07L2 Lemma 50.17.1. Let $D$ and $D(n)$ be as in 50.17.0.1) and 50.17.0.4. The coprojection $P \rightarrow P \otimes_{A} \ldots \otimes_{A} P, f \mapsto f \otimes 1 \otimes \ldots \otimes 1$ induces an isomorphism

07L3

$$
\begin{equation*}
D(n)=\lim _{e} D\left\langle\xi_{i}(j)\right\rangle / p^{e} D\left\langle\xi_{i}(j)\right\rangle \tag{50.17.1.1}
\end{equation*}
$$

of algebras over $D$ with

$$
\xi_{i}(j)=x_{i} \otimes 1 \otimes \ldots \otimes 1-1 \otimes \ldots \otimes 1 \otimes x_{i} \otimes 1 \otimes \ldots \otimes 1
$$

for $j=1, \ldots, n$.

Proof. We have

$$
P \otimes_{A} \ldots \otimes_{A} P=P\left[\xi_{i}(j)\right]
$$

and $J(n)$ is generated by $J$ and the elements $\xi_{i}(j)$. Hence the lemma follows from Lemma 50.2.5.

07L4 Lemma 50.17.2. Let $D$ and $D(n)$ be as in (50.17.0.1) and (50.17.0.4). Then $(D, J, \bar{\gamma})$ and $(D(n), \bar{J}(n), \bar{\gamma}(n))$ are objects of $C r i s^{\wedge}(C / A)$, see Remark 50.5.4, and

$$
D(n)=\coprod_{j=0, \ldots, n} D
$$

in $\operatorname{Cris}^{\wedge}(C / A)$.
Proof. The first assertion is clear. For the second, if $(B \rightarrow C, \delta)$ is an object of Cris^ $(C / A)$, then we have

$$
\operatorname{Mor}_{\operatorname{Cris}^{\wedge}(C / A)}(D, B)=\operatorname{Hom}_{A}((P, J),(B, \operatorname{Ker}(B \rightarrow C)))
$$

and similarly for $D(n)$ replacing $(P, J)$ by $\left(P \otimes_{A} \ldots \otimes_{A} P, J(n)\right)$. The property on coproducts follows as $P \otimes_{A} \ldots \otimes_{A} P$ is a coproduct.

In the lemma below we will consider pairs $(M, \nabla)$ satisfying the following conditions

07JB
07JC
07JD
07JE
(1) $M$ is a $p$-adically complete $D$-module,
(2) $\nabla: M \rightarrow M \otimes_{D}^{\wedge} \Omega_{D}$ is a connection, i.e., $\nabla(f m)=m \otimes \mathrm{~d} f+f \nabla(m)$,
(3) $\nabla$ is integrable (see Remark 50.6.10), and
(4) $\nabla$ is topologically quasi-nilpotent: If we write $\nabla(m)=\sum \theta_{i}(m) \mathrm{d} x_{i}$ for some operators $\theta_{i}: M \rightarrow M$, then for any $m \in M$ there are only finitely many pairs $(i, k)$ such that $\theta_{i}^{k}(m) \notin p M$.
The operators $\theta_{i}$ are sometimes denoted $\nabla_{\partial / \partial x_{i}}$ in the literature. In the following lemma we construct a functor from crystals in quasi-coherent modules on Cris $(X / S)$ to the category of such pairs. We will show this functor is an equivalence in Proposition 50.17 .4 .

07JG Lemma 50.17.3. In the situation above there is a functor

$$
\begin{gathered}
\text { crystals in quasi-coherent } \\
\mathcal{O}_{X / S}-\text { modules on } \operatorname{Cris}(X / S)
\end{gathered} \longrightarrow \begin{gathered}
\text { pairs }(M, \nabla) \text { satisfying } \\
(1), ~(2), ~(3), \text { and (4) }
\end{gathered}
$$

Proof. Let $\mathcal{F}$ be a crystal in quasi-coherent modules on $X / S$. Set $T_{e}=\operatorname{Spec}\left(D_{e}\right)$ so that $\left(X, T_{e}, \bar{\gamma}\right)$ is an object of $\operatorname{Cris}(X / S)$ for $e \gg 0$. We have morphisms

$$
\left(X, T_{e}, \bar{\gamma}\right) \rightarrow\left(X, T_{e+1}, \bar{\gamma}\right) \rightarrow \ldots
$$

which are closed immersions. We set

$$
M=\lim _{e} \Gamma\left(\left(X, T_{e}, \bar{\gamma}\right), \mathcal{F}\right)=\lim _{e} \Gamma\left(T_{e}, \mathcal{F}_{T_{e}}\right)=\lim _{e} M_{e}
$$

Note that since $\mathcal{F}$ is locally quasi-coherent we have $\mathcal{F}_{T_{e}}=\widetilde{M}_{e}$. Since $\mathcal{F}$ is a crystal we have $M_{e}=M_{e+1} / p^{e} M_{e+1}$. Hence we see that $M_{e}=M / p^{e} M$ and that $M$ is p-adically complete.
By Lemma 50.15.1 we know that $\mathcal{F}$ comes endowed with a canonical integrable connection $\nabla: \mathcal{F} \rightarrow \mathcal{F} \otimes \Omega_{X / S}$. If we evaluate this connection on the objects $T_{e}$ constructed above we obtain a canonical integrable connection

$$
\nabla: M \longrightarrow M \otimes_{D}^{\wedge} \Omega_{D}
$$

To see that this is topologically nilpotent we work out what this means.

Now we can do the same procedure for the rings $D(n)$. This produces a $p$-adically complete $D(n)$-module $M(n)$. Again using the crystal property of $\mathcal{F}$ we obtain isomorphisms

$$
M \otimes_{D, p_{0}}^{\wedge} D(1) \rightarrow M(1) \leftarrow M \otimes_{D, p_{1}}^{\wedge} D(1)
$$

compare with the proof of Lemma 50.15.1. Denote $c$ the composition from left to right. Pick $m \in M$. Write $\xi_{i}=x_{i} \otimes 1-1 \otimes x_{i}$. Using (50.17.1.1) we can write uniquely

$$
c(m \otimes 1)=\sum_{K} \theta_{K}(m) \otimes \prod \xi_{i}^{\left[k_{i}\right]}
$$

for some $\theta_{K}(m) \in M$ where the sum is over multi-indices $K=\left(k_{i}\right)$ with $k_{i} \geq 0$ and $\sum k_{i}<\infty$. Set $\theta_{i}=\theta_{K}$ where $K$ has a 1 in the $i$ th spot and zeros elsewhere. We have

$$
\nabla(m)=\sum \theta_{i}(m) \mathrm{d} x_{i}
$$

as can be seen by comparing with the definition of $\nabla$. Namely, the defining equation is $p_{1}^{*} m=\nabla(m)-c\left(p_{0}^{*} m\right)$ in Lemma 50.15.1 but the sign works out because in the stacks project we consistently use $\mathrm{d} f=p_{1}(f)-p_{0}(f)$ modulo the ideal of the diagonal squared, and hence $\xi_{i}=x_{i} \otimes 1-1 \otimes x_{i}$ maps to $-\mathrm{d} x_{i}$ modulo the ideal of the diagonal squared.

Denote $q_{i}: D \rightarrow D(2)$ and $q_{i j}: D(1) \rightarrow D(2)$ the coprojections corresponding to the indices $i, j$. As in the last paragraph of the proof of Lemma 50.15.1 we see that

$$
q_{02}^{*} c=q_{12}^{*} c \circ q_{01}^{*} c .
$$

This means that

$$
\sum_{K^{\prime \prime}} \theta_{K^{\prime \prime}}(m) \otimes \prod \zeta_{i}^{\prime \prime\left[k_{i}^{\prime \prime}\right]}=\sum_{K^{\prime}, K} \theta_{K^{\prime}}\left(\theta_{K}(m)\right) \otimes \prod \zeta_{i}^{\prime\left[k_{i}^{\prime}\right]} \prod \zeta_{i}^{\left[k_{i}\right]}
$$

in $M \otimes_{D, q_{2}}^{\wedge} D(2)$ where

$$
\begin{aligned}
\zeta_{i} & =x_{i} \otimes 1 \otimes 1-1 \otimes x_{i} \otimes 1, \\
\zeta_{i}^{\prime} & =1 \otimes x_{i} \otimes 1-1 \otimes 1 \otimes x_{i} \\
\zeta_{i}^{\prime \prime} & =x_{i} \otimes 1 \otimes 1-1 \otimes 1 \otimes x_{i}
\end{aligned}
$$

In particular $\zeta_{i}^{\prime \prime}=\zeta_{i}+\zeta_{i}^{\prime}$ and we have that $D(2)$ is the $p$-adic completion of the divided power polynomial ring in $\zeta_{i}, \zeta_{i}^{\prime}$ over $q_{2}(D)$, see Lemma 50.17.1. Comparing coefficients in the expression above it follows immediately that $\theta_{i} \circ \theta_{j}=\theta_{j} \circ \theta_{i}$ (this provides an alternative proof of the integrability of $\nabla$ ) and that

$$
\theta_{K}(m)=\left(\prod \theta_{i}^{k_{i}}\right)(m)
$$

In particular, as the sum expressing $c(m \otimes 1)$ above has to converge $p$-adically we conclude that for each $i$ and each $m \in M$ only a finite number of $\theta_{i}^{k}(m)$ are allowed to be nonzero modulo $p$.

07JH Proposition 50.17.4. The functor

$$
\begin{gathered}
\text { crystals in quasi-coherent } \\
\mathcal{O}_{X / S}-\text { modules on } \operatorname{Cris}(X / S)
\end{gathered} \longrightarrow \begin{gathered}
\text { pairs }(M, \nabla) \text { satisfying } \\
(1), \sqrt{2}),(3), \text { and (4) }
\end{gathered}
$$

of Lemma 50.17 .3 is an equivalence of categories.

Proof. Let $(M, \nabla)$ be given. We are going to construct a crystal in quasi-coherent modules $\mathcal{F}$. Write $\nabla(m)=\sum \theta_{i}(m) \mathrm{d} x_{i}$. Then $\theta_{i} \circ \theta_{j}=\theta_{j} \circ \theta_{i}$ and we can set $\theta_{K}(m)=\left(\prod \theta_{i}^{k_{i}}\right)(m)$ for any multi-index $K=\left(k_{i}\right)$ with $k_{i} \geq 0$ and $\sum k_{i}<\infty$.
Let $(U, T, \delta)$ be any object of $\operatorname{Cris}(X / S)$ with $T$ affine. Say $T=\operatorname{Spec}(B)$ and the ideal of $U \rightarrow T$ is $J_{B} \subset B$. By Lemma 50.5.6 there exists an integer $e$ and a morphism

$$
f:(U, T, \delta) \longrightarrow\left(X, T_{e}, \bar{\gamma}\right)
$$

where $T_{e}=\operatorname{Spec}\left(D_{e}\right)$ as in the proof of Lemma 50.17.3. Choose such an $e$ and $f ;$ denote $f: D \rightarrow B$ also the corresponding divided power $A$-algebra map. We will set $\mathcal{F}_{T}$ equal to the quasi-coherent sheaf of $\mathcal{O}_{T}$-modules associated to the $B$-module

$$
M \otimes_{D, f} B
$$

However, we have to show that this is independent of the choice of $f$. Suppose that $g: D \rightarrow B$ is a second such morphism. Since $f$ and $g$ are morphisms in $\operatorname{Cris}(X / S)$ we see that the image of $f-g: D \rightarrow B$ is contained in the divided power ideal $J_{B}$. Write $\xi_{i}=f\left(x_{i}\right)-g\left(x_{i}\right) \in J_{B}$. By analogy with the proof of Lemma 50.17.3 we define an isomorphism

$$
c_{f, g}: M \otimes_{D, f} B \longrightarrow M \otimes_{D, g} B
$$

by the formula

$$
m \otimes 1 \longmapsto \sum_{K} \theta_{K}(m) \otimes \prod \xi_{i}^{\left[k_{i}\right]}
$$

which makes sense by our remarks above and the fact that $\nabla$ is topologically quasinilpotent (so the sum is finite!). A computation shows that

$$
c_{g, h} \circ c_{f, g}=c_{f, h}
$$

if given a third morphism $h:(U, T, \delta) \longrightarrow\left(X, T_{e}, \bar{\gamma}\right)$. It is also true that $c_{f, f}=$ 1. Hence these maps are all isomorphisms and we see that the module $\mathcal{F}_{T}$ is independent of the choice of $f$.
If $a:\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right) \rightarrow(U, T, \delta)$ is a morphism of affine objects of $\operatorname{Cris}(X / S)$, then choosing $f^{\prime}=f \circ a$ it is clear that there exists a canonical isomorphism $a^{*} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$. We omit the verification that this map is independent of the choice of $f$. Using these maps as the restriction maps it is clear that we obtain a crystal in quasicoherent modules on the full subcategory of $\operatorname{Cris}(X / S)$ consisting of affine objects. We omit the proof that this extends to a crystal on all of $\operatorname{Cris}(X / S)$. We also omit the proof that this procedure is a functor and that it is quasi-inverse to the functor constructed in Lemma 50.17.3.

07L5 Lemma 50.17.5. In Situation 50.5.1. Let $A \rightarrow P^{\prime} \rightarrow C$ be ring maps with $A \rightarrow P^{\prime}$ smooth and $P^{\prime} \rightarrow C$ surjective with kernel $J^{\prime}$. Let $D^{\prime}$ be the $p$-adic completion of $D_{P^{\prime}, \gamma}\left(J^{\prime}\right)$. There are homomorphisms of divided power $A$-algebras

$$
a: D \longrightarrow D^{\prime}, \quad b: D^{\prime} \longrightarrow D
$$

compatible with the maps $D \rightarrow C$ and $D^{\prime} \rightarrow C$ such that $a \circ b=i d_{D^{\prime}}$. These maps induce an equivalence of categories of pairs $(M, \nabla)$ satisfying (1), (2), (3), and (4) over $D$ and pairs $\left(M^{\prime}, \nabla^{\prime}\right)$ satisfying (1), (2), (3), and (4) over $D^{\prime}$. In particular, the equivalence of categories of Proposition 50.17 .4 also holds for the corresponding functor towards pairs over $D^{\prime}$.

Proof. We can pick the map $P=A\left[x_{i}\right] \rightarrow C$ such that it factors through a surjection of $A$-algebras $P \rightarrow P^{\prime}$ (we may have to increase the number of variables in $P$ to do this). Hence we obtain a surjective map $a: D \rightarrow D^{\prime}$ by functoriality of divided power envelopes and completion. Pick $e$ large enough so that $D_{e}$ is a divided power thickening of $C$ over $A$. Then $D_{e} \rightarrow C$ is a surjection whose kernel is locally nilpotent, see Divided Power Algebra, Lemma 23.2.6. Setting $D_{e}^{\prime}=D^{\prime} / p^{e} D^{\prime}$ we see that the kernel of $D_{e} \rightarrow D_{e}^{\prime}$ is locally nilpotent. Hence by Algebra, Lemma 10.136 .16 we can find a lift $\beta_{e}: P^{\prime} \rightarrow D_{e}$ of the map $P^{\prime} \rightarrow D_{e}^{\prime}$. Note that $D_{e+i+1} \rightarrow D_{e+i} \times{ }_{D_{e+i}^{\prime}} D_{e+i+1}^{\prime}$ is surjective with square zero kernel for any $i \geq 0$ because $p^{e+i} D \rightarrow p^{e+i} D^{\prime}$ is surjective. Applying the usual lifting property (Algebra, Proposition 10.136.13) successively to the diagrams

we see that we can find an $A$-algebra map $\beta: P^{\prime} \rightarrow D$ whose composition with $a$ is the given map $P^{\prime} \rightarrow D^{\prime}$. By the universal property of the divided power envelope we obtain a map $D_{P^{\prime}, \gamma}\left(J^{\prime}\right) \rightarrow D$. As $D$ is $p$-adically complete we obtain $b: D^{\prime} \rightarrow D$ such that $a \circ b=\operatorname{id}_{D^{\prime}}$.

Consider the base change functor

$$
(M, \nabla) \longmapsto\left(M \otimes_{D}^{\wedge} D^{\prime}, \nabla^{\prime}\right)
$$

from pairs for $D$ to pairs for $D^{\prime}$, see Remark 50.6.11. Similarly, we have the base change functor corresponding to the divided power homomorphism $D^{\prime} \rightarrow D$. To finish the proof of the lemma we have to show that the base change for the compositions $b \circ a: D \rightarrow D$ and $a \circ b: D^{\prime} \rightarrow D^{\prime}$ are isomorphic to the identity functor. This is clear for the second as $a \circ b=\operatorname{id}_{D^{\prime}}$. To prove it for the first, we use the functorial isomorphism

$$
c_{\mathrm{id}_{D}, b \circ a}: M \otimes_{D, \mathrm{id}_{D}} D \longrightarrow M \otimes_{D, b \circ a} D
$$

of the proof of Proposition 50.17.4. The only thing to prove is that these maps are horizontal, which we omit.

The last statement of the proof now follows.
07L6 Remark 50.17.6. The equivalence of Proposition 50.17 .4 holds if we start with a surjection $P \rightarrow C$ where $P / A$ satisfies the strong lifting property of Algebra, Lemma 10.136.16. To prove this we can argue as in the proof of Lemma 50.17.5. (Details will be added here if we ever need this.) Presumably there is also a direct proof of this result, but the advantage of using polynomial rings is that the rings $D(n)$ are $p$-adic completions of divided power polynomial rings and the algebra is simplified.

### 50.18. General remarks on cohomology

07JI In this section we do a bit of work to translate the cohomology of modules on the cristalline site of an affine scheme into an algebraic question.

07JJ Lemma 50.18.1. In Situation 50.7.5. Let $\mathcal{F}$ be a locally quasi-coherent $\mathcal{O}_{X / S^{-}}$ module on $\operatorname{Cris}(X / S)$. Then we have

$$
H^{p}((U, T, \delta), \mathcal{F})=0
$$

for all $p>0$ and all $(U, T, \delta)$ with $T$ or $U$ affine.
Proof. As $U \rightarrow T$ is a thickening we see that $U$ is affine if and only if $T$ is affine, see Limits, Lemma31.10.1. Having said this, let us apply Cohomology on Sites, Lemma 21.11 .9 to the collection $\mathcal{B}$ of affine objects $(U, T, \delta)$ and the collection Cov of affine open coverings $\mathcal{U}=\left\{\left(U_{i}, T_{i}, \delta_{i}\right) \rightarrow(U, T, \delta)\right\}$. The Čech complex $\check{C}^{*}(\mathcal{U}, \mathcal{F})$ for such a covering is simply the Cech complex of the quasi-coherent $\mathcal{O}_{T}$-module $\mathcal{F}_{T}$ (here we are using the assumption that $\mathcal{F}$ is locally quasi-coherent) with respect to the affine open covering $\left\{T_{i} \rightarrow T\right\}$ of the affine scheme $T$. Hence the Cech cohomology is zero by Cohomology of Schemes, Lemma 29.2.6 and 29.2.2. Thus the hypothesis of Cohomology on Sites, Lemma 21.11 .9 are satisfied and we win.

07JK Lemma 50.18.2. In Situation 50.7.5. Assume moreover $X$ and $S$ are affine schemes. Consider the full subcategory $\mathcal{C} \subset \operatorname{Cris}(X / S)$ consisting of divided power thickenings $(X, T, \delta)$ endowed with the chaotic topology (see Sites, Example 7.6.6). For any locally quasi-coherent $\mathcal{O}_{X / S}-$ module $\mathcal{F}$ we have

$$
R \Gamma\left(\mathcal{C},\left.\mathcal{F}\right|_{\mathcal{C}}\right)=R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})
$$

Proof. We will use without further mention that $\mathcal{C}$ and $\operatorname{Cris}(X / S)$ have products and fibre products, see Lemma 50.8.2. Note that the inclusion functor $u$ : $\mathcal{C} \rightarrow \operatorname{Cris}(X / S)$ is fully faithful, continuous and commutes with products and fibre products. We claim it defines a morphism of ringed sites

$$
f:\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right) \longrightarrow\left(S h(\mathcal{C}), \mathcal{O}_{X / S} \mid \mathcal{C}\right)
$$

To see this we will use Sites, Lemma 7.15.5. Note that $\mathcal{C}$ has fibre products and $u$ commutes with them so the categories $\mathcal{I}_{(U, T, \delta)}^{u}$ are disjoint unions of directed categories (by Sites, Lemma 7.5.1 and Categories, Lemma 4.19.7). Hence it suffices to show that $\mathcal{I}_{(U, T, \delta)}^{u}$ is connected. Nonempty follows from Lemma 50.5.6 and connectedness follows from the fact that $\mathcal{C}$ has products and that $u$ commutes with them (compare with the proof of Sites, Lemma 7.5.2.
Note that $f_{*} \mathcal{F}=\left.\mathcal{F}\right|_{\mathcal{C}}$. Hence the lemma follows if $R^{p} f_{*} \mathcal{F}=0$ for $p>0$, see Cohomology on Sites, Lemma 21.14.6. By Cohomology on Sites, Lemma 21.8.4 it suffices to show that $H^{p}((X, T, \delta), \mathcal{F})=0$ for all $(X, T, \delta)$. This follows from Lemma 50.18.1.

07JL Lemma 50.18.3. In Situation50.5.1. Set $\mathcal{C}=(\operatorname{Cris}(C / A))^{\text {opp }}$ and $\mathcal{C}^{\wedge}=\left(C r i s^{\wedge}(C / A)\right)^{\text {opp }}$ endowed with the chaotic topology, see Remark 50.5.4 for notation. There is a morphism of topoi

$$
g: \operatorname{Sh}(\mathcal{C}) \longrightarrow \operatorname{Sh}\left(\mathcal{C}^{\wedge}\right)
$$

such that if $\mathcal{F}$ is a sheaf of abelian groups on $\mathcal{C}$, then

$$
R^{p} g_{*} \mathcal{F}(B \rightarrow C, \delta)=\left\{\begin{array}{cc}
\lim _{e} \mathcal{F}\left(B_{e} \rightarrow C, \delta\right) & \text { if } p=0 \\
R^{1} \lim _{e} \mathcal{F}\left(B_{e} \rightarrow C, \delta\right) & \text { if } p=1 \\
0 & \text { else }
\end{array}\right.
$$

where $B_{e}=B / p^{e} B$ for $e \gg 0$.

Proof. Any functor between categories defines a morphism between chaotic topoi in the same direction, for example because such a functor can be considered as a cocontinuous functor between sites, see Sites, Section 7.20. Proof of the description of $g_{*} \mathcal{F}$ is omitted. Note that in the statement we take $\left(B_{e} \rightarrow C, \delta\right)$ is an object of $\operatorname{Cris}(C / A)$ only for $e$ large enough. Let $\mathcal{I}$ be an injective abelian sheaf on $\mathcal{C}$. Then the transition maps

$$
\mathcal{I}\left(B_{e} \rightarrow C, \delta\right) \leftarrow \mathcal{I}\left(B_{e+1} \rightarrow C, \delta\right)
$$

are surjective as the morphisms

$$
\left(B_{e} \rightarrow C, \delta\right) \longrightarrow\left(B_{e+1} \rightarrow C, \delta\right)
$$

are monomorphisms in the category $\mathcal{C}$. Hence for an injective abelian sheaf both sides of the displayed formula of the lemma agree. Taking an injective resolution of $\mathcal{F}$ one easily obtains the result (sheaves are presheaves, so exactness is measured on the level of groups of sections over objects).

07JM Lemma 50.18.4. Let $\mathcal{C}$ be a category endowed with the chaotic topology. Let $X$ be an object of $\mathcal{C}$ such that every object of $\mathcal{C}$ has a morphism towards $X$. Assume that $\mathcal{C}$ has products. Then for every abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ the total cohomology $R \Gamma(\mathcal{C}, \mathcal{F})$ is represented by the complex

$$
\mathcal{F}(X) \rightarrow \mathcal{F}(X \times X) \rightarrow \mathcal{F}(X \times X \times X) \rightarrow \ldots
$$

associated to the cosimplicial abelian group $[n] \mapsto \mathcal{F}\left(X^{n}\right)$.
Proof. Note that $H^{q}\left(X^{p}, \mathcal{F}\right)=0$ for all $q>0$ as sheaves are presheaves on $\mathcal{C}$. The assumption on $X$ is that $h_{X} \rightarrow *$ is surjective. Using that $H^{q}(X, \mathcal{F})=H^{p}\left(h_{X}, \mathcal{F}\right)$ and $H^{p}(\mathcal{C}, \mathcal{F})=H^{p}(*, \mathcal{F})$ we see that our statement is a special case of Cohomology on Sites, Lemma 21.13.2.

### 50.19. Cosimplicial preparations

07JP In this section we compare crystalline cohomology with de Rham cohomology. We follow BdJ11.

07L7 Example 50.19.1. Suppose that $A_{*}$ is any cosimplicial ring. Consider the cosimplicial module $M_{*}$ defined by the rule

$$
M_{n}=\bigoplus_{i=0, \ldots, n} A_{n} e_{i}
$$

For a map $f:[n] \rightarrow[m]$ define $M_{*}(f): M_{n} \rightarrow M_{m}$ to be the unique $A_{*}(f)$-linear map which maps $e_{i}$ to $e_{f(i)}$. We claim the identity on $M_{*}$ is homotopic to 0 . Namely, a homotopy is given by a map of cosimplicial modules

$$
h: M_{*} \longrightarrow \operatorname{Hom}\left(\Delta[1], M_{*}\right)
$$

see Section 50.16. For $j \in\{0, \ldots, n+1\}$ we let $\alpha_{j}^{n}:[n] \rightarrow$ [1] be the map defined by $\alpha_{j}^{n}(i)=0 \Leftrightarrow i<j$. Then $\Delta[1]_{n}=\left\{\alpha_{0}^{n}, \ldots, \alpha_{n+1}^{n}\right\}$ and correspondingly $\operatorname{Hom}\left(\Delta[1], M_{*}\right)_{n}=\prod_{j=0, \ldots, n+1} M_{n}$, see Simplicial, Sections 14.26 and 14.28 Instead of using this product representation, we think of an element in $\operatorname{Hom}\left(\Delta[1], M_{*}\right)_{n}$ as a function $\Delta[1]_{n} \rightarrow M_{n}$. Using this notation, we define $h$ in degree $n$ by the rule

$$
h_{n}\left(e_{i}\right)\left(\alpha_{j}^{n}\right)=\left\{\begin{array}{cc}
e_{i} & \text { if } \quad i<j \\
0 & \text { else }
\end{array}\right.
$$

We first check $h$ is a morphism of cosimplicial modules. Namely, for $f:[n] \rightarrow[m]$ we will show that
07L8 (50.19.1.1)

$$
h_{m} \circ M_{*}(f)=\operatorname{Hom}\left(\Delta[1], M_{*}\right)(f) \circ h_{n}
$$

The left hand side of 50.19.1.1 evaluated at $e_{i}$ and then in turn evaluated at $\alpha_{j}^{m}$ is

$$
h_{m}\left(e_{f(i)}\right)\left(\alpha_{j}^{m}\right)=\left\{\begin{array}{cc}
e_{f(i)} & \text { if } \\
0 & \text { else }
\end{array} \quad f(i)<j\right.
$$

Note that $\alpha_{j}^{m} \circ f=\alpha_{j^{\prime}}^{n}$ where $0 \leq j^{\prime} \leq n+1$ is the unique index such that $f(i)<j$ if and only if $i<j^{\prime}$. Thus the right hand side of (50.19.1.1) evaluated at $e_{i}$ and then in turn evaluated at $\alpha_{j}^{m}$ is

$$
M_{*}(f)\left(h_{n}\left(e_{i}\right)\left(\alpha_{j}^{m} \circ f\right)=M_{*}(f)\left(h_{n}\left(e_{i}\right)\left(\alpha_{j^{\prime}}^{n}\right)\right)=\left\{\begin{array}{ccc}
e_{f(i)} & \text { if } & i<j^{\prime} \\
0 & \text { else }
\end{array}\right.\right.
$$

It follows from our description of $j^{\prime}$ that the two answers are equal. Hence $h$ is a map of cosimplicial modules. Let $0: \Delta[0] \rightarrow \Delta[1]$ and $1: \Delta[0] \rightarrow \Delta[1]$ be the obvious maps, and denote $e v_{0}, e v_{1}: \operatorname{Hom}\left(\Delta[1], M_{*}\right) \rightarrow M_{*}$ the corresponding evaluation maps. The reader verifies readily that the the compositions

$$
e v_{0} \circ h, e v_{1} \circ h: M_{*} \longrightarrow M_{*}
$$

are 0 and 1 respectively, whence $h$ is the desired homotopy between 0 and 1 .
07L9 Lemma 50.19.2. With notation as in 50.17.0.5 the complex

$$
\Omega_{D(0)} \rightarrow \Omega_{D(1)} \rightarrow \Omega_{D(2)} \rightarrow \ldots
$$

is homotopic to zero as a $D(*)$-cosimplicial module.
Proof. We are going to use the principle of Simplicial, Lemma 14.28 .3 and more specifically Lemma 50.16.1 which tells us that homotopic maps between (co)simplicial objects are transformed by any functor into homotopic maps. The complex of the lemma is equal to the $p$-adic completion of the base change of the cosimplicial module

$$
M_{*}=\left(\Omega_{P / A} \rightarrow \Omega_{P \otimes_{A} P / A} \rightarrow \Omega_{P \otimes_{A} P \otimes_{A} P / A} \rightarrow \ldots\right)
$$

via the cosimplicial ring map $P \otimes_{A} \ldots \otimes_{A} P \rightarrow D(n)$. This follows from Lemma 50.6.6, see comments following 50.17 .0 .2 . Hence it suffices to show that the cosimplicial module $M_{*}$ is homotopic to zero (uses base change and $p$-adic completion). We can even assume $A=\mathbf{Z}$ and $P=\mathbf{Z}\left[\left\{x_{i}\right\}_{i \in I}\right]$ as we can use base change with $\mathbf{Z} \rightarrow A$. In this case $P^{\otimes n+1}$ is the polynomial algebra on the elements

$$
x_{i}(e)=1 \otimes \ldots \otimes x_{i} \otimes \ldots \otimes 1
$$

with $x_{i}$ in the $e$ th slot. The modules of the complex are free on the generators $\mathrm{d} x_{i}(e)$. Note that if $f:[n] \rightarrow[m]$ is a map then we see that

$$
M_{*}(f)\left(\mathrm{d} x_{i}(e)\right)=\mathrm{d} x_{i}(f(e))
$$

Hence we see that $M_{*}$ is a direct sum over $I$ of copies of the module studied in Example 50.19.1 and we win.
07LA Lemma 50.19.3. With notation as in 50.17.0.4 and 50.17.0.5, given any cosimplicial module $M_{*}$ over $D(*)$ and $i>0$ the cosimplicial module

$$
M_{0} \otimes_{D(0)}^{\wedge} \Omega_{D(0)}^{i} \rightarrow M_{1} \otimes_{D(1)}^{\wedge} \Omega_{D(1)}^{i} \rightarrow M_{2} \otimes_{D(2)}^{\wedge} \Omega_{D(2)}^{i} \rightarrow \ldots
$$

is homotopic to zero, where $\Omega_{D(n)}^{i}$ is the p-adic completion of the ith exterior power of $\Omega_{D(n)}$.
Proof. By Lemma 50.19 .2 the endomorphisms 0 and 1 of $\Omega_{D(*)}$ are homotopic. If we apply the functor $\wedge^{2}$ we see that the same is true for the cosimplicial module $\wedge^{i} \Omega_{D(*)}$, see Lemma 50.16.1. Another application of the same lemma shows the $p$-adic completion $\Omega_{D(*)}^{i}$ is homotopy equivalent to zero. Tensoring with $M_{*}$ we see that $M_{*} \otimes_{D(*)} \Omega_{D(*)}^{i}$ is homotopic to zero, see Lemma 50.16.1 again. A final application of the $p$-adic completion functor finishes the proot.

### 50.20. Divided power Poincaré lemma

07LB Just the simplest possible version.
07LC Lemma 50.20.1. Let $A$ be a ring. Let $P=A\left\langle x_{i}\right\rangle$ be a divided power polynomial ring over $A$. For any $A$-module $M$ the complex

$$
0 \rightarrow M \rightarrow M \otimes_{A} P \rightarrow M \otimes_{A} \Omega_{P / A, \delta}^{1} \rightarrow M \otimes_{A} \Omega_{P / A, \delta}^{2} \rightarrow \ldots
$$

is exact. Let $D$ be the p-adic completion of $P$. Let $\Omega_{D}^{i}$ be the p-adic completion of the ith exterior power of $\Omega_{D / A, \delta}$. For any p-adically complete $A$-module $M$ the complex

$$
0 \rightarrow M \rightarrow M \otimes_{A}^{\wedge} D \rightarrow M \otimes_{A}^{\wedge} \Omega_{D}^{1} \rightarrow M \otimes_{A}^{\wedge} \Omega_{D}^{2} \rightarrow \ldots
$$

is exact.
Proof. It suffices to show that the complex

$$
E:\left(0 \rightarrow A \rightarrow P \rightarrow \Omega_{P / A, \delta}^{1} \rightarrow \Omega_{P / A, \delta}^{2} \rightarrow \ldots\right)
$$

is homotopy equivalent to zero as a complex of $A$-modules. For every multi-index $K=\left(k_{i}\right)$ we can consider the subcomplex $E(K)$ which in degree $j$ consists of

$$
\bigoplus_{I=\left\{i_{1}, \ldots, i_{j}\right\} \subset \operatorname{Supp}(K)} A \prod_{i \notin I} x_{i}^{\left[k_{i}\right]} \prod_{i \in I} x_{i}^{\left[k_{i}-1\right]} \mathrm{d} x_{i_{1}} \wedge \ldots \wedge \mathrm{~d} x_{i_{j}}
$$

Since $E=\bigoplus E(K)$ we see that it suffices to prove each of the complexes $E(K)$ is homotopic to zero. If $K=0$, then $E(K):(A \rightarrow A)$ is homotopic to zero. If $K$ has nonempty (finite) support $S$, then the complex $E(K)$ is isomorphic to the complex

$$
0 \rightarrow A \rightarrow \bigoplus_{s \in S} A \rightarrow \wedge^{2}\left(\bigoplus_{s \in S} A\right) \rightarrow \ldots \rightarrow \wedge^{\# S}\left(\bigoplus_{s \in S} A\right) \rightarrow 0
$$

which is homotopic to zero, for example by More on Algebra, Lemma 15.22.5.
An alternative (more direct) approach to the following lemma is explained in Example 50.25.2.

07LD Lemma 50.20.2. Let $A$ be a ring. Let $(B, J, \delta)$ be a divided power ring. Let $P=B\left\langle x_{i}\right\rangle$ be a divided power polynomial ring over $B$ with divided power ideal $J=I P+B\left\langle x_{i}\right\rangle_{+}$as usual. Let $M$ be a $B$-module endowed with an integrable connection $\nabla: M \rightarrow M \otimes_{B} \Omega_{B / A, \delta}^{1}$. Then the map of de Rham complexes

$$
M \otimes_{B} \Omega_{B / A, \delta}^{*} \longrightarrow M \otimes_{P} \Omega_{P / A, \delta}^{*}
$$

is a quasi-isomorphism. Let $D$, resp. $D^{\prime}$ be the p-adic completion of $B$, resp. $P$ and let $\Omega_{D}^{i}$, resp. $\Omega_{D^{\prime}}^{i}$ be the p-adic completion of $\Omega_{B / A, \delta}^{i}$, resp. $\Omega_{P / A, \delta}^{i}$. Let $M$
be a p-adically complete $D$-module endowed with an integral connection $\nabla: M \rightarrow$ $M \otimes_{D}^{\hat{D}} \Omega_{D}^{1}$. Then the map of de Rham complexes

$$
M \otimes_{D}^{\wedge} \Omega_{D}^{*} \longrightarrow M \otimes_{D}^{\wedge} \Omega_{D^{\prime}}^{*}
$$

is a quasi-isomorphism.
Proof. Consider the decreasing filtration $F^{*}$ on $\Omega_{B / A, \delta}^{*}$ given by the subcomplexes $F^{i}\left(\Omega_{B / A, \delta}^{*}\right)=\sigma_{\geq i} \Omega_{B / A, \delta}^{*}$. See Homology, Section 12.13 . This induces a decreasing filtration $F^{*}$ on $\Omega_{P / A, \delta}^{*}$ by setting

$$
F^{i}\left(\Omega_{P / A, \delta}^{*}\right)=F^{i}\left(\Omega_{B / A, \delta}^{*}\right) \wedge \Omega_{P / A, \delta}^{*} .
$$

We have a split short exact sequence

$$
0 \rightarrow \Omega_{B / A, \delta}^{1} \otimes_{B} P \rightarrow \Omega_{P / A, \delta}^{1} \rightarrow \Omega_{P / B, \delta}^{1} \rightarrow 0
$$

and the last module is free on $\mathrm{d} x_{i}$. It follows from this that $F^{i}\left(\Omega_{P / A, \delta}^{*}\right) \rightarrow \Omega_{P / A, \delta}^{*}$ is a termwise split injection and that

$$
\operatorname{gr}_{F}^{i}\left(\Omega_{B / A, \delta}^{*}\right)=\Omega_{B / A, \delta}^{i} \otimes_{B} \Omega_{P / B, \delta}^{*}
$$

as complexes. Thus we can define a filtration $F^{*}$ on $M \otimes_{B} \Omega_{B / A, \delta}^{*}$ by setting

$$
F^{i}\left(M \otimes_{B} \Omega_{P / A, \delta}^{*}\right)=M \otimes_{B} F^{i}\left(\Omega_{P / A, \delta}^{*}\right)
$$

and we have

$$
\operatorname{gr}_{F}^{i}\left(M \otimes_{B} \Omega_{P / A, \delta}^{*}\right)=M \otimes_{B} \Omega_{B / A, \delta}^{i} \otimes_{B} \Omega_{P / B, \delta}^{*}
$$

as complexes. By Lemma 50.20.1 each of these complexes is quasi-isomorphic to $M \otimes_{B} \Omega_{B / A, \delta}^{i}$ placed in degree 0 . Hence we see that the first displayed map of the lemma is a morphism of filtered complexes which induces a quasi-isomorphism on graded pieces. This implies that it is a quasi-isomorphism, for example by the spectral sequence associated to a filtered complex, see Homology, Section 12.21
The proof of the second quasi-isomorphism is exactly the same.

### 50.21. Cohomology in the affine case

07LE Let's go back to the situation studied in Section 50.17. We start with $(A, I, \gamma)$ and $A / I \rightarrow C$ and set $X=\operatorname{Spec}(C)$ and $S=\operatorname{Spec}(A)$. Then we choose a polynomial ring $P$ over $A$ and a surjection $P \rightarrow C$ with kernel $J$. We obtain $D$ and $D(n)$ see 50.17.0.1) and 50.17.0.4). Set $T(n)_{e}=\operatorname{Spec}\left(D(n) / p^{e} D(n)\right)$ so that $\left(X, T(n)_{e}, \delta(n)\right)$ is an object of $\operatorname{Cris}(X / S)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X / S}$-modules and set

$$
M(n)=\lim _{e} \Gamma\left(\left(X, T(n)_{e}, \delta(n)\right), \mathcal{F}\right)
$$

for $n=0,1,2,3, \ldots$. This forms a cosimplicial module over the cosimplicial ring $D(0), D(1), D(2), \ldots$.
07JN Proposition 50.21.1. With notations as above assume that
(1) $\mathcal{F}$ is locally quasi-coherent, and
(2) for any morphism $(U, T, \delta) \rightarrow\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ of $\operatorname{Cris}(X / S)$ where $f: T \rightarrow T^{\prime}$ is a closed immersion the map $c_{f}: f^{*} \mathcal{F}_{T^{\prime}} \rightarrow \mathcal{F}_{T}$ is surjective.
Then the complex

$$
M(0) \rightarrow M(1) \rightarrow M(2) \rightarrow \ldots
$$

computes $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$.

Proof. Using assumption (1) and Lemma 50.18 .2 we see that $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ is isomorphic to $R \Gamma(\mathcal{C}, \mathcal{F})$. Note that the categories $\mathcal{C}$ used in Lemmas 50.18 .2 and 50.18 .3 agree. Let $f: T \rightarrow T^{\prime}$ be a closed immersion as in (2). Surjectivity of $c_{f}: f^{*} \mathcal{F}_{T^{\prime}} \rightarrow \mathcal{F}_{T}$ is equivalent to surjectivity of $\mathcal{F}_{T^{\prime}} \rightarrow f_{*} \mathcal{F}_{T}$. Hence, if $\mathcal{F}$ satisfies (1) and (2), then we obtain a short exact sequence

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{T^{\prime}} \rightarrow f_{*} \mathcal{F}_{T} \rightarrow 0
$$

of quasi-coherent $\mathcal{O}_{T^{\prime}-\text { modules on }} T^{\prime}$, see Schemes, Section 25.24 and in particular Lemma 25.24.1. Thus, if $T^{\prime}$ is affine, then we conclude that the restriction map $\mathcal{F}\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right) \rightarrow \mathcal{F}(U, T, \delta)$ is surjective by the vanishing of $H^{1}\left(T^{\prime}, \mathcal{K}\right)$, see Cohomology of Schemes, Lemma 29.2.2. Hence the transition maps of the inverse systems in Lemma 50.18 .3 are surjective. We conclude that that $R^{p} g_{*}\left(\left.\mathcal{F}\right|_{\mathcal{C}}\right)=0$ for all $p \geq 1$ where $g$ is as in Lemma 50.18.3. The object $D$ of the category $\mathcal{C}^{\wedge}$ satisfies the assumption of Lemma 50.18.4 by Lemma 50.5.7 with

$$
D \times \ldots \times D=D(n)
$$

in $\mathcal{C}$ because $D(n)$ is the $n+1$-fold coproduct of $D$ in $\operatorname{Cris}^{\wedge}(C / A)$, see Lemma 50.17.2. Thus we win.

