Lemma 52.8.3. As $U=\bigcup U_{i}$ is an open covering it is clear that $\coprod F_{i} \rightarrow F$ is surjective. Thus it follows that $U / R$ is an algebraic space, by Spaces, Lemma 52.8.4. In this way we reduce to the case where $U$ is affine and $s, t$ are flat, locally of finite presentation, and locally quasi-finite and $j$ is an equivalence.

Assume ( $U, R, s, t, c$ ) is a groupoid scheme over $S$, with $U$ affine, such that $s, t$ are flat, locally of finite presentation, and locally quasi-finite, and $j$ is an equivalence relation. Choose $u \in U$. We apply More on Groupoids in Spaces, Lemma 66.13.9 to $u \in U, R, s, t, c$. We obtain an affine scheme $U^{\prime}$, an étale morphism $g: U^{\prime} \rightarrow U$, a point $u^{\prime} \in U^{\prime}$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ such that the restriction $R^{\prime}=\left.R\right|_{U^{\prime}}$ is quasisplit over $u^{\prime}$. Note that the image $g\left(U^{\prime}\right)$ is open as $g$ is étale and contains $u^{\prime}$. Hence, repeatedly applying the lemma, we can find finitely many points $u_{i} \in U$, $i=1, \ldots, n$, affine schemes $U_{i}^{\prime}$, étale morphisms $g_{i}: U_{i}^{\prime} \rightarrow U$, points $u_{i}^{\prime} \in U_{i}^{\prime}$ with $g\left(u_{i}^{\prime}\right)=u_{i}$ such that (a) each restriction $R_{i}^{\prime}$ is quasi-split over some point in $U_{i}^{\prime}$ and (b) $U=\bigcup_{i=1, \ldots, n} g_{i}\left(U_{i}^{\prime}\right)$. Now we rerun the last part of the argument in the preceding paragraph: Using Lemma 67.7.1 (or the simpler Spaces, Lemma 52.10.2) the map $U_{i}^{\prime} / R_{i}^{\prime} \rightarrow U / R$ is representable by open immersions. If we can show that $F_{i}=U_{i}^{\prime} / R_{i}^{\prime}$ is an algebraic space, then $\coprod_{i \in I} F_{i}$ is an algebraic space by Spaces, Lemma 52.8.3. As $\left\{g_{i}: U_{i}^{\prime} \rightarrow U\right\}$ is an étale covering it is clear that $\coprod F_{i} \rightarrow F$ is surjective. Thus it follows that $U / R$ is an algebraic space, by Spaces, Lemma 52.8.4. In this way we reduce to the case where $U$ is affine and $s, t$ are flat, locally of finite presentation, and locally quasi-finite, $j$ is an equivalence, and $R$ is quasi-split over $u$ for some $u \in U$.

Assume ( $U, R, s, t, c$ ) is a groupoid scheme over $S$, with $U$ affine, $u \in U$ such that $s, t$ are flat, locally of finite presentation, and locally quasi-finite and $j=(t, s)$ : $R \rightarrow U \times{ }_{S} U$ is an equivalence relation and $R$ is quasi-split over $u$. Let $P \subset R$ be a quasi-splitting of $R$ over $u$. By Lemma 67.9.1 we see that $(U, R, s, t, c)$ is the restriction of a groupoid $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ by a surjective finite locally free morphism $U \rightarrow \bar{U}$ such that $P=U \times{ }_{\bar{U}} U$. Note that $s, t$ are the base changes of the morphisms $\bar{s}, \bar{t}$ by $U \rightarrow \bar{U}$. As $\{U \rightarrow \bar{U}\}$ is an fppf covering we conclude $\bar{s}, \bar{t}$ are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 34.19.13, 34.19.9,
and 34.19.22. Consider the commutative diagram

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since $P$ is open in $R$ (by definition of a quasi-splitting) we conclude that $\bar{e}$ is an open immersion by Descent, Lemma 34.19.14. An application of Groupoids, Lemma 38.20.5 shows that $U / R=\bar{U} / \bar{R}$. Hence we have reduced to the case where $(U, R, s, t, c)$ is a groupoid scheme over $S$, with $U$ affine, $u \in U$ such that $s, t$ are flat, locally of finite presentation, and locally quasi-finite and $j=(t, s): R \rightarrow U \times_{S} U$ is an equivalence relation and $e: U \rightarrow R$ is an open immersion!

But of course, if $e$ is an open immersion and $s, t$ are flat and locally of finite presentation then the morphisms $t, s$ are étale. For example you can see this by applying More on Groupoids, Lemma 39.4.1 which shows that $\Omega_{R / U}=0$ which in turn implies that $s, t: R \rightarrow U$ is G-unramified (see Morphisms, Lemma 28.35.2), which in turn implies that $s, t$ are étale (see Morphisms, Lemma 28.36.16). And if $s, t$ are étale then finally $U / R$ is an algebraic space by Spaces, Theorem 52.10.5.

### 67.11. Applications

04SJ As a first application we obtain the following fundamental fact:
A sheaf which is fppf locally an algebraic space is an algebraic space.
This is the content of the following lemma. Note that assumption (2) is equivalent to the condition that $\left.F\right|_{\left(S c h / S_{i}\right)_{f p p f}}$ is an algebraic space, see Spaces, Lemma 52.16 .4 . Assumption (3) is a set theoretic condition which may be ignored by those not worried about set theoretic questions.

04SK Lemma 67.11.1. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{\text {opp }} \rightarrow$ Sets be a functor. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a covering of $(S c h / S)_{\text {fppff }}$. Assume that
(1) $F$ is a sheaf,
(2) each $F_{i}=h_{S_{i}} \times F$ is an algebraic space, and
(3) $\coprod_{i \in I} F_{i}$ is an algebraic space (see Spaces, Lemma 52.8.3).

Then $F$ is an algebraic space.
Proof. Consider the morphism $\coprod F_{i} \rightarrow F$. This is the base change of $\coprod S_{i} \rightarrow S$ via $F \rightarrow S$. Hence it is representable, locally of finite presentation, flat and surjective by our definition of an fppf covering and Lemma 67.4.2. Thus Theorem 67.10.1 applies to show that $F$ is an algebraic space.

As a second application we obtain
Any fppf descent datum for algebraic spaces is effective.
This is the content of the following lemma.

0ADV Lemma 67.11.2. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering of algebraic spaces over $S$. Assume $I$ is countable ${ }^{3}$. Then any descent datum for algebraic spaces relative to $\left\{X_{i} \rightarrow X\right\}$ is effective.

Proof. By Descent on Spaces, Lemma 61.20.1 this translates into the statement that an fppf sheaf $F$ endowed with a map $F \rightarrow X$ is an algebraic space provided that each $F \times_{X} X_{i}$ is an algebraic space. The restriction on the cardinality of $I$ implies that coproducts of algebraic spaces indexed by $I$ are algebraic spaces, see Spaces, Lemma 52.8.3 and Sets, Lemma 3.9.9. The morphism

$$
\coprod F \times_{X} X_{i} \longrightarrow F
$$

is representable by algebraic spaces (as the base change of $\coprod X_{i} \rightarrow X$, see Lemma 67.3.3), and surjective, flat, and locally of finite presentation (as the base change of $\coprod X_{i} \rightarrow X$, see Lemma 67.4.2). Hence the lemma follows from Theorem 67.10.1.

Here is a different type of application.
0AMP Lemma 67.11.3. Let $S$ be a scheme. Let $a: F \rightarrow G$ and $b: G \rightarrow H$ be transformations of functors $(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Assume
(1) $F, G, H$ are sheaves,
(2) $a: F \rightarrow G$ is representable by algebraic spaces, flat, locally of finite presentation, and surjective, and
(3) $b \circ a: F \rightarrow H$ is representable by algebraic spaces.

Then $b$ is representable by algebraic spaces.
Proof. Let $U$ be a scheme over $S$ and let $\xi \in H(U)$. We have to show that $U \times_{\xi, H} G$ is an algebraic space. On the other hand, we know that $U \times_{\xi, H} F$ is an algebraic space and that $U \times_{\xi, H} F \rightarrow U \times_{\xi, H} G$ is representable by algebraic spaces, flat, locally of finite presentation, and surjective as a base change of the morphism $a$ (see Lemma 67.4.2). Thus the result follows from Theorem 67.10.1.

Here is a special case of Lemma 67.11.1 where we do not need to worry about set theoretical issues.

04U0 Lemma 67.11.4. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{\text {opp }} \rightarrow$ Sets be a functor. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a covering of $(S c h / S)_{\text {fppf }}$. Assume that
(1) $F$ is a sheaf,
(2) each $F_{i}=h_{S_{i}} \times F$ is an algebraic space, and
(3) the morphisms $F_{i} \rightarrow S_{i}$ are of finite type.

Then $F$ is an algebraic space.
Proof. We will use Lemma 67.11.1 above. To do this we will show that the assumption that $F_{i}$ is of finite type over $S_{i}$ to prove that the set theoretic condition in the lemma is satisfied (after perhaps refining the given covering of $S$ a bit). We suggest the reader skip the rest of the proof.
If $S_{i}^{\prime} \rightarrow S_{i}$ is a morphism of schemes then

$$
h_{S_{i}^{\prime}} \times F=h_{S_{i}^{\prime}} \times{ }_{h_{S_{i}}} h_{S_{i}} \times F=h_{S_{i}^{\prime}} \times{ }_{h_{S_{i}}} F_{i}
$$

[^184]is an algebraic space of finite type over $S_{i}^{\prime}$, see Spaces, Lemma 52.7.3 and Morphisms of Spaces, Lemma 54.23.3. Thus we may refine the given covering. After doing this we may assume: (a) each $S_{i}$ is affine, and (b) the cardinality of $I$ is at most the cardinality of the set of points of $S$. (Since to cover all of $S$ it is enough that each point is in the image of $S_{i} \rightarrow S$ for some $i$.)
Since each $S_{i}$ is affine and each $F_{i}$ of finite type over $S_{i}$ we conclude that $F_{i}$ is quasi-compact. Hence by Properties of Spaces, Lemma 53.6.3 we can find an affine $U_{i} \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $U_{i} \rightarrow F_{i}$. The fact that $F_{i} \rightarrow S_{i}$ is locally of finite type then implies that $U_{i} \rightarrow S_{i}$ is locally of finite type, and in particular $U_{i} \rightarrow S$ is locally of finite type. By Sets, Lemma 3.9.7 we conclude that $\operatorname{size}\left(U_{i}\right) \leq \operatorname{size}(S)$. Since also $|I| \leq \operatorname{size}(S)$ we conclude that $\coprod_{i \in I} U_{i}$ is isomorphic to an object of $(S c h / S)_{f p p f}$ by Sets, Lemma 3.9.5 and the construction of $S c h$. This implies that $\coprod F_{i}$ is an algebraic space by Spaces, Lemma 52.8 .3 and we win.

04TB Lemma 67.11.5. Assume $B \rightarrow S$ and $(U, R, s, t, c)$ are as in Groupoids in Spaces, Definition 65.19.1 (1). For any scheme $T$ over $S$ and objects $x, y$ of $[U / R]$ over $T$ the sheaf $\operatorname{Isom}(x, y)$ on $(S c h / T)_{f p p f}$ is an algebraic space.

Proof. By Groupoids in Spaces, Lemma 65.21.3 there exists an fppf covering $\left\{T_{i} \rightarrow\right.$ $T\}_{i \in I}$ such that $\left.\operatorname{Isom}(x, y)\right|_{\left(S c h / T_{i}\right)_{f p p f}}$ is an algebraic space for each $i$. By Spaces, Lemma 52.16.4 this means that each $F_{i}=h_{S_{i}} \times \operatorname{Isom}(x, y)$ is an algebraic space. Thus to prove the lemma we only have to verify the set theoretic condition that $\coprod F_{i}$ is an algebraic space of Lemma 67.11.1 above to conclude. To do this we use Spaces, Lemma 52.8.3 which requires showing that $I$ and the $F_{i}$ are not "too large". We suggest the reader skip the rest of the proof.

Choose $U^{\prime} \in \mathrm{Ob}(S c h / S)_{f p p f}$ and a surjective étale morphism $U^{\prime} \rightarrow U$. Let $R^{\prime}$ be the restriction of $R$ to $U^{\prime}$. Since $[U / R]=\left[U^{\prime} / R^{\prime}\right]$ we may, after replacing $U$ by $U^{\prime}$, assume that $U$ is a scheme. (This step is here so that the fibre products below are over a scheme.)
Note that if we refine the covering $\left\{T_{i} \rightarrow T\right\}$ then it remains true that each $F_{i}$ is an algebraic space. Hence we may assume that each $T_{i}$ is affine. Since $T_{i} \rightarrow T$ is locally of finite presentation, this then implies that $\operatorname{size}\left(T_{i}\right) \leq \operatorname{size}(T)$, see Sets, Lemma 3.9.7. We may also assume that the cardinality of the index set $I$ is at most the cardinality of the set of points of $T$ since to get a covering it suffices to check that each point of $T$ is in the image. Hence $|I| \leq \operatorname{size}(T)$. Choose $W \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $W \rightarrow R$. Note that in the proof of Groupoids in Spaces, Lemma 65.21.3 we showed that $F_{i}$ is representable by $T_{i} \times{ }_{\left(y_{i}, x_{i}\right), U \times{ }_{B} U} R$ for some $x_{i}, y_{i}: T_{i} \rightarrow U$. Hence now we see that $V_{i}=T_{i} \times{ }_{\left(y_{i}, x_{i}\right), U \times_{B} U} W$ is a scheme which comes with an étale surjection $V_{i} \rightarrow F_{i}$. By Sets, Lemma 3.9.6 we see that

$$
\operatorname{size}\left(V_{i}\right) \leq \max \left\{\operatorname{size}\left(T_{i}\right), \operatorname{size}(W)\right\} \leq \max \{\operatorname{size}(T), \operatorname{size}(W)\}
$$

Hence, by Sets, Lemma 3.9.5 we conclude that

$$
\operatorname{size}\left(\coprod_{i \in I} V_{i}\right) \leq \max \{|I|, \operatorname{size}(T), \operatorname{size}(W)\}
$$

Hence we conclude by our construction of $S c h$ that $\coprod_{i \in I} V_{i}$ is isomorphic to an object $V$ of $(S c h / S)_{f p p f}$. This verifies the hypothesis of Spaces, Lemma 52.8.3 and we win.

06PG Lemma 67.11.6. Let $S$ be a scheme. Consider an algebraic space $F$ of the form $F=U / R$ where $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $S$ such that $s, t$ are flat and locally of finite presentation, and $j=(t, s): R \rightarrow U \times_{S} U$ is an equivalence relation. Then $U \rightarrow F$ is surjective, flat, and locally of finite presentation.
Proof. This is almost but not quite a triviality. Namely, by Groupoids in Spaces, Lemma 65.18 .5 and the fact that $j$ is a monomorphism we see that $R=U \times_{F} U$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow F$. As $U \rightarrow F$ is a surjection of sheaves we can find an fppf covering $\left\{W_{i} \rightarrow W\right\}$ and maps $W_{i} \rightarrow U$ lifting the morphisms $W_{i} \rightarrow F$. Then we see that

$$
W_{i} \times_{F} U=W_{i} \times_{U} U \times_{F} U=W_{i} \times_{U, t} R
$$

and the projection $W_{i} \times_{F} U \rightarrow W_{i}$ is the base change of $t: R \rightarrow U$ hence flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 54.29.4 and 54.28 .3 Hence by Descent on Spaces, Lemmas 61.10.11 and 61.10.8 we see that $U \rightarrow F$ is flat and locally of finite presentation. It is surjective by Spaces, Remark 52.5.2.

06PH Lemma 67.11.7. Let $S$ be a scheme. Let $X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $G$ be a group algebraic space over $B$ and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on $X$ over $B$. If
(1) $a$ is a free action, and
(2) $G \rightarrow B$ is flat and locally of finite presentation, then $X / G$ (see Groupoids in Spaces, Definition 65.18.1) is an algebraic space and $X \rightarrow X / G$ is surjective, flat, and locally of finite presentation.

Proof. The fact that $X / G$ is an algebraic space is immediate from Theorem 67.10.1 and the definitions. Namely, $X / G=X / R$ where $R=G \times_{B} X$. The morphisms $s, t: G \times{ }_{B} X \rightarrow X$ are flat and locally of finite presentation (clear for $s$ as a base change of $G \rightarrow B$ and by symmetry using the inverse it follows for $t$ ) and the morphism $j: G \times_{B} X \rightarrow X \times_{B} X$ is a monomorphism by Groupoids in Spaces, Lemma 65.8.3 as the action is free. The assertions about the morphism $X \rightarrow X / G$ follow from Lemma 67.11.6.

04U1 Lemma 67.11.8. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a covering of $(S c h / S)_{f p p f}$. Let $G$ be a group algebraic space over $S$, and denote $G_{i}=G_{S_{i}}$ the base changes. Suppose given
(1) for each $i \in I$ an fppf $G_{i}$-torsor $X_{i}$ over $S_{i}$, and
(2) for each $i, j \in I$ a $G_{S_{i} \times{ }_{S} S_{j}}$-equivariant isomorphism $\varphi_{i j}: X_{i} \times_{S} S_{j} \rightarrow$ $S_{i} \times_{S} X_{j}$ satisfying the cocycle condition over every $S_{i} \times{ }_{S} S_{j} \times{ }_{S} S_{j}$.
Then there exists an fppf $G$-torsor $X$ over $S$ whose base change to $S_{i}$ is isomorphic to $X_{i}$ such that we recover the descent datum $\varphi_{i j}$.

Proof. We may think of $X_{i}$ as a sheaf on $\left(S c h / S_{i}\right)_{f p p f}$, see Spaces, Section 52.16 . By Sites, Section 7.25 the descent datum $\left(X_{i}, \varphi_{i j}\right)$ is effective in the sense that there exists a unique sheaf $X$ on $(S c h / S)_{f p p f}$ which recovers the algebraic spaces $X_{i}$ after restricting back to $\left(S c h / S_{i}\right)_{f p p f}$. Hence we see that $X_{i}=h_{S_{i}} \times X$. By Lemma 67.11.1 we see that $X$ is an algebraic space, modulo verifying that $\amalg X_{i}$ is an algebraic space which we do at the end of the proof. By the equivalence of categories in Sites, Lemma 7.25 .3 the action maps $G_{i} \times S_{i} X_{i} \rightarrow X_{i}$ glue to give a map $a: G \times_{S} X \rightarrow X$. Now we have to show that $a$ is an action and that
$X$ is a pseudo-torsor, and fppf locally trivial (see Groupoids in Spaces, Definition 65.9.3. These may be checked fppf locally, and hence follow from the corresponding properties of the actions $G_{i} \times_{S_{i}} X_{i} \rightarrow X_{i}$. Hence the lemma is true.
We suggest the reader skip the rest of the proof, which is purely set theoretical. Pick coverings $\left\{S_{i j} \rightarrow S_{j}\right\}_{j \in J_{i}}$ of $(S c h / S)_{f p p f}$ which trivialize the $G_{i}$ torsors $X_{i}$ (possible by assumption, and Topologies, Lemma 33.7.7 part (1)). Then $\left\{S_{i j} \rightarrow\right.$ $S\}_{i \in I, j \in J_{i}}$ is a covering of $(S c h / S)_{f p p f}$ and hence we may assume that each $X_{i}$ is the trivial torsor! Of course we may also refine the covering further, hence we may assume that each $S_{i}$ is affine and that the index set $I$ has cardinality bounded by the cardinality of the set of points of $S$. Choose $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and a surjective étale morphism $U \rightarrow G$. Then we see that $U_{i}=U \times_{S} S_{i}$ comes with an étale surjective morphism to $X_{i} \cong G_{i}$. By Sets, Lemma 3.9.6 we see $\operatorname{size}\left(U_{i}\right) \leq$ $\max \left\{\operatorname{size}(U), \operatorname{size}\left(S_{i}\right)\right\}$. By Sets, Lemma 3.9.7 we have $\operatorname{size}\left(S_{i}\right) \leq \operatorname{size}(S)$. Hence we see that $\operatorname{size}\left(U_{i}\right) \leq \max \{\operatorname{size}(U), \operatorname{size}(S)\}$ for all $i \in I$. Together with the bound on $|I|$ we found above we conclude from Sets, Lemma 3.9.5 that size $\left(\amalg U_{i}\right) \leq$ $\max \{\operatorname{size}(U), \operatorname{size}(S)\}$. Hence Spaces, Lemma 52.8 .3 applies to show that $\amalg X_{i}$ is an algebraic space which is what we had to prove.

### 67.12. Algebraic spaces in the étale topology

076 L Let $S$ be a scheme. Instead of working with sheaves over the big fppf site $(S c h / S)_{f p p f}$ we could work with sheaves over the big étale site $(S c h / S)_{\text {étale }}$. All of the material in Algebraic Spaces, Sections 52.3 and 52.5 makes sense for sheaves over $(S c h / S)_{\text {étale }}$. Thus we get a second notion of algebraic spaces by working in the étale topology. This notion is (a priori) weaker then the notion introduced in Algebraic Spaces, Definition 52.6.1 since a sheaf in the fppf topology is certainly a sheaf in the étale topology. However, the notions are equivalent as is shown by the following lemma.

076M Lemma 67.12.1. Denote the common underlying category of $S^{\text {L }} h_{\text {fppf }}$ and $S h_{\text {étale }}$ by Sch (see Topologies, Remark33.9.1). Let $S$ be an object of Sch ${ }_{\alpha}$. Let

$$
F:\left(S c h_{\alpha} / S\right)^{o p p} \longrightarrow \text { Sets }
$$

be a presheaf with the following properties:
(1) $F$ is a sheaf for the étale topology,
(2) the diagonal $\Delta: F \rightarrow F \times F$ is representable, and
(3) there exists $U \in \mathrm{Ob}\left(S c h_{\alpha} / S\right)$ and $U \rightarrow F$ which is surjective and étale.

Then $F$ is an algebraic space in the sense of Algebraic Spaces, Definition 52.6.1.
Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Spaces, Definition 52.6.1 are independent of the topology. This is true because these properties involve only the notion of a fibre product of presheaves, maps of presheaves, the notion of a representable transformation of functors, and what it means for such a transformation to be surjective and étale. Thus all we have to prove is that an étale sheaf $F$ with properties (2) and (3) is also an fppf sheaf.

To do this, let $R=U \times_{F} U$. By (2) the presheaf $R$ is representable by a scheme and by (3) the projections $R \rightarrow U$ are étale. Thus $j: R \rightarrow U \times{ }_{S} U$ is an étale equivalence relation. Moreover $U \rightarrow F$ identifies $F$ as the quotient of $U$ by $R$ for the étale topology: (a) if $T \rightarrow F$ is a morphism, then $\left\{T \times{ }_{F} U \rightarrow T\right\}$ is an
étale covering, hence $U \rightarrow F$ is a surjection of sheaves for the étale topology, (b) if $a, b: T \rightarrow U$ map to the same section of $F$, then $(a, b): T \rightarrow R$ hence $a$ and $b$ have the same image in the quotient of $U$ by $R$ for the étale topology. Next, let $U / R$ denote the quotient sheaf in the fppf topology which is an algebraic space by Spaces, Theorem 52.10.5. Thus we have morphisms (transformations of functors)

$$
U \rightarrow F \rightarrow U / R
$$

By the aforementioned Spaces, Theorem 52.10.5 the composition is representable, surjective, and étale. Hence for any scheme $T$ and morphism $T \rightarrow U / R$ the fibre product $V=T \times_{U / R} U$ is a scheme surjective and étale over $T$. In other words, $\{V \rightarrow U\}$ is an étale covering. This proves that $U \rightarrow U / R$ is surjective as a map of sheaves in the étale topology. It follows that $F \rightarrow U / R$ is surjective as a map of sheaves in the étale topology. On the other hand, the map $F \rightarrow U / R$ is injective (as a map of presheaves) since $R=U \times_{U / R} U$ again by Spaces, Theorem 52.10.5. It follows that $F \rightarrow U / R$ is an isomorphism of étale sheaves, see Sites, Lemma 7.12 .2 which concludes the proof.

There is also an analogue of Spaces, Lemma 52.11.1.
0BH4 Lemma 67.12.2. Denote the common underlying category of $S^{\text {. }} h_{\text {fppf }}$ and $S_{\text {chetale }}$ by Sch (see Topologies, Remark 33.9.1). Let $S$ be an object of Sch ${ }_{\alpha}$. Let

$$
F:\left(S c h_{\alpha} / S\right)^{o p p} \longrightarrow \text { Sets }
$$

be a presheaf with the following properties:
(1) $F$ is a sheaf for the étale topology,
(2) there exists an algebraic space $U$ over $S$ and a map $U \rightarrow F$ which is representable by algebraic spaces, surjective, and étale.
Then $F$ is an algebraic space in the sense of Algebraic Spaces, Definition 52.6.1.
Proof. Set $R=U \times_{F} U$. This is an algebraic space as $U \rightarrow F$ is assumed representable by algebraic spaces. The projections $s, t: R \rightarrow U$ are étale morphisms of algebraic spaces as $U \rightarrow F$ is assumed étale. The map $j=(t, s): R \rightarrow U \times_{S} U$ is a monomorphism and an equivalence relation as $R=U \times{ }_{F} U$. By Theorem 67.10.1 the fppf quotient sheaf $F^{\prime}=U / R$ is an algebraic space. The morphism $U \rightarrow F^{\prime}$ is surjective, flat, and locally of finite presentation by Lemma 67.11.6. The map $R \rightarrow U \times{ }_{F^{\prime}} U$ is surjective as a map of fppf sheaves by Groupoids in Spaces, Lemma 65.18 .5 and since $j$ is a monomorphism it is an isomorphism. Hence the base change of $U \rightarrow F^{\prime}$ by $U \rightarrow F^{\prime}$ is étale, and we conclude that $U \rightarrow F^{\prime}$ is étale by Descent on Spaces, Lemma 61.10.26. Thus $U \rightarrow F^{\prime}$ is surjective as a map of étale sheaves. This means that $F^{\prime}$ is equal to the quotient sheaf $U / R$ in the étale topology (small check omitted). Hence we obtain a canonical factorization $U \rightarrow F^{\prime} \rightarrow F$ and $F^{\prime} \rightarrow F$ is an injective map of sheaves. On the other hand, $U \rightarrow F$ is surjective as a map of étale sheaves and hence so is $F^{\prime} \rightarrow F$. This means that $F^{\prime}=F$ and the proof is complete.

In fact, it suffices to have a smooth cover by a scheme and it suffices to assume the diagonal is representable by algebraic spaces.
07WF Lemma 67.12.3. Denote the common underlying category of $S_{\text {. }} h_{\text {fppf }}$ and $S h_{\text {étale }}$ by Sch (see Topologies, Remark 33.9.1). Let $S$ be an object of $S c h_{\alpha}$.

$$
F:\left(S c h_{\alpha} / S\right)^{o p p} \longrightarrow \text { Sets }
$$

be a presheaf with the following properties:
(1) $F$ is a sheaf for the étale topology,
(2) the diagonal $\Delta: F \rightarrow F \times F$ is representable by algebraic spaces, and
(3) there exists $U \in \mathrm{Ob}\left(S c h_{\alpha} / S\right)$ and $U \rightarrow F$ which is surjective and smooth.

Then $F$ is an algebraic space in the sense of Algebraic Spaces, Definition 52.6.1.
Proof. The proof mirrors the proof of Lemma 67.12.1. Let $R=U \times{ }_{F} U$. By (2) the presheaf $R$ is an algebraic space and by (3) the projections $R \rightarrow U$ are smooth and surjective. Denote ( $U, R, s, t, c$ ) the groupoid associated to the equivalence relation $j: R \rightarrow U \times_{S} U$ (see Groupoids in Spaces, Lemma 65.11.3). By Theorem 67.10.1 we see that $X=U / R$ (quotient in the fppf-topology) is an algebraic space. Using that the smooth topology and the étale topology have the same sheaves (by More on Morphisms, Lemma 36.28 .7 ) we see the map $U \rightarrow F$ identifies $F$ as the quotient of $U$ by $R$ for the smooth topology (details omitted). Thus we have morphisms (transformations of functors)

$$
U \rightarrow F \rightarrow X
$$

By Lemma 67.11 .6 we see that $U \rightarrow X$ is surjective, flat and locally of finite presentation. By Groupoids in Spaces, Lemma 65.18.5 (and the fact that $j$ is a monomorphism) we have $R=U \times_{X} U$. By Descent on Spaces, Lemma 61.10.24 we conclude that $U \rightarrow X$ is smooth and surjective (as the projections $R \rightarrow U$ are smooth and surjective and $\{U \rightarrow X\}$ is an fppf covering). Hence for any scheme $T$ and morphism $T \rightarrow X$ the fibre product $T \times{ }_{X} U$ is an algebraic space surjective and smooth over $T$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow T \times{ }_{X} U$. Then $\{V \rightarrow T\}$ is a smooth covering such that $V \rightarrow T \rightarrow X$ lifts to a morphism $V \rightarrow U$. This proves that $U \rightarrow X$ is surjective as a map of sheaves in the smooth topology. It follows that $F \rightarrow X$ is surjective as a map of sheaves in the smooth topology. On the other hand, the map $F \rightarrow X$ is injective (as a map of presheaves) since $R=U \times_{X} U$. It follows that $F \rightarrow X$ is an isomorphism of smooth (= étale) sheaves, see Sites, Lemma 7.12 .2 which concludes the proof.

## CHAPTER 68

## Quotients of Groupoids

### 68.1. Introduction

048B This chapter is devoted to generalities concerning groupoids and their quotients (as far as they exist). There is a lot of literature on this subject, see for example MFK94, Ses72, Kol97, KM97, Kol08] and many more.

### 68.2. Conventions and notation

048 C In this chapter the conventions and notation are those introduced in Groupoids in Spaces, Sections 65.2 and 65.3

### 68.3. Invariant morphisms

048D
048E Definition 68.3.1. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j=(t, s): R \rightarrow U \times_{B} U$ be a pre-relation of algebraic spaces over $B$. We say a morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is $R$-invariant if the diagram

is commutative. If $j: R \rightarrow U \times{ }_{B} U$ comes from the action of a group algebraic space $G$ on $U$ over $B$ as in Groupoids in Spaces, Lemma 65.14.1, then we say that $\phi$ is $G$-invariant.

In other words, a morphism $U \rightarrow X$ is $R$-invariant if it equalizes $s$ and $t$. We can reformulate this in terms of associated quotient sheaves as follows.

048F Lemma 68.3.2. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j=(t, s): R \rightarrow U \times_{B} U$ be a pre-relation of algebraic spaces over $B . A$ morphism of algebraic spaces $\phi: U \rightarrow X$ is $R$-invariant if and only if it factors as $U \rightarrow U / R \rightarrow X$.

Proof. This is clear from the definition of the quotient sheaf in Groupoids in Spaces, Section 65.18 .

048G Lemma 68.3.3. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j=(t, s): R \rightarrow U \times{ }_{B} U$ be a pre-relation of algebraic spaces over $B$. Let $U \rightarrow X$ be an $R$-invariant morphism of algebraic spaces over $B$. Let $X^{\prime} \rightarrow X$ be any morphism of algebraic spaces.
(1) Setting $U^{\prime}=X^{\prime} \times_{X} U, R^{\prime}=X^{\prime} \times_{X} R$ we obtain a pre-relation $j^{\prime}: R^{\prime} \rightarrow$ $U^{\prime} \times{ }_{B} U^{\prime}$.
(2) The pre-relation $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times{ }_{B} U^{\prime}$ is the restriction of $j: R \rightarrow U \times_{B} U$ via $U^{\prime} \rightarrow U$, see Groupoids in Spaces, Definition 65.4.3.
(3) If $j$ is a relation, then $j^{\prime}$ is a relation.
(4) If $j$ is a pre-equivalence relation, then $j^{\prime}$ is a pre-equivalence relation.
(5) If $j$ is an equivalence relation, then $j^{\prime}$ is an equivalence relation.
(6) If $j$ comes from a groupoid in algebraic spaces $(U, R, s, t, c)$ over $B$, then $j^{\prime}$ comes from the restriction of this groupoid to $U^{\prime}$, see Groupoids in Spaces, Definition 65.16.2.
(7) If $j$ comes from the action of a group algebraic space $G / B$ on $U$ as in Groupoids in Spaces, Lemma 65.14.1 then $j^{\prime}$ comes from the induced action of $G$ on $U^{\prime}$.
Proof. Omitted. Hint: Functorial point of view combined with the picture:

048 H Definition 68.3.4. In the situation of Lemma 68.3.3 we call $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times_{B} U^{\prime}$ the pullback of the pre-relation $j$ to $X^{\prime}$. We say it is a flat pullback if $X^{\prime} \rightarrow X$ is a flat morphism of algebraic spaces.

### 68.4. Categorical quotients

048 I This is the most basic kind of quotient one can consider.
048J Definition 68.4.1. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j=(t, s): R \rightarrow U \times_{B} U$ be pre-relation in algebraic spaces over $B$.
(1) We say a morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is a categorical quotient if it is $R$-invariant, and for every $R$-invariant morphism $\psi: U \rightarrow$ $Y$ of algebraic spaces over $B$ there exists a unique morphism $\chi: X \rightarrow Y$ such that $\psi=\phi \circ \chi$.
(2) Let $\mathcal{C}$ be a full subcategory of the category of algebraic spaces over $B$. Assume $U, R$ are objects of $\mathcal{C}$. In this situation we say a morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is a categorical quotient in $\mathcal{C}$ if $X \in \mathrm{Ob}(\mathcal{C})$, and $\phi$ is $R$-invariant, and for every $R$-invariant morphism $\psi: U \rightarrow Y$ with $Y \in \operatorname{Ob}(\mathcal{C})$ there exists a unique morphism $\chi: X \rightarrow Y$ such that $\psi=\phi \circ \chi$.
(3) If $B=S$ and $\mathcal{C}$ is the category of schemes over $S$, then we say $U \rightarrow X$ is a categorical quotient in the category of schemes, or simply a categorical quotient in schemes.

We often single out a category $\mathcal{C}$ of algebraic spaces over $B$ by some separation axiom, see Example 68.4 .3 for some standard cases. Note that if $\phi: U \rightarrow X$ is a categorical quotient if and only if $U \rightarrow X$ is a coequalizer for the morphisms $t, s: R \rightarrow U$ in the category. Hence we immediately deduce the following lemma.

048K Lemma 68.4.2. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation in algebraic spaces over $B$. If a categorical quotient in the category of algebraic spaces over $B$ exists, then it is unique up to unique isomorphism. Similarly for categorical quotients in full subcategories of Spaces/B.

Proof. See Categories, Section 4.11.
049V Example 68.4.3. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Here are some standard examples of categories $\mathcal{C}$ that we often come up when applying Definition 68.4.1.
(1) $\mathcal{C}$ is the category of all algebraic spaces over $B$,
(2) $B$ is separated and $\mathcal{C}$ is the category of all separated algebraic spaces over $B$,
(3) $B$ is quasi-separated and $\mathcal{C}$ is the category of all quasi-separated algebraic spaces over $B$,
(4) $B$ is locally separated and $\mathcal{C}$ is the category of all locally separated algebraic spaces over $B$,
(5) $B$ is decent and $\mathcal{C}$ is the category of all decent algebraic spaces over $B$, and
(6) $S=B$ and $\mathcal{C}$ is the category of schemes over $S$.

In this case, if $\phi: U \rightarrow X$ is a categorical quotient then we say $U \rightarrow X$ is (1) a categorical quotient, (2) a categorical quotient in separated algebraic spaces, (3) a categorical quotient in quasi-separated algebraic spaces, (4) a categorical quotient in locally separated algebraic spaces, (5) a categorical quotient in decent algebraic spaces, (6) a categorical quotient in schemes.
048L Definition 68.4.4. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $\mathcal{C}$ be a full subcategory of the category of algebraic spaces over $B$ closed under fibre products. Let $j=(t, s): R \rightarrow U \times_{B} U$ be pre-relation in $\mathcal{C}$, and let $U \rightarrow X$ be an $R$-invariant morphism with $X \in \mathrm{Ob}(\mathcal{C})$.
(1) We say $U \rightarrow X$ is a universal categorical quotient in $\mathcal{C}$ if for every morphism $X^{\prime} \rightarrow X$ in $\mathcal{C}$ the morphism $U^{\prime}=X^{\prime} \times_{X} U \rightarrow X^{\prime}$ is the categorical quotient in $\mathcal{C}$ of the pullback $j^{\prime}: R^{\prime} \rightarrow U^{\prime}$ of $j$.
(2) We say $U \rightarrow X$ is a uniform categorical quotient in $\mathcal{C}$ if for every flat morphism $X^{\prime} \rightarrow X$ in $\mathcal{C}$ the morphism $U^{\prime}=X^{\prime} \times_{X} U \rightarrow X^{\prime}$ is the categorical quotient in $\mathcal{C}$ of the pullback $j^{\prime}: R^{\prime} \rightarrow U^{\prime}$ of $j$.

049W Lemma 68.4.5. In the situation of Definition 68.4.1. If $\phi: U \rightarrow X$ is a categorical quotient and $U$ is reduced, then $X$ is reduced. The same holds for categorical quotients in a category of spaces $\mathcal{C}$ listed in Example 68.4.3.

Proof. Let $X_{\text {red }}$ be the reduction of the algebraic space $X$. Since $U$ is reduced the morphism $\phi: U \rightarrow X$ factors through $i: X_{\text {red }} \rightarrow X$ (insert future reference here). Denote this morphism by $\phi_{\text {red }}: U \rightarrow X_{r e d}$. Since $\phi \circ s=\phi \circ t$ we see that also $\phi_{r e d} \circ s=\phi_{r e d} \circ t\left(\right.$ as $i: X_{r e d} \rightarrow X$ is a monomorphism). Hence by the universal
property of $\phi$ there exists a morphism $\chi: X \rightarrow X_{\text {red }}$ such that $\phi_{\text {red }}=\phi \circ \chi$. By uniqueness we see that $i \circ \chi=\operatorname{id}_{X}$ and $\chi \circ i=\operatorname{id}_{X_{r e d}}$. Hence $i$ is an isomorphism and $X$ is reduced.
To show that this argument works in a category $\mathcal{C}$ one just needs to show that the reduction of an object of $\mathcal{C}$ is an object of $\mathcal{C}$. We omit the verification that this holds for each of the standard examples.

### 68.5. Quotients as orbit spaces

048 M Let $j=(t, s): R \rightarrow U \times_{B} U$ be a pre-relation. If $j$ is a pre-equivalence relation, then loosely speaking the "orbits" of $R$ on $U$ are the subsets $t\left(s^{-1}(\{u\})\right)$ of $U$. However, if $j$ is just a pre-relation, then we need to take the equivalence relation generated by $R$.

048N Definition 68.5.1. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation over $B$. If $u \in|U|$, then the orbit, or more precisely the $R$-orbit of $u$ is

$$
O_{u}=\left\{\begin{array}{c}
\exists n \geq 1, \exists u_{0}, \ldots, u_{n} \in|U| \text { such that } \\
\text { for all } i \in\{0, \ldots, n-1\} \text { either } \\
u^{\prime} \in|U|: \\
\exists r \in|R|, s(r)=u_{i+1} \text { or } \\
\exists r \in|R|, t(r)=u_{i}, t(r)=u_{i+1} \text { or } \\
\\
\quad \exists(r)=u_{i+1}
\end{array}\right\}
$$

It is clear that these are the equivalence classes of an equivalence relation, i.e., we have $u^{\prime} \in O_{u}$ if and only if $u \in O_{u^{\prime}}$. The following lemma is a reformulation of Groupoids in Spaces, Lemma 65.4.4.

048 O Lemma 68.5.2. Let $B \rightarrow S$ as in Section 68.2. Let $j: R \rightarrow U \times_{B} U$ be a pre-equivalence relation of algebraic spaces over $B$. Then

$$
O_{u}=\left\{u^{\prime} \in|U| \text { such that } \exists r \in|R|, s(r)=u, t(r)=u^{\prime}\right\}
$$

Proof. By the aforementioned Groupoids in Spaces, Lemma65.4.4 we see that the orbits $O_{u}$ as defined in the lemma give a disjoint union decomposition of $|U|$. Thus we see they are equal to the orbits as defined in Definition 68.5.1.

048P Lemma 68.5.3. In the situation of Definition 68.5.1. Let $\phi: U \rightarrow X$ be an $R$-invariant morphism of algebraic spaces over $B$. Then $\phi|:|U| \rightarrow| X \mid$ is constant on the orbits.

Proof. To see this we just have to show that $\phi(u)=\phi\left(u^{\prime}\right)$ for all $u, u^{\prime} \in|U|$ such that there exists an $r \in|R|$ such that $s(r)=u$ and $t(r)=u^{\prime}$. And this is clear since $\phi$ equalizes $s$ and $t$.
There are several problems with considering the orbits $O_{u} \subset|U|$ as a tool for singling out properties of quotient maps. One issue is the following. Suppose that $\operatorname{Spec}(k) \rightarrow B$ is a geometric point of $B$. Consider the canonical map

$$
U(k) \longrightarrow|U| .
$$

Then it is usually not the case that the equivalence classes of the equivalence relation generated by $j(R(k)) \subset U(k) \times U(k)$ are the inverse images of the orbits $O_{u} \subset|U|$. A silly example is to take $S=B=\operatorname{Spec}(\mathbf{Z}), U=R=\operatorname{Spec}(k)$ with $s=t=\operatorname{id}_{k}$. Then $|U|=|R|$ is a single point but $U(k) / R(k)$ is enormous. A more interesting
example is to take $S=B=\operatorname{Spec}(\mathbf{Q})$, choose some of number fields $K \subset L$, and set $U=\operatorname{Spec}(L)$ and $R=\operatorname{Spec}\left(L \otimes_{K} L\right)$ with obvious maps $s, t: R \rightarrow U$. In this case $|U|$ still has just one point, but the quotient

$$
U(k) / R(k)=\operatorname{Hom}(K, k)
$$

consists of more than one element. We conclude from both examples that if $U \rightarrow X$ is an $R$-invariant map and if we want it to "separate orbits" we get a much stronger and interesting notion by considering the induced maps $U(k) \rightarrow X(k)$ and ask that those maps separate orbits.

There is an issue with this too. Namely, suppose that $S=B=\operatorname{Spec}(\mathbf{R}), U=$ $\operatorname{Spec}(\mathbf{C})$, and $R=\operatorname{Spec}(\mathbf{C}) \amalg \operatorname{Spec}(K)$ for some field extension $\sigma: \mathbf{C} \rightarrow K$. Let the maps $s, t$ be given by the identity on the component $\operatorname{Spec}(\mathbf{C})$, but by $\sigma, \sigma \circ \tau$ on the second component where $\tau$ is complex conjugation. If $K$ is a nontrivial extension of $\mathbf{C}$, then the two points $1, \tau \in U(\mathbf{C})$ are not equivalent under $j(R(\mathbf{C}))$. But after choosing an extension $\mathbf{C} \subset \Omega$ of sufficiently large cardinality (for example larger than the cardinality of $K$ ) then the images of $1, \tau \in U(\mathbf{C})$ in $U(\Omega)$ do become equivalent! It seems intuitively clear that this happens either because $s, t: R \rightarrow U$ are not locally of finite type or because the cardinality of the field $k$ is not large enough.

Keeping this in mind we make the following definition.
048Q Definition 68.5.4. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$. Let $\operatorname{Spec}(k) \rightarrow B$ be a geometric point of $B$.
(1) We say $\bar{u}, \bar{u}^{\prime} \in U(k)$ are weakly $R$-equivalent if they are in the same equivalence class for the equivalence relation generated by the relation $j(R(k)) \subset U(k) \times U(k)$.
(2) We say $\bar{u}, \bar{u}^{\prime} \in U(k)$ are $R$-equivalent if for some overfield $k \subset \Omega$ the images in $U(\Omega)$ are weakly $R$-equivalent.
(3) The weak orbit, or more precisely the weak $R$-orbit of $\bar{u} \in U(k)$ is set of all elements of $U(k)$ which are weakly $R$-equivalent to $\bar{u}$.
(4) The orbit, or more precisely the $R$-orbit of $\bar{u} \in U(k)$ is set of all elements of $U(k)$ which are $R$-equivalent to $\bar{u}$.

It turns out that in good cases orbits and weak orbits agree, see Lemma 68.5.7. The following lemma illustrates the difference in the special case of a pre-equivalence relation.

048R Lemma 68.5.5. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $\operatorname{Spec}(k) \rightarrow B$ be a geometric point of $B$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-equivalence relation over $B$. In this case the weak orbit of $\bar{u} \in U(k)$ is simply

$$
\left\{\bar{u}^{\prime} \in U(k) \text { such that } \exists \bar{r} \in R(k), s(\bar{r})=\bar{u}, t(\bar{r})=\bar{u}^{\prime}\right\}
$$

and the orbit of $\bar{u} \in U(k)$ is

$$
\left\{\bar{u}^{\prime} \in U(k): \exists \text { field extension } k \subset K, \exists r \in R(K), s(r)=\bar{u}, t(r)=\bar{u}^{\prime}\right\}
$$

Proof. This is true because by definition of a pre-equivalence relation the image $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.

Let us describe the recipe for turning any pre-relation into a pre-equivalence relation. We will use the morphisms

048S

| $j_{\text {diag }}$ | $:$ | $U$ | $\longrightarrow$ | $U \times_{B} U$, | $u$ | $\longmapsto$ | $(u, u)$ |

| $j_{\text {flip }}$ | $:$ | $R$ | $\longrightarrow$ | $U \times_{B} U$, | $r$ | $\longmapsto$ | $(s(r), t(r))$ |
| $j_{\text {comp }}$ | $:$ | $R \times_{s, U, t} R$ | $\longrightarrow$ | $U \times_{B} U$, | $\left(r, r^{\prime}\right)$ | $\longmapsto$ | $\left(t(r), s\left(r^{\prime}\right)\right)$ |

We define $j_{1}=\left(t_{1}, s_{1}\right): R_{1} \rightarrow U \times_{B} U$ to be the morphism

$$
j \amalg j_{\text {diag }} \amalg j_{\text {flip }}: R \amalg U \amalg R \longrightarrow U \times_{B} U
$$

with notation as in Equation (68.5.5.1). For $n>1$ we set

$$
j_{n}=\left(t_{n}, s_{n}\right): R_{n}=R_{1} \times_{s_{1}, U, t_{n-1}} R_{n-1} \longrightarrow U \times_{B} U
$$

where $t_{n}$ comes from $t_{1}$ precomposed with projection onto $R_{1}$ and $s_{n}$ comes from $s_{n-1}$ precomposed with projection onto $R_{n-1}$. Finally, we denote

$$
j_{\infty}=\left(t_{\infty}, s_{\infty}\right): R_{\infty}=\coprod_{n \geq 1} R_{n} \longrightarrow U \times_{B} U
$$

048T Lemma 68.5.6. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$. Then $j_{\infty}: R_{\infty} \rightarrow U \times_{B} U$ is a pre-equivalence relation over $B$. Moreover
(1) $\phi: U \rightarrow X$ is $R$-invariant if and only if it is $R_{\infty}$-invariant,
(2) the canonical map of quotient sheaves $U / R \rightarrow U / R_{\infty}$ (see Groupoids in Spaces, Section 65.18) is an isomorphism,
(3) weak $R$-orbits agree with weak $R_{\infty \text {-orbits, }}$
(4) $R$-orbits agree with $R_{\infty \text {-orbits, }}$
(5) if $s, t$ are locally of finite type, then $s_{\infty}, t_{\infty}$ are locally of finite type,
(6) add more here as needed.

Proof. Omitted. Hint for (5): Any property of $s, t$ which is stable under composition and stable under base change, and Zariski local on the source will be inherited by $s_{\infty}, t_{\infty}$.

048U Lemma 68.5.7. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$. Let $\operatorname{Spec}(k) \rightarrow B$ be a geometric point of $B$.
(1) If $s, t: R \rightarrow U$ are locally of finite type then weak $R$-equivalence on $U(k)$ agrees with $R$-equivalence, and weak $R$-orbits agree with $R$-orbits on $U(k)$.
(2) If $k$ has sufficiently large cardinality then weak $R$-equivalence on $U(k)$ agrees with $R$-equivalence, and weak $R$-orbits agree with $R$-orbits on $U(k)$.

Proof. We first prove (1). Assume $s, t$ locally of finite type. By Lemma 68.5.6 we may assume that $R$ is a pre-equivalence relation. Let $k$ be an algebraically closed field over $B$. Suppose $\bar{u}, \bar{u}^{\prime} \in U(k)$ are $R$-equivalent. Then for some extension field $k \subset \Omega$ there exists a point $\bar{r} \in R(\Omega)$ mapping to $\left(\bar{u}, \bar{u}^{\prime}\right) \in\left(U \times{ }_{B} U\right)(\Omega)$, see Lemma 68.5.5. Hence

$$
Z=R \times_{j, U \times_{B} U,\left(\bar{u}, \bar{u}^{\prime}\right)} \operatorname{Spec}(k)
$$

is nonempty. As $s$ is locally of finite type we see that also $j$ is locally of finite type, see Morphisms of Spaces, Lemma 54.23.6. This implies $Z$ is a nonempty algebraic space locally of finite type over the algebraically closed field $k$ (use Morphisms of Spaces, Lemma 54.23.3). Thus $Z$ has a $k$-valued point, see Morphisms of Spaces,

Lemma 54.24.1. Hence we conclude there exists a $\bar{r} \in R(k)$ with $j(\bar{r})=\left(\bar{u}, \bar{u}^{\prime}\right)$, and we conclude that $\bar{u}, \bar{u}^{\prime}$ are $R$-equivalent as desired.
The proof of part (2) is the same, except that it uses Morphisms of Spaces, Lemma 54.24 .2 instead of Morphisms of Spaces, Lemma 54.24.1. This shows that the assertion holds as soon as $|k|>\lambda(R)$ with $\lambda(R)$ as introduced just above Morphisms of Spaces, Lemma 54.24.1.

In the following definition we use the terminology " $k$ is a field over $B$ " to mean that $\operatorname{Spec}(k)$ comes equipped with a morphism $\operatorname{Spec}(k) \rightarrow B$.
048V Definition 68.5.8. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$.
(1) We say $\phi: U \rightarrow X$ is set-theoretically $R$-invariant if and only if the map $U(k) \rightarrow X(k)$ equalizes the two maps $s, t: R(k) \rightarrow U(k)$ for every algebraically closed field $k$ over $B$.
(2) We say $\phi: U \rightarrow X$ separates orbits, or separates $R$-orbits if it is settheoretically $R$-invariant and $\phi(\bar{u})=\phi\left(\bar{u}^{\prime}\right)$ in $X(k)$ implies that $\bar{u}, \bar{u}^{\prime} \in$ $U(k)$ are in the same orbit for every algebraically closed field $k$ over $B$.
In Example 68.5 .12 we show that being set-theoretically invariant is "too weak" a notion in the category of algebraic spaces. A more geometric reformulation of what it means to be set-theoretically invariant or to separate orbits is in Lemma 68.5.17,
048W Lemma 68.5.9. In the situation of Definition 68.5.8. A morphism $\phi: U \rightarrow X$ is set-theoretically $R$-invariant if and only if for any algebraically closed field $k$ over $B$ the map $U(k) \rightarrow X(k)$ is constant on orbits.

Proof. This is true because the condition is supposed to hold for all algebraically closed fields over $B$.

048X Lemma 68.5.10. In the situation of Definition 68.5.8. An invariant morphism is set-theoretically invariant.
Proof. This is immediate from the definitions.
048Y Lemma 68.5.11. In the situation of Definition 68.5.8. Let $\phi: U \rightarrow X$ be $a$ morphism of algebraic spaces over B. Assume
(1) $\phi$ is set-theoretically $R$-invariant,
(2) $R$ is reduced, and
(3) $X$ is locally separated over $B$.

Then $\phi$ is $R$-invariant.
Proof. Consider the equalizer

$$
Z=R \times_{(\phi, \phi) \circ j, X \times_{B} X, \Delta_{X / B}} X
$$

algebraic space. Then $Z \rightarrow R$ is an immersion by assumption (3). By assumption (1) $|Z| \rightarrow|R|$ is surjective. This implies that $Z \rightarrow R$ is a bijective closed immersion (use Schemes, Lemma 25.10 .4 ) and by assumption (2) we conclude that $Z=R$.

048Z Example 68.5.12. There exist reduced quasi-separated algebraic spaces $X, Y$ and a pair of morphisms $a, b: Y \rightarrow X$ which agree on all $k$-valued points but are not equal. To get an example take $Y=\operatorname{Spec}(k[[x]])$ and

$$
X=\mathbf{A}_{k}^{1} /(\Delta \amalg\{(x,-x) \mid x \neq 0\})
$$

the algebraic space of Spaces, Example 52.14.1. The two morphisms $a, b: Y \rightarrow X$ come from the two maps $x \mapsto x$ and $x \mapsto-x$ from $Y$ to $\mathbf{A}_{k}^{1}=\operatorname{Spec}(k[x])$. On the generic point the two maps are the same because on the open part $x \neq 0$ of the space $X$ the functions $x$ and $-x$ are equal. On the closed point the maps are obviously the same. It is also true that $a \neq b$. This implies that Lemma 68.5.11 does not hold with assumption (3) replaced by the assumption that $X$ be quasi-separated. Namely, consider the diagram

then the composition $a \circ(-1)=b$. Hence we can set $R=Y, U=Y, s=1, t=-1$, $\phi=a$ to get an example of a set-theoretically invariant morphism which is not invariant.

The example above is instructive because the map $Y \rightarrow X$ even separates orbits. It shows that in the category of algebraic spaces there are simply too many settheoretically invariant morphisms lying around. Next, let us define what it means for $R$ to be a set-theoretic equivalence relation, while remembering that we need to allow for field extensions to make this work correctly.

0490 Definition 68.5.13. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation over $B$.
(1) We say $j$ is a set-theoretic pre-equivalence relation if

$$
\bar{u} \sim_{R} \bar{u}^{\prime} \Leftrightarrow \begin{gathered}
\exists \text { field extension } k \subset K, \exists r \in R(K), \\
s(r)=\bar{u}, t(r)=\bar{u}^{\prime}
\end{gathered}
$$

defines an equivalence relation on $U(k)$ for all algebraically closed fields $k$ over $B$.
(2) We say $j$ is a set-theoretic equivalence relation if $j$ is universally injective and a set-theoretic pre-equivalence relation.

Let us reformulate this in more geometric terms.
0491 Lemma 68.5.14. In the situation of Definition 68.5.13. The following are equivalent:
(1) The morphism $j$ is a set-theoretic pre-equivalence relation.
(2) The subset $j(|R|) \subset\left|U \times_{B} U\right|$ contains the image of $\left|j^{\prime}\right|$ for any of the morphisms $j^{\prime}$ as in Equation 68.5.5.1.
(3) For every algebraically closed field $k$ over $B$ of sufficiently large cardinality the subset $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.
If $s, t$ are locally of finite type these are also equivalent to
(4) For every algebraically closed field $k$ over $B$ the subset $j(R(k)) \subset U(k) \times$ $U(k)$ is an equivalence relation.

Proof. Assume (2). Let $k$ be an algebraically closed field over $B$. We are going to show that $\sim_{R}$ is an equivalence relation. Suppose that $\bar{u}_{i}: \operatorname{Spec}(k) \rightarrow U, i=1,2$ are $k$-valued points of $U$. Suppose that $\left(\bar{u}_{1}, \bar{u}_{2}\right)$ is the image of a $K$-valued point
$r \in R(K)$. Consider the solid commutative diagram

We also denote $r \in|R|$ the image of $r$. By assumption the image of $\left|j_{f l i p}\right|$ is contained in the image of $|j|$, in other words there exists a $r^{\prime} \in|R|$ such that $|j|\left(r^{\prime}\right)=\left|j_{f l i p}\right|(r)$. But note that $\left(\bar{u}_{2}, \bar{u}_{1}\right)$ is in the equivalence class that defines $|j|\left(r^{\prime}\right)$ (by the commutativity of the solid part of the diagram). This means there exists a field extension $k \subset K^{\prime}$ and a morphism $r^{\prime}: \operatorname{Spec}(K) \rightarrow R$ (abusively denoted $r^{\prime}$ as well) with $j \circ r^{\prime}=\left(\bar{u}_{2}, \bar{u}_{1}\right) \circ i$ where $i: \operatorname{Spec}\left(K^{\prime}\right) \rightarrow \operatorname{Spec}(K)$ is the obvious map. In other words the dotted part of the diagram commutes. This proves that $\sim_{R}$ is a symmetric relation on $U(k)$. In the similar way, using that the image of $\left|j_{\text {diag }}\right|$ is contained in the image of $|j|$ we see that $\sim_{R}$ is reflexive (details omitted).

To show that $\sim_{R}$ is transitive assume given $\bar{u}_{i}: \operatorname{Spec}(k) \rightarrow U, i=1,2,3$ and field extensions $k \subset K_{i}$ and points $r_{i}: \operatorname{Spec}\left(K_{i}\right) \rightarrow R, i=1,2$ such that $j\left(r_{1}\right)=\left(\bar{u}_{1}, \bar{u}_{2}\right)$ and $j\left(r_{1}\right)=\left(\bar{u}_{2}, \bar{u}_{3}\right)$. Then we may choose a commutative diagram of fields

and we may think of $r_{1}, r_{2} \in R(K)$. We consider the commutative solid diagram

By exactly the same reasoning as in the first part of the proof, but this time using that $\left|j_{\text {comp }}\right|\left(\left(r_{1}, r_{2}\right)\right)$ is in the image of $|j|$, we conclude that a field $K^{\prime}$ and dotted arrows exist making the diagram commute. This proves that $\sim_{R}$ is transitive and concludes the proof that (2) implies (1).

Assume (1) and let $k$ be an algebraically closed field over $B$ whose cardinality is larger than $\lambda(R)$, see Morphisms of Spaces, Lemma54.24.2. Suppose that $\bar{u} \sim_{R} \bar{u}^{\prime}$ with $\bar{u}, \bar{u}^{\prime} \in U(k)$. By assumption there exists a point in $|R|$ mapping to $\left(\bar{u}, \bar{u}^{\prime}\right) \in$ $\left|U \times{ }_{B} U\right|$. Hence by Morphisms of Spaces, Lemma 54.24 .2 we conclude there exists an $\bar{r} \in R(k)$ with $j(\bar{r})=\left(\bar{u}, \bar{u}^{\prime}\right)$. In this way we see that (1) implies (3).

Assume (3). Let us show that $\operatorname{Im}\left(\left|j_{\text {comp }}\right|\right) \subset \operatorname{Im}(|j|)$. Pick any point $c \in\left|R \times_{s, U, t} R\right|$. We may represent this by a morphism $\bar{c}: \operatorname{Spec}(k) \rightarrow R \times_{s, U, t} R$, with $k$ over $B$ having sufficiently large cardinality. By assumption we see that $j_{\text {comp }}(\bar{c}) \in U(k) \times U(k)=$ $\left(U \times_{B} U\right)(k)$ is also the image $j(\bar{r})$ for some $\bar{r} \in R(k)$. Hence $j_{\text {comp }}(c)=j(r)$ in $\left|U \times_{B} U\right|$ as desired (with $r \in|R|$ the equivalence class of $\left.\bar{r}\right)$. The same argument shows also that $\operatorname{Im}\left(\left|j_{\text {diag }}\right|\right) \subset \operatorname{Im}(|j|)$ and $\operatorname{Im}\left(\left|j_{f l i p}\right|\right) \subset \operatorname{Im}(|j|)$ (details omitted). In this way we see that (3) implies (2). At this point we have shown that (1), (2) and (3) are all equivalent.

It is clear that (4) implies (3) (without any assumptions on $s, t$ ). To finish the proof of the lemma we show that (1) implies (4) if $s, t$ are locally of finite type. Namely, let $k$ be an algebraically closed field over $B$. Suppose that $\bar{u} \sim_{R} \bar{u}^{\prime}$ with $\bar{u}, \bar{u}^{\prime} \in U(k)$. By assumption the algebraic space $Z=R \times_{j, U \times{ }_{B} U,\left(\bar{u}, \bar{u}^{\prime}\right)} \operatorname{Spec}(k)$ is nonempty. On the other hand, since $j=(t, s)$ is locally of finite type the morphism $Z \rightarrow \operatorname{Spec}(k)$ is locally of finite type as well (use Morphisms of Spaces, Lemmas 54.23 .6 and 54.23 .3 . Hence $Z$ has a $k$ point by Morphisms of Spaces, Lemma 54.24 .1 and we conclude that $\left(\bar{u}, \bar{u}^{\prime}\right) \in j(R(k))$ as desired. This finishes the proof of the lemma.

049X Lemma 68.5.15. In the situation of Definition 68.5.13. The following are equivalent:
(1) The morphism $j$ is a set-theoretic equivalence relation.
(2) The morphism $j$ is universally injective and $j(|R|) \subset\left|U \times_{B} U\right|$ contains the image of $\left|j^{\prime}\right|$ for any of the morphisms $j^{\prime}$ as in Equation (68.5.5.1).
(3) For every algebraically closed field $k$ over $B$ of sufficiently large cardinality the map $j: R(k) \rightarrow U(k) \times U(k)$ is injective and its image is an equivalence relation.

If $j$ is decent, or locally separated, or quasi-separated these are also equivalent to
(4) For every algebraically closed field $k$ over $B$ the map $j: R(k) \rightarrow U(k) \times$ $U(k)$ is injective and its image is an equivalence relation.

Proof. The implications $(1) \Rightarrow(2)$ and $(2) \Rightarrow(3)$ follow from Lemma 68.5.14 and the definitions. The same lemma shows that (3) implies $j$ is a set-theoretic pre-equivalence relation. But of course condition (3) also implies that $j$ is universally injective, see Morphisms of Spaces, Lemma 54.19.2, so that $j$ is indeed a set-theoretic equivalence relation. At this point we know that (1), (2), (3) are all equivalent.

Condition (4) implies (3) without any further hypotheses on $j$. Assume $j$ is decent, or locally separated, or quasi-separated and the equivalent conditions (1), (2), (3) hold. By More on Morphisms of Spaces, Lemma 63.3.4 we see that $j$ is radicial. Let $k$ be any algebraically closed field over $B$. Let $\bar{u}, \bar{u}^{\prime} \in U(k)$ with $\bar{u} \sim_{R} \bar{u}^{\prime}$. We see that $R \times_{U \times_{B} U,\left(\bar{u}, \bar{u}^{\prime}\right)} \operatorname{Spec}(k)$ is nonempty. Hence, as $j$ is radicial, its reduction is the spectrum of a field purely inseparable over $k$. As $k=\bar{k}$ we see that it is the spectrum of $k$. Whence a point $\bar{r} \in R(k)$ with $t(\bar{r})=\bar{u}$ and $s(\bar{r})=\bar{u}^{\prime}$ as desired.

0492 Lemma 68.5.16. Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation over $B$.
(1) If $j$ is a pre-equivalence relation, then $j$ is a set-theoretic pre-equivalence relation. This holds in particular when $j$ comes from a groupoid in algebraic spaces, or from an action of a group algebraic space on $U$.
(2) If $j$ is an equivalence relation, then $j$ is a set-theoretic equivalence relation.

Proof. Omitted.
049Y Lemma 68.5.17. Let $B \rightarrow S$ be as in Section 68.2. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation. Let $\phi: U \rightarrow X$ be a morphism of algebraic spaces over $B$. Consider
the diagram

Then we have:
(1) The morphism $\phi$ is set-theoretically invariant if and only if $p$ is surjective.
(2) If $j$ is a set-theoretic pre-equivalence relation then $\phi$ separates orbits if and only if $p$ and $q$ are surjective.
(3) If $p$ and $q$ are surjective, then $j$ is a set-theoretic pre-equivalence relation (and $\phi$ separates orbits).
(4) If $\phi$ is $R$-invariant and $j$ is a set-theoretic pre-equivalence relation, then $\phi$ separates orbits if and only if the induced morphism $R \rightarrow U \times_{X} U$ is surjective.

Proof. Assume $\phi$ is set-theoretically invariant. This means that for any algebraically closed field $k$ over $B$ and any $\bar{r} \in R(k)$ we have $\phi(s(\bar{r}))=\phi(t(\bar{r}))$. Hence $((\phi(t(\bar{r})), \phi(s(\bar{r}))), \bar{r})$ defines a point in the fibre product mapping to $\bar{r}$ via $p$. This shows that $p$ is surjective. Conversely, assume $p$ is surjective. Pick $\bar{r} \in R(k)$. As $p$ is surjective, we can find a field extension $k \subset K$ and a $K$-valued point $\tilde{r}$ of the fibre product with $p(\tilde{r})=\bar{r}$. Then $q(\tilde{r}) \in U \times{ }_{X} U$ maps to $(t(\bar{r}), s(\bar{r}))$ in $U \times_{B} U$ and we conclude that $\phi(s(\bar{r}))=\phi(t(\bar{r}))$. This proves that $\phi$ is set-theoretically invariant.
The proofs of (2), (3), and (4) are omitted. Hint: Assume $k$ is an algebraically closed field over $B$ of large cardinality. Consider the associated diagram of sets

By the lemmas above the equivalences posed in (2), (3), and (4) become settheoretic questions related to the diagram we just displayed, using that surjectivity translates into surjectivity on $k$-valued points by Morphisms of Spaces, Lemma 54.24 .2 .

Because we have seen above that the notion of a set-theoretically invariant morphism is a rather weak one in the category of algebraic spaces, we define an orbit space for a pre-relation as follows.
0493 Definition 68.5.18. Let $B \rightarrow S$ as in Section 68.2. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation. We say $\phi: U \rightarrow X$ is an orbit space for $R$ if
(1) $\phi$ is $R$-invariant,
(2) $\phi$ separates $R$-orbits, and
(3) $\phi$ is surjective.

The definition of separating $R$-orbits involves a discussion of points with values in algebraically closed fields. But as we've seen in many cases this just corresponds to the surjectivity of certain canonically associated morphisms of algebraic spaces. We summarize some of the discussion above in the following characterization of orbit spaces.

049Z Lemma 68.5.19. Let $B \rightarrow S$ as in Section 68.2. Let $j: R \rightarrow U \times_{B} U$ be a set-theoretic pre-equivalence relation. A morphism $\phi: U \rightarrow X$ is an orbit space for $R$ if and only if
(1) $\phi \circ s=\phi \circ t$, i.e., $\phi$ is invariant,
(2) the induced morphism $(t, s): R \rightarrow U \times_{X} U$ is surjective, and
(3) the morphism $\phi: U \rightarrow X$ is surjective.

This characterization applies for example if $j$ is a pre-equivalence relation, or comes from a groupoid in algebraic spaces over $B$, or comes from the action of a group algebraic space over $B$ on $U$.

Proof. Follows immediately from Lemma 68.5.17 part (4).
In the following lemma it is (probably) not good enough to assume just that the morphisms $s, t$ are locally of finite type. The reason is that it may happen that some $\operatorname{map} \phi: U \rightarrow X$ is an orbit space, yet is not locally of finite type. In that case $U(k) \rightarrow X(k)$ may not be surjective for all algebraically closed fields $k$ over $B$.

04A0 Lemma 68.5.20. Let $B \rightarrow S$ as in Section 68.2. Let $j=(t, s): R \rightarrow U \times{ }_{B} U$ be a pre-relation. Assume $R, U$ are locally of finite type over $B$. Let $\phi: U \rightarrow X$ be an $R$-invariant morphism of algebraic spaces over $B$. Then $\phi$ is an orbit space for $R$ if and only if the natural map

$$
U(k) /(\text { equivalence relation generated by } j(R(k))) \longrightarrow X(k)
$$

is bijective for all algebraically closed fields $k$ over $B$.
Proof. Note that since $U, R$ are locally of finite type over $B$ all of the morphisms $s, t, j, \phi$ are locally of finite type, see Morphisms of Spaces, Lemma 54.23.6. We will also use without further mention Morphisms of Spaces, Lemma 54.24.1. Assume $\phi$ is an orbit space. Let $k$ be any algebraically closed field over $B$. Let $\bar{x} \in X(k)$. Consider $U \times_{\phi, X, \bar{x}} \operatorname{Spec}(k)$. This is a nonempty algebraic space which is locally of finite type over $k$. Hence it has a $k$-valued point. This shows the displayed map of the lemma is surjective. Suppose that $\bar{u}, \bar{u}^{\prime} \in U(k)$ map to the same element of $X(k)$. By Definition 68.5 .8 this means that $\bar{u}, \bar{u}^{\prime}$ are in the same $R$-orbit. By Lemma 68.5.7 this means that they are equivalent under the equivalence relation generated by $j(R(k))$. Thus the displayed morphism is injective.
Conversely, assume the displayed map is bijective for all algebraically closed fields $k$ over $B$. This condition clearly implies that $\phi$ is surjective. We have already assumed that $\phi$ is $R$-invariant. Finally, the injectivity of all the displayed maps implies that $\phi$ separates orbits. Hence $\phi$ is an orbit space.

### 68.6. Coarse quotients

04A1 We only add this here so that we can later say that coarse quotients correspond to coarse moduli spaces (or moduli schemes).

04A2 Definition 68.6.1. Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation. A morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is called a coarse quotient if
(1) $\phi$ is a categorical quotient, and
(2) $\phi$ is an orbit space.

If $S=B, U, R$ are all schemes, then we say a morphism of schemes $\phi: U \rightarrow X$ is a coarse quotient in schemes if
(1) $\phi$ is a categorical quotient in schemes, and
(2) $\phi$ is an orbit space.

In many situations the algebraic spaces $R$ and $U$ are locally of finite type over $B$ and the orbit space condition simply means that

$$
U(k) /(\text { equivalence relation generated by } j(R(k))) \cong X(k)
$$

for all algebraically closed fields $k$. See Lemma 68.5.20. If $j$ is also a (set-theoretic) pre-equivalence relation, then the condition is simply equivalent to $U(k) / j(R(k)) \rightarrow$ $X(k)$ being bijective for all algebraically closed fields $k$.

### 68.7. Topological properties

04A3 Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation. We say a subset $T \subset|U|$ is $R$-invariant if $s^{-1}(T)=t^{-1}(T)$ as subsets of $|R|$. Note that if $T$ is closed, then it may not be the case that the corresponding reduced closed subspace of $U$ is $R$-invariant (as in Groupoids in Spaces, Definition 65.17 .1 because the pullbacks $s^{-1}(T), t^{-1}(T)$ may not be reduced. Here are some conditions that we can consider for an invariant morphism $\phi: U \rightarrow X$.

04A4 Definition 68.7.1. Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation. Let $\phi: U \rightarrow X$ be an $R$-invariant morphism of algebraic spaces over $B$.
04A5 (1) The morphism $\phi$ is submersive.
04A6 (2) For any $R$-invariant closed subset $Z \subset|U|$ the image $\phi(Z)$ is closed in $|X|$.
04A7
(3) Condition (2) holds and for any pair of $R$-invariant closed subsets $Z_{1}, Z_{2} \subset$ $|U|$ we have

$$
\phi\left(Z_{1} \cap Z_{2}\right)=\phi\left(Z_{1}\right) \cap \phi\left(Z_{2}\right)
$$

04A8 (4) The morphism $(t, s): R \rightarrow U \times_{X} U$ is universally submersive.
For each of these properties we can also require them to hold after any flat pullback, or after any pullback, see Definition 68.3.4. In this case we say condition (1), (2), (3), or (4) holds uniformly or universally.

### 68.8. Invariant functions

04A9 In some cases it is convenient to pin down the structure sheaf of a quotient by requiring any invariant function to be a local section of the structure sheaf of the quotient.

04AA Definition 68.8.1. Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times_{B} U$ be a pre-relation. Let $\phi: U \rightarrow X$ be an $R$-invariant morphism. Denote $\phi^{\prime}=\phi \circ s=\phi \circ t: R \rightarrow X$.
(1) We denote $\left(\phi_{*} \mathcal{O}_{U}\right)^{R}$ the $\mathcal{O}_{X}$-sub-algebra of $\phi_{*} \mathcal{O}_{U}$ which is the equalizer of the two maps

on $X_{\text {étale }}$. We sometimes call this the sheaf of $R$-invariant functions on $X$.
(2) We say the functions on $X$ are the $R$-invariant functions on $U$ if the natural map $\mathcal{O}_{X} \rightarrow\left(\phi_{*} \mathcal{O}_{U}\right)^{R}$ is an isomorphism.
Of course we can require this property holds after any (flat or any) pullback, leading to a (uniform or) universal notion. This condition is often thrown in with other conditions in order to obtain a (more) unique quotient. And of course a good deal of motivation for the whole subject comes from the following special case: $U=\operatorname{Spec}(A)$ is an affine scheme over a field $S=B=\operatorname{Spec}(k)$ and where $R=G \times U$, with $G$ an affine group scheme over $k$. In this case you have the option of taking for the quotient:

$$
X=\operatorname{Spec}\left(A^{G}\right)
$$

so that at least the condition of the definition above is satisfied. Even though this is a nice thing you can do it is often not the right quotient; for example if $U=\mathrm{GL}_{n, k}$ and $G$ is the group of upper triangular matrices, then the above gives $X=\operatorname{Spec}(k)$, whereas a much better quotient (namely the flag variety) exists.

### 68.9. Good quotients

04 AB Especially when taking quotients by group actions the following definition is useful.
04AC Definition 68.9.1. Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation. A morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is called a good quotient if
(1) $\phi$ is invariant,
(2) $\phi$ is affine,
(3) $\phi$ is surjective,
(4) condition (3) holds universally, and
(5) the functions on $X$ are the $R$-invariant functions on $U$.

In Ses72 Seshadri gives almost the same definition, except that instead of (4) he simply requires the condition (3) to hold - he does not require it to hold universally.

### 68.10. Geometric quotients

04 AD This is Mumford's definition of a geometric quotient (at least the definition from the first edition of GIT; as far as we can tell later editions changed "universally submersive" to "submersive").

04AE Definition 68.10.1. Let $S$ be a scheme and $B$ an algebraic space over $S$. Let $j: R \rightarrow U \times{ }_{B} U$ be a pre-relation. A morphism $\phi: U \rightarrow X$ of algebraic spaces over $B$ is called a geometric quotient if
(1) $\phi$ is an orbit space,
(2) condition (1) holds universally, i.e., $\phi$ is universally submersive, and
(3) the functions on $X$ are the $R$-invariant functions on $U$.

## CHAPTER 69

## Simplicial Spaces

09VI

### 69.1. Introduction

09VJ This chapter develops some theory concerning simplicial topological spaces, simplicial ringed spaces, simplicial schemes, and simplicial algebraic spaces. The theory of simplicial spaces sometimes allows one to prove local to global principles which appear difficult to prove in other ways. Some example applications can be found in the papers Fal03, Kie72, and Del74b.
We assume throughout that the reader is familiar with the basic concepts and results of the chapter Simplical Methods, see Simplicial, Section 14.1. In particular, we continue to write $X$ and not $X_{\bullet}$ for a simplicial object.

### 69.2. Simplicial topological spaces

09 VK A simplicial space is a simplicial object in the category of topological spaces where morphisms are continuous maps of topological spaces. (We will use "simplicial algebraic space" to refer to simplicial objects in the category of algebraic spaces.) We may picture a simplicial space $X$ as follows

$$
X_{2} \underset{ }{\rightleftarrows} X_{1} \stackrel{\longrightarrow}{\rightleftarrows} X_{0}
$$

Here there are two morphisms $d_{0}^{1}, d_{1}^{1}: X_{1} \rightarrow X_{0}$ and a single morphism $s_{0}^{0}: X_{0} \rightarrow$ $X_{1}$, etc. It is important to keep in mind that $d_{i}^{n}: X_{n} \rightarrow X_{n-1}$ should be thought of as a "projection forgetting the $i$ th coordinate" and $s_{j}^{n}: X_{n} \rightarrow X_{n+1}$ as the diagonal map repeating the $j$ th coordinate.
Let $X$ be a simplicial space. We associate a site $X_{Z a r}{ }^{1}$ to $X$ as follows.
(1) An object of $X_{Z a r}$ is an open $U$ of $X_{n}$ for some $n$,
(2) a morphism $U \rightarrow V$ of $X_{Z a r}$ is given by a $\varphi:[m] \rightarrow[n]$ where $n, m$ are such that $U \subset X_{n}, V \subset X_{m}$ and $\varphi$ is such that $X(\varphi)(U) \subset V$, and
(3) a covering $\left\{U_{i} \rightarrow U\right\}$ in $X_{Z a r}$ means that $U, U_{i} \subset X_{n}$ are open, the maps $U_{i} \rightarrow U$ are given by id : $[n] \rightarrow[n]$, and $U=\bigcup U_{i}$.
Note that in particular, if $U \rightarrow V$ is a morphism of $X_{Z a r}$ give by $\varphi$, then $X(\varphi)$ : $X_{n} \rightarrow X_{m}$ does in fact induce a continuous map $U \rightarrow V$ of topological spaces. It is clear that the above is a special case of a construction that associates to any diagram of topological spaces a site. We formulate the obligatory lemma.
09VL Lemma 69.2.1. Let $X$ be a simplicial space. Then $X_{Z a r}$ as defined above is a site.

[^185]Proof. Omitted.
Let $X$ be a simplicial space. Let $\mathcal{F}$ be a sheaf on $X_{Z a r}$. It is clear from the definition of coverings, that the restriction of $\mathcal{F}$ to the opens of $X_{n}$ defines a sheaf $\mathcal{F}_{n}$ on the topological space $X_{n}$. For every $\varphi:[m] \rightarrow[n]$ the restriction maps of $\mathcal{F}$ for pairs $U \subset X_{n}, V \subset X_{m}$ with $X(\varphi)(U) \subset V$, define an $X(\varphi)$-map $\mathcal{F}(\varphi): \mathcal{F}_{m} \rightarrow \mathcal{F}_{n}$, see Sheaves, Definition 6.21.7. Moreover, given $\varphi:[m] \rightarrow[n]$ and $\psi:[l] \rightarrow[m]$ we have

$$
\mathcal{F}(\psi) \circ \mathcal{F}(\varphi)=\mathcal{F}(\varphi \circ \psi)
$$

(LHS uses composition of $f$-maps, see Sheaves, Definition 6.21.9). Clearly, the converse is true as well: if we have a system $\left(\left\{\mathcal{F}_{n}\right\}_{n \geq 0},\{\mathcal{F}(\varphi)\}_{\varphi \in \text { Arrows }(\Delta)}\right)$ as above, satisfying the displayed equalities, then we obtain a sheaf on $X_{Z a r}$.
09VM Lemma 69.2.2. Let $X$ be a simplicial space. There is an equivalence of categories between
(1) $\operatorname{Sh}\left(X_{Z a r}\right)$, and
(2) category of systems $\left(\mathcal{F}_{n}, \mathcal{F}(\varphi)\right)$ described above.

Proof. See discussion above.
09VN Lemma 69.2.3. Let $f: Y \rightarrow X$ be a morphism of simplicial spaces. Then the functor $u: X_{Z a r} \rightarrow Y_{Z a r}$ which associates to the open $U \subset X_{n}$ the open $f_{n}^{-1}(U) \subset Y_{n}$ defines a morphism of sites $f_{Z a r}: Y_{Z a r} \rightarrow X_{Z a r}$.
Proof. It is clear that $u$ is a continuous functor. Hence we obtain functors $f_{Z a r, *}=$ $u^{s}$ and $f_{\text {Zar }}^{-1}=u_{s}$, see Sites, Section 7.15 . To see that we obtain a morphism of sites we have to show that $u^{s}$ is exact. We will use Sites, Lemma 7.15 .5 to see this. Let $V \subset Y_{n}$ be an open subset. The category $\mathcal{I}_{V}^{u}$ (see Sites, Section 7.5) consists of pairs $(U, \varphi)$ where $\varphi:[m] \rightarrow[n]$ and $U \subset X_{m}$ open such that $Y(\varphi)(V) \subset f_{m}^{-1}(U)$. Moreover, a morphism $(U, \varphi) \rightarrow\left(U^{\prime}, \varphi^{\prime}\right)$ is given by a $\psi:\left[m^{\prime}\right] \rightarrow[m]$ such that $X(\psi)(U) \subset U^{\prime}$ and $\varphi \circ \psi=\varphi^{\prime}$. It is our task to show that $\mathcal{I}_{V}^{u}$ is cofiltered.
We verify the conditions of Categories, Definition 4.20.1. Condition (1) holds because $\left(X_{n}, \mathrm{id}_{[n]}\right)$ is an object. Let $(U, \varphi)$ be an object. The condition $Y(\varphi)(V) \subset$ $f_{m}^{-1}(U)$ is equivalent to $V \subset f_{n}^{-1}\left(X(\varphi)^{-1}(U)\right)$. Hence we obtain a morphism $\left(X(\varphi)^{-1}(U), \mathrm{id}_{[n]}\right) \rightarrow(U, \varphi)$ given by setting $\psi=\varphi$. Moreover, given a pair of objects of the form $\left(U, \mathrm{id}_{[n]}\right)$ and $\left(U^{\prime}, \mathrm{id}_{[n]}\right)$ we see there exists an object, namely $\left(U \cap U^{\prime}, \operatorname{id}_{[n]}\right)$, which maps to both of them. Thus condition (2) holds. To verify condition (3) suppose given two morphisms $a, a^{\prime}:(U, \varphi) \rightarrow\left(U^{\prime}, \varphi^{\prime}\right)$ given by $\psi, \psi^{\prime}:$ $\left[m^{\prime}\right] \rightarrow[m]$. Then precomposing with the morphism $\left(X(\varphi)^{-1}(U), \mathrm{id}_{[n]}\right) \rightarrow(U, \varphi)$ given by $\varphi$ equalizes $a, a^{\prime}$ because $\varphi \circ \psi=\varphi^{\prime}=\varphi \circ \psi^{\prime}$. This finishes the proof.
09VP Lemma 69.2.4. Let $f: Y \rightarrow X$ be a morphism of simplicial spaces. In terms of the description of sheaves in Lemma 69.2.2 the morphism $f_{Z a r}$ of Lemma 69.2.3 can be described as follows.
(1) If $\mathcal{G}$ is a sheaf on $Y$, then $\left(f_{Z a r, *} \mathcal{G}\right)_{n}=f_{n, *} \mathcal{G}_{n}$.
(2) If $\mathcal{F}$ is a sheaf on $X$, then $\left(f_{\text {Zar }}^{-1} \mathcal{F}\right)_{n}=f_{n}^{-1} \mathcal{F}_{n}$.

Proof. The first part is immediate from the definitions. For the second part, note that in the proof of Lemma 69.2.3 we have shown that for a $V \subset Y_{n}$ open the category $\left(\mathcal{I}_{V}^{u}\right)^{o p p}$ contains as a cofinal subcategory the category of opens $U \subset X_{n}$ with $f_{n}^{-1}(U) \supset V$ and morphisms given by inclusions. Hence we see that the restriction of $u_{p} \mathcal{F}$ to opens of $Y_{n}$ is the presheaf $f_{n, p} \mathcal{F}_{n}$ as defined in Sheaves, Lemma
6.21.3. Since $f_{\text {Zar }}^{-1} \mathcal{F}=u_{s} \mathcal{F}$ is the sheafification of $u_{p} \mathcal{F}$ and since sheafification uses only coverings and since coverings in $Y_{Z a r}$ use only inclusions between opens on the same $Y_{n}$, the result follows from the fact that $f_{n}^{-1} \mathcal{F}_{n}$ is (correspondingly) the sheafification of $f_{n, p} \mathcal{F}_{n}$, see Sheaves, Section 6.21.
Let $X$ be a topological space. In Sites, Example 7.6.4 we denoted $X_{Z a r}$ the site consisting of opens of $X$ with inclusions as morphisms and coverings given by open coverings. We identify the topos $\operatorname{Sh}\left(X_{Z a r}\right)$ with the category of sheaves on $X$.

09W0 Lemma 69.2.5. Let $X$ be a simplicial space. The functor $X_{n, Z a r} \rightarrow X_{Z a r}, U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g: \operatorname{Sh}\left(X_{n}\right) \rightarrow$ $\operatorname{Sh}\left(X_{Z a r}\right)$ satisfies
(1) $g^{-1}$ associates to the sheaf $\mathcal{F}$ on $X$ the sheaf $\mathcal{F}_{n}$ on $X_{n}$,
(2) $g^{-1}$ has a left adjoint $g_{!}^{S h}$ which commutes with finite connected limits,
(3) $g^{-1}: A b\left(X_{Z a r}\right) \rightarrow A b\left(X_{n}\right)$ has a left adjoint $g_{!}: A b\left(X_{n}\right) \rightarrow A b\left(X_{Z a r}\right)$ which is exact.

Proof. Besides the properties of our functor mentioned in the statement, the category $X_{n, Z a r}$ has fibre products and equalizers and the functor commutes with them (beware that $X_{Z a r}$ does not have all fibre products). Hence the lemma follows from the discussion in Sites, Sections 7.19 and 7.20 and Modules on Sites, Section 18.16 More precisely, Sites, Lemmas 7.20.1, 7.20.5 and 7.20 .6 and Modules on Sites, Lemmas 18.16 .2 and 18.16 .3 ,

09W1 Lemma 69.2.6. Let $X$ be a simplicial space. If $\mathcal{I}$ is an injective abelian sheaf on $X_{Z a r}$, then $\mathcal{I}_{n}$ is an injective abelian sheaf on $X_{n}$.
Proof. This follows from Homology, Lemma 12.25 .1 and Lemma 69.2.5.
09W2 Lemma 69.2.7. Let $f: Y \rightarrow X$ be a morphism of simplicial spaces. Then

is a commutative diagram of topoi.
Proof. Direct from the description of pullback functors in Lemmas 69.2.4 and 69.2 .5

Let $X$ be a topological space. Denote $X_{\bullet}$ the constant simplicial topological space with value $X$. By Lemma 69.2 .2 a sheaf on $X_{\bullet, Z a r}$ is the same thing as a cosimplicial object in the category of sheaves on $X$.

09W3 Lemma 69.2.8. Let $X$ be a topological space. Let $X$ • be the constant simplical topological space with value $X$. The functor

$$
X_{\bullet, Z a r} \longrightarrow X_{Z a r}, \quad U \longmapsto U
$$

is continuous and cocontinuous and defines a morphism of topoi $g: \operatorname{Sh}\left(X_{\bullet}, Z a r\right) \rightarrow$ Sh $(X)$ as well as a left adjoint $g$ ! to $g^{-1}$. We have
(1) $g^{-1}$ associates to a sheaf on $X$ the constant cosimplicial sheaf on $X$,
(2) $g_{!}$associates to a sheaf $\mathcal{F}$ on $X_{\bullet, Z a r}$ the sheaf $\mathcal{F}_{0}$, and
(3) $g_{*}$ associates to a sheaf $\mathcal{F}$ on $X_{\bullet, Z a r}$ the equalizer of the two maps $\mathcal{F}_{0} \rightarrow$ $\mathcal{F}_{1}$.

Proof. The statements about the functor are straightforward to verify. The existence of $g$ and $g$ ! follow from Sites, Lemmas 7.20.1 and 7.20.5. The description of $g^{-1}$ is immediate from Sites, Lemma 7.20.5. The description of $g_{*}$ and $g_{\text {! }}$ follows as the functors given are right and left adjoint to $g^{-1}$.

09W4 Lemma 69.2.9. Let $Y$ be a simplicial space and $X$ a topological space. Let $a$ : $Y \rightarrow X$ be an augmentation (Simplicial, Definition 14.20.1). There is a canonical morphism of topoi

$$
a: S h\left(Y_{Z a r}\right) \rightarrow \operatorname{Sh}(X)
$$

which comes from composing the morphism $a_{Z a r}: S h\left(Y_{Z a r}\right) \rightarrow S h\left(X_{\bullet}, Z a r\right)$ of Lemma 69.2.3 with the morphism $g: \operatorname{Sh}\left(X_{\bullet}\right.$, Zar $) \rightarrow \operatorname{Sh}(X)$ of Lemma 69.2.8.

Proof. This lemma proves itself.
09W5 Lemma 69.2.10. Let $X$ be a simplicial topological space. The complex of abelian presheaves on $X_{Z a r}$

$$
\ldots \rightarrow \mathbf{Z}_{X_{2}} \rightarrow \mathbf{Z}_{X_{1}} \rightarrow \mathbf{Z}_{X_{0}}
$$

with boundary $\sum(-1)^{i} d_{i}^{n}$ is a resolution of the constant presheaf $\mathbf{Z}$.
Proof. Let $U \subset X_{m}$ be an object of $X_{Z a r}$. Then the value of the complex above on $U$ is the complex of abelian groups

$$
\ldots \rightarrow \mathbf{Z}\left[\operatorname{Mor}_{\Delta}([2],[m])\right] \rightarrow \mathbf{Z}\left[\operatorname{Mor}_{\Delta}([1],[m])\right] \rightarrow \mathbf{Z}\left[\operatorname{Mor}_{\Delta}([0],[m])\right]
$$

In other words, this is the complex associated to the free abelian group on the simplicial set $\Delta[m]$, see Simplicial, Example 14.11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see Simplicial, Example 14.26.7, and since "taking free abelian groups" is a functor, we see that the complex above is homotopy equivalent to the free abelian group on $\Delta[0]$ (Simplicial, Remark 14.26 .4 and Lemma 14.27.2). This complex is acyclic in positive degrees and equal to $\mathbf{Z}$ in degree 0 .

09W6 Lemma 69.2.11. Let $X$ be a simplicial topological space. Let $\mathcal{F}$ be an abelian sheaf on $X$. There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{1}^{p, q}=H^{q}\left(X_{p}, \mathcal{F}_{p}\right)
$$

converging to $H^{p+q}\left(X_{Z a r}, \mathcal{F}\right)$. This spectral sequence is functorial in $\mathcal{F}$.
Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Consider the double complex with terms

$$
A^{p, q}=\mathcal{I}^{q}\left(X_{p}\right)
$$

and first differential given by the alternating sum along the maps $d_{i}^{p+1}$-maps $\mathcal{I}_{p}^{q} \rightarrow$ $\mathcal{I}_{p+1}^{q}$, see Lemma 69.2.2. Note that

$$
A^{p, q}=\Gamma\left(X_{p}, \mathcal{I}_{p}^{q}\right)=\operatorname{Mor}_{P S h}\left(h_{X_{p}}, \mathcal{I}^{q}\right)=\operatorname{Mor}_{P A b}\left(\mathbf{Z}_{X_{p}}, \mathcal{I}^{q}\right)
$$

Hence it follows from Lemma 69.2.10 and Cohomology on Sites, Lemma 21.11.1 that the rows of the double complex are exact in positive degrees and evaluate to $\Gamma\left(X_{Z a r}, \mathcal{I}^{q}\right)$ in degree 0 . On the other hand, since restriction is exact (Lemma 69.2 .5 ) the map

$$
\mathcal{F}_{p} \rightarrow \mathcal{I}_{p}^{\bullet}
$$

is a resolution. The sheaves $\mathcal{I}_{p}^{q}$ are injective abelian sheaves on $X_{p}$ (Lemma 69.2.6). Hence the cohomology of the columns computes the groups $H^{q}\left(X_{p}, \mathcal{F}_{p}\right)$. We conclude by applying Homology, Lemmas 12.22 .6 and 12.22 .7 .

### 69.3. Simplicial sites and topoi

09WB It seems natural to define a simplicial site as a simplicial object in the (big) category whose objects are sites and whose morphisms are morphisms of sites. See Sites, Definitions 7.6 .2 and 7.15 .1 with composition of morphisms as in Sites, Lemma 7.15.3. But here are some variants one might want to consider: (a) we could work with cocontinuous functors (see Sites, Sections 7.19 and 7.20 between sites instead, (b) we could work in a suitable 2-category of sites where one introduces the notion of a 2-morphism between morphisms of sites, (c) we could work in a 2-category constructed out of cocontinuous functors. Instead of picking one of these variants as a definition we will simply develop theory as needed.

Certainly a simplicial topos should probably be defined as a pseudo-functor from $\Delta^{o p p}$ into the 2-category of topoi. See Categories, Definition 4.28.5 and Sites, Section 7.16 and 7.35 . We will try to avoid working with such a beast if possible.
Let $\mathcal{C}$ be a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. This means that for every morphism $\varphi:[m] \rightarrow$ $[n]$ of $\Delta$ we have a morphism of sites $f_{\varphi}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{m}$. This morphism is given by a continuous functor in the oppsite direction which we will denote $u_{\varphi}: \mathcal{C}_{m} \rightarrow \mathcal{C}_{n}$.
09WC Lemma 69.3.1. Let $\mathcal{C}$ be a simplicial object in the category of sites. With notation as above we construct a site $\mathcal{C}_{\text {site }}$ as follows.
(1) An object of $\mathcal{C}_{\text {site }}$ is an object $U$ of $\mathcal{C}_{n}$ for some $n$,
(2) a morphism $(\varphi, f): U \rightarrow V$ of $\mathcal{C}_{\text {site }}$ is given by a map $\varphi:[m] \rightarrow[n]$ with $U \in \operatorname{Ob}\left(\mathcal{C}_{n}\right), V \in \operatorname{Ob}\left(\mathcal{C}_{m}\right)$ and a morphism $f: U \rightarrow u_{\varphi}(V)$ of $\mathcal{C}_{n}$, and
(3) a covering $\left\{\left(i d, f_{i}\right): U_{i} \rightarrow U\right\}$ in $\mathcal{C}_{\text {site }}$ is given by an $n$ and a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of $\mathcal{C}_{n}$.
Proof. Composition of $(\varphi, f): U \rightarrow V$ with $(\psi, g): V \rightarrow W$ is given by $(\varphi \circ$ $\left.\psi, u_{\varphi}(g) \circ f\right)$. This uses that $u_{\varphi} \circ u_{\psi}=u_{\varphi \circ \psi}$.
Let $\left\{\left(\mathrm{id}, f_{i}\right): U_{i} \rightarrow U\right\}$ be a covering as in (3) and let $(\varphi, g): W \rightarrow U$ be a morphism with $W \in \operatorname{Ob}\left(\mathcal{C}_{m}\right)$. We claim that

$$
W \times_{(\varphi, g), U,\left(\mathrm{id}, f_{i}\right)} U_{i}=W \times_{g, u_{\varphi}(U), u_{\varphi}\left(f_{i}\right)} u_{\varphi}\left(U_{i}\right)
$$

in the category $\mathcal{C}_{\text {site }}$. This makes sense as by our definition of morphisms of sites, the required fibre products in $\mathcal{C}_{m}$ exist since $u_{\varphi}$ transforms coverings into coverings. The same reasoning implies the claim (details omitted). Thus we see that the collection of coverings is stable under base change. The other axioms of a site are immediate.

Let $\mathcal{C}$ be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. This means that for every morphism $\varphi$ : $[m] \rightarrow[n]$ of $\Delta$ we have a cocontinuous functor denoted $u_{\varphi}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{m}$.

09WD Lemma 69.3.2. Let $\mathcal{C}$ be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. With notation as above, assume the functors $u_{\varphi}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{m}$ have property $P$ of Sites, Remark 7.19.5. Then we can construct a site $\mathcal{C}_{\text {site }}$ as follows.
(1) An object of $\mathcal{C}_{\text {site }}$ is an object $U$ of $\mathcal{C}_{n}$ for some $n$,
(2) a morphism $(\varphi, f): U \rightarrow V$ of $\mathcal{C}_{\text {site }}$ is given by a map $\varphi:[m] \rightarrow[n]$ with $U \in \mathrm{Ob}\left(\mathcal{C}_{n}\right), V \in \mathrm{Ob}\left(\mathcal{C}_{m}\right)$ and a morphism $f: u_{\varphi}(U) \rightarrow V$ of $\mathcal{C}_{m}$, and
(3) a covering $\left\{\left(i d, f_{i}\right): U_{i} \rightarrow U\right\}$ in $\mathcal{C}_{\text {site }}$ is given by an $n$ and a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of $\mathcal{C}_{n}$.
Proof. Composition of $(\varphi, f): U \rightarrow V$ with $(\psi, g): V \rightarrow W$ is given by $(\varphi \circ \psi, g \circ$ $\left.u_{\psi}(f)\right)$. This uses that $u_{\psi} \circ u_{\varphi}=u_{\varphi \circ \psi}$.
Let $\left\{\left(\mathrm{id}, f_{i}\right): U_{i} \rightarrow U\right\}$ be a covering as in (3) and let $(\varphi, g): W \rightarrow U$ be a morphism with $W \in \mathrm{Ob}\left(\mathcal{C}_{m}\right)$. We claim that

$$
W \times_{(\varphi, g), U,\left(\mathrm{id}, f_{i}\right)} U_{i}=W \times_{g, U, f_{i}} U_{i}
$$

in the category $\mathcal{C}_{\text {site }}$ where the right hand side is the object of $\mathcal{C}_{m}$ defined in Sites, Remark 7.19 .5 which exists by property $P$. Compatibility of this type of fibre product with compositions of functors implies the claim (details omitted). Since the family $\left\{W \times_{g, U, f_{i}} U_{i} \rightarrow W\right\}$ is a covering of $\mathcal{C}_{m}$ by property $P$ we see that the collection of coverings is stable under base change. The other axioms of a site are immediate.

09WE Situation 69.3.3. Here we have one of the following two cases
(A) $\mathcal{C}$ is a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. For every morphism $\varphi:[m] \rightarrow[n]$ of $\Delta$ we have a morphism of sites $f_{\varphi}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{m}$ given by a continuous functor $u_{\varphi}: \mathcal{C}_{m} \rightarrow \mathcal{C}_{n}$.
(B) $\mathcal{C}$ is a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors having property $P$ of Sites, Remark 7.19.5. For every morphism $\varphi:[m] \rightarrow[n]$ of $\Delta$ we have a cocontinuous functor $u_{\varphi}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{m}$ which induces a morphism of topoi $f_{\varphi}: \operatorname{Sh}\left(\mathcal{C}_{n}\right) \rightarrow$ $\operatorname{Sh}\left(\mathcal{C}_{m}\right)$.
As usual we will denote $f_{\varphi}^{-1}$ and $f_{\varphi, *}$ the pullback and pushforward. We let $\mathcal{C}_{\text {site }}$ denote the site defined in Lemma 69.3.1 (case A) or Lemma 69.3.2 (case B).

Let $\mathcal{C}$ be as in Situation 69.3.3. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}_{\text {site }}$. It is clear from the definition of coverings, that the restriction of $\mathcal{F}$ to the objects of $\mathcal{C}_{n}$ defines a sheaf $\mathcal{F}_{n}$ on the site $\mathcal{C}_{n}$. For every $\varphi:[m] \rightarrow[n]$ the restriction maps of $\mathcal{F}$ along the morphisms $(\varphi, f): U \rightarrow V$ with $U \in \mathrm{Ob}\left(\mathcal{C}_{n}\right)$ and $V \in \mathrm{Ob}\left(\mathcal{C}_{m}\right)$ define an element $\mathcal{F}(\varphi)$ of

$$
\operatorname{Mor}_{S h\left(\mathcal{C}_{m}\right)}\left(\mathcal{F}_{m}, f_{\varphi, *} \mathcal{F}_{n}\right)=\operatorname{Mor}_{S h\left(\mathcal{C}_{n}\right)}\left(f_{\varphi}^{-1} \mathcal{F}_{m}, \mathcal{F}_{n}\right)
$$

Moreover, given $\varphi:[m] \rightarrow[n]$ and $\psi:[l] \rightarrow[m]$ we have

$$
f_{\varphi}^{-1} \mathcal{F}(\psi) \circ \mathcal{F}(\varphi)=\mathcal{F}(\varphi \circ \psi)
$$

Clearly, the converse is true as well: if we have a system $\left(\left\{\mathcal{F}_{n}\right\}_{n \geq 0},\{\mathcal{F}(\varphi)\}_{\varphi \in \operatorname{Arrows}(\Delta)}\right)$ as above, satisfying the displayed equalities, then we obtain a sheaf on $\mathcal{C}_{\text {site }}$.

09WF Lemma 69.3.4. In Situation 69.3.3 there is an equivalence of categories between
(1) $\operatorname{Sh}\left(\mathcal{C}_{\text {site }}\right)$, and
(2) category of systems $\left(\mathcal{F}_{n}, \mathcal{F}(\varphi)\right)$ described above.

In particular, the topos $\operatorname{Sh}\left(\mathcal{C}_{\text {site }}\right)$ only depends on the topoi $\operatorname{Sh}\left(\mathcal{C}_{n}\right)$ and the morphisms of topoi $f_{\varphi}$.

Proof. See discussion above.
09WG Lemma 69.3.5. In Situation 69.3.3 the functor $\mathcal{C}_{n} \rightarrow \mathcal{C}_{\text {site }}, U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g: \operatorname{Sh}\left(\mathcal{C}_{n}\right) \rightarrow \operatorname{Sh}\left(\mathcal{C}_{\text {site }}\right)$ satisfies
(1) $g^{-1}$ associates to the sheaf $\mathcal{F}$ on $\mathcal{C}_{\text {site }}$ the sheaf $\mathcal{F}_{n}$ on $\mathcal{C}_{n}$,
(2) $g^{-1}$ has a left adjoint $g_{!}^{S h}$ which commutes with finite connected limits, and
(3) $g^{-1}: A b\left(\mathcal{C}_{\text {site }}\right) \rightarrow A b\left(\mathcal{C}_{n}\right)$ has a left adjoint $g_{!}: A b\left(\mathcal{C}_{n}\right) \rightarrow A b\left(\mathcal{C}_{\text {site }}\right)$ which is exact.

Proof. It is clear that functor $\mathcal{C}_{n} \rightarrow \mathcal{C}_{\text {site }}$ is continuous and cocontinuous. Hence part (1) and the existence of $g_{!}^{S h}$ and $g$ ! follows from Sites, Lemmas 7.20.1 and 7.20 .5 and Modules on Sites, Lemmas 18.16 .2 and 18.16 .4

Next, we come to the exactness properties of $g_{!}^{S h}$ and $g!$. Perhaps the most straightforward way to prove this is to give a formula for these functors. If $\mathcal{G}$ is a sheaf on $\mathcal{C}_{n}$, then we claim $\mathcal{H}=g_{!}^{S h} \mathcal{G}$ is the sheaf on $\mathcal{C}_{\text {site }}$ whose degree $m$ part is the sheaf

$$
\mathcal{H}_{m}=\coprod_{\varphi:[n] \rightarrow[m]} f_{\varphi}^{-1} \mathcal{G}
$$

Given a map $\psi:[m] \rightarrow\left[m^{\prime}\right]$ the map $\mathcal{H}(\psi): f_{\psi}^{-1} \mathcal{H}_{m} \rightarrow \mathcal{H}_{m^{\prime}}$ is given on components by the identifications

$$
f_{\psi}^{-1} f_{\varphi}^{-1} \mathcal{G} \rightarrow f_{\psi \circ \varphi}^{-1} \mathcal{G}
$$

Observe that given a map $a: \mathcal{H} \rightarrow \mathcal{F}$ of sheaves on $\mathcal{C}_{\text {site }}$ we obtain a map $\mathcal{G} \rightarrow \mathcal{F}_{n}$ corresponding to the restriction of $a_{n}$ to the component $\mathcal{G}$ in $\mathcal{H}_{n}$. Conversely, given $b: \mathcal{G} \rightarrow \mathcal{H}_{n}$ we can define $a: \mathcal{H} \rightarrow \mathcal{F}$ by letting $a_{m}$ be the map which on components

$$
f_{\varphi}^{-1} \mathcal{G} \rightarrow \mathcal{F}_{m}
$$

uses the maps adjoint to $\mathcal{F}(\varphi) \circ f_{\varphi}^{-1} b$. We omit the arguments showing these two constructions give mutually inverse maps

$$
\operatorname{Mor}_{S h\left(\mathcal{C}_{n}\right)}\left(\mathcal{G}, \mathcal{F}_{n}\right)=\operatorname{Mor}_{S h\left(\mathcal{C}_{s i t e}\right)}(\mathcal{H}, \mathcal{F})
$$

thus verifying the claim above. If $\mathcal{G}$ is an abelian sheaf on $\mathcal{C}_{n}$, then $g$ ! $\mathcal{G}$ is the abelian sheaf on $\mathcal{C}_{\text {site }}$ whose degree $m$ part is the sheaf

$$
\bigoplus_{\varphi:[n] \rightarrow[m]} f_{\varphi}^{-1} \mathcal{G}
$$

with transition maps defined exactly as above. By definition of the site $\mathcal{C}_{\text {site }}$ we see that these functors have the desired exactness properties and we conclude.

09WH Lemma 69.3.6. In Situation 69.3.3. If $\mathcal{I}$ is an injective abelian sheaf on $\mathcal{C}_{\text {site }}$, then $\mathcal{I}_{n}$ is an injective abelian sheaf on $\mathcal{C}_{n}$.

Proof. This follows from Homology, Lemma 12.25.1 and Lemma 69.3.5.
Let $\mathcal{C}$ be as in Situation 69.3.3. In statement of the following lemmas we will let $g_{n}: \mathcal{C}_{n} \rightarrow \mathcal{C}_{\text {site }}$ be the functor of Lemma 69.3.5. If $\varphi:[m] \rightarrow[n]$ is a morphism of $\Delta$, then the diagram of topoi

is not commutative, but there is a 2-morphism $g_{n} \rightarrow g_{m} \circ f_{\varphi}$ coming from the maps $\mathcal{F}(\varphi): f_{\varphi}^{-1} \mathcal{F}_{m} \rightarrow \mathcal{F}_{n}$. See Sites, Section 7.35 .

09WI Lemma 69.3.7. In Situation 69.3 .3 and with notation as above there is a complex

$$
\ldots \rightarrow g_{2!} \mathbf{Z} \rightarrow g_{1!} \mathbf{Z} \rightarrow g_{0!} \mathbf{Z}
$$

of abelian sheaves on $\mathcal{C}_{\text {site }}$ which forms a resolution of the constant sheaf with value $\mathbf{Z}$ on $\mathcal{C}_{\text {site }}$.

Proof. We will use the description of the functors $g_{n}$ ! in the proof of Lemma 69.3 .5 without further mention. As maps of the complex we take $\sum(-1)^{i} d_{i}^{n}$ where $d_{i}^{n}: g_{n!} \mathbf{Z} \rightarrow g_{n-1!} \mathbf{Z}$ is the adjoint to the map $\mathbf{Z} \rightarrow \bigoplus_{[n-1] \rightarrow[n]} \mathbf{Z}=g_{n}^{-1} g_{n-1!} \mathbf{Z}$ corresponding to the factor labeled with $\delta_{i}^{n}:[n-1] \rightarrow[n]$. Then $g_{m}^{-1}$ applied to the complex gives the complex

$$
\cdots \rightarrow \bigoplus_{\left.\alpha \in \operatorname{Mor}_{\Delta}([2],[m])\right]} \mathbf{Z} \rightarrow \bigoplus_{\left.\alpha \in \operatorname{Mor}_{\Delta}([1],[m])\right]} \mathbf{Z} \rightarrow \bigoplus_{\left.\alpha \in \operatorname{Mor}_{\Delta}([0],[m])\right]} \mathbf{Z}
$$

on $\mathcal{C}_{m}$. In other words, this is the complex associated to the free abelian sheaf on the simplicial set $\Delta[m]$, see Simplicial, Example 14.11 .2 . Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see Simplicial, Example 14.26.7, and since "taking free abelian sheaf on" is a functor, we see that the complex above is homotopy equivalent to the free abelian sheaf on $\Delta[0]$ (Simplicial, Remark 14.26 .4 and Lemma 14.27.2). This complex is acyclic in positive degrees and equal to $\mathbf{Z}$ in degree 0 .

09WJ Lemma 69.3.8. In Situation 69.3.3. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}_{\text {site }}$. There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{1}^{p, q}=H^{q}\left(\mathcal{C}_{p}, \mathcal{F}_{p}\right)
$$

converging to $H^{p+q}\left(\mathcal{C}_{\text {site }}, \mathcal{F}\right)$. This spectral sequence is functorial in $\mathcal{F}$.
Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Consider the double complex with terms

$$
A^{p, q}=\Gamma\left(\mathcal{C}_{p}, \mathcal{I}_{p}^{q}\right)
$$

and first differential given by the alternating sum along the maps $d_{i}^{p+1}$-maps $\mathcal{I}_{p}^{q} \rightarrow$ $\mathcal{I}_{p+1}^{q}$, see Lemma 69.3.4. Note that

$$
A^{p, q}=\Gamma\left(\mathcal{C}_{p}, \mathcal{I}_{p}^{q}\right)=\operatorname{Mor}_{A b\left(\mathcal{C}_{s i t e}\right)}\left(g_{p!} \mathbf{Z}, \mathcal{I}^{q}\right)
$$

Hence it follows from Lemma 69.3.7 that the rows of the double complex are exact in positive degrees and evaluate to $\Gamma\left(\mathcal{C}_{\text {site }}, \mathcal{I}^{q}\right)$ in degree 0 . On the other hand, since restriction is exact (Lemma 69.3.5) the map

$$
\mathcal{F}_{p} \rightarrow \mathcal{I}_{p}^{\bullet}
$$

is a resolution. The sheaves $\mathcal{I}_{p}^{q}$ are injective abelian sheaves on $\mathcal{C}_{p}$ (Lemma 69.3.6). Hence the cohomology of the columns computes the groups $H^{q}\left(\mathcal{C}_{p}, \mathcal{F}_{p}\right)$. We conclude by applying Homology, Lemmas 12.22 .6 and 12.22 .7 .

### 69.4. Simplicial semi-representable objects

09 WK Let $\mathcal{C}$ be a site. Recall that $\mathrm{SR}(\mathcal{C})$ denotes the category of semi-representable objects of $\mathcal{C}$. See Hypercoverings, Definition 24.2.1. For an object $K=\left\{U_{i}\right\}_{i \in I}$ of $\operatorname{SR}(\mathcal{C})$ we will use the notation

$$
\mathcal{C} / K=\coprod_{i \in I} \mathcal{C} / U_{i}
$$

and we will call it the localization of $\mathcal{C}$ at $K$. There is a natural structure of a site on this category, with coverings inherited from the localizations $\mathcal{C} / U_{i}$ (and whence from $\mathcal{C}$ ). If $f: K \rightarrow L$ is a morphism of $\operatorname{SR}(\mathcal{C})$, then we obtain a cocontinuous functor

$$
f: \mathcal{C} / K \longrightarrow \mathcal{C} / L
$$

by applying the construction of Sites, Lemma 7.24 .7 to the components. More precisely, if $f=\left(\alpha, f_{i}\right)$ where $K=\left\{U_{i}\right\}_{i \in I}, L=\left\{V_{j}\right\}_{j \in J}, \alpha: I \rightarrow J$, and $f_{i}$ : $U_{i} \rightarrow V_{\alpha(i)}$ then $f$ maps the component $\mathcal{C} / U_{i}$ into the component $\mathcal{C} / V_{\alpha(i)}$ via the construction of the aforementioned lemma.
Let $K$ be a simplicial object of $\operatorname{SR}(\mathcal{C})$. By the construction above we obtain a simplicial object $n \mapsto \mathcal{C} / K_{n}$ in the category whose objects are sites and whose morphisms are cocontinuous functors of sites. Since these localization functors satisfy the assumption of Lemma 69.3.2 by Sites, Remark 7.24 .10 we obtain a site $(\mathcal{C} / K)_{\text {site }}$.

We can describe this site explicitly as follows. Say $K_{n}=\left\{U_{n, i}\right\}_{i \in I_{n}}$ and that for $\varphi:[m] \rightarrow[n]$ the morphism $K(\varphi): K_{n} \rightarrow K_{m}$ is given by $a(\varphi): I_{n} \rightarrow I_{m}$ and $f_{\varphi, i}: U_{n, i} \rightarrow U_{m, a(\varphi)(i)}$ for $i \in I_{n}$. Then we have
(1) an object of $\mathcal{C} / K$ corresponds to an object $\left(U / U_{n, i}\right)$ of $\mathcal{C} / U_{n, i}$ for some $n$ and some $i \in I_{n}$,
(2) a morphism between $U$ and $V$ is a pair $(\varphi, f)$ where $\varphi:[m] \rightarrow[n]$ with $U / U_{n, i}$ and $V / U_{m, a(\varphi)(i)}$ and $f: U \rightarrow V$ is a morphism of $\mathcal{C}$ such that

is commutative, and
(3) a covering $\left\{\left(\mathrm{id}, f_{j}\right): U_{j} \rightarrow U\right\}$ is given by an $n$ and $i \in I_{n}$ and objects $U / U_{n, i}, U_{j} / U_{n, i}$ such that $\left\{f_{j}: U_{j} \rightarrow U\right\}$ is a covering of $\mathcal{C}$.

09WL Lemma 69.4.1. Let $\mathcal{C}$ be a site. Let $K$ be a simplicial object of $S R(\mathcal{C})$. If $\mathcal{C}$ has fibre products, then $\mathcal{C} / K$ can also be viewed as a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. The construction of Lemma 69.3.1 then produces the same site as the construction above.

Proof. Given a morphism of objects $U \rightarrow V$ of $\mathcal{C}$ the localization morphism $j$ : $\mathcal{C} / U \rightarrow \mathcal{C} / U$ is a left adjoint to the base change functor $\mathcal{C} / V \rightarrow \mathcal{C} / U$. The base change functor is continuous and induces the same morphism of topoi as $j$. See Sites, Lemma 7.26.3. Argueing as above we can use this to define a morphism of sites $\mathcal{C} / A \rightarrow \mathcal{C} / B$ given any morphism $A \rightarrow B$ of $\operatorname{SR}(\mathcal{C})$. Applying this to the morphisms of the simplicial object $K$ we obtain simplicial object $(\mathcal{C} / K)^{\prime}$ in the
category of sites with morphisms of sites. Let $(\mathcal{C} / K)_{\text {site }}^{\prime}$ be the site constructed in Lemma 69.3.1 Since the base change functors are adjoint to the localization functors, we find that $(\mathcal{C} / K)_{s i t e}^{\prime}$ is the same as the category $(\mathcal{C} / K)_{\text {site }}$. Equality of the sets of coverings is immediate from the definitions.

Let $\mathcal{C}$ be a site. Let $L=\left\{V_{i}\right\}$ be an object of $\mathrm{SR}(\mathcal{C})$. There is a continuous and cocontinuous localization functor $j: \mathcal{C} / K \rightarrow \mathcal{C}$ which is the product of the localization functors $\mathcal{C} / V_{i} \rightarrow \mathcal{C}$. We obtain functors $j^{-1}, j_{*}, j_{!}^{S h}$, and $j$ ! exactly as in Sites, Section 7.24 and Modules on Sites, Section 18.19 . Given a simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$ we obtain a family of localization functors $j_{n}: \mathcal{C} / K_{n} \rightarrow \mathcal{C}$.

09WM Lemma 69.4.2. Let $\mathcal{C}$ be a site. Let $K$ be a simplicial object of $S R(\mathcal{C})$. The forgetful functor $(\mathcal{C} / K)_{\text {site }} \rightarrow \mathcal{C}$ is continuous and cocontinuous and induces a morphism of topoi

$$
g: S h\left((\mathcal{C} / K)_{\text {site }}\right) \longrightarrow S h(\mathcal{C})
$$

as well as functors $g_{!}^{S h}$ and $g_{!}$left adjoint to $g^{-1}$ on sheaves of sets and abelian groups with the following properties:
(1) the functor $g^{-1}$ associates to a sheaf $\mathcal{F}$ on $\mathcal{C}$ the sheaf on $(\mathcal{C} / K)_{\text {site }}$ wich in degree $n$ is equal to $j_{n}^{-1} \mathcal{F}$,
(2) the functor $g_{*}$ associates to a sheaf $\mathcal{G}$ on $(\mathcal{C} / K)_{\text {site }}$ the equalizer of the two maps $j_{0, *} \mathcal{G}_{0} \rightarrow j_{1, *} \mathcal{G}_{1}$,
Proof. The functor is continuous and cocontinuous by our choice of coverings and our description of (certain) fibre products in $(\mathcal{C} / K)_{\text {site }}$ in the proof of Lemma 69.3.2. Details omitted. Thus we obtain a morphism of topoi and functors $g_{!}^{S h}$ and $g_{!}$, see Sites, Section 7.20 and Modules on Sites, Section 18.16 . The description of $g^{-1}$ is immediate from the definition as the compostion $\mathcal{C} / K_{n} \rightarrow \mathcal{C} / K \rightarrow \mathcal{C}$ is the localization morphism $j_{n}$.

Proof of (2). Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$ and let $\mathcal{G}$ be a sheaf on $(\mathcal{C} / K)_{\text {site }}$. A map $a: g^{-1} \mathcal{F} \rightarrow \mathcal{G}$ corresponds to a system of maps $a_{n}: j_{n}^{-1} \mathcal{F} \rightarrow \mathcal{G}_{n}$ on $\mathcal{C} / K_{n}$ by Lemma 69.3.4. Taking $n=0$ we get a $\operatorname{map} j_{0}^{-1} \mathcal{F} \rightarrow \mathcal{G}_{0}$ which is adjoint to a map $a_{0}: \mathcal{F} \rightarrow j_{0, *} \mathcal{G}_{0}$. Since $a_{0}$ is compatible with $a_{1}$ via the two maps $j_{0, *} \mathcal{G}_{0} \rightarrow j_{1, *} \mathcal{G}_{1}$ we see that $a_{0}$ maps into the equalizer. Conversely, given a map $a_{0}: \mathcal{F} \rightarrow j_{0, *} \mathcal{G}_{0}$ into the equalizer we can pick, for any $n$, one of the maps $j_{0, *} \mathcal{G}_{0} \rightarrow j_{n, *} \mathcal{G}_{n}$ and compose to get a well defined map $a_{n}: \mathcal{F} \rightarrow j_{n, *} \mathcal{G}_{n}$. These fit together to define a map of sheaves $g^{-1} \mathcal{F} \rightarrow \mathcal{G}$.

09X6 Lemma 69.4.3. Let $\mathcal{C}$ be a site with equalizers and fibre products. Let $\mathcal{G}$ be a presheaf of sets on $\mathcal{C}$. Let $K$ be a hypercovering of $\mathcal{G}$, see Hypercoverings, Definition 24.5.1. Then we have a canonical isomorphism

$$
R \Gamma(\mathcal{G}, E)=R \Gamma\left((\mathcal{C} / K)_{\text {site }}, g^{-1} E\right)
$$

for $E \in D^{+}(\mathcal{C})$. If $K$ is a hypercovering, then $R \Gamma(E)=R \Gamma\left((\mathcal{C} / K)_{\text {site }}, g^{-1} E\right)$.
Proof. First, let $\mathcal{I}$ be an injective abelian sheaf on $\mathcal{C}$. Then the spectral sequence of Lemma 69.3.8 for the sheaf $g^{-1} \mathcal{I}$ degenerates as $\left(g^{-1} \mathcal{I}\right)_{p}$ is the restriction of $\mathcal{I}$ to $\mathcal{C} / K_{p}$ which is injective by Cohomology on Sites, Lemma 21.8.1 (extended in the obvious manner to localization at semi-representable objects of $\mathcal{C}$ ). Thus we see that the complex

$$
\mathcal{I}\left(K_{0}\right) \rightarrow \mathcal{I}\left(K_{1}\right) \rightarrow \mathcal{I}\left(K_{2}\right) \rightarrow \ldots
$$

computes $R \Gamma\left((\mathcal{C} / K)_{\text {site }}, g^{-1} \mathcal{I}\right)$. This is exactly the Čech complex of $\mathcal{I}$ with respect to the simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$ as defined in Hypercoverings, Section 24.4 . Thus Hypercoverings, Lemma 24.5 .3 shows that this complex computes $R \Gamma(\overline{\mathcal{G}}, \mathcal{I})$ (which has zero higher cohomology groups as $\mathcal{I}$ is injective). In other words, we have $H^{0}(\mathcal{G}, \mathcal{I})=H^{0}\left((\mathcal{C} / K)_{\text {site }}, \mathcal{I}\right)$ and $H^{p}(\mathcal{G}, \mathcal{I})=H^{p}\left((\mathcal{C} / K)_{\text {site }}, \mathcal{I}\right)=0$ for all $p>0$.
The lemma now follows formally. Namely, let $A \in D^{+}(\mathcal{C})$ be arbitrary. We can represent $A$ by a bounded below complex $\mathcal{I}^{\bullet}$ of injective abelian sheaves. By Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) $R \Gamma\left((\mathcal{C} / K)_{\text {site }}, A\right)$ is computed by the complex $\Gamma\left((\mathcal{C} / K)_{\text {site }}, g^{-1} \mathcal{I}^{\bullet}\right)$ and $R \Gamma(\mathcal{G}, A)$ is computed by $\Gamma\left(\mathcal{G}, \mathcal{I}^{\bullet}\right)$. Since these complexes are the same we obtain the conclusion.
The final statement refers to the special case where $\mathcal{G}=*$ is the final object in the category of presheaves on $\mathcal{C}$.

09X7 Lemma 69.4.4. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$, see Hypercoverings, Definition 24.2.6. Then we have a canonical isomorphism

$$
R \Gamma(X, E)=R \Gamma\left((\mathcal{C} / K)_{\text {site }}, g^{-1} E\right)
$$

for $E \in D^{+}(\mathcal{C})$.
Proof. If $\mathcal{C}$ also has equalizers, then this is a special case of Lemma 69.4.3 because a hypercovering of $X$ is a hypercovering of $h_{X}$ by Hypercoverings, Lemma 24.2.10, This also uses that $H^{q}\left(h_{X}, \mathcal{F}\right)=H^{q}\left(h_{X}^{\#}, \mathcal{F}\right)=H^{q}(X, \mathcal{F})$, see discussion in Hypercoverings, Section 24.5 and Cohomology on Sites, Section 21.13. In general (when $\mathcal{C}$ does not have equalizers) one proves this using exactly the same argument as in the proof of Lemma 69.4 .3 but substituting Hypercoverings, Lemma 24.4 .2 for Hypercoverings, Lemma 24.5.3.

### 69.5. Hypercovering in a site

09X8 In the previous section we worked out, in great generality, how hypercoverings give rise to simplicial sites and how cohomology of (say) constant sheaves on this site computes the cohomology of the object the hypercovering is augmented towards. In this section we explain what this means in a special case.

Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$ and let $X_{\bullet}$ be a simplicial object of $\mathcal{C}$. Assume we have an augmentation

$$
a: X_{\bullet} \rightarrow X
$$

The discussion above turns this into a morphism of topoi

$$
g:\left(\mathcal{C} / X_{\bullet}\right)_{\text {site }} \longrightarrow \mathcal{C} / X
$$

Here an object of the site $\left(\mathcal{C} / X_{\bullet}\right)_{\text {site }}$ is given by a $U / X_{n}$ and a morphism $(\varphi, f)$ : $U / X_{n} \rightarrow V / X_{m}$ is given by a morphism $\varphi:[m] \rightarrow[n]$ in $\Delta$ and a morphism $f: U \rightarrow V$ such that the diagram

is commutative. The morphism of topoi $g$ is given by the cocontinuous functor $U / X_{n} \mapsto U / X$. That's all folks!

Thus we may translate some of the results above to this setting. For example, let us say that the augmentation is a hypercovering if the following hold
(1) $\left\{X_{0} \rightarrow X\right\}$ is a covering of $\mathcal{C}$,
(2) $\left\{X_{1} \rightarrow X_{0} \times_{X} X_{0}\right\}$ is a covering of $\mathcal{C}$,
(3) $\left\{X_{n+1} \rightarrow\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} X_{\bullet}\right)_{n+1}\right\}$ is a covering of $\mathcal{C}$ for $n \geq 1$.

The category $\mathcal{C} / X$ has all finite limits, hence the coskeleta used in the formulation above exist.

09X9 Lemma 69.5.1. In the situation above assume that $X_{\bullet}$ is a hypercovering of $X$. Then we have a canonical isomorphism

$$
R \Gamma(X, E)=R \Gamma\left(\left(\mathcal{C} / X_{\bullet}\right)_{\text {site }}, g^{-1} E\right)
$$

for $E \in D^{+}(\mathcal{C} / X)$.
Proof. This is a special case of Lemma 69.4.4.

### 69.6. Proper hypercoverings in topology

09XA Let's work in the category $L C$ of Hausdorff and locally quasi-compact topological spaces and continuous maps, see Cohomology on Sites, Section 21.23 Let $X$ be an object of $L C$ and let $X_{\bullet}$ be a simplicial object of $L C$. Assume we have an augmentation

$$
a: X_{\bullet} \rightarrow X
$$

We say that $X_{\bullet}$ is a proper hypercovering of $X$ if
(1) $X_{0} \rightarrow X$ is a proper surjective map,
(2) $X_{1} \rightarrow X_{0} \times_{X} X_{0}$ is a proper surjective map,
(3) $X_{n+1} \rightarrow\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} X_{\bullet}\right)_{n+1}$ is a proper surjective map for $n \geq 1$.

The category $L C$ has all finite limits, hence the coskeleta used in the formulation above exist.

Principle: Proper hypercoverings can be used to compute cohomology.
A key idea behind the proof of the principle is to find a topology on $L C$ which is stronger than the usual one such that (A) a surjective proper map defines a covering, and (B) cohomology of usual sheaves with respect to this stronger topology agrees with the usual cohomology. Properties (A) and (B) hold for the qc topology, see Cohomology on Sites, Section 21.23 . Once we have (A) and (B) we deduce the principle via a combination of the spectral sequences of Hypercoverings, Lemma 24.4.3 and Lemma 69.2.11. The following lemma is just a first step.

09XB Lemma 69.6.1. In the situation above, let $\mathcal{F}$ be an abelian sheaf on $X$. Let $\mathcal{F}_{n}$ be the pullback to $X_{n}$. If $X_{\bullet}$ is a proper hypercovering of $X$, then there exists $a$ canonical spectral sequence

$$
E_{1}^{p, q}=H^{q}\left(X_{p}, \mathcal{F}_{p}\right)
$$

converging to $H^{p+q}(X, \mathcal{F})$.

Proof. By Cohomology on Sites, Lemma 21.23 .6 we have

$$
H^{*}(X, \mathcal{F})=H^{*}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)
$$

Since a proper surjective map defines a qc covering (Cohomology on Sites, Lemma 21.23 .7 we see that $X_{\bullet} \rightarrow X$ is a hypercovering in the site $L C_{q c}$ as in Section 69.5 . Thus we have

$$
R \Gamma(X, \mathcal{F})=R \Gamma\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)=R \Gamma\left(\left(L C / X_{\bullet}\right)_{\text {site }}, g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}\right)
$$

by Lemma 69.5.1. By Lemma 69.3 .8 there is a spectral sequence with

$$
E_{1}^{p, q}=H^{q}\left(L C_{q c} / X_{p},\left(g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}\right)_{p}\right)
$$

converging to the cohomology of $g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}$. Finally, the restriction $\left(g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}\right)_{p}$ is just the restriction to $L C_{q c} / X_{p}$ of $\epsilon^{-1} \pi^{-1} \mathcal{F}$ which by Cohomology on Sites, Lemma 21.23 .5 is the pullback of $\mathcal{F}_{p}$ to $L C_{q c} / X_{p}$. By Cohomology on Sites, Lemma 21.23.6 again we conclude that

$$
H^{q}\left(L C_{q c} / X_{p},\left(g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}\right)_{p}\right)=H^{q}\left(X_{p}, \mathcal{F}_{p}\right)
$$

and the proof is finished.
09XC Lemma 69.6.2. In the situation above, let $\mathcal{F}$ be an abelian sheaf on $X$. Let $\mathcal{F} \bullet$ be the pullback of $\mathcal{F}$ via $a: X_{\bullet} \rightarrow X$. If $X_{\bullet}$ is a proper hypercovering of $X$, then

$$
H^{*}(X, \mathcal{F})=H^{*}\left(\left(X_{\bullet}\right)_{Z a r}, \mathcal{F}_{\bullet}\right)
$$

Proof. Consider the continuous functor

$$
\left(X_{\bullet}\right)_{Z a r} \longrightarrow\left(L C_{q c} / X_{\bullet}\right)_{\text {site }}, \quad U \longmapsto U
$$

We obtain a commutative diagram of topoi

Thus our sheaf $\mathcal{F}$ gives rise to a compatible collection of abelian sheaves in each topos. In the proof of Lemma 69.6.1 we have seen that the sheaf $\mathcal{F}$ has the same cohomology as the sheaf $\epsilon^{-1} \pi^{-1} \mathcal{F}$ and $g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}$. On the other hand, the terms of the spectral sequence of Lemma 69.2 .11 for $\mathcal{F}_{\bullet}$ are the same as those in the statement and proof of Lemma 69.6.1. A simple argument with spectral sequences then shows that the map

$$
R \Gamma\left(\left(X_{\bullet}\right)_{Z a r}, \mathcal{F}_{\bullet}\right) \longrightarrow R \Gamma\left(\left(L C_{q c} / X_{\bullet}\right)_{\text {site }}, g^{-1} \epsilon^{-1} \pi^{-1} \mathcal{F}\right)
$$

is an isomorphism. Some details omitted.
09XS Lemma 69.6.3. In the situation above, assume $a: X_{\bullet} \rightarrow X$ gives a proper hypercovering of $X$. Then for all $K \in D^{+}(X)$

$$
K \rightarrow R a_{*}\left(a^{-1} K\right)
$$

is an isomorphism where $a: \operatorname{Sh}\left(\left(X_{\bullet}\right)_{Z a r}\right) \rightarrow \operatorname{Sh}(X)$ is as in Lemma 69.2.9.

Proof. Observe that for any abelian sheaf $\mathcal{F}$ on $X$ the sheaf $R^{q} a_{*}\left(a^{-1} \mathcal{F}\right)$ is the sheaf associated to the presheaf

$$
U \mapsto H^{q}\left(\left(U_{\bullet}\right)_{Z a r}, a^{-1} \mathcal{F}\right)=H^{q}(U, \mathcal{F})
$$

where $U_{\bullet}=a^{-1}(U)$. The last equality holds by Lemma 69.6.2. Thus $R^{q} a_{*}\left(a^{-1} \mathcal{F}\right)$ is zero for $q>0$ and equal to $\mathcal{F}$ for $q=0$. This proves the result in case $K$ consists of a single abelian sheaf in a single degree. The general case follows from this immediately.

### 69.7. Simplicial schemes

09XT A simplicial scheme is a simplicial object in the category of schemes, see Simplicial, Definition 14.3.1. Recall that a simplicial scheme looks like

$$
X_{2} \underset{\rightleftarrows}{\rightleftarrows} X_{1} \rightleftarrows X_{0}
$$

Here there are two morphisms $d_{0}^{1}, d_{1}^{1}: X_{1} \rightarrow X_{0}$ and a single morphism $s_{0}^{0}: X_{0} \rightarrow$ $X_{1}$, etc. It is important to keep in mind that $d_{i}^{n}: X_{n} \rightarrow X_{n-1}$ should be thought of as a "projection forgetting the $i$ th coordinate" and $s_{j}^{n}: X_{n} \rightarrow X_{n+1}$ as the diagonal map repeating the $j$ th coordinate.

### 69.8. Descent in terms of simplicial schemes

0248 Cartesian morphisms are defined as follows.
0249 Definition 69.8.1. Let $a: Y \rightarrow X$ be a morphism of simplicial schemes. We say $a$ is cartesian, or that $Y$ is cartesian over $X$, if for every morphism $\varphi:[n] \rightarrow[m]$ of $\Delta$ the corresponding diagram

is a fibre square in the category of schemes.
Cartesian morphisms are related to descent data. First we prove a general lemma describing the category of cartesian simplicial schemes over a fixed simplicial scheme. In this lemma we denote $f^{*}: S c h / X \rightarrow S c h / Y$ the base change functor associated to a morphism of schemes $Y \rightarrow X$.

07TC Lemma 69.8.2. Let $X$ be a simplicial scheme. The category of simplicial schemes cartesian over $X$ is equivalent to the category of pairs $(V, \varphi)$ where $V$ is a scheme over $X_{0}$ and

$$
\varphi: V \times_{X_{0}, d_{1}^{1}} X_{1} \longrightarrow X_{1} \times_{d_{0}^{1}, X_{0}} V
$$

is an isomorphism over $X_{1}$ such that $\left(s_{0}^{0}\right)^{*} \varphi=i d_{V}$ and such that

$$
\left(d_{1}^{2}\right)^{*} \varphi=\left(d_{0}^{2}\right)^{*} \varphi \circ\left(d_{2}^{2}\right)^{*} \varphi
$$

as morphisms of schemes over $X_{2}$.

Proof. The statement of the displayed equality makes sense because $d_{1}^{1} \circ d_{2}^{2}=$ $d_{1}^{1} \circ d_{1}^{2}, d_{1}^{1} \circ d_{0}^{2}=d_{0}^{1} \circ d_{2}^{2}$, and $d_{0}^{1} \circ d_{0}^{2}=d_{0}^{1} \circ d_{1}^{2}$ as morphisms $X_{2} \rightarrow X_{0}$, see Simplicial, Remark 14.3 .3 hence we can picture these maps as follows

and the condition signifies the diagram is commutative. It is clear that given a simplicial scheme $Y$ cartesian over $X$ we can set $V=Y_{0}$ and $\varphi$ equal to the composition

$$
V \times_{X_{0}, d_{1}^{1}} X_{1}=Y_{0} \times_{X_{0}, d_{1}^{1}} X_{1}=Y_{1}=X_{1} \times_{X_{0}, d_{0}^{1}} Y_{0}=X_{1} \times_{X_{0}, d_{0}^{1}} V
$$

of identifications given by the cartesian structure. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 34.3 from which we borrow the notation $\tau_{i}^{n}:[0] \rightarrow[n], 0 \mapsto i$ and $\tau_{i j}^{n}:[1] \rightarrow[n], 0 \mapsto i, 1 \mapsto j$. Namely, given a pair $(V, \varphi)$ as in the lemma we set $Y_{n}=X_{n} \times_{X\left(\tau_{n}^{n}\right), X_{0}} V$. Then given $\beta:[n] \rightarrow[m]$ we define $V(\beta): Y_{m} \rightarrow Y_{n}$ as the pullback by $X\left(\tau_{\beta(n) m}^{m}\right)$ of the map $\varphi$ postcomposed by the projection $X_{m} \times_{X(\beta), X_{n}} Y_{n} \rightarrow Y_{n}$. This makes sense because

$$
X_{m} \times_{X\left(\tau_{\beta(n) m}^{m}\right), X_{1}} X_{1} \times_{d_{1}^{1}, X_{0}} V=X_{m} \times_{X\left(\tau_{m}^{m}\right), X_{0}} V=Y_{m}
$$

and

$$
X_{m} \times_{X\left(\tau_{\beta(n) m}^{m}\right), X_{1}} X_{1} \times_{d_{0}^{1}, X_{0}} V=X_{m} \times_{X\left(\tau_{\beta(n)}^{m}\right), X_{0}} V=X_{m} \times_{X(\beta), X_{n}} Y_{n}
$$

We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly. We also omit the verification that the two functors are quasi-inverse to each other.

024A Definition 69.8.3. Let $f: X \rightarrow S$ be a morphism of schemes. The simplicial scheme associated to $f$, denoted $(X / S)_{\bullet}$, is the functor $\Delta^{o p p} \rightarrow S c h,[n] \mapsto X \times_{S}$ $\ldots \times_{S} X$ described in Simplicial, Example 14.3.5.

Thus $(X / S)_{n}$ is the $(n+1)$-fold fibre product of $X$ over $S$. The morphism $d_{0}^{1}$ : $X \times{ }_{S} X \rightarrow X$ is the map $\left(x_{0}, x_{1}\right) \mapsto x_{1}$ and the morphism $d_{1}^{1}$ is the other projection. The morphism $s_{0}^{0}$ is the diagonal morphism $X \rightarrow X \times_{S} X$.

024B Lemma 69.8.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\pi: Y \rightarrow(X / S)$ • be a cartesian morphism of simplicial schemes. Set $V=Y_{0}$ considered as a scheme over $X$. The morphisms $d_{0}^{1}, d_{1}^{1}: Y_{1} \rightarrow Y_{0}$ and the morphism $\pi_{1}: Y_{1} \rightarrow X \times_{S} X$ induce isomorphisms

$$
V \times_{S} X \nprec \stackrel{\left(d_{1}^{1}, p r_{1} \circ \pi_{1}\right)}{<} Y_{1} \xrightarrow{\left(p r_{0} \circ \pi_{1}, d_{0}^{1}\right)} X \times_{S} V .
$$

Denote $\varphi: V \times_{S} X \rightarrow X \times_{S} V$ the resulting isomorphism. Then the pair $(V, \varphi)$ is a descent datum relative to $X \rightarrow S$.

Proof. This is a special case of (part of) Lemma 69.8.2 as the displayed equation of that lemma is equivalent to the cocycle condition of Descent, Definition 34.30.1.

024C Lemma 69.8.5. Let $f: X \rightarrow S$ be a morphism of schemes. The construction

$$
\begin{gathered}
\text { category of cartesian } \\
\text { schemes over }(X / S) \bullet
\end{gathered} \quad \begin{gathered}
\text { category of descent data } \\
\text { relative to } X / S
\end{gathered}
$$

of Lemma 69.8.4 is an equivalence of categories.
Proof. The functor from left to right is given in Lemma 69.8.4. Hence this is a special case of Lemma 69.8.2.

We may reinterpret the pullback of Descent, Lemma 34.30 .6 as follows. Suppose given a morphism of simplicial schemes $f: X^{\prime} \rightarrow X$ and a cartesian morphism of simplicial schemes $Y \rightarrow X$. Then the fibre product (viewed as a "pullback")

$$
f^{*} Y=Y \times_{X} X^{\prime}
$$

of simplicial schemes is a simplicial scheme cartesian over $X^{\prime}$. Suppose given a commutative diagram of morphisms of schemes

This gives rise to a morphism of simplicial schemes

$$
f_{\bullet}:\left(X^{\prime} / S^{\prime}\right) \bullet(X / S)_{\bullet}
$$

We claim that the "pullback" $f_{\bullet}^{*}$ along the morphism $f_{\bullet}:\left(X^{\prime} / S^{\prime}\right) \bullet(X / S) \bullet$ corresponds via Lemma 69.8.5 with the pullback defined in terms of descent data in the aforementioned Descent, Lemma 34.30.6.

### 69.9. Quasi-coherent modules on simplicial schemes

07 TE In the following definition we make use of the description of sheaves on a simplicial space given in Lemma 69.2.2.

07TF Definition 69.9.1. Let $S$ be a scheme. Let $U$ be a simplicial scheme over $S$.
(1) A quasi-coherent sheaf on $U$ is given by a sheaf of $\mathcal{O}_{U}$-modules $\mathcal{F}$ such that $\mathcal{F}_{n}$ is quasi-coherent for all $n \geq 0$.
(2) A quasi-coherent sheaf $\mathcal{F}$ on $U$ is cartesian if and only if all the maps $\mathcal{F}(\varphi): \mathcal{F}_{n} \rightarrow \mathcal{F}_{m}$ induce isomorphisms $U(\varphi)^{*} \mathcal{F}_{n} \rightarrow \mathcal{F}_{m}$.

The property on pullbacks needs only be checked for the degeneracies.
07TG Lemma 69.9.2. Let $S$ be a scheme. Let $U$ be a simplicial scheme over $S$. Let $\mathcal{F}$ be a quasi-coherent module on $U$. Then $\mathcal{F}$ is cartesian if and only if the induced maps $\left(d_{j}^{n}\right)^{*} \mathcal{F}_{n-1} \rightarrow \mathcal{F}_{n}$ are isomorphisms.
Proof. The category $\Delta$ is generated by the morphisms the morphisms $\delta_{j}^{n}$ and $\sigma_{j}^{n}$, see Simplicial, Lemma 14.2 .2 . Hence we only need to check the maps $\left(d_{j}^{n}\right)^{*} \mathcal{F}_{n-1} \rightarrow$ $\mathcal{F}_{n}$ and $\left(s_{j}^{n}\right)^{*} \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ are isomorphisms, see Simplicial, Lemma 14.3.2 for notation. But $d_{j}^{n+1} \circ s_{j}^{n}=\operatorname{id}_{U_{n}}$ so it the result for $d_{j}^{n+1}$ implies the result for $s_{j}^{n}$.

07TH Lemma 69.9.3. Let $S$ be a scheme. Let $U$ be a simplicial scheme over $S$. The category of cartesian quasi-coherent modules over $U$ is equivalent to the category of pairs $(\mathcal{F}, \alpha)$ where $\mathcal{F}$ is a quasi-coherent module over $U_{0}$ and

$$
\alpha:\left(d_{1}^{1}\right)^{*} \mathcal{F} \longrightarrow\left(d_{0}^{1}\right)^{*} \mathcal{F}
$$

is an isomorphism such that $\left(s_{0}^{0}\right)^{*} \alpha=i d_{\mathcal{F}}$ and such that

$$
\left(d_{1}^{2}\right)^{*} \alpha=\left(d_{0}^{2}\right)^{*} \alpha \circ\left(d_{2}^{2}\right)^{*} \alpha
$$

on $X_{2}$.
Proof. The statement of the displayed equality makes sense because $d_{1}^{1} \circ d_{2}^{2}=$ $d_{1}^{1} \circ d_{1}^{2}, d_{1}^{1} \circ d_{0}^{2}=d_{0}^{1} \circ d_{2}^{2}$, and $d_{0}^{1} \circ d_{0}^{2}=d_{0}^{1} \circ d_{1}^{2}$ as morphisms $X_{2} \rightarrow X_{0}$, see Simplicial, Remark 14.3.3 hence we can picture these maps as follows

and the condition signifies the diagram is commutative. It is clear that given a cartesian quasi-coherent sheaf $\mathcal{F}$ we can set $\mathcal{F}=\mathcal{F}_{0}$ and $\alpha$ equal to the composition

$$
\left(d_{1}^{0}\right)^{*} \mathcal{F}_{0}=\mathcal{F}_{1}=\left(d_{0}^{0}\right)^{*} \mathcal{F}_{0}
$$

of identifications given by the cartesian structure. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 34.3 from which we borrow the notation $\tau_{i}^{n}:[0] \rightarrow[n], 0 \mapsto i$ and $\tau_{i j}^{n}:[1] \rightarrow[n], 0 \mapsto i, 1 \mapsto j$. Namely, given a pair $(\mathcal{F}, \alpha)$ as in the lemma we set $\mathcal{F}_{n}=X\left(\tau_{n}^{n}\right)^{*} \mathcal{F}$. Then given $\beta:[n] \rightarrow[m]$ we define $\mathcal{F}(\beta): \mathcal{F}_{n} \rightarrow \mathcal{F}_{m}$ as the pullback by $X\left(\tau_{\beta(n) m}^{m}\right)$ of the map $\alpha$ precomposed with the canonical $X(\beta)$-map $\mathcal{F}_{n} \rightarrow X(\beta)^{*} \mathcal{F}_{n}$. We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly. We also omit the verification that the two functors are quasi-inverse to each other.

07TI Lemma 69.9.4. Let $f: V \rightarrow U$ be a morphism of simplicial schemes. Given a cartesian quasi-coherent module $\mathcal{F}$ on $U$ the pullback $f^{*} \mathcal{F}$ is a cartesian quasicoherent module on $V$.

Proof. This is immediate from the definitions.
07TJ Lemma 69.9.5. Let $f: V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_{j}^{n}: U_{n} \rightarrow U_{n-1}$ are flat and the morphisms $V_{n} \rightarrow U_{n}$ are quasi-compact and quasi-separated. For a cartesian quasi-coherent module $\mathcal{G}$ on $V$ the pushforward $f_{*} \mathcal{G}$ is a cartesian quasi-coherent module on $U$.

Proof. If $\mathcal{F}=f_{*} \mathcal{G}$, then $\mathcal{F}_{n}=f_{n, *} \mathcal{G}_{n}$ and the maps $\mathcal{F}(\varphi)$ are defined using the base change maps, see Cohomology, Section 20.18. The sheaves $\mathcal{F}_{n}$ are quasi-coherent by Schemes, Lemma 25.24.1. The base change maps along the degeneracies $d_{j}^{n}$ are
isomorphisms by Cohomology of Schemes, Lemma 29.5.2. Hence we are done by Lemma 69.9.2
07TK Lemma 69.9.6. Let $f: V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_{j}^{n}: U_{n} \rightarrow U_{n-1}$ are flat and the morphisms $V_{n} \rightarrow U_{n}$ are quasi-compact and quasi-separated. Then $f^{*}$ and $f_{*}$ form an adjoint pair of functors between the categories of cartesian quasi-coherent modules on $U$ and $V$.
Proof. We have seen in Lemmas 69.9.4 and 69.9.5 that the statement makes sense. The adjointness property follows immediately from the fact that each $f_{n}^{*}$ is adjoint to $f_{n, *}$.
07TL Lemma 69.9.7. Let $f: X \rightarrow S$ be a morphism of schemes which has a sectior ${ }^{2}$. Let $(X / S)$. be the simplicial scheme associated to $X \rightarrow S$, see Definition 69.8.3. Then pullback defines an equivalence between the category of quasi-coherent $\mathcal{O}_{S}$ modules and the category of cartesian quasi-coherent modules on $(X / S)$. .
Proof. Let $\sigma: S \rightarrow X$ be a section of $f$. Let $(\mathcal{F}, \alpha)$ be a pair as in Lemma 69.9.3. Set $\mathcal{G}=\sigma^{*} \mathcal{F}$. Consider the diagram

Note that $\operatorname{pr}_{0}=d_{1}^{1}$ and $\operatorname{pr}_{1}=d_{0}^{1}$. Hence we see that $(\sigma \circ f, 1)^{*} \alpha$ defines an isomorphism

$$
f^{*} \mathcal{G}=(\sigma \circ f, 1)^{*} \operatorname{pr}_{0}^{*} \mathcal{F} \longrightarrow(\sigma \circ f, 1)^{*} \operatorname{pr}_{1}^{*} \mathcal{F}=\mathcal{F}
$$

We omit the verification that this isomorphism is compatible with $\alpha$ and the canonical isomorphism $\operatorname{pr}_{0}^{*} f^{*} \mathcal{G} \rightarrow \operatorname{pr}_{1}^{*} f^{*} \mathcal{G}$.

### 69.10. Groupoids and simplicial schemes

07TM Given a groupoid in schemes we can build a simplicial scheme. It will turn out that the category of quasi-coherent sheaves on a groupoid is equivalent to the category of cartesian quasi-coherent sheaves on the associated simplicial scheme.
07TN Lemma 69.10.1. Let $(U, R, s, t, c, e, i)$ be a groupoid scheme over $S$. There exists a simplicial scheme $X$ over $S$ with the following properties
(1) $X_{0}=U, X_{1}=R, X_{2}=R \times_{s, U, t} R$,
(2) $s_{0}^{0}=e: X_{0} \rightarrow X_{1}$,
(3) $d_{0}^{1}=s: X_{1} \rightarrow X_{0}, d_{1}^{1}=t: X_{1} \rightarrow X_{0}$,
(4) $s_{0}^{1}=(e \circ t, 1): X_{1} \rightarrow X_{2}, s_{1}^{1}=(1, e \circ t): X_{1} \rightarrow X_{2}$,
(5) $d_{0}^{2}=p r_{1}: X_{2} \rightarrow X_{1}, d_{1}^{2}=c: X_{2} \rightarrow X_{1}, d_{2}^{2}=p r_{0}$, and
(6) $X=\operatorname{cosk}_{2} s k_{2} X$.

For all $n$ we have $X_{n}=R \times_{s, U, t} \ldots \times_{s, U, t} R$ with $n$ factors. The map $d_{j}^{n}: X_{n} \rightarrow$ $X_{n-1}$ is given on functors of points by

$$
\left(r_{1}, \ldots, r_{n}\right) \longmapsto\left(r_{1}, \ldots, c\left(r_{j}, r_{j+1}\right), \ldots, r_{n}\right)
$$

for $1 \leq j \leq n-1$ whereas $d_{0}^{n}\left(r_{1}, \ldots, r_{n}\right)=\left(r_{2}, \ldots, r_{n}\right)$ and $d_{n}^{n}\left(r_{1}, \ldots, r_{n}\right)=$ $\left(r_{1}, \ldots, r_{n-1}\right)$.

[^186]Proof. We only have to verify that the rules prescribed in (1), (2), (3), (4), (5) define a 2-truncated simplicial scheme $U^{\prime}$ over $S$, since then (6) allows us to set $X=\operatorname{cosk}_{2} U^{\prime}$, see Simplicial, Lemma 14.19.2. Using the functor of points approach, all we have to verify is that if ( Ob , Arrows, $s, t, c, e, i$ ) is a groupoid, then

is a 2-truncated simplicial set. We omit the details.
Finally, the description of $X_{n}$ for $n>2$ follows by induction from the description of $X_{0}, X_{1}, X_{2}$, and Simplicial, Remark 14.19 .9 and Lemma 14.19.6. Alternately, one shows that cosk $_{2}$ applied to the 2-truncated simplicial set displayed above gives a simplicial set whose $n$th term equals Arrows $\times{ }_{s, \mathrm{Ob}, t} \ldots \times_{s, \mathrm{Ob}, t}$ Arrows with $n$ factors and degeneracy maps as given in the lemma. Some details omitted.

07TP Lemma 69.10.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $X$ be the simplicial scheme over $S$ constructed in Lemma69.10.1. Then the category of quasi-coherent modules on $(U, R, s, t, c)$ is equivalent to the category of cartesian quasi-coherent modules on $X$.

Proof. This is clear from Lemma 69.9.3 and Groupoids, Definition 38.14.1.
In the following lemma we will use the concept of a cartesian morphism $V \rightarrow U$ of simplicial schemes as defined in Definition 69.8.1.
07TQ Lemma 69.10.3. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$. Let $X$ be the simplicial scheme over $S$ constructed in Lemma 69.10.1. Let $(R / U)$ • be the simplicial scheme associated to $s: R \rightarrow U$, see Definition 69.8.3. There exists a cartesian morphism $t_{\bullet}:(R / U) \bullet X$ of simplicial schemes with low degree morphisms given by

Proof. For arbitrary $n$ we define $(R / U) \bullet \rightarrow X_{n}$ by the rule

$$
\left(r_{0}, \ldots, r_{n}\right) \longrightarrow\left(r_{0} \circ r_{1}^{-1}, \ldots, r_{n-1} \circ r_{n}^{-1}\right)
$$

Compatibility with degeneracy maps is clear from the description of the degeneracies in Lemma 69.10.1. We omit the verification that the maps respect the morphisms $s_{j}^{n}$. Groupoids, Lemma 38.13.5 (with the roles of $s$ and $t$ reversed)
shows that the two right squares are cartesian. In exactly the same manner one shows all the other squares are cartesian too. Hence the morphism is cartesian.

### 69.11. Descent data give equivalence relations

024D In Section 69.8 we saw how descent data relative to $X \rightarrow S$ can be formulated in terms of cartesian simplicial schemes over $(X / S)$.. Here we link this to equivalence relations as follows.

024E Lemma 69.11.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\pi: Y \rightarrow(X / S)$ • be a cartesian morphism of simplicial schemes, see Definitions 69.8.1 and 69.8.3. Then the morphism

$$
j=\left(d_{1}^{1}, d_{0}^{1}\right): Y_{1} \rightarrow Y_{0} \times_{S} Y_{0}
$$

defines an equivalence relation on $Y_{0}$ over $S$, see Groupoids, Definition 38.3.1.
Proof. Note that $j$ is a monomorphism. Namely the composition $Y_{1} \rightarrow Y_{0} \times{ }_{S} Y_{0} \rightarrow$ $Y_{0} \times_{S} X$ is an isomorphism as $\pi$ is cartesian.

Consider the morphism

$$
\left(d_{2}^{2}, d_{0}^{2}\right): Y_{2} \rightarrow Y_{1} \times_{d_{0}^{1}, Y_{0}, d_{1}^{1}} Y_{1}
$$

This works because $d_{0} \circ d_{2}=d_{1} \circ d_{0}$, see Simplicial, Remark 14.3.3. Also, it is a morphism over $(X / S)_{2}$. It is an isomorphism because $Y \rightarrow(X / S)$ • is cartesian. Note for example that the right hand side is isomorphic to $Y_{0} \times{ }_{\pi_{0}, X, \mathrm{pr}_{1}}\left(X \times{ }_{S} X \times_{S}\right.$ $X)=X \times{ }_{S} Y_{0} \times{ }_{S} X$ because $\pi$ is cartesian. Details omitted.

As in Groupoids, Definition 38.3.1 we denote $t=\operatorname{pr}_{0} \circ j=d_{1}^{1}$ and $s=\operatorname{pr}_{1} \circ j=d_{0}^{1}$. The isomorphism above, combined with the morphism $d_{1}^{2}: Y_{2} \rightarrow Y_{1}$ give us a composition morphism

$$
c: Y_{1} \times_{s, Y_{0}, t} Y_{1} \longrightarrow Y_{1}
$$

over $Y_{0} \times_{S} Y_{0}$. This immediately implies that for any scheme $T / S$ the relation $Y_{1}(T) \subset Y_{0}(T) \times Y_{0}(T)$ is transitive.

Reflexivity follows from the fact that the restriction of the morphism $j$ to the diagonal $\Delta: X \rightarrow X \times_{S} X$ is an isomorphism (again use the cartesian property of $\pi)$.

To see symmetry we consider the morphism

$$
\left(d_{2}^{2}, d_{1}^{2}\right): Y_{2} \rightarrow Y_{1} \times_{d_{1}^{1}, Y_{0}, d_{1}^{1}} Y_{1}
$$

This works because $d_{1} \circ d_{2}=d_{1} \circ d_{1}$, see Simplicial, Remark 14.3.3 It is an isomorphism because $Y \rightarrow(X / S)$. is cartesian. Note for example that the right hand side is isomorphic to $Y_{0} \times_{\pi_{0}, X, \mathrm{pr}_{0}}\left(X \times_{S} X \times_{S} X\right)=Y_{0} \times_{S} X \times_{S} X$ because $\pi$ is cartesian. Details omitted.

Let $T / S$ be a scheme. Let $a \sim b$ for $a, b \in Y_{0}(T)$ be synonymous with $(a, b) \in Y_{1}(T)$. The isomorphism $\left(d_{2}^{2}, d_{1}^{2}\right)$ above implies that if $a \sim b$ and $a \sim c$, then $b \sim c$. Combined with reflexivity this shows that $\sim$ is an equivalence relation.
69.12. An example case

024 F In this section we show that disjoint unions of spectra of Artinian rings can be descended along a quasi-compact surjective flat morphism of schemes.
024G Lemma 69.12.1. Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow(X / S)$ • is a cartesian morphism of simplicial schemes. For $y \in Y_{0}$ a point define

$$
T_{y}=\left\{y^{\prime} \in Y_{0} \mid \exists y_{1} \in Y_{1}: d_{1}^{1}\left(y_{1}\right)=y, d_{0}^{1}\left(y_{1}\right)=y^{\prime}\right\}
$$

as a subset of $Y_{0}$. Then $y \in T_{y}$ and $T_{y} \cap T_{y^{\prime}} \neq \emptyset \Rightarrow T_{y}=T_{y^{\prime}}$.
Proof. Combine Lemma 69.11.1 and Groupoids, Lemma 38.3.4.
024H Lemma 69.12.2. Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow(X / S)$ • is a cartesian morphism of simplicial schemes. Let $y \in Y_{0}$ be a point. If $X \rightarrow S$ is quasi-compact, then

$$
T_{y}=\left\{y^{\prime} \in Y_{0} \mid \exists y_{1} \in Y_{1}: d_{1}^{1}\left(y_{1}\right)=y, d_{0}^{1}\left(y_{1}\right)=y^{\prime}\right\}
$$

is a quasi-compact subset of $Y_{0}$.
Proof. Let $F_{y}$ be the scheme theoretic fibre of $d_{1}^{1}: Y_{1} \rightarrow Y_{0}$ at $y$. Then we see that $T_{y}$ is the image of the morphism

Note that $F_{y}$ is quasi-compact. This proves the lemma.
024 Lemma 69.12.3. Let $X \rightarrow S$ be a quasi-compact flat surjective morphism. Let $(V, \varphi)$ be a descent datum relative to $X \rightarrow S$. If $V$ is a disjoint union of spectra of Artinian rings, then $(V, \varphi)$ is effective.
Proof. Let $Y \rightarrow(X / S)$. be the cartesian morphism of simplicial schemes corresponding to $(V, \varphi)$ by Lemma 69.8.5. Observe that $Y_{0}=V$. Write $V=\coprod_{i \in I} \operatorname{Spec}\left(A_{i}\right)$ with each $A_{i}$ local Artinian. Moreover, let $v_{i} \in V$ be the unique closed point of $\operatorname{Spec}\left(A_{i}\right)$ for all $i \in I$. Write $i \sim j$ if and only if $v_{i} \in T_{v_{j}}$ with notation as in Lemma 69.12 .1 above. By Lemmas 69.12 .1 and 69.12 .2 this is an equivalence relation with finite equivalence classes. Let $\bar{I}=I / \sim$. Then we can write $V=\coprod_{\bar{i} \in \bar{I}} V_{\bar{i}}$ with $V_{\bar{i}}=\coprod_{i \in \bar{i}} \operatorname{Spec}\left(A_{i}\right)$. By construction we see that $\varphi: V \times_{S} X \rightarrow X \times_{S} V$ maps the open and closed subspaces $V_{\bar{i}} \times{ }_{S} X$ into the open and closed subspaces $X \times{ }_{S} V_{\bar{i}}$. In other words, we get descent data $\left(V_{\bar{i}}, \varphi_{\bar{i}}\right)$, and $(V, \varphi)$ is the coproduct of them in the category of descent data. Since each of the $V_{\bar{i}}$ is a finite union of spectra of Artinian local rings the morphism $V_{\bar{i}} \rightarrow X$ is affine, see Morphisms, Lemma 28.12.13. Since $\{X \rightarrow S\}$ is an fpqc covering we see that all the descent data $\left(V_{\bar{i}}, \varphi_{\bar{i}}\right)$ are effective by Descent, Lemma 34.33.1.
To be sure, the lemma above has very limited applicability!

## CHAPTER 70

## Formal Algebraic Spaces

0AHW

### 70.1. Introduction

0AHX Formal schemes were introduced in DG67. A more general version of formal schemes was introduced in McQ02 and another in Yas09. Formal algebraic spaces were introduced in Knu71. Related material and much besides can be found in Abb10 and FK. This chapter introduces the notion of formal algebraic spaces we will work with. Our definition is general enough to allow most classes of formal schemes/spaces in the literature as full subcategories.

Although we do discuss the comparison of some of these alternative theories with ours, we do not always give full details when it is not necessary for the logical development of the theory.
Besides introducing formal algebraic spaces, we also prove a few very basic properties and we discuss a few types of morphisms.

### 70.2. Formal schemes à la EGA

$0 A H Y$ In this section we review the construction of formal schemes in DG67. This notion, although very useful in algebraic geometry, may not always be the correct one to consider. Perhaps it is better to say that in the setup of the theory a number of choices are made, where for different purposes others might work better. And indeed in the literature one can find many different closely related theories adapted to the problem the authors may want to consider. Still, one of the major advantages of the theory as sketched here is that one gets to work with definite geometric objects.

Before we start we should point out an issue with the sheaf condition for sheaves of topological rings or more generally sheaves of topological spaces. Namely, the big categories
(1) category of topological spaces,
(2) category of topological groups,
(3) category of topological rings,
(4) category of topological modules over a given topological ring,
endowed with their natural forgetful functors to Sets are not examples of types of algebraic structures as defined in Sheaves, Section 6.15. Thus we cannot blithely apply to them the machinery developed in that chapter. On the other hand, each of the categories listed above has limits and equalizers and the forgetful functor to sets, groups, rings, modules commutes with them (see Topology, Lemmas 5.13.1, 5.29 .3 . 5.29.8 and 5.29.11. Thus we can define the notion of a sheaf as in Sheaves,

Definition 6.9.1 and the underlying presheaf of sets, groups, rings, or modules is a sheaf. The key difference is that for an open covering $U=\bigcup_{i \in I} U_{i}$ the diagram

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \longrightarrow \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)
$$

has to be an equalizer diagram in the category of topological spaces, topological groups, topological rings, topological modules, i.e., that the first map identifies $\mathcal{F}(U)$ with a subspace of $\prod_{i \in I} \mathcal{F}\left(U_{i}\right)$ which is endowed with the product topology.
The stalk $\mathcal{F}_{x}$ of a sheaf $\mathcal{F}$ of topological spaces, topological groups, topological rings, or topological modules at a point $x \in X$ is defined as the colimit over open neighbourhoods

$$
\mathcal{F}_{x}=\operatorname{colim}_{x \in U} \mathcal{F}(U)
$$

in the corresponding category. This is the same as taking the colimit on the level of sets, groups, rings, or modules (see Topology, Lemmas 5.28.1, 5.29.6, 5.29.9, and 5.29.12 but comes equipped with a topology. Warning: the topology one gets depends on which category one is working with, see Examples, Section 88.65 . One can sheafify presheaves of topological spaces, topological groups, topological rings, or topological modules and taking stalks commutes with this operation, see Remark 70.2.4.

Let $f: X \rightarrow Y$ be a continuous map of topological spaces. There is a functor $f_{*}$ from the category of sheaves of topological spaces, topological groups, topological rings, topological modules, to the corresponding category of sheaves on $Y$ which is defined by setting $f_{*} \mathcal{F}(V)=\mathcal{F}\left(f^{-1} V\right)$ as usual. (We delay discussing the pullback in this setting till later.) We define the notion of an $f$-map $\xi: \mathcal{G} \rightarrow \mathcal{F}$ between a sheaf of topological spaces $\mathcal{G}$ on $Y$ and a sheaf of topological spaces $\mathcal{F}$ on $X$ in exactly the same manner as in Sheaves, Definition 6.21 .7 with the additional constraint that $\xi_{V}: \mathcal{G}(V) \rightarrow \mathcal{F}\left(f^{-1} V\right)$ be continuous for every open $V \subset Y$. We have

$$
\{f \text {-maps from } \mathcal{G} \text { to } \mathcal{F}\}=\operatorname{Mor}_{S h(Y, T o p)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

as in Sheaves, Lemma 6.21.8. Similarly for sheaves of topological groups, topological rings, topological modules. Finally, let $\xi: \mathcal{G} \rightarrow \mathcal{F}$ be an $f$-map as above. Then given $x \in X$ with image $y=f(x)$ there is a continuous map

$$
\xi_{x}: \mathcal{G}_{y} \longrightarrow \mathcal{F}_{x}
$$

of stalks defined in exactly the same manner as in the discussion following Sheaves, Definition 6.21.9.

Using the discussion above, we can define a category $L T R S$ of "locally topologically ringed spaces". An object is a pair $\left(X, \mathcal{O}_{X}\right)$ consisting of a topological space $X$ and a sheaf of topological rings $\mathcal{O}_{X}$ whose stalks $\mathcal{O}_{X, x}$ are local rings (if one forgets about the topology). A morphism $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ of $L T R S$ is a pair $\left(f, f^{\sharp}\right)$ where $f: X \rightarrow Y$ is a continuous map of topological spaces and $f^{\sharp}: \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$ is an $f$-map such that for every $x \in X$ the induced map

$$
f_{x}^{\sharp}: \mathcal{O}_{Y, f(x)} \longrightarrow \mathcal{O}_{X, x}
$$

is a local homomorphism of local rings (forgetting about the topologies). The composition works in exactly the same manner as composition of morphisms of locally ringed spaces.

Assume now that the topological space $X$ has a basis consisting of quasi-compact opens. Given a sheaf $\mathcal{F}$ of sets, groups, rings, modules over a ring, one can endow $\mathcal{F}$ with the structure of a sheaf of topological spaces, topological groups, topological rings, topological modules. Namely, if $U \subset X$ is quasi-compact open, we endow $\mathcal{F}(U)$ with the discrete topology. If $U \subset X$ is arbitrary, then we choose an open covering $U=\bigcup_{i \in I} U_{i}$ by quasi-compact opens and we endow $\mathcal{F}(U)$ with the induced topology from $\prod_{i \in I} \mathcal{F}\left(U_{i}\right)$ (as we should do according to our discussion above). The reader may verify (omitted) that we obtain a sheaf of topological spaces, topological groups, topological rings, topological modules in this fashion. Let us say that a sheaf of topological spaces, topological groups, topological rings, topological modules is pseudo-discrete if the topology on $\mathcal{F}(U)$ is discrete for every quasi-compact open $U \subset X$. Then the construction given above is an adjoint to the forgetful functor and induces an equivalence between the category of sheaves of sets and the category of pseudo-discrete sheaves of topological spaces (similarly for groups, rings, modules).
Grothendieck and Dieudonné first define formal affine schemes. These correspond to admissible topological rings $A$, see More on Algebra, Definition 15.28.1. Namely, given $A$ one considers a fundamental system $I_{\lambda}$ of ideals of definition for the ring $A$. (In any admissible topological ring the family of all ideals of definition forms a fundamental system.) For each $\lambda$ we can consider the scheme $\operatorname{Spec}\left(A / I_{\lambda}\right)$. For $I_{\lambda} \subset I_{\mu}$ the induced morphism

$$
\operatorname{Spec}\left(A / I_{\mu}\right) \rightarrow \operatorname{Spec}\left(A / I_{\lambda}\right)
$$

is a thickening because $I_{\mu}^{n} \subset I_{\lambda}$ for some $n$. Another way to see this, is to notice that the image of each of the maps

$$
\operatorname{Spec}\left(A / I_{\lambda}\right) \rightarrow \operatorname{Spec}(A)
$$

is a homeomorphism onto the set of open prime ideals of $A$. This motivates the definition

$$
\operatorname{Spf}(A)=\{\text { open prime ideals } \mathfrak{p} \subset A\}
$$

endowed with the topology coming from $\operatorname{Spec}(A)$. For each $\lambda$ we can consider the structure sheaf $\mathcal{O}_{\operatorname{Spec}\left(A / I_{\lambda}\right)}$ as a sheaf on $\operatorname{Spf}(A)$. Let $\mathcal{O}_{\lambda}$ be the corresponding pseudo-discrete sheaf of topological rings, see above. Then we set

$$
\mathcal{O}_{\operatorname{Spf}(A)}=\lim \mathcal{O}_{\lambda}
$$

where the limit is taken in the category of sheaves of topological rings. The pair $\left(\operatorname{Spf}(A), \mathcal{O}_{\operatorname{Spf}(A)}\right)$ is called the formal spectrum of $A$.
At this point one should check several things. The first is that the stalks $\mathcal{O}_{\operatorname{Spf}(A), x}$ are local rings (forgetting about the topology). The second is that given $f \in A$, for the corresponding open $D(f) \cap \operatorname{Spf}(A)$ we have

$$
\Gamma\left(D(f) \cap \operatorname{Spf}(A), \mathcal{O}_{\operatorname{Spf}(A)}\right)=A_{\{f\}}=\lim \left(A / I_{\lambda}\right)_{f}
$$

as topological rings where $I_{\lambda}$ is a fundamental system of ideals of definition as above. Moreover, the ring $A_{\{f\}}$ is admissible too and $\left(\operatorname{Spf}\left(A_{f}\right), \mathcal{O}_{\operatorname{Spf}\left(A_{\{f\}}\right)}\right)$ is isomorphic to $\left(D(f) \cap \operatorname{Spf}(A),\left.\mathcal{O}_{\operatorname{Spf}(A)}\right|_{D(f) \cap \operatorname{Spf}(A)}\right)$. Finally, given a pair of admissible topological rings $A, B$ we have
0AHZ (70.2.0.1) $\quad \operatorname{Mor}_{L T R S}\left(\left(\operatorname{Spf}(B), \mathcal{O}_{\operatorname{Spf}(B)}\right),\left(\operatorname{Spf}(A), \mathcal{O}_{\operatorname{Spf}(A)}\right)\right)=\operatorname{Hom}_{\text {cont }}(A, B)$
where LTRS is the category of "locally topologically ringed spaces" as defined above.

Having said this, in DG67 a formal scheme is defined as a pair $\left(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}\right)$ where $\mathfrak{X}$ is a topological space and $\mathcal{O}_{\mathfrak{X}}$ is a sheaf of topological rings such that every point has an open neighbourhood isomorphic (in $L T R S$ ) to an affine formal scheme. A morphism of formal schemes $f:\left(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}\right) \rightarrow\left(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y}}\right)$ is a morphism in the category LTRS.

Let $A$ be a ring endowed with the discrete topology. Then $A$ is admissible and the formal scheme $\operatorname{Spf}(A)$ is equal to $\operatorname{Spec}(A)$. The structure sheaf $\mathcal{O}_{\operatorname{Spf}(A)}$ is the pseudo-discrete sheaf of topological rings associated to $\mathcal{O}_{\operatorname{Spec}(A)}$, in other words, its underlying sheaf of rings is equal to $\mathcal{O}_{\operatorname{Spec}(A)}$ and the ring $\mathcal{O}_{\operatorname{Spf}(A)}(U)=\mathcal{O}_{\operatorname{Spec}(A)}(U)$ over a quasi-compact open $U$ has the discrete topology, but not in general. Thus we can associate to every affine scheme a formal affine scheme. In exactly the same manner we can start with a general scheme $\left(X, \mathcal{O}_{X}\right)$ and associate to it $\left(X, \mathcal{O}_{X}^{\prime}\right)$ where $\mathcal{O}_{X}^{\prime}$ is the pseudo-discrete sheaf of topological rings whose underlying sheaf of rings is $\mathcal{O}_{X}$. This construction is compatible with morphisms and defines a functor

0AI0 (70.2.0.2)
It follows in a straightforward manner from (70.2.0.1 that this functor is fully faithful.

Let $\mathfrak{X}$ be a formal scheme. Let us define the size of the formal scheme by the formula $\operatorname{size}(\mathfrak{X})=\max \left(\aleph_{0}, \kappa_{1}, \kappa_{2}\right)$ where $\kappa_{1}$ is the cardinality of the formal affine opens of $\mathfrak{X}$ and $\kappa_{2}$ is the supremum of the cardinalities of $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ where $\mathfrak{U} \subset \mathfrak{X}$ is such a formal affine open.

0AI1 Lemma 70.2.1. Choose a category of schemes $S c h_{\alpha}$ as in Sets, Lemma 3.9.2. Given a formal scheme $\mathfrak{X}$ let

$$
h_{\mathfrak{X}}:\left(S c h_{\alpha}\right)^{\text {opp }} \longrightarrow \text { Sets, } \quad h_{\mathfrak{X}}(S)=\operatorname{Mor}_{\text {Formal Schemes }}(S, \mathfrak{X})
$$

be its functor of points. Then we have

$$
\operatorname{Mor}_{\text {Formal Schemes }}(\mathfrak{X}, \mathfrak{Y})=\operatorname{Mor}_{P S h\left(S c h_{\alpha}\right)}\left(h_{\mathfrak{X}}, h_{\mathfrak{Y}}\right)
$$

provided the size of $\mathfrak{X}$ is not too large.
Proof. First we observe that $h_{\mathfrak{X}}$ satisfies the sheaf property for the Zariski topology for any formal scheme $\mathfrak{X}$ (see Schemes, Definition 25.15.3). This follows from the local nature of morphisms in the category of formal schemes. Also, for an open immersion $\mathfrak{V} \rightarrow \mathfrak{W}$ of formal schemes, the corresponding transformation of functors $h_{\mathfrak{V}} \rightarrow h_{\mathfrak{W}}$ is injective and representable by open immersions (see Schemes, Definition 25.15.3. Choose an open covering $\mathfrak{X}=\bigcup \mathfrak{U}_{i}$ of a formal scheme by affine formal schemes $\mathfrak{U}_{i}$. Then the collection of functors $h_{\mathfrak{U}_{i}}$ covers $h_{\mathfrak{X}}$ (see Schemes, Definition 25.15.3. Finally, note that

$$
h_{\mathfrak{U}_{i}} \times_{h_{\mathfrak{X}}} h_{\mathfrak{U}_{j}}=h_{\mathfrak{U}_{i} \cap \mathfrak{U}_{j}}
$$

Hence in order to give a map $h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ is equivalent to giving a family of maps $h_{\mathfrak{U}_{i}} \rightarrow h_{\mathfrak{Y}}$ which agree on overlaps. Thus we can reduce the bijectivity (resp. injectivity) of the map of the lemma to bijectivity (resp. injectivity) for the pairs $\left(\mathfrak{U}_{i}, \mathfrak{Y}\right)$ and injectivity (resp. nothing) for $\left(\mathfrak{U}_{i} \cap \mathfrak{U}_{j}, \mathfrak{Y}\right)$. In this way we reduce to the case where $\mathfrak{X}$ is an affine formal scheme. Say $\mathfrak{X}=\operatorname{Spf}(A)$ for some admissible topological ring $A$. Also, choose a fundamental system of ideals of definition $I_{\lambda} \subset A$.

We can also localize on $\mathfrak{Y}$. Namely, suppose that $\mathfrak{V} \subset \mathfrak{Y}$ is an open formal subscheme and $\varphi: h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$. Then

$$
h_{\mathfrak{V}} \times_{h_{\mathfrak{Y}}, \varphi} h_{\mathfrak{X}} \rightarrow h_{\mathfrak{X}}
$$

is representable by open immersions. Pulling back to $\operatorname{Spec}\left(A / I_{\lambda}\right)$ for all $\lambda$ we find an open subscheme $U_{\lambda} \subset \operatorname{Spec}\left(A / I_{\lambda}\right)$. However, for $I_{\lambda} \subset I_{\mu}$ the morphism $\operatorname{Spec}\left(A / I_{\lambda}\right) \rightarrow \operatorname{Spec}\left(A / I_{\mu}\right)$ pulls back $U_{\mu}$ to $U_{\lambda}$. Thus these glue to give an open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$. A straightforward $\operatorname{argument}$ (omitted) shows that

$$
h_{\mathfrak{U}}=h_{\mathfrak{V}} \times_{h_{\mathfrak{Y}}} h_{\mathfrak{X}}
$$

In this way we see that given an open covering $\mathfrak{Y}=\bigcup \mathfrak{V}_{j}$ and a transformation of functors $\varphi: h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ we obtain a corresponding open covering of $\mathfrak{X}$. Since $\mathfrak{X}$ is affine, we can refine this covering by a finite open covering $\mathfrak{X}=\mathfrak{U}_{1} \cup \ldots \cup \mathfrak{U}_{n}$ by affine formal subschemes. In other words, for each $i$ there is a $j$ and a map $\varphi_{i}: h_{\mathfrak{U}_{i}} \rightarrow h_{\mathfrak{V}_{j}}$ such that

commutes. With a few additional arguments (which we omit) this implies that it suffices to prove the bijectivity of the lemma in case both $\mathfrak{X}$ and $\mathfrak{Y}$ are affine formal schemes.

Assume $\mathfrak{X}$ and $\mathfrak{Y}$ are affine formal schemes. Say $\mathfrak{X}=\operatorname{Spf}(A)$ and $\mathfrak{Y}=\operatorname{Spf}(B)$. Let $\varphi: h_{\mathfrak{X}} \rightarrow h_{\mathfrak{Y}}$ be a transformation of functors. Let $I_{\lambda} \subset A$ be a fundamental system of ideals of definition. The canonical inclusion morphism $i_{\lambda}: \operatorname{Spec}\left(A / I_{\lambda}\right) \rightarrow \mathfrak{X}$ maps to a morphism $\varphi\left(i_{\lambda}\right): \operatorname{Spec}\left(A / I_{\lambda}\right) \rightarrow \mathfrak{Y}$. By 70.2 .0 .1 this corresponds to a continuous map $\chi_{\lambda}: B \rightarrow A / I_{\lambda}$. Since $\varphi$ is a transformation of functors it follows that for $I_{\lambda} \subset I_{\mu}$ the composition $B \rightarrow A / I_{\lambda} \rightarrow A / I_{\mu}$ is equal to $\chi_{\mu}$. In other words we obtain a ring map

$$
\chi=\lim \chi_{\lambda}: B \longrightarrow \lim A / I_{\lambda}=A
$$

This is a continuous homomorphism because the inverse image of $I_{\lambda}$ is open for all $\lambda$ (as $A / I_{\lambda}$ has the discrete topology and $\chi_{\lambda}$ is continuous). Thus we obtain a morphism $\operatorname{Spf}(\chi): \mathfrak{X} \rightarrow \mathfrak{Y}$ by 70.2.0.1. We omit the verification that this construction is the inverse to the map of the lemma in this case.

Set theoretic remarks. To make this work on the given category of schemes $S_{c h}$ we just have to make sure all the schemes used in the proof above are isomorphic to objects of $S c h_{\alpha}$. In fact, a careful analysis shows that it suffices if the schemes $\operatorname{Spec}\left(A / I_{\lambda}\right)$ occurring above are isomorphic to objects of $S c h_{\alpha}$. For this it certainly suffices to assume the size of $\mathfrak{X}$ is at most the size of a scheme contained in $S c h_{\alpha}$.

0AI2 Lemma 70.2.2. Let $\mathfrak{X}$ be a formal scheme. The functor of points $h_{\mathfrak{X}}$ (see Lemma 70.2.1) satisfies the sheaf condition for fpqc coverings.

Proof. Topologies, Lemma 33.8.13 reduces us to the case of a Zariski covering and a covering $\{\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)\}$ with $R \rightarrow S$ faithfully flat. We observed in the proof of Lemma 70.2 .1 that $h_{\mathfrak{X}}$ satisfies the sheaf condition for Zariski coverings.

Suppose that $R \rightarrow S$ is a faithfully flat ring map. Denote $\pi: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ the corresponding morphism of schemes. It is surjective and flat. Let $f: \operatorname{Spec}(S) \rightarrow$ $\mathfrak{X}$ be a morphism such that $f \circ \operatorname{pr}_{1}=f \circ \operatorname{pr}_{2}$ as maps $\operatorname{Spec}\left(S \otimes_{R} S\right) \rightarrow \mathfrak{X}$. By Descent, Lemma 34.9.1 we see that as a map on the underlying sets $f$ is of the form $f=g \circ \pi$ for some (set theoretic) map $g: \operatorname{Spec}(R) \rightarrow \mathfrak{X}$. By Morphisms, Lemma 28.25.10 and the fact that $f$ is continuous we see that $g$ is continuous.

Pick $y \in \operatorname{Spec}(R)$. Choose $\mathfrak{U} \subset \mathfrak{X}$ an affine formal open subscheme containing $g(y)$. Say $\mathfrak{U}=\operatorname{Spf}(A)$ for some admissible topological ring $A$. By the above we may choose an $r \in R$ such that $x \in D(r) \subset g^{-1}(\mathfrak{U})$. The restriction of $f$ to $\pi^{-1}(D(r))$ into $\mathfrak{U}$ corresponds to a continuous ring map $A \rightarrow S_{r}$ by (70.2.0.1). The two induced ring maps $A \rightarrow S_{r} \otimes_{R_{r}} S_{r}=\left(S \otimes_{R} S\right)_{r}$ are equal by assumption on $f$. Note that $R_{r} \rightarrow S_{r}$ is faithfully flat. By Descent, Lemma 34.3.6 the equalizer of the two arrows $S_{r} \rightarrow S_{r} \otimes_{R_{r}} S_{r}$ is $R_{r}$. We conclude that $A \rightarrow S_{r}$ factors uniquely through a map $A \rightarrow R_{r}$ which is also continuous as it has the same (open) kernel as the $\operatorname{map} A \rightarrow S_{r}$. This map in turn gives a morphism $D(r) \rightarrow \mathfrak{U}$ by 70.2.0.1).
What have we proved so far? We have shown that for any $y \in \operatorname{Spec}(R)$ there exists a standard affine open $y \in D(r) \subset \operatorname{Spec}(R)$ such that the morphism $\left.f\right|_{\pi^{-1}(D(r))}$ : $\pi^{-1}(D(r)) \rightarrow \mathfrak{X}$ factors uniquely though some morphism $D(r) \rightarrow \mathfrak{X}$. We omit the verification that these morphisms glue to the desired morphism $\operatorname{Spec}(R) \rightarrow \mathfrak{X}$.

0AI3 Remark 70.2.3 (McQuillan's variant). There is a variant of the construction of formal schemes due to McQuillan, see McQ02. He suggests a slight weakening of the condition of admissibility. Namely, recall that an admissible topological ring is a complete (and separated by our conventions) topological ring $A$ which is linearly topologized such that there exists an ideal of definition: an open ideal $I$ such that any neighbourhood of 0 contains $I^{n}$. McQuillan works with what we will call weakly admissible topological rings. A weakly admissible topological ring $A$ is a complete (and separated by our conventions) topological ring which is linearly topologized such that there exists an weak ideal of definition: an open ideal $I$ such that for all $f \in I$ we have $f^{n} \rightarrow 0$ for $n \rightarrow \infty$. Similarly to the admissible case, if $I$ is a weak ideal of definition and $J \subset A$ is an open ideal, then $I \cap J$ is a weak ideal of definition. Thus the weak ideals of definition form a fundamental system of open neighbourhoods of 0 and one can proceed along much the same route as above to define a larger category of formal schemes based on this notion. The analogues of Lemmas 70.2 .1 and 70.2 .2 still hold in this setting (with the same proof).

0AI4 Remark 70.2.4 (Sheafification of presheaves of topological spaces). In this remark we briefly discuss sheafification of presheaves of topological spaces. The exact same arguments work for presheaves of topological abelian groups, topological rings, and topological modules (over a given topological ring). In order to do this in the correct generality let us work over a site $\mathcal{C}$. The reader who is interested in the case of (pre)sheaves over a topological space $X$ should think of objects of $\mathcal{C}$ as the opens of $X$, of morphisms of $\mathcal{C}$ as inclusions of opens, and of coverings in $\mathcal{C}$ as coverings in $X$, see Sites, Example 7.6.4. Denote $S h(\mathcal{C}, T o p)$ the category of sheaves of topological spaces on $\mathcal{C}$ and denote $\operatorname{PSh}(\mathcal{C}, T o p)$ the category of presheaves of topological spaces on $\mathcal{C}$. Let $\mathcal{F}$ be a presheaf of topological spaces on $\mathcal{C}$. The sheafification $\mathcal{F}^{\#}$ should satisfy the formula

$$
\operatorname{Mor}_{P S h(\mathcal{C}, T o p)}(\mathcal{F}, \mathcal{G})=\operatorname{Mor}_{S h(\mathcal{C}, T o p)}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

functorially in $\mathcal{G}$ from $\operatorname{Sh}(\mathcal{C}, T o p)$. In other words, we are trying to construct the left adjoint to the inclusion functor $\operatorname{Sh}(\mathcal{C}, T o p) \rightarrow \operatorname{PSh}(\mathcal{C}, T o p)$. We first claim that $S h(\mathcal{C}, T o p)$ has limits and that the inclusion functor commutes with them. Namely, given a category $\mathcal{I}$ and a functor $i \mapsto \mathcal{G}_{i}$ into $\operatorname{Sh}(\mathcal{C}, T o p)$ we simply define

$$
\left(\lim \mathcal{G}_{i}\right)(U)=\lim \mathcal{G}_{i}(U)
$$

where we take the limit in the category of topological spaces (Topology, Lemma 5.13.1). This defines a sheaf because limits commute with limits (Categories, Lemma 4.14.9) and in particular products and equalizers (which are the operations used in the sheaf axiom). Finally, a morphism of presheaves from $\mathcal{F} \rightarrow \lim \mathcal{G}_{i}$ is clearly the same thing as a compatible system of morphisms $\mathcal{F} \rightarrow \mathcal{G}_{i}$. In other words, the object $\lim \mathcal{G}_{i}$ is the limit in the category of presheaves of topological spaces and a fortiori in the category of sheaves of topological spaces. Our second claim is that any morphism of presheaves $\mathcal{F} \rightarrow \mathcal{G}$ with $\mathcal{G}$ an object of $\operatorname{Sh}(\mathcal{C}, T o p)$ factors through a subsheaf $\mathcal{G}^{\prime} \subset \mathcal{G}$ whose size is bounded. Here we define the size $|\mathcal{H}|$ of a sheaf of topological spaces $\mathcal{H}$ to be the cardinal $\sup _{U \in \operatorname{Ob}(\mathcal{C})}|\mathcal{H}(U)|$. To prove our claim we let

$$
\mathcal{G}^{\prime}(U)=\left\{\begin{array}{l|l}
s \in \mathcal{G}(U) & \begin{array}{l}
\text { there exists a covering }\left\{U_{i} \rightarrow U\right\}_{i \in I} \\
\text { such that }\left.s\right|_{U_{i}} \in \operatorname{Im}\left(\mathcal{F}\left(U_{i}\right) \rightarrow \mathcal{G}\left(U_{i}\right)\right)
\end{array}
\end{array}\right\}
$$

We endow $\mathcal{G}^{\prime}(U)$ with the induced topology. Then $\mathcal{G}^{\prime}$ is a sheaf of topological spaces (details omitted) and $\mathcal{G}^{\prime} \rightarrow \mathcal{G}$ is a morphism through which the given map $\mathcal{F} \rightarrow \mathcal{G}$ factors. Moreover, the size of $\mathcal{G}^{\prime}$ is bounded by some cardinal $\kappa$ depending only on $\mathcal{C}$ and the presheaf $\mathcal{F}$ (hint: use that coverings in $\mathcal{C}$ form a set by our conventions). Putting everything together we see that the assumptions of Categories, Theorem 4.25 .3 are satisfied and we obtain sheafification as the left adjoint of the inclusion functor from sheaves to presheaves. Finally, let $p$ be a point of the site $\mathcal{C}$ given by a functor $u: \mathcal{C} \rightarrow$ Sets, see Sites, Definition 7.31.2. For a topological space $M$ the presheaf defined by the rule

$$
U \mapsto \operatorname{Map}(u(U), M)=\prod_{x \in u(U)} M
$$

endowed with the product topology is a sheaf of topological spaces. Hence the exact same argument as given in the proof of Sites, Lemma 7.31.5 shows that $\mathcal{F}_{p}=\mathcal{F}_{p}^{\#}$, in other words, sheafification commutes with taking stalks at a point.

### 70.3. Conventions and notation

0AI5 The conventions from now on will be similar to the conventions in Properties of Spaces, Section 53.2. Thus from now on the standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site. For topological rings $A$ we assume only that all discrete quotients have this property (but usually we assume more, compare with Remark 70.7.6).

Let $S$ be a scheme and let $X$ be a "space" over $S$, i.e., a sheaf on $(S c h / S)_{f p p f}$. In this chapter we will write $X \times_{S} X$ for the product of $X$ with itself in the category of sheaves on $(S c h / S)_{f p p f}$ instead of $X \times X$. Moreover, if $X$ and $Y$ are "spaces" then we say "let $f: X \rightarrow Y$ be a morphism" to indicate that $f$ is a natural transformation of functors, i.e., a map of sheaves on $(S c h / S)_{f p p f}$. Similarly, if $U$ is a scheme over $S$ and $X$ is a "space" over $S$, then we say "let $f: U \rightarrow X$ be a
morphism" or "let $g: X \rightarrow U$ be a morphism" to indicate that $f$ or $g$ is a map of sheaves $h_{U} \rightarrow X$ or $X \rightarrow h_{U}$ where $h_{U}$ is as in Categories, Example 4.3.4.

### 70.4. Topological rings and modules

$0 A M Q$ This section is a continuation of More on Algebra, Section 15.28. Let $R$ be a topological ring and let $M$ be a linearly topologized $R$-module. When we say "let $M_{\lambda}$ be a fundamental system of open submodules" we will mean that each $M_{\lambda}$ is an open submodule and that any neighbourhood of 0 contains one of the $M_{\lambda}$. In other words, this means that $M_{\lambda}$ is a fundamental system of neighbourhoods of 0 in $M$ consisting of submodules. Similarly, if $R$ is a linearly topologized ring, then we say "let $I_{\lambda}$ be a fundamental system of open ideals" to mean that $I_{\lambda}$ is a fundamental system of neighbourhoods of 0 in $R$ consisting of ideals.

0AMR Example 70.4.1. Let $R$ be a linearly topologized ring and let $M$ be a linearly topologized $A$-module. Let $I_{\lambda}$ be a fundamental system of open ideals in $R$ and let $M_{\mu}$ be a fundamental system of open submodules of $M$. The continuity of $+: M \times M \rightarrow M$ is automatic and the continuity of $R \times M \rightarrow M$ signifies

$$
\forall f, x, \mu \exists \lambda, \nu,\left(f+I_{\lambda}\right)\left(x+M_{\nu}\right) \subset f x+M_{\mu}
$$

Since $f M_{\nu}+I_{\lambda} M_{\nu} \subset M_{\mu}$ if $M_{\nu} \subset M_{\mu}$ we see that the condition is equivalent to

$$
\forall x, \mu \exists \lambda I_{\lambda} x \subset M_{\mu}
$$

However, it need not be the case that given $\mu$ there is a $\lambda$ such that $I_{\lambda} M \subset M_{\mu}$. For example, consider $R=k[[t]]$ with the $t$-adic topology and $M=\bigoplus_{n \in \mathbf{N}} R$ with fundamental system of open submodules given by

$$
M_{m}=\bigoplus_{n \in \mathbf{N}} t^{n m} R
$$

Since every $x \in M$ has finitely many nonzero coordinates we see that, given $m$ and $x$ there exists a $k$ such that $t^{k} x \in M_{m}$. Thus $M$ is a linearly topologized $R$-module, but it isn't true that given $m$ there is a $k$ such that $t^{k} M \subset M_{m}$. On the other hand, if $R \rightarrow S$ is a continuous map of linearly topologized rings, then the corresponding statement does hold, i.e., for every open ideal $J \subset S$ there exists an open ideal $I \subset R$ such that $I S \subset J$ (as the reader can easily deduce from continuity of the $\operatorname{map} R \rightarrow S$ ).

0AMS Lemma 70.4.2. Let $R$ be a topological ring. Let $M$ be a linearly topologized $R$-module and let $M_{\lambda}, \lambda \in \Lambda$ be a fundamental system of open submodules. Let $N \subset M$ be a submodule. The closure of $N$ is $\bigcap_{\lambda \in \Lambda}\left(N+M_{\lambda}\right)$.

Proof. Since each $N+M_{\lambda}$ is open, it is also closed. Hence the intersection is closed. If $x \in M$ is not in the closure of $N$, then $\left(x+M_{\lambda}\right) \cap N=0$ for some $\lambda$. Hence $x \notin N+M_{\lambda}$. This proves the lemma.

Unless otherwise mentioned we endow submodules and quotient modules with the induced topology. Let $M$ be a linearly topologized module over a topological ring $R$, and let $0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0$ is a short exact sequence of $R$-modules. If $M_{\lambda}$ is a fundamental system of open submodules of $M$, then $N \cap M_{\lambda}$ is a fundamental system of open submodules of $N$. If $\pi: M \rightarrow Q$ is the quotient map, then $\pi\left(M_{\lambda}\right)$ is a fundamental system of open submodules of $Q$. In particular these induced topologies are linear topologies.

0ARZ Lemma 70.4.3. Let $R$ be a topological ring. Let $M$ be a linearly topologized $R$-module. Let $N \subset M$ be a submodule. Then
(1) $0 \rightarrow N^{\wedge} \rightarrow M^{\wedge} \rightarrow(M / N)^{\wedge}$ is exact, and
(2) $N^{\wedge}$ is the closure of the image of $N \rightarrow M^{\wedge}$.

Proof. Let $M_{\lambda}, \lambda \in \Lambda$ be a fundamental system of open submodules. Then $N \cap M_{\lambda}$ is a fundamental system of open submodules of $N$ and $M_{\lambda}+N / N$ is a fundamental system of open submodules of $M / N$. Thus we see that (1) follows from the exactness of the sequences

$$
0 \rightarrow N / N \cap M_{\lambda} \rightarrow M / M_{\lambda} \rightarrow M /\left(M_{\lambda}+N\right) \rightarrow 0
$$

and the fact that taking limits commutes with limits. The second statement follows from this and the fact that $N \rightarrow N^{\wedge}$ has dense image and that the kernel of $M^{\wedge} \rightarrow(M / N)^{\wedge}$ is closed.

0AMT Lemma 70.4.4. Let $R$ be a topological ring. Let $M$ be a complete, linearly topologized $R$-module. Let $N \subset M$ be a closed submodule. If $M$ has a countable fundamental system of neighbourhoods of 0 , then $M / N$ is complete and the map $M \rightarrow M / N$ is open.

Proof. Let $M_{n}, n \in \mathbf{N}$ be a fundamental system of open submodules of $M$. We may assume $M_{n+1} \subset M_{n}$ for all $n$. The $\left(M_{n}+N\right) / N$ is a fundamental system in $M / N$. Hence we have to show that $M / N=\lim M /\left(M_{n}+N\right)$. Consider the short exact sequences

$$
0 \rightarrow N / N \cap M_{n} \rightarrow M / M_{n} \rightarrow M /\left(M_{n}+N\right) \rightarrow 0
$$

Since the transition maps of the system $\left\{N / N \cap M_{n}\right\}$ are surjective we see that $M=\lim M / M_{n}($ by completeness of $M)$ surjects onto $\lim M /\left(M_{n}+N\right)$ by Algebra, Lemma 10.85.4 As $N$ is closed we see that the kernel of $M \rightarrow \lim M /\left(M_{n}+N\right)$ is $N$ (see Lemma 70.4.2). Finally, $M \rightarrow M / N$ is open by definition of the quotient topology.

0AS0 Lemma 70.4.5. Let $R$ be a topological ring. Let $M$ be a linearly topologized $R$ module. Let $N \subset M$ be a submodule. Assume $M$ has a countable fundamental system of neighbourhoods of 0 . Then
(1) $0 \rightarrow N^{\wedge} \rightarrow M^{\wedge} \rightarrow(M / N)^{\wedge} \rightarrow 0$ is exact,
(2) $N^{\wedge}$ is the closure of the image of $N \rightarrow M^{\wedge}$,
(3) $M^{\wedge} \rightarrow(M / N)^{\wedge}$ is open.

Proof. We have $0 \rightarrow N^{\wedge} \rightarrow M^{\wedge} \rightarrow(M / N)^{\wedge}$ is exact and statement (2) by Lemma 70.4.3. This produces a canonical map $c: M^{\wedge} / N^{\wedge} \rightarrow(M / N)^{\wedge}$. The module $M^{\wedge} / N^{\wedge}$ is complete and $M^{\wedge} \rightarrow M^{\wedge} / N^{\wedge}$ is open by Lemma 70.4.4. By the universal property of completion we obtain a canonical map $b:(M / N)^{\wedge} \rightarrow M^{\wedge} / N^{\wedge}$. Then $b$ and $c$ are mutually inverse as they are on a dense subset.

0AMU Definition 70.4.6. Let $R$ be a topological ring. Let $M$ and $N$ be linearly topologized $R$-modules. The tensor product of $M$ and $N$ is the (usual) tensor product $M \otimes_{R} N$ endowed with the linear topology defined by declaring

$$
\operatorname{Im}\left(M_{\mu} \otimes_{R} N+M \otimes_{R} N_{\nu} \longrightarrow M \otimes_{R} N\right)
$$

to be a fundamental system of open submodules, where $M_{\mu} \subset M$ and $N_{\nu} \subset N$ run through fundamental systems of open submodules in $M$ and $N$. The completed tensor product

$$
M \widehat{\otimes}_{R} N=\lim M \otimes_{R} N /\left(M_{\mu} \otimes_{R} N+M \otimes_{R} N_{\nu}\right)=\lim M / M_{\mu} \otimes_{R} N / N_{\nu}
$$

is the completion of the tensor product.
Observe that the topology on $R$ is immaterial for the construction of the tensor product or the completed tensor product. If $R \rightarrow A$ and $R \rightarrow B$ are continuous maps of linearly topologized rings, then the construction above gives a tensor product $A \otimes_{R} B$ and a completed tensor product $A \widehat{\otimes}_{R} B$.
We record here the notions introduced in Remark 70.2.3.
0AMV Definition 70.4.7. Let $A$ be a linearly topologized ring.
(1) An element $f \in A$ is called topologically nilpotent if $f^{n} \rightarrow 0$ as $n \rightarrow \infty$.
(2) A weak ideal of definition for $A$ is an open ideal $I \subset A$ consisting entirely of topologically nilpotent elements.
(3) We say $A$ is weakly pre-admissible if $A$ has a weak ideal of definition.
(4) We say $A$ is weakly admissible if $A$ is weakly pre-admissible and complet $\mathcal{~}^{1}$.

Given a weak ideal of definition $I$ in a linearly topologized ring $A$ and an open ideal $J$ the intersection $I \cap J$ is a weak ideal of definition. Hence if there is one weak ideal of definition, then there is a fundamental system of open ideals consisting of weak ideals of definition. In particular, given a weakly admissible topological ring $A$ then $A=\lim A / I_{\lambda}$ where $\left\{I_{\lambda}\right\}$ is a fundamental system of weak ideals of definition.

0AMW Lemma 70.4.8. Let $\varphi: A \rightarrow B$ be a continuous map of linearly topologized rings.
(1) If $f \in A$ is topologically nilpotent, then $\varphi(f)$ is topologically nilpotent.
(2) If $I \subset A$ consists of topologically nilpotent elements, then the closure of $\varphi(I) B$ consists of topologically nilpotent elements.

Proof. Part (1) is clear. Let $g$ be an element of the closure of $\varphi(I) B$. Let $J \subset B$ be an open ideal. We have to show $g^{e} \in J$ for some $e$. We have $g \in \varphi(I) B+J$ by Lemma 70.4.2. Hence $g=\sum_{i=1, \ldots, n} f_{i} b_{i}+h$ for some $f_{i} \in I, b_{i} \in B$ and $h \in J$. Pick $e_{i}$ such that $\varphi\left(f_{i}^{e_{i}}\right) \in J$. Then $g^{e_{1}+\ldots+e_{n}+1} \in J$.

0AMX Definition 70.4.9. Let $\varphi: A \rightarrow B$ be a continuous map of linearly topologized rings. We say $\varphi$ is $t a u t^{2}$ if for every open ideal $I \subset A$ the closure of the ideal $\varphi(I) B$ is open and these closures form a fundamental system of open ideals.

If $\varphi: A \rightarrow B$ is a continuous map of linearly topologized rings and $I_{\lambda}$ a fundamental system of open ideals of $A$, then $\varphi$ is taut if and only if the closures of $I_{\lambda} B$ are open and form a fundamental system of open ideals in $A$.
0AMY Lemma 70.4.10. Let $\varphi: A \rightarrow B$ be a continuous map of weakly admissible topological rings. The following are equivalent
(1) $\varphi$ is taut,

[^187](2) for every weak ideal of definition $I \subset A$ the closure of $\varphi(I) B$ is a weak ideal of definition of $B$ and these form a fundamental system of weak ideals of definition of $B$.
Proof. It is clear that (2) implies (1). The other implication follows from Lemma 70.4.8.

0AMZ Lemma 70.4.11. Let $A \rightarrow B$ be a continuous map of linearly topologized rings. Let $I \subset A$ be an ideal. The closure of $I B$ is the kernel of $B \rightarrow B \widehat{\otimes}_{A} A / I$.
Proof. Let $J_{\mu}$ be a fundamental system of open ideals of $B$. The closure of $I B$ is $\bigcap\left(I B+J_{\lambda}\right)$ by Lemma 70.4.2. Let $I_{\mu}$ be a fundamental system of open ideals in $A$. Then

$$
B \widehat{\otimes}_{A} A / I=\lim \left(B / J_{\lambda} \otimes_{A} A /\left(I_{\mu}+I\right)\right)=\lim B /\left(J_{\lambda}+I_{\mu} B+I B\right)
$$

Since $A \rightarrow B$ is continuous, for every $\lambda$ there is a $\mu$ such that $I_{\mu} B \subset J_{\lambda}$, see discussion in Example 70.4.1. Hence the limit can be written as $\lim B /\left(J_{\lambda}+I B\right)$ and the result is clear.

0APT Lemma 70.4.12. Let $\varphi: A \rightarrow B$ be a continuous homomorphism of linearly topologized rings. If
(1) $\varphi$ is taut,
(2) $\varphi$ has dense image,
(3) $A$ is complete,
(4) $B$ is separated, and
(5) A has a countable fundamental system of neighbourhoods of 0.

Then $\varphi$ is surjective and open, $B$ is complete, and $B=A / K$ for some closed ideal $K \subset A$.

Proof. We may choose a sequence of open ideals $A \supset I_{1} \supset I_{2} \supset I_{3} \supset \ldots$ which form a fundamental system of neighbourhoods of 0 . For each $i$ let $J_{i} \subset B$ be the closure of $\varphi\left(I_{i}\right) B$. As $\varphi$ is taut we see that these form a fundamental system of open ideals of $B$. Set $I_{0}=A$ and $J_{0}=B$. Let $n \geq 0$ and let $y_{n} \in J_{n}$. Since $J_{n+1}$ is the closure of $\varphi\left(I_{n}\right) B$ we can write

$$
y_{n}=\sum_{t} \varphi\left(f_{t}\right) b_{t}+y_{n+1}^{\prime}
$$

for some $f_{t} \in I_{n}, b_{t} \in B$, and $y_{n+1}^{\prime} \in J_{n+1}$. Since $\varphi$ has dense image we can choose $a_{t} \in A$ with $\varphi\left(a_{t}\right)=b_{t} \bmod J_{n+1}$. Thus

$$
y_{n}=\varphi\left(f_{n}\right)+y_{n+1}
$$

with $f_{n}=\sum f_{t} a_{t} \in I_{n}$ and $y_{n+1}=y_{n+1}^{\prime}+\sum f_{t}\left(b_{t}-\varphi\left(a_{t}\right)\right) \in J_{n+1}$. Thus, starting with any $y=y_{0} \in B$, we can find by induction a sequence $f_{m} \in I_{m}, m \geq 0$ such that

$$
y=y_{0}=\varphi\left(f_{0}+f_{1}+\ldots+f_{n}\right)+y_{n+1}
$$

with $y_{n+1} \in J_{n+1}$. Since $A$ is complete we see that

$$
x=x_{0}=f_{0}+f_{1}+f_{2}+\ldots
$$

exists. Since the partial sums approximate $x$ in $A$, since $\varphi$ is continuous, and since $B$ is separated we find that $\varphi(x)=y$ because above we've shown that the images of the partial sums approximate $y$ in $B$. Thus $\varphi$ is surjective. In exactly the same manner we find that $\varphi\left(I_{n}\right)=J_{n}$ for all $n \geq 1$. This proves the lemma.

The next lemma says " $\varphi$ is taut" if and only if " $\varphi$ is adic" for continuous maps $\varphi: A \rightarrow B$ between adic rings if $A$ has a finitely generated ideal of definition. In some sense the previously introduced notion of tautness for continuous ring maps supersedes the notion of an adic map between adic rings. See also Section 70.17.

0APU Lemma 70.4.13. Let $\varphi: A \rightarrow B$ be a continuous map of linearly topologized rings. Let $I \subset A$ be an ideal. Assume
(1) $I$ is finitely generated,
(2) A has the I-adic topology,
(3) $B$ is complete, and
(4) $\varphi$ is taut.

Then the topology on $B$ is the I-adic topology.
Proof. Let $J_{n}$ be the closure of $\varphi\left(I^{n}\right) B$ in $B$. Since $B$ is complete we have $B=$ $\lim B / J_{n}$. Let $B^{\prime}=\lim B / I^{n} B$ be the $I$-adic completion of $B$. By Algebra, Lemma 10.95 .5 the $I$-adic topology on $B^{\prime}$ is complete and $B^{\prime} / I^{n} B^{\prime}=B / I^{n} B$. Thus the ring map $B^{\prime} \rightarrow B$ is continuous and has dense image as $B^{\prime} \rightarrow B / I^{n} B \rightarrow B / J_{n}$ is surjective for all $n$. Finally, the map $B^{\prime} \rightarrow B$ is taut because $\left(I^{n} B^{\prime}\right) B=I^{n} B$ and $A \rightarrow B$ is taut. By Lemma 70.4 .12 we see that $B^{\prime} \rightarrow B$ is open and surjective which implies the lemma.

### 70.5. Affine formal algebraic spaces

0AI6 In this section we introduce affine formal algebraic spaces. These will in fact be the same as what are called affine formal schemes in $\mathbf{B D}$. However, we will call them affine formal algebraic spaces, in order to prevent confusion with the notion of an affine formal scheme as defined in DG67.

Recall that a thickening of schemes is a closed immersion which induces a surjection on underlying topological spaces, see More on Morphisms, Definition 36.2.1.

0AI7 Definition 70.5.1. Let $S$ be a scheme. We say a sheaf $X$ on $(S c h / S)_{f p p f}$ is an affine formal algebraic space if there exist
(1) a directed partially ordered set $\Lambda$,
(2) a system $\left(X_{\lambda}, f_{\lambda \mu}\right)$ over $\Lambda$ in $(S c h / S)_{f p p f}$ where
(a) each $X_{\lambda}$ is affine,
(b) each $f_{\lambda \mu}: X_{\lambda} \rightarrow X_{\mu}$ is a thickening,
such that

$$
X \cong \operatorname{colim}_{\lambda \in \Lambda} X_{\lambda}
$$

as fppf sheaves and $X$ satisfies a set theoretic condition (see Remark 70.7.6. A morphism of affine formal algebraic spaces over $S$ is a map of sheaves.

Observe that the system $\left(X_{\lambda}, f_{\lambda \mu}\right)$ is not part of the data. Suppose that $U$ is a quasi-compact scheme over $S$. Since the transition maps are monomorphisms, we see that

$$
X(U)=\operatorname{colim} X_{\lambda}(U)
$$

by Sites, Lemma 7.11.2. Thus the fppf sheafification inherent in the colimit of the definition is a Zariski sheafification which does not do anything for quasi-compact schemes.

0AI8 Lemma 70.5.2. Let $S$ be a scheme. If $X$ is an affine formal algebraic space over $S$, then the diagonal morphism $\Delta: X \rightarrow X \times_{S} X$ is representable and a closed immersion.

Proof. Suppose given $U \rightarrow X$ and $V \rightarrow X$ where $U, V$ are schemes over $S$. Let us show that $U \times_{X} V$ is representable. Write $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. The discussion above shows that Zariski locally on $U$ and $V$ the morphisms factors through some $X_{\lambda}$. In this case $U \times_{X} V=U \times_{X_{\lambda}} V$ which is a scheme. Thus the diagonal is representable, see Spaces, Lemma 52.5 .10 . Given $(a, b): W \rightarrow X \times{ }_{S} X$ where $W$ is a scheme over $S$ consider the map $X \times_{\Delta, X \times{ }_{S} X,(a, b)} W \rightarrow W$. As before locally on $W$ the morphisms $a$ and $b$ map into the affine scheme $X_{\lambda}$ for some $\lambda$ and then we get the morphism $X_{\lambda} \times_{\Delta_{\lambda}, X_{\lambda} \times{ }_{S} X_{\lambda},(a, b)} W \rightarrow W$. This is the base change of $\Delta_{\lambda}: X_{\lambda} \rightarrow X_{\lambda} \times_{S} X_{\lambda}$ which is a closed immersion as $X_{\lambda} \rightarrow S$ is separated (because $X_{\lambda}$ is affine). Thus $X \rightarrow X \times_{S} X$ is a closed immersion.

A morphism of schemes $X \rightarrow X^{\prime}$ is a thickening if it is a closed immersion and induces a surjection on underlying sets of points, see (More on Morphisms, Definition 36.2.1. Hence the property of being a thickening is preserved under arbitrary base change and fpqc local on the target, see Spaces, Section 52.4. Thus Spaces, Definition 52.5.1 applies to "thickening" and we know what it means for a representable transformation $F \rightarrow G$ of presheaves on $(S c h / S)_{f p p f}$ to be a thickening. We observe that this does not clash with our definition (More on Morphisms of Spaces, Definition 63.9.1) of thickenings in case $F$ and $G$ are algebraic spaces.

0AI9 Lemma 70.5.3. Let $X_{\lambda}, \lambda \in \Lambda$ and $X=\operatorname{colim} X_{\lambda}$ be as in Definition 70.5.1. Then $X_{\lambda} \rightarrow X$ is representable and a thickening.

Proof. The statement makes sense by the discussion in Spaces, Section 52.3 and 52.5. By Lemma 70.5.2 the morphisms $X_{\lambda} \rightarrow X$ are representable. Given $U \rightarrow X$ where $U$ is a scheme, then the discussion following Definition 70.5.1 shows that Zariski locally on $U$ the morphism factors through some $X_{\mu}$ with $\lambda \leq \mu$. In this case $U \times_{X} X_{\lambda}=U \times_{X_{\mu}} X_{\lambda}$ so that $U \times_{X} X_{\lambda} \rightarrow U$ is a base change of the thickening $X_{\lambda} \rightarrow X_{\mu}$.
0AIA Lemma 70.5.4. Let $X_{\lambda}, \lambda \in \Lambda$ and $X=\operatorname{colim} X_{\lambda}$ be as in Definition 70.5.1. If $Y$ is a quasi-compact algebraic space over $S$, then any morphism $Y \rightarrow X$ factors through an $X_{\lambda}$.

Proof. Choose an affine scheme $V$ and a surjective étale morphism $V \rightarrow Y$. The composition $V \rightarrow Y \rightarrow X$ factors through $X_{\lambda}$ for some $\lambda$ by the discussion following Definition 70.5.1. Since $V \rightarrow Y$ is a surjection of sheaves, we conclude.

0AIB Lemma 70.5.5. Let $S$ be a scheme. Let $X$ be a sheaf on $(S c h / S)_{f p p f}$. Then $X$ is an affine formal algebraic space if and only if the following hold
(1) any morphism $U \rightarrow X$ where $U$ is an affine scheme over $S$ factors through a morphism $T \rightarrow X$ which is representable and a thickening with $T$ an affine scheme over $S$, and
(2) a set theoretic condition as in Remark 70.7.6.

Proof. It follows from Lemmas 70.5 .3 and 70.5 .4 that an affine formal algebraic space satisfies (1) and (2). In order to prove the converse we may assume $X$ is not empty. Let $\Lambda$ be the category of representable morphisms $T \rightarrow X$ which are
thickenings where $T$ is an affine scheme over $S$. This category is directed. Since $X$ is not empty, $\Lambda$ contains at least one object. If $T \rightarrow X$ and $T^{\prime} \rightarrow X$ are in $\Lambda$, then we can factor $T \amalg T^{\prime} \rightarrow X$ through $T^{\prime \prime} \rightarrow X$ in $\Lambda$. Between any two objects of $\Lambda$ there is a unique arrow or none. Thus $\Lambda$ is a directed partially ordered set and by assumption $X=\operatorname{colim}_{T \rightarrow X}$ in $\Lambda T$.
For a general affine formal algebraic space $X$ there is no guarantee that $X$ has enough functions to separate points (for example). See Examples, Section 88.62 , To characterize those that do we offer the following lemma.

0AIC Lemma 70.5.6. Let $S$ be a scheme. Let $X$ be an fppf sheaf on $(S c h / S)_{f p p f}$ which satisfies the set theoretic condition of Remark 70.7.6. The following are equivalent:
(1) there exists a weakly admissible topological ring $A$ over $S$ (see Remark 70.2.3) such that $X=\operatorname{colim}_{I \subset A \text { weak ideal of definition }} \operatorname{Spec}(A / I)$,
(2) $X$ is an affine formal algebraic space and there exists an $S$-algebra $A$ and a map $X \rightarrow \operatorname{Spec}(A)$ such that for a closed immersion $T \rightarrow X$ with $T$ an affine scheme the composition $T \rightarrow \operatorname{Spec}(A)$ is a closed immersion,
(3) $X$ is an affine formal algebraic space and there exists an $S$-algebra $A$ and a map $X \rightarrow \operatorname{Spec}(A)$ such that for a closed immersion $T \rightarrow X$ with $T$ a scheme the composition $T \rightarrow \operatorname{Spec}(A)$ is a closed immersion,
(4) $X$ is an affine formal algebraic space and for some choice of $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1 the projections $\lim \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right) \rightarrow \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right)$ are surjective,
(5) $X$ is an affine formal algebraic space and for any choice of $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1 the projections $\lim \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right) \rightarrow \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right)$ are surjective.
Moreover, the weakly admissible topological ring is $A=\lim \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right)$ endowed with its limit topology and the weak ideals of definition classify exactly the morphisms $T \rightarrow X$ which are representable and thickenings.

