of obstruction modules,
(2) for $(x, A)$ as in (1), a ring map $A \rightarrow B, M \in \operatorname{Mod}_{A}, N \in \operatorname{Mod}_{B}$, and an $A$-linear map $M \rightarrow N$ an induced $A$-linear map $\mathcal{O}_{x}(M) \rightarrow \mathcal{O}_{y}(N)$ where $y=\left.x\right|_{\operatorname{Spec}(B)}$, and
(3) for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ an obstruction element $o_{x}\left(A^{\prime}\right) \in$ $\mathcal{O}_{x}(I)$ where $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$.
These data are subject to the following conditions
(i) the functoriality maps turn the obstruction modules into a functor from the category of triples $(x, A, M)$ to sets,
(ii) for every morphism of deformation situations $\left(y, B^{\prime} \rightarrow B\right) \rightarrow\left(x, A^{\prime} \rightarrow A\right)$ the element $o_{x}\left(A^{\prime}\right)$ maps to $o_{y}\left(B^{\prime}\right)$, and
(iii) we have

$$
\operatorname{Lift}\left(x, A^{\prime}\right) \neq \emptyset \Leftrightarrow o_{x}\left(A^{\prime}\right)=0
$$

for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$.
This last condition explains the terminology. The module $\mathcal{O}_{x}\left(A^{\prime}\right)$ is called the obstruction module. The element $o_{x}\left(A^{\prime}\right)$ is the obstruction. Most obstruction theories have additional properties, and in order to make them useful additional conditions are needed. Moreover, this is just a sample definition, for example in the definition we could consider only deformation situations of finite type over $S$.

One of the main reasons for introducing obstruction theories is to check openness of versality. The initial idea to do this is due to Artin, see the papers of Artin mentioned in the introduction. It has been taken up for example in the work by Flenner Fle81, Hall Hal12, Hall and Rydh HR12, Olsson Ols06a, Olsson and Starr OS03, and Lieblich Lie06a] (random order of references). Moreover, for particular categories fibred in groupoids, often authors develop a little bit of theory adapted to the problem at hand. We will develop this theory later (insert future reference here).

07YH Example 80.19.2. Let $S=\operatorname{Spec}(\Lambda)$ for some Noetherian ring $\Lambda$. Let $W \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{W}$-module flat over $S$. Consider the functor

$$
F:(S c h / S)_{f p p f}^{o p p} \longrightarrow S e t s, \quad T / S \longrightarrow H^{0}\left(W_{T}, \mathcal{F}_{T}\right)
$$

where $W_{T}=T \times{ }_{S} W$ is the base change and $\mathcal{F}_{T}$ is the pullback of $\mathcal{F}$ to $W_{T}$. If $T=\operatorname{Spec}(A)$ we will write $W_{T}=W_{A}$, etc. Let $\mathcal{X} \rightarrow(S c h / S)_{f p p f}$ be the category fibred in groupoids associated to $F$. Then $\mathcal{X}$ has an obstruction theory. Namely,
(1) given $A$ over $\Lambda$ and $x \in H^{0}\left(W_{A}, \mathcal{F}_{A}\right)$ we set $\mathcal{O}_{x}(M)=H^{1}\left(W_{A}, \mathcal{F}_{A} \otimes_{A} M\right)$,
(2) given a deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ we let $o_{x}\left(A^{\prime}\right) \in \mathcal{O}_{x}(A)$ be the image of $x$ under the boundary map

$$
H^{0}\left(W_{A}, \mathcal{F}_{A}\right) \longrightarrow H^{1}\left(W_{A}, \mathcal{F}_{A} \otimes_{A} I\right)
$$

coming from the short exact sequence of modules

$$
0 \rightarrow \mathcal{F}_{A} \otimes_{A} I \rightarrow \mathcal{F}_{A^{\prime}} \rightarrow \mathcal{F}_{A} \rightarrow 0
$$

We have omitted some details, in particular the construction of the short exact sequence above (it uses that $W_{A}$ and $W_{A^{\prime}}$ have the same underlying topological space) and the explanation for why flatness of $\mathcal{F}$ over $S$ implies that the sequence above is short exact.

07YI Example 80.19.3 (Key example). Let $S=\operatorname{Spec}(\Lambda)$ for some Noetherian ring $\Lambda$. Say $\mathcal{X}=(S c h / X)_{\text {fppf }}$ with $X=\operatorname{Spec}(R)$ and $R=\Lambda\left[x_{1}, \ldots, x_{n}\right] / J$. The naive cotangent complex $N L_{R / \Lambda}$ is (canonically) homotopy equivalent to

$$
J / J^{2} \longrightarrow \bigoplus_{i=1, \ldots, n} R \mathrm{~d} x_{i}
$$

see Algebra, Lemma 10.132 .2 . Consider a deformation situation $\left(x, A^{\prime} \rightarrow A\right)$. Denote $I$ the kernel of $\overline{A^{\prime} \rightarrow A \text {. The object } x \text { corresponds to }\left(a_{1}, \ldots, a_{n}\right) \text { with } a_{i} \in A, ~\left(a_{1}\right)}$ such that $f\left(a_{1}, \ldots, a_{n}\right)=0$ in $A$ for all $f \in J$. Set

$$
\begin{aligned}
\mathcal{O}_{x}\left(A^{\prime}\right) & =\operatorname{Hom}_{R}\left(J / J^{2}, I\right) / \operatorname{Hom}_{R}\left(R^{\oplus n}, I\right) \\
& =\operatorname{Ext}_{R}^{1}\left(N L_{R / \Lambda}, I\right) \\
& =\operatorname{Ext}_{A}^{1}\left(N L_{R / \Lambda} \otimes_{R} A, I\right)
\end{aligned}
$$

Choose lifts $a_{i}^{\prime} \in A^{\prime}$ of $a_{i}$ in $A$. Then $o_{x}\left(A^{\prime}\right)$ is the class of the map $J / J^{2} \rightarrow I$ defined by sending $f \in J$ to $f\left(a_{1}^{\prime}, \ldots, a_{n}^{\prime}\right) \in I$. We omit the verification that $o_{x}\left(A^{\prime}\right)$ is independent of choices. It is clear that if $o_{x}\left(A^{\prime}\right)=0$ then the map lifts. Finally, functoriality is straightforward. Thus we obtain an obstruction theory. We observe that $o_{x}\left(A^{\prime}\right)$ can be described a bit more canonically as the composition

$$
N L_{R / \Lambda} \rightarrow N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}=I[1]
$$

in $D(A)$, see Algebra, Lemma 10.132 .6 for the last identification.

### 80.20. Naive obstruction theories

07 YJ The title of this section refers to the fact that we will use the naive cotangent complex in this section. Let $\left(x, A^{\prime} \rightarrow A\right)$ be a deformation situation for a given category fibred in groupoids over a locally Noetherian scheme $S$. The key Example 80.19 .3 suggests that any obstruction theory should be closely related to maps in $D(A)$ with target the naive cotangent complex of $A$. Working this out we find a criterion for versality in Lemma 80.20 .3 which leads to a criterion for openness of versality in Lemma 80.20.4. We introduce a notion of a naive obstruction theory in Definition 80.20.5 to try to formalize the notion a bit further.

In the following we will use the naive cotangent complex as defined in Algebra, Section 10.132 In particular, if $A^{\prime} \rightarrow A$ is a surjection of $\Lambda$-algebras with square zero kernel $I$, then there are maps

$$
N L_{A^{\prime} / \Lambda} \rightarrow N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}
$$

whose composition is homotopy equivalent to zero (see Algebra, Remark 10.132.5). This doesn't form a distinguished triangle in general as we are using the naive cotangent complex and not the full one. There is a homotopy equivalence $N L_{A / A^{\prime}} \rightarrow$ $I[1]$ (the complex consisting of $I$ placed in degree -1 , see Algebra, Lemma 10.132.6). Finally, note that there is a canonical map $N L_{A / \Lambda} \rightarrow \Omega_{A / \Lambda}$.
07 YK Lemma 80.20.1. Let $A \rightarrow k$ be a ring map with $k$ a field. Let $E \in D^{-}(A)$. Then $E x t_{A}^{2}(E, k)=\operatorname{Hom}_{k}\left(H^{-i}\left(E \otimes^{\mathbf{L}} k\right), k\right)$.
Proof. Omitted. Hint: Replace $E$ by a bounded above complex of free $A$-modules and compute both sides.
07YL Lemma 80.20.2. Let $\Lambda \rightarrow A \rightarrow k$ be finite type ring maps of Noetherian rings with $k=\kappa(\mathfrak{p})$ for some prime $\mathfrak{p}$ of $A$. Let $\xi: E \rightarrow N L_{A / \Lambda}$ be morphism of $D^{-}(A)$ such that $H^{-1}\left(\xi \otimes^{\mathbf{L}} k\right)$ is not surjective. Then there exists a surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras such that
(a) $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$ has square zero and is isomorphic to $k$ as an $A$-module,
(b) $\Omega_{A^{\prime} / \Lambda} \otimes k=\Omega_{A / \Lambda} \otimes k$, and
(c) $E \rightarrow N L_{A / A^{\prime}}$ is zero.

Proof. Let $f \in A, f \notin \mathfrak{p}$. Suppose that $A^{\prime \prime} \rightarrow A_{f}$ satisfies (a), (b), (c) for the induced map $E \otimes_{A} A_{f} \rightarrow N L_{A_{f} / \Lambda}$, see Algebra, Lemma 10.132.13. Then we can set $A^{\prime}=A^{\prime \prime} \times_{A_{f}} A$ and get a solution. Namely, it is clear that $A^{\prime} \rightarrow A$ satisfies (a) because $\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)=\operatorname{Ker}\left(A^{\prime \prime} \rightarrow A\right)=I$. Pick $f^{\prime \prime} \in A^{\prime \prime}$ lifting $f$. Then the localization of $A^{\prime}$ at $\left(f^{\prime \prime}, f\right)$ is isomorphic to $A^{\prime \prime}$ (for example by More on Algebra, Lemma 15.5.3. Thus (b) and (c) are clear for $A^{\prime}$ too. In this way we see that we may replace $A$ by the localization $A_{f}$ (finitely many times). In particular (after such a replacement) we may assume that $\mathfrak{p}$ is a maximal ideal of $A$, see Morphisms, Lemma 28.16.1.
Choose a presentation $A=\Lambda\left[x_{1}, \ldots, x_{n}\right] / J$. Then $N L_{A / \Lambda}$ is (canonically) homotopy equivalent to

$$
J / J^{2} \longrightarrow \bigoplus_{i=1, \ldots, n} A \mathrm{~d} x_{i}
$$

see Algebra, Lemma 10.132 .2 . After localizing if necessary (using Nakayama's lemma) we can choose generators $f_{1}, \ldots, f_{m}$ of $J$ such that $f_{j} \otimes 1$ form a basis for $J / J^{2} \otimes_{A} k$. Moreover, after renumbering, we can assume that the images of $\mathrm{d} f_{1}, \ldots, \mathrm{~d} f_{r}$ form a basis for the image of $J / J^{2} \otimes k \rightarrow \bigoplus k \mathrm{~d} x_{i}$ and that $\mathrm{d} f_{r+1}, \ldots, \mathrm{~d} f_{m}$ map to zero in $\bigoplus k \mathrm{~d} x_{i}$. With these choices the space

$$
H^{-1}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)=H^{-1}\left(N L_{A / \Lambda} \otimes_{A} k\right)
$$

has basis $f_{r+1} \otimes 1, \ldots, f_{m} \otimes 1$. Changing basis once again we may assume that the image of $H^{-1}\left(\xi \otimes^{\mathbf{L}} k\right)$ is contained in the $k$-span of $f_{r+1} \otimes 1, \ldots, f_{m-1} \otimes 1$. Set

$$
A^{\prime}=\Lambda\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m-1}, \mathfrak{p} f_{m}\right)
$$

By construction $A^{\prime} \rightarrow A$ satisfies (a). Since $\mathrm{d} f_{m}$ maps to zero in $\bigoplus k \mathrm{~d} x_{i}$ we see that (b) holds. Finally, by construction the induced map $E \rightarrow N L_{A / A^{\prime}}=I[1]$
induces the zero map $H^{-1}\left(E \otimes_{A}^{\mathbf{L}} k\right) \rightarrow I \otimes_{A} k$. By Lemma 80.20.1 we see that the composition is zero.
The following lemma is our key technical result.
07YM Lemma 80.20.3. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$ satisfying $\left(R S^{*}\right)$. Let $U=\operatorname{Spec}(A)$ be an affine scheme of finite type over $S$ which maps into an affine open $\operatorname{Spec}(\Lambda)$. Let $x$ be an object of $\mathcal{X}$ over $U$. Let $\xi: E \rightarrow N L_{A / \Lambda}$ be a morphism of $D^{-}(A)$. Assume
(i) for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ we have: $x$ lifts to $\operatorname{Spec}\left(A^{\prime}\right)$ if and only if $E \rightarrow N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}$ is zero, and
(ii) there is an isomorphism of functors $T_{x}(-) \rightarrow \operatorname{Ext}_{A}^{0}(E,-)$ such that $E \rightarrow$ $N L_{A / \Lambda} \rightarrow \Omega_{A / \Lambda}^{1}$ corresponds to the canonical element (see Remark80.18.6). Let $u_{0} \in U$ be a finite type point with residue field $k=\kappa\left(u_{0}\right)$. Consider the following statements
(1) $x$ is versal at $u_{0}$, and
(2) $\xi: E \rightarrow N L_{A / \Lambda}$ induces a surjection $H^{-1}\left(E \otimes_{A}^{\mathbf{L}} k\right) \rightarrow H^{-1}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)$ and an injection $H^{0}\left(E \otimes_{A}^{\mathbf{L}} k\right) \rightarrow H^{0}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)$.
Then we always have (2) $\Rightarrow$ (1) and we have (1) $\Rightarrow$ (2) if $u_{0}$ is a closed point.
Proof. Let $\mathfrak{p}=\operatorname{Ker}(A \rightarrow k)$ be the prime corresponding to $u_{0}$.
Assume that $x$ versal at $u_{0}$ and that $u_{0}$ is a closed point of $U$. If $H^{-1}\left(\xi \otimes_{A}^{\mathbf{L}} k\right)$ is not surjective, then let $A^{\prime} \rightarrow A$ be an extension with kernel $I$ as in Lemma 80.20.2. Because $u_{0}$ is a closed point, we see that $I$ is a finite $A$-module, hence that $A^{\prime}$ is a finite type $\Lambda$-algebra (this fails if $u_{0}$ is not closed). In particular $A^{\prime}$ is Noetherian. By property (c) for $A^{\prime}$ and (i) for $\xi$ we see that $x$ lifts to an object $x^{\prime}$ over $A^{\prime}$. Let $\mathfrak{p}^{\prime} \subset A^{\prime}$ be kernel of the surjective map to $k$. By Artin-Rees (Algebra, Lemma 10.50.2) there exists an $n>1$ such that $\left(\mathfrak{p}^{\prime}\right)^{n} \cap I=0$. Then we see that

$$
B^{\prime}=A^{\prime} /\left(\mathfrak{p}^{\prime}\right)^{n} \longrightarrow A / \mathfrak{p}^{n}=B
$$

is a small, essential extension of local Artinian rings, see Formal Deformation Theory, Lemma 73.3 .12 On the other hand, as $x$ is versal at $u_{0}$ and as $\left.x^{\prime}\right|_{\operatorname{Spec}\left(B^{\prime}\right)}$ is a lift of $\left.x\right|_{\operatorname{Spec}(B)}$, there exists an integer $m \geq n$ and a $\operatorname{map} q: A / \mathfrak{p}^{m} \rightarrow B^{\prime}$ such that the composition $A / \mathfrak{p}^{m} \rightarrow B^{\prime} \rightarrow B$ is the quotient map. Since the maximal ideal of $B^{\prime}$ has $n$th power equal to zero, this $q$ factors through $B$ which contradicts the fact that $B^{\prime} \rightarrow B$ is an essential surjection. This contradiction shows that $H^{-1}\left(\xi \otimes_{A}^{\mathbf{L}} k\right)$ is surjective.
Assume that $x$ versal at $u_{0}$. By Lemma 80.20.1 the map $H^{0}\left(\xi \otimes_{A}^{\mathbf{L}} k\right)$ is dual to the $\operatorname{map} \operatorname{Ext}_{A}^{0}\left(N L_{A / \Lambda}, k\right) \rightarrow \operatorname{Ext}_{A}^{0}(E, k)$. Note that

$$
\operatorname{Ext}_{A}^{0}\left(N L_{A / \Lambda}, k\right)=\operatorname{Der}_{\Lambda}(A, k) \quad \text { and } \quad T_{x}(k)=\operatorname{Ext}_{A}^{0}(E, k)
$$

Condition (ii) assures us the map $\operatorname{Ext}_{A}^{0}\left(N L_{A / \Lambda}, k\right) \rightarrow \operatorname{Ext}_{A}^{0}(E, k)$ sends a tangent vector $\theta$ to $U$ at $u_{0}$ to the corresponding infinitesimal deformation of $x_{0}$, see Remark 80.18.6. Hence if $x$ is versal, then this map is surjective, see Formal Deformation Theory, Lemma 73.12 .2 Hence $H^{0}\left(\xi \otimes_{A}^{\mathbf{L}} k\right)$ is injective. This finishes the proof of $(1) \Rightarrow(2)$ in case $u_{0}$ is a closed point.
For the rest of the proof assume $H^{-1}\left(E \otimes_{A}^{\mathbf{L}} k\right) \rightarrow H^{-1}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)$ is surjective and $H^{0}\left(E \otimes_{A}^{\mathbf{L}} k\right) \rightarrow H^{0}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)$ injective. Set $R=A_{\mathfrak{p}}^{\wedge}$ and let $\eta$ be the
formal object over $R$ associated to $\left.x\right|_{\operatorname{Spec}(R)}$. The map $d \underline{\eta}$ on tangent spaces is surjective because it is identified with the dual of the injective map $H^{0}\left(E \otimes_{A}^{\mathbf{L}}\right.$ $k) \rightarrow H^{0}\left(N L_{A / \Lambda} \otimes_{A}^{\mathbf{L}} k\right)$ (see previous paragraph). According to Formal Deformation Theory, Lemma 73.12 .2 it suffices to prove the following: Let $C^{\prime} \rightarrow C$ be a small extension of finite type Artinian local $\Lambda$-algebras with residue field $k$. Let $R \rightarrow C$ be a $\Lambda$-algebra map compatible with identifications of residue fields. Let $y=\left.x\right|_{\operatorname{Spec}(C)}$ and let $y^{\prime}$ be a lift of $y$ to $C^{\prime}$. To show: we can lift the $\Lambda$-algebra map $R \rightarrow C$ to $R \rightarrow C^{\prime}$.

Observe that it suffices to lift the $\Lambda$-algebra map $A \rightarrow C$. Let $I=\operatorname{Ker}\left(C^{\prime} \rightarrow C\right)$. Note that $I$ is a 1 -dimensional $k$-vector space. The obstruction ob to lifting $A \rightarrow C$ is an element of $\operatorname{Ext}_{A}^{1}\left(N L_{A / \Lambda}, I\right)$, see Example 80.19.3. By Lemma 80.20.1 and our assumption the map $\xi$ induces an injection

$$
\operatorname{Ext}_{A}^{1}\left(N L_{A / \Lambda}, I\right) \longrightarrow \operatorname{Ext}_{A}^{1}(E, I)
$$

By the construction of $o b$ and (i) the image of $o b$ in $\operatorname{Ext}_{A}^{1}(E, I)$ is the obstruction to lifting $x$ to $A \times{ }_{C} C^{\prime}$. By ( $\left.\mathrm{RS}^{*}\right)$ the fact that $y / C$ lifts to $y^{\prime} / C^{\prime}$ implies that $x$ lifts to $A \times{ }_{C} C^{\prime}$. Hence $o b=0$ and we are done.

The key lemma above allows us to conclude that we have openness of versality in some cases.

07YN Lemma 80.20.4. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{\text {fppf }}$ satisfying $\left(R S^{*}\right)$. Let $U=\operatorname{Spec}(A)$ be an affine scheme of finite type over $S$ which maps into an affine open $\operatorname{Spec}(\Lambda)$. Let $x$ be an object of $\mathcal{X}$ over $U$. Let $\xi: E \rightarrow N L_{A / \Lambda}$ be a morphism of $D^{-}(A)$. Assume
(i) for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ we have: $x$ lifts to $\operatorname{Spec}\left(A^{\prime}\right)$ if and only if $E \rightarrow N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}$ is zero,
(ii) there is an isomorphism of functors $T_{x}(-) \rightarrow E x t_{A}^{0}(E,-)$ such that $E \rightarrow$ $N L_{A / \Lambda} \rightarrow \Omega_{A / \Lambda}^{1}$ corresponds to the canonical element (see Remark 80.18.6),
(iii) the cohomology groups of $E$ are finite $A$-modules.

If $x$ is versal at a closed point $u_{0} \in U$, then there exists an open neighbourhood $u_{0} \in U^{\prime} \subset U$ such that $x$ is versal at every finite type point of $U^{\prime}$.

Proof. Let $C$ be the cone of $\xi$ so that we have a distinguished triangle

$$
E \rightarrow N L_{A / \Lambda} \rightarrow C \rightarrow E[1]
$$

in $D^{-}(A)$. By Lemma 80.20 .3 the assumption that $x$ is versal at $u_{0}$ implies that $H^{-1}\left(C \otimes^{\mathbf{L}} k\right)=0$. By More on Algebra, Lemma 15.63 .4 there exists an $f \in A$ not contained in the prime corresponding to $u_{0}$ such that $H^{-1}\left(C \otimes_{A}^{\mathbf{L}} M\right)=0$ for any $A_{f}$-module $M$. Using Lemma 80.20 .3 again we see that we have versality for all finite type points of the open $D(f) \subset U$.

The technical lemmas above suggest the following definition.
07 YP Definition 80.20.5. Let $S$ be a locally Noetherian base. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Assume that $\mathcal{X}$ satisfies $\left(\mathrm{RS}^{*}\right)$. A naive obstruction theory is given by the following data
$07 \mathrm{YQ} \quad(1)$ for every $S$-algebra $A$ such that $\operatorname{Spec}(A) \rightarrow S$ maps into an affine open $\operatorname{Spec}(\Lambda) \subset S$ and every object $x$ of $\mathcal{X}$ over $\operatorname{Spec}(A)$ we are given an object $E_{x} \in D^{-}(A)$ and a $\operatorname{map} \xi_{x}: E \rightarrow N L_{A / \Lambda}$,

07YR

07 YS

These data are subject to the following conditions
(i) in the situation of (3) the diagram

is commutative in $D(A)$,
(ii) given $(x, A)$ as in (1) and $A \rightarrow B \rightarrow C$ setting $y=\left.x\right|_{\operatorname{Spec}(B)}$ and $z=$ $\left.x\right|_{\operatorname{Spec}(C)}$ the composition of the functoriality maps $E_{x} \rightarrow E_{y}$ and $E_{y} \rightarrow E_{z}$ is the functoriality map $E_{x} \rightarrow E_{z}$,
(iii) the maps of 2 are isomorphisms compatible with the functoriality maps and the maps of Remark 80.18.4.
(iv) the composition $E_{x} \rightarrow N L_{A / \Lambda} \rightarrow \Omega_{A / \Lambda}$ corresponds to the canonical element of $T_{x}\left(\Omega_{A / \Lambda}\right)=\operatorname{Ext}^{0}\left(E_{x}, \Omega_{A / \Lambda}\right)$, see Remark 80.18.6,
(v) given a deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ with $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$ the composition $E_{x} \rightarrow N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}$ is zero in

$$
\operatorname{Hom}_{A}\left(E_{x}, N L_{A / \Lambda}\right)=\operatorname{Ext}_{A}^{0}\left(E_{x}, N L_{A / A^{\prime}}\right)=\operatorname{Ext}_{A}^{1}\left(E_{x}, I\right)
$$

if and only if $x$ lifts to $A^{\prime}$.
Thus we see in particular that we obtain an obstruction theory as in Section 80.19 by setting $\mathcal{O}_{x}(-)=\operatorname{Ext}_{A}^{1}\left(E_{x},-\right)$.

07YT Lemma 80.20.6. Let $S$ and $\mathcal{X}$ be as in Definition 80.20.5 and let $\mathcal{X}$ be endowed with a naive obstruction theory. Let $A \rightarrow B$ and $y \rightarrow x$ be as in (3). Let $k$ be $a$ $B$-algebra which is a field. Then the functoriality map $E_{x} \rightarrow E_{y}$ induces bijections

$$
H^{i}\left(E_{x} \otimes_{A}^{\mathbf{L}} k\right) \rightarrow H^{i}\left(E_{y} \otimes_{A}^{\mathbf{L}} k\right)
$$

for $i=0,1$.
Proof. Let $z=\left.x\right|_{\operatorname{Spec}(k)}$. Then (RS*) implies that

$$
\operatorname{Lift}(x, A[k])=\operatorname{Lift}(z, k[k]) \quad \text { and } \quad \operatorname{Lift}(y, B[k])=\operatorname{Lift}(z, k[k])
$$

because $A[k]=A \times_{k} k[k]$ and $B[k]=B \times_{k} k[k]$. Hence the properties of a naive obstruction theory imply that the functoriality map $E_{x} \rightarrow E_{y}$ induces bijections $\operatorname{Ext}_{A}^{i}\left(E_{x}, k\right) \rightarrow \operatorname{Ext}_{B}^{i}\left(E_{y}, k\right)$ for $i=-1,0$. By Lemma 80.20.1 our maps $H^{i}\left(E_{x} \otimes_{A}^{\mathbf{L}}\right.$ $k) \rightarrow H^{i}\left(E_{y} \otimes_{A}^{\mathbf{L}} k\right), i=0,1$ induce isomorphisms on dual vector spaces hence are isomorphisms.

07YU Lemma 80.20.7. Let $S$ be a locally Noetherian scheme. Let $p: \mathcal{X} \rightarrow(S c h / S)_{\text {fppf }}^{o p p}$ be a category fibred in groupoids. Assume that $\mathcal{X}$ satisfies $\left(R S^{*}\right)$ and that $\mathcal{X}$ has a naive obstruction theory. Then openness of versality holds for $\mathcal{X}$ provided the complexes $E_{x}$ of Definition 80.20.5 have finitely generated cohomology groups for pairs $(A, x)$ where $A$ is of finite type over $S$.

Proof. Let $U$ be a scheme locally of finite type over $S$, let $x$ be an object of $\mathcal{X}$ over $U$, and let $u_{0}$ be a finite type point of $U$ such that $x$ is versal at $u_{0}$. We may first shrink $U$ to an affine scheme such that $u_{0}$ is a closed point and such that $U \rightarrow S$ maps into an affine open $\operatorname{Spec}(\Lambda)$. Say $U=\operatorname{Spec}(A)$. Let $\xi_{x}: E_{x} \rightarrow N L_{A / \Lambda}$ be the obstruction map. At this point we may apply Lemma 80.20 .4 to conclude.

### 80.21. A dual notion

07 YV Let $\left(x, A^{\prime} \rightarrow A\right)$ be a deformation situation for a given category $\mathcal{X}$ fibred in groupoids over a locally Noetherian scheme $S$. Assume $\mathcal{X}$ has an obstruction theory, see Definition 80.19.1. In practice one often has a complex $K^{\bullet}$ of $A$-modules and isomorphisms of functors

$$
\operatorname{Inf}_{x}(-) \rightarrow H^{0}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right), \quad T_{x}(-) \rightarrow H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right), \quad \mathcal{O}_{x}(-) \rightarrow H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right)
$$

In this section we formalize this a little bit and show how this leads to a verification of openness of versality in some cases.

07YW Example 80.21.1. Let $\Lambda, S, W, \mathcal{F}$ be as in Example 80.19.2. Assume that $W \rightarrow S$ is proper and $\mathcal{F}$ coherent. By Cohomology of Schemes, Remark 29.21 .2 there exists a finite complex of finite projective $\Lambda$-modules $N^{\bullet}$ which universally computes the cohomology of $\mathcal{F}$. In particular the obstruction spaces from Example 80.19 .2 are $\mathcal{O}_{x}(M)=H^{1}\left(N^{\bullet} \otimes_{\Lambda} M\right)$. Hence with $K^{\bullet}=N^{\bullet} \otimes_{\Lambda} A[-1]$ we see that $\mathcal{O}_{x}(M)=$ $H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} M\right)$.

07YX Situation 80.21.2. Let $S$ be a locally Noetherian scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(S c h / S)_{f p p f}$. Assume that $\mathcal{X}$ has $\left(\mathrm{RS}^{*}\right)$ so that we can speak of the functor $T_{x}(-)$, see Lemma 80.18.3. Let $U=\operatorname{Spec}(A)$ be an affine scheme of finite type over $S$ which maps into an affine open $\operatorname{Spec}(\Lambda)$. Let $x$ be an object of $\mathcal{X}$ over $U$. Assume we are given
(1) a complex of $A$-modules $K^{\bullet}$,
(2) a transformation of functors $T_{x}(-) \rightarrow H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right)$,
(3) for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ with kernel $I=\operatorname{Ker}\left(A^{\prime} \rightarrow A\right)$ an element $o_{x}\left(A^{\prime}\right) \in H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} I\right)$
satisfying the following (minimal) conditions
(i) the transformation $T_{x}(-) \rightarrow H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right)$ is an isomorphism,
(ii) given a morphism $\left(x, A^{\prime \prime} \rightarrow A\right) \rightarrow\left(x, A^{\prime} \rightarrow A\right)$ of deformation situations the element $o_{x}\left(A^{\prime}\right)$ maps to the element $o_{x}\left(A^{\prime \prime}\right)$ via the map $H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}\right.$ $I) \rightarrow H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} I^{\prime}\right)$ where $I^{\prime}=\operatorname{Ker}\left(A^{\prime \prime} \rightarrow A\right)$, and
(iii) $x$ lifts to an object over $\operatorname{Spec}\left(A^{\prime}\right)$ if and only if $o_{x}\left(A^{\prime}\right)=0$.

It is possible to incorporate infinitesimal automorphisms as well, but we refrain from doing so in order to get the sharpest possible result.

In Situation 80.21 .2 an important role will be played by $K^{\bullet} \otimes_{A}^{\mathbf{L}} N L_{A / \Lambda}$. Suppose we are given an element $\xi \in H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} N L_{A / \Lambda}\right)$. Then (1) for any surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras with kernel $I$ of square zero the canonical map $N L_{A / \Lambda} \rightarrow N L_{A / A^{\prime}}=I[1]$ sends $\xi$ to an element $\xi_{A^{\prime}} \in H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} I\right)$ and (2) the map $N L_{A / \Lambda} \rightarrow \Omega_{A / \Lambda}$ sends $\xi$ to an element $\xi_{c a n}$ of $H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \Omega_{A / \Lambda}\right)$.

07YY Lemma 80.21.3. In Situation 80.21.2. Assume furthermore that
(iv) given a short exact sequence of deformation situations as in Remark 80.18.8 and a lift $x_{2}^{\prime} \in \operatorname{Lift}\left(x, A_{2}^{\prime}\right)$ then $o_{x}\left(A_{3}^{\prime}\right) \in H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} I_{3}\right)$ equals $\partial \theta$ where $\theta \in H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} I_{1}\right)$ is the element corresponding to $\left.x_{2}^{\prime}\right|_{\operatorname{Spec}\left(A_{1}^{\prime}\right)}$ via $A_{1}^{\prime}=$ $A\left[I_{1}\right]$ and the given map $T_{x}(-) \rightarrow H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right)$.
In this case there exists an element $\xi \in H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} N L_{A / \Lambda}\right)$ such that
(1) for every deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ we have $\xi_{A^{\prime}}=o_{x}\left(A^{\prime}\right)$, and
(2) $\xi_{\text {can }}$ matches the canonical element of Remark 80.18 .6 via the given transformation $T_{x}(-) \rightarrow H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}}-\right)$.
Proof. Choose a $\alpha: \Lambda\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ with kernel $J$. Write $P=\Lambda\left[x_{1}, \ldots, x_{n}\right]$. In the rest of this proof we work with

$$
N L(\alpha)=\left(J / J^{2} \longrightarrow \bigoplus A \mathrm{~d} x_{i}\right)
$$

which is permissible by Algebra, Lemma 10.132 .2 and More on Algebra, Lemma 15.49.1. Consider the element $o_{x}\left(P / J^{2}\right) \in H^{2}\left(K^{\bullet} \otimes_{A}^{\mathrm{L}} J / J^{2}\right)$ and consider the quotient

$$
C=\left(P / J^{2} \times \bigoplus A \mathrm{~d} x_{i}\right) /\left(J / J^{2}\right)
$$

where $J / J^{2}$ is embedded diagonally. Note that $C \rightarrow A$ is a surjection with kernel $\bigoplus A \mathrm{~d} x_{i}$. Moreover there is a section $A \rightarrow C$ to $C \rightarrow A$ given by mapping the class of $f \in P$ to the class of $(f, \mathrm{~d} f)$ in the pushout. For later use, denote $x_{C}$ the pullback of $x$ along the corresponding morphism $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$. Thus we see that $o_{x}(C)=0$. We conclude that $o_{x}\left(P / J^{2}\right)$ maps to zero in $H^{2}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \bigoplus A \mathrm{~d} x_{i}\right)$. It follows that there exists some element $\xi \in H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} N L(\alpha)\right)$ mapping to $o_{x}\left(P / J^{2}\right)$.
Note that for any deformation situation $\left(x, A^{\prime} \rightarrow A\right)$ there exists a $\Lambda$-algebra map $P / J^{2} \rightarrow A^{\prime}$ compatible with the augmentations to $A$. Hence the element $\xi$ satisfies the first property of the lemma by construction and property (ii) of Situation 80.21 .2 .

Note that our choice of $\xi$ was well defined up to the choice of an element of $H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \bigoplus A \mathrm{~d} x_{i}\right)$. We will show that after modifying $\xi$ by an element of the aforementioned group we can arrange it so that the second assertion of the lemma is true. Let $C^{\prime} \subset C$ be the image of $P / J^{2}$ under the $\Lambda$-algebra map $P / J^{2} \rightarrow C$ (inclusion of first factor). Observe that $\operatorname{Ker}\left(C^{\prime} \rightarrow A\right)=\operatorname{Im}\left(J / J^{2} \rightarrow \bigoplus A \mathrm{~d} x_{i}\right)$. Set $\bar{C}=A\left[\Omega_{A / \Lambda}\right]$. The map $P / J^{2} \times \bigoplus A \mathrm{~d} x_{i} \rightarrow \bar{C},\left(f, \sum f_{i} \mathrm{~d} x_{i}\right) \mapsto\left(f \bmod J, \sum f_{i} \mathrm{~d} x_{i}\right)$ factors through a surjective map $C \rightarrow \bar{C}$. Then

$$
(x, \bar{C} \rightarrow A) \rightarrow(x, C \rightarrow A) \rightarrow\left(x, C^{\prime} \rightarrow A\right)
$$

is a short exact sequence of deformation situations. The associated splitting $\bar{C}=$ $A\left[\Omega_{A / \Lambda}\right]$ (from Remark 80.18.8 equals the given splitting above. Moreover, the section $A \rightarrow C$ composed with the map $C \rightarrow \bar{C}$ is the map (1, d) : $A \rightarrow A\left[\Omega_{A / \Lambda}\right]$ of Remark 80.18.6. Thus $x_{C}$ restricts to the canonical element $x_{\text {can }}$ of $T_{x}\left(\Omega_{A / \Lambda}\right)=$ $\operatorname{Lift}\left(x, A\left[\Omega_{A / \Lambda}\right]\right)$. By condition (iv) we conclude that $o_{x}\left(P / J^{2}\right)$ maps to $\partial x_{c a n}$ in

$$
H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \operatorname{Im}\left(J / J^{2} \rightarrow \bigoplus A \mathrm{~d} x_{i}\right)\right)
$$

By construction $\xi$ maps to $o_{x}\left(P / J^{2}\right)$. It follows that $x_{c a n}$ and $\xi_{c a n}$ map to the same element in the displayed group which means (by the long exact cohomology sequence) that they differ by an element of $H^{1}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \bigoplus A \mathrm{~d} x_{i}\right)$ as desired.

07YZ Lemma 80.21.4. In Situation 80.21.2 assume that (iv) of Lemma 80.21.3 holds and that $K^{\bullet}$ is a perfect object of $D(A)$. In this case, if $x$ is versal at a closed point $u_{0} \in U$ then there exists an open neighbourhood $u_{0} \in U^{\prime} \subset U$ such that $x$ is versal at every finite type point of $U^{\prime}$.
Proof. We may assume that $K^{\bullet}$ is a finite complex of finite projective $A$-modules. Thus the derived tensor product with $K^{\bullet}$ is the same as simply tensoring with $K^{\bullet}$. Let $E^{\bullet}$ be the dual perfect complex to $K^{\bullet}$, see More on Algebra, Lemma 15.61.14 (So $E^{n}=\operatorname{Hom}_{A}\left(K^{-n}, A\right)$ with differentials the transpose of the differentials of $K^{\bullet}$.) Let $E \in D^{-}(A)$ denote the object represented by the complex $E^{\bullet}[-1]$. Let $\xi \in H^{1}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{A} N L_{A / \Lambda}\right)\right)$ be the element constructed in Lemma 80.21.3 and denote $\xi: E=E^{\bullet}[-1] \rightarrow N L_{A / \Lambda}$ the corresponding map (loc.cit.). We claim that the pair $(E, \xi)$ satisfies all the assumptions of Lemma 80.20 .4 which finishes the proof.
Namely, assumption (i) of Lemma 80.20.4 follows from conclusion (1) of Lemma 80.21 .3 and the fact that $H^{2}\left(K^{\bullet} \otimes_{A}^{L}-\right)=\operatorname{Ext}^{1}(E,-)$ by loc.cit. Assumption (ii) of Lemma 80.20 .4 follows from conclusion (2) of Lemma 80.21 .3 and the fact that $H^{1}\left(K^{\bullet} \otimes_{A}^{L}-\right)=\operatorname{Ext}^{0}(E,-)$ by loc.cit. Assumption (iii) of Lemma 80.20.4 is clear.

### 80.22. Examples of deformation problems

06 LA List of things that should go here:
(1) Describe the general outline of an example.
(2) Deformations of schemes:
(a) The Rim-Schlessinger condition.
(b) Computing the tangent space.
(c) Computing the infinitesimal deformations.
(d) The deformation category of an affine hypersurface.
(3) Deformations of representations of abstract groups.
(4) Deformations of representations of topological groups (e.g., profinite ones).
(5) Deformations of sheaves (for example fix $X / S$, a finite type point $s$ of $S$, and a quasi-coherent sheaf $\mathcal{F}_{s}$ over $X_{s}$ ).
(6) Deformations of algebraic spaces (very similar to deformations of schemes; maybe even easier?).
(7) Deformations of maps (eg morphisms between schemes; you can fix both or one of the target and/or source).
(8) Add more here.

## CHAPTER 81

## Quot and Hilbert Spaces

05X4

### 81.1. Introduction

05X5 The purpose of this chapter is to write about Quot and Hilbert functors and to prove that these are algebraic spaces provided certain technical conditions are satisfied. In this chapter we will discuss this in the setting of algebraic space. A reference is Grothendieck's lectures, see Gro95a, Gro95b, Gro95e, Gro95f, Gro95c, and [Gro95d]. Another reference is the paper [OS03]; this paper discusses the more general case of Quot and Hilbert spaces associated to a morphism of algebraic stacks which we will discuss in another chapter, see (insert future reference here).

In the case of Hilbert spaces there is a more general notion of "Hilbert stacks" which we will discuss in a separate chapter, see (insert future reference here).

We have intentionally placed this chapter, as well as the chapters "Examples of Stacks", "Sheaves on Algebraic Stacks", "Criteria for Representability", and "Artin's Axioms" before the general development of the theory of algebraic stacks. The reason for this is that starting with the next chapter (see Properties of Stacks, Section 82.2 we will no longer distinguish between a scheme and the algebraic stack it gives rise to. Thus our language will become more flexible and easier for a human to parse, but also less precise. These first few chapters, including the initial chapter "Algebraic Stacks", lay the groundwork that later allow us to ignore some of the very technical distinctions between different ways of thinking about algebraic stacks. But especially in the chapters "Artin's Axioms" and "Criteria of Representability" we need to be very precise about what objects exactly we are working with, as we are trying to show that certain constructions produce algebraic stacks or algebraic spaces.

Unfortunately, this means that some of the notation, conventions and terminology is awkward and may seem backwards to the more experienced reader. We hope the reader will forgive us!

### 81.2. Conventions

05X6 The standing assumption is that all schemes are contained in a big fppf site $S_{c h} h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 81.3. The Hom functor

08JS In this section we study the functor of homomorphisms defined below.
08JT Situation 81.3.1. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent $\mathcal{O}_{X}$-modules. For any scheme $T$ over $B$ we will denote $\mathcal{F}_{T}$ and $\mathcal{G}_{T}$ the base changes of $\mathcal{F}$ and $\mathcal{G}$ to $T$, in other words, the pullbacks via the projection morphism $X_{T}=X \times_{B} T \rightarrow X$. We consider the functor
08JU (81.3.1.1) $\quad \operatorname{Hom}(\mathcal{F}, \mathcal{G}):(S c h / B)^{o p p} \longrightarrow S e t s, \quad T \longrightarrow \operatorname{Hom}_{\mathcal{O}_{x_{T}}}\left(\mathcal{F}_{T}, \mathcal{G}_{T}\right)$
In Situation 81.3.1 we sometimes think of the functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ as a functor

$$
\operatorname{Hom}(\mathcal{F}, \mathcal{G}):(S c h / S)^{o p p} \longrightarrow \text { Sets }
$$

endowed with a morphism $\operatorname{Hom}(\mathcal{F}, \mathcal{G}) \rightarrow B$. Namely, if $T$ is a scheme over $S$, then an element of $\operatorname{Hom}(\mathcal{F}, \mathcal{G})(T)$ consists of a pair $(h, u)$, where $h$ is a morphism $h: T \rightarrow B$ and $u: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ is an $\mathcal{O}_{X_{T}}$-module map where $X_{T}=T \times_{h, B} X$ and $\mathcal{F}_{T}$ and $\mathcal{G}_{T}$ are the pullbacks to $X_{T}$. In particular, when we say that $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is an algebraic space, we mean that the corresponding functor $(S c h / S)^{o p p} \rightarrow$ Sets is an algebraic space.
08JV Lemma 81.3.2. In Situation 81.3.1 the functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for the fpqc topology.
Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $B$. Set $X_{i}=X_{T_{i}}=$ $X \times{ }_{S} T_{i}$ and $\mathcal{F}_{i}=u_{T_{i}}$ and $\mathcal{G}_{i}=\mathcal{G}_{T_{i}}$. Note that $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$, see Topologies on Spaces, Lemma 60.3.2. Thus a family of maps $u_{i}: \mathcal{F}_{i} \rightarrow \mathcal{G}_{i}$ such that $u_{i}$ and $u_{j}$ restrict to the same map on $X_{T_{i} \times_{T} T_{j}}$ comes from a unique map $u: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ by descent (Descent on Spaces, Proposition 61.4.1).

08JW Remark 81.3.3. In Situation 81.3.1 let $B^{\prime} \rightarrow B$ be a morphism of algebraic spaces over $S$. Set $X^{\prime}=X \times_{B} B^{\prime}$ and denote $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ the pullback of $\mathcal{F}, \mathcal{G}$ to $X^{\prime}$. Then we obtain a functor $\operatorname{Hom}\left(\mathcal{F}^{\prime}, \mathcal{G}^{\prime}\right):\left(S c h / B^{\prime}\right)^{o p p} \rightarrow$ Sets associated to the base change $f^{\prime}: X^{\prime} \rightarrow B^{\prime}$. For a scheme $T$ over $B^{\prime}$ it is clear that we have

$$
\operatorname{Hom}\left(\mathcal{F}^{\prime}, \mathcal{G}^{\prime}\right)(T)=\operatorname{Hom}(\mathcal{F}, \mathcal{G})(T)
$$

where on the right hand side we think of $T$ as a scheme over $B$ via the composition $T \rightarrow B^{\prime} \rightarrow B$. This trivial remark will occasionally be useful to change the base algebraic space.

08K3 Lemma 81.3.4. In Situation 81.3.1 let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering and for each $i, j \in I$ let $\left\{X_{i j k} \rightarrow X_{i} \times_{X} X_{j}\right\}$ be an fppf covering. Denote $\mathcal{F}_{i}$, resp. $\mathcal{F}_{i j k}$ the pullback of $\mathcal{F}$ to $X_{i}$, resp. $X_{i j k}$. Similarly define $\mathcal{G}_{i}$ and $\mathcal{G}_{i j k}$. For every scheme $T$ over $B$ the diagram

$$
\operatorname{Hom}(\mathcal{F}, \mathcal{G})(T) \longrightarrow \prod_{i} \operatorname{Hom}\left(\mathcal{F}_{i}, \mathcal{G}_{i}\right)(T) \xrightarrow[p r_{1}^{*}]{\stackrel{p r_{0}^{*}}{\longrightarrow}} \prod_{i, j, k} \operatorname{Hom}\left(\mathcal{F}_{i j k}, \mathcal{G}_{i j k}\right)(T)
$$

presents the first arrow as the equalizer of the other two.
Proof. Let $u_{i}: \mathcal{F}_{i, T} \rightarrow \mathcal{G}_{i, T}$ be an element in the equalizer of $\mathrm{pr}_{0}^{*}$ and $\mathrm{pr}_{1}^{*}$. Since the base change of an fppf covering is an fppf covering (Topologies on Spaces, Lemma 60.4.2 we see that $\left\{X_{i, T} \rightarrow X_{T}\right\}_{i \in I}$ and $\left\{X_{i j k, T} \rightarrow X_{i, T} \times X_{T} X_{j, T}\right\}$ are
fppf coverings. Applying Descent on Spaces, Proposition 61.4.1 we first conclude that $u_{i}$ and $u_{j}$ restrict to the same morphism over $X_{i, T} \times{ }_{X_{T}} X_{j, T}$, whereupon a second application shows that there is a unique morphism $u: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ restricting to $u_{i}$ for each $i$. This finishes the proof.
08K4 Lemma 81.3.5. In Situation 81.3.1. If $\mathcal{F}$ is of finite presentation and $f$ is quasicompact and quasi-separated, then $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is limit preserving.
Proof. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $B$-schemes. We have to show that

$$
\operatorname{Hom}(\mathcal{F}, \mathcal{G})(T)=\operatorname{colim} \operatorname{Hom}(\mathcal{F}, \mathcal{G})\left(T_{i}\right)
$$

Pick $0 \in I$. We may replace $B$ by $T_{0}, X$ by $X_{T_{0}}, \mathcal{F}$ by $\mathcal{F}_{T_{0}}, \mathcal{G}$ by $\mathcal{G}_{T_{0}}$, and $I$ by $\{i \in I \mid i \geq 0\}$. See Remark 81.3.3. Thus we may assume $B=\operatorname{Spec}(R)$ is affine.

When $B$ is affine, then $X$ is quasi-compact and quasi-separated. Choose a surjective étale morphism $U \rightarrow X$ where $U$ is an affine scheme (Properties of Spaces, Lemma 53.6.3). Since $X$ is quasi-separated, the scheme $U \times_{X} U$ is quasi-compact and we may choose a surjective étale morphism $V \rightarrow U \times_{X} U$ where $V$ is an affine scheme. Applying Lemma 81.3.4 we see that $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is the equalizer of two maps between

$$
\operatorname{Hom}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right) \quad \text { and } \quad \operatorname{Hom}\left(\left.\mathcal{F}\right|_{V},\left.\mathcal{G}\right|_{V}\right)
$$

This reduces us to the case that $X$ is affine.
In the affine case the statement of the lemma reduces to the following problem: Given a ring map $R \rightarrow A$, two $A$-modules $M, N$ and a directed system of $R$ algebras $C=\operatorname{colim} C_{i}$. When is it true that the map
is bijective? By Algebra, Lemma 10.126 .3 this holds if $M \otimes_{R} C$ is of finite presentation over $A \otimes_{R} C$, i.e., when $M$ is of finite presentation over $A$.

08K5 Lemma 81.3.6. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $i: X^{\prime} \rightarrow X$ be a closed immersion of algebraic spaces over $B$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module and let $\mathcal{G}^{\prime}$ be a quasi-coherent $\mathcal{O}_{X^{\prime}}$-module. Then

$$
\operatorname{Hom}\left(\mathcal{F}, i_{*} \mathcal{G}^{\prime}\right)=\operatorname{Hom}\left(i^{*} \mathcal{F}, \mathcal{G}^{\prime}\right)
$$

as functors on $(S c h / B)$.
Proof. Let $g: T \rightarrow B$ be a morphism where $T$ is a scheme. Denote $i_{T}: X_{T}^{\prime} \rightarrow X_{T}$ the base change of $i$. Denote $h: X_{T} \rightarrow X$ and $h^{\prime}: X_{T}^{\prime} \rightarrow X^{\prime}$ the projections. Observe that $\left(h^{\prime}\right)^{*} i^{*} \mathcal{F}=i_{T}^{*} h^{*} \mathcal{F}$. As a closed immersion is affine (Morphisms of Spaces, Lemma 54.20.6) we have $h^{*} i_{*} \mathcal{G}=i_{T, *}\left(h^{\prime}\right)^{*} \mathcal{G}$ by Cohomology of Spaces, Lemma 56.10.2. Thus we have

$$
\begin{aligned}
\operatorname{Hom}\left(\mathcal{F}, i_{*} \mathcal{G}^{\prime}\right)(T) & =\operatorname{Hom}_{\mathcal{O}_{X_{T}}}\left(h^{*} \mathcal{F}, h^{*} i_{*} \mathcal{G}^{\prime}\right) \\
& =\operatorname{Hom}_{\mathcal{O}_{X_{T}}}\left(h^{*} \mathcal{F}, i_{T, *}\left(h^{\prime}\right)^{*} \mathcal{G}\right) \\
& =\operatorname{Hom}_{\mathcal{O}_{X_{T}^{\prime}}}\left(i_{T}^{*} h^{*} \mathcal{F},\left(h^{\prime}\right)^{*} \mathcal{G}\right) \\
& \left.=\operatorname{Hom}_{\mathcal{O}_{X_{T}^{\prime}}}\left(h^{\prime}\right)^{*} i^{*} \mathcal{F},\left(h^{\prime}\right)^{*} \mathcal{G}\right) \\
& =\operatorname{Hom}\left(i^{*} \mathcal{F}, \mathcal{G}^{\prime}\right)(T)
\end{aligned}
$$

as desired. The middle equality follows from the adjointness of the functors $i_{T, *}$ and $i_{T}^{*}$.

08JX Lemma 81.3.7. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $K$ be a pseudo-coherent object of $D\left(\mathcal{O}_{B}\right)$.
(1) If for all $g: T \rightarrow B$ in $(S c h / B)$ the cohomology sheaf $H^{-1}\left(L g^{*} K\right)$ is zero, then the functor

$$
(S c h / B)^{o p p} \longrightarrow S e t s, \quad(g: T \rightarrow B) \longmapsto H^{0}\left(T, H^{0}\left(L g^{*} K\right)\right)
$$

is an algebraic space affine and of finite presentation over $B$.
(2) If for all $g: T \rightarrow B$ in $(S c h / B)$ the cohomology sheaves $H^{i}\left(L g^{*} K\right)$ are zero for $i<0$, then $K$ is perfect with tor amplitude in $[0, b]$ for some $b \geq 0$ and the functor

$$
(S c h / B)^{o p p} \longrightarrow \text { Sets, } \quad(g: T \rightarrow B) \longmapsto H^{0}\left(T, L g^{*} K\right)
$$

is an algebraic space affine and of finite presentation over $B$.
Proof. Under the assumptions of (2) we have $H^{0}\left(T, L g^{*} K\right)=H^{0}\left(T, H^{0}\left(L g^{*} K\right)\right)$. Let us prove that the rule $T \mapsto H^{0}\left(T, H^{0}\left(L g^{*} K\right)\right)$ satisfies the sheaf property for the fppf topology. To do this assume we have an fppf covering $\left\{h_{i}: T_{i} \rightarrow T\right\}$ of a scheme $g: T \rightarrow B$ over $B$. Set $g_{i}=g \circ h_{i}$. Note that since $h_{i}$ is flat, we have $L h_{i}^{*}=h_{i}^{*}$ and $h_{i}^{*}$ commutes with taking cohomology. Hence

$$
H^{0}\left(T_{i}, H^{0}\left(L g_{i}^{*} K\right)\right)=H^{0}\left(T_{i}, H^{0}\left(h_{i}^{*} L g^{*} K\right)\right)=H^{0}\left(T, h_{i}^{*} H^{0}\left(L g^{*} K\right)\right)
$$

Similarly for the pullback to $T_{i} \times_{T} T_{j}$. Since $L g^{*} K$ is a pseudo-coherent complex on $T$ (Cohomology on Sites, Lemma 21.35.3) the cohomology sheaf $\mathcal{F}=H^{0}\left(L g^{*} K\right)$ is quasi-coherent (Derived Categories of Spaces, Lemma 62.12.5). Hence by Descent on Spaces, Proposition 61.4.1 we see that

$$
H^{0}(T, \mathcal{F})=\operatorname{Ker}\left(\prod H^{0}\left(T_{i}, h_{i}^{*} \mathcal{F}\right) \rightarrow \prod H^{0}\left(T_{i}, h_{i}^{*} \mathcal{F}\right)\right)
$$

In this way we see that the rules in (1) and (2) satisfy the sheaf property for fppf coverings. This mean we may apply Bootstrap, Lemma 67.11.4 it suffices to prove the representability étale locally on $B$. Moreover, we may check whether the end result is affine and of finite presentation étale locally on $B$, see Morphisms of Spaces, Lemmas 54.20 .3 and 54.28.4. Hence we may assume that $B$ is an affine scheme.

Assume $B=\operatorname{Spec}(A)$ is an affine scheme. By the results of Derived Categories of Spaces, Lemmas 62.12.5, 62.4.2, and 62.12.2 we deduce that in the rest of the proof we may think of $K$ as a perfect object of the derived category of complexes of modules on $B$ in the Zariski topology. By Derived Categories of Schemes, Lemmas 35.10 .1 35.3.5, and 35.10 .3 we can find a pseudo-coherent complex $M^{\bullet}$ of $A$-modules such that $K$ is the corresponding object of $D\left(\mathcal{O}_{B}\right)$. Our assumption on pullbacks implies that $M^{\bullet} \otimes_{A}^{\mathbf{L}} \kappa(\mathfrak{p})$ has vanishing $H^{-1}$ for all primes $\mathfrak{p} \subset A$. By More on Algebra, Lemma 15.63 .4 we can write

$$
M^{\bullet}=\tau_{\geq 0} M^{\bullet} \oplus \tau_{\leq-1} M^{\bullet}
$$

with $\tau_{\geq 0} M^{\bullet}$ perfect with Tor amplitude in $[0, b]$ for some $b \geq 0$ (here we also have used More on Algebra, Lemmas 15.61 .11 and 15.55.15. Note that in case (2) we also see that $\tau_{\leq-1} M^{\bullet}=0$ in $D(A)$ whence $M^{\bullet}$ and $K$ are perfect with tor amplitude in $[0, b]$. For any $B$-scheme $g: T \rightarrow B$ we have

$$
H^{0}\left(T, H^{0}\left(L g^{*} K\right)\right)=H^{0}\left(T, H^{0}\left(L g^{*} \tau_{\geq 0} K\right)\right)
$$

(by the dual of Derived Categories, Lemma 13.17.1) hence we may replace $K$ by $\tau_{\geq 0} K$ and correspondingly $M^{\bullet}$ by $\tau_{\geq 0} M^{\bullet}$. In other words, we may assume $M^{\bullet}$ has tor amplitude in $[0, b]$.
Assume $M^{\bullet}$ has tor amplitude in $[0, b]$. We may assume $M^{\bullet}$ is a bounded above complex of finite free $A$-modules (by our definition of pseudo-coherent complexes, see More on Algebra, Definition 15.54.1 and the discussion following the definition). By More on Algebra, Lemma 15.55 .2 we see that $M=\operatorname{Coker}\left(M^{-1} \rightarrow M^{0}\right)$ is flat. By Algebra, Lemma 10.77 .2 we see that $M$ is finite locally free. Hence $M^{\bullet}$ is quasi-isomorphic to

$$
M \rightarrow M^{1} \rightarrow M^{2} \rightarrow \ldots \rightarrow M^{d} \rightarrow 0 \ldots
$$

Note that this is a K-flat complex (Cohomology, Lemma 20.27.8), hence derived pullback of $K$ via a morphism $T \rightarrow B$ is computed by the complex

$$
g^{*} \widetilde{M} \rightarrow g^{*} \widetilde{M^{1}} \rightarrow \ldots
$$

Thus it suffices to show that the functor

$$
(g: T \rightarrow B) \longmapsto \operatorname{Ker}\left(\Gamma\left(T, g^{*} \widetilde{M}\right) \rightarrow \Gamma\left(T, g^{*}\left(\widetilde{M^{1}}\right)\right)\right.
$$

is representable by an affine scheme of finite presentation over $B$.
We may still replace $B$ by the members of an affine open covering in order to prove this last statement. Hence we may assume that $M$ is finite free (recall that $M^{1}$ is finite free to begin with). Write $M=A^{\oplus n}$ and $M^{1}=A^{\oplus m}$. Let the map $M \rightarrow M^{1}$ be given by the $m \times n$ matrix $\left(a_{i j}\right)$ with coefficients in $A$. Then $\widetilde{M}=\mathcal{O}_{B}^{\oplus n}$ and $\widetilde{M^{1}}=\mathcal{O}_{B}^{\oplus m}$. Thus the functor above is equal to the functor

$$
(g: T \rightarrow B) \longmapsto\left\{\left(f_{1}, \ldots, f_{n}\right) \in \Gamma\left(T, \mathcal{O}_{T}\right) \mid \sum g^{\sharp}\left(a_{i j} f_{i}=0, j=1, \ldots, m\right\}\right.
$$

Clearly this is representable by the affine scheme

$$
\operatorname{Spec}\left(A\left[x_{1}, \ldots, x_{n}\right] /\left(\sum a_{i j} x_{i} ; j=1, \ldots, m\right)\right)
$$

and the lemma has been proved.
The functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is representable in a number of situations. All of our results will be based on the following basic case. The proof of this lemma as given below is in some sense the natural generalization to the proof of [DG67, III, Cor 7.7.8].

08JY Lemma 81.3.8. In Situation 81.3.1 assume that
(1) $B$ is a Noetherian algebraic space,
(2) $f$ is locally of finite type and quasi-separated,
(3) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module, and
(4) $\mathcal{G}$ is a finite type $\mathcal{O}_{X}$-module, flat over $B$, with scheme theoretic support proper over $B$.
Then the functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine and of finite presentation over $B$.

Proof. We may replace $X$ by a quasi-compact open neighbourhood of the support of $\mathcal{G}$, hence we may assume $X$ is Noetherian. In this case $X$ and $f$ are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow \mathcal{F}$ by a perfect complex $P$
of the triple $(X, \mathcal{F}, 0)$, see Derived Categories of Spaces, Definition 62.13.1 and Theorem 62.13.7). Then the induced map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(P, \mathcal{G})
$$

is an isomorphism because $P \rightarrow \mathcal{F}$ induces an isomorphism $H^{0}(P) \rightarrow \mathcal{F}$ and $H^{i}(P)=0$ for $i>0$. Moreover, for any morphism $g: T \rightarrow B$ denote $h: X_{T}=$ $T \times_{B} X \rightarrow X$ the projection and set $P_{T}=L h^{*} P$. Then it is equally true that

$$
\operatorname{Hom}_{\mathcal{O}_{X_{T}}}\left(\mathcal{F}_{T}, \mathcal{G}_{T}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{X_{T}}\right)}\left(P_{T}, \mathcal{G}_{T}\right)
$$

is an isomorphism, as $P_{T}=L h^{*} P \rightarrow L h^{*} \mathcal{F} \rightarrow \mathcal{F}_{T}$ induces an isomorphism $H^{0}\left(P_{T}\right) \rightarrow \mathcal{F}_{T}$ (because $h^{*}$ is right exact and $H^{i}(P)=0$ for $i>0$ ). Thus it suffices to prove the result for the functor

$$
T \longmapsto \operatorname{Hom}_{D\left(\mathcal{O}_{X_{T}}\right)}\left(P_{T}, \mathcal{G}_{T}\right) .
$$

By the Leray spectral sequence (see Cohomology on Sites, Remark 21.14.4) we have

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X_{T}}\right)}\left(P_{T}, \mathcal{G}_{T}\right)=H^{0}\left(X_{T}, R \mathcal{H o m}\left(P_{T}, \mathcal{G}_{T}\right)\right)=H^{0}\left(T, R f_{T, *} R \mathcal{H o m}\left(P_{T}, \mathcal{G}_{T}\right)\right)
$$

where $f_{T}: X_{T} \rightarrow T$ is the base change of $f$. By Derived Categories of Spaces, Lemma 62.17 .6 we have

$$
R f_{T, *} R \mathcal{H o m}\left(P_{T}, \mathcal{G}_{T}\right)=L g^{*} R f_{*} R \mathcal{H o m}(P, \mathcal{G}) .
$$

By Derived Categories of Spaces, Lemma 62.19.2 the object $K=R f_{*} R \mathcal{H o m}(P, \mathcal{G})$ of $D\left(\mathcal{O}_{B}\right)$ is perfect. This means we can apply Lemma 81.3 .7 as long as we can prove that the cohomology sheaf $H^{i}\left(L g^{*} K\right)$ is 0 for all $i<0$ and $g: T \rightarrow$ $B$ as above. This is clear from the last displayed formula as the cohomology sheaves of $R f_{T, *} R \mathcal{H} \operatorname{om}\left(P_{T}, \mathcal{G}_{T}\right)$ are zero in negative degrees due to the fact that $R \mathcal{H} \operatorname{lom}\left(P_{T}, \mathcal{G}_{T}\right)$ has vanishing cohomology sheaves in negative degrees as $P_{T}$ is perfect with vanishing cohomology sheaves in positive degrees.

Here is a cheap consequence of Lemma 81.3.8.
08K6 Proposition 81.3.9. In Situation 81.3.1 assume that
(1) $f$ is of finite presentation, and
(2) $\mathcal{G}$ is a finitely presented $\mathcal{O}_{X}$-module, flat over $B$, with scheme theoretic support proper over $B$.
Then the functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine over $B$. If $\mathcal{F}$ is of finite presentation, then $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ is of finite presentation over $B$.
Proof. By Lemma 81.3 .2 the functor $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for fppf coverings. This mean we may ${ }^{1}$ apply Bootstrap, Lemma 67.11.1 to check the representability étale locally on $B$. Moreover, we may check whether the end result is affine or of finite presentation étale locally on $B$, see Morphisms of Spaces, Lemmas 54.20 .3 and 54.28 .4 . Hence we may assume that $B$ is an affine scheme.
Assume $B$ is an affine scheme. As $f$ is of finite presentation, it follows $X$ is quasicompact and quasi-separated. Thus we can write $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ as a filtered colimit of $\mathcal{O}_{X}$-modules of finite presentation (Limits of Spaces, Lemma 57.9.1). It is clear that

$$
\operatorname{Hom}(\mathcal{F}, \mathcal{G})=\lim \operatorname{Hom}\left(\mathcal{F}_{i}, \mathcal{G}\right)
$$

[^213]Hence if we can show that each $\operatorname{Hom}\left(\mathcal{F}_{i}, \mathcal{G}\right)$ is representable by an affine scheme, then we see that the same thing holds for $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$. Use the material in Limits, Section 31.2 and Limits of Spaces, Section 57.4 . Thus we may assume that $\mathcal{F}$ is of finite presentation.

Say $B=\operatorname{Spec}(R)$. Write $R=\operatorname{colim} R_{i}$ with each $R_{i}$ a finite type $\mathbf{Z}$-algebra. Set $B_{i}=\operatorname{Spec}\left(R_{i}\right)$. By the results of Limits of Spaces, Lemmas 57.7.1 and 57.7.2 we can find an $i$, a morphism of algebraic spaces $X_{i} \rightarrow B_{i}$, and finitely presented $\mathcal{O}_{X_{i}}$-modules $\mathcal{F}_{i}$ and $\mathcal{G}_{i}$ such that the base change of $\left(X_{i}, \mathcal{F}_{i}, \mathcal{G}_{i}\right)$ to $B$ recovers $(X, \mathcal{F}, \mathcal{G})$. By Limits of Spaces, Lemma 57.6.11 we may, after increasing $i$, assume that $\mathcal{G}_{i}$ is flat over $B_{i}$. By Limits of Spaces, Lemma 57.12 .3 we may similarly assume the scheme theoretic support of $\mathcal{G}_{i}$ is proper over $B_{i}$. At this point we can apply Lemma 81.3 .8 to see that $H_{i}=\operatorname{Hom}\left(\mathcal{F}_{i}, \mathcal{G}_{i}\right)$ is an algebraic space affine of finite presentation over $B_{i}$. Pulling back to $B$ (using Remark 81.3.3) we see that $H_{i} \times{ }_{B_{i}} B=\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ and we win.

### 81.4. The Isom functor

08K7
In Situation 81.3.1 we can consider the subfunctor

$$
\operatorname{Isom}(\mathcal{F}, \mathcal{G}) \subset H o m(\mathcal{F}, \mathcal{G})
$$

whose value on a scheme $T$ over $B$ is the set of invertible $\mathcal{O}_{X_{T}}$-homomorphisms $u: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$. In this brief section we quickly point out some properties of this functor.

08K8 Lemma 81.4.1. In Situation 81.3.1 the functor $\operatorname{Isom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property for the fpqc topology.

Proof. We have already seen that $\operatorname{Hom}(\mathcal{F}, \mathcal{G})$ satisfies the sheaf property. Hence it remains to show the following: Given an fpqc covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ of schemes over $B$ and an $\mathcal{O}_{X_{T}}$-linear map $u: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ such that $u_{T_{i}}$ is an isomorphism for all $i$, then $u$ is an isomorphism. Since $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$, see Topologies on Spaces, Lemma 60.3.2, this follows from Descent on Spaces, Proposition 61.4.1.

08K9 Proposition 81.4.2. In Situation 81.3.1 assume that
(1) $f$ is of finite presentation, and
(2) $\mathcal{F}$ and $\mathcal{G}$ are finitely presented $\mathcal{O}_{X}$-modules, flat over $B$, with scheme theoretic support proper over $B$.
Then the functor $\operatorname{Isom}(\mathcal{F}, \mathcal{G})$ is representable by an algebraic space affine of finite presentation over $B$.

Proof. We will use the abbreviations $H=\operatorname{Hom}(\mathcal{F}, \mathcal{G}), I=\operatorname{Hom}(\mathcal{F}, \mathcal{F}), H^{\prime}=$ $\operatorname{Hom}(\mathcal{G}, \mathcal{F})$, and $I^{\prime}=\operatorname{Hom}(\mathcal{G}, \mathcal{G})$. By Proposition 81.3 .9 the functors $H, I, H^{\prime}, I^{\prime}$ are algebraic spaces and the morphisms $H \rightarrow B, I \rightarrow B, H^{\prime} \rightarrow B$, and $I^{\prime} \rightarrow B$ are affine and of finite presentation. The composition of maps gives a morphism

$$
c: H^{\prime} \times_{B} H \longrightarrow I \times_{B} I^{\prime}, \quad\left(u^{\prime}, u\right) \longmapsto\left(u \circ u^{\prime}, u^{\prime} \circ u\right)
$$

of algebraic spaces over $B$. Since $I \times_{B} I^{\prime} \rightarrow B$ is separated, the section $\sigma: B \rightarrow$ $I \times_{B} I^{\prime}$ corresponding to $\left(\mathrm{id}_{\mathcal{F}}, \mathrm{id}_{\mathcal{G}}\right)$ is a closed immersion (Morphisms of Spaces,

Lemma 54.4.7. Moreover, $\sigma$ is of finite presentation (Morphisms of Spaces, Lemma 54.28.9. Hence

$$
\operatorname{Isom}(\mathcal{F}, \mathcal{G})=\left(H^{\prime} \times_{B} H\right) \times_{c, I \times{ }_{B} I^{\prime}, \sigma} B
$$

is an algebraic space affine of finite presentation over $B$ as well. Some details omitted.

### 81.5. The stack of coherent sheaves

08 KA In this section we prove that the stack of coherent sheaves on $X / B$ is algebraic under suitable hypotheses. This is a special case of [Lie06b, Theorem 2.1.1] which treats the case of the stack of coherent sheaves on an Artin stack over a base.

08 KB Situation 81.5.1. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Assume that $f$ is of finite presentation. We denote $\operatorname{Coh}_{X / B}$ the category whose objects are triples $(T, g, \mathcal{F})$ where
(1) $T$ is a scheme over $S$,
(2) $g: T \rightarrow B$ is a morphism over $S$, and setting $X_{T}=T \times{ }_{g, B} X$
(3) $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X_{T}}$-module of finite presentation, flat over $T$, with scheme theoretic support proper over $T$.
A morphism $(T, g, \mathcal{F}) \rightarrow\left(T^{\prime}, g^{\prime}, \mathcal{F}^{\prime}\right)$ is given by a pair $(h, \varphi)$ where
(1) $h: T \rightarrow T^{\prime}$ is a morphism of schemes over $B$ (i.e., $g^{\prime} \circ h=g$ ), and
(2) $\varphi:\left(h^{\prime}\right)^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$ is an isomorphism of $\mathcal{O}_{X_{T}}$-modules where $h^{\prime}: X_{T} \rightarrow X_{T^{\prime}}$ is the base change of $h$.

Thus $\operatorname{Coh}_{X / B}$ is a category and the rule

$$
p: \operatorname{Coh}_{X / B} \longrightarrow(S c h / S)_{f p p f}, \quad(T, g, \mathcal{F}) \longmapsto T
$$

is a functor. For a scheme $T$ over $S$ we denote $\operatorname{Coh}_{X / B, T}$ the fibre category of $p$ over $T$. These fibre categories are groupoids.
08W5 Lemma 81.5.2. In Situation 81.5 .1 the functor $p: \operatorname{Coh}_{X / B} \longrightarrow(S c h / S)_{f p p f}$ is fibred in groupoids.

Proof. We show that $p$ is fibred in groupoids by checking conditions (1) and (2) of Categories, Definition 4.34.1. Given an object $\left(T^{\prime}, g^{\prime}, \mathcal{F}^{\prime}\right)$ of $\operatorname{Coh}_{X / B}$ and a morphism $h: T \rightarrow T^{\prime}$ of schemes over $S$ we can set $g=h \circ g^{\prime}$ and $\mathcal{F}=\left(h^{\prime}\right)^{*} \mathcal{F}^{\prime}$ where $h^{\prime}: X_{T} \rightarrow X_{T^{\prime}}$ is the base change of $h$. Then it is clear that we obtain a morphism $(T, g, \mathcal{F}) \rightarrow\left(T^{\prime}, g^{\prime}, \mathcal{F}^{\prime}\right)$ of $C o h_{X / B}$ lying over $h$. This proves (1). For (2) suppose we are given morphisms

$$
\left(h_{1}, \varphi_{1}\right):\left(T_{1}, g_{1}, \mathcal{F}_{1}\right) \rightarrow(T, g, \mathcal{F}) \quad \text { and } \quad\left(h_{2}, \varphi_{2}\right):\left(T_{2}, g_{2}, \mathcal{F}_{2}\right) \rightarrow(T, g, \mathcal{F})
$$

of $C o h_{X / B}$ and a morphism $h: T_{1} \rightarrow T_{2}$ such that $h_{2} \circ h=h_{1}$. Then we can let $\varphi$ be the composition

$$
\left(h^{\prime}\right)^{*} \mathcal{F}_{2} \xrightarrow{\left(h^{\prime}\right)^{*} \varphi_{2}^{-1}}\left(h^{\prime}\right)^{*}\left(h_{2}\right)^{*} \mathcal{F}=\left(h_{1}\right)^{*} \mathcal{F} \xrightarrow{\varphi_{1}} \mathcal{F}_{1}
$$

to obtain the morphism $(h, \varphi):\left(T_{1}, g_{1}, \mathcal{F}_{1}\right) \rightarrow\left(T_{2}, g_{2}, \mathcal{F}_{2}\right)$ that witnesses the truth of condition (2).

08W6 Lemma 81.5.3. In Situation 81.5.1. Denote $\mathcal{X}=\operatorname{Coh}_{X / B}$. Then $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces.

Proof. Consider two objects $x=(T, g, \mathcal{F})$ and $y=(T, h, \mathcal{G})$ of $\mathcal{X}$ over a scheme $T$. We have to show that $\operatorname{Isom}_{\mathcal{X}}(x, y)$ is representable by an algebraic space over $T$, see Algebraic Stacks, Lemma 76.10.11. If for $a: T^{\prime} \rightarrow T$ the restrictions $\left.x\right|_{T^{\prime}}$ and $\left.y\right|_{T^{\prime}}$ are isomorphic in the fibre category $\mathcal{X}_{T^{\prime}}$, then $g \circ a=h \circ a$. Hence there is a transformation of presheaves

$$
\operatorname{Isom}_{\mathcal{X}}(x, y) \longrightarrow \operatorname{Equalizer}(g, h)
$$

Since the diagonal of $B$ is representable by schemes this equalizer is a scheme. Thus we may replace $T$ by this equalizer and the sheaves $\mathcal{F}$ and $\mathcal{G}$ by their pullbacks. Thus we may assume $g=h$. In this case we have $\operatorname{Isom}_{\mathcal{X}}(x, y)=\operatorname{Isom}(\mathcal{F}, \mathcal{G})$ and the result follows from Proposition 81.4.2,

08KC Lemma 81.5.4. In Situation 81.5 .1 the functor $p: \operatorname{Coh}_{X / B} \longrightarrow(S c h / S)_{f p p f}$ is a stack in groupoids.

Proof. To prove that $\operatorname{Coh}_{X / B}$ is a stack in groupoids, we have to show that the presheaves Isom are sheaves and that descent data are effective. The statement on Isom follows from Lemma 81.5.3, see Algebraic Stacks, Lemma 76.10.11, Let us prove the statement on descent data. Suppose that $\left\{a_{i}: T_{i} \rightarrow T\right\}$ is an fppf covering of schemes over $S$. Let $\left(\xi_{i}, \varphi_{i j}\right)$ be a descent datum for $\left\{T_{i} \rightarrow T\right\}$ with values in $C^{0} h_{X / B}$. For each $i$ we can write $\xi_{i}=\left(T_{i}, g_{i}, \mathcal{F}_{i}\right)$. Denote $\mathrm{pr}_{0}: T_{i} \times_{T} T_{j} \rightarrow T_{i}$ and $\mathrm{pr}_{1}: T_{i} \times_{T} T_{j} \rightarrow T_{j}$ the projections. The condition that $\left.\xi_{i}\right|_{T_{i} \times_{T} T_{j}}=\left.\xi_{j}\right|_{T_{i} \times{ }_{T} T_{j}}$ implies in particular that $g_{i} \circ \mathrm{pr}_{0}=g_{j} \circ \mathrm{pr}_{1}$. Thus there exists a unique morphism $g: T \rightarrow B$ such that $g_{i}=g \circ a_{i}$, see Descent on Spaces, Lemma 61.6.2 Denote $X_{T}=T \times_{g, B} X$. Set $X_{i}=X_{T_{i}}=T_{i} \times_{g_{i}, B} X=T_{i} \times_{a_{i}, T} X_{T}$ and

$$
X_{i j}=X_{T_{i}} \times_{X_{T}} X_{T_{j}}=X_{i} \times_{X_{T}} X_{j}
$$

with projections $\mathrm{pr}_{i}$ and $\mathrm{pr}_{j}$ to $X_{i}$ and $X_{j}$. Observe that the pullback of $\left(T_{i}, g_{i}, \mathcal{F}_{i}\right)$ by $\operatorname{pr}_{0}: T_{i} \times_{T} T_{j} \rightarrow T_{i}$ is given by $\left(T_{i} \times_{T} T_{j}, g_{i} \circ \operatorname{pr}_{0}, \operatorname{pr}_{i}^{*} \mathcal{F}_{i}\right)$. Hence a descent datum for $\left\{T_{i} \rightarrow T\right\}$ in $\operatorname{Coh}_{X / B}$ is given by the objects $\left(T_{i}, g \circ a_{i}, \mathcal{F}_{i}\right)$ and for each pair $i, j$ an isomorphism of $\mathcal{O}_{X_{i j}}$-modules

$$
\varphi_{i j}: \operatorname{pr}_{i}^{*} \mathcal{F}_{i} \longrightarrow \operatorname{pr}_{j}^{*} \mathcal{F}_{j}
$$

satisfying the cocycle condition over (the pullback of $X$ to) $T_{i} \times_{T} T_{j} \times_{T} T_{k}$. Ok, and now we simply use that $\left\{X_{i} \rightarrow X_{T}\right\}$ is an fppf covering so that we can view $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ as a descent datum for this covering. By Descent on Spaces, Proposition 61.4 .1 this descent datum is effective and we obtain a quasi-coherent sheaf $\mathcal{F}$ over $X_{T}$ restricting to $\mathcal{F}_{i}$ on $X_{i}$. By Morphisms of Spaces, Lemma 54.30.5 we see that $\mathcal{F}$ is flat over $T$ and Descent on Spaces, Lemma 61.5.2 guarantees that $\mathcal{Q}$ is of finite presentation as an $\mathcal{O}_{X_{T}}$-module. Finally, by Descent on Spaces, Lemma 61.10.17 we see that the scheme theoretic support of $\mathcal{F}$ is proper over $T$ as we've assume the scheme theoretic support of $\mathcal{F}_{i}$ is proper over $T_{i}$ (note that taking scheme theoretic support commutes with flat base change by Morphisms of Spaces, Lemma 54.29.10. In this way and we obtain our desired object over $T$.
08LP Remark 81.5.5. In Situation 81.5.1 the rule $(T, g, \mathcal{F}) \mapsto(T, g)$ defines a 1morphism

$$
\operatorname{Coh}_{X / B} \longrightarrow \mathcal{S}_{B}
$$

of categories fibred in groupoids (see Lemma 81.5.4. Algebraic Stacks, Section 76.7, and Examples of Stacks, Section 77.10 . Let $B^{\prime} \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $\mathcal{S}_{B^{\prime}} \rightarrow \mathcal{S}_{B}$ be the associated 1-morphism of stacks fibred in
sets. Set $X^{\prime}=X \times_{B} B^{\prime}$. We obtain a stack in groupoids $C o h_{X^{\prime} / B^{\prime}} \rightarrow(S c h / S)_{f p p f}$ associated to the base change $f^{\prime}: X^{\prime} \rightarrow B^{\prime}$. In this situation the diagram

is 2-fibre product square. This trivial remark will occasionally be useful to change the base algebraic space.

08KD Lemma 81.5.6. In Situation 81.5.1 assume that $B \rightarrow S$ is locally of finite presentation. Then $p: C o h_{X / B} \rightarrow(S c h / S)_{f p p f}$ is limit preserving (Artin's Axioms, Definition 80.13.1).

Proof. Write $B(T)$ for the discrete category whose objects are the $S$-morphisms $T \rightarrow B$. Let $T=\lim T_{i}$ be a filtered limit of affine schemes over $S$. Assigning to an object $(T, h, \mathcal{F})$ of $C o h_{X / B, T}$ the object $h$ of $B(T)$ gives us a commutative diagram of fibre categories

We have to show the top horizontal arrow is an equivalence. Since we have assume that $B$ is locally of finite presentation over $S$ we see from Limits of Spaces, Remark 57.3 .10 that the bottom horizontal arrow is an equivalence. This means that we may assume $T=\lim T_{i}$ be a filtered limit of affine schemes over $B$. Denote $g_{i}$ : $T_{i} \rightarrow B$ and $g: T \rightarrow B$ the corresponding morphisms. Set $X_{i}=T_{i} \times g_{i}, B X$ and $X_{T}=T \times_{g, B} X$. Observe that $X_{T}=\operatorname{colim} X_{i}$ and that the algebraic spaces $X_{i}$ and $X_{T}$ are quasi-separated and quasi-compact (as they are of finite presentation over the affines $T_{i}$ and $T$ ). By Limits of Spaces, Lemma 57.7.2 we see that

$$
\operatorname{colim} F P\left(X_{i}\right)=F P\left(X_{T}\right)
$$

where $F P(W)$ is short hand for the category of finitely presented $\mathcal{O}_{W}$-modules. The results of Limits of Spaces, Lemmas 57.6 .11 and 57.12 .3 tell us the same thing is true if we replace $F P\left(X_{i}\right)$ and $F P\left(X_{T}\right)$ by the full subcategory of objects flat over $T_{i}$ and $T$ with scheme theoretic support proper over $T_{i}$ and $T$. This proves the lemma.

08LQ Lemma 81.5.7. In Situation 81.5.1. Let

be a pushout in the category of schemes over $S$ where $Z \rightarrow Z^{\prime}$ is a thickening and $Z \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.3. Then the functor on fibre categories

$$
\operatorname{Coh}_{X / B, Y^{\prime}} \longrightarrow \operatorname{Coh}_{X / B, Y} \times_{\operatorname{Coh}_{X / B, Z}} \operatorname{Coh}_{X / B, Z^{\prime}}
$$

is an equivalence.

Proof. Observe that the corresponding map

$$
B\left(Y^{\prime}\right) \longrightarrow B(Y) \times_{B(Z)} B\left(Z^{\prime}\right)
$$

is a bijection, see Pushouts of Spaces, Lemma 64.2.2. Thus using the commutative diagram

we see that we may assume that $Y^{\prime}$ is a scheme over $B^{\prime}$. By Remark 81.5.5 we may replace $B$ by $Y^{\prime}$ and $X$ by $X \times_{B} Y^{\prime}$. Thus we may assume $B=Y^{\prime}$. In this case the statement follows from Pushouts of Spaces, Lemma 64.2.7.

08W7 Lemma 81.5.8. Let

be a cartesian square of algebraic spaces where $T \rightarrow T^{\prime}$ is a first order thickening. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}_{X^{\prime}}$-module flat over $T^{\prime}$. Set $\mathcal{F}=i^{*} \mathcal{F}^{\prime}$. The following are equivalent
(1) $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X^{\prime}}$-module of finite presentation,
(2) $\mathcal{F}$ is an $\mathcal{O}_{X^{\prime}}$-module of finite presentation,
(3) $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation,
(4) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation,

Proof. Recall that a finitely presented module is quasi-coherent hence the equivalence of (1) and (2) and (3) and (4). The equivalence of (2) and (4) is a special case of Deformation Theory, Lemma 74.10.3.

08W8 Lemma 81.5.9. In Situation 81.5.1 assume that $S$ is a locally Noetherian scheme and $B \rightarrow S$ is locally of finite presentation. Let $k$ be a finite type field over $S$ and let $x_{0}=\left(\operatorname{Spec}(k), g_{0}, \mathcal{G}_{0}\right)$ be an object of $\mathcal{X}=\operatorname{Coh}_{X / B}$ over $k$. Then the spaces $T \mathcal{F}_{\mathcal{X}, k, x_{0}}$ and Inf $_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)$ (Artin's Axioms, Section 80.8) are finite dimensional.

Proof. Observe that by Lemma 81.5 .7 our stack in groupoids $\mathcal{X}$ satisfies property (RS*) defined in Artin's Axioms, Section 80.18. In particular $\mathcal{X}$ satisfies (RS). Hence all associated predeformation categories are deformation categories (Artin's Axioms, Lemma 80.6.1 and the statement makes sense.
In this paragraph we show that we can reduce to the case $B=\operatorname{Spec}(k)$. Set $X_{0}=\operatorname{Spec}(k) \times_{g_{0}, B} X$ and denote $\mathcal{X}_{0}=\operatorname{Coh}_{X_{0} / k}$. In Remark 81.5.5 we have seen that $\mathcal{X}_{0}$ is the 2 -fibre product of $\mathcal{X}$ with $\operatorname{Spec}(k)$ over $B$ as categories fibred in groupoids over $(S c h / S)_{f p p f}$. Thus by Artin's Axioms, Lemma 80.8.2 we reduce to proving that $B, \operatorname{Spec}(k)$, and $\mathcal{X}_{0}$ have finite dimensional tangent spaces and infinitesimal automorphism spaces. The tangent space of $B$ and $\operatorname{Spec}(k)$ are finite dimensional by Artin's Axioms, Lemma 80.8.1 and of course these have vanishing Inf. Thus it suffices to deal with $\mathcal{X}_{0}$.
Let $k[\epsilon]$ be the dual numbers over $k$. Let $\operatorname{Spec}(k[\epsilon]) \rightarrow B$ be the composition of $g_{0}$ : $\operatorname{Spec}(k) \rightarrow B$ and the morphism $\operatorname{Spec}(k[\epsilon]) \rightarrow \operatorname{Spec}(k)$ coming from the inclusion
$k \rightarrow k[\epsilon]$. Set $X_{0}=\operatorname{Spec}(k) \times_{B} X$ and $X_{\epsilon}=\operatorname{Spec}(k[\epsilon]) \times_{B} X$. Observe that $X_{\epsilon}$ is a first order thickening of $X_{0}$ flat over the first order thickening $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k[\epsilon])$. Unwinding the definitions and using Lemma 81.5.8 we see that $T \mathcal{F}_{\mathcal{X}_{0}, k, x_{0}}$ is the set of lifts of $\mathcal{G}_{0}$ to a flat module on $X_{\epsilon}$. By Deformation Theory, Lemma 74.11.1 we conclude that

$$
T \mathcal{F}_{\mathcal{X}_{0}, k, x_{0}}=\operatorname{Ext}_{\mathcal{O}_{X_{0}}}^{1}\left(\mathcal{G}_{0}, \mathcal{G}_{0}\right)
$$

Here we have used the identification $\epsilon k[\epsilon] \cong k$ of $k[\epsilon]$-modules. Using Deformation Theory, Lemma 74.11.1 once more we see that

$$
\operatorname{Inf}_{x_{0}}\left(\mathcal{F}_{\mathcal{X}, k, x_{0}}\right)=\operatorname{Ext}_{\mathcal{O}_{X_{0}}}^{0}\left(\mathcal{G}_{0}, \mathcal{G}_{0}\right)
$$

These spaces are finite dimensional over $k$ as $\mathcal{G}_{0}$ has support proper over $\operatorname{Spec}(k)$. Namely, $X_{0}$ is of finite presentation over $\operatorname{Spec}(k)$, hence Noetherian. Since $\mathcal{G}_{0}$ is of finite presentation it is a coherent $\mathcal{O}_{X_{0}}$-module. Thus we may apply Derived Categories of Spaces, Lemma 62.19.3 to conclude the desired finiteness.
08W9 Lemma 81.5.10. In Situation 81.5.1 assume that $S$ is a locally Noetherian scheme and that $f: X \rightarrow B$ is separated. Let $\mathcal{X}=\operatorname{Coh}_{X / B}$. Then the functor Artin's Axioms, Equation 80.9.2.1) is an equivalence.
Proof. Let $A$ be an $S$-algebra which is a complete local Noetherian ring with maximal ideal $\mathfrak{m}$ whose residue field $k$ is of finite type over $S$. We have to show that the category of objects over $A$ is equivalent to the category of formal objects over $A$. Since we know this holds for the category $\mathcal{S}_{B}$ fibred in sets associated to $B$ by Artin's Axioms, Lemma 80.9.4, it suffices to prove this for those objects lying over a given morphism $\operatorname{Spec}(A) \rightarrow B$.
Set $X_{A}=\operatorname{Spec}(A) \times{ }_{B} X$ and $X_{n}=\operatorname{Spec}\left(A / \mathfrak{m}^{n}\right) \times{ }_{B} X$. By Grothendieck's existence theorem (More on Morphisms of Spaces, Theorem63.32.11) we see that the category of coherent modules $\mathcal{F}$ on $X_{A}$ with support proper over $\operatorname{Spec}(A)$ is equivalent to the category of systems $\left(\mathcal{F}_{n}\right)$ of coherent modules $\mathcal{F}_{n}$ on $X_{n}$ with support proper over $\operatorname{Spec}\left(A / \mathfrak{m}^{n}\right)$. The equivalence sends $\mathcal{F}$ to the $\operatorname{system}\left(\mathcal{F} \otimes_{A} A / \mathfrak{m}^{n}\right)$. See discussion in More on Morphisms of Spaces, Remark 63.32.12. To finish the proof of the lemma, it suffices to show that $\mathcal{F}$ is flat over $A$ if and only if all $\mathcal{F} \otimes_{A} A / \mathfrak{m}^{n}$ are flat over $A / \mathfrak{m}^{n}$. This follows from More on Morphisms of Spaces, Lemma 63.21.3
08WA Lemma 81.5.11. In Situation 81.5.1 assume that $S$ is a locally Noetherian scheme, $S=B$, and $f: X \rightarrow \bar{B}$ is flat. Let $\mathcal{X}=\operatorname{Coh}_{X / B}$. Then we have openness of versality for $\mathcal{X}$ (see Artin's Axioms, Definition 80.14.1).
Proof. Let $U \rightarrow S$ be of finite type morphism of schemes, $x$ an object of $\mathcal{X}$ over $U$ and $u_{0} \in U$ a finite type point such that $x$ is versal at $u_{0}$. After shrinking $U$ we may assume that $u_{0}$ is a closed point (Morphisms, Lemma 28.16.1) and $U=\operatorname{Spec}(A)$ with $U \rightarrow S$ mapping into an affine open $\operatorname{Spec}(\Lambda)$ of $S$. We will use Artin's Axioms, Lemma 80.21 .4 to prove the lemma. Let $\mathcal{F}$ be the coherent module on $X_{A}=\operatorname{Spec}(A) \times_{S} X$ flat over $A$ corresponding to the given object $x$.
According to Deformation Theory, Lemma 74.11.1 we have an isomorphism of functors

$$
T_{x}(M)=\operatorname{Ext}_{X_{A}}^{1}\left(\mathcal{F}, \mathcal{F} \otimes_{A} M\right)
$$

and given any surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras with square zero kernel $I$ we have an obstruction class

$$
\xi_{A^{\prime}} \in \operatorname{Ext}_{X_{A}}^{2}\left(\mathcal{F}, \mathcal{F} \otimes_{A} I\right)
$$

This uses that for any $A^{\prime} \rightarrow A$ as above the base change $X_{A^{\prime}}=\operatorname{Spec}\left(A^{\prime}\right) \times_{B} X$ is flat over $A^{\prime}$. Apply Derived Categories of Spaces, Lemma 62.19 .3 to the computation of the Ext groups $\operatorname{Ext}_{X_{A}}^{i}\left(\mathcal{F}, \mathcal{F} \otimes_{A} M\right)$ for $i \leq m$ with $m=2$. We find a perfect object $K \in D(A)$ and functorial isomorphisms

$$
H^{i}\left(K \otimes_{A}^{\mathbf{L}} M\right) \longrightarrow \operatorname{Ext}_{X_{A}}^{i}\left(\mathcal{F}, \mathcal{F} \otimes_{A} M\right)
$$

for $i \leq m$ compatible with boundary maps. This object $K$, together with the displayed identifications above gives us a datum as in Artin's Axioms, Situation 80.21 .2 Finally, condition (iv) of Artin's Axioms, Lemma 80.21 .3 holds by Deformation Theory, Lemma 74.11.3. Thus Artin's Axioms, Lemma 80.21.4 does indeed apply and the lemma is proved.

08WC Theorem 81.5.12 (Algebraicity of stack coherent sheaves). Let $S$ be a scheme. Let $f: X \rightarrow B$ be morphism of algebraic spaces over $S$. Assume that $f$ is of finite presentation, separated, and flat ${ }^{2}$. Then $C o h_{X / B}$ is an algebraic stack over $S$.

Proof. Set $\mathcal{X}=\operatorname{Coh}_{X / B}$. We have seen that $\mathcal{X}$ is a stack in groupoids over $(S c h / S)_{\text {fppf }}$ with diagonal representable by algebraic spaces (Lemmas 81.5.4 and 81.5.3). Hence it suffices to find a scheme $W$ and a surjective and smooth morphism $W \rightarrow \mathcal{X}$.

Let $B^{\prime}$ be a scheme and let $B^{\prime} \rightarrow B$ be a surjective étale morphism. Set $X^{\prime}=$ $B^{\prime} \times_{B} X$ and denote $f^{\prime}: X^{\prime} \rightarrow B^{\prime}$ the projection. Then $\mathcal{X}^{\prime}=C o h_{X^{\prime} / B^{\prime}}$ is equal to the 2 -fibre product of $\mathcal{X}$ with the category fibred in sets associated to $B^{\prime}$ over the category fibred in sets associated to $B$ (Remark 81.5.5). By the material in Algebraic Stacks, Section 76.10 the morphism $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is surjective and étale. Hence it suffices to prove the result for $\mathcal{X}^{\prime}$. In other words, we may assume $B$ is a scheme.

Assume $B$ is a scheme. In this case we may replace $S$ by $B$, see Algebraic Stacks, Section 76.19. Thus we may assume $S=B$.

Assume $S=B$. Choose an affine open covering $S=\bigcup U_{i}$. Denote $\mathcal{X}_{i}$ the restriction of $\mathcal{X}$ to $\left(S c h / U_{i}\right)_{f p p f}$. If we can find schemes $W_{i}$ over $U_{i}$ and surjective smooth morphisms $W_{i} \rightarrow \mathcal{X}_{i}$, then we set $W=\coprod W_{i}$ and we obtain a surjective smooth morphism $W \rightarrow \mathcal{X}$. Thus we may assume $S=B$ is affine.

Assume $S=B$ is affine, say $S=\operatorname{Spec}(\Lambda)$. Write $\Lambda=\operatorname{colim} \Lambda_{i}$ as a filtered colimit with each $\Lambda_{i}$ of finite type over $\mathbf{Z}$. For some $i$ we can find a morphism of algebraic spaces $X_{i} \rightarrow \operatorname{Spec}\left(\Lambda_{i}\right)$ which is of finite presentation and flat and whose base change to $\Lambda$ is $X$. See Limits of Spaces, Lemmas 57.7.1 and 57.6.11. If we show that $\operatorname{Coh}_{X_{i} / \operatorname{Spec}\left(\Lambda_{i}\right)}$ is an algebraic stack, then it follows by base change (Remark 81.5 .5 and Algebraic Stacks, Section 76.19 that $\mathcal{X}$ is an algebraic stack. Thus we may assume that $\Lambda$ is a finite type $\mathbf{Z}$-algebra.
Assume $S=B=\operatorname{Spec}(\Lambda)$ is affine of finite type over Z. In this case we will verify conditions (1), (2), (3), and (4) of Artin's Axioms, Lemma 80.17.1 to conclude that $\mathcal{X}$ is an algebraic stack. Note that $\Lambda$ is a G-ring, see More on Algebra, Proposition 15.41.12. Hence all local rings of $S$ are G-rings. Thus (4) holds. By Lemma 81.5.11 we have that $\mathcal{X}$ satisfies openness of versality, hence (3) holds. To check (2) we have to verify axioms [-1], [0], [1], [2], [3], and [4] of Artin's Axioms, Section 80.12. We

[^214]omit the verification of [-1] and axioms [0], [1], [2], [3], [4] correspond respectively to Lemmas 81.5.4 81.5.6 81.5.7, 81.5.9, and 81.5.10. Finally, condition (1) is Lemma 81.5.3. This finishes the proof of the theorem.

### 81.6. The stack of coherent sheaves in the non-flat case

08WB In Theorem 81.5.12 the assumption that $f: X \rightarrow B$ is flat is not necessary. In this section we explain where this assumption is used in the proof and one way to get around it.
For a different approach to this problem the reader may wish to consult Art69b and follow the method discussed in the papers OS03, Lie06b, Ols05, HR13, HR10, Ryd11. Some of these papers deal with the more general case of the stack of coherent sheaves on an algebraic stack over an algebraic stack and others deal with similar problems in the case of Hilbert stacks or Quot functors. Our strategy will be to show algebraicity of some cases of Hilbert stacks and Quot functors as a consequence of the algebraicity of the stack of coherent sheaves.
The only step in the proof of Theorem 81.5 .12 which uses flatness is in the application of Lemma 81.5.11. The lemma is used to construct an obstruction theory as in Artin's Axioms, Section 80.21. The proof of the lemma relies on Deformation Theory, Lemmas 74.11.1 and 74.11.3 from Deformation Theory, Section 74.11, This is how the assumption that $f$ is flat comes about. Before we go on, note that results (2) and (3) of Deformation Theory, Lemmas 74.11 .1 do hold without the assumption that $f$ is flat as they rely on Deformation Theory, Lemmas 74.10.7. and 74.10 .4 which do not have any flatness assumptions.
Before we give the details we give some motivation for the construction from derived algebraic geometry, since we think it will clarify what follows. Let $A$ be a finite type algebra over the locally Noetherian base $S$. Denote $X \otimes^{\mathbf{L}} A$ a "derived base change" of $X$ to $A$ and denote $i: X_{A} \rightarrow X \otimes^{\mathbf{L}} A$ the canonical inclusion morphism. The object $X \otimes^{\mathbf{L}} A$ does not (yet) have a definition in the Stacks project; we may think of it as the algebraic space $X_{A}$ endowed with a simplicial sheaf of rings $\mathcal{O}_{X \otimes{ }^{\mathrm{L}} A}$ whose homology sheaves are

$$
H_{i}\left(\mathcal{O}_{X \otimes \otimes_{A}}\right)=\operatorname{Tor}_{i}^{\mathcal{O}_{S}}\left(\mathcal{O}_{X}, A\right)
$$

The morphism $X \otimes^{\mathbf{L}} A \rightarrow \operatorname{Spec}(A)$ is flat (the terms of the simplicial sheaf of rings being $A$-flat), so the usual material for deformations of flat modules applies to it. Thus we see that we get an obstruction theory using the groups

$$
\operatorname{Ext}_{X \otimes \otimes_{A}}^{i}\left(i_{*} \mathcal{F}, i_{*} \mathcal{F} \otimes_{A} M\right)
$$

where $i=0,1,2$ for inf auts, inf defs, obstructions. Note that a flat deformation of $i_{*} \mathcal{F}$ to $X \otimes^{\mathbf{L}} A^{\prime}$ is automatically of the form $i_{*}^{\prime} \mathcal{F}^{\prime}$ where $\mathcal{F}^{\prime}$ is a flat deformation of $\mathcal{F}$. By adjunction of the functors $L i^{*}$ and $i_{*}=R i_{*}$ these ext groups are equal to

$$
\operatorname{Ext}_{X_{A}}^{i}\left(L i^{*}\left(i_{*} \mathcal{F}\right), \mathcal{F} \otimes_{A} M\right)
$$

Thus we obtain obstruction groups of exactly the same form as in the proof of Lemma 81.5.11 with the only change being that one replaces the first occurrence of $\mathcal{F}$ by the complex $L i^{*}\left(i_{*} \mathcal{F}\right)$.
Below we prove the non-flat version of the lemma by a "direct" construction of $E(\mathcal{F})=L i^{*}\left(i_{*} \mathcal{F}\right)$ and direct proof of its relationship to the deformation theory of $\mathcal{F}$. In fact, it suffices to construct $\tau_{\geq-2} E(\mathcal{F})$, as we are only interested in the
ext groups $\operatorname{Ext}_{X_{A}}^{i}\left(L i^{*}\left(i_{*} \mathcal{F}\right), \mathcal{F} \otimes_{A} M\right)$ for $i=0,1,2$. We can even identify the cohomology sheaves

$$
H^{i}(E(\mathcal{F}))=\left\{\begin{array}{cc}
0 & \text { if } i>0 \\
\mathcal{F} & \text { if } i=0 \\
0 & \text { if } i=-1 \\
\operatorname{Tor}_{1}^{\mathcal{O}_{S}}\left(\mathcal{O}_{X}, A\right) \otimes_{\mathcal{O}_{X}} \mathcal{F} & \text { if } i=-2
\end{array}\right.
$$

This observation will guide our construction of $E(\mathcal{F})$ in the remarks below.
09DN Remark 81.6.1 (Direct construction). Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $U$ be another algebraic space over $B$. Denote $q: X \times_{B} U \rightarrow U$ the second projection. Consider the distinguished triangle

$$
L q^{*} L_{U / B} \rightarrow L_{X \times_{B} U / B} \rightarrow E \rightarrow L q^{*} L_{U / B}[1]
$$

of Cotangent, Section 75.27 . For any sheaf $\mathcal{F}$ of $\mathcal{O}_{X \times{ }_{B} U}$-modules we have the Atiyah class

$$
\mathcal{F} \rightarrow L_{X \times_{B} U / B} \otimes_{\mathcal{O}_{X \times_{B} U}}^{\mathbf{L}} \mathcal{F}[1]
$$

see Cotangent, Section 75.18 . We can compose this with the map to $E$ and choose a distinguished triangle

$$
E(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X \times{ }_{B} U}}^{\mathbf{L}} E[1] \rightarrow E(\mathcal{F})[1]
$$

in $D\left(\mathcal{O}_{X \times_{B} U}\right)$. By construction the Atiyah class lifts to a map

$$
e_{\mathcal{F}}: E(\mathcal{F}) \longrightarrow L q^{*} L_{U / B} \otimes_{\mathcal{O}_{X \times{ }_{B} U}}^{\mathbf{L}} \mathcal{F}[1]
$$

fitting into a morphism of distinguished triangles

Given $S, B, X, f, U, \mathcal{F}$ we fix a choice of $E(\mathcal{F})$ and $e_{\mathcal{F}}$.
09DP Remark 81.6.2 (Construction of obstruction class). With notation as in Remark 81.6.1 let $i: U \rightarrow U^{\prime}$ be a first order thickening of $U$ over $B$. Let $\mathcal{I} \subset \mathcal{O}_{U^{\prime}}$ be the quasi-coherent sheaf of ideals cutting out $B$ in $B^{\prime}$. The fundamental triangle

$$
L i^{*} L_{U^{\prime} / B} \rightarrow L_{U / B} \rightarrow L_{U / U^{\prime}} \rightarrow L i^{*} L_{U^{\prime} / B}[1]
$$

together with the map $L_{U / U^{\prime}} \rightarrow \mathcal{I}[1]$ determine a map $e_{U^{\prime}}: L_{U / B} \rightarrow \mathcal{I}[1]$. Combined with the map $e_{\mathcal{F}}$ of the previous remark we obtain

$$
\left(\operatorname{id}_{\mathcal{F}} \otimes L q^{*} e_{U^{\prime}}\right) \cup e_{\mathcal{F}}: E(\mathcal{F}) \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X \times{ }_{B} U}} q^{*} \mathcal{I}[2]
$$

(we have also composed with the map from the derived tensor product to the usual tensor product). In other words, we obtain an element

$$
\xi_{U^{\prime}} \in \operatorname{Ext}_{\mathcal{O}_{X \times B_{B} U}}^{2}\left(E(\mathcal{F}), \mathcal{F} \otimes_{\mathcal{O}_{X \times{ }_{B} U}} q^{*} \mathcal{I}\right)
$$

09DQ Lemma 81.6.3. In the situation of Remark 81.6.2 assume that $\mathcal{F}$ is flat over $U$. Then the vanishing of the class $\xi_{U^{\prime}}$ is a necessary and sufficient condition for the existence of a $\mathcal{O}_{X \times{ }_{B} U^{\prime}-m o d u l e} \mathcal{F}^{\prime}$ flat over $U^{\prime}$ with $i^{*} \mathcal{F}^{\prime} \cong \mathcal{F}$.

Proof (sketch). We will use the criterion of Deformation Theory, Lemma 74.10.8. We will abbreviate $\mathcal{O}=\mathcal{O}_{X \times_{B} U}$ and $\mathcal{O}^{\prime}=\mathcal{O}_{X \times_{B} U^{\prime}}$. Consider the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{U^{\prime}} \rightarrow \mathcal{O}_{U} \rightarrow 0
$$

Let $\mathcal{J} \subset \mathcal{O}^{\prime}$ be the quasi-coherent sheaf of ideals cutting out $X \times_{B} U$. By the above we obtain an exact sequence

$$
\operatorname{Tor}_{1}^{\mathcal{O}_{B}}\left(\mathcal{O}_{X}, \mathcal{O}_{U}\right) \rightarrow q^{*} \mathcal{I} \rightarrow \mathcal{J} \rightarrow 0
$$

where the $\operatorname{Tor}_{1}^{\mathcal{O}_{B}}\left(\mathcal{O}_{X}, \mathcal{O}_{U}\right)$ is an abbreviation for

$$
\operatorname{Tor}_{1}^{h^{-1}} \mathcal{O}_{B}\left(p^{-1} \mathcal{O}_{X}, q^{-1} \mathcal{O}_{U}\right) \otimes_{\left(p^{-1} \mathcal{O}_{X} \otimes_{h-1} \mathcal{O}_{B} q^{-1} \mathcal{O}_{U}\right)} \mathcal{O}
$$

Tensoring with $\mathcal{F}$ we obtain the exact sequence

$$
\mathcal{F} \otimes_{\mathcal{O}} \operatorname{Tor}_{1}^{\mathcal{O}_{B}}\left(\mathcal{O}_{X}, \mathcal{O}_{U}\right) \rightarrow \mathcal{F} \otimes_{\mathcal{O}} q^{*} \mathcal{I} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{J} \rightarrow 0
$$

(Note that the roles of the letters $\mathcal{I}$ and $\mathcal{J}$ are reversed relative to the notation in Deformation Theory, Lemma 74.10.8.) Condition (1) of the lemma is that the last map above is an isomorphism, i.e., that the first map is zero. The vanishing of this map may be checked on stalks at geometric points $\bar{z}=(\bar{x}, \bar{u}): \operatorname{Spec}(k) \rightarrow X \times_{B} U$. Set $R=\mathcal{O}_{B, \bar{b}}, A=\mathcal{O}_{X, \bar{x}}, B=\mathcal{O}_{U, \bar{u}}$, and $C=\mathcal{O}_{\bar{z}}$. By Cotangent, Lemma 75.27.2 and the defining triangle for $E(\mathcal{F})$ we see that

$$
H^{-2}(E(\mathcal{F}))_{\bar{z}}=\mathcal{F}_{\bar{z}} \otimes \operatorname{Tor}_{1}^{R}(A, B)
$$

The map $\xi_{U^{\prime}}$ therefore induces a map

$$
\mathcal{F}_{\bar{z}} \otimes \operatorname{Tor}_{1}^{R}(A, B) \longrightarrow \mathcal{F}_{\bar{z}} \otimes_{B} \mathcal{I}_{\bar{u}}
$$

We claim this map is the same as the stalk of the map described above (proof omitted; this is a purely ring theoretic statement). Thus we see that condition (1) of Deformation Theory, Lemma 74.10 .8 is equivalent to the vanishing $H^{-2}\left(\xi_{U^{\prime}}\right)$ : $H^{-2}(E(\mathcal{F})) \rightarrow \mathcal{F} \otimes \mathcal{I}$.

To finish the proof we show that, assuming that condition (1) is satisfied, condition (2) is equivalent to the vanising of $\xi_{U^{\prime}}$. In the rest of the proof we write $\mathcal{F} \otimes \mathcal{I}$ to denote $\mathcal{F} \otimes_{\mathcal{O}} q^{*} \mathcal{I}=\mathcal{F} \otimes_{\mathcal{O}} \mathcal{J}$. A consideration of the spectral sequence

$$
\operatorname{Ext}^{i}\left(H^{-j}(E(\mathcal{F})), \mathcal{F} \otimes \mathcal{I}\right) \Rightarrow \operatorname{Ext}^{i+j}(E(\mathcal{F}), \mathcal{F} \otimes \mathcal{I})
$$

using that $H^{0}(E(\mathcal{F}))=\mathcal{F}$ and $H^{-1}(E(\mathcal{F}))=0$ shows that there is an exact sequence

$$
0 \rightarrow \operatorname{Ext}^{2}(\mathcal{F}, \mathcal{F} \otimes \mathcal{I}) \rightarrow \operatorname{Ext}^{2}(E(\mathcal{F}), \mathcal{F} \otimes \mathcal{I}) \rightarrow \operatorname{Hom}\left(H^{-2}(E(\mathcal{F})), \mathcal{F} \otimes \mathcal{I}\right)
$$

Thus our element $\xi_{U^{\prime}}$ is an element of $\operatorname{Ext}^{2}(\mathcal{F}, \mathcal{F} \otimes \mathcal{I})$. The proof is finished by showing this element agrees with the element of Deformation Theory, Lemma 74.10 .8 a verification we omit.

09DR Lemma 81.6.4. In Situation 81.5.1 assume that $S$ is a locally Noetherian scheme and $S=B$. Let $\mathcal{X}=\operatorname{Coh}_{X / B}$. Then we have openness of versality for $\mathcal{X}$ (see Artin's Axioms, Definition 80.14.1.

Proof (sketch). Let $U \rightarrow S$ be of finite type morphism of schemes, $x$ an object of $\mathcal{X}$ over $U$ and $u_{0} \in U$ a finite type point such that $x$ is versal at $u_{0}$. After shrinking $U$ we may assume that $u_{0}$ is a closed point (Morphisms, Lemma 28.16.1) and $U=\operatorname{Spec}(A)$ with $U \rightarrow S$ mapping into an affine open $\operatorname{Spec}(\Lambda)$ of $S$. We will use Artin's Axioms, Lemma 80.21 .4 to prove the lemma. Let $\mathcal{F}$ be the coherent module on $X_{A}=\operatorname{Spec}(A) \times_{S} X$ flat over $A$ corresponding to the given object $x$.
Choose $E(\mathcal{F})$ and $e_{\mathcal{F}}$ as in Remark 81.6.1. The description of the cohomology sheaves of $E(\mathcal{F})$ shows that

$$
\operatorname{Ext}^{1}\left(E(\mathcal{F}), \mathcal{F} \otimes_{A} M\right)=\operatorname{Ext}^{1}\left(\mathcal{F}, \mathcal{F} \otimes_{A} M\right)
$$

for any $A$-module $M$. Using this and using Deformation Theory, Lemma 74.10.7 we have an isomorphism of functors

$$
T_{x}(M)=\operatorname{Ext}_{X_{A}}^{1}\left(E(\mathcal{F}), \mathcal{F} \otimes_{A} M\right)
$$

By Lemma 81.6 .3 given any surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras with square zero kernel $I$ we have an obstruction class

$$
\xi_{A^{\prime}} \in \operatorname{Ext}_{X_{A}}^{2}\left(E(\mathcal{F}), \mathcal{F} \otimes_{A} I\right)
$$

Apply Derived Categories of Spaces, Lemma 62.19.3 to the computation of the Ext groups $\operatorname{Ext}_{X_{A}}^{i}\left(E(\mathcal{F}), \mathcal{F} \otimes_{A} M\right)$ for $i \leq m$ with $m=2$. We omit the verification that $E(\mathcal{F})$ is in $D_{\text {Coh }}^{-}$; hint: use Cotangent, Lemma 75.5.4. We find a perfect object $K \in D(A)$ and functorial isomorphisms

$$
H^{i}\left(K \otimes_{A}^{\mathbf{L}} M\right) \longrightarrow \operatorname{Ext}_{X_{A}}^{i}\left(E(\mathcal{F}), \mathcal{F} \otimes_{A} M\right)
$$

for $i \leq m$ compatible with boundary maps. This object $K$, together with the displayed identifications above gives us a datum as in Artin's Axioms, Situation 80.21.2 Finally, condition (iv) of Artin's Axioms, Lemma 80.21 .3 holds by a variant of Deformation Theory, Lemma 74.11 .3 whose formulation and proof we omit. Thus Artin's Axioms, Lemma 80.21.4 applies and the lemma is proved.

09DS Theorem 81.6.5 (Algebraicity of stack coherent sheaves; general case). Let $S$ be a scheme. Let $f: X \rightarrow B$ be morphism of algebraic spaces over $S$. Assume that $f$ is of finite presentation and separated. Then $\operatorname{Coh}_{X / B}$ is an algebraic stack over $S$.

Proof. Identical to the proof of Theorem 81.5 .12 except that we substitute Lemma 81.6 .4 for Lemma 81.5.11.

### 81.7. Flattening functors

083 E This section is the analogue of More on Flatness, Section 37.20. We urge the reader to skip this section on a first reading.

083 F Situation 81.7.1. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $u: \mathcal{F} \rightarrow \mathcal{G}$ be a homomorphism of quasi-coherent $\mathcal{O}_{X}$-modules. For any scheme $T$ over $B$ we will denote $u_{T}: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ the base change of $u$ to $T$, in other words, $u_{T}$ is the pullback of $u$ via the projection morphism $X_{T}=X \times_{B} T \rightarrow$ $X$. In this situation we can consider the functor

083G
(81.7.1.1) $\quad F_{i s o}:(S c h / B)^{o p p} \longrightarrow$ Sets, $\quad T \longrightarrow\left\{\begin{array}{cc}\{*\} & \text { if } u_{T} \text { is an isomorphism, } \\ \emptyset & \text { else. }\end{array}\right.$

There are variants $F_{\text {inj }}, F_{\text {surj }}, F_{\text {zero }}$ where we ask that $u_{T}$ is injective, surjective, or zero.

In Situation 81.7 .1 we sometimes think of the functors $F_{i s o}, F_{\text {inj }}, F_{\text {surj }}$, and $F_{\text {zero }}$ as functors $(S c h / S)^{o p p} \rightarrow$ Sets endowed with a morphism $F_{i s o} \rightarrow B, F_{i n j} \rightarrow B$, $F_{\text {surj }} \rightarrow B$, and $F_{\text {zero }} \rightarrow B$. Namely, if $T$ is a scheme over $S$, then an element $h \in F_{\text {iso }}(T)$ is just a morphism $h: T \rightarrow B$, i.e., an element $h \in B(T)$, such that the base change of $u$ via $h$ is an isomorphism. In particular, when we say that $F_{\text {iso }}$ is an algebraic space, we mean that the corresponding functor $(S c h / S)^{\text {opp }} \rightarrow$ Sets is an algebraic space.

083H Lemma 81.7.2. In Situation 81.7.1. Each of the functors $F_{\text {iso }}, F_{\text {inj }}, F_{\text {surj }}, F_{\text {zero }}$ satisfies the sheaf property for the fpqc topology.

Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $B$. Set $X_{i}=X_{T_{i}}=$ $X \times_{S} T_{i}$ and $u_{i}=u_{T_{i}}$. Note that $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$, see Topologies on Spaces, Lemma 60.3.2. In particular, for every $x \in\left|X_{T}\right|$ there exists an $i \in I$ and an $x_{i} \in\left|X_{i}\right|$ mapping to $x$. Since $\mathcal{O}_{X_{T}, \bar{x}} \rightarrow \mathcal{O}_{X_{i}, \overline{x_{i}}}$ is flat, hence faithfully flat (see Morphisms of Spaces, Section 54.29). we conclude that $\left(u_{i}\right)_{x_{i}}$ is injective, surjective, bijective, or zero if and only if $\left(u_{T}\right)_{x}$ is injective, surjective, bijective, or zero. The lemma follows.

083I Lemma 81.7.3. In Situation 81.7.1 let $X^{\prime} \rightarrow X$ be a flat morphism of algebraic spaces. Denote $u^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ the pullback of $u$ to $X^{\prime}$. Denote $F_{i s o}^{\prime}, F_{i n j}^{\prime}, F_{\text {surj }}^{\prime}$, $F_{z e r o}^{\prime}$ the functors on $S c h / B$ associated to $u^{\prime}$.
(1) If $\mathcal{G}$ is of finite type and the image of $\left|X^{\prime}\right| \rightarrow|X|$ contains the support of $\mathcal{G}$, then $F_{\text {surj }}=F_{\text {surj }}^{\prime}$ and $F_{\text {zero }}=F_{\text {zero }}^{\prime}$.
(2) If $\mathcal{F}$ is of finite type and the image of $\left|X^{\prime}\right| \rightarrow|X|$ contains the support of $\mathcal{F}$, then $F_{i n j}=F_{\text {inj }}^{\prime}$ and $F_{z e r o}=F_{z e r o}^{\prime}$.
(3) If $\mathcal{F}$ and $\mathcal{G}$ are of finite type and the image of $\left|X^{\prime}\right| \rightarrow|X|$ contains the supports of $\mathcal{F}$ and $\mathcal{G}$, then $F_{\text {iso }}=F_{\text {iso }}^{\prime}$.

Proof. let $v: \mathcal{H} \rightarrow \mathcal{E}$ be a map of quasi-coherent modules on an algebraic space $Y$ and let $\varphi: Y^{\prime} \rightarrow Y$ be a surjective flat morphism of algebraic spaces, then $v$ is an isomorphism, injective, surjective, or zero if and only if $\varphi^{*} v$ is an isomorphism, injective, surjective, or zero. Namely, for every $y \in|Y|$ there exists a $y^{\prime} \in\left|Y^{\prime}\right|$ and the map of local rings $\mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{Y^{\prime}, \overline{y^{\prime}}}$ is faithfully flat (see Morphisms of Spaces, Section 54.29). Of course, to check for injectivity or being zero it suffices to look at the points in the support of $\mathcal{H}$, and to check for surjectivity it suffices to look at points in the support of $\mathcal{E}$. Moreover, under the finite type assumptions as in the statement of the lemma, taking the supports commutes with base change, see Morphisms of Spaces, Lemma 54.15.2. Thus the lemma is clear.
Recall that we've defined the scheme theoretic support of a finite type quasicoherent module in Morphisms of Spaces, Definition 54.15.4.
083J Lemma 81.7.4. In Situation 81.7.1.
(1) If $\mathcal{G}$ is of finite type and the scheme theoretic support of $\mathcal{G}$ is quasi-compact over $B$, then $F_{\text {surj }}$ is limit preserving.
(2) If $\mathcal{F}$ of finite type and the scheme theoretic support of $\mathcal{F}$ is quasi-compact over $B$, then $F_{\text {zero }}$ is limit preserving.
(3) If $\mathcal{F}$ is of finite type, $\mathcal{G}$ is of finite presentation, and the scheme theoretic supports of $\mathcal{F}$ and $\mathcal{G}$ are quasi-compact over $B$, then $F_{\text {iso }}$ is limit preserving.

Proof. Proof of (1). Let $i: Z \rightarrow X$ be the scheme theoretic support of $\mathcal{G}$ and think of $\mathcal{G}$ as a finite type quasi-coherent module on $Z$. We may replace $X$ by $Z$ and $u$ by the $\operatorname{map} i^{*} \mathcal{F} \rightarrow \mathcal{G}$ (details omitted). Hence we may assume $f$ is quasi-compact and $\mathcal{G}$ of finite type. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $B$-schemes and assume that $u_{T}$ is surjective. Set $X_{i}=X_{T_{i}}=X \times_{S} T_{i}$ and $u_{i}=u_{T_{i}}: \mathcal{F}_{i}=\mathcal{F}_{T_{i}} \rightarrow \mathcal{G}_{i}=\mathcal{G}_{T_{i}}$. To prove (1) we have to show that $u_{i}$ is surjective for some $i$. Pick $0 \in I$ and replace $I$ by $\{i \mid i \geq 0\}$. Since $f$ is quasi-compact we see $X_{0}$ is quasi-compact. Hence we may choose a surjective étale morphism $\varphi_{0}: W_{0} \rightarrow X_{0}$ where $W_{0}$ is an affine scheme. Set $W=W_{0} \times_{T_{0}} T$ and $W_{i}=W_{0} \times_{T_{0}} T_{i}$ for $i \geq 0$. These are affine schemes endowed with a surjective étale morphisms $\varphi: W \rightarrow X_{T}$ and $\varphi_{i}: W_{i} \rightarrow X_{i}$. Note that $W=\lim W_{i}$. Hence $\varphi^{*} u_{T}$ is surjective and it suffices to prove that $\varphi_{i}^{*} u_{i}$ is surjective for some $i$. Thus we have reduced the problem to the affine case which is Algebra, Lemma 10.126 .3 part (2).
Proof of (2). Assume $\mathcal{F}$ is of finite type with scheme theoretic support $Z \subset B$ quasi-compact over $B$. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $B$-schemes and assume that $u_{T}$ is zero. Set $X_{i}=T_{i} \times{ }_{B} X$ and denote $u_{i}: \mathcal{F}_{i} \rightarrow \mathcal{G}_{i}$ the pullback. Choose $0 \in I$ and replace $I$ by $\{i \mid i \geq 0\}$. Set $Z_{0}=Z \times_{X} X_{0}$. By Morphisms of Spaces, Lemma 54.15 .2 the support of $\mathcal{F}_{i}$ is $\left|Z_{0}\right|$. Since $\left|Z_{0}\right|$ is quasi-compact we can find an affine scheme $W_{0}$ and an étale morphism $W_{0} \rightarrow X_{0}$ such that $\left|Z_{0}\right| \subset \operatorname{Im}\left(\left|W_{0}\right| \rightarrow\left|X_{0}\right|\right)$. Set $W=W_{0} \times_{T_{0}} T$ and $W_{i}=W_{0} \times_{T_{0}} T_{i}$ for $i \geq 0$. These are affine schemes endowed with étale morphisms $\varphi: W \rightarrow X_{T}$ and $\varphi_{i}: W_{i} \rightarrow X_{i}$. Note that $W=\lim W_{i}$ and that the support of $\mathcal{F}_{T}$ and $\mathcal{F}_{i}$ is contained in the image of $|W| \rightarrow\left|X_{T}\right|$ and $\left|W_{i}\right| \rightarrow\left|X_{i}\right|$. Now $\varphi^{*} u_{T}$ is injective and it suffices to prove that $\varphi_{i}^{*} u_{i}$ is injective for some $i$. Thus we have reduced the problem to the affine case which is Algebra, Lemma 10.126 .3 part (1).

Proof of (3). This can be proven in exactly the same manner as in the previous two paragraphs using Algebra, Lemma 10.126 .3 part (3). We can also deduce it from (1) and (2) as follows. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $B$-schemes and assume that $u_{T}$ is an isomorphism. By part (1) there exists an $0 \in I$ such that $u_{T_{0}}$ is surjective. Set $\mathcal{K}=\operatorname{Ker}\left(u_{T_{0}}\right)$ and consider the map of quasi-coherent modules $v: \mathcal{K} \rightarrow \mathcal{F}_{T_{0}}$. For $i \geq 0$ the base change $v_{T_{i}}$ is zero if and only if $u_{i}$ is an isomorphism. Moreover, $v_{T}$ is zero. Since $\mathcal{G}_{T_{0}}$ is of finite presentation, $\mathcal{F}_{T_{0}}$ is of finite type, and $u_{T_{0}}$ is surjective we conclude that $\mathcal{K}$ is of finite type (Modules on Sites, Lemma 18.24.1). It is clear that the support of $\mathcal{K}$ is contained in the support of $\mathcal{F}_{T_{0}}$ which is quasi-compact over $T_{0}$. Hence we can apply part (2) to see that $v_{T_{i}}$ is zero for some $i$.

083K Lemma 81.7.5. Let $S=\operatorname{Spec}(R)$ be an affine scheme. Let $X$ be an algebraic space over $S$. Let $u: \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent $\mathcal{O}_{X}$-modules. Assume $\mathcal{G}$ flat over $S$. Let $T \rightarrow S$ be a quasi-compact morphism of schemes such that the base change $u_{T}$ is zero. Then exists a closed subscheme $Z \subset S$ such that (a) $T \rightarrow S$ factors through $Z$ and (b) the base change $u_{Z}$ is zero. If $\mathcal{F}$ is a finite type $\mathcal{O}_{X^{-}}$ module and the scheme theoretic support of $\mathcal{F}$ is quasi-compact, then we can take $Z \rightarrow S$ of finite presentation.

Proof. Let $U \rightarrow X$ be a surjective étale morphism of algebraic spaces where $U=$ $\coprod U_{i}$ is a disjoint union of affine schemes (see Properties of Spaces, Lemma 53.6.1). By Lemma 81.7 .3 we see that we may replace $X$ by $U$. In other words, we may assume that $X=\coprod X_{i}$ is a disjoint union of affine schemes $X_{i}$. Suppose that we can
prove the lemma for $u_{i}=\left.u\right|_{X_{i}}$. Then we find a closed subscheme $Z_{i} \subset S$ such that $T \rightarrow S$ factors through $Z_{i}$ and $u_{i, Z_{i}}$ is zero. If $Z_{i}=\operatorname{Spec}\left(R / I_{i}\right) \subset \operatorname{Spec}(R)=S$, then taking $Z=\operatorname{Spec}\left(R / \sum I_{i}\right)$ works. Thus we may assume that $X=\operatorname{Spec}(A)$ is affine.

Choose a finite affine open covering $T=T_{1} \cup \ldots \cup T_{m}$. It is clear that we may replace $T$ by $\coprod_{j=1, \ldots, m} T_{j}$. Hence we may assume $T$ is affine. Say $T=\operatorname{Spec}\left(R^{\prime}\right)$. Let $u: M \rightarrow N$ be the homomorphisms of $A$-modules corresponding to $u: \mathcal{F} \rightarrow \mathcal{G}$. Then $N$ is a flat $R$-module as $\mathcal{G}$ is flat over $S$. The assumption of the lemma means that the composition

$$
M \otimes_{R} R^{\prime} \rightarrow N \otimes_{R} R^{\prime}
$$

is zero. Let $z \in M$. By Lazard's theorem (Algebra, Theorem 10.80.4) and the fact that $\otimes$ commutes with colimits we can find free $R$-module $F_{z}$, an element $\tilde{z} \in F_{z}$, and a map $F_{z} \rightarrow N$ such that $u(z)$ is the image of $\tilde{z}$ and $\tilde{z}$ maps to zero in $F_{z} \otimes_{R} R^{\prime}$. Choose a basis $\left\{e_{z, \alpha}\right\}$ of $F_{z}$ and write $\tilde{z}=\sum f_{z, \alpha} e_{z, \alpha}$ with $f_{z, \alpha} \in R$. Let $I \subset R$ be the ideal generated by the elements $f_{z, \alpha}$ with $z$ ranging over all elements of $M$. By construction $I$ maps to zero in $R^{\prime}$ and the elements $\tilde{z}$ map to zero in $F_{z} / I F_{z}$ whence in $N / I N$. Thus $Z=\operatorname{Spec}(R / I)$ is a solution to the problem in this case.
Assume $\mathcal{F}$ is of finite type with quasi-compact scheme theoretic support. Write $Z=\operatorname{Spec}(R / I)$. Write $I=\bigcup I_{\lambda}$ as a filtered union of finitely generated ideals. Set $Z_{\lambda}=\operatorname{Spec}\left(R / I_{\lambda}\right)$, so $Z=\operatorname{colim} Z_{\lambda}$. Since $u_{Z}$ is zero, we see that $u_{Z_{\lambda}}$ is zero for some $\lambda$ by Lemma 81.7.4. This finishes the proof of the lemma.

083L Lemma 81.7.6. Let $A$ be a ring. Let $u: M \rightarrow N$ be a map of $A$-modules. If $N$ is projective as an $A$-module, then there exists an ideal $I \subset A$ such that for any ring map $\varphi: A \rightarrow B$ the following are equivalent
(1) $u \otimes 1: M \otimes_{A} B \rightarrow N \otimes_{A} B$ is zero, and
(2) $\varphi(I)=0$.

Proof. As $M$ is projective we can find a projective $A$-module $C$ such that $F=$ $N \oplus C$ is a free $R$-module. By replacing $u$ by $u \oplus 1: F=M \oplus C \rightarrow N \oplus C$ we see that we may assume $N$ is free. In this case let $I$ be the ideal of $A$ generated by coefficients of all the elements of $\operatorname{Im}(u)$ with respect to some (fixed) basis of $N$.

It would be interesting to find a simple direct proof of the following lemma using the result of Lemma 81.7.5. A "classical" proof of this lemma when $f: X \rightarrow B$ is a projective morphism and $B$ a Noetherian scheme would be: (a) choose a relatively ample invertible sheaf $\mathcal{O}_{X}(1)$, (b) set $u_{n}: f_{*} \mathcal{F}(n) \rightarrow f_{*} \mathcal{G}(n)$, (c) observe that $f_{*} \mathcal{G}(n)$ is a finite locally free sheaf for all $n \gg 0$, and (d) $F_{\text {zero }}$ is represented by the vanishing locus of $u_{n}$ for some $n \gg 0$.

083M Lemma 81.7.7. In Situation 81.7.1. Assume
(1) $f$ is locally of finite presentation,
(2) $\mathcal{G}$ is an $\mathcal{O}_{X}$-module of finite presentation flat over $B$,
(3) the scheme theoretic support of $\mathcal{G}$ is proper over $B$.

Then the functor $F_{z e r o}$ is an algebraic space and $F_{z e r o} \rightarrow B$ is a closed immersion. If $\mathcal{F}$ is of finite type, then $F_{\text {zero }} \rightarrow B$ is of finite presentation.
Proof. In order to prove that $F_{\text {zero }}$ is an algebraic space, it suffices to show that $F_{\text {zero }} \rightarrow B$ is representable, see Spaces, Lemma 52.11.3. Let $B^{\prime} \rightarrow B$ be a morphism where $B^{\prime}$ is a scheme and let $u^{\prime}: \mathcal{F}^{\prime} \rightarrow \mathcal{G}^{\prime}$ be the pullback of $u$ to $X^{\prime}=X_{B^{\prime}}$. Then
the associated functor $F_{z e r o}^{\prime}$ equals $F_{z e r o} \times_{B} B^{\prime}$. This reduces us to the case that $B$ is a scheme.
Assume $B$ is a scheme. We will show that $F_{z e r o}$ is representable by a closed subscheme of $B$. By Lemma 81.7 .2 and Descent, Lemmas 34.33 .2 and 34.35 .1 the question is local for the étale topology on $B$. Let $b \in B$. We first replace $B$ by an affine neighbourhood of $b$. Denote $Z \subset X$ the scheme theoretic support of $\mathcal{G}$. Denote $Z_{b} \subset X_{b}$ the fibre of $Z \subset X \rightarrow B$ over $b$. The space $\left|Z_{b}\right|$ is quasi-compact by the last assumption of the lemma. Choose an affine scheme $U$ and an étale morphism $\varphi: U \rightarrow X$ such that $\left|Z_{b}\right| \subset \operatorname{Im}(|U| \rightarrow|X|)$. After replacing $B$ by an affine elementary étale neighbourhood of $b$ and replacing $U$ by some affine $U^{\prime}$ étale over $U$ with $U_{b}^{\prime} \rightarrow U_{b}$ surjective, we may assume that $\Gamma\left(U, \varphi^{*} \mathcal{G}\right)$ is a projective $\Gamma\left(B, \mathcal{O}_{B}\right)$-module, see More on Flatness, Lemma 37.12.5. Since $Z \rightarrow B$ is proper the image of

$$
|Z| \backslash \operatorname{Im}(|U| \rightarrow|X|)
$$

in $|B|$ is a closed subset not containing $b$. Hence, after replacing $B$ by an affine open containing $b$, we may assume that $|Z| \subset \operatorname{Im}(|U| \rightarrow|X|)$. (To be sure, after this replacement it is still true that $\Gamma\left(U, \varphi^{*} \mathcal{G}\right)$ is a projective $\Gamma\left(B, \mathcal{O}_{B}\right)$-module.) By Lemma 81.7 .3 we see that $F_{z e r o}$ is the same as the corresponding functor for the map $\varphi^{*} \mathcal{F} \rightarrow \varphi^{*} \mathcal{G}$. This case follows immediately from Lemma 81.7.6.

We still have to show that $F_{\text {zero }} \rightarrow B$ is of finite presentation if $\mathcal{F}$ is of finite type. Let $\mathcal{F}^{\prime} \subset \mathcal{G}$ be the image of $u$ and denote $F_{\text {zero }}^{\prime}$ the functor corresponding to $\mathcal{F}^{\prime} \rightarrow \mathcal{G}$. Then $F_{z e r o}=F_{\text {zero }}^{\prime}$ and the scheme theoretic support of $\mathcal{F}^{\prime}$ is a closed subspace of the scheme theoretic support of $\mathcal{G}$, hence proper over $B$. Thus Lemma 81.7.4 implies that $F_{z e r o}=F_{z e r o}^{\prime}$ is limit preserving over $B$. We conclude by Limits of Spaces, Proposition 57.3.9.

The following result is a variant of More on Flatness, Theorem 37.23.3.
083N Lemma 81.7.8. In Situation 81.7.1. Assume
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is locally of finite presentation and flat over $B$,
(3) the scheme theoretic support of $\mathcal{F}$ is proper over $B$, and
(4) $u$ is surjective.

Then the functor $F_{\text {iso }}$ is an algebraic space and $F_{i s o} \rightarrow B$ is a closed immersion. If $\mathcal{G}$ is of finite presentation, then $F_{\text {iso }} \rightarrow B$ is of finite presentation.
Proof. Let $\mathcal{K}=\operatorname{Ker}(u)$ and apply Lemma 81.7 .7 to $\mathcal{K} \rightarrow \mathcal{F}$. Note that $\mathcal{K}$ is of finite type if $\mathcal{G}$ is of finite presentation, see Modules on Sites, Lemma 18.24.1.

We will use the following (easy) result when discussing the Quot functor.
09TP Lemma 81.7.9. In Situation 81.7.1. Assume
(1) $f$ is locally of finite presentation,
(2) $\mathcal{G}$ is of finite type,
(3) the scheme theoretic support of $\mathcal{G}$ is proper over $B$.

Then $F_{\text {surj }}$ is an algebraic space and $F_{\text {surj }} \rightarrow B$ is an open immersion.
Proof. Consider Coker $(u)$. Observe that $\operatorname{Coker}\left(u_{T}\right)=\operatorname{Coker}(u)_{T}$ for any $T / B$. Note that formation of the support of a finite type quasi-coherent module commutes
with pullback (Morphisms of Spaces, Lemma 54.15.1). Hence $F_{\text {surj }}$ is representable by the open subspace of $B$ corresponding to the open set

$$
|B| \backslash|f|(\operatorname{Supp}(\operatorname{Coker}(u)))
$$

see Properties of Spaces, Lemma 53.4.8. This is an open because $|f|$ is closed on $\operatorname{Supp}(\mathcal{G})$ and $\operatorname{Supp}(\operatorname{Coker}(u))$ is a closed subset of $\operatorname{Supp}(\mathcal{G})$.

### 81.8. The functor of quotients

082 L In this section we discuss some generalities regarding the functor $Q_{\mathcal{F} / X / B}$ defined below. The notation Quot $_{\mathcal{F} / X / B}$ is reserved for a subfunctor of $\mathrm{Q}_{\mathcal{F} / X / B}$. We urge the reader to skip this section on a first reading.
082M Situation 81.8.1. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. For any scheme $T$ over $B$ we will denote $X_{T}$ the base change of $X$ to $T$ and $\mathcal{F}_{T}$ the pullback of $\mathcal{F}$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. Given such a $T$ we set

$$
\mathrm{Q}_{\mathcal{F} / X / B}(T)=\left\{\begin{array}{c}
\text { quotients } \mathcal{F}_{T} \rightarrow \mathcal{Q} \text { where } \mathcal{Q} \text { is a quasi-coherent } \\
\mathcal{O}_{X_{T}} \text {-module of finite presentation, flat over } T
\end{array}\right\}
$$

We identify quotients if they have the same kernel. Suppose that $T^{\prime} \rightarrow T$ is a morphism of schemes over $B$ and $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ is an element of $\mathrm{Q}_{\mathcal{F} / X / B}(T)$. Then the pullback $\mathcal{Q}^{\prime}=\left(X_{T^{\prime}} \rightarrow X_{T}\right)^{*} \mathcal{Q}$ is a quasi-coherent $\mathcal{O}_{X_{T^{\prime}}}$-module of finite presentation flat over $T^{\prime}$ (see Properties of Spaces, Section 53.29 and Morphisms of Spaces, Lemma 54.30.3). Thus we obtain a functor
082N

$$
\begin{equation*}
\mathrm{Q}_{\mathcal{F} / X / B}:(S c h / B)^{o p p} \longrightarrow \text { Sets } \tag{81.8.1.1}
\end{equation*}
$$

This is the functor of quotients of $\mathcal{F} / X / B$.
In Situation 81.8.1 we sometimes think of $\mathrm{Q}_{\mathcal{F} / X / B}$ as a functor $(S c h / S)^{\text {opp }} \rightarrow$ Sets endowed with a morphism $\mathrm{Q}_{\mathcal{F} / X / S} \rightarrow B$. Namely, if $T$ is a scheme over $S$, then we can think of an element of $\mathrm{Q}_{\mathcal{F} / X / B}$ as a pair $(h, \mathcal{Q})$ where $h$ a morphism $h: T \rightarrow B$, i.e., an element $h \in B(T)$, and $\mathcal{Q}$ is a $T$-flat quotient $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ of finite presentation on $X_{T}=X \times_{B, h} T$. In particular, when we say that $\mathrm{Q}_{\mathcal{F} / X / S}$ is an algebraic space, we mean that the corresponding functor $(S c h / S)^{o p p} \rightarrow$ Sets is an algebraic space.
08IT Remark 81.8.2. In Situation 81.8.1 let $B^{\prime} \rightarrow B$ be a morphism of algebraic spaces over $S$. Set $X^{\prime}=X \times_{B} B^{\prime}$ and denote $\mathcal{F}^{\prime}$ the pullback of $\mathcal{F}$ to $X^{\prime}$. Thus we have the functor $Q_{\mathcal{F}^{\prime} / X^{\prime} / B^{\prime}}$ on the category of schemes over $B^{\prime}$. For a scheme $T$ over $B^{\prime}$ it is clear that we have

$$
Q_{\mathcal{F}^{\prime} / X^{\prime} / B^{\prime}}(T)=Q_{\mathcal{F} / X / B}(T)
$$

where on the right hand side we think of $T$ as a scheme over $B$ via the composition $T \rightarrow B^{\prime} \rightarrow B$. This trivial remark will occasionally be useful to change the base algebraic space.
08IU Remark 81.8.3. Let $S$ be a scheme, $X$ an algebraic space over $S$, and $\mathcal{F}$ a quasicoherent $\mathcal{O}_{X}$-module. Suppose that $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering and for each $i, j \in I$ we are given an fpqc covering $\left\{X_{i j k} \rightarrow X_{i} \times_{X} X_{j}\right\}$. In this situation we have a bijection

$$
\left\{\begin{array}{c}
\text { quotients } \mathcal{F} \rightarrow \mathcal{Q} \text { where } \\
\mathcal{Q} \text { is a quasi-coherent }
\end{array}\right\} \longrightarrow\left\{\begin{array}{c}
\text { families of quotients } f_{i}^{*} \mathcal{F} \rightarrow \mathcal{Q}_{i} \text { where } \\
\mathcal{Q}_{i} \text { is quasi-coherent and } \mathcal{Q}_{i} \text { and } \mathcal{Q}_{j} \\
\text { restrict to the same quotient on } X_{i j k}
\end{array}\right\}
$$

Namely, let $\left(f_{i}^{*} \mathcal{F} \rightarrow \mathcal{Q}_{i}\right)_{i \in I}$ be an element of the right hand side. Then since $\left\{X_{i j k} \rightarrow X_{i} \times_{X} X_{j}\right\}$ is an fpqc covering we see that the pullbacks of $\mathcal{Q}_{i}$ and $\mathcal{Q}_{j}$ restrict to the same quotient of the pullback of $\mathcal{F}$ to $X_{i} \times{ }_{X} X_{j}$ (by fully faithfulness in Descent on Spaces, Proposition 61.4.1). Hence we obtain a descent datum for quasi-coherent modules with respect to $\left\{X_{i} \rightarrow X\right\}_{i \in I}$. By Descent on Spaces, Proposition 61.4.1 we find a map of quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{F} \rightarrow \mathcal{Q}$ whose restriction to $X_{i}$ recovers the given maps $f_{i}^{*} \mathcal{F} \rightarrow \mathcal{Q}_{i}$. Since the family of morphisms $\left\{X_{i} \rightarrow X\right\}$ is jointly surjective and flat, for every point $x \in|X|$ there exists an $i$ and a point $x_{i} \in\left|X_{i}\right|$ mapping to $x$. Note that the induced map on local rings $\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{X_{i}, \overline{x_{i}}}$ is faithfully flat, see Morphisms of Spaces, Section 54.29. Thus we see that $\mathcal{F} \rightarrow \mathcal{Q}$ is surjective.

082P Lemma 81.8.4. In Situation 81.8.1. The functor $Q_{\mathcal{F} / X / B}$ satisfies the sheaf property for the fpqc topology.
Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $S$. Set $X_{i}=X_{T_{i}}=$ $X \times_{S} T_{i}$ and $\mathcal{F}_{i}=\mathcal{F}_{T_{i}}$. Note that $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$ (Topologies on Spaces, Lemma 60.3.2) and that $X_{T_{i} \times{ }_{T} T_{i^{\prime}}}=X_{i} \times_{X_{T}} X_{i^{\prime}}$. Suppose that $\mathcal{F}_{i} \rightarrow \mathcal{Q}_{i}$ is a collection of elements of $\mathrm{Q}_{\mathcal{F} / X / B}\left(T_{i}\right)$ such that $\mathcal{Q}_{i}$ and $\mathcal{Q}_{i^{\prime}}$ restrict to the same element of $\mathrm{Q}_{\mathcal{F} / X / B}\left(T_{i} \times_{T} T_{i^{\prime}}\right)$. By Remark 81.8.3 we obtain a surjective map of quasi-coherent $\mathcal{O}_{X_{T}}$-modules $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ whose restriction to $X_{i}$ recovers the given quotients. By Morphisms of Spaces, Lemma 54.30.5 we see that $\mathcal{Q}$ is flat over $T$. Finally, Descent on Spaces, Lemma 61.5.2 guarantees that $\mathcal{Q}$ is of finite presentation as an $\mathcal{O}_{X_{T}}$-module.

08IV Lemma 81.8.5. In Situation 81.8.1 let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering and for each $i, j \in I$ let $\left\{X_{i j k} \rightarrow X_{i} \times_{X} X_{j}\right\}$ be an fppf covering. Denote $\mathcal{F}_{i}$, resp. $\mathcal{F}_{i j k}$ the pullback of $\mathcal{F}$ to $X_{i}$, resp. $X_{i j k}$. For every scheme $T$ over $B$ the diagram

$$
Q_{\mathcal{F} / X / B}(T) \longrightarrow \prod_{i} Q_{\mathcal{F}_{i} / X_{i} / B}(T) \xrightarrow[p r_{1}^{*}]{\stackrel{p r_{0}^{*}}{\longrightarrow}} \prod_{i, j, k} Q_{\mathcal{F}_{i j k} / X_{i j k} / B}(T)
$$

presents the first arrow as the equalizer of the other two.
Proof. Let $\mathcal{F}_{i, T} \rightarrow \mathcal{Q}_{i}$ be an element in the equalizer of $\mathrm{pr}_{0}^{*}$ and $\mathrm{pr}_{1}^{*}$. By Remark 81.8 .3 we obtain a surjection $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ of quasi-coherent $\mathcal{O}_{X_{T}}$-modules whose restriction to $X_{i, T}$ recovers $\mathcal{F}_{i} \rightarrow \mathcal{Q}_{i}$. By Morphisms of Spaces, Lemma 54.30 .5 we see that $\mathcal{Q}$ is flat over $T$ as desired.

082Q Lemma 81.8.6. In Situation 81.8.1 assume also that (a) $f$ is quasi-compact and quasi-separated and (b) $\mathcal{F}$ is of finite presentation. Then the functor $Q_{\mathcal{F} / X / B}$ is limit preserving in the following sense: If $T=\lim T_{i}$ is a directed limit of affine schemes over $B$, then $Q_{\mathcal{F} / X / B}(T)=\operatorname{colim} Q_{\mathcal{F} / X / B}\left(T_{i}\right)$.
Proof. Let $T=\lim T_{i}$ be as in the statement of the lemma. Choose $i_{0} \in I$ and replace $I$ by $\left\{i \in I \mid i \geq i_{0}\right\}$. We may set $B=S=T_{i_{0}}$ and we may replace $X$ by $X_{T_{0}}$ and $\mathcal{F}$ by the pullback to $X_{T_{0}}$. Then $X_{T}=\lim X_{T_{i}}$, see Limits of Spaces, Lemma 57.4.1 Let $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ be an element of $\mathrm{Q}_{\mathcal{F} / X / B}(T)$. By Limits of Spaces, Lemma 57.7.2 there exists an $i$ and a map $\mathcal{F}_{T_{i}} \rightarrow \mathcal{Q}_{i}$ of $\mathcal{O}_{X_{T_{i}}}$-modules of finite presentation whose pullback to $X_{T}$ is the given quotient map.
We still have to check that, after possibly increasing $i$, the map $\mathcal{F}_{T_{i}} \rightarrow \mathcal{Q}_{i}$ is surjective and $\mathcal{Q}_{i}$ is flat over $T_{i}$. To do this, choose an affine scheme $U$ and a
surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 53.6.3). We may check surjectivity and flatness over $T_{i}$ after pulling back to the étale cover $U_{T_{i}} \rightarrow X_{T_{i}}$ (by definition). This reduces us to the case where $X=\operatorname{Spec}\left(B_{0}\right)$ is an affine scheme of finite presentation over $B=S=T_{0}=\operatorname{Spec}\left(A_{0}\right)$. Writing $T_{i}=\operatorname{Spec}\left(A_{i}\right)$, then $T=\operatorname{Spec}(A)$ with $A=\operatorname{colim} A_{i}$ we have reached the following algebra problem. Let $M_{i} \rightarrow N_{i}$ be a map of finitely presented $B_{0} \otimes_{A_{0}} A_{i}$-modules such that $M_{i} \otimes_{A_{i}} A \rightarrow N_{i} \otimes_{A_{i}} A$ is surjective and $N_{i} \otimes_{A_{i}} A$ is flat over $A$. Show that for some $i^{\prime} \geq i M_{i} \otimes_{A_{i}} A_{i^{\prime}} \rightarrow N_{i} \otimes_{A_{i}} A_{i^{\prime}}$ is surjective and $N_{i} \otimes_{A_{i}} A_{i^{\prime}}$ is flat over $A$. The first follows from Algebra, Lemma 10.126 .3 and the second from Algebra, Lemma 10.160.1.

08IW Lemma 81.8.7. In Situation 81.8.1 assume $X \rightarrow B$ locally of finite presentation. Let

be a pushout in the category of schemes over $B$ where $Z \rightarrow Z^{\prime}$ is a thickening and $Z \rightarrow Y$ is affine, see More on Morphisms, Lemma 36.11.3. Then the natural map

$$
Q_{\mathcal{F} / X / B}\left(Y^{\prime}\right) \longrightarrow Q_{\mathcal{F} / X / B}(Y) \times_{Q_{\mathcal{F} / X / B}(Z)} Q_{\mathcal{F} / X / B}\left(Z^{\prime}\right)
$$

is bijective.
Proof. We first argue that it suffices to prove this when all the schemes and algebraic spaces in sight are affine schemes. Let $Y^{\prime}=\bigcup Y_{i}^{\prime}$ be an affine open covering and let $Y_{i}, Z_{i}^{\prime}$, and $Z_{i}$ be the corresponding (affine) opens of $Y, Z^{\prime}$, and $Z$. Since $Q_{\mathcal{F} / X / B}$ satisfies the sheaf property for the fpqc topology (Lemma 81.8.4), it suffices to prove the result of the lemma for the diagrams

This reduces us to the case where the schemes $Y^{\prime}, Y, Z^{\prime}, Z$ are separated and a second application of this argument to the case where $Y^{\prime}, Y, Z^{\prime}, Z$ are affine.

Assume $Y^{\prime}$ (and hence also $Y, Z^{\prime}$, and $Z$ ) is affine. By Remark 81.8.2 we may replace $B$ by $Y^{\prime}$ and $X$ by $X \times_{B} Y^{\prime}$, and $\mathcal{F}$ by the pullback. Thus we may assume $B=Y^{\prime}$.

Assume $B=Y^{\prime}$ (and hence also $Y, Z^{\prime}$, and $Z$ ) is affine. Choose an étale covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ with each $X_{i}$ affine and similarly choose étale coverings $\left\{X_{i j k} \rightarrow\right.$ $\left.X_{i} \times{ }_{X} X_{j}\right\}$ with each $X_{i j k}$ affine (Properties of Spaces, Lemma 53.6.1). By Lemma 81.8 .5 it suffices to prove the lemma for each of the functors associated to $X_{i}$ and $X_{i j k}$. Hence we may assume $X$ is affine as well. This reduces the lemma to More on Algebra, Remark 15.5.16

### 81.9. The quot functor

09 TQ In this section we prove the Quot functor is representable by an algebraic space.
09TR Situation 81.9.1. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. For any scheme $T$ over $B$ we will denote $X_{T}$ the base change of $X$ to $T$ and $\mathcal{F}_{T}$ the pullback of $\mathcal{F}$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. Given such a $T$ we set

$$
\text { Quot }_{\mathcal{F} / X / B}(T)=\left\{\begin{array}{c}
\text { quotients } \mathcal{F}_{T} \rightarrow \mathcal{Q} \text { where } \mathcal{Q} \text { is a quasi-coherent } \\
\mathcal{O}_{X_{T}} \text {-module of finite presentation, flat over } T \\
\text { with scheme theoretic support proper over } T
\end{array}\right\}
$$

This is a subfunctor of $Q_{\mathcal{F} / X / T}$ discussed in Section 81.8 . Thus we obtain a functor
09TS

$$
\begin{equation*}
\text { Quot }_{\mathcal{F} / X / B}:(S c h / B)^{o p p} \longrightarrow \text { Sets } \tag{81.9.1.1}
\end{equation*}
$$

This is the quot functor associated to $\mathcal{F} / X / B$.
In Situation 81.9.1 we may think of Quot $_{\mathcal{F} / X / B}$ as a functor $(S c h / S)^{\text {opp }} \rightarrow$ Sets endowed with a morphism Quot $_{\mathcal{F} / X / S} \rightarrow B$. Namely, if $T$ is a scheme over $S$, then we can think of an element of Quot $_{\mathcal{F} / X / B}$ as a pair $(h, \mathcal{Q})$ where $h$ a morphism $h: T \rightarrow B$, i.e., an element $h \in B(T)$, and $Q$ is a finitely presented, $T$-flat quotient $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ on $X_{T}=X \times_{B, h} T$ with support proper over $T$. In particular, when we say that Quot ${ }_{\mathcal{F} / X / S}$ is an algebraic space, we mean that the corresponding functor $(S c h / S)^{o p p} \rightarrow$ Sets is an algebraic space.

09TT Lemma 81.9.2. In Situation 81.9.1. The functor Quot $_{\mathcal{F} / X / B}$ satisfies the sheaf property for the fpqc topology.

Proof. In Lemma 81.8.4 we have seen that the functor $\mathrm{Q}_{\mathcal{F} / X / S}$ is a sheaf. Recall that for a scheme $T$ over $S$ the subset Quot $_{\mathcal{F} / X / S}(T) \subset \mathrm{Q}_{\mathcal{F} / X / S}(T)$ picks out those quotients whose support is proper over $T$. This defines a subsheaf by the result of Descent on Spaces, Lemma 61.10.17 (combined with Morphisms of Spaces, Lemma 54.29 .10 which shows that taking scheme theoretic support commutes with flat base change).

09TU Proposition 81.9.3. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. If $f$ is of finite presentation and separated, then Quot $_{\mathcal{F} / X / B}$ is an algebraic space. If $\mathcal{F}$ is of finite presentation, then Quot $_{\mathcal{F} / X / B} \rightarrow B$ is locally of finite presentation.
Proof. Note that Quot ${ }_{\mathcal{F} / X / B}$ is a sheaf in the fppf topology. Let Quot $_{\mathcal{F} / X / B}$ be the stack in groupoids corresponding to Quot $_{\mathcal{F} / X / S}$, see Algebraic Stacks, Section 76.7. By Algebraic Stacks, Proposition 76.13.3 it suffices to show that Quot $_{\mathcal{F} / X / B}$ is an algebraic stack. Consider the 1-morphism of stacks in groupoids

$$
\text { Quot }_{\mathcal{F} / X / S} \longrightarrow \operatorname{Coh}_{X / B}
$$

on $(S c h / S)_{\text {fppf }}$ which associates to the quotient $\mathcal{F}_{T} \rightarrow \mathcal{Q}$ the coherent sheaf $\mathcal{Q}$. By Theorem 81.6.5 we know that $C o h_{X / B}$ is an algebraic stack. By Algebraic Stacks, Lemma 76.15 .4 it suffices to show that this 1-morphism is representable by algebraic spaces.

Let $T$ be a scheme over $S$ and let the object $(h, \mathcal{G})$ of $\operatorname{Coh}_{X / B}$ over $T$ correspond to a 1-morphism $\xi:(S c h / T)_{f p p f} \rightarrow \operatorname{Coh}_{X / B}$. The 2 -fibre product

$$
\mathcal{Z}=(S c h / T)_{f p p f} \times_{\xi, \text { Coh }_{X / B}} \text { Quot }_{\mathcal{F} / X / S}
$$

is a stack in setoids, see Stacks, Lemma 8.6.7. The corresponding sheaf of sets (i.e., functor, see Stacks, Lemmas 8.6.7 and 8.6.2 assigns to a scheme $T^{\prime} / T$ the set of surjections $u: \mathcal{F}_{T^{\prime}} \rightarrow \mathcal{G}_{T^{\prime}}$ of quasi-coherent modules on $X_{T^{\prime}}$. Thus we see that $\mathcal{Z}$ is representable by an open subspace (by Lemma 81.7.9) of the algebraic space $\operatorname{Hom}\left(\mathcal{F}_{T}, \mathcal{G}\right)$ from Proposition 81.3.9.

## CHAPTER 82

## Properties of Algebraic Stacks

04X8

### 82.1. Introduction

04X9 Please see Algebraic Stacks, Section 76.1 for a brief introduction to algebraic stacks, and please read some of that chapter for our foundations of algebraic stacks. The intent is that in that chapter we are careful to distinguish between schemes, algebraic spaces, algebraic stacks, and starting with this chapter we employ the customary abuse of language where all of these concepts are used interchangeably.

The goal of this chapter is to introduce some basic notions and properties of algebraic stacks. A fundamental reference for the case of quasi-separated algebraic stacks with representable diagonal is LMB00.

### 82.2. Conventions and abuse of language

04XA We choose a big fppf site $S c h_{f p p f}$. All schemes are contained in $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.

We also fix a base scheme $S$, by the conventions above an element of $S c h_{f p p f}$. The reader who is only interested in the absolute case can take $S=\operatorname{Spec}(\mathbf{Z})$.