07LF Lemma 50.21.2. Assumptions and notation as in Proposition 50.21.1. Then

$$
H^{j}\left(\operatorname{Cris}(X / S), \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i}\right)=0
$$

for all $i>0$ and all $j \geq 0$.
Proof. Using Lemma 50.12.6 it follows that $\mathcal{H}=\mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i}$ also satisfies assumptions (1) and (2) of Proposition 50.21.1. Write $M(n)_{e}=\Gamma\left(\left(X, T(n)_{e}, \delta(n)\right), \mathcal{F}\right)$ so that $M(n)=\lim _{e} M(n)_{e}$. Then

$$
\begin{aligned}
\lim _{e} \Gamma\left(\left(X, T(n)_{e}, \delta(n)\right), \mathcal{H}\right) & =\lim _{e} M(n)_{e} \otimes_{D(n)_{e}} \Omega_{D(n)} / p^{e} \Omega_{D(n)} \\
& =\lim _{e} M(n)_{e} \otimes_{D(n)} \Omega_{D(n)}
\end{aligned}
$$

By Lemma 50.19.3 the cosimplicial modules

$$
M(0)_{e} \otimes_{D(0)} \Omega_{D(0)}^{i} \rightarrow M(1)_{e} \otimes_{D(1)} \Omega_{D(1)}^{i} \rightarrow M(2)_{e} \otimes_{D(2)} \Omega_{D(2)}^{i} \rightarrow \ldots
$$

are homotopic to zero. Because the transition maps $M(n)_{e+1} \rightarrow M(n)_{e}$ are surjective, we see that the inverse limit of the associated complexes are acycli $4^{5}$. Hence the vanishing of cohomology of $\mathcal{H}$ by Proposition 50.21.1.

07LG Proposition 50.21.3. Assumptions as in Proposition 50.21.1 but now assume that $\mathcal{F}$ is a crystal in quasi-coherent modules. Let $(M, \nabla)$ be the corresponding module with connection over $D$, see Proposition 50.17.4. Then the complex

$$
M \otimes_{D}^{\wedge} \Omega_{D}^{*}
$$

computes $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$.

[^140]Proof. We will prove this using the two spectral sequences associated to the double complex $K^{*, *}$ with terms

$$
K^{a, b}=M \otimes_{D}^{\wedge} \Omega_{D(b)}^{a}
$$

What do we know so far? Well, Lemma 50.19 .3 tells us that each column $K^{a, *}, a>0$ is acyclic. Proposition 50.21.1 tells us that the first column $K^{0, *}$ is quasi-isomorphic to $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$. Hence the first spectral sequence associated to the double complex shows that there is a canonical quasi-isomorphism of $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ with $\operatorname{Tot}\left(K^{*, *}\right)$.
Next, let's consider the rows $K^{*, b}$. By Lemma 50.17 .1 each of the $b+1$ maps $D \rightarrow D(b)$ presents $D(b)$ as the $p$-adic completion of a divided power polynomial algebra over $D$. Hence Lemma 50.20 .2 shows that the map

$$
M \otimes_{D}^{\wedge} \Omega_{D}^{*} \longrightarrow M \otimes_{D(b)}^{\wedge} \Omega_{D(b)}^{*}=K^{*, b}
$$

is a quasi-isomorphism. Note that each of these maps defines the same map on cohomology (and even the same map in the derived category) as the inverse is given by the co-diagonal map $D(b) \rightarrow D$ (corresponding to the multiplication map $\left.P \otimes_{A} \ldots \otimes_{A} P \rightarrow P\right)$. Hence if we look at the $E_{1}$ page of the second spectral sequence we obtain

$$
E_{1}^{a, b}=H^{a}\left(M \otimes_{D}^{\wedge} \Omega_{D}^{*}\right)
$$

with differentials

$$
E_{1}^{a, 0} \xrightarrow{0} E_{1}^{a, 1} \xrightarrow{1} E_{1}^{a, 2} \xrightarrow{0} E_{1}^{a, 3} \xrightarrow{1} \ldots
$$

as each of these is the alternation sum of the given identifications $H^{a}\left(M \otimes_{D}^{\wedge} \Omega_{D}^{*}\right)=$ $E_{1}^{a, 0}=E_{1}^{a, 1}=\ldots$. Thus we see that the $E_{2}$ page is equal $H^{a}\left(M \otimes_{D}^{\wedge} \Omega_{D}^{*}\right)$ on the first row and zero elsewhere. It follows that the identification of $M \otimes_{D}^{\wedge} \Omega_{D}^{*}$ with the first row induces a quasi-isomorphism of $M \otimes_{D} \Omega_{D}^{*}$ with $\operatorname{Tot}\left(K^{*, *}\right)$.

07LH Lemma 50.21.4. Assumptions as in Proposition 50.21.3. Let $A \rightarrow P^{\prime} \rightarrow C$ be ring maps with $A \rightarrow P^{\prime}$ smooth and $P^{\prime} \rightarrow C$ surjective with kernel $J^{\prime}$. Let $D^{\prime}$ be the p-adic completion of $D_{P^{\prime}, \gamma}\left(J^{\prime}\right)$. Let $\left(M^{\prime}, \nabla^{\prime}\right)$ be the pair over $D^{\prime}$ corresponding to $\mathcal{F}$, see Lemma 50.17.5. Then the complex

$$
M^{\prime} \otimes_{D^{\prime}}^{\wedge} \Omega_{D^{\prime}}^{*}
$$

computes $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$.
Proof. Choose $a: D \rightarrow D^{\prime}$ and $b: D^{\prime} \rightarrow D$ as in Lemma 50.17.5 Note that the base change $M=M^{\prime} \otimes_{D^{\prime}, b} D$ with its connection $\nabla$ corresponds to $\mathcal{F}$. Hence we know that $M \otimes_{D}^{\wedge} \Omega_{D}^{*}$ computes the crystalline cohomology of $\mathcal{F}$, see Proposition 50.21.3. Hence it suffices to show that the base change maps (induced by $a$ and $b$ )

$$
M^{\prime} \otimes_{D^{\prime}}^{\wedge} \Omega_{D^{\prime}}^{*} \longrightarrow M \otimes_{D}^{\wedge} \Omega_{D}^{*} \quad \text { and } \quad M \otimes_{D}^{\wedge} \Omega_{D}^{*} \longrightarrow M^{\prime} \otimes_{D^{\prime}}^{\wedge} \Omega_{D^{\prime}}^{*}
$$

are quasi-isomorphisms. Since $a \circ b=\mathrm{id}_{D^{\prime}}$ we see that the composition one way around is the identity on the complex $M^{\prime} \otimes_{D^{\prime}} \Omega_{D^{\prime}}^{*}$. Hence it suffices to show that the map

$$
M \otimes_{D}^{\wedge} \Omega_{D}^{*} \longrightarrow M \otimes_{D}^{\wedge} \Omega_{D}^{*}
$$

induced by $b \circ a: D \rightarrow D$ is a quasi-isomorphism. (Note that we have the same complex on both sides as $M=M^{\prime} \otimes_{D^{\prime}, b}^{\wedge} D$, hence $M \otimes_{D, b \circ a}^{\wedge} D=M^{\prime} \otimes_{D^{\prime}, b \circ a \circ b}^{\wedge}$ $D=M^{\prime} \otimes_{D^{\prime}, b}^{\wedge} D=M$.) In fact, we claim that for any divided power $A$-algebra homomorphism $\rho: D \rightarrow D$ compatible with the augmentation to $C$ the induced $\operatorname{map} M \otimes_{D}^{\wedge} \Omega_{D}^{*} \rightarrow M \otimes_{D, \rho}^{\wedge} \Omega_{D}^{*}$ is a quasi-isomorphism.

Write $\rho\left(x_{i}\right)=x_{i}+z_{i}$. The elements $z_{i}$ are in the divided power ideal of $D$ because $\rho$ is compatible with the augmentation to $C$. Hence we can factor the map $\rho$ as a composition

$$
D \xrightarrow{\sigma} D\left\langle\xi_{i}\right\rangle^{\wedge} \xrightarrow{\tau} D
$$

where the first map is given by $x_{i} \mapsto x_{i}+\xi_{i}$ and the second map is the divided power $D$-algebra map which maps $\xi_{i}$ to $z_{i}$. (This uses the universal properties of polynomial algebra, divided power polynomial algebras, divided power envelopes, and $p$-adic completion.) Note that there exists an automorphism $\alpha$ of $D\left\langle\xi_{i}\right\rangle^{\wedge}$ with $\alpha\left(x_{i}\right)=x_{i}-\xi_{i}$ and $\alpha\left(\xi_{i}\right)=\xi_{i}$. Applying Lemma 50.20 .2 to $\alpha \circ \sigma$ (which maps $x_{i}$ to $x_{i}$ ) and using that $\alpha$ is an isomorphism we conclude that $\sigma$ induces a quasiisomorphism of $M \otimes_{D}^{\wedge} \Omega_{D}^{*}$ with $M \otimes_{D, \sigma}^{\wedge} \Omega_{D\left\langle x_{i}\right\rangle \wedge}^{*}$. On the other hand the map $\tau$ has as a left inverse the map $D \rightarrow D\left\langle x_{i}\right\rangle^{\wedge}, x_{i} \mapsto x_{i}$ and we conclude (using Lemma 50.20 .2 once more) that $\tau$ induces a quasi-isomorphism of $M \otimes_{D, \sigma}^{\wedge} \Omega_{D\left\langle x_{i}\right\rangle \wedge}^{*}$ with $M \otimes_{D, \tau \circ \sigma}^{\prime} \Omega_{D}^{*}$. Composing these two quasi-isomorphisms we obtain that $\rho$ induces a quasi-isomorphism $M \otimes_{D}^{\wedge} \Omega_{D}^{*} \rightarrow M \otimes_{D, \rho}^{\wedge} \Omega_{D}^{*}$ as desired.

### 50.22. Two counter examples

07 LI Before we turn to some of the successes of crystalline cohomology, let us give two examples which explain why crystalline cohomology does not work very well if the schemes in question are either not proper over the base, or singular. The first example can be found in $\mathbf{B O 8 3}$.

07LJ Example 50.22.1. Let $A=\mathbf{Z}_{p}$ with divided power ideal $(p)$ endowed with its unique divided powers $\gamma$. Let $C=\mathbf{F}_{p}[x, y] /\left(x^{2}, x y, y^{2}\right)$. We choose the presentation

$$
C=P / J=\mathbf{Z}_{p}[x, y] /\left(x^{2}, x y, y^{2}, p\right)
$$

Let $D=D_{P, \gamma}(J)^{\wedge}$ with divided power ideal $(\bar{J}, \bar{\gamma})$ as in Section 50.17. We will denote $x, y$ also the images of $x$ and $y$ in $D$. Consider the element

$$
\tau=\bar{\gamma}_{p}\left(x^{2}\right) \bar{\gamma}_{p}\left(y^{2}\right)-\bar{\gamma}_{p}(x y)^{2} \in D
$$

We note that $p \tau=0$ as

$$
p!\bar{\gamma}_{p}\left(x^{2}\right) \bar{\gamma}_{p}\left(y^{2}\right)=x^{2 p} \bar{\gamma}_{p}\left(y^{2}\right)=\bar{\gamma}_{p}\left(x^{2} y^{2}\right)=x^{p} y^{p} \bar{\gamma}_{p}(x y)=p!\bar{\gamma}_{p}(x y)^{2}
$$

in $D$. We also note that $\mathrm{d} \tau=0$ in $\Omega_{D}$ as

$$
\begin{aligned}
\mathrm{d}\left(\bar{\gamma}_{p}\left(x^{2}\right) \bar{\gamma}_{p}\left(y^{2}\right)\right) & =\bar{\gamma}_{p-1}\left(x^{2}\right) \bar{\gamma}_{p}\left(y^{2}\right) \mathrm{d} x^{2}+\bar{\gamma}_{p}\left(x^{2}\right) \bar{\gamma}_{p-1}\left(y^{2}\right) \mathrm{d} y^{2} \\
& =2 x \bar{\gamma}_{p-1}\left(x^{2}\right) \bar{\gamma}_{p}\left(y^{2}\right) \mathrm{d} x+2 y \bar{\gamma}_{p}\left(x^{2}\right) \bar{\gamma}_{p-1}\left(y^{2}\right) \mathrm{d} y \\
& =2 /(p-1)!\left(x^{2 p-1} \bar{\gamma}_{p}\left(y^{2}\right) \mathrm{d} x+y^{2 p-1} \bar{\gamma}_{p}\left(x^{2}\right) \mathrm{d} y\right) \\
& =2 /(p-1)!\left(x^{p-1} \bar{\gamma}_{p}\left(x y^{2}\right) \mathrm{d} x+y^{p-1} \bar{\gamma}_{p}\left(x^{2} y\right) \mathrm{d} y\right) \\
& =2 /(p-1)!\left(x^{p-1} y^{p} \bar{\gamma}_{p}(x y) \mathrm{d} x+x^{p} y^{p-1} \bar{\gamma}_{p}(x y) \mathrm{d} y\right) \\
& =2 \bar{\gamma}_{p-1}(x y) \bar{\gamma}_{p}(x y)(y \mathrm{~d} x+x \mathrm{~d} y) \\
& =\mathrm{d}\left(\bar{\gamma}_{p}(x y)^{2}\right)
\end{aligned}
$$

Finally, we claim that $\tau \neq 0$ in $D$. To see this it suffices to produce an object $\left(B \rightarrow \mathbf{F}_{p}[x, y] /\left(x^{2}, x y, y^{2}\right), \delta\right)$ of $\operatorname{Cris}(C / S)$ such that $\tau$ does not map to zero in $B$. To do this take

$$
B=\mathbf{F}_{p}[x, y, u, v] /\left(x^{3}, x^{2} y, x y^{2}, y^{3}, x u, y u, x v, y v, u^{2}, v^{2}\right)
$$

with the obvious surjection to $C$. Let $K=\operatorname{Ker}(B \rightarrow C)$ and consider the map

$$
\delta_{p}: K \longrightarrow K, \quad a y^{2}+b x y+c y^{2}+d u+e v+f u v \longmapsto a^{p} u+c^{p} v
$$

One checks this satisfies the assumptions (1), (2), (3) of Divided Power Algebra, Lemma 23.5.3 and hence defines a divided power structure. Moreover, we see that $\tau$ maps to $u v$ which is not zero in $B$. Set $X=\operatorname{Spec}(C)$ and $S=\operatorname{Spec}(A)$. We draw the following conclusions
(1) $H^{0}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ has $p$-torsion, and
(2) pulling back by frobenius $F^{*}: H^{0}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right) \rightarrow H^{0}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ is not injective.
Namely, $\tau$ defines a nonzero torsion element of $H^{0}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ by Proposition 50.21.3. Similarly, $F^{*}(\tau)=\sigma(\tau)$ where $\sigma: D \rightarrow D$ is the map induced by any lift of Frobenius on $P$. If we choose $\sigma(x)=x^{p}$ and $\sigma(y)=y^{p}$, then an easy computation shows that $F^{*}(\tau)=0$.

The next example shows that even for affine $n$-space crystalline cohomology does not give the correct thing.

07LK Example 50.22.2. Let $A=\mathbf{Z}_{p}$ with divided power ideal $(p)$ endowed with its unique divided powers $\gamma$. Let $C=\mathbf{F}_{p}\left[x_{1}, \ldots, x_{r}\right]$. We choose the presentation

$$
C=P / J=P / p P \quad \text { with } \quad P=\mathbf{Z}_{p}\left[x_{1}, \ldots, x_{r}\right]
$$

Note that $p P$ has divided powers by Divided Power Algebra, Lemma 23.4.2 Hence setting $D=P^{\wedge}$ with divided power ideal $(p)$ we obtain a situation as in Section 50.17. We conclude that $R \Gamma\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ is represented by the complex

$$
D \rightarrow \Omega_{D}^{1} \rightarrow \Omega_{D}^{2} \rightarrow \ldots \rightarrow \Omega_{D}^{r}
$$

see Proposition 50.21.3. Assuming $r>0$ we conclude the following
(1) The cristalline cohomology of the cristalline structure sheaf of $X=\mathbf{A}_{\mathbf{F}_{p}}^{r}$ over $S=\operatorname{Spec}\left(\mathbf{Z}_{p}\right)$ is zero except in degrees $0, \ldots, r$.
(2) We have $H^{0}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)=\mathbf{Z}_{p}$.
(3) The cohomology group $H^{r}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ is infinite and is not a torsion abelian group.
(4) The cohomology group $H^{r}\left(\operatorname{Cris}(X / S), \mathcal{O}_{X / S}\right)$ is not separated for the $p$ adic topology.
While the first two statements are reasonable, parts (3) and (4) are disconcerting! The truth of these statements follows immediately from working out what the complex displayed above looks like. Let's just do this in case $r=1$. Then we are just looking at the two term complex of $p$-adically complete modules

$$
\mathrm{d}: D=\left(\bigoplus_{n \geq 0} \mathbf{Z}_{p} x^{n}\right)^{\wedge} \longrightarrow \Omega_{D}^{1}=\left(\bigoplus_{n \geq 1} \mathbf{Z}_{p} x^{n-1} \mathrm{~d} x\right)^{\wedge}
$$

The map is given by $\operatorname{diag}(0,1,2,3,4, \ldots)$ except that the first summand is missing on the right hand side. Now it is clear that $\bigoplus_{n>0} \mathbf{Z}_{p} / n \mathbf{Z}_{p}$ is a subgroup of the cokernel, hence the cokernel is infinite. In fact, the element

$$
\omega=\sum_{e>0} p^{e} x^{p^{2 e}-1} \mathrm{~d} x
$$

is clearly not a torsion element of the cokernel. But it gets worse. Namely, consider the element

$$
\eta=\sum_{e>0} p^{e} x^{p^{e}-1} \mathrm{~d} x
$$

For every $t>0$ the element $\eta$ is congruent to $\sum_{e>t} p^{e} x^{p^{e}-1} \mathrm{~d} x$ modulo the image of d which is divisible by $p^{t}$. But $\eta$ is not in the image of d because it would have to be the image of $a+\sum_{e>0} x^{p^{e}}$ for some $a \in \mathbf{Z}_{p}$ which is not an element of the left hand side. In fact, $p^{N} \eta$ is similarly not in the image of d for any integer $N$. This implies that $\eta$ "generates" a copy of $\mathbf{Q}_{p}$ inside of $H_{\text {cris }}^{1}\left(\mathbf{A}_{\mathbf{F}_{p}}^{1} / \operatorname{Spec}\left(\mathbf{Z}_{p}\right)\right)$.

### 50.23. Applications

07 LL In this section we collect some applications of the material in the previous sections.
07LM Proposition 50.23.1. In Situation 50.7.5. Let $\mathcal{F}$ be a crystal in quasi-coherent modules on Cris $(X / S)$. The truncation map of complexes

$$
\left(\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{1} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{2} \rightarrow \ldots\right) \longrightarrow \mathcal{F}[0]
$$

while not a quasi-isomorphism, becomes a quasi-isomorphism after applying $R u_{X / S, *}$. In fact, for any $i>0$, we have

$$
R u_{X / S, *}\left(\mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i}\right)=0
$$

Proof. By Lemma 50.15.1 we get a de Rham complex as indicated in the lemma. We abbreviate $\mathcal{H}=\mathcal{F} \otimes \Omega_{X / S}^{i}$. Let $X^{\prime} \subset X$ be an affine open subscheme which maps into an affine open subscheme $S^{\prime} \subset S$. Then

$$
\left.\left(R u_{X / S, *} \mathcal{H}\right)\right|_{X_{Z a r}^{\prime}}=R u_{X^{\prime} / S^{\prime}, *}\left(\left.\mathcal{H}\right|_{\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right)}\right)
$$

see Lemma 50.9.5. Thus Lemma 50.21 .2 shows that $R u_{X / S, *} \mathcal{H}$ is a complex of sheaves on $X_{Z a r}$ whose cohomology on any affine open is trivial. As $X$ has a basis for its topology consisting of affine opens this implies that $R u_{X / S, *} \mathcal{H}$ is quasiisomorphic to zero.

07LN Remark 50.23.2. The proof of Proposition 50.23 .1 shows that the conclusion

$$
R u_{X / S, *}\left(\mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i}\right)=0
$$

for $i>0$ is true for any $\mathcal{O}_{X / S}$-module $\mathcal{F}$ which satisfies conditions (1) and (2) of Proposition 50.21.1. This applies to the following non-crystals: $\Omega_{X / S}^{i}$ for all $i$, and any sheaf of the form $\underline{\mathcal{F}}$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module. In particular, it applies to the sheaf $\underline{\mathcal{O}_{X}}=\underline{\mathbf{G}_{a}}$. But note that we need something like Lemma50.15.1 to produce a de Rham complex which requires $\mathcal{F}$ to be a crystal. Hence (currently) the collection of sheaves of modules for which the full statement of Proposition 50.23 .1 holds is exactly the category of crystals in quasi-coherent modules.

In Situation 50.7.5 Let $\mathcal{F}$ be a crystal in quasi-coherent modules on $\operatorname{Cris}(X / S)$. Let $(U, T, \delta)$ be an object of $\operatorname{Cris}(X / S)$. Proposition 50.23 .1 allows us to construct a canonical map

07LP

$$
\begin{equation*}
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F}) \longrightarrow R \Gamma\left(T, \mathcal{F}_{T} \otimes_{\mathcal{O}_{T}} \Omega_{T / S, \delta}^{*}\right) \tag{50.23.2.1}
\end{equation*}
$$

Namely, we have $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=R \Gamma\left(\operatorname{Cris}(X / S), \mathcal{F} \otimes \Omega_{X / S}^{*}\right)$, we can restrict global cohomology classes to $T$, and $\Omega_{X / S}$ restricts to $\Omega_{T / S, \delta}$ by Lemma 50.12.3.

### 50.24. Some further results

07 MI In this section we mention some results whose proof is missing. We will formulate these as a series of remarks and we will convert them into actual lemmas and propositions only when we add detailed proofs.

07MJ Remark 50.24.1 (Higher direct images). Let $p$ be a prime number. Let $(S, \mathcal{I}, \gamma) \rightarrow$ $\left(S^{\prime}, \mathcal{I}^{\prime}, \gamma^{\prime}\right)$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Let

be a commutative diagram of morphisms of schemes and assume $p$ is locally nilpotent on $X$ and $X^{\prime}$. Let $\mathcal{F}$ be an $\mathcal{O}_{X / S}$-module on $\operatorname{Cris}(X / S)$. Then $R f_{\text {cris,* }} \mathcal{F}$ can be computed as follows.

Given an object $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ of $\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right)$ set $U=X \times{ }_{X^{\prime}} U^{\prime}=f^{-1}\left(U^{\prime}\right)$ (an open subscheme of $X$ ). Denote $\left(T_{0}, T, \delta\right)$ the divided power scheme over $S$ such that

is cartesian in the category of divided power schemes, see Lemma 50.7.4 There is an induced morphism $U \rightarrow T_{0}$ and we obtain a morphism $(U / T)_{\text {cris }} \rightarrow(X / S)_{\text {cris }}$, see Remark 50.9.3 Let $\mathcal{F}_{U}$ be the pullback of $\mathcal{F}$. Let $\tau_{U / T}:(U / T)_{\text {cris }} \rightarrow T_{Z a r}$ be the structure morphism. Then we have

07MK

$$
\begin{equation*}
\left(R f_{\text {cris }, *} \mathcal{F}\right)_{T^{\prime}}=R\left(T \rightarrow T^{\prime}\right)_{*}\left(R \tau_{U / T, *} \mathcal{F}_{U}\right) \tag{50.24.1.1}
\end{equation*}
$$

where the left hand side is the restriction (see Section 50.10).
Hints: First, show that $\operatorname{Cris}(U / T)$ is the localization (in the sense of Sites, Lemma 7.29.3 of $\operatorname{Cris}(X / S)$ at the sheaf of sets $f_{\text {cris }}^{-1} h_{\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)}$. Next, reduce the statement to the case where $\mathcal{F}$ is an injective module and pushforward of modules using that the pullback of an injective $\mathcal{O}_{X / S}$-module is an injective $\mathcal{O}_{U / T}$-module on $\operatorname{Cris}(U / T)$. Finally, check the result holds for plain pushforward.

07ML Remark 50.24.2 (Mayer-Vietoris). In the situation of Remark 50.24.1 suppose we have an open covering $X=X^{\prime} \cup X^{\prime \prime}$. Denote $X^{\prime \prime \prime}=X^{\prime} \cap X^{\prime \prime}$. Let $f^{\prime}$, $f^{\prime \prime}$, and $f^{\prime \prime}$ be the restriction of $f$ to $X^{\prime}, X^{\prime \prime}$, and $X^{\prime \prime \prime}$. Moreover, Let $\mathcal{F}^{\prime}, \mathcal{F}^{\prime \prime}$, and $\mathcal{F}^{\prime \prime \prime}$ be the restriction of $\mathcal{F}$ to the crystalline sites of $X^{\prime}, X^{\prime \prime}$, and $X^{\prime \prime \prime}$. Then there exists a distinguished triangle

$$
R f_{\text {cris }, *} \mathcal{F} \longrightarrow R f_{\text {cris }, *}^{\prime} \mathcal{F}^{\prime} \oplus R f_{\text {cris }, *}^{\prime \prime} \mathcal{F}^{\prime \prime} \longrightarrow R f_{\text {cris }, *}^{\prime \prime \prime} \mathcal{F}^{\prime \prime \prime} \longrightarrow R f_{\text {cris }, *} \mathcal{F}[1]
$$

in $D\left(\mathcal{O}_{X^{\prime} / S^{\prime}}\right)$.
Hints: This is a formal consequence of the fact that the subcategories $\operatorname{Cris}\left(X^{\prime} / S\right)$, $\operatorname{Cris}\left(X^{\prime \prime} / S\right)$, Cris $\left(X^{\prime \prime \prime} / S\right)$ correspond to open subobjects of the final sheaf on Cris $(X / S)$ and that the last is the intersection of the first two.

07MM Remark 50.24.3 (Čech complex). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $A$ a $\mathbf{Z}_{(p)}$-algebra. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $X$ be a separated ${ }^{6}$ scheme over $S_{0}$ such that $p$ is locally nilpotent on $X$. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules.
Choose an affine open covering $X=\bigcup_{\lambda \in \Lambda} U_{\lambda}$ of $X$. Write $U_{\lambda}=\operatorname{Spec}\left(C_{\lambda}\right)$. Choose a polynomial algebra $P_{\lambda}$ over $A$ and a surjection $P_{\lambda} \rightarrow C_{\lambda}$. Having fixed these choices we can construct a Čech complex which computes $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$.

Given $n \geq 0$ and $\lambda_{0}, \ldots, \lambda_{n} \in \Lambda$ write $U_{\lambda_{0} \ldots \lambda_{n}}=U_{\lambda_{0}} \cap \ldots \cap U_{\lambda_{n}}$. This is an affine scheme by assumption. Write $U_{\lambda_{0} \ldots \lambda_{n}}=\operatorname{Spec}\left(C_{\lambda_{0} \ldots \lambda_{n}}\right)$. Set

$$
P_{\lambda_{0} \ldots \lambda_{n}}=P_{\lambda_{0}} \otimes_{A} \ldots \otimes_{A} P_{\lambda_{n}}
$$

which comes with a canonical surjection onto $C_{\lambda_{0} \ldots \lambda_{n}}$. Denote the kernel $J_{\lambda_{0} \ldots \lambda_{n}}$ and set $D_{\lambda_{0} \ldots \lambda_{n}}$ the $p$-adically completed divided power envelope of $J_{\lambda_{0} \ldots \lambda_{n}}$ in $P_{\lambda_{0} \ldots \lambda_{n}}$ relative to $\gamma$. Let $M_{\lambda_{0} \ldots \lambda_{n}}$ be the $P_{\lambda_{0} \ldots \lambda_{n}}$-module corresponding to the restriction of $\mathcal{F}$ to $\operatorname{Cris}\left(U_{\lambda_{0} \ldots \lambda_{n}} / S\right)$ via Proposition 50.17.4. By construction we obtain a cosimplicial divided power ring $D(*)$ having in degree $n$ the ring

$$
D(n)=\prod_{\lambda_{0} \ldots \lambda_{n}} D_{\lambda_{0} \ldots \lambda_{n}}
$$

(use that divided power envelopes are functorial and the trivial cosimplicial structure on the ring $P(*)$ defined similarly). Since $M_{\lambda_{0} \ldots \lambda_{n}}$ is the "value" of $\mathcal{F}$ on the objects $\operatorname{Spec}\left(D_{\lambda_{0} \ldots \lambda_{n}}\right)$ we see that $M(*)$ defined by the rule

$$
M(n)=\prod_{\lambda_{0} \ldots \lambda_{n}} M_{\lambda_{0} \ldots \lambda_{n}}
$$

forms a cosimplicial $D(*)$-module. Now we claim that we have

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=s(M(*))
$$

Here $s(-)$ denotes the cochain complex associated to a cosimplicial module (see Simplicial, Section 14.25 .
Hints: The proof of this is similar to the proof of Proposition 50.21.1 (in particular the result holds for any module satisfying the assumptions of that proposition).

07MN Remark 50.24.4 (Alternating Čech complex). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $A$ a $\mathbf{Z}_{(p)}$-algebra. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $X$ be a separated quasi-compact scheme over $S_{0}$ such that $p$ is locally nilpotent on $X$. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules.
Choose a finite affine open covering $X=\bigcup_{\lambda \in \Lambda} U_{\lambda}$ of $X$ and a total ordering on $\Lambda$. Write $U_{\lambda}=\operatorname{Spec}\left(C_{\lambda}\right)$. Choose a polynomial algebra $P_{\lambda}$ over $A$ and a surjection $P_{\lambda} \rightarrow C_{\lambda}$. Having fixed these choices we can construct an alternating Čech complex which computes $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$.

We are going to use the notation introduced in Remark 50.24.3. Denote $\Omega_{\lambda_{0} \ldots \lambda_{n}}$ the $p$-adically completed module of differentials of $D_{\lambda_{0} \ldots \lambda_{n}}$ over $A$ compatible with the divided power structure. Let $\nabla$ be the integrable connection on $M_{\lambda_{0} \ldots \lambda_{n}}$ coming from Proposition 50.17.4 Consider the double complex $M^{\bullet \bullet \bullet}$ with terms

$$
M^{n, m}=\bigoplus_{\lambda_{0}<\ldots<\lambda_{n}} M_{\lambda_{0} \ldots \lambda_{n}} \otimes_{D_{\lambda_{0} \ldots \lambda_{n}}} \Omega_{D_{\lambda_{0} \ldots \lambda_{n}}}^{m}
$$

[^141]For the differential $d_{1}$ (increasing $n$ ) we use the usual Čech differential and for the differential $d_{2}$ we use the connection, i.e., the differential of the de Rham complex. We claim that

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=\operatorname{Tot}\left(M^{\bullet \bullet \bullet}\right)
$$

Here $\operatorname{Tot}(-)$ denotes the total complex associated to a double complex, see Homology, Definition 12.22.3.

Hints: We have

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=R \Gamma\left(\operatorname{Cris}(X / S), \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{\bullet}\right)
$$

by Proposition 50.23.1. The right hand side of the formula is simply the alternating Čech complex for the covering $X=\bigcup_{\lambda \in \Lambda} U_{\lambda}$ (which induces an open covering of the final sheaf of $\operatorname{Cris}(X / S))$ and the complex $\mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{\bullet}$, see Proposition 50.21.3. Now the result follows from a general result in cohomology on sites, namely that the alternating Čech complex computes the cohomology provided it gives the correct answer on all the pieces (insert future reference here).

07MP Remark 50.24.5 (Quasi-coherence). In the situation of Remark 50.24.1 assume that $S \rightarrow S^{\prime}$ is quasi-compact and quasi-separated and that $X \rightarrow S_{0}$ is quasicompact and quasi-separated. Then for a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules $\mathcal{F}$ the sheaves $R^{i} f_{\text {cris }, *} \mathcal{F}$ are locally quasi-coherent.

Hints: We have to show that the restrictions to $T^{\prime}$ are quasi-coherent $\mathcal{O}_{T^{\prime}}$-modules, where $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ is any object of $\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right)$. It suffices to do this when $T^{\prime}$ is affine. We use the formula 50.24.1.1), the fact that $T \rightarrow T^{\prime}$ is quasi-compact and quasiseparated (as $T$ is affine over the base change of $T^{\prime}$ by $S \rightarrow S^{\prime}$ ), and Cohomology of Schemes, Lemma 29.4.5 to see that it suffices to show that the sheaves $R^{i} \tau_{U / T, *} \mathcal{F}_{U}$ are quasi-coherent. Note that $U \rightarrow T_{0}$ is also quasi-compact and quasi-separated, see Schemes, Lemmas 25.21.15 and 25.21.15.

This reduces us to proving that $R^{i} \tau_{X / S, *} \mathcal{F}$ is quasi-coherent on $S$ in the case that $p$ locally nilpotent on $S$. Here $\tau_{X / S}$ is the structure morphism, see Remark 50.9.6. We may work locally on $S$, hence we may assume $S$ affine (see Lemma 50.9.5). Induction on the number of affines covering $X$ and Mayer-Vietoris (Remark 50.24 .2 ) reduces the question to the case where $X$ is also affine (as in the proof of Cohomology of Schemes, Lemma 29.4.5). Say $X=\operatorname{Spec}(C)$ and $S=\operatorname{Spec}(A)$ so that $(A, I, \gamma)$ and $A \rightarrow C$ are as in Situation 50.5.1. Choose a polynomial algebra $P$ over $A$ and a surjection $P \rightarrow C$ as in Section 50.17. Let $(M, \nabla)$ be the module corresponding to $\mathcal{F}$, see Proposition 50.17.4. Applying Proposition 50.21.3 we see that $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ is represented by $M \otimes_{D} \Omega_{D}^{*}$. Note that completion isn't necessary as $p$ is nilpotent in $A$ ! We have to show that this is compatible with taking principal opens in $S=\operatorname{Spec}(A)$. Suppose that $g \in A$. Then we conclude that similarly $R \Gamma\left(\operatorname{Cris}\left(X_{g} / S_{g}\right), \mathcal{F}\right)$ is computed by $M_{g} \otimes_{D_{g}} \Omega_{D_{g}}^{*}$ (again this uses that $p$-adic completion isn't necessary). Hence we conclude because localization is an exact functor on $A$-modules.

07MQ Remark 50.24.6 (Boundedness). In the situation of Remark 50.24.1 assume that $S \rightarrow S^{\prime}$ is quasi-compact and quasi-separated and that $X \rightarrow S_{0}$ is of finite type and quasi-separated. Then there exists an integer $i_{0}$ such that for any crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules $\mathcal{F}$ we have $R^{i} f_{\text {cris }, *} \mathcal{F}=0$ for all $i>i_{0}$.

Hints: Arguing as in Remark 50.24.5 (using Cohomology of Schemes, Lemma 29.4.5) we reduce to proving that $H^{i}(\operatorname{Cris}(X / S), \mathcal{F})=0$ for $i \gg 0$ in the situation of Proposition 50.21.3 when $C$ is a finite type algebra over $A$. This is clear as we can choose a finite polynomial algebra and we see that $\Omega_{D}^{i}=0$ for $i \gg 0$.
07MR Remark 50.24.7 (Specific boundedness). In Situation 50.7.5 let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules. Assume that $S_{0}$ has a unique point and that $X \rightarrow S_{0}$ is of finite presentation.
(1) If $\operatorname{dim} X=d$ and $X / S_{0}$ has embedding dimension $e$, then $H^{i}(\operatorname{Cris}(X / S), \mathcal{F})=$ 0 for $i>d+e$.
(2) If $X$ is separated and can be covered by $q$ affines, and $X / S_{0}$ has embedding dimension $e$, then $H^{i}(\operatorname{Cris}(X / S), \mathcal{F})=0$ for $i>q+e$.
Hints: In case (1) we can use that

$$
H^{i}(\operatorname{Cris}(X / S), \mathcal{F})=H^{i}\left(X_{Z a r}, R u_{X / S, *} \mathcal{F}\right)
$$

and that $R u_{X / S, *} \mathcal{F}$ is locally calculated by a de Rham complex constructed using an embedding of $X$ into a smooth scheme of dimension $e$ over $S$ (see Lemma 50.21.4). These de Rham complexes are zero in all degrees $>e$. Hence (1) follows from Cohomology, Proposition 20.21.6 In case (2) we use the alternating Čech complex (see Remark 50.24.4) to reduce to the case $X$ affine. In the affine case we prove the result using the de Rham complex associated to an embedding of $X$ into a smooth scheme of dimension $e$ over $S$ (it takes some work to construct such a thing).

07MS Remark 50.24 .8 (Base change map). In the situation of Remark 50.24.1 assume $S=\operatorname{Spec}(A)$ and $S^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ are affine. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}_{X^{\prime} / S^{\prime}}$-module. Let $\mathcal{F}$ be the pullback of $\mathcal{F}^{\prime}$. Then there is a canonical base change map

$$
L\left(S^{\prime} \rightarrow S\right)^{*} R \tau_{X^{\prime} / S^{\prime}, *} \mathcal{F}^{\prime} \longrightarrow R \tau_{X / S, *} \mathcal{F}
$$

where $\tau_{X / S}$ and $\tau_{X^{\prime} / S^{\prime}}$ are the structure morphisms, see Remark 50.9.6. On global sections this gives a base change map
07MT (50.24.8.1)

$$
R \Gamma\left(\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right), \mathcal{F}^{\prime}\right) \otimes_{A^{\prime}}^{\mathbf{L}} A \longrightarrow R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})
$$

in $D(A)$.
Hint: Compose the very general base change map of Cohomology on Sites, Remark 21.19 .2 with the canonical map $L f_{\text {cris }}^{*} \mathcal{F}^{\prime} \rightarrow f_{\text {cris }}^{*} \mathcal{F}^{\prime}=\mathcal{F}$.

07MU Remark 50.24.9 (Base change isomorphism). The map 50.24.8.1 is an isomorphism provided all of the following conditions are satisfied:
(1) $p$ is nilpotent in $A^{\prime}$,
(2) $\mathcal{F}^{\prime}$ is a crystal in quasi-coherent $\mathcal{O}_{X^{\prime} / S^{\prime}}$-modules,
(3) $X^{\prime} \rightarrow S_{0}^{\prime}$ is a quasi-compact, quasi-separated morphism,
(4) $X=X^{\prime} \times_{S_{0}^{\prime}} S_{0}$,
(5) $\mathcal{F}^{\prime}$ is a flat $\mathcal{O}_{X^{\prime} / S^{\prime}}$-module,
(6) $X^{\prime} \rightarrow S_{0}^{\prime}$ is a local complete intersection morphism (see More on Morphisms, Definition 36.44.2 this holds for example if $X^{\prime} \rightarrow S_{0}^{\prime}$ is syntomic or smooth),
(7) $X^{\prime}$ and $S_{0}$ are Tor independent over $S_{0}^{\prime}$ (see More on Algebra, Definition 15.51.1 this holds for example if either $S_{0} \rightarrow S_{0}^{\prime}$ or $X^{\prime} \rightarrow S_{0}^{\prime}$ is flat).