Proof. It is clear that (5) implies (4).
Assume (4) for $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. Set $A=\lim \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right)$. Let $T \rightarrow X$ be a closed immersion with $T$ a scheme (note that $T \rightarrow X$ is representable by Lemma 70.5.2). Since $X_{\lambda} \rightarrow X$ is a thickening, so is $X_{\lambda} \times{ }_{X} T \rightarrow T$. On the other hand, $X_{\lambda} \times_{X} T \rightarrow X_{\lambda}$ is a closed immersion, hence $X_{\lambda} \times_{X} T$ is affine. Hence $T$ is affine by Limits, Proposition 31.10.2. Then $T \rightarrow X$ factors through $X_{\lambda}$ for some $\lambda$ by Lemma 70.5.4. Thus $A \rightarrow \Gamma\left(X_{\lambda}, \mathcal{O}\right) \rightarrow \Gamma(T, \mathcal{O})$ is surjective. In this way we see that (3) holds.
It is clear that (3) implies (2).
Assume (2) for $A$ and $X \rightarrow \operatorname{Spec}(A)$. Write $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. Then $A_{\lambda}=\Gamma\left(X_{\lambda}, \mathcal{O}\right)$ is a quotient of $A$ by assumption (2). Hence $A^{\wedge}=\lim A_{\lambda}$ is a complete topological ring, see discussion in More on Algebra, Section 15.28. The maps $A^{\wedge} \rightarrow A_{\lambda}$ are surjective as $A \rightarrow A_{\lambda}$ is. We claim that for any $\lambda$ the kernel $I_{\lambda} \subset A^{\wedge}$ of $A^{\wedge} \rightarrow A_{\lambda}$ is a weak ideal of definition. Namely, it is open by definition of the limit topology. If $f \in I_{\lambda}$, then for any $\mu \in \Lambda$ the image of $f$ in $A_{\mu}$ is zero in all the residue fields of the points of $X_{\mu}$. Hence it is a nilpotent element of $A_{\mu}$. Hence some power $f^{n} \in I_{\mu}$. Thus $f^{n} \rightarrow 0$ as $n \rightarrow 0$. Thus $A^{\wedge}$ is weakly admissible. Finally, suppose that $I \subset A^{\wedge}$ is a weak ideal of definition. Then $I \subset A^{\wedge}$ is open and hence there exists some $\lambda$ such that $I \supset I_{\lambda}$. Thus we obtain a morphism
$\operatorname{Spec}\left(A^{\wedge} / I\right) \rightarrow \operatorname{Spec}\left(A_{\lambda}\right) \rightarrow X$. Then it follows that $X=\operatorname{colim} \operatorname{Spec}\left(A^{\wedge} / I\right)$ where now the colimit is over all weak ideals of definition. Thus (1) holds.
Assume (1). In this case it is clear that $X$ is an affine formal algebraic space. Let $X=\operatorname{colim} X_{\lambda}$ be any presentation as in Definition 70.5.1. For each $\lambda$ we can find a weak ideal of definition $I \subset A$ such that $X_{\lambda} \rightarrow X$ factors through $\operatorname{Spec}(A / I) \rightarrow X$, see Lemma 70.5.4 Then $X_{\lambda}=\operatorname{Spec}\left(A / I_{\lambda}\right)$ with $I \subset I_{\lambda}$. Conversely, for any weak ideal of definition $I \subset A$ the morphism $\operatorname{Spec}(A / I) \rightarrow X$ factors through $X_{\lambda}$ for some $\lambda$, i.e., $I_{\lambda} \subset I$. It follows that each $I_{\lambda}$ is a weak ideal of definition and that they form a cofinal subset of the set of weak ideals of definition. Hence $A=\lim A / I=$ $\lim A / I_{\lambda}$ and we see that (5) is true and moreover that $A=\lim \Gamma\left(X_{\lambda}, \mathcal{O}_{X_{\lambda}}\right)$.
With this lemma in hand we can make the following definition.
0AID Definition 70.5.7. Let $S$ be a scheme. Let $X$ be an affine formal algebraic space over $S$. We say $X$ is $M c Q u i l l a n$ if $X$ satisfies the equivalent conditions of Lemma 70.5.6. Let $A$ be the weakly admissible topological ring associated to $X$. We say
(1) $X$ is classical if $X$ is McQuillan and $A$ is admissible,
(2) $X$ is adic if $X$ is McQuillan and $A$ is adic,
(3) $X$ is $a d i c^{*}$ if $X$ is McQuillan, $A$ is adic, and $A$ has a finitely generated ideal of definition, and
(4) $X$ is Noetherian if $X$ is McQuillan and $A$ is both Noetherian and adic.

In [FK] they use the terminology "of finite ideal type" for the property that an adic topological ring $A$ contains a finitely generated ideal of definition.

0AIE Remark 70.5.8. The classical affine formal algebraic spaces correspond to the affine formal schemes considered in EGA (DG67). To explain this we assume our base scheme is $\operatorname{Spec}(\mathbf{Z})$. Let $\mathfrak{X}=\operatorname{Spf}(A)$ be an affine formal scheme. Let $h_{\mathfrak{X}}$ be its functor of points as in Lemma 70.2.1. Then $h_{\mathfrak{X}}=\operatorname{colim} h_{\operatorname{Spec}(A / I)}$ where the colimit is over the collection of ideals of definition of the admissible topological ring $A$. This follows from (70.2.0.1) when evaluating on affine schemes and it suffices to check on affine schemes as both sides are fppf sheaves, see Lemma 70.2.2. Thus $h_{\mathfrak{X}}$ is an affine formal algebraic space. In fact, it is a classical affine formal algebraic space by Definition 70.5.7. Thus Lemma 70.2.1 tells us the category of affine formal schemes is equivalent to the category of classical affine formal algebraic spaces.

Having made the connection with affine formal schemes above, it seems natural to make the following definition.
0AIF Definition 70.5.9. Let $S$ be a scheme. Let $A$ be a weakly admissible topological ring over $S$, see Definition 70.4.7 The formal spectrum of $A$ is the affine formal algebraic space

$$
\operatorname{Spf}(A)=\operatorname{colim} \operatorname{Spec}(A / I)
$$

where the colimit is over the set of weak ideals of definition of $A$ and taken in the category $\operatorname{Sh}\left((S c h / S)_{\text {fppf }}\right)$.
Such a formal spectrum is McQuillan by construction and conversely every McQuillan affine formal algebraic space is isomorphic to a formal spectrum. To be sure, in our theory there exist affine formal algebraic spaces which are not the formal

[^188]spectrum of any weakly admissible topological ring. Following Yas09 we could introduce $S$-pro-rings to be pro-objects in the category of $S$-algebras, see Categories, Remark 4.22.4. Then every affine formal algebraic space over $S$ would be the formal spectrum of such an $S$-pro-ring. We will not do this and instead we will work directly with the corresponding affine formal algebraic spaces.

The construction of the formal spectrum is functorial. To explain this let $\varphi: B \rightarrow A$ be a continuous map of weakly admissible topological rings over $S$. Then

$$
\operatorname{Spf}(\varphi): \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)
$$

is the unique morphism of affine formal algebraic spaces such that the diagrams

commute for all weak ideals of definition $I \subset A$ and $J \subset B$ with $\varphi(I) \subset J$. Since continuity of $\varphi$ implies that for every weak ideal of definition $J \subset B$ there is a weak ideal of definition $I \subset A$ with the required property, we see that the required commutativities uniquely determine and define $\operatorname{Spf}(\varphi)$.

0AN0 Lemma 70.5.10. Let $S$ be a scheme. Let $A, B$ be weakly admissible topological rings over $S$. Any morphism $f: \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ of affine formal algebraic spaces over $S$ is equal to $\operatorname{Spf}\left(f^{\sharp}\right)$ for a unique continuous $S$-algebra map $f^{\sharp}: A \rightarrow B$.

Proof. Let $f: \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ be as in the lemma. Let $J \subset B$ be a weak ideal of definition. By Lemma 70.5 .4 there exists a weak ideal of definition $I \subset A$ such that $\operatorname{Spec}(B / J) \rightarrow \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ factors through $\operatorname{Spec}(A / I)$. By Schemes, Lemma 25.6 .4 we obtain an $S$-algebra map $A / I \rightarrow B / J$. These maps are compatible for varying $J$ and define the map $f^{\sharp}: A \rightarrow B$. This map is continuous because for every weak ideal of definition $J \subset B$ there is a weak ideal of definition $I \subset A$ such that $f^{\sharp}(I) \subset J$. The equality $f=\operatorname{Spf}\left(f^{\sharp}\right)$ holds by our choice of the ring maps $A / I \rightarrow B / J$ which make up $f^{\sharp}$.

0AIG Lemma 70.5.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a map of presheaves on $(S c h / S)_{\text {fppf }}$. If $X$ is an affine formal algebraic space and $f$ is representable by algebraic spaces and locally quasi-finite, then $f$ is representable (by schemes).

Proof. Let $T$ be a scheme over $S$ and $T \rightarrow Y$ a map. We have to show that the algebraic space $X \times_{Y} T$ is a scheme. Write $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. Let $W \subset X \times_{Y} T$ be a quasi-compact open subspace. The restriction of the projection $X \times_{Y} T \rightarrow X$ to $W$ factors through $X_{\lambda}$ for some $\lambda$. Then

$$
W \rightarrow X_{\lambda} \times_{S} T
$$

is a monomorphism (hence separated) and locally quasi-finite (because $W \rightarrow X \times_{Y}$ $T \rightarrow T$ is locally quasi-finite by our assumption on $X \rightarrow Y$, see Morphisms of Spaces, Lemma 54.27.8). Hence $W$ is a scheme by Morphisms of Spaces, Proposition 54.47.2. Thus $X \times_{Y} T$ is a scheme by Properties of Spaces, Lemma 53.12.1.

### 70.6. Countably indexed affine formal algebraic spaces

0AIH These are the affine formal algebraic spaces as in the following lemma.
0AII Lemma 70.6.1. Let $S$ be a scheme. Let $X$ be an affine formal algebraic space over $S$. The following are equivalent
(1) there exists a system $X_{1} \rightarrow X_{2} \rightarrow X_{3} \rightarrow \ldots$ of thickenings of affine schemes over $S$ such that $X=\operatorname{colim} X_{n}$,
(2) there exists a choice $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1 such that $\Lambda$ is countable.

Proof. This follows from the observation that a countable directed partially ordered set has a cofinal subset isomorphic to $(\mathbf{N}, \geq)$. See proof of Algebra, Lemma 10.85.3.

0AIJ Definition 70.6.2. Let $S$ be a scheme. Let $X$ be an affine formal algebraic space over $S$. We say $X$ is countably indexed if the equivalent conditions of Lemma 70.6.1 are satisfied.

In the language of $\mathbf{B D}$ this is expressed by saying that $X$ is an $\aleph_{0}$-ind scheme.
0AIK Lemma 70.6.3. Let $X$ be an affine formal algebraic space over a scheme $S$.
(1) If $X$ is Noetherian, then $X$ is adic*.
(2) If $X$ is adic*, then $X$ is adic.
(3) If $X$ is adic, then $X$ is countably indexed.
(4) If $X$ is countably indexed, then $X$ is McQuillan.

Proof. Parts (1) and (2) are immediate from the definitions.
Proof of (3). By definition there exists an adic topological ring $A$ such that $X=$ colim $\operatorname{Spec}(A / I)$ where the colimit is over the ideals of definition of $A$. As $A$ is adic, there exits an ideal $I$ such that $\left\{I^{n}\right\}$ forms a fundamental system of neighbourhoods of 0 . Then each $I^{n}$ is an ideal of definition and $X=\operatorname{colim} \operatorname{Spec}\left(A / I^{n}\right)$. Thus $X$ is countably indexed.
Proof of (4). Write $X=\lim X_{n}$ for some system $X_{1} \rightarrow X_{2} \rightarrow X_{3} \rightarrow \ldots$ of thickenings of affine schemes over $S$. Then

$$
A=\lim \Gamma\left(X_{n}, \mathcal{O}_{X_{n}}\right)
$$

surjects onto each $\Gamma\left(X_{n}, \mathcal{O}_{X_{n}}\right)$ because the transition maps are surjections as the morphisms $X_{n} \rightarrow X_{n+1}$ are closed immersions.

0AN1 Lemma 70.6.4. Let $S$ be a scheme. Let $X$ be a presheaf on $(S c h / S)_{f p p f}$. The following are equivalent
(1) $X$ is a countably indexed affine formal algebraic space,
(2) $X=\operatorname{Spf}(A)$ where $A$ is a weakly admissible topological $S$-algebra which has a countable fundamental system of neighbourhoods of 0 ,
(3) $X=\operatorname{Spf}(A)$ where $A$ is a weakly admissible topological S-algebra which has a fundamental system $A \supset I_{1} \supset I_{2} \supset I_{3} \supset \ldots$ of weak ideals of definition,
(4) $X=\operatorname{Spf}(A)$ where $A$ is a complete topological $S$-algebra with a fundamental system of open neighbourhoods of 0 given by a countable sequence $A \supset I_{1} \supset I_{2} \supset I_{3} \supset \ldots$ of ideals such that $I_{n} / I_{n+1}$ is locally nilpotent, and
(5) $X=\operatorname{Spf}(A)$ where $A=\lim B / J_{n}$ with the limit topology where $B \supset J_{1} \supset$ $J_{2} \supset J_{3} \supset \ldots$ is a sequence of ideals in an $S$-algebra $B$ with $J_{n} / J_{n+1}$ locally nilpotent.
Proof. Assume (1). By Lemma 70.6 .3 we can write $X=\operatorname{Spf}(A)$ where $A$ is a weakly admissible topological $S$-algebra. For any presentation $X=\operatorname{colim} X_{n}$ as in Lemma 70.6.1 part (1) we see that $A=\lim A_{n}$ with $X_{n}=\operatorname{Spec}\left(A_{n}\right)$ and $A_{n}=A / I_{n}$ for some weak ideal of definition $I_{n} \subset A$. This follows from the final statement of Lemma 70.5.6 which moreover implies that $\left\{I_{n}\right\}$ is a fundamental system of open neighbourhoods of 0 . Thus we have a sequence

$$
A \supset I_{1} \supset I_{2} \supset I_{3} \supset \ldots
$$

of weak ideals of definition with $A=\lim A / I_{n}$. In this way we see that condition (1) implies each of the conditions (2) - (5).

Assume (5). First note that the limit topology on $A=\lim B / J_{n}$ is a linearly topologized, complete topology, see More on Algebra, Section 15.28. If $f \in A$ maps to zero in $B / J_{1}$, then some power maps to zero in $B / J_{2}$ as its image in $J_{1} / J_{2}$ is nilpotent, then a further power maps to zero in $J_{2} / J_{3}$, etc, etc. In this way we see the open ideal $\operatorname{Ker}\left(A \rightarrow B / J_{1}\right)$ is a weak ideal of definition. Thus $A$ is weakly admissible. In this way we see that (5) implies (2).
It is clear that (4) is a special case of (5) by taking $B=A$. It is clear that (3) is a special case of (2).
Assume $A$ is as in (2). Let $E_{n}$ be a countable fundamental system of neighbourhoods of 0 in $A$. Since $A$ is a weakly admissible topological ring we can find open ideals $I_{n} \subset E_{n}$. We can also choose a weak ideal of definition $J \subset A$. Then $J \cap I_{n}$ is a fundamental system of weak ideals of definition of $A$ and we get $X=\operatorname{Spf}(A)=$ $\operatorname{colim} \operatorname{Spec}\left(A /\left(J \cap I_{n}\right)\right)$ which shows that $X$ is a countably indexed affine formal algebraic space.
0AKM Lemma 70.6.5. Let $S$ be a scheme. Let $X$ be an affine formal algebraic space. The following are equivalent
(1) $X$ is Noetherian,
(2) $X$ is adic* and for some choice of $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1 the schemes $X_{\lambda}$ are Noetherian,
(3) $X$ is adic* and for any closed immersion $T \rightarrow X$ with $T$ a scheme, $T$ is Noetherian.

Proof. This follows from the fact that if $A$ is a ring complete with respect to a finitely generated ideal $I$, then $A$ is Noetherian if and only if $A / I$ is Noetherian, see Algebra, Lemma 10.96.5 Details omitted.

### 70.7. Formal algebraic spaces

0AIL We take a break from our habit of introducing new concepts first for rings, then for schemes, and then for algebraic spaces, by introducing formal algebraic spaces without first introducing formal schemes. The general idea will be that a formal algebraic space is a sheaf in the fppf topology which étale locally is an affine formal scheme in the sense of [BD. Related material can be found in [Yas09.
In the definition of a formal algebraic space we are going to borrow some terminology from Bootstrap, Sections 67.3 and 67.4

0AIM Definition 70.7.1. Let $S$ be a scheme. We say a sheaf $X$ on $(S c h / S)_{f p p f}$ is a formal algebraic space if there exist a family of maps $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ of sheaves such that
(1) $X_{i}$ is an affine formal algebraic space,
(2) $X_{i} \rightarrow X$ is representable by algebraic spaces and étale,
(3) $\coprod X_{i} \rightarrow X$ is surjective as a map of sheaves
and $X$ satisfies a set theoretic condition (see Remark70.7.6). A morphism of formal algebraic spaces over $S$ is a map of sheaves.

Discussion. Sanity check: an affine formal algebraic space is a formal algebraic space. In the situation of the definition the morphisms $X_{i} \rightarrow X$ are representable (by schemes), see Lemma 70.5.11. By Bootstrap, Lemma 67.4 .6 we could instead of asking $\coprod X_{i} \rightarrow X$ to be surjective as a map of sheaves, require that it be surjective (which makes sense because it is representable).
Our notion of a formal algebraic space is very general. In fact, even affine formal algebraic spaces as defined above are very nasty objects. However, they do have an underlying reduced algebraic space as the following lemma demonstrates.

0AIN Lemma 70.7.2. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. There exists a reduced algebraic space $X_{\text {red }}$ and a representable morphism $X_{\text {red }} \rightarrow$ $X$ which is a thickening. A morphism $U \rightarrow X$ with $U$ a reduced algebraic space factors uniquely through $X_{\text {red }}$.

Proof. First assume that $X$ is an affine formal algebraic space. Say $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. Since the transition morphisms are thickenings, the affine schemes $X_{\lambda}$ all have isomorphic reductions $X_{r e d}$. The morphism $X_{r e d} \rightarrow X$ is representable and a thickening by Lemma 70.5 .3 and the fact that compositions of thickenings are thickenings. We omit the verification of the universal property (use Schemes, Definition 25.12.5. Schemes, Lemma 25.12.6, Properties of Spaces, Definition 53.11.6 and Properties of Spaces, Lemma 53.11.5.
Let $X$ and $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be as in Definition 70.7.1. For each $i$ let $X_{i, r e d} \rightarrow X_{i}$ be the reduction as constructed above. For $i, j \in I$ the projection $X_{i, \text { red }} \times{ }_{X}$ $X_{j} \rightarrow X_{i, \text { red }}$ is an étale (by assumption) morphism of schemes (by Lemma 70.5.11). Hence $X_{i, r e d} \times{ }_{X} X_{j}$ is reduced (see Descent, Lemma 34.14.1). Thus the projection $X_{i, \text { red }} \times{ }_{X} X_{j} \rightarrow X_{j}$ factors through $X_{j, \text { red }}$ by the universal property. We conclude that

$$
R_{i j}=X_{i, \text { red }} \times_{X} X_{j}=X_{i, \text { red }} \times_{X} X_{j, \text { red }}=X_{i} \times_{X} X_{j, \text { red }}
$$

because the morphisms $X_{i, \text { red }} \rightarrow X_{i}$ are injections of sheaves. Set $U=\coprod X_{i, \text { red }}$, set $R=\coprod R_{i j}$, and denote $s, t: R \rightarrow U$ the two projections. As a sheaf $R=U \times_{X} U$ and $s$ and $t$ are étale. Then $(t, s): R \rightarrow U$ defines an étale equivalence relation by our observations above. Thus $X_{\text {red }}=U / R$ is an algebraic space by Spaces, Theorem 52.10.5. By construction the diagram

is cartesian. Since the right vertical arrow is étale surjective and the top horizontal arrow is representable and a thickening we conclude that $X_{\text {red }} \rightarrow X$ is representable
by Bootstrap, Lemma 67.5 .2 (to verify the assumptions of the lemma use that a surjective étale morphism is surjective, flat, and locally of finite presentation and use that thickenings are separated and locally quasi-finite). Then we can use Spaces, Lemma 52.5 .6 to conclude that $X_{\text {red }} \rightarrow X$ is a thickening (use that being a thickening is equivalent to being a surjective closed immersion).

Finally, suppose that $U \rightarrow X$ is a morphism with $U$ a reduced algebraic space over $S$. Then each $X_{i} \times_{X} U$ is étale over $U$ and therefore reduced (by our definition of reduced algebraic spaces in Properties of Spaces, Section53.7). Then $X_{i} \times{ }_{X} U \rightarrow X_{i}$ factors through $X_{i, r e d}$. Hence $U \rightarrow X$ factors through $X_{\text {red }}$ because $\left\{X_{i} \times_{X} U \rightarrow U\right\}$ is an étale covering.

0AIP Lemma 70.7.3. Let $S$ be a scheme. If $X$ is a formal algebraic space over $S$, then the diagonal morphism $\Delta: X \rightarrow X \times{ }_{S} X$ is representable, a monomorphism, locally quasi-finite, locally of finite type, and separated.

Proof. Suppose given $U \rightarrow X$ and $V \rightarrow X$ with $U, V$ schemes over $S$. Then $U \times_{X} V$ is a sheaf. Choose $\left\{X_{i} \rightarrow X\right\}$ as in Definition 70.7.1. For every $i$ the morphism

$$
\left(U \times_{X} X_{i}\right) \times_{X_{i}}\left(V \times_{X} X_{i}\right)=\left(U \times_{X} V\right) \times_{X} X_{i} \rightarrow U \times_{X} V
$$

is representable and étale as a base change of $X_{i} \rightarrow X$ and its source is a scheme (use Lemmas 70.5 .2 and 70.5 .11 . These maps are jointly surjective hence $U \times_{X} V$ is an algebraic space by Bootstrap, Theorem 67.10.1. The morphism $U \times{ }_{X} V \rightarrow U \times{ }_{S} V$ is a monomorphism. It is also locally quasi-finite, because on precomposing with the morphism displayed above we obtain the composition

$$
\left(U \times_{X} X_{i}\right) \times_{X_{i}}\left(V \times_{X} X_{i}\right) \rightarrow\left(U \times_{X} X_{i}\right) \times_{S}\left(V \times_{X} X_{i}\right) \rightarrow U \times_{S} V
$$

which is locally quasi-finite as a composition of a closed immersion (Lemma 70.5.2) and an étale morphism, see Descent on Spaces, Lemma 61.17.2. Hence we conclude that $U \times_{X} V$ is a scheme by Morphisms of Spaces, Proposition 54.47.2. Thus $\Delta$ is representable, see Spaces, Lemma 52.5.10.

Let $W \rightarrow X \times{ }_{S} X$ be a morphism where $W$ is a scheme over $S$. For each $i$ consider the diagram

The vertical arrows are étale because $X_{i} \rightarrow X$ is étale. The top horizontal arrow is a closed immersion by Lemma 70.5.2 Because the maps $X_{i} \rightarrow X$ are jointly surjective, this certainly implies that the lower horizontal arrow is locally of finite type, see Morphisms of Spaces, Lemma 54.23.4. Since it is clearly a monomorphism, we conclude that it is locally quasi-finite (Morphisms of Spaces, Lemma 54.27.10). It is separated because any monomorphism is separated (Morphisms of Spaces, Lemma 54.10.3). This finishes the proof.

0AIQ Lemma 70.7.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism from an algebraic space over $S$ to a formal algebraic space over $S$. Then $f$ is representable by algebraic spaces.

Proof. Let $Z \rightarrow Y$ be a morphism where $Z$ is a scheme over $S$. We have to show that $X \times_{Y} Z$ is an algebraic space. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Then $U \times_{Y} Z \rightarrow X \times_{Y} Z$ is representable surjective étale (Spaces, Lemma 52.5.5) and $U \times_{Y} Z$ is a scheme by Lemma 70.7.3. Hence the result by Bootstrap, Theorem 67.10.1.

0AIR Remark 70.7.5. Modulo set theoretic issues the category of formal schemes à la EGA (see Section 70.2 ) is equivalent to a full subcategory of the category of formal algebraic spaces. To explain this we assume our base scheme is $\operatorname{Spec}(\mathbf{Z})$. By Lemma 70.2 .2 the functor of points $h_{\mathfrak{X}}$ associated to a formal scheme $\mathfrak{X}$ is a sheaf in the fppf topology. By Lemma 70.2 .1 the assignment $\mathfrak{X} \mapsto h_{\mathfrak{X}}$ is a fully faithful embedding of the category of formal schemes into the category of fppf sheaves. Given a formal scheme $\mathfrak{X}$ we choose an open covering $\mathfrak{X}=\bigcup \mathfrak{X}_{i}$ with $\mathfrak{X}_{i}$ affine formal schemes. Then $h_{\mathfrak{X}_{i}}$ is an affine formal algebraic space by Remark 70.5.8. The morphisms $h_{\mathfrak{X}_{i}} \rightarrow h_{\mathfrak{X}}$ are representable and open immersions. Thus $\left\{h_{\mathfrak{X}_{i}} \rightarrow h_{\mathfrak{X}}\right\}$ is a family as in Definition 70.7.1 and we see that $h_{\mathfrak{X}}$ is a formal algebraic space.

0AIS Remark 70.7.6. Let $S$ be a scheme and let $(S c h / S)_{f p p f}$ be a big fppf site as in Topologies, Definition 33.7.8. As our set theoretic condition on $X$ in Definitions 70.5 .1 and 70.7 .1 we take: there exist objects $U, R$ of $(S c h / S)_{f p p f}$, a morphism $U \rightarrow X$ which is a surjection of fppf sheaves, and a morphism $R \rightarrow U \times_{X} U$ which is a surjection of fppf sheaves. In other words, we require our sheaf to be a coequalizer of two maps between representable sheaves. Here are some observations which imply this notion behaves reasonably well:
(1) Suppose $X=\operatorname{colim}_{\lambda \in \Lambda} X_{\lambda}$ and the system satisfies conditions (1) and (2) of Definition 70.5.1. Then $U=\coprod_{\lambda \in \Lambda} X_{\lambda} \rightarrow X$ is a surjection of fppf sheaves. Moreover, $U \times_{X} U$ is a closed subscheme of $U \times_{S} U$ by Lemma 70.5 .2 . Hence if $U$ is representable by an object of $(S c h / S)_{f p p f}$ then $U \times{ }_{S} U$ is too (see Sets, Lemma 3.9.9) and the set theoretic condition is satisfied. This is always the case if $\Lambda$ is countable, see Sets, Lemma 3.9.9.
(2) Sanity check. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be as in Definition 70.7.1 (with the set theoretic condition as formulated above) and assume that each $X_{i}$ is actually an affine scheme. Then $X$ is an algebraic space. Namely, if we choose a larger big fppf site $\left(S c h^{\prime} / S\right)_{\text {fppf }}$ such that $U^{\prime}=\coprod X_{i}$ and $R^{\prime}=\coprod X_{i} \times_{X} X_{j}$ are representable by objects in it, then $X^{\prime}=U^{\prime} / R^{\prime}$ will be an object of the category of algebraic spaces for this choice. Then an application of Spaces, Lemma 52.15 .2 shows that $X$ is an algebraic space for $(S c h / S)_{f p p f}$.
(3) Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a family of maps of sheaves satisfying conditions (1), (2), (3) of Definition 70.7.1. For each $i$ we can pick $U_{i} \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and $U_{i} \rightarrow X_{i}$ which is a surjection of sheaves. Thus if $I$ is not too large (for example countable) then $U=\coprod U_{i} \rightarrow X$ is a surjection of sheaves and $U$ is representable by an object of $(S c h / S)_{\text {fppf }}$. To get $R \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ surjecting onto $U \times{ }_{X} U$ it suffices to assume the diagonal $\Delta: X \rightarrow X \times{ }_{S} X$ is not too wild, for example this always works if the diagonal of $X$ is quasicompact, i.e., $X$ is quasi-separated.
70.8. Colimits of algebraic spaces along thickenings

0AIT

A special type of formal algebraic space is one which can globally be written as a cofiltered colimit of algebraic spaces along thickenings as in the following lemma. We will see later (in Section 70.13 that any quasi-compact and quasi-separated formal algebraic space is such a global colimit.
0AIU Lemma 70.8.1. Let $S$ be a scheme. Suppose given a directed partially ordered set $\Lambda$ and a system of algebraic spaces $\left(X_{\lambda}, f_{\lambda \mu}\right)$ over $\Lambda$ where each $f_{\lambda \mu}: X_{\lambda} \rightarrow X_{\mu}$ is a thickening. Then $X=\operatorname{colim}_{\lambda \in \Lambda} X_{\lambda}$ is a formal algebraic space over $S$.

Proof. Since we take the colimit in the category of fppf sheaves, we see that $X$ is a sheaf. Choose and fix $\lambda \in \Lambda$. Choose an étale covering $\left\{X_{i, \lambda} \rightarrow X_{\lambda}\right\}$ where $X_{i}$ is an affine scheme over $S$, see Properties of Spaces, Lemma 53.6.1. For each $\mu \geq \lambda$ there exists a cartesian diagram

with étale vertical arrows, see More on Morphisms of Spaces, Theorem 63.8.1 (this also uses that a thickening is a surjective closed immersion which satisfies the conditions of the theorem). Moreover, these diagrams are unique up to unique isomorphism and hence $X_{i, \mu}=X_{\mu} \times_{X_{\mu^{\prime}}} X_{i, \mu^{\prime}}$ for $\mu^{\prime} \geq \mu$. The morphisms $X_{i, \mu} \rightarrow X_{i, \mu^{\prime}}$ is a thickening as a base change of a thickening. Each $X_{i, \mu}$ is an affine scheme by Limits of Spaces, Proposition 57.15 .2 and the fact that $X_{i, \lambda}$ is affine. Set $X_{i}=\operatorname{colim}_{\mu \geq \lambda} X_{i, \mu}$. Then $X_{i}$ is an affine formal algebraic space. The morphism $X_{i} \rightarrow X$ is étale because given an affine scheme $U$ any $U \rightarrow X$ factors through $X_{\mu}$ for some $\mu \geq \lambda$ (details omitted). In this way we see that $X$ is a formal algebraic space.

Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. How does one prove or check that $X$ is a global colimit as in Lemma 70.8.1? To do this we look for maps $i: Z \rightarrow X$ where $Z$ is an algebraic space over $S$ and $i$ is surjective and a closed immersion, in other words, $i$ is a thickening. This makes sense as $i$ is representable by algebraic spaces (Lemma 70.7.4) and we can use Bootstrap, Definition 67.4.1 as before.

0AIV Remark 70.8.2 (Weak ideals of definition). Let $\mathfrak{X}$ be a formal scheme in the sense of McQuillan, see Remark 70.2.3. An weak ideal of definition for $\mathfrak{X}$ is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{\mathfrak{X}}$ such that for all $\mathfrak{U} \subset \mathfrak{X}$ affine formal open subscheme the ideal $\mathcal{I}(\mathfrak{U}) \subset \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ is a weak ideal of definition of the weakly admissible topological ring $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$. It suffices to check the condition on the members of an affine open covering. There is a one-to-one correspondence

$$
\{\text { weak ideals of definition for } \mathfrak{X}\} \leftrightarrow\left\{\text { thickenings } i: Z \rightarrow h_{\mathfrak{X}} \text { as above }\right\}
$$

This correspondence associates to $\mathcal{I}$ the scheme $Z=\left(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}} / \mathcal{I}\right)$ together with the obvious morphism to $\mathfrak{X}$. A fundamental system of weak ideals of definition is a collection of weak ideals of definition $\mathcal{I}_{\lambda}$ such that on every affine open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$ the ideals

$$
I_{\lambda}=\mathcal{I}_{\lambda}(\mathfrak{U}) \subset A=\Gamma\left(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}\right)
$$

form a fundamental system of weak ideals of definition of the weakly admissible topological ring $A$. It suffices to check on the members of an affine open covering. We conclude that the formal algebraic space $h_{\mathfrak{X}}$ associated to the McQuillan formal scheme $\mathfrak{X}$ is a colimit of schemes as in Lemma 70.8.1 if and only if there exists a fundamental system of weak ideals of definition for $\mathfrak{X}$.

0AIW Remark 70.8.3 (Ideals of definition). Let $\mathfrak{X}$ be a formal scheme à la EGA. An ideal of definition for $\mathfrak{X}$ is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{\mathfrak{X}}$ such that for all $\mathfrak{U} \subset \mathfrak{X}$ affine formal open subscheme the ideal $\mathcal{I}(\mathfrak{U}) \subset \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$ is an ideal of definition of the admissible topological ring $\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})$. It suffices to check the condition on the members of an affine open covering. We do not get the same correspondence between ideals of definition and thickenings $Z \rightarrow \mathfrak{X}$ as in Remark 70.8.2. A fundamental system of ideals of definition is a collection of ideals of definition $\mathcal{I}_{\lambda}$ such that on every affine open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$ the ideals

$$
I_{\lambda}=\mathcal{I}_{\lambda}(\mathfrak{U}) \subset A=\Gamma\left(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}\right)
$$

form a fundamental system of ideals of definition of the admissible topological ring $A$. It suffices to check on the members of an affine open covering. Suppose that $\mathfrak{X}$ is quasi-compact and that $\left\{\mathcal{I}_{\lambda}\right\}_{\lambda \in \Lambda}$ is a fundamental system of weak ideals of definition. If $A$ is an admissible topological ring $A$ then all sufficiently small open ideals are ideals of definition (namely any open ideal contained in an ideal of definition is an ideal of definition). Thus since we only need to check on the finitely many members of an affine open covering we see that $\mathcal{I}_{\lambda}$ is an ideal of definition for $\lambda$ sufficiently large. Using the discussion in Remark 70.8.2 we conclude that the formal algebraic space $h_{\mathfrak{X}}$ associated to the quasi-compact formal scheme $\mathfrak{X}$ à la EGA is a colimit of schemes as in Lemma 70.8.1 if and only if there exists a fundamental system of ideals of definition for $\mathfrak{X}$.

### 70.9. Completion along a closed subset

0AIX Our notion of a formal algebraic space is well adapted to taking the completion along a closed.

0AIY Lemma 70.9.1. Let $S$ be a scheme. Let $X$ be an affine scheme over $S$. Let $T \subset|X|$ be a closed subset. Then the functor

$$
(S c h / S)_{f p p f} \longrightarrow S e t s, \quad U \longmapsto\{f: U \rightarrow X \mid f(|U|) \subset T\}
$$

is a McQuillan affine formal algebraic space.
Proof. Say $X=\operatorname{Spec}(A)$ and $T$ corresponds to the radical ideal $I \subset A$. Let $U=\operatorname{Spec}(B)$ be an affine scheme over $S$ and let $f: U \rightarrow X$ be an element of $F(U)$. Then $f$ corresponds to a ring map $\varphi: A \rightarrow B$ such that every prime of $B$ contains $\varphi(I) B$. Thus every element of $\varphi(I)$ is nilpotent in $B$, see Algebra, Lemma 10.16.2. Setting $J=\operatorname{Ker}(\varphi)$ we conclude that $I / J$ is a locally nilpotent ideal in $A / J$. Equivalently, $V(J)=V(I)=T$. In other words, the functor of the lemma equals colim $\operatorname{Spec}(A / J)$ where the colimit is over the collection of ideals $J$ with $V(J)=T$. Thus our functor is an affine formal algebraic space. It is McQuillan (Definition 70.5 .7 ) because the maps $A \rightarrow A / J$ are surjective and hence $A^{\wedge}=\lim A / J \rightarrow A / J$ is surjective, see Lemma 70.5.6.

0AIZ Lemma 70.9.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Then the functor

$$
(S c h / S)_{\text {fppf }} \longrightarrow \text { Sets, } \quad U \longmapsto\{f: U \rightarrow X \mid f(|U|) \subset T\}
$$

is a formal algebraic space.
Proof. Denote $F$ the functor. Let $\left\{U_{i} \rightarrow U\right\}$ be an fppf covering. Then $\coprod\left|U_{i}\right| \rightarrow$ $|U|$ is surjective. Since $X$ is an fppf sheaf, it follows that $F$ is an fppf sheaf.

Let $\left\{g_{i}: X_{i} \rightarrow X\right\}$ be an étale covering such that $X_{i}$ is affine for all $i$, see Properties of Spaces, Lemma 53.6.1. The morphisms $F \times_{X} X_{i} \rightarrow F$ are étale (see Spaces, Lemma 52.5.5 and the map $\amalg F \times_{X} X_{i} \rightarrow F$ is a surjection of sheaves. Thus it suffices to prove that $F \times{ }_{X} X_{i}$ is an affine formal algebraic space. A $U$-valued point of $F \times_{X} X_{i}$ is a morphism $U \rightarrow X_{i}$ whose image is contained in the closed subset $g_{i}^{-1}(T) \subset\left|X_{i}\right|$. Thus this follows from Lemma 70.9.1.
0AMC Definition 70.9.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. The formal algebraic space of Lemma 70.9.2 is called the completion of $X$ along $T$.

In DG67, Chapter I, Section 10.8] the notation $X_{/ T}$ is used to denote the completion and we will occasionally use this notation as well. Let $f: X \rightarrow X^{\prime}$ be a morphism of algebraic spaces over a scheme $S$. Suppose that $T \subset|X|$ and $T^{\prime} \subset\left|X^{\prime}\right|$ are closed subsets such that $|f|(T) \subset T^{\prime}$. Then it is clear that $f$ defines a morphism of formal algebraic spaces

$$
X_{/ T} \longrightarrow X_{/ T^{\prime}}^{\prime}
$$

between the completions.
0APV Lemma 70.9.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $T \subset|Y|$ be a closed subset and let $T^{\prime}=|f|^{-1}(T) \subset|X|$. Then $X_{/ T^{\prime}} \rightarrow Y_{/ T}$ is representable by algebraic spaces.
Proof. Namely, suppose that $V \rightarrow Y$ is a morphism from a scheme into $Y$ such that $|V|$ maps into $T$. Then $V \times_{Y} X \rightarrow X$ is a morphism of algebraic spaces such that $\left|V \times_{Y} X\right|$ maps into $T^{\prime}$. Hence the functor $V \times_{Y_{/ T^{\prime}}} X_{/ T}$ is represented by $V \times_{Y} X$ and we see that the lemma holds.

The following lemma is due to Ofer Gabber.
0APW Lemma 70.9.5. Let $S$ be a scheme. Let $X=\operatorname{Spec}(A)$ be an affine scheme over $S$. Let $T \subset X$ be a closed subscheme.
(1) If the formal completion $X_{/ T}$ is countably indexed and there exist countably many $f_{1}, f_{2}, f_{3}, \ldots \in A$ such that $T=V\left(f_{1}, f_{2}, f_{3}, \ldots\right)$, then $X_{/ T}$ is adic*.
(2) The conclusion of (1) is wrong if we omit the assumption that $T$ can be cut out by countably many functions in $X$.

Proof. The assumption that $X_{/ T}$ is countably indexed means that there exists a sequence of ideals

$$
A \supset J_{1} \supset J_{2} \supset J_{3} \supset \ldots
$$

with $V\left(J_{n}\right)=T$ such that every ideal $J \subset A$ with $V(J)=T$ there exists an $n$ such that $J \supset J_{n}$.

Email by Ofer Gabber of September 11, 2014.

To construct an example for (2) let $\omega_{1}$ be the first uncountable ordinal. Let $k$ be a field and let $A$ be the $k$-algebra generated by $x_{\alpha}, \alpha \in \omega_{1}$ and $y_{\alpha \beta}$ with $\alpha \in \beta \in \omega_{1}$ subject to the relations $x_{\alpha}=y_{\alpha \beta} x_{\beta}$. Let $T=V\left(x_{\alpha}\right)$. Let $J_{n}=\left(x_{\alpha}^{n}\right)$. If $J \subset A$ is an ideal such that $V(J)=T$, then $x_{\alpha}^{n_{\alpha}} \in J$ for some $n_{\alpha} \geq 1$. One of the sets $\left\{\alpha \mid n_{\alpha}=n\right\}$ must be unbounded in $\omega_{1}$. Then the relations imply that $J_{n} \subset J$.
To see that (2) holds it now suffices to show that $A^{\wedge}=\lim A / J_{n}$ is not a ring complete with respect to a finitely generated ideal. For $\gamma \in \omega_{1}$ let $A_{\gamma}$ be the quotient of $A$ by the ideal generated by $x_{\alpha}, \alpha \in \gamma$ and $y_{\alpha \beta}, \alpha \in \gamma$. As $A / J_{1}$ is reduced, every topologically nilpotent element $f$ of $\lim A / J_{n}$ is in $J_{1}^{\wedge}=\lim J_{1} / J_{n}$. This means $f$ is an infinite series involving only a countable number of generators. Hence $f$ dies in $A_{\gamma}^{\wedge}=\lim A_{\gamma} / J_{n} A_{\gamma}$ for some $\gamma$. Note that $A^{\wedge} \rightarrow A_{\gamma}^{\wedge}$ is continuous and open by Lemma 70.4.5. If the topology on $A^{\wedge}$ was $I$-adic for some finitely generated ideal $I \subset A^{\wedge}$, then $I$ would go to zero in some $A_{\gamma}^{\wedge}$. This would mean that $A_{\gamma}^{\wedge}$ is discrete, which is not the case as there is a surjective continuous and open (by Lemma 70.4.5) map $\left.A_{\gamma}^{\wedge} \rightarrow k[t]\right]$ given by $x_{\alpha} \mapsto t, y_{\alpha \beta} \mapsto 1$ for $\gamma=\alpha$ or $\gamma \in \alpha$.
Before we prove (1) we first prove the following: If $I \subset A^{\wedge}$ is a finitely generated ideal whose closure $\bar{I}$ is open, then $I=\bar{I}$. Since $V\left(J_{n}^{2}\right)=T$ there exists an $m$ such that $J_{n}^{2} \supset J_{m}$. Thus, we may assume that $J_{n}^{2} \supset J_{n+1}$ for all $n$ by passing to a subsequence. Set $J_{n}^{\wedge}=\lim _{k \geq n} J_{n} / J_{k} \subset A^{\wedge}$. Since the closure $\bar{I}=\bigcap\left(I+J_{n}^{\wedge}\right)$ (Lemma 70.4.2) is open we see that there exists an $m$ such that $I+J_{n}^{\wedge} \supset J_{m}^{\wedge}$ for all $n \geq m$. Fix such an $m$. We have

$$
J_{n-1}^{\wedge} I+J_{n+1}^{\wedge} \supset J_{n-1}^{\wedge}\left(I+J_{n+1}^{\wedge}\right) \supset J_{n-1}^{\wedge} J_{m}^{\wedge} \supset J_{n}^{\wedge}
$$

for all $n \geq m+1$. Namely, the first inclusion is trivial. The second was shown above. The third as $J_{n-1} J_{m} \supset J_{n-1}^{2} \supset J_{n}$, hence $J_{n-1}^{\wedge} J_{m}^{\wedge} \supset J_{n}^{\wedge}$. Say $I=\left(g_{1}, \ldots, g_{t}\right)$. Pick $f \in J_{m+1}^{\wedge}$. Using the displayed inclusions above, valid for all $n \geq m+1$, we can write by induction on $c \geq 0$

$$
f=\sum f_{i, c} g_{i} \quad \bmod J_{m+1+c}^{\wedge}
$$

with $f_{i, c} \in J_{m}^{\wedge}$ and $f_{i, c} \equiv f_{i, c-1} \bmod J_{m+c}^{\wedge}$. It follows that $I J_{m}^{\wedge} \supset J_{m+1}^{\wedge}$. Combined with $I+J_{m+1}^{\wedge} \supset J_{m}^{\wedge}$ we conclude that $I$ is open.
Proof of (1). Assume $T=V\left(f_{1}, f_{2}, f_{3}, \ldots\right)$. Let $I_{m} \subset A^{\wedge}$ be the ideal generated by $f_{1}, \ldots, f_{m}$. Case I: For some $m$ the closure of $I_{m}$ is open. Then $I_{m}$ is open by the result of the previous paragraph. Since in $A^{\wedge}$ the product of open ideals is open, we see that $I_{m}^{k}$ is open for all $k$. As each element of $I_{m}$ is topologically nilpotent, we conclude that $I_{m}$ is an ideal of definition which proves that $A^{\wedge}$ is adic with a finitely generated ideal of definition, i.e., $X$ is adic*.
Case II. For all $m$ the closure $\bar{I}_{m}$ of $I_{m}$ is not open. Then the topology on $A^{\wedge} / \bar{I}_{m}$ is not discrete. This means we can pick $\phi(m) \geq m$ such that

$$
\operatorname{Im}\left(J_{\phi(m)} \rightarrow A /\left(f_{1}, \ldots, f_{m}\right)\right) \neq \operatorname{Im}\left(J_{\phi(m)+1} \rightarrow A /\left(f_{1}, \ldots, f_{m}\right)\right)
$$

To see this we have used that $A^{\wedge} /\left(\bar{I}_{m}+J_{n}^{\wedge}\right)=A /\left(\left(f_{1}, \ldots, f_{m}\right)+J_{n}\right)$. Choose exponents $e_{i}>0$ such that $f_{i}^{e_{i}} \in J_{\phi(m)+1}$ for $0<m<i$. Let $J=\left(f_{1}^{e_{1}}, f_{2}^{e_{2}}, f_{3}^{e_{3}}, \ldots\right)$. Then $V(J)=T$. We claim that $J \not \supset J_{n}$ for all $n$ which is a contradiction proving Case II does not occur. Namely, the image of $J$ in $A /\left(f_{1}, \ldots, f_{m}\right)$ is contained in the image of $J_{\phi(m)+1}$ which is properly contained in the image of $J_{m}$.

### 70.10. Fibre products

0AJ0 Obligatory section about fibre products of formal algebraic spaces.
0AJ1 Lemma 70.10.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a family of maps of sheaves on $(S c h / S)_{\text {fppf }}$. Assume (a) $X_{i}$ is a formal algebraic space over $S$, (b) $X_{i} \rightarrow X$ is representable by algebraic spaces and étale, and (c) $\amalg X_{i} \rightarrow X$ is a surjection of sheaves. Then $X$ is a formal algebraic space over $S$.

Proof. For each $i$ pick $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$ as in Definition 70.7.1. Then $\left\{X_{i j} \rightarrow\right.$ $X\}_{i \in I, j \in J_{i}}$ is a family as in Definition 70.7.1 for $X$.

0AJ2 Lemma 70.10.2. Let $S$ be a scheme. Let $X, Y$ be formal algebraic spaces over $S$ and let $Z$ be a sheaf whose diagonal is representable by algebraic spaces. Let $X \rightarrow Z$ and $Y \rightarrow Z$ be maps of sheaves. Then $X \times_{Z} Y$ is a formal algebraic space.

Proof. Choose $\left\{X_{i} \rightarrow X\right\}$ and $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1. Then $\left\{X_{i} \times{ }_{Z}\right.$ $\left.Y_{j} \rightarrow X \times_{Z} Y\right\}$ is a family of maps which are representable by algebraic spaces and étale. Thus Lemma 70.10 .1 tells us it suffices to show that $X \times_{Z} Y$ is a formal algebraic space when $X$ and $Y$ are affine formal algebraic spaces.

Assume $X$ and $Y$ are affine formal algebraic spaces. Write $X=\operatorname{colim} X_{\lambda}$ and $Y=\operatorname{colim} Y_{\mu}$ as in Definition 70.5.1. Then $X \times_{Z} Y=\operatorname{colim} X_{\lambda} \times_{Z} Y_{\mu}$. Each $X_{\lambda} \times{ }_{Z} Y_{\mu}$ is an algebraic space. For $\lambda \leq \lambda^{\prime}$ and $\mu \leq \mu^{\prime}$ the morphism

$$
X_{\lambda} \times_{Z} Y_{\mu} \rightarrow X_{\lambda} \times_{Z} Y_{\mu^{\prime}} \rightarrow X_{\lambda^{\prime}} \times_{Z} Y_{\mu^{\prime}}
$$

is a thickening as a composition of base changes of thickenings. Thus we conclude by applying Lemma 70.8.1.

0AJ3 Lemma 70.10.3. Let $S$ be a scheme. The category of formal algebraic spaces over $S$ has fibre products.

Proof. Special case of Lemma 70.10.2 because formal algebraic spaces have representable diagonals, see Lemma 70.7.3.
We have already proved the following lemma (without knowing that fibre products exist).
0AN2 Lemma 70.10.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The diagonal morphism $\Delta: X \rightarrow X \times_{Y} X$ is representable (by schemes), a monomorphism, locally quasi-finite, locally of finite type, and separated.

Proof. Let $T$ be a scheme and let $T \rightarrow X \times_{Y} X$ be a morphism. Then

$$
T \times_{\left(X \times_{Y} X\right)} X=T \times_{\left(X \times_{S} X\right)} X
$$

Hence the result follows immediately from Lemma 70.7.3.

### 70.11. Separation axioms for formal algebraic spaces

0AJ4 This section is about "absolute" separation conditions on formal algebraic spaces. We will discuss separation conditions for morphisms of formal algebraic spaces later.

0AJ5 Lemma 70.11.1. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. The following are equivalent
(1) the reduction of $X$ (Lemma 70.7.2) is a quasi-separated algebraic space,
(2) for $U \rightarrow X, V \rightarrow X$ with $U, V$ quasi-compact schemes the fibre product $U \times_{X} V$ is quasi-compact,
(3) for $U \rightarrow X, V \rightarrow X$ with $U, V$ affine the fibre product $U \times_{X} V$ is quasicompact.

Proof. Observe that $U \times_{X} V$ is a scheme by Lemma 70.7.3. Let $U_{\text {red }}, V_{\text {red }}, X_{\text {red }}$ be the reduction of $U, V, X$. Then

$$
U_{\text {red }} \times_{X_{\text {red }}} V_{\text {red }}=U_{\text {red }} \times_{X} V_{\text {red }} \rightarrow U \times_{X} V
$$

is a thickening of schemes. From this the equivalence of (1) and (2) is clear, keeping in mind the analogous lemma for algebraic spaces, see Properties of Spaces, Lemma 53.3.3. We omit the proof of the equivalence of (2) and (3).

0AJ6 Lemma 70.11.2. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. The following are equivalent
(1) the reduction of $X$ (Lemma 70.7.2) is a separated algebraic space,
(2) for $U \rightarrow X, V \rightarrow X$ with $U$, $V$ affine the fibre product $U \times_{X} V$ is affine and

$$
\mathcal{O}(U) \otimes_{\mathbf{z}} \mathcal{O}(V) \longrightarrow \mathcal{O}\left(U \times_{X} V\right)
$$

is surjective.
Proof. If (2) holds, then $X_{r e d}$ is a separated algebraic space by applying Properties of Spaces, Lemma 53.3.3 to morphisms $U \rightarrow X_{\text {red }}$ and $V \rightarrow X_{\text {red }}$ with $U, V$ affine and using that $U \times_{X_{\text {red }}} V=U \times_{X} V$.
Assume (1). Let $U \rightarrow X$ and $V \rightarrow X$ be as in (2). Observe that $U \times_{X} V$ is a scheme by Lemma 70.7.3. Let $U_{\text {red }}, V_{\text {red }}, X_{\text {red }}$ be the reduction of $U, V, X$. Then

$$
U_{\text {red }} \times_{X_{\text {red }}} V_{\text {red }}=U_{\text {red }} \times_{X} V_{\text {red }} \rightarrow U \times_{X} V
$$

is a thickening of schemes. It follows that $\left(U \times_{X} V\right)_{\text {red }}=\left(U_{\text {red }} \times_{X_{\text {red }}} V_{\text {red }}\right)_{\text {red }}$. In particular, we see that $\left(U \times_{X} V\right)_{\text {red }}$ is an affine scheme and that

$$
\mathcal{O}(U) \otimes_{\mathbf{z}} \mathcal{O}(V) \longrightarrow \mathcal{O}\left(\left(U \times_{X} V\right)_{r e d}\right)
$$

is surjective, see Properties of Spaces, Lemma 53.3.3. Then $U \times_{X} V$ is affine by Limits of Spaces, Proposition57.15.2. On the other hand, the morphism $U \times_{X} V \rightarrow$ $U \times V$ of affine schemes is the composition

$$
U \times_{X} V=X \times_{\left(X \times_{S} X\right)}\left(U \times_{S} V\right) \rightarrow U \times_{S} V \rightarrow U \times V
$$

The first morphism is a monomorphism and locally of finite type (Lemma 70.7.3). The second morphism is an immersion (Schemes, Lemma 25.21.10). Hence the composition is a monomorphism which is locally of finite type. On the other hand, the composition is integral as the map on underlying reduced affine schemes is a closed immersion by the above and hence universally closed (use Morphisms, Lemma 28.43.7). Thus the ring map

$$
\mathcal{O}(U) \otimes_{\mathbf{z}} \mathcal{O}(V) \longrightarrow \mathcal{O}\left(U \times_{X} V\right)
$$

is an epimorphism which is integral of finite type hence finite hence surjective (use Morphisms, Lemma 28.43.4 and Algebra, Lemma 10.106.6).

0AJ7 Definition 70.11.3. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. We say
(1) $X$ is quasi-separated if the equivalent conditions of Lemma 70.11.1 are satisfied.
(2) $X$ is separated if the equivalent conditions of Lemma 70.11 .2 are satisfied. The following lemma implies in particular that the completed tensor product of weakly admissible topological rings is a weakly admissible topological ring.

0AN3 Lemma 70.11.4. Let $S$ be a scheme. Let $X \rightarrow Z$ and $Y \rightarrow Z$ be morphisms of formal algebraic spaces over $S$. Assume $Z$ separated.
(1) If $X$ and $Y$ are affine formal algebraic spaces, then so is $X \times{ }_{Z} Y$.
(2) If $X$ and $Y$ are McQuillan affine formal algebraic spaces, then so is $X \times_{Z}$ $Y$.
(3) If $X, Y$, and $Z$ are McQuillan affine formal algebraic spaces corresponding to the weakly admissible topological $S$-algebras $A, B$, and $C$, then $X \times{ }_{Z} Y$ corresponds to $A \widehat{\otimes}_{C} B$.

Proof. Write $X=\operatorname{colim} X_{\lambda}$ and $Y=\operatorname{colim} Y_{\mu}$ as in Definition 70.5.1. Then $X \times{ }_{Z} Y=\operatorname{colim} X_{\lambda} \times_{Z} Y_{\mu}$. Since $Z$ is separated the fibre products are affine, hence we see that (1) holds. Assume $X$ and $Y$ corresponds to the weakly admissible topological $S$-algebras $A$ and $B$ and $X_{\lambda}=\operatorname{Spec}\left(A / I_{\lambda}\right)$ and $Y_{\mu}=\operatorname{Spec}\left(B / J_{\mu}\right)$. Then

$$
X_{\lambda} \times_{Z} Y_{\mu} \rightarrow X_{\lambda} \times Y_{\mu} \rightarrow \operatorname{Spec}(A \otimes B)
$$

is a closed immersion. Thus one of the conditions of Lemma 70.5.6 holds and we conclude that $X \times_{Z} Y$ is McQuillan. If also $Z$ is McQuillan corresponding to $C$, then

$$
X_{\lambda} \times_{Z} Y_{\mu}=\operatorname{Spec}\left(A / I_{\lambda} \otimes_{C} B / J_{\mu}\right)
$$

hence we see that the weakly admissible topological ring corresponding to $X \times_{Z} Y$ is the completed tensor product (see Definition 70.4.6).

0APX Lemma 70.11.5. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. Let $U \rightarrow X$ be a morphism where $U$ is a separated algebraic space over $S$. Then $U \rightarrow X$ is separated.

Proof. The statement makes sense because $U \rightarrow X$ is representable by algebraic spaces (Lemma 70.7.4). Let $T$ be a scheme and $T \rightarrow X$ a morphism. We have to show that $U \times_{X} T \rightarrow T$ is separated. Since $U \times_{X} T \rightarrow U \times_{S} T$ is a monomorphism, it suffices to show that $U \times_{S} T \rightarrow T$ is separated. As this is the base change of $U \rightarrow S$ this follows. We used in the argument above: Morphisms of Spaces, Lemmas 54.4.4, 54.4.8, 54.10.3, and 54.4.11.

### 70.12. Quasi-compact formal algebraic spaces

0AJ8 Here is the characterization of quasi-compact formal algebraic spaces.
0AJ9 Lemma 70.12.1. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. The following are equivalent
(1) the reduction of $X$ (Lemma 70.7.2) is a quasi-compact algebraic space,
(2) we can find $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ as in Definition 70.7.1 with I finite,
(3) there exists a morphism $Y \rightarrow X$ representable by algebraic spaces which is étale and surjective and where $Y$ is an affine formal algebraic space.
Proof. Omitted.

0AJA Definition 70.12.2. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. We say $X$ is quasi-compact if the equivalent conditions of Lemma 70.12 .1 are satisfied.

0AJB Lemma 70.12.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The following are equivalent
(1) the induced map $f_{\text {red }}: X_{\text {red }} \rightarrow Y_{\text {red }}$ between reductions (Lemma 70.7.2) is a quasi-compact morphism of algebraic spaces,
(2) for every quasi-compact scheme $T$ and morphism $T \rightarrow Y$ the fibre product $X \times_{Y} T$ is a quasi-compact formal algebraic space,
(3) for every affine scheme $T$ and morphism $T \rightarrow Y$ the fibre product $X \times_{Y} T$ is a quasi-compact formal algebraic space, and
(4) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 such that each $X \times_{Y} Y_{j}$ is a quasi-compact formal algebraic space.

Proof. Omitted.
0AJC Definition 70.12.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. We say $f$ is quasi-compact if the equivalent conditions of Lemma 70.12.3 are satisfied.

This agrees with the already existing notion when the morphism is representable by algebraic spaces (and in particular when it is representable).
0AM2 Lemma 70.12.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$ which is representable by algebraic spaces. Then $f$ is quasicompact in the sense of Definition 70.12.4 if and only if $f$ is quasi-compact in the sense of Bootstrap, Definition 67.4.1.

Proof. This is immediate from the definitions and Lemma 70.12.3.

### 70.13. Quasi-compact and quasi-separated formal algebraic spaces

0AJD The following result is due to Yasuda, see Yas09, Proposition 3.32].
0AJE Lemma 70.13.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated formal algebraic space over $S$. Then $X=\operatorname{colim} X_{\lambda}$ for a system of algebraic spaces $\left(X_{\lambda}, f_{\lambda \mu}\right)$ over a directed partially ordered set $\Lambda$ where each $f_{\lambda \mu}$ : $X_{\lambda} \rightarrow X_{\mu}$ is a thickening.

Proof. By Lemma 70.12.1 we may choose an affine formal algebraic space $Y$ and a representable surjective étale morphism $Y \rightarrow X$. Write $Y=\operatorname{colim} Y_{\lambda}$ as in Definition 70.5.1.
Pick $\lambda \in \Lambda$. Then $Y_{\lambda} \times_{X} Y$ is a scheme by Lemma 70.5.11. The reduction (Lemma 70.7.2 of $Y_{\lambda} \times_{X} Y$ is equal to the reduction of $Y_{\text {red }} \times{ }_{X_{r e d}} Y_{\text {red }}$ which is quasicompact as $X$ is quasi-separated and $Y_{\text {red }}$ is affine. Therefore $Y_{\lambda} \times_{X} Y$ is a quasicompact scheme. Hence there exists a $\mu \geq \lambda$ such that $\mathrm{pr}_{2}: Y_{\lambda} \times_{X} Y \rightarrow Y$ factors through $Y_{\mu}$, see Lemma 70.5.4 Let $Z_{\lambda}$ be the scheme theoretic image of the morphism $\mathrm{pr}_{2}: Y_{\lambda} \times_{X} Y \rightarrow Y_{\mu}$. This is independent of the choice of $\mu$ and we can and will think of $Z_{\lambda} \subset Y$ as the scheme theoretic image of the morphism $\operatorname{pr}_{2}: Y_{\lambda} \times_{X} Y \rightarrow Y$. Observe that $Z_{\lambda}$ is also equal to the scheme theoretic image of the morphism $\mathrm{pr}_{1}: Y \times_{X} Y_{\lambda} \rightarrow Y$ since this is isomorphic to the morphism used to define $Z_{\lambda}$. We claim that $Z_{\lambda} \times_{X} Y=Y \times_{X} Z_{\lambda}$ as subfunctors of $Y \times_{X} Y$. Namely,

Yas09, Proposition
since $Y \rightarrow X$ is étale we see that $Z_{\lambda} \times_{X} Y$ is the scheme theoretic image of the morphism

$$
\operatorname{pr}_{13}=\operatorname{pr}_{1} \times \operatorname{id}_{Y}: Y \times_{X} Y_{\lambda} \times_{X} Y \longrightarrow Y \times_{X} Y
$$

by Morphisms of Spaces, Lemma 54.16.3. By the same token, $Y \times_{X} Z_{\lambda}$ is the scheme theoretic image of the morphism

$$
\operatorname{pr}_{13}=\operatorname{id}_{Y} \times \operatorname{pr}_{2}: Y \times_{X} Y_{\lambda} \times_{X} Y \longrightarrow Y \times_{X} Y
$$

The claim follows. Then $R_{\lambda}=Z_{\lambda} \times_{X} Y=Y \times_{X} Z_{\lambda}$ together with the morphism $R_{\lambda} \rightarrow Z_{\lambda} \times{ }_{S} Z_{\lambda}$ defines an étale equivalence relation. In this way we obtain an algebraic space $X_{\lambda}=Z_{\lambda} / R_{\lambda}$. By construction the diagram

is cartesian (because $X$ is the coequalizer of the two projections $R=Y \times_{X} Y \rightarrow Y$, because $Z_{\lambda} \subset Y$ is $R$-invariant, and because $R_{\lambda}$ is the restriction of $R$ to $Z_{\lambda}$ ). Hence $X_{\lambda} \rightarrow X$ is representable and a closed immersion, see Spaces, Lemma 52.11.5. On the other hand, since $Y_{\lambda} \subset Z_{\lambda}$ we see that $\left(X_{\lambda}\right)_{\text {red }}=X_{\text {red }}$, in other words, $X_{\lambda} \rightarrow X$ is a thickening. Finally, we claim that

$$
X=\operatorname{colim} X_{\lambda}
$$

We have $Y \times_{X} X_{\lambda}=Z_{\lambda} \supset Y_{\lambda}$. Every morphism $T \rightarrow X$ where $T$ is a scheme over $S$ lifts étale locally to a morphism into $Y$ which lifts étale locally into a morphism into some $Y_{\lambda}$. Hence $T \rightarrow X$ lifts étale locally on $T$ to a morphism into $X_{\lambda}$. This finishes the proof.

0AJF Remark 70.13.2. In this remark we translate the statement and proof of Lemma 70.13 .1 into the language of formal schemes à la EGA. Looking at Remark 70.8.3 we see that the lemma can be translated as follows
(*) Every quasi-compact and quasi-separated formal scheme has a fundamental system of ideals of definition.
To prove this we first use the induction principle (reformulated for quasi-compact and quasi-separated formal schemes) of Cohomology of Schemes, Lemma 29.4.1 to reduce to the following situation: $\mathfrak{X}=\mathfrak{U} \cup \mathfrak{V}$ with $\mathfrak{U}$, $\mathfrak{V}$ open formal subschemes, with $\mathfrak{V}$ affine, and the result is true for $\mathfrak{U}, \mathfrak{V}$, and $\mathfrak{U} \cap \mathfrak{V}$. Pick any ideals of definition $\mathcal{I} \subset \mathcal{O}_{\mathfrak{U}}$ and $\mathcal{J} \subset \mathcal{O}_{\mathfrak{V}}$. By our assumption that we have a fundamental system of ideals of definition on $\mathfrak{U}$ and $\mathfrak{V}$ and because $\mathfrak{U} \cap \mathfrak{V}$ is quasi-compact, we can find ideals of definition $\mathcal{I}^{\prime} \subset \mathcal{I}$ and $\mathcal{J}^{\prime} \subset \mathcal{J}$ such that

$$
\left.\left.\mathcal{I}^{\prime}\right|_{\mathfrak{U} \cap \mathfrak{V} \mathcal{J}} \subset \mathcal{J}\right|_{\mathfrak{L} \cap \mathfrak{V}} \quad \text { and }\left.\left.\quad \mathcal{J}^{\prime}\right|_{\mathfrak{U} \cap \mathfrak{V}} \subset \mathcal{I}\right|_{\mathfrak{U} \cap \mathfrak{V}}
$$

Let $U \rightarrow U^{\prime} \rightarrow \mathfrak{U}$ and $V \rightarrow V^{\prime} \rightarrow \mathfrak{V}$ be the closed immersions determined by the ideals of definition $\mathcal{I}^{\prime} \subset \mathcal{I} \subset \mathcal{O}_{\mathfrak{U}}$ and $\mathcal{J}^{\prime} \subset \mathcal{J} \subset \mathcal{O}_{\mathfrak{U}}$. Let $\mathfrak{U} \cap V$ denote the open subscheme of $V$ whose underlying topological space is that of $\mathfrak{U} \cap \mathfrak{V}$. Similarly for $U \cap \mathfrak{V}$. Then we consider

$$
Z_{U}=\text { scheme theoretic image of } U \amalg(\mathfrak{U} \cap V) \longrightarrow U^{\prime}
$$

and

$$
Z_{V}=\text { scheme theoretic image of }(U \cap \mathfrak{V}) \amalg V \longrightarrow V^{\prime}
$$

Since taking scheme theoretic images of quasi-compact morphisms commutes with restriction to opens (Morphisms, Lemma 28.6.3) we see that $Z_{U} \cap \mathfrak{V}=\mathfrak{U} \cap Z_{V}$. Thus $Z_{U}$ and $Z_{V}$ glue to a scheme $Z$ which comes equipped with a morphism $Z \rightarrow \mathfrak{X}$. Analogous to the discussion in Remark 70.8 .2 we see that $Z$ corresponds to a weak ideal of definition $\mathcal{I}_{Z} \subset \mathcal{O}_{\mathfrak{X}}$. Note that $U \subset Z_{U} \subset Z$ and that $V \subset Z_{V} \subset Z$. Thus the collection of all $\mathcal{I}_{Z}$ constructed in this manner forms a fundamental system of weak ideals of definition. Hence a subfamily gives a fundamental system of ideals of definition, see Remark 70.8.3.

### 70.14. Morphisms representable by algebraic spaces

0AJG Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces which is representable by algebraic spaces. For these types of morphisms we have a lot of theory at our disposal, thanks to the work done in the chapters on algebraic spaces.
0APY Lemma 70.14.1. The composition of morphisms representable by algebraic spaces is representable by algebraic spaces. The same holds for representable (by schemes).
Proof. See Bootstrap, Lemma 67.3.8.
0APZ Lemma 70.14.2. A base change of a morphism representable by algebraic spaces is representable by algebraic spaces. The same holds for representable (by schemes).
Proof. See Bootstrap, Lemma 67.3.3.
0AQ0 Lemma 70.14.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of formal algebraic spaces over $S$. If $g \circ f: X \rightarrow Z$ is representable by algebraic spaces, then $f: X \rightarrow Y$ is representable by algebraic spaces.
Proof. Note that the diagonal of $Y \rightarrow Z$ is representable by Lemma 70.10.4. Thus $U \rightarrow V$ is representable by algebraic spaces by Bootstrap, Lemma 67.3.10

The property of being representable by algebraic spaces is local on the source and the target.

0AN4 Lemma 70.14.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The following are equivalent:
(1) the morphism $f$ is representable by algebraic spaces,
(2) there exists a commutative diagram

where $U, V$ are formal algebraic spaces, the vertical arrows are representable by algebraic spaces, $U \rightarrow X$ is surjective étale, and $U \rightarrow V$ is representable by algebraic spaces,
(3) for any commutative diagram

where $U, V$ are formal algebraic spaces and the vertical arrows are representable by algebraic spaces, the morphism $U \rightarrow V$ is representable by algebraic spaces,
(4) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 and for each $j$ a covering $\left\{X_{j i} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Definition 70.7.1 such that $X_{j i} \rightarrow Y_{j}$ is representable by algebraic spaces for each $j$ and $i$,
(5) there exist a covering $\left\{X_{i} \rightarrow X\right\}$ as in Definition 70.7.1 and for each $i$ a factorization $X_{i} \rightarrow Y_{i} \rightarrow Y$ where $Y_{i}$ is an affine formal algebraic space, $Y_{i} \rightarrow Y$ is representable by algebraic spaces, such that $X_{i} \rightarrow Y_{i}$ is representable by algebraic spaces, and
(6) add more here.

Proof. It is clear that (1) implies (2) because we can take $U=X$ and $V=Y$. Conversely, (2) implies (1) by Bootstrap, Lemma 67.11.3 applied to $U \rightarrow X \rightarrow Y$.
Assume (1) is true and consider a diagram as in (3). Then $U \rightarrow Y$ is representable by algebraic spaces (as the composition $U \rightarrow X \rightarrow Y$, see Bootstrap, Lemma 67.3 .8 and factors through $V$. Thus $U \rightarrow V$ is representable by algebraic spaces by Lemma 70.14.3.
It is clear that (3) implies (2). Thus now (1) - (3) are equivalent.
Observe that the condition in (4) makes sense as the fibre product $Y_{j} \times_{Y} X$ is a formal algebraic space by Lemma 70.10.3. It is clear that (4) implies (5).

Assume $X_{i} \rightarrow Y_{i} \rightarrow Y$ as in (5). Then we set $V=\coprod Y_{i}$ and $U=\coprod X_{i}$ to see that (5) implies (2).

Finally, assume (1) - (3) are true. Thus we can choose any covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 and for each $j$ any covering $\left\{X_{j i} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Definition 70.7.1. Then $X_{i j} \rightarrow Y_{j}$ is representable by algebraic spaces by (3) and we see that (4) is true. This concludes the proof.

0AJH Lemma 70.14.5. Let $S$ be a scheme. Let $Y$ be an affine formal algebraic space over $S$. Let $f: X \rightarrow Y$ be a map of sheaves on $(S c h / S)_{\text {fppf }}$ which is representable by algebraic spaces. Then $X$ is a formal algebraic space.

Proof. Write $Y=\operatorname{colim} Y_{\lambda}$ as in Definition 70.5.1. For each $\lambda$ the fibre product $X \times_{Y} Y_{\lambda}$ is an algebraic space. Hence $X=\operatorname{colim} X \times_{Y} Y_{\lambda}$ is a formal algebraic space by Lemma 70.8.1.

0AJI Lemma 70.14.6. Let $S$ be a scheme. Let $Y$ be a formal algebraic space over $S$. Let $f: X \rightarrow Y$ be a map of sheaves on $(S c h / S)_{\text {fppf }}$ which is representable by algebraic spaces. Then $X$ is a formal algebraic space.

Proof. Let $\left\{Y_{i} \rightarrow Y\right\}$ be as in Definition 70.7.1. Then $X \times_{Y} Y_{i} \rightarrow X$ is a family of morphisms representable by algebraic spaces, étale, and jointly surjective. Thus it suffices to show that $X \times_{Y} Y_{i}$ is a formal algebraic space, see Lemma 70.10.1. This follows from Lemma 70.14 .5

0AKN Lemma 70.14.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of affine formal algebraic spaces which is representable by algebraic spaces. Then $f$ is representable (by schemes) and affine.

Proof. The first assertion follows from Lemma 70.5.11. Write $Y=\operatorname{colim} Y_{\mu}$ and $X=\operatorname{colim} X_{\lambda}$ as in Definition 70.5.1. For the second, let $T \rightarrow Y$ be a morphism where $T$ is a scheme over $S$. We have to show that $X \times_{Y} T \rightarrow T$ is affine, see Spaces, Definition 52.5.1. To do this we may assume that $T$ is affine and we have to prove that $X \times_{Y} T$ is affine. In this case $T \rightarrow Y$ factors through $Y_{\mu} \rightarrow Y$ for some $\mu$, see Lemma 70.5.4. Since $f$ is quasi-compact we see that $X \times_{Y} T$ is quasi-compact (Lemma 70.12.3). Hence $X \times_{Y} T \rightarrow X$ factors through $X_{\lambda}$ for some $\lambda$. Similarly $X_{\lambda} \rightarrow Y$ factors through $Y_{\mu}$ after increasing $\mu$. Then $X \times_{Y} T=X_{\lambda} \times_{Y_{\mu}} T$. We conclude as fibre products of affine schemes are affine.

0AKP Lemma 70.14.8. Let $S$ be a scheme. Let $Y$ be an affine formal algebraic space. Let $f: X \rightarrow Y$ be a map of sheaves on $(S c h / S)_{\text {fppf }}$ which is representable and affine. Then
(1) $X$ is an affine formal algebraic space.
(2) if $Y$ is countably indexed, then $X$ is countably indexed.
(3) if $Y$ is adic*, then $X$ is adic*,
(4) if $Y$ is Noetherian and $f$ is (locally) of finite type, then $X$ is Noetherian.

Proof. Proof of (1). Write $Y=\operatorname{colim}_{\lambda \in \Lambda} Y_{\lambda}$ as in Definition 70.5.1. Since $f$ is representable and affine, the fibre products $X_{\lambda}=Y_{\lambda} \times_{Y} X$ are affine. And $X=\operatorname{colim} Y_{\lambda} \times_{Y} X$. Thus $X$ is an affine formal algebraic space.
Proof of (2). If $Y$ is countably indexed, then in the argument above we may assume $\Lambda$ is countable. Then we immediately see that $X$ is countably indexed too.

Proof of (3). Assume $Y$ is adic*. Then $Y=\operatorname{Spf}(B)$ for some adic topological ring $B$ which has a finitely generated ideal $J$ such that $\left\{J^{n}\right\}$ is a fundamental system of open ideals. Of course, then $Y=\operatorname{colim} \operatorname{Spec}\left(B / J^{n}\right)$. The schemes $X \times_{Y} \operatorname{Spec}\left(B / J^{n}\right)$ are affine and we can write $X \times_{Y} \operatorname{Spec}\left(B / J^{n}\right)=\operatorname{Spec}\left(A_{n}\right)$. Then $X=\operatorname{colim} \operatorname{Spec}\left(A_{n}\right)$. The $B$-algebra maps $A_{n+1} \rightarrow A_{n}$ are surjective and induce isomorphisms $A_{n+1} / J^{n} A_{n+1} \rightarrow A_{n}$. By Algebra, Lemma 10.97.1 the ring $A=\lim A_{n}$ is $J$-adically complete and $A / J^{n} A=A_{n}$. Hence $X=\operatorname{Spf}\left(A^{\wedge}\right)$ is adic*.
Proof of (4). Combining (3) with Lemma 70.6 .3 we see that $X$ is adic*. Thus we can use the criterion of Lemma 70.6.5. First, it tells us the affine schemes $Y_{\lambda}$ are Noetherian. Then $X_{\lambda} \rightarrow Y_{\lambda}$ is of finite type, hence $X_{\lambda}$ is Noetherian too (Morphisms, Lemma 28.15.6). Then the criterion tells us $X$ is Noetherian and the proof is complete.

0AKQ Lemma 70.14.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of affine formal algebraic spaces which is representable by algebraic spaces. Then
(1) if $Y$ is countably indexed, then $X$ is countably indexed.
(2) if $Y$ is adic*, then $X$ is adic*,
(3) if $Y$ is Noetherian and $f$ is (locally) of finite type, then $X$ is Noetherian.

Proof. Combine Lemmas 70.14.7 and 70.14.8.
0AN5 Lemma 70.14.10. Let $S$ be a scheme. Let $\varphi: A \rightarrow B$ be a continuous map of weakly admissible topological rings over $S$. The following are equivalent
(1) $\operatorname{Spf}(\varphi): \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is representable by algebraic spaces,
(2) $\operatorname{Spf}(\varphi): \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is representable (by schemes),
(3) $\varphi$ is taut, see Definition 70.4.9.

Proof. Parts (1) and (2) are equivalent by Lemma 70.14.7.
Assume the equivalent conditions (1) and (2) hold. If $I \subset A$ is a weak ideal of definition, then $\operatorname{Spec}(A / I) \rightarrow \operatorname{Spf}(A)$ is representable and a thickening (this is clear from the construction of the formal spectrum but it also follows from Lemma 70.5.6). Then $\operatorname{Spec}(A / I) \times{ }_{\operatorname{Spf}(A)} \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(B)$ is representable and a thickening as a base change. Hence by Lemma 70.5.6 there is a weak ideal of definition $J(I) \subset B$ such that $\operatorname{Spec}(A / I) \times_{\operatorname{Spf}(A)} \operatorname{Spf}(B)=\operatorname{Spec}(B / J(I))$ as subfunctors of $\operatorname{Spf}(B)$. We obtain a cartesian diagram

By Lemma 70.11 .4 we see that $B / J(I)=B \widehat{\otimes}_{A} A / I$. It follows that $J(I)$ is the closure of the ideal $\varphi(I) B$, see Lemma 70.4.11. Since $\operatorname{Spf}(A)=\operatorname{colim} \operatorname{Spec}(A / I)$ with $I$ as above, we find that $\operatorname{Spf}(B)=$ colim $\operatorname{Spec}(B / J(I))$. Thus the ideals $J(I)$ form a fundamental system of weak ideals of definition (see Lemma 70.5.6). Hence (3) holds.

Assume (3) holds. For a weak ideal of definition $I \subset A$ denote $J(I)$ the closure of $\varphi(I) B$. By Lemma 70.4 .8 the ideal $J(I)$ is a weak ideal of definition of $B$. Using Lemmas 70.11 .4 and 70.4 .11 we see that the diagram displayed above is cartesian. Since every morphism $T \rightarrow \operatorname{Spf}(A)$ with $T$ quasi-compact factors through $\operatorname{Spec}(A / I)$ for some weak ideal of definition $I$ (Lemma 70.5.4) we conclude that $\operatorname{Spf}(\varphi)$ is representable, i.e., (2) holds. This finishes the proof.

0AN6 Example 70.14.11. Let $B$ be a weakly admissible topological ring. Let $B \rightarrow A$ be a ring map (no topology). Then we can can consider

$$
A^{\wedge}=\lim A / J A
$$

where the limit is over all weak ideals of definition $J$ of $B$. Then $A^{\wedge}$ (endowed with the limit topology) is a complete linearly topologized ring. The (open) kernel $I$ of the surjection $A^{\wedge} \rightarrow A / J A$ is the closure of $J A^{\wedge}$, see Lemma 70.4.2. By Lemma 70.4 .8 we see that $I$ consists of topologically nilpotent elements. Thus $I$ is a weak ideal of definition of $A^{\wedge}$ and we conclude $A^{\wedge}$ is a weakly admissible topological ring. Thus $\varphi: B \rightarrow A^{\wedge}$ is taut map of weakly admissible topological rings and

$$
\operatorname{Spf}\left(A^{\wedge}\right) \longrightarrow \operatorname{Spf}(B)
$$

is a special case of the phenomenon studied in Lemma 70.14.10.
0AN7 Remark 70.14.12 (Warning). Lemma 70.14 .10 does not mean that given a morphism $f: X \rightarrow Y$ of affine formal algebraic spaces with $f$ representable and $Y$ McQuillan we have that $X$ is McQuillan.

The warning above notwithstanding, we do have the following result.
0AN8 Lemma 70.14.13. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of affine formal algebraic spaces over $S$. Assume
(1) $Y$ is $M c Q u i l l a n$, i.e., equal to $\operatorname{Spf}(B)$ for some weakly admissible topological S-algebra B, and
(2) $f: Y \rightarrow X$ is representable by algebraic spaces and étale.

Then there exists an étale ring map $B \rightarrow A$ such that

$$
Y=\operatorname{Spf}\left(A^{\wedge}\right) \quad \text { where } \quad A^{\wedge}=\lim A / J A
$$

with $J \subset B$ running over the weak ideals of definition of $B$. In particular, $Y$ is McQuillan.

Proof. Choose a weak ideal of definition $J_{0} \subset B$. Set $Y_{0}=\operatorname{Spec}\left(B / J_{0}\right)$ and $X_{0}=Y_{0} \times_{Y} X$. Then $X_{0} \rightarrow Y_{0}$ is an étale morphism of affine schemes (see Lemma 70.14.7. Say $X_{0}=\operatorname{Spec}\left(A_{0}\right)$. By Algebra, Lemma 10.141 .11 we can find an étale algebra map $B \rightarrow A$ such that $A_{0} \cong A / J_{0} A$. Consider an ideal of definition $J \subset J_{0}$. As above we may write $\operatorname{Spec}(B / J) \times_{Y} X=\operatorname{Spec}(\bar{A})$ for some étale ring $\operatorname{map} B / J \rightarrow \bar{A}$. Then both $B / J \rightarrow \bar{A}$ and $B / J \rightarrow A / J A$ are étale ring maps lifting the étale ring map $B / J_{0} \rightarrow A_{0}$. By More on Algebra, Lemma 15.8.2 there is a unique $B / J$-algebra isomorphism $\varphi_{J}: A / J A \rightarrow \bar{A}$ lifting the identification modulo $J_{0}$. Since the maps $\varphi_{J}$ are unique they are compatible for varying $J$. Thus

$$
X=\operatorname{colim} \operatorname{Spec}(B / J) \times_{Y} X=\operatorname{colim} \operatorname{Spec}(A / J A)
$$

and we see that the lemma holds.
0AN9 Lemma 70.14.14. With notation and assumptions as in Lemma 70.14.13. The following are equivalent
(1) $f: X \rightarrow Y$ is surjective,
(2) $B \rightarrow A$ is faithfully flat,
(3) for every weak ideal of definition $J \subset B$ the ring map $B \rightarrow A / J A$ is faithfully flat, and
(4) for some weak ideal of definition $J \subset B$ the ring $\operatorname{map} B \rightarrow A / J A$ is faithfully flat.

Proof. Let $J \subset B$ be an ideal of definition. As every element of $J$ is topologically nilpotent, we see that every element of $1+J$ is a unit. It follows that $J$ is contained in the Jacobson radical of $B$ (Algebra, Lemma 10.18.1). Hence a flat ring map $B \rightarrow A$ is faithfully flat if and only if $B / J \rightarrow A / \overline{J A}$ is faithfully flat (Algebra, Lemma 10.38 .16 ). In this way we see that (2) - (4) are equivalent. If (1) holds, then for every weak ideal of definition $J \subset B$ the morphism $\operatorname{Spec}(A / J A)=\operatorname{Spec}(B / J) \times{ }_{Y} X \rightarrow$ $\operatorname{Spec}(B / J)$ is surjective which implies (3). Conversely, assume (3). A morphism $T \rightarrow Y$ with $T$ quasi-compact factors through $\operatorname{Spec}(B / J)$ for some ideal of definition $J$ of $B$ (Lemma 70.5.4). Hence $X \times_{Y} T=\operatorname{Spec}(A / J A) \times{ }_{\operatorname{Spec}(B / J)} T \rightarrow T$ is surjective as a base change of the surjective morphism $\operatorname{Spec}(A / J A) \rightarrow \operatorname{Spec}(B / J)$. Thus (1) holds.

### 70.15. Types of formal algebraic spaces

$0 A K R$ In this section we define Noetherian, adic*, and countably indexed formal algebraic spaces. The types adic, classical, and McQuillan are missing as we do not know how to prove the analogue of the following lemmas for those cases.

0AKS Lemma 70.15.1. Let $S$ be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, and flat. Then $X$ is countably indexed if and only if $Y$ is countably indexed.

Proof. Assume $X$ is countably indexed. We write $X=\operatorname{colim} X_{n}$ as in Lemma 70.6.1. Write $Y=\operatorname{colim} Y_{\lambda}$ as in Definition 70.5.1. For every $n$ we can pick a $\lambda_{n}$ such that $X_{n} \rightarrow Y$ factors through $Y_{\lambda_{n}}$, see Lemma 70.5.4. On the other hand, for every $\lambda$ the scheme $Y_{\lambda} \times_{Y} X$ is affine (Lemma 70.14.7) and hence $Y_{\lambda} \times_{Y} X \rightarrow X$ factors through $X_{n}$ for some $n$ (Lemma 70.5.4). Picture

If we can show the dotted arrow exists, then we conclude that $Y=\operatorname{colim} Y_{\lambda_{n}}$ and $Y$ is countably indexed. To do this we pick a $\mu$ such that we have the solid arrows in the diagram. Say $Y_{\mu}=\operatorname{Spec}\left(B_{\mu}\right)$, the closed subscheme $Y_{\lambda}$ corresponds to $J \subset B_{\mu}$, and the closed subscheme $Y_{\lambda_{n}}$ corresponds to $J^{\prime} \subset B_{\mu}$. We are trying to show that $J \subset J^{\prime}$. By the diagram above we know $J A_{\mu} \subset J^{\prime} A_{\mu}$ where $Y_{\mu} \times_{Y} X=\operatorname{Spec}\left(A_{\mu}\right)$. Since $X \rightarrow Y$ is surjective and flat the morphism $Y_{\lambda} \times_{Y} X \rightarrow Y_{\lambda}$ is a faithfully flat morphism of affine schemes, hence $B_{\mu} \rightarrow A_{\mu}$ is faithfully flat. Thus $J \subset J^{\prime}$ as desired.

Assume $Y$ is countably indexed. Then $X$ is countably indexed by Lemma 70.14.9.

0AKT Lemma 70.15.2. Let $S$ be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, and flat. Then $X$ is adic* if and only if $Y$ is adic*.

Proof. Assume $Y$ is adic*. Then $X$ is adic* by Lemma 70.14 .9
Assume $X$ is adic*. Write $X=\operatorname{Spf}(A)$ for some adic ring $A$ which has a finitely generated ideal $I$ such that $\left\{I^{n}\right\}$ is a fundamental system of open ideals. By Lemmas 70.15 .1 we see that $Y$ is countably indexed. Thus, by Lemma 70.6.4 we can write $Y=\operatorname{Spf}(B)$ where $B$ is a weakly admissible topological ring with a countable fundamental system $\left\{J_{m}\right\}$ of weak ideals of definition. Set $Y_{m}=\operatorname{Spec}\left(B / J_{m}\right)$ so that $Y=\operatorname{colim} Y_{m}$. The scheme $Y_{m} \times_{Y} X$ is affine (Lemma 70.14.7) and we have $X=\operatorname{colim} Y_{m} \times_{Y} X$. Say $Y_{m} \times_{Y} X=\operatorname{Spec}\left(A_{m}\right)$ so that $B / J_{m} \rightarrow A_{m}$ is a faithfully flat ring map. It follows from Lemma 70.11 .4 that $\operatorname{Ker}\left(A \rightarrow A_{m}\right)$ is the closure of $J_{m} A$.

Choose $n \geq 1$. There exists an $m$ such that $\operatorname{Spec}\left(A / I^{n}\right) \rightarrow Y$ factors through $Y_{m}$. In terms of ideals

0 AKU

$$
\begin{equation*}
\forall n \exists m, J_{m} A \subset I^{n} \tag{70.15.2.1}
\end{equation*}
$$

Choose $m \geq 1$. We can find an $n$ such that the morphism $\operatorname{Spec}\left(A_{m}\right) \rightarrow X$ factors through $\operatorname{Spec}\left(A / I^{n}\right)$. In terms of ideals

0AKV (70.15.2.2)

$$
\forall m \exists n, I^{n} \subset \operatorname{Ker}\left(A \rightarrow A_{m}\right)
$$

Fix an $m$. Pick $n$ such that $I^{n} \subset \operatorname{Ker}\left(A \rightarrow A_{m}\right) 70.15 .2 .2$. Choose generators $f_{1}, \ldots, f_{r}$ of $I$. For any $E=\left(e_{1}, \ldots, e_{r}\right)$ with $|E|=\sum e_{i}=n$ write

$$
f_{1}^{e_{1}} \ldots f_{r}^{e_{r}}=\sum g_{E, j} a_{E, j}+\delta_{E}
$$

with $g_{E, j} \in J_{m}, a_{E, j} \in A$, and $\delta_{E} \in I^{n+1}$ (possible by the above). Let $J=\left(g_{E, j}\right) \subset$ $B$. Then we see that

$$
I^{n} \subset J A+I^{n+1}
$$

As $I$ is contained in the radical of $A$ and $I^{n}$ is finitely generated we see that $I^{n} \subset J A$ by Algebra, Lemma 10.19.1.
We first apply what we just proved as follows: since $I^{n} \subset J_{m} A$ we see that $J_{m} A$ is open in $A$, hence closed, hence $\operatorname{Ker}\left(A \rightarrow A_{m}\right)=J_{m} A$, in other words, $A_{m}=$ $A / J_{m} A$. This holds for every $m$.
Next, we pick $m$ with $J_{m} A \subset I$ 70.15.2.1). Then choose $J \subset J_{m}$ with $I^{n} \subset J A \subset I$ as above. For every $k \geq 1$ we define $\mathfrak{b}_{k}=\operatorname{Ker}\left(B \rightarrow A / J^{k} A\right)$. For every $k$ there exists an $m^{\prime}$ with $J_{m^{\prime}} \subset \mathfrak{b}_{k}$ as we have $I^{n k} \subset J^{k} A$ and we can apply 70.15.2.1. On the other hand, for every $m^{\prime}$ there exists a $k$ such that $I^{k} \subset J_{m^{\prime}} A$ because $J_{m^{\prime}} A$ is open. Then $\mathfrak{b}_{k}$ maps to zero in $A / J_{m^{\prime}} A$ which is faithfully flat over $B / J_{m^{\prime}}$. Hence $\mathfrak{b}_{k} \subset J_{m^{\prime}}$. In other words, we see that the topology on $B$ is defined by the sequence of ideals $\mathfrak{b}_{k}$. Note that $J^{k} \subset \mathfrak{b}_{k}$ which implies that $\mathfrak{b}_{k} A=J^{k} A$. In other words, we have reduced the problem to the situation discussed in the following paragraph.
We are given a ring map $B \rightarrow A$ where
(1) $B$ is a weakly admissible topological ring with a fundamental system $J_{1} \supset$ $J_{2} \supset J_{3} \supset \ldots$ of ideals of definition,
(2) $A$ is a ring complete with respect to a finitely generated ideal $I$,
(3) we have $J_{k} A=I^{k}$ for all $k$, and
(4) $B / J_{k} \rightarrow A / I^{k}$ is faithfully flat.

Pick $g_{1}, \ldots, g_{r} \in J_{1}$ whose images in $A / I^{2}$ generate $I / I^{2}$; this is possible because $J_{1} A / J_{2} A=I / I^{2}$. Then for all $k \geq 1$ we see that the elements $g^{E}=g_{1}^{e_{1}} \ldots g_{r}^{e_{r}}$ with $|E|=k$ are in $J_{k}$ and their classes in $J_{k} / J_{k+1}$ map to generators of $I^{k} / I^{k+1}$. Since $B / J_{k+1} \rightarrow A / I^{k+1}$ and $B / J_{k} \rightarrow A / I^{k}$ are flat we see that

$$
J_{k} / J_{k+1} \otimes_{B / J_{1}} A / I=J_{k} / J_{k+1} \otimes_{B / J_{k+1}} A / I^{k+1} \rightarrow I^{k} / I^{k+1}
$$

is an isomorphism (see More on Morphisms, Lemma 36.8.1). Since $B / J_{1} \rightarrow A / I$ is faithfully flat, we conclude that the classes of the elements $g^{E},|E|=k$ generate $J_{k} / J_{k+1}$. We claim that $J_{k}=\left(g^{E},|E|=k\right)$. Namely, suppose that $x_{k} \in J_{k}$. By the above we can write

$$
x_{k}=\sum_{|E|=k} b_{E, 0} g^{E}+x_{k+1}
$$

with $x_{k+1} \in J_{k+1}$ and some $b_{E, 0} \in B$. Now we can write $x_{k+1}$ as follows

$$
x_{k+1}=\sum_{|E|=k}\left(\sum_{\left|E^{\prime}\right|=1} b_{E, E^{\prime}} g^{E^{\prime}}\right) g^{E}+x_{k+2}
$$

because every multi-index of degree $k+1$ is a sum of a multi-index of degree $k$ and a multi-index of degree 1 . Continuing in this manner we can find $b_{E, E^{\prime}} \in B$ such that for every $l>1$ we have

$$
x_{k}=\sum_{|E|=k}\left(\sum_{0 \leq\left|E^{\prime}\right|<l} b_{E, E^{\prime}} g^{E^{\prime}}\right) g^{E}+x_{k+l}
$$

with some $x_{k+l} \in J_{k+l}$. Then we can finally define

$$
b_{E}=\sum_{E^{\prime}} b_{E, E^{\prime}} g^{E^{\prime}}
$$

as an element in $B$ and we see that $x_{k}=\sum b_{E} g^{E}$ as desired. This finishes the proof as now $J_{1}$ is finitely generated and $J_{k}=J_{1}^{k}$ for all $k \geq 1$.

0AKW Lemma 70.15.3. Let $S$ be a scheme. Let $X \rightarrow Y$ be a morphism of affine formal schemes which is representable by algebraic spaces, surjective, flat, and (locally) of finite type. Then $X$ is Noetherian if and only if $Y$ is Noetherian.

Proof. Observe that a Noetherian affine formal algebraic space is adic*, see Lemma 70.6.3. Thus by Lemma 70.15 .2 we may assume that both $X$ and $Y$ are adic*. We will use the criterion of Lemma 70.6 .5 to see that the lemma holds. Namely, write $Y=\operatorname{colim} Y_{n}$ as in Lemma 70.6.1. For each $n$ set $X_{n}=Y_{n} \times_{Y} X$. Then $X_{n}$ is an affine scheme (Lemma 70.14.7) and $X=\operatorname{colim} X_{n}$. Each of the morphisms $X_{n} \rightarrow Y_{n}$ is faithfully flat and of finite type. Thus the lemma follows from the fact that in this situation $X_{n}$ is Noetherian if and only if $Y_{n}$ is Noetherian, see Algebra, Lemma 10.156.1 (to go down) and Algebra, Lemma 10.30.1 (to go up).

0AKX Lemma 70.15.4. Let $S$ be a scheme. Let $P \in\{$ countably indexed, adic*, Noetherian $\}$. Let $X$ be a formal algebraic space over $S$. The following are equivalent
(1) if $Y$ is an affine formal algebraic space and $f: Y \rightarrow X$ is representable by algebraic spaces and étale, then $Y$ has property $P$,
(2) for some $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ as in Definition 70.7.1 each $X_{i}$ has property $P$.

Proof. It is clear that (1) implies (2). Assume (2) and let $Y \rightarrow X$ be as in (1). Since the fibre products $X_{i} \times_{Y} X$ are formal algebraic spaces (Lemma 70.10.2 we can pick coverings $\left\{X_{i j} \rightarrow X_{i} \times_{X} Y\right\}$ as in Definition 70.7.1. Since $Y$ is quasicompact, there exist $\left(i_{1}, j_{1}\right), \ldots,\left(i_{n}, j_{n}\right)$ such that

$$
X_{i_{1} j_{1}} \amalg \ldots \amalg X_{i_{n} j_{n}} \longrightarrow Y
$$

is surjective. Then $X_{i_{k} j_{k}} \rightarrow X_{i_{k}}$ is representable by algebraic spaces and étale hence $X_{i_{k} j_{k}}$ has property $P$ by Lemma 70.14 .9 . Then $X_{i_{1} j_{1}} \amalg \ldots \amalg X_{i_{n} j_{n}}$ is an affine formal algebraic space with property $P$ (small detail omitted on finite disjoint unions of affine formal algebraic spaces). Hence we conclude by applying one of Lemmas 70.15 .1 70.15.2 and 70.15 .3 .

The previous lemma clears the way for the following definition.
0AKY Definition 70.15.5. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. We say $X$ is locally countably indexed, locally adic*, or locally Noetherian if the equivalent conditions of Lemma 70.15 .4 hold for the corresponding property.

The formal completion of a locally Noetherian algebraic space along a closed is a locally Noetherian formal algebraic space.

0AQ1 Lemma 70.15.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $X_{/ T}$ be the formal completion of $X$ along $T$.
(1) If $X \backslash T \rightarrow X$ is quasi-compact, then $X_{/ T}$ is locally adic*.
(2) If $X$ is locally Noetherian, then $X_{/ T}$ is locally Noetherian.

Proof. Choose a surjective étale morphism $U \rightarrow X$ with $U=\coprod U_{i}$ a disjoint union of affine schemes, see Properties of Spaces, Lemma 53.6.1. Let $T_{i} \subset U_{i}$ be the inverse image of $T$. We have $X_{/ T} \times{ }_{X} U_{i}=\left(U_{i}\right)_{/ T_{i}}$ (small detail omitted). Hence $\left\{\left(U_{i}\right)_{/ T_{i}} \rightarrow X_{/ T}\right\}$ is a covering as in Definition 70.7.1. Moreover, if $X \backslash T \rightarrow X$ is quasi-compact, so is $U_{i} \backslash T_{i} \rightarrow U_{i}$ and if $X$ is locally Noetherian, so is $U_{i}$. Thus it suffices to prove the lemma in case $X$ is affine.

Assume $X=\operatorname{Spec}(A)$ is affine and $X \backslash T \rightarrow X$ is quasi-compact. Then there exists a finitely generated ideal $I=\left(f_{1}, \ldots, f_{r}\right) \subset A$ cutting out $T$ (Algebra, Lemma 10.28.1). If $Z=\operatorname{Spec}(B)$ is an affine scheme and $g: Z \rightarrow X$ is a morphism with $g(Z) \subset T$ (set theoretically), then $g^{\sharp}\left(f_{i}\right)$ is nilpotent in $B$ for each $i$. Thus $I^{n}$ maps to zero in $B$ for some $n$. Hence we see that $X_{/ T}=\operatorname{colim} \operatorname{Spec}\left(A / I^{n}\right)$ and $X$ is adic*.

Assume $X=\operatorname{Spec}(A)$ is affine with $A$ Noetherian. By the above we see that $X_{/ T}=\operatorname{Spf}\left(A^{\wedge}\right)$ where $A^{\wedge}$ is the $I$-adic completion of $A$ with respect to some ideal $I \subset A$. Then $X_{/ T}$ is Noetherian because $A^{\wedge}$ is so, see Algebra, Lemma 10.96.6.

### 70.16. Morphisms and continuous ring maps

0ANA In this section we denote $W A d m$ the category of weakly admissible topological rings and continuous ring homomorphisms. We define full subcategories

$$
W A d m \supset W A d m^{\text {count }} \supset W A d m^{\text {adic* }} \supset W A d m^{\text {Noeth }}
$$

whose objects are
(1) $W A d m^{\text {count }}$ : those weakly admissible topological rings $A$ which have a countable fundamental system of neighbourhoods of 0 ,
(2) WAdm ${ }^{\text {adic* }: ~ t h e ~ a d i c ~ t o p o l o g i c a l ~ r i n g s ~ w h i c h ~ h a v e ~ a ~ f i n i t e l y ~ g e n e r a t e d ~}$ ideal of definition, and
(3) WAdm Noeth : the adic topological rings which are Noetherian.

Clearly, the formal spectra of these types of rings are the basic building blocks of locally countably indexed, locally adic*, and locally Noetherian formal algebraic spaces.
We briefly review the relationship between morphisms of countably indexed, affine formal algebraic spaces and morphisms of $W A d m^{\text {count }}$. Let $S$ be a scheme. Let $X$ and $Y$ be countably indexed, affine formal algebraic spaces. Write $X=\operatorname{Spf}(A)$ and $Y=\operatorname{Spf}(B)$ topological $S$-algebras $A$ and $B$ in $W A d m^{\text {count }}$, see Lemma 70.6.4. By Lemma 70.5 .10 there is a 1-to-1 correspondence between morphisms $f: X \rightarrow Y$ and continuous maps

$$
\varphi: B \longrightarrow A
$$

of topological $S$-algebras. The relationship is given by $f \mapsto f^{\sharp}$ and $\varphi \mapsto \operatorname{Spf}(\varphi)$.
Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally countably indexed formal algebraic spaces. Consider a commutative diagram

with $U$ and $V$ affine formal algebraic spaces and $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale. By Definition 70.15 .5 (and hence via Lemma 70.15.4)
we see that $U$ and $V$ are countably indexed affine formal algebraic spaces. By the discussion in the previous paragraph we see that $U \rightarrow V$ is isomorphic to $\operatorname{Spf}(\varphi)$ for some continuous map

$$
\varphi: B \longrightarrow A
$$

of topological $S$-algebras in $W A d m^{\text {count }}$.
0 ANB Lemma 70.16.1. Let $A \in \mathrm{Ob}(W A d m)$. Let $A \rightarrow A^{\prime}$ be a ring map (no topology). Let $\left(A^{\prime}\right)^{\wedge}=\lim _{I \subset A \text { w.i.d }} A^{\prime} / I A^{\prime}$ be the object of WAdm constructed in Example 70.14.11.
(1) If $A$ is in $W A d m^{\text {count }}$, so is $\left(A^{\prime}\right)^{\wedge}$.
(2) If $A$ is in $W A d m^{\text {adic* }}$, so is $\left(A^{\prime}\right)^{\wedge}$.
(3) If $A$ is in $W A d m^{\text {Noeth }}$ and $A^{\prime}$ is Noetherian, then $\left(A^{\prime}\right)^{\wedge}$ is in $W A d m^{\text {Noeth }}$.

Proof. Part (1) is clear from the construction. Assume $A$ has a finitely generated ideal of definition $I \subset A$. Then $I^{n}\left(A^{\prime}\right)^{\wedge}=\operatorname{Ker}\left(\left(A^{\prime}\right)^{\wedge} \rightarrow A^{\prime} / I^{n} A^{\prime}\right)$ by Algebra, Lemma 10.95.5. Thus $I\left(A^{\prime}\right)^{\wedge}$ is a finitely generated ideal of definition and we see that (2) holds. Finally, assume that $A$ is Noetherian and adic. By (2) we know that $\left(A^{\prime}\right)^{\wedge}$ is adic. By Algebra, Lemma 10.96 .6 we see that $\left(A^{\prime}\right)^{\wedge}$ is Noetherian. Hence (3) holds.

Let $P$ be a property of morphisms of $W A d m^{\text {count }}$. Consider commutative diagrams

0ANC (70.16.1.1)

satisfying the following conditions
(1) $A$ and $B$ are objects of $W A d m^{\text {count }}$,
(2) $A \rightarrow A^{\prime}$ and $B \rightarrow B^{\prime}$ are étale ring maps,
(3) $\left(A^{\prime}\right)^{\wedge}=\lim A^{\prime} / I A^{\prime}$, resp. $\left(B^{\prime}\right)^{\wedge}=\lim B^{\prime} / J B^{\prime}$ where $I \subset A$, resp. $J \subset B$ runs through the weakly admissible ideals of definition of $A$, resp. $B$,
(4) $\varphi: A \rightarrow B$ and $\varphi^{\prime}:\left(A^{\prime}\right)^{\wedge} \rightarrow\left(B^{\prime}\right)^{\wedge}$ are continuous.

By Lemma 70.16 .1 the topological rings $\left(A^{\prime}\right)^{\wedge}$ and $\left(B^{\prime}\right)^{\wedge}$ are objects of $W A d m^{\text {count }}$. We say $P$ is a local property if the following axioms hold:
0 AND $\quad(1)$ for any diagram 70.16.1.1 we have $P(\varphi) \Rightarrow P\left(\varphi^{\prime}\right)$,
0ANE
(2) for any diagram 70.16 .1 .1 with $A \rightarrow A^{\prime}$ faithfully flat we have $P\left(\varphi^{\prime}\right) \Rightarrow$ $P(\varphi)$,
(3) if $P\left(A \rightarrow B_{i}\right)$ for $i=1, \ldots, n$, then $P\left(A \rightarrow \prod_{i=1, \ldots, n} B_{i}\right)$.

Axiom (3) makes sense as $W A d m^{\text {count }}$ has finite products.
0ANG Lemma 70.16.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally countably indexed formal algebraic spaces over $S$. Let $P$ be a local property of morphisms of WAdm ${ }^{\text {count }}$. The following are equivalent
(1) for every commutative diagram

with $U$ and $V$ affine formal algebraic spaces, $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale, the morphism $U \rightarrow V$ corresponds to a morphism of WAdm ${ }^{\text {count }}$ with property $P$,
(2) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7 .1 and for each $j$ a covering $\left\{X_{j i} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Definition 70.7.1 such that each $X_{j i} \rightarrow Y_{j}$ corresponds to a morphism of WAdm ${ }^{\text {count }}$ with property $P$, and
(3) there exist a covering $\left\{X_{i} \rightarrow X\right\}$ as in Definition 70.7.1 and for each $i$ a factorization $X_{i} \rightarrow Y_{i} \rightarrow Y$ where $Y_{i}$ is an affine formal algebraic space, $Y_{i} \rightarrow Y$ is representable by algebraic spaces and étale, and $X_{i} \rightarrow Y_{i}$ corresponds to a morphism of WAdm ${ }^{\text {count }}$ with property $P$.

Proof. It is clear that (1) implies (2) and that (2) implies (3). Assume $\left\{X_{i} \rightarrow X\right\}$ and $X_{i} \rightarrow Y_{i} \rightarrow Y$ as in (3) and let a diagram as in (1) be given. Since $Y_{i} \times_{Y} V$ is a formal algebraic space (Lemma 70.10.2) we may pick coverings $\left\{Y_{i j} \rightarrow Y_{i} \times_{Y} V\right\}$ as in Definition 70.7.1 For each $(i, j)$ we may similarly choose coverings we can pick coverings $\left\{X_{i j k} \rightarrow Y_{i j} \times_{Y_{i}} X_{i} \times{ }_{X} U\right\}$ as in Definition 70.7.1. Since $U$ is quasicompact we can choose $\left(i_{1}, j_{1}, k_{1}\right), \ldots,\left(i_{n}, j_{n}, k_{n}\right)$ such that

$$
X_{i_{1} j_{1} k_{1}} \amalg \ldots \amalg X_{i_{n} j_{n} k_{n}} \longrightarrow U
$$

is surjective. For $s=1, \ldots, n$ consider the commutative diagram

Let us say that $P$ holds for a morphism of countably indexed affine formal algebraic spaces if it holds for the corresponding morphism of $W A d m^{\text {count }}$. Observe that the maps $X_{i_{s} j_{s} k_{s}} \rightarrow X_{i_{s}}, Y_{i_{s} j_{s}} \rightarrow Y_{i}$ are given by completions of étale ring maps, see Lemma 70.14.13. Hence we see that $P\left(X_{i_{s}} \rightarrow Y_{i_{s}}\right)$ implies $P\left(X_{i_{s} j_{s} k_{s}} \rightarrow Y_{i_{s} j_{s}}\right)$ by axiom (1). By axiom (2) (and the fact that identities are faithfully flat ring maps) we conclude that $P\left(X_{i_{s} j_{s} k_{s}} \rightarrow V\right)$ holds. By axiom (3) we find that $P\left(\coprod_{s=1, \ldots, n} X_{i_{s} j_{s} k_{s}} \rightarrow V\right)$ holds. Since the morphism $\coprod X_{i_{s} j_{s} k_{s}} \rightarrow U$ is surjective by construction, the corresponding morphism of $W A d m^{\text {count }}$ is the completion of a faithfully flat étale ring map, see Lemma 70.14.14. One more application of axiom (2) implies that $P(U \rightarrow V)$ is true as desired.

0ANH Remark 70.16.3 (Variant for adic-star). Let $P$ be a property of morphisms of WAdm ${ }^{\text {adıc* }}$. We say $P$ is a local property if axioms (1), (2), (3), hold for diagrams 70.16.1.1 with $\varphi$ a morphism of WAdm ${ }^{\text {adic* }}$. In exactly the same way we obtain a variant of Lemma 70.16 .2 for morphisms between locally adic* formal algebraic spaces over $S$.

0ANI Remark 70.16.4 (Variant for Noetherian). Let $P$ be a property of morphisms of $W A d m^{\text {Noeth }}$. We say $P$ is a local property if axioms (1), (2), (3), hold for diagrams
70.16.1.1 with $\varphi$ a morphism of $W A d m^{\text {Noeth }}$. In exactly the same way we obtain a variant of Lemma 70.16 .2 for morphisms between locally Noetherian formal algebraic spaces over $S$.
0ANJ Lemma 70.16.5. Let $B \rightarrow A$ be an arrow of $W A d m^{\text {count }}$. The following are equivalent
(a) $B \rightarrow A$ is taut (Definition 70.4.9),
(b) for $B \supset J_{1} \supset J_{2} \supset J_{3} \supset \ldots$ a fundamental system of weak ideals of definitions there exist a commutative diagram

such that $A_{n+1} / J_{n} A_{n+1}=A_{n}$ and $A=\lim A_{n}$ as topological ring.
Moreover, these equivalent conditions define a local property, i.e., they satisfy axioms (1), (2), (3).

Proof. The equivalence of (a) and (b) is immediate. Below we will give an algebraic proof of the axioms, but it turns out we've already proven them. Namely, using Lemma 70.14 .10 (a) and (b) translate to saying the corresponding morphism of affine formal schemes is representable, and this condition is "étale local on the source and target" by Lemma 70.14.4.
Let a diagram 70.16.1.1) be given. By Example 70.14.11 the maps $A \rightarrow\left(A^{\prime}\right)^{\wedge}$ and $B \rightarrow\left(B^{\prime}\right)^{\wedge}$ satisfy (a) and (b).
Assume (a) and (b) hold for $\varphi$. Let $J \subset B$ be a weak ideal of definition. Then the closure of $J A$, resp. $J\left(B^{\prime}\right)^{\wedge}$ is a weak ideal of definition $I \subset A$, resp. $J^{\prime} \subset\left(B^{\prime}\right)^{\wedge}$. Then the closure of $I\left(A^{\prime}\right)^{\wedge}$ is a weak ideal of definition $I^{\prime} \subset\left(A^{\prime}\right)^{\wedge}$. A topological argument shows that $I^{\prime}$ is also the closure of $J\left(A^{\prime}\right)^{\wedge}$ and of $J^{\prime}\left(A^{\prime}\right)^{\wedge}$. Finally, as $J$ runs over a fundamental system of weak ideals of definition of $B$ so do the ideals $I$ and $I^{\prime}$ in $A$ and $\left(A^{\prime}\right)^{\wedge}$. It follows that (a) holds for $\varphi^{\prime}$. This proves (1).
Assume $A \rightarrow A^{\prime}$ is faithfully flat and that (a) and (b) hold for $\varphi^{\prime}$. Let $J \subset B$ be a weak ideal of definition. Using (a) and (b) for the maps $B \rightarrow\left(B^{\prime}\right)^{\wedge} \rightarrow\left(A^{\prime}\right)^{\wedge}$ we find that the closure $I^{\prime}$ of $J\left(A^{\prime}\right)^{\wedge}$ is a weak ideal of definition. In particular, $I^{\prime}$ is open and hence the inverse image of $I^{\prime}$ in $A$ is open. Now we have (explanation below)

$$
\begin{aligned}
A \cap I^{\prime} & =A \cap \bigcap\left(J\left(A^{\prime}\right)^{\wedge}+\operatorname{Ker}\left(\left(A^{\prime}\right)^{\wedge} \rightarrow A^{\prime} / I_{0} A^{\prime}\right)\right) \\
& =A \cap \bigcap \operatorname{Ker}\left(\left(A^{\prime}\right)^{\wedge} \rightarrow A^{\prime} / J A^{\prime}+I_{0} A^{\prime}\right) \\
& =\bigcap\left(J A+I_{0}\right)
\end{aligned}
$$

which is the closure of $J A$ by Lemma 70.4.2. The intersections are over weak ideals of definition $I_{0} \subset A$. The first equality because a fundamental system of neighbourhoods of 0 in $\left(A^{\prime}\right)^{\wedge}$ are the kernels of the maps $\left(A^{\prime}\right)^{\wedge} \rightarrow A^{\prime} / I_{0} A^{\prime}$. The second equality is trivial. The third equality because $A \rightarrow A^{\prime}$ is faithfully flat, see Algebra, Lemma 10.81.11. Thus the closure of $J A$ is open. By Lemma 70.4.8 the closure of $J A$ is a weak ideal of definition of $A$. Finally, given a weak ideal of definition $I \subset A$ we can find $J$ such that $J\left(A^{\prime}\right)^{\wedge}$ is contained in the closure of
$I\left(A^{\prime}\right)^{\wedge}$ by property (a) for $B \rightarrow\left(B^{\prime}\right)^{\wedge}$ and $\varphi^{\prime}$. Thus we see that (a) holds for $\varphi$. This proves (22).
We omit the proof of (3).
0ANK Lemma 70.16.6. Let $P=$ "taut" viewed as a property of morphisms of WAdm ${ }^{\text {count }}$. Then under the assumptions of Lemma 70.16.2 the equivalent conditions (1), (2), and (3) are also equivalent to the condition
(4) $f$ is representable by algebraic spaces.

Proof. Property $P$ is a local property by Lemma 70.16.5. By Lemma 70.14.10 condition $P$ on morphisms of $W A d m^{\text {count }}$ corresponds to "representable by algebraic spaces" for the corresponding morphisms of countably indexed affine formal algebraic spaces. Thus the lemma follows from Lemma 70.14.4.

### 70.17. Adic morphisms

0AQ2 Suppose that $\varphi: A \rightarrow B$ is a continuous map between adic topological rings. One says $\varphi$ is adic if there exists an ideal of definition $I \subset A$ such that the topology on $B$ is $I$-adic. However, this is not a good notion unless we assume $A$ has a finitely generated ideal of definition. In this case, the condition is equivalent to $\varphi$ being taut, see Lemma 70.4 .13 .
Let $P$ be the property of morphisms $\varphi: A \rightarrow B$ of WAdm ${ }^{\text {adic* }}$ defined by

$$
P(\varphi)=" \varphi \text { is adic" }=" \varphi \text { is taut" }
$$

(see above for the equivalence). Since $W A d m^{\text {adic* }}$ is a full subcategory of $W A d m^{\text {count }}$ it follows trivially from Lemma 70.16 .5 that $P$ is a local property on morphisms of WAdm ${ }^{\text {adic* }}$, see Remark 70.16 .3 . Combining Lemmas 70.16 .2 and 70.16 .6 we obtain the result stated in the next paragraph.

Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally adic* formal algebraic spaces over $S$. Then the following are equivalent
(1) $f$ is representable by algebraic spaces (in other words, the equivalent conditions of Lemma 70.14.4 hold),
(2) for every commutative diagram

with $U$ and $V$ affine formal algebraic spaces, $U \rightarrow X$ and $V \rightarrow Y$ representable by algebraic spaces and étale, the morphism $U \rightarrow V$ corresponds to an adic map in $W A d m^{a d i c *}$ (in other words, the equivalent conditions of Lemma 70.16 .2 hold with $P$ as above).
In this situation we will sometimes say that $f$ is an adic morphism. Here it is understood that this notion is only defined for morphisms between formal algebraic spaces which are locally adic*.

0AQ3 Definition 70.17.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. Assume $X$ and $Y$ are locally adic*. We say $f$ is an adic morphism if $f$ is representable by algebraic spaces. See discussion above.

### 70.18. Morphisms of finite type

0AM3 Due to how things are setup in the Stacks project, the following is really the correct thing to do and stronger notions should have a different name.

0AM4 Definition 70.18.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of formal algebraic spaces over $S$.
(1) We say $f$ is locally of finite type if $f$ is representable by algebraic spaces and is locally of finite type in the sense of Bootstrap, Definition 67.4.1.
(2) We say $f$ is of finite type if $f$ is locally of finite type and quasi-compact (Definition 70.12.4).

We will discuss the relationship between finite type morphisms of certain formal algebraic spaces and continuous ring maps $A \rightarrow B$ which are topologically of finite type in Restricted Power Series, Section 71.3 .

0AJJ Lemma 70.18.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The following are equivalent
(1) $f$ is of finite type,
(2) $f$ is representable by algebraic spaces and is of finite type in the sense of Bootstrap, Definition 67.4.1.

Proof. This follows from Bootstrap, Lemma 67.4.5, the implication "quasi-compact + locally of finite type $\Rightarrow$ finite type" for morphisms of algebraic spaces, and Lemma 70.12 .5

0AQ4 Lemma 70.18.3. The composition of finite type morphisms is of finite type. The same holds for locally of finite type.

Proof. See Bootstrap, Lemma 67.4 .3 and use Morphisms of Spaces, Lemma 54.23.2

0AQ5 Lemma 70.18.4. A base change of a finite type morphism is finite type. The same holds for locally of finite type.

Proof. See Bootstrap, Lemma 67.4.2 and use Morphisms of Spaces, Lemma 54.23.3.

0AQ6 Lemma 70.18.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of formal algebraic spaces over $S$. If $g \circ f: X \rightarrow Z$ is locally of finite type, then $f: X \rightarrow Y$ is locally of finite type.

Proof. By Lemma 70.14 .3 we see that $f$ is representable by algebraic spaces. Let $T$ be a scheme and let $T \rightarrow Z$ be a morphism. Then we can apply Morphisms of Spaces, Lemma 54.23.6 to the morphisms $T \times_{Z} X \rightarrow T \times{ }_{Z} Y \rightarrow T$ of algebraic spaces to conclude.

Being locally of finite type is local on the source and the target.
0ANL Lemma 70.18.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The following are equivalent:
(1) the morphism $f$ is locally of finite type,
(2) there exists a commutative diagram

where $U, V$ are formal algebraic spaces, the vertical arrows are representable by algebraic spaces and étale, $U \rightarrow X$ is surjective, and $U \rightarrow V$ is locally of finite type,
(3) for any commutative diagram

where $U, V$ are formal algebraic spaces and vertical arrows representable by algebraic spaces and étale, the morphism $U \rightarrow V$ is locally of finite type,
(4) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 and for each $j$ a covering $\left\{X_{j i} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Definition 70.7.1 such that $X_{j i} \rightarrow Y_{j}$ is locally of finite type for each $j$ and $i$,
(5) there exist a covering $\left\{X_{i} \rightarrow X\right\}$ as in Definition 70.7.1 and for each i a factorization $X_{i} \rightarrow Y_{i} \rightarrow Y$ where $Y_{i}$ is an affine formal algebraic space, $Y_{i} \rightarrow Y$ is representable by algebraic spaces and étale, such that $X_{i} \rightarrow Y_{i}$ is locally of finite type, and
(6) add more here.

Proof. In each of the 5 cases the morphism $f: X \rightarrow Y$ is representable by algebraic spaces, see Lemma 70.14.4. We will use this below without further mention.
It is clear that (1) implies (2) because we can take $U=X$ and $V=Y$. Conversely, assume given a diagram as in (2). Let $T$ be a scheme and let $T \rightarrow Y$ be a morphism. Then we can consider

The vertical arrows are étale and the top horizontal arrow is locally of finite type as base changes of such morphisms. Hence by Morphisms of Spaces, Lemma 54.23.4 we conclude that $X \times_{Y} T \rightarrow T$ is locally of finite type. In other words (1) holds.
Assume (1) is true and consider a diagram as in (3). Then $U \rightarrow Y$ is locally of finite type (as the composition $U \rightarrow X \rightarrow Y$, see Bootstrap, Lemma 67.4.3). Let $T$ be a scheme and let $T \rightarrow V$ be a morphism. Then the projection $T \times{ }_{V} U \rightarrow U$ factors as

$$
T \times_{V} U=\left(T \times_{Y} U\right) \times_{\left(V \times_{Y} V\right)} V \rightarrow T \times_{Y} U \rightarrow U
$$

The second arrow is locally of finite type (see above) and the first is the base change of the diagonal $V \rightarrow V \times_{Y} V$ which is locally of finite type by Lemma 70.10.4.
It is clear that (3) implies (2). Thus now (1) - (3) are equivalent.

Observe that the condition in (4) makes sense as the fibre product $Y_{j} \times_{Y} X$ is a formal algebraic space by Lemma 70.10.3. It is clear that (4) implies (5).
Assume $X_{i} \rightarrow Y_{i} \rightarrow Y$ as in (5). Then we set $V=\coprod Y_{i}$ and $U=\coprod X_{i}$ to see that (5) implies (2).

Finally, assume (1) - (3) are true. Thus we can choose any covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 and for each $j$ any covering $\left\{X_{j i} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Definition 70.7.1. Then $X_{i j} \rightarrow Y_{j}$ is locally of finite type by (3) and we see that (4) is true. This concludes the proof.

0ANM Example 70.18.7. Let $S$ be a scheme. Let $A$ be a weakly admissible topological ring over $S$. Let $A \rightarrow A^{\prime}$ be a finite type ring map. Then

$$
\left(A^{\prime}\right)^{\wedge}=\lim _{I \subset A \text { w.i.d. }} A^{\prime} / I A^{\prime}
$$

is a weakly admissible ring and the corresponding morphism $\operatorname{Spf}\left(\left(A^{\prime}\right)^{\wedge}\right) \rightarrow \operatorname{Spf}(A)$ is representable, see Example 70.14.11. If $T \rightarrow \operatorname{Spf}(A)$ is a morphism where $T$ is a quasi-compact scheme, then this factors through $\operatorname{Spec}(A / I)$ for some weak ideal of definition $I \subset A$ (Lemma 70.5.4). Then $T \times{ }_{\operatorname{Spf}(A)} \operatorname{Spf}\left(\left(A^{\prime}\right)^{\wedge}\right)$ is equal to $T \times_{\operatorname{Spec}(A / I)} \operatorname{Spec}\left(A^{\prime} / I A^{\prime}\right)$ and we see that $\operatorname{Spf}\left(\left(A^{\prime}\right)^{\wedge}\right) \rightarrow \operatorname{Spf}(A)$ is of finite type.
0AQ7 Lemma 70.18.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. If $Y$ is locally Noetherian and $f$ locally of finite type, then $X$ is locally Noetherian.

Proof. Pick $\left\{Y_{j} \rightarrow Y\right\}$ and $\left\{X_{i j} \rightarrow Y_{j} \times_{Y} X\right\}$ as in Lemma 70.18.6. Then it follows from Lemma 70.14 .8 that each $X_{i j}$ is Noetherian. This proves the lemma.

0AQ8 Lemma 70.18.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of formal algebraic spaces over $S$. If $Z$ is locally Noetherian and $f$ locally of finite type, then $Z \times_{Y} X$ is locally Noetherian.

Proof. The morphism $Z \times_{Y} X \rightarrow Z$ is locally of finite type by Lemma 70.18 .4 . Hence this follows from Lemma 70.18.8.

0AQ9 Lemma 70.18.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is locally of finite type. Let $T \subset|Y|$ be a closed subset and let $T^{\prime}=|f|^{-1}(T) \subset|X|$. Then $X_{/ T^{\prime}} \rightarrow Y_{/ T}$ is locally of finite type.

Proof. Namely, suppose that $V \rightarrow Y$ is a morphism from a scheme into $Y$ such that $|V|$ maps into $T$. In the proof of Lemma 70.9.4 we have seen that $V \times_{Y} X \rightarrow X$ is an algebraic space representing $V \times_{Y_{/ T^{\prime}}} X_{/ T}$. Since $V \times_{Y} X \rightarrow V$ is locally of finite type (by Morphisms of Spaces, Lemma 54.23.3) we conclude.

### 70.19. Monomorphisms

0AQA Here is the definition.
0AQB Definition 70.19.1. Let $S$ be a scheme. A morphism of formal algebraic spaces over $S$ is called a monomorphism if it is an injective map of sheaves.
An example is the following. Let $X$ be an algebraic space and let $T \subset|X|$ be a closed subset. Then the morphism $X_{/ T} \rightarrow X$ from the formal completion of $X$ along $T$ to $X$ is a monomorphism. In particular, monomorphisms of formal algebraic spaces are in general not representable.

### 70.20. Closed immersions

0ANN Here is the definition.
0 ANP Definition 70.20.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of formal algebraic spaces over $S$. We say $f$ is a closed immersion if $f$ is representable by algebraic spaces and a closed immersion in the sense of Bootstrap, Definition 67.4.1.
 space over $S$. Let $f: Y \rightarrow X$ be a closed immersion of formal algebraic spaces over $S$. Then $Y$ is a McQuillan affine formal algebraic space and $f$ corresponds to a continuous homomorphism $A \rightarrow B$ of weakly admissible topological $S$-algebras which is taut, has closed kernel, and has dense image.

Proof. Write $X=\operatorname{Spf}(A)$ where $A$ is a weakly admissible topological ring. Let $I_{\lambda}$ be a fundamental system of weakly admissible ideals of definition in $A$. Then $Y \times_{X} \operatorname{Spec}\left(A / I_{\lambda}\right)$ is a closed subscheme of $\operatorname{Spec}\left(A / I_{\lambda}\right)$ and hence affine (Definition 70.20.1. Say $Y \times{ }_{X} \operatorname{Spec}\left(A / I_{\lambda}\right)=\operatorname{Spec}\left(B_{\lambda}\right)$. The ring map $A / I_{\lambda} \rightarrow B_{\lambda}$ is surjective. Hence the projections

$$
B=\lim B_{\lambda} \longrightarrow B_{\lambda}
$$

are surjective as the compositions $A \rightarrow B \rightarrow B_{\lambda}$ are surjective. It follows that $Y$ is McQuillan by Lemma 70.5.6. The ring map $A \rightarrow B$ is taut by Lemma 70.14.10. The kernel is closed because $B$ is complete and $A \rightarrow B$ is continuous. Finally, as $A \rightarrow B_{\lambda}$ is surjective for all $\lambda$ we see that the image of $A$ in $B$ is dense.

Even though we have the result above, in general we do not know how closed immersions behave when the target is a McQuillan affine formal algebraic space, see Restricted Power Series, Remark 71.3.4.

0ANR Example 70.20.3. Let $S$ be a scheme. Let $A$ be a weakly admissible topological ring over $S$. Let $K \subset A$ be a closed ideal. Setting

$$
B=(A / K)^{\wedge}=\lim _{I \subset A \text { w.i.d. }} A /(I+K)
$$

the morphism $\operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is representable, see Example 70.14.11. If $T \rightarrow$ $\operatorname{Spf}(A)$ is a morphism where $T$ is a quasi-compact scheme, then this factors through $\operatorname{Spec}(A / I)$ for some weak ideal of definition $I \subset A$ (Lemma 70.5.4). Then $T \times_{\operatorname{Spf}(A)}$ $\operatorname{Spf}(B)$ is equal to $T \times_{\operatorname{Spec}(A / I)} \operatorname{Spec}(A /(K+I))$ and we see that $\operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is a closed immersion. The kernel of $A \rightarrow B$ is $K$ as $K$ is closed, but beware that in general the ring map $A \rightarrow B=(A / K)^{\wedge}$ need not be surjective.

### 70.21. Separation axioms for morphisms

0ARM This section is the analogue of Morphisms of Spaces, Section 54.4 for morphisms of formal algebraic spaces.

0ARN Definition 70.21.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. Let $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ be the diagonal morphism.
(1) We say $f$ is separated if $\Delta_{X / Y}$ is a closed immersion.
(2) We say $f$ is quasi-separated if $\Delta_{X / Y}$ is quasi-compact.

Since $\Delta_{X / Y}$ is representable (by schemes) by Lemma 70.10.4 we can test this by considering morphisms $T \rightarrow X \times_{Y} X$ from affine schemes $T$ and checking whether

$$
E=T \times_{X \times_{Y} X} X \longrightarrow T
$$

is quasi-compact or a closed immersion, see Lemma 70.12 .5 or Definition 70.20.1. Note that the scheme $E$ is the equalizer of two morphisms $a, b: T \rightarrow X$ which agree as morphisms into $Y$ and that $E \rightarrow T$ is a monomorphism and locally of finite type.
0ARP Lemma 70.21.2. All of the separation axioms listed in Definition 70.21.1 are stable under base change.
Proof. Let $f: X \rightarrow Y$ and $Y^{\prime} \rightarrow Y$ be morphisms of formal algebraic spaces. Let $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ be the base change of $f$ by $Y^{\prime} \rightarrow Y$. Then $\Delta_{X^{\prime} / Y^{\prime}}$ is the base change of $\Delta_{X / Y}$ by the morphism $X^{\prime} \times_{Y^{\prime}} X^{\prime} \rightarrow X \times_{Y} X$. Each of the properties of the diagonal used in Definition 70.21.1 is stable under base change. Hence the lemma is true.

0ARQ Lemma 70.21.3. Let $S$ be a scheme. Let $f: X \rightarrow Z, g: Y \rightarrow Z$ and $Z \rightarrow T$ be morphisms of formal algebraic spaces over $S$. Consider the induced morphism $i: X \times_{Z} Y \rightarrow X \times_{T} Y$. Then
(1) $i$ is representable (by schemes), locally of finite type, locally quasi-finite, separated, and a monomorphism,
(2) if $Z \rightarrow T$ is separated, then $i$ is a closed immersion, and
(3) if $Z \rightarrow T$ is quasi-separated, then $i$ is quasi-compact.

Proof. By general category theory the following diagram

is a fibre product diagram. Hence $i$ is the base change of the diagonal morphism $\Delta_{Z / T}$. Thus the lemma follows from Lemma 70.10.4.
0ARR Lemma 70.21.4. All of the separation axioms listed in Definition 70.21.1 are stable under composition of morphisms.

Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of formal algebraic spaces to which the axiom in question applies. The diagonal $\Delta_{X / Z}$ is the composition

$$
X \longrightarrow X \times_{Y} X \longrightarrow X \times_{Z} X
$$

Our separation axiom is defined by requiring the diagonal to have some property $\mathcal{P}$. By Lemma 70.21 .3 above we see that the second arrow also has this property. Hence the lemma follows since the composition of (representable) morphisms with property $\mathcal{P}$ also is a morphism with property $\mathcal{P}$.
0ARS Lemma 70.21.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. Let $\mathcal{P}$ be any of the separation axioms of Definition 70.21.1. The following are equivalent
(1) $f$ is $\mathcal{P}$,
(2) for every scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is $\mathcal{P}$,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is $\mathcal{P}$,
(4) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the formal algebraic space $Z \times_{Y} X$ is $\mathcal{P}$ (see Definition 70.11.3),
(5) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 such that the base change $Y_{j} \times_{Y} X \rightarrow Y_{j}$ has $\mathcal{P}$ for all $j$.
Proof. We will repeatedly use Lemma 70.21 .2 without further mention. In particular, it is clear that (1) implies (2) and (2) implies (3).
Assume (3) and let $Z \rightarrow Y$ be a morphism where $Z$ is an affine scheme. Let $U, V$ be affine schemes and let $a: U \rightarrow Z \times_{Y} X$ and $b: V \rightarrow Z \times_{Y} X$ be morphisms. Then

$$
U \times_{Z \times_{Y} X} V=\left(Z \times_{Y} X\right) \times_{\Delta,\left(Z \times_{Y} X\right) \times_{Z}\left(Z \times_{Y} X\right)}\left(U \times_{Z} V\right)
$$

and we see that this is quasi-compact if $\mathcal{P}=$ "quasi-separated" or an affine scheme equipped with a closed immersion into $U \times_{Z} V$ if $\mathcal{P}=$ "separated". Thus (4) holds.
Assume (4) and let $Z \rightarrow Y$ be a morphism where $Z$ is an affine scheme. Let $U, V$ be affine schemes and let $a: U \rightarrow Z \times_{Y} X$ and $b: V \rightarrow Z \times_{Y} X$ be morphisms. Reading the argument above backwards, we see that $U \times_{Z \times_{Y} X} V \rightarrow U \times_{Z} V$ is quasi-compact if $\mathcal{P}=$ "quasi-separated" or a closed immersion if $\mathcal{P}=$ "separated". Since we can find an étale covering of $Z \times_{Y} X$ by $U$ and $V$ as above, we find that the corresponding morphisms

$$
U \times_{Z} V \rightarrow\left(Z \times_{Y} X\right) \times_{Z}\left(Z \times_{Y} X\right)
$$

form an étale covering by affines. Hence we conclude that $\Delta:\left(Z \times_{Y} X\right) \rightarrow\left(Z \times_{Y}\right.$ $X) \times_{Z}\left(Z \times_{Y} X\right)$ is quasi-compact, resp. a closed immersion. Thus (3) holds.
Let us prove that (3) implies (5). Assume (3) and let $\left\{Y_{j} \rightarrow Y\right\}$ be as in Definition 70.7.1. We have to show that the morphisms

$$
\Delta_{j}: Y_{j} \times_{Y} X \longrightarrow\left(Y_{j} \times_{Y} X\right) \times_{Y_{j}}\left(Y_{j} \times_{Y} X\right)=Y_{j} \times_{Y} X \times_{Y} X
$$

has the corresponding property (i.e., is quasi-compact or a closed immersion). Write $Y_{j}=\operatorname{colim} Y_{j, \lambda}$ as in Definition 70.5.1. Replacing $Y_{j}$ by $Y_{j, \lambda}$ in the formula above, we have the property by our assumption that (3) holds. Since the displayed arrow is the colimit of the arrows $\Delta_{j, \lambda}$ and since we can test whether $\Delta_{j}$ has the corresponding property by testing after base change by affine schemes mapping into $Y_{j} \times_{Y} X \times_{Y} X$, we conclude by Lemma 70.5.4.
Let us prove that (5) implies (1). Let $\left\{Y_{j} \rightarrow Y\right\}$ be as in (5). Then we have the fibre product diagram

By assumption the left vertical arrow is quasi-compact or a closed immersion. It follows from Spaces, Lemma 52.5 .6 that also the right vertical arrow is quasi-compact or a closed immersion.

### 70.22. Proper morphisms

0AM5 Here is the definition we will use.
0AM6 Definition 70.22.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of formal algebraic spaces over $S$. We say $f$ is proper if $f$ is representable by algebraic spaces and is proper in the sense of Bootstrap, Definition 67.4.1.

It follows from the definitions that a proper morphism is of finite type.
0ART Lemma 70.22.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. The following are equivalent
(1) $f$ is proper,
(2) for every scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is proper,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is proper,
(4) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the formal algebraic space $Z \times_{Y} X$ is an algebraic space proper over $Z$,
(5) there exists a covering $\left\{Y_{j} \rightarrow Y\right\}$ as in Definition 70.7.1 such that the base change $Y_{j} \times_{Y} X \rightarrow Y_{j}$ is proper for all $j$.
Proof. Omitted.

### 70.23. Formal algebraic spaces and fpqc coverings

0AQC This section is the analogue of Properties of Spaces, Section 53.16. Please read that section first.

0AQD Lemma 70.23.1. Let $S$ be a scheme. Let $X$ be a formal algebraic space over $S$. Then $X$ satisfies the sheaf property for the fpqc topology.

Proof. The proof is identical to the proof of Properties of Spaces, Proposition 53.16.1. Since $X$ is a sheaf for the Zariski topology it suffices to show the following. Given a surjective flat morphism of affines $f: T^{\prime} \rightarrow T$ we have: $X(T)$ is the equalizer of the two maps $X\left(T^{\prime}\right) \rightarrow X\left(T^{\prime} \times_{T} T^{\prime}\right)$. See Topologies, Lemma 33.8.13.

Let $a, b: T \rightarrow X$ be two morphisms such that $a \circ f=b \circ f$. We have to show $a=b$. Consider the fibre product

$$
E=X \times_{\Delta_{X / S}, X \times_{S} X,(a, b)} T
$$

By Lemma 70.7 .3 the morphism $\Delta_{X / S}$ is a representable monomorphism. Hence $E \rightarrow T$ is a monomorphism of schemes. Our assumption that $a \circ f=b \circ f$ implies that $T^{\prime} \rightarrow T$ factors (uniquely) through $E$. Consider the commutative diagram

Since the projection $T^{\prime} \times_{T} E \rightarrow T^{\prime}$ is a monomorphism with a section we conclude it is an isomorphism. Hence we conclude that $E \rightarrow T$ is an isomorphism by Descent, Lemma 34.19.15. This means $a=b$ as desired.

Next, let $c: T^{\prime} \rightarrow X$ be a morphism such that the two compositions $T^{\prime} \times_{T} T^{\prime} \rightarrow$ $T^{\prime} \rightarrow X$ are the same. We have to find a morphism $a: T \rightarrow X$ whose composition with $T^{\prime} \rightarrow T$ is $c$. Choose a formal affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow\left|X_{\text {red }}\right|$ contains the image of $|c|:\left|T^{\prime}\right| \rightarrow\left|X_{\text {red }}\right|$. This is possible by Definition 70.7.1. Properties of Spaces, Lemma 53.4.6, the fact that a finite union of formal affine algebraic spaces is a formal affine algebraic space, and the fact that $\left|T^{\prime}\right|$ is quasi-compact (small argument omitted). The
morphism $U \rightarrow X$ is representable by schemes (Lemma 70.5.11) and separated (Lemma 70.11.5). Thus

$$
V=U \times_{X, c} T^{\prime} \longrightarrow T^{\prime}
$$

is an étale and separated morphism of schemes. It is also surjective by our choice of $U \rightarrow X$ (if you do not want to argue this you can replace $U$ by a disjoint union of formal affine algebraic spaces so that $U \rightarrow X$ is surjective everything else still works as well). The fact that $c \circ \operatorname{pr}_{0}=c \circ \operatorname{pr}_{1}$ means that we obtain a descent datum on $V / T^{\prime} / T$ (Descent, Definition 34.30.1) because

$$
\begin{aligned}
V \times_{T^{\prime}}\left(T^{\prime} \times_{T} T^{\prime}\right) & =U \times_{X, c o \mathrm{pr}_{0}}\left(T^{\prime} \times_{T} T^{\prime}\right) \\
& =\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{c \circ \mathrm{pr}_{1}, X} U \\
& =\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{T^{\prime}} V
\end{aligned}
$$

The morphism $V \rightarrow T^{\prime}$ is ind-quasi-affine by More on Morphisms, Lemma 36.48 .4 (because étale morphisms are locally quasi-finite, see Morphisms, Lemma 28.36.6). By More on Groupoids, Lemma 39.14 .3 the descent datum is effective. Say $W \rightarrow T$ is a morphism such that there is an isomorphism $\alpha: T^{\prime} \times_{T} W \rightarrow V$ compatible with the given descent datum on $V$ and the canonical descent datum on $T^{\prime} \times_{T} W$. Then $W \rightarrow T$ is surjective and étale (Descent, Lemmas 34.19.6 and 34.19.27). Consider the composition

$$
b^{\prime}: T^{\prime} \times_{T} W \longrightarrow V=U \times_{X, c} T^{\prime} \longrightarrow U
$$

The two compositions $c^{\prime} \circ\left(\operatorname{pr}_{0}, 1\right), c^{\prime} \circ\left(\operatorname{pr}_{1}, 1\right):\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{T} W \rightarrow T^{\prime} \times_{T} W \rightarrow U$ agree by our choice of $\alpha$ and the corresponding property of $c$ (computation omitted). Hence $b^{\prime}$ descends to a morphism $b: W \rightarrow U$ by Descent, Lemma 34.9.3. The diagram

is commutative. What this means is that we have proved the existence of $a$ étale locally on $T$, i.e., we have an $a^{\prime}: W \rightarrow X$. However, since we have proved uniqueness in the first paragraph, we find that this étale local solutions satisfy the glueing condition, i.e., we have $\mathrm{pr}_{0}^{*} a^{\prime}=\operatorname{pr}_{1}^{*} a^{\prime}$ as elements of $X\left(W \times_{T} W\right)$. Since $X$ is an étale sheaf we find an unique $a \in X(T)$ restricting to $a^{\prime}$ on $W$.

### 70.24. Maps out of affine formal schemes

0AQE We prove a few results that will be useful later. In the paper Bha14 the reader can find very general results of a similar nature.

0AQF Lemma 70.24.1. Let $S$ be a scheme. Let $A$ be a weakly admissible topological $S$-algebra. Let $X$ be an affine scheme over $S$. Then the natural map

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(A), X) \longrightarrow \operatorname{Mor}_{S}(\operatorname{Spf}(A), X)
$$

is bijective.
Proof. If $X$ is affine, say $X=\operatorname{Spec}(B)$, then we see from Lemma 70.5.10 that morphisms $\operatorname{Spf}(A) \rightarrow \operatorname{Spec}(B)$ correspond to continuous $S$-algebra maps $B \rightarrow A$ where $B$ has the discrete topology. These are just $S$-algebra maps, which correspond to morphisms $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(B)$.

0AQG Lemma 70.24.2. Let $S$ be a scheme. Let $A$ be a weakly admissible topological $S$-algebra such that $A / I$ is a local ring for some weak ideal of definition $I \subset A$. Let $X$ be a scheme over $S$. Then the natural map

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(A), X) \longrightarrow \operatorname{Mor}_{S}(S p f(A), X)
$$

is bijective.
Proof. Let $\varphi: \operatorname{Spf}(A) \rightarrow X$ be a morphism. Since $\operatorname{Spec}(A / I)$ is local we see that $\varphi$ maps $\operatorname{Spec}(A / I)$ into an affine open $U \subset X$. However, this then implies that $\operatorname{Spec}(A / J)$ maps into $U$ for every ideal of definition $J$. Hence we may apply Lemma 70.24 .1 to see that $\varphi$ comes from a morphism $\operatorname{Spec}(A) \rightarrow X$. This proves surjectivity of the map. We omit the proof of injectivity.
0AQH Lemma 70.24.3. Let $S$ be a scheme. Let $R$ be a complete local Noetherian $S$ algebra. Let $X$ be an algebraic space over $S$. Then the natural map

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(R), X) \longrightarrow \operatorname{Mor}_{S}(S p f(R), X)
$$

is bijective.
Proof. Let $\mathfrak{m}$ be the maximal ideal of $R$. We have to show that

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(R), X) \longrightarrow \lim \operatorname{Mor}_{S}\left(\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right), X\right)
$$

is bijective for $R$ as above.
Injectivity: Let $x, x^{\prime}: \operatorname{Spec}(R) \rightarrow X$ be two morphisms mapping to the same element in the right hand side. Consider the fibre product

$$
T=\operatorname{Spec}(R) \times_{\left(x, x^{\prime}\right), X \times{ }_{S} X, \Delta} X
$$

Then $T$ is a scheme and $T \rightarrow \operatorname{Spec}(R)$ is locally of finite type, monomorphism, separated, and locally quasi-finite, see Morphisms of Spaces, Lemma 54.4.1. In particular $T$ is locally Noetherian, see Morphisms, Lemma 28.15.6. Let $t \in T$ be the unique point mapping to the closed point of $\operatorname{Spec}(R)$ which exists as $x$ and $x^{\prime}$ agree over $R / \mathfrak{m}$. Then $R \rightarrow \mathcal{O}_{T, t}$ is a local ring map of Noetherian rings such that $R / \mathfrak{m}^{n} \rightarrow \mathcal{O}_{T, t} / \mathfrak{m}^{n} \mathcal{O}_{T, t}$ is an isomorphism for all $n$ (because $x$ and $x^{\prime}$ agree over $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$ for all $n$ ). Since $\mathcal{O}_{T, t}$ maps injectively into its completion (see Algebra, Lemma 10.50.4 we conclude that $R=\mathcal{O}_{T, t}$. Hence $x$ and $x^{\prime}$ agree over $R$.
Surjectivity: Let $\left(x_{n}\right)$ be an element of the right hand side. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Denote $x_{0}: \operatorname{Spec}(k) \rightarrow X$ the morphism induced on the residue field $k=R / \mathfrak{m}$. The morphism of schemes $U \times{ }_{X, x_{0}} \operatorname{Spec}(k) \rightarrow$ $\operatorname{Spec}(k)$ is surjective étale. Thus $U \times_{X, x_{0}} \operatorname{Spec}(k)$ is a nonempty disjoint union of spectra of finite separable field extensions of $k$, see Morphisms, Lemma 28.36.7. Hence we can find a finite separable field extension $k \subset k^{\prime}$ and a $k^{\prime}$-point $u_{0}$ : $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow U$ such that

commutes. Let $R \subset R^{\prime}$ be the finite étale extension of Noetherian complete local rings which induces $k \subset k^{\prime}$ on residue fields (see Algebra, Lemmas 10.148 .8 and
10.148.10). Denote $x_{n}^{\prime}$ the restriction of $x_{n}$ to $\operatorname{Spec}\left(R^{\prime} / \mathfrak{m}^{n} R^{\prime}\right)$. By More on Morphisms of Spaces, Lemma 63.14 .8 we can find an element $\left(u_{n}^{\prime}\right) \in \lim \operatorname{Mor}_{S}\left(\operatorname{Spec}\left(R^{\prime} / \mathfrak{m}^{n} R^{\prime}\right), U\right)$ mapping to $\left(x_{n}^{\prime}\right)$. By Lemma 70.24 .2 the family $\left(u_{n}^{\prime}\right)$ comes from a unique morphism $u^{\prime}: \operatorname{Spec}\left(R^{\prime}\right) \rightarrow U$. Denote $x^{\prime}: \operatorname{Spec}\left(R^{\prime}\right) \rightarrow X$ the composition. Note that $R^{\prime} \otimes_{R} R^{\prime}$ is a finite product of spectra of Noetherian complete local rings to which our current discussion applies. Hence the diagram

is commutative by the injectivity shown above and the fact that $x_{n}^{\prime}$ is the restriction of $x_{n}$ which is defined over $R / \mathfrak{m}^{n}$. Since $\left\{\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)\right\}$ is an fppf covering we conclude that $x^{\prime}$ descends to a morphism $x: \operatorname{Spec}(R) \rightarrow X$. We omit the proof that $x_{n}$ is the restriction of $x$ to $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$.

## CHAPTER 71

## Restricted Power Series

0AM7

### 71.1. Introduction

0AM8 In this chapter we discuss algebras topologically of finite type over pre-adic topological rings and their homomorphisms. Many of the results discussed here can be found in the paper Elk73. Other general references for this chapter are DG67, Abb10, and FK.

### 71.2. Restricted power series

0 AKZ Let $A$ be a topological ring complete with respect to a linear topology (More on Algebra, Definition 15.28.1). Let $I_{\lambda}$ be a fundamental system of open ideals. Let $r \geq 0$ be an integer. In this setting one often denotes

$$
A\left\{x_{1}, \ldots, x_{r}\right\}=\lim _{\lambda} A / I_{\lambda}\left[x_{1}, \ldots, x_{r}\right]=\lim _{\lambda}\left(A\left[x_{1}, \ldots, x_{r}\right] / I_{\lambda} A\left[x_{1}, \ldots, x_{r}\right]\right)
$$

endowed with the limit topology. In other words, this is the completion of the polynomial ring with respect to the ideals $I_{\lambda}$. We can think of elements of $A\left\{x_{1}, \ldots, x_{r}\right\}$ as power series

$$
f=\sum_{E=\left(e_{1}, \ldots, e_{r}\right)} a_{E} x_{1}^{e_{1}} \ldots x_{r}^{e_{r}}
$$

in $x_{1}, \ldots, x_{r}$ with coefficients $a_{E} \in A$ which tend to zero in the topology of $A$. In other words, for any $\lambda$ all but a finite number of $a_{E}$ are in $I_{\lambda}$. For this reason elements of $A\left\{x_{1}, \ldots, x_{r}\right\}$ are sometimes called restricted power series. Sometimes this ring is denoted $A\left\langle x_{1}, \ldots, x_{r}\right\rangle$; we will refrain from using this notation.

0AJM Remark 71.2.1 (Universal property restricted power series). Let $A \rightarrow C$ be a continuous map of complete linearly topologized rings. Then any $A$-algebra map $A\left[x_{1}, \ldots x_{r}\right] \rightarrow C$ extends uniquely to a continuous map $A\left\{x_{1}, \ldots, x_{r}\right\} \rightarrow C$ on restricted power series.

0AL0 Remark 71.2.2. Let $A$ be a ring and let $I \subset A$ be an ideal. If $A$ is $I$-adically complete, then the $I$-adic completion $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ of $A\left[x_{1}, \ldots, x_{r}\right]$ is the restricted power series ring over $A$ as a ring. However, it is not clear that $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ is $I$-adically complete. We think of the topology on $A\left\{x_{1}, \ldots, x_{r}\right\}$ as the limit topology (which is always complete) whereas we often think of the topology on $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ as the $I$-adic topology (not always complete). If $I$ is finitely generated, then $A\left\{x_{1}, \ldots, x_{r}\right\}=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ as topological rings, see Algebra, Lemma 10.95.5

### 71.3. Algebras topologically of finite type

0ALL Here is our definition. This definition is not generally agreed upon. Many authors impose further conditions, often because they are only interested in specific types of rings and not the most general case.
0ANS Definition 71.3.1. Let $A \rightarrow B$ be a continuous map of topological rings (More on Algebra, Definition 15.28.1. We say $B$ is topologically of finite type over $A$ if there exists an $A$-algebra map $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ whose image is dense in $B$.

If $A$ is a complete, linearly topologized ring, then the restricted power series ring $A\left\{x_{1}, \ldots, x_{r}\right\}$ is topologically of finite type over $A$. For continuous taut maps of weakly admissible topological rings, this notion corresponds exactly to morphisms of finite type between the associated affine formal algebraic spaces.

0ANT Lemma 71.3.2. Let $S$ be a scheme. Let $\varphi: A \rightarrow B$ be a continuous map of weakly admissible topological rings over $S$. The following are equivalent
(1) $\operatorname{Spf}(\varphi): \operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is of finite type,
(2) $\varphi$ is taut and $B$ is topologically of finite type over $A$.

Proof. We can use Formal Spaces, Lemma 70.14 .10 to relate tautness of $\varphi$ to representability of $\operatorname{Spf}(\varphi)$. We will use this without further mention below. Note that $X=\operatorname{colim} \operatorname{Spec}(A / I)$ and $Y=\operatorname{colim} \operatorname{Spec}(B / J(I))$ where $I \subset A$ runs over the weak ideals of definition of $A$ and $J(I)$ is the closure of $I B$ in $B$.

Assume (2). Choose a ring map $A\left[x_{1}, \ldots, x_{r}\right] \rightarrow B$ whose image is dense. Then $A\left[x_{1}, \ldots, x_{r}\right] \rightarrow B \rightarrow B / J(I)$ has dense image too which means that it is surjective. Therefore $B / J(I)$ is of finite type over $A / I$. Let $T \rightarrow X$ be a morphism with $T$ a quasi-compact scheme. Then $T \rightarrow X$ factors through $\operatorname{Spec}(B / I)$ for some $I$ (Formal Spaces, Lemma 70.5.4). Then $T \times_{X} Y=T \times_{\operatorname{Spec}(A / I)} \operatorname{Spec}(B / J(I))$, see proof of Formal Spaces, Lemma 70.14.10. Henc $T \times_{Y} X \rightarrow T$ is of finite type as the base change of the morphism $\operatorname{Spec}(B / J(I)) \rightarrow \operatorname{Spec}(A / I)$ which is of finite type. Thus (1) is true.

Assume (1). Pick any $I \subset A$ as above. Since $\operatorname{Spec}(A / I) \times{ }_{X} Y=\operatorname{Spec}(B / J(I))$ we see that $A / I \rightarrow B / J(I)$ is of finite type. Choose $b_{1}, \ldots, b_{r} \in B$ mapping to generators of $B / J(I)$ over $A / I$. We claim that the image of the ring map $A\left[x_{1}, \ldots, x_{r}\right] \rightarrow B$ sending $x_{i}$ to $b_{i}$ is dense. To prove this, let $I^{\prime} \subset I$ be a second weak ideal of definition. Then we have

$$
B /\left(J\left(I^{\prime}\right)+I B\right)=B / J(I)
$$

because $J(I)$ is the closure of $I B$ and because $J\left(I^{\prime}\right)$ is open. Hence we may apply Algebra, Lemma 10.125 .8 to see that $A / I^{\prime}\left[x_{1}, \ldots, x_{r}\right] \rightarrow B / J\left(I^{\prime}\right)$ is surjective Thus (2) is true, concluding the proof.

Let $A$ be a topological ring complete with respect to a linear topology. Let $I_{\lambda}$ be a fundamental system of open ideals. Let $\mathcal{C}$ be the category of systems $\left(B_{\lambda}\right)$ where
(1) $B_{\lambda}$ is a finite type $A / I_{\lambda}$-algebra, and
(2) $B_{\mu} \rightarrow B_{\lambda}$ is an $A / I_{\mu}$-algebra homomorphism which induces an isomorphism $B_{\mu} / I_{\lambda} B_{\mu} \rightarrow B_{\lambda}$.
Morphisms in $\mathcal{C}$ are given by systems of homomorphisms.

0AL1 Lemma 71.3.3. Let $S$ be a scheme. Let $X$ be an affine formal scheme over $S$. Assume $X$ is McQuillan and let $A$ be the weakly admissible topological ring associated to $X$. Then there is an anti-equivalence of categories between
(1) the category $\mathcal{C}$ introduced above, and
(2) the category of maps $Y \rightarrow X$ of finite type of affine formal algebraic spaces.

Proof. Let $I_{\lambda}$ be a fundamental system of weakly admissible ideals of definition in $A$. Then $Y \times_{X} \operatorname{Spec}\left(A / I_{\lambda}\right)$ is affine (Formal Spaces, Definition 70.18.1 and Lemma 70.14.7). Say $Y \times_{X} \operatorname{Spec}\left(A / I_{\lambda}\right)=\operatorname{Spec}\left(B_{\lambda}\right)$. Then $\left(B_{\lambda}\right)$ is an object of $\mathcal{C}$. Conversely, given a system $\left(B_{\lambda}\right)$ we can set $Y=\operatorname{colim} \operatorname{Spec}\left(B_{\lambda}\right)$. Some details omitted.

0AJK Remark 71.3.4. Let $A$ be a weakly admissible topological ring and let $I_{\lambda}$ be a fundamental system of weak ideals of definition. Let $X=\operatorname{Spf}(A)$, in other words, $X$ is a McQuillan affine formal algebraic space. Let $f: Y \rightarrow X$ be a morphism of affine formal algebraic spaces. In general it will not be true that $Y$ is McQuillan. More specifically, we can ask the following questions:
(1) Assume that $f: Y \rightarrow X$ is a closed immersion. Then $Y$ is McQuillan and $f$ corresponds to a continuous map $\varphi: A \rightarrow B$ of weakly admissible topological rings which is taut, whose kernel $K \subset A$ is a closed ideal, and whose image $\varphi(A)$ is dense in $B$, see Formal Spaces, Lemma 70.20.2. What conditions on $A$ guarantee that $B=(A / K)^{\wedge}$ as in Formal Spaces, Example 70.20.3?
(2) What conditions on $A$ guarantee that closed immersions $f: Y \rightarrow X$ correspond to quotients $A / K$ of $A$ by closed ideals, in other words, the corresponding continuous map $\varphi$ is surjective and open?
(3) Suppose that $f: Y \rightarrow X$ is of finite type. Then we get $Y=\operatorname{colim} \operatorname{Spec}\left(B_{\lambda}\right)$ where $\left(B_{\lambda}\right)$ is an object of $\mathcal{C}$ by Lemma 71.3 .3 . In this case it is true that there exists a fixed integer $r$ such that $B_{\lambda}$ is generated by $r$ elements over $A / I_{\lambda}$ for all $\lambda$ (hint: use Algebra, Lemma 10.125.8). However, it is not clear that the projections $\lim B_{\lambda} \rightarrow B_{\lambda}$ are surjective, i.e., it is not clear that $Y$ is McQuillan. Is there an example where $Y$ is not McQuillan?
(4) Suppose that $f: Y \rightarrow X$ is of finite type and $Y$ is McQuillan. Then $f$ corresponds to a continuous map $\varphi: A \rightarrow B$ of weakly admissible topological rings. In fact $\varphi$ is taut and $B$ is topologically of finite type over $A$, see Lemma 71.3.2. In other words, $f$ factors as

$$
Y \longrightarrow \mathbf{A}_{X}^{r} \longrightarrow X
$$

where the first arrow is a closed immersion of McQuillan affine formal algebraic spaces. However, then questions (1) and (2) are in force for $Y \rightarrow \mathbf{A}_{X}^{r}$.
Below we will answer these questions when $X$ is countably indexed, i.e., when $A$ has a countable fundamental system of open ideals. If you have answers to these questions in greater generality, or if you have counter examples, please email stacks.project@gmail.com.
0AQI Lemma 71.3.5. Let $S$ be a scheme. Let $X$ be a countably indexed affine formal algebraic space over $S$. Let $f: Y \rightarrow X$ be a closed immersion of formal algebraic spaces over $S$. Then $Y$ is a countably indexed affine formal algebraic space and
$f$ corresponds to $A \rightarrow A / K$ where $A$ is an object of WAdm ${ }^{\text {count }}$ (Formal Spaces, Section 70.16) and $K \subset A$ is a closed ideal.

Proof. By Formal Spaces, Lemma 70.6.4 we see that $X=\operatorname{Spf}(A)$ where $A$ is an object of $W A d m^{\text {count }}$. Since a closed immersion is representable and affine, we conclude by Formal Spaces, Lemma 70.14 .8 that $Y$ is an affine formal algebraic space and countably index. Thus applying Formal Spaces, Lemma 70.6 .4 again we see that $Y=\operatorname{Spf}(B)$ with $B$ an object of $W A d m^{\text {count }}$. By Formal Spaces, Lemma 70.20 .2 we conclude that $f$ is given by a morphism $A \rightarrow B$ of $W A d m{ }^{\text {count }}$ which is taut and has dense image. To finish the proof we apply Formal Spaces, Lemma 70.4.12.

0ANU Lemma 71.3.6. Let $B \rightarrow A$ be an arrow of $W A d m^{\text {count }}$, see Formal Spaces, Section 70.16. The following are equivalent
(a) $B \rightarrow A$ is taut and $B / J \rightarrow A / I$ is of finite type for every weak ideal of definition $J \subset B$ where $I \subset A$ is the closure of $J A$,
(b) $B \rightarrow A$ is taut and $B / J \rightarrow A / I$ is of finite type for some weak ideal of definition $J \subset B$ with $I \subset A$ the closure of $J A$,
(c) $B \rightarrow A$ is taut and $A$ is topologically of finite type over $B$,
(d) $A$ is isomorphic to a quotient of $B\left\{x_{1}, \ldots, x_{n}\right\}$ by a closed ideal.

Moreover, these equivalent conditions define a local property, i.e., they satisfy Formal Spaces, Axioms (1), (2), (3).

Proof. The implications $(\mathrm{a}) \Rightarrow(\mathrm{b}),(\mathrm{c}) \Rightarrow(\mathrm{a}),(\mathrm{d}) \Rightarrow(\mathrm{c})$ are straightforward from the definitions. Assume (b) holds and let $J \subset B$ and $I \subset A$ be as in (b). Choose a commutative diagram

such that $A_{n+1} / J_{n} A_{n+1}=A_{n}$ and such that $A=\lim A_{n}$ as in Formal Spaces, Lemma 70.16.5. We may assume $J=J_{1}$ by replacing $J_{1}$ by $J_{1}+J$ if necessary. Let $\alpha_{1}, \ldots, \alpha_{n} \in A_{1}$ be generators of $A_{1}$ over $B / J_{1}=B / J$. Since $A$ is a countable limit of a system with surjective transition maps, we can find $a_{1}, \ldots, a_{n} \in A$ mapping to $\alpha_{1}, \ldots, \alpha_{n}$ in $A_{1}$. By Remark 71.2 .1 we find a continuous map $B\left\{x_{1}, \ldots, x_{n}\right\} \rightarrow$ $A$ mapping $x_{i}$ to $a_{i}$. This map induces surjections $B / J_{m}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A_{m}$ by Algebra, Lemma 10.125.8. For $m \geq 1$ we obtain a short exact sequence

$$
0 \rightarrow K_{m} \rightarrow B / J_{m}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A_{m} \rightarrow 0
$$

The induced transition maps $K_{m+1} \rightarrow K_{m}$ are surjective because $A_{m+1} / J_{m} A_{m+1}=$ $A_{m}$. Hence the inverse limit of these short exact sequences is exact, see Algebra, Lemma 10.85.4 Since $B\left\{x_{1}, \ldots, x_{n}\right\}=\lim B / J_{m}\left[x_{1}, \ldots, x_{n}\right]$ and $A=\lim A_{m}$ we conclude that $B\left\{x_{1}, \ldots, x_{n}\right\} \rightarrow A$ is surjective. As $A$ is complete the kernel is a closed ideal. In this way we see that (a), (b), (c), and (d) are equivalent.
Let a diagram as in Formal Spaces, Diagram 70.16.1.1 be given. By Formal Spaces, Example 70.18 .7 the maps $A \rightarrow\left(A^{\prime}\right)^{\wedge}$ and $B \rightarrow\left(B^{\prime}\right)^{\wedge}$ satisfy (a), (b), (c), and (d). Moreover, by Formal Spaces, Lemma 70.16.5 in order to prove Formal Spaces, Axioms (1) and (2) we may assume both $A \rightarrow B$ and $\left(B^{\prime}\right)^{\wedge} \rightarrow\left(A^{\prime}\right)^{\wedge}$
are taut. Now pick a weak ideal of definition $J \subset B$. Let $J^{\prime} \subset\left(B^{\prime}\right)^{\wedge}, I \subset A$, $I^{\prime} \subset\left(A^{\prime}\right)^{\wedge}$ be the closure of $J\left(B^{\prime}\right)^{\wedge}, J A, J\left(A^{\prime}\right)^{\wedge}$. By what was said above, it suffices to consider the commutative diagram

and to show (1) $\bar{\varphi}$ finite type $\Rightarrow \bar{\varphi}^{\prime}$ finite type, and (2) if $A \rightarrow A^{\prime}$ is faithfully flat, then $\bar{\varphi}^{\prime}$ finite type $\Rightarrow \bar{\varphi}$ finite type. Note that $\left(B^{\prime}\right)^{\wedge} / J^{\prime}=B^{\prime} / J B^{\prime}$ and $\left(A^{\prime}\right)^{\wedge} / I^{\prime}=$ $A^{\prime} / I A^{\prime}$ by the construction of the topologies on $\left(B^{\prime}\right)^{\wedge}$ and $\left(A^{\prime}\right)^{\wedge}$. In particular the horizontal maps in the diagram are étale. Part (1) now follows from Algebra, Lemma 10.6 .2 and part (2) from Descent, Lemma 34.10 .2 as the ring map $A / I \rightarrow$ $\left(A^{\prime}\right)^{\wedge} / I^{\prime}=A^{\prime} / I A^{\prime}$ is faithfully flat and étale.
We omit the proof of Formal Spaces, Axiom (3).
0ANV Lemma 71.3.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of affine formal algebraic spaces. Assume $Y$ countably indexed. The following are equivalent
(1) $f$ is locally of finite type,
(2) $f$ is of finite type,
(3) $f$ corresponds to a morphism $B \rightarrow A$ of WAdm ${ }^{\text {count }}$ (Formal Spaces, Section 70.16) satisfying the equivalent conditions of Lemma 71.3.6.

Proof. Since $X$ and $Y$ are affine it is clear that conditions (1) and (2) are equivalent. In cases (1) and (2) we see that $X$ is countably indexed as well by Formal Spaces, Lemma 70.14.8. Write $X=\operatorname{Spf}(A)$ and $Y=\operatorname{Spf}(B)$ for topological $S$ algebras $A$ and $B$ in $W A d m^{\text {count }}$, see Formal Spaces, Lemma 70.6.4. By Formal Spaces, Lemma 70.5 .10 we see that $f$ corresponds to a continuous map $B \rightarrow A$. Hence now the result follows from Lemma 71.3.2,

0ANW Lemma 71.3.8. Let $P$ be the property of morphisms of WAdm ${ }^{\text {count }}$ (Formal Spaces, Section 70.16) defined by the equivalent conditions (a), (b), (c), and (d) of Lemma 71.3.6. Then under the assumptions of Formal Spaces, Lemma 70.16.2 the equivalent conditions (1), (2), and (3) are also equivalent to the condition
(4) $f$ is locally of finite type.

Proof. By Lemma 71.3 .7 the condition on morphisms of $W A d m^{\text {count }}$ translates into morphisms of countably indexed, affine formal algebraic spaces being of finite type. Thus the lemma follows from Formal Spaces, Lemma 70.18.6

### 71.4. Two categories

0AL2 Let $A$ be a ring and let $I \subset A$ be an ideal. In this section ${ }^{\wedge}$ will mean $I$-adic completion. Set $A_{n}=A / I^{n}$ so that the $I$-adic completion of $A$ is $A^{\wedge}=\lim A_{n}$. Let $\mathcal{C}$ be the category

0AL3 (71.4.0.1)

$$
\mathcal{C}=\left\{\begin{array}{c}
\text { systems }\left(B_{n}, B_{n+1} \rightarrow B_{n}\right)_{n \in \mathbf{N}} \text { where } \\
B_{n} \text { is a finite type } A_{n} \text {-algebra, } \\
B_{n+1} \rightarrow B_{n} \text { is an } A_{n+1} \text {-algebra map } \\
\text { which induces } B_{n+1} / I^{n} B_{n+1} \cong B_{n}
\end{array}\right\}
$$

Morphisms in $\mathcal{C}$ are given by systems of homomorphisms. Let $\mathcal{C}^{\prime}$ be the category
0AL4

$$
\mathcal{C}^{\prime}=\left\{\begin{array}{c}
A \text {-algebras } B \text { which are } I \text {-adically complete }  \tag{71.4.0.2}\\
\text { such that } B / I B \text { is of finite type over } A / I
\end{array}\right\}
$$

Morphisms in $\mathcal{C}^{\prime}$ are $A$-algebra maps. There is a functor
0AJN

$$
\begin{equation*}
\mathcal{C}^{\prime} \longrightarrow \mathcal{C}, \quad B \longmapsto\left(B / I^{n} B\right) \tag{71.4.0.3}
\end{equation*}
$$

Indeed, since $B / I B$ is of finite type over $A / I$ the ring maps $A_{n}=A / I^{n} \rightarrow B / I^{n} B$ are of finite type (apply Algebra, Lemma 10.19 .1 to a ring map $A / I^{n}\left[x_{1}, \ldots, x_{r}\right] \rightarrow$ $B / I^{n} B$ such that the images of $x_{1}, \ldots, x_{r}$ generate $B / I B$ over $\left.A / I\right)$.
0AJP Lemma 71.4.1. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. The functor

$$
\mathcal{C} \longrightarrow \mathcal{C}^{\prime}, \quad\left(B_{n}\right) \longmapsto B=\lim B_{n}
$$

is a quasi-inverse to $\sqrt{(71.4 .0 .3)}$. The completions $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ are in $\mathcal{C}^{\prime}$ and any object of $\mathcal{C}^{\prime}$ is of the form

$$
B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J
$$

for some ideal $J \subset A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$.
Proof. Let $\left(B_{n}\right)$ be an object of $\mathcal{C}$. By Algebra, Lemma 10.97 .1 we see that $B=\lim B_{n}$ is $I$-adically complete and $B / I^{n} B=B_{n}$. Hence we see that $B$ is an object of $\mathcal{C}^{\prime}$ and that we can recover the object $\left(B_{n}\right)$ by taking the quotients. Conversely, if $B$ is an object of $\mathcal{C}^{\prime}$, then $B=\lim B / I^{n} B$ by assumption. Thus $B \mapsto\left(B / I^{n} B\right)$ is a quasi-inverse to the functor of the lemma.
Since $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}=\lim A_{n}\left[x_{1}, \ldots, x_{r}\right]$ it is an object of $\mathcal{C}^{\prime}$ by the first statement of the lemma. Finally, let $B$ be an object of $\mathcal{C}^{\prime}$. Choose $b_{1}, \ldots, b_{r} \in B$ whose images in $B / I B$ generate $B / I B$ as an algebra over $A / I$. Since $B$ is $I$-adically complete, the $A$-algebra map $A\left[x_{1}, \ldots, x_{r}\right] \rightarrow B, x_{i} \mapsto b_{i}$ extends to an $A$-algebra map $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \rightarrow B$. To finish the proof we have to show this map is surjective which follows from Algebra, Lemma 10.95 .1 as our map $A\left[x_{1}, \ldots, x_{r}\right] \rightarrow B$ is surjective modulo $I$ and as $B=B^{\wedge}$.

We warn the reader that, in case $A$ is not Noetherian, the quotient of an object of $\mathcal{C}^{\prime}$ may not be an object of $\mathcal{C}^{\prime}$. See Examples, Lemma 88.7.1 Next we show this does not happen when $A$ is Noetherian.
0AJQ Lemma 71.4.2. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Then
(1) every object of the category $\mathcal{C}^{\prime}$, in particular the completion $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$, is Noetherian,
(2) if $B$ is an object of $\mathcal{C}^{\prime}$ and $J \subset B$ is an ideal, then $B / J$ is an object of $\mathcal{C}^{\prime}$.

GD60, Proposition 7.5.5]

Proof. To see (1) by Lemma 71.4.1 we reduce to the case of the completion of the polynomial ring. This case follows from Algebra, Lemma 10.96 .6 as $A\left[x_{1}, \ldots, x_{r}\right]$ is Noetherian (Algebra, Lemma 10.30.1). Part (2) follows from Algebra, Lemma 10.96 .1 which tells us that ever finite $B$-module is $I B$-adically complete.

0AL5 Remark 71.4.3 (Base change). Let $\varphi: A_{1} \rightarrow A_{2}$ be a ring map and let $I_{i} \subset A_{i}$ be ideals such that $\varphi\left(I_{1}^{c}\right) \subset I_{2}$ for some $c \geq 1$. This induces ring maps $A_{1, c n}=$ $A_{1} / I_{1}^{c n} \rightarrow A_{2} / I_{2}^{n}=A_{2, n}$ for all $n \geq 1$. Let $\mathcal{C}_{i}$ be the category 71.4.0.1 for $\left(A_{i}, I_{i}\right)$. There is a base change functor
0AJZ

$$
\begin{equation*}
\mathcal{C}_{1} \longrightarrow \mathcal{C}_{2}, \quad\left(B_{n}\right) \longmapsto\left(B_{c n} \otimes_{A_{1, c n}} A_{2, n}\right) \tag{71.4.3.1}
\end{equation*}
$$

Let $\mathcal{C}_{i}^{\prime}$ be the category $\sqrt[71.4 .0 .2]{ }$ for $\left(A_{i}, I_{i}\right)$. If $I_{2}$ is finitely generated, then there is a base change functor

$$
\begin{equation*}
\mathcal{C}_{1}^{\prime} \longrightarrow \mathcal{C}_{2}^{\prime}, \quad B \longmapsto\left(B \otimes_{A_{1}} A_{2}\right)^{\wedge} \tag{71.4.3.2}
\end{equation*}
$$

because in this case the completion is complete (Algebra, Lemma 10.95.5). If both $I_{1}$ and $I_{2}$ are finitely generated, then the two base change functors agree via the functors 71.4.0.3 which are equivalences by Lemma 71.4.1.

0AL6 Remark 71.4.4 (Base change by closed immersion). Let $A$ be a Noetherian ring and $I \subset A$ an ideal. Let $\mathfrak{a} \subset A$ be an ideal. Denote $\bar{A}=A / \mathfrak{a}$. Let $\bar{I} \subset \bar{A}$ be an ideal such that $I^{c} \bar{A} \subset \bar{I}$ and $\bar{I}^{d} \subset I \bar{A}$ for some $c, d \geq 1$. In this case the base change functor $\sqrt{71.4 .3 .2}$ for $(A, I)$ to $(\bar{A}, \bar{I})$ is given by $B \mapsto \bar{B}=B / \mathfrak{a} B$. Namely, we have
0AK1 (71.4.4.1)

$$
\bar{B}=\left(B \otimes_{A} \bar{A}\right)^{\wedge}=(B / \mathfrak{a} B)^{\wedge}=B / \mathfrak{a} B
$$

the last equality because any finite $B$-module is $I$-adically complete by Algebra, Lemma 10.96 .1 and if annihilated by $\mathfrak{a}$ also $\bar{I}$-adically complete by Algebra, Lemma 10.95 .9

### 71.5. A naive cotangent complex

0AJL Let $A$ be a Noetherian ring and let $I \subset A$ be a ideal. Let $B$ be an $A$-algebra which is $I$-adically complete such that $A / I \rightarrow B / I B$ is of finite type, i.e., an object of 71.4.0.2. By Lemma 71.4.2 we can write

$$
B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J
$$

for some finitely generated ideal $J$. For a choice of presentation as above we define the naive cotangent complex in this setting by the formula

0AJR (71.5.0.2)

$$
N L_{B / A}^{\wedge}=\left(J / J^{2} \longrightarrow \bigoplus B \mathrm{~d} x_{i}\right)
$$

with terms sitting in degrees -1 and 0 where the map sends the residue class of $g \in J$ to the differential $\mathrm{d} g=\sum\left(\partial g / \partial x_{i}\right) \mathrm{d} x_{i}$. Here the partial derivative is taken by thinking of $g$ as a power series. The following lemma shows that $N L_{B / A}^{\wedge}$ is well defined in $D(B)$, i.e., independent of the chosen presentation, although this could be shown directly by comparing presentations as in Algebra, Section 10.132
0AJS Lemma 71.5.1. Let $A$ be a Noetherian ring and let $I \subset A$ be a ideal. Let $B$ be an object of (71.4.0.2). Then $N L_{B / A}^{\wedge}=R \lim N L_{B_{n} / A_{n}}$ in $D(B)$.
Proof. In fact, the presentation $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$ defines presentations

$$
B_{n}=B / I^{n} B=A_{n}\left[x_{1}, \ldots, x_{r}\right] / J_{n}
$$

where

$$
J_{n}=J A_{n}\left[x_{1}, \ldots, x_{r}\right]=J /\left(J \cap I^{n} A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}\right)
$$

By Artin-Rees (Algebra, Lemma 10.50.2) in the Noetherian ring $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ (Lemma 71.4.2) we see that we have canonical surjections

$$
J / I^{n} J \rightarrow J_{n} \rightarrow J / I^{n-c} J, \quad n \geq c
$$

for some $c \geq 0$. It follows that $\lim J_{n} / J_{n}^{2}=J / J^{2}$ as any finite $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ module is $I$-adically complete (Algebra, Lemma 10.96.1). Thus

$$
N L_{B / A}^{\wedge}=\lim \left(J_{n} / J_{n}^{2} \longrightarrow \bigoplus B_{n} \mathrm{~d} x_{i}\right)
$$

(termwise limit) and the transition maps in the system are termwise surjective. The two term complex $J_{n} / J_{n}^{2} \longrightarrow \bigoplus B_{n} \mathrm{~d} x_{i}$ represents $N L_{B_{n} / A_{n}}$ by Algebra, Section 10.132. It follows that $N L_{B / A}^{\wedge}$ represents $R \lim N L_{B_{n} / A_{n}}$ in the derived category by More on Algebra, Lemma 15.68.9.

0 ALM Lemma 71.5.2. Let $A$ be a Noetherian ring and let $I \subset A$ be a ideal. Let $B \rightarrow C$ be morphism of (71.4.0.2). Then there is an exact sequence

Proof. Choose a presentation $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$. Note that $(B, I B)$ is a pair consisting of a Noetherian ring and an ideal, and $C$ is in the corresponding category 71.4.0.2 for this pair. Hence we can choose a presentation $C=B\left[y_{1}, \ldots, y_{s}\right]^{\wedge} / J^{\prime}$. Combinging these presentations gives a presentation

$$
C=A\left[x_{1}, \ldots, x_{r}, y_{1}, \ldots, y_{s}\right]^{\wedge} / K
$$

Then the reader verifies that we obtain a commutative diagram

with exact rows. Note that the vertical arrow on the left hand side is the tensor product of the arrow defining $N L_{B / A}^{\wedge}$ with id ${ }_{C}$. The lemma follows by applying the snake lemma (Algebra, Lemma 10.4.1.

0AQJ Lemma 71.5.3. With assumptions as in Lemma 71.5.2 assume that $B / I^{n} B \rightarrow$ $C / I^{n} C$ is a local complete intersection homomorphism for all $n$. Then $H^{-1}\left(N L_{B / A}^{\wedge} \otimes_{B} C\right) \rightarrow$ $H^{-1}\left(N L_{C / A}^{\wedge}\right)$ is injective.

Proof. By More on Algebra, Lemma 15.25 .6 we see that this holds for the map between naive cotangent complexes of the situation modulo $I^{n}$ for all $n$. In other words, we obtain a distinguished triangle in $D\left(C / I^{n} C\right)$ for every $n$. Using Lemma 71.5 .1 this implies the lemma; details omitted.

Maps in the derived category out of a complex such as 71.5.0.2 are easy to understand by the result of the following lemma.

0ALN Lemma 71.5.4. Let $R$ be a ring. Let $M^{\bullet}$ be a complex of modules over $R$ with $M^{\imath}=0$ for $i>0$ and $M^{0}$ a projective $R$-module. Let $K^{\bullet}$ be a second complex.
(1) If $K^{i}=0$ for $i \leq-2$, then $\operatorname{Hom}_{D(R)}\left(M^{\bullet}, K^{\bullet}\right)=\operatorname{Hom}_{K(R)}\left(M^{\bullet}, K^{\bullet}\right)$,
(2) If $K^{i}=0$ for $i \leq-3$ and $\alpha \in \operatorname{Hom}_{D(R)}\left(M^{\bullet}, K^{\bullet}\right)$ composed with $K^{\bullet} \rightarrow$ $K^{-2}[2]$ comes from an $R$-module map $a: M^{-2} \rightarrow K^{-2}$ with $a \circ d_{M}^{-3}=0$, then $\alpha$ can be represented by a map of complexes $a^{\bullet}: M^{\bullet} \rightarrow K^{\bullet}$ with $a^{-2}=a$.
(3) In (2) for any second map of complexes ( $\left.a^{\prime}\right)^{\bullet}: M^{\bullet} \rightarrow K^{\bullet}$ representing $\alpha$ with $a=\left(a^{\prime}\right)^{-2}$ there exist $h^{\prime}: M^{0} \rightarrow K^{-1}$ and $h: M^{-1} \rightarrow K^{-2}$ such that

$$
h \circ d_{M}^{-2}=0, \quad\left(a^{\prime}\right)^{-1}=a^{-1}+d_{K}^{-2} \circ h+h^{\prime} \circ d_{M}^{-1}, \quad\left(a^{\prime}\right)^{0}=a^{0}+d_{K}^{-1} \circ h^{\prime}
$$

Proof. Set $F^{0}=M^{0}$. Choose a free $R$-module $F^{-1}$ and a surjection $F^{-1} \rightarrow$ $M^{-1}$. Choose a free $R$-module $F^{-2}$ and a surjection $F^{-2} \rightarrow M^{-2} \times_{M^{-1}} F^{-1}$. Continuing in this way we obtain a quasi-isomorphism $p^{\bullet}: F^{\bullet} \rightarrow M^{\bullet}$ which is termwise surjective and with $F^{i}$ free for all $i$.
Proof of (1). By Derived Categories, Lemma 13.19 .8 we have

$$
\operatorname{Hom}_{D(R)}\left(M^{\bullet}, K^{\bullet}\right)=\operatorname{Hom}_{K(R)}\left(F^{\bullet}, K^{\bullet}\right)
$$

If $K^{i}=0$ for $i \leq-2$, then any morphism of complexes $F^{\bullet} \rightarrow K^{\bullet}$ factors through $p^{\bullet}$. Similarly, any homotopy $\left\{h^{i}: F^{i} \rightarrow K^{i-1}\right\}$ factors through $p^{\bullet}$. Thus (1) holds.
Proof of (2). Choose $b^{\bullet}: F^{\bullet} \rightarrow K^{\bullet}$ representing $\alpha$. The composition of $\alpha$ with $K^{\bullet} \rightarrow K^{-2}[2]$ is represented by $b^{-2}: F^{-2} \rightarrow K^{-2}$. As this is homotopic to $a \circ p^{-2}: F^{-2} \rightarrow M^{-2} \rightarrow K^{-2}$, there is a map $h: F^{-1} \rightarrow K^{-2}$ such that $b^{-2}=$ $a \circ p^{-2}+h \circ d_{F}^{-2}$. Adjusting $b^{\bullet}$ by $h$ viewed as a homotopy from $F^{\bullet}$ to $K^{\bullet}$, we find that $b^{-2}=a \circ p^{-2}$. Hence $b^{-2}$ factors through $p^{-2}$. Since $F^{0}=M^{0}$ the kernel of $p^{-2}$ surjects onto the kernel of $p^{-1}$ (for example because the kernel of $p^{\bullet}$ is an acyclic complex or by a diagram chase). Hence $b^{-1}$ necessarily factors through $p^{-1}$ as well and we see that (2) holds for these factorizations and $a^{0}=b^{0}$.
Proof of (3) is omitted. Hint: There is a homotopy between $a^{\bullet} \circ p^{\bullet}$ and $\left(a^{\prime}\right)^{\bullet} \circ p^{\bullet}$ and we argue as before that this homotopy factors through $p^{\bullet}$.

0AJT Lemma 71.5.5. Let $R$ be a ring. Let $M^{\bullet}$ be a two term complex $M^{-1} \rightarrow M^{0}$ over $R$. If $\varphi, \psi \in \operatorname{End}_{D(R)}\left(M^{\bullet}\right)$ are zero on $H^{i}\left(M^{\bullet}\right)$, then $\varphi \circ \psi=0$.
Proof. Apply Derived Categories, Lemma 13.12 .5 to see that $\varphi \circ \psi$ factors through $\tau_{\leq-2} M^{\bullet}=0$.

### 71.6. Rig-étale homomorphisms

0ALP In this and some of the later sections we will study ring maps as in Lemma 71.6.1. Condition (4) is one of the conditions used in Art70 to define modifications. Ring maps like this are sometimes called rig-étale or rigid-étale ring maps in the literature. These and the analogously defined rig-smooth ring maps were studied in Elk73. A detailed exposition can also be found in Abb10. Our main goal will be to show that rig-étale ring maps are completions of finite type algebras, a result very similar to results found in Elkik's paper Elk73.

0AJU Lemma 71.6.1. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Let $B$ be an object of (71.4.0.2). The following are equivalent
0AJV (1) there exists a $c \geq 0$ such that multiplication by a on $N L_{B / A}^{\wedge}$ is zero in $D(B)$ for all $a \in I^{c}$,
0AJW (2) there exits a $c \geq 0$ such that $H^{i}\left(N L_{B / A}^{\wedge}\right), i=-1,0$ is annihilated by $I^{c}$,
0AJX
(3) there exists a $c \geq 0$ such that $H^{i}\left(N L_{B_{n} / A_{n}}\right), i=-1,0$ is annihlated by $I^{c}$ for all $n \geq 1$,
0AJY (4) $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$ and for every $a \in I$ there exists a $c \geq 0$ such that (a) $a^{c}$ annihilates $H^{0}\left(N L_{B / A}^{\wedge}\right)$, and
(b) there exist $f_{1}, \ldots, f_{r} \in J$ such that $a^{c} J \subset\left(f_{1}, \ldots, f_{r}\right)+J^{2}$.

Proof. The equivalence of (1) and (2) follows from Lemma 71.5.5. The equivalence of $(1)+(2)$ and (3) follows from Lemma 71.5.1. Some details omitted.

Assume the equivalent conditions (1), (2), (3) holds and let $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$ be a presentation (see Lemma 71.4.1). Let $a \in I$. Let $c$ be such that multplication by $a^{c}$ is zero on $N L_{B / A}^{\wedge}$ which exists by (1). By Lemma 71.5.4 there exists a map $\alpha: \bigoplus B \mathrm{~d} x_{i} \rightarrow J / J^{2}$ such that $\mathrm{d} \circ \alpha$ and $\alpha \circ \mathrm{d}$ are both multiplication by $a^{c}$. Let $f_{i} \in J$ be an element whose class modulo $J^{2}$ is equal to $\alpha\left(\mathrm{d} x_{i}\right)$. Then we see that (4) (a), (b) hold.

Assume (4) holds. Say $I=\left(a_{1}, \ldots, a_{t}\right)$. Let $c_{i} \geq 0$ be the integer such that 44 (a), (b) hold for $a_{i}^{c_{i}}$. Then we see that $I^{\sum c_{i}}$ annihilates $H^{0}\left(N L_{B / A}^{\wedge}\right)$. Let $f_{i, 1}, \ldots, f_{i, r} \in J$ be as in (b) for $a_{i}$. Consider the composition

$$
B^{\oplus r} \rightarrow J / J^{2} \rightarrow \bigoplus B \mathrm{~d} x_{i}
$$

where the $j$ th basis vector is mapped to the class of $f_{i, j}$ in $J / J^{2}$. By 4) (a) and (b) the cokernel of the composition is annihilated by $a_{i}^{2 c_{i}}$. Thus this map is surjective after inverting $a_{i}^{c_{i}}$, and hence an isomorphism (Algebra, Lemma 10.15.4). Thus the kernel of $B^{\oplus r} \rightarrow \bigoplus B \mathrm{~d} x_{i}$ is $a_{i}$-power torsion, and hence $H^{-1}\left(N L_{B / A}^{\wedge}\right)=$ $\operatorname{Ker}\left(J / J^{2} \rightarrow \bigoplus B \mathrm{~d} x_{i}\right)$ is $a_{i}$-power torsion. Since $B$ is Noetherian (Lemma 71.4.2), all modules including $H^{-1}\left(N L_{B / A}^{\wedge}\right)$ are finite. Thus $a_{i}^{d_{i}}$ annihilates $H^{-1}\left(N L_{B / A}^{\wedge}\right)$ for some $d_{i} \geq 0$. It follows that $I^{\sum d_{i}}$ annihilates $H^{-1}\left(N L_{B / A}^{\wedge}\right)$ and we see that (2) holds.

0ALQ Lemma 71.6.2. Let $A$ be a Noetherian ring and let $I$ be an ideal. Let $B$ be $a$ finite type $A$-algebra.
(1) If $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$, then $B^{\wedge}$ satisfies the equivalent conditions of Lemma 71.6.1.
(2) If $B^{\wedge}$ satisfies the equivalent conditions of Lemma 71.6.1, then there exists $g \in 1+I B$ such that $\operatorname{Spec}\left(B_{g}\right)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$.

Proof. Assume $B^{\wedge}$ satisfies the equivalent conditions of Lemma 71.6.1. The naive cotangent complex $N L_{B / A}$ is a complex of finite type $B$-modules and hence $H^{-1}$ and $H^{0}$ are finite $B$-modules. Completion is an exact functor on finite $B$-modules (Algebra, Lemma 10.96 .2 and $N L_{B^{\wedge} / A}^{\wedge}$ is the completion of the complex $N L_{B / A}$ (this is easy to see by choosing presentations). Hence the assumption implies there exists a $c \geq 0$ such that $H^{-1} / I^{n} H^{-1}$ and $H^{0} / I^{n} H^{0}$ are annihilated by $I^{c}$ for all $n$. By Nakayama's lemma (Algebra, Lemma 10.19.1) this means that $I^{c} H^{-1}$ and $I^{c} H^{0}$ are annihilated by an element of the form $g=1+x$ with $x \in I B$. After inverting $g$ (which does not change the quotients $B / I^{n} B$ ) we see that $N L_{B / A}$ has cohomology annihilated by $I^{c}$. Thus $A \rightarrow B$ is étale at any prime of $B$ not lying over $V(I)$ by the definition of étale ring maps, see Algebra, Definition 10.141.1.

Conversely, assume that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$. Then for every $a \in I$ there exists a $c \geq 0$ such that multiplication by $a^{c}$ is zero $N L_{B / A}$. Since $N L_{B^{\wedge} / A}^{\wedge}$ is the derived completion of $N L_{B / A}$ (see Lemma 71.5.1) it follows that $B^{\wedge}$ satisfies the equivalent conditions of Lemma 71.6.1.

0AK2 Lemma 71.6.3. Assume the map $\left(A_{1}, I_{1}\right) \rightarrow\left(A_{2}, I_{2}\right)$ is as in Remark 71.4.3 with $A_{1}$ and $A_{2}$ Noetherian. Let $B_{1}$ be in (71.4.0.2) for $\left(A_{1}, I_{1}\right)$. Let $B_{2}$ be the base change of $B_{1}$. If multiplication by $f_{1} \in B_{1}$ on $N L_{B_{1} / A_{1}}^{\wedge}$ is zero in $D\left(B_{1}\right)$, then multiplication by the image $f_{2} \in B_{2}$ on $N L_{B_{2} / A_{2}}^{\wedge}$ is zero in $D\left(B_{2}\right)$.

Proof. Choose a presentation $B_{1}=A_{1}\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J_{1}$. Since $A_{2} / I_{2}^{n}\left[x_{1}, \ldots, x_{r}\right]=$ $A_{1} / I_{1}^{c n}\left[x_{1}, \ldots, x_{r}\right] \otimes_{A_{1} / I_{1}^{c n}} A_{2} / I_{2}^{n}$ we have

$$
A_{2}\left[x_{1}, \ldots, x_{r}\right]^{\wedge}=\left(A_{1}\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \otimes_{A_{1}} A_{2}\right)^{\wedge}
$$

where we use $I_{2}$-adic completion on both sides (but of course $I_{1}$-adic completion for $\left.A_{1}\left[x_{1}, \ldots, x_{r}\right]^{\wedge}\right)$. Set $J_{2}=J_{1} A_{2}\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$. Arguing similarly we get the presentation

$$
\begin{aligned}
B_{2} & =\left(B_{1} \otimes_{A_{1}} A_{2}\right)^{\wedge} \\
& =\lim \frac{A_{1} / I_{1}^{c n}\left[x_{1}, \ldots, x_{r}\right]}{J_{1}\left(A_{1} / I_{1}^{c n}\left[x_{1}, \ldots, x_{r}\right]\right)} \otimes_{A_{1} / I_{1}^{c n}} A_{2} / I_{2}^{n} \\
& =\lim \frac{A_{2} / I_{2}^{n}\left[x_{1}, \ldots, x_{r}\right]}{J_{2}\left(A_{2} / I_{2}^{n}\left[x_{1}, \ldots, x_{r}\right]\right)} \\
& =A_{2}\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J_{2}
\end{aligned}
$$

for $B_{2}$ over $A_{2}$. Consider the commutative diagram

The induced arrow $J_{1} / J_{1}^{2} \otimes_{B_{1}} B_{2} \rightarrow J_{2} / J_{2}^{2}$ is surjective because $J_{2}$ is generated by the image of $J_{1}$. By Lemma 71.5 .4 there is a map $\alpha_{1}: \bigoplus B \mathrm{~d} x_{i} \rightarrow J_{1} / J_{1}^{2}$ such that $f_{1} \mathrm{id}_{\oplus B_{1} \mathrm{~d} x_{i}}=\mathrm{d} \circ \alpha_{1}$ and $f_{1} \operatorname{id}_{J_{1} / J_{1}^{2}}=\alpha_{1} \circ \mathrm{~d}$. We define $\alpha_{2}: \bigoplus B_{1} \mathrm{~d} x_{i} \rightarrow J_{2} / J_{2}^{2}$ by mapping $\mathrm{d} x_{i}$ to the image of $\alpha_{1}\left(\mathrm{~d} x_{i}\right)$ in $J_{2} / J_{2}^{2}$. Because the image of the vertical arrows contains generators of the modules $J_{2} / J_{2}^{2}$ and $\bigoplus B_{2} \mathrm{~d} x_{i}$ it follows that $\alpha_{2}$ also defines a homotopy between multiplication by $f_{2}$ and the zero map.
0 AKJ Lemma 71.6.4. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $B$ be a finite type $A$-algebra such that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$. Let $C$ be a Noetherian A-algebra. Then any A-algebra map $B^{\wedge} \rightarrow C^{\wedge}$ of I-adic completions comes from a unique $A$-algebra map

$$
B \longrightarrow C^{h}
$$

where $C^{h}$ is the henselization of the pair $(C, I C)$ as in More on Algebra, Lemma 15.8.13. Moreover, any A-algebra homomorphism $B \rightarrow C^{h}$ factors through some étale $C$-algebra $C^{\prime}$ such that $C / I C \rightarrow C^{\prime} / I C^{\prime}$ is an isomorphism.
Proof. Uniqueness follows from the fact that $C^{h}$ is a subring of $C^{\wedge}$, see for example More on Algebra, Lemma 15.8.16. The final assertion follows from the fact that $C^{h}$ is the filtered colimit of these $C$-algebras $C^{\prime}$, see proof of More on Algebra, Lemma 15.8.13. Having said this we now turn to the proof of existence.

Let $\varphi: B^{\wedge} \rightarrow C^{\wedge}$ be the given map. This defines a section

$$
\sigma:\left(B \otimes_{A} C\right)^{\wedge} \longrightarrow C^{\wedge}
$$

of the completion of the map $C \rightarrow B \otimes_{A} C$. We may replace $(A, I, B, C, \varphi)$ by $\left(C, I C, B \otimes_{A} C, C, \sigma\right)$. In this way we see that we may assume that $A=C$.
Proof of existence in the case $A=C$. In this case the map $\varphi: B^{\wedge} \rightarrow A^{\wedge}$ is necessarily surjective. By Lemmas 71.6 .2 and 71.5 .2 we see that the cohomology groups of $N L_{A^{\wedge} / \varphi B^{\wedge}}^{\wedge}$ are annihilated by a power of $I$. Since $\varphi$ is surjective, this implies that $\operatorname{Ker}(\varphi) / \operatorname{Ker}(\varphi)^{2}$ is annihilated by a power of $I$. Hence $\varphi: B^{\wedge} \rightarrow A^{\wedge}$ is the completion of a finite type $B$-algebra $B \rightarrow D$, see Dualizing Complexes, Lemma 45.13.2. Hence $A \rightarrow D$ is a finite type algebra map which induces an isomorphism $A^{\wedge} \rightarrow D^{\wedge}$. By Lemma 71.6 .2 we may replace $D$ by a localization and assume that $A \rightarrow D$ is étale away from $V(I)$. Since $A^{\wedge} \rightarrow D^{\wedge}$ is an isomorphism, we see that $\operatorname{Spec}(D) \rightarrow \operatorname{Spec}(A)$ is also étale in a neighbourhood of $V(I D)$ (for example by More on Morphisms, Lemma 36.10.3). Thus $\operatorname{Spec}(D) \rightarrow \operatorname{Spec}(A)$ is étale. Therefore $D$ maps to $A^{h}$ and the lemma is proved.

### 71.7. Rig-étale morphisms

0AQK We can use the notion introduced in the previous section to define a new type of morphism of locally Noetherian formal algebraic spaces. Before we do so, we have to check it is a local property.
0AQL Lemma 71.7.1. For morphisms $A \rightarrow B$ of the category WAdm ${ }^{\text {Noeth (Formal }}$ Spaces, Section 70.16) consider the condition $P=$ "for some ideal of definition $I$ of A the topology on $B$ is the $I$-adic topology, the ring map $A / I \rightarrow B / I B$ is of finite type and $A \rightarrow B$ satisfies the equivalent conditions of Lemma 71.6.1". Then $P$ is a local property, see Formal Spaces, Remark 70.16.4.

Proof. We have to show that Formal Spaces, Axioms (1), (2), and (3) hold for maps between Noetherian adic rings. For a Noetherian adic ring $A$ with ideal of definition $I$ we have $A\left\{x_{1}, \ldots, x_{r}\right\}=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ as topological $A$-algebras (see Remark 71.2.2). We will use without further mention that we know the axioms hold for the property " $B$ is a quotient of $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge ", ~ s e e ~ L e m m a ~ 71.3 .6 . ~}$
Let a diagram as in Formal Spaces, Diagram (70.16.1.1) be given with $A$ and $B$ in the category $W A d m^{\text {Noeth }}$. Pick an ideal of definition $I \subset A$. By the remarks above the topology on each ring in the diagram is the $I$-adic topology. Since $A \rightarrow A^{\prime}$ and $B \rightarrow B^{\prime}$ are étale we see that $N L_{\left(A^{\prime}\right)^{\wedge} / A}^{\wedge}$ and $N L_{\left(B^{\prime}\right)^{\wedge} / B}^{\wedge}$ are zero. By Lemmas 71.5 .2 and 71.5 .3 we get
$H^{i}\left(N L_{\left(B^{\prime}\right) \wedge /\left(A^{\prime}\right)^{\wedge}}^{\wedge}\right) \cong H^{i}\left(N L_{\left(B^{\prime}\right)^{\wedge} / A}^{\wedge}\right) \quad$ and $\quad H^{i}\left(N L_{B / A}^{\wedge} \otimes_{B}\left(B^{\prime}\right)^{\wedge}\right) \cong H^{i}\left(N L_{\left(B^{\prime}\right)^{\wedge} / A}^{\wedge}\right)$
for $i=-1,0$. Since $B$ is Noetherian the ring map $B \rightarrow B^{\prime} \rightarrow\left(B^{\prime}\right)^{\wedge}$ is flat (Algebra, Lemma 10.96.2 hence the tensor product comes out. Moreover, as $B$ is $I$-adically complete, then if $B \rightarrow B^{\prime}$ is faithfully flat, so is $B \rightarrow\left(B^{\prime}\right)^{\wedge}$. From these observations Formal Spaces, Axioms (1) and (2) follow immediately.
We omit the proof of Formal Spaces, Axiom (3).
0AQM Definition 71.7.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian formal algebraic spaces over $S$. We say $f$ is rig-étale if $f$ satisfies the equivalent conditions of Formal Spaces, Lemma 70.16.2 (in the setting of locally Noetherian formal algebraic spaces, see Formal Spaces, Remark 70.16.3 for the property $P$ of Lemma 71.7.1.

To be sure, a rig-étale morphism is locally of finite type.
0AQN Lemma 71.7.3. A rig-étale morphism of locally Noetherian formal algebraic spaces is locally of finite type.

Proof. The property $P$ in Lemma 71.7 .1 implies the equivalent conditions (a), (b), (c), and (d) in Lemma 71.3.6. Hence this follows from Lemma 71.3.8.

### 71.8. Glueing rings along a principal ideal

0 AK 5 In this situation we prove some results about the categories $\mathcal{C}$ and $\mathcal{C}^{\prime}$ of Section 71.4 in case $A$ is a Noetherian ring and $I=(a)$ is a principal ideal.

0AK3 Remark 71.8.1 (Linear approximation). Let $A$ be a ring and $I \subset A$ be a finitely generated ideal. Let $C$ be an $I$-adically complete $A$-algebra. Let $\psi$ : $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \rightarrow C$ be a continuous $A$-algebra map. Suppose given $\delta_{i} \in C$, $i=1, \ldots, r$. Then we can consider

$$
\psi^{\prime}: A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \rightarrow C, \quad x_{i} \longmapsto \psi\left(x_{i}\right)+\delta_{i}
$$

see Remark 71.2.1. Then we have

$$
\psi^{\prime}(g)=\psi(g)+\sum \psi\left(\partial g / \partial x_{i}\right) \delta_{i}+\xi
$$

with error term $\xi \in\left(\delta_{i} \delta_{j}\right)$. This follows by writing $g$ as a power series and working term by term. Convergence is automatic as the coefficients of $g$ tend to zero. Details omitted.

0AK6 Lemma 71.8.2. Let $A$ be a Noetherian ring and $I=(a)$ a principal ideal. Let $B$ be an objects of (71.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by $a^{c}$ on $N L_{B / A}^{\wedge}$ is zero in $D(B)$. Let $C$ be an I-adically complete $A$-algebra such that $a$ is a nonzerodivisor on $C$. Let $n>2 c$. For any $A_{n}$-algebra map $\psi_{n}: B / a^{n} B \rightarrow$ $C / a^{n} C$ there exists an A-algebra map $\varphi: B \rightarrow C$ such that $\psi_{n} \bmod a^{n-c}=\varphi \bmod$ $a^{n-c}$.

Proof. Choose a presentation $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$. Choose a lift

$$
\psi: A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \rightarrow C
$$

of $\psi_{n}$. Then $\psi(J) \subset a^{n} C$ and $\psi\left(J^{2}\right) \subset a^{2 n} C$ which determines a linear map

$$
J / J^{2} \longrightarrow a^{n} C / a^{2 n} C, \quad g \longmapsto \psi(g)
$$

By assumption and Lemma 71.5 .4 there is a $B$-module map $\bigoplus B d x_{i} \rightarrow a^{n} C / a^{2 n} C$, $\mathrm{d} x_{i} \mapsto \delta_{i}$ such that $a^{c} \psi(g)=\sum \psi\left(\partial g / \partial x_{i}\right) \delta_{i}$ for all $g \in J$. Write $\delta_{i}=-a^{c} \delta_{i}^{\prime}$ for some $\delta_{i}^{\prime} \in a^{n-c} C$. Since $a$ is a nonzerodivisor on $C$ we see that $\psi(g)=$ $-\sum \psi\left(\partial g / \partial x_{i}\right) \delta_{i}^{\prime}$ in $C / a^{2 n-c} C$. Then we look at the map

$$
\psi^{\prime}: A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} \rightarrow C, \quad x_{i} \longmapsto \psi\left(x_{i}\right)+\delta_{i}^{\prime}
$$

A computation with power series (see Remark 71.8.1) shows that $\psi^{\prime}(J) \subset a^{2 n-2 c} C$. Since $n>2 c$ we see that $n^{\prime}=2 n-2 c=n+(n-2 c)>n$. Thus we obtain a morphism $\psi_{n^{\prime}}: B / a^{n^{\prime}} B \rightarrow C / a^{n^{\prime}} C$ agreeing with $\psi_{n}$ modulo $a^{n-c}$. Continuing in this fashion and taking the limit into $C=\lim C / a^{t} C$ we obtain the lemma.

0AK7 Lemma 71.8.3. Let $A$ be a Noetherian ring and $I=(a)$ a principal ideal. Let $B$ be an object of 71.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by $a^{c}$ on $N L_{B / A}^{\wedge}$ is zero in $D(B)$. Let $C$ be an I-adically complete $A$-algebra. Assume given an integer $d \geq 0$ such that $C\left[a^{\infty}\right] \cap a^{d} C=0$. Let $n>\max (2 c, c+d)$. For any $A_{n}$-algebra map $\psi_{n}: B / a^{n} B \rightarrow C / a^{n} C$ there exists an $A$-algebra map $\varphi: B \rightarrow C$ such that $\psi_{n} \bmod a^{n-c}=\varphi \bmod a^{n-c}$.
If $C$ is Noetherian we have $C\left[a^{\infty}\right]=C\left[a^{e}\right]$ for some $e \geq 0$. By Artin-Rees (Algebra, Lemma 10.50 .2 there exists an integer $f$ such that $a^{n} C \cap C\left[a^{\infty}\right] \subset a^{n-f} C\left[a^{\infty}\right]$ for all $n \geq f$. Then $d=e+f$ is an integer as in the lemma. This argument works in particular if $C$ is an object of 71.4.0.2 by Lemma 71.4.2.

Proof. Let $C \rightarrow C^{\prime}$ be the quotient of $C$ by $C\left[a^{\infty}\right]$. The $A$-algebra $C^{\prime}$ is $I$-adically complete by Algebra, Lemma 10.95 .10 and the fact that $\bigcap\left(C\left[a^{\infty}\right]+a^{n} C\right)=C\left[a^{\infty}\right]$ because for $n \geq d$ the sum $C\left[a^{\infty}\right]+a^{n} C$ is direct. For $m \geq d$ the diagram

has exact rows. Thus $C$ is the fibre product of $C^{\prime}$ and $C / a^{m} C$ over $C^{\prime} / a^{m} C^{\prime}$. Thus the lemma now follows formally from the lifting result of Lemma 71.8.2.

0ALS Lemma 71.8.4. Let $A$ be a Noetherian ring and $I=(a)$ a principal ideal. Let $B$ be an object of (71.4.0.2). Assume given an integer $c \geq 0$ such that multiplication by $a^{c}$ on $N L_{B / A}^{\wedge}$ is zero in $D(B)$. Then there exists a finite type $A$-algebra $C$ and an isomorphism $B \cong C^{\wedge}$.
Proof. Choose a presentation $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$. By Lemma 71.5 .4 we can find a map $\alpha: \bigoplus B \mathrm{~d} x_{i} \rightarrow J / J^{2}$ such that $\mathrm{d} \circ \alpha$ and $\alpha \circ \mathrm{d}$ are both multiplication by $a^{c}$. Pick an element $f_{i} \in J$ whose class modulo $J^{2}$ is equal to $\alpha\left(\mathrm{d} x_{i}\right)$. Then we see that $\mathrm{d} f_{i}=a^{c} \mathrm{~d} x_{i}$ in $\bigoplus \mathrm{d} x_{i}$. In particular we have a ring map

$$
A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} /\left(f_{1}, \ldots, f_{r}, \Delta\left(f_{1}, \ldots, f_{r}\right)-a^{r c}\right) \longrightarrow B
$$

where $\Delta\left(f_{1}, \ldots, f_{r}\right) \in A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ is the determinant of the matrix of partial derivatives of the $f_{i}$.
Pick a large integer $N$. Pick $F_{1}, \ldots, F_{r} \in A\left[x_{1}, \ldots, x_{r}\right]$ such that $F_{i}-f_{i} \in$ $I^{N} A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$. Set

$$
C=A\left[x_{1}, \ldots, x_{r}, z\right] /\left(F_{1}, \ldots, F_{r}, z \Delta\left(F_{1}, \ldots, F_{r}\right)-a^{r c}\right)
$$

We claim that multplication by $a^{2 r c}$ is zero on $N L_{C / A}$ in $D(C)$. Namely, the determinant of the matrix of the partial derivatives of the $r+1$ generators of the ideal of $C$ with respect to the variables $x_{1}, \ldots, x_{r+1}, z$ is $\Delta\left(F_{1}, \ldots, F_{r}\right)^{2}$. Since $\Delta\left(F_{1}, \ldots, F_{r}\right)$ divides $a^{r c}$ we in $C$ the claim follows for example from Algebra, Lemma 10.14 .4 Let $C^{\wedge}$ be the $I$-adic completion of $C$. Since $N L_{C^{\wedge} / A}^{\wedge}$ is the $I$-adic completion of $N L_{C / A}$ we conclude that multiplication by $a^{2 r c}$ is zero on $N L_{C^{\wedge} / A}^{\wedge}$ as well.
By construction there is a (surjective) $\operatorname{map} \psi_{N}: C / I^{N} C \rightarrow B / I^{N} B$ sending $x_{i}$ to $x_{i}$ and $z$ to 1 . By Lemma 71.8 .3 (with the roles of $B$ and $C$ reversed) for $N$ large enough we get a map $\varphi: C^{\wedge} \rightarrow B$ which agrees with $\psi_{N}$ modulo $I^{N-2 r c}$.

The rig-étale case of Elk73, III
Theorem 7] which handles the rig-smooth case.

Since $\varphi: C^{\wedge} \rightarrow B$ is surjective modulo $I$ we see that it is surjective (for example use Algebra, Lemma 10.95.1). By construction and assumption the naive cotangent complexes $N L_{C^{\wedge / A}}^{\wedge}$ and $N L_{B / A}^{\wedge}$ have cohomology annihilated by a fixed power of $a$. Thus the same thing is true for $N L_{B / C \wedge}^{\wedge}$ by Lemma 71.5.2. Since $\varphi$ is surjective we conclude that $\operatorname{Ker}(\varphi) / \operatorname{Ker}(\varphi)^{2}$ is annihilated by a power of $a$. The result of the lemma now follows from Dualizing Complexes, Lemma 45.13.2.

### 71.9. Glueing rings along an ideal

0 AK8 Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. In this section we study $I$-adically complete $A$-algebras which are, in some vague sense, étale over the complement of $V(I)$ in $\operatorname{Spec}(A)$.

0AK9 Lemma 71.9.1. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $t$ be the minimal number of generators for $I$. Let $C$ be a Noetherian I-adically complete $A$-algebra. There exists an integer $d \geq 0$ depending only on $I \subset A \rightarrow C$ with the following property: given
(1) $c \geq 0$ and $B$ in 71.4.0.2) such that for $a \in I^{c}$ multiplication by $a$ on $N L_{B / A}^{\wedge}$ is zero in $\overline{D(B)}$,
(2) an integer $n>2 t \max (c, d)$,
(3) an $A / I^{n}$-algebra map $\psi_{n}: B / I^{n} B \rightarrow C / I^{n} C$,
there exists a map $\varphi: B \rightarrow C$ of $A$-algebras such that $\psi_{n} \bmod I^{m-c}=\varphi \bmod I^{m-c}$ with $m=\left\lfloor\frac{n}{t}\right\rfloor$.
Proof. We prove this lemma by induction on the number of generators of $I$. Say $I=\left(a_{1}, \ldots, a_{t}\right)$. If $t=0$, then $I=0$ and there is nothing to prove. If $t=1$, then the lemma follows from Lemma 71.8 .3 because $2 \max (c, d) \geq \max (2 c, c+d)$. Assume $t>1$.

Set $m=\left\lfloor\frac{n}{t}\right\rfloor$ as in the lemma. Set $\bar{A}=A /\left(a_{t}^{m}\right)$. Consider the ideal $\bar{I}=$ $\left(\bar{a}_{1}, \ldots, \bar{a}_{t-1}\right)$ in $\bar{A}$. Set $\bar{C}=C /\left(a_{t}^{m}\right)$. Note that $\bar{C}$ is a $\bar{I}$-adically complete Noetherian $\bar{A}$-algebra (use Algebra, Lemmas 10.96.1 and 10.95.9). Let $\bar{d}$ be the integer for $\bar{I} \subset \bar{A} \rightarrow \bar{C}$ which exists by induction hypothesis.
Let $d_{1} \geq 0$ be an integer such that $C\left[a_{t}^{\infty}\right] \cap a_{t}^{d_{1}} C=0$ as in Lemma 71.8.3 (see discussion following the lemma and before the proof).
We claim the lemma holds with $d=\max \left(\bar{d}, d_{1}\right)$. To see this, let $c, B, n, \psi_{n}$ be as in the lemma.
Note that $\bar{I} \subset I \bar{A}$. Hence by Lemma 71.6 .3 multiplication by an element of $\bar{I}^{c}$ on the cotangent complex of $\bar{B}=B /\left(a_{t}^{m}\right)$ is zero in $D(\bar{B})$. Also, we have

$$
\bar{I}^{n-m+1} \supset I^{n} \bar{A}
$$

Thus $\psi_{n}$ gives rise to a map

$$
\bar{\psi}_{n-m+1}: \bar{B} / \bar{I}^{n-m+1} \bar{B} \longrightarrow \bar{C} / \bar{I}^{n-m+1} \bar{C}
$$

Since $n>2 t \max (c, d)$ and $d \geq \bar{d}$ we see that

$$
n-m+1 \geq(t-1) n / t>2(t-1) \max (c, d) \geq 2(t-1) \max (c, \bar{d})
$$

Hence we can find a morphism $\varphi_{m}: \bar{B} \rightarrow \bar{C}$ agreeing with $\bar{\psi}_{n-m+1}$ modulo the ideal $\bar{I}^{m^{\prime}-c}$ where $m^{\prime}=\left\lfloor\frac{n-m+1}{t-1}\right\rfloor$.

Since $m \geq n / t>2 \max (c, d) \geq 2 \max \left(c, d_{1}\right) \geq \max \left(2 c, c+d_{1}\right)$, we can apply Lemma 71.8 .3 for the ring map $A \rightarrow B$ and the ideal $\left(a_{t}\right)$ to find a morphism $\varphi: B \rightarrow C$ agreeing modulo $a_{t}^{m-c}$ with $\varphi_{m}$.
All in all we find $\varphi: B \rightarrow C$ which agrees with $\psi_{n}$ modulo

$$
\left(a_{t}^{m-c}\right)+\left(a_{1}, \ldots, a_{t-1}\right)^{m^{\prime}-c} \subset I^{\min \left(m-c, m^{\prime}-c\right)}
$$

We leave it to the reader to see that $\min \left(m-c, m^{\prime}-c\right)=m-c$. This concludes the proof.

0 LLT Lemma 71.9.2. Let $A$ be a Noetherian ring and $I \subset A$ an ideal. Let $J \subset A$ be a nilpotent ideal. Consider a diagram

whose vertical arrows are of finite type such that
(1) $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$,
(2) $\operatorname{Spec}\left(B_{0}\right) \rightarrow \operatorname{Spec}(A / J)$ is étale over $\operatorname{Spec}(A / J) \backslash V((I+J) / J)$, and
(3) $B_{0} \rightarrow C / J C$ is étale and induces an isomorphism $B_{0} / I B_{0}=C /(I+J) C$.

Then we can fill in the diagram

with $A \rightarrow B$ of finite type, $B / J B=B_{0}, B \rightarrow C$ étale, and $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ étale over $\operatorname{Spec}(A) \backslash V(I)$.