Here are our conventions regarding algebraic stacks:
(1) When we say algebraic stack we will mean an algebraic stacks over $S$, i.e., a category fibred in groupoids $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ which satisfies the conditions of Algebraic Stacks, Definition 76.12.1
(2) We will say $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks to indicate a 1morphism of algebraic stacks over $S$, i.e., a 1-morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$, see Algebraic Stacks, Definition 76.12.3.
(3) A 2-morphism $\alpha: f \rightarrow g$ will indicate a 2-morphism in the 2-category of algebraic stacks over $S$, see Algebraic Stacks, Definition 76.12.3.
(4) Given morphisms $\mathcal{X} \rightarrow \mathcal{Z}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ of algebraic stacks we abusively call the 2-fibre product $\mathcal{X} \times{ }_{\mathcal{Z}} \mathcal{Y}$ the fibre product.
(5) We will write $\mathcal{X} \times_{S} \mathcal{Y}$ for the product of the algebraic stacks $\mathcal{X}, \mathcal{Y}$.
(6) We will often abuse notation and say two algebraic stacks $\mathcal{X}$ and $\mathcal{Y}$ are isomorphic if they are equivalent in this 2-category.
Here are our conventions regarding algebraic spaces.
(1) If we say $X$ is an algebraic space then we mean that $X$ is an algebraic space over $S$, i.e., $X$ is a presheaf on $(S c h / S)_{f p p f}$ which satisfies the conditions of Spaces, Definition 52.6.1.
(2) A morphism of algebraic spaces $f: X \rightarrow Y$ is a morphism of algebraic spaces over $S$ as defined in Spaces, Definition 52.6.3.
(3) We will not distinguish between an algebraic space $X$ and the algebraic stack $\mathcal{S}_{X} \rightarrow(S c h / S)_{\text {fppf }}$ it gives rise to, see Algebraic Stacks, Lemma 76.13 .1
(4) In particular, a morphism $f: X \rightarrow \mathcal{Y}$ from $X$ to an algebraic stack $\mathcal{Y}$ means a morphism $f: \mathcal{S}_{X} \rightarrow \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \rightarrow X$.
(5) Moreover, given an algebraic stack $\mathcal{X}$ we say $\mathcal{X}$ is an algebraic space to indicate that $\mathcal{X}$ is representable by an algebraic space, see Algebraic Stacks, Definition 76.8.1
(6) We will use the following notational convention: If we indicate an algebraic stack by a roman capital (such as $X, Y, Z, A, B, \ldots$ ) then it will be the case that its inertia stack is trivial, and hence it is an algebraic space, see Algebraic Stacks, Proposition 76.13.3.
Here are our conventions regarding schemes.
(1) If we say $X$ is a scheme then we mean that $X$ is a scheme over $S$, i.e., $X$ is an object of $(S c h / S)_{f p p f}$.
(2) By a morphism of schemes we mean a morphism of schemes over $S$.
(3) We will not distinguish between a scheme $X$ and the algebraic stack $\mathcal{S}_{X} \rightarrow(S c h / S)_{\text {fppf }}$ it gives rise to, see Algebraic Stacks, Lemma 76.13.1.
(4) In particular, a morphism $f: X \rightarrow \mathcal{Y}$ from a scheme $X$ to an algebraic stack $\mathcal{Y}$ means a morphism $f: \mathcal{S}_{X} \rightarrow \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \rightarrow X$.
(5) Moreover, given an algebraic stack $\mathcal{X}$ we say $\mathcal{X}$ is a scheme to indicate that $\mathcal{X}$ is representable, see Algebraic Stacks, Section 76.4 ,
Here are our conventions regarding morphisms of algebraic stacks:
(1) A morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is representable, or representable by schemes if for every scheme $T$ and morphism $T \rightarrow \mathcal{Y}$ the fibre product $T \times \mathcal{Y} \mathcal{X}$ is a scheme. See Algebraic Stacks, Section 76.6 ,
(2) A morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is representable by algebraic spaces if for every scheme $T$ and morphism $T \rightarrow \mathcal{Y}$ the fibre product $T \times \mathcal{Y} \mathcal{X}$ is an algebraic space. See Algebraic Stacks, Definition 76.9.1. In this case $Z \times \mathcal{Y} \mathcal{X}$ is an algebraic space whenever $Z \rightarrow \mathcal{Y}$ is a morphism whose source is an algebraic space, see Algebraic Stacks, Lemma 76.9.8.
Note that every morphism $X \rightarrow \mathcal{Y}$ from an algebraic space to an algebraic stack is representable by algebraic spaces, see Algebraic Stacks, Lemma 76.10.11. We will use this basic result without further mention.

### 82.3. Properties of morphisms representable by algebraic spaces

04XB We will study properties of (arbitrary) morphisms of algebraic stacks in its own chapter. For morphisms representable by algebraic spaces we know what it means to be surjective, smooth, or étale, etc. This applies in particular to morphisms $X \rightarrow \mathcal{Y}$ from algebraic spaces to algebraic stacks. In this section, we recall how this works, we list the properties to which this applies, and we prove a few easy lemmas.

Our first lemma says a morphism is representable by algebraic spaces if it is so after a base change by a flat, locally finitely presented, surjective morphism.

04ZP Lemma 82.3.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $W$ be an algebraic space and let $W \rightarrow \mathcal{Y}$ be surjective, locally of finite presentation, and flat. The following are equivalent
(1) $f$ is representable by algebraic spaces, and
(2) $W \times \mathcal{Y} \mathcal{X}$ is an algebraic space.

Proof. The implication (1) $\Rightarrow(2)$ is Algebraic Stacks, Lemma 76.9.8. Conversely, let $W \rightarrow \mathcal{Y}$ be as in (2). To prove (1) it suffices to show that $f$ is faithful on fibre categories, see Algebraic Stacks, Lemma 76.15.2. Assumption (2) implies in particular that $W \times \mathcal{Y} \mathcal{X} \rightarrow W$ is faithful. Hence the faithfulness of $f$ follows from Stacks, Lemma 8.6.9.

Let $P$ be a property of morphisms of algebraic spaces which is fppf local on the target and preserved by arbitrary base change. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then we say $f$ has property $P$ if and only if for every scheme $T$ and morphism $T \rightarrow \mathcal{Y}$ the morphism of algebraic spaces $T \times \mathcal{Y} \mathcal{X} \rightarrow T$ has property $P$, see Algebraic Stacks, Definition 76.10.1.
It turns out that if $f: \mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces and has property $P$, then for any morphism of algebraic stacks $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ the base change $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$ has property $P$, see Algebraic Stacks, Lemmas 76.9.7 and 76.10.6. If the property $P$ is preserved under compositions, then this holds also in the setting of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemmas 76.9 .9 and 76.10 .5 . Moreover, in this case products $\mathcal{X}_{1} \times \mathcal{X}_{2} \rightarrow \mathcal{Y}_{1} \times \mathcal{Y}_{2}$ of morphisms representable by algebraic spaces having property $\mathcal{P}$ have property $\mathcal{P}$, see Algebraic Stacks, Lemma 76.10.8

Finally, if we have two properties $P, P^{\prime}$ of morphisms of algebraic spaces which are fppf local on the target and preserved by arbitrary base change and if $P(f) \Rightarrow$ $P^{\prime}(f)$ for every morphism $f$, then the same implication holds for the corresponding property of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemma 76.10.9. We will use this without further mention in the following and in the following chapters.

The discussion above applies to each of the following properties of morphisms of algebraic spaces
(1) quasi-compact, see Morphisms of Spaces, Lemma 54.8.3 and Descent on Spaces, Lemma 61.10.1
(2) quasi-separated, see Morphisms of Spaces, Lemma 54.4.4 and Descent on Spaces, Lemma 61.10.2.
(3) universally closed, see Morphisms of Spaces, Lemma 54.9.3 and Descent on Spaces, Lemma 61.10.3,
(4) universally open, see Morphisms of Spaces, Lemma 54.6.3 and Descent on Spaces, Lemma 61.10.4
(5) surjective, see Morphisms of Spaces, Lemma 54.5.5 and Descent on Spaces, Lemma 61.10.5
(6) universally injective, see Morphisms of Spaces, Lemma 54.19.5 and Descent on Spaces, Lemma 61.10.6,
(7) locally of finite type, see Morphisms of Spaces, Lemma 54.23 .3 and Descent on Spaces, Lemma 61.10.7,
(8) locally of finite presentation, see Morphisms of Spaces, Lemma 54.28.3 and Descent on Spaces, Lemma 61.10.8,
(9) finite type, see Morphisms of Spaces, Lemma 54.23 .3 and Descent on Spaces, Lemma 61.10.9.
(10) finite presentation, see Morphisms of Spaces, Lemma 54.28 .3 and Descent on Spaces, Lemma 61.10.10,
(11) flat, see Morphisms of Spaces, Lemma 54.29.4 and Descent on Spaces, Lemma 61.10.11.
(12) open immersion, see Morphisms of Spaces, Section 54.12 and Descent on Spaces, Lemma 61.10.12,
(13) isomorphism, see Descent on Spaces, Lemma 61.10.13,
(14) affine, see Morphisms of Spaces, Lemma 54.20.5 and Descent on Spaces, Lemma 61.10.14
(15) closed immersion, see Morphisms of Spaces, Section 54.12 and Descent on Spaces, Lemma 61.10.15

(24) unramified, see Morphisms of Spaces, Lemma 54.37.4 and Descent on Spaces, Lemma 61.10.25
(25) étale, see Morphisms of Spaces, Lemma 54.38 .4 and Descent on Spaces, Lemma 61.10.26
(26) finite locally free, see Morphisms of Spaces, Lemma 54.44 .5 and Descent on Spaces, Lemma 61.10.27,
(27) monomorphism, see Morphisms of Spaces, Lemma 54.10.5 and Descent on Spaces, Lemma 61.10.28.
(28) immersion, see Morphisms of Spaces, Section 54.12 and Descent on Spaces, Lemma 61.11.1,
(29) locally separated, see Morphisms of Spaces, Lemma 54.4.4 and Descent on Spaces, Lemma 61.11.2.

04XC Lemma 82.3.2. Let $P$ be a property of morphisms of algebraic spaces as above. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. The following are equivalent:
(1) $f$ has $P$,
(2) for every algebraic space $Z$ and morphism $Z \rightarrow \mathcal{Y}$ the morphism $Z \times \mathcal{\mathcal { X }} \mathcal{X} \rightarrow$ $Z$ has $P$.
Proof. The implication (2) $\Rightarrow(1)$ is immediate. Assume (1). Let $Z \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme $U$ and a surjective étale morphism $U \rightarrow Z$. By assumption the morphism $U \times_{\mathcal{y}} \mathcal{X} \rightarrow U$ has $P$. But the diagram

is cartesian, hence the right vertical arrow has $P$ as $\{U \rightarrow Z\}$ is an fppf covering.
The following lemma tells us it suffices to check $P$ after a base change by a surjective, flat, locally finitely presented morphism.

04XD Lemma 82.3.3. Let $P$ be a property of morphisms of algebraic spaces as above. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let $W$ be an algebraic space and let $W \rightarrow \mathcal{Y}$ be surjective, locally of finite presentation, and flat. Set $V=W \times_{\mathcal{y}} \mathcal{X}$. Then

$$
(f \text { has } P) \Leftrightarrow(\text { the projection } V \rightarrow W \text { has } P) .
$$

Proof. The implication from left to right follows from Lemma 82.3.2 Assume $V \rightarrow W$ has $P$. Let $T$ be a scheme, and let $T \rightarrow \mathcal{Y}$ be a morphism. Consider the commutative diagram

of algebraic spaces. The squares are cartesian. The bottom left morphism is a surjective, flat morphism which is locally of finite presentation, hence $\left\{T \times{ }_{\mathcal{Y}} V \rightarrow T\right\}$ is an fppf covering. Hence the fact that the right vertical arrow has property $P$ implies that the left vertical arrow has property $P$.
06 TY Lemma 82.3.4. Let $P$ be a property of morphisms of algebraic spaces as above. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Set $\mathcal{W}=\mathcal{Z} \times \mathcal{y} \mathcal{X}$. Then

$$
(f \text { has } P) \Leftrightarrow(\text { the projection } \mathcal{W} \rightarrow \mathcal{Z} \text { has } P) .
$$

Proof. Choose an algebraic space $W$ and a morphism $W \rightarrow \mathcal{Z}$ which is surjective, flat, and locally of finite presentation. By the discussion above the composition $W \rightarrow \mathcal{Y}$ is also surjective, flat, and locally of finite presentation. Denote $V=$ $W \times_{\mathcal{z}} \mathcal{W}=V \times_{\mathcal{Y}} \mathcal{X}$. By Lemma 82.3.3 we see that $f$ has $\mathcal{P}$ if and only if $V \rightarrow W$ does and that $\mathcal{W} \rightarrow \mathcal{Z}$ has $\mathcal{P}$ if and only if $V \rightarrow W$ does. The lemma follows.

06M2 Lemma 82.3.5. Let $P$ be a property of morphisms of algebraic spaces as above. Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks representable by algebraic spaces. Assume
(1) $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation,
(2) the composition has $P$, and
(3) $P$ is local on the source in the fppf topology.

Then $\mathcal{Y} \rightarrow \mathcal{Z}$ has property $P$.
Proof. Let $Z$ be a scheme and let $Z \rightarrow \mathcal{Z}$ be a morphism. Set $X=\mathcal{X} \times_{\mathcal{Z}} Z$, $Y=\mathcal{Y} \times_{\mathcal{Z}} Z$. By (1) $\{X \rightarrow Y\}$ is an fppf covering of algebraic spaces and by (2) $X \rightarrow Z$ has property $P$. By (3) this implies that $Y \rightarrow Z$ has property $P$ and we win.

04Y6 Lemma 82.3.6. Let $g: \mathcal{X}^{\prime} \rightarrow \mathcal{X}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Let $[U / R] \rightarrow \mathcal{X}$ be a presentation. Set $U^{\prime}=$ $U \times \mathcal{X} \mathcal{X}^{\prime}$, and $R^{\prime}=R \times \mathcal{X} \mathcal{X}^{\prime}$. Then there exists a groupoid in algebraic spaces of the form $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$, a presentation $\left[U^{\prime} / R^{\prime}\right] \rightarrow \mathcal{X}^{\prime}$, and the diagram

is 2-commutative where the morphism [pr] comes from a morphism of groupoids $p r:\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$.

Proof. Since $U \rightarrow \mathcal{Y}$ is surjective and smooth, see Algebraic Stacks, Lemma 76.17.2 the base change $U^{\prime} \rightarrow \mathcal{X}^{\prime}$ is also surjective and smooth. Hence, by Algebraic Stacks, Lemma 76.16 .2 it suffices to show that $R^{\prime}=U^{\prime} \times \mathcal{X}^{\prime} U^{\prime}$ in order to get a smooth groupoid ( $U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) and a presentation $\left[U^{\prime} / R^{\prime}\right] \rightarrow \mathcal{X}^{\prime}$. Using that $R=V \times \mathcal{Y} V$ (see Groupoids in Spaces, Lemma 65.21.2) this follows from

$$
R^{\prime}=U \times_{\mathcal{X}} U \times_{\mathcal{X}} \mathcal{X}^{\prime}=\left(U \times_{\mathcal{X}} \mathcal{X}^{\prime}\right) \times_{\mathcal{X}^{\prime}}\left(U \times_{\mathcal{X}} \mathcal{X}^{\prime}\right)
$$

see Categories, Lemmas 4.30.8 and 4.30.10. Clearly the projection morphisms $U^{\prime} \rightarrow$ $U$ and $R^{\prime} \rightarrow R$ give the desired morphism of groupoids pr : $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow$ $(U, R, s, t, c)$. Hence the morphism [pr] of quotient stacks by Groupoids in Spaces, Lemma 65.20.1.

We still have to show that the diagram 2-commutes. It is clear that the diagram

2-commutes where $\operatorname{pr}_{U}: U^{\prime} \rightarrow U$ is the projection. There is a canonical 2-arrow $\tau: f \circ t \rightarrow f \circ s$ in $\operatorname{Mor}(R, \mathcal{X})$ coming from $R=U \times_{\mathcal{X}} U, t=\mathrm{pr}_{0}$, and $s=\mathrm{pr}_{1}$. Using the isomorphism $R^{\prime} \rightarrow U^{\prime} \times \mathcal{X}^{\prime} U^{\prime}$ we get similarly an isomorphism $\tau^{\prime}: f^{\prime} \circ t^{\prime} \rightarrow f^{\prime} \circ s^{\prime}$. Note that $g \circ f^{\prime} \circ t^{\prime}=f \circ t \circ \operatorname{pr}_{R}$ and $g \circ f^{\prime} \circ s^{\prime}=f \circ s \circ \operatorname{pr}_{R}$, where $\operatorname{pr}_{R}: R^{\prime} \rightarrow R$ is the projection. Thus it makes sense to ask if

04 Y 7

$$
\begin{equation*}
\tau \star \operatorname{id}_{\mathrm{pr}_{R}}=\operatorname{id}_{g} \star \tau^{\prime} \tag{82.3.6.1}
\end{equation*}
$$

Now we make two claims: (1) if Equation 82.3.6.1 holds, then the diagram 2commutes, and (2) Equation 82.3.6.1 holds. We omit the proof of both claims.

Hints: part (1) follows from the construction of $f=f_{c a n}$ and $f^{\prime}=f_{c a n}^{\prime}$ in Algebraic Stacks, Lemma 76.16.1. Part (2) follows by carefuly working through the definitions.

04ZQ Remark 82.3.7. Let $\mathcal{Y}$ be an algebraic stack. Consider the following 2-category:
(1) An object is a morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ which is representable by algebraic spaces,
(2) a 1-morphism $(g, \beta):\left(f_{1}: \mathcal{X}_{1} \rightarrow \mathcal{Y}\right) \rightarrow\left(f_{2}: \mathcal{X}_{2} \rightarrow \mathcal{Y}\right)$ consists of a morphism $g: \mathcal{X}_{1} \rightarrow \mathcal{X}_{2}$ and a 2-morphism $\beta: f_{1} \rightarrow f_{2} \circ g$, and
(3) a 2-morphism between $(g, \beta),\left(g^{\prime}, \beta^{\prime}\right):\left(f_{1}: \mathcal{X}_{1} \rightarrow \mathcal{Y}\right) \rightarrow\left(f_{2}: \mathcal{X}_{2} \rightarrow \mathcal{Y}\right)$ is a 2-morphism $\alpha: g \rightarrow g^{\prime}$ such that $\left(\operatorname{id}_{\left.f_{2} \star \alpha\right) \circ \beta=\beta^{\prime} .}\right.$.
Let us denote this 2-category Spaces $/ \mathcal{Y}$ by analogy with the notation of Topologies on Spaces, Section 60.2. Now we claim that in this 2-category the morphism categories

$$
\operatorname{Mor}_{\text {Spaces } / \mathcal{Y}}\left(\left(f_{1}: \mathcal{X}_{1} \rightarrow \mathcal{Y}\right),\left(f_{2}: \mathcal{X}_{2} \rightarrow \mathcal{Y}\right)\right)
$$

are all setoids. Namely, a 2 -morphism $\alpha$ is a rule which to each object $x_{1}$ of $\mathcal{X}_{1}$ assigns an isomorphism $\alpha_{x_{1}}: g\left(x_{1}\right) \longrightarrow g^{\prime}\left(x_{1}\right)$ in the relevant fibre category of $\mathcal{X}_{2}$ such that the diagram

commutes. But since $f_{2}$ is faithful (see Algebraic Stacks, Lemma 76.15.2 this means that if $\alpha_{x_{1}}$ exists, then it is unique! In other words the 2-category Spaces $/ \mathcal{Y}$ is very close to being a category. Namely, if we replace 1-morphisms by isomorphism classes of 1-morphisms we obtain a category. We will often perform this replacement without further mention.

### 82.4. Points of algebraic stacks

04 XE Let $\mathcal{X}$ be an algebraic stack. Let $K, L$ be two fields and let $p: \operatorname{Spec}(K) \rightarrow \mathcal{X}$ and $q: \operatorname{Spec}(L) \rightarrow \mathcal{X}$ be morphisms. We say that $p$ and $q$ are equivalent if there exists a field $\Omega$ and a 2 -commutative diagram

04XF Lemma 82.4.1. The notion above does indeed define an equivalence relation on morphisms from spectra of fields into the algebraic stack $\mathcal{X}$.

Proof. It is clear that the relation is reflexive and symmetric. Hence we have to prove that it is transitive. This comes down to the following: Given a diagram

with both squares 2 -commutative we have to show that $p$ is equivalent to $p^{\prime}$. By the 2-Yoneda lemma (see Algebraic Stacks, Section 76.5) the morphisms $p, p^{\prime}$, and $q$ are given by objects $x, x^{\prime}$, and $y$ in the fibre categories of $\mathcal{X}$ over $\operatorname{Spec}(K)$, $\operatorname{Spec}\left(K^{\prime}\right)$, and $\operatorname{Spec}(L)$. The 2-commutativity of the squares means that there are isomorphisms $\alpha: a^{*} x \rightarrow b^{*} y$ and $\alpha^{\prime}:\left(a^{\prime}\right)^{*} x^{\prime} \rightarrow\left(b^{\prime}\right)^{*} y$ in the fibre categories of $\mathcal{X}$ over $\operatorname{Spec}(\Omega)$ and $\operatorname{Spec}\left(\Omega^{\prime}\right)$. Choose any field $\Omega^{\prime \prime}$ and embeddings $\Omega \rightarrow \Omega^{\prime \prime}$ and $\Omega^{\prime} \rightarrow \Omega^{\prime \prime}$ agreeing on $L$. Then we can extend the diagram above to

with commutative triangles and

$$
\left(q^{\prime}\right)^{*}\left(\alpha^{\prime}\right)^{-1} \circ\left(q^{\prime}\right)^{*} \alpha:(a \circ c)^{*} x \longrightarrow\left(a^{\prime} \circ c^{\prime}\right)^{*} x^{\prime}
$$

is an isomorphism in the fibre category over $\operatorname{Spec}\left(\Omega^{\prime \prime}\right)$. Hence $p$ is equivalent to $p^{\prime}$ as desired.

04XG Definition 82.4.2. Let $\mathcal{X}$ be an algebraic stack. A point of $\mathcal{X}$ is an equivalence class of morphisms from spectra of fields into $\mathcal{X}$. The set of points of $\mathcal{X}$ is denoted $|\mathcal{X}|$.

This agrees with our definition of points of algebraic spaces, see Properties of Spaces, Definition 53.4.1. Moreover, for a scheme we recover the usual notion of points, see Properties of Spaces, Lemma 53.4.2 If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks then there is an induced map $|f|:|\mathcal{X}| \rightarrow|\mathcal{Y}|$ which maps a representative $x: \operatorname{Spec}(K) \rightarrow \mathcal{X}$ to the representative $f \circ x: \operatorname{Spec}(K) \rightarrow \mathcal{Y}$. This is well defined: namely 2 -isomorphic 1 -morphisms remain 2 -isomorphic after pre- or postcomposing by a 1 -morphism because you can horizontally pre- or post-compose by the identity of the given 1-morphism. This holds in any (strict) $(2,1)$-category. If

is a 2-commutative diagram of algebraic stacks, then the diagram of sets

is commutative. In particular, if $\mathcal{X} \rightarrow \mathcal{Y}$ is an equivalence then $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is a bijection.

04XH Lemma 82.4.3. Let

be a fibre product of algebraic stacks. Then the map of sets of points

$$
|\mathcal{Z} \times \mathcal{Y} \mathcal{X}| \longrightarrow|\mathcal{Z}| \times_{|\mathcal{Y}|}|\mathcal{X}|
$$

is surjective.
Proof. Namely, suppose given fields $K, L$ and morphisms $\operatorname{Spec}(K) \rightarrow \mathcal{X}, \operatorname{Spec}(L) \rightarrow$ $\mathcal{Z}$, then the assumption that they agree as elements of $|\mathcal{Y}|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $\operatorname{Spec}(M) \rightarrow \operatorname{Spec}(K) \rightarrow \mathcal{X} \rightarrow \mathcal{Y}$ and $\operatorname{Spec}(M) \rightarrow \operatorname{Spec}(L) \rightarrow \mathcal{Z} \rightarrow \mathcal{Y}$ are 2 -isomorphic. And this is exactly the condition which says you get a morphism $\operatorname{Spec}(M) \rightarrow \mathcal{Z} \times \mathcal{Y} \mathcal{X}$.

04XI Lemma 82.4.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:
(1) $|f|:|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is surjective, and
(2) $f$ is surjective.

Proof. Assume (1). Let $T \rightarrow \mathcal{Y}$ be a morphism whose source is a scheme. To prove (2) we have to show that the morphism of algebraic spaces $T \times \mathcal{Y} \mathcal{X} \rightarrow T$ is surjective. By Morphisms of Spaces, Definition 54.5.2 this means we have to show that $|T \times \mathcal{Y} \mathcal{X}| \rightarrow|T|$ is surjective. Applying Lemma 82.4 .3 we see that this follows from (1).
Conversely, assume (2). Let $y: \operatorname{Spec}(K) \rightarrow \mathcal{Y}$ be a morphism from the spectrum of a field into $\mathcal{Y}$. By assumption the morphism $\operatorname{Spec}(K) \times_{y, \mathcal{Y}} \mathcal{X} \rightarrow \operatorname{Spec}(K)$ of algebraic spaces is surjective. By Morphisms of Spaces, Definition 54.5.2 this means there exists a field extension $K \subset K^{\prime}$ and a morphism $\operatorname{Spec}\left(K^{\prime}\right) \rightarrow \operatorname{Spec}(K) \times_{y, \mathcal{Y}} \mathcal{X}$ such that the left square of the diagram

is commutative. This shows that $|X| \rightarrow|\mathcal{Y}|$ is surjective.
Here is a lemma explaining how to compute the set of points in terms of a presentation.

04XJ Lemma 82.4.5. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X}=[U / R]$ be a presentation of $\mathcal{X}$, see Algebraic Stacks, Definition 76.16.5. Then the image of $|R| \rightarrow|U| \times|U|$ is an equivalence relation and $|\mathcal{X}|$ is the quotient of $|U|$ by this equivalence relation.

Proof. The assumption means that we have a smooth groupoid $(U, R, s, t, c)$ in algebraic spaces, and an equivalence $f:[U / R] \rightarrow \mathcal{X}$. We may assume $\mathcal{X}=[U / R]$. The induced morphism $p: U \rightarrow \mathcal{X}$ is smooth and surjective, see Algebraic Stacks, Lemma 76.17.2 Hence $|U| \rightarrow|\mathcal{X}|$ is surjective by Lemma 82.4.4. Note that $R=$
$U \times_{\mathcal{X}} U$, see Groupoids in Spaces, Lemma 65.21.2. Hence Lemma 82.4.3 implies the map

$$
|R| \longrightarrow|U| \times_{|\mathcal{X}|}|U|
$$

is surjective. Hence the image of $|R| \rightarrow|U| \times|U|$ is exactly the set of pairs $\left(u_{1}, u_{2}\right) \in$ $|U| \times|U|$ such that $u_{1}$ and $u_{2}$ have the same image in $|\mathcal{X}|$. Combining these two statements we get the result of the lemma.

04XK Remark 82.4.6. The result of Lemma 82.4.5 can be generalized as follows. Let $\mathcal{X}$ be an algebraic stack. Let $U$ be an algebraic space and let $f: U \rightarrow \mathcal{X}$ be a surjective morphism (which makes sense by Section 82.3). Let $R=U \times \mathcal{X} U$, let $(U, R, s, t, c)$ be the groupoid in algebraic spaces, and let $f_{c a n}:[U / R] \rightarrow \mathcal{X}$ be the canonical morphism as constructed in Algebraic Stacks, Lemma 76.16.1. Then the image of $|R| \rightarrow|U| \times|U|$ is an equivalence relation and $|\mathcal{X}|=|U| /|R|$. The proof of Lemma 82.4 .5 works without change. (Of course in general $[U / R]$ is not an algebraic stack, and in general $f_{c a n}$ is not an isomorphism.)

04XL Lemma 82.4.7. There exists a unique topology on the sets of points of algebraic stacks with the following properties:
(1) for every morphism of algebraic stacks $\mathcal{X} \rightarrow \mathcal{Y}$ the map $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is continuous, and
(2) for every morphism $U \rightarrow \mathcal{X}$ which is flat and locally of finite presentation with $U$ an algebraic space the map of topological spaces $|U| \rightarrow|\mathcal{X}|$ is continuous and open.

Proof. Choose a morphism $p: U \rightarrow \mathcal{X}$ which is surjective, flat, and locally of finite presentation with $U$ an algebraic space. Such exist by the definition of an algebraic stack, as a smooth morphism is flat and locally of finite presentation (see Morphisms of Spaces, Lemmas 54.36.5 and 54.36.7). We define a topology on $|\mathcal{X}|$ by the rule: $W \subset|\mathcal{X}|$ is open if and only if $|p|^{-1}(W)$ is open in $|U|$. To show that this is independent of the choice of $p$, let $p^{\prime}: U^{\prime} \rightarrow \mathcal{X}$ be another morphism which is surjective, flat, locally of finite presentation from an algebraic space to $\mathcal{X}$. Set $U^{\prime \prime}=U \times_{\mathcal{X}} U^{\prime}$ so that we have a 2 -commutative diagram

As $U \rightarrow \mathcal{X}$ and $U^{\prime} \rightarrow \mathcal{X}$ are surjective, flat, locally of finite presentation we see that $U^{\prime \prime} \rightarrow U^{\prime}$ and $U^{\prime \prime} \rightarrow U$ are surjective, flat and locally of finite presentation, see Lemma 82.3.2. Hence the maps $\left|U^{\prime \prime}\right| \rightarrow\left|U^{\prime}\right|$ and $\left|U^{\prime \prime}\right| \rightarrow|U|$ are continuous, open and surjective, see Morphisms of Spaces, Definition 54.5.2 and Lemma 54.29.6. This clearly implies that our definition is independent of the choice of $p: U \rightarrow \mathcal{X}$.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. By Algebraic Stacks, Lemma 76.15 .1 we can find a 2 -commutative diagram

with surjective smooth vertical arrows. Consider the associated commutative diagram

of sets. If $W \subset|\mathcal{Y}|$ is open, then by the definition above this means exactly that $|y|^{-1}(W)$ is open in $|V|$. Since $|a|$ is continuous we conclude that $|a|^{-1}|y|^{-1}(W)=$ $|x|^{-1}|f|^{-1}(W)$ is open in $|W|$ which means by definition that $|f|^{-1}(W)$ is open in $|\mathcal{X}|$. Thus $|f|$ is continuous.
Finally, we have to show that if $U$ is an algebraic space, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation, then $|U| \rightarrow|\mathcal{X}|$ is open. Let $V \rightarrow \mathcal{X}$ be surjective, flat, and locally of finite presentation with $V$ an algebraic space. Consider the commutative diagram

Now the morphism $U \times_{\mathcal{X}} V \rightarrow U$ is surjective, i.e, $f:\left|U \times_{\mathcal{X}} V\right| \rightarrow|U|$ is surjective. The left top horizontal arrow is surjective, see Lemma 82.4.3. The morphism $U \times \mathcal{X}$ $V \rightarrow V$ is flat and locally of finite presentation, hence $d \circ e:\left|U \times_{\mathcal{X}} V\right| \rightarrow|V|$ is open, see Morphisms of Spaces, Lemma 54.29.6. Pick $W \subset|U|$ open. The properties above imply that $b^{-1}(a(W))=(d \circ e)\left(f^{-1}(W)\right)$ is open, which by construction means that $a(W)$ is open as desired.
04Y8 Definition 82.4.8. Let $\mathcal{X}$ be an algebraic stack. The underlying topological space of $\mathcal{X}$ is the set of points $|\mathcal{X}|$ endowed with the topology constructed in Lemma 82.4.7.

This definition does not conflict with the already existing topology on $|\mathcal{X}|$ if $\mathcal{X}$ is an algebraic space.
04Y9 Lemma 82.4.9. Let $\mathcal{X}$ be an algebraic stack. Every point of $|\mathcal{X}|$ has a fundamental system of quasi-compact open neighbourhoods. In particular $|\mathcal{X}|$ is locally quasicompact in the sense of Topology, Definition5.12.1.
Proof. This follows formally from the fact that there exists a scheme $U$ and a surjective, open, continuous map $U \rightarrow|\mathcal{X}|$ of topological spaces. Namely, if $U \rightarrow$ $\mathcal{X}$ is surjective and smooth, then Lemma 82.4.7 guarantees that $|U| \rightarrow|\mathcal{X}|$ is continuous, surjective, and open.

### 82.5. Surjective morphisms

04ZR Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Section 82.3 we have already defined what it means for $f$ to be surjective. In Lemma 82.4.4 we have seen that this is equivalent to requiring $|f|:|\mathcal{X}| \rightarrow|\mathcal{Y}|$ to be surjective. This clears the way for the following definition.
04ZS Definition 82.5.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is surjective if the map $|f|:|\mathcal{X}| \rightarrow|\mathcal{Y}|$ of associated topological spaces is surjective.

Here are some lemmas.
04ZT Lemma 82.5.2. The composition of surjective morphisms is surjective.
Proof. Omitted.
04ZU Lemma 82.5.3. The base change of a surjective morphism is surjective.
Proof. Omitted. Hint: Use Lemma 82.4.3.

06PM Lemma 82.5.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ be a surjective morphism of algebraic stacks. If the base change $f^{\prime}: \mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$ of $f$ is surjective, then $f$ is surjective.

Proof. Immediate from Lemma 82.4.3

06PN Lemma 82.5.5. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is surjective so is $\mathcal{Y} \rightarrow \mathcal{Z}$.

Proof. Immediate.

### 82.6. Quasi-compact algebraic stacks

04YA The following definition is equivalent with the definition for algebraic spaces by Properties of Spaces, Lemma 53.5.2.

04YB Definition 82.6.1. Let $\mathcal{X}$ be an algebraic stack. We say $\mathcal{X}$ is quasi-compact if and only if $|\mathcal{X}|$ is quasi-compact.

04YC Lemma 82.6.2. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent:
(1) $\mathcal{X}$ is quasi-compact,
(2) there exists a surjective smooth morphism $U \rightarrow \mathcal{X}$ with $U$ a quasi-compact scheme,
(3) there exists a surjective smooth morphism $U \rightarrow \mathcal{X}$ with $U$ a quasi-compact algebraic space, and
(4) there exists a surjective morphism $\mathcal{U} \rightarrow \mathcal{X}$ of algebraic stacks such that $\mathcal{U}$ is quasi-compact.

Proof. We will use Lemma 82.4.4. Suppose $\mathcal{U}$ and $\mathcal{U} \rightarrow \mathcal{X}$ are as in (4). Then since $|\mathcal{U}| \rightarrow|\mathcal{X}|$ is surjective and continuous we conclude that $|\mathcal{X}|$ is quasi-compact. Thus (4) implies (1). The implications $(2) \Rightarrow(3) \Rightarrow(4)$ are immediate. Assume (1), i.e., $\mathcal{X}$ is quasi-compact, i.e., that $|\mathcal{X}|$ is quasi-compact. Choose a scheme $U$ and a surjective smooth morphism $U \rightarrow \mathcal{X}$. Then since $|U| \rightarrow|\mathcal{X}|$ is open we see that there exists a quasi-compact open $U^{\prime} \subset U$ such that $\left|U^{\prime}\right| \rightarrow|X|$ is surjective (and still smooth). Hence (2) holds.

04YD Lemma 82.6.3. A finite disjoint union of quasi-compact algebraic stacks is a quasi-compact algebraic stack.

Proof. This is clear from the corresponding topological fact.
82.7. Properties of algebraic stacks defined by properties of schemes

04 YE Any smooth local property of schemes gives rise to a corresponding property of algebraic stacks via the following lemma. Note that a property of schemes which is smooth local is also étale local as any étale covering is also a smooth covering. Hence for a smooth local property $P$ of schemes we know what it means to say that an algebraic space has $P$, see Properties of Spaces, Section 82.7.

04YF Lemma 82.7.1. Let $\mathcal{P}$ be a property of schemes which is local in the smooth topology, see Descent, Definition 34.11.1. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent
(1) for some scheme $U$ and some surjective smooth morphism $U \rightarrow \mathcal{X}$ the scheme $U$ has property $\mathcal{P}$,
(2) for every scheme $U$ and every smooth morphism $U \rightarrow \mathcal{X}$ the scheme $U$ has property $\mathcal{P}$,
(3) for some algebraic space $U$ and some surjective smooth morphism $U \rightarrow \mathcal{X}$ the algebraic space $U$ has property $\mathcal{P}$, and
(4) for every algebraic space $U$ and every smooth morphism $U \rightarrow \mathcal{X}$ the algebraic space $U$ has property $\mathcal{P}$.
If $\mathcal{X}$ is a scheme this is equivalent to $\mathcal{P}(U)$. If $\mathcal{X}$ is an algebraic space this is equivalent to $X$ having property $\mathcal{P}$.

Proof. Let $U \rightarrow \mathcal{X}$ surjective and smooth with $U$ an algebraic space. Let $V \rightarrow \mathcal{X}$ be a smooth morphism with $V$ an algebraic space. Choose schemes $U^{\prime}$ and $V^{\prime}$ and surjective étale morphisms $U^{\prime} \rightarrow U$ and $V^{\prime} \rightarrow V$. Finally, choose a scheme $W$ and a surjective étale morphism $W \rightarrow V^{\prime} \times \mathcal{X} U^{\prime}$. Then $W \rightarrow V^{\prime}$ and $W \rightarrow U^{\prime}$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 54.38.6 and 54.36.2. Moreover, $W \rightarrow V^{\prime}$ is surjective as $U^{\prime} \rightarrow \mathcal{X}$ is surjective. Hence, we have

$$
\mathcal{P}(U) \Leftrightarrow \mathcal{P}\left(U^{\prime}\right) \Rightarrow \mathcal{P}(W) \Rightarrow \mathcal{P}\left(V^{\prime}\right) \Leftrightarrow \mathcal{P}(V)
$$

where the equivalences are by definition of property $\mathcal{P}$ for algebraic spaces, and the two implications come from Descent, Definition 34.11.1. This proves (3) $\Rightarrow$ (4).

The implications $(2) \Rightarrow(1),(1) \Rightarrow(3)$, and $(4) \Rightarrow(2)$ are immediate.
04YG Definition 82.7.2. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{P}$ be a property of schemes which is local in the smooth topology. We say $\mathcal{X}$ has property $\mathcal{P}$ if any of the equivalent conditions of Lemma 82.7.1 hold.

04YH Remark 82.7.3. Here is a list of properties which are local for the smooth topology (keep in mind that the fpqc, fppf, and syntomic topologies are stronger than the smooth topology):
(1) locally Noetherian, see Descent, Lemma 34.12.1,
(2) Jacobson, see Descent, Lemma 34.12.2,
(3) locally Noetherian and $\left(S_{k}\right)$, see Descent, Lemma 34.13.1.
(4) Cohen-Macaulay, see Descent, Lemma 34.13.2,
(5) reduced, see Descent, Lemma 34.14.1.
(6) normal, see Descent, Lemma 34.14.2,
(7) locally Noetherian and $\left(R_{k}\right)$, see Descent, Lemma 34.14.3,
(8) regular, see Descent, Lemma 34.14.4,
(9) Nagata, see Descent, Lemma 34.14.5.

Any smooth local property of germs of schemes gives rise to a corresponding property of algebraic stacks. Note that a property of germs which is smooth local is also étale local. Hence for a smooth local property of germs of schemes $P$ we know what it means to say that an algebraic space $X$ has property $P$ at $x \in|X|$, see Properties of Spaces, Section 82.7.

04YI Lemma 82.7.4. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$ be a point of $\mathcal{X}$. Let $\mathcal{P}$ be a property of germs of schemes which is smooth local, see Descent, Definition 34.17.1. The following are equivalent
(1) for any smooth morphism $U \rightarrow \mathcal{X}$ with $U$ a scheme and $u \in U$ with $a(u)=x$ we have $\mathcal{P}(U, u)$,
(2) for some smooth morphism $U \rightarrow \mathcal{X}$ with $U$ a scheme and some $u \in U$ with $a(u)=x$ we have $\mathcal{P}(U, u)$,
(3) for any smooth morphism $U \rightarrow \mathcal{X}$ with $U$ an algebraic space and $u \in|U|$ with $a(u)=x$ the algebraic space $U$ has property $\mathcal{P}$ at $u$, and
(4) for some smooth morphism $U \rightarrow \mathcal{X}$ with $U$ a an algebraic space and some $u \in|U|$ with $a(u)=x$ the algebraic space $U$ has property $\mathcal{P}$ at $u$.
If $\mathcal{X}$ is representable, then this is equivalent to $\mathcal{P}(\mathcal{X}, x)$. If $\mathcal{X}$ is an algebraic space then this is equivalent to $\mathcal{X}$ having property $\mathcal{P}$ at $x$.

Proof. Let $a: U \rightarrow \mathcal{X}$ and $u \in|U|$ as in (3). Let $b: V \rightarrow \mathcal{X}$ be another smooth morphism with $V$ an algebraic space and $v \in|V|$ with $b(v)=x$ also. Choose a scheme $U^{\prime}$, an étale morphism $U^{\prime} \rightarrow U$ and $u^{\prime} \in U^{\prime}$ mapping to $u$. Choose a scheme $V^{\prime}$, an étale morphism $V^{\prime} \rightarrow V$ and $v^{\prime} \in V^{\prime}$ mapping to $v$. By Lemma 82.4.3 there exists a point $\bar{w} \in\left|V^{\prime} \times_{\mathcal{X}} U^{\prime}\right|$ mapping to $u^{\prime}$ and $v^{\prime}$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow V^{\prime} \times \mathcal{X} U^{\prime}$. We may choose a $w \in|W|$ mapping to $\bar{w}$ (see Properties of Spaces, Lemma 53.4.4). Then $W \rightarrow V^{\prime}$ and $W \rightarrow U^{\prime}$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 54.38.6 and 54.36.2. Hence

$$
\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}\left(U^{\prime}, u^{\prime}\right) \Leftrightarrow \mathcal{P}(W, w) \Leftrightarrow \mathcal{P}\left(V^{\prime}, v^{\prime}\right) \Leftrightarrow \mathcal{P}(V, v)
$$

The outer two equivalences by Properties of Spaces, Definition 53.7.5 and the other two by what it means to be a smooth local property of germs of schemes. This proves $(4) \Rightarrow(3)$.
The implications $(1) \Rightarrow(2),(2) \Rightarrow(4)$, and $(3) \Rightarrow(1)$ are immediate.
04YJ Definition 82.7.5. Let $\mathcal{P}$ be a property of germs of schemes which is smooth local. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. We say $\mathcal{X}$ has property $\mathcal{P}$ at $x$ if any of the equivalent conditions of Lemma 82.7 .4 holds.

### 82.8. Monomorphisms of algebraic stacks

04ZV We define a monomorphism of algebraic stacks in the following way. We will see in Lemma 82.8.4 that this is compatible with the corresponding 2-category theoretic notion.

04ZW Definition 82.8.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is a monomorphism if it is representable by algebraic spaces and a monomorphism in the sense of Section 82.3 .

First some basic lemmas.
04ZX Lemma 82.8.2. Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a monomorphism. Then $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{X}$ is a monomorphism.

Proof. This follows from the general discussion in Section 82.3 .
04ZY Lemma 82.8.3. Compositions of monomorphisms of algebraic stacks are monomorphisms.

Proof. This follows from the general discussion in Section 82.3 and Morphisms of Spaces, Lemma 54.10.4.

04ZZ Lemma 82.8.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent:
(1) $f$ is a monomorphism,
(2) $f$ is fully faithful,
(3) the diagonal $\Delta_{f}: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ is an equivalence, and
(4) there exists an algebraic space $W$ and a surjective, flat morphism $W \rightarrow \mathcal{Y}$ which is locally of finite presentation such that $V=\mathcal{X} \times \mathcal{Y} W$ is an algebraic space, and the morphism $V \rightarrow W$ is a monomorphism of algebraic spaces.
Proof. The equivalence of (1) and (4) follows from the general discussion in Section 82.3 and in particular Lemmas 82.3.1 and 82.3.3.

The equivalence of (2) and (3) is Categories, Lemma 4.34.9
Assume the equivalent conditions (2) and (3). Then $f$ is representable by algebraic spaces according to Algebraic Stacks, Lemma 76.15.2. Moreover, the 2-Yoneda lemma combined with the fully faithfulness implies that for every scheme $T$ the functor

$$
\operatorname{Mor}(T, \mathcal{X}) \longrightarrow \operatorname{Mor}(T, \mathcal{Y})
$$

is fully faithful. Hence given a morphism $y: T \rightarrow \mathcal{Y}$ there exists up to unique 2 -isomorphism at most one morphism $x: T \rightarrow \mathcal{X}$ such that $y \cong f \circ x$. In particular, given a morphism of schemes $h: T^{\prime} \rightarrow T$ there exists at most one lift $\tilde{h}: T^{\prime} \rightarrow$ $T \times \mathcal{Y} \mathcal{X}$ of $h$. Thus $T \times \mathcal{Y} \mathcal{X} \rightarrow T$ is a monomorphism of algebraic spaces, which proves that (1) holds.

Finally, assume that (1) holds. Then for any scheme $T$ and morphism $y: T \rightarrow \mathcal{Y}$ the fibre product $T \times \mathcal{Y} \mathcal{X}$ is an algebraic space, and $T \times \mathcal{Y} \mathcal{X} \rightarrow T$ is a monomorphism. Hence there exists up to unique isomorphism exactly one pair $(x, \alpha)$ where $x: T \rightarrow$ $\mathcal{X}$ is a morphism and $\alpha: f \circ x \rightarrow y$ is a 2-morphism. Applying the 2-Yoneda lemma this says exactly that $f$ is fully faithful, i.e., that (2) holds.

0500 Lemma 82.8.5. A monomorphism of algebraic stacks induces an injective map of sets of points.

Proof. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a monomorphism of algebraic stacks. Suppose that $x_{i}: \operatorname{Spec}\left(K_{i}\right) \rightarrow \mathcal{X}$ be morphisms such that $f \circ x_{1}$ and $f \circ x_{2}$ define the same element of $|\mathcal{Y}|$. Applying the definition we find a common extension $\Omega$ with corresponding morphisms $c_{i}: \operatorname{Spec}(\Omega) \rightarrow \operatorname{Spec}\left(K_{i}\right)$ and a 2-isomorphism $\beta: f \circ x_{1} \circ c_{1} \rightarrow f \circ x_{1} \circ c_{2}$. As $f$ is fully faithful, see Lemma 82.8.4 we can lift $\beta$ to an isomorphism $\alpha$ : $f \circ x_{1} \circ c_{1} \rightarrow f \circ x_{1} \circ c_{2}$. Hence $x_{1}$ and $x_{2}$ define the same point of $|\mathcal{X}|$ as desired.

### 82.9. Immersions of algebraic stacks

04YK Immersions of algebraic stacks are defined as follows.
04YL Definition 82.9.1. Immersions.
(1) A morphism of algebraic stacks is called an open immersion if it is representable, and an open immersion in the sense of Section 82.3 .
(2) A morphism of algebraic stacks is called a closed immersion if it is representable, and a closed immersion in the sense of Section 82.3 .
(3) A morphism of algebraic stacks is called an immersion if it is representable, and an immersion in the sense of Section 82.3
This is not the most convenient way to think about immersions for us. For us it is a little bit more convenient to think of an immersion as a morphism of algebraic stacks which is representable by algebraic spaces and is an immersion in the sense of Section 82.3. Similarly for closed and open immersions. Since this is clearly equivalent to the notion just defined we shall use this characterization without further mention. We prove a few simple lemmas about this notion.
0501 Lemma 82.9.2. Let $\mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a (closed, resp. open) immersion. Then $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{X}$ is a (closed, resp. open) immersion.
Proof. This follows from the general discussion in Section 82.3 .
0502 Lemma 82.9.3. Compositions of immersions of algebraic stacks are immersions. Similarly for closed immersions and open immersions.
Proof. This follows from the general discussion in Section 82.3 and Spaces, Lemma 52.12 .2 .

0503 Lemma 82.9.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. let $W$ be an algebraic space and let $W \rightarrow \mathcal{Y}$ be a surjective, flat morphism which is locally of finite presentation. The following are equivalent:
(1) $f$ is an (open, resp. closed) immersion, and
(2) $V=W \times \mathcal{Y} \mathcal{X}$ is an algebraic space, and $V \rightarrow W$ is an (open, resp. closed) immersion.
Proof. This follows from the general discussion in Section 82.3 and in particular Lemmas 82.3.1 and 82.3.3.
0504 Lemma 82.9.5. An immersion is a monomorphism.
Proof. See Morphisms of Spaces, Lemma 54.10.7.
The following two lemmas explain how to think about immersions in terms of presentations.
0505 Lemma 82.9.6. Let $(U, R, s, t, c)$ be a smooth groupoid in algebraic spaces. Let $i: \mathcal{Z} \rightarrow[U / R]$ be an immersion. Then there exists an $R$-invariant locally closed subspace $Z \subset U$ and a presentation $\left[Z / R_{Z}\right] \rightarrow \mathcal{Z}$ where $R_{Z}$ is the restriction of $R$ to $Z$ such that

is 2-commutative. If $i$ is a closed (resp. open) immersion then $Z$ is a closed (resp. open) subspace of $U$.
Proof. By Lemma 82.3.6 we get a commutative diagram

where $U^{\prime}=\mathcal{Z} \times_{[U / R]} U$ and $R^{\prime}=\mathcal{Z} \times{ }_{[U / R]} R$. Since $\mathcal{Z} \rightarrow[U / R]$ is an immersion we see that $U^{\prime} \rightarrow U$ is an immersion of algebraic spaces. Let $Z \subset U$ be the locally closed subspace such that $U^{\prime} \rightarrow U$ factors through $Z$ and induces an isomorphism $U^{\prime} \rightarrow Z$. It is clear from the construction of $R^{\prime}$ that $R^{\prime}=U^{\prime} \times_{U, t} R=R \times_{s, U} U^{\prime}$. This implies that $Z \cong U^{\prime}$ is $R$-invariant and that the image of $R^{\prime} \rightarrow R$ identifies $R^{\prime}$ with the restriction $R_{Z}=s^{-1}(Z)=t^{-1}(Z)$ of $R$ to $Z$. Hence the lemma holds.

04YN Lemma 82.9.7. Let $(U, R, s, t, c)$ be a smooth groupoid in algebraic spaces. Let $\mathcal{X}=[U / R]$ be the associated algebraic stack, see Algebraic Stacks, Theorem 76.17.3. Let $Z \subset U$ be an $R$-invariant locally closed subspace. Then

$$
\left[Z / R_{Z}\right] \longrightarrow[U / R]
$$

is an immersion of algebraic stacks, where $R_{Z}$ is the restriction of $R$ to $Z$. If $Z \subset U$ is open (resp. closed) then the morphism is an open (resp. closed) immersion of algebraic stacks.

Proof. Recall that by Groupoids in Spaces, Definition 65.17.1 (see also discussion following the definition) we have $R_{Z}=s^{-1}(Z)=t^{-1}(Z)$ as locally closed subspaces of $R$. Hence the two morphisms $R_{Z} \rightarrow Z$ are smooth as base changes of $s$ and $t$. Hence ( $Z, R_{Z},\left.s\right|_{R_{Z}},\left.t\right|_{R_{Z}},\left.c\right|_{R_{Z} \times_{s, Z, t} R_{Z}}$ ) is a smooth groupoid in algebraic spaces, and we see that $\left[Z / R_{Z}\right]$ is an algebraic stack, see Algebraic Stacks, Theorem 76.17.3. The assumptions of Groupoids in Spaces, Lemma 65.24 .3 are all satisfied and it follows that we have a 2-fibre square

It follows from this and Lemma 82.3.1 that $\left[Z / R_{Z}\right] \rightarrow[U / R]$ is representable by algebraic spaces, whereupon it follows from Lemma 82.3 .3 that the right vertical arrow is an immersion (resp. closed immersion, resp. open immersion) if and only if the left vertical arrow is.

We can define open, closed, and locally closed substacks as follows.
04YM Definition 82.9.8. Let $\mathcal{X}$ be an algebraic stack.
(1) An open substack of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $\mathcal{X}^{\prime}$ is an algebraic stack and $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is an open immersion.
(2) A closed substack of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $\mathcal{X}^{\prime}$ is an algebraic stack and $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is a closed immersion.
(3) A locally closed substack of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $\mathcal{X}^{\prime}$ is an algebraic stack and $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is an immersion.

This definition should be used with caution. Namely, if $f: \mathcal{X} \rightarrow \mathcal{Y}$ is an equivalence of algebraic stacks and $\mathcal{X}^{\prime} \subset \mathcal{X}$ is an open substack, then it is not necessarily the case that the subcategory $f\left(\mathcal{X}^{\prime}\right)$ is an open substack of $\mathcal{Y}$. The problem is that it may not be a strictly full subcategory; but this is also the only problem. Here is a formal statement.

0506 Lemma 82.9.9. For any immersion $i: \mathcal{Z} \rightarrow \mathcal{X}$ there exists a unique locally closed substack $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $i$ factors as the composition of an equivalence $i^{\prime}: \mathcal{Z} \rightarrow \mathcal{X}^{\prime}$ followed by the inclusion morphism $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$. If $i$ is a closed (resp. open) immersion, then $\mathcal{X}^{\prime}$ is a closed (resp. open) substack of $\mathcal{X}$.

Proof. Omitted.
0507 Lemma 82.9.10. Let $[U / R] \rightarrow \mathcal{X}$ be a presentation of an algebraic stack. There is a canonical bijection
$R$-invariant locally closed subspaces $Z$ of $U \leftrightarrow$ locally closed substacks $\mathcal{Z}$ of $\mathcal{X}$
where if $Z$ corresponds to $\mathcal{Z}$, then $\left[Z / R_{Z}\right] \rightarrow \mathcal{Z}$ is a presentation fitting into $a$ 2 -commutative diagram with the given presentation of $\mathcal{X}$. Similarly for closed substacks and open substacks.

Proof. Omitted. Hints: Use Lemma 82.9 .6 to go from right to left and Lemma 82.9 .7 from left to right.

06FJ Lemma 82.9.11. Let $\mathcal{X}$ be an algebraic stack. The rule $\mathcal{U} \mapsto|\mathcal{U}|$ defines an inclusion preserving bijection between open substacks of $\mathcal{X}$ and open subsets of $|\mathcal{X}|$.
Proof. Choose a presentation $[U / R] \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemma 76.16.2, By Lemma 82.9 .10 we see that open substacks correspond to $R$-invariant open subschemes of $U$. On the other hand Lemmas 82.4 .5 and 82.4 .7 guarantee these correspond bijectively to open subsets of $|\mathcal{X}|$.

05UP Lemma 82.9.12. Let $\mathcal{X}$ be an algebraic stack. Let $U$ be an algebraic space and $U \rightarrow \mathcal{X}$ a surjective smooth morphism. For an open immersion $V \hookrightarrow U$, there exists an algebraic stack $\mathcal{Y}$, an open immersion $\mathcal{Y} \rightarrow \mathcal{X}$, and a surjective smooth morphism $V \rightarrow \mathcal{Y}$.

Proof. We define a category fibred in groupoids $\mathcal{Y}$ by letting the fiber category $\mathcal{Y}_{T}$ over an object $T$ of $(S c h / S)_{f p p f}$ be the full subcategory of $\mathcal{X}_{T}$ consisting of all $y \in \operatorname{Ob}\left(\mathcal{X}_{T}\right)$ such that the projection morphism $V \times_{\mathcal{X}, y} T \rightarrow T$ surjective. Now for any morphism $x: T \rightarrow \mathcal{X}$, the 2-fibred product $T \times_{x, \mathcal{X}} \mathcal{Y}$ has fiber category over $T^{\prime}$ consisting of triples $\left(f: T^{\prime} \rightarrow T, y \in \mathcal{X}_{T^{\prime}}, f^{*} x \simeq y\right)$ such that $V \times_{\mathcal{X}, y} T^{\prime} \rightarrow T^{\prime}$ is surjective. Note that $T \times_{x, \mathcal{X}} \mathcal{Y}$ is fibered in setoids since $\mathcal{Y} \rightarrow \mathcal{X}$ is faithful (see Stacks, Lemma 8.6.7). Now the isomorphism $f^{*} x \simeq y$ gives the diagram

where both squares are cartesian. The morphism $V \times{ }_{\mathcal{X}, x} T \rightarrow T$ is smooth by base change, and hence open. Let $T_{0} \subset T$ be its image. From the cartesian squares we deduce that $V \times_{\mathcal{X}, y} T^{\prime} \rightarrow T^{\prime}$ is surjective if and only if $f$ lands in $T_{0}$. Therefore $T \times_{x, \mathcal{X}} \mathcal{Y}$ is representable by $T_{0}$, so the inclusion $\mathcal{Y} \rightarrow \mathcal{X}$ is an open immersion. By

Algebraic Stacks, Lemma 76.15 .5 we conclude that $\mathcal{Y}$ is an algebraic stack. Lastly if we denote the morphism $V \rightarrow \mathcal{X}$ by $g$, we have $V \times \mathcal{X} V \rightarrow V$ is surjective (the diagonal gives a section). Hence $g$ is in the image of $\mathcal{Y}_{V} \rightarrow \mathcal{X}_{V}$, i.e., we obtain a morphism $g^{\prime}: V \rightarrow \mathcal{Y}$ fitting into the commutative diagram

Since $V \times_{g, \mathcal{X}} \mathcal{Y} \rightarrow V$ is a monomorphism, it is in fact an isomorphism since $\left(1, g^{\prime}\right)$ defines a section. Therefore $g^{\prime}: V \rightarrow \mathcal{Y}$ is a smooth morphism, as it is the base change of the smooth morphism $g: V \rightarrow \mathcal{X}$. It is surjective by our construction of $\mathcal{Y}$ which finishes the proof of the lemma.

05UQ Lemma 82.9.13. Let $\mathcal{X}$ be an algebraic stack and $\mathcal{X}_{i} \subset \mathcal{X}$ a collection of open substacks indexed by $i \in I$. Then there exists an open substack, which we denote $\bigcup_{i \in I} \mathcal{X}_{i} \subset \mathcal{X}$, such that the $\mathcal{X}_{i}$ are open substacks covering it.

Proof. We define a fibred subcategory $\mathcal{X}^{\prime}=\bigcup_{i \in I} \mathcal{X}_{i}$ by letting the fiber category over an object $T$ of $(S c h / S)_{f p p f}$ be the full subcategory of $\mathcal{X}_{T}$ consisting of all $x \in \mathrm{Ob}\left(\mathcal{X}_{T}\right)$ such that the morphism $\coprod_{i \in I}\left(\mathcal{X}_{i} \times \mathcal{X} T\right) \rightarrow T$ is surjective. Let $x_{i} \in \operatorname{Ob}\left(\left(\mathcal{X}_{i}\right)_{T}\right)$. Then $\left(x_{i}, 1\right)$ gives a section of $\mathcal{X}_{i} \times \mathcal{X} T \rightarrow T$, so we have an isomorphism. Thus $\mathcal{X}_{i} \subset \mathcal{X}^{\prime}$ is a full subcategory. Now let $x \in \operatorname{Ob}\left(\mathcal{X}_{T}\right)$. Then $\mathcal{X}_{i} \times_{\mathcal{X}} T$ is representable by an open subscheme $T_{i} \subset T$. The 2-fibred product $\mathcal{X}^{\prime} \times \mathcal{X} T$ has fiber over $T^{\prime}$ consisting of $\left(y \in \mathcal{X}_{T^{\prime}}, f: T^{\prime} \rightarrow T, f^{*} x \simeq y\right)$ such that $\coprod\left(\mathcal{X}_{i} \times_{\mathcal{X}, y} T^{\prime}\right) \rightarrow T^{\prime}$ is surjective. The isomorphism $f^{*} x \simeq y$ induces an isomorphism $\mathcal{X}_{i} \times_{\mathcal{X}, y} T^{\prime} \simeq T_{i} \times_{T} T^{\prime}$. Then the $T_{i} \times_{T} T^{\prime}$ cover $T^{\prime}$ if and only if $f$ lands in $\bigcup T_{i}$. Therefore we have a diagram

with both squares cartesian. By Algebraic Stacks, Lemma 76.15 .5 we conclude that $\mathcal{X}^{\prime} \subset \mathcal{X}$ is algebraic and an open substack. It is also clear from the cartesian squares above that the morphism $\coprod_{i \in I} \mathcal{X}_{i} \rightarrow \mathcal{X}^{\prime}$ which finishes the proof of the lemma.

05UR Lemma 82.9.14. Let $\mathcal{X}$ be an algebraic stack and $\mathcal{X}^{\prime} \subset \mathcal{X}$ a quasi-compact open substack. Suppose that we have a collection of open substacks $\mathcal{X}_{i} \subset \mathcal{X}$ indexed by $i \in I$ such that $\mathcal{X}^{\prime} \subset \bigcup_{i \in I} \mathcal{X}_{i}$, where we define the union as in Lemma 82.9.13. Then there exists a finite subset $I^{\prime} \subset I$ such that $\mathcal{X}^{\prime} \subset \bigcup_{i \in I^{\prime}} \mathcal{X}_{i}$.

Proof. Since $\mathcal{X}$ is algebraic, there exists a scheme $U$ with a surjective smooth morphism $U \rightarrow \mathcal{X}$. Let $U_{i} \subset U$ be the open subscheme representing $\mathcal{X}_{i} \times \mathcal{X} U$ and $U^{\prime} \subset U$ the open subscheme representing $\mathcal{X}^{\prime} \times \mathcal{X} U$. By hypothesis, $U^{\prime} \subset \bigcup_{i \in I} U_{i}$. From the proof of Lemma 82.6.2 there is a quasi-compact open $V \subset U^{\prime}$ such that $V \rightarrow \mathcal{X}^{\prime}$ is a surjective smooth morphism. Therefore there exists a finite subset $I^{\prime} \subset I$ such that $V \subset \bigcup_{i \in I^{\prime}} U_{i}$. We claim that $\mathcal{X}^{\prime} \subset \bigcup_{i \in I^{\prime}} \mathcal{X}_{i}$. Take $x \in \operatorname{Ob}\left(\mathcal{X}_{T}^{\prime}\right)$ for $T \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$. Since $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is a monomorphism, we have cartesian
squares

By base change, $V \times_{\mathcal{X}} T \rightarrow T$ is surjective. Therefore $\bigcup_{i \in I^{\prime}} U_{i} \times_{\mathcal{X}} T \rightarrow T$ is also surjective. Let $T_{i} \subset T$ be the open subscheme representing $\mathcal{X}_{i} \times \mathcal{X} T$. By a formal argument, we have a Cartesian square

where the vertical arrows are surjective by base change. Since $U_{i} \times_{\mathcal{X}_{i}} T_{i} \simeq U_{i} \times{ }_{\mathcal{X}} T$, we find that $\bigcup_{i \in I^{\prime}} T_{i}=T$. Hence $x$ is an object of $\left(\bigcup_{i \in I^{\prime}} \mathcal{X}_{i}\right)_{T}$ by definition of the union. Observe that the inclusion $\mathcal{X}^{\prime} \subset \bigcup_{i \in I^{\prime}} \mathcal{X}_{i}$ is automatically an open substack.

05WE Lemma 82.9.15. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X}_{i}, i \in I$ be a set of open substacks of $\mathcal{X}$. Assume
(1) $\mathcal{X}=\bigcup_{i \in I} \mathcal{X}$, and
(2) each $\mathcal{X}_{i}$ is an algebraic space.

Then $\mathcal{X}$ is an algebraic space.
Proof. Apply Stacks, Lemma 8.6 .10 to the morphism $\coprod_{i \in I} \mathcal{X}_{i} \rightarrow \mathcal{X}$ and the morphism id : $\mathcal{X} \rightarrow \mathcal{X}$ to see that $\mathcal{X}$ is a stack in setoids. Hence $\mathcal{X}$ is an algebraic space, see Algebraic Stacks, Proposition 76.13.3.

05WF Lemma 82.9.16. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X}_{i}, i \in I$ be a set of open substacks of $\mathcal{X}$. Assume
(1) $\mathcal{X}=\bigcup_{i \in I} \mathcal{X}_{i}$, and
(2) each $\mathcal{X}_{i}$ is a scheme

Then $\mathcal{X}$ is a scheme.
Proof. By Lemma 82.9 .15 we see that $\mathcal{X}$ is an algebraic space. Since any algebraic space has a largest open subspace which is a scheme, see Properties of Spaces, Lemma 53.12.1 we see that $\mathcal{X}$ is a scheme.

The following lemma is the analogue of More on Groupoids, Lemma 39.5.1.
06M3 Lemma 82.9.17. Let $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ be properties of morphisms of algebraic spaces. Assume
(1) $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ are fppf local on the target and stable under arbitrary base change,
(2) smooth $\Rightarrow \mathcal{R}$,
(3) for any morphism $f: X \rightarrow Y$ which has $\mathcal{Q}$ there exists a largest open subspace $W(\mathcal{P}, f) \subset X$ such that $\left.f\right|_{W(\mathcal{P}, f)}$ has $\mathcal{P}$, and
(4) for any morphism $f: X \rightarrow Y$ which has $\mathcal{Q}$, and any morphism $Y^{\prime} \rightarrow Y$ which has $\mathcal{R}$ we have $Y^{\prime} \times_{Y} W(\mathcal{P}, f)=W\left(\mathcal{P}, f^{\prime}\right)$, where $f^{\prime}: X_{Y^{\prime}} \rightarrow Y^{\prime}$ is the base change of $f$.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphisms of algebraic stacks representable by algebraic spaces. Assume $f$ has $\mathcal{Q}$. Then
(A) there exists a largest open substack $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $\left.f\right|_{\mathcal{X}^{\prime}}$ has $\mathcal{P}$, and
(B) if $\mathcal{Z} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has $\mathcal{R}$ then $\mathcal{Z} \times \mathcal{Y} \mathcal{X}^{\prime}$ is the largest open substack of $\mathcal{Z} \times \mathcal{Y} \mathcal{X}$ over which the base change $i d_{\mathcal{Z}} \times f$ has property $\mathcal{P}$.

Proof. Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U=$ $V \times \mathcal{Y} \mathcal{X}$ and let $f^{\prime}: U \rightarrow V$ be the base change of $f$. The morphism of algebraic spaces $f^{\prime}: U \rightarrow V$ has property $\mathcal{Q}$. Thus we obtain the open $W\left(\mathcal{P}, f^{\prime}\right) \subset U$ by assumption (3). Note that $U \times_{\mathcal{X}} U=(V \times \mathcal{Y} V) \times \mathcal{y} \mathcal{X}$ hence the morphism $f^{\prime \prime}: U \times \mathcal{X} U \rightarrow V \times \mathcal{Y} V$ is the base change of $f$ via either projection $V \times \mathcal{Y} V \rightarrow V$. By our choice of $V$ these projections are smooth, hence have property $\mathcal{R}$ by (2). Thus by (4) we see that the inverse images of $W\left(\mathcal{P}, f^{\prime}\right)$ under the two projections $\mathrm{pr}_{i}: U \times \mathcal{X} U \rightarrow U$ agree. In other words, $W\left(\mathcal{P}, f^{\prime}\right)$ is an $R$-invariant subspace of $U$ (where $R=U \times \mathcal{X} U$ ). Let $\mathcal{X}^{\prime}$ be the open substack of $\mathcal{X}$ corresponding to $W(\mathcal{P}, f)$ via Lemma 82.9.6. By construction $W\left(\mathcal{P}, f^{\prime}\right)=\mathcal{X}^{\prime} \times \mathcal{Y} V$ hence $\left.f\right|_{\mathcal{X}^{\prime}}$ has property $\mathcal{P}$ by Lemma 82.3 .3 . Also, $\mathcal{X}^{\prime}$ is the largest open substack such that $\left.f\right|_{\mathcal{X}}$ has $\mathcal{P}$ as the same maximality holds for $W(\mathcal{P}, f)$. This proves (A).

Finally, if $\mathcal{Z} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has $\mathcal{R}$ then we set $T=V \times \mathcal{Y}_{\mathcal{Z}}^{\mathcal{Z}}$ and we see that $T \rightarrow V$ is a morphism of algebraic spaces having property $\mathcal{R}$. Set $f_{T}^{\prime}: T \times{ }_{V} U \rightarrow T$ the base change of $f^{\prime}$. By (4) again we see that $W\left(\mathcal{P}, f_{T}^{\prime}\right)$ is the inverse image of $W(\mathcal{P}, f)$ in $T \times_{V} U$. This implies (B); some details omitted.

06M4 Remark 82.9.18. Warning: Lemma 82.9.17 should be used with care. For example, it applies to $\mathcal{P}=$ "flat", $\mathcal{Q}=$ "empty", and $\mathcal{R}=$ "flat and locally of finite presentation". But given a morphism of algebraic spaces $f: X \rightarrow Y$ the largest open subspace $W \subset X$ such that $\left.f\right|_{W}$ is flat is not the set of points where $f$ is flat!

Remark 82.9.19. Notwithstanding the warning in Remark 82.9.18 there are some cases where Lemma 82.9.17 can be used without causing ambiguity. We give a list. In each case we omit the verification of assumptions (1) and (2) and we give references which imply (3) and (4). Here is the list:
(1) $\mathcal{Q}=$ "locally of finite type", $\mathcal{R}=\emptyset$, and $\mathcal{P}=$ "relative dimension $\leq d "$. See Morphisms of Spaces, Definition 54.32 .2 and Morphisms of Spaces, Lemmas 54.33.4 and 54.33.3.
(2) $\mathcal{Q}=$ "locally of finite type" $\mathcal{R}=\emptyset$, and $\mathcal{P}=$ "locally quasi-finite". This is the case $d=0$ of the previous item, see Morphisms of Spaces, Lemma 54.33 .6 On the other hand, properties (3) and (4) are spelled out in Morphisms of Spaces, Lemma 54.33.7.
(3) $\mathcal{Q}=$ "locally of finite type" $\mathcal{R}=\emptyset$, and $\mathcal{P}=$ "unramified". This is Morphisms of Spaces, Lemma 54.37.10.
(4) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "flat". See More on Morphisms of Spaces, Theorem 63.19.1 and Lemma 63.19.2. Note that here $W(\mathcal{P}, f)$ is always exactly the set of points where the morphism $f$ is flat because we only consider this open when $f$ has $\mathcal{Q}$ (see loc.cit.).

06MA (5) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "étale". This follows on combining (3) and (4) because an unramified morphism which is flat and locally of finite presentation is étale, see Morphisms of Spaces, Lemma 54.38.12
(6) Add more here as needed (compare with the longer list at More on Groupoids, Remark 39.5.3.

### 82.10. Reduced algebraic stacks

0508 We have already defined reduced algebraic stacks in Section 82.7.
0509 Lemma 82.10.1. Let $\mathcal{X}$ be an algebraic stack. Let $T \subset|\mathcal{X}|$ be a closed subset. There exists a unique closed substack $\mathcal{Z} \subset \mathcal{X}$ with the following properties: (a) we have $|\mathcal{Z}|=T$, and (b) $\mathcal{Z}$ is reduced.
Proof. Let $U \rightarrow \mathcal{X}$ be a surjective smooth morphism, where $U$ is an algebraic space. Set $R=U \times \mathcal{X} U$, so that there is a presentation $[U / R] \rightarrow \mathcal{X}$, see Algebraic Stacks, Lemma 76.16.2 As usual we denote $s, t: R \rightarrow U$ the two smooth projection morphisms. By Lemma 82.4.5 we see that $T$ corresponds to a closed subset $T^{\prime} \subset|U|$ such that $|s|^{-1}\left(T^{\prime}\right)=|t|^{-1}\left(T^{\prime}\right)$. Let $Z \subset U$ be the reduced induced algebraic space structure on $T^{\prime}$, see Properties of Spaces, Definition 53.11.6. The fibre products $Z \times_{U, t} R$ and $R \times_{s, U} Z$ are closed subspaces of $R$ (Spaces, Lemma 52.12.3). The projections $Z \times_{U, t} R \rightarrow Z$ and $R \times_{s, U} Z \rightarrow Z$ are smooth by Morphisms of Spaces, Lemma 54.36.3. Thus as $Z$ is reduced, it follows that $Z \times_{U, t} R$ and $R \times_{s, U} Z$ are reduced, see Remark 82.7.3. Since

$$
\left|Z \times_{U, t} R\right|=|t|^{-1}\left(T^{\prime}\right)=|s|^{-1}\left(T^{\prime}\right)=R \times_{s, U} Z
$$

we conclude from the uniqueness in Properties of Spaces, Lemma 53.11.4 that $Z \times_{U, t} R=R \times_{s, U} Z$. Hence $Z$ is an $R$-invariant closed subspace of $U$. By the correspondence of Lemma 82.9.10 (and its proof) we obtain a closed substack $\mathcal{Z} \subset \mathcal{Z}$ with a presentation $\left[Z / R_{Z}\right] \rightarrow \mathcal{Z}$. Then $|\mathcal{Z}|=|Z| /\left|R_{Z}\right|=\left|T^{\prime}\right| / \sim$ is the given closed subset $T$. We omit the proof of unicity.

050A Lemma 82.10.2. Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}^{\prime} \subset \mathcal{X}$ is a closed substack, $\mathcal{X}$ is reduced and $\left|\mathcal{X}^{\prime}\right|=|\mathcal{X}|$, then $\mathcal{X}^{\prime}=\mathcal{X}$.

Proof. Choose a presentation $[U / R] \rightarrow \mathcal{X}$ with $U$ a scheme. As $\mathcal{X}$ is reduced, we see that $U$ is reduced (by definition of reduced algebraic stacks). By Lemma 82.9.10 $\mathcal{X}^{\prime}$ corresponds to an $R$-invariant closed subscheme $Z \subset U$. But now $|Z| \subset|U|$ is the inverse image of $\left|\mathcal{X}^{\prime}\right|$, and hence $|Z|=|U|$. Hence $Z$ is a closed subscheme of $U$ whose underlying sets of points agree. By Schemes, Lemma 25.12.6 the map $\operatorname{id}_{U}: U \rightarrow U$ factors through $Z \rightarrow U$, and hence $Z=U$, i.e., $\mathcal{X}^{\prime}=\mathcal{X}$.

050B Lemma 82.10.3. Let $\mathcal{X}, \mathcal{Y}$ be algebraic stacks. Let $\mathcal{Z} \subset \mathcal{X}$ be a closed substack Assume $\mathcal{Y}$ is reduced. A morphism $f: \mathcal{Y} \rightarrow \mathcal{X}$ factors through $\mathcal{Z}$ if and only if $f(|\mathcal{Y}|) \subset|\mathcal{Z}|$.

Proof. Assume $f(|\mathcal{Y}|) \subset|\mathcal{Z}|$. Consider $\mathcal{Y} \times_{\mathcal{X}} \mathcal{Z} \rightarrow \mathcal{Y}$. There is an equivalence $\mathcal{Y} \times \mathcal{X} \mathcal{Z} \rightarrow \mathcal{Y}^{\prime}$ where $\mathcal{Y}^{\prime}$ is a closed substack of $\mathcal{Y}$, see Lemmas 82.9.2 and 82.9.9. Using Lemmas 82.4.3, 82.8.5, and 82.9.5 we see that $\left|\mathcal{Y}^{\prime}\right|=|\mathcal{Y}|$. Hence we have reduced the lemma to Lemma 82.10.2,

050C Definition 82.10.4. Let $\mathcal{X}$ be an algebraic stack. Let $Z \subset|\mathcal{X}|$ be a closed subset. An algebraic stack structure on $Z$ is given by a closed substack $\mathcal{Z}$ of $\mathcal{X}$ with $|\mathcal{Z}|$ equal to $Z$. The reduced induced algebraic stack structure on $Z$ is the one constructed in Lemma 82.10.1. The reduction $\mathcal{X}_{\text {red }}$ of $\mathcal{X}$ is the reduced induced algebraic stack structure on $|\mathcal{X}|$.
In fact we can use this to define the reduced induced algebraic stack structure on a locally closed subset.

06FK Remark 82.10.5. Let $X$ be an algebraic stack. Let $T \subset|\mathcal{X}|$ be a locally closed subset. Let $\partial T$ be the boundary of $T$ in the topological space $|\mathcal{X}|$. In a formula

$$
\partial T=\bar{T} \backslash T
$$

Let $\mathcal{U} \subset \mathcal{X}$ be the open substack of $X$ with $|\mathcal{U}|=|\mathcal{X}| \backslash \partial T$, see Lemma 82.9.11, Let $\mathcal{Z}$ be the reduced closed substack of $\mathcal{U}$ with $|\mathcal{Z}|=T$ obtained by taking the reduced induced closed subspace structure, see Definition 82.10.4. By construction $\mathcal{Z} \rightarrow \mathcal{U}$ is a closed immersion of algebraic stacks and $\mathcal{U} \rightarrow \mathcal{X}$ is an open immersion, hence $\mathcal{Z} \rightarrow \mathcal{X}$ is an immersion of algebraic stacks by Lemma 82.9.3. Note that $\mathcal{Z}$ is a reduced algebraic stack and that $|\mathcal{Z}|=T$ as subsets of $|X|$. We sometimes say $\mathcal{Z}$ is the reduced induced substack structure on $T$.

### 82.11. Residual gerbes

06 ML In the stacks project we would like to define the residual gerbe of an algebraic stack $\mathcal{X}$ at a point $x \in|\mathcal{X}|$ to be a monomorphism of algebraic stacks $m_{x}: \mathcal{Z}_{x} \rightarrow \mathcal{X}$ where $\mathcal{Z}_{x}$ is a reduced algebraic stack having a unique point which is mapped by $m_{x}$ to $x$. It turns out that there are many issues with this notion; existence is not clear in general and neither is uniqueness. We resolve the uniqueness issue by imposing a slightly stronger condition on the algebraic stacks $\mathcal{Z}_{x}$. We discuss this in more detail by working through a few simple lemmas regarding reduced algebraic stacks having a unique point.

06MM Lemma 82.11.1. Let $\mathcal{Z}$ be an algebraic stack. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ be surjective and flat. Then any morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \mathcal{Z}$ where $k^{\prime}$ is a field is surjective and flat.
Proof. Consider the fibre square

Note that $T \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ is flat and surjective hence $T$ is not empty. On the other hand $T \rightarrow \operatorname{Spec}(k)$ is flat as $k$ is a field. Hence $T \rightarrow \mathcal{Z}$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 54.30 .5 (via the discussion in Section 82.3) that $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \mathcal{Z}$ is flat. It is clear that it is surjective as by assumption $|\mathcal{Z}|$ is a singleton.
06 MN Lemma 82.11.2. Let $\mathcal{Z}$ be an algebraic stack. The following are equivalent
(1) $\mathcal{Z}$ is reduced and $|\mathcal{Z}|$ is a singleton,
(2) there exists a surjective flat morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ where $k$ is a field, and
(3) there exists a locally of finite type, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ where $k$ is a field.
Proof. Assume (1). Let $W$ be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Then $W$ is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of $W$. Since $W$ is reduced we have $\mathcal{O}_{W, \eta}=\kappa(\eta)$. It follows that the canonical morphism $\eta=\operatorname{Spec}(\kappa(\eta)) \rightarrow W$ is flat. We see that the composition $\eta \rightarrow \mathcal{Z}$ is flat (see Morphisms of Spaces, Lemma 54.29.3). It is also surjective as $|\mathcal{Z}|$ is a singleton. In other words (2) holds.

Assume (2). Let $W$ be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Choose a field $k$ and a surjective flat morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$. Then $W \times{ }_{\mathcal{Z}} \operatorname{Spec}(k)$ is an algebraic space smooth over $k$, hence regular (see Spaces over Fields, Lemma 59.9.1) and in particular reduced. Since $W \times_{\mathcal{Z}} \operatorname{Spec}(k) \rightarrow W$ is surjective and flat we conclude that $W$ is reduced (Descent on Spaces, Lemma 61.8.2). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme $W$ and a smooth morphism $W \rightarrow \mathcal{Z}$. Pick a closed point $w \in W$ and set $k=\kappa(w)$. The composition

$$
\operatorname{Spec}(k) \xrightarrow{w} W \longrightarrow \mathcal{Z}
$$

is locally of finite type by Morphisms of Spaces, Lemmas 54.23.2 and 54.36.6. It is also flat and surjective by Lemma 82.11.1. Hence (3) holds.

The following lemma singles out a slightly better class of singleton algebraic stacks than the preceding lemma.
06MP Lemma 82.11.3. Let $\mathcal{Z}$ be an algebraic stack. The following are equivalent
(1) $\mathcal{Z}$ is reduced, locally Noetherian, and $|\mathcal{Z}|$ is a singleton, and
(2) there exists a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow$ $\mathcal{Z}$ where $k$ is a field.
Proof. Assume (2) holds. By Lemma 82.11 .2 we see that $\mathcal{Z}$ is reduced and $|\mathcal{Z}|$ is a singleton. Let $W$ be a scheme and let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism. Choose a field $k$ and a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$. Then $W \times{ }_{\mathcal{Z}} \operatorname{Spec}(k)$ is an algebraic space smooth over $k$, hence locally Noetherian (see Morphisms of Spaces, Lemma 54.23.5). Since $W \times{ }_{\mathcal{Z}} \operatorname{Spec}(k) \rightarrow W$ is flat, surjective, and locally of finite presentation, we see that $\left\{W \times_{\mathcal{Z}} \operatorname{Spec}(k) \rightarrow W\right\}$ is an fppf covering and we conclude that $W$ is locally Noetherian (Descent on Spaces, Lemma 61.8.3. In other words (1) holds.
Assume (1). Pick a nonempty affine scheme $W$ and a smooth morphism $W \rightarrow \mathcal{Z}$. Pick a closed point $w \in W$ and set $k=\kappa(w)$. Because $W$ is locally Noetherian the morphism $w: \operatorname{Spec}(k) \rightarrow W$ is of finite presentation, see Morphisms, Lemma 28.21.7. Hence the composition

$$
\operatorname{Spec}(k) \xrightarrow{w} W \longrightarrow \mathcal{Z}
$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 54.28 .2 and 54.36.5. It is also flat and surjective by Lemma 82.11.1. Hence (2) holds.

06MQ Lemma 82.11.4. Let $\mathcal{Z}^{\prime} \rightarrow \mathcal{Z}$ be a monomorphism of algebraic stacks. Assume there exists a field $k$ and a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$. Then either $\mathcal{Z}^{\prime}$ is empty or $\mathcal{Z}^{\prime} \rightarrow \mathcal{Z}$ is an equivalence.

Proof. We may assume that $\mathcal{Z}^{\prime}$ is nonempty. In this case the fibre product $T=$ $\mathcal{Z}^{\prime} \times_{\mathcal{Z}} \operatorname{Spec}(k)$ is nonempty, see Lemma 82.4.3. Now $T$ is an algebraic space and the projection $T \rightarrow \operatorname{Spec}(k)$ is a monomorphism. Hence $T=\operatorname{Spec}(k)$, see Morphisms of Spaces, Lemma 54.10.8. We conclude that $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ factors through $\mathcal{Z}^{\prime}$. Suppose the morphism $z: \operatorname{Spec}(k) \rightarrow \mathcal{Z}$ is given by the object $\xi$ over $\operatorname{Spec}(k)$. We have just seen that $\xi$ is isomorphic to an object $\xi^{\prime}$ of $\mathcal{Z}^{\prime}$ over $\operatorname{Spec}(k)$. Since $z$ is is surjective, flat, and locally of finite presentation we see that every object of $\mathcal{Z}$ over any scheme is fppf locally isomorphic to a pullback of $\xi$, hence also to a pullback of $\xi^{\prime}$. By descent of objects for stacks in groupoids this implies that $\mathcal{Z}^{\prime} \rightarrow \mathcal{Z}$ is essentially surjective (as well as fully faithful, see Lemma 82.8.4). Hence we win.

06MR Lemma 82.11.5. Let $\mathcal{Z}$ be an algebraic stack. Assume $\mathcal{Z}$ satisfies the equivalent conditions of Lemma 82.11.2. Then there exists a unique strictly full subcategory $\mathcal{Z}^{\prime} \subset \mathcal{Z}$ such that $\mathcal{Z}^{\prime}$ is an algebraic stack which satisfies the equivalent conditions of Lemma 82.11.3. The inclusion morphism $\mathcal{Z}^{\prime} \rightarrow \mathcal{Z}$ is a monomorphism of algebraic stacks.

Proof. The last part is immediate from the first part and Lemma 82.8.4. Pick a field $k$ and a morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ which is surjective, flat, and locally of finite type. Set $U=\operatorname{Spec}(k)$ and $R=U \times_{\mathcal{Z}} U$. The projections $s, t: R \rightarrow U$ are locally of finite type. Since $U$ is the spectrum of a field, it follows that $s, t$ are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 54.28.7). We see that $\mathcal{Z}^{\prime}=[U / R]$ is an algebraic stack by Criteria for Representability, Theorem 79.17.2. By Algebraic Stacks, Lemma 76.16.1 we obtain a canonical morphism

$$
f: \mathcal{Z}^{\prime} \longrightarrow \mathcal{Z}
$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 76.15.2 and a monomorphism, see Lemma 82.8.4. By Criteria for Representability, Lemma 79.17.1 the morphism $U \rightarrow \mathcal{Z}^{\prime}$ is surjective, flat, and locally of finite presentation. Hence $\mathcal{Z}^{\prime}$ is an algebraic stack which satisfies the equivalent conditions of Lemma 82.11.3. By Algebraic Stacks, Lemma 76.12.4 we may replace $\mathcal{Z}^{\prime}$ by its essential image in $\mathcal{Z}$. Hence we have proved all the assertions of the lemma except for the uniqueness of $\mathcal{Z}^{\prime} \subset \mathcal{Z}$. Suppose that $\mathcal{Z}^{\prime \prime} \subset \mathcal{Z}$ is a second such algebraic stack. Then the projections

$$
\mathcal{Z}^{\prime} \longleftarrow \mathcal{Z}^{\prime} \times_{\mathcal{Z}} \mathcal{Z}^{\prime \prime} \longrightarrow \mathcal{Z}^{\prime \prime}
$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 82.4.3. Hence the two projections are isomorphisms by Lemma 82.11.4 and we win.

06MS Example 82.11.6. Here is an example where the morphism constructed in Lemma 82.11 .5 isn't an isomorphism. This example shows that imposing that residual gerbes are locally Noetherian is necessary in Definition 82.11.8. In fact, the example is even an algebraic space! Let $\operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q})$ be the absolute Galois group of $\mathbf{Q}$ with the pro-finite topology. Let

$$
U=\operatorname{Spec}(\overline{\mathbf{Q}}) \times_{\operatorname{Spec}(\mathbf{Q})} \operatorname{Spec}(\overline{\mathbf{Q}})=\operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q}) \times \operatorname{Spec}(\overline{\mathbf{Q}})
$$

(we omit a precise explanation of the meaning of the last equal sign). Let $G$ denote the absolute Galois group $\operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q})$ with the discrete topology viewed as a constant group scheme over $\operatorname{Spec}(\overline{\mathbf{Q}})$, see Groupoids, Example 38.5.6. Then $G$ acts
freely and transitively on $U$. Let $X=U / G$, see Spaces, Definition52.14.4. Then $X$ is a non-noetherian reduced algebraic space with exactly one point. Furthermore, $X$ has a (locally) finite type point:

$$
x: \operatorname{Spec}(\overline{\mathbf{Q}}) \longrightarrow U \longrightarrow X
$$

Indeed, every point of $U$ is actually closed! As $X$ is an algebraic space over $\overline{\mathbf{Q}}$ it follows that $x$ is a monomorphism. So $x$ is the morphism constructed in Lemma 82.11.5 but $x$ is not an isomorphism. In fact $\operatorname{Spec}(\overline{\mathbf{Q}}) \rightarrow X$ is the residual gerbe of $X$ at $x$.

It will turn out later that under mild assumptions on the algebraic stack $\mathcal{X}$ the equivalent conditions of the following lemma are satisfied for every point $x \in|\mathcal{X}|$ (insert future reference here).
06MT Lemma 82.11.7. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$ be a point. The following are equivalent
(1) there exists an algebraic stack $\mathcal{Z}$ and a monomorphism $\mathcal{Z} \rightarrow \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is $x$,
(2) there exists a reduced algebraic stack $\mathcal{Z}$ and a monomorphism $\mathcal{Z} \rightarrow \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is $x$,
(3) there exists an algebraic stack $\mathcal{Z}$, a monomorphism $f: \mathcal{Z} \rightarrow \mathcal{X}$, and a surjective flat morphism $z: \operatorname{Spec}(k) \rightarrow \mathcal{Z}$ where $k$ is a field such that $x=f(z)$.
Moreover, if these conditions hold, then there exists a unique strictly full subcategory $\mathcal{Z}_{x} \subset \mathcal{X}$ such that $\mathcal{Z}_{x}$ is a reduced, locally Noetherian algebraic stack and $\left|\mathcal{Z}_{x}\right|$ is a singleton which maps to $x$ via the map $\left|\mathcal{Z}_{x}\right| \rightarrow|\mathcal{X}|$.

Proof. If $\mathcal{Z} \rightarrow \mathcal{X}$ is as in (1), then $\mathcal{Z}_{\text {red }} \rightarrow \mathcal{X}$ is as in (2). (See Section 82.10 for the notion of the reduction of an algebraic stack.) Hence (1) implies (2). It is immediate that (2) implies (1). The equivalence of (2) and (3) is immediate from Lemma 82.11.2
At this point we've seen the equivalence of (1)-(3). Pick a monomorphism $f: \mathcal{Z} \rightarrow$ $\mathcal{X}$ as in (2). Note that this implies that $f$ is fully faithful, see Lemma 82.8.4. Denote $\mathcal{Z}^{\prime} \subset \mathcal{X}$ the essential image of the functor $f$. Then $f: \mathcal{Z} \rightarrow \mathcal{Z}^{\prime}$ is an equivalence and hence $\mathcal{Z}^{\prime}$ is an algebraic stack, see Algebraic Stacks, Lemma 76.12.4 Apply Lemma 82.11.5 to get a strictly full subcategory $\mathcal{Z}_{x} \subset \mathcal{Z}^{\prime}$ as in the statement of the lemma. This proves all the statements of the lemma except for uniqueness.

In order to prove the uniqueness suppose that $\mathcal{Z}_{x} \subset \mathcal{X}$ and $\mathcal{Z}_{x}^{\prime} \subset \mathcal{X}$ are two strictly full subcategories as in the statement of the lemma. Then the projections

$$
\mathcal{Z}_{x}^{\prime} \longleftarrow \mathcal{Z}_{x}^{\prime} \times \mathcal{X} \mathcal{Z}_{x} \longrightarrow \mathcal{Z}_{x}
$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 82.4.3. Hence the two projections are isomorphisms by Lemma 82.11.4 and we win.

Having explained the above we can now make the following definition.
06 MU Definition 82.11.8. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$.
(1) We say the residual gerbe of $\mathcal{X}$ at $x$ exists if the equivalent conditions (1), (2), and (3) of Lemma 82.11.7 hold.
(2) If the residual gerbe of $\mathcal{X}$ at $x$ exists, then the residual gerbe of $\mathcal{X}$ at $x_{1}^{11}$ is the strictly full subcategory $\mathcal{Z}_{x} \subset \mathcal{X}$ constructed in Lemma 82.11.7.

In particular we know that $\mathcal{Z}_{x}$ (if it exists) is a locally Noetherian, reduced algebraic stack and that there exists a field and a surjective, flat, locally finitely presented morphism

$$
\operatorname{Spec}(k) \longrightarrow \mathcal{Z}_{x}
$$

We will see in Morphisms of Stacks, Lemma 83.19 .10 that $\mathcal{Z}_{x}$ is a gerbe. It turns out that $\mathcal{Z}_{x}$ is a regular algebraic stack as follows from the following lemma.

06MV Lemma 82.11.9. A reduced, locally Noetherian algebraic stack $\mathcal{Z}$ such that $|\mathcal{Z}|$ is a singleton is regular.

Proof. Let $W \rightarrow \mathcal{Z}$ be a surjective smooth morphism where $W$ is a scheme. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ be surjective, flat, and locally of finite presentation (see Lemma 82.11.3). The algebraic space $T=W \times_{\mathcal{Z}} \operatorname{Spec}(k)$ is smooth over $k$ in particular regular, see Spaces over Fields, Lemma 59.9.1. Since $T \rightarrow W$ is locally of finite presentation, flat, and surjective it follows that $W$ is regular, see Descent on Spaces, Lemma 61.8.4. By definition this means that $\mathcal{Z}$ is regular.

06MW Lemma 82.11.10. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. Assume that the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ exists. Let $f: \operatorname{Spec}(K) \rightarrow \mathcal{X}$ be a morphism where $K$ is a field in the equivalence class of $x$. Then $f$ factors through the inclusion morphism $\mathcal{Z}_{x} \rightarrow \mathcal{X}$.

Proof. Choose a field $k$ and a surjective flat locally finite presentation morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}_{x}$. Set $T=\operatorname{Spec}(K) \times \mathcal{X} \mathcal{Z}_{x}$. By Lemma 82.4.3 we see that $T$ is nonempty. As $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is a monomorphism we see that $T \rightarrow \operatorname{Spec}(K)$ is a monomorphism. Hence by Morphisms of Spaces, Lemma 54.10 .8 we see that $T=\operatorname{Spec}(K)$ which proves the lemma.

06MX Lemma 82.11.11. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. Let $\mathcal{Z}$ be an algebraic stack satisfying the equivalent conditions of Lemma 82.11.3 and let $\mathcal{Z} \rightarrow \mathcal{X}$ be $a$ monomorphism such that the image of $|\mathcal{Z}| \rightarrow|\mathcal{X}|$ is $x$. Then the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ at $x$ exists and $\mathcal{Z} \rightarrow \mathcal{X}$ factors as $\mathcal{Z} \rightarrow \mathcal{Z}_{x} \rightarrow \mathcal{X}$ where the first arrow is an equivalence.

Proof. Let $\mathcal{Z}_{x} \subset \mathcal{X}$ be the full subcategory corresponding to the essential image of the functor $\mathcal{Z} \rightarrow \mathcal{X}$. Then $\mathcal{Z} \rightarrow \mathcal{Z}_{x}$ is an equivalence, hence $\mathcal{Z}_{x}$ is an algebraic stack, see Algebraic Stacks, Lemma 76.12.4. Since $\mathcal{Z}_{x}$ inherits all the properties of $\mathcal{Z}$ from this equivalence it is clear from the uniqueness in Lemma 82.11.7 that $\mathcal{Z}_{x}$ is the residual gerbe of $\mathcal{X}$ at $x$.

[^215]
### 82.12. Dimension of a stack

0 AFL We can define the dimension of an algebraic stack $\mathcal{X}$ at a point $x$, using the notion of dimension of an algebraic space at a point (Properties of Spaces, Definition 53.8.1). In the following lemma the output may be $\infty$ either because $\mathcal{X}$ is not quasi-compact or because we run into the phenomenon described in Examples, Section 88.14

0AFM Lemma 82.12.1. Let $\mathcal{X}$ be a locally Noetherian algebraic stack over a scheme $S$. Let $x \in|\mathcal{X}|$ be a point of $\mathcal{X}$. Let $[U / R] \rightarrow \mathcal{X}$ be a presentation (Algebraic Stacks, Definition 76.16.5) where $U$ is a scheme. Let $u \in U$ be a point that maps to $x$. Let $e: U \rightarrow R$ be the "identity" map and let $s: R \rightarrow U$ be the "source" map, which is a smooth morphism of algebraic spaces. Let $R_{u}$ be the fiber of $s: R \rightarrow U$ over $u$. The element

$$
\operatorname{dim}_{x}(\mathcal{X})=\operatorname{dim}_{u}(U)-\operatorname{dim}_{e(u)}\left(R_{u}\right) \in \mathbf{Z} \cup \infty
$$

is independent of the choice of presentation and the point $u$ over $x$.
Proof. Since $R \rightarrow U$ is smooth, the scheme $R_{u}$ is smooth over $\kappa(u)$ and hence has finite dimension. On the other hand, the scheme $U$ is locally Noetherian, but this does not guarantee that $\operatorname{dim}_{u}(U)$ is finite. Thus the difference is an element of $\mathbf{Z} \cup\{\infty\}$.
Let $\left[U^{\prime} / R^{\prime}\right] \rightarrow \mathcal{X}$ and $u^{\prime} \in U^{\prime}$ be a second presentation where $U^{\prime}$ is a scheme and $u^{\prime}$ maps to $x$. Consider the algebraic space $P=U \times_{\mathcal{X}} U^{\prime}$. By Lemma 82.4.3 there exists a $p \in|P|$ mapping to $u$ and $u^{\prime}$. Since $P \rightarrow U$ and $P^{\prime} \rightarrow U^{\prime}$ are smooth we see that $\operatorname{dim}_{p}(P)=\operatorname{dim}_{u}(U)+\operatorname{dim}_{p}\left(P_{u}\right)$ and $\operatorname{dim}_{p}(P)=\operatorname{dim}_{u^{\prime}}\left(U^{\prime}\right)+\operatorname{dim}_{p}\left(P_{u^{\prime}}\right)$, see Morphisms of Spaces, Lemma 54.36.9. Note that

$$
R_{u^{\prime}}^{\prime}=\operatorname{Spec}\left(\kappa\left(u^{\prime}\right)\right) \times \mathcal{X} U^{\prime} \quad \text { and } \quad P_{u}=\operatorname{Spec}(\kappa(u)) \times \mathcal{X} U^{\prime}
$$

Let us represent $p \in|P|$ by a morphism $\operatorname{Spec}(\Omega) \rightarrow P$. Since $p$ maps to both $u$ and $u^{\prime}$ it induces a 2 -morphism between the compositions $\operatorname{Spec}(\Omega) \rightarrow \operatorname{Spec}\left(\kappa\left(u^{\prime}\right)\right) \rightarrow \mathcal{X}$ and $\operatorname{Spec}(\Omega) \rightarrow \operatorname{Spec}(\kappa(u)) \rightarrow \mathcal{X}$ which in turn defines an isomorphism

$$
\operatorname{Spec}(\Omega) \times_{\operatorname{Spec}\left(\kappa\left(u^{\prime}\right)\right)} R_{u^{\prime}}^{\prime} \cong \operatorname{Spec}(\Omega) \times_{\operatorname{Spec}(\kappa(u))} P_{u}
$$

as algebraic spaces over $\operatorname{Spec}(\Omega)$ mapping the $\Omega$-rational point $\left(1, e^{\prime}\left(u^{\prime}\right)\right)$ to $(1, p)$ (some details omitted). We conclude that

$$
\operatorname{dim}_{e^{\prime}\left(u^{\prime}\right)}\left(R_{u^{\prime}}^{\prime}\right)=\operatorname{dim}_{p}\left(P_{u}\right)
$$

by Morphisms of Spaces, Lemma 54.33.3. By symmetry we have $\left.\operatorname{dim}_{e(u)} R_{u}\right)=$ $\operatorname{dim}_{p}\left(P_{u^{\prime}}\right)$. Putting everything together we obtain the independence of choices.

We can use the lemma above to make the following definition.
0AFN Definition 82.12.2. Let $\mathcal{X}$ be a locally Noetherian algebraic stack over a scheme $S$. Let $x \in|\mathcal{X}|$ be a point of $\mathcal{X}$. Let $[U / R] \rightarrow \mathcal{X}$ be a presentation (Algebraic Stacks, Definition 76.16.5 where $U$ is a scheme and let $u \in U$ be a point that maps to $x$. We define the dimension of $\mathcal{X}$ at $x$ to be the element $\operatorname{dim}_{x}(\mathcal{X}) \in \mathbf{Z} \cup \infty$ such that

$$
\operatorname{dim}_{x}(\mathcal{X})=\operatorname{dim}_{u}(U)-\operatorname{dim}_{e(u)}\left(R_{u}\right)
$$

with notation as in Lemma 82.12.1.
The dimension of a stack at a point agrees with the usual notion when $\mathcal{X}$ is a scheme (Topology, Definition 5.9.1), or more generally when $\mathcal{X}$ is a locally Noetherian algebraic space (Properties of Spaces, Definition 53.8.1).

0AFP Definition 82.12.3. Let $S$ be a scheme. Let $\mathcal{X}$ be a locally Noetherian algebraic stack over $S$. The dimension $\operatorname{dim}(\mathcal{X})$ of $\mathcal{X}$ is defined to be

$$
\operatorname{dim}(\mathcal{X})=\sup _{x \in|\mathcal{X}|} \operatorname{dim}_{x}(\mathcal{X})
$$

This definition of dimension agrees with the usual notion if $\mathcal{X}$ is a scheme (Properties, Lemma 27.10.2) or an algebraic space (Properties of Spaces, Definition 53.8.2).
$0 A F Q$ Remark 82.12.4. If $\mathcal{X}$ is a nonempty stack of finite type over a field, then $\operatorname{dim}(\mathcal{X})$ is an integer. For an arbitrary locally Noetherian algebraic stack $\mathcal{X}, \operatorname{dim}(\mathcal{X})$ is in $Z \cup\{ \pm \infty\}$, and $\operatorname{dim}(\mathcal{X})=-\infty$ if and only if $\mathcal{X}$ is empty.

0AFR Example 82.12.5. Let $X$ be a scheme of finite type over a field $k$, and let $G$ be a group scheme of finite type over $k$ which acts on $X$. Then the dimension of the quotient stack $[X / G]$ is equal to $\operatorname{dim}(X)-\operatorname{dim}(G)$. In particular, the dimension of the classifying stack $B G=[\operatorname{Spec}(k) / G]$ is $-\operatorname{dim}(G)$. Thus the dimension of an algebraic stack can be a negative integer, in contrast to what happens for schemes or algebraic spaces.

## CHAPTER 83

## Morphisms of Algebraic Stacks

04XM

### 83.1. Introduction

04 XN In this chapter we introduce some types of morphisms of algebraic stacks. A reference in the case of quasi-separated algebraic stacks with representable diagonal is LMB00.

The goal is to extend the definition of each of the types of morphisms of algebraic spaces to morphisms of algebraic stacks. Each case is slightly different and it seems best to treat them all separately.
For morphisms of algebraic stacks which are representable by algebraic spaces we have already defined a large number of types of morphisms, see Properties of Stacks, Section 82.3 For each corresponding case in this chapter we have to make sure the definition in the general case is compatible with the definition given there.

### 83.2. Conventions and abuse of language

04XP We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 82.2,

### 83.3. Properties of diagonals

04XQ The diagonal of an algebraic stack is closely related to the Isom-sheaves, see Algebraic Stacks, Lemma 76.10.11. By the second defining property of an algebraic stack these Isom-sheaves are always algebraic spaces.

04XR Lemma 83.3.1. Let $\mathcal{X}$ be an algebraic stack. Let $T$ be a scheme and let $x, y$ be objects of the fibre category of $\mathcal{X}$ over $T$. Then the morphism $\operatorname{Isom}_{\mathcal{X}}(x, y) \rightarrow T$ is locally of finite type.

Proof. By Algebraic Stacks, Lemma 76.16 .2 we may assume that $\mathcal{X}=[U / R]$ for some smooth groupoid in algebraic spaces. By Descent on Spaces, Lemma 61.10.7 it suffices to check the property fppf locally on $T$. Thus we may assume that $x, y$ come from morphisms $x^{\prime}, y^{\prime}: T \rightarrow U$. By Groupoids in Spaces, Lemma 65.21.1 we see that in this case $\operatorname{Isom}_{\mathcal{X}}(x, y)=T \times{ }_{\left(y^{\prime}, x^{\prime}\right), U \times_{S} U} R$. Hence it suffices to prove that $R \rightarrow U \times{ }_{S} U$ is locally of finite type. This follows from the fact that the composition $s: R \rightarrow U \times{ }_{S} U \rightarrow U$ is smooth (hence locally of finite type, see Morphisms of Spaces, Lemmas 54.36.5 and 54.28.5 and Morphisms of Spaces, Lemma 54.23.6

04YP Lemma 83.3.2. Let $\mathcal{X}$ be an algebraic stack. Let $T$ be a scheme and let $x, y$ be objects of the fibre category of $\mathcal{X}$ over $T$. Then
(1) $\operatorname{Isom}_{\mathcal{X}}(y, y)$ is a group algebraic space over $T$, and
(2) $\operatorname{Isom}_{\mathcal{X}}(x, y)$ is a pseudo torsor for $\operatorname{Isom}_{\mathcal{X}}(y, y)$ over $T$.

Proof. See Groupoids in Spaces, Definitions 65.5.1 and 65.9.1. The lemma follows immediately from the fact that $\mathcal{X}$ is a stack in groupoids.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The diagonal of $f$ is the morphism

$$
\Delta_{f}: \mathcal{X} \longrightarrow \mathcal{X} \times \mathcal{Y}_{\mathcal{X}}^{\mathcal{X}}
$$

Here are two properties that every diagonal morphism has.
04XS Lemma 83.3.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then
(1) $\Delta_{f}$ is representable by algebraic spaces, and
(2) $\Delta_{f}$ is locally of finite type.

Proof. Let $T$ be a scheme and let $a: T \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ be a morphism. By definition of the fibre product and the 2-Yoneda lemma the morphism $a$ is given by a triple $a=\left(x, x^{\prime}, \alpha\right)$ where $x, x^{\prime}$ are objects of $\mathcal{X}$ over $T$, and $\alpha: f(x) \rightarrow f\left(x^{\prime}\right)$ is a morphism in the fibre category of $\mathcal{Y}$ over $T$. By definition of an algebraic stack the sheaves $\operatorname{Isom}_{\mathcal{X}}\left(x, x^{\prime}\right)$ and $\operatorname{Isom}_{\mathcal{Y}}\left(f(x), f\left(x^{\prime}\right)\right)$ are algebraic spaces over $T$. In this language $\alpha$ defines a section of the morphism $\operatorname{Isom}_{\mathcal{Y}}\left(f(x), f\left(x^{\prime}\right)\right) \rightarrow T$. A $T^{\prime}$ valued point of $\mathcal{X} \times{ }_{\mathcal{X} \times \mathcal{Y} \mathcal{X}, a} T$ for $T^{\prime} \rightarrow T$ a scheme over $T$ is the same thing as an isomorphism $\left.\left.x\right|_{T^{\prime}} \rightarrow x^{\prime}\right|_{T^{\prime}}$ whose image under $f$ is $\left.\alpha\right|_{T^{\prime}}$. Thus we see that

04XT

is a fibre square of sheaves over $T$. In particular we see that $\mathcal{X} \times \mathcal{X}_{\times \mathcal{Y}} \mathcal{X}, a t$ is an algebraic space which proves part (1) of the lemma.
To prove the second statement we have to show that the left vertical arrow of Diagram 83.3.3.1) is locally of finite type. By Lemma 83.3.1 the algebraic space $\operatorname{Isom}_{\mathcal{X}}\left(x, x^{\prime}\right)$ and is locally of finite type over $T$. Hence the right vertical arrow of Diagram 83.3 .3 .1 is locally of finite type, see Morphisms of Spaces, Lemma 54.23.6. We conclude by Morphisms of Spaces, Lemma 54.23.3.

04YQ Lemma 83.3.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Then
(1) $\Delta_{f}$ is representable (by schemes),
(2) $\Delta_{f}$ is locally of finite type,
(3) $\Delta_{f}$ is a monomorphism,
(4) $\Delta_{f}$ is separated, and
(5) $\Delta_{f}$ is locally quasi-finite.

Proof. We have already seen in Lemma 83.3.3 that $\Delta_{f}$ is representable by algebraic spaces. Hence the statements $(2)-(5)$ make sense, see Properties of Stacks, Section 82.3 Also Lemma 83.3.3 guarantees (2) holds. Let $T \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ be a morphism and contemplate Diagram 83.3.3.1). By Algebraic Stacks, Lemma 76.9.2 the right vertical arrow is injective as a map of sheaves, i.e., a monomorphism of algebraic spaces. Hence also the morphism $T \times_{\mathcal{X} \times \mathcal{Y}} \mathcal{X} \mathcal{X} \rightarrow T$ is a monomorphism. Thus
(3) holds. We already know that $T \times{ }_{\mathcal{X}} \times \mathcal{y} \mathcal{X} \mathcal{X} \rightarrow T$ is locally of finite type. Thus Morphisms of Spaces, Lemma 54.27.10 allows us to conclude that $T \times{ }_{\mathcal{X} \times \mathcal{Y}} \mathcal{X} \mathcal{X} \rightarrow T$ is locally quasi-finite and separated. This proves (4) and (5). Finally, Morphisms of Spaces, Proposition 54.47 .2 implies that $T \times_{\mathcal{X} \times \mathcal{y}} \mathcal{X} \mathcal{X}$ is a scheme which proves (1).

04YS Lemma 83.3.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent
(1) $f$ is separated,
(2) $\Delta_{f}$ is a closed immersion,
(3) $\Delta_{f}$ is proper, or
(4) $\Delta_{f}$ is universally closed.

Proof. The statements " $f$ is separated", " $\Delta_{f}$ is a closed immersion", " $\Delta_{f}$ is universally closed", and " $\Delta_{f}$ is proper" refer to the notions defined in Properties of Stacks, Section 82.3. Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U=\mathcal{X} \times \mathcal{Y} V$ which is an algebraic space by assumption, and the morphism $U \rightarrow \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.30.14 and Properties of Stacks, Lemma 82.3 .3 we see that for any property $P$ (as in that lemma) we have: $\Delta_{f}$ has $P$ if and only if $\Delta_{U / V}: U \rightarrow U \times_{V} U$ has $P$. Hence the equivalence of (2), (3) and (4) follows from Morphisms of Spaces, Lemma 54.39 .9 applied to $U \rightarrow V$. Moreover, if (1) holds, then $U \rightarrow V$ is separated and we see that $\Delta_{U / V}$ is a closed immersion, i.e., (2) holds. Finally, assume (2) holds. Let $T$ be a scheme, and $a: T \rightarrow \mathcal{Y}$ a morphism. Set $T^{\prime}=\mathcal{X} \times \mathcal{Y} T$. To prove (1) we have to show that the morphism of algebraic spaces $T^{\prime} \rightarrow T$ is separated. Using Categories, Lemma 4.30 .14 once more we see that $\Delta_{T^{\prime} / T}$ is the base change of $\Delta_{f}$. Hence our assumption (2) implies that $\Delta_{T^{\prime} / T}$ is a closed immersion, hence $T^{\prime} \rightarrow T$ is separated as desired.

04YT Lemma 83.3.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent
(1) $f$ is quasi-separated,
(2) $\Delta_{f}$ is quasi-compact, or
(3) $\Delta_{f}$ is finite type.

Proof. The statements " $f$ is quasi-separated", " $\Delta_{f}$ is quasi-compact", and " $\Delta_{f}$ is finite type" refer to the notions defined in Properties of Stacks, Section 82.3. Note that (2) and (3) are equivalent in view of the fact that $\Delta_{f}$ is locally of finite type by Lemma 83.3.4 (and Algebraic Stacks, Lemma 76.10 .9 . Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Set $U=\mathcal{X} \times \mathcal{Y} V$ which is an algebraic space by assumption, and the morphism $U \rightarrow \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.30.14 and Properties of Stacks, Lemma 82.3.3 we see that we have: $\Delta_{f}$ is quasi-compact if and only if $\Delta_{U / V}: U \rightarrow U \times_{V} U$ is quasi-compact. If (1) holds, then $U \rightarrow V$ is quasi-separated and we see that $\Delta_{U / V}$ is quasi-compact, i.e., (2) holds. Assume (2) holds. Let $T$ be a scheme, and $a: T \rightarrow \mathcal{Y}$ a morphism. Set $T^{\prime}=\mathcal{X} \times \mathcal{Y} T$. To prove (1) we have to show that the morphism of algebraic spaces $T^{\prime} \rightarrow T$ is quasi-separated. Using Categories, Lemma 4.30.14 once more we see that $\Delta_{T^{\prime} / T}$ is the base change of $\Delta_{f}$. Hence our assumption (2) implies that $\Delta_{T^{\prime} / T}$ is quasi-compact, hence $T^{\prime} \rightarrow T$ is quasi-separated as desired.

04YU Lemma 83.3.7. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent
(1) $f$ is locally separated, and
(2) $\Delta_{f}$ is an immersion.

Proof. The statements " $f$ is locally separated", and " $\Delta_{f}$ is an immersion" refer to the notions defined in Properties of Stacks, Section 82.3. Proof omitted. Hint: Argue as in the proofs of Lemmas 83.3.5 and 83.3.6

### 83.4. Separation axioms

04 YV Let $\mathcal{X}=[U / R]$ be a presentation of an algebraic stack. Then the properties of the diagonal of $\mathcal{X}$ over $S$, are the properties of the morphism $j: R \rightarrow U \times{ }_{S} U$. For example, if $\mathcal{X}=[S / G]$ for some smooth group $G$ in algebraic spaces over $S$ then $j$ is the structure morphism $G \rightarrow U$. Hence the diagonal is not automatically separated itself (contrary to what happens in the case of schemes and algebraic spaces). To say that $[S / G]$ is quasi-separated over $S$ should certainly imply that $G \rightarrow S$ is quasi-compact, but we hesitate to say that $[S / G]$ is quasi-separated over $S$ without also requiring the morphism $G \rightarrow S$ to be quasi-separated. In other words, requiring the diagonal morphism to be quasi-compact does not really agree with our intuition for a "quasi-separated algebraic stack", and we should also require the diagonal itself to be quasi-separated.
What about "separated algebraic stacks"? We have seen in Morphisms of Spaces, Lemma 54.39 .9 that an algebraic space is separated if and only if the diagonal is proper. This is the condition that is usually used to define separated algebraic stacks too. In the example $[S / G] \rightarrow S$ above this means that $G \rightarrow S$ is a proper group scheme. This means algebraic stacks of the form $[\operatorname{Spec}(k) / E]$ are proper over $k$ where $E$ is an elliptic curve over $k$ (insert future reference here). In certain situations it may be more natural to assume the diagonal is finite.

04YW Definition 83.4.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ is $D M$ if $\Delta_{f}$ is unramified ${ }^{1}$.
(2) We say $f$ is quasi- $D M$ if $\Delta_{f}$ is locally quasi-finite ${ }^{2}$
(3) We say $f$ is separated if $\Delta_{f}$ is proper.
(4) We say $f$ is quasi-separated if $\Delta_{f}$ is quasi-compact and quasi-separated.

In this definition we are using that $\Delta_{f}$ is representable by algebraic spaces and we are using Properties of Stacks, Section 82.3 to make sense out of imposing conditions on $\Delta_{f}$. We note that these definitions do not conflict with the already existing notions if $f$ is representable by algebraic spaces, see Lemmas 83.3.6 and 83.3.5. There is an interesting way to characterize these conditions by looking at higher diagonals, see Lemma 83.6.4.

[^216]050D Definition 83.4.2. Let $\mathcal{X}$ be an algebraic stack over the base scheme $S$. Denote $p: \mathcal{X} \rightarrow S$ the structure morphism.
(1) We say $\mathcal{X}$ is $D M$ over $S$ if $p: \mathcal{X} \rightarrow S$ is DM.
(2) We say $\mathcal{X}$ is quasi-DM over $S$ if $p: \mathcal{X} \rightarrow S$ is quasi-DM.
(3) We say $\mathcal{X}$ is separated over $S$ if $p: \mathcal{X} \rightarrow S$ is separated.
(4) We say $\mathcal{X}$ is quasi-separated over $S$ if $p: \mathcal{X} \rightarrow S$ is quasi-separated.
(5) We say $\mathcal{X}$ is $D M$ if $\mathcal{X}$ is $\mathrm{DM}^{3}$ over $\operatorname{Spec}(\mathbf{Z})$.
(6) We say $\mathcal{X}$ is quasi-DM if $\mathcal{X}$ is quasi-DM over $\operatorname{Spec}(\mathbf{Z})$.
(7) We say $\mathcal{X}$ is separated if $\mathcal{X}$ is separated over $\operatorname{Spec}(\mathbf{Z})$.
(8) We say $\mathcal{X}$ is quasi-separated if $\mathcal{X}$ is quasi-separated over $\operatorname{Spec}(\mathbf{Z})$.

In the last 4 definitions we view $\mathcal{X}$ as an algebraic stack over $\operatorname{Spec}(\mathbf{Z})$ via Algebraic Stacks, Definition 76.19.2.

Thus in each case we have an absolute notion and a notion relative to our given base scheme (mention of which is usually suppressed by our abuse of notation introduced in Properties of Stacks, Section 82.2 . We will see that $(1) \Leftrightarrow(5)$ and $(2) \Leftrightarrow(6)$ in Lemma 83.4.13. We spend some time proving some standard results on these notions.

050E Lemma 83.4.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) If $f$ is separated, then $f$ is quasi-separated.
(2) If $f$ is $D M$, then $f$ is quasi-DM.
(3) If $f$ is representable by algebraic spaces, then $f$ is DM.

Proof. To see (1) note that a proper morphism of algebraic spaces is quasi-compact and quasi-separated, see Morphisms of Spaces, Definition 54.39.1. To see (2) note that an unramified morphism of algebraic spaces is locally quasi-finite, see Morphisms of Spaces, Lemma 54.37.7. Finally (3) follows from Lemma 83.3.4.

050F Lemma 83.4.4. All of the separation axioms listed in Definition 83.4.1 are stable under base change.

Proof. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ be morphisms of algebraic stacks. Let $f^{\prime}: \mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$ be the base change of $f$ by $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$. Then $\Delta_{f^{\prime}}$ is the base change of $\Delta_{f}$ by the morphism $\mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{X}^{\prime} \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$, see Categories, Lemma 4.30.14. By the results of Properties of Stacks, Section 82.3 each of the properties of the diagonal used in Definition 83.4.1 is stable under base change. Hence the lemma is true.

06TZ Lemma 83.4.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \rightarrow \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where $W$ is an algebraic space. If the base change $W \times \mathcal{Y} \mathcal{X} \rightarrow W$ has one of the separation properties of Definition 83.4.1 then so does $f$.

Proof. Denote $g: W \times \mathcal{Y} \mathcal{X} \rightarrow W$ the base change. Then $\Delta_{g}$ is the base change of $\Delta_{f}$ by the morphism $q: W \times \mathcal{Y}(\mathcal{X} \times \mathcal{Y} \mathcal{X}) \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$. Since $q$ is the base change of $W \rightarrow \mathcal{Y}$ we see that $q$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Hence the result follows from Properties of Stacks, Lemma 82.3.4

[^217]050G Lemma 83.4.6. Let $S$ be a scheme. The property of being quasi-DM over $S$, quasi-separated over $S$, or separated over $S$ (see Definition 83.4.2) is stable under change of base scheme, see Algebraic Stacks, Definition 76.19.3.

Proof. Follows immediately from Lemma 83.4.4.
050 H Lemma 83.4.7. Let $f: \mathcal{X} \rightarrow \mathcal{Z}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ and $\mathcal{Z} \rightarrow \mathcal{T}$ be morphisms of algebraic stacks. Consider the induced morphism $i: \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$. Then
(1) $i$ is representable by algebraic spaces and locally of finite type,
(2) if $\Delta_{\mathcal{Z} / \mathcal{T}}$ is quasi-separated, then $i$ is quasi-separated,
(3) if $\Delta_{\mathcal{Z} / \mathcal{T}}$ is separated, then $i$ is separated,
(4) if $\mathcal{Z} \rightarrow \mathcal{T}$ is $D M$, then $i$ is unramified,
(5) if $\mathcal{Z} \rightarrow \mathcal{T}$ is quasi-DM, then $i$ is locally quasi-finite,
(6) if $\mathcal{Z} \rightarrow \mathcal{T}$ is separated, then $i$ is proper, and
(7) if $\mathcal{Z} \rightarrow \mathcal{T}$ is quasi-separated, then $i$ is quasi-compact and quasi-separated.

Proof. The following diagram

is a 2-fibre product diagram, see Categories, Lemma 4.30.13. Hence $i$ is the base change of the diagonal morphism $\Delta_{\mathcal{Z} / \mathcal{T}}$. Thus the lemma follows from Lemma 83.3.3, and the material in Properties of Stacks, Section 82.3 .

050 Lemma 83.4.8. Let $\mathcal{T}$ be an algebraic stack. Let $g: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over $\mathcal{T}$. Consider the graph $i: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{T} \mathcal{Y}$ of $g$. Then
(1) $i$ is representable by algebraic spaces and locally of finite type,
(2) if $\mathcal{Y} \rightarrow \mathcal{T}$ is $D M$, then $i$ is unramified,
(3) if $\mathcal{Y} \rightarrow \mathcal{T}$ is quasi- $D M$, then $i$ is locally quasi-finite,
(4) if $\mathcal{Y} \rightarrow \mathcal{T}$ is separated, then $i$ is proper, and
(5) if $\mathcal{Y} \rightarrow \mathcal{T}$ is quasi-separated, then $i$ is quasi-compact and quasi-separated.

Proof. This is a special case of Lemma 83.4.7 applied to the morphism $\mathcal{X}=$ $\mathcal{X} \times \mathcal{Y} \mathcal{Y} \rightarrow \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$.

050J Lemma 83.4.9. Let $f: \mathcal{X} \rightarrow \mathcal{T}$ be a morphism of algebraic stacks. Let $s: \mathcal{T} \rightarrow \mathcal{X}$ be a morphism such that $f \circ s$ is 2 -isomorphic to $i d_{\mathcal{T}}$. Then
(1) $s$ is representable by algebraic spaces and locally of finite type,
(2) if $f$ is $D M$, then $s$ is unramified,
(3) if $f$ is quasi-DM, then $s$ is locally quasi-finite,
(4) if $f$ is separated, then $s$ is proper, and
(5) if $f$ is quasi-separated, then $s$ is quasi-compact and quasi-separated.

Proof. This is a special case of Lemma 83.4.8 applied to $g=s$ and $\mathcal{Y}=\mathcal{T}$ in which case $i: \mathcal{T} \rightarrow \mathcal{T} \times \mathcal{T} \mathcal{X}$ is 2-isomorphic to $s$.

050K Lemma 83.4.10. All of the separation axioms listed in Definition 83.4.1 are stable under composition of morphisms.

Proof. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks to which the axiom in question applies. The diagonal $\Delta_{\mathcal{X} / \mathcal{Z}}$ is the composition

$$
\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}
$$

Our separation axiom is defined by requiring the diagonal to have some property $\mathcal{P}$. By Lemma 83.4.7 above we see that the second arrow also has this property. Hence the lemma follows since the composition of morphisms which are representable by algebraic spaces with property $\mathcal{P}$ also is a morphism with property $\mathcal{P}$, see our general discussion in Properties of Stacks, Section 82.3 and Morphisms of Spaces, Lemmas 54.37.3, 54.27.3, 54.39.4, 54.8.4, and 54.4.8

050L Lemma 83.4.11. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme $S$.
(1) If $\mathcal{Y}$ is $D M$ over $S$ and $f$ is $D M$, then $\mathcal{X}$ is $D M$ over $S$.
(2) If $\mathcal{Y}$ is quasi-DM over $S$ and $f$ is quasi-DM, then $\mathcal{X}$ is quasi-DM over $S$.
(3) If $\mathcal{Y}$ is separated over $S$ and $f$ is separated, then $\mathcal{X}$ is separated over $S$.
(4) If $\mathcal{Y}$ is quasi-separated over $S$ and $f$ is quasi-separated, then $\mathcal{X}$ is quasiseparated over $S$.
(5) If $\mathcal{Y}$ is $D M$ and $f$ is $D M$, then $\mathcal{X}$ is $D M$.
(6) If $\mathcal{Y}$ is quasi-DM and $f$ is quasi-DM, then $\mathcal{X}$ is quasi-DM.
(7) If $\mathcal{Y}$ is separated and $f$ is separated, then $\mathcal{X}$ is separated.
(8) If $\mathcal{Y}$ is quasi-separated and $f$ is quasi-separated, then $\mathcal{X}$ is quasi-separated.

Proof. Parts (1), (2), (3), and (4) follow immediately from Lemma 83.4.10 and Definition 83.4.2. For (5), (6), (7), and (8) think of $\mathcal{X}$ and $\mathcal{Y}$ as algebraic stacks over $\operatorname{Spec}(\mathbf{Z})$ and apply Lemma 83.4.10. Details omitted.

The following lemma is a bit different to the analogue for algebraic spaces. To compare take a look at Morphisms of Spaces, Lemma 54.4.10

050M Lemma 83.4.12. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks.
(1) If $g \circ f$ is $D M$ then so is $f$.
(2) If $g \circ f$ is quasi-DM then so is $f$.
(3) If $g \circ f$ is separated and $\Delta_{g}$ is separated, then $f$ is separated.
(4) If $g \circ f$ is quasi-separated and $\Delta_{g}$ is quasi-separated, then $f$ is quasiseparated.

Proof. Consider the factorization

$$
\mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}
$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces, see Lemmas 83.3 .3 and 83.4.7. Hence for any scheme $T$ and morphism $T \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ we get morphisms of algebraic spaces

$$
A=\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Z} \mathcal{X})} T \longrightarrow B=\left(\mathcal{X} \times \mathcal{Y}^{\mathcal{X}}\right) \times_{(\mathcal{X} \times \mathcal{Z} \mathcal{X})} T \longrightarrow T
$$

If $g \circ f$ is DM (resp. quasi-DM), then the composition $A \rightarrow T$ is unramified (resp. locally quasi-finite). Hence (1) (resp. (2)) follows on applying Morphisms of Spaces, Lemma 54.37.11 (resp. Morphisms of Spaces, Lemma 54.27.8). This proves (1) and (2).

Proof of (4). Assume $g \circ f$ is quasi-separated and $\Delta_{g}$ is quasi-separated. Consider the factorization

$$
\mathcal{X} \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}
$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is quasi-separated, see Lemmas 83.3.3 and 83.4.7. Hence for any scheme $T$ and morphism $T \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ we get morphisms of algebraic spaces

$$
A=\mathcal{X} \times_{\left(\mathcal{X} \times{ }_{\mathcal{Z}} \mathcal{X}\right)} T \longrightarrow B=\left(\mathcal{X} \times \mathcal{Y}_{\mathcal{X}} \mathcal{X}\right) \times_{\left(\mathcal{X} \times{ }_{\mathcal{Z}} \mathcal{X}\right)} T \longrightarrow T
$$

such that $B \rightarrow T$ is quasi-separated. The composition $A \rightarrow T$ is quasi-compact and quasi-separated as we have assumed that $g \circ f$ is quasi-separated. Hence $A \rightarrow B$ is quasi-separated by Morphisms of Spaces, Lemma 54.4.10. And $A \rightarrow B$ is quasicompact by Morphisms of Spaces, Lemma 54.8.8. Thus $f$ is quasi-separated.
Proof of (3). Assume $g \circ f$ is separated and $\Delta_{g}$ is separated. Consider the factorization

$$
\mathcal{X} \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}
$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is separated, see Lemmas 83.3 .3 and 83.4.7. Hence for any scheme $T$ and morphism $T \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}$ we get morphisms of algebraic spaces

$$
A=\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Z} \mathcal{X})} T \longrightarrow B=\left(\mathcal{X} \times \mathcal{Y}_{\mathcal{X}} \mathcal{X}\right) \times_{(\mathcal{X} \times \mathcal{Z} \mathcal{X})} T \longrightarrow T
$$

such that $B \rightarrow T$ is separated. The composition $A \rightarrow T$ is proper as we have assumed that $g \circ f$ is quasi-separated. Hence $A \rightarrow B$ is proper by Morphisms of Spaces, Lemma 54.39 .6 which means that $f$ is separated.

Lemma 83.4.13. Let $\mathcal{X}$ be an algebraic stack over the base scheme $S$.
(1) $\mathcal{X}$ is $D M \Leftrightarrow \mathcal{X}$ is $D M$ over $S$.
(2) $\mathcal{X}$ is quasi-DM $\Leftrightarrow \mathcal{X}$ is quasi-DM over $S$.
(3) If $\mathcal{X}$ is separated, then $\mathcal{X}$ is separated over $S$.
(4) If $\mathcal{X}$ is quasi-separated, then $\mathcal{X}$ is quasi-separated over $S$.

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme $S$.
(5) If $\mathcal{X}$ is $D M$ over $S$, then $f$ is $D M$.
(6) If $\mathcal{X}$ is quasi-DM over $S$, then $f$ is quasi-DM.
(7) If $\mathcal{X}$ is separated over $S$ and $\Delta_{\mathcal{Y} / S}$ is separated, then $f$ is separated.
(8) If $\mathcal{X}$ is quasi-separated over $S$ and $\Delta_{\mathcal{Y} / S}$ is quasi-separated, then $f$ is quasi-separated.

Proof. Parts (5), (6), (7), and (8) follow immediately from Lemma 83.4 .12 and Spaces, Definition 52.13.2. To prove (3) and (4) think of $X$ and $Y$ as algebraic stacks over $\operatorname{Spec}(\mathbf{Z})$ and apply Lemma 83.4.12. Similarly, to prove (1) and (2), think of $\mathcal{X}$ as an algebraic stack over $\operatorname{Spec}(\mathbf{Z})$ consider the morphisms

$$
\mathcal{X} \longrightarrow \mathcal{X} \times_{S} \mathcal{X} \longrightarrow \mathcal{X} \times_{\operatorname{Spec}(\mathbf{Z})} \mathcal{X}
$$

Both arrows are representable by algebraic spaces. The second arrow is unramified and locally quasi-finite as the base change of the immersion $\Delta_{S / \mathbf{z}}$. Hence the composition is unramified (resp. locally quasi-finite) if and only if the first arrow is unramified (resp. locally quasi-finite), see Morphisms of Spaces, Lemmas 54.37.3 and 54.37.11 (resp. Morphisms of Spaces, Lemmas 54.27.3 and 54.27.8).
06 MB Lemma 83.4.14. Let $\mathcal{X}$ be an algebraic stack. Let $W$ be an algebraic space, and let $f: W \rightarrow \mathcal{X}$ be a surjective, flat, locally finitely presented morphism.
(1) If $f$ is unramified (i.e., étale, i.e., $\mathcal{X}$ is Deligne-Mumford), then $\mathcal{X}$ is DM.
(2) If $f$ is locally quasi-finite, then $\mathcal{X}$ is quasi-DM.

Proof. Note that if $f$ is unramified, then it is étale by Morphisms of Spaces, Lemma 54.38.12. This explains the parenthetical remark in (1). Assume $f$ is unramified (resp. locally quasi-finite). We have to show that $\Delta_{\mathcal{X}}: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{X}$ is unramified (resp. locally quasi-finite). Note that $W \times W \rightarrow \mathcal{X} \times \mathcal{X}$ is also surjective, flat, and locally of finite presentation. Hence it suffices to show that

$$
W \times_{\mathcal{X} \times \mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X}=W \times_{\mathcal{X}} W \longrightarrow W \times W
$$

is unramified (resp. locally quasi-finite), see Properties of Stacks, Lemma 82.3.3. By assumption the morphism $\operatorname{pr}_{i}: W \times \mathcal{X} W \rightarrow W$ is unramified (resp. locally quasi-finite). Hence the displayed arrow is unramified (resp. locally quasi-finite) by Morphisms of Spaces, Lemma 54.37.11 (resp. Morphisms of Spaces, Lemma 54.27.8.

06MY Lemma 83.4.15. A monomorphism of algebraic stacks is separated and DM. The same is true for immersions of algebraic stacks.

Proof. If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a monomorphism of algebraic stacks, then $\Delta_{f}$ is an isomorphism, see Properties of Stacks, Lemma 82.8.4. Since an isomorphism of algebraic spaces is proper and unramified we see that $f$ is separated and DM. The second assertion follows from the first as an immersion is a monomorphism, see Properties of Stacks, Lemma 82.9.5.

06 MZ Lemma 83.4.16. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. Assume the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ at $x$ exists. If $\mathcal{X}$ is $D M$, resp. quasi-DM, resp. separated, resp. quasi-separated, then so is $\mathcal{Z}_{x}$.

Proof. This is true because $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is a monomorphism hence DM and separated by Lemma 83.4.15. Apply Lemma 83.4.11 to conclude.

### 83.5. Inertia stacks

050P The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 8.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.33 .

050Q Lemma 83.5.1. Let $\mathcal{X}$ be an algebraic stack. Then the inertia stack $\mathcal{I}_{\mathcal{X}}$ is an algebraic stack as well. The morphism

$$
\mathcal{I}_{\mathcal{X}} \longrightarrow \mathcal{X}
$$

is representable by algebraic spaces and locally of finite type. More generally, let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then the morphism

$$
\mathcal{I}_{\mathcal{X} / \mathcal{Y}} \longrightarrow \mathcal{X}
$$

is representable by algebraic spaces and locally of finite type.
Proof. By Categories, Lemma 4.33.1 there are equivalences

$$
\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X} \times \times_{\Delta, \mathcal{X} \times{ }_{S} \mathcal{X}, \Delta} \mathcal{X} \quad \text { and } \quad \mathcal{I}_{\mathcal{X} / \mathcal{Y}} \rightarrow \mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{Y}} \mathcal{X}, \Delta, \mathcal{X}
$$

which shows that the inertia stacks are algebraic stacks. Let $T \rightarrow \mathcal{X}$ be a morphism given by the object $x$ of the fibre category of $\mathcal{X}$ over $T$. Then we get a 2 -fibre product square

This follows immediately from the definition of $\mathcal{I}_{\mathcal{X}}$. Since $\operatorname{Isom}_{\mathcal{X}}(x, x)$ is always an algebraic space locally of finite type over $T$ (see Lemma 83.3.1) we conclude that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is representable by algebraic spaces and locally of finite type. Finally, for the relative inertia we get

with both squares 2-fibre products. This follows from Categories, Lemma 4.33 .3 . The left vertical arrow is a morphism of algebraic spaces locally of finite type over $T$, and hence is locally of finite type, see Morphisms of Spaces, Lemma 54.23.6, Thus $K$ is an algebraic space and $K \rightarrow T$ is locally of finite type. This proves the assertion on the relative inertia.

050R Remark 83.5.2. Let $\mathcal{X}$ be an algebraic stack. In Properties of Stacks, Remark 82.3.7 we have seen that the 2 -category of morphisms $\mathcal{X}^{\prime} \rightarrow \mathcal{X}$ representable by algebraic spaces with target $\mathcal{X}$ forms a category. In this category the inertia stack of $\mathcal{X}$ is a group object. Recall that an object of $\mathcal{I}_{\mathcal{X}}$ is just a pair $(x, \alpha)$ where $x$ is an object of $\mathcal{X}$ and $\alpha$ is an automorphism of $x$ in the fibre category of $\mathcal{X}$ that $x$ lives in. The composition

$$
c: \mathcal{I}_{\mathcal{X}} \times \mathcal{X} \mathcal{I}_{\mathcal{X}} \longrightarrow \mathcal{I}_{\mathcal{X}}
$$

is given by the rule on objects

$$
\left((x, \alpha),\left(x^{\prime}, \alpha^{\prime}\right), \beta\right) \mapsto\left(x, \alpha \circ \beta^{-1} \circ \alpha^{\prime} \circ \beta\right)
$$

which makes sense as $\beta: x \rightarrow x^{\prime}$ is an isomorphism in the fibre category by our definition of fibre products. The neutral element $e: \mathcal{X} \rightarrow \mathcal{I}_{\mathcal{X}}$ is given by the functor $x \mapsto\left(x, \mathrm{id}_{x}\right)$. We omit the proof that the axioms of a group object hold. There is a variant of this remark for relative inertia stacks.

Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{I}_{\mathcal{X}}$ be its inertia stack. We have seen in the proof of Lemma 83.5.1 that for any scheme $T$ and object $x$ of $\mathcal{X}$ over $T$ there is a canonical cartesian square

The group structure on $\mathcal{I}_{\mathcal{X}}$ discussed in Remark 83.5 .2 induces the group structure on $\operatorname{Isom}_{\mathcal{X}}(x, x)$ of Lemma 83.3.2. This allows us to define the sheaf $\operatorname{Isom}_{\mathcal{X}}$ also for morphisms from algebraic spaces to $\mathcal{X}$. We formalize this in the following definition.

06PP Definition 83.5.3. Let $\mathcal{X}$ be an algebraic stack and let $X$ be an algebraic space. Let $x: X \rightarrow \mathcal{X}$ be a morphism. We set

$$
\operatorname{Isom}_{\mathcal{X}}(x, x)=X \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}}
$$

We endow it with the structure of a group algebraic space over $X$ by pulling back the composition law discussed in Remark 83.5.2. We will sometimes refer to $\operatorname{Isom}_{\mathcal{X}}(x, x)$ as the sheaf of automorphisms of $x$.

As a variant we may occasionally use the notation $\operatorname{Isom}_{\mathcal{X}}(x, y)$ when given two morphisms $x, y: X \rightarrow \mathcal{X}$. This will mean simply the algebraic space

$$
\left(X \times_{x, \mathcal{X}, y} X\right) \times_{X \times X, \Delta_{X}} X
$$

Then it is true, as in Lemma 83.3.2, that $\operatorname{Isom}_{\mathcal{X}}(x, y)$ is a pseudo torsor for $\operatorname{Isom}_{\mathcal{X}}(x, x)$ over $X$. We omit the verification.
06PQ Lemma 83.5.4. Let $\pi: \mathcal{X} \rightarrow X$ be a morphism from an algebraic stack to an algebraic space. Let $f: X^{\prime} \rightarrow X$ be a morphism of algebraic spaces. Set $\mathcal{X}^{\prime}=X^{\prime} \times_{X} \mathcal{X}$. Then both squares in the diagram

are fibre product squares.
Proof. The inertia stack $\mathcal{I}_{\mathcal{X}^{\prime}}$ is defined as the category of pairs ( $x^{\prime}, \alpha^{\prime}$ ) where $x^{\prime}$ is an object of $\mathcal{X}^{\prime}$ and $\alpha^{\prime}$ is an automorphism of $x^{\prime}$ in its fibre category over $(S c h / S)_{f p p f}$, see Categories, Section 4.33. Suppose that $x^{\prime}$ lies over the scheme $U$ and maps to the object $x$ of $\mathcal{X}$. By the construction of the 2 -fibre product in Categories, Lemma 4.31 .3 we see that $x^{\prime}=\left(U, a^{\prime}, x, 1\right)$ where $a^{\prime}: U \rightarrow X^{\prime}$ is a morphism and 1 indicates that $f \circ a^{\prime}=\pi \circ x$ as morphisms $U \rightarrow X$. Moreover we have $\operatorname{Isom}_{\mathcal{X}^{\prime}}\left(x^{\prime}, x^{\prime}\right)=\operatorname{Isom}_{\mathcal{X}}(x, x)$ as sheaves on $U$ (by the very construction of the 2 -fibre product). This implies that the left square is a fibre product square (details omitted).

06R5 Lemma 83.5.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a monomorphism of algebraic stacks. Then the diagram

is a fibre product square.
Proof. This follows immediately from the fact that $f$ is fully faithful (see Properties of Stacks, Lemma 82.8.4 and the definition of the inertia in Categories, Section 4.33 Namely, an object of $\mathcal{I}_{\mathcal{X}}$ over a scheme $T$ is the same thing as a pair $(x, \alpha)$ consisting of an object $x$ of $\mathcal{X}$ over $T$ and a morphism $\alpha: x \rightarrow x$ in the fibre category of $\mathcal{X}$ over $T$. As $f$ is fully faithful we see that $\alpha$ is the same thing as a morphism $\beta: f(x) \rightarrow f(x)$ in the fibre category of $\mathcal{Y}$ over $T$. Hence we can think of objects of $\mathcal{I}_{\mathcal{X}}$ over $T$ as triples $((y, \beta), x, \gamma)$ where $y$ is an object of $\mathcal{Y}$ over $T$,
$\beta: y \rightarrow y$ in $\mathcal{Y}_{T}$ and $\gamma: y \rightarrow f(x)$ is an isomorhism over $T$, i.e., an object of $\mathcal{I}_{\mathcal{Y}} \times \mathcal{Y} \mathcal{X}$ over $T$.

06PR Lemma 83.5.6. Let $\mathcal{X}$ be an algebraic stack. Let $[U / R] \rightarrow \mathcal{X}$ be a presentation. Let $G / U$ be the stabilizer group algebraic space associated to the groupoid (U, R, s, t, c). Then

is a fibre product diagram.
Proof. Immediate from Groupoids in Spaces, Lemma 65.25.2.

### 83.6. Higher diagonals

04 YX Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. In this situation it makes sense to consider not only the diagonal

$$
\Delta_{f}: \mathcal{X} \rightarrow \mathcal{X} \times \mathcal{Y} \mathcal{X}
$$

but also the diagonal of the diagonal, i.e., the morphism

$$
\Delta_{\Delta_{f}}: \mathcal{X} \longrightarrow \mathcal{X} \times_{(\mathcal{X} \times \mathcal{Y} \mathcal{X})} \mathcal{X}
$$

Because of this we sometimes use the following terminology. We denote $\Delta_{f, 0}=$ $f$ the zeroth diagonal, we denote $\Delta_{f, 1}=\Delta_{f}$ the first diagonal, and we denote $\Delta_{f, 2}=\Delta_{\Delta_{f}}$ the second diagonal. Note that $\Delta_{f, 1}$ is representable by algebraic spaces and locally of finite type, see Lemma 83.3.3. Hence $\Delta_{f, 2}$ is representable, a monomorphism, locally of finite type, separated, and locally quasi-finite, see Lemma 83.3 .4

We can describe the second diagonal using the relative inertia stack. Namely, the fibre product $\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Y} \mathcal{X})} \mathcal{X}$ is equivalent to the relative inertia stack $\mathcal{I}_{\mathcal{X} / \mathcal{Y}}$ by Categories, Lemma 4.33.1. Moreover, via this identification the second diagonal becomes the neutral section

$$
e: \mathcal{X} \rightarrow \mathcal{I}_{\mathcal{X} / \mathcal{Y}}
$$

of the relative inertia stack. Moreover, recall from the proof of Lemma 83.5.1 that given a morphism $x: T \rightarrow \mathcal{X}$ the fibre product $T \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X} / \mathcal{Y}}$ is given as the kernel $K=K_{f, x}$ of the homomorphism of group algebraic spaces

$$
\operatorname{Isom}_{\mathcal{X}}(x, x) \longrightarrow \operatorname{Isom}_{\mathcal{Y}}(f(x), f(x))
$$

over $T$. The morphism $e$ corresponds to the neutral section $e: T \rightarrow K$ in this situation.
04YY Lemma 83.6.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent:
(1) the morphism $f$ is representable by algebraic spaces,
(2) the second diagonal of $f$ is an isomorphism,
(3) the group stack $\mathcal{I}_{\mathcal{X} / \mathcal{Y}}$ is trivial over $\mathcal{X}$, and
(4) for all morphisms $x: T \rightarrow \mathcal{X}$ the associated group algebraic space $K$ is trivial.

Proof. We first prove the equivalence of (1) and (2). Namely, $f$ is representable by algebraic spaces if and only if $f$ is faithful, see Algebraic Stacks, Lemma 76.15.2. On the other hand, $f$ is faithful if and only if for every object $x$ of $\mathcal{X}$ over a scheme $T$ the functor $f$ induces an injection $\operatorname{Isom}_{\mathcal{X}}(x, x) \rightarrow \operatorname{Isom}_{\mathcal{Y}}(f(x), f(x))$, which happens if and only if the kernel $K$ is trivial, which happens if and only if $e: T \rightarrow K$ is an isomorphism for every $x: T \rightarrow \mathcal{X}$. Since $K=T \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X} / \mathcal{Y}}$ as discussed above, this proves the equivalence of (1) and (2). To prove the equivalence of (2) and (3), by the discussion above, it suffices to note that a group stack is trivial if and only if its identity section is an isomorphism. Finally, the equivalence of (3) and (4) follows from the definitions.

This lemma leads to the following hierarchy for morphisms of algebraic stacks.
0AHJ Lemma 83.6.2. A morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks is
(1) a monomorphism if and only if $\Delta_{f, 1}$ is an isomorphism, and
(2) representable by algebraic spaces if and only if $\Delta_{f, 1}$ is a monomorphism.

Moreover, the second diagonal $\Delta_{f, 2}$ is always a monomorphism.
Proof. Recall from Properties of Stacks, Lemma 82.8.4 that a morphism of algebraic stacks is a monomorphism if and only if its diagonal is an isomorphism of stacks. Thus Lemma 83.6.1 can be rephrased as saying that a morphism is representable by algebraic spaces if the diagonal is a monomorphism. In particular, it shows that condition (3) of Lemma 83.3 .4 is actually an if and only if, i.e., a morphism of algebraic stacks is representable by algebraic spaces if and only if its diagonal is a monomorphism.

04YZ Lemma 83.6.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then
(1) $\Delta_{f, 1}$ separated $\Leftrightarrow \Delta_{f, 2}$ closed immersion $\Leftrightarrow \Delta_{f, 2}$ proper $\Leftrightarrow \Delta_{f, 2}$ universally closed,
(2) $\Delta_{f, 1}$ quasi-separated $\Leftrightarrow \Delta_{f, 2}$ finite type $\Leftrightarrow \Delta_{f, 2}$ quasi-compact, and
(3) $\Delta_{f, 1}$ locally separated $\Leftrightarrow \Delta_{f, 2}$ immersion.

Proof. Follows from Lemmas 83.3.5, 83.3.6, and 83.3.7 applied to $\Delta_{f, 1}$.
The following lemma is kind of cute and it may suggest a generalization of these conditions to higher algebraic stacks.

04Z0 Lemma 83.6.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then
(1) $f$ is separated if and only if $\Delta_{f, 1}$ and $\Delta_{f, 2}$ are universally closed, and
(2) $f$ is quasi-separated if and only if $\Delta_{f, 1}$ and $\Delta_{f, 2}$ are quasi-compact.
(3) $f$ is quasi-DM if and only if $\Delta_{f, 1}$ and $\Delta_{f, 2}$ are locally quasi-finite.
(4) $f$ is $D M$ if and only if $\Delta_{f, 1}$ and $\Delta_{f, 2}$ are unramified.

Proof. Proof of (1). Assume that $\Delta_{f, 2}$ and $\Delta_{f, 1}$ are universally closed. Then $\Delta_{f, 1}$ is separated and universally closed by Lemma 83.6.3. By Morphisms of Spaces, Lemma 54.9 .7 and Algebraic Stacks, Lemma 76.10.9 we see that $\Delta_{f, 1}$ is quasicompact. Hence it is quasi-compact, separated, universally closed and locally of finite type (by Lemma 83.3.3) so proper. This proves " $\Leftarrow$ " of (1). The proof of the implication in the other direction is omitted.

Proof of (2). This follows immediately from Lemma 83.6.3.

Proof of (3). This follows from the fact that $\Delta_{f, 2}$ is always locally quasi-finite by Lemma 83.3.4 applied to $\Delta_{f}=\Delta_{f, 1}$.
Proof of (4). This follows from the fact that $\Delta_{f, 2}$ is always unramified as Lemma 83.3.4 applied to $\Delta_{f}=\Delta_{f, 1}$ shows that $\Delta_{f, 2}$ is locally of finite type and a monomorphism. See More on Morphisms of Spaces, Lemma 63.12.8.

### 83.7. Quasi-compact morphisms

050 S Let $f$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 82.3 we have defined what it means for $f$ to be quasi-compact. Here is another characterization.

050T Lemma 83.7.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:
(1) $f$ is quasi-compact, and
(2) for every quasi-compact algebraic stack $\mathcal{Z}$ and any morphism $\mathcal{Z} \rightarrow \mathcal{Y}$ the algebraic stack $\mathcal{Z} \times \mathcal{Y} \mathcal{X}$ is quasi-compact.

Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks with $\mathcal{Z}$ quasi-compact. By Properties of Stacks, Lemma 82.6 .2 there exists a quasi-compact scheme $U$ and a surjective smooth morphism $U \rightarrow \mathcal{Z}$. Since $f$ is representable by algebraic spaces and quasi-compact we see by definition that $U \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and that $U \times_{\mathcal{Y}} \mathcal{X} \rightarrow U$ is quasi-compact. Hence $U \times_{Y} X$ is a quasi-compact algebraic space. The morphism $U \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z} \times \mathcal{Y} \mathcal{X}$ is smooth and surjective (as the base change of the smooth and surjective morphism $U \rightarrow \mathcal{Z})$. Hence $\mathcal{Z} \times \mathcal{Y} \mathcal{X}$ is quasi-compact by another application of Properties of Stacks, Lemma 82.6.2

Assume (2). Let $Z \rightarrow \mathcal{Y}$ be a morphism, where $Z$ is a scheme. We have to show that the morphism of algebraic spaces $p: Z \times \mathcal{Y} \mathcal{X} \rightarrow Z$ is quasi-compact. Let $U \subset Z$ be affine open. Then $p^{-1}(U)=U \times_{\mathcal{Y}} \mathcal{Z}$ and the algebraic space $U \times \mathcal{Y} \mathcal{Z}$ is quasi-compact by assumption (2). Hence $p$ is quasi-compact, see Morphisms of Spaces, Lemma 54.8.7.

This motivates the following definition.
050U Definition 83.7.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is quasi-compact if for every quasi-compact algebraic stack $\mathcal{Z}$ and morphism $\mathcal{Z} \rightarrow \mathcal{Y}$ the fibre product $\mathcal{Z} \times \mathcal{Y} \mathcal{X}$ is quasi-compact.
By Lemma 83.7.1 above this agrees with the already existing notion for morphisms of algebraic stacks representable by algebraic spaces. In particular this notion agrees with the notions already defined for morphisms between algebraic stacks and schemes.

050V Lemma 83.7.3. The base change of a quasi-compact morphism of algebraic stacks by any morphism of algebraic stacks is quasi-compact.

Proof. Omitted.
050W Lemma 83.7.4. The composition of a pair of quasi-compact morphisms of algebraic stacks is quasi-compact.

Proof. Omitted.

050X Lemma 83.7.5. Let

be a 2-commutative diagram of morphisms of algebraic stacks. If $f$ is surjective and $p$ is quasi-compact, then $q$ is quasi-compact.

Proof. Let $\mathcal{T}$ be a quasi-compact algebraic stack, and let $\mathcal{T} \rightarrow \mathcal{Z}$ be a morphism. By Properties of Stacks, Lemma 82.5.3 the morphism $\mathcal{T} \times{ }_{\mathcal{Z}} \mathcal{X} \rightarrow \mathcal{T} \times{ }_{\mathcal{Z}} \mathcal{Y}$ is surjective and by assumption $\mathcal{T} \times_{\mathcal{Z}} \mathcal{X}$ is quasi-compact. Hence $\mathcal{T} \times_{\mathcal{Z}} \mathcal{Y}$ is quasi-compact by Properties of Stacks, Lemma 82.6.2.
050Y Lemma 83.7.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f$ is quasi-compact and $g$ is quasi-separated then $f$ is quasi-compact.

Proof. This is true because $f$ equals the composition $(1, f): \mathcal{X} \rightarrow \mathcal{X} \times{ }_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{Y}$. The first map is quasi-compact by Lemma 83.4 .9 because it is a section of the quasiseparated morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{X}$ (a base change of $g$, see Lemma 83.4.4). The second map is quasi-compact as it is the base change of $f$, see Lemma 83.7.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 83.7.4

075S Lemma 83.7.7. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) If $\mathcal{X}$ is quasi-compact and $\mathcal{Y}$ is quasi-separated, then $f$ is quasi-compact.
(2) If $\mathcal{X}$ is quasi-compact and quasi-separated and $\mathcal{Y}$ is quasi-separated, then $f$ is quasi-compact and quasi-separated.
(3) A fibre product of quasi-compact and quasi-separated algebraic stacks is quasi-compact and quasi-separated.
Proof. Part (1) follows from Lemma 83.7.6. Part (2) follows from (1) and Lemma 83.4.12. For (3) let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Z} \rightarrow \mathcal{Y}$ be morphisms of quasi-compact and quasi-separated algebraic stacks. Then $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{Z}$ is quasi-compact and quasiseparated as a base change of $\mathcal{X} \rightarrow \mathcal{Y}$ using (2) and Lemmas 83.7.3 and 83.4.4. Hence $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ is quasi-compact and quasi-separated as an algebraic stack quasicompact and quasi-separated over $\mathcal{Z}$, see Lemmas 83.4.11 and 83.7.4.

### 83.8. Noetherian algebraic stacks

050Z We have already defined locally Noetherian algebraic stacks in Properties of Stacks, Section 82.7

0510 Definition 83.8.1. Let $\mathcal{X}$ be an algebraic stack. We say $\mathcal{X}$ is Noetherian if $\mathcal{X}$ is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic stack $\mathcal{X}$ is not just quasi-compact and locally Noetherian, but also quasi-separated. In the language of Section 83.6 if we denote $p: \mathcal{X} \rightarrow \operatorname{Spec}(\mathbf{Z})$ the "absolute" structure morphism (i.e., the structure morphism of $\mathcal{X}$ viewed as an algebraic stack over $\mathbf{Z}$ ), then
$\mathcal{X}$ Noetherian $\Leftrightarrow \mathcal{X}$ locally Noetherian and $\Delta_{p, 0}, \Delta_{p, 1}, \Delta_{p, 2}$ quasi-compact.
This will later mean that an algebraic stack of finite type over a Noetherian algebraic stack is not automatically Noetherian.

### 83.9. Open morphisms

06U0 Let $f$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 82.3 we have defined what it means for $f$ to be universally open. Here is another characterization.

06U1 Lemma 83.9.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent
(1) $f$ is universally open, and
(2) for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times \mathcal{Y} \mathcal{X}| \rightarrow|\mathcal{Z}|$ is open.

Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Z}$. By assumption the morphism $V \times \mathcal{Y} \mathcal{X} \rightarrow V$ of algebraic spaces is universally open, in particular the map $|V \times \mathcal{Y} \mathcal{X}| \rightarrow|V|$ is open. By Properties of Stacks, Section 82.4 in the commutative diagram

the horizontal arrows are open and surjective, and moreover

$$
\left|V \times_{\mathcal{Y}} \mathcal{X}\right| \longrightarrow|V| \times_{|\mathcal{Z}|}\left|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}\right|
$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication (2) $\Rightarrow(1)$ follows from the definitions.

Thus we may use the following natural definition.
06U2 Definition 83.9.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ is open if the map of topological spaces $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is open.
(2) We say $f$ is universally open if for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces

$$
|\mathcal{Z} \times \mathcal{Y} \mathcal{X}| \rightarrow|\mathcal{Z}|
$$

is open, i.e., the base change $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ is open.
06U3 Lemma 83.9.3. The base change of a universally open morphism of algebraic stacks by any morphism of algebraic stacks is universally open.

Proof. This is immediate from the definition.

06U4 Lemma 83.9.4. The composition of a pair of (universally) open morphisms of algebraic stacks is (universally) open.

Proof. Omitted.

### 83.10. Submersive morphisms

06U5
06U6 Definition 83.10.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ is submersiv $\epsilon^{4}$ if the continuous map $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is submersive, see Topology, Definition 5.5.3.
(2) We say $f$ is universally submersive if for every morphism of algebraic stacks $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ the base change $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$ is submersive.
We note that a submersive morphism is in particular surjective.

### 83.11. Universally closed morphisms

0511 Let $f$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 82.3 we have defined what it means for $f$ to be universally closed. Here is another characterization.

0512 Lemma 83.11.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent
(1) $f$ is universally closed, and
(2) for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times \mathcal{Y} \mathcal{X}| \rightarrow|\mathcal{Z}|$ is closed.
Proof. Assume (1), and let $\mathcal{Z} \rightarrow \mathcal{Y}$ be as in (2). Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Z}$. By assumption the morphism $V \times \mathcal{Y} \mathcal{X} \rightarrow V$ of algebraic spaces is universally closed, in particular the map $\left|V \times_{\mathcal{Y}} \mathcal{X}\right| \rightarrow|V|$ is closed. By Properties of Stacks, Section 82.4 in the commutative diagram

the horizontal arrows are open and surjective, and moreover

$$
\left|V \times_{\mathcal{Y}} \mathcal{X}\right| \longrightarrow|V| \times_{|\mathcal{Z}|}\left|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}\right|
$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication $(2) \Rightarrow(1)$ follows from the definitions.

Thus we may use the following natural definition.
0513 Definition 83.11.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ is closed if the map of topological spaces $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is closed.
(2) We say $f$ is universally closed if for every morphism of algebraic stacks $\mathcal{Z} \rightarrow \mathcal{Y}$ the morphism of topological spaces

$$
|\mathcal{Z} \times \mathcal{Y} \mathcal{X}| \rightarrow|\mathcal{Z}|
$$

is closed, i.e., the base change $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ is closed.
0514 Lemma 83.11.3. The base change of a universally closed morphism of algebraic stacks by any morphism of algebraic stacks is universally closed.

[^218]Proof. This is immediate from the definition.

0515 Lemma 83.11.4. The composition of a pair of (universally) closed morphisms of algebraic stacks is (universally) closed.

Proof. Omitted.

### 83.12. Types of morphisms smooth local on source-and-target

06FL Given a property of morphisms of algebraic spaces which is smooth local on the source-and-target, see Descent on Spaces, Definition 61.18.1 we may use it to define a corresponding property of morphisms of algebraic stacks, namely by imposing either of the equivalent conditions of the lemma below.

06FM Lemma 83.12.1. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Consider commutative diagrams

where $U$ and $V$ are algebraic spaces and the vertical arrows are smooth. The following are equivalent
(1) for any diagram as above such that in addition $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ is smooth the morphism $h$ has property $\mathcal{P}$, and
(2) for some diagram as above with $a: U \rightarrow \mathcal{X}$ surjective the morphism $h$ has property $\mathcal{P}$.
If $\mathcal{X}$ and $\mathcal{Y}$ are representable by algebraic spaces, then this is also equivalent to $f$ (as a morphism of algebraic spaces) having property $\mathcal{P}$. If $\mathcal{P}$ is also preserved under any base change, and fppf local on the base, then for morphisms $f$ which are representable by algebraic spaces this is also equivalent to $f$ having property $\mathcal{P}$ in the sense of Properties of Stacks, Section 82.3.

Proof. Let us prove the implication $(1) \Rightarrow(2)$. Pick an algebraic space $V$ and a surjective and smooth morphism $V \rightarrow \mathcal{Y}$. Pick an algebraic space $U$ and a surjective and smooth morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$. Note that $U \rightarrow \mathcal{X}$ is surjective and smooth as well, as a composition of the base change $\mathcal{X} \times \mathcal{Y} V \rightarrow \mathcal{X}$ and the chosen $\operatorname{map} U \rightarrow \mathcal{X} \times \mathcal{Y} V$. Hence we obtain a diagram as in (1). Thus if (1) holds, then $h: U \rightarrow V$ has property $\mathcal{P}$, which means that (2) holds as $U \rightarrow \mathcal{X}$ is surjective.