Hints: Condition (1) means that in the arguments below $p$-adic completion does nothing and can be ignored. Using condition (3) and Mayer Vietoris (see Remark 50.24 .2 this reduces to the case where $X^{\prime}$ is affine. In fact by condition (6), after shrinking further, we can assume that $X^{\prime}=\operatorname{Spec}\left(C^{\prime}\right)$ and we are given a presentation $C^{\prime}=A^{\prime} / I^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}^{\prime}, \ldots, \bar{f}_{c}^{\prime}\right)$ where $\bar{f}_{1}^{\prime}, \ldots, \bar{f}_{c}^{\prime}$ is a Koszulregular sequence in $A^{\prime} / I^{\prime}$. (This means that smooth locally $\bar{f}_{1}^{\prime}, \ldots, \bar{f}_{c}^{\prime}$ forms a regular sequence, see More on Algebra, Lemma 15.23.17.) We choose a lift of $\bar{f}_{i}^{\prime}$ to an element $f_{i}^{\prime} \in A^{\prime}\left[x_{1}, \ldots, x_{n}\right]$. By (4) we see that $X=\operatorname{Spec}(C)$ with $C=A / I\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ where $f_{i} \in A\left[x_{1}, \ldots, x_{n}\right]$ is the image of $f_{i}^{\prime}$. By property (7) we see that $\bar{f}_{1}, \ldots, \bar{f}_{c}$ is a Koszul-regular sequence in $A / I\left[x_{1}, \ldots, x_{n}\right]$. The divided power envelope of $I^{\prime} A^{\prime}\left[x_{1}, \ldots, x_{n}\right]+\left(f_{1}^{\prime}, \ldots, f_{c}^{\prime}\right)$ in $A^{\prime}\left[x_{1}, \ldots, x_{n}\right]$ relative to $\gamma^{\prime}$ is

$$
D^{\prime}=A^{\prime}\left[x_{1}, \ldots, x_{n}\right]\left\langle\xi_{1}, \ldots, \xi_{c}\right\rangle /\left(\xi_{i}-f_{i}^{\prime}\right)
$$

see Lemma 50.2.4. Then you check that $\xi_{1}-f_{1}^{\prime}, \ldots, \xi_{n}-f_{n}^{\prime}$ is a Koszul-regular sequence in the ring $A^{\prime}\left[x_{1}, \ldots, x_{n}\right]\left\langle\xi_{1}, \ldots, \xi_{c}\right\rangle$. Similarly the divided power envelope of $I A\left[x_{1}, \ldots, x_{n}\right]+\left(f_{1}, \ldots, f_{c}\right)$ in $A\left[x_{1}, \ldots, x_{n}\right]$ relative to $\gamma$ is

$$
D=A\left[x_{1}, \ldots, x_{n}\right]\left\langle\xi_{1}, \ldots, \xi_{c}\right\rangle /\left(\xi_{i}-f_{i}\right)
$$

and $\xi_{1}-f_{1}, \ldots, \xi_{n}-f_{n}$ is a Koszul-regular sequence in the ring $A\left[x_{1}, \ldots, x_{n}\right]\left\langle\xi_{1}, \ldots, \xi_{c}\right\rangle$. It follows that $D^{\prime} \otimes_{A^{\prime}}^{\mathbf{L}} A=D$. Condition (2) implies $\mathcal{F}^{\prime}$ corresponds to a pair $\left(M^{\prime}, \nabla\right)$ consisting of a $D^{\prime}$-module with connection, see Proposition 50.17.4. Then $M=M^{\prime} \otimes_{D^{\prime}} D$ corresponds to the pullback $\mathcal{F}$. By assumption (5) we see that $M^{\prime}$ is a flat $D^{\prime}$-module, hence

$$
M=M^{\prime} \otimes_{D^{\prime}} D=M^{\prime} \otimes_{D^{\prime}} D^{\prime} \otimes_{A^{\prime}}^{\mathbf{L}} A=M^{\prime} \otimes_{A^{\prime}}^{\mathbf{L}} A
$$

Since the modules of differentials $\Omega_{D^{\prime}}$ and $\Omega_{D}$ (as defined in Section50.17) are free $D^{\prime}$-modules on the same generators we see that

$$
M \otimes_{D} \Omega_{D}^{\bullet}=M^{\prime} \otimes_{D^{\prime}} \Omega_{D^{\prime}}^{\bullet} \otimes_{D^{\prime}} D=M^{\prime} \otimes_{D^{\prime}} \Omega_{D^{\prime}}^{\bullet} \otimes_{A^{\prime}}^{\mathbf{L}} A
$$

which proves what we want by Proposition 50.21.3.
07MV Remark 50.24.10 (Rlim). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $A$ an algebra over $\mathbf{Z}_{(p)}$ with $p$ nilpotent in $A / I$. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $X$ be a scheme over $S_{0}$ with $p$ locally nilpotent on $X$. Let $\mathcal{F}$ be any $\mathcal{O}_{X / S}$-module. For $e \gg 0$ we have $\left(p^{e}\right) \subset I$ is preserved by $\gamma$, see Divided Power Algebra, Lemma 23.4.5. Set $S_{e}=\operatorname{Spec}\left(A / p^{e} A\right)$ for $e \gg 0$. Then $\operatorname{Cris}\left(X / S_{e}\right)$ is a full subcategory of $\operatorname{Cris}(X / S)$ and we denote $\mathcal{F}_{e}$ the restriction of $\mathcal{F}$ to $\operatorname{Cris}\left(X / S_{e}\right)$. Then

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=R \lim _{e} R \Gamma\left(\operatorname{Cris}\left(X / S_{e}\right), \mathcal{F}_{e}\right)
$$

Hints: Suffices to prove this for $\mathcal{F}$ injective. In this case the sheaves $\mathcal{F}_{e}$ are injective modules too, the transition maps $\Gamma\left(\mathcal{F}_{e+1}\right) \rightarrow \Gamma\left(\mathcal{F}_{e}\right)$ are surjective, and we have $\Gamma(\mathcal{F})=\lim _{e} \Gamma\left(\mathcal{F}_{e}\right)$ because any object of $\operatorname{Cris}(X / S)$ is locally an object of one of the categories $\operatorname{Cris}\left(X / S_{e}\right)$ by definition of $\operatorname{Cris}(X / S)$.
07MW Remark 50.24.11 (Comparison). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $p$ nilpotent in $A$. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $Y$ be a smooth scheme over $S$ and set $X=Y \times{ }_{S} S_{0}$. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules. Then
(1) $\gamma$ extends to a divided power structure on the ideal of $X$ in $Y$ so that $(X, Y, \gamma)$ is an object of $\operatorname{Cris}(X / S)$,
(2) the restriction $\mathcal{F}_{Y}$ (see Section 50.10) comes endowed with a canonical integrable connection $\nabla: \mathcal{F}_{Y} \rightarrow \mathcal{F}_{Y} \otimes_{\mathcal{O}_{Y}} \Omega_{Y / S}$, and
(3) we have

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=R \Gamma\left(Y, \mathcal{F}_{Y} \otimes_{\mathcal{O}_{Y}} \Omega_{Y / S}^{\bullet}\right)
$$

in $D(A)$.
Hints: See Divided Power Algebra, Lemma 23.4.2 for (1). See Lemma 50.15.1 for (2). For Part (3) note that there is a map, see (50.23.2.1). This map is an isomorphism when $X$ is affine, see Lemma 50.21.4. This shows that $R u_{X / S, *} \mathcal{F}$ and $\mathcal{F}_{Y} \otimes$ $\Omega_{Y / S}^{\bullet}$ are quasi-isomorphic as complexes on $Y_{Z a r}=X_{Z a r}$. Since $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=$ $R \Gamma\left(X_{Z a r}, R u_{X / S, *} \mathcal{F}\right)$ the result follows.

07MX Remark 50.24.12 (Perfectness). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $p$ nilpotent in $A$. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $X$ be a proper smooth scheme over $S_{0}$. Let $\mathcal{F}$ be a crystal in finite locally free quasi-coherent $\mathcal{O}_{X / S}$-modules. Then $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ is a perfect object of $D(A)$.
Hints: By Remark 50.24.9 we have

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F}) \otimes_{A}^{\mathbf{L}} A / I \cong R \Gamma\left(\operatorname{Cris}\left(X / S_{0}\right),\left.\mathcal{F}\right|_{\operatorname{Cris}\left(X / S_{0}\right)}\right)
$$

By Remark 50.24.11 we have

$$
R \Gamma\left(\operatorname{Cris}\left(X / S_{0}\right),\left.\mathcal{F}\right|_{\operatorname{Cris}\left(X / S_{0}\right)}\right)=R \Gamma\left(X, \mathcal{F}_{X} \otimes \Omega_{X / S_{0}}^{\bullet}\right)
$$

Using the stupid filtration on the de Rham complex we see that the last displayed complex is perfect in $D(A / I)$ as soon as the complexes

$$
R \Gamma\left(X, \mathcal{F}_{X} \otimes \Omega_{X / S_{0}}^{q}\right)
$$

are perfect complexes in $D(A / I)$, see More on Algebra, Lemma 15.61.4. This is true by standard arguments in coherent cohomology using that $\mathcal{F}_{X} \otimes \Omega_{X / S_{0}}^{q}$ is a finite locally free sheaf and $X \rightarrow S_{0}$ is proper and flat (insert future reference here). Applying More on Algebra, Lemma 15.64 .4 we see that

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F}) \otimes_{A}^{\mathbf{L}} A / I^{n}
$$

is a perfect object of $D\left(A / I^{n}\right)$ for all $n$. This isn't quite enough unless $A$ is Noetherian. Namely, even though $I$ is locally nilpotent by our assumption that $p$ is nilpotent, see Divided Power Algebra, Lemma 23.2.6, we cannot conclude that $I^{n}=0$ for some $n$. A counter example is $\mathbf{F}_{p}\langle x\rangle$. To prove it in general when $\mathcal{F}=$ $\mathcal{O}_{X / S}$ the argument of http://math.columbia.edu/~dejong/wordpress/?p=2227 works. When the coefficients $\mathcal{F}$ are non-trivial the argument of [Fal99] seems to be as follows. Reduce to the case $p A=0$ by More on Algebra, Lemma 15.64.4. In this case the Frobenius map $A \rightarrow A, a \mapsto a^{p}$ factors as $A \rightarrow A / I \xrightarrow{\varphi} A$ (as $x^{p}=0$ for $\left.x \in I\right)$. Set $X^{(1)}=X \otimes_{A / I, \varphi} A$. The absolute Frobenius morphism of $X$ factors through a morphism $F_{X}: X \rightarrow X^{(1)}$ (a kind of relative Frobenius). Affine locally if $X=\operatorname{Spec}(C)$ then $X^{(1)}=\operatorname{Spec}\left(C \otimes_{A / I, \varphi} A\right)$ and $F_{X}$ corresponds to $C \otimes_{A / I, \varphi} A \rightarrow C, c \otimes a \mapsto c^{p} a$. This defines morphisms of ringed topoi

$$
(X / S)_{\text {cris }} \xrightarrow{\left(F_{X}\right)_{\text {cris }}}\left(X^{(1)} / S\right)_{\text {cris }} \xrightarrow{u_{X(1) / S}} S h\left(X_{Z a r}^{(1)}\right)
$$

whose composition is denoted $\operatorname{Frob}_{X}$. One then shows that $R \operatorname{Frob}_{X, *} \mathcal{F}$ is representable by a perfect complex of $\mathcal{O}_{X^{(1)}}$-modules(!) by a local calculation.

07MY Remark 50.24.13 (Complete perfectness). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $A$ a $p$-adically complete ring and $p$ nilpotent in $A / I$. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $X$ be a proper smooth scheme over $S_{0}$. Let $\mathcal{F}$ be a crystal in finite locally free quasi-coherent $\mathcal{O}_{X / S}$-modules. Then $R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ is a perfect object of $D(A)$.

Hints: We know that $K=R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})$ is the derived limit $K=R \lim K_{e}$ of the cohomologies over $A / p^{e} A$, see Remark 50.24.10. Each $K_{e}$ is a perfect complex of $D\left(A / p^{e} A\right)$ by Remark 50.24 .12 Since $A$ is $p$-adically complete the result follows from More on Algebra, Lemma 15.75.3.

07MZ Remark 50.24.14 (Complete comparison). Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring with $A$ a Noetherian $p$-adically complete ring and $p$ nilpotent in $A / I$. Set $S=\operatorname{Spec}(A)$ and $S_{0}=\operatorname{Spec}(A / I)$. Let $Y$ be a proper smooth scheme over $S$ and set $X=Y \times{ }_{S} S_{0}$. Let $\mathcal{F}$ be a finite type crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules. Then
(1) there exists a coherent $\mathcal{O}_{Y}$-module $\mathcal{F}_{Y}$ endowed with integrable connection

$$
\nabla: \mathcal{F}_{Y} \longrightarrow \mathcal{F}_{Y} \otimes_{\mathcal{O}_{Y}} \Omega_{Y / S}
$$

such that $\mathcal{F}_{Y} / p^{e} \mathcal{F}_{Y}$ is the module with connection over $A / p^{e} A$ found in Remark 50.24.11, and
(2) we have

$$
R \Gamma(\operatorname{Cris}(X / S), \mathcal{F})=R \Gamma\left(Y, \mathcal{F}_{Y} \otimes_{\mathcal{O}_{Y}} \Omega_{Y / S}^{\bullet}\right)
$$

in $D(A)$.
Hints: The existence of $\mathcal{F}_{Y}$ is Grothendieck's existence theorem (insert future reference here). The isomorphism of cohomologies follows as both sides are computed as $R$ lim of the versions modulo $p^{e}$ (see Remark 50.24 .10 for the left hand side; use the theorem on formal functions, see Cohomology of Schemes, Theorem 29.19.5 for the right hand side). Each of the versions modulo $p^{e}$ are isomorphic by Remark 50.24.11.

### 50.25. Pulling back along purely inseparable maps

07 PZ By an $\alpha_{p}$-cover we mean a morphism of the form

$$
X^{\prime}=\operatorname{Spec}\left(C[z] /\left(z^{p}-c\right)\right) \longrightarrow \operatorname{Spec}(C)=X
$$

where $C$ is an $\mathbf{F}_{p}$-algebra and $c \in C$. Equivalently, $X^{\prime}$ is an $\alpha_{p}$-torsor over $X$. An iterated $\alpha_{p}$-cove $\|^{7}$ is a morphism of schemes in characteristic $p$ which is locally on the target a composition of finitely many $\alpha_{p}$-covers. In this section we prove that pullback along such a morphism induces a quasi-isomorphism on crystalline cohomology after inverting the prime $p$. In fact, we prove a precise version of this result. We beging with a preliminary lemma whose formulation needs some notation.

[^142]Assume we have a ring map $B \rightarrow B^{\prime}$ and quotients $\Omega_{B} \rightarrow \Omega$ and $\Omega_{B^{\prime}} \rightarrow \Omega^{\prime}$ satisfying the assumptions of Remark 50.6.11. Thus 50.6.11.1 provides a canonical map of complexes

$$
c_{M}^{\bullet}: M \otimes_{B} \Omega^{\bullet} \longrightarrow M \otimes_{B}\left(\Omega^{\prime}\right)^{\bullet}
$$

for all $B$-modules $M$ endowed with integrable connection $\nabla: M \rightarrow M \otimes_{B} \Omega_{B}$.
Suppose we have $a \in B, z \in B^{\prime}$, and a map $\theta: B^{\prime} \rightarrow B^{\prime}$ satisfying the following assumptions
(1) $\mathrm{d}(a)=0$,
(2) $\Omega^{\prime}=B^{\prime} \otimes_{B} \Omega \oplus B^{\prime} \mathrm{d} z$; we write $\mathrm{d}(f)=\mathrm{d}_{1}(f)+\partial_{z}(f) \mathrm{d} z$ with $\mathrm{d}_{1}(f) \in B^{\prime} \otimes \Omega$ and $\partial_{z}(f) \in N^{\prime}$ for all $f \in B^{\prime}$,
(3) $\theta: B^{\prime} \rightarrow B^{\prime}$ is $B$-linear,
(4) $\partial_{z} \circ \theta=a$,
(5) $B \rightarrow B^{\prime}$ is universally injective (and hence $\Omega \rightarrow \Omega^{\prime}$ is injective),
(6) $a f-\theta\left(\partial_{z}(f)\right) \in B$ for all $f \in B^{\prime}$,
(7) $(\theta \otimes 1)\left(\mathrm{d}_{1}(f)\right)-\mathrm{d}_{1}(\theta(f)) \in \Omega$ for all $f \in B^{\prime}$ where $\theta \otimes 1: B^{\prime} \otimes \Omega \rightarrow B^{\prime} \otimes \Omega$

These conditions are not logically independent. For example, assumption (4) implies that $\partial_{z}\left(a f-\theta\left(\partial_{z}(f)\right)\right)=0$. Hence if the image of $B \rightarrow B^{\prime}$ is the collection of elements annihilated by $\partial_{z}$, then (6) follows. A similar argument can be made for condition (7).

07Q7 Lemma 50.25.1. In the situation above there exists a map of complexes

$$
e_{M}^{\bullet}: M \otimes_{B}\left(\Omega^{\prime}\right)^{\bullet} \longrightarrow M \otimes_{B} \Omega^{\bullet}
$$

such that $c_{M}^{\bullet} \circ e_{M}^{\bullet}$ and $e_{M}^{\bullet} \circ c_{M}^{\bullet}$ are homotopic to multiplication by $a$.
Proof. In this proof all tensor products are over $B$. Assumption (2) implies that

$$
M \otimes\left(\Omega^{\prime}\right)^{i}=\left(B^{\prime} \otimes M \otimes \Omega^{i}\right) \oplus\left(B^{\prime} \mathrm{d} z \otimes M \otimes \Omega^{i-1}\right)
$$

for all $i \geq 0$. A collection of additive generators for $M \otimes\left(\Omega^{\prime}\right)^{i}$ is formed by elements of the form $f \omega$ and elements of the form $f \mathrm{~d} z \wedge \eta$ where $f \in B^{\prime}, \omega \in M \otimes \Omega^{i}$, and $\eta \in M \otimes \Omega^{i-1}$.

For $f \in B^{\prime}$ we write

$$
\epsilon(f)=a f-\theta\left(\partial_{z}(f)\right) \quad \text { and } \quad \epsilon^{\prime}(f)=(\theta \otimes 1)\left(\mathrm{d}_{1}(f)\right)-\mathrm{d}_{1}(\theta(f))
$$

so that $\epsilon(f) \in B$ and $\epsilon^{\prime}(f) \in \Omega$ by assumptions (6) and (7). We define $e_{M}^{\bullet}$ by the rules $e_{M}^{i}(f \omega)=\epsilon(f) \omega$ and $e_{M}^{i}(f \mathrm{~d} z \wedge \eta)=\epsilon^{\prime}(f) \wedge \eta$. We will see below that the collection of maps $e_{M}^{i}$ is a map of complexes.

We define

$$
h^{i}: M \otimes_{B}\left(\Omega^{\prime}\right)^{i} \longrightarrow M \otimes_{B}\left(\Omega^{\prime}\right)^{i-1}
$$

by the rules $h^{i}(f \omega)=0$ and $h^{i}(f \mathrm{~d} z \wedge \eta)=\theta(f) \eta$ for elements as above. We claim that

$$
\mathrm{d} \circ h+h \circ \mathrm{~d}=a-c_{M}^{\bullet} \circ e_{M}^{\bullet}
$$

Note that multiplication by $a$ is a map of complexes by (1). Hence, since $c_{M}^{\bullet}$ is an injective map of complexes by assumption (5), we conclude that $e_{M}^{\bullet}$ is a map of
complexes. To prove the claim we compute

$$
\begin{aligned}
(\mathrm{d} \circ h+h \circ \mathrm{~d})(f \omega) & =h(\mathrm{~d}(f) \wedge \omega+f \nabla(\omega)) \\
& =\theta\left(\partial_{z}(f)\right) \omega \\
& =a f \omega-\epsilon(f) \omega \\
& =a f \omega-c_{M}^{i}\left(e_{M}^{i}(f \omega)\right)
\end{aligned}
$$

The second equality because $\mathrm{d} z$ does not occur in $\nabla(\omega)$ and the third equality by assumption (6). Similarly, we have

$$
\begin{aligned}
(\mathrm{d} \circ h+h \circ \mathrm{~d})(f \mathrm{~d} z \wedge \eta) & =\mathrm{d}(\theta(f) \eta)+h(\mathrm{~d}(f) \wedge \mathrm{d} z \wedge \eta-f \mathrm{~d} z \wedge \nabla(\eta)) \\
& =\mathrm{d}(\theta(f)) \wedge \eta+\theta(f) \nabla(\eta)-(\theta \otimes 1)\left(\mathrm{d}_{1}(f)\right) \wedge \eta-\theta(f) \nabla(\eta) \\
& =\mathrm{d}_{1}(\theta(f)) \wedge \eta+\partial_{z}(\theta(f)) \mathrm{d} z \wedge \eta-(\theta \otimes 1)\left(\mathrm{d}_{1}(f)\right) \wedge \eta \\
& =a f \mathrm{~d} z \wedge \eta-\epsilon^{\prime}(f) \wedge \eta \\
& =a f \mathrm{~d} z \wedge \eta-c_{M}^{i}\left(e_{M}^{i}(f \mathrm{~d} z \wedge \eta)\right)
\end{aligned}
$$

The second equality because $\mathrm{d}(f) \wedge \mathrm{d} z \wedge \eta=-\mathrm{d} z \wedge \mathrm{~d}_{1}(f) \wedge \eta$. The fourth equality by assumption (4). On the other hand it is immediate from the definitions that $e_{M}^{i}\left(c_{M}^{i}(\omega)\right)=\epsilon(1) \omega=a \omega$. This proves the lemma.

07Q8 Example 50.25.2. A standard example of the situation above occurs when $B^{\prime}=$ $B\langle z\rangle$ is the divided power polynomial ring over a divided power ring $(B, J, \delta)$ with divided powers $\delta^{\prime}$ on $J^{\prime}=B_{+}^{\prime}+J B^{\prime} \subset B^{\prime}$. Namely, we take $\Omega=\Omega_{B, \delta}$ and $\Omega^{\prime}=\Omega_{B^{\prime}, \delta^{\prime}}$. In this case we can take $a=1$ and

$$
\theta\left(\sum b_{m} z^{[m]}\right)=\sum b_{m} z^{[m+1]}
$$

Note that

$$
f-\theta\left(\partial_{z}(f)\right)=f(0)
$$

equals the constant term. It follows that in this case Lemma 50.25.1 recovers the crystalline Poincaré lemma (Lemma 50.20.2).

07N1 Lemma 50.25.3. In Situation 50.5.1. Assume $D$ and $\Omega_{D}$ are as in 50.17.0.1. and (50.17.0.2). Let $\lambda \in D$. Let $D^{\prime}$ be the p-adic completion of

$$
D[z]\langle\xi\rangle /\left(\xi-\left(z^{p}-\lambda\right)\right)
$$

and let $\Omega_{D^{\prime}}$ be the p-adic completion of the module of divided power differentials of $D^{\prime}$ over $A$. For any pair $(M, \nabla)$ over $D$ satisfying (1), (2), (3), and (4) the canonical map of complexes 50.6.11.1)

$$
c_{M}^{\bullet}: M \otimes_{D}^{\wedge} \Omega_{D}^{\bullet} \longrightarrow M \otimes_{D}^{\wedge} \Omega_{D^{\prime}}^{\bullet}
$$

has the following property: There exists a map $e_{M}^{\bullet}$ in the opposite direction such that both $c_{M}^{\bullet} \circ e_{M}^{\bullet}$ and $e_{M}^{\bullet} \circ c_{M}^{\bullet}$ are homotopic to multiplication by $p$.
Proof. We will prove this using Lemma 50.25.1 with $a=p$. Thus we have to find $\theta: D^{\prime} \rightarrow D^{\prime}$ and prove (1), (2), (3), (4), (5), (6), (7). We first collect some information about the rings $D$ and $D^{\prime}$ and the modules $\Omega_{D}$ and $\Omega_{D^{\prime}}$.

Writing

$$
D[z]\langle\xi\rangle /\left(\xi-\left(z^{p}-\lambda\right)\right)=D\langle\xi\rangle[z] /\left(z^{p}-\xi-\lambda\right)
$$

we see that $D^{\prime}$ is the $p$-adic completion of the free $D$-module

$$
\bigoplus_{i=0, \ldots, p-1} \bigoplus_{n \geq 0} z^{i} \xi^{[n]} D
$$

where $\xi^{[0]}=1$. It follows that $D \rightarrow D^{\prime}$ has a continuous $D$-linear section, in particular $D \rightarrow D^{\prime}$ is universally injective, i.e., (5) holds. We think of $D^{\prime}$ as a divided power algebra over $A$ with divided power ideal $\bar{J}^{\prime}=\bar{J} D^{\prime}+(\xi)$. Then $D^{\prime}$ is also the $p$-adic completion of the divided power envelope of the ideal generated by $z^{p}-\lambda$ in $D$, see Lemma 50.2.4. Hence

$$
\Omega_{D^{\prime}}=\Omega_{D} \otimes_{D}^{\wedge} D^{\prime} \oplus D^{\prime} \mathrm{d} z
$$

by Lemma 50.6.6. This proves (2). Note that (1) is obvious.
At this point we construct $\theta$. (We wrote a PARI/gp script theta.gp verifying some of the formulas in this proof which can be found in the scripts subdirectory of the stacks project.) Before we do so we compute the derivative of the elements $z^{i} \xi^{[n]}$. We have $\mathrm{d} z^{i}=i z^{i-1} \mathrm{~d} z$. For $n \geq 1$ we have

$$
\mathrm{d} \xi^{[n]}=\xi^{[n-1]} \mathrm{d} \xi=-\xi^{[n-1]} \mathrm{d} \lambda+p z^{p-1} \xi^{[n-1]} \mathrm{d} z
$$

because $\xi=z^{p}-\lambda$. For $0<i<p$ and $n \geq 1$ we have

$$
\begin{aligned}
\mathrm{d}\left(z^{i} \xi^{[n]}\right) & =i z^{i-1} \xi^{[n]} \mathrm{d} z+z^{i} \xi^{[n-1]} \mathrm{d} \xi \\
& =i z^{i-1} \xi^{[n]} \mathrm{d} z+z^{i} \xi^{[n-1]} \mathrm{d}\left(z^{p}-\lambda\right) \\
& =-z^{i} \xi^{[n-1]} \mathrm{d} \lambda+\left(i z^{i-1} \xi^{[n]}+p z^{i+p-1} \xi^{[n-1]}\right) \mathrm{d} z \\
& =-z^{i} \xi^{[n-1]} \mathrm{d} \lambda+\left(i z^{i-1} \xi^{[n]}+p z^{i-1}(\xi+\lambda) \xi^{[n-1]}\right) \mathrm{d} z \\
& =-z^{i} \xi^{[n-1]} \mathrm{d} \lambda+\left((i+p n) z^{i-1} \xi^{[n]}+p \lambda z^{i-1} \xi^{[n-1]}\right) \mathrm{d} z
\end{aligned}
$$

the last equality because $\xi \xi^{[n-1]}=n \xi^{[n]}$. Thus we see that

$$
\begin{aligned}
\partial_{z}\left(z^{i}\right) & =i z^{i-1} \\
\partial_{z}\left(\xi^{[n]}\right) & =p z^{p-1} \xi^{[n-1]} \\
\partial_{z}\left(z^{i} \xi^{[n]}\right) & =(i+p n) z^{i-1} \xi^{[n]}+p \lambda z^{i-1} \xi^{[n-1]}
\end{aligned}
$$

Motivated by these formulas we define $\theta$ by the rules

$$
\begin{array}{cccc}
\theta\left(z^{j}\right) & = & p \frac{z^{j+1}}{j+1} & j=0, \ldots p-1, \\
\theta\left(z^{p-1} \xi^{[m]}\right) & = & \xi^{[m+1]} & m \geq 1, \\
\theta\left(z^{j} \xi^{[m]}\right) & = & \frac{p z^{j+1} \xi^{[m]}-\theta\left(p \lambda z^{j} \xi^{[m-1]}\right)}{(j+1+p m)} & 0 \leq j<p-1, m \geq 1
\end{array}
$$

where in the last line we use induction on $m$ to define our choice of $\theta$. Working this out we get (for $0 \leq j<p-1$ and $1 \leq m$ )

$$
\theta\left(z^{j} \xi^{[m]}\right)=\frac{p z^{j+1} \xi^{[m]}}{(j+1+p m)}-\frac{p^{2} \lambda z^{j+1} \xi^{[m-1]}}{(j+1+p m)(j+1+p(m-1))}+\ldots+\frac{(-1)^{m} p^{m+1} \lambda^{m} z^{j+1}}{(j+1+p m) \ldots(j+1)}
$$

although we will not use this expression below. It is clear that $\theta$ extends uniquely to a $p$-adically continuous $D$-linear map on $D^{\prime}$. By construction we have $\sqrt{3}$ and (4). It remains to prove (6) and (7).

Proof of (6) and (7). As $\theta$ is $D$-linear and continuous it suffices to prove that $p-\theta \circ \partial_{z}$, resp. $(\theta \otimes 1) \circ \mathrm{d}_{1}-\mathrm{d}_{1} \circ \theta$ gives an element of $D$, resp. $\Omega_{D}$ when evaluated
on the elements $z^{i} \xi^{[n]} \|^{8}$. Set $D_{0}=\mathbf{Z}_{(p)}[\lambda]$ and $D_{0}^{\prime}=\mathbf{Z}_{(p)}[z, \lambda]\langle\xi\rangle /\left(\xi-z^{p}+\lambda\right)$. Observe that each of the expressions above is an element of $D_{0}^{\prime}$ or $\Omega_{D_{0}^{\prime}}$. Hence it suffices to prove the result in the case of $D_{0} \rightarrow D_{0}^{\prime}$. Note that $D_{0}$ and $D_{0}^{\prime}$ are torsion free rings and that $D_{0} \otimes \mathbf{Q}=\mathbf{Q}[\lambda]$ and $D_{0}^{\prime} \otimes \mathbf{Q}=\mathbf{Q}[z, \lambda]$. Hence $D_{0} \subset D_{0}^{\prime}$ is the subring of elements annihilated by $\partial_{z}$ and (6) follows from (4), see the discussion directly preceding Lemma 50.25.1. Similarly, we have $\mathrm{d}_{1}(f)=\partial_{\lambda}(f) \mathrm{d} \lambda$ hence

$$
\left((\theta \otimes 1) \circ \mathrm{d}_{1}-\mathrm{d}_{1} \circ \theta\right)(f)=\left(\theta\left(\partial_{\lambda}(f)\right)-\partial_{\lambda}(\theta(f))\right) \mathrm{d} \lambda
$$

Applying $\partial_{z}$ to the coefficient we obtain

$$
\begin{aligned}
\partial_{z}\left(\theta\left(\partial_{\lambda}(f)\right)-\partial_{\lambda}(\theta(f))\right) & =p \partial_{\lambda}(f)-\partial_{z}\left(\partial_{\lambda}(\theta(f))\right) \\
& =p \partial_{\lambda}(f)-\partial_{\lambda}\left(\partial_{z}(\theta(f))\right) \\
& =p \partial_{\lambda}(f)-\partial_{\lambda}(p f)=0
\end{aligned}
$$

whence the coefficient does not depend on $z$ as desired. This finishes the proof of the lemma.

Note that an iterated $\alpha_{p}$-cover $X^{\prime} \rightarrow X$ (as defined in the introduction to this section) is finite locally free. Hence if $X$ is connected the degree of $X^{\prime} \rightarrow X$ is constant and is a power of $p$.
07Q9 Lemma 50.25.4. Let $p$ be a prime number. Let $(S, \mathcal{I}, \gamma)$ be a divided power scheme over $\mathbf{Z}_{(p)}$ with $p \in \mathcal{I}$. We set $S_{0}=V(\mathcal{I}) \subset S$. Let $f: X^{\prime} \rightarrow X$ be an iterated $\alpha_{p}$-cover of schemes over $S_{0}$ with constant degree $q$. Let $\mathcal{F}$ be any crystal in quasi-coherent sheaves on $X$ and set $\mathcal{F}^{\prime}=f_{\text {cris }}^{*} \mathcal{F}$. In the distinguished triangle

$$
R u_{X / S, *} \mathcal{F} \longrightarrow f_{*} R u_{X^{\prime} / S, *} \mathcal{F}^{\prime} \longrightarrow E \longrightarrow R u_{X / S, *} \mathcal{F}[1]
$$

the object $E$ has cohomology sheaves annihilated by $q$.
Proof. Note that $X^{\prime} \rightarrow X$ is a homeomorphism hence we can identify the underlying topological spaces of $X$ and $X^{\prime}$. The question is clearly local on $X$, hence we may assume $X, X^{\prime}$, and $S$ affine and $X^{\prime} \rightarrow X$ given as a composition

$$
X^{\prime}=X_{n} \rightarrow X_{n-1} \rightarrow X_{n-2} \rightarrow \ldots \rightarrow X_{0}=X
$$

where each morphism $X_{i+1} \rightarrow X_{i}$ is an $\alpha_{p}$-cover. Denote $\mathcal{F}_{i}$ the pullback of $\mathcal{F}$ to $X_{i}$. It suffices to prove that each of the maps

$$
R \Gamma\left(\operatorname{Cris}\left(X_{i} / S\right), \mathcal{F}_{i}\right) \longrightarrow R \Gamma\left(\operatorname{Cris}\left(X_{i+1} / S\right), \mathcal{F}_{i+1}\right)
$$

fits into a triangle whose third member has cohomology groups annihilated by $p$. (This uses axiom TR4 for the triangulated category $D(X)$. Details omitted.)
Hence we may assume that $S=\operatorname{Spec}(A), X=\operatorname{Spec}(C), X^{\prime}=\operatorname{Spec}\left(C^{\prime}\right)$ and $C^{\prime}=C[z] /\left(z^{p}-c\right)$ for some $c \in C$. Choose a polynomial algebra $P$ over $A$ and a surjection $P \rightarrow C$. Let $D$ be the $p$-adically completed divided power envelop of $\operatorname{Ker}(P \rightarrow C)$ in $P$ as in 50.17.0.1). Set $P^{\prime}=P[z]$ with surjection $P^{\prime} \rightarrow C^{\prime}$ mapping $z$ to the class of $z$ in $C^{\prime}$. Choose a lift $\lambda \in D$ of $c \in C$. Then we see that the $p$-adically completed divided power envelope $D^{\prime}$ of $\operatorname{Ker}\left(P^{\prime} \rightarrow C^{\prime}\right)$ in $P^{\prime}$ is isomorphic to the $p$-adic completion of $D[z]\langle\xi\rangle /\left(\xi-\left(z^{p}-\lambda\right)\right)$, see Lemma 50.25 .3 and its proof. Thus we see that the result follows from this lemma by the computation of cohomology of crystals in quasi-coherent modules in Proposition 50.21.3.

[^143]The bound in the following lemma is probably not optimal.
07QA Lemma 50.25.5. With notations and assumptions as in Lemma 50.25.4 the map

$$
f^{*}: H^{i}(\operatorname{Cris}(X / S), \mathcal{F}) \longrightarrow H^{i}\left(\operatorname{Cris}\left(X^{\prime} / S\right), \mathcal{F}^{\prime}\right)
$$

has kernel and cokernel annihilated by $q^{i+1}$.
Proof. This follows from the fact that $E$ has nonzero cohomology sheaves in degrees -1 and up, so that the spectral sequence $H^{a}\left(\mathcal{H}^{b}(E)\right) \Rightarrow H^{a+b}(E)$ converges. This combined with the long exact cohomology sequence associated to a distinguished triangle gives the bound.

In Situation 50.7.5 assume that $p \in \mathcal{I}$. Set

$$
X^{(1)}=X \times_{S_{0}, F_{S_{0}}} S_{0}
$$

Denote $F_{X / S_{0}}: X \rightarrow X^{(1)}$ the relative Frobenius morphism.
07QB Lemma 50.25.6. In the situation above, assume that $X \rightarrow S_{0}$ is smooth of relative dimension $d$. Then $F_{X / S_{0}}$ is an iterated $\alpha_{p}$-cover of degree $p^{d}$. Hence Lemmas 50.25.4 and50.25.5 apply to this situation. In particular, for any crystal in quasi-coherent modules $\mathcal{G}$ on $\operatorname{Cris}\left(X^{(1)} / S\right)$ the map

$$
F_{X / S_{0}}^{*}: H^{i}\left(\operatorname{Cris}\left(X^{(1)} / S\right), \mathcal{G}\right) \longrightarrow H^{i}\left(\operatorname{Cris}(X / S), F_{X / S_{0}, \operatorname{cris}}^{*} \mathcal{G}\right)
$$

has kernel and cokernel annihilated by $p^{d(i+1)}$.
Proof. It suffices to prove the first statement. To see this we may assume that $X$ is étale over $\mathbf{A}_{S_{0}}^{d}$, see Morphisms, Lemma 28.36 .20 . Denote $\varphi: X \rightarrow \mathbf{A}_{S_{0}}^{d}$ this étale morphism. In this case the relative Frobenius of $X / S_{0}$ fits into a diagram

where the lower horizontal arrow is the relative frobenius morphism of $\mathbf{A}_{S_{0}}^{d}$ over $S_{0}$. This is the morphism which raises all the coordinates to the $p$ th power, hence it is an iterated $\alpha_{p}$-cover. The proof is finished by observing that the diagram is a fibre square, see the proof of Étale Cohomology, Theorem 49.79.4.

### 50.26. Frobenius action on crystalline cohomology

07 N 0 In this section we prove that Frobenius pullback induces a quasi-isomorphism on crystalline cohomology after inverting the prime $p$. But in order to even formulate this we need to work in a special situation.

07N2 Situation 50.26.1. In Situation 50.7.5 assume the following
(1) $S=\operatorname{Spec}(A)$ for some divided power ring $(A, I, \gamma)$ with $p \in I$,
(2) there is given a homomorphism of divided power rings $\sigma: A \rightarrow A$ such that $\sigma(x)=x^{p} \bmod p A$ for all $x \in A$.

In Situation 50.26 .1 the morphism $\operatorname{Spec}(\sigma): S \rightarrow S$ is a lift of the absolute Frobenius $F_{S_{0}}: S_{0} \rightarrow S_{0}$ and since the diagram

is commutative where $F_{X}: X \rightarrow X$ is the absolute Frobenius morphism of $X$. Thus we obtain a morphism of crystalline topoi

$$
\left(F_{X}\right)_{\text {cris }}:(X / S)_{\text {cris }} \longrightarrow(X / S)_{\text {cris }}
$$

see Remark 50.9.3. Here is the terminology concerning $F$-crystals following the notation of Saavedra, see SR72].

07N3 Definition 50.26.2. In Situation 50.26.1 an $F$-crystal on $X / S$ (relative to $\sigma$ ) is a pair $\left(\mathcal{E}, F_{\mathcal{E}}\right)$ given by a crystal in finite locally free $\mathcal{O}_{X / S}$-modules $\mathcal{E}$ together with a map

$$
F_{\mathcal{E}}:\left(F_{X}\right)_{\text {cris }}^{*} \mathcal{E} \longrightarrow \mathcal{E}
$$

An $F$-crystal is called nondegenerate if there exists an integer $i \geq 0$ a map $V: \mathcal{E} \rightarrow$ $\left(F_{X}\right)_{\text {cris }}^{*} \mathcal{E}$ such that $V \circ F_{\mathcal{E}}=p^{i}$ id.

07N4 Remark 50.26.3. Let $(\mathcal{E}, F)$ be an $F$-crystal as in Definition 50.26.2 In the literature the nondegeneracy condition is often part of the definition of an $F$-crystal. Moreover, often it is also assumed that $F \circ V=p^{n} \mathrm{id}$. What is needed for the result below is that there exists an integer $j \geq 0$ such that $\operatorname{Ker}(F)$ and $\operatorname{Coker}(F)$ are killed by $p^{j}$. If the rank of $\mathcal{E}$ is bounded (for example if $X$ is quasi-compact), then both of these conditions follow from the nondegeneracy condition as formulated in the definition. Namely, suppose $R$ is a ring, $r \geq 1$ is an integer and $K, L \in \operatorname{Mat}(r \times r, R)$ are matrices with $K L=p^{i} 1_{r \times r}$. Then $\operatorname{det}(K) \operatorname{det}(L)=p^{r i}$. Let $L^{\prime}$ be the adjugate matrix of $L$, i.e., $L^{\prime} L=L L^{\prime}=\operatorname{det}(L)$. Set $K^{\prime}=p^{r i} K$ and $j=r i+i$. Then we have $K^{\prime} L=p^{j} 1_{r \times r}$ as $K L=p^{i}$ and

$$
L K^{\prime}=L K \operatorname{det}(L) \operatorname{det}(M)=L K L L^{\prime} \operatorname{det}(M)=L p^{i} L^{\prime} \operatorname{det}(M)=p^{j} 1_{r \times r}
$$

It follows that if $V$ is as in Definition 50.26 .2 then setting $V^{\prime}=p^{N} V$ where $N>$ $i \cdot \operatorname{rank}(\mathcal{E})$ we get $V^{\prime} \circ F=p^{N+i}$ and $F \circ V^{\prime}=p^{N+i}$.

07N5 Theorem 50.26.4. In Situation 50.26.1 let $\left(\mathcal{E}, F_{\mathcal{E}}\right)$ be a nondegenerate $F$-crystal. Assume $A$ is a p-adically complete Noetherian ring and that $X \rightarrow S_{0}$ is proper smooth. Then the canonical map

$$
F_{\mathcal{E}} \circ\left(F_{X}\right)_{c r i s}^{*}: R \Gamma(\operatorname{Cris}(X / S), \mathcal{E}) \otimes_{A, \sigma}^{\mathbf{L}} A \longrightarrow R \Gamma(\operatorname{Cris}(X / S), \mathcal{E})
$$

becomes an isomorphism after inverting $p$.
Proof. We first write the arrow as a composition of three arrows. Namely, set

$$
X^{(1)}=X \times_{S_{0}, F_{S_{0}}} S_{0}
$$

and denote $F_{X / S_{0}}: X \rightarrow X^{(1)}$ the relative Frobenius morphism. Denote $\mathcal{E}^{(1)}$ the base change of $\mathcal{E}$ by $\operatorname{Spec}(\sigma)$, in other words the pullback of $\mathcal{E}$ to $\operatorname{Cris}\left(X^{(1)} / S\right)$ by
the morphism of crystalline topoi associated to the commutative diagram

Then we have the base change map
07QC

$$
\begin{equation*}
R \Gamma(\operatorname{Cris}(X / S), \mathcal{E}) \otimes_{A, \sigma}^{\mathbf{L}} A \longrightarrow R \Gamma\left(\operatorname{Cris}\left(X^{(1)} / S\right), \mathcal{E}^{(1)}\right) \tag{50.26.4.1}
\end{equation*}
$$

see Remark 50.24.8. Note that the composition of $F_{X / S_{0}}: X \rightarrow X^{(1)}$ with the projection $X^{(1)} \rightarrow X$ is the absolute Frobenius morphism $F_{X}$. Hence we see that $F_{X / S_{0}}^{*} \mathcal{E}^{(1)}=\left(F_{X}\right)_{\text {cris }}^{*} \mathcal{E}$. Thus pullback by $F_{X / S_{0}}$ is a map
07N6
(50.26.4.2) $\quad F_{X / S_{0}}^{*}: R \Gamma\left(\operatorname{Cris}\left(X^{(1)} / S\right), \mathcal{E}^{(1)}\right) \longrightarrow R \Gamma\left(\operatorname{Cris}(X / S),\left(F_{X}\right)_{\text {cris }}^{*} \mathcal{E}\right)$

Finally we can use $F_{\mathcal{E}}$ to get a map
07QD
(50.26.4.3)

$$
R \Gamma\left(\operatorname{Cris}(X / S),\left(F_{X}\right)_{\text {cris }}^{*} \mathcal{E}\right) \longrightarrow R \Gamma(\operatorname{Cris}(X / S), \mathcal{E})
$$

The map of the theorem is the composition of the three maps (50.26.4.1), 550.26.4.2, and (50.26.4.3) above. The first is a quasi-isomorphism modulo all powers of $p$ by Remark 50.24.9. Hence it is a quasi-isomorphism since the complexes involved are perfect in $D(A)$ see Remark 50.24 .13 . The third map is a quasi-isomorphism after inverting $p$ simply because $F_{\mathcal{E}}$ has an inverse up to a power of $p$, see Remark 50.26.3. Finally, the second is an isomorphism after inverting $p$ by Lemma 50.25.6.

## CHAPTER 51

## Pro-étale Cohomology

### 51.1. Introduction

0966
The material in this chapter and more can be found in the preprint [BS13.
The goal of this chapter is to introduce the pro-étale topology and show how it simplifies the introduction of $\ell$-adic cohomology in algebraic geometry.