Proof. By induction on the smallest $n$ such that $J^{n}=0$ we reduce to the case $J^{2}=0$. Denote by a subscript zero the base change of objects to $A_{0}=A / J$. Since $J^{2}=0$ we see that $J C$ is a $C_{0}$-module.
Consider the canonical map

$$
\gamma: J \otimes_{A_{0}} C_{0} \longrightarrow J C
$$

Since $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$ is étale over the complement of $V(I)$ (and hence flat) we see that $\gamma$ is an isomorphism away from $V\left(I C_{0}\right)$, see More on Morphisms, Lemma 36.8.1. In particular, the kernel and cokernel of $\gamma$ are annihilated by a power of $I$ (use that $C_{0}$ is Noetherian and that the modules in question are finite). Observe that $J \otimes_{A_{0}} C_{0}=\left(J \otimes_{A_{0}} B_{0}\right) \otimes_{B_{0}} C_{0}$. Hence by More on Algebra, Lemma 15.70.16 there exists a unique $B_{0}$-module homomorphism

$$
c: J \otimes_{A_{0}} B_{0} \rightarrow N
$$

with $c \otimes \operatorname{id}_{C_{0}}=\gamma$ and $\operatorname{Ker}(\gamma)=\operatorname{Ker}(c)$ and $\operatorname{Coker}(\gamma)=\operatorname{Coker}(c)$. Moreover, $N$ is a finite $B_{0}$-module, see More on Algebra, Remark 15.70.19.
Choose a presentation $B_{0}=A\left[x_{1}, \ldots, x_{r}\right] / K$. To construct $B$ we try to find the dotted arrow $m$ fitting into the following pushout diagram

where the curved arrow is the map $c$ constructed above and the map $J \otimes_{A_{0}} B_{0} \rightarrow$ $K / K^{2}$ is the obvious one.
As $B_{0} \rightarrow C_{0}$ is étale we can write $C_{0}=B_{0}\left[y_{1}, \ldots, y_{r}\right] /\left(g_{0,1}, \ldots, g_{0, r}\right)$ such that the determinant of the partial derivatives of the $g_{0, j}$ is invertible in $C_{0}$, see Algebra, Lemma 10.141.2. We combine this with the chosen presentation of $B_{0}$ to get a presentation $C_{0}=A\left[x_{1}, \ldots, x_{r}, y_{1}, \ldots, y_{s}\right] / L$. Choose a lift $\psi: A\left[x_{i}, y_{j}\right] \rightarrow C$ of the map to $C_{0}$. Then it is the case that $C$ fits into the diagram

where the curved arrow is the map $\gamma$ constructed above and the map $J \otimes_{A_{0}} C_{0} \rightarrow$ $L / L^{2}$ is the obvious one. By our choice of presentations and the fact that $C_{0}$ is a complete intersection over $B_{0}$ we have

$$
L / L^{2}=K / K^{2} \otimes_{B_{0}} C_{0} \oplus \bigoplus C_{0} g_{j}
$$

where $g_{j} \in L$ is any lift of $g_{0, j}$, see More on Algebra, Lemma 15.25 .6 .
Consider the three term complex

$$
K^{\bullet}: J \otimes_{A_{0}} B_{0} \rightarrow K / K^{2} \rightarrow \bigoplus B_{0} \mathrm{~d} x_{i}
$$

where the second arrow is the differential in the naive cotangent complex of $B_{0}$ over $A$ for the given presentation and the last term is placed in degree 0 . Since $\operatorname{Spec}\left(B_{0}\right) \rightarrow \operatorname{Spec}\left(A_{0}\right)$ is étale away from $V(I)$ the cohomology modules of this complex are supported on $V\left(I B_{0}\right)$. Namely, for $a \in I$ after inverting $a$ we can apply More on Algebra, Lemma 15.25 .6 for the ring maps $A_{a} \rightarrow A_{0, a} \rightarrow B_{0, a}$ and use that $N L_{A_{0, a} / A_{a}}=J_{a}$ and $N L_{B_{0, a} / A_{0, a}}=0$ (some details omitted). Hence these cohomology groups are annihilated by a power of $I$.
Similarly, consider the three term complex

$$
L^{\bullet}: J \otimes_{A_{0}} C_{0} \rightarrow L / L^{2} \rightarrow \bigoplus C_{0} \mathrm{~d} x_{i} \oplus \bigoplus C_{0} \mathrm{~d} y_{j}
$$

By our direct sum decomposition of $L / L^{2}$ above and the fact that the the determinant of the partial derivatives of the $g_{0, j}$ is invertible in $C_{0}$ we see that the natural map $K^{\bullet} \rightarrow L^{\bullet}$ induces a quasi-isomorphism

$$
K^{\bullet} \otimes_{B_{0}} C_{0} \longrightarrow L^{\bullet}
$$

Applying Dualizing Complexes, Lemma 45.9.9 we find that

$$
\begin{equation*}
\operatorname{Hom}_{D\left(B_{0}\right)}\left(K^{\bullet}, E\right)=\operatorname{Hom}_{D\left(C_{0}\right)}\left(L^{\bullet}, E \otimes_{B_{0}} C_{0}\right) \tag{71.9.2.1}
\end{equation*}
$$

for any object $E \in D\left(B_{0}\right)$.
The maps $\operatorname{id}_{J \otimes_{A_{0}} C_{0}}$ and $\mu$ define an element in

$$
\operatorname{Hom}_{D\left(C_{0}\right)}\left(L^{\bullet},\left(J \otimes_{A_{0}} C_{0} \rightarrow J C\right)\right)
$$

(the target two term complex is placed in degree -2 and -1 ) such that the composition with the map to $J \otimes_{A_{0}} C_{0}[2]$ is the element in $\operatorname{Hom}_{D\left(C_{0}\right)}\left(L^{\bullet}, J \otimes_{A_{0}} C_{0}[2]\right)$ corresponding to id ${ }_{J \otimes A_{0} C_{0}}$. Picture

Applying 71.9.2.1 we obtain a unique element

$$
\xi \in \operatorname{Hom}_{D\left(B_{0}\right)}\left(K^{\bullet},\left(J \otimes_{A_{0}} B_{0} \rightarrow N\right)\right)
$$

Its composition with the map to $J \otimes_{A_{0}} B_{0}[2]$ is the element in $\operatorname{Hom}_{D\left(C_{0}\right)}\left(K^{\bullet}, J \otimes_{A_{0}}\right.$ $\left.B_{0}[2]\right)$ corresponding to id $\otimes_{A_{0} B_{0}}$. By Lemma 71.5.4 we can find a map of complexes $K^{\bullet} \rightarrow\left(J \otimes_{A_{0}} B_{0} \rightarrow N\right)$ representing $\xi$ and equal to $\mathrm{id}_{J \otimes A_{0} B_{0}}$ in degree -2 . Denote $m: K / K^{2} \rightarrow N$ the degree -1 part of this map. Picture

Thus we can use $m$ to create an algebra $B$ by push out as explained above. However, we may still have to change $m$ a bit to make sure that $B$ maps to $C$ in the correct manner.
Denote $m \otimes \operatorname{id}_{C_{0}} \oplus 0: L / L^{2} \rightarrow J C$ the map coming from the direct sum decomposition of $L / L^{2}$ (see above), using that $N \otimes_{B_{0}} C_{0}=J C$, and using 0 on the second factor. By our choice of $m$ above the maps of complexes $\left(\mathrm{id}_{J \otimes_{A_{0}} C_{0}}, \mu, 0\right)$ and $\left(\mathrm{id}_{J \otimes_{A_{0}} C_{0}}, m \otimes \operatorname{id}_{C_{0}} \oplus 0,0\right)$ define the same element of $\operatorname{Hom}_{D\left(C_{0}\right)}\left(L^{\bullet},\left(J \otimes_{A_{0}} C_{0} \rightarrow\right.\right.$ $J C)$ ). By Lemma 71.5 .4 there exist maps $h: L^{-1} \rightarrow J \otimes_{A_{0}} C_{0}$ and $h^{\prime}: L^{0} \rightarrow J C$ which define a homotopy between $\left(\mathrm{id}_{J \otimes_{A_{0}} C_{0}}, \mu, 0\right)$ and $\left(\mathrm{id}_{J \otimes_{A_{0}} C_{0}}, m \otimes \mathrm{id}_{C_{0}} \oplus 0,0\right)$. Picture

Since $h$ precomposed with $d_{L}^{-2}$ is zero it defines an element in $\operatorname{Hom}_{D\left(C_{0}\right)}\left(L^{\bullet}, J \otimes_{A_{0}}\right.$ $\left.C_{0}[1]\right)$ which comes from a unique element $\chi$ of $\operatorname{Hom}_{D\left(B_{0}\right)}\left(K^{\bullet}, J \otimes_{A_{0}} B_{0}[1]\right)$ by 71.9.2.1. Applying Lemma 71.5 .4 again we represent $\chi$ by a map $g: K / K^{2} \rightarrow$ $J \otimes_{A_{0}} B_{0}$. Then the base change $g \otimes \operatorname{id}_{C_{0}}$ and $h$ differ by a homotopy $h^{\prime \prime}: L^{0} \rightarrow$ $J \otimes_{A_{0}} C$. Hence if we modify $m$ into $m+c \circ g$, then we find that $m \otimes \mathrm{id}_{C_{0}} \oplus 0$ and $\mu$ just differ by a map $h^{\prime}: L^{0} \rightarrow J C$.

Changing our choice of the map $\psi: A\left[x_{i}, y_{j}\right] \rightarrow C$ by sending $x_{i}$ to $\psi\left(x_{i}\right)+h^{\prime}\left(\mathrm{d} x_{i}\right)$ and sending $y_{j}$ to $\psi\left(y_{j}\right)+h^{\prime}\left(\mathrm{d} y_{j}\right)$, we find a commutative diagram

At this point we can define $B$ as the pushout in the first commutative diagram of the proof. The commutativity of the diagram just displayed, shows that there is an $A$-algebra map $B \rightarrow C$ compatible with the given map $N=J B \rightarrow J C$. As $N \otimes_{B_{0}} C_{0}=J C$ it follows from More on Morphisms, Lemma 36.8.1 that $B \rightarrow C$ is flat. From this it easily follows that it is étale. We omit the proof of the other properties as they are mostly self evident at this point.

0AKA Lemma 71.9.3. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $B$ be an object of (71.4.0.2). Assume there is an integer $c \geq 0$ such that for $a \in I^{c}$ multiplication by a on $N L_{B / A}^{\wedge}$ is zero in $D(B)$. Then there exists a finite type A-algebra $C$ and an isomorphism $B \cong C^{\wedge}$.

In Section 71.10 we will give a simpler proof of this result in case $A$ is a G-ring.
Proof. We prove this lemma by induction on the number of generators of $I$. Say $I=\left(a_{1}, \ldots, a_{t}\right)$. If $t=0$, then $I=0$ and there is nothing to prove. If $t=1$, then the lemma follows from Lemma 71.8.4. Assume $t>1$.

For any $m \geq 1$ set $\bar{A}_{m}=A /\left(a_{t}^{m}\right)$. Consider the ideal $\bar{I}_{m}=\left(\bar{a}_{1}, \ldots, \bar{a}_{t-1}\right)$ in $\bar{A}_{m}$. Let $B_{m}=B /\left(a_{t}^{m}\right)$ be the base change of $B$ for the map $(A, I) \rightarrow\left(\bar{A}_{m}, \bar{I}_{m}\right)$, see 71.4.4.1. By Lemma 71.6 .3 the assumption of the lemma holds for $\bar{I}_{m} \subset \bar{A}_{m} \rightarrow$ $B_{m}$.
By induction hypothesis (on $t$ ) we can find a finite type $\bar{A}_{m}$-algebra $C_{m}$ and a map $C_{m} \rightarrow B_{m}$ which induces an isomorphism $C_{m}^{\wedge} \cong B_{m}$ where the completion is with respect to $\bar{I}_{m}$. By Lemma 71.6 .2 we may assume that $\operatorname{Spec}\left(C_{m}\right) \rightarrow \operatorname{Spec}\left(\bar{A}_{m}\right)$ is étale over $\operatorname{Spec}\left(\bar{A}_{m}\right) \backslash V\left(\bar{I}_{m}\right)$.
We claim that we may choose $A_{m} \rightarrow C_{m} \rightarrow B_{m}$ as in the previous paragraph such that moreover there are isomorphisms $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow C_{m-1}$ compatible with the given $A$-algebra structure and the maps to $B_{m-1}=B_{m} /\left(a_{t}^{m-1}\right)$. Namely, first fix a choice of $A_{1} \rightarrow C_{1} \rightarrow B_{1}$. Suppose we have found $C_{m-1} \rightarrow C_{m-2} \rightarrow \ldots \rightarrow C_{1}$ with the desired properties. Note that $C_{m} /\left(a_{t}^{m-1}\right)$ is étale over $\operatorname{Spec}\left(\bar{A}_{m-1}\right) \backslash V\left(\bar{I}_{m-1}\right)$. Hence by Lemma 71.6 .4 there exists an étale extension $C_{m-1} \rightarrow C_{m-1}^{\prime}$ which induces an isomorphism modulo $\bar{I}_{m-1}$ and an $\bar{A}_{m-1}$-algebra map $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow$
$C_{m-1}^{\prime}$ inducing the isomorphism $B_{m} /\left(a_{t}^{m-1}\right) \rightarrow B_{m-1}$ on completions. Note that $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow C_{m-1}^{\prime}$ is étale over the complement of $V\left(\bar{I}_{m-1}\right)$ by Morphisms, Lemma 28.36 .18 and over $V\left(\bar{I}_{m-1}\right)$ induces an isomorphism on completions hence is étale there too (for example by More on Morphisms, Lemma 36.10.3). Thus $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow C_{m-1}^{\prime}$ is étale. By the topological invariance of étale morphisms (Étale Morphisms, Theorem 40.15.2 there exists an étale ring map $C_{m} \rightarrow C_{m}^{\prime}$ such that $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow C_{m-1}^{\prime}$ is isomorphic to $C_{m} /\left(a_{t}^{m-1}\right) \rightarrow C_{m}^{\prime} /\left(a_{t}^{m-1}\right)$. Observe that the $\bar{I}_{m}$-adic completion of $C_{m}^{\prime}$ is equal to the $\bar{I}_{m}$-adic completion of $C_{m}$, i.e., to $B_{m}$ (details omitted). We apply Lemma 71.9 .2 to the diagram

to see that there exists a "lift" of $C_{m}^{\prime \prime}$ of $C_{m-1}$ to an algebra over $\bar{A}_{m}$ with all the desired properties.

By construction $\left(C_{m}\right)$ is an object of the category 71.4.0.1 for the principal ideal $\left(a_{t}\right)$. Thus the inverse limit $B^{\prime}=\lim C_{m}$ is an $\left(a_{t}\right)$-adically complete $A$-algebra such that $B^{\prime} / a_{t} B^{\prime}$ is of finite type over $A /\left(a_{t}\right)$, see Lemma 71.4.1. By construction the $I$-adic completion of $B^{\prime}$ is isomorphic to $B$ (details omitted). Consider the complex $N L_{B^{\prime} / A}^{\wedge}$ constructed using the $\left(a_{t}\right)$-adic topology. Choosing a presentation for $B^{\prime}$ (which induces a similar presentation for $B$ ) the reader immediately sees that $N L_{B^{\prime} / A}^{\wedge} \otimes_{B^{\prime}} B=N L_{B / A}^{\wedge}$. Since $a_{t} \in I$ and since the cohomology modules of $N L_{B^{\prime} / A}^{\wedge}$ are finite $B^{\prime}$-modules (hence complete for the $a_{t}$-adic topology), we conclude that $a_{t}^{c}$ acts as zero on these cohomologies as the same thing is true by assumption for $N L_{B / A}^{\wedge}$. Thus multiplication by $a_{t}^{2 c}$ is zero on $N L_{B^{\prime} / A}^{\wedge}$ by Lemma 71.5.5. Hence finally, we may apply Lemma 71.8 .4 to $\left(a_{t}\right) \subset A \rightarrow B^{\prime}$ to finish the proof.

0 AKG Lemma 71.9.4. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $B$ be an I-adically complete $A$-algebra with $A / I \rightarrow B / I B$ of finite type. The equivalent conditions of Lemma 71.6.1 are also equivalent to
$0 \mathrm{AKH} \quad(5)$ there exists a finite type $A$-algebra $C$ with $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$ such that $B \cong C^{\wedge}$.

Proof. First, assume conditions (1) - (4) hold. Then there exists a finite type $A$ algebra $C$ with such that $B \cong C^{\wedge}$ by Lemma 71.9.3. In other words, $B_{n}=C / I^{n} C$. The naive cotangent complex $N L_{C / A}$ is a complex of finite type $C$-modules and hence $H^{-1}$ and $H^{0}$ are finite $C$-modules. By assumption there exists a $c \geq 0$ such that $H^{-1} / I^{n} H^{-1}$ and $H^{0} / I^{n} H^{0}$ are annihilated by $I^{c}$ for some $n$. By Nakayama's lemma this means that $I^{c} H^{-1}$ and $I^{c} H^{0}$ are annihilated by an element of the form $f=1+x$ with $x \in I C$. After inverting $f$ (which does not change the quotients $B_{n}=C / I^{n} C$ ) we see that $N L_{C / A}$ has cohomology annihilated by $I^{c}$. Thus $A \rightarrow C$ is étale at any prime of $C$ not lying over $V(I)$ by the definition of étale ring maps, see Algebra, Definition 10.141.1.

Conversely, assume that $A \rightarrow C$ of finite type is given such that $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$ is étale over $\operatorname{Spec}(A) \backslash V(I)$. Then for every $a \in I$ there exists an $c \geq 0$ such that multiplication by $a^{c}$ is zero $N L_{C / A}$. Since $N L_{C^{\wedge} / A}^{\wedge}$ is the derived completion of $N L_{C / A}$ (see Lemma 71.5.1) it follows that $B=C^{\wedge}$ satisfies the equivalent conditions of Lemma 71.6.1.

### 71.10. In case the base ring is a G-ring

$0 A L U$ If the base ring $A$ is a Noetherian G-ring, then some of the material above simplifies somewhat and we obtain some additional results.

Proof of Lemma 71.9 .3 in case $A$ is a G-ring. This proof is easier in that it does not depend on the somewhat delicate deformation theory argument given in the proof of Lemma 71.9 .2 but of course it requires a very strong assumption on the Noetherian ring $A$.
Choose a presentation $B=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J$. Choose generators $g_{1}, \ldots, g_{m} \in J$. Choose generators $k_{1}, \ldots, k_{t}$ of the module of relations between $g_{1}, \ldots, g_{m}$, i.e., such that

$$
\left(A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}\right)^{\oplus t} \xrightarrow{k_{1}, \ldots, k_{t}}\left(A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}\right)^{\oplus m} \xrightarrow{g_{1}, \ldots, g_{m}} A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}
$$

is exact in the middle. Write $k_{i}=\left(k_{i 1}, \ldots, k_{i m}\right)$ so that we have
0AKB (71.10.0.1)

$$
\sum k_{i j} g_{j}=0
$$

for $i=1, \ldots, t$. Let $I^{c}=\left(a_{1}, \ldots, a_{s}\right)$. For each $l \in\{1, \ldots, s\}$ we know that multiplication by $a_{l}$ on $N L_{B / A}^{\wedge}$ is zero in $D(B)$. By Lemma 71.5.4 we can find a $\operatorname{map} \alpha_{l}: \bigoplus B \mathrm{~d} x_{i} \rightarrow J / J^{2}$ such that $\mathrm{d} \circ \alpha_{l}$ and $\alpha_{l} \circ \mathrm{~d}$ are both multiplication by $a_{l}$. Pick an element $f_{l, i} \in J$ whose class modulo $J^{2}$ is equal to $\alpha_{l}\left(\mathrm{~d} x_{i}\right)$. Then we have for all $l=1, \ldots, s$ and $i=1, \ldots, r$ that

0AKC (71.10.0.2)

$$
\sum_{i^{\prime}}\left(\partial f_{l, i} / \partial x_{i^{\prime}}\right) \mathrm{d} x_{i^{\prime}}=a_{l} \mathrm{~d} x_{i}+\sum h_{l, i}^{j^{\prime}, i^{\prime}} g_{j^{\prime}} \mathrm{d} x_{i^{\prime}}
$$

for some $h_{l, i}^{j^{\prime}, i^{\prime}} \in A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$. We also have for $j=1, \ldots, m$ and $l=1, \ldots, s$ that
0AKD

$$
\begin{equation*}
a_{l} g_{j}=\sum h_{l, j}^{i} f_{l, i}+\sum h_{l, j}^{j^{\prime}, j^{\prime \prime}} g_{j^{\prime}} g_{j^{\prime \prime}} \tag{71.10.0.3}
\end{equation*}
$$

for some $h_{l, j}^{i}$ and $h_{l, j}^{j^{\prime}, j^{\prime \prime}}$ in $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$. Of course, since $f_{l, i} \in J$ we can write for $l=1, \ldots, s$ and $i=1, \ldots, r$
0AKE

$$
\begin{equation*}
f_{l, i}=\sum h_{l, i}^{j} g_{j} \tag{71.10.0.4}
\end{equation*}
$$

for some $h_{l, i}^{j}$ in $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$.
Let $A\left[x_{1}, \ldots, x_{r}\right]^{h}$ be the henselization of the pair $\left(A\left[x_{1}, \ldots, x_{r}\right], I A\left[x_{1}, \ldots, x_{r}\right]\right)$, see More on Algebra, Lemma 15.8.13. Since $A$ is a Noetherian G-ring, so is $A\left[x_{1}, \ldots, x_{r}\right]$, see More on Algebra, Proposition 15.41.10. Hence we have approximation for the map $A\left[x_{1}, \ldots, x_{r}\right]^{h} \rightarrow A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$ with respect to the ideal generated by $I$, see Smoothing Ring Maps, Lemma 16.15.1. Choose a large integer M. Choose

$$
G_{j}, K_{i j}, F_{l, i}, H_{l, j}^{i}, H_{l, j}^{j^{\prime}, j^{\prime \prime}}, H_{l, i}^{j} \in A\left[x_{1}, \ldots, x_{r}\right]^{h}
$$

such that analogues of equations 71.10.0.1, 71.10.0.3, and 71.10.0.4 hold for these elements in $A\left[x_{1}, \ldots, x_{r}\right]^{h}$, i.e.,

$$
\sum K_{i j} G_{j}=0, \quad a_{l} G_{j}=\sum H_{l, j}^{i} F_{l, i}+\sum H_{l, j^{\prime}}^{j^{\prime} j^{\prime \prime}} G_{j^{\prime}} G_{j^{\prime \prime}}, \quad F_{l, i}=\sum H_{l, i}^{j} G_{j}
$$

and such that we have
$G_{j}-g_{j}, K_{i j}-k_{i j}, F_{l, i}-f_{l, i}, H_{l, j}^{i}-h_{l, j}^{i}, H_{l, j}^{j^{\prime}, j^{\prime \prime}}-h_{l, j}^{j^{\prime}, j^{\prime \prime}}, H_{l, i}^{j}-h_{l, i}^{j} \in I^{M} A\left[x_{1}, \ldots, x_{r}\right]^{h}$
where we take liberty of thinking of $A\left[x_{1}, \ldots, x_{r}\right]^{h}$ as a subring of $A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$. Note that we cannot guarantee that the analogue of 71.10 .0 .2 holds in $A\left[x_{1}, \ldots, x_{r}\right]^{h}$, because it is not a polynomial equation. But since taking partial derivatives is $A$ linear, we do get the analogue modulo $I^{M}$. More precisely, we see that
0AKF
(71.10.0.5) $\quad \sum_{i^{\prime}}\left(\partial F_{l, i} / \partial x_{i^{\prime}}\right) \mathrm{d} x_{i^{\prime}}-a_{l} \mathrm{~d} x_{i}-\sum h_{l, i}^{j^{\prime}, i^{\prime}} G_{j^{\prime}} \mathrm{d} x_{i^{\prime}} \in I^{M} A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}$
for $l=1, \ldots, s$ and $i=1, \ldots, r$.
With these choices, consider the ring

$$
C^{h}=A\left[x_{1}, \ldots, x_{r}\right]^{h} /\left(G_{1}, \ldots, G_{r}\right)
$$

and denote $C^{\wedge}$ its $I$-adic completion, namely

$$
C^{\wedge}=A\left[x_{1}, \ldots, x_{r}\right]^{\wedge} / J^{\prime}, \quad J^{\prime}=\left(G_{1}, \ldots, G_{r}\right) A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}
$$

In the following paragraphs we esthablish the fact that $C^{\wedge}$ is isomorphic to $B$. Then in the final paragraph we deal with show that $C^{h}$ comes from a finite type algebra over $A$ as in the statement of the lemma.
First consider the cokernel

$$
\Omega=\operatorname{Coker}\left(J^{\prime} /\left(J^{\prime}\right)^{2} \longrightarrow \bigoplus C^{\wedge} \mathrm{d} x_{i}\right)
$$

This $C^{\wedge}$ module is generated by the images of the elements $\mathrm{d} x_{i}$. Since $F_{l, i} \in J^{\prime}$ by the analogue of $\sqrt[71.10 .0 .4]{ }$ we see from 71.10 .0 .5 we see that $a_{l} \mathrm{~d} x_{i} \in I^{M} \Omega$. As $I^{c}=\left(a_{l}\right)$ we see that $I^{c} \Omega \subset I^{M} \Omega$. Since $M>c$ we conclude that $I^{c} \Omega=0$ by Algebra, Lemma 10.19.1.
Next, consider the kernel

$$
H_{1}=\operatorname{Ker}\left(J^{\prime} /\left(J^{\prime}\right)^{2} \longrightarrow \bigoplus C^{\wedge} \mathrm{d} x_{i}\right)
$$

By the analogue of 71.10 .0 .3 we see that $a_{l} J^{\prime} \subset\left(F_{l, i}\right)+\left(J^{\prime}\right)^{2}$. On the other hand, the determinant $\Delta_{l}$ of the matrix $\left(\partial F_{l, i} / \partial x_{i^{\prime}}\right)$ satisfies $\Delta_{l}=a_{l}^{r} \bmod I^{M} C^{\wedge}$ by 71.10.0.5. It follows that $a_{l}^{r+1} H_{1} \subset I^{M} H_{1}$ (some details omitted; use Algebra, Lemma 10.14.4. Now $\left(a_{1}^{r+1}, \ldots, a_{s}^{r+1}\right) \supset I^{(s r+1) c}$. Hence $I^{(s r+1) c} H_{1} \subset I^{M} H_{1}$ and since $M>(s r+1) c$ we conclude that $I^{(s r+1) c} H_{1}=0$.
By Lemma 71.5 .5 we conclude that multiplication by an element of $I^{2(s r+1) c}$ on $N L_{C^{\wedge} / A}^{\wedge}$ is zero (note that the bound does not depend on $M$ or the choice of the approximation, as long as $M$ is large enough). Since $G_{j}-g_{j}$ is in the ideal generated by $I^{M}$ we see that there is an isomorphism

$$
\psi_{M}: C^{\wedge} / I^{M} C^{\wedge} \rightarrow B / I^{M} B
$$

As $M$ is large enough we can use Lemma 71.9.1 with $d=d(I \subset A \rightarrow B)$, with $C^{\wedge}$ playing the role of $B$, with $2(r s+1) c$ instead of $c$, to find a morphism

$$
\psi: C^{\wedge} \longrightarrow B
$$

which agrees with $\psi_{M}$ modulo $I^{q-2(r s+1) c}$ where $q$ is the quotent of $M$ by the number of generators of $I$. We claim $\psi$ is an isomorphism. Since $C^{\wedge}$ and $B$ are $I$-adically complete the map $\psi$ is surjective because it is surjective modulo $I$ (see Algebra, Lemma 10.95.1. On the other hand, as $M$ is large enough we see that

$$
\operatorname{Gr}_{I}\left(C^{\wedge}\right) \cong \operatorname{Gr}_{I}(B)
$$

as graded $\operatorname{Gr}_{I}\left(A\left[x_{1}, \ldots, x_{r}\right]^{\wedge}\right)$-modules by More on Algebra, Lemma 15.4.2. Since $\psi$ is compatible with this isomorphism as it agrees with $\psi_{M}$ modulo $\bar{I}$, this means that $\operatorname{Gr}_{I}(\psi)$ is an isomorphism. As $C^{\wedge}$ and $B$ are $I$-adically complete, it follows that $\psi$ is an isomorphism.

This paragraph serves to deal with the issue that $C^{h}$ is not of finite type over $A$. Namely, the ring $A\left[x_{1}, \ldots, x_{r}\right]^{h}$ is a filtered colimit of étale $A\left[x_{1}, \ldots, x_{r}\right]$ algebras $A^{\prime}$ such that $A / I\left[x_{1}, \ldots, x_{r}\right] \rightarrow A^{\prime} / I A^{\prime}$ is an isomorphism (see proof of More on Algebra, Lemma 15.8.13. Pick an $A^{\prime}$ such that $G_{1}, \ldots, G_{m}$ are the images of $G_{1}^{\prime}, \ldots, G_{m}^{\prime} \in A^{\prime}$. Setting $C=A^{\prime} /\left(G_{1}^{\prime}, \ldots, G_{m}^{\prime}\right)$ we get the finite type algebra we were looking for.

The following lemma isn't true in general if $A$ is not a G-ring but just Noetherian. Namely, if $(A, \mathfrak{m})$ is local and $I=\mathfrak{m}$, then the lemma is equivalent to Artin approximation for $A^{h}$ (as in Smoothing Ring Maps, Theorem 16.14.1 which does not hold for every Noetherian local ring.

0AK4 Lemma 71.10.1. Let $A$ be a Noetherian $G$-ring. Let $I \subset A$ be an ideal. Let $B, C$ be finite type $A$-algebras. For any $A$-algebra $\operatorname{map} \varphi: B^{\wedge} \rightarrow C^{\wedge}$ of I-adic completions and any $N \geq 1$ there exist
(1) an étale ring map $C \rightarrow C^{\prime}$ which induces an isomorphism $C / I C \rightarrow$ $C^{\prime} / I C^{\prime}$,
(2) an A-algebra map $\varphi: B \rightarrow C^{\prime}$
such that $\varphi$ and $\psi$ agree modulo $I^{N}$ into $C^{\wedge}=\left(C^{\prime}\right)^{\wedge}$.
Proof. The statement of the lemma makes sense as $C \rightarrow C^{\prime}$ is flat (Algebra, Lemma 10.141.3) hence induces an isomorphism $C / I^{n} C \rightarrow C^{\prime} / I^{n} C^{\prime}$ for all $n$ (More on Algebra, Lemma 15.70.2 and hence an isomorphism on completions. Let $C^{h}$ be the henselization of the pair $(C, I C)$, see More on Algebra, Lemma 15.8.13. Then $C^{h}$ is the filtered colimit of the algebras $C^{\prime}$ and the maps $C \rightarrow C^{\prime} \rightarrow C^{h}$ induce isomorphism on completions (More on Algebra, Lemma 15.8.16). Thus it suffices to prove there exists an $A$-algebra map $B \rightarrow C^{h}$ which is congruent to $\psi$ modulo $I^{N}$. Write $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. The ring map $\psi$ corresponds to elements $\hat{c}_{1}, \ldots, \hat{c}_{n} \in C^{\wedge}$ with $f_{j}\left(\hat{c}_{1}, \ldots, \hat{c}_{n}\right)=0$ for $j=1, \ldots, m$. Namely, as $A$ is a Noetherian G-ring, so is $C$, see More on Algebra, Proposition 15.41.10. Thus Smoothing Ring Maps, Lemma 16.15 .1 applies to give elements $c_{1}, \ldots, c_{n} \in C^{h}$ such that $f_{j}\left(c_{1}, \ldots, c_{n}\right)=0$ for $j=1, \ldots, m$ and such that $\hat{c}_{i}-c_{i} \in I^{N} C^{h}$. This determines the map $B \rightarrow C^{h}$ as desired.

### 71.11. Rig-surjective morphisms

0AQP For morphisms locally of finite type between locally Noetherian formal algebraic spaces a definition borrowed from Art70 can be used. See Remark 71.11 .10 for a discussion of what to do in more general cases.

0AQQ Definition 71.11.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces over $S$. Assume that $X$ and $Y$ are locally Noetherian and that $f$ is locally of finite type. We say $f$ is rig-surjective if for every solid diagram

where $R$ is a complete discrete valuation ring and where $p$ is an adic morphism there exists an extension of complete discrete valuation rings $R \subset R^{\prime}$ and a morphism $\operatorname{Spf}\left(R^{\prime}\right) \rightarrow X$ making the displayed diagram commute.

We prove a few lemmas to explain what this means.
0AQR Lemma 71.11.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of formal algebraic spaces over $S$. Assume $X, Y, Z$ are locally Noetherian and $f$ and $g$ locally of finite type. Then if $f$ and $g$ are rig-surjective, so is $g \circ f$.

Proof. Follows in a straightforward manner from the definitions (and Formal Spaces, Lemma 70.18.3).

0AQS Lemma 71.11.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of formal algebraic spaces over $S$. Assume $X, Y, Z$ are locally Noetherian and $f$ and $g$ locally of finite type. If $f$ is rig-surjective, then the base change $Z \times_{Y} X \rightarrow Z$ is too.

Proof. Follows in a straightforward manner from the definitions (and Formal Spaces, Lemmas 70.18.9 and 70.18.4.

0AQT Lemma 71.11.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of formal algebraic spaces over $S$. Assume $X, Y, Z$ locally Noetherian and $f$ and $g$ locally of finite type. If $g \circ f: X \rightarrow Z$ is rig-surjective, so is $g: Y \rightarrow Z$.

Proof. Immediate from the definition.
0AQU Lemma 71.11.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces which is representable by algebraic spaces, étale, and surjective. Assume $X$ and $Y$ locally Noetherian. Then $f$ is rig-surjective.

Proof. Let $p: \operatorname{Spf}(R) \rightarrow Y$ be an adic morphism where $R$ is a complete discrete valuation ring. Let $Z=\operatorname{Spf}(R) \times_{Y} X$. Then $Z \rightarrow \operatorname{Spf}(R)$ is representable by algebraic spaces, étale, and surjective. Hence $Z$ is nonempty. Pick a nonempty affine formal algebraic space $V$ and an étale morphism $V \rightarrow Z$ (possible by our definitions). Then $V \rightarrow \operatorname{Spf}(R)$ corresponds to $R \rightarrow A^{\wedge}$ where $R \rightarrow A$ is an étale ring map, see Formal Spaces, Lemma 70.14.13. Since $A^{\wedge} \neq 0$ (as $V \neq \emptyset$ ) we can find a maximal ideal $\mathfrak{m}$ of $A$ lying over $\mathfrak{m}_{R}$. Then $A_{\mathfrak{m}}$ is a discrete valuation ring (More on Algebra, Lemma 15.35.4). Then $R^{\prime}=A_{\mathrm{m}}^{\wedge}$ is a complete discrete valuation ring (More on Algebra, Lemma 15.34.5. Applying Formal Spaces, Lemma 70.5.10. we find the desired morphism $\operatorname{Spf}\left(R^{\prime}\right) \rightarrow V \rightarrow Z \rightarrow X$.

0AQV Remark 71.11.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian formal algebraic spaces which is locally of finite type. The upshot of the lemmas above is that we may check whether $f: X \rightarrow Y$ is rig-surjective, étale
locally on $Y$. For example, suppose that $\left\{Y_{i} \rightarrow Y\right\}$ is a covering as in Formal Spaces, Definition 70.7.1. Then $f$ is rig-surjective if and only if $f_{i}: X \times_{Y} Y_{i} \rightarrow Y_{i}$ is rig-surjective. Namely, if $f$ is rig-surjective, so is any base change (Lemma 71.11.3). Conversely, if all $f_{i}$ are rig-surjective, so is $\coprod f_{i}: \coprod X \times_{Y} Y_{i} \rightarrow \coprod Y_{i}$. By Lemma 71.11 .5 the morphism $\coprod Y_{i} \rightarrow Y$ is rig-surjective. Hence $\coprod X \times_{Y} Y_{i} \rightarrow Y$ is rigsurjective (Lemma 71.11 .2 ). Since this morphism factors through $X \rightarrow Y$ we see that $X \rightarrow Y$ is rig-surjective by Lemma 71.11.4.

0AQW Lemma 71.11.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper surjective morphism of locally Noetherian algebraic spaces over $S$. Let $T \subset|Y|$ be a closed subset and let $T^{\prime}=|f|^{-1}(T) \subset|X|$. Then $X_{/ T^{\prime}} \rightarrow Y_{/ T}$ is rig-surjective.

Proof. The statement makes sense by Formal Spaces, Lemmas 70.15.6 and 70.18.10. Let $Y_{j} \rightarrow Y$ be a jointly surjective family of étale morphism where $Y_{j}$ is an affine scheme for each $j$. Denote $T_{j} \subset Y_{j}$ the inverse image of $T$. Then $\left\{\left(Y_{j}\right)_{/ T_{j}} \rightarrow Y_{/ T}\right\}$ is a covering as in Formal Spaces, Definition 70.7.1. Moreover, setting $X_{j}=Y_{j} \times_{Y} X$ and $T_{j}^{\prime} \subset\left|X_{j}\right|$ the inverse image of $T$, we have

$$
\left(X_{j}\right)_{/ T_{j}^{\prime}}=\left(Y_{j}\right)_{/ T_{j}} \times_{\left(Y_{/ T}\right)} X_{/ T^{\prime}}
$$

By the discussion in Remark 71.11 .6 we reduce to the case where $Y$ is an affine Noetherian scheme treated in the next paragraph.

Assume $Y=\operatorname{Spec}(A)$ where $A$ is a Noetherian ring. This implies that $Y_{/ T}=$ $\operatorname{Spf}\left(A^{\wedge}\right)$ where $A^{\wedge}$ is the $I$-adic completion of $A$ for some ideal $I \subset A$. Let $p$ : $\operatorname{Spf}(R) \rightarrow \operatorname{Spf}\left(A^{\wedge}\right)$ be an adic morphism where $R$ is a complete discrete valuation ring. Let $K$ be the field of fractions of $R$. Consider the composition $A \rightarrow A^{\wedge} \rightarrow R$. Since $X \rightarrow Y$ is surjective, the fibre $X_{K}=\operatorname{Spec}(K) \times_{Y} X$ is nonempty. Thus we may choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that $U_{K}$ is nonempty. Let $u \in U_{K}$ be a closed point (possible as $U_{K}$ is affine). By Morphisms, Lemma 28.20 .3 the residue field $L=\kappa(u)$ is a finite extension of $K$. Let $R^{\prime} \subset L$ be the integral closure of $R$ in $L$. By More on Algebra, Remark 15.81 .6 we see that $R^{\prime}$ is a discrete valuation ring. Because $X \rightarrow Y$ is proper we see that the given morphism $\operatorname{Spec}(L)=u \rightarrow U_{K} \rightarrow X_{K} \rightarrow X$ extends to a morphism $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow X$ over the given morphism $\operatorname{Spec}(R) \rightarrow Y$ (Decent Spaces, Lemma 55.14.5. By commutativity of the diagram the induced morphisms $\operatorname{Spec}\left(R^{\prime} / \mathfrak{m}_{R^{\prime}}^{n}\right) \rightarrow X$ are points of $X_{/ T^{\prime}}$ and we find

$$
\operatorname{Spf}\left(\left(R^{\prime}\right)^{\wedge}\right)=\operatorname{colim} \operatorname{Spec}\left(R^{\prime} / \mathfrak{m}_{R^{\prime}}^{n}\right) \longrightarrow X_{/ T^{\prime}}
$$

as desired (note that $\left(R^{\prime}\right)^{\wedge}$ is a complete discrete valuation ring by More on Algebra, Lemma 15.34.5, in fact in the current situation $R^{\prime}=\left(R^{\prime}\right)^{\wedge}$ but we do not need this).

0AQX Lemma 71.11.8. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Let $B$ be an I-adically complete $A$-algebra. If $A / I^{n} \rightarrow B / I^{n} B$ is of finite type and flat for all $n$ and faithfully flat for $n=1$, then $\operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is rig-surjective.

Proof. We will use without further mention that morphisms between formal spectra are given by continuous maps between the corresponding topological rings, see Formal Spaces, Lemma 70.5.10. Let $\varphi: A \rightarrow R$ be a continuous map into a complete discrete valuation ring $A$. This implies that $\varphi(I) \subset \mathfrak{m}_{R}$. On the other hand, since we only need to produce the lift $\varphi^{\prime}: B^{\prime} \rightarrow R^{\prime}$ in the case that $\varphi$ corresponds to an adic morphism, we may assume that $\varphi(I) \neq 0$. Thus we may consider the
base change $C=B \widehat{\otimes}_{A} R$, see Remark 71.4.3 for example. Then $C$ is an $\mathfrak{m}_{R}$-adically complete $R$-algebra such that $C / \mathfrak{m}_{R}^{n} C$ is of finite type and flat over $R / \mathfrak{m}_{R}^{n}$ and such that $C / \mathfrak{m}_{R} C$ is nonzero. Pick any maximal ideal $\mathfrak{m} \subset C$ lying over $\mathfrak{m}_{R}$. By flatness (which implies going down) we see that $\operatorname{Spec}\left(C_{\mathfrak{m}}\right) \backslash V\left(\mathfrak{m}_{R} C_{\mathfrak{m}}\right)$ is a nonempty open. Hence We can pick a prime $\mathfrak{q} \subset \mathfrak{m}$ such that $\mathfrak{q}$ defines a closed point of $\operatorname{Spec}\left(C_{\mathfrak{m}}\right) \backslash\{\mathfrak{m}\}$ and such that $\mathfrak{q} \notin V\left(I C_{\mathfrak{m}}\right)$, see Properties, Lemma 27.6.4. Then $C / \mathfrak{q}$ is a dimension 1-local domain and we can find $C / \mathfrak{q} \subset R^{\prime}$ with $R^{\prime}$ a discrete valuation ring (Algebra, Lemma 10.118.13). By construction $\mathfrak{m}_{R} R^{\prime} \subset \mathfrak{m}_{R^{\prime}}$ and we see that $C \rightarrow R^{\prime}$ extends to a continuous map $C \rightarrow\left(R^{\prime}\right)^{\wedge}$ (in fact we can pick $R^{\prime}$ such that $R^{\prime}=\left(R^{\prime}\right)^{\wedge}$ in our current situation but we do not need this). Since the completion of a discrete valuation ring is a discrete valuation ring, we see that the assumption gives a commutative diagram of rings

which gives the desired lift.

0AQY Lemma 71.11.9. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Let $B$ be an I-adically complete $A$-algebra. Assume that
(1) the $I$-torsion in $A$ is 0 ,
(2) $A / I^{n} \rightarrow B / I^{n} B$ is flat and of finite type for all $n$.

Then $\operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is rig-surjective if and only if $A / I \rightarrow B / I B$ is faithfully flat.

Proof. Faithful flatness implies rig-surjectivity by Lemma 71.11.8. To prove the converse we will use without further mention that the vanishing of $I$-torsion is equivalent to the vanising of $I$-power torsion (More on Algebra, Lemma 15.69.3). We will also use without further mention that morphisms between formal spectra are given by continuous maps between the corresponding topological rings, see Formal Spaces, Lemma 70.5.10.

Assume $\operatorname{Spf}(B) \rightarrow \operatorname{Spf}(A)$ is rig-surjective. Choose a maximal ideal $I \subset \mathfrak{m} \subset A$. The open $U=\operatorname{Spec}\left(A_{\mathfrak{m}}\right) \backslash V\left(I_{\mathfrak{m}}\right)$ of $\operatorname{Spec}\left(A_{\mathfrak{m}}\right)$ is nonempty as the $I_{\mathfrak{m}}$-torsion of $A_{\mathfrak{m}}$ is zero (use Algebra, Lemma 10.61.4). Thus we can find a prime $\mathfrak{q} \subset A_{\mathfrak{m}}$ which defines a point of $U$ (i.e., $I A_{\mathfrak{m} \not \subset \mathfrak{q})}$ and which corresponds to a closed point of $\operatorname{Spec}\left(A_{\mathfrak{m}}\right) \backslash\{\mathfrak{m}\}$, see Properties, Lemma 27.6.4. Then $A_{\mathfrak{m}} / \mathfrak{q}$ is a dimension 1 local domain. Thus we can find an injective local homomorphism of local rings $A_{\mathfrak{m}} / \mathfrak{q} \subset R$ where $R$ is a discrete valuation ring (Algebra, Lemma 10.118.13). By construction $I R \subset \mathfrak{m}_{R}$ and we see that $A \rightarrow R$ extends to a continuous map $A \rightarrow R^{\wedge}$. Since the completion of a discrete valuation ring is a discrete valuation ring, we see that the assumption gives a commutative diagram of rings

Thus we find a prime ideal of $B$ lying over $\mathfrak{m}$. It follows that $\operatorname{Spec}(B / I B) \rightarrow$ $\operatorname{Spec}(A / I)$ is surjective, whence $A / I \rightarrow B / I B$ is faithfully flat (Algebra, Lemma 10.38.16).

0AQZ Remark 71.11.10. The condition as formulated in Definition 71.11.1 is not right for morphisms of locally adic* formal algebraic spaces. For example, if $A=\left(\bigcup_{n \geq 1} k\left[t^{1 / n}\right]\right)^{\wedge}$ where the completion is the $t$-adic completion, then there are no adic morphisms $\operatorname{Spf}(R) \rightarrow \operatorname{Spf}(A)$ where $R$ is a complete discrete valuation ring. Thus any morphism $X \rightarrow \operatorname{Spf}(A)$ would be rig-surjective, but since $A$ is a domain and $t \in A$ is not zero, we want to think of $A$ as having at least one "rigpoint", and we do not want to allow $X=\emptyset$. To cover this particular case, one can consider adic morphisms

$$
\operatorname{Spf}(R) \longrightarrow Y
$$

where $R$ is a valuation ring complete with respect to a principal ideal $J$ whose radical is $\mathfrak{m}_{R}=\sqrt{J}$. In this case the value group of $R$ can be embedded into $(\mathbf{R},+)$ and one obtains the point of view used by Berkovich in defining an analytic space associated to $Y$, see Ber90. Another approach is championed by Huber. In his theory, one drops the hypothesis that $\operatorname{Spec}(R / J)$ is a singleton, see Hub93a].
0AR0 Lemma 71.11.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of formal algebraic spaces. Assume $X$ and $Y$ are locally Noetherian, $f$ locally of finite type, and $f$ a monomorphism. Then $f$ is rig surjective if and only if every adic morphism $\operatorname{Spf}(R) \rightarrow Y$ where $R$ is a complete discrete valuation ring factors through $X$.

Proof. One direction is trivial. For the other, suppose that $\operatorname{Spf}(R) \rightarrow Y$ is an adic morphism such that there exists an extension of complete discrete valuation rings $R \subset R^{\prime}$ with $\operatorname{Spf}\left(R^{\prime}\right) \rightarrow \operatorname{Spf}(R) \rightarrow X$ factoring through $Y$. Then $\operatorname{Spec}\left(R^{\prime} / \mathfrak{m}_{R}^{n} R^{\prime}\right) \rightarrow$ $\operatorname{Spec}\left(R / \mathfrak{m}_{R}^{n}\right)$ is surjective and flat, hence the morphisms $\operatorname{Spec}\left(R / \mathfrak{m}_{R}^{n}\right) \rightarrow X$ factor through $X$ as $X$ satisfies the sheaf condition for fpqc coverings, see Formal Spaces, Lemma 70.23.1. In other words, $\operatorname{Spf}(R) \rightarrow Y$ factors through $X$.

### 71.12. Algebraization

0AR1 In this section we prove a generalization of the result on dilatations from the paper of Artin Art70. We first reformulate the algebra results proved above into the language of formal algebraic spaces.
Let $S$ be a scheme. Let $V$ be a locally Noetherian formal algebraic space over $S$. We denote $\mathcal{C}_{V}$ the category of formal algebraic spaces $W$ over $V$ such that the structure morphism $W \rightarrow V$ is rig-étale.

Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Recall that $X_{/ T}$ denotes the formal completion of $X$ along $T$, see Formal Spaces, Section 70.9. More generally, for any algebraic space $Y$ over $X$ we denote $Y_{/ T}$ the completion of $Y$ along the inverse image of $T$ in $|Y|$, so that $Y_{/ T}$ is a formal algebraic space over $X_{/ T}$.

0AR2 Lemma 71.12.1. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. If $Y \rightarrow X$ is morphism of algebraic spaces which is locally of finite type and étale over $X \backslash T$, then $Y_{/ T} \rightarrow X_{/ T}$ is rig-étale, i.e., $Y_{/ T}$ is an object of $\mathcal{C}_{X_{/ T}}$ defined above.

Proof. Choose a surjective étale morphism $U \rightarrow X$ with $U=\coprod U_{i}$ a disjoint union of affine schemes, see Properties of Spaces, Lemma 53.6.1. For each $i$ choose a surjective étale morphism $V_{i} \rightarrow Y \times_{X} U_{i}$ where $V_{i}=\coprod V_{i j}$ is a disjoint union of affines. Write $U_{i}=\operatorname{Spec}\left(A_{i}\right)$ and $V_{i j}=\operatorname{Spec}\left(B_{i j}\right)$. Let $I_{i} \subset A_{i}$ be an ideal cutting out the inverse image of $T$ in $U_{i}$. Then we may apply Lemma 71.6 .2 to see that the map of $I_{i}$-adic completions $A_{i}^{\wedge} \rightarrow B_{i j}^{\wedge}$ has the property $P$ of Lemma 71.7.1. Since $\left\{\operatorname{Spf}\left(A_{i}^{\wedge}\right) \rightarrow X_{/ T}\right\}$ and $\left\{\operatorname{Spf}\left(B_{i j}\right) \rightarrow Y_{/ T}\right\}$ are coverings as in Formal Spaces, Definition 70.7.1 we see that $Y_{/ T} \rightarrow X_{/ T}$ is rig-étale by definition.

0AR3 Lemma 71.12.2. Let $X$ be a Noetherian affine scheme. Let $T \subset X$ be a closed subset. Let $U$ be an affine scheme and let $U \rightarrow X$ a finite type morphism étale over $X \backslash T$. Let $V$ be a Noetherian affine scheme over $X$. For any morphism $c^{\prime}: V_{/ T} \rightarrow$ $U_{/ T}$ over $X_{/ T}$ there exists an étale morphism $b: V^{\prime} \rightarrow V$ of affine schemes which induces an isomorphism $b_{/ T}: V_{/ T}^{\prime} \rightarrow V_{/ T}$ and a morphism $a: V^{\prime} \rightarrow U$ such that $c^{\prime}=a_{/ T} \circ b_{/ T}^{-1}$.

Proof. This is a reformulation of Lemma 71.6.4.
0AR4 Lemma 71.12.3. Let $X$ be a Noetherian affine scheme. Let $T \subset X$ be a closed subset. Let $W \rightarrow X_{/ T}$ be a rig-étale morphism of formal algebraic spaces with $W$ an affine formal algebraic space. Then there exists an afffine scheme $U$, a finite type morphism $U \rightarrow X$ étale over $X \backslash T$ such that $W \cong U_{/ T}$. Moreover, if $W \rightarrow X_{/ T}$ is étale, then $U \rightarrow X$ is étale.

Proof. The existence of $U$ is a restatement of Lemma 71.9.4. The final statement follows from More on Morphisms, Lemma 36.10.3.

Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$ and let $T \subset|X|$ be a closed subset. Let us denote $\mathcal{C}_{X, T}$ the category of algebraic spaces $Y$ over $X$ such that the structure morphism $f: Y \rightarrow X$ is locally of finite type and an isomorphism over the complement of $T$. Formal completion defines a functor

0AR5 (71.12.3.1) $\quad F_{X, T}: \mathcal{C}_{X, T} \longrightarrow \mathcal{C}_{X_{/ T}}, \quad(f: Y \rightarrow X) \longmapsto\left(f_{/ T}: Y_{/ T} \rightarrow X_{/ T}\right)$
see Lemma 71.12.1.
0AR6 Lemma 71.12.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Z \rightarrow Y$ be morphisms of algebraic spaces. Let $T \subset|X|$ be closed. Assume that
(1) $X$ is locally Noetherian,
(2) $g$ is a monomorphism and locally of finite type,
(3) $\left.f\right|_{X \backslash T}: X \backslash T \rightarrow Y$ factors through $g$, and
(4) $f_{/ T}: X_{/ T} \rightarrow Y$ factors through $g$,
then $f$ factors through $g$.
Proof. Consider the fibre product $E=X \times_{Y} Z \rightarrow X$. By assumption the the open immersion $X \backslash T \rightarrow X$ factors through $E$ and any morphism $\varphi: X^{\prime} \rightarrow X$ with $|\varphi|\left(\left|X^{\prime}\right|\right) \subset T$ factors through $E$ as well, see Formal Spaces, Section 70.9 . By More on Morphisms of Spaces, Lemma 63.18.3 this implies that $E \rightarrow X$ is étale at every point of $E$ mapping to a point of $T$. Hence $E \rightarrow X$ is an étale monomorphism, hence an open immersion (Morphisms of Spaces, Lemma 54.48.2). Then it follows that $E=X$ since our assumptions imply that $|X|=|E|$.

0AR7 Lemma 71.12.5. Let $S$ be a scheme. Let $X, Y$ be locally Noetherian algebraic spaces over $S$. Let $T \subset|X|$ and $T^{\prime} \subset|Y|$ be closed subsets. Let $a, b: X \rightarrow Y$ be morphisms of algebraic spaces over $S$ such that $\left.a\right|_{X \backslash T}=\left.b\right|_{X \backslash T}$, such that $|a|(T) \subset$ $T^{\prime}$ and $|b|(T) \subset T^{\prime}$, and such that $a_{/ T}=b_{/ T}$ as morphisms $X_{/ T} \rightarrow Y_{/ T^{\prime}}$. Then $a=b$.

Proof. Let $E$ be the equalizer of $a$ and $b$. Then $E$ is an algebraic space and $E \rightarrow X$ is locally of finite type and a monomorphism, see Morphisms of Spaces, Lemma 54.4.1. Our assumptions imply we can apply Lemma 71.12 .4 to the two morphisms $f=\mathrm{id}: X \rightarrow X$ and $g: E \rightarrow X$ and the closed subset $T$ of $|X|$.

0AR8 Lemma 71.12.6. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $s, t: R \rightarrow U$ be two morphisms of algebraic spaces over $X$. Assume
(1) $R, U$ are locally of finite type over $X$,
(2) the base change of $s$ and $t$ to $X \backslash T$ is an étale equivalence relation, and
(3) the formal completion $\left(t_{/ T}, s_{/ T}\right): R_{/ T} \rightarrow U_{/ T} \times X_{/ T} U_{/ T}$ is an equivalence relation too.
Then $(t, s): R \rightarrow U \times_{X} U$ is an étale equivalence relation.
Proof. The morphisms $s, t: R \rightarrow U$ are étale over $X \backslash T$ by assumption. Since the formal completions of the maps $s, t: R \rightarrow U$ are étale, we see that $s$ and $t$ are étale for example by More on Morphisms, Lemma 36.10.3. Applying Lemma 71.12 .4 to the morphisms id : $R \times_{U \times_{X} U} R \rightarrow R \times_{U \times_{X} U} R$ and $\Delta: R \rightarrow R \times_{U \times_{X} U} R$ we conclude that $(t, s)$ is a monomorphism. Applying it again to $\left(t \circ \operatorname{pr}_{0}, s \circ \operatorname{pr}_{1}\right)$ : $R \times_{s, U, t} R \rightarrow U \times_{X} U$ and $(t, s): R \rightarrow U \times_{X} U$ we find that "transitivity" holds. We omit the proof of the other two axioms of an equivalence relation.

0AR9 Remark 71.12.7. Let $S, X$, and $T \subset|X|$ be as in 71.12.3.1|. Let $U \rightarrow X$ be an algebraic space over $X$ such that $U \rightarrow X$ is locally of finite type and étale outside of $T$. We will construct a factorization

$$
U \longrightarrow Y \longrightarrow X
$$

with $Y$ in $\mathcal{C}_{X, T}$ such that $U_{/ T} \rightarrow Y_{/ T}$ is an isomorphism. We may assume the image of $U \rightarrow X$ contains $X \backslash T$, otherwise we replace $U$ by $U \amalg(X \backslash T)$. For an algebraic space $Z$ over $X$, let us denote $Z^{\circ}$ the open subspace which is the inverse image of $X \backslash T$. Let

$$
R=U \amalg_{U^{\circ}}\left(U \times_{X} U\right)^{\circ}
$$

be the pushout of $U^{\circ} \rightarrow U$ and the diagonal morphism $U^{\circ} \rightarrow U^{\circ} \times_{X} U^{\circ}=\left(U \times_{X}\right.$ $U)^{\circ}$. Since $U^{\circ} \rightarrow X$ is étale, the diagonal is an open immersion and we see that $R$ is an algebraic space (this follows for example from Spaces, Lemma 52.8.4. The two projections $\left(U \times_{X} U\right)^{\circ} \rightarrow U$ extend to $R$ and we obtain two étale morphisms $s, t: R \rightarrow U$. Checking on each piece separatedly we find that $R$ is an étale equivalence relation on $U$. Set $Y=U / R$ which is an algebraic space by Bootstrap, Theorem 67.10.1 Since $U^{\circ} \rightarrow X \backslash T$ is a surjective étale morphism and since $R^{\circ}=U^{\circ} \times_{X \backslash T} U^{\circ}$ we see that $Y^{\circ} \rightarrow X \backslash T$ is an isomorphism. In other words, $Y \rightarrow X$ is an object of $\mathcal{C}_{X, T}$. On the other hand, the morphism $U \rightarrow Y$ induces an isomorphism $U_{/ T} \rightarrow Y_{/ T}$. Namely, the formal completion of $R$ along the inverse image of $T$ is equal to the formal completion of $U$ along the inverse image of $T$ by
our choice of $R$. By our construction of the formal completion in Formal Spaces, Section 70.9 we conclude that $U_{/ T}=Y_{/ T}$.

0ARA Lemma 71.12.8. Let $S$ be a scheme. Let $X$ be a Noetherian affine algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Then the functor $F_{X, T}$ is an equivalence.

Before we prove this lemma let us discuss an example. Suppose that $S=\operatorname{Spec}(k)$, $X=\mathbf{A}_{k}^{1}$, and $T=\{0\}$. Then $X_{/ T}=\operatorname{Spf}(k[[x]])$. Let $W=\operatorname{Spf}(k[[x]] \times k[[x]])$. Then the corresponding $Y$ is the affine line with zero doubled (Schemes, Example 25.14.3). Moreover, this is the output of the construction in Remark 71.12.7 starting with $U=X \amalg X$.

Proof. For any scheme or algebraic space $Z$ over $X$, let us denote $Z_{0} \subset Z$ the inverse image of $T$ with the induced reduced closed subscheme or subspace structure. Note that $Z_{0}=\left(Z_{/ T}\right)_{\text {red }}$ is the reduction of the formal completion.
The functor $F_{X, T}$ is faithful by Lemma 71.12.5.
Let $Y, Y^{\prime}$ be objects of $\mathcal{C}_{X, T}$ and let $a^{\prime}: Y_{/ T} \rightarrow Y_{/ T}^{\prime}$ be a morphism in $\mathcal{C}_{X_{/ T}}$. To prove $F_{X, T}$ is fully faithful, we will construct a morphism $a: Y \rightarrow Y^{\prime}$ in $\mathcal{C}_{X, T}$ such that $a^{\prime}=a_{/ T}$.
Let $U$ be an affine scheme and let $U \rightarrow Y$ be an étale morphism. Because $U$ is affine, $U_{0}$ is affine and the image of $U_{0} \rightarrow Y_{0} \rightarrow Y_{0}^{\prime}$ is a quasi-compact subspace of $\left|Y_{0}^{\prime}\right|$. Thus we can choose an affine scheme $V$ and an étale morphism $V \rightarrow Y^{\prime}$ such that the image of $\left|V_{0}\right| \rightarrow\left|Y_{0}^{\prime}\right|$ contains this quasi-compact subset. Consider the formal algebraic space

$$
W=U_{/ T} \times_{Y_{/ T}^{\prime}} V_{/ T}
$$

By our choice of $V$ the above, the map $W \rightarrow U_{/ T}$ is surjective. Thus there exists an affine formal algebraic space $W^{\prime}$ and an étale morphism $W^{\prime} \rightarrow W$ such that $W^{\prime} \rightarrow W \rightarrow U_{/ T}$ is surjective. Then $W^{\prime} \rightarrow U_{/ T}$ is étale. By Lemma 71.12.3 $W^{\prime}=U^{\prime}{ }_{T}$ for $U^{\prime} \rightarrow U$ étale and $U^{\prime}$ affine. Write $V=\operatorname{Spec}(C)$. By Lemma 71.12 .2 there exists an étale morphism $U^{\prime \prime} \rightarrow U^{\prime}$ of affines which is an isomorphism on completions and a morphism $U^{\prime \prime} \rightarrow V$ whose completion is the composition $U_{/ T}^{\prime \prime} \rightarrow U_{/ T}^{\prime} \rightarrow W \rightarrow V_{/ T}$. Thus we get

$$
Y \longleftarrow U^{\prime \prime} \longrightarrow Y^{\prime}
$$

over $X$ agreeing with the given map on formal completions such that the image of $U_{0}^{\prime \prime} \rightarrow Y_{0}$ is the same as the image of $U_{0} \rightarrow Y_{0}$.
Taking a disjoint union of $U^{\prime \prime}$ as constructed in the previous paragraph, we find a scheme $U$, an étale morphism $U \rightarrow Y$, and a morphism $b: U \rightarrow Y^{\prime}$ over $X$, such that the diagram

is commutative and such that $U_{0} \rightarrow Y_{0}$ is surjective. Taking a disjoint union with the open $X \backslash T$ (which is also open in $Y$ and $Y^{\prime}$ ), we find that we may even assume that $U \rightarrow Y$ is a surjective étale morphism. Let $R=U \times_{Y} U$. Then the two compositions $R \rightarrow U \rightarrow Y^{\prime}$ agree both over $X \backslash T$ and after formal completion
along $T$, whence are equal by Lemma 71.12.5. This means exactly that $b$ factors as $U \rightarrow Y \rightarrow Y^{\prime}$ to give us our desired morphism $a: Y \rightarrow Y^{\prime}$.
Essential surjectivity. Let $W$ be an object of $\mathcal{C}_{X_{/ T}}$. We prove $W$ is in the essential image in a number of steps.

Step 1: $W$ is an affine formal algebraic space. Then we can find $U \rightarrow X$ of finite type and étale over $X \backslash T$ such that $U_{/ T}$ is isomorphic to $W$, see Lemma 71.12.3. Thus we see that $W$ is in the essential image by the construction in Remark 71.12.7.
Step 2: $W$ is separated. Choose $\left\{W_{i} \rightarrow W\right\}$ as in Formal Spaces, Definition 70.7.1. By Step 1 the formal algebraic spaces $W_{i}$ and $W_{i} \times_{W} W_{j}$ are in the essential image. Say $W_{i}=\left(Y_{i}\right)_{/ T}$ and $W_{i} \times_{W} W_{j}=\left(Y_{i j}\right)_{/ T}$. By fully faithfulness we obtain morphisms $t_{i j}: Y_{i j} \rightarrow Y_{i}$ and $s_{i j}: Y_{i j} \rightarrow Y_{j}$ matching the projections $W_{i} \times_{W} W_{j} \rightarrow W_{i}$ and $W_{i} \times_{W} W_{j} \rightarrow W_{j}$. Set $R=\coprod Y_{i j}$ and $U=\coprod Y_{i}$ and denote $s=\coprod s_{i j}: R \rightarrow U$ and $t=\coprod t_{i j}: R \rightarrow U$. Applying Lemma 71.12 .6 we find that $(t, s): R \rightarrow U \times_{X} U$ is an étale equivalence relation. Thus we can take the quotient $Y=U / R$ and it is an algebraic space, see Bootstrap, Theorem 67.10.1. Since completion commutes with fibre products and taking quotient sheaves, we find that $Y_{/ T} \cong W$ in $\mathcal{C}_{X_{/ T}}$.
Step 3: $W$ is general. Choose $\left\{W_{i} \rightarrow W\right\}$ as in Formal Spaces, Definition 70.7.1. The formal algebraic spaces $W_{i}$ and $W_{i} \times{ }_{W} W_{j}$ are separated. Hence by Step 2 the formal algebraic spaces $W_{i}$ and $W_{i} \times_{W} W_{j}$ are in the essential image. Then we argue exactly as in the previous paragraph to see that $W$ is in the essential image as well. This concludes the proof.

0ARB Theorem 71.12.9. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. The functor $F_{X, T}$ 71.12.3.1)
$\left\{\begin{array}{c}\text { algebraic spaces } Y \text { locally of finite } \\ \text { type over } X \text { such that } Y \rightarrow X \\ \text { is an isomorphism over } X \backslash T\end{array}\right\} \rightarrow\left\{\begin{array}{c}\text { formal algebraic spaces } W \text { endowed } \\ \text { with a rig-étale morphism } W \rightarrow X_{/ T}\end{array}\right\}$
given by formal completion is an equivalence.
Proof. The theorem is essentially a formal consequence of Lemma 71.12.8. We give the details but we encourage the reader to think it through for themselves. Let $g: U \rightarrow X$ be a surjective étale morphism with $U=\coprod U_{i}$ and each $U_{i}$ affine. Denote $F_{U, T}$ the functor for $U$ and the inverse image of $T$ in $|U|$.
Since $U=\coprod U_{i}$ both the category $\mathcal{C}_{U, T}$ and the category $\mathcal{C}_{U_{/ T}}$ decompose as a product of categories, one for each $i$. Since the functors $F_{U_{i}, T}$ are equivalences for all $i$ by the lemma we find that the same is true for $F_{U, T}$.
Since $F_{U, T}$ is faithful, it follows that $F_{X, T}$ is faithful too. Namely, if $a, b: Y \rightarrow Y^{\prime}$ are morphisms in $\mathcal{C}_{X, T}$ such that $a_{/ T}=b_{/ T}$, then we find on pulling back that the base changes $a_{U}, b_{U}: U \times_{X} Y \rightarrow U \times_{X} Y^{\prime}$ are equal. Since $U \times_{X} Y \rightarrow Y$ is surjective étale, this implies that $a=b$.
At this point we know that $F_{X, T}$ is faithful for every situation as in the theorem. Let $R=U \times{ }_{X} U$ where $U$ is as above. Let $t, s: R \rightarrow U$ be the projections. Since $X$ is Noetherian, so is $R$. Thus the functor $F_{R, T}$ (defined in the obvious manner) is faithful. Let $Y \rightarrow X$ and $Y^{\prime} \rightarrow X$ be objects of $\mathcal{C}_{X, T}$. Let $a^{\prime}: Y_{/ T} \rightarrow Y_{/ T}^{\prime}$ be a morphism in the category $\mathcal{C}_{X_{/ T}}$. Taking the base change to $U$ we obtain a morphism
$a_{U}^{\prime}:\left(U \times_{X} Y\right)_{/ T} \rightarrow\left(U \times_{X} Y^{\prime}\right)_{/ T}$ in the category $\mathcal{C}_{U / T}$. Since the functor $F_{U, T}$ is fully faithful we obtain a morphism $a_{U}: U \times_{X} Y \rightarrow U \times_{X} Y^{\prime}$ with $F_{U, T}\left(a_{U}\right)=a_{U}^{\prime}$. Since $s^{*}\left(a_{U}^{\prime}\right)=t^{*}\left(a_{U}^{\prime}\right)$ and since $F_{R, T}$ is faithful, we find that $s^{*}\left(a_{U}\right)=t^{*}\left(a_{U}\right)$. Since

$$
R \times_{X} Y \longrightarrow U \times_{X} Y \longrightarrow Y
$$

is an equalizer diagram of sheaves, we find that $a_{U}$ descends to a morphism $a$ : $Y \rightarrow Y^{\prime}$. We omit the proof that $F_{X, T}(a)=a^{\prime}$.
At this point we know that $F_{X, T}$ is faithful for every situation as in the theorem. To finish the proof we show that $F_{X, T}$ is essentially surjective. Let $W \rightarrow X_{/ T}$ be an object of $\mathcal{C}_{X_{/ T}}$. Then $U \times_{X} W$ is an object of $\mathcal{C}_{U_{/ T}}$. By the affine case we find an object $V \rightarrow U$ of $\mathcal{C}_{U, T}$ and an isomorphism $\alpha: F_{U, T}(V) \rightarrow U \times_{X} W$ in $\mathcal{C}_{U_{/ T}}$. By fully faithfulness of $F_{R, T}$ we find a unique morphism $h: s^{*} V \rightarrow t^{*} V$ in the category $\mathcal{C}_{R, T}$ such that $F_{R, T}(h)$ corresponds, via the isomorphism $\alpha$, to the canonical descent datum on $U \times_{X} W$ in the category $\mathcal{C}_{R_{/ T}}$. Using faithfulness of our functor on $R \times_{s, U, t} R$ we see that $h$ satisfies the cocycle condition. We conclude, for example by the much more general Bootstrap, Lemma 67.11.2, that there exists an object $Y \rightarrow X$ of $\mathcal{C}_{X, T}$ and an isomorphism $\beta: U \times_{X} Y \rightarrow V$ such that the descent datum $h$ corresponds, via $\beta$, to the canonical descent datum on $U \times_{X} Y$. We omit the verification that $F_{X, T}(Y)$ is isomorphic to $W$; hint: in the category of formal algebraic spaces there is descent for morphisms along étale coverings.

We are often interested as to whether the output of the construction of Theorem 71.12 .9 is a separated algebraic space. In the next few lemmas we match properties of $Y \rightarrow X$ and the corresponding completion $Y_{/ T} \rightarrow X_{/ T}$.

0ARU Lemma 71.12.10. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $W \rightarrow X_{/ T}$ be an object of the category $\mathcal{C}_{X_{/ T}}$ and let $Y \rightarrow X$ be the object corresponding to $W$ via Theorem 71.12.9. Then $Y \rightarrow X$ is quasi-compact if and only if $W \rightarrow X_{/ T}$ is so.

Proof. These conditions may be checked after base change to an affine scheme étale over $X$, resp. a formal affine algebraic space étale over $X_{/ T}$, see Morphisms of Spaces, Lemma 54.8.7 as well as Formal Spaces, Lemma 70.12.3. If $U \rightarrow X$ ranges over étale morphisms wtih $U$ affine, then the formal completions $U_{/ T} \rightarrow X_{/ T}$ give a family of formal affine coverings as in Formal Spaces, Definition 70.7.1. Thus we may and do assume $X$ is affine.

Let $V \rightarrow Y$ be a surjective étale morphism where $V=\coprod_{j \in J} V_{j}$ is a disjoint union of affines. Then $V_{/ T} \rightarrow Y_{/ T}=W$ is a surjective étale morphism. Thus if $Y$ is quasicompact, we can choose $J$ is finite, and we conclude that $W$ is quasi-compact. Conversely, if $W$ is quasi-compact, then we can find a finite subset $J^{\prime} \subset J$ such that $\coprod_{j \in J^{\prime}}\left(V_{j}\right)_{/ T} \rightarrow W$ is surjective. Then it follows that

$$
(X \backslash T) \amalg \coprod_{j \in J^{\prime}} V_{j} \longrightarrow Y
$$

is surjective. This either follows from the construction of $Y$ in the proof of Lemma 71.12 .8 or it follows since we have

$$
|Y|=|X \backslash T| \amalg\left|W_{r e d}\right|
$$

as $Y_{/ T}=W$.

0ARV Lemma 71.12.11. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $W \rightarrow X_{/ T}$ be an object of the category $\mathcal{C}_{X_{/ T}}$ and let $Y \rightarrow X$ be the object corresponding to $W$ via Theorem 71.12.9. Then $Y \rightarrow X$ is quasi-separated if and only if $W \rightarrow X_{/ T}$ is so.

Proof. These conditions may be checked after base change to an affine scheme étale over $X$, resp. a formal affine algebraic space étale over $X_{/ T}$, see Morphisms of Spaces, Lemma 54.4 .12 as well as Formal Spaces, Lemma 70.21 .5 . If $U \rightarrow X$ ranges over étale morphisms wtih $U$ affine, then the formal completions $U_{/ T} \rightarrow X_{/ T}$ give a family of formal affine coverings as in Formal Spaces, Definition 70.7.1. Thus we may and do assume $X$ is affine.

Let $V \rightarrow Y$ be a surjective étale morphism where $V=\coprod_{j \in J} V_{j}$ is a disjoint union of affines. Then $Y$ is quasi-separated if and only if $V_{j} \times_{Y} V_{j^{\prime}}$ is quasi-compact for all $j, j^{\prime} \in J$. Similarly, $W$ is quasi-separated if and only if $\left(V_{j} \times_{Y} V_{j^{\prime}}\right)_{/ T}=$ $\left(V_{j}\right)_{/ T} \times{ }_{Y_{/ T}}\left(V_{j^{\prime}}\right)_{/ T}$ is quasi-compact for all $j, j^{\prime} \in J$. Since $X$ is Noetherian affine, we see that

$$
\left(V_{j} \times_{Y} V_{j^{\prime}}\right) \times_{X}(X \backslash T)
$$

is quasi-compact. Hence we conclude the equvalence holds by the equality

$$
\left|V_{j} \times_{Y} V_{j^{\prime}}\right|=\left|\left(V_{j} \times_{Y} V_{j^{\prime}}\right) \times_{X}(X \backslash T)\right| \amalg\left|\left(V_{j} \times_{Y} V_{j^{\prime}}\right)_{/ T}\right|
$$

and the fact that the second summand is closed in the left hand side.

0ARW Lemma 71.12.12. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $W \rightarrow X_{/ T}$ be an object of the category $\mathcal{C}_{X_{/ T}}$ and let $Y \rightarrow X$ be the object corresponding to $W$ via Theorem 71.12.9. Then $Y \rightarrow X$ is separated if and only if $W \rightarrow X_{/ T}$ is separated and $\Delta: W \rightarrow W \times_{X_{/ T}} W$ is rig-surjective.

Proof. These conditions may be checked after base change to an affine scheme étale over $X$, resp. a formal affine algebraic space étale over $X_{/ T}$, see Morphisms of Spaces, Lemma 54.4.12 as well as Formal Spaces, Lemma 70.21.5. If $U \rightarrow X$ ranges over étale morphisms wtih $U$ affine, then the formal completions $U_{/ T} \rightarrow X_{/ T}$ give a family of formal affine coverings as in Formal Spaces, Definition 70.7.1 Thus we may and do assume $X$ is affine. In the proof of both directions we may assume that $Y \rightarrow X$ and $W \rightarrow X_{/ T}$ are quasi-separated by Lemma 71.12.11.

Proof of easy direction. Assume $Y \rightarrow X$ is separated. Then $Y \rightarrow Y \times_{X} Y$ is a closed immersion and it follows that $W \rightarrow W \times_{X_{/ T}} W$ is a closed immersion too, i.e., we see that $W \rightarrow X_{/ T}$ is separated. Let

$$
p: \operatorname{Spf}(R) \longrightarrow W \times_{X_{/ T}} W=\left(Y \times_{X} Y\right)_{/ T}
$$

be an adic morphism where $R$ is a complete discrete valuation ring with fraction field $K$. The composition into $Y \times_{X} Y$ corresponds to a morphism $g: \operatorname{Spec}(R) \rightarrow$ $Y \times_{X} Y$, see Formal Spaces, Lemma 70.24.3. Since $p$ is an adic morphism, so is the composition $\operatorname{Spf}(R) \rightarrow X$. Thus we see that $g(\operatorname{Spec}(K))$ is a point of

$$
\left(Y \times_{X} Y\right) \times_{X}(X \backslash T) \cong X \backslash T \cong Y \times_{X}(X \backslash T)
$$

(small detail omitted). Hence this lifts to a $K$-point of $Y$ and we obtain a commutaive diagram

Since $Y \rightarrow X$ was assumed separated we find the dotted arrow exists (Cohomology of Spaces, Lemma 56.18.1. Applying the functor completion along $T$ we find that $p$ can be lifted to a morphism into $W$, i.e., $W \rightarrow W \times_{X_{/ T}} W$ is rig-surjective.

Proof of hard direction. Assume $W \rightarrow X_{/ T}$ separated and $W \rightarrow W \times_{X_{/ T}} W$ rig-surjective. By Cohomology of Spaces, Lemma 56.18.1 and Remark 56.18.3 it suffices to show that given any commtutative diagram

where $R$ is a complete discrete valuation ring with fraction field $K$, there is at most one dotted arrow making the diagram commute. Let $h: \operatorname{Spec}(R) \rightarrow X$ be the composition of $g$ with the morphism $Y \times_{X} Y \rightarrow X$. There are three cases: Case I: $h(\operatorname{Spec}(R)) \subset(X \backslash T)$. This case is trivial because $Y \times_{X}(X \backslash T)=X \backslash T$. Case II: $h$ maps $\operatorname{Spec}(R)$ into $T$. This case follows from our assumption that $W \rightarrow X_{/ T}$ is separated. Namely, if $T$ denotes the reduced induced closed subspace structure on $T$, then $h$ factors through $T$ and

$$
W \times_{X_{/ T}} T=Y \times_{X} T \longrightarrow T
$$

is separated by assumption (and for example Formal Spaces, Lemma 70.21.5) which implies we get the lifting property by Cohomology of Spaces, Lemma 56.18.1 applied to the displayed arrow. Case III: $h(\operatorname{Spec}(K))$ is not in $T$ but $h$ maps the closed point of $\operatorname{Spec}(R)$ into $T$. In this case the corresponding morphism

$$
g_{/ T}: \operatorname{Spf}(R) \longrightarrow\left(Y \times_{X} Y\right)_{/ T}=W \times_{X_{/ T}} W
$$

is an adic morphism (detail omitted). Hence our assumption that $W \rightarrow W \times{ }_{X_{/ T}} W$ be rig-surjective implies we can lift $g_{/ T}$ to a morphism $e: \operatorname{Spf}(R) \rightarrow W=Y_{/ T}$ (see Lemma 71.11.11 for why we do not need to extend $R$ ). Algebraizing the composition $\operatorname{Spf}(R) \rightarrow Y$ using Formal Spaces, Lemma 70.24 .3 we find a morphism $\operatorname{Spec}(R) \rightarrow Y$ lifing $g$ as desired.

0ARX Lemma 71.12.13. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $T \subset|X|$ be a closed subset. Let $W \rightarrow X_{/ T}$ be an object of the category $\mathcal{C}_{X_{/ T}}$ and let $Y \rightarrow X$ be the object corresponding to $W$ via Theorem 71.12.9. Then $Y \rightarrow X$ is proper if and only if the following conditions hold
(1) $W \rightarrow X_{/ T}$ is proper,
(2) $W \rightarrow X_{/ T}$ is rig-surjective, and
(3) $\Delta: W \rightarrow W \times_{X_{/ T}} W$ is rig-surjective.

Proof. These conditions may be checked after base change to an affine scheme étale over $X$, resp. a formal affine algebraic space étale over $X_{/ T}$, see Morphisms of Spaces, Lemma 54.39 .2 as well as Formal Spaces, Lemma 70.22.2. If $U \rightarrow X$ ranges over étale morphisms wtih $U$ affine, then the formal completions $U_{/ T} \rightarrow X_{/ T}$ give a family of formal affine coverings as in Formal Spaces, Definition 70.7.1. Thus we may and do assume $X$ is affine. In the proof of both directions we may assume that $Y \rightarrow X$ and $W \rightarrow X_{/ T}$ are separated and quasi-compact and that $W \rightarrow W \times_{X_{/ T}} W$ is rig-surjective by Lemmas 71.12.10 and 71.12.12.
Proof of the easy direction. Assume $Y \rightarrow X$ is proper. Then $Y_{/ T}=Y \times_{X} X_{/ T} \rightarrow$ $X_{/ T}$ is proper too. Let

$$
p: \operatorname{Spf}(R) \longrightarrow X_{/ T}
$$

be an adic morphism where $R$ is a complete discrete valuation ring with fraction field $K$. Then $p$ corresponds to a morphism $g: \operatorname{Spec}(R) \rightarrow X$, see Formal Spaces, Lemma 70.24.3. Since $p$ is an adic morphism, we have $p(\operatorname{Spec}(K)) \notin T$. Since $Y \rightarrow X$ is an isomorphism over $X \backslash T$ we can lift to $X$ and obtain a commutative diagram

Since $Y \rightarrow X$ was assumed proper we find the dotted arrow exists. (Cohomology of Spaces, Lemma 56.18.2). Applying the functor completion along $T$ we find that $p$ can be lifted to a morphism into $W$, i.e., $W \rightarrow X_{/ T}$ is rig-surjective.

Proof of hard direction. Assume $W \rightarrow X_{/ T}$ proper, $W \rightarrow W \times_{X_{/ T}} W$ rig-surjective, and $W \rightarrow X_{/ T}$ rig-surjective. By Cohomology of Spaces, Lemma 56.18.2 and Remark 56.18.3 it suffices to show that given any commtutative diagram

where $R$ is a complete discrete valuation ring with fraction field $K$, there is a dotted arrow making the diagram commute. Let $h: \operatorname{Spec}(R) \rightarrow X$ be the composition of $g$ with the morphism $Y \times_{X} Y \rightarrow X$. There are three cases: Case I: $h(\operatorname{Spec}(R)) \subset$ $(X \backslash T)$. This case is trivial because $Y \times_{X}(X \backslash T)=X \backslash T$. Case II: $h$ maps $\operatorname{Spec}(R)$ into $T$. This case follows from our assumption that $W \rightarrow X_{/ T}$ is proper. Namely, if $T$ denotes the reduced induced closed subspace structure on $T$, then $h$ factors through $T$ and

$$
W \times_{X_{/ T}} T=Y \times_{X} T \longrightarrow T
$$

is proper by assumption which implies we get the lifting property by Cohomology of Spaces, Lemma 56.18 .2 applied to the displayed arrow. Case III: $h(\operatorname{Spec}(K))$ is not in $T$ but $h$ maps the closed point of $\operatorname{Spec}(R)$ into $T$. In this case the corresponding morphism

$$
g_{/ T}: \operatorname{Spf}(R) \longrightarrow Y_{/ T}=W
$$

is an adic morphism (detail omitted). Hence our assumption that $W \rightarrow X_{/ T}$ be rig-surjective implies we can lift $g_{/ T}$ to a morphism $e: \operatorname{Spf}\left(R^{\prime}\right) \rightarrow W=Y_{/ T}$
for some extension of complete discrete valuation rings $R \subset R^{\prime}$. Algebraizing the composition $\operatorname{Spf}\left(R^{\prime}\right) \rightarrow Y$ using Formal Spaces, Lemma 70.24 .3 we find a morphism $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow Y$ lifing $g$. By the discussion in Cohomology of Spaces, Remark 56.18.3 this is sufficient to conclude that $Y \rightarrow X$ is proper.

### 71.13. Application to modifications

0AS1 Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. We set $S=\operatorname{Spec}(A)$ and $U=S \backslash V(I)$. In this section we will consider the category

0AS2 (71.13.0.1)

$$
\left\{\begin{array}{l|c}
f: X \longrightarrow S & \begin{array}{c}
X \text { is an algebraic space } \\
f \text { is locally of finite type } \\
f^{-1}(U) \rightarrow U \text { is an isomorphism }
\end{array}
\end{array}\right\}
$$

A morphism from $X / S$ to $X^{\prime} / S$ will be a morphism of algebraic spaces $X \rightarrow X^{\prime}$ compatible with the structure morphisms over $S$.
Let $A \rightarrow B$ be a homomorphism of Noetherian rings and let $J \subset B$ be an ideal such that $J=\sqrt{I B}$. Then base change along the morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ gives a functor from the category 71.13 .0 .1 for $A$ to the category 71.13 .0 .1 for $B$.

0AE5 Lemma 71.13.1. Let $(A, I)$ be a pair consisting of a Noetherian ring and an ideal $I$. Let $A^{\wedge}$ be the $I$-adic completion of $A$. Then base change defines an equivalence of categories between the category (71.13.0.1) for $A$ with the category (71.13.0.1) for the completion $A^{\wedge}$.

Proof. Set $S=\operatorname{Spec}(A)$ as in 71.13.0.1 and $T=V(I)$. Similarly, write $S^{\prime}=$ $\operatorname{Spec}\left(A^{\wedge}\right)$ and $T^{\prime}=V\left(I A^{\wedge}\right)$. The morphism $S^{\prime} \rightarrow S$ defines an isomorphism $S_{/^{\prime}}^{\prime} \rightarrow$ $S_{/ T}$ of formal completions. Let $\mathcal{C}_{S, T}, \mathcal{C}_{S_{/ T}}, \mathcal{C}_{S_{/ T^{\prime}}^{\prime}}$, and $\mathcal{C}_{S^{\prime}, T^{\prime}}$ be the corresponding categories as used in 71.12.3.1). By Theorem 71.12 .9 (in fact we only need the affine case treated in Lemma 71.12 .8 ) we see that

$$
\mathcal{C}_{S, T}=\mathcal{C}_{S_{/ T}}=\mathcal{C}_{S^{\prime} / T^{\prime}}=\mathcal{C}_{S^{\prime}, T^{\prime}}
$$

Since $\mathcal{C}_{S, T}$ is the category 71.13.0.1 for $A$ and $\mathcal{C}_{S^{\prime}, T^{\prime}}$ the category 71.13.0.1 for $A^{\wedge}$ this proves the lemma.
0BH5 Lemma 71.13.2. Notation and assumptions as in Lemma 71.13.1. Let $f: X \rightarrow$ $\operatorname{Spec}(A)$ correspond to $g: Y \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ via the equivalence. Then $f$ is quasicompact, quasi-separated, separated, proper, finite, and add more here if and only if $g$ is so.
Proof. You can deduce this for the statements quasi-compact, quasi-separated, separated, and proper by using Lemmas 71.12.10 71.12.11, 71.12.12, 71.12.11, and 71.12 .13 to translate the corresponding property into a property of the formal completion and using the argument of the proof of Lemma 71.13.1. However, there is a direct argument using fpqc descent as follows. First, note that $\left\{U \rightarrow \operatorname{Spec}(A), \operatorname{Spec}\left(A^{\wedge}\right) \rightarrow \operatorname{Spec}(A)\right\}$ is an fpqc covering with $U=\operatorname{Spec}(A) \backslash V(I)$ as before. The base change of $f$ by $U \rightarrow \operatorname{Spec}(A)$ is $\operatorname{id}_{U}$ by definition of our category 71.13.0.1. Let $P$ be a property of morphisms of algebraic spaces which is fpqc local on the base (Descent on Spaces, Definition 61.9.1) such that $P$ holds for identity morphisms. Then we see that $P$ holds for $f$ if and only if $P$ holds for $g$. This applies to $P$ equal to quasi-compact, quasi-separated, separated, proper,
and finite by Descent on Spaces, Lemmas 61.10.1, 61.10.2, 61.10.16, 61.10.17, and 61.10 .21 .

0AF7 Lemma 71.13.3. Let $A \rightarrow B$ be a local map of local Noetherian rings such that
(1) $A \rightarrow B$ is flat,
(2) $\mathfrak{m}_{B}=\mathfrak{m}_{A} B$, and
(3) $\kappa\left(\mathfrak{m}_{A}\right)=\kappa\left(\mathfrak{m}_{B}\right)$
(equivalently, $A \rightarrow B$ induces an isomorphism on completions, see More on Algebra, Lemma 15.34.7). Then the base change functor from the category 71.13.0.1) for $\left(A, \mathfrak{m}_{A}\right)$ to the category 71.13.0.1) for $\left(B, \mathfrak{m}_{B}\right)$ is an equivalence.

Proof. This follows immediately from Lemma 71.13.1.
0AE6 Lemma 71.13.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $f: X \rightarrow S$ be an object of (71.13.0.1). Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ which dominates $X$.

Proof. Special case of More on Morphisms of Spaces, Lemma 63.29.4.

## CHAPTER 72

## Resolution of Surfaces Revisited

0BH6

### 72.1. Introduction

0BH7 This chapter discusses resolution of singularities of Noetherian algebraic spaces of dimension 2. We have already discussed resolution of surfaces for schemes following Lipman Lip78 in an earlier chapter. See Resolution of Surfaces, Section 47.1. Most of the results in this chapter are straightforward consequences of the results on schemes.

Unless specifically mentioned otherwise all geometric objects in this chapter will be algebraic spaces. Thus if we say "let $f: X \rightarrow Y$ be a modification" then this means that $f$ is a morphism as in Spaces over Fields, Definition 59.5.1. Similarly for proper morphism, etc, etc.

### 72.2. Modifications

0BH8 Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. We set $S=\operatorname{Spec}(A)$ and $U=S \backslash\{\mathfrak{m}\}$. In this section we will consider the category

0AE2 (72.2.0.1)

$$
\left\{\begin{array}{l|c}
f: X \longrightarrow S & \begin{array}{c}
X \text { is an algebraic space } \\
f \text { is a proper morphism } \\
f^{-1}(U) \rightarrow U \text { is an isomorphism }
\end{array}
\end{array}\right\}
$$

A morphism from $X / S$ to $X^{\prime} / S$ will be a morphism of algebraic spaces $X \rightarrow$ $X^{\prime}$ compatible with the structure morphisms over $S$. In Restricted Power Series, Section 71.13 we have seen that this category only depends on the completion of $A$ and we have proven some elementary properties of objects in this category. In this section we specifically study cases where $\operatorname{dim}(A) \leq 2$ or where the dimension of the closed fibre is at most 1.

0AE3 Lemma 72.2.1. Let $(A, \mathfrak{m}, \kappa)$ be a 2-dimensional Noetherian local domain such that $U=\operatorname{Spec}(A) \backslash\{\mathfrak{m}\}$ is a normal scheme. Then any modification $f: X \rightarrow$ $\operatorname{Spec}(A)$ is a morphism as in 72.2.0.1.
Proof. Let $f: X \rightarrow S$ be a modification. We have to show that $f^{-1}(U) \rightarrow U$ is an isomorphism. Since every closed point $u$ of $U$ has codimension 1, this follows from Spaces over Fields, Lemma 59.3.3

0AGM Lemma 72.2.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $g: X \rightarrow Y$ be $a$ morphism in the category 72.2.0.1). If the induced morphism $X_{\kappa} \rightarrow Y_{\kappa}$ of special fibres is a closed immersion, then $g$ is a closed immersion.

Proof. This is a special case of More on Morphisms of Spaces, Lemma 63.38.3.

0AE7 Lemma 72.2.3. Let $(A, \mathfrak{m}, \kappa)$ be a complete Noetherian local ring. Let $X$ be an algebraic space over $\operatorname{Spec}(A)$. If $X \rightarrow \operatorname{Spec}(A)$ is proper and $\operatorname{dim}\left(X_{\kappa}\right) \leq 1$, then $X$ is a scheme projective over $A$.

Proof. By Spaces over Fields, Lemma 59.6 .3 the algebraic space $X_{\kappa}$ is a scheme. Hence $X_{\kappa}$ is a proper scheme of dimension $\leq 1$ over $\kappa$. By Varieties, Lemma 32.32.4 we see that $X_{\kappa}$ is H-projective over $\kappa$. Let $\mathcal{L}$ be an ample invertible sheaf on $X_{\kappa}$.

We are going to show that $\mathcal{L}$ lifts to a compatible system $\left\{\mathcal{L}_{n}\right\}$ of invertible sheaves on the $n$th infinitesimal neighbourhoods

$$
X_{n}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A / \mathfrak{m}^{n}\right)
$$

of $X_{\kappa}=X_{1}$. Recall that the étale sites of $X_{\kappa}$ and all $X_{n}$ are canonically equivalent, see More on Morphisms of Spaces, Lemma 63.9.6. In the rest of the proof we do not distinguish between sheaves on $X_{n}$ and sheaves on $X_{m}$ or $X_{\kappa}$. Suppose, given a lift $\mathcal{L}_{n}$ to $X_{n}$. We consider the exact sequence

$$
1 \rightarrow\left(1+\mathfrak{m}^{n} \mathcal{O}_{X} / \mathfrak{m}^{n+1} \mathcal{O}_{X}\right)^{*} \rightarrow \mathcal{O}_{X_{n+1}}^{*} \rightarrow \mathcal{O}_{X_{n}}^{*} \rightarrow 1
$$

of sheaves on $X_{n+1}$. We have $\left(1+\mathfrak{m}^{n} \mathcal{O}_{X} / \mathfrak{m}^{n+1} \mathcal{O}_{X}\right)^{*} \cong \mathfrak{m}^{n} \mathcal{O}_{X} / \mathfrak{m}^{n+1} \mathcal{O}_{X}$ as abelian sheaves on $X_{n+1}$. The class of $\mathcal{L}_{n}$ in $H^{1}\left(X_{n}, \mathcal{O}_{X_{n}}^{*}\right)$ (see Cohomology on Sites, Lemma 21.7.1 can be lifted to an element of $H^{1}\left(X_{n+1}, \mathcal{O}_{X_{n+1}}^{*}\right)$ if and only if the obstruction in $H^{2}\left(X_{n+1}, \mathfrak{m}^{n} \mathcal{O}_{X} / \mathfrak{m}^{n+1} \mathcal{O}_{X}\right)$ is zero. Note that $\mathfrak{m}^{n} \mathcal{O}_{X} / \mathfrak{m}^{n+1} \mathcal{O}_{X}$ is a quasi-coherent $\mathcal{O}_{X_{\kappa}}$-module on $X_{\kappa}$. Hence its étale cohomology agrees with its cohomology on the scheme $X_{\kappa}$, see Descent, Proposition 34.7.10. However, as $X_{\kappa}$ is a Noetherian scheme of dimension $\leq 1$ this cohomology group vanishes (Cohomology, Proposition 20.21.6).
By Grothendieck's algebraization theorem (Cohomology of Schemes, Theorem 29.24.4) we find a projective morphism of schemes $Y \rightarrow \operatorname{Spec}(A)$ and a compatible system of isomorphisms $X_{n} \rightarrow Y_{n}$. Here we use the assumption that $A$ is complete. By More on Morphisms of Spaces, Lemma 63.33.3 we see that $X \cong Y$ and the proof is complete.

0AYJ Lemma 72.2.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local domain of dimension $\geq 1$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a morphism of algebraic spaces. Assume at least one of the following conditions is satisfied
(1) $f$ is a modification (Spaces over Fields, Definition 59.5.1),
(2) $f$ is an alteration (Spaces over Fields, Definition 59.5.3),
(3) $f$ is locally of finite type, quasi-separated, $X$ is integral, and there is exactly one point of $|X|$ mapping to the generic point of $\operatorname{Spec}(A)$,
(4) $f$ is locally of finite type, $X$ is decent, and the points of $|X|$ mapping to the generic point of $\operatorname{Spec}(A)$ are the generic points of irreducible components of $|X|$,
(5) add more here.

Then $\operatorname{dim}\left(X_{\kappa}\right) \leq \operatorname{dim}(A)-1$.
Proof. Cases (1), (2), and (3) are special cases of (4). Choose an affine scheme $U=\operatorname{Spec}(B)$ and an étale morphism $U \rightarrow X$. The ring map $A \rightarrow B$ is of finite type. We have to show that $\operatorname{dim}\left(U_{\kappa}\right) \leq \operatorname{dim}(A)-1$. Since $X$ is decent, the generic points of irreducible components of $U$ are the points lying over generic points of irreducible components of $|X|$, see Decent Spaces, Lemma 55.18.1. Hence the fibre
of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ over (0) is the (finite) set of minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ of $B$. Thus $A_{f} \rightarrow B_{f}$ is finite for some nonzero $f \in A$ (Algebra, Lemma 10.121.9). We conclude the field extensions $f . f .(A) \subset \kappa\left(\mathfrak{q}_{i}\right)$ are finite. Let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{m}$. Then

$$
\operatorname{dim}\left(B_{\mathfrak{q}}\right)=\max \operatorname{dim}\left(\left(B / \mathfrak{q}_{i}\right)_{\mathfrak{q}}\right) \leq \operatorname{dim}(A)
$$

the inequality by the dimension formula for $A \subset B / \mathfrak{q}_{i}$, see Algebra, Lemma 10.112.1. However, the dimension of $B_{\mathfrak{q}} / \mathfrak{m} B_{\mathfrak{q}}$ (which is the local ring of $U_{\kappa}$ at the corresponding point) is at least one less because the minimal primes $\mathfrak{q}_{i}$ are not in $V(\mathfrak{m})$. We conclude by Properties, Lemma 27.10.2.

0AGN Lemma 72.2.5. If $(A, \mathfrak{m}, \kappa)$ is a complete Noetherian local domain of dimension 2 , then every modification of $\operatorname{Spec}(A)$ is projective over $A$.

Proof. By Lemma 72.2 .3 it suffices to show that the special fibre of any modification $X$ of $\operatorname{Spec}(A)$ has dimension $\leq 1$. This follows from Lemma 72.2.4.

### 72.3. Strategy

0BH9 Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x_{1}, \ldots, x_{n} \in$ $|X|$ be pairwise distinct closed points. For each $i$ we pick an elementary étale neighbourhood $\left(U_{i}, u_{i}\right) \rightarrow\left(X, x_{i}\right)$ as in Decent Spaces, Lemma 55.10.2. This means that $U_{i}$ is an affine scheme, $U_{i} \rightarrow X$ is étale, $u_{i}$ is the unique point of $U_{i}$ lying over $x_{i}$, and $\operatorname{Spec}\left(\kappa\left(u_{i}\right)\right) \rightarrow X$ is a monomorphism representing $x_{i}$. After shrinking $U_{i}$ we may and do assume that for $j \neq i$ there does not exist a point of $U_{i}$ mapping to $x_{j}$. Observe that $u_{i} \in U_{i}$ is a closed point.
Denote $\mathcal{C}_{X,\left\{x_{1}, \ldots, x_{n}\right\}}$ the category of morphisms of algebraic spaces $f: Y \rightarrow X$ which induce an isomorphism $f^{-1}\left(X \backslash\left\{x_{1}, \ldots, x_{n}\right\}\right) \rightarrow X \backslash\left\{x_{1}, \ldots, x_{n}\right\}$. For each $i$ denote $\mathcal{C}_{U_{i}, u_{i}}$ the category of morphisms of algebraic spaces $g_{i}: Y_{i} \rightarrow U_{i}$ which induce an isomorphism $g_{i}^{-1}\left(U_{i} \backslash\left\{u_{i}\right\}\right) \rightarrow U_{i} \backslash\left\{u_{i}\right\}$. Base change defines an functor

0BHA (72.3.0.1)

$$
F: \mathcal{C}_{X,\left\{x_{1}, \ldots, x_{n}\right\}} \longrightarrow \mathcal{C}_{U_{1}, u_{1}} \times \ldots \times \mathcal{C}_{U_{n}, u_{n}}
$$

To reduce at least some of the problems in this chapter to the case of schemes we have the following lemma.

0BHB Lemma 72.3.1. The functor $F$ 72.3.0.1 is an equivalence.
Proof. For $n=1$ this is Limits of Spaces, Lemma 57.18.1. For $n>1$ the lemma can be proved in exactly the same way or it can be deduced from it. For example, suppose that $g_{i}: Y_{i} \rightarrow U_{i}$ are objects of $\mathcal{C}_{U_{i}, u_{i}}$. Then by the case $n=1$ we can find $f_{i}^{\prime}: Y_{i}^{\prime} \rightarrow X$ which are isomorphisms over $X \backslash\left\{x_{i}\right\}$ and whose base change to $U_{i}$ is $f_{i}$. Then we can set

$$
f: Y=Y_{1}^{\prime} \times_{X} \ldots \times_{X} Y_{n}^{\prime} \rightarrow X
$$

This is an object of $\mathcal{C}_{X,\left\{x_{1}, \ldots, x_{n}\right\}}$ whose base change by $U_{i} \rightarrow X$ recovers $g_{i}$. Thus the functor is essentially surjective. We omit the proof of fully faithfulness.

0BHC Lemma 72.3.2. Let $X, x_{i}, U_{i} \rightarrow X, u_{i}$ be as in 72.3.0.1). If $f: Y \rightarrow X$ corresponds to $g_{i}: Y_{i} \rightarrow U_{i}$ under $F$, then $f$ is quasi-compact, quasi-separated, separated, locally of finite presentation, of finite presentation, locally of finite type, of finite type, proper, integral, finite, if and only if $g_{i}$ is so for $i=1, \ldots, n$.

Proof. Follows from Limits of Spaces, Lemma 57.18.2

0BHD Lemma 72.3.3. Let $X, x_{i}, U_{i} \rightarrow X, u_{i}$ be as in 72.3.0.1. If $f: Y \rightarrow X$ corresponds to $g_{i}: Y_{i} \rightarrow U_{i}$ under $F$, then $Y_{x_{i}} \cong\left(Y_{i}\right)_{u_{i}}$ as algebraic spaces.
Proof. This is clear because $u_{i} \rightarrow x_{i}$ is an isomorphism.

### 72.4. Dominating by quadratic transformations

0AHG We define the blow up of a space at a point only if $X$ is decent.
0BHE Definition 72.4.1. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x \in|X|$ be a closed point. By Decent Spaces, Lemma 55.12.6 we can represent $x$ by a closed immersion $i: \operatorname{Spec}(k) \rightarrow X$. The blowing up $X^{\prime} \rightarrow X$ of $X$ at $x$ means the blowing up of $X$ in the closed subspace $Z=i(\operatorname{Spec}(k)) \subset X$.

In this generality the blowing up of $X$ at $x$ is not necessarily proper. However, if $X$ is locally Noetherian, then it follows from Divisors on Spaces, Lemma 58.6.11 that the blowing up is proper. Recall that a locally Noetherian algebraic space is Noetherian if and only if it is quasi-compact and quasi-separated. Moreover, for a locally Noetherian algebraic space, being quasi-separated is equivalent to being decent (Decent Spaces, Lemma 55.12.1).
0BHF Lemma 72.4.2. Let $X, x_{i}, U_{i} \rightarrow X, u_{i}$ be as in 72.3.0.1) and assume $f: Y \rightarrow X$ corresponds to $g_{i}: Y_{i} \rightarrow U_{i}$ under $F$. Then there exists a factorization

$$
Y=Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow Z_{0}=X
$$

of $f$ where $Z_{j+1} \rightarrow Z_{j}$ is the blowing up of $Z_{j}$ at a closed point $z_{j}$ lying over $\left\{x_{1}, \ldots, x_{n}\right\}$ if and only if for each $i$ there exists a factorization

$$
Y_{i}=Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=U_{i}
$$

of $g_{i}$ where $Z_{i, j+1} \rightarrow Z_{i, j}$ is the blowing up of $Z_{i, j}$ at a closed point $z_{i, j}$ lying over $u_{i}$.

Proof. A blowing up is a representable morphism. Hence in either case we inductively see that $Z_{j} \rightarrow X$ or $Z_{i, j} \rightarrow U_{i}$ is representable. Whence each $Z_{j}$ or $Z_{i, j}$ is a decent algebraic space by Decent Spaces, Lemma 55.6.5. This shows that the assertions make sense (since blowing up is only defined for decent spaces). To prove the equivalence, let's start with a sequence of blowups $Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow$ $Z_{0}=X$. The first morphism $Z_{1} \rightarrow X$ is given by blowing up one of the $x_{i}$, say $x_{1}$. Applying $F$ to $Z_{1} \rightarrow X$ we find a blow up $Z_{1,1} \rightarrow U_{1}$ at $u_{1}$ is the blowing up at $u_{1}$ and otherwise $Z_{i, 0}=U_{i}$ for $i>1$. In the next step, we either blow up one of the $x_{i}, i \geq 2$ on $Z_{1}$ or we pick a closed point $z_{1}$ of the fibre of $Z_{1} \rightarrow X$ over $x_{1}$. In the first case it is clear what to do and in the second case we use that $\left(Z_{1}\right)_{x_{1}} \cong\left(Z_{1,1}\right)_{u_{1}}$ (Lemma 72.3.3) to get a closed point $z_{1,1} \in Z_{1,1}$ corresponding to $z_{1}$. Then we set $Z_{1,2} \rightarrow Z_{1,1}$ equal to the blowing up in $z_{1,1}$. Continuing in this manner we construct the factorizations of each $g_{i}$.
Conversely, given sequences of blowups $Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=U_{i}$ we construct the sequence of blowing ups of $X$ in exactly the same manner.

0BHG Lemma 72.4.3. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $T \subset|X|$ be a finite set of closed points $x$ such that (1) $X$ is regular at $x$ and (2) the local ring of $X$ at $x$ has dimension 2. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals such that $\mathcal{O}_{X} / \mathcal{I}$ is supported on $T$. Then there exists a sequence

$$
X_{m} \rightarrow X_{m-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{j+1} \rightarrow X_{j}$ is the blowing up of $X_{j}$ at a closed point $x_{j}$ lying above a point of $T$ such that $\mathcal{I} \mathcal{O}_{X_{n}}$ is an invertible ideal sheaf.
Proof. Say $T=\left\{x_{1}, \ldots, x_{r}\right\}$. Pick elementary étale neighbourhoods $\left(U_{i}, u_{i}\right) \rightarrow$ $\left(X, x_{i}\right)$ as in Section 72.3. For each $i$ the restriction $\mathcal{I}_{i}=\left.\mathcal{I}\right|_{U_{i}} \subset \mathcal{O}_{U_{i}}$ is a quasicoherent sheaf of ideals supported at $u_{i}$. The local ring of $U_{i}$ at $u_{i}$ is regular and has dimension 2. Thus we may apply Resolution of Surfaces, Lemma 47.4.1 to find a sequence

$$
X_{i, m_{i}} \rightarrow X_{i, m_{i}-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{i, 0}=U_{i}
$$

of blowing ups in closed points lying over $u_{i}$ such that $\mathcal{I}_{i} \mathcal{O}_{X_{i, m_{i}}}$ is invertible. By Lemma 72.4.2 we find a sequence of blowing ups

$$
X_{m} \rightarrow X_{m-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

as in the statement of the lemma whose base change to our $U_{i}$ produces the given sequences. It follows that $\mathcal{I} \mathcal{O}_{X_{n}}$ is an invertible ideal sheaf. Namely, we know this is true over $X \backslash\left\{x_{1}, \ldots, x_{n}\right\}$ and in an étale neighbourhood of the fibre of each $x_{i}$ it is true by construction.

0BHH Lemma 72.4.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $T \subset|X|$ be a finite set of closed points $x$ such that (1) $X$ is regular at $x$ and (2) the local ring of $X$ at $x$ has dimension 2. Let $f: Y \rightarrow X$ be a proper morphism of algebraic spaces which is an isomorphism over $U=X \backslash T$. Then there exists $a$ sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{i+1} \rightarrow X_{i}$ is the blowing up of $X_{i}$ at a closed point $x_{i}$ lying above a point of $T$ and a factorization $X_{n} \rightarrow Y \rightarrow X$ of the composition.

Proof. By More on Morphisms of Spaces, Lemma 63.29.4 there exists a $U$-admissible blowup $X^{\prime} \rightarrow X$ which dominates $Y \rightarrow X$. Hence we may assume there exists an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{X}$ such that $\mathcal{O}_{X} / \mathcal{I}$ is supported on $T$ and such that $Y$ is the blowing up of $X$ in $\mathcal{I}$. By Lemma 72.4 .3 there exists a sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{i+1} \rightarrow X_{i}$ is the blowing up of $X_{i}$ at a closed point $x_{i}$ lying above a point of $T$ such that $\mathcal{I} \mathcal{O}_{X_{n}}$ is an invertible ideal sheaf. By the universal property of blowing up (Divisors on Spaces, Lemma 58.6.5) we find the desired factorization.

### 72.5. Dominating by normalized blowups

0BHI In this section we prove that a modification of a surface can be dominated by a sequence of normalized blowups in poins.

0BHJ Definition 72.5.1. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$ satisfying the equivalent conditions of Morphisms of Spaces, Lemma 54.46.1. Let $x \in|X|$ be a closed point. The normalized blowup of $X$ at $x$ is the composition $X^{\prime \prime} \rightarrow X^{\prime} \rightarrow X$ where $X^{\prime} \rightarrow X$ is the blowup of $X$ at $x$ (Definition 72.4.1) and $X^{\prime \prime} \rightarrow X^{\prime}$ is the normalization of $X^{\prime}$.
Here the normalization $X^{\prime \prime} \rightarrow X^{\prime}$ is defined as the algebraic space $X^{\prime}$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 54.46.1 by Divisors on Spaces, Lemma 58.6.8. See Morphisms of Spaces, Definition 54.46 .3 for the definition of the normalization.

In general the normalized blowing up need not be proper even when $X$ is Noetherian. Recall that an algebraic space is Nagata if it has an étale covering by affines which are spectra of Nagata rings (Properties of Spaces, Definition 53.7.2 and Remark 53.7.3 and Properties, Definition 27.13.1.
0BHK Lemma 72.5.2. In Definition 72.5.1 if $X$ is Nagata, then the normalized blowing up of $X$ at $x$ is a normal Nagata algebraic space proper over $X$.
Proof. The blowup morphism $X^{\prime} \rightarrow X$ is proper (as $X$ is locally Noetherian we may apply Divisors on Spaces, Lemma 58.6.11). Thus $X^{\prime}$ is Nagata (Morphisms of Spaces, Lemma 54.26.1). Therefore the normalization $X^{\prime \prime} \rightarrow X^{\prime}$ is finite (Morphisms of Spaces, Lemma 54.46 .6 ) and we conclude that $X^{\prime \prime} \rightarrow X$ is proper as well (Morphisms of Spaces, Lemmas 54.43.9 and 54.39.4). It follows that the normalized blowing up is a normal (Morphisms of Spaces, Lemma 54.46.5) Nagata algebraic space.

Here is the analogue of Lemma 72.4 .2 for normalized blowups.
0BHL Lemma 72.5.3. Let $X, x_{i}, U_{i} \rightarrow X, u_{i}$ be as in 72.3.0.1) and assume $f: Y \rightarrow X$ corresponds to $g_{i}: Y_{i} \rightarrow U_{i}$ under $F$. Assume $X$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 54.46.1. Then there exists a factorization

$$
Y=Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow Z_{0}=X
$$

of $f$ where $Z_{j+1} \rightarrow Z_{j}$ is the normalized blowing up of $Z_{j}$ at a closed point $z_{j}$ lying over $\left\{x_{1}, \ldots, x_{n}\right\}$ if and only if for each $i$ there exists a factorization

$$
Y_{i}=Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=U_{i}
$$

of $g_{i}$ where $Z_{i, j+1} \rightarrow Z_{i, j}$ is the normalized blowing up of $Z_{i, j}$ at a closed point $z_{i, j}$ lying over $u_{i}$.

Proof. This follows by the exact same argument as used to prove Lemma 72.4.2.

A Nagata algebraic space is locally Noetherian.
0BHM Lemma 72.5.4. Let $S$ be a scheme. Let $X$ be a Noetherian Nagata algebraic space over $S$ with $\operatorname{dim}(X)=2$. Let $f: Y \rightarrow X$ be a proper birational morphism. Then there exists a commutative diagram

where $X_{0} \rightarrow X$ is the normalization and where $X_{i+1} \rightarrow X_{i}$ is the normalized blowing up of $X_{i}$ at a closed point.

Proof. Although one can prove this lemma directly for algebraic spaces, we will continue the approach used above to reduce it to the case of schemes.

We will use that Noetherian algebraic spaces are quasi-separated and hence points have well defined residue fields (for example by Decent Spaces, Lemma 55.10.2). We will use the results of Morphisms of Spaces, Sections 54.26, 54.34, and 54.46 without further mention. We may replace $Y$ by its normalization. Let $X_{0} \rightarrow X$
be the normalization. The morphism $Y \rightarrow X$ factors through $X_{0}$. Thus we may assume that both $X$ and $Y$ are normal.
Assume $X$ and $Y$ are normal. The morphism $f: Y \rightarrow X$ is an isomorphism over an open which contains every point of codimension 0 and 1 in $Y$ and every point of $Y$ over which the fibre is finite, see Spaces over Fields, Lemma 59.3.3. Hence we see that there is a finite set of closed points $T \subset|X|$ such that $f$ is an isomorphism over $X \backslash T$. By More on Morphisms of Spaces, Lemma 63.29.4 there exists an $X \backslash T$-admissible blowup $Y^{\prime} \rightarrow X$ which dominates $Y$. After replacing $Y$ by the normalization of $Y^{\prime}$ we see that we may assume that $Y \rightarrow X$ is representable.
Say $T=\left\{x_{1}, \ldots, x_{r}\right\}$. Pick elementary étale neighbourhoods $\left(U_{i}, u_{i}\right) \rightarrow\left(X, x_{i}\right)$ as in Section 72.3. For each $i$ the morphism $Y_{i}=Y \times_{X} U_{i} \rightarrow U_{i}$ is a proper birational morphism which is an isomorphism over $U_{i} \backslash\left\{u_{i}\right\}$. Thus we may apply Resolution of Surfaces, Lemma 47.5.3 to find a sequence

$$
X_{i, m_{i}} \rightarrow X_{i, m_{i}-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{i, 0}=U_{i}
$$

of normalized blowing ups in closed points lying over $u_{i}$ such that $X_{i, m_{i}}$ dominates $Y_{i}$. By Lemma 72.5.3 we find a sequence of normalized blowing ups

$$
X_{m} \rightarrow X_{m-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

as in the statement of the lemma whose base change to our $U_{i}$ produces the given sequences. It follows that $X_{m}$ dominates $Y$ by the equivalence of categories of Lemma 72.3.1.

### 72.6. Base change to the completion

0BHN The following simple lemma will turn out to be a useful tool in what follows.
0BHP Lemma 72.6.1. Let $(A, \mathfrak{m}, \kappa)$ be a local ring with finitely generated maximal ideal $\mathfrak{m}$. Let $X$ be a decent algebraic space over $A$. Let $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ where $A^{\wedge}$ is the $\mathfrak{m}$-adic completion of $A$. For a point $q \in|Y|$ with image $p \in|X|$ lying over the closed point of $\operatorname{Spec}(A)$ the map $\mathcal{O}_{X, p}^{h} \rightarrow \mathcal{O}_{Y, q}^{h}$ of henselian local rings induces an isomorphism on completions.

Proof. This follows immediately from the case of schemes by choosing an elementary étale neighbourhood $(U, u) \rightarrow(X, p)$ as in Decent Spaces, Lemma 55.10.2, setting $V=U \times_{X} Y=U \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ and $v=(u, q)$. The case of schemes is Resolution of Surfaces, Lemma 47.11.1.
0BHQ Lemma 72.6.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $X \rightarrow \operatorname{Spec}(A)$ be a morphism which is locally of finite type with $X$ a decent algebraic space. Set $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$. Let $y \in|Y|$ with image $x \in|X|$. Then
(1) if $\mathcal{O}_{Y, y}^{h}$ is regular, then $\mathcal{O}_{X, x}^{h}$ is regular,
(2) if $y$ is in the closed fibre, then $\mathcal{O}_{Y, y}^{h}$ is regular $\Leftrightarrow \mathcal{O}_{X, x}^{h}$ is regular, and
(3) If $X$ is proper over $A$, then $X$ is regular if and only if $Y$ is regular.

Proof. By étale localization the first two statements follow immediately from the counter part to this lemma for schemes, see Resolution of Surfaces, Lemma 47.11.2, For part (3), since $Y \rightarrow X$ is surjective (as $A \rightarrow A^{\wedge}$ is faithfully flat) we see that $Y$ regular implies $X$ regular by part (1). Conversely, if $X$ is regular, then the henselian local rings of $Y$ are regular for all points of the special fibre. Let $y \in|Y|$ be a general point. Since $|Y| \rightarrow\left|\operatorname{Spec}\left(A^{\wedge}\right)\right|$ is closed in the proper case, we can
find a specialization $y \rightsquigarrow y_{0}$ with $y_{0}$ in the closed fibre. Choose an elementary étale neighbourhood $\left(V, v_{0}\right) \rightarrow\left(Y, y_{0}\right)$ as in Decent Spaces, Lemma 55.10.2. Since $Y$ is decent we can lift $y \rightsquigarrow y_{0}$ to a specialization $v \rightsquigarrow v_{0}$ in $V$ (Decent Spaces, Lemma 55.10.7). Then we conclude that $\mathcal{O}_{V, v}$ is a localization of $\mathcal{O}_{V, v_{0}}$ hence regular and the proof is complete.

0BHR Lemma 72.6.3. Let $(A, \mathfrak{m})$ be a local Noetherian ring. Let $X$ be an algebraic space over A. Assume
(1) $A$ is analytically unramified (Algebra, Definition 10.154.9),
(2) $X$ is locally of finite type over $A$,
(3) $X \rightarrow \operatorname{Spec}(A)$ is étale at every point of codimension 0 in $X$.

Then the normalization of $X$ is finite over $X$.
Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Then $U \rightarrow \operatorname{Spec}(A)$ satisfies the assumptions and hence the conclusions of Resolution of Surfaces, Lemma 47.11.5.

### 72.7. Implied properties

0BHS In this section we prove that for a Noetherian integral algebraic space the existence of a regular alteration has quite a few consequences. This section should be skipped by those not interested in "bad" Noetherian algebraic spaces.

0BHT Lemma 72.7.1. Let $S$ be a scheme. Let $Y$ be a Noetherian integral algebraic space over $S$. Assume there exists an alteration $f: X \rightarrow Y$ with $X$ regular. Then the normalization $Y^{\nu} \rightarrow Y$ is finite and $Y$ has a dense open which is regular.

Proof. By étale localization, it suffices to prove this when $Y=\operatorname{Spec}(A)$ where $A$ is a Noetherian domain. Let $B$ be the integral closure of $A$ in its fraction field. Set $C=\Gamma\left(X, \mathcal{O}_{X}\right)$. By Cohomology of Spaces, Lemma 56.19.2 we see that $C$ is a finite $A$-module. As $X$ is normal (Properties of Spaces, Lemma 53.24.4) we see that $C$ is normal domain (Spaces over Fields, Lemma 59.4.6). Thus $B \subset C$ and we conclude that $B$ is finite over $A$ as $A$ is Noetherian.

There exists a nonempty open $V \subset Y$ such that $f^{-1} V \rightarrow V$ is finite, see Spaces over Fields, Definition 59.5.3. After shrinking $V$ we may assume that $f^{-1} V \rightarrow V$ is flat (Morphisms of Spaces, Proposition 54.31.1). Thus $f^{-1} V \rightarrow V$ is faithfully flat. Then $V$ is regular by Algebra, Lemma 10.156.4.

0BHU Lemma 72.7.2. Let $(A, \mathfrak{m}, \kappa)$ be a local Noetherian domain. Assume there exists an alteration $f: X \rightarrow \operatorname{Spec}(A)$ with $X$ regular. Then
(1) there exists a nonzero $f \in A$ such that $A_{f}$ is regular,
(2) the integral closure $B$ of $A$ in its fraction field is finite over $A$,
(3) the $\mathfrak{m}$-adic completion of $B$ is a normal ring, i.e., the completions of $B$ at its maximal ideals are normal domains, and
(4) the generic formal formal fibre of $A$ is regular.

Proof. Parts (1) and (2) follow from Lemma 72.7.1. We have to redo part of the proof of that lemma in order to set up notation for the proof of (3). Set $C=\Gamma\left(X, \mathcal{O}_{X}\right)$. By Cohomology of Spaces, Lemma 56.19.2 we see that $C$ is a finite $A$-module. As $X$ is normal (Properties of Spaces, Lemma 53.24.4) we see that $C$ is normal domain (Spaces over Fields, Lemma 59.4.6). Thus $B \subset C$ and we conclude
that $B$ is finite over $A$ as $A$ is Noetherian. By Resolution of Surfaces, Lemma 47.13 .2 in order to prove (3) it suffices to show that the $\mathfrak{m}$-adic completion $C^{\wedge}$ is normal.

By Algebra, Lemma 10.96 .8 the completion $C^{\wedge}$ is the product of the completions of $C$ at the prime ideals of $C$ lying over $\mathfrak{m}$. There are finitely many of these and these are the maximal ideals $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ of $C$. (The corresponding result for $B$ explains the final statement of the lemma.) Thus replacing $A$ by $C_{\mathfrak{m}_{i}}$ and $X$ by $X_{i}=X \times_{\operatorname{Spec}(C)} \operatorname{Spec}\left(C_{\mathfrak{m}_{i}}\right)$ we reduce to the case discussed in the next paragraph. (Note that $\Gamma\left(X_{i}, \mathcal{O}\right)=C_{\mathfrak{m}_{i}}$ by Cohomology of Spaces, Lemma 56.10.1.)

Here $A$ is a Noetherian local normal domain and $f: X \rightarrow \operatorname{Spec}(A)$ is a regular alteration with $\Gamma\left(X, \mathcal{O}_{X}\right)=A$. We have to show that the completion $A^{\wedge}$ of $A$ is a normal domain. By Lemma $72.6 .2 Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ is regular. Since $\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ by Cohomology of Spaces, Lemma 56.10.1. We conclude that $A^{\wedge}$ is normal as before. Namely, $Y$ is normal by Properties of Spaces, Lemma 53.24.4. It is connected because $\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ is local. Hence $Y$ is normal and integral (as connected and normal implies integral for separated algebraic spaces). Thus $\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ is a normal domain by Spaces over Fields, Lemma 59.4.6. This proves (3).

Proof of (4). Let $\eta \in \operatorname{Spec}(A)$ denote the generic point and denote by a subscript $\eta$ the base change to $\eta$. Since $f$ is an alteration, the scheme $X_{\eta}$ is finite and faithfully flat over $\eta$. Since $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ is regular by Lemma 72.6 .2 we see that $Y_{\eta}$ is regular (as a limit of opens in $Y$ ). Then $Y_{\eta} \rightarrow \operatorname{Spec}\left(A^{\wedge} \otimes_{A} f . f .(A)\right)$ is finite faithfully flat onto the generic formal fibre. We conclude by Algebra, Lemma 10.156 .4 .

### 72.8. Resolution

0BHV Here is a definition.
0BHW Definition 72.8.1. Let $S$ be a scheme. Let $Y$ be a Noetherian integral algebraic space over $S$. A resolution of singularities of $X$ is a modification $f: X \rightarrow Y$ such that $X$ is regular.

In the case of surfaces we sometimes want a bit more information.
0BHX Definition 72.8.2. Let $S$ be a scheme. Let $Y$ be a 2-dimensional Noetherian integral algebraic space over $S$. We say $Y$ has a resolution of singularities by normalized blowups if there exists a sequence

$$
Y_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow Y_{0} \rightarrow Y
$$

where
(1) $Y_{i}$ is proper over $Y$ for $i=0, \ldots, n$,
(2) $Y_{0} \rightarrow Y$ is the normalization,
(3) $Y_{i} \rightarrow Y_{i-1}$ is a normalized blowup for $i=1, \ldots, n$, and
(4) $Y_{n}$ is regular.

Observe that condition (1) implies that the normalization $Y_{0}$ of $Y$ is finite over $Y$ and that the normalizations used in the normalized blowing ups are finite as well. We finally come to the main theorem of this chapter.

0BHY Theorem 72.8.3. Let $S$ be a scheme. Let $Y$ be a two dimensional integral Noetherian algebraic space over $S$. The following are equivalent
(1) there exists an alteration $X \rightarrow Y$ with $X$ regular,
(2) there exists a resolution of singularities of $Y$,
(3) $Y$ has a resolution of singularities by normalized blowups,
(4) the normalization $Y^{\nu} \rightarrow Y$ is finite and $Y^{\nu}$ has finitely many singular points $y_{1}, \ldots, y_{m} \in|Y|$ such that the completions of the henselian local rings $\mathcal{O}_{Y^{\nu}, y_{i}}^{h}$ are normal.
Proof. The implications $(3) \Rightarrow(2) \Rightarrow(1)$ are immediate.
Let $X \rightarrow Y$ be an alteration with $X$ regular. Then $Y^{\nu} \rightarrow Y$ is finite by Lemma 72.7.1. Consider the factorization $f: X \rightarrow Y^{\nu}$ from Morphisms of Spaces, Lemma 54.46.5. The morphism $f$ is finite over an open $V \subset Y^{\nu}$ containing every point of codimension $\leq 1$ in $Y^{\nu}$ by Spaces over Fields, Lemma 59.3.2. Then $f$ is flat over $V$ by Algebra, Lemma 10.127.1 and the fact that a normal local ring of dimension $\leq 2$ is Cohen-Macaulay by Serre's criterion (Algebra, Lemma 10.149.4. Then $V$ is regular by Algebra, Lemma 10.156.4. As $Y^{\nu}$ is Noetherian we conclude that $Y^{\nu} \backslash$ $V=\left\{y_{1}, \ldots, y_{m}\right\}$ is finite. For each $i$ let $\mathcal{O}_{Y^{\nu}, y_{i}}^{h}$ be the henselian local ring. Then $X \times_{Y} \operatorname{Spec}\left(\mathcal{O}_{Y^{\nu}, y_{i}}^{h}\right)$ is a regular alteration of $\operatorname{Spec}\left(\mathcal{O}_{Y^{\nu}, y_{i}}^{h}\right)$ (some details omitted). By Lemma 72.7 .2 the completion of $\mathcal{O}_{Y^{\nu}, y_{i}}^{h}$ is normal. In this way we see that (1) $\Rightarrow$ (4).
Assume (4). We have to prove (3). We may immediately replace $Y$ by its normalization. Let $y_{1}, \ldots, y_{m} \in|Y|$ be the singular points. Choose a collection of elementary étale neighbourhoods $\left(V_{i}, v_{i}\right) \rightarrow\left(Y, y_{i}\right)$ as in Section 72.3. For each $i$ the henselian local ring $\mathcal{O}_{Y^{\nu}, y_{i}}^{h}$ is the henselization of $\mathcal{O}_{V_{i}, v_{i}}$. Hence these rings have isomorphic completions. Thus by the result for schemes (Resolution of Surfaces, Theorem 47.14.5 we see that there exist finite sequences of normalized blowups

$$
X_{i, n_{i}} \rightarrow X_{i, n_{i}-1} \rightarrow \ldots \rightarrow V_{i}
$$

blowing up only in points lying over $v_{i}$ such that $X_{i, n_{i}}$ is regular. By Lemma 72.5 .3 there is a sequence of normalized blowing ups

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow Y
$$

and of course $X_{n}$ is regular too (look at the local rings). This completes the proof.

### 72.9. Examples

0AE8 Some examples related to the results earlier in this chapter.
0AE9 Example 72.9.1. Let $k$ be a field. The ring $A=k[x, y, z] /\left(x^{r}+y^{s}+z^{t}\right)$ is a UFD for $r, s, t$ pairwise coprime integers. Namely, since $x^{r}+y^{s}+z^{t}$ is irreducible $A$ is a domain. The element $z$ is a prime element, i.e., generates a prime ideal in $A$. On the other hand, if $r=1+e r s$ for some $e$, then

$$
A[1 / z] \cong k\left[x^{\prime}, y^{\prime}, 1 / z\right]
$$

where $x^{\prime}=x / z^{e s}, y^{\prime}=y / z^{e t}$ and $z=\left(x^{\prime}\right)^{r}+\left(y^{\prime}\right)^{s}$. Thus $A[1 / z]$ is a localization of a polynomial ring and hence a UFD. It follows from an argument of Nagata that $A$ is a UFD. See Algebra, Lemma 10.119.7. A similar argument can be given if $r$ is not congruent to 1 modulo $r s$.

0AEA Example 72.9.2. The ring $A=\mathbf{C}[[x, y, z]] /\left(x^{r}+y^{s}+z^{t}\right)$ is not a UFD when $r<s<t$ are pairwise coprime integers and not equal to $2,3,5$. For example consider the special case $A=\mathbf{C}[[x, y, z]] /\left(x^{2}+y^{5}+z^{7}\right)$. Consider the maps

$$
\psi_{\zeta}: \mathbf{C}[[x, y, z]] /\left(x^{2}+y^{5}+z^{7}\right) \rightarrow \mathbf{C}[[t]]
$$

given by

$$
x \mapsto t^{7}, \quad y \mapsto t^{3}, \quad z \mapsto-\zeta t^{2}(1+t)^{1 / 7}
$$

where $\zeta$ is a 7 th root of unity. The kernel $\mathfrak{p}_{\zeta}$ of $\psi_{\zeta}$ is a height one prime, hence if $A$ is a UFD, then it is principal, say given by $f_{\zeta} \in \mathbf{C}[[x, y, z]]$. Note that $V\left(x^{3}-\right.$ $\left.y^{7}\right)=\bigcup V\left(\mathfrak{p}_{\zeta}\right)$ and $A /\left(x^{3}-y^{7}\right)$ is reduced away from the closed point. Hence, still assuming $A$ is a UFD, we would obtain

$$
\prod_{\zeta} f_{\zeta}=u\left(x^{3}-y^{7}\right)+a\left(x^{2}+y^{5}+z^{7}\right) \quad \text { in } \quad \mathbf{C}[[x, y, z]]
$$

for some unit $u \in \mathbf{C}[[x, y, z]]$ and some element $a \in \mathbf{C}[[x, y, z]]$. After scaling by a constant we may assume $u(0,0,0)=1$. Note that the left hand side vanishes to order 7. Hence $a=-x \bmod \mathfrak{m}^{2}$. But then we get a term $x y^{5}$ on the right hand side which does not occur on the left hand side. A contradiction.

0AEB Example 72.9.3. There exists an excellent 2-dimensional Noetherian local ring and a modification $X \rightarrow S=\operatorname{Spec}(A)$ which is not a scheme. We sketch a construction. Let $X$ be a normal surface over $\mathbf{C}$ with a unique singular point $x \in X$. Assume that there exists a resolution $\pi: X^{\prime} \rightarrow X$ such that the exceptional fibre $C=\pi^{-1}(x)_{\text {red }}$ is a smooth projective curve. Furthermore, assume there exists a point $c \in C$ such that if $\mathcal{O}_{C}(n c)$ is in the image of $\operatorname{Pic}\left(X^{\prime}\right) \rightarrow \operatorname{Pic}(C)$, then $n=0$. Then we let $X^{\prime \prime} \rightarrow X^{\prime}$ be the blowing up in the nonsingular point $c$. Let $C^{\prime} \subset X^{\prime \prime}$ be the strict transform of $C$ and let $E \subset X^{\prime \prime}$ be the exceptional fibre. By Artin's results ( $\mathbf{A r t 7 0}$; use for example Mum61] to see that the normal bundle of $C^{\prime}$ is negative) we can blow down the curve $C^{\prime}$ in $X^{\prime \prime}$ to obtain an algebraic space $X^{\prime \prime \prime}$. Picture

We claim that $X^{\prime \prime \prime}$ is not a scheme. This provides us with our example because $X^{\prime \prime \prime}$ is a scheme if and only if the base change of $X^{\prime \prime \prime}$ to $A=\mathcal{O}_{X, x}$ is a scheme (details omitted). If $X^{\prime \prime \prime}$ where a scheme, then the image of $C^{\prime}$ in $X^{\prime \prime \prime}$ would have an affine neighbourhood. The complement of this neighbourhood would be an effective Cartier divisor on $X^{\prime \prime \prime}$ (because $X^{\prime \prime \prime}$ is nonsingular apart from 1 point). This effective Cartier divisor would correspond to an effective Cartier divisor on $X^{\prime \prime}$ meeting $E$ and avoiding $C^{\prime}$. Taking the image in $X^{\prime}$ we obtain an effective Cartier divisor meeting $C$ (set theoretically) in $c$. This is impossible as no multiple of $c$ is the restriction of a Cartier divisor by assumption.

To finish we have to find such a singular surface $X$. We can just take $X$ to be the affine surface given by

$$
x^{3}+y^{3}+z^{3}+x^{4}+y^{4}+z^{4}=0
$$

in $\mathbf{A}_{\mathbf{C}}^{3}=\operatorname{Spec}(\mathbf{C}[x, y, z])$ and singular point $(0,0,0)$. Then $(0,0,0)$ is the only singular point. Blowing up $X$ in the maximal ideal corresponding to $(0,0,0)$ we find three charts each isomorphic to the smooth affine surface

$$
1+s^{3}+t^{3}+x\left(1+s^{4}+t^{4}\right)=0
$$

which is nonsingular with exceptional divisor $C$ given by $x=0$. The reader will recognize $C$ as an elliptic curve. Finally, the surface $X$ is rational as projection from $(0,0,0)$ shows, or because in the equation for the blow up we can solve for $x$. Finally, the Picard group of a nonsingular rational surface is countable, whereas the Picard group of an elliptic curve over the complex numbers is uncountable. Hence we can find a closed point $c$ as indicated.

## CHAPTER 73

## Formal Deformation Theory

06G7

### 73.1. Introduction

06G8 This chapter develops formal deformation theory in a form applicable later in the stacks project, closely following Rim [GRR72, Exposee VI] and Schlessinger Sch68. We strongly encourage the reader new to this topic to read the paper by Schlessinger first, as it is sufficiently general for most applications, and Schlessinger's results are indeed used in most papers that use this kind of formal deformation theory.

Let $\Lambda$ be a complete Noetherian local ring with residue field $k$, and let $\mathcal{C}_{\Lambda}$ denote the category of Artinian local $\Lambda$-algebras with residue field $k$. Given a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets such that $F(k)$ is a one element set, Schlessinger's paper introduced conditions (H1)-(H4) such that:
(1) $F$ has a "hull" if and only if (H1)-(H3) hold.
(2) $F$ is prorepresentable if and only (H1)-(H4) hold.

The purpose of this chapter is to generalize these results in two ways exactly as is done in Rim's paper:
(A) The functor $F$ is replaced by a category $\mathcal{F}$ cofibered in groupoids over $\mathcal{C}_{\Lambda}$, see Section 73.3
(B) We let $\Lambda$ be a Noetherian ring and $\Lambda \rightarrow k$ a finite ring map to a field. The category $\mathcal{C}_{\Lambda}$ is the category of Artinian local $\Lambda$-algebras $A$ endowed with a given identification $A / \mathfrak{m}_{A}=k$.
The analogue of the condition that $F(k)$ is a one element set is that $\mathcal{F}(k)$ is the trivial groupoid. If $\mathcal{F}$ satisfies this condition then we say it is a predeformation category, but in general we do not make this assumption. Rim's paper GRR72, Exposee VI] is the original source for the results in this document. We also mention the useful paper [TV10], which discusses deformation theory with groupoids but in less generality than we do here.

An important role is played by the "completion" $\widehat{\mathcal{C}}_{\Lambda}$ of the category $\mathcal{C}_{\Lambda}$. An object of $\widehat{\mathcal{C}_{\Lambda}}$ is a Noetherian complete local $\Lambda$-algebra $R$ whose residue field is identified with $k$, see Section 73.4 On the one hand $\mathcal{C}_{\Lambda} \subset \widehat{\mathcal{C}}_{\Lambda}$ is a strictly full subcategory and on the other hand $\mathcal{C}_{\Lambda}$ is a full subcategory of the category of pro-objects of $\mathcal{C}_{\Lambda}$. A functor $\mathcal{C}_{\Lambda} \rightarrow$ Sets is prorepresentable if it is isomorphic to the restriction of a representable functor $\underline{R}=\operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(R,-)$ to $\mathcal{C}_{\Lambda}$ where $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$.
Categories cofibred in groupoids are dual to categories fibred in groupoids; we introduce them in Section 73.5. A smooth morphism of categories cofibred in groupoids
over $\mathcal{C}_{\Lambda}$ is one that satisfies the infinitesimal lifting criterion for objects, see Section 73.8. This is analogous to the definition of a formally smooth ring map, see Algebra, Definition 10.136 .1 and is exactly dual to the notion in Criteria for Representability, Section 79.6 This is an important notion as we eventually want to prove that certain kinds of categories cofibred in groupoids have a smooth prorepresentable presentation, much like the characterization of algebraic stacks in Algebraic Stacks, Sections 76.16 and 76.17. A versal formal object of a category $\mathcal{F}$ cofibred in groupoids over $\mathcal{C}_{\Lambda}$ is an object $\xi \in \widehat{\mathcal{F}}(R)$ of the completion such that the associated morphism $\underline{\xi}: \underline{R} \rightarrow \mathcal{F}$ is smooth.
In Section 73.9 , we define conditions (S1) and (S2) on $\mathcal{F}$ generalizing Schlessinger's (H1) and (H2). The analogue of Schlessinger's (H3) - the condition that $\mathcal{F}$ has finite dimensional tangent space - is not given a name. A key step in the development of the theory is the existence of versal formal objects for predeformation categories satisfying (S1), (S2) and (H3), see Lemma 73.12.4. Schlessinger's notion of a hull for a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets is, in our terminology, a versal formal object $\xi \in \widehat{F}(R)$ such that the induced map of tangent spaces $d \underline{\xi}: T \underline{R} \rightarrow T F$ is an isomorphism. In the literature a hull is often called a "miniversal" object. We do not do so, and here is why. It can happen that a functor has a versal formal object without having a hull. Moreover, we show in Section 73.13 that if a predeformation category has a versal formal object, then it always has a minimal one (as defined in Definition 73.13 .4 which is unique up to isomorphism, see Lemma 73.13.5. But it can happen that the minimal versal formal object does not induce an isomorphism on tangent spaces! (See Examples 73.14.3 and 73.14.8.)
Keeping in mind the differences pointed out above, Theorem 73.14 .5 is the direct generalization of (1) above: it recovers Schlessinger's result in the case that $\mathcal{F}$ is a functor and it characterizes minimal versal formal objects, in the presence of conditions (S1) and (S2), in terms of the map $d \underline{\xi}: T \underline{R} \rightarrow T F$ on tangent spaces.
In Section 73.15, we define Rim's condition (RS) on $\mathcal{F}$ generalizing Schlessinger's (H4). A deformation category is defined as a predeformation category satisfying (RS). The analogue to prorepresentable functors are the categories cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which have a presentation by a smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$, see Definitions 73.19.1, 73.20.1, and 73.21.1. This notion of a presentation takes into account the groupoid structure of the fibers of $\mathcal{F}$. In Theorem 73.24 .4 we prove that $\mathcal{F}$ has a presentation by a smooth prorepresentable groupoid in functors if and only if $\mathcal{F}$ has a finite dimensional tangent space and finite dimensional infinitesimal automorphism space. This is the generalization of (2) above: it reduces to Schlessinger's result in the case that $\mathcal{F}$ is a functor. There is a final Section 73.25 where we discuss how to use minimal versal formal objects to produce a (unique up to isomorphism) minimal presentation by a smooth prorepresentable groupoid in functors.

We also find the following conceptual explanation for Schlessinger's conditions. If a predeformation category $\mathcal{F}$ satisfies (RS), then the associated functor of isomorphism classes $\overline{\mathcal{F}}: \mathcal{C}_{\Lambda} \rightarrow$ Sets satisfies (H1) and (H2) (Lemmas 73.15.6 and 73.9.5). Conversely, if a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets arises naturally as the functor of isomorphism classes of a category $\mathcal{F}$ cofibered in groupoids, then it seems to happen in practice that an argument showing $F$ satisfies (H1) and (H2) will also show $\mathcal{F}$ satisfies (RS) (see Artin's Axioms, Section 80.22 for examples). Moreover, if $\mathcal{F}$ satisfies (RS),
then condition (H4) for $\overline{\mathcal{F}}$ has a simple interpretation in terms of extending automorphisms of objects of $\mathcal{F}$ (Lemma 73.15.7). These observations suggest that (RS) should be regarded as the fundamental deformation theoretic glueing condition.

### 73.2. Notation and Conventions

06G9 A ring is commutative with 1 . The maximal ideal of a local ring $A$ is denoted by $\mathfrak{m}_{A}$. The set of positive integers is denoted by $\mathbf{N}=\{1,2,3, \ldots\}$. If $U$ is an object of a category $\mathcal{C}$, we denote by $\underline{U}$ the functor $\operatorname{Mor}_{\mathcal{C}}(U,-): \mathcal{C} \rightarrow$ Sets, see Remarks 73.5 .2 12. Warning: this may conflict with the notation in other chapters where we sometimes use $\underline{U}$ to denote $h_{U}(-)=\operatorname{Mor}_{\mathcal{C}}(-, U)$.
Throughout this chapter $\Lambda$ is a Noetherian ring and $\Lambda \rightarrow k$ is a finite ring map from $\Lambda$ to a field. The kernel of this map is denoted $\mathfrak{m}_{\Lambda}$ and the image $k^{\prime} \subset k$. It turns out that $\mathfrak{m}_{\Lambda}$ is a maximal ideal, $k^{\prime}=\Lambda / \mathfrak{m}_{\Lambda}$ is a field, and the extension $k^{\prime} \subset k$ is finite. See discussion surrounding 73.3.3.1.

### 73.3. The base category

06GB Motivation. An important application of formal deformation theory is to criteria for representability by algebraic spaces. Suppose given a locally Noetherian base $S$ and a functor $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $k$ be a finite type field over $S$, i.e., we are given a finite type morphism $\operatorname{Spec}(k) \rightarrow S$. One of Artin's criteria is that for any element $x \in F(\operatorname{Spec}(k))$ the predeformation functor associated to the triple $(S, k, x)$ should be prorepresentable. By Morphisms, Lemma 28.16.1 the condition that $k$ is of finite type over $S$ means that there exists an affine open $\operatorname{Spec}(\Lambda) \subset S$ such that $k$ is a finite $\Lambda$-algebra. This motivates why we work throughout this chapter with a base category as follows.
06GC Definition 73.3.1. Let $\Lambda$ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where $k$ is a field. We define $\mathcal{C}_{\Lambda}$ to be the category with
(1) objects are pairs $(A, \varphi)$ where $A$ is an Artinian local $\Lambda$-algebra and where $\varphi: A / \mathfrak{m}_{A} \rightarrow k$ is a $\Lambda$-algebra isomorphism, and
(2) morphisms $f:(B, \psi) \rightarrow(A, \varphi)$ are local $\Lambda$-algebra homomorphisms such that $\varphi \circ(f \bmod \mathfrak{m})=\psi$.
We say we are in the classical case if $\Lambda$ is a Noetherian complete local ring and $k$ is its residue field.

Note that if $\Lambda \rightarrow k$ is surjective and if $A$ is an Artinian local $\Lambda$-algebra, then the identification $\varphi$, if it exists, is unique. Moreover, in this case any $\Lambda$-algebra map $A \rightarrow B$ is going to be compatible with the identifications. Hence in this case $\mathcal{C}_{\Lambda}$ is just the category of local Artinian $\Lambda$-algebras whose residue field "is" $k$. By abuse of notation we also denote objects of $\mathcal{C}_{\Lambda}$ simply $A$ in the general case. Moreover, we will often write $A / \mathfrak{m}=k$, i.e., we will pretend all rings in $\mathcal{C}_{\Lambda}$ have residue field $k$ (since all ring maps in $\mathcal{C}_{\Lambda}$ are compatible with the given identifications this should never cause any problems). Throughout the rest of this chapter the base ring $\Lambda$ and the field $k$ are fixed. The category $\mathcal{C}_{\Lambda}$ will be the base category for the cofibered categories considered below.
06GD Definition 73.3.2. Let $f: B \rightarrow A$ be a ring map in $\mathcal{C}_{\Lambda}$. We say $f$ is a small extension if it is surjective and $\operatorname{Ker}(f)$ is a nonzero principal ideal which is annihilated by $\mathfrak{m}_{B}$.

By the following lemma we can often reduce arguments involving surjective ring maps in $\mathcal{C}_{\Lambda}$ to the case of small extensions.

06GE Lemma 73.3.3. Let $f: B \rightarrow A$ be a surjective ring map in $\mathcal{C}_{\Lambda}$. Then $f$ can be factored as a composition of small extensions.

Proof. Let $I$ be the kernel of $f$. The maximal ideal $\mathfrak{m}_{B}$ is nilpotent since $B$ is Artinian, say $\mathfrak{m}_{B}^{n}=0$. Hence we get a factorization

$$
B=B / I \mathfrak{m}_{B}^{n-1} \rightarrow B / I \mathfrak{m}_{B}^{n-2} \rightarrow \ldots \rightarrow B / I \cong A
$$

of $f$ into a composition of surjective maps whose kernels are annihilated by the maximal ideal. Thus it suffices to prove the lemma when $f$ itself is such a map, i.e. when $I$ is annihilated by $\mathfrak{m}_{B}$. In this case $I$ is a $k$-vector space, which has finite dimension, see Algebra, Lemma 10.52.6. Take a basis $x_{1}, \ldots, x_{n}$ of $I$ as a $k$-vector space to get a factorization

$$
B \rightarrow B /\left(x_{1}\right) \rightarrow \ldots \rightarrow B /\left(x_{1}, \ldots, x_{n}\right) \cong A
$$

of $f$ into a composition of small extensions.
The next lemma says that we can compute the length of a module over a local $\Lambda$ algebra with residue field $k$ in terms of the length over $\Lambda$. To explain the notation in the statement, let $k^{\prime} \subset k$ be the image of our fixed finite ring map $\Lambda \rightarrow k$. Note that $k / k^{\prime}$ is a finite extension of rings. Hence $k^{\prime}$ is a field and $k^{\prime} / k$ is a finite extension, see Algebra, Lemma 10.35.16. Moreover, as $\Lambda \rightarrow k^{\prime}$ is surjective we see that its kernel is a maximal ideal $\mathfrak{m}_{\Lambda}$. Thus

06S2

$$
\begin{equation*}
\left[k: k^{\prime}\right]=\left[k: \Lambda / \mathfrak{m}_{\Lambda}\right]<\infty \tag{73.3.3.1}
\end{equation*}
$$

and in the classical case we have $k=k^{\prime}$. The notation $k^{\prime}=\Lambda / \mathfrak{m}_{\Lambda}$ will be fixed throughout this chapter.

06GG Lemma 73.3.4. Let $A$ be a local $\Lambda$-algebra with residue field $k$. Let $M$ be an A-module. Then $\left[k: k^{\prime}\right] \operatorname{length}_{A}(M)=$ length $_{\Lambda}(M)$. In the classical case we have length $_{A}(M)=$ length $_{\Lambda}(M)$.
Proof. If $M$ is a simple $A$-module then $M \cong k$ as an $A$-module, see Algebra, Lemma 10.51.10, In this case length $A(M)=1$ and length $\Lambda_{\Lambda}(M)=\left[k^{\prime}: k\right]$, see Algebra, Lemma 10.51.6. If length $A_{A}(M)$ is finite, then the result follows on choosing a filtration of $M$ by $A$-submodules with simple quotients using additivity, see Algebra, Lemma 10.51 .3 . If length ${ }_{A}(M)$ is infinite, the result follows from the obvious inequality length $A_{A}(M) \leq$ length $_{\Lambda}(M)$.

06S3 Lemma 73.3.5. Let $A \rightarrow B$ be a ring map in $\mathcal{C}_{\Lambda}$. The following are equivalent
(1) $f$ is surjective,
(2) $\mathfrak{m}_{A} / \mathfrak{m}_{A}^{2} \rightarrow \mathfrak{m}_{B} / \mathfrak{m}_{B}^{2}$ is surjective, and
(3) $\mathfrak{m}_{A} /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right) \rightarrow \mathfrak{m}_{B} /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ is surjective.

Proof. For any ring map $f: A \rightarrow B$ in $\mathcal{C}_{\Lambda}$ we have $f\left(\mathfrak{m}_{A}\right) \subset \mathfrak{m}_{B}$ for example because $\mathfrak{m}_{A}, \mathfrak{m}_{B}$ is the set of nilpotent elements of $A, B$. Suppose $f$ is surjective. Let $y \in \mathfrak{m}_{B}$. Choose $x \in A$ with $f(x)=y$. Since $f$ induces an isomorphism $A / \mathfrak{m}_{A} \rightarrow B / \mathfrak{m}_{B}$ we see that $x \in \mathfrak{m}_{A}$. Hence the induced map $\mathfrak{m}_{A} / \mathfrak{m}_{A}^{2} \rightarrow \mathfrak{m}_{B} / \mathfrak{m}_{B}^{2}$ is surjective. In this way we see that (1) implies (2).

It is clear that (2) implies (3). The map $A \rightarrow B$ gives rise to a canonical commutative diagram

with exact rows. Hence if (3) holds, then so does (2).
Assume (2). To show that $A \rightarrow B$ is surjective it suffices by Nakayama's lemma (Algebra, Lemma 10.19.1) to show that $A / \mathfrak{m}_{A} \rightarrow B / \mathfrak{m}_{A} B$ is surjective. (Note that $\mathfrak{m}_{A}$ is a nilpotent ideal.) As $k=A / \mathfrak{m}_{A}=B / \mathfrak{m}_{B}$ it suffices to show that $\mathfrak{m}_{A} B \rightarrow \mathfrak{m}_{B}$ is surjective. Applying Nakayama's lemma once more we see that it suffices to see that $\mathfrak{m}_{A} B / \mathfrak{m}_{A} \mathfrak{m}_{B} \rightarrow \mathfrak{m}_{B} / \mathfrak{m}_{B}^{2}$ is surjective which is what we assumed.
If $A \rightarrow B$ is a ring map in $\mathcal{C}_{\Lambda}$, then the map $\mathfrak{m}_{A} /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right) \rightarrow \mathfrak{m}_{B} /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ is the map on relative cotangent spaces. Here is a formal definition.
06GY Definition 73.3.6. Let $R \rightarrow S$ be a local homomorphism of local rings. The relative cotangent spac $\xi^{1}$ of $R$ over $S$ is the $S / \mathfrak{m}_{S}$-vector space $\mathfrak{m}_{S} /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right)$.
If $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ are two ring maps, then the fiber product $A_{1} \times{ }_{A} A_{2}$ is the subring of $A_{1} \times A_{2}$ consisting of elements whose two projections to $A$ are equal. Throughout this chapter we will be considering conditions involving such a fiber product when $f_{1}$ and $f_{2}$ are in $\mathcal{C}_{\Lambda}$. It isn't always the case that the fibre product is an object of $\mathcal{C}_{\Lambda}$.

06S4 Example 73.3.7. Let $p$ be a prime number and let $n \in \mathbf{N}$. Let $\Lambda=\mathbf{F}_{p}\left(t_{1}, t_{2}, \ldots, t_{n}\right)$ and let $k=\mathbf{F}_{p}\left(x_{1}, \ldots, x_{n}\right)$ with map $\Lambda \rightarrow k$ given by $t_{i} \mapsto x_{i}^{p}$. Let $A=k[\epsilon]=$ $k[x] /\left(x^{2}\right)$. Then $A$ is an object of $\mathcal{C}_{\Lambda}$. Suppose that $D: k \rightarrow k$ is a derivation of $k$ over $\Lambda$, for example $D=\partial / \partial x_{i}$. Then the map

$$
f_{D}: k \longrightarrow k[\epsilon], \quad a \mapsto a+D(a) \epsilon
$$

is a morphism of $\mathcal{C}_{\Lambda}$. Set $A_{1}=A_{2}=k$ and set $f_{1}=f_{\partial / \partial x_{1}}$ and $f_{2}(a)=a$. Then $A_{1} \times{ }_{A} A_{2}=\left\{a \in k \mid \partial / \partial x_{1}(a)=0\right\}$ which does not surject onto $k$. Hence the fibre product isn't an object of $\mathcal{C}_{\Lambda}$.

It turns out that this problem can only occur if the residue field extension $k^{\prime} \subset k$ 73.3.3.1 is inseparable and neither $f_{1}$ nor $f_{2}$ is surjective.

06GH Lemma 73.3.8. Let $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ be ring maps in $\mathcal{C}_{\Lambda}$. Then:
(1) If $f_{1}$ or $f_{2}$ is surjective, then $A_{1} \times A_{2}$ is in $\mathcal{C}_{\Lambda}$.
(2) If $f_{2}$ is a small extension, then so is $A_{1} \times{ }_{A} A_{2} \rightarrow A_{1}$.
(3) If the field extension $k^{\prime} \subset k$ is separable, then $A_{1} \times{ }_{A} A_{2}$ is in $\mathcal{C}_{\Lambda}$.

Proof. The ring $A_{1} \times{ }_{A} A_{2}$ is a $\Lambda$-algebra via the map $\Lambda \rightarrow A_{1} \times{ }_{A} A_{2}$ induced by the maps $\Lambda \rightarrow A_{1}$ and $\Lambda \rightarrow A_{2}$. It is a local ring with unique maximal ideal

$$
\mathfrak{m}_{A_{1}} \times_{\mathfrak{m}_{A}} \mathfrak{m}_{A_{2}}=\operatorname{Ker}\left(A_{1} \times_{A} A_{2} \longrightarrow k\right)
$$

${ }^{1}$ Caution: We will see later that in our general setting the tangent space of an object $A \in \mathcal{C}_{\Lambda}$ over $\Lambda$ should not be defined simply as the $k$-linear dual of the relative cotangent space. In fact, the correct definition of the relative cotangent space is $\Omega_{S / R} \otimes_{S} S / \mathfrak{m}_{S}$.

A ring is Artinian if and only if it has finite length as a module over itself, see Algebra, Lemma 10.52.6. Since $A_{1}$ and $A_{2}$ are Artinian, Lemma 73.3 .4 implies length $_{\Lambda}\left(A_{1}\right)$ and length ${ }_{\Lambda}\left(A_{2}\right)$, and hence length ${ }_{\Lambda}\left(A_{1} \times A_{2}\right)$, are all finite. As $A_{1} \times{ }_{A} A_{2} \subset A_{1} \times A_{2}$ is a $\Lambda$-submodule, this implies length $A_{A_{1} \times A_{A}}\left(A_{1} \times A_{2}\right) \leq$ length ${ }_{\Lambda}\left(A_{1} \times_{A} A_{2}\right)$ is finite. So $A_{1} \times{ }_{A} A_{2}$ is Artinian. Thus the only thing that is keeping $A_{1} \times{ }_{A} A_{2}$ from being an object of $\mathcal{C}_{\Lambda}$ is the possibility that its residue field maps to a proper subfield of $k$ via the map $A_{1} \times_{A} A_{2} \rightarrow A \rightarrow A / \mathfrak{m}_{A}=k$ above.

Proof of (1). If $f_{2}$ is surjective, then the projection $A_{1} \times{ }_{A} A_{2} \rightarrow A_{1}$ is surjective. Hence the composition $A_{1} \times{ }_{A} A_{2} \rightarrow A_{1} \rightarrow A_{1} / \mathfrak{m}_{A_{1}}=k$ is surjective and we conclude that $A_{1} \times{ }_{A} A_{2}$ is an object of $\mathcal{C}_{\Lambda}$.

Proof of (2). If $f_{2}$ is a small extension then $A_{2} \rightarrow A$ and $A_{1} \times_{A} A_{2} \rightarrow A_{1}$ are both surjective with the same kernel. Hence the kernel of $A_{1} \times{ }_{A} A_{2} \rightarrow A_{1}$ is a 1-dimensional $k$-vector space and we see that $A_{1} \times_{A} A_{2} \rightarrow A_{1}$ is a small extension.

Proof of (3). Choose $\bar{x} \in k$ such that $k=k^{\prime}(\bar{x})$ (see Fields, Lemma 9.18.1). Let $P^{\prime}(T) \in k^{\prime}[T]$ be the minimal polynomial of $\bar{x}$ over $k^{\prime}$. Since $k / k^{\prime}$ is separable we see that $\mathrm{d} P / \mathrm{d} T(\bar{x}) \neq 0$. Choose a monic $P \in \Lambda[T]$ which maps to $P^{\prime}$ under the surjective map $\Lambda[T] \rightarrow k^{\prime}[T]$. Because $A, A_{1}, A_{2}$ are henselian, see Algebra, Lemma 10.148.11, we can find $x, x_{1}, x_{2} \in A, A_{1}, A_{2}$ with $P(x)=0, P\left(x_{1}\right)=0, P\left(x_{2}\right)=0$ and such that the image of $x, x_{1}, x_{2}$ in $k$ is $\bar{x}$. Then $\left(x_{1}, x_{2}\right) \in A_{1} \times_{A} A_{2}$ because $x_{1}, x_{2}$ map to $x \in A$ by uniqueness, see Algebra, Lemma 10.148.2. Hence the residue field of $A_{1} \times{ }_{A} A_{2}$ contains a generator of $k$ over $k^{\prime}$ and we win.

Next we define essential surjections in $\mathcal{C}_{\Lambda}$. A necessary and sufficient condition for a surjection in $\mathcal{C}_{\Lambda}$ to be essential is given in Lemma 73.3.12,

06GF Definition 73.3.9. Let $f: B \rightarrow A$ be a ring map in $\mathcal{C}_{\Lambda}$. We say $f$ is an essential surjection if it has the following properties:
(1) $f$ is surjective.
(2) If $g: C \rightarrow B$ is a ring map in $\mathcal{C}_{\Lambda}$ such that $f \circ g$ is surjective, then $g$ is surjective.
Using Lemma 73.3.5, we can characterize essential surjections in $\mathcal{C}_{\Lambda}$ as follows.
06S5 Lemma 73.3.10. Let $f: B \rightarrow A$ be a ring map in $\mathcal{C}_{\Lambda}$. The following are equivalent
(1) $f$ is an essential surjection,
(2) the map $B / \mathfrak{m}_{B}^{2} \rightarrow A / \mathfrak{m}_{A}^{2}$ is an essential surjection, and
(3) the map $B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right) \rightarrow A /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ is an essential surjection.

Proof. Assume (3). Let $C \rightarrow B$ be a ring map in $\mathcal{C}_{\Lambda}$ such that $C \rightarrow A$ is surjective. Then $C \rightarrow A /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ is surjective too. We conclude that $C \rightarrow B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ is surjective by our assumption. Hence $C \rightarrow B$ is surjective by applying Lemma 73.3 .5 (2 times).

Assume (1). Let $C \rightarrow B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ be a morphism of $\mathcal{C}_{\Lambda}$ such that $C \rightarrow$ $A /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ is surjective. Set $C^{\prime}=\stackrel{B}{C} \times_{B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)} B$ which is an object of $\mathcal{C}_{\Lambda}$ by Lemma 73.3.8. Note that $C^{\prime} \rightarrow A /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ is still surjective, hence $C^{\prime} \rightarrow A$ is surjective by Lemma 73.3.5. Thus $C^{\prime} \rightarrow B$ is surjective by our assumption. This implies that $C^{\prime} \rightarrow B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ is surjective, which implies by the construction of $C^{\prime}$ that $C \rightarrow B /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right)$ is surjective.

In the first paragraph we proved $(3) \Rightarrow(1)$ and in the second paragraph we proved $(1) \Rightarrow(3)$. The equivalence of (2) and (3) is a special case of the equivalence of (1) and (3), hence we are done.

To analyze essential surjections in $\mathcal{C}_{\Lambda}$ a bit more we introduce some notation. Suppose that $A$ is an object of $\mathcal{C}_{\Lambda}$. There is a canonical exact sequence

$$
\begin{equation*}
\mathfrak{m}_{A} / \mathfrak{m}_{A}^{2} \xrightarrow{\mathrm{~d}_{A}} \Omega_{A / \Lambda} \otimes_{A} k \rightarrow \Omega_{k / \Lambda} \rightarrow 0 \tag{73.3.10.1}
\end{equation*}
$$

see Algebra, Lemma 10.130.9. Note that $\Omega_{k / \Lambda}=\Omega_{k / k^{\prime}}$ with $k^{\prime}$ as in 73.3.3.1. Let $H_{1}\left(L_{k / \Lambda}\right)$ be the first homology module of the naive cotangent complex of $k$ over $\Lambda$, see Algebra, Definition 10.132.1. Then we can extend $\sqrt{73.3 .10 .1}$ to the exact sequence

06S7

$$
\begin{equation*}
H_{1}\left(L_{k / \Lambda}\right) \rightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2} \xrightarrow{\mathrm{~d}_{A}} \Omega_{A / \Lambda} \otimes_{A} k \rightarrow \Omega_{k / \Lambda} \rightarrow 0 \tag{73.3.10.2}
\end{equation*}
$$

see Algebra, Lemma 10.132 .4 If $B \rightarrow A$ is a ring map in $\mathcal{C}_{\Lambda}$ then we obtain a commutative diagram

06S8

with exact rows.
06S9 Lemma 73.3.11. There is a canonical map

$$
\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2} \longrightarrow H_{1}\left(L_{k / \Lambda}\right)
$$

If $k^{\prime} \subset k$ is separable (for example if the characteristic of $k$ is zero), then this map induces an isomorphism $\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2} \otimes_{k^{\prime}} k=H_{1}\left(L_{k / \Lambda}\right)$. If $k=k^{\prime}$ (for example in the classical case), then $\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2}=H_{1}\left(L_{k / \Lambda}\right)$. The composition

$$
\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2} \longrightarrow H_{1}\left(L_{k / \Lambda}\right) \longrightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}
$$

comes from the canonical map $\mathfrak{m}_{\Lambda} \rightarrow \mathfrak{m}_{A}$.
Proof. Note that $H_{1}\left(L_{k^{\prime} / \Lambda}\right)=\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2}$ as $\Lambda \rightarrow k^{\prime}$ is surjective with kernel $\mathfrak{m}_{\Lambda}$. The map arises from functoriality of the naive cotangent complex. If $k^{\prime} \subset k$ is separable, then $k^{\prime} \rightarrow k$ is an étale ring map, see Algebra, Lemma 10.141.4. Thus its naive cotangent complex has trivial homology groups, see Algebra, Definition 10.141.1. Then Algebra, Lemma 10.132 .4 applied to the ring maps $\Lambda \rightarrow k^{\prime} \rightarrow k$ implies that $\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2} \otimes_{k^{\prime}} k=H_{1}\left(L_{k / \Lambda}\right)$. We omit the proof of the final statement.

06H0 Lemma 73.3.12. Let $f: B \rightarrow A$ be a ring map in $\mathcal{C}_{\Lambda}$. Notation as in 73.3.10.3.
(1) The equivalent conditions of Lemma 73.3 .10 characterizing when $f$ is surjective are also equivalent to
(a) $\operatorname{Im}\left(d_{B}\right) \rightarrow \operatorname{Im}\left(d_{A}\right)$ is surjective, and
(b) the map $\Omega_{B / \Lambda} \otimes_{B} k \rightarrow \Omega_{A / \Lambda} \otimes_{A} k$ is surjective.
(2) The following are equivalent
(a) $f$ is an essential surjection,
(b) the map $\operatorname{Im}\left(d_{B}\right) \rightarrow \operatorname{Im}\left(d_{A}\right)$ is an isomorphism, and
(c) the $\operatorname{map} \Omega_{B / \Lambda} \otimes_{B} k \rightarrow \Omega_{A / \Lambda} \otimes_{A} k$ is an isomorphism.
(3) If $k / k^{\prime}$ is separable, then $f$ is an essential surjection if and only if the map $\mathfrak{m}_{B} /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right) \rightarrow \mathfrak{m}_{A} /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ is an isomorphism.
(4) If $f$ is a small extension, then $f$ is not essential if and only if $f$ has a section $s: A \rightarrow B$ in $\mathcal{C}_{\Lambda}$ with $f \circ s=i d_{A}$.

Proof. Proof of (1). It follows from 73.3.10.3 that (1)(a) and (1)(b) are equivalent. Also, if $A \rightarrow B$ is surjective, then (1)(a) and (1)(b) hold. Assume (1)(a). Since the kernel of $\mathrm{d}_{A}$ is the image of $H_{1}\left(L_{k / \Lambda}\right)$ which also maps to $\mathfrak{m}_{B} / \mathfrak{m}_{B}^{2}$ we conclude that $\mathfrak{m}_{B} / \mathfrak{m}_{B}^{2} \rightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}$ is surjective. Hence $B \rightarrow A$ is surjective by Lemma 73.3.5. This finishes the proof of (1).

Proof of (2). The equivalence of (2)(b) and (2)(c) is immediate from 73.3.10.3).
Assume (2)(b). Let $g: C \rightarrow B$ be a ring map in $\mathcal{C}_{\Lambda}$ such that $f \circ g$ is surjective. We conclude that $\mathfrak{m}_{C} / \mathfrak{m}_{C}^{2} \rightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}$ is surjective by Lemma 73.3.5. Hence $\operatorname{Im}\left(\mathrm{d}_{C}\right) \rightarrow$ $\operatorname{Im}\left(\mathrm{d}_{A}\right)$ is surjective and by the assumption we see that $\operatorname{Im}\left(\mathrm{d}_{C}\right) \rightarrow \operatorname{Im}\left(\mathrm{d}_{B}\right)$ is surjective. It follows that $C \rightarrow B$ is surjective by (1).

Assume (2)(a). Then $f$ is surjective and we see that $\Omega_{B / \Lambda} \otimes_{B} k \rightarrow \Omega_{A / \Lambda} \otimes_{A} k$ is surjective. Let $K$ be the kernel. Note that $K=\mathrm{d}_{B}\left(\operatorname{Ker}\left(\mathfrak{m}_{B} / \mathfrak{m}_{B}^{2} \rightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}\right)\right)$ by 73.3.10.3). Choose a splitting

$$
\Omega_{B / \Lambda} \otimes_{B} k=\Omega_{A / \Lambda} \otimes_{A} k \oplus K
$$

of $k$-vector space. The map d : B $\rightarrow \Omega_{B / \Lambda}$ induces via the projection onto $K$ a map $D: B \rightarrow K$. Set $C=\{b \in B \mid D(b)=0\}$. The Leibniz rule shows that this is a $\Lambda$-subalgebra of $B$. Let $\bar{x} \in k$. Choose $x \in B$ mapping to $\bar{x}$. If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_{B}$ such that $D(y)=D(x)$. Hence $x-y \in C$ is an element which maps to $\bar{x}$. Thus $C \rightarrow k$ is surjective and $C$ is an object of $\mathcal{C}_{\Lambda}$. Similarly, pick $\omega \in \operatorname{Im}\left(\mathrm{d}_{A}\right)$. We can find $x \in \mathfrak{m}_{B}$ such that $\mathrm{d}_{B}(x)$ maps to $\omega$ by (1). If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_{B}$ which maps to zero in $\mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}$ such that $D(y)=D(x)$. Hence $z=x-y$ is an element of $\mathfrak{m}_{C}$ whose image $\mathrm{d}_{C}(z) \in \Omega_{C / k} \otimes_{C} k$ maps to $\omega$. Hence $\operatorname{Im}\left(\mathrm{d}_{C}\right) \rightarrow \operatorname{Im}\left(\mathrm{d}_{A}\right)$ is surjective. We conclude that $C \rightarrow A$ is surjective by (1). Hence $C \rightarrow B$ is surjective by assumption. Hence $D=0$, i.e., $K=0$, i.e., (2)(c) holds. This finishes the proof of (2).
Proof of (3). If $k^{\prime} / k$ is separable, then $H_{1}\left(L_{k / \Lambda}\right)=\mathfrak{m}_{\Lambda} / \mathfrak{m}_{\Lambda}^{2} \otimes_{k^{\prime}} k$, see Lemma 73.3.11. Hence $\operatorname{Im}\left(\mathrm{d}_{A}\right)=\mathfrak{m}_{A} /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$ and similarly for $B$. Thus (3) follows from (2).

Proof of (4). A section $s$ of $f$ is not surjective (by definition a small extension has nontrivial kernel), hence $f$ is not essentially surjective. Conversely, assume $f$ is a small surjection but not an essential surjection. Choose a ring map $C \rightarrow B$ in $\mathcal{C}_{\Lambda}$ which is not surjective, such that $C \rightarrow A$ is surjective. Let $C^{\prime} \subset B$ be the image of $C \rightarrow B$. Then $C^{\prime} \neq B$ but $C^{\prime}$ surjects onto $A$. Since $f: B \rightarrow A$ is a small extension, length $C_{C}(B)=\operatorname{length}_{C}(A)+1$. Thus length $C_{C}\left(C^{\prime}\right) \leq \operatorname{length}_{C}(A)$ since $C^{\prime}$ is a proper subring of $B$. But $C^{\prime} \rightarrow A$ is surjective, so in fact we must have length $C\left(C^{\prime}\right)=\operatorname{length}_{C}(A)$ and $C^{\prime} \rightarrow A$ is an isomorphism which gives us our section.

06SA Example 73.3.13. Let $\Lambda=k[[x]]$ be the power series ring in 1 variable over $k$. Set $A=k$ and $B=\Lambda /\left(x^{2}\right)$. Then $B \rightarrow A$ is an essential surjection by Lemma
73.3 .12 because it is a small extension and the map $B \rightarrow A$ does not have a right inverse (in the category $\mathcal{C}_{\Lambda}$ ). But the map

$$
k \cong \mathfrak{m}_{B} / \mathfrak{m}_{B}^{2} \longrightarrow \mathfrak{m}_{A} / \mathfrak{m}_{A}^{2}=0
$$

is not an isomorphism. Thus in Lemma 73.3 .12 (3) it is necessary to consider the map of relative cotangent spaces $\mathfrak{m}_{B} /\left(\mathfrak{m}_{\Lambda} B+\mathfrak{m}_{B}^{2}\right) \rightarrow \mathfrak{m}_{A} /\left(\mathfrak{m}_{\Lambda} A+\mathfrak{m}_{A}^{2}\right)$.

### 73.4. The completed base category

06GV The following "completion" of the category $\mathcal{C}_{\Lambda}$ will serve as the base category of the completion of a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ (Section 73.7).

06GW Definition 73.4.1. Let $\Lambda$ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where $k$ is a field. We define $\widehat{\mathcal{C}}_{\Lambda}$ to be the category with
(1) objects are pairs $(R, \varphi)$ where $R$ is a Noetherian complete local $\Lambda$-algebra and where $\varphi: R / \mathfrak{m}_{R} \rightarrow k$ is a $\Lambda$-algebra isomorphism, and
(2) morphisms $f:(S, \psi) \rightarrow(R, \varphi)$ are local $\Lambda$-algebra homomorphisms such that $\varphi \circ(f \bmod \mathfrak{m})=\psi$.

As in the discussion following Definition 73.3.1 we will usually denote an object of $\widehat{\mathcal{C}}_{\Lambda}$ simply $R$, with the identification $R / \mathfrak{m}_{R}=k$ understood. In this section we discuss some basic properties of objects and morphisms of the category $\widehat{\mathcal{C}}_{\Lambda}$ paralleling our discussion of the category $\mathcal{C}_{\Lambda}$ in the previous section.
Our first observation is that any object $A \in \mathcal{C}_{\Lambda}$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$ as an Artinian local ring is always Noetherian and complete with respect to its maximal ideal (which is after all a nilpotent ideal). Moreover, it is clear from the definitions that $\mathcal{C}_{\Lambda} \subset \widehat{\mathcal{C}}_{\Lambda}$ is the strictly full subcategory consisting of all Artinian rings. As it turns out, conversely every object of $\widehat{\mathcal{C}}_{\Lambda}$ is a limit of objects of $\mathcal{C}_{\Lambda}$.

Suppose that $R$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$. Consider the rings $R_{n}=R / \mathfrak{m}_{R}^{n}$ for $n \in \mathbf{N}$. These are Noetherian local rings with a unique nilpotent prime ideal, hence Artinian, see Algebra, Proposition 10.59.6. The ring maps

$$
\ldots \rightarrow R_{n+1} \rightarrow R_{n} \rightarrow \ldots \rightarrow R_{2} \rightarrow R_{1}=k
$$

are all surjective. Completeness of $R$ by definition means that $R=\lim R_{n}$. If $f: R \rightarrow S$ is a ring map in $\widehat{\mathcal{C}}_{\Lambda}$ then we obtain a system of ring maps $f_{n}: R_{n} \rightarrow S_{n}$ whose limit is the given map.

06GZ Lemma 73.4.2. Let $f: R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_{\Lambda}$. The following are equivalent (1) $f$ is surjective,
(2) the map $\mathfrak{m}_{R} / \mathfrak{m}_{R}^{2} \rightarrow \mathfrak{m}_{S} / \mathfrak{m}_{S}^{2}$ is surjective, and
(3) the map $\mathfrak{m}_{R} /\left(\mathfrak{m}_{\Lambda} R+\mathfrak{m}_{R}^{2}\right) \rightarrow \mathfrak{m}_{S} /\left(\mathfrak{m}_{\Lambda} S+\mathfrak{m}_{S}^{2}\right)$ is surjective.

Proof. Note that for $n \geq 2$ we have the equality of relative cotangent spaces

$$
\mathfrak{m}_{R} /\left(\mathfrak{m}_{\Lambda} R+\mathfrak{m}_{R}^{2}\right)=\mathfrak{m}_{R_{n}} /\left(\mathfrak{m}_{\Lambda} R_{n}+\mathfrak{m}_{R_{n}}^{2}\right)
$$

and similarly for $S$. Hence by Lemma 73.3 .5 we see that $R_{n} \rightarrow S_{n}$ is surjective for all $n$. Now let $K_{n}$ be the kernel of $R_{n} \rightarrow S_{n}$. Then the sequences

$$
0 \rightarrow K_{n} \rightarrow R_{n} \rightarrow S_{n} \rightarrow 0
$$

form an exact sequence of directed inverse systems. The system ( $K_{n}$ ) is MittagLeffler since each $K_{n}$ is Artinian. Hence by Algebra, Lemma 10.85 .4 taking limits preserves exactness. So $\lim R_{n} \rightarrow \lim S_{n}$ is surjective, i.e., $f$ is surjective.
06SB Lemma 73.4.3. The category $\widehat{\mathcal{C}}_{\Lambda}$ admits pushouts.
Proof. Let $R \rightarrow S_{1}$ and $R \rightarrow S_{2}$ be morphisms of $\widehat{\mathcal{C}}_{\Lambda}$. Consider the ring $C=$ $S_{1} \otimes_{R} S_{2}$. This ring has a finitely generated maximal ideal $\mathfrak{m}=\mathfrak{m}_{S_{1}} \otimes S_{2}+S_{1} \otimes \mathfrak{m}_{S_{2}}$ with residue field $k$. Set $C^{\wedge}$ equal to the completion of $C$ with respect to $\mathfrak{m}$. Then $C^{\wedge}$ is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^{\wedge}=\mathfrak{m} C^{\wedge}$ whose residue field is identified with $k$, see Algebra, Lemma 10.96.5. Hence $C^{\wedge}$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$. Then $S_{1} \rightarrow C^{\wedge}$ and $S_{2} \rightarrow C^{\wedge}$ turn $C^{\wedge}$ into a pushout over $R$ in $\widehat{\mathcal{C}}_{\Lambda}$ (details omitted).
We will not need the following lemma.
06H1 Lemma 73.4.4. The category $\widehat{\mathcal{C}}_{\Lambda}$ admits coproducts of pairs of objects.
Proof. Let $R$ and $S$ be objects of $\widehat{\mathcal{C}}_{\Lambda}$. Consider the ring $C=R \otimes_{\Lambda} S$. There is a canonical surjective map $C \rightarrow R \otimes_{\Lambda} S \rightarrow k \otimes_{\Lambda} k \rightarrow k$ where the last map is the multiplication map. The kernel of $C \rightarrow k$ is a maximal ideal $\mathfrak{m}$. Note that $\mathfrak{m}$ is generated by $\mathfrak{m}_{R} C, \mathfrak{m}_{S} C$ and finitely many elements of $C$ which map to generators of the kernel of $k \otimes_{\Lambda} k \rightarrow k$. Hence $\mathfrak{m}$ is a finitely generated ideal. Set $C^{\wedge}$ equal to the completion of $C$ with respect to $\mathfrak{m}$. Then $C^{\wedge}$ is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^{\wedge}=\mathfrak{m} C^{\wedge}$ with residue field $k$, see Algebra, Lemma 10.96.5. Hence $C^{\wedge}$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$. Then $R \rightarrow C^{\wedge}$ and $S \rightarrow C^{\wedge}$ turn $C^{\wedge}$ into a coproduct in $\widehat{\mathcal{C}}_{\Lambda}$ (details omitted).

An empty coproduct in a category is an initial object of the category. In the classical case $\widehat{\mathcal{C}}_{\Lambda}$ has an initial object, namely $\Lambda$ itself. More generally, if $k^{\prime}=k$, then the completion $\Lambda^{\wedge}$ of $\Lambda$ with respect to $\mathfrak{m}_{\Lambda}$ is an initial object. More generally still, if $k^{\prime} \subset k$ is separable, then $\widehat{\mathcal{C}}_{\Lambda}$ has an initial object too. Namely, choose a monic polynomial $P \in \Lambda[T]$ such that $k \cong k^{\prime}[T] /\left(P^{\prime}\right)$ where $p^{\prime} \in k^{\prime}[T]$ is the image of $P$. Then $R=\Lambda^{\wedge}[T] /(P)$ is an initial object, see proof of Lemma 73.3.8.

If $R$ is an initial object as above, then we have $\mathcal{C}_{\Lambda}=\mathcal{C}_{R}$ and $\widehat{\mathcal{C}}_{\Lambda}=\widehat{\mathcal{C}}_{R}$ which effectively brings the whole discussion in this chapter back to the classical case. But, if $k^{\prime} \subset k$ is inseparable, then an initial object does not exist.
06 SC Lemma 73.4.5. Let $S$ be an object of $\widehat{\mathcal{C}}_{\Lambda}$. Then $\operatorname{dim}_{k} \operatorname{Der}_{\Lambda}(S, k)<\infty$.
Proof. Let $x_{1}, \ldots, x_{n} \in \mathfrak{m}_{S}$ map to a $k$-basis for the relative cotangent space $\mathfrak{m}_{S} /\left(\mathfrak{m}_{\Lambda} S+\mathfrak{m}_{S}^{2}\right)$. Choose $y_{1}, \ldots, y_{m} \in S$ whose images in $k$ generate $k$ over $k^{\prime}$. We claim that $\operatorname{dim}_{k} \operatorname{Der}_{\Lambda}(S, k) \leq n+m$. To see this it suffices to prove that if $D\left(x_{i}\right)=0$ and $D\left(y_{j}\right)=0$, then $D=0$. Let $a \in S$. We can find a polynomial $P=\sum \lambda_{J} y^{J}$ with $\lambda_{J} \in \Lambda$ whose image in $k$ is the same as the image of $a$ in $k$. Then we see that $D(a-P)=D(a)-D(P)=D(a)$ by our assumption that $D\left(y_{j}\right)=0$ for all $j$. Thus we may assume $a \in \mathfrak{m}_{S}$. Write $a=\sum a_{i} x_{i}$ with $a_{i} \in S$. By the Leibniz rule

$$
D(a)=\sum x_{i} D\left(a_{i}\right)+\sum a_{i} D\left(x_{i}\right)=\sum x_{i} D\left(a_{i}\right)
$$

as we assumed $D\left(x_{i}\right)=0$. We have $\sum x_{i} D\left(a_{i}\right)=0$ as multiplication by $x_{i}$ is zero on $k$.

06SD Lemma 73.4.6. Let $f: R \rightarrow S$ be a morphism of $\widehat{\mathcal{C}}_{\Lambda}$. If $\operatorname{Der}_{\Lambda}(S, k) \rightarrow \operatorname{Der}_{\Lambda}(R, k)$ is injective, then $f$ is surjective.
Proof. If $f$ is not surjective, then $\mathfrak{m}_{S} /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right)$ is nonzero by Lemma 73.4.2. Then also $Q=S /\left(f(R)+\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right)$ is nonzero. Note that $Q$ is a $k=R / \mathfrak{m}_{R}$-vector space via $f$. We turn $Q$ into an $S$-module via $S \rightarrow k$. The quotient map $D: S \rightarrow Q$ is an $R$-derivation: if $a_{1}, a_{2} \in S$, we can write $a_{1}=f\left(b_{1}\right)+a_{1}^{\prime}$ and $a_{2}=f\left(b_{2}\right)+a_{2}^{\prime}$ for some $b_{1}, b_{2} \in R$ and $a_{1}^{\prime}, a_{2}^{\prime} \in \mathfrak{m}_{S}$. Then $b_{i}$ and $a_{i}$ have the same image in $k$ for $i=1,2$ and

$$
\begin{aligned}
a_{1} a_{2} & =\left(f\left(b_{1}\right)+a_{1}^{\prime}\right)\left(f\left(b_{2}\right)+a_{2}^{\prime}\right) \\
& =f\left(b_{1}\right) a_{2}^{\prime}+f\left(b_{2}\right) a_{1}^{\prime} \\
& =f\left(b_{1}\right)\left(f\left(b_{2}\right)+a_{2}^{\prime}\right)+f\left(b_{2}\right)\left(f\left(b_{1}\right)+a_{1}^{\prime}\right) \\
& =f\left(b_{1}\right) a_{2}+f\left(b_{2}\right) a_{1}
\end{aligned}
$$

in $Q$ which proves the Leibniz rule. Hence $D: S \rightarrow Q$ is a $\Lambda$-derivation which is zero on composing with $R \rightarrow S$. Since $Q \neq 0$ there also exist derivations $D: S \rightarrow k$ which are zero on composing with $R \rightarrow S$, i.e., $\operatorname{Der}_{\Lambda}(S, k) \rightarrow \operatorname{Der}_{\Lambda}(R, k)$ is not injective.
06SE Lemma 73.4.7. Let $R$ be an object of $\widehat{\mathcal{C}}_{\Lambda}$. Let $\left(J_{n}\right)$ be a decreasing sequence of ideals such that $\mathfrak{m}_{R}^{n} \subset J_{n}$. Set $J=\bigcap J_{n}$. Then the sequence $\left(J_{n} / J\right)$ defines the $\mathfrak{m}_{R / J}$-adic topology on $R / J$.
Proof. It is clear that $\mathfrak{m}_{R / J}^{n} \subset J_{n} / J$. Thus it suffices to show that for every $n$ there exists an $N$ such that $J_{N} / J \subset \mathfrak{m}_{R / J}^{n}$. This is equivalent to $J_{N} \subset \mathfrak{m}_{R}^{n}+J$. For each $n$ the ring $R / \mathfrak{m}_{R}^{n}$ is Artinian, hence there exists a $N_{n}$ such that

$$
J_{N_{n}}+\mathfrak{m}_{R}^{n}=J_{N_{n}+1}+\mathfrak{m}_{R}^{n}=\ldots
$$

Set $E_{n}=\left(J_{N_{n}}+\mathfrak{m}_{R}^{n}\right) / \mathfrak{m}_{R}^{n}$. Set $E=\lim E_{n} \subset \lim R / \mathfrak{m}_{R}^{n}=R$. Note that $E \subset J$ as for any $f \in E$ and any $m$ we have $f \in J_{m}+\mathfrak{m}_{R}^{n}$ for all $n \gg 0$, so $f \in J_{m}$ by Artin-Rees, see Algebra, Lemma 10.50 .4 Since the transition maps $E_{n} \rightarrow E_{n-1}$ are all surjective, we see that $J$ surjects onto $E_{n}$. Hence for $N=N_{n}$ works.
06SF Lemma 73.4.8. Let $\ldots \rightarrow A_{3} \rightarrow A_{2} \rightarrow A_{1}$ be a sequence of surjective ring maps in $\mathcal{C}_{\Lambda}$. If $\operatorname{dim}_{k}\left(\mathfrak{m}_{A_{n}} / \mathfrak{m}_{A_{n}}^{2}\right)$ is bounded, then $S=\lim A_{n}$ is an object in $\widehat{\mathcal{C}}_{\Lambda}$ and the ideals $I_{n}=\operatorname{Ker}\left(S \rightarrow A_{n}\right)$ define the $\mathfrak{m}_{S}$-adic topology on $S$.
Proof. We will use freely that the maps $S \rightarrow A_{n}$ are surjective for all $n$. Note that the maps $\mathfrak{m}_{A_{n+1}} / \mathfrak{m}_{A_{n+1}}^{2} \rightarrow \mathfrak{m}_{A_{n}} / \mathfrak{m}_{A_{n}}^{2}$ are surjective, see Lemma 73.4.2. Hence for $n$ sufficiently large the dimension $\operatorname{dim}_{k}\left(\mathfrak{m}_{A_{n}} / \mathfrak{m}_{A_{n}}^{2}\right)$ stabilizes to an integer, say $r$. Thus we can find $x_{1}, \ldots, x_{r} \in \mathfrak{m}_{S}$ whose images in $A_{n}$ generate $\mathfrak{m}_{A_{n}}$. Moreover, pick $y_{1}, \ldots, y_{t} \in S$ whose images in $k$ generate $k$ over $\Lambda$. Then we get a ring map $P=\Lambda\left[z_{1}, \ldots, z_{r+t}\right] \rightarrow S, z_{i} \mapsto x_{i}$ and $z_{r+j} \mapsto y_{j}$ such that the composition $P \rightarrow S \rightarrow A_{n}$ is surjective for all $n$. Let $\mathfrak{m} \subset P$ be the kernel of $P \rightarrow k$. Let $R=P^{\wedge}$ be the $\mathfrak{m}$-adic completion of $P$; this is an object of $\widehat{\mathcal{C}}_{\Lambda}$. Since we still have the compatible system of (surjective) maps $R \rightarrow A_{n}$ we get a map $R \rightarrow S$. Set $J_{n}=\operatorname{Ker}\left(R \rightarrow A_{n}\right)$. Set $J=\bigcap J_{n}$. By Lemma 73.4.7 we see that $R / J=$ $\lim R / J_{n}=\lim A_{n}=S$ and that the ideals $J_{n} / J=I_{n}$ define the m-adic topology. (Note that for each $n$ we have $\mathfrak{m}_{R}^{N_{n}} \subset J_{n}$ for some $N_{n}$ and not necessarily $N_{n}=n$, so a renumbering of the ideals $J_{n}$ may be necessary before applying the lemma.)

06SG Lemma 73.4.9. Let $R^{\prime}, R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$. Suppose that $R=R^{\prime} \oplus I$ for some ideal $I$ of $R$. Let $x_{1}, \ldots, x_{r} \in I$ map to a basis of $I / \mathfrak{m}_{R} I$. Set $S=R^{\prime}\left[\left[X_{1}, \ldots, X_{r}\right]\right]$ and consider the $R^{\prime}$-algebra map $S \rightarrow R$ mapping $X_{i}$ to $x_{i}$. Assume that for every $n \gg 0$ the map $S / \mathfrak{m}_{S}^{n} \rightarrow R / \mathfrak{m}_{R}^{n}$ has a left inverse in $\mathcal{C}_{\Lambda}$. Then $S \rightarrow R$ is an isomorphism.

Proof. As $R=R^{\prime} \oplus I$ we have

$$
\mathfrak{m}_{R} / \mathfrak{m}_{R}^{2}=\mathfrak{m}_{R^{\prime}} / \mathfrak{m}_{R^{\prime}}^{2} \oplus I / \mathfrak{m}_{R} I
$$

and similarly

$$
\mathfrak{m}_{R} / \mathfrak{m}_{R}^{2}=\mathfrak{m}_{R^{\prime}} / \mathfrak{m}_{R^{\prime}}^{2} \oplus \bigoplus k X_{i}
$$

Hence for $n>1$ the map $S / \mathfrak{m}_{S}^{n} \rightarrow R / \mathfrak{m}_{R}^{n}$ induces an isomorphism on cotangent spaces. Thus a left inverse $h_{n}: R / \mathfrak{m}_{R}^{n} \rightarrow S / \mathfrak{m}_{S}^{n}$ is surjective by Lemma 73.4.2. Since $h_{n}$ is injective as a left inverse it is an isomorphism. Thus the canonical surjections $S / \mathfrak{m}_{S}^{n} \rightarrow R / \mathfrak{m}_{R}^{n}$ are all isomorphisms and we win.

### 73.5. Categories cofibered in groupoids

06GA In developing the theory we work with categories cofibered in groupoids. We assume as known the definition and basic properties of categories fibered in groupoids, see Categories, Section 4.34

06GJ Definition 73.5.1. Let $\mathcal{C}$ be a category. A category cofibered in groupoids over $\mathcal{C}$ is a category $\mathcal{F}$ equipped with a functor $p: \mathcal{F} \rightarrow \mathcal{C}$ such that $\mathcal{F}^{o p p}$ is a category fibered in groupoids over $\mathcal{C}^{o p p}$ via $p^{o p p}: \mathcal{F}^{o p p} \rightarrow \mathcal{C}^{o p p}$.

Explicitly, $p: \mathcal{F} \rightarrow \mathcal{C}$ is cofibered in groupoids if the following two conditions hold:
(1) For every morphism $f: U \rightarrow V$ in $\mathcal{C}$ and every object $x$ lying over $U$, there is a morphism $x \rightarrow y$ of $\mathcal{F}$ lying over $f$.
(2) For every pair of morphisms $a: x \rightarrow y$ and $b: x \rightarrow z$ of $\mathcal{F}$ and any morphism $f: p(y) \rightarrow p(z)$ such that $p(b)=f \circ p(a)$, there exists a unique morphism $c: y \rightarrow z$ of $\mathcal{F}$ lying over $f$ such that $b=c \circ a$.

06GK Remarks 73.5.2. Everything about categories fibered in groupoids translates directly to the cofibered setting. The following remarks are meant to fix notation. Let $\mathcal{C}$ be a category.
(1) We often omit the functor $p: \mathcal{F} \rightarrow \mathcal{C}$ from the notation.
(2) The fiber category over an object $U$ in $\mathcal{C}$ is denoted by $\mathcal{F}(U)$. Its objects are those of $\mathcal{F}$ lying over $U$ and its morphisms are those of $\mathcal{F}$ lying over $\mathrm{id}_{U}$. If $x, y$ are objects of $\mathcal{F}(U)$, we sometimes write $\operatorname{Mor}_{U}(x, y)$ for $\operatorname{Mor}_{\mathcal{F}(U)}(x, y)$.
(3) The fibre categories $\mathcal{F}(U)$ are groupoids, see Categories, Lemma 4.34.2. Hence the morphisms in $\mathcal{F}(U)$ are all isomorphisms. We sometimes write $\operatorname{Aut}_{U}(x)$ for $\operatorname{Mor}_{\mathcal{F}(U)}(x, x)$.
06SH
(4) Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}$, let $f: U \rightarrow V$ be a morphism in $\mathcal{C}$, and let $x \in \operatorname{Ob}(\mathcal{F}(U))$. A pushforward of $x$ along $f$ is a morphism $x \rightarrow y$ of $\mathcal{F}$ lying over $f$. A pushforward is unique up to unique isomorphism (see the discussion following Categories, Definition 4.32.1). We sometimes write $x \rightarrow f_{*} x$ for "the" pushforward of $x$ along $f$.
(5) A choice of pushforwards for $\mathcal{F}$ is the choice of a pushforward of $x$ along $f$ for every pair $(x, f)$ as above. We can make such a choice of pushforwards for $\mathcal{F}$ by the axiom of choice.
(6) Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}$. Given a choice of pushforwards for $\mathcal{F}$, there is an associated pseudo-functor $\mathcal{C} \rightarrow$ Groupoids. We will never use this construction so we give no details.

06GL

06GM

06GN

07W5

06GP

06GQ

06SI

06GR
(7) A morphism of categories cofibered in groupoids over $\mathcal{C}$ is a functor commuting with the projections to $\mathcal{C}$. If $\mathcal{F}$ and $\mathcal{F}^{\prime}$ are categories cofibered in groupoids over $\mathcal{C}$, we denote the morphisms from $\mathcal{F}$ to $\mathcal{F}^{\prime}$ by $\operatorname{Mor}_{\mathcal{C}}\left(\mathcal{F}, \mathcal{F}^{\prime}\right)$.
(8) Categories cofibered in groupoids form a $(2,1)$-category $\operatorname{Cof}(\mathcal{C})$. Its 1morphisms are the morphisms described in (7). If $p: \mathcal{F} \rightarrow C$ and $p^{\prime}:$ $\mathcal{F}^{\prime} \rightarrow \mathcal{C}$ are categories cofibered in groupoids and $\varphi, \psi: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ are 1morphisms, then a 2 -morphism $t: \varphi \rightarrow \psi$ is a morphism of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{F})$.
(9) Let $F: \mathcal{C} \rightarrow$ Groupoids be a functor. There is a category cofibered in groupoids $\mathcal{F} \rightarrow \mathcal{C}$ associated to $F$ as follows. An object of $\mathcal{F}$ is a pair $(U, x)$ where $U \in \mathrm{Ob}(\mathcal{C})$ and $x \in \mathrm{Ob}(F(U))$. A morphism $(U, x) \rightarrow(V, y)$ is a pair $(f, a)$ where $f \in \operatorname{Mor}_{\mathcal{C}}(U, V)$ and $a \in \operatorname{Mor}_{F(V)}(F(f)(x), y)$. The functor $\mathcal{F} \rightarrow \mathcal{C}$ sends $(U, x)$ to $U$. See Categories, Section 4.36
(10) Let $\mathcal{F}$ be cofibered in groupoids over $\mathcal{C}$. For $U \in \operatorname{Ob}(\mathcal{C})$ set $\overline{\mathcal{F}}(U)$ equal to the set of isomorphisms classes of the category $\mathcal{F}(U)$. If $f: U \rightarrow V$ is a morphism of $\mathcal{C}$, then we obtain a map of sets $\overline{\mathcal{F}}(U) \rightarrow \overline{\mathcal{F}}(V)$ by mapping the isomorphism class of $x$ to the isomorphism class of a pushforward $f_{*} x$ of $x$ see (4). Then $\overline{\mathcal{F}}: \mathcal{C} \rightarrow$ Sets is a functor. Similarly, if $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of cofibered categories, we denote by $\bar{\varphi}: \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ the associated morphism of functors.
(11) Let $F: \mathcal{C} \rightarrow$ Sets be a functor. We can think of a set as a discrete category, i.e., as a groupoid with only identity morphisms. Then the construction (9) associates to $F$ a category cofibered in sets. This defines a fully faithful embedding of the category of functors $\mathcal{C} \rightarrow$ Sets to the category of categories cofibered in groupoids over $\mathcal{C}$. We identify the category of functors with its image under this embedding. Hence if $F$ : $\mathcal{C} \rightarrow$ Sets is a functor, we denote the associated category cofibered in sets also by $F$; and if $\varphi: F \rightarrow G$ is a morphism of functors, we denote still by $\varphi$ the corresponding morphism of categories cofibered in sets, and vice-versa. See Categories, Section 4.37.
(12) Let $U$ be an object of $\mathcal{C}$. We write $\underline{U}$ for the functor $\operatorname{Mor}_{\mathcal{C}}(U,-): \mathcal{C} \rightarrow$ Sets. This defines a fully faithful embedding of $\mathcal{C}^{o p p}$ into the category of functors $\mathcal{C} \rightarrow$ Sets. Hence, if $f: U \rightarrow V$ is a morphism, we are justified in denoting still by $f$ the induced morphism $\underline{V} \rightarrow \underline{U}$, and vice-versa.
(13) Fiber products of categories cofibered in groupoids: If $\mathcal{F} \rightarrow \mathcal{H}$ and $\mathcal{G} \rightarrow$ $\mathcal{H}$ are morphisms of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$, then a construction of their 2-fiber product is given by the construction for their 2 -fiber product as categories over $\mathcal{C}_{\Lambda}$, as described in Categories, Lemma 4.31 .3 .
(14) Restricting the base category: Let $p: \mathcal{F} \rightarrow \mathcal{C}$ be a category cofibered in groupoids, and let $\mathcal{C}^{\prime}$ be a full subcategory of $\mathcal{C}$. The restriction $\left.\mathcal{F}\right|_{\mathcal{C}^{\prime}}$ is the
full subcategory of $\mathcal{F}$ whose objects lie over objects of $\mathcal{C}^{\prime}$. It is a category cofibered in groupoids via the functor $\left.p\right|_{\mathcal{C}^{\prime}}:\left.\mathcal{F}\right|_{\mathcal{C}^{\prime}} \rightarrow \mathcal{C}^{\prime}$.

### 73.6. Prorepresentable functors and predeformation categories

06GI Our basic goal is to understand categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$ and $\widehat{\mathcal{C}}_{\Lambda}$. Since $\mathcal{C}_{\Lambda}$ is a full subcategory of $\widehat{\mathcal{C}}_{\Lambda}$ we can restrict categories cofibred in groupoids over $\widehat{\mathcal{C}}_{\Lambda}$ to $\mathcal{C}_{\Lambda}$, see Remarks 73.5.2 14). In particular we can do this with functors, in particular with representable functors. The functors on $\mathcal{C}_{\Lambda}$ one obtains in this way are called prorepresentable functors.

06GX Definition 73.6.1. Let $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a functor. We say $F$ is prorepresentable if there exists an isomorphism $\left.F \cong \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ of functors for some $R \in \mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$.

Note that if $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets is prorepresentable by $R \in \mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$, then

$$
F(k)=\operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(R, k)=\{*\}
$$

is a singleton. The categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$ that are arise in deformation theory will often satisfy an analogous condition.

06GS Definition 73.6.2. A predeformation category $\mathcal{F}$ is a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ such that $\mathcal{F}(k)$ is equivalent to a category with a single object and a single morphism, i.e., $\mathcal{F}(k)$ contains at least one object and there is a unique morphism between any two objects. A morphism of predeformation categories is a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$.

A feature of a predeformation category is the following. Let $x_{0} \in \mathrm{Ob}(\mathcal{F}(k))$. Then every object of $\mathcal{F}$ comes equipped with a unique morphism to $x_{0}$. Namely, if $x$ is an object of $\mathcal{F}$ over $A$, then we can choose a pushforward $x \rightarrow q_{*} x$ where $q: A \rightarrow k$ is the quotient map. There is a unique isomorphism $q_{*} x \rightarrow x_{0}$ and the composition $x \rightarrow q_{*} x \rightarrow x_{0}$ is the desired morphism.

06GT Remark 73.6.3. We say that a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets is a predeformation functor if the associated cofibered set is a predeformation category, i.e. if $F(k)$ is a one element set. Thus if $\mathcal{F}$ is a predeformation category, then $\overline{\mathcal{F}}$ is a predeformation functor.

06GU Remark 73.6.4. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids, and let $x \in \operatorname{Ob}(\mathcal{F}(k))$. We denote by $\mathcal{F}_{x}$ the category of objects over $x$. An object of $\mathcal{F}_{x}$ is an arrow $y \rightarrow x$. A morphism $(y \rightarrow x) \rightarrow(z \rightarrow x)$ in $\mathcal{F}_{x}$ is a commutative diagram

There is a forgetful functor $\mathcal{F}_{x} \rightarrow \mathcal{F}$. We define the functor $p_{x}: \mathcal{F}_{x} \rightarrow \mathcal{C}_{\Lambda}$ as the composition $\mathcal{F}_{x} \rightarrow \mathcal{F} \xrightarrow{p} \mathcal{C}_{\Lambda}$. Then $p_{x}: \mathcal{F}_{x} \rightarrow \mathcal{C}_{\Lambda}$ is a predeformation category (proof omitted). In this way we can pass from an arbitrary category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ to a predeformation category at any $x \in \operatorname{Ob}(\mathcal{F}(k))$.

### 73.7. Formal objects and completion categories

06 H 2 In this section we discuss how to go between categories cofibred in groupoids over $\mathcal{C}_{\Lambda}$ to categories cofibred in groupoids over $\widehat{\mathcal{C}}_{\Lambda}$ and vice versa.

06H3 Definition 73.7.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. The category $\widehat{\mathcal{F}}$ of formal objects of $\mathcal{F}$ is the category with the following objects and morphisms.
(1) A formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\mathcal{F}$ consists of an object $R$ of $\widehat{\mathcal{C}}_{\Lambda}$, and a collection indexed by $n \in \mathbf{N}$ of objects $\xi_{n}$ of $\mathcal{F}\left(R / \mathfrak{m}_{R}^{n}\right)$ and morphisms $f_{n}: \xi_{n+1} \rightarrow \xi_{n}$ lying over the projection $R / \mathfrak{m}_{R}^{n+1} \rightarrow R / \mathfrak{m}_{R}^{n}$.
(2) Let $\xi=\left(R, \xi_{n}, f_{n}\right)$ and $\eta=\left(S, \eta_{n}, g_{n}\right)$ be formal objects of $\mathcal{F}$. A morphism $a: \xi \rightarrow \eta$ of formal objects consists of a map $a_{0}: R \rightarrow S$ in $\widehat{\mathcal{C}}_{\Lambda}$ and a collection $a_{n}: \xi_{n} \rightarrow \eta_{n}$ of morphisms of $\mathcal{F}$ lying over $R / \mathfrak{m}_{R}^{n} \rightarrow S / \mathfrak{m}_{S}^{n}$, such that for every $n$ the diagram

commutes.
The category of formal objects comes with a functor $\widehat{p}: \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_{\Lambda}$ which sends an $\operatorname{object}\left(R, \xi_{n}, f_{n}\right)$ to $R$ and a morphism $\left(R, \xi_{n}, f_{n}\right) \rightarrow\left(S, \eta_{n}, g_{n}\right)$ to the map $R \rightarrow S$.

06H4 Lemma 73.7.2. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids. Then $\widehat{p}: \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_{\Lambda}$ is a category cofibered in groupoids.

Proof. Let $R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_{\Lambda}$. Let $\left(R, \xi_{n}, f_{n}\right)$ be an object of $\widehat{\mathcal{F}}$. For each $n$ choose a pushforward $\xi_{n} \rightarrow \eta_{n}$ of $\xi_{n}$ along $R / \mathfrak{m}_{R}^{n} \rightarrow S / \mathfrak{m}_{S}^{n}$. For each $n$ there exists a unique morphism $g_{n}: \eta_{n+1} \rightarrow \eta_{n}$ in $\mathcal{F}$ lying over $S / \mathfrak{m}_{S}^{n+1} \rightarrow S / \mathfrak{m}_{S}^{n}$ such that

commutes (by the first axiom of a category cofibred in groupoids). Hence we obtain a morphism $\left(R, \xi_{n}, f_{n}\right) \rightarrow\left(S, \eta_{n}, g_{n}\right)$ lying over $R \rightarrow S$, i.e., the first axiom of a category cofibred in groupoids holds for $\widehat{\mathcal{F}}$. To see the second axiom suppose that we have morphisms $a:\left(R, \xi_{n}, f_{n}\right) \rightarrow\left(S, \eta_{n}, g_{n}\right)$ and $b:\left(R, \xi_{n}, f_{n}\right) \rightarrow\left(T, \theta_{n}, h_{n}\right)$ in $\widehat{\mathcal{F}}$ and a morphism $c_{0}: S \rightarrow T$ in $\widehat{\mathcal{C}}_{\Lambda}$ such that $c_{0} \circ a_{0}=b_{0}$. By the second axiom of a category cofibred in groupoids for $\mathcal{F}$ we obtain unique maps $c_{n}: \eta_{n} \rightarrow \theta_{n}$ lying over $S / \mathfrak{m}_{S}^{n} \rightarrow T / \mathfrak{m}_{T}^{n}$ such that $c_{n} \circ a_{n}=b_{n}$. Setting $c=\left(c_{n}\right)_{n \geq 0}$ gives the desired morphism $c:\left(S, \eta_{n}, g_{n}\right) \rightarrow\left(T, \theta_{n}, h_{n}\right)$ in $\widehat{\mathcal{F}}$ (we omit the verification that $\left.h_{n} \circ c_{n+1}=c_{n} \circ g_{n}\right)$.

06H5 Definition 73.7.3. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids. The category cofibered in groupoids $\widehat{p}: \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{C}}_{\Lambda}$ is called the completion of $\mathcal{F}$.

If $\mathcal{F}$ is a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$, we have defined $\widehat{\mathcal{F}}(R)$ for $R \in$ $\mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ in terms of the filtration of $R$ by powers of its maximal ideal. But suppose $\mathcal{I}=\left(I_{n}\right)$ is a filtration of $R$ by ideals inducing the $\mathfrak{m}_{R}$-adic topology. We define $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ to be the category with the following objects and morphisms:
(1) An object is a collection $\left(\xi_{n}, f_{n}\right)_{n \in \mathbf{N}}$ of objects $\xi_{n}$ of $\mathcal{F}\left(R / I_{n}\right)$ and morphisms $f_{n}: \xi_{n+1} \rightarrow \xi_{n}$ lying over the projections $R / I_{n+1} \rightarrow R / I_{n}$.
(2) A morphism $a:\left(\xi_{n}, f_{n}\right) \rightarrow\left(\eta_{n}, g_{n}\right)$ consists of a collection $a_{n}: \xi_{n} \rightarrow \eta_{n}$ of morphisms in $\mathcal{F}\left(R / I_{n}\right)$, such that for every $n$ the diagram

commutes.
06H6 Lemma 73.7.4. In the situation above, $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ is equivalent to the category $\widehat{\mathcal{F}}(R)$. Proof. An equivalence $\widehat{\mathcal{F}}_{\mathcal{I}}(R) \rightarrow \widehat{\mathcal{F}}(R)$ can be defined as follows. For each $n$, let $m(n)$ be the least $m$ that $I_{m} \subset \mathfrak{m}_{R}^{n}$. Given an object $\left(\xi_{n}, f_{n}\right)$ of $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$, let $\eta_{n}$ be the pushforward of $\xi_{m(n)}$ along $R / I_{m(n)} \rightarrow R / \mathfrak{m}_{R}^{n}$. Let $g_{n}: \eta_{n+1} \rightarrow \eta_{n}$ be the unique morphism of $\mathcal{F}$ lying over $R / \mathfrak{m}_{R}^{n+1} \rightarrow R / \mathfrak{m}_{R}^{n}$ such that

commutes (existence and uniqueness is guaranteed by the axioms of a cofibred category). The functor $\widehat{\mathcal{F}}_{\mathcal{I}}(R) \rightarrow \widehat{\mathcal{F}}(R)$ sends $\left(\xi_{n}, f_{n}\right)$ to $\left(R, \eta_{n}, g_{n}\right)$. We omit the verification that this is indeed an equivalence of categories.
06H7 Remark 73.7.5. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids. Suppose that for each $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ we are given a filtration $\mathcal{I}_{R}$ of $R$ by ideals. If $\mathcal{I}_{R}$ induces the $\mathfrak{m}_{R}$-adic topology on $R$ for all $R$, then one can define a category $\widehat{\mathcal{F}}_{\mathcal{I}}$ by mimicking the definition of $\widehat{\mathcal{F}}$. This category comes equipped with a morphism $\widehat{p}_{\mathcal{I}}: \widehat{\mathcal{F}}_{\mathcal{I}} \rightarrow \widehat{\mathcal{C}}_{\Lambda}$ making it into a category cofibered in groupoids such that $\widehat{\mathcal{F}}_{\mathcal{I}}(R)$ is isomorphic to $\widehat{\mathcal{F}}_{\mathcal{I}_{R}}(R)$ as defined above. The categories cofibered in groupoids $\widehat{\mathcal{F}}_{\mathcal{I}}$ and $\widehat{\mathcal{F}}$ are equivalent, by using over an object $R \in \mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ the equivalence of Lemma 73.7.4

06H8 Remark 73.7.6. Let $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a functor. Identifying functors with cofibered sets, the completion of $F$ is the functor $\widehat{F}: \widehat{\mathcal{C}}_{\Lambda} \rightarrow$ Sets given by $\widehat{F}(S)=$ $\lim F\left(S / \mathfrak{m}_{S}^{n}\right)$. This agrees with the definition in Schlessinger's paper Sch68.

06SJ Remark 73.7.7. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. We claim that there is a canonical equivalence

$$
\operatorname{can}:\left.\widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}} \longrightarrow \mathcal{F}
$$

Namely, let $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$ and let $\left(A, \xi_{n}, f_{n}\right)$ be an object of $\left.\widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}}(A)$. Since $A$ is Artinian there is a minimal $m \in \mathbf{N}$ such that $\mathfrak{m}_{A}^{m}=0$. Then can sends $\left(A, \xi_{n}, f_{n}\right)$
to $\xi_{m}$. This functor is an equivalence of categories cofibered in groupoids by Categories, Lemma 4.34 .8 because it is an equivalence on all fibre categories by Lemma 73.7 .4 and the fact that the $\mathfrak{m}_{A}$-adic topology on a local Artinian ring $A$ comes from the zero ideal. We will frequently identify $\mathcal{F}$ with a full subcategory of $\widehat{\mathcal{F}}$ via a quasi-inverse to the functor can.
06H9 Remark 73.7.8. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then there is an induced morphism $\widehat{\varphi}: \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{G}}$ of categories cofibered in groupoids over $\widehat{\mathcal{C}}_{\Lambda}$. It sends an object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\widehat{\mathcal{F}}$ to $\left(R, \varphi\left(\xi_{n}\right), \varphi\left(f_{n}\right)\right)$, and it sends a morphism $\left(a_{0}: R \rightarrow S, a_{n}: \xi_{n} \rightarrow \eta_{n}\right)$ between objects $\xi$ and $\eta$ of $\widehat{\mathcal{F}}$ to $\left(a_{0}: R \rightarrow S, \varphi\left(a_{n}\right): \varphi\left(\xi_{n}\right) \rightarrow \varphi\left(\eta_{n}\right)\right)$. Finally, if $t: \varphi \rightarrow \varphi^{\prime}$ is a 2-morphism between 1-morphisms $\varphi, \varphi^{\prime}: \mathcal{F} \rightarrow \mathcal{G}$ of categories cofibred in groupoids, then we obtain a 2-morphism $\widehat{t}: \widehat{\varphi} \rightarrow \hat{\varphi}^{\prime}$. Namely, for $\xi=\left(R, \xi_{n}, f_{n}\right)$ as above we set $\widehat{t}_{\xi}=\left(t_{\varphi\left(\xi_{n}\right)}\right)$. Hence completion defines a functor between 2-categories

$$
\wedge: \operatorname{Cof}\left(\mathcal{C}_{\Lambda}\right) \longrightarrow \operatorname{Cof}\left(\widehat{\mathcal{C}}_{\Lambda}\right)
$$

from the 2-category of categories cofibred in groupoids over $\mathcal{C}_{\Lambda}$ to the 2-category of categories cofibred in groupoids over $\widehat{\mathcal{C}}_{\Lambda}$.

06HA Remark 73.7.9. We claim the completion functor of Remark 73.7.8 and the restriction functor $\left.\right|_{\mathcal{C}_{\Lambda}}: \operatorname{Cof}\left(\widehat{\mathcal{C}}_{\Lambda}\right) \rightarrow \operatorname{Cof}\left(\mathcal{C}_{\Lambda}\right)$ of Remarks 73.5.2 14) are "2-adjoint" in the following precise sense. Let $\mathcal{F} \in \operatorname{Ob}\left(\operatorname{Cof}\left(\mathcal{C}_{\Lambda}\right)\right)$ and let $\mathcal{G} \in \operatorname{Ob}\left(\operatorname{Cof}\left(\widehat{\mathcal{C}}_{\Lambda}\right)\right)$. Then there is an equivalence of categories

$$
\Phi: \operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right) \longrightarrow \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\mathcal{G}, \widehat{\mathcal{F}})
$$

To describe this equivalence, we define canonical morphisms $\mathcal{G} \rightarrow \widehat{\mathcal{G} \mid \mathcal{C}_{\Lambda}}$ and $\left.\widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}} \rightarrow$ $\mathcal{F}$ as follows
(1) Let $\left.R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)\right)$ and let $\xi$ be an object of the fiber category $\mathcal{G}(R)$. Choose a pushforward $\xi \rightarrow \xi_{n}$ of $\xi$ to $R / \mathfrak{m}_{R}^{n}$ for each $n \in \mathbf{N}$, and let $f_{n}: \xi_{n+1} \rightarrow \xi_{n}$ be the induced morphism. Then $\mathcal{G} \rightarrow \widehat{\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}}}$ sends $\xi$ to $\left(R, \xi_{n}, f_{n}\right)$.
(2) This is the equivalence can: $\left.\widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ of Remark 73.7.7.

Having said this, the equivalence $\Phi: \operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right) \rightarrow \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\mathcal{G}, \widehat{\mathcal{F}})$ sends a mor$\operatorname{phism} \varphi:\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ to

$$
\mathcal{G} \rightarrow \widehat{\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}}} \xrightarrow{\widehat{\varphi}} \widehat{\mathcal{F}}
$$

There is a quasi-inverse $\Psi: \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\mathcal{G}, \widehat{\mathcal{F}}) \rightarrow \operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right)$ to $\Phi$ which sends $\psi: \mathcal{G} \rightarrow \widehat{\mathcal{F}}$ to

$$
\left.\left.\mathcal{G}\right|_{\mathcal{C}_{\Lambda}} \xrightarrow{\left.\psi\right|_{\mathcal{C}_{\Lambda}}} \widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}
$$

We omit the verification that $\Phi$ and $\Psi$ are quasi-inverse. We also do not address functoriality of $\Phi$ (because it would lead into 3-category territory which we want to avoid at all cost).
06 HB Remark 73.7.10. For a category $\mathcal{C}$ we denote by $\operatorname{CofSet}(\mathcal{C})$ the category of cofibered sets over $\mathcal{C}$. It is a 1-category isomorphic the category of functors $\mathcal{C} \rightarrow$ Sets. See Remarks 73.5 .2 11). The completion and restriction functors restrict to functors ${ }^{\wedge}: \operatorname{CofSet}\left(\mathcal{C}_{\Lambda}\right) \rightarrow \operatorname{CofSet}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ and $\left.\right|_{\mathcal{C}_{\Lambda}}: \operatorname{CofSet}\left(\widehat{\mathcal{C}}_{\Lambda}\right) \rightarrow \operatorname{CofSet}\left(\mathcal{C}_{\Lambda}\right)$ which we denote by the same symbols. As functors on the categories of cofibered sets,
completion and restriction are adjoints in the usual 1-categorical sense: the same construction as in Remark 73.7.9 defines a functorial bijection

$$
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.G\right|_{\mathcal{C}_{\Lambda}}, F\right) \longrightarrow \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(G, \widehat{F})
$$

for $F \in \operatorname{Ob}\left(\operatorname{CofSet}\left(\mathcal{C}_{\Lambda}\right)\right)$ and $G \in \operatorname{Ob}\left(\operatorname{CofSet}\left(\widehat{\mathcal{C}}_{\Lambda}\right)\right)$. Again the map $\left.\widehat{F}\right|_{\mathcal{C}_{\Lambda}} \rightarrow F$ is an isomorphism.

06HE Remark 73.7.11. Let $G: \widehat{\mathcal{C}}_{\Lambda} \rightarrow$ Sets be a functor that commutes with limits. Then the $\operatorname{map} G \rightarrow \widehat{\left.G\right|_{\mathcal{C}_{\Lambda}}}$ described in Remark 73.7 .9 is an isomorphism. Indeed, if $S$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$, then we have canonical bijections

$$
\widehat{\left.G\right|_{\mathcal{C}_{\Lambda}}}(S)=\lim _{n} G\left(S / \mathfrak{m}_{S}^{n}\right)=G\left(\lim _{n} S / \mathfrak{m}_{S}^{n}\right)=G(S)
$$

In particular, if $R$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$ then $\underline{R}=\left.\widehat{R}\right|_{\mathcal{C}_{\Lambda}}$ because the representable functor $\underline{R}$ commutes with limits by definition of limits.