Conversely, assume (2) holds and let $U, V, a, b, h$ be as in (2). Next, let $U^{\prime}, V^{\prime}, a^{\prime}, b^{\prime}, h^{\prime}$ be any diagram as in (1). Picture

To show that (2) implies (1) we have to prove that $h^{\prime}$ has $\mathcal{P}$. To do this consider the commutative diagram

of algebraic spaces. Note that the horizontal arrows are smooth as base changes of the smooth morphisms $V \rightarrow \mathcal{Y}, V^{\prime} \rightarrow \mathcal{Y}, U \rightarrow \mathcal{X}$, and $U^{\prime} \rightarrow \mathcal{X}$. Note that

is cartesian, hence the left vertical arrow is smooth as $U^{\prime}, V^{\prime}, a^{\prime}, b^{\prime}, h^{\prime}$ is as in (1). Since $\mathcal{P}$ is local on the target we see that the base change $U \times \mathcal{y} V^{\prime} \rightarrow V \times \mathcal{y} V^{\prime}$ has $\mathcal{P}$ and hence after precomposing by the smooth morphism $U \times_{\mathcal{X}} U^{\prime} \rightarrow U \times_{\mathcal{Y}} V^{\prime}$ the morphism we conclude $\left(h, h^{\prime}\right)$ has $\mathcal{P}$. Finally, since $U \times_{X} U^{\prime} \rightarrow U^{\prime}$ is surjective this implies that $h^{\prime}$ has $\mathcal{P}$ as $\mathcal{P}$ is local on the source-and-target. This finishes the proof of the equivalence of (1) and (2).
If $\mathcal{X}$ and $\mathcal{Y}$ are representable, then Descent on Spaces, Lemma 61.18.3 applies which shows that (1) and (2) are equivalent to $f$ having $\mathcal{P}$.

Finally, suppose $f$ is representable, and $U, V, a, b, h$ are as in part (2) of the lemma, and that $\mathcal{P}$ is preserved under arbitrary base change. We have to show that for any scheme $Z$ and morphism $Z \rightarrow \mathcal{X}$ the base change $Z \times \mathcal{Y} \mathcal{X} \rightarrow Z$ has property $\mathcal{P}$. Consider the diagram

Note that the top horizontal arrow is a base change of $h$ and hence has property $\mathcal{P}$. The left vertical arrow is smooth and surjective and the right vertical arrow is smooth. Thus Descent on Spaces, Lemma 61.18.3 kicks in and shows that $Z \times \mathcal{Y} \mathcal{X} \rightarrow$ $Z$ has property $\mathcal{P}$.

06FN Definition 83.12.2. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. We say a morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks has property $\mathcal{P}$ if the equivalent conditions of Lemma 83.12 .1 hold.

06FP Remark 83.12.3. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under composition. Then the property of morphisms of algebraic stacks defined in Definition 83.12.2 is stable under composition. Namely, let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks having property $\mathcal{P}$. Choose an algebraic space $W$ and a surjective
smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$. Finally, choose an algebraic space $U$ and a surjective and smooth morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$. Then the morphisms $V \rightarrow W$ and $U \rightarrow V$ have property $\mathcal{P}$ by definition. Whence $U \rightarrow W$ has property $\mathcal{P}$ as we assumed that $\mathcal{P}$ is stable under composition. Thus, by definition again, we see that $g \circ f: \mathcal{X} \rightarrow \mathcal{Z}$ has property $\mathcal{P}$.

06FQ Remark 83.12.4. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under base change. Then the property of morphisms of algebraic stacks defined in Definition 83.12.2 is stable under base change. Namely, let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ be morphisms of algebraic stacks and assume $f$ has property $\mathcal{P}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$. Finally, choose an algebraic space $V^{\prime}$ and a surjective and smooth morphism $V^{\prime} \rightarrow \mathcal{Y}^{\prime} \times \mathcal{Y} V$. Then the morphism $U \rightarrow V$ has property $\mathcal{P}$ by definition. Whence $V^{\prime} \times_{V} U \rightarrow V^{\prime}$ has property $\mathcal{P}$ as we assumed that $\mathcal{P}$ is stable under base change. Considering the diagram

we see that the left top horizontal arrow is smooth and surjective, whence by definition we see that the projection $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$ has property $\mathcal{P}$.

06PS Remark 83.12.5. Let $\mathcal{P}, \mathcal{P}^{\prime}$ be properties of morphisms of algebraic spaces which are smooth local on the source-and-target and stable under base change. Suppose that we have $\mathcal{P} \Rightarrow \mathcal{P}^{\prime}$ for morphisms of algebraic spaces. Then we also have $\mathcal{P} \Rightarrow \mathcal{P}^{\prime}$ for the properties of morphisms of algebraic stacks defined in Definition 83.12 .2 using $\mathcal{P}$ and $\mathcal{P}^{\prime}$. This is clear from the definition.

### 83.13. Morphisms of finite type

06 FR The property "locally of finite type" of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 61.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 54.23 .3 and Descent on Spaces, Lemma 61.10.7. Hence, by Lemma 83.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 82.3 when the morphism is representable by algebraic spaces.

06FS Definition 83.13.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ locally of finite type if the equivalent conditions of Lemma 83.12.1 hold with $\mathcal{P}=$ locally of finite type.
(2) We say $f$ is of finite type if it is locally of finite type and quasi-compact.

06FT Lemma 83.13.2. The composition of finite type morphisms is of finite type. The same holds for locally of finite type.

Proof. Combine Remark 83.12 .3 with Morphisms of Spaces, Lemma 54.23.2

06FU Lemma 83.13.3. A base change of a finite type morphism is finite type. The same holds for locally of finite type.

Proof. Combine Remark 83.12 .4 with Morphisms of Spaces, Lemma 54.23 .3
06FV Lemma 83.13.4. An immersion is locally of finite type.
Proof. Follows from Morphisms of Spaces, Lemma 54.23.7
06R6 Lemma 83.13.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If $f$ is locally of finite type and $\mathcal{Y}$ is locally Noetherian, then $\mathcal{X}$ is locally Noetherian.

Proof. Let

be a commutative diagram where $U, V$ are schemes, $V \rightarrow \mathcal{Y}$ is surjective and smooth, and $U \rightarrow V \times \mathcal{Y} \mathcal{X}$ is surjective and smooth. Then $U \rightarrow V$ is locally of finite type. If $\mathcal{Y}$ is locally Noetherian, then $V$ is locally Noetherian. By Morphisms, Lemma 28.15.6 we see that $U$ is locally Noetherian, which means that $\mathcal{X}$ is locally Noetherian.

The following two lemmas will be improved on later (after we have discussed morphisms of algebraic stacks which are locally of finite presentation).

06U7 Lemma 83.13.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \rightarrow \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where $W$ is an algebraic space. If the base change $W \times \mathcal{Y} \mathcal{X} \rightarrow W$ is locally of finite type, then $f$ is locally of finite type.

Proof. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. We have to show that $U \rightarrow V$ is locally of finite presentation. Now we base change everything by $W \rightarrow \mathcal{Y}$ : Set $U^{\prime}=W \times \mathcal{Y} U, V^{\prime}=W \times \mathcal{Y} V, \mathcal{X}^{\prime}=W \times \mathcal{Y} \mathcal{X}$, and $\mathcal{Y}^{\prime}=W \times \mathcal{Y} \mathcal{Y}=W$. Then it is still true that $U^{\prime} \rightarrow V^{\prime} \times \mathcal{Y}^{\prime} \mathcal{X}^{\prime}$ is smooth by base change. Hence by our definition of locally finite type morphisms of algebraic stacks and the assumption that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ is locally of finite type, we see that $U^{\prime} \rightarrow V^{\prime}$ is locally of finite type. Then, since $V^{\prime} \rightarrow V$ is surjective, flat, and locally of finite presentation as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is locally of finite type by Descent on Spaces, Lemma 61.10.7 and we win.

06U8 Lemma 83.13.7. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. Assume $\mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite type and that $\mathcal{X} \rightarrow \mathcal{Y}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then $\mathcal{Y} \rightarrow \mathcal{Z}$ is locally of finite type.

Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow W \times \mathcal{Z} \mathcal{Y}$. Set $U=V \times \mathcal{Y} \mathcal{X}$ which is an algebraic space. We know that $U \rightarrow V$ is surjective, flat, and locally of finite presentation and that $U \rightarrow W$ is locally of finite type. Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 61.14.2.

06U9 Lemma 83.13.8. Let $f: \mathcal{X} \rightarrow \mathcal{Y}, g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f: \mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite type, then $f: \mathcal{X} \rightarrow \mathcal{Y}$ is locally of finite type.

Proof. We can find a diagram

where $U, V, W$ are schemes, the vertical arrow $W \rightarrow \mathcal{Z}$ is surjective and smooth, the arrow $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$ is surjective and smooth, and the arrow $U \rightarrow \mathcal{X} \times{ }_{\mathcal{Y}} V$ is surjective and smooth. Then also $U \rightarrow \mathcal{X} \times_{\mathcal{Z}} V$ is surjective and smooth (as a composition of a surjective and smooth morphism with a base change of such). By definition we see that $U \rightarrow W$ is locally of finite type. Hence $U \rightarrow V$ is locally of finite type by Morphisms, Lemma 28.15 .8 which in turn means (by definition) that $\mathcal{X} \rightarrow \mathcal{Y}$ is locally of finite type.

### 83.14. Points of finite type

06 FW Let $\mathcal{X}$ be an algebraic stack. A finite type point $x \in|\mathcal{X}|$ is a point which can be represented by a morphism $\operatorname{Spec}(k) \rightarrow \mathcal{X}$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always "enough of them" for example.

06FX Lemma 83.14.1. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. The following are equivalent:
(1) There exists a morphism $\operatorname{Spec}(k) \rightarrow \mathcal{X}$ which is locally of finite type and represents $x$.
(2) There exists a scheme $U$, a closed point $u \in U$, and a smooth morphism $\varphi: U \rightarrow \mathcal{X}$ such that $\varphi(u)=x$.

Proof. Let $u \in U$ and $U \rightarrow \mathcal{X}$ be as in (2). Then $\operatorname{Spec}(\kappa(u)) \rightarrow U$ is of finite type, and $U \rightarrow \mathcal{X}$ is representable and locally of finite type (by Morphisms of Spaces, Lemmas 54.38.8 and 54.28.5). Hence we see (1) holds by Lemma 83.13.2.

Conversely, assume $\operatorname{Spec}(k) \rightarrow \mathcal{X}$ is locally of finite type and represents $x$. Let $U \rightarrow \mathcal{X}$ be a surjective smooth morphism where $U$ is a scheme. By assumption $U \times_{\mathcal{X}} \operatorname{Spec}(k) \rightarrow U$ is a morphism of algebraic spaces which is locally of finite type. Pick a finite type point $v$ of $U \times \mathcal{X} \operatorname{Spec}(k)$ (there exists at least one, see Morphisms of Spaces, Lemma 54.25.3). By Morphisms of Spaces, Lemma 54.25.4 the image $u \in U$ of $v$ is a finite type point of $U$. Hence by Morphisms, Lemma 28.16.4 after shrinking $U$ we may assume that $u$ is a closed point of $U$, i.e., (2) holds.

06FY Definition 83.14.2. Let $\mathcal{X}$ be an algebraic stack. We say a point $x \in|\mathcal{X}|$ is a finite type poin ${ }^{5}$ if the equivalent conditions of Lemma 83.14.1 are satisfied. We denote $\mathcal{X}_{\mathrm{ft}-\mathrm{pts}}$ the set of finite type points of $\mathcal{X}$.

We can describe the set of finite type points as follows.

[^219]06FZ Lemma 83.14.3. Let $\mathcal{X}$ be an algebraic stack. We have

$$
\mathcal{X}_{f t-p t s}=\bigcup_{\varphi: U \rightarrow X \text { smooth }}|\varphi|\left(U_{0}\right)
$$

where $U_{0}$ is the set of closed points of $U$. Here we may let $U$ range over all schemes smooth over $\mathcal{X}$ or over all affine schemes smooth over $\mathcal{X}$.

Proof. Immediate from Lemma 83.14.1.
06G0 Lemma 83.14.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If $f$ is locally of finite type, then $f\left(\mathcal{X}_{f t-p t s}\right) \subset \mathcal{Y}_{f t-p t s}$.

Proof. Take $x \in \mathcal{X}_{\mathrm{ft}-\mathrm{pts}}$. Represent $x$ by a locally finite type morphism $x$ : $\operatorname{Spec}(k) \rightarrow \mathcal{X}$. Then $f \circ x$ is locally of finite type by Lemma 83.13.2. Hence $f(x) \in \mathcal{Y}_{\mathrm{ft}-\mathrm{pts}}$.

06G1 Lemma 83.14.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If $f$ is locally of finite type and surjective, then $f\left(\mathcal{X}_{f t-p t s}\right)=\mathcal{Y}_{f t-p t s}$.
Proof. We have $f\left(\mathcal{X}_{\mathrm{ft}-\mathrm{pts}}\right) \subset \mathcal{Y}_{\mathrm{ft}-\mathrm{pts}}$ by Lemma 83.14.4. Let $y \in|\mathcal{Y}|$ be a finite type point. Represent $y$ by a morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Y}$ which is locally of finite type. As $f$ is surjective the algebraic stack $\mathcal{X}_{k}=\operatorname{Spec}(k) \times \mathcal{Y} \mathcal{X}$ is nonempty, therefore has a finite type point $x \in\left|\mathcal{X}_{k}\right|$ by Lemma 83.14.3. Now $\mathcal{X}_{k} \rightarrow \mathcal{X}$ is a morphism which is locally of finite type as a base change of $\operatorname{Spec}(k) \rightarrow \mathcal{Y}$ (Lemma 83.13.3). Hence the image of $x$ in $\mathcal{X}$ is a finite type point by Lemma 83.14.4 which maps to $y$ by construction.

06G2 Lemma 83.14.6. Let $\mathcal{X}$ be an algebraic stack. For any locally closed subset $T \subset|\mathcal{X}|$ we have

$$
T \neq \emptyset \Rightarrow T \cap \mathcal{X}_{f t-p t s} \neq \emptyset
$$

In particular, for any closed subset $T \subset|\mathcal{X}|$ we see that $T \cap \mathcal{X}_{f t-p t s}$ is dense in $T$.
Proof. Let $i: \mathcal{Z} \rightarrow \mathcal{X}$ be the reduced induced substack structure on $T$, see Properties of Stacks, Remark 82.10.5. An immersion is locally of finite type, see Lemma 83.13.4. Hence by Lemma 83.14.4 we see $\mathcal{Z}_{\mathrm{ft} \text {-pts }} \subset \mathcal{X}_{\mathrm{ft} \text {-pts }} \cap T$. Finally, any nonempty affine scheme $U$ with a smooth morphism towards $\mathcal{Z}$ has at least one closed point, hence $\mathcal{Z}$ has at least one finite type point by Lemma 83.14.3. The lemma follows.

Here is another, more technical, characterization of a finite type point on an algebraic stack. It tells us in particular that the residual gerbe of $\mathcal{X}$ at $x$ exists whenever $x$ is a finite type point!

06G3 Lemma 83.14.7. Let $\mathcal{X}$ be an algebraic stack. Let $x \in|\mathcal{X}|$. The following are equivalent:
(1) $x$ is a finite type point,
(2) there exists an algebraic stack $\mathcal{Z}$ whose underlying topological space $|\mathcal{Z}|$ is a singleton, and a morphism $f: \mathcal{Z} \rightarrow \mathcal{X}$ which is locally of finite type such that $\{x\}=|f|(|\mathcal{Z}|)$, and
(3) the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ at $x$ exists and the inclusion morphism $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is locally of finite type.

Proof. (All of the morphisms occurring in this paragraph are representable by algebraic spaces, hence the conventions and results of Properties of Stacks, Section 82.3 are applicable.) Assume $x$ is a finite type point. Choose an affine scheme $U$, a closed point $u \in U$, and a smooth morphism $\varphi: U \rightarrow \mathcal{X}$ with $\varphi(u)=x$, see Lemma 83.14.3. Set $u=\operatorname{Spec}(\kappa(u))$ as usual. Set $R=u \times \mathcal{X} u$ so that we obtain a groupoid in algebraic spaces $(u, R, s, t, c)$, see Algebraic Stacks, Lemma 76.16.1. The projection morphisms $R \rightarrow u$ are the compositions

$$
R=u \times_{\mathcal{X}} u \rightarrow u \times_{\mathcal{X}} U \rightarrow u \times_{\mathcal{X}} X=u
$$

where the first arrow is of finite type (a base change of the closed immersion of schemes $u \rightarrow U$ ) and the second arrow is smooth (a base change of the smooth morphism $U \rightarrow \mathcal{X}$ ). Hence $s, t: R \rightarrow u$ are locally of finite type (as compositions, see Morphisms of Spaces, Lemma 54.23.2. Since $u$ is the spectrum of a field, it follows that $s, t$ are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 54.28.7). We see that $\mathcal{Z}=[u / R]$ is an algebraic stack by Criteria for Representability, Theorem79.17.2. By Algebraic Stacks, Lemma 76.16.1 we obtain a canonical morphism

$$
f: \mathcal{Z} \longrightarrow \mathcal{X}
$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 76.15 .2 and a monomorphism, see Properties of Stacks, Lemma 82.8.4. It follows that the residual gerbe $\mathcal{Z}_{x} \subset \mathcal{X}$ of $\mathcal{X}$ at $x$ exists and that $f$ factors through an equivalence $\mathcal{Z} \rightarrow \mathcal{Z}_{x}$, see Properties of Stacks, Lemma 82.11.11. By construction the diagram

is commutative. By Criteria for Representability, Lemma 79.17.1 the left vertical arrow is surjective, flat, and locally of finite presentation. Consider

As $u \rightarrow \mathcal{X}$ is locally of finite type, we see that the base change $u \times \mathcal{X} U \rightarrow U$ is locally of finite type. Moreover, $u \times_{\mathcal{X}} U \rightarrow \mathcal{Z} \times_{\mathcal{X}} U$ is surjective, flat, and locally of finite presentation as a base change of $u \rightarrow \mathcal{Z}$. Thus $\{u \times \mathcal{X} U \rightarrow \mathcal{Z} \times \mathcal{X} U\}$ is an fppf covering of algebraic spaces, and we conclude that $\mathcal{Z} \times \mathcal{X} U \rightarrow U$ is locally of finite type by Descent on Spaces, Lemma61.14.1. By definition this means that $f$ is locally of finite type (because the vertical arrow $\mathcal{Z} \times \mathcal{X} U \rightarrow \mathcal{Z}$ is smooth as a base change of $U \rightarrow \mathcal{X}$ and surjective as $\mathcal{Z}$ has only one point). Since $\mathcal{Z}=\mathcal{Z}_{x}$ we see that (3) holds.

It is clear that (3) implies (2). If (2) holds then $x$ is a finite type point of $\mathcal{X}$ by Lemma 83.14 .4 and Lemma 83.14 .6 to see that $\mathcal{Z}_{\mathrm{ft}-\mathrm{pts}}$ is nonempty, i.e., the unique point of $\mathcal{Z}$ is a finite type point of $\mathcal{Z}$.

### 83.15. Special presentations of algebraic stacks

06 MC The following lemma gives a criterion for when a "slice" of a presentation is still flat over the algebraic stack.
06MD Lemma 83.15.1. Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram

where $U$ is an algebraic space, $k$ is a field, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Let $f_{1}, \ldots, f_{r} \in \Gamma\left(U, \mathcal{O}_{U}\right)$ and $z \in|F|$ such that $f_{1}, \ldots, f_{r}$ map to $a$ regular sequence in the local ring $\mathcal{O}_{F, \bar{z}}$. Then, after replacing $U$ by an open subspace containing $p(z)$, the morphism

$$
V\left(f_{1}, \ldots, f_{r}\right) \longrightarrow \mathcal{X}
$$

is flat and locally of finite presentation.
Proof. Choose a scheme $W$ and a surjective smooth morphism $W \rightarrow \mathcal{X}$. Choose an extension of fields $k \subset k^{\prime}$ and a morphism $w: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow W$ such that $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow$ $W \rightarrow \mathcal{X}$ is 2-isomorphic to $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k) \rightarrow \mathcal{X}$. This is possible as $W \rightarrow \mathcal{X}$ is surjective. Consider the commutative diagram

both of whose squares are cartesian. By our choice of $w$ we see that $F^{\prime}=F \times \times_{\operatorname{Spec}(k)}$ $\operatorname{Spec}\left(k^{\prime}\right)$. Thus $F^{\prime} \rightarrow F$ is surjective and we can choose a point $z^{\prime} \in\left|F^{\prime}\right|$ mapping to $z$. Since $F^{\prime} \rightarrow F$ is flat we see that $\mathcal{O}_{F, \bar{z}} \rightarrow \mathcal{O}_{F^{\prime}, \bar{z}^{\prime}}$ is flat, see Morphisms of Spaces, Lemma 54.29.8. Hence $f_{1}, \ldots, f_{r}$ map to a regular sequence in $\mathcal{O}_{F^{\prime}, \bar{z}^{\prime}}$, see Algebra, Lemma 10.67.5. Note that $U \times{ }_{\mathcal{X}} W \rightarrow W$ is a morphism of algebraic spaces which is flat and locally of finite presentation. Hence by More on Morphisms of Spaces, Lemma 63.23.1 we see that there exists an open subspace $U^{\prime}$ of $U \times \mathcal{X} W$ containing $p\left(z^{\prime}\right)$ such that the intersection $U^{\prime} \cap\left(V\left(f_{1}, \ldots, f_{r}\right) \times \mathcal{X} W\right)$ is flat and locally of finite presentation over $W$. Note that $\operatorname{pr}_{0}\left(U^{\prime}\right)$ is an open subspace of $U$ containing $p(z)$ as $\mathrm{pr}_{0}$ is smooth hence open. Now we see that $U^{\prime} \cap\left(V\left(f_{1}, \ldots, f_{r}\right) \times_{\mathcal{X}} W\right) \rightarrow \mathcal{X}$ is flat and locally of finite presentation as the composition

$$
U^{\prime} \cap\left(V\left(f_{1}, \ldots, f_{r}\right) \times \mathcal{X} W\right) \rightarrow W \rightarrow \mathcal{X}
$$

Hence Properties of Stacks, Lemma 82.3.5 implies $\operatorname{pr}_{0}\left(U^{\prime}\right) \cap V\left(f_{1}, \ldots, f_{r}\right) \rightarrow \mathcal{X}$ is flat and locally of finite presentation as desired.

06ME Lemma 83.15.2. Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram

where $U$ is an algebraic space, $k$ is a field, and $U \rightarrow \mathcal{X}$ is locally of finite type. Let $z \in|F|$ be such that $\operatorname{dim}_{z}(F)=0$. Then, after replacing $U$ by an open subspace containing $p(z)$, the morphism

$$
U \longrightarrow \mathcal{X}
$$

is locally quasi-finite.
Proof. Since $f: U \rightarrow \mathcal{X}$ is locally of finite type there exists a maximal open $W(f) \subset U$ such that the restriction $\left.f\right|_{W(f)}: W(f) \rightarrow \mathcal{X}$ is locally quasi-finite, see Properties of Stacks, Remark 82.9.19 (2). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite at $z$. This follows immediately from Morphisms of Spaces, Lemma 54.33 .6

A quasi-DM stack has a locally quasi-finite "covering" by a scheme.
06MF Theorem 83.15.3. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent
(1) $\mathcal{X}$ is quasi-DM, and
(2) there exists a scheme $W$ and a surjective, flat, locally finitely presented, locally quasi-finite morphism $W \rightarrow \mathcal{X}$.
Proof. The implication $(2) \Rightarrow(1)$ is Lemma 83.4.14. Assume (1). Let $x \in|\mathcal{X}|$ be a finite type point. We will produce a scheme over $\mathcal{X}$ which "works" in a neighbourhood of $x$. At the end of the proof we will take the disjoint union of all of these to conclude.

Let $U$ be an affine scheme, $U \rightarrow \mathcal{X}$ a smooth morphism, and $u \in U$ a closed point which maps to $x$, see Lemma 83.14.1. Denote $u=\operatorname{Spec}(\kappa(u))$ as usual. Consider the following commutative diagram

with both squares fibre product squares, in particular $R=u \times \mathcal{X} u$. In the proof of Lemma 83.14.7 we have seen that $(u, R, s, t, c)$ is a groupoid in algebraic spaces with $s, t$ locally of finite type. Let $G \rightarrow u$ be the stabilizer group algebraic space (see Groupoids in Spaces, Definition 65.15.2). Note that

$$
G=R \times_{(u \times u)} u=(u \times \mathcal{X} u) \times_{(u \times u)} u=\mathcal{X} \times \mathcal{X} \times \mathcal{X} u .
$$

As $\mathcal{X}$ is quasi-DM we see that $G$ is locally quasi-finite over $u$. By More on Groupoids in Spaces, Lemma 66.7.11 we have $\operatorname{dim}(R)=0$.
Let $e: u \rightarrow R$ be the identity of the groupoid. Thus both compositions $u \rightarrow R \rightarrow u$ are equal to the identity morphism of $u$. Note that $R \subset F$ is a closed subspace as $u \subset U$ is a closed subscheme. Hence we can also think of $e$ as a point of $F$. Consider the maps of étale local rings

$$
\mathcal{O}_{U, u} \xrightarrow{p^{\sharp}} \mathcal{O}_{F, \bar{e}} \longrightarrow \mathcal{O}_{R, \bar{e}}
$$

Note that $\mathcal{O}_{R, \bar{e}}$ has dimension 0 by the result of the first paragraph. On the other hand, the kernel of the second arrow is $p^{\sharp}\left(\mathfrak{m}_{u}\right) \mathcal{O}_{F, \bar{e}}$ as $R$ is cut out in $F$ by $\mathfrak{m}_{u}$. Thus we see that

$$
\mathfrak{m}_{\bar{z}}=\sqrt{p^{\sharp}\left(\mathfrak{m}_{u}\right) \mathcal{O}_{F, \bar{e}}}
$$

On the other hand, as the morphism $U \rightarrow \mathcal{X}$ is smooth we see that $F \rightarrow u$ is a smooth morphism of algebraic spaces. This means that $F$ is a regular algebraic space (Spaces over Fields, Lemma 59.9.1). Hence $\mathcal{O}_{F, \bar{e}}$ is a regular local ring (Properties of Spaces, Lemma 53.24.1). Note that a regular local ring is CohenMacaulay (Algebra, Lemma 10.105.3). Let $d=\operatorname{dim}\left(\mathcal{O}_{F, \bar{e}}\right)$. By Algebra, Lemma 10.103.10 we can find $f_{1}, \ldots, f_{d} \in \mathcal{O}_{U, u}$ whose images $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{d}\right)$ form a regular sequence in $\mathcal{O}_{F, \bar{z}}$. By Lemma 83.15.1 after shrinking $U$ we may assume that $Z=V\left(f_{1}, \ldots, f_{d}\right) \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Note that by construction $F_{Z}=Z \times_{\mathcal{X}} u$ is a closed subspace of $F=U \times_{\mathcal{X}} u$, that $e$ is a point of this closed subspace, and that

$$
\operatorname{dim}\left(\mathcal{O}_{F_{Z}, \bar{e}}\right)=0
$$

By Morphisms of Spaces, Lemma 54.33.1 it follows that $\operatorname{dim}_{e}\left(F_{Z}\right)=0$ because the transcendence degree of $e$ relative to $u$ is zero. Hence it follows from Lemma 83.15.2 that after possibly shrinking $U$ the morphism $Z \rightarrow \mathcal{X}$ is locally quasi-finite.

We conclude that for every finite type point $x$ of $\mathcal{X}$ there exists a locally quasifinite, flat, locally finitely presented morphism $f_{x}: Z_{x} \rightarrow \mathcal{X}$ with $x$ in the image of $\left|f_{x}\right|$. Set $W=\coprod_{x} Z_{x}$ and $f=\coprod f_{x}$. Then $f$ is flat, locally of finite presentation, and locally quasi-finite. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 82.4.7. By construction the image contains all finite type points of $\mathcal{X}$, hence $f$ is surjective by Lemma 83.14 .6 (and Properties of Stacks, Lemma 82.4.4.

06N0 Lemma 83.15.4. Let $\mathcal{Z}$ be a DM, locally Noetherian, reduced algebraic stack with $|\mathcal{Z}|$ a singleton. Then there exists $a$ field $k$ and a surjective étale morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$.

Proof. By Properties of Stacks, Lemma 82.11 .3 there exists a field $k$ and a surjective, flat, locally finitely presented morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$. Set $U=\operatorname{Spec}(k)$ and $R=U \times_{\mathcal{Z}} U$ so we obtain a groupoid in algebraic spaces $(U, R, s, t, c)$, see Algebraic Stacks, Lemma 76.9.2. Note that by Algebraic Stacks, Remark 76.16.3 we have an equivalence

$$
f_{\text {can }}:[U / R] \longrightarrow \mathcal{Z}
$$

The projections $s, t: R \rightarrow U$ are locally of finite presentation. As $\mathcal{Z}$ is DM we see that the stabilizer group algebraic space

$$
G=U \times_{U \times U} R=U \times_{U \times U}\left(U \times_{\mathcal{Z}} U\right)=U \times_{\mathcal{X} \times \mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X}
$$

is unramified over $U$. In particular $\operatorname{dim}(G)=0$ and by More on Groupoids in Spaces, Lemma 66.7.11 we have $\operatorname{dim}(R)=0$. This implies that $R$ is a scheme, see Spaces over Fields, Lemma 59.6.1. By Varieties, Lemma 32.17.2 we see that $R$ (and also $G$ ) is the disjoint union of spectra of Artinian local rings finite over $k$ via either $s$ or $t$. Let $P=\operatorname{Spec}(A) \subset R$ be the open and closed subscheme whose underlying point is the identity $e$ of the groupoid scheme $(U, R, s, t, c)$. As $s \circ e=t \circ e=\operatorname{id}_{\operatorname{Spec}(k)}$ we see that $A$ is an Artinian local ring whose residue field is identified with $k$ via
either $s^{\sharp}: k \rightarrow A$ or $t^{\sharp}: k \rightarrow A$. Note that $s, t: \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(k)$ are finite (by the lemma referenced above). Since $G \rightarrow \operatorname{Spec}(k)$ is unramified we see that

$$
G \cap P=P \times_{U \times U} U=\operatorname{Spec}\left(A \otimes_{k \otimes k} k\right)
$$

is unramified over $k$. On the other hand $A \otimes_{k \otimes k} k$ is local as a quotient of $A$ and surjects onto $k$. We conclude that $A \otimes_{k \otimes k} k=k$. It follows that $P \rightarrow U \times U$ is universally injective (as $P$ has only one point with residue field $k$, unramified (by the computation of the fibre over the unique image point above), and of finite type (because $s, t$ are) hence a monomorphism (see Étale Morphisms, Lemma 40.7.1). Thus $\left.s\right|_{P},\left.t\right|_{P}: P \rightarrow U$ define a finite flat equivalence relation. Thus we may apply Groupoids, Proposition 38.23 .8 to conclude that $U / P$ exists and is a scheme $\bar{U}$. Moreover, $U \rightarrow \bar{U}$ is finite locally free and $P=U \times_{\bar{U}} U$. In fact $\bar{U}=\operatorname{Spec}\left(k_{0}\right)$ where $k_{0} \subset k$ is the ring of $R$-invariant functions. As $k$ is a field it follows from the definition Groupoids, Equation (38.23.0.1 that $k_{0}$ is a field.
We claim that

$$
\begin{equation*}
\operatorname{Spec}\left(k_{0}\right)=\bar{U}=U / P \rightarrow[U / R]=\mathcal{Z} \tag{83.15.4.1}
\end{equation*}
$$

is the desired surjective étale morphism. It follows from Properties of Stacks, Lemma 82.11.1 that this morphism is surjective. Thus it suffices to show that 83.15.4.1) is étald ${ }^{6}$, Instead of proving the étaleness directly we first apply Bootstrap, Lemma 67.9 .1 to see that there exists a groupoid scheme ( $\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c}$ ) such that $(U, R, s, t, c)$ is the restriction of $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ via the quotient morphism $U \rightarrow$ $\bar{U}$. (We verified all the hypothesis of the lemma above except for the assertion that $j: R \rightarrow U \times U$ is separated and locally quasi-finite which follows from the fact that $R$ is a separated scheme locally quasi-finite over $k$.) Since $U \rightarrow \bar{U}$ is finite locally free we see that $[U / R] \rightarrow[\bar{U} / \bar{R}]$ is an equivalence, see Groupoids in Spaces, Lemma 65.24 .2

Note that $s, t$ are the base changes of the morphisms $\bar{s}, \bar{t}$ by $U \rightarrow \bar{U}$. As $\{U \rightarrow \bar{U}\}$ is an fppf covering we conclude $\bar{s}, \bar{t}$ are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 34.19.13, 34.19.9, and 34.19.22. Consider the commutative diagram

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since $P$ is open in $R$ we conclude that $\bar{e}$ is an open immersion by Descent, Lemma 34.19.14.

But of course, if $\bar{e}$ is an open immersion and $\bar{s}, \bar{t}$ are flat and locally of finite presentation then the morphisms $\bar{t}, \bar{s}$ are étale. For example you can see this by applying More on Groupoids, Lemma 39.4.1 which shows that $\Omega_{\bar{R} / \bar{U}}=0$ implies that $\bar{s}, \bar{t}: \bar{R} \rightarrow \bar{U}$ is unramified (see Morphisms, Lemma 28.35.2), which in turn implies that $\bar{s}, \bar{t}$ are étale (see Morphisms, Lemma 28.36.16). Hence $\mathcal{Z}=[\bar{U} / \bar{R}]$ is

[^220]an étale presentation of the algebraic stack $\mathcal{Z}$ and we conclude that $\bar{U} \rightarrow \mathcal{Z}$ is étale by Properties of Stacks, Lemma 82.3.3.
06N2 Lemma 83.15.5. Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram

where $U$ is an algebraic space, $k$ is a field, and $U \rightarrow \mathcal{X}$ is flat and locally of finite presentation. Let $z \in|F|$ be such that $F \rightarrow \operatorname{Spec}(k)$ is unramified at $z$. Then, after replacing $U$ by an open subspace containing $p(z)$, the morphism
$$
U \longrightarrow \mathcal{X}
$$
is étale.
Proof. Since $f: U \rightarrow \mathcal{X}$ is flat and locally of finite presentation there exists a maximal open $W(f) \subset U$ such that the restriction $\left.f\right|_{W(f)}: W(f) \rightarrow \mathcal{X}$ is étale, see Properties of Stacks, Remark 82.9.19 (5). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \rightarrow \operatorname{Spec}(k)$ is étale at $z$. Since it is flat and locally of finite presentation as a base change of $U \rightarrow \mathcal{X}$ and since $F \rightarrow \operatorname{Spec}(k)$ is unramified at $z$ by assumption, this follows from Morphisms of Spaces, Lemma 54.38.12.

A DM stack is a Deligne-Mumford stack.
06N3 Theorem 83.15.6. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent
(1) $\mathcal{X}$ is $D M$,
(2) $\mathcal{X}$ is Deligne-Mumford, and
(3) there exists a scheme $W$ and a surjective étale morphism $W \rightarrow \mathcal{X}$.

Proof. Recall that (3) is the definition of (2), see Algebraic Stacks, Definition 76.12.2. The implication $(3) \Rightarrow(1)$ is Lemma 83.4.14. Assume (1). Let $x \in|\mathcal{X}|$ be a finite type point. We will produce a scheme over $\mathcal{X}$ which "works" in a neighbourhood of $x$. At the end of the proof we will take the disjoint union of all of these to conclude.

By Lemma 83.14.7 the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ at $x$ exists and $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is locally of finite type. By Lemma 83.4 .16 the algebraic stack $\mathcal{Z}_{x}$ is DM. By Lemma 83.15 .4 there exists a field $k$ and a surjective étale morphism $z: \operatorname{Spec}(k) \rightarrow \mathcal{Z}_{x}$. In particular the composition $x: \operatorname{Spec}(k) \rightarrow \mathcal{X}$ is locally of finite type (by Morphisms of Spaces, Lemmas 54.23.2 and 54.38.9.
Pick a scheme $U$ and a smooth morphism $U \rightarrow \mathcal{X}$ such that $x$ is in the image of $|U| \rightarrow|\mathcal{X}|$. Consider the following fibre square

in other words $F=U \times{ }_{\mathcal{X}, x} \operatorname{Spec}(k)$. By Properties of Stacks, Lemma 82.4.3 we see that $F$ is nonempty. As $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is a monomorphism we have

$$
\operatorname{Spec}(k) \times_{z, \mathcal{Z}_{x}, z} \operatorname{Spec}(k)=\operatorname{Spec}(k) \times_{x, \mathcal{X}, x} \operatorname{Spec}(k)
$$

with étale projection maps to $\operatorname{Spec}(k)$ by construction of $z$. Since

$$
F \times_{U} F=\left(\operatorname{Spec}(k) \times_{\mathcal{X}} \operatorname{Spec}(k)\right) \times_{\operatorname{Spec}(k)} F
$$

we see that the projections maps $F \times_{U} F \rightarrow F$ are étale as well. It follows that $\Delta_{F / U}: F \rightarrow F \times_{U} F$ is étale (see Morphisms of Spaces, Lemma 54.38.11). By Morphisms of Spaces, Lemma 54.48 .2 this implies that $\Delta_{F / U}$ is an open immersion, which finally implies by Morphisms of Spaces, Lemma 54.37 .9 that $F \rightarrow U$ is unramified.

Pick a nonempty affine scheme $V$ and an étale morphism $V \rightarrow F$. (This could be avoided by working directly with $F$, but it seems easier to explain what's going on by doing so.) Picture

Then $V \rightarrow \operatorname{Spec}(k)$ is a smooth morphism of schemes and $V \rightarrow U$ is an unramified morphism of schemes (see Morphisms of Spaces, Lemmas 54.36.2 and 54.37.3). Pick a closed point $v \in V$ with $k \subset \kappa(v)$ finite separable, see Varieties, Lemma 32.20.6. Let $u \in U$ be the image point. The local ring $\mathcal{O}_{V, v}$ is regular (see Varieties, Lemma 32.20 .3 and the local ring homomorphism

$$
\varphi: \mathcal{O}_{U, u} \longrightarrow \mathcal{O}_{V, v}
$$

coming from the morphism $V \rightarrow U$ is such that $\varphi\left(\mathfrak{m}_{u}\right) \mathcal{O}_{V, v}=\mathfrak{m}_{v}$, see Morphisms, Lemma 28.35.14. Hence we can find $f_{1}, \ldots, f_{d} \in \mathcal{O}_{U, u}$ such that the images $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{d}\right)$ form a basis for $\mathfrak{m}_{v} / \mathfrak{m}_{v}^{2}$ over $\kappa(v)$. Since $\mathcal{O}_{V, v}$ is a regular local ring this implies that $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{d}\right)$ form a regular sequence in $\mathcal{O}_{V, v}$ (see Algebra, Lemma 10.105.3). After replacing $U$ by an open neighbourhood of $u$ we may assume $f_{1}, \ldots, f_{d} \in \Gamma\left(U, \mathcal{O}_{U}\right)$. After replacing $U$ by a possibly even smaller open neighbourhood of $u$ we may assume that $V\left(f_{1}, \ldots, f_{d}\right) \rightarrow \mathcal{X}$ is flat and locally of finite presentation, see Lemma 83.15.1. By construction

$$
V\left(f_{1}, \ldots, f_{d}\right) \times_{\mathcal{X}} \operatorname{Spec}(k) \longleftarrow V\left(f_{1}, \ldots, f_{d}\right) \times_{\mathcal{X}} V
$$

is étale and $V\left(f_{1}, \ldots, f_{d}\right) \times_{\mathcal{X}} V$ is the closed subscheme $T \subset V$ cut out by $\left.f_{1}\right|_{V}, \ldots,\left.f_{d}\right|_{V}$. Hence by construction $v \in T$ and

$$
\mathcal{O}_{T, v}=\mathcal{O}_{V, v} /\left(\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{d}\right)\right)=\kappa(v)
$$

a finite separable extension of $k$. It follows that $T \rightarrow \operatorname{Spec}(k)$ is unramified at $v$, see Morphisms, Lemma 28.35.14. By definition of an unramified morphism of algebraic spaces this means that $V\left(f_{1}, \ldots, f_{d}\right) \times \mathcal{X} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ is unramified at the image of $v$ in $V\left(f_{1}, \ldots, f_{d}\right) \times \mathcal{X} \operatorname{Spec}(k)$. Applying Lemma 83.15.5 we see that on shrinking $U$ to yet another open neighbourhood of $u$ the morphism $V\left(f_{1}, \ldots, f_{d}\right) \rightarrow$ $\mathcal{X}$ is étale.

We conclude that for every finite type point $x$ of $\mathcal{X}$ there exists an étale morphism $f_{x}: W_{x} \rightarrow \mathcal{X}$ with $x$ in the image of $\left|f_{x}\right|$. Set $W=\coprod_{x} W_{x}$ and $f=\coprod f_{x}$. Then
$f$ is étale. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 82.4.7. By construction the image contains all finite type points of $\mathcal{X}$, hence $f$ is surjective by Lemma 83.14.6 (and Properties of Stacks, Lemma 82.4.4).

### 83.16. Quasi-finite morphisms

06PT The property "locally quasi-finite" of morphisms of algebraic spaces is not smooth local on the source-and-target so we cannot use the material in Section 83.12 to define locally quasi-finite morphisms of algebraic stacks. We do already know what it means for a morphism of algebraic stacks representable by algebraic spaces to be locally quasi-finite, see Properties of Stacks, Section 82.3. To find a condition suitable for general morphisms we make the following observation.

06UA Lemma 83.16.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Assume $f$ is representable by algebraic spaces. The following are equivalent
(1) $f$ is locally quasi-finite, and
(2) $f$ is locally of finite type and for every morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Y}$ where $k$ is a field the space $|\operatorname{Spec}(k) \times \mathcal{Y} \mathcal{X}|$ is discrete.

Proof. Assume (1). In this case the morphism of algebraic spaces $\mathcal{X}_{k} \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite as a base change of $f$. Hence $\left|\mathcal{X}_{k}\right|$ is discrete by Morphisms of Spaces, Lemma 54.27.5. Conversely, assume (2). Pick a surjective smooth morphism $V \rightarrow \mathcal{Y}$ where $V$ is a scheme. It suffices to show that the morphism of algebraic spaces $V \times \mathcal{Y} \mathcal{X} \rightarrow V$ is locally quasi-finite, see Properties of Stacks, Lemma 82.3.3. The morphism $V \times \mathcal{Y} \mathcal{X} \rightarrow V$ is locally of finite type by assumption. For any morphism $\operatorname{Spec}(k) \rightarrow V$ where $k$ is a field

$$
\operatorname{Spec}(k) \times_{V}(V \times \mathcal{Y} \mathcal{X})=\operatorname{Spec}(k) \times \mathcal{Y} \mathcal{X}
$$

has a discrete space of points by assumption. Hence we conclude that $V \times \mathcal{Y} \mathcal{X} \rightarrow V$ is locally quasi-finite by Morphisms of Spaces, Lemma 54.27.5.

A morphism of algebraic stacks which is representable by algebraic spaces is quasiDM, see Lemma 83.4.3. Combined with the lemma above we see that the following definition does not conflict with all of the already existing notion in the case of morphisms representable by algebraic spaces.

06PU Definition 83.16.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is locally quasi-finite if $f$ is quasi-DM, locally of finite type, and for every morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Y}$ where $k$ is a field the space $\left|\mathcal{X}_{k}\right|$ is discrete.
The condition that $f$ be quasi-DM is natural. For example, let $k$ be a field and consider the morphism $\pi:\left[\operatorname{Spec}(k) / \mathbf{G}_{m}\right] \rightarrow \operatorname{Spec}(k)$ which has singleton fibres and is locally of finite type. As we will see later this morphism is smooth of relative dimension -1 , and we'd like our locally quasi-finite morphisms to have relative dimension 0. Also, note that the $\operatorname{section} \operatorname{Spec}(k) \rightarrow\left[\operatorname{Spec}(k) / \mathbf{G}_{m}\right]$ does not have discrete fibres, hence is not locally quasi-finite, and we'd like to have the following permanence property for locally quasi-finite morphisms: If $f: \mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is a morphism of algebraic stacks locally quasi-finite over the algebraic stack $\mathcal{Y}$, then $f$ is locally quasi-finite (in fact something a bit stronger holds, see Lemma 83.16.8.
Another justification for the definition above is Lemma 83.16 .7 below which characterizes being locally quasi-finite in terms of the existence of suitable "presentations" or "coverings" of $\mathcal{X}$ and $\mathcal{Y}$.

06UB Lemma 83.16.3. A base change of a locally quasi-finite morphism is locally quasifinite.
Proof. We have seen this for quasi-DM morphisms in Lemma 83.4.4 and for locally finite type morphisms in Lemma 83.13.3. It is immediate that the condition on fibres is inherited by a base change.

06UC Lemma 83.16.4. Let $\mathcal{X} \rightarrow \operatorname{Spec}(k)$ be a locally quasi-finite morphism where $\mathcal{X}$ is an algebraic stack and $k$ is a field. Let $f: V \rightarrow \mathcal{X}$ be a locally quasi-finite morphism where $V$ is a scheme. Then $V \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite.
Proof. By Lemma 83.13.2 we see that $V \rightarrow \operatorname{Spec}(k)$ is locally of finite type. Assume, to get a contradiction, that $V \rightarrow \operatorname{Spec}(k)$ is not locally quasi-finite. Then there exists a nontrivial specialization $v \rightsquigarrow v^{\prime}$ of points of $V$, see Morphisms, Lemma 28.20.6. In particular $\operatorname{trdeg}_{k}(\kappa(v))>\operatorname{trdeg}_{k}\left(\kappa\left(v^{\prime}\right)\right)$, see Morphisms, Lemma 28.28.6. Because $|\mathcal{X}|$ is discrete we see that $|f|(v)=|f|\left(v^{\prime}\right)$. Consider $R=V \times{ }_{\mathcal{X}} V$. Then $R$ is an algebraic space and the projections $s, t: R \rightarrow V$ are locally quasi-finite as base changes of $V \rightarrow \mathcal{X}$ (which is representable by algebraic spaces so this follows from the discussion in Properties of Stacks, Section 82.3). By Properties of Stacks, Lemma 82.4.3 we see that there exists an $r \in|R|$ such that $s(r)=v$ and $t(r)=v^{\prime}$. By Morphisms of Spaces, Lemma 54.32.3 we see that the transcendence degree of $v / k$ is equal to the transcendence degree of $r / k$ is equal to the transcendence degree of $v^{\prime} / k$. This contradiction proves the lemma.

06UD Lemma 83.16.5. A composition of a locally quasi-finite morphisms is locally quasi-finite.

Proof. We have seen this for quasi-DM morphisms in Lemma 83.4.10 and for locally finite type morphisms in Lemma 83.13.2. Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be locally quasi-finite. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ be a morphism. It suffices to show that $\left|\mathcal{X}_{k}\right|$ is discrete. By Lemma 83.16.3 the morphisms $\mathcal{X}_{k} \rightarrow \mathcal{Y}_{k}$ and $\mathcal{Y}_{k} \rightarrow \operatorname{Spec}(k)$ are locally quasi-finite. In particular we see that $\mathcal{Y}_{k}$ is a quasi-DM algebraic stack, see Lemma 83.4.13. By Theorem 83.15.3 we can find a scheme $V$ and a surjective, flat, locally finitely presented, locally quasi-finite morphism $V \rightarrow \mathcal{Y}_{k}$. By Lemma 83.16 .4 we see that $V$ is locally quasi-finite over $k$, in particular $|V|$ is discrete. The morphism $V \times \mathcal{Y}_{k} \mathcal{X}_{k} \rightarrow \mathcal{X}_{k}$ is surjective, flat, and locally of finite presentation hence $\left|V \times \mathcal{Y}_{k} \mathcal{X}_{k}\right| \rightarrow\left|\mathcal{X}_{k}\right|$ is surjective and open. Thus it suffices to show that $\left|V \times \mathcal{Y}_{k} \mathcal{X}_{k}\right|$ is discrete. Note that $V$ is a disjoint union of spectra of Artinian local $k$-algebras $A_{i}$ with residue fields $k_{i}$, see Varieties, Lemma 32.17 .2 . Thus it suffices to show that each

$$
\left|\operatorname{Spec}\left(A_{i}\right) \times \mathcal{Y}_{k} \mathcal{X}_{k}\right|=\left|\operatorname{Spec}\left(k_{i}\right) \times \mathcal{Y}_{k} \mathcal{X}_{k}\right|=\left|\operatorname{Spec}\left(k_{i}\right) \times \mathcal{Y} \mathcal{X}\right|
$$

is discrete, which follows from the assumption that $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite.
Before we characterize locally quasi-finite morphisms in terms of coverings we do it for quasi-DM morphisms.
06UE Lemma 83.16.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent
(1) $f$ is quasi-DM,
(2) for any morphism $V \rightarrow \mathcal{Y}$ with $V$ an algebraic space there exists a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \rightarrow$ $\mathcal{X} \times \mathcal{Y} V$ where $U$ is an algebraic space, and
(3) there exist algebraic spaces $U, V$ and a morphism $V \rightarrow \mathcal{Y}$ which is surjective, flat, and locally of finite presentation, and a morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ which is surjective, flat, locally of finite presentation, and locally quasifinite.

Proof. The implication (2) $\Rightarrow(3)$ is immediate.
Assume (1) and let $V \rightarrow \mathcal{Y}$ be as in (2). Then $\mathcal{X} \times \mathcal{Y} V \rightarrow V$ is quasi-DM, see Lemma 83.4.4 By Lemma 83.4.3 the algebraic space $V$ is DM, hence quasi-DM. Thus $\mathcal{X} \times{ }_{\mathcal{Y}} V$ is quasi-DM by Lemma 83.4.11. Hence we may apply Theorem83.15.3 to get the morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ as in (2).

Assume (3). Let $V \rightarrow \mathcal{Y}$ and $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ be as in (3). To prove that $f$ is quasi-DM it suffices to show that $\mathcal{X} \times \mathcal{Y} V \rightarrow V$ is quasi-DM, see Lemma 83.4.5. By Lemma 83.4.14 we see that $\mathcal{X} \times{ }_{\mathcal{Y}} V$ is quasi-DM. Hence $\mathcal{X} \times{ }_{\mathcal{Y}} V \rightarrow V$ is quasi-DM by Lemma 83.4 .13 and (1) holds. This finishes the proof of the lemma.

06UF Lemma 83.16.7. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent
(1) $f$ is locally quasi-finite,
(2) $f$ is quasi-DM and for any morphism $V \rightarrow \mathcal{Y}$ with $V$ an algebraic space and any locally quasi-finite morphism $U \rightarrow \mathcal{X} \times{ }_{\mathcal{Y}} V$ where $U$ is an algebraic space the morphism $U \rightarrow V$ is locally quasi-finite,
(3) for any morphism $V \rightarrow \mathcal{Y}$ from an algebraic space $V$ there exists a surjective, flat, locally finitely presented, and locally quasi-finite morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ where $U$ is an algebraic space such that $U \rightarrow V$ is locally quasi-finite,
(4) there exists algebraic spaces $U, V$, a surjective, flat, and locally of finite presentation morphism $V \rightarrow \mathcal{Y}$, and a morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$ which is surjective, flat, locally of finite presentation, and locally quasi-finite such that $U \rightarrow V$ is locally quasi-finite.

Proof. Assume (1). Then $f$ is quasi-DM by assumption. Let $V \rightarrow \mathcal{Y}$ and $U \rightarrow$ $\mathcal{X} \times \mathcal{Y} V$ be as in (2). By Lemma 83.16.5 the composition $U \rightarrow \mathcal{X} \times \mathcal{Y} V \rightarrow V$ is locally quasi-finite. Thus (1) implies (2).

Assume (2). Let $V \rightarrow \mathcal{Y}$ be as in (3). By Lemma 83.16.6 we can find an algebraic space $U$ and a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$. By (2) the composition $U \rightarrow V$ is locally quasi-finite. Thus (2) implies (3).

It is immediate that (3) implies (4).
Assume (4). We will prove (1) holds, which finishes the proof. By Lemma 83.16.6 we see that $f$ is quasi-DM. To prove that $f$ is locally of finite type it suffices to prove that $g: \mathcal{X} \times \mathcal{Y} V \rightarrow V$ is locally of finite type, see Lemma 83.13.6. Then it suffices to check that $g$ precomposed with $h: U \rightarrow \mathcal{X} \times \mathcal{Y} V$ is locally of finite type, see Lemma 83.13.7. Since $g \circ h: U \rightarrow V$ was assumed to be locally quasi-finite this holds, hence $f$ is locally of finite type. Finally, let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow \mathcal{Y}$ be a morphism. Then $V \times \mathcal{y} \operatorname{Spec}(k)$ is a nonempty algebraic space which is locally of finite presentation over $k$. Hence we can find a finite extension $k \subset k^{\prime}$ and a
morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow V$ such that

commutes (details omitted). Then $\mathcal{X}_{k^{\prime}} \rightarrow \mathcal{X}_{k}$ is representable (by schemes), surjective, and finite locally free. In particular $\left|\mathcal{X}_{k^{\prime}}\right| \rightarrow\left|\mathcal{X}_{k}\right|$ is surjective and open. Thus it suffices to prove that $\left|\mathcal{X}_{k^{\prime}}\right|$ is discrete. Since

$$
U \times_{V} \operatorname{Spec}\left(k^{\prime}\right)=U \times_{\mathcal{X}_{\times_{\mathcal{V}} V}} \mathcal{X}_{k^{\prime}}
$$

we see that $U \times_{V} \operatorname{Spec}\left(k^{\prime}\right) \rightarrow \mathcal{X}_{k^{\prime}}$ is surjective, flat, and locally of finite presentation (as a base change of $U \rightarrow \mathcal{X} \times{ }_{\mathcal{Y}} V$ ). Hence $\left|U \times_{V} \operatorname{Spec}\left(k^{\prime}\right)\right| \rightarrow\left|\mathcal{X}_{k^{\prime}}\right|$ is surjective and open. Thus it suffices to show that $\left|U \times_{V} \operatorname{Spec}\left(k^{\prime}\right)\right|$ is discrete. This follows from the fact that $U \rightarrow V$ is locally quasi-finite (either by our definition above or from the original definition for morphisms of algebraic spaces, via Morphisms of Spaces, Lemma 54.27.5.
06UG Lemma 83.16.8. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. Assume that $\mathcal{X} \rightarrow \mathcal{Z}$ is locally quasi-finite and $\mathcal{Y} \rightarrow \mathcal{Z}$ is quasi-DM. Then $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite.

Proof. Write $\mathcal{X} \rightarrow \mathcal{Y}$ as the composition

$$
\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{Y}
$$

The second arrow is locally quasi-finite as a base change of $\mathcal{X} \rightarrow \mathcal{Z}$, see Lemma 83.16.3. The first arrow is locally quasi-finite by Lemma 83.4.8 as $\mathcal{Y} \rightarrow \mathcal{Z}$ is quasiDM. Hence $\mathcal{X} \rightarrow \mathcal{Y}$ is locally quasi-finite by Lemma 83.16.5

### 83.17. Flat morphisms

06PV The property "being flat" of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 61.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 54.29.4 and Descent on Spaces, Lemma 61.10.11. Hence, by Lemma 83.12.1 above, we may define what it means for a morphism of algebraic spaces to be flat as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 82.3 when the morphism is representable by algebraic spaces.

06PW Definition 83.17.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is flat if the equivalent conditions of Lemma 83.12.1 hold with $\mathcal{P}=$ flat.

06PX Lemma 83.17.2. The composition of flat morphisms is flat.
Proof. Combine Remark 83.12 .3 with Morphisms of Spaces, Lemma 54.29 .3
06PY Lemma 83.17.3. A base change of a flat morphism is flat.
Proof. Combine Remark 83.12 .4 with Morphisms of Spaces, Lemma 54.29.4
06PZ Lemma 83.17.4. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a surjective flat morphism of algebraic stacks. If the base change $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ is flat, then $f$ is flat.

Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Then $W \rightarrow \mathcal{Z}$ is surjective and flat (Morphisms of Spaces, Lemma 54.36.7) hence $W \rightarrow \mathcal{Y}$ is surjective and flat (by Properties of Stacks, Lemma 82.5.2 and Lemma 83.17.2. Since the base change of $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ by $W \rightarrow \mathcal{Z}$ is a flat morphism (Lemma 83.17.3) we may replace $\mathcal{Z}$ by $W$.
Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. We have to show that $U \rightarrow V$ is flat. Now we base change everything by $W \rightarrow \mathcal{Y}$ : Set $U^{\prime}=W \times \mathcal{Y} U, V^{\prime}=W \times \mathcal{Y} V, \mathcal{X}^{\prime}=W \times \mathcal{Y} \mathcal{X}$, and $\mathcal{Y}^{\prime}=W \times \mathcal{Y} \mathcal{Y}=W$. Then it is still true that $U^{\prime} \rightarrow V^{\prime} \times \mathcal{Y}^{\prime} \mathcal{X}^{\prime}$ is smooth by base change. Hence by our definition of flat morphisms of algebraic stacks and the assumption that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ is flat, we see that $U^{\prime} \rightarrow V^{\prime}$ is flat. Then, since $V^{\prime} \rightarrow V$ is surjective as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is flat by Morphisms of Spaces, Lemma54.30.3 (2) and we win.

06Q0 Lemma 83.17.5. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is flat and $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective and flat, then $\mathcal{Y} \rightarrow \mathcal{Z}$ is flat.

Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow W \times \mathcal{Z} \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. We know that $U \rightarrow V$ is flat and that $U \rightarrow W$ is flat. Also, as $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective we see that $U \rightarrow V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Morphisms of Spaces, Lemma 54.30.5.

### 83.18. Morphisms of finite presentation

06Q1 The property "locally of finite presentation" of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 61.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 54.28 .3 and Descent on Spaces, Lemma 61.10.8. Hence, by Lemma 83.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 82.3 when the morphism is representable by algebraic spaces.
06Q2 Definition 83.18.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) We say $f$ locally of finite presentation if the equivalent conditions of Lemma 83.12 .1 hold with $\mathcal{P}=$ locally of finite presentation.
(2) We say $f$ is of finite presentation if it is locally of finite presentation, quasi-compact, and quasi-separated.
Note that a morphism of finite presentation is not just a quasi-compact morphism which is locally of finite presentation.

06Q3 Lemma 83.18.2. The composition of finitely presented morphisms is of finite presentation. The same holds for morphisms which are locally of finite presentation.
Proof. Combine Remark 83.12 .3 with Morphisms of Spaces, Lemma 54.28.2.
06Q4 Lemma 83.18.3. A base change of a finitely presented morphism is of finite presentation. The same holds for morphisms which are locally of finite presentation.

Proof. Combine Remark 83.12.4 with Morphisms of Spaces, Lemma 54.28.3.
06Q5 Lemma 83.18.4. A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.

Proof. Combine Remark 83.12 .5 with Morphisms of Spaces, Lemma 54.28 .5
06Q6 Lemma 83.18.5. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks If $g \circ f$ is locally of finite presentation and $g$ is locally of finite type, then $f$ is locally of finite presentation.
Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y} \times_{\mathcal{Z}} W$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow \mathcal{X} \times \mathcal{Y} V$. The lemma follows upon applying Morphisms of Spaces, Lemma 54.28.9 to the morphisms $U \rightarrow V \rightarrow W$.

06Q7 Lemma 83.18.6. An open immersion is locally of finite presentation.
Proof. Follows from Morphisms of Spaces, Lemma 54.28.11.
06Q8 Lemma 83.18.7. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \rightarrow \mathcal{Y}$ be a surjective, flat, locally finitely presented morphism of algebraic stacks. If the base change $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite presentation, then $f$ is locally of finite presentation.

Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Then $W \rightarrow \mathcal{Z}$ is surjective, flat, and locally of finite presentation (Morphisms of Spaces, Lemmas 54.36.7 and 54.36.5 hence $W \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation (by Properties of Stacks, Lemma 82.5.2 and Lemmas 83.17.2 and 83.18.2. . Since the base change of $\mathcal{Z} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Z}$ by $W \rightarrow \mathcal{Z}$ is locally of finite presentation (Lemma 83.17.3) we may replace $\mathcal{Z}$ by $W$.

Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. We have to show that $U \rightarrow V$ is locally of finite presentation. Now we base change everything by $W \rightarrow \mathcal{Y}$ : Set $U^{\prime}=W \times \mathcal{Y} U, V^{\prime}=W \times \mathcal{Y} V, \mathcal{X}^{\prime}=W \times \mathcal{Y} \mathcal{X}$, and $\mathcal{Y}^{\prime}=W \times \mathcal{Y} \mathcal{Y}=W$. Then it is still true that $U^{\prime} \rightarrow V^{\prime} \times \mathcal{Y}^{\prime} \mathcal{X}^{\prime}$ is smooth by base change. Hence by our definition of locally finitely presented morphisms of algebraic stacks and the assumption that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ is locally of finite presentation, we see that $U^{\prime} \rightarrow V^{\prime}$ is locally of finite presentation. Then, since $V^{\prime} \rightarrow V$ is surjective, flat, and locally of finite presentation as a base change of $W \rightarrow \mathcal{Y}$ we see that $U \rightarrow V$ is locally of finite presentation by Descent on Spaces, Lemma 61.10.8 and we win.

06Q9 Lemma 83.18.8. Let $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \rightarrow \mathcal{Z}$ is locally of finite presentation and $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation, then $\mathcal{Y} \rightarrow \mathcal{Z}$ is locally of finite presentation.
Proof. Choose an algebraic space $W$ and a surjective smooth morphism $W \rightarrow \mathcal{Z}$. Choose an algebraic space $V$ and a surjective smooth morphism $V \rightarrow W \times \mathcal{Z} \mathcal{Y}$. Choose an algebraic space $U$ and a surjective smooth morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. We know that $U \rightarrow V$ is flat and locally of finite presentation and that $U \rightarrow W$ is locally of finite presentation. Also, as $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective we see that $U \rightarrow V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces
to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 61.14.1.
06QA Lemma 83.18.9. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks which is surjective, flat, and locally of finite presentation. Then for every scheme $U$ and object $y$ of $\mathcal{Y}$ over $U$ there exists an fppf covering $\left\{U_{i} \rightarrow U\right\}$ and objects $x_{i}$ of $\mathcal{X}$ over $U_{i}$ such that $\left.f\left(x_{i}\right) \cong y\right|_{U_{i}}$ in $\mathcal{Y}_{U_{i}}$.

Proof. We may think of $y$ as a morphism $U \rightarrow \mathcal{Y}$. By Properties of Stacks, Lemma 82.5 .3 and Lemmas 83.18 .3 and 83.17 .3 we see that $\mathcal{X} \times \mathcal{Y} U \rightarrow U$ is surjective, flat, and locally of finite presentation. Let $V$ be a scheme and let $V \rightarrow \mathcal{X} \times \mathcal{Y} U$ smooth and surjective. Then $V \rightarrow \mathcal{X} \times \mathcal{Y} U$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 54.36.7 and 54.36.5). Hence also $V \rightarrow U$ is surjective, flat, and locally of finite presentation, see Properties of Stacks, Lemma 82.5.2 and Lemmas 83.18.2, and 83.17.2. Hence $\{V \rightarrow U\}$ is the desired fppf covering and $x: V \rightarrow \mathcal{X}$ is the desired object.
07AN Lemma 83.18.10. Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}, j \in J$ be a family of morphisms of algebraic stacks which are each flat and locally of finite presentation and which are jointly surjective, i.e., $|\mathcal{X}|=\bigcup\left|\mathcal{X}_{i}\right|$. Then for every scheme $U$ and object $x$ of $\mathcal{X}$ over $U$ there exists an fppf covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$, a map $a: I \rightarrow J$, and objects $x_{i}$ of $\mathcal{X}_{a(i)}$ over $U_{i}$ such that $\left.f_{a(i)}\left(x_{i}\right) \cong y\right|_{U_{i}}$ in $\mathcal{X}_{U_{i}}$.

Proof. Apply Lemma 83.18 .9 to the morphism $\coprod_{j \in J} \mathcal{X}_{j} \rightarrow \mathcal{X}$. (There is a slight set theoretic issue here - due to our setup of things - which we ignore.) To finish, note that a morphism $x_{i}: U_{i} \rightarrow \coprod_{j \in J} \mathcal{X}_{j}$ is given by a disjoint union decomposition $U_{i}=\coprod U_{i, j}$ and morphisms $U_{i, j} \rightarrow \mathcal{X}_{j}$. Then the fppf covering $\left\{U_{i, j} \rightarrow U\right\}$ and the morphisms $U_{i, j} \rightarrow \mathcal{X}_{j}$ do the job.

06R7 Lemma 83.18.11. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be flat and locally of finite presentation. Then $|f|:|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is open.
Proof. Choose a scheme $V$ and a smooth surjective morphism $V \rightarrow \mathcal{Y}$. Choose a scheme $U$ and a smooth surjective morphism $U \rightarrow V \times \mathcal{Y} \mathcal{X}$. By assumption the morphism of schemes $U \rightarrow V$ is flat and locally of finite presentation. Hence $U \rightarrow V$ is open by Morphisms, Lemma 28.25 .9 . By construction of the topology on $|\mathcal{Y}|$ the $\operatorname{map}|V| \rightarrow|\mathcal{Y}|$ is open. The map $|U| \rightarrow|\mathcal{X}|$ is surjective. The result follows from these facts by elementary topology.

### 83.19. Gerbes

06QB An important type of algebraic stack are the stacks of the form $[B / G]$ where $B$ is an algebraic space and $G$ is a flat and locally finitely presented group algebraic space over $B$ (acting trivially on $B$ ), see Criteria for Representability, Lemma 79.18.3. It turns out that an algebraic stack is a gerbe when it locally in the fppf topology is of this form, see Lemma 83.19.8. In this section we briefly discuss this notion and the corresponding relative notion.

06QC Definition 83.19.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ if $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ as stacks in groupoids over $(S c h / S)_{f p p f}$, see Stacks, Definition 8.11.4. We say an algebraic stack $\mathcal{X}$ is a gerbe if there exists a morphism $\mathcal{X} \rightarrow X$ where $X$ is an algebraic space which turns $\mathcal{X}$ into a gerbe over $X$.

The condition that $\mathcal{X}$ be a gerbe over $\mathcal{Y}$ is defined purely in terms of the topology and category theory underlying the given algebraic stacks; but as we will see later this condition has geometric consequences. For example it implies that $\mathcal{X} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation, see Lemma 83.19.7. The absolute notion is trickier to parse, because it may not be at first clear that $X$ is well determined. Actually, it is.

06QD Lemma 83.19.2. Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}$ is a gerbe, then the sheafification of the presheaf

$$
(S c h / S)_{f p p f}^{o p p} \rightarrow \text { Sets, } \quad U \mapsto \mathrm{Ob}\left(\mathcal{X}_{U}\right) / \cong
$$

is an algebraic space and $\mathcal{X}$ is a gerbe over it.
Proof. (In this proof the abuse of language introduced in Section 83.2 really pays off.) Choose a morphism $\pi: \mathcal{X} \rightarrow X$ where $X$ is an algebraic space which turns $\mathcal{X}$ into a gerbe over $X$. It suffices to prove that $X$ is the sheafification of the presheaf $\mathcal{F}$ displayed in the lemma. It is clear that there is a map $c: \mathcal{F} \rightarrow X$. We will use Stacks, Lemma 8.11 .3 properties (2)(a) and (2)(b) to see that the map $c^{\#}: \mathcal{F}^{\#} \rightarrow X$ is surjective and injective, hence an isomorphism, see Sites, Lemma 7.12.2. Surjective: Let $T$ be a scheme and let $f: T \rightarrow X$. By property (2)(a) there exists an fppf covering $\left\{h_{i}: T_{i} \rightarrow T\right\}$ and morphisms $x_{i}: T_{i} \rightarrow \mathcal{X}$ such that $f \circ h_{i}$ corresponds to $\pi \circ x_{i}$. Hence we see that $\left.f\right|_{T_{i}}$ is in the image of $c$. Injective: Let $T$ be a scheme and let $x, y: T \rightarrow \mathcal{X}$ be morphisms such that $c \circ x=c \circ y$. By (2)(b) we can find a covering $\left\{T_{i} \rightarrow T\right\}$ and morphisms $\left.\left.x\right|_{T_{i}} \rightarrow y\right|_{T_{i}}$ in the fibre category $\mathcal{X}_{T_{i}}$. Hence the restrictions $\left.x\right|_{T_{i}},\left.y\right|_{T_{i}}$ are equal in $\mathcal{F}\left(T_{i}\right)$. This proves that $x, y$ give the same section of $\mathcal{F}^{\#}$ over $T$ as desired.

06QE Lemma 83.19.3. Let

be a fibre product of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then $\mathcal{X}^{\prime}$ is a gerbe over $\mathcal{Y}^{\prime}$.
Proof. Immediate from the definitions and Stacks, Lemma 8.11.5.
06R8 Lemma 83.19.4. Let $\mathcal{X} \rightarrow \mathcal{Y}$ and $\mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ and $\mathcal{Y}$ is a gerbe over $\mathcal{Z}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Z}$.

Proof. Immediate from Stacks, Lemma 8.11.6.
06QF Lemma 83.19.5. Let

be a fibre product of algebraic stacks. If $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$ is surjective, flat, and locally of finite presentation and $\mathcal{X}^{\prime}$ is a gerbe over $\mathcal{Y}^{\prime}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Y}$.

Proof. Follows immediately from Lemma 83.18 .9 and Stacks, Lemma 8.11.7.

06QG Lemma 83.19.6. Let $\pi: \mathcal{X} \rightarrow U$ be a morphism from an algebraic stack to an algebraic space and let $x: U \rightarrow \mathcal{X}$ be a section of $\pi$. Set $G=\operatorname{Isom}_{\mathcal{X}}(x, x)$, see Definition 83.5.3. If $\mathcal{X}$ is a gerbe over $U$, then
(1) there is a canonical equivalence of stacks in groupoids

$$
x_{c a n}:[U / G] \longrightarrow \mathcal{X} .
$$

where $[U / G]$ is the quotient stack for the trivial action of $G$ on $U$,
(2) $G \rightarrow U$ is flat and locally of finite presentation, and
(3) $U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation.

Proof. Set $R=U \times_{x, \mathcal{X}, x} U$. The morphism $R \rightarrow U \times U$ factors through the diagonal $\Delta_{U}: U \rightarrow U \times U$ as it factors through $U \times_{U} U=U$. Hence $R=G$ because

$$
\begin{aligned}
G & =\operatorname{Isom}_{\mathcal{X}}(x, x) \\
& =U \times_{x, \mathcal{X}} \mathcal{I}_{\mathcal{X}} \\
& =U \times_{x, \mathcal{X}}\left(\mathcal{X} \times_{\Delta, \mathcal{X} \times_{S} \mathcal{X}, \Delta} \mathcal{X}\right) \\
& =\left(U \times_{x, \mathcal{X}, x} U\right) \times_{U \times U, \Delta_{U}} U \\
& =R \times_{U \times U, \Delta_{U}} U \\
& =R
\end{aligned}
$$

for the fourth equality use Categories, Lemma 4.30.12 Let $t, s: R \rightarrow U$ be the projections. The composition law $c: R \times_{s, U, t} R \rightarrow R$ constructed on $R$ in Algebraic Stacks, Lemma 76.16.1 agrees with the group law on $G$ (proof omitted). Thus Algebraic Stacks, Lemma 76.16 .1 shows we obtain a canonical fully faithful 1-morphism

$$
x_{c a n}:[U / G] \longrightarrow \mathcal{X}
$$

of stacks in groupoids over $(S c h / S)_{f p p f}$. To see that it is an equivalence it suffices to show that it is essentially surjective. To do this it suffices to show that any object of $\mathcal{X}$ over a scheme $T$ comes fppf locally from $x$ via a morphism $T \rightarrow U$, see Stacks, Lemma 8.4.8. However, this follows the condition that $\pi$ turns $\mathcal{X}$ into a gerbe over $X$, see property (2)(a) of Stacks, Lemma 8.11.3.
By Criteria for Representability, Lemma 79.18 .3 we conclude that $G \rightarrow U$ is flat and locally of finite presentation. Finally, $U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation by Criteria for Representability, Lemma 79.17.1.

06QH Lemma 83.19.7. Let $\pi: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent
(1) $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, and
(2) there exists an algebraic space $U$, a group algebraic space $G$ flat and locally of finite presentation over $U$, and a surjective, flat, and locally finitely presented morphism $U \rightarrow \mathcal{Y}$ such that $\mathcal{X} \times \mathcal{Y} U \cong[U / G]$ over $U$.

Proof. Assume (2). By Lemma 83.19.5 to prove (1) it suffices to show that $[U / G]$ is a gerbe over $U$. This is immediate from Groupoids in Spaces, Lemma65.26.2.
Assume (1). Any base change of $\pi$ is a gerbe, see Lemma 83.19.3. As a first step we choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Thus we may assume that $\pi: \mathcal{X} \rightarrow V$ is a gerbe over a scheme. This means that there exists an fppf covering $\left\{V_{i} \rightarrow V\right\}$ such that the fibre category $\mathcal{X}_{V_{i}}$ is nonempty, see Stacks,

Lemma 8.11.3 (2)(a). Note that $U=\coprod V_{i} \rightarrow U$ is surjective, flat, and locally of finite presentation. Hence we may replace $V$ by $U$ and assume that $\pi: \mathcal{X} \rightarrow U$ is a gerbe over a scheme $U$ and that there exists an object $x$ of $\mathcal{X}$ over $U$. By Lemma 83.19 .6 we see that $\mathcal{X}=[U / G]$ over $U$ for some flat and locally finitely presented group algebraic space $G$ over $U$.

06QI Lemma 83.19.8. Let $\pi: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then $\pi$ is surjective, flat, and locally of finite presentation.

Proof. By Properties of Stacks, Lemma 82.5.4 and Lemmas 83.17.4 and 83.18.7 it suffices to prove to the lemma after replacing $\pi$ by a base change with a surjective, flat, locally finitely presented morphism $\mathcal{Y}^{\prime} \rightarrow \mathcal{Y}$. By Lemma 83.19.7 we may assume $\mathcal{Y}=U$ is an algebraic space and $\mathcal{X}=[U / G]$ over $U$. Then $U \rightarrow[U / G]$ is surjective, flat, and locally of finite presentation, see Lemma 83.19.6. This implies that $\pi$ is surjective, flat, and locally of finite presentation by Properties of Stacks, Lemma 82.5.5 and Lemmas 83.17.5 and 83.18.8.

06QJ Proposition 83.19.9. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent (1) $\mathcal{X}$ is a gerbe, and
(2) $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is flat and locally of finite presentation.

Proof. Assume (1). Choose a morphism $\mathcal{X} \rightarrow X$ into an algebraic space $X$ which turns $\mathcal{X}$ into a gerbe over $X$. Let $X^{\prime} \rightarrow X$ be a surjective, flat, locally finitely presented morphism and set $\mathcal{X}^{\prime}=X^{\prime} \times_{X} \mathcal{X}$. Note that $\mathcal{X}^{\prime}$ is a gerbe over $X^{\prime}$ by Lemma 83.19.3. Then both squares in

are fibre product squares, see Lemma 83.5.4. Hence to prove $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is flat and locally of finite presentation it suffices to do so after such a base change by Lemmas 83.17.4 and 83.18.7. Thus we can apply Lemma 83.19.7 to assume that $\mathcal{X}=[U / G]$. By Lemma 83.19.6 we see $G$ is flat and locally of finite presentation over $U$ and that $x: U \rightarrow[U / G]$ is surjective, flat, and locally of finite presentation. Moreover, the pullback of $\mathcal{I}_{\mathcal{X}}$ by $x$ is $G$ and we conclude that (2) holds by descent again, i.e., by Lemmas 83.17.4 and 83.18.7.

Conversely, assume (2). Choose a smooth presentation $\mathcal{X}=[U / R]$, see Algebraic Stacks, Section 76.16. Denote $G \rightarrow U$ the stabilizer group algebraic space of the $\operatorname{groupoid}(U, R, s, t, c, e, i)$, see Groupoids in Spaces, Definition 65.15.2. By Lemma 83.5 .6 we see that $G \rightarrow U$ is flat and locally of finite presentation as a base change of $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$, see Lemmas 83.17.3 and 83.18.3. Consider the following action

$$
a: G \times_{U, t} R \rightarrow R, \quad(g, r) \mapsto c(g, r)
$$

of $G$ on $R$. This action is free on $T$-valued points for any scheme $T$ as $R$ is a groupoid. Hence $R^{\prime}=R / G$ is an algebraic space and the quotient morphism $\pi: R \rightarrow R^{\prime}$ is surjective, flat, and locally of finite presentation by Bootstrap, Lemma 67.11.7. The projections $s, t: R \rightarrow U$ are $G$-invariant, hence we obtain morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U$ such that $s=s^{\prime} \circ \pi$ and $t=t^{\prime} \circ \pi$. Since $s, t: R \rightarrow U$ are flat and locally of finite presentation we conclude that $s^{\prime}, t^{\prime}$ are flat and locally
of finite presentation, see Morphisms of Spaces, Lemmas 54.30 .5 and Descent on Spaces, Lemma 61.14.1. Consider the morphism

$$
j^{\prime}=\left(t^{\prime}, s^{\prime}\right): R^{\prime} \longrightarrow U \times U
$$

We claim this is a monomorphism. Namely, suppose that $T$ is a scheme and that $a, b: T \rightarrow R^{\prime}$ are morphisms which have the same image in $U \times U$. By definition of the quotient $R^{\prime}=R / G$ there exists an fppf covering $\left\{h_{j}: T_{j} \rightarrow T\right\}$ such that $a \circ h_{j}=\pi \circ a_{j}$ and $b \circ h_{j}=\pi \circ b_{j}$ for some morphisms $a_{j}, b_{j}: T_{j} \rightarrow R$. Since $a_{j}, b_{j}$ have the same image in $U \times U$ we see that $g_{j}=c\left(a_{j}, i\left(b_{j}\right)\right)$ is a $T_{j}$-valued point of $G$ such that $c\left(g_{j}, b_{j}\right)=a_{j}$. In other words, $a_{j}$ and $b_{j}$ have the same image in $R^{\prime}$ and the claim is proved. Since $j: R \rightarrow U \times U$ is a pre-equivalence relation (see Groupoids in Spaces, Lemma 65.11.2) and $R \rightarrow R^{\prime}$ is surjective (as a map of sheaves) we see that $j^{\prime}: R^{\prime} \rightarrow U \times U$ is an equivalence relation. Hence Bootstrap, Theorem 67.10.1 shows that $X=U / R^{\prime}$ is an algebraic space. Finally, we claim that the morphism

$$
\mathcal{X}=[U / R] \longrightarrow X=U / R^{\prime}
$$

turns $\mathcal{X}$ into a gerbe over $X$. This follows from Groupoids in Spaces, Lemma 65.26.1 as $R \rightarrow R^{\prime}$ is surjective, flat, and locally of finite presentation (if needed use Bootstrap, Lemma 67.4 .6 to see this implies the required hypothesis).

At this point we have developed enough machinery to prove that residual gerbes (when they exist) are gerbes.

06QK Lemma 83.19.10. Let $\mathcal{Z}$ be a reduced, locally Noetherian algebraic stack such that $|\mathcal{Z}|$ is a singleton. Then $\mathcal{Z}$ is a gerbe over a reduced, locally Noetherian algebraic space $Z$ with $|Z|$ a singleton.

Proof. By Properties of Stacks, Lemma 82.11 .3 there exists a surjective, flat, locally finitely presented morphism $\operatorname{Spec}(k) \rightarrow \mathcal{Z}$ where $k$ is a field. Then $\mathcal{I}_{Z} \times \mathcal{Z}$ $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ is representable by algebraic spaces and locally of finite type (as a base change of $\mathcal{I}_{\mathcal{Z}} \rightarrow \mathcal{Z}$, see Lemmas 83.5.1 and 83.13.3). Therefore it is locally of finite presentation, see Morphisms of Spaces, Lemma 54.28.7. Of course it is also flat as $k$ is a field. Hence we may apply Lemmas 83.17 .4 and 83.18 .7 to see that $\mathcal{I}_{\mathcal{Z}} \rightarrow \mathcal{Z}$ is flat and locally of finite presentation. We conclude that $\mathcal{Z}$ is a gerbe by Proposition 83.19.9. Let $\pi: \mathcal{Z} \rightarrow Z$ be a morphism to an algebraic space such that $\mathcal{Z}$ is a gerbe over $Z$. Then $\pi$ is surjective, flat, and locally of finite presentation by Lemma 83.19.8. Hence $\operatorname{Spec}(k) \rightarrow Z$ is surjective, flat, and locally of finite presentation as a composition, see Properties of Stacks, Lemma 82.5.2 and Lemmas 83.17 .2 and 83.18 .2 Hence by Properties of Stacks, Lemma 82.11 .3 we see that $|Z|$ is a singleton and that $Z$ is locally Noetherian and reduced.

06R9 Lemma 83.19.11. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ then the map $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is a homeomorphism of topological spaces.

Proof. Let $k$ be a field and let $y$ be an object of $\mathcal{Y}$ over $\operatorname{Spec}(k)$. By Stacks, Lemma 8.11.3 property (2)(a) there exists an fppf covering $\left\{T_{i} \rightarrow \operatorname{Spec}(k)\right\}$ and objects $x_{i}$ of $\mathcal{X}$ over $T_{i}$ with $\left.f\left(x_{i}\right) \cong y\right|_{T_{i}}$. Choose an $i$ such that $T_{i} \neq \emptyset$. Choose a morphism $\operatorname{Spec}(K) \rightarrow T_{i}$ for some field $K$. Then $k \subset K$ and $\left.x_{i}\right|_{K}$ is an object of $\mathcal{X}$ lying over $\left.y\right|_{K}$. Thus we see that $|\mathcal{Y}| \rightarrow|\mathcal{X}|$. is surjective. The map $|\mathcal{Y}| \rightarrow|\mathcal{X}|$ is also injective. Namely, if $x, x^{\prime}$ are objects of $\mathcal{X}$ over $\operatorname{Spec}(k)$ whose images $f(x), f\left(x^{\prime}\right)$ become isomorphic (over an extension) in $\mathcal{Y}$, then Stacks, Lemma 8.11.3 property
(2)(b) guarantees the existence of an extension of $k$ over which $x$ and $x^{\prime}$ become isomorphic (details omitted). Hence $|\mathcal{X}| \rightarrow|\mathcal{Y}|$ is continuous and bijective and it suffices to show that it is also open. This follows from Lemmas 83.19 .8 and 83.18.11.

The following lemma tells us that residual gerbes exist for all points on any algebraic stack which is a gerbe.

06RA Lemma 83.19.12. Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}$ is a gerbe then for every $x \in|\mathcal{X}|$ the residual gerbe of $\mathcal{X}$ at $x$ exists.

Proof. Let $\pi: \mathcal{X} \rightarrow X$ be a morphism from $\mathcal{X}$ into an algebraic space $X$ which turns $\mathcal{X}$ into a gerbe over $X$. Let $Z_{x} \rightarrow X$ be the residual space of $X$ at $x$, see Decent Spaces, Definition 55.11.6. Let $\mathcal{Z}=\mathcal{X} \times{ }_{X} Z_{x}$. By Lemma 83.19.3 the algebraic stack $\mathcal{Z}$ is a gerbe over $Z_{x}$. Hence $|\mathcal{Z}|=\left|Z_{x}\right|$ (Lemma 83.19.11) is a singleton. Since $\mathcal{Z} \rightarrow Z_{x}$ is locally of finite presentation as a base change of $\pi$ (see Lemmas 83.19 .8 and 83.18 .3 we see that $\mathcal{Z}$ is locally Noetherian, see Lemma 83.13.5. Thus the residual gerbe $\mathcal{Z}_{x}$ of $\mathcal{X}$ at $x$ exists and is equal to $\mathcal{Z}_{x}=\mathcal{Z}_{\text {red }}$ the reduction of the algebraic stack $\mathcal{Z}$. Namely, we have seen above that $\left|\mathcal{Z}_{\text {red }}\right|$ is a singleton mapping to $x \in|\mathcal{X}|$, it is reduced by construction, and it is locally Noetherian (as the reduction of a locally Noetherian algebraic stack is locally Noetherian, details omitted).

### 83.20. Stratification by gerbes

06RB The goal of this section is to show that many algebraic stacks $\mathcal{X}$ have a "stratification" by locally closed substacks $\mathcal{X}_{i} \subset \mathcal{X}$ such that each $\mathcal{X}_{i}$ is a gerbe. This shows that in some sense gerbes are the building blocks out of which any algebraic stack is constructed. Note that by stratification we only mean that

$$
|\mathcal{X}|=\bigcup_{i}\left|\mathcal{X}_{i}\right|
$$

is a stratification of the topological space associated to $\mathcal{X}$ and nothing more (in this section). Hence it is harmless to replace $\mathcal{X}$ by its reduction (see Properties of Stacks, Section 82.10 in order to study this stratification.

The following proposition tells us there is (almost always) a dense open substack of the reduction of $\mathcal{X}$

06RC Proposition 83.20.1. Let $\mathcal{X}$ be a reduced algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then there exists a dense open substack $\mathcal{U} \subset \mathcal{X}$ which is a gerbe.

Proof. According to Proposition 83.19 .9 it is enough to find a dense open substack $\mathcal{U}$ such that $\mathcal{I}_{\mathcal{U}} \rightarrow \mathcal{U}$ is flat and locally of finite presentation. Note that $\mathcal{I}_{\mathcal{U}}=$ $\mathcal{I}_{\mathcal{X}} \times \mathcal{X} \mathcal{U}$, see Lemma 83.5.4.

Choose a presentation $\mathcal{X}=[U / R]$. Let $G \rightarrow U$ be the stabilizer group algebraic space of the groupoid $R$. By Lemma 83.5.6 we see that $G \rightarrow U$ is the base change of $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ hence quasi-compact (by assumption) and locally of finite type (by Lemma 83.5.1). Let $W \subset U$ be the largest open (possibly empty) subscheme such that the restriction $G_{W} \rightarrow W$ is flat and locally of finite presentation (we omit the proof that $W$ exists; hint: use that the properties are local). By Morphisms of Spaces, Proposition 54.31.1 we see that $W \subset U$ is dense. Note that $W \subset U$ is $R$-invariant by More on Groupoids in Spaces, Lemma66.4.2. Hence $W$ corresponds to an open
substack $\mathcal{U} \subset \mathcal{X}$ by Properties of Stacks, Lemma 82.9.10. Since $|U| \rightarrow|\mathcal{X}|$ is open and $|W| \subset|U|$ is dense we conclude that $\mathcal{U}$ is dense in $\mathcal{X}$. Finally, the morphism $\mathcal{I}_{\mathcal{U}} \rightarrow \mathcal{U}$ is flat and locally of finite presentation because the base change by the surjective smooth morphism $W \rightarrow \mathcal{U}$ is the morphism $G_{W} \rightarrow W$ which is flat and locally of finite presentation by construction. See Lemmas 83.17.4 and 83.18.7.
The above proposition immediately implies that any point has a residual gerbe on an algebraic stack with quasi-compact inertia, as we will show in Lemma 83.21.1. It turns out that there doesn't always exist a finite stratification by gerbes. Here is an example.
06RE Example 83.20.2. Let $k$ be a field. Take $U=\operatorname{Spec}\left(k\left[x_{0}, x_{1}, x_{2}, \ldots\right]\right)$ and let $\mathbf{G}_{m}$ act by $t\left(x_{0}, x_{1}, x_{2}, \ldots\right)=\left(t x_{0}, t^{p} x_{1}, t^{p^{2}} x_{2}, \ldots\right)$ where $p$ is a prime number. Let $\mathcal{X}=\left[U / \mathbf{G}_{m}\right]$. This is an algebraic stack. There is a stratification of $\mathcal{X}$ by strata
(1) $\mathcal{X}_{0}$ is where $x_{0}$ is not zero,
(2) $\mathcal{X}_{1}$ is where $x_{0}$ is zero but $x_{1}$ is not zero,
(3) $\mathcal{X}_{2}$ is where $x_{0}, x_{1}$ are zero, but $x_{2}$ is not zero,
(4) and so on, and
(5) $\mathcal{X}_{\infty}$ is where all the $x_{i}$ are zero.

Each stratum is a gerbe over a scheme with group $\mu_{p^{i}}$ for $\mathcal{X}_{i}$ and $\mathbf{G}_{m}$ for $\mathcal{X}_{\infty}$. The strata are reduced locally closed substacks. There is no coarser stratification with the same properties.

Nonetheless, using transfinite induction we can use Proposition 83.20.1find possibly infinite stratifications by gerbes...!
06RF Lemma 83.20.3. Let $\mathcal{X}$ be an algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then there exists a well-ordered index set $I$ and for every $i \in I$ a reduced locally closed substack $\mathcal{U}_{i} \subset \mathcal{X}$ such that
(1) each $\mathcal{U}_{i}$ is a gerbe,
(2) we have $|\mathcal{X}|=\bigcup_{i \in I}\left|\mathcal{U}_{i}\right|$,
(3) $T_{i}=|\mathcal{X}| \backslash \bigcup_{i^{\prime}<i}\left|\mathcal{U}_{i^{\prime}}\right|$ is closed in $|\mathcal{X}|$ for all $i \in I$, and
(4) $\left|\mathcal{U}_{i}\right|$ is open in $T_{i}$.

We can moreover arrange it so that either (a) $\left|\mathcal{U}_{i}\right| \subset T_{i}$ is dense, or (b) $\mathcal{U}_{i}$ is quasicompact. In case (a), if we choose $\mathcal{U}_{i}$ as large as possible (see proof for details), then the stratification is canonical.
Proof. Let $T \subset|\mathcal{X}|$ be a nonempty closed subset. We are going to find (resp. choose) for every such $T$ a reduced locally closed substack $\mathcal{U}(T) \subset \mathcal{X}$ with $|\mathcal{U}(T)| \subset$ $T$ open dense (resp. nonempty quasi-compact). Namely, by Properties of Stacks, Lemma 82.10.1 there exists a unique reduced closed substack $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $T=\left|\mathcal{X}^{\prime}\right|$. Note that $\mathcal{I}_{\mathcal{X}^{\prime}}=\mathcal{I}_{\mathcal{X}} \times \mathcal{X} \mathcal{X}^{\prime}$ by Lemma 83.5.5. Hence $\mathcal{I}_{\mathcal{X}^{\prime}} \rightarrow \mathcal{X}^{\prime}$ is quasi-compact as a base change, see Lemma 83.7.3. Therefore Proposition 83.20.1 implies there exists a dense maximal (see proof proposition) open substack $\mathcal{U} \subset \mathcal{X}^{\prime}$ which is a gerbe. In case (a) we set $\mathcal{U}(T)=\mathcal{U}$ (this is canonical) and in case (b) we simply choose a nonempty quasi-compact open $\mathcal{U}(T) \subset \mathcal{U}$, see Properties of Stacks, Lemma 82.4.9 (we can do this for all $T$ simultaneously by the axiom of choice).

By transfinite induction we construct for every ordinal $\alpha$ a closed subset $T_{\alpha} \subset|\mathcal{X}|$. For $\alpha=0$ we set $T_{0}=|\mathcal{X}|$. Given $T_{\alpha}$ set

$$
T_{\alpha+1}=T_{\alpha} \backslash\left|\mathcal{U}\left(T_{\alpha}\right)\right|
$$

If $\beta$ is a limit ordinal we set

$$
T_{\beta}=\bigcap_{\alpha<\beta} T_{\alpha}
$$

We claim that $T_{\alpha}=\emptyset$ for all $\alpha$ large enough. Namely, assume that $T_{\alpha} \neq \emptyset$ for all $\alpha$. Then we obtain an injective map from the class of ordinals into the set of subsets of $|\mathcal{X}|$ which is a contradiction.
The claim implies the lemma. Namely, let

$$
I=\left\{\alpha \mid \mathcal{U}_{\alpha} \neq \emptyset\right\}
$$

This is a well-ordered set by the claim. For $i=\alpha \in I$ we set $\mathcal{U}_{i}=\mathcal{U}_{\alpha}$. So $\mathcal{U}_{i}$ is a reduced locally closed substack and a gerbe, i.e., (1) holds. By construction $T_{i}=T \alpha$ if $i=\alpha \in I$, hence (3) holds. Also, (4) and (a) or (b) hold by our choice of $\mathcal{U}(T)$ as well. Finally, to see (2) let $x \in|\mathcal{X}|$. There exists a smallest ordinal $\beta$ with $x \notin T_{\beta}$ (because the ordinals are well-ordered). In this case $\beta$ has to be a successor ordinal by the definition of $T_{\beta}$ for limit ordinals. Hence $\beta=\alpha+1$ and $x \in\left|\mathcal{U}\left(T_{\alpha}\right)\right|$ and we win.

06RG Remark 83.20.4. We can wonder about the order type of the canonical stratifications which occur as output of the stratifications of type (a) constructed in Lemma 83.20.3. A natural guess is that the well-ordered set $I$ has cardinality at most $\aleph_{0}$. We have no idea if this is true or false. If you do please email stacks.project@gmail.com.

### 83.21. Existence of residual gerbes

06 UH In this section we prove that residual gerbes (as defined in Properties of Stacks, Definition 82.11.8 exist on many algebraic stacks. First, here is the promised application of Proposition 83.20.1.
06RD Lemma 83.21.1. Let $\mathcal{X}$ be an algebraic stack such that $\mathcal{I}_{\mathcal{X}} \rightarrow \mathcal{X}$ is quasi-compact. Then the residual gerbe of $\mathcal{X}$ at $x$ exists for every $x \in|\mathcal{X}|$.

Proof. Let $T=\overline{\{x\}} \subset|\mathcal{X}|$ be the closure of $x$. By Properties of Stacks, Lemma 82.10 .1 there exists a reduced closed substack $\mathcal{X}^{\prime} \subset \mathcal{X}$ such that $T=\left|\mathcal{X}^{\prime}\right|$. Note that $\mathcal{I}_{\mathcal{X}^{\prime}}=\mathcal{I}_{\mathcal{X}} \times{ }_{\mathcal{X}} \mathcal{X}^{\prime}$ by Lemma 83.5.5. Hence $\mathcal{I}_{\mathcal{X}^{\prime}} \rightarrow \mathcal{X}^{\prime}$ is quasi-compact as a base change, see Lemma 83.7.3. Therefore Proposition 83.20 .1 implies there exists a dense open substack $\mathcal{U} \subset \mathcal{X}^{\prime}$ which is a gerbe. Note that $x \in|\mathcal{U}|$ because $\{x\} \subset T$ is a dense subset too. Hence a residual gerbe $\mathcal{Z}_{x} \subset \mathcal{U}$ of $\mathcal{U}$ at $x$ exists by Lemma 83.19.12. It is immediate from the definitions that $\mathcal{Z}_{x} \rightarrow \mathcal{X}$ is a residual gerbe of $\mathcal{X}$ at $x$.

If the stack is quasi-DM then residual gerbes exist too. In particular, residual gerbes always exist for Delinge-Mumford stacks.

06UI Lemma 83.21.2. Let $\mathcal{X}$ be a quasi-DM algebraic stack. Then the residual gerbe of $\mathcal{X}$ at $x$ exists for every $x \in|\mathcal{X}|$.

Proof. Choose a scheme $U$ and a surjective, flat, locally finite presented, and locally quasi-finite morphism $U \rightarrow \mathcal{X}$, see Theorem 83.15.3. Set $R=U \times_{\mathcal{X}} U$. The projections $s, t: R \rightarrow U$ are surjective, flat, locally of finite presentation, and locally quasi-finite as base changes of the morphism $U \rightarrow \mathcal{X}$. There is a canonical morphism $[U / R] \rightarrow \mathcal{X}$ (see Algebraic Stacks, Lemma 76.16.1) which is an equivalence because $U \rightarrow \mathcal{X}$ is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Remark 76.16.3. Thus we may assume that $\mathcal{X}=[U / R]$ where $(U, R, s, t, c)$ is a
groupoid in algebraic spaces such that $s, t: R \rightarrow U$ are surjective, flat, locally of finite presentation, and locally quasi-finite. Set

$$
U^{\prime}=\coprod_{u \in U \text { lying over } x} \operatorname{Spec}(\kappa(u))
$$

The canonical morphism $U^{\prime} \rightarrow U$ is a monomorphism. Let

$$
R^{\prime}=U^{\prime} \times_{\mathcal{X}} U^{\prime}=R \times_{(U \times U)}\left(U^{\prime} \times U^{\prime}\right)
$$

Because $U^{\prime} \rightarrow U$ is a monomorphism we see that both projections $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ factor as a monomorphism followed by a locally quasi-finite morphism. Hence, as $U^{\prime}$ is a disjoint union of spectra of fields, using Spaces over Fields, Lemma 59.7.9 we conclude that the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are locally quasi-finite. Again since $U^{\prime}$ is a disjoint union of spectra of fields, the morphisms $s^{\prime}, t^{\prime}$ are also flat. Finally, $s^{\prime}, t^{\prime}$ locally quasi-finite implies $s^{\prime}, t^{\prime}$ locally of finite type, hence $s^{\prime}, t^{\prime}$ locally of finite presentation (because $U^{\prime}$ is a disjoint union of spectra of fields in particular locally Noetherian, so that Morphisms of Spaces, Lemma 54.28 .7 applies). Hence $\mathcal{Z}=\left[U^{\prime} / R^{\prime}\right]$ is an algebraic stack by Criteria for Representability, Theorem 79.17.2 As $R^{\prime}$ is the restriction of $R$ by $U^{\prime} \rightarrow U$ we see $\mathcal{Z} \rightarrow \mathcal{X}$ is a monomorphism by Groupoids in Spaces, Lemma 65.24.1 and Properties of Stacks, Lemma 82.8.4. Since $\mathcal{Z} \rightarrow \mathcal{X}$ is a monomorphism we see that $|\mathcal{Z}| \rightarrow|\mathcal{X}|$ is injective, see Properties of Stacks, Lemma 82.8.5. By Properties of Stacks, Lemma 82.4.3 we see that

$$
\left|U^{\prime}\right|=\left|\mathcal{Z} \times_{\mathcal{X}} U^{\prime}\right| \longrightarrow|\mathcal{Z}| \times_{|\mathcal{X}|}\left|U^{\prime}\right|
$$

is surjective which implies (by our choice of $U^{\prime}$ ) that $|\mathcal{Z}| \rightarrow|\mathcal{X}|$ has image $\{x\}$. We conclude that $|\mathcal{Z}|$ is a singleton. Finally, by construction $U^{\prime}$ is locally Noetherian and reduced, i.e., $\mathcal{Z}$ is reduced and locally Noetherian. This means that the essential image of $\mathcal{Z} \rightarrow \mathcal{X}$ is the residual gerbe of $\mathcal{X}$ at $x$, see Properties of Stacks, Lemma 82.11.11.

### 83.22. Smooth morphisms

075 T The property "being smooth" of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 61.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 54.36 .3 and Descent on Spaces, Lemma 61.10.24. Hence, by Lemma 83.12 .1 above, we may define what it means for a morphism of algebraic spaces to be smooth as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 82.3 when the morphism is representable by algebraic spaces.

075 U Definition 83.22.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. We say $f$ is smooth if the equivalent conditions of Lemma 83.12.1 hold with $\mathcal{P}=$ smooth.

075 V Lemma 83.22.2. The composition of smooth morphisms is smooth.
Proof. Combine Remark 83.12 .3 with Morphisms of Spaces, Lemma 54.36.2.
075W Lemma 83.22.3. A base change of a smooth morphism is smooth.
Proof. Combine Remark 83.12.4 with Morphisms of Spaces, Lemma 54.36.3.

## CHAPTER 84

## Cohomology of Algebraic Stacks

### 84.1. Introduction

073Q In this chapter we write about cohomology of algebraic stacks. This mean in particular cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapters entitled "Cohomology of Schemes" and "Cohomology of Algebraic Spaces". The results in this chapter are different from those in [LMB00 mainly because we consistently use the "big sites". Before reading this chapter please take a quick look at the chapter "Sheaves on Algebraic Stacks" in order to become familiar with the terminology introduced there, see Sheaves on Stacks, Section 78.1 .

### 84.2. Conventions and abuse of language

073 R We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 82.2,

### 84.3. Notation

073 S Different topologies. If we indicate an algebraic stack by a calligraphic letter, such as $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$, then the notation $\mathcal{X}_{\text {Zar }}, \mathcal{X}_{\text {étale }}, \mathcal{X}_{\text {smooth }}, \mathcal{X}_{\text {syntomic }}, \mathcal{X}_{\text {fppf }}$ indicates the site introduced in Sheaves on Stacks, Definition 78.4.1. (Think "big site".) Correspondingly the structure sheaf of $\mathcal{X}$ is a sheaf on $\mathcal{X}_{f p p f}$. On the other hand, algebraic spaces and schemes are usually indicated by roman capitals, such as $X, Y, Z$, and in this case $X_{\text {étale }}$ indicates the small étale site of $X$ (as defined in Topologies, Definition 33.4 .8 or Properties of Spaces, Definition 53.17.1). It seems that the distinction should be clear enough.

The default topology is the fppf topology. Hence we will sometimes say "sheaf on $\mathcal{X}$ " or "sheaf of $\mathcal{O}_{\mathcal{X}}$ " modules when we mean sheaf on $\mathcal{X}_{\text {fppf }}$ or object of $\operatorname{Mod}\left(\mathcal{X}_{f p p f}, \mathcal{O}_{\mathcal{X}}\right)$.
If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks, then the functors $f_{*}$ and $f^{-1}$ defined on presheaves preserves sheaves for any of the topologies mentioned above. In particular when we discuss the pushforward or pullback of a sheaf we don't have to mention which topology we are working with. The same isn't true when we compute cohomology groups and/or higher direct images. In this case we will always mention which topology we are working with.

Suppose that $f: X \rightarrow \mathcal{Y}$ is a morphism from an algebraic space $X$ to an algebraic stack $\mathcal{Y}$. Let $\mathcal{G}$ be a sheaf on $\mathcal{Y}_{\tau}$ for some topology $\tau$. In this case $f^{-1} \mathcal{G}$ is a sheaf for the $\tau$ topology on $\mathcal{S}_{X}$ (the algebraic stack associated to $X$ ) because (by our conventions) $f$ really is a 1-morphism $f: \mathcal{S}_{X} \rightarrow \mathcal{Y}$. If $\tau=$ étale or stronger, then
we write $\left.f^{-1} \mathcal{G}\right|_{X_{\text {etale }}}$ to denote the restriction to the étale site of $X$, see Sheaves on Stacks, Section 78.21. If $\mathcal{G}$ is an $\mathcal{O}_{\mathcal{X}}$-module we sometimes write $f^{*} \mathcal{G}$ and $\left.f^{*} \mathcal{G}\right|_{X_{\text {etale }}}$ instead.

### 84.4. Pullback of quasi-coherent modules

076 W Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. It is a very general fact that quasi-coherent modules on ringed topoi are compatible with pullbacks. In particular the pullback $f^{*}$ preserves quasi-coherent modules and we obtain a functor

$$
f^{*}: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

see Sheaves on Stacks, Lemma 78.11.2. In general this functor isn't exact, but if $f$ is flat then it is.

076X Lemma 84.4.1. If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a flat morphism of algebraic stacks then $f^{*}$ : $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is an exact functor.

Proof. Choose a scheme $V$ and a surjective smooth morphism $V \rightarrow \mathcal{Y}$. Choose a scheme $U$ and a surjective smooth morphism $U \rightarrow V \times{ }_{\mathcal{Y}} \mathcal{X}$. Then $U \rightarrow \mathcal{X}$ is still smooth and surjective as a composition of two such morphisms. From the commutative diagram

we obtain a commutative diagram

of abelian categories. Our proof that the bottom two categories in this diagram are abelian showed that the vertical functors are faithful exact functors (see proof of Sheaves on Stacks, Lemma 78.14.1). Since $f^{\prime}$ is a flat morphism of schemes (by our definition of flat morphisms of algebraic stacks) we see that $\left(f^{\prime}\right)^{*}$ is an exact functor on quasi-coherent sheaves on $V$. Thus we win.

### 84.5. The key lemma

076 Y The following lemma is the basis for our understanding of higher direct images of certain types of sheaves of modules. There are two versions: one for the étale topology and one for the fppf topology.
076 Z Lemma 84.5.1. Let $\mathcal{M}$ be a rule which associates to every algebraic stack $\mathcal{X}$ a subcategory $\mathcal{M}_{\mathcal{X}}$ of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ such that
(1) $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ (see Homology, Definition 12.9.1) for all algebraic stacks $\mathcal{X}$,
(2) for a smooth morphism of algebraic stacks $f: \mathcal{Y} \rightarrow \mathcal{X}$ the functor $f^{*}$ maps $\mathcal{M}_{\mathcal{X}}$ into $\mathcal{M}_{\mathcal{Y}}$,
(3) if $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{i}\right|\left(\left|\mathcal{X}_{i}\right|\right)$, then an object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ is in $\mathcal{M}_{\mathcal{X}}$ if and only if $f_{i}^{*} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_{i}}$ for all $i$, and
(4) if $f: \mathcal{Y} \rightarrow \mathcal{X}$ is a morphism of algebraic stacks such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes, then $R^{i} f_{*}$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$.
Then for any quasi-compact and quasi-separated morphism $f: \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks $R^{i} f_{*}$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$. (Higher direct images computed in étale topology.)
Proof. Let $f: \mathcal{Y} \rightarrow \mathcal{X}$ be a quasi-compact and quasi-separated morphism of algebraic stacks and let $\mathcal{F}$ be an object of $\mathcal{M}_{\mathcal{Y}}$. Choose a surjective smooth morphism $\mathcal{U} \rightarrow \mathcal{X}$ where $\mathcal{U}$ is representable by a scheme. By Sheaves on Stacks, Lemma 78.20 .3 taking higher direct images commutes with base change. Assumption (2) shows that the pullback of $\mathcal{F}$ to $\mathcal{U} \times \mathcal{X} \mathcal{Y}$ is in $\mathcal{M}_{\mathcal{U} \times \mathcal{X}} \mathcal{Y}$ because the projection $\mathcal{U} \times \mathcal{X} \mathcal{Y} \rightarrow \mathcal{Y}$ is smooth as a base change of a smooth morphism. Hence (3) shows we may replace $\mathcal{Y} \rightarrow \mathcal{X}$ by the projection $\mathcal{U} \times \mathcal{X} \mathcal{Y} \rightarrow \mathcal{U}$. In other words, we may assume that $\mathcal{X}$ is representable by a scheme. Using (3) once more, we see that the question is Zariski local on $\mathcal{X}$, hence we may assume that $\mathcal{X}$ is representable by an affine scheme. Since $f$ is quasi-compact this implies that also $\mathcal{Y}$ is quasicompact. Thus we may choose a surjective smooth morphism $g: \mathcal{V} \rightarrow \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme.
In this situation we have the spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(f \circ g_{p}\right)_{*} g_{p}^{*} \mathcal{F} \Rightarrow R^{p+q} f_{*} \mathcal{F}
$$

of Sheaves on Stacks, Proposition 78.20.1. Recall that this is a first quadrant spectral sequence hence we may use the last part of Homology, Lemma 12.22.6. Note that the morphisms

$$
g_{p}: \mathcal{V}_{p}=\mathcal{V} \times \mathcal{Y} \ldots \times \mathcal{Y} \mathcal{V} \longrightarrow \mathcal{Y}
$$

are smooth as compositions of base changes of the smooth morphism $g$. Thus the sheaves $g_{p}^{*} \mathcal{F}$ are in $\mathcal{M}_{\mathcal{V}_{p}}$ by (2). Hence it suffices to prove that the higher direct images of objects of $\mathcal{M}_{\mathcal{V}_{p}}$ under the morphisms

$$
\mathcal{V}_{p}=\mathcal{V} \times \mathcal{Y} \ldots \times \mathcal{Y} \mathcal{V} \longrightarrow \mathcal{X}
$$

are in $\mathcal{M}_{\mathcal{X}}$. The algebraic stacks $\mathcal{V}_{p}$ are quasi-compact and quasi-separated by Morphisms of Stacks, Lemma 83.7.7. Of course each $\mathcal{V}_{p}$ is representable by an algebraic space (the diagonal of the algebraic stack $\mathcal{Y}$ is representable by algebraic spaces). This reduces us to the case where $\mathcal{Y}$ is representable by an algebraic space and $\mathcal{X}$ is representable by an affine scheme.
In the situation where $\mathcal{Y}$ is representable by an algebraic space and $\mathcal{X}$ is representable by an affine scheme, we choose anew a surjective smooth morphism $\mathcal{V} \rightarrow \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. Going through the argument above once again we once again reduce to the morphisms $\mathcal{V}_{p} \rightarrow \mathcal{X}$. But in the current situation the algebraic stacks $\mathcal{V}_{p}$ are representable by quasi-compact and quasiseparated schemes (bacause the diagonal of an algebraic space is representable by schemes).

Thus we may assume $\mathcal{Y}$ is representable by a scheme and $\mathcal{X}$ is representable by an affine scheme. Choose (again) a surjective smooth morphism $\mathcal{V} \rightarrow \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. In this case all the algebraic stacks $\mathcal{V}_{p}$ are representable by separated schemes (because the diagonal of a scheme is separated).

Thus we may assume $\mathcal{Y}$ is representable by a separated scheme and $\mathcal{X}$ is representable by an affine scheme. Choose (yet again) a surjective smooth morphism $\mathcal{V} \rightarrow \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. In this case all the algebraic stacks $\mathcal{V}_{p}$ are representable by affine schemes (because the diagonal of a separated scheme is a closed immersion hence affine) and this case is handled by assumption (4). This finishes the proof.

Here is the version for the fppf topology.
0770 Lemma 84.5.2. Let $\mathcal{M}$ be a rule which associates to every algebraic stack $\mathcal{X}$ a subcategory $\mathcal{M}_{\mathcal{X}}$ of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ such that
(1) $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ for all algebraic stacks $\mathcal{X}$,
(2) for a smooth morphism of algebraic stacks $f: \mathcal{Y} \rightarrow \mathcal{X}$ the functor $f^{*}$ maps $\mathcal{M}_{\mathcal{X}}$ into $\mathcal{M}_{\mathcal{Y}}$,
(3) if $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{i}\right|\left(\left|\mathcal{X}_{i}\right|\right)$, then an object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ is in $\mathcal{M}_{\mathcal{X}}$ if and only if $f_{i}^{*} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_{i}}$ for all $i$, and
(4) if $f: \mathcal{Y} \rightarrow \mathcal{X}$ is a morphism of algebraic stacks and $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes, then $R^{i} f_{*}$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$.
Then for any quasi-compact and quasi-separated morphism $f: \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks $R^{i} f_{*}$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$. (Higher direct images computed in fppf topology.)

Proof. Identical to the proof of Lemma 84.5.1.

### 84.6. Locally quasi-coherent modules

075 X Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. We can ask whether $\mathcal{F}$ is locally quasi-coherent, see Sheaves on Stacks, Definition 78.11.4, Briefly, this means $\mathcal{F}$ is an $\mathcal{O}_{\mathcal{X}}$-module for the étale topology such that for any morphism $f: U \rightarrow \mathcal{X}$ the restriction $\left.f^{*} \mathcal{F}\right|_{U_{\text {étale }}}$ is quasi-coherent on $U_{\text {étale }}$. (The actual definition is slightly different, but equivalent.) A useful fact is that

$$
L Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \subset \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)
$$

is a weak Serre subcategory, see Sheaves on Stacks, Lemma 78.11.7.
075Y Lemma 84.6.1. Let $\mathcal{X}$ be an algebraic stack. Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {étale }}$. If each $f_{j}^{-1} \mathcal{F}$ is locally quasi-coherent, then so is $\mathcal{F}$.
Proof. We may replace each of the algebraic stacks $\mathcal{X}_{j}$ by a scheme $U_{j}$ (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 83.22.2. . The pullback of $\mathcal{F}$ to $\left(S c h / U_{j}\right)_{\text {étale }}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 78.11.6. Then $f=\coprod f_{j}: U=\coprod U_{j} \rightarrow \mathcal{X}$ is a surjective smooth morphism. Let $x$ be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 78.18.10 there exists an étale covering $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ such that each $x_{i}$ lifts to an object $u_{i}$ of $(S c h / U)_{\text {étale }}$. This just means that $x, x_{i}$ live over schemes $V, V_{i}$, that $\left\{V_{i} \rightarrow V\right\}$ is an étale covering, and that $x_{i}$ comes from a morphism $u_{i}: V_{i} \rightarrow U$. The restriction $\left.x_{i}^{*} \mathcal{F}\right|_{V_{i, \text { étale }}}$ is equal to the restriction of $f^{*} \mathcal{F}$ to $V_{i \text {,étale }}$, see Sheaves on Stacks, Lemma 78.9.3. Hence $\left.x^{*} \mathcal{F}\right|_{V_{\text {étale }}}$ is a sheaf on the small étale site of $V$ which is quasi-coherent when restricted to $V_{i, \text { étale }}$ for each $i$. This implies that it is quasi-coherent (as desired), for example by Properties of Spaces, Lemma 53.28.6.

075Z Lemma 84.6.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be a locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module on $\mathcal{X}_{\text {étale }}$. Then $R^{i} f_{*} \mathcal{F}$ (computed in the étale topology) is locally quasi-coherent on $\mathcal{Y}_{\text {étale }}$.

Proof. We will use Lemma 84.5.1 to prove this. We will check its assumptions (1) - (4). Parts (1) and (2) follows from Sheaves on Stacks, Lemma 78.11.7. Part (3) follows from Lemma 84.6.1. Thus it suffices to show (4).

Suppose $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes $X$ and $Y$. Choose any object $y$ of $\mathcal{Y}$ lying over a scheme $V$. For clarity, denote $\mathcal{V}=(S c h / V)_{f p p f}$ the algebraic stack corresponding to $V$. Consider the cartesian diagram

Thus $\mathcal{Z}$ is representable by the scheme $Z=V \times_{Y} X$ and $f^{\prime}$ is quasi-compact and separated (even affine). By Sheaves on Stacks, Lemma 78.21.3 we have

$$
\left.R^{i} f_{*} \mathcal{F}\right|_{V_{\text {étale }}}=R^{i} f_{\text {small }, *}^{\prime}\left(\left.g^{*} \mathcal{F}\right|_{Z_{\text {étale }}}\right)
$$

The right hand side is a quasi-coherent sheaf on $V_{\text {étale }}$ by Cohomology of Spaces, Lemma 56.3.2. This implies the left hand side is quasi-coherent which is what we had to prove.

07AP Lemma 84.6.3. Let $\mathcal{X}$ be an algebraic stack. Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {fppf }}$. If each $f_{j}^{-1} \mathcal{F}$ is locally quasi-coherent, then so is $\mathcal{F}$.

Proof. First, suppose there is a morphism $a: \mathcal{U} \rightarrow \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^{*} \mathcal{F}$ is locally quasi-coherent. Then there is an exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow a_{*} a^{*} \mathcal{F} \rightarrow b_{*} b^{*} \mathcal{F}
$$

where $b$ is the morphism $b: \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$, see Sheaves on Stacks, Proposition 78.18 .7 and Lemma 78.18.10. Moreover, the pullback $b^{*} \mathcal{F}$ is the pullback of $a^{*} \mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent (Sheaves on Stacks, Lemma 78.11.6). The modules $a_{*} a^{*} \mathcal{F}$ and $b_{*} b^{*} \mathcal{F}$ are locally quasi-coherent by Lemma 84.6.2. (Note that $a_{*}$ and $b_{*}$ don't care about which topology is used to calculate them.) We conclude that $\mathcal{F}$ is locally quasi-coherent, see Sheaves on Stacks, Lemma 78.11.7.

We are going to reduce the proof of the general case the the situation in the first paragraph. Let $x$ be an object of $\mathcal{X}$ lying over the scheme $U$. We have to show that $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is a quasi-coherent $\mathcal{O}_{U}$-module. It suffices to do this (Zariski) locally on $U$, hence we may assume that $U$ is affine. By Morphisms of Stacks, Lemma 83.18.10 there exists an fppf covering $\left\{a_{i}: U_{i} \rightarrow U\right\}$ such that each $x \circ a_{i}$ factors through some $f_{j}$. Hence $a_{i}^{*} \mathcal{F}$ is locally quasi-coherent on $\left(S c h / U_{i}\right)_{f p p f}$. After refining the covering we may assume $\left\{U_{i} \rightarrow U\right\}_{i=1, \ldots, n}$ is a standard fppf covering. Then $x^{*} \mathcal{F}$ is an fppf module on $(S c h / U)_{f p p f}$ whose pullback by the morphism $a: U_{1} \amalg \ldots \amalg U_{n} \rightarrow U$
is locally quasi-coherent. Hence by the first paragraph we see that $x^{*} \mathcal{F}$ is locally quasi-coherent, which certainly implies that $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is quasi-coherent.

### 84.7. Flat comparison maps

0760 Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{F}$ be an object of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. Given an object $x$ of $\mathcal{X}$ lying over the scheme $U$ the restriction $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is the restriction of $x^{-1} \mathcal{F}$ to the small étale site of $U$, see Sheaves on Stacks, Definition 78.9.2. Next, let $\varphi: x \rightarrow x^{\prime}$ be a morphism of $\mathcal{X}$ lying over a morphism of schemes $f: U \rightarrow U^{\prime}$. Thus a 2-commutative diagram

Associated to $\varphi$ we obtain a comparison map between restrictions

$$
\begin{equation*}
c_{\varphi}:\left.f_{\text {small }}^{*}\left(\left.\mathcal{F}\right|_{U_{\text {étale }}^{\prime}}\right) \longrightarrow \mathcal{F}\right|_{U_{\text {ettale }}} \tag{84.7.0.1}
\end{equation*}
$$

see Sheaves on Stacks, Equation 78.9.4.1. In this situation we can consider the following property of $\mathcal{F}$.
0762 Definition 84.7.1. Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{F}$ in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. We say $\mathcal{F}$ has the flat base change property 1 if and only if $c_{\varphi}$ is an isomorphism whenever $f$ is flat.
Here is a lemma with some properties of this notion.
0764 Lemma 84.7.2. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{X}}$-module on $\mathcal{X}$ étale.
(1) If $\mathcal{F}$ has the flat base change property then for any morphism $g: \mathcal{Y} \rightarrow \mathcal{X}$ of algebraic stacks, the pullback $g^{*} \mathcal{F}$ does too.
(2) The full subcategory of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ consisting of modules with the flat base change property is a weak Serre subcategory.
(3) Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}|=\bigcup_{i}\left|f_{i}\right|\left(\left|\mathcal{X}_{i}\right|\right)$. If each $f_{i}^{*} \mathcal{F}$ has the flat base change property then so does $\mathcal{F}$.
(4) The category of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {étale }}$ with the flat base change property has colimits and they agree with colimits in $\operatorname{Mod}\left(\mathcal{X}_{\text {etale }}, \mathcal{O}_{\mathcal{X}}\right)$.
Proof. Let $g: \mathcal{Y} \rightarrow \mathcal{X}$ be as in (1). Let $y$ be an object of $\mathcal{Y}$ lying over a scheme $V$. By Sheaves on Stacks, Lemma 78.9.3 we have $\left.\left(g^{*} \mathcal{F}\right)\right|_{V_{\text {etale }}}=\left.\mathcal{F}\right|_{V_{\text {etale }}}$. Moreover a comparison mapping for the sheaf $g^{*} \mathcal{F}$ on $\mathcal{Y}$ is a special case of a comparison map for the sheaf $\mathcal{F}$ on $\mathcal{X}$, see Sheaves on Stacks, Lemma 78.9.3. In this way (1) is clear.
Proof of (2). We use the characterization of weak Serre subcategories of Homology, Lemma 12.9.3. Kernels and cokernels of maps between sheaves having the flat base change property also have the flat base change property. This is clear because $f_{s m a l l}^{*}$ is exact for a flat morphism of schemes and since the restriction functors $\left.(-)\right|_{U_{\text {étale }}}$ are exact (because we are working in the étale topology). Finally, if $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is a short exact sequence of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ and the outer two sheaves have the flat base change property then the middle one does as

[^221]well, again because of the exactness of $f_{\text {small }}^{*}$ and the restriction functors (and the 5 lemma).

Proof of (3). Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_{i}^{*} \mathcal{F}$ has the flat base change property. By part (1), the definition of an algebraic stack, and the fact that compositions of smooth morphisms are smooth (see Morphisms of Stacks, Lemma 83.22.2 we may assume that each $\mathcal{X}_{i}$ is representable by a scheme. Let $\varphi: x \rightarrow x^{\prime}$ be a morphism of $\mathcal{X}$ lying over a flat morphism $a: U \rightarrow U^{\prime}$ of schemes. By Sheaves on Stacks, Lemma 78.18 .10 there exists a jointly surjective family of étale morphisms $U_{i}^{\prime} \rightarrow U^{\prime}$ such that $U^{\prime} \rightarrow U^{\prime} \rightarrow \mathcal{X}$ factors through $\mathcal{X}_{i}$. Thus we obtain commutative diagrams

Note that each $a_{i}$ is a flat morphism of schemes as a base change of $a$. Denote $\psi_{i}: x_{i} \rightarrow x_{i}^{\prime}$ the morphism of $\mathcal{X}_{i}$ lying over $a_{i}$ with target $x_{i}^{\prime}$. By assumption the comparison maps $c_{\psi_{i}}:\left.\left(a_{i}\right)_{\text {small }}^{*}\left(\left.f_{i}^{*} \mathcal{F}\right|_{\left.\left(U_{i}^{\prime}\right)_{\text {etale }}\right)}\right) \rightarrow f_{i}^{*} \mathcal{F}\right|_{\left(U_{i}\right)_{\text {etale }}}$ is an isomorphism. Because the vertical arrows $U_{i}^{\prime} \rightarrow U^{\prime}$ and $U_{i} \rightarrow U$ are étale, the sheaves $\left.f_{i}^{*} \mathcal{F}\right|_{\left(U_{i}^{\prime}\right)_{\text {étale }}}$ and $\left.f_{i}^{*} \mathcal{F}\right|_{\left(U_{i}\right)_{\text {etale }}}$ are the restrictions of $\left.\mathcal{F}\right|_{U_{\text {étale }}^{\prime}}$ and $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ and the map $c_{\psi_{i}}$ is the restriction of $c_{\varphi}$ to $\left(U_{i}\right)_{\text {étale }}$, see Sheaves on Stacks, Lemma 78.9.3. Since $\left\{U_{i} \rightarrow U\right\}$ is an étale covering, this implies that the comparison map $c_{\varphi}$ is an isomorphism which is what we wanted to prove.

Proof of (4). Let $\mathcal{I} \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right), i \mapsto \mathcal{F}_{i}$ be a diagram and assume each $\mathcal{F}_{i}$ has the flat base change property. Recall that $\operatorname{colim}_{i} \mathcal{F}_{i}$ is the sheafification of the presheaf colimit. As we are using the étale topology, it is clear that

$$
\left.\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)\right|_{U_{\text {étale }}}=\left.\operatorname{colim}_{i} \mathcal{F}_{i}\right|_{U_{\text {étale }}}
$$

As $f_{\text {small }}^{*}$ commutes with colimits (as a left adjoint) we see that (4) holds.
0765 Lemma 84.7.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be an object of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ which is locally quasicoherent and has the flat base change property. Then each $R^{i} g_{*} \mathcal{F}$ (computed in the étale topology) has the flat base change property.

Proof. We will use Lemma 84.5.1 to prove this. For every algebraic stack $\mathcal{X}$ let $\mathcal{M}_{\mathcal{X}}$ denote the full subcategory of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ consisting of locally quasicoherent sheaves with the flat base change property. Once we verify conditions (1) - (4) of Lemma 84.5.1 the lemma will follow. Properties (1), (2), and (3) follow from Sheaves on Stacks, Lemmas 78.11.6 and 78.11.7 and Lemmas 84.6.1 and 84.7.2 Thus it suffices to show part (4).

Suppose $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a morphism of algebraic stacks such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes $X$ and $Y$. In this case, suppose that $\psi: y \rightarrow y^{\prime}$ is a morphism of $\mathcal{Y}$ lying over a flat morphism $b: V \rightarrow V^{\prime}$ of schemes. For clarity denote $\mathcal{V}=(S c h / V)_{f p p f}$ and $\mathcal{V}^{\prime}=\left(S c h / V^{\prime}\right)_{f p p f}$ the corresponding algebraic stacks.

Consider the diagram of algebraic stacks

with both squares cartesian. As $f$ is representable by schemes (and quasi-compact and separated - even affine) we see that $\mathcal{Z}$ and $\mathcal{Z}^{\prime}$ are representable by schemes $Z$ and $Z^{\prime}$ and in fact $Z=V \times_{V^{\prime}} Z^{\prime}$. Since $\mathcal{F}$ has the flat base change property we see that

$$
\left.a_{\text {small }}^{*}\left(\left.\mathcal{F}\right|_{Z_{\text {étale }}^{\prime}}\right) \longrightarrow \mathcal{F}\right|_{Z_{\text {étale }}}
$$

is an isomorphism. Moreover,

$$
\left.R^{i} f_{*} \mathcal{F}\right|_{V_{\text {étale }}^{\prime}} ^{\prime}=R^{i}\left(f^{\prime}\right)_{\text {small }, *}\left(\left.\mathcal{F}\right|_{Z_{\text {étale }}^{\prime}}\right)
$$

and

$$
\left.R^{i} f_{*} \mathcal{F}\right|_{V_{\text {etale }}}=R^{i}\left(f^{\prime \prime}\right)_{\text {small }, *}\left(\left.\mathcal{F}\right|_{Z_{\text {etale }}}\right)
$$

by Sheaves on Stacks, Lemma 78.21.3. Hence we see that the comparison map

$$
c_{\psi}:\left.b_{\text {small }}^{*}\left(\left.R^{i} f_{*} \mathcal{F}\right|_{V_{\text {étale }}^{\prime}} ^{\prime}\right) \longrightarrow R^{i} f_{*} \mathcal{F}\right|_{V_{\text {étale }}}
$$

is an isomorphism by Cohomology of Spaces, Lemma 56.10.1. Thus $R^{i} f_{*} \mathcal{F}$ has the flat base change property. Since $R^{i} f_{*} \mathcal{F}$ is locally quasi-coherent by Lemma 84.6.2 we win.

0771 Proposition 84.7.4. Summary of results on locally quasi-coherent modules having the flat base change property.
(1) Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{F}$ is an object of $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ which is locally quasi-coherent and has the flat base change property, then $\mathcal{F}$ is a sheaf for the fppf topology, i.e., it is an object of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$.
(2) The category of modules which are locally quasi-coherent and have the flat base change property is a weak Serre subcategory $\mathcal{M}_{\mathcal{X}}$ of both $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ and $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$.
(3) Pullback $f^{*}$ along any morphism of algebraic stacks $f: \mathcal{X} \rightarrow \mathcal{Y}$ induces a functor $f^{*}: \mathcal{M}_{\mathcal{Y}} \rightarrow \mathcal{M}_{\mathcal{X}}$.
(4) If $f: \mathcal{X} \rightarrow \mathcal{Y}$ is a quasi-compact and quasi-separated morphism of algebraic stacks and $\mathcal{F}$ is an object of $\mathcal{M}_{\mathcal{X}}$, then
(a) the derived direct image $R f_{*} \mathcal{F}$ and the higher direct images $R^{i} f_{*} \mathcal{F}$ can be computed in either the étale or the fppf topology with the same result, and
(b) each $R^{i} f_{*} \mathcal{F}$ is an object of $\mathcal{M}_{\mathcal{Y}}$.
(5) The category $\mathcal{M}_{\mathcal{X}}$ has colimits and they agree with colimits in $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ as well as in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$.

Proof. Part (1) is Sheaves on Stacks, Lemma 78.22.1
Part (2) for the embedding $\mathcal{M}_{\mathcal{X}} \subset \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ we have seen in the proof of Lemma 84.7.3 Let us prove (2) for the embedding $\mathcal{M}_{\mathcal{X}} \subset \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism between objects of $\mathcal{M}_{\mathcal{X}}$. Since $\operatorname{Ker}(\varphi)$ is the same whether computed in the étale or the fppf topology, we see that $\operatorname{Ker}(\varphi)$ is in $\mathcal{M}_{\mathcal{X}}$ by the étale case. On the other hand, the cokernel computed in the fppf topology is the fppf sheafification of the cokernel computed in the étale topology. However,
this étale cokernel is in $\mathcal{M}_{\mathcal{X}}$ hence an fppf sheaf by (1) and we see that the cokernel is in $\mathcal{M}_{\mathcal{X}}$. Finally, suppose that

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

is an exact sequence in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ (i.e., using the fppf topology) with $\mathcal{F}_{1}, \mathcal{F}_{2}$ in $\mathcal{M}_{\mathcal{X}}$. In order to show that $\mathcal{F}_{2}$ is an object of $\mathcal{M}_{\mathcal{X}}$ it suffices to show that the sequence is also exact in the étale topology. To do this it suffices to show that any element of $H_{f p p f}^{1}\left(x, \mathcal{F}_{1}\right)$ becomes zero on the members of an étale covering of $x$ (for any object $x$ of $\mathcal{X})$. This is true because $H_{f p p f}^{1}\left(x, \mathcal{F}_{1}\right)=H_{\text {étale }}^{1}\left(x, \mathcal{F}_{1}\right)$ by Sheaves on Stacks, Lemma 78.22 .2 and because of locality of cohomology, see Cohomology on Sites, Lemma 21.8.3. This proves (2).
Part (3) follows from Lemma 84.7.2 and Sheaves on Stacks, Lemma 78.11.6.
Part (4)(b) for $R^{i} f_{*} \mathcal{F}$ computed in the étale cohomology follows from Lemma 84.7.3. Whereupon part (4)(a) follows from Sheaves on Stacks, Lemma 78.22 .2 combined with (1) above.

Part (5) for the étale topology follows from Sheaves on Stacks, Lemma 78.11.7 and Lemma 84.7.2. The fppf version then follows as the colimit in the étale topology is already an fppf sheaf by part (1).

07AQ Lemma 84.7.5. Let $\mathcal{X}$ be an algebraic stack. With $\mathcal{M}_{\mathcal{X}}$ the category of locally quasi-coherent modules with the flat base change property.
(1) Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {étale }}$. If each $f_{j}^{-1} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_{i}}$, then $\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}}$.
(2) Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {fppf }}$. If each $f_{j}^{-1} \mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_{i}}$, then $\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}}$.

Proof. Part (1) follows from a combination of Lemmas 84.6.1 and 84.7.2 The proof of (2) is analogous to the proof of Lemma 84.6.3. Let $\mathcal{F}$ of a sheaf of $\mathcal{O}_{\mathcal{X}}{ }^{-}$ modules on $\mathcal{X}_{\text {fppf }}$.
First, suppose there is a morphism $a: \mathcal{U} \rightarrow \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^{*} \mathcal{F}$ is locally quasi-coherent and has the flat base change property. Then there is an exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow a_{*} a^{*} \mathcal{F} \rightarrow b_{*} b^{*} \mathcal{F}
$$

where $b$ is the morphism $b: \mathcal{U} \times \mathcal{X} \mathcal{U} \rightarrow \mathcal{X}$, see Sheaves on Stacks, Proposition 78.18 .7 and Lemma 78.18.10. Moreover, the pullback $b^{*} \mathcal{F}$ is the pullback of $a^{*} \mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent and has the flat base change property, see Proposition 84.7.4 The modules $a_{*} a^{*} \mathcal{F}$ and $b_{*} b^{*} \mathcal{F}$ are locally quasi-coherent and have the flat base change property by Proposition 84.7.4. We conclude that $\mathcal{F}$ is locally quasi-coherent and has the flat base change property by Proposition 84.7.4.

Choose a scheme $U$ and a surjective smooth morphism $x: U \rightarrow \mathcal{X}$. By part (1) it suffices to show that $x^{*} \mathcal{F}$ is locally quasi-coherent and has the flat base change property. Again by part (1) it suffices to do this (Zariski) locally on $U$, hence we may assume that $U$ is affine. By Morphisms of Stacks, Lemma 83.18.10 there exists
an fppf covering $\left\{a_{i}: U_{i} \rightarrow U\right\}$ such that each $x \circ a_{i}$ factors through some $f_{j}$. Hence the module $a_{i}^{*} \mathcal{F}$ on $\left(S c h / U_{i}\right)_{f p p f}$ is locally quasi-coherent and has the flat base change property. After refining the covering we may assume $\left\{U_{i} \rightarrow U\right\}_{i=1, \ldots, n}$ is a standard fppf covering. Then $x^{*} \mathcal{F}$ is an fppf module on $(S c h / U)_{f p p f}$ whose pullback by the morphism $a: U_{1} \amalg \ldots \amalg U_{n} \rightarrow U$ is locally quasi-coherent and has the flat base change property. Hence by the previous paragraph we see that $x^{*} \mathcal{F}$ is locally quasi-coherent and has the flat base change property as desired.

### 84.8. Parasitic modules

0772 The following definition is compatible with Descent, Definition 34.8.1
Definition 84.8.1. Let $\mathcal{X}$ be an algebraic stack. A presheaf of $\mathcal{O}_{\mathcal{X}}$-modules $\mathcal{F}$ is parasitic if we have $\mathcal{F}(x)=0$ for any object $x$ of $\mathcal{X}$ which lies over a scheme $U$ such that the corresponding morphism $x: U \rightarrow \mathcal{X}$ is flat.

Here is a lemma with some properties of this notion.
0774 Lemma 84.8.2. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules.
(1) If $\mathcal{F}$ is parasitic and $g: \mathcal{Y} \rightarrow \mathcal{X}$ is a flat morphism of algebraic stacks, then $g^{*} \mathcal{F}$ is parasitic.
(2) For $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$ we have
(a) the $\tau$ sheafification of a parasitic presheaf of modules is parasitic, and
(b) the full subcategory of $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$ consisting of parasitic modules is a Serre subcategory.
(3) Suppose $\mathcal{F}$ is a sheaf for the étale topology. Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}|=\bigcup_{i}\left|f_{i}\right|\left(\left|\mathcal{X}_{i}\right|\right)$. If each $f_{i}^{*} \mathcal{F}$ is parasitic then so is $\mathcal{F}$.
(4) Suppose $\mathcal{F}$ is a sheaf for the fppf topology. Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks such that $|\mathcal{X}|=\bigcup_{i}\left|f_{i}\right|\left(\left|\mathcal{X}_{i}\right|\right)$. If each $f_{i}^{*} \mathcal{F}$ is parasitic then so is $\mathcal{F}$.

Proof. To see part (1) let $y$ be an object of $\mathcal{Y}$ which lies over a scheme $V$ such that the corresponding morphism $y: V \rightarrow \mathcal{Y}$ is flat. Then $g(y): V \rightarrow \mathcal{Y} \rightarrow \mathcal{X}$ is flat as a composition of flat morphisms (see Morphisms of Stacks, Lemma 83.17.2 hence $\mathcal{F}(g(y))$ is zero by assumption. Since $g^{*} \mathcal{F}=g^{-1} \mathcal{F}(y)=\mathcal{F}(g(y))$ we conclude $g^{*} \mathcal{F}$ is parasitic.

To see part (2)(a) note that if $\left\{x_{i} \rightarrow x\right\}$ is a $\tau$-covering of $\mathcal{X}$, then each of the morphisms $x_{i} \rightarrow x$ lies over a flat morphism of schemes. Hence if $x$ lies over a scheme $U$ such that $x: U \rightarrow \mathcal{X}$ is flat, so do all of the objects $x_{i}$. Hence the presheaf $\mathcal{F}^{+}$(see Sites, Section 7.10) is parasitic if the presheaf $\mathcal{F}$ is parasitic. This proves (2)(a) as the sheafification of $\mathcal{F}$ is $\left(\mathcal{F}^{+}\right)^{+}$.

Let $\mathcal{F}$ be a parasitic $\tau$-module. It is immediate from the definitions that any submodule of $\mathcal{F}$ is parasitic. On the other hand, if $\mathcal{F}^{\prime} \subset \mathcal{F}$ is a submodule, then it is equally clear that the presheaf $x \mapsto \mathcal{F}(x) / \mathcal{F}^{\prime}(x)$ is parasitic. Hence the quotient $\mathcal{F} / \mathcal{F}^{\prime}$ is a parasitic module by $(2)(\mathrm{a})$. Finally, we have to show that given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ with $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ parasitic, then $\mathcal{F}_{2}$ is parasitic. This follows immediately on evaluating on $x$ lying over a scheme flat over $\mathcal{X}$. This proves $(2)(\mathrm{b})$, see Homology, Lemma 12.9.2.

Let $f_{i}: \mathcal{X}_{i} \rightarrow \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_{i}^{*} \mathcal{F}$ is parasitic. Let $x$ be an object of $\mathcal{X}$ which lies over a scheme $U$ such that $x: U \rightarrow \mathcal{X}$ is flat. Consider a surjective smooth covering $W_{i} \rightarrow U \times_{x, \mathcal{X}} \mathcal{X}_{i}$. Denote $y_{i}: W_{i} \rightarrow \mathcal{X}_{i}$ the projection. It follows that $\left\{f_{i}\left(y_{i}\right) \rightarrow x\right\}$ is a covering for the smooth topology on $\mathcal{X}$. Since a composition of flat morphisms is flat we see that $f_{i}^{*} \mathcal{F}\left(y_{i}\right)=0$. On the other hand, as we saw in the proof of (1), we have $f_{i}^{*} \mathcal{F}\left(y_{i}\right)=\mathcal{F}\left(f_{i}\left(y_{i}\right)\right)$. Hence we see that for some smooth covering $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ in $\mathcal{X}$ we have $\mathcal{F}\left(x_{i}\right)=0$. This implies $\mathcal{F}(x)=0$ because the smooth topology is the same as as the étale topology, see More on Morphisms, Lemma 36.28.7. Namely, $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ lies over a smooth covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of schemes. By the lemma just referenced there exists an étale covering $\left\{V_{j} \rightarrow U\right\}_{j \in J}$ which refines $\left\{U_{i} \rightarrow U\right\}_{i \in I}$. Denote $x_{j}^{\prime}=\left.x\right|_{V_{j}}$. Then $\left\{x_{j}^{\prime} \rightarrow x\right\}$ is an étale covering in $\mathcal{X}$ refining $\left\{x_{i} \rightarrow x\right\}_{i \in I}$. This means the map $\mathcal{F}(x) \rightarrow \prod_{j \in J} \mathcal{F}\left(x_{j}^{\prime}\right)$, which is injective as $\mathcal{F}$ is a sheaf in the étale topology, factors through $\mathcal{F}(x) \rightarrow \prod_{i \in I} \mathcal{F}\left(x_{i}\right)$ which is zero. Hence $\mathcal{F}(x)=0$ as desired.
Proof of (4): omitted. Hint: similar, but simpler, than the proof of (3).
Parasitic modules are preserved under absolutely any pushforward.
0775 Lemma 84.8.3. Let $\tau \in\{$ étale, fppf\}. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be $a$ parasitic object of $\operatorname{Mod}\left(\mathcal{X}_{\tau}, \mathcal{O}_{\mathcal{X}}\right)$.
(1) $H_{\tau}^{i}(\mathcal{X}, \mathcal{F})=0$ for all $i$.
(2) Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Then $R^{i} f_{*} \mathcal{F}$ (computed in $\tau$-topology) is a parasitic object of $\operatorname{Mod}\left(\mathcal{Y}_{\tau}, \mathcal{O}_{\mathcal{Y}}\right)$.

Proof. We first reduce (2) to (1). By Sheaves on Stacks, Lemma 78.20.2 we see that $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf

$$
y \longmapsto H_{\tau}^{i}\left(V \times_{y, \mathcal{Y}} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{F}\right)
$$

Here $y$ is a typical object of $\mathcal{Y}$ lying over the scheme $V$. By Lemma84.8.2 it suffices to show that these cohomology groups are zero when $y: V \rightarrow \mathcal{Y}$ is flat. Note that pr : $V \times_{y, \mathcal{Y}} \mathcal{X} \rightarrow \mathcal{X}$ is flat as a base change of $y$. Hence by Lemma 84.8.2 we see that $\mathrm{pr}^{-1} \mathcal{F}$ is parasitic. Thus it suffices to prove (1).

To see (1) we can use the spectral sequence of Sheaves on Stacks, Proposition 78.19.1 to reduce this to the case where $\mathcal{X}$ is an algebraic stack representable by an algebraic space. Note that in the spectral sequence each $f_{p}^{-1} \mathcal{F}=f_{p}^{*} \mathcal{F}$ is a parasitic module by Lemma 84.8 .2 because the morphisms $f_{p}: \mathcal{U}_{p}=\mathcal{U} \times{ }_{\mathcal{X}} \ldots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ are flat. Reusing this spectral sequence one more time (as in the proof of the key Lemma 84.5.1) we reduce to the case where the algebraic stack $\mathcal{X}$ is representable by a scheme $X$. Then $H_{\tau}^{i}(\mathcal{X}, \mathcal{F})=H^{i}\left((S c h / X)_{\tau}, \mathcal{F}\right)$. In this case the vanishing follows easily from an argument with Čech coverings, see Descent, Lemma 34.8.2.

The following lemma is one of the major reasons we care about parasitic modules. To understand the statement, recall that the functors $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ and $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ aren't exact in general.

0776 Lemma 84.8.4. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}^{\bullet}$ be an exact complex in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$. Then the cohomology sheaves of $\mathcal{F}^{\bullet}$ in either the étale or the fppf topology are parasitic $\mathcal{O}_{\mathcal{X}}$-modules.

Proof. Let $x: U \rightarrow \mathcal{X}$ be a flat morphism where $U$ is a scheme. Then $x^{*} \mathcal{F}^{\bullet}$ is exact by Lemma 84.4.1. Hence the restriction $\left.x^{*} \mathcal{F}^{\bullet}\right|_{U_{\text {étale }}}$ is exact which is what we had to prove.

### 84.9. Quasi-coherent modules, I

0777 We have seen that the category of quasi-coherent modules on an algebraic stack is equivalent to the category of quasi-coherent modules on a presentation, see Sheaves on Stacks, Section 78.14. This fact is the basis for the following.

0778 Lemma 84.9.1. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}}$ be the category of locally quasi-coherent modules with the flat base change property, see Proposition 84.7.4. The inclusion functor $i: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \mathcal{M}_{\mathcal{X}}$ has a right adjoint

$$
Q: \mathcal{M}_{\mathcal{X}} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

such that $Q \circ i$ is the identity functor.
Proof. Choose a scheme $U$ and a surjective smooth morphism $f: U \rightarrow \mathcal{X}$. Set $R=U \times_{\mathcal{X}} U$ so that we obtain a smooth groupoid ( $U, R, s, t, c$ ) in algebraic spaces with the property that $\mathcal{X}=[U / R]$, see Algebraic Stacks, Lemma 76.16.2. We may and do replace $\mathcal{X}$ by $[U / R]$. In the proof of Sheaves on Stacks, Proposition 78.13.1 we constructed a functor

$$
q_{1}: Q \operatorname{Coh}(U, R, s, t, c) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

The construction of the inverse functor in the proof of Sheaves on Stacks, Proposition 78.13.1 works for objects of $\mathcal{M}_{\mathcal{X}}$ and induces a functor

$$
q_{2}: \mathcal{M}_{\mathcal{X}} \longrightarrow Q \operatorname{Coh}(U, R, s, t, c)
$$

Namely, if $\mathcal{F}$ is an object of $\mathcal{M}_{\mathcal{X}}$ the we set

$$
q_{2}(\mathcal{F})=\left(\left.f^{*} \mathcal{F}\right|_{U_{\text {etale }}}, \alpha\right)
$$

where $\alpha$ is the isomorphism

$$
\left.\left.t_{\text {small }}^{*}\left(\left.f^{*} \mathcal{F}\right|_{U_{\text {étale }}}\right) \rightarrow t^{*} f^{*} \mathcal{F}\right|_{R_{\text {etale }}} \rightarrow s^{*} f^{*} \mathcal{F}\right|_{R_{\text {etale }}} \rightarrow s_{\text {small }}^{*}\left(\left.f^{*} \mathcal{F}\right|_{U_{\text {etale }}}\right)
$$

where the outer two morphisms are the comparison maps. Note that $q_{2}(\mathcal{F})$ is quasi-coherent precisely because $\mathcal{F}$ is locally quasi-coherent (and we used the flat base change property in the construction of the descent datum $\alpha$ ). We omit the verification that the cocycle condition (see Groupoids in Spaces, Definition 65.12.1) holds. We define $Q=q_{1} \circ q_{2}$. Let $\mathcal{F}$ be an object of $\mathcal{M}_{\mathcal{X}}$ and let $\mathcal{G}$ be an object of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$. We have

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{M}_{\mathcal{X}}}(i(\mathcal{G}), \mathcal{F}) & =\operatorname{Mor}_{Q \operatorname{Coh}(U, R, s, t, c)}\left(q_{2}(\mathcal{G}), q_{2}(\mathcal{F})\right) \\
& =\operatorname{Mor}_{Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)}(\mathcal{G}, Q(\mathcal{F}))
\end{aligned}
$$

where the first equality is Sheaves on Stacks, Lemma 78.13 .2 and the second equality holds because $q_{1}$ and $q_{2}$ are inverse equivalences of categories. The assertion $Q \circ i \cong$ id is a formal consequence of the fact that $i$ is fully faithful.

0779 Lemma 84.9.2. Let $\mathcal{X}$ be an algebraic stack. Let $Q: \mathcal{M}_{\mathcal{X}} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ be the functor constructed in Lemma 84.9.1.
(1) The kernel of $Q$ is exactly the collection of parasitic objects of $\mathcal{M}_{\mathcal{X}}$.
(2) For any object $\mathcal{F}$ of $\mathcal{M}_{\mathcal{X}}$ both the kernel and the cokernel of the adjunction map $Q(\mathcal{F}) \rightarrow \mathcal{F}$ are parasitic.
(3) The functor $Q$ is exact.

Proof. Write $\mathcal{X}=[U / R]$ as in the proof of Lemma 84.9.1. Let $\mathcal{F}$ be an object of $\mathcal{M}_{\mathcal{X}}$. It is clear from the proof of Lemma 84.9.1 that $\mathcal{F}$ is in the kernel of $Q$ if and only if $\left.\mathcal{F}\right|_{U_{\text {étale }}}=0$. In particular, if $\mathcal{F}$ is parasitic then $\mathcal{F}$ is in the kernel. Next, let $x: V \rightarrow \mathcal{X}$ be a flat morphism, where $V$ is a scheme. Set $W=V \times_{\mathcal{X}} U$ and consider the diagram

Note that the projection $p: W \rightarrow U$ is flat and the projection $q: W \rightarrow V$ is smooth and surjective. This implies that $q_{s m a l l}^{*}$ is a faithful functor on quasi-coherent modules. By assumption $\mathcal{F}$ has the flat base change property so that we obtain $\left.\left.p_{\text {small }}^{*} \mathcal{F}\right|_{U_{\text {étale }}} \cong q_{\text {small }}^{*} \mathcal{F}\right|_{V_{\text {étale }}}$. Thus if $\mathcal{F}$ is in the kernel of $Q$, then $\left.\mathcal{F}\right|_{V_{\text {étale }}}=0$ which completes the proof of (1).

Part (2) follows from the discussion above and the fact that the map $Q(\mathcal{F}) \rightarrow \mathcal{F}$ becomes an isomorphism after restricting to $U_{\text {étale }}$.
To see part (3) note that $Q$ is left exact as a right adjoint. Suppose that $0 \rightarrow \mathcal{F} \rightarrow$ $\mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$ is a short exact sequence in $\mathcal{M}_{\mathcal{X}}$. Let $\mathcal{E}=\operatorname{Coker}(Q(\mathcal{G}) \rightarrow Q(\mathcal{H}))$ in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$. Since $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \mathcal{M}_{\mathcal{X}}$ is a left adjoint it is right exact. Hence we see that $Q(\mathcal{G}) \rightarrow Q(\mathcal{H}) \rightarrow \mathcal{E} \rightarrow 0$ is exact in $\mathcal{M}_{\mathcal{X}}$. Using Lemma 84.8.4 we find that the top row of the following commutative diagram has parasitic cohomology sheaves at $Q(\mathcal{F})$ and $Q(\mathcal{G})$ :

The bottom row is exact and the vertical arrows $a, b, c$ have parasitic kernel and cokernels by part (2). It follows that $\mathcal{E}$ is parasitic: in the quotient category of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right) /$ Parasitic (see Homology, Lemma 12.9 .6 and Lemma 84.8.2) we see that $a, b, c$ are isomorphisms and that the top row becomes exact. As it is also quasicoherent, we conclude that $\mathcal{E}$ is zero because $\mathcal{E}=Q(\mathcal{E})=0$ by part (1).

### 84.10. Pushforward of quasi-coherent modules

Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. Consider the pushforward

$$
f_{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

It turns out that this functor almost never preserves the subcategories of quasicoherent sheaves. For example, consider the morphism of schemes

$$
j: X=\mathbf{A}_{k}^{2} \backslash\{0\} \longrightarrow \mathbf{A}_{k}^{2}=Y
$$

Associated to this we have the corresponding morphism of algebraic stacks

$$
f=j_{b i g}: \mathcal{X}=(S c h / X)_{\text {fppf }} \rightarrow(S c h / Y)_{f p p f}=\mathcal{Y}
$$

The pushforward $f_{*} \mathcal{O}_{\mathcal{X}}$ of the structure sheaf has global sections $k[x, y]$. Hence if $f_{*} \mathcal{O}_{\mathcal{X}}$ is quasi-coherent on $\mathcal{Y}$ then we would have $f_{*} \mathcal{O}_{\mathcal{X}}=\mathcal{O}_{\mathcal{Y}}$. However, consider $T=\operatorname{Spec}(k) \rightarrow \mathbf{A}_{k}^{2}=Y$ mapping to 0 . Then $\Gamma\left(T, f_{*} \mathcal{O}_{\mathcal{X}}\right)=0$ because $X \times_{Y} T=$
$\emptyset$ whereas $\Gamma\left(T, \mathcal{O}_{\mathcal{Y}}\right)=k$. On the positive side, we know from Cohomology of Schemes, Lemma 29.5.2 that for any flat morphism $T \rightarrow Y$ we have the equality $\Gamma\left(T, f_{*} \mathcal{O}_{\mathcal{X}}\right)=\Gamma\left(T, \mathcal{O}_{\mathcal{Y}}\right)$ (this uses that $j$ is quasi-compact and quasi-separated).
Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. We work around the problem mentioned above using the following three observations:
(1) $f_{*}$ does preserve locally quasi-coherent modules (Lemma 84.6.2),
(2) $f_{*}$ transforms a quasi-coherent sheaf into a locally quasi-coherent sheaf whose flat comparison maps are isomorphisms (Lemma 84.7.3), and
(3) locally quasi-coherent $\mathcal{O}_{\mathcal{Y}}$-modules with the flat base change property give rise to quasi-coherent modules on a presentation of $\mathcal{Y}$ and hence quasicoherent modules on $\mathcal{Y}$, see Sheaves on Stacks, Section 78.14
Thus we obtain a functor

$$
f_{Q \operatorname{Coh}, *}: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

which is a right adjoint to $f^{*}: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ such that moreover

$$
\Gamma\left(y, f_{*} \mathcal{F}\right)=\Gamma\left(y, f_{Q C o h, *} \mathcal{F}\right)
$$

for any $y \in \operatorname{Ob}(\mathcal{Y})$ such that the associated 1-morphism $y: V \rightarrow \mathcal{Y}$ is flat, see (insert future reference here). Moreover, a similar construction will produce functors $R^{i} f_{Q C o h, *}$. However, these results will not be sufficient to produce a total direct image functor (of complexes with quasi-coherent cohomology sheaves).

077A Proposition 84.10.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor $f^{*}: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ has a right adjoint

$$
f_{Q C o h, *}: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

which can be defined as the composition

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \mathcal{M}_{\mathcal{X}} \xrightarrow{f_{*}} \mathcal{M}_{\mathcal{Y}} \xrightarrow{Q} Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

where the functors $f_{*}$ and $Q$ are as in Proposition 84.7.4 and Lemma 84.9.1. Moreover, if we define $R^{i} f_{Q C o h, *}$ as the composition

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \mathcal{M}_{\mathcal{X}} \xrightarrow{R^{i} f_{*}} \mathcal{M}_{\mathcal{Y}} \xrightarrow{Q} Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

then the sequence of functors $\left\{R^{i} f_{Q C o h, *}\right\}_{i \geq 0}$ forms a cohomological $\delta$-functor.
Proof. This is a combination of the results mentioned in the statement. The adjointness can be shown as follows: Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module and let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{\mathcal{Y}}$-module. Then we have

$$
\begin{aligned}
\operatorname{Mor}_{Q C o h\left(\mathcal{O}_{\mathcal{X}}\right)}\left(f^{*} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{\mathcal{M}_{\mathcal{Y}}}\left(\mathcal{G}, f_{*} \mathcal{F}\right) \\
& =\operatorname{Mor}_{Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(\mathcal{G}, Q\left(f_{*} \mathcal{F}\right)\right) \\
& =\operatorname{Mor}_{Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(\mathcal{G}, f_{Q C o h, *} \mathcal{F}\right)
\end{aligned}
$$

the first equality by adjointness of $f_{*}$ and $f^{*}$ (for arbitrary sheaves of modules). By Proposition 84.7.4 we see that $f_{*} \mathcal{F}$ is an object of $\mathcal{M}_{\mathcal{Y}}$ (and can be computed in either the fppf or étale topology) and we obtain the second equality by Lemma 84.9.1. The third equality is the definition of $f_{Q C o h, *}$.

To see that $\left\{R^{i} f_{Q C o h, *}\right\}_{i \geq 0}$ is a cohomological $\delta$-functor as defined in Homology, Definition 12.11.1 let

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

be a short exact sequence of $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$. This sequence may not be an exact sequence in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ but we know that it is up to parasitic modules, see Lemma 84.8.4. Thus we may break up the sequence into short exact sequences

$$
\begin{aligned}
& 0 \rightarrow \mathcal{P}_{1} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{I}_{2} \rightarrow 0 \\
& 0 \rightarrow \mathcal{I}_{2} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{Q}_{2} \rightarrow 0 \\
& 0 \rightarrow \mathcal{P}_{2} \rightarrow \mathcal{Q}_{2} \rightarrow \mathcal{I}_{3} \rightarrow 0 \\
& 0 \rightarrow \mathcal{I}_{3} \rightarrow \mathcal{F}_{3} \rightarrow \mathcal{P}_{3} \rightarrow 0
\end{aligned}
$$

of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ with $\mathcal{P}_{i}$ parasitic. Note that each of the sheaves $\mathcal{P}_{j}, \mathcal{I}_{j}, \mathcal{Q}_{j}$ is an object of $\mathcal{M}_{\mathcal{X}}$, see Proposition 84.7.4. Applying $R^{i} f_{*}$ we obtain long exact sequences

$$
\begin{aligned}
& 0 \rightarrow f_{*} \mathcal{P}_{1} \rightarrow f_{*} \mathcal{F}_{1} \rightarrow f_{*} \mathcal{I}_{2} \rightarrow R^{1} f_{*} \mathcal{P}_{1} \rightarrow \ldots \\
& 0 \rightarrow f_{*} \mathcal{I}_{2} \rightarrow f_{*} \mathcal{F}_{2} \rightarrow f_{*} \mathcal{Q}_{2} \rightarrow R^{1} f_{*} \mathcal{I}_{2} \rightarrow \ldots \\
& 0 \rightarrow f_{*} \mathcal{P}_{2} \rightarrow f_{*} \mathcal{Q}_{2} \rightarrow f_{*} \mathcal{I}_{3} \rightarrow R^{1} f_{*} \mathcal{P}_{2} \rightarrow \ldots \\
& 0 \rightarrow f_{*} \mathcal{I}_{3} \rightarrow f_{*} \mathcal{F}_{3} \rightarrow f_{*} \mathcal{P}_{3} \rightarrow R^{1} f_{*} \mathcal{I}_{3} \rightarrow \ldots
\end{aligned}
$$

where are the terms are objects of $\mathcal{M}_{\mathcal{Y}}$ by Proposition84.7.4. By Lemma 84.8.3 the sheaves $R^{i} f_{*} \mathcal{P}_{j}$ are parasitic, hence vanish on applying the functor $Q$, see Lemma 84.9.2. Since $Q$ is exact the maps

$$
Q\left(R^{i} f_{*} \mathcal{F}_{3}\right) \cong Q\left(R^{i} f_{*} \mathcal{I}_{3}\right) \cong Q\left(R^{i} f_{*} \mathcal{Q}_{2}\right) \rightarrow Q\left(R^{i+1} f_{*} \mathcal{I}_{2}\right) \cong Q\left(R^{i+1} f_{*} \mathcal{F}_{1}\right)
$$

can serve as the connecting map which turns the family of functors $\left\{R^{i} f_{Q C o h, *}\right\}_{i \geq 0}$ into a cohomological $\delta$-functor.