A brief overview of the history of this material as we have understood it. In Gro77, Exposés V and VI] Grothendieck et al developed a theory for dealing with $\ell$-adic sheaves as inverse systems of sheaves of $\mathbf{Z} / \ell^{n} \mathbf{Z}$-modules. In his second paper on the Weil conjectures (Del74a) Deligne introduced a derived category of $\ell$-adic sheaves as a certain 2-limit of categories of complexes of sheaves of $\mathbf{Z} / \ell^{n} \mathbf{Z}$-modules on the étale site of a scheme $X$. This approach is used in the paper by Beilinson, Bernstein, and Deligne ( $\overline{\mathbf{B B D 8 2}}$ ) as the basis for their beautiful theory of perverse sheaves. In a paper entitled "Continuous Étale Cohomology" (Jan88) Uwe Jannsen discusses an important variant of the cohomology of a $\ell$-adic sheaf on a variety over a field. His paper is followed up by a paper of Torsten Ekedahl (Eke90) who discusses the adic formalism needed to work comfortably with derived categories defined as limits.

The goal of this chapter is to show that, if we work with the pro-étale site of a scheme, then one can avoid some of the technicalities these authors encountered. This comes at the expense of having to work with non-Noetherian schemes, even when one is only interested in working with $\ell$-adic sheaves and cohomology of such on varieties over an algebraically closed field.

### 51.2. Some topology

0967 Some preliminaries. We have defined spectral spaces and spectral maps of spectral spaces in Topology, Section 5.22 . The spectrum of a ring is a spectral space, see Algebra, Lemma 10.25.2.

0968 Lemma 51.2.1. Let $X$ be a spectral space. Let $X_{0} \subset X$ be the set of closed points. The following are equivalent
(1) Every open covering of $X$ can be refined by a finite disjoint union decomposition $X=\coprod U_{i}$ with $U_{i}$ open and closed in $X$.
(2) The composition $X_{0} \rightarrow X \rightarrow \pi_{0}(X)$ is bijective.

Moreover, if $X_{0}$ is closed in $X$ and every point of $X$ specializes to a unique point of $X_{0}$, then these conditions are satisfied.

Proof. We will use without further mention that $X_{0}$ is quasi-compact (Topology, Lemma 5.11.9) and $\pi_{0}(X)$ is profinite (Topology, Lemma 5.22.8. Picture

If (2) holds, the continuous bijective map $f: X_{0} \rightarrow \pi_{0}(X)$ is a homeomorphism by Topology, Lemma 5.16.8. Given an open covering $X=\bigcup U_{i}$, we get an open covering $\pi_{0}(X)=\bigcup f\left(X_{0} \cap U_{i}\right)$. By Topology, Lemma 5.21.3 we can find a finite open covering of the form $\pi_{0}(X)=\coprod V_{j}$ which refines this covering. Since $X_{0} \rightarrow$ $\pi_{0}(X)$ is bijective each connected component of $X$ has a unique closed point, whence is equal to the set of points specializing to this closed point. Hence $\pi^{-1}\left(V_{j}\right)$ is the set of points specializing to the points of $f^{-1}\left(V_{j}\right)$. Now, if $f^{-1}\left(V_{j}\right) \subset X_{0} \cap U_{i} \subset$ $U_{i}$, then it follows that $\pi^{-1}\left(V_{j}\right) \subset U_{i}$ (because the open set $U_{i}$ is closed under generalizations). In this way we see that the open covering $X=\coprod \pi^{-1}\left(V_{j}\right)$ refines the covering we started out with. In this way we see that (2) implies (1).

Assume (1). Let $x, y \in X$ be closed points. Then we have the open covering $X=(X \backslash\{x\}) \cup(X \backslash\{y\})$. It follows from (1) that there exists a disjoint union decomposition $X=U \amalg V$ with $U$ and $V$ open (and closed) and $x \in U$ and $y \in V$. In particular we see that every connected component of $X$ has at most one closed point. By Topology, Lemma 5.11 .8 every connected component (being closed) also does have a closed point. Thus $X_{0} \rightarrow \pi_{0}(X)$ is bijective. In this way we see that (1) implies (2).

Assume $X_{0}$ is closed in $X$ and every point specializes to a unique point of $X_{0}$. Then $X_{0}$ is a spectral space (Topology, Lemma 5.22.4) consisting of closed points, hence profinite (Topology, Lemma 5.22.7). Let $x, y \in X_{0}$ be distinct. By Topology, Lemma 5.21 .3 we can find a disjoint union decomposition $X_{0}=U_{0} \amalg V_{0}$ with $U_{0}$ and $V_{0}$ open and closed. Let $\left\{U_{i}\right\}$ be the set of quasi-compact open subsets of $X$ such that $U_{0}=X_{0} \cap U_{i}$. Similarly, let $\left\{V_{j}\right\}$ be the set of quasi-compact open subsets of $X$ such that and $V_{0}=X_{0} \cap V_{j}$. If $U_{i} \cap V_{j}$ is nonempty for all $i, j$, then there exists a point $\xi$ contained in all of them (use the $U_{i} \cap V_{j}$ is constructible, hence closed in the constructible topology, and use Topology, Lemmas 5.22 .2 and 5.11.6). However, since $X$ is sober and $V_{0}$ is closed in $X$, the intersection $\bigcap U_{i}$ is the set of points specializing to $U_{0}$. Similarly, $\bigcap V_{j}$ is the set of points specializing to $V_{0}$. Since $U_{0} \cap V_{0}$ is empty this is a contradiction. Thus we find disjoint quasicompact opens $U, V \subset X$ such that $U_{0}=X_{0} \cap U$ and $V_{0}=X_{0} \cap V$. Observe that $X=U \cup V=U \amalg V$ as $X_{0} \subset U \cup V$ (use Topology, Lemma 5.11.8). This proves that $x, y$ are not in the same connected component of $X$. In other words, $X_{0} \rightarrow \pi_{0}(X)$ is injective. The map is also surjective by Topology, Lemma 5.11 .8 and the fact that connected components are closed. In this way we see that the final condition implies (1).

Example 51.2.2. Let $T$ be a profinite space. Let $t \in T$ be a point and assume that $T \backslash\{t\}$ is not quasi-compact. Let $X=T \times\{0,1\}$. Consider the topology on $X$ with a subbase given by the sets $U \times\{0,1\}$ for $U \subset T$ open, $X \backslash\{(t, 0)\}$, and $U \times\{1\}$ for $U \subset T$ open with $t \notin U$. The set of closed points of $X$ is $X_{0}=T \times\{0\}$ and $(t, 1)$ is in the closure of $X_{0}$. Moreover, $X_{0} \rightarrow \pi_{0}(X)$ is a bijection. This example
shows that conditions (1) and (2) of Lemma 51.2.1 do no imply the set of closed points is closed.
It turns out it is more convenient to work with spectral spaces which have the slightly stronger property mentioned in the final statement of Lemma 51.2.1. We give this property a name.

096A Definition 51.2.3. A spectral space $X$ is $w$-local if the set of closed points $X_{0}$ is closed and every point of $X$ specializes to a unique closed point. A continuous map $f: X \rightarrow Y$ of w-local spaces is $w$-local if it is spectral and maps any closed point of $X$ to a closed point of $Y$.

We have seen in the proof of Lemma 51.2.1 that in this case $X_{0} \rightarrow \pi_{0}(X)$ is a homeomorphism and that $X_{0} \cong \pi_{0}(X)$ is a profinite space. Moreover, a connected component of $X$ is exactly the set of points specializing to a given $x \in X_{0}$.

096B Lemma 51.2.4. Let $X$ be a w-local spectral space. If $Y \subset X$ is closed, then $Y$ is w-local.

Proof. The subset $Y_{0} \subset Y$ of closed points is closed because $Y_{0}=X_{0} \cap Y$. Since $X$ is $w$-local, every $y \in Y$ specializes to a unique point of $X_{0}$. This specialization is in $Y$, and hence also in $Y_{0}$, because $\overline{\{y\}} \subset Y$. In conclusion, $Y$ is $w$-local.
096C Lemma 51.2.5. Let $X$ be a spectral space. Let

be a cartesian diagram in the category of topological spaces with $T$ profinite. Then $Y$ is spectral and $T=\pi_{0}(Y)$. If moreover $X$ is w-local, then $Y$ is w-local, $Y \rightarrow X$ is w-local, and the set of closed points of $Y$ is the inverse image of the set of closed points of $X$.
Proof. Note that $Y$ is a closed subspace of $X \times T$ as $\pi_{0}(X)$ is a profinite space hence Hausdorff (use Topology, Lemmas 5.22 .8 and 5.3.4). Since $X \times T$ is spectral (Topology, Lemma 5.22.9) it follows that $Y$ is spectral (Topology, Lemma 5.22.4). Let $Y \rightarrow \pi_{0}(Y) \rightarrow T$ be the canonical factorization (Topology, Lemma 5.6.8). It is clear that $\pi_{0}(Y) \rightarrow T$ is surjective. The fibres of $Y \rightarrow T$ are homeomorphic to the fibres of $X \rightarrow \pi_{0}(X)$. Hence these fibres are connected. It follows that $\pi_{0}(Y) \rightarrow T$ is injective. We conclude that $\pi_{0}(Y) \rightarrow T$ is a homeomorphism by Topology, Lemma 5.16.8.
Next, assume that $X$ is w-local and let $X_{0} \subset X$ be the set of closed points. The inverse image $Y_{0} \subset Y$ of $X_{0}$ in $Y$ maps bijectively onto $T$ as $X_{0} \rightarrow \pi_{0}(X)$ is a bijection by Lemma 51.2.1. Moreover, $Y_{0}$ is quasi-compact as a closed subset of the spectral space $Y$. Hence $Y_{0} \rightarrow \pi_{0}(Y)=T$ is a homeomorphism by Topology, Lemma 5.16.8. It follows that all points of $Y_{0}$ are closed in $Y$. Conversely, if $y \in Y$ is a closed point, then it is closed in the fibre of $Y \rightarrow \pi_{0}(Y)=T$ and hence its image $x$ in $X$ is closed in the (homeomorphic) fibre of $X \rightarrow \pi_{0}(X)$. This implies $x \in X_{0}$ and hence $y \in Y_{0}$. Thus $Y_{0}$ is the collection of closed points of $Y$ and for each $y \in Y_{0}$ the set of generalizations of $y$ is the fibre of $Y \rightarrow \pi_{0}(Y)$. The lemma follows.

### 51.3. Local isomorphisms

096D We start with a definition.
096E Definition 51.3.1. Let $\varphi: A \rightarrow B$ be a ring map.
(1) We say $A \rightarrow B$ is a local isomorphism if for every prime $\mathfrak{q} \subset B$ there exists a $g \in B, g \notin \mathfrak{q}$ such that $A \rightarrow B_{g}$ induces an open immersion $\operatorname{Spec}\left(B_{g}\right) \rightarrow \operatorname{Spec}(A)$.
(2) We say $A \rightarrow B$ identifies local rings if for every prime $\mathfrak{q} \subset B$ the canonical $\operatorname{map} A_{\varphi^{-1}(\mathfrak{q})} \rightarrow B_{\mathfrak{q}}$ is an isomorphism.
We list some elementary properties.
096 F Lemma 51.3.2. Let $A \rightarrow B$ and $A \rightarrow A^{\prime}$ be ring maps. Let $B^{\prime}=B \otimes_{A} A^{\prime}$ be the base change of $B$.
(1) If $A \rightarrow B$ is a local isomorphism, then $A^{\prime} \rightarrow B^{\prime}$ is a local isomorphism.
(2) If $A \rightarrow B$ identifies local rings, then $A^{\prime} \rightarrow B^{\prime}$ identifies local rings.

Proof. Omitted.
096G Lemma 51.3.3. Let $A \rightarrow B$ and $B \rightarrow C$ be ring maps.
(1) If $A \rightarrow B$ and $B \rightarrow C$ are local isomorphisms, then $A \rightarrow C$ is a local isomorphism.
(2) If $A \rightarrow B$ and $B \rightarrow C$ identify local rings, then $A \rightarrow C$ identifies local rings.
Proof. Omitted.
096H Lemma 51.3.4. Let $A$ be a ring. Let $B \rightarrow C$ be an A-algebra homomorphism.
(1) If $A \rightarrow B$ and $A \rightarrow C$ are local isomorphisms, then $B \rightarrow C$ is a local isomorphism.
(2) If $A \rightarrow B$ and $A \rightarrow C$ identify local rings, then $B \rightarrow C$ identifies local rings.
Proof. Omitted.
096I Lemma 51.3.5. Let $A \rightarrow B$ be a local isomorphism. Then
(1) $A \rightarrow B$ is étale,
(2) $A \rightarrow B$ identifies local rings,
(3) $A \rightarrow B$ is quasi-finite.

Proof. Omitted.
096J Lemma 51.3.6. Let $A \rightarrow B$ be a local isomorphism. Then there exist $n \geq 0$, $g_{1}, \ldots, g_{n} \in B, f_{1}, \ldots, f_{n} \in A$ such that $\left(g_{1}, \ldots, g_{n}\right)=B$ and $A_{f_{i}} \cong B_{g_{i}}$.
Proof. Omitted.
096K Lemma 51.3.7. Let $p:\left(Y, \mathcal{O}_{Y}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ and $q:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be morphisms of locally ringed spaces. If $\mathcal{O}_{Y}=p^{-1} \mathcal{O}_{X}$, then
$\operatorname{Mor}_{L R S /\left(X, \mathcal{O}_{X}\right)}\left(\left(Z, \mathcal{O}_{Z}\right),\left(Y, \mathcal{O}_{Y}\right)\right) \longrightarrow \operatorname{Mor}_{T o p / X}(Z, Y), \quad\left(f, f^{\sharp}\right) \longmapsto f$
is bijective. Here $L R S /\left(X, \mathcal{O}_{X}\right)$ is the category of locally ringed spaces over $X$ and Top/ $X$ is the category of topological spaces over $X$.

Proof. This is immediate from the definitions.
096L Lemma 51.3.8. Let $A$ be a ring. Set $X=\operatorname{Spec}(A)$. The functor

$$
B \longmapsto \operatorname{Spec}(B)
$$

from the category of $A$-algebras $B$ such that $A \rightarrow B$ identifies local rings to the category of topological spaces over $X$ is fully faithful.
Proof. This follows from Lemma 51.3.7 and the fact that if $A \rightarrow B$ identifies local rings, then the pullback of the structure sheaf of $\operatorname{Spec}(A)$ via $p: \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is equal to the structure sheaf of $\operatorname{Spec}(B)$.

### 51.4. Ind-Zariski algebra

096M We start with a definition; please see Remark 51.6 .9 for a comparison with the corresponding definition of the article [BS13].
096N Definition 51.4.1. A ring map $A \rightarrow B$ is said to be ind-Zariski if $B$ can be written as a filtered colimit $B=\operatorname{colim} B_{i}$ with each $A \rightarrow B_{i}$ a local isomorphism.

An example of an Ind-Zariski map is a localization $A \rightarrow S^{-1} A$, see Algebra, Lemma 10.9.9. The category of ind-Zariski algebras is closed under several natural operations.

096P Lemma 51.4.2. Let $A \rightarrow B$ and $A \rightarrow A^{\prime}$ be ring maps. Let $B^{\prime}=B \otimes_{A} A^{\prime}$ be the base change of $B$. If $A \rightarrow B$ is ind-Zariski, then $A^{\prime} \rightarrow B^{\prime}$ is ind-Zariski.
Proof. Omitted.
096Q Lemma 51.4.3. Let $A \rightarrow B$ and $B \rightarrow C$ be ring maps. If $A \rightarrow B$ and $B \rightarrow C$ are ind-Zariski, then $A \rightarrow C$ is ind-Zariski.

Proof. Omitted.
096R Lemma 51.4.4. Let $A$ be a ring. Let $B \rightarrow C$ be an $A$-algebra homomorphism. If $A \rightarrow B$ and $A \rightarrow C$ are ind-Zariski, then $B \rightarrow C$ is ind-Zariski.

Proof. Omitted.
096S Lemma 51.4.5. A filtered colimit of ind-Zariski $A$-algebras is ind-Zariski over $A$.
Proof. Omitted.
096T Lemma 51.4.6. Let $A \rightarrow B$ be ind-Zariski. Then $A \rightarrow B$ identifies local rings, Proof. Omitted.

### 51.5. Constructing w-local affine schemes

096 U An affine scheme $X$ is called $w$-local if its underlying topological space is w-local (Definition 51.2.3). It turns out given any ring $A$ there is a canonical faithfully flat ind-Zariski ring map $A \rightarrow A_{w}$ such that $\operatorname{Spec}\left(A_{w}\right)$ is w-local. The key to constructing $A_{w}$ is the following simple lemma.
096V Lemma 51.5.1. Let $A$ be a ring. Set $X=\operatorname{Spec}(A)$. Let $Z \subset X$ be a locally closed subscheme which of the form $D(f) \cap V(I)$ for some $f \in A$ and ideal $I \subset A$. Then
(1) there exists a multiplicative subset $S \subset A$ such that $\operatorname{Spec}\left(S^{-1} A\right)$ maps by a homeomorphism to the set of points of $X$ specializing to $Z$,
(2) the $A$-algebra $A_{Z}^{\sim}=S^{-1} A$ depends only on the underlying locally closed subset $Z \subset X$,
(3) $Z$ is a closed subscheme of $\operatorname{Spec}\left(A_{Z}^{\sim}\right)$,

If $A \rightarrow A^{\prime}$ is a ring map and $Z^{\prime} \subset X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ is a locally closed subscheme of the same form which maps into $Z$, then there is a unique $A$-algebra map $A_{Z}^{\sim} \rightarrow\left(A^{\prime}\right) \tilde{Z}^{\prime}$.

Proof. Let $S \subset A$ be the multiplicative set of elements which map to invertible elements of $\Gamma\left(Z, \mathcal{O}_{Z}\right)=(A / I)_{f}$. If $\mathfrak{p}$ is a prime of $A$ which does not specialize to $Z$, then $\mathfrak{p}$ generates the unit ideal in $(A / I)_{f}$. Hence we can write $f^{n}=g+h$ for some $n \geq 0, g \in \mathfrak{p}, h \in I$. Then $g \in S$ and we see that $\mathfrak{p}$ is not in the spectrum of $S^{-1} A$. Conversely, if $\mathfrak{p}$ does specialize to $Z$, say $\mathfrak{p} \subset \mathfrak{q} \supset I$ with $f \notin \mathfrak{q}$, then we see that $S^{-1} A$ maps to $A_{\mathfrak{q}}$ and hence $\mathfrak{p}$ is in the spectrum of $S^{-1} A$. This proves (1).

The isomorphism class of the localization $S^{-1} A$ depends only on the corresponding subset $\operatorname{Spec}\left(S^{-1} A\right) \subset \operatorname{Spec}(A)$, whence (2) holds. By construction $S^{-1} A$ maps surjectively onto $(A / I)_{f}$, hence (3). The final statement follows as the multiplicative subset $S^{\prime} \subset A^{\prime}$ corresponding to $Z^{\prime}$ contains the image of the multiplicative subset $S$.

Let $A$ be a ring. Let $E \subset A$ be a finite subset. We get a stratification of $X=$ $\operatorname{Spec}(A)$ into locally closed subschemes by looking at the vanishing behaviour of the elements of $E$. More precisely, given a disjoint union decomposition $E=E^{\prime} \amalg E^{\prime \prime}$ we set

096W

$$
\begin{equation*}
Z\left(E^{\prime}, E^{\prime \prime}\right)=\bigcap_{f \in E^{\prime}} D(f) \cap \bigcap_{f \in E^{\prime \prime}} V(f)=D\left(\prod_{f \in E^{\prime}} f\right) \cap V\left(\sum_{f \in E^{\prime \prime}} f A\right) \tag{51.5.1.1}
\end{equation*}
$$

The points of $Z\left(E^{\prime}, E^{\prime \prime}\right)$ are exactly those $x \in X$ such that $f \in E^{\prime}$ maps to a nonzero element in $\kappa(x)$ and $f \in E^{\prime \prime}$ maps to zero in $\kappa(x)$. Thus it is clear that

096X

$$
\begin{equation*}
X=\coprod_{E=E^{\prime} \amalg E^{\prime \prime}} Z\left(E^{\prime}, E^{\prime \prime}\right) \tag{51.5.1.2}
\end{equation*}
$$

set theoretically. Observe that each stratum is constructible.
096Y Lemma 51.5.2. Let $X=\operatorname{Spec}(A)$ as above. Given any finite stratification $X=$】Ti by constructible subsets, there exists a finite subset $E \subset A$ such that the stratification 51.5.1.2 refines $X=\coprod T_{i}$.

Proof. We may write $T_{i}=\bigcup_{j} U_{i, j} \cap V_{i, j}^{c}$ as a finite union for some $U_{i, j}$ and $V_{i, j}$ quasi-compact open in $X$. Then we may write $U_{i, j}=\bigcup D\left(f_{i, j, k}\right)$ and $V_{i, j}=$ $\bigcup D\left(g_{i, j, l}\right)$. Then we set $E=\left\{f_{i, j, k}\right\} \cup\left\{g_{i, j, l}\right\}$. This does the job, because the stratification 51.5 .1 .2 is the one whose strata are labeled by the vanishing pattern of the elements of $E$ which clearly refines the given stratification.

We continue the discussion. Given a finite subset $E \subset A$ we set

$$
\begin{equation*}
A_{E}=\prod_{E=E^{\prime} \amalg E^{\prime \prime}} A_{\tilde{Z}\left(E^{\prime}, E^{\prime \prime}\right)}^{\sim} \tag{51.5.2.1}
\end{equation*}
$$

with notation as in Lemma 51.5.1. This makes sense because (51.5.1.1) shows that each $Z\left(E^{\prime}, E^{\prime \prime}\right)$ has the correct shape. We take the spectrum of this ring and denote it

$$
\begin{equation*}
X_{E}=\operatorname{Spec}\left(A_{E}\right)=\coprod_{E=E^{\prime} \amalg E^{\prime \prime}} X_{E^{\prime}, E^{\prime \prime}} \tag{51.5.2.2}
\end{equation*}
$$

with $X_{E^{\prime}, E^{\prime \prime}}=\operatorname{Spec}\left(A_{Z\left(E^{\prime}, E^{\prime \prime}\right)}^{\sim}\right)$. Note that

$$
\begin{equation*}
Z_{E}=\coprod_{E=E^{\prime} \amalg E^{\prime \prime}} Z\left(E^{\prime}, E^{\prime \prime}\right) \longrightarrow X_{E} \tag{51.5.2.3}
\end{equation*}
$$

is a closed subscheme. By construction the closed subscheme $Z_{E}$ contains all the closed points of the affine scheme $X_{E}$ as every point of $X_{E^{\prime}, E^{\prime \prime}}$ specializes to a point of $Z\left(E^{\prime}, E^{\prime \prime}\right)$.

Let $I(A)$ be the partially ordered set of all finite subsets of $A$. This is a directed partially ordered set. For $E_{1} \subset E_{2}$ there is a canonical transition map $A_{E_{1}} \rightarrow A_{E_{2}}$ of $A$-algebras. Namely, given a decomposition $E_{2}=E_{2}^{\prime} \amalg E_{2}^{\prime \prime}$ we set $E_{1}^{\prime}=E_{1} \cap E_{2}^{\prime}$ and $E_{1}^{\prime \prime}=E_{1} \cap E_{2}^{\prime \prime}$. Then observe that $Z\left(E_{1}^{\prime}, E_{1}^{\prime \prime}\right) \subset Z\left(E_{2}^{\prime}, E_{2}^{\prime \prime}\right)$ hence a unique $A$-algebra $\operatorname{map} A_{Z\left(E_{1}^{\prime}, E_{1}^{\prime \prime}\right)}^{\sim} \rightarrow A_{Z\left(E_{2}^{\prime}, E_{2}^{\prime \prime}\right)}^{\sim}$ by Lemma 51.5.1. Using these maps collectively we obtain the desired ring map $A_{E_{1}} \rightarrow A_{E_{2}}$. Observe that the corresponding map of affine schemes

0972

$$
\begin{equation*}
X_{E_{2}} \longrightarrow X_{E_{1}} \tag{51.5.2.4}
\end{equation*}
$$

maps $Z_{E_{2}}$ into $Z_{E_{1}}$. By uniqueness we obtain a system of $A$-algebras over $I(A)$ and we set

0973

$$
\begin{equation*}
A_{w}=\operatorname{colim}_{E \in I(A)} A_{E} \tag{51.5.2.5}
\end{equation*}
$$

This $A$-algebra is ind-Zariski and faithfully flat over $A$. Finally, we set $X_{w}=$ $\operatorname{Spec}\left(A_{w}\right)$ and endow it with the closed subscheme $Z=\lim _{E \in I(A)} Z_{E}$. In a formula

$$
\begin{equation*}
X_{w}=\lim _{E \in I(A)} X_{E} \supset Z=\lim _{E \in I(A)} Z_{E} \tag{51.5.2.6}
\end{equation*}
$$

Lemma 51.5.3. Let $X=\operatorname{Spec}(A)$ be an affine scheme. With $A \rightarrow A_{w}, X_{w}=$ $\operatorname{Spec}\left(A_{w}\right)$, and $Z \subset X_{w}$ as above.
(1) $A \rightarrow A_{w}$ is ind-Zariski and faithfully flat,
(2) $X_{w} \rightarrow X$ induces a bijection $Z \rightarrow X$,
(3) $Z$ is the set of closed points of $X_{w}$,
(4) $Z$ is a reduced scheme, and
(5) every point of $X_{w}$ specializes to a unique point of $Z$.

In particular, $X_{w}$ is w-local (Definition 51.2.3).
Proof. The map $A \rightarrow A_{w}$ is ind-Zariski by construction. For every $E$ the morphism $Z_{E} \rightarrow X$ is a bijection, hence (2). As $Z \subset X_{w}$ we conclude $X_{w} \rightarrow X$ is surjective and $A \rightarrow A_{w}$ is faithfully flat by Algebra, Lemma 10.38.16. This proves (1).
Suppose that $y \in X_{w}, y \notin Z$. Then there exists an $E$ such that the image of $y$ in $X_{E}$ is not contained in $Z_{E}$. Then for all $E \subset E^{\prime}$ also $y$ maps to an element of $X_{E^{\prime}}$ not contained in $Z_{E^{\prime}}$. Let $T_{E^{\prime}} \subset X_{E^{\prime}}$ be the reduced closed subscheme which is the closure of the image of $y$. It is clear that $T=\lim _{E \subset E^{\prime}} T_{E^{\prime}}$ is the closure of $y$ in $X_{w}$. For every $E \subset E^{\prime}$ the scheme $T_{E^{\prime}} \cap Z_{E^{\prime}}$ is nonempty by construction of $X_{E^{\prime}}$. Hence $\lim T_{E^{\prime}} \cap Z_{E^{\prime}}$ is nonempty and we conclude that $T \cap Z$ is nonempty. Thus $y$ is not a closed point. It follows that every closed point of $X_{w}$ is in $Z$.

Suppose that $y \in X_{w}$ specializes to $z, z^{\prime} \in Z$. We will show that $z=z^{\prime}$ which will finish the proof of (3) and will imply (5). Let $x, x^{\prime} \in X$ be the images of $z$ and $z^{\prime}$. Since $Z \rightarrow X$ is bijective it suffices to show that $x=x^{\prime}$. If $x \neq x^{\prime}$, then there exists an $f \in A$ such that $x \in D(f)$ and $x^{\prime} \in V(f)$ (or vice versa). Set $E=\{f\}$ so that

$$
X_{E}=\operatorname{Spec}\left(A_{f}\right) \amalg \operatorname{Spec}\left(A_{V(f)}\right)
$$

Then we see that $z$ and $z^{\prime}$ map $x_{E}$ and $x_{E}^{\prime}$ which are in different parts of the given decomposition of $X_{E}$ above. But then it impossible for $x_{E}$ and $x_{E}^{\prime}$ to be specializations of a common point. This is the desired contradiction.
Recall that given a finite subset $E \subset A$ we have $Z_{E}$ is a disjoint union of the locally closed subschemes $Z\left(E^{\prime}, E^{\prime \prime}\right)$ each isomorphic to the spectrum of $(A / I)_{f}$ where $I$ is the ideal generated by $E^{\prime \prime}$ and $f$ the product of the elements of $E^{\prime}$. Any nilpotent element $b$ of $(A / I)_{f}$ is the class of $g / f^{n}$ for some $g \in A$. Then setting $E^{\prime}=E \cup\{g\}$ the reader verifies that $b$ is pulls back to zero under the transition map $Z_{E^{\prime}} \rightarrow Z_{E}$ of the system. This proves (4).

0976 Remark 51.5.4. Let $A$ be a ring. Let $\kappa$ be an infinite cardinal bigger or equal than the cardinality of $A$. Then the cardinality of $A_{w}$ (Lemma 51.5.3) is at most $\kappa$. Namely, each $A_{E}$ has cardinality at most $\kappa$ and the set of finite subsets of $A$ has cardinality at most $\kappa$ as well. Thus the result follows as $\kappa \otimes \kappa=\kappa$, see Sets, Section 3.6 .

0977 Lemma 51.5.5 (Universal property of the construction). Let $A$ be a ring. Let $A \rightarrow A_{w}$ be the ring map constructed in Lemma 51.5.3. For any ring map $A \rightarrow B$ such that $\operatorname{Spec}(B)$ is w-local, there is a unique factorization $A \rightarrow A_{w} \rightarrow B$ such that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}\left(A_{w}\right)$ is w-local.

Proof. Denote $Y=\operatorname{Spec}(B)$ and $Y_{0} \subset Y$ the set of closed points. Denote $f: Y \rightarrow X$ the given morphism. Recall that $Y_{0}$ is profinite, in particular every constructible subset of $Y_{0}$ is open and closed. Let $E \subset A$ be a finite subset. Recall that $A_{w}=\operatorname{colim} A_{E}$ and that the set of closed points of $\operatorname{Spec}\left(A_{w}\right)$ is the limit of the closed subsets $Z_{E} \subset X_{E}=\operatorname{Spec}\left(A_{E}\right)$. Thus it suffices to show there is a unique factorization $A \rightarrow A_{E} \rightarrow B$ such that $Y \rightarrow X_{E}$ maps $Y_{0}$ into $Z_{E}$. Since $Z_{E} \rightarrow X=\operatorname{Spec}(A)$ is bijective, and since the strata $Z\left(E^{\prime}, E^{\prime \prime}\right)$ are constructible we see that

$$
Y_{0}=\coprod f^{-1}\left(Z\left(E^{\prime}, E^{\prime \prime}\right)\right) \cap Y_{0}
$$

is a disjoint union decomposition into open and closed subsets. As $Y_{0}=\pi_{0}(Y)$ we obtain a corresponding decomposition of $Y$ into open and closed pieces. Thus it suffices to construct the factorization in case $f\left(Y_{0}\right) \subset Z\left(E^{\prime}, E^{\prime \prime}\right)$ for some decomposition $E=E^{\prime} \amalg E^{\prime \prime}$. In this case $f(Y)$ is contained in the set of points of $X$ specializing to $Z\left(E^{\prime}, E^{\prime \prime}\right)$ which is homeomorphic to $X_{E^{\prime}, E^{\prime \prime}}$. Thus we obtain a unique continuous map $Y \rightarrow X_{E^{\prime}, E^{\prime \prime}}$ over $X$. By Lemma 51.3.7 this corresponds to a unique morphism of schemes $Y \rightarrow X_{E^{\prime}, E^{\prime \prime}}$ over $X$. This finishes the proof.

Recall that the spectrum of a ring is profinite if and only if every point is closed. There are in fact a whole slew of equivalent conditions that imply this. See Algebra, Lemma 10.25 .5 or Topology, Lemma 5.22.7.

0978 Lemma 51.5.6. Let $A$ be a ring such that $\operatorname{Spec}(A)$ is profinite. Let $A \rightarrow B$ be a ring map. Then $\operatorname{Spec}(B)$ is profinite in each of the following cases:
(1) if $\mathfrak{q}, \mathfrak{q}^{\prime} \subset B$ lie over the same prime of $A$, then neither $\mathfrak{q} \subset \mathfrak{q}^{\prime}$, nor $\mathfrak{q}^{\prime} \subset \mathfrak{q}$,
(2) $A \rightarrow B$ induces algebraic extensions of residue fields,
(3) $A \rightarrow B$ is a local isomorphism,
(4) $A \rightarrow B$ identifies local rings,
(5) $A \rightarrow B$ is weakly étale,
(6) $A \rightarrow B$ is quasi-finite,
(7) $A \rightarrow B$ is unramified,
(8) $A \rightarrow B$ is étale,
(9) $B$ is a filtered colimit of $A$-algebras as in (1) - (8),
(10) etc.

Proof. By the references mentioned above (Algebra, Lemma 10.25 .5 or Topology, Lemma 5.22.7) there are no specializations between distinct points of $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$ is profinite if and only if there are no specializations between distinct points of $\operatorname{Spec}(B)$. These specializations can only happen in the fibres of $\operatorname{Spec}(B) \rightarrow$ $\operatorname{Spec}(A)$. In this way we see that (1) is true.

The assumption in (2) implies all primes of $B$ are maximal by Algebra, Lemma 10.34.9. Thus (2) holds. If $A \rightarrow B$ is a local isomorphism or identifies local rings, then the residue field extensions are trivial, so (3) and (4) follow from (2). If $A \rightarrow B$ is weakly étale, then More on Algebra, Lemma 15.78 .16 tells us it induces separable algebraic residue field extensions, so (5) follows from (2). If $A \rightarrow B$ is quasifinite, then the fibres are finite discrete topological spaces. Hence (6) follows from (1). Hence (3) follows from (1). Cases (7) and (8) follow from this as unramified and étale ring map are quasi-finite (Algebra, Lemmas 10.147 .6 and 10.141.6). If $B=\operatorname{colim} B_{i}$ is a filtered colimit of $A$-algebras, then $\operatorname{Spec}(B)=\operatorname{colim\operatorname {Spec}(B_{i}),~}$ hence if each $\operatorname{Spec}\left(B_{i}\right)$ is profinite, so is $\operatorname{Spec}(B)$. This proves (9).

0979 Lemma 51.5.7. Let $A$ be a ring. Let $V(I) \subset \operatorname{Spec}(A)$ be a closed subset which is a profinite topological space. Then there exists an ind-Zariski ring map $A \rightarrow B$ such that $\operatorname{Spec}(B)$ is w-local, the set of closed points is $V(I B)$, and $A / I \cong B / I B$.

Proof. Let $A \rightarrow A_{w}$ and $Z \subset Y=\operatorname{Spec}\left(A_{w}\right)$ as in Lemma 51.5.3. Let $T \subset Z$ be the inverse image of $V(I)$. Then $T \rightarrow V(I)$ is a homeomorphism by Topology, Lemma 5.16.8. Let $B=\left(A_{w}\right)_{T}$, see Lemma 51.5.1. It is clear that $B$ is w-local with closed points $V(I B)$. The ring map $A / I \rightarrow B / I B$ is ind-Zariski and induces a homeomorphism on underlying topological spaces. Hence it is an isomorphism by Lemma 51.3.8.

097A Lemma 51.5.8. Let $A$ be a ring such that $X=\operatorname{Spec}(A)$ is w-local. Let $I \subset A$ be the radical ideal cutting out the set $X_{0}$ of closed points in $X$. Let $A \rightarrow B$ be a ring map inducing algebraic extensions on residue fields at primes. Then
(1) every point of $Z=V(I B)$ is a closed point of $\operatorname{Spec}(B)$,
(2) there exists an ind-Zariski ring map $B \rightarrow C$ such that
(a) $B / I B \rightarrow C / I C$ is an isomorphism,
(b) the space $Y=\operatorname{Spec}(C)$ is $w$-local,
(c) the induced map $p: Y \rightarrow X$ is w-local, and
(d) $p^{-1}\left(X_{0}\right)$ is the set of closed points of $Y$.

Proof. By Lemma 51.5.6 applied to $A / I \rightarrow B / I B$ all points of $Z=V(I B)=$ $\operatorname{Spec}(B / I B)$ are closed, in fact $\operatorname{Spec}(B / I B)$ is a profinite space. To finish the proof we apply Lemma 51.5 .7 to $I B \subset B$.

### 51.6. Identifying local rings versus ind-Zariski

097B An ind-Zariski ring map $A \rightarrow B$ identifies local rings (Lemma 51.4.6). The converse does not hold (Examples, Section 88.37). However, it turns out that there is a kind
of structure theorem for ring maps which identify local rings in terms of ind-Zariski ring maps, see Proposition 51.6.6.
Let $A$ be a ring. Let $X=\operatorname{Spec}(A)$. The space of connected components $\pi_{0}(X)$ is a profinite space by Topology, Lemma 5.22 .8 (and Algebra, Lemma 10.25.2).

097C Lemma 51.6.1. Let $A$ be a ring. Let $X=\operatorname{Spec}(A)$. Let $T \subset \pi_{0}(X)$ be a closed subset. There exists a surjective ind-Zariski ring map $A \rightarrow B$ such that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ induces a homeomorphism of $\operatorname{Spec}(B)$ with the inverse image of $T$ in $X$.

Proof. Let $Z \subset X$ be the inverse image of $T$. Then $Z$ is the intersection $Z=\bigcap Z_{\alpha}$ of the open and closed subsets of $X$ containing $Z$, see Topology, Lemma 5.11.12, For each $\alpha$ we have $Z_{\alpha}=\operatorname{Spec}\left(A_{\alpha}\right)$ where $A \rightarrow A_{\alpha}$ is a local isomorphism (a localization at an idempotent). Setting $B=\operatorname{colim} A_{\alpha}$ proves the lemma.

097D Lemma 51.6.2. Let $A$ be a ring and let $X=\operatorname{Spec}(A)$. Let $T$ be a profinite space and let $T \rightarrow \pi_{0}(X)$ be a continuous map. There exists an ind-Zariski ring map $A \rightarrow B$ such that with $Y=\operatorname{Spec}(B)$ the diagram

is cartesian in the category of topological spaces and such that $\pi_{0}(Y)=T$ as spaces over $\pi_{0}(X)$.

Proof. Namely, write $T=\lim T_{i}$ as the limit of an inverse system finite discrete spaces over a directed partially ordered set (see Topology, Lemma 5.21.2). For each $i$ let $Z_{i}=\operatorname{Im}\left(T \rightarrow \pi_{0}(X) \times T_{i}\right)$. This is a closed subset. Observe that $X \times T_{i}$ is the spectrum of $A_{i}=\prod_{t \in T_{i}} A$ and that $A \rightarrow A_{i}$ is a local isomorphism. By Lemma 51.6.1 we see that $Z_{i} \subset \pi_{0}\left(X \times T_{i}\right)=\pi_{0}(X) \times T_{i}$ corresponds to a surjection $A_{i} \rightarrow B_{i}$ which is ind-Zariski such that $\operatorname{Spec}\left(B_{i}\right)=X \times_{\pi_{0}(X)} Z_{i}$ as subsets of $X \times T_{i}$. The transition maps $T_{i} \rightarrow T_{i^{\prime}}$ induce maps $Z_{i} \rightarrow Z_{i^{\prime}}$ and $X \times_{\pi_{0}(X)} Z_{i} \rightarrow X \times_{\pi_{0}(X)} Z_{i^{\prime}}$. Hence ring maps $B_{i^{\prime}} \rightarrow B_{i}$ (Lemmas 51.3.8 and 51.4.6). Set $B=\operatorname{colim} B_{i}$. Because $T=\lim Z_{i}$ we have $X \times_{\pi_{0}(X)} T=\lim X \times_{\pi_{0}(X)} Z_{i}$ and hence $Y=\operatorname{Spec}(B)=$ $\lim \operatorname{Spec}\left(B_{i}\right)$ fits into the cartesian diagram

of topological spaces. By Lemma 51.2.5 we conclude that $T=\pi_{0}(Y)$.
09BJ Example 51.6.3. Let $k$ be a field. Let $T$ be a profinite topological space. There exists an ind-Zariski ring map $k \rightarrow A$ such that $\operatorname{Spec}(A)$ is homeomorphic to $T$. Namely, just apply Lemma 51.6.2 to $T \rightarrow \pi_{0}(\operatorname{Spec}(k))=\{*\}$. In fact, in this case we have

$$
A=\operatorname{colim} \operatorname{Map}\left(T_{i}, k\right)
$$

whenever we write $T=\lim T_{i}$ as a filtered limit with each $T_{i}$ finite.

097E Lemma 51.6.4. Let $A \rightarrow B$ be ring map such that
(1) $A \rightarrow B$ identifies local rings,
(2) the topological spaces $\operatorname{Spec}(B), \operatorname{Spec}(A)$ are w-local,
(3) $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is w-local, and
(4) $\pi_{0}(\operatorname{Spec}(B)) \rightarrow \pi_{0}(\operatorname{Spec}(A))$ is bijective.

Then $A \rightarrow B$ is an isomorphism
Proof. Let $X_{0} \subset X=\operatorname{Spec}(A)$ and $Y_{0} \subset Y=\operatorname{Spec}(B)$ be the sets of closed points. By assumption $Y_{0}$ maps into $X_{0}$ and the induced map $Y_{0} \rightarrow X_{0}$ is a bijection. As a space $\operatorname{Spec}(A)$ is the disjoint union of the spectra of the local rings of $A$ at closed points. Similarly for $B$. Hence $X \rightarrow Y$ is a bijection. Since $A \rightarrow B$ is flat we have going down (Algebra, Lemma 10.38.18. Thus Algebra, Lemma 10.40.11 shows for any prime $\mathfrak{q} \subset B$ lying over $\mathfrak{p} \subset A$ we have $B_{\mathfrak{q}}=B_{\mathfrak{p}}$. Since $B_{\mathfrak{q}}=A_{\mathfrak{p}}$ by assumption, we see that $A_{\mathfrak{p}}=B_{\mathfrak{p}}$ for all primes $\mathfrak{p}$ of $A$. Thus $A=B$ by Algebra, Lemma 10.23.1.

097F Lemma 51.6.5. Let $A \rightarrow B$ be ring map such that
(1) $A \rightarrow B$ identifies local rings,
(2) the topological spaces $\operatorname{Spec}(B), \operatorname{Spec}(A)$ are $w$-local, and
(3) $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is w-local.