06 HC Remark 73.7.12. Let $R$ be an object of $\widehat{\mathcal{C}}_{\Lambda}$. It defines a functor $\underline{R}: \widehat{\mathcal{C}}_{\Lambda} \rightarrow$ Sets as described in Remarks 73.5 .2 12). As usual we identify this functor with the associated cofibered set. If $\mathcal{F}$ is a cofibered category over $\mathcal{C}_{\Lambda}$, then there is an equivalence of categories
06SK

$$
\begin{equation*}
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right) \longrightarrow \widehat{\mathcal{F}}(R) \tag{73.7.12.1}
\end{equation*}
$$

It is given by the composition

$$
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right) \xrightarrow{\Phi} \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\sim} \widehat{\mathcal{F}}(R)
$$

where $\Phi$ is as in Remark 73.7 .9 and the second equivalence comes from the 2 Yoneda lemma (the cofibered analogue of Categories, Lemma 4.40.1). Explicitly, the equivalence sends a morphism $\varphi:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ to the formal object $(R, \varphi(R \rightarrow$ $\left.\left.R / \mathfrak{m}_{R}^{n}\right), \varphi\left(f_{n}\right)\right)$ in $\widehat{\mathcal{F}}(R)$, where $f_{n}: R / \mathfrak{m}_{R}^{n+1} \rightarrow R / \mathfrak{m}_{R}^{n}$ is the projection.

Assume a choice of pushforwards for $\mathcal{F}$ has been made. Given any $\xi \in \operatorname{Ob}(\widehat{\mathcal{F}}(R))$ we construct an explicit $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ which maps to $\xi$ under 73.7 .12 .1 . Namely, say $\xi=\left(R, \xi_{n}, f_{n}\right)$. An object $\alpha$ in $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is the same thing as a morphism $\alpha: R \rightarrow A$ of $\widehat{\mathcal{C}}_{\Lambda}$ with $A$ Artinian. Let $m \in \mathbf{N}$ be minimal such that $\mathfrak{m}_{A}^{m}=0$. Then $\alpha$ factors through a unique $\alpha_{m}: R / \mathfrak{m}_{R}^{m} \rightarrow A$ and we can set $\underline{\xi}(\alpha)=\alpha_{m, *} \xi_{m}$. We omit the description of $\underline{\xi}$ on morphisms and we omit the proof that $\underline{\xi}$ maps to $\xi$ via 73.7.12.1).

Assume a choice of pushforwards for $\widehat{\mathcal{F}}$ has been made. In this case the proof of Categories, Lemma 4.40.1 gives an explicit quasi-inverse

$$
\iota: \widehat{\mathcal{F}}(R) \longrightarrow \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\underline{R}, \widehat{\mathcal{F}})
$$

to the 2-Yoneda equivalence which takes $\xi$ to the morphism $\iota(\xi): \underline{R} \rightarrow \widehat{\mathcal{F}}$ sending $f \in \underline{R}(S)=\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(R, S)$ to $f_{*} \xi$. A quasi-inverse to $(73.7 .12 .1)$ is then

$$
\widehat{\mathcal{F}}(R) \xrightarrow{\iota} \operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\Psi} \operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}, \mathcal{F}\right)
$$

where $\Psi$ is as in Remark 73.7.9. Given $\xi \in \operatorname{Ob}(\widehat{\mathcal{F}}(R))$ we have $\Psi(\iota(\xi)) \cong \underline{\xi}$ where $\underline{\xi}$ is as in the previous paragraph, because both are mapped to $\xi$ under the equivalence of categories 73.7.12.1). Using $\underline{R}=\left.\widehat{R}\right|_{\mathcal{C}_{\Lambda}}$ (see Remark 73.7.11) and unwinding the definitions of $\Phi$ and $\Psi$ we conclude that $\iota(\xi)$ is isomorphic to the completion of $\underline{\xi}$.

06SL Remark 73.7.13. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. Let $\xi=$ $\left(R, \xi_{i}, f_{n}\right)$ and $\eta=\left(S, \eta_{n}, g_{n}\right)$ be formal objects of $\mathcal{F}$. Let $a=\left(a_{n}\right): \xi \rightarrow \eta$ be a morphism of formal objects, i.e., a morphism of $\widehat{\mathcal{F}}$. Let $f=\widehat{p}(a)=a_{0}: R \rightarrow S$ be the projection of $a$ in $\widehat{\mathcal{C}}_{\Lambda}$. Then we obtain a 2 -commutative diagram

where $\underline{\xi}$ and $\underline{\eta}$ are the morphisms constructed in Remark 73.7.12. To see this let $\alpha: S \xrightarrow{-} A$ be an object of $\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}}$ (see loc. cit.). Let $m \in \mathbf{N}$ be minimal such that $\mathfrak{m}_{A}^{m}=0$. We get a commutative diagram

such that the bottom arrows compose to give $\alpha$. Then $\eta(\alpha)=\alpha_{m, *} \eta_{m}$ and $\xi(\alpha \circ f)=$ $\beta_{m, *} \xi_{m}$. The morphism $a_{m}: \xi_{m} \rightarrow \eta_{m}$ lies over $f_{m} \overline{\text { hence }}$ we obtain a canonical morphism

$$
\underline{\xi}(\alpha \circ f)=\beta_{m, *} \xi_{m} \longrightarrow \underline{\eta}(\alpha)=\alpha_{m, *} \eta_{m}
$$

lying over $\mathrm{id}_{A}$ such that

commutes by the axioms of a category cofibred in groupoids. This defines a transformation of functors $\underline{\xi} \circ f \rightarrow \underline{\eta}$ which witnesses the 2-commutativity of the first diagram of this remark.

06HD Remark 73.7.14. According to Remark 73.7.12 giving a formal object $\xi$ of $\mathcal{F}$ is equivalent to giving a prorepresentable functor $U: \mathcal{C}_{\Lambda} \rightarrow$ Sets and a morphism $U \rightarrow \mathcal{F}$.

### 73.8. Smooth morphisms

06 HF In this section we discuss smooth morphisms of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$.

06HG Definition 73.8.1. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. We say $\varphi$ is smooth if it satisfies the following condition: Let $B \rightarrow A$ be a surjective ring map in $\mathcal{C}_{\Lambda}$. Let $y \in \operatorname{Ob}(\mathcal{G}(B)), x \in \operatorname{Ob}(\mathcal{F}(A))$, and $y \rightarrow \varphi(x)$ be a morphism lying over $B \rightarrow A$. Then there exists $x^{\prime} \in \operatorname{Ob}(\mathcal{F}(B))$, a morphism $x^{\prime} \rightarrow x$ lying over $B \rightarrow A$, and a morphism $\varphi\left(x^{\prime}\right) \rightarrow y$ lying over
id $: B \rightarrow B$, such that the diagram

commutes.
06HH Lemma 73.8.2. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then $\varphi$ is smooth if the condition in Definition 73.8.1 is assumed to hold only for small extensions $B \rightarrow A$.

Proof. Let $B \rightarrow A$ be a surjective ring map in $\mathcal{C}_{\Lambda}$. Let $y \in \operatorname{Ob}(\mathcal{G}(B)), x \in$ $\mathrm{Ob}(\mathcal{F}(A))$, and $y \rightarrow \varphi(x)$ be a morphism lying over $B \rightarrow A$. By Lemma 73.3.3 we can factor $B \rightarrow A$ into small extensions $B=B_{n} \rightarrow B_{n-1} \rightarrow \ldots \rightarrow B_{0}=A$. We argue by induction on $n$. If $n=1$ the result is true by assumption. If $n>1$, then denote $f: B=B_{n} \rightarrow B_{n-1}$ and denote $g: B_{n-1} \rightarrow B_{0}=A$. Choose a pushforward $y \rightarrow f_{*} y$ of $y$ along $f$, so that the morphism $y \rightarrow \varphi(x)$ factors as $y \rightarrow f_{*} y \rightarrow \varphi(x)$. By the induction hypothesis we can find $x_{n-1} \rightarrow x$ lying over $g: B_{n-1} \rightarrow A$ and $a: \varphi\left(x_{n-1}\right) \rightarrow f_{*} y$ lying over id : $B_{n-1} \rightarrow B_{n-1}$ such that

commutes. We can apply the assumption to the composition $y \rightarrow \varphi\left(x_{n-1}\right)$ of $y \rightarrow f_{*} y$ with $a^{-1}: f_{*} y \rightarrow \varphi\left(x_{n-1}\right)$. We obtain $x_{n} \rightarrow x_{n-1}$ lying over $B_{n} \rightarrow B_{n-1}$ and $\varphi\left(x_{n}\right) \rightarrow y$ lying over id : $B_{n} \rightarrow B_{n}$ so that the diagram

commutes. Then the composition $x_{n} \rightarrow x_{n-1} \rightarrow x$ and $\varphi\left(x_{n}\right) \rightarrow y$ are the morphisms required by the definition of smoothness.

06HI Remark 73.8.3. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $B \rightarrow A$ be a ring map in $\mathcal{C}_{\Lambda}$. Choices of pushforwards along $B \rightarrow A$ for objects in the fiber categories $\mathcal{F}(B)$ and $\mathcal{G}(B)$ determine functors $\mathcal{F}(B) \rightarrow \mathcal{F}(A)$ and $\mathcal{G}(B) \rightarrow \mathcal{G}(A)$ fitting into a 2-commutative diagram

Hence there is an induced functor $\mathcal{F}(B) \rightarrow \mathcal{F}(A) \times_{\mathcal{G}(A)} \mathcal{G}(B)$. Unwinding the definitions shows that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is smooth if and only if this induced functor is essentially surjective whenever $B \rightarrow A$ is surjective (or equivalently, by Lemma 73.8.2, whenever $B \rightarrow A$ is a small extension).

06HJ Remark 73.8.4. The characterization of smooth morphisms in Remark 73.8.3 is analogous to Schlessinger's notion of a smooth morphism of functors, cf. Sch68, Definition 2.2.]. In fact, when $\mathcal{F}$ and $\mathcal{G}$ are cofibered in sets then our notion is equivalent to Schlessinger's. Namely, in this case let $F, G: \mathcal{C}_{\Lambda} \rightarrow$ Sets be the corresponding functors, see Remarks 73.5 .2 11). Then $F \rightarrow G$ is smooth if and only if for every surjection of rings $B \rightarrow A$ in $\mathcal{C}_{\Lambda}$ the map $F(B) \rightarrow F(A) \times{ }_{G(A)} G(B)$ is surjective.

06HK Remark 73.8.5. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then the morphism $\mathcal{F} \rightarrow \overline{\mathcal{F}}$ is smooth.

If $R \rightarrow S$ is a ring map $\widehat{\mathcal{C}}_{\Lambda}$, then there is an induced morphism $\underline{S} \rightarrow \underline{R}$ between the functors $\underline{S}, \underline{R}: \widehat{\mathcal{C}}_{\Lambda} \rightarrow$ Sets. In this situation, smoothness of the restriction $\left.\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is a familiar notion:

06 HL Lemma 73.8.6. Let $R \rightarrow S$ be a ring map in $\widehat{\mathcal{C}}_{\Lambda}$. Then the induced morphism $\left.\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth if and only if $S$ is a power series ring over $R$.

Proof. Assume $S$ is a power series ring over $R$. Say $S=R\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Smoothness of $\left.\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ means the following (see Remark 73.8.4): Given a surjective ring map $B \rightarrow A$ in $\mathcal{C}_{\Lambda}$, a ring map $R \rightarrow B$, a ring map $S \rightarrow A$ such that the solid diagram

is commutative then a dotted arrow exists making the diagram commute. (Note the similarity with Algebra, Definition 10.136.1.) To construct the dotted arrow choose elements $b_{i} \in B$ whose images in $A$ are equal to the images of $x_{i}$ in $A$. Note that $b_{i} \in \mathfrak{m}_{B}$ as $x_{i}$ maps to an element of $\mathfrak{m}_{A}$. Hence there is a unique $R$-algebra map $R\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow B$ which maps $x_{i}$ to $b_{i}$ and which can serve as our dotted arrow.

Conversely, assume $\left.\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth. Let $x_{1}, \ldots, x_{n} \in S$ be elements whose images form a basis in the relative cotangent space $\mathfrak{m}_{S} /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right)$ of $S$ over $R$. Set $T=R\left[\left[X_{1}, \ldots, X_{n}\right]\right]$. Note that both

$$
S /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right) \cong R / \mathfrak{m}_{R}\left[x_{1}, \ldots, x_{n}\right] /\left(x_{i} x_{j}\right)
$$

and

$$
T /\left(\mathfrak{m}_{R} T+\mathfrak{m}_{T}^{2}\right) \cong R / \mathfrak{m}_{R}\left[X_{1}, \ldots, X_{n}\right] /\left(X_{i} X_{j}\right)
$$

Let $S /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right) \rightarrow T /\left(\mathfrak{m}_{R} T+\mathfrak{m}_{T}^{2}\right)$ be the local $R$-algebra isomorphism given by mapping the class of $x_{i}$ to the class of $X_{i}$. Let $f_{1}: S \rightarrow T /\left(\mathfrak{m}_{R} T+\mathfrak{m}_{T}^{2}\right)$ be the composition $S \rightarrow S /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right) \rightarrow T /\left(\mathfrak{m}_{R} T+\mathfrak{m}_{T}^{2}\right)$. The assumption that $\left.\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth means we can lift $f_{1}$ to a map $f_{2}: S \rightarrow T / \mathfrak{m}_{T}^{2}$, then to a map $f_{3}: S \rightarrow T / \mathfrak{m}_{T}^{3}$, and so on, for all $n \geq 1$. Thus we get an induced map $f: S \rightarrow T=\lim T / \mathfrak{m}_{T}^{n}$ of local $R$-algebras. By our choice of $f_{1}$, the map $f$
induces an isomorphism $\mathfrak{m}_{S} /\left(\mathfrak{m}_{R} S+\mathfrak{m}_{S}^{2}\right) \rightarrow \mathfrak{m}_{T} /\left(\mathfrak{m}_{R} T+\mathfrak{m}_{T}^{2}\right)$ of relative cotangent spaces. Hence $f$ is surjective by Lemma 73.4.2 (where we think of $f$ as a map in $\widehat{\mathcal{C}}_{R}$ ). Choose preimages $y_{i} \in S$ of $X_{i} \in T$ under $f$. As $T$ is a power series ring over $R$ there exists a local $R$-algebra homomorphism $s: T \rightarrow S$ mapping $X_{i}$ to $y_{i}$. By construction $f \circ s=\mathrm{id}$. Then $s$ is injective. But $s$ induces an isomorphism on relative cotangent spaces since $f$ does, so it is also surjective by Lemma 73.4.2 again. Hence $s$ and $f$ are isomorphisms.

Smooth morphisms satisfy the following functorial properties.
06HM Lemma 73.8.7. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\psi: \mathcal{G} \rightarrow \mathcal{H}$ be morphisms of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$.
(1) If $\varphi$ and $\psi$ are smooth, then $\psi \circ \varphi$ is smooth.
(2) If $\varphi$ is essentially surjective and $\psi \circ \varphi$ is smooth, then $\psi$ is smooth.
(3) If $\mathcal{G}^{\prime} \rightarrow \mathcal{G}$ is a morphism of categories cofibered in groupoids and $\varphi$ is smooth, then $\mathcal{F} \times{ }_{\mathcal{G}} \mathcal{G}^{\prime} \rightarrow \mathcal{G}^{\prime}$ is smooth.

Proof. Statements (1) and (2) follow immediately from the definitions. Proof of (3) omitted. Hints: use the formulation of smoothness given in Remark 73.8.3 and use that $\mathcal{F} \times{ }_{\mathcal{G}} \mathcal{G}^{\prime}$ is the 2 -fibre product, see Remarks 73.5.2 13 ).

06HN Lemma 73.8.8. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a smooth morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Assume $\varphi: \mathcal{F}(k) \rightarrow \mathcal{G}(k)$ is essentially surjective. Then $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\widehat{\varphi}: \widehat{\mathcal{F}} \rightarrow \widehat{\mathcal{G}}$ are essentially surjective.

Proof. Let $y$ be an object of $\mathcal{G}$ lying over $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$. Let $y \rightarrow y_{0}$ be a pushforward of $y$ along $A \rightarrow k$. By the assumption on essential surjectivity of $\varphi: \mathcal{F}(k) \rightarrow$ $\mathcal{G}(k)$ there exist an object $x_{0}$ of $\mathcal{F}$ lying over $k$ and an isomorphism $y_{0} \rightarrow \varphi\left(x_{0}\right)$. Smoothness of $\varphi$ implies there exists an object $x$ of $\mathcal{F}$ over $A$ whose image $\varphi(x)$ is isomorphic to $y$. Thus $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is essentially surjective.
Let $\eta=\left(R, \eta_{n}, g_{n}\right)$ be an object of $\widehat{\mathcal{G}}$. We construct an object $\xi$ of $\widehat{\mathcal{F}}$ with an isomorphism $\eta \rightarrow \varphi(\xi)$. By the assumption on essential surjectivity of $\varphi: \mathcal{F}(k) \rightarrow$ $\mathcal{G}(k)$, there exists a morphism $\eta_{1} \rightarrow \varphi\left(\xi_{1}\right)$ in $\mathcal{G}(k)$ for some $\xi_{1} \in \operatorname{Ob}(\mathcal{F}(k))$. The morphism $\eta_{2} \xrightarrow{g_{1}} \eta_{1} \rightarrow \varphi\left(\xi_{1}\right)$ lies over the surjective ring map $R / \mathfrak{m}_{R}^{2} \rightarrow k$, hence by smoothness of $\varphi$ there exists $\xi_{2} \in \operatorname{Ob}\left(\mathcal{F}\left(R / \mathfrak{m}_{R}^{2}\right)\right)$, a morphism $f_{1}: \xi_{2} \rightarrow \xi_{1}$ lying over $R / \mathfrak{m}_{R}^{2} \rightarrow k$, and a morphism $\eta_{2} \rightarrow \varphi\left(\xi_{2}\right)$ such that

commutes. Continuing in this way we construct an object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\widehat{\mathcal{F}}$ and a morphism $\eta \rightarrow \varphi(\xi)=\left(R, \varphi\left(\xi_{n}\right), \varphi\left(f_{n}\right)\right)$ in $\widehat{\mathcal{G}}(R)$.

06HP Remark 73.8.9. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids. We can consider $\mathcal{C}_{\Lambda}$ as the trivial category cofibered in groupoids over $\mathcal{C}_{\Lambda}$, and then $p$ is a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. We say $\mathcal{F}$ is smooth if its structure morphism $p$ is smooth. This is the "absolute" notion of smoothness for a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$.

06SM Example 73.8.10. Let $R \in \mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$. When is $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ smooth? In the classical case this means that $R$ is a power series ring over $\Lambda$, see Lemma 73.8.6. (Strictly speaking this uses that $\left.\underline{\Lambda}\right|_{\mathcal{C}_{\Lambda}}=\mathcal{C}_{\Lambda}$ because $\Lambda$ is an initial object of $\widehat{\mathcal{C}}_{\Lambda}$ in the classical case.) In the general case we can construct examples as follows. Pick an integer $n \geq 0$ and a maximal ideal $\mathfrak{m} \subset \Lambda\left[x_{1}, \ldots, x_{n}\right]$ lying over $\mathfrak{m}_{\Lambda}$ so that

$$
k^{\prime}=\Lambda / \mathfrak{m}_{\Lambda} \longrightarrow \Lambda\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}
$$

is isomorphic to $k^{\prime} \rightarrow k$. Fix such an identification $k=\Lambda\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}$. Set $R=\Lambda\left[x_{1}, \ldots, x_{n}\right]^{\wedge}$ equal to the $\mathfrak{m}$-adic completion of $\Lambda\left[x_{1}, \ldots, x_{n}\right]$. Then $R$ is an object of $\widehat{\mathcal{C}}_{\Lambda}$. Namely, it is a complete local Noetherian ring (see Algebra, Lemma 10.96.6 and its residue field is identified with $k$. We claim that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth. To see this we have to show: Given a surjection $B \rightarrow A$ in $\mathcal{C}_{\Lambda}$ and a map $R \rightarrow A$ there exists a lift of this map to $B$. This is clear as we can first lift the composition $\Lambda\left[x_{1}, \ldots, x_{n}\right] \rightarrow R \rightarrow A$ to a map $\Lambda\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ and then observe that this latter map factors through the completion $R$ as $B$ is complete (being Artinian). In fact, it turns out that whenever $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth, then $R$ is isomorphic to a completion of a smooth algebra over $\Lambda$, but we won't use this.

06SN Example 73.8.11. Here is a more explicit example of an $R$ as in Example 73.8.10. Let $p$ be a prime number and let $n \in \mathbf{N}$. Let $\Lambda=\mathbf{F}_{p}\left(t_{1}, t_{2}, \ldots, t_{n}\right)$ and let $k=$ $\mathbf{F}_{p}\left(x_{1}, \ldots, x_{n}\right)$ with map $\Lambda \rightarrow k$ given by $t_{i} \mapsto x_{i}^{p}$. Then we can take

$$
R=\Lambda\left[x_{1}, \ldots, x_{n}\right]_{\left(x_{1}^{p}-t_{1}, \ldots, x_{n}^{p}-t_{n}\right)}^{\wedge}
$$

We cannot do "better" in this example, i.e., we cannot approximate $\mathcal{C}_{\Lambda}$ by a smaller smooth object of $\widehat{\mathcal{C}}_{\Lambda}$ (one can argue that the dimension of $R$ has to be at least $n$ since the map $\Omega_{R / \Lambda} \otimes_{R} k \rightarrow \Omega_{k / \Lambda}$ is surjective). We will discuss this phenomenon later in more detail.

06HQ Remark 73.8.12. Suppose $\mathcal{F}$ is a predeformation category admitting a smooth morphism $\varphi: \mathcal{U} \rightarrow \mathcal{F}$ from a predeformation category $\mathcal{U}$. Then by Lemma 73.8.8 $\varphi$ is essentially surjective, so by Lemma 73.8.7 $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ is smooth if and only if the composition $\mathcal{U} \xrightarrow{\varphi} \mathcal{F} \xrightarrow{p} \mathcal{C}_{\Lambda}$ is smooth, i.e. $\mathcal{F}$ is smooth if and only if $\mathcal{U}$ is smooth.

Later we are interested in producing smooth morphisms from prorepresentable functors to predeformation categories $\mathcal{F}$. By the discussion in Remark 73.7 .12 these morphisms correspond to certain formal objects of $\mathcal{F}$ More precisely, these are the so-called versal formal objects of $\mathcal{F}$.

06HR Definition 73.8.13. Let $\mathcal{F}$ be a category cofibered in groupoids. Let $\xi$ be a formal object of $\mathcal{F}$ lying over $R \in \mathrm{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$. We say $\xi$ is versal if the corresponding morphism $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ of Remark 73.7 .12 is smooth.

06HS Remark 73.8.14. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$, and let $\xi$ be a formal object of $\mathcal{F}$. It follows from the definition of smoothness that versality of $\xi$ is equivalent to the following condition: If

is a diagram in $\widehat{\mathcal{F}}$ such that $y \rightarrow x$ lies over a surjective map $B \rightarrow A$ of Artinian rings (we may assume it is a small extension), then there exists a morphism $\xi \rightarrow y$ such that

commutes. In particular, the condition that $\xi$ be versal does not depend on the choices of pushforwards made in the construction of $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ in Remark 73.7.12.

06HT Lemma 73.8.15. Let $\mathcal{F}$ be a predeformation category. Let $\xi$ be a versal formal object of $\mathcal{F}$. For any formal object $\eta$ of $\widehat{\mathcal{F}}$, there exists a morphism $\xi \rightarrow \eta$.

Proof. By assumption the morphism $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ is smooth. Then $\iota(\xi): \underline{R} \rightarrow \widehat{\mathcal{F}}$ is the completion of $\underline{\xi}$, see Remark 73.7.12. By Lemma 73.8 .8 there exists an object $f$ of $\underline{R}$ such that $\iota(\xi)(f)=\eta$. Then $f$ is a ring map $f: R \rightarrow S$ in $\widehat{\mathcal{C}}_{\Lambda}$. And $\iota(\xi)(f)=\eta$ means that $f_{*} \xi \cong \eta$ which means exactly that there is a morphism $\xi \rightarrow \eta$ lying over $f$.

### 73.9. Schlessinger's conditions

06 HV In the following we often consider fibre products $A_{1} \times{ }_{A} A_{2}$ of rings in the category $\mathcal{C}_{\Lambda}$. We have seen in Example 73.3 .7 that such a fibre product may not always be an object of $\mathcal{C}_{\Lambda}$. However, in virtually all cases below one of the two maps $A_{i} \rightarrow A$ is surjective and $A_{1} \times{ }_{A} A_{2}$ will be an object of $\mathcal{C}_{\Lambda}$ by Lemma 73.3.8. We will use this result without further mention.

We denote by $k[\epsilon]$ the ring of dual numbers over $k$. More generally, for a $k$-vector space $V$, we denote by $k[V]$ the $k$-algebra whose underlying vector space is $k \oplus V$ and whose multiplication is given by $(a, v) \cdot\left(a^{\prime}, v^{\prime}\right)=\left(a a^{\prime}, a v^{\prime}+a^{\prime} v\right)$. When $V=k$, $k[V]$ is the ring of dual numbers over $k$. For any finite dimensional $k$-vector space $V$ the ring $k[V]$ is in $\mathcal{C}_{\Lambda}$.

06HW Definition 73.9.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. We define conditions (S1) and (S2) on $\mathcal{F}$ as follows:
(S1) Every diagram in $\mathcal{F}$

in $\mathcal{C}_{\Lambda}$ with $A_{2} \rightarrow A$ surjective can be completed to a commutative diagram

(S2) The condition of (S1) holds for diagrams in $\mathcal{F}$ lying over a diagram in $\mathcal{C}_{\Lambda}$ of the form

Moreover, if we have two commutative diagrams in $\mathcal{F}$

then there exists a morphism $b: y \rightarrow y^{\prime}$ in $\mathcal{F}\left(A \times_{k} k[\epsilon]\right)$ such that $a=a^{\prime} \circ b$.
We can partly explain the meaning of conditions (S1) and (S2) in terms of fibre categories. Suppose that $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ are ring maps in $\mathcal{C}_{\Lambda}$ with $f_{2}$ surjective. Denote $p_{i}: A_{1} \times_{A} A_{2} \rightarrow A_{i}$ the projection maps. Assume a choice of pushforwards for $\mathcal{F}$ has been made. Then the commutative diagram of rings translates into a 2 -commutative diagram

of fibre categories whence a functor

$$
\begin{equation*}
\mathcal{F}\left(A_{1} \times_{A} A_{2}\right) \rightarrow \mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right) \tag{73.9.1.1}
\end{equation*}
$$

into the 2-fibre product of categories. Condition (S1) requires that this functor be essentially surjective. The first part of condition (S2) requires that this functor be a essentially surjective if $f_{2}$ equals the map $k[\epsilon] \rightarrow k$. Moreover in this case, the second part of (S2) implies that two objects which become isomorphic in the target are isomorphic in the source (but it is not equivalent to this statement). The advantage of stating the conditions as in the definition is that no choices have to be made.
06HX Lemma 73.9.2. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then $\mathcal{F}$ satisfies (S1) if the condition of (S1) is assumed to hold only when $A_{2} \rightarrow A$ is a small extension.

Proof. Proof omitted. Hints: apply Lemma 73.3 .3 and use induction similar to the proof of Lemma 73.8.2.

06HY Remark 73.9.3. When $\mathcal{F}$ is cofibered in sets, conditions (S1) and (S2) are exactly conditions (H1) and (H2) from Schlessinger's paper Sch68. Namely, for a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets, conditions (S1) and (S2) state:
(S1) If $A_{1} \rightarrow A$ and $A_{2} \rightarrow A$ are maps in $\mathcal{C}_{\Lambda}$ with $A_{2} \rightarrow A$ surjective, then the induced map $F\left(A_{1} \times_{A} A_{2}\right) \rightarrow F\left(A_{1}\right) \times_{F(A)} F\left(A_{2}\right)$ is surjective.
(S2) If $A \rightarrow k$ is a map in $\mathcal{C}_{\Lambda}$, then the induced map $F\left(A \times_{k} k[\epsilon]\right) \rightarrow F(A) \times{ }_{F(k)}$ $F(k[\epsilon])$ is bijective.

The injectivity of the map $F\left(A \times_{k} k[\epsilon]\right) \rightarrow F(A) \times_{F(k)} F(k[\epsilon])$ comes from the second part of condition (S2) and the fact that morphisms are identities.

06 HZ Lemma 73.9.4. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. If $\mathcal{F}$ satisfies (S2), then the condition of (S2) also holds when $k[\epsilon]$ is replaced by $k[V]$ for any finite dimensional $k$-vector space $V$.

Proof. In the case that $\mathcal{F}$ is cofibred in sets, i.e., corresponds to a functor $F$ : $\mathcal{C}_{\Lambda} \rightarrow$ Sets this follows from the description of (S2) for $F$ in Remark 73.9 .3 and the fact that $k[V] \cong k[\epsilon] \times{ }_{k} \ldots \times_{k} k[\epsilon]$ with $\operatorname{dim}_{k} V$ factors. The case of functors is what we will use in the rest of this chapter.

We prove the general case by induction on $\operatorname{dim}(V)$. If $\operatorname{dim}(V)=1$, then $k[V] \cong k[\epsilon]$ and the result holds by assumption. If $\operatorname{dim}(V)>1$ we write $V=V^{\prime} \oplus k \epsilon$. Pick a diagram

Choose a morphism $x_{V} \rightarrow x_{V^{\prime}}$ lying over $k[V] \rightarrow k\left[V^{\prime}\right]$ and a morphism $x_{V} \rightarrow x_{\epsilon}$ lying over $k[V] \rightarrow k[\epsilon]$. Note that the morphism $x_{V} \rightarrow x_{0}$ factors as $x_{V} \rightarrow x_{V^{\prime}} \rightarrow x_{0}$ and as $x_{V} \rightarrow x_{\epsilon} \rightarrow x_{0}$. By induction hypothesis we can find a diagram

This gives us a commutative diagram

Hence by (S2) we get a commutative diagram

Note that $\left(A \times_{k} k\left[V^{\prime}\right]\right) \times_{k} k[\epsilon]=A \times_{k} k\left[V^{\prime} \oplus k \epsilon\right]=A \times_{k} k[V]$. We claim that $y$ fits into the correct commutative diagram. To see this we let $y \rightarrow y_{V}$ be a morphism lying over $A \times_{k} k[V] \rightarrow k[V]$. We can factor the morphisms $y \rightarrow y^{\prime} \rightarrow x_{V^{\prime}}$ and $y \rightarrow x_{\epsilon}$ through the morphism $y \rightarrow y_{V}$ (by the axioms of categories cofibred in groupoids). Hence we see that both $y_{V}$ and $x_{V}$ fit into commutative diagrams

and

and hence by the second part of (S2) there exists an isomorphism $y_{V} \rightarrow x_{V}$ compatible with $y_{V} \rightarrow x_{V^{\prime}}$ and $x_{V} \rightarrow x_{V^{\prime}}$ and in particular compatible with the maps to $x_{0}$. The composition $y \rightarrow y_{V} \rightarrow x_{V}$ then fits into the required commutative diagram

In this way we see that the first part of (S2) holds with $k[\epsilon]$ replaced by $k[V]$.
To prove the second part suppose given two commutative diagrams

We will use the morphisms $x_{V} \rightarrow x_{V^{\prime}} \rightarrow x_{0}$ and $x_{V} \rightarrow x_{\epsilon} \rightarrow x_{0}$ introduced in the first paragraph of the proof. Choose morphisms $y \rightarrow y_{V^{\prime}}$ and $y^{\prime} \rightarrow y_{V^{\prime}}^{\prime}$ lying over $A \times_{k} k[V] \rightarrow A \times_{k} k\left[V^{\prime}\right]$. The axioms of a cofibred category imply we can find commutative diagrams

By induction hypothesis we obtain an isomorphism $b: y_{V^{\prime}} \rightarrow y_{V^{\prime}}^{\prime}$ compatible with the morphisms $y_{V^{\prime}} \rightarrow x$ and $y_{V^{\prime}}^{\prime} \rightarrow x$, in particular compatible with the morphisms to $x_{0}$. Then we have commutative diagrams

and

where the morphism $y \rightarrow y_{V^{\prime}}^{\prime}$ is the composition $y \rightarrow y_{V^{\prime}} \xrightarrow{b} y_{V^{\prime}}^{\prime}$ and where the morphisms $y \rightarrow x_{\epsilon}$ and $y^{\prime} \rightarrow x_{\epsilon}$ are the compositions of the maps $y \rightarrow x_{V}$ and $y^{\prime} \rightarrow x_{V}$ with the morphism $x_{V} \rightarrow x_{\epsilon}$. Then the second part of (S2) guarantees the existence of an isomorphism $y \rightarrow y^{\prime}$ compatible with the maps to $y_{V^{\prime}}^{\prime}$, in particular compatible with the maps to $x$ (because $b$ was compatible with the maps to $x$ ).

06I0 Lemma 73.9.5. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$.
(1) If $\mathcal{F}$ satisfies (S1), then so does $\overline{\mathcal{F}}$.
(2) If $\mathcal{F}$ satisfies (S2), then so does $\overline{\mathcal{F}}$ provided at least one of the following conditions is satisfied
(a) $\mathcal{F}$ is a predeformation category,
(b) the category $\mathcal{F}(k)$ is a set or a setoid, or
(c) for any morphism $x_{\epsilon} \rightarrow x_{0}$ of $\mathcal{F}$ lying over $k[\epsilon] \rightarrow k$ the pushforward map $A u t_{k[\epsilon]}\left(x_{\epsilon}\right) \rightarrow A u t_{k}\left(x_{0}\right)$ is surjective.

Proof. Assume $\mathcal{F}$ has (S1). Suppose we have ring maps $f_{i}: A_{i} \rightarrow A$ in $\mathcal{C}_{\Lambda}$ with $f_{2}$ surjective. Let $x_{i} \in \mathcal{F}\left(A_{i}\right)$ such that the pushforwards $f_{1, *}\left(x_{1}\right)$ and $f_{2, *}\left(x_{2}\right)$ are isomorphic. Then we can denote $x$ an object of $\mathcal{F}$ over $A$ isomorphic to both of these and we obtain a diagram as in (S1). Hence we find an object $y$ of $\mathcal{F}$ over $A_{1} \times_{A} A_{2}$ whose pushforward to $A_{1}$, resp. $A_{2}$ is isomorphic to $x_{1}$, resp. $x_{2}$. In this way we see that (S1) holds for $\overline{\mathcal{F}}$.

Assume $\mathcal{F}$ has (S2). The first part of (S2) for $\overline{\mathcal{F}}$ follows as in the argument above. The second part of (S2) for $\overline{\mathcal{F}}$ signifies that the map

$$
\overline{\mathcal{F}}\left(A \times_{k} k[\epsilon]\right) \rightarrow \overline{\mathcal{F}}(A) \times_{\overline{\mathcal{F}}(k)} \overline{\mathcal{F}}(k[\epsilon])
$$

is injective for any ring $A$ in $\mathcal{C}_{\Lambda}$. Suppose that $y, y^{\prime} \in \mathcal{F}\left(A \times_{k} k[\epsilon]\right)$. Using the axioms of cofibred categories we can choose commutative diagrams

Assume that there exist isomorphisms $\alpha: x \rightarrow x^{\prime}$ in $\mathcal{F}(A)$ and $\beta: x_{\epsilon} \rightarrow x_{\epsilon}^{\prime}$ in $\mathcal{F}(k[\epsilon])$. This also means there exists an isomorphism $\gamma: x_{0} \rightarrow x_{0}^{\prime}$ compatible with $\alpha$. To prove (S2) for $\overline{\mathcal{F}}$ we have to show that there exists an isomorphism $y \rightarrow y^{\prime}$ in $\mathcal{F}\left(A \times_{k} k[\epsilon]\right)$. By (S2) for $\mathcal{F}$ such a morphism will exist if we can choose the isomorphisms $\alpha$ and $\beta$ and $\gamma$ such that

is commutative (because then we can replace $x$ by $x^{\prime}$ and $x_{\epsilon}$ by $x_{\epsilon}^{\prime}$ in the previous displayed diagram). The left hand square commutes by our choice of $\gamma$. We can factor $e^{\prime} \circ \beta$ as $\gamma^{\prime} \circ e$ for some second map $\gamma^{\prime}: x_{0} \rightarrow x_{0}^{\prime}$. Now the question is whether we can arrange it so that $\gamma=\gamma^{\prime}$ ? This is clear if $\mathcal{F}(k)$ is a set, or a setoid. Moreover, if $\operatorname{Aut}_{k[\epsilon]}\left(x_{\epsilon}\right) \rightarrow \operatorname{Aut}_{k}\left(x_{0}\right)$ is surjective, then we can adjust the choice of $\beta$ by precomposing with an automorphism of $x_{\epsilon}$ whose image is $\gamma^{-1} \circ \gamma^{\prime}$ to make things work.

06SQ Lemma 73.9.6. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $x_{0} \in$ $\operatorname{Ob}(\mathcal{F}(k))$. Let $\mathcal{F}_{x_{0}}$ be the category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ constructed in Remark 73.6.4.
(1) If $\mathcal{F}$ satisfies (S1), then so does $\mathcal{F}_{x_{0}}$.
(2) If $\mathcal{F}$ satisfies (S2), then so does $\mathcal{F}_{x_{0}}$.

Proof. Any diagram as in Definition 73.9.1 in $\mathcal{F}_{x_{0}}$ gives rise to a diagram in $\mathcal{F}$ and the output of condition (S1) or (S2) for this diagram in $\mathcal{F}$ can be viewed as an output for $\mathcal{F}_{x_{0}}$ as well.

06IS Lemma 73.9.7. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be a category cofibered in groupoids. Consider a diagram of $\mathcal{F}$

in $\mathcal{C}_{\Lambda}$. Assume $\mathcal{F}$ satisfies (S2). Then there exists a morphism $s: x \rightarrow y$ with $a \circ s=i d_{x}$ if and only if there exists a morphism $s_{\epsilon}: x \rightarrow x_{\epsilon}$ with $e \circ s_{\epsilon}=d$.

Proof. The "only if" direction is clear. Conversely, assume there exists a morphism $s_{\epsilon}: x \rightarrow x_{\epsilon}$ with $e \circ s_{\epsilon}=d$. Note that $p\left(s_{\epsilon}\right): A \rightarrow k[\epsilon]$ is a ring map compatible with the map $A \rightarrow k$. Hence we obtain

$$
\sigma=\left(\operatorname{id}_{A}, p\left(s_{\epsilon}\right)\right): A \rightarrow A \times_{k} k[\epsilon] .
$$

Choose a pushforward $x \rightarrow \sigma_{*} x$. By construction we can factor $s_{\epsilon}$ as $x \rightarrow \sigma_{*} x \rightarrow x_{\epsilon}$. Moreover, as $\sigma$ is a section of $A \times_{k} k[\epsilon] \rightarrow A$, we get a morphism $\sigma_{*} x \rightarrow x$ such that $x \rightarrow \sigma_{*} x \rightarrow x$ is $\mathrm{id}_{x}$. Because $e \circ s_{\epsilon}=d$ we find that the diagram

is commutative. Hence by (S2) we obtain a morphism $\sigma_{*} x \rightarrow y$ such that $\sigma_{*} x \rightarrow$ $y \rightarrow x$ is the given map $\sigma_{*} x \rightarrow x$. The solution to the problem is now to take $a: x \rightarrow y$ equal to the composition $x \rightarrow \sigma_{*} x \rightarrow y$.

06IT Lemma 73.9.8. Consider a commutative diagram in a predeformation category $\mathcal{F}$

in $\mathcal{C}_{\Lambda}$ where $f_{2}: A_{2} \rightarrow A$ is a small extension. Assume there is a map $h: A_{1} \rightarrow A_{2}$ such that $f_{2}=f_{1} \circ h$. Let $I=\operatorname{Ker}\left(f_{2}\right)$. Consider the ring map

$$
g: A_{1} \times_{A} A_{2} \longrightarrow k[I]=k \oplus I, \quad(u, v) \longmapsto \bar{u} \oplus(v-h(u))
$$

Choose a pushforward $y \rightarrow g_{*} y$. Assume $\mathcal{F}$ satisfies (S2). If there exists a morphism $x_{1} \rightarrow g_{*} y$, then there exists a morphism $b: x_{1} \rightarrow x_{2}$ such that $a_{1}=a_{2} \circ b$.

Proof. Note that $\operatorname{id}_{A_{1}} \times g: A_{1} \times_{A} A_{2} \rightarrow A_{1} \times_{k} k[I]$ is an isomorphism and that $k[I] \cong k[\epsilon]$. Hence we have a diagram

where $x_{0}$ is an object of $\mathcal{F}$ lying over $k$ (every object of $\mathcal{F}$ has a unique morphism to $x_{0}$, see discussion following Definition 73.6.2. If we have a morphism $x_{1} \rightarrow g_{*} y$ then Lemma 73.9.7 provides us with a section $s: x_{1} \rightarrow y$ of the map $y \rightarrow x_{1}$.

Composing this with the map $y \rightarrow x_{2}$ we obtain $b: x_{1} \rightarrow x_{2}$ which has the property that $a_{1}=a_{2} \circ b$ because the diagram of the lemma commutes and because $s$ is a section.

### 73.10. Tangent spaces of functors

06 I 2 Let $R$ be a ring. We write $\operatorname{Mod}_{R}$ for the category of $R$-modules and $\operatorname{Mod}_{R}^{f g}$ for the category of finitely generated $R$-modules.

06I3 Definition 73.10.1. Let $L: \operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}$, resp. $L: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ be a functor. We say that $L$ is $R$-linear if for every pair of objects $M, N$ of $\operatorname{Mod}_{R}^{f g}$, resp. $\operatorname{Mod}_{R}$ the map

$$
L: \operatorname{Hom}_{R}(M, N) \longrightarrow \operatorname{Hom}_{R}(L(M), L(N))
$$

is a map of $R$-modules.
06I4 Remark 73.10.2. One can define the notion of an $R$-linearity for any functor between categories enriched over $\operatorname{Mod}_{R}$. We made the definition specifically for functors $L: \operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}$ and $L: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ because these are the cases that we have needed so far.
06I5 Remark 73.10.3. If $L: \operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}$ is an $R$-linear functor, then $L$ preserves finite products and sends the zero module to the zero module, see Homology, Lemma 12.3.7. On the other hand, if a functor $\operatorname{Mod}_{R}^{f g} \rightarrow$ Sets preserves finite products and sends the zero module to a one element set, then it has a unique lift to a $R$-linear functor, see Lemma 73.10.4.

06I6 Lemma 73.10.4. Let $L:$ Mod $_{R}^{f g} \rightarrow$ Sets, resp. $L: M o d_{R} \rightarrow$ Sets be a functor. Suppose $L(0)$ is a one element set and $L$ preserves finite products. Then there exists a unique $R$-linear functor $\widetilde{L}: \operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}$, resp. $\widetilde{L}: \operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}$, such that

resp.

commutes.
Proof. We only prove this in case $L: \operatorname{Mod}_{R}^{f g} \rightarrow$ Sets. Let $M$ be a finitely generated $R$-module. We define $\widetilde{L}(M)$ to be the set $L(M)$ with the following $R$-module structure.

Multiplication: If $r \in R$, multiplication by $r$ on $L(M)$ is defined to be the map $L(M) \rightarrow L(M)$ induced by the multiplication map $r \cdot: M \rightarrow M$.
Addition: The sum map $M \times M \rightarrow M:\left(m_{1}, m_{2}\right) \mapsto m_{1}+m_{2}$ induces a map $L(M \times$ $M) \rightarrow L(M)$. By assumption $L(M \times M)$ is canonically isomorphic to $L(M) \times L(M)$. Addition on $L(M)$ is defined by the map $L(M) \times L(M) \cong L(M \times M) \rightarrow L(M)$.
Zero: There is a unique map $0 \rightarrow M$. The zero element of $L(M)$ is the image of $L(0) \rightarrow L(M)$.

We omit the verification that this defines an $R$-module $\widetilde{L}(M)$, the unique such that is $R$-linearly functorial in $M$.

06 I 7 Lemma 73.10.5. Let $L_{1}, L_{2}: \operatorname{Mod}_{R}^{f g} \rightarrow$ Sets be functors that take 0 to a one element set and preserve finite products. Let $t: L_{1} \rightarrow L_{2}$ be a morphism of functors. Then $t$ induces a morphism $\widetilde{t}: \widetilde{L}_{1} \rightarrow \widetilde{L}_{2}$ between the functors guaranteed by Lemma 73.10.4, which is given simply by $\widetilde{t}_{M}=t_{M}: \widetilde{L}_{1}(M) \rightarrow \widetilde{L}_{2}(M)$ for each $M \in$ $\mathrm{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$. In other words, $t_{M}: \widetilde{L}_{1}(M) \rightarrow \widetilde{L}_{2}(M)$ is a map of $R$-modules.

Proof. Omitted.
In the case $R=K$ is a field, a $K$-linear functor $L: \operatorname{Mod}_{K}^{f g} \rightarrow \operatorname{Mod}_{K}$ is determined by its value $L(K)$.

06 I8 Lemma 73.10.6. Let $K$ be a field. Let $L: \operatorname{Mod}_{K}^{f g} \rightarrow \operatorname{Mod}_{K}$ be a $K$-linear functor. Then $L$ is isomorphic to the functor $L(K) \otimes_{K}-: \operatorname{Mod}_{K}^{f g} \rightarrow \operatorname{Mod}_{K}$.
Proof. For $V \in \mathrm{Ob}\left(\operatorname{Mod}_{K}^{f g}\right)$, the isomorphism $L(K) \otimes_{K} V \rightarrow L(V)$ is given on pure tensors by $x \otimes v \mapsto L\left(f_{v}\right)(x)$, where $f_{v}: K \rightarrow V$ is the $K$-linear map sending $1 \mapsto v$. When $V=K$, this is the isomorphism $L(K) \otimes_{K} K \rightarrow L(K)$ given by multiplication by $K$. For general $V$, it is an isomorphism by the case $V=K$ and the fact that $L$ commutes with finite products (Remark 73.10.3).

For a ring $R$ and an $R$-module $M$, let $R[M]$ be the $R$-algebra whose underlying $R$ module is $R \oplus M$ and whose multiplication is given by $(r, m) \cdot\left(r^{\prime}, m^{\prime}\right)=\left(r r^{\prime}, r m^{\prime}+\right.$ $r^{\prime} m$ ). When $M=R$ this is the ring of dual numbers over $R$, which we denote by $R[\epsilon]$.
Now let $S$ be a ring and assume $R$ is an $S$-algebra. Then the assignment $M \mapsto R[M]$ determines a functor $\operatorname{Mod}_{R} \rightarrow S-\mathrm{Alg} / R$, where $S$ - $\operatorname{Alg} / R$ denotes the category of $S$-algebras over $R$. Note that $S$ - $\mathrm{Alg} / R$ admits finite products: if $A_{1} \rightarrow R$ and $A_{2} \rightarrow R$ are two objects, then $A_{1} \times{ }_{R} A_{2}$ is a product.

06I9 Lemma 73.10.7. Let $R$ be an $S$-algebra. Then the functor $\operatorname{Mod}_{R} \rightarrow S-A l g / R$ described above preserves finite products.

Proof. This is merely the statement that if $M$ and $N$ are $R$-modules, then the $\operatorname{map} R[M \times N] \rightarrow R[M] \times{ }_{R} R[N]$ is an isomorphism in $S-\mathrm{Alg} / R$.

06IA Lemma 73.10.8. Let $R$ be an $S$-algebra, and let $\mathcal{C}$ be a strictly full subcategory of $S-A l g / R$ containing $R[M]$ for all $M \in \mathrm{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$. Let $F: \mathcal{C} \rightarrow$ Sets be a functor. Suppose that $F(R)$ is a one element set and that for any $M, N \in \operatorname{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$, the induced map

$$
F\left(R[M] \times{ }_{R} R[N]\right) \rightarrow F(R[M]) \times F(R[N])
$$

is a bijection. Then $F(R[M])$ has a natural $R$-module structure for any $M \in$ $\mathrm{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$.

Proof. Note that $R \cong R[0]$ and $R[M] \times{ }_{R} R[N] \cong R[M \times N]$ hence $R$ and $R[M] \times{ }_{R}$ $R[N]$ are objects of $\mathcal{C}$ by our assumptions on $\mathcal{C}$. Thus the conditions on $F$ make sense. The functor $\operatorname{Mod}_{R} \rightarrow S-\mathrm{Alg} / R$ of Lemma 73.10.7 restricts to a functor $\operatorname{Mod}_{R}^{f g} \rightarrow \mathcal{C}$ by the assumption on $\mathcal{C}$. Let $L$ be the composition $\operatorname{Mod}_{R}^{f g} \rightarrow \mathcal{C} \rightarrow$ Sets, i.e., $L(M)=F(R[M])$. Then $L$ preserves finite products by Lemma 73.10 .7 and the assumption on $F$. Hence Lemma 73.10.4 shows that $L(M)=F(R[M])$ has a natural $R$-module structure for any $M \in \mathrm{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$.

06IB Definition 73.10.9. Let $\mathcal{C}$ be a category as in Lemma 73.10.8. Let $F: \mathcal{C} \rightarrow$ Sets be a functor such that $F(R)$ is a one element set. The tangent space $T F$ of $F$ is $F(R[\epsilon])$.
When $F: \mathcal{C} \rightarrow$ Sets satisfies the hypotheses of Lemma 73.10.8, the tangent space $T F$ has a natural $R$-module structure.

06SR Example 73.10.10. Since $\mathcal{C}_{\Lambda}$ contains all $k[V]$ for finite dimensional vector spaces $V$ we see that Definition 73.10 .9 applies with $S=\Lambda, R=k, \mathcal{C}=\mathcal{C}_{\Lambda}$, and $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets a predeformation functor. The tangent space is $T F=F(k[\epsilon])$.
06IC Example 73.10.11. Let us work out the tangent space of Example 73.10 .10 when $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets is a prorepresentable functor, say $F=\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}}$ for $S \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$. Then $F$ commutes with arbitrary limits and thus satisfies the hypotheses of Lemma 73.10.8. We compute

$$
T F=F(k[\epsilon])=\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(S, k[\epsilon])=\operatorname{Der}_{\Lambda}(S, k)
$$

and more generally for a finite dimensional $k$-vector space $V$ we have

$$
F(k[V])=\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(S, k[V])=\operatorname{Der}_{\Lambda}(S, V)
$$

Explicitly, a $\Lambda$-algebra map $f: S \rightarrow k[V]$ compatible with the augmentations $q: S \rightarrow k$ and $k[V] \rightarrow k$ corresponds to the derivation $D$ defined by $s \mapsto f(s)-q(s)$. Conversely, a $\Lambda$-derivation $D: S \rightarrow V$ corresponds to $f: S \rightarrow k[V]$ in $\mathcal{C}_{\Lambda}$ defined by the rule $f(s)=q(s)+D(s)$. Since these identifications are functorial we see that the $k$-vector spaces structures on $T F$ and $\operatorname{Der}_{\Lambda}(S, k)$ correspond (see Lemma 73.10.5). It follows that $\operatorname{dim}_{k} T F$ is finite by Lemma 73.4.5.

06SS Example 73.10.12. The computation of Example 73.10.11 simplifies in the classical case. Namely, in this case the tangent space of the functor $F=\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}}$ is simply the relative cotangent space of $S$ over $\Lambda$, in a formula $T F=T_{S / \Lambda}$. In fact, this works more generally when the field extension $k^{\prime} \subset k$ is separable. See Exercises, Exercise 89.28.2.

06ID Lemma 73.10.13. Let $F, G: \mathcal{C} \rightarrow$ Sets be functors satisfying the hypotheses of Lemma 73.10.8. Let $t: F \rightarrow G$ be a morphism of functors. For any $M \in$ $\mathrm{Ob}\left(\operatorname{Mod}_{R}^{f g}\right)$, the map $t_{R[M]}: F(R[M]) \rightarrow G(R[M])$ is a map of $R$-modules, where $F(R[M])$ and $G(R[M])$ are given the $R$-module structure from Lemma 73.10.8. In particular, $t_{R[\epsilon]}: T F \rightarrow T G$ is a map of $R$-modules.
Proof. Follows from Lemma 73.10.5
06ST Example 73.10.14. Suppose that $f: R \rightarrow S$ is a ring map in $\widehat{\mathcal{C}}_{\Lambda}$. Set $F=\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ and $G=\left.\underline{S}\right|_{\mathcal{C}_{\Lambda}}$. The ring map $f$ induces a transformation of functors $G \rightarrow F$. By Lemma 73.10 .13 we get a $k$-linear map $T G \rightarrow T F$. This is the map

$$
T G=\operatorname{Der}_{\Lambda}(S, k) \longrightarrow \operatorname{Der}_{\Lambda}(R, k)=T F
$$

as follows from the canonical identifications $F(k[V])=\operatorname{Der}_{\Lambda}(R, V)$ and $G(k[V])=$ $\operatorname{Der}_{\Lambda}(S, V)$ of Example 73.10 .11 and the rule for computing the map on tangent spaces.

06IE Lemma 73.10.15. Let $F: \mathcal{C} \rightarrow$ Sets be a functor satisfying the hypotheses of Lemma 73.10.8. Assume $R=K$ is a field. Then $F(K[V]) \cong T F \otimes_{K} V$ for any finite dimensional $K$-vector space $V$.
Proof. Follows from Lemma 73.10.6

### 73.11. Tangent spaces of predeformation categories

06 I 1 We will define tangent spaces of predeformation functors using the general Definition 73.10 .9 . We have spelled this out in Example 73.10 .10 . It applies to predeformation categories by looking at the associated functor of isomorphism classes.

06IG Definition 73.11.1. Let $\mathcal{F}$ be a predeformation category. The tangent space $T \mathcal{F}$ of $\mathcal{F}$ is the set $\overline{\mathcal{F}}(k[\epsilon])$ of isomorphism classes of objects in the fiber category $\mathcal{F}(k[\epsilon])$.

Thus $T \mathcal{F}$ is nothing but the tangent space of the associated functor $\overline{\mathcal{F}}: \mathcal{C}_{\Lambda} \rightarrow$ Sets. It has a natural vector space structure when $\mathcal{F}$ satisfies (S2), or, in fact, as long as $\overline{\mathcal{F}}$ does.

06IH Lemma 73.11.2. Let $\mathcal{F}$ be a predeformation category such that $\overline{\mathcal{F}}$ satisfies (S2). Then $T \mathcal{F}$ has a natural $k$-vector space structure. For any finite dimensional vector space $V$ we have $\overline{\mathcal{F}}(k[V])=T \mathcal{F} \otimes_{k} V$ functorially in $V$.

Proof. Let us write $F=\overline{\mathcal{F}}: \mathcal{C}_{\Lambda} \rightarrow$ Sets. This is a predeformation functor and $F$ satisfies (S2). By Lemma 73.9.4 (and the translation of Remark 73.9.3) we see that

$$
F\left(A \times_{k} k[V]\right) \longrightarrow F(A) \times F(k[V])
$$

is a bijection for every finite dimensional vector space $V$ and every $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$. In particular, if $A=k[W]$ then we see that $F\left(k[W] \times{ }_{k} k[V]\right)=F(k[W]) \times F(k[V])$. In other words, the hypotheses of Lemma 73.10 .8 hold and we see that $T F=T \mathcal{F}$ has a natural $k$-vector space structure. The final assertion follows from Lemma 73.10 .15 .

A morphism of predeformation categories induces a map on tangent spaces.
06II Definition 73.11.3. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism predeformation categories. The differential $d \varphi: T \mathcal{F} \rightarrow T \mathcal{G}$ of $\varphi$ is the map obtained by evaluating the morphism of functors $\bar{\varphi}: \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ at $A=k[\epsilon]$.
06IJ Lemma 73.11.4. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of predeformation categories. Assume $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ both satisfy (S2). Then $d \varphi: T \mathcal{F} \rightarrow T \mathcal{G}$ is $k$-linear.
Proof. In the proof of Lemma 73.11 .2 we have seen that $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ satisfy the hypotheses of Lemma 73.10.8. Hence the lemma follows from Lemma 73.10.13.

06IK Remark 73.11.5. We can globalize the notions of tangent space and differential to arbitrary categories cofibered in groupoids as follows. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$, and let $x \in \operatorname{Ob}(\mathcal{F}(k))$. As in Remark 73.6.4 we get a predeformation category $\mathcal{F}_{x}$. We define the tangent space $T_{x} \mathcal{F}$ of $\mathcal{F}$ at $x$ to be the tangent space $T \mathcal{F}_{x}$ of $\mathcal{F}_{x}$. Similarly, if $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$ and $x \in \operatorname{Ob}(\mathcal{F}(k))$, then there is an induced morphism $\varphi_{x}: \mathcal{F}_{x} \rightarrow \mathcal{G}_{\varphi(x)}$. We define the differential $d_{x} \varphi: T_{x} \mathcal{F} \rightarrow T_{\varphi(x)} \mathcal{G}$ of $\varphi$ at $x$ to be the map $d \varphi_{x}: T \mathcal{F}_{x} \rightarrow T \mathcal{G}_{\varphi(x)}$. If both $\mathcal{F}$ and $\mathcal{G}$ satisfy (S2) then all of these tangent spaces have a natural $k$-vector space structure and all the differentials $d_{x} \varphi: T_{x} \mathcal{F} \rightarrow T_{\varphi(x)} \mathcal{G}$ are $k$-linear (use Lemmas 73.9.6 and 73.11.4).
The following observations are uninteresting in the classical case or when $k^{\prime} \subset k$ is a separable field extension, because then $\operatorname{Der}_{\Lambda}(k, k)$ and $\operatorname{Der}_{\Lambda}(k, V)$ are zero. There is a canonical identification

$$
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(k, k[\epsilon])=\operatorname{Der}_{\Lambda}(k, k)
$$

Namely, for $D \in \operatorname{Der}_{\Lambda}(k, k)$ let $f_{D}: k \rightarrow k[\epsilon]$ be the map $a \mapsto a+D(a) \epsilon$. More generally, given a finite dimensional vector space $V$ over $k$ we have

$$
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(k, k[V])=\operatorname{Der}_{\Lambda}(k, V)
$$

and we will use the same notation $f_{D}$ for the map associated to the derivation $D$. We also have

$$
\operatorname{Mor}_{\mathcal{C}_{\Lambda}}(k[W], k[V])=\operatorname{Hom}_{k}(V, W) \oplus \operatorname{Der}_{\Lambda}(k, V)
$$

where $(\varphi, D)$ corresponds to the map $f_{\varphi, D}: a+w \mapsto a+\varphi(w)+D(a)$. We will sometimes write $f_{1, D}: a+v \rightarrow a+v+D(a)$ for the automorphism of $k[V]$ determined by the derivation $D: k \rightarrow V$. Note that $f_{1, D} \circ f_{1, D^{\prime}}=f_{1, D+D^{\prime}}$.

Let $\mathcal{F}$ be a predeformation category over $\mathcal{C}_{\Lambda}$. Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. By the above there is a canonical map

$$
\gamma_{V}: \operatorname{Der}_{\Lambda}(k, V) \longrightarrow \overline{\mathcal{F}}(k[V])
$$

defined by $D \mapsto f_{D, *}\left(x_{0}\right)$. Moreover, there is an action

$$
a_{V}: \operatorname{Der}_{\Lambda}(k, V) \times \overline{\mathcal{F}}(k[V]) \longrightarrow \overline{\mathcal{F}}(k[V])
$$

defined by $(D, x) \mapsto f_{1, D, *}(x)$. These two maps are compatible, i.e., $f_{1, D, *} f_{D^{\prime}, *} x_{0}=$ $f_{D+D^{\prime}, *} x_{0}$ as follows from a computation of the compositions of these maps. Note that the maps $\gamma_{V}$ and $a_{V}$ are independent of the choice of $x_{0}$ as there is a unique $x_{0}$ up to isomorphism.

06SU Lemma 73.11.6. Let $\mathcal{F}$ be a predeformation category over $\mathcal{C}_{\Lambda}$. If $\overline{\mathcal{F}}$ has (S2) then the maps $\gamma_{V}$ are $k$-linear and we have $a_{V}(D, x)=x+\gamma_{V}(D)$.

Proof. In the proof of Lemma 73.11.2 we have seen that the functor $V \mapsto \overline{\mathcal{F}}(k[V])$ transforms 0 to a singleton and products to products. The same is true of the functor $V \mapsto \operatorname{Der}_{\Lambda}(k, V)$. Hence $\gamma_{V}$ is linear by Lemma 73.10.5. Let $D: k \rightarrow V$ be a $\Lambda$-derivation. Set $D_{1}: k \rightarrow V^{\oplus 2}$ equal to $a \mapsto(D(a), 0)$. Then

commutes. Unwinding the definitions and using that $\bar{F}(V \times V)=\bar{F}(V) \times \bar{F}(V)$ this means that $a_{D}\left(x_{1}\right)+x_{2}=a_{D}\left(x_{1}+x_{2}\right)$ for all $x_{1}, x_{2} \in \bar{F}(V)$. Thus it suffices to show that $a_{V}(D, 0)=0+\gamma_{V}(D)$ where $0 \in \bar{F}(V)$ is the zero vector. By definition this is the element $f_{0, *}\left(x_{0}\right)$. Since $f_{D}=f_{1, D} \circ f_{0}$ the desired result follows.

A special case of the constructions above are the map

$$
\begin{equation*}
\gamma: \operatorname{Der}_{\Lambda}(k, k) \longrightarrow T \mathcal{F} \tag{73.11.6.1}
\end{equation*}
$$

and the action
06SW

$$
\begin{equation*}
a: \operatorname{Der}_{\Lambda}(k, k) \times T \mathcal{F} \longrightarrow T \mathcal{F} \tag{73.11.6.2}
\end{equation*}
$$

defined for any predeformation category $\mathcal{F}$. Note that if $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of predeformation categories, then we get commutative diagrams

### 73.12. Versal formal objects

06SX The existence of a versal formal object forces $\mathcal{F}$ to have property (S1).
06SY Lemma 73.12.1. Let $\mathcal{F}$ be a predeformation category. Assume $\mathcal{F}$ has a versal formal object. Then $\mathcal{F}$ satisfies (S1).

Proof. Let $\xi$ be a versal formal object of $\mathcal{F}$. Let

be a diagram in $\mathcal{F}$ such that $x_{2} \rightarrow x$ lies over a surjective ring map. Since the natural morphism $\left.\widehat{\mathcal{F}}\right|_{\mathcal{C}_{\Lambda}} \xrightarrow{\sim} \mathcal{F}$ is an equivalence (see Remark 73.7.7), we can consider this diagram also as a diagram in $\widehat{\mathcal{F}}$. By Lemma 73.8 .15 there exists a morphism $\xi \rightarrow x_{1}$, so by Remark 73.8 .14 we also get a morphism $\xi \rightarrow x_{2}$ making the diagram

commute. If $x_{1} \rightarrow x$ and $x_{2} \rightarrow x$ lie above ring maps $A_{1} \rightarrow A$ and $A_{2} \rightarrow A$ then taking the pushforward of $\xi$ to $A_{1} \times{ }_{A} A_{2}$ gives an object $y$ as required by (S1).

In the case that our cofibred category satisfies (S1) and (S2) we can characterize the versal formal objects as follows.

06IU Lemma 73.12.2. Let $\mathcal{F}$ be a predeformation category satisfying (S1) and (S2). Let $\xi$ be a formal object of $\mathcal{F}$ corresponding to $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$, see Remark 73.7.12. Then $\xi$ is versal if and only if the following two conditions hold:
(1) the map d토:T́R$\left.\right|_{\mathcal{C}_{\Lambda}} \rightarrow T \mathcal{F}$ on tangent spaces is surjective, and
(2) given a diagram in $\widehat{\mathcal{F}}$

in $\widehat{\mathcal{C}}_{\Lambda}$ with $B \rightarrow A$ a small extension of Artinian rings, then there exists a ring map $R \rightarrow B$ such that

commutes.
Proof. If $\xi$ is versal then (1) holds by Lemma 73.8 .8 and (2) holds by Remark 73.8.14. Assume (1) and (2) hold. By Remark 73.8.14 we must show that given a diagram in $\widehat{\mathcal{F}}$ as in (2), there exists $\xi \rightarrow y$ such that

commutes. Let $b: R \rightarrow B$ be the map guaranteed by (2). Denote $y^{\prime}=b_{*} \xi$ and choose a factorization $\xi \rightarrow y^{\prime} \rightarrow x$ lying over $R \rightarrow B \rightarrow A$ of the given morphism $\xi \rightarrow x$. By (S1) we obtain a commutative diagram

Set $I=\operatorname{Ker}(k)$. Let $\bar{g}: B \times_{A} B \rightarrow k[I]$ be the ring map $(u, v) \mapsto \bar{u} \oplus(v-u)$, cf. Lemma 73.9.8. By (1) there exists a morphism $\xi \rightarrow \bar{g}_{*} z$ which lies over a ring map $i: R \rightarrow k[\epsilon]$. Choose an Artinian quotient $b_{1}: R \rightarrow B_{1}$ such that both $b: R \rightarrow B$ and $i: R \rightarrow k[\epsilon]$ factor through $R \rightarrow B_{1}$, i.e., giving $h: B_{1} \rightarrow B$ and $i^{\prime}: B_{1} \rightarrow k[\epsilon]$. Choose a pushforward $y_{1}=b_{1, *} \xi$, a factorization $\xi \rightarrow y_{1} \rightarrow y^{\prime}$ lying over $R \rightarrow B_{1} \rightarrow B$ of $\xi \rightarrow y^{\prime}$, and a factorization $\xi \rightarrow y_{1} \rightarrow \bar{g}_{*} z$ lying over $R \rightarrow B_{1} \rightarrow k[\epsilon]$ of $\xi \rightarrow \bar{g}_{*} z$. Applying (S1) once more we obtain

lying over

Note that the map $g: B_{1} \times_{A} B \rightarrow k[I]$ of Lemma 73.9 .8 (defined using $h$ ) is the composition of $B_{1} \times{ }_{A} B \rightarrow B \times_{A} B$ and the map $\bar{g}$ above. By construction there exists a morphism $y_{1} \rightarrow g_{*} z_{1} \cong \bar{g}_{*} z$ ! Hence Lemma 73.9 .8 applies (to the outer rectangles in the diagrams above) to give a morphism $y_{1} \rightarrow y$ and precomposing with $\xi \rightarrow y_{1}$ gives the desired morphism $\xi \rightarrow y$.

If $\mathcal{F}$ has property (S1) then the "largest quotient where a lift exists" exists. Here is a precise statement.

06SZ Lemma 73.12.3. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which has (S1). Let $B \rightarrow A$ be a surjection in $\mathcal{C}_{\Lambda}$ with kernel $I$ annihilated by $\mathfrak{m}_{B}$. Let $x \in \mathcal{F}(A)$. The set of ideals

$$
\mathcal{J}=\{J \subset I \mid \text { there exists an } y \rightarrow x \text { lying over } B / J \rightarrow A\}
$$

has a smallest element.
Proof. Note that $\mathcal{J}$ is nonempty as $I \in \mathcal{J}$. Also, if $J \in \mathcal{J}$ and $J \subset J^{\prime} \subset I$ then $J^{\prime} \in \mathcal{J}$ because we can pushforward the object $y$ to an object $y^{\prime}$ over $B / J^{\prime}$. Let $J$ and $K$ be elements of the displayed set. We claim that $J \cap K \in \mathcal{J}$ which will prove the lemma. Since $I$ is a $k$-vector space we can find an ideal $J \subset J^{\prime} \subset I$ such that $J \cap K=J^{\prime} \cap K$ and such that $J^{\prime}+K=I$. By the above we may replace $J$ by $J^{\prime}$ and assume that $J+K=I$. In this case

$$
A /(J \cap K)=A / J \times_{A / I} A / K
$$

Hence the existence of an element $z \in \mathcal{F}(A /(J \cap K))$ mapping to $x$ follows, via (S1), from the existence of the elements we have assumed exist over $A / J$ and $A / K$.

We will improve on the following result later.
06IW Lemma 73.12.4. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. Assume the following conditions hold:
(1) $\mathcal{F}$ is a predeformation category.
(2) $\mathcal{F}$ satisfies (S1).
(3) $\mathcal{F}$ satisfies (S2).
(4) $\operatorname{dim}_{k} T \mathcal{F}$ is finite.

Then $\mathcal{F}$ has a versal formal object.
Proof. Assume (1), (2), (3), and (4) hold. Choose an object $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ such that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth, see Example 73.8.10. Let $r=\operatorname{dim}_{k} T \mathcal{F}$ and put $S=$ $R\left[\left[X_{1}, \ldots, X_{r}\right]\right]$.

We are going to inductively construct for $n \geq 2$ pairs $\left(J_{n}, f_{n-1}: \xi_{n} \rightarrow \xi_{n-1}\right)$ where $J_{n} \subset S$ is an decreasing sequence of ideals and $f_{n-1}: \xi_{n} \rightarrow \xi_{n-1}$ is a morphism of $\mathcal{F}$ lying over the projection $S / J_{n} \rightarrow S / J_{n-1}$.
Step 1. Let $J_{1}=\mathfrak{m}_{S}$. Let $\xi_{1}$ be the unique (up to unique isomorphism) object of $\mathcal{F}$ over $k=S / J_{1}=S / \mathfrak{m}_{S}$
Step 2. Let $J_{2}=\mathfrak{m}_{S}^{2}+\mathfrak{m}_{R} S$. Then $S / J_{2}=k[V]$ with $V=k X_{1} \oplus \ldots \oplus k X_{r}$ By (S2) for $\overline{\mathcal{F}}$ we get a bijection

$$
\overline{\mathcal{F}}\left(S / J_{2}\right) \longrightarrow T \mathcal{F} \otimes_{k} V
$$

see Lemmas 73.9.5 and 73.11.2. Choose a basis $\theta_{1}, \ldots, \theta_{r}$ for $T \mathcal{F}$ and set $\xi_{2}=$ $\sum \theta_{i} \otimes X_{i} \in \operatorname{Ob}\left(\mathcal{F}\left(S / J_{2}\right)\right)$. The point of this choice is that

$$
d \xi_{2}: \operatorname{Mor}_{\mathcal{C}_{\Lambda}}\left(S / J_{2}, k[\epsilon]\right) \longrightarrow T \mathcal{F}
$$

is surjective. Let $f_{1}: \xi_{2} \rightarrow \xi_{1}$ be the unique morphism.
Induction step. Assume $\left(J_{n}, f_{n-1}: \xi_{n} \rightarrow \xi_{n-1}\right)$ has been constructed for some $n \geq 2$. There is a minimal element $J_{n+1}$ of the set of ideals $J \subset S$ satisfying: (a) $\mathfrak{m}_{S} J_{n} \subset J \subset J_{n}$ and (b) there exists a morphism $\xi_{n+1} \rightarrow \xi_{n}$ lying over $S / J \rightarrow$ $S / J_{n}$, see Lemma 73.12.3. Let $f_{n}: \xi_{n+1} \rightarrow \xi_{n}$ be any morphism of $\mathcal{F}$ lying over $S / J_{n+1} \rightarrow S / J_{n}$.
Set $J=\bigcap J_{n}$. Set $\bar{S}=S / J$. Set $\bar{J}_{n}=J_{n} / J$. By Lemma 73.4.7 the sequence of ideals $\left(\bar{J}_{n}\right)$ induces the $\mathfrak{m}_{\bar{S}}$-adic topology on $\bar{S}$. Since $\left(\xi_{n}, f_{n}\right)$ is an object of $\widehat{\mathcal{F}}_{\mathcal{I}}(\bar{S})$, where $\mathcal{I}$ is the filtration $\left(\bar{J}_{n}\right)$ of $\bar{S}$, we see that $\left(\xi_{n}, f_{n}\right)$ induces an object $\xi$ of $\widehat{\mathcal{F}}(\bar{S})$. see Lemma 73.7.4

We prove $\xi$ is versal. For versality it suffices to check conditions (1) and (2) of Lemma 73.12.2. Condition (1) follows from our choice of $\xi_{2}$ in Step 2 above. Suppose given a diagram in $\widehat{\mathcal{F}}$

lying over

in $\widehat{\mathcal{C}}_{\Lambda}$ with $f: B \rightarrow A$ a small extension of Artinian rings. We have to show there is a map $\bar{S} \rightarrow B$ fitting into the diagram on the right. Choose $n$ such that $\bar{S} \rightarrow A$ factors through $\bar{S} \rightarrow S / J_{n}$. This is possible as the sequence $\left(\bar{J}_{n}\right)$ induces the $\mathfrak{m}_{\bar{S}^{-}}$ adic topology as we saw above. The pushforward of $\xi$ along $\bar{S} \rightarrow S / J_{n}$ is $\xi_{n}$. We may factor $\xi \rightarrow x$ as $\xi \rightarrow \xi_{n} \rightarrow x$ hence we get a diagram in $\mathcal{F}$

To check condition (2) of Lemma 73.12 .2 it suffices to complete the diagram

or equivalently, to complete the diagram

If $p_{1}$ has a section we are done. If not, by Lemma 73.3.8 (2) $p_{1}$ is a small extension, so by Lemma 73.3.12 (4) $p_{1}$ is an essential surjection. Recall that $S=R\left[\left[X_{1}, \ldots, X_{r}\right]\right]$ and that we chose $R$ such that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth. Hence there exists a map $h: R \rightarrow B$ lifting the map $R \rightarrow S \rightarrow S / J_{n} \rightarrow A$. By the universal property of a power series ring there is an $R$-algebra map $h: S=R\left[\left[X_{1}, \ldots, X_{2}\right]\right] \rightarrow B$ lifting the given map $S \rightarrow S / J_{n} \rightarrow A$. This induces a map $g: S \rightarrow S / J_{n} \times{ }_{A} B$ making the solid square in the diagram

commute. Then $g$ is a surjection since $p_{1}$ is an essential surjection. We claim the ideal $K=\operatorname{Ker}(g)$ of $S$ satisfies conditions (a) and (b) of the construction of $J_{n+1}$ in the induction step above. Namely, $K \subset J_{n}$ is clear and $\mathfrak{m}_{S} J_{n} \subset K$ as $p_{1}$ is a
small extension; this proves (a). By (S1) applied to

there exists a lifting of $\xi_{n}$ to $S / K \cong S / J_{n} \times_{A} B$, so (b) holds. Since $J_{n+1}$ was the minimal ideal with properties (a) and (b) this implies $J_{n+1} \subset K$. Thus the desired $\operatorname{map} S / J_{n+1} \rightarrow S / K \cong S / J_{n} \times{ }_{A} B$ exists.

### 73.13. Minimal versal formal objects

06 T 0 We do a little bit of work to try and understand (non)uniqueness of versal formal objects. It turns out that if a predeformation category has a versal formal object, then it has a minimal versal formal object and any two such are isomorphic. Moreover, all versal formal objects are "more or less" the same up to replacing the base ring by a power series extension.

Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. For every object $x$ of $\mathcal{F}$ lying over $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$ consider the category $\mathcal{S}_{x}$ with objects

$$
\operatorname{Ob}\left(\mathcal{S}_{x}\right)=\left\{x^{\prime} \rightarrow x \mid x^{\prime} \rightarrow x \text { lies over } A^{\prime} \subset A\right\}
$$

and morphisms are morphisms over $x$. For every $y \rightarrow x$ in $\mathcal{F}$ lying over $f: B \rightarrow A$ in $\mathcal{C}_{\Lambda}$ there is a functor $f_{*}: \mathcal{S}_{y} \rightarrow \mathcal{S}_{x}$ defined as follows: Given $y^{\prime} \rightarrow y$ lying over $B^{\prime} \subset B$ set $A^{\prime}=f\left(B^{\prime}\right)$ and let $y^{\prime} \rightarrow x^{\prime}$ be over $B^{\prime} \rightarrow f\left(B^{\prime}\right)$ be the pushforward of $y^{\prime}$. By the axioms of a category cofibred in groupoids we obtain a unique morphism $x^{\prime} \rightarrow x$ lying over $f\left(B^{\prime}\right) \rightarrow A$ such that

commutes. Then $x^{\prime} \rightarrow x$ is an object of $\mathcal{S}_{x}$. We say an object $x^{\prime} \rightarrow x$ of $\mathcal{S}_{x}$ is minimal if any morphism $\left(x_{1}^{\prime} \rightarrow x\right) \rightarrow\left(x^{\prime} \rightarrow x\right)$ in $\mathcal{S}_{x}$ is an isomorphism, i.e., $x^{\prime}$ and $x_{1}^{\prime}$ are defined over the same subring of $A$. Since $A$ has finite length as a $\Lambda$-module we see that minimal objects always exist.

06 T 1 Lemma 73.13.1. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which has (S1).
(1) For $y \rightarrow x$ in $\mathcal{F}$ a minimal object in $\mathcal{S}_{y}$ maps to a minimal object of $\mathcal{S}_{x}$.
(2) For $y \rightarrow x$ in $\mathcal{F}$ lying over a surjection $f: B \rightarrow A$ in $\mathcal{C}_{\Lambda}$ every minimal object of $\mathcal{S}_{x}$ is the image of a minimal object of $\mathcal{S}_{y}$.

Proof. Proof of (1). Say $y \rightarrow x$ lies over $f: B \rightarrow A$. Let $y^{\prime} \rightarrow y$ lying over $B^{\prime} \subset B$ be a minimal object of $\mathcal{S}_{y}$. Let

be as in the construction of $f_{*}$ above. Suppose that $\left(x^{\prime \prime} \rightarrow x\right) \rightarrow\left(x^{\prime} \rightarrow x\right)$ is a morphism of $\mathcal{S}_{x}$ with $x^{\prime \prime} \rightarrow x^{\prime}$ lying over $A^{\prime \prime} \subset f\left(B^{\prime}\right)$. By (S1) there exists $y^{\prime \prime} \rightarrow y^{\prime}$ lying over $B^{\prime} \times_{f\left(B^{\prime}\right)} A^{\prime \prime} \rightarrow B^{\prime}$. Since $y^{\prime} \rightarrow y$ is minimal we conclude that $B^{\prime} \times_{f\left(B^{\prime}\right)} A^{\prime \prime} \rightarrow B^{\prime}$ is an isomorphism, which implies that $A^{\prime \prime}=f\left(B^{\prime}\right)$, i.e., $x^{\prime} \rightarrow x$ is minimal.

Proof of (2). Suppose $f: B \rightarrow A$ is surjective and $y \rightarrow x$ lies over $f$. Let $x^{\prime} \rightarrow x$ be a minimal object of $\mathcal{S}_{x}$ lying over $A^{\prime} \subset A$. By (S1) there exists $y^{\prime} \rightarrow y$ lying over $B^{\prime}=f^{-1}\left(A^{\prime}\right)=B \times_{A} A^{\prime} \rightarrow B$ whose image in $\mathcal{S}_{x}$ is $x^{\prime} \rightarrow x$. So $f_{*}\left(y^{\prime} \rightarrow y\right)=x^{\prime} \rightarrow x$. Choose a morphism $\left(y^{\prime \prime} \rightarrow y\right) \rightarrow\left(y^{\prime} \rightarrow y\right)$ in $\mathcal{S}_{y}$ with $y^{\prime \prime} \rightarrow y$ a minimal object (this is possible by the remark on lengths above the lemma). Then $f_{*}\left(y^{\prime \prime} \rightarrow y\right)$ is an object of $\mathcal{S}_{x}$ which maps to $x^{\prime} \rightarrow x$ (by functoriality of $f_{*}$ ) hence is isomorphic to $x^{\prime} \rightarrow x$ by minimality of $x^{\prime} \rightarrow x$.

06 T 2 Lemma 73.13.2. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which has (S1). Let $\xi$ be a versal formal object of $\mathcal{F}$ lying over $R$. There exists a morphism $\xi^{\prime} \rightarrow \xi$ lying over $R^{\prime} \subset R$ with the following minimality properties
(1) for every $f: R \rightarrow A$ with $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$ the pushforwards

produce a minimal object $x^{\prime} \rightarrow x$ of $\mathcal{S}_{x}$, and
(2) for any morphism of formal objects $\xi^{\prime \prime} \rightarrow \xi^{\prime}$ the corresponding morphism $R^{\prime \prime} \rightarrow R^{\prime}$ is surjective.

Proof. Write $\xi=\left(R, \xi_{n}, f_{n}\right)$. Set $R_{1}^{\prime}=k$ and $\xi_{1}^{\prime}=\xi_{1}$. Suppose that we have constructed minimal objects $\xi_{m}^{\prime} \rightarrow \xi_{m}$ of $\mathcal{S}_{\xi_{m}}$ lying over $R_{m}^{\prime} \subset R / \mathfrak{m}_{R}^{m}$ for $m \leq n$ and morphisms $f_{m}^{\prime}: \xi_{m+1}^{\prime} \rightarrow \xi_{m}^{\prime}$ compatible with $f_{m}$ for $m \leq n-1$. By Lemma 73.13 .1 (2) there exists a minimal object $\xi_{n+1}^{\prime} \rightarrow \xi_{n+1}$ lying over $R_{n+1}^{\prime} \subset R / \mathfrak{m}_{R}^{n+1}$ whose image is $\xi_{n}^{\prime} \rightarrow \xi_{n}$ over $R_{n}^{\prime} \subset R / \mathfrak{m}_{R}^{n}$. This produces the commutative diagram

by construction. Moreover the ring map $R_{n+1}^{\prime} \rightarrow R_{n}^{\prime}$ is surjective. Set $R^{\prime}=$ $\lim _{n} R_{n}^{\prime}$. Then $R^{\prime} \rightarrow R$ is injective.

However, it isn't a priori clear that $R^{\prime}$ is Noetherian. To prove this we use that $\xi$ is versal. Namely, versality implies that there exists a morphism $\xi \rightarrow \xi_{n}^{\prime}$ in $\widehat{\mathcal{F}}$, see Lemma 73.8.15. The corresponding map $R \rightarrow R_{n}^{\prime}$ has to be surjective (as $\xi_{n}^{\prime} \rightarrow \xi_{n}$ is minimal in $\mathcal{S}_{\xi_{n}}$ ). Thus the dimensions of the cotangent spaces are bounded and Lemma 73.4.8 implies $R^{\prime}$ is Noetherian, i.e., an object of $\widehat{\mathcal{C}}_{\Lambda}$. By Lemma 73.7.4 (plus the result on filtrations of Lemma 73.4.8) the sequence of elements $\xi_{n}^{\prime}$ defines a formal object $\xi^{\prime}$ over $R^{\prime}$ and we have a map $\xi^{\prime} \rightarrow \xi$.

By construction (1) holds for $R \rightarrow R / \mathfrak{m}_{R}^{n}$ for each $n$. Since each $R \rightarrow A$ as in (1) factors through $R \rightarrow R / \mathfrak{m}_{R}^{n} \rightarrow A$ we see that (1) for $x^{\prime} \rightarrow x$ over $f(R) \subset A$ follows from the minimality of $\xi_{n}^{\prime} \rightarrow \xi_{n}$ over $R_{n}^{\prime} \rightarrow R / \mathfrak{m}_{R}^{n}$ by Lemma 73.13.1 (1).
If $R^{\prime \prime} \rightarrow R^{\prime}$ as in (2) is not surjective, then $R^{\prime \prime} \rightarrow R^{\prime} \rightarrow R_{n}^{\prime}$ would not be surjective for some $n$ and $\xi_{n}^{\prime} \rightarrow \xi_{n}$ wouldn't be minimal, a contradiction. This contradiction proves (2).

06 T 3 Lemma 73.13.3. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which has (S1). Let $\xi$ be a versal formal object of $\mathcal{F}$ lying over $R$. Let $\xi^{\prime} \rightarrow \xi$ be a morphism of formal objects lying over $R^{\prime} \subset R$ as constructed in Lemma 73.13.2. Then

$$
R \cong R^{\prime}\left[\left[x_{1}, \ldots, x_{r}\right]\right]
$$

is a power series ring over $R^{\prime}$. Moreover, $\xi^{\prime}$ is a versal formal object too.
Proof. By Lemma 73.8 .15 there exists a morphism $\xi \rightarrow \xi^{\prime}$. By Lemma 73.13 .2 the corresponding map $f: R \rightarrow R^{\prime}$ induces a surjection $\left.f\right|_{R^{\prime}}: R^{\prime} \rightarrow R^{\prime}$. This is an isomorphism by Algebra, Lemma 10.30.8. Hence $I=\operatorname{Ker}(f)$ is an ideal of $R$ such that $R=R^{\prime} \oplus I$. Let $x_{1}, \ldots, x_{n} \in I$ be elements which form a basis for $I / \mathfrak{m}_{R} I$. Consider the map $S=R^{\prime}\left[\left[X_{1}, \ldots, X_{r}\right]\right] \rightarrow R$ mapping $X_{i}$ to $x_{i}$. For every $n \geq 1$ we get a surjection of Artinian $R^{\prime}$-algebras $B=S / \mathfrak{m}_{S}^{n} \rightarrow R / \mathfrak{m}_{R}^{n}=A$. Denote $y \in \operatorname{Ob}\left(\mathcal{F}(B)\right.$, resp. $x \in \operatorname{Ob}(\mathcal{F}(A))$ the pushforward of $\xi^{\prime}$ along $R^{\prime} \rightarrow S \rightarrow B$, resp. $R^{\prime} \rightarrow S \rightarrow A$. Note that $x$ is also the pushforward of $\xi$ along $R \rightarrow A$ as $\xi$ is the pushforward of $\xi^{\prime}$ along $R^{\prime} \rightarrow R$. Thus we have a solid diagram

Because $\xi$ is versal, using Remark 73.8.14 we obtain the dotted arrows fitting into these diagrams. In particular, the maps $S / \mathfrak{m}_{S}^{n} \rightarrow R / \mathfrak{m}_{R}^{n}$ have sections $h_{n}: R / \mathfrak{m}_{R}^{n} \rightarrow$ $S / \mathfrak{m}_{S}^{n}$. It follows from Lemma 73.4.9 that $S \rightarrow R$ is an isomorphism.

As $\xi$ is a pushforward of $\xi^{\prime}$ along $R^{\prime} \rightarrow R$ we obtain from Remark 73.7.13 a commutative diagram

Since $R^{\prime} \rightarrow R$ has a left inverse (namely $R \rightarrow R / I=R^{\prime}$ ) we see that $\left.\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \underline{R^{\prime}}\right|_{\mathcal{C}_{\Lambda}}$ is essentially surjective. Hence by Lemma 73.8 .7 we see that $\underline{\xi}^{\prime}$ is smooth, i.e., $\xi^{\prime}$ is a versal formal object.

Motivated by the preceding lemmas we make the following definition.
06T4 Definition 73.13.4. Let $\mathcal{F}$ be a predeformation category. We say a versal formal object $\xi$ of $\mathcal{F}$ is minima ${ }^{2}$ if for any morphism of formal objects $\xi^{\prime} \rightarrow \xi$ the underlying map on rings is surjective. Sometimes a minimal versal formal object is called miniversal.

[^189]The work in this section shows this definition is reasonable. First of all, the existence of a versal formal object implies that $\mathcal{F}$ has (S1). Then the preceding lemmas show there exists a minimal versal formal object. Finally, any two minimal versal formal objects are isomorphic. Here is a summary of our results (with detailed proofs).
06T5 Lemma 73.13.5. Let $\mathcal{F}$ be a predeformation category which has a versal formal object. Then
(1) $\mathcal{F}$ has a minimal versal formal object,
(2) minimal versal objects are unique up to isomorphism, and
(3) any versal object is the pushforward of a minimal versal object along a power series ring extension.
Proof. Suppose $\mathcal{F}$ has a versal formal object $\xi$ over $R$. Then it satisfies (S1), see Lemma 73.12.1. Let $\xi^{\prime} \rightarrow \xi$ over $R^{\prime} \subset R$ be any of the morphisms constructed in Lemma 73.13.2. By Lemma 73.13 .3 we see that $\xi^{\prime}$ is versal, hence it is a minimal versal formal object (by construction). This proves (1). Also, $R \cong R^{\prime}\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ which proves (3).

Suppose that $\xi_{i} / R_{i}$ are two minimal versal formal objects. By Lemma 73.8 .15 there exist morphisms $\xi_{1} \rightarrow \xi_{2}$ and $\xi_{2} \rightarrow \xi_{1}$. The corresponding ring maps $f: R_{1} \rightarrow R_{2}$ and $g: R_{2} \rightarrow R_{1}$ are surjective by minimality. Hence the compositions $g \circ f: R_{1} \rightarrow$ $R_{1}$ and $f \circ g: R_{2} \rightarrow R_{2}$ are isomorphisms by Algebra, Lemma 10.30.8. Thus $f$ and $g$ are isomorphisms whence the maps $\xi_{1} \rightarrow \xi_{2}$ and $\xi_{2} \rightarrow \xi_{1}$ are isomorphisms (because $\widehat{\mathcal{F}}$ is cofibred in groupoids by Lemma 73.7.2). This proves (2) and finishes the proof of the lemma.

### 73.14. Miniversal formal objects and tangent spaces

06IL The general notion of minimality introduced in Definition 73.13.4 can sometimes be deduced from the behaviour on tangent spaces. Let $\xi$ be a formal object of the predeformation category $\mathcal{F}$ and let $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ be the corresponding morphism. Then we can consider the following the condition
06IM

$$
\begin{equation*}
d \underline{\xi}: \operatorname{Der}_{\Lambda}(R, k) \rightarrow T \mathcal{F} \text { is bijective } \tag{73.14.0.1}
\end{equation*}
$$

and the condition
$06 \mathrm{~T} 6 \quad(73.14 .0 .2) \quad d \underline{\xi}: \operatorname{Der}_{\Lambda}(R, k) \rightarrow T \mathcal{F}$ is bijective on $\operatorname{Der}_{\Lambda}(k, k)$-orbits.
Here we are using the identification $\left.T \underline{R}\right|_{\mathcal{C}_{\Lambda}}=\operatorname{Der}_{\Lambda}(R, k)$ of Example 73.10 .11 and the action 73.11 .6 .2 of derivations on the tangent spaces. If $k^{\prime} \subset k$ is separable, then $\operatorname{Der}_{\Lambda}(k, k)=0$ and the two conditions are equivalent. It turns out that, in the presence of condition (S2) a versal formal object is minimal if and only if $\underline{\xi}$ satisfies 73.14.0.2). Moreover, if $\underline{\xi}$ satisfies $\sqrt[73.14 .0 .1]{ }$, then $\mathcal{F}$ satisfies (S2).

06IR Lemma 73.14.1. Let $\mathcal{F}$ be a predeformation category. Let $\xi$ be a versal formal object of $\mathcal{F}$ such that 73.14.0.2 holds. Then $\xi$ is a minimal versal formal object. In particular, such $\xi$ are unique up to isomorphism.

Proof. If $\xi$ is not minimal, then there exists a morphism $\xi^{\prime} \rightarrow \xi$ lying over $R^{\prime} \rightarrow R$ such that $R=R^{\prime}\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ with $n>0$, see Lemma 73.13.5. Thus $d \underline{\xi}$ factors as

$$
\operatorname{Der}_{\Lambda}(R, k) \rightarrow \operatorname{Der}_{\Lambda}\left(R^{\prime}, k\right) \rightarrow T \mathcal{F}
$$

and we see that 73.14 .0 .2 cannot hold because $D: f \mapsto \partial / \partial x_{1}(f) \bmod \mathfrak{m}_{R}$ is an element of the kernel of the first arrow which is not in the image of $\operatorname{Der}_{\Lambda}(k, k) \rightarrow$ $\operatorname{Der}_{\Lambda}(R, k)$.

06IV Lemma 73.14.2. Let $\mathcal{F}$ be a predeformation category. Let $\xi$ be a versal formal object of $\mathcal{F}$ such that 73.14.0.1) holds. Then
(1) $\mathcal{F}$ satisfies (S1).
(2) $\mathcal{F}$ satisfies (SZ).
(3) $\operatorname{dim}_{k} T \mathcal{F}$ is finite.

Proof. Condition (S1) holds by Lemma 73.12.1. The first part of (S2) holds since (S1) holds. Let

be diagrams as in the second part of (S2). As above we can find morphisms $b: \xi \rightarrow y$ and $b^{\prime}: \xi \rightarrow y^{\prime}$ such that

commutes. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ denote the structure morphism. Say $\widehat{p}(\xi)=R$, i.e., $\xi$ lies over $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$. We see that the pushforward of $\xi$ via $p(c) \circ p(b)$ is $x_{\epsilon}$ and that the pushforward of $\xi$ via $p\left(c^{\prime}\right) \circ p\left(b^{\prime}\right)$ is $x_{\epsilon}$. Since $\xi$ satisfies 73.14.0.1, we see that $p(c) \circ p(b)=p\left(c^{\prime}\right) \circ p\left(b^{\prime}\right)$ as maps $R \rightarrow k[\epsilon]$. Hence $p(b)=p\left(b^{\prime}\right)$ as maps from $R \rightarrow A \times_{k} k[\epsilon]$. Thus we see that $y$ and $y^{\prime}$ are isomorphic to the pushforward of $\xi$ along this map and we get a unique morphism $y \rightarrow y^{\prime}$ over $A \times_{k} k[\epsilon]$ compatible with $b$ and $b^{\prime}$ as desired.

Finally, by Example 73.10.11 we see $\operatorname{dim}_{k} T \mathcal{F}=\left.\operatorname{dim}_{k} T \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is finite.
06 T 7 Example 73.14.3. There exist predeformation categories which have a versal formal object satisfying (73.14.0.2) but which do not satisfy (S2). A quick example is to take $F=k[\epsilon] / G$ where $G \subset \operatorname{Aut}_{\mathcal{C}_{\Lambda}}(k[\epsilon])$ is a finite nontrivial subgroup. Namely, the map $\underline{k[\epsilon]} \rightarrow F$ is smooth, but the tangent space of $F$ does not have a natural $k$-vector space structure (as it is a quotient of a $k$-vector space by a finite group).

06 T 8 Lemma 73.14.4. Let $\mathcal{F}$ be a predeformation category satisfying (S2) which has a versal formal object. Then its minimal versal formal object satisfies 73.14.0.2.

Proof. Let $\xi$ be a minimal versal formal object for $\mathcal{F}$, see Lemma 73.13.5. Say $\xi$ lies over $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}_{\Lambda}}\right)$. In order to parse $\sqrt{73.14 .0 .2}$ we point out that $T \mathcal{F}$ has a natural $k$-vector space structure (see Lemma 73.11 .2 , that $d \underline{\xi}: \operatorname{Der}_{\Lambda}(R, k) \rightarrow T \mathcal{F}$ is linear (see Lemma 73.11.4), and that the action of $\operatorname{Der}_{\Lambda}(k, k)$ is given by addition
(see Lemma 73.11.6). Consider the diagram

The vector space $K$ is the kernel of $d \xi$. Note that the middle column is exact in the middle as it is dual to the sequence (73.3.10.1). If 73.14 .0 .2 fails, then we can find a nonzero element $D \in K$ which does not map to zero in $\operatorname{Hom}_{k}\left(\mathfrak{m}_{R} / \mathfrak{m}_{R}^{2}, k\right)$. This means there exists an $t \in \mathfrak{m}_{R}$ such that $D(t)=1$. Set $R^{\prime}=\{a \in R \mid D(a)=0\}$. As $D$ is a derivation this is a subring of $R$. Since $D(t)=1$ we see that $R^{\prime} \rightarrow k$ is surjective (compare with the proof of Lemma 73.3.12). Note that $\mathfrak{m}_{R^{\prime}}=\operatorname{Ker}(D$ : $\left.\mathfrak{m}_{R} \rightarrow k\right)$ is an ideal of $R$ and $\mathfrak{m}_{R}^{2} \subset \mathfrak{m}_{R^{\prime}}$. Hence

$$
\mathfrak{m}_{R} / \mathfrak{m}_{R}^{2}=\mathfrak{m}_{R^{\prime}} / \mathfrak{m}_{R}^{2}+k \bar{t}
$$

which implies that the map

$$
R^{\prime} / \mathfrak{m}_{R}^{2} \times_{k} k[\epsilon] \rightarrow R / \mathfrak{m}_{R}^{2}
$$

sending $\epsilon$ to $\bar{t}$ is an isomorphism. In particular there is a map $R / \mathfrak{m}_{R}^{2} \rightarrow R^{\prime} / \mathfrak{m}_{R}^{2}$.
Let $\xi \rightarrow y$ be a morphism lying over $R \rightarrow R / \mathfrak{m}_{R}^{2}$. Let $y \rightarrow x$ be a morphism lying over $R / \mathfrak{m}_{R}^{2} \rightarrow R^{\prime} / \mathfrak{m}_{R}^{2}$. Let $y \rightarrow x_{\epsilon}$ be a morphism lying over $R / \mathfrak{m}_{R}^{2} \rightarrow k[\epsilon]$. Let $x_{0}$ be the unique (up to unique isomorphism) object of $\mathcal{F}$ over $k$. By the axioms of a category cofibred in groupoids we obtain a commutative diagram

Because $D \in K$ we see that $x_{\epsilon}$ is isomorphic to $0 \in \mathcal{F}(k[\epsilon])$, i.e., $x_{\epsilon}$ is the pushforward of $x_{0}$ via $k \rightarrow k[\epsilon], a \mapsto a$. Hence by Lemma 73.9.7 we see that there exists a morphism $x \rightarrow y$. Since length ${ }_{\Lambda}\left(R^{\prime} / \mathfrak{m}_{R}^{2}\right)<\operatorname{length}_{\Lambda}\left(R / \mathfrak{m}_{R}^{2}\right)$ the corresponding ring $\operatorname{map} R^{\prime} / \mathfrak{m}_{R}^{2} \rightarrow R / \mathfrak{m}_{R}^{2}$ is not surjective. This contradicts the minimality of $\xi / R$, see part (1) of Lemma 73.13 .2 This contradiction shows that such a $D$ cannot exist, hence we win.

06IX Theorem 73.14.5. Let $\mathcal{F}$ be a predeformation category. Consider the following conditions
(1) $\mathcal{F}$ has a minimal versal formal object satisfying 73.14.0.1,
(2) $\mathcal{F}$ has a minimal versal formal object satisfying 73.14.0.2),
(3) the following conditions hold:
(a) $\mathcal{F}$ satisfies (S1).
(b) $\mathcal{F}$ satisfies (S2).
(c) $\operatorname{dim}_{k} T \mathcal{F}$ is finite.

We always have

$$
(1) \Rightarrow(3) \Rightarrow(2)
$$

If $k^{\prime} \subset k$ is separable, then all three are equivalent.
Proof. Lemma 73.14 .2 shows that $(1) \Rightarrow(3)$. Lemmas 73.12 .4 and 73.14 .4 show that $(3) \Rightarrow(2)$. If $k^{\prime} \subset k$ is separable then $\operatorname{Der}_{\Lambda}(k, k)=0$ and we see that (73.14.0.1) $=73.14 .0 .2$, i.e., (1) is the same as (2).
An alternative proof of $(3) \Rightarrow(1)$ in the classical case is to add a few words to the proof of Lemma 73.12 .4 to see that one can right away construct a versal object which satisfies 73.14 .0 .1 in this case. This avoids the use of Lemma 73.12.4 in the classical case. Details omitted.

06IY Remark 73.14.6. When $\mathcal{F}$ is a predeformation functor, the condition $\operatorname{dim}_{k} T \mathcal{F}<$ $\infty$ is precisely condition (H3) from Schlessinger's paper. In the classical case (or the case where $k^{\prime} \subset k$ is separable), Theorem 73.14.5 recovers Schlessinger's theorem on the existence of "hulls". In our terminology a hull is a versal formal object $\xi$ for a predeformation functor such that $d \xi$ is an isomorphism.
06IZ Remark 73.14.7. Let $\mathcal{F}$ be a predeformation category satisfying (S1), (S2), and $\operatorname{dim}_{k} T \mathcal{F}<\infty$. Then $\overline{\mathcal{F}}$ also satisfies (S1), (S2), and $\operatorname{dim}_{k} T \overline{\mathcal{F}}<\infty$, see Lemma 73.9.5. Thus, if $k^{\prime} \subset k$ is separable, then $\overline{\mathcal{F}}$ has a hull (see Remark 73.14.6). In fact, if $\xi$ is a minimal versal object for $\mathcal{F}$ lying over $R$, then the composition

$$
\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \longrightarrow \mathcal{F} \longrightarrow \overline{\mathcal{F}}
$$

is smooth and identifies tangent spaces, i.e., the image $\bar{\xi}$ of $\xi$ in $\overline{\mathcal{F}}$ is a hull. This follows from the fact that $\mathcal{F} \rightarrow \overline{\mathcal{F}}$ identifies tangent spaces.

06 T 9 Example 73.14.8. In Example 73.8.10 we constructed objects $R \in \widehat{\mathcal{C}}_{\Lambda}$ such that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth. We can reformulate this as follows. Let $\mathcal{F}=\mathcal{C}_{\Lambda}$ considered as cofibred in groupoids via the identity functor. In other words, $\mathcal{F}$ is the category cofibred in sets corresponding to the functor $F: A \mapsto\{*\}$ (this is the final object in the category of functors $\mathcal{C}_{\Lambda} \rightarrow$ Sets). The condition that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ is smooth means exactly that $\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow F$ is smooth, i.e., that $\xi=*$ is a formal versal object of $\mathcal{F}$ over $R$. Hence $\mathcal{F}$ has a versal formal object. In fact, it is easy to see that $\mathcal{F}$ satisfies condition (3) of Theorem 73.14.5. The theorem implies that (2) holds. This means we can find a minimal versal formal object $* \in \widehat{\mathcal{F}}(S)$ over some $S \in \widehat{\mathcal{C}}_{\Lambda}$ such that $d *: \operatorname{Der}_{\Lambda}(S, k) \rightarrow 0$ is bijective on $\operatorname{Der}_{\Lambda}(k, k)$-orbits. Clearly this means that the injection $\operatorname{Der}_{\Lambda}(k, k) \rightarrow \operatorname{Der}_{\Lambda}(S, k)$ is also surjective. In other words, the exact sequence 73.3 .10 .2 turns into a pair of isomorphisms

$$
H_{1}\left(L_{k / \Lambda}\right)=\mathfrak{m}_{S} / \mathfrak{m}_{S}^{2} \quad \text { and } \quad \Omega_{S / \Lambda} \otimes_{S} k=\Omega_{k / \Lambda}
$$

(The first arrow is injective because of the formal smoothness of $S$ over $\Lambda$; details omitted.) Of course the existence of such a ring $S$ can be proved directly by judiciously slicing the ring $R$ constructed in Example 73.8.10.

### 73.15. Rim-Schlessinger conditions and deformation categories

06 J 1 There is a very natural property of categories fibred in groupoids over $\mathcal{C}_{\Lambda}$ which is easy to check in practice and which implies Schlessinger's properties (S1) and (S2) we have introduced earlier.

06J2 Definition 73.15.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. We say that $\mathcal{F}$ satisfies condition $(R S)$ if for every diagram in $\mathcal{F}$

in $\mathcal{C}_{\Lambda}$ with $A_{2} \rightarrow A$ surjective, there exists a fiber product $x_{1} \times{ }_{x} x_{2}$ in $\mathcal{F}$ such that the diagram

06J3 Lemma 73.15.2. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Given a commutative diagram in $\mathcal{F}$

with $A_{2} \rightarrow A$ surjective, then it is a fiber square.
Proof. Since $\mathcal{F}$ satisfies (RS), there exists a fiber product diagram

The induced map $y \rightarrow x_{1} \times{ }_{x} x_{2}$ lies over id: $A_{1} \times{ }_{A} A_{1} \rightarrow A_{1} \times{ }_{A} A_{1}$, hence it is an isomorphism.

06J4 Lemma 73.15.3. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then $\mathcal{F}$ satisfies (RS) if the condition in Definition 73.15.1 is assumed to hold only when $A_{2} \rightarrow A$ is a small extension.
Proof. Apply Lemma 73.3.3. The proof is similar to that of Lemma 73.8.2.
06J5 Lemma 73.15.4. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. The following are equivalent
(1) $\mathcal{F}$ satisfies ( $R S$ ),
(2) the functor $\mathcal{F}\left(A_{1} \times_{A} A_{2}\right) \rightarrow \mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)$ see 73.9.1.1) is an equivalence of categories whenever $A_{2} \rightarrow A$ is surjective, and
(3) same as in (2) whenever $A_{2} \rightarrow A$ is a small extension.

Proof. Assume (1). By Lemma 73.15 .2 we see that every object of $\mathcal{F}\left(A_{1} \times{ }_{A} A_{2}\right)$ is of the form $x_{1} \times{ }_{x} x_{2}$. Moreover
$\operatorname{Mor}_{A_{1} \times{ }_{A} A_{2}}\left(x_{1} \times_{x} x_{2}, y_{1} \times_{y} y_{2}\right)=\operatorname{Mor}_{A_{1}}\left(x_{1}, y_{1}\right) \times_{\operatorname{Mor}_{A}(x, y)} \operatorname{Mor}_{A_{2}}\left(x_{2}, y_{2}\right)$.
Hence we see that $\mathcal{F}\left(A_{1} \times_{A} A_{2}\right)$ is a 2-fibre product of $\mathcal{F}\left(A_{1}\right)$ with $\mathcal{F}\left(A_{2}\right)$ over $\mathcal{F}(A)$ by Categories, Remark 4.30.5. In other words, we see that (2) holds.

The implication $(2) \Rightarrow(3)$ is immediate.
Assume (3). Let $q_{1}: A_{1} \rightarrow A$ and $q_{2}: A_{2} \rightarrow A$ be given with $q_{2}$ a small extension. We will use the description of the 2 -fibre product $\mathcal{F}\left(A_{1}\right) \times{ }_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)$ from Categories, Remark 4.30.5. Hence let $y \in \mathcal{F}\left(A_{1} \times_{A} A_{2}\right)$ correspond to $\left(x_{1}, x_{2}, x, a_{1}: x_{1} \rightarrow x, a_{2}: x_{2} \rightarrow x\right)$. Let $z$ be an object of $\mathcal{F}$ lying over $C$. Then

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{F}}(z, y)= & \left\{(f, \alpha) \mid f: C \rightarrow A_{1} \times_{A} A_{2}, \alpha: f_{*} z \rightarrow y\right\} \\
= & \left\{\left(f_{1}, f_{2}, \alpha_{1}, \alpha_{2}\right) \mid f_{i}: C \rightarrow A_{i}, \alpha_{i}: f_{i, *} z \rightarrow x_{i},\right. \\
& \left.q_{1} \circ f_{1}=q_{2} \circ f_{2}, q_{1, *} \alpha_{1}=q_{2, *} \alpha_{2}\right\} \\
= & \operatorname{Mor}_{\mathcal{F}}\left(z, x_{1}\right) \times_{\operatorname{Mor}_{\mathcal{F}}(z, x)} \operatorname{Mor}_{\mathcal{F}}\left(z, x_{2}\right)
\end{aligned}
$$

whence $y$ is a fibre product of $x_{1}$ and $x_{2}$ over $x$. Thus we see that $\mathcal{F}$ satisfies (RS) in case $A_{2} \rightarrow A$ is a small extension. Hence (RS) holds by Lemma 73.15.3.

06J6 Remark 73.15.5. When $\mathcal{F}$ is cofibered in sets, condition (RS) is exactly condition (H4) from Schlessinger's paper [Sch68, Theorem 2.11]. Namely, for a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets, condition (RS) states: If $A_{1} \rightarrow A$ and $A_{2} \rightarrow A$ are maps in $\mathcal{C}_{\Lambda}$ with $A_{2} \rightarrow A$ surjective, then the induced map $F\left(A_{1} \times_{A} A_{2}\right) \rightarrow F\left(A_{1}\right) \times_{F(A)} F\left(A_{2}\right)$ is bijective.

06J7 Lemma 73.15.6. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. The condition (RS) for $\mathcal{F}$ implies both (S1) and (S2) for $\mathcal{F}$.

Proof. Using the reformulation of Lemma 73.15 .4 and the explanation of (S1) following Definition 73.9.1 it is immediate that (RS) implies (S1). This proves the first part of (S2). The second part of (S2) follows because Lemma 73.15 .2 tells us that $y=x_{1} \times_{d, x_{0}, e} x_{2}=y^{\prime}$ if $y, y^{\prime}$ are as in the second part of the definition of (S2) in Definition 73.9.1. (In fact the morphism $y \rightarrow y^{\prime}$ is compatible with both $a, a^{\prime}$ and $c, c^{\prime}$ !)

The following lemma is the analogue of Lemma 73.9.5. Recall that if $\mathcal{F}$ is a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ and $x$ is an object of $\mathcal{F}$ lying over $A$, then we denote $\operatorname{Aut}_{A}(x)=\operatorname{Mor}_{A}(x, x)=\operatorname{Mor}_{\mathcal{F}(A)}(x, x)$. If $x^{\prime} \rightarrow x$ is a morphism of $\mathcal{F}$ lying over $A^{\prime} \rightarrow A$ then there is a well defined map of groups $\operatorname{Aut}_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)$.

06J8 Lemma 73.15.7. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). The following conditions are equivalent:
(1) $\overline{\mathcal{F}}$ satisfies $(R S)$.
(2) Let $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ be ring maps in $\mathcal{C}_{\Lambda}$ with $f_{2}$ surjective. The induced map of sets of isomorphism classes

$$
\overline{\mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)} \rightarrow \overline{\mathcal{F}}\left(A_{1}\right) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}\left(A_{2}\right)
$$

is injective.
(3) For every morphism $x^{\prime} \rightarrow x$ in $\mathcal{F}$ lying over a surjective ring map $A^{\prime} \rightarrow A$, the map $A u t_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)$ is surjective.
(4) For every morphism $x^{\prime} \rightarrow x$ in $\mathcal{F}$ lying over a small extension $A^{\prime} \rightarrow A$, the map $A u t_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)$ is surjective.
Proof. We prove that (1) is equivalent to (2) and (2) is equivalent to (3). The equivalence of (3) and (4) follows from Lemma 73.3 .3 .

Let $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ be ring maps in $\mathcal{C}_{\Lambda}$ with $f_{2}$ surjective. By Remark 73.15 .5 we see $\overline{\mathcal{F}}$ satisfies (RS) if and only if the map

$$
\overline{\mathcal{F}}\left(A_{1} \times_{A} A_{2}\right) \rightarrow \overline{\mathcal{F}}\left(A_{1}\right) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}\left(A_{2}\right)
$$

is bijective for any such $f_{1}, f_{2}$. This map is at least surjective since that is the condition of (S1) and $\overline{\mathcal{F}}$ satisfies (S1) by Lemmas 73.15.6 and 73.9.5. Moreover, this map factors as

$$
\overline{\mathcal{F}}\left(A_{1} \times_{A} A_{2}\right) \longrightarrow \overline{\mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)} \longrightarrow \overline{\mathcal{F}}\left(A_{1}\right) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}\left(A_{2}\right)
$$

where the first map is a bijection since

$$
\mathcal{F}\left(A_{1} \times_{A} A_{2}\right) \longrightarrow \mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)
$$

is an equivalence by (RS) for $\mathcal{F}$. Hence (1) is equivalent to (2).
Assume (2) holds. Let $x^{\prime} \rightarrow x$ be a morphism in $\mathcal{F}$ lying over a surjective ring map $f: A^{\prime} \rightarrow A$. Let $a \in \operatorname{Aut}_{A}(x)$. The objects

$$
\left(x^{\prime}, x^{\prime}, a: x \rightarrow x\right), \quad\left(x^{\prime}, x^{\prime}, \mathrm{id}: x \rightarrow x\right)
$$

of $\mathcal{F}\left(A^{\prime}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A^{\prime}\right)$ have the same image in $\overline{\mathcal{F}}\left(A^{\prime}\right) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}\left(A^{\prime}\right)$. By (2) there exists maps $b_{1}, b_{2}: x^{\prime} \rightarrow x^{\prime}$ such that

commutes. Hence $b_{2}^{-1} \circ b_{1} \in \operatorname{Aut}_{A^{\prime}}\left(x^{\prime}\right)$ has image $a \in \operatorname{Aut}_{A}(x)$. Hence (3) holds.
Assume (3) holds. Suppose

$$
\left(x_{1}, x_{2}, a:\left(f_{1}\right)_{*} x_{1} \rightarrow\left(f_{2}\right)_{*} x_{2}\right),\left(x_{1}^{\prime}, x_{2}^{\prime}, a^{\prime}:\left(f_{1}\right)_{*} x_{1}^{\prime} \rightarrow\left(f_{2}\right)_{*} x_{2}^{\prime}\right)
$$

are objects of $\mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)$ with the same image in $\overline{\mathcal{F}}\left(A_{1}\right) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}\left(A_{2}\right)$. Then there are morphisms $b_{1}: x_{1} \rightarrow x_{1}^{\prime}$ in $\mathcal{F}\left(A_{1}\right)$ and $b_{2}: x_{2} \rightarrow x_{2}^{\prime}$ in $\mathcal{F}\left(A_{2}\right)$. By (3) we can modify $b_{2}$ by an automorphism of $x_{2}$ over $A_{2}$ so that the diagram

$$
\begin{aligned}
&\left(f_{1}\right)_{*} x_{1} \xrightarrow[a]{ }\left(f_{2}\right)_{*} x_{2} \\
&\left(f_{1}\right)_{*} b_{1}
\end{aligned} \downarrow \begin{aligned}
& \downarrow \\
& \\
& \left.\left(f_{1}\right)_{*} x_{1}^{\prime}\right)_{*} b_{2} \\
& a^{\prime} \\
& \\
& \hline
\end{aligned}\left(f_{2}\right)_{*} x_{2}^{\prime} .
$$

commutes. This proves $\left(x_{1}, x_{2}, a\right) \cong\left(x_{1}^{\prime}, x_{2}^{\prime}, a^{\prime}\right)$ in $\overline{\mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)}$. Hence (2) holds.

Finally we define the notion of a deformation category.
06J9 Definition 73.15.8. A deformation category is a predeformation category $\mathcal{F}$ satisfying (RS). A morphism of deformation categories is a morphism of categories over $\mathcal{C}_{\Lambda}$.

06JA Remark 73.15.9. We say that a functor $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets is a deformation functor if the associated cofibered set is a deformation category, i.e. if $F(k)$ is a one element set and $F$ satisfies (RS). If $\mathcal{F}$ is a deformation category, then $\overline{\mathcal{F}}$ is a predeformation functor but not necessarily a deformation functor, as Lemma 73.15.7 shows.

06JB Example 73.15.10. A prorepresentable functor $F$ is a deformation functor. Namely, suppose $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$ and $F(A)=\operatorname{Mor}_{\widehat{\mathcal{C}}_{\Lambda}}(R, A)$. There is a unique morphism $R \rightarrow k$, so $F(k)$ is a one element set. Since

$$
\operatorname{Hom}_{\Lambda}\left(R, A_{1} \times_{A} A_{2}\right)=\operatorname{Hom}_{\Lambda}\left(R, A_{1}\right) \times \times_{\operatorname{Hom}_{\Lambda}(R, A)} \operatorname{Hom}_{\Lambda}\left(R, A_{2}\right)
$$

the same is true for maps in $\widehat{\mathcal{C}}_{\Lambda}$ and we see that $F$ has (RS).
The following is one of our typical remarks on passing from a category cofibered in groupoids to the predeformation category at a point over $k$ : it says that this process preserves (RS).

06JC Lemma 73.15.11. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $x_{0} \in$ $\mathrm{Ob}(\mathcal{F}(k))$. Let $\mathcal{F}_{x_{0}}$ be the category cofibred in groupoids over $\mathcal{C}_{\Lambda}$ constructed in Remark 73.6.4. If $\mathcal{F}$ satisfies $(R S)$, then so does $\mathcal{F}_{x_{0}}$. In particular, $\mathcal{F}_{x_{0}}$ is a deformation category.

Proof. Any diagram as in Definition 73.15 .1 in $\mathcal{F}_{x_{0}}$ gives rise to a diagram in $\mathcal{F}$ and the output of (RS) for this diagram in $\mathcal{F}$ can be viewed as an output for $\mathcal{F}_{x_{0}}$ as well.

The following lemma is the analogue of the fact that 2-fibre products of algebraic stacks are algebraic stacks.

06L4 Lemma 73.15.12. Let

be 2-fibre product of categories cofibered in groupoids over $\mathcal{C}_{\Lambda}$. If $\mathcal{F}, \mathcal{G}, \mathcal{H}$ all satisfy (RS), then $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ satisfies $(R S)$.

Proof. If $A$ is an object of $\mathcal{C}_{\Lambda}$, then an object of the fiber category of $\mathcal{H} \times{ }_{\mathcal{F}} \mathcal{G}$ over $A$ is a triple $(u, v, a)$ where $u \in \mathcal{H}(A), v \in \mathcal{G}(A)$, and $a: f(u) \rightarrow g(v)$ is a morphism in $\mathcal{F}(A)$. Consider a diagram in $\mathcal{H} \times{ }_{\mathcal{F}} \mathcal{G}$

in $\mathcal{C}_{\Lambda}$ with $A_{2} \rightarrow A$ surjective. Since $\mathcal{H}$ and $\mathcal{G}$ satisfy (RS), there are fiber products $u_{1} \times{ }_{u} u_{2}$ and $v_{1} \times{ }_{v} v_{2}$ lying over $A_{1} \times{ }_{A} A_{2}$. Since $\mathcal{F}$ satisfies (RS), Lemma73.15.2 shows

are both fiber squares in $\mathcal{F}$. Thus we can view $a_{1} \times_{a} a_{2}$ as a morphism from $f\left(u_{1} \times_{u} u_{2}\right)$ to $g\left(v_{1} \times_{v} v_{2}\right)$ over $A_{1} \times{ }_{A} A_{2}$. It follows that

is a fiber square in $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ as desired.

### 73.16. Lifts of objects

06JD The content of this section is that the tangent space has a principal homogeneous action on the set of lifts along a small surjection in the case of a deformation category.

06JE Definition 73.16.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $f: A^{\prime} \rightarrow A$ be a map in $\mathcal{C}_{\Lambda}$. Let $x \in \mathcal{F}(A)$. The category Lift $(x, f)$ of lifts of $x$ along $f$ is the category with the following objects and morphisms.
(1) Objects: A lift of $x$ along $f$ is a morphism $x^{\prime} \rightarrow x$ lying over $f$.
(2) Morphisms: A morphism of lifts from $a_{1}: x_{1}^{\prime} \rightarrow x$ to $a_{2}: x_{2}^{\prime} \rightarrow x$ is a morphism $b: x_{1}^{\prime} \rightarrow x_{2}^{\prime}$ in $\mathcal{F}\left(A^{\prime}\right)$ such that $a_{2}=a_{1} \circ b$.
The set $\operatorname{Lift}(x, f)$ of lifts of $x$ along $f$ is the set of isomorphism classes of $\operatorname{Lift}(x, f)$.
06JF Remark 73.16.2. When the map $f: A^{\prime} \rightarrow A$ is clear from the context, we may write Lift $\left(x, A^{\prime}\right)$ and $\operatorname{Lift}\left(x, A^{\prime}\right)$ in place of $\operatorname{Lift}(x, f)$ and $\operatorname{Lift}(x, f)$.

06JG Remark 73.16.3. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_{\Lambda}$. Let $x_{0} \in$ $\operatorname{Ob}(\mathcal{F}(k))$. Let $V$ be a finite dimensional vector space. Then $\operatorname{Lift}\left(x_{0}, k[V]\right)$ is the set of isomorphism classes of $\mathcal{F}_{x_{0}}(k[V])$ where $\mathcal{F}_{x_{0}}$ is the predeformation category of objects in $\mathcal{F}$ lying over $x_{0}$, see Remark 73.6.4. Hence if $\mathcal{F}$ satisfies (S2), then so does $\mathcal{F}_{x_{0}}$ (see Lemma 73.9.6) and by Lemma 73.11.2 we see that

$$
\operatorname{Lift}\left(x_{0}, k[V]\right)=T \mathcal{F}_{x_{0}} \otimes_{k} V
$$

as $k$-vector spaces.
06JH Remark 73.16.4. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let

be a fibre square in $\mathcal{C}_{\Lambda}$ such that either $A_{1} \rightarrow A$ or $A_{2} \rightarrow A$ is surjective. Let $x \in \operatorname{Ob}(\mathcal{F}(A))$. Given lifts $x_{1} \rightarrow x$ and $x_{2} \rightarrow x$ of $x$ to $A_{1}$ and $A_{2}$, we get by (RS) a lift $x_{1} \times{ }_{x} x_{2} \rightarrow x$ of $x$ to $A_{1} \times{ }_{A} A_{2}$. Conversely, by Lemma 73.15 .2 any lift of $x$ to $A_{1} \times{ }_{A} A_{2}$ is of this form. Hence a bijection

$$
\operatorname{Lift}\left(x, A_{1}\right) \times \operatorname{Lift}\left(x, A_{2}\right) \longrightarrow \operatorname{Lift}\left(x, A_{1} \times_{A} A_{2}\right)
$$

Similarly, if $x_{1} \rightarrow x$ is a fixed lifting of $x$ to $A_{1}$, then there is a bijection

$$
\operatorname{Lift}\left(x_{1}, A_{1} \times_{A} A_{2}\right) \longrightarrow \operatorname{Lift}\left(x, A_{2}\right)
$$

Now let

be a composition of fibre squares in $\mathcal{C}_{\Lambda}$ with both $A_{1}^{\prime} \rightarrow A_{1}$ and $A_{1} \rightarrow A$ surjective. Let $x_{1} \rightarrow x$ be a morphism lying over $A_{1} \rightarrow A$. Then by the above we have bijections

$$
\begin{aligned}
\operatorname{Lift}\left(x_{1}, A_{1}^{\prime} \times_{A} A_{2}\right) & =\operatorname{Lift}\left(x_{1}, A_{1}^{\prime}\right) \times \operatorname{Lift}\left(x_{1}, A_{1} \times_{A} A_{2}\right) \\
& =\operatorname{Lift}\left(x_{1}, A_{1}^{\prime}\right) \times \operatorname{Lift}\left(x, A_{2}\right)
\end{aligned}
$$

06JI Lemma 73.16.5. Let $\mathcal{F}$ be a deformation category. Let $A^{\prime} \rightarrow A$ be a surjective ring map in $\mathcal{C}_{\Lambda}$ whose kernel $I$ is annihilated by $\mathfrak{m}_{A^{\prime}}$. Let $x \in \operatorname{Ob}(\mathcal{F}(A))$. If Lift $\left(x, A^{\prime}\right)$ is nonempty, then there is a free and transitive action of $T \mathcal{F} \otimes_{k} I$ on Lift ( $x, A^{\prime}$ ).

Proof. Consider the ring map $g: A^{\prime} \times_{A} A^{\prime} \rightarrow k[I]$ defined by the rule $g\left(a_{1}, a_{2}\right)=$ $\overline{a_{1}} \oplus a_{2}-a_{1}$ (compare with Lemma 73.9.8). There is an isomorphism

$$
A^{\prime} \times_{A} A^{\prime} \xrightarrow{\sim} A^{\prime} \times_{k} k[I]
$$

given by $\left(a_{1}, a_{2}\right) \mapsto\left(a_{1}, g\left(a_{1}, a_{2}\right)\right)$. This isomorphism commutes with the projections to $A^{\prime}$ on the first factor, and hence with the projections of $A^{\prime} \times{ }_{A} A^{\prime}$ and $A^{\prime} \times_{k} k[I]$ to $A$. Thus there is a bijection

06TA

$$
\begin{equation*}
\operatorname{Lift}\left(x, A^{\prime} \times{ }_{A} A^{\prime}\right) \longrightarrow \operatorname{Lift}\left(x, A^{\prime} \times_{k} k[I]\right) \tag{73.16.5.1}
\end{equation*}
$$

By Remark 73.16 .4 there is a bijection
06TB

$$
\begin{equation*}
\operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x, A^{\prime}\right) \longrightarrow \operatorname{Lift}\left(x, A^{\prime} \times_{A} A^{\prime}\right) \tag{73.16.5.2}
\end{equation*}
$$

There is a commutative diagram

Thus if we choose a pushforward $x \rightarrow x_{0}$ of $x$ along $A \rightarrow k$, we obtain by the end of Remark 73.16.4 a bijection
06TC (73.16.5.3)

$$
\operatorname{Lift}\left(x, A^{\prime} \times_{k} k[I]\right) \longrightarrow \operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x_{0}, k[I]\right)
$$

Composing 73.16.5.2, 73.16.5.1, and 73.16.5.3 we get a bijection

$$
\Phi: \operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x, A^{\prime}\right) \longrightarrow \operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x_{0}, k[I]\right)
$$

This bijection commutes with the projections on the first factors. By Remark 73.16 .3 we see that $\operatorname{Lift}\left(x_{0}, k[I]\right)=T \mathcal{F} \otimes_{k} I$. If $\mathrm{pr}_{2}$ is the second projection of $\operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x, A^{\prime}\right)$, then we get a map

$$
a=\operatorname{pr}_{2} \circ \Phi^{-1}: \operatorname{Lift}\left(x, A^{\prime}\right) \times\left(T \mathcal{F} \otimes_{k} I\right) \longrightarrow \operatorname{Lift}\left(x, A^{\prime}\right)
$$

Unwinding all the above we see that $a\left(x^{\prime} \rightarrow x, \theta\right)$ is the unique lift $x^{\prime \prime} \rightarrow x$ such that $g_{*}\left(x^{\prime}, x^{\prime \prime}\right)=\theta$ in $\operatorname{Lift}\left(x_{0}, k[I]\right)=T \mathcal{F} \otimes_{k} I$. To see this is an action of $T \mathcal{F} \otimes_{k} I$ on $\operatorname{Lift}\left(x, A^{\prime}\right)$ we have to show the following: if $x^{\prime}, x^{\prime \prime}, x^{\prime \prime \prime}$ are lifts of $x$ and $g_{*}\left(x^{\prime}, x^{\prime \prime}\right)=$
$\theta, g_{*}\left(x^{\prime \prime}, x^{\prime \prime \prime}\right)=\theta^{\prime}$, then $g_{*}\left(x^{\prime}, x^{\prime \prime \prime}\right)=\theta+\theta^{\prime}$. This follows from the commutative diagram

$$
A^{\prime} \times_{A} A^{\prime} \times_{A} A^{\prime} \underset{\left(a_{1}, a_{2}, a_{3}\right) \mapsto g\left(a_{1}, a_{3}\right)}{\underset{\left(a_{1}, a_{2}, a_{3}\right) \mapsto\left(g\left(a_{1}, a_{2}\right), g\left(a_{2}, a_{3}\right)\right)}{\longrightarrow} k[I] \times_{k} k[I]=k[I \times I]} \begin{array}{|c}
\downarrow \\
\downarrow
\end{array}
$$

The action is free and transitive because $\Phi$ is bijective.
06JJ Remark 73.16.6. The action of Lemma 73.16.5 is functorial. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of deformation categories. Let $A^{\prime} \rightarrow A$ be a surjective ring map whose kernel $I$ is annihilated by $\mathfrak{m}_{A^{\prime}}$. Let $x \in \operatorname{Ob}(\mathcal{F}(A))$. In this situation $\varphi$ induces the vertical arrows in the following commutative diagram

The commutativity follows as each of the maps 73.16.5.2, 73.16.5.1, and 73.16.5.3 of the proof of Lemma 73.16 .5 gives rise to a similar commutative diagram.

### 73.17. Schlessinger's theorem on prorepresentable functors

06JK We deduce Schlessinger's theorem characterizing prorepresentable functors on $\mathcal{C}_{\Lambda}$.
06JL Lemma 73.17.1. Let $F, G: \mathcal{C}_{\Lambda} \rightarrow$ Sets be deformation functors. Let $\varphi: F \rightarrow G$ be a smooth morphism which induces an isomorphism $d \varphi: T F \rightarrow T G$ of tangent spaces. Then $\varphi$ is an isomorphism.

Proof. We prove $F(A) \rightarrow G(A)$ is a bijection for all $A \in \mathrm{Ob}\left(\mathcal{C}_{\Lambda}\right)$ by induction on length $_{A}(A)$. For $A=k$ the statement follows from the assumption that $F$ and $G$ are deformation functors. Suppose that the statement holds for rings of length less than $n$ and let $A^{\prime}$ be a ring of length $n$. Choose a small extension $f: A^{\prime} \rightarrow A$. We have a commutative diagram

where the map $F(A) \rightarrow G(A)$ is a bijection. By smoothness of $F \rightarrow G, F\left(A^{\prime}\right) \rightarrow$ $G\left(A^{\prime}\right)$ is surjective (Lemma 73.8.8). Thus we can check bijectivity by checking it on fibers $F(f)^{-1}(x) \rightarrow G(f)^{-1}(\varphi(x))$ for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty. These fibers are precisely $\operatorname{Lift}\left(x, A^{\prime}\right)$ and $\operatorname{Lift}\left(\varphi(x), A^{\prime}\right)$ and by assumption we have an isomorphism $d \varphi \otimes \mathrm{id}: T F \otimes_{k} \operatorname{Ker}(f) \rightarrow T G \otimes_{k} \operatorname{Ker}(f)$. Thus, by Lemma 73.16 .5 and Remark 73.16.6, for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty the map $F(f)^{-1}(x) \rightarrow G(f)^{-1}(\varphi(x))$ is a map of sets commuting with free transitive actions by $T F \otimes_{k} \operatorname{Ker}(f)$. Hence it is bijective.

Note that in case $k^{\prime} \subset k$ is separable condition (c) in the theorem below is empty.

06JM Theorem 73.17.2. Let $F: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a functor. Then $F$ is prorepresentable if and only if (a) $F$ is a deformation functor, (b) $\operatorname{dim}_{k} T F$ is finite, and (c) $\gamma$ : $\operatorname{Der}_{\Lambda}(k, k) \rightarrow T F$ is injective.

Proof. Assume $F$ is prorepresentable by $R \in \widehat{\mathcal{C}}_{\Lambda}$. We see $F$ is a deformation functor by Example 73.15.10. We see $\operatorname{dim}_{k} T F$ is finite by Example 73.10.11. Finally, $\operatorname{Der}_{\Lambda}(k, k) \rightarrow T F$ is identified with $\operatorname{Der}_{\Lambda}(k, k) \rightarrow \operatorname{Der}_{\Lambda}(R, k)$ by Example 73.10.14 which is injective because $R \rightarrow k$ is surjective.
Conversely, assume (a), (b), and (c) hold. By Lemma 73.15.6 we see that (S1) and (S2) hold. Hence by Theorem 73.14.5 there exists a minimal versal formal object $\xi$ of $F$ such that 73.14 .0 .2 holds. Say $\xi$ lies over $R$. The map

$$
d \underline{\xi}: \operatorname{Der}_{\Lambda}(R, k) \rightarrow T \mathcal{F}
$$

is bijective on $\operatorname{Der}_{\Lambda}(k, k)$-orbits. Since the action of $\operatorname{Der}_{\Lambda}(k, k)$ on the left hand side is free by (c) and Lemma 73.11.6 we see that the map is bijective. Thus we see that $\underline{\xi}$ is an isomorphism by Lemma 73.17.1.

### 73.18. Infinitesimal automorphisms

06JN Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Given a morphism $x^{\prime} \rightarrow x$ in $\mathcal{F}$ lying over $A^{\prime} \rightarrow A$, there is an induced homomorphism

$$
\operatorname{Aut}_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)
$$

Lemma 73.15 .7 says that the cokernel of this homomorphism determines whether condition (RS) on $\mathcal{F}$ passes to $\overline{\mathcal{F}}$. In this section we study the kernel of this homomorphism. We will see that it also gives a measure of how far $\mathcal{F}$ is from $\overline{\mathcal{F}}$.

06JP Definition 73.18.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $x^{\prime} \rightarrow x$ be a morphism in $\mathcal{F}$ lying over $A^{\prime} \rightarrow A$. The group of infinitesimal automorphisms of $x^{\prime}$ over $x$ is the kernel of $\operatorname{Aut}_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)$. Notation $\operatorname{Inf}\left(x^{\prime} / x\right)=\operatorname{Ker}\left(\operatorname{Aut}_{A^{\prime}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{A}(x)\right)$.

06JQ Definition 73.18.2. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Assume a choice of pushforward $x_{0} \rightarrow x_{0}^{\prime}$ of $x_{0}$ along the map $k \rightarrow k[\epsilon], a \mapsto a$ has been made. Then there is a unique map $x_{0}^{\prime} \rightarrow x_{0}$ such that $x_{0} \rightarrow x_{0}^{\prime} \rightarrow x_{0}$ is the identity on $x_{0}$. The group of infinitesimal automorphisms of $x_{0}$ is $\operatorname{Inf}_{x_{0}}(\mathcal{F}):=\operatorname{Inf}\left(x_{0}^{\prime} / x_{0}\right)$.

06JR Remark 73.18.3. Up to isomorphism, $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ does not depend on the choice of pushforward $x_{0} \rightarrow x_{0}^{\prime}$. Moreover, if $y_{0} \in \mathcal{F}(k)$ and $x_{0} \cong y_{0}$ in $\mathcal{F}(k)$, then $\operatorname{Inf}_{x_{0}}(\mathcal{F}) \cong \operatorname{Inf}_{y_{0}}(\mathcal{F})$.

06JS Remark 73.18.4. When $\mathcal{F}$ is a predeformation category, Aut $_{k}\left(x_{0}\right)$ is trivial and hence $\operatorname{Inf}_{x_{0}}(\mathcal{F})=\operatorname{Aut}_{k[\epsilon]}\left(x_{0}^{\prime}\right)$.

We will see that $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ has a natural $k$-vector space structure when $\mathcal{F}$ satisfies (RS). At the same time, we will see that if $\mathcal{F}$ satisfies (RS), then the infinitesimal automorphisms $\operatorname{Inf}\left(x^{\prime} / x\right)$ of a morphism $x^{\prime} \rightarrow x$ lying over a small extension are governed by $\operatorname{Inf}_{x_{0}}(\mathcal{F})$, where $x_{0}$ is a pushforward of $x$ to $\mathcal{F}(k)$. In order to do this, we introduce the automorphism functor for any object $x \in \operatorname{Ob}(\mathcal{F})$ as follows.

06JT Definition 73.18.5. Let $p: \mathcal{F} \rightarrow \mathcal{C}$ be a category cofibered in groupoids over an arbitrary base category $\mathcal{C}$. Assume a choice of pushforwards has been made. Let $x \in \operatorname{Ob}(\mathcal{F})$ and let $U=p(x)$. Let $U / \mathcal{C}$ denote the category of objects under $U$. The automorphism functor of $x$ is the functor $\operatorname{Aut}(x): U / \mathcal{C} \rightarrow$ Sets sending an object $f: U \rightarrow V$ to $\operatorname{Aut}_{V}\left(f_{*} x\right)$ and sending a morphism

to the homomorphism $\operatorname{Aut}_{V^{\prime}}\left(f_{*}^{\prime} x\right) \rightarrow \operatorname{Aut}_{V}\left(f_{*} x\right)$ coming from the unique morphism $f_{*}^{\prime} x \rightarrow f_{*} x$ lying over $V^{\prime} \rightarrow V$ and compatible with $x \rightarrow f_{*}^{\prime} x$ and $x \rightarrow f_{*} x$.

We will be concerned with the automorphism functors of objects in a category cofibered in groupoids $\mathcal{F}$ over $\mathcal{C}_{\Lambda}$. If $A \in \operatorname{Ob}\left(\mathcal{C}_{\Lambda}\right)$, then the category $A / \mathcal{C}_{\Lambda}$ is nothing but the category $\mathcal{C}_{A}$, i.e. the category defined in Section 73.3 where we take $\Lambda=A$ and $k=A / \mathfrak{m}_{A}$. Hence the automorphism functor of an object $x \in \operatorname{Ob}(\mathcal{F}(A))$ is a functor $\operatorname{Aut}(x): \mathcal{C}_{A} \rightarrow$ Sets.
The following lemma could be deduced from Lemma 73.15 .12 by thinking about the "inertia" of a category cofibred in groupoids, see for example Stacks, Section 8.7 and Categories, Section 4.33 However, it is easier to see it directly.

06JU Lemma 73.18.6. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying $(R S)$. Let $x \in \operatorname{Ob}(\mathcal{F}(A))$. Then $A u t(x): \mathcal{C}_{A} \rightarrow$ Sets satisfies (RS).

Proof. It follows that $\operatorname{Aut}(x)$ satisfies (RS) from the fully faithfulness of the functor $\mathcal{F}\left(A_{1} \times_{A} A_{2}\right) \rightarrow \mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)$ in Lemma 73.15.4.

06JV Lemma 73.18.7. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x \in \operatorname{Ob}(\mathcal{F}(A))$. Let $x_{0}$ be a pushforward of $x$ to $\mathcal{F}(k)$.
(1) $T_{i d_{x_{0}}} A u t(x)$ has a natural $k$-vector space structure such that addition agrees with composition in $T_{i d_{x_{0}}} A u t(x)$. In particular, composition in $T_{i d_{x_{0}}} A u t(x)$ is commutative.
(2) There is a canonical isomorphism $T_{i d_{x_{0}}} A u t(x) \rightarrow T_{i d_{x_{0}}} A u t\left(x_{0}\right)$ of $k$-vector spaces.

Proof. We apply Remark 73.6 .4 to the functor $\operatorname{Aut}(x): \mathcal{C}_{A} \rightarrow$ Sets and the element $\mathrm{id}_{x_{0}} \in \operatorname{Aut}(x)(k)$ to get a predeformation functor $F=A u t(x)_{\mathrm{id}_{x_{0}}}$. By Lemmas 73.18 .6 and $73.15 .11 F$ is a deformation functor. By definition $T_{\mathrm{id}_{x_{0}}} A u t(x)=$ $T F=F(k[\epsilon])$ which has a natural $k$-vector space structure specified by Lemma 73.10 .8

Addition is defined as the composition

$$
F(k[\epsilon]) \times F(k[\epsilon]) \longrightarrow F\left(k[\epsilon] \times_{k} k[\epsilon]\right) \longrightarrow F(k[\epsilon])
$$

where the first map is the inverse of the bijection guaranteed by (RS) and the second is induced by the $k$-algebra map $k[\epsilon] \times_{k} k[\epsilon] \rightarrow k[\epsilon]$ which maps $(\epsilon, 0)$ and $(0, \epsilon)$ to $\epsilon$. If $A \rightarrow B$ is a ring map in $\mathcal{C}_{\Lambda}$, then $F(A) \rightarrow F(B)$ is a homomorphism where $F(A)=A u t(x)_{\mathrm{id}_{x_{0}}}(A)$ and $F(B)=A u t(x)_{\mathrm{id}_{x_{0}}}(B)$ are groups under composition. We conclude that $+: F(k[\epsilon]) \times F(k[\epsilon]) \rightarrow F(k[\epsilon])$ is a homomorphism where $F(k[\epsilon])$ is regarded as a group under composition. With id $\in F(k[\epsilon])$ the unit element we see
that $+(v, \mathrm{id})=+(\mathrm{id}, v)=v$ for any $v \in F(k[\epsilon])$ because (id, $v$ ) is the pushforward of $v$ along the ring map $k[\epsilon] \rightarrow k[\epsilon] \times_{k} k[\epsilon]$ with $\epsilon \mapsto(\epsilon, 0)$. In general, given a group $G$ with multiplication $\circ$ and $+: G \times G \rightarrow G$ is a homomorphism such that $+(g, 1)=+(1, g)=g$, where 1 is the identity of $G$, then $+=0$. This shows addition in the $k$-vector space structure on $F(k[\epsilon])$ agrees with composition.
Finally, (2) is a matter of unwinding the definitions. Namely $T_{\mathrm{id}_{x_{0}}} A u t(x)$ is the set of automorphisms $\alpha$ of the pushforward of $x$ along $A \rightarrow k \rightarrow k[\epsilon]$ which are trivial modulo $\epsilon$. On the other hand $T_{\operatorname{id}_{x_{0}}} \operatorname{Aut}\left(x_{0}\right)$ is the set of automorphisms of the pushforward of $x_{0}$ along $k \rightarrow k[\epsilon]$ which are trivial modulo $\epsilon$. Since $x_{0}$ is the pushforward of $x$ along $A \rightarrow k$ the result is clear.
06JW Remark 73.18.8. We point out some basic relationships between infinitesimal automorphism groups, liftings, and tangent spaces to automorphism functors. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $x^{\prime} \rightarrow x$ be a morphism lying over a ring map $A^{\prime} \rightarrow A$. Let $x_{0}$ be a pushforward of $x$ to $\mathcal{F}(k)$. Then from the definitions we have an equality

$$
\operatorname{Inf}\left(x^{\prime} / x\right)=\operatorname{Lift}\left(\operatorname{id}_{x}, A^{\prime}\right)
$$

where the liftings are of $\mathrm{id}_{x}$ as an object of $\operatorname{Aut}\left(x^{\prime}\right)$. If $x_{0} \in \mathrm{Ob}(\mathcal{F}(k))$ and $x_{0}^{\prime}$ is the pushforward to $\mathcal{F}(k[\epsilon])$, then applying this to $x_{0}^{\prime} \rightarrow x_{0}$ we get

$$
\operatorname{Inf}_{x_{0}}(\mathcal{F})=\operatorname{Lift}\left(\operatorname{id}_{x_{0}}, k[\epsilon]\right)=T_{\mathrm{id}_{x_{0}}} A u t\left(x_{0}\right)
$$

the last equality following directly from the definitions.
06JX Lemma 73.18.9. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Then $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ is equal as a set to $T_{i d_{x_{0}}} A u t\left(x_{0}\right)$, and so has a natural $k$-vector space structure such that addition agrees with composition of automorphisms.
Proof. The equality of sets is as in the end of Remark 73.18 .8 and the statement about the vector space structure follows from Lemma 73.18.7.

07W6 Lemma 73.18.10. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of categories cofibred in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Then $\varphi$ induces a $k$-linear $\operatorname{map} \operatorname{Inf}_{x_{0}}(\mathcal{F}) \rightarrow \operatorname{Inf}_{\varphi\left(x_{0}\right)}(\mathcal{G})$.
Proof. It is clear that $\varphi$ induces a morphism from $\operatorname{Aut}\left(x_{0}\right) \rightarrow \operatorname{Aut}\left(\varphi\left(x_{0}\right)\right)$ which maps the identity to the identity. Hence this follows from the result for tangent spaces, see Lemma 73.11.4.

06JY Lemma 73.18.11. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x^{\prime} \rightarrow x$ be a morphism lying over a surjective ring map $A^{\prime} \rightarrow A$ with kernel I annihilated by $\mathfrak{m}_{A^{\prime}}$. Let $x_{0}$ be a pushforward of $x$ to $\mathcal{F}(k)$. Then Inf $\left(x^{\prime} / x\right)$ has a free and transitive action by $T_{i d_{x_{0}}} A u t\left(x^{\prime}\right) \otimes_{k} I=\operatorname{Inf} f_{x_{0}}(\mathcal{F}) \otimes_{k} I$.
Proof. This is just the analogue of Lemma 73.16 .5 in the setting of automorphism sheaves. To be precise, we apply Remark 73.6 .4 to the functor $\operatorname{Aut}\left(x^{\prime}\right): \mathcal{C}_{A^{\prime}} \rightarrow$ Sets and the element $\mathrm{id}_{x_{0}} \in \operatorname{Aut}(x)(k)$ to get a predeformation functor $F=A u t\left(x^{\prime}\right)_{\mathrm{id}_{x_{0}}}$. By Lemmas 73.18 .6 and $73.15 .11 F$ is a deformation functor. Hence Lemma 73.16 .5 gives a free and transitive action of $T F \otimes_{k} I$ on $\operatorname{Lift}\left(\mathrm{id}_{x}, A^{\prime}\right)$, because as $\operatorname{Lift}\left(\mathrm{id}_{x}, A^{\prime}\right)$ is a group it is always nonempty. Note that we have equalities of vector spaces

$$
T F=T_{\mathrm{id}_{x_{0}}} \operatorname{Aut}\left(x^{\prime}\right) \otimes_{k} I=\operatorname{Inf}_{x_{0}}(\mathcal{F}) \otimes_{k} I
$$

by Lemma 73.18.7. The equality $\operatorname{Inf}\left(x^{\prime} / x\right)=\operatorname{Lift}\left(\operatorname{id}_{x}, A^{\prime}\right)$ of Remark 73.18 .8 finishes the proof.

06JZ Lemma 73.18.12. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x^{\prime} \rightarrow x$ be a morphism in $\mathcal{F}$ lying over a surjective ring map. Let $x_{0}$ be a pushforward of $x$ to $\mathcal{F}(k)$. If $\operatorname{Inf}_{x_{0}}(\mathcal{F})=0$ then $\operatorname{Inf}\left(x^{\prime} / x\right)=0$.
Proof. Follows from Lemmas 73.3.3 and 73.18.11.
06K0 Lemma 73.18.13. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$ satisfying (RS). Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Then $\operatorname{Inf}_{x_{0}}(\mathcal{F})=0$ if and only if the natural morphism $\mathcal{F}_{x_{0}} \rightarrow \overline{\mathcal{F}_{x_{0}}}$ of categories cofibered in groupoids is an equivalence.
Proof. The morphism $\mathcal{F}_{x_{0}} \rightarrow \overline{\mathcal{F}_{x_{0}}}$ is an equivalence if and only if $\mathcal{F}_{x_{0}}$ is fibered in setoids, cf. Categories, Section 4.38 (a setoid is by definition a groupoid in which the only automorphism of any object is the identity). We prove that $\operatorname{Inf}_{x_{0}}(\mathcal{F})=0$ if and only if this condition holds for $\mathcal{F}_{x_{0}}$. Obviously if $\mathcal{F}_{x_{0}}$ is fibered in setoids then $\operatorname{Inf}_{x_{0}}(\mathcal{F})=0$. Conversely assume $\operatorname{Inf}_{x_{0}}(\mathcal{F})=0$. Let $A$ be an object of $\mathcal{C}_{\Lambda}$. Then by Lemma 73.18.12, $\operatorname{Inf}\left(x / x_{0}\right)=0$ for any object $x \rightarrow x_{0}$ of $\mathcal{F}_{x_{0}}(A)$. Since by definition $\operatorname{Inf}\left(x / x_{0}\right)$ equals the group of automorphisms of $x \rightarrow x_{0}$ in $\mathcal{F}_{x_{0}}(A)$, this proves $\mathcal{F}_{x_{0}}(A)$ is a setoid.

06L5 Lemma 73.18.14. Let $f: \mathcal{H} \rightarrow \mathcal{F}$ and $g: \mathcal{G} \rightarrow \mathcal{F}$ be 1-morphisms of deformation categories. Then
(1) $\mathcal{W}=\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ is a deformation category
(2) let $w_{0} \in \operatorname{Ob}(\mathcal{W}(k))$ and let $x_{0}, y_{0}, z_{0}$ be the image of $w_{0}$ in $\mathcal{F}, \mathcal{H}, \mathcal{G}$. Then we have a 6 -term exact sequence of vector spaces

$$
0 \rightarrow \operatorname{Inf}_{w_{0}}(\mathcal{W}) \rightarrow \operatorname{Inf}_{y_{0}}(\mathcal{H}) \oplus \operatorname{Inf}_{z_{0}}(\mathcal{G}) \rightarrow \operatorname{Inf}_{x_{0}}(\mathcal{F}) \rightarrow T \mathcal{W} \rightarrow T \mathcal{H} \oplus T \mathcal{G} \rightarrow T \mathcal{F}
$$

Proof. Part (1) follows from Lemma 73.15 .12 and the fact that $\mathcal{W}(k)$ is the fibre product of two setoids with a unique isomorphism class over a setoid with a unique isomorphism class.

Part (2). We apply Lemmas 73.11 .4 and 73.18 .10 to get all the linear maps except for the "boundary map" $\delta: \operatorname{Inf}_{x_{0}}(\mathcal{F}) \rightarrow T \mathcal{W}$. We will insert suitable signs later.
Construction of $\delta$. Choose a pushforward $w_{0} \rightarrow w_{0}^{\prime}$ along $k \rightarrow k[\epsilon]$. Denote $x_{0}^{\prime}, y_{0}^{\prime}, z_{0}^{\prime}$ the images of $w_{0}^{\prime}$ in $\mathcal{F}, \mathcal{H}, \mathcal{G}$. In particular we obtain isomorphisms $b^{\prime}: f\left(y_{0}^{\prime}\right) \rightarrow x_{0}^{\prime}$ and $c^{\prime}: x_{0}^{\prime} \rightarrow g\left(z_{0}^{\prime}\right)$. Denote $b: f\left(y_{0}\right) \rightarrow x_{0}$ and $c: x_{0} \rightarrow g\left(z_{0}\right)$ the pushforwards along $k[\epsilon] \rightarrow k$. Observe that this means $w_{0}^{\prime}=\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ b^{\prime}\right)$ and $w_{0}=$ $\left(k, y_{0}, z_{0}, c \circ b\right)$ in terms of the explicit form of the fibre product of categories, see Remarks 73.5.2 13). Given $\alpha: x_{0}^{\prime} \rightarrow x_{0}^{\prime}$ we set $\delta(\alpha)=\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ \alpha \circ b^{\prime}\right)$ which is indeed an object of $\mathcal{W}$ over $k[\epsilon]$ and comes with a morphism $\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ \alpha \circ b^{\prime}\right) \rightarrow$ $w_{0}$ over $k[\epsilon] \rightarrow k$ as $\alpha$ pushes forward to the identity over $k$. More generally, for any $k$-vector space $V$ we can define a map

$$
\operatorname{Lift}\left(\operatorname{id}_{x_{0}}, k[V]\right) \longrightarrow \operatorname{Lift}\left(w_{0}, k[V]\right)
$$

using exactly the same formulae. This construction is functorial in the vector space $V$ (details omitted). Hence $\delta$ is $k$-linear by an application of Lemma 73.10.5.
Having constructed these maps it is straightforward to show the sequence is exact. Injectivity of the first map comes from the fact that $f \times g: \mathcal{W} \rightarrow \mathcal{F} \times \mathcal{G}$ is faithful. If $(\beta, \gamma) \in \operatorname{Inf}_{y_{0}}(\mathcal{H}) \oplus \operatorname{Inf}_{z_{0}}(\mathcal{G})$ map to the same element of $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ then $(\beta, \gamma)$ defines
an automorphism of $w_{0}^{\prime}=\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ b^{\prime}\right)$ whence exactness at the second spot. If $\alpha$ as above gives the trivial deformation $\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ \alpha \circ b^{\prime}\right)$ of $w_{0}$, then the isomorphism $w_{0}^{\prime}=\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ b^{\prime}\right) \rightarrow\left(k[\epsilon], y_{0}^{\prime}, z_{0}^{\prime}, c^{\prime} \circ \alpha \circ b^{\prime}\right)$ produces a pair $(\beta, \gamma)$ which is a preimage of $\alpha$. If $w=(k[\epsilon], y, z, \phi)$ is a deformation of $w_{0}$ such that $y_{0}^{\prime} \cong y$ and $z \cong z_{0}^{\prime}$ then the map

$$
f\left(y_{0}^{\prime}\right) \rightarrow f(y) \xrightarrow{\phi} g(z) \rightarrow g\left(z_{0}^{\prime}\right)
$$

is an $\alpha$ which maps to $w$ under $\delta$. Finally, if $y$ and $z$ are deformations of $y_{0}$ and $z_{0}$ and there exists an isomorphism $\phi: f(y) \rightarrow g(z)$ of deformations of $f\left(y_{0}\right)=x_{0}=$ $g\left(z_{0}\right)$ then we get a preimage $w=(k[\epsilon], y, z, \phi)$ of $(x, y)$ in $T \mathcal{W}$. This finishes the proof.

### 73.19. Groupoids in functors on an arbitrary category

06 K 2 We begin with generalities on groupoids in functors on an arbitrary category. In the next section we will pass to the category $\mathcal{C}_{\Lambda}$. For clarity we shall sometimes refer to an ordinary groupoid, i.e., a category whose morphisms are all isomorphisms, as a groupoid category.
06K3 Definition 73.19.1. Let $\mathcal{C}$ be a category. The category of groupoids in functors on $\mathcal{C}$ is the category with the following objects and morphisms.
(1) Objects: A groupoid in functors on $\mathcal{C}$ is a quintuple $(U, R, s, t, c)$ where $U, R: \mathcal{C} \rightarrow$ Sets are functors and $s, t: R \rightarrow U$ and $c: R \times_{s, U, t} R \rightarrow R$ are morphisms with the following property: For any object $T$ of $\mathcal{C}$, the quintuple

$$
(U(T), R(T), s, t, c)
$$

is a groupoid category.
(2) Morphisms: A morphism $(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoids in functors on $\mathcal{C}$ consists of morphisms $U \rightarrow U^{\prime}$ and $R \rightarrow R^{\prime}$ with the following property: For any object $T$ of $\mathcal{C}$, the induced maps $U(T) \rightarrow$ $U^{\prime}(T)$ and $R(T) \rightarrow R^{\prime}(T)$ define a functor between groupoid categories

$$
(U(T), R(T), s, t, c) \rightarrow\left(U^{\prime}(T), R^{\prime}(T), s^{\prime}, t^{\prime}, c^{\prime}\right)
$$

06K4 Remark 73.19.2. A groupoid in functors on $\mathcal{C}$ amounts to the data of a functor $\overline{\mathcal{C}} \rightarrow$ Groupoids, and a morphism of groupoids in functors on $\mathcal{C}$ amounts to a morphism of the corresponding functors $\mathcal{C} \rightarrow$ Groupoids (where Groupoids is regarded as a 1-category). However, for our purposes it is more convenient to use the terminology of groupoids in functors. In fact, thinking of a groupoid in functors as the corresponding functor $\mathcal{C} \rightarrow$ Groupoids, or equivalently as the category cofibered in groupoids associated to that functor, can lead to confusion (Remark 73.21.2).

06K5 Remark 73.19.3. Let $(U, R, s, t, c)$ be a groupoid in functors on a category $\mathcal{C}$. There are unique morphisms $e: U \rightarrow R$ and $i: R \rightarrow R$ such that for every object $T$ of $\mathcal{C}$, $e: U(T) \rightarrow R(T)$ sends $x \in U(T)$ to the identity morphism on $x$ and $i: R(T) \rightarrow R(T)$ sends $a \in U(T)$ to the inverse of $a$ in the groupoid category $(U(T), R(T), s, t, c)$. We will sometimes refer to $s, t, c, e$, and $i$ as "source", "target", "composition", "identity", and "inverse".
06K6 Definition 73.19.4. Let $\mathcal{C}$ be a category. A groupoid in functors on $\mathcal{C}$ is representable if it is isomorphic to one of the form $(\underline{U}, \underline{R}, s, t, c)$ where $U$ and $R$ are objects of $\mathcal{C}$ and the pushout $R \amalg_{s, U, t} R$ exists.

06K7 Remark 73.19.5. Hence a representable groupoid in functors on $\mathcal{C}$ is given by objects $U$ and $R$ of $\mathcal{C}$ and morphisms $s, t: U \rightarrow R$ and $c: R \rightarrow R \amalg_{s, U, t} R$ such that $(\underline{U}, \underline{R}, s, t, c)$ satisfies the condition of Definition 73.19.1. The reason for requiring the existence of the pushout $R \amalg_{s, U, t} R$ is so that the composition morphism $c$ is defined at the level of morphisms in $\mathcal{C}$. This requirement will always be satisfied below when we consider representable groupoids in functors on $\widehat{\mathcal{C}}_{\Lambda}$, since by Lemma 73.4 .3 the category $\widehat{\mathcal{C}}_{\Lambda}$ admits pushouts.

06 K 8 Remark 73.19.6. We will say "let $(\underline{U}, \underline{R}, s, t, c)$ be a groupoid in functors on $\mathcal{C}$ " to mean that we have a representable groupoid in functors. Thus this means that $U$ and $R$ are objects of $\mathcal{C}$, there are morphisms $s, t: U \rightarrow R$, the pushout $R \amalg_{s, U, t} R$ exists, there is a morphism $c: R \rightarrow R \amalg_{s, U, t} R$, and $(\underline{U}, \underline{R}, s, t, c)$ is a groupoid in functors on $\mathcal{C}$.

We introduce notation for restriction of groupoids in functors. This will be relevant below in situations where we restrict from $\widehat{\mathcal{C}}_{\Lambda}$ to $\mathcal{C}_{\Lambda}$.

06K9 Definition 73.19.7. Let $(U, R, s, t, c)$ be a groupoid in functors on a category $\mathcal{C}$. Let $\mathcal{C}^{\prime}$ be a subcategory of $\mathcal{C}$. The restriction $\left.(U, R, s, t, c)\right|_{\mathcal{C}^{\prime}}$ of $(U, R, s, t, c)$ to $\mathcal{C}^{\prime}$ is the groupoid in functors on $\mathcal{C}^{\prime}$ given by $\left(\left.U\right|_{\mathcal{C}^{\prime}},\left.R\right|_{\mathcal{C}^{\prime}},\left.s\right|_{\mathcal{C}^{\prime}},\left.t\right|_{\mathcal{C}^{\prime}},\left.c\right|_{\mathcal{C}^{\prime}}\right)$.
06KA Remark 73.19.8. In the situation of Definition 73.19.7. we often denote $\left.s\right|_{\mathcal{C}^{\prime}},\left.t\right|_{\mathcal{C}^{\prime}},\left.c\right|_{\mathcal{C}^{\prime}}$ simply by $s, t, c$.
06KB Definition 73.19.9. Let $(U, R, s, t, c)$ be a groupoid in functors on a category $\mathcal{C}$.
(1) The assignment $T \mapsto(U(T), R(T), s, t, c)$ determines a functor $\mathcal{C} \rightarrow$ Groupoids. The quotient category cofibered in groupoids $[U / R] \rightarrow \mathcal{C}$ is the category cofibered in groupoids over $\mathcal{C}$ associated to this functor (as in Remarks 73.5 .2 (9)).
(2) The quotient morphism $U \rightarrow[U / R]$ is the morphism of categories cofibered in groupoids over $\mathcal{C}$ defined by the rules
(a) $x \in U(T)$ maps to the object $(T, x) \in \operatorname{Ob}([U / R](T))$, and
(b) $x \in U(T)$ and $f: T \rightarrow T^{\prime}$ give rise to the morphism $\left(f, \mathrm{id}_{U(f)(x)}\right):$ $(T, x) \rightarrow(T, U(f)(x))$ lying over $f: T \rightarrow T^{\prime}$.

### 73.20. Groupoids in functors on the base category

06 KC In this section we discuss groupoids in functors on $\mathcal{C}_{\Lambda}$. Our eventual goal is to show that prorepresentable groupoids in functors on $\mathcal{C}_{\Lambda}$ serve as "presentations" for well-behaved deformation categories in the same way that smooth groupoids in algebraic spaces serve as presentations for algebraic stacks, cf. Algebraic Stacks, Section 76.16

06KD Definition 73.20.1. A groupoid in functors on $\mathcal{C}_{\Lambda}$ is prorepresentable if it isomorphic to ( $\left.\underline{R_{0}}, \underline{R_{1}}, s, t, c\right)\left.\right|_{\mathcal{C}_{\Lambda}}$ for some representable groupoid in functors ( $\underline{R_{0}}, \underline{R_{1}}, s, t, c$ ) on the category $\widehat{\mathcal{C}_{\Lambda}}$.

Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$. Taking completions, we get a quintuple $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$. By Remark 73.7 .10 completion as a functor on $\operatorname{CofSet}\left(\mathcal{C}_{\Lambda}\right)$ is a right adjoint, so it commutes with limits. In particular, there is a canonical isomorphism

$$
R \widehat{\times_{s, U, t}} R \longrightarrow \widehat{R} \times_{\widehat{s}, \widehat{U}, \widehat{t}} \widehat{R}
$$

so $\widehat{c}$ can be regarded as a functor $\widehat{R} \times_{\widehat{s}, \widehat{U}, \widehat{t}} \widehat{R} \rightarrow \widehat{R}$. Then $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$ is a groupoid in functors on $\widehat{\mathcal{C}}_{\Lambda}$, with identity and inverse morphisms being the completions of those of $(U, R, s, t, c)$.

06KE Definition 73.20.2. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$. The completion $(U, R, s, t, c)^{\wedge}$ of $(U, R, s, t, c)$ is the groupoid in functors $(\widehat{U}, \widehat{R}, \widehat{s}, \widehat{t}, \widehat{c})$ on $\widehat{\mathcal{C}}_{\Lambda}$ described above.

06KF Remark 73.20.3. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$. Then there is a canonical isomorphism $\left.(U, R, s, t, c)^{\wedge}\right|_{\mathcal{C}_{\Lambda}} \cong(U, R, s, t, c)$, see Remark 73.7.7. On the other hand, let $(U, R, s, t, c)$ be a groupoid in functors on $\widehat{\mathcal{C}}_{\Lambda}$ such that $U, R: \widehat{\mathcal{C}_{\Lambda}} \rightarrow$ Sets both commute with limits, e.g. if $U, R$ are representable. Then there is a canonical isomorphism $\left(\left.(U, R, s, t, c)\right|_{\mathcal{C}_{\Lambda}}\right)^{\wedge} \cong(U, R, s, t, c)$. This follows from Remark 73.7.11.
06KG Lemma 73.20.4. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$.
(1) $(U, R, s, t, c)$ is prorepresentable if and only if its completion is representable as a groupoid in functors on $\widehat{\mathcal{C}}_{\Lambda}$.
(2) ( $U, R, s, t, c)$ is prorepresentable if and only if $U$ and $R$ are prorepresentable.

Proof. Part (1) follows from Remark 73.20.3. For (2), the "only if" direction is clear from the definition of a prorepresentable groupoid in functors. Conversely, assume $U$ and $R$ are prorepresentable, say $U \cong R_{0} \mid \mathcal{C}_{\Lambda}$ and $R \cong R_{1} \mid \mathcal{C}_{\Lambda}$ for objects $R_{0}$ and $R_{1}$ of $\widehat{\mathcal{C}}_{\Lambda}$. Since $\underline{R_{0}} \cong \widehat{R_{0} \mid \mathcal{C}_{\Lambda}}$ and $\underline{R_{1}} \cong \widehat{R_{1} \mid \mathcal{C}_{\Lambda}}$ by Remark 73.7.11 we see that the completion $(U, R, s, t, c)^{\wedge}$ is a groupoid in functors of the form ( $\left.\underline{R_{0}}, \underline{R_{1}}, \widehat{s}, \widehat{t}, \widehat{c}\right)$. By Lemma 73.4 .3 the pushout $\underline{R_{1}} \times_{\widehat{s}, \underline{R_{1}}, \widehat{t} \underline{R_{1}}}$ exists. Hence $\left(\underline{R_{0}}, \underline{R_{1}}, \widehat{s}, \widehat{t}, \widehat{c}\right)$ is a representable groupoid in functors on $\widehat{\mathcal{C}}_{\Lambda}$. Finally, the restriction $\left.\left(\underline{R_{0}}, \underline{R_{1}}, s, t, c\right)\right|_{\mathcal{C}_{\Lambda}}$ gives back $(U, R, s, t, c)$ by Remark 73.20 .3 hence $(U, R, s, t, c)$ is prorepresentable by definition.

### 73.21. Smooth groupoids in functors on the base category

06 KH The notion of smoothness for groupoids in functors on $\mathcal{C}_{\Lambda}$ is defined as follows.
06KI Definition 73.21.1. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$. We say $(U, R, s, t, c)$ is smooth if $s, t: R \rightarrow U$ are smooth.

06KJ Remark 73.21.2. We note that this terminology is potentially confusing: if $(U, R, s, t, c)$ is a smooth groupoid in functors, then the quotient $[U / R]$ need not be a smooth category cofibred in groupoids as defined in Remark 73.8.9. However smoothness of ( $U, R, s, t, c$ ) does imply (in fact is equivalent to) smoothness of the quotient morphism $U \rightarrow[U / R]$ as we shall see in Lemma 73.21.4.
06KK Remark 73.21.3. Let $\left.\left(\underline{R_{0}}, \underline{R_{1}}, s, t, c\right)\right|_{\mathcal{C}_{\Lambda}}$ be a prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$. Then $\left.\left(\underline{R_{0}}, \underline{R_{1}}, s, \overline{t, c}\right)\right|_{\mathcal{C}_{\Lambda}}$ is smooth if and only if $R_{1}$ is a power series over $R_{0}$ via both $s$ and $\bar{t}$. This follows from Lemma 73.8.6.

06KL Lemma 73.21.4. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}_{\Lambda}$. The following are equivalent:
(1) The groupoid in functors $(U, R, s, t, c)$ is smooth.
(2) The morphism $s: R \rightarrow U$ is smooth.
(3) The morphism $t: R \rightarrow U$ is smooth.
(4) The quotient morphism $U \rightarrow[U / R]$ is smooth.

Proof. Statement (2) is equivalent to (3) since the inverse $i: R \rightarrow R$ of ( $U, R, s, t, c$ ) is an isomorphism and $t=s \circ i$. By definition (1) is equivalent to (2) and (3) together, hence it is equivalent to either of them individually.
Finally we prove (2) is equivalent to (4). Unwinding the definitions:
(2) Smoothness of $s: R \rightarrow U$ amounts to the following condition: If $f: B \rightarrow$ $A$ is a surjective ring map in $\mathcal{C}_{\Lambda}, a \in R(A)$, and $y \in U(B)$ such that $s(a)=U(f)(y)$, then there exists $a^{\prime} \in R(B)$ such that $R(f)\left(a^{\prime}\right)=a$ and $s\left(a^{\prime}\right)=y$.
(4) Smoothness of $U \rightarrow[U / R]$ amounts to the following condition: If $f: B \rightarrow$ $A$ is a surjective ring map in $\mathcal{C}_{\Lambda}$ and $(f, a):(B, y) \rightarrow(A, x)$ is a morphism of $[U / R]$, then there exists $x^{\prime} \in U(B)$ and $b \in R(B)$ with $s(b)=x^{\prime}$, $t(b)=y$ such that $c(a, R(f)(b))=e(x)$. Here $e: U \rightarrow R$ denotes the identity and the notation $(f, a)$ is as in Remarks 73.5.2 (9); in particular $a \in R(A)$ with $s(a)=U(f)(y)$ and $t(a)=x$.
If (4) holds and $f, a, y$ as in (2) are given, let $x=t(a)$ so that we have a morphism $(f, a):(B, y) \rightarrow(A, x)$. Then (4) produces $x^{\prime}$ and $b$, and $a^{\prime}=i(b)$ satisfies the requirements of (2). Conversely, assume (2) holds and let $(f, a):(B, y) \rightarrow(A, x)$ as in (4) be given. Then (2) produces $a^{\prime} \in R(B)$, and $x^{\prime}=t\left(a^{\prime}\right)$ and $b=i\left(a^{\prime}\right)$ satisfy the requirements of (4).

### 73.22. Deformation categories as quotients of groupoids in functors

06 KS We discuss conditions on a groupoid in functors on $\mathcal{C}_{\Lambda}$ which guarantee that the quotient is a deformation category, and we calculate the tangent and infinitesimal automorphism spaces of such a quotient.
06 KT Lemma 73.22.1. Let $(U, R, s, t, c)$ be a smooth groupoid in functors on $\mathcal{C}_{\Lambda}$. $A s$ sume $U$ and $R$ satisfy ( $R S$ ). Then $[U / R]$ satisfies ( $R S$ ).
Proof. Let

$$
\begin{array}{r}
\left(A_{2}, x_{2}\right) \\
\stackrel{\downarrow\left(f_{2}, a_{2}\right)}{ } \\
\left(A_{1}, x_{1}\right) \xrightarrow{\left(f_{1}, a_{1}\right)}(A, x)
\end{array}
$$

be a diagram in $[U / R]$ such that $f_{2}: A_{2} \rightarrow A$ is surjective. The notation is as in Remarks 73.5.2 (9). Hence $f_{1}: A_{1} \rightarrow A, f_{2}: A_{2} \rightarrow A$ are maps in $\mathcal{C}_{\Lambda}, x \in U(A)$, $x_{1} \in U\left(A_{1}\right), x_{2} \in U\left(A_{2}\right)$, and $a_{1}, a_{2} \in R(A)$ with $s\left(a_{1}\right)=U\left(f_{1}\right)\left(x_{1}\right), t\left(a_{1}\right)=x$ and $s\left(a_{2}\right)=U\left(f_{2}\right)\left(x_{2}\right), t\left(a_{2}\right)=x$. We construct a fiber product lying over $A_{1} \times{ }_{A} A_{2}$ for this diagram in $[U / R]$ as follows.

Let $a=c\left(i\left(a_{1}\right), a_{2}\right)$, where $i: R \rightarrow R$ is the inverse morphism. Then $a \in R(A), x_{2} \in$ $U\left(A_{2}\right)$ and $s(a)=U\left(f_{2}\right)\left(x_{2}\right)$. Hence an element $\left(a, x_{2}\right) \in R(A) \times_{s, U(A), U\left(f_{2}\right)} U\left(A_{2}\right)$. By smoothness of $s: R \rightarrow U$ there is an element $\widetilde{a} \in R\left(A_{2}\right)$ with $R\left(f_{2}\right)(\widetilde{a})=a$ and $s(\widetilde{a})=x_{2}$. In particular $U\left(f_{2}\right)(t(\widetilde{a}))=t(a)=U\left(f_{1}\right)\left(x_{1}\right)$. Thus $x_{1}$ and $t(\widetilde{a})$ define an element

$$
\left(x_{1}, t(\widetilde{a})\right) \in U\left(A_{1}\right) \times_{U(A)} U\left(A_{2}\right)
$$

By the assumption that $U$ satisfies (RS), we have an identification $U\left(A_{1}\right) \times{ }_{U(A)}$ $U\left(A_{2}\right)=U\left(A_{1} \times_{A} A_{2}\right)$. Let us denote $x_{1} \times t(\widetilde{a}) \in U\left(A_{1} \times_{A} A_{2}\right)$ the element corresponding to $\left(x_{1}, t(\widetilde{a})\right) \in U\left(A_{1}\right) \times_{U(A)} U\left(A_{2}\right)$. Let $p_{1}, p_{2}$ be the projections of $A_{1} \times{ }_{A} A_{2}$. We claim

is a fiber square in $[U / R]$. (Note $e: U \rightarrow R$ denotes the identity.)
The diagram is commutative because $c\left(a_{2}, R\left(f_{2}\right)(i(\widetilde{a}))\right)=c\left(a_{2}, i(a)\right)=a_{1}$. To check it is a fiber square, let

be a commutative diagram in $[U / R]$. We will show there is a unique morphism $(g, b):(B, z) \rightarrow\left(A_{1} \times_{A} A_{2}, x_{1} \times t(\widetilde{a})\right)$ compatible with the morphisms to $\left(A_{1}, x_{1}\right)$ and $\left(A_{2}, x_{2}\right)$. We must take $g=\left(g_{1}, g_{2}\right): B \rightarrow A_{1} \times{ }_{A} A_{2}$. Since by assumption $R$ satisfies (RS), we have an identification $R\left(A_{1} \times_{A} A_{2}\right)=R\left(A_{1}\right) \times_{R(A)} R\left(A_{2}\right)$. Hence we can write $b=\left(b_{1}^{\prime}, b_{2}^{\prime}\right)$ for some $b_{1}^{\prime} \in R\left(A_{1}\right), b_{2}^{\prime} \in R\left(A_{2}\right)$ which agree in $R(A)$. Then $\left(\left(g_{1}, g_{2}\right),\left(b_{1}^{\prime}, b_{2}^{\prime}\right)\right):(B, z) \rightarrow\left(A_{1} \times_{A} A_{2}, x_{1} \times t(\widetilde{a})\right)$ will commute with the projections if and only if $b_{1}^{\prime}=b_{1}$ and $b_{2}^{\prime}=c\left(\widetilde{a}, b_{2}\right)$ proving unicity and existence.

06KU Lemma 73.22.2. Let $(U, R, s, t, c)$ be a smooth groupoid in functors on $\mathcal{C}_{\Lambda}$. Assume $U$ and $R$ are deformation functors. Then:
(1) The quotient $[U / R]$ is a deformation category.
(2) The tangent space of $[U / R]$ is

$$
T[U / R]=\operatorname{Coker}(d s-d t: T R \rightarrow T U)
$$

(3) Let $x_{0}$ be the unique object of $[U / R](k)$. The space of infinitesimal automorphisms of $[U / R]$ is

$$
\operatorname{Inf} x_{x_{0}}([U / R])=\operatorname{Ker}(d s \oplus d t: T R \rightarrow T U \oplus T U)
$$

Proof. Since $U$ and $R$ are deformation functors $[U / R]$ is a predeformation category. Since (RS) holds for deformation functors by definition we see that (RS) holds for $[\mathrm{U} / \mathrm{R}]$ by Lemma 73.22 .1 . Hence $[U / R]$ is a deformation category. Statements (2) and (3) follow directly from the definitions.

### 73.23. Presentations of categories cofibered in groupoids

06 KW A presentation is defined as follows.
06KX Definition 73.23.1. Let $\mathcal{F}$ be a category cofibered in groupoids over a category $\mathcal{C}$. Let $(U, R, s, t, c)$ be a groupoid in functors on $\mathcal{C}$. A presentation of $\mathcal{F}$ by $(U, R, s, t, c)$ is an equivalence $\varphi:[U / R] \rightarrow \mathcal{F}$ of categories cofibered in groupoids over $\mathcal{C}$.
The following two general lemmas will be used to get presentations.

06KY Lemma 73.23.2. Let $\mathcal{F}$ be category cofibered in groupoids over a category $\mathcal{C}$. Let $U: \mathcal{C} \rightarrow$ Sets be a functor. Let $f: U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}$. Define $R, s, t, c$ as follows:
(1) $R: \mathcal{C} \rightarrow$ Sets is the functor $U \times_{f, \mathcal{F}, f} U$.
(2) $t, s: R \rightarrow U$ are the first and second projections, respectively.
(3) $c: R \times_{s, U, t} R \rightarrow R$ is the morphism given by projection onto the first and last factors of $U \times_{f, \mathcal{F}, f} U \times_{f, \mathcal{F}, f} U$ under the canonical isomorphism $R \times_{s, U, t} R \rightarrow U \times_{f, \mathcal{F}, f} U \times_{f, \mathcal{F}, f} U$.
Then $(U, R, s, t, c)$ is a groupoid in functors on $\mathcal{C}$.
Proof. Omitted.
06KZ Lemma 73.23.3. Let $\mathcal{F}$ be category cofibered in groupoids over a category $\mathcal{C}$. Let $U: \mathcal{C} \rightarrow$ Sets be a functor. Let $f: U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}$. Let $(U, R, s, t, c)$ be the groupoid in functors on $\mathcal{C}$ constructed from $f: U \rightarrow \mathcal{F}$ in Lemma 73.23.2. Then there is a natural morphism $[f]:[U / R] \rightarrow \mathcal{F}$ such that:
(1) $[f]:[U / R] \rightarrow \mathcal{F}$ is fully faithful.
(2) $[f]:[U / R] \rightarrow \mathcal{F}$ is an equivalence if and only if $f: U \rightarrow \mathcal{F}$ is essentially surjective.

Proof. Omitted.

### 73.24. Presentations of deformation categories

06L0 According to the next lemma, a smooth morphism from a predeformation functor to a predeformation category $\mathcal{F}$ gives rise to a presentation of $\mathcal{F}$ by a smooth groupoid in functors.

06L1 Lemma 73.24.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Let $U$ : $\mathcal{C}_{\Lambda} \rightarrow$ Sets be a functor. Let $f: U \rightarrow \mathcal{F}$ be a smooth morphism of categories cofibered in groupoids. Then:
(1) If $(U, R, s, t, c)$ is the groupoid in functors on $\mathcal{C}_{\Lambda}$ constructed from $f: U \rightarrow$ $\mathcal{F}$ in Lemma 73.23.2, then $(U, R, s, t, c)$ is smooth.
(2) If $f: U(k) \rightarrow \mathcal{F}(k)$ is essentially surjective, then the morphism $[f]$ : $[U / R] \rightarrow \mathcal{F}$ of Lemma 73.23.3 is an equivalence.

Proof. From the construction of Lemma 73.23 .2 we have a commutative diagram

where $t, s$ are the first and second projections. So $t, s$ are smooth by Lemma 73.8.7. Hence (1) holds.

If the assumption of (2) holds, then by Lemma 73.8 .8 the morphism $f: U \rightarrow \mathcal{F}$ is essentially surjective. Hence by Lemma 73.23 .3 the morphism $[f]:[U / R] \rightarrow \mathcal{F}$ is an equivalence.

06L6 Lemma 73.24.2. Let $\mathcal{F}$ be a deformation category. Let $U: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a deformation functor. Let $f: U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let $u_{0}$ be the unique element of $U(k)$. Then $U \times_{f, F, f} U$ is a deformation functor with tangent space fitting into an exact sequence of $k$-vector spaces

$$
0 \rightarrow I n f_{f\left(u_{0}\right)}(\mathcal{F}) \rightarrow T\left(U \times_{f, \mathcal{F}, f} U\right) \rightarrow T U \oplus T U
$$

Proof. Follows from Lemma 73.18 .14 and the fact that $\operatorname{Inf}_{u_{0}}(U)=(0)$.
06L7 Lemma 73.24.3. Let $\mathcal{F}$ be a deformation category. Let $U: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a prorepresentable functor. Let $f: U \rightarrow \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let $(U, R, s, t, c)$ be the groupoid in functors on $\mathcal{C}_{\Lambda}$ constructed from $f: U \rightarrow \mathcal{F}$ in Lemma 73.23.2. Assume $\operatorname{dim}_{k} \operatorname{Inf} f_{x_{0}}(\mathcal{F})$ is finite for $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Then $(U, R, s, t, c)$ is prorepresentable.

Proof. Note that $U$ is a deformation functor by Example 73.15.10. By Lemma 73.24 .2 we see that $R=U \times_{f, \mathcal{F}, f} U$ is a deformation functor whose tangent space $T R=T\left(U \times_{f, \mathcal{F}, f} U\right)$ sits in an exact sequence $0 \rightarrow \operatorname{Inf}_{x_{0}}(\mathcal{F}) \rightarrow T R \rightarrow$ $T U \oplus T U$. Since we have assumed the first space has finite dimension and since $T U$ has finite dimension by Example 73.10 .11 we see that $\operatorname{dim} T R<\infty$. The map $\gamma: \operatorname{Der}_{\Lambda}(k, k) \rightarrow T R$ see (73.11.6.1) is injective because its composition with $T R \rightarrow T U$ is injective by Theorem 73.17 .2 for the prorepresentable functor $U$. Thus $R$ is prorepresentable by Theorem 73.17.2. It follows from Lemma 73.20.4 that $(U, R, s, t, c)$ is prorepresentable.

06L8 Theorem 73.24.4. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Then $\mathcal{F}$ admits a presentation by a smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$ if and only if the following conditions hold:
(1) $\mathcal{F}$ is a deformation category.
(2) $\operatorname{dim}_{k} T \mathcal{F}$ is finite.
(3) $\operatorname{dim}_{k} \operatorname{Inf} f_{x_{0}}(\mathcal{F})$ is finite for some $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$.

Proof. Recall that a prorepresentable functor is a deformation functor, see Example 73.15.10. Thus if $\mathcal{F}$ is equivalent to a smooth prorepresentable groupoid in functors, then conditions (1), (2), and (3) follow from Lemma 73.22 .2 (1), (2), and (3).

Conversely, assume conditions (1), (2), and (3) hold. Condition (1) implies that (S1) and (S2) are satisfied, see Lemma 73.15.6. By Lemma 73.12 .4 there exists a versal formal object $\xi$. Setting $U=\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ the associated map $\underline{\xi}: U \rightarrow \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let $(U, R, s, t, c)$ be the groupoid in functors constructed in Lemma 73.23 .2 from the map $\underline{\xi}$. By Lemma 73.24 .1 we see that $(U, R, s, t, c)$ is a smooth groupoid in functors and that $[U / R] \rightarrow \mathcal{F}$ is an equivalence. By Lemma 73.24 .3 we see that $(U, R, s, t, c)$ is prorepresentable. Hence $[U / R] \rightarrow \mathcal{F}$ is the desired presentation of $\mathcal{F}$.

### 73.25. Remarks regarding minimality

06TD The main theorem of this chapter is Theorem 73.24 .4 above. It describes completely those categories cofibred in groupoids over $\mathcal{C}_{\Lambda}$ which have a presentation by a smooth prorepresentable groupoid in functors. In this section we briefly discuss how the minimality discussed in Sections 73.13 and 73.14 can be used to obtain a "minimal" smooth prorepresentable presentation.

06KM Definition 73.25.1. Let $(U, R, s, t, c)$ be a smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$.
(1) We say $(U, R, s, t, c)$ is normalized if the groupoid $(U(k[\epsilon]), R(k[\epsilon]), s, t, c)$ is totally disconnected, i.e., there are no morphisms between distinct objects.
(2) We say $(U, R, s, t, c)$ is minimal if the $U \rightarrow[U / R]$ is given by a minimal versal formal object of $[U / R]$.

The difference between the two notions is related to the difference between conditions 73.14 .0 .1 and 73.14 .0 .2 and disappears when $k^{\prime} \subset k$ is separable. Also a normalized smooth prorepresentable groupoid in functors is minimal as the following lemma shows. Here is a precise statement.

06KN Lemma 73.25.2. Let $(U, R, s, t, c)$ be a smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$.
(1) $(U, R, s, t, c)$ is normalized if and only if the morphism $U \rightarrow[U / R]$ induces an isomorphism on tangent spaces, and
(2) $(U, R, s, t, c)$ is minimal if and only if the kernel of $T U \rightarrow T[U / R]$ is contained in the image of $\operatorname{Der}_{\Lambda}(k, k) \rightarrow T U$.

Proof. Part (1) follows immediately from the definitions. To see part (2) set $\mathcal{F}=$ $[U / R]$. Since $\mathcal{F}$ has a presentation it is a deformation category, see Theorem 73.24.4, In particular it satisfies (RS), (S1), and (S2), see Lemma 73.15.6. Recall that minimal versal formal objects are unique up to isomorphism, see Lemma 73.13.5. By Theorem 73.14 .5 a minimal versal object induces a map $\underline{\xi}:\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}} \rightarrow \mathcal{F}$ satisfying 73.14.0.2). Since $\left.U \cong \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ over $\mathcal{F}$ we see that $T U \rightarrow T \mathcal{F}=T[U / R]$ satisfies the property as stated in the lemma.

The quotient of a minimal prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$ does not admit autoequivalences which are not automorphisms. To prove this, we first note the following lemma.

06KP Lemma 73.25.3. Let $U: \mathcal{C}_{\Lambda} \rightarrow$ Sets be a prorepresentable functor. Let $\varphi: U \rightarrow$ $U$ be a morphism such that $d \varphi: T U \rightarrow T U$ is an isomorphism. Then $\varphi$ is an isomorphism.

Proof. If $\left.U \cong \underline{R}\right|_{\mathcal{C}_{\Lambda}}$ for some $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$, then completing $\varphi$ gives a morphism $\underline{R} \rightarrow \underline{R}$. If $f: R \rightarrow R$ is the corresponding morphism in $\widehat{\mathcal{C}}_{\Lambda}$, then $f$ induces an isomorphism $\operatorname{Der}_{\Lambda}(R, k) \rightarrow \operatorname{Der}_{\Lambda}(R, k)$, see Example 73.10.14 In particular $f$ is a surjection by Lemma 73.4.6. As a surjective endomorphism of a Noetherian ring is an isomorphism (see Algebra, Lemma 10.30 .8 ) we conclude $f$, hence $\underline{R} \rightarrow \underline{R}$, hence $\varphi: U \rightarrow U$ is an isomorphism.

06KQ Lemma 73.25.4. Let $(U, R, s, t, c)$ be a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$. If $\varphi:[U / R] \rightarrow[U / R]$ is an equivalence of categories cofibered in groupoids, then $\varphi$ is an isomorphism.

Proof. A morphism $\varphi:[U / R] \rightarrow[U / R]$ is the same thing as a morphism $\varphi:$ $(U, R, s, t, c) \rightarrow(U, R, s, t, c)$ of groupoids in functors over $\mathcal{C}_{\Lambda}$ as defined in Definition 73.19.1. Denote $\phi: U \rightarrow U$ and $\psi: R \rightarrow R$ the corresponding morphisms. Because
the diagram

is commutative, since $d \varphi$ is bijective, and since we have the characterization of minimality in Lemma 73.25 .2 we conclude that $d \phi$ is injective (hence bijective by dimension reasons). Thus $\phi: U \rightarrow U$ is an isomorphism by Lemma 73.25.3. We can use a similar argument, using the exact sequence

$$
0 \rightarrow \operatorname{Inf}_{x_{0}}([U / R]) \rightarrow T R \rightarrow T U \oplus T U
$$

of Lemma 73.24 .2 to prove that $\psi: R \rightarrow R$ is an isomorphism. But is also a consequence of the fact that $R=U \times_{[U / R]} U$ and that $\varphi$ and $\phi$ are isomorphisms.

06KR Lemma 73.25.5. Let $(U, R, s, t, c)$ and $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be minimal smooth prorepresentable groupoids in functors on $\mathcal{C}_{\Lambda}$. If $\varphi:[U / R] \rightarrow\left[U^{\prime} / R^{\prime}\right]$ is an equivalence of categories cofibered in groupoids, then $\varphi$ is an isomorphism.
Proof. Let $\psi:\left[U^{\prime} / R^{\prime}\right] \rightarrow[U / R]$ be a quasi-inverse to $\varphi$. Then $\psi \circ \varphi$ and $\varphi \circ \psi$ are isomorphisms by Lemma 73.25.4, hence $\varphi$ and $\psi$ are isomorphisms.

The following lemma summarizes some of the things we have seen earlier in this chapter.
06L2 Lemma 73.25.6. Let $\mathcal{F}$ be a deformation category such that $\operatorname{dim}_{k} T \mathcal{F}<\infty$ and $\operatorname{dim}_{k} \operatorname{Inf}_{x_{0}}(\mathcal{F})<\infty$ for some $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$. Then there exists a minimal versal formal object $\xi$ of $\mathcal{F}$. Say $\xi$ lies over $R \in \operatorname{Ob}\left(\widehat{\mathcal{C}}_{\Lambda}\right)$. Let $U=\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$. Let $f=\underline{\xi}: U \rightarrow \mathcal{F}$ be the associated morphism. Let $(U, R, s, t, c)$ be the groupoid in functors on $\mathcal{C}_{\Lambda}$ constructed from $f: U \rightarrow \mathcal{F}$ in Lemma 73.23.2. Then $(U, R, s, t, c)$ is a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$ and there is an equivalence $[U / R] \rightarrow \mathcal{F}$.
Proof. As $\mathcal{F}$ is a deformation category it satisfies (S1) and (S2), see Lemma 73.15.6. By Lemma 73.12 .4 there exists a versal formal object. By Lemma 73.13 .5 there exists a minimal versal formal object $\xi / R$ as in the statement of the lemma. Setting $U=\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}$ the associated map $\underline{\xi}: U \rightarrow \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let $(U, R, s, t, c)$ be the groupoid in functors constructed in Lemma 73.23 .2 from the map $\xi$. By Lemma 73.24 .1 we see that $(U, R, s, t, c)$ is a smooth groupoid in functors and that $[U / R] \rightarrow \mathcal{F}$ is an equivalence. By Lemma 73.24 .3 we see that $(U, R, s, t, c)$ is prorepresentable. Finally, $(U, R, s, t, c)$ is minimal because $U \rightarrow[U / R]=\mathcal{F}$ corresponds to the minimal versal formal object $\xi$.

Presentations by minimal prorepresentable groupoids in functors satisfy the following uniqueness property.
06L3 Lemma 73.25.7. Let $\mathcal{F}$ be category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Assume there exist presentations of $\mathcal{F}$ by minimal smooth prorepresentable groupoids in
functors $(U, R, s, t, c)$ and $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$. Then $(U, R, s, t, c)$ and $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ are isomorphic.

Proof. Follows from Lemma 73.25 .5 and the observation that a morphism $[U / R] \rightarrow$ $\left[U^{\prime} / R^{\prime}\right]$ is the same thing as a morphism of groupoids in functors (by our explicit construction of $[U / R]$ in Definition 73.19.9.

In summary we have proved the following theorem.
06TE Theorem 73.25.8. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_{\Lambda}$. Consider the following conditions
(1) $\mathcal{F}$ admits a presentation by a normalized smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$,
(2) $\mathcal{F}$ admits a presentation by a smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$,
(3) $\mathcal{F}$ admits a presentation by a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_{\Lambda}$, and
(4) $\mathcal{F}$ satisfies the following conditions
(a) $\mathcal{F}$ is a deformation category.
(b) $\operatorname{dim}_{k} T \mathcal{F}$ is finite.
(c) $\operatorname{dim}_{k} \operatorname{Inf} f_{x_{0}}(\mathcal{F})$ is finite for some $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$.

Then (2), (3), (4) are equivalent and are implied by (1). If $k^{\prime} \subset k$ is separable, then (1), (2), (3), (4) are all equivalent. Furthermore, the minimal smooth prorepresentable groupoids in functors which provide a presentation of $\mathcal{F}$ are unique up to isomorphism.

Proof. We see that (1) implies (3) and is equivalent to (3) if $k^{\prime} \subset k$ is separable from Lemma 73.25 .2 . It is clear that (3) implies (2). We see that (2) implies (4) by Theorem 73.24.4. We see that (4) implies (3) by Lemma 73.25.6. This proves all the implications. The final uniqueness statement follows from Lemma 73.25.7.

### 73.26. Change of residue field

07W7 In this section we quickly discuss what happens if we replace the residue field $k$ by a finite extension. Let $\Lambda$ be a Noetherian ring and let $\Lambda \rightarrow k$ be a finite ring map where $k$ is a field. Throughout this whole chapter we have used $\mathcal{C}_{\Lambda}$ to denote the category of Artinian local $\Lambda$-algebras whose residue field is identified with $k$, see Definition 73.3.1. However, since in this section we will discuss what happen when we change $k$ we will instead use the notation $\mathcal{C}_{\Lambda, k}$ to indicate the dependence on $k$.

07W8 Situation 73.26.1. Let $\Lambda$ be a Noetherian ring and let $\Lambda \rightarrow k \rightarrow l$ be a finite ring maps where $k$ and $l$ are fields. Thus $k \subset l$ is a finite extensions of fields. A typical object of $\mathcal{C}_{\Lambda, l}$ will be denoted $B$ and a typical object of $\mathcal{C}_{\Lambda, k}$ will be denoted $A$. We define

07W9 (73.26.1.1)

$$
\mathcal{C}_{\Lambda, l} \longrightarrow \mathcal{C}_{\Lambda, k}, \quad B \longmapsto B \times_{l} k
$$

Given a category cofibred in groupoids $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda, k}$ we obtain an associated category cofibred in groupoids

$$
p_{l / k}: \mathcal{F}_{l / k} \longrightarrow \mathcal{C}_{\Lambda, l}
$$

by setting $\mathcal{F}_{l / k}(B)=\mathcal{F}\left(B \times_{l} k\right)$.

The functor 73.26.1.1 makes sense: because $B \times_{l} k \subset B$ we have

$$
\begin{aligned}
{\left[k: k^{\prime}\right] \text { length }_{B \times_{l} k}\left(B \times_{l} k\right) } & =\operatorname{length}_{\Lambda}\left(B \times_{l} k\right) \\
& \leq \operatorname{length}_{\Lambda}(B) \\
& =\left[l: k^{\prime}\right] \operatorname{length}_{B}(B)<\infty
\end{aligned}
$$

(see Lemma 73.3.4) hence $B \times_{l} k$ is Artinian (see Algebra, Lemma 10.52.6). Thus $B \times{ }_{l} k$ is an Artinian local ring with residue field $k$. Note that 73.26.1.1) commutes with fibre products

$$
\left(B_{1} \times_{B} B_{2}\right) \times_{l} k=\left(B_{1} \times_{l} k\right) \times_{\left(B \times_{l} k\right)}\left(B_{2} \times_{l} k\right)
$$

and transforms surjective ring maps into surjective ring maps. We use the "expensive" notation $\mathcal{F}_{l / k}$ to prevent confusion with the construction of Remark 73.6.4. Here are some elementary observations.

07WA Lemma 73.26.2. With notation and assumptions as in Situation 73.26.1.
(1) We have $\overline{\mathcal{F}_{l / k}}=(\overline{\mathcal{F}})_{l / k}$.
(2) If $\mathcal{F}$ is a predeformation category, then $\mathcal{F}_{l / k}$ is a predeformation category.
(3) If $\mathcal{F}$ satisfies (S1), then $\mathcal{F}_{l / k}$ satisfies (S1).
(4) If $\mathcal{F}$ satisfies (S2), then $\mathcal{F}_{l / k}$ satisfies (S2).
(5) If $\mathcal{F}$ satisfies $(R S)$, then $\mathcal{F}_{l / k}$ satisfies $(R S)$.

Proof. Part (1) is immediate from the definitions.
Since $\mathcal{F}_{l / k}(l)=\mathcal{F}(k)$ part (2) follows from the definition, see Definition 73.6.2
Part (3) follows as the functor 73.26 .1 .1 commutes with fibre products and transforms surjective maps into surjective maps, see Definition 73.9.1.

Part (4). To see this consider a diagram

in $\mathcal{C}_{\Lambda, l}$ as in Definition 73.9.1. Applying the functor 73.26.1.1 we obtain

where $l \epsilon$ denotes the finite dimensional $k$-vector space $l \epsilon \subset l[\epsilon]$. According to Lemma 73.9 .4 the condition of (S2) for $\mathcal{F}$ also holds for this diagram. Hence (S2) holds for $\mathcal{F}_{l / k}$.

Part (5) follows from the characterization of (RS) in Lemma 73.15.4 part (2) and the fact that (73.26.1.1) commutes with fibre products.

The following lemma applies in particular when $\mathcal{F}$ satisfies (S2) and is a predeformation category, see Lemma 73.9.5.

07WB Lemma 73.26.3. With notation and assumptions as in Situation 73.26.1. Assume $\mathcal{F}$ is a predeformation category and $\overline{\mathcal{F}}$ satisfies (S2). Then there is a canonical $l$ vector space isomorphism

$$
T \mathcal{F} \otimes_{k} l \longrightarrow T \mathcal{F}_{l / k}
$$

of tangent spaces.
Proof. By Lemma 73.26 .2 we may replace $\mathcal{F}$ by $\overline{\mathcal{F}}$. Moreover we see that $T \mathcal{F}$, resp. $T \mathcal{F}_{l / k}$ has a canonical $k$-vector space structure, resp. $l$-vector space structure, see Lemma 73.11.2. Then

$$
T \mathcal{F}_{l / k}=\mathcal{F}_{l / k}(l[\epsilon])=\mathcal{F}(k[l \epsilon])=T \mathcal{F} \otimes_{k} l
$$

the last equality by Lemma 73.11.2. More generally, given a finite dimensional $l$-vector space $V$ we have

$$
\mathcal{F}_{l / k}(l[V])=\mathcal{F}\left(k\left[V_{k}\right]\right)=T \mathcal{F} \otimes_{k} V_{k}
$$

where $V_{k}$ denotes $V$ seen as a $k$-vector space. We conclude that the functors $V \mapsto \mathcal{F}_{l / k}(l[V])$ and $V \mapsto T \mathcal{F} \otimes_{k} V_{k}$ are canonically identified as functors to the category of sets. By Lemma 73.10 .4 we see there is at most one way to turn either functor into an $l$-linear functor. Hence the isomorphisms are compatible with the $l$-vector space structures and we win.
07WC Lemma 73.26.4. With notation and assumptions as in Situation 73.26.1. Assume $\mathcal{F}$ is a deformation category. Let $x_{0} \in \operatorname{Ob}(\mathcal{F}(k))$ and denote $x_{l, 0}$ the corresponding object of $\mathcal{F}_{l / k}$ over $l$. Then there is a canonical l-vector space isomorphism

$$
\operatorname{Inf} f_{x_{0}}(\mathcal{F}) \otimes_{k} l \longrightarrow I n f_{x_{l, 0}}\left(\mathcal{F}_{l / k}\right)
$$

of infinitesimal automorphism spaces.
Proof. Recall that the vector space structure on $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ comes from identifying it with the tangent space of the functor $\operatorname{Aut}\left(x_{0}\right)$ which is defined on the category $\mathcal{C}_{k, k}$ of Artinian local $k$-algebras with residue field $k$. Similarly, $\operatorname{Inf}_{x_{l, 0}}\left(\mathcal{F}_{l / k}\right)$ is the tangent space of $\operatorname{Aut}\left(x_{l, 0}\right)$ which is defined on the category $\mathcal{C}_{l, l}$ of Artinian local $l$-algebras with residue field $l$. Unwinding the definitions we see that $\operatorname{Aut}\left(x_{l, 0}\right)$ is the restriction of $\operatorname{Aut}\left(x_{0}\right)_{l / k}$ (which lives on $\mathcal{C}_{k, l}$ ) to $\mathcal{C}_{l, l}$. Since there is no difference between the tangent space of $\operatorname{Aut}\left(x_{0}\right)_{l / k}$ seen as a functor on $\mathcal{C}_{k, l}$ or $\mathcal{C}_{l, l}$, the lemma follows from Lemma 73.26 .3 and the fact that $A u t\left(x_{0}\right)$ satisfies (RS) by Lemma 73.18 .6 (whence we have (S2) by Lemma 73.15.6).

07WD Lemma 73.26.5. With notation and assumptions as in Situation 73.26.1. If $\mathcal{F} \rightarrow \mathcal{G}$ is a smooth morphism of categories cofibred in groupoids over $\mathcal{C}_{\Lambda, k}$, then $\mathcal{F}_{l / k} \rightarrow \mathcal{G}_{l / k}$ is a smooth morphism of categories cofibred in groupoids over $\mathcal{C}_{\Lambda, l}$.
Proof. This follows immediately from the definitions and the fact that 73.26 .1 .1 preserves surjections.

There are many more things you can say about the relationship between $\mathcal{F}$ and $\mathcal{F}_{l / k}$ (in particular about the relationship between versal deformations) and we will add these here as needed.

## CHAPTER 74

## Deformation Theory

08KW

### 74.1. Introduction

08KX The goal of this chapter is to give a (relatively) gentle introduction to deformation theory of modules, morphisms, etc. In this chapter we deal with those results that can be proven using the naive cotangent complex. In the chapter on the cotangent complex we will extend these results a little bit. The advanced reader may wish to consult the treatise by Illusie on this subject, see [Ill72.

### 74.2. Deformations of rings and the naive cotangent complex

08S3 In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a surjective ring map $A^{\prime} \rightarrow A$ whose kernel is an ideal $I$ of square zero. Moreover we assume given a ring map $A \rightarrow B$, a $B$-module $N$, and an $A$-module map $c: I \rightarrow N$. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

08S4

and moreover how unique the solution is (if it exists). More precisely, we look for a surjection of $A^{\prime}$-algebras $B^{\prime} \rightarrow B$ whose kernel is identified with $N$ such that $A^{\prime} \rightarrow B^{\prime}$ induces the given map $c$. We will say $B^{\prime}$ is a solution to 74.2.0.1.

08S5 Lemma 74.2.1. Given a commutative diagram

with front and back solutions to (74.2.0.1) we have
(1) There exist a canonical element in $\operatorname{Ext}_{B_{1}}^{1}\left(N L_{B_{1} / A_{1}}, N_{2}\right)$ whose vanishing is a necessary and sufficient condition for the existence of a ring map $B_{1}^{\prime} \rightarrow B_{2}^{\prime}$ fitting into the diagram.
(2) If there exists a map $B_{1}^{\prime} \rightarrow B_{2}^{\prime}$ fitting into the diagram the set of all such maps is a principal homogeneous space under $\operatorname{Hom}_{B_{1}}\left(\Omega_{B_{1} / A_{1}}, N_{2}\right)$.
Proof. Let $E=B_{1}$ viewed as a set. Consider the surjection $A_{1}[E] \rightarrow B_{1}$ with kernel $J$ used to define the naive cotangent complex by the formula

$$
N L_{B_{1} / A_{1}}=\left(J / J^{2} \rightarrow \Omega_{A_{1}[E] / A_{1}} \otimes_{A_{1}[E]} B_{1}\right)
$$

in Algebra, Section 10.132 . Since $\Omega_{A_{1}[E] / A_{1}} \otimes B_{1}$ is a free $B_{1}$-module we have

$$
\operatorname{Ext}_{B_{1}}^{1}\left(N L_{B_{1} / A_{1}}, N_{2}\right)=\frac{\operatorname{Hom}_{B_{1}}\left(J / J^{2}, N_{2}\right)}{\operatorname{Hom}_{B_{1}}\left(\Omega_{A_{1}[E] / A_{1}} \otimes B_{1}, N_{2}\right)}
$$

We will construct an obstruction in the module on the right. Let $J^{\prime}=\operatorname{Ker}\left(A_{1}^{\prime}[E] \rightarrow\right.$ $\left.B_{1}\right)$. Note that there is a surjection $J^{\prime} \rightarrow J$ whose kernel is $I_{1} A_{1}[E]$. For every $e \in E$ denote $x_{e} \in A_{1}[E]$ the corresponding variable. Choose a lift $y_{e} \in B_{1}^{\prime}$ of the image of $x_{e}$ in $B_{1}$ and a lift $z_{e} \in B_{2}^{\prime}$ of the image of $x_{e}$ in $B_{2}$. These choices determine $A_{1}^{\prime}$-algebra maps

$$
A_{1}^{\prime}[E] \rightarrow B_{1}^{\prime} \quad \text { and } \quad A_{1}^{\prime}[E] \rightarrow B_{2}^{\prime}
$$

The first of these gives a map $J^{\prime} \rightarrow N_{1}, f^{\prime} \mapsto f^{\prime}\left(y_{e}\right)$ and the second gives a map $J^{\prime} \rightarrow N_{2}, f^{\prime} \mapsto f^{\prime}\left(z_{e}\right)$. A calculation shows that these maps annihilate $\left(J^{\prime}\right)^{2}$. Because the left square of the diagram (involving $c_{1}$ and $c_{2}$ ) commutes we see that these maps agree on $I_{1} A_{1}[E]$ as maps into $N_{2}$. Observe that $B_{1}^{\prime}$ is the pushout of $J^{\prime} \rightarrow A_{1}^{\prime}\left[B_{1}\right]$ and $J^{\prime} \rightarrow N_{1}$. Thus, if the maps $J^{\prime} \rightarrow N_{1} \rightarrow N_{2}$ and $J^{\prime} \rightarrow N_{2}$ agree, then we obtain a map $B_{1}^{\prime} \rightarrow B_{2}^{\prime}$ fitting into the diagram. Thus we let the obstruction be the class of the map

$$
J / J^{2} \rightarrow N_{2}, \quad f \mapsto f^{\prime}\left(z_{e}\right)-\nu\left(f^{\prime}\left(y_{e}\right)\right)
$$

where $\nu: N_{1} \rightarrow N_{2}$ is the given map and where $f^{\prime} \in J^{\prime}$ is a lift of $f$. This is well defined by our remarks above. Note that we have the freedom to modify our choices of $z_{e}$ into $z_{e}+\delta_{2, e}$ and $y_{e}$ into $y_{e}+\delta_{1, e}$ for some $\delta_{i, e} \in N_{i}$. This will modify the map above into

$$
f \mapsto f^{\prime}\left(z_{e}+\delta_{2, e}\right)-\nu\left(f^{\prime}\left(y_{e}+\delta_{1, e}\right)\right)=f^{\prime}\left(z_{e}\right)-\nu\left(f^{\prime}\left(z_{e}\right)\right)+\sum\left(\delta_{2, e}-\nu\left(\delta_{1, e}\right)\right) \frac{\partial f}{\partial x_{e}}
$$

This means exactly that we are modifying the map $J / J^{2} \rightarrow N_{2}$ by the composition $J / J^{2} \rightarrow \Omega_{A_{1}[E] / A_{1}} \otimes B_{1} \rightarrow N_{2}$ where the second map sends $\mathrm{d} x_{e}$ to $\delta_{2, e}-\nu\left(\delta_{1, e}\right)$. Thus our obstruction is well defined and is zero if and only if a lift exists.
Part (2) comes from the observation that given two maps $\varphi, \psi: B_{1}^{\prime} \rightarrow B_{2}^{\prime}$ fitting into the diagram, then $\varphi-\psi$ factors through a map $D: B_{1} \rightarrow N_{2}$ which is an $A_{1}$-derivation:

$$
\begin{aligned}
D(f g) & =\varphi\left(f^{\prime} g^{\prime}\right)-\psi\left(f^{\prime} g^{\prime}\right) \\
& =\varphi\left(f^{\prime}\right) \varphi\left(g^{\prime}\right)-\psi\left(f^{\prime}\right) \psi\left(g^{\prime}\right) \\
& =\left(\varphi\left(f^{\prime}\right)-\psi\left(f^{\prime}\right)\right) \varphi\left(g^{\prime}\right)+\psi\left(f^{\prime}\right)\left(\varphi\left(g^{\prime}\right)-\psi\left(g^{\prime}\right)\right) \\
& =g D(f)+f D(g)
\end{aligned}
$$

Thus $D$ corresponds to a unique $B_{1}$-linear map $\Omega_{B_{1} / A_{1}} \rightarrow N_{2}$. Conversely, given such a linear map we get a derivation $D$ and given a ring map $\psi: B_{1}^{\prime} \rightarrow B_{2}^{\prime}$ fitting into the diagram the map $\psi+D$ is another ring map fitting into the diagram.

The naive cotangent complex isn't good enough to contain all information regarding obstructions to finding solutions to 74.2.0.1. However, if the ring map is a local complete intersection, then the obstruction vanishes. This is a kind of lifting result; observe that for syntomic ring maps we have proved a rather strong lifting result in Smoothing Ring Maps, Proposition 16.4.2.
08S6 Lemma 74.2.2. If $A \rightarrow B$ is a local complete intersection ring map, then there exists a solution to 74.2.0.1.
Proof. Write $B=A\left[x_{1}, \ldots, x_{n}\right] / J$. Let $J^{\prime} \subset A^{\prime}\left[x_{1}, \ldots, x_{n}\right]$ be the inverse image of $J$. Denote $I\left[x_{1}, \ldots, x_{n}\right]$ the kernel of $A^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A\left[x_{1}, \ldots, x_{n}\right]$. By More on Algebra, Lemma 15.24.5 we have $I\left[x_{1}, \ldots, x_{n}\right] \cap\left(J^{\prime}\right)^{2}=J^{\prime} I\left[x_{1}, \ldots, x_{n}\right]=$ $J I\left[x_{1}, \ldots, x_{n}\right]$. Hence we obtain a short exact sequence

$$
0 \rightarrow I \otimes_{A} B \rightarrow J^{\prime} /\left(J^{\prime}\right)^{2} \rightarrow J / J^{2} \rightarrow 0
$$

Since $J / J^{2}$ is projective (More on Algebra, Lemma 15.24.3) we can choose a splitting of this sequence

$$
J^{\prime} /\left(J^{\prime}\right)^{2}=I \otimes_{A} B \oplus J / J^{2}
$$

Let $\left(J^{\prime}\right)^{2} \subset J^{\prime \prime} \subset J^{\prime}$ be the elements which map to the second summand in the decomposition above. Then

$$
0 \rightarrow I \otimes_{A} B \rightarrow A^{\prime}\left[x_{1}, \ldots, x_{n}\right] / J^{\prime \prime} \rightarrow B \rightarrow 0
$$

is a solution to 74.2 .0 .1 with $N=I \otimes_{A} B$. The general case is obtained by doing a pushout along the given map $I \otimes_{A} B \rightarrow N$.

08S7 Lemma 74.2.3. If there exists a solution to (74.2.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{B}^{1}\left(N L_{B / A}, N\right)$.
Proof. We observe right away that given two solutions $B_{1}^{\prime}$ and $B_{2}^{\prime}$ to 74.2 .0 .1 we obtain by Lemma 74.2 .1 an obstruction element $o\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \operatorname{Ext}_{B}^{1}\left(N L_{B / A}, N\right)$ to the existence of a map $B_{1}^{\prime} \rightarrow B_{2}^{\prime}$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution $B^{\prime}$ and an element $\xi \in \operatorname{Ext}_{B}^{1}\left(N L_{B / A}, N\right)$ we can find a second solution $B_{\xi}^{\prime}$ such that $o\left(B^{\prime}, B_{\xi}^{\prime}\right)=\xi$.
Let $E=B$ viewed as a set. Consider the surjection $A[E] \rightarrow B$ with kernel $J$ used to define the naive cotangent complex by the formula

$$
N L_{B / A}=\left(J / J^{2} \rightarrow \Omega_{A[E] / A} \otimes_{A[E]} B\right)
$$

in Algebra, Section 10.132. Since $\Omega_{A[E] / A} \otimes B$ is a free $B$-module we have

$$
\operatorname{Ext}_{B}^{1}\left(N L_{B / A}, N\right)=\frac{\operatorname{Hom}_{B}\left(J / J^{2}, N\right)}{\operatorname{Hom}_{B}\left(\Omega_{A[E] / A} \otimes B, N\right)}
$$

Thus we may represent $\xi$ as the class of a morphism $\delta: J / J^{2} \rightarrow N$.
For every $e \in E$ denote $x_{e} \in A[E]$ the corresponding variable. Choose a lift $y_{e} \in B^{\prime}$ of the image of $x_{e}$ in $B$. These choices determine an $A^{\prime}$-algebra map $\varphi: A^{\prime}[E] \rightarrow B^{\prime}$.

Let $J^{\prime}=\operatorname{Ker}\left(A^{\prime}[E] \rightarrow B\right)$. Observe that $\varphi$ induces a map $\left.\varphi\right|_{J^{\prime}}: J^{\prime} \rightarrow N$ and that $B^{\prime}$ is the pushout, as in the following diagram

Let $\psi: J^{\prime} \rightarrow N$ be the sum of the map $\left.\varphi\right|_{J^{\prime}}$ and the composition

$$
J^{\prime} \rightarrow J^{\prime} /\left(J^{\prime}\right)^{2} \rightarrow J / J^{2} \xrightarrow{\delta} N
$$

Then the pushout along $\psi$ is an other ring extension $B_{\xi}^{\prime}$ fitting into a diagram as above. A calculation shows that $o\left(B^{\prime}, B_{\xi}^{\prime}\right)=\xi$ as desired.

08S8 Lemma 74.2.4. Let $A$ be a ring and let $I$ be an $A$-module.
(1) The set of extensions of rings $0 \rightarrow I \rightarrow A^{\prime} \rightarrow A \rightarrow 0$ where $I$ is an ideal of square zero is canonically bijective to $\operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, I\right)$.
(2) Given a ring map $A \rightarrow B$, a B-module $N$, an $A$-module map $c: I \rightarrow N$, and given extensions of rings with square zero kernels:
(a) $0 \rightarrow I \rightarrow A^{\prime} \rightarrow A \rightarrow 0$ corresponding to $\alpha \in \operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, I\right)$, and
(b) $0 \rightarrow N \rightarrow B^{\prime} \rightarrow B \rightarrow 0$ corresponding to $\beta \in \operatorname{Ext}_{B}^{1}\left(N L_{B} / \mathbf{Z}, N\right)$
then there is a map $A^{\prime} \rightarrow B^{\prime}$ fitting into a diagram 74.2.0.1) if and only if $\beta$ and $\alpha$ map to the same element of $\operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, N\right)$.

Proof. To prove this we apply the previous results where we work over $0 \rightarrow 0 \rightarrow$ $\mathbf{Z} \rightarrow \mathbf{Z} \rightarrow 0$, in order words, we work over the extension of $\mathbf{Z}$ by 0 . Part (1) follows from Lemma 74.2 .3 and the fact that there exists a solution, namely $I \oplus A$. Part (2) follows from Lemma 74.2 .1 and a compatibility between the constructions in the proofs of Lemmas 74.2 .3 and 74.2 .1 whose statement and proof we omit.

### 74.3. Thickenings of ringed spaces

In the following few sections we will use the following notions:
(1) A sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X^{\prime}}$ on a ringed space $\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is locally nilpotent if any local section of $\mathcal{I}$ is locally nilpotent. Compare with Algebra, Item 29
(2) A thickening of ringed spaces is a morphism $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ of ringed spaces such that
(a) $i$ induces a homeomorphism $X \rightarrow X^{\prime}$,
(b) the map $i^{\sharp}: \mathcal{O}_{X^{\prime}} \rightarrow i_{*} \mathcal{O}_{X}$ is surjective, and
(c) the kernel of $i^{\#}$ is a locally nilpotent sheaf of ideals.
(3) A first order thickening of ringed spaces is a thickening $i:\left(X, \mathcal{O}_{X}\right) \rightarrow$ $\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ of ringed spaces such that $\operatorname{Ker}\left(i^{\sharp}\right)$ has square zero.
(4) It is clear how to define morphisms of thickenings, morphisms of thickenings over a base ringed space, etc.
If $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is a thickening of ringed spaces then we identify the underlying topological spaces and think of $\mathcal{O}_{X}, \mathcal{O}_{X^{\prime}}$, and $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$ as sheaves on $X=X^{\prime}$. We obtain a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

of $\mathcal{O}_{X^{\prime}}$-modules. By Modules, Lemma 17.13 .4 the category of $\mathcal{O}_{X}$-modules is equivalent to the category of $\mathcal{O}_{X^{\prime}}$-modules annihilated by $\mathcal{I}$. In particular, if $i$ is a first order thickening, then $\mathcal{I}$ is a $\mathcal{O}_{X}$-module.
08 KZ Situation 74.3.1. A morphism of thickenings $\left(f, f^{\prime}\right)$ is given by a commutative diagram

08L0 (74.3.1.1)

of ringed spaces whose horizontal arrows are thickenings. In this situation we set $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}_{X^{\prime}}$ and $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right) \subset \mathcal{O}_{S^{\prime}}$. As $f=f^{\prime}$ on underlying topological spaces we will identify the (topological) pullback functors $f^{-1}$ and $\left(f^{\prime}\right)^{-1}$. Observe that $\left(f^{\prime}\right)^{\sharp}: f^{-1} \mathcal{O}_{S^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}}$ induces in particular a map $f^{-1} \mathcal{J} \rightarrow \mathcal{I}$ and therefore a map of $\mathcal{O}_{X^{\prime}-\text { modules }}$

$$
\left(f^{\prime}\right)^{*} \mathcal{J} \longrightarrow \mathcal{I}
$$

If $i$ and $t$ are first order thickenings, then $\left(f^{\prime}\right)^{*} \mathcal{J}=f^{*} \mathcal{J}$ and the map above becomes a $\operatorname{map} f^{*} \mathcal{J} \rightarrow \mathcal{I}$.