0782 Lemma 84.10.2. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then there exists a spectral sequence with $E_{2}$-page

$$
E_{2}^{p, q}=H^{p}\left(\mathcal{Y}, R^{q} f_{Q C o h, *} \mathcal{F}\right)
$$

converging to $H^{p+q}(\mathcal{X}, \mathcal{F})$.
Proof. By Cohomology on Sites, Lemma 21.14.5 the Leray spectral sequence with

$$
E_{2}^{p, q}=H^{p}\left(\mathcal{Y}, R^{q} f_{*} \mathcal{F}\right)
$$

converges to $H^{p+q}(\mathcal{X}, \mathcal{F})$. The kernel and cokernel of the adjunction map

$$
R^{q} f_{Q C o h, *} \mathcal{F} \longrightarrow R^{q} f_{*} \mathcal{F}
$$

are parasitic modules on $\mathcal{Y}$ (Lemma 84.9.2 hence have vanishing cohomology (Lemma 84.8.3). It follows formally that $H^{p}\left(\mathcal{Y}, R^{q} f_{Q C o h, *} \mathcal{F}\right)=H^{p}\left(\mathcal{Y}, R^{q} f_{*} \mathcal{F}\right)$ and we win.

0783 Lemma 84.10.3. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be quasi-compact and quasiseparated morphisms of algebraic stacks. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then there exists a spectral sequence with $E_{2}$-page

$$
E_{2}^{p, q}=R^{p} g_{Q C o h, *}\left(R^{q} f_{Q C o h, *} \mathcal{F}\right)
$$

converging to $R^{p+q}(g \circ f)_{Q C o h, *} \mathcal{F}$.

Proof. By Cohomology on Sites, Lemma 21.14 .7 the Leray spectral sequence with

$$
E_{2}^{p, q}=R^{p} g_{*}\left(R^{q} f_{*} \mathcal{F}\right)
$$

converges to $R^{p+q}(g \circ f)_{*} \mathcal{F}$. By the results of Proposition 84.7.4 all the terms of this spectral sequence are objects of $\mathcal{M}_{\mathcal{Z}}$. Applying the exact functor $Q_{\mathcal{Z}}$ : $\mathcal{M}_{\mathcal{Z}} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Z}}\right)$ we obtain a spectral sequence in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Z}}\right)$ covering to $R^{p+q}(g \circ$ $f)_{Q C o h, *} \mathcal{F}$. Hence the result follows if we can show that

$$
Q_{\mathcal{Z}}\left(R^{p} g_{*}\left(R^{q} f_{*} \mathcal{F}\right)\right)=Q_{\mathcal{Z}}\left(R^{p} g_{*}\left(Q_{\mathcal{X}}\left(R^{q} f_{*} \mathcal{F}\right)\right)\right.
$$

This follows from the fact that the kernel and cokernel of the map

$$
Q_{\mathcal{X}}\left(R^{q} f_{*} \mathcal{F}\right) \longrightarrow R^{q} f_{*} \mathcal{F}
$$

are parasitic (Lemma 84.9.2) and that $R^{p} g_{*}$ transforms parasitic modules into parasitic modules (Lemma 84.8.3).

To end this section we make explicit the spectral sequences associated to a smooth covering by a scheme. Please compare with Sheaves on Stacks, Sections 78.19 and 78.20 .

0784 Proposition 84.10.4. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ be a morphism of algebraic stacks. Assume $f$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module. Then there is a spectral sequence

$$
E_{2}^{p, q}=H^{q}\left(\mathcal{U}_{p}, f_{p}^{*} \mathcal{F}\right) \Rightarrow H^{p+q}(\mathcal{X}, \mathcal{F})
$$

where $f_{p}$ is the morphism $\mathcal{U} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ ( $p+1$ factors ).
Proof. This is a special case of Sheaves on Stacks, Proposition 78.19.1.
0785 Proposition 84.10.5. Let $f: \mathcal{U} \rightarrow \mathcal{X}$ and $g: \mathcal{X} \rightarrow \mathcal{Y}$ be composable morphisms of algebraic stacks. Assume that
(1) $f$ is representable by algebraic spaces, surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated, and
(2) $g$ is quasi-compact and quasi-separated.

If $\mathcal{F}$ is in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ then there is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{Q C o h, *} f_{p}^{*} \mathcal{F} \Rightarrow R^{p+q} g_{Q C o h, *} \mathcal{F}
$$

in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)$.
Proof. Note that each of the morphisms $f_{p}: \mathcal{U} \times \mathcal{X} \ldots \times_{\mathcal{X}} \mathcal{U} \rightarrow \mathcal{X}$ is quasi-compact and quasi-separated, hence $g \circ f_{p}$ is quasi-compact and quasi-separated, hence the assertion makes sense (i.e., the functors $R^{q}\left(g \circ f_{p}\right)_{Q C o h, *}$ are defined). There is a spectral sequence

$$
E_{2}^{p, q}=R^{q}\left(g \circ f_{p}\right)_{*} f_{p}^{-1} \mathcal{F} \Rightarrow R^{p+q} g_{*} \mathcal{F}
$$

by Sheaves on Stacks, Proposition 78.20.1. Applying the exact functor $Q_{\mathcal{Y}}: \mathcal{M}_{\mathcal{Y}} \rightarrow$ $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)$ gives the desired spectral sequence in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{Y}}\right)$.

### 84.11. The lisse-étale and the flat-fppf sites

0786 In the book LMB00] many of the results above are proved using the lisse-étale site of an algebraic stack. We define this site here. In Examples, Section 88.50 we show that the lisse-étale site isn't functorial. We also define its analogue, the flat-fppf site, which is better suited to the development of algebraic stacks as given in the stacks project (because we use the fppf topology as our base topology). Of course the flat-fppf site isn't functorial either.
0787 Definition 84.11.1. Let $\mathcal{X}$ be an algebraic stack.
(1) The lisse-étale site of $\mathcal{X}$ is the full subcategory $\mathcal{X}_{\text {lisse,étale }}{ }^{2}$ of $\mathcal{X}$ whose objects are those $x \in \operatorname{Ob}(\mathcal{X})$ lying over a scheme $U$ such that $x: U \rightarrow \mathcal{X}$ is smooth. A covering of $\mathcal{X}_{\text {lisse, étale }}$ is a family of morphisms $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ of $\mathcal{X}_{\text {lisse,étale }}$ which forms a covering of $\mathcal{X}_{\text {étale }}$.
(2) The flat-fppf site of $\mathcal{X}$ is the full subcategory $\mathcal{X}_{\text {flat,fppf }}$ of $\mathcal{X}$ whose objects are those $x \in \operatorname{Ob}(\mathcal{X})$ lying over a scheme $U$ such that $x: U \rightarrow \mathcal{X}$ is flat. A covering of $\mathcal{X}_{\text {flat,fppf }}$ is a family of morphisms $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ of $\mathcal{X}_{\text {flat,fppf }}$ which forms a covering of $\mathcal{X}_{\text {fppf }}$.
We denote $\mathcal{O}_{\mathcal{X}_{\text {lisse,etale }}}$ the restriction of $\mathcal{O}_{\mathcal{X}}$ to the lisse-étale site and similarly for $\mathcal{O}_{\mathcal{X}_{f l a t, f p p f}}$. The relationship between the lisse-étale site and the étale site is as follows (we mainly stick to "topological" properties in this lemma).
0788 Lemma 84.11.2. Let $\mathcal{X}$ be an algebraic stack.
(1) The inclusion functor $\mathcal{X}_{\text {lisse,étale }} \rightarrow \mathcal{X}_{\text {étale }}$ is fully faithful, continuous and cocontinuous. It follows that
(a) there is a morphism of topoi

$$
g: S h\left(\mathcal{X}_{\text {lisse,étale }}\right) \longrightarrow S h\left(\mathcal{X}_{\text {étale }}\right)
$$

with $g^{-1}$ given by restriction,
(b) the functor $g^{-1}$ has a left adjoint $g_{!}^{S h}$ on sheaves of sets,
(c) the adjunction maps $g^{-1} g_{*} \rightarrow$ id and $i d \rightarrow g^{-1} g_{!}^{S h}$ are isomorphisms,
(d) the functor $g^{-1}$ has a left adjoint $g$ ! on abelian sheaves,
(e) the adjunction map id $\rightarrow g^{-1} g$ ! is an isomorphism, and
(f) we have $g^{-1} \mathcal{O}_{\mathcal{X}}=\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}$ hence $g$ induces a flat morphism of ringed topoi such that $g^{-1}=g^{*}$.
(2) The inclusion functor $\mathcal{X}_{\text {flat,fppf }} \rightarrow \mathcal{X}_{\text {fppf }}$ is fully faithful, continuous and cocontinuous. It follows that
(a) there is a morphism of topoi

$$
g: S h\left(\mathcal{X}_{f l a t, f p p f}\right) \longrightarrow \operatorname{Sh}\left(\mathcal{X}_{f p p f}\right)
$$

with $g^{-1}$ given by restriction,
(b) the functor $g^{-1}$ has a left adjoint $g_{!}^{S h}$ on sheaves of sets,
(c) the adjunction maps $g^{-1} g_{*} \rightarrow$ id and $i d \rightarrow g^{-1} g_{!}^{S h}$ are isomorphisms,
(d) the functor $g^{-1}$ has a left adjoint $g$ ! on abelian sheaves,
(e) the adjunction map id $\rightarrow g^{-1} g$ ! is an isomorphism, and
(f) we have $g^{-1} \mathcal{O}_{\mathcal{X}}=\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}$ hence $g$ induces a flat morphism of ringed topoi such that $g^{-1}=g^{*}$.

[^222]Proof. In both cases it is immediate that the functor is fully faithful, continuous, and cocontinuous (see Sites, Definitions 7.14.1 and 7.19.1). Hence properties (a), (b), (c) follow from Sites, Lemmas 7.20.5 and 7.20.7. Parts (d), (e) follow from Modules on Sites, Lemmas 18.16.2 and 18.16.4. Part (f) is immediate.

0789 Lemma 84.11.3. Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemma 84.11.2.
(1) There exists a functor

$$
g_{!}: \operatorname{Mod}\left(\mathcal{X}_{\text {lisse,étale }}, \mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)
$$

which is left adjoint to $g^{*}$. Moreover it agrees with the functor $g_{!}$on abelian sheaves and $g^{*} g_{!}=i d$.
(2) There exists a functor

$$
g_{!}: \operatorname{Mod}\left(\mathcal{X}_{f l a t, f p p f}, \mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{X}_{f p p f}, \mathcal{O}_{\mathcal{X}}\right)
$$

which is left adjoint to $g^{*}$. Moreover it agrees with the functor $g_{!}$on abelian sheaves and $g^{*} g_{!}=i d$.

Proof. In both cases, the existence of the functor $g_{!}$follows from Modules on Sites, Lemma 18.40.1. To see that $g_{\text {! }}$ agrees with the functor on abelian sheaves we will show the maps Modules on Sites, Equation 18.40.2.1 are isomorphisms.
Lisse-étale case. Let $x \in \operatorname{Ob}\left(\mathcal{X}_{\text {lisse,étale }}\right)$ lying over a scheme $U$ with $x: U \rightarrow \mathcal{X}$ smooth. Consider the induced fully faithful functor

$$
g^{\prime}: \mathcal{X}_{\text {lisse,étale }} / x \longrightarrow \mathcal{X}_{\text {étale }} / x
$$

The right hand side is identified with $(S c h / U)_{\text {étale }}$ and the left hand side with the full subcategory of schemes $U^{\prime} / U$ such that the composition $U^{\prime} \rightarrow U \rightarrow \mathcal{X}$ is smooth. Thus Étale Cohomology, Lemma 49.50 .2 applies.
Flat-fppf case. Let $x \in \operatorname{Ob}\left(\mathcal{X}_{\text {flat,fppf }}\right)$ lying over a scheme $U$ with $x: U \rightarrow \mathcal{X}$ flat. Consider the induced fully faithful functor

$$
g^{\prime}: \mathcal{X}_{\text {flat }, \text { fppf }} / x \longrightarrow \mathcal{X}_{f p p f} / x
$$

The right hand side is identified with $(S c h / U)_{\text {fppf }}$ and the left hand side with the full subcategory of schemes $U^{\prime} / U$ such that the composition $U^{\prime} \rightarrow U \rightarrow \mathcal{X}$ is flat. Thus Étale Cohomology, Lemma 49.50 .2 applies.
In both cases the equality $g^{*} g!=$ id follows from $g^{*}=g^{-1}$ and the equality for abelian sheaves in Lemma 84.11.2.

078A Lemma 84.11.4. Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemmas 84.11.2 and 84.11.3.
(1) We have $g_{!} \mathcal{O}_{\mathcal{X}_{\text {lisse }, \text { etale }}}=\mathcal{O}_{\mathcal{X}}$.
(2) We have $g_{!} \mathcal{O}_{\mathcal{X}_{\text {flat }, \text { fppf }}}=\mathcal{O}_{\mathcal{X}}$.

Proof. In this proof we write $\mathcal{C}=\mathcal{X}_{\text {étale }}$ (resp. $\mathcal{C}=\mathcal{X}_{\text {fppf }}$ ) and we denote $\mathcal{C}^{\prime}=$ $\mathcal{X}_{\text {lisse,étale }}\left(\right.$ resp. $\left.\mathcal{C}^{\prime}=\mathcal{X}_{\text {flat,fppf }}\right)$. Then $\mathcal{C}^{\prime}$ is a full subcategory of $\mathcal{C}$. In this proof we will think of objects $V$ of $\mathcal{C}$ as schemes over $\mathcal{X}$ and objects $U$ of $\mathcal{C}^{\prime}$ as schemes smooth (resp. flat) over $\mathcal{X}$. Finally, we write $\mathcal{O}=\mathcal{O}_{\mathcal{X}}$ and $\mathcal{O}^{\prime}=\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}$ (resp. $\mathcal{O}^{\prime}=\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}$ ). In the notation above we have $\mathcal{O}(V)=\Gamma\left(V, \mathcal{O}_{V}\right)$ and $\mathcal{O}^{\prime}(U)=\Gamma\left(U, \mathcal{O}_{U}\right)$. Consider the $\mathcal{O}$-module homomorphism $g!\mathcal{O}^{\prime} \rightarrow \mathcal{O}$ adjoint to the identification $\mathcal{O}^{\prime}=g^{-1} \mathcal{O}$.

Recall that $g_{!} \mathcal{O}^{\prime}$ is the sheaf associated to the presheaf $g_{p!} \mathcal{O}^{\prime}$ given by the rule

$$
V \longmapsto \operatorname{colim}_{V \rightarrow U} \mathcal{O}^{\prime}(U)
$$

where the colimit is taken in the category of abelian groups (Modules on Sites, Definition 18.16.1. Below we will use frequently that if

$$
V \rightarrow U \rightarrow U^{\prime}
$$

are morphisms and if $f^{\prime} \in \mathcal{O}^{\prime}\left(U^{\prime}\right)$ restricts to $f \in \mathcal{O}^{\prime}(U)$, then $(V \rightarrow U, f)$ and $\left(V \rightarrow U^{\prime}, f^{\prime}\right)$ define the same element of the colimit. Also, $g_{!} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$ maps the element $(V \rightarrow U, f)$ simply to the pullback of $f$ to $V$.

To see that $g_{!} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$ is surjective it suffices to show that $1 \in \Gamma(\mathcal{C}, \mathcal{O})$ is locally in the image. Choose an object $U$ of $\mathcal{C}^{\prime}$ corresponding to a surjective smooth morphism $U \rightarrow \mathcal{X}$. Then viewing $U$ both as an object of $\mathcal{C}^{\prime}$ and $\mathcal{C}$ we see that $(U \rightarrow U, 1)$ is an element of the colimit above which maps to $1 \in \mathcal{O}(U)$. Since $U$ surjects onto the final object of $\operatorname{Sh}(\mathcal{C})$ we conclude $g!\mathcal{O}^{\prime} \rightarrow \mathcal{O}$ is surjective.
Suppose that $s \in g_{!} \mathcal{O}^{\prime}(V)$ is a section mapping to zero in $\mathcal{O}(V)$. To finish the proof we have to show that $s$ is zero. After replacing $V$ by the members of a covering we may assume $s$ is an element of the colimit

$$
\operatorname{colim}_{V \rightarrow U} \mathcal{O}^{\prime}(U)
$$

Say $s=\sum\left(\varphi_{i}, s_{i}\right)$ is a finite sum with $\varphi_{i}: V \rightarrow U_{i}, U_{i}$ smooth (resp. flat) over $\mathcal{X}$, and $s_{i} \in \Gamma\left(U_{i}, \mathcal{O}_{U_{i}}\right)$. Choose a scheme $W$ surjective étale over the algebraic space $U=U_{1} \times \mathcal{X} \ldots \times \mathcal{X} U_{n}$. Note that $W$ is still smooth (resp. flat) over $\mathcal{X}$, i.e., defines an object of $\mathcal{C}^{\prime}$. The fibre product

$$
V^{\prime}=V \times{ }_{\left(\varphi_{1}, \ldots, \varphi_{n}\right), U} W
$$

is surjective étale over $V$, hence it suffices to show that $s$ maps to zero in $g_{!} \mathcal{O}^{\prime}\left(V^{\prime}\right)$. Note that the restriction $\left.\sum\left(\varphi_{i}, s_{i}\right)\right|_{V^{\prime}}$ corresponds to the sum of the pullbacks of the functions $s_{i}$ to $W$. In other words, we have reduced to the case of $(\varphi, s)$ where $\varphi: V \rightarrow U$ is a morphism with $U$ in $\mathcal{C}^{\prime}$ and $s \in \mathcal{O}^{\prime}(U)$ restricts to zero in $\mathcal{O}(V)$. By the commutative diagram

we see that $\left((\varphi, 0): V \rightarrow U \times \mathbf{A}^{1}, \operatorname{pr}_{2}^{*} x\right)$ represents zero in the colimit above. Hence we may replace $U$ by $U \times \mathbf{A}^{1}, \varphi$ by $(\varphi, 0)$ and $s$ by $\operatorname{pr}_{1}^{*} s+\operatorname{pr}_{2}^{*} x$. Thus we may assume that the vanishing locus $Z: s=0$ in $U$ of $s$ is smooth (resp. flat) over $\mathcal{X}$. Then we see that $(V \rightarrow Z, 0)$ and $(\varphi, s)$ have the same value in the colimit, i.e., we see that the element $s$ is zero as desired.

The lisse-étale and the flat-fppf sites can be used to characterize parasitic modules as follows.

07AR Lemma 84.11.5. Let $\mathcal{X}$ be an algebraic stack.
(1) Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{X}}$-module with the flat base change property on $\mathcal{X}_{\text {étale }}$. The following are equivalent
(a) $\mathcal{F}$ is parasitic, and
(b) $g^{*} \mathcal{F}=0$ where $g: \operatorname{Sh}\left(\mathcal{X}_{\text {lisse,étale }}\right) \rightarrow \operatorname{Sh}\left(\mathcal{X}_{\text {étale }}\right)$ is as in Lemma 84.11.2.
(2) Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{X}}$-module on $\mathcal{X}_{\text {fppf }}$. The following are equivalent
(a) $\mathcal{F}$ is parasitic, and
(b) $g^{*} \mathcal{F}=0$ where $g: \operatorname{Sh}\left(\mathcal{X}_{\text {flat,fppf }}\right) \rightarrow \operatorname{Sh}\left(\mathcal{X}_{\text {fppf }}\right)$ is as in Lemma 84.11.2.

Proof. Part (2) is immediate from the definitions (this is one of the advantages of the flat-fppf site over the lisse-étale site). The implication $(1)(\mathrm{a}) \Rightarrow(1)(\mathrm{b})$ is immediate as well. To see $(1)(\mathrm{b}) \Rightarrow(1)(\mathrm{a})$ let $U$ be a scheme and let $x: U \rightarrow \mathcal{X}$ be a surjective smooth morphism. Then $x$ is an object of the lisse-étale site of $\mathcal{X}$. Hence we see that (1)(b) implies that $\left.\mathcal{F}\right|_{U_{\text {étale }}}=0$. Let $V \rightarrow \mathcal{X}$ be an flat morphism where $V$ is a scheme. Set $W=U \times \mathcal{X} V$ and consider the diagram

Note that the projection $p: W \rightarrow U$ is flat and the projection $q: W \rightarrow V$ is smooth and surjective. This implies that $q_{\text {small }}^{*}$ is a faithful functor on quasi-coherent modules. By assumption $\mathcal{F}$ has the flat base change property so that we obtain $\left.\left.p_{\text {small }}^{*} \mathcal{F}\right|_{U_{\text {étale }}} \cong q_{\text {small }}^{*} \mathcal{F}\right|_{V_{\text {étale }}}$. Thus if $\mathcal{F}$ is in the kernel of $g^{*}$, then $\left.\mathcal{F}\right|_{V_{\text {étale }}}=0$ as desired.

The lisse-étale site is functorial for smooth morphisms of algebraic stacks and the flat-fppf site is functorial for flat morphisms of algebraic stacks.

07AT Lemma 84.11.6. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks.
(1) If $f$ is smooth, then $f$ restricts to a continuous and cocontinuous functor $\mathcal{X}_{\text {lisse,étale }} \rightarrow \mathcal{Y}_{\text {lisse,étale }}$ which gives a morphism of ringed topoi fitting into the following commutative diagram

We have $f_{*}^{\prime}\left(g^{\prime}\right)^{-1}=g^{-1} f_{*}$ and $g_{!}^{\prime}\left(f^{\prime}\right)^{-1}=f^{-1} g_{!}$.
(2) If $f$ is flat, then $f$ restricts to a continuous and cocontinuous functor $\mathcal{X}_{\text {flat,fppf }} \rightarrow \mathcal{Y}_{\text {flat,fppf }}$ which gives a morphism of ringed topoi fitting into the following commutative diagram

We have $f_{*}^{\prime}\left(g^{\prime}\right)^{-1}=g^{-1} f_{*}$ and $g_{!}^{\prime}\left(f^{\prime}\right)^{-1}=f^{-1} g!$.
Proof. The initial statement comes from the fact that if $x \in \operatorname{Ob}(\mathcal{X})$ lies over a scheme $U$ such that $x: U \rightarrow \mathcal{X}$ is smooth (resp. flat) and if $f$ is smooth (resp. flat) then $f(x): U \rightarrow \mathcal{Y}$ is smooth (resp. flat), see Morphisms of Stacks, Lemmas 83.22.2
and 83.17.2. The induced functor $\mathcal{X}_{\text {lisse,étale }} \rightarrow \mathcal{Y}_{\text {lisse,étale }}$ (resp. $\mathcal{X}_{\text {flat,fppf }} \rightarrow$ $\mathcal{Y}_{\text {flat,fppf }}$ ) is continuous and cocontinuous by our definition of coverings in these categories. Finally, the commutativity of the diagram is a consequence of the fact that the horizontal morphisms are given by the inclusion functors (see Lemma 84.11.2 and Sites, Lemma 7.20.2.

To show that $f_{*}^{\prime}\left(g^{\prime}\right)^{-1}=g^{-1} f_{*}$ let $\mathcal{F}$ be a sheaf on $\mathcal{X}_{\text {étale }}$ (resp. $\mathcal{X}_{\text {fppf }}$ ). There is a canonical pullback map

$$
g^{-1} f_{*} \mathcal{F} \longrightarrow f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

see Sites, Section 7.44 We claim this map is an isomorphism. To prove this pick an object $y$ of $\mathcal{Y}_{\text {lisse,étale }}$ (resp. $\mathcal{Y}_{\text {flat,fppf }}$ ). Say $y$ lies over the scheme $V$ such that $y: V \rightarrow \mathcal{Y}$ is smooth (resp. flat). Since $g^{-1}$ is the restriction we find that

$$
\left(g^{-1} f_{*} \mathcal{F}\right)(y)=\Gamma\left(V \times_{y, \mathcal{Y}} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{F}\right)
$$

by Sheaves on Stacks, Equation 78.5.0.1). Let $\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime} \subset V \times_{y, \mathcal{Y}} \mathcal{X}$ be the full subcategory consisting of objects $z: W \rightarrow V \times_{y, \mathcal{Y}} \mathcal{X}$ such that the induced morphism $W \rightarrow \mathcal{X}$ is smooth (resp. flat). Denote

$$
\operatorname{pr}^{\prime}:\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime} \longrightarrow \mathcal{X}_{\text {lisse,étale }}\left(\text { resp. } \mathcal{X}_{\text {flat,fppf }}\right)
$$

the restriction of the functor pr used in the formula above. Exactly the same argument that proves Sheaves on Stacks, Equation 78.5.0.1 shows that for any sheaf $\mathcal{H}$ on $\mathcal{X}_{\text {lisse,étale }}\left(\right.$ resp. $\left.\mathcal{X}_{\text {flat,fppf }}\right)$ we have

$$
\begin{equation*}
f_{*}^{\prime} \mathcal{H}(y)=\Gamma\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left(\mathrm{pr}^{\prime}\right)^{-1} \mathcal{H}\right) \tag{84.11.6.1}
\end{equation*}
$$

Since $\left(g^{\prime}\right)^{-1}$ is restriction we see that

$$
\left(f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}\right)(y)=\Gamma\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left.\operatorname{pr}^{-1} \mathcal{F}\right|_{\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime}}\right)
$$

By Sheaves on Stacks, Lemma 78.22 .3 we see that

$$
\Gamma\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left.\operatorname{pr}^{-1} \mathcal{F}\right|_{\left(V \times_{y, \mathcal{L}} \mathcal{X}\right)^{\prime}}\right)=\Gamma\left(V \times_{y, \mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{F}\right)
$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \rightarrow \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.
Finally, the equality $g_{!}^{\prime}\left(f^{\prime}\right)^{-1}=f^{-1} g$ ! follows formally from the equality $f_{*}^{\prime}\left(g^{\prime}\right)^{-1}=$ $g^{-1} f_{*}$ by the adjointness of $f^{-1}$ and $f_{*}$, the adjointness of $g_{!}$and $g^{-1}$, and their "primed" versions.

### 84.12. Quasi-coherent modules, II

07 AY In this section we explain how to think of quasi-coherent modules on an algebraic stack in terms of its lisse-étale or flat-fppf site.
07AZ Lemma 84.12.1. Let $\mathcal{X}$ be an algebraic stack.
(1) Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {étale }}$. If each $f_{j}^{-1} \mathcal{F}$ is quasi-coherent, then so is $\mathcal{F}$.
(2) Let $f_{j}: \mathcal{X}_{j} \rightarrow \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}|=\bigcup\left|f_{j}\right|\left(\left|\mathcal{X}_{j}\right|\right)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{X}}$-modules on $\mathcal{X}_{\text {fppf }}$. If each $f_{j}^{-1} \mathcal{F}$ is quasi-coherent, then so is $\mathcal{F}$.

Proof. Proof of (1). We may replace each of the algebraic stacks $\mathcal{X}_{j}$ by a scheme $U_{j}$ (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 83.22.2 . The pullback of $\mathcal{F}$ to $\left(S c h / U_{j}\right)_{\text {étale }}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 78.11.2. Then $f=\coprod f_{j}: U=\coprod U_{j} \rightarrow \mathcal{X}$ is a smooth surjective morphism. Let $x: V \rightarrow \mathcal{X}$ be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 78.18 .10 there exists an étale covering $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ such that each $x_{i}$ lifts to an object $u_{i}$ of $(S c h / U)_{\text {étale. }}$. This just means that $x_{i}$ lives over a scheme $V_{i}$, that $\left\{V_{i} \rightarrow V\right\}$ is an étale covering, and that $x_{i}$ comes from a morphism $u_{i}: V_{i} \rightarrow U$. Then $x_{i}^{*} \mathcal{F}=u_{i}^{*} f^{*} \mathcal{F}$ is quasi-coherent. This implies that $x^{*} \mathcal{F}$ on $(S c h / V)_{\text {étale }}$ is quasi-coherent, for example by Modules on Sites, Lemma 18.23.3. By Sheaves on Stacks, Lemma 78.11 .3 we see that $\mathcal{F}$ is quasi-coherent.

Proof of (2). This is proved using exactly the same argument, which we fully write out here. We may replace each of the algebraic stacks $\mathcal{X}_{j}$ by a scheme $U_{j}$ (using that any algebraic stack has a smooth covering by a scheme and that flat and locally finite presented morphisms are preserved by composition, see Morphisms of Stacks, Lemmas 83.17 .2 and 83.18 .2 ). The pullback of $\mathcal{F}$ to $\left(S c h / U_{j}\right)_{\text {étale }}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 78.11.2. Then $f=\coprod f_{j}$ : $U=\amalg U_{j} \rightarrow \mathcal{X}$ is a surjective, flat, and locally finitely presented morphism. Let $x: V \rightarrow \mathcal{X}$ be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 78.18 .10 there exists an fppf covering $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ such that each $x_{i}$ lifts to an object $u_{i}$ of $(S c h / U)_{\text {étale }}$. This just means that $x_{i}$ lives over a scheme $V_{i}$, that $\left\{V_{i} \rightarrow V\right\}$ is an fppf covering, and that $x_{i}$ comes from a morphism $u_{i}: V_{i} \rightarrow U$. Then $x_{i}^{*} \mathcal{F}=u_{i}^{*} f^{*} \mathcal{F}$ is quasicoherent. This implies that $x^{*} \mathcal{F}$ on $(S c h / V)_{\text {étale }}$ is quasi-coherent, for example by Modules on Sites, Lemma 18.23.3. By Sheaves on Stacks, Lemma 78.11.3 we see that $\mathcal{F}$ is quasi-coherent.

We recall that we have defined the notion of a quasi-coherent module on any ringed topos in Modules on Sites, Section 18.23 .

07B0 Lemma 84.12.2. Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemma 84.11.2.
(1) Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{\text {lisse,etale }}-m o d u l e ~ o n ~ t h e ~ l i s s e-e ́ t a l e ~ s i t e ~ o f ~}^{\mathcal{X}}$. Then $g!\mathcal{H}$ is a quasi-coherent module on $\mathcal{X}$.
(2) Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}$-module on the flat-fppf site of $\mathcal{X}$. Then $g!\mathcal{H}$ is a quasi-coherent module on $\mathcal{X}$.

Proof. Pick a scheme $U$ and a surjective smooth morphism $x: U \rightarrow \mathcal{X}$. By Modules on Sites, Definition 18.23 .1 there exists an étale (resp. fppf) covering $\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ such that each pullback $f_{i}^{-1} \mathcal{H}$ has a global presentation (see Modules on Sites, Definition 18.17.1). Here $f_{i}: U_{i} \rightarrow \mathcal{X}$ is the composition $U_{i} \rightarrow U \rightarrow \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback "is" the restriction to $\mathcal{X} / f_{i}$, see Sheaves on Stacks, Definition 78.9 .2 and the discussion following.) Since each $f_{i}$ is smooth (resp. flat) by Lemma 84.11.6 we see that $f_{i}^{-1} g_{!} \mathcal{H}=g_{i,!}\left(f_{i}^{\prime}\right)^{-1} \mathcal{H}$. Using Lemma 84.12.1 we reduce the statement of the lemma to the case where $\mathcal{H}$ has a global presentation. Say we have

$$
\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{H} \longrightarrow 0
$$

of $\mathcal{O}$-modules where $\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {lisse }, \text { etale }}}\left(\right.$ resp. $\left.\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$. Since $g_{!}$commutes with arbitrary colimits (as a left adjoint functor, see Lemma 84.11.3 and Categories,

Lemma 4.24.4 we conclude that there exists an exact sequence

$$
\bigoplus_{j \in J} g_{!} \mathcal{O} \longrightarrow \bigoplus_{i \in I} g_{!} \mathcal{O} \longrightarrow g_{!} \mathcal{H} \longrightarrow 0
$$

Finally, Lemma 84.11 .4 shows that $g!\mathcal{O}=\mathcal{O}_{\mathcal{X}}$ and we win.
07B1 Lemma 84.12.3. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}}$ be the category of locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$-modules with the flat base change property.
(1) With $g$ as in Lemma 84.11.2 for the lisse-étale site we have
(a) the functors $g^{-1}$ and $g$ ! define mutually inverse functors

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \underset{g_{!}}{\stackrel{g^{-1}}{<}} Q \operatorname{Coh}\left(\mathcal{X}_{\text {lisse,étale }}, \mathcal{O}_{\mathcal{X}_{\text {lisse,êtale }}}\right)
$$

(b) if $\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}}$ then $g^{-1} \mathcal{F}$ is in $Q \operatorname{Coh}\left(\mathcal{X}_{\text {lisse,étale }}, \mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right)$ and
(c) $Q(\mathcal{F})=g!g^{-1} \mathcal{F}$ where $Q$ is as in Lemma 84.9.1.
(2) With $g$ as in Lemma 84.11.2 for the flat-fppf site we have
(a) the functors $g^{-1}$ and $g$ ! define mutually inverse functors

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \underset{g_{!}}{\stackrel{g^{-1}}{\underset{~}{\leftrightarrows}}} Q \operatorname{Coh}\left(\mathcal{X}_{f l a t, f p p f}, \mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)
$$

(b) if $\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}}$ then $g^{-1} \mathcal{F}$ is in $Q \operatorname{Coh}\left(\mathcal{X}_{\text {flat,fppf }}, \mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$ and
(c) $Q(\mathcal{F})=g!g^{-1} \mathcal{F}$ where $Q$ is as in Lemma 84.9.1.

Proof. Pullback by any morphism of ringed topoi preserves categories of quasicoherent modules, see Modules on Sites, Lemma 18.23.4. Hence $g^{-1}$ preserves the categories of quasi-coherent modules. The same is true for $g_{!}$by Lemma 84.12.2, We know that $\mathcal{H} \rightarrow g^{-1} g!\mathcal{H}$ is an isomorphism by Lemma 84.11.2, Conversely, if $\mathcal{F}$ is in $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ then the $\operatorname{map} g_{!} g^{-1} \mathcal{F} \rightarrow \mathcal{F}$ is a map of quasi-coherent modules on $\mathcal{X}$ whose restriction to any scheme smooth over $\mathcal{X}$ is an isomorphism. Then the discussion in Sheaves on Stacks, Sections 78.13 and 78.14 (comparing with quasicoherent modules on presentations) shows it is an isomorphism. This proves (1)(a) and (2)(a).
Let $\mathcal{F}$ be an object of $\mathcal{M}_{\mathcal{X}}$. By Lemma 84.9.2 the kernel and cokernel of the $\operatorname{map} Q(\mathcal{F}) \rightarrow \mathcal{F}$ are parasitic. Hence by Lemma 84.11 .5 and since $g^{*}=g^{-1}$ is exact, we conclude $g^{*} Q(\mathcal{F}) \rightarrow g^{*} \mathcal{F}$ is an isomorphism. Thus $g^{*} \mathcal{F}$ is quasicoherent. This proves (1)(b) and (2)(b). Finally, (1)(c) and (2)(c) follow because $g!g^{*} Q(\mathcal{F}) \rightarrow Q(\mathcal{F})$ is an isomorphism by our arguments above.

07B2 Remark 84.12.4. Let $\mathcal{X}$ be an algebraic stack. The results of Lemmas 84.9.1 and 84.9.2 imply that

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)=\mathcal{M}_{\mathcal{X}} / \text { Parasitic } \cap \mathcal{M}_{\mathcal{X}}
$$

in words: the category of quasi-coherent modules is the category of locally quasicoherent modules with the flat base change property divided out by the Serre subcategory consisting of parasitic objects. See Homology, Lemma 12.9.6. The existence of the inclusion functor $i: Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \mathcal{M}_{\mathcal{X}}$ which is left adjoint to the quotient functor means that $\mathcal{M}_{\mathcal{X}} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)$ is a Bousfield colocalization or a right Bousfield localization (insert future reference here). Our next goal is to show a similar result holds on the level of derived categories.

07B4 Lemma 84.12.5. Let $\mathcal{X}$ be an algebraic stack.
(1) $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right)$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,êtale }}}\right)$.
(2) $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$.

Proof. We will verify conditions (1), (2), (3), (4) of Homology, Lemma 12.9.3. Since 0 is a quasi-coherent module on any ringed site we see that (1) holds. By definition $Q \operatorname{Coh}(\mathcal{O})$ is a strictly full subcategory $\operatorname{Mod}(\mathcal{O})$, so (2) holds. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be a morphism of quasi-coherent modules on $\mathcal{X}_{\text {lisse,étale }}$ or $\mathcal{X}_{\text {flat,fppf }}$. We have $g^{*} g_{!} \mathcal{F}=\mathcal{F}$ and similarly for $\mathcal{G}$ and $\varphi$, see Lemma 84.11.3. By Lemma 84.12.2 we see that $g_{!} \mathcal{F}$ and $g!\mathcal{G}$ are quasi-coherent $\mathcal{O}_{\mathcal{X}}$-modules. Hence we see that $\operatorname{Ker}(g!\varphi)$ and $\operatorname{Coker}(g!\varphi)$ are quasi-coherent modules on $\mathcal{X}$. Since $g^{*}$ is exact (see Lemma 84.11 .2 we see that $g^{*} \operatorname{Ker}(g!\varphi)=\operatorname{Ker}\left(g^{*} g!\varphi\right)=\operatorname{Ker}(\varphi)$ and $g^{*} \operatorname{Coker}(g!\varphi)=$ $\operatorname{Coker}\left(g^{*} g!\varphi\right)=\operatorname{Coker}(\varphi)$ are quasi-coherent too (see Lemma 84.12.3). This proves (3).

Finally, suppose that

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0
$$

is an extension of $\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}$-modules (resp. $\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}$-modules) with $\mathcal{F}$ and $\mathcal{G}$ quasi-coherent. We have to show that $\mathcal{E}$ is quasi-coherent on $\mathcal{X}_{\text {lisse, étale }}$ (resp. $\left.\mathcal{X}_{\text {flat,fppf }}\right)$. We strongly urge the reader to write out what this means on a napkin and prove it him/herself rather than reading the somewhat labyrinthine proof that follows. By Lemma 84.12 .3 this is true if and only if $g!\mathcal{E}$ is quasi-coherent. By Lemmas 84.12 .1 and Lemma 84.11 .6 we may check this after replacing $\mathcal{X}$ by a smooth (resp. fppf) cover. Choose a scheme $U$ and a smooth surjective morphism $U \rightarrow \mathcal{X}$. By definition there exists an étale (resp. fppf) covering $\left\{U_{i} \rightarrow U\right\}_{i}$ such that $\mathcal{G}$ has a global presentation over each $U_{i}$. Replacing $\mathcal{X}$ by $U_{i}$ (which is permissible by the discussion above) we may assume that the site $\mathcal{X}_{\text {lisse, étale }}$ (resp. $\mathcal{X}_{\text {flat,fppf }}$ ) has a final object $U$ (in other words $\mathcal{X}$ is representable by the scheme $U)$ and that $\mathcal{G}$ has a global presentation

$$
\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{G} \longrightarrow 0
$$

of $\mathcal{O}$-modules where $\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\left(\right.$ resp. $\left.\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$. Let $\mathcal{E}^{\prime}$ be the pullback of $\mathcal{E}$ via the map $\bigoplus_{i \in I} \mathcal{O} \rightarrow \mathcal{G}$. Then we see that $\mathcal{E}$ is the cokernel of a map $\bigoplus_{j \in J} \mathcal{O} \rightarrow \mathcal{E}^{\prime}$ hence by property (3) which we proved above, it suffices to prove that $\mathcal{E}^{\prime}$ is quasi-coherent. Consider the exact sequence

$$
L_{1} g!\left(\bigoplus_{i \in I} \mathcal{O}\right) \rightarrow g_{!} \mathcal{F} \rightarrow g_{!} \mathcal{E}^{\prime} \rightarrow g_{!}\left(\bigoplus_{i \in I} \mathcal{O}\right) \rightarrow 0
$$

where $L_{1} g_{!}$is the first left derived functor of $g_{!}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ (resp. $\left.g_{!}: \operatorname{Mod}\left(\mathcal{X}_{\text {flat,fppf }}, \mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{f p p f}, \mathcal{O}_{\mathcal{X}}\right)\right)$. This derived functor exists by Cohomology on Sites, Lemma 21.28.1. Moreover, since $\mathcal{O}=j_{U}!\mathcal{O}_{U}$ we have $L g!\mathcal{O}=g!\mathcal{O}=\mathcal{O}_{\mathcal{X}}$ also by Cohomology on Sites, Lemma 21.28.1. Thus the left hand term vanishes and we obtain a short exact sequence

$$
0 \rightarrow g!\mathcal{F} \rightarrow g_{!} \mathcal{E}^{\prime} \rightarrow \bigoplus_{i \in I} \mathcal{O}_{\mathcal{X}} \rightarrow 0
$$

By Proposition 84.7 .4 it follows that $g!\mathcal{E}^{\prime}$ is locally quasi-coherent with the flat base change property. Finally, Lemma 84.12 .3 implies that $\mathcal{E}^{\prime}=g^{-1} g!\mathcal{E}^{\prime}$ is quasicoherent as desired.

# Derived Categories of Stacks 

08MW

### 85.1. Introduction

08MX In this chapter we write about derived categories associated to algebraic stacks. This means in particular derived categories of quasi-coherent sheaves, i.e., we prove analogues of the results on schemes (see Derived Categories of Schemes, Section 35.1 ) and algebraic spaces (see Derived Categories of Spaces, Section 62.1). The results in this chapter are different from those in LMB00 mainly because we consistently use the "big sites". Before reading this chapter please take a quick look at the chapters "Sheaves on Algebraic Stacks" and "Cohomology of Algebraic Stacks" where the terminology we use here is introduced.

### 85.2. Conventions, notation, and abuse of language

08 MY We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 82.2. We use notation as explained in Cohomology of Stacks, Section 84.3 .

### 85.3. The lisse-étale and the flat-fppf sites

08 MZ The section is the analogue of Cohomology of Stacks, Section 84.11 for derived categories.

07AS Lemma 85.3.1. Let $\mathcal{X}$ be an algebraic stack. Notation as in Cohomology of Stacks, Lemmas 84.11.2 and 84.11.3.
(1) The functor $g_{!}: A b\left(\mathcal{X}_{\text {lisse,étale }}\right) \rightarrow A b\left(\mathcal{X}_{\text {étale }}\right)$ has a left derived functor

$$
L g_{!}: D\left(\mathcal{X}_{\text {lisse,étale }}\right) \longrightarrow D\left(\mathcal{X}_{\text {étale }}\right)
$$

which is left adjoint to $g^{-1}$ and such that $g^{-1} L g_{!}=i d$.
(2) The functor $g_{!}: \operatorname{Mod}\left(\mathcal{X}_{\text {lisse,étale }}, \mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ has a left derived functor

$$
L g_{!}: D\left(\mathcal{O}_{\mathcal{X}_{\text {lisse }, \text { étale }}}\right) \longrightarrow D\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)
$$

which is left adjoint to $g^{*}$ and such that $g^{*} L g!=i d$.
(3) The functor $g_{!}: A b\left(\mathcal{X}_{\text {flat,fppf }}\right) \rightarrow A b\left(\mathcal{X}_{\text {fppf }}\right)$ has a left derived functor

$$
L g_{!}: D\left(\mathcal{X}_{\text {flat,fppf }}\right) \longrightarrow D\left(\mathcal{X}_{f p p f}\right)
$$

which is left adjoint to $g^{-1}$ and such that $g^{-1} L g_{!}=i d$.
(4) The functor $g_{!}: \operatorname{Mod}\left(\mathcal{X}_{\text {flat,fppf }}, \mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{X}_{f p p f}, \mathcal{O}_{\mathcal{X}}\right)$ has a left derived functor

$$
L g_{!}: D\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right) \longrightarrow D\left(\mathcal{O}_{\mathcal{X}}\right)
$$

which is left adjoint to $g^{*}$ and such that $g^{*} L g_{!}=i d$.
Warning: It is not clear (a priori) that $L g_{!}$on modules agrees with $L g_{!}$on abelian sheaves, see Cohomology on Sites, Remark 21.28.2.

Proof. The existence of the functor $L g_{!}$and adjointness to $g^{*}$ is Cohomology on Sites, Lemma 21.28.1. (For the case of abelian sheaves use the constant sheaf $\mathbf{Z}$ as the structure sheaves.) Moreover, it is computed on a complex $\mathcal{H}^{\bullet}$ by taking a suitable left resolution $\mathcal{K}^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ and applying the functor $g_{!}$to $\mathcal{K}^{\bullet}$. Since $g^{-1} g_{!} \mathcal{K}^{\bullet}=\mathcal{K}^{\bullet}$ by Cohomology of Stacks, Lemmas 84.11.3 and 84.11.2 we see that the final assertion holds in each case.

07AV Lemma 85.3.2. With assumptions and notation as in Cohomology of Stacks, Lemma 84.11.6. We have

$$
g^{-1} \circ R f_{*}=R f_{*}^{\prime} \circ\left(g^{\prime}\right)^{-1} \quad \text { and } \quad L\left(g^{\prime}\right)!\circ\left(f^{\prime}\right)^{-1}=f^{-1} \circ L g_{!}
$$

on unbounded derived categories (both for the case of modules and for the case of abelian sheaves).

Proof. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{X}_{\text {étale }}\left(\right.$ resp. $\left.\mathcal{X}_{f p p f}\right)$. We first show that the canonical (base change) map

$$
g^{-1} R f_{*} \mathcal{F} \longrightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

is an isomorphism. To do this let $y$ be an object of $\mathcal{Y}_{\text {lisse,étale }}\left(r e s p . \mathcal{Y}_{\text {flat,fppf }}\right)$. Say $y$ lies over the scheme $V$ such that $y: V \rightarrow \mathcal{Y}$ is smooth (resp. flat). Since $g^{-1}$ is the restriction we find that

$$
\left(g^{-1} R^{p} f_{*} \mathcal{F}\right)(y)=H_{\tau}^{p}\left(V \times_{y, \mathcal{Y}} \mathcal{X}, \operatorname{pr}^{-1} \mathcal{F}\right)
$$

where $\tau=$ étale (resp. $\tau=f p p f$ ), see Sheaves on Stacks, Lemma 78.20.2. By Cohomology of Stacks, Equation 84.11.6.1 for any sheaf $\mathcal{H}$ on $\mathcal{X}_{\text {lisse,étale }}$ (resp. $\left.\mathcal{X}_{\text {flat,fppf }}\right)$

$$
f_{*}^{\prime} \mathcal{H}(y)=\Gamma\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left(\mathrm{pr}^{\prime}\right)^{-1} \mathcal{H}\right)
$$

An object of $\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime}$ can be seen as a pair $(x, \varphi)$ where $x$ is an object of $\mathcal{X}_{\text {lisse,étale }}\left(\operatorname{resp} . \mathcal{X}_{\text {flat,fppf }}\right)$ and $\varphi: f(x) \rightarrow y$ is a morphism in $\mathcal{Y}$. We can also think of $\varphi$ as a section of $\left(f^{\prime}\right)^{-1} h_{y}$ over $x$. Thus $(V \times \mathcal{Y} \mathcal{X})^{\prime}$ is the localization of the site $\mathcal{X}_{\text {lisse,étale }}\left(\right.$ resp. $\left.\mathcal{X}_{\text {flat,fppf }}\right)$ at the sheaf of sets $\left(f^{\prime}\right)^{-1} h_{y}$, see Sites, Lemma 7.29.3. The morphism

$$
\mathrm{pr}^{\prime}:\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime} \rightarrow \mathcal{X}_{\text {lisse,étale }}\left(\text { resp. } \mathrm{pr}^{\prime}:\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime} \rightarrow \mathcal{X}_{\text {flat,fppf }}\right)
$$

is the localization morphism. In particular, the pullback $\left(\mathrm{pr}^{\prime}\right)^{-1}$ preserves injective abelian sheaves, see Cohomology on Sites, Lemma 21.13.3. At this point exactly the same argument as in Sheaves on Stacks, Lemma 78.20 .2 shows that

$$
\begin{equation*}
R^{p} f_{*}^{\prime} \mathcal{H}(y)=H_{\tau}^{p}\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left(\mathrm{pr}^{\prime}\right)^{-1} \mathcal{H}\right) \tag{85.3.2.1}
\end{equation*}
$$

where $\tau=$ étale (resp. $\tau=f p p f$ ). Since $\left(g^{\prime}\right)^{-1}$ is given by restriction we conclude that

$$
\left(R^{p} f_{*}^{\prime}\left(g^{\prime}\right)^{*} \mathcal{F}\right)(y)=H_{\tau}^{p}\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left.\operatorname{pr}^{-1} \mathcal{F}\right|_{\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime}}\right)
$$

Finally, we can apply Sheaves on Stacks, Lemma 78.22 .3 to see that

$$
H_{\tau}^{p}\left(\left(V \times_{y, \mathcal{Y}} \mathcal{X}\right)^{\prime},\left.\operatorname{pr}^{-1} \mathcal{F}\right|_{\left(V \times_{y, \mathcal{V}} \mathcal{X}\right)^{\prime}}\right)=H_{\tau}^{p}\left(V \times_{y, \mathcal{Y}} \mathcal{X}, \mathrm{pr}^{-1} \mathcal{F}\right)
$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \rightarrow \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.

The rest of the proof is formal. Since cohomology of abelian groups and sheaves of modules agree we also conclude that $g^{-1} R f_{*} \mathcal{F}=R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$ when $\mathcal{F}$ is a sheaf of modules on $\mathcal{X}_{\text {étale }}\left(\right.$ resp. $\left.\mathcal{X}_{f p p f}\right)$.
Next we show that for $\mathcal{G}$ (either sheaf of modules or abelian groups) on $\mathcal{Y}_{\text {lisse,étale }}$ (resp. $\mathcal{Y}_{\text {flat,fppf }}$ ) the canonical map

$$
L\left(g^{\prime}\right)!\left(f^{\prime}\right)^{-1} \mathcal{G} \rightarrow f^{-1} L g!\mathcal{G}
$$

is an isomorphism. To see this it is enough to prove for any injective sheaf $\mathcal{I}$ on $\mathcal{X}_{\text {étale }}\left(\right.$ resp. $\left.\mathcal{X}_{\text {fppf }}\right)$ that the induced map

$$
\operatorname{Hom}\left(L\left(g^{\prime}\right)!\left(f^{\prime}\right)^{-1} \mathcal{G}, \mathcal{I}[n]\right) \leftarrow \operatorname{Hom}\left(f^{-1} L g!\mathcal{G}, \mathcal{I}[n]\right)
$$

is an isomorphism for all $n \in \mathbf{Z}$. (Hom's taken in suitable derived categories.) By the adjointness of $f^{-1}$ and $R f_{*}$, the adjointness of $L g_{!}$and $g^{-1}$, and their "primed" versions this follows from the isomorphism $g^{-1} R f_{*} \mathcal{I} \rightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{I}$ proved above.

In the case of a bounded complex $\mathcal{G}^{\bullet}$ (of modules or abelian groups) on $\mathcal{Y}_{\text {lisse,étale }}$ (resp. $\mathcal{Y}_{f p p f}$ ) the canonical map

$$
\begin{equation*}
L\left(g^{\prime}\right)!\left(f^{\prime}\right)^{-1} \mathcal{G}^{\bullet} \rightarrow f^{-1} L g!\mathcal{G}^{\bullet} \tag{85.3.2.2}
\end{equation*}
$$

is an isomorphism as follows from the case of a sheaf by the usual arguments involving truncations and the fact that the functors $L\left(g^{\prime}\right)!\left(f^{\prime}\right)^{-1}$ and $f^{-1} L g_{!}$are exact functors of triangulated categories.
Suppose that $\mathcal{G}^{\bullet}$ is a bounded above complex (of modules or abelian groups) on $\mathcal{Y}_{\text {lisse,étale }}\left(\right.$ resp. $\left.\mathcal{Y}_{\text {fppf }}\right)$. The canonical map 85.3 .2 .2 is an isomorphism because we can use the stupid truncations $\sigma_{\geq-n}$ (see Homology, Section 12.13 to write $\mathcal{G}^{\bullet}$ as a colimit $\mathcal{G}^{\bullet}=\operatorname{colim} \mathcal{G}_{n}^{\bullet}$ of bounded complexes. This gives a distinguished triangle

$$
\bigoplus_{n \geq 1} \mathcal{G}_{n}^{\bullet} \rightarrow \bigoplus_{n \geq 1} \mathcal{G}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet} \rightarrow \ldots
$$

and each of the functors $L\left(g^{\prime}\right)!,\left(f^{\prime}\right)^{-1}, f^{-1}, L g_{!}$commutes with direct sums (of complexes).

If $\mathcal{G}^{\bullet}$ is an arbitrary complex (of modules or abelian groups) on $\mathcal{Y}_{\text {lisse, étale }}$ (resp. $\mathcal{Y}_{f p p f}$ ) then we use the canonical truncations $\tau_{\leq n}$ (see Homology, Section 12.13) to write $\mathcal{G} \bullet$ as a colimit of bounded above complexes and we repeat the argument of the paragraph above.
Finally, by the adjointness of $f^{-1}$ and $R f_{*}$, the adjointness of $L g_{!}$and $g^{-1}$, and their "primed" versions we conclude that the first identity of the lemma follows from the second in full generality.

07B3 Lemma 85.3.3. Let $\mathcal{X}$ be an algebraic stack. Notation as in Cohomology of Stacks, Lemma 84.11.2.
(1) Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}$-module on the lisse-étale site of $\mathcal{X}$. For all $p \in \mathbf{Z}$ the sheaf $H^{p}(L g!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on $\mathcal{X}$.
(2) Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}-m o d u l e ~ o n ~ t h e ~ f l a t-f p p f ~ s i t e ~ o f ~}^{\mathcal{X}}$. For all $p \in \mathbf{Z}$ the sheaf $H^{p}(L g!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on $\mathcal{X}$.

Proof. Pick a scheme $U$ and a surjective smooth morphism $x: U \rightarrow \mathcal{X}$. By Modules on Sites, Definition 18.23 .1 there exists an étale (resp. fppf) covering $\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ such that each pullback $f_{i}^{-1} \mathcal{H}$ has a global presentation (see Modules on Sites, Definition 18.17.1). Here $f_{i}: U_{i} \rightarrow \mathcal{X}$ is the composition $U_{i} \rightarrow U \rightarrow \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback "is" the restriction to $\mathcal{X} / f_{i}$, see Sheaves on Stacks, Definition 78.9 .2 and the discussion following.) After refining the covering we may assume each $U_{i}$ is an affine scheme. Since each $f_{i}$ is smooth (resp. flat) by Lemma 85.3.2 we see that $f_{i}^{-1} L g_{!} \mathcal{H}=L g_{i,!}\left(f_{i}^{\prime}\right)^{-1} \mathcal{H}$. Using Cohomology of Stacks, Lemma 84.7.5 we reduce the statement of the lemma to the case where $\mathcal{H}$ has a global presentation and where $\mathcal{X}=(S c h / X)_{\text {fppf }}$ for some affine scheme $X=\operatorname{Spec}(A)$.

Say our presentation looks like

$$
\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{H} \longrightarrow 0
$$

where $\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\left(\right.$ resp. $\left.\mathcal{O}=\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$. Note that the site $\mathcal{X}_{\text {lisse,étale }}$ (resp. $\mathcal{X}_{\text {flat,fppf }}$ ) has a final object, namely $X / X$ which is quasi-compact (see Cohomology on Sites, Section 21.16. Hence we have

$$
\Gamma\left(\bigoplus_{i \in I} \mathcal{O}\right)=\bigoplus_{i \in I} A
$$

by Sites, Lemma 7.11.2. Hence the map in the presentation corresponds to a similar presentation

$$
\bigoplus_{j \in J} A \longrightarrow \bigoplus_{i \in I} A \longrightarrow M \longrightarrow 0
$$

of an $A$-module $M$. Moreover, $\mathcal{H}$ is equal to the restriction to the lisse-étale (resp. flat-fppf) site of the quasi-coherent sheaf $M^{a}$ associated to $M$. Choose a resolution

$$
\ldots \rightarrow F_{2} \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

by free $A$-modules. The complex

$$
\ldots \mathcal{O} \otimes_{A} F_{2} \rightarrow \mathcal{O} \otimes_{A} F_{1} \rightarrow \mathcal{O} \otimes_{A} F_{0} \rightarrow \mathcal{H} \rightarrow 0
$$

is a resolution of $\mathcal{H}$ by free $\mathcal{O}$-modules because for each object $U / X$ of $\mathcal{X}_{\text {lisse,étale }}$ (resp. $\mathcal{X}_{\text {flat, fppf }}$ ) the structure morphism $U \rightarrow X$ is flat. Hence by construction the value of $L g!\mathcal{H}$ is

$$
\ldots \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_{A} F_{2} \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_{A} F_{1} \rightarrow \mathcal{O}_{\mathcal{X}} \otimes_{A} F_{0} \rightarrow 0 \rightarrow \ldots
$$

Since this is a complex of quasi-coherent modules on $\mathcal{X}_{\text {étale }}$ (resp. $\mathcal{X}_{\text {fppf }}$ ) it follows from Cohomology of Stacks, Proposition 84.7.4 that $H^{p}\left(L g_{!} \mathcal{H}\right)$ is quasi-coherent.

### 85.4. Derived categories of quasi-coherent modules

07B5 Let $\mathcal{X}$ be an algebraic stack. As the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ isn't exact, we cannot define $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$ as the full subcategory of $D\left(\mathcal{O}_{\mathcal{X}}\right)$ consisting of complexes with quasi-coherent cohomology sheaves. In stead we define the category as follows.
07B6 Definition 85.4.1. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_{\mathcal{X}} \subset \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ denote the category of locally quasi-coherent $\mathcal{O}_{\mathcal{X}}$-modules with the flat base change property. Let $\mathcal{P}_{\mathcal{X}} \subset \mathcal{M}_{\mathcal{X}}$ be the full subcategory consisting of parasitic objects. We define the derived category of $\mathcal{O}_{\mathcal{X}}$-modules with quasi-coherent cohomology sheaves as the Verdier quotient ${ }^{11}$

$$
D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)=D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right) / D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

This definition makes sense: By Cohomology of Stacks, Proposition 84.7.4 we see that $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ hence $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ is a strictly full, saturated triangulated subcategory of $D\left(\mathcal{O}_{\mathcal{X}}\right)$, see Derived Categories, Lemma 13.13.1. Since parasitic modules form a Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ (by Cohomology of Stacks, Lemma 84.8.2 we see that $\mathcal{P}_{\mathcal{X}}=$ Parasitic $\cap \mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)$ and hence $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ is a strictly full, saturated triangulated subcategory of $D\left(\mathcal{O}_{\mathcal{X}}\right)$. Since clearly

$$
D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right) \subset D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

we conclude that the first is a strictly full, saturated triangulated subcategory of the second. Hence the Verdier quotient exists. A morphism $a: E \rightarrow E^{\prime}$ of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ becomes an isomorphism in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$ if and only if the cone $C(a)$ has parasitic cohomology sheaves, see Derived Categories, Section 13.6 and especially Lemma 13.6 .10

Consider the functors

$$
D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right) \xrightarrow{H^{i}} \mathcal{M}_{\mathcal{X}} \xrightarrow{Q} Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

Note that $Q$ annihilates the subcategory $\mathcal{P}_{\mathcal{X}}$, see Cohomology of Stacks, Lemma 84.9.2. By Derived Categories, Lemma 13.6 .8 we obtain a cohomological functor

$$
\begin{equation*}
H^{i}: D_{Q \operatorname{Coh}}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{X}}\right) \tag{85.4.1.1}
\end{equation*}
$$

Moreover, note that $E \in D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$ is zero if and only if $H^{i}(E)=0$ for all $i \in \mathbf{Z}$.
Note that the categories $\mathcal{P}_{\mathcal{X}}$ and $\mathcal{M}_{\mathcal{X}}$ are also weak Serre subcategories of the abelian category $\operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ of modules in the étale topology, see Cohomology of Stacks, Proposition 84.7.4 and Lemma 84.8.2. Hence the statement of the following lemma makes sense.
07B8 Lemma 85.4.2. Let $\mathcal{X}$ be an algebraic stack. The comparison morphism $\epsilon$ : $\mathcal{X}_{\text {fppf }} \rightarrow \mathcal{X}_{\text {étale }}$ induces a commutative diagram

[^223]Moreover, the left two vertical arrows are equivalences of triangulated categories, hence we also obtain an equivalence

$$
D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right) / D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

Proof. Since $\epsilon^{*}$ is exact it is clear that we obtain a diagram as in the statement of the lemma. We will show the middle vertical arrow is an equivalence by applying Cohomology on Sites, Lemma 21.22.3 to the following situation: $\mathcal{C}=\mathcal{X}, \tau=f p p f$, $\tau^{\prime}=$ étale, $\mathcal{O}=\mathcal{O}_{\mathcal{X}}, \mathcal{A}=\mathcal{M}_{\mathcal{X}}$, and $\mathcal{B}$ is the set of objects of $\mathcal{X}$ lying over affine schemes. To see the lemma applies we have to check conditions (1), (2), (3), (4). Conditions (1) and (2) are clear from the discussion above (explicitly this follows from Cohomology of Stacks, Proposition 84.7.4). Condition (3) holds because every scheme has a Zariski open covering by affines. Condition (4) follows from Descent, Lemma 34.8.4

We omit the verification that the equivalence of categories $\epsilon^{*}: D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right) \rightarrow$ $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ induces an equivalence of the subcategories of complexes with parasitic cohomology sheaves.
It turns out that $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$ is the same as the derived category of complexes of modules with quasi-coherent cohomology sheaves on the lisse-étale or flat-fppf site.
07B9 Lemma 85.4.3. Let $\mathcal{X}$ be an algebraic stack.
(1) Let $\mathcal{F}^{\bullet}$ be an object of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$. With $g$ as in Cohomology of Stacks, Lemma 84.11.2 for the lisse-étale site we have
(a) $g^{-1} \mathcal{F}^{\bullet}$ is in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse, étale }}}\right)$,
(b) $g^{-1} \mathcal{F}^{\bullet}=0$ if and only if $\mathcal{F}^{\bullet}$ is in $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$,
(c) $L g_{!} \mathcal{H}^{\bullet}$ is in $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)$ for $\mathcal{H}^{\bullet}$ in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse }, \text { étale }}}\right)$, and
(d) the functors $g^{-1}$ and $L g_{!}$define mutually inverse functors

$$
D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right) \stackrel{g^{-1}}{\underset{L g!}{\rightleftarrows}} D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse }, \text { etale }}}\right)
$$

(2) Let $\mathcal{F}^{\bullet}$ be an object of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$. With $g$ as in Cohomology of Stacks, Lemma 84.11.2 for the flat-fppf site we have
(a) $g^{-1} \mathcal{F}^{\bullet}$ is in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$,
(b) $g^{-1} \mathcal{F}^{\bullet}=0$ if and only if $\mathcal{F}^{\bullet}$ is in $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$,
(c) $L g!\mathcal{H}^{\bullet}$ is in $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ for $\mathcal{H}^{\bullet}$ in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$, and
(d) the functors $g^{-1}$ and $L g_{!}$define mutually inverse functors

$$
D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right) \stackrel{g^{-1}}{\stackrel{\longleftrightarrow}{L g!}} D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{f l a t, f p p f}}\right)
$$

Proof. The functor $g^{-1}$ is exact, hence (1)(a), (2)(a), (1)(b), and (2)(b) follow from Cohomology of Stacks, Lemmas 84.12.3 and 84.11.5.
Proof of (1)(c) and (2)(c). The construction of $L g_{!}$in Lemma 85.3.1 (via Cohomology on Sites, Lemma 21.28.1 which in turn uses Derived Categories, Proposition 13.28 .2 shows that $L g_{\text {! on }}$ on object $\mathcal{H}^{\bullet}$ of $D\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right)$ is computed as

$$
L g_{!} \mathcal{H}^{\bullet}=\operatorname{colim} g!\mathcal{K}_{n}^{\bullet}=g!\operatorname{colim} \mathcal{K}_{n}^{\bullet}
$$

(termwise colimits) where the quasi-isomorphism $\operatorname{colim} \mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ induces quasiisomorphisms $\mathcal{K}_{n}^{\bullet} \rightarrow \tau_{\leq n} \mathcal{H}^{\bullet}$. Since $\mathcal{M}_{\mathcal{X}} \subset \operatorname{Mod}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)\left(\right.$ resp. $\left.\mathcal{M}_{\mathcal{X}} \subset \operatorname{Mod}\left(\mathcal{O}_{\mathcal{X}}\right)\right)$
is preserved under colimits we see that it suffices to prove (c) on bounded above complexes $\mathcal{H}^{\bullet}$ in $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,étale }}}\right)$ (resp. $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {flat,fppf }}}\right)$ ). In this case to show that $H^{n}\left(L g!\mathcal{H}^{\bullet}\right)$ is in $\mathcal{M}_{\mathcal{X}}$ we can argue by induction on the integer $m$ such that $\mathcal{H}^{i}=0$ for $i>m$. If $m<n$, then $H^{n}\left(L g_{!} \mathcal{H}^{\bullet}\right)=0$ and the result holds. In general consider the distinguished triangle

$$
\tau_{\leq m-1} \mathcal{H}^{\bullet} \rightarrow \mathcal{H}^{\bullet} \rightarrow H^{m}\left(\mathcal{H}^{\bullet}\right)[-m] \rightarrow \ldots
$$

(Derived Categories, Remark 13.12.4) and apply the functor $L g_{!}$. Since $\mathcal{M}_{\mathcal{X}}$ is a weak Serre subcategory of the module category it suffices to prove (c) for two out of three. We have the result for $L g_{!} \tau_{\leq m-1} \mathcal{H}^{\bullet}$ by induction and we have the result for $L g_{!} H^{m}\left(\mathcal{H}^{\bullet}\right)[-m]$ by Lemma 85.3.3. Whence (c) holds.
Let us prove $(2)(\mathrm{d})$. By $(2)(\mathrm{a})$ and $(2)(\mathrm{b})$ the functor $g^{-1}=g^{*}$ induces a functor

$$
c: D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{f l a t, f p p f}}\right)
$$

see Derived Categories, Lemma 13.6.8. Thus we have the following diagram of triangulated categories

where $q$ is the quotient functor, the inner triangle is commutative, and $g^{-1} L g_{!}=\mathrm{id}$. For any object of $E$ of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ the map $a: L g!g^{-1} E \rightarrow E$ maps to a quasiisomorphism in $D\left(\mathcal{O}_{\mathcal{X}_{f l a t, f p p f}}\right)$. Hence the cone on $a$ maps to zero under $g^{-1}$ and by $(2)(\mathrm{b})$ we see that $q(a)$ is an isomorphism. Thus $q \circ L g!$ is a quasi-inverse to $c$. In the case of the lisse-étale site exactly the same argument as above proves that

$$
D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right) / D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{X}_{\text {étale }}, \mathcal{O}_{\mathcal{X}}\right)
$$

is equivalent to $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}_{\text {lisse,etale }}}\right)$. Applying the last equivalence of Lemma 85.4.2 finishes the proof.

The following lemma tells us that the quotient functor $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$ is a Bousfield colocalization (insert future reference here).

07BA Lemma 85.4.4. Let $\mathcal{X}$ be an algebraic stack. Let $E$ be an object of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$. There exists a canonical distinguished triangle

$$
E^{\prime} \rightarrow E \rightarrow P \rightarrow E^{\prime}[1]
$$

in $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ such that $P$ is in $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ and

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{X}}\right)}\left(E^{\prime}, P^{\prime}\right)=0
$$

for all $P^{\prime}$ in $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$.
Proof. Consider the morphism of ringed topoi $g: \operatorname{Sh}\left(\mathcal{X}_{\text {flat,fppf }}\right) \longrightarrow \operatorname{Sh}\left(\mathcal{X}_{f p p f}\right)$. Set $E^{\prime}=L g!g^{-1} E$ and let $P$ be the cone on the adjunction map $E^{\prime} \rightarrow E$. Since $g^{-1} E^{\prime} \rightarrow g^{-1} E$ is an isomorphism we see that $P$ is an object of $D_{\mathcal{P}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ by Lemma 85.4.3 (2)(b). Finally, $\operatorname{Hom}\left(E^{\prime}, P^{\prime}\right)=\operatorname{Hom}\left(L g!g^{-1} E, P^{\prime}\right)=\operatorname{Hom}\left(g^{-1} E, g^{-1} P^{\prime}\right)=$ 0 as $g^{-1} P^{\prime}=0$.
Uniqueness. Suppose that $E^{\prime \prime} \rightarrow E \rightarrow P^{\prime}$ is a second distinguished triangle as in the statement of the lemma. Since $\operatorname{Hom}\left(E^{\prime}, P^{\prime}\right)=0$ the morphism $E^{\prime} \rightarrow E$ factors
as $E^{\prime} \rightarrow E^{\prime \prime} \rightarrow E$, see Derived Categories, Lemma 13.4.2. Similarly, the morphism $E^{\prime \prime} \rightarrow E$ factors as $E^{\prime \prime} \rightarrow E^{\prime} \rightarrow E$. Consider the composition $\varphi: E^{\prime} \rightarrow E^{\prime}$ of the $\operatorname{maps} E^{\prime} \rightarrow E^{\prime \prime}$ and $E^{\prime \prime} \rightarrow E^{\prime}$. Note that $\varphi-1: E^{\prime} \rightarrow E^{\prime}$ fits into the commutative diagram

hence factors through $P[-1] \rightarrow E$. Since $\operatorname{Hom}\left(E^{\prime}, P[-1]\right)=0$ we see that $\varphi=1$. Whence the maps $E^{\prime} \rightarrow E^{\prime \prime}$ and $E^{\prime \prime} \rightarrow E^{\prime}$ are inverse to each other.

### 85.5. Derived pushforward of quasi-coherent modules

07 BB As a first application of the material above we construct the derived pushforward. In Examples, Section 88.51 the reader can find an example of a quasi-compact and quasi-separated morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks such that the direct image functor $R f_{*}$ does not induce a functor $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)$. Thus restricting to bounded below complexes is necessary.

07BC Proposition 85.5.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor $R f_{*}$ induces a commutative diagram

and hence induces a functor

$$
R f_{Q C o h, *}: D_{Q C o h}^{+}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{\mathcal{Y}}\right)
$$

on quotient categories. Moreover, the functor $R^{i} f_{Q C o h}$ of Cohomology of Stacks, Proposition 84.10.1 are equal to $H^{i} \circ R f_{Q C o h, *}$ with $H^{i}$ as in 85.4.1.1.

Proof. We have to show that $R f_{*} E$ is an object of $D_{\mathcal{M}_{\mathcal{V}}}^{+}\left(\mathcal{O}_{\mathcal{Y}}\right)$ for $E$ in $D_{\mathcal{M}_{\mathcal{X}}}^{+}\left(\mathcal{O}_{\mathcal{X}}\right)$. This follows from Cohomology of Stacks, Proposition 84.7.4 and the spectral sequence $R^{i} f_{*} H^{j}(E) \Rightarrow R^{i+j} f_{*} E$. The case of parasitic modules works the same way using Cohomology of Stacks, Lemma 84.8.3. The final statement is clear from the definition of $H^{i}$ in 85.4.1.1.

### 85.6. Derived pullback of quasi-coherent modules

07BD Derived pullback of complexes with quasi-coherent cohomology sheaves exists in general.

07BE Proposition 85.6.1. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ be a morphism of algebraic stacks. The exact functor $f^{*}$ induces a commutative diagram

The composition

$$
D_{\mathcal{M}_{\mathcal{Y}}}\left(\mathcal{O}_{\mathcal{Y}}\right) \xrightarrow{f^{*}} D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right) \xrightarrow{q_{\mathcal{X}}} D_{Q \operatorname{Coh}}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

is left deriveable with respect to the localization $D_{\mathcal{M}_{\mathcal{Y}}}\left(\mathcal{O}_{\mathcal{Y}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)$ and we may define $L f_{Q C o h}^{*}$ as its left derived functor

$$
L f_{Q C o h}^{*}: D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{\mathcal{X}}\right)
$$

(see Derived Categories, Definitions 13.15.2 and 13.15.9). If $f$ is quasi-compact and quasi-separated, then $L f_{Q C o h}^{*}$ and $R f_{Q C o h, *}$ satisfy the following adjointness:

$$
\operatorname{Hom}_{D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)}\left(L f_{Q C o h}^{*} A, B\right)=\operatorname{Hom}_{D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(A, R f_{Q C o h, *} B\right)
$$

for $A \in D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)$ and $B \in D_{Q C o h}^{+}\left(\mathcal{O}_{\mathcal{X}}\right)$.
Proof. To prove the first statement, we have to show that $f^{*} E$ is an object of $D_{\mathcal{M}_{\mathcal{X}}}\left(\mathcal{O}_{\mathcal{X}}\right)$ for $E$ in $D_{\mathcal{M}_{\mathcal{Y}}}\left(\mathcal{O}_{\mathcal{Y}}\right)$. Since $f^{*}=f^{-1}$ is exact this follows immediately from the fact that $f^{*}$ maps $\mathcal{M}_{\mathcal{Y}}$ into $\mathcal{M}_{\mathcal{X}}$.
Set $\mathcal{D}=D_{\mathcal{M}_{\mathcal{Y}}}\left(\mathcal{O}_{\mathcal{Y}}\right)$. Let $S$ be the collection of morphisms in $\mathcal{D}$ whose cone is an object of $D_{\mathcal{P}_{\mathcal{Y}}}\left(\mathcal{O}_{\mathcal{Y}}\right)$. Set $\mathcal{D}^{\prime}=D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$. Set $F=q_{\mathcal{X}} \circ f^{*}: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$. Then $\mathcal{D}, S, \mathcal{D}^{\prime}, F$ are as in Derived Categories, Situation 13.15.1 and Definition 13.15.2 Let us prove that $L F(E)$ is defined for any object $E$ of $\mathcal{D}$. Namely, consider the triangle

$$
E^{\prime} \rightarrow E \rightarrow P \rightarrow E^{\prime}[1]
$$

constructed in Lemma 85.4.4. Note that $s: E^{\prime} \rightarrow E$ is an element of $S$. We claim that $E^{\prime}$ computes $L F$. Namely, suppose that $s^{\prime}: E^{\prime \prime} \rightarrow E$ is another element of $S$, i.e., fits into a triangle $E^{\prime \prime} \rightarrow E \rightarrow P^{\prime} \rightarrow E^{\prime \prime}[1]$ with $P^{\prime}$ in $D_{\mathcal{P}_{y}}\left(\mathcal{O}_{\mathcal{Y}}\right)$. By Lemma 85.4 .4 (and its proof) we see that $E^{\prime} \rightarrow E$ factors through $E^{\prime \prime} \rightarrow E$. Thus we see that $E^{\prime} \rightarrow E$ is cofinal in the system $S / E$. Hence it is clear that $E^{\prime}$ computes $L F$. To see the final statement, write $B=q_{\mathcal{X}}(H)$ and $A=q_{\mathcal{Y}}(E)$. Choose $E^{\prime} \rightarrow E$ as above. We will use on the one hand that $R f_{Q C o h, *}(B)=q \mathcal{Y}\left(R f_{*} H\right)$ and on the other that $L f_{Q C o h}^{*}(A)=q_{\mathcal{X}}\left(f^{*} E^{\prime}\right)$.

$$
\begin{aligned}
\operatorname{Hom}_{D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)}\left(L f_{Q C o h}^{*} A, B\right) & =\operatorname{Hom}_{D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)}\left(q_{\mathcal{X}}\left(f^{*} E^{\prime}\right), q_{\mathcal{X}}(H)\right) \\
& =\operatorname{colim}_{H \rightarrow H^{\prime}} \operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{X}}\right)}\left(f^{*} E^{\prime}, H^{\prime}\right) \\
& =\operatorname{colim}_{H \rightarrow H^{\prime}} \operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(E^{\prime}, R f_{*} H^{\prime}\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(E^{\prime}, R f_{*} H\right) \\
& =\operatorname{Hom}_{D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(A, R f_{Q C o h, *} B\right)
\end{aligned}
$$

Here the colimit is over morphisms $s: H \rightarrow H^{\prime}$ in $D_{\mathcal{M}_{\mathcal{X}}}^{+}\left(\mathcal{O}_{\mathcal{X}}\right)$ whose cone $P(s)$ is an object of $D_{\mathcal{P}_{\mathcal{X}}}^{+}\left(\mathcal{O}_{\mathcal{X}}\right)$. The first equality we've seen above. The second equality holds by construction of the Verdier quotient. The third equality holds by Cohomology on Sites, Lemma 21.19.1. Since $R f_{*} P(s)$ is an object of $D_{\mathcal{P}_{\mathcal{V}}}^{+}\left(\mathcal{O}_{\mathcal{Y}}\right)$ by Proposition 85.5 .1 we see that $\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{Y}}\right)}\left(E^{\prime}, R f_{*} P(s)\right)=0$. Thus the fourth equality holds. The final equality holds by construction of $E^{\prime}$.

## CHAPTER 86

## Introducing Algebraic Stacks

### 86.1. Why read this?

072I We give a very informal introduction to algebraic stacks aimed at graduate students and advanced undergraduates. The goal is to quickly introduce a simple language which you can use to think about local and global properties of your favorite moduli problem. Having done this it should be possible to ask yourself well-posed questions about moduli problems and to start solving them, whilst assuming a general theory exists. If you end up with an interesting result, you can go back to the general theory in the other parts of the stacks project and fill in the gaps as needed.

The point of view we take here is very close to the point of view taken in KM85 and Mum65.

### 86.2. Preliminary

072J Let $S$ be a scheme. An elliptic curve over $S$ is a triple $(E, f, 0)$ where $E$ is a scheme and $f: E \rightarrow S$ and $0: S \rightarrow E$ are morphisms of schemes such that
(1) $f: E \rightarrow S$ is proper, smooth of relative dimension 1 ,
(2) for every $s \in S$ the fibre $E_{s}$ is a connected curve of genus 1, i.e., $H^{0}\left(E_{s}, \mathcal{O}\right)$ and $H^{1}\left(E_{s}, \mathcal{O}\right)$ both are 1-dimensional $\kappa(s)$-vector spaces, and
(3) 0 is a section of $f$.

Given elliptic curves $(E, f, 0) / S$ and $\left(E^{\prime}, f^{\prime}, 0^{\prime}\right) / S^{\prime}$ a morphism of elliptic curves over $a: S \rightarrow S^{\prime}$ is a morphism $\alpha: E \rightarrow E^{\prime}$ such that the diagram

is commutative and the inner square is cartesian, in other words the morphism $\alpha$ induces an isomorphism $E \rightarrow S \times{ }_{S^{\prime}} E^{\prime}$. We are going to define the stack of elliptic curves $\mathcal{M}_{1,1}$. In the rest of the stacks project we work out the method introduced in Deligne and Mumford's paper DM69 which consists in presenting $\mathcal{M}_{1,1}$ as a category endowed with a functor

$$
p: \mathcal{M}_{1,1} \longrightarrow S c h, \quad(E, f, 0) / S \longmapsto S
$$

This means you work with fibred categories over the categories of schemes, topologies, stacks fibred in groupoids, coverings, etc, etc. In this chapter we throw all of that out of the window and we think about it a bit differently - probably closer to how the initiators of the theory started thinking about it themselves.

### 86.3. The moduli stack of elliptic curves

072 K Here is what we are going to do:
(1) Start with your favorite category of schemes Sch.
(2) Add a new symbol $\mathcal{M}_{1,1}$.
(3) A morphism $S \rightarrow \mathcal{M}_{1,1}$ is an elliptic curve $(E, f, 0)$ over $S$.
(4) A diagram

is commutative if and only if there exists a morphism $\alpha: E \rightarrow E^{\prime}$ of elliptic curves over $a: S \rightarrow S^{\prime}$. We say $\alpha$ witnesses the commutativity of the diagram.
(5) Note that commutative diagrams glue as follows

because $\alpha^{\prime} \circ \alpha$ witnesses the commutativity of the outer triangle if $\alpha$ and $\alpha^{\prime}$ witness the commutativity of the left and right triangles.
(6) The composition

$$
S \xrightarrow{a} S^{\prime} \xrightarrow{\left(E^{\prime}, f^{\prime}, 0^{\prime}\right)} \mathcal{M}_{1,1}
$$

is given by $\left(E^{\prime} \times{ }_{S^{\prime}} S, f^{\prime} \times{ }_{S^{\prime}} S, 0^{\prime} \times{ }_{S^{\prime}} S\right)$.
At the end of this procedure we have enlarged the category $S c h$ of schemes with exactly one object...
Except that we haven't defined what a morphism from $\mathcal{M}_{1,1}$ to a scheme $T$ is. The answer is that it is the weakest possible notion such that compositions make sense. Thus a morphism $F: \mathcal{M}_{1,1} \rightarrow T$ is a rule which to every elliptic curve $(E, f, 0) / S$ associates a morphism $F(E, f, 0): S \rightarrow T$ such that given any commutative diagram

the diagram

is commutative also. An example is the $j$-invariant

$$
j: \mathcal{M}_{1,1} \longrightarrow \mathbf{A}_{\mathbf{Z}}^{1}
$$

which you may have heard of. Aha, so now we're done...

Except, no we're not! We still have to define a notion of morphisms $\mathcal{M}_{1,1} \rightarrow \mathcal{M}_{1,1}$. This we do in exactly the same way as before, i.e., a morphism $F: \mathcal{M}_{1,1} \rightarrow \mathcal{M}_{1,1}$ is a rule which to every elliptic curve $(E, f, 0) / S$ associates another elliptic curve $F(E, f, 0)$ preserving commutativity of diagrams as above. However, since I don't know of a nontrivial example of such a functor, I'll just define the set of morphisms from $\mathcal{M}_{1,1}$ to itself to consist of the identity for now.
I hope you see how to add other objects to this enlarged category. Somehow it seems intuitively clear that given any "well-behaved" moduli problem we can perform the construction above and add an object to our category. In fact, much of modern day algebraic geometry takes place in such a universe where $S c h$ is enlarged with countably many (explicitly constructed) moduli stacks.
You may object that the category we obtain isn't a category because there is a "vagueness" about when diagrams commute and which combinations of diagrams continue to commute as we have to produce a witness to the commutativity. However, it turns out that this, the idea of having witnesses to commutativity, is a valid approach to 2-categories! Thus we stick with it.

### 86.4. Fibre products

072 L The question we pose here is what should be the fibre product

The answer: A morphism from a scheme $T$ into ? should be a triple ( $a, a^{\prime}, \alpha$ ) where $a: T \rightarrow S, a^{\prime}: T \rightarrow S^{\prime}$ are morphisms of schemes and where $\alpha: E \times{ }_{S, a} T \rightarrow$ $E^{\prime} \times{ }_{S^{\prime}, a^{\prime}} T$ is an isomorphism of elliptic curves over $T$. This makes sense because of our definition of composition and commutative diagrams earlier in the discussion.

072M Lemma 86.4.1 (Key fact). The functor Sch ${ }^{\text {opp }} \rightarrow$ Sets, $T \mapsto\left\{\left(a, a^{\prime}, \alpha\right)\right.$ as above $\}$ is representable by a scheme $S \times_{\mathcal{M}_{1,1}} S^{\prime}$.

Proof. Idea of proof. Relate this functor to

$$
\operatorname{Isom}_{S \times S^{\prime}}\left(E \times S^{\prime}, S \times E^{\prime}\right)
$$

and use Grothendieck's theory of Hilbert schemes.
072N Remark 86.4.2. We have the formula $S \times_{\mathcal{M}_{1,1}} S^{\prime}=\left(S \times S^{\prime}\right) \times_{\mathcal{M}_{1,1} \times \mathcal{M}_{1,1}} \mathcal{M}_{1,1}$. Hence the key fact is a property of the diagonal $\Delta_{\mathcal{M}_{1,1}}$ of $\mathcal{M}_{1,1}$.

In any case the key fact allows us to make the following definition.
072P Definition 86.4.3. We say a morphism $S \rightarrow \mathcal{M}_{1,1}$ is smooth if for every morphism $S^{\prime} \rightarrow \mathcal{M}_{1,1}$ the projection morphism

$$
S \times_{\mathcal{M}_{1,1}} S^{\prime} \longrightarrow S^{\prime}
$$

is smooth.

Note that this is compatible with the notion of a smooth morphism of schemes as the base change of a smooth morphism is smooth. Moreover, it is clear how to extend this definition to other properties of morphisms into $\mathcal{M}_{1,1}$ (or your own favorite moduli stack). In particular we will use it below for surjective morphisms.

### 86.5. The definition

072Q We'll formulate it as a definition and not as a result since we expect the reader to try out other cases (not just the stack $\mathcal{M}_{1,1}$ and not just $S c h$ the category of all schemes).

072R Definition 86.5.1. We say $\mathcal{M}_{1,1}$ is an algebraic stack if and only if
(1) We have descent for objects for the étale topology on $S c h$.
(2) The key fact holds.
(3) there exists a surjective and smooth morphism $S \rightarrow \mathcal{M}_{1,1}$.

The first condition is a "sheaf property". We're going to spell it out since there is a technical point we should make. Suppose given a scheme $S$ and an étale covering $\left\{S_{i} \rightarrow S\right\}$ and morphisms $e_{i}: S_{i} \rightarrow \mathcal{M}_{1,1}$ such that the diagrams

commute. The sheaf condition does not guarantee the existence of a morphism $e: S \rightarrow \mathcal{M}_{1,1}$ in this situation. Namely, we need to pick witnesses $\alpha_{i j}$ for the diagrams above and require that

$$
\operatorname{pr}_{02}^{*} \alpha_{i k}=\operatorname{pr}_{12} \alpha_{j k} \circ \operatorname{pr}_{01}^{*} \alpha_{i j}
$$

as witnesses over $S_{i} \times_{S} S_{j} \times{ }_{S} S_{k}$. I think it is clear what this means... If not, then I'm afraid you'll have to read some of the material on categories fibred in groupoids, etc. In any case, the displayed equation is often called the cocycle condition. A more precise statement of the "sheaf property" is: given $\left\{S_{i} \rightarrow S\right\}, e_{i}: S_{i} \rightarrow \mathcal{M}_{1,1}$ and witnesses $\alpha_{i j}$ satisfying the cocycle condition, there exists a unique (up to unique isomorphism) $e: S \rightarrow \mathcal{M}_{1,1}$ with $\left.e_{i} \cong e\right|_{S_{i}}$ recovering the $\alpha_{i j}$.
As you can see even formulating a precise statement takes a bit of work. The proof of this "sheaf property" relies on a fundamental technique in algebraic geometry, namely descent theory. My suggestion is to initially simply accept the "sheaf property" holds, and see what it implies in practice. In fact, a certain amount of mental agility is required to boil the "sheaf property" down to a manageable statement that you can fit on a napkin. Perhaps the simplest variant which is already a bit interesting is the following: Suppose we have a Galois extension $K \subset L$ of fields with Galois group $G=\operatorname{Gal}(L / K)$. Set $T=\operatorname{Spec}(L)$ and $S=\operatorname{Spec}(K)$. Then $\{T \rightarrow S\}$ is an étale covering. Let $(E, f, 0)$ be an elliptic curve over $L$. (Yes, this just means that $E \subset \mathbf{P}_{L}^{2}$ is given by a Weierstrass equation and 0 is the usual point at infinity.) Denote $E_{\sigma}=E \times_{T, \operatorname{Spec}(\sigma)} T$ the base change. (Yes, this corresponds to applying $\sigma$ to the coefficients of the Weierstrass equation, or is it $\sigma^{-1}$ ?) Now, suppose moreover that for every $\sigma \in G$ we are given an isomorphism

$$
\alpha_{\sigma}: E \longrightarrow E_{\sigma}
$$

over $T$. The cocycle condition above means in this situation that

$$
\left(\alpha_{\tau}\right)^{\sigma} \circ \alpha_{\sigma}=\alpha_{\tau \sigma}
$$

for $\sigma, \tau \in G$. If you've ever done any group cohomology then this should be familiar. Anyway, the "glueing" condition on $\mathcal{M}_{1,1}$ says that if you have a solution to this set of equations, then there exists an elliptic curve $E^{\prime}$ over $S$ such that $E \cong E \times_{S} T$ (it says a little bit more because it also tells you how to recover the $\alpha_{\sigma}$ ).
Challenge: Can you prove this entirely using only elliptic curves defined in terms of Weierstrass equations?

### 86.6. A smooth cover

072 S The last thing we have to do is find a smooth cover of $\mathcal{M}_{1,1}$. In fact, in some sense the existence of a smooth cover implie ${ }^{11}$ the key fact! In the case of elliptic curves we use the Weierstrass equation to construct one.
Set

$$
W=\operatorname{Spec}\left(\mathbf{Z}\left[a_{1}, a_{2}, a_{3}, a_{4}, a_{6}, 1 / \Delta\right]\right)
$$

where $\Delta \in \mathbf{Z}\left[a_{1}, a_{2}, a_{3}, a_{4}, a_{6}\right]$ is a certain polynomial (see below). Set

$$
\mathbf{P}_{W}^{2} \supset E_{W}: z y^{2}+a_{1} x y z+a_{3} y z^{2}=x^{3}+a_{2} x^{2} z+a_{4} x z^{3}+a_{6} z^{3} .
$$

Denote $f_{W}: E_{W} \rightarrow W$ the projection. Finally, denote $0_{W}: W \rightarrow E_{W}$ the section of $f_{W}$ given by $(0: 1: 0)$. It turns out that there is a degree 12 homogeneous polynomial $\Delta$ in $a_{i}$ where $\operatorname{deg}\left(a_{i}\right)=i$ such that $E_{W} \rightarrow W$ is smooth. You can find it explicitly by computing partials of the Weierstrass equation - of course you can also look it up. You can also use pari/gp to compute it for you. Here it is

$$
\begin{aligned}
\Delta & =-a_{6} a_{1}^{6}+a_{4} a_{3} a_{1}^{5}+\left(\left(-a_{3}^{2}-12 a_{6}\right) a_{2}+a_{4}^{2}\right) a_{1}^{4}+ \\
& \left(8 a_{4} a_{3} a_{2}+\left(a_{3}^{3}+36 a_{6} a_{3}\right)\right) a_{1}^{3}+ \\
& \left(\left(-8 a_{3}^{2}-48 a_{6}\right) a_{2}^{2}+8 a_{4}^{2} a_{2}+\left(-30 a_{4} a_{3}^{2}+72 a_{6} a_{4}\right)\right) a_{1}^{2}+ \\
& \left(16 a_{4} a_{3} a_{2}^{2}+\left(36 a_{3}^{3}+144 a_{6} a_{3}\right) a_{2}-96 a_{4}^{2} a_{3}\right) a_{1}+ \\
& \left(-16 a_{3}^{2}-64 a_{6}\right) a_{2}^{3}+16 a_{4}^{2} a_{2}^{2}+\left(72 a_{4} a_{3}^{2}+288 a_{6} a_{4}\right) a_{2}+ \\
& -27 a_{3}^{4}-216 a_{6} a_{3}^{2}-64 a_{4}^{3}-432 a_{6}^{2}
\end{aligned}
$$

You may recognize the last two terms from the case $y^{2}=x^{3}+A x+B$ having discriminant $-64 A^{3}-432 B^{2}=-16\left(4 A^{3}+27 B^{2}\right)$.

072 T Lemma 86.6.1. The morphism $W \xrightarrow{\left(E_{W}, f_{W}, 0_{W}\right)} \mathcal{M}_{1,1}$ is smooth and surjective.
Proof. Surjectivity follows from the fact that every elliptic curve over a field has a Weierstrass equation. We give a very rough sketch of one way to prove smoothness. Consider the sub group scheme

$$
H=\left\{\left.\left(\begin{array}{ccc}
u^{2} & s & 0 \\
0 & u^{3} & 0 \\
r & t & 1
\end{array}\right) \right\rvert\, \begin{array}{c}
u \text { unit } \\
s, r, t \text { arbitrary }
\end{array}\right\} \subset \mathrm{GL}_{3, \mathbf{Z}}
$$

[^224]There is an action $H \times W \rightarrow W$ of $H$ on the Weierstrass scheme $W$. To find the equations for this action write out what a coordinate change given by a matrix in $H$ does to the general Weierstrass equation. Then it turns out the following statements hold
(1) any elliptic curve $(E, f, 0) / S$ has Zariski locally on $S$ a Weierstrass equation,
(2) any two Weierstrass equations for $(E, f, 0)$ differ (Zariski locally) by an element of $H$.
Considering the fibre product $S \times_{\mathcal{M}_{1,1}} W=\operatorname{Isom}_{S \times W}\left(E \times W, S \times E_{W}\right)$ we conclude that this means that the morphism $W \rightarrow \mathcal{M}_{1,1}$ is an $H$-torsor. Since $H \rightarrow \operatorname{Spec}(\mathbf{Z})$ is smooth, and since torsors over smooth group schemes are smooth we win.

072U Remark 86.6.2. The argument sketched above actually shows that $\mathcal{M}_{1,1}=$ $[W / H]$ is a global quotient stack. It is true about $50 \%$ of the time that an argument proving a moduli stack is algebraic will show that it is a global quotient stack.

### 86.7. Properties of algebraic stacks

072 V Ok, so now we know that $\mathcal{M}_{1,1}$ is an algebraic stack. What can we do with this? Well, it isn't so much the fact that it is an algebraic stack that helps us here, but more the point of view that properties of $\mathcal{M}_{1,1}$ should be encoded in the properties of morphisms $S \rightarrow \mathcal{M}_{1,1}$, i.e., in families of elliptic curves. We list some examples

## Local properties:

$$
\mathcal{M}_{1,1} \rightarrow \operatorname{Spec}(\mathbf{Z}) \text { is smooth } \Leftrightarrow W \rightarrow \operatorname{Spec}(\mathbf{Z}) \text { is smooth }
$$

Idea. Local properties of an algebraic stack are encoded in the local properties of its smooth cover.

## Global properties:

$\mathcal{M}_{1,1}$ is quasi-compact $\Leftarrow W$ is quasi-compact
$\mathcal{M}_{1,1}$ is irreducible $\Leftarrow W$ is irreducible
Idea. Some global properties of an algebraic stack can be read off from the corresponding property of a suitabl $\ell^{2}$ smooth cover.

## Quasi-coherent sheaves:

$$
Q \operatorname{Coh}\left(\mathcal{O}_{\mathcal{M}_{1,1}}\right)=H \text {-equivariant quasi-coherent modules on } W
$$

Idea. On the one hand a quasi-coherent module on $\mathcal{M}_{1,1}$ should correspond to a quasi-coherent sheaf $\mathcal{F}_{S, e}$ on $S$ for each morphism $e: S \rightarrow \mathcal{M}_{1,1}$. In particular for the morphism $\left(E_{W}, f_{W}, 0_{W}\right): W \rightarrow \mathcal{M}_{1,1}$. Since this morphism is $H$-equivariant we see the quasi-coherent module $\mathcal{F}_{W}$ we obtain is $H$-equivariant. Conversely, given an $H$-equivariant module we can recover the sheaves $\mathcal{F}_{S, e}$ by descent theory starting with the observation that $S \times_{e, \mathcal{M}_{1,1}} W$ is an $H$-torsor.
Picard group:

$$
\operatorname{Pic}\left(\mathcal{M}_{1,1}\right)=\operatorname{Pic}_{H}(W)=\mathbf{Z} / 12 \mathbf{Z}
$$

[^225]Idea. We have seen the first equality above. Note that $\operatorname{Pic}(W)=0$ because the ring $\mathbf{Z}\left[a_{1}, a_{2}, a_{3}, a_{4}, a_{6}, 1 / \Delta\right]$ has trivial class group. There is an exact sequence

$$
\mathbf{Z} \Delta \rightarrow \operatorname{Pic}_{H}\left(\mathbf{A}_{\mathbf{Z}}^{5}\right) \rightarrow \operatorname{Pic}_{H}(W) \rightarrow 0
$$

The middle group equals $\operatorname{Hom}\left(H, \mathbf{G}_{m}\right)=\mathbf{Z}$. The image $\Delta$ is 12 because $\Delta$ has degree 12. This argument is roughly correct, see [FO10].
Étale cohomology: Let $\Lambda$ be a ring. There is a first quadrant spectral sequence converging to $H_{\text {étale }}^{p+q}\left(\mathcal{M}_{1,1}, \Lambda\right)$ with $E_{2}$-page

$$
E_{2}^{p, q}=H_{\text {étale }}^{q}(W \times H \times \ldots \times H, \Lambda) \quad(p \text { factors } H)
$$

Idea. Note that

$$
W \times_{\mathcal{M}_{1,1}} W \times_{\mathcal{M}_{1,1}} \ldots \times_{\mathcal{M}_{1,1}} W=W \times H \times \ldots \times H
$$

because $W \rightarrow \mathcal{M}_{1,1}$ is a $H$-torsor. The spectral sequence is the Čech-to-cohomology spectral sequence for the smooth cover $\left\{W \rightarrow \mathcal{M}_{1,1}\right\}$. For example we see that $H_{\text {étale }}^{0}\left(\mathcal{M}_{1,1}, \Lambda\right)=\Lambda$ because $W$ is connected, and $H_{\text {étale }}^{1}\left(\mathcal{M}_{1,1}, \Lambda\right)=0$ because $H_{\text {étale }}^{1}(W, \Lambda)=0$ (of course this requires a proof). Of course, the smooth covering $W \rightarrow \mathcal{M}_{1,1}$ may not be "optimal" for the computation of étale cohomology.

## CHAPTER 87

## More on Morphisms of Stacks

0BPK

### 87.1. Introduction

0BPL In this chapter we continue our study of properties of morphisms of algebraic stacks. A reference in the case of quasi-separated algebraic stacks with representable diagonal is LMB00.

### 87.2. Conventions and abuse of language

0BPM We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 82.2,

### 87.3. Thickenings

0BPN The following terminology may not be completely standard, but it is convenient. If $\mathcal{Y}$ is a closed substack of an algebraic stack $\mathcal{X}$, then the morphism $\mathcal{Y} \rightarrow \mathcal{X}$ is representable.

0BPP Definition 87.3.1. Thickenings.
(1) We say an algebraic stack $\mathcal{X}^{\prime}$ is a thickening of an algebraic stack $\mathcal{X}$ if $\mathcal{X}$ is a closed substack of $\mathcal{X}^{\prime}$ and the associated topological spaces are equal.
(2) Given two thickenings $\mathcal{X} \subset \mathcal{X}^{\prime}$ and $\mathcal{Y} \subset \mathcal{Y}^{\prime}$ a morphism of thickenings is a morphism $f^{\prime}: \mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ of algebraic stacks such that $\left.f^{\prime}\right|_{\mathcal{X}}$ factors through the closed substack $\mathcal{Y}$. In this situation we set $f=\left.f^{\prime}\right|_{\mathcal{X}}: \mathcal{X} \rightarrow \mathcal{Y}$ and we say that $\left(f, f^{\prime}\right):\left(\mathcal{X} \subset \mathcal{X}^{\prime}\right) \rightarrow\left(\mathcal{Y} \subset \mathcal{Y}^{\prime}\right)$ is a morphism of thickenings.
(3) Let $\mathcal{Z}$ be an algebraic stack. We similarly define thickenings over $\mathcal{Y}$ and morphisms of thickenings over $\mathcal{Y}$. This means that the algebraic stacks $\mathcal{X}^{\prime}$ and $\mathcal{Y}^{\prime}$ are algebraic stack endowed with a structure morphism to $\mathcal{Z}$ and that $f^{\prime}$ fits into a suitable 2-commutative diagram of algebraic stacks.

Let $\mathcal{X} \subset \mathcal{X}^{\prime}$ be a thickening of algebraic stacks. Let $U^{\prime}$ be a scheme and let $U^{\prime} \rightarrow \mathcal{X}^{\prime}$ be a surjective smooth morphism. Setting $U=\mathcal{X} \times \mathcal{X}^{\prime} U^{\prime}$ we obtain a morphism of thickenings

$$
\left(U \subset U^{\prime}\right) \longrightarrow\left(\mathcal{X} \subset \mathcal{X}^{\prime}\right)
$$

and $U \rightarrow \mathcal{X}$ is a surjective smooth morphism. We can often deduce properties of the thickening $\mathcal{X} \subset \mathcal{X}^{\prime}$ from the corresponding properties of the thickening $U \subset U^{\prime}$. Sometimes, by abuse of language, we say that a morphism $\mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is a thickening if it is a closed immersion inducing a bijection $|\mathcal{X}| \rightarrow\left|\mathcal{X}^{\prime}\right|$. By More on Morphisms of Spaces, Lemmas 63.9.10 and 63.9.8. the property $P$ that a morphism of algebraic spaces is a (first order) thickening is fpqc local on the base and stable under base change. Thus an alternative definition of a thickening of algebraic stacks is that it
is a morphism of algebraic stacks which is representable by algebraic spaces having property $P$, see Properties of Stacks, Section 82.3 . We will use this without further mention. In particular this allows us to define a first order thickening as follows.

0BPQ Definition 87.3.2. We say an algebraic stack $\mathcal{X}^{\prime}$ is a first order thickening of an algebraic stack $\mathcal{X}$ if $\mathcal{X}$ is a closed substack of $\mathcal{X}^{\prime}$ and $\mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is a first order thickening in the sense of Properties of Stacks, Section 82.3 .
If $\left(U \subset U^{\prime}\right) \rightarrow\left(\mathcal{X} \subset \mathcal{X}^{\prime}\right)$ is a smooth cover by a scheme as above, then this simply means that $U \subset U^{\prime}$ is a first order thickening. Next we formulate the obligatory lemmas.

0BPR Lemma 87.3.3. Let $\mathcal{Y} \subset \mathcal{Y}^{\prime}$ be a thickening of algebraic stacks. Let $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ be a morphism of algebraic stacks and set $\mathcal{X}=\mathcal{Y}{\times \mathcal{Y}^{\prime}} \mathcal{X}^{\prime}$. Then $\left(\mathcal{X} \subset \mathcal{X}^{\prime}\right) \rightarrow\left(\mathcal{Y} \subset \mathcal{Y}^{\prime}\right)$ is a morphism of thickenings. If $\mathcal{Y} \subset \mathcal{Y}^{\prime}$ is a first order thickening, then $\mathcal{X} \subset \mathcal{X}^{\prime}$ is a first order thickening.

Proof. See discussion above, Properties of Stacks, Section 82.3, and More on Morphisms of Spaces, Lemma 63.9.8.

0BPS Lemma 87.3.4. If $\mathcal{X} \subset \mathcal{X}^{\prime}$ and $\mathcal{X}^{\prime} \subset \mathcal{X}^{\prime \prime}$ are thickenings of algebraic stacks, then so is $\mathcal{X} \subset \mathcal{X}^{\prime \prime}$.

Proof. See discussion above, Properties of Stacks, Section 82.3, and More on Morphisms of Spaces, Lemma 63.9.9

0BPT Example 87.3.5. Let $\mathcal{X}^{\prime}$ be an algebraic stack. Then $\mathcal{X}^{\prime}$ is a thickening of the reduction $\mathcal{X}_{\text {red }}^{\prime}$, see Properties of Stacks, Definition 82.10.4. Moreover, if $\mathcal{X} \subset \mathcal{X}^{\prime}$ is a thickening of algebraic stacks, then $\mathcal{X}_{\text {red }}^{\prime}=\mathcal{X}_{\text {red }} \subset \mathcal{X}$. In other words, $\mathcal{X}=\mathcal{X}_{\text {red }}^{\prime}$ if and only if $\mathcal{X}$ is a reduced algebraic stack.

0BPU Lemma 87.3.6. Let $\mathcal{X} \rightarrow Y$ be a morphism from an algebraic stack to an algebraic space. Then the canonical diagram

is cartesian.
Proof. Observe that the right vertical arrow in the diagram is a thickening by Example 87.3 .5 and Lemmas 87.3 .4 and 87.3.3. Hence the projection

$$
\mathcal{X} \times_{\left(\mathcal{X} \times{ }_{Y} \mathcal{X}\right)}\left(\mathcal{X}_{\text {red }} \times_{Y} \mathcal{X}_{\text {red }}\right) \longrightarrow \mathcal{X}
$$

is a thickening (Lemma 87.3.3). Hence by Example 87.3 .5 it suffices to prove that the source of this arrow is reduced.

Let $U \rightarrow \mathcal{X}$ be a surjective smooth morphism where $U$ is a scheme. Then $U \times{ }_{Y} U \rightarrow$ $\mathcal{X} \times_{Y} \mathcal{X}$ and $U_{\text {red }} \times_{Y} U_{\text {red }} \rightarrow \mathcal{X}_{\text {red }} \times_{Y} \mathcal{X}_{\text {red }}$ are smooth and surjective. Juggling with 2-fibre products (as in Algebraic Stacks, Lemma 76.10.11) we see that

$$
R=U \times_{\mathcal{X}} U=\mathcal{X} \times_{\left(\mathcal{X} \times_{Y} \mathcal{X}\right)}\left(U \times_{Y} U\right)
$$

is an algebraic space smooth over $\mathcal{X}$. Moreover, we obtain a commutative diagram

with 2 -cartesian squares and smooth vertical arrows. Since the lower right arrow is a closed immersion, we see that

$$
R \times_{\left(U \times_{Y} U\right)}\left(U_{\text {red }} \times_{Y} U_{\text {red }}\right)
$$

is an algebraic space with a smooth surjective morphism towards $\mathcal{X} \times\left(\mathcal{X} \times_{Y} \mathcal{X}\right)$ $\left(\mathcal{X}_{\text {red }} \times_{Y} \mathcal{X}_{\text {red }}\right)$. It now suffices to show this algebraic space is reduced.
The morphism

$$
R \times_{U \times_{Y} U}\left(U_{\text {red }} \times_{Y} U_{\text {red }}\right) \longrightarrow R \times_{U \times_{Y} U}\left(U_{\text {red }} \times_{Y} U\right)
$$

induced by the closed immersion $U_{r e d} \rightarrow U$ is a thickening and so it suffices to show that its target is reduced. This target may be identified with $R \times_{U} U_{r e d}$ (the fibre product being taken with respect to the first projection $R \rightarrow U$ ). The projection from this fibre product onto $U_{\text {red }}$ is smooth (being the base-change of the projection $R \rightarrow U$, which is smooth as $R=U \times_{\mathcal{X}} U$ and as $U \rightarrow \mathcal{X}$ is smooth), and thus this fibre product is indeed reduced, as we wanted to show.

0BPV Lemma 87.3.7. Let $\mathcal{X} \subset \mathcal{X}^{\prime}$ be a thickening of algebraic stacks over an algebraic space $Y$. Let $\Delta: \mathcal{X} \rightarrow \mathcal{X} \times_{Y} \mathcal{X}$ and $\Delta^{\prime}: \mathcal{X}^{\prime} \rightarrow \mathcal{X}^{\prime} \times_{Y} \mathcal{X}^{\prime}$ be the corresponding diagonal morphisms. Then each property from the following list is satisfied by $\Delta$ if and only if it is satisfied by $\Delta^{\prime}$ : (a) representable by schemes, (b) affine, (c) surjective, (d) quasi-compact, (e) universally closed, (f) integral, (g) quasi-separated, ( $h$ ) separated, ( $i$ ) universally injective, ( $j$ ) universally open, ( $k$ ) locally quasi-finite, ( $l$ ) finite, ( $m$ ) unramified, ( $n$ ) monomorphism, (o) immersion, ( $p$ ) closed immersion, and (q) proper.

Proof. Observe that

$$
\left(\mathcal{X} \subset \mathcal{X}^{\prime}\right) \longrightarrow\left(\mathcal{X} \times_{Y} \mathcal{X} \subset \mathcal{X}^{\prime} \times_{Y} \mathcal{X}^{\prime}\right)
$$

is a morphism of thickenings. Moreover $\Delta$ and $\Delta^{\prime}$ are representable by algebraic spaces by Morphisms of Stacks, Lemma 83.3.3. Hence, via the discussion in Properties of Stacks, Section 82.3 the lemma follows for cases (a), (b), (c), (d), (e), (f), (g), (h), (i), and (j) by using More on Morphisms of Spaces, Lemma 63.9.11.

Note that $\mathcal{X}$ and $\mathcal{X}^{\prime}$ have the same underlying reduced substack, say $\mathcal{X}_{\text {red }}$, and so it suffices to prove the proposition in the case of the thickening $\mathcal{X}_{\text {red }} \rightarrow \mathcal{X}$. In this case Lemma 87.3 .6 tells us that $\mathcal{X}=\left(\mathcal{X} \times_{Y} \mathcal{X}\right) \times_{\left(\mathcal{X}^{\prime} \times_{Y} \mathcal{X}^{\prime}\right)} \mathcal{X}^{\prime}$. Moreover, $\Delta$ and $\Delta^{\prime}$ are locally of finite type by the aforementioned Morphisms of Stacks, Lemma 83.3.3. Hence the result for cases (k), (l), (m), (n), (o), (p), and (q) by using More on Morphisms of Spaces, Lemma 63.9.13.

As a consequence we obtain the following pleasing result.
0BPW Lemma 87.3.8. Let $\mathcal{X} \subset \mathcal{X}^{\prime}$ be a thickening of algebraic stacks. Then
(1) $\mathcal{X}$ is an algebraic space if and only if $\mathcal{X}^{\prime}$ is an algebraic space,
(2) $\mathcal{X}$ is a scheme if and only if $\mathcal{X}^{\prime}$ is a scheme,
(3) $\mathcal{X}$ is $D M$ if and only if $\mathcal{X}^{\prime}$ is $D M$,
(4) $\mathcal{X}$ is quasi-DM if and only if $\mathcal{X}^{\prime}$ is quasi-DM,
(5) $\mathcal{X}$ is separated if and only if $\mathcal{X}^{\prime}$ is separated,
(6) $\mathcal{X}$ is quasi-separated if and only if $\mathcal{X}^{\prime}$ is quasi-separated, and
(7) add more here.

Proof. In each case we reduce to a question about the diagonal and then we use Lemma 87.3.7.

Case (1). An algebraic stack is an algebraic space if and only if its diagonal is a monomorphism, see Morphisms of Stacks, Lemma 83.6.2 (this also follows immediately from Algebraic Stacks, Proposition 76.13.3).
Case (2). By (1) we may assume that $\mathcal{X}$ and $\mathcal{X}^{\prime}$ are algebraic spaces and then we can use More on Morphisms of Spaces, Lemma 63.9.5.

Case (3) - (6). Each of these cases corresponds to a condition on the diagonal, see Morphisms of Stacks, Definitions 83.4.1 and 83.4.2.

## CHAPTER 88

## Examples

### 88.1. Introduction

0270 This chapter will contain examples which illuminate the theory.

### 88.2. An empty limit

0 AKK This example is due to Waterhouse, see Wat72. Let $S$ be an uncountable set. For every finite subset $T \subset S$ consider the set $M_{T}$ of injective maps $T \rightarrow \mathbf{N}$. For $T \subset T^{\prime} \subset S$ finite the restriction $M_{T^{\prime}} \rightarrow M_{T}$ is surjective. Thus we have a directed inverse system with surjective transition maps. But $\lim M_{T}=\emptyset$ as an element in the limit would define an injective map $S \rightarrow \mathbf{N}$.

### 88.3. A zero limit

0ANX Let $\left(S_{i}\right)_{i \in I}$ be a directed inverse system of nonempty sets with surjective transition maps and with $\lim S_{i}=\emptyset$, see Section 88.2 . Let $K$ be a field and set

$$
V_{i}=\bigoplus_{s \in S_{i}} K
$$

Then the transition maps $V_{i} \rightarrow V_{j}$ are surjective for $i \geq j$. However, $\lim V_{i}=0$. Namely, if $v=\left(v_{i}\right)$ is an element of the limit, then the support of $v_{i}$ would be a finite subset $T_{i} \subset S_{i}$ with $\lim T_{i} \neq \emptyset$, see Categories, Lemma 4.21.5.

For each $i$ consider the unique $K$-linear map $V_{i} \rightarrow K$ which sends each basis vector $s \in S_{i}$ to 1 . Let $W_{i} \subset V_{i}$ be the kernel. Then

$$
0 \rightarrow\left(W_{i}\right) \rightarrow\left(V_{i}\right) \rightarrow(K) \rightarrow 0
$$

is a nonsplit short exact sequence of inverse systems of vector spaces over the directed partially ordered set $I$. Hence $W_{i}$ is a directed system of $K$-vector spaces with surjective transition maps, vanishing limit, and nonvanishing $R^{1} \mathrm{lim}$.

### 88.4. Non-quasi-compact inverse limit of quasi-compact spaces

09ZJ Let $\mathbf{N}$ denote the set of natural numbers. For every integer $n$, let $I_{n}$ denote the set of all natural numbers $>n$. Define $T_{n}$ to be the unique topology on $\mathbf{N}$ with basis $\{1\}, \ldots,\{n\}, I_{n}$. Denote by $X_{n}$ the topological space $\left(\mathbf{N}, T_{n}\right)$. For each $m<n$, the identity map,

$$
f_{n, m}: X_{n} \longrightarrow X_{m}
$$

is continuous. Obviously for $m<n<p$, the composition $f_{p, n} \circ f_{n, m}$ equals $f_{p, m}$. So $\left(\left(X_{n}\right),\left(f_{n, m}\right)\right)$ is a directed inverse system of quasi-compact topological spaces.

Let $T$ be the discrete topology on $\mathbf{N}$, and let $X$ be $(\mathbf{N}, T)$. Then for every integer $n$, the identity map,

$$
f_{n}: X \longrightarrow X_{n}
$$

is continuous. We claim that this is the inverse limit of the directed system above. Let $(Y, S)$ be any topological space. For every integer $n$, let

$$
g_{n}:(Y, S) \longrightarrow\left(\mathbf{N}, T_{n}\right)
$$

be a continuous map. Assume that for every $m<n$ we have $f_{n, m} \circ g_{n}=g_{m}$, i.e., the system $\left(g_{n}\right)$ is compatible with the directed system above. In particular, all of the set maps $g_{n}$ are equal to a common set map

$$
g: Y \longrightarrow \mathbf{N}
$$

Moreover, for every integer $n$, since $\{n\}$ is open in $X_{n}$, also $g^{-1}(\{n\})=g_{n}^{-1}(\{n\})$ is open in $Y$. Therefore the set map $g$ is continuous for the topology $S$ on $Y$ and the topology $T$ on $\mathbf{N}$. Thus $\left(X,\left(f_{n}\right)\right)$ is the inverse limit of the directed system above.
However, clearly $X$ is not quasi-compact, since the infinite open covering by singleton sets has no inverse limit.

09ZK Lemma 88.4.1. There exists an inverse system of quasi-compact topological spaces over $\mathbf{N}$ whose limit is not quasi-compact.

Proof. See discussion above.

### 88.5. A nonintegral connected scheme whose local rings are domains

0568 We give an example of an affine scheme $X=\operatorname{Spec}(A)$ which is connected, all of whose local rings are domains, but which is not integral. Connectedness of $X$ means $A$ has no nontrivial idempotents, see Algebra, Lemma 10.20.3. The local rings of $X$ are domains if, whenever $f g=0$ in $A$, every point of $X$ has a neighborhood where either $f$ or $g$ vanishes. As long as $A$ is not a domain, then $X$ is not integral (Properties, Definition 27.3.1.
Roughly speaking, the construction is as follows: let $X_{0}$ be the cross (the union of coordinate axes) on the affine plane. Then let $X_{1}$ be the (reduced) full preimage of $X_{0}$ on the blow-up of the plane ( $X_{1}$ has three rational components forming a chain). Then blow up the resulting surface at the two singularities of $X_{1}$, and let $X_{2}$ be the reduced preimage of $X_{1}$ (which has five rational components), etc. Take $X$ to be the inverse limit. The only problem with this construction is that blow-ups glue in a projective line, so $X_{1}$ is not affine. Let us correct this by glueing in an affine line instead (so our scheme will be an open subset in what was described above).
Here is a completely algebraic construction: For every $k \geq 0$, let $A_{k}$ be the following ring: its elements are collections of polynomials $p_{i} \in \mathbf{C}[x]$ where $i=0, \ldots, 2^{k}$ such that $p_{i}(1)=p_{i+1}(0)$. Set $X_{k}=\operatorname{Spec}\left(A_{k}\right)$. Observe that $X_{k}$ is a union of $2^{k}+1$ affine lines that meet transversally in a chain. Define a ring homomorphism $A_{k} \rightarrow A_{k+1}$ by

$$
\left(p_{0}, \ldots, p_{2^{k}}\right) \longmapsto\left(p_{0}, p_{0}(1), p_{1}, p_{1}(1), \ldots, p_{2^{k}}\right),
$$

in other words, every other polynomial is constant. This identifies $A_{k}$ with a subring of $A_{k+1}$. Let $A$ be the direct limit of $A_{k}$ (basically, their union). Set $X=\operatorname{Spec}(A)$. For every $k$, we have a natural embedding $A_{k} \rightarrow A$, that is, a map $X \rightarrow X_{k}$. Each
$A_{k}$ is connected but not integral; this implies that $A$ is connected but not integral. It remains to show that the local rings of $A$ are domains.

Take $f, g \in A$ with $f g=0$ and $x \in X$. Let us construct a neighborhood of $x$ on which one of $f$ and $g$ vanishes. Choose $k$ such that $f, g \in A_{k-1}$ (note the $k-1$ index). Let $y$ be the image of $x$ in $X_{k}$. It suffices to prove that $y$ has a neighborhood on which either $f$ or $g$ viewed as sections of $\mathcal{O}_{X_{k}}$ vanishes. If $y$ is a smooth point of $X_{k}$, that is, it lies on only one of the $2^{k}+1$ lines, this is obvious. We can therefore assume that $y$ is one of the $2^{k}$ singular points, so two components of $X_{k}$ pass through $y$. However, on one of these two components (the one with odd index), both $f$ and $g$ are constant, since they are pullbacks of functions on $X_{k-1}$. Since $f g=0$ everywhere, either $f$ or $g$ (say, $f$ ) vanishes on the other component. This implies that $f$ vanishes on both components, as required.

### 88.6. Noncomplete completion

05JA Let $R$ be a ring and let $\mathfrak{m}$ be a maximal ideal. Consider the completion

$$
R^{\wedge}=\lim R / \mathfrak{m}^{n}
$$

Note that $R^{\wedge}$ is a local ring with maximal ideal $\mathfrak{m}^{\prime}=\operatorname{Ker}\left(R^{\wedge} \rightarrow R / \mathfrak{m}\right)$. Namely, if $x=\left(x_{n}\right) \in R^{\wedge}$ is not in $\mathfrak{m}^{\prime}$, then $y=\left(x_{n}^{-1}\right) \in R^{\wedge}$ satisfies $x y=1$, whence $R^{\wedge}$ is local by Algebra, Lemma 10.17.2. Now it is always true that $R^{\wedge}$ complete in its limit topology (see the discussion in More on Algebra, Section 15.28). But beyond that, we have the following questions:
(1) Is it true that $\mathfrak{m} R^{\wedge}=\mathfrak{m}^{\prime}$ ?
(2) Is $R^{\wedge}$ viewed as an $R^{\wedge}$-module $\mathfrak{m}^{\prime}$-adically complete?
(3) Is $R^{\wedge}$ viewed as an $R$-module $\mathfrak{m}$-adically complete?

It turns out that these questions all have a negative answer. The example below was taken from an unpublished note of Bart de Smit and Hendrik Lenstra. See also Bou61, Exercise III.2.12] and Yek11, Example 1.8]

Let $k$ be a field, $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$, and $\mathfrak{m}=\left(x_{1}, x_{2}, x_{3}, \ldots\right)$. We will think of an element $f$ of $R^{\wedge}$ as a (possibly) infinite sum

$$
f=\sum a_{I} x^{I}
$$

(using multi-index notation) such that for each $d \geq 0$ there are only finitely many nonzero $a_{I}$ for $|I|=d$. The maximal ideal $\mathfrak{m}^{\prime} \subset R^{\wedge}$ is the collection of $f$ with zero constant term. In particular, the element

$$
f=x_{1}+x_{2}^{2}+x_{3}^{3}+\ldots
$$

is in $\mathfrak{m}^{\prime}$ but not in $\mathfrak{m} R^{\wedge}$ which shows that (1) is false in this example. Note that we do have $\mathfrak{m} R^{\wedge} \subset \mathfrak{m}^{\prime}$. Hence, $R^{\wedge}$ is not $\mathfrak{m}$-adically complete as an $R$-module, then it is also not $\mathfrak{m}^{\prime}$-adically complete. To show that $R^{\wedge}$ is not $\mathfrak{m}$-adically complete (as an $R$-module) it suffices to show that $K_{2}=\operatorname{Ker}\left(R^{\wedge} \rightarrow R / \mathfrak{m}^{2}\right)$ is not equal to $\mathfrak{m}^{2} R^{\wedge}$, see Algebra, Lemma 10.95.4 Note that an element of $\mathfrak{m}^{2} R^{\wedge} \subset\left(\mathfrak{m}^{\prime}\right)^{2}$ can be written as a finite sum

$$
\begin{equation*}
\sum_{i=1, \ldots, t} f_{i} g_{i} \tag{88.6.0.1}
\end{equation*}
$$

with $f_{i}, g_{i} \in R^{\wedge}$ having vanishing constant terms. To get an example we are going to choose an $z \in K_{2}$ of the form

$$
z=z_{1}+z_{2}+z_{3}+\ldots
$$

with the following properties
(1) there exist sequences $1<d_{1}<d_{2}<d_{3}<\ldots$ and $0<n_{1}<n_{2}<n_{3}<\ldots$. such that $z_{i} \in k\left[x_{n_{i}}, x_{n_{i}+1}, \ldots, x_{n_{i+1}-1}\right]$ homogeneous of degree $d_{i}$, and
(2) in the ring $k\left[\left[x_{n_{i}}, x_{n_{i}+1}, \ldots, x_{n_{i+1}-1}\right]\right]$ the element $z_{i}$ cannot be written as a sum 88.6.0.1 with $t \leq i$.
Clearly this implies that $z$ is not in $\left(\mathfrak{m}^{\prime}\right)^{2}$ because the image of the relation 88.6.0.1 in the ring $k\left[\left[x_{n_{i}}, x_{n_{i}+1}, \ldots, x_{n_{i+1}-1}\right]\right]$ for $i$ large enough would produce a contradiction. Hence it suffices to prove that for all $t>0$ there exists a $d \gg 0$ and an integer $n$ such that we can find an homogeneous element $z \in k\left[x_{1}, \ldots, x_{n}\right]$ of degree $d$ which cannot be written as a sum 88.6.0.1 for the given $t$ in $k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Take $n>2 t$ and any $d>1$ prime to the characteristic of $p$ and set $z=\sum_{i=1, \ldots, n} x_{i}^{d}$. Then the vanishing locus of the ideal

$$
\left(\frac{\partial z}{\partial x_{1}}, \ldots, \frac{\partial z}{\partial x_{n}}\right)=\left(d x_{1}^{d-1}, \ldots, d x_{n}^{d-1}\right)
$$

consists of one point. On the other hand,

$$
\frac{\partial\left(\sum_{i=1, \ldots, t} f_{i} g_{i}\right)}{\partial x_{j}} \in\left(f_{1}, \ldots, f_{t}, g_{1}, \ldots, g_{t}\right)
$$

by the Leibniz rule and hence the vanishing locus of these derivatives contains at least

$$
V\left(f_{1}, \ldots, f_{t}, g_{1}, \ldots, g_{t}\right) \subset \operatorname{Spec}\left(k\left[\left[x_{1}, \ldots, x_{n}\right]\right]\right)
$$

Hence this is a contradiction as the dimension of $V\left(f_{1}, \ldots, f_{t}, g_{1}, \ldots, g_{t}\right)$ is at least $n-2 t \geq 1$.

05JC Lemma 88.6.1. There exists a local ring $R$ and a maximal ideal $\mathfrak{m}$ such that the completion $R^{\wedge}$ of $R$ with respect to $\mathfrak{m}$ has the following properties
(1) $R^{\wedge}$ is local, but its maximal ideal is not equal to $\mathfrak{m} R^{\wedge}$,
(2) $R^{\wedge}$ is not a complete local ring, and
(3) $R^{\wedge}$ is not $\mathfrak{m}$-adically complete as an $R$-module.

Proof. This follows from the discussion above as (with $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ ) the completion of the localization $R_{\mathfrak{m}}$ is equal to the completion of $R$.

### 88.7. Noncomplete quotient

05JD Let $k$ be a field. Let

$$
R=k\left[t, z_{1}, z_{2}, z_{3}, \ldots, w_{1}, w_{2}, w_{3}, \ldots, x\right] /\left(z_{i} t-x^{i} w_{i}, z_{i} w_{j}\right)
$$

Note that in particular $z_{i} z_{j} t=0$ in this ring. Any element $f$ of $R$ can be uniquely written as a finite sum

$$
f=\sum_{i=0, \ldots, d} f_{i} x^{i}
$$

where each $f_{i} \in k\left[t, z_{i}, w_{j}\right]$ has no terms involving the products $z_{i} t$ or $z_{i} w_{j}$. Moreover, if $f$ is written in this way, then $f \in\left(x^{n}\right)$ if and only if $f_{i}=0$ for $i<n$. So $x$ is a nonzerodivisor and $\bigcap\left(x^{n}\right)=0$. Let $R^{\wedge}$ be the completion of $R$ with respect to the ideal $(x)$. Note that $R^{\wedge}$ is $(x)$-adically complete, see Algebra, Lemma 10.95 .5 .

By the above we see that an element of $R^{\wedge}$ can be uniquely written as an infinite sum

$$
f=\sum_{i=0}^{\infty} f_{i} x^{i}
$$

where each $f_{i} \in k\left[t, z_{i}, w_{j}\right]$ has no terms involving the products $z_{i} t$ or $z_{i} w_{j}$. Consider the element

$$
f=\sum_{i=1}^{\infty} x^{i} w_{i}=x w_{1}+x^{2} w_{2}+x^{3} w_{3}+\ldots
$$

i.e., we have $f_{n}=w_{n}$. Note that $f \in\left(t, x^{n}\right)$ for every $n$ because $x^{m} w_{m} \in(t)$ for all $m$. We claim that $f \notin(t)$. To prove this assume that $t g=f$ where $g=\sum g_{l} x^{l}$ in canonical form as above. Since $t z_{i} z_{j}=0$ we may as well assume that none of the $g_{l}$ have terms involving the products $z_{i} z_{j}$. Examining the process to get $t g$ in canonical form we see the following: Given any term cm of $g_{l}$ where $c \in k$ and $m$ is a monomial in $t, z_{i}, w_{j}$ and we make the following replacement
(1) if the monomial $m$ does not involve any $z_{i}$, then $c t m$ is a term of $f_{l}$, and
(2) if the monomial $m$ does involve a $z_{i}$ then it is equal to $m=z_{i}$ and we see that $c w_{i}$ is term of $f_{l+i}$.
Since $g_{0}$ is a polynomial only finitely many of the variables $z_{i}$ occur in it. Pick $n$ such that $z_{n}$ does not occur in $g_{0}$. Then the rules above show that $w_{n}$ does not occur in $f_{n}$ which is a contradiction. It follows that $R^{\wedge} /(t)$ is not complete, see Algebra, Lemma 10.95 .10 .

05JE Lemma 88.7.1. There exists a ring $R$ complete with respect to a principal ideal $I$ and a principal ideal $J$ such that $R / J$ is not $I$-adically complete.

Proof. See discussion above.

### 88.8. Completion is not exact

$05 J F \quad$ A quick example is the following. Suppose that $R=k[t]$. Let $P=K=\bigoplus_{n \in \mathbf{N}} R$ and $M=\bigoplus_{n \in \mathbf{N}} R /\left(t^{n}\right)$. Then there is a short exact sequence $0 \rightarrow K \rightarrow P \rightarrow$ $M \rightarrow 0$ where the first map is given by multiplication by $t^{n}$ on the $n$th summand. We claim that $0 \rightarrow K^{\wedge} \rightarrow P^{\wedge} \rightarrow M^{\wedge} \rightarrow 0$ is not exact in the middle. Namely, $\xi=\left(t^{2}, t^{3}, t^{4}, \ldots\right) \in P^{\wedge}$ maps to zero in $M^{\wedge}$ but is not in the image of $K^{\wedge} \rightarrow P^{\wedge}$, because it would be the image of $(t, t, t, \ldots)$ which is not an element of $K^{\wedge}$.

A "smaller" example is the following. In the situation of Lemma 88.7.1 the short exact sequence $0 \rightarrow J \rightarrow R \rightarrow R / J \rightarrow 0$ does not remain exact after completion. Namely, if $f \in J$ is a generator, then $f: R \rightarrow J$ is surjective, hence $R \rightarrow J^{\wedge}$ is surjective, hence the image of $J^{\wedge} \rightarrow R$ is $(f)=J$ but the fact that $R / J$ is noncomplete means that the kernel of the surjection $R \rightarrow(R / J)^{\wedge}$ is strictly bigger than $J$, see Algebra, Lemmas 10.95.1 and 10.95.10. By the same token the sequence $R \rightarrow R \rightarrow R /(f) \rightarrow 0$ does not remain exact on completion.

05JG Lemma 88.8.1. Completion is not an exact functor in general; it is not even right exact in general. This holds even when I is finitely generated on the category of finitely presented modules.

Proof. See discussion above.

### 88.9. The category of complete modules is not abelian

07JQ Let $R$ be a ring and let $I \subset R$ be a finitely generated ideal. Consider the category $\mathcal{A}$ of $I$-adically complete $R$-modules, see Algebra, Definition 10.95.3. Let $\varphi: M \rightarrow N$ be a morphism of $\mathcal{A}$. The cokernel of $\varphi$ in $\mathcal{A}$ is the completion $(\operatorname{Coker}(\varphi))^{\wedge}$ of the usual cokernel (as $I$ is finitely generated this completion is complete, see Algebra, Lemma 10.95 .5 . Let $K=\operatorname{Ker}(\varphi)$. We claim that $K$ is complete and hence is the kernel of $\varphi$ in $\mathcal{A}$. Namely, let $K^{\wedge}$ be the completion. As $M$ is complete we obtain a factorization

$$
K \rightarrow K^{\wedge} \rightarrow M \xrightarrow{\varphi} N
$$

Since $\varphi$ is continuous for the $I$-adic topology, $K \rightarrow K^{\wedge}$ has dense image, and $K=\operatorname{Ker}(\varphi)$ we conclude that $K^{\wedge}$ maps into $K$. Thus $K^{\wedge}=K \oplus C$ and $K$ is a direct summand of a complete module, hence complete.

We will give an example that shows that $\operatorname{Im} \neq$ Coim in general. We take $R=\mathbf{Z}_{p}=$ $\lim _{n} \mathbf{Z} / p^{n} \mathbf{Z}$ to be the ring of $p$-adic integers and we take $I=(p)$. Consider the map

$$
\operatorname{diag}\left(1, p, p^{2}, \ldots\right):\left(\bigoplus_{n \geq 1} \mathbf{Z}_{p}\right)^{\wedge} \longrightarrow \prod_{n \geq 1} \mathbf{Z}_{p}
$$

where the left hand side is the $p$-adic completion of the direct sum. Hence an element of the left hand side is a vector $\left(x_{1}, x_{2}, x_{3}, \ldots\right)$ with $x_{i} \in \mathbf{Z}_{p}$ with $p$-adic valuation $v_{p}\left(x_{i}\right) \rightarrow \infty$ as $i \rightarrow \infty$. This maps to $\left(x_{1}, p x_{2}, p^{2} x_{3}, \ldots\right)$. Hence we see that $\left(1, p, p^{2}, \ldots\right)$ is in the closure of the image but not in the image. By our description of kernels and cokernels above it is clear that $\operatorname{Im} \neq$ Coim for this map.
07JR Lemma 88.9.1. Let $R$ be a ring and let $I \subset R$ be a finitely generated ideal. The category of I-adically complete $R$-modules has kernels and cokernels but is not abelian in general.

Proof. See above.

### 88.10. The category of derived complete modules

0 ARC Let $A$ be a ring and let $I$ be an ideal. Consider the category $\mathcal{C}$ of derived complete modules as defined in More on Algebra, Definition 15.72.4. By More on Algebra, Lemma 15.72 .6 we see that $\mathcal{C}$ is abelian.

Let $T$ be a set and let $M_{t}, t \in T$ be a family of derived complete modules. We claim that in general $\bigoplus M_{t}$ is not a complete module. For a specific example, let $A=\mathbf{Z}_{p}$ and $I=(p)$ and $\bigoplus_{n \in \mathbf{N}} \mathbf{Z}_{p}$. The map from $\bigoplus_{n \in \mathbf{N}} \mathbf{Z}_{p}$ to its $p$-adic completion isn't surjective. This means that $\bigoplus_{n \in \mathbf{N}} \mathbf{Z}_{p}$ cannot be derived complete as this would imply otherwise, see More on Algebra, Lemma 15.72.3.
Assume $I$ is finitely generated. Let ${ }^{\wedge}: D(A) \rightarrow D(A)$ denote the derived completion functor, see More on Algebra, Lemma 15.72.9. We claim that

$$
M=H^{0}\left(\left(\bigoplus M_{t}\right)^{\wedge}\right) \in \mathrm{Ob}(\mathcal{C})
$$

is a direct sum of $M_{t}$ in the category $\mathcal{C}$. Note that for $E$ a derived complete object of $D(A)$ we have

$$
\operatorname{Hom}_{D(A)}\left(\left(\bigoplus M_{t}\right)^{\wedge}, E\right)=\operatorname{Hom}_{D(A)}\left(\bigoplus M_{t}, E\right)=\prod \operatorname{Hom}_{D(A)}\left(M_{t}, E\right)
$$

Note that the right hand side is zero if $H^{i}(E)=0$ for $i<1$. In particular, applying this with $E=\tau_{\geq 1}\left(\bigoplus M_{t}\right)^{\wedge}$ which is derived complete by More on Algebra, Lemma
15.72 .6 we see that the canonical map $\left(\bigoplus M_{t}\right)^{\wedge} \rightarrow \tau_{\geq 1}\left(\bigoplus M_{t}\right)^{\wedge}$ is zero, in other words, we have $H^{i}\left(\left(\bigoplus M_{t}\right)^{\wedge}\right)=0$ for $i \geq 1$. Then, for an object $N \in \mathcal{C}$ we see that

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{C}}(M, N) & =\operatorname{Hom}_{D(A)}\left(\left(\bigoplus M_{t}\right)^{\wedge}, N\right) \\
& =\prod \operatorname{Hom}_{A}\left(M_{t}, N\right) \\
& =\prod \operatorname{Hom}_{\mathcal{C}}\left(M_{t}, N\right)
\end{aligned}
$$

as desired. This implies that $\mathcal{C}$ has all colimits, see Categories, Lemma 4.14.11. In fact, arguing similarly as above we see that given a system $M_{t}$ in $\mathcal{C}$ over a partially ordered set $T$ the colimit in $\mathcal{C}$ is equal to $H^{0}\left(\left(\operatorname{colim} M_{t}\right)^{\wedge}\right)$ where the inner colimit is the colimit in the category of $A$-modules.

However, we claim that filtered colimits are not exact in the category $\mathcal{C}$. Namely, suppose that $A=\mathbf{Z}_{p}$ and $I=(p)$. One has inclusions $f_{n}: \mathbf{Z}_{p} / p \mathbf{Z}_{p} \rightarrow \mathbf{Z}_{p} / p^{n} \mathbf{Z}_{p}$ of $p$-adically complete $A$-modules given by multiplication by $p^{n-1}$. There are commutative diagrams

Now take the colimit of these inclusions in the category $\mathcal{C}$ derived to get $\mathbf{Z}_{p} / p \mathbf{Z}_{p} \rightarrow$ 0 . Namely, the colimit in $\operatorname{Mod}_{A}$ of the system on the right is $\mathbf{Q}_{p} / \mathbf{Z}_{p}$. The reader can directly compute that $\left(\mathbf{Q}_{p} / \mathbf{Z}_{p}\right)^{\wedge}=\mathbf{Z}_{p}[1]$ in $D(A)$. Thus $H^{0}=0$ which proves our claim.

0ARD Lemma 88.10.1. Let $A$ be a ring and let $I \subset A$ be an ideal. The category $\mathcal{C}$ of derived complete modules is abelian and the inclusion functor $F: \mathcal{C} \rightarrow \operatorname{Mod}_{A}$ is exact and commutes with arbitrary limits. If $I$ is finitely generated, then $\mathcal{C}$ has arbitrary direct sums and colimits, but $F$ does not commute with these in general. Finally, filtered colimits are not exact in $\mathcal{C}$ in general, hence $\mathcal{C}$ is not a Grothendieck abelian category.

Proof. See discussion above.

### 88.11. Nonflat completions

0AL8 The completion of a ring with respect to an ideal isn't always flat, contrary to the Noetherian case. We have seen two examples of this phenomenon in More on Algebra, Example 15.71.10. In this section we give two more examples.

0AL9 Lemma 88.11.1. Let $R$ be a ring. Let $M$ be an $R$-module which is countable. Then $M$ is a finite $R$-module if and only if $M \otimes_{R} R^{\mathbf{N}} \rightarrow M^{\mathbf{N}}$ is surjective.

Proof. If $M$ is a finite module, then the map is surjective by Algebra, Proposition 10.88.2. Conversely, assume the map is surjective. Let $m_{1}, m_{2}, m_{3}, \ldots$ be an enumeration of the elements of $M$. Let $\sum_{j=1, \ldots, m} x_{j} \otimes a_{j}$ be an element of the tensor product mapping to the element $\left(m_{n}\right) \in M^{\mathbf{N}}$. Then we see that $x_{1}, \ldots, x_{m}$ generate $M$ over $R$ as in the proof of Algebra, Proposition 10.88.2.

0ALA Lemma 88.11.2. Let $R$ be a countable ring. Let $M$ be a countable $R$-module. Then $M$ is finitely presented if and only if the canonical map $M \otimes_{R} R^{\mathbf{N}} \rightarrow M^{\mathbf{N}}$ is an isomorphism.

Proof. If $M$ is a finitely presented module, then the map is an isomorphism by Algebra, Proposition 10.88.3. Conversely, assume the map is an isomorphism. By Lemma 88.11.1 the module $M$ is finite. Choose a surjection $R^{\oplus m} \rightarrow M$ with kernel $K$. Then $K$ is countable as a submodule of $R^{\oplus m}$. Arguing as in the proof of Algebra, Proposition 10.88 .3 we see that $K \otimes_{R} R^{\mathbf{N}} \rightarrow K^{\mathbf{N}}$ is surjective. Hence we conclude that $K$ is a finite $R$-module by Lemma 88.11.1. Thus $M$ is finitely presented.

0ALB Lemma 88.11.3. Let $R$ be a countable ring. Then $R$ is coherent if and only if $R^{\mathbf{N}}$ is a flat $R$-module.

Proof. If $R$ is coherent, then $R^{\mathbf{N}}$ is a flat module by Algebra, Proposition 10.89.5. Assume $R^{\mathbf{N}}$ is flat. Let $I \subset R$ be a finitely generated ideal. To prove the lemma we show that $I$ is finitely presented as an $R$-module. Namely, the map $I \otimes_{R} R^{\mathbf{N}} \rightarrow R^{\mathbf{N}}$ is injective as $R^{\mathbf{N}}$ is flat and its image is $I^{\mathbf{N}}$ by Lemma 88.11.1. Thus we conclude by Lemma 88.11.2.
Let $R$ be a countable ring. Observe that $R[[x]]$ is isomorphic to $R^{\mathbf{N}}$ as an $R$-module. By Lemma 88.11.3 we see that $R \rightarrow R[[x]]$ is flat if and only if $R$ is coherent. There are plenty of noncoherent countable rings, for example

$$
R=k\left[y, z, a_{1}, b_{1}, a_{2}, b_{2}, a_{3}, b_{3}, \ldots\right] /\left(a_{1} y+b_{1} z, a_{2} y+b_{2} z, a_{3} y+b_{3} z, \ldots\right)
$$

where $k$ is a countable field. This ring is not coherent because the ideal $(y, z)$ of $R$ is not a finitely presented $R$-module. Note that $R[[x]]$ is the completion of $R[x]$ by the principal ideal $(x)$.
0ALC Lemma 88.11.4. There exists a ring such that the completion $R[[x]]$ of $R[x]$ at $(x)$ is not flat over $R$ and a fortiori not flat over $R[x]$.

Proof. See discussion above.
Next, we will construct an example where the completion of a localization is nonflat. To do this consider the ring

$$
R=k\left[y, z, a_{1}, a_{2}, a_{3}, \ldots\right] /\left(y a_{i}, a_{i} a_{j}\right)
$$

Denote $f \in R$ the residue class of $z$. We claim the ring map
0ALD (88.11.4.1)

$$
R[[x]] \longrightarrow R_{f}[[x]]
$$

isn't flat. Let $I$ be the kernel of $y: R[[x]] \rightarrow R[[x]]$. A typical element $g$ of $I$ looks like $g=\sum g_{n, m} a_{m} x^{n}$ where $g_{n, m} \in k[z]$ and for a given $n$ only a finite number of nonzero $g_{n, m}$. Let $J$ be the kernel of $y: R_{f}[[x]] \rightarrow R_{f}[[x]]$. We claim that $J \neq I R_{f}[[x]]$. Namely, if this were true then we would have

$$
\sum z^{-n} a_{n} x^{n}=\sum_{i=1, \ldots, m} h_{i} g_{i}
$$

for some $m \geq 1, g_{i} \in I$, and $h_{i} \in R_{f}[[x]]$. Say $h_{i}=\bar{h}_{i} \bmod \left(y, a_{1}, a_{2}, a_{3}, \ldots\right)$ with $\bar{h}_{i} \in k[z, 1 / z][[x]]$. Looking at the coefficient of $a_{n}$ and using the description of the elements $g_{i}$ above we would get

$$
z^{-n} x^{n}=\sum \bar{h}_{i} \bar{g}_{i, n}
$$

for some $\bar{g}_{i, n} \in k[z][[x]]$. This would mean that all $z^{-n} x^{n}$ are contained in the finite $k[z][[x]]$-module generated by the elements $\bar{h}_{i}$. Since $k[z][[x]]$ is Noetherian this implies that the $R[z][[x]]$-submodule of $k[z, 1 / z][[x]]$ generated by $1, z^{-1} x, z^{-2} x^{2}, \ldots$ is finite. By Algebra, Lemma 10.35.2 we would conclude that $z^{-1} x$ is integral over $k[z][[x]]$ which is absurd. On the other hand, if 88.11.4.1 were flat, then we would get $J=I R_{f}[[x]]$ by tensoring the exact sequence $0 \rightarrow I \rightarrow R[[x]] \xrightarrow{y} R[[x]]$ with $R_{f}[[x]]$.

0ALE Lemma 88.11.5. There exists a ring A complete with respect to a principal ideal $I$ and an element $f \in A$ such that the $I$-adic completion $A_{f}^{\wedge}$ of $A_{f}$ is not flat over A.

Proof. Set $A=R[[x]]$ and $I=(x)$ and observe that $R_{f}[[x]]$ is the completion of $R[[x]]_{f}$.

### 88.12. Nonabelian category of quasi-coherent modules

0ALF In Sheaves on Stacks, Section 78.11 we defined the category of quasi-coherent modules on a category fibred in groupoids over Sch. Although we show in Sheaves on Stacks, Section 78.14 that this category is abelian for algebraic stacks, in this section we show that this is not the case for formal algebraic spaces.

Namely, consider $\mathbf{Z}_{p}$ viewed as topological ring using the $p$-adic topology. Let $X=\operatorname{Spf}\left(\mathbf{Z}_{p}\right)$, see Formal Spaces, Definition 70.5.9. Then $X$ is a sheaf in sets on $(S c h / \mathbf{Z})_{\text {fppf }}$ and gives rise to a stack in setoids $\mathcal{X}$, see Stacks, Lemma 8.6.2. Thus the discussion of Sheaves on Stacks, Section 78.14 applies.

Let $\mathcal{F}$ be a quasi-coherent module on $\mathcal{X}$. Since $X=\operatorname{colim} \operatorname{Spec}\left(\mathbf{Z} / p^{n} \mathbf{Z}\right)$ it is clear from Sheaves on Stacks, Lemma 78.11 .5 that $\mathcal{F}$ is given by a sequence $\left(\mathcal{F}_{n}\right)$ where
(1) $\mathcal{F}_{n}$ is a quasi-coherent module on $\operatorname{Spec}\left(\mathbf{Z} / p^{n} \mathbf{Z}\right)$, and
(2) the transition maps give isomorphisms $\mathcal{F}_{n}=\mathcal{F}_{n+1} / p^{n} \mathcal{F}_{n+1}$.

Converting into modules we see that $\mathcal{F}$ corresponds to a system $\left(M_{n}\right)$ where each $M_{n}$ is an abelian group annihilated by $p^{n}$ and the transition maps induce isomorphisms $M_{n}=M_{n+1} / p^{n} M_{n+1}$. In this situation the module $M=\lim M_{n}$ is a $p$-adically complete module and $M_{n}=M / p^{n} M$, see Algebra, Lemma 10.97.1. We conclude that the category of quasi-coherent modules on $X$ is equivalent to the category of $p$-adically complete abelian groups. This category is not abelian, see Section 88.9

0ALG Lemma 88.12.1. The category of quasi-coheren ${ }^{11}$ modules on a formal algebraic space $X$ is not abelian in general, even if $X$ is a Noetherian affine formal algebraic space.

Proof. See discussion above.

[^226]
### 88.13. Regular sequences and base change

063 Z We are going to construct a ring $R$ with a regular sequence $(x, y, z)$ such that there exists a nonzero element $\delta \in R / z R$ with $x \delta=y \delta=0$.
To construct our example we first construct a peculiar module $E$ over the ring $k[x, y, z]$ where $k$ is any field. Namely, $E$ will be a push-out as in the following diagram

where the rows are short exact sequences (we dropped the outer zeros due to typesetting problems). Another way to describe $E$ is as

$$
E=\left\{(f, g) \mid f \in k\left[x, y, z, x^{-1}, y^{-1}\right], g \in k\left[x, y, z, y^{-1}\right]\right\} / \sim
$$

where $(f, g) \sim\left(f^{\prime}, g^{\prime}\right)$ if and only if there exists a $h \in k\left[x, y, z, y^{-1}\right]$ such that

$$
f=f^{\prime}+x h \bmod y k\left[x, y, z, x^{-1}\right], \quad g=g^{\prime}-z h \bmod y z k[x, y, z]
$$

We claim: (a) $x: E \rightarrow E$ is injective, (b) $y: E / x E \rightarrow E / x E$ is injective, (c) $E /(x, y) E=0,(\mathrm{~d})$ there exists a nonzero element $\delta \in E / z E$ such that $x \delta=y \delta=0$.

To prove (a) suppose that $(f, g)$ is a pair that gives rise to an element of $E$ and that $(x f, x g) \sim 0$. Then there exists a $h \in k\left[x, y, z, y^{-1}\right]$ such that $x f+x h \in$ $y k\left[x, y, z, x^{-1}\right]$ and $x g-z h \in y z k[x, y, z]$. We may assume that $h=\sum a_{i, j, k} x^{i} y^{j} z^{k}$ is a sum of monomials where only $j \leq 0$ occurs. Then $x g-z h \in y z k[x, y, z]$ implies that only $i>0$ occurs, i.e., $h=x h^{\prime}$ for some $h^{\prime} \in k\left[x, y, z, y^{-1}\right]$. Then $(f, g) \sim\left(f+x h^{\prime}, g-z h^{\prime}\right)$ and we see that we may assume that $g=0$ and $h=0$. In this case $x f \in y k\left[x, y, z, x^{-1}\right]$ implies $f \in y k\left[x, y, z, x^{-1}\right]$ and we see that $(f, g) \sim 0$. Thus $x: E \rightarrow E$ is injective.
Since multiplication by $x$ is an isomorphism on $\frac{k\left[x, y, z, x^{-1}, y^{-1}\right]}{y k\left[x, y, z, x^{-1}\right]}$ we see that $E / x E$ is isomorphic to

$$
\frac{k\left[x, y, z, y^{-1}\right]}{y z k[x, y, z]+x k\left[x, y, z, y^{-1}\right]+z k\left[x, y, z, y^{-1}\right]}=\frac{k\left[x, y, z, y^{-1}\right]}{x k\left[x, y, z, y^{-1}\right]+z k\left[x, y, z, y^{-1}\right]}
$$

and hence multiplication by $y$ is an isomorphism on $E / x E$. This clearly implies (b) and (c).
Let $e \in E$ be the equivalence class of $(1,0)$. Suppose that $e \in z E$. Then there exist $f \in k\left[x, y, z, x^{-1}, y^{-1}\right], g \in k\left[x, y, z, y^{-1}\right]$, and $h \in k\left[x, y, z, y^{-1}\right]$ such that

$$
1+z f+x h \in y k\left[x, y, z, x^{-1}\right], \quad 0+z g-z h \in y z k[x, y, z]
$$

This is impossible: the monomial 1 cannot occur in $z f$, nor in $x h$. On the other hand, we have $y e=0$ and $x e=(x, 0) \sim(0,-z)=z(0,-1)$. Hence setting $\delta$ equal to the congruence class of $e$ in $E / z E$ we obtain (d).

0640 Lemma 88.13.1. There exists a local ring $R$ and a regular sequence $x, y, z$ (in the maximal ideal) such that there exists a nonzero element $\delta \in R / z R$ with $x \delta=y \delta=0$.

Proof. Let $R=k[x, y, z] \oplus E$ where $E$ is the module above considered as a square zero ideal. Then it is clear that $x, y, z$ is a regular sequence in $R$, and that the element $\delta \in E / z E \subset R / z R$ gives an element with the desired properties. To get a local example we may localize $R$ at the maximal ideal $\mathfrak{m}=(x, y, z, E)$. The sequence $x, y, z$ remains a regular sequence (as localization is exact), and the element $\delta$ remains nonzero as it is supported at $\mathfrak{m}$.

0641 Lemma 88.13.2. There exists a local homomorphism of local rings $A \rightarrow B$ and a regular sequence $x, y$ in the maximal ideal of $B$ such that $B /(x, y)$ is flat over $A$, but such that the images $\bar{x}, \bar{y}$ of $x, y$ in $B / \mathfrak{m}_{A} B$ do not form a regular sequence, nor even a Koszul-regular sequence.

Proof. Set $A=k[z]_{(z)}$ and let $B=(k[x, y, z] \oplus E)_{(x, y, z, E)}$. Since $x, y, z$ is a regular sequence in $B$, see proof of Lemma 88.13.1, we see that $x, y$ is a regular sequence in $B$ and that $B /(x, y)$ is a torsion free $A$-module, hence flat. On the other hand, there exists a nonzero element $\delta \in B / \mathfrak{m}_{A} B=B / z B$ which is annihilated by $\bar{x}, \bar{y}$. Hence $H_{2}\left(K_{\bullet}\left(B / \mathfrak{m}_{A} B, \bar{x}, \bar{y}\right)\right) \neq 0$. Thus $\bar{x}, \bar{y}$ is not Koszul-regular, in particular it is not a regular sequence, see More on Algebra, Lemma 15.23.2

### 88.14. A Noetherian ring of infinite dimension

02JC A Noetherian local ring has finite dimension as we saw in Algebra, Proposition 10.59 .8 . But there exist Noetherian rings of infinite dimension. See Nag62b, Appendix, Example 1].
Namely, let $k$ be a field, and consider the ring

$$
R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right] .
$$

Let $\mathfrak{p}_{i}=\left(x_{2^{i-1}}, x_{2^{i-1}+1}, \ldots, x_{2^{i}-1}\right)$ for $i=1,2, \ldots$ which are prime ideals of $R$. Let $S$ be the multiplicative subset

$$
S=\bigcap_{i \geq 1}\left(R \backslash \mathfrak{p}_{i}\right)
$$

Consider the ring $A=S^{-1} R$. We claim that
(1) The maximal ideals of the ring $A$ are the ideals $\mathfrak{m}_{i}=\mathfrak{p}_{i} A$.
(2) We have $A_{\mathfrak{m}_{i}}=R_{\mathfrak{p}_{i}}$ which is a Noetherian local ring of dimension $2^{i}$.
(3) The ring $A$ is Noetherian.

Hence it is clear that this is the example we are looking for. Details omitted.

### 88.15. Local rings with nonreduced completion

02JD In Algebra, Example 10.118 .5 we gave an example of a characteristic $p$ Noetherian local domain $R$ of dimension 1 whose completion is nonreduced. In this section we present the example of [FR70, Proposition 3.1] which gives a similar ring in characteristic zero.

Let $\mathbf{C}\{x\}$ be the ring of convergent power series over the field $\mathbf{C}$ of complex numbers. The ring of all power series $\mathbf{C}[[x]]$ is its completion. Let $K=\mathbf{C}\{x\}[1 / x]=f . f .(B)$ be the field of convergent Laurent series. The $K$-module $\Omega_{K / \mathbf{C}}$ of algebraic differentials of $K$ over $\mathbf{C}$ is an infinite dimensional $K$-vector space (proof omitted). We may choose $f_{n} \in x \mathbf{C}\{x\}, n \geq 1$ such that $\mathrm{d} x, \mathrm{~d} f_{1}, \mathrm{~d} f_{2}, \ldots$ are part of a basis of $\Omega_{K / \mathbf{C}}$. Thus we can find a $\mathbf{C}$-derivation

$$
D: \mathbf{C}\{x\} \longrightarrow \mathbf{C}((x))
$$

such that $D(x)=0$ and $D\left(f_{i}\right)=x^{-n}$. Let

$$
A=\{f \in \mathbf{C}\{x\} \mid D(f) \in \mathbf{C}[[x]]\}
$$

We claim that
(1) $\mathbf{C}\{x\}$ is integral over $A$,
(2) $A$ is a local domain,
(3) $\operatorname{dim}(A)=1$,
(4) the maximal ideal of $A$ is generated by $x$ and $x f_{1}$,
(5) $A$ is Noetherian, and
(6) the completion of $A$ is equal to the ring of dual numbers over $\mathbf{C}[[x]]$.

Since the dual numbers are nonreduced the ring $A$ gives the example.
Note that if $0 \neq f \in x \mathbf{C}\{x\}$ then we may write $D(f)=h / f^{n}$ for some $n \geq 0$ and $h \in \mathbf{C}[[x]]$. Hence $D\left(f^{n+1} /(n+1)\right) \in \mathbf{C}[[x]]$ and $D\left(f^{n+2} /(n+2)\right) \in \mathbf{C}[[x]]$. Thus we see $f^{n+1}, f^{n+2} \in A$ ! In particular we see (1) holds. We also conclude that the fraction field of $A$ is equal to the fraction field of $\mathbf{C}\{x\}$. It also follows immediately that $A \cap x \mathbf{C}\{x\}$ is the set of nonunits of $A$, hence $A$ is a local domain of dimension 1. If we can show (4) then it will follow that $A$ is Noetherian (proof omitted). Suppose that $f \in A \cap x \mathbf{C}\{x\}$. Write $D(f)=h, h \in \mathbf{C}[[x]]$. Write $h=c+x h^{\prime}$ with $c \in \mathbf{C}$, $h^{\prime} \in \mathbf{C}[[x]]$. Then $D\left(f-c x f_{1}\right)=c+x h^{\prime}-c=x h^{\prime}$. On the other hand $f-c x f_{1}=x g$ with $g \in \mathbf{C}\{x\}$, but by the computation above we have $D(g)=h^{\prime} \in \mathbf{C}[[x]]$ and hence $g \in A$. Thus $f=c x f_{1}+x g \in\left(x, x f_{1}\right)$ as desired.
Finally, why is the completion of $A$ nonreduced? Denote $\hat{A}$ the completion of $A$. Of course this maps surjectively to the completion $\mathbf{C}[[x]]$ of $\mathbf{C}\{x\}$ because $x \in A$. Denote this map $\psi: \hat{A} \rightarrow \mathbf{C}[[x]]$. Above we saw that $\mathfrak{m}_{A}=\left(x, x f_{1}\right)$ and hence $D\left(\mathfrak{m}_{A}^{n}\right) \subset\left(x^{n-1}\right)$ by an easy computation. Thus $D: A \rightarrow \mathbf{C}[[x]]$ is continuous and gives rise to a continuous derivation $\hat{D}: \hat{A} \rightarrow \mathbf{C}[[x]]$ over $\psi$. Hence we get a ring map

$$
\psi+\epsilon \hat{D}: \hat{A} \longrightarrow \mathbf{C}[[x]][\epsilon]
$$

Since $\hat{A}$ is a one dimensional Noetherian complete local ring, if we can show this arrow is surjective then it will follow that $\hat{A}$ is nonreduced. Actually the map is an isomorphism but we omit the verification of this. The subring $\mathbf{C}[x]_{(x)} \subset A$ gives rise to a map $i: \mathbf{C}[[x]] \rightarrow \hat{A}$ on completions such that $i \circ \psi=\mathrm{id}$ and such that $D \circ i=0$ (as $D(x)=0$ by construction). Consider the elements $x^{n} f_{n} \in A$. We have

$$
(\psi+\epsilon D)\left(x^{n} f_{n}\right)=x^{n} f_{n}+\epsilon
$$

for all $n \geq 1$. Surjectivity easily follows from these remarks.