Then $A \rightarrow B$ is ind-Zariski.
Proof. Set $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. Let $X_{0} \subset X$ and $Y_{0} \subset Y$ be the set of closed points. Let $A \rightarrow A^{\prime}$ be the ind-Zariski morphism of affine schemes such that with $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ the diagram

is cartesian in the category of topological spaces and such that $\pi_{0}\left(X^{\prime}\right)=\pi_{0}(Y)$ as spaces over $\pi_{0}(X)$, see Lemma 51.6.2. By Lemma 51.2.5 we see that $X^{\prime}$ is w-local and the set of closed points $X_{0}^{\prime} \subset X^{\prime}$ is the inverse image of $X_{0}$.
We obtain a continuous map $Y \rightarrow X^{\prime}$ of underlying topological spaces over $X$ identifying $\pi_{0}(Y)$ with $\pi_{0}\left(X^{\prime}\right)$. By Lemma 51.3.8 (and Lemma 51.4.6) this is corresponds to a morphism of affine schemes $Y \rightarrow X^{\prime}$ over $X$. Since $Y \rightarrow X$ maps $Y_{0}$ into $X_{0}$ we see that $Y \rightarrow X^{\prime}$ maps $Y_{0}$ into $X_{0}^{\prime}$, i.e., $Y \rightarrow X^{\prime}$ is w-local. By Lemma 51.6.4 we see that $Y \cong X^{\prime}$ and we win.

The following proposition is a warm up for the type of result we will prove later.
097G Proposition 51.6.6. Let $A \rightarrow B$ be a ring map which identifies local rings. Then there exists a faithfully flat, ind-Zariski ring map $B \rightarrow B^{\prime}$ such that $A \rightarrow B^{\prime}$ is ind-Zariski.

Proof. Let $A \rightarrow A_{w}$, resp. $B \rightarrow B_{w}$ be the faithfully flat, ind-Zariski ring map constructed in Lemma 51.5 .3 for $A$, resp. $B$. Since $\operatorname{Spec}\left(B_{w}\right)$ is w-local, there exists a unique factorization $A \rightarrow A_{w} \rightarrow B_{w}$ such that $\operatorname{Spec}\left(B_{w}\right) \rightarrow \operatorname{Spec}\left(A_{w}\right)$ is w-local by Lemma 51.5.5. Note that $A_{w} \rightarrow B_{w}$ identifies local rings, see Lemma 51.3.4 By Lemma 51.6.5 this means $A_{w} \rightarrow B_{w}$ is ind-Zariski. Since $B \rightarrow B_{w}$ is faithfully
flat, ind-Zariski (Lemma 51.5.3) and the composition $A \rightarrow B \rightarrow B_{w}$ is ind-Zariski (Lemma 51.4.3) the proposition is proved.

The proposition above allows us to characterize the affine, weakly contractible objects in the pro-Zariski site of an affine scheme.

09AZ Lemma 51.6.7. Let $A$ be a ring. The following are equivalent
(1) every faithfully flat ring map $A \rightarrow B$ identifying local rings has a section,
(2) every faithfully flat ind-Zariski ring map $A \rightarrow B$ has a section, and
(3) A satisfies
(a) $\operatorname{Spec}(A)$ is w-local, and
(b) $\pi_{0}(\operatorname{Spec}(A))$ is extremally disconnected.

Proof. The equivalence of (1) and (2) follows immediately from Proposition 51.6.6.
Assume (3)(a) and (3)(b). Let $A \rightarrow B$ be faithfully flat and ind-Zariski. We will use without further mention the fact that a flat map $A \rightarrow B$ is faithfully flat if and only if every closed point of $\operatorname{Spec}(A)$ is in the image of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ We will show that $A \rightarrow B$ has a section.

Let $I \subset A$ be an ideal such that $V(I) \subset \operatorname{Spec}(A)$ is the set of closed points of $\operatorname{Spec}(A)$. We may replace $B$ by the ring $C$ constructed in Lemma 51.5 .8 for $A \rightarrow B$ and $I \subset A$. Thus we may assume $\operatorname{Spec}(B)$ is w-local such that the set of closed points of $\operatorname{Spec}(B)$ is $V(I B)$.

Assume $\operatorname{Spec}(B)$ is w-local and the set of closed points of $\operatorname{Spec}(B)$ is $V(I B)$. Choose a continuous section to the surjective continuous map $V(I B) \rightarrow V(I)$. This is possible as $V(I) \cong \pi_{0}(\operatorname{Spec}(A))$ is extremally disconnected, see Topology, Proposition 5.25.6. The image is a closed subspace $T \subset \pi_{0}(\operatorname{Spec}(B)) \cong V(J B)$ mapping homeomorphically onto $\pi_{0}(A)$. Replacing $B$ by the ind-Zariski quotient ring constructed in Lemma 51.6.1 we see that we may assume $\pi_{0}(\operatorname{Spec}(B)) \rightarrow \pi_{0}(\operatorname{Spec}(A))$ is bijective. At this point $A \rightarrow B$ is an isomorphism by Lemma 51.6.4.

Assume (1) or equivalently (2). Let $A \rightarrow A_{w}$ be the ring map constructed in Lemma 51.5.3. By (1) there is a section $A_{w} \rightarrow A$. Thus $\operatorname{Spec}(A)$ is homeomorphic to a closed subset of $\operatorname{Spec}\left(A_{w}\right)$. By Lemma 51.2.4 we see (3)(a) holds. Finally, let $T \rightarrow \pi_{0}(A)$ be a surjective map with $T$ an extremally disconnected, quasicompact, Hausdorff topological space (Topology, Lemma 5.25.9). Choose $A \rightarrow B$ as in Lemma 51.6 .2 adapted to $T \rightarrow \pi_{0}(\operatorname{Spec}(A))$. By (1) there is a section $B \rightarrow$ $A$. Thus we see that $T=\pi_{0}(\operatorname{Spec}(B)) \rightarrow \pi_{0}(\operatorname{Spec}(A))$ has a section. A formal categorical argument, using Topology, Proposition 5.25.6. implies that $\pi_{0}(\operatorname{Spec}(A))$ is extremally disconnected.

09B0 Lemma 51.6.8. Let $A$ be a ring. There exists a faithfully flat, ind-Zariski ring map $A \rightarrow B$ such that $B$ satisfies the equivalent conditions of Lemma 51.6.7.

Proof. We first apply Lemma 51.5 .3 to see that we may assume that $\operatorname{Spec}(A)$ is wlocal. Choose an extremally disconnected space $T$ and a surjective continuous map $T \rightarrow \pi_{0}(\operatorname{Spec}(A))$, see Topology, Lemma 5.25.9. Note that $T$ is profinite. Apply Lemma 51.6 .2 to find an ind-Zariski ring map $A \rightarrow B$ such that $\pi_{0}(\operatorname{Spec}(B)) \rightarrow$
$\pi_{0}(\operatorname{Spec}(A))$ realizes $T \rightarrow \pi_{0}(\operatorname{Spec}(A))$ and such that

is cartesian in the category of topological spaces. Note that $\operatorname{Spec}(B)$ is w-local, that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is w-local, and that the set of closed points of $\operatorname{Spec}(B)$ is the inverse image of the set of closed points of $\operatorname{Spec}(A)$, see Lemma 51.2.5. Thus condition (3) of Lemma 51.6.7 holds for $B$.

0A0D Remark 51.6.9. In each of Lemmas 51.6.1 51.6.2 Proposition 51.6.6, and Lemma 51.6 .8 we find an ind-Zariski ring map with some properties. In the paper [BS13] the authors use the notion of an ind-(Zariski localization) which is a filtered colimit of finite products of principal localizations. It is possible to replace ind-Zariski by ind-(Zariski localization) in each of the results listed above. However, we do not need this and the notion of an ind-Zariski homomorphism of rings as defined here has slightly better formal properties. Moreover, the notion of an ind-Zariski ring map is the natural analogue of the notion of an ind-étale ring map defined in the next section.

### 51.7. Ind-étale algebra

097 H We start with a definition.
097I Definition 51.7.1. A ring map $A \rightarrow B$ is said to be ind-étale if $B$ can be written as a filtered colimit of étale $A$-algebras.

The category of ind-étale algebras is closed under a number of natural operations.
097J Lemma 51.7.2. Let $A \rightarrow B$ and $A \rightarrow A^{\prime}$ be ring maps. Let $B^{\prime}=B \otimes_{A} A^{\prime}$ be the base change of $B$. If $A \rightarrow B$ is ind-étale, then $A^{\prime} \rightarrow B^{\prime}$ is ind-étale.

Proof. Omitted.
097K Lemma 51.7.3. Let $A \rightarrow B$ and $B \rightarrow C$ be ring maps. If $A \rightarrow B$ and $B \rightarrow C$ are ind-étale, then $A \rightarrow C$ is ind-étale.

Proof. Omitted.
097L Lemma 51.7.4. A filtered colimit of ind-étale $A$-algebras is ind-étale over $A$.
Proof. Omitted.
097M Lemma 51.7.5. Let $A$ be a ring. Let $B \rightarrow C$ be an $A$-algebra map of ind-étale $A$-algebras. Then $C$ is an ind-étale $B$-algebra.

Proof. Write $B=\operatorname{colim} B_{i}$ and $C=\operatorname{colim} C_{j}$ as filtered colimits of étale $A$ algebras. Then

$$
C=B \otimes_{B} C=\operatorname{colim}_{(i, j)} B \otimes_{B_{i}} C_{j}
$$

where the colimit is over the partially ordered set of pairs $(i, j)$ such that $B_{i} \rightarrow$ $B \rightarrow C$ factors through $C_{j} \rightarrow C$. Note that the factorization $B_{i} \rightarrow C_{j}$ is étale by Algebra, Lemma 10.141.9. Some details omitted.

097 N Lemma 51.7.6. Let $A \rightarrow B$ be ind-étale. Then $A \rightarrow B$ is weakly étale (More on Algebra, Definition 15.78.1).

Proof. This follows from More on Algebra, Lemma 15.78 .13
097P Lemma 51.7.7. Let $A$ be a ring and let $I \subset A$ be an ideal. The base change functor

$$
\text { ind-étale } A \text {-algebras } \longrightarrow \text { ind-étale } A / I \text {-algebras }, \quad C \longmapsto C / I C
$$

has a fully faithful right adjoint $v$. In particular, given an ind-étale $A / I$-algebra $\bar{C}$ there exists an ind-étale $A$-algebra $C=v(\bar{C})$ such that $\bar{C}=C / I C$.

Proof. Let $\bar{C}$ be an ind-étale $A / I$-algebra. Consider the category $\mathcal{C}$ of factorizations $A \rightarrow B \rightarrow \bar{C}$ where $A \rightarrow B$ is étale. (We ignore some set theoretical issues in this proof.) We will show that this category is directed and that $C=\operatorname{colim}_{\mathcal{C}} B$ is an ind-étale $A$-algebra such that $\bar{C}=C / I C$.

We first prove that $\mathcal{C}$ is directed (Categories, Definition 4.19.1). The category is nonempty as $A \rightarrow A \rightarrow \bar{C}$ is an object. Suppose that $A \rightarrow \overline{B \rightarrow C}$ and $A \rightarrow B^{\prime} \rightarrow \bar{C}$ are two objects of $\mathcal{C}$. Then $A \rightarrow B \otimes_{A} B^{\prime} \rightarrow \bar{C}$ is another (use Algebra, Lemma 10.141.3). Suppose that $f, g: B \rightarrow B^{\prime}$ are two maps between objects $A \rightarrow B \rightarrow \bar{C}$ and $A \rightarrow B^{\prime} \rightarrow \bar{C}$ of $\mathcal{C}$. Then a coequalizer is $A \rightarrow B^{\prime} \otimes_{f, B, g} B^{\prime} \rightarrow \bar{C}$. This is an object of $\mathcal{C}$ by Algebra, Lemmas 10.141 .3 and 10.141.9. Thus the category $\mathcal{C}$ is directed.

Write $\bar{C}=\operatorname{colim} \overline{B_{i}}$ as a filtered colimit with $\overline{B_{i}}$ étale over $A / I$. For every $i$ there exists $A \rightarrow B_{i}$ étale with $\overline{B_{i}}=B_{i} / I B_{i}$, see Algebra, Lemma 10.141.11. Thus $C \rightarrow \bar{C}$ is surjective. Since $C / I C \rightarrow \bar{C}$ is ind-étale (Lemma 51.7.5) we see that it is flat. Hence $\bar{C}$ is a localization of $C / I C$ at some multiplicative subset $S \subset C / I C$ (Algebra, Lemma 10.107.2). Take an $f \in C$ mapping to an element of $S \subset C / I C$. Choose $A \rightarrow B \rightarrow \bar{C}$ in $\mathcal{C}$ and $g \in B$ mapping to $f$ in the colimit. Then we see that $A \rightarrow B_{g} \rightarrow \bar{C}$ is an object of $\mathcal{C}$ as well. Thus $f$ is an invertible element of $C$. It follows that $C / I C=\bar{C}$.

Next, we claim that for an ind-étale algebra $D$ over $A$ we have

$$
\operatorname{Mor}_{A}(D, C)=\operatorname{Mor}_{A / I}(D / I D, \bar{C})
$$

Namely, let $D / I D \rightarrow \bar{C}$ be an $A / I$-algebra map. Write $D=\operatorname{colim}_{i \in I} D_{i}$ as a filtered colimit over a partially ordered set $I$ with $D_{i}$ étale over $A$. By choice of $\mathcal{C}$ we obtain a transformation $I \rightarrow \mathcal{C}$ and hence a map $D \rightarrow C$ compatible with maps to $\bar{C}$. Whence the claim.

It follows that the functor $v$ defined by the rule

$$
\bar{C} \longmapsto v(\bar{C})=\operatorname{colim}_{A \rightarrow B \rightarrow \bar{C}} B
$$

is a right adjoint to the base change functor $u$ as required by the lemma. The functor $v$ is fully faithful because $u \circ v=\mathrm{id}$ by construction, see Categories, Lemma 4.24 .3 .

### 51.8. Constructing ind-étale algebras

097 Q Let $A$ be a ring. Recall that any étale ring map $A \rightarrow B$ is isomorphic to a standard smooth ring map of relative dimension 0 . Such a ring map is of the form

$$
A \longrightarrow A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)
$$

where the determinant of the $n \times n$-matrix with entries $\partial f_{i} / \partial x_{j}$ is invertible in the quotient ring. See Algebra, Lemma 10.141 .2 .
Let $S(A)$ be the set of all faithfully fla ${ }^{11}$ standard smooth $A$-algebras of relative dimension 0 . Let $I(A)$ be the partially ordered (by inclusion) set of finite subsets $E$ of $S(A)$. Note that $I(A)$ is a directed partially ordered set. For $E=\{A \rightarrow$ $\left.B_{1}, \ldots, A \rightarrow B_{n}\right\}$ set

$$
B_{E}=B_{1} \otimes_{A} \ldots \otimes_{A} B_{n}
$$

Observe that $B_{E}$ is a faithfully flat étale $A$-algebra. For $E \subset E^{\prime}$, there is a canonical transition map $B_{E} \rightarrow B_{E^{\prime}}$ of étale $A$-algebras. Namely, say $E=\left\{A \rightarrow B_{1}, \ldots, A \rightarrow\right.$ $\left.B_{n}\right\}$ and $E^{\prime}=\left\{A \rightarrow B_{1}, \ldots, A \rightarrow B_{n+m}\right\}$ then $B_{E} \rightarrow B_{E^{\prime}}$ sends $b_{1} \otimes \ldots \otimes b_{n}$ to the element $b_{1} \otimes \ldots \otimes b_{n} \otimes 1 \otimes \ldots \otimes 1$ of $B_{E^{\prime}}$. This construction defines a system of faithfully flat étale $A$-algebras over $I(A)$ and we set

$$
T(A)=\operatorname{colim}_{E \in I(A)} B_{E}
$$

Observe that $T(A)$ is a faithfully flat ind-étale $A$-algebra (Algebra, Lemma 10.38.20). By construction given any faithfully flat étale $A$-algebra $B$ there is a (non-unique) $A$-algebra map $B \rightarrow T(A)$. Namely, pick some $\left(A \rightarrow B_{0}\right) \in S(A)$ and an isomorphism $B \cong B_{0}$. Then the canonical coprojection

$$
B \rightarrow B_{0} \rightarrow T(A)=\operatorname{colim}_{E \in I(A)} B_{E}
$$

is the desired map.
097R Lemma 51.8.1. Given a ring $A$ there exists a faithfully flat ind-étale $A$-algebra $C$ such that every faithfully flat étale ring map $C \rightarrow B$ has a section.
Proof. Set $T^{1}(A)=T(A)$ and $T^{n+1}(A)=T\left(T^{n}(A)\right)$. Let

$$
C=\operatorname{colim} T^{n}(A)
$$

This algebra is faithfully flat over each $T^{n}(A)$ and in particular over $A$, see Algebra, Lemma 10.38 .20 . Moreover, $C$ is ind-étale over $A$ by Lemma 51.7.4. If $C \rightarrow B$ is étale, then there exists an $n$ and an étale ring map $T^{n}(A) \rightarrow B^{\prime}$ such that $B=C \otimes_{T^{n}(A)} B^{\prime}$, see Algebra, Lemma 10.141.3. If $C \rightarrow B$ is faithfully flat, then $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(C) \rightarrow \operatorname{Spec}\left(T^{n}(A)\right)$ is surjective, hence $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}\left(T^{n}(A)\right)$ is surjective. In other words, $T^{n}(A) \rightarrow B^{\prime}$ is faithfully flat. By our construction, there is a $T^{n}(A)$-algebra map $B^{\prime} \rightarrow T^{n+1}(A)$. This induces a $C$-algebra map $B \rightarrow C$ which finishes the proof.

097S Remark 51.8.2. Let $A$ be a ring. Let $\kappa$ be an infinite cardinal bigger or equal than the cardinality of $A$. Then the cardinality of $T(A)$ is at most $\kappa$. Namely, each $B_{E}$ has cardinality at most $\kappa$ and the index set $I(A)$ has cardinality at most $\kappa$ as well. Thus the result follows as $\kappa \otimes \kappa=\kappa$, see Sets, Section 3.6. It follows that the ring constructed in the proof of Lemma 51.8.1 has cardinality at most $\kappa$ as well.

[^144]097T Remark 51.8.3. The construction $A \mapsto T(A)$ is functorial in the following sense: If $A \rightarrow A^{\prime}$ is a ring map, then we can construct a commutative diagram

Namely, given $\left(A \rightarrow A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)\right)$ in $S(A)$ we can use the ring map $\varphi: A \rightarrow A^{\prime}$ to obtain a corresponding element $\left(A^{\prime} \rightarrow A^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}^{\varphi}, \ldots, f_{n}^{\varphi}\right)\right)$ of $S\left(A^{\prime}\right)$ where $f^{\varphi}$ means the polynomial obtained by applying $\varphi$ to the coefficients of the polynomial $f$. Moreover, there is a commutative diagram

which is a in the category of rings. For $E \subset S(A)$ finite, set $E^{\prime}=\varphi(E)$ and define $B_{E} \rightarrow B_{E^{\prime}}$ in the obvious manner. Taking the colimit gives the desired map $T(A) \rightarrow T\left(A^{\prime}\right)$, see Categories, Lemma 4.14.7.

097U Lemma 51.8.4. Let $A$ be a ring such that every faithfully flat étale ring map $A \rightarrow B$ has a section. Then the same is true for every quotient ring $A / I$.

Proof. Omitted.
097V Lemma 51.8.5. Let $A$ be a ring such that every faithfully flat étale ring map $A \rightarrow B$ has a section. Then every local ring of $A$ at a maximal ideal is strictly henselian.

Proof. Let $\mathfrak{m}$ be a maximal ideal of $A$. Let $A \rightarrow B$ be an étale ring map and let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{m}$. By the description of the strict henselization $A_{\mathfrak{m}}^{s h}$ in Algebra, Lemma 10.148 .27 it suffices to show that $A_{\mathfrak{m}}=B_{\mathfrak{q}}$. Note that there are finitely many primes $\mathfrak{q}=\mathfrak{q}_{1}, \mathfrak{q}_{2}, \ldots, \mathfrak{q}_{n}$ lying over $\mathfrak{m}$ and there are no specializations between them as an étale ring map is quasi-finite, see Algebra, Lemma 10.141.6. Thus $\mathfrak{q}_{i}$ is a maximal ideal and we can find $g \in \mathfrak{q}_{2} \cap \ldots \cap \mathfrak{q}_{n}, g \notin \mathfrak{q}$ (Algebra, Lemma 10.14.2. After replacing $B$ by $B_{g}$ we see that $\mathfrak{q}$ is the only prime of $B$ lying over $\mathfrak{m}$. The image $U \subset \operatorname{Spec}(A)$ of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is open (Algebra, Proposition 10.40.8). Thus the complement $\operatorname{Spec}(A) \backslash U$ is closed and we can find $f \in A, f \notin \mathfrak{p}$ such that $\operatorname{Spec}(A)=U \cup D(f)$. The ring map $A \rightarrow B \times A_{f}$ is faithfully flat and étale, hence has a section $\sigma: B \times A_{f} \rightarrow A$ by assumption on $A$. Observe that $\sigma$ is étale, hence flat as a map between étale $A$-algebras (Algebra, Lemma 10.141.9. Since $\mathfrak{q}$ is the only prime of $B \times A_{f}$ lying over $A$ we find that $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ has a section which is also flat. Thus $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}} \rightarrow A_{\mathfrak{p}}$ are flat local ring maps whose composition is the identity. Since a flat local homomorphism of local rings is injective we conclude these maps are isomorphisms as desired.

097W Lemma 51.8.6. Let $A$ be a ring such that every faithfully flat étale ring map $A \rightarrow$ $B$ has a section. Let $Z \subset \operatorname{Spec}(A)$ be a closed subscheme of the form $D(f) \cap V(I)$ and let $A \rightarrow A_{Z}^{\sim}$ be as constructed in Lemma51.5.1. Then every faithfully flat étale ring map $A_{Z}^{\tilde{Z}} \rightarrow C$ has a section.

Proof. There exists an étale ring map $A \rightarrow B^{\prime}$ such that $C=B^{\prime} \otimes_{A} A_{Z}^{\sim}$ as $A_{Z^{-}}^{\sim}$ algebras. The image $U^{\prime} \subset \operatorname{Spec}(A)$ of $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}(A)$ is open and contains $V(I)$, hence we can find $f \in I$ such that $\operatorname{Spec}(A)=U^{\prime} \cup D(f)$. Then $A \rightarrow B^{\prime} \times A_{f}$ is étale and faithfully flat. By assumption there is a section $B^{\prime} \times A_{f} \rightarrow A$. Localizing we obtain the desired section $C \rightarrow A_{Z}^{\tilde{Z}}$.
097X Lemma 51.8.7. Let $A \rightarrow B$ be a ring map inducing algebraic extensions on residue fields. There exists a commutative diagram

with the following properties:
(1) $A \rightarrow C$ is faithfully flat and ind-étale,
(2) $B \rightarrow D$ is faithfully flat and ind-étale,
(3) $\operatorname{Spec}(C)$ is w-local,
(4) $\operatorname{Spec}(D)$ is w-local,
(5) $\operatorname{Spec}(D) \rightarrow \operatorname{Spec}(C)$ is w-local,
(6) the set of closed points of $\operatorname{Spec}(D)$ is the inverse image of the set of closed points of $\operatorname{Spec}(C)$,
(7) the set of closed points of $\operatorname{Spec}(C)$ surjects onto $\operatorname{Spec}(A)$,
(8) the set of closed points of $\operatorname{Spec}(D)$ surjects onto $\operatorname{Spec}(B)$,
(9) for $\mathfrak{m} \subset C$ maximal the local ring $C_{\mathfrak{m}}$ is strictly henselian.

Proof. There is a faithfully flat, ind-Zariski ring map $A \rightarrow A^{\prime}$ such that $\operatorname{Spec}\left(A^{\prime}\right)$ is w-local and such that the set of closed points of $\operatorname{Spec}\left(A^{\prime}\right)$ maps onto $\operatorname{Spec}(A)$, see Lemma 51.5.3. Let $I \subset A^{\prime}$ be the ideal such that $V(I)$ is the set of closed points of $\operatorname{Spec}\left(A^{\prime}\right)$. Choose $A^{\prime} \rightarrow C^{\prime}$ as in Lemma 51.8.1. Note that the local rings $C_{\mathfrak{m}^{\prime}}^{\prime}$ at maximal ideals $\mathfrak{m}^{\prime} \subset C^{\prime}$ are strictly henselian by Lemma 51.8.5. We apply Lemma 51.5 .8 to $A^{\prime} \rightarrow C^{\prime}$ and $I \subset A^{\prime}$ to get $C^{\prime} \rightarrow C$ with $C^{\prime} / I C^{\prime} \cong C / I C$. Note that since $A^{\prime} \rightarrow C^{\prime}$ is faithfully flat, $\operatorname{Spec}\left(C^{\prime} / I C^{\prime}\right)$ surjects onto the set of closed points of $A^{\prime}$ and in particular onto $\operatorname{Spec}(A)$. Moreover, as $V(I C) \subset \operatorname{Spec}(C)$ is the set of closed points of $C$ and $C^{\prime} \rightarrow C$ is ind-Zariski (and identifies local rings) we obtain properties (1), (3), (7), and (9).

Denote $J \subset C$ the ideal such that $V(J)$ is the set of closed points of $\operatorname{Spec}(C)$. Set $D^{\prime}=B \otimes_{A} C$. The ring map $C \rightarrow D^{\prime}$ induces algebraic residue field extensions. Keep in mind that since $V(J) \rightarrow \operatorname{Spec}(A)$ is surjective the map $T=V(J D) \rightarrow$ $\operatorname{Spec}(B)$ is surjective too. Apply Lemma 51.5 .8 to $C \rightarrow D^{\prime}$ and $J \subset C$ to get $D^{\prime} \rightarrow D$ with $D^{\prime} / J D^{\prime} \cong D / J D$. All of the remaining properties given in the lemma are immediate from the results of Lemma 51.5.8.

### 51.9. Weakly étale versus pro-étale

097Y Recall that a ring homomorphism $A \rightarrow B$ is weakly étale if $A \rightarrow B$ is flat and $B \otimes_{A} B \rightarrow B$ is flat. We have proved some properties of such ring maps in More on Algebra, Section 15.78. In particular, if $A \rightarrow B$ is a local homomorphism, and $A$ is a strictly henselian local rings, then $A=B$, see More on Algebra, Theorem 15.78.24. Using this theorem and the work we've done above we obtain the following structure theorem for weakly étale ring maps.

097Z Proposition 51.9.1. Let $A \rightarrow B$ be a weakly étale ring map. Then there exists a faithfully flat, ind-étale ring map $B \rightarrow B^{\prime}$ such that $A \rightarrow B^{\prime}$ is ind-étale.

Proof. The ring map $A \rightarrow B$ induces (separable) algebraic extensions of residue fields, see More on Algebra, Lemma | 15.78 .16 . Thus we may apply Lemma 51.8.7 |
| :---: | and choose a diagram

with the properties as listed in the lemma. Note that $C \rightarrow D$ is weakly étale by More on Algebra, Lemma 15.78.11. Pick a maximal ideal $\mathfrak{m} \subset D$. By construction this lies over a maximal ideal $\mathfrak{m}^{\prime} \subset C$. By More on Algebra, Theorem 15.78 .24 the ring map $C_{\mathfrak{m}^{\prime}} \rightarrow D_{\mathfrak{m}}$ is an isomorphism. As every point of $\operatorname{Spec}(C)$ specializes to a closed point we conclude that $C \rightarrow D$ identifies local rings. Thus Proposition 51.6 .6 applies to the ring map $C \rightarrow D$. Pick $D \rightarrow D^{\prime}$ faithfully flat and ind-Zariski such that $C \rightarrow D^{\prime}$ is ind-Zariski. Then $B \rightarrow D^{\prime}$ is a solution to the problem posed in the proposition.

### 51.10. Constructing w-contractible covers

0980 In this section we construct w-contractible covers of affine schemes.
0981 Definition 51.10.1. Let $A$ be a ring. We say $A$ is $w$-contractible if every faithfully flat weakly-etale ring map $A \rightarrow B$ has a section.
We remark that by Proposition 51.9.1 an equivalent definition would be to ask that every faithfully flat, ind-étale ring map $A \rightarrow B$ has a section. Here is a key observation that will allow us to construct w-contractible rings.

0982 Lemma 51.10.2. Let $A$ be a ring. The following are equivalent
(1) $A$ is $w$-contractible,
(2) every faithfully flat, ind-étale ring map $A \rightarrow B$ has a section, and
(3) A satisfies
(a) $\operatorname{Spec}(A)$ is w-local,
(b) $\pi_{0}(\operatorname{Spec}(A))$ is extremally disconnected, and
(c) for every maximal ideal $\mathfrak{m} \subset A$ the local ring $A_{\mathfrak{m}}$ is strictly henselian.

Proof. The equivalence of (1) and (2) follows immediately from Proposition 51.9.1.
Assume (3)(a), (3)(b), and (3)(c). Let $A \rightarrow B$ be faithfully flat and ind-étale. We will use without further mention the fact that a flat map $A \rightarrow B$ is faithfully flat if and only if every closed point of $\operatorname{Spec}(A)$ is in the image of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ We will show that $A \rightarrow B$ has a section.
Let $I \subset A$ be an ideal such that $V(I) \subset \operatorname{Spec}(A)$ is the set of closed points of $\operatorname{Spec}(A)$. We may replace $B$ by the ring $C$ constructed in Lemma 51.5 .8 for $A \rightarrow B$ and $I \subset A$. Thus we may assume $\operatorname{Spec}(B)$ is w-local such that the set of closed points of $\operatorname{Spec}(B)$ is $V(I B)$. In this case $A \rightarrow B$ identifies local rings by condition $(3)(c)$ as it suffices to check this at maximal ideals of $B$ which lie over maximal ideals of $A$. Thus $A \rightarrow B$ has a section by Lemma 51.6.7.
Assume (1) or equivalently (2). We have (3)(c) by Lemma 51.8.5. Properties (3)(a) and $(3)(\mathrm{b})$ follow from Lemma 51.6.7.

0983 Proposition 51.10.3. For every ring $A$ there exists a faithfully flat, ind-étale ring map $A \rightarrow D$ such that $D$ is w-contractible.

Proof. Applying Lemma 51.8.7 to $\mathrm{id}_{A}: A \rightarrow A$ we find a faithfully flat, ind-étale ring map $A \rightarrow C$ such that $C$ is w-local and such that every local ring at a maximal ideal of $C$ is strictly henselian. Choose an extremally disconnected space $T$ and a surjective continuous map $T \rightarrow \pi_{0}(\operatorname{Spec}(C))$, see Topology, Lemma 5.25.9. Note that $T$ is profinite. Apply Lemma 51.6 .2 to find an ind-Zariski ring map $C \rightarrow D$ such that $\pi_{0}(\operatorname{Spec}(D)) \rightarrow \pi_{0}(\operatorname{Spec}(C))$ realizes $T \rightarrow \pi_{0}(\operatorname{Spec}(C))$ and such that

is cartesian in the category of topological spaces. Note that $\operatorname{Spec}(D)$ is w-local, that $\operatorname{Spec}(D) \rightarrow \operatorname{Spec}(C)$ is w-local, and that the set of closed points of $\operatorname{Spec}(D)$ is the inverse image of the set of closed points of $\operatorname{Spec}(C)$, see Lemma 51.2.5. Thus it is still true that the local rings of $D$ at its maximal ideals are strictly henselian (as they are isomorphic to the local rings at the corresponding maximal ideals of $C$ ). It follows from Lemma 51.10 .2 that $D$ is w-contractible.

0984 Remark 51.10.4. Let $A$ be a ring. Let $\kappa$ be an infinite cardinal bigger or equal than the cardinality of $A$. Then the cardinality of the ring $D$ constructed in Proposition 51.10 .3 is at most

$$
\kappa^{2^{2^{2^{\kappa}}}}
$$

Namely, the ring map $A \rightarrow D$ is constructed as a composition

$$
A \rightarrow A_{w}=A^{\prime} \rightarrow C^{\prime} \rightarrow C \rightarrow D
$$

Here the first three steps of the construction are carried out in the first paragraph of the proof of Lemma 51.8.7. For the first step we have $\left|A_{w}\right| \leq \kappa$ by Remark 51.5.4. We have $\left|C^{\prime}\right| \leq \kappa$ by Remark 51.8 .2 . Then $|C| \leq \kappa$ because $C$ is a localization of $\left(C^{\prime}\right)_{w}$ (it is constructed from $C^{\prime}$ by an application of Lemma 51.5.7 in the proof of Lemma 51.5.8). Thus $C$ has at most $2^{\kappa}$ maximal ideals. Finally, the ring map $C \rightarrow D$ identifies local rings and the cardinality of the set of maximal ideals of $D$ is at most $2^{2^{2^{\kappa}}}$ by Topology, Remark 5.25 .10 . Since $D \subset \prod_{\mathfrak{m} \subset D} D_{\mathfrak{m}}$ we see that $D$ has at most the size displayed above.

0985 Lemma 51.10.5. Let $A \rightarrow B$ be a quasi-finite and finitely presented ring map. If the residue fields of $A$ are separably algebraically closed and $\operatorname{Spec}(A)$ is extremally disconnected, then $\operatorname{Spec}(B)$ is extremally disconnected.

Proof. Set $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. Choose a finite partition $X=\coprod X_{i}$ and $X_{i}^{\prime} \rightarrow X_{i}$ as in Étale Cohomology, Lemma 49.69.3. Because $X$ is extremally disconnected, every constructible locally closed subset is open and closed, hence we see that $X$ is topologically the disjoint union of the strata $X_{i}$. Thus we may replace $X$ by the $X_{i}$ and assume there exists a surjective finite locally free morphism $X^{\prime} \rightarrow X$ such that $\left(X^{\prime} \times_{X} Y\right)_{r e d}$ is isomorphic to a finite disjoint union of copies
of $X_{r e d}^{\prime}$. Picture

The assumption on the residue fields of $A$ implies that this diagram is a fibre product diagram on underlying sets of points (details omitted). Since $X$ is extremally disconnected and $X^{\prime}$ is Hausdorff (Lemma 51.5.6), the continuous map $X^{\prime} \rightarrow X$ has a continuous section $\sigma$. Then $\coprod_{i=1, \ldots, r} \sigma(X) \rightarrow Y$ is a bijective continuous map. By Topology, Lemma 5.16 .8 we see that it is a homeomorphism and the proof is done.

0986 Lemma 51.10.6. Let $A \rightarrow B$ be a finite and finitely presented ring map. If $A$ is $w$-contractible, so is $B$.

Proof. We will use the criterion of Lemma 51.10.2. Set $X=\operatorname{Spec}(A)$ and $Y=$ $\operatorname{Spec}(B)$. As $Y \rightarrow X$ is a finite morphism, we see that the set of closed points $Y_{0}$ of $Y$ is the inverse image of the set of closed points $X_{0}$ of $X$. Moreover, every point of $Y$ specializes to a unique point of $Y_{0}$ as (a) this is true for $X$ and (b) the map $X \rightarrow Y$ is separated. For every $y \in Y_{0}$ with image $x \in X_{0}$ we see that $\mathcal{O}_{Y, y}$ is strictly henselian by Algebra, Lemma 10.148 .4 applied to $\mathcal{O}_{X, x} \rightarrow B \otimes_{A} \mathcal{O}_{X, x}$. It remains to show that $Y_{0}$ is extremally disconnected. To do this we look at $X_{0} \times_{X} Y \rightarrow X_{0}$ where $X_{0} \subset X$ is the reduced induced scheme structure. Note that the underlying topological space of $X_{0} \times_{X} Y$ agrees with $Y_{0}$. Now the desired result follows from Lemma 51.10.5

0987 Lemma 51.10.7. Let $A$ be a ring. Let $Z \subset \operatorname{Spec}(A)$ be a closed subset of the form $Z=V\left(f_{1}, \ldots, f_{r}\right)$. Set $B=A_{Z}^{\tilde{Z}}$, see Lemma 51.5.1. If $A$ is w-contractible, so is $B$.

Proof. Let $A_{Z}^{\sim} \rightarrow B$ be a weakly étale faithfully flat ring map. Consider the ring map

$$
A \longrightarrow A_{f_{1}} \times \ldots \times A_{f_{r}} \times B
$$

this is faithful flat and weakly étale. If $A$ is w-contractible, then there is a section $\sigma$. Consider the morphism

$$
\operatorname{Spec}\left(A_{Z}^{\sim}\right) \rightarrow \operatorname{Spec}(A) \xrightarrow{\operatorname{Spec}(\sigma)} \coprod \operatorname{Spec}\left(A_{f_{i}}\right) \amalg \operatorname{Spec}(B)
$$

Every point of $Z \subset \operatorname{Spec}\left(A_{Z}^{\sim}\right)$ maps into the component $\operatorname{Spec}(B)$. Since every point of $\operatorname{Spec}\left(A_{Z}^{\tilde{Z}}\right)$ specializes to a point of $Z$ we find a morphism $\operatorname{Spec}\left(A_{Z}^{\tilde{Z}}\right) \rightarrow \operatorname{Spec}(B)$ as desired.

### 51.11. The pro-étale site

0988 The (small) pro-étale site of a scheme has some remarkable properties. In particular, it has enough w-contractible objects which implies a number of useful consequences for the derived category of abelian sheaves and for inverse systems of sheaves. Thus it is well adapted to deal with some of the intricacies of working with $\ell$-adic sheaves.

On the other hand, the pro-étale topology is a bit like the fpqc topology (see Topologies, Section 33.8 in that the topos of sheaves on the small pro-étale site of a scheme depends on the choice of the underlying category of schemes. Thus we
cannot speak of the pro-étale topos of a scheme. However, it will be true that the cohomology groups of a sheaf are unchanged if we enlarge our underlying category of schemes.

Another curiosity is that we define pro-étale coverings using weakly étale morphisms of schemes, see More on Morphisms, Section 36.46. The reason is that, on the one hand, it is somewhat awkward to define the notion of a pro-étale morphism of schemes, and on the other, Proposition 51.9.1 assures us that we obtain the same sheaves with the definition that follows.

0989 Definition 51.11.1. Let $T$ be a scheme. A pro-étale covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is weakly-étale and such that for every affine open $U \subset T$ there exists $n \geq 0$, a map $a:\{1, \ldots, n\} \rightarrow I$ and affine opens $V_{j} \subset T_{a(j)}, j=1, \ldots, n$ with $\bigcup_{j=1}^{n} f_{a(j)}\left(V_{j}\right)=U$.

To be sure this condition implies that $T=\bigcup f_{i}\left(T_{i}\right)$. Here is a lemma that will allow us to recognize pro-étale coverings. It will also allow us to reduce many lemmas about pro-étale coverings to the corresponding results for fpqc coverings.

098A Lemma 51.11.2. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. The following are equivalent
(1) $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is a pro-étale covering,
(2) each $f_{i}$ is weakly étale and $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering,
(3) each $f_{i}$ is weakly étale and for every affine open $U \subset T$ there exist quasi-compact opens $U_{i} \subset T_{i}$ which are almost all empty, such that $U=$ $\bigcup f_{i}\left(U_{i}\right)$,
(4) each $f_{i}$ is weakly étale and there exists an affine open covering $T=$ $\bigcup_{\alpha \in A} U_{\alpha}$ and for each $\alpha \in A$ there exist $i_{\alpha, 1}, \ldots, i_{\alpha, n(\alpha)} \in I$ and quasicompact opens $U_{\alpha, j} \subset T_{i_{\alpha, j}}$ such that $U_{\alpha}=\bigcup_{j=1, \ldots, n(\alpha)} f_{i_{\alpha, j}}\left(U_{\alpha, j}\right)$.
If $T$ is quasi-separated, these are also equivalent to
(5) each $f_{i}$ is weakly étale, and for every $t \in T$ there exist $i_{1}, \ldots, i_{n} \in I$ and quasi-compact opens $U_{j} \subset T_{i_{j}}$ such that $\bigcup_{j=1, \ldots, n} f_{i_{j}}\left(U_{j}\right)$ is a (not necessarily open) neighbourhood of $t$ in $T$.

Proof. The equivalence of (1) and (2) is immediate from the definitions. Hence the lemma follows from Topologies, Lemma 33.8.2.

098B Lemma 51.11.3. Any étale covering and any Zariski covering is a pro-étale covering.

Proof. This follows from the corresponding result for fpqc coverings (Topologies, Lemma 33.8.6), Lemma 51.11.2, and the fact that an étale morphism is a weakly étale morphism, see More on Morphisms, Lemma 36.46.9,

098C Lemma 51.11.4. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is a pro-étale covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a pro-étale covering and for each $i$ we have a pro-étale covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a pro-étale covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a pro-étale covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is a pro-étale covering.

Proof. This follows from the fact that composition and base changes of weakly étale morphisms are weakly étale (More on Morphisms, Lemmas 36.46.5 and 36.46.6), Lemma 51.11.2, and the corresponding results for fpqc coverings, see Topologies, Lemma 33.8.7.

098D Lemma 51.11.5. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be a pro-étale covering of $T$. Then there exists a pro-étale covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, n}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.

Proof. This follows directly from the definition.
Thus we define the corresponding standard coverings of affines as follows.
098E Definition 51.11.6. Let $T$ be an affine scheme. A standard pro-étale covering of $T$ is a family $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i=1, \ldots, n}$ with each $T_{j}$ is affine, each $f_{i}$ is weakly étale, and $T=\bigcup f_{i}\left(T_{i}\right)$.

We interrupt the discussion for an explanation of the notion of w-contractible rings in terms of pro-étale coverings.

098F Lemma 51.11.7. Let $T=\operatorname{Spec}(A)$ be an affine scheme. The following are equivalent
(1) $A$ is w-contractible, and
(2) every pro-étale covering of $T$ can be refined by a Zariski covering of the form $T=\coprod_{i=1, \ldots, n} U_{i}$.