08L1 Definition 74.3.2. In Situation 74.3.1 we say that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings if the map $\left(f^{\prime}\right)^{*} \mathcal{J} \longrightarrow \mathcal{I}$ is surjective.

The following lemma in particular shows that a morphism $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow$ ( $S \subset S^{\prime}$ ) of thickenings of schemes is strict if and only if $X=S \times{ }_{S^{\prime}} X^{\prime}$.

08L2 Lemma 74.3.3. In Situation 74.3.1 the morphism $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings if and only if (74.3.1.1) is cartesian in the category of ringed spaces.

Proof. Omitted.

### 74.4. Modules on first order thickenings of ringed spaces

08L3 In this section we discuss some preliminaries to the deformation theory of modules. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. We will freely use the notation introduced in Section 74.3, in particular we will identify the underlying topological spaces. In this section we consider short exact sequences
08L4

$$
\begin{equation*}
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \tag{74.4.0.1}
\end{equation*}
$$

of $\mathcal{O}_{X^{\prime}}$-modules, where $\mathcal{F}, \mathcal{K}$ are $\mathcal{O}_{X}$-modules and $\mathcal{F}^{\prime}$ is an $\mathcal{O}_{X^{\prime}}$-module. In this situation we have a canonical $\mathcal{O}_{X}$-module map

$$
c_{\mathcal{F}^{\prime}}: \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \longrightarrow \mathcal{K}
$$

where $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$. Namely, given local sections $f$ of $\mathcal{I}$ and $s$ of $\mathcal{F}$ we set $c_{\mathcal{F}^{\prime}}(f \otimes s)=$ $f s^{\prime}$ where $s^{\prime}$ is a local section of $\mathcal{F}^{\prime}$ lifting $s$.

08L5 Lemma 74.4.1. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

as in 74.4.0.1 and maps $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\psi: \mathcal{K} \rightarrow \mathcal{L}$.
(1) If there exists an $\mathcal{O}_{X^{\prime}}$-module map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$, then the diagram

is commutative.
(2) The set of $\mathcal{O}_{X^{\prime}}$-module maps $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$ is, if nonempty, a principal homogeneous space under $\operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{L})$.

Proof. Part (1) is immediate from the description of the maps. For (2), if $\varphi^{\prime}$ and $\varphi^{\prime \prime}$ are two maps $\mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$, then $\varphi^{\prime}-\varphi^{\prime \prime}$ factors as

$$
\mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime}
$$

The map in the middle comes from a unique element of $\operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{L})$ by Modules, Lemma 17.13.4. Conversely, given an element $\alpha$ of this group we can add the composition (as displayed above with $\alpha$ in the middle) to $\varphi^{\prime}$. Some details omitted.

08L6 Lemma 74.4.2. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

as in (74.4.0.1) and maps $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\psi: \mathcal{K} \rightarrow \mathcal{L}$. Assume the diagram

is commutative. Then there exists an element

$$
o(\varphi, \psi) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{L})
$$

whose vanishing is a necessary and sufficient condition for the existence of a map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$.

Proof. We can construct explicitly an extension

$$
0 \rightarrow \mathcal{L} \rightarrow \mathcal{H} \rightarrow \mathcal{F} \rightarrow 0
$$

by taking $\mathcal{H}$ to be the cohomology of the complex

$$
\mathcal{K} \xrightarrow{1,-\psi} \mathcal{F}^{\prime} \oplus \mathcal{G}^{\prime} \xrightarrow{\varphi, 1} \mathcal{G}
$$

in the middle (with obvious notation). A calculation with local sections using the assumption that the diagram of the lemma commutes shows that $\mathcal{H}$ is annihilated by $\mathcal{I}$. Hence $\mathcal{H}$ defines a class in

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{L}) \subset \operatorname{Ext}_{\mathcal{O}_{X^{\prime}}}^{1}(\mathcal{F}, \mathcal{L})
$$

Finally, the class of $\mathcal{H}$ is the difference of the pushout of the extension $\mathcal{F}^{\prime}$ via $\psi$ and the pullback of the extension $\mathcal{G}^{\prime}$ via $\varphi$ (calculations omitted). Thus the vanishing
of the class of $\mathcal{H}$ is equivalent to the existence of a commutative diagram

as desired.
08L7 Lemma 74.4.3. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Assume given $\mathcal{O}_{X}$-modules $\mathcal{F}, \mathcal{K}$ and an $\mathcal{O}_{X}$-linear map $c: \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}$. If there exists a sequence (74.4.0.1) with $c_{\mathcal{F}^{\prime}}=c$ then the set of isomorphism classes of these extensions is principal homogeneous under $E x t_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{K})$.

Proof. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{1}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

with $c_{\mathcal{F}_{1}^{\prime}}=c_{\mathcal{F}_{2}^{\prime}}=c$. Then the difference (in the extension group, see Homology, Section 12.6 is an extension

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0
$$

where $\mathcal{E}$ is annihilated by $\mathcal{I}$ (local computation omitted). Hence the sequence is an extension of $\mathcal{O}_{X}$-modules, see Modules, Lemma 17.13.4. Conversely, given such an extension $\mathcal{E}$ we can add the extension $\mathcal{E}$ to the $\mathcal{O}_{X^{\prime}}$-extension $\mathcal{F}^{\prime}$ without affecting the map $c_{\mathcal{F}^{\prime}}$. Some details omitted.

08L8 Lemma 74.4.4. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Assume given $\mathcal{O}_{X}$-modules $\mathcal{F}, \mathcal{K}$ and an $\mathcal{O}_{X}$-linear map $c: \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}$. Then there exists an element

$$
o(\mathcal{F}, \mathcal{K}, c) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{2}(\mathcal{F}, \mathcal{K})
$$

whose vanishing is a necessary and sufficient condition for the existence of a sequence (74.4.0.1 with $c_{\mathcal{F}^{\prime}}=c$.

Proof. We first show that if $\mathcal{K}$ is an injective $\mathcal{O}_{X}$-module, then there does exist a sequence 74.4.0.1 with $c_{\mathcal{F}^{\prime}}=c$. To do this, choose a flat $\mathcal{O}_{X^{\prime}}$-module $\mathcal{H}^{\prime}$ and a surjection $\mathcal{H}^{\prime} \rightarrow \mathcal{F}$ (Modules, Lemma 17.16.6). Let $\mathcal{J} \subset \mathcal{H}^{\prime}$ be the kernel. Since $\mathcal{H}^{\prime}$ is flat we have

$$
\mathcal{I} \otimes_{\mathcal{O}_{X}}, \mathcal{H}^{\prime}=\mathcal{I} \mathcal{H}^{\prime} \subset \mathcal{J} \subset \mathcal{H}^{\prime}
$$

Observe that the map

$$
\mathcal{I} \mathcal{H}^{\prime}=\mathcal{I} \otimes_{\mathcal{O}_{X^{\prime}}} \mathcal{H}^{\prime} \longrightarrow \mathcal{I} \otimes_{\mathcal{O}_{X^{\prime}}} \mathcal{F}=\mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

annihilates $\mathcal{I} \mathcal{J}$. Namely, if $f$ is a local section of $\mathcal{I}$ and $s$ is a local section of $\mathcal{H}$, then $f s$ is mapped to $f \otimes \bar{s}$ where $\bar{s}$ is the image of $s$ in $\mathcal{F}$. Thus we obtain

a diagram of $\mathcal{O}_{X}$-modules. If $\mathcal{K}$ is injective as an $\mathcal{O}_{X}$-module, then we obtain the dotted arrow. Denote $\gamma^{\prime}: \mathcal{J} \rightarrow \mathcal{K}$ the composition of $\gamma$ with $\mathcal{J} \rightarrow \mathcal{J} / \mathcal{I} \mathcal{J}$. A local calculation shows the pushout

is a solution to the problem posed by the lemma.
General case. Choose an embedding $\mathcal{K} \subset \mathcal{K}^{\prime}$ with $\mathcal{K}^{\prime}$ an injective $\mathcal{O}_{X}$-module. Let $\mathcal{Q}$ be the quotient, so that we have an exact sequence

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{K}^{\prime} \rightarrow \mathcal{Q} \rightarrow 0
$$

Denote $c^{\prime}: \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}^{\prime}$ be the composition. By the paragraph above there exists a sequence

$$
0 \rightarrow \mathcal{K}^{\prime} \rightarrow \mathcal{E}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.4.0.1 with $c_{\mathcal{E}^{\prime}}=c^{\prime}$. Note that $c^{\prime}$ composed with the map $\mathcal{K}^{\prime} \rightarrow \mathcal{Q}$ is zero, hence the pushout of $\mathcal{E}^{\prime}$ by $\mathcal{K}^{\prime} \rightarrow \mathcal{Q}$ is an extension

$$
0 \rightarrow \mathcal{Q} \rightarrow \mathcal{D}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.4.0.1 with $c_{\mathcal{D}^{\prime}}=0$. This means exactly that $\mathcal{D}^{\prime}$ is annihilated by $\mathcal{I}$, in other words, the $\mathcal{D}^{\prime}$ is an extension of $\mathcal{O}_{X}$-modules, i.e., defines an element

$$
o(\mathcal{F}, \mathcal{K}, c) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{Q})=\operatorname{Ext}_{\mathcal{O}_{X}}^{2}(\mathcal{F}, \mathcal{K})
$$

(the equality holds by the long exact cohomology sequence associated to the exact sequence above and the vanishing of higher ext groups into the injective module $\left.\mathcal{K}^{\prime}\right)$. If $o(\mathcal{F}, \mathcal{K}, c)=0$, then we can choose a splitting $s: \mathcal{F} \rightarrow \mathcal{D}^{\prime}$ and we can set

$$
\mathcal{F}^{\prime}=\operatorname{Ker}\left(\mathcal{E}^{\prime} \rightarrow \mathcal{D}^{\prime} / s(\mathcal{F})\right)
$$

so that we obtain the following diagram

with exact rows which shows that $c_{\mathcal{F}^{\prime}}=c$. Conversely, if $\mathcal{F}^{\prime}$ exists, then the pushout of $\mathcal{F}^{\prime}$ by the $\operatorname{map} \mathcal{K} \rightarrow \mathcal{K}^{\prime}$ is isomorphic to $\mathcal{E}^{\prime}$ by Lemma 74.4.3 and the vanishing of higher ext groups into the injective module $\mathcal{K}^{\prime}$. This gives a diagram as above, which implies that $\mathcal{D}^{\prime}$ is split as an extension, i.e., the class $o(\mathcal{F}, \mathcal{K}, c)$ is zero.

08L9 Remark 74.4.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. A first order thickening $i$ : $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is said to be trivial if there exists a morphism of ringed spaces $\pi:\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ which is a left inverse to $i$. The choice of such a morphism $\pi$ is called a trivialization of the first order thickening. Given $\pi$ we obtain a splitting
08LA

$$
\begin{equation*}
\mathcal{O}_{X^{\prime}}=\mathcal{O}_{X} \oplus \mathcal{I} \tag{74.4.5.1}
\end{equation*}
$$

as sheaves of algebras on $X$ by using $\pi^{\sharp}$ to split the surjection $\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X}$. Conversely, such a splitting determines a morphism $\pi$. The category of trivialized first order thickenings of $\left(X, \mathcal{O}_{X}\right)$ is equivalent to the category of $\mathcal{O}_{X}$-modules.

08LB Remark 74.4.6. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a trivial first order thickening of ringed spaces and let $\pi:\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be a trivialization. Then given any triple $(\mathcal{F}, \mathcal{K}, c)$ consisting of a pair of $\mathcal{O}_{X}$-modules and a map $c: \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}$ we may set

$$
\mathcal{F}_{c, \text { triv }}^{\prime}=\mathcal{F} \oplus \mathcal{K}
$$

and use the splitting 74.4 .5 .1 associated to $\pi$ and the map $c$ to define the $\mathcal{O}_{X^{\prime}}$ module structure and obtain an extension $\sqrt[74.4 .0 .1]{ }$. We will call $\mathcal{F}_{c, \text { triv }}^{\prime}$ the trivial extension of $\mathcal{F}$ by $\mathcal{K}$ corresponding to $c$ and the trivialization $\pi$. Given any extension $\mathcal{F}^{\prime}$ as in 74.4.0.1 we can use $\pi^{\sharp}: \mathcal{O}_{X} \rightarrow \mathcal{O}_{X^{\prime}}$ to think of $\mathcal{F}^{\prime}$ as an $\mathcal{O}_{X}$-module extension, hence a class $\xi_{\mathcal{F}^{\prime}}$ in $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{K})$. Lemma 74.4 .3 assures that $\mathcal{F}^{\prime} \mapsto \xi_{\mathcal{F}^{\prime}}$ induces a bijection

$$
\left\{\begin{array}{c}
\text { isomorphism classes of extensions } \\
\mathcal{F}^{\prime} \text { as in 74.4.0.1 with } c=c_{\mathcal{F}^{\prime}}
\end{array}\right\} \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{1}(\mathcal{F}, \mathcal{K})
$$

Moreover, the trivial extension $\mathcal{F}_{c, \text { triv }}^{\prime}$ maps to the zero class.
08LC Remark 74.4.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X_{i}^{\prime}, \mathcal{O}_{X_{i}^{\prime}}\right), i=$ 1,2 be first order thickenings with ideal sheaves $\mathcal{I}_{i}$. Let $h:\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X_{2}^{\prime}, \mathcal{O}_{X_{2}^{\prime}}\right)$ be a morphism of first order thickenings of $\left(X, \mathcal{O}_{X}\right)$. Picture

Observe that $h^{\sharp}: \mathcal{O}_{X_{2}^{\prime}} \rightarrow \mathcal{O}_{X_{1}^{\prime}}$ in particular induces an $\mathcal{O}_{X}$-module map $\mathcal{I}_{2} \rightarrow \mathcal{I}_{1}$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Let $\left(\mathcal{K}_{i}, c_{i}\right), i=1,2$ be a pair consisting of an $\mathcal{O}_{X}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume furthermore given a map of $\mathcal{O}_{X}$-modules $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ such that

is commutative. Then there is a canonical functoriality

$$
\left\{\begin{array}{c}
\mathcal{F}_{2}^{\prime} \text { as in } 74.4 .0 .1 \text { with } \\
c_{2}=c_{\mathcal{F}_{2}^{\prime}} \text { and } \mathcal{K}=\mathcal{K}_{2}
\end{array}\right\} \rightarrow\left\{\begin{array}{c}
\mathcal{F}_{1}^{\prime} \text { as in 74.4.0.1 with } \\
c_{1}=c_{\mathcal{F}_{1}^{\prime}} \text { and } \mathcal{K}=\mathcal{K}_{1}
\end{array}\right\}
$$

Namely, thinking of all sheaves $\mathcal{O}_{X}, \mathcal{O}_{X_{i}^{\prime}}, \mathcal{F}, \mathcal{K}_{i}$, etc as sheaves on $X$, we set given $\mathcal{F}_{2}^{\prime}$ the sheaf $\mathcal{F}_{1}^{\prime}$ equal to the pushout, i.e., fitting into the following diagram of extensions

We omit the construction of the $\mathcal{O}_{X_{1}^{\prime}}$-module structure on the pushout (this uses the commutativity of the diagram involving $c_{1}$ and $c_{2}$ ).

08LD Remark 74.4.8. Let $\left(X, \mathcal{O}_{X}\right),\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X_{i}^{\prime}, \mathcal{O}_{X_{i}^{\prime}}\right), \mathcal{I}_{i}$, and $h:\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow$ $\left(X_{2}^{\prime}, \mathcal{O}_{X_{2}^{\prime}}\right)$ be as in Remark 74.4.7. Assume that we are given given trivializations $\pi_{i}: X_{i}^{\prime} \rightarrow X$ such that $\pi_{1}=h \circ \pi_{2}$. In other words, assume $h$ is a morphism of trivialized first order thickening of $\left(X, \mathcal{O}_{X}\right)$. Let $\left(\mathcal{K}_{i}, c_{i}\right), i=1,2$ be a pair consisting of an $\mathcal{O}_{X}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume furthermore given a map of $\mathcal{O}_{X}$-modules $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ such that

is commutative. In this situation the construction of Remark 74.4.6 induces a commutative diagram

where the vertical map on the right is given by functoriality of Ext and the map $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ and the vertical map on the left is the one from Remark 74.4.7.

08LE Remark 74.4.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. We define a sequence of morphisms of first order thickenings

$$
\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X_{2}^{\prime}, \mathcal{O}_{X_{2}^{\prime}}\right) \rightarrow\left(X_{3}^{\prime}, \mathcal{O}_{X_{3}^{\prime}}\right)
$$

of $\left(X, \mathcal{O}_{X}\right)$ to be a complex if the corresponding maps between the ideal sheaves $\mathcal{I}_{i}$ give a complex of $\mathcal{O}_{X}$-modules $\mathcal{I}_{3} \rightarrow \mathcal{I}_{2} \rightarrow \mathcal{I}_{1}$ (i.e., the composition is zero). In this case the composition $\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X_{3}^{\prime}, \mathcal{O}_{X_{3}^{\prime}}\right)$ factors through $\left(X, \mathcal{O}_{X}\right) \rightarrow$ $\left(X_{3}^{\prime}, \mathcal{O}_{X_{3}^{\prime}}\right)$, i.e., the first order thickening $\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right)$ of $\left(X, \mathcal{O}_{X}\right)$ is trivial and comes with a canonical trivialization $\pi:\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$.

We say a sequence of morphisms of first order thickenings

$$
\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X_{2}^{\prime}, \mathcal{O}_{X_{2}^{\prime}}\right) \rightarrow\left(X_{3}^{\prime}, \mathcal{O}_{X_{3}^{\prime}}\right)
$$

of $\left(X, \mathcal{O}_{X}\right)$ is a short exact sequence if the corresponding maps between ideal sheaves is a short exact sequence

$$
0 \rightarrow \mathcal{I}_{3} \rightarrow \mathcal{I}_{2} \rightarrow \mathcal{I}_{1} \rightarrow 0
$$

of $\mathcal{O}_{X}$-modules.
08LF Remark 74.4.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Let

$$
\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X_{2}^{\prime}, \mathcal{O}_{X_{2}^{\prime}}\right) \rightarrow\left(X_{3}^{\prime}, \mathcal{O}_{X_{3}^{\prime}}\right)
$$

be a complex first order thickenings of $\left(X, \mathcal{O}_{X}\right)$, see Remark 74.4.9. Let $\left(\mathcal{K}_{i}, c_{i}\right)$, $i=1,2,3$ be pairs consisting of an $\mathcal{O}_{X}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume given a short exact sequence of $\mathcal{O}_{X}$-modules

$$
0 \rightarrow \mathcal{K}_{3} \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{K}_{1} \rightarrow 0
$$

such that

are commutative. Finally, assume given an extension

$$
0 \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.4.0.1 with $\mathcal{K}=\mathcal{K}_{2}$ of $\mathcal{O}_{X_{2}^{\prime}}$-modules with $c_{\mathcal{F}_{2}^{\prime}}=c_{2}$. In this situation we can apply the functoriality of Remark 74.4 .7 to obtain an extension $\mathcal{F}_{1}^{\prime}$ on $X_{1}^{\prime}$ (we'll describe $\mathcal{F}_{1}^{\prime}$ in this special case below). By Remark 74.4.6 using the canonical splitting $\pi:\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ of Remark 74.4.9 we obtain $\xi_{\mathcal{F}_{1}^{\prime}} \in$ $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, \mathcal{K}_{1}\right)$. Finally, we have the obstruction

$$
o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(\mathcal{F}, \mathcal{K}_{3}\right)
$$

see Lemma 74.4.4. In this situation we claim that the canonical map

$$
\partial: \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, \mathcal{K}_{1}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(\mathcal{F}, \mathcal{K}_{3}\right)
$$

coming from the short exact sequence $0 \rightarrow \mathcal{K}_{3} \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{K}_{1} \rightarrow 0$ sends $\xi_{\mathcal{F}_{1}^{\prime}}$ to the obstruction class $o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right)$.
To prove this claim choose an embedding $j: \mathcal{K}_{3} \rightarrow \mathcal{K}$ where $\mathcal{K}$ is an injective $\mathcal{O}_{X^{-}}$ module. We can lift $j$ to a map $j^{\prime}: \mathcal{K}_{2} \rightarrow \mathcal{K}$. Set $\mathcal{E}_{2}^{\prime}=j_{*}^{\prime} \mathcal{F}_{2}^{\prime}$ equal to the pushout of $\mathcal{F}_{2}^{\prime}$ by $j^{\prime}$ so that $c_{\mathcal{E}_{2}^{\prime}}=j^{\prime} \circ c_{2}$. Picture:

Set $\mathcal{E}_{3}^{\prime}=\mathcal{E}_{2}^{\prime}$ but viewed as an $\mathcal{O}_{X_{3}^{\prime}}-$ module via $\mathcal{O}_{X_{3}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$. Then $c_{\mathcal{E}_{3}^{\prime}}=j \circ c_{3}$. The proof of Lemma 74.4 .4 constructs $o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right)$ as the boundary of the class of the extension of $\mathcal{O}_{X}$-modules

$$
0 \rightarrow \mathcal{K} / \mathcal{K}_{3} \rightarrow \mathcal{E}_{3}^{\prime} / \mathcal{K}_{3} \rightarrow \mathcal{F} \rightarrow 0
$$

On the other hand, note that $\mathcal{F}_{1}^{\prime}=\mathcal{F}_{2}^{\prime} / \mathcal{K}_{3}$ hence the class $\xi_{\mathcal{F}_{1}^{\prime}}$ is the class of the extension

$$
0 \rightarrow \mathcal{K}_{2} / \mathcal{K}_{3} \rightarrow \mathcal{F}_{2}^{\prime} / \mathcal{K}_{3} \rightarrow \mathcal{F} \rightarrow 0
$$

seen as a sequence of $\mathcal{O}_{X}$-modules using $\pi^{\sharp}$ where $\pi:\left(X_{1}^{\prime}, \mathcal{O}_{X_{1}^{\prime}}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ is the canonical splitting. Thus finally, the claim follows from the fact that we have a commutative diagram

which is $\mathcal{O}_{X}$-linear (with the $\mathcal{O}_{X}$-module structures given above).
74.5. Infinitesimal deformations of modules on ringed spaces

08LG Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. We freely use the notation introduced in Section 74.3 . Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}_{X^{\prime}}$-module and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. In this situation we have a short exact sequence

$$
0 \rightarrow \mathcal{I F}^{\prime} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

of $\mathcal{O}_{X^{\prime}}$-modules. Since $\mathcal{I}^{2}=0$ the $\mathcal{O}_{X^{\prime}}$-module structure on $\mathcal{I F}^{\prime}$ comes from a unique $\mathcal{O}_{X^{\prime}}$-module structure. Thus the sequence above is an extension as in 74.4.0.1. As a special case, if $\mathcal{F}^{\prime}=\mathcal{O}_{X^{\prime}}$ we have $i^{*} \mathcal{O}_{X^{\prime}}=\mathcal{O}_{X}$ and $\mathcal{I} \mathcal{O}_{X^{\prime}}=\mathcal{I}$ and we recover the sequence of structure sheaves

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

08LH Lemma 74.5.1. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Let $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ be $\mathcal{O}_{X^{\prime}}$-modules. Set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-linear map. The set of lifts of $\varphi$ to an $\mathcal{O}_{X^{\prime}}$-linear map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ is, if nonempty, a principal homogeneous space under $\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{I} \mathcal{G}^{\prime}\right)$.

Proof. This is a special case of Lemma 74.4.1 but we also give a direct proof. We have short exact sequences of modules

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{I} \mathcal{G}^{\prime} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

and similarly for $\mathcal{F}^{\prime}$. Since $\mathcal{I}$ has square zero the $\mathcal{O}_{X^{\prime}}$-module structure on $\mathcal{I}$ and $\mathcal{I} \mathcal{G}^{\prime}$ comes from a unique $\mathcal{O}_{X}$-module structure. It follows that

$$
\operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{I} \mathcal{G}^{\prime}\right) \quad \text { and } \quad \operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})
$$

The lemma now follows from the exact sequence

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right) \rightarrow \operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{G}^{\prime}\right) \rightarrow \operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)
$$

see Homology, Lemma 12.5.8.
08LI Lemma 74.5.2. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings of ringed spaces as in Situation 74.3.1. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}_{X^{\prime}}$-module and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. Assume that $\mathcal{F}$ is flat over $S$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings (Definition 74.3.2). Then the following are equivalent
(1) $\mathcal{F}^{\prime}$ is flat over $S^{\prime}$, and
(2) the canonical map $f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{I} \mathcal{F}^{\prime}$ is an isomorphism.

Moreover, in this case the maps

$$
f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{I} \mathcal{F}^{\prime}
$$

are isomorphisms.
Proof. The map $f^{*} \mathcal{J} \rightarrow \mathcal{I}$ is surjective as $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. Hence the final statement is a consequence of (2).

Proof of the equivalence of (1) and (2). We may check these conditions at stalks. Let $x \in X \subset X^{\prime}$ be a point with image $s=f(x) \in S \subset S^{\prime}$. Set $A^{\prime}=\mathcal{O}_{S^{\prime}, s}$, $B^{\prime}=\mathcal{O}_{X^{\prime}, x}, A=\mathcal{O}_{S, s}$, and $B=\mathcal{O}_{X, x}$. Then $A=A^{\prime} / J$ and $B=B^{\prime} / I$ for some square zero ideals. Since $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings we have $I=J B^{\prime}$. Let $M^{\prime}=\mathcal{F}_{x}^{\prime}$ and $M=\mathcal{F}_{x}$. Then $M^{\prime}$ is a $B^{\prime}$-module and $M$ is a $B$-module. Since
$\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ we see that the kernel of the surjection $M^{\prime} \rightarrow M$ is $I M^{\prime}=J M^{\prime}$. Thus we have a short exact sequence

$$
0 \rightarrow J M^{\prime} \rightarrow M^{\prime} \rightarrow M \rightarrow 0
$$

Using Sheaves, Lemma 6.26.4 and Modules, Lemma 17.15 .1 to identify stalks of pullbacks and tensor products we see that the stalk at $x$ of the canonical map of the lemma is the map

$$
\left(J \otimes_{A} B\right) \otimes_{B} M=J \otimes_{A} M=J \otimes_{A^{\prime}} M^{\prime} \longrightarrow J M^{\prime}
$$

The assumption that $\mathcal{F}$ is flat over $S$ signifies that $M$ is a flat $A$-module.
Assume (1). Flatness implies $\operatorname{Tor}_{1}^{A^{\prime}}\left(M^{\prime}, A\right)=0$ by Algebra, Lemma 10.74.8. This means $J \otimes_{A^{\prime}} M^{\prime} \rightarrow M^{\prime}$ is injective by Algebra, Remark 10.74.9. Hence $J \otimes_{A} M \rightarrow$ $J M^{\prime}$ is an isomorphism.
Assume (2). Then $J \otimes_{A^{\prime}} M^{\prime} \rightarrow M^{\prime}$ is injective. Hence $\operatorname{Tor}_{1}^{A^{\prime}}\left(M^{\prime}, A\right)=0$ by Algebra, Remark 10.74.9. Hence $M^{\prime}$ is flat over $A^{\prime}$ by Algebra, Lemma 10.98.8.

08LJ Lemma 74.5.3. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.3.1. Let $\mathcal{F}^{\prime}$, $\mathcal{G}^{\prime}$ be $\mathcal{O}_{X^{\prime}}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-linear map. Assume that $\mathcal{G}^{\prime}$ is flat over $S^{\prime}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. The set of lifts of $\varphi$ to an $\mathcal{O}_{X^{\prime}}$-linear map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ is, if nonempty, a principal homogeneous space under

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{J}\right)
$$

Proof. Combine Lemmas 74.5.1 and 74.5.2
08LK Lemma 74.5.4. Let $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ be a first order thickening of ringed spaces. Let $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ be $\mathcal{O}_{X^{\prime}}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-linear map. There exists an element

$$
o(\varphi) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of $\varphi$ to an $\mathcal{O}_{X^{\prime}-l i n e a r ~ m a p ~} \varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$.
Proof. It is clear from the proof of Lemma 74.5.1 that the vanishing of the boundary of $\varphi$ via the map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X^{\prime}}}^{1}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

is a necessary and sufficient condition for the existence of a lift. We conclude as

$$
\operatorname{Ext}_{\mathcal{O}_{X^{\prime}}}^{1}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

the adjointness of $i_{*}=R i_{*}$ and $L i^{*}$ on the derived category (Cohomology, Lemma 20.29.1).

08LL Lemma 74.5.5. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.3.1. Let $\mathcal{F}^{\prime}$, $\mathcal{G}^{\prime}$ be $\mathcal{O}_{X^{\prime}}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-linear map. Assume that $\mathcal{F}^{\prime}$ and $\mathcal{G}^{\prime}$ are flat over $S^{\prime}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. There exists an element

$$
o(\varphi) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{J}\right)
$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of $\varphi$ to an $\mathcal{O}_{X^{\prime}}$-linear $\operatorname{map} \varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$.

First proof. This follows from Lemma 74.5 .4 as we claim that under the assumptions of the lemma we have

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{J}\right)
$$

Namely, we have $\mathcal{I} \mathcal{G}^{\prime}=\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{J}$ by Lemma 74.5.2. On the other hand, observe that

$$
H^{-1}\left(L i^{*} \mathcal{F}^{\prime}\right)=\operatorname{Tor}_{1}^{\mathcal{O}_{X^{\prime}}}\left(\mathcal{F}^{\prime}, \mathcal{O}_{X}\right)
$$

(local computation omitted). Using the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

we see that this $\operatorname{Tor}_{1}$ is computed by the kernel of the map $\mathcal{I} \otimes \mathcal{O}_{X} \mathcal{F} \rightarrow \mathcal{I} \mathcal{F}^{\prime}$ which is zero by the final assertion of Lemma 74.5.2. Thus $\tau_{\geq-1} L i^{*} \mathcal{F}^{\prime}=\mathcal{F}$. On the other hand, we have

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\tau_{\geq-1} L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

by the dual of Derived Categories, Lemma 13.17.1.
Second proof. We can apply Lemma 74.4 .2 as follows. Note that $\mathcal{K}=\mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}$ and $\mathcal{L}=\mathcal{I} \otimes \mathcal{O}_{X} \mathcal{G}$ by Lemma 74.5.2, that $c_{\mathcal{F}^{\prime}}=1 \otimes 1$ and $c_{\mathcal{G}^{\prime}}=1 \otimes 1$ and taking $\psi=1 \otimes \varphi$ the diagram of the lemma commutes. Thus $o(\varphi)=o(\varphi, 1 \otimes \varphi)$ works.

08LM Lemma 74.5.6. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.3.1. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Assume $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings and $\mathcal{F}$ flat over $S$. If there exists a pair $\left(\mathcal{F}^{\prime}, \alpha\right)$ consisting of an $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$ flat over $S^{\prime}$ and an isomorphism $\alpha: i^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$, then the set of isomorphism classes of such pairs is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$.
Proof. If we assume there exists one such module, then the canonical map

$$
f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

is an isomorphism by Lemma 74.5.2. Apply Lemma 74.4.3 with $\mathcal{K}=\mathcal{I} \otimes \mathcal{O}_{X} \mathcal{F}$ and $c=1$. By Lemma 74.5.2 the corresponding extensions $\mathcal{F}^{\prime}$ are all flat over $S^{\prime}$.

08LN Lemma 74.5.7. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.3.1. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Assume $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings and $\mathcal{F}$ flat over $S$. There exists an $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$ flat over $S^{\prime}$ with $i^{*} \mathcal{F}^{\prime} \cong \mathcal{F}$, if and only if
(1) the canonical map $f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}$ is an isomorphism, and
(2) the class $o\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}, 1\right) \in E x t_{\mathcal{O}_{X}}^{2}\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$ of Lemma 74.4 .4 is zero.

Proof. This follows immediately from the characterization of $\mathcal{O}_{X^{\prime}}$-modules flat over $S^{\prime}$ of Lemma 74.5.2 and Lemma 74.4.4
74.6. Application to flat modules on flat thickenings of ringed spaces

08VQ Consider a commutative diagram

of ringed spaces whose horizontal arrows are first order thickenings as in Situation 74.3.1. Set $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}_{X^{\prime}}$ and $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right) \subset \mathcal{O}_{S^{\prime}}$. Let $\mathcal{F}$ be an $\mathcal{O}_{X^{\prime}}$-module. Assume that
(1) $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings,
(2) $f^{\prime}$ is flat, and
(3) $\mathcal{F}$ is flat over $S$.

Note that $(1)+(2)$ imply that $\mathcal{I}=f^{*} \mathcal{J}$ (apply Lemma 74.5.2 to $\mathcal{O}_{X^{\prime}}$ ). The theory of the preceding section is especially nice under these assumptions. We summarize the results already obtained in the following lemma.

08 VR Lemma 74.6.1. In the situation above.
(1) There exists an $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$ flat over $S^{\prime}$ with $i^{*} \mathcal{F}^{\prime} \cong \mathcal{F}$, if and only if the class $o\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F}, 1\right) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$ of Lemma 74.4.4 is zero.
(2) If such a module exists, then the set of isomorphism classes of lifts is principal homogeneous under $E x t_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$.
(3) Given a lift $\mathcal{F}^{\prime}$, the set of automorphisms of $\mathcal{F}^{\prime}$ which pull back to $i d_{\mathcal{F}}$ is canonically isomorphic to $\operatorname{Ext}_{\mathcal{O}_{X}}^{0}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$.

Proof. Part (1) follows from Lemma 74.5 .7 as we have seen above that $\mathcal{I}=f^{*} \mathcal{J}$. Part (2) follows from Lemma 74.5.6. Part (3) follows from Lemma 74.5.3.

08 VS Situation 74.6.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$ be a morphism of ringed spaces. Consider a commutative diagram

where (a) the top row is a short exact sequence of first order thickenings of $X$, (b) the lower row is a short exact sequence of first order thickenings of $S$, (c) each $f_{i}^{\prime}$ restricts to $f,(\mathrm{~d})$ each pair $\left(f, f_{i}^{\prime}\right)$ is a strict morphism of thickenings, and (e) each $f_{i}^{\prime}$ is flat. Finally, let $\mathcal{F}_{2}^{\prime}$ be an $\mathcal{O}_{2}^{\prime}$-module flat over $S_{2}^{\prime}$ and set $\mathcal{F}=\left.\mathcal{F}_{2}^{\prime}\right|_{X}$. Let $\pi: X_{1}^{\prime} \rightarrow X$ be the canonical splitting (Remark 74.4.9).

08VT Lemma 74.6.3. In Situation 74.6.2 the modules $\pi^{*} \mathcal{F}$ and $h^{*} \mathcal{F}_{2}^{\prime}$ are $\mathcal{O}_{1}^{\prime}$-modules flat over $S_{1}^{\prime}$ restricting to $\mathcal{F}$ on $X$. Their difference (Lemma 74.6.1) is an element $\theta$ of $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{F}, f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$ whose boundary in $\operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(\mathcal{F}, f^{*} \mathcal{J}_{3} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$ equals the obstruction (Lemma 74.6.1) to lifting $\mathcal{F}$ to an $\mathcal{O}_{3}^{\prime}$-module flat over $S_{3}^{\prime}$.

Proof. Note that both $\pi^{*} \mathcal{F}$ and $h^{*} \mathcal{F}_{2}^{\prime}$ restrict to $\mathcal{F}$ on $X$ and that the kernels of $\pi^{*} \mathcal{F} \rightarrow \mathcal{F}$ and $h^{*} \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F}$ are given by $f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{F}$. Hence flatness by Lemma 74.5.2. Taking the boundary makes sense as the sequence of modules

$$
0 \rightarrow f^{*} \mathcal{J}_{3} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow f^{*} \mathcal{J}_{2} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow 0
$$

is short exact due to the assumptions in Situation 74.6 .2 and the fact that $\mathcal{F}$ is flat over $S$. The statement on the obstruction class is a direct translation of the result of Remark 74.4 .10 to this particular situation.
74.7. Deformations of ringed spaces and the naive cotangent complex

08U6 In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a first order thickening $t:\left(S, \mathcal{O}_{S}\right) \rightarrow\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$ of ringed spaces. We denote $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right)$ and we identify the underlying topological spaces of $S$ and $S^{\prime}$. Moreover we assume given a morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow$ $\left(S, \mathcal{O}_{S}\right)$, an $\mathcal{O}_{X}$-module $\mathcal{G}$, and an $f$-map $c: \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of modules (Sheaves, Definition 6.21 .7 and Section 6.26). In this section we ask ourselves whether we can find the question mark fitting into the following diagram

08U7

(where the vertical arrows are $f$-maps) and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ and a morphism of thickenings $\left(f, f^{\prime}\right)$ as in 74.3.1.1 where $\operatorname{Ker}\left(i^{\sharp}\right)$ is identified with $\mathcal{G}$ such that $\left(f^{\prime}\right)^{\sharp}$ induces the given map $c$. We will say $X^{\prime}$ is a solution to 74.7.0.1.

08U8 Lemma 74.7.1. Assume given a commutative diagram of morphisms ringed spaces

whose horizontal arrows are first order thickenings. Set $\mathcal{G}_{j}=\operatorname{Ker}\left(i_{j}^{\sharp}\right)$ and assume given a g-map $\nu: \mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ of modules giving rise to the commutative diagram

08UA

with front and back solutions to (74.7.0.1).
(1) There exist a canonical element in $\operatorname{Ext}_{\mathcal{O}_{X_{2}}}^{1}\left(L g^{*} N L_{X_{1} / S_{1}}, \mathcal{G}_{2}\right)$ whose vanishing is a necessary and sufficient condition for the existence of a morphism of ringed spaces $X_{2}^{\prime} \rightarrow X_{1}^{\prime}$ fitting into (74.7.1.1) compatibly with $\nu$.
(2) If there exists a morphism $X_{2}^{\prime} \rightarrow X_{1}^{\prime}$ fitting into 74.7.1.1) compatibly with $\nu$ the set of all such morphisms is a principal homogeneous space under
$\operatorname{Hom}_{\mathcal{O}_{X_{1}}}\left(\Omega_{X_{1} / S_{1}}, g_{*} \mathcal{G}_{2}\right)=\operatorname{Hom}_{\mathcal{O}_{X_{2}}}\left(g^{*} \Omega_{X_{1} / S_{1}}, \mathcal{G}_{2}\right)=E x t_{\mathcal{O}_{X_{2}}}^{0}\left(L g^{*} N L_{X_{1} / S_{1}}, \mathcal{G}_{2}\right)$.
Proof. The naive cotangent complex $N L_{X_{1} / S_{1}}$ is defined in Modules, Definition 17.25.4 The equalities in the last statement of the lemma follow from the fact that $g^{*}$ is adjoint to $g_{*}$, the fact that $H^{0}\left(N L_{X_{1} / S_{1}}\right)=\Omega_{X_{1} / S_{1}}$ (by construction of the naive cotangent complex) and the fact that $L g^{*}$ is the left derived functor of $g^{*}$. Thus we will work with the groups $\operatorname{Ext}_{\mathcal{O}_{X_{2}}}^{k}\left(L g^{*} N L_{X_{1} / S_{1}}, \mathcal{G}_{2}\right), k=0,1$ in the rest of the proof. We first argue that we can reduce to the case where the underlying topological spaces of all ringed spaces in the lemma is the same.

To do this, observe that $g^{-1} N L_{X_{1} / S_{1}}$ is equal to the naive cotangent complex of the homomorphism of sheaves of rings $g^{-1} f_{1}^{-1} \mathcal{O}_{S_{1}} \rightarrow g^{-1} \mathcal{O}_{X_{1}}$, see Modules, Lemma 17.25.3. Moreover, the degree 0 term of $N L_{X_{1} / S_{1}}$ is a flat $\mathcal{O}_{X_{1}}$-module, hence the canonical map

$$
L g^{*} N L_{X_{1} / S_{1}} \longrightarrow g^{-1} N L_{X_{1} / S_{1}} \otimes_{g^{-1}} \mathcal{O}_{X_{1}} \mathcal{O}_{X_{2}}
$$

induces an isomorphism on cohomology sheaves in degrees 0 and -1 . Thus we may replace the Ext groups of the lemma with

$$
\operatorname{Ext}_{g^{-1} \mathcal{O}_{X_{1}}}^{k}\left(g^{-1} N L_{X_{1} / S_{1}}, \mathcal{G}_{2}\right)=\operatorname{Ext}_{g^{-1} \mathcal{O}_{X_{1}}}^{k}\left(N L_{\left.\left.g^{-1} \mathcal{O}_{X_{1} / g^{-1} f_{1}^{-1} \mathcal{O}_{S_{1}}}, \mathcal{G}_{2}\right), ~()^{2}\right)}\right.
$$

The set of morphism of ringed spaces $X_{2}^{\prime} \rightarrow X_{1}^{\prime}$ fitting into 74.7.1.1 compatibly with $\nu$ is in one-to-one bijection with the set of homomorphisms of $g^{-1} f_{1}^{-1} \mathcal{O}_{S_{1}^{\prime}}$ algebras $g^{-1} \mathcal{O}_{X_{1}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$ which are compatible with $f^{\sharp}$ and $\nu$. In this way we see that we may assume we have a diagram 74.7.1.2 of sheaves on $X$ and we are looking to find a homomorphism of sheaves of rings $\mathcal{O}_{X_{1}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$ fitting into it.
In the rest of the proof of the lemma we assume all underlying topological spaces are the same, i.e., we have a diagram (74.7.1.2) of sheaves on a space $X$ and we are looking for homomorphisms of sheaves of rings $\mathcal{O}_{X_{1}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$ fitting into it. As ext groups we will use $\operatorname{Ext}_{\mathcal{O}_{X_{1}}}^{k}\left(N L_{\mathcal{O}_{X_{1}} / \mathcal{O}_{S_{1}}}, \mathcal{G}_{2}\right), k=0,1$.
Step 1. Construction of the obstruction class. Consider the sheaf of sets

$$
\mathcal{E}=\mathcal{O}_{X_{1}^{\prime}} \times{ }_{\mathcal{O}_{X_{2}}} \mathcal{O}_{X_{2}^{\prime}}
$$

This comes with a surjective map $\alpha: \mathcal{E} \rightarrow \mathcal{O}_{X_{1}}$ and hence we can use $N L(\alpha)$ instead of $N L_{\mathcal{O}_{X_{1}} / \mathcal{O}_{S_{1}}}$, see Modules, Lemma 17.25 .2 . Set

$$
\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{X_{1}}\right) \quad \text { and } \quad \mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{S_{1}}[\mathcal{E}] \rightarrow \mathcal{O}_{X_{1}}\right)
$$

There is a surjection $\mathcal{I}^{\prime} \rightarrow \mathcal{I}$ whose kernel is $\mathcal{J}_{1} \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}]$. We obtain two homomorphisms of $\mathcal{O}_{S_{2}^{\prime}}$-algebras

$$
a: \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{X_{1}^{\prime}} \quad \text { and } \quad b: \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{X_{2}^{\prime}}
$$

which induce maps $\left.a\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}_{1}$ and $\left.b\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}_{2}$. Both $a$ and $b$ annihilate $\left(\mathcal{I}^{\prime}\right)^{2}$. Moreover $a$ and $b$ agree on $\mathcal{J}_{1} \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}]$ as maps into $\mathcal{G}_{2}$ because the left hand
square of 74.7 .1 .2 is commutative. Thus the difference $\left.b\right|_{\mathcal{I}^{\prime}}-\left.\nu \circ a\right|_{\mathcal{I}^{\prime}}$ induces a well defined $\mathcal{O}_{X_{1}}$-linear map

$$
\xi: \mathcal{I} / \mathcal{I}^{2} \longrightarrow \mathcal{G}_{2}
$$

which sends the class of a local section $f$ of $\mathcal{I}$ to $a\left(f^{\prime}\right)-\nu\left(b\left(f^{\prime}\right)\right)$ where $f^{\prime}$ is a lift of $f$ to a local section of $\mathcal{I}^{\prime}$. We let $[\xi] \in \operatorname{Ext}_{\mathcal{O}_{X_{1}}}^{1}\left(N L(\alpha), \mathcal{G}_{2}\right)$ be the image (see below).
Step 2. Vanishing of [ $\xi]$ is necessary. Let us write $\Omega=\Omega_{\mathcal{O}_{S_{1}}[\mathcal{E}] / \mathcal{O}_{S_{1}}} \otimes_{\mathcal{O}_{S_{1}}[\mathcal{E}]} \mathcal{O}_{X_{1}}$. Observe that $N L(\alpha)=\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega\right)$ fits into a distinguished triangle

$$
\Omega[0] \rightarrow N L(\alpha) \rightarrow \mathcal{I} / \mathcal{I}^{2}[1] \rightarrow \Omega[1]
$$

Thus we see that $[\xi]$ is zero if and only if $\xi$ is a composition $\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega \rightarrow \mathcal{G}_{2}$ for some map $\Omega \rightarrow \mathcal{G}_{2}$. Suppose there exists a homomorphisms of sheaves of rings $\varphi: \mathcal{O}_{X_{1}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$ fitting into 74.7 .1 .2 . In this case consider the map $\mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{G}_{2}$, $f^{\prime} \mapsto b\left(f^{\prime}\right)-\varphi\left(a\left(f^{\prime}\right)\right)$. A calculation shows this annihilates $\mathcal{J}_{1} \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}]$ and induces a derivation $\mathcal{O}_{S_{1}}[\mathcal{E}] \rightarrow \mathcal{G}_{2}$. The resulting linear map $\Omega \rightarrow \mathcal{G}_{2}$ witnesses the fact that $[\xi]=0$ in this case.
Step 3. Vanishing of $[\xi]$ is sufficient. Let $\theta: \Omega \rightarrow \mathcal{G}_{2}$ be a $\mathcal{O}_{X_{1}}$-linear map such that $\xi$ is equal to $\theta \circ\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega\right)$. Then a calculation shows that

$$
b+\theta \circ d: \mathcal{O}_{S_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{X_{2}^{\prime}}
$$

annihilates $\mathcal{I}^{\prime}$ and hence defines a map $\mathcal{O}_{X_{1}^{\prime}} \rightarrow \mathcal{O}_{X_{2}^{\prime}}$ fitting into 74.7.1.2.
Proof of (2) in the special case above. Omitted. Hint: This is exactly the same as the proof of (2) of Lemma 74.2.1.

08UB Lemma 74.7.2. Let $X$ be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let $\mathcal{G}$ be a $\mathcal{B}$-module. Let $\xi \in \operatorname{Ext}_{\mathcal{B}}^{1}\left(N L_{\mathcal{B} / \mathcal{A}}, \mathcal{G}\right)$. There exists a map of sheaves of sets $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ such that $\xi \in \operatorname{Ext}_{\mathcal{B}}^{1}(N L(\alpha), \mathcal{G})$ is the class of $a$ map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$ (see proof for notation).
Proof. Recall that given $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ such that $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$ is surjective with kernel $\mathcal{I}$ the complex $N L(\alpha)=\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}\right)$ is canonically isomorphic to $N L_{\mathcal{B} / \mathcal{A}}$, see Modules, Lemma 17.25 .2 . Observe moreover, that $\Omega=\Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{e \in \mathcal{E}(U)} \mathcal{B}(U)$. In other words, $\Omega$ is the free $\mathcal{B}$-module on the sheaf of sets $\mathcal{E}$ and in particular there is a canonical map $\mathcal{E} \rightarrow \Omega$.

Having said this, pick some $\mathcal{E}$ (for example $\mathcal{E}=\mathcal{B}$ as in the definition of the naive cotangent complex). The obstruction to writing $\xi$ as the class of a $\operatorname{map} \mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$ is an element in $\operatorname{Ext}_{\mathcal{B}}^{1}(\Omega, \mathcal{G})$. Say this is represented by the extension $0 \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow$ $\Omega \rightarrow 0$ of $\mathcal{B}$-modules. Consider the sheaf of sets $\mathcal{E}^{\prime}=\mathcal{E} \times{ }_{\Omega} \mathcal{H}$ which comes with an induced map $\alpha^{\prime}: \mathcal{E}^{\prime} \rightarrow \mathcal{B}$. Let $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{A}\left[\mathcal{E}^{\prime}\right] \rightarrow \mathcal{B}\right)$ and $\Omega^{\prime}=\Omega_{\mathcal{A}\left[\mathcal{E}^{\prime}\right] / \mathcal{A}} \otimes_{\mathcal{A}\left[\mathcal{E}^{\prime}\right]} \mathcal{B}$. The pullback of $\xi$ under the quasi-isomorphism $N L\left(\alpha^{\prime}\right) \rightarrow N L(\alpha)$ maps to zero in $\operatorname{Ext}_{\mathcal{B}}^{1}\left(\Omega^{\prime}, \mathcal{G}\right)$ because the pullback of the extension $\mathcal{H}$ by the map $\Omega^{\prime} \rightarrow \Omega$ is split as $\Omega^{\prime}$ is the free $\mathcal{B}$-module on the sheaf of sets $\mathcal{E}^{\prime}$ and since by construction there is a commutative diagram

This finishes the proof.
08UC Lemma 74.7.3. If there exists a solution to 74.7.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / S}, \mathcal{G}\right)$.

Proof. We observe right away that given two solutions $X_{1}^{\prime}$ and $X_{2}^{\prime}$ to 74.7.0.1 we obtain by Lemma 74.7.1 an obstruction element $o\left(X_{1}^{\prime}, X_{2}^{\prime}\right) \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / S}, \mathcal{G}\right)$ to the existence of a map $X_{1}^{\prime} \rightarrow X_{2}^{\prime}$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution $X^{\prime}$ and an element $\xi \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / S}, \mathcal{G}\right)$ we can find a second solution $X_{\xi}^{\prime}$ such that $o\left(X^{\prime}, X_{\xi}^{\prime}\right)=\xi$.

Pick $\alpha: \mathcal{E} \rightarrow \mathcal{O}_{X}$ as in Lemma 74.7 .2 for the class $\xi$. Consider the surjection $f^{-1} \mathcal{O}_{S}[\mathcal{E}] \rightarrow \mathcal{O}_{X}$ with kernel $\mathcal{I}$ and corresponding naive cotangent complex $N L(\alpha)=\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{f^{-1} \mathcal{O}_{S}[\mathcal{E}] / f^{-1} \mathcal{O}_{S}} \otimes_{f^{-1}} \mathcal{O}_{S}[\mathcal{E}] \mathcal{O}_{X}\right)$. By the lemma $\xi$ is the class of a morphism $\delta: \mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$. After replacing $\mathcal{E}$ by $\mathcal{E} \times \mathcal{O}_{X} \mathcal{O}_{X^{\prime}}$ we may also assume that $\alpha$ factors through a map $\alpha^{\prime}: \mathcal{E} \rightarrow \mathcal{O}_{X^{\prime}}$.

These choices determine an $f^{-1} \mathcal{O}_{S^{\prime}}$-algebra map $\varphi: \mathcal{O}_{S^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{X^{\prime}}$. Let $\mathcal{I}^{\prime}=$ $\operatorname{Ker}(\varphi)$. Observe that $\varphi$ induces a $\left.\operatorname{map} \varphi\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}$ and that $\mathcal{O}_{X^{\prime}}$ is the pushout, as in the following diagram

Let $\psi: \mathcal{I}^{\prime} \rightarrow \mathcal{G}$ be the sum of the map $\left.\varphi\right|_{\mathcal{I}^{\prime}}$ and the composition

$$
\mathcal{I}^{\prime} \rightarrow \mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2} \rightarrow \mathcal{I} / \mathcal{I}^{2} \xrightarrow{\delta} \mathcal{G}
$$

Then the pushout along $\psi$ is an other ring extension $\mathcal{O}_{X_{\xi}^{\prime}}$ fitting into a diagram as above. A calculation (omitted) shows that $o\left(X^{\prime}, X_{\xi}^{\prime}\right)=\xi$ as desired.

08UD Lemma 74.7.4. Let $\left(S, \mathcal{O}_{S}\right)$ be a ringed space and let $\mathcal{J}$ be an $\mathcal{O}_{S}$-module.
(1) The set of extensions of sheaves of rings $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{S^{\prime}} \rightarrow \mathcal{O}_{S} \rightarrow 0$ where $\mathcal{J}$ is an ideal of square zero is canonically bijective to $\operatorname{Ext}_{\mathcal{O}_{S}}^{1}\left(N L_{S / \mathbf{Z}}, \mathcal{J}\right)$.
(2) Given a morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$, an $\mathcal{O}_{X}$-module $\mathcal{G}$, an $f$-map $c: \mathcal{J} \rightarrow \mathcal{G}$, and given extensions of sheaves of rings with square zero kernels:
(a) $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{S^{\prime}} \rightarrow \mathcal{O}_{S} \rightarrow 0$ corresponding to $\alpha \in \operatorname{Ext}_{\mathcal{O}_{S}}^{1}\left(N L_{S / \mathbf{Z}}, \mathcal{J}\right)$,
(b) $0 \rightarrow \mathcal{G} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0$ corresponding to $\beta \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / \mathbf{Z}}, \mathcal{G}\right)$ then there is a morphism $X^{\prime} \rightarrow S^{\prime}$ fitting into a diagram (74.7.0.1) if and only if $\beta$ and $\alpha$ map to the same element of $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} N L_{S / \mathbf{Z}}, \mathcal{G}\right)$.

Proof. To prove this we apply the previous results where we work over the base ringed space ( $*, \mathbf{Z}$ ) with trivial thickening. Part (1) follows from Lemma 74.7 .3 and the fact that there exists a solution, namely $\mathcal{J} \oplus \mathcal{O}_{S}$. Part (2) follows from Lemma 74.7.1 and a compatibility between the constructions in the proofs of Lemmas 74.7.3 and 74.7 .1 whose statement and proof we omit.

### 74.8. Thickenings of ringed topoi

08M6 This section is the analogue of Section 74.3 for ringed topoi. In the following few sections we will use the following notions:
(1) A sheaf of ideals $\mathcal{I} \subset \mathcal{O}^{\prime}$ on a ringed topos $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ is locally nilpotent if any local section of $\mathcal{I}$ is locally nilpotent.
(2) A thickening of ringed topoi is a morphism $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ of ringed topoi such that
(a) $i_{*}$ is an equivalence $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$,
(b) the map $i^{\sharp}: \mathcal{O}^{\prime} \rightarrow i_{*} \mathcal{O}$ is surjective, and
(c) the kernel of $i^{\sharp}$ is a locally nilpotent sheaf of ideals.
(3) A first order thickening of ringed topoi is a thickening $i:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow$ $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ of ringed topoi such that $\operatorname{Ker}\left(i^{\sharp}\right)$ has square zero.
(4) It is clear how to define morphisms of thickenings of ringed topoi, morphisms of thickenings of ringed topoi over a base ringed topos, etc.
If $i:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ is a thickening of ringed topoi then we identify the underlying topoi and think of $\mathcal{O}, \mathcal{O}^{\prime}$, and $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$ as sheaves on $\mathcal{C}$. We obtain a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0
$$

of $\mathcal{O}^{\prime}$-modules. By Modules on Sites, Lemma 18.25 .1 the category of $\mathcal{O}$-modules is equivalent to the category of $\mathcal{O}^{\prime}$-modules annihilated by $\mathcal{I}$. In particular, if $i$ is a first order thickening, then $\mathcal{I}$ is a $\mathcal{O}$-module.
08M7 Situation 74.8.1. A morphism of thickenings of ringed topoi $\left(f, f^{\prime}\right)$ is given by a commutative diagram

08M8

of ringed topoi whose horizontal arrows are thickenings. In this situation we set $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}^{\prime}$ and $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right) \subset \mathcal{O}_{\mathcal{B}^{\prime}}$. As $f=f^{\prime}$ on underlying topoi we will identify the pullback functors $f^{-1}$ and $\left(f^{\prime}\right)^{-1}$. Observe that $\left(f^{\prime}\right)^{\sharp}: f^{-1} \mathcal{O}_{\mathcal{B}^{\prime}} \rightarrow \mathcal{O}^{\prime}$ induces in particular a map $f^{-1} \mathcal{J} \rightarrow \mathcal{I}$ and therefore a map of $\mathcal{O}^{\prime}$-modules

$$
\left(f^{\prime}\right)^{*} \mathcal{J} \longrightarrow \mathcal{I}
$$

If $i$ and $t$ are first order thickenings, then $\left(f^{\prime}\right)^{*} \mathcal{J}=f^{*} \mathcal{J}$ and the map above becomes a $\operatorname{map} f^{*} \mathcal{J} \rightarrow \mathcal{I}$.

08M9 Definition 74.8.2. In Situation 74.8.1 we say that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings if the $\operatorname{map}\left(f^{\prime}\right)^{*} \mathcal{J} \longrightarrow \mathcal{I}$ is surjective.

### 74.9. Modules on first order thickenings of ringed topoi

08MA In this section we discuss some preliminaries to the deformation theory of modules. Let $i:\left(S h(\mathcal{C}, \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)\right.$ be a first order thickening of ringed topoi. We will freely use the notation introduced in Section 74.8, in particular we will identify the underlying topological topoi. In this section we consider short exact sequences
08MB

$$
\begin{equation*}
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \tag{74.9.0.1}
\end{equation*}
$$

of $\mathcal{O}^{\prime}$-modules, where $\mathcal{F}, \mathcal{K}$ are $\mathcal{O}$-modules and $\mathcal{F}^{\prime}$ is an $\mathcal{O}^{\prime}$-module. In this situation we have a canonical $\mathcal{O}$-module map

$$
c_{\mathcal{F}^{\prime}}: \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \longrightarrow \mathcal{K}
$$

where $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$. Namely, given local sections $f$ of $\mathcal{I}$ and $s$ of $\mathcal{F}$ we set $c_{\mathcal{F}^{\prime}}(f \otimes s)=$ $f s^{\prime}$ where $s^{\prime}$ is a local section of $\mathcal{F}^{\prime}$ lifting $s$.

08 MC Lemma 74.9.1. Let $i:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

as in 74.9.0.1 and maps $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\psi: \mathcal{K} \rightarrow \mathcal{L}$.
(1) If there exists an $\mathcal{O}^{\prime}$-module map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$, then the diagram

is commutative.
(2) The set of $\mathcal{O}^{\prime}$-module maps $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$ is, if nonempty, a principal homogeneous space under $\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{L})$.

Proof. Part (1) is immediate from the description of the maps. For (2), if $\varphi^{\prime}$ and $\varphi^{\prime \prime}$ are two maps $\mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$, then $\varphi^{\prime}-\varphi^{\prime \prime}$ factors as

$$
\mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime}
$$

The map in the middle comes from a unique element of $\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{L})$ by Modules on Sites, Lemma 18.25.1. Conversely, given an element $\alpha$ of this group we can add the composition (as displayed above with $\alpha$ in the middle) to $\varphi^{\prime}$. Some details omitted.

08 MD Lemma 74.9.2. Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{L} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

as in 74.9.0.1) and maps $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ and $\psi: \mathcal{K} \rightarrow \mathcal{L}$. Assume the diagram

is commutative. Then there exists an element

$$
o(\varphi, \psi) \in E x t_{\mathcal{O}}^{1}(\mathcal{F}, \mathcal{L})
$$

whose vanishing is a necessary and sufficient condition for the existence of a map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ compatible with $\varphi$ and $\psi$.

Proof. We can construct explicitly an extension

$$
0 \rightarrow \mathcal{L} \rightarrow \mathcal{H} \rightarrow \mathcal{F} \rightarrow 0
$$

by taking $\mathcal{H}$ to be the cohomology of the complex

$$
\mathcal{K} \xrightarrow{1,-\psi} \mathcal{F}^{\prime} \oplus \mathcal{G}^{\prime} \xrightarrow{\varphi, 1} \mathcal{G}
$$

in the middle (with obvious notation). A calculation with local sections using the assumption that the diagram of the lemma commutes shows that $\mathcal{H}$ is annihilated by $\mathcal{I}$. Hence $\mathcal{H}$ defines a class in

$$
\operatorname{Ext}_{\mathcal{O}}^{1}(\mathcal{F}, \mathcal{L}) \subset \operatorname{Ext}_{\mathcal{O}^{\prime}}^{1}(\mathcal{F}, \mathcal{L})
$$

Finally, the class of $\mathcal{H}$ is the difference of the pushout of the extension $\mathcal{F}^{\prime}$ via $\psi$ and the pullback of the extension $\mathcal{G}^{\prime}$ via $\varphi$ (calculations omitted). Thus the vanishing of the class of $\mathcal{H}$ is equivalent to the existence of a commutative diagram

as desired.
08ME Lemma 74.9.3. Let $i:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Assume given $\mathcal{O}$-modules $\mathcal{F}, \mathcal{K}$ and an $\mathcal{O}$-linear map $c: \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$. If there exists a sequence (74.9.0.1) with $c_{\mathcal{F}^{\prime}}=c$ then the set of isomorphism classes of these extensions is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}}^{1}(\mathcal{F}, \mathcal{K})$.

Proof. Assume given extensions

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{1}^{\prime} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

with $c_{\mathcal{F}_{1}^{\prime}}=c_{\mathcal{F}_{2}^{\prime}}=c$. Then the difference (in the extension group, see Homology, Section 12.6 is an extension

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0
$$

where $\mathcal{E}$ is annihilated by $\mathcal{I}$ (local computation omitted). Hence the sequence is an extension of $\mathcal{O}$-modules, see Modules on Sites, Lemma 18.25.1. Conversely, given such an extension $\mathcal{E}$ we can add the extension $\mathcal{E}$ to the $\mathcal{O}^{\prime}$-extension $\mathcal{F}^{\prime}$ without affecting the map $c_{\mathcal{F}^{\prime}}$. Some details omitted.

08MF Lemma 74.9.4. Let $i:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Assume given $\mathcal{O}$-modules $\mathcal{F}, \mathcal{K}$ and an $\mathcal{O}$-linear map $c: \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$. Then there exists an element

$$
o(\mathcal{F}, \mathcal{K}, c) \in E x t_{\mathcal{O}}^{2}(\mathcal{F}, \mathcal{K})
$$

whose vanishing is a necessary and sufficient condition for the existence of a sequence (74.9.0.1) with $c_{\mathcal{F}^{\prime}}=c$.
Proof. We first show that if $\mathcal{K}$ is an injective $\mathcal{O}$-module, then there does exist a sequence 74.9 .0 .1 with $c_{\mathcal{F}^{\prime}}=c$. To do this, choose a flat $\mathcal{O}^{\prime}$-module $\mathcal{H}^{\prime}$ and a surjection $\mathcal{H}^{\prime} \rightarrow \mathcal{F}$ (Modules on Sites, Lemma 18.28.6). Let $\mathcal{J} \subset \mathcal{H}^{\prime}$ be the kernel. Since $\mathcal{H}^{\prime}$ is flat we have

$$
\mathcal{I} \otimes_{\mathcal{O}^{\prime}} \mathcal{H}^{\prime}=\mathcal{I} \mathcal{H}^{\prime} \subset \mathcal{J} \subset \mathcal{H}^{\prime}
$$

Observe that the map

$$
\mathcal{I} \mathcal{H}^{\prime}=\mathcal{I} \otimes_{\mathcal{O}^{\prime}} \mathcal{H}^{\prime} \longrightarrow \mathcal{I} \otimes_{\mathcal{O}^{\prime}} \mathcal{F}=\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}
$$

annihilates $\mathcal{I} \mathcal{J}$. Namely, if $f$ is a local section of $\mathcal{I}$ and $s$ is a local section of $\mathcal{H}$, then $f s$ is mapped to $f \otimes \bar{s}$ where $\bar{s}$ is the image of $s$ in $\mathcal{F}$. Thus we obtain

a diagram of $\mathcal{O}$-modules. If $\mathcal{K}$ is injective as an $\mathcal{O}$-module, then we obtain the dotted arrow. Denote $\gamma^{\prime}: \mathcal{J} \rightarrow \mathcal{K}$ the composition of $\gamma$ with $\mathcal{J} \rightarrow \mathcal{J} / \mathcal{I} \mathcal{J}$. A local calculation shows the pushout

is a solution to the problem posed by the lemma.
General case. Choose an embedding $\mathcal{K} \subset \mathcal{K}^{\prime}$ with $\mathcal{K}^{\prime}$ an injective $\mathcal{O}$-module. Let $\mathcal{Q}$ be the quotient, so that we have an exact sequence

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{K}^{\prime} \rightarrow \mathcal{Q} \rightarrow 0
$$

Denote $c^{\prime}: \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}^{\prime}$ be the composition. By the paragraph above there exists a sequence

$$
0 \rightarrow \mathcal{K}^{\prime} \rightarrow \mathcal{E}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.9.0.1 with $c_{\mathcal{E}^{\prime}}=c^{\prime}$. Note that $c^{\prime}$ composed with the map $\mathcal{K}^{\prime} \rightarrow \mathcal{Q}$ is zero, hence the pushout of $\mathcal{E}^{\prime}$ by $\mathcal{K}^{\prime} \rightarrow \mathcal{Q}$ is an extension

$$
0 \rightarrow \mathcal{Q} \rightarrow \mathcal{D}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.9.0.1 with $c_{\mathcal{D}^{\prime}}=0$. This means exactly that $\mathcal{D}^{\prime}$ is annihilated by $\mathcal{I}$, in other words, the $\mathcal{D}^{\prime}$ is an extension of $\mathcal{O}$-modules, i.e., defines an element

$$
o(\mathcal{F}, \mathcal{K}, c) \in \operatorname{Ext}_{\mathcal{O}}^{1}(\mathcal{F}, \mathcal{Q})=\operatorname{Ext}_{\mathcal{O}}^{2}(\mathcal{F}, \mathcal{K})
$$

(the equality holds by the long exact cohomology sequence associated to the exact sequence above and the vanishing of higher ext groups into the injective module $\left.\mathcal{K}^{\prime}\right)$. If $o(\mathcal{F}, \mathcal{K}, c)=0$, then we can choose a splitting $s: \mathcal{F} \rightarrow \mathcal{D}^{\prime}$ and we can set

$$
\mathcal{F}^{\prime}=\operatorname{Ker}\left(\mathcal{E}^{\prime} \rightarrow \mathcal{D}^{\prime} / s(\mathcal{F})\right)
$$

so that we obtain the following diagram

with exact rows which shows that $c_{\mathcal{F}^{\prime}}=c$. Conversely, if $\mathcal{F}^{\prime}$ exists, then the pushout of $\mathcal{F}^{\prime}$ by the map $\mathcal{K} \rightarrow \mathcal{K}^{\prime}$ is isomorphic to $\mathcal{E}^{\prime}$ by Lemma 74.9.3 and the vanishing of higher ext groups into the injective module $\mathcal{K}^{\prime}$. This gives a diagram as above, which implies that $\mathcal{D}^{\prime}$ is split as an extension, i.e., the class $o(\mathcal{F}, \mathcal{K}, c)$ is zero.

08MG Remark 74.9.5. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. A first order thickening $i$ : $(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ is said to be trivial if there exists a morphism of ringed topoi $\pi:\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right) \rightarrow(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ which is a left inverse to $i$. The choice of such a morphism $\pi$ is called a trivialization of the first order thickening. Given $\pi$ we obtain a splitting

08MH (74.9.5.1)

$$
\mathcal{O}^{\prime}=\mathcal{O} \oplus \mathcal{I}
$$

as sheaves of algebras on $\mathcal{C}$ by using $\pi^{\sharp}$ to split the surjection $\mathcal{O}^{\prime} \rightarrow \mathcal{O}$. Conversely, such a splitting determines a morphism $\pi$. The category of trivialized first order thickenings of $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ is equivalent to the category of $\mathcal{O}$-modules.

08 MI Remark 74.9.6. Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a trivial first order thickening of ringed topoi and let $\pi:\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ be a trivialization. Then given any triple $(\mathcal{F}, \mathcal{K}, c)$ consisting of a pair of $\mathcal{O}$-modules and a map $c: \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}$ we may set

$$
\mathcal{F}_{c, \text { triv }}^{\prime}=\mathcal{F} \oplus \mathcal{K}
$$

and use the splitting 74.9.5.1 associated to $\pi$ and the map $c$ to define the $\mathcal{O}^{\prime}$ module structure and obtain an extension 74.9 .0 .1 . We will call $\mathcal{F}_{c, \text { triv }}^{\prime}$ the trivial extension of $\mathcal{F}$ by $\mathcal{K}$ corresponding to $c$ and the trivialization $\pi$. Given any extension $\mathcal{F}^{\prime}$ as in 74.9.0.1 we can use $\pi^{\sharp}: \mathcal{O} \rightarrow \mathcal{O}^{\prime}$ to think of $\mathcal{F}^{\prime}$ as an $\mathcal{O}$-module extension, hence a class $\xi_{\mathcal{F}^{\prime}}$ in $\operatorname{Ext}^{1}{ }_{\mathcal{O}}(\mathcal{F}, \mathcal{K})$. Lemma 74.9 .3 assures that $\mathcal{F}^{\prime} \mapsto \xi_{\mathcal{F}^{\prime}}$ induces a bijection

$$
\left\{\begin{array}{c}
\text { isomorphism classes of extensions } \\
\mathcal{F}^{\prime} \text { as in }
\end{array}\right\} \longrightarrow \operatorname{Ext}_{\mathcal{O}}^{1}(\mathcal{F}, \mathcal{K})
$$

Moreover, the trivial extension $\mathcal{F}_{c, \text { triv }}^{\prime}$ maps to the zero class.
08MJ Remark 74.9.7. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{D}_{i}\right), \mathcal{O}_{i}^{\prime}\right)$, $i=1,2$ be first order thickenings with ideal sheaves $\mathcal{I}_{i}$. Let $h:\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow$ $\left(\operatorname{Sh}\left(\mathcal{D}_{2}\right), \mathcal{O}_{2}^{\prime}\right)$ be a morphism of first order thickenings of $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$. Picture

Observe that $h^{\sharp}: \mathcal{O}_{2}^{\prime} \rightarrow \mathcal{O}_{1}^{\prime}$ in particular induces an $\mathcal{O}$-module map $\mathcal{I}_{2} \rightarrow \mathcal{I}_{1}$. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Let $\left(\mathcal{K}_{i}, c_{i}\right), i=1,2$ be a pair consisting of an $\mathcal{O}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume furthermore given a map of $\mathcal{O}$-modules $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ such that

is commutative. Then there is a canonical functoriality

$$
\left\{\begin{array}{c}
\mathcal{F}_{2}^{\prime} \text { as in } 74.9 .0 .1 \text { with } \\
c_{2}=c_{\mathcal{F}_{2}^{\prime}} \text { and } \mathcal{K}=\mathcal{K}_{2}
\end{array}\right\} \rightarrow\left\{\begin{array}{c}
\mathcal{F}_{1}^{\prime} \text { as in } 74.9 .0 .1 \text { with } \\
c_{1}=c_{\mathcal{F}_{1}^{\prime}} \text { and } \mathcal{K}=\mathcal{K}_{1}
\end{array}\right\}
$$

Namely, thinking of all sheaves $\mathcal{O}, \mathcal{O}_{i}^{\prime}, \mathcal{F}, \mathcal{K}_{i}$, etc as sheaves on $\mathcal{C}$, we set given $\mathcal{F}_{2}^{\prime}$ the sheaf $\mathcal{F}_{1}^{\prime}$ equal to the pushout, i.e., fitting into the following diagram of extensions

We omit the construction of the $\mathcal{O}_{1}^{\prime}$-module structure on the pushout (this uses the commutativity of the diagram involving $c_{1}$ and $c_{2}$ ).
08MK Remark 74.9.8. Let $(\operatorname{Sh}(\mathcal{C}), \mathcal{O}),(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{D}_{i}\right), \mathcal{O}_{i}^{\prime}\right), \mathcal{I}_{i}$, and $h:\left(\operatorname{Sh}\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow$ $\left(\operatorname{Sh}\left(\mathcal{D}_{2}\right), \mathcal{O}_{2}^{\prime}\right)$ be as in Remark 74.9.7. Assume that we are given given trivializations $\pi_{i}:\left(\operatorname{Sh}\left(\mathcal{D}_{i}\right), \mathcal{O}_{i}^{\prime}\right) \rightarrow(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ such that $\pi_{1}=h \circ \pi_{2}$. In other words, assume $h$ is a morphism of trivialized first order thickenings of $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$. Let $\left(\mathcal{K}_{i}, c_{i}\right), i=1,2$ be a pair consisting of an $\mathcal{O}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume furthermore given a map of $\mathcal{O}$-modules $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ such that

is commutative. In this situation the construction of Remark 74.9.6 induces a commutative diagram

where the vertical map on the right is given by functoriality of Ext and the map $\mathcal{K}_{2} \rightarrow \mathcal{K}_{1}$ and the vertical map on the left is the one from Remark 74.9.7.

08ML Remark 74.9.9. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. We define a sequence of morphisms of first order thickenings

$$
\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{D}_{2}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{D}_{3}\right), \mathcal{O}_{3}^{\prime}\right)
$$

of $(S h(\mathcal{C}), \mathcal{O})$ to be a complex if the corresponding maps between the ideal sheaves $\mathcal{I}_{i}$ give a complex of $\mathcal{O}$-modules $\mathcal{I}_{3} \rightarrow \mathcal{I}_{2} \rightarrow \mathcal{I}_{1}$ (i.e., the composition is zero). In this case the composition $\left(\operatorname{Sh}\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{D}_{3}\right), \mathcal{O}_{3}^{\prime}\right)$ factors through $(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow$ $\left(\operatorname{Sh}\left(\mathcal{D}_{3}\right), \mathcal{O}_{3}^{\prime}\right)$, i.e., the first order thickening $\left(\operatorname{Sh}\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right)$ of $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ is trivial and comes with a canonical trivialization $\pi:\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$.
We say a sequence of morphisms of first order thickenings

$$
\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{D}_{2}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{D}_{3}\right), \mathcal{O}_{3}^{\prime}\right)
$$

of $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ is a short exact sequence if the corresponding maps between ideal sheaves is a short exact sequence

$$
0 \rightarrow \mathcal{I}_{3} \rightarrow \mathcal{I}_{2} \rightarrow \mathcal{I}_{1} \rightarrow 0
$$

of $\mathcal{O}$-modules.

08 MM Remark 74.9.10. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Let

$$
\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{D}_{2}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{D}_{3}\right), \mathcal{O}_{3}^{\prime}\right)
$$

be a complex first order thickenings of $(S h(\mathcal{C}), \mathcal{O})$, see Remark 74.9.9. Let $\left(\mathcal{K}_{i}, c_{i}\right)$, $i=1,2,3$ be pairs consisting of an $\mathcal{O}$-module $\mathcal{K}_{i}$ and a map $c_{i}: \mathcal{I}_{i} \otimes \mathcal{O} \mathcal{F} \rightarrow \mathcal{K}_{i}$. Assume given a short exact sequence of $\mathcal{O}$-modules

$$
0 \rightarrow \mathcal{K}_{3} \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{K}_{1} \rightarrow 0
$$

such that

are commutative. Finally, assume given an extension

$$
0 \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

as in 74.9.0.1 with $\mathcal{K}=\mathcal{K}_{2}$ of $\mathcal{O}_{2}^{\prime}$-modules with $c_{\mathcal{F}_{2}^{\prime}}=c_{2}$. In this situation we can apply the functoriality of Remark 74.9 .7 to obtain an extension $\mathcal{F}_{1}^{\prime}$ of $\mathcal{O}_{1}^{\prime-}$ modules (we'll describe $\mathcal{F}_{1}^{\prime}$ in this special case below). By Remark 74.9.6 using the canonical splitting $\pi:\left(S h\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ of Remark 74.9.9 we obtain $\xi_{\mathcal{F}_{1}^{\prime}} \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, \mathcal{K}_{1}\right)$. Finally, we have the obstruction

$$
o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right) \in \operatorname{Ext}_{\mathcal{O}}^{2}\left(\mathcal{F}, \mathcal{K}_{3}\right)
$$

see Lemma 74.9.4. In this situation we claim that the canonical map

$$
\partial: \operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, \mathcal{K}_{1}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}}^{2}\left(\mathcal{F}, \mathcal{K}_{3}\right)
$$

coming from the short exact sequence $0 \rightarrow \mathcal{K}_{3} \rightarrow \mathcal{K}_{2} \rightarrow \mathcal{K}_{1} \rightarrow 0$ sends $\xi_{\mathcal{F}_{1}^{\prime}}$ to the obstruction class $o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right)$.

To prove this claim choose an embedding $j: \mathcal{K}_{3} \rightarrow \mathcal{K}$ where $\mathcal{K}$ is an injective $\mathcal{O}$ module. We can lift $j$ to a map $j^{\prime}: \mathcal{K}_{2} \rightarrow \mathcal{K}$. Set $\mathcal{E}_{2}^{\prime}=j_{*}^{\prime} \mathcal{F}_{2}^{\prime}$ equal to the pushout of $\mathcal{F}_{2}^{\prime}$ by $j^{\prime}$ so that $c_{\mathcal{E}_{2}^{\prime}}=j^{\prime} \circ c_{2}$. Picture:

Set $\mathcal{E}_{3}^{\prime}=\mathcal{E}_{2}^{\prime}$ but viewed as an $\mathcal{O}_{3}^{\prime}$-module via $\mathcal{O}_{3}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$. Then $c_{\mathcal{E}_{3}^{\prime}}=j \circ c_{3}$. The proof of Lemma 74.9 .4 constructs $o\left(\mathcal{F}, \mathcal{K}_{3}, c_{3}\right)$ as the boundary of the class of the extension of $\mathcal{O}$-modules

$$
0 \rightarrow \mathcal{K} / \mathcal{K}_{3} \rightarrow \mathcal{E}_{3}^{\prime} / \mathcal{K}_{3} \rightarrow \mathcal{F} \rightarrow 0
$$

On the other hand, note that $\mathcal{F}_{1}^{\prime}=\mathcal{F}_{2}^{\prime} / \mathcal{K}_{3}$ hence the class $\xi_{\mathcal{F}_{1}^{\prime}}$ is the class of the extension

$$
0 \rightarrow \mathcal{K}_{2} / \mathcal{K}_{3} \rightarrow \mathcal{F}_{2}^{\prime} / \mathcal{K}_{3} \rightarrow \mathcal{F} \rightarrow 0
$$

seen as a sequence of $\mathcal{O}$-modules using $\pi^{\sharp}$ where $\pi:\left(\operatorname{Sh}\left(\mathcal{D}_{1}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ is the canonical splitting. Thus finally, the claim follows from the fact that we have a commutative diagram

which is $\mathcal{O}$-linear (with the $\mathcal{O}$-module structures given above).

### 74.10. Infinitesimal deformations of modules on ringed topi

08 MN Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. We freely use the notation introduced in Section 74.8. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}^{\prime}$-module and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. In this situation we have a short exact sequence

$$
0 \rightarrow \mathcal{I F}^{\prime} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

of $\mathcal{O}^{\prime}$-modules. Since $\mathcal{I}^{2}=0$ the $\mathcal{O}^{\prime}$-module structure on $\mathcal{I F ^ { \prime }}$ comes from a unique $\mathcal{O}$-module structure. Thus the sequence above is an extension as in 74.9.0.1). As a special case, if $\mathcal{F}^{\prime}=\mathcal{O}^{\prime}$ we have $i^{*} \mathcal{O}^{\prime}=\mathcal{O}$ and $\mathcal{I} \mathcal{O}^{\prime}=\mathcal{I}$ and we recover the sequence of structure sheaves

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0
$$

08 MP Lemma 74.10.1. Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Let $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ be $\mathcal{O}^{\prime}$-modules. Set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}$-linear map. The set of lifts of $\varphi$ to an $\mathcal{O}^{\prime}$-linear map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ is, if nonempty, a principal homogeneous space under $\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{I} \mathcal{G}^{\prime}\right)$.

Proof. This is a special case of Lemma 74.9.1 but we also give a direct proof. We have short exact sequences of modules

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{I} \mathcal{G}^{\prime} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G} \rightarrow 0
$$

and similarly for $\mathcal{F}^{\prime}$. Since $\mathcal{I}$ has square zero the $\mathcal{O}^{\prime}$-module structure on $\mathcal{I}$ and $\mathcal{I} \mathcal{G}^{\prime}$ comes from a unique $\mathcal{O}$-module structure. It follows that

$$
\operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{I} \mathcal{G}^{\prime}\right) \quad \text { and } \quad \operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)=\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})
$$

The lemma now follows from the exact sequence

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right) \rightarrow \operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{G}^{\prime}\right) \rightarrow \operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right)
$$

see Homology, Lemma 12.5.8.
08MQ Lemma 74.10.2. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings of ringed topoi as in Situation 74.8.1. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}^{\prime}$-module and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. Assume that $\mathcal{F}$ is flat over $\mathcal{O}_{\mathcal{B}}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings (Definition 74.8.2). Then the following are equivalent
(1) $\mathcal{F}^{\prime}$ is flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$, and
(2) the canonical map $f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I \mathcal { F } ^ { \prime }}$ is an isomorphism.

Moreover, in this case the maps

$$
f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \mathcal{F}^{\prime}
$$

are isomorphisms.

Proof. The map $f^{*} \mathcal{J} \rightarrow \mathcal{I}$ is surjective as $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. Hence the final statement is a consequence of (2).
Proof of the equivalence of (1) and (2). By definition flatness over $\mathcal{O}_{\mathcal{B}}$ means flatness over $f^{-1} \mathcal{O}_{\mathcal{B}}$. Similarly for flatness over $f^{-1} \mathcal{O}_{\mathcal{B}^{\prime}}$. Note that the strictness of $\left(f, f^{\prime}\right)$ and the assumption that $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ imply that

$$
\mathcal{F}=\mathcal{F}^{\prime} /\left(f^{-1} \mathcal{J}\right) \mathcal{F}^{\prime}
$$

as sheaves on $\mathcal{C}$. Moreover, observe that $f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}=f^{-1} \mathcal{J} \otimes_{f^{-1}} \mathcal{O}_{\mathcal{B}} \mathcal{F}$. Hence the equivalence of (1) and (2) follows from Modules on Sites, Lemma 18.28.13.

08VU Lemma 74.10.3. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings of ringed topoi as in Situation 74.8.1. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}^{\prime}$-module and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. Assume that $\mathcal{F}^{\prime}$ is flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. Then the following are equivalent
(1) $\mathcal{F}^{\prime}$ is an $\mathcal{O}^{\prime}$-module of finite presentation, and
(2) $\mathcal{F}$ is an $\mathcal{O}$-module of finite presentation.

Proof. The implication $(1) \Rightarrow(2)$ follows from Modules on Sites, Lemma 18.23.4 For the converse, assume $\mathcal{F}$ of finite presentation. We may and do assume that $\mathcal{C}=\mathcal{C}^{\prime}$. By Lemma 74.10 .2 we have a short exact sequence

$$
0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

Let $U$ be an object of $\mathcal{C}$ such that $\left.\mathcal{F}\right|_{U}$ has a presentation

$$
\left.\mathcal{O}_{U}^{\oplus m} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{F}\right|_{U} \rightarrow 0
$$

After replacing $U$ by the members of a covering we may assume the map $\mathcal{O}_{U}^{\oplus n} \rightarrow$ $\left.\mathcal{F}\right|_{U}$ lifts to a map $\left.\left(\mathcal{O}_{U}^{\prime}\right)^{\oplus n} \rightarrow \mathcal{F}^{\prime}\right|_{U}$. The induced map $\mathcal{I}^{\oplus n} \rightarrow \mathcal{I} \otimes \mathcal{F}$ is surjective by right exactness of $\otimes$. Thus after replacing $U$ by the members of a covering we can find a lift $\left(\left.\mathcal{O}^{\prime}\right|_{U}\right)^{\oplus m} \rightarrow\left(\left.\mathcal{O}^{\prime}\right|_{U}\right)^{\oplus n}$ of the given map $\mathcal{O}_{U}^{\oplus m} \rightarrow \mathcal{O}_{U}^{\oplus n}$ such that

$$
\left.\left(\mathcal{O}_{U}^{\prime}\right)^{\oplus m} \rightarrow\left(\mathcal{O}_{U}^{\prime}\right)^{\oplus n} \rightarrow \mathcal{F}^{\prime}\right|_{U} \rightarrow 0
$$

is a complex. Using right exactness of $\otimes$ once more it is seen that this complex is exact.

08MR Lemma 74.10.4. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.8.1. Let $\mathcal{F}^{\prime}$, $\mathcal{G}^{\prime}$ be $\mathcal{O}^{\prime}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}$-linear map. Assume that $\mathcal{G}^{\prime}$ is flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. The set of lifts of $\varphi$ to an $\mathcal{O}^{\prime}$-linear map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ is, if nonempty, a principal homogeneous space under

$$
\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^{*} \mathcal{J}\right)
$$

Proof. Combine Lemmas 74.10.1 and 74.10.2.
08MS Lemma 74.10.5. Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a first order thickening of ringed topoi. Let $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ be $\mathcal{O}^{\prime}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}$-linear map. There exists an element

$$
o(\varphi) \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of $\varphi$ to an $\mathcal{O}^{\prime}$-linear $\operatorname{map} \varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$.

Proof. It is clear from the proof of Lemma 74.10.1 that the vanishing of the boundary of $\varphi$ via the map

$$
\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{G}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}^{\prime}}^{1}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

is a necessary and sufficient condition for the existence of a lift. We conclude as

$$
\operatorname{Ext}_{\mathcal{O}^{\prime}}^{1}\left(\mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

the adjointness of $i_{*}=R i_{*}$ and $L i^{*}$ on the derived category (Cohomology on Sites, Lemma 21.19.1.

08MT Lemma 74.10.6. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.8.1. Let $\mathcal{F}^{\prime}$, $\mathcal{G}^{\prime}$ be $\mathcal{O}^{\prime}$-modules and set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$ and $\mathcal{G}=i^{*} \mathcal{G}^{\prime}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be an $\mathcal{O}$-linear map. Assume that $\mathcal{F}^{\prime}$ and $\mathcal{G}^{\prime}$ are flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ and that $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings. There exists an element

$$
o(\varphi) \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^{*} \mathcal{J}\right)
$$

whose vanishing is a necessary and sufficient condition for the existence of a lift of $\varphi$ to an $\mathcal{O}^{\prime}$-linear map $\varphi^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$.

First proof. This follows from Lemma 74.10.5 as we claim that under the assumptions of the lemma we have

$$
\operatorname{Ext}_{\mathcal{O}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} f^{*} \mathcal{J}\right)
$$

Namely, we have $\mathcal{I} \mathcal{G}^{\prime}=\mathcal{G} \otimes_{\mathcal{O}} f^{*} \mathcal{J}$ by Lemma 74.10.2. On the other hand, observe that

$$
H^{-1}\left(L i^{*} \mathcal{F}^{\prime}\right)=\operatorname{Tor}_{1}^{\mathcal{O}^{\prime}}\left(\mathcal{F}^{\prime}, \mathcal{O}\right)
$$

(local computation omitted). Using the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0
$$

we see that this $\operatorname{Tor}_{1}$ is computed by the kernel of the map $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \mathcal{F}^{\prime}$ which is zero by the final assertion of Lemma 74.10 .2 . Thus $\tau_{\geq-1} L i^{*} \mathcal{F}^{\prime}=\mathcal{F}$. On the other hand, we have

$$
\operatorname{Ext}_{\mathcal{O}}^{1}\left(L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)=\operatorname{Ext}_{\mathcal{O}}^{1}\left(\tau_{\geq-1} L i^{*} \mathcal{F}^{\prime}, \mathcal{I} \mathcal{G}^{\prime}\right)
$$

by the dual of Derived Categories, Lemma 13.17.1.
Second proof. We can apply Lemma 74.9 .2 as follows. Note that $\mathcal{K}=\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ and $\mathcal{L}=\mathcal{I} \otimes_{\mathcal{O}} \mathcal{G}$ by Lemma 74.10 .2 , that $c_{\mathcal{F}^{\prime}}=1 \otimes 1$ and $c_{\mathcal{G}^{\prime}}=1 \otimes 1$ and taking $\psi=1 \otimes \varphi$ the diagram of the lemma commutes. Thus $o(\varphi)=o(\varphi, 1 \otimes \varphi)$ works.

08 MU Lemma 74.10.7. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.8.1. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Assume $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings and $\mathcal{F}$ flat over $\mathcal{O}_{\mathcal{B}}$. If there exists a pair $\left(\mathcal{F}^{\prime}, \alpha\right)$ consisting of an $\mathcal{O}^{\prime}$-module $\mathcal{F}^{\prime}$ flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ and an isomorphism $\alpha: i^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$, then the set of isomorphism classes of such pairs is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}\right)$.
Proof. If we assume there exists one such module, then the canonical map

$$
f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}
$$

is an isomorphism by Lemma 74.10 .2 . Apply Lemma 74.9 .3 with $\mathcal{K}=\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ and $c=1$. By Lemma 74.10 .2 the corresponding extensions $\mathcal{F}^{\prime}$ are all flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$.

08MV Lemma 74.10.8. Let $\left(f, f^{\prime}\right)$ be a morphism of first order thickenings as in Situation 74.8.1. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Assume $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings and $\mathcal{F}$ flat over $\mathcal{O}_{\mathcal{B}}$. There exists an $\mathcal{O}^{\prime}$-module $\mathcal{F}^{\prime}$ flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ with $i^{*} \mathcal{F}^{\prime} \cong \mathcal{F}$, if and only if
(1) the canonical map $f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}$ is an isomorphism, and
(2) the class $o\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}, 1\right) \in \operatorname{Ext}_{\mathcal{O}}^{2}\left(\mathcal{F}, \mathcal{I} \otimes_{\mathcal{O}} \mathcal{F}\right)$ of Lemma 74.9.4 is zero.

Proof. This follows immediately from the characterization of $\mathcal{O}^{\prime}$-modules flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ of Lemma 74.10.2 and Lemma 74.9.4.

### 74.11. Application to flat modules on flat thickenings of ringed topoi

08 VV Consider a commutative diagram

of ringed topoi whose horizontal arrows are first order thickenings as in Situation 74.8.1. Set $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}^{\prime}$ and $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right) \subset \mathcal{O}_{\mathcal{B}^{\prime}}$. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Assume that
(1) $\left(f, f^{\prime}\right)$ is a strict morphism of thickenings,
(2) $f^{\prime}$ is flat, and
(3) $\mathcal{F}$ is flat over $\mathcal{O}_{\mathcal{B}}$.

Note that $(1)+(2)$ imply that $\mathcal{I}=f^{*} \mathcal{J}$ (apply Lemma 74.10 .2 to $\left.\mathcal{O}^{\prime}\right)$. The theory of the preceding section is especially nice under these assumptions. We summarize the results already obtained in the following lemma.
08VW Lemma 74.11.1. In the situation above.
(1) There exists an $\mathcal{O}^{\prime}$-module $\mathcal{F}^{\prime}$ flat over $\mathcal{O}_{\mathcal{B}^{\prime}}$ with $i^{*} \mathcal{F}^{\prime} \cong \mathcal{F}$, if and only if the class $o\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}, 1\right) \in \operatorname{Ext}_{\mathcal{O}}^{2}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}\right)$ of Lemma 74.9.4 is zero.
(2) If such a module exists, then the set of isomorphism classes of lifts is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}\right)$.
(3) Given a lift $\mathcal{F}^{\prime}$, the set of automorphisms of $\mathcal{F}^{\prime}$ which pull back to $i d_{\mathcal{F}}$ is canonically isomorphic to $\operatorname{Ext}{ }_{\mathcal{O}}^{0}\left(\mathcal{F}, f^{*} \mathcal{J} \otimes_{\mathcal{O}} \mathcal{F}\right)$.
Proof. Part (1) follows from Lemma 74.10 .8 as we have seen above that $\mathcal{I}=f^{*} \mathcal{J}$. Part (2) follows from Lemma 74.10.7. Part (3) follows from Lemma 74.10.4.
08VX Situation 74.11.2. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$ be a morphism of ringed topoi. Consider a commutative diagram

where (a) the top row is a short exact sequence of first order thickenings of $(S h(\mathcal{C}), \mathcal{O})$, (b) the lower row is a short exact sequence of first order thickenings of $\left(\operatorname{Sh}(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$,
(c) each $f_{i}^{\prime}$ restricts to $f$, (d) each pair $\left(f, f_{i}^{\prime}\right)$ is a strict morphism of thickenings,
and (e) each $f_{i}^{\prime}$ is flat. Finally, let $\mathcal{F}_{2}^{\prime}$ be an $\mathcal{O}_{2}^{\prime}$-module flat over $\mathcal{O}_{\mathcal{B}_{2}^{\prime}}$ and set $\mathcal{F}=\mathcal{F}_{2}^{\prime} \otimes \mathcal{O}$. Let $\pi:\left(S h\left(\mathcal{C}_{1}^{\prime}\right), \mathcal{O}_{1}^{\prime}\right) \rightarrow(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ be the canonical splitting (Remark 74.9.9).

08VY Lemma 74.11.3. In Situation 74.11.2 the modules $\pi^{* \mathcal{F}}$ and $h^{*} \mathcal{F}_{2}^{\prime}$ are $\mathcal{O}_{1}^{\prime}$-modules flat over $\mathcal{O}_{\mathcal{B}_{1}^{\prime}}$ restricting to $\mathcal{F}$ on $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$. Their difference (Lemma 74.11.1) is an element $\theta$ of $\operatorname{Ext}_{\mathcal{O}}^{1}\left(\mathcal{F}, f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}} \mathcal{F}\right)$ whose boundary in $E x t_{\mathcal{O}}^{2}\left(\mathcal{F}, f^{*} \mathcal{J}_{3} \otimes_{\mathcal{O}} \mathcal{F}\right)$ equals the obstruction (Lemma 74.11.1) to lifting $\mathcal{F}$ to an $\mathcal{O}_{3}^{\prime}$-module flat over $\mathcal{O}_{\mathcal{B}_{3}^{\prime}}$.

Proof. Note that both $\pi^{*} \mathcal{F}$ and $h^{*} \mathcal{F}_{2}^{\prime}$ restrict to $\mathcal{F}$ on $(S h(\mathcal{C}), \mathcal{O})$ and that the kernels of $\pi^{*} \mathcal{F} \rightarrow \mathcal{F}$ and $h^{*} \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F}$ are given by $f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}} \mathcal{F}$. Hence flatness by Lemma 74.10.2. Taking the boundary makes sense as the sequence of modules

$$
0 \rightarrow f^{*} \mathcal{J}_{3} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow f^{*} \mathcal{J}_{2} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow f^{*} \mathcal{J}_{1} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow 0
$$

is short exact due to the assumptions in Situation 74.11 .2 and the fact that $\mathcal{F}$ is flat over $\mathcal{O}_{\mathcal{B}}$. The statement on the obstruction class is a direct translation of the result of Remark 74.9 .10 to this particular situation.

### 74.12. Deformations of ringed topoi and the naive cotangent complex

08 UE In this section we use the naive cotangent complex to do a little bit of deformation theory. We start with a first order thickening $t:\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right) \rightarrow\left(S h\left(\mathcal{B}^{\prime}\right), \mathcal{O}_{\mathcal{B}^{\prime}}\right)$ of ringed topoi. We denote $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right)$ and we identify the underlying topoi of $\mathcal{B}$ and $\mathcal{B}^{\prime}$. Moreover we assume given a morphism of ringed topoi $f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow$ $\left(\operatorname{Sh}(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$, an $\mathcal{O}$-module $\mathcal{G}$, and a $\operatorname{map} f^{-1} \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of $f^{-1} \mathcal{O}_{\mathcal{B}}$-modules. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

08UF

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ and a morphism of thickenings $\left(f, f^{\prime}\right)$ as in 74.8.1.1 where $\operatorname{Ker}\left(i^{\sharp}\right)$ is identified with $\mathcal{G}$ such that $\left(f^{\prime}\right)^{\sharp}$ induces the given map $c$. We will say $\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ is a solution to 74.12.0.1.

08UG Lemma 74.12.1. Assume given a commutative diagram of morphisms ringed topoi

08UH
(74.12.1.1)

whose horizontal arrows are first order thickenings. Set $\mathcal{G}_{j}=\operatorname{Ker}\left(i_{j}^{\sharp}\right)$ and assume given a map of $g^{-1} \mathcal{O}_{1}$-modules $\nu: g^{-1} \mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ giving rise to the commutative diagram

08UI

with front and back solutions to 74.12.0.1). (The north-north-west arrows are maps on $\mathcal{C}_{2}$ after applying $g^{-1}$ to the source.)
(1) There exist a canonical element in $\operatorname{Ext}_{\mathcal{O}_{2}}^{1}\left(L g^{*} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right)$ whose vanishing is a necessary and sufficient condition for the existence of a morphism of ringed topoi $\left(\operatorname{Sh}\left(\mathcal{C}_{2}^{\prime}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{C}_{1}^{\prime}\right), \mathcal{O}_{1}^{\prime}\right)$ fitting into 74.12.1.1) compatibly with $\nu$.
(2) If there exists a morphism $\left(\operatorname{Sh}\left(\mathcal{C}_{2}^{\prime}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{C}_{1}^{\prime}\right), \mathcal{O}_{1}^{\prime}\right)$ fitting into 74.12.1.1) compatibly with $\nu$ the set of all such morphisms is a principal homogeneous space under

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\Omega_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, g_{*} \mathcal{G}_{2}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(g^{*} \Omega_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right)=\operatorname{Ext}_{\mathcal{O}_{2}}^{0}\left(L g^{*} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right)
$$

Proof. The proof of this lemma is identical to the proof of Lemma 74.7.1. We urge the reader to read that proof instead of this one. We will identify the underlying topoi for every thickening in sight (we have already used this convention in the statement). The equalities in the last statement of the lemma are immediate from the definitions. Thus we will work with the groups $\operatorname{Ext}_{\mathcal{O}_{2}}^{k}\left(L g^{*} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right), k=$ 0,1 in the rest of the proof. We first argue that we can reduce to the case where the underlying topos of all ringed topoi in the lemma is the same.

To do this, observe that $g^{-1} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}$ is equal to the naive cotangent complex of the homomorphism of sheaves of rings $g^{-1} f_{1}^{-1} \mathcal{O}_{\mathcal{B}_{1}} \rightarrow g^{-1} \mathcal{O}_{1}$, see Modules on Sites, Lemma 18.32.5. Moreover, the degree 0 term of $N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}$ is a flat $\mathcal{O}_{1}$-module, hence the canonical map

$$
L g^{*} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}} \longrightarrow g^{-1} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}} \otimes_{g^{-1} \mathcal{O}_{1}} \mathcal{O}_{2}
$$

induces an isomorphism on cohomology sheaves in degrees 0 and -1 . Thus we may replace the Ext groups of the lemma with

$$
\operatorname{Ext}_{g^{-1} \mathcal{O}_{1}}^{k}\left(g^{-1} N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right)=\operatorname{Ext}_{g^{-1} \mathcal{O}_{1}}^{k}\left(N L_{g^{-1} \mathcal{O}_{1} / g^{-1} f_{1}^{-1} \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right)
$$

The set of morphism of ringed topoi $\left(S h\left(\mathcal{C}_{2}^{\prime}\right), \mathcal{O}_{2}^{\prime}\right) \rightarrow\left(S h\left(\mathcal{C}_{1}^{\prime}\right), \mathcal{O}_{1}^{\prime}\right)$ fitting into 74.12.1.1 compatibly with $\nu$ is in one-to-one bijection with the set of homomorphisms of $g^{-1} f_{1}^{-1} \mathcal{O}_{\mathcal{B}_{1}^{\prime}}$-algebras $g^{-1} \mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$ which are compatible with $f^{\sharp}$ and $\nu$. In this way we see that we may assume we have a diagram 74.12.1.2 of sheaves on a site $\mathcal{C}$
(with $f_{1}=f_{2}=$ id on underlying topoi) and we are looking to find a homomorphism of sheaves of rings $\mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$ fitting into it.
In the rest of the proof of the lemma we assume all underlying topological spaces are the same, i.e., we have a diagram (74.12.1.2) of sheaves on a site $\mathcal{C}$ (with $f_{1}=f_{2}=$ id on underlying topoi) and we are looking for homomorphisms of sheaves of rings $\mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$ fitting into it. As ext groups we will use $\operatorname{Ext}_{\mathcal{O}_{1}}^{k}\left(N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}, \mathcal{G}_{2}\right), k=0,1$.
Step 1. Construction of the obstruction class. Consider the sheaf of sets

$$
\mathcal{E}=\mathcal{O}_{1}^{\prime} \times{ }_{\mathcal{O}_{2}} \mathcal{O}_{2}^{\prime}
$$

This comes with a surjective map $\alpha: \mathcal{E} \rightarrow \mathcal{O}_{1}$ and hence we can use $N L(\alpha)$ instead of $N L_{\mathcal{O}_{1} / \mathcal{O}_{\mathcal{B}_{1}}}$, see Modules on Sites, Lemma 18.34.2. Set

$$
\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{1}\right) \quad \text { and } \quad \mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{\mathcal{B}_{1}}[\mathcal{E}] \rightarrow \mathcal{O}_{1}\right)
$$

There is a surjection $\mathcal{I}^{\prime} \rightarrow \mathcal{I}$ whose kernel is $\mathcal{J}_{1} \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}]$. We obtain two homomorphisms of $\mathcal{O}_{\mathcal{B}_{2}^{\prime}}$-algebras

$$
a: \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{1}^{\prime} \quad \text { and } \quad b: \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}_{2}^{\prime}
$$

which induce maps $\left.a\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}_{1}$ and $\left.b\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}_{2}$. Both $a$ and $b$ annihilate $\left(\mathcal{I}^{\prime}\right)^{2}$. Moreover $a$ and $b$ agree on $\mathcal{J}_{1} \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}]$ as maps into $\mathcal{G}_{2}$ because the left hand square of $\sqrt{74.12 .1 .2}$ is commutative. Thus the difference $\left.b\right|_{\mathcal{I}^{\prime}}-\left.\nu \circ a\right|_{\mathcal{I}^{\prime}}$ induces a well defined $\mathcal{O}_{1}$-linear map

$$
\xi: \mathcal{I} / \mathcal{I}^{2} \longrightarrow \mathcal{G}_{2}
$$

which sends the class of a local section $f$ of $\mathcal{I}$ to $a\left(f^{\prime}\right)-\nu\left(b\left(f^{\prime}\right)\right)$ where $f^{\prime}$ is a lift of $f$ to a local section of $\mathcal{I}^{\prime}$. We let $[\xi] \in \operatorname{Ext}_{\mathcal{O}_{1}}^{1}\left(N L(\alpha), \mathcal{G}_{2}\right)$ be the image (see below).
Step 2. Vanishing of [ $\xi]$ is necessary. Let us write $\Omega=\Omega_{\mathcal{O}_{\mathcal{B}_{1}}[\mathcal{E}] / \mathcal{O}_{\mathcal{B}_{1}}} \otimes_{\mathcal{O}_{\mathcal{B}_{1}}[\mathcal{E}]} \mathcal{O}_{1}$. Observe that $N L(\alpha)=\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega\right)$ fits into a distinguished triangle

$$
\Omega[0] \rightarrow N L(\alpha) \rightarrow \mathcal{I} / \mathcal{I}^{2}[1] \rightarrow \Omega[1]
$$

Thus we see that $[\xi]$ is zero if and only if $\xi$ is a composition $\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega \rightarrow \mathcal{G}_{2}$ for some map $\Omega \rightarrow \mathcal{G}_{2}$. Suppose there exists a homomorphisms of sheaves of rings $\varphi: \mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$ fitting into 74.12 .1 .2 . In this case consider the map $\mathcal{O}_{1}^{\prime}[\mathcal{E}] \rightarrow \mathcal{G}_{2}$, $f^{\prime} \mapsto b\left(f^{\prime}\right)-\varphi\left(a\left(f^{\prime}\right)\right)$. A calculation shows this annihilates $\mathcal{J}_{1} \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}]$ and induces a derivation $\mathcal{O}_{\mathcal{B}_{1}}[\mathcal{E}] \rightarrow \mathcal{G}_{2}$. The resulting linear map $\Omega \rightarrow \mathcal{G}_{2}$ witnesses the fact that $[\xi]=0$ in this case.
Step 3. Vanishing of $[\xi]$ is sufficient. Let $\theta: \Omega \rightarrow \mathcal{G}_{2}$ be a $\mathcal{O}_{1}$-linear map such that $\xi$ is equal to $\theta \circ\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega\right)$. Then a calculation shows that

$$
b+\theta \circ d: \mathcal{O}_{\mathcal{B}_{1}^{\prime}}[\mathcal{E}] \longrightarrow \mathcal{O}_{2}^{\prime}
$$

annihilates $\mathcal{I}^{\prime}$ and hence defines a map $\mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$ fitting into 74.12.1.2.
Proof of (2) in the special case above. Omitted. Hint: This is exactly the same as the proof of (2) of Lemma 74.2.1.

08UJ Lemma 74.12.2. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. Let $\mathcal{G}$ be a $\mathcal{B}$-module. Let $\xi \in \operatorname{Ext}_{\mathcal{B}}^{1}\left(N L_{\mathcal{B} / \mathcal{A}}, \mathcal{G}\right)$. There exists a map of sheaves of sets $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ such that $\xi \in \operatorname{Ext}_{\mathcal{B}}^{1}(N L(\alpha), \mathcal{G})$ is the class of a map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$ (see proof for notation).

Proof. Recall that given $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ such that $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$ is surjective with kernel $\mathcal{I}$ the complex $N L(\alpha)=\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}\right)$ is canonically isomorphic to $N L_{\mathcal{B} / \mathcal{A}}$, see Modules on Sites, Lemma 18.34 .2 . Observe moreover, that $\Omega=\Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{e \in \mathcal{E}(U)} \mathcal{B}(U)$. In other words, $\Omega$ is the free $\mathcal{B}$-module on the sheaf of sets $\mathcal{E}$ and in particular there is a canonical map $\mathcal{E} \rightarrow \Omega$.

Having said this, pick some $\mathcal{E}$ (for example $\mathcal{E}=\mathcal{B}$ as in the definition of the naive cotangent complex). The obstruction to writing $\xi$ as the class of a $\operatorname{map} \mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$ is an element in $\operatorname{Ext}_{\mathcal{B}}^{1}(\Omega, \mathcal{G})$. Say this is represented by the extension $0 \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow$ $\Omega \rightarrow 0$ of $\mathcal{B}$-modules. Consider the sheaf of sets $\mathcal{E}^{\prime}=\mathcal{E} \times{ }_{\Omega} \mathcal{H}$ which comes with an induced map $\alpha^{\prime}: \mathcal{E}^{\prime} \rightarrow \mathcal{B}$. Let $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{A}\left[\mathcal{E}^{\prime}\right] \rightarrow \mathcal{B}\right)$ and $\Omega^{\prime}=\Omega_{\mathcal{A}\left[\mathcal{E}^{\prime}\right] / \mathcal{A}} \otimes_{\mathcal{A}\left[\mathcal{E}^{\prime}\right]} \mathcal{B}$. The pullback of $\xi$ under the quasi-isomorphism $N L\left(\alpha^{\prime}\right) \rightarrow N L(\alpha)$ maps to zero in $\operatorname{Ext}_{\mathcal{B}}^{1}\left(\Omega^{\prime}, \mathcal{G}\right)$ because the pullback of the extension $\mathcal{H}$ by the map $\Omega^{\prime} \rightarrow \Omega$ is split as $\Omega^{\prime}$ is the free $\mathcal{B}$-module on the sheaf of sets $\mathcal{E}^{\prime}$ and since by construction there is a commutative diagram

This finishes the proof.
08UK Lemma 74.12.3. If there exists a solution to 74.12.0.1), then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}}^{1}\left(N L_{\mathcal{O} / \mathcal{O}_{\mathcal{B}}}, \mathcal{G}\right)$.

Proof. We observe right away that given two solutions $\mathcal{O}_{1}^{\prime}$ and $\mathcal{O}_{2}^{\prime}$ to 74.12.0.1 we obtain by Lemma 74.12 .1 an obstruction element $o\left(\mathcal{O}_{1}^{\prime}, \mathcal{O}_{2}^{\prime}\right) \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(N L_{\mathcal{O} / \mathcal{O}_{\mathcal{B}}}, \mathcal{G}\right)$ to the existence of a map $\mathcal{O}_{1}^{\prime} \rightarrow \mathcal{O}_{2}^{\prime}$. Clearly, this element is the obstruction to the existence of an isomorphism, hence separates the isomorphism classes. To finish the proof it therefore suffices to show that given a solution $\mathcal{O}^{\prime}$ and an element $\xi \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(N L_{\mathcal{O} / \mathcal{O}_{\mathcal{B}}}, \mathcal{G}\right)$ we can find a second solution $\mathcal{O}_{\xi}^{\prime}$ such that $o\left(\mathcal{O}^{\prime}, \mathcal{O}_{\xi}^{\prime}\right)=\xi$.

Pick $\alpha: \mathcal{E} \rightarrow \mathcal{O}$ as in Lemma 74.12 .2 for the class $\xi$. Consider the surjection $f^{-1} \mathcal{O}_{\mathcal{B}}[\mathcal{E}] \rightarrow \mathcal{O}$ with kernel $\mathcal{I}$ and corresponding naive cotangent complex $N L(\alpha)=$ $\left(\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{f^{-1}} \mathcal{O}_{\mathcal{B}}[\mathcal{E}] / f^{-1} \mathcal{O}_{\mathcal{B}} \otimes_{f^{-1} \mathcal{O}_{\mathcal{B}}[\mathcal{E}]} \mathcal{O}\right)$. By the lemma $\xi$ is the class of a morphism $\delta: \mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{G}$. After replacing $\mathcal{E}$ by $\mathcal{E} \times_{\mathcal{O}} \mathcal{O}^{\prime}$ we may also assume that $\alpha$ factors through a map $\alpha^{\prime}: \mathcal{E} \rightarrow \mathcal{O}^{\prime}$.

These choices determine an $f^{-1} \mathcal{O}_{\mathcal{B}^{\prime}}$ algebra $\operatorname{map} \varphi: \mathcal{O}_{\mathcal{B}^{\prime}}[\mathcal{E}] \rightarrow \mathcal{O}^{\prime}$. Let $\mathcal{I}^{\prime}=\operatorname{Ker}(\varphi)$. Observe that $\varphi$ induces a map $\left.\varphi\right|_{\mathcal{I}^{\prime}}: \mathcal{I}^{\prime} \rightarrow \mathcal{G}$ and that $\mathcal{O}^{\prime}$ is the pushout, as in the following diagram

Let $\psi: \mathcal{I}^{\prime} \rightarrow \mathcal{G}$ be the sum of the map $\left.\varphi\right|_{\mathcal{I}^{\prime}}$ and the composition

$$
\mathcal{I}^{\prime} \rightarrow \mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2} \rightarrow \mathcal{I} / \mathcal{I}^{2} \xrightarrow{\delta} \mathcal{G} .
$$

Then the pushout along $\psi$ is an other ring extension $\mathcal{O}_{\xi}^{\prime}$ fitting into a diagram as above. A calculation (omitted) shows that $o\left(\mathcal{O}^{\prime}, \mathcal{O}_{\xi}^{\prime}\right)=\xi$ as desired.

08UL Lemma 74.12.4. Let $\left(\operatorname{Sh}(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$ be a ringed topos and let $\mathcal{J}$ be an $\mathcal{O}_{\mathcal{B}}$-module.
(1) The set of extensions of sheaves of rings $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{\mathcal{B}^{\prime}} \rightarrow \mathcal{O}_{\mathcal{B}} \rightarrow 0$ where $\mathcal{J}$ is an ideal of square zero is canonically bijective to $\operatorname{Ext}_{\mathcal{O}_{\mathcal{B}}}^{1}\left(N L_{\mathcal{O}_{\mathcal{B}} / \mathbf{Z}}, \mathcal{J}\right)$.
(2) Given a morphism of ringed topoi $f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$, an $\mathcal{O}$ module $\mathcal{G}$, an $f^{-1} \mathcal{O}_{\mathcal{B}}$-module map $c: f^{-1} \mathcal{J} \rightarrow \mathcal{G}$, and given extensions of sheaves of rings with square zero kernels:
(a) $0 \rightarrow \mathcal{J} \rightarrow \mathcal{O}_{\mathcal{B}^{\prime}} \rightarrow \mathcal{O}_{\mathcal{B}} \rightarrow 0$ corresponding to $\alpha \in \operatorname{Ext}_{\mathcal{O}_{\mathcal{B}}}^{1}\left(N L_{\mathcal{O}_{\mathcal{B}} / \mathbf{Z}}, \mathcal{J}\right)$, (b) $0 \rightarrow \mathcal{G} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0$ corresponding to $\beta \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(N L_{\mathcal{O} / \mathbf{Z}}, \mathcal{G}\right)$ then there is a morphism $\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}^{\prime}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{B}, \mathcal{O}_{\mathcal{B}^{\prime}}\right)\right.$ fitting into a diagram 74.12.0.1 if and only if $\beta$ and $\alpha$ map to the same element of $E x t_{\mathcal{O}}^{1}\left(L f^{*} N L_{\mathcal{O}_{\mathcal{B}} / \mathbf{Z}}, \mathcal{G}\right)$.

Proof. To prove this we apply the previous results where we work over the base ringed topos $(S h(*), \mathbf{Z})$ with trivial thickening. Part (1) follows from Lemma 74.12 .3 and the fact that there exists a solution, namely $\mathcal{J} \oplus \mathcal{O}_{\mathcal{B}}$. Part (2) follows from Lemma 74.12 .1 and a compatibility between the constructions in the proofs of Lemmas 74.12 .3 and 74.12 .1 whose statement and proof we omit.

## CHAPTER 75

## The Cotangent Complex

### 75.1. Introduction

08P6 The goal of this chapter is to construct the cotangent complex of a ring map, of a morphism of schemes, and of a morphism of algebraic spaces. Some references are the notes Qui, the paper Qui70, and the books And67 and Ill72.

### 75.2. Advice for the reader

08UM In writing this chapter we have tried to minimize the use of simplicial techniques. We view the choice of a resolution $P_{\bullet}$ of a ring $B$ over a ring $A$ as a tool to calculating the homology of abelian sheaves on the category $\mathcal{C}_{B / A}$, see Remark 75.5.5. This is similar to the role played by a "good cover" to compute cohomology using the Čech complex. To read a bit on homology on categories, please visit Cohomology on Sites, Section 21.30. The derived lower shriek functor $L \pi$ ! is to homology what $R \Gamma\left(\mathcal{C}_{B / A},-\right)$ is to cohomology. The category $\mathcal{C}_{B / A}$, studied in Section 75.4 , is the opposite of the category of factorizations $A \rightarrow P \rightarrow B$ where $P$ is a polynomial algebra over $A$. This category comes with maps of sheaves of rings

$$
\underline{A} \longrightarrow \mathcal{O} \longrightarrow \underline{B}
$$

where over the object $U=(P \rightarrow B)$ we have $\mathcal{O}(U)=P$. It turns out that we obtain the cotangent complex of $B$ over $A$ as

$$
L_{B / A}=L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{A}} \otimes_{\mathcal{O}} \underline{B}\right)
$$

see Lemma 75.4.3. We have consistently tried to use this point of view to prove the basic properties of cotangent complexes of ring maps. In particular, all of the results can be proven without relying on the existence of standard resolutions, although we have not done so. The theory is quite satisfactory, except that perhaps the proof of the fundamental triangle (Proposition 75.7.4) uses just a little bit more theory on derived lower shriek functors. To provide the reader with an alternative, we give a rather complete sketch of an approach to this result based on simple properties of standard resolutions in Remarks 75.7.5 and 75.7.6.

Our approach to the cotangent complex for morphisms of ringed topoi, morphisms of schemes, morphisms of algebraic spaces, etc is to deduce as much as possible from the case of "plain ring maps" discussed above.

### 75.3. The cotangent complex of a ring map

08 PL Let $A$ be a ring. Let $A l g_{A}$ be the category of $A$-algebras. Consider the pair of adjoint functors $(F, i)$ where $i: A l g_{A} \rightarrow$ Sets is the forgetful functor and $F: S e t s \rightarrow A l g_{A}$ assigns to a set $E$ the polynomial algebra $A[E]$ on $E$ over $A$. Let $X_{\bullet}$ be the simplicial object of $\operatorname{Fun}\left(A l g_{A}, A l g_{A}\right)$ constructed in Simplicial, Section 14.33 .
Consider an $A$-algebra $B$. Denote $P_{\bullet}=X_{\bullet}(B)$ the resulting simplicial $A$-algebra. Recall that $P_{0}=A[B], P_{1}=A[A[B]]$, and so on. In particular each term $P_{n}$ is a polynomial $A$-algebra. Recall also that there is an augmentation

$$
\epsilon: P_{\bullet} \longrightarrow B
$$

where we view $B$ as a constant simplicial $A$-algebra.
08PM Definition 75.3.1. Let $A \rightarrow B$ be a ring map. The standard resolution of $B$ over $A$ is the augmentation $\epsilon: P_{\bullet} \rightarrow A$ with terms

$$
P_{0}=A[B], \quad P_{1}=A[A[B]], \quad \ldots
$$

and maps as constructed above.
It will turn out that we can use the standard resolution to compute left derived functors in certain settings.

08PN Definition 75.3.2. The cotangent complex $L_{B / A}$ of a ring map $A \rightarrow B$ is the complex of $B$-modules associated to the simplicial $B$-module

$$
\Omega_{P_{\bullet} / A} \otimes_{P_{\bullet}, \epsilon} B
$$

where $\epsilon: P_{\bullet} \rightarrow B$ is the standard resolution of $B$ over $A$.
In Simplicial, Section 14.23 we associate a chain complex to a simplicial module, but here we work with cochain complexes. Thus the term $L_{B / A}^{-n}$ in degree $-n$ is the $B$-module $\Omega_{P_{n} / A} \otimes_{P_{n}, \epsilon_{n}} B$ and $L_{B / A}^{m}=0$ for $m>0$.

08PP Remark 75.3.3. Let $A \rightarrow B$ be a ring map. Let $\mathcal{A}$ be the category of arrows $\psi: C \rightarrow B$ of $A$-algebras and let $\mathcal{S}$ be the category of maps $E \rightarrow B$ where $E$ is a set. There are adjoint functors $i: \mathcal{A} \rightarrow \mathcal{S}$ (the forgetful functor) and $F: \mathcal{S} \rightarrow \mathcal{A}$ which sends $E \rightarrow B$ to $A[E] \rightarrow B$. Let $X_{\bullet}$ be the $\operatorname{simplicial}$ object of $\operatorname{Fun}(\mathcal{A}, \mathcal{A})$ constructed in Simplicial, Section 14.33. The diagram

commutes. It follows that $X_{\bullet}\left(\mathrm{id}_{B}: B \rightarrow B\right)$ is equal to the standard resolution of $B$ over $A$.

08S9 Lemma 75.3.4. Let $A_{i} \rightarrow B_{i}$ be a system of ring maps over a directed index set I. Then colim $L_{A_{i} / B_{i}}=L_{\text {colim } A_{i} / \operatorname{colim} B_{i}}$.

Proof. This is true because the forgetful functor $i: A-A l g \rightarrow$ Sets and its adjoint $F:$ Sets $\rightarrow A$-Alg commute with filtered colimits. Moreover, the functor $B / A \mapsto$ $\Omega_{B / A}$ does as well (Algebra, Lemma 10.130.4).

### 75.4. Simplicial resolutions and derived lower shriek

08 PQ Let $A \rightarrow B$ be a ring map. Consider the category of $A$-algebra maps $\alpha: P \rightarrow B$ where $P$ is a polynomial algebra over $A$ (in some set ${ }^{1}$ of variables). Let $\mathcal{C}=\mathcal{C}_{B / A}$ denote the opposite of this category. The reason for taking the opposite is that we want to think of objects $(P, \alpha)$ as corresponding to the diagram of affine schemes

We endow $\mathcal{C}$ with the chaotic topology (Sites, Example 7.6.6), i.e., we endow $\mathcal{C}$ with the structure of a site where coverings are given by identities so that all presheaves are sheaves. Moreover, we endow $\mathcal{C}$ with two sheaves of rings. The first is the sheaf $\mathcal{O}$ which sends to object $(P, \alpha)$ to $P$. Then second is the constant sheaf $B$, which we will denote $\underline{B}$. We obtain the following diagram of morphisms of ringed topoi

08PR

The morphism $i$ is the identity on underlying topoi and $i^{\sharp}: \mathcal{O} \rightarrow \underline{B}$ is the obvious map. The map $\pi$ is as in Cohomology on Sites, Example 21.30.1. An important role will be played in the following by the derived functors $L i^{*}: D(\mathcal{O}) \longrightarrow D(\underline{B})$ left adjoint to $R i_{*}=i_{*}: D(\underline{B}) \rightarrow D(\mathcal{O})$ and $L \pi_{!}: D(\underline{B}) \longrightarrow D(B)$ left adjoint to $\pi^{*}=\pi^{-1}: D(B) \rightarrow D(\underline{B})$.

08PS Lemma 75.4.1. With notation as above let $P_{\bullet}$ be a simplicial $A$-algebra endowed with an augmentation $\epsilon: P_{\bullet} \rightarrow B$. Assume each $P_{n}$ is a polynomial algebra over $A$ and $\epsilon$ is a trivial Kan fibration on underlying simplicial sets. Then

$$
L \pi_{!}(\mathcal{F})=\mathcal{F}\left(P_{\bullet}, \epsilon\right)
$$

in $D(A b)$, resp. $D(B)$ functorially in $\mathcal{F}$ in $A b(\mathcal{C})$, $\operatorname{resp} . \operatorname{Mod}(\underline{B})$.
Proof. We will use the criterion of Cohomology on Sites, Lemma 21.30.7 to prove this. Given an object $U=(Q, \beta)$ of $\mathcal{C}$ we have to show that

$$
S_{\bullet}=\operatorname{Mor}_{\mathcal{C}}\left((Q, \beta),\left(P_{\bullet}, \epsilon\right)\right)
$$

is homotopy equivalent to a singleton. Write $Q=A[E]$ for some set $E$ (this is possible by our choice of the category $\mathcal{C})$. We see that

$$
S_{\bullet}=\operatorname{Mor}_{S e t s}\left(\left(E,\left.\beta\right|_{E}\right),\left(P_{\bullet}, \epsilon\right)\right)
$$

Let $*$ be the constant simplicial set on a singleton. For $b \in B$ let $F_{b, \bullet}$ be the simplicial set defined by the cartesian diagram

[^190]With this notation $S \bullet=\prod_{e \in E} F_{\beta(e), \bullet}$. Since we assumed $\epsilon$ is a trivial Kan fibration we see that $F_{b, \bullet} \rightarrow *$ is a trivial Kan fibration (Simplicial, Lemma 14.30.3). Thus $S_{\bullet} \rightarrow *$ is a trivial Kan fibration (Simplicial, Lemma 14.30.6). Therefore $S_{\bullet}$ is homotopy equivalent to $*$ (Simplicial, Lemma 14.30.8).

In particular, we can use the standard resolution of $B$ over $A$ to compute derived lower shriek.

08PT Lemma 75.4.2. Let $A \rightarrow B$ be a ring map. Let $\epsilon: P_{\bullet} \rightarrow B$ be the standard resolution of $B$ over $A$. Let $\pi$ be as in 75.4.0.1). Then

$$
L \pi_{!}(\mathcal{F})=\mathcal{F}\left(P_{\bullet}, \epsilon\right)
$$

in $D(A b)$, resp. $D(B)$ functorially in $\mathcal{F}$ in $A b(\mathcal{C})$, $\operatorname{resp} . \operatorname{Mod}(\underline{B})$.
First proof. We will apply Lemma 75.4.1. Since the terms $P_{n}$ are polynomial algebras we see the first assumption of that lemma is satisfied. The second assumption is proved as follows. By Simplicial, Lemma 14.33 .5 the map $\epsilon$ is a homotopy equivalence of underlying simplicial sets. By Simplicial, Lemma 14.31 .9 this implies $\epsilon$ induces a quasi-isomorphism of associated complexes of abelian groups. By Simplicial, Lemma 14.31 .8 this implies that $\epsilon$ is a trivial Kan fibration of underlying simplicial sets.
Second proof. We will use the criterion of Cohomology on Sites, Lemma 21.30.7. Let $U=(Q, \beta)$ be an object of $\mathcal{C}$. We have to show that

$$
S_{\bullet}=\operatorname{Mor}_{\mathcal{C}}\left((Q, \beta),\left(P_{\bullet}, \epsilon\right)\right)
$$

is homotopy equivalent to a singleton. Write $Q=A[E]$ for some set $E$ (this is possible by our choice of the category $\mathcal{C}$ ). Using the notation of Remark 75.3 .3 we see that

$$
S_{\bullet}=\operatorname{Mor}_{\mathcal{S}}\left((E \rightarrow B), i\left(P_{\bullet} \rightarrow B\right)\right)
$$

By Simplicial, Lemma 14.33 .5 the map $i\left(P_{\bullet} \rightarrow B\right) \rightarrow i(B \rightarrow B)$ is a homotopy equivalence in $\mathcal{S}$. Hence $S_{\bullet}$ is homotopy equivalent to

$$
\operatorname{Mor}_{\mathcal{S}}((E \rightarrow B),(B \rightarrow B))=\{*\}
$$

as desired.
08PU Lemma 75.4.3. Let $A \rightarrow B$ be a ring map. Let $\pi$ and $i$ be as in (75.4.0.1). There is a canonical isomorphism

$$
L_{B / A}=L \pi_{!}\left(L i^{*} \Omega_{\mathcal{O} / A}\right)=L \pi_{!}\left(i^{*} \Omega_{\mathcal{O} / A}\right)=L \pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right)
$$

in $D(B)$.
Proof. For an object $\alpha: P \rightarrow B$ of the category $\mathcal{C}$ the module $\Omega_{P / A}$ is a free $P$ module. Thus $\Omega_{\mathcal{O} / A}$ is a flat $\mathcal{O}$-module. Hence $L i^{*} \Omega_{\mathcal{O} / A}=i^{*} \Omega_{\mathcal{O} / A}$ is the sheaf of $\underline{B}$-modules which associates to $\alpha: P \rightarrow A$ the $B$-module $\Omega_{P / A} \otimes_{P, \alpha} B$. By Lemma 75.4 .2 we see that the right hand side is computed by the value of this sheaf on the standard resolution which is our definition of the left hand side (Definition 75.3.2.

08QE Lemma 75.4.4. If $A \rightarrow B$ is a ring map, then $L \pi_{!}\left(\pi^{-1} M\right)=M$ with $\pi$ as in 75.4.0.1.

Proof. This follows from Lemma 75.4.1 which tells us $L \pi_{!}\left(\pi^{-1} M\right)$ is computed by $\left(\pi^{-1} M\right)\left(P_{\bullet}, \epsilon\right)$ which is the constant simplicial object on $M$.

08QF Lemma 75.4.5. If $A \rightarrow B$ is a ring map, then $H^{0}\left(L_{B / A}\right)=\Omega_{B / A}$.
Proof. We will prove this by a direct calculation. We will use the identification of Lemma 75.4.3. There is clearly a map from $\Omega_{\mathcal{O} / A} \otimes \underline{B}$ to the constant sheaf with value $\Omega_{B / A}$. Thus this map induces a map

$$
H^{0}\left(L_{B / A}\right)=H^{0}\left(L \pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes \underline{B}\right)\right)=\pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes \underline{B}\right) \rightarrow \Omega_{B / A}
$$

By choosing an object $P \rightarrow B$ of $\mathcal{C}_{B / A}$ with $P \rightarrow B$ surjective we see that this map is surjective (by Algebra, Lemma 10.130.6). To show that it is injective, suppose that $P \rightarrow B$ is an object of $\mathcal{C}_{B / A}$ and that $\xi \in \Omega_{P / A} \otimes_{P} B$ is an element which maps to zero in $\Omega_{B / A}$. We first choose factorization $P \rightarrow P^{\prime} \rightarrow B$ such that $P^{\prime} \rightarrow B$ is surjective and $P^{\prime}$ is a polynomial algebra over $A$. We may replace $P$ by $P^{\prime}$. If $B=P / I$, then the kernel $\Omega_{P / A} \otimes_{P} B \rightarrow \Omega_{B / A}$ is the image of $I / I^{2}$ (Algebra, Lemma 10.130.9. Say $\xi$ is the image of $f \in I$. Then we consider the two maps $a, b: P^{\prime}=P[x] \rightarrow P$, the first of which maps $x$ to 0 and the second of which maps $x$ to $f$ (in both cases $P[x] \rightarrow B$ maps $x$ to zero). We see that $\xi$ and 0 are the image of $\mathrm{d} x \otimes 1$ in $\Omega_{P^{\prime} / A} \otimes_{P^{\prime}} B$. Thus $\xi$ and 0 have the same image in the colimit (see Cohomology on Sites, Example 21.30.1) $\pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes \underline{B}\right)$ as desired.

08QG Lemma 75.4.6. If $B$ is a polynomial algebra over the ring $A$, then with $\pi$ as in (75.4.0.1) we have that $\pi_{!}$is exact and $\pi_{!} \mathcal{F}=\mathcal{F}(B \rightarrow B)$.

Proof. This follows from Lemma 75.4.1 which tells us the constant simplicial algebra on $B$ can be used to compute $L \pi!$.

08QH Lemma 75.4.7. If $B$ is a polynomial algebra over the ring $A$, then $L_{B / A}$ is quasiisomorphic to $\Omega_{B / A}[0]$.

Proof. Immediate from Lemmas 75.4 .3 and 75.4.6.

### 75.5. Constructing a resolution

08PV In the Noetherian finite type case we can construct a "small" simplicial resolution for finite type ring maps.

08PW Lemma 75.5.1. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Let $\mathcal{A}$ be the category of $A$-algebra maps $C \rightarrow B$. Let $n \geq 0$ and let $P_{\bullet}$ be $a$ simplicial object of $\mathcal{A}$ such that
(1) $P_{\bullet} \rightarrow B$ is a trivial Kan fibration of simplicial sets,
(2) $P_{k}$ is finite type over $A$ for $k \leq n$,
(3) $P_{\bullet}=\operatorname{cosk}_{n} s k_{n} P_{\bullet}$ as simplicial objects of $\mathcal{A}$.

Then $P_{n+1}$ is a finite type $A$-algebra.
Proof. Although the proof we give of this lemma is straightforward, it is a bit messy. To clarify the idea we explain what happens for low $n$ before giving the proof in general. For example, if $n=0$, then (3) means that $P_{1}=P_{0} \times{ }_{B} P_{0}$. Since the ring map $P_{0} \rightarrow B$ is surjective, this is of finite type over $A$ by More on Algebra, Lemma 15.5.1.

If $n=1$, then (3) means that

$$
P_{2}=\left\{\left(f_{0}, f_{1}, f_{2}\right) \in P_{1}^{3} \mid d_{0} f_{0}=d_{0} f_{1}, d_{1} f_{0}=d_{0} f_{2}, d_{1} f_{1}=d_{1} f_{2}\right\}
$$

where the equalities take place in $P_{0}$. Observe that the triple

$$
\left(d_{0} f_{0}, d_{1} f_{0}, d_{1} f_{1}\right)=\left(d_{0} f_{1}, d_{0} f_{2}, d_{1} f_{2}\right)
$$

is an element of the fibre product $P_{0} \times{ }_{B} P_{0} \times{ }_{B} P_{0}$ over $B$ because the maps $d_{i}$ : $P_{1} \rightarrow P_{0}$ are morphisms over $B$. Thus we get a map

$$
\psi: P_{2} \longrightarrow P_{0} \times_{B} P_{0} \times_{B} P_{0}
$$

The fibre of $\psi$ over an element $\left(g_{0}, g_{1}, g_{2}\right) \in P_{0} \times_{B} P_{0} \times{ }_{B} P_{0}$ is the set of triples $\left(f_{0}, f_{1}, f_{2}\right)$ of 1-simplices with $\left(d_{0}, d_{1}\right)\left(f_{0}\right)=\left(g_{0}, g_{1}\right),\left(d_{0}, d_{1}\right)\left(f_{1}\right)=\left(g_{0}, g_{2}\right)$, and $\left(d_{0}, d_{1}\right)\left(f_{2}\right)=\left(g_{1}, g_{2}\right)$. As $P_{\bullet} \rightarrow B$ is a trivial Kan fibration the map $\left(d_{0}, d_{1}\right):$ $P_{1} \rightarrow P_{0} \times{ }_{B} P_{0}$ is surjective. Thus we see that $P_{2}$ fits into the cartesian diagram

By More on Algebra, Lemma 15.5.2 we conclude. The general case is similar, but requires a bit more notation.

The case $n>1$. By Simplicial, Lemma 14.19 .14 the condition $P_{\bullet}=\operatorname{cosk}_{n} \mathrm{sk}_{n} P_{\bullet}$ implies the same thing is true in the category of simplicial $A$-algebras and hence in the category of sets (as the forgetful functor from $A$-algebras to sets commutes with limits). Thus

$$
P_{n+1}=\operatorname{Mor}\left(\Delta[n+1], P_{\bullet}\right)=\operatorname{Mor}\left(\operatorname{sk}_{n} \Delta[n+1], \operatorname{sk}_{n} P_{\bullet}\right)
$$

by Simplicial, Lemma 14.11 .3 and Equation 14.19 .0 .1 . We will prove by induction on $1 \leq k<m \leq n+1$ that the ring

$$
Q_{k, m}=\operatorname{Mor}\left(\mathrm{sk}_{k} \Delta[m], \mathrm{sk}_{k} P_{\bullet}\right)
$$

is of finite type over $A$. The case $k=1,1<m \leq n+1$ is entirely similar to the discussion above in the case $n=1$. Namely, there is a cartesian diagram

where $N=\binom{m+1}{2}$. We conclude as before.
Let $1 \leq k_{0} \leq n$ and assume $Q_{k, m}$ is of finite type over $A$ for all $1 \leq k \leq k_{0}$ and $k<m \leq n+1$. For $k_{0}+1<m \leq n+1$ we claim there is a cartesian square

where $N$ is the number of nondegenerate $\left(k_{0}+1\right)$-simplices of $\Delta[m]$. Namely, to see this is true, think of an element of $Q_{k_{0}+1, m}$ as a function $f$ from the $\left(k_{0}+1\right)$-skeleton of $\Delta[m]$ to $P_{\bullet}$. We can restrict $f$ to the $k_{0}$-skeleton which gives the left vertical map of the diagram. We can also restrict to each nondegenerate $\left(k_{0}+1\right)$-simplex
which gives the top horizontal arrow. Moreover, to give such an $f$ is the same thing as giving its restriction to $k_{0}$-skeleton and to each nondegenerate $\left(k_{0}+1\right)$-face, provided these agree on the overlap, and this is exactly the content of the diagram. Moreover, the fact that $P_{\bullet} \rightarrow B$ is a trivial Kan fibration implies that the map

$$
P_{k_{0}} \rightarrow Q_{k_{0}, k_{0}+1}=\operatorname{Mor}\left(\partial \Delta\left[k_{0}+1\right], P_{\bullet}\right)
$$

is surjective as every map $\partial \Delta\left[k_{0}+1\right] \rightarrow B$ can be extended to $\Delta\left[k_{0}+1\right] \rightarrow B$ for $k_{0} \geq 1$ (small argument about constant simplicial sets omitted). Since by induction hypothesis the rings $Q_{k_{0}, m}, Q_{k_{0}, k_{0}+1}$ are finite type $A$-algebras, so is $Q_{k_{0}+1, m}$ by More on Algebra, Lemma 15.5.2 once more.

08PX Proposition 75.5.2. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. There exists a simplicial $A$-algebra $P_{\bullet}$ with an augmentation $\epsilon: P_{\bullet} \rightarrow B$ such that each $P_{n}$ is a polynomial algebra of finite type over $A$ and such that $\epsilon$ is a trivial Kan fibration of simplicial sets.

Proof. Let $\mathcal{A}$ be the category of $A$-algebra maps $C \rightarrow B$. In this proof our simplicial objects and skeleton and coskeleton functors will be taken in this category.

Choose a polynomial algebra $P_{0}$ of finite type over $A$ and a surjection $P_{0} \rightarrow B$. As a first approximation we take $P_{\bullet}=\operatorname{cosk}_{0}\left(P_{0}\right)$. In other words, $P_{\bullet}$ is the simplicial $A$-algebra with terms $P_{n}=P_{0} \times{ }_{A} \ldots \times{ }_{A} P_{0}$. (In the final paragraph of the proof this simplicial object will be denoted $P_{\bullet}^{0}$.) By Simplicial, Lemma 14.32 .3 the map $P_{\bullet} \rightarrow$ $B$ is a trivial Kan fibration of simplicial sets. Also, observe that $P_{\bullet}=\operatorname{cosk}_{0} \operatorname{sk}_{0} P_{\bullet}$.

Suppose for some $n \geq 0$ we have constructed $P_{\bullet}$ (in the final paragraph of the proof this will be $P_{\bullet}^{n}$ ) such that
(a) $P_{\bullet} \rightarrow B$ is a trivial Kan fibration of simplicial sets,
(b) $P_{k}$ is a finitely generated polynomial algebra for $0 \leq k \leq n$, and
(c) $P_{\bullet}=\operatorname{cosk}_{n} \mathrm{sk}_{n} P_{\bullet}$

By Lemma 75.5.1 we can find a finitely generated polynomial algebra $Q$ over $A$ and a surjection $Q \rightarrow P_{n+1}$. Since $P_{n}$ is a polynomial algebra the $A$-algebra maps $s_{i}: P_{n} \rightarrow P_{n+1}$ lift to maps $s_{i}^{\prime}: P_{n} \rightarrow Q$. Set $d_{j}^{\prime}: Q \rightarrow P_{n}$ equal to the composition of $Q \rightarrow P_{n+1}$ and $d_{j}: P_{n+1} \rightarrow P_{n}$. We obtain a truncated simplicial object $P_{\bullet}^{\prime}$ of $\mathcal{A}$ by setting $P_{k}^{\prime}=P_{k}$ for $k \leq n$ and $P_{n+1}^{\prime}=Q$ and morphisms $d_{i}^{\prime}=d_{i}$ and $s_{i}^{\prime}=s_{i}$ in degrees $k \leq n-1$ and using the morphisms $d_{j}^{\prime}$ and $s_{i}^{\prime}$ in degree $n$. Extend this to a full simplicial object $P_{\bullet}^{\prime}$ of $\mathcal{A}$ using $\operatorname{cosk}_{n+1}$. By functoriality of the coskeleton functors there is a morphism $P_{\bullet}^{\prime} \rightarrow P_{\bullet}$ of simplicial objects extending the given morphism of $(n+1)$-truncated simplicial objects. (This morphism will be denoted $P_{\bullet}^{n+1} \rightarrow P_{\bullet}^{n}$ in the final paragraph of the proof.)

Note that conditions (b) and (c) are satisfied for $P_{\bullet}^{\prime}$ with $n$ replaced by $n+1$. We claim the map $P_{\bullet}^{\prime} \rightarrow P_{\bullet}$ satisfies assumptions (1), (2), (3), and (4) of Simplicial, Lemmas 14.32.1 with $n+1$ instead of $n$. Conditions (1) and (2) hold by construction. By Simplicial, Lemma 14.19 .14 we see that we have $P_{\bullet}=\operatorname{cosk}_{n+1} \operatorname{sk}_{n+1} P_{\bullet}$ and $P_{\bullet}^{\prime}=\operatorname{cosk}_{n+1} \mathrm{sk}_{n+1} P_{\bullet}^{\prime}$ not only in $\mathcal{A}$ but also in the category of $A$-algebras, whence in the category of sets (as the forgetful functor from $A$-algebras to sets commutes with all limits). This proves (3) and (4). Thus the lemma applies and $P_{\bullet}^{\prime} \rightarrow P_{\bullet}$ is a trivial Kan fibration. By Simplicial, Lemma 14.30 .4 we conclude that $P_{\bullet}^{\prime} \rightarrow B$ is a trivial Kan fibration and (a) holds as well.

To finish the proof we take the inverse limit $P_{\bullet}=\lim P_{\bullet}^{n}$ of the sequence of simplicial algebras

$$
\ldots \rightarrow P_{\bullet}^{2} \rightarrow P_{\bullet}^{1} \rightarrow P_{\bullet}^{0}
$$

constructed above. The map $P_{\bullet} \rightarrow B$ is a trivial Kan fibration by Simplicial, Lemma 14.30.5. However, the construction above stabilizes in each degree to a fixed finitely generated polynomial algebra as desired.

08PY Lemma 75.5.3. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Let $\pi, \underline{B}$ be as in 75.4.0.1). If $\mathcal{F}$ is an $\underline{B}$-module such that $\mathcal{F}(P, \alpha)$ is a finite $B$-module for all $\alpha: P=A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$, then the cohomology modules of $L \pi_{!}(\mathcal{F})$ are finite $B$-modules.

Proof. By Lemma 75.4 .1 and Proposition 75.5 .2 we can compute $L \pi!(\mathcal{F})$ by a complex constructed out of the values of $\mathcal{F}$ on finite type polynomial algebras.

08PZ Lemma 75.5.4. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. Then $H^{n}\left(L_{B / A}\right)$ is a finite $B$-module for all $n \in \mathbf{Z}$.

Proof. Apply Lemmas 75.4 .3 and 75.5 .3 .
08QI Remark 75.5.5 (Resolutions). Let $A \rightarrow B$ be any ring map. Let us call an augmented simplicial $A$-algebra $\epsilon: P_{\bullet} \rightarrow B$ a resolution of $B$ over $A$ if each $P_{n}$ is a polynomial algebra and $\epsilon$ is a trivial Kan fibration of simplicial sets. If $P_{\bullet} \rightarrow B$ is an augmentation of a simplicial $A$-algebra with each $P_{n}$ a polynomial algebra surjecting onto $B$, then the following are equivalent
(1) $\epsilon: P_{\bullet} \rightarrow B$ is a resolution of $B$ over $A$,
(2) $\epsilon: P_{\bullet} \rightarrow B$ is a quasi-isomorphism on associated complexes,
(3) $\epsilon: P_{\bullet} \rightarrow B$ induces a homotopy equivalence of simplicial sets.

To see this use Simplicial, Lemmas 14.30.8, 14.31.9, and 14.31.8. A resolution $P_{\bullet}$ of $B$ over $A$ gives a cosimplicial object $U \bullet$ of $\mathcal{C}_{B / A}$ as in Cohomology on Sites, Lemma 21.30 .7 and it follows that

$$
L \pi_{!} \mathcal{F}=\mathcal{F}\left(P_{\bullet}\right)
$$

functorially in $\mathcal{F}$, see Lemma 75.4.1. The (formal part of the) proof of Proposition 75.5 .2 shows that resolutions exist. We also have seen in the first proof of Lemma 75.4 .2 that the standard resolution of $B$ over $A$ is a resolution (so that this terminology doesn't lead to a conflict). However, the argument in the proof of Proposition 75.5 .2 shows the existence of resolutions without appealing to the simplicial computations in Simplicial, Section 14.33 . Moreover, for any choice of resolution we have a canonical isomorphism

$$
L_{B / A}=\Omega_{P_{\bullet} / A} \otimes_{P_{\bullet}, \epsilon} B
$$

in $D(B)$ by Lemma 75.4.3. The freedom to choose an arbitrary resolution can be quite useful.

08QJ Lemma 75.5.6. Let $A \rightarrow B$ be a ring map. Let $\pi, \mathcal{O}, \underline{B}$ be as in (75.4.0.1). For any $\mathcal{O}$-module $\mathcal{F}$ we have

$$
L \pi!(\mathcal{F})=L \pi!\left(L i^{*} \mathcal{F}\right)=L \pi!\left(\mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}\right)
$$

in $D(A b)$.

Proof. It suffices to verify the assumptions of Cohomology on Sites, Lemma 21.30 .12 hold for $\mathcal{O} \rightarrow \underline{B}$ on $\mathcal{C}_{B / A}$. We will use the results of Remark 75.5 .5 without further mention. Choose a resolution $P_{\bullet}$ of $B$ over $A$ to get a suitable cosimplicial object $U_{\bullet}$ of $\mathcal{C}_{B / A}$. Since $P_{\bullet} \rightarrow B$ induces a quasi-isomorphism on associated complexes of abelian groups we see that $L \pi!\mathcal{O}=B$. On the other hand $L \pi!\underline{B}$ is computed by $\underline{B}\left(U_{\bullet}\right)=B$. This verifies the second assumption of Cohomology on Sites, Lemma 21.30 .12 and we are done with the proof.

08QK Lemma 75.5.7. Let $A \rightarrow B$ be a ring map. Let $\pi, \mathcal{O}, \underline{B}$ be as in 75.4.0.1. We have

$$
L \pi_{!}(\mathcal{O})=L \pi_{!}(\underline{B})=B \quad \text { and } \quad L_{B / A}=L \pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right)=L \pi_{!}\left(\Omega_{\mathcal{O} / A}\right)
$$

in $D(A b)$.
Proof. This is just an application of Lemma 75.5 .6 (and the first equality on the right is Lemma 75.4.3.

Here is a special case of the fundamental triangle that is easy to prove.
08SA Lemma 75.5.8. Let $A \rightarrow B \rightarrow C$ be ring maps. If $B$ is a polynomial algebra over $A$, then there is a distinguished triangle $L_{B / A} \otimes_{B}^{\mathbf{L}} C \rightarrow L_{C / A} \rightarrow L_{C / B} \rightarrow$ $L_{B / A} \otimes_{B}^{\mathbf{L}} C[1]$ in $D(C)$.

Proof. We will use the observations of Remark 75.5 .5 without further mention. Choose a resolution $\epsilon: P_{\bullet} \rightarrow C$ of $C$ over $B$ (for example the standard resolution). Since $B$ is a polynomial algebra over $A$ we see that $P_{\bullet}$ is also a resolution of $C$ over $A$. Hence $L_{C / A}$ is computed by $\Omega_{P_{\bullet} / A} \otimes_{P_{\bullet}, \epsilon} C$ and $L_{C / B}$ is computed by $\Omega_{P_{\bullet} / B} \otimes_{P_{\bullet}, \epsilon} C$. Since for each $n$ we have the short exact sequence $0 \rightarrow \Omega_{B / A} \otimes_{B} P_{n} \rightarrow \Omega_{P_{n} / A} \rightarrow$ $\Omega_{P_{n} / B}$ (Algebra, Lemma 10.136.9) and since $L_{B / A}=\Omega_{B / A}[0]$ (Lemma 75.4.7) we obtain the result.

09D4 Example 75.5.9. Let $A \rightarrow B$ be a ring map. In this example we will construct an "explicit" resolution $P$. of $B$ over $A$ of length 2. To do this we follow the procedure of the proof of Proposition 75.5 .2 , see also the discussion in Remark 75.5.5.

We choose a surjection $P_{0}=A\left[u_{i}\right] \rightarrow B$ where $u_{i}$ is a set of variables. Choose generators $f_{t} \in P_{0}, t \in T$ of the ideal $\operatorname{Ker}\left(P_{0} \rightarrow B\right)$. We choose $P_{1}=A\left[u_{i}, x_{t}\right]$ with face maps $d_{0}$ and $d_{1}$ the unique $A$-algebra maps with $d_{j}\left(u_{i}\right)=u_{i}$ and $d_{0}\left(x_{t}\right)=0$ and $d_{1}\left(x_{t}\right)=f_{t}$. The map $s_{0}: P_{0} \rightarrow P_{1}$ is the unique $A$-algebra map with $s_{0}\left(u_{i}\right)=u_{i}$. It is clear that

$$
P_{1} \xrightarrow{d_{0}-d_{1}} P_{0} \rightarrow B \rightarrow 0
$$

is exact, in particular the map $\left(d_{0}, d_{1}\right): P_{1} \rightarrow P_{0} \times_{B} P_{0}$ is surjective. Thus, if $P_{\bullet}$ denotes the 1 -truncated simplicial $A$-algebra given by $P_{0}, P_{1}, d_{0}, d_{1}$, and $s_{0}$, then the augmentation $\operatorname{cosk}_{1}\left(P_{\bullet}\right) \rightarrow B$ is a trivial Kan fibration. The next step of the procedure in the proof of Proposition 75.5 .2 is to choose a polynomial algebra $P_{2}$ and a surjection

$$
P_{2} \longrightarrow \operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}
$$

Recall that
$\operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}=\left\{\left(g_{0}, g_{1}, g_{2}\right) \in P_{1}^{3} \mid d_{0}\left(g_{0}\right)=d_{0}\left(g_{1}\right), d_{1}\left(g_{0}\right)=d_{0}\left(g_{2}\right), d_{1}\left(g_{1}\right)=d_{1}\left(g_{2}\right)\right\}$
Thinking of $g_{i} \in P_{1}$ as a polynomial in $x_{t}$ the conditions are

$$
g_{0}(0)=g_{1}(0), \quad g_{0}\left(f_{t}\right)=g_{2}(0), \quad g_{1}\left(f_{t}\right)=g_{2}\left(f_{t}\right)
$$

Thus $\operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}$ contains the elements $y_{t}=\left(x_{t}, x_{t}, f_{t}\right)$ and $z_{t}=\left(0, x_{t}, x_{t}\right)$. Every element $G$ in $\operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}$ is of the form $G=H+(0,0, g)$ where $H$ is in the image of $A\left[u_{i}, y_{t}, z_{t}\right] \rightarrow \operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}$. Here $g \in P_{1}$ is a polynomial with vanishing constant term such that $g\left(f_{t}\right)=0$ in $P_{0}$. Observe that
(1) $g=x_{t} x_{t^{\prime}}-f_{t} x_{t^{\prime}}$ and
(2) $g=\sum r_{t} x_{t}$ with $r_{t} \in P_{0}$ if $\sum r_{t} f_{t}=0$ in $P_{0}$
are elements of $P_{1}$ of the desired form. Let

$$
\operatorname{Rel}=\operatorname{Ker}\left(\bigoplus_{t \in T} P_{0} \longrightarrow P_{0}\right), \quad\left(r_{t}\right) \longmapsto \sum r_{t} f_{t}
$$

We set $P_{2}=A\left[u_{i}, y_{t}, z_{t}, v_{r}, w_{t, t^{\prime}}\right]$ where $r=\left(r_{t}\right) \in$ Rel, with map

$$
P_{2} \longrightarrow \operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}
$$

given by $y_{t} \mapsto\left(x_{t}, x_{t}, f_{t}\right), z_{t} \mapsto\left(0, x_{t}, x_{t}\right), v_{r} \mapsto\left(0,0, \sum r_{t} x_{t}\right)$, and $w_{t, t^{\prime}} \mapsto$ $\left(0,0, x_{t} x_{t^{\prime}}-f_{t} x_{t^{\prime}}\right)$. A calculation (omitted) shows that this map is surjective. Our choice of the map displayed above determines the maps $d_{0}, d_{1}, d_{2}: P_{2} \rightarrow P_{1}$. Finally, the procedure in the proof of Proposition 75.5 .2 tells us to choose the maps $s_{0}, s_{1}: P_{1} \rightarrow P_{2}$ lifting the two maps $P_{1} \rightarrow \operatorname{cosk}_{1}\left(P_{\bullet}\right)_{2}$. It is clear that we can take $s_{i}$ to be the unique $A$-algebra maps determined by $s_{0}\left(x_{t}\right)=y_{t}$ and $s_{1}\left(x_{t}\right)=z_{t}$.

### 75.6. Functoriality

08QL In this section we consider a commutative square

08QM

of ring maps. We claim there is a canonical $B$-linear map of complexes

$$
L_{B / A} \longrightarrow L_{B^{\prime} / A^{\prime}}
$$

associated to this diagram. Namely, if $P_{\bullet} \rightarrow B$ is the standard resolution of $B$ over $A$ and $P_{\bullet}^{\prime} \rightarrow B^{\prime}$ is the standard resolution of $B^{\prime}$ over $A^{\prime}$, then there is a canonical map $P_{\bullet} \rightarrow P_{\bullet}^{\prime}$ of simplicial $A$-algebras compatible with the augmentations $P_{\bullet} \rightarrow B$ and $P_{\bullet}^{\prime} \rightarrow B^{\prime}$. This can be seen in terms of the construction of standard resolutions in Simplicial, Section 14.33 but in the special case at hand it probably suffices to say simply that the maps

$$
P_{0}=A[B] \longrightarrow A^{\prime}\left[B^{\prime}\right]=P_{0}^{\prime}, \quad P_{1}=A[A[B]] \longrightarrow A^{\prime}\left[A^{\prime}\left[B^{\prime}\right]\right]=P_{1}^{\prime}
$$

and so on are given by the given maps $A \rightarrow A^{\prime}$ and $B \rightarrow B^{\prime}$. The desired map $L_{B / A} \rightarrow L_{B^{\prime} / A^{\prime}}$ then comes from the associated maps $\Omega_{P_{n} / A} \rightarrow \Omega_{P_{n}^{\prime} / A^{\prime}}$.
Another description of the functoriality map can be given as follows. Let $\mathcal{C}=\mathcal{C}_{B / A}$ and $\mathcal{C}^{\prime}=\mathcal{C}_{B^{\prime} / A}^{\prime}$ be the categories considered in Section 75.4 . There is a functor

$$
u: \mathcal{C} \longrightarrow \mathcal{C}^{\prime}, \quad(P, \alpha) \longmapsto\left(P \otimes_{A} A^{\prime}, c \circ(\alpha \otimes 1)\right)
$$

where $c: B \otimes_{A} A^{\prime} \rightarrow B^{\prime}$ is the obvious map. As discussed in Cohomology on Sites, Example 21.30 .3 we obtain a morphism of topoi $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ and a
commutative diagram of maps of ringed topoi

08QN
(75.6.0.2)

Here $h$ is the identity on underlying topoi and given by the ring map $B \rightarrow B^{\prime}$ on sheaves of rings. By Cohomology on Sites, Remark 21.29.7 given $\mathcal{F}$ on $\mathcal{C}$ and $\mathcal{F}^{\prime}$ on $\mathcal{C}^{\prime}$ and a transformation $t: \mathcal{F} \rightarrow g^{-1} \mathcal{F}^{\prime}$ we obtain a canonical map $L \pi_{!}(\mathcal{F}) \rightarrow$ $L \pi_{!}^{\prime}\left(\mathcal{F}^{\prime}\right)$. If we apply this to the sheaves

$$
\mathcal{F}:(P, \alpha) \mapsto \Omega_{P / A} \otimes_{P} B, \quad \mathcal{F}^{\prime}:\left(P^{\prime}, \alpha^{\prime}\right) \mapsto \Omega_{P^{\prime} / A^{\prime}} \otimes_{P^{\prime}} B^{\prime}
$$

and the transformation $t$ given by the canonical maps

$$
\Omega_{P / A} \otimes_{P} B \longrightarrow \Omega_{P \otimes_{A} A^{\prime} / A^{\prime}} \otimes_{P \otimes_{A} A^{\prime}} B^{\prime}
$$

to get a canonical map

$$
L \pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right) \longrightarrow L \pi_{!}^{\prime}\left(\Omega_{\mathcal{O}^{\prime} / A^{\prime}} \otimes_{\mathcal{O}^{\prime}} \underline{B^{\prime}}\right)
$$

By Lemma 75.4 .3 this gives $L_{B / A} \rightarrow L_{B^{\prime} / A^{\prime}}$. We omit the verification that this map agrees with the map defined above in terms of simplicial resolutions.
08QP Lemma 75.6.1. Assume 75.6.0.1 induces a quasi-isomorphism $B \otimes_{A}^{\mathbf{L}} A^{\prime}=B^{\prime}$. Then, with notation as in (75.6.0.2) and $\mathcal{F}^{\prime} \in A b\left(\mathcal{C}^{\prime}\right)$, we have $L \pi!\left(g^{-1} \mathcal{F}^{\prime}\right)=$ $L \pi_{!}^{\prime}\left(\mathcal{F}^{\prime}\right)$.

Proof. We use the results of Remark 75.5 .5 without further mention. We will apply Cohomology on Sites, Lemma 21.30.8. Let $P_{\bullet} \rightarrow B$ be a resolution. If we can show that $u\left(P_{\bullet}\right)=P_{\bullet} \otimes_{A} A^{\prime} \rightarrow B^{\prime}$ is a quasi-isomorphism, then we are done. The complex of $A$-modules $s\left(P_{\bullet}\right)$ associated to $P_{\bullet}$ (viewed as a simplicial $A$-module) is a free $A$-module resolution of $B$. Namely, $P_{n}$ is a free $A$-module and $s\left(P_{\bullet}\right) \rightarrow B$ is a quasi-isomorphism. Thus $B \otimes_{A}^{\mathbf{L}} A^{\prime}$ is computed by $s\left(P_{\bullet}\right) \otimes_{A} A^{\prime}=s\left(P_{\bullet} \otimes_{A} A^{\prime}\right)$. Therefore the assumption of the lemma signifies that $\epsilon^{\prime}: P_{\bullet} \otimes_{A} A^{\prime} \rightarrow B^{\prime}$ is a quasi-isomorphism.

The following lemma in particular applies when $A \rightarrow A^{\prime}$ is flat and $B^{\prime}=B \otimes_{A} A^{\prime}$ (flat base change).
08QQ Lemma 75.6.2. If 75.6.0.1 induces a quasi-isomorphism $B \otimes_{A}^{\mathbf{L}} A^{\prime}=B^{\prime}$, then the functoriality map induces an isomorphism

$$
L_{B / A} \otimes_{B}^{\mathbf{L}} B^{\prime} \longrightarrow L_{B^{\prime} / A^{\prime}}
$$

Proof. We will use the notation introduced in Equation 75.6.0.2. We have

$$
L_{B / A} \otimes_{B}^{\mathbf{L}} B^{\prime}=L \pi_{!}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right) \otimes_{B}^{\mathbf{L}} B^{\prime}=L \pi_{!}\left(L h^{*}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right)\right)
$$

the first equality by Lemma 75.4 .3 and the second by Cohomology on Sites, Lemma 21.30.6 Since $\Omega_{\mathcal{O} / A}$ is a flat $\mathcal{O}$-module, we see that $\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}$ is a flat $\underline{B}$-module. Thus $L h^{*}\left(\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}\right)=\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B^{\prime}}$ which is equal to $g^{-1}\left(\Omega_{\mathcal{O}^{\prime} / A^{\prime}} \otimes_{\mathcal{O}^{\prime}} \underline{B^{\prime}}\right)$ by inspection. we conclude by Lemma 75.6 .1 and the fact that $L_{B^{\prime} / A^{\prime}}$ is computed by $L \pi_{!}^{\prime}\left(\Omega_{\mathcal{O}^{\prime} / A^{\prime}} \otimes_{\mathcal{O}^{\prime}} \underline{B^{\prime}}\right)$.

08SB Remark 75.6.3. Suppose that we are given a square 75.6.0.1 such that there exists an arrow $\kappa: B \rightarrow A^{\prime}$ making the diagram commute:

In this case we claim the functoriality map $P_{\bullet} \rightarrow P_{\bullet}^{\prime}$ is homotopic to the composition $P_{\bullet} \rightarrow B \rightarrow A^{\prime} \rightarrow P_{\bullet}^{\prime}$. Namely, using $\kappa$ the functoriality map factors as

$$
P_{\bullet} \rightarrow P_{A^{\prime} / A^{\prime}, \bullet} \rightarrow P_{\bullet}^{\prime}
$$

where $P_{A^{\prime} / A^{\prime}, \bullet}$ is the standard resolution of $A^{\prime}$ over $A^{\prime}$. Since $A^{\prime}$ is the polynomial algebra on the empty set over $A^{\prime}$ we see from Simplicial, Lemma 14.33 .5 that the augmentation $\epsilon_{A^{\prime} / A^{\prime}}: P_{A^{\prime} / A^{\prime}, \bullet} \rightarrow A^{\prime}$ is a homotopy equivalence of simplicial rings. Observe that the homotopy inverse map $c: A^{\prime} \rightarrow P_{A^{\prime} / A^{\prime}, \bullet}$ constructed in the proof of that lemma is just the structure morphism, hence we conclude what we want because the two compositions

$$
P_{\bullet} \longrightarrow P_{A^{\prime} / A^{\prime}, \bullet} \xrightarrow[\operatorname{co~}_{A^{\prime} / A^{\prime}}]{\mathrm{id}} P_{A^{\prime} / A^{\prime}, \bullet} \longrightarrow P_{\bullet}^{\prime}
$$

are the two maps discussed above and these are homotopic (Simplicial, Remark 14.26 .5 . Since the second map $P_{\bullet} \rightarrow P_{\bullet}^{\prime}$ induces the zero map $\Omega_{P_{\bullet} / A} \rightarrow \Omega_{P_{\bullet}^{\prime} / A^{\prime}}$ we conclude that the functoriality map $L_{B / A} \rightarrow L_{B^{\prime} / A^{\prime}}$ is homotopic to zero in this case.

08SC Lemma 75.6.4. Let $A \rightarrow B$ and $A \rightarrow C$ be ring maps. Then the map $L_{B \times C / A} \rightarrow$ $L_{B / A} \oplus L_{C / A}$ is an isomorphism in $D(B \times C)$.

Proof. Although this lemma can be deduced from the fundamental triangle we will give a direct and elementary proof of this now. Factor the ring map $A \rightarrow B \times C$ as $A \rightarrow A[x] \rightarrow B \times C$ where $x \mapsto(1,0)$. By Lemma 75.5 .8 we have a distinguished triangle

$$
L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}}(B \times C) \rightarrow L_{B \times C / A} \rightarrow L_{B \times C / A[x]} \rightarrow L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}}(B \times C)[1]
$$

in $D(B \times C)$. Similarly we have the distinguished triangles

$$
\begin{array}{r}
L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}} B \rightarrow L_{B / A} \rightarrow L_{B / A[x]} \rightarrow L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}} B[1] \\
L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}} C \rightarrow L_{C / A} \rightarrow L_{C / A[x]} \rightarrow L_{A[x] / A} \otimes_{A[x]}^{\mathbf{L}} C[1]
\end{array}
$$

Thus it suffices to prove the result for $B \times C$ over $A[x]$. Note that $A[x] \rightarrow A\left[x, x^{-1}\right]$ is flat, that $(B \times C) \otimes_{A[x]} A\left[x, x^{-1}\right]=B \otimes_{A[x]} A\left[x, x^{-1}\right]$, and that $C \otimes_{A[x]} A\left[x, x^{-1}\right]=0$. Thus by base change (Lemma 75.6.2) the map $L_{B \times C / A[x]} \rightarrow L_{B / A[x]} \oplus L_{C / A[x]}$ becomes an isomorphism after inverting $x$. In the same way one shows that the map becomes an isomorphism after inverting $x-1$. This proves the lemma.

### 75.7. The fundamental triangle

08QR In this section we consider a sequence of ring maps $A \rightarrow B \rightarrow C$. It is our goal to show that this triangle gives rise to a distinguished triangle

$$
\begin{equation*}
L_{B / A} \otimes_{B}^{\mathbf{L}} C \rightarrow L_{C / A} \rightarrow L_{C / B} \rightarrow L_{B / A} \otimes_{B}^{\mathbf{L}} C[1] \tag{75.7.0.1}
\end{equation*}
$$

in $D(C)$. This will be proved in Proposition 75.7 .4 . For an alternative approach see Remark 75.7.5
Consider the category $\mathcal{C}_{C / B / A}$ wich is the opposite of the category whose objects are $(P \rightarrow B, Q \rightarrow C)$ where
(1) $P$ is a polynomial algebra over $A$,
(2) $P \rightarrow B$ is an $A$-algebra homomorphism,
(3) $Q$ is a polynomial algebra over $P$, and
(4) $Q \rightarrow C$ is a $P$-algebra-homomorphism.

We take the opposite as we want to think of $(P \rightarrow B, Q \rightarrow C)$ as corresponding to the commutative diagram

Let $\mathcal{C}_{B / A}, \mathcal{C}_{C / A}, \mathcal{C}_{C / B}$ be the categories considered in Section 75.4 . There are functors

$$
\begin{array}{lc}
u_{1}: \mathcal{C}_{C / B / A} \rightarrow \mathcal{C}_{B / A}, & (P \rightarrow B, Q \rightarrow C) \mapsto(P \rightarrow B) \\
u_{2}: \mathcal{C}_{C / B / A} \rightarrow \mathcal{C}_{C / A}, & (P \rightarrow B, Q \rightarrow C) \mapsto(Q \rightarrow C) \\
u_{3}: \mathcal{C}_{C / B / A} \rightarrow \mathcal{C}_{C / B}, & (P \rightarrow B, Q \rightarrow C) \mapsto\left(Q \otimes_{P} B \rightarrow C\right)
\end{array}
$$

These functors induce corresponding morphisms of topoi $g_{i}$. Let us denote $\mathcal{O}_{i}=$ $g_{i}^{-1} \mathcal{O}$ so that we get morphisms of ringed topoi

$$
\begin{aligned}
& g_{1}:\left(S h\left(\mathcal{C}_{C / B / A}\right), \mathcal{O}_{1}\right) \longrightarrow\left(S h\left(\mathcal{C}_{B / A}\right), \mathcal{O}\right) \\
& g_{2}:\left(S h\left(\mathcal{C}_{C / B / A}\right), \mathcal{O}_{2}\right) \longrightarrow\left(S h\left(\mathcal{C}_{C / A}\right), \mathcal{O}\right) \\
& g_{3}:\left(S h\left(\mathcal{C}_{C / B / A}\right), \mathcal{O}_{3}\right) \longrightarrow\left(S h\left(\mathcal{C}_{C / B}\right), \mathcal{O}\right)
\end{aligned}
$$

Let us denote $\pi: \operatorname{Sh}\left(\mathcal{C}_{C / B / A}\right) \rightarrow \operatorname{Sh}(*), \pi_{1}: \operatorname{Sh}\left(\mathcal{C}_{B / A}\right) \rightarrow \operatorname{Sh}(*), \pi_{2}: \operatorname{Sh}\left(\mathcal{C}_{C / A}\right) \rightarrow$ $\operatorname{Sh}(*)$, and $\pi_{3}: \operatorname{Sh}\left(\mathcal{C}_{C / B}\right) \rightarrow \operatorname{Sh}(*)$, so that $\pi=\pi_{i} \circ g_{i}$. We will obtain our distinguished triangle from the identification of the cotangent complex in Lemma 75.4 .3 and the following lemmas.

08QU Lemma 75.7.1. With notation as in 75.7.0.2) set

$$
\begin{aligned}
& \Omega_{1}=\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B} \text { on } \mathcal{C}_{B / A} \\
& \Omega_{2}=\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{C} \text { on } \mathcal{C}_{C / A} \\
& \Omega_{3}=\Omega_{\mathcal{O} / B} \otimes_{\mathcal{O}} \underline{C} \text { on } \mathcal{C}_{C / B}
\end{aligned}
$$

Then we have a canonical short exact sequence of sheaves of $\underline{C}$-modules

$$
0 \rightarrow g_{1}^{-1} \Omega_{1} \otimes_{\underline{B}} \underline{C} \rightarrow g_{2}^{-1} \Omega_{2} \rightarrow g_{3}^{-1} \Omega_{3} \rightarrow 0
$$

on $\mathcal{C}_{C / B / A}$.
Proof. Recall that $g_{i}^{-1}$ is gotten by simply precomposing with $u_{i}$. Given an object $U=(P \rightarrow B, Q \rightarrow C)$ we have a split short exact sequence

$$
0 \rightarrow \Omega_{P / A} \otimes Q \rightarrow \Omega_{Q / A} \rightarrow \Omega_{Q / P} \rightarrow 0
$$

for example by Algebra, Lemma 10.136.9. Tensoring with $C$ over $Q$ we obtain a short exact sequence

$$
0 \rightarrow \Omega_{P / A} \otimes C \rightarrow \Omega_{Q / A} \otimes C \rightarrow \Omega_{Q / P} \otimes C \rightarrow 0
$$

We have $\Omega_{P / A} \otimes C=\Omega_{P / A} \otimes B \otimes C$ whence this is the value of $g_{1}^{-1} \Omega_{1} \otimes_{\underline{B}} \underline{C}$ on $U$. The module $\Omega_{Q / A} \otimes C$ is the value of $g_{2}^{-1} \Omega_{2}$ on $U$. We have $\Omega_{Q / P} \otimes C=\Omega_{Q \otimes_{P} B / B} \otimes C$ by Algebra, Lemma 10.130 .12 hence this is the value of $g_{3}^{-1} \Omega_{3}$ on $U$. Thus the short exact sequence of the lemma comes from assigning to $U$ the last displayed short exact sequence.

08QV Lemma 75.7.2. With notation as in 75.7.0.2 suppose that $C$ is a polynomial algebra over $B$. Then $L \pi_{!}\left(g_{3}^{-1} \mathcal{F}\right)=L \pi_{3,!} \mathcal{F}=\pi_{3,!} \mathcal{F}$ for any abelian sheaf $\mathcal{F}$ on $\mathcal{C}_{C / B}$

Proof. Write $C=B[E]$ for some set $E$. Choose a resolution $P_{\bullet} \rightarrow B$ of $B$ over $A$. For every $n$ consider the object $U_{n}=\left(P_{n} \rightarrow B, P_{n}[E] \rightarrow C\right)$ of $\mathcal{C}_{C / B / A}$. Then $U_{\bullet}$ is a cosimplicial object of $\mathcal{C}_{C / B / A}$. Note that $u_{3}\left(U_{\bullet}\right)$ is the constant cosimplicial object of $\mathcal{C}_{C / B}$ with value $(C \rightarrow C)$. We will prove that the object $U_{\bullet}$ of $\mathcal{C}_{C / B / A}$ satisfies the hypotheses of Cohomology on Sites, Lemma 21.30.7. This implies the lemma as it shows that $L \pi_{!}\left(g_{3}^{-1} \mathcal{F}\right)$ is computed by the constant simplicial abelian group $\mathcal{F}(C \rightarrow C)$ which is the value of $L \pi_{3,!} \mathcal{F}=\pi_{3,!} \mathcal{F}$ by Lemma 75.4.6.
Let $U=(\beta: P \rightarrow B, \gamma: Q \rightarrow C)$ be an object of $\mathcal{C}_{C / B / A}$. We may write $P=A[S]$ and $Q=A[S \amalg T]$ by the definition of our category $\mathcal{C}_{C / B / A}$. We have to show that

$$
\operatorname{Mor}_{\mathcal{C}_{C / B / A}}\left(U_{\bullet}, U\right)
$$

is homotopy equivalent to a singleton simplicial set *. Observe that this simplicial set is the product

$$
\Pi_{e \in S}{ }^{F_{x} \times} \times \prod_{\epsilon \epsilon T} F_{i}
$$

where $F_{s}$ is the corresponding simplicial set for $U_{s}=(A[\{s\}] \rightarrow B, A[\{s\}] \rightarrow C)$ and $F_{t}^{\prime}$ is the corresponding simplicial set for $U_{t}=(A \rightarrow B, A[\{t\}] \rightarrow C)$. Namely, the object $U$ is the product $\prod U_{s} \times \prod U_{t}$ in $\mathcal{C}_{C / B / A}$. It suffices each $F_{s}$ and $F_{t}^{\prime}$ is homotopy equivalent to $*$, see Simplicial, Lemma 14.26.10. The case of $F_{s}$ follows as $P_{\bullet} \rightarrow B$ is a trivial Kan fibration (as a resolution) and $F_{s}$ is the fibre of this map over $\beta(s)$. (Use Simplicial, Lemmas 14.30 .3 and 14.30 .8 . The case of $F_{t}^{\prime}$ is more interesting. Here we are saying that the fibre of

$$
P_{\bullet}[E] \longrightarrow C=B[E]
$$

over $\gamma(t) \in C$ is homotopy equivalent to a point. In fact we will show this map is a trivial Kan fibration. Namely, $P_{\bullet} \rightarrow B$ is a trivial can fibration. For any ring $R$ we have

$$
R[E]=\operatorname{colim}_{\Sigma \subset M a p\left(E, \mathbf{z}_{\geq 0}\right) \text { finite }} \prod_{I \in \Sigma} R
$$

(filtered colimit). Thus the displayed map of simplicial sets is a filtered colimit of trivial Kan fibrations, whence a trivial Kan fibration by Simplicial, Lemma 14.30.7.

08QW Lemma 75.7.3. With notation as in 75.7.0.2 we have $L g_{i,!} \circ g_{i}^{-1}=$ id for $i=1,2,3$ and hence also $L \pi_{!} \circ g_{i}^{-1}=L \pi_{i,!}$ for $i=1,2,3$.

Proof. Proof for $i=1$. We claim the functor $\mathcal{C}_{C / B / A}$ is a fibred category over $\mathcal{C}_{B / A}$ Namely, suppose given $(P \rightarrow B, Q \rightarrow C)$ and a morphism $\left(P^{\prime} \rightarrow B\right) \rightarrow(P \rightarrow B)$ of $\mathcal{C}_{B / A}$. Recall that this means we have an $A$-algebra homomorphism $P \rightarrow P^{\prime}$ compatible with maps to $B$. Then we set $Q^{\prime}=Q \otimes_{P} P^{\prime}$ with induced map to $C$ and the morphism

$$
\left(P^{\prime} \rightarrow B, Q^{\prime} \rightarrow C\right) \longrightarrow(P \rightarrow B, Q \rightarrow C)
$$

in $\mathcal{C}_{C / B / A}$ (note reversal arrows again) is strongly cartesian in $\mathcal{C}_{C / B / A}$ over $\mathcal{C}_{B / A}$. Moreover, observe that the fibre category of $u_{1}$ over $P \rightarrow B$ is the category $\mathcal{C}_{C / P}$. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}_{B / A}$. Since we have a fibred category we may apply Cohomology on Sites, Lemma 21.31.2 Thus $L_{n} g_{1,!} g_{1}^{-1} \mathcal{F}$ is the (pre)sheaf which assigns to $U \in \operatorname{Ob}\left(\mathcal{C}_{B / A}\right)$ the $n$th homology of $g_{1}^{-1} \mathcal{F}$ restricted to the fibre category over $U$. Since these restrictions are constant the desired result follows from Lemma 75.4 .4 via our identifications of fibre categories above.

The case $i=2$. We claim $\mathcal{C}_{C / B / A}$ is a fibred category over $\mathcal{C}_{C / A}$ is a fibred category. Namely, suppose given $(P \rightarrow B, Q \rightarrow C)$ and a morphism $\left(Q^{\prime} \rightarrow C\right) \rightarrow(Q \rightarrow C)$ of $\mathcal{C}_{C / A}$. Recall that this means we have a $B$-algebra homomorphism $Q \rightarrow Q^{\prime}$ compatible with maps to $C$. Then

$$
\left(P \rightarrow B, Q^{\prime} \rightarrow C\right) \longrightarrow(P \rightarrow B, Q \rightarrow C)
$$

is strongly cartesian in $\mathcal{C}_{C / B / A}$ over $\mathcal{C}_{C / A}$. Note that the fibre category of $u_{2}$ over $Q \rightarrow C$ has an final (beware reversal arrows) object, namely, $(A \rightarrow B, Q \rightarrow C)$. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}_{C / A}$. Since we have a fibred category we may apply Cohomology on Sites, Lemma 21.31.2. Thus $L_{n} g_{2,!} g_{2}^{-1} \mathcal{F}$ is the (pre)sheaf which assigns to $U \in \operatorname{Ob}\left(\mathcal{C}_{C / A}\right)$ the $n$th homology of $g_{1}^{-1} \mathcal{F}$ restricted to the fibre category over $U$. Since these restrictions are constant the desired result follows from Cohomology on Sites, Lemma 21.30 .5 because the fibre categories all have final objects.

The case $i=3$. In this case we will apply Cohomology on Sites, Lemma 21.31 .3 to $u=u_{3}: \mathcal{C}_{C / B / A} \rightarrow \mathcal{C}_{C / B}$ and $\mathcal{F}^{\prime}=g_{3}^{-1} \mathcal{F}$ for some abelian sheaf $\mathcal{F}$ on $\mathcal{C}_{C / B}$. Suppose $U=(\bar{Q} \rightarrow C)$ is an object of $\mathcal{C}_{C / B}$. Then $\mathcal{I}_{U}=\mathcal{C}_{\bar{Q} / B / A}$ (again beware of reversal of arrows). The sheaf $\mathcal{F}_{U}^{\prime}$ is given by the rule $(P \rightarrow B, Q \rightarrow \bar{Q}) \mapsto$ $\mathcal{F}\left(Q \otimes_{P} B \rightarrow C\right)$. In other words, this sheaf is the pullback of a sheaf on $\mathcal{C}_{\bar{Q} / C}$ via the morphism $\operatorname{Sh}\left(\mathcal{C}_{\bar{Q} / B / A}\right) \rightarrow \operatorname{Sh}\left(\mathcal{C}_{\bar{Q} / B}\right)$. Thus Lemma 75.7.2 shows that $H_{n}\left(\mathcal{I}_{U}, \mathcal{F}_{U}^{\prime}\right)=$ 0 for $n>0$ and equal to $\mathcal{F}(\bar{Q} \rightarrow C)$ for $n=0$. The aforementioned Cohomology on Sites, Lemma 21.31 .3 implies that $L g_{3,!}\left(g_{3}^{-1} \mathcal{F}\right)=\mathcal{F}$ and the proof is done.

08QX Proposition 75.7.4. Let $A \rightarrow B \rightarrow C$ be ring maps. There is a canonical distinguished triangle

$$
L_{B / A} \otimes_{B}^{\mathbf{L}} C \rightarrow L_{C / A} \rightarrow L_{C / B} \rightarrow L_{B / A} \otimes_{B}^{\mathbf{L}} C[1]
$$

in $D(C)$.
Proof. Consider the short exact sequence of sheaves of Lemma 75.7.1 and apply the derived functor $L \pi!$ to obtain a distinguished triangle

$$
L \pi!\left(g_{1}^{-1} \Omega_{1} \otimes_{\underline{B}} \underline{C}\right) \rightarrow L \pi!\left(g_{2}^{-1} \Omega_{2}\right) \rightarrow L \pi!\left(g_{3}^{-1} \Omega_{3}\right) \rightarrow L \pi!\left(g_{1}^{-1} \Omega_{1} \otimes_{\underline{B}} \underline{C}\right)[1]
$$

in $D(C)$. Using Lemmas 75.7 .3 and 75.4 .3 we see that the second and third terms agree with $L_{C / A}$ and $L_{C / B}$ and the first one equals

$$
L \pi_{1,!}\left(\Omega_{1} \otimes_{\underline{B}} \underline{C}\right)=L \pi_{1,!}\left(\Omega_{1}\right) \otimes_{B}^{\mathbf{L}} C=L_{B / A} \otimes_{B}^{\mathbf{L}} C
$$

The first equality by Cohomology on Sites, Lemma 21.30.6 (and flatness of $\Omega_{1}$ as a sheaf of modules over $\underline{B}$ ) and the second by Lemma 75.4 .3 .

08SD Remark 75.7.5. We sketch an alternative, perhaps simpler, proof of the existence of the fundamental triangle. Let $A \rightarrow B \rightarrow C$ be ring maps and assume that $B \rightarrow C$ is injective. Let $P_{\bullet} \rightarrow B$ be the standard resolution of $B$ over $A$ and let $Q_{\bullet} \rightarrow C$ be the standard resolution of $C$ over $B$. Picture

Observe that since $B \rightarrow C$ is injective, the ring $Q_{n}$ is a polynomial algebra over $P_{n}$ for all $n$. Hence we obtain a cosimplicial object in $\mathcal{C}_{C / B / A}$ (beware reversal arrows). Now set $\bar{Q}_{\bullet}=Q_{\bullet} \otimes_{P_{\bullet}} B$. The key to the proof of Proposition 75.7.4 is to show that $\bar{Q}_{\bullet}$ is a resolution of $C$ over $B$. This follows from Cohomology on Sites, Lemma 21.30 .12 applied to $\mathcal{C}=\Delta, \mathcal{O}=P_{\bullet}, \mathcal{O}^{\prime}=B$, and $\mathcal{F}=Q_{\bullet}$ (this uses that $Q_{n}$ is flat over $P_{n}$; see Cohomology on Sites, Remark 21.30 .11 to relate simplicial modules to sheaves). The key fact implies that the distinguished triangle of Proposition 75.7.4 is the distinguished triangle associated to the short exact sequence of simplicial $C$-modules

$$
0 \rightarrow \Omega_{P_{\bullet} / A} \otimes_{P_{\bullet}} C \rightarrow \Omega_{Q_{\bullet} / A} \otimes_{Q_{\bullet}} C \rightarrow \Omega_{\bar{Q}_{\bullet} / B} \otimes_{\bar{Q}_{\bullet}} C \rightarrow 0
$$

which is deduced from the short exact sequences $0 \rightarrow \Omega_{P_{n} / A} \otimes_{P_{n}} Q_{n} \rightarrow \Omega_{Q_{n} / A} \rightarrow$ $\Omega_{Q_{n} / P_{n}} \rightarrow 0$ of Algebra, Lemma 10.136.9. Namely, by Remark 75.5.5 and the key fact the complex on the right hand side represents $L_{C / B}$ in $D(C)$.

If $B \rightarrow C$ is not injective, then we can use the above to get a fundamental triangle for $A \rightarrow B \rightarrow B \times C$. Since $L_{B \times C / B} \rightarrow L_{B / B} \oplus L_{C / B}$ and $L_{B \times C / A} \rightarrow L_{B / A} \oplus$ $L_{C / A}$ are quasi-isomorphism in $D(B \times C)$ (Lemma 75.6.4) this induces the desired distinguished triangle in $D(C)$ by tensoring with the flat ring map $B \times C \rightarrow C$.

08SE Remark 75.7.6. Let $A \rightarrow B \rightarrow C$ be ring maps with $B \rightarrow C$ injective. Recall the notation $P_{\bullet}, Q_{\bullet}, \bar{Q}_{\bullet}$ of Remark 75.7.5. Let $R_{\bullet}$ be the standard resolution of $C$ over $B$. In this remark we explain how to get the canonical identification of $\Omega_{\bar{Q}_{\bullet} / B} \otimes_{\bar{Q}_{\bullet}} C$ with $L_{C / B}=\Omega_{R_{\bullet} / B} \otimes_{R_{\bullet}} C$. Let $S_{\bullet} \rightarrow B$ be the standard resolution of $\dot{B}$ over $\dot{B}$. Note that the functoriality map $S_{\bullet} \rightarrow R_{\bullet}$ identifies $R_{n}$ as a polynomial algebra over $S_{n}$ because $B \rightarrow C$ is injective. For example in degree 0 we have the map $B[B] \rightarrow B[C]$, in degree 1 the map $B[B[B]] \rightarrow B[B[C]]$, and so on. Thus $\bar{R}_{\bullet}=R_{\bullet} \otimes_{S_{\bullet}} B$ is a simplicial polynomial algebra over $B$ as well and it follows (as in Remark 75.7.5 from Cohomology on Sites, Lemma 21.30 .12 that $\bar{R}_{\bullet} \rightarrow C$ is a
resolution. Since we have a commutative diagram

we obtain a canonical map $\bar{Q}_{\bullet}=Q_{\bullet} \otimes_{P_{\bullet}} B \rightarrow \bar{R}_{\bullet}$. Thus the maps

$$
L_{C / B}=\Omega_{R_{\bullet} / B} \otimes_{R_{\bullet}} C \longrightarrow \Omega_{\bar{R}_{\bullet} / B} \otimes_{\bar{R}_{\bullet}} C \longleftarrow \Omega_{\bar{Q}_{\bullet} / B} \otimes_{\bar{Q}_{\bullet}} C
$$

are quasi-isomorphisms (Remark 75.5.5) and composing one with the inverse of the other gives the desired identification.

### 75.8. Localization and étale ring maps

08QY In this section we study what happens if we localize our rings. Let $A \rightarrow A^{\prime} \rightarrow B$ be ring maps such that $B=B \otimes_{A}^{\mathbf{L}} A^{\prime}$. This happens for example if $A^{\prime}=S^{-1} A$ is the localization of $A$ at a multiplicative subset $S \subset A$. In this case for an abelian sheaf $\mathcal{F}^{\prime}$ on $\mathcal{C}_{B / A^{\prime}}$ the homology of $g^{-1} \mathcal{F}^{\prime}$ over $\mathcal{C}_{B / A}$ agrees with the homology of $\mathcal{F}^{\prime}$ over $\mathcal{C}_{B / A^{\prime}}$, see Lemma 75.6 .1 for a precise statement.

08QZ Lemma 75.8.1. Let $A \rightarrow A^{\prime} \rightarrow B$ be ring maps such that $B=B \otimes_{A}^{\mathbf{L}} A^{\prime}$. Then $L_{B / A}=L_{B / A^{\prime}}$ in $D(B)$.
Proof. According to the discussion above (i.e., using Lemma 75.6.1) and Lemma 75.4 .3 we have to show that the sheaf given by the rule $(P \rightarrow B) \mapsto \Omega_{P / A} \otimes_{P} B$ on $\overline{\mathcal{C}_{B / A}}$ is the pullback of the sheaf given by the rule $(P \rightarrow B) \mapsto \Omega_{P / A^{\prime}} \otimes_{P} B$. The pullback functor $g^{-1}$ is given by precomposing with the functor $u: \mathcal{C}_{B / A} \rightarrow \mathcal{C}_{B / A^{\prime}}$, $(P \rightarrow B) \mapsto\left(P \otimes_{A} A^{\prime} \rightarrow B\right)$. Thus we have to show that

$$
\Omega_{P / A} \otimes_{P} B=\Omega_{P \otimes_{A} A^{\prime} / A^{\prime}} \otimes_{\left(P \otimes_{A} A^{\prime}\right)} B
$$

By Algebra, Lemma 10.130 .12 the right hand side is equal to

$$
\left(\Omega_{P / A} \otimes_{A} A^{\prime}\right) \otimes_{\left(P \otimes_{A} A^{\prime}\right)} B
$$

Since $P$ is a polynomial algebra over $A$ the module $\Omega_{P / A}$ is free and the equality is obvious.
08R0 Lemma 75.8.2. Let $A \rightarrow B$ be a ring map such that $B=B \otimes_{A}^{\mathbf{L}} B$. Then $L_{B / A}=0$ in $D(B)$.
Proof. This is true because $L_{B / A}=L_{B / B}=0$ by Lemmas 75.8.1 and 75.4.7.
08R1 Lemma 75.8.3. Let $A \rightarrow B$ be a ring map such that $\operatorname{Tor}_{i}^{A}(B, B)=0$ for $i>0$ and such that $L_{B / B \otimes_{A} B}=0$. Then $L_{B / A}=0$ in $D(B)$.
Proof. By Lemma 75.6.2 we see that $L_{B / A} \otimes_{B}^{\mathbf{L}}\left(B \otimes_{A} B\right)=L_{B \otimes_{A} B / B}$. Now we use the distinguished triangle 75.7.0.1

$$
L_{B \otimes_{A} B / B} \otimes_{\left(B \otimes_{A} B\right)}^{\mathrm{L}} B \rightarrow L_{B / B} \rightarrow L_{B / B \otimes_{A} B} \rightarrow L_{B \otimes_{A} B / B} \otimes_{\left(B \otimes_{A} B\right)}^{\mathrm{L}} B[1]
$$

associated to the ring maps $B \rightarrow B \otimes_{A} B \rightarrow B$ and the vanishing of $L_{B / B}$ (Lemma 75.4.7) and $L_{B / B \otimes_{A} B}$ (assumed) to see that

$$
0=L_{B \otimes_{A} B / B} \otimes_{\left(B \otimes_{A} B\right)}^{\mathbf{L}} B=L_{B / A} \otimes_{B}^{\mathbf{L}}\left(B \otimes_{A} B\right) \otimes_{\left(B \otimes_{A} B\right)}^{\mathbf{L}} B=L_{B / A}
$$

as desired.

08R2 Lemma 75.8.4. The cotangent complex $L_{B / A}$ is zero in each of the following cases:
(1) $A \rightarrow B$ and $B \otimes_{A} B \rightarrow B$ are flat, i.e., $A \rightarrow B$ is weakly étale (More on Algebra, Definition 15.78.1),
(2) $A \rightarrow B$ is a flat epimorphism of rings,
(3) $B=S^{-1} A$ for some multiplicative subset $S \subset A$,
(4) $A \rightarrow B$ is unramified and flat,
(5) $A \rightarrow B$ is étale,
(6) $A \rightarrow B$ is a filtered colimit of ring maps for which the cotangent complex vanishes,
(7) $B$ is a henselization of a local ring of $A$,
(8) $B$ is a strict henselization of a local ring of $A$, and
(9) add more here.

Proof. In case (1) we may apply Lemma 75.8 .2 to the surjective flat ring map $B \otimes_{A} B \rightarrow B$ to conclude that $L_{B \otimes_{A} B / B}=0$ and then we use Lemma 75.8 .3 to conclude. The cases (2) - (5) are each special cases of (1). Part (6) follows from Lemma 75.3.4 Parts (7) and (8) follows from the fact that (strict) henselizations are filtered colimits of étale ring extensions of $A$, see Algebra, Lemmas 10.148.21 and 10.148 .27

08R3 Lemma 75.8.5. Let $A \rightarrow B \rightarrow C$ be ring maps such that $L_{C / B}=0$. Then $L_{C / A}=L_{B / A} \otimes_{B}^{\mathbf{L}} C$.
Proof. This is a trivial consequence of the distinguished triangle 75.7.0.1.
08SF Lemma 75.8.6. Let $A \rightarrow B$ be ring maps and $S \subset A, T \subset B$ multiplicative subsets such that $S$ maps into $T$. Then $L_{T^{-1} B / S^{-1} A}=L_{B / A} \otimes_{B} T^{-1} B$ in $D\left(T^{-1} B\right)$.
Proof. Lemma 75.8 .5 shows that $L_{T^{-1} B / A}=L_{B / A} \otimes_{B} T^{-1} B$ and Lemma 75.8.1 shows that $L_{T^{-1} B / A}=L_{T^{-1} B / S^{-1} A}$.
08UN Lemma 75.8.7. Let $A \rightarrow B$ be a local ring homomorphism of local rings. Let $A^{h} \rightarrow B^{h}$, resp. $A^{\text {sh }} \rightarrow B^{\text {sh }}$ be the induced maps of henselizations, resp. strict henselizations. Then

$$
L_{B^{h} / A^{h}}=L_{B^{h} / A}=L_{B / A} \otimes_{B}^{\mathbf{L}} B^{h} \quad \text { resp. } \quad L_{B^{s h} / A^{s h}}=L_{B^{s h} / A}=L_{B / A} \otimes_{B}^{\mathbf{L}} B^{s h}
$$

in $D\left(B^{h}\right)$, resp. $D\left(B^{s h}\right)$.
Proof. The complexes $L_{A^{h} / A}, L_{A^{s h} / A}, L_{B^{h} / B}$, and $L_{B^{s h} / B}$ are all zero by Lemma 75.8.4. Using the fundamental distinguished triangle 75.7.0.1 for $A \rightarrow B \rightarrow B^{h}$ we obtain $L_{B^{h} / A}=L_{B / A} \otimes_{B}^{\mathbf{L}} B^{h}$. Using the fundamental triangle for $A \rightarrow A^{h} \rightarrow B^{h}$ we obtain $L_{B^{h} / A^{h}}=L_{B^{h} / A}$. Similarly for strict henselizations.

### 75.9. Smooth ring maps

08R4 Let $C \rightarrow B$ be a surjection of rings with kernel $I$. Let us call such a ring map "weakly quasi-regular" if $I / I^{2}$ is a flat $B$-module and $\operatorname{Tor}_{*}^{C}(B, B)$ is the exterior algebra on $I / I^{2}$. The generalization to "smooth ring maps" of what is done in Lemma 75.8 .4 for "étale ring maps" is to look at flat ring maps $A \rightarrow B$ such that the multiplication map $B \otimes_{A} B \rightarrow B$ is weakly quasi-regular. For the moment we just stick to smooth ring maps.

08R5 Lemma 75.9.1. If $A \rightarrow B$ is a smooth ring map, then $L_{B / A}=\Omega_{B / A}[0]$.
Proof. We have the agreement in cohomological degree 0 by Lemma 75.4.5. Thus it suffices to prove the other cohomology groups are zero. It suffices to prove this locally on $\operatorname{Spec}(B)$ as $L_{B_{g} / A}=\left(L_{B / A}\right)_{g}$ for $g \in B$ by Lemma 75.8.5 Thus we may assume that $A \rightarrow B$ is standard smooth (Algebra, Lemma 10.135.10), i.e., that we can factor $A \rightarrow B$ as $A \rightarrow A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ with $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ étale. In this case Lemmas 75.8 .4 and Lemma 75.8 .5 show that $L_{B / A}=L_{A\left[x_{1}, \ldots, x_{n}\right] / A} \otimes B$ whence the conclusion by Lemma 75.4.7.

### 75.10. Comparison with the naive cotangent complex

08R6 The naive cotangent complex was introduced in Algebra, Section 10.132 .
08R7 Remark 75.10.1. Let $A \rightarrow B$ be a ring map. Working on $\mathcal{C}_{B / A}$ as in Section 75.4 let $\mathcal{J} \subset \mathcal{O}$ be the kernel of $\mathcal{O} \rightarrow \underline{B}$. Note that $L \pi!(\mathcal{J})=0$ by Lemma 75.5.7. Set $\Omega=\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}$ so that $L_{B / A}=L \pi_{!}(\Omega)$ by Lemma 75.4.3. It follows that $L \pi!(\mathcal{J} \rightarrow \Omega)=L \pi!(\Omega)=L_{B / A}$. Thus, for any object $U=(P \rightarrow B)$ of $\mathcal{C}_{B / A}$ we obtain a map

08R8 (75.10.1.1)

$$
\left(J \rightarrow \Omega_{P / A} \otimes_{P} B\right) \longrightarrow L_{B / A}
$$

where $J=\operatorname{Ker}(P \rightarrow B)$ in $D(A)$, see Cohomology on Sites, Remark 21.30.4. Continuing in this manner, note that $L \pi_{!}\left(\mathcal{J} \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}\right)=L \pi_{!}(\mathcal{J})=0$ by Lemma 75.5.6. Since $\operatorname{Tor}_{0}^{\mathcal{O}}(\mathcal{J}, \underline{B})=\mathcal{J} / \mathcal{J}^{2}$ the spectral sequence

$$
H_{p}\left(\mathcal{C}_{B / A}, \operatorname{Tor}_{q}^{\mathcal{O}}(\mathcal{J}, \underline{B})\right) \Rightarrow H_{p+q}\left(\mathcal{C}_{B / A}, \mathcal{J} \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}\right)=0
$$

(dual of Derived Categories, Lemma 13.21.3) implies that $H_{0}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right)=0$ and $H_{1}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right)=0$. It follows that the complex of $\underline{B}$-modules $\mathcal{J} / \mathcal{J}^{2} \rightarrow \Omega$ satisfies $\tau_{\geq-1} L \pi_{!}\left(\mathcal{J} / \mathcal{J}^{2} \rightarrow \Omega\right)=\tau_{\geq-1} L_{B / A}$. Thus, for any object $U=(P \rightarrow B)$ of $\mathcal{C}_{B / A}$ we obtain a map

08R9

$$
\begin{equation*}
\left(J / J^{2} \rightarrow \Omega_{P / A} \otimes_{P} B\right) \longrightarrow \tau_{\geq-1} L_{B / A} \tag{75.10.1.2}
\end{equation*}
$$

in $D(B)$, see Cohomology on Sites, Remark 21.30.4.
The first case is where we have a surjection of rings.
08RA Lemma 75.10.2. Let $A \rightarrow B$ be a surjective ring map with kernel $I$. Then $H^{0}\left(L_{B / A}\right)=0$ and $H^{-1}\left(L_{B / A}\right)=I / I^{2}$. This isomorphism comes from the map 75.10.1.2) for the object $(A \rightarrow B)$ of $\mathcal{C}_{B / A}$.

Proof. We will show below (using the surjectivity of $A \rightarrow B$ ) that there exists a short exact sequence

$$
0 \rightarrow \pi^{-1}\left(I / I^{2}\right) \rightarrow \mathcal{J} / \mathcal{J}^{2} \rightarrow \Omega \rightarrow 0
$$

of sheaves on $\mathcal{C}_{B / A}$. Taking $L \pi$ ! and the associated long exact sequence of homology, and using the vanishing of $H_{1}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right)$ and $H_{0}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right)$ shown in Remark 75.10 .1 we obtain what we want using Lemma 75.4.4.

What is left is to verify the local statement mentioned above. For every object $U=(P \rightarrow B)$ of $\mathcal{C}_{B / A}$ we can choose an isomorphism $P=A[E]$ such that the map $P \rightarrow B$ maps each $e \in E$ to zero. Then $J=\mathcal{J}(U) \subset P=\mathcal{O}(U)$ is equal to
$J=I P+(e ; e \in E)$. The value on $U$ of the short sequence of sheaves above is the sequence

$$
0 \rightarrow I / I^{2} \rightarrow J / J^{2} \rightarrow \Omega_{P / A} \otimes_{P} B \rightarrow 0
$$

Verification omitted (hint: the only tricky point is that $I P \cap J^{2}=I J$; which follows for example from More on Algebra, Lemma 15.23.8).

08RB Lemma 75.10.3. Let $A \rightarrow B$ be a ring map. Then $\tau_{\geq-1} L_{B / A}$ is canonically quasi-isomorphic to the naive cotangent complex.
Proof. Consider $P=A[B] \rightarrow B$ with kernel $I$. The naive cotangent complex $N L_{B / A}$ of $B$ over $A$ is the complex $I / I^{2} \rightarrow \Omega_{P / A} \otimes_{P} B$, see Algebra, Definition 10.132.1. Observe that in 75.10 .1 .2 we have already constructed a canonical map

$$
c: N L_{B / A} \longrightarrow \tau_{\geq-1} L_{B / A}
$$

Consider the distinguished triangle 75.7.0.1

$$
L_{P / A} \otimes_{P}^{\mathbf{L}} B \rightarrow L_{B / A} \rightarrow L_{B / P} \rightarrow\left(L_{P / A} \otimes_{P}^{\mathbf{L}} B\right)[1]
$$

associated to the ring maps $A \rightarrow A[B] \rightarrow B$. We know that $L_{P / A}=\Omega_{P / A}[0]=$ $N L_{P / A}$ in $D(P)$ (Lemma 75.4.7 and Algebra, Lemma 10.132.3) and that $\tau_{\geq-1} L_{B / P}=$ $I / I^{2}[1]=N L_{B / P}$ in $D(B)$ (Lemma 75.10 .2 and Algebra, Lemma 10.132.6). To show $c$ is a quasi-isomorphism it suffices by Algebra, Lemma 10.132 .4 and the long exact cohomology sequence associated to the distinguished triangle to show that the maps $L_{P / A} \rightarrow L_{B / A} \rightarrow L_{B / P}$ are compatible on cohomology groups with the corresponding maps $N L_{P / A} \rightarrow N L_{B / A} \rightarrow N L_{B / P}$ of the naive cotangent complex. We omit the verification.

08UP Remark 75.10.4. We can make the comparison map of Lemma 75.10.3 explicit in the following way. Let $P_{\bullet}$ be the standard resolution of $B$ over $A$. Let $I=$ $\operatorname{Ker}(A[B] \rightarrow B)$. Recall that $P_{0}=A[B]$. The map of the lemma is given by the commutative diagram

We construct the downward arrow with target $I / I^{2}$ by sending $\mathrm{d} f \otimes b$ to the class of $\left(d_{0}(f)-d_{1}(f)\right) b$ in $I / I^{2}$. Here $d_{i}: P_{1} \rightarrow P_{0}, i=0,1$ are the two face maps of the simplicial structure. This makes sense as $d_{0}-d_{1}$ maps $P_{1}$ into $I=\operatorname{Ker}\left(P_{0} \rightarrow B\right)$. We omit the verification that this rule is well defined. Our map is compatible with the differential $\Omega_{P_{1} / A} \otimes_{P_{1}} B \rightarrow \Omega_{P_{0} / A} \otimes_{P_{0}} B$ as this differential maps $\mathrm{d} f \otimes b$ to $\mathrm{d}\left(d_{0}(f)-d_{1}(f)\right) \otimes b$. Moreover, the differential $\Omega_{P_{2} / A} \otimes_{P_{2}} B \rightarrow \Omega_{P_{1} / A} \otimes_{P_{1}} B$ maps $\mathrm{d} f \otimes b$ to $\mathrm{d}\left(d_{0}(f)-d_{1}(f)+d_{2}(f)\right) \otimes b$ which are annihilated by our downward arrow. Hence a map of complexes. We omit the verification that this is the same as the map of Lemma 75.10.3.
09D5 Remark 75.10.5. Adopt notation as in Remark 75.10.1. The arguments given there show that the differential

$$
H_{2}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right) \longrightarrow H_{0}\left(\mathcal{C}_{B / A}, \operatorname{Tor}_{1}^{\mathcal{O}}(\mathcal{J}, \underline{B})\right)
$$

of the spectral sequence is an isomorphism. Let $\mathcal{C}_{B / A}^{\prime}$ denote the full subcategory of $\mathcal{C}_{B / A}$ consisting of surjective maps $P \rightarrow B$. The agreement of the cotangent
complex with the naive cotangent complex (Lemma 75.10.3) shows that we have an exact sequence of sheaves

$$
0 \rightarrow \underline{H_{1}\left(L_{B / A}\right)} \rightarrow \mathcal{J} / \mathcal{J}^{2} \xrightarrow{\mathrm{~d}} \Omega \rightarrow \underline{H_{2}\left(L_{B / A}\right)} \rightarrow 0
$$

on $\mathcal{C}_{B / A}^{\prime}$. It follows that $\operatorname{Ker}(d)$ and $\operatorname{Coker}(d)$ on the whole category $\mathcal{C}_{B / A}$ have vanishing higher homology groups, since these are computed by the homology groups of constant simplicial abelian groups by Lemma 75.4.1. Hence we conclude that

$$
H_{n}\left(\mathcal{C}_{B / A}, \mathcal{J} / \mathcal{J}^{2}\right) \rightarrow H_{n}\left(L_{B / A}\right)
$$

is an isomorphism for all $n \geq 2$. Combined with the remark above we obtain the formula $H_{2}\left(L_{B / A}\right)=H_{0}\left(\mathcal{C}_{B / A}, \operatorname{Tor}_{1}^{\mathcal{O}}(\mathcal{J}, \underline{B})\right)$.

### 75.11. A spectral sequence of Quillen

08 RC In this section we discuss a spectral sequence relating derived tensor product to the cotangent complex.

08RD Lemma 75.11.1. Notation and assumptions as in Cohomology on Sites, Example 21.30.1. Assume $\mathcal{C}$ has a cosimplicial object as in Cohomology on Sites, Lemma 21.30.7. Let $\mathcal{F}$ be a flat $\underline{B}$-module such that $H_{0}(\mathcal{C}, \mathcal{F})=0$. Then $H_{l}\left(\mathcal{C}, \operatorname{Sym}_{\underline{B}}^{k}(\mathcal{F})\right)=$ 0 for $l<k$.

Proof. We drop the subscript $\underline{B}$ from tensor products, wedge powers, and symmetric powers. We will prove the lemma by induction on $k$. The cases $k=0,1$ follow from the assumptions. If $k>1$ consider the exact complex

$$
\ldots \rightarrow \wedge^{2} \mathcal{F} \otimes \operatorname{Sym}^{k-2} \mathcal{F} \rightarrow \mathcal{F} \otimes \operatorname{Sym}^{k-1} \mathcal{F} \rightarrow \operatorname{Sym}^{k} \mathcal{F} \rightarrow 0
$$

with differentials as in the Koszul complex. If we think of this as a resolution of $\operatorname{Sym}^{k} \mathcal{F}$, then this gives a first quadrant spectral sequence

$$
E_{1}^{p, q}=H_{p}\left(\mathcal{C}, \wedge^{q+1} \mathcal{F} \otimes \operatorname{Sym}^{k-q-1} \mathcal{F}\right) \Rightarrow H_{p+q}\left(\mathcal{C}, \operatorname{Sym}^{k}(\mathcal{F})\right)
$$

By Cohomology on Sites, Lemma 21.30.10 we have

$$
\left.L \pi!\left(\wedge^{q+1} \mathcal{F} \otimes \operatorname{Sym}^{k-q-1} \mathcal{F}\right)=L \pi!\left(\wedge^{q+1} \mathcal{F}\right) \otimes_{B}^{\mathbf{L}} L \pi!\left(\operatorname{Sym}^{k-q-1} \mathcal{F}\right)\right)
$$

It follows (from the construction of derived tensor products) that the induction hypothesis combined with the vanishing of $H_{0}\left(\mathcal{C}, \wedge^{q+1}(\mathcal{F})\right)=0$ will prove what we want. This is true because $\wedge^{q+1}(\mathcal{F})$ is a quotient of $\mathcal{F}^{\otimes q+1}$ and $H_{0}\left(\mathcal{C}, \mathcal{F}^{\otimes q+1}\right)$ is a quotient of $H_{0}(\mathcal{C}, \mathcal{F})^{\otimes q+1}$ which is zero.

08SG Remark 75.11.2. In the situation of Lemma 75.11.1 one can show that $H_{k}\left(\mathcal{C}, \operatorname{Sym}^{k}(\mathcal{F})\right)=$ $\wedge_{B}^{k}\left(H_{1}(\mathcal{C}, \mathcal{F})\right)$. Namely, it can be deduced from the proof that $H_{k}\left(\mathcal{C}, \operatorname{Sym}^{k}(\mathcal{F})\right)$ is the $S_{k}$-coinvariants of

$$
H^{-k}\left(L \pi_{!}(\mathcal{F}) \otimes_{B}^{\mathbf{L}} L \pi!(\mathcal{F}) \otimes_{B}^{\mathbf{L}} \ldots \otimes_{B}^{\mathbf{L}} L \pi!(\mathcal{F})\right)=H_{1}(\mathcal{C}, \mathcal{F})^{\otimes k}
$$

Thus our claim is that this action is given by the usual action of $S_{k}$ on the tensor product multiplied by the sign character. To prove this one has to work through the sign conventions in the definition of the total complex associated to a multicomplex. We omit the verification.
08RE Lemma 75.11.3. Let $A$ be a ring. Let $P=A[E]$ be a polynomial ring. Set $I=(e ; e \in E) \subset P$. The maps $\operatorname{Tor}_{i}^{P}\left(A, I^{n+1}\right) \rightarrow \operatorname{Tor}_{i}^{P}\left(A, I^{n}\right)$ are zero for all $i$ and $n$.

Proof. Denote $x_{e} \in P$ the variable corresponding to $e \in E$. A free resolution of $A$ over $P$ is given by the Koszul complex $K_{\bullet}$ on the $x_{e}$. Here $K_{i}$ has basis given by wedges $e_{1} \wedge \ldots \wedge e_{i}, e_{1}, \ldots, e_{i} \in E$ and $d(e)=x_{e}$. Thus $K_{\bullet} \otimes_{P} I^{n}=I^{n} K_{\bullet}$ computes $\operatorname{Tor}_{i}^{P}\left(A, I^{n}\right)$. Observe that everything is graded with $\operatorname{deg}\left(x_{e}\right)=1, \operatorname{deg}(e)=1$, and $\operatorname{deg}(a)=0$ for $a \in A$. Suppose $\xi \in I^{n+1} K_{i}$ is a cocycle homogeneous of degree $m$. Note that $m \geq i+1+n$. Then $\xi=\mathrm{d} \eta$ for some $\eta \in K_{i+1}$ as $K_{\bullet}$ is exact in degrees $>0$. (The case $i=0$ is left to the reader.) Now $\operatorname{deg}(\eta)=m \geq i+1+n$. Hence writing $\eta$ in terms of the basis we see the coordinates are in $I^{n}$. Thus $\xi$ maps to zero in the homology of $I^{n} K_{\bullet}$ as desired.

08RF Theorem 75.11.4 (Quillen spectral sequence). Let $A \rightarrow B$ be a surjective ring map. Consider the sheaf $\Omega=\Omega_{\mathcal{O} / A} \otimes_{\mathcal{O}} \underline{B}$ of $\underline{B}$-modules on $\mathcal{C}_{B / A}$, see Section 75.4. Then there is a spectral sequence with $E_{1}$-page

$$
E_{1}^{p, q}=H_{-p-q}\left(\mathcal{C}_{B / A}, \operatorname{Sym}_{\underline{B}}^{p}(\Omega)\right) \Rightarrow \operatorname{Tor}_{-p-q}^{A}(B, B)
$$

with $d_{r}$ of bidegree $(r,-r+1)$. Moreover, $H_{i}\left(\mathcal{C}_{B / A}, \operatorname{Sym}_{\underline{B}}^{k}(\Omega)\right)=0$ for $i<k$.
Proof. Let $I \subset A$ be the kernel of $A \rightarrow B$. Let $\mathcal{J} \subset \mathcal{O}$ be the kernel of $\mathcal{O} \rightarrow \underline{B}$. Then $I \mathcal{O} \subset \mathcal{J}$. Set $\mathcal{K}=\mathcal{J} / I \mathcal{O}$ and $\overline{\mathcal{O}}=\mathcal{O} / I \mathcal{O}$.
For every object $U=(P \rightarrow B)$ of $\mathcal{C}_{B / A}$ we can choose an isomorphism $P=A[E]$ such that the map $P \rightarrow B$ maps each $e \in E$ to zero. Then $J=\mathcal{J}(U) \subset P=\mathcal{O}(U)$ is equal to $J=I P+(e ; e \in E)$. Moreover $\overline{\mathcal{O}}(U)=B[E]$ and $K=\mathcal{K}(U)=(e ; e \in E)$ is the ideal generated by the variables in the polynomial ring $B[E]$. In particular it is clear that

$$
K / K^{2} \xrightarrow{\mathrm{~d}} \Omega_{P / A} \otimes_{P} B
$$

is a bijection. In other words, $\Omega=\mathcal{K} / \mathcal{K}^{2}$ and $\operatorname{Sym}_{B}^{k}(\Omega)=\mathcal{K}^{k} / \mathcal{K}^{k+1}$. Note that $\pi_{!}(\Omega)=\Omega_{B / A}=0$ (Lemma 75.4.5 as $A \rightarrow B$ is surjective (Algebra, Lemma 10.130.5. By Lemma 75.11.1 we conclude that

$$
H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{k} / \mathcal{K}^{k+1}\right)=H_{i}\left(\mathcal{C}_{B / A}, \operatorname{Sym}_{\underline{B}}^{k}(\Omega)\right)=0
$$

for $i<k$. This proves the final statement of the theorem.
The approach to the theorem is to note that

$$
B \otimes_{A}^{\mathbf{L}} B=L \pi_{!}(\mathcal{O}) \otimes_{A}^{\mathbf{L}} B=L \pi_{!}\left(\mathcal{O} \otimes_{\underline{A}}^{\mathbf{L}} \underline{B}\right)=L \pi_{!}(\overline{\mathcal{O}})
$$

The first equality by Lemma 75.5.7, the second equality by Cohomology on Sites, Lemma 21.30.6, and the third equality as $\mathcal{O}$ is flat over $\underline{A}$. The sheaf $\overline{\mathcal{O}}$ has a filtration

$$
\ldots \subset \mathcal{K}^{3} \subset \mathcal{K}^{2} \subset \mathcal{K} \subset \overline{\mathcal{O}}
$$

This induces a filtration $F$ on a complex $C$ representing $L \pi_{!}(\overline{\mathcal{O}})$ with $F^{p} C$ representing $L \pi_{!}\left(\mathcal{K}^{p}\right)$ (construction of $C$ and $F$ omitted). Consider the spectral sequence of Homology, Section 12.21 associated to $(C, F)$. It has $E_{1}$-page

$$
E_{1}^{p, q}=H_{-p-q}\left(\mathcal{C}_{B / A}, \mathcal{K}^{p} / \mathcal{K}^{p+1}\right) \quad \Rightarrow \quad H_{-p-q}\left(\mathcal{C}_{B / A}, \overline{\mathcal{O}}\right)=\operatorname{Tor}_{-p-q}^{A}(B, B)
$$

and differentials $E_{r}^{p, q} \rightarrow E_{r}^{p+r, q-r+1}$. To show convergence we will show that for every $k$ there exists a $c$ such that $H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n}\right)=0$ for $i<k$ and $n>\xi^{2}$
Given $k \geq 0$ set $c=k^{2}$. We claim that

$$
H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n+c}\right) \rightarrow H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n}\right)
$$

[^191]is zero for $i<k$ and all $n \geq 0$. Note that $\mathcal{K}^{n} / \mathcal{K}^{n+c}$ has a finite filtration whose successive quotients $\mathcal{K}^{m} / \mathcal{K}^{m+1}, n \leq m<n+c$ have $H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{m} / \mathcal{K}^{m+1}\right)=0$ for $i<n$ (see above). Hence the claim implies $H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n+c}\right)=0$ for $i<k$ and all $n \geq k$ which is what we need to show.
Proof of the claim. Recall that for any $\mathcal{O}$-module $\mathcal{F}$ the map $\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} B$ induces an isomorphism on applying $L \pi!$, see Lemma 75.5.6. Consider the map
$$
\mathcal{K}^{n+k} \otimes_{\mathcal{O}}^{\mathbf{L}} B \longrightarrow \mathcal{K}^{n} \otimes_{\mathcal{O}}^{\mathbf{L}} B
$$

We claim that this map induces the zero map on cohomology sheaves in degrees $0,-1, \ldots,-k+1$. If this second claim holds, then the $k$-fold composition

$$
\mathcal{K}^{n+c} \otimes_{\mathcal{O}}^{\mathbf{L}} B \longrightarrow \mathcal{K}^{n} \otimes_{\mathcal{O}}^{\mathbf{L}} B
$$

factors through $\tau_{\leq-k} \mathcal{K}^{n} \otimes_{\mathcal{O}}^{\mathbf{L}} B$ hence induces zero on $H_{i}\left(\mathcal{C}_{B / A},-\right)=L_{i} \pi_{!}(-)$for $i<k$, see Derived Categories, Lemma 13.12.5. By the remark above this means the same thing is true for $H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n+c}\right) \rightarrow H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n}\right)$ which proves the (first) claim.