### 88.16. A non catenary Noetherian local ring

02JE Even though there is a succesful dimension theory of Noetherian local rings there are non-catenary Noetherian local rings. An example may be found in Nag62b Appendix, Example 2]. In fact, we will present this example in the simplest case. Namely, we will construct a local Noetherian domain $A$ of dimension 2 which is not universally catenary. (Note that $A$ is automatically catenary, see Exercises, Exercise 89.12.2.) The existence of a Noetherian local ring which is not universally catenary implies the existence of a Noetherian local ring which is not catenary and we spell this out at the end of this section in the particular example at hand.

Let $k$ be a field, and consider the formal power series ring $k[[x]]$ in one variable over $k$. Let

$$
z=\sum_{i=1}^{\infty} a_{i} x^{i}
$$

be a formal power series. We assume $z$ as an element of the Laurent series field $k((x))=f . f .(k[[x]])$ is transcendental over $k(x)$. Put

$$
z_{j}=x^{-j}\left(z-\sum_{i=1, \ldots, j-1} a_{i} x^{i}\right)=\sum_{i=j}^{\infty} a_{i} x^{i-j} \in k[[x]]
$$

Note that $z=z_{1}$. Let $R$ be the subring of $k[[x]]$ generated by $x, z$ and all of the $z_{j}$, in other words

$$
R=k\left[x, z_{1}, z_{2}, z_{3}, \ldots\right] \subset k[[x]] .
$$

Consider the ideals $\mathfrak{m}=(x)$ and $\mathfrak{n}=\left(x-1, z_{1}, z_{2}, \ldots\right)$ of $R$.
We have $x\left(z_{j+1}+a_{j}\right)=z_{j}$. Hence $R / \mathfrak{m}=k$ and $\mathfrak{m}$ is a maximal ideal. Moreover, any element of $R$ not in $\mathfrak{m}$ maps to a unit in $k[[x]]$ and hence $R_{\mathfrak{m}} \subset k[[x]]$. In fact it is easy to deduce that $R_{\mathfrak{m}}$ is a discrete valuation ring and residue field $k$.
We claim that

$$
R /(x-1)=k\left[x, z_{1}, z_{2}, z_{3}, \ldots\right] /(x-1) \cong k[z]
$$

Namely, the relation above implies that $(x-1)\left(z_{j+1}+a_{j}\right)=-z_{j+1}-a_{j}+z_{j}$, and hence we may express the class of $z_{j+1}$ in terms of $z_{j}$ in the quotient $R /(x-1)$. Since the fraction field of $R$ has transcendence degree 2 over $k$ by construction we see that $z$ is transcendental over $k$ in $R /(x-1)$, whence the desired isomorphism. Hence $\mathfrak{n}=(x-1, z)$ and is a maximal ideal. In fact the map

$$
k\left[x, x^{-1}, z\right]_{(x-1, z)} \longrightarrow R_{\mathfrak{n}}
$$

is an isomorphism (since $x^{-1}$ is invertible in $R_{\mathfrak{n}}$ and since $z_{j+1}=x^{-1} z_{j}-a_{j}=$ $\left.\ldots=f_{j}\left(x, x^{-1}, z\right)\right)$. This shows that $R_{\mathfrak{n}}$ is a regular local ring of dimension 2 and residue field $k$.

Let $S$ be the multiplicative subset

$$
S=(R \backslash \mathfrak{m}) \cap(R \backslash \mathfrak{n})=R \backslash(\mathfrak{m} \cup \mathfrak{n})
$$

and set $B=S^{-1} R$. We claim that
(1) The ring $B$ is a $k$-algebra.
(2) The maximal ideals of the ring $B$ are the two ideals $\mathfrak{m} B$ and $\mathfrak{n} B$.
(3) The residue fields at these maximal ideals is $k$.
(4) We have $B_{\mathfrak{m} B}=R_{\mathfrak{m}}$ and $B_{\mathfrak{n} B}=R_{\mathfrak{n}}$ which are Noetherian regular local rings of dimensions 1 and 2 .
(5) The ring $B$ is Noetherian.

We omit the details of the verifications.
Whenever given a $k$-algebra $B$ with the properties listed above we get an example as follows. Take $A=k+\operatorname{rad}(B) \subset B$, in our case $\operatorname{rad}(B)=\mathfrak{m} B+\mathfrak{n} B$. It is easy to see that $B$ is finite over $A$ and hence $A$ is Noetherian by Eakin's theorem (see Eak68, or Nag62b Appendix A1], or insert future reference here). Also $A$ is a local domain with the same fraction field as $B$ and residue field $k$. Since the dimension of $B$ is 2 we see that $A$ has dimension 2 as well, by Algebra, Lemma 10.111.4.

If $A$ were universally catenary then the dimension formula, Algebra, Lemma 10.112.1 would give $\operatorname{dim}\left(B_{\mathfrak{m} B}\right)=2$ contradiction.
Note that $B$ is generated by one element over $A$. Hence $B=A[x] / \mathfrak{p}$ for some prime $\mathfrak{p}$ of $A[x]$. Let $\mathfrak{m}^{\prime} \subset A[x]$ be the maximal ideal corresponding to $\mathfrak{m} B$. Then on the one hand $\operatorname{dim}\left(A[x]_{\mathfrak{m}^{\prime}}\right)=3$ and on the other hand

$$
(0) \subset \mathfrak{p} A[x]_{\mathfrak{m}^{\prime}} \subset \mathfrak{m}^{\prime} A[x]_{\mathfrak{m}^{\prime}}
$$

is a maximal chain of primes. Hence $A[x]_{\mathfrak{m}^{\prime}}$ is an example of a non catenary Noetherian local ring.

### 88.17. Existence of bad local Noetherian rings

0 LL7 Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian complete local ring. In Lec86a it was shown that $A$ is the completion of a Noetherian local domain if $\operatorname{depth}(A) \geq 1$ and $A$ contains either $\mathbf{Q}$ or $\mathbf{F}_{p}$ as a subring, or contains $\mathbf{Z}$ as a subring and $A$ is torsion free as a $\mathbf{Z}$ module. This produces many examples of Noetherian local domains with "bizarre" properties.
Applying this for example to $A=\mathbf{C}[[x, y]] /\left(y^{2}\right)$ we find a Noetherian local domain whose completion is nonreduced. Please compare with Section 88.15.

In LLPY01 conditions were found that characterize when $A$ is the completion of a reduced local Noetherian ring.
In Hei93 it was shown that $A$ is the completion of a local Noetherian UFD $R$ if $\operatorname{depth}(A) \geq 2$ and $A$ contains either $\mathbf{Q}$ or $\mathbf{F}_{p}$ as a subring, or contains $\mathbf{Z}$ as a subring and $A$ is torsion free as a $\mathbf{Z}$-module. In particular $R$ is normal (Algebra, Lemma 10.119.9 $)$ hence the henselization of $R$ is a normal domain too (More on Algebra, Lemma 15.36.6). Thus $A$ as above is the completion of a henselian Noetherian local normal domain (because the completion of $R$ and its henselization agree, see More on Algebra, Lemma 15.36.3).

Apply this to find a Noetherian local UFD $R$ such that $R^{\wedge} \cong \mathbf{C}[[x, y, z, w]] /(w x, w y)$. Note that $\operatorname{Spec}\left(R^{\wedge}\right)$ is the union of a regular 2-dimensional and a regular 3dimensional component. The ring $R$ cannot be universally catenary: Let

$$
X \longrightarrow \operatorname{Spec}(R)
$$

be the blowing up of the maximal ideal. Then $X$ is an integral scheme. There is a closed point $x \in X$ such that $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=2$, namely, on the level of the complete local ring we pick $x$ to lie on the strict transform of the 2 -dimensional component and not on the strict transform of the 3-dimensional component. By Morphisms, Lemma 28.30.1 we see that $R$ is not universally catenary. Please compare with Section 88.16

The ring above is catenary (being a 3-dimensional local Noetherian UFD). However, in Ogo80 the author constructs a normal local Noetherian domain $R$ with $R^{\wedge} \cong$ $\mathbf{C}[[x, y, z, w]] /(w x, w y)$ such that $R$ is not catenary. See also Hei82 and Lec86b.

In Hei94] it was shown that $A$ is the completion of a local Noetherian ring $R$ with an isolated singularity provided $A$ contains either $\mathbf{Q}$ or $\mathbf{F}_{p}$ as a subring or $A$ has residue characteristic $p>0$ and $p$ cannot map to a nonzero zerodivisor in any proper localization of $A$. Here we say a Noetherian local ring $R$ has an isolated singularity if $R_{\mathfrak{p}}$ is a regular local ring for all nonmaximal primes $\mathfrak{p} \subset R$.

The paper [Nis12] contains a long list of "bad" Noetherian local rings with given completions. In particular it constructs an example of a 2-dimensional Nagata local normal domain whose completion is $\mathbf{C}[[x, y, z]] /(y z)$ and one whose completion is $\mathbf{C}[[x, y, z]] /\left(y^{2}-z^{3}\right)$.
As an aside, in Loe03 it was shown that $A$ is the completion of an excellent Noetherian local domain if $A$ is reduced, equidimensional, and no integer in $A$ is a zero divisor. However, this doesn't lead to "bad" Noetherian local rings as we obtain excellent ones!

### 88.18. Non-quasi-affine variety with quasi-affine normalization

0271 The existence of an example of this kind is mentioned in DG67, II Remark 6.6.13]. They refer to the fifth volume of EGA for such an example, but the fifth volume did not appear.
Let $k$ be a field. Let $Y=\mathbf{A}_{k}^{2} \backslash\{(0,0)\}$. We are going to construct a finite surjective birational morphism $\pi: Y \longrightarrow X$ with $X$ a variety over $k$ such that $X$ is not quasi-affine. Namely, consider the following curves in $Y$ :

$$
\begin{aligned}
& C_{1}: \\
& C_{2}:
\end{aligned}: \quad x=0
$$

Note that $C_{1} \cap C_{2}=\emptyset$. We choose the isomorphism $\varphi: C_{1} \rightarrow C_{2},(0, y) \mapsto\left(y^{-1}, 0\right)$. We claim there is a unique morphism $\pi: Y \rightarrow X$ as above such that

$$
C_{1} \xrightarrow[\varphi]{\stackrel{\text { id }}{\longrightarrow}} Y \xrightarrow{\pi} X
$$

is a coequalizer diagram in the category of varieties (and even in the category of schemes). Accepting this for the moment let us show that such an $X$ cannot be quasi-affine. Namely, it is clear that we would get

$$
\Gamma\left(X, \mathcal{O}_{X}\right)=\left\{f \in k[x, y] \mid f(0, y)=f\left(y^{-1}, 0\right)\right\}=k \oplus(x y) \subset k[x, y]
$$

In particular these functions do not separate the points $(1,0)$ and $(-1,0)$ whose images in $X$ (we will see below) are distinct (if the characteristic of $k$ is not 2 ).
To show that $X$ exists consider the Zariski open $D(x+y) \subset Y$ of $Y$. This is the spectrum of the ring $k[x, y, 1 /(x+y)]$ and the curves $C_{1}, C_{2}$ are completely contained in $D(x+y)$. Moreover the morphism

$$
C_{1} \amalg C_{2} \longrightarrow D(x+y) \cap Y=\operatorname{Spec}(k[x, y, 1 /(x+y)])
$$

is a closed immersion. It follows from More on Algebra, Lemma 15.5.1 that the ring

$$
A=\left\{f \in k[x, y, 1 /(x+y)] \mid f(0, y)=f\left(y^{-1}, 0\right)\right\}
$$

is of finite type over $k$. On the other hand we have the open $D(x y) \subset Y$ of $Y$ which is disjoint from the curves $C_{1}$ and $C_{2}$. It is the spectrum of the ring

$$
B=k[x, y, 1 / x y] .
$$

Note that we have $A_{x y} \cong B_{x+y}$ (since $A$ clearly contains the elements $x y P(x, y)$ any polynomial $P$ and the element $x y /(x+y))$. The scheme $X$ is obtained by glueing the affine schemes $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$ using the isomorphism $A_{x y} \cong B_{x+y}$ and hence is clearly of finite type over $k$. To see that it is separated one has to show that the ring map $A \otimes_{k} B \rightarrow B_{x+y}$ is surjective. To see this use that $A \otimes_{k} B$
contains the element $x y /(x+y) \otimes 1 / x y$ which maps to $1 /(x+y)$. The morphism $X \rightarrow Y$ is given by the natural maps $D(x+y) \rightarrow \operatorname{Spec}(A)$ and $D(x y) \rightarrow \operatorname{Spec}(B)$. Since these are both finite we deduce that $X \rightarrow Y$ is finite as desired. We omit the verification that $X$ is indeed the coequalizer of the displayed diagram above, however, see (insert future reference for pushouts in the category of schemes here). Note that the morphism $\pi: Y \rightarrow X$ does map the points $(1,0)$ and $(-1,0)$ to distinct points in $X$ because the function $\left(x+y^{3}\right) /(x+y)^{2} \in A$ has value $1 / 1$, resp. $-1 /(-1)^{2}=-1$ which are always distinct (unless the characteristic is $2-$ please find your own points for characteristic 2 ). We summarize this discussion in the form of a lemma.

0272 Lemma 88.18.1. Let $k$ be a field. There exists a variety $X$ whose normalization is quasi-affine but which is itself not quasi-affine.

Proof. See discussion above and (insert future reference on normalization here).

### 88.19. A locally closed subscheme which is not open in closed

078B This is a copy of Morphisms, Example 28.3.4. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let $k$ be a field. Let $X=\operatorname{Spec}\left(k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\right)$. Let $U=\bigcup_{n=1}^{\infty} D\left(x_{n}\right)$. Then $U \rightarrow X$ is an open immersion. Consider the ideals

$$
I_{n}=\left(x_{1}^{n}, x_{2}^{n}, \ldots, x_{n-1}^{n}, x_{n}-1, x_{n+1}, x_{n+2}, \ldots\right) \subset k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n}\right] .
$$

Note that $I_{n} k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n} x_{m}\right]=(1)$ for any $m \neq n$. Hence the quasicoherent ideals $\widetilde{I}_{n}$ on $D\left(x_{n}\right)$ agree on $D\left(x_{n} x_{m}\right)$, namely $\left.\widetilde{I}_{n}\right|_{D\left(x_{n} x_{m}\right)}=\mathcal{O}_{D\left(x_{n} x_{m}\right)}$ if $n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{U}$. Let $Z \subset U$ be the closed subscheme corresponding to $\mathcal{I}$. Thus $Z \rightarrow X$ is an immersion.
We claim that we cannot factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z} \rightarrow X$, where $\bar{Z} \rightarrow X$ is closed and $Z \rightarrow \bar{Z}$ is open. Namely, $\bar{Z}$ would have to be defined by an ideal $I \subset k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ such that $I_{n}=\operatorname{Ik}\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n}\right]$. But the only element $f \in k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ which ends up in all $I_{n}$ is 0 ! Hence $I$ does not exist.

### 88.20. Nonexistence of suitable opens

086G This section complements the results of Properties, Section 27.29,
Let $k$ be a field and let $A=k\left[z_{1}, z_{2}, z_{3}, \ldots\right] / I$ where $I$ is the ideal generated by all pairwise products $z_{i} z_{j}, i \neq j, i, j \in \mathbf{N}$. Set $S=\operatorname{Spec}(A)$. Let $s \in S$ be the closed point corresponding to the maximal ideal $\left(z_{i}\right)$. We claim there is no quasicompact open $V \subset S \backslash\{s\}$ which is dense in $S \backslash\{s\}$. Note that $S \backslash\{s\}=\bigcup D\left(z_{i}\right)$. Each $D\left(z_{i}\right)$ is open and irreducible with generic point $\eta_{i}$. We conclude that $\eta_{i} \in V$ for all $i$. However, a principal affine open of $S \backslash\{s\}$ is of the form $D(f)$ where $f \in\left(z_{1}, z_{2}, \ldots\right)$. Then $f \in\left(z_{1}, \ldots, z_{n}\right)$ for some $n$ and we see that $D(f)$ contains only finitely many of the points $\eta_{i}$. Thus $V$ cannot be quasi-compact.

Let $k$ be a field and let $B=k\left[x, z_{1}, z_{2}, z_{3}, \ldots\right] / J$ where $J$ is the ideal generated by the products $x z_{i}, i \in \mathbf{N}$ and by all pairwise products $z_{i} z_{j}, i \neq j, i, j \in \mathbf{N}$. Set $T=\operatorname{Spec}(B)$. Consider the principal open $U=D(x)$. We claim there is no quasi-compact open $V \subset S$ such that $V \cap U=\emptyset$ and $V \cup U$ is dense in $S$. Let $t \in T$ be the closed point corresponding to the maximal ideal $\left(x, z_{i}\right)$. The closure of $U$ in
$T$ is $\bar{U}=U \cup\{t\}$. Hence $V \subset \bigcup_{i} D\left(z_{i}\right)$ is a quasi-compact open. By the arguments of the previous paragraph we see that $V$ cannot be dense in $\bigcup D\left(z_{i}\right)$.

086H Lemma 88.20.1. Nonexistence quasi-compact opens of affines:
(1) There exist an affine scheme $S$ and affine open $U \subset S$ such that there is no quasi-compact open $V \subset S$ with $U \cap V=\emptyset$ and $U \cup V$ dense in $S$.
(2) There exists an affine scheme $S$ and a closed point $s \in S$ such that $S \backslash\{s\}$ does not contain a quasi-compact dense open.
Proof. See discussion above.
Let $X$ be the glueing of two copies of the affine scheme $T$ (see above) along the affine open $U$. Thus there is a morphism $\pi: X \rightarrow T$ and $X=U_{1} \cup U_{2}$ such that $\pi$ maps $U_{i}$ isomorphically to $T$ and $U_{1} \cap U_{2}$ isomorphically to $U$. Note that $X$ is quasi-separated (by Schemes, Lemma 25.21.7) and quasi-compact. We claim there does not exist a separated, dense, quasi-compact open $W \subset X$. Namely, consider the two closed points $x_{1} \in U_{1}, x_{2} \in U_{2}$ mapping to the closed point $t \in T$ introduced above. Let $\tilde{\eta} \in U_{1} \cap U_{2}$ be the generic point mapping to the (unique) generic point $\eta$ of $U$. Note that $\tilde{\eta} \rightsquigarrow x_{1}$ and $\tilde{\eta} \rightsquigarrow x_{2}$ lying over the specialization $\eta \rightsquigarrow s$. Since $\left.\pi\right|_{W}: W \rightarrow T$ is separated we conclude that we cannot have both $x_{1}$ and $x_{2} \in W$ (by the valuative criterion of separatedness Schemes, Lemma 25.22.2). Say $x_{1} \notin W$. Then $W \cap U_{1}$ is a quasi-compact (as $X$ is quasi-separated) dense open of $U_{1}$ which does not contain $x_{1}$. Now observe that there exists an isomorphism $(T, t) \cong(S, s)$ of schemes (by sending $x$ to $z_{1}$ and $z_{i}$ to $\left.z_{i+1}\right)$. Hence by the first paragraph of this section we arrive at a contradiction.

086 I Lemma 88.20.2. There exists a quasi-compact and quasi-separated scheme $X$ which does not contain a separated quasi-compact dense open.

Proof. See discussion above.

### 88.21. Nonexistence of quasi-compact dense open subscheme

087 H Let $X$ be a quasi-compact and quasi-separated algebraic space over a field $k$. We know that the schematic locus $X^{\prime} \subset X$ is a dense open subspace, see Properties of Spaces, Proposition 53.12.3. In fact, this result holds when $X$ is reasonable, see Decent Spaces, Proposition 55.9.1. A natural question is whether one can find a quasi-compact dense open subscheme of $X$. It turns out this is not possible in general.

Assume the characteristic of $k$ is not 2 . Let $B=k\left[x, z_{1}, z_{2}, z_{3}, \ldots\right] / J$ where $J$ is the ideal generated by the products $x z_{i}, i \in \mathbf{N}$ and by all pairwise products $z_{i} z_{j}$, $i \neq j, i, j \in \mathbf{N}$. Set $U=\operatorname{Spec}(B)$. Denote $0 \in U$ the closed point all of whose coordinates are zero. Set

$$
j: R=\Delta \amalg \Gamma \longrightarrow U \times_{k} U
$$

where $\Delta$ is the image of the diagonal morphism of $U$ over $k$ and

$$
\Gamma=\left\{((x, 0,0,0, \ldots),(-x, 0,0,0, \ldots)) \mid x \in \mathbf{A}_{k}^{1}, x \neq 0\right\}
$$

It is clear that $s, t: R \rightarrow U$ are étale, and hence $j$ is an étale equivalence relation. The quotient $X=U / R$ is an algebraic space (Spaces, Theorem 52.10.5). Note that $j$ is not an immersion because $(0,0) \in \Delta$ is in the closure of $\Gamma$. Hence $X$ is not a
scheme. On the other hand, $X$ is quasi-separated as $R$ is quasi-compact. Denote $0_{X}$ the image of the point $0 \in U$. We claim that $X \backslash\left\{0_{X}\right\}$ is a scheme, namely

$$
X \backslash\left\{0_{X}\right\}=\operatorname{Spec}\left(k\left[x^{2}, x^{-2}\right]\right) \amalg \operatorname{Spec}\left(k\left[z_{1}, z_{2}, z_{3}, \ldots\right] /\left(z_{i} z_{j}\right)\right) \backslash\{0\}
$$

(details omitted). On the other hand, we have seen in Section 88.20 that the scheme on the right hand side does not contain a quasi-compact dense open.

087I Lemma 88.21.1. There exists a quasi-compact and quasi-separated algebraic space which does not contain a quasi-compact dense open subscheme.
Proof. See discussion above.
Using the construction of Spaces, Example 52.14 .2 in the same manner as we used the construction of Spaces, Example 52.14.1 above, one obtains an example of a quasi-compact, quasi-separated, and locally separated algebraic space which does not contain a quasi-compact dense open subscheme.

### 88.22. Affines over algebraic spaces

088V
Suppose that $f: Y \rightarrow X$ is a morphism of schemes with $f$ locally of finite type and $Y$ affine. Then there exists an immersion $Y \rightarrow \mathbf{A}_{X}^{n}$ of $Y$ into affine $n$-space over $X$. See the slightly more general Morphisms, Lemma 28.39 .2
Now suppose that $f: Y \rightarrow X$ is a morphism of algebraic spaces with $f$ locally of finite type and $Y$ an affine scheme. Then it is not true in general that we can find an immersion of $Y$ into affine $n$-space over $X$.
A first (nasty) counter example is $Y=\operatorname{Spec}(k)$ and $X=\left[\mathbf{A}_{k}^{1} / \mathbf{Z}\right]$ where $k$ is a field of characteristic zero and $\mathbf{Z}$ acts on $\mathbf{A}_{k}^{1}$ by translation $(n, t) \mapsto t+n$. Namely, for any morphism $Y \rightarrow \mathbf{A}_{X}^{n}$ over $X$ we can pullback to the covering $\mathbf{A}_{k}^{1}$ of $X$ and we get an infinite disjoint union of $\mathbf{A}_{k}^{1}$ 's mapping into $\mathbf{A}_{k}^{n+1}$ which is not an immersion.
A second counter example is $Y=\mathbf{A}_{k}^{1} \rightarrow X=\mathbf{A}_{k}^{1} / R$ with $R=\{(t, t)\} \amalg\{(t,-t), t \neq$ $0\}$. Namely, in this case the morphism $Y \rightarrow \mathbf{A}_{X}^{n}$ would be given by some regular functions $f_{1}, \ldots, f_{n}$ on $Y$ and hence the fibre product of $Y$ with the covering $\mathbf{A}_{k}^{n+1} \rightarrow \mathbf{A}_{X}^{n}$ would be the scheme

$$
\left\{\left(f_{1}(t), \ldots, f_{n}(t), t\right)\right\} \amalg\left\{\left(f_{1}(t), \ldots, f_{n}(t),-t\right), t \neq 0\right\}
$$

with obvious morphism to $\mathbf{A}_{k}^{n+1}$ which is not an immersion. Note that this gives a counter example with $X$ quasi-separated.

088W Lemma 88.22.1. There exists a finite type morphism of algebraic spaces $Y \rightarrow X$ with $Y$ affine and $X$ quasi-separated, such that there does not exist an immersion $Y \rightarrow \mathbf{A}_{X}^{n}$ over $X$.
Proof. See discussion above.

### 88.23. Pushforward of quasi-coherent modules

078C In Schemes, Lemma 25.24.1 we proved that $f_{*}$ transforms quasi-coherent modules into quasi-coherent modules when $f$ is quasi-compact and quasi-separated. Here are some examples to show that these conditions are both necessary.

Suppose that $Y=\operatorname{Spec}(A)$ is an affine scheme and that $X=\coprod_{n \in \mathbf{N}} Y$. We claim that $f_{*} \mathcal{O}_{X}$ is not quasi-coherent where $f: X \rightarrow Y$ is the obvious morphism. Namely, for $a \in A$ we have

$$
f_{*} \mathcal{O}_{X}(D(a))=\prod_{n \in \mathbf{N}} A_{a}
$$

Hence, in order for $f_{*} \mathcal{O}_{X}$ to be quasi-coherent we would need

$$
\prod_{n \in \mathbf{N}} A_{a}=\left(\prod_{n \in \mathbf{N}} A\right)_{a}
$$

for all $a \in A$. This isn't true in general, for example if $A=\mathbf{Z}$ and $a=2$, then $(1,1 / 2,1 / 4,1 / 8, \ldots)$ is an element of the left hand side which is not in the right hand side. Note that $f$ is a non-quasi-compact separated morphism.

Let $k$ be a field. Set

$$
A=k\left[t, z, x_{1}, x_{2}, x_{3}, \ldots\right] /\left(t x_{1} z, t^{2} x_{2}^{2} z, t^{3} x_{3}^{3} z, \ldots\right)
$$

Let $Y=\operatorname{Spec}(A)$. Let $V \subset Y$ be the open subscheme $V=D\left(x_{1}\right) \cup D\left(x_{2}\right) \cup \ldots$. Let $X$ be two copies of $Y$ glued along $V$. Let $f: X \rightarrow Y$ be the obvious morphism. Then we have an exact sequence

$$
0 \rightarrow f_{*} \mathcal{O}_{X} \rightarrow \mathcal{O}_{Y} \oplus \mathcal{O}_{Y} \xrightarrow{(1,-1)} j_{*} \mathcal{O}_{V}
$$

where $j: V \rightarrow Y$ is the inclusion morphism. Since

$$
A \longrightarrow \prod A_{x_{n}}
$$

is injective (details omitted) we see that $\Gamma\left(Y, f_{*} \mathcal{O}_{X}\right)=A$. On the other hand, the kernel of the map

$$
A_{t} \longrightarrow \prod A_{t x_{n}}
$$

is nonzero because it contains the element $z$. Hence $\Gamma\left(D(t), f_{*} \mathcal{O}_{X}\right)$ is strictly bigger than $A_{t}$ because it contains $(z, 0)$. Thus we see that $f_{*} \mathcal{O}_{X}$ is not quasi-coherent. Note that $f$ is quasi-compact but non-quasi-separated.

078D Lemma 88.23.1. Schemes, Lemma 25.24.1 is sharp in the sense that one can neither drop the assumption of quasi-compactness nor the assumption of quasiseparatedness.

Proof. See discussion above.

### 88.24. A nonfinite module with finite free rank 1 stalks

065J Let $R=\mathbf{Q}[x]$. Set $M=\sum_{n \in \mathbf{N}} \frac{1}{x-n} R$ as a submodule of the fraction field of $R$. Then $M$ is not finitely generated, but for every prime $\mathfrak{p}$ of $R$ we have $M_{\mathfrak{p}} \cong R_{\mathfrak{p}}$ as an $R_{\mathfrak{p}}$-module.

### 88.25. A finite flat module which is not projective

052 H This is a copy of Algebra, Remark 10.77.3. It is not true that a finite $R$-module which is $R$-flat is automatically projective. A counter example is where $R=\mathcal{C}^{\infty}(\mathbf{R})$ is the ring of infinitely differentiable functions on $\mathbf{R}$, and $M=R_{\mathfrak{m}}=R / I$ where $\mathfrak{m}=\{f \in R \mid f(0)=0\}$ and $I=\{f \in R|\exists \epsilon, \epsilon>0: f(x)=0 \forall x,|x|<\epsilon\}$.

The morphism $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$ is also an example of a flat closed immersion which is not open.
05FY Lemma 88.25.1. Strange flat modules.
(1) There exists a ring $R$ and a finite flat $R$-module $M$ which is not projective.
(2) There exists a closed immersion which is flat but not open.

Proof. See discussion above.

### 88.26. A projective module which is not locally free

05 WG We give two examples. One where the rank is between 0 and 1 and one where the rank is $\aleph_{0}$.
05WH Lemma 88.26.1. Let $R$ be a ring. Let $I \subset R$ be an ideal generated by a countable collection of idempotents. Then $I$ is projective as an $R$-module.

Proof. Say $I=\left(e_{1}, e_{2}, e_{3}, \ldots\right)$ with $e_{n}$ an idempotent of $R$. After inductively replacing $e_{n+1}$ by $e_{n}+\left(1-e_{n}\right) e_{n+1}$ we may assume that $\left(e_{1}\right) \subset\left(e_{2}\right) \subset\left(e_{3}\right) \subset \ldots$ and hence $I=\bigcup_{n \geq 1}\left(e_{n}\right)=\operatorname{colim}_{n} e_{n} R$. In this case

$$
\operatorname{Hom}_{R}(I, M)=\operatorname{Hom}_{R}\left(\operatorname{colim}_{n} e_{n} R, M\right)=\lim _{n} \operatorname{Hom}_{R}\left(e_{n} R, M\right)=\lim _{n} e_{n} M
$$

Note that the transition maps $e_{n+1} M \rightarrow e_{n} M$ are given by multiplication by $e_{n}$ and are surjective. Hence by Algebra, Lemma 10.85.4 the functor $\operatorname{Hom}_{R}(I, M)$ is exact, i.e., $I$ is a projective $R$-module.
05WI Lemma 88.26.2. Let $R$ be a nonzero ring. Let $n \geq 1$. Let $M$ be an $R$-module generated by $<n$ elements. Then any $R$-module map $f: R^{\oplus n} \rightarrow M$ has a nonzero kernel.

Proof. Choose a surjection $R^{\oplus n-1} \rightarrow M$. We may lift the map $f$ to a map $f^{\prime}: R^{\oplus n} \rightarrow R^{\oplus n-1}$. It suffices to prove $f^{\prime}$ has a nonzero kernel. The map $f^{\prime}$ : $R^{\oplus n} \rightarrow R^{\oplus n-1}$ is given by a matrix $A=\left(a_{i j}\right)$. If one of the $a_{i j}$ is not nilpotent, say $a=a_{i j}$ is not, then we can replace $A$ by the localization $A_{a}$ and we may assume $a_{i j}$ is a unit. Since if we find a nonzero kernel after localization then there was a nonzero kernel to start with as localization is exact, see Algebra, Proposition 10.9.12. In this case we can do a base change on both $R^{\oplus n}$ and $R^{\oplus n-1}$ and reduce to the case where

$$
A=\left(\begin{array}{cccc}
1 & 0 & 0 & \ldots \\
0 & a_{22} & a_{23} & \ldots \\
0 & a_{32} & \cdots & \\
\cdots & \cdots & &
\end{array}\right)
$$

Hence in this case we win by induction on $n$. If not then each $a_{i j}$ is nilpotent. Set $I=\left(a_{i j}\right) \subset R$. Note that $I^{m+1}=0$ for some $m \geq 0$. Let $m$ be the largest integer such that $I^{m} \neq 0$. Then we see that $\left(I^{m}\right)^{\oplus n}$ is contained in the kernel of the map and we win.

Suppose that $P \subset Q$ is an inclusion of $R$-modules with $Q$ a finite $R$-module and $P$ locally free, see Algebra, Definition 10.77.1. Suppose that $Q$ can be generated by $N$ elements as an $R$-module. Then it follows from Lemma 88.26 .2 that $P$ is finite locally free (with the free parts having rank at most $N$ ). And in this case $P$ is a finite $R$-module, see Algebra, Lemma 10.77.2.

Combining this with the above we see that a non-finitely-generated ideal which is generated by a countable collection of idempotents is projective but not locally free. An explicit example is $R=\prod_{n \in \mathbf{N}} \mathbf{F}_{2}$ and $I$ the ideal generated by the idempotents

$$
e_{n}=(1,1, \ldots, 1,0, \ldots)
$$

where the sequence of 1 's has length $n$.
05WJ Lemma 88.26.3. There exists a ring $R$ and an ideal $I$ such that $I$ is projective as an $R$-module but not locally free as an $R$-module.

Proof. See above.
05WK Lemma 88.26.4. Let $K$ be a field. Let $C_{i}, i=1, \ldots, n$ be smooth, projective, geometrically irreducible curves over $K$. Let $P_{i} \in C_{i}(K)$ be a rational point and let $Q_{i} \in C_{i}$ be a point such that $\left[\kappa\left(Q_{i}\right): K\right]=2$. Then $\left[P_{1} \times \ldots \times P_{n}\right]$ is nonzero in $A_{0}\left(U_{1} \times_{K} \ldots \times_{K} U_{n}\right)$ where $U_{i}=C_{i} \backslash\left\{Q_{i}\right\}$.
Proof. There is a degree map deg : $A_{0}\left(C_{1} \times_{K} \ldots \times_{K} C_{n}\right) \rightarrow \mathbf{Z}$ Because each $Q_{i}$ has degree 2 over $K$ we see that any zero cycle supported on the "boundary"

$$
C_{1} \times_{K} \ldots \times_{K} C_{n} \backslash U_{1} \times_{K} \ldots \times_{K} U_{n}
$$

has degree divisible by 2 .
We can construct another example of a projective but not locally free module using the lemma above as follows. Let $C_{n}, n=1,2,3, \ldots$ be smooth, projective, geometrically irreducible curves over $\mathbf{Q}$ each with a pair of points $P_{n}, Q_{n} \in C_{n}$ such that $\kappa\left(P_{n}\right)=\mathbf{Q}$ and $\kappa\left(Q_{n}\right)$ is a quadratic extension of $\mathbf{Q}$. Set $U_{n}=C_{n} \backslash\left\{Q_{n}\right\}$; this is an affine curve. Let $\mathcal{L}_{n}$ be the inverse of the ideal sheaf of $P_{n}$ on $U_{n}$. Note that $c_{1}\left(\mathcal{L}_{n}\right)=\left[P_{n}\right]$ in the group of zero cycles $A_{0}\left(U_{n}\right)$. Set $A_{n}=\Gamma\left(U_{n}, \mathcal{O}_{U_{n}}\right)$. Let $L_{n}=\Gamma\left(U_{n}, \mathcal{L}_{n}\right)$ which is a locally free module of rank 1 over $A_{n}$. Set

$$
B_{n}=A_{1} \otimes_{\mathbf{Q}} A_{2} \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} A_{n}
$$

so that $\operatorname{Spec}\left(B_{n}\right)=U_{1} \times \ldots \times U_{n}$ all products over $\operatorname{Spec}(\mathbf{Q})$. For $i \leq n$ we set

$$
L_{n, i}=A_{1} \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} M_{i} \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} A_{n}
$$

which is a locally free $B_{n}$-module of rank 1 . Note that this is also the global sections of $\operatorname{pr}_{i}^{*} \mathcal{L}_{n}$. Set

$$
B_{\infty}=\operatorname{colim}_{n} B_{n} \quad \text { and } \quad L_{\infty, i}=\operatorname{colim}_{n} L_{n, i}
$$

Finally, set

$$
M=\bigoplus_{i \geq 1} L_{\infty, i}
$$

This is a direct sum of finite locally free modules, hence projective. We claim that $M$ is not locally free. Namely, suppose that $f \in B_{\infty}$ is a nonzero function such that $M_{f}$ is free over $\left(B_{\infty}\right)_{f}$. Let $e_{1}, e_{2}, \ldots$ be a basis. Choose $n \geq 1$ such that $f \in B_{n}$. Choose $m \geq n+1$ such that $e_{1}, \ldots, e_{n+1}$ are in

$$
\bigoplus_{1 \leq i \leq m} L_{m, i}
$$

Because the elements $e_{1}, \ldots, e_{n+1}$ are part of a basis after a faithfully flat base change we conclude that the chern classes

$$
c_{i}\left(\operatorname{pr}_{1}^{*} \mathcal{L}_{1} \oplus \ldots \oplus \operatorname{pr}_{m}^{*} \mathcal{L}_{m}\right), \quad i=m, m-1, \ldots, m-n
$$

are zero in the chow group of

$$
D(f) \subset U_{1} \times \ldots \times U_{m}
$$

Since $f$ is the pullback of a function on $U_{1} \times \ldots \times U_{n}$ this implies in particular that

$$
c_{m-n}\left(\mathcal{O}_{W}^{\oplus n} \oplus \operatorname{pr}_{1}^{*} \mathcal{L}_{n+1} \oplus \ldots \oplus \operatorname{pr}_{m-n}^{*} \mathcal{L}_{m}\right)=0
$$

on the variety

$$
W=\left(C_{n+1} \times \ldots \times C_{m}\right)_{K}
$$

over the field $K=\mathbf{Q}\left(C_{1} \times \ldots \times C_{n}\right)$. In other words the cycle

$$
\left[\left(P_{n+1} \times \ldots \times P_{m}\right)_{K}\right]
$$

is zero in the chow group of zero cycles on $W$. This contradicts Lemma 88.26.4 above because the points $Q_{i}, n+1 \leq i \leq m$ induce corresponding points $Q_{i}^{\prime}$ on $\left(C_{n}\right)_{K}$ and as $K / \mathbf{Q}$ is geometrically irreducible we have $\left[\kappa\left(Q_{i}^{\prime}\right): K\right]=2$.

05WL Lemma 88.26.5. There exists a countable ring $R$ and a projective module $M$ which is a direct sum of countably many locally free rank 1 modules such that $M$ is not locally free.

Proof. See above.

### 88.27. Zero dimensional local ring with nonzero flat ideal

$05 F Z$ In Laz67, and Laz69 there is an example of a zero dimensional local ring with a nonzero flat ideal. Here is the construction. Let $k$ be a field. Let $X_{i}, Y_{i}, i \geq 1$ be variables. Take $R=k\left[X_{i}, Y_{i}\right] /\left(X_{i}-Y_{i} X_{i+1}, Y_{i}^{2}\right)$. Denote $x_{i}$, resp. $y_{i}$ the image of $X_{i}$, resp. $Y_{i}$ in this ring. Note that

$$
x_{i}=y_{i} x_{i+1}=y_{i} y_{i+1} x_{i+2}=y_{i} y_{i+1} y_{i+2} x_{i+3}=\ldots
$$

in this ring. The ring $R$ has only one prime ideal, namely $\mathfrak{m}=\left(x_{i}, y_{i}\right)$. We claim that the ideal $I=\left(x_{i}\right)$ is flat as an $R$-module.
Note that the annihilator of $x_{i}$ in $R$ is the ideal $\left(x_{1}, x_{2}, x_{3}, \ldots, y_{i}, y_{i+1}, y_{i+2}, \ldots\right)$. Consider the $R$-module $M$ generated by elements $e_{i}, i \geq 1$ and relations $e_{i}=y_{i} e_{i+1}$. Then $M$ is flat as it is the colimit $\operatorname{colim}_{i} R$ of copies of $R$ with transition maps

$$
R \xrightarrow{y_{1}} R \xrightarrow{y_{2}} R \xrightarrow{y_{3}} \ldots
$$

Note that the annihilator of $e_{i}$ in $M$ is the ideal $\left(x_{1}, x_{2}, x_{3}, \ldots, y_{i}, y_{i+1}, y_{i+2}, \ldots\right)$. Since every element of $M$, resp. $I$ can be written as $f e_{i}$, resp. $h x_{i}$ for some $f, h \in R$ we see that the map $M \rightarrow I, e_{i} \rightarrow x_{i}$ is an isomorphism and $I$ is flat.
05G0 Lemma 88.27.1. There exists a local ring $R$ with a unique prime ideal and a nonzero ideal $I \subset R$ which is a flat $R$-module

Proof. See discussion above.

### 88.28. An epimorphism of zero-dimensional rings which is not surjective

06RH In Laz68 and Laz69 one can find the following example. Let $k$ be a field. Consider the ring homomorphism

$$
k\left[x_{1}, x_{2}, \ldots, z_{1}, z_{2}, \ldots\right] /\left(x_{i}^{4^{i}}, z_{i}^{4^{i}}\right) \longrightarrow k\left[x_{1}, x_{2}, \ldots, y_{1}, y_{2}, \ldots\right] /\left(x_{i}^{4^{i}}, y_{i}-x_{i+1} y_{i+1}^{2}\right)
$$

which maps $x_{i}$ to $x_{i}$ and $z_{i}$ to $x_{i} y_{i}$. Note that $y_{i}^{4^{i+1}}$ is zero in the right hand side but that $y_{1}$ is not zero (details omitted). This map is not surjective: we can think of the above as a map of $\mathbf{Z}$-graded algebras by $\operatorname{setting} \operatorname{deg}\left(x_{i}\right)=-1, \operatorname{deg}\left(z_{i}\right)=0$, and $\operatorname{deg}\left(y_{i}\right)=1$ and then it is clear that $y_{1}$ is not in the image. Finally, the map is an epimorphism because

$$
y_{i-1} \otimes 1=x_{i} y_{i}^{2} \otimes 1=y_{i} \otimes x_{i} y_{i}=x_{i} y_{i} \otimes y_{i}=1 \otimes x_{i} y_{i}^{2}
$$

hence the tensor product of the target over the source is isomorphic to the target.
06RI Lemma 88.28.1. There exists an epimorphism of local rings of dimension 0 which is not a surjection.

Proof. See discussion above.

### 88.29. Finite type, not finitely presented, flat at prime

05G1 Let $k$ be a field. Consider the local ring $A_{0}=k[x, y]_{(x, y)}$. Denote $\mathfrak{p}_{0, n}=\left(y+x^{n}+\right.$ $\left.x^{2 n+1}\right)$. This is a prime ideal. Set

$$
A=A_{0}\left[z_{1}, z_{2}, z_{3}, \ldots\right] /\left(z_{n} z_{m}, z_{n}\left(y+x^{n}+x^{2 n+1}\right)\right)
$$

Note that $A \rightarrow A_{0}$ is a surjection whose kernel is an ideal of square zero. Hence $A$ is also a local ring and the prime ideals of $A$ are in one-to-one correspondence with the prime ideals of $A_{0}$. Denote $\mathfrak{p}_{n}$ the prime ideal of $A$ corresponding to $\mathfrak{p}_{0, n}$. Observe that $\mathfrak{p}_{n}$ is the annihilator of $z_{n}$ in $A$. Let

$$
C=A[z] /\left(x z^{2}+z+y\right)\left[\frac{1}{2 z x+1}\right]
$$

Note that $A \rightarrow C$ is an étale ring map, see Algebra, Example 10.135.8. Let $\mathfrak{q} \subset C$ be the maximal ideal generated by $x, y, z$ and all $z_{n}$. As $A \rightarrow C$ is flat we see that the annihilator of $z_{n}$ in $C$ is $\mathfrak{p}_{n} C$. We compute

$$
\begin{aligned}
C / \mathfrak{p}_{n} C & =A_{0}[z] /\left(x z^{2}+z+y, y+x^{n}+x^{2 n+1}\right)[1 /(2 z x+1)] \\
& =k[x]_{(x)}[z] /\left(x z^{2}+z-x^{n}-x^{2 n+1}\right)[1 /(2 z x+1)] \\
& =k[x]_{(x)}[z] /\left(z-x^{n}\right) \times k[x]_{(x)}[z] /\left(x z+x^{n+1}+1\right)[1 /(2 z x+1)] \\
& =k[x]_{(x)} \times k(x)
\end{aligned}
$$

because $\left(z-x^{n}\right)\left(x z+x^{n+1}+1\right)=x z^{2}+z-x^{n}-x^{2 n+1}$. Hence we see that $\mathfrak{p}_{n} C=\mathfrak{r}_{n} \cap \mathfrak{q}_{n}$ with $\mathfrak{r}_{n}=\mathfrak{p}_{n} C+\left(z-x^{n}\right) C$ and $\mathfrak{q}_{n}=\mathfrak{p}_{n} C+\left(x z+x^{n+1}+1\right) C$. Since $\mathfrak{q}_{n}+\mathfrak{r}_{n}=C$ we also get $\mathfrak{p}_{n} C=\mathfrak{r}_{n} \mathfrak{q}_{n}$. It follows that $\mathfrak{q}_{n}$ is the annihilator of $\xi_{n}=\left(z-x^{n}\right) z_{n}$. Observe that on the one hand $\mathfrak{r}_{n} \subset \mathfrak{q}$, and on the other hand $\mathfrak{q}_{n}+\mathfrak{q}=C$. This follows for example because $\mathfrak{q}_{n}$ is a maximal ideal of $C$ distinct from $\mathfrak{q}$. Similarly we have $\mathfrak{q}_{n}+\mathfrak{q}_{m}=C$ for $n \neq m$. At this point we let

$$
B=\operatorname{Im}\left(C \longrightarrow C_{\mathfrak{q}}\right)
$$

We observe that the elements $\xi_{n}$ map to zero in $B$ as $x z+x^{n+1}+1$ is not in $\mathfrak{q}$. Denote $\mathfrak{q}^{\prime} \subset B$ the image of $\mathfrak{q}$. By construction $B$ is a finite type $A$-algebra, with $B_{\mathfrak{q}^{\prime}} \cong C_{\mathfrak{q}}$. In particular we see that $B_{\mathfrak{q}^{\prime}}$ is flat over $A$.
We claim there does not exist an element $g^{\prime} \in B, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $B_{g^{\prime}}$ is of finite presentation over $A$. We sketch a proof of this claim. Choose an element $g \in C$ which maps to $g^{\prime} \in B$. Consider the map $C_{g} \rightarrow B_{g^{\prime}}$. By Algebra, Lemma 10.6.3 we see that $B_{g}$ is finitely presented over $A$ if and only if the kernel of $C_{g} \rightarrow B_{g^{\prime}}$ is finitely generated. But the element $g \in C$ is not contained in $\mathfrak{q}$, hence maps to a nonzero element of $A_{0}[z] /\left(x z^{2}+z+y\right)$. Hence $g$ can only be contained in finitely many of the prime ideals $\mathfrak{q}_{n}$, because the primes $\left(y+x^{n}+x^{2 n+1}, x z+x^{n+1}+1\right)$ are an infinite collection of codimension 1 points of the 2-dimensional irreducible Noetherian space $\operatorname{Spec}\left(k[x, y, z] /\left(x z^{2}+z+y\right)\right)$. The map

$$
\bigoplus_{g \notin \mathfrak{q}_{n}} C / \mathfrak{q}_{n} \longrightarrow C_{g}, \quad\left(c_{n}\right) \longrightarrow \sum c_{n} \xi_{n}
$$

is injective and its image is the kernel of $C_{g} \rightarrow B_{g^{\prime}}$. We omit the proof of this statement. (Hint: Write $A=A_{0} \oplus I$ as an $A_{0}$-module where $I$ is the kernel of $A \rightarrow A_{0}$. Similarly, write $C=C_{0} \oplus I C$. Write $I C=\bigoplus C z_{n} \cong \bigoplus\left(C / \mathfrak{r}_{n} \oplus C / \mathfrak{q}_{n}\right)$ and study the effect of multiplication by $g$ on the summands.) This concludes the sketch of the proof of the claim. This also proves that $B_{g^{\prime}}$ is not flat over $A$ for any $g^{\prime}$ as above. Namely, if it were flat, then the annihilator of the image of $z_{n}$ in $B_{g^{\prime}}$ would be $\mathfrak{p}_{n} B_{g^{\prime}}$, and would not contain $z-x^{n}$.

As a consequence we can answer (negatively) a question posed in GR71, Part I, Remarques (3.4.7) (v)]. Here is a precise statement.

05G2 Lemma 88.29.1. There exists a local ring $A$, a finite type ring map $A \rightarrow B$ and a prime $\mathfrak{q}$ lying over $\mathfrak{m}_{A}$ such that $B_{\mathfrak{q}}$ is flat over $A$, and for any element $g \in B$, $g \notin \mathfrak{q}$ the ring $B_{g}$ is neither finitely presented over $A$ nor flat over $A$.

Proof. See discussion above.

### 88.30. Finite type, flat and not of finite presentation

05 LB In this section we give some examples of ring maps and morphisms which are of finite type and flat but not of finite presentation.

Let $R$ be a ring which has an ideal $I$ such that $R / I$ is a finite flat module but not projective, see Section 88.25 for an explicit example. Note that this means that $I$ is not finitely generated, see Algebra, Lemma 10.107.5. Note that $I=I^{2}$, see Algebra, Lemma 10.107.2. The base ring in our examples will be $R$ and correspondingly the base scheme $S=\operatorname{Spec}(R)$.

Consider the ring map $R \rightarrow R \oplus R / I \epsilon$ where $\epsilon^{2}=0$ by convention. This is a finite, flat ring map which is not of finite presentation. All the fibre rings are complete intersections and geometrically irreducible.

Let $A=R[x, y] /(x y, a y ; a \in I)$. Note that as an $R$-module we have $A=\bigoplus_{i \geq 0} R y^{i} \oplus$ $\bigoplus_{j>0} R / I x^{j}$. Hence $R \rightarrow A$ is a flat finite type ring map which is not of finite presentation. Each fibre ring is isomorphic to either $\kappa(\mathfrak{p})[x, y] /(x y)$ or $\kappa(\mathfrak{p})[x]$.

We can turn the previous example into a projective morphism by taking $B=$ $R\left[X_{0}, X_{1}, X_{2}\right] /\left(X_{1} X_{2}, a X_{2} ; a \in I\right)$. In this case $X=\operatorname{Proj}(B) \rightarrow S$ is a proper flat morphism which is not of finite presentation such that for each $s \in S$ the fibre $X_{s}$ is isomorphic either to $\mathbf{P}_{s}^{1}$ or to the closed subscheme of $\mathbf{P}_{s}^{2}$ defined by the vanishing of $X_{1} X_{2}$ (this is a projective nodal curve of arithmetic genus 0 ).
Let $M=R \oplus R \oplus R / I$. Set $B=\operatorname{Sym}_{R}(M)$ the symmetric algebra on $M$. Set $X=\operatorname{Proj}(B)$. Then $X \rightarrow S$ is a proper flat morphism, not of finite presentation such that for $s \in S$ the geometric fibre is isomorphic to either $\mathbf{P}_{s}^{1}$ or $\mathbf{P}_{s}^{2}$. In particular these fibres are smooth and geometrically irreducible.

05LC Lemma 88.30.1. There exist examples of
(1) a flat finite type ring map with geometrically irreducible complete intersection fibre rings which is not of finite presentation,
(2) a flat finite type ring map with geometrically connected, geometrically reduced, dimension 1, complete intersection fibre rings which is not of finite presentation,
(3) a proper flat morphism of schemes $X \rightarrow S$ each of whose fibres is isomorphic to either $\mathbf{P}_{s}^{1}$ or to the vanishing locus of $X_{1} X_{2}$ in $\mathbf{P}_{s}^{2}$ which is not of finite presentation, and
(4) a proper flat morphism of schemes $X \rightarrow S$ each of whose fibres is isomorphic to either $\mathbf{P}_{s}^{1}$ or $\mathbf{P}_{s}^{2}$ which is not of finite presentation.
Proof. See discussion above.

### 88.31. Topology of a finite type ring map

$05 \mathrm{JH} \quad$ Let $A \rightarrow B$ be a local map of local domains. If $A$ is Noetherian, $A \rightarrow B$ is essentially of finite type, and $A / \mathfrak{m}_{A} \subset B / \mathfrak{m}_{B}$ is finite then there exists a prime $\mathfrak{q} \subset B, \mathfrak{q} \neq \mathfrak{m}_{B}$ such that $A \rightarrow B / \mathfrak{q}$ is the localization of a quasi-finite ring map. See More on Morphisms, Lemma 36.37.6.

In this section we give an example that shows this result is false $A$ is no longer Noetherian. Namely, let $k$ be a field and set

$$
A=\left\{a_{0}+a_{1} x+a_{2} x^{2}+\ldots \mid a_{0} \in k, a_{i} \in k((y)) \text { for } i \geq 1\right\}
$$

and

$$
C=\left\{a_{0}+a_{1} x+a_{2} x^{2}+\ldots \mid a_{0} \in k[y], a_{i} \in k((y)) \text { for } i \geq 1\right\}
$$

The inclusion $A \rightarrow C$ is of finite type as $C$ is generated by $y$ over $A$. We claim that $A$ is a local ring with maximal ideal $\mathfrak{m}=\left\{a_{1} x+a_{2} x^{2}+\ldots \in A\right\}$ and no prime ideals besides ( 0 ) and $\mathfrak{m}$. Namely, an element $f=a_{0}+a_{1} x+a_{2} x^{2}+\ldots$ of $A$ is invertible as soon as $a_{0} \neq 0$. If $\mathfrak{q} \subset A$ is a nonzero prime ideal, and $f=a_{i} x^{i}+\ldots \in \mathfrak{q}$, then using properties of power series one sees that for any $g \in k((y))$ the element $g^{i+1} x^{i+1} \in \mathfrak{q}$, i.e., $g x \in \mathfrak{q}$. This proves that $\mathfrak{q}=\mathfrak{m}$.

As to the spectrum of the ring $C$, arguing in the same way as above we see that any nonzero prime ideal contains the prime $\mathfrak{p}=\left\{a_{1} x+a_{2} x^{2}+\ldots \in C\right\}$ which lies over $\mathfrak{m}$. Thus the only prime of $C$ which lies over (0) is (0). Set $\mathfrak{m}_{C}=y C+\mathfrak{p}$ and $B=C_{\mathfrak{m}_{C}}$. Then $A \rightarrow B$ is the desired example.
05JI Lemma 88.31.1. There exists a local homomorphism $A \rightarrow B$ of local domains which is essentially of finite type and such that $A / \mathfrak{m}_{A} \rightarrow B / \mathfrak{m}_{B}$ is finite such that for every prime $\mathfrak{q} \neq \mathfrak{m}_{B}$ of $B$ the ring map $A \rightarrow B / \mathfrak{q}$ is not the localization of $a$ quasi-finite ring map.

Proof. See the discussion above.

### 88.32. Pure not universally pure

05JJ Let $k$ be a field. Let

$$
R=k\left[\left[x, x y, x y^{2}, \ldots\right]\right] \subset k[[x, y]] .
$$

In other words, a power series $f \in k[[x, y]]$ is in $R$ if and only if $f(0, y)$ is a constant. In particular $R[1 / x]=k[[x, y]][1 / x]$ and $R / x R$ is a local ring with a maximal ideal whose square is zero. Denote $R[y] \subset k[[x, y]]$ the set of power series $f \in k[[x, y]]$ such that $f(0, y)$ is a polynomial in $y$. Then $R \rightarrow R[y]$ is a finite type but not finitely presented ring map which induces an isomorphism after inverting $x$. Also there is a surjection $R[y] / x R[y] \rightarrow k[y]$ whose kernel has square zero. Consider the finitely presented ring map $R \rightarrow S=R[t] /(x t-x y)$. Again $R[1 / x] \rightarrow$ $S[1 / x]$ is an isomorphism and in this case $S / x S \cong(R / x R)[t] /(x y)$ maps onto $k[t]$
with nilpotent kernel. There is a surjection $S \rightarrow R[y], t \longmapsto y$ which induces an isomorphism on inverting $x$ and a surjection with nilpotent kernel modulo $x$. Hence the kernel of $S \rightarrow R[y]$ is locally nilpotent. In particular $S \rightarrow R[y]$ is a universal homeomorphism.

First we claim that $S$ is an $S$-module which is relatively pure over $R$. Since on inverting $x$ we obtain an isomorphism we only need to check this at the maximal ideal $\mathfrak{m} \subset R$. Since $R$ is complete with respect to its maximal ideal it is henselian hence we need only check that every prime $\mathfrak{p} \subset R, \mathfrak{p} \neq \mathfrak{m}$, the unique prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{p}$ satisfies $\mathfrak{m} S+\mathfrak{q} \neq S$. Since $\mathfrak{p} \neq \mathfrak{m}$ it corresponds to a unique prime ideal of $k[[x, y]][1 / x]$. Hence either $\mathfrak{p}=(0)$ or $\mathfrak{p}=(f)$ for some irreducible element $f \in k[[x, y]]$ which is not associated to $x$ (here we use that $k[[x, y]]$ is a UFD - insert future reference here). In the first case $\mathfrak{q}=(0)$ and the result is clear. In the second case we may multiply $f$ by a unit so that $f \in R[y]$ (Weierstrass preparation; details omitted). Then it is easy to see that $R[y] / f R[y] \cong k[[x, y]] /(f)$ hence $f$ defines a prime ideal of $R[y]$ and $\mathfrak{m} R[y]+f R[y] \neq R[y]$. Since $S \rightarrow R[y]$ is a universal homeomorphism we deduce the desired result for $S$ also.

Second we claim that $S$ is not universally relatively pure over $R$. Namely, to see this it sufffices to find a valuation ring $\mathcal{O}$ and a local ring map $R \rightarrow \mathcal{O}$ such that $\operatorname{Spec}\left(R[y] \otimes_{R} \mathcal{O}\right) \rightarrow \operatorname{Spec}(\mathcal{O})$ does not hit the closed point of $\operatorname{Spec}(\mathcal{O})$. Equivalently, we have to find $\varphi: R \rightarrow \mathcal{O}$ such that $\varphi(x) \neq 0$ and $v(\varphi(x))>v(\varphi(x y))$ where $v$ is the valuation of $\mathcal{O}$. (Because this means that the valuation of $y$ is negative.) To do this consider the ring map

$$
R \longrightarrow\left\{a_{0}+a_{1} x+a_{2} x^{2}+\ldots \mid a_{0} \in k\left[y^{-1}\right], a_{i} \in k((y))\right\}
$$

defined in the obvious way. We can find a valuation ring $\mathcal{O}$ dominating the localization of the right hand side at the maximal ideal $\left(y^{-1}, x\right)$ and we win.

05JK Lemma 88.32.1. There exists a morphism of affine schemes of finite presentation $X \rightarrow S$ and an $\mathcal{O}_{X}$-module $\mathcal{F}$ of finite presentation such that $\mathcal{F}$ is pure relative to $S$, but not universally pure relative to $S$.

Proof. See discussion above.

### 88.33. A formally smooth non-flat ring map

057 V Let $k$ be a field. Consider the $k$-algebra $k[\mathbf{Q}]$. This is the $k$-algebra with basis $x_{\alpha}, \alpha \in \mathbf{Q}$ and multiplication determined by $x_{\alpha} x_{\beta}=x_{\alpha+\beta}$. (In particular $x_{0}=1$.) Consider the $k$-algebra homomorphism

$$
k[\mathbf{Q}] \longrightarrow k, \quad x_{\alpha} \longmapsto 1 .
$$

It is surjective with kernel $J$ generated by the elements $x_{\alpha}-1$. Let us compute $J / J^{2}$. Note that multiplication by $x_{\alpha}$ on $J / J^{2}$ is the identity map. Denote $z_{\alpha}$ the class of $x_{\alpha}-1$ modulo $J^{2}$. These classes generate $J / J^{2}$. Since

$$
\left(x_{\alpha}-1\right)\left(x_{\beta}-1\right)=x_{\alpha+\beta}-x_{\alpha}-x_{\beta}+1=\left(x_{\alpha+\beta}-1\right)-\left(x_{\alpha}-1\right)-\left(x_{\beta}-1\right)
$$

we see that $z_{\alpha+\beta}=z_{\alpha}+z_{\beta}$ in $J / J^{2}$. A general element of $J / J^{2}$ is of the form $\sum \lambda_{\alpha} z_{\alpha}$ with $\lambda_{\alpha} \in k$ (only finitely many nonzero). Note that if the characteristic of $k$ is $p>0$ then

$$
0=p z_{\alpha / p}=z_{\alpha / p}+\ldots+z_{\alpha / p}=z_{\alpha}
$$

and we see that $J / J^{2}=0$. If the characteristic of $k$ is zero, then

$$
J / J^{2}=\mathbf{Q} \otimes_{\mathbf{Z}} k \cong k
$$

(details omitted) is not zero.
We claim that $k[\mathbf{Q}] \rightarrow k$ is a formally smooth ring map if the characteristic of $k$ is positive. Namely, suppose given a solid commutative diagram

with $A^{\prime} \rightarrow A$ a surjection whose kernel $I$ has square zero. To show that $k[\mathbf{Q}] \rightarrow k$ is formally smooth we have to prove that $\varphi$ factors through $k$. Since $\varphi\left(x_{\alpha}-1\right)$ maps to zero in $A$ we see that $\varphi$ induces a map $\bar{\varphi}: J / J^{2} \rightarrow I$ whose vanishing is the obstruction to the desired factorization. Since $J / J^{2}=0$ if the characteristic is $p>0$ we get the result we want, i.e., $k[\mathbf{Q}] \rightarrow k$ is formally smooth in this case. Finally, this ring map is not flat, for example as the nonzerodivisor $x_{2}-1$ is mapped to zero.

057W Lemma 88.33.1. There exists a formally smooth ring map which is not flat.
Proof. See discussion above.

### 88.34. A formally étale non-flat ring map

060 H In this section we give a counterexample to the final sentence in DG67, 0, Example 19.10.3(i)] (this was not one of the items caught in their later errata lists). Consider $A \rightarrow A / J$ for a local ring $A$ and a nonzero proper ideal $J$ such that $J^{2}=J$ (so $J$ isn't finitely generated); the valuation ring of an algebraically closed non-archimedean field with $J$ its maximal ideal is a source of such $(A, J)$. These non-flat quotient maps are formally étale. Namely, suppose given a commutative diagram

where $I$ is an ideal of the ring $R$ with $I^{2}=0$. Then $A \rightarrow R$ factors uniquely through $A / J$ because

$$
\varphi(J)=\varphi\left(J^{2}\right) \subset(\varphi(J) A)^{2} \subset I^{2}=0
$$

Hence this also provides a counterexample to the formally étale case of the "structure theorem" for locally finite type and formally étale morphisms in DG67, IV, Theorem 18.4.6(i)] (but not a counterexample to part (ii), which is what people actually use in practice). The error in the proof of the latter is that the very last step of the proof is to invoke the incorrect [DG67, 0, Example 19.3.10(i)], which is how the counterexample just mentioned creeps in.

060I Lemma 88.34.1. There exist formally étale nonflat ring maps.
Proof. See discussion above.

### 88.35. A formally étale ring map with nontrivial cotangent complex

06 E 5 Let $k$ be a field. Consider the ring

$$
R=k\left[\left\{x_{n}\right\}_{n \geq 1},\left\{y_{n}\right\}_{n \geq 1}\right] /\left(x_{1} y_{1}, x_{n m}^{m}-x_{n}, y_{n m}^{m}-y_{n}\right)
$$

Let $A$ be the localization at the maximal ideal generated by all $x_{n}, y_{n}$ and denote $J \subset A$ the maximal ideal. Set $B=A / J$. By construction $J^{2}=J$ and hence $A \rightarrow B$ is formally étale (see Section 88.34). We claim that the element $x_{1} \otimes y_{1}$ is a nonzero element in the kernel of

$$
J \otimes_{A} J \longrightarrow J
$$

Namely, $(A, J)$ is the colimit of the localizations $\left(A_{n}, J_{n}\right)$ of the rings

$$
R_{n}=k\left[x_{n}, y_{n}\right] /\left(x_{n}^{n} y_{n}^{n}\right)
$$

at their corresponding maximal ideals. Then $x_{1} \otimes y_{1}$ corresponds to the element $x_{n}^{n} \otimes y_{n}^{n} \in J_{n} \otimes_{A_{n}} J_{n}$ and is nonzero (by an explicit computation which we omit). Since $\otimes$ commutes with colimits we conclude. By [Ill72, III Section 3.3] we see that $J$ is not weakly regular. Hence by [Ill72, III Proposition 3.3.3] we see that the cotangent complex $L_{B / A}$ is not zero. In fact, we can be more precise. We have $H_{0}\left(L_{B / A}\right)=\Omega_{B / A}$ and $H_{1}\left(L_{B / A}\right)=0$ because $J / J^{2}=0$. But from the fiveterm exact sequence of Quillen's fundamental spectral sequence (see Cotangent, Remark 75.11.5 or [Rei, Corollary 8.2.6]) and the nonvanishing of $\operatorname{Tor}_{2}^{A}(B, B)=$ $\operatorname{Ker}\left(J \otimes_{A} J \rightarrow J\right)$ we conclude that $H_{2}\left(L_{B / A}\right)$ is nonzero.

06E6 Lemma 88.35.1. There exists a formally étale surjective ring map $A \rightarrow B$ with $L_{B / A}$ not equal to zero.
Proof. See discussion above.

### 88.36. Ideals generated by sets of idempotents and localization

04QK Let $R$ be a ring. Consider the ring

$$
B(R)=R\left[x_{n} ; n \in \mathbf{Z}\right] /\left(x_{n}\left(x_{n}-1\right), x_{n} x_{m} ; n \neq m\right)
$$

It is easy to show that every prime $\mathfrak{q} \subset B(R)$ is either of the form

$$
\mathfrak{q}=\mathfrak{p} B(R)+\left(x_{n} ; n \in \mathbf{Z}\right)
$$

or of the form

$$
\mathfrak{q}=\mathfrak{p} B(R)+\left(x_{n}-1\right)+\left(x_{m} ; n \neq m, m \in \mathbf{Z}\right) .
$$

Hence we see that

$$
\operatorname{Spec}(B(R))=\operatorname{Spec}(R) \amalg \coprod_{n \in \mathbf{Z}} \operatorname{Spec}(R)
$$

where the topology is not just the disjoint union topology. It has the following properties: Each of the copies indexed by $n \in \mathbf{Z}$ is an open subscheme, namely it is the standard open $D\left(x_{n}\right)$. The "central" copy of $\operatorname{Spec}(R)$ is in the closure of the union of any infinitely many of the other copies of $\operatorname{Spec}(R)$. Note that this last copy of $\operatorname{Spec}(R)$ is cut out by the ideal $\left(x_{n}, n \in \mathbf{Z}\right)$ which is generated by the idempotents $x_{n}$. Hence we see that if $\operatorname{Spec}(R)$ is connected, then the decomposition above is exactly the decomposition of $\operatorname{Spec}(B(R))$ into connected components.
Next, let $A=\mathbf{C}[x, y] /\left(\left(y-x^{2}+1\right)\left(y+x^{2}-1\right)\right)$. The spectrum of $A$ consists of two irreducible components $C_{1}=\operatorname{Spec}\left(A_{1}\right), C_{2}=\operatorname{Spec}\left(A_{2}\right)$ with $A_{1}=\mathbf{C}[x, y] /(y-$ $\left.x^{2}+1\right)$ and $A_{2}=\mathbf{C}[x, y] /\left(y+x^{2}-1\right)$. Note that these are parametrized by
$(x, y)=\left(t, t^{2}-1\right)$ and $(x, y)=\left(t,-t^{2}+1\right)$ which meet in $P=(-1,0)$ and $Q=(1,0)$. We can make a twisted version of $B(A)$ where we glue $B\left(A_{1}\right)$ to $B\left(A_{2}\right)$ in the following way: Above $P$ we let $x_{n} \in B\left(A_{1}\right) \otimes \kappa(P)$ correspond to $x_{n} \in B\left(A_{2}\right) \otimes \kappa(P)$, but above $Q$ we let $x_{n} \in B\left(A_{1}\right) \otimes \kappa(Q)$ correspond to $x_{n+1} \in B\left(A_{2}\right) \otimes \kappa(Q)$. Let $B^{\text {twist }}(A)$ denote the resulting $A$-algebra. Details omitted. By construction $B^{t w i s t}(A)$ is Zariski locally over $A$ isomorphic to the untwisted version. Namely, this happens over both the principal open $\operatorname{Spec}(A) \backslash\{P\}$ and the principal open $\operatorname{Spec}(A) \backslash\{Q\}$. However, our choice of glueing produces enough "monodromy" such that $\operatorname{Spec}\left(B^{t w i s t}(A)\right)$ is connected (details omitted). Finally, there is a central copy of $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(B^{\text {twist }}(A)\right)$ which gives a closed subscheme whose ideal is Zariski locally on $B^{t w i s t}(A)$ cut out by ideals generated by idempotents, but not globally (as $B^{t w i s t}(A)$ has no nontrivial idempotents).

04QL Lemma 88.36.1. There exists an affine scheme $X=\operatorname{Spec}(A)$ and a closed subscheme $T \subset X$ such that $T$ is Zariski locally on $X$ cut out by ideals generated by idempotents, but $T$ is not cut out by an ideal generated by idempotents.

Proof. See above.

### 88.37. A ring map which identifies local rings which is not ind-étale

09AN Note that the ring map $R \rightarrow B(R)$ constructed in Section 88.36 is a colimit of finite products of copies of $R$. Hence $R \rightarrow B(R)$ is ind-Zariski, see Pro-étale Cohomology, Definition 51.4.1. Next, consider the ring map $A \rightarrow B^{t w i s t}(A)$ constructed in Section 88.36. Since this ring map is Zariski locally on $\operatorname{Spec}(A)$ isomorphic to an ind-Zariski ring map $R \rightarrow B(R)$ we conclude that it identifies local rings (see Proétale Cohomology, Lemma 51.4.6). The discussion in Section 88.36 shows there is a section $B^{\text {twist }}(A) \rightarrow A$ whose kernel is not generated by idempotents. Now, if $A \rightarrow B^{t w i s t}(A)$ were ind-étale, i.e., $B^{t w i s t}(A)=\operatorname{colim} A_{i}$ with $A \rightarrow A_{i}$ étale, then the kernel of $A_{i} \rightarrow A$ would be generated by an idempotent (Algebra, Lemmas 10.141 .9 and 10.141 .10 . This would contradict the result mentioned above.

09AP Lemma 88.37.1. There is a ring map $A \rightarrow B$ which identifies local rings but which is not ind-étale. A fortiori it is not ind-Zariski.

Proof. See discussion above.

### 88.38. Non flasque quasi-coherent sheaf associated to injective module

0273 For more examples of this type see BGI71, Exposé II, Appendix I] where Illusie explains some examples due to Verdier.

Consider the affine scheme $X=\operatorname{Spec}(A)$ where

$$
A=k\left[x, y, z_{1}, z_{2}, \ldots\right] /\left(x^{n} z_{n}\right)
$$

is the ring from Properties, Example 27.25.2. Set $I=(x) \subset A$. Consider the quasicompact open $U=D(x)$ of $X$. We have seen in loc. cit. that there is a section $s \in \mathcal{O}_{X}(U)$ which does not come from an $A$-module map $I^{n} \rightarrow A$ for any $n \geq 0$.
Let $\alpha: A \rightarrow J$ be the embedding of $A$ into an injective $A$-module. Let $Q=J / \alpha(A)$ and denote $\beta: J \rightarrow Q$ the quotient map. We claim that the map

$$
\Gamma(X, \widetilde{J}) \longrightarrow \Gamma(U, \widetilde{J})
$$

is not surjective. Namely, we claim that $\alpha(s)$ is not in the image. To see this, we argue by contradiction. So assume that $x \in J$ is an element which restricts to $\alpha(s)$ over $U$. Then $\beta(x) \in Q$ is an element which restricts to 0 over $U$. Hence we know that $I^{n} \beta(x)=0$ for some $n$, see Properties, Lemma 27.25.1. This implies that we get a morphism $\varphi: I^{n} \rightarrow A, h \mapsto \alpha^{-1}(h x)$. It is easy to see that this morphism $\varphi$ gives rise to the section $s$ via the map of Properties, Lemma 27.25.1 which is a contradiction.

0274 Lemma 88.38.1. There exists an affine scheme $X=\operatorname{Spec}(A)$ and an injective $A$-module $J$ such that $\widetilde{J}$ is not a flasque sheaf on $X$. Even the restriction $\Gamma(X, \widetilde{J}) \rightarrow$ $\Gamma(U, \widetilde{J})$ with $U$ a standard open need not be surjective.

Proof. See above.

### 88.39. A non-separated flat group scheme

06E7 Every group scheme over a field is separated, see Groupoids, Lemma 38.7.3. This is not true for group schemes over a base.
Let $k$ be a field. Let $S=\operatorname{Spec}(k[x])=\mathbf{A}_{k}^{1}$. Let $G$ be the affine line with 0 doubled (see Schemes, Example 25.14.3) seen as a scheme over $S$. Thus a fibre of $G \rightarrow S$ is either a singleton or a set with two elements (one in $U$ and one in $V$ ). Thus we can endow these fibres with the structure of a group (by letting the element in $U$ be the zero of the group structure). More precisely, $G$ has two opens $U, V$ which map isomorphically to $S$ such that $U \cap V$ is mapped isomorphically to $S \backslash\{0\}$. Then

$$
G \times_{S} G=U \times_{S} U \cup V \times_{S} U \cup U \times_{S} V \cup V \times_{S} V
$$

where each piece is isomorphic to $S$. Hence we can define a multiplication $m$ : $G \times{ }_{S} G \rightarrow G$ as the unique $S$-morphism which maps the first and the last piece into $U$ and the two middle pieces into $V$. This matches the pointwise description given above. We omit the verification that this defines a group scheme structure.

06E8 Lemma 88.39.1. There exists a flat group scheme of finite type over the affine line which is not separated.

Proof. See the discussion above.
08IX Lemma 88.39.2. There exists a flat group scheme of finite type over the infinite dimensional affine space which is not quasi-separated.
Proof. The same construction as above can be carried out with the infinite dimensional affine space $S=\mathbf{A}_{k}^{\infty}=\operatorname{Spec} k\left[x_{1}, x_{2}, \ldots\right]$ as the base and the origin $0 \in S$ corresponding to the maximal ideal $\left(x_{1}, x_{2}, \ldots\right)$ as the closed point which is doubled in $G$. The resulting group scheme $G \rightarrow S$ is not quasi-separated as explained in Schemes, Example 25.21.4

### 88.40. A non-flat group scheme with flat identity component

06RJ Let $X \rightarrow S$ be a monomorphism of schemes. Let $G=S \amalg X$. Let $m: G \times{ }_{S} G \rightarrow G$ be the $S$-morphism

$$
G \times_{S} G=X \times_{S} X \amalg X \amalg X \amalg S \longrightarrow G=X \amalg S
$$

which maps the summands $X \times_{S} X$ and $S$ into $S$ and maps the summands $X$ into $X$ by the identity morphism. This defines a group law. To see this we have to show
that $m \circ\left(m \times \operatorname{id}_{G}\right)=m \circ\left(\mathrm{id}_{G} \times m\right)$ as maps $G \times_{S} G \times_{S} G \rightarrow G$. Decomposing $G \times{ }_{S} G \times_{S} G$ into components as above, we see that we need to verify this for the restriction to each of the 8-pieces. Each piece is isomorphic to either $S, X$, $X \times_{S} X$, or $X \times_{S} X \times_{S} X$. Moreover, both maps map these pieces to $S, X, S$, $X$ respectively. Having said this, the fact that $X \rightarrow S$ is a monomorphism implies that $X \times{ }_{S} X \cong X$ and $X \times_{S} X \times_{S} X \cong X$ and that there is in each case exactly one $S$-morphism $S \rightarrow S$ or $X \rightarrow X$. Thus we see that $m \circ\left(m \times \mathrm{id}_{G}\right)=m \circ\left(\mathrm{id}_{G} \times m\right)$. Thus taking $X \rightarrow S$ to be any nonflat monomorphism of schemes (e.g., a closed immersion) we get an example of a group scheme over a base $S$ whose identity component is $S$ (hence flat) but which is not flat.

06RK Lemma 88.40.1. There exists a group scheme $G$ over a base $S$ whose identity component is flat over $S$ but which is not flat over $S$.

Proof. See discussion above.

### 88.41. A non-separated group algebraic space over a field

06E9 Every group scheme over a field is separated, see Groupoids, Lemma 38.7.3. This is not true for group algebraic spaces over a field (but see end of this section for positive results).
Let $k$ be a field of characteristic zero. Consider the algebraic space $G=\mathbf{A}_{k}^{1} / \mathbf{Z}$ from Spaces, Example 52.14.8. By construction $G$ is the fppf sheaf associated to the presheaf

$$
T \longmapsto \Gamma\left(T, \mathcal{O}_{T}\right) / \mathbf{Z}
$$

on the category of schemes over $k$. The obvious addition rule on the presheaf induces an addition $m: G \times G \rightarrow G$ which turns $G$ into a group algebraic space over $\operatorname{Spec}(k)$. Note that $G$ is not separated (and not even quasi-separated or locally separated). On the other hand $G \rightarrow \operatorname{Spec}(k)$ is of finite type!
06EA Lemma 88.41.1. There exists a group algebraic space of finite type over a field which is not separated (and not even quasi-separated or locally separated).
Proof. See discussion above.
Positive results: If the group algebraic space $G$ is either quasi-separated, or locally separated, or more generally a decent algebraic space, then $G$ is in fact separated, see More on Groupoids in Spaces, Lemma66.7.4. Moreover, a finite type, separated group algebraic space over a field is in fact a scheme (insert future reference here). The idea of the proof is that the schematic locus is open dense, see Properties of Spaces, Proposition 53.12 .3 or Decent Spaces, Theorem 55.9.2. By translating this open we see that every point of $G$ has an open neighbourhood which is a scheme.

### 88.42. Specializations between points in fibre étale morphism

06UJ If $f: X \rightarrow Y$ is an étale, or more generally a locally quasi-finite morphism of schemes, then there are no specializations between points of fibres, see Morphisms, Lemma 28.20.8. However, for morphisms of algebraic spaces this doesn't hold in general.

To give an example, let $k$ be a field. Set

$$
P=k\left[u, u^{-1}, y,\left\{x_{n}\right\}_{n \in \mathbf{Z}}\right] .
$$

Consider the action of $\mathbf{Z}$ on $P$ by $k$-algebra maps generated by the automorphism $\tau$ given by the rules $\tau(u)=u, \tau(y)=u y$, and $\tau\left(x_{n}\right)=x_{n+1}$. For $d \geq 1$ set $I_{d}=\left(\left(1-u^{d}\right) y, x_{n}-x_{n+d}, n \in \mathbf{Z}\right)$. Then $V\left(I_{d}\right) \subset \operatorname{Spec}(P)$ is the fix point locus of $\tau^{d}$. Let $S \subset P$ be the multiplicative subset generated by $y$ and all $1-u^{d}, d \in \mathbf{N}$. Then we see that $\mathbf{Z}$ acts freely on $U=\operatorname{Spec}\left(S^{-1} P\right)$. Let $X=U / \mathbf{Z}$ be the quotient algebraic space, see Spaces, Definition 52.14.4.
Consider the prime ideals $\mathfrak{p}_{n}=\left(x_{n}, x_{n+1}, \ldots\right)$ in $S^{-1} P$. Note that $\tau\left(\mathfrak{p}_{n}\right)=\mathfrak{p}_{n+1}$. Hence each of these define point $\xi_{n} \in U$ whose image in $X$ is the same point $x$ of $X$. Moreover we have the specializations

$$
\ldots \rightsquigarrow \xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots
$$

We conclude that $U \rightarrow X$ is an example of the promised type.
06UK Lemma 88.42.1. There exists an étale morphism of algebraic spaces $f: X \rightarrow Y$ and a nontrivial specialization of points $x \rightsquigarrow x^{\prime}$ in $|X|$ with $f(x)=f\left(x^{\prime}\right)$ in $|Y|$.

Proof. See discussion above.

### 88.43. A torsor which is not an fppf torsor

04 AF In Groupoids, Remark 38.11 .5 we raise the question whether any $G$-torsor is a $G$ torsor for the fppf topology. In this section we show that this is not always the case.
Let $k$ be a field. All schemes and stacks are over $k$ in what follows. Let $G \rightarrow \operatorname{Spec}(k)$ be the group scheme

$$
G=\left(\mu_{2, k}\right)^{\infty}=\mu_{2, k} \times_{k} \mu_{2, k} \times_{k} \mu_{2, k} \times_{k} \ldots=\lim _{n}\left(\mu_{2, k}\right)^{n}
$$

where $\mu_{2, k}$ is the group scheme of second roots of unity over $\operatorname{Spec}(k)$, see Groupoids, Example 38.5.2. As an inverse limit of affine schemes we see that $G$ is an affine group scheme. In fact it is the spectrum of the ring $k\left[t_{1}, t_{2}, t_{3}, \ldots\right] /\left(t_{i}^{2}-1\right)$. The multiplication map $m: G \times_{k} G \rightarrow G$ is on the algebra level given by $t_{i} \mapsto t_{i} \otimes t_{i}$.
We claim that any $G$-torsor over $k$ is of the form

$$
P=\operatorname{Spec}\left(k\left[x_{1}, x_{2}, x_{3}, \ldots\right] /\left(x_{i}^{2}-a_{i}\right)\right)
$$

for certain $a_{i} \in k^{*}$ and with $G$-action $G \times_{k} P \rightarrow P$ given by $x_{i} \rightarrow t_{i} \otimes x_{i}$ on the algebra level. We omit the proof. Actually for the example we only need that $P$ is a $G$-torsor which is clear since over $k^{\prime}=k\left(\sqrt{a_{1}}, \sqrt{a_{2}}, \ldots\right)$ the scheme $P$ becomes isomorphic to $G$ in a $G$-equivariant manner. Note that $P$ is trivial if and only if $k^{\prime}=k$ since if $P$ has a $k$-rational point then all of the $a_{i}$ are squares.
We claim that $P$ is an fppf torsor if and only if the field extension $k \subset k^{\prime}=$ $k\left(\sqrt{a_{1}}, \sqrt{a_{2}}, \ldots\right)$ is finite. If $k^{\prime}$ is finite over $k$, then $\left\{\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)\right\}$ is an $\operatorname{fppf}$ covering which trivializes $P$ and we see that $P$ is indeed an fppf torsor. Conversely, suppose that $P$ is a $G$-torsor for the fppf topology. This means that there exists an fppf covering $\left\{S_{i} \rightarrow \operatorname{Spec}(k)\right\}$ such that each $P_{S_{i}}$ is trivial. Pick an $i$ such that $S_{i}$ is not empty. Let $s \in S_{i}$ be a closed point. By Varieties, Lemma 32.12.1 the field extension $k \subset \kappa(s)$ is finite, and by construction $P_{\kappa(s)}$ has a $\kappa(s)$-rational point. Thus we see that $k \subset k^{\prime} \subset \kappa(s)$ and $k^{\prime}$ is finite over $k$.
To get an explicit example take $k=\mathbf{Q}$ and $a_{i}=i$ for example (or $a_{i}$ is the $i$ th prime if you like).

077B Lemma 88.43.1. Let $S$ be a scheme. Let $G$ be a group scheme over $S$. The stack $G$-Principal classifying principal homogeneous $G$-spaces (see Examples of Stacks, Subsection 77.14.5) and the stack $G$-Torsors classifying fppf G-torsors (see Examples of Stacks, Subsection 77.14.8) are not equivalent in general.

Proof. The discussion above shows that the functor $G$-Torsors $\rightarrow G$-Principal isn't essentially surjective in general.

### 88.44. Stack with quasi-compact flat covering which is not algebraic

04 AG In this section we briefly describe an example due to Brian Conrad. You can find the example online at this location. Our example is slightly different.

Let $k$ be an algebraically closed field. All schemes and stacks are over $k$ in what follows. Let $G \rightarrow \operatorname{Spec}(k)$ be an affine group scheme. In Examples of Stacks, Proposition 77.15 .3 we have seen that $\mathcal{X}=[\operatorname{Spec}(k) / G]$ is a stack in groupoids over $(S c h / \operatorname{Spec}(k))_{f p p f}$ which can be described as follows. A 1-morphism $T \rightarrow \mathcal{X}$ corresponds by definition to an fppf $G_{T}$-torsor $P$ over $T$. The diagonal 1-morphism

$$
\Delta: \mathcal{X} \longrightarrow \mathcal{X} \times_{\operatorname{Spec}(k)} \mathcal{X}
$$

is representable and affine. The reason for this is that given any pair of $G_{T^{-} \text {-torsors }}$ $P_{1}, P_{2}$ in the fppf topology over a scheme $S / k$ the scheme $\operatorname{Isom}\left(P_{1}, P_{2}\right)$ is affine over $T$. The trivial $G$-torsor over $\operatorname{Spec}(k)$ defines a 1 -morphism

$$
f: \operatorname{Spec}(k) \longrightarrow \mathcal{X}
$$

We claim that this is a surjective 1 -morphism. The reason is simply that by definition for any 1-morphism $T \rightarrow \mathcal{X}$ there exists a fppf covering $\left\{T_{i} \rightarrow T\right\}$ such that $P_{T_{i}}$ is isomorphic to the trivial $G_{T_{i}}$-torsor. Hence the compositions $T_{i} \rightarrow T \rightarrow \mathcal{X}$ factor through $f$. Thus it is clear that the projection $T \times \mathcal{X} \operatorname{Spec}(k) \rightarrow \mathcal{X}$ is surjective (which is how we define the property that $f$ is surjective, see Algebraic Stacks, Definition 76.10.1. In a similar way you show that $f$ is quasi-compact and flat (details omitted). We also record here the observation that

$$
\operatorname{Spec}(k) \times \mathcal{X} \operatorname{Spec}(k) \cong G
$$

as schemes over $k$.
Suppose there exists a surjective smooth morphism $p: U \rightarrow \mathcal{X}$ where $U$ is a scheme. Consider the fibre product

Then we see that $W$ is a nonempty smooth scheme over $k$ which hence has a $k$-point. This means that we can factor $f$ through $U$. Hence we obtain

$$
G \cong \operatorname{Spec}(k) \times_{\mathcal{X}} \operatorname{Spec}(k) \cong\left(\operatorname{Spec}(k) \times_{k} \operatorname{Spec}(k)\right) \times_{\left(U \times_{k} U\right)}\left(U \times_{\mathcal{X}} U\right)
$$

and since the projections $U \times \mathcal{X} U \rightarrow U$ were assumed smooth we conclude that $U \times_{\mathcal{X}} U \rightarrow U \times_{k} U$ is locally of finite type, see Morphisms, Lemma 28.15.8. It follows that in this case $G$ is locally of finite type over $k$. Altogether we have proved the following lemma (which can be significantly generalized).

04AH Lemma 88.44.1. Let $k$ be a field. Let $G$ be an affine group scheme over $k$. If the stack $[\operatorname{Spec}(k) / G]$ has a smooth covering by a scheme, then $G$ is of finite type over $k$.

Proof. See discussion above.
To get an explicit example as in the title of this section, take for example $G=$ $\left(\mu_{2, k}\right)^{\infty}$ the group scheme of Section 88.43 , which is not locally of finite type over $k$. By the discussion above we see that $\mathcal{X}=[\operatorname{Spec}(k) / G]$ has properties (1) and (2) of Algebraic Stacks, Definition 76.12.1, but not property (3). Hence $\mathcal{X}$ is not an algebraic stack. On the other hand, there does exists a scheme $U$ an a surjective, flat, quasi-compact morphism $U \rightarrow \mathcal{X}$, namely the morphism $f: \operatorname{Spec}(k) \rightarrow \mathcal{X}$ we studied above.

### 88.45. Limit preserving on objects, not limit preserving

07 Z 0 Let $S$ be a nonempty scheme. Let $\mathcal{G}$ be an injective abelian sheaf on $(S c h / S)_{\text {fppf }}$. We obtain a stack in groupoids

$$
\mathcal{G} \text {-Torsors } \longrightarrow(S c h / S)_{f p p f}
$$

over $S$, see Examples of Stacks, Lemma 77.14.2. This stack is limit preserving on objects over $(S c h / S)_{f p p f}$ (see Criteria for Representability, Section 79.5) because every $\mathcal{G}$-torsor is trivial. On the other hand, $\mathcal{G}$-Torsors is in general not limit preserving (see Artin's Axioms, Definition 80.13.1) as $\mathcal{G}$ need not be limit preserving as a sheaf. For example, take any nonzero injective sheaf $\mathcal{I}$ and set $\mathcal{G}=\prod_{n \in \mathbf{Z}} \mathcal{I}$ to get an example.
07Z1 Lemma 88.45.1. Let $S$ be a nonempty scheme. There exists a stack in groupoids $p: \mathcal{X} \rightarrow(S c h / S)_{f p p f}$ such that $p$ is limit preserving on objects, but $\mathcal{X}$ is not limit preserving.

Proof. See discussion above.

### 88.46. A non-algebraic classifying stack

077 C Let $S=\operatorname{Spec}\left(\mathbf{F}_{p}\right)$ and let $\mu_{p}$ denote the group scheme of $p$ th roots of unity over $S$. In Groupoids in Spaces, Section 65.19 we have introduced the quotient stack $\left[S / \mu_{p}\right]$ and in Examples of Stacks, Section 77.15 we have shown $\left[S / \mu_{p}\right]$ is the classifying stack for fppf $\mu_{p}$-torsors: Given a scheme $T$ over $S$ the category $\operatorname{Mor}_{S}\left(T,\left[S / \mu_{p}\right]\right)$ is canonically equivalent to the category of fppf $\mu_{p}$-torsors over $T$. Finally, in Criteria for Representability, Theorem 79.17 .2 we have seen that $\left[S / \mu_{p}\right]$ is an algebraic stack.
Now we can ask the question: "How about the category fibred in groupoids $\mathcal{S}$ classifying étale $\mu_{p}$-torsors?" (In other words $\mathcal{S}$ is a category over $S c h / S$ whose fibre category over a scheme $T$ is the category of étale $\mu_{p}$-torsors over $T$.)
The first objection is that this isn't a stack for the fppf topology, because descent for objects isn't going to hold. For example the $\mu_{p}$-torsor $\operatorname{Spec}\left(\mathbf{F}_{p}(t)[x] /\left(x^{p}-t\right)\right)$ over $T=\operatorname{Spec}\left(\mathbf{F}_{p}(T)\right)$ is fppf locally trivial, but not étale locally trivial.
A fix for this first problem is to work with the étale topology and in this case descent for objects does work. Indeed it is true that $\mathcal{S}$ is a stack in groupoids over $(S c h / S)_{\text {étale }}$. Moreover, it is also the case that the diagonal $\Delta: \mathcal{S} \rightarrow \mathcal{S} \times \mathcal{S}$ is representable (by schemes). This is true because given two $\mu_{p}$-torsors (whether
they be étale locally trivial or not) the sheaf of isomorphisms between them is representable by a scheme.
Thus we can finally ask if there exists a scheme $U$ and a smooth and surjective 1-morphism $U \rightarrow \mathcal{S}$. We will show in two ways that this is impossible: by a direct argument (which we advise the reader to skip) and by an argument using a general result.

Direct argument (sketch): Note that the 1-morphism $\mathcal{S} \rightarrow \operatorname{Spec}\left(\mathbf{F}_{p}\right)$ satisfies the infinitesimal lifting criterion for formal smoothness. This is true because given a first order infinitesimal thickening of schemes $T \rightarrow T^{\prime}$ the kernel of $\mu_{p}\left(T^{\prime}\right) \rightarrow \mu_{p}(T)$ is isomorphic to the sections of the ideal sheaf of $T$ in $T^{\prime}$, and hence $H_{\text {étale }}^{1}\left(T, \mu_{p}\right)=$ $H_{\text {étale }}^{1}\left(T^{\prime}, \mu_{p}\right)$. Moreover, $\mathcal{S}$ is a limit preserving stack. Hence if $U \rightarrow \mathcal{S}$ is smooth, then $U \rightarrow \operatorname{Spec}\left(\mathbf{F}_{p}\right)$ is limit preserving and satisfies the infinitesimal lifting criterion for formal smoothness. This implies that $U$ is smooth over $\mathbf{F}_{p}$. In particular $U$ is reduced, hence $H_{\text {étale }}^{1}\left(U, \mu_{p}\right)=0$. Thus $U \rightarrow \mathcal{S}$ factors as $U \rightarrow \operatorname{Spec}\left(\mathbf{F}_{p}\right) \rightarrow \mathcal{S}$ and the first arrow is smooth. By descent of smoothness, we see that $U \rightarrow \mathcal{S}$ being smooth would imply $\operatorname{Spec}\left(\mathbf{F}_{p}\right) \rightarrow \mathcal{S}$ is smooth. However, this is not the case as $\operatorname{Spec}\left(\mathbf{F}_{p}\right) \times_{\mathcal{S}} \operatorname{Spec}\left(\mathbf{F}_{p}\right)$ is $\mu_{p}$ which is not smooth over $\operatorname{Spec}\left(\mathbf{F}_{p}\right)$.

Structural argument: In Criteria for Representability, Section 79.19 we have seen that we can think of algebraic stacks as those stacks in groupoids for the étale topology with diagonal representable by algebraic spaces having a smooth covering. Hence if a smooth surjective $U \rightarrow \mathcal{S}$ exists then $\mathcal{S}$ is an algebraic stack, and in particular satisfies descent in the fppf topology. But we've seen above that $\mathcal{S}$ does not satisfies descent in the fppf topology.
Loosely speaking the arguments above show that the classifying stack in the étale topology for étale locally trivial torsors for a group scheme $G$ over a base $B$ is algebraic if and only if $G$ is smooth over $B$. One of the advantages of working with the fppf topology is that it suffices to assume that $G \rightarrow B$ is flat and locally of finite presentation. In fact the quotient stack (for the fppf topology) $[B / G]$ is algebraic if and only if $G \rightarrow B$ is flat and locally of finite presentation, see Criteria for Representability, Lemma 79.18.3.

### 88.47. Sheaf with quasi-compact flat covering which is not algebraic

078 E Consider the functor $F=\left(\mathbf{P}^{1}\right)^{\infty}$, i.e., for a scheme $T$ the value $F(T)$ is the set of $f=\left(f_{1}, f_{2}, f_{3}, \ldots\right)$ where each $f_{i}: T \rightarrow \mathbf{P}^{1}$ is a morphism of schemes. Note that $\mathbf{P}^{1}$ satisfies the sheaf property for fpqc coverings, see Descent, Lemma 34.9.3. A product of sheaves is a sheaf, so $F$ also satisfies the sheaf property for the fpqc topology. The diagonal of $F$ is representable: if $f: T \rightarrow F$ and $g: S \rightarrow F$ are morphisms, then $T \times{ }_{F} S$ is the scheme theoretic intersection of the closed subschemes $T \times{ }_{f_{i}, \mathbf{P}^{1}, g_{i}} S$ inside the scheme $T \times S$. Consider the group scheme $\mathrm{SL}_{2}$ which comes with a surjective smooth affine morphism $\mathrm{SL}_{2} \rightarrow \mathbf{P}^{1}$. Next, consider $U=\left(\mathrm{SL}_{2}\right)^{\infty}$ with its canonical (product) morphism $U \rightarrow F$. Note that $U$ is an affine scheme. We claim the morphism $U \rightarrow F$ is flat, surjective, and universally open. Namely, suppose $f: T \rightarrow F$ is a morphism. Then $Z=T \times{ }_{F} U$ is the infinite fibre product of the schemes $Z_{i}=T \times{ }_{f_{i}, \mathbf{P}^{1}} \mathrm{SL}_{2}$ over $T$. Each of the morphisms $Z_{i} \rightarrow T$ is surjective smooth and affine which implies that

$$
Z=Z_{1} \times_{T} Z_{2} \times_{T} Z_{3} \times_{T} \ldots
$$

is a scheme flat and affine over $Z$. A simple limit argument shows that $Z \rightarrow T$ is open as well.
On the other hand, we claim that $F$ isn't an algebraic space. Namely, if $F$ where an algebraic space it would be a quasi-compact and separated (by our description of fibre products over $F$ ) algebraic space. Hence cohomology of quasi-coherent sheaves would vanish above a certain cutoff (see Cohomology of Spaces, Proposition 56.6.2 and remarks preceding it). But clearly by taking the pullback of $\mathcal{O}(-2,-2, \ldots,-2)$ under the projection

$$
\left(\mathbf{P}^{1}\right)^{\infty} \longrightarrow\left(\mathbf{P}^{1}\right)^{n}
$$

(which has a section) we can obtain a quasi-coherent sheaf whose cohomology is nonzero in degree $n$. Altogether we obtain an answer to a question asked by Anton Geraschenko on mathoverflow.

078F Lemma 88.47.1. There exists a functor $F: S c h^{o p p} \rightarrow$ Sets which satisfies the sheaf condition for the fpqc topology, has representable diagonal $\Delta: F \rightarrow F \times F$, and such that there exists a surjective, flat, universally open, quasi-compact morphism $U \rightarrow F$ where $U$ is a scheme, but such that $F$ is not an algebraic space.
Proof. See discussion above.

### 88.48. Sheaves and specializations

05 LD In the following we fix a big étale site $S c_{\text {étale }}$ as constructed in Topologies, Definition 33.4.6. Moreover, a scheme will be an object of this site. Recall that if $x, x^{\prime}$ are points of a scheme $X$ we say $x$ is a specialization of $x^{\prime}$ or we write $x^{\prime} \rightsquigarrow x$ if $x \in \overline{\left\{x^{\prime}\right\}}$. This is true in particular if $x=x^{\prime}$.
Consider the functor $F: S h_{\text {étale }} \rightarrow A b$ defined by the following rules:

$$
F(X)=\prod_{x \in X} \prod_{x^{\prime} \in X, x^{\prime} \rightsquigarrow x, x^{\prime} \neq x} \mathbf{Z} / 2 \mathbf{Z}
$$

Given a scheme $X$ we denote $|X|$ the underlying set of points. An element $a \in F(X)$ will be viewed as a map of sets $|X| \times|X| \rightarrow \mathbf{Z} / 2 \mathbf{Z},\left(x, x^{\prime}\right) \mapsto a\left(x, x^{\prime}\right)$ which is zero if $x=x^{\prime}$ or if $x$ is not a specialization of $x^{\prime}$. Given a morphism of schemes $f: X \rightarrow Y$ we define

$$
F(f): F(Y) \longrightarrow F(X)
$$

by the rule that for $b \in F(Y)$ we set

$$
F(f)(b)\left(x, x^{\prime}\right)=\left\{\begin{array}{cc}
0 & \text { if } x \text { is not a specialization of } x^{\prime} \\
b\left(f(x), f\left(x^{\prime}\right)\right) & \text { else. }
\end{array}\right.
$$

Note that this really does define an element of $F(X)$. We claim that if $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are composable morphisms then $F(f) \circ F(g)=F(g \circ f)$. Namely, let $c \in F(Z)$ and let $x^{\prime} \rightsquigarrow x$ be a specialization of points in $X$, then

$$
F(g \circ f)\left(x, x^{\prime}\right)=c\left(g(f(x)), g\left(f\left(x^{\prime}\right)\right)\right)=F(g)(F(f)(c))\left(x, x^{\prime}\right)
$$

because $f\left(x^{\prime}\right) \rightsquigarrow f(x)$. (This also works if $f(x)=f\left(x^{\prime}\right)$.)
Let $G$ be the sheafification of $F$ in the étale topology.
I claim that if $X$ is a scheme and $x^{\prime} \rightsquigarrow x$ is a specialization and $x^{\prime} \neq x$, then $G(X) \neq 0$. Namely, let $a \in F(X)$ be an element such that when we think of $a$ as a function $|X| \times|X| \rightarrow \mathbf{Z} / 2 \mathbf{Z}$ it is nonzero at $\left(x, x^{\prime}\right)$. Let $\left\{f_{i}: U_{i} \rightarrow X\right\}$ be an étale covering of $X$. Then we can pick an $i$ and a point $u_{i} \in U_{i}$ with $f_{i}\left(u_{i}\right)=x$. Since
generalizations lift along flat morphisms (see Morphisms, Lemma 28.25.8) we can find a specialization $u_{i}^{\prime} \rightsquigarrow u_{i}$ with $f_{i}\left(u_{i}^{\prime}\right)=x^{\prime}$. By our construction above we see that $F\left(f_{i}\right)(a) \neq 0$. Hence $a$ determines a nonzero element of $G(X)$.
Note that if $X=\operatorname{Spec}(k)$ where $k$ is a field (or more generally a ring all of whose prime ideals are maximal), then $F(X)=0$ and for every étale morphism $U \rightarrow X$ we have $F(U)=0$ because there are no specializations between distinct points in fibres of an étale morphism. Hence $G(X)=0$.
Suppose that $X \subset X^{\prime}$ is a thickening, see More on Morphisms, Definition 36.2.1. Then the category of schemes étale over $X^{\prime}$ is equivalent to the category of schemes étale over $X$ by the base change functor $U^{\prime} \mapsto U=U^{\prime} \times_{X^{\prime}} X$, see Étale Cohomology, Theorem 49.46.1. Since it is always the case that $F(U)=F\left(U^{\prime}\right)$ in this situation we see that also $G(X)=G\left(X^{\prime}\right)$.

As a variant we can consider the presheaf $F_{n}$ which associates to a scheme $X$ the collection of maps $a:|X|^{n+1} \rightarrow \mathbf{Z} / 2 \mathbf{Z}$ where $a\left(x_{0}, \ldots, x_{n}\right)$ is nonzero only if $x_{n} \rightsquigarrow \ldots \rightsquigarrow x_{0}$ is a sequence of specializations and $x_{n} \neq x_{n-1} \neq \ldots \neq x_{0}$. Let $G_{n}$ be the sheaf associated to $F_{n}$. In exactly the same way as above one shows that $G_{n}$ is nonzero if $\operatorname{dim}(X) \geq n$ and is zero if $\operatorname{dim}(X)<n$.

05LE Lemma 88.48.1. There exists a sheaf of abelian groups $G$ on $S_{\text {chetale }}$ with the following properties
(1) $G(X)=0$ whenever $\operatorname{dim}(X)<n$,
(2) $G(X)$ is not zero if $\operatorname{dim}(X) \geq n$, and
(3) if $X \subset X^{\prime}$ is a thickening, then $G(X)=G\left(X^{\prime}\right)$.

Proof. See the discussion above.
05LF Remark 88.48.2. Here are some remarks:
(1) The presheaves $F$ and $F_{n}$ are separated presheaves.
(2) It turns out that $F, F_{n}$ are not sheaves.
(3) One can show that $G, G_{n}$ is actually a sheaf for the fppf topology.

We will prove these results if we need them.

### 88.49. Sheaves and constructible functions

05LG In the following we fix a big étale site $S h_{\text {étale }}$ as constructed in Topologies, Definition 33.4.6. Moreover, a scheme will be an object of this site. In this section we say that a constructible partition of a scheme $X$ is a locally finite disjoint union decomposition $X=\coprod_{i \in I} X_{i}$ such that each $X_{i} \subset X$ is a locally constructible subset of $X$. Locally finite means that for any quasi-compact open $U \subset X$ there are only finitely many $i \in I$ such that $X_{i} \cap U$ is not empty. Note that if $f: X \rightarrow Y$ is a morphism of schemes and $Y=\coprod Y_{j}$ is a constructible partition, then $X=\coprod f^{-1}\left(Y_{j}\right)$ is a constructible partition of $X$. Given a set $S$ and a scheme $X$ a constructible function $f:|X| \rightarrow S$ is a map such that $X=\coprod_{s \in S} f^{-1}(s)$ is a constructible partition of $X$. If $G$ is an (abstract group) and $a, b:|X| \rightarrow G$ are constructible functions, then $a b:|X| \rightarrow G, x \mapsto a(x) b(x)$ is a constructible function too. The reason is that given any two constructible partitions there is a third one refining both.
Let $A$ be any abelian group. For any scheme $X$ we define

$$
F(X)=\frac{\{a:|X| \rightarrow A \mid a \text { is a constructible function }\}}{\{\text { locally constant functions }|X| \rightarrow A\}}
$$

We think of an element $a$ of $F(X)$ simply as a function well defined up to adding a locally constant one. Given a morphism of schemes $f: X \rightarrow Y$ and an element $b \in F(Y)$, then we define $F(f)(b)=b \circ f$. Thus $F$ is a presheaf on $S c h_{e ́ t a l e}$.
Note that if $\left\{f_{i}: U_{i} \rightarrow X\right\}$ is an fppf covering, and $a \in F(X)$ is such that $F\left(f_{i}\right)(a)=$ 0 in $F\left(U_{i}\right)$, then $a \circ f_{i}$ is a locally constant function for each $i$. This means in turn that $a$ is a locally constant function as the morphisms $f_{i}$ are open. Hence $a=0$ in $F(X)$. Thus we see that $F$ is a separated presheaf (in the fppf topology hence a fortiori in the étale topology).
Let $G$ be the sheafification of $F$ in the étale topology. Since $F$ is separated, and since $F(X) \neq 0$ for example when $X$ is the spectrum of a discrete valuation ring, we see that $G$ is not zero.

Let $X=\operatorname{Spec}(k)$ where $k$ is a field. Then any étale covering of $X$ can be dominated by a covering $\left\{\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)\right\}$ with $k \subset k^{\prime}$ a finite separable extension of fields. Since $F\left(\operatorname{Spec}\left(k^{\prime}\right)\right)=0$ we see that $G(X)=0$.
Suppose that $X \subset X^{\prime}$ is a thickening, see More on Morphisms, Definition 36.2.1. Then the category of schemes étale over $X^{\prime}$ is equivalent to the category of schemes étale over $X$ by the base change functor $U^{\prime} \mapsto U=U^{\prime} \times{ }_{X^{\prime}} X$, see Étale Cohomology, Theorem 49.46.1. Since $F(U)=F\left(U^{\prime}\right)$ in this situation we see that also $G(X)=$ $G\left(X^{\prime}\right)$.

The sheaf $G$ is limit preserving, see Limits of Spaces, Definition57.3.1. Namely, let $R$ be a ring which is written as a directed colimit $R=\operatorname{colim}_{i} R_{i}$ of rings. Set $X=$ $\operatorname{Spec}(R)$ and $X_{i}=\operatorname{Spec}\left(R_{i}\right)$, so that $X=\lim _{i} X_{i}$. Then $G(X)=\operatorname{colim}_{i} G\left(X_{i}\right)$. To prove this one first proves that a constructible partition of $\operatorname{Spec}(R)$ comes from a constructible partitions of some $\operatorname{Spec}\left(R_{i}\right)$. Hence the result for $F$. To get the result for the sheafification, use that any étale ring map $R \rightarrow R^{\prime}$ comes from an étale ring $\operatorname{map} R_{i} \rightarrow R_{i}^{\prime}$ for some $i$. Details omitted.

05LH Lemma 88.49.1. There exists a sheaf of abelian groups $G$ on $S_{\text {Cetale }}$ with the following properties
(1) $G(\operatorname{Spec}(k))=0$ whenever $k$ is a field,
(2) $G$ is limit preserving,
(3) if $X \subset X^{\prime}$ is a thickening, then $G(X)=G\left(X^{\prime}\right)$, and
(4) $G$ is not zero.

Proof. See discussion above.

### 88.50. The lisse-étale site is not functorial

07BF The lisse-étale site $X_{\text {lisse étale }}$ of $X$ is the category of schemes smooth over $X$ endowed with (usual) étale coverings, see Cohomology of Stacks, Section 84.11 . Let $f: X \rightarrow Y$ be a morphism of schemes. There is a functor

$$
u: Y_{\text {lisse,étale }} \longrightarrow X_{\text {lisse,étale }}, \quad V / Y \longmapsto V \times_{Y} X
$$

which is continuous. Hence we obtain an adjoint pair of functors

$$
u^{s}: S h\left(X_{\text {lisse,étale }}\right) \longrightarrow S h\left(Y_{\text {lisse,étale }}\right), \quad u_{s}: S h\left(Y_{\text {lisse,étale }}\right) \longrightarrow S h\left(X_{\text {lisse,étale }}\right),
$$

see Sites, Section 7.14. We claim that, in general, $u$ does not define a morphism of sites, see Sites, Definition 7.15.1. In other words, we claim that $u_{s}$ is not left exact in general. Note that representable presheaves are sheaves on lisse-étale sites.

Hence, by Sites, Lemma 7.14 .5 we see that $u_{s} h_{V}=h_{V \times_{Y} X}$. Now consider two morphisms

of schemes $V_{1}, V_{2}$ smooth over $Y$. Now if $u_{s}$ is left exact, then we would have

$$
u_{s} \operatorname{Equalizer}\left(h_{a}, h_{b}: h_{V_{1}} \rightarrow h_{V_{2}}\right)=\operatorname{Equalizer}\left(h_{a \times 1}, h_{b \times 1}: h_{V_{1} \times_{Y} X} \rightarrow h_{V_{2} \times_{Y} X}\right)
$$

We will take the morphisms $a, b: V_{1} \rightarrow V_{2}$ such that there exists no morphism from a scheme smooth over $Y$ into $(a=b) \subset V_{1}$, i.e., such that the left hand side is the empty sheaf, but such that after base change to $X$ the equalizer is nonempty and smooth over $X$. A silly example is to take $X=\operatorname{Spec}\left(\mathbf{F}_{p}\right), Y=\operatorname{Spec}(\mathbf{Z})$ and $V_{1}=V_{2}=\mathbf{A}_{\mathbf{Z}}^{1}$ with morphisms $a(x)=x$ and $b(x)=x+p$. Note that the equalizer of $a$ and $b$ is the fibre of $\mathbf{A}_{\mathbf{Z}}^{1}$ over $(p)$.

07BG Lemma 88.50.1. The lisse-étale site is not functorial, even for morphisms of schemes.

Proof. See discussion above.

### 88.51. Derived pushforward of quasi-coherent modules

$07 \mathrm{DC} \quad$ Let $k$ be a field of characteristic $p>0$. Let $S=\operatorname{Spec}(k[x])$. Let $G=\mathbf{Z} / p \mathbf{Z}$ viewed either as an abstract group or as a constant group scheme over $S$. Consider the algebraic stack $\mathcal{X}=[S / G]$ where $G$ acts trivially on $S$, see Examples of Stacks, Remark 77.15.4 and Criteria for Representability, Lemma 79.18.3. Consider the structure morphism

$$
f: \mathcal{X} \longrightarrow S
$$

This morphism is quasi-compact and quasi-separated. Hence we get a functor

$$
R f_{Q C o h, *}: D_{Q C o h}^{+}\left(\mathcal{O}_{\mathcal{X}}\right) \longrightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{S}\right)
$$

see Derived Categories of Stacks, Proposition 85.5.1. Let's compute $R f_{Q C o h, *} \mathcal{O}_{\mathcal{X}}$. Since $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ is equivalent to the derived category of $k[x]$-modules (see Derived Categories of Schemes, Lemma 35.3.5) this is equivalent to computing $R \Gamma\left(\mathcal{X}, \mathcal{O}_{\mathcal{X}}\right)$. For this we can use the covering $S \rightarrow \mathcal{X}$ and the spectral sequence

$$
H^{q}\left(S \times \mathcal{X} \ldots \times_{\mathcal{X}} S, O\right) \Rightarrow H^{p+q}\left(\mathcal{X}, \mathcal{O}_{\mathcal{X}}\right)
$$

see Cohomology of Stacks, Proposition 84.10.4. Note that

$$
S \times \mathcal{X} \ldots \times_{\mathcal{X}} S=S \times G^{p}
$$

which is affine. Thus the complex

$$
k[x] \rightarrow \operatorname{Map}(G, k[x]) \rightarrow \operatorname{Map}\left(G^{2}, k[x]\right) \rightarrow \ldots
$$

computes $R \Gamma\left(\mathcal{X}, \mathcal{O}_{\mathcal{X}}\right)$. Here for $\varphi \in \operatorname{Map}\left(G^{p-1}, k[x]\right)$ its differential is the map which sends $\left(g_{1}, \ldots, g_{p}\right)$ to

$$
\varphi\left(g_{2}, \ldots, g_{p}\right)+\sum_{i=1}^{p-1}(-1)^{i} \varphi\left(g_{1}, \ldots, g_{i}+g_{i+1}, \ldots, g_{p}\right)+(-1)^{p} \varphi\left(g_{1}, \ldots, g_{p-1}\right)
$$

This is just the complex computing the group cohomology of $G$ acting trivially on $k[x]$ (insert future reference here). The cohomology of the cyclic group $G$ on $k[x]$ is
exactly one copy of $k[x]$ in each cohomological degree $\geq 0$ (insert future reference here). We conclude that

$$
R f_{*} \mathcal{O}_{\mathcal{X}}=\bigoplus_{n \geq 0} \mathcal{O}_{S}[-n]
$$

Now, consider the complex

$$
E=\bigoplus_{m \geq 0} \mathcal{O}_{\mathcal{X}}[m]
$$

This is an object of $D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right)$. We interrupt the discussion for a general result.
$08 \mathrm{~L} Y$ Lemma 88.51.1. Let $\mathcal{X}$ be an algebraic stack. Let $K$ be an object of $D\left(\mathcal{O}_{\mathcal{X}}\right)$ whose cohomology sheaves are locally quasi-coherent (Sheaves on Stacks, Definition 78.11.4) and satisfy the flat base change property (Cohomology of Stacks, Definition 84.7.1). Then there exists a distinguished triangle

$$
K \rightarrow \prod_{n \geq 0} \tau_{\geq-n} K \rightarrow \prod_{n \geq 0} \tau_{\geq-n} K \rightarrow K[1]
$$

in $D\left(\mathcal{O}_{\mathcal{X}}\right)$. In other words, $K$ is the derived limit of its canonical truncations.
Proof. Recall that we work on the "big fppf site" $\mathcal{X}_{\text {fppf }}$ of $\mathcal{X}$ (by our conventions for sheaves of $\mathcal{O}_{\mathcal{X}}$-modules in the chapters Sheaves on Stacks and Cohomology on Stacks). Let $\mathcal{B}$ be the set of objects $x$ of $\mathcal{X}_{\text {fppf }}$ which lie over an affine scheme $U$. Combining Sheaves on Stacks, Lemmas 78.22.2, 78.15.1, Descent, Lemma 34.8.4. and Cohomology of Schemes, Lemma 29.2.2 we see that $H^{p}(x, \mathcal{F})=0$ if $\mathcal{F}$ is locally quasi-coherent and $x \in \mathcal{B}$. Now the claim follows from Cohomology on Sites, Lemma 21.21.5.

08IZ Lemma 88.51.2. Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{F}_{n}$ is a collection of locally quasicoherent sheaves with the flat base change property on $\mathcal{X}$, then $\oplus_{n} \mathcal{F}_{n}[n] \rightarrow \prod_{n} \mathcal{F}_{n}[n]$ is an isomorphism in $D\left(\mathcal{O}_{\mathcal{X}}\right)$.

Proof. This is true because by Lemma 88.51.1 we see that the direct sum is isomorphic to the product.

We continue our discussion. Since a quasi-coherent module is locally quasi-coherent and satisfies the flat base change property (Sheaves on Stacks, Lemma 78.11.5) we get

$$
E=\prod_{m \geq 0} \mathcal{O}_{\mathcal{X}}[m]
$$

Since cohomology commutes with limits we see that

$$
R f_{*} E=\prod_{m \geq 0}\left(\bigoplus_{n \geq 0} \mathcal{O}_{S}[m-n]\right)
$$

Note that this complex is not an object of $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ because the cohomology sheaf in degree 0 is an infinite product of copies of $\mathcal{O}_{S}$ which is not even a locally quasi-coherent $\mathcal{O}_{S}$-module.

07DD Lemma 88.51.3. A quasi-compact and quasi-separated morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ of algebraic stacks need not induce a functor $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{\mathcal{X}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\mathcal{Y}}\right)$.

Proof. See discussion above.

### 88.52. A big abelian category

07JS The purpose of this section is to give an example of a "big" abelian category $\mathcal{A}$ and objects $M, N$ such that the collection of isomorphism classes of extensions $\operatorname{Ext}_{\mathcal{A}}(M, N)$ is not a set. The example is due to Freyd, see [Fre64, page 131, Exercise A].
We define $\mathcal{A}$ as follows. An object of $\mathcal{A}$ consists of a triple $(M, \alpha, f)$ where $M$ is an abelian group and $\alpha$ is an ordinal and $f: \alpha \rightarrow \operatorname{End}(M)$ is a map. A morphism $(M, \alpha, f) \rightarrow\left(M^{\prime}, \alpha^{\prime}, f^{\prime}\right)$ is given by a homomorphism of abelian groups $\varphi: M \rightarrow M^{\prime}$ such that for any ordinal $\beta$ we have

$$
\varphi \circ f(\beta)=f^{\prime}(\beta) \circ \varphi
$$

Here the rule is that we set $f(\beta)=0$ if $\beta$ is not in $\alpha$ and similarly we set $f^{\prime}(\beta)$ equal to zero if $\beta$ is not an element of $\alpha^{\prime}$. We omit the verification that the category so defined is abelian.

Consider the object $Z=(\mathbf{Z}, \emptyset, f)$, i.e., all the operators are zero. The observation is that computed in $\mathcal{A}$ the group $\operatorname{Ext}_{\mathcal{A}}{ }^{1}(Z, Z)$ is a proper class and not a set. Namely, for each ordinal $\alpha$ we can find an extension $(M, \alpha+1, f)$ of $Z$ by $Z$ whose underlying group is $M=\mathbf{Z} \oplus \mathbf{Z}$ and where the value of $f$ is always zero except for

$$
f(\alpha)=\left(\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right)
$$

This clearly produces a proper class of isomorphism classes of extensions. In particular, the derived category of $\mathcal{A}$ has proper classes for its collections of morphism, see Derived Categories, Lemma 13.27.6. This means that some care has to be exercised when defining Verdier quotients of triangulated categories.

07JT Lemma 88.52.1. There exists a "big" abelian category $\mathcal{A}$ whose Ext-groups are proper classes.

Proof. See discussion above.

### 88.53. Weakly associated points and scheme theoretic density

084J Let $k$ be a field. Let $R=k\left[z, x_{i}, y_{i}\right] /\left(z^{2}, z x_{i} y_{i}\right)$ where $i$ runs over the elements of $\mathbf{N}$. Note that $R=R_{0} \oplus M_{0}$ where $R_{0}=k\left[x_{i}, y_{i}\right]$ is a subring and $M_{0}$ is an ideal of square zero with $M_{0} \cong R_{0} /\left(x_{i} y_{i}\right)$ as $R_{0}$-module. The prime $\mathfrak{p}=\left(z, x_{i}\right)$ is weakly associated to $R$ as an $R$-module (Algebra, Definition 10.65.1). Indeed, the element $z$ in $R_{\mathfrak{p}}$ is nonzero but annihilated by $\mathfrak{p} R_{\mathfrak{p}}$. On the other hand, consider the open subscheme

$$
U=\bigcup D\left(x_{i}\right) \subset \operatorname{Spec}(R)=S
$$

We claim that $U \subset S$ is scheme theoretically dense (Morphisms, Definition 28.7.1). To prove this it suffices to show that $\mathcal{O}_{S} \rightarrow j_{*} \mathcal{O}_{U}$ is injective where $j: U \rightarrow S$ is the inclusion morphism, see Morphisms, Lemma 28.7.5. Translated back into algebra, we have to show that for all $g \in R$ the map

$$
R_{g} \longrightarrow \prod R_{x_{i} g}
$$

is injective. Write $g=g_{0}+m_{0}$ with $g_{0} \in R_{0}$ and $m_{0} \in M_{0}$. Then $R_{g}=R_{g_{0}}$ (details omitted). Hence we may assume $g \in R_{0}$. We may also assume $g$ is not zero. Now $R_{g}=\left(R_{0}\right)_{g} \oplus\left(M_{0}\right)_{g}$. Since $R_{0}$ is a domain, the map $\left(R_{0}\right)_{g} \rightarrow \prod\left(R_{0}\right)_{x_{i} g}$ is injective.

If $g \in\left(x_{i} y_{i}\right)$ then $\left(M_{0}\right)_{g}=0$ and there is nothing to prove. If $g \notin\left(x_{i} y_{i}\right)$ then, since $\left(x_{i} y_{i}\right)$ is a radical ideal of $R_{0}$, we have to show that $M_{0} \rightarrow \prod\left(M_{0}\right)_{x_{i} g}$ is injective. The kernel of $R_{0} \rightarrow M_{0} \rightarrow\left(M_{0}\right)_{x_{n}}$ is $\left(x_{i} y_{i}, y_{n}\right)$. Since $\left(x_{i} y_{i}, y_{n}\right)$ is a radical ideal, if $g \notin\left(x_{i} y_{i}, y_{n}\right)$ then the kernel of $R_{0} \rightarrow M_{0} \rightarrow\left(M_{0}\right)_{x_{n} g}$ is $\left(x_{i} y_{i}, y_{n}\right)$. As $g \notin\left(x_{i} y_{i}, y_{n}\right)$ for all $n \gg 0$ we conclude that the kernel is contained in $\bigcap_{n \gg 0}\left(x_{i} y_{i}, y_{n}\right)=\left(x_{i} y_{i}\right)$ as desired.

Second example due to Ofer Gabber. Let $k$ be a field and let $R$, resp. $R^{\prime}$ be the ring of functions $\mathbf{N} \rightarrow k$, resp. the ring of eventually constant functions $\mathbf{N} \rightarrow k$. Then $\operatorname{Spec}(R)$, resp. $\operatorname{Spec}\left(R^{\prime}\right)$ is the Stone-Čech compactification ${ }^{2} \beta \mathbf{N}$, resp. the one point compactification $\square^{3} \mathbf{N}^{*}=\mathbf{N} \cup\{\infty\}$. All points are weakly associated since all primes are minimal in the rings $R$ and $R^{\prime}$.
084K Lemma 88.53.1. There exists a reduced scheme $X$ and a schematically dense open $U \subset X$ such that some weakly associated point $x \in X$ is not in $U$.

Proof. In the first example we have $\mathfrak{p} \notin U$ by construction. In Gabber's examples the schemes $\operatorname{Spec}(R)$ or $\operatorname{Spec}\left(R^{\prime}\right)$ are reduced.

### 88.54. Example of non-additivity of traces

087J Let $k$ be a field and let $R=k[\epsilon]$ be the ring of dual numbers over $k$. In other words, $R=k[x] /\left(x^{2}\right)$ and $\epsilon$ is the congruence class of $x$ in $R$. Consider the short exact sequence of complexes

Here the columns are the complexes, the first row is placed in degree 0 , and the second row in degree 1 . Denote the first complex (i.e., the left column) by $A^{\bullet}$, the second by $B^{\bullet}$ and the third $C^{\bullet}$. We claim that the diagram

087K

commutes in $K(R)$, i.e., is a diagram of complexes commuting up to homotopy. Namely, the square on the right commutes and the one on the left is off by the homotopy $1: A^{1} \rightarrow B^{0}$. On the other hand,

$$
\operatorname{Tr}_{A} \bullet(1+\epsilon)+\operatorname{Tr}_{C} \bullet(1) \neq \operatorname{Tr}_{B} \cdot(1)
$$

087L Lemma 88.54.1. There exists a ring $R$, a distringuished triangle ( $K, L, M, \alpha, \beta, \gamma$ ) in the homotopy category $K(R)$, and an endomorphism $(a, b, c)$ of this distinguished triangle, such that $K, L, M$ are perfect complexes and $\operatorname{Tr}_{K}(a)+\operatorname{Tr}_{M}(c) \neq \operatorname{Tr}_{L}(b)$.

[^227]${ }^{3}$ Here one argues that there is really only one extra maximal ideal in $R^{\prime}$.

Proof. Consider the example above. The map $\gamma: C^{\bullet} \rightarrow A^{\bullet}[1]$ is given by multiplication by $\epsilon$ in degree 0, see Derived Categories, Definition 13.10.1. Hence it is also true that

commutes in $K(R)$ as $\epsilon(1+\epsilon)=\epsilon$. Thus we indeed have a morphism of distinguished triangles.

### 88.55. Being projective is not local on the base

08J0 In the chapter on descent we have seen that many properties of morphisms are local on the base, even in the fpqc topology. See Descent, Sections 34.18, 34.19, and 34.20 . This is not true for projectivity of morphisms.

08J1 Lemma 88.55.1. The properties
$\mathcal{P}(f)=" f$ is projective", and
$\mathcal{P}(f)=" f$ is quasi-projective"
are not Zariski local on the base. A fortiori, they are not fpqc local on the base.
Proof. Following Hironaka Har77, Example B.3.4.1], we define a proper morphism of smooth complex 3-folds $f: V_{Y} \rightarrow Y$ which is Zariski-locally projective, but not projective. Since $f$ is proper and not projective, it is also not quasi-projective.

Let $Y$ be projective 3 -space over the complex numbers $\mathbf{C}$. Let $C$ and $D$ be smooth conics in $Y$ such that the closed subscheme $C \cap D$ is reduced and consists of two complex points $P$ and $Q$. (For example, let $C=\left\{[x, y, z, w]: x y=z^{2}, w=0\right\}$, $D=\left\{[x, y, z, w]: x y=w^{2}, z=0\right\}, P=[1,0,0,0]$, and $\left.Q=[0,1,0,0].\right)$ On $Y-Q$, first blow up the curve $C$, and then blow up the strict transform of the curve $D$ (Divisors, Definition 30.27.1). On $Y-P$, first blow up the curve $D$, and then blow up the strict transform of the curve $C$. Over $Y-P-Q$, the two varieties we have constructed are canonically isomorphic, and so we can glue them over $Y-P-Q$. The result is a smooth proper 3 -fold $V_{Y}$ over $\mathbf{C}$. The morphism $f: V_{Y} \rightarrow Y$ is proper and Zariski-locally projective (since it is a blow-up over $Y-P$ and over $Y-Q$ ), by Divisors, Lemma 30.26.13. We will show that $V_{Y}$ is not projective over C. That will imply that $f$ is not projective.

To do this, let $L$ be the inverse image in $V_{Y}$ of a complex point of $C-P-Q$, and $M$ the inverse image of a complex point of $D-P-Q$. Then $L$ and $M$ are isomorphic to the projective line $\mathbf{P}_{\mathbf{C}}^{1}$. Next, let $E$ be the inverse image in $V_{Y}$ of $C \cup D \subset Y$ in $V_{Y}$; thus $E \rightarrow C \cup D$ is a proper morphism, with fibers isomorphic to $\mathbf{P}^{1}$ over $(C \cup D)-\{P, Q\}$. The inverse image of $P$ in $E$ is a union of two lines $L_{0}$ and $M_{0}$, and we have rational equivalences of cycles $L \sim L_{0}+M_{0}$ and $M \sim M_{0}$ on $E$ (using that $C$ and $D$ are isomorphic to $\mathbf{P}^{1}$ ). Note the asymmetry resulting from the order in which we blew up the two curves. Near $Q$, the opposite happens. So the inverse image of $Q$ is the union of two lines $L_{0}^{\prime}$ and $M_{0}^{\prime}$, and we have rational equivalences $L \sim L_{0}^{\prime}$ and $M \sim L_{0}^{\prime}+M_{0}^{\prime}$ on $E$. Combining these equivalences, we find that $L_{0}+M_{0}^{\prime} \sim 0$ on $E$ and hence on $V_{Y}$. If $V_{Y}$ were projective over $\mathbf{C}$, it would have an ample line bundle $H$, which would have degree $>0$ on all curves in $V_{Y}$. In particular $H$ would have positive degree on $L_{0}+M_{0}^{\prime}$, contradicting that the
degree of a line bundle is well-defined on 1-cycles modulo rational equivalence on a proper scheme over a field (Chow Homology, Lemma 41.21 .2 and Lemma 41.27.2). So $V_{Y}$ is not projective over $\mathbf{C}$.

In different terminology, Hironaka's 3-fold $V_{Y}$ is a small resolution of the blow-up $Y^{\prime}$ of $Y$ along the reduced subscheme $C \cup D$; here $Y^{\prime}$ has two node singularities. If we define $Z$ by blowing up $Y$ along $C$ and then along the strict transform of $D$, then $Z$ is a smooth projective 3 -fold, and the non-projective 3 -fold $V_{Y}$ differs from $Z$ by a "flop" over $Y-P$.

### 88.56. Descent data for schemes need not be effective, even for a projective morphism

08 KE In the chapter on descent we have seen that descent data for schemes relative to an fpqc morphism are effective for several classes of morphisms. In particular, affine morphisms and more generally quasi-affine morphisms satisfy descent for fpqc coverings (Descent, Lemma 34.34.1). This is not true for projective morphisms.

08KF Lemma 88.56.1. There is an etale covering $X \rightarrow S$ of schemes and a descent datum $(V / X, \varphi)$ relative to $X \rightarrow S$ such that $V \rightarrow X$ is projective, but the descent datum is not effective in the category of schemes.

Proof. We imitate Hironaka's example of a smooth separated complex algebraic space of dimension 3 which is not a scheme Har77, Example B.3.4.2].
Consider the action of the group $G=\mathbf{Z} / 2=\{1, g\}$ on projective 3 -space $\mathbf{P}^{3}$ over the complex numbers by

$$
g[x, y, z, w]=[y, x, w, z]
$$

The action is free outside the two disjoint lines $L_{1}=\{[x, x, z, z]\}$ and $L_{2}=$ $\{[x,-x, z,-z]\}$ in $\mathbf{P}^{3}$. Let $Y=\mathbf{P}^{3}-\left(L_{1} \cup L_{2}\right)$. There is a smooth quasi-projective scheme $S=Y / G$ over $\mathbf{C}$ such that $Y \rightarrow S$ is a $G$-torsor (Groupoids, Definition 38.11.3). Explicitly, we can define $S$ as the image of the open subset $Y$ in $\mathbf{P}^{3}$ under the morphism

$$
\begin{aligned}
\mathbf{P}^{3} & \rightarrow \operatorname{Proj} \mathbf{C}[x, y, z, w]^{G} \\
& =\operatorname{Proj} \mathbf{C}\left[u_{0}, u_{1}, v_{0}, v_{1}, v_{2}\right] /\left(v_{0} v_{1}=v_{2}^{2}\right),
\end{aligned}
$$

where $u_{0}=x+y, u_{1}=z+w, v_{0}=(x-y)^{2}, v_{1}=(z-w)^{2}$, and $v_{2}=(x-y)(z-w)$, and the ring is graded with $u_{0}, u_{1}$ in degree 1 and $v_{0}, v_{1}, v_{2}$ in degree 2 .
Let $C=\left\{[x, y, z, w]: x y=z^{2}, w=0\right\}$ and $D=\left\{[x, y, z, w]: x y=w^{2}, z=0\right\}$. These are smooth conic curves in $\mathbf{P}^{3}$, contained in the $G$-invariant open subset $Y$, with $g(C)=D$. Also, $C \cap D$ consists of the two points $P:=[1,0,0,0]$ and $Q:=[0,1,0,0]$, and these two points are switched by the action of $G$.

Let $V_{Y} \rightarrow Y$ be the scheme which over $Y-P$ is defined by blowing up $D$ and then the strict transform of $C$, and over $Y-Q$ is defined by blowing up $C$ and then the strict transform of $D$. (This is the same construction as in the proof of Lemma 88.55.1. except that $Y$ here denotes an open subset of $\mathbf{P}^{3}$ rather than all of $\mathbf{P}^{3}$.) Then the action of $G$ on $Y$ lifts to an action of $G$ on $V_{Y}$, which switches the inverse images of $Y-P$ and $Y-Q$. This action of $G$ on $V_{Y}$ gives a descent datum $\left(V_{Y} / Y, \varphi_{Y}\right)$ on $V_{Y}$ relative to the $G$-torsor $Y \rightarrow S$. The morphism $V_{Y} \rightarrow Y$ is proper but not projective, as shown in the proof of Lemma 88.55.1

Let $X$ be the disjoint union of the open subsets $Y-P$ and $Y-Q$; then we have surjective etale morphisms $X \rightarrow Y \rightarrow S$. Let $V$ be the pullback of $V_{Y} \rightarrow Y$ to $X$; then the morphism $V \rightarrow X$ is projective, since $V_{Y} \rightarrow Y$ is a blow-up over each of the open subsets $Y-P$ and $Y-Q$. Moreover, the descent datum $\left(V_{Y} / Y, \varphi_{Y}\right)$ pulls back to a descent datum $(V / X, \varphi)$ relative to the etale covering $X \rightarrow S$.
Suppose that this descent datum is effective in the category of schemes. That is, there is a scheme $U \rightarrow S$ which pulls back to the morphism $V \rightarrow X$ together with its descent datum. Then $U$ would be the quotient of $V_{Y}$ by its $G$-action.

Let $E$ be the inverse image of $C \cup D \subset Y$ in $V_{Y}$; thus $E \rightarrow C \cup D$ is a proper morphism, with fibers isomorphic to $\mathbf{P}^{1}$ over $(C \cup D)-\{P, Q\}$. The inverse image of $P$ in $E$ is a union of two lines $L_{0}$ and $M_{0}$. It follows that the inverse image of $Q=g(P)$ in $E$ is the union of two lines $L_{0}^{\prime}=g\left(M_{0}\right)$ and $M_{0}^{\prime}=g\left(L_{0}\right)$. As shown in the proof of Lemma 88.55.1, we have a rational equivalence $L_{0}+M_{0}^{\prime}=L_{0}+g\left(L_{0}\right) \sim$ 0 on $E$.

By descent of closed subschemes, there is a curve $L_{1} \subset U$ (isomorphic to $\mathbf{P}^{1}$ ) whose inverse image in $V_{Y}$ is $L_{0} \cup g\left(L_{0}\right)$. (Use Descent, Lemma 34.33.1, noting that a closed immersion is an affine morphism.) Let $R$ be a complex point of $L_{1}$. Since we assumed that $U$ is a scheme, we can choose a function $f$ in the local ring $O_{U, R}$ that vanishes at $R$ but not on the whole curve $L_{1}$. Let $D_{\text {loc }}$ be an irreducible component of the closed subset $\{f=0\}$ in Spec $O_{U, R}$; then $D_{\text {loc }}$ has codimension 1. The closure of $D_{\text {loc }}$ in $U$ is an irreducible divisor $D_{U}$ in $U$ which contains the point $R$ but not the whole curve $L_{1}$. The inverse image of $D_{U}$ in $V_{Y}$ is an effective divisor $D$ which intersects $L_{0} \cup g\left(L_{0}\right)$ but does not contain either curve $L_{0}$ or $g\left(L_{0}\right)$.
Since the complex 3 -fold $V_{Y}$ is smooth, $O(D)$ is a line bundle on $V_{Y}$. We use here that a regular local ring is factorial, or in other words is a UFD, see More on Algebra, Lemma 15.83.7. The restriction of $O(D)$ to the proper surface $E \subset V_{Y}$ is a line bundle which has positive degree on the 1-cycle $L_{0}+g\left(L_{0}\right)$, by our information on $D$. Since $L_{0}+g\left(L_{0}\right) \sim 0$ on $E$, this contradicts that the degree of a line bundle is well-defined on 1 -cycles modulo rational equivalence on a proper scheme over a field (Chow Homology, Lemma 41.21 .2 and Lemma 41.27.2). Therefore the descent datum $(V / X, \varphi)$ is in fact not effective; that is, $U$ does not exist as a scheme.

In this example, the descent datum is effective in the category of algebraic spaces. More precisely, $U$ exists as a smooth separated algebraic space of dimension 3 over $\mathbf{C}$, for example by Algebraic Spaces, Lemma 52.14.3 Hironaka's 3-fold $U$ is a small resolution of the blow-up $S^{\prime}$ of the smooth quasi-projective 3 -fold $S$ along the irreducible nodal curve $(C \cup D) / G$; the 3-fold $S^{\prime}$ has a node singularity. The other small resolution of $S^{\prime}$ (differing from $U$ by a "flop") is again an algebraic space which is not a scheme.

### 88.57. Derived base change

08J2 Let $R \rightarrow A$ be a ring map. In More on Algebra, Section 15.50 we construct a derived base change functor $-\otimes_{R}^{\mathbf{L}} A: D(R) \rightarrow D(A)$. Next, let $R \rightarrow B$ be a second ring map. Picture

Given a $B$-module $M$ the tensor product $M \otimes_{R} A$ is a $B \otimes_{R} A$-module. In this section we show there does not exist a "derived base change functor" $D(B) \rightarrow D\left(B \otimes_{R} A\right)$.

Let $k$ be a field. Set $R=k[x, y]$. Set $A=R /(x y)$ and $B=R /\left(x^{2}\right)$. The object $B \otimes_{R}^{\mathbf{L}} A$ in $D(A)$ is represented by

$$
x^{2}: A \longrightarrow A
$$

and we have $H^{0}\left(B \otimes_{R}^{\mathbf{L}} A\right)=B \otimes_{R} A$. We claim that there does not exist an object $E$ of $D\left(B \otimes_{R} A\right)$ mapping to $B \otimes_{R}^{\mathbf{L}} A$ in $D(A)$. Namely, for such an $E$ the module $H^{0}(E)$ would be free, hence $E$ would decompose as $H^{0}(E)[0] \oplus H^{-1}(E)[1]$. But it is easy to see that $B \otimes_{R}^{\mathrm{L}} A$ is not isomorphic to the sum of its cohomology groups in $D(A)$.

08J3 Lemma 88.57.1. Let $R \rightarrow A$ and $R \rightarrow B$ be ring maps. In general there does not exist a functor $T: D(B) \rightarrow D\left(B \otimes_{R} A\right)$ of triangulated categories such that a $B$-module $M$ gives an object $T(M)$ of $D\left(B \otimes_{R} A\right)$ which maps to $M \otimes_{R}^{\mathbf{L}} A$ under the map $D\left(B \otimes_{R} A\right) \rightarrow D(A)$.

Proof. See discussion above.

### 88.58. An interesting compact object

09R4 Let $R$ be a ring. Let $(A, \mathrm{~d})$ be a differential graded $R$-algebra. If $A=R$, then we know that every compact object of $D(A, \mathrm{~d})=D(R)$ is represented by a finite complex of finite projective modules. In other words, compact objects are perfect, see More on Algebra, Proposition 15.64.3. The analogue in the language of differential graded modules would be the question: "Is every compact object of $D(A, \mathrm{~d})$ represented by a differential graded $A$-module $P$ which is finite and graded projective?"

For general differential graded algebras, this is not true. Namely, let $k$ be a field of characteristic 2 (so we don't have to worry about signs). Let $A=k[x, y] /\left(y^{2}\right)$ with
(1) $x$ of degree 0
(2) $y$ of degree -1 ,
(3) $\mathrm{d}(x)=0$, and
(4) $\mathrm{d}(y)=x^{2}+x$.

Then $x: A \rightarrow A$ is a projector in $K(A, \mathrm{~d})$. Hence we see that

$$
A=\operatorname{Ker}(x) \oplus \operatorname{Im}(1-x)
$$

in $K(A, \mathrm{~d})$, see Differential Graded Algebra, Lemma 22.5 .4 and Derived Categories, Lemma 13.4.12 It is clear that $A$ is a compact object of $D(A, \mathrm{~d})$. Then $\operatorname{Ker}(x)$ is a compact object of $D(A, \mathrm{~d})$ as follows from Derived Categories, Lemma 13.34.2.

Next, suppose that $M$ is a differential graded (right) $A$-module representing $\operatorname{Ker}(x)$ and suppose that $M$ is finite and projective as a graded $A$-module. Because every finite graded projective module over $k[x, y] /\left(y^{2}\right)$ is graded free, we see that $M$ is finite free as a graded $k[x, y] /\left(y^{2}\right)$-module (i.e., when we forget the differential). We set $N=M / M\left(x^{2}+x\right)$. Consider the exact sequence

$$
0 \rightarrow M \xrightarrow{x^{2}+x} M \rightarrow N \rightarrow 0
$$

Since $x^{2}+x$ is of degree 0 , in the center of $A$, and $\mathrm{d}\left(x^{2}+x\right)=0$ we see that this is a short exact sequence of differential graded $A$-modules. Moreover, as $\mathrm{d}(y)=x^{2}+x$ we see that the differential on $N$ is linear. The maps

$$
H^{-1}(N) \rightarrow H^{0}(M) \quad \text { and } \quad H^{0}(M) \rightarrow H^{0}(N)
$$

are isomorphisms as $H^{*}(M)=H^{0}(M)=k$ since $M \cong \operatorname{Ker}(x)$ in $D(A, \mathrm{~d})$. A computation of the boundary map shows that $H^{*}(N)=k[x, y] /\left(x, y^{2}\right)$ as a graded module; we omit the details. Since $N$ is a free $k[x, y] /\left(y^{2}, x^{2}+x\right)$-module we have a resolution

$$
\ldots \rightarrow N[2] \xrightarrow{y} N[1] \xrightarrow{y} N \rightarrow N / N y \rightarrow 0
$$

compatible with differentials. Since $N$ is bounded and since $H^{0}(N)=k[x, y] /\left(x, y^{2}\right)$ it follows from Homology, Lemma 12.22 .6 that $H^{0}(N / N y)=k[x] /(x)$. But as $N / N y$ is a finite complex of free $k[x] /\left(x^{2}+x\right)=k \times k$-modules, we see that its cohomology has to have even dimension, a contradiction.

09R5 Lemma 88.58.1. There exists a differential graded algebra $(A, d)$ and a compact object $E$ of $D(A, d)$ such that $E$ cannot be represented by a finite and graded projective differential graded $A$-module.

Proof. See discussion above.

### 88.59. Two differential graded categories

09R6 In this section we construct two differential graded categories satisfying axioms (A), (B), and (C) as in Differential Graded Algebra, Situation 22.20 .2 whose objects do not come with a Z-grading.

Example I. Let $X$ be a topological space. Denote $\underline{\mathbf{Z}}$ the constant sheaf with value Z. Let $A$ be an $\underline{\mathbf{Z}}$-torsor. In this setting we say a sheaf of abelian groups $\mathcal{F}$ is $A$-graded if given a local section $a \in A(U)$ there is a projector $p_{a}:\left.\left.\mathcal{F}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ such that whenever we have a local isomorphism $\left.\left.\underline{\mathbf{Z}}\right|_{U} \rightarrow A\right|_{U}$ then $\left.\mathcal{F}\right|_{U}=\bigoplus_{n \in \mathbf{Z}} p_{n}(\mathcal{F})$. Another way to say this is that locally on $X$ the abelian sheaf $\mathcal{F}$ has a $\mathbf{Z}$-grading, but on overlaps the different choices of gradings differ by a shift in degree given by the transition functions for the torsor $A$. We say that a pair $(\mathcal{F}, \mathrm{d})$ is an $A$-graded complex of abelian sheaves, if $\mathcal{F}$ is an $A$-graded abelian sheaf and $\mathrm{d}: \mathcal{F} \rightarrow \mathcal{F}$ is a differential, i.e., $\mathrm{d}^{2}=0$ such that $p_{a+1} \circ \mathrm{~d}=\mathrm{d} \circ p_{a}$ for every local section $a$ of $A$. In other words, $\mathrm{d}\left(p_{a}(\mathcal{F})\right)$ is contained in $p_{a+1}(\mathcal{F})$.

Next, consider the category $\mathcal{A}$ with
(1) objects are $A$-graded complexes of abelian sheaves, and
(2) for objects $(\mathcal{F}, \mathrm{d}),(\mathcal{G}, \mathrm{d})$ we set

$$
\operatorname{Hom}_{\mathcal{A}}((\mathcal{F}, \mathrm{d}),(\mathcal{G}, \mathrm{d}))=\bigoplus \operatorname{Hom}^{n}(\mathcal{F}, \mathcal{G})
$$

where $\operatorname{Hom}^{n}(\mathcal{F}, \mathcal{G})$ is the group of maps of abelian sheaves $f$ such that $f\left(p_{a}(\mathcal{F})\right) \subset p_{a+n}(\mathcal{G})$ for all local sections $a$ of $A$. As differential we take $\mathrm{d}(f)=\mathrm{d} \circ f-(-1)^{n} f \circ \mathrm{~d}$, see Differential Graded Algebra, Example 22.19 .6

We omit the verification that this is indeed a differential graded category satisfying (A), (B), and (C). All the properties may be verified locall on $X$ where one just recovers the differential graded category of complexes of abelian sheaves. Thus we obtain a triangulated category $K(\mathcal{A})$.

Twisted derived category of $X$. Observe that given an object $(\mathcal{F}, \mathrm{d})$ of $\mathcal{A}$, there is a well defined $A$-graded cohomology sheaf $H(\mathcal{F}, \mathrm{~d})$. Hence it is clear what is meant by a quasi-isomorphism in $K(\mathcal{A})$. We can invert quasi-isomorphisms to obtain the derived category $D(\mathcal{A})$ of complexes of $A$-graded sheaves. If $A$ is the trivial torsor, then $D(\mathcal{A})$ is equal to $D(X)$, but for nonzero torsors, one obtains a kind of twisted derived category of $X$.

Example II. Let $C$ be a smooth curve over a perfect field $k$ of characteristic 2 . Then $\Omega_{C / k}$ comes endowed with a canonical square root. Namely, we can write $\Omega_{C / k}=\mathcal{L}^{\otimes 2}$ such that for every local function $f$ on $C$ the section $\mathrm{d}(f)$ is equal to $s^{\otimes 2}$ for some local section $s$ of $\mathcal{L}$. The "reason" is that

$$
\mathrm{d}\left(a_{0}+a_{1} t+\ldots+a_{d} t^{d}\right)=\left(\sum_{i \text { odd }} a_{i}^{1 / 2} t^{(i-1) / 2}\right)^{2} \mathrm{~d} t
$$

(insert future reference here). This in particular determines a canonical connection

$$
\nabla_{c a n}: \Omega_{C / k} \longrightarrow \Omega_{C / k} \otimes_{\mathcal{O}_{C}} \Omega_{C / k}
$$

whose 2-curvature is zero (namely, the unique connection such that the squares have derivative equal to zero). Observe that the category of vector bundles with connections is a tensor category, hence we also obtain canonical connections $\nabla_{c a n}$ on the invertible sheaves $\Omega_{C / k}^{\otimes n}$ for all $n \in \mathbf{Z}$.
Let $\mathcal{A}$ be the category with
(1) objects are pairs $(\mathcal{F}, \nabla)$ consisting of a finite locally free sheaf $\mathcal{F}$ endowed with a connection

$$
\nabla: \mathcal{F} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{C}} \Omega_{C / k}
$$

whose 2-curvature is zero, and
(2) morphisms between $\left(\mathcal{F}, \nabla_{\mathcal{F}}\right)$ and $\left(\mathcal{G}, \nabla_{\mathcal{G}}\right)$ are given by

$$
\operatorname{Hom}_{\mathcal{A}}\left(\left(\mathcal{F}, \nabla_{\mathcal{F}}\right),\left(\mathcal{G}, \nabla_{\mathcal{G}}\right)\right)=\bigoplus \operatorname{Hom}_{\mathcal{O}_{C}}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{C}} \Omega_{C / k}^{\otimes n}\right)
$$

For an element $f: \mathcal{F} \rightarrow \mathcal{G} \otimes \Omega_{C / k}^{\otimes n}$ of degree $n$ we set

$$
\mathrm{d}(f)=\nabla_{\mathcal{G} \otimes \Omega_{C / k}^{\otimes n}} \circ f+f \circ \nabla_{\mathcal{F}}
$$

with suitable identifications.
We omit the verification that this forms a differential graded category with properties (A), (B), (C). Thus we obtain a triangulated homotopy category $K(\mathcal{A})$.
If $C=\mathbf{P}_{k}^{1}$, then $K(\mathcal{A})$ is the zero category. However, if $C$ is a smooth proper curve of genus $>1$, then $K(\mathcal{A})$ is not zero. Namely, suppose that $\mathcal{N}$ is an invertible sheaf
of degree $0 \leq d<g-1$ with a nonzero section $\sigma$. Then $\operatorname{set}\left(\mathcal{F}, \nabla_{\mathcal{F}}\right)=\left(\mathcal{O}_{C}, \mathrm{~d}\right)$ and $\left(\mathcal{G}, \nabla_{\mathcal{G}}\right)=\left(\mathcal{N}^{\otimes 2}, \nabla_{c a n}\right)$. We see that

$$
\operatorname{Hom}_{\mathcal{A}}^{n}\left(\left(\mathcal{F}, \nabla_{\mathcal{F}}\right),\left(\mathcal{G}, \nabla_{\mathcal{G}}\right)\right)=\left\{\begin{array}{clc}
0 & \text { if } & n<0 \\
\Gamma\left(C, \mathcal{N}^{\otimes 2}\right) & \text { if } & n=0 \\
\Gamma\left(C, \mathcal{N}^{\otimes 2} \otimes \Omega_{C / k}\right) & \text { if } & n=1
\end{array}\right.
$$

The first 0 because the degree of $\mathcal{N}^{\otimes 2} \otimes \Omega_{C / k}^{\otimes-1}$ is negative by the condition $d<g-1$. Now, the section $\sigma^{\otimes 2}$ has derivative equal zero, hence the homomorphism group

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(\left(\mathcal{F}, \nabla_{\mathcal{F}}\right),\left(\mathcal{G}, \nabla_{\mathcal{G}}\right)\right)
$$

is nonzero.

### 88.60. An example of a non-algebraic Hom-stack

0 AF 8 Let $\mathcal{Y}, \mathcal{Z}$ be algebraic stacks over a scheme $S$. The Hom-stack Mor $_{S}(\mathcal{Y}, \mathcal{Z})$ is the stack in groupoids over $S$ whose category of sections over a scheme $T$ is given by the category

$$
\operatorname{Mor}_{T}\left(\mathcal{Y} \times_{S} T, \mathcal{Z} \times_{S} T\right)
$$

whose objects are 1-morphisms and whose morphisms are 2-morphisms. We omit the proof this this is indeed a stack in groupoids over $(S c h / S)_{f p p f}$ (insert future reference here). Of course, in general the Hom-stack will not be algebraic. In this section we give an example where it is not true and where $\mathcal{Y}$ is representable by a proper flat scheme over $S$ and $\mathcal{Z}$ is smooth and proper over $S$.

Let $k$ be an algebraically closed field which is not the algebraic closure of a finite field. Let $S=\operatorname{Spec}(k[[t]])$ and $S_{n}=\operatorname{Spec}\left(k[t] /\left(t^{n}\right)\right) \subset S$. Let $f: X \rightarrow S$ be a map satisfying the following
(1) $f$ is projective and flat, and its fibres are geometrically connected curves,
(2) the fibre $X_{0}=X \times_{S} S_{0}$ is a nodal curve with smooth irreducible components whose dual graph has a loop consisting of rational curves,
(3) $X$ is a regular scheme.

To make such a surface $X$ we can take for example

$$
X \quad: \quad T_{0} T_{1} T_{2}-t\left(T_{0}^{3}+T_{1}^{3}+T_{2}^{3}\right)=0
$$

in $\mathbf{P}_{k[[t]]}^{2}$. Let $A_{0}$ be a non-zero abelian variety over $k$ for example an elliptic curve. Let $A=A_{0} \times{ }_{\operatorname{Spec}(k)} S$ be the constant abelian scheme over $S$ associated to $A_{0}$. We will show that the stack $\left.\mathcal{X}=\underline{\operatorname{Mor}}_{S}(X,[S / A])\right)$ is not algebraic.
Recall that $[S / A]$ is on the one hand the quotient stack of $A$ acting trivially on $S$ and on the other hand equal to the stack classifying fppf $A$-torsors, see Examples of Stacks, Proposition 77.15 .3 . Observe that $[S / A]=\left[\operatorname{Spec}(k) / A_{0}\right] \times_{\operatorname{Spec}(k)} S$. This allows us to describe the fibre category over a scheme $T$ as follows

$$
\begin{aligned}
\mathcal{X}_{T} & =\underline{\operatorname{Mor}}_{S}(X,[S / A])_{T} \\
& =\operatorname{Mor}_{T}\left(X \times_{S} T,[S / A] \times_{S} T\right) \\
& =\operatorname{Mor}_{S}\left(X \times_{S} T,[S / A]\right) \\
& =\operatorname{Mor}_{S p e c}(k)\left(X \times_{S} T,\left[\operatorname{Spec}(k) / A_{0}\right]\right)
\end{aligned}
$$

for any $S$-scheme $T$. In other words, the groupoid $\mathcal{X}_{T}$ is the groupoid of fppf $A_{0}{ }^{-}$ torsors on $X \times_{S} T$. Before we discuss why $\mathcal{X}$ is not an algebraic stack, we need a few lemmas.

0AF9 Lemma 88.60.1. Let $W$ be a two dimensional regular integral Noetherian scheme with function field $K$. Let $G \rightarrow W$ be an abelian scheme. Then then map $H_{f p p f}^{1}(W, G) \rightarrow$ $H_{f p p f}^{1}(\operatorname{Spec}(K), G)$ is injective.
Sketch of proof. Let $P \rightarrow W$ be an fppf $G$-torsor which is trivial in the generic point. Then we have a morphism $\operatorname{Spec}(K) \rightarrow P$ over $W$ and we can take its scheme theoretic image $Z \subset P$. Since $P \rightarrow W$ is proper (as a torsor for a proper group algebraic space over $W$ ) we see that $Z \rightarrow W$ is a proper birational morphism. By Spaces over Fields, Lemma 59.3 .2 the morphism $Z \rightarrow W$ is finite away from finitely many closed points of $W$. By (insert future reference on resolving indeterminacies of morphisms by blowing quadratic transformations for surfaces) the irreducible components of the geometric fibres of $Z \rightarrow W$ are rational curves. By More on Groupoids in Spaces, Lemma 66.9.3 there are no nonconstant morphisms from rational curves to group schemes or torsors over such. Hence $Z \rightarrow W$ is finite, whence $Z$ is a scheme and $Z \rightarrow W$ is an isomorphism by Morphisms, Lemma 28.49.5. In other words, the torsor $P$ is trivial.

0AFA Lemma 88.60.2. Let $G$ be a smooth commutative group algebraic space over a field $K$. Then $H_{f p p f}^{1}(\operatorname{Spec}(K), G)$ is torsion.

Proof. Every $G$-torsor $P$ over $\operatorname{Spec}(K)$ is smooth over $K$ as a form of $G$. Hence $P$ has a point over a finite separable extension $K \subset L$. Say $[L: K]=n$. Let $[n](P)$ denote the $G$-torsor whose class is $n$ times the class of $P$ in $H_{f p p f}^{1}(\operatorname{Spec}(K), G)$. There is a canonical morphism

$$
P \times_{\operatorname{Spec}(K)} \ldots \times_{\operatorname{Spec}(K)} P \rightarrow[n](P)
$$

of algebraic spaces over $K$. This morphism is symmetric as $G$ is abelian. Hence it factors through the quotient

$$
\left(P \times_{\operatorname{Spec}(K)} \cdots \times_{\operatorname{Spec}(K)} P\right) / S_{n}
$$

On the other hand, the morphism $\operatorname{Spec}(L) \rightarrow P$ defines a morphism

$$
\left(\operatorname{Spec}(L) \times_{\operatorname{Spec}(K)} \ldots \times_{\operatorname{Spec}(K)} \operatorname{Spec}(L)\right) / S_{n} \longrightarrow\left(P \times_{\operatorname{Spec}(K)} \ldots \times_{\operatorname{Spec}(K)} P\right) / S_{n}
$$

and the reader can verify that the scheme on the left has a $K$-rational point. Thus we see that $[n](P)$ is the trivial torsor.

To prove $\mathcal{X}=\underline{\operatorname{Mor}}_{S}(X,[S / A])$ is not an algebraic stack, by Artin's Axioms, Lemma 80.9 .4 , it is enough to show the following.

0 AFB Lemma 88.60.3. The canonical map $\mathcal{X}(S) \rightarrow \lim \mathcal{X}\left(S_{n}\right)$ is not essentially surjective.
Sketch of proof. Unwinding definitions, it is enough to check that $H^{1}\left(X, A_{0}\right) \rightarrow$ $\lim H^{1}\left(X_{n}, A_{0}\right)$ is not surjective. As $X$ is regular and projective, by Lemmas 88.60.2 and 88.60.1 each $A_{0}$-torsor over $X$ is torsion. In particular, the group $H^{1}\left(X, A_{0}\right)$ is torsion. It is thus enough to show: (a) the group $H^{1}\left(X_{0}, A_{0}\right)$ is non-torsion, and (b) the maps $H^{1}\left(X_{n+1}, A_{0}\right) \rightarrow H^{1}\left(X_{n}, A_{0}\right)$ are surjective for all $n$.