Proof. Assume $A$ is w-contractible. By Lemma 51.11.5 it suffices to prove we can refine every standard pro-étale covering $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i=1, \ldots, n}$ by a Zariski covering of $T$. The morphism $\coprod T_{i} \rightarrow T$ is a surjective weakly étale morphism of affine schemes. Hence by Definition 51.10.1 there exists a morphism $\sigma: T \rightarrow \amalg T_{i}$ over $T$. Then the Zariski covering $T=\rrbracket \sigma^{-1}\left(T_{i}\right)$ refines $\left\{f_{i}: T_{i} \rightarrow T\right\}$.
Conversely, assume (2). If $A \rightarrow B$ is faithfully flat and weakly étale, then $\{\operatorname{Spec}(B) \rightarrow$ $T\}$ is a pro-étale covering. Hence there exists a Zariski covering $T=\coprod U_{i}$ and morphisms $U_{i} \rightarrow \operatorname{Spec}(B)$ over $T$. Since $T=\coprod U_{i}$ we obtain $T \rightarrow \operatorname{Spec}(B)$, i.e., an $A$-algebra map $B \rightarrow A$. This means $A$ is w-contractible.

We follow the general outline given in Topologies, Section 33.2 for constructing the big pro-étale site we will be working with. However, because we need a bit larger rings to accommodate for the size of certain constructions we modify the constructions slightly.

098G Definition 51.11.8. A big pro-étale site is any site $S c h_{p r o-e ́ t a l e}$ as in Sites, Definition 7.6 .2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of pro-étale coverings $\operatorname{Cov}_{0}$ among these schemes.
(2) Change the function Bound of Sets, Equation (3.9.1.1) into

$$
\operatorname{Bound}(\kappa)=\max \left\{\kappa^{2^{2^{2^{\kappa}}}}, \kappa^{\aleph_{0}}, \kappa^{+}\right\} .
$$

(3) As underlying category take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9.2 starting with the set $S_{0}$ and the function Bound.
(4) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of pro-étale coverings, and the set Cov ${ }_{0}$ chosen above.

See the remarks following Topologies, Definition 33.3 .5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big and small pro-étale sites of a scheme, let us point out that (1) our category contains many weakly contractible objects, and (2) the topology on a big pro-étale site $S c h_{\text {pro-étale }}$ is in some sense induced from the pro-étale topology on the category of all schemes.
098H Lemma 51.11.9. Let Sch pro-étale be a big pro-étale site as in Definition 51.11.8. Let $T=\operatorname{Spec}(A)$ be an affine object of Sch pro-étale. If $A$ is w-contractible, then $T$ is a weakly contractible (Sites, Definition 7.39.2) object of Sch pro-étale.

Proof. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a surjection of sheaves on Sch pro-étale. Let $s \in \mathcal{G}(T)$. We have to show that $s$ is in the image of $\mathcal{F}(T) \rightarrow \mathcal{G}(T)$. We can find a covering $\left\{T_{i} \rightarrow T\right\}$ of $S c h_{\text {pro-étale }}$ such that $s$ lifts to a section of $\mathcal{F}$ over $T_{i}$ (Sites, Definition 7.12.1). By Lemma 51.11.7 we can refine $\left\{T_{i} \rightarrow T\right\}$ by a Zariski covering of the form $T=\coprod_{j=1, \ldots, m} \overline{V_{j}}$. Hence we get $t_{j} \in \mathcal{F}\left(U_{j}\right)$ mapping to $\left.s\right|_{U_{j}}$. Since Zariski coverings are coverings in $S c h_{\text {pro-étale }}$ (Lemma 51.11.3) we conclude that $\mathcal{F}(T)=$ $\prod \mathcal{F}\left(U_{j}\right)$. Thus, taking $t=\left(t_{1}, \ldots, t_{m}\right) \in \mathcal{F}(T)$ is a section mapping to $s$.
 For every object $T$ of $S_{\text {cherale }}$ there exists a covering $\left\{T_{i} \rightarrow T\right\}$ in $S c h_{\text {pro-étale }}$ with each $T_{i}$ affine and the spectrum of a w-contractible ring. In particular, $T_{i}$ is weakly contractible in $S$ ch pro-étale.

Proof. For those readers who do not care about set-theoretical issues this lemma is a trivial consequence of Lemma 51.11 .9 and Proposition 51.10.3. Here are the details. Choose an affine open covering $T=\bigcup U_{i}$. Write $U_{i}=\operatorname{Spec}\left(A_{i}\right)$. Choose faithfully flat, ind-étale ring maps $A_{i} \rightarrow D_{i}$ such that $D_{i}$ is w-contractible as in Proposition 51.10.3. The family of morphisms $\left\{\operatorname{Spec}\left(D_{i}\right) \rightarrow T\right\}$ is a pro-étale covering. If we can show that $\operatorname{Spec}\left(D_{i}\right)$ is isomorphic to an object, say $T_{i}$, of $S c h_{\text {pro-étale }}$, then $\left\{T_{i} \rightarrow T\right\}$ will be combinatorially equivalent to a covering of $S c h_{\text {pro-étale }}$ by the construction of $S c h_{\text {pro-étale }}$ in Definition 51.11 .8 and more precisely the application of Sets, Lemma 3.11.1 in the last step. To prove $\operatorname{Spec}\left(D_{i}\right)$ is isomorphic to an object of $S c h_{\text {pro-étale }}$, it suffices to prove that $\left|D_{i}\right| \leq \operatorname{Bound}(\operatorname{Size}(T))$ by the construction of $S c h_{\text {pro-étale }}$ in Definition 51.11 .8 and more precisely the application of Sets, Lemma 3.9.2 in step (3). Since $\left|A_{i}\right| \leq \operatorname{size}\left(U_{i}\right) \leq \operatorname{size}(T)$ by Sets, Lemmas 3.9.4 and 3.9.7 we get $\left|D_{i}\right| \leq \kappa^{2^{2^{2^{\kappa}}}}$ where $\kappa=\operatorname{size}(T)$ by Remark 51.10.4. Thus by our choice of the function Bound in Definition 51.11 .8 we win.

098J Lemma 51.11.11. Let $S_{\text {schoétale }}$ be a big pro-étale site as in Definition 51.11.8. Let $T \in \mathrm{Ob}\left(S c h_{\text {pro-étale }}\right)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary pro-étale covering of $T$. There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{\text {pro-étale }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.
Proof. Namely, we first let $\left\{V_{k} \rightarrow T\right\}$ be a covering as in Lemma 51.11.10. Then the pro-étale coverings $\left\{T_{i} \times_{T} V_{k} \rightarrow V_{k}\right\}$ can be refined by a finite disjoint open covering $V_{k}=V_{k, 1} \amalg \ldots \amalg V_{k, n_{k}}$, see Lemma 51.11.7. Then $\left\{V_{k, i} \rightarrow T\right\}$ is a covering of $S c h_{\text {pro-étale }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.

098K Definition 51.11.12. Let $S$ be a scheme. Let $S c h_{p r o-e ́ t a l e ~}$ be a big pro-étale site containing $S$.
(1) The big pro-étale site of $S$, denoted $(S c h / S)_{\text {pro-étale }}$, is the site $S c h_{\text {pro-étale }} / S$ introduced in Sites, Section 7.24
(2) The small pro-étale site of $S$, which we denote $S_{\text {pro-étale }}$, is the full subcategory of $(S c h / S)_{\text {pro-étale }}$ whose objects are those $U / S$ such that $U \rightarrow S$ is weakly étale. A covering of $S_{\text {pro-étale }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {pro-étale }}$ with $U \in \mathrm{Ob}\left(S_{\text {pro-étale }}\right)$.
(3) The big affine pro-étale site of $S$, denoted $(A f f / S)_{\text {pro-étale }}$, is the full subcategory of $(S c h / S)_{\text {pro-étale }}$ whose objects are affine $U / S$. A covering of $(A f f / S)_{\text {pro-étale }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {pro-étale }}$ which is a standard pro-étale covering.

It is not completely clear that the small pro-étale site and the big affine pro-étale site are sites. We check this now.

098L Lemma 51.11.13. Let $S$ be a scheme. Let $S c h_{\text {pro-étale }}$ be a big pro-étale site containing $S$. Both $S_{\text {pro-étale }}$ and $(A f f / S)_{\text {pro-étale }}$ are sites.

Proof. Let us show that $S_{\text {pro-étale }}$ is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 7.6.2. Since $(S c h / S)_{\text {pro-étale }}$ is a site, it suffices to prove that given any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {pro-étale }}$ with $U \in \mathrm{Ob}\left(S_{\text {pro-étale }}\right)$ we also have $U_{i} \in \mathrm{Ob}\left(S_{\text {pro-étale }}\right)$. This follows from the definitions as the composition of weakly étale morphisms is weakly étale.
To show that $(A f f / S)_{\text {pro-étale }}$ is a site, reasoning as above, it suffices to show that the collection of standard pro-étale coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. This follows from Lemma 51.11 .2 and the corresponding result for standard fpqc coverings (Topologies, Lemma 33.8.10).

098M Lemma 51.11.14. Let $S$ be a scheme. Let $S c h_{p r o-e ́ t a l e ~ b e ~ a ~ b i g ~ p r o-e ́ t a l e ~ s i t e ~}^{\text {d }}$ containing $S$. Let $S c h$ be the category of all schemes.
(1) The categories $S c h_{\text {pro-étale }},(S c h / S)_{\text {pro-étale }}, S_{\text {pro-étale }}$, and $(A f f / S)_{\text {pro-étale }}$ have fibre products agreeing with fibre products in Sch.
(2) The categories $S c h_{\text {pro-étale }},(S c h / S)_{\text {pro-étale }}, S_{\text {pro-étale }}$ have equalizers agreeing with equalizers in Sch.
(3) The categories $(S c h / S)_{\text {pro-étale }}$, and $S_{\text {pro-étale }}$ both have a final object, namely $S / S$.
(4) The category $S_{\text {pro-étale }}$ has a final object agreeing with the final object of Sch, namely $\operatorname{Spec}(\mathbf{Z})$.

Proof. The category $S c h_{\text {pro-étale }}$ contains $\operatorname{Spec}(\mathbf{Z})$ and is closed under products and fibre products by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S$, $V \rightarrow U, W \rightarrow U$ morphisms of schemes with $U, V, W \in \mathrm{Ob}\left(S c h_{\text {pro-étale }}\right)$. The fibre product $V \times_{U} W$ in $S c h_{\text {pro-étale }}$ is a fibre product in $S c h$ and is the fibre product of $V / S$ with $W / S$ over $U / S$ in the category of all schemes over $S$, and hence also a fibre product in $(S c h / S)_{\text {pro-étale. }}$. This proves the result for $(S c h / S)_{\text {pro-étale }}$. If $U \rightarrow S, V \rightarrow U$ and $W \rightarrow U$ are weakly étale then so is $V \times_{U} W \rightarrow S$ (see More on Morphisms, Section 36.46 and hence we get fibre products for $S_{\text {pro-étale }}$. If $U, V, W$ are affine, so is $V \times_{U} W$ and hence we get fibre products for $(A f f / S)_{\text {pro-étale. }}$.

Let $a, b: U \rightarrow V$ be two morphisms in $S c h_{\text {pro-étale }}$. In this case the equalizer of $a$ and $b$ (in the category of schemes) is

$$
V \times_{\Delta_{V / \operatorname{Spec}(\mathbf{Z})}, V \times_{\operatorname{Spec}(\mathbf{Z})} V,(a, b)}\left(U \times_{\operatorname{Spec}(\mathbf{Z})} U\right)
$$

which is an object of $S c h_{\text {pro-étale }}$ by what we saw above. Thus $S c h_{\text {pro-étale }}$ has equalizers. If $a$ and $b$ are morphisms over $S$, then the equalizer (in the category of schemes) is also given by

$$
V \times_{\Delta_{V / S}, V \times{ }_{S} V,(a, b)}\left(U \times_{S} U\right)
$$

hence we see that $(S c h / S)_{\text {pro-étale }}$ has equalizers. Moreover, if $U$ and $V$ are weaklyétale over $S$, then so is the equalizer above as a fibre product of schemes weakly étale over $S$. Thus $S_{\text {pro-étale }}$ has equalizers. The statements on final objects is clear.

Next, we check that the big affine pro-étale site defines the same topos as the big pro-étale site.

098N Lemma 51.11.15. Let $S$ be a scheme. Let $S c h_{p r o-e ́ t a l e ~ b e ~ a ~ b i g ~ p r o-e ́ t a l e ~ s i t e ~}^{\text {a }}$ containing $S$. The functor $(A f f / S)_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale }}$ is a special cocontinuous functor. Hence it induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{\text {pro-étale }}\right)$ to Sh $\left((S c h / S)_{\text {pro-étale }}\right)$.
Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28 .2 . Thus we have to verify assumptions $(1)-(5)$ of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale. Being cocon- }}$ tinuous just means that any pro-étale covering of $T / S, T$ affine, can be refined by a standard pro-étale covering of $T$. This is the content of Lemma 51.11.5. Hence (1) holds. We see $u$ is continuous simply because a standard pro-étale covering is a pro-étale covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

098P Lemma 51.11.16. Let $S_{\text {pro-étale }}$ be a big pro-étale site. Let $f: T \rightarrow S$ be a morphism in $S c h_{\text {pro-étale. }}$. The functor $T_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale }}$ is cocontinuous and induces a morphism of topoi

$$
i_{f}: S h\left(T_{\text {pro-étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {pro-étale }}\right)
$$

For a sheaf $\mathcal{G}$ on $(S c h / S)_{\text {pro-étale }}$ we have the formula $\left(i_{f}^{-1} \mathcal{G}\right)(U / T)=\mathcal{G}(U / S)$. The functor $i_{f}^{-1}$ also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u: T_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale. }}$. In other words, given a weakly étale morphism $j: U \rightarrow T$ corresponding to an object of $T_{\text {pro-étale }}$ we set $u(U \rightarrow T)=(f \circ j: U \rightarrow S)$. This functor commutes with fibre products, see Lemma 51.11.14. Moreover, $T_{\text {pro-étale }}$ has equalizers and $u$ commutes with them by Lemma 51.11.14. It is clearly cocontinuous. It is also continuous as $u$ transforms coverings to coverings and commutes with fibre products. Hence the lemma follows from Sites, Lemmas 7.20.5 and 7.20.6.

098Q Lemma 51.11.17. Let $S$ be a scheme. Let $S c h_{\text {pro-étale }}$ be a big pro-étale site containing $S$. The inclusion functor $S_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale }}$ satisfies the hypotheses of Sites, Lemma 7.20.8 and hence induces a morphism of sites

$$
\pi_{S}:(S c h / S)_{\text {pro-étale }} \longrightarrow S_{\text {pro-étale }}
$$

and a morphism of topoi

$$
i_{S}: S h\left(S_{\text {pro-étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {pro-étale }}\right)
$$

such that $\pi_{S} \circ i_{S}=i d$. Moreover, $i_{S}=i_{i d_{S}}$ with $i_{i d_{S}}$ as in Lemma 51.11.16. In particular the functor $i_{S}^{-1}=\pi_{S, *}$ is described by the rule $i_{S}^{-1}(\mathcal{G})(U / S)=\mathcal{G}(U / S)$.
Proof. In this case the functor $u: S_{\text {pro-étale }} \rightarrow(S c h / S)_{\text {pro-étale }}$, in addition to the properties seen in the proof of Lemma 51.11.16 above, also is fully faithful and transforms the final object into the final object. The lemma follows from Sites, Lemma 7.20.8.

098R Definition 51.11.18. In the situation of Lemma 51.11 .17 the functor $i_{S}^{-1}=\pi_{S, *}$ is often called the restriction to the small pro-étale site, and for a sheaf $\mathcal{F}$ on the big pro-étale site we denote $\left.\mathcal{F}\right|_{S_{\text {pro-étale }}}$ this restriction.
With this notation in place we have for a sheaf $\mathcal{F}$ on the big site and a sheaf $\mathcal{G}$ on the big site that

$$
\begin{aligned}
& \operatorname{Mor}_{S h\left(S_{\text {pro-étale })}\right)}\left(\left.\mathcal{F}\right|_{S_{\text {pro-étale }}} \mathcal{G}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{\text {pro-étale })}\left(\mathcal{F}, i_{S, *} \mathcal{G}\right)\right.}^{\operatorname{Mor}_{S h\left(S_{\text {pro-étale })}\right)}\left(\mathcal{G},\left.\mathcal{F}\right|_{S_{\text {pro-étale }}}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{\text {pro-étale }}\right)}\left(\pi_{S}^{-1} \mathcal{G}, \mathcal{F}\right)}
\end{aligned}
$$

Moreover, we have $\left.\left(i_{S, *} \mathcal{G}\right)\right|_{S_{\text {pro-étale }}}=\mathcal{G}$ and we have $\left.\left(\pi_{S}^{-1} \mathcal{G}\right)\right|_{S_{\text {pro-étale }}}=\mathcal{G}$.
098 Lemma 51.11.19. Let Sch $h_{\text {pro-étale be a big pro-étale site. Let } f: T \rightarrow S \text { be } a, ~}^{\text {a }}$ morphism in Sch pro-étale. The functor

$$
u:(S c h / T)_{\text {pro-étale }} \longrightarrow(S c h / S)_{\text {pro-étale }}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{\text {pro-étale }} \longrightarrow(S c h / T)_{\text {pro-étale }}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right) .
$$

They induce the same morphism of topoi

$$
f_{b i g}: S h\left((S c h / T)_{\text {pro-étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {pro-étale }}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.
Proof. The functor $u$ is cocontinuous, continuous, and commutes with fibre products and equalizers (details omitted; compare with proof of Lemma 51.11.16). Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for $f_{\text {big }}^{-1}$ and the existence of $f$ big!. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.

098T Lemma 51.11.20. Let Sch pro-étale be a big pro-étale site. Let $f: T \rightarrow S$ be a morphism in Schpro-étale.
(1) We have $i_{f}=f_{\text {big }} \circ i_{T}$ with $i_{f}$ as in Lemma51.11.16 and $i_{T}$ as in Lemma 51.11 .17 .
(2) The functor $S_{\text {pro-étale }} \rightarrow T_{\text {pro-étale, }},(U \rightarrow S) \mapsto\left(U \times_{S} T \rightarrow T\right)$ is continuous and induces a morphism of topoi

$$
f_{\text {small }}: S h\left(T_{\text {pro-étale }}\right) \longrightarrow S h\left(S_{\text {pro-étale }}\right)
$$

We have $f_{\text {small }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$.
(3) We have a commutative diagram of morphisms of sites

so that $f_{\text {small }} \circ \pi_{T}=\pi_{S} \circ f_{\text {big }}$ as morphisms of topoi.
(4) We have $f_{\text {small }}=\pi_{S} \circ f_{b i g} \circ i_{T}=\pi_{S} \circ i_{f}$.

Proof. The equality $i_{f}=f_{b i g} \circ i_{T}$ follows from the equality $i_{f}^{-1}=i_{T}^{-1} \circ f_{b i g}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).
The functor $u: S_{\text {pro-étale }} \rightarrow T_{\text {pro-étale }}, u(U \rightarrow S)=\left(U \times_{S} T \rightarrow T\right)$ transforms coverings into coverings and commutes with fibre products, see Lemmas 51.11.4 and 51.11.14 Moreover, both $S_{\text {pro-étale }}, T_{\text {pro-étale }}$ have final objects, namely $S / S$ and $T / T$ and $u(S / S)=T / T$. Hence by Sites, Proposition 7.15.6 the functor $u$ corresponds to a morphism of sites $T_{\text {pro-étale }} \rightarrow S_{\text {pro-étale. }}$. This in turn gives rise to the morphism of topoi, see Sites, Lemma 7.16.2. The description of the pushforward is clear from these references.
Part (3) follows because $\pi_{S}$ and $\pi_{T}$ are given by the inclusion functors and $f_{\text {small }}$ and $f_{\text {big }}$ by the base change functors $U \mapsto U \times_{S} T$.

Statement (4) follows from (3) by precomposing with $i_{T}$.
In the situation of the lemma, using the terminology of Definition 51.11.18 we have: for $\mathcal{F}$ a sheaf on the big pro-étale site of $T$

$$
\left.\left(f_{\text {big }, *} \mathcal{F}\right)\right|_{S_{\text {pro-étale }}}=f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{T_{\text {pro-étale }}}\right)
$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small pro-étale site of $T$, resp. $S$ is given by $\pi_{T, *}$, resp. $\pi_{S, *}$. A similar formula involving pullbacks and restrictions is false.

098U Lemma 51.11.21. Given schemes $X, Y, Y$ in $S_{\text {Sco-étale }}$ and morphisms $f$ : $X \rightarrow Y, g: Y \rightarrow Z$ we have $g_{\text {big }} \circ f_{\text {big }}=(g \circ f)_{\text {big }}$ and $g_{\text {small }} \circ f_{\text {small }}=(g \circ f)_{\text {small }}$.
Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 51.11.19. For the functors on the small sites this follows from the description of the pushforward functors in Lemma 51.11.20.

We can think about a sheaf on the big pro-étale site of $S$ as a collection of sheaves on the small pro-étale site on schemes over $S$.

098V Lemma 51.11.22. Let $S$ be a scheme contained in a big pro-étale site $S_{\text {Sco-étale }}$. A sheaf $\mathcal{F}$ on the big pro-étale site $(S c h / S)_{\text {pro-étale }}$ is given by the following data:
(1) for every $T / S \in \mathrm{Ob}\left((S c h / S)_{\text {pro-étale }}\right)$ a sheaf $\mathcal{F}_{T}$ on $T_{\text {pro-étale }}$,
(2) for every $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{\text {pro-étale }}$ a map $c_{f}: f_{\text {small }}^{-1} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$.

These data are subject to the following conditions:
(a) given any $f: T^{\prime} \rightarrow T$ and $g: T^{\prime \prime} \rightarrow T^{\prime}$ in $(S c h / S)_{\text {pro-étale }}$ the composition $g_{\text {small }}^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$, and
(b) if $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{\text {pro-étale }}$ is weakly étale then $c_{f}$ is an isomorphism.

Proof. Identical to the proof of Topologies, Lemma 33.4.18.
098W Lemma 51.11.23. Let $S$ be a scheme. Let $S_{a f f i n e, p r o-e ́ t a l e ~}$ denote the full subcategory of $S_{\text {pro-étale }}$ consisting of affine objects. A covering of $S_{a f f i n e, p r o-e ́ t a l e ~}$ will be a standard étale covering, see Definition 51.11.6. Then restriction

$$
\left.\mathcal{F} \longmapsto \mathcal{F}\right|_{S_{\text {affine,étale }}}
$$

defines an equivalence of topoi $\operatorname{Sh}\left(S_{\text {pro-étale }}\right) \cong \operatorname{Sh}\left(S_{\text {affine,pro-étale }}\right)$.
Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 7.28.1 by checking that the inclusion functor $S_{\text {affine,pro-étale }} \rightarrow S_{\text {pro-étale }}$ is a special cocontinuous functor (see Sites, Definition 7.28.2.

098X Lemma 51.11.24. Let $S$ be an affine scheme. Let $S_{a p p}$ denote the full subcategory of $S_{\text {pro-étale }}$ consisting of affine objects $U$ such that $\mathcal{O}(S) \rightarrow \mathcal{O}(U)$ is ind-étale. A covering of $S_{\text {app }}$ will be a standard pro-étale covering, see Definition 51.11.6. Then restriction

$$
\left.\mathcal{F} \longmapsto \mathcal{F}\right|_{S_{a p p}}
$$

defines an equivalence of topoi $S h\left(S_{\text {pro-étale }}\right) \cong \operatorname{Sh}\left(S_{\text {app }}\right)$.
Proof. By Lemma 51.11 .23 we may replace $S_{\text {pro-étale }}$ by $S_{a f f i n e, p r o-e ́ t a l e . ~ T h e ~}^{\text {. }}$ lemma follows from Sites, Lemma 7.28.1 by checking that the inclusion functor $S_{a p p} \rightarrow S_{\text {affine,pro-étale }}$ is a special cocontinuous functor, see Sites, Definition 7.28 .2 . The conditions of Sites, Lemma 7.28 .1 follow immediately from the definition and the facts (a) any object $U$ of $S_{\text {affine, pro-étale }}$ has a covering $\{V \rightarrow U\}$ with $V$ ind-étale over $X$ (Proposition 51.9.1) and (b) the functor $u$ is fully faithful.

Next we show that cohomology of sheaves is independent of the choice of a partial universe. Namely, the functor $g_{*}$ of the lemma below is an embedding of pro-étale topoi which does not change cohomology.

098Y Lemma 51.11.25. Let $S$ be a scheme. Let $S_{\text {pro-étale }} \subset S_{\text {pro-étale }}^{\prime}$ be two small proétale sites of $S$ as constructed in Definition51.11.12. Then the inclusion functor satisfies the assumptions of Sites, Lemma 7.20.8. Hence there exist morphisms of topoi

$$
S h\left(S_{\text {pro-étale }}\right) \xrightarrow{g} S h\left(S_{\text {pro-étale }}^{\prime}\right) \xrightarrow{f} S h\left(S_{\text {pro-étale }}\right)
$$

whose composition is isomorphic to the identity and with $f_{*}=g^{-1}$. Moreover,
(1) for $\mathcal{F}^{\prime} \in A b\left(S_{\text {pro-étale }}^{\prime}\right)$ we have $H^{p}\left(S_{\text {pro-étale }}^{\prime}, \mathcal{F}^{\prime}\right)=H^{p}\left(S_{\text {pro-étale }}, g^{-1} \mathcal{F}^{\prime}\right)$,
(2) for $\mathcal{F} \in A b\left(S_{\text {pro-étale }}\right)$ we have

$$
H^{p}\left(S_{\text {pro-étale }}, \mathcal{F}\right)=H^{p}\left(S_{\text {pro-étale }}^{\prime}, g_{*} \mathcal{F}\right)=H^{p}\left(S_{\text {pro-étale }}^{\prime}, f^{-1} \mathcal{F}\right)
$$

Proof. The inclusion functor is fully faithful and continuous. We have seen that $S_{\text {pro-étale }}$ and $S_{\text {pro-étale }}^{\prime}$ have fibre products and final objects and that our functor commutes with these (Lemma 51.11.14). It follows from Lemma 51.11.11 that the inclusion functor is cocontinuous. Hence the existence of $f$ and $g$ follows from Sites, Lemma 7.20.8. The equality in (1) is Cohomology on Sites, Lemma 21.8.2 Part (2) follows from (1) as $\mathcal{F}=g^{-1} g_{*} \mathcal{F}=g^{-1} f^{-1} \mathcal{F}$.

098Z Lemma 51.11.26. Let $S$ be a scheme. The topology on each of the pro-étale sites $S_{\text {pro-étale }},(S c h / S)_{\text {pro-étale }}, S_{\text {affine,pro-étale }}$, and $(A f f / S)_{\text {pro-étale }}$ is subcanonical.
Proof. Combine Lemma 51.11.2 and Descent, Lemma 34.9.3.
0990 Lemma 51.11.27. Let $S$ be a scheme. The pro-étale sites $S_{\text {pro-étale }},(S c h / S)_{\text {pro-étale }}$, $S_{\text {affine,pro-étale, }}$, and $(A f f / S)_{\text {pro-étale }}$ and if $S$ is affine $S_{a p p}$ have enough quasicompact, weakly contractible objects, see Sites, Definition 7.39.2.

Proof. Follows immediately from Lemma 51.11.10.

### 51.12. Points of the pro-étale site

0991 We first apply Deligne's criterion to show that there are enough points.
0992 Lemma 51.12.1. Let $S$ be a scheme. The pro-étale sites $S_{\text {pro-étale }},(S c h / S)_{\text {pro-étale }}$, $S_{\text {affine,pro-étale, }}$, and $(A f f / S)_{\text {pro-étale }}$ have enough points.

Proof. The big topos is equivalent to the topos defined by $(A f f / S)_{\text {pro-étale }}$, see Lemma 51.11.15. The topos of sheaves on $S_{\text {pro-étale }}$ is equivalent to the topos associated to $S_{\text {affine,pro-étale }}$, see Lemma 51.11 .23 . The result for the sites $(A f f / S)_{\text {pro-étale }}$ and $S_{a f f i n e, p r o-e ́ t a l e}$ follows immediately from Deligne's result Sites, Proposition 7.38 .3 .

Let $S$ be a scheme. Let $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ be a geometric point. We define a pro-étale neighbourhood of $\bar{s}$ to be a commutative diagram

with $U \rightarrow S$ weakly étale. In exactly the same manner as in the chapter on étale cohomology one shows that the category of pro-étale neighbourhoods of $\bar{s}$ is cofiltered. Moreover, if $(U, \bar{u})$ is a pro-étale neighbourhood, and if $\left\{U_{i} \rightarrow U\right\}$ is a pro-étale covering, then there exists an $i$ and a lift of $\bar{u}$ to a geometric point $\bar{u}_{i}$ of $U_{i}$. For $\mathcal{F}$ in $S h\left(S_{\text {pro-étale }}\right)$ define the stalk of $\mathcal{F}$ at $\bar{s}$ by the formula

$$
\mathcal{F}_{\bar{s}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{F}(U)
$$

where the colimit is over all pro-étale neighbourhoods $(U, \bar{u})$ of $\bar{s}$ with $U \in \mathrm{Ob}\left(S_{\text {pro-étale }}\right)$. A formal argument using the facts above shows the functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ defines a point of the topos $S h\left(S_{\text {pro-étale }}\right)$ : it is an exact functor which commutes with arbitrary colimits. In fact, this functor has another description.
0993 Lemma 51.12.2. In the situation above the scheme $\operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right)$ is an object of $X_{\text {pro-étale }}$ and there is a canonical isomorphism

$$
\mathcal{F}\left(\operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right)\right)=\mathcal{F}_{\bar{s}}
$$

## functorial in $\mathcal{F}$.

Proof. The first statement is clear from the construction of the strict henselization as a filtered colimit of étale algebras over $S$, or by the characterization of weakly étale morphisms of More on Morphisms, Lemma 36.46.11. The second statement follows as by Olivier's theorem (More on Algebra, Theorem 15.78.24) the scheme $\operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right)$ is an initial object of the category of pro-étale neighbourhoods of $\bar{s}$.

Contrary to the situation with the étale topos of $S$ it is not true that every point of $\operatorname{Sh}\left(S_{\text {pro-étale }}\right)$ is of this form, and it is not true that the collection of points associated to geometric point is conservative. Namely, suppose that $S=\operatorname{Spec}(k)$ where $k$ is an algebraically closed field. Let $A$ be an abelian group. Consider the sheaf $\mathcal{F}$ on $S_{\text {pro-étale }}$ defined by the rule

$$
\mathcal{F}(U)=\frac{\{\text { functions } U \rightarrow A\}}{\{\text { locally constant functions }\}}
$$

Then $\mathcal{F}(U)=0$ if $U=S=\operatorname{Spec}(k)$ but in general $\mathcal{F}$ is not zero. Namely, $S_{\text {pro-étale }}$ contains objects with infinitely many points. For example, let $E=\lim E_{n}$ be an inverse limit of finite sets with surjective transition maps, e.g., $E=\lim \mathbf{Z} / n \mathbf{Z}$. The $\operatorname{scheme} \operatorname{Spec}\left(\operatorname{colim} \operatorname{Map}\left(E_{n}, k\right)\right)$ is an object of $S_{\text {pro-étale }}$ because colim $\operatorname{Map}\left(E_{n}, k\right)$ is weakly étale (even ind-Zariski) over $k$. Thus $\mathcal{F}$ is a nonzero abelian sheaf whose stalk at the unique geometric point of $S$ is zero.

The solution is to use the existence of quasi-compact, weakly contractible objects. First, there are enough quasi-compact, weakly contractible objects by Lemma 51.11.27. Second, if $W \in \operatorname{Ob}\left(S_{\text {pro-étale }}\right)$ is quasi-compact, weakly contractible, then the functor

$$
\text { Sh }\left(S_{\text {pro-étale }}\right) \longrightarrow \text { Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}(W)
$$

is an exact functor $S h\left(S_{\text {pro-étale }}\right) \rightarrow$ Sets which commutes with all limits. The functor

$$
A b\left(S_{\text {pro-étale }}\right) \longrightarrow A b, \quad \mathcal{F} \longmapsto \mathcal{F}(W)
$$

is exact and commutes with direct sums (as $W$ is quasi-compact, see Sites, Lemma 7.11 .2 , hence commutes with all limits and colimits. Moreover, we can check exactness of a complex of abelian sheaves by evaluation at the quasi-compact, weakly contractible objects of $S_{\text {pro-étale }}$, see Cohomology on Sites, Proposition 21.39.2.

### 51.13. Compact generation

0994 Let $S$ be a scheme. The site $S_{\text {pro-étale }}$ has enough quasi-compact, weakly contractible objects $U$. For any sheaf of rings $\mathcal{A}$ on $S_{\text {pro-étale }}$ the corresponding objects $j_{U!} \mathcal{A}_{U}$ are compact objects of the derived category $D(\mathcal{A})$, see Cohomology on Sites, Lemma 21.40.5. Since every complex of $\mathcal{A}$-modules is quasi-isomorphic to a complex whose terms are direct sums of the modules $j_{U!} \mathcal{A}_{U}$ (details omitted). Thus we see that $D(\mathcal{A})$ is generated by its compact objects.

The same argument works for the big pro-étale site of $S$.

### 51.14. Generalities on derived completion

0995 We urge the reader to skip this section on a first reading.
The algebra version of this material can be found in More on Algebra, Section 15.72 Let $\mathcal{O}$ be a sheaf of rings on a site $\mathcal{C}$. Let $f$ be a global section of $\mathcal{O}$. We denote $\mathcal{O}_{f}$ the sheaf associated to the presheaf of localizations $U \mapsto \mathcal{O}(U)_{f}$.

0996 Lemma 51.14.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $f$ be a global section of $\mathcal{O}$.
(1) For $L, N \in D\left(\mathcal{O}_{f}\right)$ we have $R \mathcal{H o m}_{\mathcal{O}}(L, N)=R \mathcal{H o m}_{\mathcal{O}_{f}}(L, N)$. In particular the two $\mathcal{O}_{f}$-structures on $R \mathcal{H o m}_{\mathcal{O}}(L, N)$ agree.
(2) For $K \in D(\mathcal{O})$ and $L \in D\left(\mathcal{O}_{f}\right)$ we have

$$
R \mathcal{H o m}_{\mathcal{O}}(L, K)=R \mathcal{H o m}_{\mathcal{O}_{f}}\left(L, R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)\right)
$$

In particular $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)\right)=R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)$.
(3) If $g$ is a second global section of $\mathcal{O}$, then

$$
R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, R \mathcal{H}_{\boldsymbol{H}}\left(\mathcal{O}_{g}, K\right)\right)=R \mathcal{H}_{\boldsymbol{\mathcal { O }}}\left(\mathcal{O}_{g f}, K\right)
$$

Proof. Proof of (1). Let $\mathcal{J}^{\bullet}$ be a K-injective complex of $\mathcal{O}_{f}$-modules representing $N$. By Cohomology on Sites, Lemma 21.20 .3 it follows that $\mathcal{J}^{\bullet}$ is a K-injective complex of $\mathcal{O}$-modules as well. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}_{f}$-modules representing $L$. Then

$$
R \mathcal{H o m}_{\mathcal{O}}(L, N)=R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}^{\bullet}, \mathcal{J}^{\bullet}\right)=R \mathcal{H o m}_{\mathcal{O}_{f}}\left(\mathcal{F}^{\bullet}, \mathcal{J}^{\bullet}\right)
$$

by Modules on Sites, Lemma 18.11.4 because $\mathcal{J}^{\bullet}$ is a K-injective complex of $\mathcal{O}$ and of $\mathcal{O}_{f}$-modules.

Proof of (2). Let $\mathcal{I} \bullet$ be a K-injective complex of $\mathcal{O}$-modules representing $K$. Then $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)$ is represented by $\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{O}_{f}, \mathcal{I} \bullet\right)$ which is a K-injective complex of $\mathcal{O}_{f}$-modules and of $\mathcal{O}$-modules by Cohomology on Sites, Lemmas 21.20 .4 and 21.20.3. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}_{f}$-modules representing $L$. Then

$$
R \mathcal{H o m}_{\mathcal{O}}(L, K)=R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}^{\bullet}, \mathcal{I}^{\bullet}\right)=R \mathcal{H o m}_{\mathcal{O}_{f}}\left(\mathcal{F}^{\bullet}, \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, \mathcal{I}^{\bullet}\right)\right)
$$

by Modules on Sites, Lemma 18.27 .5 and because $\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, \mathcal{I} \bullet\right)$ is a K-injective complex of $\mathcal{O}_{f}$-modules.
Proof of (3). This follows from the fact that $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{g}, \mathcal{I}^{\bullet}\right)$ is K-injective as a complex of $\mathcal{O}$-modules and the fact that $\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{g}, \mathcal{H}\right)\right)=\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{g f}, \mathcal{H}\right)$ for all sheaves of $\mathcal{O}$-modules $\mathcal{H}$.

Let $K \in D(\mathcal{O})$. We denote $T(K, f)$ a derived limit (Derived Categories, Definition 13.32.1 of the system

$$
\ldots \rightarrow K \xrightarrow{f} K \xrightarrow{f} K
$$

in $D(\mathcal{O})$.
0997 Lemma 51.14.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $f$ be a global section of $\mathcal{O}$. Let $K \in D(\mathcal{O})$. The following are equivalent
(1) $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)=0$,
(2) $R \mathcal{H o m}_{\mathcal{O}}(L, K)=0$ for all $L$ in $D\left(\mathcal{O}_{f}\right)$,
(3) $T(K, f)=0$.

Proof. It is clear that (2) implies (1). The implication (1) $\Rightarrow$ (2) follows from Lemma 51.14.1. A free resolution of the $\mathcal{O}$-module $\mathcal{O}_{f}$ is given by

$$
0 \rightarrow \bigoplus_{n \in \mathbf{N}} \mathcal{O} \rightarrow \bigoplus_{n \in \mathbf{N}} \mathcal{O} \rightarrow \mathcal{O}_{f} \rightarrow 0
$$

where the first map sends a local section $\left(x_{0}, x_{1}, \ldots\right)$ to $\left(f x_{0}-x_{1}, f x_{1}-x_{2}, \ldots\right)$ and the second map sends $\left(x_{0}, x_{1}, \ldots\right)$ to $x_{0}+x_{1} / f+x_{2} / f^{2}+\ldots$. Applying $\operatorname{Hom}_{\mathcal{O}}\left(-, \mathcal{I}^{\bullet}\right)$ where $\mathcal{I}^{\bullet}$ is a K-injective complex of $\mathcal{O}$-modules representing $K$ we get a short exact sequence of complexes

$$
0 \rightarrow \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, \mathcal{I}^{\bullet}\right) \rightarrow \prod \mathcal{I}^{\bullet} \rightarrow \prod \mathcal{I}^{\bullet} \rightarrow 0
$$

because $\mathcal{I}^{n}$ is an injective $\mathcal{O}$-module. The products are products in $D(\mathcal{O})$, see Injectives, Lemma 19.13.4 This means that the object $T(K, f)$ is a representative of $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)$ in $D(\mathcal{O})$. Thus the equivalence of (1) and (3).

0998 Lemma 51.14.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K \in D(\mathcal{O})$. The rule which associates to $U$ the set $\mathcal{I}(U)$ of sections $f \in \mathcal{O}(U)$ such that $T\left(\left.K\right|_{U}, f\right)=0$ is a sheaf of ideals in $\mathcal{O}$.

Proof. We will use the results of Lemma 51.14.2 without further mention. If $f \in$ $\mathcal{I}(U)$, and $g \in \mathcal{O}(U)$, then $\mathcal{O}_{U, g f}$ is an $\mathcal{O}_{U, f}$-module hence $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{U, g f},\left.K\right|_{U}\right)=$ 0 , hence $g f \in \mathcal{I}(U)$. Suppose $f, g \in \mathcal{O}(U)$. Then there is a short exact sequence

$$
0 \rightarrow \mathcal{O}_{U, f+g} \rightarrow \mathcal{O}_{U, f(f+g)} \oplus \mathcal{O}_{U, g(f+g)} \rightarrow \mathcal{O}_{U, g f(f+g)} \rightarrow 0
$$

because $f, g$ generate the unit ideal in $\mathcal{O}(U)_{f+g}$. This follows from Algebra, Lemma 10.22 .1 and the easy fact that the last arrow is surjective. Because $R \mathcal{H o m}_{\mathcal{O}}\left(-,\left.K\right|_{U}\right)$ is an exact functor of triangulated categories the vanishing of $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, f(f+g)},\left.K\right|_{U}\right)$, $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, g(f+g)},\left.K\right|_{U}\right)$, and $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, g f(f+g)},\left.K\right|_{U}\right)$, implies the vanishing of $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, f+g},\left.K\right|_{U}\right)$. We omit the verification of the sheaf condition.

We can make the following definition for any ringed site.
0999 Definition 51.14.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. Let $K \in D(\mathcal{O})$. We say that $K$ is derived complete with respect to $\mathcal{I}$ if for every object $U$ of $\mathcal{C}$ and $f \in \mathcal{I}(U)$ the object $T\left(\left.K\right|_{U}, f\right)$ of $D\left(\mathcal{O}_{U}\right)$ is zero.

It is clear that the full subcategory $D_{\text {comp }}(\mathcal{O})=D_{\text {comp }}(\mathcal{O}, \mathcal{I}) \subset D(\mathcal{O})$ consisting of derived complete objects is a saturated triangulated subcategory, see Derived Categories, Definitions 13.3 .4 and 13.6 .1 . This subcategory is preserved under products and homotopy limits in $D(\mathcal{O})$. But it is not preserved under countable direct sums in general.

099A Lemma 51.14.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. If $K \in D(\mathcal{O})$ and $L \in D_{\text {comp }}(\mathcal{O})$, then $R \mathcal{H o m}_{\mathcal{O}}(K, L) \in D_{\text {comp }}(\mathcal{O})$.