Proof of the second claim. The statement is local, hence we may work over an object $U=(P \rightarrow B)$ as above. We have to show the maps

$$
\operatorname{Tor}_{i}^{P}\left(B, K^{n+k}\right) \rightarrow \operatorname{Tor}_{i}^{P}\left(B, K^{n}\right)
$$

are zero for $i<k$. There is a spectral sequence

$$
\operatorname{Tor}_{a}^{P}\left(P / I P, \operatorname{Tor}_{b}^{P / I P}\left(B, K^{n}\right)\right) \Rightarrow \operatorname{Tor}_{a+b}^{P}\left(B, K^{n}\right)
$$

see More on Algebra, Example 15.52.2. Thus it suffices to prove the maps

$$
\operatorname{Tor}_{i}^{P / I P}\left(B, K^{n+1}\right) \rightarrow \operatorname{Tor}_{i}^{P / I P}\left(B, K^{n}\right)
$$

are zero for all $i$. This is Lemma 75.11.3,
08RG Remark 75.11.5. In the situation of Theorem 75.11.4 let $I=\operatorname{Ker}(A \rightarrow B)$. Then $H^{-1}\left(L_{B / A}\right)=H_{1}\left(\mathcal{C}_{B / A}, \Omega\right)=I / I^{2}$, see Lemma 75.10.2. Hence $H_{k}\left(\mathcal{C}_{B / A}, \operatorname{Sym}^{k}(\Omega)\right)=$ $\wedge_{B}^{k}\left(I / I^{2}\right)$ by Remark 75.11 .2 . Thus the $E_{1}$-page looks like

$$
\begin{array}{cccl}
B & & & \\
0 & & & \\
0 & I / I^{2} & & \\
0 & H^{-2}\left(L_{B / A}\right) & & \\
0 & H^{-3}\left(L_{B / A}\right) & \wedge^{2}\left(I / I^{2}\right) & \\
0 & H^{-4}\left(L_{B / A}\right) & H_{3}\left(\mathcal{C}_{B / A}, \operatorname{Sym}^{2}(\Omega)\right) & \\
0 & H^{-5}\left(L_{B / A}\right) & H_{4}\left(\mathcal{C}_{B / A}, \operatorname{Sym}^{2}(\Omega)\right) & \wedge^{3}\left(I / I^{2}\right)
\end{array}
$$

with horizontal differential. Thus we obtain edge maps $\operatorname{Tor}_{i}^{A}(B, B) \rightarrow H^{-i}\left(L_{B / A}\right)$, $i>0$ and $\wedge_{B}^{i}\left(I / I^{2}\right) \rightarrow \operatorname{Tor}_{i}^{A}(B, B)$. Finally, we have $\operatorname{Tor}_{1}^{A}(B, B)=I / I^{2}$ and there is a five term exact sequence

$$
\operatorname{Tor}_{3}^{A}(B, B) \rightarrow H^{-3}\left(L_{B / A}\right) \rightarrow \wedge_{B}^{2}\left(I / I^{2}\right) \rightarrow \operatorname{Tor}_{2}^{A}(B, B) \rightarrow H^{-2}\left(L_{B / A}\right) \rightarrow 0
$$

of low degree terms.

09D6 Remark 75.11.6. Let $A \rightarrow B$ be a ring map. Let $P_{\bullet}$ be a resolution of $B$ over $A$ (Remark 75.5.5). Set $J_{n}=\operatorname{Ker}\left(P_{n} \rightarrow B\right)$. Note that

$$
\operatorname{Tor}_{2}^{P_{n}}(B, B)=\operatorname{Tor}_{1}^{P_{n}}\left(J_{n}, B\right)=\operatorname{Ker}\left(J_{n} \otimes_{P_{n}} J_{n} \rightarrow J_{n}^{2}\right)
$$

Hence $H_{2}\left(L_{B / A}\right)$ is canonically equal to

$$
\operatorname{Coker}\left(\operatorname{Tor}_{2}^{P_{1}}(B, B) \rightarrow \operatorname{Tor}_{2}^{P_{0}}(B, B)\right)
$$

by Remark 75.10 .5 To make this more explicit we choose $P_{2}, P_{1}, P_{0}$ as in Example 75.5.9. We claim that

$$
\operatorname{Tor}_{2}^{P_{1}}(B, B)=\wedge^{2}\left(\bigoplus_{t \in T} B\right) \oplus \bigoplus_{t \in T} J_{0} \oplus \operatorname{Tor}_{2}^{P_{0}}(B, B)
$$

Namely, the basis elements $x_{t} \wedge x_{t^{\prime}}$ of the first summand corresponds to the element $x_{t} \otimes x_{t^{\prime}}-x_{t^{\prime}} \otimes x_{t}$ of $J_{1} \otimes_{P_{1}} J_{1}$. For $f \in J_{0}$ the element $x_{t} \otimes f$ of the second summand corresponds to the element $x_{t} \otimes s_{0}(f)-s_{0}(f) \otimes x_{t}$ of $J_{1} \otimes_{P_{1}} J_{1}$. Finally, the map $\operatorname{Tor}_{2}^{P_{0}}(B, B) \rightarrow \operatorname{Tor}_{2}^{P_{1}}(B, B)$ is given by $s_{0}$. The $\operatorname{map} d_{0}-d_{1}: \operatorname{Tor}_{2}^{P_{1}}(B, B) \rightarrow$ $\operatorname{Tor}_{2}^{P_{0}}(B, B)$ is zero on the last summand, maps $x_{t} \otimes f$ to $f \otimes f_{t}-f_{t} \otimes f$, and maps $x_{t} \wedge x_{t^{\prime}}$ to $f_{t} \otimes f_{t^{\prime}}-f_{t^{\prime}} \otimes f_{t}$. All in all we conclude that there is an exact sequence

$$
\wedge_{B}^{2}\left(J_{0} / J_{0}^{2}\right) \rightarrow \operatorname{Tor}_{2}^{P_{0}}(B, B) \rightarrow H^{-2}\left(L_{B / A}\right) \rightarrow 0
$$

In this way we obtain a direct proof of a consequence of Quillen's spectral sequence discussed in Remark 75.11.5.

### 75.12. Comparison with Lichtenbaum-Schlessinger

09AM Let $A \rightarrow B$ be a ring map. In LS67 there is a fairly explicit determination of $\tau_{\geq-2} L_{B / A}$ which is often used in calculations of versal deformation spaces of singularities. The construction follows. Choose a polynomial algebra $P$ over $A$ and a surjection $P \rightarrow B$ with kernel $I$. Choose generators $f_{t}, t \in T$ for $I$ which induces a surjection $F=\bigoplus_{t \in T} P \rightarrow I$ with $F$ a free $P$ algebra. Let Rel $\subset F$ be the kernel of $F \rightarrow I$, in other words Rel is the set of relations among the $f_{t}$. Let TrivRel $\subset$ Rel be the submodule of trivial relations, i.e., the submodule of Rel generated by the elements $\left(\ldots, f_{t^{\prime}}, 0, \ldots, 0,-f_{t}, 0, \ldots\right)$. Consider the complex of $B$-modules

09CD

$$
\begin{equation*}
\text { Rel/TrivRel } \longrightarrow F \otimes_{P} B \longrightarrow \Omega_{P / A} \otimes_{P} B \tag{75.12.0.1}
\end{equation*}
$$

where the last term is placed in degree 0 . The first map is the obvious one and the second map sends the basis element corresponding to $t \in T$ to $\mathrm{d} f_{t} \otimes 1$.

09CE Definition 75.12.1. Let $A \rightarrow B$ be a ring map. Let $M$ be a $(B, B)$-bimodule over $A$. An $A$-biderivation is an $A$-linear map $\lambda: B \rightarrow M$ such that $\lambda(x y)=$ $x \lambda(y)+\lambda(x) y$.

For a polynomial algebra the biderivations are easy to describe.
09CF Lemma 75.12.2. Let $P=A[S]$ be a polynomial ring over $A$. Let $M$ be a $(P, P)$ bimodule over $A$. Given $m_{s} \in M$ for $s \in S$, there exists a unique $A$-biderivation $\lambda: P \rightarrow M$ mapping $s$ to $m_{s}$ for $s \in S$.

Proof. We set

$$
\lambda\left(s_{1} \ldots s_{t}\right)=\sum s_{1} \ldots s_{i-1} m_{s_{i}} s_{i+1} \ldots s_{t}
$$

in $M$. Extending by $A$-linearity we obtain a biderivation.

Here is the comparison statement. The reader may also read about this in And74, page 206, Proposition 12] or in the paper DRGV92 which extends the complex 75.12.0.1) by one term and the comparison to $\tau_{\geq-3}$.

09CG Lemma 75.12.3. In the situation above denote $L$ the complex 75.12.0.1). There is a canonical map $L_{B / A} \rightarrow L$ in $D(A)$ which induces an isomorphism $\tau_{\geq-2} L_{B / A} \rightarrow$ $L$ in $D(B)$.

Proof. Let $P_{\bullet} \rightarrow B$ be a resolution of $B$ over $A$ (Remark 75.5.5). We will identify $L_{B / A}$ with $\Omega_{P_{\bullet} / A} \otimes B$. To construct the map we make some choices.
Choose an $A$-algebra map $\psi: P_{0} \rightarrow P$ compatible with the given maps $P_{0} \rightarrow B$ and $P \rightarrow B$.

Write $P_{1}=A[S]$ for some set $S$. For $s \in S$ we may write

$$
\psi\left(d_{0}(s)-d_{1}(s)\right)=\sum p_{s, t} f_{t}
$$

for some $p_{s, t} \in P$. Think of $F=\bigoplus_{t \in T} P$ as a $\left(P_{1}, P_{1}\right)$-bimodule via the maps $\left(\psi \circ d_{0}, \psi \circ d_{1}\right)$. By Lemma 75.12 .2 we obtain a unique $A$-biderivation $\lambda: P_{1} \rightarrow F$ mapping $s$ to the vector with coordinates $p_{s, t}$. By construction the composition

$$
P_{1} \longrightarrow F \longrightarrow P
$$

sends $f \in P_{1}$ to $\psi\left(d_{0}(f)-d_{1}(f)\right)$ because the map $f \mapsto \psi\left(d_{0}(f)-d_{1}(f)\right)$ is an $A$-biderivation agreeing with the composition on generators.

For $g \in P_{2}$ we claim that $\lambda\left(d_{0}(g)-d_{1}(g)+d_{2}(g)\right)$ is an element of Rel. Namely, by the last remark of the previous paragraph the image of $\lambda\left(d_{0}(g)-d_{1}(g)+d_{2}(g)\right)$ in $P$ is

$$
\psi\left(\left(d_{0}-d_{1}\right)\left(d_{0}(g)-d_{1}(g)+d_{2}(g)\right)\right)
$$

which is zero by Simplicial, Section 14.23 ).
The choice of $\psi$ determines a map

$$
\mathrm{d} \psi \otimes 1: \Omega_{P_{0} / A} \otimes B \longrightarrow \Omega_{P / A} \otimes B
$$

Composing $\lambda$ with the map $F \rightarrow F \otimes B$ gives a usual $A$-derivation as the two $P_{1}$-module structures on $F \otimes B$ agree. Thus $\lambda$ determines a map

$$
\bar{\lambda}: \Omega_{P_{1} / A} \otimes B \longrightarrow F \otimes B
$$

Finally, We obtain a $B$-linear map

$$
q: \Omega_{P_{2} / A} \otimes B \longrightarrow \text { Rel/TrivRel }
$$

by mapping $\mathrm{d} g$ to the class of $\lambda\left(d_{0}(g)-d_{1}(g)+d_{2}(g)\right)$ in the quotient.
The diagram

commutes (calculation omitted) and we obtain the map of the lemma. By Remark 75.10 .4 and Lemma 75.10 .3 we see that this map induces isomorphisms $H_{1}\left(L_{B / A}\right) \rightarrow$ $H_{1}(L)$ and $H_{0}\left(L_{B / A}\right) \rightarrow H_{0}(L)$.

It remains to see that our map $L_{B / A} \rightarrow L$ induces an isomorphism $H_{2}\left(L_{B / A}\right) \rightarrow$ $H_{2}(L)$. Choose a resolution of $B$ over $A$ with $P_{0}=P=A\left[u_{i}\right]$ and then $P_{1}$ and $P_{2}$ as in Example 75.5.9. In Remark 75.11.6 we have constructed an exact sequence

$$
\wedge_{B}^{2}\left(J_{0} / J_{0}^{2}\right) \rightarrow \operatorname{Tor}_{2}^{P_{0}}(B, B) \rightarrow H^{-2}\left(L_{B / A}\right) \rightarrow 0
$$

where $P_{0}=P$ and $J_{0}=\operatorname{Ker}(P \rightarrow B)=I$. Calculating the Tor group using the short exact sequences $0 \rightarrow I \rightarrow P \rightarrow B \rightarrow 0$ and $0 \rightarrow$ Rel $\rightarrow F \rightarrow I \rightarrow 0$ we find that $\operatorname{Tor}_{2}^{P}(B, B)=\operatorname{Ker}(\operatorname{Rel} \otimes B \rightarrow F \otimes B)$. The image of the map $\wedge_{B}^{2}\left(I / I^{2}\right) \rightarrow$ $\operatorname{Tor}_{2}^{P}(B, B)$ under this identification is exactly the image of $\operatorname{TrivRel} \otimes B$. Thus we see that $H_{2}\left(L_{B / A}\right) \cong H_{2}(L)$.
Finally, we have to check that our map $L_{B / A} \rightarrow L$ actually induces this isomorphism. We will use the notation and results discussed in Example 75.5.9 and Remarks 75.11 .6 and 75.10 .5 without further mention. Pick an element $\xi$ of $\operatorname{Tor}_{2}^{P_{0}}(B, B)=\operatorname{Ker}\left(I \otimes_{P} I \rightarrow I^{2}\right)$. Write $\xi=\sum h_{t^{\prime}, t} f_{t^{\prime}} \otimes f_{t}$ for some $h_{t^{\prime}, t} \in P$. Tracing through the exact sequences above we find that $\xi$ corresponds to the image in $R e l \otimes B$ of the element $r \in \operatorname{Rel} \subset F=\bigoplus_{t \in T} P$ with $t$ th coordinate $r_{t}=\sum_{t^{\prime} \in T} h_{t^{\prime}, t} f_{t^{\prime}}$. On the other hand, $\xi$ corresponds to the element of $H_{2}\left(L_{B / A}\right)=H_{2}(\Omega)$ which is the image via d: $H_{2}\left(\mathcal{J} / \mathcal{J}^{2}\right) \rightarrow H_{2}(\Omega)$ of the boundary of $\xi$ under the 2 -extension

$$
0 \rightarrow \operatorname{Tor}_{2}^{\mathcal{O}}(\underline{B}, \underline{B}) \rightarrow \mathcal{J} \otimes_{\mathcal{O}} \mathcal{J} \rightarrow \mathcal{J} \rightarrow \mathcal{J} / \mathcal{J}^{2} \rightarrow 0
$$

We compute the successive transgressions of our element. First we have

$$
\xi=\left(d_{0}-d_{1}\right)\left(-\sum s_{0}\left(h_{t^{\prime}, t} f_{t^{\prime}}\right) \otimes x_{t}\right)
$$

and next we have

$$
\sum s_{0}\left(h_{t^{\prime}, t} f_{t^{\prime}}\right) x_{t}=d_{0}\left(v_{r}\right)-d_{1}\left(v_{r}\right)+d_{2}\left(v_{r}\right)
$$

by our choice of the variables $v$ in Example 75.5.9. We may choose our map $\lambda$ above such that $\lambda\left(u_{i}\right)=0$ and $\lambda\left(x_{t}\right)=-e_{t}$ where $e_{t} \in F$ denotes the basis vector corresponding to $t \in T$. Hence the construction of our map $q$ above sends $\mathrm{d} v_{r}$ to

$$
\lambda\left(\sum s_{0}\left(h_{t^{\prime}, t} f_{t^{\prime}}\right) x_{t}\right)=\sum_{t}\left(\sum_{t^{\prime}} h_{t^{\prime}, t} f_{t^{\prime}}\right) e_{t}
$$

matching the image of $\xi$ in $\operatorname{Rel} \otimes B$ (the two minus signs we found above cancel out). This agreement finishes the proof.

09D7 Remark 75.12.4 (Functoriality of the Lichtenbaum-Schlessinger complex). Consider a commutative square

of ring maps. Choose a factorization

with $P$ a polynomial algebra over $A$ and $P^{\prime}$ a polynomial algebra over $A^{\prime}$. Choose generators $f_{t}, t \in T$ for $\operatorname{Ker}(P \rightarrow B)$. For $t \in T$ denote $f_{t}^{\prime}$ the image of $f_{t}$ in $P^{\prime}$.

Choose $f_{s}^{\prime} \in P^{\prime}$ such that the elements $f_{t}^{\prime}$ for $t \in T^{\prime}=T \amalg S$ generate the kernel of $P^{\prime} \rightarrow B^{\prime}$. Set $F=\bigoplus_{t \in T} P$ and $F^{\prime}=\bigoplus_{t^{\prime} \in T^{\prime}} P^{\prime}$. Let Rel $=\operatorname{Ker}(F \rightarrow P)$ and $\operatorname{Rel}^{\prime}=\operatorname{Ker}\left(F^{\prime} \rightarrow P^{\prime}\right)$ where the maps are given by multiplication by $f_{t}$, resp. $f_{t}^{\prime}$ on the coordinates. Finally, set TrivRel, resp. TrivRel equal to the submodule of Rel, resp. TrivRel generated by the elements (..., $f_{t^{\prime}}, 0, \ldots, 0,-f_{t}, 0, \ldots$ ) for $t, t^{\prime} \in T$, resp. $T^{\prime}$. Having made these choices we obtain a canonical commutative diagram

Moreover, tracing through the choices made in the proof of Lemma 75.12 .3 the reader sees that one obtains a commutative diagram

### 75.13. The cotangent complex of a local complete intersection

08 SH If $A \rightarrow B$ is a local complete intersection map, then $L_{B / A}$ is a perfect complex. The key to proving this is the following lemma.

08SI Lemma 75.13.1. Let $A=\mathbf{Z}[x] \rightarrow B=\mathbf{Z}$ be the ring map which sends $x$ to 0 . Let $I=(x) \subset A$. Then $L_{B / A}$ is quasi-isomorphic to $I / I^{2}[1]$.

Proof. There are several ways to prove this. For example one can explicitly construct a resolution of $B$ over $A$ and compute. Or one can use the spectral sequence of Quillen (Theorem 75.11.4) and the vanishing of $\operatorname{Tor}_{i}^{A}(B, B)$ for $i>1$. Finally, one can use 75.7 .0 .1 which is what we will do here. Namely, consider the distinguished triangle

$$
L_{\mathbf{Z}[x] / \mathbf{Z}} \otimes_{\mathbf{Z}[x]} \mathbf{Z} \rightarrow L_{\mathbf{Z} / \mathbf{Z}} \rightarrow L_{\mathbf{Z} / \mathbf{Z}[x]} \rightarrow L_{\mathbf{Z}[x] / \mathbf{Z}} \otimes_{\mathbf{Z}[x]} \mathbf{Z}[1]
$$

The complex $L_{\mathbf{Z}[x] / \mathbf{Z}}$ is quasi-isomorphic to $\Omega_{\mathbf{Z}[x] / \mathbf{Z}}$ by Lemma 75.4.7. The complex $L_{\mathbf{Z} / \mathbf{Z}}$ is zero in $D(\mathbf{Z})$ by Lemma 75.8 .4 . Thus we see that $L_{B / A}$ has only one nonzero cohomology group which is as described in the lemma by Lemma 75.10.2.

08SJ Lemma 75.13.2. Let $A \rightarrow B$ be a surjective ring map whose kernel $I$ is generated by a regular sequence. Then $L_{B / A}$ is quasi-isomorphic to $I / I^{2}[1]$.

Proof. This is true if $I=(0)$. If $I=(f)$ is generated by a single nonzerodivisor, then consider the ring map $\mathbf{Z}[x] \rightarrow A$ which sends $x$ to $f$. By assumption we have $B=A \otimes_{\mathbf{Z}[x]}^{\mathbf{L}} \mathbf{Z}$. Thus we obtain $L_{B / A}=I / I^{2}[1]$ from Lemmas 75.6.2 and 75.13.1.

We prove the general case by induction. Suppose that we have $I=\left(f_{1}, \ldots, f_{r}\right)$ where $f_{1}, \ldots, f_{r}$ is a regular sequence. Set $C=A /\left(f_{1}, \ldots, f_{r-1}\right)$. By induction the result is true for $A \rightarrow C$ and $C \rightarrow B$. We have a distinguished triangle 75.7.0.1

$$
L_{C / A} \otimes_{C}^{\mathbf{L}} B \rightarrow L_{B / A} \rightarrow L_{B / C} \rightarrow L_{C / A} \otimes_{C}^{\mathbf{L}} B[1]
$$

which shows that $L_{B / A}$ has only one nonzero cohomology group which is as described in the lemma by Lemma 75.10 .2 .

08SK Lemma 75.13.3. Let $A \rightarrow B$ be a surjective ring map whose kernel $I$ is Koszul. Then $L_{B / A}$ is quasi-isomorphic to $I / I^{2}[1]$.

Proof. Flat locally on $\operatorname{Spec}(A)$ the ideal $I$ is generated by a regular sequence, see More on Algebra, Lemma 15.23.17. Hence this follows from Lemma 75.6.2 and flat descent.

08SL Proposition 75.13.4. Let $A \rightarrow B$ be a local complete intersection map. Then $L_{B / A}$ is a perfect complex with tor amplitude in $[-1,0]$.

Proof. Choose a surjection $P=A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ with kernel $J$. By Lemma 75.10 .3 we see that $J / J^{2} \rightarrow \bigoplus B \mathrm{~d} x_{i}$ is quasi-isomorphic to $\tau_{\geq-1} L_{B / A}$. Note that $J / J^{2}$ is finite projective (More on Algebra, Lemma 15.24.3), hence $\tau_{\geq-1} L_{B / A}$ is a perfect complex with tor amplitude in $[-1,0]$. Thus it suffices to show that $H^{i}\left(L_{B / A}\right)=0$ for $i \notin[-1,0]$. This follows from 75.7.0.1

$$
L_{P / A} \otimes_{P}^{\mathrm{L}} B \rightarrow L_{B / A} \rightarrow L_{B / P} \rightarrow L_{P / A} \otimes_{P}^{\mathbf{L}} B[1]
$$

and Lemma 75.13 .3 to see that $H^{i}\left(L_{B / P}\right)$ is zero unless $i \in\{-1,0\}$. (We also use Lemma 75.4 .7 for the term on the left.)

### 75.14. Tensor products and the cotangent complex

09D8 Let $R$ be a ring and let $A, B$ be $R$-algebras. In this section we discuss $L_{A \otimes_{R} B / R}$. Most of the information we want is contained in the following diagram (75.14.0.1)

Explanation: The middle row is the fundamental triangle 75.7.0.1 for the ring maps $R \rightarrow A \rightarrow A \otimes_{R} B$. The middle column is the fundamental triangle 75.7.0.1) for the ring maps $R \rightarrow B \rightarrow A \otimes_{R} B$. Next, $E$ is an object of $D\left(A \otimes_{R} B\right)$ which "fits" into the upper right corner, i.e., which turns both the top row and the right column into distinguished triangles. Such an $E$ exists by Derived Categories, Proposition 13.4.21 applied to the lower left square (with 0 placed in the missing spot). To be more explicit, we could for example define $E$ as the cone (Derived Categories, Definition 13.9.1) of the map of complexes

$$
L_{A / R} \otimes_{A}^{\mathbf{L}}\left(A \otimes_{R} B\right) \oplus L_{B / R} \otimes_{B}^{\mathbf{L}}\left(A \otimes_{R} B\right) \longrightarrow L_{A \otimes_{R} B / R}
$$

and get the two maps with target $E$ by an application of TR3. In the Tor independent case the object $E$ is zero.

09DA Lemma 75.14.1. If $A$ and $B$ are Tor independent $R$-algebras, then the object $E$ in 75.14.0.1) is zero. In this case we have

$$
L_{A \otimes_{R} B / R}=L_{A / R} \otimes_{A}^{\mathbf{L}}\left(A \otimes_{R} B\right) \oplus L_{B / R} \otimes_{B}^{\mathbf{L}}\left(A \otimes_{R} B\right)
$$

which is represented by the complex $L_{A / R} \otimes_{R} B \oplus L_{B / R} \otimes_{R} A$ of $A \otimes_{R} B$-modules.
Proof. The first two statements are immediate from Lemma 75.6.2. The last statement follows as $L_{A / R}$ is a complex of free $A$-modules, hence $L_{A / R} \otimes_{A}^{\mathbf{L}}\left(A \otimes_{R} B\right)$ is represented by $L_{A / R} \otimes_{A}\left(A \otimes_{R} B\right)=L_{A / R} \otimes_{R} B$

In general we can say this about the object $E$.
09DB Lemma 75.14.2. Let $R$ be a ring and let $A, B$ be $R$-algebras. The object $E$ in 75.14.0.1) satisfies

$$
H^{i}(E)=\left\{\begin{array}{cc}
0 & \text { if } \quad i \geq-1 \\
\operatorname{Tor}_{1}^{R}(A, B) & \text { if } \quad i=-2
\end{array}\right.
$$

Proof. We use the description of $E$ as the cone on $L_{B / R} \otimes_{B}^{\mathbf{L}}\left(A \otimes_{R} B\right) \rightarrow L_{A \otimes_{R} B / A}$. By Lemma 75.12 .3 the canonical truncations $\tau_{\geq-2} L_{B / R}$ and $\tau_{\geq-2} L_{A \otimes_{R} B / A}$ are computed by the Lichtenbaum-Schlessinger complex (75.12.0.1). These isomorphisms are compatible with functoriality (Remark 75.12.4). Thus in this proof we work with the Lichtenbaum-Schlessinger complexes.

Choose a polynomial algebra $P$ over $R$ and a surjection $P \rightarrow B$. Choose generators $f_{t} \in P, t \in T$ of the kernel of this surjection. Let $\operatorname{Rel} \subset F=\bigoplus_{t \in T} P$ be the kernel of the map $F \rightarrow P$ which maps the basis vector corresponding to $t$ to $f_{t}$. Set $P_{A}=A \otimes_{R} P$ and $F_{A}=A \otimes_{R} F=P_{A} \otimes_{P} F$. Let Rel $_{A}$ be the kernel of the map $F_{A} \rightarrow P_{A}$. Using the exact sequence

$$
0 \rightarrow \text { Rel } \rightarrow F \rightarrow P \rightarrow B \rightarrow 0
$$

and standard short exact sequences for Tor we obtain an exact sequence

$$
A \otimes_{R} \text { Rel } \rightarrow \operatorname{Rel}_{A} \rightarrow \operatorname{Tor}_{1}^{R}(A, B) \rightarrow 0
$$

Note that $P_{A} \rightarrow A \otimes_{R} B$ is a surjection whose kernel is generated by the elements $1 \otimes f_{t}$ in $P_{A}$. Denote TrivRel $_{A} \subset \operatorname{Rel}_{A}$ the $P_{A}$-submodule generated by the elements $\left(\ldots, 1 \otimes f_{t^{\prime}}, 0, \ldots, 0,-1 \otimes f_{t} \otimes 1,0, \ldots\right)$. Since TrivRel $\otimes_{R} A \rightarrow \operatorname{TrivRel}_{A}$ is surjective, we find a canonical exact sequence

$$
A \otimes_{R}(\operatorname{Rel} / \operatorname{TrivRel}) \rightarrow \operatorname{Rel}_{A} / \operatorname{TrivRel}_{A} \rightarrow \operatorname{Tor}_{1}^{R}(A, B) \rightarrow 0
$$

The map of Lichtenbaum-Schlessinger complexes is given by the diagram

Note that vertical maps -1 and -0 induce an isomorphism after applying the functor $A \otimes_{R}-=P_{A} \otimes_{P}-$ to the source and the vertical map -2 gives exactly the map whose cokernel is the desired Tor module as we saw above.

### 75.15. Deformations of ring maps and the cotangent complex

08SM This section is the continuation of Deformation Theory, Section 74.2 which we urge the reader to read first. We start with a surjective ring map $A^{\prime} \rightarrow A$ whose kernel is an ideal $I$ of square zero. Moreover we assume given a ring map $A \rightarrow B$, a $B$-module $N$, and an $A$-module map $c: I \rightarrow N$. In this section we ask ourselves whether we can find the question mark fitting into the following diagram

08SN

and moreover how unique the solution is (if it exists). More precisely, we look for a surjection of $A^{\prime}$-algebras $B^{\prime} \rightarrow B$ whose kernel is identified with $N$ such that $A^{\prime} \rightarrow B^{\prime}$ induces the given map $c$. We will say $B^{\prime}$ is a solution to 75.15.0.1).

08SP
Lemma 75.15.1. In the situation above we have
(1) There is a canonical element $\xi \in \operatorname{Ext}_{B}^{2}\left(L_{B / A}, N\right)$ whose vanishing is a sufficient and necessary condition for the existence of a solution to (75.15.0.1).
(2) If there exists a solution, then then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{B}^{1}\left(L_{B / A}, N\right)$.
(3) Given a solution $B^{\prime}$, the set of automorphisms of $B^{\prime}$ fitting into 75.15.0.1) is canonically isomorphic to $\operatorname{Ext}_{B}^{0}\left(L_{B / A}, N\right)$.

Proof. Via the identifications $N L_{B / A}=\tau_{\geq-1} L_{B / A}$ (Lemma 75.10.3) and $H^{0}\left(L_{B / A}\right)=$ $\Omega_{B / A}$ (Lemma 75.4.5) we have seen parts (2) and (3) in Deformation Theory, Lemmas 74.2.1 and 74.2.3

Proof of (1). We will use the results of Deformation Theory, Lemma 74.2 .4 without further mention. Let $\alpha \in \operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, I\right)$ be the element corresponding to the isomorphism class of $A^{\prime}$. The existence of $B^{\prime}$ corresponds to an element $\beta \in \operatorname{Ext}_{B}^{1}\left(N L_{B / \mathbf{Z}}, N\right)$ which maps to the image of $\alpha$ in $\operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, N\right)$. Note that

$$
\operatorname{Ext}_{A}^{1}\left(N L_{A / \mathbf{Z}}, N\right)=\operatorname{Ext}_{A}^{1}\left(L_{A / \mathbf{Z}}, N\right)=\operatorname{Ext}_{B}^{1}\left(L_{A / \mathbf{Z}} \otimes_{A}^{\mathbf{L}} B, N\right)
$$

and

$$
\operatorname{Ext}_{B}^{1}\left(N L_{B / \mathbf{Z}}, N\right)=\operatorname{Ext}_{B}^{1}\left(L_{B / \mathbf{Z}}, N\right)
$$

by Lemma 75.10.3. Since the distinguished triangle 75.7.0.1 for $\mathbf{Z} \rightarrow A \rightarrow B$ gives rise to a long exact sequence

$$
\ldots \rightarrow \operatorname{Ext}_{B}^{1}\left(L_{B / \mathbf{Z}}, N\right) \rightarrow \operatorname{Ext}_{B}^{1}\left(L_{A / \mathbf{Z}} \otimes_{A}^{\mathbf{L}} B, N\right) \rightarrow \operatorname{Ext}_{B}^{2}\left(L_{B / A}, N\right) \rightarrow \ldots
$$

we obtain the result with $\xi$ the image of $\alpha$.

### 75.16. The Atiyah class of a module

09 DC Let $A \rightarrow B$ be a ring map. Let $M$ be a $B$-module. Let $P \rightarrow B$ be an object of $\mathcal{C}_{B / A}$ (Section 75.4). Consider the extension of principal parts

$$
0 \rightarrow \Omega_{P / A} \otimes_{P} M \rightarrow P_{P / A}^{1}(M) \rightarrow M \rightarrow 0
$$

see Algebra, Lemma 10.131.6. This sequence is functorial in $P$ by Algebra, Remark 10.131.7. Thus we obtain a short exact sequence of sheaves of $\mathcal{O}$-modules

$$
0 \rightarrow \Omega_{\mathcal{O} / \underline{A}} \otimes_{\mathcal{O}} \underline{M} \rightarrow P_{\mathcal{O} / \underline{A}}^{1}(M) \rightarrow \underline{M} \rightarrow 0
$$

on $\mathcal{C}_{B / A}$. We have $L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{A}} \otimes_{\mathcal{O}} \underline{M}\right)=L_{B / A} \otimes_{B} M=L_{B / A} \otimes_{B}^{\mathbf{L}} M$ by Lemma 75.4 .2 and the flatness of the terms of $L_{B / A}$. We have $L \pi_{!}(\underline{M})=M$ by Lemma 75.4.4. Thus a distinguished triangle

09DD

$$
\begin{equation*}
L_{B / A} \otimes_{B}^{\mathbf{L}} M \rightarrow L \pi!\left(P_{\mathcal{O} / \underline{A}}^{1}(M)\right) \rightarrow M \rightarrow L_{B / A} \otimes_{B}^{\mathbf{L}} M[1] \tag{75.16.0.1}
\end{equation*}
$$

in $D(B)$. Here we use Cohomology on Sites, Remark 21.30 .13 to get a distinguished triangle in $D(B)$ and not just in $D(A)$.
09DE Definition 75.16.1. Let $A \rightarrow B$ be a ring map. Let $M$ be a $B$-module. The map $M \rightarrow L_{B / A} \otimes_{B}^{\mathbf{L}} M[1]$ in 75.16.0.1 is called the Atiyah class of $M$.

### 75.17. The cotangent complex

08 UQ In this section we discuss the cotangent complex of a map of sheaves of rings on a site. In later sections we specialize this to obtain the cotangent complex of a morphism of ringed topoi, a morphism of ringed spaces, a morphism of schemes, a morphism of algebraic space, etc.

Let $\mathcal{C}$ be a site and let $\operatorname{Sh}(\mathcal{C})$ denote the associated topos. Let $\mathcal{A}$ denote a sheaf of rings on $\mathcal{C}$. Let $\mathcal{A}$-Alg be the category of $\mathcal{A}$-algebras. Consider the pair of adjoint functors $(F, i)$ where $i: \mathcal{A}-A l g \rightarrow \operatorname{Sh}(\mathcal{C})$ is the forgetful functor and $F: \operatorname{Sh}(\mathcal{C}) \rightarrow$ $\mathcal{A}$ - $\operatorname{llg}$ assigns to a sheaf of sets $\mathcal{E}$ the polynomial algebra $\mathcal{A}[\mathcal{E}]$ on $\mathcal{E}$ over $\mathcal{A}$. Let $X_{\bullet}$ be the simplicial object of $\operatorname{Fun}(\mathcal{A}-A l g, \mathcal{A}-A l g)$ constructed in Simplicial, Section 14.33 .

Now assume that $\mathcal{A} \rightarrow \mathcal{B}$ is a homomorphism of sheaves of rings. Then $\mathcal{B}$ is an object of the category $\mathcal{A}$ - $\operatorname{Alg}$. Denote $\mathcal{P}_{\bullet}=X_{\bullet}(\mathcal{B})$ the resulting simplicial $\mathcal{A}$ algebra. Recall that $\mathcal{P}_{0}=\mathcal{A}[\mathcal{B}], \mathcal{P}_{1}=\mathcal{A}[\mathcal{A}[\mathcal{B}]]$, and so on. Recall also that there is an augmentation

$$
\epsilon: \mathcal{P}_{\bullet} \longrightarrow \mathcal{B}
$$

where we view $\mathcal{B}$ as a constant simplicial $\mathcal{A}$-algebra.
08SR Definition 75.17.1. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. The standard resolution of $\mathcal{B}$ over $\mathcal{A}$ is the augmentation $\epsilon: \mathcal{P} \bullet \rightarrow \mathcal{B}$ with terms

$$
\mathcal{P}_{0}=\mathcal{A}[\mathcal{B}], \quad \mathcal{P}_{1}=\mathcal{A}[\mathcal{A}[\mathcal{B}]], \quad \ldots
$$

and maps as constructed above.
With this definition in hand the cotangent complex of a map of sheaves of rings is defined as follows. We will use the module of differentials as defined in Modules on Sites, Section 18.32 .

08SS Definition 75.17.2. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. The cotangent complex $L_{\mathcal{B} / \mathcal{A}}$ is the complex of $\mathcal{B}$-modules associated to the simplicial module

$$
\Omega_{\mathcal{P}_{\bullet} / \mathcal{A}} \otimes_{\mathcal{P}_{\bullet}, \epsilon} \mathcal{B}
$$

where $\epsilon: \mathcal{P}_{\bullet} \rightarrow \mathcal{B}$ is the standard resolution of $\mathcal{B}$ over $\mathcal{A}$. We usually think of $L_{\mathcal{B} / \mathcal{A}}$ as an object of $D(\mathcal{B})$.

These constructions satisfy a functoriality similar to that discussed in Section 75.6 Namely, given a commutative diagram

08ST
(75.17.2.1)

of sheaves of rings on $\mathcal{C}$ there is a canonical $\mathcal{B}$-linear map of complexes

$$
L_{\mathcal{B} / \mathcal{A}} \longrightarrow L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}
$$

constructed as follows. If $\mathcal{P}_{\bullet} \rightarrow \mathcal{B}$ is the standard resolution of $\mathcal{B}$ over $\mathcal{A}$ and $\mathcal{P}_{\bullet}^{\prime} \rightarrow \mathcal{B}^{\prime}$ is the standard resolution of $\mathcal{B}^{\prime}$ over $\mathcal{A}^{\prime}$, then there is a canonical map $\mathcal{P}_{\bullet} \rightarrow \mathcal{P}_{\bullet}^{\prime}$ of simplicial $\mathcal{A}$-algebras compatible with the augmentations $\mathcal{P}_{\bullet} \rightarrow \mathcal{B}$ and $\mathcal{P}_{\bullet}^{\prime} \rightarrow \mathcal{B}^{\prime}$. The maps

$$
\mathcal{P}_{0}=\mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right]=\mathcal{P}_{0}^{\prime}, \quad \mathcal{P}_{1}=\mathcal{A}[\mathcal{A}[\mathcal{B}]] \longrightarrow \mathcal{A}^{\prime}\left[\mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right]\right]=\mathcal{P}_{1}^{\prime}
$$

and so on are given by the given maps $\mathcal{A} \rightarrow \mathcal{A}^{\prime}$ and $\mathcal{B} \rightarrow \mathcal{B}^{\prime}$. The desired map $L_{\mathcal{B} / \mathcal{A}} \rightarrow L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}$ then comes from the associated maps on sheaves of differentials.
08SV Lemma 75.17.3. Let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. Then $f^{-1} L_{\mathcal{B} / \mathcal{A}}=L_{f^{-1} \mathcal{B} / f^{-1} \mathcal{A}}$.
Proof. The diagram

commutes.
08SW Lemma 75.17.4. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. Then $H^{i}\left(L_{\mathcal{B} / \mathcal{A}}\right)$ is the sheaf associated to the presheaf $U \mapsto H^{i}\left(L_{\mathcal{B}(U) / \mathcal{A}(U)}\right)$.
Proof. Let $\mathcal{C}^{\prime}$ be the site we get by endowing $\mathcal{C}$ with the chaotic topology (presheaves are sheaves). There is a morphism of topoi $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ where $f_{*}$ is the inclusion of sheaves into presheaves and $f^{-1}$ is sheafification. By Lemma 75.17.3 it suffices to prove the result for $\mathcal{C}^{\prime}$, i.e., in case $\mathcal{C}$ has the chaotic topology.
If $\mathcal{C}$ carries the chaotic topology, then $L_{\mathcal{B} / \mathcal{A}}(U)$ is equal to $L_{\mathcal{B}(U) / \mathcal{A}(U)}$ because

commutes.
08SX Remark 75.17.5. It is clear from the proof of Lemma 75.17 .4 that for any $U \in$ $\operatorname{Ob}(\mathcal{C})$ there is a canonical map $L_{\mathcal{B}(U) / \mathcal{A}(U)} \rightarrow L_{\mathcal{B} / \mathcal{A}}(U)$ of complexes of $\mathcal{B}(U)$ modules. Moreover, these maps are compatible with restriction maps and the complex $L_{\mathcal{B} / \mathcal{A}}$ is the sheafification of the rule $U \mapsto L_{\mathcal{B}(U) / \mathcal{A}(U)}$.
08UR Lemma 75.17.6. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. Then $H^{0}\left(L_{\mathcal{B} / \mathcal{A}}\right)=\Omega_{\mathcal{B} / \mathcal{A}}$.

Proof. Follows from Lemmas 75.17 .4 and 75.4 .5 and Modules on Sites, Lemma 18.32.4

08SY Lemma 75.17.7. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ and $\mathcal{A} \rightarrow \mathcal{B}^{\prime}$ be homomorphisms of sheaves of rings on $\mathcal{C}$. Then

$$
L_{\mathcal{B} \times \mathcal{B}^{\prime} / \mathcal{A}} \longrightarrow L_{\mathcal{B} / \mathcal{A}} \oplus L_{\mathcal{B}^{\prime} / \mathcal{A}}
$$

is an isomorphism in $D\left(\mathcal{B} \times \mathcal{B}^{\prime}\right)$.
Proof. By Lemma 75.17 .4 it suffices to prove this for ring maps. In the case of rings this is Lemma 75.6 .4 .

The fundamental triangle for the cotangent complex of sheaves of rings is an easy consequence of the result for homomorphisms of rings.
08SZ Lemma 75.17.8. Let $\mathcal{D}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be homomorphisms of sheaves of rings on $\mathcal{D}$. There is a canonical distinguished triangle

$$
L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{C} \rightarrow L_{\mathcal{C} / \mathcal{A}} \rightarrow L_{\mathcal{C} / \mathcal{B}} \rightarrow L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{C}[1]
$$

in $D(\mathcal{C})$.
Proof. We will use the method described in Remarks 75.7.5 and 75.7.6 to construct the triangle; we will freely use the results mentioned there. As in those remarks we first construct the triangle in case $\mathcal{B} \rightarrow \mathcal{C}$ is an injective map of sheaves of rings. In this case we set
(1) $\mathcal{P}_{\bullet}$ is the standard resolution of $\mathcal{B}$ over $\mathcal{A}$,
(2) $\mathcal{Q}_{\bullet}$ is the standard resolution of $\mathcal{C}$ over $\mathcal{A}$,
(3) $\mathcal{R}_{\bullet}$ is the standard resolution of $\mathcal{C}$ over $\mathcal{B}$,
(4) $\mathcal{S}_{\bullet}$ is the standard resolution of $\mathcal{B}$ over $\mathcal{B}$,
(5) $\overline{\mathcal{Q}}_{\bullet}=\mathcal{Q}_{\bullet} \otimes_{\mathcal{P}_{\bullet}} \mathcal{B}$, and
(6) $\overline{\mathcal{R}}_{\bullet}=\mathcal{R}_{\bullet} \otimes_{\mathcal{S}} \mathcal{B}$.

The distinguished triangle is the distinguished triangle associated to the short exact sequence of simplicial $\mathcal{C}$-modules

$$
0 \rightarrow \Omega_{\mathcal{P}_{\bullet} / \mathcal{A}} \otimes_{\mathcal{P}_{\bullet}} \mathcal{C} \rightarrow \Omega_{\mathcal{Q}_{\bullet} / \mathcal{A}} \otimes_{\mathcal{Q}_{\bullet}} \mathcal{C} \rightarrow \Omega_{\overline{\mathcal{Q}}_{\bullet} / \mathcal{B}} \otimes_{\overline{\mathcal{Q}}_{\bullet}} \mathcal{C} \rightarrow 0
$$

The first two terms are equal to the first two terms of the triangle of the statement of the lemma. The identification of the last term with $L_{\mathcal{C} / \mathcal{B}}$ uses the quasiisomorphisms of complexes

$$
L_{\mathcal{C} / \mathcal{B}}=\Omega_{\mathcal{R}_{\bullet} / \mathcal{B}} \otimes_{\mathcal{R}_{\bullet}} \mathcal{C} \longrightarrow \Omega_{\overline{\mathcal{R}}_{\bullet} / \mathcal{B}} \otimes_{\overline{\mathcal{R}}_{\bullet}} \mathcal{C} \longleftarrow \Omega_{\overline{\mathcal{Q}}_{\bullet} / \mathcal{B}} \otimes_{\overline{\mathcal{Q}}_{\bullet}} \mathcal{C}
$$

All the constructions used above can first be done on the level of presheaves and then sheafified. Hence to prove sequences are exact, or that map are quasi-isomorphisms it suffices to prove the corresponding statement for the ring maps $\mathcal{A}(U) \rightarrow \mathcal{B}(U) \rightarrow$ $\mathcal{C}(U)$ which are known. This finishes the proof in the case that $\mathcal{B} \rightarrow \mathcal{C}$ is injective.

In general, we reduce to the case where $\mathcal{B} \rightarrow \mathcal{C}$ is injective by replacing $\mathcal{C}$ by $\mathcal{B} \times \mathcal{C}$ if necessary. This is possible by the argument given in Remark 75.7.5 by Lemma 75.17 .7

08 T 0 Lemma 75.17.9. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. If $p$ is a point of $\mathcal{C}$, then $\left(L_{\mathcal{B} / \mathcal{A}}\right)_{p}=L_{\mathcal{B}_{p} / \mathcal{A}_{p}}$.
Proof. This is a special case of Lemma 75.17 .3 .

For the construction of the naive cotangent complex and its properties we refer to Modules on Sites, Section 18.34 .
08US Lemma 75.17.10. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. There is a canonical map $L_{\mathcal{B} / \mathcal{A}} \rightarrow N L_{\mathcal{B} / \mathcal{A}}$ which identifies the naive cotangent complex with the truncation $\tau_{\geq-1} L_{\mathcal{B} / \mathcal{A}}$.
Proof. Let $\mathcal{P}_{\bullet}$ be the standard resolution of $\mathcal{B}$ over $\mathcal{A}$. Let $\mathcal{I}=\operatorname{Ker}(\mathcal{A}[\mathcal{B}] \rightarrow \mathcal{B})$. Recall that $\mathcal{P}_{0}=\mathcal{A}[\mathcal{B}]$. The map of the lemma is given by the commutative diagram

We construct the downward arrow with target $\mathcal{I} / \mathcal{I}^{2}$ by sending a local section $\mathrm{d} f \otimes b$ to the class of $\left(d_{0}(f)-d_{1}(f)\right) b$ in $\mathcal{I} / \mathcal{I}^{2}$. Here $d_{i}: \mathcal{P}_{1} \rightarrow \mathcal{P}_{0}, i=0,1$ are the two face maps of the simplicial structure. This makes sense as $d_{0}-d_{1}$ maps $\mathcal{P}_{1}$ into $\mathcal{I}=\operatorname{Ker}\left(\mathcal{P}_{0} \rightarrow \mathcal{B}\right)$. We omit the verification that this rule is well defined. Our map is compatible with the differential $\Omega_{\mathcal{P}_{1} / \mathcal{A}} \otimes_{\mathcal{P}_{1}} \mathcal{B} \rightarrow \Omega_{\mathcal{P}_{0} / \mathcal{A}} \otimes_{\mathcal{P}_{0}} \mathcal{B}$ as this differential maps a local section $\mathrm{d} f \otimes b$ to $\mathrm{d}\left(d_{0}(f)-d_{1}(f)\right) \otimes b$. Moreover, the differential $\Omega_{\mathcal{P}_{2} / \mathcal{A}} \otimes_{\mathcal{P}_{2}} \mathcal{B} \rightarrow \Omega_{\mathcal{P}_{1} / \mathcal{A}} \otimes_{\mathcal{P}_{1}} \mathcal{B}$ maps a local section $\mathrm{d} f \otimes b$ to $\mathrm{d}\left(d_{0}(f)-d_{1}(f)+d_{2}(f)\right) \otimes b$ which are annihilated by our downward arrow. Hence a map of complexes.
To see that our map induces an isomorphism on the cohomology sheaves $H^{0}$ and $H^{-1}$ we argue as follows. Let $\mathcal{C}^{\prime}$ be the site with the same underlying category as $\mathcal{C}$ but endowed with the chaotic topology. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ be the morphism of topoi whose pullback functor is sheafification. Let $\mathcal{A}^{\prime} \rightarrow \mathcal{B}^{\prime}$ be the given map, but thought of as a map of sheaves of rings on $\mathcal{C}^{\prime}$. The construction above gives a map $L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}} \rightarrow N L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}$ on $\mathcal{C}^{\prime}$ whose value over any object $U$ of $\mathcal{C}^{\prime}$ is just the map

$$
L_{\mathcal{B}(U) / \mathcal{A}(U)} \rightarrow N L_{\mathcal{B}(U) / \mathcal{A}(U)}
$$

of Remark 75.10.4 which induces an isomorphism on $H^{0}$ and $H^{-1}$. Since $f^{-1} L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}=$ $L_{\mathcal{B} / \mathcal{A}}$ (Lemma 75.17.3) and $f^{-1} N L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}=N L_{\mathcal{B} / \mathcal{A}}$ (Modules on Sites, Lemma 18.34.3 the lemma is proved.

### 75.18. The Atiyah class of a sheaf of modules

09DF Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let $\mathcal{F}$ be a sheaf of $\mathcal{B}$-modules. Let $\mathcal{P} \bullet \rightarrow \mathcal{B}$ be the standard resolution of $\mathcal{B}$ over $\mathcal{A}$ (Section 75.17). For every $n \geq 0$ consider the extension of principal parts

09DG (75.18.0.1)

$$
0 \rightarrow \Omega_{\mathcal{P}_{n} / \mathcal{A}} \otimes_{\mathcal{P}_{n}} \mathcal{F} \rightarrow \mathcal{P}_{\mathcal{P}_{n} / \mathcal{A}}^{1}(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow 0
$$

see Modules on Sites, Lemma 18.33.6. The functoriality of this construction (Modules on Sites, Remark 18.33 .7 tells us 75.18 .0 .1 is the degree $n$ part of a short exact sequence of simplicial $\mathcal{P}_{\bullet}$-modules (Cohomology on Sites, Section 21.32). Using the functor $L \pi_{!}: D\left(\mathcal{P}_{\bullet}\right) \rightarrow D(\mathcal{B})$ of Cohomology on Sites, Remark 21.32 .3 (here we use that $\mathcal{P}_{\bullet} \rightarrow \mathcal{A}$ is a resolution) we obtain a distinguished triangle

09DH

$$
\begin{equation*}
L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{F} \rightarrow L \pi!\left(\mathcal{P}_{\mathcal{P} \cdot / \mathcal{A}}^{1}(\mathcal{F})\right) \rightarrow \mathcal{F} \rightarrow L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathbf{L}} \mathcal{F}[1] \tag{75.18.0.2}
\end{equation*}
$$

in $D(\mathcal{B})$.

09DI Definition 75.18.1. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. Let $\mathcal{F}$ be a sheaf of $\mathcal{B}$-modules. The map $\mathcal{F} \rightarrow L_{\mathcal{B} / \mathcal{A}} \otimes_{\mathcal{B}}^{\mathrm{L}} \mathcal{F}$ [1] in 75.18.0.2 is called the Atiyah class of $\mathcal{F}$.
75.19. The cotangent complex of a morphism of ringed spaces

08UT The cotangent complex of a morphism of ringed spaces is defined in terms of the cotangent complex we defined above.

08UU Definition 75.19.1. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$ be a morphism of ringed spaces. The cotangent complex $L_{f}$ of $f$ is $L_{f}=L_{\mathcal{O}_{X} / f^{-1} \mathcal{O}_{S}}$. We will also use the notation $L_{f}=L_{X / S}=L_{\mathcal{O}_{X} / \mathcal{O}_{S}}$.

More precisely, this means that we consider the cotangent complex (Definition 75.17.2 of the homomorphism $f^{\sharp}: f^{-1} \mathcal{O}_{S} \rightarrow \mathcal{O}_{X}$ of sheaves of rings on the site associated to the topological space $X$ (Sites, Example 7.6.4).

08UV Lemma 75.19.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$ be a morphism of ringed spaces. Then $H^{0}\left(L_{X / S}\right)=\Omega_{X / S}$.
Proof. Special case of Lemma 75.17.6.
08T4 Lemma 75.19.3. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of ringed spaces. Then there is a canonical distinguished triangle

$$
L f^{*} L_{Y / Z} \rightarrow L_{X / Z} \rightarrow L_{X / Y} \rightarrow L f^{*} L_{Y / Z}[1]
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. Set $h=g \circ f$ so that $h^{-1} \mathcal{O}_{Z}=f^{-1} g^{-1} \mathcal{O}_{Z}$. By Lemma 75.17.3 we have $f^{-1} L_{Y / Z}=L_{f^{-1}} \mathcal{O}_{Y} / h^{-1} \mathcal{O}_{Z}$ and this is a complex of flat $f^{-1} \mathcal{O}_{Y}$-modules. Hence the distinguished triangle above is an example of the distinguished triangle of Lemma 75.17 .8 with $\mathcal{A}=h^{-1} \mathcal{O}_{Z}, \mathcal{B}=f^{-1} \mathcal{O}_{Y}$, and $\mathcal{C}=\mathcal{O}_{X}$.

08UW Lemma 75.19.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. There is a canonical map $L_{X / Y} \rightarrow N L_{X / Y}$ which identifies the naive cotangent complex with the truncation $\tau_{\geq-1} L_{X / Y}$.

Proof. Special case of Lemma 75.17.10.

### 75.20. Deformations of ringed spaces and the cotangent complex

08UX This section is the continuation of Deformation Theory, Section 74.7 which we urge the reader to read first. We briefly recall the setup. We have a first order thickening $t:\left(S, \mathcal{O}_{S}\right) \rightarrow\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$ of ringed spaces with $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right)$, a morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$, an $\mathcal{O}_{X}$-module $\mathcal{G}$, and an $f$-map $c: \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of modules. We ask whether we can find the question mark fitting into the following diagram

08UY (75.20.0.1)

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ and a morphism of thickenings
$\left(f, f^{\prime}\right)$ as in Deformation Theory, Equation 74.3.1.1 where $\operatorname{Ker}\left(i^{\sharp}\right)$ is identified with $\mathcal{G}$ such that $\left(f^{\prime}\right)^{\sharp}$ induces the given map $c$. We will say $X^{\prime}$ is a solution to 75.20.0.1).

08UZ Lemma 75.20.1. In the situation above we have
(1) There is a canonical element $\xi \in E x t_{\mathcal{O}_{X}}^{2}\left(L_{X / S}, \mathcal{G}\right)$ whose vanishing is a sufficient and necessary condition for the existence of a solution to (75.20.0.1).
(2) If there exists a solution, then then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L_{X / S}, \mathcal{G}\right)$.
(3) Given a solution $X^{\prime}$, the set of automorphisms of $X^{\prime}$ fitting into 75.20.0.1) is canonically isomorphic to Ext $_{\mathcal{O}_{X}}^{0}\left(L_{X / S}, \mathcal{G}\right)$.
Proof. Via the identifications $N L_{X / S}=\tau_{\geq-1} L_{X / S}$ (Lemma 75.19.4) and $H^{0}\left(L_{X / S}\right)=$ $\Omega_{X / S}$ (Lemma 75.19 .2 ) we have seen parts $(2)$ and (3) in Deformation Theory, Lemmas 74.7.1 and 74.7.3

Proof of (1). We will use the results of Deformation Theory, Lemma 74.7.4 without further mention. Let $\alpha \in \operatorname{Ext}_{\mathcal{O}_{S}}^{1}\left(N L_{S / \mathbf{Z}}, \mathcal{J}\right)$ be the element corresponding to the isomorphism class of $S^{\prime}$. The existence of $X^{\prime}$ corresponds to an element $\beta \in \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / \mathbf{Z}}, \mathcal{G}\right)$ which maps to the image of $\alpha$ in $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} N L_{S / \mathbf{Z}}, \mathcal{G}\right)$. Note that

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} N L_{S / \mathbf{Z}}, \mathcal{G}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} L_{S / \mathbf{Z}}, \mathcal{G}\right)
$$

and

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{X / \mathbf{Z}}, \mathcal{G}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L_{X / \mathbf{Z}}, \mathcal{G}\right)
$$

by Lemma 75.19 .4 . The distinguished triangle of Lemma 75.19 .3 for $X \rightarrow S \rightarrow$ $(*, \mathbf{Z})$ gives rise to a long exact sequence

$$
\ldots \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L_{X / \mathbf{Z}}, \mathcal{G}\right) \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} L_{S / \mathbf{Z}}, \mathcal{G}\right) \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(L_{X / S}, \mathcal{G}\right) \rightarrow \ldots
$$

We obtain the result with $\xi$ the image of $\alpha$.

### 75.21. The cotangent complex of a morphism of ringed topoi

08 SQ The cotangent complex of a morphism of ringed topoi is defined in terms of the cotangent complex we defined above.

08 SU Definition 75.21.1. Let $\left(f, f^{\sharp}\right):\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. The cotangent complex $L_{f}$ of $f$ is $L_{f}=L_{\mathcal{O}_{\mathcal{C}} / f^{-1} \mathcal{O}_{\mathcal{D}}}$. We sometimes write $L_{f}=L_{\mathcal{O}_{\mathcal{C}} / \mathcal{O}_{\mathcal{D}}}$.

This definition applies to many situations, but it doesn't always produce the thing one expects. For example, if $f: X \rightarrow Y$ is a morphism of schemes, then $f$ induces a morphism of big étale sites $f_{b i g}:(S c h / X)_{\text {étale }} \rightarrow(S c h / Y)_{\text {étale }}$ which is a morphism of ringed topoi (Descent, Remark 34.7.4. However, $L_{f_{b i g}}=0$ since $\left(f_{b i g}\right)^{\#}$ is an isomorphism. On the other hand, if we take $L_{f}$ where we think of $f$ as a morphism between the underlying Zariski ringed topoi, then $L_{f}$ does agree with the cotangent complex $L_{X / Y}$ (as defined below) whose zeroth cohomology sheaf is $\Omega_{X / Y}$.

08V0 Lemma 75.21.2. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$ be a morphism of ringed topoi. Then $H^{0}\left(L_{f}\right)=\Omega_{f}$.

Proof. Special case of Lemma 75.17.6.
75.22. DEFORMATIONS OF RINGED TOPOI AND THE COTANGENT COMPLEX 4400

08V1 Lemma 75.21.3. Let $f:\left(S h\left(\mathcal{C}_{1}\right), \mathcal{O}_{1}\right) \rightarrow\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right)$ and $g:\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right) \rightarrow$ $\left(S h\left(\mathcal{C}_{3}\right), \mathcal{O}_{3}\right)$ be morphisms of ringed topoi. Then there is a canonical distinguished triangle

$$
L f^{*} L_{g} \rightarrow L_{g \circ f} \rightarrow L_{f} \rightarrow L f^{*} L_{g}[1]
$$

in $D\left(\mathcal{O}_{1}\right)$.
Proof. Set $h=g \circ f$ so that $h^{-1} \mathcal{O}_{3}=f^{-1} g^{-1} \mathcal{O}_{3}$. By Lemma 75.17.3 we have $f^{-1} L_{g}=L_{f^{-1}} \mathcal{O}_{2} / h^{-1} \mathcal{O}_{3}$ and this is a complex of flat $f^{-1} \mathcal{O}_{2}$-modules. Hence the distinguished triangle above is an example of the distinguished triangle of Lemma 75.17 .8 with $\mathcal{A}=h^{-1} \mathcal{O}_{3}, \mathcal{B}=f^{-1} \mathcal{O}_{2}$, and $\mathcal{C}=\mathcal{O}_{1}$.

08V2 Lemma 75.21.4. Let $f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$ be a morphism of ringed topoi. There is a canonical map $L_{f} \rightarrow N L_{f}$ which identifies the naive cotangent complex with the truncation $\tau_{\geq-1} L_{f}$.
Proof. Special case of Lemma 75.17.10.

### 75.22. Deformations of ringed topoi and the cotangent complex

08V3 This section is the continuation of Deformation Theory, Section 74.12 which we urge the reader to read first. We briefly recall the setup. We have a first order thickening $t:\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right) \rightarrow\left(S h\left(\mathcal{B}^{\prime}\right), \mathcal{O}_{\mathcal{B}^{\prime}}\right)$ of ringed topoi with $\mathcal{J}=\operatorname{Ker}\left(t^{\sharp}\right)$, a morphism of ringed topoi $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right)$, an $\mathcal{O}$-module $\mathcal{G}$, and a $\operatorname{map} f^{-1} \mathcal{J} \rightarrow \mathcal{G}$ of sheaves of $f^{-1} \mathcal{O}_{\mathcal{B}}$-modules. We ask whether we can find the question mark fitting into the following diagram

08V4 (75.22.0.1)

and moreover how unique the solution is (if it exists). More precisely, we look for a first order thickening $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ and a morphism of thickenings $\left(f, f^{\prime}\right)$ as in Deformation Theory, Equation 74.8.1.1 where $\operatorname{Ker}\left(i^{\sharp}\right)$ is identified with $\mathcal{G}$ such that $\left(f^{\prime}\right)^{\#}$ induces the given map $c$. We will say $\left(\operatorname{Sh}\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ is a solution to 75.22.0.1.

08V5 Lemma 75.22.1. In the situation above we have
(1) There is a canonical element $\xi \in E x t_{\mathcal{O}}^{2}\left(L_{f}, \mathcal{G}\right)$ whose vanishing is a sufficient and necessary condition for the existence of a solution to 75.22.0.1.
(2) If there exists a solution, then then the set of isomorphism classes of solutions is principal homogeneous under $\operatorname{Ext}_{\mathcal{O}}^{1}\left(L_{f}, \mathcal{G}\right)$.
(3) Given a solution $X^{\prime}$, the set of automorphisms of $X^{\prime}$ fitting into (75.22.0.1) is canonically isomorphic to Ext $t_{\mathcal{O}}^{0}\left(L_{f}, \mathcal{G}\right)$.
Proof. Via the identifications $N L_{f}=\tau_{\geq-1} L_{f}$ (Lemma 75.21.4) and $H^{0}\left(L_{X / S}\right)=$ $\Omega_{X / S}$ (Lemma 75.21.2) we have seen parts (2) and (3) in Deformation Theory, Lemmas 74.12.1 and74.12.3.
Proof of (1). We will use the results of Deformation Theory, Lemma 74.12 .4 without further mention. Denote

$$
p:(S h(\mathcal{C}), \mathcal{O}) \rightarrow(S h(*), \mathbf{Z}) \quad \text { and } \quad q:\left(S h(\mathcal{B}), \mathcal{O}_{\mathcal{B}}\right) \rightarrow(S h(*), \mathbf{Z})
$$

Let $\alpha \in \operatorname{Ext}_{\mathcal{O}_{\mathcal{B}}}^{1}\left(N L_{q}, \mathcal{J}\right)$ be the element corresponding to the isomorphism class of $\mathcal{O}_{\mathcal{B}^{\prime}}$. The existence of $\mathcal{O}^{\prime}$ corresponds to an element $\beta \in \operatorname{Ext}_{\mathcal{O}}^{1}\left(N L_{p}, \mathcal{G}\right)$ which maps to the image of $\alpha$ in $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} N L_{q}, \mathcal{G}\right)$. Note that

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} N L_{q}, \mathcal{G}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} L_{q}, \mathcal{G}\right)
$$

and

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(N L_{p}, \mathcal{G}\right)=\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L_{p}, \mathcal{G}\right)
$$

by Lemma 75.21 .4 . The distinguished triangle of Lemma 75.21 .3 for $p=q \circ f$ gives rise to a long exact sequence

$$
\ldots \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L_{p}, \mathcal{G}\right) \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(L f^{*} L_{q}, \mathcal{G}\right) \rightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{2}\left(L_{f}, \mathcal{G}\right) \rightarrow \ldots
$$

We obtain the result with $\xi$ the image of $\alpha$.

### 75.23. The cotangent complex of a morphism of schemes

08 T 1 As promised above we define the cotangent complex of a morphism of schemes as follows.

08T2 Definition 75.23.1. Let $f: X \rightarrow Y$ be a morphism of schemes. The cotangent complex $L_{X / Y}$ of $X$ over $Y$ is the cotangent complex of $f$ as a morphism of ringed spaces (Definition 75.19.1).

In particular, the results of Section 75.19 apply to cotangent complexes of morphisms of schemes. The next lemma shows this definition is compatible with the definition for ring maps and it also implies that $L_{X / Y}$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

08T3 Lemma 75.23.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $U=\operatorname{Spec}(A) \subset$ $X$ and $V=\operatorname{Spec}(B) \subset Y$ be affine opens such that $f(U) \subset V$. There is a canonical map

$$
\left.\widetilde{L_{B / A}} \longrightarrow L_{X / Y}\right|_{U}
$$

of complexes which is an isomorphism in $D\left(\mathcal{O}_{U}\right)$. This map is compatible with restricting to smaller affine opens of $X$ and $Y$.

Proof. By Remark 75.17 .5 there is a canonical map of complexes $L_{\mathcal{O}_{X}(U) / f^{-1} \mathcal{O}_{Y}(U)} \rightarrow$ $L_{X / Y}(U)$ of $B=\mathcal{O}_{X}(U)$-modules, which is compatible with further restrictions. Using the canonical map $A \rightarrow f^{-1} \mathcal{O}_{Y}(U)$ we obtain a canonical map $L_{B / A} \rightarrow$ $L_{\mathcal{B} / \mathcal{A}}(U)$ of $B$-modules. Using the universal property of the ${ }^{\sim}$ functor (see Schemes, Lemma 25.7.1 we obtain a map as in the statement of the lemma. We may check this map is an isomorphism on cohomology sheaves by checking it induces isomorphisms on stalks. This follows immediately from Lemmas 75.17 .9 and 75.8 .6 (and the description of the stalks of $\mathcal{O}_{X}$ and $f^{-1} \mathcal{O}_{Y}$ at a point $\mathfrak{p} \in \operatorname{Spec}(B)$ as $B_{\mathfrak{p}}$ and $A_{\mathfrak{q}}$ where $\mathfrak{q}=A \cap \mathfrak{p}$; references used are Schemes, Lemma 25.5.4 and Sheaves, Lemma 6.21.5).

08V6 Lemma 75.23.3. Let $\Lambda$ be a ring. Let $X$ be a scheme over $\Lambda$. Then

$$
L_{X / \operatorname{Spec}(\Lambda)}=L_{\mathcal{O}_{X} / \underline{\Lambda}}
$$

where $\underline{\Lambda}$ is the constant sheaf with value $\Lambda$ on $X$.

Proof. Let $p: X \rightarrow \operatorname{Spec}(\Lambda)$ be the structure morphism. Let $q: \operatorname{Spec}(\Lambda) \rightarrow(*, \Lambda)$ be the obvious morphism. By the distinguished triangle of Lemma 75.19.3 it suffices to show that $L_{q}=0$. To see this it suffices to show for $\mathfrak{p} \in \operatorname{Spec}(\Lambda)$ that

$$
\left(L_{q}\right)_{\mathfrak{p}}=L_{\mathcal{O}_{\operatorname{Spec}(\Lambda), \mathfrak{p}} / \Lambda}=L_{\Lambda_{\mathfrak{p}} / \Lambda}
$$

(Lemma 75.17.9) is zero which follows from Lemma 75.8.4.

### 75.24. The cotangent complex of a scheme over a ring

08 V 7 Let $\Lambda$ be a ring and let $X$ be a scheme over $\Lambda$. Write $L_{X / \operatorname{Spec}(\Lambda)}=L_{X / \Lambda}$ which is justified by Lemma 75.23 .3 . In this section we give a description of $L_{X / \Lambda}$ similar to Lemma 75.4.3. Namely, we construct a category $\mathcal{C}_{X / \Lambda}$ fibred over $X_{Z a r}$ and endow it with a sheaf of (polynomial) $\Lambda$-algebras $\mathcal{O}$ such that

$$
L_{X / \Lambda}=L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)
$$

We will later use the category $\mathcal{C}_{X / \Lambda}$ to construct a naive obstruction theory for the stack of coherent sheaves.

Let $\Lambda$ be a ring. Let $X$ be a scheme over $\Lambda$. Let $\mathcal{C}_{X / \Lambda}$ be the category whose objects are commutative diagrams

08V8

of schemes where
(1) $U$ is an open subscheme of $X$,
(2) there exists an isomorphism $\mathbf{A}=\operatorname{Spec}(P)$ where $P$ is a polynomial algebra over $\Lambda$ (on some set of variables).
In other words, $\mathbf{A}$ is an (infinite dimensional) affine space over $\operatorname{Spec}(\Lambda)$. Morphisms are given by commutative diagrams. Recall that $X_{Z a r}$ denotes the small Zariski site $X$. There is a forgetful functor

$$
u: \mathcal{C}_{X / \Lambda} \rightarrow X_{Z a r}, \quad(U \rightarrow \mathbf{A}) \mapsto U
$$

Observe that the fibre category over $U$ is canonically equivalent to the category $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ introduced in Section 75.4 .

08V9 Lemma 75.24.1. In the situation above the category $\mathcal{C}_{X / \Lambda}$ is fibred over $X_{\text {Zar }}$.
Proof. Given an object $U \rightarrow \mathbf{A}$ of $\mathcal{C}_{X / \Lambda}$ and a morphism $U^{\prime} \rightarrow U$ of $X_{Z a r}$ consider the object $U^{\prime} \rightarrow \mathbf{A}$ of $\mathcal{C}_{X / \Lambda}$ where $U^{\prime} \rightarrow \mathbf{A}$ is the composition of $U \rightarrow \mathbf{A}$ and $U^{\prime} \rightarrow U$. The morphism $\left(U^{\prime} \rightarrow \mathbf{A}\right) \rightarrow(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X / \Lambda}$ is strongly cartesian over $X_{Z a r}$.

We endow $\mathcal{C}_{X / \Lambda}$ with the topology inherited from $X_{Z a r}$ (see Stacks, Section 8.10). The functor $u$ defines a morphism of topoi $\pi: \operatorname{Sh}\left(\mathcal{C}_{X / \Lambda}\right) \rightarrow \operatorname{Sh}\left(X_{Z a r}\right)$. The site $\mathcal{C}_{X / \Lambda}$ comes with several sheaves of rings.
(1) The sheaf $\mathcal{O}$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \Gamma\left(\mathbf{A}, \mathcal{O}_{\mathbf{A}}\right)$.
(2) The sheaf $\underline{\mathcal{O}}_{X}=\pi^{-1} \mathcal{O}_{X}$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{O}_{X}(U)$.
(3) The constant sheaf $\underline{\Lambda}$.

We obtain morphisms of ringed topoi

08VA

The morphism $i$ is the identity on underlying topoi and $i^{\sharp}: \mathcal{O} \rightarrow \underline{\mathcal{O}}_{X}$ is the obvious map. The map $\pi$ is a special case of Cohomology on Sites, Situation 21.29.1. An important role will be played in the following by the derived functors $L i^{*}: D(\mathcal{O}) \longrightarrow$ $D\left(\underline{\mathcal{O}}_{X}\right)$ left adjoint to $R i_{*}=i_{*}: D\left(\underline{\mathcal{O}}_{X}\right) \rightarrow D(\mathcal{O})$ and $L \pi!: D\left(\underline{\mathcal{O}}_{X}\right) \longrightarrow D\left(\mathcal{O}_{X}\right)$ left adjoint to $\pi^{*}=\pi^{-1}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\underline{\mathcal{O}}_{X}\right)$. We can compute $L \pi$ ! thanks to our earlier work.

08VB Remark 75.24.2. In the situation above, for every $U \subset X$ open let $P_{\bullet}, U$ be the standard resolution of $\mathcal{O}_{X}(U)$ over $\Lambda$. Set $\mathbf{A}_{n, U}=\operatorname{Spec}\left(P_{n, U}\right)$. Then $\mathbf{A}_{\bullet, U}$ is a cosimplicial object of the fibre category $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ of $\mathcal{C}_{X / \Lambda}$ over $U$. Moreover, as discussed in Remark 75.5 .5 we have that $\mathbf{A}_{\bullet, U}$ is a cosimplicial object of $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ as in Cohomology on Sites, Lemma 21.30.7. Since the construction $U \mapsto \mathbf{A}_{\bullet, U}$ is functorial in $U$, given any (abelian) sheaf $\mathcal{F}$ on $\mathcal{C}_{X / \Lambda}$ we obtain a complex of presheaves

$$
U \longmapsto \mathcal{F}\left(\mathbf{A}_{\bullet}, U\right)
$$

whose cohomology groups compute the homology of $\mathcal{F}$ on the fibre category. We conclude by Cohomology on Sites, Lemma 21.31 .2 that the sheafification computes $L_{n} \pi_{!}(\mathcal{F})$. In other words, the complex of sheaves whose term in degree $-n$ is the sheafification of $U \mapsto \mathcal{F}\left(\mathbf{A}_{n, U}\right)$ computes $L \pi!(\mathcal{F})$.

With this remark out of the way we can state the main result of this section.
08 T 9
Lemma 75.24.3. In the situation above there is a canonical isomorphism

$$
L_{X / \Lambda}=L \pi_{!}\left(L i^{*} \Omega_{\mathcal{O} / \underline{\Lambda}}\right)=L \pi_{!}\left(i^{*} \Omega_{\mathcal{O} / \underline{\Lambda}}\right)=L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. We first observe that for any object $(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X / \Lambda}$ the value of the sheaf $\mathcal{O}$ is a polynomial algebra over $\Lambda$. Hence $\Omega_{\mathcal{O} / \underline{\Lambda}}$ is a flat $\mathcal{O}$-module and we conclude the second and third equalities of the statement of the lemma hold.

By Remark 75.24 .2 the object $L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)$ is computed as the sheafification of the complex of presheaves

$$
U \mapsto\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)\left(\mathbf{A}_{\bullet, U}\right)=\Omega_{P_{\bullet}, U / \Lambda} \otimes_{P_{\bullet}, U} \mathcal{O}_{X}(U)=L_{\mathcal{O}_{X}(U) / \Lambda}
$$

using notation as in Remark 75.24 .2 . Now Remark 75.17 .5 shows that $L \pi_{!}\left(\Omega_{\mathcal{O} / \Lambda} \otimes_{\mathcal{O}}\right.$ $\underline{\mathcal{O}}_{X}$ ) computes the cotangent complex of the map of rings $\underline{\Lambda} \rightarrow \mathcal{O}_{X}$ on $X$. This is what we want by Lemma 75.23 .3 .

### 75.25. The cotangent complex of a morphism of algebraic spaces

08 VC We define the cotangent complex of a morphism of algebraic spaces using the associated morphism between the small étale sites.

08VD Definition 75.25.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The cotangent complex $L_{X / Y}$ of $X$ over $Y$ is the cotangent complex of the morphism of ringed topoi $f_{\text {small }}$ between the small étale sites of $X$ and $Y$ (see Properties of Spaces, Lemma 53.20.3 and Definition 75.21.1).
In particular, the results of Section 75.21 apply to cotangent complexes of morphisms of algebraic spaces. The next lemmas show this definition is compatible with the definition for ring maps and for schemes and that $L_{X / Y}$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

08VE Lemma 75.25.2. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$ with $p$ and $q$ étale. Then there is a canonical identification $\left.L_{X / Y}\right|_{U_{\text {étale }}}=L_{U / V}$ in $D\left(\mathcal{O}_{U}\right)$.
Proof. Formation of the cotangent complex commutes with pullback (Lemma 75.17.3 and we have $p_{\text {small }}^{-1} \mathcal{O}_{X}=\mathcal{O}_{U}$ and $g_{\text {small }}^{-1} \mathcal{O}_{V_{\text {étale }}}=p_{\text {small }}^{-1} f_{\text {small }}^{-1} \mathcal{O}_{Y_{\text {étale }}}$ because $q_{\text {small }}^{-1} \mathcal{O}_{Y_{\text {etale }}}=\mathcal{O}_{V_{\text {étale }}}$ (Properties of Spaces, Lemma 53.25.1). Tracing through the definitions we conclude that $\left.L_{X / Y}\right|_{U_{\text {étale }}}=L_{U / V}$.

08VF Lemma 75.25.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $X$ and $Y$ representable by schemes $X_{0}$ and $Y_{0}$. Then there is a canonical identification $L_{X / Y}=\epsilon^{*} L_{X_{0} / Y_{0}}$ in $D\left(\mathcal{O}_{X}\right)$ where $\epsilon$ is as in Derived Categories of Spaces, Section 62.4 and $L_{X_{0} / Y_{0}}$ is as in Definition 75.23.1.

Proof. Let $f_{0}: X_{0} \rightarrow Y_{0}$ be the morphism of schemes corresponding to $f$. There is a canonical map $\epsilon^{-1} f_{0}^{-1} \mathcal{O}_{Y_{0}} \rightarrow f_{\text {small }}^{-1} \mathcal{O}_{Y}$ compatible with $\epsilon^{\sharp}: \epsilon^{-1} \mathcal{O}_{X_{0}} \rightarrow \mathcal{O}_{X}$ because there is a commutative diagram

see Derived Categories of Spaces, Remark 62.6.3. Thus we obtain a canonical map

$$
\epsilon^{-1} L_{X_{0} / Y_{0}}=\epsilon^{-1} L_{\mathcal{O}_{X_{0}} / f_{0}^{-1} \mathcal{O}_{Y_{0}}}=L_{\epsilon^{-1} \mathcal{O}_{X_{0}} / \epsilon^{-1} f_{0}^{-1} \mathcal{O}_{Y_{0}}} \longrightarrow L_{\mathcal{O}_{X} / f_{s m a l l}^{-1} \mathcal{O}_{Y}}=L_{X / Y}
$$

by the functoriality discussed in Section 75.17 and Lemma 75.17.3. To see that the induced map $\epsilon^{*} L_{X_{0} / Y_{0}} \rightarrow L_{X / Y}$ is an isomorphism we may check on stalks at geometric points (Properties of Spaces, Theorem 53.18.12). We will use Lemma 75.17 .9 to compute the stalks. Let $\bar{x}: \operatorname{Spec}(k) \rightarrow X_{0}$ be a geometric point lying over $x \in X_{0}$, with $\bar{y}=f \circ \bar{x}$ lying over $y \in Y_{0}$. Then

$$
L_{X / Y, \bar{x}}=L_{\mathcal{O}_{X, \bar{x}} / \mathcal{O}_{Y, \bar{y}}}
$$

and

$$
\left(\epsilon^{*} L_{X_{0} / Y_{0}}\right)_{\bar{x}}=L_{X_{0} / Y_{0}, x} \otimes_{\mathcal{O}_{X_{0}, x}} \mathcal{O}_{X, \bar{x}}=L_{\mathcal{O}_{X_{0}, x} / \mathcal{O}_{Y_{0}, y}} \otimes_{\mathcal{O}_{X_{0}, x}} \mathcal{O}_{X, \bar{x}}
$$

Some details omitted (hint: use that the stalk of a pullback is the stalk at the image point, see Sites, Lemma 7.33.1, as well as the corresponding result for modules, see

Modules on Sites, Lemma 18.35 .4 . Observe that $\mathcal{O}_{X, \bar{x}}$ is the strict henselization of $\mathcal{O}_{X_{0}, x}$ and similarly for $\mathcal{O}_{Y, \bar{y}}$ (Properties of Spaces, Lemma 53.21.1). Thus the result follows from Lemma 75.8.7

08VG Lemma 75.25.4. Let $\Lambda$ be a ring. Let $X$ be an algebraic space over $\Lambda$. Then

$$
L_{X / \operatorname{Spec}(\Lambda)}=L_{\mathcal{O}_{X} / \underline{\Lambda}}
$$

where $\underline{\Lambda}$ is the constant sheaf with value $\Lambda$ on $X_{\text {étale }}$.
Proof. Let $p: X \rightarrow \operatorname{Spec}(\Lambda)$ be the structure morphism. Let $q: \operatorname{Spec}(\Lambda)_{\text {étale }} \rightarrow$ $(*, \Lambda)$ be the obvious morphism. By the distinguished triangle of Lemma 75.21 .3 it suffices to show that $L_{q}=0$. To see this it suffices to show (Properties of Spaces, Theorem 53.18.12 for a geometric point $\bar{t}: \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(\Lambda)$ that

$$
\left(L_{q}\right)_{\bar{t}}=L_{\mathcal{O}_{\mathrm{Spec}(\Lambda)_{e ́ t a l e}, \bar{t}} / \Lambda}
$$

(Lemma 75.17.9) is zero. Since $\mathcal{O}_{\text {Spec }(\Lambda)_{\text {etale }, \bar{t}} \text { is a strict henselization of a local ring }}$ of $\Lambda$ (Properties of Spaces, Lemma 53.21.1) this follows from Lemma 75.8.4.

### 75.26. The cotangent complex of an algebraic space over a ring

08 VH Let $\Lambda$ be a ring and let $X$ be an algebraic space over $\Lambda$. Write $L_{X / \operatorname{Spec}(\Lambda)}=L_{X / \Lambda}$ which is justified by Lemma 75.25 .4 . In this section we give a description of $L_{X / \Lambda}$ similar to Lemma 75.4.3. Namely, we construct a category $\mathcal{C}_{X / \Lambda}$ fibred over $X_{\text {étale }}$ and endow it with a sheaf of (polynomial) $\Lambda$-algebras $\mathcal{O}$ such that

$$
L_{X / \Lambda}=L \pi_{!}\left(\Omega_{\mathcal{O} / \Lambda} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)
$$

We will later use the category $\mathcal{C}_{X / \Lambda}$ to construct a naive obstruction theory for the stack of coherent sheaves.

Let $\Lambda$ be a ring. Let $X$ be an algebraic space over $\Lambda$. Let $\mathcal{C}_{X / \Lambda}$ be the category whose objects are commutative diagrams

08VI

of schemes where
(1) $U$ is a scheme,
(2) $U \rightarrow X$ is étale,
(3) there exists an isomorphism $\mathbf{A}=\operatorname{Spec}(P)$ where $P$ is a polynomial algebra over $\Lambda$ (on some set of variables).
In other words, $\mathbf{A}$ is an (infinite dimensional) affine space over $\operatorname{Spec}(\Lambda)$. Morphisms are given by commutative diagrams. Recall that $X_{\text {étale }}$ denotes the small étale site of $X$ whose objects are schemes étale over $X$. There is a forgetful functor

$$
u: \mathcal{C}_{X / \Lambda} \rightarrow X_{\text {étale }}, \quad(U \rightarrow \mathbf{A}) \mapsto U
$$

Observe that the fibre category over $U$ is canonically equivalent to the category $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ introduced in Section 75.4

08 VJ Lemma 75.26.1. In the situation above the category $\mathcal{C}_{X / \Lambda}$ is fibred over $X_{\text {étale }}$.

Proof. Given an object $U \rightarrow \mathbf{A}$ of $\mathcal{C}_{X / \Lambda}$ and a morphism $U^{\prime} \rightarrow U$ of $X_{\text {étale }}$ consider the object $U^{\prime} \rightarrow \mathbf{A}$ of $\mathcal{C}_{X / \Lambda}$ where $U^{\prime} \rightarrow \mathbf{A}$ is the composition of $U \rightarrow \mathbf{A}$ and $U^{\prime} \rightarrow U$. The morphism $\left(U^{\prime} \rightarrow \mathbf{A}\right) \rightarrow(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X / \Lambda}$ is strongly cartesian over $X_{\text {étale }}$.

We endow $\mathcal{C}_{X / \Lambda}$ with the topology inherited from $X_{\text {étale }}$ (see Stacks, Section 8.10). The functor $u$ defines a morphism of topoi $\pi: \operatorname{Sh}\left(\mathcal{C}_{X / \Lambda}\right) \rightarrow \operatorname{Sh}\left(X_{\text {étale }}\right)$. The site $\mathcal{C}_{X / \Lambda}$ comes with several sheaves of rings.
(1) The sheaf $\mathcal{O}$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \Gamma\left(\mathbf{A}, \mathcal{O}_{\mathbf{A}}\right)$.
(2) The sheaf $\underline{\mathcal{O}}_{X}=\pi^{-1} \mathcal{O}_{X}$ given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{O}_{X}(U)$.
(3) The constant sheaf $\underline{\Lambda}$.

We obtain morphisms of ringed topoi

08VK (75.26.1.1)

The morphism $i$ is the identity on underlying topoi and $i^{\sharp}: \mathcal{O} \rightarrow \underline{\mathcal{O}}_{X}$ is the obvious map. The map $\pi$ is a special case of Cohomology on Sites, Situation 21.29.1. An important role will be played in the following by the derived functors $L i^{*}: D(\mathcal{O}) \longrightarrow$ $D\left(\underline{\mathcal{O}}_{X}\right)$ left adjoint to $R i_{*}=i_{*}: D\left(\underline{\mathcal{O}}_{X}\right) \rightarrow D(\mathcal{O})$ and $L \pi_{!}: D\left(\underline{\mathcal{O}}_{X}\right) \longrightarrow D\left(\mathcal{O}_{X}\right)$ left adjoint to $\pi^{*}=\pi^{-1}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\underline{\mathcal{O}}_{X}\right)$. We can compute $L \pi_{!}$thanks to our earlier work.

08VL Remark 75.26.2. In the situation above, for every object $U \rightarrow X$ of $X_{\text {étale }}$ let $P_{\bullet}, U$ be the standard resolution of $\mathcal{O}_{X}(U)$ over $\Lambda$. Set $\mathbf{A}_{n, U}=\operatorname{Spec}\left(P_{n, U}\right)$. Then $\mathbf{A}_{\bullet, U}$ is a cosimplicial object of the fibre category $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ of $\mathcal{C}_{X / \Lambda}$ over $U$. Moreover, as discussed in Remark 75.5.5 we have that $\mathbf{A}_{\bullet, U}$ is a cosimplicial object of $\mathcal{C}_{\mathcal{O}_{X}(U) / \Lambda}$ as in Cohomology on Sites, Lemma 21.30.7. Since the construction $U \mapsto \mathbf{A}_{\bullet, U}$ is functorial in $U$, given any (abelian) sheaf $\mathcal{F}$ on $\mathcal{C}_{X / \Lambda}$ we obtain a complex of presheaves

$$
U \longmapsto \mathcal{F}\left(\mathbf{A}_{\bullet}, U\right)
$$

whose cohomology groups compute the homology of $\mathcal{F}$ on the fibre category. We conclude by Cohomology on Sites, Lemma 21.31 .2 that the sheafification computes $L_{n} \pi_{!}(\mathcal{F})$. In other words, the complex of sheaves whose term in degree $-n$ is the sheafification of $U \mapsto \mathcal{F}\left(\mathbf{A}_{n, U}\right)$ computes $L \pi!(\mathcal{F})$.

With this remark out of the way we can state the main result of this section.
08VM Lemma 75.26.3. In the situation above there is a canonical isomorphism

$$
L_{X / \Lambda}=L \pi_{!}\left(L i^{*} \Omega_{\mathcal{O} / \underline{\Lambda}}\right)=L \pi_{!}\left(i^{*} \Omega_{\mathcal{O} / \underline{\Lambda}}\right)=L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. We first observe that for any object $(U \rightarrow \mathbf{A})$ of $\mathcal{C}_{X / \Lambda}$ the value of the sheaf $\mathcal{O}$ is a polynomial algebra over $\Lambda$. Hence $\Omega_{\mathcal{O} / \underline{\Lambda}}$ is a flat $\mathcal{O}$-module and we conclude the second and third equalities of the statement of the lemma hold.

By Remark 75.26 .2 the object $L \pi_{!}\left(\Omega_{\mathcal{O} / \underline{\Lambda}} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)$ is computed as the sheafification of the complex of presheaves

$$
U \mapsto\left(\Omega_{\mathcal{O} / \Lambda} \otimes_{\mathcal{O}} \underline{\mathcal{O}}_{X}\right)\left(\mathbf{A} \mathbf{A}_{\bullet}, U\right)=\Omega_{P_{\bullet}, U / \Lambda} \otimes_{P_{\bullet}, U} \mathcal{O}_{X}(U)=L_{\mathcal{O}_{X}(U) / \Lambda}
$$

using notation as in Remark 75.26.2. Now Remark 75.17 .5 shows that $L \pi_{!}\left(\Omega_{\mathcal{O} / \Lambda} \otimes_{\mathcal{O}}\right.$ $\left.\underline{\mathcal{O}}_{X}\right)$ computes the cotangent complex of the map of rings $\underline{\Lambda} \rightarrow \mathcal{O}_{X}$ on $X_{\text {étale }}$. This is what we want by Lemma 75.25 .4 .

### 75.27. Fibre products of algebraic spaces and the cotangent complex

09DJ Let $S$ be a scheme. Let $X \rightarrow B$ and $Y \rightarrow B$ be morphisms of algebraic spaces pver $S$. Consider the fibre product $X \times_{B} Y$ with projection morphisms $p: X \times_{B} Y \rightarrow X$ and $q: X \times_{B} Y \rightarrow Y$. In this section we discuss $L_{X \times{ }_{B} Y / B}$. Most of the information we want is contained in the following diagram

09DK
(75.27.0.1)

Explanation: The middle row is the fundamental triangle of Lemma 75.21 .3 for the morphisms $X \times_{B} Y \rightarrow X \rightarrow B$. The middle column is the fundamental triangle for the morphisms $X \times_{B} Y \rightarrow Y \rightarrow B$. Next, $E$ is an object of $D\left(\mathcal{O}_{X \times{ }_{B} Y}\right)$ which "fits" into the upper right corner, i.e., which turns both the top row and the right column into distinguished triangles. Such an $E$ exists by Derived Categories, Proposition 13.4.21 applied to the lower left square (with 0 placed in the missing spot). To be more explicit, we could for example define $E$ as the cone (Derived Categories, Definition 13.9.1 of the map of complexes

$$
L p^{*} L_{X / B} \oplus L q^{*} L_{Y / B} \longrightarrow L_{X \times_{B} Y / B}
$$

and get the two maps with target $E$ by an application of TR3. In the Tor independent case the object $E$ is zero.

09DL Lemma 75.27.1. In the situation above, if $X$ and $Y$ are Tor independent over $B$, then the object $E$ in 75.27.0.1) is zero. In this case we have

$$
L_{X \times_{B} Y / B}=L p^{*} L_{X / B} \oplus L q^{*} L_{Y / B}
$$

Proof. Choose a scheme $W$ and a surjective étale morphsm $W \rightarrow B$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{B} W$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y \times_{B} W$. Then $U \times_{W} V \rightarrow X \times_{B} Y$ is surjective étale too. Hence it suffices to prove that the restriction of $E$ to $U \times_{W} V$ is zero. By Lemma 75.25 .3 and Derived Categories of Spaces, Lemma 62.17 .3 this reduces us to the case of schemes. Taking suitable affine opens we reduce to the case of affine schemes. Using Lemma 75.23 .2 we reduce to the case of a tensor product of rings, i.e., to Lemma 75.14.1.

In general we can say the following about the object $E$.
09DM Lemma 75.27.2. Let $S$ be a scheme. Let $X \rightarrow B$ and $Y \rightarrow B$ be morphisms of algebraic spaces over $S$. The object $E$ in (75.27.0.1) satisfies $H^{i}(E)=0$ for $i=0,-1$ and for a geometric point $(\bar{x}, \bar{y}): \operatorname{Spec}(k) \rightarrow X \times_{B} Y$ we have

$$
H^{-2}(E)_{(\bar{x}, \bar{y})}=\operatorname{Tor}_{1}^{R}(A, B) \otimes_{A \otimes_{R} B} C
$$

where $R=\mathcal{O}_{B, \bar{b}}, A=\mathcal{O}_{X, \bar{x}}, B=\mathcal{O}_{Y, \bar{y}}$, and $C=\mathcal{O}_{X \times_{B} Y,(\bar{x}, \bar{y})}$.
Proof. The formation of the cotangent complex commutes with taking stalks and pullbacks, see Lemmas 75.17.9 and75.17.3. Note that $C$ is a henselization of $A \otimes_{R} B$. $L_{C / R}=L_{A \otimes_{R} B / R} \otimes_{A \otimes_{R} B} C$ by the results of Section 75.8. Thus the stalk of $E$ at our geometric point is the cone of the map $L_{A / R} \otimes C \rightarrow L_{A \otimes_{R} B / R} \otimes C$. Therefore the results of the lemma follow from the case of rings, i.e., Lemma 75.14.2.

## CHAPTER 76

## Algebraic Stacks

026K

### 76.1. Introduction

026L This is where we define algebraic stacks and make some very elementary observations. The general philosophy will be to have no separation conditions whatsoever and add those conditions necessary to make lemmas, propositions, theorems true/provable. Thus the notions discussed here differ slightly from those in other places in the literature, e.g., LMB00.

This chapter is not an introduction to algebraic stacks. For an informal discussion of algebraic stacks, please take a look at Introducing Algebraic Stacks, Section 86.1.

### 76.2. Conventions

026M The conventions we use in this chapter are the same as those in the chapter on algebraic spaces. For convenience we repeat them here.
We work in a suitable big fppf site $S c h_{f p p f}$ as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of $S_{\text {ch }} h_{f p p f}$. We discuss what changes if you change the big fppf site in Section 76.18 .

We will always work relative to a base $S$ contained in $S c h_{f p p f}$. And we will then work with the big fppf site $(S c h / S)_{f p p f}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S=\operatorname{Spec}(\mathbf{Z})$.

If $U, T$ are schemes over $S$, then we denote $U(T)$ for the set of $T$-valued points over $S$. In a formula: $U(T)=\operatorname{Mor}_{S}(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see Descent, Lemma 34.9.3. Hence the topology on $S c h_{f p p f}$ is weaker than the canonical topology and all representable presheaves are sheaves.

### 76.3. Notation

0400 We use the letters $S, T, U, V, X, Y$ to indicate schemes. We use the letters $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ to indicate categories (fibred, fibred in groupoids, stacks, ...) over $(S c h / S)_{f p p f}$. We use small case letters $f, g$ for functors such as $f: \mathcal{X} \rightarrow \mathcal{Y}$ over $(S c h / S)_{f p p f}$. We use capital $F, G, H$ for algebraic spaces over $S$, and more generally for presheaves of sets on $(S c h / S)_{\text {fppf }}$. (In future chapters we will revert to using also $X, Y$, etc for algebraic spaces.)
The reason for these choices is that we want to clearly distinguish between the different types of objects in this chapter, to build the foundations.

### 76.4. Representable categories fibred in groupoids

02 ZQ Let $S$ be a scheme contained in $S c h_{f p p f}$. The basic object of study in this chapter will be a category fibred in groupoids $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$, see Categories, Definition 4.34.1. We will often simply say "let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$ " to indicate this situation. A 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ of categories in groupoids over $(S c h / S)_{f p p f}$ will be a 1-morphism in the 2-category of categories fibred in groupoids over $(S c h / S)_{f p p f}$, see Categories, Definition 4.34.6. It is simply a functor $\mathcal{X} \rightarrow \mathcal{Y}$ over $(S c h / S)_{f p p f}$. We recall this is really a $(2,1)$-category and that all 2-fibre products exist.

Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Recall that $\mathcal{X}$ is said to be representable if there exists a scheme $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and an equivalence

$$
j: \mathcal{X} \longrightarrow(S c h / U)_{f p p f}
$$

of categories over $(S c h / S)_{f p p f}$, see Categories, Definition 4.39.1. We will sometimes say that $\mathcal{X}$ is representable by a scheme to distinguish from the case where $\mathcal{X}$ is representable by an algebraic space (see below).

If $\mathcal{X}, \mathcal{Y}$ are fibred in groupoids and representable by $U, V$, then we have
04SR
(76.4.0.1) $\quad \operatorname{Mor}_{C a t /(S c h / S)_{f p p f}}(\mathcal{X}, \mathcal{Y}) / 2$-isomorphism $=\operatorname{Mor}_{S c h / S}(U, V)$
see Categories, Lemma 4.39.3. More precisely, any 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ gives rise to a morphism $U \rightarrow V$. Conversely, given a morphism of schemes $U \rightarrow V$ over $S$ there exists a 1-morphism $\phi: \mathcal{X} \rightarrow \mathcal{Y}$ which gives rise to $U \rightarrow V$ and which is unique up to unique 2 -isomorphism.

### 76.5. The 2-Yoneda lemma

04 SS Let $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, and let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We will frequently use the 2-Yoneda lemma, see Categories, Lemma 4.40.1. Technically it says that there is an equivalence of categories

$$
\operatorname{Mor}_{C a t /(S c h / S)_{f p p f}}\left((S c h / U)_{f p p f}, \mathcal{X}\right) \longrightarrow \mathcal{X}_{U}, \quad f \longmapsto f(U / U)
$$

It says that 1-morphisms $(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ correspond to objects $x$ of the fibre category $\mathcal{X}_{U}$. Namely, given a 1-morphism $f:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ we obtain the object $x=f(U / U) \in \operatorname{Ob}\left(\mathcal{X}_{U}\right)$. Conversely, given a choice of pullbacks for $\mathcal{X}$ as in Categories, Definition 4.32.6, and an object $x$ of $\mathcal{X}_{U}$, we obtain a functor $(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ defined by the rule

$$
(\varphi: V \rightarrow U) \longmapsto \varphi^{*} x
$$

on objects. By abuse of notation we use $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ to indicate this functor. It indeed has the property that $x(U / U)=x$ and moreover, given any other functor $f$ with $f(U / U)=x$ there exists a unique 2-isomorphism $x \rightarrow f$. In other words the functor $x$ is well determined by the object $x$ up to unique 2-isomorphism.

We will use this without further mention in the following.

### 76.6. Representable morphisms of categories fibred in groupoids

04 ST Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a representable 1-morphism, see Categories, Definition 4.40.5. This means that for every $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and any $y \in \mathrm{Ob}\left(\mathcal{Y}_{U}\right)$ the 2-fibre product $(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable. Choose a representing object $V_{y}$ and an equivalence

$$
\left(S c h / V_{y}\right)_{f p p f} \longrightarrow(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}
$$

The projection $\left(S c h / V_{y}\right)_{f p p f} \rightarrow(S c h / U)_{f p p f} \times \mathcal{Y} \mathcal{Y} \rightarrow(S c h / U)_{f p p f}$ comes from a morphism of schemes $f_{y}: V_{y} \rightarrow U$, see Section 76.4 We represent this by the diagram

0401 (76.6.0.2)

where the squiggly arrows represent the 2 -Yoneda embedding. Here are some lemmas about this notion that work in great generality (namely, they work for categories fibred in groupoids over any base category which has fibre products).

02ZR Lemma 76.6.1. Let $S, X, Y$ be objects of $S_{\text {ch }}^{\text {fppf }}$. Let $f: X \rightarrow Y$ be a morphism of schemes. Then the 1-morphism induced by $f$

$$
(S c h / X)_{f p p f} \longrightarrow(S c h / Y)_{f p p f}
$$

is a representable 1-morphism.
Proof. This is formal and relies only on the fact that the category $(S c h / S)_{f p p f}$ has fibre products.

0456 Lemma 76.6.2. Let $S$ be an object of $S_{\text {Sch }}^{\text {fppf }}$. Consider a 2 -commutative diagram

of 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume the horizontal arrows are equivalences. Then $f$ is representable if and only if $f^{\prime}$ is representable.

Proof. Omitted.
02 ZS Lemma 76.6.3. Let $S$ be a scheme contained in $S_{\text {Sch fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ Let $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ be representable 1 -morphisms. Then

$$
g \circ f: \mathcal{X} \longrightarrow \mathcal{Z}
$$

is a representable 1-morphism.
Proof. This is entirely formal and works in any category.

02ZT Lemma 76.6.4. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a representable 1-morphism. Let $g: \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram

Then the base change $f^{\prime}$ is a representable 1-morphism.
Proof. This is entirely formal and works in any category.
02ZU Lemma 76.6.5. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}_{i}, \mathcal{Y}_{i}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}, i=1,2$. Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{Y}_{i}, i=1,2$ be representable 1-morphisms. Then

$$
f_{1} \times f_{2}: \mathcal{X}_{1} \times \mathcal{X}_{2} \longrightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}
$$

is a representable 1-morphism.
Proof. Write $f_{1} \times f_{2}$ as the composition $\mathcal{X}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}$. The first arrow is the base change of $f_{1}$ by the map $\mathcal{Y}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1}$, and the second arrow is the base change of $f_{2}$ by the map $\mathcal{Y}_{1} \times \mathcal{Y}_{2} \rightarrow \mathcal{Y}_{2}$. Hence this lemma is a formal consequence of Lemmas 76.6 .3 and 76.6 .4 .

### 76.7. Split categories fibred in groupoids

04 SU Let $S$ be a scheme contained in $S c h_{f p p f}$. Recall that given a "presheaf of groupoids"

$$
F:(S c h / S)_{f p p f}^{o p p} \longrightarrow \text { Groupoids }
$$

we get a category fibred in groupoids $\mathcal{S}_{F}$ over $(S c h / S)_{f p p f}$, see Categories, Example 4.36.1. Any category fibred in groupoids isomorphic (!) to one of these is called a split category fibred in groupoids. Any category fibred in groupoids is equivalent to a split one.

If $F$ is a presheaf of sets then $\mathcal{S}_{F}$ is fibred in sets, see Categories, Definition 4.37.2, and Categories, Example 4.37.5. The rule $F \mapsto \mathcal{S}_{F}$ is in some sense fully faithful on presheaves, see Categories, Lemma 4.37.6. If $F, G$ are presheaves, then

$$
\mathcal{S}_{F \times G}=\mathcal{S}_{F} \times{ }_{(S c h / S)_{f p p f}} \mathcal{S}_{G}
$$

and if $F \rightarrow H$ and $G \rightarrow H$ are maps of presheaves of sets, then

$$
\mathcal{S}_{F \times{ }_{H} G}=\mathcal{S}_{F} \times_{\mathcal{S}_{H}} \mathcal{S}_{G}
$$

where the right hand sides are 2 -fibre products. This is immediate from the definitions as the fibre categories of $\mathcal{S}_{F}, \mathcal{S}_{G}, \mathcal{S}_{H}$ have only identity morphisms.

An even more special case is where $F=h_{X}$ is a representable presheaf. In this case we have $\mathcal{S}_{h_{X}}=(S c h / X)_{\text {fppf }}$, see Categories, Example 4.37.7.

We will use the notation $\mathcal{S}_{F}$ without further mention in the following.
76.8. Categories fibred in groupoids representable by algebraic spaces

02 ZV A slightly weaker notion than being representable is the notion of being representable by algebraic spaces which we discuss in this section. This discussion might have been avoided had we worked with some category Spaces $_{f p p f}$ of algebraic spaces instead of the category $S c h_{f p p f}$. However, it seems to us natural to consider the category of schemes as the natural collection of "test objects" over which the fibre categories of an algebraic stack are defined.

In analogy with Categories, Definitions 4.39.1 we make the following definition.
04SV Definition 76.8.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. A category fibred in groupoids $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ is called representable by an algebraic space over $S$ if there exists an algebraic space $F$ over $S$ and an equivalence $j: \mathcal{X} \rightarrow \mathcal{S}_{F}$ of categories over $(S c h / S)_{f p p f}$.

We continue our abuse of notation in suppressing the equivalence $j$ whenever we encounter such a situation. It follows formally from the above that if $\mathcal{X}$ is representable (by a scheme), then it is representable by an algebraic space. Here is the analogue of Categories, Lemma 4.39.2.

02ZX Lemma 76.8.2. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Then $\mathcal{X}$ is representable by an algebraic space over $S$ if and only if the following conditions are satisfied:
(1) $\mathcal{X}$ is fibred in setoid $\S^{1}$, and
(2) the presheaf $U \mapsto \operatorname{Ob}\left(\mathcal{X}_{U}\right) / \cong$ is an algebraic space.

Proof. Omitted, but see Categories, Lemma 4.39.2.
If $\mathcal{X}, \mathcal{Y}$ are fibred in groupoids and representable by algebraic spaces $F, G$ over $S$, then we have

04SW

$$
\begin{equation*}
\operatorname{Mor}_{C a t /(S c h / S)_{f p p f}}(\mathcal{X}, \mathcal{Y}) / 2 \text {-isomorphism }=\operatorname{Mor}_{S c h / S}(F, G) \tag{76.8.2.1}
\end{equation*}
$$

see Categories, Lemma 4.38.6. More precisely, any 1-morphism $\mathcal{X} \rightarrow \mathcal{Y}$ gives rise to a morphism $F \rightarrow G$. Conversely, give a morphism of sheaves $F \rightarrow G$ over $S$ there exists a 1-morphism $\phi: \mathcal{X} \rightarrow \mathcal{Y}$ which gives rise to $F \rightarrow G$ and which is unique up to unique 2 -isomorphism.

### 76.9. Morphisms representable by algebraic spaces

04SX In analogy with Categories, Definition 4.40.5 we make the following definition.
02ZW Definition 76.9.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. A 1-morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of categories fibred in groupoids over $(S c h / S)_{f p p f}$ is called representable by algebraic spaces if for any $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and any $y:(S c h / U)_{f p p f} \rightarrow \mathcal{Y}$ the category fibred in groupoids

$$
(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}
$$

over $(S c h / U)_{f p p f}$ is representable by an algebraic space over $U$.

[^192]Choose an algebraic space $F_{y}$ over $U$ which represents $(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$. We may think of $F_{y}$ as an algebraic space over $S$ which comes equipped with a canonical morphism $f_{y}: F_{y} \rightarrow U$ over $S$, see Spaces, Section 52.16. Here is the diagram

0402

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The right square is 2 -commutative, and is a 2 -fibre product square.
Here is the analogue of Categories, Lemma 4.40.7.
02ZY Lemma 76.9.2. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. The following are necessary and sufficient conditions for $f$ to be representable by algebraic spaces:
(1) for each scheme $U / S$ the functor $f_{U}: \mathcal{X}_{U} \longrightarrow \mathcal{Y}_{U}$ between fibre categories is faithful, and
(2) for each $U$ and each $y \in \operatorname{Ob}\left(\mathcal{Y}_{U}\right)$ the presheaf

$$
(h: V \rightarrow U) \longmapsto\left\{(x, \phi) \mid x \in \mathrm{Ob}\left(\mathcal{X}_{V}\right), \phi: h^{*} y \rightarrow f(x)\right\} / \cong
$$

is an algebraic space over $U$.
Here we have made a choice of pullbacks for $\mathcal{Y}$.
Proof. This follows from the description of fibre categories of the 2-fibre products $(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ in Categories, Lemma 4.40.3 combined with Lemma 76.8.2.

Here are some lemmas about this notion that work in great generality.
0457 Lemma 76.9.3. Let $S$ be an object of $S_{\text {s }}^{\text {fppf }}$. Consider a 2 -commutative diagram

of 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume the horizontal arrows are equivalences. Then $f$ is representable by algebraic spaces if and only if $f^{\prime}$ is representable by algebraic spaces.
Proof. Omitted.
02ZZ Lemma 76.9.4. Let $S$ be an object of $S_{\text {Sch }}^{f p p f}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $S$. If $\mathcal{X}$ and $\mathcal{Y}$ are representable by algebraic spaces over $S$, then the 1-morphism $f$ is representable by algebraic spaces.

Proof. Omitted. This relies only on the fact that the category of algebraic spaces over $S$ has fibre products, see Spaces, Lemma 52.7.3.

0458 Lemma 76.9.5. Let $S$ be an object of $S_{\text {Sch }}^{\text {fppf }}$. Let $a: F \rightarrow G$ be a map of presheaves of sets on $(S c h / S)_{\text {fppf }}$. Denote $a^{\prime}: \mathcal{S}_{F} \rightarrow \mathcal{S}_{G}$ the associated map of categories fibred in sets. Then a is representable by algebraic spaces (see Bootstrap, Definition 67.3.1) if and only if $a^{\prime}$ is representable by algebraic spaces.

Proof. Omitted.
04SY Lemma 76.9.6. Let $S$ be an object of $S_{\text {Sch }}^{\text {fppf }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of categories fibred in setoids over $(S c h / S)_{\text {fppf }}$. Let $F$, resp. $G$ be the presheaf which to $T$ associates the set of isomorphism classes of objects of $\mathcal{X}_{T}$, resp. $\mathcal{Y}_{T}$. Let $a: F \rightarrow G$ be the map of presheaves corresponding to $f$. Then a is representable by algebraic spaces (see Bootstrap, Definition 67.3.1) if and only if $f$ is representable by algebraic spaces.

Proof. Omitted. Hint: Combine Lemmas 76.9.3 and 76.9.5,
0302 Lemma 76.9.7. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g: \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram

Then the base change $f^{\prime}$ is a 1-morphism representable by algebraic spaces.
Proof. This is formal.
0300 Lemma 76.9.8. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ Let $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms. Assume
(1) $f$ is representable by algebraic spaces, and
(2) $\mathcal{Z}$ is representable by an algebraic space over $S$.

Then the 2 -fibre product $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X}$ is representable by an algebraic space.
Proof. This is a reformulation of Bootstrap, Lemma67.3.6. First note that $\mathcal{Z} \times_{g, \mathcal{Y}, f}$ $\mathcal{X}$ is fibred in setoids over $(S c h / S)_{f p p f}$. Hence it is equivalent to $\mathcal{S}_{F}$ for some presheaf $F$ on $(S c h / S)_{f p p f}$, see Categories, Lemma 4.38.5. Moreover, let $G$ be an algebraic space which represents $\mathcal{Z}$. The 1 -morphism $\mathcal{Z} \times g, \mathcal{Y}, f, \mathcal{X} \rightarrow \mathcal{Z}$ is representable by algebraic spaces by Lemma 76.9.7. And $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} \rightarrow \mathcal{Z}$ corresponds to a morphism $F \rightarrow G$ by Categories, Lemma 4.38.6. Then $F \rightarrow G$ is representable by algebraic spaces by Lemma 76.9.6. Hence Bootstrap, Lemma 67.3.6 implies that $F$ is an algebraic space as desired.

Let $S, \mathcal{X}, \mathcal{Y}, \mathcal{Z}, f, g$ be as in Lemma 76.9 .8 . Let $F$ and $G$ be algebraic spaces over $S$ such that $F$ represents $\mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X}$ and $G$ represents $\mathcal{Z}$. The 1-morphism $f^{\prime}: \mathcal{Z} \times_{g, \mathcal{Y}, f} \mathcal{X} \rightarrow \mathcal{Z}$ corresponds to a morphism $f^{\prime}: F \rightarrow G$ of algebraic spaces by 76.8.2.1). Thus we have the following diagram

0403

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The middle square is 2-commutative with equivalences as horizontal arrows.
76.10. PROPERTIES OF MORPHISMS REPRESENTABLE BY ALGEBRAIC SPACES 4417

0301 Lemma 76.9.9. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ are 1-morphisms representable by algebraic spaces, then

$$
g \circ f: \mathcal{X} \longrightarrow \mathcal{Z}
$$

is a 1-morphism representable by algebraic spaces.
Proof. This follows from Lemma 76.9.8. Details omitted.
0303 Lemma 76.9.10. Let $S$ be a scheme contained in $S_{\text {sch }}^{\text {fppf }}$. Let $\mathcal{X}_{i}, \mathcal{Y}_{i}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}, i=1,2$. Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{Y}_{i}, i=1,2$ be 1-morphisms representable by algebraic spaces. Then

$$
f_{1} \times f_{2}: \mathcal{X}_{1} \times \mathcal{X}_{2} \longrightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}
$$

is a 1-morphism representable by algebraic spaces.
Proof. Write $f_{1} \times f_{2}$ as the composition $\mathcal{X}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}$. The first arrow is the base change of $f_{1}$ by the map $\mathcal{Y}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1}$, and the second arrow is the base change of $f_{2}$ by the map $\mathcal{Y}_{1} \times \mathcal{Y}_{2} \rightarrow \mathcal{Y}_{2}$. Hence this lemma is a formal consequence of Lemmas 76.9.9 and 76.9.7.

### 76.10. Properties of morphisms representable by algebraic spaces

03 YJ Here is the definition that makes this work.
$03 Y K$ Definition 76.10.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Assume $f$ is representable by algebraic spaces. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which
(1) is preserved under any base change, and
(2) is fppf local on the base, see Descent on Spaces, Definition 61.9.1.

In this case we say that $f$ has property $\mathcal{P}$ if for every $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and any $y \in \mathcal{Y}_{U}$ the resulting morphism of algebraic spaces $f_{y}: F_{y} \rightarrow U$, see diagram 76.9.1.1), has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the target. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

0459 Lemma 76.10.2. Let $S$ be an object of $S_{\text {Ch }}^{\text {fppf }}$. Let $\mathcal{P}$ be as in Definition 76.10.1. Consider a 2-commutative diagram

of 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume the horizontal arrows are equivalences and $f$ (or equivalently $f^{\prime}$ ) is representably by algebraic spaces. Then $f$ has $\mathcal{P}$ if and only if $f^{\prime}$ has $\mathcal{P}$.

Proof. Note that this makes sense by Lemma 76.9.3. Proof omitted.

### 76.10. PROPERTIES OF MORPHISMS REPRESENTABLE BY ALGEBRAIC SPACES 4418

Here is a sanity check.
045A Lemma 76.10.3. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $a: F \rightarrow G$ be a map of presheaves on $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be as in Definition 76.10.1. Assume $a$ is representable by algebraic spaces. Then $a: F \rightarrow G$ has property $\mathcal{P}$ (see Bootstrap, Definition 67.4.1) if and only if the corresponding morphism $\mathcal{S}_{F} \rightarrow \mathcal{S}_{G}$ of categories fibred in groupoids has property $\mathcal{P}$.

Proof. Note that the lemma makes sense by Lemma 76.9.5. Proof omitted.
04TC Lemma 76.10.4. Let $S$ be an object of $S_{\text {Chppf }}$. Let $\mathcal{P}$ be as in Definition 76.10.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in setoids over $(S c h / S)_{\text {fppf }}$. Let $F$, resp. $G$ be the presheaf which to $T$ associates the set of isomorphism classes of objects of $\mathcal{X}_{T}$, resp. $\mathcal{Y}_{T}$. Let $a: F \rightarrow G$ be the map of presheaves corresponding to $f$. Then a has $\mathcal{P}$ if and only if $f$ has $\mathcal{P}$.
Proof. The lemma makes sense by Lemma 76.9.6. The lemma follows on combining Lemmas 76.10 .2 and 76.10.3,

045B Lemma 76.10.5. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be a property as in Definition 76.10 .1 which is stable under composition. Let $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1morphisms which are representable by algebraic spaces. If $f$ and $g$ have property $\mathcal{P}$ so does $g \circ f: \mathcal{X} \rightarrow \mathcal{Z}$.

Proof. Note that the lemma makes sense by Lemma 76.9.9. Proof omitted.
045C Lemma 76.10.6. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf. }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be a property as in Definition 76.10.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g: \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the 2 -fibre product diagram

If $f$ has $\mathcal{P}$, then the base change $f^{\prime}$ has $\mathcal{P}$.
Proof. The lemma makes sense by Lemma 76.9.7. Proof omitted.
045D Lemma 76.10.7. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be a property as in Definition 76.10.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g: \mathcal{Z} \rightarrow \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram

Assume that for every scheme $U$ and object $x$ of $\mathcal{Y}_{U}$, there exists an fppf covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.x\right|_{U_{i}}$ is in the essential image of the functor $g: \mathcal{Z}_{U_{i}} \rightarrow \mathcal{Y}_{U_{i}}$. In this case, if $f^{\prime}$ has $\mathcal{P}$, then $f$ has $\mathcal{P}$.
Proof. Proof omitted. Hint: Compare with the proof of Spaces, Lemma 52.5.6.
76.10. PROPERTIES OF MORPHISMS REPRESENTABLE BY ALGEBRAIC SPACES 4419

045E Lemma 76.10.8. Let $S$ be a scheme contained in $S_{\text {sch }}^{\text {fppf }}$. Let $\mathcal{P}$ be a property as in Definition 76.10 .1 which is stable under composition. Let $\mathcal{X}_{i}, \mathcal{Y}_{i}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}, i=1,2$. Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{Y}_{i}, i=1,2$ be 1morphisms representable by algebraic spaces. If $f_{1}$ and $f_{2}$ have property $\mathcal{P}$ so does $f_{1} \times f_{2}: \mathcal{X}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}$.
Proof. The lemma makes sense by Lemma 76.9.10. Proof omitted.
045F Lemma 76.10.9. Let $S$ be a scheme contained in $S_{\text {sch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $\mathcal{P}, \mathcal{P}^{\prime}$ be properties as in Definition 76.10.1. Suppose that for any morphism of algebraic spaces $a: F \rightarrow G$ we have $\mathcal{P}(a) \Rightarrow \mathcal{P}^{\prime}(a)$. If $f$ has property $\mathcal{P}$ then $f$ has property $\mathcal{P}^{\prime}$.
Proof. Formal.
05UK Lemma 76.10.10. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $j: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $j$ is representable by algebraic spaces and a monomorphism (see Definition 76.10 .1 and Descent on Spaces, Lemma 61.10.28). Then $j$ is fully faithful on fibre categories.

Proof. We have seen in Lemma 76.9 .2 that $j$ is faithful on fibre categories. Consider a scheme $U$, two objects $u, v$ of $\mathcal{X}_{U}$, and an isomorphism $t: j(u) \rightarrow j(v)$ in $\mathcal{Y}_{U}$. We have to construct an isomorphism in $\mathcal{X}_{U}$ between $u$ and $v$. By the 2-Yoneda lemma (see Section 76.5) we think of $u, v$ as 1-morphisms $u, v:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ and we consider the 2 -fibre product

$$
(S c h / U)_{f p p f} \times_{j o v, \mathcal{Y}} \mathcal{X}
$$

By assumption this is representable by an algebraic space $F_{j o v}$, over $U$ and the morphism $F_{j o v} \rightarrow U$ is a monomorphism. But since $\left(1_{U}, v, 1_{j(v)}\right)$ gives a 1-morphism of $(S c h / U)_{f p p f}$ into the displayed 2-fibre product, we see that $F_{j o v}=U$ (here we use that if $V \rightarrow U$ is a monomorphism of algebraic spaces which has a section, then $V=U)$. Therefore the 1-morphism projecting to the first coordinate

$$
(S c h / U)_{f p p f} \times_{j o v, \mathcal{Y}} \mathcal{X} \rightarrow(S c h / U)_{f p p f}
$$

is an equivalence of fibre categories. Since $\left(1_{U}, u, t\right)$ and $\left(1_{U}, v, 1_{j(v)}\right)$ give two objects in $\left((S c h / U)_{f p p f} \times_{j o v, \mathcal{Y}} \mathcal{X}\right)_{U}$ which have the same first coordinate, there must be a 2 -morphism between them in the 2-fibre product. This is by definition a morphism $\tilde{t}: u \rightarrow v$ such that $j(\tilde{t})=t$.

Here is a characterization of those categories fibred in groupoids for which the diagonal is representable by algebraic spaces.
045G Lemma 76.10.11. Let $S$ be a scheme contained in $S c h_{\text {fppf }}$. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. The following are equivalent:
(1) the diagonal $\mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,
(2) for every scheme $U$ over $S$, and any $x, y \in \operatorname{Ob}\left(\mathcal{X}_{U}\right)$ the sheaf Isom $(x, y)$ is representable by an algebraic space over $U$,
(3) for every scheme $U$ over $S$, and any $x \in \operatorname{Ob}\left(\mathcal{X}_{U}\right)$ the associated 1morphism $x:(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}$ is representable by algebraic spaces,
(4) for every pair of schemes $T_{1}, T_{2}$ over $S$, and any $x_{i} \in \operatorname{Ob}\left(\mathcal{X}_{T_{i}}\right), i=1,2$ the 2-fibre product $\left(S c h / T_{1}\right)_{\text {fppf }} \times{ }_{x_{1}, \mathcal{X}, x_{2}}\left(S c h / T_{2}\right)_{\text {fppf }}$ is representable by an algebraic space,
(5) for every representable category fibred in groupoids $\mathcal{U}$ over $(S c h / S)_{\text {fppf }}$ every 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces,
(6) for every pair $\mathcal{T}_{1}, \mathcal{T}_{2}$ of representable categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ and any 1-morphisms $x_{i}: \mathcal{T}_{i} \rightarrow \mathcal{X}, i=1,2$ the 2 -fibre product $\mathcal{T}_{1} \times{ }_{x_{1}, \mathcal{X}, x_{2}} \mathcal{T}_{2}$ is representable by an algebraic space,
(7) for every category fibred in groupoids $\mathcal{U}$ over $(S c h / S)_{\text {fppf }}$ which is representable by an algebraic space every 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces,
(8) for every pair $\mathcal{T}_{1}, \mathcal{T}_{2}$ of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ which are representable by algebraic spaces, and any 1-morphisms $x_{i}$ : $\mathcal{T}_{i} \rightarrow \mathcal{X}$ the 2 -fibre product $\mathcal{T}_{1} \times_{x_{1}, \mathcal{X}, x_{2}} \mathcal{T}_{2}$ is representable by an algebraic space.

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.2.5 and the definitions. Let us prove the equivalence of (1) and (3). Write $\mathcal{C}=(S c h / S)_{f p p f}$ for the base category. We will use some of the observations of the proof of the similar Categories, Lemma 4.40.8. We will use the symbol $\cong$ to mean "equivalence of categories fibred in groupoids over $\mathcal{C}=(S c h / S)_{f p p f}$ ". Assume (1). Suppose given $U$ and $x$ as in (3). For any scheme $V$ and $y \in \operatorname{Ob}\left(\mathcal{X}_{V}\right)$ we see (compare reference above) that

$$
\mathcal{C} / U \times_{x, \mathcal{X}, y} \mathcal{C} / V \cong\left(\mathcal{C} / U \times_{S} V\right) \times_{(x, y), \mathcal{X} \times \mathcal{X}, \Delta} \mathcal{X}
$$

which is representable by an algebraic space by assumption. Conversely, assume (3). Consider any scheme $U$ over $S$ and a pair $\left(x, x^{\prime}\right)$ of objects of $\mathcal{X}$ over $U$. We have to show that $\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X},\left(x, x^{\prime}\right)} U$ is representable by an algebraic space. This is clear because (compare reference above)

$$
\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X},\left(x, x^{\prime}\right)} \mathcal{C} / U \cong\left(\mathcal{C} / U \times_{x, \mathcal{X}, x^{\prime}} \mathcal{C} / U\right) \times_{\mathcal{C} / U \times{ }_{S} U, \Delta} \mathcal{C} / U
$$

and the right hand side is representable by an algebraic space by assumption and the fact that the category of algebraic spaces over $S$ has fibre products and contains $U$ and $S$.

The equivalences $(3) \Leftrightarrow(4),(5) \Leftrightarrow(6)$, and $(7) \Leftrightarrow(8)$ are formal. The equivalences $(3) \Leftrightarrow(5)$ and $(4) \Leftrightarrow(6)$ follow from Lemma 76.9 .3 . Assume (3), and let $\mathcal{U} \rightarrow \mathcal{X}$ be as in (7). To prove (7) we have to show that for every scheme $V$ and 1-morphism $y:(S c h / V)_{f p p f} \rightarrow \mathcal{X}$ the 2-fibre product $(S c h / V)_{f p p f} \times_{y, \mathcal{X}} \mathcal{U}$ is representable by an algebraic space. Property (3) tells us that $y$ is representable by algebraic spaces hence Lemma 76.9 .8 implies what we want. Finally, (7) directly implies (3).

In the situation of the lemma, for any 1-morphism $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ as in the lemma, it makes sense to say that $x$ has property $\mathcal{P}$, for any property as in Definition 76.10.1. In particular this holds for $\mathcal{P}=$ "surjective", $\mathcal{P}=$ "smooth", and $\mathcal{P}=$ "étale", see Descent on Spaces, Lemmas 61.10.5 61.10.24, and 61.10.26, We will use these three cases in the definitions of algebraic stacks below.

### 76.11. Stacks in groupoids

0304 Let $S$ be a scheme contained in $S c h_{f p p f}$. Recall that a category $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ over $(S c h / S)_{f p p f}$ is said to be a stack in groupoids (see Stacks, Definition 8.5.1) if and only if
(1) $p: \mathcal{X} \rightarrow \mathcal{C}$ is fibred in groupoids over $(S c h / S)_{f p p f}$,
(2) for all $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, for all $x, y \in \mathrm{Ob}\left(\mathcal{X}_{U}\right)$ the presheaf $\operatorname{Isom}(x, y)$ is a sheaf on the site $(S c h / U)_{f p p f}$, and
(3) for all coverings $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ in $(S c h / S)_{\text {fppf }}$, all descent data $\left(x_{i}, \phi_{i j}\right)$ for $\mathcal{U}$ are effective.
For examples see Examples of Stacks, Section 77.9 ff .

### 76.12. Algebraic stacks

026 N Here is the definition of an algebraic stack. We remark that condition (2) implies we can make sense out of the condition in part (3) that $(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}$ is smooth and surjective, see discussion following Lemma 76.10.11.
026 Definition 76.12.1. Let $S$ be a base scheme contained in $S c h_{f p p f}$. An algebraic stack over $S$ is a category

$$
p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}
$$

over $(S c h / S)_{f p p f}$ with the following properties:
(1) The category $\mathcal{X}$ is a stack in groupoids over $(S c h / S)_{\text {fppf }}$.
(2) The diagonal $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces.
(3) There exists a scheme $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and a 1-morphism $(S c h / U)_{f p p f} \rightarrow$ $\mathcal{X}$ which is surjective and smooth ${ }^{2}$.

There are some differences with other definitions found in the literature.
The first is that we require $\mathcal{X}$ to be a stack in groupoids in the fppf topology, whereas in many references the étale topology is used. It somehow seems to us that the fppf topology is the natural topology to work with. In the end the resulting 2-category of algebraic stacks ends up being the same. This is explained in Criteria for Representability, Section 79.19 .
The second is that we only require the diagonal map of $\mathcal{X}$ to be representable by algebraic spaces, whereas in most references some other conditions are imposed. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of $\mathcal{X}$ be representable by algebraic spaces, and simply add an additional hypothesis wherever this is necessary. It has the added benefit that any algebraic space (as defined in Spaces, Definition 52.6.1) gives rise to an algebraic stack.
The third is that in some papers it is required that there exists a scheme $U$ and a surjective and étale morphism $U \rightarrow \mathcal{X}$. In the groundbreaking paper DM69 where algebraic stacks were first introduced Deligne and Mumford used this definition and showed that the moduli stack of stable genus $g>1$ curves is an algebraic stack which has an étale covering by a scheme. Michael Artin, see Art74, realized that many natural results on algebraic stacks generalize to the case where one only assume a smooth covering by a scheme. Hence our choice above. To distinguish the two cases one sees the terms "Deligne-Mumford stack" and "Artin stack" used in the literature. We will reserve the term "Artin stack" for later use (insert future reference here), and continue to use "algebraic stack", but we will use "DeligneMumford stack" to indicate those algebraic stacks which have an étale covering by a scheme.

[^193]$03 Y O$ Definition 76.12.2. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $\mathcal{X}$ be an algebraic stack over $S$. We say $\mathcal{X}$ is a Deligne-Mumford stack if there exists a scheme $U$ and a surjective étale morphism $(S c h / U)_{f p p f} \rightarrow \mathcal{X}$.
We will compare our notion of a Deligne-Mumford stack with the notion as defined in the paper by Deligne and Mumford later (see insert future reference here).

The category of algebraic stacks over $S$ forms a 2-category. Here is the precise definition.

03YP Definition 76.12.3. Let $S$ be a scheme contained in $S c h_{\text {fppf }}$. The 2-category of algebraic stacks over $S$ is the sub 2-category of the 2-category of categories fibred in groupoids over $(S c h / S)_{f p p f}$ (see Categories, Definition 4.34.6) defined as follows:
(1) Its objects are those categories fibred in groupoids over $(S c h / S)_{f p p f}$ which are algebraic stacks over $S$.
(2) Its 1-morphisms $f: \mathcal{X} \rightarrow \mathcal{Y}$ are any functors of categories over $(S c h / S)_{\text {fppf }}$, as in Categories, Definition 4.31.1.
(3) Its 2-morphisms are transformations between functors over $(S c h / S)_{f p p f}$, as in Categories, Definition 4.31.1.
In other words this 2-category is the full sub 2-category of $C a t /(S c h / S)_{f p p f}$ whose objects are algebraic stacks. Note that every 2 -morphism is automatically an isomorphism. Hence this is actually a $(2,1)$-category and not just a 2 -category.
We will see later (insert future reference here) that this 2-category has 2-fibre products.
Similar to the remark above the 2-category of algebraic stacks over $S$ is a full sub 2 -category of the 2-category of categories fibred in groupoids over $(S c h / S)_{f p p f}$. It turns out that it is closed under equivalences. Here is the precise statement.
$03 Y Q$ Lemma 76.12.4. Let $S$ be a scheme contained in $S_{\text {ch }}^{f p p f}$. Let $\mathcal{X}, \mathcal{Y}$ be categories over $(S c h / S)_{\text {fppf }}$. Assume $\mathcal{X}, \mathcal{Y}$ are equivalent as categories over $(S c h / S)_{\text {fppf }}$. Then $\mathcal{X}$ is an algebraic stack if and only if $\mathcal{Y}$ is an algebraic stack. Similarly, $\mathcal{X}$ is a Deligne-Mumford stack if and only if $\mathcal{Y}$ is a Deligne-Mumford stack.
Proof. Assume $\mathcal{X}$ is an algebraic stack (resp. a Deligne-Mumford stack). By Stacks, Lemma 8.5.4 this implies that $\mathcal{Y}$ is a stack in groupoids over $S c h_{f p p f}$. Choose an equivalence $f: \mathcal{X} \rightarrow \mathcal{Y}$ over $S c h_{f p p f}$. This gives a 2-commutative diagram

whose horizontal arrows are equivalences. This implies that $\Delta_{\mathcal{Y}}$ is representable by algebraic spaces according to Lemma 76.9.3. Finally, let $U$ be a scheme over $S$, and let $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ be a 1-morphism which is surjective and smooth (resp. étale). Considering the diagram

and applying Lemma 76.10 .2 we conclude that $x \circ f$ is surjective and smooth (resp. étale) as desired.

### 76.13. Algebraic stacks and algebraic spaces

$03 Y R$ In this section we discuss some simple criteria which imply that an algebraic stack is an algebraic space. The main result is that this happens exactly when objects of fibre categories have no nontrivial automorphisms. This is not a triviality! Before we come to this we first do a sanity check.

03YS Lemma 76.13.1. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$.
(1) A category fibred in groupoids $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ which is representable by an algebraic space is a Deligne-Mumford stack.
(2) If $F$ is an algebraic space over $S$, then the associated category fibred in groupoids $p: \mathcal{S}_{F} \rightarrow(S c h / S)_{\text {fppf }}$ is a Deligne-Mumford stack.
(3) If $X \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$, then $(S c h / X)_{\text {fppf }} \rightarrow(S c h / S)_{\text {fppf }}$ is a DeligneMumford stack.

Proof. It is clear that (2) implies (3). Parts (1) and (2) are equivalent by Lemma 76.12 .4 . Hence it suffices to prove (2). First, we note that $\mathcal{S}_{F}$ is stack in sets since $F$ is a sheaf (Stacks, Lemma 8.6.3). A fortiori it is a stack in groupoids. Second the diagonal morphism $\mathcal{S}_{F} \rightarrow \mathcal{S}_{F} \times \mathcal{S}_{F}$ is the same as the morphism $\mathcal{S}_{F} \rightarrow \mathcal{S}_{F \times F}$ which comes from the diagonal of $F$. Hence this is representable by algebraic spaces according to Lemma 76.9.4. Actually it is even representable (by schemes), as the diagonal of an algebraic space is representable, but we do not need this. Let $U$ be a scheme and let $h_{U} \rightarrow F$ be a surjective étale morphism. We may think of this a surjective étale morphism of algebraic spaces. Hence by Lemma 76.10 .3 the corresponding 1-morphism $(S c h / U)_{f p p f} \rightarrow \mathcal{S}_{F}$ is surjective and étale.

The following result says that a Deligne-Mumford stack whose inertia is trivial "is" an algebraic space. This lemma will be obsoleted by the stronger Proposition 76.13 .3 below which says that this holds more generally for algebraic stacks...

045H Lemma 76.13.2. Let $S$ be a scheme contained in $S_{\text {S }}^{\text {fppf }}$. Let $\mathcal{X}$ be an algebraic stack over $S$. The following are equivalent
(1) $\mathcal{X}$ is a Deligne-Mumford stack and is a stack in setoids,
(2) $\mathcal{X}$ is a Deligne-Mumford stack such that the canonical 1-morphism $\mathcal{I}_{\mathcal{X}} \rightarrow$ $\mathcal{X}$ is an equivalence, and
(3) $\mathcal{X}$ is representable by an algebraic space.

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.7.2. The implication $(3) \Rightarrow(1)$ follows from Lemma 76.13.1. Finally, assume (1). By Stacks, Lemma 8.6.3 there exists a sheaf $F$ on $(S c h / S)_{\text {fppf }}$ and an equivalence $j: \mathcal{X} \rightarrow \mathcal{S}_{F}$. By Lemma 76.9 .5 the fact that $\Delta_{\mathcal{X}}$ is representable by algebraic spaces, means that $\Delta_{F}: F \rightarrow F \times F$ is representable by algebraic spaces. Let $U$ be a scheme, and let $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ be a surjective étale morphism. The composition $j \circ x:(S c h / U)_{f p p f} \rightarrow \mathcal{S}_{F}$ corresponds to a morphism $h_{U} \rightarrow F$ of sheaves. By Bootstrap, Lemma 67.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 76.10 .4 we conclude that $h_{U} \rightarrow F$ is surjective and étale. Finally, we apply Bootstrap, Theorem 67.6.1 to see that $F$ is an algebraic space.

04SZ Proposition 76.13.3. Let $S$ be a scheme contained in Sch $_{\text {fppf }}$. Let $\mathcal{X}$ be an algebraic stack over $S$. The following are equivalent
(1) $\mathcal{X}$ is a stack in setoids,
(2) the canonical 1-morphism $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is an equivalence, and
(3) $\mathcal{X}$ is representable by an algebraic space.

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 8.7.2. The implication $(3) \Rightarrow(1)$ follows from Lemma 76.13.2. Finally, assume (1). By Stacks, Lemma 8.6 .3 there exists an equivalence $j: \mathcal{X} \rightarrow \mathcal{S}_{F}$ where $F$ is a sheaf on $(S c h / S)_{f p p f}$. By Lemma 76.9 .5 the fact that $\Delta_{\mathcal{X}}$ is representable by algebraic spaces, means that $\Delta_{F}: F \rightarrow F \times F$ is representable by algebraic spaces. Let $U$ be a scheme and let $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ be a surjective smooth morphism. The composition $j \circ x:(S c h / U)_{f p p f} \rightarrow \mathcal{S}_{F}$ corresponds to a morphism $h_{U} \rightarrow F$ of sheaves. By Bootstrap, Lemma 67.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 76.10 .4 we conclude that $h_{U} \rightarrow F$ is surjective and smooth. In particular it is surjective, flat and locally of finite presentation (by Lemma 76.10 .9 and the fact that a smooth morphism of algebraic spaces is flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 54.36.5 and 54.36.7. Finally, we apply Bootstrap, Theorem 67.10.1 to see that $F$ is an algebraic space.

### 76.14. 2-Fibre products of algebraic stacks

04 TD The 2-category of algebraic stacks has products and 2 -fibre products. The first lemma is really a special case of Lemma 76.14 .3 but its proof is slightly easier.

04TE Lemma 76.14.1. Let $S$ be a scheme contained in $S c h_{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}$ be algebraic stacks over $S$. Then $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ is an algebraic stack, and is a product in the 2-category of algebraic stacks over $S$.

Proof. An object of $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ over $T$ is just a pair $(x, y)$ where $x$ is an object of $\mathcal{X}_{T}$ and $y$ is an object of $\mathcal{Y}_{T}$. Hence it is immediate from the definitions that $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ is a stack in groupoids. If $(x, y)$ and $\left(x^{\prime}, y^{\prime}\right)$ are two objects of $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ over $T$, then

$$
\operatorname{Isom}\left((x, y),\left(x^{\prime}, y^{\prime}\right)\right)=\operatorname{Isom}\left(x, x^{\prime}\right) \times \operatorname{Isom}\left(y, y^{\prime}\right)
$$

Hence it follows from the equivalences in Lemma 76.10.11 and the fact that the category of algebraic spaces has products that the diagonal of $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ is representable by algebraic spaces. Finally, suppose that $U, V \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, and let $x, y$ be surjective smooth morphisms $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}, y:(S c h / Y)_{f p p f} \rightarrow \mathcal{Y}$. Note that

$$
\left(S c h / U \times_{S} V\right)_{f p p f}=(S c h / U)_{f p p f} \times{ }_{(S c h / S)_{f p p f}}(S c h / V)_{f p p f}
$$

The object $\left(\mathrm{pr}_{U}^{*} x, \mathrm{pr}_{V}^{*} y\right)$ of $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ over $\left(S c h / U \times_{S} V\right)_{f p p f}$ thus defines a 1-morphism

$$
\left(S c h / U \times_{S} V\right)_{f p p f} \longrightarrow \mathcal{X} \times_{(S c h / S)_{f p p f}} \mathcal{Y}
$$

which is the composition of base changes of $x$ and $y$, hence is surjective and smooth, see Lemmas 76.10 .6 and 76.10 .5 . We conclude that $\mathcal{X} \times{ }_{(S c h / S)_{f p p f}} \mathcal{Y}$ is indeed an algebraic stack. We omit the verification that it really is a product.

04 TF Lemma 76.14.2. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{Z}$ be a stack in groupoids over $(S c h / S)_{\text {fppf }}$ whose diagonal is representable by algebraic spaces. Let
$\mathcal{X}, \mathcal{Y}$ be algebraic stacks over $S$. Let $f: \mathcal{X} \rightarrow \mathcal{Z}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of stacks in groupoids. Then the 2 -fibre product $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack.

Proof. We have to check conditions (1), (2), and (3) of Definition 76.12.1. The first condition follows from Stacks, Lemma 8.5.6.
The second condition we have to check is that the Isom-sheaves are representable by algebraic spaces. To do this, suppose that $T$ is a scheme over $S$, and $u, v$ are objects of $\left(\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}\right)_{T}$. By our construction of 2-fibre products (which goes all the way back to Categories, Lemma 4.31.3) we may write $u=(x, y, \alpha)$ and $v=\left(x^{\prime}, y^{\prime}, \alpha^{\prime}\right)$. Here $\alpha: f(x) \rightarrow g(y)$ and similarly for $\alpha^{\prime}$. Then it is clear that

is a cartesian diagram of sheaves on $(S c h / T)_{f p p f}$. Since by assumption the sheaves $\operatorname{Isom}\left(y, y^{\prime}\right)$, $\operatorname{Isom}\left(x, x^{\prime}\right), \operatorname{Isom}\left(f(x), g\left(y^{\prime}\right)\right)$ are algebraic spaces (see Lemma 76.10.11) we see that $\operatorname{Isom}(u, v)$ is an algebraic space.

Let $U, V \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$, and let $x, y$ be surjective smooth morphisms $x$ : $(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}, y:(S c h / Y)_{\text {fppf }} \rightarrow \mathcal{Y}$. Consider the morphism

$$
(S c h / U)_{f p p f} \times_{f \circ x, \mathcal{Z}, g \circ y}(S c h / V)_{f p p f} \longrightarrow \mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}
$$

As the diagonal of $\mathcal{Z}$ is representable by algebraic spaces the source of this arrow is representable by an algebraic space $F$, see Lemma 76.10.11. Moreover, the morphism is the composition of base changes of $x$ and $y$, hence surjective and smooth, see Lemmas 76.10 .6 and 76.10 .5 . Choosing a scheme $W$ and a surjective étale morphism $W \rightarrow F$ we see that the composition of the displayed 1-morphism with the corresponding 1-morphism

$$
(S c h / W)_{f p p f} \longrightarrow(S c h / U)_{f p p f} \times_{f \circ x, \mathcal{Z}, g \circ y}(S c h / V)_{f p p f}
$$

is surjective and smooth which proves the last condition.
04 T 2 Lemma 76.14.3. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be algebraic stacks over $S$. Let $f: \mathcal{X} \rightarrow \mathcal{Z}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of algebraic stacks. Then the 2 -fibre product $\mathcal{X} \times_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack. It is also the 2 -fibre product in the 2-category of algebraic stacks over $(S c h / S)_{f p p f}$.

Proof. The fact that $\mathcal{X} \times{ }_{f, \mathcal{Z}, g} \mathcal{Y}$ is an algebraic stack follows from the stronger Lemma 76.14 .2 . The fact that $\mathcal{X} \times f, \mathcal{Z}, g$ Y is a 2 -fibre product in the 2 -category of algebraic stacks over $S$ follows formally from the fact that the 2-category of algebraic stacks over $S$ is a full sub 2-category of the 2-category of stacks in groupoids over $(S c h / S)_{f p p f}$.

### 76.15. Algebraic stacks, overhauled

04 T 0 Some basic results on algebraic stacks.
04T1 Lemma 76.15.1. Let $S$ be a scheme contained in Sch fppf . Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over $S$. Let $V \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$. Let $y$ :
$(S c h / V)_{\text {fppf }} \rightarrow \mathcal{Y}$ be surjective and smooth. Then there exists an object $U \in$ $\mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a 2-commutative diagram

with $x$ surjective and smooth.
Proof. First choose $W \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective smooth 1-morphism $z:(S c h / W)_{f p p f} \rightarrow \mathcal{X}$. As $\mathcal{Y}$ is an algebraic stack we may choose an equivalence

$$
j: \mathcal{S}_{F} \longrightarrow(S c h / W)_{f p p f} \times_{f \circ z, \mathcal{Y}, y}(S c h / V)_{f p p f}
$$

where $F$ is an algebraic space. By Lemma 76.10 .6 the morphism $\mathcal{S}_{F} \rightarrow(S c h / W)_{f p p f}$ is surjective and smooth as a base change of $y$. Hence by Lemma 76.10 .5 we see that $\mathcal{S}_{F} \rightarrow \mathcal{X}$ is surjective and smooth. Choose an object $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $U \rightarrow F$. Then applying Lemma 76.10 .5 once more we obtain the desired properties.

This lemma is a generalization of Proposition 76.13 .3
04Y5 Lemma 76.15.2. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over $S$. The following are equivalent:
(1) for $U \in \operatorname{Ob}\left((S c h / S)_{\text {fppf }}\right)$ the functor $f: \mathcal{X}_{U} \rightarrow \mathcal{Y}_{U}$ is faithful,
(2) the functor $f$ is faithful, and
(3) $f$ is representable by algebraic spaces.

Proof. Parts (1) and (2) are equivalent by general properties of 1-morphisms of categories fibred in groupoids, see Categories, Lemma 4.34.8. We see that (3) implies (2) by Lemma 76.9.2. Finally, assume (2). Let $U$ be a scheme. Let $y \in$ $\operatorname{Ob}\left(\mathcal{Y}_{U}\right)$. We have to prove that

$$
\mathcal{W}=(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}
$$

is representable by an algebraic space over $U$. Since $(S c h / U)_{f p p f}$ is an algebraic stack we see from Lemma 76.14 .3 that $\mathcal{W}$ is an algebraic stack. On the other hand the explicit description of objects of $\mathcal{W}$ as triples $(V, x, \alpha: y(V) \rightarrow f(x))$ and the fact that $f$ is faithful, shows that the fibre categories of $\mathcal{W}$ are setoids. Hence Proposition 76.13 .3 guarantees that $\mathcal{W}$ is representable by an algebraic space.

05UL Lemma 76.15.3. Let $S$ be a scheme contained in $S_{c h} h_{f p p f}$. Let $u: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. If
(1) $\mathcal{U}$ is representable by an algebraic space, and
(2) $u$ is representable by algebraic spaces, surjective and smooth, then $\mathcal{X}$ is an algebraic stack over $S$.

Proof. We have to show that $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces, see Definition 76.12.1. Given two schemes $T_{1}, T_{2}$ over $S$ denote $\mathcal{T}_{i}=\left(S c h / T_{i}\right)_{\text {fppf }}$ the associated representable fibre categories. Suppose given 1-morphisms $f_{i}: \mathcal{T}_{i} \rightarrow$ $\mathcal{X}$. According to Lemma 76.10 .11 it suffices to prove that the 2 -fibered product $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ is representable by an algebraic space. By Stacks, Lemma 8.6 .8 this is in any case a stack in setoids. Thus $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ corresponds to some sheaf $F$
on $(S c h / S)_{\text {fppf }}$, see Stacks, Lemma 8.6.3. Let $U$ be the algebraic space which represents $\mathcal{U}$. By assumption

$$
\mathcal{T}_{i}^{\prime}=\mathcal{U} \times_{u, \mathcal{X}, f_{i}} \mathcal{T}_{i}
$$

is representable by an algebraic space $T_{i}^{\prime}$ over $S$. Hence $\mathcal{T}_{1}^{\prime} \times{ }_{\mathcal{U}} \mathcal{T}_{2}^{\prime}$ is representable by the algebraic space $T_{1}^{\prime} \times{ }_{U} T_{2}^{\prime}$. Consider the commutative diagram

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}_{1}^{\prime} \times \mathcal{U} \mathcal{T}_{2}^{\prime} \rightarrow$ $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ is the "base change" of $\mathcal{U} \rightarrow \mathcal{X}$, more precisely the diagram

is a 2-fibre square. Hence $T_{1}^{\prime} \times_{U} T_{2}^{\prime} \rightarrow F$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 76.9.6, 76.9.7, 76.10.4, and 76.10.6. Therefore $F$ is an algebraic space by Bootstrap, Theorem 67.10 .1 and we win.

An application of Lemma 76.15 .3 is that something which is an algebraic space over an algebraic stack is an algebraic stack. This is the analogue of Bootstrap, Lemma 67.3.6. Actually, it suffices to assume the morphism $\mathcal{X} \rightarrow \mathcal{Y}$ is "algebraic", as we will see in Criteria for Representability, Lemma 79.8.2.

05UM Lemma 76.15.4. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume that
(1) $\mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces, and
(2) $\mathcal{Y}$ is an algebraic stack over $S$.

Then $\mathcal{X}$ is an algebraic stack over $S$.
Proof. Let $\mathcal{V} \rightarrow \mathcal{Y}$ be a surjective smooth 1-morphism from a representable stack in groupoids to $\mathcal{Y}$. This exists by Definition 76.12.1. Then the 2-fibre product $\mathcal{U}=\mathcal{V} \times \mathcal{Y} \mathcal{X}$ is representable by an algebraic space by Lemma 76.9.8. The 1morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 76.9.7 and 76.10.6. By Lemma 76.15.3 we conclude that $\mathcal{X}$ is an algebraic stack.

05UN Lemma 76.15.5. Let $S$ be a scheme contained in Sch $_{\text {fppf }}$. Let $j: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $j$ is
representable by algebraic spaces and a monomorphism ${ }^{3}$. Then, if $\mathcal{Y}$ is a stack in groupoids (resp. an algebraic stack), so is $\mathcal{X}$.

Proof. We prove that $\mathcal{X}$ is a stack. The case of algebraic stacks will then follow from Lemma 76.15.4 It suffices to check effectiveness of descent for $\mathcal{X}$. Fix a scheme $T$ and an fppf covering $\left\{f_{i}: T_{i} \rightarrow T\right\}$. Suppose we have objects $x_{i}$ of the fibre categories $\mathcal{X}_{T_{i}}$ together with a descent datum. Then since $\mathcal{Y}$ is a stack, there exists an object $y$ in the fibre category $\mathcal{Y}_{T}$ such that $f_{i}^{*}(y) \simeq j\left(x_{i}\right)$ in $\mathcal{Y}_{T_{i}}$. By hypothesis, the 2 -fibered product

$$
\mathcal{X} \times_{j, \mathcal{Y}, y}(S c h / T)_{f p p f}
$$

is representable by an algebraic space $U$ such that the induced morphism $U \rightarrow T$ is a monomorphism of algebraic spaces. By the universal property of the 2-fibre product and the fact that $f_{i}^{*}(y) \cong j\left(x_{i}\right)$, we have that $f_{i}: T_{i} \rightarrow T$ factors through $U \rightarrow T$ for all $i$. Hence $U \rightarrow T$ is a monomorphism of fppf sheaves, but also surjective as $\left\{f_{i}: T_{i} \rightarrow T\right\}$ is a covering. We conclude that $U=T$. Thus $y$ comes from some object $x$ of the fibre category $\mathcal{X}_{T}$. We have $f_{i}^{*} x \cong x_{i}$ in the fibre category $\mathcal{X}_{T_{i}}$ as the functor $j$ is fully faithful on fibre categories, see Lemma 76.10.10.

### 76.16. From an algebraic stack to a presentation

04T3 Given an algebraic stack over $S$ we obtain a groupoid in algebraic spaces over $S$ whose associated quotient stack is the algebraic stack.
Recall that if $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $S$ then $[U / R]$ denotes the quotient stack associated to this datum, see Groupoids in Spaces, Definition 65.19.1. In general $[U / R]$ is not an algebraic stack. In particular the stack $[U / R]$ occurring in the following lemma is in general not algebraic.

04 T 4 Lemma 76.16.1. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $\mathcal{X}$ be an algebraic stack over $S$. Let $\mathcal{U}$ be an algebraic stack over $S$ which is representable by an algebraic space. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism. Then
(1) the 2 -fibre product $\mathcal{R}=\mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U}$ is representable by an algebraic space,
(2) there is a canonical equivalence

$$
\mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U} \times_{f, \mathcal{X}, f} \mathcal{U}=\mathcal{R} \times_{p r_{1}, \mathcal{U}, p r_{0}} \mathcal{R}
$$

(3) the projection $p r_{02}$ induces via (2) a 1-morphism

$$
p r_{02}: \mathcal{R} \times{ }_{p r_{1}, \mathcal{U}, p r_{0}} \mathcal{R} \longrightarrow \mathcal{R}
$$

(4) let $U, R$ be the algebraic spaces representing $\mathcal{U}, \mathcal{R}$ and $t, s: R \rightarrow U$ and $c: R \times_{s, U, t} R \rightarrow U$ are the morphisms corresponding to the 1-morphisms $p r_{0}, p r_{1}: \mathcal{R} \rightarrow \mathcal{U}$ and $p r_{02}: \mathcal{R} \times_{p r_{1}, \mathcal{U}, p r_{0}} \mathcal{R} \rightarrow \mathcal{R}$ above, then the quintuple $(U, R, s, t, c)$ is a groupoid in algebraic spaces over $S$,
(5) the morphism $f$ induces a canonical 1-morphism $f_{\text {can }}:[U / R] \rightarrow \mathcal{X}$ of stacks in groupoids over $(S c h / S)_{f p p f}$, and
(6) the 1-morphism $f_{\text {can }}:[U / R] \rightarrow \mathcal{X}$ is fully faithful.

Proof. Proof of (1). By definition $\Delta_{\mathcal{X}}$ is representable by algebraic spaces so Lemma 76.10 .11 applies to show that $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces. Hence the result follows from Lemma 76.9.8.

[^194]Let $T$ be a scheme over $S$. By construction of the 2-fibre product (see Categories, Lemma 4.31.3) we see that the objects of the fibre category $\mathcal{R}_{T}$ are triples $(a, b, \alpha)$ where $a, b \in \operatorname{Ob}\left(\mathcal{U}_{T}\right)$ and $\alpha: f(a) \rightarrow f(b)$ is a morphism in the fibre category $\mathcal{X}_{T}$.
Proof of (2). The equivalence comes from repeatedly applying Categories, Lemmas 4.30 .8 and 4.30.10. Let us identify $\mathcal{U} \times{ }_{\mathcal{X}} \mathcal{U} \times{ }_{\mathcal{X}} \mathcal{U}$ with $\left(\mathcal{U} \times_{\mathcal{X}} \mathcal{U}\right) \times_{\mathcal{X}} \mathcal{U}$. If $T$ is a scheme over $S$, then on fibre categories over $T$ this equivalence maps the object $((a, b, \alpha), c, \beta)$ on the left hand side to the object $((a, b, \alpha),(b, c, \beta))$ of the right hand side.

Proof of (3). The 1-morphism $\mathrm{pr}_{02}$ is constructed in the proof of Categories, Lemma 4.30.9. In terms of the description of objects of the fibre category above we see that $((a, b, \alpha),(b, c, \beta))$ maps to $(a, c, \beta \circ \alpha)$.
Unfortunately, this is not compatible with our conventions on groupoids where we always have $j=(t, s): R \rightarrow U$, and we "think" of a $T$-valued point $r$ of $R$ as a morphism $r: s(r) \rightarrow t(r)$. However, this does not affect the proof of (4), since the opposite of a groupoid is a groupoid. But in the proof of (5) it is responsible for the inverses in the displayed formula below.
Proof of (4). Recall that the sheaf $U$ is isomorphic to the sheaf $T \mapsto \mathrm{Ob}\left(\mathcal{U}_{T}\right) / \cong$, and similarly for $R$, see Lemma 76.8.2. It follows from Categories, Lemma 4.38 .8 that this description is compatible with 2 -fibre products so we get a similar matching of $\mathcal{R} \times_{\operatorname{pr}_{1}, \mathcal{U}, \operatorname{pr}_{0}} \mathcal{R}$ and $R \times_{s, U, t} R$. The morphisms $t, s: R \rightarrow U$ and $c: R \times_{s, U, t}$ $R \rightarrow R$ we get from the general equality 76.8.2.1. Explicitly these maps are the transformations of functors that come from letting $\mathrm{pr}_{0}, \mathrm{pr}_{0}, \mathrm{pr}_{02}$ act on isomorphism classes of objects of fibre categories. Hence to show that we obtain a groupoid in algebraic spaces it suffices to show that for every scheme $T$ over $S$ the structure

$$
\left(\mathrm{Ob}\left(\mathcal{U}_{T}\right) / \cong, \mathrm{Ob}\left(\mathcal{R}_{T}\right) / \cong, \operatorname{pr}_{1}, \operatorname{pr}_{0}, \operatorname{pr}_{02}\right)
$$

is a groupoid which is clear from our description of objects of $\mathcal{R}_{T}$ above.
Proof of (5). We will eventually apply Groupoids in Spaces, Lemma 65.22 .2 to obtain the functor $[U / R] \rightarrow \mathcal{X}$. Consider the 1 -morphism $f: \mathcal{U} \rightarrow \mathcal{X}$. We have a 2-arrow $\tau: f \circ \mathrm{pr}_{1} \rightarrow f \circ \mathrm{pr}_{0}$ by definition of $\mathcal{R}$ as the 2-fibre product. Namely, on an object $(a, b, \alpha)$ of $\mathcal{R}$ over $T$ it is the map $\alpha^{-1}: b \rightarrow a$. We claim that

$$
\tau \circ \mathrm{id}_{\mathrm{pr}_{02}}=\left(\tau \star \mathrm{id}_{\mathrm{pr}_{0}}\right) \circ\left(\tau \star \mathrm{id}_{\mathrm{pr}_{1}}\right)
$$

This identity says that given an object $((a, b, \alpha),(b, c, \beta))$ of $\mathcal{R} \times{ }_{\mathrm{pr}_{1}, \mathcal{U}, \mathrm{pr}_{0}} \mathcal{R}$ over $T$, then the composition of

$$
c \xrightarrow{\beta^{-1}} b \xrightarrow{\alpha^{-1}} a
$$

is the same as the arrow $(\beta \circ \alpha)^{-1}: a \rightarrow c$. This is clearly true, hence the claim holds. In this way we see that all the assumption of Groupoids in Spaces, Lemma 65.22 .2 are satisfied for the structure $\left(\mathcal{U}, \mathcal{R}, \mathrm{pr}_{0}, \mathrm{pr}_{1}, \mathrm{pr}_{02}\right)$ and the 1-morphism $f$ and the 2-morphism $\tau$. Except, to apply the lemma we need to prove this holds for the structure $\left(\mathcal{S}_{U}, \mathcal{S}_{R}, s, t, c\right)$ with suitable morphisms.

Now there should be some general abstract nonsense argument which transfer these data between the two, but it seems to be quite long. Instead, we use the following trick. Pick a quasi-inverse $j^{-1}: \mathcal{S}_{U} \rightarrow \mathcal{U}$ of the canonical equivalence $j: \mathcal{U} \rightarrow \mathcal{S}_{U}$ which comes from $U(T)=\mathrm{Ob}\left(\mathcal{U}_{T}\right) / \cong$. This just means that for every scheme $T / S$ and every object $a \in \mathcal{U}_{T}$ we have picked out a particular element of its isomorphism
class, namely $j^{-1}(j(a))$. Using $j^{-1}$ we may therefore see $\mathcal{S}_{U}$ as a subcategory of $\mathcal{U}$. Having chosen this subcategory we can consider those objects $(a, b, \alpha)$ of $\mathcal{R}_{T}$ such that $a, b$ are objects of $\left(\mathcal{S}_{U}\right)_{T}$, i.e., such that $j^{-1}(j(a))=a$ and $j^{-1}(j(b))=b$. Then it is clear that this forms a subcategory of $\mathcal{R}$ which maps isomorphically to $\mathcal{S}_{R}$ via the canonical equivalence $\mathcal{R} \rightarrow \mathcal{S}_{R}$. Moreover, this is clearly compatible with forming the 2 -fibre product $\mathcal{R} \times{ }_{\operatorname{pr}_{1}, \mathcal{U}, \mathrm{pr}_{0}} \mathcal{R}$. Hence we see that we may simply restrict $f$ to $\mathcal{S}_{U}$ and restrict $\tau$ to a transformation between functors $\mathcal{S}_{R} \rightarrow \mathcal{X}$. Hence it is clear that the displayed equality of Groupoids in Spaces, Lemma 65.22 .2 holds since it holds even as an equality of transformations of functors $\mathcal{R} \times{ }_{\mathrm{pr}_{1}, \mathcal{U}, \mathrm{pr}_{0}} \mathcal{R} \rightarrow \mathcal{X}$ before restricting to the subcategory $\mathcal{S}_{R \times_{s, U, t} R}$.
This proves that Groupoids in Spaces, Lemma 65.22 .2 applies and we get our desired morphism of stacks $f_{\text {can }}:[U / R] \rightarrow \mathcal{X}$. We briefly spell out how $f_{c a n}$ is defined in this special case. On an object $a$ of $\mathcal{S}_{U}$ over $T$ we have $f_{\text {can }}(a)=f(a)$, where we think of $\mathcal{S}_{U} \subset \mathcal{U}$ by the chosen embedding above. If $a, b$ are objects of $\mathcal{S}_{U}$ over $T$, then a morphism $\varphi: a \rightarrow b$ in $[U / R]$ is by definition an object of the form $\varphi=(b, a, \alpha)$ of $\mathcal{R}$ over $T$. (Note switch.) And the rule in the proof of Groupoids in Spaces, Lemma 65.22.2 is that

04TG

$$
\begin{equation*}
f_{c a n}(\varphi)=\left(f(a) \xrightarrow{\alpha^{-1}} f(b)\right) . \tag{76.16.1.1}
\end{equation*}
$$

Proof of (6). Both $[U / R]$ and $\mathcal{X}$ are stacks. Hence given a scheme $T / S$ and objects $a, b$ of $[U / R]$ over $T$ we obtain a transformation of fppf sheaves

$$
\operatorname{Isom}(a, b) \longrightarrow \operatorname{Isom}\left(f_{c a n}(a), f_{c a n}(b)\right)
$$

on $(S c h / T)_{f p p f}$. We have to show that this is an isomorphism. We may work fppf locally on $T$, hence we may assume that $a, b$ come from morphisms $a, b: T \rightarrow U$. By the embedding $\mathcal{S}_{U} \subset \mathcal{U}$ above we may also think of $a, b$ as objects of $\mathcal{U}$ over $T$. In Groupoids in Spaces, Lemma 65.21.1 we have seen that the left hand sheaf is represented by the algebraic space

$$
R \times_{(t, s), U \times s,}{ }_{s,(b, a)} T
$$

over $T$. On the other hand, the right hand side is by Stacks, Lemma 8.2.5 equal to the sheaf associated to the following stack in setoids:
$\mathcal{X} \times{ }_{\mathcal{X} \times \mathcal{X},(f \circ b, f \circ a)} T=\mathcal{X} \times_{\mathcal{X} \times \mathcal{X},(f, f)}(\mathcal{U} \times \mathcal{U}) \times_{\mathcal{U} \times \mathcal{U},(b, a)} T=\mathcal{R} \times{ }_{\left(\mathrm{pr}_{0}, \mathrm{pr}_{1}\right), \mathcal{U} \times \mathcal{U},(b, a)} T$ which is representable by the fibre product displayed above. At this point we have shown that the two Isom-sheaves are isomorphic. Our 1-morphism $f_{\text {can }}:[U / R] \rightarrow$ $\mathcal{X}$ induces this isomorphism on Isom-sheaves by Equation 76.16.1.1.

We can use the previous very abstract lemma to produce presentations.
04 T 5 Lemma 76.16.2. Let $S$ be a scheme contained in $S_{\text {sch }}^{\text {fppf }}$. Let $\mathcal{X}$ be an algebraic stack over $S$. Let $U$ be an algebraic space over $S$. Let $f: \mathcal{S}_{U} \rightarrow \mathcal{X}$ be a surjective smooth morphism. Let $(U, R, s, t, c)$ be the groupoid in algebraic spaces and $f_{\text {can }}$ : $[U / R] \rightarrow \mathcal{X}$ be the result of applying Lemma 76.16.1 to $U$ and $f$. Then
(1) the morphisms s, t are smooth, and
(2) the 1-morphism $f_{\text {can }}:[U / R] \rightarrow \mathcal{X}$ is an equivalence.

Proof. The morphisms $s, t$ are smooth by Lemmas 76.10.2 and 76.10.3. As the 1 -morphism $f$ is smooth and surjective it is clear that given any scheme $T$ and any object $a \in \mathrm{Ob}\left(\mathcal{X}_{T}\right)$ there exists a smooth and surjective morphism $T^{\prime} \rightarrow T$ such
that $\left.a\right|_{T} ^{\prime}$ comes from an object of $[U / R]_{T^{\prime}}$. Since $f_{c a n}:[U / R] \rightarrow \mathcal{X}$ is fully faithful, we deduce that $[U / R] \rightarrow \mathcal{X}$ is essentially surjective as descent data on objects are effective on both sides, see Stacks, Lemma 8.4.8.

04WY Remark 76.16.3. If the morphism $f: \mathcal{S}_{U} \rightarrow \mathcal{X}$ of Lemma 76.16 .2 is only assumed surjective, flat and locally of finite presentation, then it will still be the case that $f_{c a n}:[U / R] \rightarrow \mathcal{X}$ is an equivalence. In this case the morphisms $s, t$ will be flat and locally of finite presentation, but of course not smooth in general.

Lemma 76.16 .2 suggests the following definitions.
04TH Definition 76.16.4. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. We say $(U, R, s, t, c)$ is a smooth groupoid ${ }^{4}$ if $s, t: R \rightarrow U$ are smooth morphisms of algebraic spaces.

04TI Definition 76.16.5. Let $\mathcal{X}$ be an algebraic stack over $S$. A presentation of $\mathcal{X}$ is given by a smooth groupoid ( $U, R, s, t, c$ ) in algebraic spaces over $S$, and an equivalence $f:[U / R] \rightarrow \mathcal{X}$.

We have seen above that every algebraic stack has a presentation. Our next task is to show that every smooth groupoid in algebraic spaces over $S$ gives rise to an algebraic stack.

### 76.17. The algebraic stack associated to a smooth groupoid

04 TJ In this section we start with a smooth groupoid in algebraic spaces and we show that the associated quotient stack is an algebraic stack.

04WZ Lemma 76.17.1. Let $S$ be a scheme contained in $\operatorname{Sch}_{f p p f .}$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. Then the diagonal of $[U / R]$ is representable by algebraic spaces.

Proof. It suffices to show that the Isom-sheaves are algebraic spaces, see Lemma 76.10.11. This follows from Bootstrap, Lemma 67.11.5.

04X0 Lemma 76.17.2. Let $S$ be a scheme contained in $\operatorname{Sch}_{\text {fppf }}$. Let $(U, R, s, t, c)$ be a smooth groupoid in algebraic spaces over $S$. Then the morphism $\mathcal{S}_{U} \rightarrow[U / R]$ is smooth and surjective.
Proof. Let $T$ be a scheme and let $x:(S c h / T)_{f p p f} \rightarrow[U / R]$ be a 1-morphism. We have to show that the projection

$$
\mathcal{S}_{U} \times_{[U / R]}(S c h / T)_{f p p f} \longrightarrow(S c h / T)_{f p p f}
$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space $F$, see Lemmas 76.17.1 and 76.10.11. Hence we have to show the corresponding morphism $F \rightarrow T$ of algebraic spaces is surjective and smooth. Since we are working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on $T$. By construction, there exists an fppf covering $\left\{T_{i} \rightarrow T\right\}$ of $T$ such that $\left.x\right|_{\left(S c h / T_{i}\right)_{f p p f}}$ comes from a morphism $x_{i}: T_{i} \rightarrow U$. (Note that $F \times_{T} T_{i}$ represents the 2 -fibre product $\mathcal{S}_{U} \times_{[U / R]}\left(S c h / T_{i}\right)_{\text {fppf }}$ so everything is compatible with the base change

[^195]via $T_{i} \rightarrow T$.) Hence we may assume that $x$ comes from $x: T \rightarrow U$. In this case we see that
$\mathcal{S}_{U} \times_{[U / R]}(S c h / T)_{f p p f}=\left(\mathcal{S}_{U} \times_{[U / R]} \mathcal{S}_{U}\right) \times_{\mathcal{S}_{U}}(S c h / T)_{f p p f}=\mathcal{S}_{R} \times{ }_{\mathcal{S}_{U}}(S c h / T)_{f p p f}$
The first equality by Categories, Lemma 4.30 .10 and the second equality by Groupoids in Spaces, Lemma 65.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F=R \times_{s, U, x} T$ and the projection $R \times_{s, U, x} T \rightarrow T$ is smooth as the base change of the smooth morphism of algebraic spaces $s: R \rightarrow U$. It is also surjective as $s$ has a section (namely the identity $e: U \rightarrow R$ of the groupoid). This proves the lemma.

Here is the main result of this section.
04TK Theorem 76.17.3. Let $S$ be a scheme contained in $\operatorname{Sch}_{f p p f}$. Let $(U, R, s, t, c)$ be a smooth groupoid in algebraic spaces over $S$. Then the quotient stack $[U / R]$ is an algebraic stack over $S$.

Proof. We check the three conditions of Definition 76.12.1. By construction we have that $[U / R]$ is a stack in groupoids which is the first condition.

The second condition follows from the stronger Lemma 76.17.1.
Finally, we have to show there exists a scheme $W$ over $S$ and a surjective smooth 1-morphism $(S c h / W)_{\text {fppf }} \longrightarrow \mathcal{X}$. First choose $W \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $W \rightarrow U$. Note that this gives a surjective étale morphism $\mathcal{S}_{W} \rightarrow \mathcal{S}_{U}$ of categories fibred in sets, see Lemma76.10.3. Of course then $\mathcal{S}_{W} \rightarrow \mathcal{S}_{U}$ is also surjective and smooth, see Lemma 76.10.9. Hence $\mathcal{S}_{W} \rightarrow \mathcal{S}_{U} \rightarrow[U / R]$ is surjective and smooth by a combination of Lemmas 76.17 .2 and 76.10.5.

### 76.18. Change of big site

04X1 In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. We encourage the reader to skip this section.

Pullbacks of stacks is defined in Stacks, Section 8.12.
04X2 Lemma 76.18.1. Suppose given big sites Sch fppf and Sch $_{f p p f}^{\prime}$. Assume that Sch $h_{\text {fppf }}$ is contained in $S c h_{f p p f}^{\prime}$, see Topologies, Section 33.10. Let $S$ be an object of $S_{\text {Sch }}^{\text {fppf }}$. Let Let $f:\left(S c h^{\prime} / S\right)_{\text {fppf }} \rightarrow(S c h / S)_{\text {fppf }}$ the morphism of sites corresponding to the inclusion functor $u:(S c h / S)_{\text {fppf }} \rightarrow\left(S c h^{\prime} / S\right)_{\text {fppf }}$. Let $\mathcal{X}$ be a stack in groupoids over $(S c h / S)_{f p p f}$.
(1) if $\mathcal{X}$ is representable by some $X \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$, then $f^{-1} \mathcal{X}$ is representable too, in fact it is representable by the same scheme $X$, now viewed as an object of $\left(S c h^{\prime} / S\right)_{\text {fppf }}$,
(2) if $\mathcal{X}$ is representable by $F \in \operatorname{Sh}\left((S c h / S)_{\text {fppf }}\right)$ which is an algebraic space, then $f^{-1} \mathcal{X}$ is representable by the algebraic space $f^{-1} F$,
(3) if $\mathcal{X}$ is an algebraic stack, then $f^{-1} \mathcal{X}$ is an algebraic stack, and
(4) if $\mathcal{X}$ is a Deligne-Mumford stack, then $f^{-1} \mathcal{X}$ is a Deligne-Mumford stack too.

Proof. Let us prove (3). By Lemma 76.16 .2 we may write $\mathcal{X}=[U / R]$ for some smooth groupoid in algebraic spaces $(U, R, s, t, c)$. By Groupoids in Spaces, Lemma 65.27.1 we see that $f^{-1}[U / R]=\left[f^{-1} U / f^{-1} R\right]$. Of course ( $f^{-1} U, f^{-1} R, f^{-1} s, f^{-1} t, f^{-1} c$ ) is a smooth groupoid in algebraic spaces too. Hence (3) is proved.
Now the other cases (1), (2), (4) each mean that $\mathcal{X}$ has a presentation $[U / R]$ of a particular kind, and hence translate into the same kind of presentation for $f^{-1} \mathcal{X}=\left[f^{-1} U / f^{-1} R\right]$. Whence the lemma is proved.

It is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.
 of Schfppf. Denote Algebraic-Stacks/S the 2-category of algebraic spaces over $S$ defined using $S_{\text {ch }}^{\text {fppf }}$. Similarly, denote Algebraic-Stacks' $/ S$ the 2-category of algebraic spaces over $S$ defined using $S_{\text {flh }}^{\prime}$. The rule $\mathcal{X} \mapsto f^{-1} \mathcal{X}$ of Lemma 76.18.1 defines a functor of 2-categories

$$
\text { Algebraic-Stacks/S } \longrightarrow \text { Algebraic-Stacks } / S
$$

which defines equivalences of morphism categories

$$
\operatorname{Mor}_{\text {Algebraic-Stacks } / S}(\mathcal{X}, \mathcal{Y}) \longrightarrow \operatorname{Mor}_{\text {Algebraic-Stacks' }}{ }^{\prime}\left(f^{-1} \mathcal{X}, f^{-1} \mathcal{Y}\right)
$$

for every objects $\mathcal{X}, \mathcal{Y}$ of Algebraic-Stacks/S. An object $\mathcal{X}^{\prime}$ of Algebraic-Stacks' $/ S$ is equivalence to $f^{-1} \mathcal{X}$ for some $\mathcal{X}$ in Algebraic-Stacks/ $S$ if and only if it has a presentation $\mathcal{X}=\left[U^{\prime} / R^{\prime}\right]$ with $U^{\prime}, R^{\prime}$ isomorphic to $f^{-1} U, f^{-1} R$ for some $U, R \in$ Spaces/S.

Proof. The statement on morphism categories is a consequence of the more general Stacks, Lemma 8.12.12 The characterization of the "essential image" follows from the description of $f^{-1}$ in the proof of Lemma 76.18.1.

### 76.19. Change of base scheme

04X4 In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \rightarrow S^{\prime}$ of base schemes, any algebraic stack over $S$ can be viewed as an algebraic stack over $S^{\prime}$.

04X5 Lemma 76.19.1. Let $S_{\text {fch }}^{\text {fppf }}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. The constructions $A$ and $B$ of Stacks, Section 8.13 above give isomorphisms of 2-categories $\left\{\begin{array}{c}2 \text {-category of algebraic } \\ \text { stacks } \mathcal{X} \text { over } S\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}2 \text {-category of pairs }\left(\mathcal{X}^{\prime}, f\right) \text { consisting of an } \\ \text { algebraic stack } \mathcal{X}^{\prime} \text { over } S^{\prime} \text { and a morphism } \\ f: \mathcal{X}^{\prime} \rightarrow(S c h / S)_{\text {fppf }} \text { of algebraic stacks over } S^{\prime}\end{array}\right\}$
Proof. The statement makes sense as the functor $j:(S c h / S)_{f p p f} \rightarrow\left(S c h / S^{\prime}\right)_{f p p f}$ is the localization functor associated to the object $S / S^{\prime}$ of $\left(S c h / S^{\prime}\right)_{f p p f}$. By Stacks, Lemma 8.13 .2 the only thing to show is that the constructions A and B preserve the subcategories of algebraic stacks. For example, if $\mathcal{X}=[U / R]$ then construction A applied to $\mathcal{X}$ just produces $\mathcal{X}^{\prime}=\mathcal{X}$. Conversely, if $\mathcal{X}^{\prime}=\left[U^{\prime} / R^{\prime}\right]$ the morphism $p$ induces morphisms of algebraic spaces $U^{\prime} \rightarrow S$ and $R^{\prime} \rightarrow S$, and then $\mathcal{X}=\left[U^{\prime} / R^{\prime}\right]$ but now viewed as a stack over $S$. Hence the lemma is clear.

04X6 Definition 76.19.2. Let $S c h_{f p p f}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. If $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ is an algebraic stack over $S$, then $\mathcal{X}$ viewed as an algebraic stack over $S^{\prime}$ is the algebraic stack

$$
\mathcal{X} \longrightarrow\left(S c h / S^{\prime}\right)_{f p p f}
$$

gotten by applying construction A of Lemma 76.19 .1 to $\mathcal{X}$.
Conversely, what if we start with an algebraic stack $\mathcal{X}^{\prime}$ over $S^{\prime}$ and we want to get an algebraic stack over $S$ ? Well, then we consider the 2-fibre product

$$
\mathcal{X}_{S}^{\prime}=(S c h / S)_{\text {fppf }} \times_{\left(S c h / S^{\prime}\right)_{f p p f}} \mathcal{X}^{\prime}
$$

which is an algebraic stack over $S^{\prime}$ according to Lemma 76.14.3. Moreover, it comes equipped with a natural 1-morphism $p: \mathcal{X}_{S}^{\prime} \rightarrow(S c h / S)_{f p p f}$ and hence by Lemma 76.19 .1 it corresponds in a canonical way to an algebraic stack over $S$.

04X7 Definition 76.19.3. Let $S c h_{f p p f}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. Let $\mathcal{X}^{\prime}$ be an algebraic stack over $S^{\prime}$. The change of base of $\mathcal{X}^{\prime}$ is the algebraic space $\mathcal{X}_{S}^{\prime}$ over $S$ described above.

## CHAPTER 77

## Examples of Stacks

04SL

### 77.1. Introduction

04 SM This is a discussion of examples of stacks in algebraic geometry. Some of them are algebraic stacks, some are not. We will discuss which are algebraic stacks in a later chapter. This means that in this chapter we mainly worry about the descent conditions. See Vis04 for example.

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 81.1 for an explanation.

### 77.2. Notation

04 SN In this chapter we fix a suitable big fppf site $S c_{f_{f p p f}}$ as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of $S c h_{f p p f}$. We will always work relative to a base $S$ contained in $S c h_{f p p f}$. And we will then work with the big fppf site $(S c h / S)_{\text {fppf }}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S=\operatorname{Spec}(\mathbf{Z})$.

### 77.3. Examples of stacks

04 SQ We first give some important examples of stacks over $(S c h / S)_{f p p f}$.

### 77.4. Quasi-coherent sheaves

03YL We define a category $Q C o h$ as follows:
(1) An object of $Q C o h$ is a pair $(X, \mathcal{F})$, where $X / S$ is an object of $(S c h / S)_{f p p f}$, and $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module, and
(2) a morphism $(f, \varphi):(Y, \mathcal{G}) \rightarrow(X, \mathcal{F})$ is a pair consisting of a morphism $f: Y \rightarrow X$ of schemes over $S$ and an $f$-map (see Sheaves, Section 6.26) $\varphi: \mathcal{F} \rightarrow \mathcal{G}$.
(3) The composition of morphisms

$$
(Z, \mathcal{H}) \xrightarrow{(g, \psi)}(Y, \mathcal{G}) \xrightarrow{(f, \phi)}(X, \mathcal{F})
$$

is $(f \circ g, \psi \circ \phi)$ where $\psi \circ \phi$ is the composition of $f$-maps.
Thus $Q C o h$ is a category and

$$
p: Q C o h \rightarrow(S c h / S)_{f p p f}, \quad(X, \mathcal{F}) \mapsto X
$$

is a functor. Note that the fibre category of $Q C o h$ over a scheme $X$ is just the category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ of quasi-coherent $\mathcal{O}_{X}$-modules. We remark for later use that given $(X, \mathcal{F}),(Y, \mathcal{G}) \in \mathrm{Ob}(Q C o h)$ we have

04U2 (77.4.0.1) $\operatorname{Mor}_{Q C o h}((Y, \mathcal{G}),(X, \mathcal{F}))=\coprod_{f \in \operatorname{Mor}_{S}(Y, X)} \operatorname{Mor}_{Q C o h\left(\mathcal{O}_{Y}\right)}\left(f^{*} \mathcal{F}, \mathcal{G}\right)$
See the discussion on $f$-maps of modules in Sheaves, Section 6.26.
The category $Q C o h$ is not a stack over $(S c h / S)_{f p p f}$ because its collection of objects is a proper class. On the other hand we will see that it does satisfy all the axioms of a stack. We will get around the set theoretical issue in Section 77.5 .
04U3 Lemma 77.4.1. A morphism $(f, \varphi):(Y, \mathcal{G}) \rightarrow(X, \mathcal{F})$ of $Q C o h$ is strongly cartesian if and only if the map $\varphi$ induces an isomorphism $f^{*} \mathcal{F} \rightarrow \mathcal{G}$.
Proof. Let $(X, \mathcal{F}) \in \mathrm{Ob}(Q C o h)$. Let $f: Y \rightarrow X$ be a morphism of $(S c h / S)_{\text {fppf }}$. Note that there is a canonical $f$-map $c: \mathcal{F} \rightarrow f^{*} \mathcal{F}$ and hence we get a morphism $(f, c):\left(Y, f^{*} \mathcal{F}\right) \rightarrow(X, \mathcal{F})$. We claim that $(f, c)$ is strongly cartesian. Namely, for any object $(Z, \mathcal{H})$ of $Q C o h$ we have

$$
\begin{aligned}
\operatorname{Mor}_{Q \operatorname{Coh}}\left((Z, \mathcal{H}),\left(Y, f^{*} \mathcal{F}\right)\right) & =\coprod_{g \in \operatorname{Mor}_{S}(Z, Y)} \operatorname{Mor}_{Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right)}\left(g^{*} f^{*} \mathcal{F}, \mathcal{H}\right) \\
& =\coprod_{g \in \operatorname{Mor}_{S}(Z, Y)} \operatorname{Mor}_{Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right)}\left((f \circ g)^{*} \mathcal{F}, \mathcal{H}\right) \\
& =\operatorname{Mor}_{Q \operatorname{Coh}}((Z, \mathcal{H}),(X, \mathcal{F})) \times_{\operatorname{Mor}_{S}(Z, X)} \operatorname{Mor}_{S}(Z, Y)
\end{aligned}
$$

where we have used Equation 77.4.0.1 twice. This proves that the condition of Categories, Definition 4.32.1 holds for $(f, c)$, and hence our claim is true. Now by Categories, Lemma 4.32 .2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the "if" part of the lemma. For the converse, note that given $(X, \mathcal{F})$ and $f: Y \rightarrow X$, if there exists a strongly cartesian morphism lifting $f$ with target $(X, \mathcal{F})$ then it has to be isomorphic to $(f, c)$ (see discussion following Categories, Definition 4.32.1). Hence the "only if" part of the lemma holds.

03YM Lemma 77.4.2. The functor $p: Q C o h \rightarrow(S c h / S)_{\text {fppf }}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 8.4.1.

Proof. It is clear from Lemma 77.4.1 that $Q C o h$ is a fibred category over $(S c h / S)_{f p p f}$. Given covering $\mathcal{U}=\left\{X_{i} \rightarrow X\right\}_{i \in I}$ of $(S c h / S)_{f p p f}$ the functor

$$
Q \operatorname{Coh}\left(\mathcal{O}_{T}\right) \longrightarrow D D(\mathcal{U})
$$

is fully faithful and essentially surjective, see Descent, Proposition 34.5.2. Hence Stacks, Lemma 8.4.2 applies to show that $Q C o h$ satisfies all the axioms of a stack.

### 77.5. The stack of finitely generated quasi-coherent sheaves

0404 It turns out that we can get a stack of quasi-coherent sheaves if we only consider finite type quasi-coherent modules. Let us denote

$$
p_{f g}: Q C o h_{f g} \rightarrow(S c h / S)_{f p p f}
$$

the full subcategory of $Q C o h$ over $(S c h / S)_{f p p f}$ consisting of pairs $(T, \mathcal{F})$ such that $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{T}$-module of finite type.

04U4 Lemma 77.5.1. The functor $p_{f g}: Q C o h_{f g} \rightarrow(S c h / S)_{f p p f}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 8.4.1.

Proof. We will verify assumptions (1), (2), (3) of Stacks, Lemma 8.4.3 to prove this. By Lemma 77.4.1 a morphism $(Y, \mathcal{G}) \rightarrow(X, \mathcal{F})$ is strongly cartesian if and only if it induces an isomorphism $f^{*} \mathcal{F} \rightarrow \mathcal{G}$. By Modules, Lemma 17.9 .2 the pullback of a finite type $\mathcal{O}_{X}$-module is of finite type. Hence assumption (1) of Stacks, Lemma 8.4 .3 holds. Assumption (2) holds trivially. Finally, to prove assumption (3) we have to show: If $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module and $\left\{f_{i}: X_{i} \rightarrow X\right\}$ is an fppf covering such that each $f_{i}^{*} \mathcal{F}$ is of finite type, then $\mathcal{F}$ is of finite type. Considering the restriction of $\mathcal{F}$ to an affine open of $X$ this reduces to the following algebra statement: Suppose that $R \rightarrow S$ is a finitely presented, faithfully flat ring map and $M$ an $R$-module. If $M \otimes_{R} S$ is a finitely generated $S$-module, then $M$ is a finitely generated $R$-module. A stronger form of the algebra fact can be found in Algebra, Lemma 10.82 .2 .

04U5 Lemma 77.5.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) The category of finite type $\mathcal{O}_{X}$-modules has a set of isomorphism classes.
(2) The category of finite type quasi-coherent $\mathcal{O}_{X}$-modules has a set of isomorphism classes.
Proof. Part (2) follows from part (1) as the category in (2) is a full subcategory of the category in (1). Consider any open covering $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$. Denote $j_{i}: U_{i} \rightarrow X$ the inclusion maps. Consider any map $r: I \rightarrow \mathbf{N}$. If $\mathcal{F}$ is an $\mathcal{O}_{X^{-}}$ module whose restriction to $U_{i}$ is generated by at most $r(i)$ sections from $\mathcal{F}\left(U_{i}\right)$, then $\mathcal{F}$ is a quotient of the sheaf

$$
\mathcal{H}_{\mathcal{U}, r}=\bigoplus_{i \in I} j_{i,!} \mathcal{O}_{U_{i}}^{\oplus r(i)}
$$

By definition, if $\mathcal{F}$ is of finite type, then there exists some open covering with $\mathcal{U}$ whose index set is $I=X$ such that this condition is true. Hence it suffices to show that there is a set of possible choices for $\mathcal{U}$ (obvious), a set of possible choices for $r: I \rightarrow \mathbf{N}$ (obvious), and a set of possible quotient modules of $\mathcal{H}_{\mathcal{U}, r}$ for each $\mathcal{U}$ and $r$. In other words, it suffices to show that given an $\mathcal{O}_{X}$-module $\mathcal{H}$ there is at most a set of isomorphism classes of quotients. This last assertion becomes obvious by thinking of the kernels of a quotient map $\mathcal{H} \rightarrow \mathcal{F}$ as being parametrized by a subset of the power set of $\prod_{U \subset X \text { open }} \mathcal{H}(U)$.
04U6 Lemma 77.5.3. There exists a subcategory $Q C o h_{f g, s m a l l} \subset Q C o h_{f g}$ with the following properties:
(1) the inclusion functor $Q \operatorname{Coh}_{f g, s m a l l} \rightarrow Q C o h_{f g}$ is fully faithful and essentially surjective, and
(2) the functor $p_{f g, s m a l l}: Q C o h_{f g, s m a l l} \rightarrow(S c h / S)_{f p p f}$ turns $Q C o h_{f g, s m a l l}$ into a stack over $(S c h / S)_{f p p f}$.
Proof. We have seen in Lemmas 77.5 .1 and 77.5 .2 that $p_{f g}: Q C o h_{f g} \rightarrow(S c h / S)_{f p p f}$ satisfies (1), (2) and (3) of Stacks, Definition 8.4.1 as well as the additional condition (4) of Stacks, Remark 8.4.9. Hence we obtain $Q C o h_{f g, s m a l l}$ from the discussion in that remark.

We will often perform the replacement

$$
Q \operatorname{Coh}_{f g} \rightsquigarrow Q \operatorname{Coh}_{f g, s m a l l}
$$

without further remarking on it, and by abuse of notation we will simply denote $Q C o h_{f g}$ this replacement.

04U7 Remark 77.5.4. Note that the whole discussion in this section works if we want to consider those quasi-coherent sheaves which are locally generated by at most $\kappa$ sections, for some infinite cardinal $\kappa$, e.g., $\kappa=\aleph_{0}$.

### 77.6. Finite étale covers

0BLY We define a category $F E ́ t$ as follows:
(1) An object of $F E$ Ét is a finite étale morphism $Y \rightarrow X$ of schemes (by our conventions this means a finite étale morphism in $\left.(S c h / S)_{f p p f}\right)$,
(2) A morphism $(b, a):(Y \rightarrow X) \rightarrow\left(Y^{\prime} \rightarrow X^{\prime}\right)$ of $F E ́ t$ is a commutative diagram

in the category of schemes.
Thus $F E E^{\prime}$ is a category and

$$
p: F E ́ t \rightarrow(S c h / S)_{f p p f}, \quad(Y \rightarrow X) \mapsto X
$$

is a functor. Note that the fibre category of $F E$ t over a scheme $X$ is just the category $F E ́ t_{X}$ studied in Fundamental Groups, Section 48.4 .
0BLZ Lemma 77.6.1. The functor

$$
p: F E ́ t \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. Fppf descent for finite étale morphisms follows from Descent, Lemmas 34.33.1 34.19.21, and 34.19.27. Details omitted.

### 77.7. Algebraic spaces

04SP We define a category Spaces as follows:
(1) An object of Spaces is a morphism $X \rightarrow U$ of algebraic spaces over $S$, where $U$ is representable by an object of $(S c h / S)_{f p p f}$, and
(2) a morphism $(f, g):(X \rightarrow U) \rightarrow(Y \rightarrow V)$ is a commutative diagram

of morphisms of algebraic spaces over $S$.
Thus Spaces is a category and

$$
p: \text { Spaces } \rightarrow(S c h / S)_{f p p f}, \quad(X \rightarrow U) \mapsto U
$$

is a functor. Note that the fibre category of Spaces over a scheme $U$ is just the category Spaces/ $U$ of algebraic spaces over $U$ (see Topologies on Spaces, Section 60.2 . Hence we sometimes think of an object of Spaces as a pair $X / U$ consisting of
a scheme $U$ and an algebraic space $X$ over $U$. We remark for later use that given $(X / U),(Y / V) \in \mathrm{Ob}($ Spaces $)$ we have
$04 \mathrm{U} 8 \quad$ (77.7.0.1) $\quad \operatorname{Mor}_{\text {Spaces }}(X / U, Y / V)=\coprod_{g \in \operatorname{Mor}_{S}(U, V)} \operatorname{Mor}_{\text {Spaces } / U}\left(X, U \times_{g, V} Y\right)$
The category Spaces is almost, but not quite a stack over $(S c h / S)_{f p p f}$. The problem is a set theoretical issue as we will explain below.

04U9 Lemma 77.7.1. A morphism $(f, g): X / U \rightarrow Y / V$ of Spaces is strongly cartesian if and only if the map $f$ induces an isomorphism $X \rightarrow U \times_{g, V} Y$.
Proof. Let $Y / V \in \mathrm{Ob}($ Spaces $)$. Let $g: U \rightarrow V$ be a morphism of $(S c h / S)_{f p p f}$. Note that the projection $p: U \times_{g, V} Y \rightarrow Y$ gives rise a morphism $(p, g): U \times_{g, V}$ $Y / U \rightarrow Y / V$ of Spaces. We claim that $(p, g)$ is strongly cartesian. Namely, for any object $Z / W$ of Spaces we have

$$
\begin{aligned}
\operatorname{Mor}_{\text {Spaces }}\left(Z / W, U \times_{g, V} Y / U\right) & =\coprod_{h \in \operatorname{Mor}_{S}(W, U)} \operatorname{Mor}_{\text {Spaces } / W}\left(Z, W \times_{h, U} U \times_{g, V} Y\right) \\
& =\coprod_{h \in \operatorname{Mor}_{S}(W, U)} \operatorname{Mor}_{\text {Spaces } / W}\left(Z, W \times_{g \circ h, V} Y\right) \\
& =\operatorname{Mor}_{\text {Spaces }}(Z / W, Y / V) \times_{\operatorname{Mor}_{S}(W, V)} \operatorname{Mor}_{S}(W, U)
\end{aligned}
$$

where we have used Equation 77.7.0.1 twice. This proves that the condition of Categories, Definition 4.32 .1 holds for $(p, g)$, and hence our claim is true. Now by Categories, Lemma 4.32 .2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the "if" part of the lemma. For the converse, note that given $Y / V$ and $g: U \rightarrow V$, if there exists a strongly cartesian morphism lifting $g$ with target $Y / V$ then it has to be isomorphic to $(p, g)$ (see discussion following Categories, Definition 4.32.1). Hence the "only if" part of the lemma holds.

04UA Lemma 77.7.2. The functor $p:$ Spaces $\rightarrow(S c h / S)_{\text {fppf }}$ satisfies conditions (1) and (2) of Stacks, Definition 8.4.1.
Proof. It is follows from Lemma 77.7.1 that Spaces is a fibred category over $(S c h / S)_{f p p f}$ which proves (1). Suppose that $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering of $(S c h / S)_{f p p f}$. Suppose that $X, Y$ are algebraic spaces over $U$. Finally, suppose that $\varphi_{i}: X_{U_{i}} \rightarrow$ $Y_{U_{i}}$ are morphisms of Spaces $/ U_{i}$ such that $\varphi_{i}$ and $\varphi_{j}$ restrict to the same morphisms $X_{U_{i} \times_{U} U_{j}} \rightarrow Y_{U_{i} \times_{U} U_{j}}$ of algebraic spaces over $U_{i} \times_{U} U_{j}$. To prove (2) we have to show that there exists a unique morphism $\varphi: X \rightarrow Y$ over $U$ whose base change to $U_{i}$ is equal to $\varphi_{i}$. As a morphism from $X$ to $Y$ is the same thing as a map of sheaves this follows directly from Sites, Lemma 7.25.1.

04UB Remark 77.7.3. Ignoring set theoretical difficulties ${ }^{1}$ Spaces also satisfies descent for objects and hence is a stack. Namely, we have to show that given
(1) an fppf covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$,
(2) for each $i \in I$ an algebraic space $X_{i} / U_{i}$, and
(3) for each $i, j \in I$ an isomorphism $\varphi_{i j}: X_{i} \times_{U} U_{j} \rightarrow U_{i} \times_{U} X_{j}$ of algebraic spaces over $U_{i} \times_{U} U_{j}$ satisfying the cocycle condition over $U_{i} \times_{U} U_{j} \times_{U} U_{k}$,

[^196]there exists an algebraic space $X / U$ and isomorphisms $X_{U_{i}} \cong X_{i}$ over $U_{i}$ recovering the isomorphisms $\varphi_{i j}$. First, note that by Sites, Lemma 7.25 .2 there exists a sheaf $X$ on $(S c h / U)_{f p p f}$ recovering the $X_{i}$ and the $\varphi_{i j}$. Then by Bootstrap, Lemma 67.11.1 we see that $X$ is an algebraic space (if we ignore the set theoretic condition of that lemma). We will use this argument in the next section to show that if we consider only algebraic spaces of finite type, then we obtain a stack.

### 77.8. The stack of finite type algebraic spaces

04UC It turns out that we can get a stack of spaces if we only consider spaces of finite type. Let us denote

$$
p_{f t}: \text { Spaces }_{f t} \rightarrow(S c h / S)_{f p p f}
$$

the full subcategory of Spaces over $(S c h / S)_{f p p f}$ consisting of pairs $X / U$ such that $X \rightarrow U$ is a morphism of finite type.
04UD Lemma 77.8.1. The functor $p_{f t}:$ Spaces $_{f t} \rightarrow(S c h / S)_{f p p f}$ satisfies the conditions (1), (2) and (3) of Stacks, Definition 8.4.1.

Proof. We are going to write this out in ridiculous detail (which may make it hard to see what is going on).
We have seen in Lemma 77.7 .1 that a morphism $(f, g): X / U \rightarrow Y / V$ of Spaces is strongly cartesian if the induced morphism $f: X \rightarrow U \times_{V} Y$ is an isomorphism. Note that if $Y \rightarrow V$ is of finite type then also $U \times_{V} Y \rightarrow U$ is of finite type, see Morphisms of Spaces, Lemma 54.23.3. So if $(f, g): X / U \rightarrow Y / V$ of Spaces is strongly cartesian in Spaces and $Y / V$ is an object of Spaces $_{f t}$ then automatically also $X / U$ is an object of Spaces $_{f t}$, and of course $(f, g)$ is also strongly cartesian in Spaces $_{f t}$. In this way we conclude that $S p a c e s_{f t}$ is a fibred category over $(S c h / S)_{f p p f}$. This proves (1).
The argument above also shows that the inclusion functor Spaces $_{f t} \rightarrow$ Spaces transforms strongly cartesian morphisms into strongly cartesian morphisms. In other

Let $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$. Let $X, Y$ be algebraic spaces of finite type over $U$. By Stacks, Lemma 8.2.3 we obtain a map of presheaves

$$
\operatorname{Mor}_{\text {Spaces }_{f t}}(X, Y) \longrightarrow \operatorname{Mor}_{\text {Spaces }}(X, Y)
$$

which is an isomorphism as Spaces $_{f t}$ is a full subcategory of Spaces. Hence the left hand side is a sheaf, because in Lemma 77.7 .2 we showed the right hand side is a sheaf. This proves (2).
To prove condition (3) of Stacks, Definition 8.4.1 we have to show the following: Given
(1) a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $(S c h / S)_{f p p f}$,
(2) for each $i \in I$ an algebraic space $X_{i}$ of finite type over $U_{i}$, and
(3) for each $i, j \in I$ an isomorphism $\varphi_{i j}: X_{i} \times_{U} U_{j} \rightarrow U_{i} \times_{U} X_{j}$ of algebraic spaces over $U_{i} \times_{U} U_{j}$ satisfying the cocycle condition over $U_{i} \times_{U} U_{j} \times_{U} U_{k}$, there exists an algebraic space $X$ of finite type over $U$ and isomorphisms $X_{U_{i}} \cong X_{i}$ over $U_{i}$ recovering the isomorphisms $\varphi_{i j}$. By Sites, Lemma 7.25 .2 there exists a sheaf $X$ on $(S c h / U)_{f p p f}$ recovering the $X_{i}$ and the $\varphi_{i j}$. Then by Bootstrap, Lemma 67.11 .4 we see that $X$ is an algebraic space. By Descent on Spaces, Lemma 61.10.8 we see that $X \rightarrow U$ is of finite type which concludes the proof.

04UE Lemma 77.8.2. There exists a subcategory Spaces $_{f t, s m a l l} \subset$ Spaces $_{f t}$ with the following properties:
(1) the inclusion functor Spaces $_{f t, \text { small }} \rightarrow$ Spaces $_{f t}$ is fully faithful and essentially surjective, and
(2) the functor $p_{f t, s m a l l}:$ Spaces $_{f t, s m a l l} \rightarrow(S c h / S)_{f p p f}$ turns Spaces $_{f t, s m a l l}$ into a stack over $(S c h / S)_{f p p f}$.

Proof. We have seen in Lemmas 77.8.1 that $p_{f g}: Q C o h_{f g} \rightarrow(S c h / S)_{f p p f}$ satisfies (1), (2) and (3) of Stacks, Definition 8.4.1. The additional condition (4) of Stacks, Remark 8.4 .9 holds because every algebraic space $X$ over $S$ is of the form $U / R$ for $U, R \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, see Spaces, Lemma 52.9.1. Thus there is only a set worth of isomorphism classes of objects. Hence we obtain Spaces $_{f t, s m a l l}$ from the discussion in that remark.

We will often perform the replacement

$$
\text { Spaces }_{f t} \rightsquigarrow \text { Spaces }_{f t, \text { small }}
$$

without further remarking on it, and by abuse of notation we will simply denote Spaces $_{f t}$ this replacement.

04UF Remark 77.8.3. Note that the whole discussion in this section works if we want to consider those algebraic spaces $X / U$ which are locally of finite type such that the inverse image in $X$ of an affine open of $U$ can be covered by countably many affines. If needed we can also introduce the notion of a morphism of $\kappa$-type (meaning some bound on the number of generators of ring extensions and some bound on the cardinality of the affines over a given affine in the base) where $\kappa$ is a cardinal, and then we can produce a stack

$$
\text { Spaces }_{\kappa} \longrightarrow(S c h / S)_{f p p f}
$$

in exactly the same manner as above (provided we make sure that $S c h$ is large enough depending on $\kappa$ ).

### 77.9. Examples of stacks in groupoids

04UG The examples above are examples of stacks which are not stacks in groupoids. In the rest of this chapter we give algebraic geometric examples of stacks in groupoids.

### 77.10. The stack associated to a sheaf

0305 Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a presheaf. We obtain a category fibred in sets

$$
p_{F}: \mathcal{S}_{F} \rightarrow(S c h / S)_{f p p f}
$$

see Categories, Example 4.37.5. This is a stack in sets if and only if $F$ is a sheaf, see Stacks, Lemma 8.6.3

### 77.11. The stack in groupoids of finitely generated quasi-coherent sheaves

$03 Y \mathrm{YN}$ Let $p: Q C o h_{f g} \rightarrow(S c h / S)_{f p p f}$ be the stack introduced in Section 77.5 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p^{\prime}: Q C o h_{f g}^{\prime} \rightarrow(S c h / S)_{f p p f}$ by the procedure of Categories, Lemma 4.34.3, see Stacks, Lemma 8.5.3. In this particular case this simply means $Q C o h_{f g}^{\prime}$ has the
same objects as $Q C o h_{f g}$ but the morphisms are pairs $(f, g):(U, \mathcal{F}) \rightarrow\left(U^{\prime}, \mathcal{F}^{\prime}\right)$ where $g$ is an isomorphism $g: f^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$.

### 77.12. The stack in groupoids of finite type algebraic spaces

04UH Let $p:$ Spaces $_{f t} \rightarrow(S c h / S)_{f p p f}$ be the stack introduced in Section 77.8 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p^{\prime}:$ Spaces $_{f t}^{\prime} \rightarrow(S c h / S)_{\text {fppf }}$ by the procedure of Categories, Lemma 4.34.3 see Stacks, Lemma 8.5.3. In this particular case this simply means Spaces ${ }_{f t}$ has the same objects as Spaces $_{f t}$, i.e., finite type morphisms $X \rightarrow U$ where $X$ is an algebraic space over $S$ and $U$ is a scheme over $S$. But the morphisms $(f, g): X / U \rightarrow Y / V$ are now commutative diagrams

which are cartesian.

### 77.13. Quotient stacks

04UI Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. In this case the quotient stack

$$
[U / R] \longrightarrow(S c h / S)_{f p p f}
$$

is a stack in groupoids by construction, see Groupoids in Spaces, Definition 65.19.1. It is even the case that the $I s o m$-sheaves are representable by algebraic spaces, see Bootstrap, Lemma 67.11.5. These quotient stacks are of fundamental importance to the theory of algebraic stacks.

A special case of the construction above is the quotient stack

$$
[X / G] \longrightarrow(S c h / S)_{\text {fppf }}
$$

associated to a datum $(B, G / B, m, X / B, a)$. Here
(1) $B$ is an algebraic space over $S$,
(2) $(G, m)$ is a group algebraic space over $B$,
(3) $X$ is an algebraic space over $B$, and
(4) $a: G \times{ }_{B} X \rightarrow X$ is an action of $G$ on $X$ over $B$.

Namely, by Groupoids in Spaces, Definition 65.19.1 the stack in groupoids $[X / G]$ is the quotient stack $\left[X / G \times_{B} X\right]$ given above. It behooves us to spell out what the category $[X / G]$ really looks like. We will do this in Section 77.15

### 77.14. Classifying torsors

036 Z We want to carefuly explain a number of variants of what it could mean to study the stack of torsors for a group algebraic space $G$ or a sheaf of groups $\mathcal{G}$.

04UJ 77.14.1. Torsors for a sheaf of groups. Let $\mathcal{G}$ be a sheaf of groups on $(S c h / S)_{f p p f}$. For $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ we denote $\left.\mathcal{G}\right|_{U}$ the restriction of $\mathcal{G}$ to $(S c h / U)_{\text {fppf }}$. We define a category $\mathcal{G}$-Torsors as follows:
(1) An object of $\mathcal{G}$-Torsors is a pair $(U, \mathcal{F})$ where $U$ is an object of $(S c h / S)_{\text {fppf }}$ and $\mathcal{F}$ is a $\left.\mathcal{G}\right|_{U}$-torsor, see Cohomology on Sites, Definition 21.5.1.
(2) A morphism $(U, \mathcal{F}) \rightarrow(V, \mathcal{H})$ is given by a pair $(f, \alpha)$, where $f: U \rightarrow V$ is a morphism of schemes over $S$, and $\alpha: f^{-1} \mathcal{H} \rightarrow \mathcal{F}$ is an isomorphism of $\left.\mathcal{G}\right|_{U}$-torsors.
Thus $\mathcal{G}$-Torsors is a category and

$$
p: \mathcal{G} \text {-Torsors } \longrightarrow(S c h / S)_{\text {fppf }}, \quad(U, \mathcal{F}) \longmapsto U
$$

is a functor. Note that the fibre category of $\mathcal{G}$-Torsors over $U$ is the category of $\left.\mathcal{G}\right|_{U}$-torsors which is a groupoid.

04UK Lemma 77.14.2. Up to a replacement as in Stacks, Remark 8.4.9 the functor

$$
p: \mathcal{G} \text {-Torsors } \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. The most difficult part of the proof is to show that we have descent for objects. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $(S c h / S)_{f p p f}$. Suppose that for each $i$ we are given a $\left.\mathcal{G}\right|_{U_{i}}$-torsor $\mathcal{F}_{i}$, and for each $i, j \in I$ an isomorphism $\varphi_{i j}:\left.\mathcal{F}_{i}\right|_{U_{i} \times_{U} U_{j}} \rightarrow$ $\left.\mathcal{F}_{j}\right|_{U_{i} \times{ }_{U} U_{j}}$ of $\left.\mathcal{G}\right|_{U_{i} \times{ }_{U} U_{j}}$-torsors satisfying a suitable cocycle condition on $U_{i} \times{ }_{U}$ $U_{j} \times_{U} U_{k}$. Then by Sites, Section 7.25 we obtain a sheaf $\mathcal{F}$ on $(S c h / U)_{\text {fppf }}$ whose restriction to each $U_{i}$ recovers $\mathcal{F}_{i}$ as well as recovering the descent data. By the equivalence of categories in Sites, Lemma 7.25 .3 the action maps $\left.\mathcal{G}\right|_{U_{i}} \times \mathcal{F}_{i} \rightarrow \mathcal{F}_{i}$ glue to give a map $a:\left.\mathcal{G}\right|_{U} \times \mathcal{F} \rightarrow \mathcal{F}$. Now we have to show that $a$ is an action and that $\mathcal{F}$ becomes a $\left.\mathcal{G}\right|_{U}$-torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions $\left.\mathcal{G}\right|_{U_{i}} \times \mathcal{F}_{i} \rightarrow \mathcal{F}_{i}$. This proves that descent for objects holds in $\mathcal{G}$-Torsors. Some details omitted.

04UL 77.14.3. Variant on torsors for a sheaf. The construction of Subsection 77.14.1 can be generalized slightly. Namely, let $\mathcal{G} \rightarrow \mathcal{B}$ be a map of sheaves on $\left(S c h / S_{\text {fppf }}\right.$ and let

$$
m: \mathcal{G} \times_{\mathcal{B}} \mathcal{G} \longrightarrow \mathcal{G}
$$

be a group law on $\mathcal{G} / \mathcal{B}$. In other words, the pair $(\mathcal{G}, m)$ is a group object of the topos $S h\left((S c h / S)_{f p p f}\right) / \mathcal{B}$. See Sites, Section 7.29 for information regarding localizations of topoi. In this setting we can define a category $\mathcal{G} / \mathcal{B}$-Torsors as follows (where we use the Yoneda embedding to think of schemes as sheaves):
(1) An object of $\mathcal{G} / \mathcal{B}$-Torsors is a triple $(U, b, \mathcal{F})$ where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $b: U \rightarrow \mathcal{B}$ is a section of $\mathcal{B}$ over $U$, and
(c) $\mathcal{F}$ is a $U \times_{b, \mathcal{B}} \mathcal{G}$-torsor over $U$.
(2) A morphism $(U, b, \mathcal{F}) \rightarrow\left(U^{\prime}, b^{\prime}, \mathcal{F}^{\prime}\right)$ is given by a pair $(f, g)$, where $f$ : $U \rightarrow U^{\prime}$ is a morphism of schemes over $S$ such that $b=b^{\prime} \circ f$, and $g: f^{-1} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$ is an isomorphism of $U \times_{b, \mathcal{B}} \mathcal{G}$-torsors.
Thus $\mathcal{G} / \mathcal{B}$-Torsors is a category and

$$
p: \mathcal{G} / \mathcal{B} \text {-Torsors } \longrightarrow(S c h / S)_{\text {fppf }}, \quad(U, b, \mathcal{F}) \longmapsto U
$$

is a functor. Note that the fibre category of $\mathcal{G} / \mathcal{B}$-Torsors over $U$ is the disjoint union over $b: U \rightarrow \mathcal{B}$ of the categories of $U \times_{b, \mathcal{B}} \mathcal{G}$-torsors, hence is a groupoid.

In the special case $\mathcal{B}=S$ we recover the category $\mathcal{G}$-Torsors introduced in Subsection 77.14.1.

04UM Lemma 77.14.4. Up to a replacement as in Stacks, Remark 8.4.9 the functor

$$
p: \mathcal{G} / \mathcal{B} \text {-Torsors } \longrightarrow(S c h / S)_{\text {fppf }}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. This proof is a repeat of the proof of Lemma 77.14.2 The reader is encouraged to read that proof first since the notation is less cumbersome. The most difficult part of the proof is to show that we have descent for objects. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $(S c h / S)_{\text {fppf }}$. Suppose that for each $i$ we are given a pair $\left(b_{i}, \mathcal{F}_{i}\right)$ consisting of a morphism $b_{i}: U_{i} \rightarrow \mathcal{B}$ and a $U_{i} \times{ }_{b_{i}, \mathcal{B}} \mathcal{G}$-torsor $\mathcal{F}_{i}$, and for each $i, j \in I$ we have $\left.b_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.b_{j}\right|_{U_{i} \times_{U} U_{j}}$ and we are given an isomorphism $\varphi_{i j}:\left.\left.\mathcal{F}_{i}\right|_{U_{i} \times_{U} U_{j}} \rightarrow \mathcal{F}_{j}\right|_{U_{i} \times_{U} U_{j}}$ of $\left(U_{i} \times_{U} U_{j}\right) \times_{\mathcal{B}} \mathcal{G}$-torsors satisfying a suitable cocycle condition on $U_{i} \times_{U} U_{j} \times_{U} U_{k}$. Then by Sites, Section 7.25 we obtain a sheaf $\mathcal{F}$ on $(S c h / U)_{\text {fppf }}$ whose restriction to each $U_{i}$ recovers $\mathcal{F}_{i}$ as well as recovering the descent data. By the sheaf axiom for $\mathcal{B}$ the morphisms $b_{i}$ come from a unique morphism $b: U \rightarrow \mathcal{B}$. By the equivalence of categories in Sites, Lemma 7.25 .3 the action maps $\left(U_{i} \times_{b_{i}, \mathcal{B}} \mathcal{G}\right) \times{ }_{U_{i}} \mathcal{F}_{i} \rightarrow \mathcal{F}_{i}$ glue to give a map $\left(U \times_{b, \mathcal{B}} \mathcal{G}\right) \times \mathcal{F} \rightarrow \mathcal{F}$. Now we have to show that this is an action and that $\mathcal{F}$ becomes a $U \times_{b, \mathcal{B}} \mathcal{G}$-torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions on the $\mathcal{F}_{i}$. This proves that descent for objects holds in $\mathcal{G} / \mathcal{B}$-Torsors. Some details omitted.

04UN 77.14.5. Principal homogeneous spaces. Let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. We define a category $G$-Principal as follows:
(1) An object of $G$-Principal is a triple $(U, b, X)$ where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $b: U \rightarrow B$ is a morphism over $S$, and
(c) $X$ is a principal homogeneous $G_{U}$-space over $U$ where $G_{U}=U \times{ }_{b, B} G$. See Groupoids in Spaces, Definition 65.9.3
(2) A morphism $(U, b, X) \rightarrow\left(U^{\prime}, b^{\prime}, X^{\prime}\right)$ is given by a pair $(f, g)$, where $f$ : $U \rightarrow U^{\prime}$ is a morphism of schemes over $B$, and $g: X \rightarrow U \times_{f, U^{\prime}} X^{\prime}$ is an isomorphism of principal homogeneous $G_{U}$-spaces.
Thus G-Principal is a category and

$$
p: G \text {-Principal } \longrightarrow(S c h / S)_{f p p f}, \quad(U, b, X) \longmapsto U
$$

is a functor. Note that the fibre category of $G$-Principal over $U$ is the disjoint union over $b: U \rightarrow B$ of the categories of principal homogeneous $U \times_{b, B} G$-spaces, hence is a groupoid.

In the special case $S=B$ the objects are simply pairs $(U, X)$ where $U$ is a scheme over $S$, and $X$ is a principal homogeneous $G_{U}$-space over $U$. Moreover, morphisms
are simply cartesian diagrams

where $g$ is $G$-equivariant.
04UP Remark 77.14.6. We conjecture that up to a replacement as in Stacks, Remark 8.4 .9 the functor

$$
p: G \text {-Principal } \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$. This would follow if one could show that given
(1) a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $(S c h / S)_{f p p f}$,
(2) an group algebraic space $H$ over $U$,
(3) for every $i$ a principal homogeneous $H_{U_{i}}$-space $X_{i}$ over $U_{i}$, and
(4) $H$-equivariant isomorphisms $\varphi_{i j}: X_{i, U_{i} \times{ }_{U} U_{j}} \rightarrow X_{j, U_{i} \times_{U} U_{j}}$ satisfying the cocycle condition,
there exists a principal homogeneous $H$-space $X$ over $U$ which recovers $\left(X_{i}, \varphi_{i j}\right)$. The technique of the proof of Bootstrap, Lemma 67.11 .8 reduces this to a set theoretical question, so the reader who ignores set theoretical questions will "know" that the result is true. In http://math.columbia.edu/~dejong/wordpress/?p= 591 there is a suggestion as to how to approach this problem.
04UQ 77.14.7. Variant on principal homogeneous spaces. Let $S$ be a scheme. Let $B=S$. Let $G$ be a group scheme over $B=S$. In this setting we can define a full subcategory $G$-Principal-Schemes $\subset G$-Principal whose objects are pairs $(U, X)$ where $U$ is an object of $(S c h / S)_{f p p f}$ and $X \rightarrow U$ is a principal homogeneous $G$ space over $U$ which is representable, i.e., a scheme.