Ad (a). One constructs a nontorsion $A_{0}$-torsor $P_{0}$ on the nodal curve $X_{0}$ by glueing trivial $A_{0}$-torsors on each component of $X_{0}$ using non-torsion points on $A_{0}$ as the isomorphisms over the nodes. More precisely, let $x \in X_{0}$ be a node which occurs in a loop consisting of rational curves. Let $X_{0}^{\prime} \rightarrow X_{0}$ be the normalization of $X_{0}$ in $X_{0} \backslash\{x\}$. Let $x^{\prime}, x^{\prime \prime} \in X_{0}^{\prime}$ be the two points mapping to $x_{0}$. Then we take
$A_{0} \times_{\text {Spec }(k)} X_{0}^{\prime}$ and we identify $A_{0} \times x^{\prime}$ with $A_{0} \times\left\{x^{\prime \prime}\right\}$ using translation $A_{0} \rightarrow A_{0}$ by a nontorsion point $a_{0} \in A_{0}(k)$ (there is such a nontorsion point as $k$ is algebraically closed and not the algebraic closure of a finite field - this is actually not trivial to prove). One can show that the glueing is an algebraic space (in fact one can show it is a scheme) and that it is an nontorsion $A_{0}$-torsor over $X_{0}$. The reason that it is nontorsion is that if $[n]\left(P_{0}\right)$ has a section, then that section produces a morphism $s: X_{0}^{\prime} \rightarrow A_{0}$ such that $[n]\left(a_{0}\right)=s\left(x^{\prime}\right)-s\left(x^{\prime \prime}\right)$ in the group law on $A_{0}(k)$. However, since the irreducible components of the loop are rational to section $s$ is constant on them ( More on Groupoids in Spaces, Lemma 66.9.3). Hence $s\left(x^{\prime}\right)=s\left(x^{\prime \prime}\right)$ and we obtain a contradiction.

Ad (b). Deformation theory shows that the obstruction to deforming an $A_{0}$-torsor $P_{n} \rightarrow X_{n}$ to an $A_{0}$-torsor $P_{n+1} \rightarrow X_{n+1}$ lies in $H^{2}\left(X_{0}, \omega\right)$ for a suitable vector bundle $\omega$ on $X_{0}$. The latter vanishes as $X_{0}$ is a curve, proving the claim.

0AFC Proposition 88.60.4. The stack $\left.\mathcal{X}=\underline{\operatorname{Mor}}_{S}(X,[S / A])\right)$ is not algebraic.
Proof. See discussion above.
0AFD Remark 88.60.5. Proposition 88.60 .4 contradicts Aok06b, Theorem 1.1]. The problem is the non-effectivity of formal objects for $\operatorname{Mor}_{S}(X,[S / A])$. The same problem is mentioned in the Erratum Aok06a to Aok06b. Unfortunately, the Erratum goes on the assert that $\operatorname{Mor}_{S}(\mathcal{Y}, \mathcal{Z})$ is algebraic if $\mathcal{Z}$ is separated, which also contradicts Proposition 88.60.4 as $[S / A]$ is separated.

### 88.61. A counter example to Grothendieck's existence theorem

0 ARE Let $k$ be a field and let $A=k[[t]]$. Let $X$ be the glueing of $U=\operatorname{Spec}(A[x])$ and $V=\operatorname{Spec}(A[y])$ by the identification

$$
U \backslash\left\{0_{U}\right\} \longrightarrow V \backslash\left\{0_{V}\right\}
$$

sending $x$ to $y$ where $0_{U} \in U$ and $O_{V} \in V$ are the points corresponding to the maximal ideals $(x, t)$ and $(y, t)$. Set $A_{n}=A /\left(t^{n}\right)$ and set $X_{n}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A_{n}\right)$. Let $\mathcal{F}_{n}$ be the coherent sheaf on $X_{n}$ corresponding to the $A_{n}[x]$-module $A_{n}[x] /(x) \cong$ $A_{n}$ and the $A_{n}[y]$ module 0 with obviuous glueing. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the sheaf of ideals generate by $t$. Then $\left(\mathcal{F}_{n}\right)$ is an object of the category $C o h_{\text {support proper over }} A(X, \mathcal{I})$ defined in Cohomology of Schemes, Section 29.22 On the other hand, this object is not in the image of the functor Cohomology of Schemes, Equation 29.23.6.1. Namely, if it where there would be a finite $A[x]$-module $M$, a finite $A[y]$-module $N$ and an isomorphism $M[1 / t] \cong N[1 / t]$ such that $M / t^{n} M \cong A_{n}[x] /(x)$ and $N / t^{n} N=$ 0 for all $n$. It is easy to see that this is impossible.

0ARF Lemma 88.61.1. Counter examples to algebraization of coherent sheaves.
(1) Grothendieck's existence theorem as stated in Cohomology of Schemes, Theorem 29.23.7 is false if we drop the assumption that $X \rightarrow \operatorname{Spec}(A)$ is separated.
(2) The stack of coherent sheaves $\operatorname{Coh}_{X / B}$ of Quot, Theorems 81.6.5 and 81.5.12 is in general not algebraic if we drop the assumption that $X \rightarrow S$ is separated
(3) The functor Quot $\mathcal{F} / X / B$ of Quot, Proposition 81.9 .3 is not an algebraic space in general if we drop the assumption that $X \rightarrow B$ is separated.

Proof. Part (1) we saw above. This shows that $\operatorname{Coh}_{X / A}$ fails axiom [4] of Artin's Axioms, Section 80.12. Hence it cannot be an algebraic stack by Artin's Axioms, Lemma 80.9.4. In this way we see that (2) is true. To see (3), note that there are compatible surjections $\mathcal{O}_{X_{n}} \rightarrow \mathcal{F}_{n}$ for all $n$. Thus we see that Quot $_{\mathcal{O}_{X} / X / A}$ fails axiom [4] and we see that (3) is true as before.

### 88.62. Affine formal algebraic spaces

0 ANY Let $K$ be a field and let $\left(V_{i}\right)_{i \in I}$ be a directed inverse system of nonzero vector spaces over $K$ with surjective transition maps and with $\lim V_{i}=0$, see Section 88.3. Let $R_{i}=K \oplus V_{i}$ as $K$-algebra where $V_{i}$ is an ideal of square zero. Then $R_{i}$ is an inverse system of $K$-algebras with surjective transition maps with nilpotent kernels and with $\lim R_{i}=K$. The affine formal algebraic space $X=\operatorname{colim} \operatorname{Spec}\left(R_{i}\right)$ is an example of an affine formal algebraic space which is not McQuillan.
Let $0 \rightarrow W_{i} \rightarrow V_{i} \rightarrow K \rightarrow 0$ be a system of exact sequences as in Section 88.3. Let $A_{i}=K\left[V_{i}\right] /\left(w w^{\prime} ; w, w^{\prime} \in W_{i}\right)$. Then there is a compatible system of surjections $A_{i} \rightarrow K[t]$ with nilpotent kernels and the transition maps $A_{i} \rightarrow A_{j}$ are surjective with nilpotent kernels as well. Recall that $V_{i}$ is free over $K$ with basis given by $s \in S_{i}$. Then, if the characteristic of $K$ is zero, the degree $d$ part of $A_{i}$ is free over $K$ with basis given by $s^{d}, s \in S_{i}$ each of which map to $t^{d}$. Hence the inverse system of the degree $d$ parts of the $A_{i}$ is isomorphic to the inverse system of the vector spaces $V_{i}$. As $\lim V_{i}=0$ we conclude that $\lim A_{i}=K$, at least when the characteristic of $K$ is zero. This gives an example of a affine formal algebraic space whose "regular functions" do not separate points.

### 88.63. Flat maps are not directed limits of finitely presented flat maps

0ATE The goal of this section is to give an example of a flat ring map which is not a filtered colimit of flat and finitely presented ring maps. In Gab96 it is shown that if $A$ is a nonexcellent local ring of dimension 1 and residue characteristic zero, then the (flat) ring map $A \rightarrow A^{\wedge}$ to its completion is not a filtered colimit of finite type flat ring maps. The example in this section will have a source which is an excellent ring. We encourage the reader to submit other examples; please email stacks.project@gmail.com if you have one.
For the construction, fix a prime $p$, and let $A=\mathbf{F}_{p}\left[x_{1}, \ldots, x_{n}\right]$. Choose an absolute integral closure $A^{+}$of $A$, i.e., $A^{+}$is the integral closure of $A$ in an algebraic closure of its fraction field. In HH92, §6.7] it is shown that $A \rightarrow A^{+}$is flat.

We claim that the $A$-algebra $A^{+}$is not a filtered colimit of finitely presented flat $A$-algebras if $n \geq 3$.
We sketch the argument in the case $n=3$, and we leave the generalization to higher $n$ to the reader. It is enough to prove the analogous statement for the map $R \rightarrow R^{+}$, where $R$ is the strict henselization of $A$ at the origin and $R^{+}$is its absolute integral closure. Observe that $R$ is a henselian regular local ring whose residue field $k$ is an algebraic closure of $\mathbf{F}_{p}$.
Choose an ordinary abelian surface $X$ over $k$ and a very ample line bundle $L$ on $X$. The section ring $\Gamma_{*}(X, L)=\bigoplus_{n} H^{0}\left(X, L^{n}\right)$ is the coordinate ring of the affine cone over $X$ with respect to $L$. It is a normal ring for $L$ sufficiently positive. Let $S$ denote the henselization of $\Gamma_{*}(X, L)$ at vertex of the cone. Then $S$ is a
henselian noetherian normal domain of dimension 3 . We obtain a finite injective map $R \rightarrow S$ as the henselization of a Noether normalization for the finite type $k$-algebra $\Gamma_{*}(X, L)$. As $R^{+}$is an absolute integral closure of $R$, we can also fix an embedding $S \rightarrow R^{+}$. Thus $R^{+}$is also the absolute integral closure of $S$. To show $R^{+}$is not a filtered colimit of flat $R$-algebras, it suffices to show:
(1) If there exists a factorization $S \rightarrow P \rightarrow R^{+}$with $P$ flat and finite type over $R$, then there exists a factorization $S \rightarrow T \rightarrow R^{+}$with $T$ finite flat over $R$.
(2) For any factorization $S \rightarrow T \rightarrow R^{+}$with $S \rightarrow T$ finite, the ring $T$ is not $R$-flat.
Indeed, since $S$ is finitely presented over $R$, if one could write $R^{+}=\operatorname{colim}_{i} P_{i}$ as a filtered colimit of finitely presented flat $R$-algebras $P_{i}$, then $S \rightarrow R^{+}$would factor as $S \rightarrow P_{i} \rightarrow R^{+}$for $i \gg 0$, which contradicts the above pair of assertions. Assertion (1) follows from the fact that $R$ is henselian and a slicing argument, see More on Morphisms, Lemma 36.18.5 Part (2) was proven in Bha12; for the convenience of the reader, we recall the argument.
Let $U \subset \operatorname{Spec}(S)$ be the punctured spectrum, so there are natural maps $X \leftarrow$ $U \subset \operatorname{Spec}(S)$. The first map gives an identification $H^{1}\left(U, \mathcal{O}_{U}\right) \simeq H^{1}\left(X, \mathcal{O}_{X}\right)$. By passing to the Witt vectors of the perfection and using the Artin-Schreier sequence ${ }^{4}$, this gives an identification $H_{\text {étale }}^{1}\left(U, \mathbf{Z}_{p}\right) \simeq H_{\text {étale }}^{1}\left(X, \mathbf{Z}_{p}\right)$. In particular, this group is a finite free $\mathbf{Z}_{p}$-module of rank 2 (since $X$ is ordinary). To get a contradiction assume there exists an $R$-flat $T$ as in (2) above. Let $V \subset \operatorname{Spec}(T)$ denote the preimage of $U$, and write $f: V \rightarrow U$ for the induced finite surjective map. Since $U$ is normal, there is a trace $\operatorname{map} f_{*} \mathbf{Z}_{p} \rightarrow \mathbf{Z}_{p}$ on $U_{\text {étale }}$ whose composition with the pullback $\mathbf{Z}_{p} \rightarrow f_{*} \mathbf{Z}_{p}$ is multiplication by $d=\operatorname{deg}(f)$. Passing to cohomology, and using that $H_{\text {étale }}^{1}\left(U, \mathbf{Z}_{p}\right)$ is nontorsion, then shows that $H_{\text {étale }}^{1}\left(V, \mathbf{Z}_{p}\right)$ is nonzero. Since $H_{\text {étale }}^{1}\left(V, \mathbf{Z}_{p}\right) \simeq \lim H_{\text {étale }}^{1}\left(V, \mathbf{Z} / p^{n}\right)$ as there is no $R^{1} \lim$ interference, the group $H^{1}\left(V_{\text {étale }}, \mathbf{Z} / p\right)$ must be non-zero. Since $T$ is $R$-flat we have $\Gamma\left(V, \mathcal{O}_{V}\right)=T$ which is strictly henselian and the Artin-Schreier sequence shows $H^{1}\left(V, \mathcal{O}_{V}\right) \neq 0$. This is equivalent to $H_{\mathfrak{m}}^{2}(T) \neq 0$, where $\mathfrak{m} \subset R$ is the maximal ideal. Thus, we obtain a contradiction since $T$ is finite flat (i.e., finite free) as an $R$-module and $H_{\mathfrak{m}}^{2}(R)=0$. This contradiction proves (2).
0ATF Lemma 88.63.1. There exists a commutative ring $A$ and a flat $A$-algebra $B$ which cannot be written as a filtered colimit of finitely presented flat A-algebras. In fact, we may either choose $A$ to be a finite type $\mathbf{F}_{p}$-algebra or a 1-dimensional Noetherian local ring with residue field of characteristic 0 .
Proof. See discussion above.

### 88.64. The category of modules modulo torsion modules

0B0J The category of torsion groups is a Serre subcategory (Homology, Definition 12.9.1) of the category of all abelian groups. More generally, for any ring $A$, the category of torsion $A$-modules is a Serre subcategory of the category of all $A$-modules, see More on Algebra, Section 15.44. If $A$ is a domain, then the quotient category (Homology, Lemma 12.9.6 is equivalent to the category of vector spaces over the fraction field.

[^228]0B0K Proposition 88.64.1. Let $A$ be an integral domain. Let $K$ denote its field of fractions. Let Mod $_{A}$ denote the category of $A$-modules and $\mathcal{T}$ its Serre subcategory of torsion modules. Let Vect ${ }_{K}$ denote the category of $K$-vector spaces. Then there is a canonical equivalence $\operatorname{Mod}_{A} / \mathcal{T} \rightarrow \operatorname{Vect}_{K}$.

Proof. The functor $\operatorname{Mod}_{A} \rightarrow$ Vect $_{K}$ given by $M \mapsto M \otimes_{A} K$ is exact (by Algebra, Proposition 10.9.12 and maps torsion modules to zero. Thus, by the universal property given in Homology, Lemma 12.9.6, the functor descends to a functor $\operatorname{Mod}_{A} / \mathcal{T} \rightarrow$ Vect $_{K}$.
Conversely, any $A$-module $M$ with $M \otimes_{A} K=0$ is torsion, since $M \otimes_{A} K \cong M\left[S^{-1}\right]$, where $S \subset A$ is the set of regular elements (Algebra, Lemma 10.11.15). Thus Homology, Lemma 12.9 .7 shows that the functor $\operatorname{Mod}_{A} / \mathcal{T} \rightarrow$ Vect $_{K}$ is faithful.
Furthermore, this embedding is essentially surjective: a preimage to $K^{(I)}$ is $A^{(I)}$. To show that the embedding is full, we only have to show that it is full for free modules, since any object in $\operatorname{Mod}_{A} / \mathcal{T}$ is the cokernel of a morphism between free modules.
Thus let a $K$-linear map $K^{(I)} \rightarrow K^{(J)}$ be given. We can decompose this map into a scaling map $K^{(I)} \rightarrow K^{(I)}, e_{i} \mapsto d_{i}^{-1} e_{i}\left(d_{i} \in A\right)$, followed by a map $K^{(I)} \rightarrow K^{(J)}$ whose (possibly infinite) matrix has all entries in $A$. It is then obvious that the second map is induced by an $A$-linear map $A^{(I)} \rightarrow A^{(J)}$. The scaling map possesses a preimage in $\operatorname{Mod}_{A} / \mathcal{T}$ as well, for it is the inverse to the map $A^{(I)} \rightarrow A^{(I)}, e_{i} \mapsto d_{i}$, in $\operatorname{Mod}_{A} / \mathcal{T}$. This map is indeed invertible in $\operatorname{Mod}_{A} / \mathcal{T}$, since its kernel is zero (even before passing to the quotient) and its cokernel is a torsion module.

0B0L Proposition 88.64.2. Let $A$ be a Noetherian integral domain. Let $K$ denote its field of fractions. Let $\operatorname{Mod}_{A}^{f g}$ denote the category of finitely generated $A$-modules and $\mathcal{T}^{f g}$ its Serre subcategory of finitely generated torsion modules. Then $\operatorname{Mod}_{A}^{f g} / \mathcal{T}^{f g}$ is canonically equivalent to the category of finite dimensional $K$-vector spaces.

Proof. The equivalence given in Proposition 88.64.1 restricts along the embedding $\operatorname{Mod}_{A}^{f g} / \mathcal{T}^{f g} \rightarrow \operatorname{Mod}_{A} / \mathcal{T}$ to an equivalence $\operatorname{Mod}_{A}^{f g} / \mathcal{T}{ }^{f g} \rightarrow \operatorname{Vect}_{K}^{f d}$. The Noetherian assumption guarantees that $\operatorname{Mod}_{A}^{f g}$ is an abelian category (see More on Algebra, Section 15.44) and that the canonical functor $\operatorname{Mod}_{A}^{f g} / \mathcal{T}^{f g} \rightarrow \operatorname{Mod}_{A} / \mathcal{T}$ is full (else torsion submodules of finitely generated modules might not be objects of $\mathcal{T}^{f g}$ ).

0B0M Proposition 88.64.3. The quotient of the category of abelian groups modulo its Serre subcategory of torsion groups is the category of $\mathbf{Q}$-vector spaces.

Proof. The claim follows directly from Proposition 88.64.1.

### 88.65. Different colimit topologies

0B2Y This example is TSH98, Example 1.2, page 553]. Let $G_{n}=\mathbf{Q} \times \mathbf{R}^{n}, n \geq 1$ seen as a topological group for addition endowed with the usual (Euclidean) topology. Consider the closed embeddings $G_{n} \rightarrow G_{n+1}$ mapping $\left(x_{0}, \ldots, x_{n}\right)$ to $\left(x_{0}, \ldots, x_{n}, 0\right)$. We claim that $G=\operatorname{colim} G_{n}$ endowed with the topology

$$
U \subset G \text { open } \Leftrightarrow G_{n} \cap U \text { open } \forall n
$$

is not a topological group.

To see this we consider the set

$$
U=\left\{\left(x_{0}, x_{1}, x_{2}, \ldots\right) \text { such that }\left|x_{j}\right|<\left|\cos \left(j x_{0}\right)\right| \text { for } j>0\right\}
$$

Using that $j x_{0}$ is never an integral multiple of $\pi / 2$ as $\pi$ is not rational it is easy to show that $U \cap G_{n}$ is open. Since $0 \in U$, if the topology above made $G$ into a topological group, then there would be an open neighbourhood $V \subset G$ of 0 such that $V+v \subset U$. Then, for every $j \geq 0$ there would exist $\epsilon_{j}>0$ such that $\left(0, \ldots, 0, x_{j}, 0, \ldots\right) \in V$ for $\left|x_{j}\right|<\epsilon_{j}$. Since $V+V \subset U$ we would have

$$
\left(x_{0}, 0, \ldots, 0, x_{j}, 0, \ldots\right) \in U
$$

for $\left|x_{0}\right|<\epsilon_{0}$ and $\left|x_{j}\right|<\epsilon_{j}$. However, if we take $j$ large enough such that $j \epsilon_{0}>\pi / 2$, then we can choose $x_{0} \in \mathbf{Q}$ such that $\left|\cos \left(j x_{0}\right)\right|$ is smaller than $\epsilon_{j}$, hence there exists an $x_{j}$ with $\left|\cos \left(j x_{0}\right)\right|<\left|x_{j}\right|<\epsilon_{j}$. This contradiction proves the claim.
0B2Z Lemma 88.65.1. There exists a system $G_{1} \rightarrow G_{2} \rightarrow G_{3} \rightarrow \ldots$ of (abelian) topological groups such that colim $G_{n}$ taken in the category of topological spaces is different from colim $G_{n}$ taken in the category of topological groups.
Proof. See discussion above.

## CHAPTER 89

## Exercises

### 89.1. Algebra

0276 This first section just contains some assorted questions.
02CG Exercise 89.1.1. Let $A$ be a ring, and $\mathfrak{m}$ a maximal ideal. In $A[X]$ let $\tilde{\mathfrak{m}}_{1}=(\mathfrak{m}, X)$ and $\tilde{\mathfrak{m}}_{2}=(\mathfrak{m}, X-1)$. Show that

$$
A[X]_{\tilde{\mathfrak{m}}_{1}} \cong A[X]_{\tilde{\mathfrak{m}}_{2}}
$$

02CH Exercise 89.1.2. Find an example of a non Noetherian ring $R$ such that every finitely generated ideal of $R$ is finitely presented as an $R$-module. (A ring is said to be coherent if the last property holds.)

02CI Exercise 89.1.3. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring. For any finite $A$-module $M$ define $r(M)$ to be the minimum number of generators of $M$ as an $A$-module. This number equals $\operatorname{dim}_{k} M / \mathfrak{m} M=\operatorname{dim}_{k} M \otimes_{A} k$ by NAK.
(1) Show that $r\left(M \otimes_{A} N\right)=r(M) r(N)$.
(2) Let $I \subset A$ be an ideal with $r(I)>1$. Show that $r\left(I^{2}\right)<r(I)^{2}$.
(3) Conclude that if every ideal in $A$ is a flat module, then $A$ is a PID (or a field).

02CJ Exercise 89.1.4. Let $k$ be a field. Show that the following pairs of $k$-algebras are not isomorphic:
(1) $k\left[x_{1}, \ldots, x_{n}\right]$ and $k\left[x_{1}, \ldots, x_{n+1}\right]$ for any $n \geq 1$.
(2) $k[a, b, c, d, e, f] /(a b+c d+e f)$ and $k\left[x_{1}, \ldots, x_{n}\right]$ for $n=5$.
(3) $k[a, b, c, d, e, f] /(a b+c d+e f)$ and $k\left[x_{1}, \ldots, x_{n}\right]$ for $n=6$.

02CK
Remark 89.1.5. Of course the idea of this exercise is to find a simple argument in each case rather than applying a "big" theorem. Nonetheless it is good to be guided by general principles.

02CL Exercise 89.1.6. Algebra. (Silly and should be easy.)
(1) Give an example of a ring $A$ and a nonsplit short exact sequence of $A$ modules

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

(2) Give an example of a nonsplit sequence of $A$-modules as above and a faithfully flat $A \rightarrow B$ such that

$$
0 \rightarrow M_{1} \otimes_{A} B \rightarrow M_{2} \otimes_{A} B \rightarrow M_{3} \otimes_{A} B \rightarrow 0
$$

is split as a sequence of $B$-modules.

02CM Exercise 89.1.7. Suppose that $k$ is a field having a primitive $n$th root of unity $\zeta$. This means that $\zeta^{n}=1$, but $\zeta^{m} \neq 1$ for $0<m<n$.
(1) Show that the characteristic of $k$ is prime to $n$.
(2) Suppose that $a \in k$ is an element of $k$ which is not an $d$ th power in $k$ for any divisor $d$ of $n$, in $\geq d>1$. Show that $k[x] /\left(x^{n}-a\right)$ is a field. (Hint: Consider a splitting field for $x^{n}-a$ and use Galois theory.)
02CN Exercise 89.1.8. Let $\nu: k[x] \backslash\{0\} \rightarrow \mathbf{Z}$ be a map with the following properties: $\nu(f g)=\nu(f)+\nu(g)$ whenever $f, g$ not zero, and $\nu(f+g) \geq \min (\nu(f), \nu(g))$ whenever $f, g, f+g$ are not zero, and $\nu(c)=0$ for all $c \in k^{*}$.
(1) Show that if $f, g$, and $f+g$ are nonzero and $\nu(f) \neq \nu(g)$ then we have equality $\nu(f+g)=\min (\nu(f), \nu(g))$.
(2) Show that if $f=\sum a_{i} x^{i}, f \neq 0$, then $\nu(f) \geq \min \left(\{i \nu(x)\}_{a_{i} \neq 0}\right)$. When does equality hold?
(3) Show that if $\nu$ attains a negative value then $\nu(f)=-n \operatorname{deg}(f)$ for some $n \in \mathbf{N}$.
(4) Suppose $\nu(x) \geq 0$. Show that $\{f \mid f=0$, or $\nu(f)>0\}$ is a prime ideal of $k[x]$.
(5) Describe all possible $\nu$.

Let $A$ be a ring. An idempotent is an element $e \in A$ such that $e^{2}=e$. The elements 1 and 0 are always idempotent. A nontrivial idempotent is an idempotent which is not equal to zero. Two idempotents $e, e^{\prime} \in A$ are called orthogonal if $e e^{\prime}=0$.
078G Exercise 89.1.9. Let $A$ be a ring. Show that $A$ is a product of two nonzero rings if and only if $A$ has a nontrivial idempotent.
078H Exercise 89.1.10. Let $A$ be a ring and let $I \subset A$ be a locally nilpotent ideal. Show that the map $A \rightarrow A / I$ induces a bijection on idempotents. (Hint: It may be easier to prove this when $I$ is nilpotent. Do this first. Then use "absolute Noetherian reduction" to reduce to the nilpotent case.)

### 89.2. Colimits

0277
078I Definition 89.2.1. A directed partially ordered set is a nonempty set $I$ endowed with a partial ordering $\leq$ such that given any pair $i, j \in I$ there exists a $k \in I$ such that $i \leq k$ and $j \leq k$. A system of rings over $I$ is given by a ring $A_{i}$ for each $i \in I$ and a map of rings $\varphi_{i j}: A_{i} \rightarrow A_{j}$ whenever $i \leq j$ such that the composition $A_{i} \rightarrow A_{j} \rightarrow A_{k}$ is equal to $A_{i} \rightarrow A_{k}$ whenever $i \leq j \leq k$.

One similarly defines systems of groups, modules over a fixed ring, vector spaces over a field, etc.

078J Exercise 89.2.2. Let $I$ be a directed partially ordered set and let $\left(A_{i}, \varphi_{i j}\right)$ be a system of rings over $I$. Show that there exists a ring $A$ and maps $\varphi_{i}: A_{i} \rightarrow A$ such that $\varphi_{j} \circ \varphi_{i j}=\varphi_{i}$ for all $i \leq j$ with the following universal property: Given any ring $B$ and maps $\psi_{i}: A_{i} \rightarrow B$ such that $\psi_{j} \circ \varphi_{i j}=\psi_{i}$ for all $i \leq j$, then there exists a unique ring map $\psi: A \rightarrow B$ such that $\psi_{i}=\psi \circ \varphi_{i}$.
078K Definition 89.2.3. The ring $A$ constructed in Exercise 89.2 .2 is called the colimit of the system. Notation colim $A_{i}$.

078L Exercise 89.2.4. Let $(I, \geq)$ be a directed partially ordered set and let $\left(A_{i}, \varphi_{i j}\right)$ be a system of rings over $I$ with colimit $A$. Prove that there is a bijection

$$
\operatorname{Spec}(A)=\left\{\left(\mathfrak{p}_{i}\right)_{i \in I} \mid \mathfrak{p}_{i} \subset A_{i} \text { and } \mathfrak{p}_{i}=\varphi_{i j}^{-1}\left(\mathfrak{p}_{j}\right) \forall i \leq j\right\} \subset \prod_{i \in I} \operatorname{Spec}\left(A_{i}\right)
$$

The set on the right hand side is the limit of the sets $\operatorname{Spec}\left(A_{i}\right)$. Notation lim $\operatorname{Spec}\left(A_{i}\right)$.
078 M Exercise 89.2.5. Let $(I, \geq)$ be a directed partially ordered set and let $\left(A_{i}, \varphi_{i j}\right)$ be a system of rings over $I$ with colimit $A$. Suppose that $\operatorname{Spec}\left(A_{j}\right) \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is surjective for all $i \leq j$. Show that $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is surjective for all $i$. (Hint: You can try to use Tychonoff, but there is also a basically trivial direct algebraic proof based on Algebra, Lemma 10.16.9.)
078N Exercise 89.2.6. Let $A \subset B$ be an integral ring extension. Prove that $\operatorname{Spec}(B) \rightarrow$ $\operatorname{Spec}(A)$ is surjective. Use the exercises above, the fact that this holds for a finite ring extension (proved in the lectures), and by proving that $B=\operatorname{colim} B_{i}$ is a directed colimit of finite extensions $A \subset B_{i}$.

02CO Exercise 89.2.7. Let $(I, \geq)$ be a partially ordered set which is directed. Let $A$ be a ring and let $\left(N_{i}, \varphi_{i, i^{\prime}}\right)$ be a directed system of $A$-modules indexed by $I$. Suppose that $M$ is another $A$-module. Prove that

$$
\operatorname{colim}_{i \in I} M \otimes_{A} N_{i} \cong M \otimes_{A}\left(\operatorname{colim}_{i \in I} N_{i}\right)
$$

0278 Definition 89.2.8. A module $M$ over $R$ is said to be of finite presentation over $R$ if it is isomorphic to the cokernel of a map of finite free modules $R^{\oplus n} \rightarrow R^{\oplus m}$.

02CP Exercise 89.2.9. Prove that any module over any ring is
(1) the colimit of its finitely generated submodules, and
(2) in some way a colimit of finitely presented modules.

### 89.3. Additive and abelian categories

057Y Exercise 89.3.1. Let $k$ be a field. Let $\mathcal{C}$ be the category of filtered vector spaces over $k$, see Homology, Definition 12.16.1 for the definition of a filtered object of any category.
(1) Show that this is an additive category (explain carefuly what the direct sum of two objects is).
(2) Let $f:(V, F) \rightarrow(W, F)$ be a morphism of $\mathcal{C}$. Show that $f$ has a kernel and cokernel (explain precisely what the kernel and cokernel of $f$ are).
(3) Give an example of a map of $\mathcal{C}$ such that the canonical map $\operatorname{Coim}(f) \rightarrow$ $\operatorname{Im}(f)$ is not an isomorphism.

057Z Exercise 89.3.2. Let $R$ be a Noetherian domain. Let $\mathcal{C}$ be the category of finitely generated torsion free $R$-modules.
(1) Show that this is an additive category.
(2) Let $f: N \rightarrow M$ be a morphism of $\mathcal{C}$. Show that $f$ has a kernel and cokernel (make sure you define precisely what the kernel and cokernel of $f$ are).
(3) Give an example of a Noetherian domain $R$ and a map of $\mathcal{C}$ such that the canonical map $\operatorname{Coim}(f) \rightarrow \operatorname{Im}(f)$ is not an isomorphism.

0580 Exercise 89.3.3. Give an example of a category which is additive and has kernels and cokernels but which is not as in Exercises 89.3.1 and 89.3.2

### 89.4. Flat ring maps

0279
02CQ Exercise 89.4.1. Let $S$ be a multiplicative subset of the ring $A$.
(1) For an $A$-module $M$ show that $S^{-1} M=S^{-1} A \otimes_{A} M$.
(2) Show that $S^{-1} A$ is flat over $A$.

02CR Exercise 89.4.2. Find an injection $M_{1} \rightarrow M_{2}$ of $A$-modules such that $M_{1} \otimes N \rightarrow$ $M_{2} \otimes N$ is not injective in the following cases:
(1) $A=k[x, y]$ and $N=(x, y) \subset A$. (Here and below $k$ is a field.)
(2) $A=k[x, y]$ and $N=A /(x, y)$.

02CS Exercise 89.4.3. Give an example of a ring $A$ and a finite $A$-module $M$ which is a flat but not a projective $A$-module.

02CT Remark 89.4.4. If $M$ is of finite presentation and flat over $A$, then $M$ is projective over $A$. Thus your example will have to involve a ring $A$ which is not Noetherian. I know of an example where $A$ is the ring of $\mathcal{C}^{\infty}$-functions on $\mathbf{R}$.

02CU Exercise 89.4.5. Find a flat but not free module over $\mathbf{Z}_{(2)}$.
02CV Exercise 89.4.6. Flat deformations.
(1) Suppose that $k$ is a field and $k[\epsilon]$ is the ring of dual numbers $k[\epsilon]=$ $k[x] /\left(x^{2}\right)$ and $\epsilon=\bar{x}$. Show that for any $k$-algebra $A$ there is a flat $k[\epsilon]-$ algebra $B$ such that $A$ is isomorphic to $B / \epsilon B$.
(2) Suppose that $k=\mathbf{F}_{p}=\mathbf{Z} / p \mathbf{Z}$ and

$$
A=k\left[x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}\right] /\left(x_{1}^{p}, x_{2}^{p}, x_{3}^{p}, x_{4}^{p}, x_{5}^{p}, x_{6}^{p}\right)
$$

Show that there exists a flat $\mathbf{Z} / p^{2} \mathbf{Z}$-algebra $B$ such that $B / p B$ is isomorphic to $A$. (So here $p$ plays the role of $\epsilon$.)
(3) Now let $p=2$ and consider the same question for $k=\mathbf{F}_{2}=\mathbf{Z} / 2 \mathbf{Z}$ and

$$
A=k\left[x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}\right] /\left(x_{1}^{2}, x_{2}^{2}, x_{3}^{2}, x_{4}^{2}, x_{5}^{2}, x_{6}^{2}, x_{1} x_{2}+x_{3} x_{4}+x_{5} x_{6}\right)
$$

However, in this case show that there does not exist a flat $\mathbf{Z} / 4 \mathbf{Z}$-algebra $B$ such that $B / 2 B$ is isomorphic to $A$. (Find the trick! The same example works in arbitrary characteristic $p>0$, except that the computation is more difficult.)

02CW Exercise 89.4.7. Let $(A, \mathfrak{m}, k)$ be a local ring and let $k \subset k^{\prime}$ be a finite field extension. Show there exists a flat, local map of local rings $A \rightarrow B$ such that $\mathfrak{m}_{B}=\mathfrak{m} B$ and $B / \mathfrak{m} B$ is isomorphic to $k^{\prime}$ as $k$-algebra. (Hint: first do the case where $k \subset k^{\prime}$ is generated by a single element.)

02CX Remark 89.4.8. The same result holds for arbitrary field extensions $k \subset K$.

### 89.5. The Spectrum of a ring

027A
02CY
Exercise 89.5.1. Compute $\operatorname{Spec}(\mathbf{Z})$ as a set and describe its topology.
02 CZ Exercise 89.5.2. Let $A$ be any ring. For $f \in A$ we define $D(f):=\{\mathfrak{p} \subset A \mid f \notin \mathfrak{p}\}$. Prove that the open subsets $D(f)$ form a basis of the topology of $\operatorname{Spec}(A)$.

02D0 Exercise 89.5.3. Prove that the map $I \mapsto V(I)$ defines a natural bijection

$$
\{I \subset A \text { with } I=\sqrt{I}\} \longrightarrow\{T \subset \operatorname{Spec}(A) \text { closed }\}
$$

027B Definition 89.5.4. A topological space $X$ is called quasi-compact if for any open covering $X=\bigcup_{i \in I} U_{i}$ there is a finite subset $\left\{i_{1}, \ldots, i_{n}\right\} \subset I$ such that $X=$ $U_{i_{1}} \cup \ldots U_{i_{n}}$.

02D1 Exercise 89.5.5. Prove that $\operatorname{Spec}(A)$ is quasi-compact for any ring $A$.
027C Definition 89.5.6. A topological space $X$ is said to verify the separation axiom $T_{0}$ if for any pair of points $x, y \in X, x \neq y$ there is an open subset of $X$ containing one but not the other. We say that $X$ is Hausdorff if for any pair $x, y \in X, x \neq y$ there are disjoint open subsets $U, V$ such that $x \in U$ and $y \in V$.

02D2 Exercise 89.5.7. Show that $\operatorname{Spec}(A)$ is not Hausdorff in general. Prove that $\operatorname{Spec}(A)$ is $T_{0}$. Give an example of a topological space $X$ that is not $T_{0}$.

02D3 Remark 89.5.8. Usually the word compact is reserved for quasi-compact and Hausdorff spaces.

027D Definition 89.5.9. A topological space $X$ is called irreducible if $X$ is not empty and if $X=Z_{1} \cup Z_{2}$ with $Z_{1}, Z_{2} \subset X$ closed, then either $Z_{1}=X$ or $Z_{2}=X$. A subset $T \subset X$ of a topological space is called irreducible if it is an irreducible topological space with the topology induced from $X$. This definition implies $T$ is irreducible if and only if the closure $\bar{T}$ of $T$ in $X$ is irreducible.

02D4 Exercise 89.5.10. Prove that $\operatorname{Spec}(A)$ is irreducible if and only if $\operatorname{Nil}(A)$ is a prime ideal and that in this case it is the unique minimal prime ideal of $A$.

02D5 Exercise 89.5.11. Prove that a closed subset $T \subset \operatorname{Spec}(A)$ is irreducible if and only if it is of the form $T=V(\mathfrak{p})$ for some prime ideal $\mathfrak{p} \subset A$.
027E Definition 89.5.12. A point $x$ of an irreducible topological space $X$ is called a generic point of $X$ if $X$ is equal to the closure of the subset $\{x\}$.

02D6 Exercise 89.5.13. Show that in a $T_{0}$ space $X$ every irreducible closed subset has at most one generic point.

02D7 Exercise 89.5.14. Prove that in $\operatorname{Spec}(A)$ every irreducible closed subset does have a generic point. In fact show that the map $\mathfrak{p} \mapsto \overline{\{\mathfrak{p}\}}$ is a bijection of $\operatorname{Spec}(A)$ with the set of irreducible closed subsets of $X$.

02D8 Exercise 89.5.15. Give an example to show that an irreducible subset of $\operatorname{Spec}(\mathbf{Z})$ does not neccesarily have a generic point.
027F Definition 89.5.16. A topological space $X$ is called Noetherian if any decreasing sequence $Z_{1} \supset Z_{2} \supset Z_{3} \supset \ldots$ of closed subsets of $X$ stabilizes. (It is called Artinian if any increasing sequence of closed subsets stabilizes.)

02D9 Exercise 89.5.17. Show that if the ring $A$ is Noetherian then the topological space $\operatorname{Spec}(A)$ is Noetherian. Give an example to show that the converse is false. (The same for Artinian if you like.)

027G Definition 89.5.18. A maximal irreducible subset $T \subset X$ is called an irreducible component of the space $X$. Such an irreducible component of $X$ is automatically a closed subset of $X$.

02DA Exercise 89.5.19. Prove that any irreducible subset of $X$ is contained in an irreducible component of $X$.

02DB Exercise 89.5.20. Prove that a Noetherian topological space $X$ has only finitely many irreducible components, say $X_{1}, \ldots, X_{n}$, and that $X=X_{1} \cup X_{2} \cup \ldots \cup X_{n}$. (Note that any $X$ is always the union of its irreducible components, but that if $X=\mathbf{R}$ with its usual topology for instance then the irreducible components of $X$ are the one point subsets. This is not terribly interesting.)

02DC Exercise 89.5.21. Show that irreducible components of $\operatorname{Spec}(A)$ correspond to minimal primes of $A$.

027 H Definition 89.5.22. A point $x \in X$ is called closed if $\overline{\{x\}}=\{x\}$. Let $x, y$ be points of $X$. We say that $x$ is a specialization of $y$, or that $y$ is a generalization of $x$ if $x \in \overline{\{y\}}$.

02DD Exercise 89.5.23. Show that closed points of $\operatorname{Spec}(A)$ correspond to maximal ideals of $A$.

02DE Exercise 89.5.24. Show that $\mathfrak{p}$ is a generalization of $\mathfrak{q}$ in $\operatorname{Spec}(A)$ if and only if $\mathfrak{p} \subset$ $\mathfrak{q}$. Characterize closed points, maximal ideals, generic points and minimal prime ideals in terms of generalization and specialization. (Here we use the terminology that a point of a possibly reducible topological space $X$ is called a generic point if it is a generic points of one of the irreducible components of $X$.)

02DF Exercise 89.5.25. Let $I$ and $J$ be ideals of $A$. What is the condition for $V(I)$ and $V(J)$ to be disjoint?

027I Definition 89.5.26. A topological space $X$ is called connected if it is nonempty and not the union of two nonempty disjoint open subsets. A connected component of $X$ is a maximal connected subset. Any point of $X$ is contained in a connected component of $X$ and any connected component of $X$ is closed in $X$. (But in general a connected component need not be open in $X$.)

02DG Exercise 89.5.27. Let $A$ be a nonzero ring. Show that $\operatorname{Spec}(A)$ is disconnected iff $A \cong B \times C$ for certain nonzero rings $B, C$.

02DH Exercise 89.5.28. Let $T$ be a connected component of $\operatorname{Spec}(A)$. Prove that $T$ is stable under generalization. Prove that $T$ is an open subset of $\operatorname{Spec}(A)$ if $A$ is Noetherian. (Remark: This is wrong when $A$ is an infinite product of copies of $\mathbf{F}_{2}$ for example. The spectrum of this ring consists of infinitely many closed points.)

02DI Exercise 89.5.29. Compute $\operatorname{Spec}(k[x])$, i.e., describe the prime ideals in this ring, describe the possible specializations, and describe the topology. (Work this out when $k$ is algebraically closed but also when $k$ is not.)

02DJ Exercise 89.5.30. Compute $\operatorname{Spec}(k[x, y])$, where $k$ is algebraically closed. [Hint: use the morphism $\varphi: \operatorname{Spec}(k[x, y]) \rightarrow \operatorname{Spec}(k[x])$; if $\varphi(\mathfrak{p})=(0)$ then localize with respect to $S=\{f \in k[x] \mid f \neq 0\}$ and use result of lecture on localization and Spec.] (Why do you think algebraic geometers call this affine 2-space?)
02DK Exercise 89.5.31. Compute $\operatorname{Spec}(\mathbf{Z}[y])$. [Hint: as above.] (Affine 1-space over Z.)

### 89.6. Localization

0766
0767 Exercise 89.6.1. Let $A$ be a ring. Let $S \subset A$ be a multiplicative subset. Let $M$ be an $A$-module. Let $N \subset S^{-1} M$ be an $S^{-1} A$-submodule. Show that there exists an $A$-submodule $N^{\prime} \subset M$ such that $N=S^{-1} N^{\prime}$. (This useful result applies in particular to ideals of $S^{-1} A$.)

0768 Exercise 89.6.2. Let $A$ be a ring. Let $M$ be an $A$-module. Let $m \in M$.
(1) Show that $I=\{a \in A \mid a m=0\}$ is an ideal of $A$.
(2) For a prime $\mathfrak{p}$ of $A$ show that the image of $m$ in $M_{\mathfrak{p}}$ is zero if and only if $I \not \subset \mathfrak{p}$.
(3) Show that $m$ is zero if and only if the image of $m$ is zero in $M_{\mathfrak{p}}$ for all primes $\mathfrak{p}$ of $A$.
(4) Show that $m$ is zero if and only if the image of $m$ is zero in $M_{\mathfrak{m}}$ for all maximal ideals $\mathfrak{m}$ of $A$.
(5) Show that $M=0$ if and only if $M_{\mathfrak{m}}$ is zero for all maximal ideals $\mathfrak{m}$.

0769 Exercise 89.6.3. Find a pair $(A, f)$ where $A$ is a domain with three or more pairwise distinct primes and $f \in A$ is an element such that the principal localization $A_{f}=\left\{1, f, f^{2}, \ldots\right\}^{-1} A$ is a field.
076A Exercise 89.6.4. Let $A$ be a ring. Let $M$ be a finite $A$-module. Let $S \subset A$ be a multiplicative set. Assume that $S^{-1} M=0$. Show that there exists an $f \in S$ such that the principal localization $M_{f}=\left\{1, f, f^{2}, \ldots\right\}^{-1} M$ is zero.

076B Exercise 89.6.5. Give an example of a triple $(A, I, S)$ where $A$ is a ring, $0 \neq$ $I \neq A$ is a proper nonzero ideal, and $S \subset A$ is a multiplicative subset such that $A / I \cong S^{-1} A$ as $A$-algebras.

### 89.7. Nakayama's Lemma

076C
076D Exercise 89.7.1. Let $A$ be a ring. Let $I$ be an ideal of $A$. Let $M$ be an $A$-module. Let $x_{1}, \ldots, x_{n} \in M$. Assume that
(1) $M / I M$ is generated by $x_{1}, \ldots, x_{n}$,
(2) $M$ is a finite $A$-module,
(3) $I$ is contained in every maximal ideal of $A$.

Show that $x_{1}, \ldots, x_{n}$ generate $M$. (Suggested solution: Reduce to a localization at a maximal ideal of $A$ using Exercise 89.6 .2 and exactness of localization. Then reduce to the statement of Nakayama's lemma in the lectures by looking at the quotient of $M$ by the submodule generated by $x_{1}, \ldots, x_{n}$.)

### 89.8. Length

027J
076E Definition 89.8.1. Let $A$ be a ring. Let $M$ be an $A$-module. The length of $M$ as an $R$-module is

$$
\operatorname{length}_{A}(M)=\sup \left\{n \mid \exists 0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M, M_{i} \neq M_{i+1}\right\} .
$$

In other words, the supremum of the lengths of chains of submodules.
076F Exercise 89.8.2. Show that a module $M$ over a ring $A$ has length 1 if and only if it is isomorphic to $A / \mathfrak{m}$ for some maximal ideal $\mathfrak{m}$ in $A$.
076G Exercise 89.8.3. Compute the length of the following modules over the following rings. Briefly(!) explain your answer. (Please feel free to use additivity of the length function in short exact sequences, see Algebra, Lemma 10.51.3).
(1) The length of $\mathbf{Z} / 120 \mathbf{Z}$ over $\mathbf{Z}$.
(2) The length of $\mathbf{C}[x] /\left(x^{100}+x+1\right)$ over $\mathbf{C}[x]$.
(3) The length of $\mathbf{R}[x] /\left(x^{4}+2 x^{2}+1\right)$ over $\mathbf{R}[x]$.

02DL Exercise 89.8.4. Let $A=k[x, y]_{(x, y)}$ be the local ring of the affine plane at the origin. Make any assumption you like about the field $k$. Suppose that $f=$ $x^{3}+x^{2} y^{2}+y^{100}$ and $g=y^{3}-x^{999}$. What is the length of $A /(f, g)$ as an $A$ module? (Possible way to proceed: think about the ideal that $f$ and $g$ generate in quotients of the form $A / \mathfrak{m}_{A}^{n}=k[x, y] /(x, y)^{n}$ for varying $n$. Try to find $n$ such that $A /(f, g)+\mathfrak{m}_{A}^{n} \cong A /(f, g)+\mathfrak{m}_{A}^{n+1}$ and use NAK. $)$

### 89.9. Singularities

027K
02DM Exercise 89.9.1. Let $k$ be any field. Suppose that $A=k[[x, y]] /(f)$ and $B=$ $k[[u, v]] /(g)$, where $f=x y$ and $g=u v+\delta$ with $\delta \in(u, v)^{3}$. Show that $A$ and $B$ are isomorphic rings.
02DN Remark 89.9.2. A singularity on a curve over a field $k$ is called an ordinary double point if the complete local ring of the curve at the point is of the form $k^{\prime}[[x, y]] /(f)$, where (a) $k^{\prime}$ is a finite separable extension of $k$, (b) the initial term of $f$ has degree two, i.e., it looks like $q=a x^{2}+b x y+c y^{2}$ for some $a, b, c \in k^{\prime}$ not all zero, and (c) $q$ is a nondegenerate quadratic form over $k^{\prime}$ (in char 2 this means that $b$ is not zero). In general there is one isomorphism class of such rings for each isomorphism class of pairs $\left(k^{\prime}, q\right)$.

### 89.10. Hilbert Nullstellensatz

027L
02DO Exercise 89.10.1. A silly argument using the complex numbers! Let $\mathbf{C}$ be the complex number field. Let $V$ be a vector space over $\mathbf{C}$. The spectrum of a linear operator $T: V \rightarrow V$ is the set of complex numbers $\lambda \in \mathbf{C}$ such that the operator $T-\lambda^{2} d_{V}$ is not invertible.
(1) Show that $\mathbf{C}(X)=f . f .(\mathbf{C}[X])$ has uncountable dimension over $\mathbf{C}$.
(2) Show that any linear operator on $V$ has a nonempty spectrum if the dimension of $V$ is finite or countable.
(3) Show that if a finitely generated $\mathbf{C}$-algebra $R$ is a field, then the map $\mathbf{C} \rightarrow R$ is an isomorphism.
(4) Show that any maximal ideal $\mathfrak{m}$ of $\mathbf{C}\left[x_{1}, \ldots, x_{n}\right]$ is of the form $\left(x_{1}-\right.$ $\left.\alpha_{1}, \ldots, x_{n}-\alpha_{n}\right)$ for some $\alpha_{i} \in \mathbf{C}$.
027M Remark 89.10.2. Let $k$ be a field. Then for every integer $n \in \mathbf{N}$ and every maximal ideal $\mathfrak{m} \subset k\left[x_{1}, \ldots, x_{n}\right]$ the quotient $k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}$ is a finite field extension of $k$. This will be shown later in the course. Of course (please check this) it implies a similar statement for maximal ideals of finitely generated $k$-algebras. The exercise above proves it in the case $k=\mathbf{C}$.

02DP Exercise 89.10.3. Let $k$ be a field. Please use Remark 89.10.2
(1) Let $R$ be a $k$-algebra. Suppose that $\operatorname{dim}_{k} R<\infty$ and that $R$ is a domain. Show that $R$ is a field.
(2) Suppose that $R$ is a finitely generated $k$-algebra, and $f \in R$ not nilpotent. Show that there exists a maximal ideal $\mathfrak{m} \subset R$ with $f \notin \mathfrak{m}$.
(3) Show by an example that this statement fails when $R$ is not of finite type over a field.
(4) Show that any radical ideal $I \subset \mathbf{C}\left[x_{1}, \ldots, x_{n}\right]$ is the intersection of the maximal ideals containing it.

02DQ Remark 89.10.4. This is the Hilbert Nullstellensatz. Namely it says that the closed subsets of $\operatorname{Spec}\left(k\left[x_{1}, \ldots, x_{n}\right]\right)$ (which correspond to radical ideals by a previous exercise) are determined by the closed points contained in them.

02 DR Exercise 89.10.5. Let $A=\mathbf{C}\left[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}\right]$. Let $I$ be the ideal of $A$ generated by the entries of the matrix $X Y$, with

$$
X=\left(\begin{array}{ll}
x_{11} & x_{12} \\
x_{21} & x_{22}
\end{array}\right) \quad \text { and } \quad Y=\left(\begin{array}{ll}
y_{11} & y_{12} \\
y_{21} & y_{22}
\end{array}\right)
$$

Find the irreducible components of the closed subset $V(I)$ of $\operatorname{Spec}(A)$. (I mean describe them and give equations for each of them. You do not have to prove that the equations you write down define prime ideals.) Hints:
(1) You may use the Hilbert Nullstellensatz, and it suffices to find irreducible locally closed subsets which cover the set of closed points of $V(I)$.
(2) There are two easy components.
(3) An image of an irreducible set under a continuous map is irreducible.

### 89.11. Dimension

02LT
076H
Exercise 89.11.1. Construct a ring $A$ with finitely many prime ideals having dimension $>1$.

076I Exercise 89.11.2. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that $\mathbf{C}[x, y] /(f)$ has dimension 1.
02LU Exercise 89.11.3. Let $(R, \mathfrak{m})$ be a Noetherian local ring. Let $n \geq 1$. Let $\mathfrak{m}^{\prime}=$ $\left(\mathfrak{m}, x_{1}, \ldots, x_{n}\right)$ in the polynomial ring $R\left[x_{1}, \ldots, x_{n}\right]$. Show that

$$
\operatorname{dim}\left(R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}\right)=\operatorname{dim}(R)+n
$$

### 89.12. Catenary rings

027 O Definition 89.12.1. A Noetherian ring $A$ is said to be catenary if for any triple of prime ideals $\mathfrak{p}_{1} \subset \mathfrak{p}_{2} \subset \mathfrak{p}_{3}$ we have

$$
h t\left(\mathfrak{p}_{3} / \mathfrak{p}_{1}\right)=h t\left(\mathfrak{p}_{3} / \mathfrak{p}_{2}\right)+h t\left(\mathfrak{p}_{2} / \mathfrak{p}_{1}\right)
$$

Here $h t(\mathfrak{p} / \mathfrak{q})$ means the height of $\mathfrak{p} / \mathfrak{q}$ in the $\operatorname{ring} A / \mathfrak{q}$.
02DS Exercise 89.12.2. Show that a Noetherian local domain of dimension 2 is catenary.
077D Exercise 89.12.3. Let $k$ be a field. Show that a finite type $k$-algebra is catenary.

### 89.13. Fraction fields

027P
02DT Exercise 89.13.1. Consider the domain

$$
\mathbf{Q}[r, s, t] /\left(s^{2}-(r-1)(r-2)(r-3), t^{2}-(r+1)(r+2)(r+3)\right) .
$$

Find a domain of the form $\mathbf{Q}[x, y] /(f)$ with isomorphic field of fractions.

### 89.14. Transcendence degree

077E
077F Exercise 89.14.1. Let $k \subset K \subset K^{\prime}$ be field extensions with $K^{\prime}$ algebraic over $K$. Prove that $\operatorname{trdeg}_{k}(K)=\operatorname{trdeg}_{k}\left(K^{\prime}\right)$. (Hint: Show that if $x_{1}, \ldots, x_{d} \in K$ are algebraically independent over $k$ and $d<\operatorname{trdeg}_{k}\left(K^{\prime}\right)$ then $k\left(x_{1}, \ldots, x_{d}\right) \subset K$ cannot be algebraic.)

### 89.15. Finite locally free modules

027Q
027R Definition 89.15.1. Let $A$ be a ring. Recall that a finite locally free $A$-module $M$ is a module such that for every $\mathfrak{p} \in \operatorname{Spec}(A)$ there exists an $f \in A, f \notin \mathfrak{p}$ such that $M_{f}$ is a finite free $A_{f}$-module. We say $M$ is an invertible module if $M$ is finite locally free of $\operatorname{rank} 1$, i.e., for every $\mathfrak{p} \in \operatorname{Spec}(A)$ there exists an $f \in A, f \notin \mathfrak{p}$ such that $M_{f} \cong A_{f}$ as an $A_{f}$-module.

078P Exercise 89.15.2. Prove that the tensor product of finite locally free modules is finite locally free. Prove that the tensor product of two invertible modules is invertible.
078Q Definition 89.15.3. Let $A$ be a ring. The class group of $A$, sometimes called the Picard group of $A$ is the set $\operatorname{Pic}(A)$ of isomorphism classes of invertible $A$-modules endowed with a group operation defined by tensor product (see Exercise 89.15.2).
Note that the class group of $A$ is trivial exactly when every invertible module is isomorphic to a free module of rank 1.

078R Exercise 89.15.4. Show that the class groups of the following rings are trivial
(1) a polynomial ring $A=k[x]$ where $k$ is a field,
(2) the integers $A=\mathbf{Z}$,
(3) a polynomial $\operatorname{ring} A=k[x, y]$ where $k$ is a field, and
(4) the quotient $k[x, y] /(x y)$ where $k$ is a field.

078S Exercise 89.15.5. Show that the class group of the ring $A=k[x, y] /\left(y^{2}-f(x)\right)$ where $k$ is a field of characteristic not 2 and where $f(x)=\left(x-t_{1}\right) \ldots\left(x-t_{n}\right)$ with $t_{1}, \ldots, t_{n} \in k$ distinct and $n \geq 3$ an odd integer is not trivial. (Hint: Show that the ideal $\left(y, x-t_{1}\right)$ defines a nontrivial element of $\operatorname{Pic}(A)$.)

02DU Exercise 89.15.6. Let $A$ be a ring.
(1) Suppose that $M$ is a finite locally free $A$-module, and suppose that $\varphi$ : $M \rightarrow M$ is an endomorphism. Define/construct the trace and determinant of $\varphi$ and prove that your construction is "functorial in the triple $(A, M, \varphi)$ ".
(2) Show that if $M, N$ are finite locally free $A$-modules, and if $\varphi: M \rightarrow N$ and $\psi: N \rightarrow M$ then $\operatorname{Trace}(\varphi \circ \psi)=\operatorname{Trace}(\psi \circ \varphi)$ and $\operatorname{Det}(\varphi \circ \psi)=\operatorname{Det}(\psi \circ \varphi)$.
(3) In case $M$ is finite locally free show that Det defines a multiplicative map $\operatorname{End}_{A}(M) \rightarrow A$.

02DV Exercise 89.15.7. Now suppose that $B$ is an $A$-algebra which is finite locally free as an $A$-module, in other words $B$ is a finite locally free $A$-algebra.
(1) Define Trace ${ }_{B / A}$ and $\operatorname{Norm}_{B / A}$ using Trace and Det as defined above.
(2) Let $b \in B$ and let $\pi: \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ be the induced morphism. Show that $\pi(V(b))=V\left(\operatorname{Norm}_{B / A}(b)\right)$. (Recall that $\left.V(f)=\{\mathfrak{p} \mid f \in \mathfrak{p}\}.\right)$
(3) (Base change.) Suppose that $i: A \rightarrow A^{\prime}$ is a ring map. Set $B^{\prime}=B \otimes_{A} A^{\prime}$. Indicate why $i\left(\operatorname{Norm}_{B / A}(b)\right)$ equals $\operatorname{Norm}_{B^{\prime} / A^{\prime}}(b \otimes 1)$.
(4) Compute $\operatorname{Norm}_{B / A}(b)$ when $B=A \times A \times A \times \ldots \times A$ and $b=\left(a_{1}, \ldots, a_{n}\right)$.
(5) Compute the norm of $y-y^{3}$ under the finite flat map $\mathbf{Q}[x] \rightarrow \mathbf{Q}[y]$, $x \rightarrow y^{n}$. (Hint: use the "base change" $A=\mathbf{Q}[x] \subset A^{\prime}=\mathbf{Q}\left(\zeta_{n}\right)\left(x^{1 / n}\right)$.)

### 89.16. Glueing

02DW Exercise 89.16.1. Suppose that $A$ is a ring and $M$ is an $A$-module. Let $f_{i}, i \in I$ be a collection of elements of $A$ such that

$$
\operatorname{Spec}(A)=\bigcup D\left(f_{i}\right)
$$

(1) Show that if $M_{f_{i}}$ is a finite $A_{f_{i}}$-module, then $M$ is a finite $A$-module.
(2) Show that if $M_{f_{i}}$ is a flat $A_{f_{i}}$-module, then $M$ is a flat $A$-module. (This is kind of silly if you think about it right.)

02DX Remark 89.16.2. In algebraic geometric language this means that the property of "being finitely generated" or "being flat" is local for the Zariski topology (in a suitable sense). You can also show this for the property "being of finite presentation".

078T Exercise 89.16.3. Suppose that $A \rightarrow B$ is a ring map. Let $f_{i} \in A, i \in I$ and $g_{j} \in B, j \in J$ be collections of elements such that

$$
\operatorname{Spec}(A)=\bigcup D\left(f_{i}\right) \quad \text { and } \quad \operatorname{Spec}(B)=\bigcup D\left(g_{j}\right)
$$

Show that if $A_{f_{i}} \rightarrow B_{f_{i} g_{j}}$ is of finite type for all $i, j$ then $A \rightarrow B$ is of finite type.

### 89.17. Going up and going down

027U Definition 89.17.1. Let $\phi: A \rightarrow B$ be a homomorphism of rings. We say that the going-up theorem holds for $\phi$ if the following condition is satisfied:
(GU) for any $\mathfrak{p}, \mathfrak{p}^{\prime} \in \operatorname{Spec}(A)$ such that $\mathfrak{p} \subset \mathfrak{p}^{\prime}$, and for any $P \in \operatorname{Spec}(B)$ lying over $\mathfrak{p}$, there exists $P^{\prime} \in \operatorname{Spec}(B)$ lying over $\mathfrak{p}^{\prime}$ such that $P \subset P^{\prime}$.
Similarly, we say that the going-down theorem holds for $\phi$ if the following condition is satisfied:
(GD) for any $\mathfrak{p}, \mathfrak{p}^{\prime} \in \operatorname{Spec}(A)$ such that $\mathfrak{p} \subset \mathfrak{p}^{\prime}$, and for any $P^{\prime} \in \operatorname{Spec}(B)$ lying over $\mathfrak{p}^{\prime}$, there exists $P \in \operatorname{Spec}(B)$ lying over $\mathfrak{p}$ such that $P \subset P^{\prime}$.

02DY Exercise 89.17.2. In each of the following cases determine whether (GU), (GD) holds, and explain why. (Use any Prop/Thm/Lemma you can find, but check the hypotheses in each case.)
(1) $k$ is a field, $A=k, B=k[x]$.
(2) $k$ is a field, $A=k[x], B=k[x, y]$.
(3) $A=\mathbf{Z}, B=\mathbf{Z}[1 / 11]$.
(4) $k$ is an algebraically closed field, $A=k[x, y], B=k[x, y, z] /\left(x^{2}-y, z^{2}-x\right)$.
(5) $A=\mathbf{Z}, B=\mathbf{Z}[i, 1 /(2+i)]$.
(6) $A=\mathbf{Z}, B=\mathbf{Z}[i, 1 /(14+7 i)]$.
(7) $k$ is an algebraically closed field, $A=k[x], B=k[x, y, 1 /(x y-1)] /\left(y^{2}-y\right)$.

02DZ Exercise 89.17.3. Let $k$ be an algebraically closed field. Compute the image in $\operatorname{Spec}(k[x, y])$ of the following maps:
(1) $\operatorname{Spec}\left(k\left[x, y x^{-1}\right]\right) \rightarrow \operatorname{Spec}(k[x, y])$, where $k[x, y] \subset k\left[x, y x^{-1}\right] \subset k\left[x, y, x^{-1}\right]$. (Hint: To avoid confusion, give the element $y x^{-1}$ another name.)
(2) $\operatorname{Spec}(k[x, y, a, b] /(a x-b y-1)) \rightarrow \operatorname{Spec}(k[x, y])$.
(3) $\operatorname{Spec}(k[t, 1 /(t-1)]) \rightarrow \operatorname{Spec}(k[x, y])$, induced by $x \mapsto t^{2}$, and $y \mapsto t^{3}$.
(4) $k=\mathbf{C}$ (complex numbers), $\operatorname{Spec}\left(k[s, t] /\left(s^{3}+t^{3}-1\right)\right) \rightarrow \operatorname{Spec}(k[x, y])$, where $x \mapsto s^{2}, y \mapsto t^{2}$.

02E0 Remark 89.17.4. Finding the image as above usually is done by using elimination theory.

### 89.18. Fitting ideals

02E1 Exercise 89.18.1. Let $R$ be a ring and let $M$ be a finite $R$-module. Choose a presentation

$$
\bigoplus_{j \in J} R \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0
$$

of $M$. Note that the map $R^{\oplus n} \rightarrow M$ is given by a sequence of elements $x_{1}, \ldots, x_{n}$ of $M$. The elements $x_{i}$ are generators of $M$. The map $\bigoplus_{j \in J} R \rightarrow R^{\oplus n}$ is given by a $n \times J$ matrix $A$ with coefficients in $R$. In other words, $A=\left(a_{i j}\right)_{i=1, \ldots, n, j \in J}$. The columns $\left(a_{1 j}, \ldots, a_{n j}\right), j \in J$ of $A$ are said to be the relations. Any vector $\left(r_{i}\right) \in R^{\oplus n}$ such that $\sum r_{i} x_{i}=0$ is a linear combination of the columns of $A$. Of course any finite $R$-module has a lot of different presentations.
(1) Show that the ideal generated by the $(n-k) \times(n-k)$ minors of $A$ is independent of the choice of the presentation. This ideal is the $k$ th fitting ideal of $M$. Notation $\operatorname{Fit}_{k}(M)$.
(2) Show that $\operatorname{Fit}_{0}(M) \subset \operatorname{Fit}_{1}(M) \subset \operatorname{Fit}_{2}(M) \subset \ldots$. (Hint: Use that a determinant can be computed by expanding along a column.)
(3) Show that the following are equivalent:
(a) $\operatorname{Fit}_{r-1}(M)=(0)$ and $\operatorname{Fit}_{r}(M)=R$, and
(b) $M$ is locally free of rank $r$.

### 89.19. Hilbert functions

027W
027X
Definition 89.19.1. A numerical polynomial is a polynomial $f(x) \in \mathbf{Q}[x]$ such that $f(n) \in \mathbf{Z}$ for every integer $n$.
027Y Definition 89.19.2. A graded module $M$ over a ring $A$ is an $A$-module $M$ endowed with a direct sum decomposition $\bigoplus_{n \in \mathbf{Z}} M_{n}$ into $A$-submodules. We will say that $M$ is locally finite if all of the $M_{n}$ are finite $A$-modules. Suppose that $A$ is a Noetherian ring and that $\varphi$ is a Euler-Poincaré function on finite $A$-modules. This means that for every finitely generated $A$-module $M$ we are given an integer $\varphi(M) \in \mathbf{Z}$ and for every short exact sequence

$$
0 \longrightarrow M^{\prime} \longrightarrow M \longrightarrow M^{\prime \prime} \longrightarrow 0
$$

we have $\varphi(M)=\varphi\left(M^{\prime}\right)+\varphi\left(M^{\prime}\right)$. The Hilbert function of a locally finite graded module $M$ (with respect to $\varphi$ ) is the function $\chi_{\varphi}(M, n)=\varphi\left(M_{n}\right)$. We say that $M$ has a Hilbert polynomial if there is some numerical polynomial $P_{\varphi}$ such that $\chi_{\varphi}(M, n)=P_{\varphi}(n)$ for all sufficiently large integers $n$.
027Z Definition 89.19.3. A graded $A$-algebra is a graded $A$-module $B=\bigoplus_{n \geq 0} B_{n}$ together with an $A$-bilinear map

$$
B \times B \longrightarrow B, \quad\left(b, b^{\prime}\right) \longmapsto b b^{\prime}
$$

that turns $B$ into an $A$-algebra so that $B_{n} \cdot B_{m} \subset B_{n+m}$. Finally, a graded module $M$ over a graded $A$-algebra $B$ is given by a graded $A$-module $M$ together with a (compatible) $B$-module structure such that $B_{n} \cdot M_{d} \subset M_{n+d}$. Now you can define homomorphisms of graded modules/rings, graded submodules, graded ideals, exact sequences of graded modules, etc, etc.
02E2 Exercise 89.19.4. Let $A=k$ a field. What are all possible Euler-Poincaré functions on finite $A$-modules in this case?
02E3 Exercise 89.19.5. Let $A=\mathbf{Z}$. What are all possible Euler-Poincaré functions on finite $A$-modules in this case?
02E4 Exercise 89.19.6. Let $A=k[x, y] /(x y)$ with $k$ algebraically closed. What are all possible Euler-Poincaré functions on finite $A$-modules in this case?

02E5 Exercise 89.19.7. Suppose that $A$ is Noetherian. Show that the kernel of a map of locally finite graded $A$-modules is locally finite.

02E6 Exercise 89.19.8. Let $k$ be a field and let $A=k$ and $B=k[x, y]$ with grading determined by $\operatorname{deg}(x)=2$ and $\operatorname{deg}(y)=3$. Let $\varphi(M)=\operatorname{dim}_{k}(M)$. Compute the Hilbert function of $B$ as a graded $k$-module. Is there a Hilbert polynomial in this case?

02E7 Exercise 89.19.9. Let $k$ be a field and let $A=k$ and $B=k[x, y] /\left(x^{2}, x y\right)$ with grading determined by $\operatorname{deg}(x)=2$ and $\operatorname{deg}(y)=3$. Let $\varphi(M)=\operatorname{dim}_{k}(M)$. Compute the Hilbert function of $B$ as a graded $k$-module. Is there a Hilbert polynomial in this case?

02E8 Exercise 89.19.10. Let $k$ be a field and let $A=k$. Let $\varphi(M)=\operatorname{dim}_{k}(M)$. Fix $d \in \mathbf{N}$. Consider the graded $A$-algebra $B=k[x, y, z] /\left(x^{d}+y^{d}+z^{d}\right)$, where $x, y, z$ each have degree 1. Compute the Hilbert function of $B$. Is there a Hilbert polynomial in this case?

### 89.20. Proj of a ring

0281 Definition 89.20.1. Let $R$ be a graded ring. A homogeneous ideal is simply an ideal $I \subset R$ which is also a graded submodule of $R$. Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$
f=f_{0}+f_{1}+\ldots+f_{n}
$$

is the decomposition of $f$ into homogeneous pieces in $R$ then $f_{i} \in I$ for each $i$.
0282 Definition 89.20.2. We define the homogeneous spectrum $\operatorname{Proj}(R)$ of the graded ring $R$ to be the set of homogeneous, prime ideals $\mathfrak{p}$ of $R$ such that $R_{+} \not \subset \mathfrak{p}$. Note that $\operatorname{Proj}(R)$ is a subset of $\operatorname{Spec}(R)$ and hence has a natural induced topology.

0283 Definition 89.20.3. Let $R=\oplus_{d \geq 0} R_{d}$ be a graded ring, let $f \in R_{d}$ and assume that $d \geq 1$. We define $R_{(f)}$ to be the subring of $R_{f}$ consisting of elements of the form $r / f^{n}$ with $r$ homogeneous and $\operatorname{deg}(r)=n d$. Furthermore, we define

$$
D_{+}(f)=\{\mathfrak{p} \in \operatorname{Proj}(R) \mid f \notin \mathfrak{p}\}
$$

Finally, for a homogeneous ideal $I \subset R$ we define $V_{+}(I)=V(I) \cap \operatorname{Proj}(R)$.
02E9 Exercise 89.20.4. On the topology on $\operatorname{Proj}(R)$. With definitions and notation as above prove the following statements.
(1) Show that $D_{+}(f)$ is open in $\operatorname{Proj}(R)$.
(2) Show that $D_{+}\left(f f^{\prime}\right)=D_{+}(f) \cap D_{+}\left(f^{\prime}\right)$.
(3) Let $g=g_{0}+\ldots+g_{m}$ be an element of $R$ with $g_{i} \in R_{i}$. Express $D(g) \cap \operatorname{Proj}(R)$ in terms of $D_{+}\left(g_{i}\right), i \geq 1$ and $D\left(g_{0}\right) \cap \operatorname{Proj}(R)$. No proof necessary.
(4) Let $g \in R_{0}$ be a homogeneous element of degree 0 . Express $D(g) \cap \operatorname{Proj}(R)$ in terms of $D_{+}\left(f_{\alpha}\right)$ for a suitable family $f_{\alpha} \in R$ of homogeneous elements of positive degree.
(5) Show that the collection $\left\{D_{+}(f)\right\}$ of opens forms a basis for the topology of $\operatorname{Proj}(R)$.
078 U (6) Show that there is a canonical bijection $D_{+}(f) \rightarrow \operatorname{Spec}\left(R_{(f)}\right)$. (Hint: Imitate the proof for Spec but at some point thrown in the radical of an ideal.)
(7) Show that the map from (6) is a homeomorphism.
(8) Give an example of an $R$ such that $\operatorname{Proj}(R)$ is not quasi-compact. No proof necessary.
(9) Show that any closed subset $T \subset \operatorname{Proj}(R)$ is of the form $V_{+}(I)$ for some homogeneous ideal $I \subset R$.

02EA Remark 89.20.5. There is a continuous map $\operatorname{Proj}(R) \longrightarrow \operatorname{Spec}\left(R_{0}\right)$.
02EB Exercise 89.20.6. If $R=A[X]$ with $\operatorname{deg}(X)=1$, show that the natural map $\operatorname{Proj}(R) \rightarrow \operatorname{Spec}(A)$ is a bijection and in fact a homeomorphism.
02EC Exercise 89.20.7. Blowing up: part I. In this exercise $R=B l_{I}(A)=A \oplus I \oplus I^{2} \oplus$ $\ldots$.. Consider the natural map $b: \operatorname{Proj}(R) \rightarrow \operatorname{Spec}(A)$. Set $U=\operatorname{Spec}(A)-V(I)$. Show that

$$
b: b^{-1}(U) \longrightarrow U
$$

is a homeomorphism. Thus we may think of $U$ as an open subset of $\operatorname{Proj}(R)$. Let $Z \subset \operatorname{Spec}(A)$ be an irreducible closed subscheme with generic point $\xi \in Z$. Assume that $\xi \notin V(I)$, in other words $Z \not \subset V(I)$, in other words $\xi \in U$, in other words $Z \cap U \neq \emptyset$. We define the strict transform $Z^{\prime}$ of $Z$ to be the closure of the unique point $\xi^{\prime}$ lying above $\xi$. Another way to say this is that $Z^{\prime}$ is the closure in $\operatorname{Proj}(R)$ of the locally closed subset $Z \cap U \subset U \subset \operatorname{Proj}(R)$.
02ED Exercise 89.20.8. Blowing up: Part II. Let $A=k[x, y]$ where $k$ is a field, and let $I=(x, y)$. Let $R$ be the blow up algebra for $A$ and $I$.
(1) Show that the strict transforms of $Z_{1}=V(\{x\})$ and $Z_{2}=V(\{y\})$ are disjoint.
(2) Show that the strict transforms of $Z_{1}=V(\{x\})$ and $Z_{2}=V\left(\left\{x-y^{2}\right\}\right)$ are not disjoint.
(3) Find an ideal $J \subset A$ such that $V(J)=V(I)$ and such that the strict transforms of $Z_{1}=V(\{x\})$ and $Z_{2}=V\left(\left\{x-y^{2}\right\}\right)$ are disjoint.
02EE Exercise 89.20.9. Let $R$ be a graded ring.
(1) Show that $\operatorname{Proj}(R)$ is empty if $R_{n}=(0)$ for all $n \gg 0$.
(2) Show that $\operatorname{Proj}(R)$ is an irreducible topological space if $R$ is a domain and $R_{+}$is not zero. (Recall that the empty topological space is not irreducible.)
02EF Exercise 89.20.10. Blowing up: Part III. Consider $A, I$ and $U, Z$ as in the definition of strict transform. Let $Z=V(\mathfrak{p})$ for some prime ideal $\mathfrak{p}$. Let $\bar{A}=A / \mathfrak{p}$ and let $\bar{I}$ be the image of $I$ in $\bar{A}$.
(1) Show that there exists a surjective ring map $R:=B l_{I}(A) \rightarrow \bar{R}:=B l_{\bar{I}}(\bar{A})$.
(2) Show that the ring map above induces a bijective map from $\operatorname{Proj}(\bar{R})$ onto the strict transform $Z^{\prime}$ of $Z$. (This is not so easy. Hint: Use $5(\mathrm{~b})$ above.)
(3) Conclude that the strict transform $Z^{\prime}=V_{+}(P)$ where $P \subset R$ is the homogeneous ideal defined by $P_{d}=I^{d} \cap \mathfrak{p}$.
(4) Suppose that $Z_{1}=V(\mathfrak{p})$ and $Z_{2}=V(\mathfrak{q})$ are irreducible closed subsets defined by prime ideals such that $Z_{1} \not \subset Z_{2}$, and $Z_{2} \not \subset Z_{1}$. Show that blowing up the ideal $I=\mathfrak{p}+\mathfrak{q}$ separates the strict transforms of $Z_{1}$ and $Z_{2}$, i.e., $Z_{1}^{\prime} \cap Z_{2}^{\prime}=\emptyset$. (Hint: Consider the homogeneous ideal $P$ and $Q$ from part (c) and consider $V(P+Q)$.)

### 89.21. Cohen-Macaulay rings of dimension 1

Definition 89.21.1. A Noetherian local ring $A$ is said to be Cohen-Macaulay of dimension $d$ if it has dimension $d$ and there exists a system of parameters $x_{1}, \ldots, x_{d}$ for $A$ such that $x_{i}$ is a nonzerodivisor in $A /\left(x_{1}, \ldots, x_{i-1}\right)$ for $i=1, \ldots, d$.

02EG Exercise 89.21.2. Cohen-Macaulay rings of dimension 1. Part I: Theory.
(1) Let $(A, \mathfrak{m})$ be a local Noetherian with $\operatorname{dim} A=1$. Show that if $x \in \mathfrak{m}$ is not a zerodivisor then
(a) $\operatorname{dim} A / x A=0$, in other words $A / x A$ is Artinian, in other words $\{x\}$ is a system of parameters for $A$.
(b) $A$ is has no embedded prime.
(2) Conversely, let $(A, \mathfrak{m})$ be a local Noetherian ring of dimension 1. Show that if $A$ has no embedded prime then there exists a nonzerodivisor in $\mathfrak{m}$.

02EH Exercise 89.21.3. Cohen-Macaulay rings of dimension 1. Part II: Examples.
(1) Let $A$ be the local ring at $(x, y)$ of $k[x, y] /\left(x^{2}, x y\right)$.
(a) Show that $A$ has dimension 1.
(b) Prove that every element of $\mathfrak{m} \subset A$ is a zerodivisor.
(c) Find $z \in \mathfrak{m}$ such that $\operatorname{dim} A / z A=0$ (no proof required).
(2) Let $A$ be the local ring at $(x, y)$ of $k[x, y] /\left(x^{2}\right)$. Find a nonzerodivisor in $\mathfrak{m}$ (no proof required).

02EI Exercise 89.21.4. Local rings of embedding dimension 1. Suppose that ( $A, \mathfrak{m}, k$ ) is a Noetherian local ring of embedding dimension 1, i.e.,

$$
\operatorname{dim}_{k} \mathfrak{m} / \mathfrak{m}^{2}=1
$$

Show that the function $f(n)=\operatorname{dim}_{k} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is either constant with value 1 , or its values are

$$
1,1, \ldots, 1,0,0,0,0,0, \ldots
$$

02EJ Exercise 89.21.5. Regular local rings of dimension 1. Suppose that $(A, \mathfrak{m}, k)$ is a regular Noetherian local ring of dimension 1. Recall that this means that $A$ has dimension 1 and embedding dimension 1, i.e.,

$$
\operatorname{dim}_{k} \mathfrak{m} / \mathfrak{m}^{2}=1
$$

Let $x \in \mathfrak{m}$ be any element whose class in $\mathfrak{m} / \mathfrak{m}^{2}$ is not zero.
(1) Show that for every element $y$ of $\mathfrak{m}$ there exists an integer $n$ such that $y$ can be written as $y=u x^{n}$ with $u \in A^{*}$ a unit.
(2) Show that $x$ is a nonzerodivisor in $A$.
(3) Conclude that $A$ is a domain.

02EK Exercise 89.21.6. Let $(A, \mathfrak{m}, k)$ be a Noetherian local ring with associated graded $G r_{\mathfrak{m}}(A)$.
(1) Suppose that $x \in \mathfrak{m}^{d}$ maps to a nonzerodivisor $\bar{x} \in \mathfrak{m}^{d} / \mathfrak{m}^{d+1}$ in degree $d$ of $G r_{\mathfrak{m}}(A)$. Show that $x$ is a nonzerodivisor.
(2) Suppose the depth of $A$ is at least 1. Namely, suppose that there exists a nonzerodivisor $y \in \mathfrak{m}$. In this case we can do better: assume just that $x \in \mathfrak{m}^{d}$ maps to the element $\bar{x} \in \mathfrak{m}^{d} / \mathfrak{m}^{d+1}$ in degree $d$ of $G r_{\mathfrak{m}}(A)$ which is a nonzerodivisor on sufficiently high degrees: $\exists N$ such that for all $n \geq N$ the map of multiplication by $\bar{x}$

$$
\mathfrak{m}^{n} / \mathfrak{m}^{n+1} \longrightarrow \mathfrak{m}^{n+d} / \mathfrak{m}^{n+d+1}
$$

is injective. Then show that $x$ is a nonzerodivisor.

02EL Exercise 89.21.7. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring of dimension 1. Assume also that the embedding dimension of $A$ is 2 , i.e., assume that

$$
\operatorname{dim}_{k} \mathfrak{m} / \mathfrak{m}^{2}=2
$$

Notation: $f(n)=\operatorname{dim}_{k} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$. Pick generators $x, y \in \mathfrak{m}$ and write $G r_{\mathfrak{m}}(A)=$ $k[\bar{x}, \bar{y}] / I$ for some homogeneous ideal $I$.
(1) Show that there exists a homogeneous element $F \in k[\bar{x}, \bar{y}]$ such that $I \subset$ $(F)$ with equality in all sufficiently high degrees.
(2) Show that $f(n) \leq n+1$.
(3) Show that if $f(n)<n+1$ then $n \geq \operatorname{deg}(F)$.
(4) Show that if $f(n)<n+1$, then $f(n+1) \leq f(n)$.
(5) Show that $f(n)=\operatorname{deg}(F)$ for all $n \gg 0$.

02EM Exercise 89.21.8. Cohen-Macaulay rings of dimension 1 and embedding dimension 2. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring which is Cohen-Macaulay of dimension 1. Assume also that the embedding dimension of $A$ is 2, i.e., assume that

$$
\operatorname{dim}_{k} \mathfrak{m} / \mathfrak{m}^{2}=2
$$

Notations: $f, F, x, y \in \mathfrak{m}, I$ as in Ex. 6 above. Please use any results from the problems above.
(1) Suppose that $z \in \mathfrak{m}$ is an element whose class in $\mathfrak{m} / \mathfrak{m}^{2}$ is a linear form $\alpha \bar{x}+\beta \bar{y} \in k[\bar{x}, \bar{y}]$ which is coprime with $f$.
(a) Show that $z$ is a nonzerodivisor on $A$.
(b) Let $d=\operatorname{deg}(F)$. Show that $\mathfrak{m}^{n}=z^{n+1-d} \mathfrak{m}^{d-1}$ for all sufficiently large $n$. (Hint: First show $z^{n+1-d} \mathfrak{m}^{d-1} \rightarrow \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is surjective by what you know about $G r_{\mathfrak{m}}(A)$. Then use NAK.)
(2) What condition on $k$ guarantees the existence of such a $z$ ? (No proof required; it's too easy.)
Now we are going to assume there exists a $z$ as above. This turns out to be a harmless assumption (in the sense that you can reduce to the situation where it holds in order to obtain the results in parts (d) and (e) below).
(3) Now show that $\mathfrak{m}^{\ell}=z^{\ell-d+1} \mathfrak{m}^{d-1}$ for all $\ell \geq d$.
(4) Conclude that $I=(F)$.
(5) Conclude that the function $f$ has values

$$
2,3,4, \ldots, d-1, d, d, d, d, d, d, d, \ldots
$$

02EN Remark 89.21.9. This suggests that a local Noetherian Cohen-Macaulay ring of dimension 1 and embedding dimension 2 is of the form $B / F B$, where $B$ is a 2dimensional regular local ring. This is more or less true (under suitable "niceness" properties of the ring).

### 89.22. Infinitely many primes

0286 A section with a collection of strange questions on rings where infinitely many primes are not invertible.

02EO Exercise 89.22.1. Give an example of a finite type Z-algebra $R$ with the following two properties:
(1) There is no ring map $R \rightarrow \mathbf{Q}$.
(2) For every prime $p$ there exists a maximal ideal $\mathfrak{m} \subset R$ such that $R / \mathfrak{m} \cong \mathbf{F}_{p}$.

02EP Exercise 89.22.2. For $f \in \mathbf{Z}[x, u]$ we define $f_{p}(x)=f\left(x, x^{p}\right) \bmod p \in \mathbf{F}_{p}[x]$. Give an example of an $f \in \mathbf{Z}[x, u]$ such that the following two properties hold:
(1) There exist infinitely many $p$ such that $f_{p}$ does not have a zero in $\mathbf{F}_{p}$.
(2) For all $p \gg 0$ the polynomial $f_{p}$ either has a linear or a quadratic factor.

02EQ Exercise 89.22.3. For $f \in \mathbf{Z}[x, y, u, v]$ we define $f_{p}(x, y)=f\left(x, y, x^{p}, y^{p}\right) \bmod p \in$ $\mathbf{F}_{p}\lfloor x, y\rfloor$. Give an "interesting" example of an $f$ such that $f_{p}$ is reducible for all $p \gg 0$. For example, $f=x v-y u$ with $f_{p}=x y^{p}-x^{p} y=x y\left(x^{p-1}-y^{p-1}\right)$ is "uninteresting"; any $f$ depending only on $x, u$ is "uninteresting", etc.

02ER Remark 89.22.4. Let $h \in \mathbf{Z}[y]$ be a monic polynomial of degree $d$. Then:
(1) The map $A=\mathbf{Z}[x] \rightarrow B=\mathbf{Z}[y], x \mapsto h$ is finite locally free of rank $d$.
(2) For all primes $p$ the map $A_{p}=\mathbf{F}_{p}[x] \rightarrow B_{p}=\mathbf{F}_{p}[y], y \mapsto h(y) \bmod p$ is finite locally free of rank $d$.

02 ES Exercise 89.22.5. Let $h, A, B, A_{p}, B_{p}$ be as in the remark. For $f \in \mathbf{Z}[x, u]$ we define $f_{p}(x)=f\left(x, x^{p}\right) \bmod p \in \mathbf{F}_{p}[x]$. For $g \in \mathbf{Z}[y, v]$ we define $g_{p}(y)=$ $g\left(y, y^{p}\right) \bmod p \in \mathbf{F}_{p}[y]$.
(1) Give an example of a $h$ and $g$ such that there does not exist a $f$ with the property

$$
f_{p}=\operatorname{Norm}_{B_{p} / A_{p}}\left(g_{p}\right)
$$

(2) Show that for any choice of $h$ and $g$ as above there exists a nonzero $f$ such that for all $p$ we have

$$
\operatorname{Norm}_{B_{p} / A_{p}}\left(g_{p}\right) \text { divides } f_{p} .
$$

If you want you can restrict to the case $h=y^{n}$, even with $n=2$, but it is true in general.
(3) Discuss the relevance of this to Exercises $6 \& 7$ of the previous set.

02ET Exercise 89.22.6. Unsolved problems. They may be really hard or they may be easy. I don't know.
(1) Is there any $f \in \mathbf{Z}[x, u]$ such that $f_{p}$ is irreducible for an infinite number of $p$ ? (Hint: Yes, this happens for $f(x, u)=u-x-1$ and also for $f(x, u)=u^{2}-x^{2}+1$.)
(2) Let $f \in \mathbf{Z}[x, u]$ nonzero, and suppose $\operatorname{deg}_{x}\left(f_{p}\right)=d p+d^{\prime}$ for all large $p$. (In other words $\operatorname{deg}_{u}(f)=d$ and the coefficient $c$ of $u^{d}$ in $f$ has $\operatorname{deg}_{x}(c)=d^{\prime}$.) Suppose we can write $d=d_{1}+d_{2}$ and $d^{\prime}=d_{1}^{\prime}+d_{2}^{\prime}$ with $d_{1}, d_{2}>0$ and $d_{1}^{\prime}, d_{2}^{\prime} \geq 0$ such that for all sufficiently large $p$ there exists a factorization

$$
f_{p}=f_{1, p} f_{2, p}
$$

with $\operatorname{deg}_{x}\left(f_{1, p}\right)=d_{1} p+d_{1}^{\prime}$. Is it true that $f$ comes about via a norm construction as in Exercise 4? (More precisely, are there a $h$ and $g$ such that $\operatorname{Norm}_{B_{p} / A_{p}}\left(g_{p}\right)$ divides $f_{p}$ for all $p \gg 0$.)
(3) Analogous question to the one in (b) but now with $f \in \mathbf{Z}\left[x_{1}, x_{2}, u_{1}, u_{2}\right]$ irreducible and just assuming that $f_{p}\left(x_{1}, x_{2}\right)=f\left(x_{1}, x_{2}, x_{1}^{p}, x_{2}^{p}\right) \bmod p$ factors for all $p \gg 0$.

### 89.23. Filtered derived category

0287 In order to do the exercises in this section, please read the material in Homology, Section 12.16 We will say $A$ is a filtered object of $\mathcal{A}$, to mean that $A$ comes endowed with a filtration $F$ which we omit from the notation.

0288 Exercise 89.23.1. Let $\mathcal{A}$ be an abelian category. Let $I$ be a filtered object of $\mathcal{A}$. Assume that the filtration on $I$ is finite and that each $\operatorname{gr}^{p}(I)$ is an injective object of $\mathcal{A}$. Show that there exists an isomorphism $I \cong \bigoplus \operatorname{gr}^{p}(I)$ with filtration $F^{p}(I)$ corresponding to $\bigoplus_{p^{\prime} \geq p} \operatorname{gr}^{p}(I)$.
0289 Exercise 89.23.2. Let $\mathcal{A}$ be an abelian category. Let $I$ be a filtered object of $\mathcal{A}$. Assume that the filtration on $I$ is finite. Show the following are equivalent:
(1) For any solid diagram

of filtered objects with (i) the filtrations on $A$ and $B$ are finite, and (ii) $\operatorname{gr}(\alpha)$ injective the dotted arrow exists making the diagram commute.
(2) Each $\operatorname{gr}^{p} I$ is injective.

Note that given a morphism $\alpha: A \rightarrow B$ of filtered objects with finite filtrations to say that $\operatorname{gr}(\alpha)$ injective is the same thing as saying that $\alpha$ is a strict monomorphism in the category $\operatorname{Fil}(\mathcal{A})$. Namely, being a monomorphism means $\operatorname{Ker}(\alpha)=0$ and strict means that this also implies $\operatorname{Ker}(\operatorname{gr}(\alpha))=0$. See Homology, Lemma 12.16.13. (We only use the term "injective" for a morphism in an abelian category, although it makes sense in any additive category having kernels.) The exercises above justifies the following definition.

028A Definition 89.23.3. Let $\mathcal{A}$ be an abelian category. Let $I$ be a filtered object of $\mathcal{A}$. Assume the filtration on $I$ is finite. We say $I$ is filtered injective if each $\operatorname{gr}^{p}(I)$ is an injective object of $\mathcal{A}$.
We make the following definition to avoid having to keep saying "with a finite filtration" everywhere.

028B Definition 89.23.4. Let $\mathcal{A}$ be an abelian category. We denote $F_{i l}{ }^{f}(\mathcal{A})$ the full subcategory of $\operatorname{Fil}(\mathcal{A})$ whose objects consist of those $A \in \operatorname{Ob}(\operatorname{Fil}(\mathcal{A}))$ whose filtration is finite.

028C Exercise 89.23.5. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let $A$ be an object of $\operatorname{Fil}^{f}(\mathcal{A})$. Show that there exists a strict monomorphism $\alpha: A \rightarrow I$ of $A$ into a filtered injective object $I$ of $\mathrm{Fil}^{f}(\mathcal{A})$.

028D Definition 89.23.6. Let $\mathcal{A}$ be an abelian category. Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of complexes of $\operatorname{Fil}(\mathcal{A})$. We say that $\alpha$ is a filtered quasi-isomorphism if for each $p \in \mathbf{Z}$ the morphism $\operatorname{gr}^{p}\left(K^{\bullet}\right) \rightarrow \operatorname{gr}^{p}\left(L^{\bullet}\right)$ is a quasi-isomorphism.
028E Definition 89.23.7. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex of $\operatorname{Fil}^{f}(\mathcal{A})$. We say that $K^{\bullet}$ is filtered acyclic if for each $p \in \mathbf{Z}$ the complex $\operatorname{gr}^{p}\left(K^{\bullet}\right)$ is acyclic.

028F Exercise 89.23.8. Let $\mathcal{A}$ be an abelian category. Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of bounded below complexes of $\operatorname{Fil}^{f}(\mathcal{A})$. (Note the superscript $f$.) Show that the following are equivalent:
(1) $\alpha$ is a filtered quasi-isomorphism,
(2) for each $p \in \mathbf{Z}$ the map $\alpha: F^{p} K^{\bullet} \rightarrow F^{p} L^{\bullet}$ is a quasi-isomorphism,
(3) for each $p \in \mathbf{Z}$ the map $\alpha: K^{\bullet} / F^{p} K^{\bullet} \rightarrow L^{\bullet} / F^{p} L^{\bullet}$ is a quasi-isomorphism, and
(4) the cone of $\alpha$ (see Derived Categories, Definition 13.9.1) is a filtered acyclic complex.
Moreover, show that if $\alpha$ is a filtered quasi-isomorphism then $\alpha$ is also a usual quasi-isomorphism.

028G Exercise 89.23.9. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let $A$ be an object of $\operatorname{Fil}^{f}(\mathcal{A})$. Show there exists a complex $I^{\bullet}$ of $\operatorname{Fil}^{f}(\mathcal{A})$, and a morphism $A[0] \rightarrow I^{\bullet}$ such that
(1) each $I^{p}$ is filtered injective,
(2) $I^{p}=0$ for $p<0$, and
(3) $A[0] \rightarrow I^{\bullet}$ is a filtered quasi-isomorphism.

028 H Exercise 89.23.10. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let $K^{\bullet}$ be a bounded below complex of objects of $\operatorname{Fil}^{f}(\mathcal{A})$. Show there exists a filtered quasi-isomorphism $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ a complex of $\operatorname{Fil}^{f}(\mathcal{A})$ having filtered injective terms $I^{n}$, and bounded below. In fact, we may choose $\alpha$ such that each $\alpha^{n}$ is a strict monomorphism.

028 I Exercise 89.23.11. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

of complexes of $\operatorname{Fil}^{f}(\mathcal{A})$. Assume $K^{\bullet}, L^{\bullet}$ and $I^{\bullet}$ are bounded below and assume each $I^{n}$ is a filtered injective object. Also assume that $\alpha$ is a filtered quasi-isomorphism.
(1) There exists a map of complexes $\beta$ making the diagram commute up to homotopy.
(2) If $\alpha$ is a strict monomorphism in every degree then we can find a $\beta$ which makes the diagram commute.
028J Exercise 89.23.12. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}, K^{\bullet}$ be complexes of $\operatorname{Fil}^{f}(\mathcal{A})$. Assume
(1) $K^{\bullet}$ bounded below and filtered acyclic, and
(2) $I^{\bullet}$ bounded below and consisting of filtered injective objects.

Then any morphism $K^{\bullet} \rightarrow I^{\bullet}$ is homotopic to zero.
028K Exercise 89.23.13. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

of complexes of $\operatorname{Fil}^{f}(\mathcal{A})$. Assume $K^{\bullet}, L^{\bullet}$ and $I^{\bullet}$ bounded below and each $I^{n}$ a filtered injective object. Also assume $\alpha$ a filtered quasi-isomorphism. Any two morphisms $\beta_{1}, \beta_{2}$ making the diagram commute up to homotopy are homotopic.

### 89.24. Regular functions

078W Exercise 89.24.1. In this exercise we try to see what happens with regular functions over non-algebraically closed fields. Let $k$ be a field. Let $Z \subset k^{n}$ be a Zariski locally closed subset, i.e., there exist ideals $I \subset J \subset k\left[x_{1}, \ldots, x_{n}\right]$ such that

$$
Z=\left\{a \in k^{n} \mid f(a)=0 \forall f \in I, \exists g \in J, g(a) \neq 0\right\}
$$

A function $\varphi: Z \rightarrow k$ is said to be regular if for every $z \in Z$ there exists a Zariski open neighbourhood $z \in U \subset Z$ and polynomials $f, g \in k\left[x_{1}, \ldots, x_{n}\right]$ such that $g(u) \neq 0$ for all $u \in U$ and such that $\varphi(u)=f(u) / g(u)$ for all $u \in U$.
(1) If $k=\bar{k}$ and $Z=k^{n}$ show that regular functions are given by polynomials. (Only do this if you haven't seen this argument before.)
(2) If $k$ is finite show that (a) every function $\varphi$ is regular, (b) the ring of regular functions is finite dimensional over $k$. (If you like you can take $Z=k^{n}$ and even $n=1$.)
(3) If $k=\mathbf{R}$ give an example of a regular function on $Z=\mathbf{R}$ which is not given by a polynomial.
(4) If $k=\mathbf{Q}_{p}$ give an example of a regular function on $Z=\mathbf{Q}_{p}$ which is not given by a polynomial.

### 89.25. Sheaves

028L A morphism $f: X \rightarrow Y$ of a category $\mathcal{C}$ is an monomorphism if for every pair of morphisms $a, b: W \rightarrow X$ we have $f \circ a=f \circ b \Rightarrow a=b$. A monomorphism in the category of sets is an injective map of sets.

078X Exercise 89.25.1. Carefully prove that a map of sheaves of sets is an monomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are injective.
A morphism $f: X \rightarrow Y$ of a category $\mathcal{C}$ is an isomorphism if there exists a morphism $g: Y \rightarrow X$ such that $f \circ g=\operatorname{id}_{Y}$ and $g \circ f=\operatorname{id}_{X}$. An isomorphism in the category of sets is a bijective map of sets.

078Y Exercise 89.25.2. Carefully prove that a map of sheaves of sets is an isomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are bijective.

A morphism $f: X \rightarrow Y$ of a category $\mathcal{C}$ is an epimorphism if for every pair of morphisms $a, b: Y \rightarrow Z$ we have $a \circ f=b \circ f \Rightarrow a=b$. An epimorphism in the category of sets is a surjective map of sets.
02EU Exercise 89.25.3. Carefully prove that a map of sheaves of sets is an epimorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are surjective.

02EV Exercise 89.25.4. Let $f: X \rightarrow Y$ be a map of topological spaces. Prove pushforward $f_{*}$ and pullback $f^{-1}$ for sheaves of sets form an adjoint pair of functors.

02EW Exercise 89.25.5. Let $j: U \rightarrow X$ be an open immersion. Show that $j^{-1}$ has a left adjoint $j$ ! on the category of sheaves of sets. Characterize the stalks of $j_{!}(\mathcal{G})$. (Hint: $j_{!}$is called extension by zero when you do this for abelian sheaves... )

028 M Exercise 89.25.6. Let $X=\mathbf{R}$ with the usual topology. Let $\mathcal{O}_{X}=\underline{\mathbf{Z} / 2 \mathbf{Z}}{ }_{X}$. Let $i: Z=\{0\} \rightarrow X$ be the inclusion and let $\mathcal{O}_{Z}=\underline{\mathbf{Z} / 2 \mathbf{Z}}{ }_{Z}$. Prove the following (the first three follow from the definitions but if you are not clear on the definitions you should elucidate them):
(1) $i_{*} \mathcal{O}_{Z}$ is a skyscraper sheaf.
(2) There is a canonical surjective map from $\underline{\mathbf{Z} / 2 \mathbf{Z}} X X i_{*} \underline{\mathbf{Z} / 2 \mathbf{Z}}{ }_{Z}$. Denote the kernel $\mathcal{I} \subset \mathcal{O}_{X}$.
(3) $\mathcal{I}$ is an ideal sheaf of $\mathcal{O}_{X}$.
(4) The sheaf $\mathcal{I}$ on $X$ cannot be locally generated by sections (as in Modules, Definition 17.8.1.)

028N Exercise 89.25.7. Let $X$ be a topological space. Let $\mathcal{F}$ be an abelian sheaf on $X$. Show that $\mathcal{F}$ is the quotient of a (possibly very large) direct sum of sheaves all of whose terms are of the form

$$
j_{!}\left(\underline{\mathbf{Z}}_{U}\right)
$$

where $U \subset X$ is open and $\underline{\mathbf{Z}}_{U}$ denotes the constant sheaf with value $\mathbf{Z}$ on $U$.
02EX Remark 89.25.8. Let $X$ be a topological space. In the category of abelian sheaves the direct sum of a family of sheaves $\left\{\mathcal{F}_{i}\right\}_{i \in I}$ is the sheaf associated to the presheaf $U \mapsto \oplus \mathcal{F}_{i}(U)$. Consequently the stalk of the direct sum at a point $x$ is the direct sum of the stalks of the $\mathcal{F}_{i}$ at $x$.

078Z Exercise 89.25.9. Let $X$ be a topological space. Suppose we are given a collection of abelian groups $A_{x}$ indexed by $x \in X$. Show that the rule $U \mapsto \prod_{x \in U} A_{x}$ with obvious restriction mappings defines a sheaf $\mathcal{G}$ of abelian groups. Show, by an example, that usually it is not the case that $\mathcal{G}_{x}=A_{x}$ for $x \in X$.

0790 Exercise 89.25.10. Let $X, A_{x}, \mathcal{G}$ be as in Exercise 89.25.9. Let $\mathcal{B}$ be a basis for the topology of $X$, see Topology, Definition 5.4.1. For $U \in \mathcal{B}$ let $A_{U}$ be a subgroup $A_{U} \subset \mathcal{G}(U)=\prod_{x \in U} A_{x}$. Assume that for $U \subset V$ with $U, V \in \mathcal{B}$ the restriction maps $A_{V}$ into $A_{U}$. For $U \subset X$ open set

$$
\mathcal{F}(U)=\left\{\begin{array}{l|l}
\left(s_{x}\right)_{x \in U} & \begin{array}{l}
\text { for every } x \text { in } U \text { there exists } V \in \mathcal{B} \\
x \in V \subset U \text { such that }\left(s_{y}\right)_{y \in V} \in A_{V}
\end{array}
\end{array}\right\}
$$

Show that $\mathcal{F}$ defines a sheaf of abelian groups on $X$. Show, by an example, that it is usually not the case that $\mathcal{F}(U)=A_{U}$ for $U \in \mathcal{B}$.

### 89.26. Schemes

0280 Let $L R S$ be the category of locally ringed spaces. An affine scheme is an object in $L R S$ isomorphic in $L R S$ to a pair of the form $\left(\operatorname{Spec}(A), \mathcal{O}_{\operatorname{Spec}(A)}\right)$. A scheme is an object $\left(X, \mathcal{O}_{X}\right)$ of $L R S$ such that every point $x \in X$ has an open neighbourhood $U \subset X$ such that the pair $\left(U,\left.\mathcal{O}_{X}\right|_{U}\right)$ is an affine scheme.

028P Exercise 89.26.1. Find a 1-point locally ringed space which is not a scheme.
028Q Exercise 89.26.2. Suppose that $X$ is a scheme whose underlying topological space has 2 points. Show that $X$ is an affine scheme.

03KB Exercise 89.26.3. Suppose that $X$ is a scheme whose underlying topological space is a finite discrete set. Show that $X$ is an affine scheme.
028R Exercise 89.26.4. Show that there exists a non-affine scheme having three points.
028S Exercise 89.26.5. Suppose that $X$ is a quasi-compact scheme. Show that $X$ has a closed point.
02EY Remark 89.26.6. When $\left(X, \mathcal{O}_{X}\right)$ is a ringed space and $U \subset X$ is an open subset then $\left(U,\left.\mathcal{O}_{X}\right|_{U}\right)$ is a ringed space. Notation: $\mathcal{O}_{U}=\left.\mathcal{O}_{X}\right|_{U}$. There is a canonical morphisms of ringed spaces

$$
j:\left(U, \mathcal{O}_{U}\right) \longrightarrow\left(X, \mathcal{O}_{X}\right)
$$

If $\left(X, \mathcal{O}_{X}\right)$ is a locally ringed space, so is $\left(U, \mathcal{O}_{U}\right)$ and $j$ is a morphism of locally ringed spaces. If $\left(X, \mathcal{O}_{X}\right)$ is a scheme so is $\left(U, \mathcal{O}_{U}\right)$ and $j$ is a morphism of schemes. We say that $\left(U, \mathcal{O}_{U}\right)$ is an open subscheme of $\left(X, \mathcal{O}_{X}\right)$ and that $j$ is an open immersion. More generally, any morphism $j^{\prime}:\left(V, \mathcal{O}_{V}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ that is isomorphic to a morphism $j:\left(U, \mathcal{O}_{U}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ as above is called an open immersion.
028T Exercise 89.26.7. Give an example of an affine scheme $\left(X, \mathcal{O}_{X}\right)$ and an open $U \subset X$ such that $\left(U, \mathcal{O}_{X} \mid U\right)$ is not an affine scheme.
028 U Exercise 89.26.8. Given an example of a pair of affine schemes $\left(X, \mathcal{O}_{X}\right),\left(Y, \mathcal{O}_{Y}\right)$, an open subscheme $\left(U,\left.\mathcal{O}_{X}\right|_{U}\right)$ of $X$ and a morphism of schemes $\left(U,\left.\mathcal{O}_{X}\right|_{U}\right) \rightarrow$ $\left(Y, \mathcal{O}_{Y}\right)$ that does not extend to a morphism of schemes $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$.
028V Exercise 89.26.9. (This is pretty hard.) Given an example of a scheme $X$, and open subscheme $U \subset X$ and a closed subscheme $Z \subset U$ such that $Z$ does not extend to a closed subscheme of $X$.
028W Exercise 89.26.10. Give an example of a scheme $X$, a field $K$, and a morphism of ringed spaces $\operatorname{Spec}(K) \rightarrow X$ which is NOT a morphism of schemes.
028X Exercise 89.26.11. Do all the exercises in Har77, Chapter II], Sections 1 and 2... Just kidding!

028Y Definition 89.26.12. A scheme $X$ is called integral if $X$ is nonempty and for every nonempty affine open $U \subset X$ the ring $\Gamma\left(U, \mathcal{O}_{X}\right)=\mathcal{O}_{X}(U)$ is a domain.
028Z Exercise 89.26.13. Give an example of a morphism of integral schemes $f: X \rightarrow Y$ such that the induced maps $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ are surjective for all $x \in X$, but $f$ is not a closed immersion.
0290 Exercise 89.26.14. Give an example of a fibre product $X \times{ }_{S} Y$ such that $X$ and $Y$ are affine but $X \times_{S} Y$ is not.
02EZ Remark 89.26.15. It turns out this cannot happen with $S$ separated. Do you know why?
0291 Exercise 89.26.16. Give an example of a scheme $V$ which is integral 1-dimensional scheme of finite type over $\mathbf{Q}$ such that $\operatorname{Spec}(\mathbf{C}) \times{ }_{\operatorname{Spec}(\mathbf{Q})} V$ is not integral.
0292 Exercise 89.26.17. Give an example of a scheme $V$ which is integral 1-dimensional scheme of finite type over a field $k$ such that $\operatorname{Spec}\left(k^{\prime}\right) \times_{\operatorname{Spec}(k)} V$ is not reduced for some finite field extension $k \subset k^{\prime}$.
02F0 Remark 89.26.18. If your scheme is affine then dimension is the same as the Krull dimension of the underlying ring. So you can use last semesters results to compute dimension.

### 89.27. Morphisms

0293 An important question is, given a morphism $\pi: X \rightarrow S$, whether the morphism has a section or a rational section. Here are some example exercises.
0294 Exercise 89.27.1. Consider the morphism of schemes

$$
\pi: X=\operatorname{Spec}(\mathbf{C}[x, t, 1 / x t]) \longrightarrow S=\operatorname{Spec}(\mathbf{C}[t])
$$

(1) Show there does not exist a morphism $\sigma: S \rightarrow X$ such that $\pi \circ \sigma=\mathrm{id}_{U}$.
(2) Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma: U \rightarrow X$ such that $\pi \circ \sigma=\mathrm{id}_{U}$.

0295
Exercise 89.27.2. Consider the morphism of schemes

$$
\pi: X=\operatorname{Spec}\left(\mathbf{C}[x, t] /\left(x^{2}+t\right)\right) \longrightarrow S=\operatorname{Spec}(\mathbf{C}[t])
$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma: U \rightarrow X$ such that $\pi \circ \sigma=\operatorname{id}_{U}$.
0296 Exercise 89.27.3. Let $A, B, C \in \mathbf{C}[t]$ be nonzero polynomials. Consider the morphism of schemes

$$
\pi: X=\operatorname{Spec}\left(\mathbf{C}[x, y, t] /\left(A+B x^{2}+C y^{2}\right)\right) \longrightarrow S=\operatorname{Spec}(\mathbf{C}[t])
$$

Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma: U \rightarrow X$ such that $\pi \circ \sigma=\mathrm{id}_{U}$. (Hint: Symbolically, write $x=X / Z, y=Y / Z$ for some $X, Y, Z \in \mathbf{C}[t]$ of degree $\leq d$ for some $d$, and work out the condition that this solves the equation. Then show, using dimension theory, that if $d \gg 0$ you can find nonzero $X, Y, Z$ solving the equation.)
02F1 Remark 89.27.4. Exercise 89.27 .3 is a special case of "Tsen's theorem". Exercise 89.27.5 shows that the method is limited to low degree equations (conics when the base and fibre have dimension 1).
0297 Exercise 89.27.5. Consider the morphism of schemes

$$
\pi: X=\operatorname{Spec}\left(\mathbf{C}[x, y, t] /\left(1+t x^{3}+t^{2} y^{3}\right)\right) \longrightarrow S=\operatorname{Spec}(\mathbf{C}[t])
$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma: U \rightarrow X$ such that $\pi \circ \sigma=\mathrm{id}_{U}$.

0298 Exercise 89.27.6. Consider the schemes
$X=\operatorname{Spec}\left(\mathbf{C}\left[\left\{x_{i}\right\}_{i=1}^{8}, s, t\right] /\left(1+s x_{1}^{3}+s^{2} x_{2}^{3}+t x_{3}^{3}+s t x_{4}^{3}+s^{2} t x_{5}^{3}+t^{2} x_{6}^{3}+s t^{2} x_{7}^{3}+s^{2} t^{2} x_{8}^{3}\right)\right)$
and

$$
S=\operatorname{Spec}(\mathbf{C}[s, t])
$$

and the morphism of schemes

$$
\pi: X \longrightarrow S
$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma: U \rightarrow X$ such that $\pi \circ \sigma=\mathrm{id}_{U}$.
0299 Exercise 89.27.7. (For the number theorists.) Give an example of a closed subscheme

$$
Z \subset \operatorname{Spec}\left(\mathbf{Z}\left[x, \frac{1}{x(x-1)(2 x-1)}\right]\right)
$$

such that the morphism $Z \rightarrow \operatorname{Spec}(\mathbf{Z})$ is finite and surjective.

029A Exercise 89.27.8. If you do not like number theory, you can try the variant where you look at

$$
\operatorname{Spec}\left(\mathbf{F}_{p}\left[t, x, \frac{1}{x(x-t)(t x-1)}\right]\right) \longrightarrow \operatorname{Spec}\left(\mathbf{F}_{p}[t]\right)
$$

and you try to find a closed subscheme of the top scheme which maps finite surjectively to the bottom one. (There is a theoretical reason for having a finite ground field here; although it may not be necessary in this particular case.)

02F2 Remark 89.27.9. The interpretation of the results of Exercise 89.27.7 and 89.27.8 is that given the morphism $X \rightarrow S$ all of whose fibres are nonempty, there exists a finite surjective morphism $S^{\prime} \rightarrow S$ such that the base change $X_{S^{\prime}} \rightarrow S^{\prime}$ does have a section. This is not a general fact, but it holds if the base is the spectrum of a dedekind ring with finite residue fields at closed points, and the morphism $X \rightarrow S$ is flat with geometrically irreducible generic fibre. See Exercise 89.27 .10 below for an example where it doesn't work.

029B Exercise 89.27.10. Prove there exist a $f \in \mathbf{C}[x, t]$ which is not divisible by $t-\alpha$ for any $\alpha \in \mathbf{C}$ such that there does not exist any $Z \subset \operatorname{Spec}(\mathbf{C}[x, t, 1 / f])$ which maps finite surjectively to $\operatorname{Spec}(\mathbf{C}[t]$ ). (I think that $f(x, t)=(x t-2)(x-t+3)$ works. To show any candidate has the required property is not so easy I think.)

### 89.28. Tangent Spaces

029C
029D Definition 89.28.1. For any ring $R$ we denote $R[\epsilon]$ the ring of dual numbers. As an $R$-module it is free with basis $1, \epsilon$. The ring structure comes from setting $\epsilon^{2}=0$.

029E Exercise 89.28.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point, let $s=f(x)$. Consider the solid commutative diagram

with the curved arrow being the canonical morphism of $\operatorname{Spec}(\kappa(x))$ into $X$. If $\kappa(x)=\kappa(s)$ show that the set of dotted arrows which make the diagram commute are in one to one correspondence with the set of linear maps

$$
\operatorname{Hom}_{\kappa(x)}\left(\frac{\mathfrak{m}_{x}}{\mathfrak{m}_{x}^{2}+\mathfrak{m}_{s} \mathcal{O}_{X, x}}, \kappa(x)\right)
$$

In other words: describe such a bijection. (This works more generally if $\kappa(x) \supset \kappa(s)$ is a separable algebraic extension.)

029F Definition 89.28.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. We dub the set of dotted arrows of Exercise 89.28.2 the tangent space of $X$ over $S$ and we denote it $T_{X / S, x}$. An element of this space is called a tangent vector of $X / S$ at $x$.

029G Exercise 89.28.4. For any field $K$ prove that the diagram

is a pushout diagram in the category of schemes. (Here $\epsilon_{i}^{2}=0$ as before.)
029 H Exercise 89.28.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Define addition of tangent vectors, using Exercise 89.28 .4 and a suitable morphism

$$
\operatorname{Spec}(K[\epsilon]) \longrightarrow \operatorname{Spec}\left(K\left[\epsilon_{1}, \epsilon_{2}\right] /\left(\epsilon_{1} \epsilon_{2}\right)\right) .
$$

Similarly, define scalar multiplication of tangent vectors (this is easier). Show that $T_{X / S, x}$ becomes a $\kappa(x)$-vector space with your constructions.

029I Exercise 89.28.6. Let $k$ be a field. Consider the structure morphism $f: X=$ $\mathbf{A}_{k}^{1} \rightarrow \operatorname{Spec}(k)=S$.
(1) Let $x \in X$ be a closed point. What is the dimension of $T_{X / S, x}$ ?
(2) Let $\eta \in X$ be the generic point. What is the dimension of $T_{X / S, \eta}$ ?
(3) Consider now $X$ as a scheme over $\operatorname{Spec}(\mathbf{Z})$. What are the dimensions of $T_{X / \mathbf{Z}, x}$ and $T_{X / \mathbf{Z}, \eta} ?$
02F3 Remark 89.28.7. Exercise 89.28.6 explains why it is necessary to consider the tangent space of $X$ over $S$ to get a good notion.

029J Exercise 89.28.8. Consider the morphism of schemes

$$
f: X=\operatorname{Spec}\left(\mathbf{F}_{p}(t)\right) \longrightarrow \operatorname{Spec}\left(\mathbf{F}_{p}\left(t^{p}\right)\right)=S
$$

Compute the tangent space of $X / S$ at the unique point of $X$. Isn't that weird? What do you think happens if you take the morphism of schemes corresponding to $\mathbf{F}_{p}\left[t^{p}\right] \rightarrow \mathbf{F}_{p}[t]$ ?
029K Exercise 89.28.9. Let $k$ be a field. Compute the tangent space of $X / k$ at the point $x=(0,0)$ where $X=\operatorname{Spec}\left(k[x, y] /\left(x^{2}-y^{3}\right)\right)$.

029L Exercise 89.28.10. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Let $x \in X$ be a point. Set $y=f(x)$. Assume that the natural map $\kappa(y) \rightarrow \kappa(x)$ is bijective. Show, using the definition, that $f$ induces a natural linear map

$$
\mathrm{d} f: T_{X / S, x} \longrightarrow T_{Y / S, y}
$$

Match it with what happens on local rings via Exercise 89.28.2 in case $\kappa(x)=\kappa(s)$.
029M Exercise 89.28.11. Let $k$ be an algebraically closed field. Let

$$
\begin{aligned}
f: \mathbf{A}_{k}^{n} & \longrightarrow \mathbf{A}_{k}^{m} \\
\left(x_{1}, \ldots, x_{n}\right) & \longmapsto\left(f_{1}\left(x_{i}\right), \ldots, f_{m}\left(x_{i}\right)\right)
\end{aligned}
$$

be a morphism of schemes over $k$. This is given by $m$ polynomials $f_{1}, \ldots, f_{m}$ in $n$ variables. Consider the matrix

$$
A=\left(\frac{\partial f_{j}}{\partial x_{i}}\right)
$$

Let $x \in \mathbf{A}_{k}^{n}$ be a closed point. Set $y=f(x)$. Show that the map on tangent spaces $T_{\mathbf{A}_{k}^{n} / k, x} \rightarrow T_{\mathbf{A}_{k}^{m} / k, y}$ is given by the value of the matrix $A$ at the point $x$.

### 89.29. Quasi-coherent Sheaves

029N
029 Definition 89.29.1. Let $X$ be a scheme. A sheaf $\mathcal{F}$ of $\mathcal{O}_{X}$-modules is quasicoherent if for every affine open $\operatorname{Spec}(R)=U \subset X$ the restriction $\left.\mathcal{F}\right|_{U}$ is of the form $\widetilde{M}$ for some $R$-module $M$.

It is enough to check this conditions on the members of an affine open covering of $X$. See Schemes, Section 25.24 for more results.
029P Definition 89.29.2. Let $X$ be a topological space. Let $x, x^{\prime} \in X$. We say $x$ is a specialization of $x^{\prime}$ if and only if $x \in \overline{\left\{x^{\prime}\right\}}$.
029Q Exercise 89.29.3. Let $X$ be a scheme. Let $x, x^{\prime} \in X$. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. Suppose that (a) $x$ is a specialization of $x^{\prime}$ and (b) $\mathcal{F}_{x^{\prime}} \neq 0$. Show that $\mathcal{F}_{x} \neq 0$.
029R Exercise 89.29.4. Find an example of a scheme $X$, points $x, x^{\prime} \in X$, a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ such that (a) $x$ is a specialization of $x^{\prime}$ and (b) $\mathcal{F}_{x^{\prime}} \neq 0$ and $\mathcal{F}_{x}=0$.

029S Definition 89.29.5. A scheme $X$ is called locally Noetherian if and only if for every point $x \in X$ there exists an affine open $\operatorname{Spec}(R)=U \subset X$ such that $R$ is Noetherian. A scheme is Noetherian if it is locally Noetherian and quasi-compact.

If $X$ is locally Noetherian then any affine open of $X$ is the spectrum of a Noetherian ring, see Properties, Lemma 27.5.2.

029T Definition 89.29.6. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasicoherent sheaf of $\mathcal{O}_{X}$-modules. We say $\mathcal{F}$ is coherent if for every point $x \in X$ there exists an affine open $\operatorname{Spec}(R)=U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is isomorphic to $\widetilde{M}$ for some finite $R$-module $M$.

029 U Exercise 89.29.7. Let $X=\operatorname{Spec}(R)$ be an affine scheme.
(1) Let $f \in R$. Let $\mathcal{G}$ be a quasi-coherent sheaf of $\mathcal{O}_{D(f)}$-modules on the open subscheme $D(f)$. Show that $\mathcal{G}=\left.\mathcal{F}\right|_{U}$ for some quasi-coherent sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$.
(2) Let $I \subset R$ be an ideal. Let $i: Z \rightarrow X$ be the closed subscheme of $X$ corresponding to $I$. Let $\mathcal{G}$ be a quasi-coherent sheaf of $\mathcal{O}_{Z}$-modules on the closed subscheme $Z$. Show that $\mathcal{G}=i^{*} \mathcal{F}$ for some quasi-coherent sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$. (Why is this silly?)
(3) Assume that $R$ is Noetherian. Let $f \in R$. Let $\mathcal{G}$ be a coherent sheaf of $\mathcal{O}_{D(f)}$-modules on the open subscheme $D(f)$. Show that $\mathcal{G}=\left.\mathcal{F}\right|_{U}$ for some coherent sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$.

029V Remark 89.29.8. If $U \rightarrow X$ is a quasi-compact immersion then any quasicoherent sheaf on $U$ is the restriction of a quasi-coherent sheaf on $X$. If $X$ is a Noetherian scheme, and $U \subset X$ is open, then any coherent sheaf on $U$ is the restriction of a coherent sheaf on $X$. Of course the exercise above is easier, and shouldn't use these general facts.

### 89.30. Proj and projective schemes

029W

029X Exercise 89.30.1. Give examples of graded rings $S$ such that
(1) $\operatorname{Proj}(S)$ is affine and nonempty, and
(2) $\operatorname{Proj}(S)$ is integral, nonempty but not isomorphic to $\mathbf{P}_{A}^{n}$ for any $n \geq 0$, any ring $A$.

029Y Exercise 89.30.2. Give an example of a nonconstant morphism of schemes $\mathbf{P}_{\mathbf{C}}^{1} \rightarrow$ $\mathbf{P}_{\mathbf{C}}^{5}$ over $\operatorname{Spec}(\mathbf{C})$.

029Z Exercise 89.30.3. Give an example of an isomorphism of schemes

$$
\mathbf{P}_{\mathbf{C}}^{1} \rightarrow \operatorname{Proj}\left(\mathbf{C}\left[X_{0}, X_{1}, X_{2}\right] /\left(X_{0}^{2}+X_{1}^{2}+X_{2}^{2}\right)\right)
$$

02A0 Exercise 89.30.4. Give an example of a morphism of schemes $f: X \rightarrow \mathbf{A}_{\mathbf{C}}^{1}=$ $\operatorname{Spec}(\mathbf{C}[T])$ such that the (scheme theoretic) fibre $X_{t}$ of $f$ over $t \in \mathbf{A}_{\mathbf{C}}^{1}$ is (a) isomorphic to $\mathbf{P}_{\mathbf{C}}^{1}$ when $t$ is a closed point not equal to 0 , and (b) not isomorphic to $\mathbf{P}_{\mathbf{C}}^{1}$ when $t=0$. We will call $X_{0}$ the special fibre of the morphism. This can be done in many, many ways. Try to give examples that satisfy (each of) the following additional restraints (unless it isn't possible):
(1) Can you do it with special fibre projective?
(2) Can you do it with special fibre irreducible and projective?
(3) Can you do it with special fibre integral and projective?
(4) Can you do it with special fibre smooth and projective?
(5) Can you do it with $f$ a flat morphism? This just means that for every affine open $\operatorname{Spec}(A) \subset X$ the induced ring map $\mathbf{C}[t] \rightarrow A$ is flat, which in this case means that any nonzero polynomial in $t$ is a nonzerodivisor on A.
(6) Can you do it with $f$ a flat and projective morphism?
(7) Can you do it with $f$ flat, projective and special fibre reduced?
(8) Can you do it with $f$ flat, projective and special fibre irreducible?
(9) Can you do it with $f$ flat, projective and special fibre integral?

What do you think happens when you replace $\mathbf{P}_{\mathbf{C}}^{1}$ with another variety over $\mathbf{C}$ ? (This can get very hard depending on which of the variants above you ask for.)

02A1 Exercise 89.30.5. Let $n \geq 1$ be any positive integer. Give an example of a surjective morphism $X \rightarrow \mathbf{P}_{\mathbf{C}}^{n}$ with $X$ affine.
02A2 Exercise 89.30.6. Maps of Proj. Let $R$ and $S$ be graded rings. Suppose we have a ring map

$$
\psi: R \rightarrow S
$$

and an integer $e \geq 1$ such that $\psi\left(R_{d}\right) \subset S_{d e}$ for all $d \geq 0$. (By our conventions this is not a homomorphism of graded rings, unless $e=1$.)
(1) For which elements $\mathfrak{p} \in \operatorname{Proj}(S)$ is there a well-defined corresponding point in $\operatorname{Proj}(R)$ ? In other words, find a suitable open $U \subset \operatorname{Proj}(S)$ such that $\psi$ defines a continuous map $r_{\psi}: U \rightarrow \operatorname{Proj}(R)$.
(2) Give an example where $U \neq \operatorname{Proj}(S)$.
(3) Give an example where $U=\operatorname{Proj}(S)$.
(4) (Do not write this down.) Convince yourself that the continuous map $U \rightarrow \operatorname{Proj}(R)$ comes canonically with a map on sheaves so that $r_{\psi}$ is a morphism of schemes:

$$
\operatorname{Proj}(S) \supset U \longrightarrow \operatorname{Proj}(R)
$$

(5) What can you say about this map if $R=\bigoplus_{d \geq 0} S_{d e}$ (as a graded ring with $S_{e}, S_{2 e}$, etc in degree 1,2 , etc) and $\psi$ is the inclusion mapping?

Notation. Let $R$ be a graded ring as above and let $n \geq 0$ be an integer. Let $X=\operatorname{Proj}(R)$. Then there is a unique quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{O}_{X}(n)$ on $X$ such that for every homogeneous element $f \in R$ of positive degree we have $\left.\mathcal{O}_{X}\right|_{D_{+}(f)}$ is the quasi-coherent sheaf associated to the $R_{(f)}=\left(R_{f}\right)_{0}$-module $\left(R_{f}\right)_{n}$ (=elements homogeneous of degree $n$ in $R_{f}=R[1 / f]$ ). See [Har77, page 116+]. Note that there are natural maps

$$
\mathcal{O}_{X}\left(n_{1}\right) \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}\left(n_{2}\right) \longrightarrow \mathcal{O}_{X}\left(n_{1}+n_{2}\right)
$$

02A3 Exercise 89.30.7. Pathologies in Proj. Give examples of $R$ as above such that
(1) $\mathcal{O}_{X}(1)$ is not an invertible $\mathcal{O}_{X}$-module.
(2) $\mathcal{O}_{X}(1)$ is invertible, but the natural map $\mathcal{O}_{X}(1) \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(1) \rightarrow \mathcal{O}_{X}(2)$ is NOT an isomorphism.

02A4 Exercise 89.30.8. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. Show that any finite set of points of $X$ is contained in a standard affine open.

02A5 Exercise 89.30.9. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. Let $Z, Z^{\prime} \subset X$ be two closed subschemes. Let $\varphi: Z \rightarrow Z^{\prime}$ be an isomorphism. Assume $Z \cap Z^{\prime}=\emptyset$. Show that for any $z \in Z$ there exists an affine open $U \subset X$ such that $z \in U$, $\varphi(z) \in U$ and $\varphi(Z \cap U)=Z^{\prime} \cap U$. (Hint: Use Exercise 89.30.8 and something akin to Schemes, Lemma 25.11.5)

### 89.31. Morphisms from surfaces to curves

02A6
02A7 Exercise 89.31.1. Let $R$ be a ring. Let $R \rightarrow k$ be a map from $R$ to a field. Let $n \geq 0$. Show that

$$
\operatorname{Mor}_{\operatorname{Spec}(R)}\left(\operatorname{Spec}(k), \mathbf{P}_{R}^{n}\right)=\left(k^{n+1} \backslash\{0\}\right) / k^{*}
$$

where $k^{*}$ acts via scalar multiplication on $k^{n+1}$. From now on we denote $\left(x_{0}\right.$ : $\left.\ldots: x_{n}\right)$ the morphism $\operatorname{Spec}(k) \rightarrow \mathbf{P}_{k}^{n}$ corresponding to the equivalence class of the element $\left(x_{0}, \ldots, x_{n}\right) \in k^{n+1} \backslash\{0\}$.

02A8 Exercise 89.31.2. Let $k$ be a field. Let $Z \subset \mathbf{P}_{k}^{2}$ be a irreducible closed subscheme. Show that either (a) $Z$ is a closed point, or (b) there exists an homogeneous irreducible $F \in k\left[X_{0}, X_{1}, X_{2}\right]$ of degree $>0$ such that $Z=V_{+}(F)$, or (c) $Z=\mathbf{P}_{k}^{2}$. (Hint: Look on a standard affine open.)

02A9 Exercise 89.31.3. Let $k$ be a field. Let $Z_{1}, Z_{2} \subset \mathbf{P}_{k}^{2}$ be irreducible closed subschemes of the form $V_{+}(F)$ for some homogeneous irreducible $F_{i} \in k\left[X_{0}, X_{1}, X_{2}\right]$ of degree $>0$. Show that $Z_{1} \cap Z_{2}$ is not empty. (Hint: Use dimension theory to estimate the dimension of the local ring of $k\left[X_{0}, X_{1}, X_{2}\right] /\left(F_{1}, F_{2}\right)$ at 0 .)

02AA Exercise 89.31.4. Show there does not exist a nonconstant morphism of schemes $\mathbf{P}_{\mathbf{C}}^{2} \rightarrow \mathbf{P}_{\mathbf{C}}^{1}$ over $\operatorname{Spec}(\mathbf{C})$. Here a constant morphism is one whose image is a single point. (Hint: If the morphism is not constant consider the fibres over 0 and $\infty$ and argue that they have to meet to get a contradiction.)

02AB Exercise 89.31.5. Let $k$ be a field. Suppose that $X \subset \mathbf{P}_{k}^{3}$ is a closed subscheme given by a single homogeneous equation $F \in k\left[X_{0}, X_{1}, X_{2}, X_{3}\right]$. In other words,

$$
X=\operatorname{Proj}\left(k\left[X_{0}, X_{1}, X_{2}, X_{3}\right] /(F)\right) \subset \mathbf{P}_{k}^{3}
$$

as explained in the course. Assume that

$$
F=X_{0} G+X_{1} H
$$

for some homogeneous polynomials $G, H \in k\left[X_{0}, X_{1}, X_{2}, X_{3}\right]$ of positive degree. Show that if $X_{0}, X_{1}, G, H$ have no common zeros then there exists a nonconstant morphism

$$
X \longrightarrow \mathbf{P}_{k}^{1}
$$

of schemes over $\operatorname{Spec}(k)$ which on field points (see Exercise 89.31.1) looks like $\left(x_{0}: x_{1}: x_{2}: x_{3}\right) \mapsto\left(x_{0}: x_{1}\right)$ whenever $x_{0}$ or $x_{1}$ is not zero.

### 89.32. Invertible sheaves

02AC
02AD Definition 89.32.1. Let $X$ be a locally ringed space. An invertible $\mathcal{O}_{X}$-module on $X$ is a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{L}$ such that every point has an open neighbourhood $U \subset X$ such that $\left.\mathcal{L}\right|_{U}$ is isomorphic to $\mathcal{O}_{U}$ as $\mathcal{O}_{U}$-module. We say that $\mathcal{L}$ is trivial if it is isomorphic to $\mathcal{O}_{X}$ as a $\mathcal{O}_{X}$-module.

02AE Exercise 89.32.2. General facts.
(1) Show that an invertible $\mathcal{O}_{X}$-module on a scheme $X$ is quasi-coherent.
(2) Suppose $X \rightarrow Y$ is a morphism of ringed spaces, and $\mathcal{L}$ an invertible $\mathcal{O}_{Y}$-module. Show that $f^{*} \mathcal{L}$ is an invertible $\mathcal{O}_{X}$ module.

02AF Exercise 89.32.3. Algebra.
(1) Show that an invertible $\mathcal{O}_{X}$-module on an affine scheme $\operatorname{Spec}(A)$ corresponds to an $A$-module $M$ which is (i) finite, (ii) projective, (iii) locally free of rank 1, and hence (iv) flat, and (v) finitely presented. (Feel free to quote things from last semesters course; or from algebra books.)
(2) Suppose that $A$ is a domain and that $M$ is a module as in (a). Show that $M$ is isomorphic as an $A$-module to an ideal $I \subset A$ such that $I A_{\mathfrak{p}}$ is principal for every prime $\mathfrak{p}$.

02AG Definition 89.32.4. Let $R$ be a ring. An invertible module $M$ is an $R$-module $M$ such that $\widetilde{M}$ is an invertible sheaf on the spectrum of $R$. We say $M$ is trivial if $M \cong R$ as an $R$-module.

In other words, $M$ is invertible if and only if it satisfies all of the following conditions: it is flat, of finite presentation, projective, and locally free of rank 1. (Of course it suffices for it to be locally free of rank 1 ).

02AH Exercise 89.32.5. Simple examples.
$02 \mathrm{AI} \quad(1)$ Let $k$ be a field. Let $A=k[x]$. Show that $X=\operatorname{Spec}(A)$ has only trivial invertible $\mathcal{O}_{X}$-modules. In other words, show that every invertible $A$ module is free of rank 1 .

02AJ (2) Let $A$ be the ring

$$
A=\{f \in k[x] \mid f(0)=f(1)\}
$$

Show there exists a nontrivial invertible $A$-module, unless $k=\mathbf{F}_{2}$. (Hint: Think about $\operatorname{Spec}(A)$ as identifying 0 and 1 in $\mathbf{A}_{k}^{1}=\operatorname{Spec}(k[x])$.)
02AK (3) Same question as in (2) for the ring $A=k\left[x^{2}, x^{3}\right] \subset k[x]$ (except now $k=\mathbf{F}_{2}$ works as well).

02AL Exercise 89.32.6. Higher dimensions.
(1) Prove that every invertible sheaf on two dimensional affine space is trivial. More precisely, let $\mathbf{A}_{k}^{2}=\operatorname{Spec}(k[x, y])$ where $k$ is a field. Show that every invertible sheaf on $\mathbf{A}_{k}^{2}$ is trivial. (Hint: One way to do this is to consider the corresponding module $M$, to look at $M \otimes_{k[x, y]} k(x)[y]$, and then use Exercise 89.32.5 (1) to find a generator for this; then you still have to think. Another way to is to use Exercise 89.32 .3 and use what we know about ideals of the polynomial ring: primes of height one are generated by an irreducible polynomial; then you still have to think.)
(2) Prove that every invertible sheaf on any open subscheme of two dimensional affine space is trivial. More precisely, let $U \subset \mathbf{A}_{k}^{2}$ be an open subscheme where $k$ is a field. Show that every invertible sheaf on $U$ is trivial. Hint: Show that every invertible sheaf on $U$ extends to one on $\mathbf{A}_{k}^{2}$. Not easy; but you can find it in Har77.
(3) Find an example of a nontrivial invertible sheaf on a punctured cone over a field. More precisely, let $k$ be a field and let $C=\operatorname{Spec}\left(k[x, y, z] /\left(x y-z^{2}\right)\right)$. Let $U=C \backslash\{(x, y, z)\}$. Find a nontrivial invertible sheaf on $U$. Hint: It may be easier to compute the group of isomorphism classes of invertible sheaves on $U$ than to just find one. Note that $U$ is covered by the opens $\operatorname{Spec}\left(k[x, y, z, 1 / x] /\left(x y-z^{2}\right)\right)$ and $\operatorname{Spec}\left(k[x, y, z, 1 / y] /\left(x y-z^{2}\right)\right)$ which are "easy" to deal with.

02AM Definition 89.32.7. Let $X$ be a locally ringed space. The Picard group of $X$ is the set $\operatorname{Pic}(X)$ of isomorphism classes of invertible $\mathcal{O}_{X}$-modules with addition given by tensor product. See Modules, Definition 17.21 .9 . For a ring $R$ we set $\operatorname{Pic}(R)=\operatorname{Pic}(\operatorname{Spec}(R))$.

02AN Exercise 89.32.8. Let $R$ be a ring.
(1) Show that if $R$ is a Noetherian normal domain, then $\operatorname{Pic}(R)=\operatorname{Pic}(R[t])$. [Hint: There is a map $R[t] \rightarrow R, t \mapsto 0$ which is a left inverse to the map $R \rightarrow R[t]$. Hence it suffices to show that any invertible $R[t]$-module $M$ such that $M / t M \cong R$ is free of rank 1 . Let $K=f . f .(R)$. Pick a trivialization $K[t] \rightarrow M \otimes_{R[t]} K[t]$ which is possible by Exercise 89.32.5 (1). Adjust it so it agrees with the trivialization of $M / t M$ above. Show that it is in fact a trivialization of $M$ over $R[t]$ (this is where normality comes in).]
(2) Let $k$ be a field. Show that $\operatorname{Pic}\left(k\left[x^{2}, x^{3}, t\right]\right) \neq \operatorname{Pic}\left(k\left[x^{2}, x^{3}\right]\right)$.

### 89.33. Čech Cohomology

02AO
02F4
Exercise 89.33.1. Čech cohomology. Here $k$ is a field.
(1) Let $X$ be a scheme with an open covering $\mathcal{U}: X=U_{1} \cup U_{2}$, with $U_{1}=$ $\operatorname{Spec}(k[x]), U_{2}=\operatorname{Spec}(k[y])$ with $U_{1} \cap U_{2}=\operatorname{Spec}(k[z, 1 / z])$ and with open immersions $U_{1} \cap U_{2} \rightarrow U_{1}$ resp. $U_{1} \cap U_{2} \rightarrow U_{2}$ determined by $x \mapsto z$ resp. $y \mapsto z$ (and I really mean this). (We've seen in the lectures that such an $X$ exists; it is the affine line zith zero doubled.) Compute $\check{H}^{1}(\mathcal{U}, \mathcal{O})$; eg. give a basis for it as a $k$-vectorspace.
(2) For each element in $\check{H}^{1}(\mathcal{U}, \mathcal{O})$ construct an exact sequence of sheaves of $\mathcal{O}_{X}$-modules

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow E \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

such that the boundary $\delta(1) \in \check{H}^{1}(\mathcal{U}, \mathcal{O})$ equals the given element. (Part of the problem is to make sense of this. See also below. It is also OK to show abstractly such a thing has to exist.)

02AP Definition 89.33.2. (Definition of delta.) Suppose that

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

is a short exact sequence of abelian sheaves on any topological space $X$. The boundary map $\delta: H^{0}\left(X, \mathcal{F}_{3}\right) \rightarrow \check{H}^{1}\left(X, \mathcal{F}_{1}\right)$ is defined as follows. Take an element $\tau \in H^{0}\left(X, \mathcal{F}_{3}\right)$. Choose an open covering $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ such that for each $i$ there exists a section $\tilde{\tau}_{i} \in \mathcal{F}_{2}$ lifting the restriction of $\tau$ to $U_{i}$. Then consider the assignment

$$
\left.\left(i_{0}, i_{1}\right) \longmapsto \tilde{\tau}_{i_{0}}\right|_{U_{i_{0} i_{1}}}-\left.\tilde{\tau}_{i_{1}}\right|_{U_{i_{0} i_{1}}}
$$

This is clearly a 1-coboundary in the Čech complex $\check{C}^{*}\left(\mathcal{U}, \mathcal{F}_{2}\right)$. But we observe that (thinking of $\mathcal{F}_{1}$ as a subsheaf of $\mathcal{F}_{2}$ ) the RHS always is a section of $\mathcal{F}_{1}$ over $U_{i_{0} i_{1}}$. Hence we see that the assignment defines a 1-cochain in the complex $\check{C}^{*}\left(\mathcal{U}, \mathcal{F}_{2}\right)$. The cohomology class of this 1-cochain is by definition $\delta(\tau)$.

### 89.34. Divisors

02 AQ We collect all relevant definitions here in one spot for convenience.
02AR Definition 89.34.1. Throughout, let $S$ be any scheme and let $X$ be a Noetherian, integral scheme.
(1) A Weil divisor on $X$ is a formal linear combination $\Sigma n_{i}\left[Z_{i}\right]$ of prime divisors $Z_{i}$ with integer coefficients.
(2) A prime divisor is a closed subscheme $Z \subset X$, which is integral with generic point $\xi \in Z$ such that $\mathcal{O}_{X, \xi}$ has dimension 1 . We will use the notation $\mathcal{O}_{X, Z}=\mathcal{O}_{X, \xi}$ when $\xi \in Z \subset X$ is as above. Note that $\mathcal{O}_{X, Z} \subset$ $K(X)$ is a subring of the function field of $X$.
(3) The Weil divisor associated to a rational function $f \in K(X)^{*}$ is the sum $\Sigma v_{Z}(f)[Z]$. Here $v_{Z}(f)$ is defined as follows
(a) If $f \in \mathcal{O}_{X, Z}^{*}$ then $v_{Z}(f)=0$.
(b) If $f \in \mathcal{O}_{X, Z}$ then

$$
v_{Z}(f)=\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(f)\right) .
$$

(c) If $f=\frac{a}{b}$ with $a, b \in \mathcal{O}_{X, Z}$ then

$$
v_{Z}(f)=\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(a)\right)-\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(b)\right)
$$

(4) An effective Cartier divisor on a scheme $S$ is a closed subscheme $D \subset S$ such that every point $d \in D$ has an affine open neighbourhood $\operatorname{Spec}(A)=$ $U \subset S$ in $S$ so that $D \cap U=\operatorname{Spec}(A /(f))$ with $f \in A$ a nonzerodivisor.
(5) The Weil divisor $[D]$ associated to an effective Cartier divisor $D \subset X$ of our Noetherian integral scheme $X$ is defined as the sum $\Sigma v_{Z}(D)[Z]$ where $v_{Z}(D)$ is defined as follows
(a) If the generic point $\xi$ of $Z$ is not in $D$ then $v_{Z}(D)=0$.
(b) If the generic point $\xi$ of $Z$ is in $D$ then

$$
v_{Z}(D)=\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(f)\right)
$$

where $f \in \mathcal{O}_{X, Z}=\mathcal{O}_{X, \xi}$ is the nonzerodivisor which defines $D$ in an affine neighbourhood of $\xi$ (as in (4) above).
(6) Let $S$ be a scheme. The sheaf of total quotient rings $\mathcal{K}_{S}$ is the sheaf of $\mathcal{O}_{S}$-algebras which is the sheafification of the pre-sheaf $\mathcal{K}^{\prime}$ defined as follows. For $U \subset S$ open we set $\mathcal{K}^{\prime}(U)=S_{U}^{-1} \mathcal{O}_{S}(U)$ where $S_{U} \subset \mathcal{O}_{S}(U)$ is the multiplicative subset consisting of sections $f \in \mathcal{O}_{S}(U)$ such that the germ of $f$ in $\mathcal{O}_{S, u}$ is a nonzerodivisor for every $u \in U$. In particular the elements of $S_{U}$ are all nonzerodivisors. Thus $\mathcal{O}_{S}$ is a subsheaf of $\mathcal{K}_{S}$, and we get a short exact sequence

$$
0 \rightarrow \mathcal{O}_{S}^{*} \rightarrow \mathcal{K}_{S}^{*} \rightarrow \mathcal{K}_{S}^{*} / \mathcal{O}_{S}^{*} \rightarrow 0
$$

(7) A Cartier divisor on a scheme $S$ is a global section of the quotient sheaf $\mathcal{K}_{S}^{*} / \mathcal{O}_{S}^{*}$.
(8) The Weil divisor associated to a Cartier divisor $\tau \in \Gamma\left(X, \mathcal{K}_{X}^{*} / \mathcal{O}_{X}^{*}\right)$ over our Noetherian integral scheme $X$ is the sum $\Sigma v_{Z}(\tau)[Z]$ where $v_{Z}(\tau)$ is defined as by the following recipe
(a) If the germ of $\tau$ at the generic point $\xi$ of $Z$ is zero - in other words the image of $\tau$ in the stalk $\left(\mathcal{K}^{*} / \mathcal{O}^{*}\right)_{\xi}$ is "zero" - then $v_{Z}(\tau)=0$.
(b) Find an affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ so that $\left.\tau\right|_{U}$ is the image of a section $f \in \mathcal{K}(U)$ and moreover $f=a / b$ with $a, b \in A$. Then we set
$v_{Z}(f)=\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(a)\right)-\operatorname{length}_{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{X, Z} /(b)\right)$.
02F5 Remarks 89.34.2. Here are some trivial remarks.
(1) On a Noetherian integral scheme $X$ the sheaf $\mathcal{K}_{X}$ is constant with value the function field $K(X)$.
(2) To make sense out of the definitions above one needs to show that

$$
\operatorname{length}_{\mathcal{O}}(\mathcal{O} /(a b))=\operatorname{length}_{\mathcal{O}}(\mathcal{O} /(a))+\operatorname{length}_{\mathcal{O}}(\mathcal{O} /(b))
$$

for any pair $(a, b)$ of nonzero elements of a Noetherian 1-dimensional local domain $\mathcal{O}$. This will be done in the lectures.

02F6 Exercise 89.34.3. (On any scheme.) Describe how to assign a Cartier divisor to an effective Cartier divisor.

02F7 Exercise 89.34.4. (On an integral scheme.) Describe how to assign a Cartier divisor $D$ to a rational function $f$ such that the Weil divisor associated to $D$ and to $f$ agree. (This is silly.)
02F8 Exercise 89.34.5. Give an example of a Weil divisor on a variety which is not the Weil divisor associated to any Cartier divisor.

02F9 Exercise 89.34.6. Give an example of a Weil divisor $D$ on a variety which is not the Weil divisor associated to any Cartier divisor but such that $n D$ is the Weil divisor associated to a Cartier divisor for some $n>1$.

02FA Exercise 89.34.7. Give an example of a Weil divisor $D$ on a variety which is not the Weil divisor associated to any Cartier divisor and such that $n D$ is NOT the Weil divisor associated to a Cartier divisor for any $n>1$. (Hint: Consider a cone, for example $X: x y-z w=0$ in $\mathbf{A}_{k}^{4}$. Try to show that $D=[x=0, z=0]$ works.)

02FB Exercise 89.34.8. On a separated scheme $X$ of finite type over a field: Give an example of a Cartier divisor which is not the difference of two effective Cartier divisors. Hint: Find some $X$ which does not have any nonempty effective Cartier Cartier divisors for example the scheme constructed in Har77, III Exercise 5.9]. There is even an example with $X$ a variety - namely the variety of Exercise 89.34.9.

02AS Exercise 89.34.9. Example of a nonprojective proper variety. Let $k$ be a field. Let $L \subset \mathbf{P}_{k}^{3}$ be a line and let $C \subset \mathbf{P}_{k}^{3}$ be a nonsingular conic. Assume that $C \cap L=\emptyset$. Choose an isomorphism $\varphi: L \rightarrow C$. Let $X$ be the $k$-variety obtained by glueing $C$ to $L$ via $\varphi$. In other words there is a surjective proper birational morphism

$$
\pi: \mathbf{P}_{k}^{3} \longrightarrow X
$$

and an open $U \subset X$ such that $\pi: \pi^{-1}(U) \rightarrow U$ is an isomorphism, $\pi^{-1}(U)=$ $\mathbf{P}_{k}^{3} \backslash(L \cup C)$ and such that $\left.\pi\right|_{L}=\left.\pi\right|_{C} \circ \varphi$. (These conditions do not yet uniquely define $X$. In order to do this you need to specify the structure sheaf of $X$ along points of $Z=X \backslash U$.) Show $X$ exists, is a proper variety, but is not projective. (Hint: For existence use the result of Exercise 89.30.9. For non-projectivity use that $\operatorname{Pic}\left(\mathbf{P}_{k}^{3}\right)=\mathbf{Z}$ to show that $X$ cannot have an ample invertible sheaf.)

### 89.35. Differentials

02AT Definitions and results. Kähler differentials.
(1) Let $R \rightarrow A$ be a ring map. The module of Kähler differentials of $A$ over $R$ is denoted $\Omega_{A / R}$. It is generated by the elements $\mathrm{d} a, a \in A$ subject to the relations:

$$
\mathrm{d}\left(a_{1}+a_{2}\right)=\mathrm{d} a_{1}+\mathrm{d} a_{2}, \quad \mathrm{~d}\left(a_{1} a_{2}\right)=a_{1} \mathrm{~d} a_{2}+a_{2} \mathrm{~d} a_{1}, \quad \mathrm{~d} r=0
$$

The canonical universal $R$-derivation d : $A \rightarrow \Omega_{A / R}$ maps $a \mapsto \mathrm{~d} a$.
(2) Consider the short exact sequence

$$
0 \rightarrow I \rightarrow A \otimes_{R} A \rightarrow A \rightarrow 0
$$

which defines the ideal $I$. There is a canonical derivation d : $A \rightarrow I / I^{2}$ which maps $a$ to the class of $a \otimes 1-1 \otimes a$. This is another presentation of the module of derivations of $A$ over $R$, in other words

$$
\left(I / I^{2}, \mathrm{~d}\right) \cong\left(\Omega_{A / R}, \mathrm{~d}\right)
$$

(3) For multiplicative subsets $S_{R} \subset R$ and $S_{A} \subset A$ such that $S_{R}$ maps into $S_{A}$ we have

$$
\Omega_{S_{A}^{-1} A / S_{R}^{-1} R}=S_{A}^{-1} \Omega_{A / R}
$$

(4) If $A$ is a finitely presented $R$-algebra then $\Omega_{A / R}$ is a finitely presented $A$-module. Hence in this case the fitting ideals of $\Omega_{A / R}$ are defined. (See exercise set 6 of last semester.)
(5) Let $f: X \rightarrow S$ be a morphism of schemes. There is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules $\Omega_{X / S}$ and a $\mathcal{O}_{S}$-linear derivation

$$
\mathrm{d}: \mathcal{O}_{X} \longrightarrow \Omega_{X / S}
$$

such that for any affine opens $\operatorname{Spec}(A)=U \subset X, \operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ we have

$$
\Gamma\left(\operatorname{Spec}(A), \Omega_{X / S}\right)=\Omega_{A / R}
$$

compatibly with d.
02FC Exercise 89.35.1. Let $k[\epsilon]$ be the ring of dual numbers over the field $k$, i.e., $\epsilon^{2}=0$.
(1) Consider the ring map

$$
R=k[\epsilon] \rightarrow A=k[x, \epsilon] /(\epsilon x)
$$

Show that the fitting ideals of $\Omega_{A / R}$ are (starting with the zeroth fitting ideal)

$$
(\epsilon), A, A, \ldots
$$

(2) Consider the map $R=k[t] \rightarrow A=k[x, y, t] /(x(y-t)(y-1), x(x-t))$. Show that the fitting ideals of of $\Omega_{A / R}$ in $A$ are (assume characteristic $k$ is zero for simplicity)

$$
x(2 x-t)(2 y-t-1) A, \quad(x, y, t) \cap(x, y-1, t), A, A, \ldots
$$

So the 0 -the fitting ideal is cut out by a single element of $A$, the 1 st fitting ideal defines two closed points of $\operatorname{Spec}(A)$, and the others are all trivial.
(3) Consider the map $R=k[t] \rightarrow A=k[x, y, t] /\left(x y-t^{n}\right)$. Compute the fitting ideals of $\Omega_{A / R}$.

02FD Remark 89.35.2. The $k$ th fitting ideal of $\Omega_{X / S}$ is commonly used to define the singular scheme of the morphism $X \rightarrow S$ when $X$ has relative dimension $k$ over $S$. But as part (a) shows, you have to be careful doing this when your family does not have "constant" fibre dimension, e.g., when it is not flat. As part (b) shows, flatness doesn't guarantee it works either (and yes this is a flat family). In "good cases" - such as in (c) - for families of curves you expect the 0-th fitting ideal to be zero and the 1st fitting ideal to define (scheme-theoretically) the singular locus.
02FE Exercise 89.35.3. Suppose that $R$ is a ring and

$$
A=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)
$$

Note that we are assuming that $A$ is presented by the same number of equations as variables. Thus the matrix of partial derivatives

$$
\left(\partial f_{i} / \partial x_{j}\right)
$$

is $n \times n$, i.e., a square matrix. Assume that its determinant is invertible as an element in $A$. Note that this is exactly the condition that says that $\Omega_{A / R}=(0)$ in this case of $n$-generators and $n$ relations. Let $\pi: B^{\prime} \rightarrow B$ be a surjection of $R$-algebras whose kernel $J$ has square zero (as an ideal in $B^{\prime}$ ). Let $\varphi: A \rightarrow B$ be a homomorphism of $R$-algebras. Show there exists a unique homomorphism of $R$-algebras $\varphi^{\prime}: A \rightarrow B^{\prime}$ such that $\varphi=\pi \circ \varphi^{\prime}$.

02FF Exercise 89.35.4. Find a generalization of the result of the previous exercise to the case where $A=R[x, y] /(f)$.
89.36. Schemes, Final Exam, Fall 2007

02 AU These were the questions in the final exam of a course on Schemes, in the Spring of 2007 at Columbia University.
02FG Exercise 89.36.1 (Definitions). Provide definitions of the following concepts.
(1) $X$ is a scheme
(2) the morphism of schemes $f: X \rightarrow Y$ is finite
(3) the morphisms of schemes $f: X \rightarrow Y$ is of finite type
(4) the scheme $X$ is Noetherian
(5) the $\mathcal{O}_{X}$-module $\mathcal{L}$ on the scheme $X$ is invertible
(6) the genus of a nonsingular projective curve over an algebraically closed field

02FH Exercise 89.36.2. Let $X=\operatorname{Spec}(\mathbf{Z}[x, y])$, and let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. Suppose that $\mathcal{F}$ is zero when restricted to the standard affine open $D(x)$.
(1) Show that every global section $s$ of $\mathcal{F}$ is killed by some power of $x$, i.e., $x^{n} s=0$ for some $n \in \mathbf{N}$.
(2) Do you think the same is true if we do not assume that $\mathcal{F}$ is quasi-coherent?

02FI Exercise 89.36.3. Suppose that $X \rightarrow \operatorname{Spec}(R)$ is a proper morphism and that $R$ is a discrete valuation ring with residue field $k$. Suppose that $X \times_{\operatorname{Spec}(R)} \operatorname{Spec}(k)$ is the empty scheme. Show that $X$ is the empty scheme.
02FJ Exercise 89.36.4. Consider the projectiv $\AA^{1}$ variety

$$
\mathbf{P}^{1} \times \mathbf{P}^{1}=\mathbf{P}_{\mathbf{C}}^{1} \times_{\operatorname{Spec}(\mathbf{C})} \mathbf{P}_{\mathbf{C}}^{1}
$$

over the field of complex numbers $\mathbf{C}$. It is covered by four affine pieces, corresponding to pairs of standard affine pieces of $\mathbf{P}_{\mathbf{C}}^{1}$. For example, suppose we use homogeneous coordinates $X_{0}, X_{1}$ on the first factor and $Y_{0}, Y_{1}$ on the second. Set $x=X_{1} / X_{0}$, and $y=Y_{1} / Y_{0}$. Then the 4 affine open pieces are the spectra of the rings

$$
\mathbf{C}[x, y], \quad \mathbf{C}\left[x^{-1}, y\right], \quad \mathbf{C}\left[x, y^{-1}\right], \quad \mathbf{C}\left[x^{-1}, y^{-1}\right] .
$$

Let $X \subset \mathbf{P}^{1} \times \mathbf{P}^{1}$ be the closed subscheme which is the closure of the closed subset of the first affine piece given by the equation

$$
y^{3}\left(x^{4}+1\right)=x^{4}-1
$$

(1) Show that $X$ is contained in the union of the first and the last of the 4 affine open pieces.
(2) Show that $X$ is a nonsingular projective curve.
(3) Consider the morphism $p r_{2}: X \rightarrow \mathbf{P}^{1}$ (projection onto the first factor). On the first affine piece it is the map $(x, y) \mapsto x$. Briefly explain why it has degree 3 .
(4) Compute the ramification points and ramification indices for the map $p r_{2}: X \rightarrow \mathbf{P}^{1}$.
(5) Compute the genus of $X$.

02FK Exercise 89.36.5. Let $X \rightarrow \operatorname{Spec}(\mathbf{Z})$ be a morphism of finite type. Suppose that there is an infinite number of primes $p$ such that $X \times_{\operatorname{Spec}(\mathbf{Z})} \operatorname{Spec}\left(\mathbf{F}_{p}\right)$ is not empty.

[^229](1) Show that $X \times_{\operatorname{Spec}(\mathbf{Z})} \operatorname{Spec}(\mathbf{Q})$ is not empty.
(2) Do you think the same is true if we replace the condition "finite type" by the condition "locally of finite type"?

### 89.37. Schemes, Final Exam, Spring 2009

02AV These were the questions in the final exam of a course on Schemes, in the Spring of 2009 at Columbia University.

02AW Exercise 89.37.1. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $x \in X$ be a point. Assume that $\operatorname{Supp}(\mathcal{F})=\{x\}$.
(1) Show that $x$ is a closed point of $X$.
(2) Show that $H^{0}(X, \mathcal{F})$ is not zero.
(3) Show that $\mathcal{F}$ is generated by global sections.
(4) Show that $H^{p}(X, \mathcal{F})=0$ for $p>0$.

02AX Remark 89.37.2. Let $k$ be a field. Let $\mathbf{P}_{k}^{2}=\operatorname{Proj}\left(k\left[X_{0}, X_{1}, X_{2}\right]\right)$. Any invertible sheaf on $\mathbf{P}_{k}^{2}$ is isomorphic to $\mathcal{O}_{\mathbf{P}_{k}^{2}}(n)$ for some $n \in \mathbf{Z}$. Recall that

$$
\Gamma\left(\mathbf{P}_{k}^{2}, \mathcal{O}_{\mathbf{P}_{k}^{2}}(n)\right)=k\left[X_{0}, X_{1}, X_{2}\right]_{n}
$$

is the degree $n$ part of the polynomial ring. For a quasi-coherent sheaf $\mathcal{F}$ on $\mathbf{P}_{k}^{2}$ set $\mathcal{F}(n)=\mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}_{k}^{2}}} \mathcal{O}_{\mathbf{P}_{k}^{2}}(n)$ as usual.