Proof. Let $U$ be an object of $\mathcal{C}$ and let $f \in \mathcal{I}(U)$. Recall that

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{O}_{U, f},\left.R \mathcal{H o m}_{\mathcal{O}}(K, L)\right|_{U}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.K\right|_{U} \otimes_{\mathcal{O}_{U}}^{\mathbf{L}} \mathcal{O}_{U, f},\left.L\right|_{U}\right)
$$

by Cohomology on Sites, Lemma 21.26.2. The right hand side is zero by Lemma 51.14 .2 and the relationship between internal hom and actual hom, see Cohomology on Sites, Lemma 21.26.1. The same vanishing holds for all $U^{\prime} / U$. Thus the object $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, f},\left.R \mathcal{H o m}_{\mathcal{O}}(K, L)\right|_{U}\right)$ of $D\left(\mathcal{O}_{U}\right)$ has vanishing 0th cohomology sheaf (by locus citatus). Similarly for the other cohomology sheaves, i.e.,
$R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, f},\left.R \operatorname{Hom}_{\mathcal{O}}(K, L)\right|_{U}\right)$ is zero in $D\left(\mathcal{O}_{U}\right)$. By Lemma 51.14.2 we conclude.

099C Lemma 51.14.6. Let $\mathcal{C}$ be a site. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a homomorphism of sheaves of rings. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. The inverse image of $D_{\text {comp }}(\mathcal{O}, \mathcal{I})$ under the restriction functor $D\left(\mathcal{O}^{\prime}\right) \rightarrow D(\mathcal{O})$ is $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I} \mathcal{O}^{\prime}\right)$.

Proof. Using Lemma 51.14 .3 we see that $K^{\prime} \in D\left(\mathcal{O}^{\prime}\right)$ is in $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I} \mathcal{O}^{\prime}\right)$ if and only if $T\left(\left.K^{\prime}\right|_{U}, f\right)$ is zero for every local section $f \in \mathcal{I}(U)$. Observe that the cohomology sheaves of $T\left(\left.K^{\prime}\right|_{U}, f\right)$ are computed in the category of abelian sheaves, so it doesn't matter whether we think of $f$ as a section of $\mathcal{O}$ or take the image of $f$ as a section of $\mathcal{O}^{\prime}$. The lemma follows immediately from this and the definition of derived complete objects.

099J Lemma 51.14.7. Let $f:\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ be a morphism of ringed topoi. Let $\mathcal{I} \subset \mathcal{O}$ and $\mathcal{I}^{\prime} \subset \mathcal{O}^{\prime}$ be sheaves of ideals such that $f^{\sharp}$ sends $f^{-1} \mathcal{I}$ into $\mathcal{I}^{\prime}$. Then $R f_{*}$ sends $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\prime}\right)$ into $D_{\text {comp }}(\mathcal{O}, \mathcal{I})$.
Proof. We may assume $f$ is given by a morphism of ringed sites corresponding to a continuous functor $\mathcal{C} \rightarrow \mathcal{D}$ (Modules on Sites, Lemma 18.7.2 ). Let $U$ be an object of $\mathcal{C}$ and let $g$ be a section of $\mathcal{I}$ over $U$. We have to show that $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{O}_{U, g},\left.R f_{*} K\right|_{U}\right)=0$ whenever $K$ is derived complete with respect to $\mathcal{I}^{\prime}$. Namely, by Cohomology on Sites, Lemma 21.26 .1 this, applied to all objects over $U$ and all shifts of $K$, will imply that $R \mathcal{H o m}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U, g},\left.R f_{*} K\right|_{U}\right)$ is zero, which implies that $T\left(\left.R f_{*} K\right|_{U}, g\right)$ is zero (Lemma 51.14.2) which is what we have to show (Definition 51.14.4). Let $V$ in $\mathcal{D}$ be the image of $U$. Then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{O}_{U, g},\left.R f_{*} K\right|_{U}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{V}^{\prime}\right)}\left(\mathcal{O}_{V, g^{\prime}}^{\prime},\left.K\right|_{V}\right)=0
$$

where $g^{\prime}=f^{\sharp}(g) \in \mathcal{I}^{\prime}(V)$. The second equality because $K$ is derived complete and the first equality because the derived pullback of $\mathcal{O}_{U, g}$ is $\mathcal{O}_{V, g^{\prime}}^{\prime}$ and Cohomology on Sites, Lemma 21.19.1.

The following lemma is the simplest case where one has derived completion.
099B Lemma 51.14.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed on a site. Let $f_{1}, \ldots, f_{r}$ be global sections of $\mathcal{O}$. Let $\mathcal{I} \subset \mathcal{O}$ be the ideal sheaf generated by $f_{1}, \ldots, f_{r}$. Then the inclusion functor $D_{\text {comp }}(\mathcal{O}) \rightarrow D(\mathcal{O})$ has a left adjoint, i.e., given any object $K$ of $D(\mathcal{O})$ there exists a map $K \rightarrow K^{\wedge}$ with $K^{\wedge}$ in $D_{\text {comp }}(\mathcal{O})$ such that the map

$$
\operatorname{Hom}_{D(\mathcal{O})}\left(K^{\wedge}, E\right) \longrightarrow \operatorname{Hom}_{D(\mathcal{O})}(K, E)
$$

is bijective whenever $E$ is in $D_{\text {comp }}(\mathcal{O})$. In fact we have
functorially in $K$.
Proof. Define $K^{\wedge}$ by the last displayed formula of the lemma. There is a map of complexes

$$
\left(\mathcal{O} \rightarrow \prod_{i_{0}} \mathcal{O}_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} \mathcal{O}_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow \mathcal{O}_{f_{1} \ldots f_{r}}\right) \longrightarrow \mathcal{O}
$$

which induces a map $K \rightarrow K^{\wedge}$. It suffices to prove that $K^{\wedge}$ is derived complete and that $K \rightarrow K^{\wedge}$ is an isomorphism if $K$ is derived complete.

Let $f$ be a global section of $\mathcal{O}$. By Lemma 51.14.1 the object $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K^{\wedge}\right)$ is equal to

$$
R \mathcal{H o m}_{\mathcal{O}}\left(\left(\mathcal{O}_{f} \rightarrow \prod_{i_{0}} \mathcal{O}_{f f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} \mathcal{O}_{f f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow \mathcal{O}_{f f_{1} \ldots f_{r}}\right), K\right)
$$

If $f=f_{i}$ for some $i$, then $f_{1}, \ldots, f_{r}$ generate the unit ideal in $\mathcal{O}_{f}$, hence the extended alternating Čech complex

$$
\mathcal{O}_{f} \rightarrow \prod_{i_{0}} \mathcal{O}_{f f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} \mathcal{O}_{f f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow \mathcal{O}_{f f_{1} \ldots f_{r}}
$$

is zero (even homotopic to zero). In this way we see that $K^{\wedge}$ is derived complete.
If $K$ is derived complete, then $R \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}_{f}, K\right)$ is zero for all $f=f_{i_{0}} \ldots f_{i_{p}}, p \geq 0$. Thus $K \rightarrow K^{\wedge}$ is an isomorphism in $D(\mathcal{O})$.

Next we explain why derived completion is a completion.
0A0E Lemma 51.14.9. Let $(\mathcal{C}, \mathcal{O})$ be a ringed on a site. Let $f_{1}, \ldots, f_{r}$ be global sections of $\mathcal{O}$. Let $\mathcal{I} \subset \mathcal{O}$ be the ideal sheaf generated by $f_{1}, \ldots, f_{r}$. Let $K \in D(\mathcal{O})$. The derived completion $K^{\wedge}$ of Lemma 51.14 .8 is given by the formula

$$
K^{\wedge}=R \lim K \otimes_{\mathcal{O}}^{\mathbf{L}} K_{n}
$$

where $K_{n}=K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ is the Koszul complex on $f_{1}^{n}, \ldots, f_{r}^{n}$ over $\mathcal{O}$.
Proof. In More on Algebra, Lemma 15.22 .13 we have seen that the extended alternating Čech complex

$$
\mathcal{O} \rightarrow \prod_{i_{0}} \mathcal{O}_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} \mathcal{O}_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow \mathcal{O}_{f_{1} \ldots f_{r}}
$$

is a colimit of the Koszul complexes $K^{n}=K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ sitting in degrees $0, \ldots, r$. Note that $K^{n}$ is a finite chain complex of finite free $\mathcal{O}$-modules with dual $\mathcal{H o m}_{\mathcal{O}}\left(K^{n}, \mathcal{O}\right)=K_{n}$ where $K_{n}$ is the Koszul cochain complex sitting in degrees $-r, \ldots, 0$ (as usual). By Lemma 51.14 .8 the functor $K \mapsto K^{\wedge}$ is gotten by taking $R$ Hom from the extended alternating Cech complex into $K$ :

$$
K^{\wedge}=R \mathcal{H o m}\left(\operatorname{colim} K^{n}, K\right)
$$

This is equal to $R \lim \left(K \otimes{ }_{\mathcal{O}}^{\mathbf{L}} K_{n}\right)$ by Cohomology on Sites, Lemma 21.37.10.
099D Lemma 51.14.10. There exist a way to construct
(1) for every pair $(A, I)$ consisting of a ring $A$ and a finitely generated ideal $I \subset A$ a complex $K(A, I)$ of $A$-modules,
(2) a map $K(A, I) \rightarrow A$ of complexes of $A$-modules,
(3) for every ring map $A \rightarrow B$ and finitely generated ideal $I \subset A$ a map of complexes $K(A, I) \rightarrow K(B, I B)$,
such that
(a) for $A \rightarrow B$ and $I \subset A$ finitely generated the diagram

commutes,
(b) for $A \rightarrow B \rightarrow C$ and $I \subset A$ finitely generated the composition of the maps $K(A, I) \rightarrow K(B, I B) \rightarrow K(C, I C)$ is the map $K(A, I) \rightarrow K(C, I C)$.
(c) for $A \rightarrow B$ and a finitely generated ideal $I \subset A$ the induced map $K(A, I) \otimes_{A}^{\mathbf{L}}$ $B \rightarrow K(B, I B)$ is an isomorphism in $D(B)$, and
(d) if $I=\left(f_{1}, \ldots, f_{r}\right) \subset A$ then there is a commutative diagram

in $D(A)$ whose horizontal arrows are isomorphisms.
Proof. Let $S$ be the set of rings $A_{0}$ of the form $A_{0}=\mathbf{Z}\left[x_{1}, \ldots, x_{n}\right] / J$. Every finite type $\mathbf{Z}$-algebra is isomorphic to an element of $S$. Let $\mathcal{A}_{0}$ be the category whose objects are pairs $\left(A_{0}, I_{0}\right)$ where $A_{0} \in S$ and $I_{0} \subset A_{0}$ is an ideal and whose morphisms $\left(A_{0}, I_{0}\right) \rightarrow\left(B_{0}, J_{0}\right)$ are ring maps $\varphi: A_{0} \rightarrow B_{0}$ such that $J_{0}=\varphi\left(I_{0}\right) B_{0}$.

Suppose we can construct $K\left(A_{0}, I_{0}\right) \rightarrow A_{0}$ functorially for objects of $\mathcal{A}_{0}$ having properties (a), (b), (c), and (d). Then we take

$$
K(A, I)=\operatorname{colim}_{\varphi:\left(A_{0}, I_{0}\right) \rightarrow(A, I)} K\left(A_{0}, I_{0}\right)
$$

where the colimit is over ring maps $\varphi: A_{0} \rightarrow A$ such that $\varphi\left(I_{0}\right) A=I$ with $\left(A_{0}, I_{0}\right)$ in $\mathcal{A}_{0}$. A morphism between $\left(A_{0}, I_{0}\right) \rightarrow(A, I)$ and $\left(A_{0}^{\prime}, I_{0}^{\prime}\right) \rightarrow(A, I)$ are given by maps $\left(A_{0}, I_{0}\right) \rightarrow\left(A_{0}^{\prime}, I_{0}^{\prime}\right)$ in $\mathcal{A}_{0}$ commuting with maps to $A$. The category of these $\left(A_{0}, I_{0}\right) \rightarrow(A, I)$ is filtered (details omitted). Moreover, $\operatorname{colim}_{\varphi:\left(A_{0}, I_{0}\right) \rightarrow(A, I)} A_{0}=$ $A$ so that $K(A, I)$ is a complex of $A$-modules. Finally, given $\varphi: A \rightarrow B$ and $I \subset A$ for every $\left(A_{0}, I_{0}\right) \rightarrow(A, I)$ in the colimit, the composition $\left(A_{0}, I_{0}\right) \rightarrow(B, I B)$ lives in the colimit for $(B, I B)$. In this way we get a map on colimits. Properties (a), (b), (c), and (d) follow readily from this and the corresponding properties of the complexes $K\left(A_{0}, I_{0}\right)$.

Endow $\mathcal{C}_{0}=\mathcal{A}_{0}^{\text {opp }}$ with the chaotic topology. We equip $\mathcal{C}_{0}$ with the sheaf of rings $\mathcal{O}:(A, I) \mapsto A$. The ideals $I$ fit together to give a sheaf of ideals $\mathcal{I} \subset \mathcal{O}$. Choose an injective resolution $\mathcal{O} \rightarrow \mathcal{J}^{\bullet}$. Consider the object

$$
\mathcal{F}^{\bullet}=\bigcup_{n} \mathcal{J}^{\bullet}\left[\mathcal{I}^{n}\right]
$$

Let $U=(A, I) \in \mathrm{Ob}\left(\mathcal{C}_{0}\right)$. Since the topology in $\mathcal{C}_{0}$ is chaotic, the value $\mathcal{J}^{\bullet}(U)$ is a resolution of $A$ by injective $A$-modules. Hence the value $\mathcal{F}^{\bullet}(U)$ is an object of $D(A)$ representing the image of $R \Gamma_{I}(A)$ in $D(A)$, see Dualizing Complexes, Section 45.9. Choose a complex of $\mathcal{O}$-modules $\mathcal{K}^{\bullet}$ and a commutative diagram

where the horizontal arrows are quasi-isomorphisms. This is possible by the construction of the derived category $D(\mathcal{O})$. Set $K(A, I)=\mathcal{K} \bullet(U)$ where $U=(A, I)$. Properties (a) and (b) are clear and properties (c) and (d) follow from Dualizing Complexes, Lemmas 45.10.2 and 45.10.3.

099 Lemma 51.14.11. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. There exists a map $K \rightarrow \mathcal{O}$ in $D(\mathcal{O})$ such that for every $U \in \operatorname{Ob}(\mathcal{C})$ such that $\left.\mathcal{I}\right|_{U}$ is generated by $f_{1}, \ldots, f_{r} \in \mathcal{I}(U)$ there is an isomorphism

$$
\left.\left(\mathcal{O}_{U} \rightarrow \prod_{i_{0}} \mathcal{O}_{U, f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} \mathcal{O}_{U, f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow \mathcal{O}_{U, f_{1} \ldots f_{r}}\right) \longrightarrow K\right|_{U}
$$

compatible with maps to $\mathcal{O}_{U}$.
Proof. Let $\mathcal{C}^{\prime} \subset \mathcal{C}$ be the full subcategory of objects $U$ such that $\left.\mathcal{I}\right|_{U}$ is generated by finitely many sections. Then $\mathcal{C}^{\prime} \rightarrow \mathcal{C}$ is a special cocontinuous functor (Sites, Definition 7.28.2). Hence it suffices to work with $\mathcal{C}^{\prime}$, see Sites, Lemma 7.28.1. in other words we may assume that for every object $U$ of $\mathcal{C}$ there exists a finitely generated ideal $I \subset \mathcal{I}(U)$ such that $\left.\mathcal{I}\right|_{U}=\operatorname{Im}\left(I \otimes \mathcal{O}_{U} \rightarrow \mathcal{O}_{U}\right)$. We will say that $I$ generates $\left.\mathcal{I}\right|_{U}$. Warning: We do not know that $\mathcal{I}(U)$ is a finitely generated ideal in $\mathcal{O}(U)$.
Let $U$ be an object and $I \subset \mathcal{O}(U)$ a finitely generated ideal which generates $\left.\mathcal{I}\right|_{U}$. On the category $\mathcal{C} / U$ consider the complex of presheaves

$$
K_{U, I}^{\bullet}: U^{\prime} / U \longmapsto K\left(\mathcal{O}\left(U^{\prime}\right), I \mathcal{O}\left(U^{\prime}\right)\right)
$$

with $K(-,-)$ as in Lemma 51.14 .10 . We claim that the sheafification of this is independent of the choice of $I$. Indeed, if $I^{\prime} \subset \mathcal{O}(U)$ is a finitely generated ideal which also generates $\left.\mathcal{I}\right|_{U}$, then there exists a covering $\left\{U_{j} \rightarrow U\right\}$ such that $I \mathcal{O}\left(U_{j}\right)=$ $I^{\prime} \mathcal{O}\left(U_{j}\right)$. (Hint: this works because both $I$ and $I^{\prime}$ are finitely generated and generate $\left.\mathcal{I}\right|_{U}$.) Hence $K_{U, I}^{\bullet}$ and $K_{U, I^{\prime}}^{\bullet}$ are the same for any object lying over one of the $U_{j}$. The statement on sheafifications follows. Denote $K_{U}^{\bullet}$ the common value.
The independence of choice of $I$ also shows that $\left.K_{U}^{\bullet}\right|_{\mathcal{C} / U^{\prime}}=K_{U^{\prime}}^{\bullet}$ whenever we are given a morphism $U^{\prime} \rightarrow U$ and hence a localization morphism $\mathcal{C} / U^{\prime} \rightarrow \mathcal{C} / U$. Thus the complexes $K_{U}^{\bullet}$ glue to give a single well defined complex $K^{\bullet}$ of $\mathcal{O}$-modules. The existence of the map $K^{\bullet} \rightarrow \mathcal{O}$ and the quasi-isomorphism of the lemma follow immediately from the corresponding properties of the complexes $K(-,-)$ in Lemma 51.14.10.

099F Proposition 51.14.12. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. There exists a left adjoint to the inclusion functor $D_{\text {comp }}(\mathcal{O}) \rightarrow D(\mathcal{O})$.

Proof. Let $K \rightarrow \mathcal{O}$ in $D(\mathcal{O})$ be as constructed in Lemma 51.14.11. Let $E \in D(\mathcal{O})$. Then $E^{\wedge}=R \mathcal{H} \operatorname{lom}(K, E)$ together with the map $E \rightarrow E^{\wedge}$ will do the job. Namely, locally on the site $\mathcal{C}$ we recover the adjoint of Lemma 51.14.8. This shows that $E^{\wedge}$ is always derived complete and that $E \rightarrow E^{\wedge}$ is an isomorphism if $E$ is derived complete.

0A0F Remark 51.14.13 (Localization and derived completion). Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. Let $K \mapsto K^{\wedge}$ be the derived completion functor of Proposition 51.14 .12 . It follows from the construction in the proof of the proposition that $\left.K^{\wedge}\right|_{U}$ is the derived completion of $\left.K\right|_{U}$ for any $U \in \mathrm{Ob}(\mathcal{C})$. But we can also prove this as follows. From the definition of derived complete objects it follows that $\left.K^{\wedge}\right|_{U}$ is derived complete. Thus we obtain a canonical map $a:\left.\left(\left.K\right|_{U}\right)^{\wedge} \rightarrow K^{\wedge}\right|_{U}$. On the other hand, if $E$ is a derived complete object of $D\left(\mathcal{O}_{U}\right)$, then $R j_{*} E$ is a derived complete object of $D(\mathcal{O})$ by Lemma 51.14.7. Here $j$ is the localization morphism (Modules on Sites, Section 18.19). Hence we also
obtain a canonical map $b: K^{\wedge} \rightarrow R j_{*}\left(\left(\left.K\right|_{U}\right)^{\wedge}\right)$. We omit the (formal) verification that the adjoint of $b$ is the inverse of $a$.

099G Remark 51.14.14 (Completed tensor product). Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. Denote $K \mapsto K^{\wedge}$ the adjoint of Proposition 51.14.12 Then we set

$$
K \otimes_{\mathcal{O}}^{\wedge} L=\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} L\right)^{\wedge}
$$

This completed tensor product defines a functor $D_{\text {comp }}(\mathcal{O}) \times D_{\text {comp }}(\mathcal{O}) \rightarrow D_{\text {comp }}(\mathcal{O})$ such that we have

$$
\operatorname{Hom}_{D_{\text {comp }}(\mathcal{O})}\left(K, R \mathcal{H o m}_{\mathcal{O}}(L, M)\right)=\operatorname{Hom}_{D_{\text {comp }}(\mathcal{O})}\left(K \otimes_{\mathcal{O}} L, M\right)
$$

for $K, L, M \in D_{\text {comp }}(\mathcal{O})$. Note that $R \mathcal{H}_{o m_{\mathcal{O}}}(L, M) \in D_{\text {comp }}(\mathcal{O})$ by Lemma 51.14 .5

099H Lemma 51.14.15. Let $\mathcal{C}$ be a site. Assume $\varphi: \mathcal{O} \rightarrow \mathcal{O}^{\prime}$ is a flat homomorphism of sheaves of rings. Let $f_{1}, \ldots, f_{r}$ be global sections of $\mathcal{O}$ such that $\mathcal{O} /\left(f_{1}, \ldots, f_{r}\right) \cong$ $\mathcal{O}^{\prime} /\left(f_{1}, \ldots, f_{r}\right)$. Then the map of extended alternating Čech complexes

is a quasi-isomorphism.
Proof. Observe that the second complex is the tensor product of the first complex with $\mathcal{O}^{\prime}$. We can write the first extended alternating Čech complex as a colimit of the Koszul complexes $K_{n}=K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)$, see More on Algebra, Lemma 15.22.13. Hence it suffices to prove $K_{n} \rightarrow K_{n} \otimes_{\mathcal{O}} \mathcal{O}^{\prime}$ is a quasi-isomorphism. Since $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ is flat it suffices to show that $H^{i} \rightarrow H^{i} \otimes \mathcal{O}^{\prime} \mathcal{O}^{\prime}$ is an isomorphism where $H^{i}$ is the $i$ th cohomology sheaf $H^{i}=H^{i}\left(K_{n}\right)$. These sheaves are annihilated by $f_{1}^{n}, \ldots, f_{r}^{n}$, see More on Algebra, Lemma 15.22 .6 Thus it suffices to show that $\mathcal{O} /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right) \rightarrow \mathcal{O}^{\prime} /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)$ is an isomorphism. Equivalently, we will show that $\mathcal{O} /\left(f_{1}, \ldots, f_{r}\right)^{n} \rightarrow \mathcal{O}^{\prime} /\left(f_{1}, \ldots, f_{r}\right)^{n}$ is an isomorphism for all $n$. This holds for $n=1$ by assumption. It follows for all $n$ by induction using Modules on Sites, Lemma 18.28 .13 applied to the ring map $\mathcal{O} /\left(f_{1}, \ldots, f_{r}\right)^{n+1} \rightarrow \mathcal{O} /\left(f_{1}, \ldots, f_{r}\right)^{n}$ and the module $\mathcal{O}^{\prime} /\left(f_{1}, \ldots, f_{r}\right)^{n+1}$.
0991 Lemma 51.14.16. Let $\mathcal{C}$ be a site. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a homomorphism of sheaves of rings. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. If $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ is flat and $\mathcal{O} / \mathcal{I} \cong \mathcal{O}^{\prime} / \mathcal{I} \mathcal{O}^{\prime}$, then the restriction functor $D\left(\mathcal{O}^{\prime}\right) \rightarrow D(\mathcal{O})$ induces an equivalence $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I} \mathcal{O}^{\prime}\right) \rightarrow D_{\text {comp }}(\mathcal{O}, \mathcal{I})$.
Proof. Lemma 51.14 .7 implies restriction $r: D\left(\mathcal{O}^{\prime}\right) \rightarrow D(\mathcal{O})$ sends $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I O}^{\prime}\right)$ into $D_{\text {comp }}(\mathcal{O}, \mathcal{I})$. We will construct a quasi-inverse $E \mapsto E^{\prime}$.
Let $K \rightarrow \mathcal{O}$ be the morphism of $D(\mathcal{O})$ constructed in Lemma 51.14.11. Set $K^{\prime}=$ $K \otimes_{\mathcal{O}}^{\mathrm{L}} \mathcal{O}^{\prime}$ in $D\left(\mathcal{O}^{\prime}\right)$. Then $K^{\prime} \rightarrow \mathcal{O}^{\prime}$ is a map in $D\left(\mathcal{O}^{\prime}\right)$ which satisfies the conclusions of Lemma 51.14.11 with respect to $\mathcal{I}^{\prime}=\mathcal{I O}^{\prime}$. The map $K \rightarrow r\left(K^{\prime}\right)$ is a quasiisomorphism by Lemma 51.14.15. Now, for $E \in D_{\text {comp }}(\mathcal{O}, \mathcal{I})$ we set

$$
E^{\prime}=R \mathcal{H}^{\prime} m_{\mathcal{O}}\left(r\left(K^{\prime}\right), E\right)
$$

viewed as an object in $D\left(\mathcal{O}^{\prime}\right)$ using the $\mathcal{O}^{\prime}$-module structure on $K^{\prime}$. Since $E$ is derived complete we have $E=R \mathcal{H}_{0} m_{\mathcal{O}}(K, E)$, see proof of Proposition 51.14.12, On the other hand, since $K \rightarrow r\left(K^{\prime}\right)$ is an isomorphism in we see that there is an isomorphism $E \rightarrow r\left(E^{\prime}\right)$ in $D(\mathcal{O})$. To finish the proof we have to show that, if $E=r\left(M^{\prime}\right)$ for an object $M^{\prime}$ of $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\prime}\right)$, then $E^{\prime} \cong M^{\prime}$. To get a map we use $M^{\prime}=R \mathcal{H o m}_{\mathcal{O}^{\prime}}\left(\mathcal{O}^{\prime}, M^{\prime}\right) \rightarrow R \mathcal{H o m}_{\mathcal{O}}\left(r\left(\mathcal{O}^{\prime}\right), r\left(M^{\prime}\right)\right) \rightarrow R \mathcal{H o m}_{\mathcal{O}}\left(r\left(K^{\prime}\right), r\left(M^{\prime}\right)\right)=E^{\prime}$
where the second arrow uses the map $K^{\prime} \rightarrow \mathcal{O}^{\prime}$. To see that this is an isomorphism, one shows that $r$ applied to this arrow is the same as the isomorphism $E \rightarrow r\left(E^{\prime}\right)$ above. Details omitted.

099K Lemma 51.14.17. Let $f:\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ be a morphism of ringed topoi. Let $\mathcal{I} \subset \mathcal{O}$ and $\mathcal{I}^{\prime} \subset \mathcal{O}^{\prime}$ be finite type sheaves of ideals such that $f^{\sharp}$ sends $f^{-1} \mathcal{I}$ into $\mathcal{I}^{\prime}$. Then $R f_{*}$ sends $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\prime}\right)$ into $D_{\text {comp }}(\mathcal{O}, \mathcal{I})$ and has a left adjoint $L f_{\text {comp }}^{*}$ which is $L f^{*}$ followed by derived completion.

Proof. The first statement we have seen in Lemma 51.14.7. Note that the second statement makes sense as we have a derived completion functor $D\left(\mathcal{O}^{\prime}\right) \rightarrow$ $D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\prime}\right)$ by Proposition 51.14 .12 OK, so now let $K \in D_{\text {comp }}(\mathcal{O}, \mathcal{I})$ and $M \in D_{\text {comp }}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\prime}\right)$. Then we have

$$
\operatorname{Hom}\left(K, R f_{*} M\right)=\operatorname{Hom}\left(L f^{*} K, M\right)=\operatorname{Hom}\left(L f_{c o m p}^{*} K, M\right)
$$

by the universal property of derived completion.
0 A 0 G Lemma 51.14.18. Let $f:\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ be a morphism of ringed topoi. Let $\mathcal{I} \subset \mathcal{O}$ be a finite type sheaf of ideals. Let $\mathcal{I}^{\prime} \subset \mathcal{O}^{\prime}$ be the ideal generated by $f^{\sharp}\left(f^{-1} \mathcal{I}\right)$. Then $R f_{*}$ commutes with derived completion, i.e., $R f_{*}\left(K^{\wedge}\right)=$ $\left(R f_{*} K\right)^{\wedge}$.
Proof. By Proposition 51.14 .12 the derived completion functors exist. By Lemma 51.14 .7 the object $R f_{*}\left(K^{\wedge}\right)$ is derived complete, and hence we obtain a canonical $\operatorname{map}\left(R f_{*} K\right)^{\wedge} \rightarrow R f_{*}\left(K^{\wedge}\right)$ by the universal property of derived completion. We may check this map is an isomorphism locally on $\mathcal{C}$. Thus, since derived completion commutes with localization (Remark 51.14.13) we may assume that $\mathcal{I}$ is generated by global sections $f_{1}, \ldots, f_{r}$. Then $\mathcal{I}^{\prime}$ is generated by $g_{i}=f^{\sharp}\left(f_{i}\right)$. By Lemma 51.14 .9 we have to prove that

$$
R \lim \left(R f_{*} K \otimes_{\mathcal{O}}^{\mathbf{L}} K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)\right)=R f_{*}\left(R \lim K \otimes_{\mathcal{O}^{\prime}}^{\mathbf{L}} K\left(\mathcal{O}^{\prime}, g_{1}^{n}, \ldots, g_{r}^{n}\right)\right)
$$

Because $R f_{*}$ commutes with $R \lim$ (Cohomology on Sites, Lemma 21.21.2) it suffices to prove that

$$
R f_{*} K \otimes_{\mathcal{O}}^{\mathbf{L}} K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)=R f_{*}\left(K \otimes_{\mathcal{O}^{\prime}}^{\mathbf{L}} K\left(\mathcal{O}^{\prime}, g_{1}^{n}, \ldots, g_{r}^{n}\right)\right)
$$

This follows from the projection formula (Cohomology on Sites, Lemma 21.38.1) and the fact that $L f^{*} K\left(\mathcal{O}, f_{1}^{n}, \ldots, f_{r}^{n}\right)=K\left(\mathcal{O}^{\prime}, g_{1}^{n}, \ldots, g_{r}^{n}\right)$.

### 51.15. Application to theorem on formal functions

0 A 0 H We interrupt the flow of the exposition to talk a little bit about derived completion in the setting of quasi-coherent modules on schemes and to use this to give a somewhat different proof of the theorem on formal functions. We give some pointers to the literature in Remark 51.15.5.

Generalization of BS13, Lemma 6.5.9 (2)]. Compare with HLP14, Theorem 6.5] in the setting of quasi-coherent modules and morphisms of (derived) algebraic stacks.

Lemma 51.14 .18 is a (very formal) derived version of the theorem on formal functions (Cohomology of Schemes, Theorem 29.19.5. To make this more explicit, suppose $f: X \rightarrow S$ is a morphism of schemes, $\mathcal{I} \subset \mathcal{O}_{S}$ is a quasi-coherent sheaf of ideals of finite type, and $\mathcal{F}$ is a quasi-coherent sheaf on $X$. Then the lemma says that
0A0I

$$
\begin{equation*}
R f_{*}\left(\mathcal{F}^{\wedge}\right)=\left(R f_{*} \mathcal{F}\right)^{\wedge} \tag{51.15.0.1}
\end{equation*}
$$

where $\mathcal{F}^{\wedge}$ is the derived completion of $\mathcal{F}$ with respect to $f^{-1} \mathcal{I} \cdot \mathcal{O}_{X}$ and the right hand side is the derived completion of $\mathcal{F}$ with respect to $\mathcal{I}$. To see that this gives back the theorem on formal functions we have to do a bit of work.

The following lemma will be our basic tool.
0BLX Lemma 51.15.1. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $\mathcal{C}$ be a site and let $\mathcal{O}$ be a sheaf of $A$-algebras. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Then we have

$$
R \Gamma(\mathcal{C}, \mathcal{F})^{\wedge}=R \Gamma\left(\mathcal{C}, \mathcal{F}^{\wedge}\right)
$$

in $D(A)$ where $\mathcal{F}^{\wedge}$ is the derived completion of $\mathcal{F}$ with respect to $I \mathcal{O}$ and on the left hand wide we have the derived completion with respect to I. This produces two spectral sequences

$$
E_{2}^{i, j}=H^{i}\left(H^{j}(\mathcal{C}, \mathcal{F})^{\wedge}\right) \quad \text { and } \quad E_{2}^{p, q}=H^{p}\left(\mathcal{C}, H^{q}\left(\mathcal{F}^{\wedge}\right)\right)
$$

both converging to $H^{*}\left(R \Gamma(\mathcal{C}, \mathcal{F})^{\wedge}\right)=H^{*}\left(\mathcal{C}, \mathcal{F}^{\wedge}\right)$
Proof. Apply Lemma 51.14 .18 to the morphism of ringed topoi $(\mathcal{C}, \mathcal{O}) \rightarrow(p t, A)$ and take cohomology to get the first statement. The second spectral sequence is just the Leray spectral sequence for this morphism, see Cohomology on Sites, Lemma 21.14.5. The first spectral sequence is the spectral sequence of More on Algebra, Example 15.72 .19 applied to $R \Gamma(\mathcal{C}, \mathcal{F})^{\wedge}$.
0A0K Lemma 51.15.2. Let $X$ be a Noetherian scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals.
(1) A coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ has derived completion $\mathcal{F}^{\wedge}$ equal to $\lim \mathcal{F} / \mathcal{I}^{n} \mathcal{F}$.
(2) A pseudo-coherent object $K$ of $D\left(\mathcal{O}_{X}\right)$ has derived completion $K^{\wedge}$ with cohomology sheaves $H^{q}\left(K^{\wedge}\right)$ equal to $H^{q}(K)^{\wedge}$.
Proof. Proof of (1). Since derived completion commutes with localization (Remark 51.14.13 we may assume $X=\operatorname{Spec}(A)$ and $\mathcal{I}=\widetilde{I}$ for an ideal $I \subset A$. Say $I=$ $\left(f_{1}, \ldots, f_{r}\right)$. Let $K_{n}=K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ be the Koszul complex. By Lemma 51.14 .9 the derived completion of $\mathcal{F}$ is given by $R \lim \mathcal{F} \otimes_{A} K_{n}$. Let $U=\operatorname{Spec}(B) \subset X$ be an affine open. Since $R \Gamma(U,-)$ commutes with $R \lim$ (Injectives, Lemma 19.13.6) we see that

$$
R \Gamma\left(U, \mathcal{F}^{\wedge}\right)=R \lim \mathcal{F}(U) \otimes_{A} K_{n}
$$

This is the derived completion of $\mathcal{F}(U)$ with respect to $I B$ by More on Algebra, Lemma 15.72 .16 and the fact that $K_{n} \otimes_{A} B=K\left(B, f_{1}^{n}, \ldots, f_{r}^{n}\right)$. By More on Algebra, Lemma 15.74 .3 we conclude that $R \Gamma\left(U, \mathcal{F}^{\wedge}\right)$ has vanishing cohomology in degrees different from 0 and $H^{0}\left(U, \mathcal{F}^{\wedge}\right)$ is the completion of $\mathcal{F}(U)$ in degree 0 . Since the affine opens form a basis for the topology, part (1) follows.
Part (2) can either be proved in exactly the same manner as part (1) or it can be deduced from part (1) using the derived completion is an exact functor between triangulated categories. Details omitted.

0A0L Lemma 51.15.3. Let $S=\operatorname{Spec}(A)$ be an affine Noetherian scheme. Let $I \subset A$ be an ideal and let $\mathcal{I} \subset \mathcal{O}_{S}$ be the corresponding quasi-coherent sheaf of ideals. Let $K$ be a pseudo-coherent object of $D\left(\mathcal{O}_{S}\right)$ with derived completion $K^{\wedge}$. Then

$$
H^{p}\left(S, K^{\wedge}\right)=H^{p}(S, K)^{\wedge}=\lim H^{p}(S, K) / I^{n} H^{p}(S, K)
$$

Proof. Follows from Lemma 51.15 .2 and the fact that $R \Gamma(S,-)$ commutes with derived limits. Alternately one could prove this by applying Lemma 51.14 .18 to the morphism of ringed spaces $\left(S, \mathcal{O}_{S}\right) \rightarrow(p t, A)$ and using More on Algebra, Lemma 15.74.3.

0A0M Lemma 51.15.4. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Let $X$ be a Noetherian scheme over $A$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Assume that $H^{p}(X, \mathcal{F})$ is a finite $A$-module for all $p$. Then there are short exact sequences

$$
0 \rightarrow R^{1} \lim H^{p-1}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow H^{p}(X, \mathcal{F})^{\wedge} \rightarrow \lim H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow 0
$$

of A-modules where $H^{p}(X, \mathcal{F})^{\wedge}$ is the usual I-adic completion. If $f$ is proper, then the $R^{1} \lim$ term is zero.

Proof. Consider the two spectral sequences of Lemma 51.15.1. The first degenerates by More on Algebra, Lemma 15.74 .3 and converges to $H^{p}(X, \mathcal{F})^{\wedge}$ in degree $p$. This is where we use the assumption that $H^{p}(X, \mathcal{F})$ is a finite $A$-module. The second degenerates because $\mathcal{F}^{\wedge}=\lim \mathcal{F} / I^{n} \mathcal{F}$ by Lemma 51.15 .2 and converges to $H^{p}\left(X, \lim \mathcal{F} / I^{n} \mathcal{F}\right)$ in degree $p$. On the other hand, Derived Categories of Schemes, Lemma 35.3 .2 shows that $\lim \mathcal{F} / I^{n} \mathcal{F}=R \lim \mathcal{F} / I^{n} \mathcal{F}$. Since $R \Gamma(X,-)$ commutes with derived limits (Injectives, Lemma 19.13.6) we see that

$$
R \Gamma\left(X, \lim \mathcal{F} / I^{n} \mathcal{F}\right)=R \lim R \Gamma\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

By More on Algebra, Remark 15.68.16 we obtain exact sequences

$$
0 \rightarrow R^{1} \lim H^{p-1}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow H^{p}\left(X, \lim \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow \lim H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow 0
$$

of $A$-modules. Combining the above we get the first statement of the lemma. The vanishing of the $R^{1}$ lim term follows from Cohomology of Schemes, Lemma 29.19.4.

0AKL Remark 51.15.5. Here are some references to discussions of related material the literature. It seems that a "derived formal functions theorem" for proper maps goes back to Lur04, Theorem 6.3.1]. There is the discussion in Lur11, especially Chapter 4 which discusses the affine story, see More on Algebra, Section 15.72 . In GR13, Section 2.9] one finds a discussion of proper base change and derived completion using (ind) coherent modules. An analogue of 51.15.0.1 for complexes of quasi-coherent modules can be found as [HLP14, Theorem 6.5]

### 51.16. Derived completion in the constant Noetherian case

099L Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Recall from Modules on Sites, Lemma 18.41.4 that

$$
\underline{\Lambda}^{\wedge}=\lim \underline{\Lambda / I^{n}}
$$

is a flat $\underline{\Lambda}$-algebra and that the map $\underline{\Lambda} \rightarrow \underline{\Lambda}^{\wedge}$ identifies quotients by $I$. Hence Lemma 51.14.16 tells us that

$$
D_{\text {comp }}(\mathcal{C}, \Lambda)=D_{\text {comp }}\left(\mathcal{C}, \underline{\Lambda}^{\wedge}\right)
$$

In particular the cohomology sheaves $H^{i}(K)$ of an object $K$ of $D_{\text {comp }}(\mathcal{C}, \Lambda)$ are sheaves of $\underline{\Lambda}^{\wedge}$-modules. For notational convenience we often work with $D_{\text {comp }}(\mathcal{C}, \Lambda)$.

099M Lemma 51.16.1. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. The left adjoint to the inclusion functor $D_{\text {comp }}(\mathcal{C}, \Lambda) \rightarrow D(\mathcal{C}, \Lambda)$ of Proposition 51.14.12 sends $K$ to

$$
K^{\wedge}=R \lim \left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)
$$

In particular, $K$ is derived complete if and only if $K=R \lim \left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)$.
Proof. Choose generators $f_{1}, \ldots, f_{r}$ of $I$. By Lemma 51.14.9 we have

$$
K^{\wedge}=R \lim \left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{K_{n}}\right)
$$

where $K_{n}=K\left(\Lambda, f_{1}^{n}, \ldots, f_{r}^{n}\right)$. In More on Algebra, Lemma 15.74.1 we have seen that the pro-systems $\left\{K_{n}\right\}$ and $\left\{\Lambda / I^{n}\right\}$ of $D(\Lambda)$ are isomorphic. Thus the lemma follows.

099N Lemma 51.16.2. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Then
(1) $R f_{*}$ sends $D_{\text {comp }}(\mathcal{D}, \Lambda)$ into $D_{\text {comp }}(\mathcal{C}, \Lambda)$,
(2) the map $R f_{*}: D_{\text {comp }}(\mathcal{D}, \Lambda) \rightarrow D_{\text {comp }}(\mathcal{C}, \Lambda)$ has a left adjoint $L f_{\text {comp }}^{*}$ : $D_{\text {comp }}(\mathcal{C}, \Lambda) \rightarrow D_{\text {comp }}(\mathcal{D}, \Lambda)$ which is $L f^{*}$ followed by derived completion,
(3) $R f_{*}$ commutes with derived completion,
(4) for $K$ in $D_{\text {comp }}(\mathcal{D}, \Lambda)$ we have $R f_{*} K=R \lim R f_{*}\left(K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}\right)$.
(5) for $M$ in $D_{\text {comp }}(\mathcal{C}, \Lambda)$ we have $L f_{\text {comp }}^{*} M=R \lim L f^{*}\left(M \overline{\left.\otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda} / I^{n}\right)}\right.$.

Proof. We have seen (1) and (2) in Lemma 51.14.17. Part (3) follows from Lemma 51.14 .18 . For (4) let $K$ be derived complete. Then

$$
R f_{*} K=R f_{*}\left(R \lim K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)=R \lim R f_{*}\left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)
$$

the first equality by Lemma 51.16 .1 and the second because $R f_{*}$ commutes with $R \lim$ (Cohomology on Sites, Lemma 21.21.2). This proves (4). To prove (5), by Lemma 51.16.1 we have

$$
L f_{\text {comp }}^{*} M=R \lim \left(L f^{*} M \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)
$$

Since $L f^{*}$ commutes with derived tensor product by Cohomology on Sites, Lemma 21.18 .4 and since $L f^{*} \underline{\Lambda / I^{n}}=\underline{\Lambda / I^{n}}$ we get (5).