It is in general not the case that G-Principal-Schemes is a stack in groupoids over $(S c h / S)_{\text {fppf }}$. The reason is that in general there really do exist principal homogeneous spaces which are not schemes, hence descent for objects will not be satisfied in general.

04UR 77.14.8. Torsors in fppf topology. Let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. We define a category $G$-Torsors as follows:
(1) An object of $G$-Torsors is a triple $(U, b, X)$ where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $b: U \rightarrow B$ is a morphism, and
(c) $X$ is an fppf $G_{U}$-torsor over $U$ where $G_{U}=U \times_{b, B} G$.

See Groupoids in Spaces, Definition 65.9.3.
(2) A morphism $(U, b, X) \rightarrow\left(U^{\prime}, b^{\prime}, X^{\prime}\right)$ is given by a pair $(f, g)$, where $f$ : $U \rightarrow U^{\prime}$ is a morphism of schemes over $B$, and $g: X \rightarrow U \times_{f, U^{\prime}} X^{\prime}$ is an isomorphism of $G_{U}$-torsors.
Thus $G$-Torsors is a category and

$$
p: G \text {-Torsors } \longrightarrow(S c h / S)_{f p p f}, \quad(U, a, X) \longmapsto U
$$

is a functor. Note that the fibre category of $G$-Torsors over $U$ is the disjoint union over $b: U \rightarrow B$ of the categories of fppf $U \times_{b, B} G$-torsors, hence is a groupoid.

In the special case $S=B$ the objects are simply pairs $(U, X)$ where $U$ is a scheme over $S$, and $X$ is an fppf $G_{U}$-torsor over $U$. Moreover, morphisms are simply cartesian diagrams

where $g$ is $G$-equivariant.
04US Lemma 77.14.9. Up to a replacement as in Stacks, Remark 8.4.9 the functor

$$
p: G \text {-Torsors } \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. The most difficult part of the proof is to show that we have descent for objects, which is Bootstrap, Lemma 67.11 .8 . We omit the proof of axioms (1) and (2) of Stacks, Definition 8.5.1

04UT Lemma 77.14.10. Let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. Denote $\mathcal{G}$, resp. $\mathcal{B}$ the algebraic space $G$, resp. $B$ seen as a sheaf on $(S c h / S)_{\text {fppf }}$. The functor

$$
G \text {-Torsors } \longrightarrow \mathcal{G} / \mathcal{B} \text {-Torsors }
$$

which associates to a triple $(U, b, X)$ the triple $(U, b, \mathcal{X})$ where $\mathcal{X}$ is $X$ viewed as a sheaf is an equivalence of stacks in groupoids over $(S c h / S)_{f p p f}$.
Proof. We will use the result of Stacks, Lemma 8.4.8 to prove this. The functor is fully faithful since the category of algebraic spaces over $S$ is a full subcategory of the category of sheaves on $(S c h / S)_{f p p f}$. Moreover, all objects (on both sides) are locally trivial torsors so condition (2) of the lemma referenced above holds. Hence the functor is an equivalence.

04UU 77.14.11. Variant on torsors in fppf topology. Let $S$ be a scheme. Let $B=S$. Let $G$ be a group scheme over $B=S$. In this setting we can define a full subcategory $G$-Torsors-Schemes $\subset G$-Torsors whose objects are pairs $(U, X)$ where $U$ is an object of $(S c h / S)_{\text {fppf }}$ and $X \rightarrow U$ is an fppf $G$-torsor over $U$ which is representable, i.e., a scheme.

It is in general not the case that $G$-Torsors-Schemes is a stack in groupoids over $(S c h / S)_{f p p f}$. The reason is that in general there really do exist fppf $G$-torsors which are not schemes, hence descent for objects will not be satisfied in general.

### 77.15. Quotients by group actions

04 UV At this point we have introduced enough notation that we can work out in more detail what the stacks $[X / G]$ of Section 77.13 look like.

04WL Situation 77.15.1. Here
(1) $S$ is a scheme contained in $S c h_{f p p f}$,
(2) $B$ is an algebraic space over $S$,
(3) $(G, m)$ is a group algebraic space over $B$,
(4) $\pi: X \rightarrow B$ is an algebraic space over $B$, and
(5) $a: G \times_{B} X \rightarrow X$ is an action of $G$ on $X$ over $B$.

In this situation we construct a category $[[X / G]]^{2}$ as follows:
(1) An object of $[[X / G]]$ consists of a quadruple $(U, b, P, \varphi: P \rightarrow X)$ where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $b: U \rightarrow B$ is a morphism over $S$,
(c) $P$ is an fppf $G_{U}$-torsor over $U$ where $G_{U}=U \times_{b, B} G$, and
(d) $\varphi: P \rightarrow X$ is a $G$-equivariant morphism fitting into the commutative diagram

(2) A morphism of $[[X / G]]$ is a pair $(f, g):(U, b, P, \varphi) \rightarrow\left(U^{\prime}, b^{\prime}, P^{\prime}, \varphi^{\prime}\right)$ where $f: U \rightarrow U^{\prime}$ is a morphism of schemes over $B$ and $g: P \rightarrow P^{\prime}$ is a $G$ equivariant morphism over $f$ which induces an isomorphism $P \cong U \times_{f, U^{\prime}}$ $P^{\prime}$, and has the property that $\varphi=\varphi^{\prime} \circ g$. In other words $(f, g)$ fits into the following commutative diagram

Thus $[[X / G]]$ is a category and

$$
p:[[X / G]] \longrightarrow(S c h / S)_{f p p f}, \quad(U, b, P, \varphi) \longmapsto U
$$

is a functor. Note that the fibre category of $[[X / G]]$ over $U$ is the disjoint union over $b \in \operatorname{Mor}_{S}(U, B)$ of $U \times_{b, B} G$-torsors $P$ endowed with a $G$-equivariant morphism to $X$. Hence the fibre categories of $[[X / G]]$ are groupoids.

Note that the functor

$$
[[X / G]] \longrightarrow G \text {-Torsors, } \quad(U, b, P, \varphi) \longmapsto(U, b, P)
$$

is a 1-morphism of categories over $(S c h / S)_{f p p f}$.
Lemma 77.15.2. Up to a replacement as in Stacks, Remark 8.4.9 the functor

$$
p:[[X / G]] \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. The most difficult part of the proof is to show that we have descent for objects. Suppose that $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering in $(S c h / S)_{\text {fppf }}$. Let $\xi_{i}=$ $\left(U_{i}, b_{i}, P_{i}, \varphi_{i}\right)$ be objects of $[[X / G]]$ over $U_{i}$, and let $\varphi_{i j}: \operatorname{pr}_{0}^{*} \xi_{i} \rightarrow \operatorname{pr}_{1}^{*} \xi_{j}$ be a descent datum. This in particular implies that we get a descent datum on the triples $\left(U_{i}, b_{i}, P_{i}\right)$ for the stack in groupoids $G$-Torsors by applying the functor $[[X / G]] \rightarrow G$-Torsors above. We have seen that $G$-Torsors is a stack in groupoids

[^197](Lemma 77.14.9). Hence we may assume that $b_{i}=\left.b\right|_{U_{i}}$ for some morphism $b: U \rightarrow B$, and that $P_{i}=U_{i} \times_{U} P$ for some fppf $G_{U}=U \times_{b, B} G$-torsor $P$ over $U$. The morphisms $\varphi_{i}$ are compatible with the canonical descent datum on the restrictions $U_{i} \times_{U} P$ and hence define a morphism $\varphi: P \rightarrow X$. (For example you can use Sites, Lemma 7.25 .3 or you can use Descent on Spaces, Lemma 61.6.2 to get $\varphi$.) This proves descent for objects. We omit the proof of axioms (1) and
(2) of Stacks, Definition 8.5.1.

04WM Proposition 77.15.3. In Situation 77.15 .1 there exists a canonical equivalence

$$
[X / G] \longrightarrow[[X / G]]
$$

of stacks in groupoids over $(S c h / S)_{f p p f}$.
Proof. We write this out in detail, to make sure that all the definitions work out in exactly the correct manner. Recall that $[X / G]$ is the quotient stack associated to the groupoid in algebraic spaces $\left(X, G \times_{B} X, s, t, c\right)$, see Groupoids in Spaces, Definition 65.19.1. This means that $[X / G]$ is the stackification of the category fibred in groupoids $[X / p G]$ associated to the functor

$$
(S c h / S)_{f p p f} \longrightarrow G r o u p o i d s, \quad U \longmapsto\left(X(U), G(U) \times_{B(U)} X(U), s, t, c\right)
$$

where $s(g, x)=x, t(g, x)=a(g, x)$, and $c\left((g, x),\left(g^{\prime}, x^{\prime}\right)\right)=\left(m\left(g, g^{\prime}\right), x^{\prime}\right)$. By the construction of Categories, Example 4.36.1 an object of $[X / p G]$ is a pair $(U, x)$ with $x \in X(U)$ and a morphism $(f, g):(U, x) \rightarrow\left(U^{\prime}, x^{\prime}\right)$ of $[X / p G]$ is given by a morphism of schemes $f: U \rightarrow U^{\prime}$ and an element $g \in G(U)$ such that $a(g, x)=x^{\prime} \circ f$. Hence we can define a 1-morphism of stacks in groupoids

$$
F_{p}:[X / p G] \longrightarrow[[X / G]]
$$

by the following rules: On objects we set

$$
F_{p}(U, x)=\left(U, \pi \circ x, G \times_{B, \pi \circ x} U, a \circ\left(\operatorname{id}_{G} \times x\right)\right)
$$

This makes sense because the diagram

commutes, and the two horizontal arrows are $G$-equivariant if we think of the fibre products as trivial $G$-torsors over $U$, resp. $X$. On morphisms $(f, g):(U, x) \rightarrow$ $\left(U^{\prime}, x^{\prime}\right)$ we set $F_{p}(f, g)=\left(f, R_{g}\right)$ where $R_{g}$ denotes right translation by $g$. More precisely, the morphism of $F_{p}(f, g): F_{p}(U, x) \rightarrow F_{p}\left(U^{\prime}, x^{\prime}\right)$ is given by the cartesian diagram

where $R_{g^{-1}}$ on $T$-valued points is given by

$$
R_{g^{-1}}\left(g^{\prime}, u\right)=\left(m\left(g^{\prime}, i(g)\right), f(u)\right)
$$

To see that this works we have to verify that

$$
a \circ\left(\operatorname{id}_{G} \times x\right)=a \circ\left(\mathrm{id}_{G} \times x^{\prime}\right) \circ R_{g^{-1}}
$$

which is true because the right hand side applied to the $T$-valued point $\left(g^{\prime}, u\right)$ gives the desired equality

$$
\begin{aligned}
a\left(\left(\operatorname{id}_{G} \times x^{\prime}\right)\left(m\left(g^{\prime}, i(g)\right), f(u)\right)\right) & =a\left(m\left(g^{\prime}, i(g)\right), x^{\prime}(f(u))\right) \\
& =a\left(g^{\prime}, a\left(i(g), x^{\prime}(f(u))\right)\right) \\
& =a\left(g^{\prime}, x(u)\right)
\end{aligned}
$$

because $a(g, x)=x^{\prime} \circ f$ and hence $a\left(i(g), x^{\prime} \circ f\right)=x$.
By the universal property of stackification from Stacks, Lemma 8.9.2 we obtain a canonical extension $F:[X / G] \rightarrow[[X / G]]$ of the 1-morphism $F_{p}$ above. We first prove that $F$ is fully faithful. To do this, since both source and target are stacks in groupoids, it suffices to prove that the Isom-sheaves are identified under $F$. Pick a scheme $U$ and objects $\xi, \xi^{\prime}$ of $[X / G]$ over $U$. We want to show that

$$
F: \operatorname{Isom}_{[X / G]}\left(\xi, \xi^{\prime}\right) \longrightarrow \operatorname{Isom}_{[[X / G]]}\left(F(\xi), F\left(\xi^{\prime}\right)\right)
$$

is an isomorphism of sheaves. To do this it suffices to work locally on $U$, and hence we may assume that $\xi, \xi^{\prime}$ come from objects $(U, x),\left(U, x^{\prime}\right)$ of $[X / p G]$ over $U$; this follows directly from the construction of the stackification, and it is also worked out in detail in Groupoids in Spaces, Section 65.23. Either by directly using the description of morphisms in $[X / p G]$ above, or using Groupoids in Spaces, Lemma 65.21 .1 we see that in this case

$$
\operatorname{Isom}_{[X / G]}\left(\xi, \xi^{\prime}\right)=U \times_{\left(x, x^{\prime}\right), X \times{ }_{S} X,(s, t)}\left(G \times_{B} X\right)
$$

A $T$-valued point of this fibre product corresponds to a pair $(u, g)$ with $u \in U(T)$, and $g \in G(T)$ such that $a(g, x \circ u)=x^{\prime} \circ u$. (Note that this implies $\pi \circ x \circ u=\pi \circ x^{\prime} \circ$ u.) On the other hand, a $T$-valued point of $\operatorname{Isom}_{[[X / G]]}\left(F(\xi), F\left(\xi^{\prime}\right)\right)$ by definition corresponds to a morphism $u: T \rightarrow U$ such that $\pi \circ x \circ u=\pi \circ x^{\prime} \circ u: T \rightarrow B$ and an isomorphism

$$
R: G \times_{B, \pi \circ x \circ u} T \longrightarrow G \times_{B, \pi \circ x^{\prime} \circ u} T
$$

of trivial $G_{T}$-torsors compatible with the given maps to $X$. Since the torsors are trivial we see that $R=R_{g^{-1}}$ (right multiplication) by some $g \in G(T)$. Compatibility with the maps $a \circ\left(1_{G}, x \circ u\right), a \circ\left(1_{G}, x^{\prime} \circ u\right): G \times_{B} T \rightarrow X$ is equivalent to the condition that $a(g, x \circ u)=x^{\prime} \circ u$. Hence we obtain the desired equality of Isom-sheaves.

Now that we know that $F$ is fully faithful we see that Stacks, Lemma 8.4.8 applies. Thus to show that $F$ is an equivalence it suffices to show that objects of $[[X / G]]$ are fppf locally in the essential image of $F$. This is clear as fppf torsors are locally trivial, and hence we win.

0371 Remark 77.15.4. Let $S$ be a scheme. Let $G$ be an abstract group. Let $X$ be an algebraic space over $S$. Let $G \rightarrow \operatorname{Aut}_{S}(X)$ be a group homomorphism. In this setting we can define $[[X / G]]$ similarly to the above as follows:
(1) An object of $[[X / G]]$ consists of a triple $(U, P, \varphi: P \rightarrow X)$ where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $P$ is a sheaf on $(S c h / U)_{f p p f}$ which comes with an action of $G$ that turns it into a torsor under the constant sheaf with value $G$, and
(c) $\varphi: P \rightarrow X$ is a $G$-equivariant map of sheaves.
(2) A morphism $(f, g):(U, P, \varphi) \rightarrow\left(U^{\prime}, P^{\prime}, \varphi^{\prime}\right)$ is given by a morphism of schemes $f: T \rightarrow T^{\prime}$ and a $G$-equivariant isomorphism $g: P \rightarrow f^{-1} P^{\prime}$ such that $\varphi=\varphi^{\prime} \circ g$.
In exactly the same manner as above we obtain a functor

$$
[[X / G]] \longrightarrow(S c h / S)_{f p p f}
$$

which turns $[[X / G]]$ into a stack in groupoids over $(S c h / S)_{f p p f}$. The constant sheaf $\underline{G}$ is (provided the cardinality of $G$ is not too large) representable by $G_{S}$ on $(S c h / S)_{f p p f}$ and this version of $[[X / G]]$ is equivalent to the stack $\left[\left[X / G_{S}\right]\right]$ introduced above.

### 77.16. The Picard stack

0372 Let $S$ be a scheme. Let $\pi: X \rightarrow B$ be a morphism of algebraic spaces over $S$. We define a category $\operatorname{Pic}_{X / B}$ as follows:
(1) An object is a triple $(U, b, \mathcal{L})$, where
(a) $U$ is an object of $(S c h / S)_{f p p f}$,
(b) $b: U \rightarrow B$ is a morphism over $S$, and
(c) $\mathcal{L}$ is in invertible sheaf on the base change $X_{U}=U \times_{b, B} X$.
(2) A morphism $(f, g):(U, b, \mathcal{L}) \rightarrow\left(U^{\prime}, b^{\prime}, \mathcal{L}^{\prime}\right)$ is given by a morphism of schemes $f: U \rightarrow U^{\prime}$ over $B$ and an isomorphism $g: f^{*} \mathcal{L}^{\prime} \rightarrow \mathcal{L}$.
The composition of $(f, g):(U, b, \mathcal{L}) \rightarrow\left(U^{\prime}, b^{\prime}, \mathcal{L}^{\prime}\right)$ with $\left(f^{\prime}, g^{\prime}\right):\left(U^{\prime}, b^{\prime}, \mathcal{L}^{\prime}\right) \rightarrow$ $\left(U^{\prime \prime}, b^{\prime \prime}, \mathcal{L}^{\prime \prime}\right)$ is given by $\left(f \circ f^{\prime}, g \circ f^{*}\left(g^{\prime}\right)\right)$. Thus we get a category $\operatorname{Pic}_{X / B}$ and

$$
p: \text { Pic }_{X / B} \longrightarrow(S c h / S)_{f p p f}, \quad(U, b, \mathcal{L}) \longmapsto U
$$

is a functor. Note that the fibre category of $\operatorname{Pic}_{X / B}$ over $U$ is the disjoint union over $b \in \operatorname{Mor}_{S}(U, B)$ of the categories of invertible sheaves on $X_{U}=U \times_{b, B} X$. Hence the fibre categories are groupoids.

04WN Lemma 77.16.1. Up to a replacement as in Stacks, Remark 8.4.9 the functor

$$
\text { Pic }_{X / B} \longrightarrow(S c h / S)_{f p p f}
$$

defines a stack in groupoids over $(S c h / S)_{f p p f}$.
Proof. As usual, the hardest part is to show descent for objects. To see this let $\left\{U_{i} \rightarrow U\right\}$ be a covering of $(S c h / S)_{f p p f}$. Let $\xi_{i}=\left(U_{i}, b_{i}, \mathcal{L}_{i}\right)$ be an object of $\operatorname{Pic}_{X / B}$ lying over $U_{i}$, and let $\varphi_{i j}: \operatorname{pr}_{0}^{*} \xi_{i} \rightarrow \operatorname{pr}_{1}^{*} \xi_{j}$ be a descent datum. This implies in particular that the morphisms $b_{i}$ are the restrictions of a morphism $b: U \rightarrow B$. Write $X_{U}=U \times_{b, B} X$ and $X_{i}=U_{i} \times_{b_{i}, B} X=U_{i} \times_{U} U \times_{b, B} X=U_{i} \times_{U} X_{U}$. Observe that $\mathcal{L}_{i}$ is an invertible $\mathcal{O}_{X_{i}}$-module. Note that $\left\{X_{i} \rightarrow X_{U}\right\}$ forms an fppf covering as well. Moreover, the descent datum $\varphi_{i j}$ translates into a descent datum on the invertible sheaves $\mathcal{L}_{i}$ relative to the fppf covering $\left\{X_{i} \rightarrow X_{U}\right\}$. Hence by Descent on Spaces, Proposition 61.4.1 we obtain a unique invertible sheaf $\mathcal{L}$ on $X_{U}$ which recovers $\mathcal{L}_{i}$ and the descent data over $X_{i}$. The triple $(U, b, \mathcal{L})$ is therefore the object of Pic $_{X / B}$ over $U$ we were looking for. Details omitted.

### 77.17. Examples of inertia stacks

0373 Here are some examples of inertia stacks.

0374 Example 77.17.1. Let $S$ be a scheme. Let $G$ be a commutative group. Let $X \rightarrow S$ be a scheme over $S$. Let $a: G \times X \rightarrow X$ be an action of $G$ on $X$. For $g \in G$ we denote $g: X \rightarrow X$ the corresponding automorphism. In this case the inertia stack of $[X / G]$ (see Remark 77.15.4) is given by

$$
I_{[X / G]}=\coprod_{g \in G}\left[X^{g} / G\right]
$$

where, given an element $g$ of $G$, the symbol $X^{g}$ denotes the scheme $X^{g}=\{x \in X \mid$ $g(x)=x\}$. In a formula $X^{g}$ is really the fibre product

$$
X^{g}=X \times_{(1,1), X \times_{S} X,(g, 1)} X
$$

Indeed, for any $S$-scheme $T$, a $T$-point on the inertia stack of $[X / G]$ consists of a triple $(P / T, \phi, \alpha)$ consisting of a $G$-torsor $P \rightarrow T$ together with a $G$-equivariant isomorphism $\phi: P \rightarrow X$, together with an automorphism $\alpha$ of $P \rightarrow T$ over $T$ such that $\phi \circ \alpha=\phi$. Since $G$ is a sheaf of commutative groups, $\alpha$ is, locally in the fppf topology over $T$, given by multiplication by some element $g$ of $G$. The condition that $\phi \circ \alpha=\phi$ means that $\phi$ factors through the inclusion of $X^{g}$ in $X$, i.e., $\phi$ is obtained by composing that inclusion with a morphism $P \rightarrow X^{\gamma}$. The above discussion allows us to define a morphism of fibred categories $I_{[X / G]} \rightarrow \coprod_{g \in G}\left[X^{g} / G\right]$ given on $T$-points by the discussion above. We omit showing that this is an equivalence.

0375 Example 77.17.2. Let $X \rightarrow S$ be a morphism of schemes. Assume that for any $T \rightarrow S$ the base change $f_{T}: X_{T} \rightarrow T$ has the property that the map $\mathcal{O}_{T} \rightarrow f_{T, *} \mathcal{O}_{X_{T}}$ is an isomorphism. (This implies that $f$ is cohomologically flat in dimension 0 (insert future reference here) but is stronger.) Consider the Picard stack $\mathrm{Pic}_{X / S}$, see Section 77.16 . The points of its inertia stack over an $S$-scheme $T$ consist of pairs $(\mathcal{L}, \alpha)$ where $\mathcal{L}$ is a line bundle on $X_{T}$ and $\alpha$ is an automorphism of that line bundle. I.e., we can think of $\alpha$ as an element of $H^{0}\left(X_{T}, \mathcal{O}_{X_{T}}\right)^{\times}=H^{0}\left(T, \mathcal{O}_{T}^{*}\right)$ by our condition. Note that $H^{0}\left(T, \mathcal{O}_{T}^{*}\right)=\mathbf{G}_{m, S}(T)$, see Groupoids, Example 38.5.1. Hence the inertia stack of $P i c_{X / S}$ is

$$
I_{P i c_{X / S}}=\mathbf{G}_{m, S} \times_{S} P i c_{X / S}
$$

as a stack over $(S c h / S)_{f p p f}$.

### 77.18. Finite Hilbert stacks

05WA We formulate this in somewhat greater generality than is perhaps strictly needed. Fix a 1-morphism

$$
F: \mathcal{X} \longrightarrow \mathcal{Y}
$$

of stacks in groupoids over $(S c h / S)_{f p p f}$. For each integer $d \geq 1$ consider a category $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ defined as follows:
(1) An object $(U, Z, y, x, \alpha)$ where $U, Z$ are objects of in $(S c h / S)_{f p p f}$ and $Z$ is a finite locally free of degree $d$ over $U$, where $y \in \operatorname{Ob}\left(\mathcal{Y}_{U}\right), x \in \operatorname{Ob}\left(\mathcal{X}_{Z}\right)$ and $\alpha:\left.y\right|_{Z} \rightarrow F(x)$ is an isomorphism ${ }^{3}$.

[^198](2) A morphism $(U, Z, y, x, \alpha) \rightarrow\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ is given by a morphism of schemes $f: U \rightarrow U^{\prime}$, a morphism of schemes $g: Z \rightarrow Z^{\prime}$ which induces an isomorphism $Z \rightarrow Z^{\prime} \times_{U} U^{\prime}$, and isomorphisms $b: y \rightarrow f^{*} y^{\prime}, a: x \rightarrow g^{*} x^{\prime}$ inducing a commutative diagram

It is clear from the definitions that there is a canonical forgetful functor

$$
p: \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \longrightarrow(S c h / S)_{f p p f}
$$

which assigns to the quintuple $(U, Z, y, x, \alpha)$ the scheme $U$ and to the morphism $(f, g, b, a):(U, Z, y, x, \alpha) \rightarrow\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ the morphism $f: U \rightarrow U^{\prime}$.
05WB Lemma 77.18.1. The category $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ endowed with the functor $p$ above defines a stack in groupoids over $(S c h / S)_{\text {fppf }}$.

Proof. As usual, the hardest part is to show descent for objects. To see this let $\left\{U_{i} \rightarrow U\right\}$ be a covering of $(S c h / S)_{f p p f}$. Let $\xi_{i}=\left(U_{i}, Z_{i}, y_{i}, x_{i}, \alpha_{i}\right)$ be an object of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ lying over $U_{i}$, and let $\varphi_{i j}: \operatorname{pr}_{0}^{*} \xi_{i} \rightarrow \operatorname{pr}_{1}^{*} \xi_{j}$ be a descent datum. First, observe that $\varphi_{i j}$ induces a descent datum $\left(Z_{i} / U_{i}, \varphi_{i j}\right)$ which is effective by Descent, Lemma 34.33.1 This produces a scheme $Z / U$ which is finite locally free of degree $d$ by Descent, Lemma 34.19.28. From now on we identify $Z_{i}$ with $Z \times{ }_{U} U_{i}$. Next, the objects $y_{i}$ in the fibre categories $\mathcal{Y}_{U_{i}}$ descend to an object $y$ in $\mathcal{Y}_{U}$ because $\mathcal{Y}$ is a stack in groupoids. Similarly the objects $x_{i}$ in the fibre categories $\mathcal{X}_{Z_{i}}$ descend to an object $x$ in $\mathcal{X}_{Z}$ because $\mathcal{X}$ is a stack in groupoids. Finally, the given isomorphisms

$$
\alpha_{i}:\left(\left.y\right|_{Z}\right)_{Z_{i}}=\left.y_{i}\right|_{Z_{i}} \longrightarrow F\left(x_{i}\right)=F\left(\left.x\right|_{Z_{i}}\right)
$$

glue to a morphism $\alpha:\left.y\right|_{Z} \rightarrow F(x)$ as the $\mathcal{Y}$ is a stack and hence $\operatorname{Isom}_{\mathcal{Y}}\left(\left.y\right|_{Z}, F(x)\right)$ is a sheaf. Details omitted.

05WC Definition 77.18.2. We will denote $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ the degree $d$ finite Hilbert stack of $\mathcal{X}$ over $\mathcal{Y}$ constructed above. If $\mathcal{Y}=S$ we write $\mathcal{H}_{d}(\mathcal{X})=\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$. If $\mathcal{X}=\mathcal{Y}=S$ we denote it $\mathcal{H}_{d}$.

Note that given $F: \mathcal{X} \rightarrow \mathcal{Y}$ as above we have the following natural 1-morphisms of stacks in groupoids over $(S c h / S)_{f p p f}$ :

05WD

Each of the arrows is given by a "forgetful functor".
of stacks in groupoids over $(S c h / S)_{f p p f}$. Alternatively, we may picture $\alpha$ as a 2 -morphism

$$
(S c h / Z)_{f p p f} \frac{y \circ(Z \rightarrow U)}{\Downarrow_{\alpha}} \neq \mathcal{Y} .
$$

05XV Lemma 77.18.3. The 1-morphism $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{H}_{d}(\mathcal{X})$ is faithful.
Proof. To check that $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{H}_{d}(\mathcal{X})$ is faithful it suffices to prove that it is faithful on fibre categories. Suppose that $\xi=(U, Z, y, x, \alpha)$ and $\xi^{\prime}=\left(U, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ are two objects of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over the scheme $U$. Let $(g, b, a),\left(g^{\prime}, b^{\prime}, a^{\prime}\right): \xi \rightarrow \xi^{\prime}$ be two morphisms in the fibre category of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U$. The image of these morphisms in $\mathcal{H}_{d}(\mathcal{X})$ agree if and only if $g=g^{\prime}$ and $a=a^{\prime}$. Then the commutative diagram

implies that $\left.b\right|_{Z}=\left.b^{\prime}\right|_{Z}$. Since $Z \rightarrow U$ is finite locally free of degree $d$ we see $\{Z \rightarrow U\}$ is an fppf covering, hence $b=b^{\prime}$.

## CHAPTER 78

## Sheaves on Algebraic Stacks

## 06TF

### 78.1. Introduction

06TG There is a myriad of ways to think about sheaves on algebraic stacks. In this chapter we discuss one approach, which is particularly well adapted to our foundations for algebraic stacks. Whenever we introduce a type of sheaves we will indicate the precise relationship with similar notions in the literature. The goal of this chapter is to state those results that are either obviously true or straightforward to prove and leave more intricate constructions till later.

In fact, it turns out that to develop a fully fledged theory of constructible étale sheaves and/or an adequate discussion of derived categories of complexes $\mathcal{O}$-modules whose cohomology sheaves are quasi-coherent takes a significant amount of work, see Ols07b. We will return to this in Cohomology of Stacks, Section 84.1.

In the literature and in research papers on sheaves on algebraic stacks the lisse-étale site of an algebraic stack often plays a prominent role. However, it is a problematic beast, because it turns out that a morphism of algebraic stacks does not induce a morphism of lisse-étale topoi. We have therefore made the design decision to avoid any mention of the lisse-étale site as long as possible. Arguments that traditionally use the lisse-étale site will be replaced by an argument using a Čech covering in the site $\mathcal{X}_{\text {smooth }}$ defined below.

Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 81.1 for an explanation.

### 78.2. Conventions

06 TH The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 76.2 . For convenience we repeat them here.

We work in a suitable big fppf site $S c h_{f p p f}$ as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of $S c h_{f p p f}$. We record what changes if you change the big fppf site elsewhere (insert future reference here).

We will always work relative to a base $S$ contained in $S c h_{f p p f}$. And we will then work with the big fppf site $(S c h / S)_{f p p f}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S=\operatorname{Spec}(\mathbf{Z})$.

### 78.3. Presheaves

06 TI In this section we define presheaves on categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$, but most of the discussion works for categories over any base category. This section also serves to introduce the notation we will use later on.

06TJ Definition 78.3.1. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids.
(1) A presheaf on $\mathcal{X}$ is a presheaf on the underlying category of $\mathcal{X}$.
(2) A morphism of presheaves on $\mathcal{X}$ is a morphism of presheaves on the underlying category of $\mathcal{X}$.
We denote $\operatorname{PSh}(\mathcal{X})$ the category of presheaves on $\mathcal{X}$.
This defines presheaves of sets. Of course we can also talk about presheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of abelian presheaves, i.e., presheaves of abelian groups, is denoted $\operatorname{PAb}(\mathcal{X})$.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Recall that this means just that $f$ is a functor over $(S c h / S)_{f p p f}$. The material in Sites, Section 7.18 provides us with a pair of adjoint functors ${ }^{1}$
06TK (78.3.1.1)

$$
f^{p}: \operatorname{PSh}(\mathcal{Y}) \longrightarrow P \operatorname{Sh}(\mathcal{X}) \quad \text { and } \quad{ }_{p} f: \operatorname{PSh}(\mathcal{X}) \longrightarrow \operatorname{PSh}(\mathcal{Y})
$$

The adjointness is

$$
\operatorname{Mor}_{P S h(\mathcal{X})}\left(f^{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P S h(\mathcal{Y})}\left(\mathcal{G},{ }_{p} f \mathcal{F}\right)
$$

where $\mathcal{F} \in \operatorname{Ob}(P S h(\mathcal{X}))$ and $\mathcal{G} \in \operatorname{Ob}(P S h(\mathcal{Y}))$. We call $f^{p} \mathcal{G}$ the pullback of $\mathcal{G}$. It follows from the definitions that

$$
f^{p} \mathcal{G}(x)=\mathcal{G}(f(x))
$$

for any $x \in \operatorname{Ob}(\mathcal{X})$. The presheaf ${ }_{p} f \mathcal{F}$ is called the pushforward of $\mathcal{F}$. It is described by the formula

$$
\left({ }_{p} f \mathcal{F}\right)(y)=\lim _{f(x) \rightarrow y} \mathcal{F}(x)
$$

The rest of this section should probably be moved to the chapter on sites and in any case should be skipped on a first reading.

06TL Lemma 78.3.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Then $(g \circ f)^{p}=f^{p} \circ g^{p}$ and there is a canonical isomorphism $_{p}(g \circ f) \rightarrow{ }_{p} g \circ{ }_{p} f$ compatible with with adjointness of $\left(f^{p},{ }_{p} f\right),\left(g^{p},{ }_{p} g\right)$, and $\left((g \circ f)^{p},{ }_{p}(g \circ f)\right)$.

Proof. Let $\mathcal{H}$ be a presheaf on $\mathcal{Z}$. Then $(g \circ f)^{p} \mathcal{H}=f^{p}\left(g^{p} \mathcal{H}\right)$ is given by the equalities

$$
(g \circ f)^{p} \mathcal{H}(x)=\mathcal{H}((g \circ f)(x))=\mathcal{H}(g(f(x)))=f^{p}\left(g^{p} \mathcal{H}\right)(x)
$$

We omit the verification that this is compatible with restriction maps.
Next, we define the transformation ${ }_{p}(g \circ f) \rightarrow{ }_{p} g \circ{ }_{p} f$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. If $z$ is an object of $\mathcal{Z}$ then we get a category $\mathcal{J}$ of quadruples $(x, f(x) \rightarrow y, y, g(y) \rightarrow z)$ and a category $\mathcal{I}$ of pairs $(x, g(f(x)) \rightarrow z)$. There is a canonical functor $\mathcal{J} \rightarrow \mathcal{I}$

[^199]sending the object $(x, \alpha: f(x) \rightarrow y, y, \beta: g(y) \rightarrow z)$ to $(x, \beta \circ f(\alpha): g(f(x)) \rightarrow z)$. This gives the arrow in
\[

$$
\begin{aligned}
(p(g \circ f) \mathcal{F})(z) & =\lim _{g(f(x)) \rightarrow z} \mathcal{F}(x) \\
& =\lim _{\mathcal{I}} \mathcal{F} \\
& \rightarrow \lim _{\mathcal{J}} \mathcal{F} \\
& =\lim _{g(y) \rightarrow z}\left(\lim _{f(x) \rightarrow y} \mathcal{F}(x)\right) \\
& =\left({ }_{p} g \circ{ }_{p} f \mathcal{F}\right)(x)
\end{aligned}
$$
\]

by Categories, Lemma 4.14.8. We omit the verification that this is compatible with restriction maps. An alternative to this direct construction is to define ${ }_{p}(g \circ f) \cong$ ${ }_{p} g \circ{ }_{p} f$ as the unique map compatible with the adjointness properties. This also has the advantage that one does not need to prove the compatibility.
Compatibility with adjointness of $\left(f^{p},{ }_{p} f\right),\left(g^{p},{ }_{p} g\right)$, and $\left((g \circ f)^{p},{ }_{p}(g \circ f)\right)$ means that given presheaves $\mathcal{H}$ and $\mathcal{F}$ as above we have a commutative diagram

Proof omitted.
06 TM Lemma 78.3.3. Let $f, g: \mathcal{X} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $t: f \rightarrow g$ be a 2-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. Assigned to $t$ there are canonical isomorphisms of functors

$$
t^{p}: g^{p} \longrightarrow f^{p} \quad \text { and } \quad{ }_{p} t:{ }_{p} f \longrightarrow{ }_{p} g
$$

which compatible with adjointness of $\left(f^{p},{ }_{p} f\right)$ and $\left(g^{p},{ }_{p} g\right)$ and with vertical and horizontal composition of 2 -morphisms.
Proof. Let $\mathcal{G}$ be a presheaf on $\mathcal{Y}$. Then $t^{p}: g^{p} \mathcal{G} \rightarrow f^{p} \mathcal{G}$ is given by the family of maps

$$
g^{p} \mathcal{G}(x)=\mathcal{G}(g(x)) \xrightarrow{\mathcal{G}\left(t_{x}\right)} \mathcal{G}(f(x))=f^{p} \mathcal{G}(x)
$$

parametrized by $x \in \operatorname{Ob}(\mathcal{X})$. This makes sense as $t_{x}: f(x) \rightarrow g(x)$ and $\mathcal{G}$ is a contravariant functor. We omit the verification that this is compatible with restriction mappings.
To define the transformation ${ }_{p} t$ for $y \in \operatorname{Ob}(\mathcal{Y})$ define ${ }_{y}^{f} \mathcal{I}$, resp. ${ }_{y}^{g} \mathcal{I}$ to be the category of pairs $(x, \psi: f(x) \rightarrow y)$, resp. $(x, \psi: g(x) \rightarrow y)$, see Sites, Section 7.18. Note that $t$ defines a functor ${ }_{y} t:{ }_{y}^{g} \mathcal{I} \rightarrow{ }_{y}^{f} \mathcal{I}$ given by the rule

$$
(x, g(x) \rightarrow y) \longmapsto\left(x, f(x) \xrightarrow{t_{x}} g(x) \rightarrow y\right) .
$$

Note that for $\mathcal{F}$ a presheaf on $\mathcal{X}$ the composition of ${ }_{y} t$ with $\mathcal{F}:{ }_{y}^{f} \mathcal{I}{ }^{\text {opp }} \rightarrow$ Sets, $(x, f(x) \rightarrow y) \mapsto \mathcal{F}(x)$ is equal to $\mathcal{F}:{ }_{y}^{g} \mathcal{I}^{o p p} \rightarrow$ Sets. Hence by Categories, Lemma 4.14.8 we get for every $y \in \operatorname{Ob}(\mathcal{Y})$ a canonical map

$$
\left({ }_{p} f \mathcal{F}\right)(y)=\lim _{y}^{f} \mathcal{I} \mathcal{F} \longrightarrow \lim _{\mathcal{Y} \mathcal{I}} \mathcal{F}=\left({ }_{p} g \mathcal{F}\right)(y)
$$

We omit the verification that this is compatible with restriction mappings. An alternative to this direct construction is to define ${ }_{p} t$ as the unique map compatible
with the adjointness properties of the pairs $\left(f^{p},{ }_{p} f\right)$ and $\left(g^{p},{ }_{p} g\right)$ (see below). This also has the advantage that one does not need to prove the compatibility.
Compatibility with adjointness of $\left(f^{p},{ }_{p} f\right)$ and $\left(g^{p},{ }_{p} g\right)$ means that given presheaves $\mathcal{G}$ and $\mathcal{F}$ as above we have a commutative diagram

Proof omitted. Hint: Work through the proof of Sites, Lemma 7.18.2 and observe the compatibility from the explicit description of the horizontal and vertical maps in the diagram.

We omit the verification that this is compatible with vertical and horizontal compositions. Hint: The proof of this for $t^{p}$ is straightforward and one can conclude that this holds for the ${ }_{p} t$ maps using compatibility with adjointness.

### 78.4. Sheaves

06 TN We first make an observation that is important and trivial (especially for those readers who do not worry about set theoretical issues).

Consider a big fppf site $S c h_{f p p f}$ as in Topologies, Definition 33.7.6 and denote its underlying category $S c h_{\alpha}$. Besides being the underlying category of a fppf site, the category $S c h_{\alpha}$ can also can serve as the underlying category for a big Zariski site, a big étale site, a big smooth site, and a big syntomic site, see Topologies, Remark 33.9.1. We denote these sites $S c h_{Z a r}, S c h_{\text {étale }}, S c h_{\text {smooth }}$, and $S c h_{\text {syntomic }}$. In this situation, since we have defined the big Zariski site $(S c h / S)_{Z a r}$ of $S$, the big étale site $(S c h / S)_{\text {étale }}$ of $S$, the big smooth site $(S c h / S)_{\text {smooth }}$ of $S$, the big syntomic site $(S c h / S)_{\text {syntomic }}$ of $S$, and the big fppf site $(S c h / S)_{f p p f}$ of $S$ as the localizations (see Sites, Section 7.24 $S c h_{Z a r} / S, S c h_{\text {étale }} / S, S c h_{\text {smooth }} / S, S c h_{\text {syntomic }} / S$, and $S c h_{f p p f} / S$ of these (absolute) big sites we see that all of these have the same underlying category, namely $S c h_{\alpha} / S$.
It follows that if we have a category $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ fibred in groupoids, then $\mathcal{X}$ inherits a Zariski, étale, smooth, syntomic, and fppf topology, see Stacks, Definition 8.10.2.

06TP Definition 78.4.1. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$.
(1) The associated Zariski site, denoted $\mathcal{X}_{Z a r}$, is the structure of site on $\mathcal{X}$ inherited from $(S c h / S)_{Z a r}$.
(2) The associated étale site, denoted $\mathcal{X}_{\text {étale }}$, is the structure of site on $\mathcal{X}$ inherited from $(S c h / S)_{\text {étale }}$.
(3) The associated smooth site, denoted $\mathcal{X}_{\text {smooth }}$, is the structure of site on $\mathcal{X}$ inherited from $(S c h / S)_{\text {smooth }}$.
(4) The associated syntomic site, denoted $\mathcal{X}_{\text {syntomic }}$, is the structure of site on $\mathcal{X}$ inherited from $(S c h / S)_{\text {syntomic }}$.
(5) The associated fppf site, denoted $\mathcal{X}_{f p p f}$, is the structure of site on $\mathcal{X}$ inherited from $(S c h / S)_{f p p f}$.

This definition makes sense by the discussion above. If $\mathcal{X}$ is an algebraic stack, the literature calls $\mathcal{X}_{\text {fppf }}$ (or a site equivalent to it) the big fppf site of $\mathcal{X}$ and similarly for the other ones. We may occasionally use this terminology to distinguish this construction from others.

06 TQ Remark 78.4.2. We only use this notation when the symbol $\mathcal{X}$ refers to a category fibred in groupoids, and not a scheme, an algebraic space, etc. In this way we will avoid confusion with the small étale site of a scheme, or algebraic space which is denoted $X_{\text {étale }}$ (in which case we use a roman capital instead of a calligraphic one).

Now that we have these topologies defined we can say what it means to have a sheaf on $\mathcal{X}$, i.e., define the corresponding topoi.

06TR Definition 78.4.3. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$.
(1) We say $\mathcal{F}$ is a Zariski sheaf, or a sheaf for the Zariski topology if $\mathcal{F}$ is a sheaf on the associated Zariski site $\mathcal{X}_{Z a r}$.
(2) We say $\mathcal{F}$ is an étale sheaf, or a sheaf for the étale topology if $\mathcal{F}$ is a sheaf on the associated étale site $\mathcal{X}_{\text {étale }}$.
(3) We say $\mathcal{F}$ is a smooth sheaf, or a sheaf for the smooth topology if $\mathcal{F}$ is a sheaf on the associated smooth site $\mathcal{X}_{\text {smooth }}$.
(4) We say $\mathcal{F}$ is a syntomic sheaf, or a sheaf for the syntomic topology if $\mathcal{F}$ is a sheaf on the associated syntomic site $\mathcal{X}_{\text {syntomic }}$.
(5) We say $\mathcal{F}$ is an fppf sheaf, or a sheaf, or a sheaf for the fppf topology if $\mathcal{F}$ is a sheaf on the associated fppf site $\mathcal{X}_{\text {fppf }}$.
A morphism of sheaves is just a morphism of presheaves. We denote these categories of sheaves $\operatorname{Sh}\left(\mathcal{X}_{\text {Zar }}\right)$, $\operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right), \operatorname{Sh}\left(\mathcal{X}_{\text {smooth }}\right), \operatorname{Sh}\left(\mathcal{X}_{\text {syntomic }}\right)$, and $\operatorname{Sh}\left(\mathcal{X}_{\text {fppf }}\right)$.
Of course we can also talk about sheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of abelian sheaves, i.e., sheaves of abelian groups, is denoted $A b\left(\mathcal{X}_{f p p f}\right)$ and similarly for the other topologies. If $\mathcal{X}$ is an algebraic stack, then $\operatorname{Sh}\left(\mathcal{X}_{f p p f}\right)$ is equivalent (modulo set theoretical problems) to what in the literature would be termed the category of sheaves on the big fppf site of $\mathcal{X}$. Similar for other topologies. We may occasionally use this terminology to distinguish this construction from others.

Since the topologies are listed in increasing order of strength we have the following strictly full inclusions

$$
\operatorname{Sh}\left(\mathcal{X}_{\text {fppf }}\right) \subset \operatorname{Sh}\left(\mathcal{X}_{\text {syntomic }}\right) \subset \operatorname{Sh}\left(\mathcal{X}_{\text {smooth }}\right) \subset \operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right) \subset \operatorname{Sh}\left(\mathcal{X}_{\text {Zar }}\right) \subset \operatorname{PSh}(\mathcal{X})
$$

We sometimes write $\operatorname{Sh}\left(\mathcal{X}_{f p p f}\right)=\operatorname{Sh}(\mathcal{X})$ and $\operatorname{Ab}\left(\mathcal{X}_{f p p f}\right)=A b(\mathcal{X})$ in accordance with our terminology that a sheaf on $\mathcal{X}$ is an fppf sheaf on $\mathcal{X}$.

With this setup functoriality of these topoi is straightforward, and moreover, is compatible with the inclusion functors above.

06TS Lemma 78.4.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. The functors ${ }_{p} f$ and $f^{p}$ of 78.3.1.1 transform $\tau$ sheaves into $\tau$ sheaves and define a morphism of topoi $f: \operatorname{Sh}\left(\mathcal{X}_{\tau}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\tau}\right)$.
Proof. This follows immediately from Stacks, Lemma 8.10.3.

In other words, pushforward and pullback of presheaves as defined in Section 78.3 also produces pushforward and pullback of $\tau$-sheaves. Having said all of the above we see that we can write $f^{p}=f^{-1}$ and ${ }_{p} f=f_{*}$ without any possibility of confusion.
06TT Definition 78.4.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. We denote

$$
f=\left(f^{-1}, f_{*}\right): \operatorname{Sh}\left(\mathcal{X}_{f p p f}\right) \longrightarrow \operatorname{Sh}\left(\mathcal{Y}_{f p p f}\right)
$$

the associated morphism of fppf topoi constructed above. Similarly for the associated Zariski, étale, smooth, and syntomic topoi.

As discussed in Sites, Section 7.43 the same formula (on the underlying sheaf of sets) defines pushforward and pullback for sheaves (for one of our topologies) of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc.

### 78.5. Computing pushforward

06W5 Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. Let $y \in \operatorname{Ob}(\mathcal{Y})$. We can compute $f_{*} \mathcal{F}(y)$ in the following way. Suppose that $y$ lies over the scheme $V$ and using the 2 -Yoneda lemma think of $y$ as a 1-morphism. Consider the projection

$$
\operatorname{pr}:(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X}
$$

Then we have a canonical identification
06W6 (78.5.0.1)

$$
f_{*} \mathcal{F}(y)=\Gamma\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{F}\right)
$$

Namely, objects of the 2-fibre product are triples $\left(h: U \rightarrow V, x, f(x) \rightarrow h^{*} y\right)$. Dropping the $h$ from the notation we see that this is equivalent to the data of an object $x$ of $\mathcal{X}$ and a morphism $\alpha: f(x) \rightarrow y$ of $\mathcal{Y}$. Since $f_{*} \mathcal{F}(y)=\lim _{f(x) \rightarrow y} \mathcal{F}(x)$ by definition the equality follows.
As a consequence we have the following "base change" result for pushforwards. This result is trivial and hinges on the fact that we are using "big" sites.

075B Lemma 78.5.1. Let $S$ be a scheme. Let

be a 2-cartesian diagram of categories fibred in groupoids over $S$. Then we have a canonical isomorphism

$$
g^{-1} f_{*} \mathcal{F} \longrightarrow f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

functorial in the presheaf $\mathcal{F}$ on $\mathcal{X}$.
Proof. Given an object $y^{\prime}$ of $\mathcal{Y}^{\prime}$ over $V$ there is an equivalence

$$
(S c h / V)_{f p p f} \times_{g\left(y^{\prime}\right), \mathcal{Y}} \mathcal{X}=(S c h / V)_{f p p f} \times_{y^{\prime}, \mathcal{Y}^{\prime}}\left(\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}\right)
$$

Hence by 78.5.0.1 a bijection $g^{-1} f_{*} \mathcal{F}\left(y^{\prime}\right) \rightarrow f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}\left(y^{\prime}\right)$. We omit the verification that this is compatible with restriction mappings.

In the case of a representable morphism of categories fibred in groupoids this formula 78.5.0.1 simplifies. We suggest the reader skip the rest of this section.
06W7 Lemma 78.5.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. The following are equivalent
(1) $f$ is representable, and
(2) for every $y \in \operatorname{Ob}(\mathcal{Y})$ the functor $\mathcal{X}^{\text {opp }} \rightarrow$ Sets, $x \mapsto \operatorname{Mor}_{\mathcal{Y}}(f(x), y)$ is representable.
Proof. According to the discussion in Algebraic Stacks, Section 76.6 we see that $f$ is representable if and only if for every $y \in \operatorname{Ob}(\mathcal{Y})$ lying over $U$ the 2 -fibre product $(S c h / U)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable, i.e., of the form $\left(S c h / V_{y}\right)_{f p p f}$ for some scheme $V_{y}$ over $U$. Objects in this 2-fibre products are triples $(h: V \rightarrow U, x, \alpha: f(x) \rightarrow$ $\left.h^{*} y\right)$ where $\alpha$ lies over $\mathrm{id}_{V}$. Dropping the $h$ from the notation we see that this is equivalent to the data of an object $x$ of $\mathcal{X}$ and a morphism $f(x) \rightarrow y$. Hence the 2-fibre product is representable by $V_{y}$ and $f\left(x_{y}\right) \rightarrow y$ where $x_{y}$ is an object of $\mathcal{X}$ over $V_{y}$ if and only if the functor in (2) is representable by $x_{y}$ with universal object a map $f\left(x_{y}\right) \rightarrow y$.

Let

be a 1-morphism of categories fibred in groupoids. Assume $f$ is representable. For every $y \in \operatorname{Ob}(\mathcal{Y})$ we choose an object $u(y) \in \operatorname{Ob}(\mathcal{X})$ representing the functor $x \mapsto \operatorname{Mor}_{\mathcal{Y}}(f(x), y)$ of Lemma 78.5 .2 (this is possible by the axiom of choice). The objects come with canonical morphisms $f(u(y)) \rightarrow y$ by construction. For every morphism $\beta: y^{\prime} \rightarrow y$ in $\mathcal{Y}$ we obtain a unique morphism $u(\beta): u\left(y^{\prime}\right) \rightarrow u(y)$ in $\mathcal{X}$ such that the diagram

commutes. In other words, $u: \mathcal{Y} \rightarrow \mathcal{X}$ is a functor. In fact, we can say a little bit more. Namely, suppose that $V^{\prime}=q\left(y^{\prime}\right), V=q(y), U^{\prime}=p\left(u\left(y^{\prime}\right)\right)$ and $U=p(u(y))$. Then

is a fibre product square. This is true because $U^{\prime} \rightarrow U$ represents the base change $\left(S c h / V^{\prime}\right)_{f p p f} \times_{y^{\prime}, \mathcal{Y}} \mathcal{X} \rightarrow(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ of $V^{\prime} \rightarrow V$.

06W8 Lemma 78.5.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a representable 1-morphism of categories $f$ ibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Then the functor $u: \mathcal{Y}_{\tau} \rightarrow \mathcal{X}_{\tau}$ is continuous and defines a morphism of sites $\mathcal{X}_{\tau} \rightarrow \mathcal{Y}_{\tau}$ which induces the same morphism of topoi $\operatorname{Sh}\left(\mathcal{X}_{\tau}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\tau}\right)$ as the
morphism $f$ constructed in Lemma 78.4.4. Moreover, $f_{*} \mathcal{F}(y)=\mathcal{F}(u(y))$ for any presheaf $\mathcal{F}$ on $\mathcal{X}$.

Proof. Let $\left\{y_{i} \rightarrow y\right\}$ be a $\tau$-covering in $\mathcal{Y}$. By definition this simply means that $\left\{q\left(y_{i}\right) \rightarrow q(y)\right\}$ is a $\tau$-covering of schemes. By the final remark above the lemma we see that $\left\{p\left(u\left(y_{i}\right)\right) \rightarrow p(u(y))\right\}$ is the base change of the $\tau$-covering $\left\{q\left(y_{i}\right) \rightarrow q(y)\right\}$ by $p(u(y)) \rightarrow q(y)$, hence is itself a $\tau$-covering by the axioms of a site. Hence $\left\{u\left(y_{i}\right) \rightarrow u(y)\right\}$ is a $\tau$-covering of $\mathcal{X}$. This proves that $u$ is continuous.

Let's use the notation $u_{p}, u_{s}, u^{p}, u^{s}$ of Sites, Sections 7.5 and 7.14. If we can show the final assertion of the lemma, then we see that $f_{*}=u^{p}=u^{s}$ (by continuity of $u$ seen above) and hence by adjointness $f^{-1}=u_{s}$ which will prove $u_{s}$ is exact, hence that $u$ determines a morphism of sites, and the equality will be clear as well. To see that $f_{*} \mathcal{F}(y)=\mathcal{F}(u(y))$ note that by definition

$$
f_{*} \mathcal{F}(y)=\left({ }_{p} f \mathcal{F}\right)(y)=\lim _{f(x) \rightarrow y} \mathcal{F}(x)
$$

Since $u(y)$ is a final object in the category the limit is taken over we conclude.

### 78.6. The structure sheaf

06 TU Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. The 2-category of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ has a final object, namely, id : $(S c h / S)_{f p p f} \rightarrow(S c h / S)_{f p p f}$ and $p$ is a 1-morphism from $\mathcal{X}$ to this final object. Hence any presheaf $\mathcal{G}$ on $(S c h / S)_{\text {fppf }}$ gives a presheaf $p^{-1} \mathcal{G}$ on $\mathcal{X}$ defined by the rule $p^{-1} \mathcal{G}(x)=\mathcal{G}(p(x))$. Moreover, the discussion in Section 78.4 shows that $p^{-1} \mathcal{G}$ is a $\tau$ sheaf whenever $\mathcal{G}$ is a $\tau$-sheaf.

Recall that the site $(S c h / S)_{f p p f}$ is a ringed site with structure sheaf $\mathcal{O}$ defined by the rule

$$
(S c h / S)^{o p p} \longrightarrow \text { Rings, } \quad U / S \longmapsto \Gamma\left(U, \mathcal{O}_{U}\right)
$$

see Descent, Definition 34.7.2,
06TV Definition 78.6.1. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. The structure sheaf of $\mathcal{X}$ is the sheaf of rings $\mathcal{O}_{\mathcal{X}}=p^{-1} \mathcal{O}$.

For an object $x$ of $\mathcal{X}$ lying over $U$ we have $\mathcal{O}_{\mathcal{X}}(x)=\mathcal{O}(U)=\Gamma\left(U, \mathcal{O}_{U}\right)$. Needless to say $\mathcal{O}_{\mathcal{X}}$ is also a Zariski, étale, smooth, and syntomic sheaf, and hence each of the sites $\mathcal{X}_{\text {Zar }}, \mathcal{X}_{\text {étale }}, \mathcal{X}_{\text {smooth }}, \mathcal{X}_{\text {syntomic }}$, and $\mathcal{X}_{\text {fppf }}$ is a ringed site. This construction is functorial as well.

06TW Lemma 78.6.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. There is a canonical identification $f^{-1} \mathcal{O}_{\mathcal{X}}=\mathcal{O}_{\mathcal{Y}}$ which turns $f: \operatorname{Sh}\left(\mathcal{X}_{\tau}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\tau}\right)$ into a morphism of ringed topoi.
Proof. Denote $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ and $q: \mathcal{Y} \rightarrow(S c h / S)_{f p p f}$ the structural functors. Then $q=p \circ f$, hence $q^{-1}=f^{-1} \circ p^{-1}$ by Lemma 78.3.2 The result follows.

06TX Remark 78.6.3. In the situation of Lemma 78.6 .2 the morphism of ringed topoi $f: \operatorname{Sh}\left(\mathcal{X}_{\tau}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\tau}\right)$ is flat as is clear from the equality $f^{-1} \mathcal{O}_{\mathcal{X}}=\mathcal{O}_{\mathcal{Y}}$. This is a bit counter intuitive, for example because a closed immersion of algebraic stacks is typically not flat (as a morphism of algebraic stacks). However, exactly the same
thing happens when taking a closed immersion $i: X \rightarrow Y$ of schemes: in this case the associated morphism of big $\tau$-sites $i:(S c h / X)_{\tau} \rightarrow(S c h / Y)_{\tau}$ also is flat.

### 78.7. Sheaves of modules

06WA Since we have a structure sheaf we have modules.
06WB Definition 78.7.1. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$.
(1) A presheaf of modules on $\mathcal{X}$ is a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. The category of presheaves of modules is denoted $\operatorname{PMod}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(2) We say a presheaf of modules $\mathcal{F}$ is an $\mathcal{O}_{\mathcal{X}}$-module, or more precisely a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules if $\mathcal{F}$ is an fppf sheaf. The category of $\mathcal{O}_{\mathcal{X}}$-modules is denoted $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$.

These (pre)sheaves of modules occur in the literature as (pre)sheaves of $\mathcal{O}_{\mathcal{X}}$-modules on the big fppf site of $\mathcal{X}$. We will occasionally use this terminology if we want to distinguish these categories from others. We will also encounter presheaves of modules which are sheaves in the Zariski, étale, smooth, or syntomic topologies (without necessarily being sheaves). If need be these will be denoted $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ and similarly for the other topologies.

Next, we address functoriality - first for presheaves of modules. Let

be a 1-morphism of categories fibred in groupoids. The functors $f^{-1}, f_{*}$ on abelian presheaves extend to functors
(78.7.1.1)

06WD

$$
f^{-1}: \operatorname{PMod}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{\mathcal{X}}\right) \quad \text { and } \quad f_{*}: \operatorname{PMod}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

This is immediate for $f^{-1}$ because $f^{-1} \mathcal{G}(x)=\mathcal{G}(f(x))$ which is a module over $\mathcal{O}_{\mathcal{Y}}(f(x))=\mathcal{O}(q(f(x)))=\mathcal{O}(p(x))=\mathcal{O}_{\mathcal{X}}(x)$. Alternatively it follows because $f^{-1} \mathcal{O}_{\mathcal{Y}}=\mathcal{O}_{\mathcal{X}}$ and because $f^{-1}$ commutes with limits (on presheaves). Since $f_{*}$ is a right adjoint it commutes with all limits (on presheaves) in particular products. Hence we can extend $f_{*}$ to a functor on presheaves of modules as in the proof of Modules on Sites, Lemma 18.12.1. We claim that the functors 78.7.1.1 form an adjoint pair of functors:

$$
\operatorname{Mor}_{P M o d}\left(\mathcal{O}_{\mathcal{X}}\right)\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P M o d\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

As $f^{-1} \mathcal{O}_{\mathcal{Y}}=\mathcal{O}_{\mathcal{X}}$ this follows from Modules on Sites, Lemma 18.12 .3 by endowing $\mathcal{X}$ and $\mathcal{Y}$ with the chaotic topology.

Next, we discuss functoriality for modules, i.e., for sheaves of modules in the fppf topology. Denote by $f$ also the induced morphism of ringed topoi, see Lemma 78.6 .2 (for the fppf topologies right now). Note that the functors $f^{-1}$ and $f_{*}$ of (78.7.1.1) preserve the subcategories of sheaves of modules, see Lemma 78.4.4. Hence it follows immediately that
$06 \mathrm{WE} \quad(78.7 .1 .2) \quad f^{-1}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right) \quad$ and $\quad f_{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$
form an adjoint pair of functors:

$$
\operatorname{Mor}_{M o d\left(\mathcal{O}_{\mathcal{X}}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{M o d\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

By uniqueness of adjoints we conclude that $f^{*}=f^{-1}$ where $f^{*}$ is as defined in Modules on Sites, Section 18.13 for the morphism of ringed topoi $f$ above. Of course we could have seen this directly because $f^{*}(-)=f^{-1}(-) \otimes_{f^{-1}} \mathcal{O}_{\mathcal{Y}} \mathcal{O}_{\mathcal{X}}$ and because $f^{-1} \mathcal{O}_{\mathcal{Y}}=\mathcal{O}_{\mathcal{X}}$.

Similarly for sheaves of modules in the Zariski, étale, smooth, syntomic topology.

### 78.8. Representable categories

076 N In this short section we compare our definitions with what happens in case the algebraic stacks in question are representable.

075 I Lemma 78.8.1. Let $S$ be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)$. Assume $\mathcal{X}$ is representable by a scheme $X$. For $\tau \in\{$ Zar, étale, smooth, syntomic, $f p p f\}$ there is a canonical equivalence

$$
\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)=\left((S c h / X)_{\tau}, \mathcal{O}_{X}\right)
$$

of ringed sites.
Proof. This follows by choosing an equivalence $(S c h / X)_{\tau} \rightarrow \mathcal{X}$ of categories fibred in groupoids over $(S c h / S)_{f p p f}$ and using the functoriality of the construction $\mathcal{X} \rightsquigarrow$ $\mathcal{X}_{\tau}$.

075J Lemma 78.8.2. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over $S$. Assume $\mathcal{X}, \mathcal{Y}$ are representable by schemes $X, Y$. Let $f: X \rightarrow Y$ be the morphism of schemes corresponding to $f$. For $\tau \in\{Z a r$, étale, smooth, syntomic, fpp $f\}$ the morphism of ringed topoi $f:\left(S h\left(\mathcal{X}_{\tau}\right), \mathcal{O}_{\mathcal{X}}\right) \rightarrow$ $\left(S h\left(\mathcal{X}_{\tau}\right), \mathcal{O}_{\mathcal{X}}\right)$ agrees with the morphisms of ringed topoi $f:\left(S h\left((S c h / X)_{\tau}\right), \mathcal{O}_{X}\right) \rightarrow$ $\left(\operatorname{Sh}\left((S c h / Y)_{\tau}\right), \mathcal{O}_{Y}\right)$ via the identifications of Lemma 78.8.1.

Proof. Follows by unwinding the definitions.

### 78.9. Restriction

075 C A trivial but useful observation is that the localization of a category fibred in groupoids at an object is equivalent to the big site of the scheme it lies over.

06W0 Lemma 78.9.1. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. Let $x \in \operatorname{Ob}(\mathcal{X})$ lying over $U=p(x)$. The functor $p$ induces an equivalence of sites $\mathcal{X}_{\tau} / x \rightarrow(S c h / U)_{\tau}$.

Proof. Note that $(S c h / U)_{\tau}$ is the localization of the site $(S c h / S)_{f p p f}$ at the object $U$. It follows from Categories, Definition 4.34.1 that the rule $x^{\prime} / x \mapsto p\left(x^{\prime}\right) / p(x)$ defines an equivalence of categories $\mathcal{X}_{\tau} / x \rightarrow(S c h / U)_{\tau}$. Whereupon it follows from Stacks, Definition 8.10.2 that coverings of $x^{\prime}$ in $\mathcal{X}_{\tau} / x$ are in bijective correspondence with coverings of $p\left(x^{\prime}\right)$ in $(S c h / U)_{\tau}$.

We use the lemma above to talk about the pullback and the restriction of a (pre)sheaf to a scheme.
06W1 Definition 78.9.2. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $x \in \mathrm{Ob}(\mathcal{X})$ lying over $U=p(x)$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$.
(1) The pullback $x^{-1} \mathcal{F}$ of $\mathcal{F}$ is the restriction $\left.\mathcal{F}\right|_{(\mathcal{X} / x)}$ viewed as a presheaf on $(S c h / U)_{f p p f}$ via the equivalence $\mathcal{X} / x \rightarrow(S c h / U)_{f p p f}$ of Lemma 78.9.1.
(2) The restriction of $\mathcal{F}$ to $U_{\text {étale }}$ is $\left.x^{-1} \mathcal{F}\right|_{U_{\text {etale }}}$, abusively written $\left.\mathcal{F}\right|_{U_{\text {étale }}}$.

This notation makes sense because to the object $x$ the 2-Yoneda lemma, see Algebraic Stacks, Section 76.5 associates a 1-morphism $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X} / x$ which is quasi-inverse to $p: \mathcal{X} / x \rightarrow(S c h / U)_{f p p f}$. Hence $x^{-1} \mathcal{F}$ truly is the pullback of $\mathcal{F}$ via this 1-morphism. In particular, by the material above, if $\mathcal{F}$ is a sheaf (or a Zariski, étale, smooth, syntomic sheaf), then $x^{-1} \mathcal{F}$ is a sheaf on $(S c h / U)_{f p p f}$ (or on $\left.(S c h / U)_{Z a r},(S c h / U)_{\text {étale }},(S c h / U)_{\text {smooth }},(S c h / U)_{\text {syntomic }}\right)$.
Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $\varphi: x \rightarrow y$ be a morphism of $\mathcal{X}$ lying over the morphism of schemes $a: U \rightarrow V$. Recall that $a$ induces a morphism of small étale sites $a_{\text {small }}: U_{\text {étale }} \rightarrow V_{\text {étale }}$, see Étale Cohomology, Section 49.34. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. Let $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ and $\left.\mathcal{F}\right|_{V_{\text {étale }}}$ be the restrictions of $\mathcal{F}$ via $x$ and $y$. There is a natural comparison map

06W2

$$
c_{\varphi}:\left.\mathcal{F}\right|_{V_{\text {étale }}} \longrightarrow a_{\text {small }, *}\left(\left.\mathcal{F}\right|_{U_{\text {étale }}}\right)
$$

of presheaves on $U_{\text {étale }}$. Namely, if $V^{\prime} \rightarrow V$ is étale, set $U^{\prime}=V^{\prime} \times_{V} U$ and define $c_{\varphi}$ on sections over $V^{\prime}$ via

Here $\varphi^{\prime}: x^{\prime} \rightarrow y^{\prime}$ is a morphism of $\mathcal{X}$ fitting into a commutative diagram

The existence and uniqueness of $\varphi^{\prime}$ follow from the axioms of a category fibred in groupoids. We omit the verification that $c_{\varphi}$ so defined is indeed a map of presheaves (i.e., compatible with restriction mappings) and that it is functorial in $\mathcal{F}$. In case $\mathcal{F}$ is a sheaf for the étale topology we obtain a comparison map
06W3 (78.9.2.2)

$$
c_{\varphi}:\left.a_{\text {small }}^{-1}\left(\left.\mathcal{F}\right|_{V_{\text {étale }}}\right) \longrightarrow \mathcal{F}\right|_{U_{\text {étale }}}
$$

which is also denoted $c_{\varphi}$ as indicated (this is the customary abuse of notation in not distinguishing between adjoint maps).

075D Lemma 78.9.3. Let $\mathcal{F}$ be an étale sheaf on $\mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$.
(1) If $\varphi: x \rightarrow y$ and $\psi: y \rightarrow z$ are morphisms of $\mathcal{X}$ lying over $a: U \rightarrow V$ and $b: V \rightarrow W$, then the composition

$$
\left.a_{\text {small }}^{-1}\left(b_{\text {small }}^{-1}\left(\left.\mathcal{F}\right|_{W_{\text {étale }}}\right)\right) \xrightarrow{a_{\text {small }}^{-1} c_{\psi}} a_{\text {small }}^{-1}\left(\left.\mathcal{F}\right|_{V_{\text {etale }}}\right) \xrightarrow{c_{\varphi}} \mathcal{F}\right|_{U_{\text {étale }}}
$$

is equal to $c_{\psi \circ \varphi}$ via the identification

$$
(b \circ a)_{\text {small }}^{-1}\left(\left.\mathcal{F}\right|_{W_{\text {étale }}}\right)=a_{\text {small }}^{-1}\left(b_{\text {small }}^{-1}\left(\left.\mathcal{F}\right|_{W_{\text {etale }}}\right)\right) .
$$

(2) If $\varphi: x \rightarrow y$ lies over an étale morphism of schemes $a: U \rightarrow V$, then 78.9.2.2) is an isomorphism.
(3) Suppose $f: \mathcal{Y} \rightarrow \mathcal{X}$ is a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ and $y$ is an object of $\mathcal{Y}$ lying over the scheme $U$ with image $x=f(y)$. Then there is a canonical identification $\left.f^{-1} \mathcal{F}\right|_{U_{\text {étale }}}=\left.\mathcal{F}\right|_{U_{\text {étale }}}$.
(4) Moreover, given $\psi: y^{\prime} \rightarrow y$ in $\mathcal{Y}$ lying over $a: U^{\prime} \rightarrow U$ the comparison map $c_{\psi}:\left.a_{\text {small }}^{-1}\left(\left.F^{-1} \mathcal{F}\right|_{U_{\text {étale }}}\right) \rightarrow F^{-1} \mathcal{F}\right|_{U_{\text {étale }}^{\prime}}$ is equal to the comparison map $c_{f(\psi)}:\left.\left.a_{\text {small }}^{-1} \mathcal{F}\right|_{U_{\text {étale }}} \rightarrow \mathcal{F}\right|_{U_{\text {étale }}^{\prime}}$ via the identifications in (3).
Proof. The verification of these properties is omitted.
Next, we turn to the restriction of (pre)sheaves of modules.
06W9 Lemma 78.9.4. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Let $x \in \operatorname{Ob}(\mathcal{X})$ lying over $U=$ $p(x)$. The equivalence of Lemma 78.9.1 extends to an equivalence of ringed sites $\left(\mathcal{X}_{\tau} / x,\left.\mathcal{O}_{\mathcal{X}}\right|_{x}\right) \rightarrow\left((S c h / U)_{\tau}, \mathcal{O}\right)$.
Proof. This is immediate from the construction of the structure sheaves.
Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\mathcal{F}$ be a (pre)sheaf of modules on $\mathcal{X}$ as in Definition 78.7.1. Let $x$ be an object of $\mathcal{X}$ lying over $U$. Then Lemma 78.9 .4 guarantees that the restriction $x^{-1} \mathcal{F}$ is a (pre)sheaf of modules on $(S c h / U)_{f p p f}$. We will sometimes write $x^{*} \mathcal{F}=x^{-1} \mathcal{F}$ in this case. Similarly, if $\mathcal{F}$ is a sheaf for the Zariski, étale, smooth, or syntomic topology, then $x^{-1} \mathcal{F}$ is as well. Moreover, the restriction $\left.\mathcal{F}\right|_{U_{\text {étale }}}=\left.x^{-1} \mathcal{F}\right|_{U_{\text {étale }}}$ to $U$ is a presheaf of $\mathcal{O}_{U_{\text {étale }}}$-modules. If $\mathcal{F}$ is a sheaf for the étale topology, then $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is a sheaf of modules. Moreover, if $\varphi: x \rightarrow y$ is a morphism of $\mathcal{X}$ lying over $a: U \rightarrow V$ then the comparison map 78.9.2.2 is compatible with $a_{\text {small }}^{\sharp}$ (see Descent, Remark 34.7.4 and induces a comparison map
06WC (78.9.4.1)

$$
c_{\varphi}:\left.a_{\text {small }}^{*}\left(\left.\mathcal{F}\right|_{V_{\text {étale }}}\right) \longrightarrow \mathcal{F}\right|_{U_{\text {étale }}}
$$

of $\mathcal{O}_{U_{\text {étale }}}$-modules. Note that the properties (1), (2), (3), and (4) of Lemma 78.9.3 hold in the setting of étale sheaves of modules as well. We will use this in the following without further mention.
06W4 Lemma 78.9.5. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. The site $\mathcal{X}_{\tau}$ has enough points.
Proof. By Sites, Lemma 7.37.5 we have to show that there exists a family of objects $x$ of $\mathcal{X}$ such that $\mathcal{X}_{\tau} / x$ has enough points and such that the sheaves $h_{x}^{\#}$ cover the final object of the category of sheaves. By Lemma 78.9.1 and Étale Cohomology, Lemma 49.30.1 we see that $\mathcal{X}_{\tau} / x$ has enough points for every object $x$ and we win.

### 78.10. Restriction to algebraic spaces

076 P In this section we consider sheaves on categories representable by algebraic spaces. The following lemma is the analogue of Topologies, Lemma 33.4.13 for algebraic spaces.

073M Lemma 78.10.1. Let $S$ be a scheme. Let $\mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Assume $\mathcal{X}$ is representable by an algebraic space $F$. Then there exists a continuous and cocontinuous functor $F_{\text {étale }} \rightarrow \mathcal{X}$ étale which induces a morphism of ringed sites

$$
\pi_{F}:\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right) \longrightarrow\left(F_{\text {étale }}, \mathcal{O}_{F}\right)
$$

and a morphism of ringed topoi

$$
i_{F}:\left(\operatorname{Sh}\left(F_{\text {étale }}\right), \mathcal{O}_{F}\right) \longrightarrow\left(\operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right), \mathcal{O}_{\mathcal{X}}\right)
$$

such that $\pi_{F} \circ i_{F}=i d$. Moreover $\pi_{F, *}=i_{F}^{-1}$.
Proof. Choose an equivalence $j: \mathcal{S}_{F} \rightarrow \mathcal{X}$, see Algebraic Stacks, Sections 76.7 and 76.8. An object of $F_{\text {étale }}$ is a scheme $U$ together with an étale morphism $\varphi: U \rightarrow F$. Then $\varphi$ is an object of $\mathcal{S}_{F}$ over $U$. Hence $j(\varphi)$ is an object of $\mathcal{X}$ over $U$. In this way $j$ induces a functor $u: F_{\text {étale }} \rightarrow \mathcal{X}$. It is clear that $u$ is continuous and cocontinuous for the étale topology on $\mathcal{X}$. Since $j$ is an equivalence, the functor $u$ is fully faithful. Also, fibre products and equalizers exist in $F_{\text {étale }}$ and $u$ commutes with them because these are computed on the level of underlying schemes in $F_{\text {étale }}$. Thus Sites, Lemmas 7.20.5, 7.20.6 and 7.20.7 apply. In particular $u$ defines a morphism of topoi $i_{F}: S h\left(F_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right)$ and there exists a left adjoint $i_{F, \text { ! }}$ of $i_{F}^{-1}$ which commutes with fibre products and equalizers.

We claim that $i_{F,!}$ is exact. If this is true, then we can define $\pi_{F}$ by the rules $\pi_{F}^{-1}=i_{F,!}$ and $\pi_{F, *}=i_{F}^{-1}$ and everything is clear. To prove the claim, note that we already know that $i_{F,!}$ is right exact and preserves fibre products. Hence it suffices to show that $i_{F,!}=*$ where $*$ indicates the final object in the category of sheaves of sets. Let $U$ be a scheme and let $\varphi: U \rightarrow F$ be surjective and étale. Set $R=U \times{ }_{F} U$. Then

$$
h_{R} \longrightarrow h_{U} \longrightarrow *
$$

is a coequalizer diagram in $\operatorname{Sh}\left(F_{\text {étale }}\right)$. Using the right exactness of $i_{F,!}$, using $i_{F,!}=\left(u_{p}\right)^{\#}$, and using Sites, Lemma 7.5.6 we see that

$$
h_{u(R)} \longrightarrow h_{u(U)} \longrightarrow i_{F,!}
$$

is a coequalizer diagram in $\operatorname{Sh}\left(F_{\text {étale }}\right)$. Using that $j$ is an equivalence and that $F=U / R$ it follows that the coequalizer in $\operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right)$ of the two maps $h_{u(R)} \rightarrow$ $h_{u(U)}$ is $*$. We omit the proof that these morphisms are compatible with structure sheaves.

Assume $\mathcal{X}$ is an algebraic stack represented by the algebraic space $F$. Let $j: \mathcal{S}_{F} \rightarrow$ $\mathcal{X}$ be an equivalence and denote $u: F_{\text {étale }} \rightarrow \mathcal{X}_{\text {étale }}$ the functor of the proof of Lemma 78.10.1 above. Given a sheaf $\mathcal{F}$ on $\mathcal{X}_{\text {étale }}$ we have

$$
\pi_{F, *} \mathcal{F}(U)=i_{F}^{-1} \mathcal{F}(U)=\mathcal{F}(u(U))
$$

This is why we often think of $i_{F}^{-1}$ as a restriction functor similarly to Definition 78.9 .2 and to the restriction of a sheaf on the big étale site of a scheme to the small étale site of a scheme. We often use the notation

$$
\begin{equation*}
\left.\mathcal{F}\right|_{\text {Fétale }}=i_{F}^{-1} \mathcal{F}=\pi_{F, *} \mathcal{F} \tag{78.10.1.1}
\end{equation*}
$$

in this situation.
073N Lemma 78.10.2. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $\mathcal{X}, \mathcal{Y}$ are representable by algebraic spaces $F, G$. Denote $f: F \rightarrow G$ the induced morphism of algebraic spaces, and
$f_{\text {small }}: F_{\text {etale }} \rightarrow G_{\text {etale }}$ the corresponding morphism of ringed topoi. Then

is a commutative diagram of ringed topoi.
Proof. This is similar to Topologies, Lemma 33.4 .16 (3) but there is a small snag due to the fact that $F \rightarrow G$ may not be representable by schemes. In particular we don't get a commutative diagram of ringed sites, but only a commutative diagram of ringed topoi.

Before we start the proof proper, we choose equivalences $j: \mathcal{S}_{F} \rightarrow \mathcal{X}$ and $j^{\prime}$ : $\mathcal{S}_{G} \rightarrow \mathcal{Y}$ which induce functors $u: F_{\text {étale }} \rightarrow \mathcal{X}$ and $u^{\prime}: G_{\text {étale }} \rightarrow \mathcal{Y}$ as in the proof of Lemma 78.10.1 Because of the 2 -functoriality of sheaves on categories fibred in groupoids over $S c h_{f p p f}$ (see discussion in Section 78.3) we may assume that $\mathcal{X}=\mathcal{S}_{F}$ and $\mathcal{Y}=\mathcal{S}_{G}$ and that $f: \mathcal{S}_{F} \rightarrow \mathcal{S}_{G}$ is the functor associated to the morphism $f: F \rightarrow G$. Correspondingly we will omit $u$ and $u^{\prime}$ from the notation, i.e., given an object $U \rightarrow F$ of $F_{\text {etale }}$ we denote $U / F$ the corresponding object of $\mathcal{X}$. Similarly for $G$.
Let $\mathcal{G}$ be a sheaf on $\mathcal{X}_{\text {étale }}$. To prove (2) we compute $\pi_{G, *} f_{*} \mathcal{G}$ and $f_{\text {small,* }} \pi_{F, *} \mathcal{G}$. To do this let $V \rightarrow G$ be an object of $G_{\text {étale }}$. Then

$$
\pi_{G, *} f_{*} \mathcal{G}(V)=f_{*} \mathcal{G}(V / G)=\Gamma\left((S c h / V)_{f p p f} \times \mathcal{Y} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{G}\right)
$$

see 78.5.0.1. The fibre product in the formula is

$$
(S c h / V)_{f p p f} \times \mathcal{Y} \mathcal{X}=(S c h / V)_{f p p f} \times_{\mathcal{S}_{G}} \mathcal{S}_{F}=\mathcal{S}_{V \times_{G} F}
$$

i.e., it is the split category fibred in groupoids associated to the algebraic space $V \times_{G} F$. And pr ${ }^{-1} \mathcal{G}$ is a sheaf on $\mathcal{S}_{V \times_{G} F}$ for the étale topology.

In particular, if $V \times_{G} F$ is representable, i.e., if it is a scheme, then $\pi_{G, *} f_{*} \mathcal{G}(V)=$ $\mathcal{G}\left(V \times_{G} F / F\right)$ and also

$$
f_{\text {small }, *} \pi_{F, *} \mathcal{G}(V)=\pi_{F, *} \mathcal{G}\left(V \times_{G} F\right)=\mathcal{G}\left(V \times_{G} F / F\right)
$$

which proves the desired equality in this special case.
In general, choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{G} F$. Set $R=U \times_{V \times{ }_{G} F} U$. Then $U / V \times_{G} F$ and $R / V \times_{G} F$ are objects of the fibre product category above. Since $\mathrm{pr}^{-1} \mathcal{G}$ is a sheaf for the étale topology on $\mathcal{S}_{V \times_{G} F}$ the diagram

$$
\Gamma\left((S c h / V)_{\text {fppf }} \times_{\mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{G}\right) \longrightarrow \operatorname{pr}^{-1} \mathcal{G}\left(U / V \times_{G} F\right) \longrightarrow \operatorname{pr}^{-1} \mathcal{G}\left(R / V \times_{G} F\right)
$$

is an equalizer diagram. Note that $\mathrm{pr}^{-1} \mathcal{G}\left(U / V \times{ }_{G} F\right)=\mathcal{G}(U / F)$ and $\mathrm{pr}^{-1} \mathcal{G}\left(R / V \times{ }_{G}\right.$ $F)=\mathcal{G}(R / F)$ by the definition of pullbacks. Moreover, by the material in Properties of Spaces, Section 53.17 (especially, Properties of Spaces, Remark 53.17.4 and Lemma 53.17.7) we see that there is an equalizer diagram

$$
f_{\text {small }, *} \pi_{F, *} \mathcal{G}(V) \longrightarrow \pi_{F, *} \mathcal{G}(U / F) \longrightarrow \pi_{F, *} \mathcal{G}(R / F)
$$

78.11. QUASI-COHERENT MODULES

Since we also have $\pi_{F, *} \mathcal{G}(U / F)=\mathcal{G}(U / F)$ and $\pi_{F, *} \mathcal{G}(U / F)=\mathcal{G}(U / F)$ we obtain a canonical identification $f_{s m a l l, *} \pi_{F, *} \mathcal{G}(V)=\pi_{G, *} f_{*} \mathcal{G}(V)$. We omit the proof that this is compatible with restriction mappings and that it is functorial in $\mathcal{G}$.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $f: F \rightarrow G$ be as in the second part of the lemma above. A consequence of the lemma, using 78.10.1.1, is that
075M
(78.10.2.1)

$$
\left.\left(f_{*} \mathcal{F}\right)\right|_{G_{\text {étale }}}=f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{F_{\text {étale }}}\right)
$$

for any sheaf $\mathcal{F}$ on $\mathcal{X}_{\text {étale }}$. Moreover, if $\mathcal{F}$ is a sheaf of $\mathcal{O}$-modules, then 78.10.2.1 is an isomorphism of $\mathcal{O}_{G}$-modules on $G_{\text {étale }}$.
Finally, suppose that we have a 2 -commutative diagram

of 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$, that $\mathcal{F}$ is a sheaf on $\mathcal{X}_{\text {étale }}$, and that $\mathcal{U}, \mathcal{V}$ are representable by algebraic spaces $U, V$. Then we obtain a comparison map

076Q

$$
\begin{equation*}
c_{\varphi}:\left.a_{\text {small }}^{-1}\left(\left.g^{-1} \mathcal{F}\right|_{V_{\text {étale }}}\right) \longrightarrow f^{-1} \mathcal{F}\right|_{U_{\text {étale }}} \tag{78.10.2.2}
\end{equation*}
$$

where $a: U \rightarrow V$ denotes the morphism of algebraic spaces corresponding to $a$. This is the analogue of 78.9 .2 .2 . We define $c_{\varphi}$ as the adjoint to the map

$$
\left.g^{-1} \mathcal{F}\right|_{V_{\text {étale }}} \longrightarrow a_{\text {small }, *}\left(\left.f^{-1} \mathcal{F}\right|_{U_{\text {étale }}}\right)=\left.\left(a_{*} f^{-1} \mathcal{F}\right)\right|_{V_{\text {étale }}}
$$

(equality by 78.10.2.1) which is the restriction to $V$ 78.10.1.1) of the map

$$
g^{-1} \mathcal{F} \rightarrow a_{*} a^{-1} g^{-1} \mathcal{F}=a_{*} f^{-1} \mathcal{F}
$$

where the last equality uses the 2 -commutativity of the diagram above. In case $\mathcal{F}$ is a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules $c_{\varphi}$ induces a comparison map

076R

$$
\begin{equation*}
c_{\varphi}:\left.a_{\text {small }}^{*}\left(\left.g^{*} \mathcal{F}\right|_{V_{\text {étale }}}\right) \longrightarrow f^{*} \mathcal{F}\right|_{U_{\text {étale }}} \tag{78.10.2.3}
\end{equation*}
$$

of $\mathcal{O}_{U_{\text {étale }}}$-modules. Note that the properties (1), (2), (3), and (4) of Lemma 78.9.3 hold in this setting as well.

### 78.11. Quasi-coherent modules

06 WF At this point we can apply the general definition of a quasi-coherent module to the situation discussed in this chapter.

06WG Definition 78.11.1. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. A quasi-coherent module on $\mathcal{X}$, or a quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module is a quasi-coherent module on the ringed site $\left(\mathcal{X}_{f p p f}, \mathcal{O}_{\mathcal{X}}\right)$ as in Modules on Sites, Definition 18.23.1. The category of quasi-coherent sheaves on $\mathcal{X}$ is denoted $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.

If $\mathcal{X}$ is an algebraic stack, then this definition agrees with all definitions in the literature in the sense that $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is equivalent (modulo set theoretic issues) to any variant of this category defined in the literature. For example, we will match our definition with the definition in Ols07b Definition 6.1] in Cohomology on Stacks, Lemma 78.11.5. We will also see alternative constructions of this category later on.

In general (as is the case for morphisms of schemes) the pushforward of quasicoherent sheaf along a 1-morphism is not quasi-coherent. Pullback does preserve quasi-coherence.
06WH Lemma 78.11.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids $\operatorname{over}(S c h / S)_{f p p f}$. The pullback functor $f^{*}=f^{-1}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ preserves quasi-coherent sheaves.

Proof. This is a general fact, see Modules on Sites, Lemma 18.23.4
It turns out that quasi-coherent sheaves have a very simple characterization in terms of their pullbacks. See also Lemma 78.11 .5 for a characterization in terms of restrictions.

06WI Lemma 78.11.3. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules. Then $\mathcal{F}$ is quasi-coherent if and only if $x^{*} \mathcal{F}$ is a quasi-coherent sheaf on $(S c h / U)_{\text {fppf }}$ for every object $x$ of $\mathcal{X}$ with $U=p(x)$.
Proof. By Lemma 78.11 .2 the condition is necessary. Conversely, since $x^{*} \mathcal{F}$ is just the restriction to $\mathcal{X}_{f p p f} / x$ we see that it is sufficient directly from the definition of a quasi-coherent sheaf (and the fact that the notion of being quasi-coherent is an intrinsic property of sheaves of modules, see Modules on Sites, Section 18.18.

Although there is a variant for the Zariski topology, it seems that the étale topology is the natural topology to use in the following definition.

06WJ Definition 78.11.4. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. We say $\mathcal{F}$ is locally quasi-coheren ${ }^{2}$ if $\mathcal{F}$ is a sheaf for the étale topology and for every object $x$ of $\mathcal{X}$ the restriction $\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}}$ is a quasi-coherent sheaf. Here $U=p(x)$.

We use $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ to indicate the category of locally quasi-coherent modules. We now have the following diagram of categories of modules

where the arrows are strictly full embeddings. It turns out that many results for quasi-coherent sheaves have a counter part for locally quasi-coherent modules. Moreover, from many points of view (as we shall see later) this is a natural category to consider. For example the quasi-coherent sheaves are exactly those locally quasicoherent modules that are "cartesian", i.e., satisfy the second condition of the lemma below.

06WK Lemma 78.11.5. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. Then $\mathcal{F}$ is quasi-coherent if and only if the following two conditions hold
(1) $\mathcal{F}$ is locally quasi-coherent, and
(2) for any morphism $\varphi: x \rightarrow y$ of $\mathcal{X}$ lying over $f: U \rightarrow V$ the comparison map $c_{\varphi}:\left.\left.f_{\text {small }}^{*} \mathcal{F}\right|_{V_{\text {etale }}} \rightarrow \mathcal{F}\right|_{U_{\text {etale }}}$ of (78.9.4.1) is an isomorphism.

[^200]Proof. Assume $\mathcal{F}$ is quasi-coherent. Then $\mathcal{F}$ is a sheaf for the fppf topology, hence a sheaf for the étale topology. Moreover, any pullback of $\mathcal{F}$ to a ringed topos is quasi-coherent, hence the restrictions $\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}}$ are quasi-coherent. This proves $\mathcal{F}$ is locally quasi-coherent. Let $y$ be an object of $\mathcal{X}$ with $V=p(y)$. We have seen that $\mathcal{X} / y=(S c h / V)_{f p p f}$. By Descent, Proposition 34.7.11 it follows that $y^{*} \mathcal{F}$ is the quasi-coherent module associated to a (usual) quasi-coherent module $\mathcal{F}_{V}$ on the scheme $V$. Hence certainly the comparison maps 78.9.4.1) are isomorphisms.

Conversely, suppose that $\mathcal{F}$ satisfies (1) and (2). Let $y$ be an object of $\mathcal{X}$ with $V=p(y)$. Denote $\mathcal{F}_{V}$ the quasi-coherent module on the scheme $V$ corresponding to the restriction $\left.y^{*} \mathcal{F}\right|_{V_{\text {étale }}}$ which is quasi-coherent by assumption (1), see Descent, Proposition 34.7.11. Condition (2) now signifies that the restrictions $\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}}$ for $x$ over $y$ are each isomorphic to the (étale sheaf associated to the) pullback of $\mathcal{F}_{V}$ via the corresponding morphism of schemes $U \rightarrow V$. Hence $y^{*} \mathcal{F}$ is the sheaf on $(S c h / V)_{f p p f}$ associated to $\mathcal{F}_{V}$. Hence it is quasi-coherent (by Descent, Proposition 34.7.11 again) and we see that $\mathcal{F}$ is quasi-coherent on $\mathcal{X}$ by Lemma 78.11.3.

06WL Lemma 78.11.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of categories fibred in groupoids $\operatorname{over}(S c h / S)_{\text {fppf }}$. The pullback functor $f^{*}=f^{-1}: \operatorname{Mod}\left(\mathcal{Y}_{\text {étale }}, \mathcal{O}_{\mathcal{Y}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ preserves locally quasi-coherent sheaves.

Proof. Let $\mathcal{G}$ be locally quasi-coherent on $\mathcal{Y}$. Choose an object $x$ of $\mathcal{X}$ lying over the scheme $U$. The restriction $\left.x^{*} f^{*} \mathcal{G}\right|_{U_{\text {étale }}}$ equals $\left.(f \circ x)^{*} \mathcal{G}\right|_{U_{\text {étale }}}$ hence is a quasicoherent sheaf by assumption on $\mathcal{G}$.

06WM Lemma 78.11.7. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids.
(1) The category $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has colimits and they agree with colimits in the category $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$.
(2) The category $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is abelian with kernels and cokernels computed in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$, in other words the inclusion functor is exact.
(3) Given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ if two out of three are locally quasi-coherent so is the third.
(4) Given $\mathcal{F}, \mathcal{G}$ in $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}} \mathcal{G}}$ in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ is an object of $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(5) Given $\mathcal{F}, \mathcal{G}$ in $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ with $\mathcal{F}$ locally of finite presentation on $\mathcal{X}_{\text {étale }}$ the sheaf $\mathcal{H o m}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ is an object of $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.

Proof. Each of these statements follows from the corresponding statement of Descent, Lemma 34.7.13. For example, suppose that $\mathcal{I} \rightarrow L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right), i \mapsto \mathcal{F}_{i}$ is a diagram. Consider the object $\mathcal{F}=\operatorname{colim}_{i} \mathcal{F}_{i}$ of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. For any object $x$ of $\mathcal{X}$ with $U=p(x)$ the pullback functor $x^{*}$ commutes with all colimits as it is a left adjoint. Hence $x^{*} \mathcal{F}=\operatorname{colim}_{i} x^{*} \mathcal{F}_{i}$. Similarly we have $\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}}=\left.\operatorname{colim}_{i} x^{*} \mathcal{F}_{i}\right|_{U_{\text {étale }}}$. Now by assumption each $\left.x^{*} \mathcal{F}_{i}\right|_{U_{\text {étale }}}$ is quasi-coherent, hence the colimit is quasicoherent by the aforementioned Descent, Lemma 34.7.13. This proves (1).
It follows from (1) that cokernels exist in $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ and agree with the cokernels computed in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of $\operatorname{LQCoh}\left(\mathcal{O}_{\mathcal{X}}\right)$ and let $\mathcal{K}=\operatorname{Ker}(\varphi)$ computed in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. If we can show that $\mathcal{K}$ is a locally quasi-coherent module, then the proof of (2) is complete. To see this, note that kernels are computed in the category of presheaves (no sheafification necessary). Hence $\left.\mathcal{K}\right|_{U_{\text {étale }}}$ is the kernel of the map $\left.\left.\mathcal{F}\right|_{U_{\text {étale }}} \rightarrow \mathcal{G}\right|_{U_{\text {étale }}}$, i.e., is the kernel of a
map of quasi-coherent sheaves on $U_{\text {étale }}$ whence quasi-coherent by Descent, Lemma 34.7.13. This proves (2).

Parts (3), (4), and (5) follow in exactly the same way. Details omitted.
In the generality discussed here the category of quasi-coherent sheaves is not abelian. See Examples, Section 88.12 Here is what we can prove without any further work.

06 WN Lemma 78.11.8. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids.
(1) The category $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has colimits and they agree with colimits in the category $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ as well as with colimits in the category $L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(2) Given $\mathcal{F}, \mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}} \mathcal{G}}$ in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is an object of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(3) Given $\mathcal{F}, \mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ with $\mathcal{F}$ locally of finite presentation on $\mathcal{X}_{\text {fppf }}$ the sheaf $\mathcal{H o m}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is an object of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
Proof. Let $\mathcal{I} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right), i \mapsto \mathcal{F}_{i}$ be a diagram. Consider the object $\mathcal{F}=$ $\operatorname{colim}_{i} \mathcal{F}_{i}$ of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$. For any object $x$ of $\mathcal{X}$ with $U=p(x)$ the pullback functor $x^{*}$ commutes with all colimits as it is a left adjoint. Hence $x^{*} \mathcal{F}=\operatorname{colim}_{i} x^{*} \mathcal{F}_{i}$ in $\operatorname{Mod}\left((S c h / U)_{f p p f}, \mathcal{O}\right)$. We conclude from Descent, Lemma 34.7 .13 that $x^{*} \mathcal{F}$ is quasi-coherent, hence $\mathcal{F}$ is quasi-coherent, see Lemma 78.11.3. Thus we see that $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has colimits and they agree with colimits in the category $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$. In particular the (fppf) sheaf $\mathcal{F}$ is also the colimit of the diagram in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$, hence $\mathcal{F}$ is also the colimit in $\operatorname{LQCoh}\left(\mathcal{O}_{\mathcal{X}}\right)$. This proves (1).

Parts (2) and (3) are proved in the same way. Details omitted.

### 78.12. Stackification and sheaves

06 WP It turns out that the category of sheaves on a category fibred in groupoids only "knows about" the stackification.
06WQ Lemma 78.12.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f$ induces an equivalence of stackifications, then the morphism of topoi $f: \operatorname{Sh}\left(\mathcal{X}_{f p p f}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\text {fppf }}\right)$ is an equivalence.
Proof. We may assume $\mathcal{Y}$ is the stackification of $\mathcal{X}$. We claim that $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a special cocontinuous functor, see Sites, Definition 7.28 .2 which will prove the lemma. By Stacks, Lemma 8.10.3 the functor $f$ is continuous and cocontinuous. By Stacks, Lemma 8.8.1 we see that conditions (3), (4), and (5) of Sites, Lemma 7.28 .1 hold.

06WR Lemma 78.12.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f$ induces an equivalence of stackifications, then $f^{*}$ induces equivalences $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right)$ and $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)$.
Proof. We may assume $\mathcal{Y}$ is the stackification of $\mathcal{X}$. The first assertion is clear from Lemma 78.12 .1 and $\mathcal{O}_{\mathcal{X}}=f^{-1} \mathcal{O}_{\mathcal{Y}}$. Pullback of quasi-coherent sheaves are quasi-coherent, see Lemma 78.11.2. Hence it suffices to show that if $f^{*} \mathcal{G}$ is quasicoherent, then $\mathcal{G}$ is. To see this, let $y$ be an object of $\mathcal{Y}$. Translating the condition that $\mathcal{Y}$ is the stackification of $\mathcal{X}$ we see there exists an fppf covering $\left\{y_{i} \rightarrow y\right\}$ in $\mathcal{Y}$ such that $y_{i} \cong f\left(x_{i}\right)$ for some $x_{i}$ object of $\mathcal{X}$. Say $x_{i}$ and $y_{i}$ lie over the scheme $U_{i}$. Then $f^{*} \mathcal{G}$ being quasi-coherent, means that $x_{i}^{*} f^{*} \mathcal{G}$ is quasi-coherent. Since $x_{i}^{*} f^{*} \mathcal{G}$ is isomorphic to $y_{i}^{*} \mathcal{G}$ (as sheaves on $\left(S c h / U_{i}\right)_{f p p f}$ we see that $y_{i}^{*} \mathcal{G}$ is quasi-coherent.

It follows from Modules on Sites, Lemma 18.23 .3 that the restriction of $\mathcal{G}$ to $\mathcal{Y} / y$ is quasi-coherent. Hence $\mathcal{G}$ is quasi-coherent by Lemma 78.11.3.

### 78.13. Quasi-coherent sheaves and presentations

06 WS In Groupoids in Spaces, Definition65.12.1 we have the defined the notion of a quasicoherent module on an arbitrary groupoid. The following (formal) proposition tells us that we can study quasi-coherent sheaves on quotient stacks in terms of quasicoherent modules on presentations.

06WT Proposition 78.13.1. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. Let $\mathcal{X}=[U / R]$ be the quotient stack. The category of quasi-coherent modules on $\mathcal{X}$ is equivalent to the category of quasi-coherent modules on $(U, R, s, t, c)$.
Proof. Denote $Q \operatorname{Coh}(U, R, s, t, c)$ the category of quasi-coherent modules on the groupoid ( $U, R, s, t, c$ ). We will construct quasi-inverse functors

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \longleftrightarrow Q \operatorname{Coh}(U, R, s, t, c)
$$

According to Lemma 78.12 .2 the stackification map $[U / p R] \rightarrow[U / R]$ (see Groupoids in Spaces, Definition 65.19.1) induces an equivalence of categories of quasi-coherent sheaves. Thus it suffices to prove the lemma with $\mathcal{X}=[U / p R]$.
Recall that an object $x=(T, u)$ of $\mathcal{X}=[U / p R]$ is given by a scheme $T$ and a morphism $u: T \rightarrow U$. A morphism $(T, u) \rightarrow\left(T^{\prime}, u^{\prime}\right)$ is given by a pair $(f, r)$ where $f: T \rightarrow T^{\prime}$ and $r: T \rightarrow R$ with $s \circ r=u$ and $t \circ r=u^{\prime} \circ f$. Let us call a special morphism any morphism of the form $\left(f, e \circ u^{\prime} \circ f\right):\left(T, u^{\prime} \circ f\right) \rightarrow\left(T^{\prime}, u^{\prime}\right)$. The category of $(T, u)$ with special morphisms is just the category of schemes over $U$.

Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then we obtain for every $x=(T, u)$ a quasi-coherent sheaf $\mathcal{F}_{(T, u)}=\left.x^{*} \mathcal{F}\right|_{T_{\text {étale }}}$ on $T$. Moreover, for any morphism $(f, r): x=(T, u) \rightarrow\left(T^{\prime}, u^{\prime}\right)=x^{\prime}$ we obtain a comparison isomorphism

$$
c_{(f, r)}: f_{\text {small }}^{*} \mathcal{F}_{\left(T^{\prime}, u^{\prime}\right)} \longrightarrow \mathcal{F}_{(T, u)}
$$

see Lemma 78.11.5. Moreover, these isomorphisms are compatible with compositions, see Lemma 78.9.3. If $U, R$ are schemes, then we can construct the quasicoherent sheaf on the groupoid as follows: First the object ( $U, \mathrm{id}$ ) corresponds to a quasi-coherent sheaf $\mathcal{F}_{(U, \mathrm{id})}$ on $U$. Next, the isomorphism $\alpha: t_{\text {small }}^{*} \mathcal{F}_{(U, \mathrm{id})} \rightarrow$ $s_{\text {small }}^{*} \mathcal{F}_{(U, \mathrm{id})}$ comes from
(1) the morphism $\left(R, \operatorname{id}_{R}\right):(R, s) \rightarrow(R, t)$ in the category $[U / p R]$ which produces an isomorphism $\mathcal{F}_{(R, t)} \rightarrow \mathcal{F}_{(R, s)}$,
(2) the special morphism $(R, s) \rightarrow(U, i d)$ which produces an isomorphism $s_{\text {small }}^{*} \mathcal{F}_{(U, \mathrm{id})} \rightarrow \mathcal{F}_{(R, s)}$, and
(3) the special morphism $(R, t) \rightarrow(U, i d)$ which produces an isomorphism $t_{\text {small }}^{*} \mathcal{F}_{(U, \mathrm{id})} \rightarrow \mathcal{F}_{(R, t)}$.
The cocycle condition for $\alpha$ follows from the condition that $(U, R, s, t, c)$ is groupoid, i.e., that composition is associative (details omitted).

To do this in general, i.e., when $U$ and $R$ are algebraic spaces, it suffices to explain how to associate to an algebraic space $(W, u)$ over $U$ a quasi-coherent sheaf $\mathcal{F}_{(W, u)}$ and to construct the comparison maps for morphisms between these. We set $\mathcal{F}_{(W, u)}=\left.x^{*} \mathcal{F}\right|_{W_{\text {étale }}}$ where $x$ is the 1-morphism $\mathcal{S}_{W} \rightarrow \mathcal{S}_{U} \rightarrow[U / p R]$ and the comparison maps are explained in 78.10.2.3).

Conversely, suppose that $(\mathcal{G}, \alpha)$ is a quasi-coherent module on $(U, R, s, t, c)$. We are going to define a presheaf of modules $\mathcal{F}$ on $\mathcal{X}$ as follows. Given an object $(T, u)$ of $[U / p R]$ we set

$$
\mathcal{F}(T, u):=\Gamma\left(T, u_{\text {small }}^{*} \mathcal{G}\right) .
$$

Given a morphism $(f, r):(T, u) \rightarrow\left(T^{\prime}, u^{\prime}\right)$ we get a map

$$
\begin{aligned}
\mathcal{F}\left(T^{\prime}, u^{\prime}\right) & =\Gamma\left(T^{\prime},\left(u^{\prime}\right)_{\text {small }}^{*} \mathcal{G}\right) \\
& \rightarrow \Gamma\left(T, f_{\text {small }}^{*}\left(u^{\prime}\right)_{\text {small }}^{*} \mathcal{G}\right)=\Gamma\left(T,\left(u^{\prime} \circ f\right)_{\text {small }}^{*} \mathcal{G}\right) \\
& =\Gamma\left(T,(t \circ r)_{\text {small }}^{*} \mathcal{G}\right)=\Gamma\left(T, r_{\text {small }}^{*} t_{\text {small }}^{*} \mathcal{G}\right) \\
& \rightarrow \Gamma\left(T, r_{\text {small }}^{*} s_{\text {small }}^{*} \mathcal{G}\right)=\Gamma\left(T,(s \circ r)_{\text {small }}^{*} \mathcal{G}\right) \\
& =\Gamma\left(T, u_{\text {small }}^{*} \mathcal{G}\right) \\
& =\mathcal{F}(T, u)
\end{aligned}
$$

where the first arrow is pullback along $f$ and the second arrow is $\alpha$. Note that if $(T, r)$ is a special morphism, then this map is just pullback along $f$ as $e_{s m a l l}^{*} \alpha=\mathrm{id}$ by the axioms of a sheaf of quasi-coherent modules on a groupoid. The cocycle condition implies that $\mathcal{F}$ is a presheaf of modules (details omitted). It is immediate from the definition that $\mathcal{F}$ is quasi-coherent when pulled back to $(S c h / T)_{f p p f}$ (by the simple description of the restriction maps of $\mathcal{F}$ in case of a special morphism).

We omit the verification that the functors constructed above are quasi-inverse to each other.

We finish this section with a technical lemma on maps out of quasi-coherent sheaves. It is an analogue of Schemes, Lemma 25.7.1. We will see later (Criteria for Representability, Theorem 79.17.2 that the assumptions on the groupoid imply that $\mathcal{X}$ is an algebraic stack.

076S Lemma 78.13.2. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. Assume $s, t$ are flat and locally of finite presentation. Let $\mathcal{X}=[U / R]$ be the quotient stack. Denote $\pi: \mathcal{S}_{U} \rightarrow \mathcal{X}$ the quotient map. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module, and let $\mathcal{H}$ be any object of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$. The map

$$
\operatorname{Hom}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{H}) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}},\left.x^{*} \mathcal{H}\right|_{U_{\text {étale }}}\right),\left.\quad \phi \longmapsto x^{*} \phi\right|_{U_{\text {étale }}}
$$

is injective and its image consists of exactly those $\varphi:\left.x^{*} \mathcal{F}\right|_{U_{\text {etale }}} \rightarrow x^{*} \mathcal{H}_{U_{\text {etale }}}$ which give rise to a commutative diagram

of modules on $R_{\text {étale }}$ where the horizontal arrows are the comparison maps 78.10.2.3.
Proof. According to Lemma 78.12 .2 the stackification map $\left[U /{ }_{p} R\right] \rightarrow[U / R]$ (see Groupoids in Spaces, Definition 65.19.1) induces an equivalence of categories of quasi-coherent sheaves and of fppf $\mathcal{O}$-modules. Thus it suffices to prove the lemma with $\mathcal{X}=[U / p R]$. By Proposition 78.13.1 and its proof there exists a quasi-coherent module $(\mathcal{G}, \alpha)$ on $(U, R, s, t, c)$ such that $\mathcal{F}$ is given by the rule $\mathcal{F}(T, u)=\Gamma\left(T, u^{*} \mathcal{G}\right)$. In particular $\left.x^{*} \mathcal{F}\right|_{U_{\text {étale }}}=\mathcal{G}$ and it is clear that the map of the statement of the
lemma is injective. Moreover, given a map $\varphi:\left.\mathcal{G} \rightarrow x^{*} \mathcal{H}\right|_{U_{\text {étale }}}$ and given any object $y=(T, u)$ of $[U / p R]$ we can consider the map

$$
\mathcal{F}(y)=\Gamma\left(T, u^{*} \mathcal{G}\right) \xrightarrow{u_{\text {small }}^{*} \varphi} \Gamma\left(T,\left.u_{\text {small }}^{*} x^{*} \mathcal{H}\right|_{U_{\text {étale }}}\right) \rightarrow \Gamma\left(T,\left.y^{*} \mathcal{H}\right|_{T_{\text {étale }}}\right)=\mathcal{H}(y)
$$

where the second arrow is the comparison map 78.9.4.1 for the sheaf $\mathcal{H}$. This assignment is compatible with the restriction mappings of the sheaves $\mathcal{F}$ and $\mathcal{G}$ for morphisms of $[U / p R]$ if the cocycle condition of the lemma is satisfied. Proof omitted. Hint: the restriction maps of $\mathcal{F}$ are made explicit in terms of $(\mathcal{G}, \alpha)$ in the proof of Proposition 78.13.1.

### 78.14. Quasi-coherent sheaves on algebraic stacks

06 WU Let $\mathcal{X}$ be an algebraic stack over $S$. By Algebraic Stacks, Lemma 76.16 .2 we can find an equivalence $[U / R] \rightarrow \mathcal{X}$ where $(U, R, s, t, c)$ is a smooth groupoid in algebraic spaces. Then

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \cong Q \operatorname{Coh}\left(\mathcal{O}_{[U / R]}\right) \cong Q \operatorname{Coh}(U, R, s, t, c)
$$

where the second equivalence is Proposition 78.13.1. Hence the category of quasicoherent sheaves on an algebraic stack is equivalent to the category of quasi-coherent modules on a smooth groupoid in algebraic spaces. In particular, by Groupoids in Spaces, Lemma 65.12.5 we see that $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is abelian!

There is something slightly disconcerting about our current setup. It is that the fully faithful embedding

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

is in general not exact. However, exactly the same thing happens for schemes: for most schemes $X$ the embedding

$$
Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \cong Q \operatorname{Coh}\left((S c h / X)_{f p p f}, \mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left((S c h / X)_{f p p f}, \mathcal{O}_{X}\right)
$$

isn't exact, see Descent, Lemma 34.7.13. Parenthetically, the example in the proof of Descent, Lemma 34.7.13 shows that in general the strictly full embedding $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ isn't exact either.

We collect all the positive results obtained so far in a single statement.
06WV Lemma 78.14.1. Let $\mathcal{X}$ be an algebraic stack over $S$.
(1) If $[U / R] \rightarrow \mathcal{X}$ is a presentation of $\mathcal{X}$ then there is a canonical equivalence $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \cong Q \operatorname{Coh}(U, R, s, t, c)$.
(2) The category $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is abelian.
(3) The category $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has colimits and they agree with colimits in the category $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(4) Given $\mathcal{F}, \mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{X}}} \mathcal{G}$ in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is an object of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(5) Given $\mathcal{F}, \mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ with $\mathcal{F}$ locally of finite presentation on $\mathcal{X}_{\text {fppf }}$ the sheaf $\mathcal{H o m}_{\mathcal{O}_{\mathcal{X}}}(\mathcal{F}, \mathcal{G})$ in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is an object of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$.
Proof. Properties (3), (4), and (5) were proven in Lemma 78.11.8. Part (1) is Proposition 78.13.1. Part (2) follows from Groupoids in Spaces, Lemma 65.12.5 as discussed above.

0781
Proposition 78.14.2. Let $\mathcal{X}$ be an algebraic stack over $S$.
(1) The category $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is a Grothendieck abelian category. Consequently, $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has enough injectives and all limits.
(2) The inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ has a right adjoin $4^{3}$

$$
Q: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

such that for every quasi-coherent sheaf $\mathcal{F}$ the adjunction mapping $Q(\mathcal{F}) \rightarrow$ $\mathcal{F}$ is an isomorphism.

Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 27.23 .4 and the case of algebraic spaces, see Properties of Spaces, Proposition 53.31.2. We advise the reader to read either of those proofs first.
Part (1) means $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Lemma 78.14.1 colimits in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ exist and agree with colimits in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. By Modules on Sites, Lemma 18.14 .2 filtered colimits are exact. Hence (a) and (b) hold.

Choose a presentation $\mathcal{X}=[U / R]$ so that $(U, R, s, t, c)$ is a smooth groupoid in algebraic spaces and in particular $s$ and $t$ are flat morphisms of algebraic spaces. By Lemma 78.14.1 above we have $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)=Q \operatorname{Coh}(U, R, s, t, c)$. By Groupoids in Spaces, Lemma 65.13.2 there exists a set $T$ and a family $\left(\mathcal{F}_{t}\right)_{t \in T}$ of quasi-coherent sheaves on $\mathcal{X}$ such that every quasi-coherent sheaf on $\mathcal{X}$ is the directed colimit of its subsheaves which are isomorphic to one of the $\mathcal{F}_{t}$. Thus $\bigoplus_{t} \mathcal{F}_{t}$ is a generator of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ and we conclude that (c) holds. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11.6 and Lemma 19.13.2.
Proof of (2). To construct $Q$ we use the following general procedure. Given an object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ we consider the functor

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)^{o p p} \longrightarrow \text { Sets, } \quad \mathcal{G} \longmapsto \operatorname{Hom}_{\mathcal{X}}(\mathcal{G}, \mathcal{F})
$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\operatorname{Hom}_{\mathcal{X}}(\mathcal{G}, \mathcal{F})=\operatorname{Hom}_{\mathcal{X}}(\mathcal{G}, Q(\mathcal{F}))$ for $\mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$. By the Yoneda lemma (Categories, Lemma 4.3.5 the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in $\mathcal{F}$. By construction $Q$ is a right adjoint to the inclusion functor. The fact that $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when $\mathcal{F}$ is quasi-coherent is a formal consequence of the fact that the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is fully faithful.

### 78.15. Cohomology

075 E Let $S$ be a scheme and let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. For any $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$ the categories $A b\left(\mathcal{X}_{\tau}\right)$ and $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ have enough injectives, see Injectives, Theorems 19.7.4 and 19.8.4 Thus we can use the machinery of Cohomology on Sites, Section 21.3 to define the cohomology groups

$$
H^{p}\left(\mathcal{X}_{\tau}, \mathcal{F}\right)=H_{\tau}^{p}(\mathcal{X}, \mathcal{F}) \quad \text { and } \quad H^{p}(x, \mathcal{F})=H_{\tau}^{p}(x, \mathcal{F})
$$

for any $x \in \operatorname{Ob}(\mathcal{X})$ and any object $\mathcal{F}$ of $A b\left(\mathcal{X}_{\tau}\right)$ or $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$. Moreover, if $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$, then we obtain the higher direct images $R^{i} f_{*} \mathcal{F}$ in $\operatorname{Ab}\left(\mathcal{Y}_{\tau}\right)$ or $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right)$. Of

[^201]course, as explained in Cohomology on Sites, Section 21.4 there are also derived versions of $H^{p}(-)$ and $R^{i} f_{*}$.
075F Lemma 78.15.1. Let $S$ be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Let $x \in \operatorname{Ob}(\mathcal{X})$ be an object lying over the scheme $U$. Let $\mathcal{F}$ be an object of $A b\left(\mathcal{X}_{\tau}\right)$ or $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$. Then
$$
H_{\tau}^{p}(x, \mathcal{F})=H^{p}\left((S c h / U)_{\tau}, x^{-1} \mathcal{F}\right)
$$
and if $\tau=$ étale, then we also have
$$
H_{\text {étale }}^{p}(x, \mathcal{F})=H^{p}\left(U_{\text {étale }},\left.\mathcal{F}\right|_{U_{\text {étale }}}\right) .
$$

Proof. The first statement follows from Cohomology on Sites, Lemma 21.8.1 and the equivalence of Lemma 78.9.4 The second statement follows from the first combined with Étale Cohomology, Lemma 49.20.5.

### 78.16. Injective sheaves

06 WW The pushforward of an injective abelian sheaf or module is injective.
06WX Lemma 78.16.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$.
(1) $f_{*} \mathcal{I}$ is injective in $A b\left(\mathcal{Y}_{\tau}\right)$ for $\mathcal{I}$ injective in $A b\left(\mathcal{X}_{\tau}\right)$, and
(2) $f_{*} \mathcal{I}$ is injective in $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right)$ for $\mathcal{I}$ injective in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$.

Proof. This follows formally from the fact that $f^{-1}$ is an exact left adjoint of $f_{*}$, see Homology, Lemma 12.25.1.
In the rest of this section we prove that pullback $f^{-1}$ has a left adjoint $f$ ! on abelian sheaves and modules. If $f$ is representable (by schemes or by algebraic spaces), then it will turn out that $f_{!}$is exact and $f^{-1}$ will preserve injectives. We first prove a few preliminary lemmas about fibre products and equalizers in categories fibred in groupoids and their behaviour with respect to morphisms.

06WY Lemma 78.16.2. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids.
(1) The category $\mathcal{X}$ has fibre products.
(2) If the Isom-presheaves of $\mathcal{X}$ are representable by algebraic spaces, then $\mathcal{X}$ has equalizers.
(3) If $\mathcal{X}$ is an algebraic stack (or more generally a quotient stack), then $\mathcal{X}$ has equalizers.
Proof. Part (1) follows Categories, Lemma 4.34.14 as $(S c h / S)_{f p p f}$ has fibre products.
Let $a, b: x \rightarrow y$ be morphisms of $\mathcal{X}$. Set $U=p(x)$ and $V=p(y)$. The category of schemes has equalizers hence we can let $W \rightarrow U$ be the equalizer of $p(a)$ and $p(b)$. Denote $c: z \rightarrow x$ a morphism of $\mathcal{X}$ lying over $W \rightarrow U$. The equalizer of $a$ and $b$, if it exists, is the equalizer of $a \circ c$ and $b \circ c$. Thus we may assume that $p(a)=p(b)=f: U \rightarrow V$. As $\mathcal{X}$ is fibred in groupoids, there exists a unique automorphism $i: x \rightarrow x$ in the fibre category of $\mathcal{X}$ over $U$ such that $a \circ i=b$. Again the equalizer of $a$ and $b$ is the equalizer of $\mathrm{id}_{x}$ and $i$. Recall that the $\operatorname{Isom}_{\mathcal{X}}(x)$ is the presheaf on $(S c h / U)_{\text {fppf }}$ which to $V / U$ associates the set of automorphisms of $\left.x\right|_{V}$ in the fibre category of $\mathcal{X}$ over $V$, see Stacks, Definition 8.2.2. If $\operatorname{Isom}_{\mathcal{X}}(x)$ is representable by an algebraic space $G \rightarrow U$, then we see that $\mathrm{id}_{x}$ and $i$ define
morphisms $e, i: U \rightarrow G$ over $U$. Set $V=U \times_{e, G, i} U$, which by Morphisms of Spaces, Lemma 54.4.7 is a scheme. Then it is clear that $\left.x\right|_{V} \rightarrow x$ is the equalizer of the maps $\mathrm{id}_{x}$ and $i$ in $\mathcal{X}$. This proves (2).
If $\mathcal{X}=[U / R]$ for some groupoid in algebraic spaces $(U, R, s, t, c)$ over $S$, then the hypothesis of (2) holds by Bootstrap, Lemma 67.11.5. If $\mathcal{X}$ is an algebraic stack, then we can choose a presentation $[U / R] \cong \mathcal{X}$ by Algebraic Stacks, Lemma 76.16 .2

06WZ Lemma 78.16.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$.
(1) The functor $f$ transforms fibre products into fibre products.
(2) If $f$ is faithful, then $f$ transforms equalizers into equalizers.

Proof. By Categories, Lemma 4.34 .14 we see that a fibre product in $\mathcal{X}$ is any commutative square lying over a fibre product diagram in $(S c h / S)_{\text {fppf }}$. Similarly for $\mathcal{Y}$. Hence (1) is clear.
Let $x \rightarrow x^{\prime}$ be the equalizer of two morphisms $a, b: x^{\prime} \rightarrow x^{\prime \prime}$ in $\mathcal{X}$. We will show that $f(x) \rightarrow f\left(x^{\prime}\right)$ is the equalizer of $f(a)$ and $f(b)$. Let $y \rightarrow f(x)$ be a morphism of $\mathcal{Y}$ equalizing $f(a)$ and $f(b)$. Say $x, x^{\prime}, x^{\prime \prime}$ lie over the schemes $U, U^{\prime}, U^{\prime \prime}$ and $y$ lies over $V$. Denote $h: V \rightarrow U^{\prime}$ the image of $y \rightarrow f(x)$ in the category of schemes. The morphism $y \rightarrow f(x)$ is isomorphic to $f\left(h^{*} x^{\prime}\right) \rightarrow f\left(x^{\prime}\right)$ by the axioms of fibred categories. Hence, as $f$ is faithful, we see that $h^{*} x^{\prime} \rightarrow x^{\prime}$ equalizes $a$ and $b$. Thus we obtain a unique morphism $h^{*} x^{\prime} \rightarrow x$ whose image $y=f\left(h^{*} x^{\prime}\right) \rightarrow f(x)$ is the desired morphism in $\mathcal{Y}$.

06X0 Lemma 78.16.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Z} \rightarrow \mathcal{Y}$ be faithful 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$.
(1) the functor $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Y}$ is faithful, and
(2) if $\mathcal{X}, \mathcal{Z}$ have equalizers, so does $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$.

Proof. We think of objects in $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ as quadruples $(U, x, z, \alpha)$ where $\alpha: f(x) \rightarrow$ $g(z)$ is an isomorphism over $U$, see Categories, Lemma4.31.3. A morphism $(U, x, z, \alpha) \rightarrow$ $\left(U^{\prime}, x^{\prime}, z^{\prime}, \alpha^{\prime}\right)$ is a pair of morphisms $a: x \rightarrow x^{\prime}$ and $b: z \rightarrow z^{\prime}$ compatible with $\alpha$ and $\alpha^{\prime}$. Thus it is clear that if $f$ and $g$ are faithful, so is the functor $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Y}$. Now, suppose that $(a, b),\left(a^{\prime}, b^{\prime}\right):(U, x, z, \alpha) \rightarrow\left(U^{\prime}, x^{\prime}, z^{\prime}, \alpha^{\prime}\right)$ are two morphisms of the 2 -fibre product. Then consider the equalizer $x^{\prime \prime} \rightarrow x$ of $a$ and $a^{\prime}$ and the equalizer $z^{\prime \prime} \rightarrow z$ of $b$ and $b^{\prime}$. Since $f$ commutes with equalizers (by Lemma 78.16.3) we see that $f\left(x^{\prime \prime}\right) \rightarrow f(x)$ is the equalizer of $f(a)$ and $f\left(a^{\prime}\right)$. Similarly, $g\left(z^{\prime \prime}\right) \rightarrow g(z)$ is the equalizer of $g(b)$ and $g\left(b^{\prime}\right)$. Picture

It is clear that the dotted arrow exists and is an isomorphism. However, it is not a priori the case that the image of $\alpha^{\prime \prime}$ in the category of schemes is the identity of its source. On the other hand, the existence of $\alpha^{\prime \prime}$ means that we can assume that $x^{\prime \prime}$ and $z^{\prime \prime}$ are defined over the same scheme and that the morphisms $x^{\prime \prime} \rightarrow x$
and $z^{\prime \prime} \rightarrow z$ have the same image in the category of schemes. Redoing the diagram above we see that the dotted arrow now does project to an identity morphism and we win. Some details omitted.

As we are working with big sites we have the following somewhat counter intuitive result (which also holds for morphisms of big sites of schemes). Warning: This result isn't true if we drop the hypothesis that $f$ is faithful.

06X1 Lemma 78.16.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z$ ar, étale, smooth, syntomic, fppf $\}$. The functor $f^{-1}$ : $A b\left(\mathcal{Y}_{\tau}\right) \rightarrow A b\left(\mathcal{X}_{\tau}\right)$ has a left adjoint $f_{!}: A b\left(\mathcal{X}_{\tau}\right) \rightarrow A b\left(\mathcal{Y}_{\tau}\right)$. If $f$ is faithful and $\mathcal{X}$ has equalizers, then
(1) $f_{!}$is exact, and
(2) $f^{-1} \mathcal{I}$ is injective in $A b\left(\mathcal{X}_{\tau}\right)$ for $\mathcal{I}$ injective in $A b\left(\mathcal{Y}_{\tau}\right)$.

Proof. By Stacks, Lemma 8.10.3 the functor $f$ is continuous and cocontinuous. Hence by Modules on Sites, Lemma 18.16.2 the functor $f^{-1}: A b\left(\mathcal{Y}_{\tau}\right) \rightarrow A b\left(\mathcal{X}_{\tau}\right)$ has a left adjoint $f_{!}: A b\left(\mathcal{X}_{\tau}\right) \rightarrow A b\left(\mathcal{Y}_{\tau}\right)$. To see (1) we apply Modules on Sites, Lemma 18.16 .3 and to see that the hypotheses of that lemma are satisfied use Lemmas 78.16 .2 and 78.16 .3 above. Part (2) follows from this formally, see Homology, Lemma 12.25.1.

06X2 Lemma 78.16.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. The functor $f^{*}$ : $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ has a left adjoint $f_{!}: \operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right)$ which agrees with the functor $f_{!}$of Lemma 78.16 .5 on underlying abelian sheaves. If $f$ is faithful and $\mathcal{X}$ has equalizers, then
(1) $f_{!}$is exact, and
(2) $f^{-1} \mathcal{I}$ is injective in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ for $\mathcal{I}$ injective in $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$.

Proof. Recall that $f$ is a continuous and cocontinuous functor of sites and that $f^{-1} \mathcal{O}_{\mathcal{Y}}=\mathcal{O}_{\mathcal{X}}$. Hence Modules on Sites, Lemma 18.40 .1 implies $f^{*}$ has a left adjoint $f_{!}^{M o d}$. Let $x$ be an object of $\mathcal{X}$ lying over the scheme $U$. Then $f$ induces an equivalence of ringed sites

$$
\mathcal{X} / x \longrightarrow \mathcal{Y} / f(x)
$$

as both sides are equivalent to $(S c h / U)_{\tau}$, see Lemma 78.9.4. Modules on Sites, Remark 18.40 .2 shows that $f_{!}$agrees with the functor on abelian sheaves.

Assume now that $\mathcal{X}$ has equalizers and that $f$ is faithful. Lemma 78.16 .5 tells us that $f$ ! is exact. Finally, Homology, Lemma 12.25 .1 implies the statement on pullbacks of injective modules.

### 78.17. The Čech complex

06X3 To compute the cohomology of a sheaf on an algebraic stack we compare it to the cohomology of the sheaf restricted to coverings of the given algebraic stack.

Throughout this section the situation will be as follows. We are given a 1-morphism of categories fibred in groupoids

06X4

We are going to think about $\mathcal{U}$ as a "covering" of $\mathcal{X}$. Hence we want to consider the simplicial object

$$
\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \times \mathcal{X} \mathcal{U} \equiv \mathcal{U} \times{ }_{\mathcal{X}} \mathcal{U} \Longrightarrow \mathcal{U}
$$

in the category of categories fibred in groupoids over $(S c h / S)_{f p p f}$. However, since this is a $(2,1)$-category and not a category, we should say explicitly what we mean. Namely, we let $\mathcal{U}_{n}$ be the category with objects $\left(u_{0}, \ldots, u_{n}, x, \alpha_{0}, \ldots, \alpha_{n}\right)$ where $\alpha_{i}: f\left(u_{i}\right) \rightarrow x$ is an isomorphism in $\mathcal{X}$. We denote $f_{n}: \mathcal{U}_{n} \rightarrow \mathcal{X}$ the 1-morphism which assigns to $\left(u_{0}, \ldots, u_{n}, x, \alpha_{0}, \ldots, \alpha_{n}\right)$ the object $x$. Note that $\mathcal{U}_{0}=\mathcal{U}$ and $f_{0}=f$. Given a map $\varphi:[m] \rightarrow[n]$ we consider the 1 -morphism $\mathcal{U}_{\varphi}: \mathcal{U}_{n} \longrightarrow \mathcal{U}_{n}$ given by

$$
\left(u_{0}, \ldots, u_{n}, x, \alpha_{0}, \ldots, \alpha_{n}\right) \longmapsto\left(u_{\varphi(0)}, \ldots, u_{\varphi(n)}, x, \alpha_{\varphi(0)}, \ldots, \alpha_{\varphi(n)}\right)
$$

on objects. All of these 1-morphisms compose correctly on the nose (no 2-morphisms required) and all of these 1 -morphisms are 1-morphisms over $\mathcal{X}$. We denote $\mathcal{U}_{\bullet}$ this simplicial object. If $\mathcal{F}$ is a presheaf of sets on $\mathcal{X}$, then we obtain a cosimplicial set

$$
\Gamma\left(\mathcal{U}_{0}, f_{0}^{-1} \mathcal{F}\right) \Longrightarrow \Gamma\left(\mathcal{U}_{1}, f_{1}^{-1} \mathcal{F}\right) \Longrightarrow \Gamma\left(\mathcal{U}_{2}, f_{2}^{-1} \mathcal{F}\right)
$$

Here the arrows are the pullback maps along the given morphisms of the simplicial object. If $\mathcal{F}$ is a presheaf of abelian groups, this is a cosimplicial abelian group.

Let $\mathcal{U} \rightarrow \mathcal{X}$ be as above and let $\mathcal{F}$ be an abelian presheaf on $\mathcal{X}$. The Čech complex associated to the situation is denoted $\mathcal{C}^{\bullet}(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F})$. It is the cochain complex associated to the cosimplicial abelian group above, see Simplicial, Section 14.25 . It has terms

$$
\check{\mathcal{C}}^{n}(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F})=\Gamma\left(\mathcal{U}_{n}, f_{n}^{-1} \mathcal{F}\right) .
$$

The boundary maps are the maps

$$
d^{n}=\sum_{i=0}^{n+1}(-1)^{i} \delta_{i}^{n+1}: \Gamma\left(\mathcal{U}_{n}, f_{n}^{-1} \mathcal{F}\right) \longrightarrow \Gamma\left(\mathcal{U}_{n+1}, f_{n+1}^{-1} \mathcal{F}\right)
$$

where $\delta_{i}^{n+1}$ corresponds to the map $[n] \rightarrow[n+1]$ omitting the index $i$. Note that the map $\Gamma(\mathcal{X}, \mathcal{F}) \rightarrow \Gamma\left(\mathcal{U}_{0}, f_{0}^{-1} \mathcal{F}_{0}\right)$ is in the kernel of the differential $d^{0}$. Hence we define the extended Čech complex to be the complex

$$
\ldots \rightarrow 0 \rightarrow \Gamma(\mathcal{X}, \mathcal{F}) \rightarrow \Gamma\left(\mathcal{U}_{0}, f_{0}^{-1} \mathcal{F}_{0}\right) \rightarrow \Gamma\left(\mathcal{U}_{1}, f_{1}^{-1} \mathcal{F}_{1}\right) \rightarrow \ldots
$$

with $\Gamma(\mathcal{X}, \mathcal{F})$ placed in degree -1 . The extended Čech complex is acyclic if and only if the canonical map

$$
\Gamma(\mathcal{X}, \mathcal{F})[0] \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F})
$$

is a quasi-isomorphism of complexes.
06X5 Lemma 78.17.1. Generalities on Čech complexes.
(1) If

is 2-commutative diagram of categories fibred in groupoids over $(S c h / S)_{f p p f}$, then there is a morphism of Čech complexes

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{V} \rightarrow \mathcal{Y}, e^{-1} \mathcal{F}\right)
$$

(2) if $h$ and $e$ are equivalences, then the map of (1) is an isomorphism,
(3) if $f, f^{\prime}: \mathcal{U} \rightarrow \mathcal{X}$ are 2-isomorphic, then the associated Cech complexes are isomorphic,
Proof. In the situation of (1) let $t: f \circ h \rightarrow e \circ g$ be a 2-morphism. The map on complexes is given in degree $n$ by pullback along the 1-morphisms $\mathcal{V}_{n} \rightarrow \mathcal{U}_{n}$ given by the rule

$$
\left(v_{0}, \ldots, v_{n}, y, \beta_{0}, \ldots, \beta_{n}\right) \longmapsto\left(h\left(v_{0}\right), \ldots, h\left(v_{n}\right), e(y), e\left(\beta_{0}\right) \circ t_{v_{0}}, \ldots, e\left(\beta_{n}\right) \circ t_{v_{n}}\right)
$$

For (2), note that pullback on global sections is an isomorphism for any presheaf of sets when the pullback is along an equivalence of categories. Part (3) follows on combining (1) and (2).
06X6 Lemma 78.17.2. If there exists a 1-morphism $s: \mathcal{X} \rightarrow \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $i d_{\mathcal{X}}$ then the extended Čech complex is homotopic to zero.

Proof. Set $\mathcal{U}^{\prime}=\mathcal{U} \times \mathcal{X} \mathcal{X}$ equal to the fibre product as described in Categories, Lemma 4.31.3 Set $f^{\prime}: \mathcal{U}^{\prime} \rightarrow \mathcal{X}$ equal to the second projection. Then $\mathcal{U} \rightarrow \mathcal{U}^{\prime}$, $u \mapsto(u, f(x), 1)$ is an equivalence over $\mathcal{X}$, hence we may replace $(\mathcal{U}, f)$ by $\left(\mathcal{U}^{\prime}, f^{\prime}\right)$ by Lemma 78.17.1. The advantage of this is that now $f^{\prime}$ has a section $s^{\prime}$ such that $f^{\prime} \circ s^{\prime}=\mathrm{id}_{\mathcal{X}}$ on the nose. Namely, if $t: s \circ f \rightarrow \mathrm{id}_{\mathcal{X}}$ is a 2 -isomorphism then we can set $s^{\prime}(x)=\left(s(x), x, t_{x}\right)$. Thus we may assume that $f \circ s=\mathrm{id}_{\mathcal{X}}$.
In the case that $f \circ s=\operatorname{id}_{\mathcal{X}}$ the result follows from general principles. We give the homotopy explicitly. Namely, for $n \geq 0$ define $s_{n}: \mathcal{U}_{n} \rightarrow \mathcal{U}_{n+1}$ to be the 1-morphism defined by the rule on objects

$$
\left(u_{0}, \ldots, u_{n}, x, \alpha_{0}, \ldots, \alpha_{n}\right) \longmapsto\left(u_{0}, \ldots, u_{n}, s(x), x, \alpha_{0}, \ldots, \alpha_{n}, \mathrm{id}_{x}\right)
$$

Define

$$
h^{n+1}: \Gamma\left(\mathcal{U}_{n+1}, f_{n+1}^{-1} \mathcal{F}\right) \longrightarrow \Gamma\left(\mathcal{U}_{n}, f_{n}^{-1} \mathcal{F}\right)
$$

as pullback along $s_{n}$. We also set $s_{-1}=s$ and $h^{0}: \Gamma\left(\mathcal{U}_{0}, f_{0}^{-1} \mathcal{F}\right) \rightarrow \Gamma(\mathcal{X}, \mathcal{F})$ equal to pullback along $s_{-1}$. Then the family of maps $\left\{h^{n}\right\}_{n \geq 0}$ is a homotopy between 1 and 0 on the extended Čech complex.

### 78.18. The relative Čech complex

06X7 Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ as in 78.17.0.1. Consider the associated simplicial object $\mathcal{U}_{\bullet}$ and the maps $f_{n}$ : $\mathcal{U}_{n} \rightarrow \mathcal{X}$. Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Finally, suppose that $\mathcal{F}$ is a sheaf (of sets) on $\mathcal{X}_{\tau}$. Then

$$
f_{0, *} f_{0}^{-1} \mathcal{F} \Longrightarrow f_{1, *} f_{1}^{-1} \mathcal{F} \Longrightarrow f_{2, *} f_{2}^{-1} \mathcal{F}
$$

is a cosimplicial sheaf on $\mathcal{X}_{\tau}$ where we use the pullback maps introduced in Sites, Section 7.44. If $\mathcal{F}$ is an abelian sheaf, then $f_{n, *} f_{n}^{-1} \mathcal{F}$ form a cosimplicial abelian sheaf on $\mathcal{X}_{\tau}$. The associated complex (see Simplicial, Section 14.25)

$$
\ldots \rightarrow 0 \rightarrow f_{0, *} f_{0}^{-1} \mathcal{F} \rightarrow f_{1, *} f_{1}^{-1} \mathcal{F} \rightarrow f_{2, *} f_{2}^{-1} \mathcal{F} \rightarrow \ldots
$$

is called the relative $\check{C} e c h$ complex associated to the situation. We will denote this complex $\mathcal{K} \bullet(f, \mathcal{F})$. The extended relative Čech complex is the complex

$$
\ldots \rightarrow 0 \rightarrow \mathcal{F} \rightarrow f_{0, *} f_{0}^{-1} \mathcal{F} \rightarrow f_{1, *} f_{1}^{-1} \mathcal{F} \rightarrow f_{2, *} f_{2}^{-1} \mathcal{F} \rightarrow \ldots
$$

with $\mathcal{F}$ in degree -1 . The extended relative Čech complex is acyclic if and only if the map $\mathcal{F}[0] \rightarrow \mathcal{K}^{\bullet}(f, \mathcal{F})$ is a quasi-isomorphism of complexes of sheaves.

06X8 Remark 78.18.1. We can define the complex $\mathcal{K}^{\bullet}(f, \mathcal{F})$ also if $\mathcal{F}$ is a presheaf, only we cannot use the reference to Sites, Section 7.44 to define the pullback maps. To explain the pullback maps, suppose given a commutative diagram

of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ and a presheaf $\mathcal{G}$ on $\mathcal{U}$ we can define the pullback map $f_{*} \mathcal{G} \rightarrow g_{*} h^{-1} \mathcal{G}$ as the composition

$$
f_{*} \mathcal{G} \longrightarrow f_{*} h_{*} h^{-1} \mathcal{G}=g_{*} h^{-1} \mathcal{G}
$$

where the map comes from the adjunction map $\mathcal{G} \rightarrow h_{*} h^{-1} \mathcal{G}$. This works because in our situation the functors $h_{*}$ and $h^{-1}$ are adjoint in presheaves (and agree with their counter parts on sheaves). See Sections 78.3 and 78.4 .

06X9 Lemma 78.18.2. Generalities on relative Čech complexes.
(1) If

is 2-commutative diagram of categories fibred in groupoids over $(S c h / S)_{f p p f}$, then there is a morphism $e^{-1} \mathcal{K}^{\bullet}(f, \mathcal{F}) \rightarrow \mathcal{K}^{\bullet}\left(g, e^{-1} \mathcal{F}\right)$.
(2) if $h$ and $e$ are equivalences, then the map of (1) is an isomorphism,
(3) if $f, f^{\prime}: \mathcal{U} \rightarrow \mathcal{X}$ are 2-isomorphic, then the associated relative Čech complexes are isomorphic,

Proof. Literally the same as the proof of Lemma 78.17.1 using the pullback maps of Remark 78.18.1.

06XA Lemma 78.18.3. If there exists a 1-morphism $s: \mathcal{X} \rightarrow \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $i d_{\mathcal{X}}$ then the extended relative Čech complex is homotopic to zero.

Proof. Literally the same as the proof of Lemma 78.17.2.

06XB Remark 78.18.4. Let us "compute" the value of the relative Čech complex on an object $x$ of $\mathcal{X}$. Say $p(x)=U$. Consider the 2-fibre product diagram (which serves to introduce the notation $g: \mathcal{V} \rightarrow \mathcal{Y}$ )

Note that the morphism $\mathcal{V}_{n} \rightarrow \mathcal{U}_{n}$ of the proof of Lemma 78.17.1 induces an equivalence $\mathcal{V}_{n}=(S c h / U)_{\text {fppf }} \times_{x, \mathcal{X}} \mathcal{U}_{n}$. Hence we see from 78.5.0.1 that

$$
\Gamma\left(x, \mathcal{K}^{\bullet}(f, \mathcal{F})\right)=\check{\mathcal{C}}^{\bullet}\left(\mathcal{V} \rightarrow \mathcal{Y}, x^{-1} \mathcal{F}\right)
$$

In words: The value of the relative Čech complex on an object $x$ of $\mathcal{X}$ is the Čech complex of the base change of $f$ to $\mathcal{X} / x \cong(S c h / U)_{f p p f}$. This implies for example that Lemma 78.17 .2 implies Lemma 78.18 .3 and more generally that results on the (usual) Čech complex imply results for the relative Čech complex.
06XC Lemma 78.18.5. Let

be a 2-fibre product of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ and let $\mathcal{F}$ be an abelian presheaf on $\mathcal{X}$. Then the map $e^{-1} \mathcal{K} \cdot(f, \mathcal{F}) \rightarrow \mathcal{K}^{\bullet}\left(g, e^{-1} \mathcal{F}\right)$ of Lemma 78.18.2 is an isomorphism of complexes of abelian presheaves.

Proof. Let $y$ be an object of $\mathcal{Y}$ lying over the scheme $T$. Set $x=e(y)$. We are going to show that the map induces an isomorphism on sections over $y$. Note that
$\Gamma\left(y, e^{-1} \mathcal{K}^{\bullet}(f, \mathcal{F})\right)=\Gamma\left(x, \mathcal{K}^{\bullet}(f, \mathcal{F})\right)=\check{\mathcal{C}}^{\bullet}\left((S c h / T)_{f p p f} \times_{x, \mathcal{X}} \mathcal{U} \rightarrow(S c h / T)_{f p p f}, x^{-1} \mathcal{F}\right)$
by Remark 78.18.4. On the other hand,

$$
\Gamma\left(y, \mathcal{K}^{\bullet}\left(g, e^{-1} \mathcal{F}\right)\right)=\check{\mathcal{C}}^{\bullet}\left((S c h / T)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{V} \rightarrow(S c h / T)_{f p p f}, y^{-1} e^{-1} \mathcal{F}\right)
$$

also by Remark 78.18.4. Note that $y^{-1} e^{-1} \mathcal{F}=x^{-1} \mathcal{F}$ and since the diagram is 2-cartesian the 1-morphism

$$
(S c h / T)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{V} \rightarrow(S c h / T)_{f p p f} \times_{x, \mathcal{X}} \mathcal{U}
$$

is an equivalence. Hence the map on sections over $y$ is an isomorphism by Lemma 78.17.1.

Exactness can be checked on a "covering".
06XD Lemma 78.18.6. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. Let

$$
\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}
$$

be a complex in $\operatorname{Ab}\left(\mathcal{X}_{\tau}\right)$. Assume that
(1) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$, and
(2) $f^{-1} \mathcal{F} \rightarrow f^{-1} \mathcal{G} \rightarrow f^{-1} \mathcal{H}$ is exact.

Then the sequence $\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$ is exact.

Proof. Let $x$ be an object of $\mathcal{X}$ lying over the scheme $T$. Consider the sequence $x^{-1} \mathcal{F} \rightarrow x^{-1} \mathcal{G} \rightarrow x^{-1} \mathcal{H}$ of abelian sheaves on $(S c h / T)_{\tau}$. It suffices to show this sequence is exact. By assumption there exists a $\tau$-covering $\left\{T_{i} \rightarrow T\right\}$ such that $\left.x\right|_{T_{i}}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$ over $T_{i}$ and moreover the sequence $u_{i}^{-1} f^{-1} \mathcal{F} \rightarrow u_{i}^{-1} f^{-1} \mathcal{G} \rightarrow u_{i}^{-1} f^{-1} \mathcal{H}$ of abelian sheaves on $\left(S c h / T_{i}\right)_{\tau}$ is exact. Since $u_{i}^{-1} f^{-1} \mathcal{F}=\left.x^{-1} \mathcal{F}\right|_{\left(S c h / T_{i}\right)_{\tau}}$ we conclude that the sequence $x^{-1} \mathcal{F} \rightarrow x^{-1} \mathcal{G} \rightarrow x^{-1} \mathcal{H}$ become exact after localizing at each of the members of a covering, hence the sequence is exact.

06XE Proposition 78.18.7. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z$ ar, étale, smooth, syntomic, fppf $\}$. If
(1) $\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_{\tau}$, and
(2) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$,
then the extended relative Čech complex

$$
\ldots \rightarrow 0 \rightarrow \mathcal{F} \rightarrow f_{0, *} f_{0}^{-1} \mathcal{F} \rightarrow f_{1, *} f_{1}^{-1} \mathcal{F} \rightarrow f_{2, *} f_{2}^{-1} \mathcal{F} \rightarrow \ldots
$$

is exact in $A b\left(\mathcal{X}_{\tau}\right)$.
Proof. By Lemma 78.18 .6 it suffices to check exactness after pulling back to $\mathcal{U}$. By Lemma 78.18.5 the pullback of the extended relative Čech complex is isomorphic to the extend relative Čech complex for the morphism $\mathcal{U} \times{ }_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{U}$ and an abelian sheaf on $\mathcal{U}_{\tau}$. Since there is a section $\Delta_{\mathcal{U} / \mathcal{X}}: \mathcal{U} \rightarrow \mathcal{U} \times \mathcal{X} \mathcal{U}$ exactness follows from Lemma 78.18.3.

Using this we can construct the Čech-to-cohomology spectral sequence as follows. We first give a technical, precise version. In the next section we give a version that applies only to algebraic stacks.

06XF Lemma 78.18.8. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. Assume
(1) $\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_{\tau}$,
(2) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$,
(3) the category $\mathcal{U}$ has equalizers, and
(4) the functor $f$ is faithful.

Then there is a first quadrant spectral sequence of abelian groups

$$
E_{2}^{p, q}=H^{q}\left(\left(\mathcal{U}_{p}\right)_{\tau}, f_{p}^{-1} \mathcal{F}\right) \Rightarrow H^{p+q}\left(\mathcal{X}_{\tau}, \mathcal{F}\right)
$$

converging to the cohomology of $\mathcal{F}$ in the $\tau$-topology.
Proof. Before we start the proof we make some remarks. By Lemma 78.16.4 (and induction) all of the categories fibred in groupoids $\mathcal{U}_{p}$ have equalizers and all of the morphisms $f_{p}: \mathcal{U}_{p} \rightarrow \mathcal{X}$ are faithful. Let $\mathcal{I}$ be an injective object of $A b\left(\mathcal{X}_{\tau}\right)$. By Lemma 78.16.5 we see $f_{p}^{-1} \mathcal{I}$ is an injective object of $\operatorname{Ab}\left(\left(\mathcal{U}_{p}\right)_{\tau}\right)$. Hence $f_{p, *} f_{p}^{-1} \mathcal{I}$ is an injective object of $A b\left(\mathcal{X}_{\tau}\right)$ by Lemma 78.16.1. Hence Proposition 78.18.7 shows that the extended relative Čech complex

$$
\ldots \rightarrow 0 \rightarrow \mathcal{I} \rightarrow f_{0, *} f_{0}^{-1} \mathcal{I} \rightarrow f_{1, *} f_{1}^{-1} \mathcal{I} \rightarrow f_{2, *} f_{2}^{-1} \mathcal{I} \rightarrow \ldots
$$

is an exact complex in $A b\left(\mathcal{X}_{\tau}\right)$ all of whose terms are injective. Taking global sections of this complex is exact and we see that the Cech complex $\check{\mathcal{C}} \bullet(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{I})$ is quasi-isomorphic to $\Gamma\left(\mathcal{X}_{\tau}, \mathcal{I}\right)[0]$.
With these preliminaries out of the way consider the two spectral sequences associated to the double complex (see Homology, Section 12.22)

$$
\check{\mathcal{C}}^{\bullet}\left(\mathcal{U} \rightarrow \mathcal{X}, \mathcal{I}^{\bullet}\right)
$$

where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $A b\left(\mathcal{X}_{\tau}\right)$. The discussion above shows that Homology, Lemma 12.22 .7 applies which shows that $\Gamma\left(\mathcal{X}_{\tau}, \mathcal{I}^{\bullet}\right)$ is quasi-isomorphic to the total complex associated to the double complex. By our remarks above the complex $f_{p}^{-1} \mathcal{I}^{\bullet}$ is an injective resolution of $f_{p}^{-1} \mathcal{F}$. Hence the other spectral sequence is as indicated in the lemma.

To be sure there is a version for modules as well.
06XG Lemma 78.18.9. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. Assume
(1) $\mathcal{F}$ is an object of $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$,
(2) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$,
(3) the category $\mathcal{U}$ has equalizers, and
(4) the functor $f$ is faithful.

Then there is a first quadrant spectral sequence of $\Gamma\left(\mathcal{O}_{\mathcal{X}}\right)$-modules

$$
E_{2}^{p, q}=H^{q}\left(\left(\mathcal{U}_{p}\right)_{\tau}, f_{p}^{*} \mathcal{F}\right) \Rightarrow H^{p+q}\left(\mathcal{X}_{\tau}, \mathcal{F}\right)
$$

converging to the cohomology of $\mathcal{F}$ in the $\tau$-topology.
Proof. The proof of this lemma is identical to the proof of Lemma 78.18 .8 except that it uses an injective resolution in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ and it uses Lemma 78.16 .6 instead of Lemma 78.16.5.

Here is a lemma that translates a more usual kind of covering in the kinds of coverings we have encountered above.

06XH Lemma 78.18.10. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$.
(1) Assume that $f$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then for any object $y$ of $\mathcal{Y}$ there exists an fppf covering $\left\{y_{i} \rightarrow y\right\}$ and objects $x_{i}$ of $\mathcal{X}$ such that $f\left(x_{i}\right) \cong y_{i}$ in $\mathcal{Y}$.
(2) Assume that $f$ is representable by algebraic spaces, surjective, and smooth. Then for any object $y$ of $\mathcal{Y}$ there exists an étale covering $\left\{y_{i} \rightarrow y\right\}$ and objects $x_{i}$ of $\mathcal{X}$ such that $f\left(x_{i}\right) \cong y_{i}$ in $\mathcal{Y}$.

Proof. Proof of (1). Suppose that $y$ lies over the scheme $V$. We may think of $y$ as a morphism $(S c h / V)_{f p p f} \rightarrow \mathcal{Y}$. By definition the 2 -fibre product $\mathcal{X} \times \mathcal{Y}(S c h / V)_{f p p f}$ is representable by an algebraic space $W$ and the morphism $W \rightarrow V$ is surjective, flat, and locally of finite presentation. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow W$. Then $U \rightarrow V$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 54.38.7, 54.38.8, 54.5.4, 54.28.2, and 54.29.3. Hence $\{U \rightarrow V\}$ is an fppf covering. Denote $x$ the object of $\mathcal{X}$ over
$U$ corresponding to the 1-morphism $(S c h / U)_{f p p f} \rightarrow \mathcal{X}$. Then $\{f(x) \rightarrow y\}$ is the desired fppf covering of $\mathcal{Y}$.
Proof of (1). Suppose that $y$ lies over the scheme $V$. We may think of $y$ as a morphism $(S c h / V)_{f p p f} \rightarrow \mathcal{Y}$. By definition the 2-fibre product $\mathcal{X} \times \mathcal{Y}(S c h / V)_{f p p f}$ is representable by an algebraic space $W$ and the morphism $W \rightarrow V$ is surjective and smooth. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow W$. Then $U \rightarrow V$ is also surjective and smooth (see Morphisms of Spaces, Lemmas 54.38.6. 54.5.4 and 54.36 .2 . Hence $\{U \rightarrow V\}$ is a smooth covering. By More on Morphisms, Lemma 36.28 .7 there exists an étale covering $\left\{V_{i} \rightarrow V\right.$ such that each $V_{i} \rightarrow V$ factors through $U$. Denote $x_{i}$ the object of $\mathcal{X}$ over $V_{i}$ corresponding to the 1morphism

$$
\left(S c h / V_{i}\right)_{f p p f} \rightarrow(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}
$$

Then $\left\{f\left(x_{i}\right) \rightarrow y\right\}$ is the desired étale covering of $\mathcal{Y}$.
072D Lemma 78.18.11. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ and $g: \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $\tau \in\{Z$ ar, étale, smooth, syntomic, fppf\}. Assume
(1) $\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_{\tau}$,
(2) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$,
(3) the category $\mathcal{U}$ has equalizers, and
(4) the functor $f$ is faithful.

Then there is a first quadrant spectral sequence of abelian sheaves on $\mathcal{Y}_{\tau}$

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

where all higher direct images are computed in the $\tau$-topology.
Proof. Note that the assumptions on $f: \mathcal{U} \rightarrow \mathcal{X}$ and $\mathcal{F}$ are identical to those in Lemma 78.18.8. Hence the preliminary remarks made in the proof of that lemma hold here also. These remarks imply in particular that

$$
0 \rightarrow g_{*} \mathcal{I} \rightarrow\left(g \circ f_{0}\right)_{*} f_{0}^{-1} \mathcal{I} \rightarrow\left(g \circ f_{1}\right)_{*} f_{1}^{-1} \mathcal{I} \rightarrow \ldots
$$

is exact if $\mathcal{I}$ is an injective object of $A b\left(\mathcal{X}_{\tau}\right)$. Having said this, consider the two spectral sequences of Homology, Section 12.22 associated to the double complex $\mathcal{C}^{\bullet \bullet}$ with terms

$$
\mathcal{C}^{p, q}=\left(g \circ f_{p}\right)_{*} \mathcal{I}^{q}
$$

where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $A b\left(\mathcal{X}_{\tau}\right)$. The first spectral sequence implies, via Homology, Lemma 12.22.7, that $g_{*} \mathcal{I}^{\bullet}$ is quasi-isomorphic to the total complex associated to $\mathcal{C}^{\bullet \bullet}$. Since $f_{p}^{-1} \mathcal{I}^{\bullet}$ is an injective resolution of $f_{p}^{-1} \mathcal{F}$ (see Lemma 78.16.5 the second spectral sequence has terms $E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F}$ as in the statement of the lemma.

072E Lemma 78.18.12. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ and $g: \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $\tau \in\{Z a r$, étale, smooth, syntomic, fppf\}. Assume
(1) $\mathcal{F}$ is an object of $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$,
(2) for every object $x$ of $\mathcal{X}$ there exists a covering $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}_{\tau}$ such that each $x_{i}$ is isomorphic to $f\left(u_{i}\right)$ for some object $u_{i}$ of $\mathcal{U}$,
(3) the category $\mathcal{U}$ has equalizers, and
(4) the functor $f$ is faithful.

Then there is a first quadrant spectral sequence in $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right)$

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

where all higher direct images are computed in the $\tau$-topology.
Proof. The proof is identical to the proof of Lemma 78.18.11 except that it uses an injective resolution in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ and it uses Lemma 78.16.6 instead of Lemma 78.16.5.

### 78.19. Cohomology on algebraic stacks

06XI Let $\mathcal{X}$ be an algebraic stack over $S$. In the sections above we have seen how to define sheaves for the étale, ..., fppf topologies on $\mathcal{X}$. In fact, we have constructed a site $\mathcal{X}_{\tau}$ for each $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. There is a notion of an abelian sheaf $\mathcal{F}$ on these sites. In the chapter on cohomology of sites we have explained how to define cohomology. Putting all of this together, let's define the derived global sections

$$
R \Gamma_{Z a r}(\mathcal{X}, \mathcal{F}), R \Gamma_{\text {étale }}(\mathcal{X}, \mathcal{F}), \ldots, R \Gamma_{\text {fppf }}(\mathcal{X}, \mathcal{F})
$$

as $\Gamma\left(\mathcal{X}_{\tau}, \mathcal{I}^{\bullet}\right)$ where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $A b\left(\mathcal{X}_{\tau}\right)$. The $i$ th cohomology group is the $i$ th cohomology of the total derived cohomology. We will denote this

$$
H_{Z a r}^{i}(\mathcal{X}, \mathcal{F}), H_{\text {étale }}^{i}(\mathcal{X}, \mathcal{F}), \ldots, H_{\text {fppf }}^{i}(\mathcal{X}, \mathcal{F})
$$

It will turn out that $H_{\text {étale }}^{i}=H_{\text {smooth }}^{i}$ because of More on Morphisms, Lemma 36.28 .7 . If $\mathcal{F}$ is a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules which is a sheaf in the $\tau$-topology, then we use injective resolutions in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ to compute total derived global sections and cohomology groups; of course the end result is quasi-isomorphic resp. isomorphic by the general fact Cohomology on Sites, Lemma 21.12.4.
So far our only tool to compute cohomology groups is the result on Čech complexes proved above. We rephrase it here in the language of algebraic stacks for the étale and the fppf topology. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of algebraic stacks. Recall that

$$
f_{p}: \mathcal{U}_{p}=\mathcal{U} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}} \mathcal{U} \longrightarrow \mathcal{X}
$$

is the structure morphism where there are $(p+1)$-factors. Also, recall that a sheaf on $\mathcal{X}$ is a sheaf for the fppf topology. Note that if $\mathcal{U}$ is an algebraic space, then $f$ : $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 76.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack $\mathcal{X}$ by a scheme.

06XJ Proposition 78.19.1. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of algebraic stacks.
(1) Let $\mathcal{F}$ be an abelian étale sheaf on $\mathcal{X}$. Assume that $f$ is representable by algebraic spaces, surjective, and smooth. Then there is a spectral sequence

$$
E_{2}^{p, q}=H_{\text {étale }}^{q}\left(\mathcal{U}_{p}, f_{p}^{-1} \mathcal{F}\right) \Rightarrow H_{\text {étale }}^{p+q}(\mathcal{X}, \mathcal{F})
$$

(2) Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{X}$. Assume that $f$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then there is a spectral sequence

$$
E_{2}^{p, q}=H_{f p p f}^{q}\left(\mathcal{U}_{p}, f_{p}^{-1} \mathcal{F}\right) \Rightarrow H_{f p p f}^{p+q}(\mathcal{X}, \mathcal{F})
$$

Proof. To see this we will check the hypotheses (1) - (4) of Lemma 78.18.8. The 1 -morphism $f$ is faithful by Algebraic Stacks, Lemma 76.15.2. This proves (4). Hypothesis (3) follows from the fact that $\mathcal{U}$ is an algebraic stack, see Lemma 78.16.2. To see (2) apply Lemma 78.18.10. Condition (1) is satisfied by fiat.

### 78.20. Higher direct images and algebraic stacks

072 F Let $g: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stacks over $S$. In the sections above we have constructed a morphism of ringed topoi $g: \operatorname{Sh}\left(\mathcal{X}_{\tau}\right) \rightarrow \operatorname{Sh}\left(\mathcal{Y}_{\tau}\right)$ for each $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. In the chapter on cohomology of sites we have explained how to define higher direct images. Hence the derived direct image $R g_{*} \mathcal{F}$ is defined as $g_{*} \mathcal{I}^{\bullet}$ where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $A b\left(\mathcal{X}_{\tau}\right)$. The $i$ th higher direct image $R^{i} g_{*} \mathcal{F}$ is the $i$ th cohomology of the derived direct image. Important: it matters which topology $\tau$ is used here!
If $\mathcal{F}$ is a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules which is a sheaf in the $\tau$-topology, then we use injective resolutions in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ to compute derived direct image and higher direct images.
So far our only tool to compute the higher direct images of $g_{*}$ is the result on Čech complexes proved above. This requires the choice of a "covering" $f: \mathcal{U} \rightarrow \mathcal{X}$. If $\mathcal{U}$ is an algebraic space, then $f: \mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 76.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack $\mathcal{X}$ by a scheme.

072G Proposition 78.20.1. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ and $g: \mathcal{X} \rightarrow \mathcal{Y}$ be composable 1-morphisms of algebraic stacks.
(1) Assume that $f$ is representable by algebraic spaces, surjective and smooth. (a) If $\mathcal{F}$ is in $A b\left(\mathcal{X}_{\text {étale }}\right)$ then there is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

in $A b\left(\mathcal{Y}_{\text {étale }}\right)$ with higher direct images computed in the étale topology.
(b) If $\mathcal{F}$ is in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ then there is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

in $\operatorname{Mod}\left(\mathcal{Y}_{\text {étale }}, \mathcal{O}_{\mathcal{Y}}\right)$.
(2) Assume that $f$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation.
(a) If $\mathcal{F}$ is in $A b(\mathcal{X})$ then there is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

in $A b(\mathcal{Y})$ with higher direct images computed in the fppf topology.
(b) If $\mathcal{F}$ is in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ then there is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

$$
\text { in } \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

Proof. To see this we will check the hypotheses (1) - (4) of Lemma 78.18.11 and Lemma 78.18.12. The 1-morphism $f$ is faithful by Algebraic Stacks, Lemma 76.15.2. This proves (4). Hypothesis (3) follows from the fact that $\mathcal{U}$ is an algebraic stack, see Lemma 78.16.2. To see (2) apply Lemma 78.18.10. Condition (1) is satisfied by fiat in all four cases.

Here is a description of higher direct images for a morphism of algebraic stacks.
075G Lemma 78.20.2. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of algebraic stack $\underbrace{4}$ over $S$. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Let $\mathcal{F}$ be an object of $\operatorname{Ab}\left(\mathcal{X}_{\tau}\right)$ or $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$. Then the sheaf $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf

$$
y \longmapsto H_{\tau}^{i}\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, p r^{-1} \mathcal{F}\right)
$$

Here $y$ is a typical object of $\mathcal{Y}$ lying over the scheme $V$.
Proof. Choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^{\bullet}$. By the formula for pushforward 78.5.0.1 we see that $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf which associates to $y$ the cohomology of the complex

$$
\begin{gathered}
\Gamma\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{I}^{i-1}\right) \\
\downarrow \\
\Gamma\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{I}^{i}\right) \\
\downarrow \\
\Gamma\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{I}^{i+1}\right)
\end{gathered}
$$

Since $\mathrm{pr}^{-1}$ is exact, it suffices to show that $\mathrm{pr}^{-1}$ preserves injectives. This follows from Lemmas 78.16 .5 and 78.16 .6 as well as the fact that pr is a representable morphism of algebraic stacks (so that pr is faithful by Algebraic Stacks, Lemma 76.15 .2 and that $(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ has equalizers by Lemma 78.16.2.

Here is a trivial base change result.
075H Lemma 78.20.3. Let $S$ be a scheme. Let $\tau \in\{$ Zariski,étale, smooth,syntomic, fppf\}. Let

be a 2-cartesian diagram of algebraic stacks over $S$. Then the base change map is an isomorphism

$$
g^{-1} R f_{*} \mathcal{F} \longrightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

functorial for $\mathcal{F}$ in $A b\left(\mathcal{X}_{\tau}\right)$ or $\mathcal{F}$ in $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$.
Proof. The isomorphism $g^{-1} f_{*} \mathcal{F}=f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$ is Lemma 78.5.1 (and it holds for arbitrary presheaves). For the derived direct images, there is a base change map because the morphisms $g$ and $g^{\prime}$ are flat, see Cohomology on Sites, Section 21.15. To see that this map is a quasi-isomorphism we can use that for an object $y^{\prime}$ of $\mathcal{Y}^{\prime}$ over a scheme $V$ there is an equivalence

$$
(S c h / V)_{f p p f} \times_{g\left(y^{\prime}\right), \mathcal{Y}} \mathcal{X}=(S c h / V)_{f p p f} \times_{y^{\prime}, \mathcal{Y}^{\prime}}\left(\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}\right)
$$

We conclude that the induced map $g^{-1} R^{i} f_{*} \mathcal{F} \rightarrow R^{i} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$ is an isomorphism by Lemma 78.20 .2 .

[^202]
### 78.21. Comparison

073 L In this section we collect some results on comparing cohomology defined using stacks and using algebraic spaces.
075L Lemma 78.21.1. Let $S$ be a scheme. Let $\mathcal{X}$ be an algebraic stack over $S$ representable by the algebraic space $F$.
(1) $\left.\mathcal{I}\right|_{F_{\text {étale }}}$ is injective in $A b\left(F_{\text {étale }}\right)$ for $\mathcal{I}$ injective in $A b\left(\mathcal{X}_{\text {étale }}\right)$, and
(2) $\left.\mathcal{I}\right|_{F_{\text {étale }}}$ is injective in $\operatorname{Mod}\left(F_{\text {étale }}, \mathcal{O}_{F}\right)$ for $\mathcal{I}$ injective in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}\right)$.

Proof. This follows formally from the fact that the restriction functor $\pi_{F, *}=$ $i_{F}^{-1}$ (see Lemma 78.10.1 is an exact left adjoint of $i_{F, *}$, see Homology, Lemma 12.25 .1 .

075N Lemma 78.21.2. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over $S$. Assume $\mathcal{X}, \mathcal{Y}$ are representable by algebraic spaces $F, G$. Denote $f: F \rightarrow G$ the induced morphism of algebraic spaces.
(1) For any $\mathcal{F} \in A b\left(\mathcal{X}_{\text {étale }}\right)$ we have

$$
\left.\left(R f_{*} \mathcal{F}\right)\right|_{G_{\text {etale }}}=R f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{F_{\text {etale }}}\right)
$$

in $D\left(G_{\text {étale }}\right)$.
(2) For any object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ we have

$$
\left.\left(R f_{*} \mathcal{F}\right)\right|_{G_{\text {étale }}}=R f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{F_{\text {étale }}}\right)
$$

in $D\left(\mathcal{O}_{G}\right)$.
Proof. Follows immediately from Lemma 78.21 .1 and 78.10 .2 .1 on choosing an injective resolution of $\mathcal{F}$.

075P Lemma 78.21.3. Let $S$ be a scheme. Consider a 2 -fibre product square

of algebraic stacks over $S$. Assume that $f$ is representable by algebraic spaces and that $\mathcal{Y}^{\prime}$ is representable by an algebraic space $G^{\prime}$. Then $\mathcal{X}^{\prime}$ is representable by an algebraic space $F^{\prime}$ and denoting $f^{\prime}: F^{\prime} \rightarrow G^{\prime}$ the induced morphism of algebraic spaces we have

$$
\left.g^{-1}\left(R f_{*} \mathcal{F}\right)\right|_{G_{\text {étale }}^{\prime}}=R f_{\text {small }, *}^{\prime}\left(\left.\left(g^{\prime}\right)^{-1} \mathcal{F}\right|_{F_{\text {étale }}^{\prime}}\right)
$$

for any $\mathcal{F}$ in $A b\left(\mathcal{X}_{\text {étale }}\right)$ or in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$
Proof. Follows formally on combining Lemmas 78.20 .3 and 78.21 .2 ,

### 78.22. Change of topology

075 Q Here is a technical lemma which tells us that the fppf cohomology of a locally quasicoherent sheaf is equal to its étale cohomology provided the comparison maps are isomorphisms for morphisms of $\mathcal{X}$ lying over flat morphisms.
076 T Lemma 78.22.1. Let $S$ be a scheme. Let $\mathcal{X}$ be an algebraic stack over $S$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. Assume
(a) $\mathcal{F}$ is locally quasi-coherent, and
(b) for any morphism $\varphi: x \rightarrow y$ of $\mathcal{X}$ which lies over a morphism of schemes $f: U \rightarrow V$ which is flat and locally of finite presentation the comparison map $c_{\varphi}:\left.\left.f_{\text {small }}^{*} \mathcal{F}\right|_{V_{\text {étale }}} \rightarrow \mathcal{F}\right|_{U_{\text {étale }}}$ of (78.9.4.1) is an isomorphism.
Then $\mathcal{F}$ is a sheaf for the fppf topology.
Proof. Let $\left\{x_{i} \rightarrow x\right\}$ be an fppf covering of $\mathcal{X}$ lying over the fppf covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of schemes over $S$. By assumption the restriction $\mathcal{G}=\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is quasi-coherent and the comparison maps $\left.f_{i, \text { small }}^{*} \mathcal{G} \rightarrow \mathcal{F}\right|_{U_{i, \text { étale }}}$ are isomorphisms. Hence the sheaf condition for $\mathcal{F}$ and the covering $\left\{x_{i} \rightarrow x\right\}$ is equivalent to the sheaf condition for $\mathcal{G}^{a}$ on $(S c h / U)_{\text {fppf }}$ and the covering $\left\{U_{i} \rightarrow U\right\}$ which holds by Descent, Lemma 34.7.1.

075R Lemma 78.22.2. Let $S$ be a scheme. Let $\mathcal{X}$ be an algebraic stack over $S$. Let $\mathcal{F}$ be a presheaf $\mathcal{O}_{\mathcal{X}}$-module such that
(a) $\mathcal{F}$ is locally quasi-coherent, and
(b) for any morphism $\varphi: x \rightarrow y$ of $\mathcal{X}$ which lies over a morphism of schemes $f: U \rightarrow V$ which is flat and locally of finite presentation, the comparison map $c_{\varphi}:\left.\left.f_{\text {small }}^{*} \mathcal{F}\right|_{V_{\text {étale }}} \rightarrow \mathcal{F}\right|_{U_{\text {étale }}}$ of (78.9.4.1) is an isomorphism.
Then $\mathcal{F}$ is an $\mathcal{O}_{\mathcal{X}}$-module and we have the following
(1) If $\epsilon: \mathcal{X}_{\text {fppf }} \rightarrow \mathcal{X}_{\text {étale }}$ is the comparison morphism, then $R \epsilon_{*} \mathcal{F}=\epsilon_{*} \mathcal{F}$.
(2) The cohomology groups $H_{f p p f}^{p}(\mathcal{X}, \mathcal{F})$ are equal to the cohomology groups computed in the étale topology on $\mathcal{X}$. Similarly for the cohomology groups $H_{f p p f}^{p}(x, \mathcal{F})$ and the derived versions $R \Gamma(\mathcal{X}, \mathcal{F})$ and $R \Gamma(x, \mathcal{F})$.
(3) If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$ then $R^{i} f_{*} \mathcal{F}$ is equal to the fppf-sheafification of the higher direct image computed in the étale cohomology. Similarly for derived pushforward.

Proof. The assertion that $\mathcal{F}$ is an $\mathcal{O}_{\mathcal{X}}$-module follows from Lemma 78.22.1. Note that $\epsilon$ is a morphism of sites given by the identity functor on $\mathcal{X}$. The sheaf $R^{p} \epsilon_{*} \mathcal{F}$ is therefore the sheaf associated to the presheaf $x \mapsto H_{f p p f}^{p}(x, \mathcal{F})$, see Cohomology on Sites, Lemma 21.8.4 To prove (1) it suffices to show that $H_{f p p f}^{p}(x, \mathcal{F})=0$ for $p>0$ whenever $x$ lies over an affine scheme $U$. By Lemma 78.15.1 we have $H_{f p p f}^{p}(x, \mathcal{F})=H^{p}\left((S c h / U)_{f p p f}, x^{-1} \mathcal{F}\right)$. Combining Descent, Lemma 34.8.4 with Cohomology of Schemes, Lemma 29.2.2 we see that these cohomology groups are zero.

We have seen above that $\epsilon_{*} \mathcal{F}$ and $\mathcal{F}$ are the sheaves on $\mathcal{X}_{\text {étale }}$ and $\mathcal{X}_{\text {fppf }}$ corresponding to the same presheaf on $\mathcal{X}$ (and this is true more generally for any sheaf in the fppf topology on $\mathcal{X}$ ). We often abusively identify $\mathcal{F}$ and $\epsilon_{*} \mathcal{F}$ and this is the sense in which parts (2) and (3) of the lemma should be understood. Thus part (2) follows formally from (1) and the Leray spectral sequence, see Cohomology on Sites, Lemma 21.14.6

Finally we prove (3). The sheaf $R^{i} f_{*} \mathcal{F}$ (resp. $R f_{\text {étale }, *} \mathcal{F}$ ) is the sheaf associated to the presheaf

$$
y \longmapsto H_{\tau}^{i}\left((S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{F}\right)
$$

where $\tau$ is $\operatorname{fppf}$ (resp. étale), see Lemma 78.20 .2 Note that $\mathrm{pr}^{-1} \mathcal{F}$ satisfies properties (a) and (b) also (by Lemmas 78.11.6 and 78.9.3), hence these two presheaves are equal by (2). This immediately implies (3).

We will use the following lemma to compare étale cohomology of sheaves on algebraic stacks with cohomology on the lisse-étale topos.

07AK Lemma 78.22.3. Let $S$ be a scheme. Let $\mathcal{X}$ be an algebraic stack over $S$. Let $\tau=$ étale (resp. $\tau=$ fppf). Let $\mathcal{X}^{\prime} \subset \mathcal{X}$ be a full subcategory with the following properties
(1) if $x \rightarrow x^{\prime}$ is a morphism of $\mathcal{X}$ which lies over a smooth (resp. flat and locally finitely presented) morphism of schemes and $x^{\prime} \in \mathrm{Ob}\left(\mathcal{X}^{\prime}\right)$, then $x \in \operatorname{Ob}\left(\mathcal{X}^{\prime}\right)$, and
(2) there exists an object $x \in \operatorname{Ob}\left(\mathcal{X}^{\prime}\right)$ lying over a scheme $U$ such that the associated 1-morphism $x:(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}$ is smooth and surjective.
We get a site $\mathcal{X}_{\tau}^{\prime}$ by declaring a covering of $\mathcal{X}^{\prime}$ to be any family of morphisms $\left\{x_{i} \rightarrow x\right\}$ in $\mathcal{X}^{\prime}$ which is a covering in $\mathcal{X}_{\tau}$. Then the inclusion functor $\mathcal{X}^{\prime} \rightarrow \mathcal{X}_{\tau}$ is fully faithful, cocontinuous, and continuous, whence defines a morphism of topoi

$$
g: \operatorname{Sh}\left(\mathcal{X}_{\tau}^{\prime}\right) \longrightarrow \operatorname{Sh}\left(\mathcal{X}_{\tau}\right)
$$

and $H^{p}\left(\mathcal{X}_{\tau}^{\prime}, g^{-1} \mathcal{F}\right)=H^{p}\left(\mathcal{X}_{\tau}, \mathcal{F}\right)$ for all $p \geq 0$ and all $\mathcal{F} \in A b\left(\mathcal{X}_{\tau}\right)$.
Proof. Note that assumption (1) implies that if $\left\{x_{i} \rightarrow x\right\}$ is a covering of $\mathcal{X}_{\tau}$ and $x \in \operatorname{Ob}\left(\mathcal{X}^{\prime}\right)$, then we have $x_{i} \in \operatorname{Ob}\left(\mathcal{X}^{\prime}\right)$. Hence we see that $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is continuous and cocontinuous as the coverings of objects of $\mathcal{X}_{\tau}^{\prime}$ agree with their coverings seen as objects of $\mathcal{X}_{\tau}$. We obtain the morphism $g$ and the functor $g^{-1}$ is identified with the restriction functor, see Sites, Lemma 7.20.5.

In particular, if $\left\{x_{i} \rightarrow x\right\}$ is a covering in $\mathcal{X}_{\tau}^{\prime}$, then for any abelian sheaf $\mathcal{F}$ on $\mathcal{X}$ then

$$
\check{H}^{p}\left(\left\{x_{i} \rightarrow x\right\}, g^{-1} \mathcal{F}\right)=\check{H}^{p}\left(\left\{x_{i} \rightarrow x\right\}, \mathcal{F}\right)
$$

Thus if $\mathcal{I}$ is an injective abelian sheaf on $\mathcal{X}_{\tau}$ then we see that the higher Čech cohomology groups are zero (Cohomology on Sites, Lemma21.11.2). Hence $H^{p}\left(x, g^{-1} \mathcal{I}\right)=$ 0 for all objects $x$ of $\mathcal{X}^{\prime}$ (Cohomology on Sites, Lemma 21.11.9). In other words injective abelian sheaves on $\mathcal{X}_{\tau}$ are right acyclic for the functor $H^{0}\left(x, g^{-1}-\right)$. It follows that $H^{p}\left(x, g^{-1} \mathcal{F}\right)=H^{p}(x, \mathcal{F})$ for all $\mathcal{F} \in A b(\mathcal{X})$ and all $x \in \operatorname{Ob}\left(\mathcal{X}^{\prime}\right)$.

Choose an object $x \in \mathcal{X}^{\prime}$ lying over a scheme $U$ as in assumption (2). In particular $\mathcal{X} / x \rightarrow \mathcal{X}$ is a morphism of algebraic stacks which representable by algebraic spaces, surjective, and smooth. (Note that $\mathcal{X} / x$ is equivalent to $(S c h / U)_{f p p f}$, see Lemma 78.9.1.) The map of sheaves

$$
h_{x} \longrightarrow *
$$

in $\operatorname{Sh}\left(\mathcal{X}_{\tau}\right)$ is surjective. Namely, for any object $x^{\prime}$ of $\mathcal{X}$ there exists a $\tau$-covering $\left\{x_{i}^{\prime} \rightarrow x^{\prime}\right\}$ such that there exist morphisms $x_{i}^{\prime} \rightarrow x$, see Lemma 78.18.10. Since $g$ is exact, the map of sheaves

$$
g^{-1} h_{x} \longrightarrow *=g^{-1} *
$$

in $\operatorname{Sh}\left(\mathcal{X}_{\tau}^{\prime}\right)$ is surjective also. Let $h_{x, n}$ be the $(n+1)$-fold product $h_{x} \times \ldots \times h_{x}$. Then we have spectral sequences
07AL (78.22.3.1)

$$
E_{1}^{p, q}=H^{q}\left(h_{x, p}, \mathcal{F}\right) \Rightarrow H^{p+q}\left(\mathcal{X}_{\tau}, \mathcal{F}\right)
$$

and
07AM
(78.22.3.2)

$$
E_{1}^{p, q}=H^{q}\left(g^{-1} h_{x, p}, g^{-1} \mathcal{F}\right) \Rightarrow H^{p+q}\left(\mathcal{X}_{\tau}^{\prime}, g^{-1} \mathcal{F}\right)
$$

see Cohomology on Sites, Lemma 21.13 .2
Case I: $\mathcal{X}$ has a final object $x$ which is also an object of $\mathcal{X}^{\prime}$. This case follows immediately from the discussion in the second paragraph above.

Case II: $\mathcal{X}$ is representable by an algebraic space $F$. In this case the sheaves $h_{x, n}$ are representable by an object $x_{n}$ in $\mathcal{X}$. (Namely, if $\mathcal{S}_{F}=\mathcal{X}$ and $x: U \rightarrow F$ is the given object, then $h_{x, n}$ is representable by the object $U \times_{F} \ldots \times_{F} U \rightarrow F$ of $\mathcal{S}_{F}$.) It follows that $H^{q}\left(h_{x, p}, \mathcal{F}\right)=H^{q}\left(x_{p}, \mathcal{F}\right)$. The morphisms $x_{n} \rightarrow x$ lie over smooth morphisms of schemes, hence $x_{n} \in \mathcal{X}^{\prime}$ for all $n$. Hence $H^{q}\left(g^{-1} h_{x, p}, g^{-1} \mathcal{F}\right)=H^{q}\left(x_{p}, g^{-1} \mathcal{F}\right)$. Thus in the two spectral sequences 78.22.3.1) and 78.22.3.2) above the $E_{1}^{p, q}$ terms agree by the discussion in the second paragraph. The lemma follows in Case II as well.
Case III: $\mathcal{X}$ is an algebraic stack. We claim that in this case the cohomology groups $H^{q}\left(h_{x, p}, \mathcal{F}\right)$ and $H^{q}\left(g^{-1} h_{x, n}, g^{-1} \mathcal{F}\right)$ agree by Case II above. Once we have proved this the result will follow as before.
Namely, consider the category $\mathcal{X} / h_{x, n}$, see Sites, Lemma 7.29.3. Since $h_{x, n}$ is the $(n+1)$-fold product of $h_{x}$ an object of this category is an ( $n+2$ )-tuple ( $y, s_{0}, \ldots, s_{n}$ ) where $y$ is an object of $\mathcal{X}$ and each $s_{i}: y \rightarrow x$ is a morphism of $\mathcal{X}$. This is a category over $(S c h / S)_{f p p f}$. There is an equivalence

$$
\mathcal{X} / h_{x, n} \longrightarrow(S c h / U)_{f p p f} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}}(S c h / U)_{f p p f}=: \mathcal{U}_{n}
$$

over $(S c h / S)_{f p p f}$. Namely, if $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$ also denotes the 1-morphism associated with $x$ and $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ the structure functor, then we can think of $\left(y, s_{0}, \ldots, s_{n}\right)$ as $\left(y, f_{0}, \ldots, f_{n}, \alpha_{0}, \ldots, \alpha_{n}\right)$ where $y$ is an object of $\mathcal{X}, f_{i}: p(y) \rightarrow$ $p(x)$ is a morphism of schemes, and $\alpha_{i}: y \rightarrow x\left(f_{i}\right)$ an isomorphism. The category of $2 n+3$-tuples $\left(y, f_{0}, \ldots, f_{n}, \alpha_{0}, \ldots, \alpha_{n}\right)$ is an incarnation of the $(n+1)$-fold fibred product $\mathcal{U}_{n}$ of algebraic stacks displayed above, as we discussed in Section 78.17 . By Cohomology on Sites, Lemma 21.13.3 we have

$$
H^{p}\left(\mathcal{U}_{n},\left.\mathcal{F}\right|_{\mathcal{U}_{n}}\right)=H^{p}\left(\mathcal{X} / h_{x, n},\left.\mathcal{F}\right|_{\mathcal{X} / h_{x, n}}\right)=H^{p}\left(h_{x, n}, \mathcal{F}\right) .
$$

Finally, we discuss the "primed" analogue of this. Namely, $\mathcal{X}^{\prime} / h_{x, n}$ corresponds, via the equivalence above to the full subcategory $\mathcal{U}_{n}^{\prime} \subset \mathcal{U}_{n}$ consisting of those tuples $\left(y, f_{0}, \ldots, f_{n}, \alpha_{0}, \ldots, \alpha_{n}\right)$ with $y \in \mathcal{X}^{\prime}$. Hence certainly property (1) of the statement of the lemma holds for the inclusion $\mathcal{U}_{n}^{\prime} \subset \mathcal{U}_{n}$. To see property (2) choose an object $\xi=\left(y, s_{0}, \ldots, s_{n}\right)$ which lies over a scheme $W$ such that $(S c h / W)_{\text {fppf }} \rightarrow$ $\mathcal{U}_{n}$ is smooth and surjective (this is possible as $\mathcal{U}_{n}$ is an algebraic stack). Then $(S c h / W)_{f p p f} \rightarrow \mathcal{U}_{n} \rightarrow(S c h / U)_{\text {fppf }}$ is smooth as a composition of base changes of the morphism $x:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemmas 76.10 .6 and 76.10.5. Thus axiom (1) for $\mathcal{X}$ implies that $y$ is an object of $\mathcal{X}^{\prime}$ whence $\xi$ is an object of $\mathcal{U}_{n}^{\prime}$. Using again

$$
H^{p}\left(\mathcal{U}_{n}^{\prime},\left.\mathcal{F}\right|_{\mathcal{U}_{n}^{\prime}}\right)=H^{p}\left(\mathcal{X}^{\prime} / h_{x, n},\left.\mathcal{F}\right|_{\mathcal{X}^{\prime} / h_{x, n}}\right)=H^{p}\left(g^{-1} h_{x, n}, g^{-1} \mathcal{F}\right)
$$

we now can use Case II for $\mathcal{U}_{n}^{\prime} \subset \mathcal{U}_{n}$ to conclude.

## CHAPTER 79

## Criteria for Representability

05XE

### 79.1. Introduction

05XF The purpose of this chapter is to find criteria guaranteeing that a stack in groupoids over the category of schemes with the fppf topology is an algebraic stack. Historically, this often involved proving that certain functors were representable, see Grothendieck's lectures Gro95a, Gro95b, Gro95e, Gro95f, Gro95c, and Gro95d. This explains the title of this chapter. Another important source of this material comes from the work of Artin, see Art69b], Art70, Art73, Art71b, Art71a, Art69a, Art69c, and Art74.
Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 81.1 for an explanation.

### 79.2. Conventions

05 XG The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 76.2 .

### 79.3. What we already know

05XH The analogue of this chapter for algebraic spaces is the chapter entitled "Bootstrap", see Bootstrap, Section 67.1. That chapter already contains some representability results. Moreover, some of the preliminary material treated there we already have worked out in the chapter on algebraic stacks. Here is a list:
(1) We discuss morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 67.3. In Algebraic Stacks, Section 76.9 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
(2) We discuss properties of morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 67.4. In Algebraic Stacks, Section 76.10 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
(3) We proved that if $F$ is a sheaf whose diagonal is representable by algebraic spaces and which has an étale covering by an algebraic space, then $F$ is an algebraic space, see Bootstrap, Theorem 67.6.1. (This is a weak version of the result in the next item on the list.)
05XI
(4) We proved that if $F$ is a sheaf and if there exists an algebraic space $U$ and a morphism $U \rightarrow F$ which is representable by algebraic spaces, surjective,
flat, and locally of finite presentation, then $F$ is an algebraic space, see Bootstrap, Theorem 67.10.1.
(5) We have also proved the "smooth" analogue of (4) for algebraic stacks: If $\mathcal{X}$ is a stack in groupoids over $(S c h / S)_{f p p f}$ and if there exists a stack in groupoids $\mathcal{U}$ over $(S c h / S)_{f p p f}$ which is representable by an algebraic space and a 1-morphism $u: \mathcal{U} \rightarrow \mathcal{X}$ which is representable by algebraic spaces, surjective, and smooth then $\mathcal{X}$ is an algebraic stack, see Algebraic Stacks, Lemma 76.15.3
Our first task now is to prove the analogue of (4) for algebraic stacks in general; it is Theorem 79.16.1.

### 79.4. Morphisms of stacks in groupoids

05XJ This section is preliminary and should be skipped on a first reading.
05XK Lemma 79.4.1. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be 1 -morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $\mathcal{X} \rightarrow \mathcal{Z}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ are representable by algebraic spaces and étale so is $\mathcal{X} \rightarrow \mathcal{Y}$.
Proof. Let $\mathcal{U}$ be a representable category fibred in groupoids over $S$. Let $f: \mathcal{U} \rightarrow \mathcal{Y}$ be a 1 -morphism. We have to show that $\mathcal{X} \times \mathcal{Y} \mathcal{U}$ is representable by an algebraic space and étale over $\mathcal{U}$. Consider the composition $h: \mathcal{U} \rightarrow \mathcal{Z}$. Then

$$
\mathcal{X} \times_{\mathcal{Z}} \mathcal{U} \longrightarrow \mathcal{Y} \times_{\mathcal{Z}} \mathcal{U}
$$

is a 1-morphism between categories fibres in groupoids which are both representable by algebraic spaces and both étale over $\mathcal{U}$. Hence by Properties of Spaces, Lemma 53.15 .6 this is represented by an étale morphism of algebraic spaces. Finally, we obtain the result we want as the morphism $f$ induces a morphism $\mathcal{U} \rightarrow \mathcal{Y} \times{ }_{\mathcal{Z}} \mathcal{U}$ and we have

$$
\mathcal{X} \times_{\mathcal{Y}} \mathcal{U}=\left(\mathcal{X} \times_{\mathcal{Z}} \mathcal{U}\right) \times_{\left(\mathcal{Y} \times{ }_{\mathcal{Z}} \mathcal{U}\right)} \mathcal{U}
$$

05XL Lemma 79.4.2. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Suppose that $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ are 1-morphisms. If
(1) $\mathcal{Y}, \mathcal{Z}$ are representable by algebraic spaces $Y, Z$ over $S$,
(2) the associated morphism of algebraic spaces $Y \rightarrow Z$ is surjective, flat and locally of finite presentation, and
(3) $\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X}$ is a stack in setoids,
then $\mathcal{X}$ is a stack in setoids.
Proof. This is a special case of Stacks, Lemma 8.6.10.
The following lemma is the analogue of Algebraic Stacks, Lemma 76.15 .3 and will be superseded by the stronger Theorem 79.16.1.

05XW Lemma 79.4.3. Let $S$ be a scheme. Let $u: \mathcal{U} \rightarrow \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppff }}$. If
(1) $\mathcal{U}$ is representable by an algebraic space, and
(2) $u$ is representable by algebraic spaces, surjective, flat and locally of finite presentation,
then $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ representable by algebraic spaces.

Proof. Given two schemes $T_{1}, T_{2}$ over $S$ denote $\mathcal{T}_{i}=\left(S c h / T_{i}\right)_{\text {fppf }}$ the associated representable fibre categories. Suppose given 1-morphisms $f_{i}: \mathcal{T}_{i} \rightarrow \mathcal{X}$. According to Algebraic Stacks, Lemma 76.10 .11 it suffices to prove that the 2 -fibered product $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ is representable by an algebraic space. By Stacks, Lemma 8.6 .8 this is in any case a stack in setoids. Thus $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ corresponds to some sheaf $F$ on $(S c h / S)_{f p p f}$, see Stacks, Lemma 8.6.3. Let $U$ be the algebraic space which represents $\mathcal{U}$. By assumption

$$
\mathcal{T}_{i}^{\prime}=\mathcal{U} \times_{u, \mathcal{X}, f_{i}} \mathcal{T}_{i}
$$

is representable by an algebraic space $T_{i}^{\prime}$ over $S$. Hence $\mathcal{T}_{1}^{\prime} \times{ }_{\mathcal{U}} \mathcal{T}_{2}^{\prime}$ is representable by the algebraic space $T_{1}^{\prime} \times{ }_{U} T_{2}^{\prime}$. Consider the commutative diagram

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}_{1}^{\prime} \times \mathcal{U} \mathcal{T}_{2}^{\prime} \rightarrow$ $\mathcal{T}_{1} \times \mathcal{X} \mathcal{T}_{2}$ is the "base change" of $\mathcal{U} \rightarrow \mathcal{X}$, more precisely the diagram

is a 2-fibre square. Hence $T_{1}^{\prime} \times_{U} T_{2}^{\prime} \rightarrow F$ is representable by algebraic spaces, flat, locally of finite presentation and surjective, see Algebraic Stacks, Lemmas $76.9 .6,76.9 .7,76.10 .4$, and 76.10 .6 . Therefore $F$ is an algebraic space by Bootstrap, Theorem 67.10.1 and we win.

07WG Lemma 79.4.4. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. The following are equivalent
(1) $\Delta_{\Delta}: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X} \times \mathcal{X} \mathcal{X}$ is representable by algebraic spaces,
(2) for every 1 -morphism $\mathcal{V} \rightarrow \mathcal{X} \times \mathcal{X}$ with $\mathcal{V}$ representable (by a scheme) and the fibre product $\mathcal{Y}=\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}} \mathcal{V}$ has diagonal representable by algebraic spaces.

Proof. Although this is a bit of a brain twister, it is completely formal. Namely, recall that $\mathcal{X} \times{ }_{\mathcal{X} \times \mathcal{X}} \mathcal{X}=\mathcal{I}_{\mathcal{X}}$ is the inertia of $\mathcal{X}$ and that $\Delta_{\Delta}$ is the identity section of $\mathcal{I}_{\mathcal{X}}$, see Categories, Section 4.33. Thus condition (1) says the following: Given a scheme $V$, an object $x$ of $\mathcal{X}$ over $V$, and a morphism $\alpha: x \rightarrow x$ of $\mathcal{X}_{V}$ the condition " $\alpha=\operatorname{id}_{x}$ " defines an algebraic space over $V$. (In other words, there exists a monomorphism of algebraic spaces $W \rightarrow V$ such that a morphism of schemes $f: T \rightarrow V$ factors through $W$ if and only if $f^{*} \alpha=\operatorname{id}_{f^{*} x}$.)

On the other hand, let $V$ be a scheme and let $x, y$ be objects of $\mathcal{X}$ over $V$. Then $(x, y)$ define a morphism $\mathcal{V}=(S c h / V)_{f p p f} \rightarrow \mathcal{X} \times \mathcal{X}$. Next, let $h: V^{\prime} \rightarrow V$ be a morphism of schemes and let $\alpha: h^{*} x \rightarrow h^{*} y$ and $\beta: h^{*} x \rightarrow h^{*} y$ be morphisms of $\mathcal{X}_{V^{\prime}}$. Then $(\alpha, \beta)$ define a morphism $\mathcal{V}^{\prime}=(S c h / V)_{f p p f} \rightarrow \mathcal{Y} \times \mathcal{Y}$. Condition (2) now says that (with any choices as above) the condition " $\alpha=\beta$ " defines an algebraic space over $V$.
To see the equivalence, given $(\alpha, \beta)$ as in (2) we see that (1) implies that " $\alpha^{-1} \circ \beta=$ $\mathrm{id}_{h^{*} x}$ " defines an algebraic space. The implication (2) $\Rightarrow$ (1) follows by taking $h=\mathrm{id}_{V}$ and $\beta=\mathrm{id}_{x}$.

### 79.5. Limit preserving on objects

06 CT Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. We will say that $p$ is limit preserving on objects if the following condition holds: Given any data consisting of
(1) an affine scheme $U=\lim _{i \in I} U_{i}$ which is written as the directed limit of affine schemes $U_{i}$ over $S$,
(2) an object $y_{i}$ of $\mathcal{Y}$ over $U_{i}$ for some $i$,
(3) an object $x$ of $\mathcal{X}$ over $U$, and
(4) an isomorphism $\gamma:\left.p(x) \rightarrow y_{i}\right|_{U}$,
then there exists an $i^{\prime} \geq i$, an object $x_{i^{\prime}}$ of $\mathcal{X}$ over $U_{i^{\prime}}$, an isomorphism $\beta:\left.x_{i^{\prime}}\right|_{U} \rightarrow x$, and an isomorphism $\gamma_{i^{\prime}}:\left.p\left(x_{i^{\prime}}\right) \rightarrow y_{i}\right|_{U_{i^{\prime}}}$ such that

06CU

commutes. In this situation we say that " $\left(i^{\prime}, x_{i^{\prime}}, \beta, \gamma_{i^{\prime}}\right)$ is a solution to the problem posed by our data (1), (2), (3), (4)". The motivation for this definition comes from Limits of Spaces, Lemma 57.3.2.
06CV Lemma 79.5.1. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p: \mathcal{X} \rightarrow \mathcal{Y}$ is limit preserving on objects, then so is the base change $p^{\prime}: \mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Z}$ of $p$ by $q$.
Proof. This is formal. Let $U=\lim _{i \in I} U_{i}$ be the directed limit of affine schemes $U_{i}$ over $S$, let $z_{i}$ be an object of $\mathcal{Z}$ over $U_{i}$ for some $i$, let $w$ be an object of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $U$, and let $\delta:\left.p^{\prime}(w) \rightarrow z_{i}\right|_{U}$ be an isomorphism. We may write $w=(U, x, z, \alpha)$ for some object $x$ of $\mathcal{X}$ over $U$ and object $z$ of $\mathcal{Z}$ over $U$ and isomorphism $\alpha: p(x) \rightarrow q(z)$. Note that $p^{\prime}(w)=z$ hence $\delta:\left.z \rightarrow z_{i}\right|_{U}$. Set $y_{i}=q\left(z_{i}\right)$ and $\gamma=q(\delta) \circ \alpha:\left.p(x) \rightarrow y_{i}\right|_{U}$. As $p$ is limit preserving on objects there exists an $i^{\prime} \geq i$ and an object $x_{i^{\prime}}$ of $\mathcal{X}$ over $U_{i^{\prime}}$ as well as isomorphisms $\beta:\left.x_{i^{\prime}}\right|_{U} \rightarrow x$ and $\gamma_{i^{\prime}}:\left.p\left(x_{i^{\prime}}\right) \rightarrow y_{i}\right|_{U_{i^{\prime}}}$ such that 79.5.0.1 commutes. Then we consider the object $w_{i^{\prime}}=\left(U_{i^{\prime}}, x_{i^{\prime}},\left.z_{i}\right|_{U_{i^{\prime}}}, \gamma_{i^{\prime}}\right)$ of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $U_{i^{\prime}}$ and define isomorphisms

$$
\left.w_{i^{\prime}}\right|_{U}=\left(U,\left.x_{i^{\prime}}\right|_{U},\left.z_{i}\right|_{U},\left.\gamma_{i^{\prime}}\right|_{U}\right) \xrightarrow{\left(\beta, \delta^{-1}\right)}(U, x, z, \alpha)=w
$$

and

$$
p^{\prime}\left(w_{i^{\prime}}\right)=\left.\left.z_{i}\right|_{U_{i^{\prime}}} \xrightarrow{\text { id }} z_{i}\right|_{U_{i^{\prime}}} .
$$

These combine to give a solution to the problem.

06CW Lemma 79.5.2. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p$ and $q$ are limit preserving on objects, then so is the composition $q \circ p$.

Proof. This is formal. Let $U=\lim _{i \in I} U_{i}$ be the directed limit of affine schemes $U_{i}$ over $S$, let $z_{i}$ be an object of $\mathcal{Z}$ over $U_{i}$ for some $i$, let $x$ be an object of $\mathcal{X}$ over $U$, and let $\gamma:\left.q(p(x)) \rightarrow z_{i}\right|_{U}$ be an isomorphism. As $q$ is limit preserving on objects there exist an $i^{\prime} \geq i$, an object $y_{i^{\prime}}$ of $\mathcal{Y}$ over $U_{i^{\prime}}$, an isomorphism $\beta:\left.y_{i^{\prime}}\right|_{U} \rightarrow p(x)$, and an isomorphism $\gamma_{i^{\prime}}:\left.q\left(y_{i^{\prime}}\right) \rightarrow z_{i}\right|_{U_{i^{\prime}}}$ such that 79.5 .0 .1 is commutative. As $p$ is limit preserving on objects there exist an $i^{\prime \prime} \geq i^{\prime}$, an object $x_{i^{\prime \prime}}$ of $\mathcal{X}$ over $U_{i^{\prime \prime}}$, an isomorphism $\beta^{\prime}:\left.x_{i^{\prime \prime}}\right|_{U} \rightarrow x$, and an isomorphism $\gamma_{i^{\prime \prime}}^{\prime}:\left.p\left(x_{i^{\prime \prime}}\right) \rightarrow y_{i^{\prime}}\right|_{U_{i^{\prime \prime}}}$ such that 79.5.0.1 is commutative. The solution is to take $x_{i^{\prime \prime}}$ over $U_{i^{\prime \prime}}$ with isomorphism

$$
\left.\left.q\left(p\left(x_{i^{\prime \prime}}\right)\right) \xrightarrow{q\left(\gamma_{i^{\prime \prime}}^{\prime}\right)} q\left(y_{i^{\prime}}\right)\right|_{U_{i^{\prime \prime}}} \xrightarrow{\gamma_{i^{\prime}} \mid U_{i^{\prime \prime}}} z_{i}\right|_{U_{i^{\prime \prime}}}
$$

and isomorphism $\beta^{\prime}:\left.x_{i^{\prime \prime}}\right|_{U} \rightarrow x$. We omit the verification that 79.5.0.1 is commutative.

06CX Lemma 79.5.3. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p$ is representable by algebraic spaces, then the following are equivalent:
(1) $p$ is limit preserving on objects, and
(2) $p$ is locally of finite presentation (see Algebraic Stacks, Definition 76.10.1).

Proof. Assume (2). Let $U=\lim _{i \in I} U_{i}$ be the directed limit of affine schemes $U_{i}$ over $S$, let $y_{i}$ be an object of $\mathcal{Y}$ over $U_{i}$ for some $i$, let $x$ be an object of $\mathcal{X}$ over $U$, and let $\gamma:\left.p(x) \rightarrow y_{i}\right|_{U}$ be an isomorphism. Let $X_{y_{i}}$ denote an algebraic space over $U_{i}$ representing the 2-fibre product

$$
\left(S c h / U_{i}\right)_{\text {fppf }} \times_{y_{i}, \mathcal{Y}, p} \mathcal{X}
$$

Note that $\xi=\left(U, U \rightarrow U_{i}, x, \gamma^{-1}\right)$ defines an object of this 2-fibre product over $U$. Via the 2-Yoneda lemma $\xi$ corresponds to a morphism $f_{\xi}: U \rightarrow X_{y_{i}}$ over $U_{i}$. By Limits of Spaces, Proposition 57.3.9 there exists an $i^{\prime} \geq i$ and a morphism $f_{i^{\prime}}: U_{i^{\prime}} \rightarrow X_{y_{i}}$ such that $f_{\xi}$ is the composition of $f_{i^{\prime}}$ and the projection morphism $U \rightarrow U_{i^{\prime}}$. Also, the 2-Yoneda lemma tells us that $f_{i^{\prime}}$ corresponds to an object $\xi_{i^{\prime}}=$ $\left(U_{i^{\prime}}, U_{i^{\prime}} \rightarrow U_{i}, x_{i^{\prime}}, \alpha\right)$ of the displayed 2-fibre product over $U_{i^{\prime}}$ whose restriction to $U$ recovers $\xi$. In particular we obtain an isomorphism $\gamma: x_{i^{\prime}} \mid U \rightarrow x$. Note that $\alpha:\left.y_{i}\right|_{U_{i^{\prime}}} \rightarrow p\left(x_{i^{\prime}}\right)$. Hence we see that taking $x_{i^{\prime}}$, the isomorphism $\gamma: x_{i^{\prime}} \mid U \rightarrow x$, and the isomorphism $\beta=\alpha^{-1}:\left.p\left(x_{i^{\prime}}\right) \rightarrow y_{i}\right|_{U_{i^{\prime}}}$ is a solution to the problem.

Assume (1). Choose a scheme $T$ and a 1-morphism $y:(S c h / T)_{f p p f} \rightarrow \mathcal{Y}$. Let $X_{y}$ be an algebraic space over $T$ representing the 2 -fibre product $(S c h / T)_{f p p f} \times{ }_{y, \mathcal{Y}, p} \mathcal{X}$. We have to show that $X_{y} \rightarrow T$ is locally of finite presentation. To do this we may use Limits of Spaces, Proposition 57.3 .9 in the form described in Limits of Spaces, Remark57.3.10. Hence it suffices to show that given an affine scheme $U=\lim _{i \in I} U_{i}$ written as the directed limit of affine schemes over $T$, then $X_{y}(U)=\operatorname{colim}_{i} X_{y}\left(U_{i}\right)$. Pick any $i \in I$ and set $y_{i}=\left.y\right|_{U_{i}}$. Also denote $i^{\prime}$ an element of $I$ which is bigger than or equal to $i$. By the 2-Yoneda lemma morphisms $U \rightarrow X_{y}$ over $T$ correspond bijectively to isomorphism classes of pairs $(x, \alpha)$ where $x$ is an object of $\mathcal{X}$ over $U$ and $\alpha:\left.y\right|_{U} \rightarrow p(x)$ is an isomorphism. Of course giving $\alpha$ is, up to an inverse,
the same thing as giving an isomorphism $\gamma:\left.p(x) \rightarrow y_{i}\right|_{U}$. Similarly for morphisms $U_{i^{\prime}} \rightarrow X_{y}$ over $T$. Hence (1) guarantees that

$$
X_{y}(U)=\operatorname{colim}_{i^{\prime} \geq i} X_{y}\left(U_{i^{\prime}}\right)
$$

in this situation and we win.
06CY Lemma 79.5.4. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Assume $p$ is representable by algebraic spaces and an open immersion. Then $p$ is limit preserving on objects.

Proof. This follows from Lemma 79.5 .3 and (via the general principle Algebraic Stacks, Lemma 76.10.9 from the fact that an open immersion of algebraic spaces is locally of finite presentation, see Morphisms of Spaces, Lemma 54.28.11.

Let $S$ be a scheme. In the following lemma we need the notion of the size of an algebraic space $X$ over $S$. Namely, given a cardinal $\kappa$ we will say $X$ has $\operatorname{size}(X) \leq \kappa$ if and only if there exists a scheme $U$ with $\operatorname{size}(U) \leq \kappa$ (see Sets, Section 3.9) and a surjective étale morphism $U \rightarrow X$.

07WH Lemma 79.5.5. Let $S$ be a scheme. Let $\kappa=\operatorname{size}(T)$ for some $T \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$ such that
(1) $\mathcal{Y} \rightarrow(S c h / S)_{\text {fppf }}$ is limit preserving on objects,
(2) for an affine scheme $V$ locally of finite presentation over $S$ and $y \in$ $\mathrm{Ob}\left(\mathcal{Y}_{V}\right)$ the fibre product $(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable by an algebraic space of size $\leq \kappa 1$,
(3) $\mathcal{X}$ and $\mathcal{Y}$ are stacks for the Zariski topology.

Then $f$ is representable by algebraic spaces.
Proof. Let $V$ be a scheme over $S$ and $y \in \mathcal{Y}_{V}$. We have to prove $(S c h / V)_{f p p f} \times_{y, \mathcal{Y}}$ $\mathcal{X}$ is representable by an algebraic space.

Case I: $V$ is affine and maps into an affine open $\operatorname{Spec}(\Lambda) \subset S$. Then we can write $V=\lim V_{i}$ with each $V_{i}$ affine and of finite presentation over $\operatorname{Spec}(\Lambda)$, see Algebra, Lemma 10.126.1. Then $y$ comes from an object $y_{i}$ over $V_{i}$ for some $i$ by assumption (1). By assumption (3) the fibre product $\left(S c h / V_{i}\right)_{f p p f} \times y_{i}, \mathcal{Y} \mathcal{X}$ is representable by an algebraic space $Z_{i}$. Then $(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ is representable by $Z \times_{V_{i}} V$.
Case II: $V$ is general. Choose an affine open covering $V=\bigcup_{i \in I} V_{i}$ such that each $V_{i}$ maps into an affine open of $S$. We first claim that $\mathcal{Z}=(S c h / V)_{f p p f} \times_{y, \mathcal{Y}} \mathcal{X}$ is a stack in setoids for the Zariski topology. Namely, it is a stack in groupoids for the Zariski topology by Stacks, Lemma 8.5.6. Then suppose that $z$ is an object of $\mathcal{Z}$ over a scheme $T$. Denote $g: T \rightarrow V$ the morphism corresponding to the projection of $z$ in $(S c h / V)_{f p p f}$. Consider the Zariski sheaf $I=\operatorname{Isom}_{\mathcal{Z}}(z, z)$. By Case I we see that $\left.I\right|_{g^{-1}\left(V_{i}\right)}=*$ (the singleton sheaf). Hence $\mathcal{I}=*$. Thus $\mathcal{Z}$ is fibred in setoids. To finish the proof we have to show that the Zariski sheaf $Z: T \mapsto \mathrm{Ob}\left(\mathcal{Z}_{T}\right) / \cong$ is an algebraic space, see Algebraic Stacks, Lemma 76.8.2 There is a map $p: Z \rightarrow V$ (transformation of functors) and by Case I we know that $Z_{i}=p^{-1}\left(V_{i}\right)$ is an algebraic space. The morphisms $Z_{i} \rightarrow Z$ are representable by open immersions and $\coprod Z_{i} \rightarrow Z$ is surjective (in the Zariski topology). Hence $Z$ is

[^203]a sheaf for the fppf topology by Bootstrap, Lemma 67.3.11, Thus Spaces, Lemma 52.8.4 applies and we conclude that $Z$ is an algebraic spact ${ }^{2}$

07WI Lemma 79.5.6. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces as in Algebraic Stacks, Definition 76.10.1. If
(1) $f$ is representable by algebraic spaces,
(2) $\mathcal{Y} \rightarrow(S c h / S)_{\text {fppf }}$ is limit preserving on objects,
(3) for an affine scheme $V$ locally of finite presentation over $S$ and $y \in \mathcal{Y}_{V}$ the resulting morphism of algebraic spaces $f_{y}: F_{y} \rightarrow V$, see Algebraic Stacks, Equation 76.9.1.1, has property $\mathcal{P}$.
Then $f$ has property $\mathcal{P}$.
Proof. Let $V$ be a scheme over $S$ and $y \in \mathcal{Y}_{V}$. We have to show that $F_{y} \rightarrow V$ has property $\mathcal{P}$. Since $\mathcal{P}$ is fppf local on the base we may assume that $V$ is an affine scheme which maps into an affine open $\operatorname{Spec}(\Lambda) \subset S$. Thus we can write $V=\lim V_{i}$ with each $V_{i}$ affine and of finite presentation over $\operatorname{Spec}(\Lambda)$, see Algebra, Lemma 10.126.1. Then $y$ comes from an object $y_{i}$ over $V_{i}$ for some $i$ by assumption (2). By assumption (3) the morphism $F_{y_{i}} \rightarrow V_{i}$ has property $\mathcal{P}$. As $\mathcal{P}$ is stable under arbitrary base change and since $F_{y}=F_{y_{i}} \times_{V_{i}} V$ we conclude that $F_{y} \rightarrow V$ has property $\mathcal{P}$ as desired.

### 79.6. Formally smooth on objects

06 CZ Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. We will say that $p$ is formally smooth on objects if the following condition holds: Given any data consisting of
(1) a first order thickening $U \subset U^{\prime}$ of affine schemes over $S$,
(2) an object $y^{\prime}$ of $\mathcal{Y}$ over $U^{\prime}$,
(3) an object $x$ of $\mathcal{X}$ over $U$, and
(4) an isomorphism $\gamma:\left.p(x) \rightarrow y^{\prime}\right|_{U}$,
then there exists an object $x^{\prime}$ of $\mathcal{X}$ over $U^{\prime}$ with an isomorphism $\beta:\left.x^{\prime}\right|_{U} \rightarrow x$ and an isomorphism $\gamma^{\prime}: p\left(x^{\prime}\right) \rightarrow y^{\prime}$ such that

06D0

commutes. In this situation we say that " $\left(x^{\prime}, \beta, \gamma^{\prime}\right)$ is a solution to the problem posed by our data (1), (2), (3), (4)".
06D1 Lemma 79.6.1. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p: \mathcal{X} \rightarrow \mathcal{Y}$ is formally smooth on objects, then so is the base change $p^{\prime}: \mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Z}$ of $p$ by $q$.

[^204]Proof. This is formal. Let $U \subset U^{\prime}$ be a first order thickening of affine schemes over $S$, let $z^{\prime}$ be an object of $\mathcal{Z}$ over $U^{\prime}$, let $w$ be an object of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $U$, and let $\delta:\left.p^{\prime}(w) \rightarrow z^{\prime}\right|_{U}$ be an isomorphism. We may write $w=(U, x, z, \alpha)$ for some object $x$ of $\mathcal{X}$ over $U$ and object $z$ of $\mathcal{Z}$ over $U$ and isomorphism $\alpha: p(x) \rightarrow q(z)$. Note that $p^{\prime}(w)=z$ hence $\delta:\left.z \rightarrow z\right|_{U}$. Set $y^{\prime}=q\left(z^{\prime}\right)$ and $\gamma=q(\delta) \circ \alpha:\left.p(x) \rightarrow y^{\prime}\right|_{U}$. As $p$ is formally smooth on objects there exists an object $x^{\prime}$ of $\mathcal{X}$ over $U^{\prime}$ as well as isomorphisms $\beta:\left.x^{\prime}\right|_{U} \rightarrow x$ and $\gamma^{\prime}: p\left(x^{\prime}\right) \rightarrow y^{\prime}$ such that (79.6.0.1) commutes. Then we consider the object $w=\left(U^{\prime}, x^{\prime}, z^{\prime}, \gamma^{\prime}\right)$ of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $U^{\prime}$ and define isomorphisms

$$
\left.w^{\prime}\right|_{U}=\left(U,\left.x^{\prime}\right|_{U},\left.z^{\prime}\right|_{U},\left.\gamma^{\prime}\right|_{U}\right) \xrightarrow{\left(\beta, \delta^{-1}\right)}(U, x, z, \alpha)=w
$$

and

$$
p^{\prime}\left(w^{\prime}\right)=z^{\prime} \xrightarrow{\text { id }} z^{\prime} .
$$

These combine to give a solution to the problem.
06D2 Lemma 79.6.2. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. If $p$ and $q$ are formally smooth on objects, then so is the composition $q \circ p$.

Proof. This is formal. Let $U \subset U^{\prime}$ be a first order thickening of affine schemes over $S$, let $z^{\prime}$ be an object of $\mathcal{Z}$ over $U^{\prime}$, let $x$ be an object of $\mathcal{X}$ over $U$, and let $\gamma:\left.q(p(x)) \rightarrow z^{\prime}\right|_{U}$ be an isomorphism. As $q$ is formally smooth on objects there exist an object $y^{\prime}$ of $\mathcal{Y}$ over $U^{\prime}$, an isomorphism $\beta:\left.y^{\prime}\right|_{U} \rightarrow p(x)$, and an isomorphism $\gamma^{\prime}: q\left(y^{\prime}\right) \rightarrow z^{\prime}$ such that 79.6.0.1 is commutative. As $p$ is formally smooth on objects there exist an object $x^{\prime}$ of $\mathcal{X}$ over $U^{\prime}$, an isomorphism $\beta^{\prime}:\left.x^{\prime}\right|_{U} \rightarrow x$, and an isomorphism $\gamma^{\prime \prime}: p\left(x^{\prime}\right) \rightarrow y^{\prime}$ such that 79.6.0.1) is commutative. The solution is to take $x^{\prime}$ over $U^{\prime}$ with isomorphism

$$
q\left(p\left(x^{\prime}\right)\right) \xrightarrow{q\left(\gamma^{\prime \prime}\right)} q\left(y^{\prime}\right) \xrightarrow{\gamma^{\prime}} z^{\prime}
$$

and isomorphism $\beta^{\prime}:\left.x^{\prime}\right|_{U} \rightarrow x$. We omit the verification that 79.6.0.1) is commutative.

Note that the class of formally smooth morphisms of algebraic spaces is stable under arbitrary base change and local on the target in the fpqc topology, see More on Morphisms of Spaces, Lemma 63.17.3 and 63.17.10. Hence condition (2) in the lemma below makes sense.

06D3 Lemma 79.6.3. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p$ is representable by algebraic spaces, then the following are equivalent:
(1) $p$ is formally smooth on objects, and
(2) $p$ is formally smooth (see Algebraic Stacks, Definition 76.10.1).

Proof. Assume (2). Let $U \subset U^{\prime}$ be a first order thickening of affine schemes over $S$, let $y^{\prime}$ be an object of $\mathcal{Y}$ over $U^{\prime}$, let $x$ be an object of $\mathcal{X}$ over $U$, and let $\gamma:\left.p(x) \rightarrow y^{\prime}\right|_{U}$ be an isomorphism. Let $X_{y^{\prime}}$ denote an algebraic space over $U^{\prime}$ representing the 2 -fibre product

$$
\left(S c h / U^{\prime}\right)_{f p p f} \times_{y^{\prime}, \mathcal{Y}, p} \mathcal{X}
$$

Note that $\xi=\left(U, U \rightarrow U^{\prime}, x, \gamma^{-1}\right)$ defines an object of this 2-fibre product over $U$. Via the 2-Yoneda lemma $\xi$ corresponds to a morphism $f_{\xi}: U \rightarrow X_{y^{\prime}}$ over $U^{\prime}$. As
$X_{y^{\prime}} \rightarrow U^{\prime}$ is formally smooth by assumption there exists a morphism $f^{\prime}: U^{\prime} \rightarrow X_{y^{\prime}}$ such that $f_{\xi}$ is the composition of $f^{\prime}$ and the morphism $U \rightarrow U^{\prime}$. Also, the 2Yoneda lemma tells us that $f^{\prime}$ corresponds to an object $\xi^{\prime}=\left(U^{\prime}, U^{\prime} \rightarrow U^{\prime}, x^{\prime}, \alpha\right)$ of the displayed 2-fibre product over $U^{\prime}$ whose restriction to $U$ recovers $\xi$. In particular we obtain an isomorphism $\gamma: x^{\prime} \mid U \rightarrow x$. Note that $\alpha: y^{\prime} \rightarrow p\left(x^{\prime}\right)$. Hence we see that taking $x^{\prime}$, the isomorphism $\gamma: x^{\prime} \mid U \rightarrow x$, and the isomorphism $\beta=\alpha^{-1}: p\left(x^{\prime}\right) \rightarrow y^{\prime}$ is a solution to the problem.