02AY Exercise 89.37.3. Let $k$ be a field. Let $\mathcal{E}$ be a vector bundle on $\mathbf{P}_{k}^{2}$, i.e., a finite locally free $\mathcal{O}_{\mathbf{P}_{k}^{2}}$-module. We say $\mathcal{E}$ is split if $\mathcal{E}$ is isomorphic to a direct sum invertible $\mathcal{O}_{\mathbf{P}_{k}^{2}}$-modules.
(1) Show that $\mathcal{E}$ is split if and only if $\mathcal{E}(n)$ is split.
(2) Show that if $\mathcal{E}$ is split then $H^{1}\left(\mathbf{P}_{k}^{2}, \mathcal{E}(n)\right)=0$ for all $n \in \mathbf{Z}$.
(3) Let

$$
\varphi: \mathcal{O}_{\mathbf{P}_{k}^{2}} \longrightarrow \mathcal{O}_{\mathbf{P}_{k}^{2}}(1) \oplus \mathcal{O}_{\mathbf{P}_{k}^{2}}(1) \oplus \mathcal{O}_{\mathbf{P}_{k}^{2}}(1)
$$

be given by linear forms $L_{0}, L_{1}, L_{2} \in \Gamma\left(\mathbf{P}_{k}^{2}, \mathcal{O}_{\mathbf{P}_{k}^{2}}(1)\right)$. Assume $L_{i} \neq 0$ for some $i$. What is the condition on $L_{0}, L_{1}, L_{2}$ such that the cokernel of $\varphi$ is a vector bundle? Why?
(4) Given an example of such a $\varphi$.
(5) Show that Coker $(\varphi)$ is not split (if it is a vector bundle).

02AZ Remark 89.37.4. Freely use the following facts on dimension theory (and add more if you need more).
(1) The dimension of a scheme is the supremum of the length of chains of irreducible closed subsets.
(2) The dimension of a finite type scheme over a field is the maximum of the dimensions of its affine opens.
(3) The dimension of a Noetherian scheme is the maximum of the dimensions of its irreducible components.
(4) The dimension of an affine scheme coincides with the dimension of the corresponding ring.
(5) Let $k$ be a field and let $A$ be a finite type $k$-algebra. If $A$ is a domain, and $x \neq 0$, then $\operatorname{dim}(A)=\operatorname{dim}(A / x A)+1$.

02B0 Exercise 89.37.5. Let $k$ be a field. Let $X$ be a projective, reduced scheme over $k$. Let $f: X \rightarrow \mathbf{P}_{k}^{1}$ be a morphism of schemes over $k$. Assume there exists an integer $d \geq 0$ such that for every point $t \in \mathbf{P}_{k}^{1}$ the fibre $X_{t}=f^{-1}(t)$ is irreducible of dimension $d$. (Recall that an irreducible space is not empty.)
(1) Show that $\operatorname{dim}(X)=d+1$.
(2) Let $X_{0} \subset X$ be an irreducible component of $X$ of dimension $d+1$. Prove that for every $t \in \mathbf{P}_{k}^{1}$ the fibre $X_{0, t}$ has dimension $d$.
(3) What can you conclude about $X_{t}$ and $X_{0, t}$ from the above?
(4) Show that $X$ is irreducible.

02B1 Remark 89.37.6. Given a projective scheme $X$ over a field $k$ and a coherent sheaf $\mathcal{F}$ on $X$ we set

$$
\chi(X, \mathcal{F})=\sum_{i \geq 0}(-1)^{i} \operatorname{dim}_{k} H^{i}(X, \mathcal{F})
$$

02B2 Exercise 89.37.7. Let $k$ be a field. Write $\mathbf{P}_{k}^{3}=\operatorname{Proj}\left(k\left[X_{0}, X_{1}, X_{2}, X_{3}\right]\right)$. Let $C \subset \mathbf{P}_{k}^{3}$ be a type $(5,6)$ complete intersection curve. This means that there exist $F \in k\left[X_{0}, X_{1}, X_{2}, X_{3}\right]_{5}$ and $G \in k\left[X_{0}, X_{1}, X_{2}, X_{3}\right]_{6}$ such that

$$
C=\operatorname{Proj}\left(k\left[X_{0}, X_{1}, X_{2}, X_{3}\right] /(F, G)\right)
$$

is a variety of dimension 1. (Variety implies reduced and irreducible, but feel free to assume $C$ is nonsingular if you like.) Let $i: C \rightarrow \mathbf{P}_{k}^{3}$ be the corresponding closed immersion. Being a complete intersection also implies that

$$
0 \longrightarrow \mathcal{O}_{\mathbf{P}_{k}^{3}}(-11) \xrightarrow{\binom{-G}{F}} \mathcal{O}_{\mathbf{P}_{k}^{3}}(-5) \oplus \mathcal{O}_{\mathbf{P}_{k}^{3}}(-6) \xrightarrow{(F, G)} \mathcal{O}_{\mathbf{P}_{k}^{3}} \longrightarrow i_{*} \mathcal{O}_{C} \longrightarrow 0
$$

is an exact sequence of sheaves. Please use these facts to:
(1) compute $\chi\left(C, i^{*} \mathcal{O}_{\mathbf{P}_{k}^{3}}(n)\right)$ for any $n \in \mathbf{Z}$, and
(2) compute the dimension of $H^{1}\left(C, \mathcal{O}_{C}\right)$.

02B3 Exercise 89.37.8. Let $k$ be a field. Consider the rings

$$
\begin{aligned}
A & =k[x, y] /(x y) \\
B & =k[u, v] /(u v) \\
C & =k\left[t, t^{-1}\right] \times k\left[s, s^{-1}\right]
\end{aligned}
$$

and the $k$-algebra maps

$$
\begin{array}{lrr}
A \longrightarrow C, & x \mapsto(t, 0), & y \mapsto(0, s) \\
B \longrightarrow C, & u \mapsto\left(t^{-1}, 0\right), & v \mapsto\left(0, s^{-1}\right)
\end{array}
$$

It is a true fact that these maps induce isomorphisms $A_{x+y} \rightarrow C$ and $B_{u+v} \rightarrow C$. Hence the maps $A \rightarrow C$ and $B \rightarrow C$ identify $\operatorname{Spec}(C)$ with open subsets of $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$. Let $X$ be the scheme obtained by glueing $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$ along $\operatorname{Spec}(C)$ :

$$
X=\operatorname{Spec}(A) \amalg_{\operatorname{Spec}(C)} \operatorname{Spec}(B)
$$

As we saw in the course such a scheme exists and there are affine opens $\operatorname{Spec}(A) \subset X$ and $\operatorname{Spec}(B) \subset X$ whose overlap is exactly $\operatorname{Spec}(C)$ identified with an open of each of these using the maps above.
(1) Why is $X$ separated?
(2) Why is $X$ of finite type over $k$ ?
(3) Compute $H^{1}\left(X, \mathcal{O}_{X}\right)$, or what is its dimension?
(4) What is a more geometric way to describe $X$ ?
89.38. Schemes, Final Exam, Fall 2010

069Q These were the questions in the final exam of a course on Schemes, in the Fall of 2010 at Columbia University.
069R Exercise 89.38.1 (Definitions). Provide definitions of the following concepts.
(1) a separated scheme,
(2) a quasi-compact morphism of schemes,
(3) an affine morphism of schemes,
(4) a multiplicative subset of a ring,
(5) a Noetherian scheme,
(6) a variety.

069S Exercise 89.38.2. Prime avoidance.
(1) Let $A$ be a ring. Let $I \subset A$ be an ideal and let $\mathfrak{q}_{1}, \mathfrak{q}_{2}$ be prime ideals such that $I \not \subset \mathfrak{q}_{i}$. Show that $I \not \subset \mathfrak{q}_{1} \cup \mathfrak{q}_{2}$.
(2) What is a geometric interpretation of (1)?
(3) Let $X=\operatorname{Proj}(S)$ for some graded ring $S$. Let $x_{1}, x_{2} \in X$. Show that there exists a standard open $D_{+}(F)$ which contains both $x_{1}$ and $x_{2}$.

069T Exercise 89.38.3. Why is a composition of affine morphisms affine?
069U Exercise 89.38.4 (Examples). Give examples of the following:
(1) A reducible projective scheme over a field $k$.
(2) A scheme with 100 points.
(3) A non-affine morphism of schemes.

069V Exercise 89.38.5. Chevalley's theorem and the Hilbert Nullstellensatz.
(1) Let $\mathfrak{p} \subset \mathbf{Z}\left[x_{1}, \ldots, x_{n}\right]$ be a maximal ideal. What does Chevalley's theorem imply about $\mathfrak{p} \cap \mathbf{Z}$ ?
(2) In turn, what does the Hilbert Nullstellensatz imply about $\kappa(\mathfrak{p})$ ?

069W Exercise 89.38.6. Let $A$ be a ring. Let $S=A[X]$ as a graded $A$-algebra where $X$ has degree 1. Show that $\operatorname{Proj}(S) \cong \operatorname{Spec}(A)$ as schemes over $A$.

069X Exercise 89.38.7. Let $A \rightarrow B$ be a finite ring map. Show that $\operatorname{Spec}(B)$ is a H-projective scheme over $\operatorname{Spec}(A)$.
069Y Exercise 89.38.8. Give an example of a scheme $X$ over a field $k$ such that $X$ is irreducible and such that for some finite extension $k \subset k$ the base change $X_{k^{\prime}}=X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)$ is connected but reducible.

### 89.39. Schemes, Final Exam, Spring 2011

069Z These were the questions in the final exam of a course on Schemes, in the Spring of 2011 at Columbia University.

06A0 Exercise 89.39.1 (Definitions). Provide definitions of the italicized concepts.
(1) a separated scheme,
(2) a universally closed morphism of schemes,
(3) $A$ dominates $B$ for local rings $A, B$ contained in a common field,
(4) the dimension of a scheme $X$,
(5) the codimension of an irreducible closed subscheme $Y$ of a scheme $X$,

06A1 Exercise 89.39.2 (Results). State something formally equivalent to the fact discussed in the course.
(1) The valuative criterion of properness for a morphism $X \rightarrow Y$ of varieties for example.
(2) The relationship between $\operatorname{dim}(X)$ and the function field $k(X)$ of $X$ for a variety $X$ over a field $k$.
(3) Fill in the blank: The category of nonsingular projective curves over $k$ and nonconstant morphisms is anti-equivalent to ...........
(4) Noether normalization.
(5) Jacobian criterion.

06A2 Exercise 89.39.3. Let $k$ be a field. Let $F \in k\left[X_{0}, X_{1}, X_{2}\right]$ be a homogeneous form of degree $d$. Assume that $C=V_{+}(F) \subset \mathbf{P}_{k}^{2}$ is a smooth curve over $k$. Denote $i: C \rightarrow \mathbf{P}_{k}^{2}$ the corresponding closed immersion.
(1) Show that there is a short exact sequence

$$
0 \rightarrow \mathcal{O}_{\mathbf{P}_{k}^{2}}(-d) \rightarrow \mathcal{O}_{\mathbf{P}_{k}^{2}} \rightarrow i_{*} \mathcal{O}_{C} \rightarrow 0
$$

of coherent sheaves on $\mathbf{P}_{k}^{2}$ : tell me what the maps are and briefly why it is exact.
(2) Conclude that $H^{0}\left(C, \mathcal{O}_{C}\right)=k$.
(3) Compute the genus of $C$.
(4) Assume now that $P=(0: 0: 1)$ is not on $C$. Prove that $\pi: C \rightarrow \mathbf{P}_{k}^{1}$ given by $\left(a_{0}: a_{1}: a_{2}\right) \mapsto\left(a_{0}: a_{1}\right)$ has degree $d$.
(5) Assume $k$ is algebraically closed, assume all ramification indices (the " $e_{i}$ ") are 1 or 2 , and assume the characteristic of $k$ is not equal to 2 . How many ramification points does $\pi: C \rightarrow \mathbf{P}_{k}^{1}$ have?
(6) In terms of $F$, what do you think is a set of equations of the set of ramification points of $\pi$ ?
(7) Can you guess $K_{C}$ ?

06A3 Exercise 89.39.4. Let $k$ be a field. Let $X$ be a "triangle" over $k$, i.e., you get $X$ by glueing three copies of $\mathbf{A}_{k}^{1}$ to each other by identifying 0 on the first copy to 1 on the second copy, 0 on the second copy to 1 on the first copy, and 0 on the third copy to 1 on the first copy. It turns out that $X$ is isomorphic to $\operatorname{Spec}(k[x, y] /(x y(x+y+1)))$; feel free to use this. Compute the Picard group of $X$.
06A4 Exercise 89.39.5. Let $k$ be a field. Let $\pi: X \rightarrow Y$ be a finite birational morphism of curves with $X$ a projective nonsingular curve over $k$. It follows from the material in the course that $Y$ is a proper curve and that $\pi$ is the normalization morphism of $Y$. We have also seen in the course that there exists a dense open $V \subset Y$ such that $U=\pi^{-1}(V)$ is a dense open in $X$ and $\pi: U \rightarrow V$ is an isomorphism.
(1) Show that there exists an effective Cartier divisor $D \subset X$ such that $D \subset U$ and such that $\mathcal{O}_{X}(D)$ is ample on $X$.
(2) Let $D$ be as in (1). Show that $E=\pi(D)$ is an effective Cartier divisor on $Y$.
(3) Briefly indicate why
(a) the map $\mathcal{O}_{Y} \rightarrow \pi_{*} \mathcal{O}_{X}$ has a coherent cokernel $Q$ which is supported in $Y \backslash V$, and
(b) for every $n$ there is a corresponding map $\mathcal{O}_{Y}(n E) \rightarrow \pi_{*} \mathcal{O}_{X}(n D)$ whose cokernel is isomorphic to $Q$.
(4) Show that $\operatorname{dim}_{k} H^{0}\left(X, \mathcal{O}_{X}(n D)\right)-\operatorname{dim}_{k} H^{0}\left(Y, \mathcal{O}_{Y}(n E)\right)$ is bounded (by what?) and conclude that the invertible sheaf $\mathcal{O}_{Y}(n E)$ has lots of sections for large $n$ (why?).

### 89.40. Schemes, Final Exam, Fall 2011

07 DE These were the questions in the final exam of a course on Commutative Algebra, in the Fall of 2011 at Columbia University.

07DF Exercise 89.40.1 (Definitions). Provide definitions of the italicized concepts.
(1) a Noetherian ring,
(2) a Noetherian scheme,
(3) a finite ring homomorphism,
(4) a finite morphism of schemes,
(5) the dimension of a ring.

07DG Exercise 89.40.2 (Results). State something formally equivalent to the fact discussed in the course.
(1) Zariski's Main Theorem.
(2) Noether normalization.
(3) Chinese remainder theorem.
(4) Going up for finite ring maps.

07DH Exercise 89.40.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring whose residue field has characteristic not 2 . Suppose that $\mathfrak{m}$ is generated by three elements $x, y, z$ and that $x^{2}+y^{2}+z^{2}=0$ in $A$.
(1) What are the possible values of $\operatorname{dim}(A)$ ?
(2) Give an example to show that each value is possible.
(3) Show that $A$ is a domain if $\operatorname{dim}(A)=2$. (Hint: look at $\bigoplus_{n \geq 0} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$.)

07DI Exercise 89.40.4. Let $A$ be a ring. Let $S \subset T \subset A$ be multiplicative subsets. Assume that

$$
\{\mathfrak{q} \mid \mathfrak{q} \cap S=\emptyset\}=\{\mathfrak{q} \mid \mathfrak{q} \cap T=\emptyset\}
$$

Show that $S^{-1} A \rightarrow T^{-1} A$ is an isomorphism.
07DJ Exercise 89.40.5. Let $k$ be an algebraically closed field. Let

$$
V_{0}=\{A \in \operatorname{Mat}(3 \times 3, k) \mid \operatorname{rank}(A)=1\} \subset \operatorname{Mat}(3 \times 3, k)=k^{9}
$$

(1) Show that $V_{0}$ is the set of closed points of a (Zariski) locally closed subset $V \subset \mathbf{A}_{k}^{9}$.
(2) Is $V$ irreducible?
(3) What is $\operatorname{dim}(V)$ ?

07DK Exercise 89.40.6. Prove that the ideal $\left(x^{2}, x y, y^{2}\right)$ in $\mathbf{C}[x, y]$ cannot be generated by 2 elements.

07DL Exercise 89.40.7. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that for some $\alpha, \beta \in \mathbf{C}$ the $\mathbf{C}$-algebra map

$$
\mathbf{C}[t] \longrightarrow \mathbf{C}[x, y] /(f), \quad t \longmapsto \alpha x+\beta y
$$

is finite.
07DM Exercise 89.40.8. Show that given finitely many points $p_{1}, \ldots, p_{n} \in \mathbf{C}^{2}$ the scheme $\mathbf{A}_{\mathbf{C}}^{2} \backslash\left\{p_{1}, \ldots, p_{n}\right\}$ is a union of two affine opens.
07DN Exercise 89.40.9. Show that there exists a surjective morphism of schemes $\mathbf{A}_{\mathbf{C}}^{1} \rightarrow$ $\mathbf{P}_{\mathbf{C}}^{1}$. (Surjective just means surjective on underlying sets of points.)
07DP Exercise 89.40.10. Let $k$ be an algebraically closed field. Let $A \subset B$ be an extension of domains which are both finite type $k$-algebras. Prove that the image of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ contains a nonempty open subset of $\operatorname{Spec}(A)$ using the following steps:
(1) Prove it if $A \rightarrow B$ is also finite.
(2) Prove it in case the fraction field of $B$ is a finite extension of the fraction field of $A$.
(3) Reduce the statement to the previous case.

### 89.41. Schemes, Final Exam, Fall 2013

09TV These were the questions in the final exam of a course on Commutative Algebra, in the Fall of 2013 at Columbia University.

09TW Exercise 89.41.1 (Definitions). Provide definitions of the italicized concepts.
(1) a radical ideal of a ring,
(2) a finite type ring homomorphism,
(3) a differential a la Weil,
(4) a scheme.

09TX Exercise 89.41.2 (Results). State something formally equivalent to the fact discussed in the course.
(1) result on hilbert polynomials of graded modules.
(2) dimension of a Noetherian local ring $(R, \mathfrak{m})$ and $\bigoplus_{n \geq 0} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$.
(3) Riemann-Roch.
(4) Clifford's theorem.
(5) Chevalley's theorem.

09TY Exercise 89.41.3. Let $A \rightarrow B$ be a ring map. Let $S \subset A$ be a multiplicative subset. Assume that $A \rightarrow B$ is of finite type and $S^{-1} A \rightarrow S^{-1} B$ is surjective. Show that there exists an $f \in S$ such that $A_{f} \rightarrow B_{f}$ is surjective.
09TZ Exercise 89.41.4. Give an example of an injective local homomorphism $A \rightarrow B$ of local rings, such that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is not surjective.
09U0 Situation 89.41.5 (Notation plane curve). Let $k$ be an algebraically closed field. Let $F\left(X_{0}, X_{1}, X_{2}\right) \in k\left[X_{0}, X_{1}, X_{2}\right]$ be an irreducible polynomial homogenenous of degree $d$. We let

$$
D=V(F) \subset \mathbf{P}^{2}
$$

be the projective plane curve given by the vanishing of $F$. Set $x=X_{1} / X_{0}$ and $y=$ $X_{2} / X_{0}$ and $f(x, y)=X_{0}^{-d} F\left(X_{0}, X_{1}, X_{2}\right)=F(1, x, y)$. We denote $K$ the fraction
field of the domain $k[x, y] /(f)$. We let $C$ be the abstract curve corresponding to $K$. Recall (from the lectures) that there is a surjective map $C \rightarrow D$ which is bijective over the nonsingular locus of $D$ and an isomorphism if $D$ is nonsingular. Set $f_{x}=\partial f / \partial x$ and $f_{y}=\partial f / \partial y$. Finally, we denote $\omega=\mathrm{d} x / f_{y}=-\mathrm{d} y / f_{x}$ the element of $\Omega_{K / k}$ discussed in the lectures. Denote $K_{C}$ the divisor of zeros and poles of $\omega$.

09U1 Exercise 89.41.6. In Situation 89.41 .5 assume $d \geq 3$ and that the curve $D$ has exactly one singular point, namely $P=(1: 0: 0)$. Assume further that we have the expansion

$$
f(x, y)=x y+h . o . t
$$

around $P=(0,0)$. Then $C$ has two points $v$ and $w$ lying over over $P$ characterized by

$$
v(x)=1, v(y)>1 \quad \text { and } \quad w(x)>1, w(y)=1
$$

(1) Show that the element $\omega=\mathrm{d} x / f_{y}=-\mathrm{d} y / f_{x}$ of $\Omega_{K / k}$ has a first order pole at both $v$ and $w$. (The behaviour of $\omega$ at nonsingular points is as discussed in the lectures.)
(2) In the lectures we have shown that $\omega$ vanishes to order $d-3$ at the divisor $X_{0}=0$ pulled back to $C$ under the map $C \rightarrow D$. Combined with the information of (1) what is the degree of the divisor of zeros and poles of $\omega$ on $C$ ?
(3) What is the genus of the curve $C$ ?

09U2 Exercise 89.41.7. In Situation 89.41.5 assume $d=5$ and that the curve $C=D$ is nonsingular. In the lectures we have shown that the genus of $C$ is 6 and that the linear system $K_{C}$ is given by

$$
L\left(K_{C}\right)=\{h \omega \mid h \in k[x, y], \operatorname{deg}(h) \leq 2\}
$$

where deg indicates total degre ${ }^{2}$ Let $P_{1}, P_{2}, P_{3}, P_{4}, P_{5} \in D$ be pairwise distinct points lying in the affine open $X_{0} \neq 0$. We denote $\sum P_{i}=P_{1}+P_{2}+P_{3}+P_{4}+P_{5}$ the corresponding divisor of $C$.
(1) Describe $L\left(K_{C}-\sum P_{i}\right)$ in terms of polynomials.
(2) What are the possibilities for $l\left(\sum P_{i}\right)$ ?

09U3 Exercise 89.41.8. Write down an $F$ as in Situation 89.41 .5 with $d=100$ such that the genus of $C$ is 0 .

09U4 Exercise 89.41.9. Let $k$ be an algebraically closed field. Let $K / k$ be finitely generated field extension of transcendence degree 1. Let $C$ be the abstract curve corresponding to $K$. Let $V \subset K$ be a $g_{d}^{r}$ and let $\Phi: C \rightarrow \mathbf{P}^{r}$ be the corresponding morphism. Show that the image of $C$ is contained in a quadri ${ }^{3}$ if $d$ is $V$ is a complete linear system and $d$ is large enough relative to the genus of $C$. (Extra credit: good bound on the degree needed.)

09U5 Exercise 89.41.10. Notation as in Situation 89.41.5. Let $U \subset \mathbf{P}_{k}^{2}$ be the open subscheme whose complement is $D$. Describe the $k$-algebra $A=\mathcal{O}_{\mathbf{P}_{k}^{2}}(U)$. Give an upper bound for the number of generators of $A$ as a $k$-algebra.

[^230]
### 89.42. Schemes, Final Exam, Spring 2014

0AAL These were the questions in the final exam of a course on Schemes, in the Fall of 2014 at Columbia University.
0AAM Exercise 89.42.1 (Definitions). Let $\left(X, \mathcal{O}_{X}\right)$ be a scheme. Provide definitions of the italicized concepts.
(1) the local ring of $X$ at a point $x$,
(2) a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules,
(3) a coherent sheaf of $\mathcal{O}_{X}$-modules (please assume $X$ is locally Noetherian,
(4) an affine open of $X$,
(5) a finite morphism of schemes $X \rightarrow Y$.

0AAN Exercise 89.42.2 (Theorems). Precisely state a nontrivial fact discussed in the lectures related to each item.
(1) on birational invariance of pluri-genera of varieties,
(2) being an affine morphism is a local property,
(3) the topology of a scheme theoretic fibre of a morphism, and
(4) valuative criterion of properness.
$0 A A P$ Exercise 89.42.3. Let $X=\mathbf{A}_{\mathbf{C}}^{2}$ where $\mathbf{C}$ is the field of complex numbers. A line will mean a closed subscheme of $X$ defined by one linear equation $a x+b y+c=0$ for some $a, b, c \in \mathbf{C}$ with $(a, b) \neq(0,0)$. A curve will mean an irreducible (so nonempty) closed subscheme $C \subset X$ of dimension 1. A quadric will mean a curve defined by one quadratic equation $a x^{2}+b x y+c y^{2}+d x+e y+f=0$ for some $a, b, c, d, e, f \in \mathbf{C}$ and $(a, b, c) \neq(0,0,0)$.
(1) Find a curve $C$ such that every line has nonempty intersection with $C$.
(2) Find a curve $C$ such that every line and every quadric has nonempty intersection with $C$.
(3) Show that for every curve $C$ there exists another curve such that $C \cap C^{\prime}=$ $\emptyset$.

0AAQ Exercise 89.42.4. Let $k$ be a field. Let $b: X \rightarrow \mathbf{A}_{k}^{2}$ be the blow up of the affine plane in the origin. In other words, if $\mathbf{A}_{k}^{2}=\operatorname{Spec}(k[x, y])$, then $X=\operatorname{Proj}\left(\bigoplus_{n \geq 0} \mathfrak{m}^{n}\right)$ where $\mathfrak{m}=(x, y) \subset k[x, y]$. Prove the following statements
(1) the scheme theoretic fibre $E$ of $b$ over the origin is isomorphic to $\mathbf{P}_{k}^{1}$,
(2) $E$ is an effective Cartier divisor on $X$,
(3) the restriction of $\mathcal{O}_{X}(-E)$ to $E$ is a line bundle of degree 1 .
(Recall that $\mathcal{O}_{X}(-E)$ is the ideal sheaf of $E$ in $X$.)
$0 A A R$ Exercise 89.42.5. Let $k$ be a field. Let $X$ be a projective variety over $k$. Show there exists an affine variety $U$ over $k$ and a surjective morphism of varieties $U \rightarrow X$.
0AAS Exercise 89.42.6. Let $k$ be a field of characteristic $p>0$ different from 2,3 . Consider the closed subscheme $X$ of $\mathbf{P}_{k}^{n}$ defined by

$$
\sum_{i=0, \ldots, n} X_{i}=0, \quad \sum_{i=0, \ldots, n} X_{i}^{2}=0, \quad \sum_{i=0, \ldots, n} X_{i}^{3}=0
$$

For which pairs $(n, p)$ is this variety singular?

## A Guide to the Literature

### 90.1. Short introductory articles

- Barbara Fantechi: Stacks for Everybody Fan01
- Dan Edidin: What is a stack? Edi03
- Dan Edidin: Notes on the construction of the moduli space of curves Edi00
- Angelo Vistoli: Intersection theory on algebraic stacks and on their moduli spaces, and especially the appendix. Vis89.

### 90.2. Classic references

- Mumford: Picard groups of moduli problems Mum65 Mumford never uses the term "stack" here but the concept is implicit in the paper; he computes the picard group of the moduli stack of elliptic curves.
- Deligne, Mumford: The irreducibility of the space of curves of given genus DM69

This influential paper introduces "algebraic stacks" in the sense which are now universally called Deligne-Mumford stacks (stacks with representable diagonal which admit étale presentations by schemes). There are many foundational results without proof. The paper uses stacks to give two proofs of the irreducibility of the moduli space of curves of genus $g$.

- Artin: Versal deformations and algebraic stacks Art74

This paper introduces "algebraic stacks" which generalize DeligneMumford stacks and are now commonly referred to as Artin stacks, stacks with representable diagonal which admit smooth presentations by schemes. This paper gives deformation-theoretic criterion known as Artin's criterion which allows one to prove that a given moduli stack is an Artin stack without explicitly exhibiting a presentation.

### 90.3. Books and online notes

This book is currently the most exhaustive reference on stacks containing many foundational results. It assumes the reader is familiar with algebraic spaces and frequently references Knutson's book Knu71. There is an error in chapter 12 concerning the functoriality of the lisse-étale site of an algebraic stack. One doesn't need to worry about this as the error has been patched by Martin Olsson (see Ols07b) and the results in the remaining chapters (after perhaps slight modification) are correct.

- The Stacks Project Authors: Stacks Project [Sta.

You are reading it!

- Anton Geraschenko: Lecture notes for Martin Olsson's class on stacks Ols07a

This course systematically develops the theory of algebraic spaces before introducing algebraic stacks (first defined in Lecture 27!). In addition to basic properties, the course covers the equivalence between being Deligne-Mumford and having unramified diagonal, the lisse-étale site on an Artin stack, the theory of quasi-coherent sheaves, the Keel-Mori theorem, cohomological descent, and gerbes (and their relation to the Brauer group). There are also some exercises.

- Behrend, Conrad, Edidin, Fantechi, Fulton, Göttsche, and Kresch: Algebraic stacks, online notes for a book being currently written $\left.\mathbf{B C E}{ }^{+} \mathbf{0 7}\right]$

The aim of this book is to give a friendly introduction to stacks without assuming a sophisticated background with a focus on examples and applications. Unlike LMB00, it is not assumed that the reader has digested the theory of algebraic spaces. Instead, Deligne-Mumford stacks are introduced with algebraic spaces being a special case with part of the goal being to develop enough theory to prove the assertions in DM69. The general theory of Artin stacks is to be developed in the second part. Only a fraction of the book is now available on Kresch's website.

### 90.4. Related references on foundations of stacks

- Vistoli: Notes on Grothendieck topologies, fibered categories and descent theory Vis05

Contains useful facts on fibered categories, stacks and descent theory in the fpqc topology as well as rigorous proofs.

- Knutson: Algebraic Spaces Knu71

This book, which evolved from his PhD thesis under Michael Artin, contains the foundations of the theory of algebraic spaces. The book LMB00 frequently references this text. See also Artin's papers on algebraic spaces: Art69a, Art69b, Art69c, Art70, Art71b, Art71a, Art73, and Art74

- Grothendieck et al, Théorie des Topos et Cohomologie Étale des Schémas $I, I I, I I I$ also known as SGA4 AGV71

Volume 1 contains many general facts on universes, sites and fibered categories. The word "champ" (French for "stack") appears in Deligne's Exposé XVIII.

- Jean Giraud: Cohomologie non abélienne Gir65

The book discusses fibered categories, stacks, torsors and gerbes over general sites but does not discuss algebraic stacks. For instance, if $G$ is a sheaf of abelian groups on $X$, then in the same way $H^{1}(X, G)$ can be identified with $G$-torsors, $H^{2}(X, G)$ can be identified with an appropriately defined set of $G$-gerbes. When $G$ is not abelian, then $H^{2}(X, G)$ is defined as the set of $G$-gerbes.

- Kelly and Street: Review of the elements of 2-categories KS74

The category of stacks form a 2-category although a simple type of 2-category where are 2-morphisms are invertible. This is a reference on general 2-categories. I have never used this so I cannot say how useful it is. Also note that [Sta contains some basics on 2-categories.

### 90.5. Papers in the literature

03B6 Below is a list of research papers which contain fundamental results on stacks and algebraic spaces. The intention of the summaries is to indicate only the results of the paper which contribute toward stack theory; in many cases these results are subsidiary to the main goals of the paper. We divide the papers into categories with some papers falling into multiple categories.

04UW 90.5.1. Deformation theory and algebraic stacks. The first three papers by Artin do not contain anything on stacks but they contain powerful results with the first two papers being essential for [Art74].

- Artin: Algebraic approximation of structures over complete local rings Art69a

It is proved that under mild hypotheses any effective formal deformation can be approximated: if $F:(S c h / S) \rightarrow(S e t s)$ is a contravariant functor locally of finite presentation with $S$ finite type over a field or excellent DVR, $s \in S$, and $\hat{\xi} \in F\left(\hat{\mathcal{O}}_{S, s}\right)$ is an effective formal deformation, then for any $n>0$, there exists an residually trivial étale neighborhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and $\xi^{\prime} \in F\left(S^{\prime}\right)$ such that $\xi^{\prime}$ and $\hat{\xi}$ agree up to order $n$ (ie. have the same restriction in $\left.F\left(\mathcal{O}_{S, s} / \mathfrak{m}^{n}\right)\right)$.

- Artin: Algebraization of formal moduli I Art69b

It is proved that under mild hypotheses any effective formal versal deformation is algebraizable. Let $F:(S c h / S) \rightarrow($ Sets $)$ be a contravariant functor locally of finite presentation with $S$ finite type over a field or excellent DVR, $s \in S$ be a locally closed point, $\hat{A}$ be a complete noetherian local $\mathcal{O}_{S}$-algebra with residue field $k^{\prime}$ a finite extension of $k(s)$, and $\hat{\xi} \in F(\hat{A})$ be an effective formal versal deformation of an element $\xi_{0} \in F\left(k^{\prime}\right)$. Then there is a scheme $X$ finite type over $S$ and a closed point $x \in X$ with residue field $k(x)=k^{\prime}$ and an element $\xi \in F(X)$
such that there is an isomorphism $\hat{\mathcal{O}}_{X, x} \cong \hat{A}$ identifying the restrictions of $\xi$ and $\hat{\xi}$ in each $F\left(\hat{A} / \mathfrak{m}^{n}\right)$. The algebraization is unique if $\hat{\xi}$ is a universal deformation. Applications are given to the representability of the Hilbert and Picard schemes.

- Artin: Algebraization of formal moduli. II Art70.

Vaguely, it is shown that if one can contract a closed subset $Y^{\prime} \subset$ $X^{\prime}$ formally locally around $Y^{\prime}$, then exists a global morphism $X^{\prime} \rightarrow X$ contracting $Y$ with $X$ an algebraic space.

- Artin: Versal deformations and algebraic stacks Art74

This momentous paper builds on his work in Art69a and Art69b. This paper introduces Artin's criterion which allows one to prove algebraicity of a stack by verifying deformationtheoretic properties. More precisely (but not very precisely), Artin constructs a presentation of a limit preserving stack $\mathcal{X}$ locally around a point $x \in \mathcal{X}(k)$ as follows: assuming the stack $\mathcal{X}$ satisfies Schlessinger's criterion (Sch68) , there exists a formal versal deformation $\hat{\xi} \in \lim \mathcal{X}\left(\hat{A} / \mathfrak{m}^{n}\right)$ of $x$. Assuming that formal deformations are effective (i.e., $\mathcal{X}(\hat{A}) \rightarrow \lim \mathcal{X}\left(\hat{A} / \mathfrak{m}^{n}\right)$ is bijective), then one obtains an effective formal versal deformation $\xi \in \mathcal{X}(\hat{A})$. Using results in Art69b, one produces a finite type scheme $U$ and an element $\xi_{U}: U \rightarrow \mathcal{X}$ which is formally versal at a point $u \in U$ over $x$. Then if we assume $\mathcal{X}$ admits a deformation and obstruction theory satisfying certain conditions (ie. compatibility with étale localization and completion as well as constructibility condition), then it is shown in section 4 that formal versality is an open condition so that after shrinking $U, U \rightarrow \mathcal{X}$ is smooth. Artin also presents a proof that any stack admitting an fppf presentation by a scheme admits a smooth presentation by a scheme so that in particular one can form quotient stacks by flat, separated, finitely presented group schemes.

- Conrad, de Jong: Approximation of Versal Deformations CdJ02 This paper offers an approach to Artin's algebraization result by applying Popescu's powerful result: if $A$ is a noetherian ring and $B$ a noetherian $A$-algebra, then the map $A \rightarrow B$ is a regular morphism if and only if $B$ is a direct limit of smooth $A$-algebras. It is not hard to see that Popescu's result implies Artin's approximation over an arbitrary excellent scheme (the excellence hypothesis implies that for a local ring $A$, the map $A^{\mathrm{h}} \rightarrow \hat{A}$ from the henselization to the completion is regular). The paper uses Popescu's result to give a "groupoid" generalization of the main theorem in Art69b which is valid over arbitrary excellent base schemes and for arbitrary points $s \in S$. In particular, the results in Art74 hold under an arbitrary excellent base. They discuss the étale-local uniqueness of the algebraization and whether the automorphism group of the object acts naturally on the henselization of the algebraization.
- Jason Starr: Artin's axioms, composition, and moduli spaces [Sta06]

The paper establishes that Artin's axioms for algebraization are compatible with the composition of 1-morphisms.

- Martin Olsson: Deformation theory of representable morphism of algebraic stacks Ols06a

This generalizes standard deformation theory results for morphisms of schemes to representable morphisms of algebraic stacks in terms of the cotangent complex. These results cannot be viewed as consequences of Illusie's general theory as the cotangent complex of a representable morphism $X \rightarrow \mathcal{X}$ is not defined in terms of cotangent complex of a morphism of ringed topoi (because the lisse-étale site is not functorial).

04UX 90.5.2. Coarse moduli spaces. Papers discussuing coarse moduli spaces.

- Keel, Mori: Quotients in Groupoids [KM97]

It had apparently long been "folklore" that separated DeligneMumford stacks admitted coarse moduli spaces. A rigorous (although terse) proof of the following theorem is presented here: if $\mathcal{X}$ is an Artin stack locally of finite type over a noetherian base scheme such that the inertia stack $I_{\mathcal{X}} \rightarrow \mathcal{X}$ is finite, then there exists a coarse moduli space $\phi: \mathcal{X} \rightarrow Y$ with $\phi$ separated and $Y$ an algebraic space locally of finite type over $S$. The hypothesis that the inertia is finite is precisely the right condition: there exists a coarse moduli space $\phi: \mathcal{X} \rightarrow Y$ with $\phi$ separated if and only if the inertia is finite.

- Conrad: The Keel-Mori Theorem via Stacks Con05b Keel and Mori's paper KM97 is written in the groupoid language and some find it challenging to grasp. Brian Conrad presents a stack-theoretic version of the proof which is quite transparent although it uses the sophisticated language of stacks. Conrad also removes the noetherian hypothesis.
- Rydh: Existence of quotients by finite groups and coarse moduli spaces Ryd07

Rydh removes the hypothesis from KM97 and Con05b that $\mathcal{X}$ be finitely presented over some base.

- Abramovich, Olsson, Vistoli: Tame stacks in positive characteristic AOV08 They define a tame Artin stack as an Artin stack with finite inertia such that if $\phi: \mathcal{X} \rightarrow Y$ is the coarse moduli space, $\phi_{*}$ is exact on quasi-coherent sheaves. They prove that for an Artin stack with finite inertia, the following are equivalent: $\mathcal{X}$ is tame if and only if the stabilizers of $\mathcal{X}$ are linearly reductive if and only if $\mathcal{X}$ is étale locally on the coarse moduli space a quotient of an affine scheme by a linearly reductive group scheme. For a tame Artin stack, the coarse moduli space is particularly nice. For instance, the coarse moduli space commutes with arbitrary base change while a general coarse moduli space for an Artin stack with finite inertia will only commute with flat base change.
- Alper: Good moduli spaces for Artin stacks Alp08

For general Artin stacks with infinite affine stabilizer groups (which are necessarily non-separated), coarse moduli spaces often do not exist. The simplest example is $\left[\mathbf{A}^{1} / \mathbf{G}_{m}\right]$. It is defined here that a quasi-compact morphism $\phi: \mathcal{X} \rightarrow Y$ is a good moduli space if $\mathcal{O}_{Y} \rightarrow \phi_{*} \mathcal{O}_{\mathcal{X}}$ is an isomorphism and $\phi_{*}$ is exact on quasi-coherent sheaves. This notion generalizes a tame Artin stack in AOV08 as well as encapsulates Mumford's geometric invariant theory: if $G$ is a reductive group acting linearly on $X \subset \mathbf{P}^{n}$, then the morphism from the quotient stack of the semi-stable locus to the GIT quotient $\left[X^{s s} / G\right] \rightarrow X / / G$ is a good moduli space. The notion of a good moduli space has many nice geometric properties: (1) $\phi$ is surjective, universally closed, and universally submersive, (2) $\phi$ identifies points in $Y$ with points in $\mathcal{X}$ up to closure equivalence, (3) $\phi$ is universal for maps to algebraic spaces, (4) good moduli spaces are stable under arbitrary base change, and (5) a vector bundle on an Artin stack descends to the good moduli space if and only if the representations are trivial at closed points.

04UY 90.5.3. Intersection theory. Papers discussing intersection theory on algebraic stacks.

- Vistoli: Intersection theory on algebraic stacks and on their moduli spaces Vis89

This paper develops the foundations for intersection theory with rational coefficients for Deligne-Mumford stacks. If $\mathcal{X}$ is a separated Deligne-Mumford stack, the chow group $A_{*}(\mathcal{X})$ with rational coefficients is defined as the free abelian group of integral closed substacks of dimension $k$ up to rational equivalence. There is a flat pullback, a proper push-forward and a generalized Gysin homomorphism for regular local embeddings. If $\phi: \mathcal{X} \rightarrow Y$ is a moduli space (ie. a proper morphism with is bijective on geometric points), there is an induced push-forward $A_{*}(\mathcal{X}) \rightarrow A_{k}(Y)$ which is an isomorphism.

- Edidin, Graham: Equivariant Intersection Theory EG98

The purpose of this article is to develop intersection theory with integral coefficients for a quotient stack $[X / G]$ of an action of an algebraic group $G$ on an algebraic space $X$ or, in other words, to develop a $G$-equivariant intersection theory of $X$. Equivariant chow groups defined using only invariant cycles does not produce a theory with nice properties. Instead, generalizing Totaro's definition in the case of $B G$ and motivated by the fact that if $V \rightarrow X$ is a vector bundle then $A_{i}(X) \cong A_{i}(V)$ naturally, the authors define $A_{i}^{G}(X)$ as follows: Let $\operatorname{dim}(X)=n$ and $\operatorname{dim}(G)=g$. For each $i$, choose a $l$-dimensional $G$-representation $V$ where $G$ acts freely on an open subset $U \subset V$ whose complement as codimension $d>n-i$. So $X_{G}=[X \times U / G]$ is an algebraic space (it can even be chosen to be a scheme). Then they define $A_{i}^{G}(X)=A_{i+l-g}\left(X_{G}\right)$. For the quotient stack, one defines $A_{i}([X / G]):=A_{i+g}^{G}(X)=A_{i+l}\left(X_{G}\right)$. In particular,
$A_{i}([X / G])=0$ for $i>\operatorname{dim}[X / G]=n-g$ but can be non-zero for $i \ll 0\left(\right.$ eg. $A_{i}\left(B \mathbf{G}_{m}\right)=\mathbf{Z}$ for $\left.i \leq 0\right)$. They establish that these equivariant Chow groups enjoy the same functorial properties as ordinary Chow groups. Furthermore, they establish that if $[X / G] \cong[Y / H]$ that $A_{i}([X / G])=A_{i}([Y / H])$ so that the definition is independent on how the stack is presented as a quotient stack.

- Kresch: Cycle Groups for Artin Stacks Kre99]

Kresch defines Chow groups for arbitrary Artin stacks agreeing with Edidin and Graham's definition in EG98 in the case of quotient stack. For algebraic stacks with affine stabilizer groups, the theory satisfies the usual properties.

- Behrend and Fantechi: The intrinsic normal cone BF97]

Generalizing a construction due to Li and Tian, Behrend and Fantechi construct a virtual fundamental class for a DeligneMumford stack.

04UZ 90.5.4. Quotient stacks. Quotient stack ${ }^{11}$ form a very important subclass of Artin stacks which include almost all moduli stacks studied by algebraic geometers. The geometry of a quotient stack $[X / G]$ is the $G$-equivariant geometry of $X$. It is often easier to show properties are true for quotient stacks and some results are only known to be true for quotient stacks. The following papers address: When is an algebraic stack a global quotient stack? Is an algebraic stack "locally" a quotient stack?

- Laumon, Moret-Bailly: LMB00, Chapter 6]

Chapter 6 contains several facts about the local and global structure of algebraic stacks. It is proved that an algebraic stack $\mathcal{X}$ over $S$ is a quotient stack $[Y / G]$ with $Y$ an algebraic space (resp. scheme, resp. affine scheme) and $G$ a finite group if and only if there exists an algebraic space (resp. scheme, resp. affine scheme) $Y^{\prime}$ and an finite étale morphism $Y^{\prime} \rightarrow \mathcal{X}$. It is shown that any Deligne-Mumford stack over $S$ and $x: \operatorname{Spec}(K) \rightarrow$ $\mathcal{X}$ admits an representable, étale and separated morphism $\phi$ : $[X / G] \rightarrow \mathcal{X}$ where $G$ is a finite group acting on an affine scheme over $S$ such that $\operatorname{Spec}(K)=[X / G] \times \mathcal{X} \operatorname{Spec}(K)$. The existence of presentations with geometrically connected fibers is also discussed in detail.

- Edidin, Hassett, Kresch, Vistoli: Brauer Groups and Quotient stacks EHKV01

First, they establish some fundamental (although not very difficult) facts concerning when a given algebraic stack (always assumed finite type over a noetherian scheme in this paper) is a quotient stack. For an algebraic stack $\mathcal{X}: \mathcal{X}$ is a quotient stack if and only if there exists a vector bundle $V \rightarrow \mathcal{X}$ such that for every geometric point, the stabilizer acts faithfully on the fiber

[^231]if and only if there exists a vector bundle $V \rightarrow \mathcal{X}$ and a locally closed substack $V^{0} \subset V$ such that $V^{0}$ is representable and surjects onto $F$. They establish that an algebraic stack is a quotient stack if there exists finite flat cover by an algebraic space. Any smooth Deligne-Mumford stack with generically trivial stabilizer is a quotient stack. They show that a $\mathbf{G}_{m}$-gerbe over a noetherian scheme $X$ corresponding to $\beta \in H^{2}\left(X, \mathbf{G}_{m}\right)$ is a quotient stack if and only if $\beta$ is in the image of the Brauer map $\operatorname{Br}(X) \rightarrow \operatorname{Br}^{\prime}(X)$. They use this to produce a non-separated Deligne-Mumford stack that is not a quotient stack.

- Totaro: The resolution property for schemes and stacks Tot04]

A stack has the resolution property if every coherent sheaf is the quotient of a vector bundle. The first main theorem is that if $\mathcal{X}$ is a normal noetherian algebraic stack with affine stabilizer groups at closed points, then the following are equivalent: (1) $\mathcal{X}$ has the resolution property and (2) $\mathcal{X}=\left[Y / \mathrm{GL}_{n}\right]$ with $Y$ quasiaffine. In the case $\mathcal{X}$ is finite type over a field, then (1) and (2) are equivalent to: (3) $\mathcal{X}=[\operatorname{Spec}(A) / G]$ with $G$ an affine group scheme finite type over $k$. The implication that quotient stacks have the resolution property was proven by Thomason. The second main theorem is that if $\mathcal{X}$ is a smooth Deligne-Mumford stack over a field which has a finite and generically trivial stabilizer group $I_{\mathcal{X}} \rightarrow \mathcal{X}$ and whose coarse moduli space is a scheme with affine diagonal, then $\mathcal{X}$ has the resolution property. Another cool result states that if $\mathcal{X}$ is a noetherian algebraic stack satisfying the resolution property, then $\mathcal{X}$ has affine diagonal if and only if the closed points have affine stabilizer.

- Kresch: On the Geometry of Deligne-Mumford Stacks Kre09

This article summarizes general structure results of DeligneMumford stacks (of finite type over a field) and contains some interesting results concerning quotient stacks. It is shown that any smooth, separated, generically tame Deligne-Mumford stack with quasi-projective coarse moduli space is a quotient stack $[Y / G]$ with $Y$ quasi-projective and $G$ an algebraic group. If $\mathcal{X}$ is a Deligne-Mumford stack whose coarse moduli space is a scheme, then $\mathcal{X}$ is Zariski-locally a quotient stack if and only if it admits a Zariski-open covering by stack quotients of schemes by finite groups. If $\mathcal{X}$ is a Deligne-Mumford stack proper over a field of characteristic 0 with coarse moduli space $Y$, then: $Y$ is projective and $\mathcal{X}$ is a quotient stack if and only if $Y$ is projective and $\mathcal{X}$ possesses a generating sheaf if and only if $\mathcal{X}$ admits a closed embedding into a smooth proper DM stack with projective coarse moduli space. This motivates a definition that a Deligne-Mumford stack is projective if there exists a closed embedding into a smooth, proper Deligne-Mumford stack with projective coarse moduli space.

- Kresch, Vistoli On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map [KV04]

It is shown that in characteristic 0 and for a fixed $n$, the following two statements are equivalent: (1) every smooth DeligneMumford stack of dimension $n$ is a quotient stack and (2) the Azumaya Brauer group coincides with the cohomological Brauer group for smooth schemes of dimension $n$.

- Kresch: Cycle Groups for Artin Stacks Kre99]

It is shown that a reduced Artin stack finite type over a field with affine stabilizer groups admits a stratification by quotient stacks.

- Abramovich-Vistoli: Compactifying the space of stable maps AV02 Lemma 2.2.3 establishes that for any separated Deligne-Mumford stack is étale-locally on the coarse moduli space a quotient stack $[U / G]$ where $U$ affine and $G$ a finite group. Ols06b Theorem 2.12] shows in this argument $G$ is even the stabilizer group.
- Abramovich, Olsson, Vistoli: Tame stacks in positive characteristic AOV08 This paper shows that a tame Artin stack is étale locally on the coarse moduli space a quotient stack of an affine by the stabilizer group.
- Alper: On the local quotient structure of Artin stacks Alp10

It is conjectured that for an Artin stack $\mathcal{X}$ and a closed point $x \in \mathcal{X}$ with linearly reductive stabilizer, then there is an étale morphism $\left[V / G_{x}\right] \rightarrow \mathcal{X}$ with $V$ an algebraic space. Some evidence for this conjecture is given. A simple deformation theory argument (based on ideas in AOV08) shows that it is true formally locally. A stack-theoretic proof of Luna's étale slice theorem is presented proving that for stacks $\mathcal{X}=[\operatorname{Spec}(A) / G]$ with $G$ linearly reductive, then étale locally on the GIT quotient $\operatorname{Spec}\left(A^{G}\right), \mathcal{X}$ is a quotient stack by the stabilizer.

04V0 90.5.5. Cohomology. Papers discussing cohomology of sheaves on algebraic stacks.

- Olsson: Sheaves on Artin stacks Ols07b

This paper develops the theory of quasi-coherent and constructible sheaves proving basic cohomological properties. This paper corrects a mistake in LMB00 in the functoriality of the lisseétale site. The cotangent complex is constructed. In addition, the following theorems are proved: Grothendieck's Fundamental Theorem for proper morphisms, Grothendieck's Existence Theorem, Zariski's Connectness Theorem and finiteness theorem for proper pushforwards of coherent and constructible sheaves.

- Behrend: Derived l-adic categories for algebraic stacks Beh03

Proves the Lefschetz trace formula for algebraic stacks.

- Behrend: Cohomology of stacks [Beh04]

Defines the de Rham cohomology for differentiable stacks and singular cohomology for topological stacks.

- Faltings: Finiteness of coherent cohomology for proper fppf stacks Fal03] Proves coherence for direct images of coherent sheaves for proper morphisms.
- Abramovich, Corti, Vistoli: Twisted bundles and admissible covers ACV03

The appendix contains the proper base change theorem for étale cohomology for tame Deligne-Mumford stacks.

04V1 90.5.6. Existence of finite covers by schemes. The existence of finite covers of Deligne-Mumford stacks by schemes is an important result. In intersection theory on Deligne-Mumford stacks, it is an essential ingredient in defining proper pushforward for non-representable morphisms. There are several results about $\overline{\mathcal{M}}_{g}$ relying on the existence of a finite cover by a smooth scheme which was proven by Looijenga. Perhaps the first result in this direction is [Ses72, Theorem 6.1] which treats the equivariant setting.

- Vistoli: Intersection theory on algebraic stacks and on their moduli spaces Vis89

If $\mathcal{X}$ is a Deligne-Mumford stack with a moduli space (ie. a proper morphism which is bijective on geometric points), then there exists a finite morphism $X \rightarrow \mathcal{X}$ from a scheme $X$.

- Laumon, Moret-Bailly: LMB00, Chapter 16]

As an application of Zariski's main theorem, Theorem 16.6 establishes: if $\mathcal{X}$ is a Deligne-Mumford stack finite type over a noetherian scheme, then there exists a finite, surjective, generically étale morphism $Z \rightarrow \mathcal{X}$ with $Z$ a scheme. It is also shown in Corollary 16.6.2 that any noetherian normal algebraic space is isomorphic to the algebraic space quotient $X^{\prime} / G$ for a finite group $G$ acting a normal scheme $X$.

- Edidin, Hassett, Kresch, Vistoli: Brauer Groups and Quotient stacks EHKV01

Theorem 2.7 states: if $\mathcal{X}$ is an algebraic stack of finite type over a noetherian ground scheme $S$, then the diagonal $\mathcal{X} \rightarrow \mathcal{X} \times{ }_{S} \mathcal{X}$ is quasi-finite if and only if there exists a finite surjective morphism $X \rightarrow F$ from a scheme $X$.

- Kresch, Vistoli: On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map KV04]

It is proved here that any smooth, separated Deligne-Mumford stack finite type over a field with quasi-projective coarse moduli space admits a finite, flat cover by a smooth quasi-projective scheme.

- Olsson: On proper coverings of Artin stacks Ols05

Proves that if $\mathcal{X}$ is an Artin stack separated and finite type over $S$, then there exists a proper surjective morphism $X \rightarrow \mathcal{X}$ from a scheme $X$ quasi-projective over $S$. As an application, Olsson proves coherence and constructibility of direct image sheaves under proper morphisms. As an application, he proves Grothendieck's existence theorem for proper Artin stacks.

04V2 90.5.7. Rigidification. Rigidification is a process for removing a flat subgroup from the inertia. For example, if $X$ is a projective variety, the morphism from the Picard stack to the Picard scheme is a rigidification of the group of automorphism $\mathbf{G}_{m}$.

- Abramovich, Corti, Vistoli: Twisted bundles and admissible covers ACV03

Let $\mathcal{X}$ be an algebraic stack over $S$ and $H$ be a flat, finitely presented separated group scheme over $S$. Assume that for every object $\xi \in \mathcal{X}(T)$ there is an embedding $H(S) \hookrightarrow \operatorname{Aut}_{\mathcal{X}(T)}(\xi)$ which is compatible under pullbacks in the sense that for every arrow $\phi: \xi \rightarrow \xi^{\prime}$ over $f: T \rightarrow T^{\prime}$ and $g \in H(T), g \circ \phi=\phi \circ f^{*} g$. Then there exists an algebraic stack $\mathcal{X} / H$ and a morphism $\rho$ : $\mathcal{X} \rightarrow \mathcal{X} / H$ which is an fppf gerbe such that for every $\xi \in \mathcal{X}(T)$, the morphism $\operatorname{Aut}_{\mathcal{X}(T)}(\xi) \rightarrow \operatorname{Aut}_{\mathcal{X} / H(T)}(\xi)$ is surjective with kernel $H(T)$.

- Romagny: Group actions on stacks and applications Rom05] Discusses how group actions behave with respect to rigidifications.
- Abramovich, Graber, Vistoli: Gromov-Witten theory for Deligne-Mumford stacks AGV08

The appendix gives a summary of rigidification as in ACV03] with two alternative interpretations. This paper also contains constructions for gluing algebraic stacks along closed substacks and for taking roots of line bundles.

- Abramovich, Olsson, Vistoli: Tame stacks in positive characteristic (AOV08) The appendix handles the more complicated situation where the flat subgroup stack of the inertia $H \subset I_{\mathcal{X}}$ is normal but not necessarily central.

04 V 3 90.5.8. Stacky curves. Papers discussing stacky curves.

- Abramovich, Vistoli: Compactifying the space of stable maps AV02 This paper introduces twisted curves. The moduli space of stable maps from stable curves into an algebraic stack is typically not compact. By using maps from twisted curves, the authors construct a moduli stack which is proper when the target is a tame Deligne-Mumford stack whose coarse moduli space is projective.
- Behrend, Noohi: Uniformization of Deligne-Mumford curves BN06 Proves a uniformization theorem of Deligne-Mumford analytic curves.

04V4 90.5.9. Hilbert, Quot, Hom and branchvariety stacks. Papers discussing Hilbert schemes and the like.

- Vistoli: The Hilbert stack and the theory of moduli of families Vis91 If $\mathcal{X}$ is a algebraic stack separated and locally of finite type over a locally noetherian and locally separated algebraic space $S$, Vistoli defines the Hilbert stack $\mathcal{H i l b}(\mathcal{F} / S)$ parameterizing finite and unramified morphisms from proper schemes. It is claimed without proof that $\mathcal{H i l b}(\mathcal{F} / S)$ is an algebraic stack. As a consequence, it is proved that with $\mathcal{X}$ as above, the Hom stack $\mathcal{H o m}_{S}(T, \mathcal{X})$ is an algebraic stack if $T$ is proper and flat over $S$.
- Olsson, Starr: Quot functors for Deligne-Mumford stacks OS03

If $\mathcal{X}$ is a Deligne-Mumford stack separated and locally of finite presentation over an algebraic space $S$ and $\mathcal{F}$ is a locally finitely-presented $\mathcal{O}_{\mathcal{X}}$-module, the quot functor $\operatorname{Quot}(\mathcal{F} / \mathcal{X} / S)$ is represented by an algebraic space separated and locally of
finite presentation over $S$. This paper also defines generating sheaves and proves existence of a generating sheaf for tame, separated Deligne-Mumford stacks which are global quotient stacks of a scheme by a finite group.

- Olsson: Hom-stacks and Restrictions of Scalars Ols06b

Suppose $\mathcal{X}$ and $\mathcal{Y}$ are Artin stacks locally of finite presentation over an algebraic space $S$ with finite diagonal with $\mathcal{X}$ proper and flat over $S$ such that fppf-locally on $S, \mathcal{X}$ admits a finite finitely presented flat cover by an algebraic space (eg. $\mathcal{X}$ is DeligneMumford or a tame Artin stack). Then $\operatorname{Hom}_{S}(\mathcal{X}, \mathcal{Y})$ is an Artin stack locally of finite presentation over $S$.

- Alexeev and Knutson: Complete moduli spaces of branchvarieties ( $\mathbf{A K 1 0}$ ) They define a branchvariety of $\mathbf{P}^{n}$ as a finite morphism $X \rightarrow \mathbf{P}^{n}$ from a reduced scheme $X$. They prove that the moduli stack of branchvarieties with fixed Hilbert polynomial and total degrees of $i$-dimensional components is a proper Artin stack with finite stabilizer. They compare the stack of branchvarieties with the Hilbert scheme, Chow scheme and moduli space of stable maps.
- Lieblich: Remarks on the stack of coherent algebras Lie06b

This paper constructs a generalization of Alexeev and Knutson's stack of branch-varieties over a scheme $Y$ by building the stack as a stack of algebras over the structure sheaf of $Y$. Existence proofs of Quot and Hom spaces are given.

- Starr: Artin's axioms, composition, and moduli spaces [Sta06]

As an application of the main result, a common generalization of Vistoli's Hilbert stack Vis91 and Alexeev and Knutson's stack of branchvarieties AK10 is provided. If $\mathcal{X}$ is an algebraic stack locally of finite type over an an excellent scheme $S$ with finite diagonal, then the stack $\mathcal{H}$ parameterizing morphisms $g: T \rightarrow \mathcal{X}$ from a proper algebraic space $T$ with a $G$-ample line bundle $L$ is an Artin stack locally of finite type over $S$.

- Lundkvist and Skjelnes: Non-effective deformations of Grothendieck's Hilbert functor LS08

Shows that the Hilbert functor of a non-separated scheme is not represented since there are non-effective deformations.

04V5 90.5.10. Toric stacks. Toric stacks provide a great class of examples and a natural testing ground for conjectures due to the dictionary between the geometry of a toric stack and the combinatorics of its stacky fan in a similar way that toric varieties provide examples and counterexamples in scheme theory.

- Borisov, Chen and Smith: The orbifold Chow ring of toric Deligne-Mumford stacks BCS05

Inspired by Cox's construction for toric varieties, this paper defines smooth toric DM stacks as explicit quotient stacks associated to a combinatorial object called a stacky fan.

- Iwanari: The category of toric stacks Iwa09

This paper defines a toric triple as a smooth Deligne-Mumford stack $\mathcal{X}$ with an open immersion $\mathbf{G}_{m} \hookrightarrow \mathcal{X}$ with dense image (and therefore $\mathcal{X}$ is an orbifold) and an action $\mathcal{X} \times \mathbf{G}_{m} \rightarrow \mathcal{X}$.

It is shown that there is an equivalence between the 2-category of toric triples and the 1-category of stacky fans. The relationship between toric triples and the definition of smooth toric DM stacks in BCS05] is discussed.

- Iwanari: Integral Chow rings for toric stacks Iwa07.

Generalizes Cox's $\Delta$-collections for toric varieties to toric orbifolds.

- Perroni: A note on toric Deligne-Mumford stacks Per08 Generalizes Cox's $\Delta$-collections and Iwanari's paper Iwa07 to general smooth toric DM stacks.
- Fantechi, Mann, and Nironi: Smooth toric DM stacks FMN07.

This paper defines a smooth toric DM stack as a smooth DM stack $\mathcal{X}$ with the action of a DM torus $\mathcal{T}$ (ie. a Picard stack isomorphic to $T \times B G$ with $G$ finite) having an open dense orbit isomorphic to $\mathcal{T}$. They give a "bottom-up description" and prove an equivalence between smooth toric DM stacks and stacky fans.

- Geraschenko and Satriano: Toric Stacks I and II GS11a and GS11b These papers define a toric stack as the stack quotient of a toric variety by a subgroup of its torus. A generically stacky toric stack is defined as a torus invariant substack of a toric stack. This definition encompasses and extends previous definitions of toric stacks. The first paper develops a dictionary between the combinatorics of stacky fans and the geometry of the corresponding stacks. It also gives a moduli interpretation of smooth toric stacks, generalizing the one in Per08. The second paper proves an intrinsic characterization of toric stacks.
90.5.11. Theorem on formal functions and Grothendieck's Existence The-

04V6 orem. These papers give generalizations of the theorem on formal functions DG67, III.4.1.5] (sometimes referred to Grothendieck's Fundamental Theorem for proper morphisms) and Grothendieck's Existence Theorem DG67, III.5.1.4].

- Knutson: Algebraic spaces Knu71, Chapter V] Generalizes these theorems to algebraic spaces.
- Abramovich-Vistoli: Compactifying the space of stable maps [AV02, A.1.1] Generalizes these theorems to tame Deligne-Mumford stacks
- Olsson and Starr: Quot functors for Deligne-Mumford stacks OS03. Generalizes these theorems to separated Deligne-Mumford stacks.
- Olsson: On proper coverings of Artin stacks Ols05.

Provides a generalization to proper Artin stacks.

- Conrad: Formal GAGA on Artin stacks Con05a

Provides a generalization to proper Artin stacks and proves a formal GAGA theorem.

- Olsson: Sheaves on Artin stacks Ols07b

Provides another proof for the generalization to proper Artin stacks.

04V7
90.5.12. Group actions on stacks. Actions of groups on algebraic stacks naturally appear. For instance, symmetric group $S_{n}$ acts on $\overline{\mathcal{M}}_{g, n}$ and for an action of
a group $G$ on a scheme $X$, the normalizer of $G$ in $\operatorname{Aut}(X)$ acts on $[X / G]$. Furthermore, torus actions on stacks often appear in Gromov-Witten theory.

- Romagny: Group actions on stacks and applications Rom05]

This paper makes precise what it means for a group to act on an algebraic stack and proves existence of fixed points as well as existence of quotients for actions of group schemes on algebraic stacks. See also Romagny's earlier note Rom03.

04V8 90.5.13. Taking roots of line bundles. This useful construction was discovered independently by Cadman and by Abramovich, Graber and Vistoli. Given a scheme $X$ with an effective Cartier divisor $D$, the $r$ th root stack is an Artin stack branched over $X$ at $D$ with a $\mu_{r}$ stabilizer over $D$ and scheme-like away from $D$.

- Charles Cadman Using Stacks to Impose Tangency Conditions on Curves Cad07
- Abramovich, Graber, Vistoli: Gromov-Witten theory for Deligne-Mumford stacks AGV08

04V9 90.5.14. Other papers. Potpourri of other papers.

- Lieblich: Moduli of twisted sheaves Lie07]

This paper contains a summary of gerbes and twisted sheaves. If $\mathcal{X} \rightarrow X$ is a $\mu_{n}$-gerbe with $X$ a projective relative surface with smooth connected geometric fibers, it is shown that the stack of semistable $\mathcal{X}$-twisted sheaves is an Artin stack locally of finite presentation over $S$. This paper also develops the theory of associated points and purity of sheaves on Artin stacks.

- Lieblich, Osserman: Functorial reconstruction theorem for stacks LO08 Proves some surprising and interesting results on when an algebraic stack can be reconstructed from its associated functor.
- David Rydh: Noetherian approximation of algebraic spaces and stacks Ryd08

This paper shows that every quasi-compact algebraic stack with quasi-finite diagonal can be approximated by a noetherian stack. There are applications to removing the noetherian hypothesis in results of Chevalley, Serre, Zariski and Chow.

### 90.6. Stacks in other fields

- Behrend and Noohi: Uniformization of Deligne-Mumford curves BN06] Gives an overview and comparison of topological, analytic and algebraic stacks.
- Behrang Noohi: Foundations of topological stacks I Noo05]
- David Metzler: Topological and smooth stacks Met05]

## CHAPTER 91

## Desirables

### 91.1. Introduction

02B5 This is basically just a list of things that we want to put in the stacks project. As we add material to the project continuously this is always somewhat behind the current state of the project. In fact, it may have been a mistake to try and list things we should add, because it seems impossible to keep it up to date.

Last updated: Thursday, May 9, 2013.

### 91.2. Conventions

02B7 We should have a chapter with a short list of conventions used in the document. This chapter already exists, see Conventions, Section 2.1, but a lot more could be added there. Especially useful would be to find "hidden" conventions and tacit assumptions and put those there.

### 91.3. Sites and Topoi

02BA We have a chapter on sites and sheaves, see Sites, Section 7.1 . We have a chapter on ringed sites (and topoi) and modules on them, see Modules on Sites, Section 18.1 . We have a chapter on cohomology in this setting, see Cohomology on Sites, Section 21.1 But a lot more could be added, especially in the chapter on cohomology.

### 91.4. Stacks

02 BB We have a chapter on (abstract) stacks, see Stacks, Section 8.1. It would be nice if
(1) improve the discussion on "stackyfication",
(2) give examples of stackyfication,
(3) more examples in general,
(4) improve the discussion of gerbes.

Example result which has not been added yet: Given a sheaf of abelian groups $\mathcal{F}$ over $\mathcal{C}$ the set of equivalence classes of gerbes with "group" $\mathcal{F}$ is bijective to $H^{2}(\mathcal{C}, \mathcal{F})$.

### 91.5. Simplicial methods

03 MZ We have a chapter on simplicial methods, see Simplicial, Section 14.1. This has to be reviewed and improved. The discussion of the relationship between simplicial homotopy (also known as combinatorial homotopy) and Kan complexes should be improved upon. Moreover, there should be a chapter on "simplicial algebraic geometry", where we discuss simplicial schemes, and how to think of their geometry,
cohomology, etc. Then this should be tied into the chapter on hypercoverings to "explain" the results of this chapter in the new language.

### 91.6. Cohomology of schemes

02BE There is already a chapter on cohomology of quasi-coherent sheaves, see Cohomology of Schemes, Section 29.1. We also have chapters on étale cohomology of schemes, crystalline cohomology of schemes, derived categories of schemes. But most of the material is very basic and a lot more could be added here.

### 91.7. Deformation theory à la Schlessinger

02BF We have a chapter on this material, see Formal Deformation Theory, Section 73.1 . What is needed is worked out examples of the general theory, for example the case of representations of a fixed abstract group.

### 91.8. Definition of algebraic stacks

02BK An algebraic stack is a stack in groupoids over the category of schemes with the fppf topology that has a diagonal representable by algebraic spaces and is the target of a surjective smooth morphism from a scheme. The notion "Deligne-Mumford stack" will be reserved for a stack as in DM69. We will reserve the term "Artin stack" for a stack such as in the papers by Artin (Art69b, and Art74. (See also CdJ02.) In other words, and Artin stack will be an algebraic stack with some reasonable finiteness and separatedness conditions.

### 91.9. Examples of schemes, algebraic spaces, algebraic stacks

02 BL It really is not that hard to show that $\mathcal{M}_{g}$ is an algebraic stack for $g \geq 2$. We should really have a long list of moduli problems here and prove they are all algebraic stacks. Some of them we can prove are algebraic using Artin approximation. For example the Kontsevich moduli space in characteristic $p>0$.

Here are some items for the list of moduli problems mentioned above.
(1) $\mathcal{M}_{g}$, i.e., moduli of smooth projective curves of genus $g$,
(2) $\overline{\mathcal{M}}_{g}$, i.e., moduli of stable genus $g$ curves,
(3) $\mathcal{A}_{g}$, i.e., principally polarized abelian schemes of genus $g$,
(4) $\mathcal{M}_{1,1}$, i.e., 1-pointed smooth projective genus 1 curves,
(5) $\mathcal{M}_{g, n}$, i.e., smooth projective genus $g$-curves with $n$ pairwise distinct labeled points,
(6) $\overline{\mathcal{M}}_{g, n}$, i.e., stable $n$-pointed nodal projective genus $g$-curves,
(7) $\mathcal{H o m}_{S}(\mathcal{X}, \mathcal{Y})$, moduli of morphisms (with suitable conditions on the stacks $\mathcal{X}, \mathcal{Y}$ and the base scheme $S)$,
(8) $B u n_{G}(X)=\mathcal{H o m}_{S}(X, B G)$, the stack of $G$-bundles of the geometric Langlands programme (with suitable conditions on the scheme $X$, the group scheme $G$, and the base scheme $S$ ),
(9) $P i_{\mathcal{X} / S}$, i.e., the Picard stack associated to an algebraic stack over a base scheme (or space).
How about the algebraic space you get from the deformation theory of a general surface in $\mathbf{P}^{3}$ with a node? (I mean where you deform it to a general smooth surface in $\mathbf{P}^{3}$.) Perhaps we can talk about some small dimensional examples here too. For
example the stack where you have $\mathbf{A}^{1}$ with a $B(\mathbf{Z} / 2)$ sitting at 0 . Bugeyed covers. And so on.

### 91.10. Properties of algebraic stacks

02BM This is perhaps one of the easier projects to work on, as most of the basic theory is there now. An interesting project is discussing the various ways of defining what a proper algebraic stack is. Of course these things are really properties of morphisms of stacks. We can define singularities (up to smooth factors) etc. Prove that a connected normal stack is irreducible, etc.

### 91.11. Lisse étale site of an algebraic stack

02BN This has been introduced in Cohomology of Stacks, Section 84.11. An example to show that it is not functorial with respect to 1-morphisms of algebraic stacks is discussed in Examples, Section 88.50. Of course a lot more could be said about this, but it turns out to be very useful to prove things using the "big" étale site as much as possible.

### 91.12. Things you always wanted to know but were afraid to ask

02BO There are going to be lots of lemmas that you use over and over again that are useful but aren't really mentioned specifically in the literature, or it isn't easy to find references for. Bag of tricks.
Example: Given two groupoids in schemes $R \Rightarrow U$ and $R^{\prime} \Rightarrow U^{\prime}$ what does it mean to have a 1-morphism $[U / R] \rightarrow\left[U^{\prime} / R^{\prime}\right]$ purely in terms of groupoids in schemes.

### 91.13. Quasi-coherent sheaves on stacks

02BP These are defined and discussed in the chapter Cohomology of Stacks, Section 84.1. Derived categories of modules are discussed in the chapter Derived Categories of Stacks, Section 85.1. A lot more could be added to these chapters.

### 91.14. Flat and smooth

02BR Artin's theorem that having a flat surjection from a scheme is a replacement for the smooth surjective condition. This is now available as Criteria for Representability, Theorem 79.16.1

### 91.15. Artin's representability theorem

02BS This is discussed in the chapter Artin's Axioms, Section 80.1. We also have an application, see Quot, Theorem 81.5.12. There should be a lot more applications and the chapter itself has to be cleaned up as well.

### 91.16. DM stacks are finitely covered by schemes

02BT This all begins with Gabber's lemma I think. Somewhere in Asterisque about Faltings proof of Mordell?

### 91.17. Martin Olsson's paper on properness

02BU This proves two notions of proper are the same. We can also discuss Faltings result that it suffices to use DVR's in certain cases.

### 91.18. Proper pushforward of coherent sheaves

02BV No comments yet.

### 91.19. Keel and Mori

02BW See KM97. This material has been incorporated throughout the Stacks project. See for example More on Groupoids, Section 39.12 and More on Groupoids in Spaces, Section 66.13.

### 91.20. Add more here

02BX Please.

## CHAPTER 92

## Coding Style

02BY

### 92.1. List of style comments

02BZ These will be changed over time, but having some here now will hopefully encourage a consistent LaTeX style. We will call "cod ${ }^{1}$ ' the contents of the source files.
(1) Keep all lines in all tex files to at most 80 characters.
(2) Do not use indentation in the tex file. Use syntax highlighting in your editor, instead of indentation, to visualize environments, etc.
(3) Use
\medskip\noindent
to start a new paragraph, and use
\noindent
to start a new paragraph just after an environment.
(4) Do not break the code for mathematical formulas across lines if possible. If the complete code complete with enclosing dollar signs does not fit on the line, then start with the first dollar sign on the first character of the next line. If it still does not fit, find a mathematically reasonable spot to break the code.
(5) Displayed math equations should be coded as follows

## \$\$

...
\$\$
In other words, start with a double dollar sign on a line by itself and end similarly.
(6) Do not use any macros. Rationale: This makes it easier to read the tex file, and start editing an arbitrary part without having to learn innumerable macros. And it doesn't make it harder or more timeconsuming to write. Of course the disadvantage is that the same mathematical object may be TeXed differently in different places in the text, but this should be easy to spot.
(7) The theorem environments we use are: "theorem", "proposition", "lemma" (plain), "definition", "example", "exercise", "situation" (definition), "remark", "remarks" (remark). Of course there is also a "proof" environment.
(8) An environment "foo" should be coded as follows

[^232]```
\begin{foo}
```

```
...
...
\end{foo}
```

similarly to the way displayed equations are coded.
(9) Instead of a "corollary", just use "lemma" environment since likely the result will be used to prove the next bigger theorem anyway.
(10) Directly following each lemma, proposition, or theorem is the proof of said lemma, proposition, or theorem. No nested proofs please.
(11) The files preamble.tex, chapters.tex and fdl.tex are special tex files. Apart from these, each tex file has the following structure

```
\input{preamble}
\begin{document}
\title{Title}
\maketitle
\tableofcontents
...
..
\input{chapters}
\bibliography{my}
\bibliographystyle{amsalpha}
\end{document}
```

(12) Try to add labels to lemmas, propositions, theorems, and even remarks, exercise, and other environments. If labelling a lemma use something like

```
\begin{lemma}
\label{lemma-bar}
\end{lemma}
```

Similarly for all other environments. In other words, the label of a environment named "foo" starts with "foo-". In addition to this please make all labels consist only of lower case letters, digits, and the symbol "-".
(13) Never refer to "the lemma above" (or proposition, etc). Instead use:

Lemma \ref\{lemma-bar\} above
This means that later moving lemmas around is basically harmless.
(14) Cross-file referencing. To reference a lemma labeled "lemma-bar" in the file foo.tex which has title "Foo", please use the following code

```
Foo, Lemma \ref{foo-lemma-bar}
```

If this does not work, then take a look at the file preamble.tex to find the correct expression to use. This will produce the "Foo, Lemma <link>" in the output file so it will be clear that the link points out of the file.
(15) If at all possible avoid forward references in proof environments. (It should be possible to write an automated test for this.)
(16) Do not start any sentence with a mathematical symbol.
(17) Do not have a sentence of the type "This follows from the following" just before a lemma, proposition, or theorem. Every sentence ends with a period.
(18) State all hypotheses in each lemma, proposition, theorem. This makes it easier for readers to see if a given lemma, proposition, or theorem applies to their particular problem.
(19) Keep proofs short; less than 1 page in pdf or dvi. You can always achieve this by splitting out the proof in lemmas etc.
(20) In a defining property foobar use
\{\it foobar\}
in the code inside the definition environment. Similarly if the definition occurs in the text of the document. This will make it easier for the reader to see what it is that is being defined.
(21) Put any definition that will be used outside the section it is in, in its own definition environment. Temporary definitions may be made in the text. A tricky case is that of mathematical constructions (which are often definitions involving interrelated lemmas). Maybe a good solution is to have them in their own short section so users can refer to the section instead of a definition.
(22) Do not number equations unless they are actually being referenced somewhere in the text. We can always add labels later.
(23) In statements of lemmas, propositions and theorems and in proofs keep the sentences short. For example, instead of "Let $R$ be a ring and let $M$ be an $R$-module." write "Let $R$ be a ring. Let $M$ be an $R$-module.". Rationale: This makes it easier to parse the trickier parts of proofs and statements.
(24) Use the

\section

command to make sections, but try to avoid using subsections and subsubsections.
(25) Avoid using complicated latex constructions.

## CHAPTER 93

## Obsolete

### 93.1. Introduction

In this chapter we put some lemmas that have become "obsolete" (see Mil17).

### 93.2. Homological algebra

0BFJ
076K Remark 93.2.1. The following remarks are obsolete as they are subsumed in Homology, Lemmas 12.21 .11 and 12.22 .6 Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a weak Serre subcategory (see Homology, Definition 12.9.1). Suppose that $K^{\bullet \bullet}$ is a double complex to which Homology, Lemma 12.22 .6 applies such that for some $r \geq 0$ all the objects ${ }^{\prime} E_{r}^{p, q}$ belong to $\mathcal{C}$. Then all the cohomology groups $H^{n}\left(s K^{\bullet}\right)$ belong to $\mathcal{C}$. Namely, the assumptions imply that the kernels and images of ' $d_{r}^{p, q}$ are in $\mathcal{C}$. Whereupon we see that each ' $E_{r+1}^{p, q}$ is in $\mathcal{C}$. By induction we see that each ${ }^{\prime} E_{\infty}^{p, q}$ is in $\mathcal{C}$. Hence each $H^{n}\left(s K^{\bullet}\right)$ has a finite filtration whose subquotients are in $\mathcal{C}$. Using that $\mathcal{C}$ is closed under extensions we conclude that $H^{n}\left(s K^{\bullet}\right)$ is in $\mathcal{C}$ as claimed. The same result holds for the second spectral sequence associated to $K^{\bullet \bullet}$. Similarly, if $\left(K^{\bullet}, F\right)$ is a filtered complex to which Homology, Lemma 12.21 .11 applies and for some $r \geq 0$ all the objects $E_{r}^{p, q}$ belong to $\mathcal{C}$, then each $H^{n}\left(K^{\bullet}\right)$ is an object of $\mathcal{C}$.

### 93.3. Obsolete algebra lemmas

088X
055Z Lemma 93.3.1. Let $M$ be an $R$-module of finite presentation. For any surjection $\alpha: R^{\oplus n} \rightarrow M$ the kernel of $\alpha$ is a finite $R$-module.

Proof. This is a special case of Algebra, Lemma 10.5.3.
0015 Lemma 93.3.2. Let $\varphi: R \rightarrow S$ be a ring map. If
(1) for any $x \in S$ there exists $n>0$ such that $x^{n}$ is in the image of $\varphi$, and
(2) for any $x \in \operatorname{Ker}(\varphi)$ there exists $n>0$ such that $x^{n}=0$,
then $\varphi$ induces a homeomorphism on spectra. Given a prime number $p$ such that
(a) $S$ is generated as an $R$-algebra by elements $x$ such that there exists an $n>0$ with $x^{p^{n}} \in \varphi(R)$ and $p^{n} x \in \varphi(R)$, and
(b) the kernel of $\varphi$ is generated by nilpotent elements,
then (1) and (2) hold, and for any ring map $R \rightarrow R^{\prime}$ the ring map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ also satisfies (a), (b), (1), and (2) and in particular induces a homeomorphism on spectra.

Proof. This is a combination of Algebra, Lemmas 10.45 .3 and 10.45 .6 .
The following technical lemma says that you can lift any sequence of relations from a fibre to the whole space of a ring map which is essentially of finite type, in a suitable sense.

00SX Lemma 93.3.3. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p}$. Assume $S_{\mathfrak{q}}$ is essentially of finite type over $R_{\mathfrak{p}}$. Assume given
(1) an integer $n \geq 0$,
(2) a prime $\mathfrak{a} \subset \kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]$,
(3) a surjective $\kappa(\mathfrak{p})$-homomorphism

$$
\psi:\left(\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]\right)_{\mathfrak{a}} \longrightarrow S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}
$$

and
(4) elements $\bar{f}_{1}, \ldots, \bar{f}_{e}$ in $\operatorname{Ker}(\psi)$.

Then there exist
(1) an integer $m \geq 0$,
(2) and element $g \in S, g \notin \mathfrak{q}$,
(3) a map

$$
\Psi: R\left[x_{1}, \ldots, x_{n}, x_{n+1}, \ldots, x_{n+m}\right] \longrightarrow S_{g}
$$

and
(4) elements $f_{1}, \ldots, f_{e}, f_{e+1}, \ldots, f_{e+m}$ of $\operatorname{Ker}(\Psi)$
such that
(1) the following diagram commutes

(2) the element $f_{i}, i \leq n$ maps to a unit times $\bar{f}_{i}$ in the local ring

$$
\left(\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n+m}\right]\right)_{\left(\mathfrak{a}, x_{n+1}, \ldots, x_{n+m}\right)}
$$

(3) the element $f_{e+j}$ maps to a unit times $x_{n+j}$ in the same local ring, and
(4) the induced map $R\left[x_{1}, \ldots, x_{n+m}\right]_{\mathfrak{b}} \rightarrow S_{\mathfrak{q}}$ is surjective, where $\mathfrak{b}=\Psi^{-1}\left(\mathfrak{q} S_{g}\right)$.

Proof. We claim that it suffices to prove the lemma in case $R$ and $S$ are local with maximal ideals $\mathfrak{p}$ and $\mathfrak{q}$. Namely, suppose we have constructed

$$
\Psi^{\prime}: R_{\mathfrak{p}}\left[x_{1}, \ldots, x_{n+m}\right] \longrightarrow S_{\mathfrak{q}}
$$

and $f_{1}^{\prime}, \ldots, f_{e+m}^{\prime} \in R_{\mathfrak{p}}\left[x_{1}, \ldots, x_{n+m}\right]$ with all the required properties. Then there exists an element $f \in R, f \notin \mathfrak{p}$ such that each $f f_{k}^{\prime}$ comes from an element $f_{k} \in$ $R\left[x_{1}, \ldots, x_{n+m}\right]$. Moreover, for a suitable $g \in S, g \notin \mathfrak{q}$ the elements $\Psi^{\prime}\left(x_{i}\right)$ are the image of elements $y_{i} \in S_{g}$. Let $\Psi$ be the $R$-algebra map defined by the rule $\Psi\left(x_{i}\right)=y_{i}$. Since $\Psi\left(f_{i}\right)$ is zero in the localization $S_{\mathfrak{q}}$ we may after possibly replacing $g$ assume that $\Psi\left(f_{i}\right)=0$. This proves the claim.

Thus we may assume $R$ and $S$ are local with maximal ideals $\mathfrak{p}$ and $\mathfrak{q}$. Pick $y_{1}, \ldots, y_{n} \in S$ such that $y_{i} \bmod \mathfrak{p} S=\psi\left(x_{i}\right)$. Let $y_{n+1}, \ldots, y_{n+m} \in S$ be elements which generate an $R$-subalgebra of which $S$ is the localization. These exist by the assumption that $S$ is essentially of finite type over $R$. Since $\psi$ is surjective we
may write $y_{n+j} \bmod \mathfrak{p} S=\psi\left(h_{j}\right)$ for some $h_{j} \in \kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{a}}$. Write $h_{j}=g_{j} / d$, $g_{j} \in \kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]$ for some common denominator $d \in \kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right], d \notin \mathfrak{a}$. Choose lifts $G_{j}, D \in R\left[x_{1}, \ldots, x_{n}\right]$ of $g_{j}$ and $d$. Set $y_{n+j}^{\prime}=D\left(y_{1}, \ldots, y_{n}\right) y_{n+j}-$ $G_{j}\left(y_{1}, \ldots, y_{n}\right)$. By construction $y_{n+j}^{\prime} \in \mathfrak{p} S$. It is clear that $y_{1}, \ldots, y_{n}, y_{n}^{\prime}, \ldots, y_{n+m}^{\prime}$ generate an $R$-subalgebra of $S$ whose localization is $S$. We define

$$
\Psi: R\left[x_{1}, \ldots, x_{n+m}\right] \rightarrow S
$$

to be the map that sends $x_{i}$ to $y_{i}$ for $i=1, \ldots, n$ and $x_{n+j}$ to $y_{n+j}^{\prime}$ for $j=1, \ldots, m$. Properties (1) and (4) are clear by construction. Moreover the ideal $\mathfrak{b}$ maps onto the ideal $\left(\mathfrak{a}, x_{n+1}, \ldots, x_{n+m}\right)$ in the polynomial ring $\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n+m}\right]$.
Denote $J=\operatorname{Ker}(\Psi)$. We have a short exact sequence

$$
0 \rightarrow J_{\mathfrak{b}} \rightarrow R\left[x_{1}, \ldots, x_{n+m}\right]_{\mathfrak{b}} \rightarrow S_{\mathfrak{q}} \rightarrow 0
$$

The surjectivity comes from our choice of $y_{1}, \ldots, y_{n}, y_{n}^{\prime}, \ldots, y_{n+m}^{\prime}$ above. This implies that

$$
J_{\mathfrak{b}} / \mathfrak{p} J_{\mathfrak{b}} \rightarrow \kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n+m}\right]_{\left(\mathfrak{a}, x_{n+1}, \ldots, x_{n+m}\right)} \rightarrow S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}} \rightarrow 0
$$

is exact. By construction $x_{i}$ maps to $\psi\left(x_{i}\right)$ and $x_{n+j}$ maps to zero under the last map. Thus it is easy to choose $f_{i}$ as in (2) and (3) of the lemma.

01DE Remark 93.3.4 (Projective resolutions). Let $R$ be a ring. For any set $S$ we let $F(S)$ denote the free $R$-module on $S$. Then any left $R$-module has the following two step resolution

$$
F(M \times M) \oplus F(R \times M) \rightarrow F(M) \rightarrow M \rightarrow 0
$$

The first map is given by the rule

$$
\left[m_{1}, m_{2}\right] \oplus[r, m] \mapsto\left[m_{1}+m_{2}\right]-\left[m_{1}\right]-\left[m_{2}\right]+[r m]-r[m] .
$$

02CA Lemma 93.3.5. Let $S$ be a multiplicative set of $A$. Then the map

$$
f: \operatorname{Spec}\left(S^{-1} A\right) \longrightarrow \operatorname{Spec}(A)
$$

induced by the canonical ring map $A \rightarrow S^{-1} A$ is a homeomorphism onto its image and $\operatorname{Im}(f)=\{\mathfrak{p} \in \operatorname{Spec}(A): \mathfrak{p} \cap S=\emptyset\}$.

Proof. This is a duplicate of Algebra, Lemma 10.16.5.
05IP Lemma 93.3.6. Let $A \rightarrow B$ be a finite type, flat ring map with $A$ an integral domain. Then $B$ is a finitely presented $A$-algebra.

Proof. Special case of More on Flatness, Proposition 37.13.9.
053F Lemma 93.3.7. Let $R$ be a domain with fraction field $K$. Let $S=R\left[x_{1}, \ldots, x_{n}\right]$ be a polynomial ring over $R$. Let $M$ be a finite $S$-module. Assume that $M$ is flat over $R$. If for every subring $R \subset R^{\prime} \subset K, R \neq R^{\prime}$ the module $M \otimes_{R} R^{\prime}$ is finitely presented over $S \otimes_{R} R^{\prime}$, then $M$ is finitely presented over $S$.

Proof. This lemma is true because $M$ is finitely presented even without the assumption that $M \otimes_{R} R^{\prime}$ is finitely presented for every $R^{\prime}$ as in the statement of the lemma. This follows from More on Flatness, Proposition 37.13.9. Originally this lemma had an erroneous proof (thanks to Ofer Gabber for finding the gap) and was used in an alternative proof of the proposition cited. To reinstate this lemma, we need a correct argument in case $R$ is a local normal domain using only results
from the chapters on commutative algebra; please email stacks.project@gmail.com if you have an argument.

02TQ Lemma 93.3.8. Let $A \rightarrow B$ be a ring map. Let $f \in B$. Assume that
(1) $A \rightarrow B$ is flat,
(2) $f$ is a nonzerodivisor, and
(3) $A \rightarrow B / f B$ is flat.

Then for every ideal $I \subset A$ the map $f: B / I B \rightarrow B / I B$ is injective.
Proof. Note that $I B=I \otimes_{A} B$ and $I(B / f B)=I \otimes_{A} B / f B$ by the flatness of $B$ and $B / f B$ over $A$. In particular $I B / f I B \cong I \otimes_{A} B / f B$ maps injectively into $B / f B$. Hence the result follows from the snake lemma applied to the diagram

with exact rows.
051A Lemma 93.3.9. If $R \rightarrow S$ is a faithfully flat ring map then for every $R$-module $M$ the map $M \rightarrow S \otimes_{R} M, x \mapsto 1 \otimes x$ is injective.

Proof. This lemma is a duplicate of Algebra, Lemma 10.81.11.

### 93.4. Lemmas related to ZMT

073 V The lemmas in this section were originally used in the proof of the (algebraic version of) Zariski's Main Theorem, Algebra, Theorem 10.122.13.

00PR Lemma 93.4.1. Let $\varphi: R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi\left(a_{0}\right)+\varphi\left(a_{1}\right) t+\ldots+\varphi\left(a_{n}\right) t^{n}=0$. Set $u_{n}=\varphi\left(a_{n}\right), u_{n-1}=u_{n} t+\varphi\left(a_{n-1}\right)$, and so on till $u_{1}=u_{2} t+\varphi\left(a_{1}\right)$. Then all of $u_{n}, u_{n-1}, \ldots, u_{1}$ and $u_{n} t, u_{n-1} t, \ldots, u_{1} t$ are integral over $R$, and the ideals $\left(\varphi\left(a_{0}\right), \ldots, \varphi\left(a_{n}\right)\right)$ and $\left(u_{n}, \ldots, u_{1}\right)$ of $S$ are equal.

Proof. We prove this by induction on $n$. As $u_{n}=\varphi\left(a_{n}\right)$ we conclude from Algebra, Lemma 10.122.1 that $u_{n} t$ is integral over $R$. Of course $u_{n}=\varphi\left(a_{n}\right)$ is integral over $R$. Then $u_{n-1}=u_{n} t+\varphi\left(a_{n-1}\right)$ is integral over $R$ (see Algebra, Lemma 10.35.7) and we have

$$
\varphi\left(a_{0}\right)+\varphi\left(a_{1}\right) t+\ldots+\varphi\left(a_{n-1}\right) t^{n-1}+u_{n-1} t^{n-1}=0
$$

Hence by the induction hypothesis applied to the map $S^{\prime} \rightarrow S$ where $S^{\prime}$ is the integral closure of $R$ in $S$ and the displayed equation we see that $u_{n-1}, \ldots, u_{1}$ and $u_{n-1} t, \ldots, u_{1} t$ are all in $S^{\prime}$ too. The statement on the ideals is immediate from the shape of the elements and the fact that $u_{1} t+\varphi\left(a_{0}\right)=0$.

00PS Lemma 93.4.2. Let $\varphi: R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi\left(a_{0}\right)+\varphi\left(a_{1}\right) t+\ldots+\varphi\left(a_{n}\right) t^{n}=0$. Let $J \subset S$ be an ideal such that for at least one $i$ we have $\varphi\left(a_{i}\right) \notin J$. Then there exists a $u \in S, u \notin J$ such that both $u$ and ut are integral over $R$.

Proof. This is immediate from Lemma 93.4.1 since one of the elements $u_{i}$ will not be in $J$.

The following two lemmas are a way of describing closed subschemes of $\mathbf{P}_{R}^{1}$ cut out by one (nondegenerate) equation.

00Q4 Lemma 93.4.3. Let $R$ be a ring. Let $F(X, Y) \in R[X, Y]$ be homogeneous of degree d. Assume that for every prime $\mathfrak{p}$ of $R$ at least one coefficient of $F$ is not in $\mathfrak{p}$. Let $S=R[X, Y] /(F)$ as a graded ring. Then for all $n \geq d$ the $R$-module $S_{n}$ is finite locally free of rank $d$.

Proof. The $R$-module $S_{n}$ has a presentation

$$
R[X, Y]_{n-d} \rightarrow R[X, Y]_{n} \rightarrow S_{n} \rightarrow 0
$$

Thus by Algebra, Lemma 10.78 .3 it is enough to show that multiplication by $F$ induces an injective map $\kappa(\mathfrak{p})[X, Y] \rightarrow \kappa(\mathfrak{p})[X, Y]$ for all primes $\mathfrak{p}$. This is clear from the assumption that $F$ does not map to the zero polynomial mod $\mathfrak{p}$. The assertion on ranks is clear from this as well.

00Q5 Lemma 93.4.4. Let $k$ be a field. Let $F, G \in k[X, Y]$ be homogeneous of degrees $d, e$. Assume $F, G$ relatively prime. Then multiplication by $G$ is injective on $S=$ $k[X, Y] /(F)$.

Proof. This is one way to define "relatively prime". If you have another definition, then you can show it is equivalent to this one.

00Q6 Lemma 93.4.5. Let $R$ be a ring. Let $F(X, Y) \in R[X, Y]$ be homogeneous of degree d. Let $S=R[X, Y] /(F)$ as a graded ring. Let $\mathfrak{p} \subset R$ be a prime such that some coefficient of $F$ is not in $\mathfrak{p}$. There exists an $f \in R f \notin \mathfrak{p}$, an integer $e$, and a $G \in R[X, Y]_{e}$ such that multiplication by $G$ induces isomorphisms $\left(S_{n}\right)_{f} \rightarrow\left(S_{n+e}\right)_{f}$ for all $n \geq d$.

Proof. During the course of the proof we may replace $R$ by $R_{f}$ for $f \in R, f \notin \mathfrak{p}$ (finitely often). As a first step we do such a replacement such that some coefficient of $F$ is invertible in $R$. In particular the modules $S_{n}$ are now locally free of rank $d$ for $n \geq d$ by Lemma 93.4.3. Pick any $G \in R[X, Y]_{e}$ such that the image of $G$ in $\kappa(\mathfrak{p})[X, Y]$ is relatively prime to the image of $F(X, Y)$ (this is possible for some $e$ ). Apply Algebra, Lemma 10.78 .3 to the map induced by multiplication by $G$ from $S_{d} \rightarrow S_{d+e}$. By our choice of $G$ and Lemma 93.4 .4 we see $S_{d} \otimes \kappa(\mathfrak{p}) \rightarrow$ $S_{d+e} \otimes \kappa(\mathfrak{p})$ is bijective. Thus, after replacing $R$ by $R_{f}$ for a suitable $f$ we may assume that $G: S_{d} \rightarrow S_{d+e}$ is bijective. This in turn implies that the image of $G$ in $\kappa\left(\mathfrak{p}^{\prime}\right)[X, Y]$ is relatively prime to the image of $F$ for all primes $\mathfrak{p}^{\prime}$ of $R$. And then by Algebra, Lemma 10.78 .3 again we see that all the maps $G: S_{d} \rightarrow S_{d+e}, n \geq d$ are isomorphisms.

00Q7 Remark 93.4.6. Let $R$ be a ring. Suppose that we have $F \in R[X, Y]_{d}$ and $G \in R[X, Y]_{e}$ such that, setting $S=R[X, Y] /(F)$ we have (1) $S_{n}$ is finite locally free of rank $d$ for all $n \geq d$, and (2) multiplication by $G$ defines isomorphisms $S_{n} \rightarrow S_{n+e}$ for all $n \geq d$. In this case we may define a finite, locally free $R$-algebra $A$ as follows:
(1) as an $R$-module $A=S_{e d}$, and
(2) multiplication $A \times A \rightarrow A$ is given by the rule that $H_{1} H_{2}=H_{3}$ if and only if $G^{d} H_{3}=H_{1} H_{2}$ in $S_{2 e d}$.

This makes sense because multiplication by $G^{d}$ induces a bijective map $S_{d e} \rightarrow S_{2 d e}$. It is easy to see that this defines a ring structure. Note the confusing fact that the element $G^{d}$ defines the unit element of the ring $A$.
00Q3 Lemma 93.4.7. Let $R$ be a ring, let $f \in R$. Suppose we have $S, S^{\prime}$ and the solid arrows forming the following commutative diagram of rings

Assume that $R_{f} \rightarrow S^{\prime}$ is finite. Then we can find a finite ring map $R \rightarrow S^{\prime \prime}$ and dotted arrows as in the diagram such that $S^{\prime}=\left(S^{\prime \prime}\right)_{f}$.
Proof. Namely, suppose that $S^{\prime}$ is generated by $x_{i}$ over $R_{f}, i=1, \ldots, w$. Let $P_{i}(t) \in R_{f}[t]$ be a monic polynomial such that $P_{i}\left(x_{i}\right)=0$. Say $P_{i}$ has degree $d_{i}>0$. Write $P_{i}(t)=t^{d_{i}}+\sum_{j<d_{i}}\left(a_{i j} / f^{n}\right) t^{j}$ for some uniform $n$. Also write the image of $x_{i}$ in $S_{f}$ as $g_{i} / f^{n}$ for suitable $g_{i} \in S$. Then we know that the element $\xi_{i}=$ $f^{n d_{i}} g_{i}^{d_{i}}+\sum_{j<d_{i}} f^{n\left(d_{i}-j\right)} a_{i j} g_{i}^{j}$ of $S$ is killed by a power of $f$. Hence upon increasing $n$ to $n^{\prime}$, which replaces $g_{i}$ by $f^{n^{\prime}-n} g_{i}$ we may assume $\xi_{i}=0$. Then $S^{\prime}$ is generated by the elements $f^{n} x_{i}$, each of which is a zero of the monic polynomial $Q_{i}(t)=t^{d_{i}}+$ $\sum_{j<d_{i}} f^{n\left(d_{i}-j\right)} a_{i j} t^{j}$ with coefficients in $R$. Also, by construction $Q_{i}\left(f^{n} g_{i}\right)=0$ in $S$. Thus we get a finite $R$-algebra $S^{\prime \prime}=R\left[z_{1}, \ldots, z_{w}\right] /\left(Q_{1}\left(z_{1}\right), \ldots, Q_{w}\left(z_{w}\right)\right)$ which fits into a commutative diagram as above. The map $\alpha: S^{\prime \prime} \rightarrow S$ maps $z_{i}$ to $f^{n} g_{i}$ and the map $\beta: S^{\prime \prime} \rightarrow S^{\prime}$ maps $z_{i}$ to $f^{n} x_{i}$. It may not yet be the case that $\beta$ induces an isomorphism $\left(S^{\prime \prime}\right)_{f} \cong S^{\prime}$. For the moment we only know that this map is surjective. The problem is that there could be elements $h / f^{n} \in\left(S^{\prime \prime}\right)_{f}$ which map to zero in $S^{\prime}$ but are not zero. In this case $\beta(h)$ is an element of $S$ such that $f^{N} \beta(h)=0$ for some $N$. Thus $f^{N} h$ is an element ot the ideal $J=\left\{h \in S^{\prime \prime} \mid \alpha(h)=0\right.$ and $\left.\beta(h)=0\right\}$ of $S^{\prime \prime}$. OK, and it is easy to see that $S^{\prime \prime} / J$ does the job.

### 93.5. Formally smooth ring maps

07GD
00TO Lemma 93.5.1. Let $R$ be a ring. Let $S$ be a $R$-algebra. If $S$ is of finite presentation and formally smooth over $R$ then $S$ is smooth over $R$.

Proof. See Algebra, Proposition 10.136 .13 .

### 93.6. Cohomology

0BM0 The following lemma computes the cohomology sheaves of the derived limit in a special case.

0 A 08 Lemma 93.6.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(K_{n}\right)$ be an inverse system of objects of $D(\mathcal{O})$. Let $\mathcal{B} \subset \operatorname{Ob}(\mathcal{C})$ be a subset. Let $d \in \mathbf{N}$. Assume
(1) $K_{n}$ is an object of $D^{+}(\mathcal{O})$ for all $n$,
(2) for $q \in \mathbf{Z}$ there exists $n(q)$ such that $H^{q}\left(K_{n+1}\right) \rightarrow H^{q}\left(K_{n}\right)$ is an isomorphism for $n \geq n(q)$,
(3) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(4) for every $U \in \mathcal{B}$ we have $H^{p}\left(U, H^{q}\left(K_{n}\right)\right)=0$ for $p>d$ and all $q$.

Then we have $H^{m}\left(R \lim K_{n}\right)=\lim H^{m}\left(K_{n}\right)$ for all $m \in \mathbf{Z}$.
Proof. Set $K=R \lim K_{n}$. Let $U \in \mathcal{B}$. For each $n$ there is a spectral sequence

$$
H^{p}\left(U, H^{q}\left(K_{n}\right)\right) \Rightarrow H^{p+q}\left(U, K_{n}\right)
$$

which converges as $K_{n}$ is bounded below, see Derived Categories, Lemma 13.21 .3 . If we fix $m \in \mathbf{Z}$, then we see from our assumption (4) that only $H^{p}\left(U, H^{q}\left(K_{n}\right)\right)$ contribute to $H^{m}\left(U, K_{n}\right)$ for $0 \leq p \leq d$ and $m-d \leq q \leq m$. By assumption (2) this implies that $H^{m}\left(U, K_{n+1}\right) \rightarrow H^{m}\left(U, K_{n}\right)$ is an isomorphism as soon as $n \geq \max n(m), \ldots, n(m-d)$. The functor $R \Gamma(U,-)$ commutes with derived limits by Injectives, Lemma 19.13.6. Thus we have

$$
H^{m}(U, K)=H^{m}\left(R \lim R \Gamma\left(U, K_{n}\right)\right)
$$

On the other hand we have just seen that the complexes $R \Gamma\left(U, K_{n}\right)$ have eventually constant cohomology groups. Thus by More on Algebra, Remark 15.68 .16 we find that $H^{m}(U, K)$ is equal to $H^{m}\left(U, K_{n}\right)$ for all $n \gg 0$ for some bound independent of $U \in \mathcal{B}$. Pick such an $n$. Finally, recall that $H^{m}(K)$ is the sheafification of the presheaf $U \mapsto H^{m}(U, K)$ and $H^{m}\left(K_{n}\right)$ is the sheafification of the presheaf $U \mapsto H^{m}\left(U, K_{n}\right)$. On the elements of $\mathcal{B}$ these presheaves have the same values. Therefore assumption (3) guarantees that the sheafifications are the same too. The lemma follows.

### 93.7. Simplicial methods

08Q0
01AA Lemma 93.7.1. Assumptions and notation as in Simplicial, Lemma 14.32.1. There exists a section $g: U \rightarrow V$ to the morphism $f$ and the composition $g \circ f$ is homotopy equivalent to the identity on $V$. In particular, the morphism $f$ is a homotopy equivalence.
Proof. Immediate from Simplicial, Lemmas 14.32 .1 and 14.30 .8 .
018W Lemma 93.7.2. Let $\mathcal{C}$ be a category with finite coproducts and finite limits. Let $X$ be an object of $\mathcal{C}$. Let $k \geq 0$. The canonical map

$$
\operatorname{Hom}(\Delta[k], X) \longrightarrow \operatorname{cosk}_{1} s k_{1} \operatorname{Hom}(\Delta[k], X)
$$

is an isomorphism.
Proof. For any simplicial object $V$ we have

$$
\begin{aligned}
\operatorname{Mor}\left(V, \operatorname{cosk}_{1} \mathrm{sk}_{1} \operatorname{Hom}(\Delta[k], X)\right) & =\operatorname{Mor}\left(\mathrm{sk}_{1} V, \operatorname{sk}_{1} \operatorname{Hom}(\Delta[k], X)\right) \\
& =\operatorname{Mor}\left(i_{\left.1!\mathrm{sk}_{1} V, \operatorname{Hom}(\Delta[k], X)\right)}\right. \\
& =\operatorname{Mor}\left(i_{1!\mathrm{sk}_{1}} V \times \Delta[k], X\right)
\end{aligned}
$$

The first equality by the adjointness of sk and cosk, the second equality by the adjointness of $i_{1 \text { ! }}$ and $\mathrm{sk}_{1}$, and the first equality by Simplicial, Definition 14.17.1 where the last $X$ denotes the constant simplicial object with value $X$. By Simplicial, Lemma 14.20 .2 an element in this set depends only on the terms of degree 0 and

1 of $i_{1!} \mathrm{sk}_{1} V \times \Delta[k]$. These agree with the degree 0 and 1 terms of $V \times \Delta[k]$, see Simplicial, Lemma 14.21.3. Thus the set above is equal to $\operatorname{Mor}(V \times \Delta[k], X)=$ $\operatorname{Mor}(V, \operatorname{Hom}(\Delta[k], \bar{X}))$.
018X Lemma 93.7.3. Let $\mathcal{C}$ be a category. Let $X$ be an object of $\mathcal{C}$ such that the self products $X \times \ldots \times X$ exist. Let $k \geq 0$ and let $C[k]$ be as in Simplicial, Example 14.5.6. With notation as in Simplicial, Lemma 14.15.2 the canonical map

$$
\operatorname{Hom}(C[k], X)_{1} \longrightarrow\left(\operatorname{cosk}_{0} s k_{0} \operatorname{Hom}(C[k], X)\right)_{1}
$$

is identified with the map

$$
\prod_{\alpha:[k] \rightarrow[1]} X \longrightarrow X \times X
$$

which is the projection onto the factors where $\alpha$ is a constant map.
Proof. This is shown in the proof of Hypercoverings, Lemma 24.6.3.

### 93.8. Obsolete lemmas on schemes

07VA Lemmas that seem superfluous.
03H1 Lemma 93.8.1. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $X \subset \mathbf{P}_{R}^{n}$ be a closed subscheme. Assume that $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Then the special fibre $X_{k}$ is geometrically connected.

Proof. This is a special case of More on Morphisms, Theorem 36.38.4.
01YJ Lemma 93.8.2. Let $X$ be a Noetherian scheme. Let $Z_{0} \subset X$ be an irreducible closed subset with generic point $\xi$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ such that
(1) For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every integral closed subscheme $Z \subset Z_{0} \subset X, Z \neq Z_{0}$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $(Z \rightarrow X)_{*} \mathcal{I}$.
(4) There exists some coherent sheaf $\mathcal{G}$ on $X$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z_{0}$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, and
(c) property $\mathcal{P}$ holds for $\mathcal{G}$.

Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z_{0}$.

Proof. The proof is a variant on the proof of Cohomology of Schemes, Lemma 29.12 .5 In exactly the same manner as in that proof we see that any coherent sheaf whose support is strictly contained in $Z_{0}$ has property $\mathcal{P}$.
Consider a coherent sheaf $\mathcal{G}$ as in (3). By Cohomology of Schemes, Lemma 29.12.2 there exists a sheaf of ideals $\mathcal{I}$ on $Z_{0}$ and a short exact sequence

$$
0 \rightarrow\left(\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}\right)^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0
$$

where the support of $\mathcal{Q}$ is strictly contained in $Z_{0}$. In particular $r>0$ and $\mathcal{I}$ is nonzero because the support of $\mathcal{G}$ is equal to $Z$. Since $\mathcal{Q}$ has property $\mathcal{P}$ we conclude that also $\left(\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}\right)^{\oplus r}$ has property $\mathcal{P}$. By (2) we deduce property $\mathcal{P}$ for $\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}$. Slotting this into the proof of Cohomology of Schemes, Lemma 29.12 .5 at the appropriate point gives the lemma. Some details omitted.

01YK Lemma 93.8.3. Let $X$ be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ such that
(1) For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every integral closed subscheme $Z \subset X$ with generic point $\xi$ there exists some coherent sheaf $\mathcal{G}$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, and
(c) property $\mathcal{P}$ holds for $\mathcal{G}$.

Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. This follows from Lemma 93.8 .2 in exactly the same way that Cohomology of Schemes, Lemma 29.12.6 follows from Cohomology of Schemes, Lemma 29.12.5.

01XP Lemma 93.8.4. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be quasi-coherent $\mathcal{O}_{X}$-modules. Assume that
(1) $X$ is quasi-compact,
(2) $\mathcal{F}$ is of finite type, and
(3) $\left.\mathcal{F}^{\prime}\right|_{X_{s}}=\left.\mathcal{F}\right|_{X_{s}}$.

Then there exists an $n \geq 0$ such that multiplication by $s^{n}$ on $\mathcal{F}$ factors through $\mathcal{F}^{\prime}$.
Proof. In other words we claim that $s^{n} \mathcal{F} \subset \mathcal{F}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}$ for some $n \geq 0$. In other words, we claim that the quotient map $\mathcal{F} \rightarrow \mathcal{F} / \mathcal{F}^{\prime}$ becomes zero after multiplying by a power of $s$. This follows from Properties, Lemma 27.17.3.

### 93.9. Functor of quotients

08J4
082R Lemma 93.9.1. Let $S=\operatorname{Spec}(R)$ be an affine scheme. Let $X$ be an algebraic space over $S$. Let $q_{i}: \mathcal{F} \rightarrow \mathcal{Q}_{i}, i=1,2$ be surjective maps of quasi-coherent $\mathcal{O}_{X}$ modules. Assume $\mathcal{Q}_{1}$ flat over $S$. Let $T \rightarrow S$ be a quasi-compact morphism of schemes such that there exists a factorization

Then exists a closed subscheme $Z \subset S$ such that (a) $T \rightarrow S$ factors through $Z$ and (b) $q_{1, Z}$ factors through $q_{2, Z}$. If $\operatorname{Ker}\left(q_{2}\right)$ is a finite type $\mathcal{O}_{X}$-module and $X$ quasi-compact, then we can take $Z \rightarrow S$ of finite presentation.

Proof. Apply Quot, Lemma 81.7.5 to the map $\operatorname{Ker}\left(q_{2}\right) \rightarrow \mathcal{Q}_{1}$.

### 93.10. Spaces and fpqc coverings

$0 A R G$ The material here was made obsolete by Gabber's argument showing that algebraic spaces satisfy the sheaf condition with respect to fpqc coverings. Please visit Properties of Spaces, Section 53.16

03W9 Lemma 93.10.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a fpqc covering of schemes over $S$. Then the map

$$
\operatorname{Mor}_{S}(T, X) \longrightarrow \prod_{i \in I} \operatorname{Mor}_{S}\left(T_{i}, X\right)
$$

is injective.
Proof. Immediate consequence of Properties of Spaces, Proposition 53.16.1.
03WA Lemma 93.10.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $X=\bigcup_{j \in J} X_{j}$ be a Zariski covering, see Spaces, Definition 52.12.5. If each $X_{j}$ satisfies the sheaf property for the fpqc topology then $X$ satisfies the sheaf property for the fpqc topology.

Proof. This is true because all algebraic spaces satisfy the sheaf property for the fpqc topology, see Properties of Spaces, Proposition 53.16.1.

03WB Lemma 93.10.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is Zariski locally quasi-separated over $S$, then $X$ satisfies the sheaf condition for the fpqc topology.

Proof. Immediate consequence of the general Properties of Spaces, Proposition 53.16.1.

03WC Remark 93.10.4. This remark used to discuss to what extend the original proof of Lemma 93.10.3 (of December 18, 2009) generalizes.
93.11. Very reasonable algebraic spaces

07 T 6 Material that is somewhat obsolete.
03IN Lemma 93.11.1. Let $S$ be a scheme. Let $X$ be a reasonable algebraic space over $S$. Then $|X|$ is Kolmogorov (see Topology, Definition 5.7.4).
Proof. Follows from the definitions and Decent Spaces, Lemma 55.10.8.
In the rest of this section we make some remarks about very reasonable algebraic spaces. If there exists a scheme $U$ and a surjective, étale, quasi-compact morphism $U \rightarrow X$, then $X$ is very reasonable, see Decent Spaces, Lemma 55.4.7.

03I9 Lemma 93.11.2. A scheme is very reasonable.
Proof. This is true because the identity map is a quasi-compact, surjective étale morphism.

03IA Lemma 93.11.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If there exists a Zariski open covering $X=\bigcup X_{i}$ such that each $X_{i}$ is very reasonable, then $X$ is very reasonable.

Proof. This is case $(\epsilon)$ of Decent Spaces, Lemma 55.5.2.
03IB Lemma 93.11.4. An algebraic space which is Zariski locally quasi-separated is very reasonable. In particular any quasi-separated algebraic space is very reasonable.

Proof. This is one of the implications of Decent Spaces, Lemma 55.5.1.
03JF Lemma 93.11.5. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Let $Y \rightarrow X$ be a representable morphism. If $X$ is very reasonable, so is $Y$.

Proof. This is case $(\epsilon)$ of Decent Spaces, Lemma 55.5.3.
03IC Remark 93.11.6. Very reasonable algebraic spaces form a strictly larger collection than Zariski locally quasi-separated algebraic spaces. Consider an algebraic space of the form $X=[U / G]$ (see Spaces, Definition 52.14.4) where $G$ is a finite group acting without fixed points on a non-quasi-separated scheme $U$. Namely, in this case $U \times_{X} U=U \times G$ and clearly both projections to $U$ are quasi-compact, hence $X$ is very reasonable. On the other hand, the diagonal $U \times{ }_{X} U \rightarrow U \times U$ is not quasi-compact, hence this algebraic space is not quasi-separated. Now, take $U$ the infinite affine space over a field $k$ of characteristic $\neq 2$ with zero doubled, see Schemes, Example 25.21.4 Let $0_{1}, 0_{2}$ be the two zeros of $U$. Let $G=\{+1,-1\}$, and let -1 act by -1 on all coordinates, and by switching $0_{1}$ and $0_{2}$. Then $[U / G]$ is very reasonable but not Zariski locally quasi-separated (details omitted).

Warning: The following lemma should be used with caution, as the schemes $U_{i}$ in it are not necessarily separated or even quasi-separated.

03K7 Lemma 93.11.7. Let $S$ be a scheme. Let $X$ be a very reasonable algebraic space over $S$. There exists a set of schemes $U_{i}$ and morphisms $U_{i} \rightarrow X$ such that
(1) each $U_{i}$ is a quasi-compact scheme,
(2) each $U_{i} \rightarrow X$ is étale,
(3) both projections $U_{i} \times{ }_{X} U_{i} \rightarrow U_{i}$ are quasi-compact, and
(4) the morphism $\coprod U_{i} \rightarrow X$ is surjective (and étale).

Proof. Decent Spaces, Definition 55.6.1 says that there exist $U_{i} \rightarrow X$ such that (2), (3) and (4) hold. Fix $i$, and set $R_{i}=U_{i} \times_{X} U_{i}$, and denote $s, t: R_{i} \rightarrow U_{i}$ the projections. For any affine open $W \subset U_{i}$ the open $W^{\prime}=t\left(s^{-1}(W)\right) \subset U_{i}$ is a quasi-compact $R_{i}$-invariant open (see Groupoids, Lemma 38.19.2). Hence $W^{\prime}$ is a quasi-compact scheme, $W^{\prime} \rightarrow X$ is étale, and $W^{\prime} \times_{X} W^{\prime}=s^{-1}\left(W^{\prime}\right)=t^{-1}\left(W^{\prime}\right)$ so both projections $W^{\prime} \times_{X} W^{\prime} \rightarrow W^{\prime}$ are quasi-compact. This means the family of $W^{\prime} \rightarrow X$, where $W \subset U_{i}$ runs through the members of affine open coverings of the $U_{i}$ gives what we want.

### 93.12. Variants of cotangent complexes for schemes

08 T 5 This section gives an alternative construction of the cotangent complex of a morphism of schemes. This section is currently in the obsolete chapter as we can get by with the easier version discussed in Cotangent, Section 75.24 for applications.

Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{C}_{X / Y}$ be the category whose objects are commutative diagrams
$08 \mathrm{~T} 6 \quad(93.12 .0 .1)$

of schemes where
(1) $U$ is an open subscheme of $X$,
(2) $V$ is an open subscheme of $Y$, and
(3) there exists an isomorphism $A=V \times \operatorname{Spec}(P)$ over $V$ where $P$ is a polynomial algebra over $\mathbf{Z}$ (on some set of variables).

In other words, $A$ is an (infinite dimensional) affine space over $V$. Morphisms are given by commutative diagrams.
Notation. An object of $\mathcal{C}_{X / Y}$, i.e., a diagram (93.12.0.1), is often denoted $U \rightarrow A$ where it is understood that (a) $U$ is an open subscheme of $X$, (b) $U \rightarrow A$ is a morphism over $Y$, (c) the image of the structure morphism $A \rightarrow Y$ is an open $V \subset Y$, and (d) $A \rightarrow V$ is an affine space. We'll write $U \rightarrow A / V$ to indicate $V \subset Y$ is the image of $A \rightarrow Y$. Recall that $X_{Z a r}$ denotes the small Zariski site $X$. There are forgetful functors

$$
\mathcal{C}_{X / Y} \rightarrow X_{Z a r},(U \rightarrow A) \mapsto U \quad \text { and } \quad \mathcal{C}_{X / Y} \mapsto Y_{Z a r}, \quad(U \rightarrow A / V) \mapsto V
$$

08 T 7 Lemma 93.12.1. Let $X \rightarrow Y$ be a morphism of schemes.
(1) The category $\mathcal{C}_{X / Y}$ is fibred over $X_{Z a r}$.
(2) The category $\mathcal{C}_{X / Y}$ is fibred over $Y_{\text {Zar }}$.
(3) The category $\mathcal{C}_{X / Y}$ is fibred over the category of pairs $(U, V)$ where $U \subset X$, $V \subset Y$ are open and $f(U) \subset V$.

Proof. Ad (1). Given an object $U \rightarrow A$ of $\mathcal{C}_{X / Y}$ and a morphism $U^{\prime} \rightarrow U$ of $X_{\text {Zar }}$ consider the object $i^{\prime}: U^{\prime} \rightarrow A$ of $\mathcal{C}_{X / Y}$ where $i^{\prime}$ is the composition of $i$ and $U^{\prime} \rightarrow U$. The morphism $\left(U^{\prime} \rightarrow A\right) \rightarrow(U \rightarrow A)$ of $\mathcal{C}_{X / Y}$ is strongly cartesian over $X_{Z a r}$.

Ad (2). Given an object $U \rightarrow A / V$ and $V^{\prime} \rightarrow V$ we can set $U^{\prime}=U \cap f^{-1}\left(V^{\prime}\right)$ and $A^{\prime}=V^{\prime} \times_{V} A$ to obtain a strongly cartesian morphism $\left(U^{\prime} \rightarrow A^{\prime}\right) \rightarrow(U \rightarrow A)$ over $V^{\prime} \rightarrow V$.
Ad (3). Denote $(X / Y)_{Z a r}$ the category in (3). Given $U \rightarrow A / V$ and a morphism $\left(U^{\prime}, V^{\prime}\right) \rightarrow(U, V)$ in $(X / Y)_{Z a r}$ we can consider $A^{\prime}=V^{\prime} \times_{V} A$. Then the morphism $\left(U^{\prime} \rightarrow A^{\prime} / V^{\prime}\right) \rightarrow(U \rightarrow A / V)$ is strongly cartesian in $\mathcal{C}_{X / Y}$ over $(X / Y)_{Z a r}$.
We obtain a topology $\tau_{X}$ on $\mathcal{C}_{X / Y}$ by using the topology inherited from $X_{Z a r}$ (see Stacks, Section 8.10. If not otherwise stated this is the topology on $\mathcal{C}_{X / Y}$ we will consider. To be precise, a family of morphisms $\left\{\left(U_{i} \rightarrow A_{i}\right) \rightarrow(U \rightarrow A)\right\}$ is a covering of $\mathcal{C}_{X / Y}$ if and only if
(1) $U=\bigcup U_{i}$, and
(2) $A_{i}=A$ for all $i$.

We obtain the same collection of sheaves if we allow $A_{i} \cong A$ in (2). The functor $u$ defines a morphism of topoi $\pi: \operatorname{Sh}\left(\mathcal{C}_{X / Y}\right) \rightarrow \operatorname{Sh}\left(X_{Z a r}\right)$.

The site $\mathcal{C}_{X / Y}$ comes with several sheaves of rings.
(1) The sheaf $\mathcal{O}$ given by the rule $(U \rightarrow A) \mapsto \mathcal{O}(A)$.
(2) The sheaf $\underline{\mathcal{O}}_{X}=\pi^{-1} \mathcal{O}_{X}$ given by the rule $(U \rightarrow A) \mapsto \mathcal{O}(U)$.
(3) The sheaf $\underline{\mathcal{O}}_{Y}$ given by the rule $(U \rightarrow A / V) \mapsto \mathcal{O}(V)$.

We obtain morphisms of ringed topoi

The morphism $i$ is the identity on underlying topoi and $i^{\sharp}: \mathcal{O} \rightarrow \underline{\mathcal{O}}_{X}$ is the obvious map. The map $\pi$ is a special case of Cohomology on Sites, Situation 21.29.1. An
important role will be played in the following by the derived functors $L i^{*}: D(\mathcal{O}) \longrightarrow$ $D\left(\underline{\mathcal{O}}_{X}\right)$ left adjoint to $R i_{*}=i_{*}: D\left(\underline{\mathcal{O}}_{X}\right) \rightarrow D(\mathcal{O})$ and $L \pi!: D\left(\underline{\mathcal{O}}_{X}\right) \longrightarrow D\left(\mathcal{O}_{X}\right)$ left adjoint to $\pi^{*}=\pi^{-1}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\underline{\mathcal{O}}_{X}\right)$.

08TA Remark 93.12.2. We obtain a second topology $\tau_{Y}$ on $\mathcal{C}_{X / Y}$ by taking the topology inherited from $Y_{\text {Zar }}$. There is a third topology $\tau_{X \rightarrow Y}$ where a family of morphisms $\left\{\left(U_{i} \rightarrow A_{i}\right) \rightarrow(U \rightarrow A)\right\}$ is a covering if and only if $U=\bigcup U_{i}, V=\bigcup V_{i}$ and $A_{i} \cong V_{i} \times_{V} A$. This is the topology inherited from the topology on the site $(X / Y)_{Z a r}$ whose underlying category is the category of pairs $(U, V)$ as in Lemma 93.12.1 part (3). The coverings of $(X / Y)_{Z a r}$ are families $\left\{\left(U_{i}, V_{i}\right) \rightarrow(U, V)\right\}$ such that $U=\bigcup U_{i}$ and $V=\bigcup V_{i}$. There are morphisms of topoi

$$
\operatorname{Sh}\left(\mathcal{C}_{X / Y}\right)=\operatorname{Sh}\left(\mathcal{C}_{X / Y}, \tau_{X}\right) \longleftarrow \operatorname{Sh}\left(\mathcal{C}_{X / Y}, \tau_{X \rightarrow Y}\right) \longrightarrow \operatorname{Sh}\left(\mathcal{C}_{X / Y}, \tau_{Y}\right)
$$

(recall that $\tau_{X}$ is our "default" topology). The pullback functors for these arrows are sheafification and pushforward is the identity on underlying presheaves. The diagram of topoi

is not commutative. Namely, the pullback of a nonzero abelian sheaf on $Y$ is a nonzero abelian sheaf on $\left(\mathcal{C}_{X / Y}, \tau_{X \rightarrow Y}\right)$, but we can certainly find examples where such a sheaf pulls back to zero on $X$. Note that any presheaf $\mathcal{F}$ on $Y_{Z a r}$ gives a sheaf $\underline{\mathcal{F}}$ on $\mathcal{C}_{Y / X}$ by the rule which assigns to $(U \rightarrow A / V)$ the set $\mathcal{F}(V)$. Even if $\mathcal{F}$ happens to be a sheaf it isn't true in general that $\underline{\mathcal{F}}=\pi^{-1} f^{-1} \mathcal{F}$. This is related to the noncommutativity of the diagram above, as we can describe $\underline{\mathcal{F}}$ as the pushforward of the pullback of $\mathcal{F}$ to $\operatorname{Sh}\left(\mathcal{C}_{X / Y}, \tau_{X \rightarrow Y}\right)$ via the lower horizontal and right vertical arrows. An example is the sheaf $\underline{\mathcal{O}}_{Y}$. But what is true is that there is a map $\underline{\mathcal{F}} \rightarrow \pi^{-1} f^{-1} \mathcal{F}$ which is transformed (as we shall see later) into an isomorphism after applying $\pi_{!}$.

### 93.13. Deformations and obstructions of flat modules

08 VZ In this section we sketch a construction of a deformation theory for the stack of coherent sheaves for any algebraic space $X$ over a ring $\Lambda$. This material is obsolete due to the improved discussion in Quot, Section 81.6 .
Our setup will be the following. We assume given
(1) a ring $\Lambda$,
(2) an algebraic space $X$ over $\Lambda$,
(3) a $\Lambda$-algebra $A$, set $X_{A}=X \times_{\operatorname{Spec}(\Lambda)} \operatorname{Spec}(A)$, and
(4) a finitely presented $\mathcal{O}_{X_{A}}$-module $\mathcal{F}$ flat over $A$.

In this situation we will consider all possible surjections

$$
0 \rightarrow I \rightarrow A^{\prime} \rightarrow A \rightarrow 0
$$

where $A^{\prime}$ is a $\Lambda$-algebra whose kernel $I$ is an ideal of square zero in $A^{\prime}$. Given $A^{\prime}$ we obtain a first order thickening $X_{A} \rightarrow X_{A^{\prime}}$ of algebraic spaces over $\operatorname{Spec}(\Lambda)$. For each of these we consider the problem of lifting $\mathcal{F}$ to a finitely presented module $\mathcal{F}^{\prime}$
on $X_{A^{\prime}}$ flat over $A^{\prime}$. We would like to replicate the results of Deformation Theory, Lemma 74.11.1 in this setting.
To be more precise let $\operatorname{Lift}\left(\mathcal{F}, A^{\prime}\right)$ denote the category of pairs $\left(\mathcal{F}^{\prime}, \alpha\right)$ where $\mathcal{F}^{\prime}$ is a finitely presented module on $X_{A^{\prime}}$ flat over $A^{\prime}$ and $\alpha:\left.\mathcal{F}^{\prime}\right|_{X_{A}} \rightarrow \mathcal{F}$ is an isomorphism. Morphisms $\left(\mathcal{F}_{1}^{\prime}, \alpha_{1}\right) \rightarrow\left(\mathcal{F}_{2}^{\prime}, \alpha_{2}\right)$ are isomorphisms $\mathcal{F}_{1}^{\prime} \rightarrow \mathcal{F}_{2}^{\prime}$ which are compatible with $\alpha_{1}$ and $\alpha_{2}$. The set of isomorphism classes of $\operatorname{Lift}\left(\mathcal{F}, A^{\prime}\right)$ is denoted $\operatorname{Lift}\left(\mathcal{F}, A^{\prime}\right)$.
Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{X} \otimes_{\Lambda} A$-modules on $X_{\text {étale }}$ flat over $A$. We introduce the category $\operatorname{Lift}\left(\mathcal{G}, A^{\prime}\right)$ of pairs $\left(\mathcal{G}^{\prime}, \beta\right)$ where $\mathcal{G}^{\prime}$ is a sheaf of $\mathcal{O}_{X} \otimes_{\Lambda} A^{\prime}$-modules flat over $A^{\prime}$ and $\beta$ is an isomorphism $\mathcal{G}^{\prime} \otimes_{A^{\prime}} A \rightarrow \mathcal{G}$.
08W0 Lemma 93.13.1. Notation and assumptions as above. Let $p: X_{A} \rightarrow X$ denote the projection. Given $A^{\prime}$ denote $p^{\prime}: X_{A^{\prime}} \rightarrow X$ the projection. The functor $p_{*}^{\prime}$ induces an equivalence of categories between
(1) the category $\operatorname{Lift}\left(\mathcal{F}, A^{\prime}\right)$, and
(2) the category $\operatorname{Lift}\left(p_{*} \mathcal{F}, A^{\prime}\right)$.

## Proof. FIXME.

Let $\mathcal{H}$ be a sheaf of $\mathcal{O} \otimes_{\Lambda} A$-modules on $\mathcal{C}_{X / \Lambda}$ flat over $A$. We introduce the category Lift $_{\mathcal{O}}\left(\mathcal{H}, A^{\prime}\right)$ whose objects are pairs $\left(\mathcal{H}^{\prime}, \gamma\right)$ where $\mathcal{H}^{\prime}$ is a sheaf of $\mathcal{O} \otimes_{\Lambda} A^{\prime}$-modules flat over $A^{\prime}$ and $\gamma: \mathcal{H}^{\prime} \otimes_{A} A^{\prime} \rightarrow \mathcal{H}$ is an isomorphism of $\mathcal{O} \otimes_{\Lambda} A$-modules.
Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{X} \otimes_{\Lambda} A$-modules on $X_{\text {étale }}$ flat over $A$. Consider the morphisms $i$ and $\pi$ of Cotangent, Equation 75.26.1.1. Denote $\underline{\mathcal{G}}=\pi^{-1}(\mathcal{G})$. It is simply given by the rule $(U \rightarrow \mathbf{A}) \mapsto \mathcal{G}(U)$ hence it is a sheaf of $\underline{\mathcal{O}}_{X} \otimes_{\Lambda} A$-modules. Denote $i_{*} \underline{\mathcal{G}}$ the same sheaf but viewed as a sheaf of $\mathcal{O} \otimes_{\Lambda} A$-modules.
08W1 Lemma 93.13.2. Notation and assumptions as above. The functor $\pi!$ induces an equivalence of categories between
(1) the category $\operatorname{Lift}_{\mathcal{O}}\left(i_{*} \underline{\mathcal{G}}, A^{\prime}\right)$, and
(2) the category $\operatorname{Lift}\left(\mathcal{G}, \overline{A^{\prime}}\right)$.

Proof. FIXME.
08W2 Lemma 93.13.3. Notation and assumptions as in Lemma 93.13.2. Consider the object

$$
L=L(\Lambda, X, A, \mathcal{G})=L \pi_{!}\left(L i^{*}\left(i_{*}(\underline{\mathcal{G}})\right)\right)
$$

of $D\left(\mathcal{O}_{X} \otimes_{\Lambda} A\right)$. Given a surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras with square zero kernel I we have
(1) The category $\operatorname{Lift}\left(\mathcal{G}, A^{\prime}\right)$ is nonempty if and only if a certain class $\xi \in$ $E x t_{\mathcal{O}_{X} \otimes A}^{2}\left(L, \mathcal{G} \otimes_{A} I\right)$ is zero.
(2) If Lift $\left(\mathcal{G}, A^{\prime}\right)$ is nonempty, then $\operatorname{Lift}\left(\mathcal{G}, A^{\prime}\right)$ is principal homogeneous under $E x t_{\mathcal{O}_{X} \otimes A}^{1}\left(L, \mathcal{G} \otimes_{A} I\right)$.
(3) Given a lift $\mathcal{G}^{\prime}$, the set of automorphisms of $\mathcal{G}^{\prime}$ which pull back to id $\mathcal{G}_{\mathcal{G}}$ is canonically isomorphic to Ext ${\mathcal{O}_{X} \otimes A}_{0}\left(L, \mathcal{G} \otimes_{A} I\right)$.
Proof. FIXME.
Finally, we put everything together as follows.
08W3 Proposition 93.13.4. With $\Lambda, X, A, \mathcal{F}$ as above. There exists a canonical object $L=L(\Lambda, X, A, \mathcal{F})$ of $D\left(X_{A}\right)$ such that given a surjection $A^{\prime} \rightarrow A$ of $\Lambda$-algebras with square zero kernel I we have
(1) The category Lift $\left(\mathcal{F}, A^{\prime}\right)$ is nonempty if and only if a certain class $\xi \in$ $E x t_{X_{A}}^{2}\left(L, \mathcal{F} \otimes_{A} I\right)$ is zero.
(2) If Lift $\left(\mathcal{F}, A^{\prime}\right)$ is nonempty, then $\operatorname{Lift}\left(\mathcal{F}, A^{\prime}\right)$ is principal homogeneous un$\operatorname{der} E x t_{X_{A}}^{1}\left(L, \mathcal{F} \otimes_{A} I\right)$.
(3) Given a lift $\mathcal{F}^{\prime}$, the set of automorphisms of $\mathcal{F}^{\prime}$ which pull back to $i d_{\mathcal{F}}$ is canonically isomorphic to Ext $X_{A}^{0}\left(L, \mathcal{F} \otimes_{A} I\right)$.
Proof. FIXME.
08W4 Lemma 93.13.5. In the situation of Proposition 93.13.4. if $X \rightarrow \operatorname{Spec}(\Lambda)$ is locally of finite type and $\Lambda$ is Noetherian, then $L$ is pseudo-coherent.

Proof. FIXME.

### 93.14. Modifications

0AS3 Here is a obsolete result on the category of Restricted Power Series, Equation 71.13.0.1. Please visit Restricted Power Series, Section 71.13 for the current material.

0AE4 Lemma 93.14.1. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. The category of Restricted Power Series, Equation (71.13.0.1) for $A$ is equivalent to the category Restricted Power Series, Equation (71.13.0.1) for the henselization $A^{h}$ of $A$.
Proof. This is a special case of Restricted Power Series, Lemma 71.13.3.
The following lemma on rational singularities is no longer needed in the chapter on resolving surface singularities.

0B50 Lemma 93.14.2. In Resolution of Surfaces, Situation 47.9.1. Let $M$ be a finite reflexive $A$-module. Let $M \otimes_{A} \mathcal{O}_{X}$ denote the pullback of the associated $\mathcal{O}_{S}$-module. Then $M \otimes_{A} \mathcal{O}_{X}$ maps onto its double dual.

Proof. Let $\mathcal{F}=\left(M \otimes_{A} \mathcal{O}_{X}\right)^{* *}$ be the double dual and let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the image of the evaluation map $M \otimes_{A} \mathcal{O}_{X} \rightarrow \mathcal{F}$. Then we have a short exact sequence

$$
0 \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0
$$

Since $X$ is normal, the local rings $\mathcal{O}_{X, x}$ are discrete valuation rings for points of codimension 1 (see Properties, Lemma 27.12.5. Hence $\mathcal{Q}_{x}=0$ for such points by More on Algebra, Lemma 15.17.3. Thus $\mathcal{Q}$ is supported in finitely many closed points and is globally generated by Cohomology of Schemes, Lemma 29.9.10. We obtain the exact sequence

$$
0 \rightarrow H^{0}\left(X, \mathcal{F}^{\prime}\right) \rightarrow H^{0}(X, \mathcal{F}) \rightarrow H^{0}(X, \mathcal{Q}) \rightarrow 0
$$

because $\mathcal{F}^{\prime}$ is generated by global sections (Resolution of Surfaces, Lemma 47.9.2). Since $X \rightarrow \operatorname{Spec}(A)$ is an isomorphism over the complement of the closed point, and since $M$ is reflexive, we see that the maps

$$
M \rightarrow H^{0}\left(X, \mathcal{F}^{\prime}\right) \rightarrow H^{0}(X, \mathcal{F})
$$

induce isomorphisms after localization at any nonmaximal prime of $A$. Hence these maps are isomorphisms by More on Algebra, Lemma 15.17 .11 and the fact that reflexive modules over normal rings have property $\left(S_{2}\right)$ (More on Algebra, Lemma 15.17 .14 . Thus we conclude that $\mathcal{Q}=0$ as desired.

### 93.15. Intersection theory

## 0AYK

02TL Lemma 93.15.1. Let $(S, \delta)$ be as in Chow Homology, Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $X$ be integral and $n=\operatorname{dim}_{\delta}(X)$. Let $a \in \Gamma\left(X, \mathcal{O}_{X}\right)$ be a nonzero function. Let $i: D=Z(a) \rightarrow X$ be the closed immersion of the zero scheme of $a$. Let $f \in R(X)^{*}$. In this case $i^{*} \operatorname{div}_{X}(f)=0$ in $A_{n-2}(D)$.

Proof. Special case of Chow Homology, Lemma 41.29.1.

### 93.16. Duplicate references

09AQ This section is a place where we collect duplicates.
03IF Lemma 93.16.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The map $\{\operatorname{Spec}(k) \rightarrow X$ monomorphism $\} \rightarrow|X|$ is injective.

Proof. This is a duplicate of Properties of Spaces, Lemma 53.4.11.
03QZ Theorem 93.16.2. Let $S=\operatorname{Spec}(K)$ with $K$ a field. Let $\bar{s}$ be a geometric point of $S$. Let $G=G a l_{\kappa(s)}$ denote the absolute Galois group. Then there is an equivalence of categories $\operatorname{Sh}\left(S_{\text {étale }}\right) \rightarrow G$-Sets, $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$.
Proof. This is a duplicate of Étale Cohomology, Theorem 49.56.3.
06IF Remark 93.16.3. You got here because of a duplicate tag. Please see Formal Deformation Theory, Section 73.11 for the actual content.

# GNU Free Documentation License 

Version 1.2, November 2002
Copyright © 2000 , 2001, 2002 Free Software Foundation, Inc.
51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

## Preamble

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

### 94.1. APPLICABILITY AND DEFINITIONS

05BG This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters)
and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers
are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

### 94.2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3 .

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

### 94.3. COPYING IN QUANTITY

05BI If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and BackCover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

### 94.4. MODIFICATIONS

05BJ You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the

Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:
A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
D. Preserve all the copyright notices of the Document.
E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
H. Include an unaltered copy of this License.
I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.

## O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties-for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

### 94.5. COMBINING DOCUMENTS

05BK
You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

### 94.6. COLLECTIONS OF DOCUMENTS

05BL
You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the
extracted document, and follow this License in all other respects regarding verbatim copying of that document.

### 94.7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

### 94.8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

### 94.9. TERMINATION

05BP You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

### 94.10. FUTURE REVISIONS OF THIS LICENSE

05BQ The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later
version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

### 94.11. ADDENDUM: How to use this License for your documents

05BR
To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright © C YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with...Texts." line with this:
with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

cotangent complex $L_{X / Y}$ of $X$ over $Y$ in derivation in 10.130 .1
75.25 .1
cotangent complex in 75.3 .2
cotangent complex in 75.17.2
cotangent complex in 75.19 .1
cotangent complex in 75.21 .1
countably indexed in 70.6 .2
coverings of $\mathcal{C}$ in 7.6.2
coverings in 49.10 .2
covering in 24.2 .4
covering in 24.2 .4
covers $F$ in 25.15 .3
crystal in $\mathcal{O}_{X / S}$-modules in 50.11 .1
crystal in finite locally free modules in
50.11 .3
crystal in quasi-coherent modules in
50.11 .3
crystalline site in 50.9.1
curve in 32.32.1
curve in 49.62 .6
cycle on $X$ in 41.9.1
decent in 55.6.1
decent in 55.15.1
decomposition group in 15.81 .10
decreasing filtration in 12.16 .1
Dedekind domain in 10.119.12
defined in a point $x \in X$ in 28.9.7
defines a rational singularity in 47.8.6
deformation category in 73.15 .8
degeneracy of $x$ in 14.11.1
degenerates at $E_{r}$ in 12.17 .2
degenerate in 14.11.1
degree $d$ finite Hilbert stack of $\mathcal{X}$ over $\mathcal{Y}$
in 77.18.2
degree of $X$ over $Y$ in 28.47 .8
degree of $X$ over $Y$ in 59.4.4
degree of $Z$ with respect to $\mathcal{L}$ in 32.34 .10
degree of a zero cycle in 41.41.1
degree of inseparability in 9.13 .7
degree in 9.7.1
degree in 28.45 .1
degree in 32.33 .1
degree in 32.33 .1
degree in 54.44 .2
Deligne-Mumford stack in 76.12.2
depth $k$ at a point in 29.11.1
depth $k$ at a point in 29.11.1
depth in 10.71.1
derived category of $(A, d)$ in 22.15 .2
derived category of $\mathcal{A}$ in 13.11 .3
derived category of $\mathcal{O}_{\mathcal{X}}$-modules with quasi-coherent cohomology sheaves in 85.4.1
derived category of $\mathcal{O}_{X}$-modules with quasi-coherent cohomology sheaves in
62.5 .1
derived colimit in 13.31 .1
derived complete with respect to $\mathcal{I}$ in 51.14 .4
derived complete with respect to $I$ in 15.72 .4
derived complete with respect to $I$ in 15.72 .4
derived limit in 13.32 .1
derived tensor product in 15.49 .13
derived tensor product in 20.27 .13
derived tensor product in 21.17 .11
descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasicoherent sheaves in 34.2.1
descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasicoherent sheaves in 61.3.1
descent datum $(N, \varphi)$ for modules with
respect to $R \rightarrow A$ in 34.3.1
descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow S\right\}$ in 34.30 .3
descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow X\right\}$ in 61.19.3
descent datum $\left(X_{i}, \varphi_{i j}\right)$ in $\mathcal{S}$ relative to the family $\left\{f_{i}: U_{i} \rightarrow U\right\}$ in 8.3.1
descent datum for $V / X / S$ in 34.30.1
descent datum for $V / Y / X$ in 61.19.1
descent datum relative to $X \rightarrow S$ in 34.30 .1
descent datum relative to $Y \rightarrow X$ in 61.19 .1
descent datum in 49.16.1
descent datum in 49.16.5
descent morphism for modules in 34.4 .15
determinant of $(M, \varphi, \psi)$ in 41.4.1
determinant of the finite length $R$ -
module $M$ in 41.2.1
differential $d \varphi: T \mathcal{F} \rightarrow T \mathcal{G}$ of $\varphi$ in 73.11 .3
differential graded algebra over $R$ in 22.3 .1

| differential graded category $\mathcal{A}$ over $R$ in | divided power scheme in 50.7.2 |
| :---: | :---: |

formally étale in 63.14 .1
formally catenary in 45.13.1
formally principally homogeneous under
$G$ in 38.11 .1
formally principally homogeneous under
$G$ in 65.9.1
formally smooth for the $\mathfrak{n}$-adic topology in 15.29 .3
formally smooth over $R$ in 10.136 .1
formally smooth over $R$ in 15.29.1
formally smooth in 36.9 .1
formally smooth in 63.11.1
formally smooth in 63.17.1
formally unramified over $R$ in 10.144 .1
formally unramified in 36.4 .1
formally unramified in 63.11 .1
formally unramified in 63.12 .1
fppf covering of $T$ in 33.7 .1
fppf covering of $X$ in 60.4.1
fppf sheaf in 78.4 .3
fpqc covering of $T$ in 33.8 .1
fpqc covering of $X$ in 60.3.1
fpqc covering in 49.15.1
free $\mathcal{O}$-module in 18.17 .1
free abelian presheaf on $\mathcal{G}$ in 49.18.4
free abelian presheaf in 18.4.1
free abelian sheaf in 18.5 .1
free module in 15.46 .5
free in 38.10.2
free in 65.8.2
full subcategory in 4.2 .10
fully faithful in 4.2.9
function field in 28.9 .5
functor of $R$-linear categories in 22.17 .2
functor of differential graded categories
over $R$ in 22.19.2
functor of graded categories over $R$ in 22.18 .2
functorial injective embeddings in 12.23 .5
functorial projective surjections in 12.24 .5
functor in 4.2 .8
functor in 4.28 .5
fundamental group in 48.5.1
$G$-ring in 15.41 .1
$G$-unramified at $\mathfrak{q}$ in 10.147 .1
$G$-unramified at $x \in X$ in 28.35.1
$G$-unramified at $x$ in 54.37.1
G-unramified in 10.147 .1
$G$-unramified in 28.35 .1
$G$-unramified in 54.37.1
Galois category in 48.3.6

Galois cohomology groups of $K$ with coefficients in $M$ in 49.57 .2
Galois cohomology groups in 49.57 .2
Galois group in 9.20 .3
Galois in 9.20 .1
Galois in 9.27.1
generalizations lift along $f$ in 5.18 .3
generalization in 5.18.1
generalization in 89.5.22
generalizing in 5.18.3
generated by r global sections in 18.17.1
generated by finitely many global sections
in 18.17 .1
generated by global sections in 17.4.1
generated by global sections in 18.17.1
generates the field extension in 9.6 .6
generate in 17.4.1
generator in 13.33 .2
generator in 19.10.1
generic point in 5.7.4
generic point in 89.5 .12
genus in 43.6.3
geometric frobenius in 49.79 .5
geometric frobenius in 49.79.11
geometric point lying over $x$ in 53.18.1
geometric point in 49.29.1
geometric point in 53.18.1
geometric quotient in 68.10.1
geometrically connected over $k$ in 10.47 .3 geometrically connected in 32.5.1
geometrically connected in 59.8.1
geometrically integral over $k$ in 10.48 .1
geometrically integral in 32.7.1
geometrically irreducible over $k$ in 10.46 .4
geometrically irreducible in 32.6.1
geometrically normal at $x$ in 32.8 .1
geometrically normal in 10.157 .2
geometrically normal in 32.8.1
geometrically pointwise integral at $x$ in 32.7 .1
geometrically pointwise integral in 32.7.1 geometrically reduced at $x$ in 32.4.1 geometrically reduced over $k$ in 10.42.1 geometrically reduced in 32.4 .1 geometrically regular at $x$ in 32.10 .1 geometrically regular over $k$ in 32.10 .1 geometrically regular in 10.158 .2
geometrically unibranch at $x$ in 27.15.1 geometrically unibranch at $x$ in 53.22 .2
geometrically unibranch in 15.79 .1
geometrically unibranch in 27.15 .1
geometrically unibranch in 53.22 .2
gerbe over in 8.11.4
gerbe over in 83.19.1
gerbe in 8.11.1
gerbe in 83.19.1
germ of $X$ at $x$ in 34.16 .1
global complete intersection over $k$ in 10.133.1
global dimension in 10.108 .6
global finite presentation in 18.17.1
global Lefschetz number in 49.91.1
global presentation in 18.17.1
global sections in 7.44.1
going down in 10.40 .1
going up in 10.40 .1
going-down theorem in 89.17.1
going-up theorem in 89.17.1
good quotient in 68.9.1
good stratification in 5.27 .2
Gorenstein in 45.38 .1
Gorenstein in 45.38 .1
Gorenstein in 45.38.1
graded $A$-algebra in 89.19.3
graded category $\mathcal{A}$ over $R$ in 22.18 .1
graded direct sum in 22.18 .4
graded functor in 22.18 .2
graded ideals in 89.19.3
graded module $M$ over a graded $A$ algebra $B$ in 89.19.3
graded module in 89.19 .2
graded submodules in 89.19.3
Grassmannian over $\mathbf{Z}$ in 26.22 .2
Grassmannian over $R$ in 26.22 .2
Grassmannian over $S$ in 26.22.2
Grothendieck abelian category in 19.10 .1
group algebraic space over $B$ in 65.5.1
group cohomology groups in 49.57.2
group of infinitesimal automorphisms of
$x^{\prime}$ over $x$ in 73.18.1
group of infinitesimal automorphisms of $x_{0}$ in 73.18 .2
group scheme over $S$ in 38.4 .1
groupoid in algebraic spaces over $B$ in 65.11 .1
groupoid in functors on $\mathcal{C}$ in 73.19 .1
groupoid over $S$ in 38.13 .1
groupoid scheme over $S$ in 38.13 .1
groupoid in 4.2 .5
Gysin homomorphism in 41.28.1
H-projective in 28.42 .1
H-quasi-projective in 28.40.1
has coproducts of pairs of objects in 4.5.2
has enough points in 7.37.1
has fibre products in 4.6.3
has products of pairs of objects in 4.4.2
has property $(\beta)$ in 55.15 .1
has property $(\beta)$ in 55.15 .1
has property $\mathcal{P}$ at $x$ in 53.7 .5
has property $\mathcal{P}$ at $x$ in 82.7 .5
has property $\mathcal{P}$ in 53.7.2
has property $\mathcal{P}$ in 54.22 .2
has property $\mathcal{P}$ in 82.7 .2
has property $\mathcal{P}$ in 83.12 .2
has property $\mathcal{Q}$ at $x$ in 54.22 .6
Hausdorff in 89.5.6
height in 10.59 .2
henselian local ring of $X$ at $x$ in 55.10 .5
henselian pair in 15.8 .1
henselian in 10.148 .1
henselian in 49.32 .2
henselization of $\mathcal{O}_{S, s}$ in 49.33.2
henselization of $S$ at $s$ in 49.33.2
henselization in 10.148 .18
Herbrand quotient in 41.3.2
higher direct images in 49.35 .4
Hilbert function in 89.19.2
Hilbert polynomial in 10.58.6
Hilbert polynomial in 32.28.14
Hilbert polynomial in 89.19.2
homogeneous spectrum $\operatorname{Proj}(R)$ in
89.20 .2
homogeneous spectrum of $\mathcal{A}$ over $S$ in 26.16 .7
homogeneous spectrum of $\mathcal{A}$ over $X$ in 58.3.3
homogeneous spectrum in 10.56 .1
homogeneous spectrum in 26.8.3
homogeneous in 89.20.1
homological in 13.3 .5
homology of $K$ in 24.3.1
homology in 12.19 .3
homomorphism of differential graded algebras in 22.3.2
homomorphism of differential graded modules in 22.4.1
homomorphism of divided power rings in 23.3 .1
homomorphism of divided power thickenings in 50.5 .2
homomorphism of systems in 10.8.7
homomorphism of topological groups in 5.29 .1
homomorphism of topological modules in 5.29 .10
homomorphism of topological modules in 15.28 .1
homomorphism of topological rings in 5.29 .7
homomorphism of topological rings in 15.28 .1
homomorphisms of graded mod-
ules/rings in 89.19.3
homotopic in 14.26 .1
homotopic in 14.28 .1
homotopic in 22.5 .1
homotopy between $f$ and $g$ in 22.5.1
homotopy category of $\mathcal{A}$ in 22.19 .3
homotopy category in 22.5 .3
homotopy colimit in 13.31 .1
homotopy connecting $a$ and $b$ in 14.28 .1
homotopy connecting $a$ to $b$ in 14.26.1
homotopy equivalence in 12.12 .2
homotopy equivalence in 12.12 .8
homotopy equivalence in 14.26 .6
homotopy equivalent in 12.12 .2
homotopy equivalent in 12.12 .8
homotopy equivalent in 14.26 .6
homotopy limit in 13.32 .1
horizontal in 4.27 .1
horizontal in 4.28 .1
hypercovering of $\mathcal{G}$ in 24.5 .1
hypercovering of $X$ in 24.2 .6
hypercovering in 24.5.1
ideal of definition in 15.28 .1
ideal sheaf of denominators of $s$ in 30.20 .15
identifies local rings in 51.3.1
image of $\varphi$ in 7.3.5
image of $f$ in 12.3 .9
image of the short exact sequence under
the given $\delta$-functor in 13.3 .6
immediate specialization in 5.19.1
immersion in 25.10.2
immersion in 52.12.1
immersion in 82.9.1
impurity of $\mathcal{F}$ above $s$ in 37.15 .2
ind-étale in 51.7.1
ind-quasi-affine in 36.48.1
ind-quasi-affine in 36.48.1
ind-Zariski in 51.4.1
indecomposable in 45.5.5
induced filtration in 12.16.1
induced filtration in 12.20 .4
induced filtration in 12.21 .5
inductive system over $I$ in $\mathcal{C}$ in 4.21 .1
inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$ in 4.33.2
inertia group in 15.81 .10
initial in 4.12.1
initial in 4.17.3
injective hull in 45.5.1
injective resolution of $A$ in 13.18.1
injective resolution of $K^{\bullet}$ in 13.18 .1
injective-amplitude in $[a, b]$ in 15.58.1
injective in 6.16 .2
injective in 6.16 .2
injective in 7.3.1
injective in 7.12 .1
injective in 12.5 .3
injective in 12.23 .1
injective in 15.46 .1
inseparable degree in 9.13 .7
integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$ in 28.48 .2
integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$ in 54.45 .2
integral closure in 10.35 .8
integral domain in 9.2 .2
integral over $I$ in 10.37.1
integral over $R$ in 10.35.1
integrally closed in 10.35 .8
integral in 10.35 .1
integral in 27.3.1
integral in 28.43.1
integral in 54.43 .2
integral in 59.4.1
integral in 89.26 .12
interior in 5.20 .1
intersect properly in 42.13 .5
intersect properly in 42.13 .5
intersection number in 32.34 .3
intersection with the $j$ th chern class of $\mathcal{E}$
in 41.35 .1
intersection with the first chern class of $\mathcal{L}$ in 41.24.1
inverse image $f^{-1}(Z)$ of the closed subscheme $Z$ in 25.17.7
inverse image $f^{-1}(Z)$ of the closed sub-
space $Z$ in 54.13 .2
inverse image in 49.36 .1
inverse system over $I$ in $\mathcal{C}$ in 4.21 .1
invertible $\mathcal{O}_{X}$-module in 17.21 .1
invertible $\mathcal{O}_{X}$-module in 89.32 .1
invertible module $M$ in 89.32 .4
invertible module in 89.15 .1
invertible sheaf $\mathcal{O}_{S}(D)$ associated to $D$
in 30.11.14
invertible sheaf $\mathcal{O}_{X}(D)$ associated to $D$
in 58.2.13
invertible in 15.83 .1
invertible in 18.31 .1
irreducible component in 5.7.1
irreducible component in 89.5.18
irreducible in 5.7.1
irreducible in 10.119 .1
irreducible in 89.5.9
irreducible in 89.5 .9
is essentially constant in 4.22 .1
isolated point in 5.26 .2
isomorphism in 4.2.4
$J-0$ in 15.38 .1
$J$-1 in 15.38 .1
$J$-2 in 15.38 .1
$J$-2 in 28.19.1
Jacobson ring in 10.34.1
Jacobson in 5.17.1
Jacobson in 27.6.1
Japanese in 10.153 .1
Japanese in 27.13.1
$K$-flat in 15.49 .3
$K$-flat in 20.27 .2
$K$-flat in 21.17.2
K-injective in 13.29 .1
Kan complex in 14.31.1
Kan fibration in 14.31 .1
Kaplansky dévissage in 10.83 .1
Karoubian in 12.4 .1
kernel of $F$ in 13.6.5
kernel of $H$ in 13.6 .5
kernel of the functor $F$ in 12.9 .5
kernel in 12.3 .9
Kolmogorov in 5.7.4
Koszul at $x$ in 36.44 .2
Koszul at $x$ in 63.37.1
Koszul complex on $f_{1}, \ldots, f_{r}$ in 15.22 .2
Koszul complex on $f_{1}, \ldots, f_{r}$ in 17.20 .2
Koszul complex in 15.22 .1
Koszul complex in 17.20.1
Koszul morphism in 36.44 .2
Koszul morphism in 63.37.1
Koszul-regular ideal in 15.24 .1
Koszul-regular immersion in 30.18.1
Koszul-regular immersion in 63.34 .2
Koszul-regular in 15.23.1
Koszul-regular in 30.17 .2
Krull dimension of $X$ at $x$ in 5.9.1
Krull dimension in 5.9.1
Krull dimension in 10.59.1
lattice in $V$ in 10.120 .3
left acyclic for $F$ in 13.16 .3
left adjoint in 4.24.1
left deriveable in 13.15 .9
left derived functor $L F$ is defined at in
13.15 .2
left derived functors of $F$ in 13.16 .3
left exact in 4.23.1
left multiplicative system in 4.26 .1
Leibniz rule in 10.130 .1
Leibniz rule in 17.24 .1
Leibniz rule in 18.32 .1
length in 5.9.1
length in 10.51.1
length in 89.8.1
lies over in 49.29.1
lies over in 80.9.1
lift of $x$ along $f$ in 73.16 .1
lift in 4.31 .2
lift in 4.31 .2
limit preserving in 57.3.1
limit preserving in 80.13 .1
limit in 4.14.1
limit in 12.17 .2
limp in 21.13 .4
linearly adequate in 44.3.2
linearly disjoint over $k$ in $\Omega$ in 9.26 .2
linearly topologized in 15.28 .1
linearly topologized in 15.28 .1
lisse-étale site in 84.11.1
lisse in 49.95.1
lisse in 51.26 .1
local complete intersection morphism in 36.44 .2
local complete intersection morphism in 63.37 .1
local complete intersection over $k$ in 10.133 .1
local complete intersection over $k$ in 28.31 .1
local complete intersection in 15.25 .2
local complete intersection in 23.8.5
local homomorphism of local rings in 10.17.1
local in the $\tau$-topology in 34.11.1
local isomorphism in 51.3.1
local Lefschetz number in 49.91.2
local on the base for the $\tau$-topology in 34.18 .1
local on the base for the $\tau$-topology in 61.9 .1
local on the source for the $\tau$-topology in 34.22 .1
local on the source for the $\tau$-topology in 61.12 .1
local ring map $\varphi: R \rightarrow S$ in 10.17.1
local ring of $X$ at $x$ in 25.2.1
local ring of the fibre at $\mathfrak{q}$ in 10.111 .5
local ring in 10.17 .1
localization morphism in 7.24 .1
localization morphism in 7.29 .4
localization morphism in 18.19.1
localization morphism in 18.21 .2
localization of $A$ with respect to $S$ in 10.9 .2
localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object $U$ in 18.19.1
localization of the ringed topos $(S h(\mathcal{C}), \mathcal{O})$ at $\mathcal{F}$ in 18.21 .2
localization of the site $\mathcal{C}$ at the object $U$ in 7.24.1
localization of the topos $\operatorname{Sh}(\mathcal{C})$ at $\mathcal{F}$ in 7.29 .4
localization in 10.9.6
locally $P$ in 27.4 .2
locally adic* in 70.15 .5
locally algebraic $k$-scheme in 32.17 .1
locally closed immersion in 25.10 .2
locally closed subspace in 52.12.1
locally closed substack in 82.9 .8
locally connected in 5.6.9
locally constant in 18.42.1
locally constant in 49.67.1
locally constant in 49.67.1
locally constant in 49.67 .1
locally constructible in 5.14.1
locally countably indexed in 70.15 .5
locally finite in 5.27.4
locally finite in 20.25 .2
locally finite in 89.19.2
locally free in 10.77 .1
locally free in 17.14.1
locally free in 18.23 .1
locally generated by $r$ sections in 18.23 .1
locally generated by sections in 17.8.1
locally generated by sections in 18.23.1
locally has finite tor dimension in 20.40.1
locally has finite tor dimension in 21.36 .1
locally nilpotent in 10.31 .1
locally Noetherian in 5.8.1
locally Noetherian in 27.5.1
locally Noetherian in 70.15 .5
locally Noetherian in 89.29 .5
locally of finite presentation over $S$ in 57.3 .1
locally of finite presentation in 28.21 .1 locally of finite presentation in 54.28 .1 locally of finite presentation in 57.3.1
locally of finite presentation in 57.3.1
locally of finite presentation in 83.18.1
locally of finite type in 28.15 .1
locally of finite type in 54.23 .1
locally of finite type in 70.18 .1
locally of finite type in 83.13.1
locally of type $P$ in 28.14 .2
locally principal closed subscheme in 30.11 .1
locally principal closed subspace in 58.2 .1 locally projective in 27.21.1
locally projective in 28.42 .1
locally projective in 53.30 .2
locally quasi-coherent in 50.11.1
locally quasi-coherent in 78.11 .4
locally quasi-compact in 5.12 .1
locally quasi-finite in 28.20 .1
locally quasi-finite in 54.27 .1
locally quasi-finite in 83.16.2
locally quasi-projective in 28.40 .1
locally ringed site in 18.39 .4
locally ringed space $\left(X, \mathcal{O}_{X}\right)$ in 25.2 .1
locally ringed in 18.39 .6
locally separated over $S$ in 52.13 .2
locally separated in 53.3.1
locally separated in 53.3.1
locally separated in 54.4 .2
locally trivial in 38.11 .3
locally trivial in 65.9.3
local in 27.4.1
local in 28.14.1
maximal Cohen-Macaulay in 10.102 .6
McQuillan in 70.5.7
meromorphic function in 30.20 .1
meromorphic section of $\mathcal{F}$ in 30.20 .5
minimal polynomial in 9.9.1
minimal in 73.13.4
minimal in 73.25.1
miniversal in 73.13.4
Mittag-Leffler condition in 12.27 .2
Mittag-Leffler directed system of mod-
ules in 10.87 .1
Mittag-Leffler inverse system in 10.85 .1
Mittag-Leffler in 10.87 .7
mixed characteristic in 15.81 .16
$M L$ in 12.27 .2
modification of $X$ in 28.47 .11
modification of $X$ in 59.5.1
module of differentials in 10.130.2
module of differentials in 17.24 .3
module of differentials in 18.32 .3
module of Kähler differentials in 10.130 .2
module of principal parts of order $k$ in
10.131 .4
module of principal parts of order $k$ in
18.33.4
module-valued functor in 44.3 .1
monomorphism in 4.13.1
monomorphism in 25.23.1
monomorphism in 54.10.1
monomorphism in 70.19 .1
monomorphism in 82.8.1
morphism $(A, F) \rightarrow(B, F)$ of filtered ob-
jects in 12.16.1