Assume (1). Choose a scheme $T$ and a 1-morphism $y:(S c h / T)_{f p p f} \rightarrow \mathcal{Y}$. Let $X_{y}$ be an algebraic space over $T$ representing the 2-fibre product $(S c h / T)_{f p p f} \times_{y, \mathcal{Y}, p} \mathcal{X}$. We have to show that $X_{y} \rightarrow T$ is formally smooth. Hence it suffices to show that given a first order thickening $U \subset U^{\prime}$ of affine schemes over $T$, then $X_{y}\left(U^{\prime}\right) \rightarrow X_{y}\left(U^{\prime}\right)$ is surjective (morphisms in the category of algebraic spaces over $T$ ). Set $y^{\prime}=\left.y\right|_{U^{\prime}}$. By the 2-Yoneda lemma morphisms $U \rightarrow X_{y}$ over $T$ correspond bijectively to isomorphism classes of pairs $(x, \alpha)$ where $x$ is an object of $\mathcal{X}$ over $U$ and $\alpha:\left.y\right|_{U} \rightarrow$ $p(x)$ is an isomorphism. Of course giving $\alpha$ is, up to an inverse, the same thing as giving an isomorphism $\gamma:\left.p(x) \rightarrow y^{\prime}\right|_{U}$. Similarly for morphisms $U^{\prime} \rightarrow X_{y}$ over $T$. Hence (1) guarantees the surjectivity of $X_{y}\left(U^{\prime}\right) \rightarrow X_{y}\left(U^{\prime}\right)$ in this situation and we win.

### 79.7. Surjective on objects

$06 \mathrm{D} 4 \quad$ Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. We will say that $p$ is surjective on objects if the following condition holds: Given any data consisting of
(1) a field $k$ over $S$, and
(2) an object $y$ of $\mathcal{Y}$ over $\operatorname{Spec}(k)$,
then there exists an extension $k \subset K$ of fields over $S$, an object $x$ of $\mathcal{X} \operatorname{over} \operatorname{Spec}(K)$ such that $\left.p(x) \cong y\right|_{\operatorname{Spec}(K)}$.
06D5 Lemma 79.7.1. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p: \mathcal{X} \rightarrow \mathcal{Y}$ is surjective on objects, then so is the base change $p^{\prime}: \mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Z}$ of $p$ by $q$.
Proof. This is formal. Let $z$ be an object of $\mathcal{Z}$ over a field $k$. As $p$ is surjective on objects there exists an extension $k \subset K$ and an object $x$ of $\mathcal{X}$ over $K$ and an isomorphism $\alpha:\left.p(x) \rightarrow q(z)\right|_{\operatorname{Spec}(K)}$. Then $w=\left(\operatorname{Spec}(K), x,\left.z\right|_{\operatorname{Spec}(K)}, \alpha\right)$ is an object of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $K$ with $p^{\prime}(w)=\left.z\right|_{\operatorname{Spec}(K)}$.

06D6 Lemma 79.7.2. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. If $p$ and $q$ are surjective on objects, then so is the composition $q \circ p$.

Proof. This is formal. Let $z$ be an object of $\mathcal{Z}$ over a field $k$. As $q$ is surjective on objects there exists a field extension $k \subset K$ and an object $y$ of $\mathcal{Y}$ over $K$ such that $\left.q(y) \cong x\right|_{\operatorname{Spec}(K)}$. As $p$ is surjective on objects there exists a field extension $K \subset L$ and an object $x$ of $\mathcal{X}$ over $L$ such that $\left.p(x) \cong y\right|_{\operatorname{Spec}(L)}$. Then the field extension $k \subset L$ and the object $x$ of $\mathcal{X}$ over $L$ satisfy $\left.q(p(x)) \cong z\right|_{\operatorname{Spec}(L)}$ as desired.
06D7 Lemma 79.7.3. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $p$ is representable by algebraic spaces, then the following are equivalent:
(1) $p$ is surjective on objects, and
(2) $p$ is surjective (see Algebraic Stacks, Definition 76.10.1).

Proof. Assume (2). Let $k$ be a field and let $y$ be an object of $\mathcal{Y}$ over $k$. Let $X_{y}$ denote an algebraic space over $k$ representing the 2-fibre product

$$
(S c h / \operatorname{Spec}(k))_{f p p f} \times_{y, \mathcal{Y}, p} \mathcal{X}
$$

As we've assumed that $p$ is surjective we see that $X_{y}$ is not empty. Hence we can find a field extension $k \subset K$ and a $K$-valued point $x$ of $X_{y}$. Via the 2-Yoneda lemma this corresponds to an object $x$ of $\mathcal{X}$ over $K$ together with an isomorphism $\left.p(x) \cong y\right|_{\operatorname{Spec}(K)}$ and we see that (1) holds.
Assume (1). Choose a scheme $T$ and a 1-morphism $y:(S c h / T)_{f p p f} \rightarrow \mathcal{Y}$. Let $X_{y}$ be an algebraic space over $T$ representing the 2 -fibre product $(S c h / T)_{f p p f} \times y, \mathcal{Y}, p$ X . We have to show that $X_{y} \rightarrow T$ is surjective. By Morphisms of Spaces, Definition 54.5 .2 we have to show that $\left|X_{y}\right| \rightarrow|T|$ is surjective. This means exactly that given a field $k$ over $T$ and a morphism $t: \operatorname{Spec}(k) \rightarrow T$ there exists a field extension $k \subset K$ and a morphism $x: \operatorname{Spec}(K) \rightarrow X_{y}$ such that

commutes. By the 2 -Yoneda lemma this means exactly that we have to find $k \subset K$ and an object $x$ of $\mathcal{X}$ over $K$ such that $\left.p(x) \cong t^{*} y\right|_{\operatorname{Spec}(K)}$. Hence (1) guarantees that this is the case and we win.

### 79.8. Algebraic morphisms

05XX The following notion is occasionally useful.
06CF Definition 79.8.1. Let $S$ be a scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. We say that $F$ is algebraic if for every scheme $T$ and every object $\xi$ of $\mathcal{Y}$ over $T$ the 2 -fibre product

$$
(S c h / T)_{\text {fppf }} \times_{\xi, \mathcal{Y}} \mathcal{X}
$$

is an algebraic stack over $S$.
With this terminology in place we have the following result that generalizes Algebraic Stacks, Lemma 76.15.4.
05XY Lemma 79.8.2. Let $S$ be a scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{f p p f}$. If
(1) $\mathcal{Y}$ is an algebraic stack, and
(2) $F$ is algebraic (see above),
then $\mathcal{X}$ is an algebraic stack.
Proof. By assumption (1) there exists a scheme $T$ and an object $\xi$ of $\mathcal{Y}$ over $T$ such that the corresponding 1-morphism $\xi:(S c h / T)_{f p p f} \rightarrow \mathcal{Y}$ is smooth an surjective. Then $\mathcal{U}=(S c h / T)_{f p p f} \times_{\xi, \mathcal{Y}} \mathcal{X}$ is is an algebraic stack by assumption (2). Choose a scheme $U$ and a surjective smooth 1-morphism $(S c h / U)_{f p p f} \rightarrow \mathcal{U}$. The projection $\mathcal{U} \longrightarrow \mathcal{X}$ is, as the base change of the morphism $\xi:(S c h / T)_{f p p f} \rightarrow \mathcal{Y}$,
surjective and smooth, see Algebraic Stacks, Lemma 76.10.6. Then the composition $(S c h / U)_{f p p f} \rightarrow \mathcal{U} \rightarrow \mathcal{X}$ is surjective and smooth as a composition of surjective and smooth morphisms, see Algebraic Stacks, Lemma 76.10.5. Hence $\mathcal{X}$ is an algebraic stack by Algebraic Stacks, Lemma 76.15.3.
06CG Lemma 79.8.3. Let $S$ be a scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. If $\mathcal{X}$ is an algebraic stack and $\Delta: \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces, then $F$ is algebraic.

Proof. Choose a representable stack in groupoids $\mathcal{U}$ and a surjective smooth 1morphism $\mathcal{U} \rightarrow \mathcal{X}$. Let $T$ be a scheme and let $\xi$ be an object of $\mathcal{Y}$ over $T$. The morphism of 2-fibre products

$$
(S c h / T)_{f p p f} \times_{\xi, \mathcal{Y}} \mathcal{U} \longrightarrow(S c h / T)_{f p p f} \times_{\xi, \mathcal{Y}} \mathcal{X}
$$

is representable by algebraic spaces, surjective, and smooth as a base change of $\mathcal{U} \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemmas 76.9.7 and 76.10.6. By our condition on the diagonal of $\mathcal{Y}$ we see that the source of this morphism is representable by an algebraic space, see Algebraic Stacks, Lemma 76.10.11. Hence the target is an algebraic stack by Algebraic Stacks, Lemma 76.15.3.

### 79.9. Spaces of sections

05XZ Given morphisms $W \rightarrow Z \rightarrow U$ we can consider the functor that associates to a scheme $U^{\prime}$ over $U$ the set of sections $\sigma: Z_{U^{\prime}} \rightarrow W_{U^{\prime}}$ of the base change $W_{U^{\prime}} \rightarrow Z_{U^{\prime}}$ of the morphism $W \rightarrow Z$. In this section we prove some preliminary lemmas on this functor.

05XQ Lemma 79.9.1. Let $Z \rightarrow U$ be a finite morphism of schemes. Let $W$ be an algebraic space and let $W \rightarrow Z$ be a surjective étale morphism. Then there exists a surjective étale morphism $U^{\prime} \rightarrow U$ and a section

$$
\sigma: Z_{U^{\prime}} \rightarrow W_{U^{\prime}}
$$

of the morphism $W_{U^{\prime}} \rightarrow Z_{U^{\prime}}$.
Proof. We may choose a separated scheme $W^{\prime}$ and a surjective étale morphism $W^{\prime} \rightarrow W$. Hence after replacing $W$ by $W^{\prime}$ we may assume that $W$ is a separated scheme. Write $f: W \rightarrow Z$ and $\pi: Z \rightarrow U$. Note that $f \circ \pi: W \rightarrow U$ is separated as $W$ is separated (see Schemes, Lemma 25.21.14). Let $u \in U$ be a point. Clearly it suffices to find an étale neighbourhood $\left(U^{\prime}, u^{\prime}\right)$ of $(U, u)$ such that a section $\sigma$ exists over $U^{\prime}$. Let $z_{1}, \ldots, z_{r}$ be the points of $Z$ lying above $u$. For each $i$ choose a point $w_{i} \in W$ which maps to $z_{i}$. We may pick an étale neighbourhood $\left(U^{\prime}, u^{\prime}\right) \rightarrow(U, u)$ such that the conclusions of More on Morphisms, Lemma 36.30.5 hold for both $Z \rightarrow U$ and the points $z_{1}, \ldots, z_{r}$ and $W \rightarrow U$ and the points $w_{1}, \ldots, w_{r}$. Hence, after replacing $(U, u)$ by $\left(U^{\prime}, u^{\prime}\right)$ and relabeling, we may assume that all the field extensions $\kappa(u) \subset \kappa\left(z_{i}\right)$ and $\kappa(u) \subset \kappa\left(w_{i}\right)$ are purely inseparable, and moreover that there exist disjoint union decompositions

$$
Z=V_{1} \amalg \ldots \amalg V_{r} \amalg A, \quad W=W_{1} \amalg \ldots \amalg W_{r} \amalg B
$$

by open and closed subschemes with $z_{i} \in V_{i}, w_{i} \in W_{i}$ and $V_{i} \rightarrow U, W_{i} \rightarrow U$ finite. After replacing $U$ by $U \backslash \pi(A)$ we may assume that $A=\emptyset$, i.e., $Z=V_{1} \amalg \ldots \amalg V_{r}$. After replacing $W_{i}$ by $W_{i} \cap f^{-1}\left(V_{i}\right)$ and $B$ by $B \cup \bigcup W_{i} \cap f^{-1}\left(Z \backslash V_{i}\right)$ we may assume that $f$ maps $W_{i}$ into $V_{i}$. Then $f_{i}=\left.f\right|_{W_{i}}: W_{i} \rightarrow V_{i}$ is a morphism of
schemes finite over $U$, hence finite (see Morphisms, Lemma 28.43.12. It is also étale (by assumption), $f_{i}^{-1}\left(\left\{z_{i}\right\}\right)=w_{i}$, and induces an isomorphism of residue fields $\kappa\left(z_{i}\right)=\kappa\left(w_{i}\right)$ (because both are purely inseparable extensions of $\kappa(u)$ and $\kappa\left(z_{i}\right) \subset \kappa\left(w_{i}\right)$ is separable as $f$ is étale). Hence by Étale Morphisms, Lemma 40.14.2 we see that $f_{i}$ is an isomorphism in a neighbourhood $V_{i}^{\prime}$ of $z_{i}$. Since $\pi: Z \rightarrow U$ is closed, after shrinking $U$, we may assume that $W_{i} \rightarrow V_{i}$ is an isomorphism. This proves the lemma.
05XR Lemma 79.9.2. Let $Z \rightarrow U$ be a finite locally free morphism of schemes. Let $W$ be an algebraic space and let $W \rightarrow Z$ be an étale morphism. Then the functor

$$
F:(S c h / U)_{f p p f}^{o p p} \longrightarrow S e t s
$$

defined by the rule

$$
U^{\prime} \longmapsto F\left(U^{\prime}\right)=\left\{\sigma: Z_{U^{\prime}} \rightarrow W_{U^{\prime}} \text { section of } W_{U^{\prime}} \rightarrow Z_{U^{\prime}}\right\}
$$

is an algebraic space and the morphism $F \rightarrow U$ is étale.
Proof. Assume first that $W \rightarrow Z$ is also separated. Let $U^{\prime}$ be a scheme over $U$ and let $\sigma \in F\left(U^{\prime}\right)$. By Morphisms of Spaces, Lemma 54.4.7 the morphism $\sigma$ is a closed immersion. Moreover, $\sigma$ is étale by Properties of Spaces, Lemma 53.15.6. Hence $\sigma$ is also an open immersion, see Morphisms of Spaces, Lemma 54.48.2 In other words, $Z_{\sigma}=\sigma\left(Z_{U^{\prime}}\right) \subset W_{U^{\prime}}$ is an open subspace such that the morphism $Z_{\sigma} \rightarrow Z_{U^{\prime}}$ is an isomorphism. In particular, the morphism $Z_{\sigma} \rightarrow U^{\prime}$ is finite. Hence we obtain a transformation of functors

$$
F \longrightarrow(W / U)_{f i n}, \quad \sigma \longmapsto\left(U^{\prime} \rightarrow U, Z_{\sigma}\right)
$$

where $(W / U)_{\text {fin }}$ is the finite part of the morphism $W \rightarrow U$ introduced in More on Groupoids in Spaces, Section 66.10. It is clear that this transformation of functors is injective (since we can recover $\sigma$ from $Z_{\sigma}$ as the inverse of the isomorphism $Z_{\sigma} \rightarrow Z_{U^{\prime}}$ ). By More on Groupoids in Spaces, Proposition 66.10.11 we know that $(W / U)_{f i n}$ is an algebraic space étale over $U$. Hence to finish the proof in this case it suffices to show that $F \rightarrow(W / U)_{f i n}$ is representable and an open immersion. To see this suppose that we are given a morphism of schemes $U^{\prime} \rightarrow U$ and an open subspace $Z^{\prime} \subset W_{U^{\prime}}$ such that $Z^{\prime} \rightarrow U^{\prime}$ is finite. Then it suffices to show that there exists an open subscheme $U^{\prime \prime} \subset U^{\prime}$ such that a morphism $T \rightarrow U^{\prime}$ factors through $U^{\prime \prime}$ if and only if $Z^{\prime} \times_{U^{\prime}} T$ maps isomorphically to $Z \times_{U^{\prime}} T$. This follows from More on Morphisms of Spaces, Lemma 63.38.6 (here we use that $Z \rightarrow B$ is flat and locally of finite presentation as well as finite). Hence we have proved the lemma in case $W \rightarrow Z$ is separated as well as étale.
In the general case we choose a separated scheme $W^{\prime}$ and a surjective étale morphism $W^{\prime} \rightarrow W$. Note that the morphisms $W^{\prime} \rightarrow W$ and $W \rightarrow Z$ are separated as their source is separated. Denote $F^{\prime}$ the functor associated to $W^{\prime} \rightarrow Z \rightarrow U$ as in the lemma. In the first paragraph of the proof we showed that $F^{\prime}$ is representable by an algebraic space étale over $U$. By Lemma 79.9.1 the map of functors $F^{\prime} \rightarrow F$ is surjective for the étale topology on $S c h / U$. Moreover, if $U^{\prime}$ and $\sigma: Z_{U^{\prime}} \rightarrow W_{U^{\prime}}$ define a point $\xi \in F\left(U^{\prime}\right)$, then the fibre product

$$
F^{\prime \prime}=F^{\prime} \times_{F, \xi} U^{\prime}
$$

is the functor on $S c h / U^{\prime}$ associated to the morphisms

$$
W_{U^{\prime}}^{\prime} \times W_{U^{\prime}, \sigma} Z_{U^{\prime}} \rightarrow Z_{U^{\prime}} \rightarrow U^{\prime}
$$

Since the first morphism is separated as a base change of a separated morphism, we see that $F^{\prime \prime}$ is an algebraic space étale over $U^{\prime}$ by the result of the first paragraph. It follows that $F^{\prime} \rightarrow F$ is a surjective étale transformation of functors, which is representable by algebraic spaces. Hence $F$ is an algebraic space by Bootstrap, Theorem 67.10.1. Since $F^{\prime} \rightarrow F$ is an étale surjective morphism of algebraic spaces it follows that $F \rightarrow U$ is étale because $F^{\prime} \rightarrow U$ is étale.

### 79.10. Relative morphisms

05 Y 0 We continue the discussion started in More on Morphisms, Section 36.49 .
Let $S$ be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over $S$. Given a scheme $T$ we can consider pairs $(a, b)$ where $a: T \rightarrow B$ is a morphism and $b: T \times_{a, B} Z \rightarrow T \times_{a, B} X$ is a morphism over $T$. Picture

05 Y 1
(79.10.0.1)

Of course, we can also think of $b$ as a morphism $b: T \times{ }_{a, B} Z \rightarrow X$ such that

commutes. In this situation we can define a functor
05 Y 2

$$
\begin{equation*}
\operatorname{Mor}_{B}(Z, X):(S c h / S)^{o p p} \longrightarrow S e t s, \quad T \longmapsto\{(a, b) \text { as above }\} \tag{79.10.0.2}
\end{equation*}
$$

Sometimes we think of this as a functor defined on the category of schemes over $B$, in which case we drop $a$ from the notation.

05Y3 Lemma 79.10.1. Let $S$ be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over $S$. Then
(1) $\operatorname{Mor}_{B}(Z, X)$ is a sheaf on $(S c h / S)_{f p p f}$.
(2) If $T$ is an algebraic space over $S$, then there is a canonical bijection

$$
\operatorname{Mor}_{S h\left((S c h / S)_{f p p f}\right)}\left(T, \operatorname{Mor}_{B}(Z, X)\right)=\{(a, b) \text { as in 79.10.0.1 }\}
$$

Proof. Let $T$ be an algebraic space over $S$. Let $\left\{T_{i} \rightarrow T\right\}$ be an fppf covering of $T$ (as in Topologies on Spaces, Section 60.4). Suppose that $\left(a_{i}, b_{i}\right) \in \operatorname{Mor}_{B}(Z, X)\left(T_{i}\right)$ such that $\left.\left(a_{i}, b_{i}\right)\right|_{T_{i} \times_{T} T_{j}}=\left.\left(a_{j}, b_{j}\right)\right|_{T_{i} \times_{T} T_{j}}$ for all $i, j$. Then by Descent on Spaces, Lemma 61.6.2 there exists a unique morphism $a: T \rightarrow B$ such that $a_{i}$ is the composition of $T_{i} \rightarrow T$ and $a$. Then $\left\{T_{i} \times_{a_{i}, B} Z \rightarrow T \times{ }_{a, B} Z\right\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b: T \times{ }_{a, B} Z \rightarrow$ $T \times{ }_{a, B} X$ such that $b_{i}$ is the composition of $T_{i} \times_{a_{i}, B} Z \rightarrow T \times{ }_{a, B} Z$ and $b$. Hence $(a, b) \in \operatorname{Mor}_{B}(Z, X)(T)$ restricts to $\left(a_{i}, b_{i}\right)$ over $T_{i}$ for all $i$.

Note that the result of the preceding paragraph in particular implies (1).
Let $T$ be an algebraic space over $S$. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say "pair" we mean a pair $(a, b)$ fitting into 79.10.0.1).

Let $v: T \rightarrow \operatorname{Mor}_{B}(Z, X)$ be a natural transformation. Choose a scheme $U$ and a surjective étale morphism $p: U \rightarrow T$. Then $v(p) \in \operatorname{Mor}_{B}(Z, X)(U)$ corresponds to a pair $\left(a_{U}, b_{U}\right)$ over $U$. Let $R=U \times_{T} U$ with projections $t, s: R \rightarrow U$. As $v$ is a transformation of functors we see that the pullbacks of $\left(a_{U}, b_{U}\right)$ by $s$ and $t$ agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair $(a, b)$ over $T$.
Conversely, let $(a, b)$ be a pair over $T$. Let $U \rightarrow T, R=U \times_{T} U$, and $t, s: R \rightarrow U$ be as above. Then the restriction $\left.(a, b)\right|_{U}$ gives rise to a transformation of functors $v: h_{U} \rightarrow \operatorname{Mor}_{B}(Z, X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $\left.s^{*}(a, b)\right|_{U}$ and $\left.t^{*}(a, b)\right|_{U}$ are equal, we see that $v$ coequalizes the two maps $h_{t}, h_{s}: h_{R} \rightarrow h_{U}$. Since $T=U / R$ is the fppf quotient sheaf by Spaces, Lemma 52.9 .1 and since $\operatorname{Mor}_{B}(Z, X)$ is an fppf sheaf by (1) we conclude that $v$ factors through a map $T \rightarrow \operatorname{Mor}_{B}(Z, X)$.
We omit the verification that the two constructions above are mutually inverse.
05 Y 4 Lemma 79.10.2. Let $S$ be a scheme. Let $Z \rightarrow B, X \rightarrow B$, and $B^{\prime} \rightarrow B$ be morphisms of algebraic spaces over $S$. Set $Z^{\prime}=B^{\prime} \times_{B} Z$ and $X^{\prime}=B^{\prime} \times_{B} X$. Then

$$
\operatorname{Mor}_{B^{\prime}}\left(Z^{\prime}, X^{\prime}\right)=B^{\prime} \times_{B} \operatorname{Mor}_{B}(Z, X)
$$

in $\operatorname{Sh}\left((S c h / S)_{f p p f}\right)$.
Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 79.10 .1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors).

05Y5 Lemma 79.10.3. Let $S$ be a scheme. Let $Z \rightarrow B$ and $X^{\prime} \rightarrow X \rightarrow B$ be morphisms of algebraic spaces over $S$. Assume
(1) $X^{\prime} \rightarrow X$ is étale, and
(2) $Z \rightarrow B$ is finite locally free.

Then $\operatorname{Mor}_{B}\left(Z, X^{\prime}\right) \rightarrow \operatorname{Mor}_{B}(Z, X)$ is representable by algebraic spaces and étale. If $X^{\prime} \rightarrow X$ is also surjective, then $\operatorname{Mor}_{B}\left(Z, X^{\prime}\right) \rightarrow \operatorname{Mor}_{B}(Z, X)$ is surjective.

Proof. Let $U$ be a scheme and let $\xi=(a, b)$ be an element of $\operatorname{Mor}_{B}(Z, X)(U)$. We have to prove that the functor

$$
h_{U} \times_{\xi, \operatorname{Mor}_{B}(Z, X)} \operatorname{Mor}_{B}\left(Z, X^{\prime}\right)
$$

is representable by an algebraic space étale over $U$. Set $Z_{U}=U \times_{a, B} Z$ and $W=Z_{U} \times_{b, X} X^{\prime}$. Then $W \rightarrow Z_{U} \rightarrow U$ is as in Lemma 79.9 .2 and the sheaf $F$ defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 79.9.1 which guarantees that $F \rightarrow U$ is surjective in the situation above.

05 Y 7 Proposition 79.10.4. Let $S$ be a scheme. Let $Z \rightarrow B$ and $X \rightarrow B$ be morphisms of algebraic spaces over $S$. If $Z \rightarrow B$ is finite locally free then $\operatorname{Mor}_{B}(Z, X)$ is an algebraic space.
Proof. Choose a scheme $B^{\prime}=\coprod B_{i}^{\prime}$ which is a disjoint union of affine schemes $B_{i}^{\prime}$ and an étale surjective morphism $B^{\prime} \rightarrow B$. We may also assume that $B_{i}^{\prime} \times_{B} Z$ is the spectrum of a ring which is finite free as a $\Gamma\left(B_{i}^{\prime}, \mathcal{O}_{B_{i}^{\prime}}\right)$-module. By Lemma 79.10 .2 and Spaces, Lemma 52.5.5 the morphism $\operatorname{Mor}_{B^{\prime}}\left(Z^{\prime}, X^{\prime}\right) \rightarrow \operatorname{Mor}_{B}(Z, X)$
is surjective étale. Hence by Bootstrap, Theorem 67.10.1 it suffices to prove the proposition when $B=B^{\prime}$ is a disjoint union of affine schemes $B_{i}^{\prime}$ so that each $B_{i}^{\prime} \times_{B} Z$ is finite free over $B_{i}^{\prime}$. Then it actually suffices to prove the result for the restriction to each $B_{i}^{\prime}$. Thus we may assume that $B$ is affine and that $\Gamma\left(Z, \mathcal{O}_{Z}\right)$ is a finite free $\Gamma\left(B, \mathcal{O}_{B}\right)$-module.
Choose a scheme $X^{\prime}$ which is a disjoint union of affine schemes and a surjective étale morphism $X^{\prime} \rightarrow X$. By Lemma 79.10 .3 the morphism $\operatorname{Mor}_{B}\left(Z, X^{\prime}\right) \rightarrow$ $\operatorname{Mor}_{B}(Z, X)$ is representable by algebraic spaces, étale, and surjective. Hence by Bootstrap, Theorem 67.10.1 it suffices to prove the proposition when $X$ is a disjoint union of affine schemes. This reduces us to the case discussed in the next paragraph.
Assume $X=\coprod_{i \in I} X_{i}$ is a disjoint union of affine schemes, $B$ is affine, and that $\Gamma\left(Z, \mathcal{O}_{Z}\right)$ is a finite free $\Gamma\left(B, \mathcal{O}_{B}\right)$-module. For any finite subset $E \subset I$ set

$$
F_{E}=\operatorname{Mor}_{B}\left(Z, \coprod_{i \in E} X_{i}\right)
$$

By More on Morphisms, Lemma 36.49.1 we see that $F_{E}$ is an algebraic space. Consider the morphism

$$
\coprod_{E \subset I \text { finite }} F_{E} \longrightarrow \operatorname{Mor}_{B}(Z, X)
$$

Each of the morphisms $F_{E} \rightarrow \operatorname{Mor}_{B}(Z, X)$ is an open immersion, because it is simply the locus parametrizing pairs $(a, b)$ where $b$ maps into the open subscheme $\coprod_{i \in E} X_{i}$ of $X$. Moreover, if $T$ is quasi-compact, then for any pair $(a, b)$ the image of $b$ is contained in $\coprod_{i \in E} X_{i}$ for some $E \subset I$ finite. Hence the displayed arrow is in fact an open covering and we wir ${ }^{3}$ by Spaces, Lemma 52.8.4.

### 79.11. Restriction of scalars

05 Y 8 Suppose $X \rightarrow Z \rightarrow B$ are morphisms of algebraic spaces over $S$. Given a scheme $T$ we can consider pairs $(a, b)$ where $a: T \rightarrow B$ is a morphism and $b: T \times{ }_{a, B} Z \rightarrow X$ is a morphism over $Z$. Picture

05 Y 9

In this situation we can define a functor
05 YA

$$
\begin{equation*}
\operatorname{Res}_{Z / B}(X):(S c h / S)^{o p p} \longrightarrow \text { Sets, } \quad T \longmapsto\{(a, b) \text { as above }\} \tag{79.11.0.2}
\end{equation*}
$$

Sometimes we think of this as a functor defined on the category of schemes over $B$, in which case we drop $a$ from the notation.

05YB Lemma 79.11.1. Let $S$ be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over $S$. Then

[^205](1) $\operatorname{Res}_{Z / B}(X)$ is a sheaf on $(S c h / S)_{\text {fppf }}$.
(2) If $T$ is an algebraic space over $S$, then there is a canonical bijection
$$
\operatorname{Mor}_{S h\left((S c h / S)_{f p p f}\right)}\left(T, \operatorname{Res}_{Z / B}(X)\right)=\{(a, b) \text { as in 79.11.0.1) }\}
$$

Proof. Let $T$ be an algebraic space over $S$. Let $\left\{T_{i} \rightarrow T\right\}$ be an fppf covering of $T$ (as in Topologies on Spaces, Section 60.4). Suppose that $\left(a_{i}, b_{i}\right) \in \operatorname{Res}_{Z / B}(X)\left(T_{i}\right)$ such that $\left.\left(a_{i}, b_{i}\right)\right|_{T_{i} \times_{T} T_{j}}=\left.\left(a_{j}, b_{j}\right)\right|_{T_{i} \times_{T} T_{j}}$ for all $i, j$. Then by Descent on Spaces, Lemma 61.6.2 there exists a unique morphism $a: T \rightarrow B$ such that $a_{i}$ is the composition of $T_{i} \rightarrow T$ and $a$. Then $\left\{T_{i} \times_{a_{i}, B} Z \rightarrow T \times{ }_{a, B} Z\right\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b: T \times{ }_{a, B} Z \rightarrow X$ such that $b_{i}$ is the composition of $T_{i} \times_{a_{i}, B} Z \rightarrow T \times{ }_{a, B} Z$ and $b$. Hence $(a, b) \in$ $\operatorname{Res}_{Z / B}(X)(T)$ restricts to $\left(a_{i}, b_{i}\right)$ over $T_{i}$ for all $i$.
Note that the result of the preceding paragraph in particular implies (1).
Let $T$ be an algebraic space over $S$. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say "pair" we mean a pair $(a, b)$ fitting into 79.11.0.1).
Let $v: T \rightarrow \operatorname{Res}_{Z / B}(X)$ be a natural transformation. Choose a scheme $U$ and a surjective étale morphism $p: U \rightarrow T$. Then $v(p) \in \operatorname{Res}_{Z / B}(X)(U)$ corresponds to a pair $\left(a_{U}, b_{U}\right)$ over $U$. Let $R=U \times_{T} U$ with projections $t, s: R \rightarrow U$. As $v$ is a transformation of functors we see that the pullbacks of $\left(a_{U}, b_{U}\right)$ by $s$ and $t$ agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair $(a, b)$ over $T$.
Conversely, let $(a, b)$ be a pair over $T$. Let $U \rightarrow T, R=U \times_{T} U$, and $t, s: R \rightarrow U$ be as above. Then the restriction $\left.(a, b)\right|_{U}$ gives rise to a transformation of functors $v: h_{U} \rightarrow \operatorname{Res}_{Z / B}(X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $\left.s^{*}(a, b)\right|_{U}$ and $\left.t^{*}(a, b)\right|_{U}$ are equal, we see that $v$ coequalizes the two maps $h_{t}, h_{s}: h_{R} \rightarrow h_{U}$. Since $T=U / R$ is the fppf quotient sheaf by Spaces, Lemma 52.9.1 and since $\operatorname{Res}_{Z / B}(X)$ is an fppf sheaf by (1) we conclude that $v$ factors through a map $T \rightarrow \operatorname{Res}_{Z / B}(X)$.
We omit the verification that the two constructions above are mutually inverse.
Of course the sheaf $\operatorname{Res}_{Z / B}(X)$ comes with a natural transformation of functors $\operatorname{Res}_{Z / B}(X) \rightarrow B$. We will use this without further mention in the following.
05YC Lemma 79.11.2. Let $S$ be a scheme. Let $X \rightarrow Z \rightarrow B$ and $B^{\prime} \rightarrow B$ be morphisms of algebraic spaces over $S$. Set $Z^{\prime}=B^{\prime} \times_{B} Z$ and $X^{\prime}=B^{\prime} \times_{B} X$. Then

$$
\operatorname{Res}_{Z^{\prime} / B^{\prime}}\left(X^{\prime}\right)=B^{\prime} \times_{B} \operatorname{Res}_{Z / B}(X)
$$

in $\operatorname{Sh}\left((S c h / S)_{f p p f}\right)$.
Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 79.11.1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors).

05YD Lemma 79.11.3. Let $S$ be a scheme. Let $X^{\prime} \rightarrow X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over $S$. Assume
(1) $X^{\prime} \rightarrow X$ is étale, and
(2) $Z \rightarrow B$ is finite locally free.

Then $\operatorname{Res}_{Z / B}\left(X^{\prime}\right) \rightarrow \operatorname{Res}_{Z / B}(X)$ is representable by algebraic spaces and étale. If $X^{\prime} \rightarrow X$ is also surjective, then $\operatorname{Res}_{Z / B}\left(X^{\prime}\right) \rightarrow \operatorname{Res}_{Z / B}(X)$ is surjective.

Proof. Let $U$ be a scheme and let $\xi=(a, b)$ be an element of $\operatorname{Res}_{Z / B}(X)(U)$. We have to prove that the functor

$$
h_{U} \times_{\xi, \operatorname{Res}_{Z / B}(X)} \operatorname{Res}_{Z / B}\left(X^{\prime}\right)
$$

is representable by an algebraic space étale over $U$. Set $Z_{U}=U \times_{a, B} Z$ and $W=Z_{U} \times_{b, X} X^{\prime}$. Then $W \rightarrow Z_{U} \rightarrow U$ is as in Lemma 79.9.2 and the sheaf $F$ defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 79.9.1 which guarantees that $F \rightarrow U$ is surjective in the situation above.

At this point we can use the lemmas above to prove that $\operatorname{Res}_{Z / B}(X)$ is an algebraic space whenever $Z \rightarrow B$ is finite locally free in almost exactly the same way as in the proof that $\operatorname{Mor}_{B}(Z, X)$ is an algebraic spaces, see Proposition 79.10.4 Instead we will directly deduce this result from the following lemma and the fact that $\operatorname{Mor}_{B}(Z, X)$ is an algebraic space.

05YE Lemma 79.11.4. Let $S$ be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over $S$. The following diagram

is a cartesian diagram of sheaves on $(S c h / S)_{\text {fppf }}$.
Proof. Omitted. Hint: Exercise in the functorial point of view in algebraic geometry.

05YF Proposition 79.11.5. Let $S$ be a scheme. Let $X \rightarrow Z \rightarrow B$ be morphisms of algebraic spaces over $S$. If $Z \rightarrow B$ is finite locally free then $\operatorname{Res}_{Z / B}(X)$ is an algebraic space.

Proof. By Proposition 79.10 .4 the functors $\operatorname{Mor}_{B}(Z, X)$ and $\operatorname{Mor}_{B}(Z, Z)$ are algebraic spaces. Hence this follows from the cartesian diagram of Lemma 79.11.4 and the fact that fibre products of algebraic spaces exist and are given by the fibre product in the underlying category of sheaves of sets (see Spaces, Lemma 52.7.2.

### 79.12. Finite Hilbert stacks

05 XM In this section we prove some results concerning the finite Hilbert stacks $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ introduced in Examples of Stacks, Section 77.18 .

05XN Lemma 79.12.1. Consider a 2-commutative diagram

of stacks in groupoids over $(S c h / S)_{\text {fppf }}$ with a given 2-isomorphism $\gamma: H \circ F^{\prime} \rightarrow$ $F \circ G$. In this situation we obtain a canonical 1-morphism $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}^{\prime}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$. This morphism is compatible with the forgetful 1-morphisms of Examples of Stacks, Equation 77.18.2.1.
Proof. We map the object ( $U, Z, y^{\prime}, x^{\prime}, \alpha^{\prime}$ ) to the object $\left(U, Z, H\left(y^{\prime}\right), G\left(x^{\prime}\right), \gamma \star \operatorname{id}_{H} \star\right.$ $\left.\alpha^{\prime}\right)$ where $\star$ denotes horizontal composition of 2 -morphisms, see Categories, Definition 4.27.1. To a morphism $(f, g, b, a):\left(U_{1}, Z_{1}, y_{1}^{\prime}, x_{1}^{\prime}, \alpha_{1}^{\prime}\right) \rightarrow\left(U_{2}, Z_{2}, y_{2}^{\prime}, x_{2}^{\prime}, \alpha_{2}^{\prime}\right)$ we assign $(f, g, H(b), G(a))$. We omit the verification that this defines a functor between categories over $(S c h / S)_{f p p f}$.
05XP Lemma 79.12.2. In the situation of Lemma 79.12.1 assume that the given square is 2-cartesian. Then the diagram

is 2-cartesian.
Proof. We get a 2-commutative diagram by Lemma 79.12.1 and hence we get a 1-morphism (i.e., a functor)

$$
\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}^{\prime}\right) \longrightarrow \mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})
$$

We indicate why this functor is essentially surjective. Namely, an object of the category on the right hand side is given by a scheme $U$ over $S$, an object $y^{\prime}$ of $\mathcal{Y}_{U}^{\prime}$, an object $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U$ and an isomorphism $H\left(y^{\prime}\right) \rightarrow y$ in $\mathcal{Y}_{U}$. The assumption means exactly that there exists an object $x^{\prime}$ of $\mathcal{X}_{Z}^{\prime}$ such that there exist isomorphisms $G\left(x^{\prime}\right) \cong x$ and $\alpha^{\prime}:\left.y^{\prime}\right|_{Z} \rightarrow F^{\prime}\left(x^{\prime}\right)$ compatible with $\alpha$. Then we see that $\left(U, Z, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ is an object of $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}^{\prime}\right)$ over $U$. Details omitted.
05YG Lemma 79.12.3. In the situation of Lemma 79.12.1 assume
(1) $\mathcal{Y}^{\prime}=\mathcal{Y}$ and $H=i d_{\mathcal{Y}}$,
(2) $G$ is representable by algebraic spaces and étale.

Then $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces and étale. If $G$ is also surjective, then $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is surjective.
Proof. Let $U$ be a scheme and let $\xi=(U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U$. We have to prove that the 2 -fibre product
05XT (79.12.3.1)

$$
(S c h / U)_{f p p f} \times_{\xi, \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})} \mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right)
$$

is representable by an algebraic space étale over $U$. An object of this over $U^{\prime}$ corresponds to an object $x^{\prime}$ in the fibre category of $\mathcal{X}^{\prime}$ over $Z_{U^{\prime}}$ such that $G\left(x^{\prime}\right) \cong$ $\left.x\right|_{Z_{U^{\prime}}}$. By assumption the 2-fibre product

$$
(S c h / Z)_{f p p f} \times_{x, \mathcal{X}} \mathcal{X}^{\prime}
$$

is representable by an algebraic space $W$ such that the projection $W \rightarrow Z$ is étale. Then (79.12.3.1) is representable by the algebraic space $F$ parametrizing sections of $W \rightarrow Z$ over $U$ introduced in Lemma 79.9.2. Since $F \rightarrow U$ is étale we conclude that $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces and étale. Finally, if $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is surjective also, then $W \rightarrow Z$ is surjective, and hence $F \rightarrow U$ is surjective by Lemma 79.9.1. Thus in this case $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is also surjective.

05XS Lemma 79.12.4. In the situation of Lemma 79.12.1. Assume that $G$, $H$ are representable by algebraic spaces and étale. Then $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}^{\prime}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces and étale. If also $H$ is surjective and the induced functor $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ is surjective, then $\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}^{\prime}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is surjective.

Proof. Set $\mathcal{X}^{\prime \prime}=\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$. By Lemma 79.4.1 the 1-morphism $\mathcal{X}^{\prime} \rightarrow \mathcal{X}^{\prime \prime}$ is representable by algebraic spaces and étale (in particular the condition in the second statement of the lemma that $\mathcal{X}^{\prime} \rightarrow \mathcal{X}^{\prime \prime}$ be surjective makes sense). We obtain a 2 -commutative diagram

It follows from Lemma 79.12 .2 that $\mathcal{H}_{d}\left(\mathcal{X}^{\prime \prime} / \mathcal{Y}^{\prime}\right)$ is the base change of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ by $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$. In particular we see that $\mathcal{H}_{d}\left(\mathcal{X}^{\prime \prime} / \mathcal{Y}^{\prime}\right) \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces and étale, see Algebraic Stacks, Lemma 76.10.6. Moreover, it is also surjective if $H$ is. Hence if we can show that the result holds for the left square in the diagram, then we're done. In this way we reduce to the case where $\mathcal{Y}^{\prime}=\mathcal{Y}$ which is the content of Lemma 79.12.3.

05YH Lemma 79.12.5. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume that $\Delta: \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces. Then

$$
\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \longrightarrow \mathcal{H}_{d}(\mathcal{X}) \times \mathcal{Y}
$$

see Examples of Stacks, Equation 77.18.2.1) is representable by algebraic spaces.
Proof. Let $U$ be a scheme and let $\xi=(U, Z, p, x, 1)$ be an object of $\mathcal{H}_{d}(\mathcal{X})=$ $\mathcal{H}_{d}(\mathcal{X} / S)$ over $U$. Here $p$ is just the structure morphism of $U$. The fifth component 1 exists and is unique since everything is over $S$. Also, let $y$ be an object of $\mathcal{Y}$ over $U$. We have to show the 2 -fibre product

05 YI

$$
\begin{equation*}
(S c h / U)_{f p p f} \times_{\xi \times y, \mathcal{H}_{d}(\mathcal{X}) \times \mathcal{Y}} \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \tag{79.12.5.1}
\end{equation*}
$$

is representable by an algebraic space. To explain why this is so we introduce

$$
I=\operatorname{Isom}_{\mathcal{Y}}\left(\left.y\right|_{Z}, F(x)\right)
$$

which is an algebraic space over $Z$ by assumption. Let $a: U^{\prime} \rightarrow U$ be a scheme over $U$. What does it mean to give an object of the fibre category of 79.12.5.1) over $U^{\prime}$ ? Well, it means that we have an object $\xi^{\prime}=\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U^{\prime}$ and isomorphisms $\left.\left(U^{\prime}, Z^{\prime}, p^{\prime}, x^{\prime}, 1\right) \cong(U, Z, p, x, 1)\right|_{U^{\prime}}$ and $\left.y^{\prime} \cong y\right|_{U^{\prime}}$. Thus $\xi^{\prime}$ is isomorphic to $\left(U^{\prime}, U^{\prime} \times{ }_{a, U} Z, a^{*} y,\left.x\right|_{U^{\prime} \times{ }_{a, U} Z}, \alpha\right)$ for some morphism

$$
\alpha:\left.a^{*} y\right|_{U^{\prime} \times_{a, U} Z} \longrightarrow F\left(\left.x\right|_{U^{\prime} \times_{a, U} Z}\right)
$$

in the fibre category of $\mathcal{Y}$ over $U^{\prime} \times_{a, U} Z$. Hence we can view $\alpha$ as a morphism $b: U^{\prime} \times_{a, U} Z \rightarrow I$. In this way we see that 79.12 .5 .1 is representable by $\operatorname{Res}_{Z / U}(I)$ which is an algebraic space by Proposition 79.11.5.

The following lemma is a (partial) generalization of Lemma 79.12.3.

05YJ Lemma 79.12.6. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ and $G: \mathcal{X}^{\prime} \rightarrow \mathcal{X}$ be 1-morphisms of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. If $G$ is representable by algebraic spaces, then the 1-morphism

$$
\mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right) \longrightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})
$$

is representable by algebraic spaces.
Proof. Let $U$ be a scheme and let $\xi=(U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U$. We have to prove that the 2-fibre product
$05 \mathrm{YK} \quad$ (79.12.6.1)

$$
(S c h / U)_{f p p f} \times_{\xi, \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})} \mathcal{H}_{d}\left(\mathcal{X}^{\prime} / \mathcal{Y}\right)
$$

is representable by an algebraic space étale over $U$. An object of this over $a: U^{\prime} \rightarrow$ $U$ corresponds to an object $x^{\prime}$ of $\mathcal{X}^{\prime}$ over $U^{\prime} \times_{a, U} Z$ such that $\left.G\left(x^{\prime}\right) \cong x\right|_{U^{\prime} \times_{a, U} Z}$. By assumption the 2-fibre product

$$
(S c h / Z)_{f p p f} \times_{x, \mathcal{X}} \mathcal{X}^{\prime}
$$

is representable by an algebraic space $X$ over $Z$. It follows that 79.12.6.1) is representable by $\operatorname{Res}_{Z / U}(X)$, which is an algebraic space by Proposition 79.11.5.

06 CH Lemma 79.12.7. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $F$ is representable by algebraic spaces and locally of finite presentation. Then

$$
p: \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{Y}
$$

is limit preserving on objects.
Proof. This means we have to show the following: Given
(1) an affine scheme $U=\lim _{i} U_{i}$ which is written as the directed limit of affine schemes $U_{i}$ over $S$,
(2) an object $y_{i}$ of $\mathcal{Y}$ over $U_{i}$ for some $i$, and
(3) an object $\Xi=(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U$ such that $y=\left.y_{i}\right|_{U}$,
then there exists an $i^{\prime} \geq i$ and an object $\Xi_{i^{\prime}}=\left(U_{i^{\prime}}, Z_{i^{\prime}}, y_{i^{\prime}}, x_{i^{\prime}}, \alpha_{i^{\prime}}\right)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U_{i^{\prime}}$ with $\left.\Xi_{i^{\prime}}\right|_{U}=\Xi$ and $y_{i^{\prime}}=\left.y_{i}\right|_{U_{i^{\prime}}}$. Namely, the last two equalities will take care of the commutativity of 79.5.0.1).
Let $X_{y_{i}} \rightarrow U_{i}$ be an algebraic space representing the 2 -fibre product

$$
\left(S c h / U_{i}\right)_{f p p f} \times_{y_{i}, \mathcal{Y}, F} \mathcal{X}
$$

Note that $X_{y_{i}} \rightarrow U_{i}$ is locally of finite presentation by our assumption on $F$. Write $\Xi$. It is clear that $\xi=\left(Z, Z \rightarrow U_{i}, x, \alpha\right)$ is an object of the 2-fibre product displayed above, hence $\xi$ gives rise to a morphism $f_{\xi}: Z \rightarrow X_{y_{i}}$ of algebraic spaces over $U_{i}$ (since $X_{y_{i}}$ is the functor of isomorphisms classes of objects of $\left(S c h / U_{i}\right)_{f p p f} \times_{y, \mathcal{Y}, F} \mathcal{X}$, see Algebraic Stacks, Lemma 76.8.2). By Limits, Lemmas 31.9.1 and 31.7.7 there exists an $i^{\prime} \geq i$ and a finite locally free morphism $Z_{i^{\prime}} \rightarrow U_{i^{\prime}}$ of degree $d$ whose base change to $U$ is $Z$. By Limits of Spaces, Proposition 57.3 .9 we may, after replacing $i^{\prime}$ by a bigger index, assume there exists a morphism $f_{i^{\prime}}: Z_{i^{\prime}} \rightarrow X_{y_{i}}$ such that

is commutative. We set $\Xi_{i^{\prime}}=\left(U_{i^{\prime}}, Z_{i^{\prime}}, y_{i^{\prime}}, x_{i^{\prime}}, \alpha_{i^{\prime}}\right)$ where
(1) $y_{i^{\prime}}$ is the object of $\mathcal{Y}$ over $U_{i^{\prime}}$ which is the pullback of $y_{i}$ to $U_{i^{\prime}}$,
(2) $x_{i^{\prime}}$ is the object of $\mathcal{X}$ over $Z_{i^{\prime}}$ corresponding via the 2 -Yoneda lemma to the 1-morphism

$$
\left(S c h / Z_{i^{\prime}}\right)_{f p p f} \rightarrow \mathcal{S}_{X_{y_{i}}} \rightarrow\left(S c h / U_{i}\right)_{f p p f} \times_{y_{i}, \mathcal{Y}, F} \mathcal{X} \rightarrow \mathcal{X}
$$

where the middle arrow is the equivalence which defines $X_{y_{i}}$ (notation as in Algebraic Stacks, Sections 76.8 and 76.7.
(3) $\alpha_{i^{\prime}}:\left.y_{i^{\prime}}\right|_{i^{\prime}} \rightarrow F\left(x_{i^{\prime}}\right)$ is the isomorphism coming from the 2-commutativity of the diagram

Recall that $f_{\xi}: Z \rightarrow X_{y_{i}}$ was the morphism corresponding to the object $\xi=$ $\left(Z, Z \rightarrow U_{i}, x, \alpha\right)$ of $\left(S c h / U_{i}\right)_{f p p f} \times_{y_{i}, \mathcal{Y}, F} \mathcal{X}$ over $Z$. By construction $f_{i^{\prime}}$ is the morphism corresponding to the object $\xi_{i^{\prime}}=\left(Z_{i^{\prime}}, Z_{i^{\prime}} \rightarrow U_{i}, x_{i^{\prime}}, \alpha_{i^{\prime}}\right)$. As $f_{\xi}=$ $f_{i^{\prime}} \circ\left(Z \rightarrow Z_{i^{\prime}}\right)$ we see that the object $\xi_{i^{\prime}}=\left(Z_{i^{\prime}}, Z_{i^{\prime}} \rightarrow U_{i}, x_{i^{\prime}}, \alpha_{i^{\prime}}\right)$ pulls back to $\xi$ over $Z$. Thus $x_{i^{\prime}}$ pulls back to $x$ and $\alpha_{i^{\prime}}$ pulls back to $\alpha$. This means that $\Xi_{i^{\prime}}$ pulls back to $\Xi$ over $U$ and we win.

### 79.13. The finite Hilbert stack of a point

05YL Let $d \geq 1$ be an integer. In Examples of Stacks, Definition 77.18 .2 we defined a stack in groupoids $\mathcal{H}_{d}$. In this section we prove that $\mathcal{H}_{d}$ is an algebraic stack. We will throughout assume that $S=\operatorname{Spec}(\mathbf{Z})$. The general case will follow from this by base change. Recall that the fibre category of $\mathcal{H}_{d}$ over a scheme $T$ is the category of finite locally free morphisms $\pi: Z \rightarrow T$ of degree $d$. Instead of classifying these directly we first study the quasi-coherent sheaves of algebras $\pi_{*} \mathcal{O}_{Z}$.
Let $R$ be a ring. Let us temporarily make the following definition: A free $d$ dimensional algebra over $R$ is given by a commutative $R$-algebra structure $m$ on $R^{\oplus d}$ such that $e_{1}=(1,0, \ldots, 0)$ is a unit $4^{4}$. We think of $m$ as an $R$-linear map

$$
m: R^{\oplus d} \otimes_{R} R^{\oplus d} \longrightarrow R^{\oplus d}
$$

such that $m\left(e_{1}, x\right)=m\left(x, e_{1}\right)=x$ and such that $m$ defines a commutative and associative ring structure. If we write $m\left(e_{i}, e_{j}\right)=\sum a_{i j}^{k} e_{k}$ then we see this boils down to the conditions

$$
\left\{\begin{array}{rlrl}
\sum_{l} a_{i j}^{l} a_{l k}^{m} & =\sum_{l} a_{i l}^{m} a_{j k}^{l} & \forall i, j, k, m \\
a_{i j}^{k} & =a_{j i}^{k} & & \forall i, j, k \\
a_{i 1}^{j} & =\delta_{i j} & & \forall i, j
\end{array}\right.
$$

where $\delta_{i j}$ is the Kronecker $\delta$-function. OK, so let's define

$$
R_{\text {univ }}=\mathbf{Z}\left[a_{i j}^{k}\right] / J
$$

where the ideal $J$ is the ideal generated by the relations displayed above. Denote

$$
m_{\text {univ }}: R_{u n i v}^{\oplus d} \otimes_{R_{u n i v}} R_{u n i v}^{\oplus d} \longrightarrow R_{u n i v}^{\oplus d}
$$

[^206]the free $d$-dimensional algebra $m$ over $R_{\text {univ }}$ whose structure constants are the classes of $a_{i j}^{k}$ modulo $J$. Then it is clear that given any free $d$-dimensional algebra $m$ over a ring $R$ there exists a unique Z-algebra homomorphism $\psi: R_{u n i v} \rightarrow R$ such that $\psi_{*} m_{\text {univ }}=m$ (this means that $m$ is what you get by applying the base change functor $-\otimes_{R_{\text {univ }}} R$ to $\left.m_{\text {univ }}\right)$. In other words, setting $X=\operatorname{Spec}\left(R_{\text {univ }}\right)$ we obtain a canonical identification
$$
X(T)=\{\text { free } d \text {-dimensional algebras } m \text { over } R\}
$$
for varying $T=\operatorname{Spec}(R)$. By Zariski localization we obtain the following seemingly more general identification

05 YM

$$
\begin{equation*}
X(T)=\left\{\text { free } d \text {-dimensional algebras } m \text { over } \Gamma\left(T, \mathcal{O}_{T}\right)\right\} \tag{79.13.0.1}
\end{equation*}
$$

for any scheme $T$.
Next we talk a little bit about isomorphisms of free d-dimensional $R$-algebras. Namely, suppose that $m, m^{\prime}$ are two free $d$-dimensional algebras over a ring $R$. An isomorphism from $m$ to $m^{\prime}$ is given by an invertible $R$-linear map

$$
\varphi: R^{\oplus d} \longrightarrow R^{\oplus d}
$$

such that $\varphi\left(e_{1}\right)=e_{1}$ and such that

$$
m \circ \varphi \otimes \varphi=\varphi \circ m^{\prime}
$$

Note that we can compose these so that the collection of free $d$-dimensional algebras over $R$ becomes a category. In this way we obtain a functor

05 YN

$$
\begin{equation*}
F A_{d}: S c h_{f p p f}^{o p p} \longrightarrow \text { Groupoids } \tag{79.13.0.2}
\end{equation*}
$$

from the category of schemes to groupoids: to a scheme $T$ we associate the set of free $d$-dimensional algebras over $\Gamma\left(T, \mathcal{O}_{T}\right)$ endowed with the structure of a category using the notion of isomorphisms just defined.

The above suggests we consider the functor $G$ in groups which associates to any scheme $T$ the group

$$
G(T)=\left\{g \in \mathrm{GL}_{d}\left(\Gamma\left(T, \mathcal{O}_{T}\right)\right) \mid g\left(e_{1}\right)=e_{1}\right\}
$$

It is clear that $G \subset \mathrm{GL}_{d}$ (see Groupoids, Example 38.5.4 is the closed subgroup scheme cut out by the equations $x_{11}=1$ and $x_{i 1}=0$ for $i>1$. Hence $G$ is a smooth affine group scheme over $\operatorname{Spec}(\mathbf{Z})$. Consider the action

$$
a: G \times_{\operatorname{Spec}(\mathbf{Z})} X \longrightarrow X
$$

which associates to a $T$-valued point $(g, m)$ with $T=\operatorname{Spec}(R)$ on the left hand side the free $d$-dimensional algebra over $R$ given by

$$
a(g, m)=g^{-1} \circ m \circ g \otimes g .
$$

Note that this means that $g$ defines an isomorphism $m \rightarrow a(g, m)$ of $d$-dimensional free $R$-algebras. We omit the verification that $a$ indeed defines an action of the group scheme $G$ on the scheme $X$.

05YP Lemma 79.13.1. The functor in groupoids $F A_{d}$ defined in 79.13.0.2 is isomorphic (!) to the functor in groupoids which associates to a scheme $T$ the category with
(1) set of objects is $X(T)$,
(2) set of morphisms is $G(T) \times X(T)$,
(3) $s: G(T) \times X(T) \rightarrow X(T)$ is the projection map,
(4) $t: G(T) \times X(T) \rightarrow X(T)$ is a $(T)$, and
(5) composition $G(T) \times X(T) \times_{s, X(T), t} G(T) \times X(T) \rightarrow G(T) \times X(T)$ is given $b y\left((g, m),\left(g^{\prime}, m^{\prime}\right)\right) \mapsto\left(g g^{\prime}, m^{\prime}\right)$.

Proof. We have seen the rule on objects in 79.13.0.1. We have also seen above that $g \in G(T)$ can be viewed as a morphism from $m$ to $a(g, m)$ for any free $d$ dimensional algebra $m$. Conversely, any morphism $m \rightarrow m^{\prime}$ is given by an invertible linear map $\varphi$ which corresponds to an element $g \in G(T)$ such that $m^{\prime}=a(g, m)$.

In fact the groupoid ( $X, G \times X, s, t, c$ ) described in the lemma above is the groupoid associated to the action $a: G \times X \rightarrow X$ as defined in Groupoids, Lemma 38.16.1. Since $G$ is smooth over $\operatorname{Spec}(\mathbf{Z})$ we see that the two morphisms $s, t: G \times X \rightarrow X$ are smooth: by symmetry it suffices to prove that one of them is, and $s$ is the base change of $G \rightarrow \operatorname{Spec}(\mathbf{Z})$. Hence $(G \times X, X, s, t, c)$ is a smooth groupoid scheme, and the quotient stack $[X / G]$ is an algebraic stack by Algebraic Stacks, Theorem 76.17 .3

05 YQ Proposition 79.13.2. The stack $\mathcal{H}_{d}$ is equivalent to the quotient stack $[X / G]$ described above. In particular $\mathcal{H}_{d}$ is an algebraic stack.

Proof. Note that by Groupoids in Spaces, Definition 65.19.1 the quotient stack $[X / G]$ is the stackification of the category fibred in groupoids associated to the "presheaf in groupoids" which associates to a scheme $T$ the groupoid

$$
(X(T), G(T) \times X(T), s, t, c)
$$

Since this "presheaf in groupoids" is isomorphic to $F A_{d}$ by Lemma 79.13.1 it suffices to prove that the $\mathcal{H}_{d}$ is the stackification of (the category fibred in groupoids associated to the "presheaf in groupoids") $F A_{d}$. To do this we first define a functor

$$
\text { Spec : } F A_{d} \longrightarrow \mathcal{H}_{d}
$$

Recall that the fibre category of $\mathcal{H}_{d}$ over a scheme $T$ is the category of finite locally free morphisms $Z \rightarrow T$ of degree $d$. Thus given a scheme $T$ and a free $d$-dimensional $\Gamma\left(T, \mathcal{O}_{T}\right)$-algebra $m$ we may assign to this the object

$$
Z=\underline{\operatorname{Spec}}_{T}(\mathcal{A})
$$

of $\mathcal{H}_{d, T}$ where $\mathcal{A}=\mathcal{O}_{T}^{\oplus d}$ endowed with a $\mathcal{O}_{T}$-algebra structure via $m$. Moreover, if $m^{\prime}$ is a second such free $d$-dimensional $\Gamma\left(T, \mathcal{O}_{T}\right)$-algebra and if $\varphi: m \rightarrow m^{\prime}$ is an isomorphism of these, then the induced $\mathcal{O}_{T}$-linear map $\varphi: \mathcal{O}_{T}^{\oplus d} \rightarrow \mathcal{O}_{T}^{\oplus d}$ induces an isomorphism

$$
\varphi: \mathcal{A}^{\prime} \longrightarrow \mathcal{A}
$$

of quasi-coherent $\mathcal{O}_{T}$-algebras. Hence

$$
\underline{\operatorname{Spec}}_{T}(\varphi): \underline{\operatorname{Spec}}_{T}(\mathcal{A}) \longrightarrow \underline{\operatorname{Spec}}_{T}\left(\mathcal{A}^{\prime}\right)
$$

is a morphism in the fibre category $\mathcal{H}_{d, T}$. We omit the verification that this construction is compatible with base change so we get indeed a functor Spec : $F A_{d} \rightarrow$ $\mathcal{H}_{d}$ as claimed above.
To show that Spec : $F A_{d} \rightarrow \mathcal{H}_{d}$ induces an equivalence between the stackification of $F A_{d}$ and $\mathcal{H}_{d}$ it suffices to check that
(1) $\operatorname{Isom}\left(m, m^{\prime}\right)=\operatorname{Isom}\left(\operatorname{Spec}(m), \operatorname{Spec}\left(m^{\prime}\right)\right)$ for any $m, m^{\prime} \in F A_{d}(T)$.
(2) for any scheme $T$ and any object $Z \rightarrow T$ of $\mathcal{H}_{d, T}$ there exists a covering $\left\{T_{i} \rightarrow T\right\}$ such that $\left.Z\right|_{T_{i}}$ is isomorphic to $\operatorname{Spec}(m)$ for some $m \in F A_{d}\left(T_{i}\right)$, and
see Stacks, Lemma 8.9.1. The first statement follows from the observation that any isomorphism

$$
\underline{\operatorname{Spec}}_{T}(\mathcal{A}) \longrightarrow \underline{\operatorname{Spec}}_{T}\left(\mathcal{A}^{\prime}\right)
$$

is necessarily given by a global invertible matrix $g$ when $\mathcal{A}=\mathcal{A}^{\prime}=\mathcal{O}_{T}^{\oplus d}$ as modules. To prove the second statement let $\pi: Z \rightarrow T$ be a finite locally free morphism of degree $d$. Then $\mathcal{A}$ is a locally free sheaf $\mathcal{O}_{T}$-modules of rank $d$. Consider the element $1 \in \Gamma(T, \mathcal{A})$. This element is nonzero in $\mathcal{A} \otimes_{\mathcal{O}_{T, t}} \kappa(t)$ for every $t \in T$ since the scheme $Z_{t}=\operatorname{Spec}\left(\mathcal{A} \otimes_{\mathcal{O}_{T, t}} \kappa(t)\right)$ is nonempty being of degree $d>0$ over $\kappa(t)$. Thus 1: $\mathcal{O}_{T} \rightarrow \mathcal{A}$ can locally be used as the first basis element (for example you can use Algebra, Lemma 10.78 .3 parts (1) and (2) to see this). Thus, after localizing on $T$ we may assume that there exists an isomorphism $\varphi: \mathcal{A} \rightarrow \mathcal{O}_{T}^{\oplus d}$ such that $1 \in \Gamma(\mathcal{A})$ corresponds to the first basis element. In this situation the multiplication $\operatorname{map} \mathcal{A} \otimes_{\mathcal{O}_{T}} \mathcal{A} \rightarrow \mathcal{A}$ translates via $\varphi$ into a free $d$-dimensional algebra $m$ over $\Gamma\left(T, \mathcal{O}_{T}\right)$. This finishes the proof.

### 79.14. Finite Hilbert stacks of spaces

05 YR The finite Hilbert stack of an algebraic space is an algebraic stack.
05YS Lemma 79.14.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $\mathcal{H}_{d}(X)$ is an algebraic stack.

Proof. The 1-morphism

$$
\mathcal{H}_{d}(X) \longrightarrow \mathcal{H}_{d}
$$

is representable by algebraic spaces according to Lemma 79.12.6. The stack $\mathcal{H}_{d}$ is an algebraic stack according to Proposition 79.13.2. Hence $\mathcal{H}_{d}(X)$ is an algebraic stack by Algebraic Stacks, Lemma 76.15.4.

This lemma allows us to bootstrap.
06CI Lemma 79.14.2. Let $S$ be a scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$ such that
(1) $\mathcal{X}$ is representable by an algebraic space, and
(2) $F$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation.
Then $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is an algebraic stack.
Proof. Choose a representable stack in groupoids $\mathcal{U}$ over $S$ and a 1-morphism $f: \mathcal{U} \rightarrow \mathcal{H}_{d}(\mathcal{X})$ which is representable by algebraic spaces, smooth, and surjective. This is possible because $\mathcal{H}_{d}(\mathcal{X})$ is an algebraic stack by Lemma 79.14.1. Consider the 2-fibre product

$$
\mathcal{W}=\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \times_{\mathcal{H}_{d}(\mathcal{X}), f} \mathcal{U}
$$

Since $\mathcal{U}$ is representable (in particular a stack in setoids) it follows from Examples of Stacks, Lemma 77.18 .3 and Stacks, Lemma 8.6 .7 that $\mathcal{W}$ is a stack in setoids. The 1-morphism $\mathcal{W} \rightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces, smooth, and surjective as a base change of the morphism $f$ (see Algebraic Stacks, Lemmas 76.9.7 and 76.10 .6 . Thus, if we can show that $\mathcal{W}$ is representable by an algebraic space, then the lemma follows from Algebraic Stacks, Lemma 76.15.3

The diagonal of $\mathcal{Y}$ is representable by algebraic spaces according to Lemma 79.4.3. We may apply Lemma 79.12 .5 to see that the 1-morphism

$$
\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \longrightarrow \mathcal{H}_{d}(\mathcal{X}) \times \mathcal{Y}
$$

is representable by algebraic spaces. Consider the 2 -fibre product

$$
\mathcal{V}=\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \times_{\left(\mathcal{H}_{d}(\mathcal{X}) \times \mathcal{Y}\right), f \times F}(\mathcal{U} \times \mathcal{X})
$$

The projection morphism $\mathcal{V} \rightarrow \mathcal{U} \times \mathcal{X}$ is representable by algebraic spaces as a base change of the last displayed morphism. Hence $\mathcal{V}$ is an algebraic space (see Bootstrap, Lemma 67.3 .6 or Algebraic Stacks, Lemma 76.9.8). The 1-morphism $\mathcal{V} \rightarrow \mathcal{U}$ fits into the following 2 -cartesian diagram

because

$$
\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \times_{\left(\mathcal{H}_{d}(\mathcal{X}) \times \mathcal{Y}\right), f \times F}(\mathcal{U} \times \mathcal{X})=\left(\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \times_{\mathcal{H}_{d}(\mathcal{X}), f} \mathcal{U}\right) \times_{\mathcal{Y}, F} \mathcal{X}
$$

Hence $\mathcal{V} \rightarrow \mathcal{W}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation as a base change of $F$. It follows that the same thing is true for the corresponding sheaves of sets associated to $\mathcal{V}$ and $\mathcal{W}$, see Algebraic Stacks, Lemma 76.10 .4 . Thus we conclude that the sheaf associated to $\mathcal{W}$ is an algebraic space by Bootstrap, Theorem 67.10.1.

### 79.15. LCI locus in the Hilbert stack

06CJ Please consult Examples of Stacks, Section 77.18 for notation. Fix a 1-morphism $F$ : $\mathcal{X} \longrightarrow \mathcal{Y}$ of stacks in groupoids over $(S c h / S)_{f p p f}$. Assume that $F$ is representable by algebraic spaces. Fix $d \geq 1$. Consider an object $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d}$. There is an induced 1-morphism

$$
(S c h / Z)_{f p p f} \longrightarrow(S c h / U)_{f p p f} \times_{y, \mathcal{Y}, F} \mathcal{X}
$$

(by the universal property of 2-fibre products) which is representable by a morphism of algebraic spaces over $U$. Namely, since $F$ is representable by algebraic spaces, we may choose an algebraic space $X_{y}$ over $U$ which represents the 2 -fibre product $(S c h / U)_{f p p f} \times_{y, \mathcal{Y}, F} \mathcal{X}$. Since $\alpha:\left.y\right|_{Z} \rightarrow F(x)$ is an isomorphism we see that $\xi=(Z, Z \rightarrow U, x, \alpha)$ is an object of the 2-fibre product $(S c h / U)_{\text {fppf }} \times_{y, \mathcal{Y}, F} \mathcal{X}$ over $Z$. Hence $\xi$ gives rise to a morphism $x_{\alpha}: Z \rightarrow X_{y}$ of algebraic spaces over $U$ as $X_{y}$ is the functor of isomorphisms classes of objects of $(S c h / U)_{f p p f} \times{ }_{y, \mathcal{Y}, F} \mathcal{X}$, see Algebraic Stacks, Lemma 76.8.2. Here is a picture

06CK

We remark that if $(f, g, b, a):(U, Z, y, x, \alpha) \rightarrow\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ is a morphism between objects of $\mathcal{H}_{d}$, then the morphism $x_{\alpha^{\prime}}^{\prime}: Z^{\prime} \rightarrow X_{y^{\prime}}^{\prime}$ is the base change of the morphism $x_{\alpha}$ by the morphism $g: U^{\prime} \rightarrow U$ (details omitted).

Now assume moreover that $F$ is flat and locally of finite presentation. In this situation we define a full subcategory

$$
\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \subset \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})
$$

consisting of those objects $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ such that the corresponding morphism $x_{\alpha}: Z \rightarrow X_{y}$ is unramified and a local complete intersection morphism (see Morphisms of Spaces, Definition 54.37.1 and More on Morphisms of Spaces, Definition 63.37.1 for definitions).

06CL Lemma 79.15.1. Let $S$ be a scheme. Fix a 1-morphism $F: \mathcal{X} \longrightarrow \mathcal{Y}$ of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $F$ is representable by algebraic spaces, flat, and locally of finite presentation. Then $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ is a stack in groupoids and the inclusion functor

$$
\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \longrightarrow \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})
$$

is representable and an open immersion.
Proof. Let $\Xi=(U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_{d}$. It follows from the remark following 79.15 .0 .1 that the pullback of $\Xi$ by $U^{\prime} \rightarrow U$ belongs to $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ if and only if the base change of $x_{\alpha}$ is unramified and a local complete intersection morphism. Note that $Z \rightarrow U$ is finite locally free (hence flat, locally of finite presentation and universally closed) and that $X_{y} \rightarrow U$ is flat and locally of finite presentation by our assumption on $F$. Then More on Morphisms of Spaces, Lemmas 63.38 .1 and 63.38.7 imply exists an open subscheme $W \subset U$ such that a morphism $U^{\prime} \rightarrow U$ factors through $W$ if and only if the base change of $x_{\alpha}$ via $U^{\prime} \rightarrow U$ is unramified and a local complete intersection morphism. This implies that

$$
(S c h / U)_{f p p f} \times_{\Xi, \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})
$$

is representable by $W$. Hence the final statement of the lemma holds. The first statement (that $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ is a stack in groupoids) follows from this an Algebraic Stacks, Lemma 76.15.5

Local complete intersection morphisms are "locally unobstructed". This holds in much greater generality than the special case that we need in this chapter here.

06D8 Lemma 79.15.2. Let $U \subset U^{\prime}$ be a first order thickening of affine schemes. Let $X^{\prime}$ be an algebraic space flat over $U^{\prime}$. Set $X=U \times_{U^{\prime}} X^{\prime}$. Let $Z \rightarrow U$ be finite locally free of degree $d$. Finally, let $f: Z \rightarrow X$ be unramified and a local complete intersection morphism. Then there exists a commutative diagram

of algebraic spaces over $U^{\prime}$ such that $Z^{\prime} \rightarrow U^{\prime}$ is finite locally free of degree $d$ and $Z=U \times_{U^{\prime}} Z^{\prime}$.

Proof. By More on Morphisms of Spaces, Lemma 63.37 .8 the conormal sheaf $\mathcal{C}_{Z / X}$ of the unramified morphism $Z \rightarrow X$ is a finite locally free $\mathcal{O}_{Z}$-module and by More on Morphisms of Spaces, Lemma 63.37.9 we have an exact sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{X / X^{\prime}} \rightarrow \mathcal{C}_{Z / X^{\prime}} \rightarrow \mathcal{C}_{Z / X} \rightarrow 0
$$

of conormal sheaves. Since $Z$ is affine this sequence is split. Choose a splitting

$$
\mathcal{C}_{Z / X^{\prime}}=i^{*} \mathcal{C}_{X / X^{\prime}} \oplus \mathcal{C}_{Z / X}
$$

Let $Z \subset Z^{\prime \prime}$ be the universal first order thickening of of $Z$ over $X^{\prime}$ (see More on Morphisms of Spaces, Section 63.13). Denote $\mathcal{I} \subset \mathcal{O}_{Z^{\prime \prime}}$ the quasi-coherent sheaf of ideals corresponding to $Z \subset Z^{\prime \prime}$. By definition we have $\mathcal{C}_{Z / X^{\prime}}$ is $\mathcal{I}$ viewed as a sheaf on $Z$. Hence the splitting above determines a splitting

$$
\mathcal{I}=i^{*} \mathcal{C}_{X / X^{\prime}} \oplus \mathcal{C}_{Z / X}
$$

Let $Z^{\prime} \subset Z^{\prime \prime}$ be the closed subscheme cut out by $\mathcal{C}_{Z / X} \subset \mathcal{I}$ viewed as a quasicoherent sheaf of ideals on $Z^{\prime \prime}$. It is clear that $Z^{\prime}$ is a first order thickening of $Z$ and that we obtain a commutative diagram of first order thickenings as in the statement of the lemma.

Since $X^{\prime} \rightarrow U^{\prime}$ is flat and since $X=U \times_{U^{\prime}} X^{\prime}$ we see that $\mathcal{C}_{X / X^{\prime}}$ is the pullback of $\mathcal{C}_{U / U^{\prime}}$ to $X$, see More on Morphisms of Spaces, Lemma 63.16.1. Note that by construction $\mathcal{C}_{Z / Z^{\prime}}=i^{*} \mathcal{C}_{X / X^{\prime}}$ hence we conclude that $\mathcal{C}_{Z / Z^{\prime}}$ is isomorphic to the pullback of $\mathcal{C}_{U / U^{\prime}}$ to $Z$. Applying More on Morphisms of Spaces, Lemma 63.16.1 once again (or its analogue for schemes, see More on Morphisms, Lemma 36.8.1) we conclude that $Z^{\prime} \rightarrow U^{\prime}$ is flat and that $Z=U \times_{U^{\prime}} Z^{\prime}$. Finally, More on Morphisms, Lemma 36.8 .3 shows that $Z^{\prime} \rightarrow U^{\prime}$ is finite locally free of degree $d$.

06D9 Lemma 79.15.3. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $F$ is representable by algebraic spaces, flat, and locally of finite presentation. Then

$$
p: \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{Y}
$$

is formally smooth on objects.
Proof. We have to show the following: Given
(1) an object $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ over an affine scheme $U$,
(2) a first order thickening $U \subset U^{\prime}$, and
(3) an object $y^{\prime}$ of $\mathcal{Y}$ over $U^{\prime}$ such that $\left.y^{\prime}\right|_{U}=y$,
then there exists an object $\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ of $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ over $U^{\prime}$ with $Z=$ $U \times_{U^{\prime}} Z^{\prime}$, with $x=\left.x^{\prime}\right|_{Z}$, and with $\alpha=\left.\alpha^{\prime}\right|_{U}$. Namely, the last two equalities will take care of the commutativity of 79.6.0.1).
Consider the morphism $x_{\alpha}: Z \rightarrow X_{y}$ constructed in Equation 79.15.0.1). Denote similarly $X_{y^{\prime}}^{\prime}$ the algebraic space over $U^{\prime}$ representing the 2-fibre product $\left(S c h / U^{\prime}\right)_{f p p f} \times_{y^{\prime}, \mathcal{Y}, F} \mathcal{X}$. By assumption the morphism $X_{y^{\prime}}^{\prime} \rightarrow U^{\prime}$ is flat (and locally of finite presentation). As $\left.y^{\prime}\right|_{U}=y$ we see that $X_{y}=U \times_{U^{\prime}} X_{y^{\prime}}^{\prime}$. Hence we may apply Lemma 79.15 .2 to find $Z^{\prime} \rightarrow U^{\prime}$ finite locally free of degree $d$ with $Z=U \times_{U^{\prime}} Z^{\prime}$ and with $Z^{\prime} \rightarrow X_{y^{\prime}}^{\prime}$ extending $x_{\alpha}$. By construction the morphism $Z^{\prime} \rightarrow X_{y^{\prime}}^{\prime}$ corresponds to a pair $\left(x^{\prime}, \alpha^{\prime}\right)$. It is clear that $\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ is an object of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ over $U^{\prime}$ with $Z=U \times_{U^{\prime}} Z^{\prime}$, with $x=\left.x^{\prime}\right|_{Z}$, and with $\alpha=\left.\alpha^{\prime}\right|_{U}$. As we've seen in Lemma 79.15 .1 that $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \subset \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$ is an "open substack" it follows that $\left(U^{\prime}, Z^{\prime}, y^{\prime}, x^{\prime}, \alpha^{\prime}\right)$ is an object of $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ as desired.

06DA Lemma 79.15.4. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $F$ is representable by algebraic spaces, flat, surjective, and
locally of finite presentation. Then

$$
\coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \longrightarrow \mathcal{Y}
$$

is surjective on objects.
Proof. It suffices to prove the following: For any field $k$ and object $y$ of $\mathcal{Y}$ over $\operatorname{Spec}(k)$ there exists an integer $d \geq 1$ and an object $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ with $U=\operatorname{Spec}(k)$. Namely, in this case we see that $p$ is surjective on objects in the strong sense that an extension of the field is not needed.

Denote $X_{y}$ the algebraic space over $U=\operatorname{Spec}(k)$ representing the 2-fibre product $\left(S c h / U^{\prime}\right)_{f p p f} \times{ }_{y^{\prime}, \mathcal{Y}, F} \mathcal{X}$. By assumption the morphism $X_{y} \rightarrow \operatorname{Spec}(k)$ is surjective and locally of finite presentation (and flat). In particular $X_{y}$ is nonempty. Choose a nonempty affine scheme $V$ and an étale morphism $V \rightarrow X_{y}$. Note that $V \rightarrow \operatorname{Spec}(k)$ is (flat), surjective, and locally of finite presentation (by Morphisms of Spaces, Definition 54.28.1). Pick a closed point $v \in V$ where $V \rightarrow \operatorname{Spec}(k)$ is CohenMacaulay (i.e., $V$ is Cohen-Macaulay at $v$ ), see More on Morphisms, Lemma36.17.5. Applying More on Morphisms, Lemma 36.18.4 we find a regular immersion $Z \rightarrow V$ with $Z=\{v\}$. This implies $Z \rightarrow V$ is a closed immersion. Moreover, it follows that $Z \rightarrow \operatorname{Spec}(k)$ is finite (for example by Algebra, Lemma 10.121.1). Hence $Z \rightarrow \operatorname{Spec}(k)$ is finite locally free of some degree $d$. Now $Z \rightarrow X_{y}$ is unramified as the composition of an closed immersion followed by an étale morphism (see Morphisms of Spaces, Lemmas 54.37.3, 54.38.10, and 54.37.8. Finally, $Z \rightarrow X_{y}$ is a local complete intersection morphism as a composition of a regular immersion of schemes and an étale morphism of algebraic spaces (see More on Morphisms, Lemma 36.44 .9 and Morphisms of Spaces, Lemmas 54.38 .6 and 54.36 .8 and More on Morphisms of Spaces, Lemmas 63.37 .6 and 63.37.5). The morphism $Z \rightarrow X_{y}$ corresponds to an object $x$ of $\mathcal{X}$ over $Z$ together with an isomorphism $\alpha:\left.y\right|_{Z} \rightarrow$ $F(x)$. We obtain an object $(U, Z, y, x, \alpha)$ of $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})$. By what was said above about the morphism $Z \rightarrow X_{y}$ we see that it actually is an object of the subcategory $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ and we win.

### 79.16. Bootstrapping algebraic stacks

06 DB The following theorem is one of the main results of this chapter.
06DC Theorem 79.16.1. Let $S$ be a scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(S c h / S)_{\text {fppf }}$. If
(1) $\mathcal{X}$ is representable by an algebraic space, and
(2) $F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation,
then $\mathcal{Y}$ is an algebraic stack.
Proof. By Lemma 79.4 .3 we see that the diagonal of $\mathcal{Y}$ is representable by algebraic spaces. Hence we only need to verify the existence of a 1-morphism $f: \mathcal{V} \rightarrow \mathcal{Y}$ of stacks in groupoids over $(S c h / S)_{f p p f}$ with $\mathcal{V}$ representable and $f$ surjective and smooth. By Lemma 79.14.2 we know that

$$
\coprod_{d \geq 1} \mathcal{H}_{d}(\mathcal{X} / \mathcal{Y})
$$

is an algebraic stack. It follows from Lemma 79.15.1 and Algebraic Stacks, Lemma 76.15.5 that

$$
\coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})
$$

is an algebraic stack as well. Choose a representable stack in groupoids $\mathcal{V}$ over $(S c h / S)_{f p p f}$ and a surjective and smooth 1-morphism

$$
\mathcal{V} \longrightarrow \coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})
$$

We claim that the composition

$$
\mathcal{V} \longrightarrow \coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \longrightarrow \mathcal{Y}
$$

is smooth and surjective which finishes the proof of the theorem. In fact, the smoothness will be a consequence of Lemmas 79.12 .7 and 79.15 .3 and the surjectivity a consequence of Lemma 79.15.4. We spell out the details in the following paragraph.
By construction $\mathcal{V} \rightarrow \coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ is representable by algebraic spaces, surjective, and smooth (and hence also locally of finite presentation and formally smooth by the general principle Algebraic Stacks, Lemma 76.10 .9 and More on Morphisms of Spaces, Lemma 63.17.6). Applying Lemmas 79.5.3, 79.6.3, and 79.7.3 we see that $\mathcal{V} \rightarrow \coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y})$ is limit preserving on objects, formally smooth on objects, and surjective on objects. The 1-morphism $\coprod_{d \geq 1} \mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{Y}$ is
(1) limit preserving on objects: this is Lemma 79.12 .7 for $\mathcal{H}_{d}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{Y}$ and we combine it with Lemmas 79.15.1, 79.5.4 and 79.5 .2 to get it for $\mathcal{H}_{d, l c i}(\mathcal{X} / \mathcal{Y}) \rightarrow \mathcal{Y}$,
(2) formally smooth on objects by Lemma 79.15.3 and
(3) surjective on objects by Lemma 79.15.4

Using Lemmas 79.5.2, 79.6.2, and 79.7.2 we conclude that the composition $\mathcal{V} \rightarrow$ $\mathcal{Y}$ is limit preserving on objects, formally smooth on objects, and surjective on objects. Using Lemmas 79.5.3, 79.6.3, and 79.7 .3 we see that $\mathcal{V} \rightarrow \mathcal{Y}$ is locally of finite presentation, formally smooth, and surjective. Finally, using (via the general principle Algebraic Stacks, Lemma 76.10.9) the infinitesimal lifting criterion (More on Morphisms of Spaces, Lemma 63.17.6 we see that $\mathcal{V} \rightarrow \mathcal{Y}$ is smooth and we win.

### 79.17. Applications

06FG Our first task is to show that the quotient stack $[U / R]$ associated to a "flat and locally finitely presented groupoid" is an algebraic stack. See Groupoids in Spaces, Definition 65.19 .1 for the definition of the quotient stack. The following lemma is preliminary and is the analogue of Algebraic Stacks, Lemma 76.17.2.

06FH Lemma 79.17.1. Let $S$ be a scheme contained in $\operatorname{Sch}_{f p p f}$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. Assume $s, t$ are flat and locally of finite presentation. Then the morphism $\mathcal{S}_{U} \rightarrow[U / R]$ is flat, locally of finite presentation, and surjective.

Proof. Let $T$ be a scheme and let $x:(S c h / T)_{f p p f} \rightarrow[U / R]$ be a 1-morphism. We have to show that the projection

$$
\mathcal{S}_{U} \times_{[U / R]}(S c h / T)_{f p p f} \longrightarrow(S c h / T)_{f p p f}
$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space $F$, see Algebraic Stacks, Lemmas 76.17.1 and 76.10.11. Hence we have to show the corresponding morphism $F \rightarrow T$ of algebraic spaces is surjective, locally of finite presentation, and flat. Since we are working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on $T$. By construction, there exists an fppf covering $\left\{T_{i} \rightarrow T\right\}$ of $T$ such that $\left.x\right|_{\left(S c h / T_{i}\right)_{f p p f}}$ comes from a morphism $x_{i}: T_{i} \rightarrow U$. (Note that $F \times_{T} T_{i}$ represents the 2-fibre product $\mathcal{S}_{U} \times_{[U / R]}\left(S c h / T_{i}\right)_{f p p f}$ so everything is compatible with the base change via $T_{i} \rightarrow T$.) Hence we may assume that $x$ comes from $x: T \rightarrow U$. In this case we see that
$\mathcal{S}_{U} \times_{[U / R]}(S c h / T)_{f p p f}=\left(\mathcal{S}_{U} \times{ }_{[U / R]} \mathcal{S}_{U}\right) \times \mathcal{S}_{U}(S c h / T)_{\text {fppf }}=\mathcal{S}_{R} \times \mathcal{S}_{U}(S c h / T)_{f p p f}$
The first equality by Categories, Lemma 4.30 .10 and the second equality by Groupoids in Spaces, Lemma 65.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F=R \times_{s, U, x} T$ and the projection $R \times_{s, U, x} T \rightarrow T$ is flat and locally of finite presentation as the base change of the flat locally finitely presented morphism of algebraic spaces $s: R \rightarrow U$. It is also surjective as $s$ has a section (namely the identity $e: U \rightarrow R$ of the groupoid). This proves the lemma.

Here is the first main result of this section.
06FI Theorem 79.17.2. Let $S$ be a scheme contained in $\operatorname{Sch}_{f p p f}$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $S$. Assume $s, t$ are flat and locally of finite presentation. Then the quotient stack $[U / R]$ is an algebraic stack over $S$.

Proof. We check the two conditions of Theorem 79.16.1 for the morphism

$$
(S c h / U)_{f p p f} \longrightarrow[U / R] .
$$

The first is trivial (as $U$ is an algebraic space). The second is Lemma 79.17.1.

### 79.18. When is a quotient stack algebraic?

06PI In Groupoids in Spaces, Section 65.19 we have defined the quotient stack $[U / R]$ associated to a groupoid $(U, R, s, t, c)$ in algebraic spaces. Note that $[U / R]$ is a stack in groupoids whose diagonal is representable by algebraic spaces (see Bootstrap, Lemma 67.11.5 and Algebraic Stacks, Lemma 76.10.11 and such that there exists an algebraic space $U$ and a 1-morphism $(S c h / U)_{\text {fppf }} \rightarrow[U / R]$ which is an "fppf surjection" in the sense that it induces a map on presheaves of isomorphism classes of objects which becomes surjective after sheafification. However, it is not the case that that $[U / R]$ is an algebraic stack in general. This is not a contradiction with Theorem 79.16 .1 as the 1-morphism $(S c h / U)_{\text {fppf }} \rightarrow[U / R]$ is not representable by algebraic spaces in general, and if it is it may not be flat and locally of finite presentation.

The easiest way to make examples of non-algebraic quotient stacks is to look at quotients of the form $[S / G]$ where $S$ is a scheme and $G$ is a group scheme over $S$ acting trivially on $S$. Namely, we will see below (Lemma 79.18.3) that if $[S / G]$ is algebraic, then $G \rightarrow S$ has to be flat and locally of finite presentation. An explicit example can be found in Examples, Section 88.44 .
06PJ Lemma 79.18.1. Let $S$ be a scheme and let $B$ be an algebraic space over $S$. Let $(U, R, s, t, c)$ be a groupoid in algebraic spaces over $B$. The quotient stack $[U / R]$
is an algebraic stack if and only if there exists a morphism of algebraic spaces $g: U^{\prime} \rightarrow U$ such that
(1) the composition $U^{\prime} \times_{g, U, t} R \rightarrow R \xrightarrow{s} U$ is a surjection of sheaves, and
(2) the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are flat and locally of finite presentation where $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is the restriction of $(U, R, s, t, c)$ via $g$.

Proof. First, assume that $g: U^{\prime} \rightarrow U$ satisfies (1) and (2). Property (1) implies that $\left[U^{\prime} / R^{\prime}\right] \rightarrow[U / R]$ is an equivalence, see Groupoids in Spaces, Lemma 65.24.2, By Theorem 79.17 .2 the quotient stack $\left[U^{\prime} / R^{\prime}\right]$ is an algebraic stack. Hence $[U / R]$ is an algebraic stack too, see Algebraic Stacks, Lemma 76.12.4
Conversely, assume that $[U / R]$ is an algebraic stack. We may choose a scheme $W$ and a surjective smooth 1-morphism

$$
f:(S c h / W)_{\text {fppf }} \longrightarrow[U / R] .
$$

By the 2-Yoneda lemma (Algebraic Stacks, Section 76.5) this corresponds to an object $\xi$ of $[U / R]$ over $W$. By the description of $[U / R]$ in Groupoids in Spaces, Lemma 65.23.1 we can find a surjective, flat, locally finitely presented morphism $b: U^{\prime} \rightarrow W$ of schemes such that $\xi^{\prime}=b^{*} \xi$ corresponds to a morphism $g: U^{\prime} \rightarrow U$. Note that the 1-morphism

$$
f^{\prime}:\left(S c h / U^{\prime}\right)_{f p p f} \longrightarrow[U / R] .
$$

corresponding to $\xi^{\prime}$ is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Lemma 76.10.5. Hence $\left(S c h / U^{\prime}\right)_{f p p f} \times{ }_{[U / R]}\left(S c h / U^{\prime}\right)_{f p p f}$ which is represented by the algebraic space

$$
\operatorname{Isom}_{[U / R]}\left(\operatorname{pr}_{0}^{*} \xi^{\prime}, \operatorname{pr}_{1}^{*} \xi^{\prime}\right)=\left(U^{\prime} \times_{S} U^{\prime}\right) \times{ }_{\left(g \circ \operatorname{pr}_{0}, g \circ \operatorname{pr}_{1}\right), U \times_{S} U} R=R^{\prime}
$$

(see Groupoids in Spaces, Lemma 65.21 .1 for the first equality; the second is the definition of restriction) is flat and locally of finite presentation over $U^{\prime}$ via both $s^{\prime}$ and $t^{\prime}$ (by base change, see Algebraic Stacks, Lemma 76.10.6). By this description of $R^{\prime}$ and by Algebraic Stacks, Lemma 76.16.1 we obtain a canonical fully faithful 1 -morphism $\left[U^{\prime} / R^{\prime}\right] \rightarrow[U / R]$. This 1-morphism is essentially surjective because $f^{\prime}$ is flat, locally of finite presentation, and surjective (see Stacks, Lemma 8.4.8); another way to prove this is to use Algebraic Stacks, Remark 76.16.3. Finally, we can use Groupoids in Spaces, Lemma 65.24 .2 to conclude that the composition $U^{\prime} \times_{g, U, t} R \rightarrow R \xrightarrow{s} U$ is a surjection of sheaves.

06PK Lemma 79.18.2. Let $S$ be a scheme and let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. Let $X$ be an algebraic space over $B$ and let $a: G \times_{B} X \rightarrow X$ be an action of $G$ on $X$ over $B$. The quotient stack $[X / G]$ is an algebraic stack if and only if there exists a morphism of algebraic spaces $\varphi: X^{\prime} \rightarrow X$ such that
(1) $G \times_{B} X^{\prime} \rightarrow X,\left(g, x^{\prime}\right) \mapsto a\left(g, \varphi\left(x^{\prime}\right)\right)$ is a surjection of sheaves, and
(2) the two projections $X^{\prime \prime} \rightarrow X^{\prime}$ of the algebraic space $X^{\prime \prime}$ given by the rule

$$
\begin{aligned}
& T \longmapsto\left\{\left(x_{1}^{\prime}, g, x_{2}^{\prime}\right) \in\left(X^{\prime} \times_{B} G \times_{B} X^{\prime}\right)(T) \mid \varphi\left(x_{1}^{\prime}\right)=a\left(g, \varphi\left(x_{2}^{\prime}\right)\right)\right\} \\
& \text { are flat and locally of finite presentation. }
\end{aligned}
$$

Proof. This lemma is a special case of Lemma 79.18.1. Namely, the quotient stack $[X / G]$ is by Groupoids in Spaces, Definition 65.19.1 equal to the quotient stack $\left[X / G \times{ }_{B} X\right]$ of the groupoid in algebraic spaces $\left(X, G \times{ }_{B} X, s, t, c\right)$ associated to the
group action in Groupoids in Spaces, Lemma 65.14.1. There is one small observation that is needed to get condition (1). Namely, the morphism $s: G \times_{B} X \rightarrow X$ is the second projection and the morphism $t: G \times_{B} X \rightarrow X$ is the action morphism $a$. Hence the morphism $h: U^{\prime} \times{ }_{g, U, t} R \rightarrow R \xrightarrow{s} U$ from Lemma 79.18.1 corresponds to the morphism

$$
X^{\prime} \times_{\varphi, X, a}\left(G \times_{B} X\right) \xrightarrow{\mathrm{pr}_{1}} X
$$

in the current setting. However, because of the symmetry given by the inverse of $G$ this morphism is isomorphic to the morphism

$$
\left(G \times_{B} X\right) \times_{\operatorname{pr}_{1}, X, \varphi} X^{\prime} \xrightarrow{a} X
$$

of the statement of the lemma. Details omitted.
06PL Lemma 79.18.3. Let $S$ be a scheme and let $B$ be an algebraic space over $S$. Let $G$ be a group algebraic space over $B$. Endow $B$ with the trivial action of $G$. Then the quotient stack $[B / G]$ is an algebraic stack if and only if $G$ is flat and locally of finite presentation over $B$.

Proof. If $G$ is flat and locally of finite presentation over $B$, then $[B / G]$ is an algebraic stack by Theorem 79.17.2.
Conversely, assume that $[B / G]$ is an algebraic stack. By Lemma 79.18 .2 and because the action is trivial, we see there exists an algebraic space $B^{\prime}$ and a morphism $B^{\prime} \rightarrow B$ such that (1) $B^{\prime} \rightarrow B$ is a surjection of sheaves and (2) the projections

$$
B^{\prime} \times_{B} G \times_{B} B^{\prime} \rightarrow B^{\prime}
$$

are flat and locally of finite presentation. Note that the base change $B^{\prime} \times_{B} G \times{ }_{B}$ $B^{\prime} \rightarrow G \times_{B} B^{\prime}$ of $B^{\prime} \rightarrow B$ is a surjection of sheaves also. Thus it follows from Descent on Spaces, Lemma 61.7.1 that the projection $G \times{ }_{B} B^{\prime} \rightarrow B^{\prime}$ is flat and locally of finite presentation. By (1) we can find an fppf covering $\left\{B_{i} \rightarrow B\right\}$ such that $B_{i} \rightarrow B$ factors through $B^{\prime} \rightarrow B$. Hence $G \times{ }_{B} B_{i} \rightarrow B_{i}$ is flat and locally of finite presentation by base change. By Descent on Spaces, Lemmas 61.10.11 and 61.10 .8 we conclude that $G \rightarrow B$ is flat and locally of finite presentation.

### 79.19. Algebraic stacks in the étale topology

076 U Let $S$ be a scheme. Instead of working with stacks in groupoids over the big fppf site $(S c h / S)_{f p p f}$ we could work with stacks in groupoids over the big étale site
 76.7 , 76.8, 76.9, 76.10, and 76.11 makes sense for categories fibred in groupoids over $(S c h / S)_{\text {étale }}$. Thus we get a second notion of an algebraic stack by working in the étale topology. This notion is (a priori) weaker then the notion introduced in Algebraic Stacks, Definition 76.12.1 since a stack in the fppf topology is certainly a stack in the étale topology. However, the notions are equivalent as is shown by the following lemma.

076V Lemma 79.19.1. Denote the common underlying category of $S_{\text {S }}^{\text {fppf }}$ and $S_{\text {Sctale }}$ by Sch ${ }_{\alpha}$ (see Sheaves on Stacks, Section 78.4 and Topologies, Remark 33.9.1). Let $S$ be an object of $S c h_{\alpha}$. Let

$$
p: \mathcal{X} \rightarrow S c h_{\alpha} / S
$$

be a category fibred in groupoids with the following properties:
(1) $\mathcal{X}$ is a stack in groupoids over $(S c h / S)_{\text {étale }}$,
(2) the diagonal $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic space ${ }^{5}$, and
(3) there exists $U \in \mathrm{Ob}\left(S c h_{\alpha} / S\right)$ and a 1-morphism $(S c h / U)_{\text {étale }} \rightarrow \mathcal{X}$ which is surjective and smooth.
Then $\mathcal{X}$ is an algebraic stack in the sense of Algebraic Stacks, Definition 76.12.1.
Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Stacks, Definition 76.12.1 are independent of the topology. This is true because these properties involve only the notion of a 2 fibre product of categories fibred in groupoids, 1- and 2-morphisms of categories fibred in groupoids, the notion of a 1-morphism of categories fibred in groupoids representable by algebraic spaces, and what it means for such a 1-morphism to be surjective and smooth. Thus all we have to prove is that an étale stack in groupoids $\mathcal{X}$ with properties (2) and (3) is also an fppf stack in groupoids.

Using (2) let $R$ be an algebraic space representing

$$
\left(S c h_{\alpha} / U\right) \times \mathcal{X}\left(S c h_{\alpha} / U\right)
$$

By (3) the projections $s, t: R \rightarrow U$ are smooth. Exactly as in the proof of Algebraic Stacks, Lemma 76.16 .1 there exists a groupoid in spaces $(U, R, s, t, c)$ and a canonical fully faithful 1-morphism $[U / R]_{\text {étale }} \rightarrow \mathcal{X}$ where $[U / R]_{\text {étale }}$ is the étale stackification of presheaf in groupoids

$$
T \longmapsto(U(T), R(T), s(T), t(T), c(T))
$$

Claim: If $V \rightarrow T$ is a surjective smooth morphism from an algebraic space $V$ to a scheme $T$, then there exists an étale covering $\left\{T_{i} \rightarrow T\right\}$ refining the covering $\{V \rightarrow T\}$. This follows from More on Morphisms, Lemma 36.28.7 or the more general Sheaves on Stacks, Lemma 78.18.10. Using the claim and arguing exactly as in Algebraic Stacks, Lemma 76.16 .2 it follows that $[U / R]_{\text {étale }} \rightarrow \mathcal{X}$ is an equivalence.

Next, let $[U / R]$ denote the quotient stack in the fppf topology which is an algebraic stack by Algebraic Stacks, Theorem 76.17.3. Thus we have 1-morphisms

$$
U \rightarrow[U / R]_{\text {étale }} \rightarrow[U / R] .
$$

Both $U \rightarrow[U / R]_{\text {étale }} \cong \mathcal{X}$ and $U \rightarrow[U / R]$ are surjective and smooth (the first by assumption and the second by the theorem) and in both cases the fibre product $U \times_{\mathcal{X}} U$ and $U \times_{[U / R]} U$ is representable by $R$. Hence the 1-morphism $[U / R]_{\text {étale }} \rightarrow[U / R]$ is fully faithful (since morphisms in the quotient stacks are given by morphisms into $R$, see Groupoids in Spaces, Section 65.23.
Finally, for any scheme $T$ and morphism $t: T \rightarrow[U / R]$ the fibre product $V=$ $T \times_{U / R} U$ is an algebraic space surjective and smooth over $T$. By the claim above there exists an étale covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ and morphisms $T_{i} \rightarrow V$ over $T$. This proves that the object $t$ of $[U / R]$ over $T$ comes étale locally from $U$. We conclude that $[U / R]_{\text {étale }} \rightarrow[U / R]$ is an equivalence of stacks in groupoids over $(S c h / S)_{\text {étale }}$ by Stacks, Lemma 8.4.8. This concludes the proof.

## CHAPTER 80

## Artin's axioms

07SZ

### 80.1. Introduction

07 T 0 In this chapter we discuss Artin's axioms for the representability of functors by algebraic spaces. As references we suggest the papers Art69b, Art70, Art74.
Some of the notation, conventions and terminology in this chapter is awkward and may seem backwards to the more experienced reader. This is intentional. Please see Quot, Section 81.1 for an explanation.

### 80.2. Conventions

07 T 1 The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 76.2 . In this chapter the base scheme $S$ will often be locally Noetherian (although we will always reiterate this condition when stating results).

### 80.3. Predeformation categories

07 T 2 Let $S$ be a locally Noetherian base scheme. Let

$$
p: \mathcal{X} \longrightarrow(S c h / S)_{f p p f}
$$

be a category fibred in groupoids. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow S$ be a morphism of finite type (see Morphisms, Lemma 28.16.1). We will sometimes simply say that $k$ is a field of finite type over $S$. Let $x_{0}$ be an object of $\mathcal{X}$ lying over $\operatorname{Spec}(k)$. Given $S, \mathcal{X}, k$, and $x_{0}$ we will construct a predeformation category, as defined in Formal Deformation Theory, Definition 73.6.2 The construction will resemble to construction of Formal Deformation Theory, Remark 73.6.4

First, by Morphisms, Lemma 28.16.1 we may pick an affine open $\operatorname{Spec}(\Lambda) \subset S$ such that $\operatorname{Spec}(k) \rightarrow S$ factors through $\operatorname{Spec}(\Lambda)$ and the associated ring map $\Lambda \rightarrow k$ is finite. This provides us with the category $\mathcal{C}_{\Lambda}$, see Formal Deformation Theory, Definition 73.3.1. The category $\mathcal{C}_{\Lambda}$, up to canonical equivalence, does not depend on the choice of the affine open $\operatorname{Spec}(\Lambda)$ of $S$. Namely, $\mathcal{C}_{\Lambda}$ is equivalent to the opposite of the category of factorizations

$$
\begin{equation*}
\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(A) \rightarrow S \tag{80.3.0.1}
\end{equation*}
$$

of the structure morphism such that $A$ is an Artinian local ring and such that $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(A)$ corresponds to a ring map $A \rightarrow k$ which identifies $k$ with the residue field of $A$.

We let $\mathcal{F}=\mathcal{F}_{\mathcal{X}, k, x_{0}}$ be the category whose
(1) objects are morphisms $x_{0} \rightarrow x$ of $\mathcal{X}$ where $p(x)=\operatorname{Spec}(A)$ with $A$ an Artinian local ring and $p\left(x_{0}\right) \rightarrow p(x) \rightarrow S$ a factorization as in 80.3.0.1, and
(2) morphisms $\left(x_{0} \rightarrow x\right) \rightarrow\left(x_{0} \rightarrow x^{\prime}\right)$ are commutative diagrams

in $\mathcal{X}$. (Note the reversal of arrows.)
If $x_{0} \rightarrow x$ is an object of $\mathcal{F}$ then writing $p(x)=\operatorname{Spec}(A)$ we obtain an object $A$ of $\mathcal{C}_{\Lambda}$. We often say that $x_{0} \rightarrow x$ or $x$ lies over $A$. A morphism of $\mathcal{F}$ between objects $x_{0} \rightarrow x$ lying over $A$ and $x_{0} \rightarrow x^{\prime}$ lying over $A^{\prime}$ corresponds to a morphism $x^{\prime} \rightarrow x$ of $\mathcal{X}$, hence a morphism $p\left(x^{\prime} \rightarrow x\right): \operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)$ which in turn corresponds to a ring map $A \rightarrow A^{\prime}$. As $\mathcal{X}$ is a category over the category of schemes over $S$ we see that $A \rightarrow A^{\prime}$ is $\Lambda$-algebra homomorphism. Thus we obtain a functor

$$
p: \mathcal{F}=\mathcal{F}_{\mathcal{X}, k, x_{0}} \longrightarrow \mathcal{C}_{\Lambda}
$$

We will use the notation $\mathcal{F}(A)$ to denote the fibre category over an object $A$ of $\mathcal{C}_{\Lambda}$. An object of $\mathcal{F}(A)$ is simply a morphism $x_{0} \rightarrow x$ of $\mathcal{X}$ such that $x$ lies over $\operatorname{Spec}(A)$ and $x_{0} \rightarrow x$ lies over $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(A)$.

07T5 Lemma 80.3.1. The functor $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ defined above is a predeformation category.

Proof. We have to show that $\mathcal{F}$ is (a) cofibred in groupoids over $\mathcal{C}_{\Lambda}$ and (b) that $\mathcal{F}(k)$ is a category equivalent to a category with a single object and a single morphism.
Proof of (a). The fibre categories of $\mathcal{F}$ over $\mathcal{C}_{\Lambda}$ are groupoids as the fibre categories of $\mathcal{X}$ are groupoids. Let $A \rightarrow A^{\prime}$ be a morphism of $\mathcal{C}_{\Lambda}$ and let $x_{0} \rightarrow x$ be an object of $\mathcal{F}(A)$. Because $\mathcal{X}$ is fibred in groupoids, we can find a morphism $x^{\prime} \rightarrow x$ lying over $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)$. Since the composition $A \rightarrow A^{\prime} \rightarrow k$ is equal the given map $A \rightarrow k$ we see (by uniqueness of pullbacks up to isomorphism) that the pullback $\operatorname{via} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ of $x^{\prime}$ is $x_{0}$, i.e., that there exists a morphism $x_{0} \rightarrow x^{\prime}$ lying over $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ compatible with $x_{0} \rightarrow x$ and $x^{\prime} \rightarrow x$. This proves that $\mathcal{F}$ has pushforwards. We conclude by (the dual of) Categories, Lemma 4.34.2.
Proof of (b). If $A=k$, then $\operatorname{Spec}(k)=\operatorname{Spec}(A)$ and since $\mathcal{X}$ is fibred in groupoids over $(S c h / S)_{\text {fppf }}$ we see that given any object $x_{0} \rightarrow x$ in $\mathcal{F}(k)$ the morphism $x_{0} \rightarrow x$ is an isomorphism. Hence every object of $\mathcal{F}(k)$ is isomorphic to $x_{0} \rightarrow x_{0}$. Clearly the only self morphism of $x_{0} \rightarrow x_{0}$ in $\mathcal{F}$ is the identity.

Let $S$ be a locally Noetherian base scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism between categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $k$ is a field of finite type over $S$. Let $x_{0}$ be an object of $\mathcal{X}$ lying over $\operatorname{Spec}(k)$. Set $y_{0}=F\left(x_{0}\right)$ which is an object of $\mathcal{Y}$ lying over $\operatorname{Spec}(k)$. Then $F$ induces a functor
07 WJ

$$
F: \mathcal{F}_{\mathcal{X}, k, x_{0}} \longrightarrow \mathcal{F}_{\mathcal{Y}, k, y_{0}}
$$

of categories cofibred over $\mathcal{C}_{\Lambda}$. Namely, to the object $x_{0} \rightarrow x$ of $\mathcal{F}_{\mathcal{X}, k, x_{0}}(A)$ we associate the object $F\left(x_{0}\right) \rightarrow F(x)$ of $\mathcal{F}_{\mathcal{Y}, k, y_{0}}(A)$.

07WK Lemma 80.3.2. Let $S$ be a locally Noetherian scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$ which is formally smooth on objects (see Criteria for Representability, Section 79.6). Then for every finite type field $k$ over $S$ and for every object $x_{0}$ of $\mathcal{X}$ over $k$ the functor 80.3.1.1) is smooth in the sense of Formal Deformation Theory, Definition 73.8.1.

Proof. This is a matter of unwinding the definitions. Details omitted.
07WL Lemma 80.3.3. Let $S$ be a locally Noetherian scheme. Let

be a 2-fibre product of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Let $k$ be $a$ finite type field over $S$ and $w_{0}$ an object of $\mathcal{W}$ over $k$. Let $x_{0}, z_{0}, y_{0}$ be the images of $w_{0}$ under the morphisms in the diagram. Then

is a fibre product of predeformation categories.
Proof. This is a matter of unwinding the definitions. Details omitted.

### 80.4. Pushouts and stacks

07 WM In this section we show that algebraic stacks behave well with respect to certain pushouts. The results in this section hold over any base scheme.

The following lemma is also correct when $Y, X^{\prime}, X, Y^{\prime}$ are algebraic spaces, see (insert future reference here).

07WN Lemma 80.4.1. Let $S$ be a scheme. Let

be a pushout in the category of schemes over $S$ where $X \rightarrow X^{\prime}$ is a thickening and $X \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.3. Let $\mathcal{Z}$ be an algebraic stack over $S$. Then the functor of fibre categories

$$
\mathcal{Z}_{Y^{\prime}} \longrightarrow \mathcal{Z}_{Y} \times \mathcal{Z}_{X} \mathcal{Z}_{X^{\prime}}
$$

is an equivalence of categories.
Proof. Let $y^{\prime}$ be an object of left hand side. The sheaf $\operatorname{Isom}\left(y^{\prime}, y^{\prime}\right)$ on the category of schemes over $Y^{\prime}$ is representable by an algebraic space $I$ over $Y^{\prime}$, see Algebraic Stacks, Lemma 76.10.11. We conclude that the functor of the lemma is fully faithful as $Y^{\prime}$ is the pushout in the category of algebraic spaces as well as the category of schemes, see Pushouts of Spaces, Lemma 64.2.2.

Let $\left(y, x^{\prime}, f\right)$ be an object of the right hand side. Here $f:\left.\left.y\right|_{X} \rightarrow x^{\prime}\right|_{X}$ is an isomorphism. To finish the proof we have to construct an object $y^{\prime}$ of $\mathcal{Z}_{Y^{\prime}}$ whose restrictions to $Y$ and $X^{\prime}$ agree with $y$ and $x^{\prime}$ in a manner compatible with $\varphi$. In fact, it suffices to construct $y^{\prime}$ fppf locally on $Y^{\prime}$, see Stacks, Lemma 8.4.8. Choose a representable algebraic stack $\mathcal{W}$ and a surjective smooth morphism $\mathcal{W} \rightarrow \mathcal{Z}$. Then

$$
(S c h / Y)_{f p p f} \times_{y, \mathcal{Z}} \mathcal{W} \quad \text { and } \quad\left(S c h / X^{\prime}\right)_{f p p f} \times_{x^{\prime}, \mathcal{Z}} \mathcal{W}
$$

are algebraic stacks representable by algebraic spaces $V$ and $U^{\prime}$ smooth over $Y$ and $X^{\prime}$. The isomorphism $f$ induces an isomorphism $\varphi: V \times_{Y} X \rightarrow U^{\prime} \times_{X^{\prime}} X$ over $X$. By Pushouts of Spaces, Lemmas 64.2 .3 and 64.2 .8 we see that the pushout $V^{\prime}=V \amalg_{V \times_{Y} X} U^{\prime}$ is an algebraic space smooth over $Y^{\prime}$ whose base change to $Y$ and $X^{\prime}$ recovers $V$ and $U^{\prime}$ in a manner compatible with $\varphi$.
Let $W$ be the algebraic space representing $\mathcal{W}$. The projections $V \rightarrow W$ and $U^{\prime} \rightarrow$ $W$ agree as morphisms over $V \times_{Y} X \cong U^{\prime} \times_{X^{\prime}} X$ hence the universal property of the pushout determines a morphism of algebraic spaces $V^{\prime} \rightarrow W$. Choose a scheme $Y_{1}^{\prime}$ and a surjective étale morphism $Y_{1}^{\prime} \rightarrow V^{\prime}$. Set $Y_{1}=Y \times_{Y^{\prime}} Y_{1}^{\prime}, X_{1}^{\prime}=X^{\prime} \times_{Y^{\prime}} Y_{1}^{\prime}$, $X_{1}=X \times_{Y^{\prime}} Y_{1}^{\prime}$. The composition

$$
\left(S c h / Y_{1}^{\prime}\right) \rightarrow\left(S c h / V^{\prime}\right) \rightarrow(S c h / W)=\mathcal{W} \rightarrow \mathcal{Z}
$$

corresponds by the 2-Yoneda lemma to an object $y_{1}^{\prime}$ of $\mathcal{Z}$ over $Y_{1}^{\prime}$ whose restriction to $Y_{1}$ and $X_{1}^{\prime}$ agrees with $\left.y\right|_{Y_{1}}$ and $\left.x^{\prime}\right|_{X_{1}^{\prime}}$ in a manner compatible with $\left.f\right|_{X_{1}}$. Thus we have constructed our desired object smooth locally over $Y^{\prime}$ and we win.

### 80.5. The Rim-Schlessinger condition

06L9 The motivation for the following definition comes from Lemma 80.4.1 and Formal Deformation Theory, Definition 73.15.1 and Lemma 73.15.4.

07WP Definition 80.5.1. Let $S$ be a locally Noetherian scheme. Let $\mathcal{Z}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We say $\mathcal{Z}$ satisfies condition $(R S)$ if for every pushout

in the category of schemes over $S$ where
(1) $X, X^{\prime}, Y, Y^{\prime}$ are spectra of local Artinian rings,
(2) $X, X^{\prime}, Y, Y^{\prime}$ are of finite type over $S$, and
(3) $X \rightarrow X^{\prime}$ (and hence $Y \rightarrow Y^{\prime}$ ) is a closed immersion
the functor of fibre categories

$$
\mathcal{Z}_{Y^{\prime}} \longrightarrow \mathcal{Z}_{Y} \times \mathcal{Z}_{X} \mathcal{Z}_{X^{\prime}}
$$

is an equivalence of categories.
If $A$ is an Artinian local ring with residue field $k$, then any morphism $\operatorname{Spec}(A) \rightarrow S$ is affine and of finite type if and only if the induced morphism $\operatorname{Spec}(k) \rightarrow S$ is of finite type, see Morphisms, Lemmas 28.12.13 and 28.16.2.

07WQ Lemma 80.5.2. Let $\mathcal{X}$ be an algebraic stack over a locally Noetherian base $S$. Then $\mathcal{X}$ satisfies ( $R S$ ).

Proof. Immediate from the definitions and Lemma 80.4.1.
07WR Lemma 80.5.3. Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $\mathcal{X}, \mathcal{Y}$, and $\mathcal{Z}$ satisfy $(R S)$, then so does $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$.

Proof. This is formal. Let

be a diagram as in Definition 80.5.1. We have to show that

$$
\left.(\mathcal{X} \times \mathcal{Y} \mathcal{Z})_{Y^{\prime}} \longrightarrow(\mathcal{X} \times \mathcal{Y} \mathcal{Z})_{Y} \times{ }_{(\mathcal{X} \times \mathcal{Y}} \mathcal{Z}\right)_{X}(\mathcal{X} \times \mathcal{Y} \mathcal{Z})_{X^{\prime}}
$$

is an equivalence. Using the definition of the 2 -fibre product this becomes
07WS

$$
\begin{equation*}
\left.\mathcal{X}_{Y^{\prime}} \times \mathcal{y}_{Y^{\prime}}, \mathcal{Z}_{Y^{\prime}} \longrightarrow\left(\mathcal{X}_{Y} \times \mathcal{y}_{Y} \mathcal{Z}_{Y}\right) \times{ }_{\left(\mathcal{X}_{X} \times y_{X}\right.} \mathcal{Z}_{X}\right)\left(\mathcal{X}_{X^{\prime}} \times \mathcal{y}_{X^{\prime}}, \mathcal{Z}_{X^{\prime}}\right) \tag{80.5.3.1}
\end{equation*}
$$

We are given that each of the functors

$$
\mathcal{X}_{Y^{\prime}} \rightarrow \mathcal{X}_{Y} \times \mathcal{y}_{Y} \mathcal{Z}_{Y}, \quad \mathcal{Y}_{Y^{\prime}} \rightarrow \mathcal{X}_{X} \times \mathcal{Y}_{X} \mathcal{Z}_{X}, \quad \mathcal{Z}_{Y^{\prime}} \rightarrow \mathcal{X}_{X^{\prime}} \times \mathcal{Y}_{X^{\prime}}, \mathcal{Z}_{X^{\prime}}
$$

are equivalences. An object of the right hand side of 80.5.3.1 is a system

$$
\left(\left(x_{Y}, z_{Y}, \phi_{Y}\right),\left(x_{X^{\prime}}, z_{X^{\prime}}, \phi_{X^{\prime}}\right),(\alpha, \beta)\right) .
$$

Then $\left(x_{Y}, x_{Y^{\prime}}, \alpha\right)$ is isomorphic to the image of an object $x_{Y^{\prime}}$ in $\mathcal{X}_{Y^{\prime}}$ and $\left(z_{Y}, z_{Y^{\prime}}, \beta\right)$ is isomorphic to the image of an object $z_{Y^{\prime}}$ of $\mathcal{Z}_{Y^{\prime}}$. The pair of morphisms $\left(\phi_{Y}, \phi_{X^{\prime}}\right)$ corresponds to a morphism $\psi$ between the images of $x_{Y^{\prime}}$ and $z_{Y^{\prime}}$ in $\mathcal{Y}_{Y^{\prime}}$. Then $\left(x_{Y^{\prime}}, z_{Y^{\prime}}, \psi\right)$ is an object of the left hand side of 80.5.3.1 mapping to the given object of the right hand side. This proves that 80.5.3.1 is essentially surjective. We omit the proof that it is fully faithful.

### 80.6. Deformation categories

07 WT We match the notation introduced above with the notation from the chapter "Formal Deformation Theory".

07WU Lemma 80.6.1. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$ satisfying ( $R S$ ). For any field $k$ of finite type over $S$ and any object $x_{0}$ of $\mathcal{X}$ lying over $k$ the predeformation category $p: \mathcal{F}_{\mathcal{X}, k, x_{0}} \rightarrow \mathcal{C}_{\Lambda}$ (80.3.0.2) is a deformation category, see Formal Deformation Theory, Definition 73.15.8.

Proof. Set $\mathcal{F}=\mathcal{F}_{\mathcal{X}, k, x_{0}}$. Let $f_{1}: A_{1} \rightarrow A$ and $f_{2}: A_{2} \rightarrow A$ be ring maps in $\mathcal{C}_{\Lambda}$ with $f_{2}$ surjective. We have to show that the functor

$$
\mathcal{F}\left(A_{1} \times_{A} A_{2}\right) \longrightarrow \mathcal{F}\left(A_{1}\right) \times_{\mathcal{F}(A)} \mathcal{F}\left(A_{2}\right)
$$

is an equivalence, see Formal Deformation Theory, Lemma 73.15.4. Set $X=$ $\operatorname{Spec}(A), X^{\prime}=\operatorname{Spec}\left(A_{2}\right), Y=\operatorname{Spec}\left(A_{1}\right)$ and $Y^{\prime}=\operatorname{Spec}\left(A_{1} \times_{A} A_{2}\right)$. Note that
$Y^{\prime}=Y \amalg_{X} X^{\prime}$ in the category of schemes, see More on Morphisms, Lemma 36.11.3. We know that in the diagram of functors of fibre categories

the top horizontal arrow is an equivalence by Definition 80.5.1. Since $\mathcal{F}(B)$ is the category of objects of $\mathcal{X}_{\mathrm{Spec}(B)}$ with an identification with $x_{0}$ over $k$ we win.

07WV Remark 80.6.2. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be fibred in groupoids over $(S c h / S) f p p f$. Let $k$ be a field of finite type over $S$ and $x_{0}$ an object of $\mathcal{X}$ over $k$. Let $p: \mathcal{F} \rightarrow \mathcal{C}_{\Lambda}$ be as in 80.3.0.2. If $\mathcal{F}$ is a deformation category, i.e., if $\mathcal{F}$ satisfies the Rim-Schlessinger condition (RS), then we see that $\mathcal{F}$ satisfies Schlessingers conditions (S1) and (S2) by Formal Deformation Theory, Lemma 73.15.6. Let $\overline{\mathcal{F}}$ be the functor of isomorphism classes, see Formal Deformation Theory, Remarks 73.5.2 10. Then $\overline{\mathcal{F}}$ satisfies (S1) and (S2) as well, see Formal Deformation Theory, Lemma 73.9.5. This holds in particular in the situation of Lemma 80.6.1.

### 80.7. Change of field

07WW This section is the analogue of Formal Deformation Theory, Section 73.26. As pointed out there, to discuss what happens under change of field we need to write $\mathcal{C}_{\Lambda, k}$ instead of $\mathcal{C}_{\Lambda}$. In the following lemma we use the notation $\mathcal{F}_{l / k}$ introduced in Formal Deformation Theory, Situation 73.26.1.

07WX Lemma 80.7.1. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $k$ be a field of finite type over $S$ and let $k \subset l$ be a finite extension. Let $x_{0}$ be an object of $\mathcal{F}$ lying over $\operatorname{Spec}(k)$. Denote $x_{l, 0}$ the restriction of $x_{0}$ to $\operatorname{Spec}(l)$. Then there is a canonical functor

$$
\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)_{l / k} \longrightarrow \mathcal{F}_{\mathcal{X}, l, x_{l, 0}}
$$

of categories cofibred in groupoids over $\mathcal{C}_{\Lambda, l}$. If $\mathcal{X}$ satisfies (RS), then this functor is an equivalence.

Proof. Consider a factorization

$$
\operatorname{Spec}(l) \rightarrow \operatorname{Spec}(B) \rightarrow S
$$

as in 80.3.0.1. By definition we have

$$
\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)_{l / k}(B)=\mathcal{F}_{\mathcal{X}, k, x_{0}}\left(B \times_{l} k\right)
$$

see Formal Deformation Theory, Situation 73.26.1. Thus an object of this is a morphism $x_{0} \rightarrow x$ of $\mathcal{X}$ lying over the morphism $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}\left(B \times_{l} k\right)$. Choosing pullback functor for $\mathcal{X}$ we can associate to $x_{0} \rightarrow x$ the morphism $x_{l, 0} \rightarrow x_{B}$ where $x_{B}$ is the restriction of $x$ to $\operatorname{Spec}(B)$ (via the morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}\left(B \times_{l} k\right)$ coming from $B \times{ }_{l} k \subset B$ ). This construction is functorial in $B$ and compatible with morphisms.

Next, assume $\mathcal{X}$ satisfies (RS). Consider the diagrams

and

The diagram on the left is a fibre product of rings. The diagram on the right is a pushout in the category of schemes, see More on Morphisms, Lemma 36.11.3. These schemes are all of finite type over $S$ (see remarks following Definition 80.5.1). Hence (RS) kicks in to give an equivalence of fibre categories

$$
\mathcal{X}_{\mathrm{Spec}\left(B \times{ }_{l} k\right)} \longrightarrow \mathcal{X}_{\mathrm{Spec}(k)} \times_{\mathcal{X}_{\mathrm{Spec}(l)}} \mathcal{X}_{\mathrm{Spec}(B)}
$$

This implies that the functor defined above gives an equivalence of fibre categories. Hence the functor is an equivalence on categories cofibred in groupoids by (the dual of) Categories, Lemma 4.34.8.

### 80.8. Tangent spaces

07 WY Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Let $k$ be a field of finite type over $S$ and let $x_{0}$ be an object of $\mathcal{X}$ over $k$. In Formal Deformation Theory, Section 73.11 we have defined the tangent space

07WZ

$$
T \mathcal{F}_{\mathcal{X}, k, x_{0}}=\left\{\begin{array}{l}
\text { isomorphism classes of morphisms }  \tag{80.8.0.1}\\
x_{0} \rightarrow x \text { over } \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k[\epsilon])
\end{array}\right\}
$$

of the predeformation category $\mathcal{F}_{\mathcal{X}, k, x_{0}}$. In Formal Deformation Theory, Section 73.18 we have defined

07X0 (80.8.0.2) $\quad \operatorname{Inf}_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)=\operatorname{Ker}\left(\operatorname{Aut}_{\operatorname{Spec}(k[\epsilon])}\left(x_{0}^{\prime}\right) \rightarrow \operatorname{Aut}_{\operatorname{Spec}(k)}\left(x_{0}\right)\right)$
where $x_{0}^{\prime}$ is the pullback of $x_{0}$ to $\operatorname{Spec}(k[\epsilon])$. If $\mathcal{X}$ satisfies the Rim-Schlessinger condition (RS), then $T \mathcal{F}_{\mathcal{X}, k, x_{0}}$ comes equipped with a natural $k$-vector space structure by Formal Deformation Theory, Lemma 73.11 .2 (assumptions hold by Lemma 80.6.1 and Remark 80.6.2). Moreover, Formal Deformation Theory, Lemma 73.18 .9 shows that $\operatorname{Inf}_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)$ has a natural $k$-vector space structure such that addition agrees with composition of automorphisms. A natural condition is to ask these vector spaces to have finite dimension.
The following lemma tells us this is true if $\mathcal{X}$ is locally of finite type over $S$ (see Morphisms of Stacks, Section 83.13.

07X1 Lemma 80.8.1. Let $S$ be a locally Noetherian scheme. Assume
(1) $\mathcal{X}$ is an algebraic stack,
(2) $U$ is a scheme locally of finite type over $S$, and
(3) $(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}$ is a smooth surjective morphism.

Then, for any $\mathcal{F}=\mathcal{F}_{\mathcal{X}, k, x_{0}}$ as in Section 80.3 the tangent space $T \mathcal{F}$ and infinitesimal automorphism space $\operatorname{Inf}_{x_{0}}(\mathcal{F})$ have finite dimension over $k$
Proof. Let us write $\mathcal{U}=(S c h / U)_{f p p f}$. By our definition of algebraic stacks the 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$ is representable by algebraic spaces. Hence in particular the 2-fibre product

$$
\mathcal{U}_{x_{0}}=(S c h / \operatorname{Spec}(k))_{f p p f} \times_{\mathcal{X}} \mathcal{U}
$$

is representable by an algebraic space $U_{x_{0}}$ over $\operatorname{Spec}(k)$. Then $U_{x_{0}} \rightarrow \operatorname{Spec}(k)$ is smooth and surjective (in particular $U_{x_{0}}$ is nonempty). By Spaces over Fields, Lemma 59.9 .2 we can find a finite extension $l \supset k$ and a point $\operatorname{Spec}(l) \rightarrow U_{x_{0}}$ over $k$. We have

$$
\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)_{l / k}=\mathcal{F}_{\mathcal{X}, l, x_{l, 0}}
$$

by Lemma 80.7.1 and the fact that $\mathcal{X}$ satisfies (RS). Thus we see that

$$
T \mathcal{F} \otimes_{k} l \cong T \mathcal{F}_{\mathcal{X}, l, x_{l, 0}} \quad \text { and } \quad \operatorname{Inf}_{x_{0}}(\mathcal{F}) \otimes_{k} l \cong \operatorname{Inf}_{x_{l, 0}}\left(\mathcal{F}_{\mathcal{X}, l, x_{l, 0}}\right)
$$

by Formal Deformation Theory, Lemmas 73.26 .3 and 73.26 .4 (these are applicable by Lemmas 80.5.2 and 80.6.1 and Remark 80.6.2). Hence it suffices to prove that $T \mathcal{F}_{\mathcal{X}, l, x_{l, 0}}$ and $\operatorname{Inf}_{x_{l, 0}}\left(\mathcal{F}_{\mathcal{X}, l, x_{l, 0}}\right)$ have finite dimension over $l$. Note that $x_{l, 0}$ comes from a point $u_{0}$ of $\mathcal{U}$ over $l$.

We interrupt the flow of the argument to show that the lemma for infinitesimal automorphisms follows from the lemma for tangent spaces. Namely, let $\mathcal{R}=\mathcal{U} \times{ }_{\mathcal{X}} \mathcal{U}$. Let $r_{0}$ be the $l$-valued point $\left(u_{0}, u_{0}, \mathrm{id}_{x_{0}}\right)$ of $\mathcal{R}$. Combining Lemma 80.3 .3 and Formal Deformation Theory, Lemma 73.24 .2 we see that

$$
\operatorname{Inf}_{x_{l, 0}}\left(\mathcal{F}_{\mathcal{X}, l, x_{l, 0}}\right) \subset T \mathcal{F}_{\mathcal{R}, k, r_{0}}
$$

Note that $\mathcal{R}$ is an algebraic stack, see Algebraic Stacks, Lemma 76.14.2. Also, $\mathcal{R}$ is representably by an algebraic space $R$ smooth over $U$ (via either projection, see Algebraic Stacks, Lemma 76.16.2). Hence, choose an scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow R$ we see that $U^{\prime}$ is smooth over $U$, hence locally of finite type over $S$. As $\left(S c h / U^{\prime}\right)_{f p p f} \rightarrow \mathcal{R}$ is surjective and smooth, we have reduced the question to the case of tangent spaces.

The functor 80.3.1.1

$$
\mathcal{F}_{\mathcal{U}, l, u_{0}} \longrightarrow \mathcal{F}_{\mathcal{X}, l, x_{l, 0}}
$$

is smooth by Lemma 80.3 .2 and Criteria for Representability, Lemma 79.6.3. The induced map on tangent spaces

$$
T \mathcal{F}_{\mathcal{U}, l, u_{0}} \longrightarrow T \mathcal{F}_{\mathcal{X}, l, x_{l, 0}}
$$

is $l$-linear (by Formal Deformation Theory, Lemma 73.11.4) and surjective (as smooth maps of predeformation categories induce surjective maps on tangent spaces by Formal Deformation Theory, Lemma 73.8.8). Hence it suffices to prove that the tangent space of the deformation space associated to the representable algebraic stack $\mathcal{U}$ at the point $u_{0}$ is finite dimensional. Let $\operatorname{Spec}(R) \subset U$ be an affine open such that $u_{0}: \operatorname{Spec}(l) \rightarrow U$ factors through $\operatorname{Spec}(R)$ and such that $\operatorname{Spec}(R) \rightarrow S$ factors through $\operatorname{Spec}(\Lambda) \subset S$. Let $\mathfrak{m}_{R} \subset R$ be the kernel of the $\Lambda$-algebra map $\varphi_{0}: R \rightarrow l$ corresponding to $u_{0}$. Note that $R$, being of finite type over the Noetherian ring $\Lambda$, is a Noetherian ring. Hence $\mathfrak{m}_{R}=\left(f_{1}, \ldots, f_{n}\right)$ is a finitely generated ideal. We have

$$
T \mathcal{F}_{\mathcal{U}, l, u_{0}}=\left\{\varphi: R \rightarrow l[\epsilon] \mid \varphi \text { is a } \Lambda \text {-algebra map and } \varphi \bmod \epsilon=\varphi_{0}\right\}
$$

An element of the right hand side is determined by its values on $f_{1}, \ldots, f_{n}$ hence the dimension is at most $n$ and we win. Some details omitted.

07X2 Lemma 80.8.2. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{f p p f}$. Assume $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ satisfy (RS). Let $k$ be a field of finite type over $S$ and let $w_{0}$ be
an object of $\mathcal{W}=\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $k$. Denote $x_{0}, y_{0}, z_{0}$ the objects of $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ you get from $w_{0}$. Then there is a 6 -term exact sequence

$$
\begin{array}{r}
0 \longrightarrow \operatorname{Inf}_{w_{0}}\left(\mathcal{F}_{\mathcal{W}, k, W_{0}}\right) \longrightarrow \operatorname{Inf}_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right) \oplus \operatorname{Inf} f_{z_{0}}\left(\mathcal{F}_{\mathcal{Z}, k, z_{0}}\right) \longrightarrow \operatorname{Inf}_{y_{0}}\left(\mathcal{F}_{\mathcal{Y}, k, y_{0}}\right) \\
T \mathcal{F}_{\mathcal{W}, k, w_{0}} \\
\longleftrightarrow T \mathcal{F}_{\mathcal{X}, k, x_{0}} \oplus T \mathcal{F}_{\mathcal{Z}, k, z_{0}} \longrightarrow T \mathcal{F}_{\mathcal{Y}, k, y_{0}}
\end{array}
$$

of $k$-vector spaces.
Proof. Apply Lemmas 80.3.3 and 80.6.1 and Formal Deformation Theory, Lemma 73.18.14

### 80.9. Formal objects

07X3 In this section we transfer some of the notions already defined in the chapter "Formal Deformation Theory" to the current setting. In the following we will say " $R$ is an $S$-algebra" to indicate that $R$ is a ring endowed with a morphism of schemes $\operatorname{Spec}(R) \rightarrow S$.

07X4 Definition 80.9.1. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids.
(1) A formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\mathcal{X}$ consists of a Noetherian complete local $S$-algebra $R$, objects $\xi_{n}$ of $\mathcal{X}$ lying over $\operatorname{Spec}\left(R / \mathfrak{m}_{R}^{n}\right)$, and morphisms $\xi_{n} \rightarrow \xi_{n+1}$ of $\mathcal{X}$ lying over $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right) \rightarrow \operatorname{Spec}\left(R / \mathfrak{m}^{n+1}\right)$ such that $R / \mathfrak{m}$ is a field of finite type over $S$.
(2) A morphism of formal objects a: $\xi=\left(R, \xi_{n}, f_{n}\right) \rightarrow \eta=\left(T, \eta_{n}, g_{n}\right)$ is given by morphisms $a_{n}: \xi_{n} \rightarrow \eta_{n}$ such that for every $n$ the diagram

is commutative. Applying the functor $p$ we obtain a compatible collection of morphisms $\operatorname{Spec}\left(R / \mathfrak{m}_{R}^{n}\right) \rightarrow \operatorname{Spec}\left(T / \mathfrak{m}_{T}^{n}\right)$ and hence a morphism $a_{0}$ : $\operatorname{Spec}(R) \rightarrow \operatorname{Spec}(T)$ over $S$. We say that a lies over $a_{0}$.

Thus we obtain a category of formal object of $\mathcal{X}$. If $F: \mathcal{X} \rightarrow \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$, then $F$ induces a functor between categories of formal objects as well.

Given a formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$, set $k=R / \mathfrak{m}$ and $x_{0}=\xi_{1}$. Then the formal object $\xi$ defines a formal object $\xi$ of $\mathcal{F}_{\mathcal{X}, k, x_{0}}$ as defined in Formal Deformation Theory, Definition 73.7.1. We will use the terminology introduced in that chapter. In particular, we will say that $\xi$ is versal if $\xi$ (as a formal object of $\mathcal{F}$ ) is versal in the sense of Formal Deformation Theory, Definition 73.8.13. We briefly spell out here what this means. Suppose given a morphism $x_{0} \rightarrow y$ lying over a closed immersion $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(A)$ where $A$ is an Artinian local ring with residue field
$k$. Then versality implies there exists an $n \geq 1$ and a commutative diagram

Please compare with Formal Deformation Theory, Remark 73.8.14
07X5 Lemma 80.9.2. Let $S$ be a locally Noetherian scheme. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let $\eta=\left(R, \eta_{n}, g_{n}\right)$ be a formal object of $\mathcal{Y}$ and let $\xi_{1}$ be an object of $\mathcal{X}$ with $F\left(\xi_{1}\right) \cong \eta_{1}$. If $F$ is formally smooth on objects (see Criteria for Representability, Section 79.6), then there exists a formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\mathcal{X}$ such that $F(\xi) \cong \eta$.

Proof. Note that each of the morphisms $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right) \rightarrow \operatorname{Spec}\left(R / \mathfrak{m}^{n+1}\right)$ is a first order thickening of affine schemes over $S$. Hence the assumption on $F$ means that we can successively lift $\xi_{1}$ to objects $\xi_{2}, \xi_{3}, \ldots$ of $\mathcal{X}$ endowed with compatible isomorphisms $\left.\eta_{n}\right|_{\operatorname{Spec}\left(R / \mathfrak{m}^{n-1}\right)} \cong \eta_{n-1}$ and $F\left(\eta_{n}\right) \cong \xi_{n}$.

Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. Suppose that $x$ is an object of $\mathcal{X}$ over $R$, where $R$ is a Noetherian complete local $S$-algebra with residue field of finite type over $S$. Then we can consider the system of restrictions $\xi_{n}=\left.x\right|_{\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)}$ endowed with the natural morphisms $\xi_{1} \rightarrow \xi_{2} \rightarrow \ldots$ coming from transitivity of restriction. Thus $\xi=\left(R, \xi_{n}, \xi_{n} \rightarrow \xi_{n+1}\right)$ is a formal object of $\mathcal{X}$. This construction is functorial in the object $x$. Thus we obtain a functor

07X6

$$
\left\{\begin{array}{c}
\text { objects } x \text { of } \mathcal{X} \text { such that } p(x)=\operatorname{Spec}(R)  \tag{80.9.2.1}\\
\text { where } R \text { is Noetherian complete local } \\
\text { with } R / \mathfrak{m} \text { of finite type over } S
\end{array}\right\} \longrightarrow\{\text { formal objects of } \mathcal{X}\}
$$

To be precise the left hand side is the full subcategory of $\mathcal{X}$ consisting of objects as indicated and the right hand side is the category of formal objects of $\mathcal{X}$ as in Definition 80.9.1.

07X7 Definition 80.9.3. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. A formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\mathcal{X}$ is called effective if it is in the essential image of the functor 80.9.2.1).

If the category fibred in groupoids is an algebraic stack, then every formal object is effective as follows from the next lemma.

07X8 Lemma 80.9.4. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be an algebraic stack over $S$. The functor 80.9.2.1) is an equivalence.

Proof. Case I: $\mathcal{X}$ is representable (by a scheme). Say $\mathcal{X}=(S c h / X)_{f p p f}$ for some scheme $X$ over $S$. Unwinding the definitions we have to prove the following: Given a Noetherian complete local $S$-algebra $R$ with $R / \mathfrak{m}$ of finite type over $S$ we have

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(R), X) \longrightarrow \lim \operatorname{Mor}_{S}\left(\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right), X\right)
$$

is bijective. This follows from Formal Spaces, Lemma 70.24.2,

Case II. $\mathcal{X}$ is representable by an algebraic space. Say $\mathcal{X}$ is representable by $X$. Again we have to show that

$$
\operatorname{Mor}_{S}(\operatorname{Spec}(R), X) \longrightarrow \lim \operatorname{Mor}_{S}\left(\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right), X\right)
$$

is bijective for $R$ as above. This is Formal Spaces, Lemma 70.24.3.
Case III: General case of an algebraic stack. A general remark is that the left and right hand side of 80.9 .2 .1 are categories fibred in groupoids over the category of affine schemes over $S$ which are spectra of Noetherian complete local rings with residue field of finite type over $S$. We will also see in the proof below that they form stacks for a certain topology on this category.

We first prove fully faithfulness. Let $R$ be a Noetherian complete local $S$-algebra with $k=R / \mathfrak{m}$ of finite type over $S$. Let $x, x^{\prime}$ be objects of $\mathcal{X}$ over $R$. As $\mathcal{X}$ is an algebraic stack $\operatorname{Isom}\left(x, x^{\prime}\right)$ is representable by an algebraic space $I$ over $\operatorname{Spec}(R)$, see Algebraic Stacks, Lemma 76.10.11. Applying Case II to $I$ over $\operatorname{Spec}(R)$ implies immediately that 80.9.2.1) is fully faithful on fibre categories over $\operatorname{Spec}(R)$. Hence the functor is fully faithful by Categories, Lemma 4.34.8.

Essential surjectivity. Let $\xi=\left(R, \xi_{n}, f_{n}\right)$ be a formal object of $\mathcal{X}$. Choose a scheme $U$ over $S$ and a surjective smooth morphism $f:(S c h / U)_{f p p f} \rightarrow \mathcal{X}$. For every $n$ consider the fibre product

$$
\left(S c h / \operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)\right)_{f p p f} \times_{\xi_{n}, \mathcal{X}, f}(S c h / U)_{f p p f}
$$

By assumption this is representable by an algebraic space $V_{n}$ surjective and smooth over $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$. The morphisms $f_{n}: \xi_{n} \rightarrow \xi_{n+1}$ induce cartesian squares

of algebraic spaces. By Spaces over Fields, Lemma 59.9 .2 we can find a finite separable extension $k \subset k^{\prime}$ and a point $v_{1}^{\prime}: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow V_{1}$ over $k$. Let $R \subset R^{\prime}$ be the finite étale extension whose residue field extension is $k \subset k^{\prime}$ (exists and is unique by Algebra, Lemmas 10.148 .8 and 10.148 .10 . By the infinitesimal lifting criterion of smoothness (see More on Morphisms of Spaces, Lemma 63.17.6) applied to $V_{n} \rightarrow \operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$ for $n=2,3,4, \ldots$ we can successively find morphisms $v_{n}^{\prime}$ : $\operatorname{Spec}\left(R^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{n}\right) \rightarrow V_{n}$ over $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$ fitting into commutive diagrams

Composing with the projection morphisms $V_{n} \rightarrow U$ we obtain a compatible system of morphisms $u_{n}^{\prime}: \operatorname{Spec}\left(R^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{n}\right) \rightarrow U$. By Case I the family $\left(u_{n}^{\prime}\right)$ comes from a unique morphism $u^{\prime}: \operatorname{Spec}\left(R^{\prime}\right) \rightarrow U$. Denote $x^{\prime}$ the object of $\mathcal{X}$ over $\operatorname{Spec}\left(R^{\prime}\right)$ we get by applying the 1 -morphism $f$ to $u^{\prime}$. By construction, there exists a morphism of formal objects

$$
\text { 80.9.2.1 }\left(x^{\prime}\right)=\left(R^{\prime},\left.x^{\prime}\right|_{\operatorname{Spec}\left(R^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{n}\right)}, \ldots\right) \longrightarrow\left(R, \xi_{n}, f_{n}\right)
$$

lying over $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)$. Note that $R^{\prime} \otimes_{R} R^{\prime}$ is a finite product of spectra of Noetherian complete local rings to which our current discussion applies. Denote $p_{0}, p_{1}: \operatorname{Spec}\left(R^{\prime} \otimes_{R} R^{\prime}\right) \rightarrow \operatorname{Spec}\left(R^{\prime}\right)$ the two projections. By the fully faithfulness shown above there exists a canonical isomorphism $\varphi: p_{0}^{*} x^{\prime} \rightarrow p_{1}^{*} x^{\prime}$ because we have such isomorphisms over $\operatorname{Spec}\left(\left(R^{\prime} \otimes_{R} R^{\prime}\right) / \mathfrak{m}^{n}\left(R^{\prime} \otimes_{R} R^{\prime}\right)\right)$. We omit the proof that the isomorphism $\varphi$ satisfies the cocycle condition (see Stacks, Definition 8.3.1). Since $\left\{\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)\right\}$ is an fppf covering we conclude that $x^{\prime}$ descends to an object $x$ of $\mathcal{X}$ over $\operatorname{Spec}(R)$. We omit the proof that $x_{n}$ is the restriction of $x$ to $\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)$.

07X9 Lemma 80.9.5. Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. If the functor 80.9.2.1) is an equivalence for $\mathcal{X}, \mathcal{Y}$, and $\mathcal{Z}$, then it is and equivalence for $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$.
Proof. The left and the right hand side of 80.9 .2 .1 for $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ are simply the 2 -fibre products of the left and the right hand side of 80.9 .2 .1 for $\mathcal{X}, \mathcal{Z}$ over $\mathcal{Y}$. Hence the result follows as taking 2 -fibre products is compatible with equivalences of categories, see Categories, Lemma 4.30.7.

### 80.10. Approximation

07XA A fundamental insight of Michael Artin is that you can approximate objects of a limit preserving stack. Namely, given an object $x$ of the stack over a Noetherian complete local ring, you can find an object $x_{A}$ over an algebraic ring which is "close to" $x$. Here an algebraic ring means a finite type $S$-algebra and close means adically close. In this section we present this in a simple, yet general form.
To formulate the result we need to pull together some definitions from different places in the stacks project. First, in Criteria for Representability, Section 79.5 we introduced limit preserving on objects for 1-morphisms of categories fibred in groupoids over the category of schemes. In More on Algebra, Definition 15.41.1 we defined the notion of a $G$-ring. Let $S$ be a locally Noetherian scheme. Let $A$ be an $S$-algebra. We say that $A$ is of finite type over $S$ or is a finite type $S$-algebra if $\operatorname{Spec}(A) \rightarrow S$ is of finite type. In this case $A$ is a Noetherian ring. Finally, given a ring $A$ and ideal $I$ we denote $\operatorname{Gr}_{I}(A)=\bigoplus I^{n} / I^{n+1}$.
07XB Lemma 80.10.1. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $x$ be an object of $\mathcal{X}$ lying over $\operatorname{Spec}(R)$ where $R$ is a Noetherian complete local ring with residue field $k$ of finite type over $S$. Let $s \in S$ be the image of $\operatorname{Spec}(k) \rightarrow S$. Assume that (a) $\mathcal{O}_{S, s}$ is a $G$-ring and (b) $p$ is limit preserving on objects. Then for every integer $N \geq 1$ there exist
(1) a finite type $S$-algebra $A$,
(2) a maximal ideal $\mathfrak{m}_{A} \subset A$,
(3) an object $x_{A}$ of $\mathcal{X}$ over $\operatorname{Spec}(A)$,
(4) an $S$-isomorphism $R / \mathfrak{m}_{R}^{N} \cong A / \mathfrak{m}_{A}^{N}$,
(5) an isomorphism $\left.\left.x\right|_{\operatorname{Spec}\left(R / \mathfrak{m}_{R}^{N}\right)} \cong x_{A}\right|_{\operatorname{Spec}\left(A / \mathfrak{m}_{A}^{N}\right)}$ compatible with (4), and
(6) an isomorphism $G r_{\mathfrak{m}_{R}}(R) \cong G r_{\mathfrak{m}_{A}}(A)$ of graded $k$-algebras.

Proof. Choose an affine open $\operatorname{Spec}(\Lambda) \subset S$ such that $k$ is a finite $\Lambda$-algebra, see Morphisms, Lemma 28.16.1. We may and do replace $S$ by $\operatorname{Spec}(\Lambda)$.
We may write $R$ as a directed colimit $R=\operatorname{colim} C_{j}$ where each $C_{j}$ is a finite type $\Lambda$-algebra (see Algebra, Lemma 10.126.1). By assumption (b) the object $x$ is
isomorphic to the restriction of an object over one of the $C_{j}$. Hence we may choose a finite type $\Lambda$-algebra $C$, a $\Lambda$-algebra map $C \rightarrow R$, and an object $x_{C}$ of $\mathcal{X}$ over $\operatorname{Spec}(C)$ such that $x=\left.x_{C}\right|_{\operatorname{Spec}(R)}$. The choice of $C$ is a bookkeeping device and could be avoided. For later use, let us write $C=\Lambda\left[y_{1}, \ldots, y_{u}\right] /\left(f_{1}, \ldots, f_{v}\right)$ and we denote $\bar{a}_{i} \in R$ the image of $y_{i}$ under the map $C \rightarrow R$. Set $\mathfrak{m}_{C}=C \cap \mathfrak{m}_{R}$.
Choose a $\Lambda$-algebra surjection $\Lambda\left[x_{1}, \ldots, x_{s}\right] \rightarrow k$ and denote $\mathfrak{m}^{\prime}$ the kernel. By the universal property of polynomial rings we may lift this to a $\Lambda$-algebra map $\Lambda\left[x_{1}, \ldots, x_{s}\right] \rightarrow R$. We add some variables (i.e., we increase $s$ a bit) mapping to generators of $\mathfrak{m}_{R}$. Having done this we see that $\Lambda\left[x_{1}, \ldots, x_{s}\right] \rightarrow R / \mathfrak{m}_{R}^{2}$ is surjective. Then we see that

07XC

$$
\begin{equation*}
P=\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}}^{\wedge} \longrightarrow R \tag{80.10.1.1}
\end{equation*}
$$

is a surjective map of Noetherian complete local rings, see for example Formal Deformation Theory, Lemma 73.4.2.
Choose lifts $a_{i} \in P$ of $\bar{a}_{i}$ we found above. Choose generators $b_{1}, \ldots, b_{r} \in P$ for the kernel of 80.10.1.1. Choose $c_{j i} \in P$ such that

$$
f_{j}\left(a_{1}, \ldots, a_{u}\right)=\sum c_{j i} b_{i}
$$

in $P$ which is possible by the choices made so far. Choose generators

$$
k_{1}, \ldots, k_{t} \in \operatorname{Ker}\left(P^{\oplus r} \xrightarrow{\left(b_{1}, \ldots, b_{r}\right)} P\right)
$$

and write $k_{i}=\left(k_{i 1}, \ldots, k_{i r}\right)$ and $K=\left(k_{i j}\right)$ so that

$$
P^{\oplus t} \xrightarrow{K} P^{\oplus r} \xrightarrow{\left(b_{1}, \ldots, b_{r}\right)} P \rightarrow R \rightarrow 0
$$

is an exact sequence of $P$-modules. In particular we have $\sum k_{i j} b_{j}=0$. After possibly increasing $N$ we may assume $N-1$ works in the Artin-Rees lemma for the first two maps of this exact sequence (see More on Algebra, Section 15.4 for terminology).

By assumption $\mathcal{O}_{S, s}=\Lambda_{\Lambda \cap \mathfrak{m}^{\prime}}$ is a G-ring. Hence by More on Algebra, Proposition 15.41.10 the ring $\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}}$ is a $G$-ring. Hence by Smoothing Ring Maps, Theorem 16.14.2 there exist an étale ring map

$$
\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}} \rightarrow B
$$

a maximal ideal $\mathfrak{m}_{B}$ of $B$ lying over $\mathfrak{m}^{\prime}$, and elements $a_{i}^{\prime}, b_{i}^{\prime}, c_{i j}^{\prime}, k_{i j}^{\prime} \in B^{\prime}$ such that
(1) $\kappa\left(\mathfrak{m}^{\prime}\right)=\kappa\left(\mathfrak{m}_{B}\right)$ which implies that $\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}} \subset B_{\mathfrak{m}_{B}} \subset P$ and $P$ is identified with the completion of $B$ at $\mathfrak{m}_{B}$, see remark preceding Smoothing Ring Maps, Theorem 16.14.2,
(2) $a_{i}-a_{i}^{\prime}, b_{i}-b_{i}^{\prime}, c_{i j}-c_{i j}^{\prime}, k_{i j}-k_{i j}^{\prime} \in\left(\mathfrak{m}^{\prime}\right)^{N} P$, and
(3) $f_{j}\left(a_{1}^{\prime}, \ldots, a_{u}^{\prime}\right)=\sum c_{j i}^{\prime} b_{i}^{\prime}$ and $\sum k_{i j}^{\prime} b_{j}^{\prime}=0$.

Set $A=B /\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)$ and denote $\mathfrak{m}_{A}$ the image of $\mathfrak{m}_{B}$ in $A$. (Note that $A$ is essentially of finite type over $\Lambda$; at the end of the proof we will show how to obtain an $A$ which is of finite type over $\Lambda$.) There is a ring map $C \rightarrow A$ sending $y_{i} \mapsto a_{i}^{\prime}$ because the $a_{i}^{\prime}$ satisfy the desired equations modulo $\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)$. Note that $A / \mathfrak{m}_{A}^{N}=$ $R / \mathfrak{m}_{R}^{N}$ as quotients of $P=B^{\wedge}$ by property (2) above. Set $x_{A}=\left.x_{C}\right|_{\operatorname{Spec}(A)}$. Since the maps

$$
C \rightarrow A \rightarrow A / \mathfrak{m}_{A}^{N} \cong R / \mathfrak{m}_{R}^{N} \quad \text { and } \quad C \rightarrow R \rightarrow R / \mathfrak{m}_{R}^{N}
$$

are equal we see that $x_{A}$ and $x$ agree modulo $\mathfrak{m}_{R}^{N}$ via the isomorphism $A / \mathfrak{m}_{A}^{N}=$ $R / \mathfrak{m}_{R}^{N}$. At this point we have shown properties (1) - (5) of the statement of the lemma. To see (6) note that

$$
P^{\oplus t} \xrightarrow{K} P^{\oplus r} \xrightarrow{\left(b_{1}, \ldots, b_{r}\right)} P \quad \text { and } \quad P^{\oplus t} \xrightarrow{K^{\prime}} P^{\oplus r} \xrightarrow{\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)} P
$$

are two complexes of $P$-modules which are congruent modulo $\left(\mathfrak{m}^{\prime}\right)^{N}$ with the first one being exact. By our choice of $N$ above we see from More on Algebra, Lemma 15.4.2 that $R=P /\left(b_{1}, \ldots, b_{r}\right)$ and $P /\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)=B^{\wedge} /\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)=A^{\wedge}$ have isomorphic associated graded algebras, which is what we wanted to show.
This last paragraph of the proof serves to clean up the issue that $A$ is essentially of finite type over $S$ and not yet of finite type. The construction above gives $A=B /\left(b_{1}^{\prime}, \ldots, b_{r}^{\prime}\right)$ and $\mathfrak{m}_{A} \subset A$ with $B$ étale over $\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}}$. Hence $A$ is of finite type over the Noetherian ring $\Lambda\left[x_{1}, \ldots, x_{s}\right]_{\mathfrak{m}^{\prime}}$. Thus we can write $A=\left(A_{0}\right)_{\mathfrak{m}^{\prime}}$ for some finite type $\Lambda\left[x_{1}, \ldots, x_{n}\right]$ algebra $A_{0}$. Then $A=\operatorname{colim}\left(A_{0}\right)_{f}$ where $f \in$ $\Lambda\left[x_{1}, \ldots, x_{n}\right] \backslash \mathfrak{m}^{\prime}$, see Algebra, Lemma 10.9.9. Because $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ is limit preserving on objects, we see that $x_{A}$ comes from some object $x_{\left(A_{0}\right)_{f}}$ over $\operatorname{Spec}\left(\left(A_{0}\right)_{f}\right)$ for an $f$ as above. After replacing $A$ by $\left(A_{0}\right)_{f}$ and $x_{A}$ by $x_{\left(A_{0}\right)_{f}}$ and $\mathfrak{m}_{A}$ by $\left(A_{0}\right)_{f} \cap \mathfrak{m}_{A}$ the proof is finished.

### 80.11. Versality

07XD In the previous section we explained how to approximate objects over complete local rings by algebraic objects. But in order to show that a stack $\mathcal{X}$ is an algebraic stack, we need to find smooth 1-morphisms from schemes towards $\mathcal{X}$. Since we are not going to assume a priori that $\mathcal{X}$ has a representable diagonal, we cannot even speak about smooth morphisms towards $\mathcal{X}$. Instead, borrowing terminology from deformation theory, we will introduce versal objects.
Let $S$ be a locally Noetherian scheme. Let $U$ be a scheme over $S$ with structure morphism $U \rightarrow S$ locally of finite type. Let $u_{0} \in U$ be a finite type point of $U$, see Morphisms, Definition 28.16.3. Set $k=\kappa\left(u_{0}\right)$. Note that the composition $\operatorname{Spec}(k) \rightarrow S$ is also of finite type, see Morphisms, Lemma 28.15.3. Let $p: \mathcal{X} \rightarrow$ $(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $x$ be an object of $\mathcal{X}$ which lies over $U$. Denote $x_{0}$ the pullback of $x$ by $u_{0}$. By the 2-Yoneda lemma $x$ corresponds to a 1-morphism

$$
x:(S c h / U)_{\text {fppf }} \longrightarrow \mathcal{X}
$$

see Algebraic Stacks, Section 76.5. We obtain a morphism of predeformation categories

07XE (80.11.0.2)

$$
\hat{x}: \mathcal{F}_{(S c h / U)_{f p p f}, k, u_{0}} \longrightarrow \mathcal{F}_{\mathcal{X}, k, x_{0}},
$$

over $\mathcal{C}_{\Lambda}$ see 80.3.1.1.
07XF Definition 80.11.1. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be fibred in groupoids over $(S c h / S)_{f p p f}$. Let $U$ be a scheme locally of finite type over $S$. Let $x$ be an object of $\mathcal{X}$ lying over $U$. Let $u_{0}$ be finite type point of $U$. We say $x$ is versal at $u_{0}$ if the morphism $\hat{x} 80.11 .0 .2$ is smooth, see Formal Deformation Theory, Definition 73.8.1.

This definition matches our notion of versality for formal objects of $\mathcal{X}$ in the following way. Observe that $\mathcal{O}_{U, u_{0}}$ is a Noetherian local $S$-algebra with residue field
$k$. Hence $R=\mathcal{O}_{U, u_{0}}^{\wedge}$ is an object of $\mathcal{C}_{\Lambda}^{\wedge}$, see Formal Deformation Theory, Definition 73.4.1. There is an identification of predeformation categories

$$
\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}=\mathcal{F}_{(S c h / U)_{f p p f}, k, u_{0}}
$$

see Formal Deformation Theory, Remark 73.7 .12 for notation. Namely, given an Artinian local $S$-algebra $A$ with residue field identified with $k$ we have

$$
\operatorname{Mor}_{\mathcal{C}_{\hat{\Lambda}}}(R, A)=\left\{\varphi \in \operatorname{Mor}_{S}(\operatorname{Spec}(A), U)|\varphi|_{\operatorname{Spec}(k)}=u_{0}\right\}
$$

Let $\xi$ be the formal object of $\mathcal{X}$ over $R$ associated to $\left.x\right|_{\operatorname{Spec}(R)}$, see 80.9.2.1. Then

$$
\left.\underline{R}\right|_{\mathcal{C}_{\Lambda}}=\mathcal{F}_{(S c h / U)_{f p p f}, k, u_{0}} \xrightarrow{\hat{x}} \mathcal{F}_{\mathcal{X}, k, x_{0}}
$$

corresponds to $\xi$ via the correspondence between formal objects and morphisms of Formal Deformation Theory, Equation 73.7.12.1. In other words, we see that
$x$ is versal at $u_{0} \Leftrightarrow \xi$ is versal
It turns out that this notion is well behaved with respect to field extensions.
07XG Lemma 80.11.2. Let $S, \mathcal{X}, U, x, u_{0}$ be as in Definition 80.11.1. Let $l$ be a field and let $u_{l, 0}: \operatorname{Spec}(l) \rightarrow U$ be a morphism with image $u_{0}$ such that $k=\kappa\left(u_{0}\right) \subset l$ is finite. Set $x_{l, 0}=\left.x_{0}\right|_{\operatorname{Spec}(l)}$. If $\mathcal{X}$ satisfies $(R S)$ and $x$ is versal at $u_{0}$, then

$$
\mathcal{F}_{(S c h / U)_{f p p f}, l, u_{l, 0}} \longrightarrow \mathcal{F}_{\mathcal{X}, l, x_{l, 0}}
$$

is smooth.
Proof. Note that $(S c h / U)_{f p p f}$ satisfies $(\mathrm{RS})$ by Lemma 80.5.2. Hence the functor of the lemma is the functor

$$
\left(\mathcal{F}_{(S c h / U)_{f p p f}, k, u_{0}}\right)_{l / k} \longrightarrow\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)_{l / k}
$$

associated to $\hat{x}$, see Lemma 80.7.1. Hence the lemma follows from Formal Deformation Theory, Lemma 73.26.5.

We restate the approximation result in terms of versal objects.
07XH Lemma 80.11.3. Let $S$ be a locally Noetherian scheme. Let p: $\mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be a category fibred in groupoids. Let $\xi=\left(R, \xi_{n}, f_{n}\right)$ be a formal object of $\mathcal{X}$ with $\xi_{1}$ lying over $\operatorname{Spec}(k) \rightarrow S$ with image $s \in S$. Assume
(1) $\xi$ is versal,
(2) $\xi$ is effective,
(3) $\mathcal{O}_{S, s}$ is a $G$-ring, and
(4) $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ is limit preserving on objects.

Then there exist a morphism of finite type $U \rightarrow S$, a finite type point $u_{0} \in U$ with residue field $k$, and an object $x$ of $\mathcal{X}$ over $U$ such that $x$ is versal at $u_{0}$ and such that $\left.x\right|_{\operatorname{Spec}(k)} \cong \xi_{1}$.

Proof. Choose an object $x_{R}$ of $\mathcal{X}$ lying over $\operatorname{Spec}(R)$ whose associated formal object is $\xi$. Let $N=2$ and apply Lemma 80.10.1. We obtain $A, \mathfrak{m}_{A}, \xi_{A}, \ldots$ Let $\eta=\left(A^{\wedge}, \eta_{n}, g_{n}\right)$ be the formal object associated to $\left.\xi_{A}\right|_{\operatorname{Spec}\left(A^{\wedge}\right)}$. We have a diagram

lying over

The versality of $\xi$ means exactly that we can find the dotted arrows in the diagrams, because we can successively find morphisms $\xi \rightarrow \eta_{3}, \xi \rightarrow \eta_{4}$, and so on by Formal Deformation Theory, Remark 73.8.14. The corresponding ring map $R \rightarrow A^{\wedge}$ is surjective by Formal Deformation Theory, Lemma 73.4.2. On the other hand, we have $\operatorname{dim}_{k} \mathfrak{m}_{R}^{n} / \mathfrak{m}_{R}^{n+1}=\operatorname{dim}_{k} \mathfrak{m}_{A}^{n} / \mathfrak{m}_{A}^{n+1}$ for all $n$ by construction. Hence $R / \mathfrak{m}_{R}^{n}$ and $A / \mathfrak{m}_{A}^{n}$ have the same (finite) length as $\Lambda$-modules by additivity of length and Formal Deformation Theory, Lemma 73.3.4. It follows that $R / \mathfrak{m}_{R}^{n} \rightarrow A / \mathfrak{m}_{A}^{n}$ is an isomorphism for all $n$, hence $R \rightarrow A^{\wedge}$ is an isomorphism. Thus $\eta$ is isomorphic to a versal object, hence versal itself.

07XI Example 80.11.4. In this example we show that the local ring $\mathcal{O}_{S, s}$ has to be a G-ring in order for the result of Lemma 80.11 .3 to be true. Namely, let $\Lambda$ be a Noetherian ring and let $\mathfrak{m}$ be a maximal ideal of $\Lambda$. Set $R=\Lambda_{\mathfrak{m}}^{\wedge}$. Let $\Lambda \rightarrow C \rightarrow R$ be a factorization with $C$ of finite type over $\Lambda$. Set $S=\operatorname{Spec}(\Lambda), U=S \backslash\{\mathfrak{m}\}$, and $S^{\prime}=U \amalg \operatorname{Spec}(C)$. Consider the functor $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets defined by the rule

$$
F(T)=\left\{\begin{array}{lc}
* & \text { if } T \rightarrow S \text { factors through } S^{\prime} \\
\emptyset & \text { else }
\end{array}\right.
$$

Let $\mathcal{X}=\mathcal{S}_{F}$ is the category fibred in sets associated to $F$, see Algebraic Stacks, Section 76.7. Then $\mathcal{X} \rightarrow(S c h / S)_{f p p f}$ is limit preserving on objects and there exists an effective, versal formal object $\xi$ over $R$. Hence if the conclusion of Lemma 80.11.3 holds for $\mathcal{X}$, then there exists a finite type ring map $\Lambda \rightarrow A$ and a maximal ideal $\mathfrak{m}_{A}$ lying over $\mathfrak{m}$ such that
(1) $\kappa(\mathfrak{m})=\kappa\left(\mathfrak{m}_{A}\right)$,
(2) $\Lambda \rightarrow A$ and $\mathfrak{m}_{A}$ satisfy condition (4) of Algebra, Lemma 10.139.2, and
(3) there exists a $\Lambda$-algebra map $C \rightarrow A$.

Thus $\Lambda \rightarrow A$ is smooth at $\mathfrak{m}_{A}$ by the lemma cited. Slicing $A$ we may assume that $\Lambda \rightarrow A$ is étale at $\mathfrak{m}_{A}$, see for example More on Morphisms, Lemma 36.28.5 or argue directly. Write $C=\Lambda\left[y_{1}, \ldots, y_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Then $C \rightarrow R$ corresponds to a solution in $R$ of the system of equations $f_{1}=\ldots=f_{m}=0$, see Smoothing Ring Maps, Section 16.14 Thus if the conclusion of Lemma 80.11 .3 holds for every $\mathcal{X}$ as above, then a system of equations which has a solution in $R$ has a solution in the henselization of $\Lambda_{\mathfrak{m}}$. In other words, the approximation property holds for $\Lambda_{\mathfrak{m}}^{h}$. This implies that $\Lambda_{\mathfrak{m}}^{h}$ is a G-ring (insert future reference here; see also discussion in Smoothing Ring Maps, Section 16.1 which in turn implies that $\Lambda_{\mathfrak{m}}$ is a G-ring.

### 80.12. Axioms

07 XJ Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Here are the axioms we will consider on $\mathcal{X}$.
$[-1]$ a set theoretic condition ${ }^{1}$ to be ignored by readers who are not interested in set theoretical issues,
[0] $\mathcal{X}$ is a stack in groupoids for the étale topology,
[1] $\mathcal{X}$ is limit preserving,
[2] $\mathcal{X}$ satisfies the Rim-Schlessinger condition (RS),

[^208][3] the spaces $T \mathcal{F}_{\mathcal{X}, k, x_{0}}$ and $\operatorname{Inf}_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)$ are finite dimensional for every $k$ and $x_{0}$, see 80.8.0.1) and 80.8.0.2 ,
[4] the functor 80.9.2.1 is an equivalence,
[5] $\mathcal{X}$ and $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ satisfy openness of versality.
We still have to define the meaning of "limit preserving" and "openness of versality".

### 80.13. Limit preserving

07 XK The morphism $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ is limit preserving on objects, as defined in Criteria for Representability, Section 79.5, if the functor of the definition below is essentially surjective. However, the example in Examples, Section 88.45 shows that this isn't equivalent to being limit preserving.
07XL Definition 80.13.1. Let $S$ be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We say $\mathcal{X}$ is limit preserving if for every affine scheme $T$ over $S$ which is a limit $T=\lim T_{i}$ of a directed inverse system of affine schemes $T_{i}$ over $S$, we have an equivalence

$$
\operatorname{colim} \mathcal{X}_{T_{i}} \longrightarrow \mathcal{X}_{T}
$$

of fibre categories.
We spell out what this means. First, given objects $x, y$ of $\mathcal{X}$ over $T_{i}$ we should have

$$
\operatorname{Mor}_{\mathcal{X}_{T}}\left(\left.x\right|_{T},\left.y\right|_{T}\right)=\operatorname{colim}_{i^{\prime} \geq i} \operatorname{Mor}_{\mathcal{X}_{T_{i}^{\prime}}}\left(\left.x\right|_{T_{i}^{\prime}},\left.y\right|_{T_{i}^{\prime}}\right)
$$

and second every object of $\mathcal{X}_{T}$ is isomorphic to the restriction of an object over $T_{i}$ for some $i$. Note that the first condition means that the presheaves $\operatorname{Isom}_{\mathcal{X}}(x, y)$ (see Stacks, Definition 8.2.2) are limit preserving.
07XM Lemma 80.13.2. Let $S$ be a scheme. Let $p: \mathcal{X} \rightarrow \mathcal{Y}$ and $q: \mathcal{Z} \rightarrow \mathcal{Y}$ be 1morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$.
(1) If $\mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ and $\mathcal{Z} \rightarrow(S c h / S)_{\text {fppf }}$ are limit preserving on objects and $\mathcal{Y}$ is limit preserving, then $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow(S c h / S)_{\text {fppf }}$ is limit preserving on objects.
(2) If $\mathcal{X}, \mathcal{Y}$, and $\mathcal{Z}$ are limit preserving, then so is $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$.

Proof. This is formal. Proof of (1). Let $T=\lim _{i \in I} T_{i}$ be the directed limit of affine schemes $T_{i}$ over $S$. We will prove that the functor $\operatorname{colim} \mathcal{X}_{T_{i}} \rightarrow \mathcal{X}_{T}$ is essentially surjective. Recall that an object of the fibre product over $T$ is a quadruple $(T, x, z, \alpha)$ where $x$ is an object of $\mathcal{X}$ lying over $T, z$ is an object of $\mathcal{Z}$ lying over $T$, and $\alpha: p(x) \rightarrow q(z)$ is a morphism in the fibre category of $\mathcal{Y}$ over $T$. By assumption on $\mathcal{X}$ and $\mathcal{Z}$ we can find an $i$ and objects $x_{i}$ and $z_{i}$ over $T_{i}$ such that $\left.x_{i}\right|_{T} \cong T$ and $\left.z_{i}\right|_{T} \cong z$. Then $\alpha$ corresponds to an isomorphism $\left.\left.p\left(x_{i}\right)\right|_{T} \rightarrow q\left(z_{i}\right)\right|_{T}$ which comes from an isomorphism $\alpha_{i^{\prime}}:\left.\left.p\left(x_{i}\right)\right|_{T_{i^{\prime}}} \rightarrow q\left(z_{i}\right)\right|_{T_{i^{\prime}}}$ by our assumption on $\mathcal{Y}$. After replacing $i$ by $i^{\prime}, x_{i}$ by $\left.x_{i}\right|_{T_{i^{\prime}}}$, and $z_{i}$ by $\left.z_{i}\right|_{T_{i^{\prime}}}$ we see that $\left(T_{i}, x_{i}, z_{i}, \alpha_{i}\right)$ is an object of the fibre product over $T_{i}$ which restricts to an object isomorphic to ( $T, x, z, \alpha$ ) over $T$ as desired.
We omit the arguments showing that $\operatorname{colim} \mathcal{X}_{T_{i}} \rightarrow \mathcal{X}_{T}$ is fully faithful in (2).
07XN Lemma 80.13.3. Let $S$ be a scheme. Let $\mathcal{X}$ be an algebraic stack over $S$. Then the following are equivalent
(1) $\mathcal{X}$ is a stack in setoids and $\mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ is limit preserving on objects,
(2) $\mathcal{X}$ is a stack in setoids and limit preserving,
(3) $\mathcal{X}$ is representable by an algebraic space locally of finite presentation.

Proof. Under each of the three assumptions $\mathcal{X}$ is representable by an algebraic space $X$ over $S$, see Algebraic Stacks, Proposition 76.13.3. It is clear that (1) and (2) are equivalent as a functor between setoids is an equivalence if and only if it is surjective on isomorphism classes. Finally, (1) and (3) are equivalent by Limits of Spaces, Proposition 57.3.9.

### 80.14. Openness of versality

07XP Next, we come to openness of versality.
07XQ Definition 80.14.1. Let $S$ be a locally Noetherian scheme.
(1) Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We say $\mathcal{X}$ satisfies openness of versality if given a scheme $U$ locally of finite type over $S$, an object $x$ of $\mathcal{X}$ over $U$, and a finite type point $u_{0} \in U$ such that $x$ is versal at $u_{0}$, then there exists an open neighbourhood $u_{0} \in U^{\prime} \subset U$ such that $x$ is versal at every finite type point of $U^{\prime}$.
(2) Let $f: \mathcal{Y} \rightarrow \mathcal{X}$ be a 1-morphism of categories fibred in groupoids. We say $f$ satisfies openness of versality if given a morphism of schemes $V \rightarrow U$ locally of finite type over $S$, an object $x$ of $\mathcal{X}$ over $U$, an object $y$ of $\mathcal{Y}$ over $V$, a morphism $\alpha: f(y) \rightarrow x$ of $\mathcal{X}$ over $V \rightarrow U$, and a finite type point $v_{0}$ of $V$ such that $(y, \alpha)$ is versal at $v_{0}$ as an object of $\mathcal{Y} \times \mathcal{X}(S c h / U)_{f p p f}$, then there exists an open neighbourhood $v_{0} \in V^{\prime} \subset V$ such that $(y, \alpha)$ is versal at every finite type point of $V^{\prime}$.

Openness of versality is often the hardest to check. The following example shows that requiring this is necessary however.

07XR Example 80.14.2. Let $k$ be a field and set $\Lambda=k[s, t]$. Consider the functor $F: \Lambda$-algebras $\longrightarrow$ Sets defined by the rule

$$
F(A)=\left\{\begin{array}{cc}
* & \text { if there exist } f_{1}, \ldots, f_{n} \in A \text { such that } \\
\emptyset & A=\left(s, t, f_{1}, \ldots, f_{n}\right) \text { and } f_{i} s=0 \forall i \\
\text { else }
\end{array}\right.
$$

Geometrically $F(A)=*$ means there exists a quasi-compact open neighbourhood $W$ of $V(s, t) \subset \operatorname{Spec}(A)$ such that $\left.s\right|_{W}=0$. Let $\mathcal{X} \subset(S c h / \operatorname{Spec}(\Lambda))_{f p p f}$ be the full subcategory consisting of schemes $T$ which have an affine open covering $T=\bigcup \operatorname{Spec}\left(A_{j}\right)$ with $F\left(A_{j}\right)=*$ for all $j$. Then $\mathcal{X}$ satisfies [0], [1], [2], [3], and [4] but not [5]. Namely, over $U=\operatorname{Spec}(k[s, t] /(s))$ there exists an object $x$ which is versal at $u_{0}=(s, t)$ but not at any other point. Details omitted.

Let $S$ be a locally Noetherian scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$. In the following two lemmas we will use the following property

07XS (80.14.2.1)
for all fields $k$ of finite type over $S$ and all $x_{0} \in \operatorname{Ob}\left(\mathcal{X}_{\operatorname{Spec}(k)}\right)$ the $\operatorname{map} \mathcal{F}_{\mathcal{X}, k, x_{0}} \rightarrow \mathcal{F}_{\mathcal{Y}, k, f\left(x_{0}\right)}$ of predeformation categories is smooth
We formulate some lemmas around this concept. First we link it with (openness of) versality.

07XT Lemma 80.14.3. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Let $U$ be a scheme locally of finite type over $S$. Let $x$ be an object of $\mathcal{X}$ over $U$. Assume that $x$ is versal at every finite type point of $U$ and that $\mathcal{X}$ satisfies $(R S)$. Then $x:(S c h / U)_{\text {fppf }} \rightarrow \mathcal{X}$ satisfies 80.14.2.1.

Proof. Let $\operatorname{Spec}(l) \rightarrow U$ be a morphism with $l$ of finite type over $S$. Then the image $u_{0} \in U$ is a finite type point of $U$ and $\kappa\left(u_{0}\right) \subset l$ is a finite extension, see discussion in Morphisms, Section 28.16. Hence we see that $\mathcal{F}_{\mathcal{X}, k, u_{l, 0}} \rightarrow \mathcal{F}_{\mathcal{Y}, k, x_{l, 0}}$ is smooth by Lemma 80.11.2.

07XU Lemma 80.14.4. Let $S$ be a locally Noetherian scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be composable 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f$ and $g$ satisfy 80.14.2.1) so does $g \circ f$.
Proof. This is formal.
07XV Lemma 80.14.5. Let $S$ be a locally Noetherian scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f$ satisfies 80.14.2.1) so does the projection $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Z}$.

Proof. Follows immediately from Lemma 80.3 .3 and Formal Deformation Theory, Lemma 73.8.7.

07XW Lemma 80.14.6. Let $S$ be a locally Noetherian scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphisms of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. If $f$ is formally smooth on objects, then $f$ satisfies 80.14.2.1). If $f$ is representable by algebraic spaces and smooth, then $f$ satisfies 80.14.2.1.

Proof. The first statement is equivalent to Lemma 80.3.2. The second follows from this and Criteria for Representability, Lemma 79.6.3.

07XX Lemma 80.14.7. Let $S$ be a locally Noetherian scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppff }}$. Assume
(1) $f$ is representable by algebraic spaces,
(2) $f$ satisfies 80.14.2.1),
(3) $\mathcal{X} \rightarrow(S c h / \bar{S})_{\text {fppf }}$ is limit preserving on objects, and
(4) $\mathcal{Y}$ is limit preserving.

Then $f$ is smooth.
Proof. The key ingredient of the proof is More on Morphisms, Lemma 36.10.1 which (almost) says that a morphism of schemes of finite type over $S$ satisfying 80.14 .2 .1 is a smooth morphism. The other arguments of the proof are essentially bookkeeping.

Let $V$ be a scheme over $S$ and let $y$ be an object of $\mathcal{Y}$ over $V$. Let $Z$ be an algebraic space representing the 2-fibre product $\mathcal{Z}=\mathcal{X} \times{ }_{f, \mathcal{X}, y}(S c h / V)_{f p p f}$. We have to show that the projection morphism $Z \rightarrow V$ is smooth, see Algebraic Stacks, Definition 76.10.1. In fact, it suffices to do this when $V$ is an affine scheme locally of finite presentation over $S$, see Criteria for Representability, Lemma 79.5.6. Then $(S c h / V)_{\text {fppf }}$ is limit preserving by Lemma 80.13.3. Hence $Z \rightarrow S$ is locally of finite presentation by Lemmas 80.13 .2 and 80.13 .3 . Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Then $W$ is locally of finite presentation over $S$.

Since $f$ satisfies 80.14.2.1 we see that so does $\mathcal{Z} \rightarrow(S c h / V)_{f p p f}$, see Lemma 80.14.5. Next, we see that $(S c h / W)_{f p p f} \rightarrow \mathcal{Z}$ satisfies 80.14.2.1 by Lemma 80.14.6. Thus the composition

$$
(S c h / W)_{f p p f} \rightarrow \mathcal{Z} \rightarrow(S c h / V)_{f p p f}
$$

satisfies 80.14.2.1 by Lemma 80.14.4 More on Morphisms, Lemma 36.10.1 shows that the composition $W \rightarrow Z \rightarrow V$ is smooth at every finite type point $w_{0}$ of $W$. Since the smooth locus is open we conclude that $W \rightarrow V$ is a smooth morphism of schemes by Morphisms, Lemma 28.16.7. Thus we conclude that $Z \rightarrow V$ is a smooth morphism of algebraic spaces by definition.

The lemma below is how we will use openness of versality.
07XY Lemma 80.14.8. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}$ be a category fibred in groupoids. Let $k$ be a finite type field over $S$ and let $x_{0}$ be an object of $\mathcal{X}$ over $\operatorname{Spec}(k)$ with image $s \in S$. Assume
(1) $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,
(2) $\mathcal{X}$ satisfies axioms [1], [2], [3], [4], and openness of versality, and
(3) $\mathcal{O}_{S, s}$ is a G-ring.

Then there exist a morphism of finite type $U \rightarrow S$ and an object $x$ of $\mathcal{X}$ over $U$ such that

$$
x:(S c h / U)_{f p p f} \longrightarrow \mathcal{X}
$$

is smooth and such that there exists a finite type point $u_{0} \in U$ whose residue field is $k$ and such that $\left.x\right|_{u_{0}} \cong x_{0}$.

Proof. By axiom [2], Lemma 80.6.1, and Remark 80.6 .2 we see that $\mathcal{F}_{\mathcal{X}, k, x_{0}}$ satisfies (S1) and (S2). Since also the tangent space has finite dimension by axiom [3] we deduce from Formal Deformation Theory, Lemma 73.12 .4 that $\mathcal{F}_{\mathcal{X}, k, x_{0}}$ has a versal formal object $\xi$. By axiom [4] $\xi$ is effective. By axiom [1] and Lemma 80.11.3 there exists a morphism of finite type $U \rightarrow S$, an object $x$ of $\mathcal{X}$ over $U$, and a finite type point $u_{0}$ of $U$ with residue field $k$ such that $x$ is versal at $u_{0}$ and such that $\left.x\right|_{\operatorname{Spec}(k)} \cong x_{0}$. By openness of versality we may shrink $U$ and assume that $x$ is versal at every finite type point $u_{0}$ of $U$. We claim that

$$
x:(S c h / U)_{\text {fppf }} \longrightarrow \mathcal{X}
$$

is smooth which proves the lemma. Namely, by Lemma 80.14.3 $x$ satisfies 80.14.2.1 whereupon Lemma 80.14.7 finishes the proof.

### 80.15. Axioms for functors

07 XZ Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Denote $\mathcal{X}=\mathcal{S}_{F}$ the category fibred in sets associated to $F$, see Algebraic Stacks, Section 76.7. In this section we provide a translation between the material above as it applies to $\mathcal{X}$, to statements about $F$.

Let $S$ be a locally Noetherian scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Let $k$ be a field of finite type over $S$. Let $x_{0} \in F(\operatorname{Spec}(k))$. The associated predeformation category 80.3 .0 .2 corresponds to the functor

$$
F_{k, x_{0}}: \mathcal{C}_{\Lambda} \longrightarrow S e t s, \quad A \longmapsto\left\{x \in F(\operatorname{Spec}(A))|x|_{\operatorname{Spec}(k)}=x_{0}\right\}
$$

Recall that we do not distinguish between categories cofibred in sets over $\mathcal{C}_{\Lambda}$ and functor $\mathcal{C}_{\Lambda} \rightarrow$ Sets, see Formal Deformation Theory, Remarks 73.5.2 11). Given a transformation of functors $a: F \rightarrow G$, setting $y_{0}=a\left(x_{0}\right)$ we obtain a morphism

$$
F_{k, x_{0}} \longrightarrow G_{k, y_{0}}
$$

see 80.3.1.1). Lemma 80.3.2 tells us that if $a: F \rightarrow G$ is formally smooth (in the sense of More on Morphisms of Spaces, Definition 63.11.1), then $F_{k, x_{0}} \longrightarrow G_{k, y_{0}}$ is smooth as in Formal Deformation Theory, Remark 73.8.4.
Lemma 80.4.1 says that if $Y^{\prime}=Y \amalg_{X} X^{\prime}$ in the category of schemes over $S$ where $X \rightarrow X^{\prime}$ is a thickening and $X \rightarrow Y$ is affine, then the map

$$
F\left(Y \amalg_{X} X^{\prime}\right) \rightarrow F(Y) \times_{F(X)} F\left(X^{\prime}\right)
$$

is a bijection, provided that $F$ is an algebraic space. We say a general functor $F$ satisfies the Rim-Schlessinger condition or we say $F$ satisfies $(R S)$ if given any pushout $Y^{\prime}=Y \amalg_{X} X^{\prime}$ where $Y, X, X^{\prime}$ are spectra of Artinian local rings of finite type over $S$, then

$$
F\left(Y \amalg_{X} X^{\prime}\right) \rightarrow F(Y) \times_{F(X)} F\left(X^{\prime}\right)
$$

is a bijection. Thus every algebraic space satisfies (RS).
Lemma 80.6.1 says that given a functor $F$ which satisfies (RS), then all $F_{k, x_{0}}$ are deformation functors as in Formal Deformation Theory, Definition 73.15.8 i.e., they satisfy (RS) as in Formal Deformation Theory, Remark 73.15.5. In particular the tangent space

$$
T F_{k, x_{0}}=\left\{x \in F(\operatorname{Spec}(k[\epsilon]))|x|_{\operatorname{Spec}(k)}=x_{0}\right\}
$$

has the structure of a $k$-vector space by Formal Deformation Theory, Lemma 73.11 .2

Lemma 80.8.1 says that an algebraic space $F$ locally of finite type over $S$ gives rise to deformation functors $F_{k, x_{0}}$ with finite dimensional tangent spaces $T F_{k, x_{0}}$.
A formal objec $\dagger^{2} \xi=\left(R, \xi_{n}\right)$ of $F$ consists of a Noetherian complete local $S$ algebra $R$ whose residue field is of finite type over $S$, together with elements $\xi_{n} \in F\left(\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)\right)$ such that $\left.\xi_{n+1}\right|_{\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)}=\xi_{n}$. A formal object $\xi$ defines a formal object $\xi$ of $F_{R / \mathfrak{m}, \xi_{1}}$. We say $\xi$ is versal if and only if it is versal in the sense of Formal Deformation Theory, Definition 73.8.13. A formal object $\xi=\left(R, \xi_{n}\right)$ is called effective if there exists an $x \in F(\operatorname{Spec}(R))$ such that $\xi_{n}=\left.x\right|_{\operatorname{Spec}\left(R / \mathfrak{m}^{n}\right)}$ for all $n \geq 1$. Lemma 80.9 .4 says that if $F$ is an algebraic space, then every formal object is effective.

Let $U$ be a scheme locally of finite type over $S$ and let $x \in F(U)$. Let $u_{0} \in$ $U$ be a finite type point. We say that $x$ is versal at $u_{0}$ if and only if $\xi=$ $\left(\mathcal{O}_{U, u_{0}}^{\wedge},\left.x\right|_{\operatorname{Spec}\left(\mathcal{O}_{U, u_{0}} / \mathfrak{m}_{u_{0}}^{n}\right)}\right)$ is a versal formal object in the sense described above.
Let $S$ be a locally Noetherian scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow S c h$ be a functor. Here are the axioms we will consider on $F$.
[-1] a set theoretic condition ${ }^{3}$ to be ignored by readers who are not interested in set theoretical issues,
[0] $F$ is a sheaf for the étale topology,

[^209][1] $F$ is limit preserving,
[2] $F$ satisfies the Rim-Schlessinger condition (RS),
[3] every tangent space $T F_{k, x_{0}}$ is finite dimensional,
[4] every formal object is effective,
[5] $F$ satisfies openness of versality.
Here limit preserving is the notion defined in Limits of Spaces, Definition 57.3.1 and openness of versality means the following: Given a scheme $U$ locally of finite type over $S$, given $x \in F(U)$, and given a finite type point $u_{0} \in U$ such that $x$ is versal at $u_{0}$, then there exists an open neighbourhood $u_{0} \in U^{\prime} \subset U$ such that $x$ is versal at every finite type point of $U^{\prime}$.

### 80.16. Algebraic spaces

07 Y 0 The following is our first main result on algebraic spaces.
07 Y 1 Proposition 80.16.1. Let $S$ be a locally Noetherian scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Assume that
(1) $\Delta: F \rightarrow F \times F$ is representable by algebraic spaces,
(2) F satisfies axioms [-1], [0], [1], [2], [3], [4], and [5],
(3) $\mathcal{O}_{S, s}$ is a $G$-ring for all finite type points $s$ of $S$.

Then $F$ is an algebraic space.
Proof. Lemma 80.14 .8 applies to $F$. Using this we choose, for every finite type field $k$ over $S$ and $x_{0} \in F(\operatorname{Spec}(k))$, an affine scheme $U_{k, x_{0}}$ of finite type over $S$ and a smooth morphism $U_{k, x_{0}} \rightarrow F$ such that there exists a finite type point $u_{k, x_{0}} \in U_{k, x_{0}}$ with residue field $k$ such that $x_{0}$ is the image of $u_{k, x_{0}}$. Then

$$
U=\coprod_{k, x_{0}} U_{k, x_{0}} \longrightarrow F
$$

is smooth 4 . To finish the proof it suffices to show this map is surjective, see Bootstrap, Lemma 67.12.3 (this is where we use axiom [0]). By Criteria for Representability, Lemma 79.5 .6 it suffices to show that $U \times{ }_{F} V \rightarrow V$ is surjective for those $V \rightarrow F$ where $V$ is an affine scheme locally of finite presentation over $S$. Since $U \times_{F} V \rightarrow V$ is smooth the image is open. Hence it suffices to show that the image of $U \times{ }_{F} V \rightarrow V$ contains all finite type points of $V$, see Morphisms, Lemma 28.16.7. Let $v_{0} \in V$ be a finite type point. Then $k=\kappa\left(v_{0}\right)$ is a finite type field over $S$. Denote $x_{0}$ the composition $\operatorname{Spec}(k) \xrightarrow{v_{0}} V \rightarrow F$. Then $\left(u_{k, x_{0}}, v_{0}\right): \operatorname{Spec}(k) \rightarrow U \times_{F} V$ is a point mapping to $v_{0}$ and we win.

07Y2 Lemma 80.16.2. Let $S$ be a locally Noetherian scheme. Let $a: F \rightarrow G$ be $a$ transformation of functors $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Assume that
(1) $a$ is injective,
(2) $F$ satisfies axioms [0], [1], [2], [4], and [5],
(3) $\mathcal{O}_{S, s}$ is a $G$-ring for all finite type points $s$ of $S$,
(4) $G$ is an algebraic space locally of finite type over $S$,

Then $F$ is an algebraic space.

[^210]Proof. By Lemma 80.8.1 the functor $G$ satisfies [3]. As $F \rightarrow G$ is injective, we conclude that $F$ also satisfies [3]. Moreover, as $F \rightarrow G$ is injective, we see that given schemes $U, V$ and morphisms $U \rightarrow F$ and $V \rightarrow F$, then $U \times_{F} V=U \times_{G} V$. Hence $\Delta: F \rightarrow F \times F$ is representable (by schemes) as this holds for $G$ by assumption. Thus Proposition 80.16.1 applies ${ }^{5}$

### 80.17. Algebraic stacks

07Y3 Proposition 80.17 .2 is our first main result on algebraic stacks.
07Y4 Lemma 80.17.1. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}^{\text {opp }}$ be a category fibred in groupoids. Assume that
(1) $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,
(2) $\mathcal{X}$ satisfies axioms [-1], [0], [1], [2], [3], [4] (see Section 80.12),
(3) $\mathcal{X}$ satisfies openness of versality, and
(4) $\mathcal{O}_{S, s}$ is a $G$-ring for all finite type points $s$ of $S$.

Then $\mathcal{X}$ is an algebraic stack.
Proof. Lemma 80.14 .8 applies to $\mathcal{X}$. Using this we choose, for every finite type field $k$ over $S$ and every isomorphism class of object $x_{0} \in \operatorname{Ob}\left(\mathcal{X}_{\operatorname{Spec}(k)}\right)$, an affine scheme $U_{k, x_{0}}$ of finite type over $S$ and a smooth morphism $\left(S c h / U_{k, x_{0}}\right)_{f p p f} \rightarrow \mathcal{X}$ such that there exists a finite type point $u_{k, x_{0}} \in U_{k, x_{0}}$ with residue field $k$ such that $x_{0}$ is the image of $u_{k, x_{0}}$. Then

$$
(S c h / U)_{f p p f} \rightarrow \mathcal{X}, \quad \text { with } \quad U=\coprod_{k, x_{0}} U_{k, x_{0}}
$$

is smooth ${ }^{6}$. To finish the proof it suffices to show this map is surjective, see Criteria for Representability, Lemma 79.19.1 (this is where we use axiom [0]). By Criteria for Representability, Lemma 79.5 .6 it suffices to show that $(S c h / U)_{f p p f} \times \mathcal{X}$ $(S c h / V)_{f p p f} \rightarrow(S c h / V)_{f p p f}$ is surjective for those $y:(S c h / V)_{f p p f} \rightarrow \mathcal{X}$ where $V$ is an affine scheme locally of finite presentation over $S$. By assumption (1) the fibre product $(S c h / U)_{f p p f} \times_{\mathcal{X}}(S c h / V)_{f p p f}$ is representable by an algebraic space $W$. Then $W \rightarrow V$ is smooth, hence the image is open. Hence it suffices to show that the image of $W \rightarrow V$ contains all finite type points of $V$, see Morphisms, Lemma 28.16.7. Let $v_{0} \in V$ be a finite type point. Then $k=\kappa\left(v_{0}\right)$ is a finite type field over $S$. Denote $x_{0}=\left.y\right|_{\operatorname{Spec}(k)}$ the pullback of $y$ by $v_{0}$. Then $\left(u_{k, x_{0}}, v_{0}\right)$ will give a morphism $\operatorname{Spec}(k) \rightarrow W$ whose composition with $W \rightarrow V$ is $v_{0}$ and we win.

07Y5 Proposition 80.17.2. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow$ $(S c h / S)_{f p p f}^{o p p}$ be a category fibred in groupoids. Assume that
(1) $\Delta_{\Delta}: \mathcal{X} \rightarrow \mathcal{X} \times{ }_{\mathcal{X} \times \mathcal{X}} \mathcal{X}$ is representable by algebraic spaces,
(2) $\mathcal{X}$ satisfies axioms [-1], [0], [1], [2], [3], [4], and [5] (see Section 80.12),
(3) $\mathcal{O}_{S, s}$ is a $G$-ring for all finite type points $s$ of $S$.

Then $\mathcal{X}$ is an algebraic stack.
Proof. We first prove that $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces. To do this it suffices to show that

$$
\mathcal{Y}=\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, y}(S c h / V)_{f p p f}
$$

[^211]is representable by an algebraic space for any affine scheme $V$ locally of finite presentation over $S$ and object $y$ of $\mathcal{X} \times \mathcal{X}$ over $V$, see Criteria for Representability, Lemma 79.5.⿹\zh26灬 . Observe that $\mathcal{Y}$ is fibred in setoids (Stacks, Lemma 8.2.5) and let $Y:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets, $T \mapsto \mathrm{Ob}\left(\mathcal{Y}_{T}\right) / \cong$ be the functor of isomorphism classes. We will apply Proposition 80.16.1 to see that $Y$ is an algebraic space.

Note that $\Delta_{\mathcal{Y}}: \mathcal{Y} \rightarrow \mathcal{Y} \times \mathcal{Y}$ (and hence also $Y \rightarrow Y \times Y$ ) is representably by algebraic spaces by condition (1) and Criteria for Representability, Lemma 79.4.4. Observe that $Y$ is a sheaf for the étale topology by Stacks, Lemmas 8.6.3 and 8.6.7, i.e., property [0] holds. Also $Y$ is limit preserving by Lemma 80.13.2 i.e., we have [1]. Note that $Y$ has (RS), i.e., axiom [2] holds, by Lemmas 80.5 .2 and 80.5.3. Axiom [3] for $Y$ follows from Lemmas 80.8.1] and 80.8.2. Axiom [4] follows from Lemmas 80.9 .4 and 80.9 .5 Axiom [5] for $Y$ follows directly from openness of versality for $\Delta_{\mathcal{X}}$ which is part of axiom [5] for $\mathcal{X}$. Thus all the assumptions of Proposition 80.16.1 are satisfied and $Y$ is an algebraic space.

At this point it follows from Lemma 80.17 .1 that $\mathcal{X}$ is an algebraic stack.

### 80.18. Infinitesimal deformations

07 Y 6 In this section we discuss a generalization of the notion of the tangent space introduced in Section 80.8 . To do this intelligently, we borrow some notation from Formal Deformation Theory, Sections 73.10, 73.16, and 73.18,

Let $S$ be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Given a homomorphism $A^{\prime} \rightarrow A$ of $S$-algebras and an object $x$ of $\mathcal{X}$ over $\operatorname{Spec}(A)$ we write $\operatorname{Lift}\left(x, A^{\prime}\right)$ for the category of lifts of $x$ to $\operatorname{Spec}\left(A^{\prime}\right)$. An object of $\operatorname{Lift}\left(x, A^{\prime}\right)$ is a morphism $x \rightarrow x^{\prime}$ of $\mathcal{X}$ lying over $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ and morphisms of Lift $\left(x, A^{\prime}\right)$ are defined as commutative diagrams. The set of isomorphism classes of Lift $\left(x, A^{\prime}\right)$ is denoted $\operatorname{Lift}\left(x, A^{\prime}\right)$. See Formal Deformation Theory, Definition 73.16 .1 and Remark 73.16.2 If $A^{\prime} \rightarrow A$ is surjective with locally nilpotent kernel we call an element $x^{\prime}$ of $\operatorname{Lift}\left(x, A^{\prime}\right)$ a (infinitesimal) deformation of $x$. In this case the group of infinitesimal automorphisms of $x^{\prime}$ over $x$ is the kernel

$$
\operatorname{Inf}\left(x^{\prime} / x\right)=\operatorname{Ker}\left(\operatorname{Aut}_{\mathcal{X}_{\operatorname{Spec}\left(A^{\prime}\right)}}\left(x^{\prime}\right) \rightarrow \operatorname{Aut}_{\mathcal{X}_{\operatorname{Spec}(A)}}(x)\right)
$$

Note that an element of $\operatorname{Inf}\left(x^{\prime} / x\right)$ is the same thing as a lift of $\mathrm{id}_{x}$ over $\operatorname{Spec}\left(A^{\prime}\right)$ for (the category fibred in sets associated to) $\operatorname{Aut}_{\mathcal{X}}\left(x^{\prime}\right)$. Compare with Formal Deformation Theory, Definition 73.18.1 and Formal Deformation Theory, Remark 73.18 .8

If $M$ is an $A$-module we denote $A[M]$ the $A$-algebra whose underlying $A$-module is $A \oplus M$ and whose multiplication is given by $(a, m) \cdot\left(a^{\prime}, m^{\prime}\right)=\left(a a^{\prime}, a m^{\prime}+a^{\prime} m\right)$. When $M=A$ this is the ring of dual numbers over $A$, which we denote $A[\epsilon]$ as is customary. There is an $A$-algebra map $A[M] \rightarrow A$. The pullback of $x$ to $\operatorname{Spec}(A[M])$ is called the trivial deformation of $x$ to $\operatorname{Spec}(A[M])$.

[^212]07Y7 Lemma 80.18.1. Let $S$ be a scheme. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Let

be a commutative diagram of $S$-algebras. Let $x$ be an object of $\mathcal{X}$ over $\operatorname{Spec}(A)$, let $y$ be an object of $\mathcal{Y}$ over $\operatorname{Spec}(B)$, and let $\phi:\left.f(x)\right|_{\operatorname{Spec}(B)} \rightarrow y$ be a morphism of $\mathcal{Y}$ over $\operatorname{Spec}(B)$. Then there is a canonical functor

$$
\operatorname{Lift}\left(x, A^{\prime}\right) \longrightarrow \operatorname{Lift}\left(y, B^{\prime}\right)
$$

of categories of lifts induced by $f$ and $\phi$. The construction is compatible with compositions of 1-morphisms of categories fibred in groupoids in an obvious manner.

Proof. This lemma proves itself.
In the rest of this chapter the following strictly stronger version of the RimSchlessinger conditions will play an important role.

07 Y 8 Definition 80.18.2. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We say $\mathcal{X}$ satisfies condition $\left(R S^{*}\right)$ if given an affine open $\operatorname{Spec}(\Lambda) \subset S$ and a fibre product diagram

of $\Lambda$-algebras, with $B^{\prime} \rightarrow B$ surjective with square zero kernel, the functor of fibre categories

$$
\mathcal{X}_{\mathrm{Spec}\left(A^{\prime}\right)} \longrightarrow \mathcal{X}_{\mathrm{Spec}(A)} \times_{\mathcal{X}_{\mathrm{Spec}(B)}} \mathcal{X}_{\mathrm{Spec}\left(B^{\prime}\right)}
$$

is an equivalence of categories.
We make some observations: with $A \rightarrow B \leftarrow B^{\prime}$ as in Definition 80.18.2
(1) if $A, B, B^{\prime}$ are of finite type over $\Lambda$ and $B$ is finite over $A$, then $A^{\prime}$ is of finite type over $\Lambda$, see More on Algebra, Lemma 15.5.1,
(2) we have $\operatorname{Spec}\left(A^{\prime}\right)=\operatorname{Spec}(A) \amalg_{\operatorname{Spec}(B)} \operatorname{Spec}\left(B^{\prime}\right)$ in the category of schemes, see More on Morphisms, Lemma 36.11.3.
(3) if $\mathcal{X}$ is an algebraic stack, then $\mathcal{X}$ satisfies ( $\mathrm{RS}^{*}$ ) by Lemma 80.4.1, and
(4) if $\mathcal{X}$ satisfies $\left(\mathrm{RS}^{*}\right)$, then $\mathcal{X}$ satisfies (RS) because (RS) covers exactly those cases of $\left(\mathrm{RS}^{*}\right)$ where $A, B, B^{\prime}$ are Artinian local.
Let $S$ be a locally Noetherian base. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. We define a category whose objects are pairs $\left(x, A^{\prime} \rightarrow A\right)$ where
(1) $A^{\prime} \rightarrow A$ is a surjection of $S$-algebras whose kernel is an ideal of square zero such that $\operatorname{Spec}(A)$ maps into an affine open of $S$, and
(2) $x$ is an object of $\mathcal{X}$ lying over $\operatorname{Spec}(A)$.

A morphism $\left(y, B^{\prime} \rightarrow B\right) \rightarrow\left(x, A^{\prime} \rightarrow A\right)$ is given by a commutative diagram

of $S$-algebras together with a morphism $\left.x\right|_{\operatorname{Spec}(B)} \rightarrow y$ over $\operatorname{Spec}(B)$. Let us call this the category of deformation situations.

07 Y 9 Lemma 80.18.3. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. Assume $\mathcal{X}$ satisfies condition $\left(R S^{*}\right)$. Let $A$ be an $S$-algebra such that $\operatorname{Spec}(A) \rightarrow S$ maps into an affine open and let $x$ be an object of $\mathcal{X}$ over $\operatorname{Spec}(A)$.
(1) There exists an $A$-linear functor Inf $_{x}: \operatorname{Mod}_{A} \rightarrow \operatorname{Mod}_{A}$ such that given a deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ and a lift $x^{\prime}$ there is an isomorphism $\operatorname{Inf} f_{x}(I) \rightarrow \operatorname{Inf}\left(x^{\prime} / x\right)$ where $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$.
(2) There exists an $A$-linear functor $T_{x}: \operatorname{Mod}_{A} \rightarrow \operatorname{Mod}_{A}$ such that
(a) given $M$ in $\operatorname{Mod}_{A}$ there is a bijection $T_{x}(M) \rightarrow \operatorname{Lift}(x, A[M])$,
(b) given a deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ there is an action

$$
T_{x}(I) \times \operatorname{Lift}\left(x, A^{\prime}\right) \rightarrow \operatorname{Lift}\left(x, A^{\prime}\right)
$$

where $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$. It is simply transitive if $\operatorname{Lift}\left(x, A^{\prime}\right) \neq \emptyset$.
Proof. To define $\operatorname{Inf}_{x}$, resp. $T_{x}$ we consider the functors

$$
\operatorname{Mod}_{A} \longrightarrow \text { Sets, } \quad M \longrightarrow \operatorname{Lift}\left(\operatorname{id}_{x}, A[M]\right), \quad \text { resp. } \quad M \longrightarrow \operatorname{Lift}(x, A[M])
$$

(for the first consider lifts of $\mathrm{id}_{x}$ as automorphisms of the trivial deformation of $x$ to $A[M]$ ) and we apply Formal Deformation Theory, Lemma 73.10.4. This lemma is applicable, since $\left(\mathrm{RS}^{*}\right)$ tells us that

$$
\operatorname{Lift}(x, A[M \times N])=\operatorname{Lift}(x, A[M]) \times \operatorname{Lift}(x, A[N])
$$

as categories (and trivial deformations match up too).
Let $\left(x, A^{\prime} \rightarrow A\right)$ be a deformation situation. Consider the ring map $g: A^{\prime} \times{ }_{A} A^{\prime} \rightarrow$ $A[I]$ defined by the rule $g\left(a_{1}, a_{2}\right)=\overline{a_{1}} \oplus a_{2}-a_{1}$. There is an isomorphism

$$
A^{\prime} \times{ }_{A} A^{\prime} \longrightarrow A^{\prime} \times{ }_{A} A[I]
$$

given by $\left(a_{1}, a_{2}\right) \mapsto\left(a_{1}, g\left(a_{1}, a_{2}\right)\right)$. This isomorphism commutes with the projections to $A^{\prime}$ on the first factor, and hence with the projections to $A$. Thus applying ( $\mathrm{RS}^{*}$ ) twice we find equivalences of categories

$$
\begin{aligned}
\operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x, A^{\prime}\right) & =\operatorname{Lift}\left(x, A^{\prime} \times{ }_{A} A^{\prime}\right) \\
& =\operatorname{Lift}\left(x, A^{\prime} \times{ }_{A} A[I]\right) \\
& =\operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}(x, A[I])
\end{aligned}
$$

Using these maps and projection onto the last factor of the last product we see that we obtain "difference maps"

$$
\operatorname{Inf}\left(x^{\prime} / x\right) \times \operatorname{Inf}\left(x^{\prime} / x\right) \longrightarrow \operatorname{Inf}_{x}(I) \quad \text { and } \quad \operatorname{Lift}\left(x, A^{\prime}\right) \times \operatorname{Lift}\left(x, A^{\prime}\right) \longrightarrow T_{x}(I)
$$

These difference maps satisfy the transitivity rule " $\left(x_{1}^{\prime}-x_{2}^{\prime}\right)+\left(x_{2}^{\prime}-x_{3}^{\prime}\right)=x_{1}^{\prime}-x_{3}^{\prime}$ " because

$$
A^{\prime} \times{ }_{A} A^{\prime} \times{ }_{A} A^{\prime} \underset{\left(a_{1}, a_{2}, a_{3}\right) \mapsto g\left(a_{1}, a_{3}\right)}{\longrightarrow\left(a_{1}, a_{2}, a_{3}\right) \mapsto\left(g\left(a_{1}, a_{2}\right), g\left(a_{2}, a_{3}\right)\right)} A[I] \times{ }_{A} A[I]=A[I \times I]
$$

is commutative. Inverting the string of equivalences above we obtain an action which is free and transitive provided $\operatorname{Inf}\left(x^{\prime} / x\right)$, resp. $\operatorname{Lift}\left(x, A^{\prime}\right)$ is nonempty. Note that $\operatorname{Inf}\left(x^{\prime} / x\right)$ is always nonempty as it is a group.

07YA Remark 80.18.4 (Functoriality). Assumptions and notation as in Lemma 80.18 .3 Suppose $A \rightarrow B$ is a ring map and $y=\left.x\right|_{\operatorname{Spec}(B)}$. Let $M \in \operatorname{Mod}_{A}, N \in \operatorname{Mod}_{B}$ and let $M \rightarrow N$ an $A$-linear map. Then there are canonical maps $\operatorname{Inf}_{x}(M) \rightarrow \operatorname{Inf}_{y}(N)$ and $T_{x}(M) \rightarrow T_{y}(N)$ simply because there is a pullback functor

$$
\operatorname{Lift}(x, A[M]) \rightarrow \operatorname{Lift}(y, B[N])
$$

coming from the ring map $A[M] \rightarrow B[N]$. Similarly, given a morphism of deformation situations $\left(y, B^{\prime} \rightarrow B\right) \rightarrow\left(x, A^{\prime} \rightarrow A\right)$ we obtain a pullback functor $\operatorname{Lift}\left(x, A^{\prime}\right) \rightarrow \operatorname{Lift}\left(y, B^{\prime}\right)$. Since the construction of the action, the addition, and the scalar multiplication on $\operatorname{Inf}_{x}$ and $T_{x}$ use only morphisms in the categories of lifts (see proof of Formal Deformation Theory, Lemma 73.10.4) we see that the constructions above are functorial. In other words we obtain $A$-linear maps

$$
\operatorname{Inf}_{x}(M) \rightarrow \operatorname{Inf}_{y}(N) \quad \text { and } \quad T_{x}(M) \rightarrow T_{y}(N)
$$

such that the diagrams

commute. Here $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right), J=\operatorname{Ker}\left(B^{\prime} \rightarrow B\right), x^{\prime}$ is a lift of $x$ to $A^{\prime}$ (which may not always exist) and $y^{\prime}=\left.x^{\prime}\right|_{\operatorname{Spec}\left(B^{\prime}\right)}$.

07YB Remark 80.18.5 (Automorphisms). Assumptions and notation as in Lemma 80.18.3. Let $x^{\prime}, x^{\prime \prime}$ be lifts of $x$ to $A^{\prime}$. Then we have a composition map

$$
\operatorname{Inf}\left(x^{\prime \prime} / x\right) \times \operatorname{Mor}_{\text {Lift }\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right) \times \operatorname{Inf}\left(x^{\prime} / x\right) \longrightarrow \operatorname{Mor}_{\text {Lift }\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right)
$$

Since $\operatorname{Lift}\left(x, A^{\prime}\right)$ is a groupoid, if $\operatorname{Mor}_{\text {Lift }\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right)$ is nonempty, then this defines a simply transitive left action of $\operatorname{Inf}\left(x^{\prime} / x\right)$ on $\operatorname{Mor}_{L i f t\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right)$ and a simply transitive right action by $\operatorname{Inf}\left(x^{\prime} / x\right)$. Now the lemma says that $\operatorname{Inf}\left(x^{\prime} / x\right)=\operatorname{Inf}_{x}(I)=$ $\operatorname{Inf}\left(x^{\prime \prime} / x\right)$. We claim that the two actions described above agree via these identifications. Namely, either $x^{\prime} \nsubseteq x^{\prime \prime}$ in which the claim is clear, or $x^{\prime} \cong x^{\prime \prime}$ and in that case we may assume that $x^{\prime \prime}=x^{\prime}$ in which case the result follows from the fact that $\operatorname{Inf}\left(x^{\prime} / x\right)$ is commutative. In particular, we obtain a well defined action

$$
\operatorname{Inf}_{x}(I) \times \operatorname{Mor}_{L i f t\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right) \longrightarrow \operatorname{Mor}_{L i f t\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right)
$$

which is simply transitive as soon as $\operatorname{Mor}_{\text {Lift }\left(x, A^{\prime}\right)}\left(x^{\prime}, x^{\prime \prime}\right)$ is nonempty.

07YC Remark 80.18.6 (Canonical element). Assumptions and notation as in Lemma 80.18.3. Choose an affine open $\operatorname{Spec}(\Lambda) \subset S$ such that $\operatorname{Spec}(A) \rightarrow S$ corresponds to a ring map $\Lambda \rightarrow A$. Consider the ring map

$$
A \longrightarrow A\left[\Omega_{A / \Lambda}\right], \quad a \longmapsto\left(a, \mathrm{~d}_{A / \Lambda}(a)\right)
$$

Pulling back $x$ along the corresponding morphism $\operatorname{Spec}\left(A\left[\Omega_{A / \Lambda}\right]\right) \rightarrow \operatorname{Spec}(A)$ we obtain a deformation $x_{\text {can }}$ of $x$ over $A\left[\Omega_{A / \Lambda}\right]$. We call this the canonical element

$$
x_{c a n} \in T_{x}\left(\Omega_{A / \Lambda}\right)=\operatorname{Lift}\left(x, A\left[\Omega_{A / \Lambda}\right]\right)
$$

Next, assume that $\Lambda \rightarrow A$ is of finite type and let $k=\kappa(\mathfrak{p})$ be a residue field at a finite type point $u_{0}$ of $U=\operatorname{Spec}(A)$. Let $x_{0}=\left.x\right|_{u_{0}}$. By (RS*) and the fact that $A[k]=A \times_{k} k[k]$ the space $T_{x}(k)$ is the tangent space to the deformation functor $\mathcal{F}_{\mathcal{X}, k, x_{0}}$. Via

$$
T \mathcal{F}_{U, k, u_{0}}=\operatorname{Der}_{\Lambda}(A, k)=\operatorname{Hom}_{A}\left(\Omega_{A / \Lambda}, k\right)
$$

(see Formal Deformation Theory, Example 73.10.11) and functoriality of $T_{x}$ the canonical element produces the map on tangent spaces induced by the object $x$ over $U$. Namely, $\theta \in T \mathcal{F}_{U, k, u_{0}}$ maps to $T_{x}(\theta)\left(x_{c a n}\right)$ in $T_{x}(k)=T \mathcal{F}_{\mathcal{X}, k, x_{0}}$.

07YD Remark 80.18.7 (Canonical automorphism). Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Assume $\mathcal{X}$ satisfies condition $\left(\mathrm{RS}^{*}\right)$. Let $A$ be an $S$-algebra such that $\operatorname{Spec}(A) \rightarrow S$ maps into an affine open and let $x, y$ be objects of $\mathcal{X}$ over $\operatorname{Spec}(A)$. Further, let $A \rightarrow B$ be a ring map and let $\alpha:\left.\left.x\right|_{\operatorname{Spec}(B)} \rightarrow y\right|_{\operatorname{Spec}(B)}$ be a morphism of $\mathcal{X}$ over $\operatorname{Spec}(B)$. Consider the ring map

$$
B \longrightarrow B\left[\Omega_{B / A}\right], \quad b \longmapsto\left(b, \mathrm{~d}_{B / A}(b)\right)
$$

Pulling back $\alpha$ along the corresponding morphism $\operatorname{Spec}\left(B\left[\Omega_{B / A}\right]\right) \rightarrow \operatorname{Spec}(B)$ we obtain a morphism $\alpha_{c a n}$ between the pullbacks of $x$ and $y$ over $B\left[\Omega_{B / A}\right]$. On the other hand, we can pullback $\alpha$ by the morphism $\operatorname{Spec}\left(B\left[\Omega_{B / A}\right]\right) \rightarrow \operatorname{Spec}(B)$ corresponding to the injection of $B$ into the first summand of $B\left[\Omega_{B / A}\right]$. By the discussion of Remark 80.18.5 we can take the difference

$$
\varphi(x, y, \alpha)=\alpha_{c a n}-\left.\alpha\right|_{\operatorname{Spec}\left(B\left[\Omega_{B / A}\right]\right)} \in \operatorname{Inf}_{\left.x\right|_{\operatorname{Spec}(B)}}\left(\Omega_{B / A}\right)
$$

We will call this the canonical automorphism. It depends on all the ingredients $A$, $x, y, A \rightarrow B$ and $\alpha$.

07YE Remark 80.18.8. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Let $A$ be an $S$-algebra such that $\operatorname{Spec}(A) \rightarrow S$ maps into an affine open. There is a notion of a short exact sequence

$$
\left(x, A_{1}^{\prime} \rightarrow A\right) \rightarrow\left(x, A_{2}^{\prime} \rightarrow A\right) \rightarrow\left(x, A_{3}^{\prime} \rightarrow A\right)
$$

of deformation situations: we ask the corresponding maps between the kernels $I_{i}=\operatorname{Ker}\left(A_{i}^{\prime} \rightarrow A\right)$ give a short exact sequence

$$
0 \rightarrow I_{3} \rightarrow I_{2} \rightarrow I_{1} \rightarrow 0
$$

of $A$-modules. Note that in this case the map $A_{3}^{\prime} \rightarrow A_{1}^{\prime}$ factors through $A$, hence there is a canonical isomorphism $A_{1}^{\prime}=A\left[I_{1}\right]$.

### 80.19. Obstruction theories

07 YF In this section we describe what an obstruction theory is. Contrary to the spaces of infinitesimal deformations and infinitesimal automorphisms, an obstruction theory is an additional piece of data. The formulation is motivated by the results of Lemma 80.18.3 and Remark 80.18.4

07YG Definition 80.19.1. Let $S$ be a locally Noetherian base. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$. An obstruction theory is given by the following data
(1) for every $S$-algebra $A$ such that $\operatorname{Spec}(A) \rightarrow S$ maps into an affine open and every object $x$ of $\mathcal{X}$ over $\operatorname{Spec}(A)$ an $A$-linear functor

$$
\mathcal{O}_{x}: \operatorname{Mod}_{A} \rightarrow \operatorname{Mod}_{A}
$$