```
morphism (N,\varphi)->(\mp@subsup{N}{}{\prime},\mp@subsup{\varphi}{}{\prime})\mathrm{ of descent morphism f:X }->Y\mathrm{ of schemes over S}

morphism of étale neighbourhoods in
morphism of abelian presheaves over $X$ in 6.4.4
morphism of affine formal algebraic spaces in 70.5.1
morphism of affine schemes in 25.5 .5
morphism of cones in 26.7.2
morphism of cosimplicial objects $U \rightarrow$
morphism of differential objects in
morphism of divided power schemes in 50.7 .2
morphism of divided power thickenings of $X$ relative to $(S, \mathcal{I}, \gamma)$ in 50.8.1
morphism of elementary étale neighbourhoods in 55.10.3
morphism of exact couples in 12.18.1
morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$ in 7.8.1
morphism of formal algebraic spaces in 70.7 .1
morphism of formal objects in 80.9.1
morphism of functors in 4.2.15
morphism of germs in 34.16 .1
morphism of groupoid schemes cartesian $\operatorname{over}(U, R, s, t, c)$ in 38.21 .1
morphism of lifts in 73.16.1
morphism of locally ringed sites in 18.39 .9
morphism of locally ringed spaces in 25.2 .1

| morphism of locally ringed topoi in 18.39 .9 | $\begin{aligned} & \text { multiplicity in } 41.3 .2 \\ & N-1 \text { in } 10.153 .1 \end{aligned}$ |
| :---: | :---: |
| morphism of module-valued functors in | $N-2$ in 10.153 .1 |

relative spectrum of $\mathcal{A}$ over $S$ in 26.4.5
relative spectrum of $\mathcal{A}$ over $X$ in 54.20 .8
relative weak assassin of $\mathcal{F}$ in $X$ over $S$
in 30.8.1
relatively ample in 28.37 .1
relatively limit preserving in 57.3.1
relatively prime in 9.11.1
relatively very ample in 28.38 .1
representable by a scheme in 25.15 .1
representable by algebraic spaces in
67.3 .1
representable by algebraic spaces in 76.9 .1
representable by an algebraic space over $S$ in 76.8.1
representable by open immersions in 25.15 .3
representable quotient in 38.20 .2
representable quotient in 38.20 .2
representable quotient in 65.18 .3
representable quotient in 65.18 .3
representable sheaves in 7.13 .3
representable in 4.3.6
representable in 4.6.4
representable in 4.8.2
representable in 4.39 .1
representable in 4.40 .5
representable in 25.15 .1
representable in 73.19 .4
residual degree in 15.81 .1
residual degree in 15.84 .1
residual gerbe of $\mathcal{X}$ at $x$ exists in 82.11 .8
residual gerbe of $\mathcal{X}$ at $x$ in 82.11 .8
residual space of $X$ at $x$ in 55.11.6
residue degree in 15.81 .1
residue degree in 15.84 .1
residue field of $X$ at $x$ in 25.2 .1
resolution functor in 13.23 .2
resolution of $M$ by finite free $R$-modules in 10.70 .2
resolution of $M$ by free $R$-modules in 10.70 .2
resolution of singularities by normalized blowups in 47.14 .2
resolution of singularities by normalized blowups in 72.8.2
resolution of singularities in 47.14.1
resolution of singularities in 72.8.1
resolution in 10.70.2
restriction $\left.(U, R, s, t, c)\right|_{\mathcal{C}^{\prime}}$ of $(U, R, s, t, c)$ to $\mathcal{C}^{\prime}$ in 73.19 .7
restriction of $(U, R, s, t, c)$ to $U^{\prime}$ in 38.18 .2
restriction of $(U, R, s, t, c)$ to $U^{\prime}$ in 65.16 .2
restriction of $\mathcal{F}$ to $\mathcal{C} / U$ in 7.24 .1
restriction of $\mathcal{F}$ to $\mathcal{C} / U$ in 18.19.1
restriction of $\mathcal{F}$ to $U_{\text {étale }}$ in 78.9 .2
restriction of $\mathcal{G}$ to $U$ in 6.31 .2
restriction of $\mathcal{G}$ to $U$ in 6.31 .2
restriction of $\mathcal{G}$ to $U$ in 6.31 .2
restriction to the small étale site in 33.4.14
restriction to the small pro-étale site in 51.11 .18
restriction to the small Zariski site in 33.3.14
restriction in 38.3.3
restriction in 65.4.3
retrocompact in 5.11 .1
rig-étale in 71.7.2
rig-surjective in 71.11.1
right acyclic for $F$ in 13.16 .3
right adjoint in 4.24.1
right deriveable in 13.15 .9
right derived functor $R F$ is defined at in 13.15 .2
right derived functors of $F$ in 13.16 .3
right exact in 4.23.1
right multiplicative system in 4.26 .1

valuation ring in 10.49 .1
valuation in 10.49.13
value group in 10.49.13
value of $L F$ at $X$ in 13.15 .2
value of $R F$ at $X$ in 13.15 .2
value in 4.22.1
value in 4.22 .1
variety in 32.3 .1
variety in 49.62 .6
vector bundle $\pi: V \rightarrow S$ over $S$ in 26.6.2
vector bundle associated to $\mathcal{E}$ in 26.6.1
versal in 73.8.13
versal in 80.11.1
vertical in 4.28.1
very ample on $X / S$ in 28.38 .1
very reasonable in 55.6.1
very reasonable in 55.15.1
viewed as an algebraic space over $S^{\prime}$ in 52.16 .2
viewed as an algebraic stack over $S^{\prime}$ in 76.19 .2
w-contractible in 51.10.1
$w$-local in 51.2.3
w-local in 51.2.3
weak $R$-orbit in 68.5.4
weak dimension $\leq d$ in 15.78 .3
weak functor in 4.28 .5
weak generator in 13.33 .2
weak ideal of definition in 70.4 .7
weak orbit in 68.5.4
weak Serre subcategory in 12.9 .1
weak solution for $A \subset B$ in 15.82 .2
weaker than the canonical topology in
7.13 .2
weakly $R$-equivalent in 68.5 .4
weakly étale in 15.78.1
weakly étale in 36.46.1

| weakly admissible in 70.4 .7 | Weil divisor in 89.34.1 |

## Set Theory

## Categories

In 4.2.1 category
In 4.2.4 isomorphism
In 4.2.5 groupoid
In 4.2.8, functor
In 4.2.9. faithful, fully faithful, essentially surjective
In 4.2.10; subcategory, full subcategory, strictly full
In 4.2.15 natural transformation, mor-
phism of functors
In 4.2.17 equivalence of categories, quasi-inverse
In 4.2.20 product category

In 4.3.1. opposite category
In 4.3.2, contravariant
In 4.3.3. presheaf of sets on $\mathcal{C}$, presheaf
In 4.3.6 representable
In 4.4.1 product
In 4.4.2 has products of pairs of objects
In 4.5.1. coproduct, amalgamated sum
In 4.5.2 has coproducts of pairs of ob-
jects
In 4.6.1 fibre product
In 4.6.2, cartesian
In 4.6.3. has fibre products
In 4.6.4 representable
In 4.8.2 representable, $F$ is relatively
representable over $G$
In 4.9.1 pushout
In 4.9.2 cocartesian
In 4.10.1 equalizer
In 4.11.1 coequalizer
In 4.12.1 initial, final

In 4.13.1 monomorphism, epimorphism
In 4.14.1 limit
In 4.14.2 colimit
In 4.14.5 product
In 4.14 .6 coproduct
In 4.16.1 connected
In 4.17.1 $\mathcal{I}$ is cofinal in $\mathcal{J}$, cofinal
In 4.17.3 $\mathcal{I}$ is initial in $\mathcal{J}$, initial
In 4.19.1 directed, filtered, directed, filtered
In 4.20.1 codirected, cofiltered, codirected, cofiltered
In 4.21.1 system over $I$ in $\mathcal{C}$, inductive system over $I$ in $\mathcal{C}$, inverse system over $I$ in $\mathcal{C}$, projective system over $I$ in $\mathcal{C}$, transition maps
In 4.21.2 directed system, directed inverse system, directed
In 4.22.1 is essentially constant, value, essentially constant, value
In 4.22.2, essentially constant system, essentially constant inverse system
In 4.23.1 left exact, right exact, exact
In 4.24.1 left adjoint, right adjoint
In 4.26.1: left multiplicative system, right
multiplicative system, multiplicative system
In 4.26.4 $s^{-1} f$
In 4.26.12 $\mathrm{fs}^{-1}$
In 4.26 .20 saturated
In 4.27.1 horizontal
In 4.28.1 2-category, 1-morphisms, 2morphisms, vertical, composition, horizontal
In 4.28.2 sub 2-category
In 4.28.4 equivalent
In 4.28.5. functor, weak functor, pseudo functor
In 4.29.1 (2, 1)-category
In 4.30.1 final object
In 4.30.2 2-fibre product of $f$ and $g$
In 4.31.1. 2-category of categories over $\mathcal{C}$
In 4.31.2, fibre category, lift, $x$ lies over
$U$, lift, $\phi$ lies over $f$
In 4.32.1; strongly cartesian morphism, strongly $\mathcal{C}$-cartesian morphism
In 4.32.5 fibred category over $\mathcal{C}$

In 4.32.6 choice of pullbacks, pullback functor
In 4.32.9. 2-category of fibred categories over $\mathcal{C}$
In 4.33.2. relative inertia of $\mathcal{S}$ over $\mathcal{S}^{\prime}$, inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$
In 4.34.1 fibred in groupoids
In 4.34.6. 2-category of categories fibred in groupoids over $\mathcal{C}$
In 4.35.2 split fibred category, $\mathcal{S}_{F}$
In 4.36.2 split category fibred in groupoids, $\mathcal{S}_{F}$
In 4.37.1 discrete
In 4.37.2, category fibred in sets, category fibred in discrete categories
In 4.37.3. 2-category of categories fibred in sets over $\mathcal{C}$
In 4.38.1 setoid
In 4.38.2 category fibred in setoids
In 4.38.3. 2-category of categories fibred in setoids over $\mathcal{C}$
In 4.39.1 representable
In 4.40.5 representable, $\mathcal{X}$ is relatively representable over $\mathcal{Y}$

## Topology

In 5.4.1. base for the topology on $X$, basis for the topology on $X$
In 5.4.3. subbase for the topology on $X$, subbasis for the topology on $X$
In 5.5.3. strict map of topological spaces, submersive
In5.6.1: connected, connected component In 5.6.7. totally disconnected
In 5.6.9, locally connected
In 5.7.1. irreducible, irreducible component
In 5.7.4. generic point, Kolmogorov, quasi-sober, sober
In 5.8.1. Noetherian, locally Noetherian
In 5.9.1. chain of irreducible closed sub-
sets, length, dimension, Krull dimension,
Krull dimension of $X$ at $x$
In 5.9.5 equidimensional
In 5.10.1 codimension
In 5.10.4 catenary
In 5.11.1. quasi-compact, quasi-compact, retrocompact
In 5.12.1 locally quasi-compact

In 5.14.1; constructible, locally constructible
In 5.16.2 closed, proper, quasi-proper, universally closed
In 5.17.1 Jacobson
In 5.18.1 specialization, generalization,
stable under specialization, stable under generalization
In 5.18.3. specializations lift along $f$, specializing, generalizations lift along $f$, generalizing
In 5.19.1 immediate specialization, dimension function
In 5.20.1 interior, nowhere dense
In 5.21.1 profinite
In 5.22.1 spectral, spectral
In 5.25.1 extremally disconnected
In 5.26.2 isolated point
In 5.27.1 partition, parts, refines
In 5.27.2 good stratification
In 5.27.3 stratification, strata
In 5.27.4 locally finite
In 5.29.1 topological group, homomor-
phism of topological groups
In 5.29.5 profinite group
In 5.29.7. topological ring, homomorphism of topological rings
In 5.29.10 topological module, homomorphism of topological modules

## Sheaves on Spaces

In 6.3.1. presheaf $\mathcal{F}$ of sets on $X$, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on $X$
In 6.3.2, constant presheaf with value $A$ In 6.4.4 presheaf of abelian groups on $X$, abelian presheaf over $X$, morphism of abelian presheaves over $X$
In 6.5.1 presheaf $\mathcal{F}$ on $X$ with values in $\mathcal{C}$, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with value in $\mathcal{C}$
In 6.5.2 underlying presheaf of sets of $\mathcal{F}$ In 6.6.1 presheaf of $\mathcal{O}$-modules, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$ modules
In 6.7.1. sheaf $\mathcal{F}$ of sets on $X$, morphism of sheaves of sets
In 6.7.4 constant sheaf with value $A$

In 6.8.1 abelian sheaf on $X$, sheaf of abelian groups on $X$
In 6.9.1. sheaf
In 6.10.1 sheaf of $\mathcal{O}$-modules, morphism
of sheaves of $\mathcal{O}$-modules
In 6.11 .2 separated
In 6.15.1 type of algebraic structure
In 6.16.2 subpresheaf, subsheaf, injec-
tive, surjective, injective, surjective
In 6.21.7 $f$-map $\xi: \mathcal{G} \rightarrow \mathcal{F}$
In 6.21.9 composition of $\varphi$ and $\psi$
In 6.25.1 ringed space, morphism of ringed spaces
In 6.25.3. composition of morphisms of ringed spaces
In 6.26.1 pushforward, pullback
In 6.27.1 skyscraper sheaf at $x$ with value $A$, skyscraper sheaf, skyscraper sheaf, skyscraper sheaf, skyscraper sheaf In 6.30.1 presheaf $\mathcal{F}$ of sets on $\mathcal{B}$, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on $\mathcal{B}$
In 6.30.2, sheaf $\mathcal{F}$ of sets on $\mathcal{B}$, morphism of sheaves of sets on $\mathcal{B}$
In 6.30.8 presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with values in $\mathcal{C}$ on $\mathcal{B}$, sheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$
In 6.30.11 presheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{B}$, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$-modules on $\mathcal{B}$, sheaf $\mathcal{F}$ of $\mathcal{O}$-modules on $\mathcal{B}$
In 6.31.2 restriction of $\mathcal{G}$ to $U$, restriction of $\mathcal{G}$ to $U$, open subspace of $(X, \mathcal{O})$ associated to $U$, restriction of $\mathcal{G}$ to $U$
In 6.31.3. extension of $\mathcal{F}$ by the empty set $j_{p!} \mathcal{F}$, extension of $\mathcal{F}$ by the empty set $j!\mathcal{F}$
In 6.31.5 extension $j_{p!} \mathcal{F}$ of $\mathcal{F}$ by 0 , extension $j!\mathcal{F}$ of $\mathcal{F}$ by 0 , extension $j_{p!} \mathcal{F}$ of $\mathcal{F}$ by e, extension $j!\mathcal{F}$ of $\mathcal{F}$ by e, extension by 0 , extension by 0

## Sites and Sheaves

In 7.2.1 presheaf of sets, Morphisms of presheaves
In 7.2.2 presheaf, morphism
In 7.3.1. injective, surjective
In 7.3.3. subpresheaf

In 7.3.5. image of $\varphi$
In 7.6.1. family of morphisms with fixed target
In 7.6.2 site, coverings of $\mathcal{C}$
In 7.7.1. sheaf
In 7.7.5. $\operatorname{Sh}(\mathcal{C})$
In 7.7.6 sheaf
In 7.8.1. morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$, morphism from $\mathcal{U}$ to $\mathcal{V}$, refinement
In 7.8.2. combinatorially equivalent, tau-
tologically equivalent
In 7.10 .9 separated
In 7.10.11, sheaf associated to $\mathcal{F}$
In 7.11.1 quasi-compact
In 7.12.1 injective, surjective
In 7.13.1. effective epimorphism, univer-
sal effective epimorphism
In 7.13.2, weaker than the canonical
topology, subcanonical
In 7.13.3 representable sheaves, $\underline{U}$
In 7.14.1 continuous
In 7.15.1 morphism of sites
In 7.15 .4 composition
In 7.16.1. topos, morphism of topoi, com-
position $f \circ g$
In 7.19.1 cocontinuous
In 7.24.1 localization of the site $\mathcal{C}$ at the object $U$, localization morphism, direct image functor, restriction of $\mathcal{F}$ to $\mathcal{C} / U$, extension of $\mathcal{G}$ by the empty set
In 7.28.2, special cocontinuous functor $u$
from $\mathcal{C}$ to $\mathcal{D}$
In 7.29.4 localization of the topos $\operatorname{Sh}(\mathcal{C})$
at $\mathcal{F}$, localization morphism
In 7.31.1 point of the topos $\operatorname{Sh}(\mathcal{C})$
In 7.31.2 point $p$ of the site $\mathcal{C}$
In 7.31.6 skyscraper sheaf
In 7.35.1 2-morphism from $f$ to $g$
In 7.36.2 morphism $f: p \rightarrow p^{\prime}$
In 7.37.1. conservative, has enough points
In 7.39.2, weakly contractible, enough weakly contractible objects, enough $P$ objects
In 7.41.1 sheaf theoretically empty
In 7.41.3 almost cocontinuous
In 7.42.1 embedding

In 7.42.2 subtopos
In 7.42 .4 open subtopos
In 7.42.6 closed subtopos
In 7.42.7 open immersion, closed im-
mersion
In 7.43.1 pushforward
In 7.44.1 global sections
In 7.45.1 sieve $S$ on $U$
In 7.45.3. sieve on $U$ generated by the morphisms $f_{i}$
In 7.45.4 pullback of $S$ by $f$
In 7.45.6 topology on $\mathcal{C}$
In 7.45.8 finer
In 7.45.10, sheaf
In 7.45.12 canonical topology
In 7.46.2 topology associated to $\mathcal{C}$
In 7.47 .2 separated
In 7.47 .4 sheaf associated to $\mathcal{F}$
In 7.50.1 point $p$

## Stacks

In 8.2.2 presheaf of morphisms from $x$ to $y$, presheaf of isomorphisms from $x$ to $y$
In 8.3.1. descent datum $\left(X_{i}, \varphi_{i j}\right)$ in $\mathcal{S}$ relative to the family $\left\{f_{i}: U_{i} \rightarrow\right.$ $U\}$, cocycle condition, morphism $\psi$ : $\left(X_{i}, \varphi_{i j}\right) \rightarrow\left(X_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data
In 8.3.4 pullback functor
In 8.3.5 trivial descent datum, canonical descent datum, effective
In 8.4.1 stack
In 8.4.5. 2-category of stacks over $\mathcal{C}$
In 8.5.1: stack in groupoids
In 8.5.5 2-category of stacks in groupoids over $\mathcal{C}$
In 8.6.1 stack in setoids, stack in sets, stack in discrete categories
In 8.6.5 2-category of stacks in setoids over $\mathcal{C}$
In 8.10.2, structure of site on $\mathcal{S}$ inherited from $\mathcal{C}, \mathcal{S}$ is endowed with the topology inherited from $\mathcal{C}$
In 8.11.1 gerbe
In 8.11.4 gerbe over
In 8.12.4. $f_{*} \mathcal{S}$, pushforward of $\mathcal{S}$ along $f$
In 8.12.9 $f^{-1} \mathcal{S}$, pullback of $\mathcal{S}$ along $f$

## Fields

In 9.2.1: field, subfield
In 9.2.2 domain, integral domain In 10.8.1. partially ordered set, directed
In 9.5.1. characteristic, prime subfield of F

In 9.6.2 field extension
In 9.6.3, tower
In 9.6.6. generates the field extension,
finitely generated field extension
In 9.7.1. degree, finite
In 9.7.7. number field
In 9.8.1: algebraic, algebraic extension
In 9.9.1: minimal polynomial
In 9.10.1 algebraically closed
In 9.10.3. algebraically closed, algebraic
closure
In 9.11.1 relatively prime
In 9.12.2 separable, separable, separable
In 9.12 .6 separable degree
In 9.13.1. purely inseparable, purely in-
separable
In 9.13.7. separable degree, inseparable
degree, degree of inseparability
In 9.14.1 normal
In 9.14.7 automorphisms of $E$ over $F$, automorphisms of $E / F$
In 9.15.2, splitting field of $P$ over $F$
In 9.15.4 normal closure $E$ over $F$
In 9.19.1 trace, norm
In 9.19.6 trace pairing
In 9.19 .8 discriminant of $L / K$
In 9.20.1 Galois
In 9.20 .3 Galois group
In 9.25.1 algebraically independent, purely transcendental extension, transcendence basis
In 9.25 .4 transcendence degree
In 9.25.9. algebraic closure of $k$ in $K$, algebraically closed in $K$
In 9.26.1 compositum of $K$ and $L$ in $\Omega$ In 9.26 .2 linearly disjoint over $k$ in $\Omega$
In 9.27.1. algebraic, separable, purely inseparable, normal, Galois

## Commutative Algebra

In 10.5.1 finite $R$-module, finitely generated $R$-module, finitely presented $R$ module, $R$-module of finite presentation In 10.6.1 finite type, $S$ is a finite type $R$-algebra, finite presentation

In 10.7.1 finite
set
In 10.8.2 system $\left(M_{i}, \mu_{i j}\right)$ of $R$-modules
over I, directed system
In 10.8.7 homomorphism of systems
In 10.8.12 relation
In 10.9.1 multiplicative subset of $R$
In 10.9.2 localization of $A$ with respect
to $S$
In 10.9.6 localization
In 10.11.1 $R$-bilinear
In 10.11.6 $(A, B)$-bimodule
In 10.13.1 base change, base change
In 10.16.1 spectrum
In 10.16.3 Zariski, standard opens
In 10.17.1. local ring, local homomor-
phism of local rings, local ring map $\varphi$ :
$R \rightarrow S$
In 10.27.2 Oka family
In 10.31.1 locally nilpotent, nilpotent
In 10.34.1 Jacobson ring
In 10.35.1 integral over $R$, integral
In 10.35.8 integral closure, integrally
closed
In 10.36.1 normal
In 10.36.3. almost integral over $R$, completely normal
In 10.36.11: normal
In 10.37.1 integral over I
In 10.38.1, flat, faithfully flat, flat, faithfully flat
In 10.39.1 support of $M$
In 10.39.3 annihilator of $m$, annihilator of $M$
In 10.40.1 going up, going down
In 10.41.1 separably generated over $k$, separable over $k$
In 10.42.1 geometrically reduced over $k$ In 10.44.1 perfect
In 10.44.5 perfect closure
In 10.46.4. geometrically irreducible over $k$
In 10.47.3 geometrically connected over $k$
In 10.48.1 geometrically integral over $k$
In 10.49.1. dominates, valuation ring, centered

In 10.49 .13 value group, valuation, dis- In 10.95 .3 I-adically complete, $I$ -
crete valuation ring
In 10.51.1: length
In 10.51.9 simple
In 10.52.1. Artinian
In 10.53.1. essentially of finite type, essentially of finite presentation
In 10.56.1 homogeneous spectrum
In 10.57.3. numerical polynomial
In 10.58.1. an ideal of definition of $R$
In 10.58.6 Hilbert polynomial
In 10.58.8 $d(M)$
In 10.59.1. Krull dimension
In 10.59.2 height
In 10.59.9. system of parameters of $R$, regular local ring, regular system of parameters
In 10.62.1 associated
In 10.63.1 symbolic power
In 10.64.2. relative assassin of $N$ over $S / R$
In 10.65.1 weakly associated
In 10.66.1 embedded associated primes, embedded primes of $R$
In 10.67.1: $M$-regular sequence, $M$ regular sequence in $I$, regular sequence
In 10.68.1 M-quasi-regular, quasiregular sequence
In 10.69.1. blowup algebra, Rees algebra, affine blowup algebra
In 10.70 .2 , resolution, resolution of $M$ by free $R$-modules, resolution of $M$ by finite free $R$-modules
In 10.71.1. $I$-depth, depth
In 10.76.1 projective
In 10.77.1 locally free, finite locally free, finite locally free of rank $r$
In 10.81.1 universally injective, universally exact
In 10.83.1: direct sum dévissage, Kaplansky dévissage
In 10.85.1 Mittag-Leffler inverse system In 10.87.1. Mittag-Leffler directed system of modules
In 10.87.2 dominates
In 10.87.7 Mittag-Leffler
In 10.89.1 coherent module, coherent ring
adically complete
In 10.101.4 rank
In 10.102.1. Cohen-Macaulay
In 10.102.6 maximal Cohen-Macaulay
In 10.102.10 Cohen-Macaulay
In 10.103.1. Cohen-Macaulay
In 10.103.6. Cohen-Macaulay
In 10.104.1. catenary
In 10.104.3. universally catenary
In 10.107.1; pure
In 10.108.2 finite projective dimension, projective dimension
In 10.108.6. finite global dimension, global dimension
In 10.109.7, regular
In 10.111.5. local ring of the fibre at $\mathfrak{q}$
In 10.118.8 uniformizer
In 10.119.1 associates, irreducible, prime In 10.119.4 unique factorization domain, UFD
In 10.119 .10 principal ideal domain, PID
In 10.119.12 Dedekind domain
In 10.120.2 order of vanishing along $R$
In 10.120.3. lattice in $V$
In 10.120 .5 distance between $M$ and $M^{\prime}$
In 10.121.3 quasi-finite at $\mathfrak{q}$, quasi-finite
In 10.122.8, strongly transcendental over
$R$
In 10.124.1. relative dimension of $S / R$ at $\mathfrak{q}$, relative dimension of
In 10.130.1. derivation, $R$-derivation, Leibniz rule
In 10.130 .2 , module of Kähler differentials, module of differentials
In 10.131.1 differential operator $D$ :
$M \rightarrow N$ of order $k$
In 10.131.4 module of principal parts of order $k$
In 10.132.1 naive cotangent complex
In 10.133.1. global complete intersection over $k$, local complete intersection over $k$
In 10.133.5 complete intersection (over
k)

In 10.134.1 syntomic, flat local complete intersection over $R$

In 10.134 .5 relative global complete in-
tersection
In 10.135.1 smooth
In 10.135.6; standard smooth algebra over $R$
In 10.135.11 smooth at $\mathfrak{q}$
In 10.136.1 formally smooth over $R$
In 10.139.1. small extension
In 10.141.1. étale, étale at $\mathfrak{q}$
In 10.141.14 standard étale
In 10.144.1 formally unramified over $R$
In 10.145 .2 universal first order thicken-
ing, conormal module, $C_{S / R}$
In 10.146.1; formally étale over $R$
In 10.147.1 unramified, $G$-unramified,
unramified at $\mathfrak{q}, G$-unramified at $\mathfrak{q}$
In 10.148.1: henselian, strictly henselian In 10.148.18 henselization, strict henselization of $R$ with respect to $\kappa \subset$ $\kappa^{\text {sep }}$, strict henselization
In 10.149.1: $\left(R_{k}\right)$, regular in codimension $\leq k,\left(S_{k}\right)$
In 10.152.1 complete local ring
In 10.152.4, coefficient ring
In 10.152.5 Cohen ring
In 10.153.1. $N-1, N$-2, Japanese
In 10.154.1 universally Japanese, Na-
gata ring
In 10.154 .9 analytically unramified, analytically unramified
In 10.157.2, geometrically normal
In 10.158.2, geometrically regular

## Brauer groups

In 11.2.1 finite
In 11.2.2 skew field
In 11.2.3 simple, simple
In 11.2.4 central
In 11.2.5 opposite algebra
In 11.5.2 Brauer group
In 11.8.1 splits, splitting field

## Homological Algebra

In 12.3.1 preadditive, additive
In 12.3.3 zero object
In 12.3.5 direct sum
In 12.3 .8 additive
In 12.3.9. kernel, cokernel, coimage of $f$, image of $f$

In 12.4.1 Karoubian
In 12.5.1 abelian
In 12.5.3. injective, surjective, subobject, quotient
In 12.5.7 complex, exact at $y$, exact,
short exact sequence
In 12.5.9 split
In 12.6.1 extension $E$ of $B$ by $A$
In 12.6.2 Ext-group
In 12.9.1 Serre subcategory, weak Serre
subcategory
In 12.9.5 kernel of the functor $F$
In 12.10.1 zeroth $K$-group of $\mathcal{A}$
In 12.11.1 cohomological $\delta$-functor, $\delta$ -
functor
In 12.11.2 morphism of $\delta$-functors from
$F$ to $G$
In 12.11 .3 universal $\delta$-functor
In 12.12.2, homotopy equivalence, homotopy equivalent
In 12.12.4 quasi-isomorphism, acyclic
In 12.12.8 homotopy equivalence, homo-
topy equivalent
In 12.12.10 quasi-isomorphism, acyclic
In 12.14.1 $k$-shifted chain complex $A[k]$ •
In 12.14.2 $H_{i+k}\left(A_{\bullet}\right) \rightarrow H_{i}(A[k] \bullet)$
In 12.14.7 $k$-shifted cochain complex
$A\left[k{ }^{\bullet}\right.$
In $12.14 .8 H^{i+k}\left(A^{\bullet}\right) \longrightarrow H^{i}(A[k] \bullet)$
In 12.15.1. category of graded objects of $\mathcal{A}$
In 12.15.4 shift
In 12.16.1. decreasing filtration, filtered object of $\mathcal{A}$, morphism $(A, F) \rightarrow(B, F)$ of filtered objects, induced filtration, quotient filtration, finite, separated, exhaus-
tive
In 12.16.3 strict
In 12.17.1 spectral sequence in $\mathcal{A}$, mor-
phism of spectral sequences
In 12.17.2 limit, degenerates at $E_{r}$
In 12.18.1 exact couple, morphism of exact couples
In 12.18 .3 spectral sequence associated to the exact couple
In 12.19.1. differential object, morphism of differential objects
In 12.19.3 homology

In 12.19.5 spectral sequence associated
to $(A, d, \alpha)$
In 12.20.1 filtered differential object
In 12.20.4 induced filtration
In 12.20 .6 weakly converges to $H(K)$, abuts to $H(K)$
In 12.21.1 filtered complex $K^{\bullet}$ of $\mathcal{A}$
In 12.21 .5 induced filtration
In 12.21.7 regular, coregular, bounded, bounded below, bounded above
In 12.21.9 weakly converges to $H^{*}\left(K^{\bullet}\right)$, abuts to $H^{*}\left(K^{\bullet}\right)$, converges to $H^{*}\left(K^{\bullet}\right)$
In 12.22.1. double complex
In 12.22.3. associated simple complex
$s A^{\bullet}$, associated total complex
In 12.22.5. weakly converges to
$H^{n}\left(s K^{\bullet}\right)$, abuts to $H^{n}\left(s K^{\bullet}\right)$, converges to $H^{n}\left(s K^{\bullet}\right)$, weakly converges to $H^{n}\left(s K^{\bullet}\right)$, abuts to $H^{n}\left(s K^{\bullet}\right)$, converges to $H^{n}\left(s K^{\bullet}\right)$
In 12.23.1 injective
In 12.23.4 enough injectives
In 12.23 .5 functorial injective embeddings
In 12.24.1 projective
In 12.24.4, enough projectives
In 12.24.5 functorial projective surjec-
tions
In 12.27.2. Mittag-Leffler condition, ML

## Derived Categories

In 13.3.1 triangle, morphism of triangles In 13.3.2. triangulated category, distinguished triangles, pre-triangulated category
In 13.3.3 exact functor, triangulated functor
In 13.3 .4 pre-triangulated subcategory, triangulated subcategory
In 13.3.5 homological, cohomological
In 13.3.6 $\delta$-functor from $\mathcal{A}$ to $\mathcal{D}$, image of the short exact sequence under the given $\delta$-functor
In 13.5.1. compatible with the triangulated structure
In 13.6.1 saturated
In 13.6.5 kernel of $F$, kernel of $H$
In 13.6.7 quotient category $\mathcal{D} / \mathcal{B}$, quotient functor

In 13.8.1 category of (cochain) complexes, bounded below, bounded above, bounded
In 13.9.1 cone
In 13.9 .4 termwise split injection $\alpha$ : $A^{\bullet} \rightarrow B^{\bullet}$, termwise split surjection $\beta$ :
$B^{\bullet} \rightarrow C^{\bullet}$
In 13.9.9 termwise split sequence of complexes of $\mathcal{A}$, triangle associated to the termwise split sequence of complexes
In 13.10.1. distinguished triangle of $K(\overline{\mathcal{A}})$
In 13.11.3 derived category of $\mathcal{A}$, bounded derived category
In 13.14.1. category of finite filtered objects of $\mathcal{A}$
In 13.14.2 filtered quasi-isomorphism, filtered acyclic
In 13.14.5 filtered derived category of $\mathcal{A}$ In 13.14.7. bounded filtered derived category
In 13.15.2 right derived functor $R F$ is defined at, value of RF at $X$, left derived functor LF is defined at, value of LF at X
In 13.15.9, right deriveable, everywhere defined, left deriveable, everywhere defined
In 13.15.10, computes, computes
In 13.16.3 right derived functors of $F$, left derived functors of $F$, right acyclic for $F$, acyclic for $R F$, left acyclic for $F$, acyclic for $L F$
In 13.17.2, ith right derived functor $R^{i} F$ of $F$
In 13.18.1 injective resolution of $A$, injective resolution of $K^{\bullet}$
In 13.19.1 projective resolution of $A$, projective resolution of $K^{\bullet}$
In 13.21.1 Cartan-Eilenberg resolution
In 13.23.2 resolution functor
In 13.26.1 filtered injective
In 13.27.1 ith extension group
In 13.27.4 Yoneda extension, equivalent
In 13.29.1 $K$-injective
In 13.31.1. derived colimit, homotopy colimit
In 13.32.1 derived limit, homotopy limit

In 13.33.2 classical generator, strong generator, weak generator, generator
In 13.34.1. compact object
In 13.34.5 compactly generated

## Simplicial Methods

In 14.2.1 $\delta_{j}^{n}:[n-1] \rightarrow[n], \sigma_{j}^{n}:[n+1] \rightarrow$ [ $n$ ]
In 14.3.1; simplicial object $U$ of $\mathcal{C}$, simplicial set, simplicial abelian group, morphism of simplicial objects $U \rightarrow U^{\prime}$, category of simplicial objects of $\mathcal{C}$
In 14.5.1. cosimplicial object $U$ of $\mathcal{C}$, cosimplicial set, cosimplicial abelian group, morphism of cosimplicial objects $U \rightarrow U^{\prime}$, category of cosimplicial objects of $\mathcal{C}$
In 14.6 .1 product of $U$ and $V$
In 14.7.1 fibre product of $V$ and $W$ over U
In 14.8.1 pushout of $V$ and $W$ over $U$
In 14.9.1 product of $U$ and $V$
In 14.10.1 fibre product of $V$ and $W$ over U

In 14.11.1 $n$-simplex of $U$, face of $x$, degeneracy of $x$, degenerate
In 14.12.1. $n$-truncated simplicial object of $\mathcal{C}$, morphism of $n$-truncated simplicial objects
In 14.13.1. product $U \times V$ of $U$ and $V$, product $U \times V$ exists
In 14.14.1: $\operatorname{Hom}(U, V)$
In 14.15.1. $\operatorname{Hom}(U, V)$
In 14.17.1. $\operatorname{Hom}(U, V)$
In 14.18.1 split
In 14.20.1. augmentation $\epsilon: U \rightarrow X$ of $U$ towards an object $X$ of $\mathcal{C}$
In 14.22.3. Eilenberg-Maclane object
$K(A, k)$
In 14.26.1 homotopy connecting $a$ to $b$,
homotopic
In 14.26.6 homotopy equivalence, homotopy equivalent
In 14.28.1 homotopic, homotopy connecting $a$ and $b$
In 14.30.1 trivial Kan fibration
In 14.31.1. Kan fibration, Kan complex

In 15.3.1 stably isomorphic, stably free
In 15.6.3 $k$ th fitting ideal
In 15.8.1 henselian pair
In 15.9 .1 auto-associated
In 15.16.1 torsion, torsion free
In 15.17 .1 reflexive
In 15.17.7 reflexive hull
In 15.18.1 content ideal of $x$
In 15.20.1 strict transform of $M$ along
$R \rightarrow R^{\prime}$
In 15.22.1 Koszul complex
In 15.22.2 Koszul complex on $f_{1}, \ldots, f_{r}$ In 15.23.1. $M$-Koszul-regular, $M-H_{1}$ regular, Koszul-regular, $H_{1}$-Koszulregular
In 15.24.1. regular ideal, Koszul-regular ideal, $H_{1}$-regular ideal, quasi-regular ideal
In 15.25.2. local complete intersection
In 15.28.1 topological ring, topological module, homomorphism of topological modules, homomorphism of topological rings, linearly topologized, linearly topologized, ideal of definition, pre-admissible, admissible, pre-adic, adic
In 15.29.1 formally smooth over $R$
In 15.29 .3 formally smooth for the $\mathfrak{n}$ adic topology
In 15.32.1 regular
In 15.37.1 $p$-independent over $k, p$-basis
of $K$ over $k$
In 15.38.1 J-0, J-1, J-2
In 15.41.1 $G$-ring
In 15.43.1 quasi-excellent, excellent
In 15.46.1 injective
In 15.46.5 $M \mapsto M^{\vee}$, free module
In 15.49.3 $K$-flat
In 15.49.13. derived tensor product
In 15.51.1 Tor independent over $R$
In 15.54.1 m-pseudo-coherent, pseudo-
coherent, m-pseudo-coherent, pseudocoherent
In 15.55.1. tor-amplitude in $[a, b]$, finite tor dimension, tor dimension $\leq d$, finite tor dimension
In 15.57.1 finite projective dimension, projective-amplitude in $[a, b]$

## More on Algebra

In 15.58.1 finite injective dimension, injective-amplitude in $[a, b]$
In 15.61.1 perfect, perfect
In 15.65.2. finitely presented relative to R

In 15.66 .4 m -pseudo-coherent relative to $R$, pseudo-coherent relative to $R, m$ -pseudo-coherent relative to $R$, pseudocoherent relative to $R$
In 15.67.1 pseudo-coherent ring map, perfect ring map
In 15.69.1 I-power torsion module, an $f$-power torsion module
In 15.72 .4 derived complete with respect to I, derived complete with respect to I
In 15.78.1 absolutely flat, weakly étale, absolutely flat
In 15.78 .3 weak dimension $\leq d$
In 15.79.1 unibranch, geometrically unibranch
In 15.81.1 extension of discrete valuation rings, ramification index, weakly unramified, residual degree, residue degree
In 15.81.7. unramified with respect to $A$, totally ramified with respect to $A$, tamely ramified with respect to $A$
In 15.81.10, decomposition group, inertia group
In 15.81.16 mixed characteristic, absolute ramification index
In 15.82.2, weak solution for $A \subset B$, solution for $A \subset B$, separable solution
In 15.83.1 invertible, trivial
In 15.84.1: extension of valuation rings, weakly unramified, residual degree, residue degree
In 15.85.5. Bézout domain, elementary divisor domain

## Smoothing Ring Maps

In 16.3.1 singular ideal of $A$ over $R$
In 16.3.3. elementary standard in $A$ over
$R$, strictly standard in $A$ over $R$

## Sheaves of Modules

In 17.4.1. generated by global sections, generate
In 17.4 .5 subsheaf generated by the $s_{i}$ In 17.5.1 support of $\mathcal{F}$, support of $s$

In 17.8.1 locally generated by sections
In 17.9.1 finite type
In 17.10.1. quasi-coherent sheaf of $\mathcal{O}_{X^{-}}$

## modules

In 17.10.6. sheaf associated to the module
$M$ and the ring map $\alpha$, sheaf associated
to the module $M$
In 17.11.1 finite presentation
In 17.12 .1 coherent $\mathcal{O}_{X}$-module
In 17.13.1. closed immersion of ringed spaces
In 17.14.1 locally free, finite locally free, finite locally free of rank r
In 17.16.1 flat
In 17.16.3 flat at $x$
In 17.17.1 flat at $x$, flat
In 17.17.3. flat over $Y$ at a point $x \in X$,
flat over Y
In 17.20.1 Koszul complex
In 17.20.2 Koszul complex on $f_{1}, \ldots, f_{r}$
In 17.21.1 invertible $\mathcal{O}_{X}$-module, trivial
In 17.21.6 tensor power
In 17.21.7 associated graded ring
In 17.21.9. Picard group
In 17.24.1 $\mathcal{O}_{1}$-derivation, $\varphi$-derivation, Leibniz rule
In 17.24 .3 module of differentials, universal $\varphi$-derivation
In 17.24.10. $S$-derivation, sheaf of differentials $\Omega_{X / S}$ of $X$ over $S$
In 17.25.1 naive cotangent complex In 17.25.4 naive cotangent complex

## Modules on Sites

In 18.4.1 free abelian presheaf
In 18.5.1 free abelian sheaf
In 18.6.1 ringed site, structure sheaf, morphism of ringed sites, composition of morphisms of ringed sites
In 18.7.1 ringed topos, structure sheaf, morphism of ringed topoi, composition of morphisms of ringed topoi
In 18.8.1 2-morphism from $f$ to $g$
In 18.9.1 presheaf of $\mathcal{O}$-modules, morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$ modules
In 18.10.1 sheaf of $\mathcal{O}$-modules, morphism of sheaves of $\mathcal{O}$-modules
In 18.13.1 pushforward, pullback

In 18.16.1 $g_{p!} \mathcal{F}, g_{!} \mathcal{F}=\left(g_{p!} \mathcal{F}\right)^{\#}$
In 18.17.1: free $\mathcal{O}$-module, finite free, generated by global sections, generated by r global sections, generated by finitely many global sections, global presentation, global finite presentation
In 18.19.1 localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object $U$, localization morphism, direct image functor, restriction of $\mathcal{F}$ to $\mathcal{C} / U$, extension by zero
In 18.21 .2 localization of the ringed topos $(S h(\mathcal{C}), \mathcal{O})$ at $\mathcal{F}$, localization morphism
In 18.23.1 locally free, finite locally free, locally generated by sections, locally generated by $r$ sections, of finite type, quasicoherent, of finite presentation, coherent In 18.28.1. flat, flat, flat, flat
In 18.30.1. flat, flat
In 18.30.3. flat over $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$
In 18.31.1. rank $r$, invertible, $\mathcal{O}^{*}$
In 18.31.6 Picard group
In 18.32.1 $\mathcal{O}_{1}$-derivation, $\varphi$-derivation, Leibniz rule
In 18.32.3 module of differentials, universal $\varphi$-derivation
In 18.32.10, $Y$-derivation, sheaf of differentials $\Omega_{X / Y}$ of $X$ over $Y$, universal $Y$-derivation
In 18.33.1; differential operator $D: \mathcal{F} \rightarrow$ $\mathcal{G}$ of order $k$
In 18.33.4 module of principal parts of order $k$
In 18.34.1. naive cotangent complex
In 18.34.4 naive cotangent complex
In 18.39.4 locally ringed site
In 18.39.6 locally ringed
In 18.39.9. morphism of locally ringed topoi, morphism of locally ringed sites
In 18.42.1 constant sheaf, locally constant, finite locally constant

## Injectives

In 19.2.4 $\alpha$-small with respect to $I$
In 19.10.1. generator, Grothendieck abelian category
In 19.11.1 size

## Cohomology of Sheaves

In 20.5.1 torsor, $\mathcal{G}$-torsor, morphism of
$\mathcal{G}$-torsors, trivial $\mathcal{G}$-torsor
In 20.10.1. Čech complex, Čech cohomology groups
In 20.13.1 flasque, flabby
In 20.24.1 alternating Čech complex
In 20.24.2 ordered Čech complex
In 20.25.2 locally finite
In 20.27.2 K-flat
In 20.27.13. derived tensor product
In 20.27.14 Tor
In 20.38.1 strictly perfect
In 20.39.1. m-pseudo-coherent, pseudocoherent, m-pseudo-coherent, pseudocoherent
In 20.40.1. tor-amplitude in $[a, b]$, finite tor dimension, locally has finite tor dimension
In 20.41.1 perfect, perfect

## Cohomology on Sites

In 21.5.1 pseudo torsor, pseudo $\mathcal{G}$ torsor, morphism of pseudo $\mathcal{G}$-torsors, torsor, $\mathcal{G}$-torsor, morphism of $G$-torsors, trivial $\mathcal{G}$-torsor
In 21.9.1. Cech complex, Cech cohomology groups
In 21.13.4 limp
In 21.17.2 $K$-flat
In 21.17.11. derived tensor product
In 21.17.12, Tor
In 21.23.2 qc covering
In 21.32.1 simplicial $\mathcal{A}_{\bullet}$-module, simplicial sheaf of $\mathcal{A}_{\bullet}$-modules
In 21.34.1. strictly perfect
In 21.35.1. m-pseudo-coherent, pseudocoherent, m-pseudo-coherent, pseudocoherent
In 21.36.1. tor-amplitude in $[a, b]$, finite tor dimension, locally has finite tor dimension
In 21.37.1 perfect, perfect

## Differential Graded Algebra

In 22.3.1. differential graded algebra over $R$

In 22.3.2. homomorphism of differential graded algebras

In 22.3.3. opposite differential graded al- In 24.2.1. semi-representable objects,
gebra
In 22.3.4 commutative, strictly commutative
In 22.3.5 tensor product differential graded algebra
In 22.4.1 differential graded module, homomorphism of differential graded modules
In 22.4.3 $k$-shifted module
In 22.5.1. homotopy between $f$ and $g$, ho-
motopic
In 22.5.3 homotopy category
In 22.6.1 cone
In 22.7.1. admissible monomorphism, admissible epimorphism, admissible short exact sequence
In 22.8.2 triangle associated to $0 \rightarrow$ $K \rightarrow L \rightarrow M \rightarrow 0$, distinguished triangle
In 22.15.2 derived category of $(A, d)$
In 22.17.1. $R$-linear category $\mathcal{A}$
In 22.17.2 functor of $R$-linear categories, $R$-linear
In 22.18.1 graded category $\mathcal{A}$ over $R$
In 22.18.2. functor of graded categories
over $R$, graded functor
In 22.18.3 $\mathcal{A}^{0}$
In 22.18.4 graded direct sum
In 22.19.1 differential graded category $\mathcal{A}$ over $R$
In 22.19.2 functor of differential graded categories over $R$
In 22.19.3 category of complexes of $\mathcal{A}$, homotopy category of $\mathcal{A}$
In 22.19.4. differential graded direct sum

## Divided Power Algebra

In 23.2.1 divided power structure
In 23.3.1 divided power ring, homomor-
phism of divided power rings
In 23.4.1 extends
In 23.6.1 divided power structure
In 23.6.4. compatible with the differential graded structure
In 23.8.5 complete intersection, local complete intersection

## Hypercoverings

semi-representable objects over $X$
In 24.2.2, which associates a presheaf to a semi-representable object
In 24.2.4 covering, covering
In 24.2.6 hypercovering of $X$
In 24.3.1 homology of $K$
In 24.5.1. hypercovering of $\mathcal{G}$, hypercovering

## Schemes

In 25.2.1 locally ringed space $\left(X, \mathcal{O}_{X}\right)$, local ring of $X$ at $x$, residue field of $X$ at $x$, morphism of locally ringed spaces In 25.3.1 open immersion
In 25.3.3. open subspace of $X$ associated to $U$
In 25.4.1 closed immersion
In 25.4.4 , closed subspace of $X$ associated to the sheaf of ideals $\mathcal{I}$
In 25.5.2, standard open covering, standard open covering
In 25.5.3 structure sheaf $\mathcal{O}_{\operatorname{Spec}(R)}$ of the spectrum of $R$, spectrum
In 25.5.5, affine scheme, morphism of affine schemes
In 25.9.1 scheme, morphism of schemes
In 25.10.2, open immersion, open subscheme, closed immersion, closed subscheme, immersion, locally closed immersion
In 25.12.1 reduced
In 25.12.5, scheme structure on $Z$, reduced induced scheme structure, reduction $X_{\text {red }}$ of $X$
In 25.15.1. representable by a scheme, representable
In 25.15.3. satisfies the sheaf property for the Zariski topology, subfunctor $H \subset F$, representable by open immersions, covers $F$
In 25.17.1 fibre product
In 25.17.7. inverse image $f^{-1}(Z)$ of the closed subscheme Z
In 25.18.1: scheme over $S$, structure morphism, scheme over $R$, morphism $f$ : $X \rightarrow Y$ of schemes over $S$, base change, base change, base change

In 25.18.3 preserved under arbitrary base change, preserved under base change, preserved under arbitrary base change, preserved under base change In 25.18.4 scheme theoretic fibre $X_{s}$ of $f$ over $s$, fibre of $f$ over $s$
In 25.19.1. quasi-compact
In 25.20.1. universally closed
In 25.20.3. satisfies the existence part of the valuative criterion, satisfies the uniqueness part of the valuative criterion In 25.21.3. separated, quasi-separated, separated, quasi-separated
In 25.23.1 monomorphism

## Constructions of Schemes

In 26.4.5 relative spectrum of $\mathcal{A}$ over $S$, spectrum of $\mathcal{A}$ over $S$
In 26.5.1 affine $n$-space over $S$, affine $n$-space over $R$
In 26.6.1 vector bundle associated to $\mathcal{E}$
In 26.6.2, vector bundle $\pi: V \rightarrow S$ over
$S$, morphism of vector bundles over $S$
In 26.7.1. cone associated to $\mathcal{A}$, affine cone associated to $\mathcal{A}$
In 26.7.2, cone $\pi: C \rightarrow S$ over $S$, morphism of cones
In 26.8.2 standard open covering
In 26.8.3 structure sheaf $\mathcal{O}_{\operatorname{Proj}(S)}$ of the homogeneous spectrum of $S$, homogeneous spectrum
In 26.10.1. twist of the structure sheaf of $\operatorname{Proj}(S)$
In 26.13.2 projective $n$-space over $\mathbf{Z}$, projective $n$-space over $S$, projective $n$ space over $R$
In 26.16.7 relative homogeneous spectrum of $\mathcal{A}$ over $S$, homogeneous spectrum of $\mathcal{A}$ over $S$, relative Proj of $\mathcal{A}$ over $S$
In 26.21.1 projective bundle associated to $\mathcal{E}$, twist of the structure sheaf
In 26.22.2, Grassmannian over $\mathbf{Z}$, Grassmannian over $S$, Grassmannian over $R$

## Properties of Schemes

In 27.3.1 integral
In 27.4.1 local
In 27.4.2 locally $P$

In 27.5.1 locally Noetherian, Noetherian
In 27.6.1 Jacobson
In 27.7.1 normal
In 27.8.1 Cohen-Macaulay
In 27.9.1 regular, nonsingular
In 27.10.1 dimension, dimension of $X$
at $x$
In 27.11.1 catenary
In 27.12.1 regular in codimension $k$, $\left(R_{k}\right),\left(S_{k}\right)$
In 27.13.1 Japanese, universally Japanese, Nagata
In 27.14.1 regular locus, singular locus
In 27.15.1, unibranch at $x$, geometrically unibranch at $x$, unibranch, geometrically unibranch
In 27.18.1 quasi-affine
In 27.21.1 locally projective
In 27.23.1 $\kappa$-generated
In 27.24.3. subsheaf of sections annihilated by $\mathcal{I}$
In 27.24.6. subsheaf of sections supported on $T$
In 27.26.1 ample

## Morphisms of Schemes

In 28.5.5 scheme theoretic support of $\mathcal{F}$
In 28.6.2 scheme theoretic image
In 28.7.1. scheme theoretic closure of $U$
in $X$, scheme theoretically dense in $X$
In 28.8.1 dominant
In 28.9.1. equivalent, rational map from
$X$ to $Y, S$-rational map from $X$ to $Y$
In 28.9.2 rational function on $X$
In 28.9.3 ring of rational functions on X
In 28.9.5 function field, field of rational functions
In 28.9.7, defined in a point $x \in X$, domain of definition
In 28.9.9 dominant
In 28.9.10 birational, $S$-birational
In 28.10.1 surjective
In 28.11.1 universally injective, radicial
In 28.12.1 affine
In 28.13.1 quasi-affine
In 28.14.1 local, stable under base
change, stable under composition
In 28.14.2 locally of type $P$

In 28.15.1 finite type at $x \in X$, locally of finite type, finite type
In 28.16.3. finite type point
In 28.17.1 universally catenary
In 28.19.1 $J$-2
In 28.20.1. quasi-finite at a point $x \in X$,
locally quasi-finite, quasi-finite
In 28.21.1 finite presentation at $x \in X$, locally of finite presentation, finite presentation
In 28.23.1 open, universally open
In 28.24.1. submersive, universally sub-
mersive
In 28.25.1, flat at a point $x \in X$, flat over $S$ at a point $x \in X$, flat, flat over $S$
In 28.26.3 canonical scheme structure
on $T$
In 28.29.1 relative dimension $\leq d$ at $x$, relative dimension $\leq d$, relative dimension d
In 28.31.1 syntomic at $x \in X$, syntomic, local complete intersection over $k$, standard syntomic
In 28.31.15, syntomic of relative dimension $d$
In 28.32.1 conormal sheaf $\mathcal{C}_{Z / X}$ of $Z$ in $X$, conormal sheaf of $i$
In 28.33.1. sheaf of differentials $\Omega_{X / S}$ of $X$ over $S$, universal $S$-derivation
In 28.34.1 smooth at $x \in X$, smooth, standard smooth
In 28.34.13 smooth of relative dimension d

In 28.35.1 unramified at $x \in X, G$ unramified at $x \in X$, unramified, $G$ unramified
In 28.36.1. étale at $x \in X$, étale, standard étale
In 28.37.1 relatively ample, $f$-relatively ample, ample on $X / S, f$-ample
In 28.38.1. relatively very ample, $f$ relatively very ample, very ample on $X / S, f$-very ample
In 28.40.1. quasi-projective, H-quasiprojective, locally quasi-projective
In 28.41.1 proper
In 28.42.1 projective, H-projective, locally projective

In 28.43.1 integral, finite
In 28.44.1 universal homeomorphism
In 28.45.1. finite locally free, rank, degree
In 28.46.1 birational
In 28.47.8 degree of $X$ over $Y$
In 28.47.11. modification of $X$
In 28.47.12, alteration of $X$
In 28.48.2 integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$
In 28.48.3 normalization of $X$ in $Y$
In 28.49.1 normalization
In 28.51.1. bounds the degrees of the fi-
bres of $f$, fibres of $f$ are universally
bounded

## Cohomology of Schemes

In 29.11.1 depth $k$ at a point, depth $k$ at a point, $\left(S_{k}\right),\left(S_{k}\right)$
In 29.11.2. Cohen-Macaulay

## Divisors

In 30.2.1 associated, associated points of X

In 30.4.1 embedded associated point, embedded point, embedded component
In 30.5.1. weakly associated, weakly associated points of $X$
In 30.7.1 relative assassin of $\mathcal{F}$ in $X$ over $S$
In 30.8.1 relative weak assassin of $\mathcal{F}$ in $X$ over $S$
In 30.9.2 torsion, torsion free
In 30.10.1 reflexive hull, reflexive
In 30.11.1 locally principal closed subscheme, effective Cartier divisor
In 30.11.6 sum of the effective Cartier divisors $D_{1}$ and $D_{2}$
In 30.11.11 pullback of $D$ by $f$ is defined, pullback of the effective Cartier divisor In 30.11.14 invertible sheaf $\mathcal{O}_{S}(D)$ associated to $D$, canonical section
In 30.11.17, regular section
In 30.11.19, zero scheme
In 30.15.2. relative effective Cartier divisor
In 30.16.1. conormal algebra $\mathcal{C}_{Z / X, *}$ of $Z$
in $X$, conormal algebra of $f$
In 30.16.5 normal cone $C_{Z} X$, normal bundle

In 30.17.2, regular, Koszul-regular, $H_{1}$ regular, quasi-regular
In 30.18.1. regular immersion, Koszulregular immersion, $H_{1}$-regular immersion, quasi-regular immersion
In 30.19 .2 relative quasi-regular immersion, relative $H_{1}$-regular immersion In 30.20.1 sheaf of meromorphic functions on $X, \mathcal{K}_{X}$, meromorphic function In 30.20.3. pullbacks of meromorphic functions are defined for $f$
In 30.20.5. meromorphic section of $\mathcal{F}$
In 30.20.11: regular
In 30.20.15 ideal sheaf of denominators of $s$
In 30.21 .2 prime divisor, Weil divisor In 30.21.3, order of vanishing of $f$ along Z
In 30.21.5 principal Weil divisor associated to $f$
In 30.21.7. Weil divisor class group
In 30.22.1. order of vanishing of $s$ along Z
In 30.22.4 Weil divisor associated to $s$, Weil divisor class associated to $\mathcal{L}$
In 30.26.1 blowing up of $X$ along $Z$, blowing up of $X$ in the ideal sheaf $\mathcal{I}$, exceptional divisor, center
In 30.27.1 strict transform, strict transform
In 30.28.1. $U$-admissible blowup

## Limits of Schemes

## Varieties

In 32.3.1 variety
In 32.4.1. geometrically reduced at $x$, geometrically reduced
In 32.5.1 geometrically connected
In 32.6.1 geometrically irreducible
In 32.7.1 geometrically pointwise integral at x, geometrically pointwise integral, geometrically integral
In 32.8.1 geometrically normal at $x$, geometrically normal
In 32.10.1: geometrically regular at $x$, geometrically regular over $k$
In 32.14.1 dual numbers

In 32.14.3. tangent space of $X$ over $S$, tangent vector
In 32.17.1. algebraic $k$-scheme, locally algebraic $k$-scheme
In 32.21.1 affine variety, projective variety, quasi-projective variety, proper variety
In 32.26.1 Euler characteristic of $\mathcal{F}$
In 32.28 .6 m-regular
In 32.28.14. Hilbert polynomial
In 32.32.1 curve
In 32.33.1 degree, degree
In 32.34.3 intersection number
In 32.34.10, degree of $Z$ with respect to $\mathcal{L}$

## Topologies on Schemes

In 33.3.1 Zariski covering of $T$
In 33.3.4 standard Zariski covering
In 33.3.5 big Zariski site
In 33.3.7. big Zariski site of $S$, small Zariski site of $S$, big affine Zariski site of $S$
In 33.3.14 restriction to the small
Zariski site
In 33.4.1 étale covering of $T$
In 33.4.5 standard étale covering
In 33.4.6 big étale site
In 33.4.8 big étale site of $S$, small étale site of $S$, big affine étale site of $S$
In 33.4.14, restriction to the small étale site
In 33.5.1 smooth covering of $T$
In 33.5.5 standard smooth covering
In 33.5.6 big smooth site
In 33.5.8 big smooth site of $S$, big affine
smooth site of $S$
In 33.6.1 syntomic covering of $T$
In 33.6.5 standard syntomic covering
In 33.6.6 big syntomic site
In 33.6.8 big syntomic site of $S$, big
affine syntomic site of $S$
In 33.7.1 fppf covering of $T$
In 33.7.5 standard fppf covering
In 33.7.6 big fppf site
In 33.7.8. big fppf site of $S$, big affine fppf
site of $S$
In 33.8.1 fpqc covering of $T$
In 33.8.9 standard fpqc covering

In 33.8.12, satisfies the sheaf property for the given family, satisfies the sheaf property for the fpqc topology

## Descent

In 34.2.1 descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves, cocycle condition, morphism $\psi:\left(\mathcal{F}_{i}, \varphi_{i j}\right) \rightarrow\left(\mathcal{F}_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data
In 34.2.3. trivial descent datum, canonical descent datum, effective
In 34.3.1 descent datum $(N, \varphi)$ for modules with respect to $R \rightarrow A$, cocycle condition, morphism $(N, \varphi) \rightarrow\left(N^{\prime}, \varphi^{\prime}\right)$ of descent data
In 34.3.4 effective
In 34.4.2 split equalizer
In 34.4.5 universally injective
In 34.4.9 $C$
In 34.4.15 base extension along $f$, descent morphism for modules, effective descent morphism for modules
In 34.4.19 $f_{*}$
In 34.7.2. structure sheaf of the big site $(S c h / S)_{\tau}$, sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$, sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$ In 34.8.1 parasitic, parasitic for the $\tau$ topology
In 34.11.1. local in the $\tau$-topology
In 34.16.1 germ of $X$ at $x$, morphism
of germs, composition of morphisms of germs
In 34.16.2, étale, smooth
In 34.17.1. étale local, smooth local
In 34.18.1 $\tau$ local on the base, $\tau$ local on the target, local on the base for the $\tau$-topology
In 34.22.1 $\tau$ local on the source, local on the source for the $\tau$-topology
In 34.28.3 étale local on source-andtarget
In 34.29.1 étale local on the source-andtarget
In 34.30.1 descent datum for $V / X / S$, cocycle condition, descent datum relative to $X \rightarrow S$, morphism $f:(V / X, \varphi) \rightarrow$ $\left(V^{\prime} / X, \varphi^{\prime}\right)$ of descent data relative to $X \rightarrow S$

In 34.30.3. descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow S\right\}$, morphism $\psi:\left(V_{i}, \varphi_{i j}\right) \rightarrow\left(V_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data In 34.30.7 pullback functor In 34.30.9 pullback functor
In 34.30 .10 trivial descent datum, canonical descent datum, effective
In 34.30.11, canonical descent datum, effective
In 34.32.1. morphisms of type $\mathcal{P}$ satisfy descent for $\tau$-coverings

## Derived Categories of Schemes

In 35.7.4 supported on $T$
In 35.13.1 approximation holds for the triple
In 35.13.2 approximation by perfect complexes holds
In 35.18.2 Tor independent over $S$

## More on Morphisms

In 36.2.1. thickening, first order thickening, morphism of thickenings, thickenings over $S$, morphisms of thickenings over $S$
In 36.3.1 first order infinitesimal neighbourhood
In 36.4.1 formally unramified
In 36.5.2, universal first order thicken-
ing, conormal sheaf of $Z$ over $X$
In 36.6.1 formally étale
In 36.9.1 formally smooth
In 36.15.1: normal at $x$, normal morphism
In 36.16.1 regular at $x$, regular morphism
In 36.17.1. Cohen-Macaulay at $x$, CohenMacaulay morphism
In 36.27.1. étale neighbourhood of $(S, s)$, morphism of étale neighbourhoods, elementary étale neighbourhood
In 36.40.1. finitely presented relative to $S$, of finite presentation relative to $S$
In 36.41.2 m-pseudo-coherent relative
to $S$, pseudo-coherent relative to $S, m$ -pseudo-coherent relative to $S$, pseudocoherent relative to $S$
In 36.42 .2 pseudo-coherent
In 36.43.2 perfect

In 36.44.2 Koszul at x, Koszul morphism, local complete intersection morphism
In 36.46.1 weakly étale, absolutely flat
In 36.48.1 ind-quasi-affine, ind-quasiaffine

## More on Flatness

In 37.4.1. one step dévissage of $\mathcal{F} / X / S$ over s
In 37.4.2, one step dévissage of $\mathcal{F} / X / S$
at $x$
In 37.4.6 standard shrinking
In 37.5.1 complete dévissage of $\mathcal{F} / X / S$
over $s$
In 37.5.2 complete dévissage of $\mathcal{F} / X / S$
at $x$
In 37.5.5 standard shrinking
In 37.6.1 elementary étale localization of
the ring map $R \rightarrow S$ at $\mathfrak{q}$
In 37.6.2 complete dévissage of $N / S / R$ over $\mathfrak{r}$
In 37.6.4. complete dévissage of $N / S / R$ at $\mathfrak{q}$
In 37.15.2 impurity of $\mathcal{F}$ above $s$
In 37.16.1 pure along $X_{s}$, universally pure along $X_{s}$, pure along $X_{s}$, universally $S$-pure, universally pure relative to $S, S$-pure, pure relative to $S, S$-pure, pure relative to $S$
In 37.21.1. universal flattening of $\mathcal{F}$ exists, universal flattening of $X$ exists
In 37.21.2, flattening stratification, flattening stratification

## Groupoid Schemes

In 38.3.1 pre-relation, relation, preequivalence relation, equivalence relation on $U$ over $S$
In 38.3.3 restriction, pullback
In 38.4.1 group scheme over $S$, morphism $\psi:(G, m) \rightarrow\left(G^{\prime}, m^{\prime}\right)$ of group schemes over $S$
In 38.4.3. closed subgroup scheme, open subgroup scheme
In 38.4.4 smooth group scheme, flat group scheme, separated group scheme In 38.9.1 abelian variety

In 38.10.1. action of $G$ on the scheme $X / S$, equivariant, $G$-equivariant In 38.10.2; free
In 38.11.1. pseudo $G$-torsor, formally principally homogeneous under $G$, trivial
In 38.11.3. principal homogeneous space, $G$-torsor, $G$-torsor in the $\tau$ topology, $\tau$ $G$-torsor, $\tau$ torsor, quasi-isotrivial, locally trivial
In 38.12.1. G-equivariant quasi-coherent $\mathcal{O}_{X}$-module, equivariant quasi-coherent $\mathcal{O}_{X}$-module
In 38.13.1 groupoid scheme over $S$, groupoid over $S$, morphism $f$ :
$(U, R, s, t, c) \quad \rightarrow \quad\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \quad o f$ groupoid schemes over $S$
In 38.14.1 quasi-coherent module on $(U, R, s, t, c)$
In 38.17.2, stabilizer of the groupoid scheme ( $U, R, s, t, c$ )
In 38.18.2 restriction of $(U, R, s, t, c)$ to $U^{\prime}$
In 38.19.1. set-theoretically $R$-invariant, $R$-invariant, $R$-invariant, $R$-invariant
In 38.20.1 quotient sheaf $U / R$
In 38.20 .2 representable quotient, representable quotient
In 38.21.1 cartesian, $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is cartesian over $(U, R, s, t, c)$, morphism of groupoid schemes cartesian over $(U, R, s, t, c)$

## More on Groupoid Schemes

## Étale Morphisms of Schemes

In 40.3.1. unramified homomorphism of local rings
In 40.3.5 unramified at $x$, unramified
In 40.9.1 flat, faithfully flat, flat (resp. faithfully flat)
In 40.9.3. flat over $Y$ at $x \in X$, flat at $x \in X$, flat, faithfully flat
In 40.11.1. étale homomorphism of local rings
In 40.11.4 étale at $x \in X$, étale

## Chow Homology and Chern Classes

In 41.2.1. admissible, symbol, admissible relation, determinant of the finite length $R$-module $M$
In 41.3.1. 2-periodic complex, cohomology modules, exact, $(2,1)$-periodic complex, cohomology modules
In 41.3.2 multiplicity, Herbrand quotient In 41.4.1 determinant of $(M, \varphi, \psi)$
In 41.5.3 symbol associated to $M, a, b$
In 41.5.5 tame symbol
In 41.8.5 $\delta$-dimension of $Z$
In 41.9.1 cycle on $X, k$-cycle
In 41.10.2. multiplicity of $Z^{\prime}$ in $Z, k$ cycle associated to $Z$
In 41.11.2, multiplicity of $Z^{\prime}$ in $\mathcal{F}, k$ cycle associated to $\mathcal{F}$
In 41.13.1 pushforward
In 41.15.1. flat pullback of $\alpha$ by $f$
In 41.18.1: principal divisor associated to
$f$
In 41.20.1. rationally equivalent to zero, rationally equivalent, Chow group of $k$ cycles on $X$, Chow group of $k$-cycles modulo rational equivalence on $X$
In 41.23.1. Weil divisor associated to $s$, Weil divisor associated to $\mathcal{L}$
In 41.24.1 intersection with the first chern class of $\mathcal{L}$
In 41.28.1. Gysin homomorphism In 41.32.1 bivariant class $c$ of degree $p$ for $f$
In 41.32.2 Chow cohomology
In 41.34.1 chern classes of $\mathcal{E}$ on $X$, total chern class of $\mathcal{E}$ on $X$
In 41.35.1 intersection with the $j$ th chern class of $\mathcal{E}$
In 41.41.1. degree of a zero cycle
In 41.43.15, $\epsilon$-invariant
In 41.43.17, sum of the effective Cartier divisors

## Intersection Theory

In 42.13.5 intersect properly, intersect properly
In 42.15.1. multiplicity of $M$ for the ideal of definition $I$

## Picard Schemes of Curves

In 43.4.1 Picard functor

In 43.6.3 genus

## Adequate Modules

In 44.3.1 module-valued functor, morphism of module-valued functors
In 44.3.2 adequate, linearly adequate
In 44.5.1 adequate
In 44.5.7: $\operatorname{Adeq}(\mathcal{O}), \operatorname{Adeq}\left((S c h / S)_{\tau}, \mathcal{O}\right)$, Adeq(S)
In 44.8.1 pure projective, pure injective
In 44.8.5 pure projective resolution, pure
injective resolution
In 44.8.8 pure extension module

## Dualizing Complexes

In 45.2.1: essential, essential extension of, essential
In 45.4.1 projective cover, projective envelope
In 45.5.1 injective hull
In 45.5.5 indecomposable
In 45.13.1 formally catenary
In 45.17.1 dualizing complex
In 45.21.2 dualizing complex
In 45.35.4 dualizing complex normalized relative to $\omega_{S}^{\bullet}$
In 45.38.1. Gorenstein, Gorenstein, Gorenstein

## Algebraic Curves

## Resolution of Surfaces

In 47.5.1 normalized blowup of $X$ at $x$
In 47.8.6 defines a rational singularity, reduction to rational singularities is possible for $A$
In 47.14.1 resolution of singularities
In 47.14.2, resolution of singularities by normalized blowups
In 47.15.5. strict normal crossings divisor

## Fundamental Groups of Schemes

In 48.2.1: G-set, discrete $G$-set, morphism of G-sets, G-Sets
In 48.3.6 Galois category
In 48.5.1 fundamental group, base point In 48.15.1 normal crossings divisor
Étale Cohomology

In 49.4.1 étale covering
In 49.9.1 presheaf of sets, abelian
presheaf
In 49.10.1 family of morphisms with fixed target
In 49.10.2 site, coverings
In 49.11.1. separated presheaf, sheaf
In 49.11.4 category of sheaves of sets, abelian sheaves
In 49.13.1. zeroth Čech cohomology group
In 49.15.1 fpqc covering
In 49.15.5 satisfies the sheaf property for
the fpqc topology
In 49.16.1. descent datum, effective
In 49.16.5 descent datum
In 49.16.6 effective
In 49.17.2 ringed site, quasi-coherent
In 49.18.1. Čech complex, Čech cohomology groups
In 49.18.4 free abelian presheaf on $\mathcal{G}$
In 49.20.1. $\tau$-covering
In 49.20.2, standard $\tau$-covering
In 49.20.4 big $\tau$-site of $S$, small $\tau$-site of $S$

In 49.21.1. étale topos, small étale topos, Zariski topos, small Zariski topos, big $\tau$ topos
In 49.23.1. constant sheaf
In 49.23.3 structure sheaf
In 49.26.1. étale
In 49.26.3. standard étale
In 49.27.1 étale covering
In 49.27.3. big étale site over $S$, small étale site over $S$, big, small Zariski sites
In 49.29.1 geometric point, lies over, étale neighborhood, morphism of étale neighborhoods
In 49.29.6, stalk
In 49.31.3 support of $\mathcal{F}$, support of $\sigma$
In 49.32.2, henselian
In 49.32.6 strictly henselian
In 49.33.2 étale local ring of $S$ at $\bar{s}$, strict henselization of $\mathcal{O}_{S, s}$, henselization of $\mathcal{O}_{S, s}$, strict henselization of $S$ at $\bar{s}$, henselization of $S$ at $s$
In 49.35.1. direct image, pushforward
In 49.35.3. direct image, pushforward
In 49.35.4 higher direct images

In 49.36.1 inverse image, pullback
In 49.56.1 absolute Galois group, alge-

## braic

In 49.57.1 $G$-module, discrete $G$-module, morphism of $G$-modules, Mod $_{G}$
In 49.57.2, continuous group cohomology groups, group cohomology groups, Galois cohomology groups, Galois cohomology
groups of $K$ with coefficients in $M$
In 49.60.3 similar, equivalent
In 49.60.4 Brauer group
In 49.62.2 $C_{r}$, nontrivial solution
In 49.62.6 variety, curve
In 49.66.1. extension by zero, extension by zero
In 49.67.1 constant sheaf with value $E$, constant sheaf, locally constant, finite locally constant, constant sheaf with value A, constant sheaf, locally constant, finite locally constant, constant sheaf with value $M$, constant sheaf, locally constant
In 49.68.1 constructible, constructible,
constructible
In 49.74.1 trace
In 49.79.3 absolute frobenius
In 49.79.5 geometric frobenius
In 49.79.9 arithmetic frobenius
In 49.79.11; geometric frobenius
In 49.80.1 trace
In 49.82.4 total right derived functor of
$F$, total right derived functor of $G$
In 49.83.1 filtered injective, projective,
filtered quasi-isomorphism
In 49.84.1 filtered derived functor
In 49.86.1 perfect
In 49.88.1 finite Tor-dimension
In 49.89.1 $D_{c}(X, \Lambda)$
In 49.89.7. $D_{c t f}(X, \Lambda)$
In 49.91.1 global Lefschetz number
In 49.91.2 local Lefschetz number
In 49.92.2 $G$-trace of $f$ on $P$
In 49.95.1 $\mathbf{Z}_{\ell}$-sheaf, lisse, morphism
In 49.95.6 torsion, stalk
In 49.95.8 $\ell$-adic cohomology
In 49.96.1 L-function of $\mathcal{F}$
In 49.96.3 L-function of $\mathcal{F}$
In 49.104.1. open

In 49.108.1 unramified cusp form on $G L_{2}(\mathbf{A})$ with values in $\Lambda$

## Crystalline Cohomology

In 50.2.2 divided power envelope of $J$ in $B$ relative to $(A, I, \gamma)$
In 50.4.1 $\delta$ is compatible with $\gamma$
In 50.5.2. divided power thickening, homomorphism of divided power thickenings
In 50.6.1 divided power $A$-derivation
In 50.7.1 divided power structure $\gamma$
In 50.7.2 divided power scheme, mor-
phism of divided power schemes
In 50.7.3 divided power thickening
In 50.8.1 divided power thickening of $X$ relative to $(S, \mathcal{I}, \gamma)$, morphism of divided power thickenings of $X$ relative to $(S, \mathcal{I}, \gamma)$
In 50.8.4 Zariski, étale, smooth, syntomic, or fppf covering, big crystalline site
In 50.9.1 crystalline site
In 50.11.1: locally quasi-coherent, quasicoherent, crystal in $\mathcal{O}_{X / S}$-modules
In 50.11.3. crystal in quasi-coherent modules, crystal in finite locally free modules
In 50.12.1 $S$-derivation $D: \mathcal{O}_{X / S} \rightarrow \mathcal{F}$
In 50.26.2 $F$-crystal on $X / S$ (relative to
$\sigma$ ), nondegenerate

## Pro-étale Cohomology

In 51.2.3 w-local, w-local
In 51.3.1 local isomorphism, identifies local rings
In 51.4.1 ind-Zariski
In 51.7.1 ind-étale
In 51.10.1 w-contractible
In 51.11.1 pro-étale covering of $T$
In 51.11.6 standard pro-étale covering
In 51.11.8 big pro-étale site
In 51.11.12, big pro-étale site of $S$, small pro-étale site of $S$, big affine pro-étale
site of $S$
In 51.11.18 restriction to the small pro-
étale site
In 51.14.4 derived complete with respect
to $\mathcal{I}$

In 51.24.1. extension by zero, extension
by zero
In 51.25.1 constructible
In 51.26.1 constructible $\Lambda$-sheaf, lisse, adic lisse, adic constructible
In 51.27.1 constructible
In 51.27.4 adic lisse, adic constructible

## Algebraic Spaces

In 52.5.1 property $\mathcal{P}$
In 52.6.1 algebraic space over $S$
In 52.6.3 morphism $f: F \rightarrow F^{\prime}$ of alge-
braic spaces over $S$
In 52.9.2 étale equivalence relation
In 52.9.3 presentation
In 52.12.1. open immersion, open subspace, closed immersion, closed subspace, immersion, locally closed subspace
In 52.12.5 Zariski covering
In 52.12.6 small Zariski site $F_{Z a r}$
In 52.13.2, separated over $S$, locally separated over $S$, quasi-separated over $S$, Zariski locally quasi-separated over $S$
In 52.14.4 acts freely, quotient of $U$ by G

In 52.16.2 base change of $F^{\prime}$ to $S$, viewed as an algebraic space over $S^{\prime}$

## Properties of Algebraic Spaces

In 53.3.1: separated, locally separated, quasi-separated, Zariski locally quasiseparated, separated, locally separated, quasi-separated, Zariski locally quasiseparated
In 53.4.1 point
In 53.4.7 topological space
In 53.5.1 quasi-compact
In 53.7.2 has property $\mathcal{P}$
In 53.7.5 has property $\mathcal{P}$ at $x$
In 53.8.1 dimension of $X$ at $x$
In 53.8.2 dimension
In 53.9.2. dimension of the local ring of
$X$ at $x, x$ is a point of codimension $d$ on $X$

In 53.11.6 algebraic space structure on $Z$, reduced induced algebraic space structure, reduction $X_{\text {red }}$ of $X$
In 53.15.2. étale
In 53.17.1 small étale site $X_{\text {étale }}$

In 53.17.2. $X_{\text {spaces, étale }}$
In 53.17.6 étale topos, small étale topos
In 53.17.8 $f$-map $\varphi: \mathcal{G} \rightarrow \mathcal{F}$
In 53.18.1 geometric point, geometric
point lying over $x$
In53.18.2, étale neighborhood, morphism of étale neighborhoods
In 53.18.6 stalk
In 53.19.3. support of $\mathcal{F}$, support of $\sigma$
In 53.20.2, structure sheaf
In 53.21.2, étale local ring of $X$ at $\bar{x}$, strict henselization of $X$ at $\bar{x}$
In53.22.2 geometrically unibranch at $x$, geometrically unibranch
In 53.23.1 Noetherian
In 53.24.2. $X$ is regular at $x$
In 53.28.1. quasi-coherent
In 53.30.2 locally projective

## Morphisms of Algebraic Spaces

In 54.4.2 separated, locally separated, quasi-separated
In 54.5.2 surjective
In 54.6.2 open, universally open
In 54.7.1 submersive, universally sub-
mersive
In 54.8.2 quasi-compact
In 54.9.2 closed, universally closed
In 54.10.1 monomorphism
In 54.13.2. inverse image $f^{-1}(Z)$ of the
closed subspace $Z$
In 54.15.4 scheme theoretic support of $\mathcal{F}$
In 54.16.2, scheme theoretic image
In 54.17.3. scheme theoretic closure of $U$
in $X$, scheme theoretically dense in $X$
In 54.18.1 dominant
In 54.19.3. universally injective
In 54.20.2, affine
In 54.20.8. relative spectrum of $\mathcal{A}$ over
$X$, spectrum of $\mathcal{A}$ over $X$
In 54.21.2 quasi-affine
In 54.22.2 has property $\mathcal{P}$
In 54.22.6. has property $\mathcal{Q}$ at $x$
In 54.23.1. locally of finite type, finite
type at $x$, of finite type
In 54.25.2 finite type point
In 54.27.1. locally quasi-finite, quasi-
finite at $x$, quasi-finite

In 54.28.1: locally of finite presentation, finite presentation at $x$, of finite presentation
In 54.29.1 flat, flat at $x$
In 54.30.2 flat at $x$ over $Y$, flat over $Y$ In 54.32.1 dimension of the local ring of the fibre of $f$ at $x$, transcendence degree of $x / f(x), f$ has relative dimension $d$ at $x$
In 54.32.2 relative dimension $\leq d$, rela-
tive dimension d
In 54.35.1 syntomic, syntomic at $x$
In 54.36.1 smooth, smooth at $x$
In 54.37.1. unramified, unramified at $x$, $G$-unramified, $G$-unramified at $x$
In 54.38.1 étale at $x$
In 54.39.1 proper
In 54.40.1 satisfies the uniqueness part of the valuative criterion, satisfies the existence part of the valuative criterion, satisfies the valuative criterion
In 54.43.2 integral, finite
In 54.44.2, finite locally free, rank, degree
In 54.45.2 integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$
In 54.45.3 normalization of $X$ in $Y$
In 54.46.3 normalization
In 54.50.2 universal homeomorphism

## Decent Algebraic Spaces

In 55.3.1. fibres of $f$ are universally
bounded
In 55.6.1 decent, reasonable, very reasonable
In 55.10.3 elementary étale neighbourhood, morphism of elementary étale neighbourhoods
In 55.10.5. henselian local ring of $X$ at $x$ In 55.11.6. residual space of $X$ at $x$ In 55.15.1. has property $(\beta)$, has property $(\beta)$, decent, reasonable, very reasonable
In 55.20.1 birational

## Cohomology of Algebraic Spaces

In 56.5.2 alternating Čech complex
In 56.11.1 coherent

## Limits of Algebraic Spaces

In 57.3.1 locally of finite presentation, limit preserving, locally of finite presentation over $S$, locally of finite presentation, relatively limit preserving
In 57.14.3. subsheaf of sections annihi-
lated by $\mathcal{I}$
In 57.14.6. subsheaf of sections supported on $T$

## Divisors on Algebraic Spaces

In 58.2.1: locally principal closed subspace, effective Cartier divisor
In58.2.6. sum of the effective Cartier divisors $D_{1}$ and $D_{2}$
In 58.2.10 pullback of $D$ by $f$ is defined, pullback of the effective Cartier divisor
In 58.2.13 invertible sheaf $\mathcal{O}_{X}(D)$ asso-
ciated to $D$
In 58.2.16 regular section
In 58.2.18 zero scheme
In58.3.3. relative homogeneous spectrum of $\mathcal{A}$ over $X$, homogeneous spectrum of $\mathcal{A}$ over $X$, relative Proj of $\mathcal{A}$ over $X$
In58.6.1 blowing up of $X$ along $Z$, blowing up of $X$ in the ideal sheaf $\mathcal{I}$, exceptional divisor, center
In 58.7.1. strict transform, strict transform
In 58.8.1 $U$-admissible blowup

## Algebraic Spaces over Fields

In 59.4.1 integral
In 59.4.4 degree of $X$ over $Y$
In 59.5.1 modification of $X$
In 59.5.3 alteration of $X$
In 59.8.1 geometrically connected
Topologies on Algebraic Spaces
In 60.3.1 fpqc covering of $X$
In 60.4.1 fppf covering of $X$
In 60.5.1 syntomic covering of $X$
In 60.6.1 smooth covering of $X$
In 60.7.1 étale covering of $X$
In 60.8.1 Zariski covering of $X$
Descent and Algebraic Spaces
In 61.3.1. descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves, cocycle condition, morphism $\psi:\left(\mathcal{F}_{i}, \varphi_{i j}\right) \rightarrow\left(\mathcal{F}_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data

In 61.3.3. trivial descent datum, canonical descent datum, effective
In 61.9.1: $\tau$ local on the base, $\tau$ local on the target, local on the base for the $\tau$ topology
In 61.12.1 $\tau$ local on the source, local on the source for the $\tau$-topology
In 61.18.1 smooth local on source-andtarget
In 61.19.1 descent datum for $V / Y / X$, cocycle condition, descent datum relative to $Y \rightarrow X$, morphism $f:(V / Y, \varphi) \rightarrow$ $\left(V^{\prime} / Y, \varphi^{\prime}\right)$ of descent data relative to $Y \rightarrow X$
In 61.19.3. descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow X\right\}$, morphism $\psi:\left(V_{i}, \varphi_{i j}\right) \rightarrow\left(V_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data In 61.19.7 pullback functor In 61.19.9 pullback functor
In 61.19.10 trivial descent datum, canonical descent datum, effective
In 61.19.11; canonical descent datum, effective

## Derived Categories of Spaces

In 62.3.2 supported on $T$
In 62.5.1 derived category of $\mathcal{O}_{X}$ modules with quasi-coherent cohomology sheaves
In 62.8.1 elementary distinguished square
In 62.13.1 approximation holds for the triple
In 62.13.2 approximation by perfect complexes holds
In 62.17.2. Tor independent over $B$
More on Morphisms of Spaces
In 63.3.1 radicial
In 63.5.1 conormal sheaf $\mathcal{C}_{Z / X}$ of $Z$ in $X$, conormal sheaf of $i$
In 63.6.1 conormal algebra $\mathcal{C}_{Z / X, *}$ of $Z$ in $X$, conormal algebra of $i$
In 63.6.5 normal cone $C_{Z} X$, normal bundle
In 63.7.2 sheaf of differentials $\Omega_{X / Y}$ of $X$ over $Y$, universal $Y$-derivation

In 63.9.1. thickening, first order thickening, morphism of thickenings, thickenings over B, morphisms of thickenings over $B$
In 63.10.1. first order infinitesimal neighbourhood
In 63.11.1 formally smooth, formally étale, formally unramified
In 63.12.1. formally unramified
In 63.13.5 universal first order thickening, conormal sheaf of $Z$ over $X$
In 63.14.1 formally étale
In 63.17.1 formally smooth
In 63.20 .2 , the restriction of $\mathcal{F}$ to its $\mathrm{fi}^{-}$ bre over $z$ is flat at $x$ over the fibre of $Y$ over $z$, the fibre of $X$ over $z$ is flat at $x$ over the fibre of $Y$ over $z$, the fibre of $X$ over $z$ is flat over the fibre of $Y$ over $z$ In 63.34.2, Koszul-regular immersion, $H_{1}$-regular immersion, quasi-regular immersion
In 63.35.1. pseudo-coherent, pseudocoherent at $x$
In 63.36.1 perfect, perfect at $x$
In 63.37.1 Koszul morphism, local complete intersection morphism, Koszul at $x$

## Pushouts of Algebraic Spaces

## Groupoids in Algebraic Spaces

In 65.4.1 pre-relation, relation, preequivalence relation, equivalence relation on $U$ over $B$
In 65.4.3 restriction, pullback
In 65.5.1. group algebraic space over $B$, morphism $\psi:(G, m) \rightarrow\left(G^{\prime}, m^{\prime}\right)$ of group algebraic spaces over $B$
In 65.8.1 action of $G$ on the algebraic space $X / B$, equivariant, $G$-equivariant
In 65.8.2 free
In 65.9.1 pseudo $G$-torsor, formally principally homogeneous under $G$, trivial
In 65.9.3. principal homogeneous space, principal homogeneous $G$-space over $B$, $G$-torsor in the $\tau$ topology, $\tau G$-torsor, $\tau$ torsor, quasi-isotrivial, locally trivial

In 65.10.1. G-equivariant quasi-coherent $\mathcal{O}_{X}$-module, equivariant quasi-coherent $\mathcal{O}_{X}$-module
In 65.11.1 groupoid in algebraic spaces over $B$, morphism $f:(U, R, s, t, c) \rightarrow$ $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoids in algebraic spaces over $B$
In 65.12.1 quasi-coherent module on ( $U, R, s, t, c$ )
In 65.15.2. stabilizer of the groupoid in algebraic spaces $(U, R, s, t, c)$
In 65.16.2 restriction of $(U, R, s, t, c)$ to $U^{\prime}$
In 65.17.1. $R$-invariant, $R$-invariant, $R$ invariant
In 65.18.1 quotient sheaf $U / R$
In 65.18.3 quotient representable by an algebraic space, representable quotient, representable quotient, quotient representable by an algebraic space
In 65.19.1. quotient stack, quotient stack

## More on Groupoids in Spaces

In 66.13.1. split over $u$, splitting of $R$ over $u$, quasi-split over $u$, quasi-splitting of $R$ over $u$

## Bootstrap

In 67.3.1 representable by algebraic spaces
In 67.4.1 property $\mathcal{P}$

## Quotients of Groupoids

In 68.3.1 $R$-invariant, $G$-invariant
In 68.3.4 pullback, flat pullback
In 68.4.1. categorical quotient, categorical quotient in $\mathcal{C}$, categorical quotient in the category of schemes, categorical quotient in schemes
In 68.4.4 universal categorical quotient, uniform categorical quotient
In 68.5.1 orbit, $R$-orbit
In 68.5.4 weakly $R$-equivalent, $R$ equivalent, weak orbit, weak $R$-orbit, orbit, $R$-orbit
In 68.5.8 set-theoretically $R$-invariant, separates orbits, separates $R$-orbits

In 68.5.13. set-theoretic pre-equivalence relation, set-theoretic equivalence relation
In 68.5.18, orbit space for $R$
In 68.6.1 coarse quotient, coarse quotient in schemes
In 68.7.1 uniformly, universally
In 68.8.1. sheaf of $R$-invariant functions on $X$, the functions on $X$ are the $R$ invariant functions on $U$
In 68.9.1 good quotient
In 68.10.1 geometric quotient

## Simplicial Spaces

In 69.8.1 cartesian, $Y$ is cartesian over X
In 69.8.3 simplicial scheme associated to $f$
In 69.9.1. quasi-coherent sheaf, cartesian

## Formal Algebraic Spaces

In 70.4.6. tensor product, completed tensor product
In 70.4.7 topologically nilpotent, weak ideal of definition, weakly pre-admissible, weakly admissible
In 70.4.9 taut
In 70.5.1. affine formal algebraic space, morphism of affine formal algebraic spaces
In 70.5.7. McQuillan, classical, adic, adic*, Noetherian
In 70.5.9 formal spectrum
In 70.6.2 countably indexed
In 70.7.1 formal algebraic space, morphism of formal algebraic spaces
In 70.9.3 completion of $X$ along $T$
In 70.11.3 quasi-separated, separated
In 70.12.2 quasi-compact
In 70.12.4 quasi-compact
In 70.15.5. locally countably indexed, lo-
cally adic*, locally Noetherian
In 70.17.1 adic morphism
In 70.18.1. locally of finite type, finite type
In 70.19.1 monomorphism
In 70.20.1 closed immersion
In 70.21.1. separated, quasi-separated
In 70.22.1 proper

## Restricted Power Series

In 71.3.1. topologically of finite type over
In 71.7.2 rig-étale
In 71.11.1. rig-surjective

## Resolution of Surfaces Revisited

In 72.4.1 blowing up $X^{\prime} \rightarrow X$ of $X$ at $x$ In 72.5.1 normalized blowup of $X$ at $x$ In 72.8.1 resolution of singularities
In 72.8.2. resolution of singularities by normalized blowups

## Formal Deformation Theory

In 73.3.1 $\mathcal{C}_{\Lambda}$, classical case
In 73.3.2 small extension
In 73.3.6 relative cotangent space
In 73.3.9 essential surjection
In 73.4.1 $\widehat{\mathcal{C}}_{\Lambda}$
In 73.5.1 category cofibered in groupoids
over $\mathcal{C}$
In 73.6.1 prorepresentable
In 73.6.2 predeformation category, mor-
phism of predeformation categories
In 73.7.1. category $\widehat{\mathcal{F}}$ of formal objects
of $\mathcal{F}$, formal object $\xi=\left(R, \xi_{n}, f_{n}\right)$ of $\mathcal{F}$,
morphism $a: \xi \rightarrow \eta$ of formal objects
In 73.7.3 completion of $\mathcal{F}$
In 73.8.1 smooth
In 73.8.13 versal
In 73.9.1 conditions (S1) and (S2)
In 73.10.1 $R$-linear
In 73.10.9 tangent space $T F$ of $F$
In 73.11.1 tangent space $T \mathcal{F}$ of $\mathcal{F}$
In 73.11.3 differential $d \varphi: T \mathcal{F} \rightarrow T \mathcal{G}$ of
$\varphi$
In 73.13.4 minimal, miniversal
In 73.15.1. condition ( $R S$ )
In 73.15.8 deformation category
In 73.16.1. lift of $x$ along $f$, morphism of
lifts
In 73.18.1. group of infinitesimal auto-
morphisms of $x^{\prime}$ over $x$
In 73.18.2. group of infinitesimal auto-
morphisms of $x_{0}$
In 73.18.5 automorphism functor of $x$
In 73.19.1 category of groupoids in functors on $\mathcal{C}$, groupoid in functors on $\mathcal{C}$, morphism $(U, R, s, t, c) \rightarrow$
$\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoids in functors on $\mathcal{C}$
In 73.19.4 representable
In 73.19.7. restriction $\left.(U, R, s, t, c)\right|_{\mathcal{C}^{\prime}}$ of (U, R, s,t,c) to $\mathcal{C}^{\prime}$
In 73.19.9 quotient category cofibered in groupoids $[U / R] \rightarrow \mathcal{C}$, quotient morphism $U \rightarrow[U / R]$
In 73.20.1. prorepresentable
In 73.20.2 completion $(U, R, s, t, c)^{\wedge}$ of (U, R, s,t,c)
In 73.21.1 smooth
In 73.23.1. presentation of $\mathcal{F}$ by
( $U, R, s, t, c$ )
In 73.25.1 normalized, minimal

## Deformation Theory

In 74.3.2 strict morphism of thickenings
In 74.8.2, strict morphism of thickenings
The Cotangent Complex
In 75.3.1. standard resolution of $B$ over A
In 75.3.2 cotangent complex
In 75.12.1. A-biderivation
In 75.16.1. Atiyah class
In 75.17.1 standard resolution of $\mathcal{B}$ over
$\mathcal{A}$
In 75.17.2 cotangent complex
In 75.18.1. Atiyah class
In 75.19.1. cotangent complex
In 75.21.1 cotangent complex
In 75.23.1 cotangent complex $L_{X / Y}$ of $X$ over $Y$
In 75.25.1 cotangent complex $L_{X / Y}$ of $X$ over $Y$

## Algebraic Stacks

In 76.8.1 representable by an algebraic space over $S$
In 76.9.1 representable by algebraic
spaces
In 76.10.1 property $\mathcal{P}$
In 76.12.1. algebraic stack over $S$
In 76.12.2. Deligne-Mumford stack
In 76.12.3. 2-category of algebraic stacks
over $S$
In 76.16.4 smooth groupoid
In 76.16.5 presentation

In 76.19.2. viewed as an algebraic stack over $S^{\prime}$
In 76.19.3 change of base of $\mathcal{X}^{\prime}$
Examples of Stacks
In 77.18.2. degree d finite Hilbert stack of $\mathcal{X}$ over $\mathcal{Y}$

## Sheaves on Algebraic Stacks

In 78.3.1 presheaf on $\mathcal{X}$, morphism of presheaves on $\mathcal{X}$
In 78.4.1 associated Zariski site, associated étale site, associated smooth site, associated syntomic site, associated fppf site
In 78.4.3. Zariski sheaf, sheaf for the Zariski topology, étale sheaf, sheaf for the étale topology, smooth sheaf, sheaf for the smooth topology, syntomic sheaf, sheaf for the syntomic topology, fppf sheaf, sheaf, sheaf for the fppf topology
In 78.4.5. associated morphism of fppf topoi
In 78.6.1 structure sheaf of $\mathcal{X}$
In 78.7.1 presheaf of modules on $\mathcal{X}, \mathcal{O}_{\mathcal{X}}$ module, sheaf of $\mathcal{O}_{\mathcal{X}}$-modules
In 78.9.2 pullback $x^{-1} \mathcal{F}$ of $\mathcal{F}$, restriction of $\mathcal{F}$ to $U_{\text {étale }}$
In 78.11.1 quasi-coherent module on $\mathcal{X}$, quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module
In 78.11.4 locally quasi-coherent
Criteria for Representability
In 79.8.1 algebraic
Artin's axioms
In 80.5.1 condition ( $R S$ )
In 80.9.1 formal object, morphism of formal objects, lies over
In 80.9.3 effective
In 80.11.1 versal
In 80.13.1 limit preserving
In 80.14.1. openness of versality, openness of versality
In 80.18.2 condition ( $R S^{*}$ )
In 80.19.1: obstruction theory, obstruction modules, obstruction
In 80.20.5 naive obstruction theory
Quot and Hilbert Spaces

Properties of Algebraic Stacks
In 82.4.2 point
In 82.4.8 topological space
In 82.5.1 surjective
In 82.6.1 quasi-compact
In 82.7.2 has property $\mathcal{P}$
In 82.7.5 has property $\mathcal{P}$ at $x$
In 82.8.1 monomorphism
In 82.9.1 open immersion, closed immersion, immersion
In 82.9.8. open substack, closed substack, locally closed substack
In 82.10.4. algebraic stack structure on $Z$, reduced induced algebraic stack structure, reduction $\mathcal{X}_{\text {red }}$ of $\mathcal{X}$
In 82.11.8 residual gerbe of $\mathcal{X}$ at $x$ exists, residual gerbe of $\mathcal{X}$ at $x$
In 82.12.2 dimension of $\mathcal{X}$ at $x$
In 82.12.3 dimension
Morphisms of Algebraic Stacks
In 83.4.1 $D M$, quasi-DM, separated, quasi-separated
In 83.4.2 $D M$ over $S$, quasi-DM over
$S$, separated over $S$, quasi-separated over $S, D M$, quasi-DM, separated, quasiseparated
In 83.5.3 sheaf of automorphisms of $x$
In 83.7.2 quasi-compact
In 83.8.1 Noetherian
In 83.9.2 open, universally open
In 83.10.1: submersive, universally sub-
mersive
In 83.11.2 closed, universally closed
In 83.12.2 has property $\mathcal{P}$
In 83.13.1. locally of finite type, of finite type
In 83.14.2 finite type point
In 83.16.2 locally quasi-finite
In 83.17.1. flat
In 83.18.1. locally of finite presentation,
of finite presentation
In 83.19.1 gerbe over, gerbe
In 83.22.1 smooth
Cohomology of Algebraic Stacks
In 84.7.1 flat base change property
In 84.8.1 parasitic
In 84.11.1 lisse-étale site, flat-fppf site

## Derived Categories of Stacks

In 85.4.1 derived category of $\mathcal{O}_{\mathcal{X}}$ modules with quasi-coherent cohomology sheaves

## Introducing Algebraic Stacks

In 86.4.3 smooth
In 86.5.1 algebraic stack

## More on Morphisms of Stacks

In 87.3.1 thickening, morphism of thickenings, thickenings over $\mathcal{Y}$, morphisms of thickenings over $\mathcal{Y}$
In 87.3.2 first order thickening

## Examples

## Exercises

In 89.2.1. directed partially ordered set, system of rings
In 89.2.3 colimit
In 89.2.8 finite presentation
In 89.5.4 quasi-compact
In 89.5.6 Hausdorff
In 89.5.9 irreducible, irreducible
In 89.5.12 generic point
In 89.5.16 Noetherian, Artinian
In 89.5.18 irreducible component
In 89.5.22 closed, specialization, generalization
In 89.5.26 connected, connected component
In 89.8.1 length
In 89.12.1 catenary
In 89.15.1: finite locally free, invertible module
In 89.15.3 class group of $A$, Picard group of $A$
In 89.17.1 going-up theorem, going-down theorem
In 89.19.1 numerical polynomial
In 89.19.2 graded module, locally finite, Euler-Poincaré function, Hilbert function, Hilbert polynomial
In 89.19.3. graded A-algebra, graded module $M$ over a graded A-algebra $B$, homomorphisms of graded modules/rings, graded submodules, graded ideals, exact sequences of graded modules

[^0]:    ${ }^{1}$ Both the set of objects and the morphism sets are countable. In fact you can prove the lemma with $\aleph_{0}$ replaced by any cardinal whatsoever in (3) and (4).

[^1]:    ${ }^{1}$ Namely, let $\mathcal{I}^{\prime}$ have the same objects as $\mathcal{I}$ but where $\operatorname{Mor}_{\mathcal{I}^{\prime}}(x, y)$ is the quotient of $\operatorname{Mor}_{\mathcal{I}}(x, y)$ by the equivalence relation which identifies $a, b: x \rightarrow y$ if $M(a)=M(b)$.

[^2]:    ${ }^{2}$ See Remark 4.2 .2

[^3]:    ${ }^{3}$ Here is a more down-to-earth way to see this: Write $b=q^{-1} i$ for some $q: Y^{\prime} \rightarrow Z$ in $S$ and some $i: Y \rightarrow Z$. By LMS2 we can find $r: Y^{\prime \prime} \rightarrow Y^{\prime \prime \prime}$ in $S$ and $j: Z \rightarrow Y^{\prime \prime \prime}$ such that $j \circ q=r \circ t$. Now, set $d=r$ and $h=j \circ i$.

[^4]:    ${ }^{4}$ In fact it seems in the 2-category case that one could define another 2-category of 2commutative diagrams where the direction of the arrows $\alpha, \beta$ is reversed, or even where the direction of only one of them is reversed. This is why we restrict to (2,1)-categories later on.

[^5]:    ${ }^{5}$ This is probably nonstandard terminology. In some texts this is called a "cleavage" but it conjures up the wrong image. Maybe a "cleaving" would be a better word. A related notion is that of a "splitting", but in many texts a "splitting" means a choice of pullbacks such that $g^{*} f^{*}=(f \circ g)^{*}$ for any composable pair of morphisms. Compare also with Definition 4.35.2

[^6]:    ${ }^{6}$ A set on steroids!?

[^7]:    ${ }^{1}$ This is very different from the notion of a submersion between differential manifolds! It is probably a good idea to use "strict and surjective" in stead of "submersive".

[^8]:    ${ }^{2}$ This may not be standard notation. Alternative notions used in the literature are: (1) Every point has some quasi-compact neighbourhood, and (2) Every point has a closed quasi-compact neighbourhood. A scheme has the property that every point has a fundamental system of open quasi-compact neighbourhoods.

[^9]:    ${ }^{3}$ In the second edition of EGA I GD71 this was called a "globally constructible" set and a the terminology "constructible" was used for what we call a locally constructible set.

[^10]:    ${ }^{4}$ This is the terminology used in Bou71. Usually this is what is called "universally closed" in the literature. Thus our notion of proper does not involve any separation conditions.

[^11]:    ${ }^{5}$ This is likely nonstandard notation. This notion is usually introduced only for (locally) Noetherian schemes, in which case condition (a) is implied by (b).

[^12]:    ${ }^{1}$ This notation differs from that of AGV71, as explained in the introduction.

[^13]:    ${ }^{2}$ It may appear this is the representable presheaf defined by $S$. This may not be the case because $S$ may not be an object of $\mathcal{T}_{G}$ which was chosen to be a sufficiently large set of $G$-sets.

[^14]:    ${ }^{3}$ This construction actually involves a choice of the fibre products $U_{i} \times{ }_{U} V$ and hence the axiom of choice. The resulting map does not depend on the choices made, see below.

[^15]:    ${ }^{4}$ Set theoretical remark: First choose $\mathcal{T}_{H}$. Then choose $\mathcal{T}_{G}$ to contain $u\left(\mathcal{T}_{H}\right)$ and such that every covering in $\mathcal{T}_{H}$ corresponds to a covering in $\mathcal{T}_{G}$. This is possible by Sets, Lemmas 3.10.1, 3.10 .2 and 3.11 .1

[^16]:    ${ }^{5}$ One should try to avoid the case where $u(U)=\emptyset$ for all $U$.

[^17]:    ${ }^{1}$ For nonalgebraic extensions this definition does not make sense and is not the correct one.
    ${ }^{2} \mathrm{~A}$ good convention for this chapter is to set $0^{0}=1$.

[^18]:    ${ }^{1}$ Later we will say that $R$ is Noetherian.

[^19]:    ${ }^{2}$ Here is the argument in more detail: Assume that we know that the second and fourth arrows are injective. Lemma 10.11 .10 (applied to the exact sequence $K \rightarrow N_{2} \rightarrow Q \rightarrow 0$ ) yields that the sequence $K \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow Q \otimes_{R} M \rightarrow 0$ is exact. Hence, $\operatorname{Ker}\left(N_{2} \otimes_{R} M \rightarrow Q \otimes_{R} M\right)=$ $\operatorname{Im}\left(K \otimes_{R} M \rightarrow N_{2} \otimes_{R} M\right)$. Since $\operatorname{Im}\left(K \otimes_{R} M \rightarrow N_{2} \otimes_{R} M\right)=\operatorname{Im}\left(N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M\right)$ (due to the surjectivity of $\left.N_{1} \otimes_{R} M \rightarrow K \otimes_{R} M\right)$ and $\operatorname{Ker}\left(N_{2} \otimes_{R} M \rightarrow Q \otimes_{R} M\right)=$ $\operatorname{Ker}\left(N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M\right)$ (due to the injectivity of $Q \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ ), this becomes $\operatorname{Ker}\left(N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M\right)=\operatorname{Im}\left(N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M\right)$, which shows that the functor $-\otimes_{R} M$ is exact, whence $M$ is flat.
    ${ }^{3}$ This becomes obvious if we identify $L^{\prime} \otimes_{R} M$ and $L \otimes_{R} M$ with submodules of $M^{\oplus n}$ (which is legitimate since the maps $L \otimes_{R} M \rightarrow M^{\oplus n}$ and $L^{\prime} \otimes_{R} M \rightarrow M^{\oplus n}$ are injective and commute with the obvious map $\left.L^{\prime} \otimes_{R} M \rightarrow L \otimes_{R} M\right)$.

[^20]:    ${ }^{4} \mathrm{An}$ irreducible space is nonempty.

[^21]:    ${ }^{5}$ At this point it would perhaps be more appropriate to say "an" in stead of "the" Ext-group.

[^22]:    ${ }^{6}$ In fact, a module map $f: R^{n} \rightarrow M$ corresponds to a choice of elements $x_{1}, x_{2}, \ldots, x_{n}$ of $M$ (namely, the images of the standard basis elements $e_{1}, e_{2}, \ldots, e_{n}$ ); furthermore, an element $x \in$ $\operatorname{Ker}(f)$ corresponds to a relation between these $x_{1}, x_{2}, \ldots, x_{n}$ (namely, the relation $\sum_{i} f_{i} x_{i}=0$, where the $f_{i}$ are the coordinates of $x$ ). The module map $h$ (represented as an $m \times n$-matrix) corresponds to the matrix $\left(a_{i j}\right)$ from Lemma 10.38 .11 and the $y_{j}$ of Lemma 10.38 .11 are the images of the standard basis vectors of $R^{m}$ under $g$.

[^23]:    ${ }^{7}$ This includes the condition that $\bigcap I^{n} M=(0)$.

[^24]:    ${ }^{8}$ We could also define this when $R$ is only semi-local but this is probably never really what you want!

[^25]:    ${ }^{9}$ This module is sometimes denoted $\Gamma_{S / R}$ in the literature.

[^26]:    ${ }^{10}$ This includes the condition that $\bigcap \mathfrak{m}^{n}=(0)$; in some texts this may be indicated by saying that $R$ is complete and separated. Warning: It can happen that the completion $\lim _{n} R / \mathfrak{m}^{n}$ of a local ring is non-complete, see Examples, Lemma 88.6.1 This does not happen when $\mathfrak{m}$ is finitely generated, see Lemma 10.95 .5 in which case the completion is Noetherian, see Lemma 10.96.5

[^27]:    ${ }^{1}$ I'm sure there is an infinitely slicker proof of this.

[^28]:    ${ }^{2}$ I am sure you think that my conventions are wrong. If so and if you feel strongly about it then drop me an email with an explanation.

[^29]:    ${ }^{3}$ This notation is not universally accepted. In some references an additonial pair of subobjects $Z_{\infty}$ and $B_{\infty}$ of $E_{1}$ such that $0=B_{1} \subset B_{2} \subset \ldots \subset B_{\infty} \subset Z_{\infty} \subset \ldots \subset Z_{2} \subset Z_{1}=E_{1}$ is part of the data comprising a spectral sequence!

[^30]:    ${ }^{4}$ This works because $T S E^{\prime}=\operatorname{Ker}(T S d) / \operatorname{Im}(T d)$ and $T g(\operatorname{Ker}(T \alpha))=T g(\operatorname{Im}(T f))=$ $\operatorname{Im}(T(d))$ and $T S(d)(\operatorname{Im}(T g))=\operatorname{Im}(T S g \circ T S f \circ T g)=0$.

[^31]:    ${ }^{1}$ We use [ ] as an abbreviation for the family $\{[n]\}_{n \in \mathbf{Z}}$.

[^32]:    ${ }^{2}$ This definition may be nonstandard. If $\mathcal{D}^{\prime}$ is a full subcategory then $\mathcal{T}^{\prime}$ is the intersection of the set of triangles in $\mathcal{D}^{\prime}$ with $\mathcal{T}$, see Lemma 13.4.14 In this case we drop $\mathcal{T}^{\prime}$ from the notation.

[^33]:    ${ }^{3}$ This is nonstandard notation.

[^34]:    ${ }^{4}$ For a discussion of when an ind-object or pro-object of a category is essentially constant we refer to Categories, Section 4.22

[^35]:    ${ }^{5}$ This is likely nonstandard terminology.

[^36]:    ${ }^{1}$ In the literature, often the maps $h_{n+1, i} \circ s_{i}: U_{n} \rightarrow V_{n+1}$ are used instead of the maps $h_{n, i}$. Of course the relations these maps satisfy are different from the ones in Lemma 14.26 .2
    ${ }^{2}$ Warning: This notion is not an equivalence relation on objects in general.

[^37]:    ${ }^{3}$ This assumption is not necessary. Also the proof as currently given is not the right one. A better proof is to define the homotopy groups of Kan complex and show that these are equal to the homology groups of the associated complex for a simplicial abelian group.

[^38]:    ${ }^{1}$ This is somewhat nonstandard notation.

[^39]:    ${ }^{2}$ We include being separated as part of being complete as we'd like to have a unique limits in complete groups. There is a definition of completeness for any topological group, agreeing, modulo the separation issue, with this one in our special case.
    ${ }^{3}$ By our conventions this includes separated.
    ${ }^{4}$ Thus the $I$-adic topology is sometimes called the $I$-pre-adic topology.

[^40]:    ${ }^{5}$ It may happen that the $I$-adic completion $M^{\wedge}$ is not $I$-adically complete, even though $M^{\wedge}$ is always complete with respect to the limit topology. If $I$ is finitely generated then the $I$-adic topology and the limit topology on $M^{\wedge}$ agree, see Algebra, Lemma 10.95 .5 and its proof.

[^41]:    ${ }^{6}$ This clashes with what is meant by a pseudo-coherent module in Bou61.

[^42]:    ${ }^{7}$ To use these spectral sequences we have to show that $A b(\mathbf{N})$ has enough injectives. A inverse system $\left(I_{n}\right)$ of abelian groups is injective if and only if each $I_{n}$ is an injective abelian group and the transition maps are split surjections. Every system embeds in one of these. Details omitted.

[^43]:    ${ }^{8}$ Recall that we use the notation Gal only in the case of Galois extensions.

[^44]:    ${ }^{9}$ If $B$ is complete, then we can choose $\sigma$ to be a ring map. If $A$ is also complete and $\sigma$ is a ring map, then $\sigma$ maps $\kappa_{A}$ into $A$.

[^45]:    ${ }^{1}$ The question/conjecture as formulated in Art82, AD83, and Pop81 is stronger and was shown to be equivalent to the original version in [P84].

[^46]:    ${ }^{1}$ This is likely nonstandard notation.

[^47]:    ${ }^{2}$ This is nonstandard notation; see discussion above.

[^48]:    ${ }^{1}$ In other chapters the notation $\mathbf{Z}[S]$ sometimes indicates the polynomial ring over $\mathbf{Z}$ on $S$.

[^49]:    ${ }^{2}$ The mechanics of this are a bit awkward, and we suggest the reader skip this part of the proof.

[^50]:    ${ }^{3}$ Of course in almost any naturally occurring case the colimit is filtered and some of the discussion in this section may be simplified.

[^51]:    ${ }^{4}$ This assumption is not necessary, see introduction to this section.

[^52]:    ${ }^{1}$ The sign depends on the convention for the signs in the long exact sequence in cohomology associated to a triangle in $D(X)$. The conventions in the stacks project are (a) distinguished triangles correspond to termwise split exact sequences and (b) the boundary maps in the long exact sequence are given by the maps in the snake lemma without the intervention of signs. See Derived Categories, Section 13.10

[^53]:    ${ }^{2}$ It suffices if $\forall m, \exists p(m), H^{p}\left(U \cdot \mathcal{H}^{m-p}\right)=0$ for $p>p(m)$.

[^54]:    ${ }^{1}$ This is probably nonstandard notation. Please email stacks.project@gmail.com if you know the correct terminology.

[^55]:    ${ }^{2}$ It suffices if $\forall m, \exists p(m), H^{p}\left(U . \mathcal{H}^{m-p}\right)=0$ for $p>p(m)$.

[^56]:    ${ }^{3}$ This is nonstandard notation. We chose it to remind the reader of fpqc coverings of schemes.

[^57]:    ${ }^{1}$ The sign rule is analogous to the one in Example 22.19 .8 although there we are working with right modules and the same sign rule taken there does not work for left modules. Sigh!

[^58]:    ${ }^{2}$ This may be nonstandard terminology.

[^59]:    ${ }^{3}$ What may be useful here is to think of the double complex $H^{\bullet \bullet}$ with terms $H^{p, q}=$ $\operatorname{Hom}_{\mathcal{B}}\left(A^{-q}, B^{p}\right)$ and differentials $d_{1}$ of degree ( 1,0 ) given by $\mathrm{d}_{B}$ and $d_{2}$ of degree $(0,1)$ given by the contragredient of $d_{A}$. Up to sign and up to replacing the direct sum by a direct product, the differential graded $\mathbf{Z}$-module $\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}\right)$ is the total complex associated to $H^{\bullet \bullet}$, see Homology, Definition 12.22 .3 To get the sign correct, change $d_{2}^{p, q}: H^{p, q} \rightarrow H^{p, q+1}$ by $(-1)^{q+1}$ (after this change we still have a double complex).

[^60]:    ${ }^{4}$ A very interesting case is when $A=\operatorname{Hom}_{\mathcal{B}}(N, N)$.

[^61]:    ${ }^{1}$ Here and in the following, $\gamma$ stands short for a sequence of maps $\gamma_{1}, \gamma_{2}, \gamma_{3}, \ldots$ from $I$ to $I$.

[^62]:    ${ }^{2}$ This can also be proven without recourse to Algebra, Theorem 10.80.4 Indeed, if $z=\sum x_{i} b_{i}$ and $z=\sum x_{i^{\prime}}^{\prime}, b_{i^{\prime}}^{\prime}$, then $\sum x_{i} b_{i}-\sum x_{i^{\prime}}^{\prime} b_{i^{\prime}}^{\prime}=0$ is a relation in the $A$-module $B$. Thus, Algebra, Lemma 10.38.11 (applied to the $x_{i}$ and $x_{i^{\prime}}^{\prime}$ taking the place of the $f_{i}$, and the $b_{i}$ and $b_{i^{\prime}}^{\prime}$ taking the role of the $x_{i}$ ) yields the existence of the $c_{1}, \ldots, c_{s} \in B$ and $a_{i j}, a_{i^{\prime} j}^{\prime} \in A$ as required.

[^63]:    ${ }^{1}$ Of course algebraic geometers still quibble over whether one should require $X$ to be geometrically irreducible over $\mathbf{Q}$.

[^64]:    ${ }^{1}$ The reader may expect here the condition that $\mathcal{E}$ is finite locally free. We do not do so in order to be consistent with [DG67 II, Definition 1.7.8].

[^65]:    ${ }^{2}$ Often one imposes the assumption that $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ over $\mathcal{O}_{S}$. We do not assume this in order to be consistent with DG67 II, (8.3.1)].

[^66]:    ${ }^{3}$ The reader may expect here the condition that $\mathcal{E}$ is finite locally free. We do not do so in order to be consistent with [DG67 II, Definition 4.1.1].

[^67]:    ${ }^{1}$ But we only list those properties here which we have not already dealt with separately somewhere else.

[^68]:    ${ }^{2}$ Nicely explained in a blog post by Akhil Mathew.

[^69]:    ${ }^{3}$ This functor is sometimes called the coherator.

[^70]:    ${ }^{1}$ This is likely nonstandard notation.

[^71]:    ${ }^{2}$ But only those properties that are not already dealt with separately elsewhere.
    ${ }^{3}$ But only those properties that are not already dealt with separately elsewhere.
    ${ }^{4}$ But only those properties that are not already dealt with separately elsewhere.

[^72]:    ${ }^{5}$ This is very different from the notion of a submersion of differential manifolds.

[^73]:    ${ }^{6}$ For example if $f$ is proper, see Definition 28.41.1

[^74]:    ${ }^{7}$ In fact, if $f$ is surjective, flat, and of finite presentation and $p$ is syntomic, then both $q$ and $f$ are syntomic, see Descent, Lemma 34.10.7

[^75]:    ${ }^{8}$ Namely, the local section $\mathrm{d}_{X / S}(f)=1 \otimes f-f \otimes 1$ of the ideal sheaf of $\Delta$ maps via $\mathrm{d}_{X \times S} X / X$ to the local section $1 \otimes 1 \otimes 1 \otimes f-1 \otimes f \otimes 1 \otimes 1-1 \otimes 1 \otimes f \otimes 1+f \otimes 1 \otimes 1 \otimes 1=\operatorname{pr}_{2}^{*} \mathrm{~d}_{X / S}(f)-\operatorname{pr}_{1}^{*} \mathrm{~d}_{X / S}(f)$.

[^76]:    ${ }^{9}$ In fact this is implied by (1) and (2), see Descent, Lemma 34.10.3 Moreover, it suffices to assume $f$ is surjective, flat and locally of finite presentation, see Descent, Lemma 34.10.5

[^77]:    ${ }^{10}$ In fact this is implied by (1) and (2), see Descent, Lemma 34.10.3 Moreover, it suffices to assume that $f$ is surjective, flat and locally of finite presentation, see Descent, Lemma 34.10.5

[^78]:    ${ }^{11}$ This is not exactly the same as the definition in Hartshorne. Namely, the definition in Hartshorne (8th corrected printing, 1997) is that $f$ should be the composition of an open immersion followed by a H-projective morphism (see Definition 28.42.1, which does not imply $f$ is quasicompact. See Lemma 28.42 .12 for the implication in the other direction.

[^79]:    ${ }^{12}$ The scheme $X^{\prime}$ need not be normal, for example if $Y=X$ and $f=\operatorname{id}_{X}$, then $X^{\prime}=X$.

[^80]:    ${ }^{13}$ It suffices if $X_{r e d}^{\prime} \rightarrow X_{r e d}$ is birational.

[^81]:    ${ }^{14}$ This is probably nonstandard notation.

[^82]:    ${ }^{1}$ This is nonstandard notation.

[^83]:    ${ }^{2}$ Danger, Will Robinson!

[^84]:    ${ }^{3}$ In other words, the integral closure of $\mathcal{O}_{S}$ in $\mathcal{A}_{0}$, see Morphisms, Definition 28.48.2 equals $\mathcal{A}_{0}$.

[^85]:    ${ }^{1} \mathrm{An}$ irreducible space is nonempty.

[^86]:    ${ }^{2}$ The case where $X$ and $Y$ are quasi-separated will be discussed in Lemma 32.23 .2 below.

[^87]:    ${ }^{3}$ One can avoid using this lemma which relies on the theorem of formal functions. Namely, $\bar{X}$ is projective hence it suffices to show a proper morphism $f: X \rightarrow Y$ with finite fibres between quasi-projective schemes over $k$ is finite. To do this, one chooses an affine open of $X$ containing the fibre of $f$ over a point $y$ using that any finite set of points of a quasi-projective scheme over $k$ is contained in an affine. Shrinking $Y$ to a small affine neighbourhood of $y$ one reduces to the case of a proper morphism between affines. Such a morphism is finite by Morphisms, Lemma 28.43.7

[^88]:    ${ }^{4}$ If $X$ is a proper curve and $\mathcal{F}$ is a coherent sheaf on $X$, then one often defines the degree as $\chi(X, \mathcal{F})-r \chi\left(X, \mathcal{O}_{X}\right)$ where $r=\operatorname{dim}_{\kappa(\xi)} \mathcal{F}_{\xi}$ is the rank of $\mathcal{F}$ at the generic point $\xi$ of $X$.

[^89]:    ${ }^{1}$ The words big and small here do not relate to bigness/smallness of the corresponding categories.

[^90]:    ${ }^{2}$ The letters fppf stand for "fidèlement plat de présentation finie".

[^91]:    ${ }^{3}$ The letters fpqc stand for "fidèlement plat quasi-compacte".
    ${ }^{4}$ A more precise statement would be that the analogue of Lemma 33.7.7 for the fpqc topology does not hold.

[^92]:    ${ }^{1}$ Note that $\tau_{i j}^{2}=\delta_{k}^{2}$, if $\{i, j, k\}=[2]=\{0,1,2\}$, see Simplicial, Definition 14.2.1
    ${ }^{2}$ We should really write $(N, \varphi)$.

[^93]:    ${ }^{3}$ To be precise, our $\theta$ here is the inverse of $\varphi$ from Definition 34.3.1

[^94]:    ${ }^{4}$ The list is: free, finite free, generated by global sections, generated by $r$ global sections, generated by finitely many global sections, having a global presentation, having a global finite presentation, locally free, finite locally free, locally generated by sections, locally generated by $r$ sections, finite type, of finite presentation, coherent, or flat.
    ${ }^{5}$ Warning: This is misleading. See part (6).

[^95]:    ${ }^{6}$ This may be nonstandard notation.

[^96]:    ${ }^{7}$ Unfortunately, we have chosen the "wrong" direction for our arrow here. In Definitions 34.30 .1 and 34.30 .3 we should have the opposite direction to what was done in Definition 34.2 .1 by the general principle that "functions" and "spaces" are dual.

[^97]:    ${ }^{8}$ This follows from (1) if $S=S^{\prime}$.

[^98]:    ${ }^{9}$ The fact that fpqc is missing is not a typo. See discussion in Topologies, Section 33.8

[^99]:    ${ }^{1}$ In particular, $E$ has a K-injective representative as in Cohomology, Lemma 20.32.1

[^100]:    ${ }^{2}$ This means that $f$ is pseudo-coherent, see More on Morphisms, Lemma 36.42 .8

[^101]:    ${ }^{1}$ The other types are coprof $\leq k$, Cohen-Macaulay, $\left(S_{k}\right)$, regular, $\left(R_{k}\right)$, and reduced. See DG67 IV Definition 6.8.1.].

[^102]:    ${ }^{2}$ In the presence of (1) this means that $f$ is quasi-finite at $x$, see Morphisms, Lemma 28.20.6

[^103]:    ${ }^{3}$ This means $f$ is pseudo-coherent, see Definition 36.42.2
    ${ }^{4}$ This means $Y \rightarrow S$ is pseudo-coherent, see Definition 36.42 .2

[^104]:    ${ }^{1}$ It is quite easy to show that $H_{p}$ is a sheaf for the fppf topology using that flat morphisms of finite presentation are open. This is all we really need later on. But it is kind of fun to prove directly that it also satisfies the sheaf condition for the fpqc topology.

[^105]:    ${ }^{2}$ The scheme $S^{\prime}$ is sometimes called the universal flatificator. In GR71 it is called the platificateur universel. Existence of the universal flattening should not be confused with the type of results discussed in More on Algebra, Section 15.20

[^106]:    ${ }^{3}$ For example this holds if $f$ is finite type and $\mathcal{F}$ is pure along $X_{s}$, or if $f$ is proper.

[^107]:    ${ }^{1}$ Using the material in Divisors, Section 30.14 we could take as effective Cartier divisor $E$ the norm of the effective Cartier divisor $\mathcal{D}$ along the finite locally free morphism $1 \times \pi^{\prime}$ bypassing some of the arguments.

[^108]:    ${ }^{2}$ This means that the default type of torsor is a pseudo torsor which is trivial on an fpqc covering. This is the definition in $\mathbf{A B D}^{+} \mathbf{6 6}$ Exposé IV, 6.5]. It is a little bit inconvenient for us as we most often work in the fppf topology.

[^109]:    ${ }^{1}$ The fact that $f p q c$ is missing is not a typo.

[^110]:    ${ }^{2}$ Explanation in groupoid language: The original set $\left\{r_{1}, \ldots, r_{n}\right\}$ was the set of arrows with source $u$. The set $\left\{u_{1}, \ldots, u_{m}\right\}$ was the set of objects isomorphic to $u$. And $\left\{r_{1}, \ldots, r_{N}\right\}$ is the set of all arrows between all the objects equivalent to $u$.

[^111]:    ${ }^{3}$ In view of the other conditions this is equivalent to requiring $j$ to be proper.

[^112]:    ${ }^{1}$ In view of condition (2) this is equivalent to $\kappa(s)=\kappa(x)$.

[^113]:    ${ }^{2}$ In view of condition (2) this is equivalent to $\kappa(s)=\kappa(x)$.

[^114]:    ${ }^{1}$ If the residue field of $R$ is finite with $q$ elements it is customary to call the Herbrand quotient $h(M, N, \varphi, \psi)=q^{e_{R}(M, N, \varphi, \psi)}$ which is equal to the number of elements of $H^{0}$ divided by the number of elements of $H^{1}$.

[^115]:    ${ }^{2}$ Obviously we could get rid of the minus sign by redefining $\operatorname{det}_{\kappa}(M, \varphi, \psi)$ as the inverse of its current value, see Definition 41.4.1

[^116]:    ${ }^{1}$ Conversely, if $f: X \rightarrow Y$ is a dominant morphism of varieties, $X$ is Cohen-Macaulay, $Y$ is nonsingular, and all fibres have the same dimension $r$, then $f$ is flat. This follows from Algebra, Lemma 10.127.1 and Varieties, Lemma 32.17.4 showing $\operatorname{dim}(X)=\operatorname{dim}(Y)+r$.

[^117]:    ${ }^{2}$ We will sometimes think of $W_{a}$ as a closed subscheme of $X \times \mathbf{P}^{1}$ and sometimes as a closed subscheme of $X$. It should always be clear from context which point of view is taken.

[^118]:    ${ }^{3}$ If $W^{\prime} \rightarrow W$ is birational, then the result follows from Chow Homology, Lemma 41.19.2 Our task is to show that even if $W^{\prime} \rightarrow W$ has degree $>1$ the basic rational equivalence $\left[W_{0}^{\prime}\right]_{k} \sim_{r a t}$ $\left[W_{\infty}^{\prime}\right]_{k}$ comes from a principal divisor on a subvariety of $X$.

[^119]:    ${ }^{4}$ Since in this chapter we only consider Chow groups of varieties, we are prohibited from taking $Z_{k}(X \backslash U)$ and $A_{k}(X \backslash U)$, hence the approach using the varieties $Z_{i}$.

[^120]:    ${ }^{5}$ The reader can see that this is not a triviality by taking $r=s=1$ and $X$ a nonsingular surface and $V=W$ a closed point $x$ of $X$. In this case there are 3 nonzero Tors of lengths $1,2,1$ at $x$.

[^121]:    ${ }^{6}$ This can be avoided by working in an affine neighbourhood of $\xi$ as above, choosing an affine open of $X$ containing the generic points of the $Z_{i}$, and translating the question into algebra. Doing this will produce a relatively elementary proof of 42.22.1.1.

[^122]:    ${ }^{1}$ See Categories, Section 4.3

[^123]:    ${ }^{1}$ This is the "adequator".

[^124]:    ${ }^{1}$ This proof works for those morphisms of quasi-compact and quasi-separated schemes such that $R f_{*} P$ is pseudo-coherent for all $P$ perfect on $X$. It follows easily from a theorem of Kiehl Kie72 that this holds if $f$ is proper and pseudo-coherent. This is the correct generality for this lemma and some of the other results in this section.

[^125]:    ${ }^{2}$ Namely, if $\alpha, \beta: F \rightarrow G$ are morphisms of functors and $\gamma: G \rightarrow H$ is an isomorphism of functors such that $\gamma \circ \alpha=\gamma \circ \beta$, then we conclude $\alpha=\beta$.

[^126]:    ${ }^{3}$ We haven't checked that these are compatible with the isomorphisms $(g \circ f)^{!} \rightarrow f^{!} \circ g^{!}$and $(g \circ f)_{\text {new }}^{!} \rightarrow f_{\text {new }}^{!} \circ g_{\text {new }}^{!}$. We will do this here if we need this later.

[^127]:    ${ }^{1}$ When we discuss the pro-étale fundamental group the general case will be of interest.

[^128]:    ${ }^{1}$ What we call a site is a called a category endowed with a pretopology in AGV71 Exposé II, Définition 1.3]. In Art62 it is called a category with a Grothendieck topology.

[^129]:    ${ }^{2}$ We use the notation $f^{-1}$ for pullbacks of sheaves of sets or sheaves of abelian groups, and we reserve $f^{*}$ for pullbacks of sheaves of modules via a morphism of ringed sites/topoi.

[^130]:    ${ }^{3}$ A way station is a place where people stop to eat and rest when they are on a long journey.

[^131]:    ${ }^{4}$ For the doubting Thomases out there.

[^132]:    ${ }^{5}$ If $X$ is a Nagata scheme, for example of finite type over a field, then $Y \rightarrow Z$ is finite.

[^133]:    ${ }^{6}$ This notation is not standard. This operator is denoted $F_{x}$ in Del77. We will likely change this notation in the future.

[^134]:    ${ }^{7}$ At this point, there should be an evil laugh in the background.

[^135]:    ${ }^{8}$ This is likely nonstandard notation.

[^136]:    ${ }^{1}$ Of course there will be a price to pay.

[^137]:    ${ }^{2}$ This actually makes sense: if $\Omega_{B}$ is the module of differentials where we only assume the Leibniz rule and not the vanishing of d 1 , then the Leibniz rule gives $\mathrm{d} 1=\mathrm{d}(1 \cdot 1)=1 \mathrm{~d} 1+1 \mathrm{~d} 1=2 \mathrm{~d} 1$ and hence $\mathrm{d} 1=0$ in $\Omega_{B}$.

[^138]:    ${ }^{3}$ This clashes with our convention to denote the topos associated to a site $\mathcal{C}$ by $\operatorname{Sh}(\mathcal{C})$.

[^139]:    ${ }^{4}$ This clashes with our convention to denote the topos associated to a site $\mathcal{C}$ by $S h(\mathcal{C})$.

[^140]:    ${ }^{5}$ Actually, they are even homotopic to zero as the homotopies fit together, but we don't need this. The reason for this roundabout argument is that the $\operatorname{limit} \lim _{e} M(n)_{e} \otimes_{D(n)} \Omega_{D(n)}^{i}$ isn't the $p$-adic completion of $M(n) \otimes_{D(n)} \Omega_{D(n)}^{i}$ as with the assumptions of the lemma we don't know that $M(n)_{e}=M(n)_{e+1} / p^{e} M(n)_{e+1}$. If $\mathcal{F}$ is a crystal then this does hold.

[^141]:    ${ }^{6}$ This assumption is not strictly necessary, as using hypercoverings the construction of the remark can be extended to the general case.

[^142]:    ${ }^{7}$ This is nonstandard notation.

[^143]:    ${ }^{8}$ This can be done by direct computation: It turns out that $p-\theta \circ \partial_{z}$ evaluated on $z^{i} \xi^{[n]}$ gives zero except for 1 which is mapped to $p$ and $\xi$ which is mapped to $-p \lambda$. It turns out that $(\theta \otimes 1) \circ \mathrm{d}_{1}-\mathrm{d}_{1} \circ \theta$ evaluated on $z^{i} \xi^{[n]}$ gives zero except for $z^{p-1} \xi$ which is mapped to $-\lambda$.

[^144]:    ${ }^{1}$ In the presence of flatness, e.g., for smooth or étale ring maps, this just means that the induced map on spectra is surjective. See Algebra, Lemma 10.38.16

[^145]:    ${ }^{2}$ To be sure, we pick $U_{i, a, b}=U_{b} \times U_{b(i, a)} U_{i, a, b(i, a)}$ although this isn't necessary for what follows.

[^146]:    ${ }^{3}$ This may be nonstandard notation.
    ${ }^{4}$ This may be nonstandard notation.

[^147]:    ${ }^{5}$ Proof: by Algebra, Lemma 10.31 .6 we can lift $\bar{p}_{i}$ to a compatible system of projectors $p_{i, n}:\left(\Lambda / I^{n}\right)^{\oplus t} \rightarrow\left(\Lambda / I^{n}\right)^{\oplus t}$ and then we set $p_{i}=\lim p_{i, n}$ which works because $\Lambda^{\wedge}=\lim \Lambda / I^{n}$.

[^148]:    ${ }^{6}$ This may be nonstandard notation
    ${ }^{7}$ This may be nonstandard notation.

[^149]:    ${ }^{8}$ This assumption can be removed if $K$ is a constructible complex, see BS13.

[^150]:    ${ }^{1}$ We will associate a topological space to an algebraic space in Properties of Spaces, Section 53.4 and its opens will correspond exactly to the open subspaces defined below.

[^151]:    ${ }^{2}$ In the literature this often refers to quasi-separated and locally separated algebraic spaces.

[^152]:    ${ }^{3}$ This definition was suggested by B. Conrad.

[^153]:    ${ }^{4}$ Requiring the existence of $R$ is necessary because of our choice of the function Bound in Sets, Equation 3.9.1.1. The size of the fibre product $U \times_{X^{\prime}} U$ can grow faster than Bound in terms of the size of $U$. We can illustrate this by setting $S=\operatorname{Spec}(A), U=\operatorname{Spec}\left(A\left[x_{i}, i \in I\right]\right)$ and $R=\coprod_{\left(\lambda_{i}\right) \in A^{I}} \operatorname{Spec}\left(A\left[x_{i}, y_{i}\right] /\left(x_{i}-\lambda_{i} y_{i}\right)\right)$. In this case the size of $R$ grows like $\kappa^{\kappa}$ where $\kappa$ is the size of $U$.

[^154]:    ${ }^{1}$ In the literature this often refers to quasi-separated and locally separated algebraic spaces.
    2 This notion was suggested by B. Conrad.

[^155]:    ${ }^{3}$ Actually we use here also Schemes, Lemma 25.11.1 (soberness schemes), Morphisms, Lemmas 28.36 .12 and 28.25 .8 (generalizations lift along étale morphisms), Lemma 53.4.5 (points on an algebraic space in terms of a presentation), and Lemma 53.4.6 (openness quotient map).

[^156]:    ${ }^{4}$ Also $\left(f^{\prime}\right)_{\text {small }}^{-1}\left(\left.\mathcal{G}\right|_{Y^{\prime}}\right)=\left.\left(f_{\text {small }}^{-1} \mathcal{G}\right)\right|_{X^{\prime}}$ because of commutativity of the diagram and 53.17.10.1

[^157]:    ${ }^{5}$ In this lemma and its proof we write simply $\varphi^{-1}$ instead of $\varphi_{\text {small }}^{-1}$ and similarly for all the other pullbacks.

[^158]:    ${ }^{6}$ Also $\left(f^{\prime}\right)^{*}\left(\left.\mathcal{G}\right|_{Y^{\prime}}\right)=\left.\left(f^{*} \mathcal{G}\right)\right|_{X^{\prime}}$ by commutativity of the diagram and 53.25.1.1

[^159]:    ${ }^{7}$ This functor is sometimes called the coherator.

[^160]:    ${ }^{1}$ In the literature this term often refers to quasi-separated and locally separated morphisms.

[^161]:    ${ }^{2}$ This is very different from the notion of a submersion of differential manifolds.

[^162]:    ${ }^{3}$ We do not know whether any monomorphism of algebraic spaces is representable. For a discussion see More on Morphisms of Spaces, Section 63.4

[^163]:    ${ }^{4}$ This is likely nonstandard notation.

[^164]:    ${ }^{5}$ This is a slight abuse of language as it would perhaps be more correct to say "locally finite type point".

[^165]:    ${ }^{6}$ It seems awkward to use "locally of finite presentation at $x$ ", but the current terminology may be misleading in the sense that "of finite presentation at $x$ " does not mean that there is an open neighbourhood $X^{\prime} \subset X$ such that $\left.f\right|_{X^{\prime}}$ is of finite presentation.

[^166]:    ${ }^{1}$ This is probably nonstandard notation.

[^167]:    ${ }^{2}$ This is nonstandard notation.

[^168]:    ${ }^{1}$ This may be nonstandard notation

[^169]:    ${ }^{1}$ The characterization (2) in Lemma 57.3 .2 may be easier to parse.

[^170]:    ${ }^{1}$ This definition is motivated by Constructions, Lemma 26.16.4 The advantage of choosing this one is that it clearly defines an equivalence relation.

[^171]:    ${ }^{2}$ In other words, the integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}_{0}$, see Morphisms of Spaces, Definition 54.45 .2 equals $\mathcal{A}_{0}$.

[^172]:    ${ }^{1}$ Unfortunately, we have chosen the "wrong" direction for our arrow here. In Definitions 61.19 .1 and 61.19 .3 we should have the opposite direction to what was done in Definition 61.3 .1 by the general principle that "functions" and "spaces" are dual.

[^173]:    ${ }^{2}$ We will see later that this is always the case if $I$ is not too large, see Bootstrap, Lemma 67.11 .2

[^174]:    ${ }^{1}$ In particular, $E$ has a K-injective representative as in Cohomology on Sites, Lemma 21.22.1

[^175]:    ${ }^{1}$ This is just one possible definition that one can make here. Another slightly weaker condition would be to require that the dotted arrow exists fppf locally on $T^{\prime}$. This weaker notion has in some sense better formal properties.

[^176]:    ${ }^{1}$ The default type of torsor in Groupoids, Definition 38.11 .3 is a pseudo torsor which is trivial on an fpqc covering. Since $G$, as an algebraic space, can be seen a sheaf of groups there already is a notion of a $G$-torsor which corresponds to fppf-torsor, see Lemma 65.9.4 Hence we use "principal

[^177]:    homogeneous space" for a pseudo torsor which is fpqc locally trivial, and we try to avoid using the word torsor in this situation.

[^178]:    ${ }^{2}$ We could single out a set of triples $\phi, \phi^{\prime}, \phi^{\prime \prime} \in \Phi$ with $j(\phi)=\left(i, i^{\prime}\right), j\left(\phi^{\prime}\right)=\left(i^{\prime}, i^{\prime \prime}\right)$, and $j\left(\phi^{\prime \prime}\right)=\left(i, i^{\prime \prime}\right)$ such that $f_{\phi^{\prime \prime}}=f_{\phi} \circ f_{\phi^{\prime}}$ and require that $\alpha_{\phi^{\prime}} \circ f_{\phi^{\prime}}^{*} \alpha_{\phi}=\alpha_{\phi^{\prime \prime}}$ for these triples. This would define an additive subcategory. For example the data ( $I, \Phi$ ) could be the set of objects and arrows of an index category and $X$ could be a diagram of schemes over this index category. The result of Lemma 65.13.1 immediately gives the corresponding result in the subcategory.

[^179]:    ${ }^{3}$ In fact the functor is fully faithful, but we won't need this.

[^180]:    ${ }^{1}$ It is enough to assume $G$ is decent, e.g., locally separated or quasi-separated by Lemma 66.7 .4

[^181]:    ${ }^{2}$ This condition is implied by (a).

[^182]:    ${ }^{1}$ Being preserved under base change holds by Morphisms of Spaces, Lemmas 54.5.5 54.8.3 54.38 .4 54.29.4 54.4.4 54.23.3 54.27.4 54.28.3 54.39.3 and Spaces, Lemma 52.12.3 Being fppf local on the base holds by Descent on Spaces, Lemmas 61.10.5 61.10.1 61.10.26 61.10.11 | 61.10 .16 | 61.10 .9 | 61.10 .22 | 61.10 .8 |

[^183]:    ${ }^{2}$ Here we should check that $U^{\prime}$ is not too large, i.e., that it is isomorphic to an object of the category $S c h_{f p p f}$, see Section 67.2 This is a purely set theoretical matter; let us use the notion of size of a scheme introduced in Sets, Section 3.9 Note that each $U_{u}^{\prime}$ has size at most the size of $U$ and that the cardinality of the index set is at most the cardinality of $|U|$ which is bounded by the size of $U$. Hence $U^{\prime}$ is isomorphic to an object of $S c h_{f p p f}$ by Sets, Lemma 3.9.9 part (6).

[^184]:    ${ }^{3}$ We can allow larger index sets here if we can bound the size of the algebraic spaces which we are descending. If we ever need this we will add a more precise statement here.

[^185]:    ${ }^{1}$ This notation is similar to the notation in Sites, Example 7.6.4 and Topologies, Definition 33.3 .7

[^186]:    ${ }^{2}$ In fact, it would be enough to assume that $f$ has fpqc locally on $S$ a section, since we have descent of quasi-coherent modules by Descent, Section 34.5

[^187]:    ${ }^{1}$ By our conventions this includes separated.
    ${ }^{2}$ This is nonstandard notation. The definition generalizes to modules, by saying a linearly topologized $A$-module $M$ is $A$-taut if for every open ideal $I \subset A$ the closure of $I M$ in $M$ is open and these closures form a fundamental system of neighbourhoods of 0 in $M$.

[^188]:    ${ }^{3}$ See More on Algebra, Definition 15.28 .1 for the classical case and see Remark 70.2 .3 for a discussion of differences.

[^189]:    ${ }^{2}$ This may be nonstandard terminology. Many authors tie this notion in with properties of tangent spaces. We will make the link in Section 73.14

[^190]:    ${ }^{1}$ It suffices to consider sets of cardinality at most the cardinality of $B$.

[^191]:    ${ }^{2}$ A posteriori the "correct" vanishing $H_{i}\left(\mathcal{C}_{B / A}, \mathcal{K}^{n}\right)=0$ for $i<n$ can be concluded.

[^192]:    ${ }^{1}$ This means that it is fibred in groupoids and objects in the fibre categories have no nontrivial automorphisms, see Categories, Definition 4.37.2

[^193]:    ${ }^{2}$ In future chapters we will denote this simply $U \rightarrow \mathcal{X}$ as is customary in the literature. Another good alternative would be to formulate this condition as the existence of a representable category fibred in groupoids $\mathcal{U}$ and a surjective smooth 1-morphism $\mathcal{U} \rightarrow \mathcal{X}$.

[^194]:    ${ }^{3}$ For example an open immersion.

[^195]:    ${ }^{4}$ This terminology might be a bit confusing: it does not imply that $[U / R]$ is smooth over anything.

[^196]:    ${ }^{1}$ The difficulty is not that Spaces is a proper class, since by our definition of an algebraic space over $S$ there is only a set worth of isomorphism classes of algebraic spaces over $S$. It is rather that arbitrary disjoint unions of algebraic spaces may end up being too large, hence lie outside of our chosen "partial universe" of sets.

[^197]:    ${ }^{2}$ The notation $[[X / G]]$ with double brackets serves to distinguish this category from the stack $[X / G]$ introduced earlier. In Proposition 77.15 .3 we show that the two are canonically equivalent. Afterwards we will use the notation $[X / G]$ to indicate either.

[^198]:    ${ }^{3}$ This means the data gives rise, via the 2-Yoneda lemma (Categories, Lemma 4.40.1, to a 2-commutative diagram
    

[^199]:    ${ }^{1}$ These functors will be denoted $f^{-1}$ and $f_{*}$ after Lemma 78.4.4 has been proved.

[^200]:    ${ }^{2}$ This is nonstandard notation.

[^201]:    ${ }^{3}$ This functor is sometimes called the coherator.

[^202]:    ${ }^{4}$ This result should hold for any 1 -morphism of categories fibred in groupoids over $(S c h / S)_{f p p f}$.

[^203]:    ${ }^{1}$ The condition on size can be dropped by those ignoring set theoretic issues.

[^204]:    2 To see that the set theoretic condition of that lemma is satisfied we argue as follows: First choose the open covering such that $|I| \leq \operatorname{size}(V)$. Next, choose schemes $U_{i}$ of size $\leq$ $\max (\kappa, \operatorname{size}(V))$ and surjective étale morphisms $U_{i} \rightarrow Z_{i}$; we can do this by assumption (2) and Sets, Lemma 3.9.6 (details omitted). Then Sets, Lemma 3.9.9 implies that $\coprod U_{i}$ is an object of $(S c h / S)_{f p p f}$. Hence $\coprod Z_{i}$ is an algebraic space by Spaces, Lemma 52.8.3

[^205]:    ${ }^{3}$ Modulo some set theoretic arguments. Namely, we have to show that $\coprod F_{E}$ is an algebraic space. This follows because $|I| \leq \operatorname{size}(X)$ and $\operatorname{size}\left(F_{E}\right) \leq \operatorname{size}(X)$ as follows from the explicit description of $F_{E}$ in the proof of More on Morphisms, Lemma 36.49.1 Some details omitted.

[^206]:    ${ }^{4}$ It may be better to think of this as a pair consisting of a multiplication map $m: R^{\oplus d} \otimes_{R}$ $R^{\oplus d} \rightarrow R^{\oplus d}$ and a ring map $\psi: R \rightarrow R^{\oplus d}$ satisfying a bunch of axioms.

[^207]:    ${ }^{5}$ Here we can either mean sheaves in the étale topology whose diagonal is representable and which have an étale surjective covering by a scheme or algebraic spaces as defined in Algebraic Spaces, Definition 52.6.1 Namely, by Bootstrap, Lemma 67.12.1 there is no difference.

[^208]:    ${ }^{1}$ The condition is the following: the supremum of all the cardinalities $\mid \mathrm{Ob}\left(\mathcal{X}_{\operatorname{Spec}(k)}\right) / \cong 1$ and $\left|\operatorname{Arrows}\left(\mathcal{X}_{\operatorname{Spec}(k)}\right)\right|$ where $k$ runs over the finite type fields over $S$ is $\leq$ than the size of some object of $(S c h / S)_{f p p f}$.

[^209]:    ${ }^{2}$ This is what Artin calls a formal deformation.
    ${ }^{3}$ The condition is the following: the supremum of all the cardinalities $|F(\operatorname{Spec}(k))|$ where $k$ runs over the finite type fields over $S$ is $\leq$ than the size of some object of $(S c h / S)_{f p p f}$.

[^210]:    ${ }^{4}$ Set theoretical remark: This coproduct is (isomorphic) to an object of $(S c h / S)_{f p p f}$ as we have a bound on the index set by axiom [-1], see Sets, Lemma 3.9.9

[^211]:    ${ }^{5}$ The set theoretic condition [-1] holds for $F$ as it holds for $G$. Details omitted.
    ${ }^{6}$ Set theoretical remark: This coproduct is (isomorphic) to an object of $(S c h / S)_{f p p f}$ as we have a bound on the index set by axiom [-1], see Sets, Lemma 3.9.9

[^212]:    ${ }^{7}$ The set theoretic condition in Criteria for Representability, Lemma 79.5 .5 will hold: the size of the algebraic space $Y$ representing $\mathcal{Y}$ is suitably bounded. Namely, $Y \rightarrow S$ will be locally of finite type and $Y$ will satisfy axiom [-1]. Details omitted.

[^213]:    ${ }^{1}$ We omit the verification of the set theoretical condition (3) of the referenced lemma.

[^214]:    ${ }^{2}$ This assumption is not necessary. See discussion in Section 81.6

[^215]:    ${ }^{1}$ This clashes with [LMB00] in spirit, but not in fact. Namely, in Chapter 11 they associate to any point on any quasi-separated algebraic stack a gerbe (not necessarily algebraic) which they call the residual gerbe. We will see in Morphisms of Stacks, Lemma 83.21.1 that on a quasiseparated algebraic stack every point has a residual gerbe in our sense which is then equivalent to theirs. For more information on this topic see Ryd10. Appendix B].

[^216]:    ${ }^{1}$ The letters DM stand for Deligne-Mumford. If $f$ is DM then given any scheme $T$ and any morphism $T \rightarrow \mathcal{Y}$ the fibre product $\mathcal{X}_{T}=\mathcal{X} \times \mathcal{Y} T$ is an algebraic stack over $T$ whose diagonal is unramified, i.e., $\mathcal{X}_{T}$ is DM. This implies $\mathcal{X}_{T}$ is a Deligne-Mumford stack, see Theorem83.15.6 In other words a DM morphism is one whose "fibres" are Deligne-Mumford stacks. This hopefully at least motivates the terminology.
    ${ }^{2}$ If $f$ is quasi-DM, then the "fibres" $\mathcal{X}_{T}$ of $\mathcal{X} \rightarrow \mathcal{Y}$ are quasi-DM. An algebraic stack $\mathcal{X}$ is quasiDM exactly if there exists a scheme $U$ and a surjective flat morphism $U \rightarrow \mathcal{X}$ of finite presentation which is locally quasi-finite, see Theorem 83.15 .3 . Note the similarity to being Deligne-Mumford, which is defined in terms of having an étale covering by a scheme.

[^217]:    ${ }^{3}$ Theorem 83.15 .6 shows that this is equivalent to $\mathcal{X}$ being a Deligne-Mumford stack.

[^218]:    ${ }^{4}$ This is very different from the notion of a submersion of differential manifolds.

[^219]:    ${ }^{5}$ This is a slight abuse of language as it would perhaps be more correct to say "locally finite type point".

[^220]:    ${ }^{6}$ We urge the reader to find his/her own proof of this fact. In fact the argument has a lot in common with the final argument of the proof of Bootstrap, Theorem 67.10.1 hence probably should be isolated into its own lemma somewhere.

[^221]:    ${ }^{1}$ This may be nonstandard notation.

[^222]:    ${ }^{2}$ In the literature the site is denoted Lis-ét $(\mathcal{X})$ or $\operatorname{Lis}-\operatorname{Et}(\mathcal{X})$ and the associated topos is denoted $\mathcal{X}_{\text {lis-ét }}$ or $\mathcal{X}_{\text {lis-et }}$. In the stacks project our convention is to name the site and denote the corresponding topos by $\operatorname{Sh}(\mathcal{C})$.

[^223]:    ${ }^{1}$ This definition is different from the one in the literature, see Ols07b 6.3], but it agrees with that definition by Lemma 85.4.3

[^224]:    ${ }^{1}$ This is a bit of a cheat because in checking the smoothness you have to prove something very close to the key fact - after all smoothness is defined in terms of fibre products. The advantage is that you only have to prove the existence of these fibre products in the case that on one side you have the morphism that you are trying to show provides the smooth cover.

[^225]:    ${ }^{2}$ I suppose that it is possible an irreducible algebraic stack exists which doesn't have an irreducible smooth cover - but if so it is going to be quite nasty!

[^226]:    ${ }^{1}$ With quasi-coherent modules as defined above. Due to how things are setup in the Stacks project, this is really the correct definition; as seen above our definition agrees with what one would naively have defined to be quasi-coherent modules on $\operatorname{Spf}(A)$, namely complete $A$-modules.

[^227]:    ${ }^{2}$ Every element $f \in R$ is of the form $u e$ where $u$ is a unit and $e$ is an idempotent. Then Algebra, Lemma 10.25 .5 shows $\operatorname{Spec}(R)$ is Hausdorff. On the other hand, $\mathbf{N}$ with the discrete topology can be viewed as a dense open subset. Given a set map $\mathbf{N} \rightarrow X$ to a Hausdorff, quasicompact toplogical space $X$, we obtain a ring map $\mathcal{C}^{0}(X ; k) \rightarrow R$ where $\mathcal{C}^{0}(X ; k)$ is the $k$-algebra of locally constant maps $X \rightarrow k$. This gives $\operatorname{Spec}(R) \rightarrow \operatorname{Spec}\left(\mathcal{C}^{0}(X ; k)\right)=X$ proving the universal property.

[^228]:    ${ }^{4}$ Here we use that $S$ is a strictly henselian local ring of characteristic $p$ and hence $S \rightarrow S$, $f \mapsto f^{p}-f$ is surjective. Also $S$ is a normal domain and hence $\Gamma\left(U, \mathcal{O}_{U}\right)=S$. Thus $H_{\text {étale }}^{1}(U, \mathbf{Z} / p)$ is the kernel of the map $H^{1}\left(U, \mathcal{O}_{U}\right) \rightarrow H^{1}\left(U, \mathcal{O}_{U}\right)$ induced by $f \mapsto f^{p}-f$.

[^229]:    ${ }^{1}$ The projective embedding is $\left(\left(X_{0}, X_{1}\right),\left(Y_{0}, Y_{1}\right)\right) \mapsto\left(X_{0} Y_{0}, X_{0} Y_{1}, X_{1} Y_{0}, X_{1} Y_{1}\right)$ in other words $(x, y) \mapsto(1, y, x, x y)$.

[^230]:    ${ }^{2}$ We get $\leq 2$ because $d-3=5-3=2$.
    ${ }^{3}$ A quadric is a degree 2 hypersurface, i.e., the zero set in $\mathbf{P}^{r}$ of a degree 2 homogeneous polynomial.

[^231]:    ${ }^{1}$ In the literature, quotient stack often means a stack of the form $[X / G]$ with $X$ an algebraic space and $G$ a subgroup scheme of $\mathrm{GL}_{n}$ rather than an arbitrary flat group scheme.

[^232]:    ${ }^{1}$ It is all Knuth's fault. See Knu79.