### 51.17. Derived completion on the pro-étale site

099 P Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Although the general theory (see Sections 51.14 and 51.16 ) concerning $D_{\text {comp }}(\mathcal{C}, \Lambda)$ is quite satisfactory it is somewhat useless as it is hard to explicitly give examples of derived complete complexes. We know that
(1) every object $M$ of $D\left(\mathcal{C}, \Lambda / I^{n}\right)$ restricts to a derived complete object of $D(\mathcal{C}, \Lambda)$, and
(2) for every $K \in D(\mathcal{C}, \Lambda)$ the derived completion $K^{\wedge}=R \lim \left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}\right)$ is derived complete.

The first type of objects are trivially complete and perhaps not interesting. The problem with (2) is that derived completion in general is somewhat mysterious, even in case $K=\underline{\Lambda}$. Namely, by definition of homotopy limits there is a distinguished triangle

$$
R \lim \left(\underline{\Lambda / I^{n}}\right) \rightarrow \prod \underline{\Lambda / I^{n}} \rightarrow \prod \underline{\Lambda / I^{n}} \rightarrow R \lim \left(\underline{\Lambda / I^{n}}\right)[1]
$$

in $D(\mathcal{C}, \Lambda)$ where the products are in $D(\mathcal{C}, \Lambda)$. These are computed by taking products of injective resolutions (Injectives, Lemma 19.13.4), so we see that the sheaf $H^{p}\left(\Pi \underline{\Lambda / I^{n}}\right)$ is the sheafification of the presheaf

$$
U \longmapsto \prod H^{p}\left(U, \Lambda / I^{n}\right)
$$

As an explicit example, if $X=\operatorname{Spec}\left(\mathbf{C}\left[t, t^{-1}\right]\right), \mathcal{C}=X_{\text {étale }}, \Lambda=\mathbf{Z}, I=(2)$, and $p=1$, then we get the sheafification of the presheaf

$$
U \mapsto \prod H^{1}\left(U_{\text {étale }}, \mathbf{Z} / 2^{n} \mathbf{Z}\right)
$$

for $U$ étale over $X$. Note that $H^{1}\left(X_{\text {étale }}, \mathbf{Z} / m \mathbf{Z}\right)$ is cyclic of order $m$ with generator $\alpha_{m}$ given by the finite étale $\mathbf{Z} / m \mathbf{Z}$-covering given by the equation $t=s^{m}$ (see Étale Cohomology, Section 49.6). Then the section

$$
\alpha=\left(\alpha_{2^{n}}\right) \in \prod H^{1}\left(X_{\text {étale }}, \mathbf{Z} / 2^{n} \mathbf{Z}\right)
$$

of the presheaf above does not restrict to zero on any nonempty étale scheme over $X$, whence the sheaf associated to the presheaf is not zero.
However, on the pro-étale site this phenomenon does not occur. The reason is that we have enough (quasi-compact) weakly contractible objects. In the following proposition we collect some results about derived completion in the Noetherian constant case for sites having enough weakly contractible objects (see Sites, Definition 7.39.2.

099Q Proposition 51.17.1. Let $\mathcal{C}$ be a site. Assume $\mathcal{C}$ has enough weakly contractible objects. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal.
(1) The category of derived complete sheaves $\Lambda$-modules is a weak Serre subcategory of $\operatorname{Mod}(\mathcal{C}, \Lambda)$.
(2) A sheaf $\mathcal{F}$ of $\Lambda$-modules satisfies $\mathcal{F}=\lim \mathcal{F} / I^{n} \mathcal{F}$ if and only if $\mathcal{F}$ is derived complete and $\bigcap I^{n} \mathcal{F}=0$.
(3) The sheaf $\underline{\Lambda}^{\wedge}$ is derived complete.
(4) If $\ldots \rightarrow \mathcal{F}_{3} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1}$ is an inverse system of derived complete sheaves of $\Lambda$-modules, then $\lim \mathcal{F}_{n}$ is derived complete.
(5) An object $K \in D(\mathcal{C}, \Lambda)$ is derived complete if and only if each cohomology sheaf $H^{p}(K)$ is derived complete.
(6) An object $K \in D_{\text {comp }}(\mathcal{C}, \Lambda)$ is bounded above if and only if $K \otimes_{\Lambda}^{\mathrm{L}} \underline{\Lambda / I}$ is bounded above.
(7) An object $K \in D_{\text {comp }}(\mathcal{C}, \Lambda)$ is bounded if $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I}$ has finite tor dimension.

Proof. Let $\mathcal{B} \subset \operatorname{Ob}(\mathcal{C})$ be a subset such that every $U \in \mathcal{B}$ is weakly contractible and every object of $\mathcal{C}$ has a covering by elements of $\mathcal{B}$. We will use the results of Cohomology on Sites, Lemma 21.39 .1 and Proposition 21.39 .2 without further mention.

Recall that $R \lim$ commutes with $R \Gamma(U,-)$, see Injectives, Lemma 19.13.6 Let $f \in I$. Recall that $T(K, f)$ is the homotopy limit of the system

$$
\ldots K \xrightarrow{f} K \xrightarrow{f} K
$$

in $D(\mathcal{C}, \Lambda)$. Thus

$$
R \Gamma(U, T(K, f))=T(R \Gamma(U, K), f)
$$

Since we can test isomorphisms of maps between objects of $D(\mathcal{C}, \Lambda)$ by evaluating at $U \in \mathcal{B}$ we conclude an object $K$ of $D(\mathcal{C}, \Lambda)$ is derived complete if and only if for every $U \in \mathcal{B}$ the object $R \Gamma(U, K)$ is derived complete as an object of $D(\Lambda)$.
The remark above implies that items (1), (5) follow from the corresponding results for modules over rings, see More on Algebra, Lemmas 15.72.1 and 15.72.6. In the same way (2) can be deduced from More on Algebra, Proposition 15.72 .5 as $\left(I^{n} \mathcal{F}\right)(U)=I^{n} \cdot \mathcal{F}(U)$ for $U \in \mathcal{B}$ (by exactness of evaluating at $\left.U\right)$.

Proof of (4). The homotopy $\operatorname{limit} R \lim \mathcal{F}_{n}$ is in $D_{\text {comp }}(X, \Lambda)$ (see discussion following Definition 51.14.4. By part (5) just proved we conclude that $\lim \mathcal{F}_{n}=$ $H^{0}\left(R \lim \mathcal{F}_{n}\right)$ is derived complete. Part (3) is a special case of (4).
Proof of (6) and (7). Follows from Lemma 51.16.1 and Cohomology on Sites, Lemma 21.36 .8 and the computation of homotopy limits in Cohomology on Sites, Proposition 21.39.2.

### 51.18. Comparison with the étale site

099R Let $X$ be a scheme. With suitable choices of sites (as in Topologies, Remark 33.9.1) the functor $u: X_{\text {étale }} \rightarrow X_{\text {pro-étale }}$ sending $U / X$ to $U / X$ defines a morphism of sites

$$
\epsilon: X_{\text {pro-étale }} \longrightarrow X_{\text {étale }}
$$

This follows from Sites, Proposition 7.15.6. A fundamental fact about this comparison morphism is the following.

099S Lemma 51.18.1. Let $X$ be a scheme. Let $Y=\lim Y_{i}$ be an inverse limit of quasicompact and quasi-separated schemes étale over $X$ with affine transition morphisms. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $\epsilon^{-1} \mathcal{F}(Y)=\operatorname{colim} \mathcal{F}\left(Y_{i}\right)$.

Proof. Let $\mathcal{F}=h_{U}$ be a representable sheaf on $X_{\text {étale }}$ with $U$ an object of $X_{\text {étale }}$. In this case $\epsilon^{-1} h_{U}=h_{u(U)}$ where $u(U)$ is $U$ viewed as an object of $X_{\text {pro-étale }}$ (Sites, Lemma 7.14.5. Then

$$
h_{u(U)}(Y)=\operatorname{Mor}_{X}(Y, U)=\operatorname{colim} \operatorname{Mor}_{X}\left(Y_{i}, U\right)=\operatorname{colim} h_{U}\left(Y_{i}\right)
$$

by Limits, Proposition 31.5.1. Hence the lemma holds for every representable sheaf. Since every sheaf is a coequalizer of a map of coproducts of representable sheaves (Sites, Lemma 7.13.5) we obtain the result in general.

099T Lemma 51.18.2. Let $X$ be a scheme. For every sheaf $\mathcal{F}$ on $X_{\text {étale }}$ the adjunction $\operatorname{map} \mathcal{F} \rightarrow \epsilon_{*} \epsilon^{-1} \mathcal{F}$ is an isomorphism.

Proof. Suppose that $U$ is a quasi-compact and quasi-separated scheme étale over $X$. Then

$$
\epsilon_{*} \epsilon^{-1} \mathcal{F}(U)=\epsilon^{-1} \mathcal{F}(U)=\mathcal{F}(U)
$$

the second equality by (a special case of) Lemma 51.18.1. Since every object of $X_{\text {étale }}$ has a covering by quasi-compact and quasi-separated objects we conclude.

099U Lemma 51.18.3. Let $X$ be an affine scheme. For injective abelian sheaf $\mathcal{I}$ on $X_{\text {étale }}$ we have $H^{p}\left(X_{\text {pro-étale }}, \epsilon^{-1} \mathcal{I}\right)=0$ for $p>0$.
Proof. We are going to use Cohomology on Sites, Lemma 21.11 .9 to prove this. The idea is simple: We show that every standard pro-étale covering of $X$ is a limit of coverings in $X_{\text {étale }}$. If this holds then Lemma 51.18.1 will kick in to show the Čech cohomology groups of $\epsilon^{-1} \mathcal{I}$ are colimits of those of $\mathcal{I}$ which are zero in positive degree.
Here are the details. Let $\mathcal{B} \subset \mathrm{Ob}\left(X_{\text {pro-étale }}\right)$ be the set of affine schemes $U$ over $X$ such that $\mathcal{O}(X) \rightarrow \mathcal{O}(U)$ is ind-étale. Let Cov be the set of pro-étale coverings $\left\{U_{i} \rightarrow U\right\}_{i=1, \ldots, n}$ with $U, U_{i} \in \mathcal{B}$ such that $\mathcal{O}(U) \rightarrow \mathcal{O}\left(U_{i}\right)$ is ind-étale for $i=$ $1, \ldots, n$. Properties (1) and (2) of Cohomology on Sites, Lemma 21.11.9 hold for $\mathcal{B}$ and Cov by Proposition 51.9.1 (it also follows from Lemma 51.11.10).
To check condition (3) suppose that $\left\{U_{i} \rightarrow U\right\}_{i=1, \ldots, n}$ is an element of Cov. Then we can write $U_{i}=\lim _{a \in A_{i}} U_{i, a}$ with $U_{i, a} \rightarrow U$ étale and $U_{i, a}$ affine. Next we write $U=\lim _{b \in B} U_{b}$ with $U_{b}$ affine and $U_{b} \rightarrow U$ étale. By Limits, Lemma 31.9.1 for each $i$ and $a \in A_{i}$ we can choose a $b(i, a) \in B$ and for all $b \geq b(i, a)$ an affine scheme $U_{i, a, b}$ étale over $U_{b}$ such that $U_{i, a}=\lim _{b \geq b(i, a)} U_{i, a, b^{2}}$. Moreover, any transition map $U_{i, a} \rightarrow U_{i, a^{\prime}}$ comes from an essentially unique morphism $U_{i, a, b} \rightarrow U_{i, a^{\prime}, b}$ for $b$ large enough (by the same reference). Finally, given $a_{1} \in A_{1}, \ldots, a_{n} \in A_{n}$ the morphism $U_{1, a_{1}} \amalg \ldots \amalg U_{n, a_{n}} \rightarrow U$ is surjective, hence for $b$ large enough the map $U_{1, a_{1}, b} \amalg \ldots \amalg U_{n, a_{n}, b} \rightarrow U_{b}$ is surjective by Limits, Lemma 31.7.11. Let $\mathcal{D}$ be the category of coverings $\left\{U_{i, a_{i}, b} \rightarrow U_{b}\right\}_{i=1, \ldots, n}$ so obtained. This category is cofiltered. We claim that, given $i_{0}, \ldots, i_{p} \in\{1, \ldots, n\}$ we have

$$
U_{i_{0}} \times \times_{U} U_{i_{1}} \times \times_{U} \ldots \times_{U} U_{i_{p}}=\lim _{\mathcal{D}} U_{i_{0}, a_{i_{0}}, b} \times_{U_{b}} U_{i_{1}, a_{i_{1}}, b} \times \times_{U_{b}} \ldots \times_{U_{b}} U_{i_{p}, a_{i_{p}}, b}
$$

This is clear from the fact that it holds for $p=-1$ (i.e., $U=\lim _{\mathcal{D}} U_{b}$ ) and for $p=0$ (i.e., $U_{i}=\lim _{\mathcal{D}} U_{i, a_{i}, b}$ ) and the fact that fibre products commute with limits. Then finally it follows from Lemma 51.18.1 that

$$
\check{\mathcal{C}}^{\bullet}\left(\left\{U_{i} \rightarrow U\right\}, \epsilon^{-1} \mathcal{I}\right)=\operatorname{colim}_{\mathcal{D}^{o p p}} \check{\mathcal{C}}^{\bullet}\left(\left\{U_{i, a_{i}, b} \rightarrow U_{b}\right\}, \mathcal{I}\right)
$$

Since each of the Čech complexes on the right hand side is acyclic in positive degrees (Cohomology on Sites, Lemma 21.11.2) it follows that the one on the left is too. This prove condition (3) of Cohomology on Sites, Lemma 21.11.9. Since $X \in \mathcal{B}$ the lemma follows.

099V Lemma 51.18.4. Let $X$ be a scheme. For an abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $R \epsilon_{*}\left(\epsilon^{-1} \mathcal{F}\right)=\mathcal{F}$.
Proof. Let $\mathcal{I}$ be an injective abelian sheaf on $X_{\text {étale }}$. Recall that $R^{q} \epsilon_{*}\left(\epsilon^{-1} \mathcal{I}\right)$ is the sheaf associated to $U \mapsto H^{q}\left(U_{\text {pro-étale }}, \epsilon^{-1} \mathcal{I}\right)$, see Cohomology on Sites, Lemma 21.8.4. By Lemma 51.18.3 we see that this is zero for $q>0$ and $U$ affine and étale over $X$. Since every object of $X_{\text {étale }}$ has a covering by affine objects, it follows that $R^{q} \epsilon_{*}\left(\epsilon^{-1} \mathcal{I}\right)=0$ for $q>0$. Combined with Lemma 51.18.2 we conclude

[^145]that $R \epsilon_{*} \epsilon^{-1} \mathcal{I}=\mathcal{I}$ for every injective abelian sheaf. Since every abelian sheaf has a resolution by injective sheaves, the result follows. (Hint: use Leray acyclicity theorem - Derived Categories, Lemma 13.17.7.)

Lemma 51.18.5. Let $X$ be a scheme. For an abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have

$$
H^{i}\left(X_{\text {étale }}, \mathcal{F}\right)=H^{i}\left(X_{\text {pro-étale }}, \epsilon^{-1} \mathcal{F}\right)
$$

for all $i$.
Proof. Immediate consequence of Lemma 51.18.4 and the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.6).

099X Lemma 51.18.6. Let $X$ be a scheme. Let $\mathcal{G}$ be a sheaf of (possibly noncommutative) groups on $X_{\text {étale }}$. We have

$$
H^{1}\left(X_{\text {étale }}, \mathcal{G}\right)=H^{1}\left(X_{\text {pro-étale }}, \epsilon^{-1} \mathcal{G}\right)
$$

where $H^{1}$ is defined as the set of isomorphism classes of torsors (see Cohomology on Sites, Section 21.5).

Proof. Since the functor $\epsilon^{-1}$ is fully faithful by Lemma 51.18 .2 it is clear that the $\operatorname{map} H^{1}\left(X_{\text {étale }}, \mathcal{G}\right) \rightarrow H^{1}\left(X_{\text {pro-étale }}, \epsilon^{-1} \mathcal{G}\right)$ is injective. To show surjectivity it suffices to show that any $\epsilon^{-1} \mathcal{G}$-torsor $\mathcal{F}$ is étale locally trivial. To do this we may assume that $X$ is affine. Thus we reduce to proving surjectivity for $X$ affine.

Choose a covering $\{U \rightarrow X\}$ with (a) $U$ affine, (b) $\mathcal{O}(X) \rightarrow \mathcal{O}(U)$ ind-étale, and (c) $\mathcal{F}(U)$ nonempty. We can do this by Proposition 51.9.1 and the fact that standard pro-étale coverings of $X$ are cofinal among all pro-étale coverings of $X$ (Lemma 51.11.5). Write $U=\lim U_{i}$ as a limit of affine schemes étale over $X$. Pick $s \in \mathcal{F}(U)$. Let $g \in \epsilon^{-1} \mathcal{G}\left(U \times_{X} U\right)$ be the unique section such that $g \cdot \operatorname{pr}_{1}^{*} s=\operatorname{pr}_{2}^{*} s$ in $\mathcal{F}\left(U \times{ }_{X} U\right)$. Then $g$ satisfies the cocycle condition

$$
\operatorname{pr}_{12}^{*} g \cdot \operatorname{pr}_{23}^{*} g=\operatorname{pr}_{13}^{*} g
$$

in $\epsilon^{-1} \mathcal{G}\left(U \times_{X} U \times_{X} U\right)$. By Lemma 51.18.1 we have

$$
\epsilon^{-1} \mathcal{G}\left(U \times_{X} U\right)=\operatorname{colim} \mathcal{G}\left(U_{i} \times_{X} U_{i}\right)
$$

and

$$
\epsilon^{-1} \mathcal{G}\left(U \times_{X} U \times_{X} U\right)=\operatorname{colim} \mathcal{G}\left(U_{i} \times_{X} U_{i} \times_{X} U_{i}\right)
$$

hence we can find an $i$ and an element $g_{i} \in \mathcal{G}\left(U_{i}\right)$ mapping to $g$ satisfying the cocycle condition. The cocycle $g_{i}$ then defines a torsor for $\mathcal{G}$ on $X_{\text {étale }}$ whose pullback is isomorphic to $\mathcal{F}$ by construction. Some details omitted (namely, the relationship between torsors and 1-cocycles which should be added to the chapter on cohomology on sites).

09B1 Lemma 51.18.7. Let $X$ be a scheme. Let $\Lambda$ be a ring.
(1) The essential image of $\epsilon^{-1}: \operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right) \rightarrow \operatorname{Mod}\left(X_{\text {pro-étale }}, \Lambda\right)$ is a weak Serre subcategory $\mathcal{C}$.
(2) The functor $\epsilon^{-1}$ defines an equivalence of categories of $D^{+}\left(X_{\text {étale }}, \Lambda\right)$ with $D_{\mathcal{C}}^{+}\left(X_{\text {pro-étale }}, \Lambda\right)$.

Proof. To prove (1) we will prove conditions (1) - (4) of Homology, Lemma 12.9.3. Since $\epsilon^{-1}$ is fully faithful (Lemma 51.18.2) and exact, everything is clear except for condition (4). However, if

$$
0 \rightarrow \epsilon^{-1} \mathcal{F}_{1} \rightarrow \mathcal{G} \rightarrow \epsilon^{-1} \mathcal{F}_{2} \rightarrow 0
$$

is a short exact sequence of sheaves of $\Lambda$-modules on $X_{\text {pro-étale }}$, then we get

$$
0 \rightarrow \epsilon_{*} \epsilon^{-1} \mathcal{F}_{1} \rightarrow \epsilon_{*} \mathcal{G} \rightarrow \epsilon_{*} \epsilon^{-1} \mathcal{F}_{2} \rightarrow R^{1} \epsilon_{*} \epsilon^{-1} \mathcal{F}_{1}
$$

which by Lemma 51.18 .4 is the same as a short exact sequence

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \epsilon_{*} \mathcal{G} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

Pulling pack we find that $\mathcal{G}=\epsilon^{-1} \epsilon_{*} \mathcal{G}$. This proves (1).
By (1) and the discussion in Derived Categories, Section 13.13 we obtain a strictly full, saturated, triangulated subcategory $D_{\mathcal{C}}\left(X_{\text {pro-étale }}, \Lambda\right)$. It is clear that $\epsilon^{-1}$ maps $D\left(X_{\text {étale }}, \Lambda\right)$ into $D_{\mathcal{C}}\left(X_{\text {pro-étale }}, \Lambda\right)$. If $M$ is in $D^{+}\left(X_{\text {étale }}, \Lambda\right)$, then Lemma 51.18.4 shows that $M \rightarrow R \epsilon_{*} \epsilon^{-1} M$ is an isomorphism. If $K$ is in $D_{\mathcal{C}}^{+}\left(X_{\text {pro-étale }}, \Lambda\right)$, then the spectral sequence

$$
R^{q} \epsilon_{*} H^{p}(K) \Rightarrow H^{p+q}\left(R \epsilon_{*} K\right)
$$

and the vanishing in Lemma 51.18 .4 shows that $H^{p}\left(R \epsilon_{*} K\right)=R \epsilon_{*} H^{p}(K)$. Since $\epsilon$ is a flat morphism of ringed sites (ringed by the constant sheaf $\underline{\Lambda}$ ) we see that $\epsilon^{-1} R \epsilon_{*} K$ has cohomology sheaves $\epsilon^{-1} R \epsilon_{*} H^{p}(K)$. Since we've assumed $H^{p}(K)$ is in $\mathcal{C}$ we conclude by Lemma 51.18 .4 once more that $\epsilon^{-1} R \epsilon_{*} K \rightarrow K$ is an isomorphism. In this way we see that $\epsilon^{-1}$ and $R \epsilon_{*}$ are quasi-inverse functors proving (2).

Let $\Lambda$ be a ring. In Modules on Sites, Section 18.42 we have defined the notion of a locally constant sheaf of $\Lambda$-modules on a site. If $M$ is a $\Lambda$-module, then $\underline{M}$ is of finite presentation as a sheaf of $\underline{\Lambda}$-modules if and only if $M$ is a finitely presented $\Lambda$-module, see Modules on Sites, Lemma 18.41.5.

099Y Lemma 51.18.8. Let $X$ be a scheme. Let $\Lambda$ be a ring. The functor $\epsilon^{-1}$ defines an equivalence of categories

$$
\left\{\begin{array}{c}
\text { locally constant sheaves } \\
\text { of } \Lambda \text {-modules on } X_{\text {étale }} \\
\text { of finite presentation }
\end{array}\right\} \longleftrightarrow\left\{\begin{array}{c}
\text { locally constant sheaves } \\
\text { of } \Lambda \text {-modules on } X_{\text {pro-étale }} \\
\text { of finite presentation }
\end{array}\right\}
$$

Proof. Let $\mathcal{F}$ be a locally constant sheaf of $\Lambda$-modules on $X_{\text {pro-étale }}$ of finite presentation. Choose a pro-étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is constant, say $\left.\mathcal{F}\right|_{U_{i}} \cong \underline{M}_{U_{i}}$. Observe that $U_{i} \times_{X} U_{j}$ is empty if $M_{i}$ is not isomorphic to $M_{j}$. For each $\Lambda$-module $M$ let $I_{M}=\left\{i \in I \mid M_{i} \cong M\right\}$. As pro-étale coverings are fpqc coverings and by Descent, Lemma 34.9.2 we see that $U_{M}=\bigcup_{i \in I_{M}} \operatorname{Im}\left(U_{i} \rightarrow X\right)$ is an open subset of $X$. Then $X=\coprod U_{M}$ is a disjoint open covering of $X$. We may replace $X$ by $U_{M}$ for some $M$ and assume that $M_{i}=M$ for all $i$.
Consider the sheaf $\mathcal{I}=\operatorname{Isom}(\underline{M}, \mathcal{F})$. This sheaf is a torsor for $\mathcal{G}=\operatorname{Isom}(\underline{M}, \underline{M})$. By Modules on Sites, Lemma 18.42 .4 we have $\mathcal{G}=\underline{G}$ where $G=\operatorname{Isom}_{\Lambda}(M, \bar{M})$. Since torsors for the étale topology and the pro-étale topology agree by Lemma 51.18 .6 it follows that $\mathcal{I}$ has sections étale locally on $X$. Thus $\mathcal{F}$ is étale locally a constant sheaf which is what we had to show.

099Z Lemma 51.18.9. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $D_{\text {flc }}\left(X_{\text {étale }}, \Lambda\right)$, resp. $D_{\text {flc }}\left(X_{\text {pro-étale }}, \Lambda\right)$ be the full subcategory of $D\left(X_{\text {étale }}, \Lambda\right)$, resp. $D\left(X_{\text {pro-étale }}, \Lambda\right)$ consisting of those complexes whose cohomology sheaves are locally constant sheaves of $\Lambda$-modules of finite type. Then

$$
\epsilon^{-1}: D_{\text {flc }}^{+}\left(X_{\text {étale }}, \Lambda\right) \longrightarrow D_{\text {flc }}^{+}\left(X_{\text {pro-étale }}, \Lambda\right)
$$

is an equivalence of categories.
Proof. The categories $D_{f l c}\left(X_{\text {étale }}, \Lambda\right)$ and $D_{f l c}\left(X_{\text {pro-étale }}, \Lambda\right)$ are strictly full, saturated, triangulated subcategories of $D\left(X_{\text {étale }}, \Lambda\right)$ and $D\left(X_{\text {pro-étale }}, \Lambda\right)$ by Modules on Sites, Lemma 18.42 .5 and Derived Categories, Section 13.13 The statement of the lemma follows by combining Lemmas 51.18.7 and 51.18.8.
09B2 Lemma 51.18.10. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $K$ be an object of $D\left(X_{\text {pro-étale }}, \Lambda\right)$. Set $K_{n}=K \otimes \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}$. If $K_{1}$ is
(1) in the essential image of $\epsilon^{-1}: D\left(X_{\text {étale }}, \Lambda / I\right) \rightarrow D\left(X_{\text {pro-étale }}, \Lambda / I\right)$, and
(2) has tor amplitude in $[a, \infty)$ for some $a \in \mathbf{Z}$,
then (1) and (2) hold for $K_{n}$ as an object of $D\left(X_{\text {pro-étale }}, \Lambda / I^{n}\right)$.
Proof. For assertion (2) this follows from the more general Cohomology on Sites, Lemma 21.36.8. The second assertion follows from the fact that the essential image of $\epsilon^{-1}$ is a triangulated subcategory of $D^{+}\left(X_{\text {pro-étale }}, \Lambda / I^{n}\right)$ (Lemma 51.18.7), the distinguished triangles

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}} \rightarrow K_{n+1} \rightarrow K_{n} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}[1]}
$$

and the isomorphism

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}=K_{1} \otimes_{\Lambda / I}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}
$$

### 51.19. Cohomology of a point

09B3 Let $\Lambda$ be a Noetherian ring complete with respect to an ideal $I \subset \Lambda$. Let $k$ be a field. In this section we "compute"

$$
H^{i}\left(\operatorname{Spec}(k)_{\text {pro-étale }}, \underline{\Lambda}^{\wedge}\right)
$$

where $\underline{\Lambda}^{\wedge}=\lim \underline{\Lambda / I^{n}}$ as before. Let $k^{\text {sep }}$ be a separable algebraic closure of $k$. Then

$$
\mathcal{U}=\left\{\operatorname{Spec}\left(k^{\operatorname{sep}}\right) \rightarrow \operatorname{Spec}(k)\right\}
$$

is a pro-étale covering of $\operatorname{Spec}(k)$. We will use the Čech to cohomology spectral sequence with respect to this covering. Set $U_{0}=\operatorname{Spec}\left(k^{s e p}\right)$ and

$$
\begin{aligned}
U_{n} & =\operatorname{Spec}\left(k^{\text {sep }}\right) \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\text {sep }}\right) \times_{\operatorname{Spec}(k)} \ldots \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\text {sep }}\right) \\
& =\operatorname{Spec}\left(k^{\text {sep }} \otimes_{k} k^{\text {sep }} \otimes_{k} \ldots \otimes_{k} k^{\text {sep }}\right)
\end{aligned}
$$

( $n+1$ factors). Note that the underlying topological space $\left|U_{0}\right|$ of $U_{0}$ is a singleton and for $n \geq 1$ we have

$$
\left|U_{n}\right|=G \times \ldots \times G \quad(n \text { factors })
$$

as profinite spaces where $G=\operatorname{Gal}\left(k^{\text {sep }} / k\right)$. Namely, every point of $U_{n}$ has residue field $k^{s e p}$ and we identify $\left(\sigma_{1}, \ldots, \sigma_{n}\right)$ with the point corresponding to the surjection

$$
k^{s e p} \otimes_{k} k^{\text {sep }} \otimes_{k} \ldots \otimes_{k} k^{s e p} \longrightarrow k^{s e p}, \quad \lambda_{0} \otimes \lambda_{1} \otimes \ldots \lambda_{n} \longmapsto \lambda_{0} \sigma_{1}\left(\lambda_{1}\right) \ldots \sigma_{n}\left(\lambda_{n}\right)
$$

Then we compute

$$
\begin{aligned}
R \Gamma\left(\left(U_{n}\right)_{\text {pro-étale }}, \underline{\Lambda}^{\wedge}\right) & =R \lim R \Gamma\left(\left(U_{n}\right)_{\text {pro-étale }}, \underline{\Lambda / I^{n}}\right) \\
& =R \lim R \Gamma\left(\left(U_{n}\right)_{\text {étale }}, \underline{\left.\Lambda / I^{n}\right)}\right. \\
& =\lim H^{0}\left(U_{n}, \underline{\Lambda / I^{n}}\right) \\
& =\operatorname{Maps}_{c o n t}(G \times \ldots \times G, \Lambda)
\end{aligned}
$$

The first equality because $R \Gamma$ commutes with derived limits and as $\Lambda^{\wedge}$ is the derived limit of the sheaves $\Lambda / I^{n}$ by Proposition 51.17.1. The second equality by Lemma 51.18.5. The third equality by Étale Cohomology, Lemma 49.55.7. The fourth equality uses Étale Cohomology, Remark 49.23 .2 to identify sections of the constant sheaf $\Lambda / I^{n}$. Then it uses the fact that $\Lambda$ is complete with respect to $I$ and hence equal to $\overline{\lim \Lambda} / I^{n}$ as a topological space, to see that $\lim \operatorname{Map}_{\text {cont }}\left(G, \Lambda / I^{n}\right)=$ $\operatorname{Map}_{\text {cont }}(G, \Lambda)$ and similarly for higher powers of $G$. At this point Cohomology on Sites, Lemmas 21.11.3 and 21.11.7 tell us that

$$
\Lambda \rightarrow \operatorname{Maps}_{\text {cont }}(G, \Lambda) \rightarrow \operatorname{Maps}_{\text {cont }}(G \times G, \Lambda) \rightarrow \ldots
$$

computes the pro-étale cohomology. In other words, we see that

$$
H^{i}\left(\operatorname{Spec}(k)_{\text {pro-étale }}, \underline{\Lambda}^{\wedge}\right)=H_{\text {cont }}^{i}(G, \Lambda)
$$

where the right hand side is continuous cohomology as defined by Tate in Tat76. Of course, this is as it should be.

09B4 Lemma 51.19.1. Let $k$ be a field. Let $G=G a l\left(k^{\text {sep }} / k\right)$ be its absolute Galois group. Further,
(1) let $M$ be a profinite abelian group with a continuous $G$-action, or
(2) let $\Lambda$ be a Noetherian ring and $I \subset \Lambda$ an ideal an let $M$ be an $I$-adically complete $\Lambda$-module with continuous $G$-action.
Then there is a canonical sheaf $\underline{M}^{\wedge}$ on $\operatorname{Spec}(k)_{\text {pro-étale }}$ associated to $M$ such that

$$
H^{i}\left(\operatorname{Spec}(k), \underline{M}^{\wedge}\right)=H_{c o n t}^{i}(G, M)
$$

as abelian groups or $\Lambda$-modules.
Proof. Proof in case (2). Set $M_{n}=M / I^{n} M$. Then $M=\lim M_{n}$ as $M$ is assumed $I$-adically complete. Since the action of $G$ is continuous we get continuous actions of $G$ on $M_{n}$. By Étale Cohomology, Theorem 49.56.3 this action corresponds to a (locally constant) sheaf $M_{n}$ of $\Lambda / I^{n}$-modules on $\operatorname{Spec}(k)$ étale. Pull back to $\operatorname{Spec}(k)_{\text {pro-étale }}$ by the comparison morphism $\epsilon$ and take the limit

$$
\underline{M}^{\wedge}=\lim \epsilon^{-1} \underline{M}_{n}
$$

to get the sheaf promised in the lemma. Exactly the same argument as given in the introduction of this section gives the comparison with Tate's continuous Galois cohomology.

### 51.20. Weakly contractible hypercoverings

09A0 Let $X$ be a scheme. For every object $U \in \mathrm{Ob}\left(X_{\text {pro-étale }}\right)$ there exists a covering $\{V \rightarrow U\}$ of $X_{\text {pro-étale }}$ with $V$ weakly contractible. This follows from Lemma 51.11 .10 and the elementary fact that a disjoint union of weakly contractible objects in $X_{\text {pro-étale }}$ is weakly contractible (discussion of set theoretic issues omitted).

This observation leads to the existence of hypercoverings made up out weakly contractible objects.

09A1 Lemma 51.20.1. Let $X$ be a scheme.
(1) For every object $U$ of $X_{\text {pro-étale }}$ there exists a hypercovering $K$ of $U$ in $X_{\text {pro-étale }}$ such that each term $K_{n}$ consists of a single weakly contractible object of $X_{\text {pro-étale }}$ covering $U$.
(2) For every quasi-compact and quasi-separated object $U$ of $X_{\text {pro-étale }}$ there exists a hypercovering $K$ of $U$ in $X_{\text {pro-étale }}$ such that each term $K_{n}$ consists of a single affine and weakly contractible object of $X_{\text {pro-étale }}$ covering $U$.
Proof. Let $\mathcal{B} \subset \mathrm{Ob}\left(X_{\text {pro-étale }}\right)$ be the set of weakly contractible objects of $X_{\text {pro-étale }}$. We have seen above that every object of $X_{\text {pro-étale }}$ has a covering by an element of $\mathcal{B}$. Apply Hypercoverings, Lemma 24.11.1 to get (1).

Let $X_{q c q s, p r o-e ́ t a l e} \subset X_{\text {pro-étale }}$ be the full subcategory consisting of quasi-compact and quasi-separated objects. Note that $X_{q c q s, p r o-e ́ t a l e}$ is preserved under fibre products. A covering of $X_{q c q s, p r o-e ́ t a l e ~}$ will be a finite pro-étale covering. Then $X_{q c q s, p r o-e ́ t a l e} \rightarrow X_{\text {pro-étale }}$ is a special cocontinuous functor hence $X_{q c q s, p r o-e ́ t a l e}$ defines the same topos as $X_{\text {pro-étale }}$. Details omitted; see Sites, Definition 7.28 .2 and Lemma 7.28.1. In particular, if $K$ is a hypercovering of an object $U$ in $X_{q c q s, p r o-e ́ t a l e ~}$ then $K$ is a hypercovering of $X_{\text {pro-étale }}$. Let $\mathcal{B} \subset \mathrm{Ob}\left(X_{q c q s, p r o-e ́ t a l e}\right)$ be the set of affine and weakly contractible objects. By Lemma 51.11.10 and the fact that finite unions of affines are affine, for every object $U$ of $X_{q c q s, p r o-e ́ t a l e ~}$ there exists a covering $\{V \rightarrow U\}$ of $X_{q c q s, p r o-e ́ t a l e}$ with $V \in \mathcal{B}$. Apply Hypercoverings, Lemma 24.11.1 to get (2).

In the following lemma we use the Čech complex $\mathcal{F}(K)$ associated to a hypercovering $K$ in a site. See Hypercoverings, Section 24.4. If $K$ is a hypercovering of $U$ and $K_{n}=\left\{U_{n} \rightarrow U\right\}$, then the Čech complex looks like this:

$$
\mathcal{F}(K)=\left(\mathcal{F}\left(U_{0}\right) \rightarrow \mathcal{F}\left(U_{1}\right) \rightarrow \mathcal{F}\left(U_{2}\right) \rightarrow \ldots\right)
$$

09A2 Lemma 51.20.2. Let $X$ be a scheme. Let $E \in D^{+}\left(X_{\text {pro-étale }}\right)$ be represented by a bounded below complex $\mathcal{E} \bullet$ of abelian sheaves. Let $K$ be a hypercovering of $U \in \mathrm{Ob}\left(X_{\text {pro-étale }}\right)$ with $K_{n}=\left\{U_{n} \rightarrow U\right\}$ where $U_{n}$ is a weakly contractible object of $X_{\text {pro-étale }}$. Then

$$
R \Gamma(U, E)=\operatorname{Tot}\left(\mathcal{E}^{\bullet}(K)\right)
$$

in $D(A b)$.
Proof. If $E=\mathcal{E}[n]$ is the object associated to a single abelian sheaf on $X_{\text {pro-étale }}$, then the spectral sequence of Hypercoverings, Lemma 24.4.3 implies that

$$
R \Gamma\left(X_{\text {pro-étale }}, \mathcal{E}\right)=\mathcal{E}(K)
$$

because the higher cohomology groups of any sheaf over $U_{n}$ vanish, see Cohomology on Sites, Lemma 21.39.1.
If $\mathcal{E}^{\bullet}$ is bounded below, then we can choose an injective resolution $\mathcal{E}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ and consider the map of complexes

$$
\operatorname{Tot}\left(\mathcal{E}^{\bullet}(K)\right) \longrightarrow \operatorname{Tot}\left(\mathcal{I}^{\bullet}(K)\right)
$$

For every $n$ the map $\mathcal{E}^{\bullet}\left(U_{n}\right) \rightarrow \mathcal{I}^{\bullet}\left(U_{n}\right)$ is a quasi-isomorphism because taking sections over $U_{n}$ is exact. Hence the displayed map is a quasi-isomorphism by one
of the spectral sequences of Homology, Lemma 12.22.6. Using the result of the first paragraph we see that for every $p$ the complex $\mathcal{I}^{p}(K)$ is acyclic in degrees $n>0$ and computes $\mathcal{I}^{p}(U)$ in degree 0 . Thus the other spectral sequence of Homology, Lemma 12.22 .6 shows $\operatorname{Tot}\left(\mathcal{I}^{\bullet}(K)\right)$ computes $R \Gamma(U, E)=\mathcal{I}^{\bullet}(U)$.
09A3 Lemma 51.20.3. Let $X$ be a quasi-compact and quasi-separated scheme. The functor $R \Gamma(X,-): D^{+}\left(X_{\text {pro-étale }}\right) \rightarrow D(A b)$ commutes with direct sums and homotopy colimits.

Proof. The statement means the following: Suppose we have a family of objects $E_{i}$ of $D^{+}\left(X_{\text {pro-étale }}\right)$ such that $\bigoplus E_{i}$ is an object of $D^{+}\left(X_{\text {pro-étale }}\right)$. Then $R \Gamma\left(X, \bigoplus E_{i}\right)=\bigoplus R \Gamma\left(X, E_{i}\right)$. To see this choose a hypercovering $K$ of $X$ with $K_{n}=\left\{U_{n} \rightarrow X\right\}$ where $U_{n}$ is an affine and weakly contractible scheme, see Lemma 51.20.1. Let $N$ be an integer such that $H^{p}\left(E_{i}\right)=0$ for $p<N$. Choose a complex of abelian sheaves $\mathcal{E}_{i}^{\bullet}$ representing $E_{i}$ with $\mathcal{E}_{i}^{p}=0$ for $p<N$. The termwise direct $\operatorname{sum} \bigoplus \mathcal{E}_{i}^{\bullet}$ represents $\bigoplus E_{i}$ in $D\left(X_{\text {pro-étale }}\right)$, see Injectives, Lemma 19.13.4. By Lemma 51.20.2 we have

$$
R \Gamma\left(X, \bigoplus E_{i}\right)=\operatorname{Tot}\left(\left(\bigoplus \mathcal{E}_{i}^{\bullet}\right)(K)\right)
$$

and

$$
R \Gamma\left(X, E_{i}\right)=\operatorname{Tot}\left(\mathcal{E}_{i}^{\bullet}(K)\right)
$$

Since each $U_{n}$ is quasi-compact we see that

$$
\operatorname{Tot}\left(\left(\bigoplus \mathcal{E}_{i}^{\bullet}\right)(K)\right)=\bigoplus \operatorname{Tot}\left(\mathcal{E}_{i}^{\bullet}(K)\right)
$$

by Modules on Sites, Lemma 18.29 .2 . The statement on homotopy colimits is a formal consequence of the fact that $R \Gamma$ is an exact functor of triangulated categories and the fact (just proved) that it commutes with direct sums.

09A4 Remark 51.20.4. Let $X$ be a scheme. Because $X_{\text {proétale }}$ has enough weakly contractible objects for all $K$ in $D\left(X_{\text {pro-étale }}\right)$ we have $K=R \lim \tau_{\geq-n} K$ by Cohomology on Sites, Proposition 21.39.2. Since $R \Gamma$ commutes with $R$ lim by Injectives, Lemma 19.13 .6 we see that

$$
R \Gamma(X, K)=R \lim R \Gamma\left(X, \tau_{\geq-n} K\right)
$$

in $D(A b)$. This will allows us to extend some results from bounded below complexes to all complexes.

### 51.21. Functoriality of the pro-étale site

09A5 Let $f: X \rightarrow Y$ be a morphism of schemes. The functor $Y_{\text {pro-étale }} \rightarrow X_{\text {pro-étale }}$, $V \mapsto X \times_{Y} V$ induces a morphism of sites $f_{\text {pro-étale }}: X_{\text {pro-étale }} \rightarrow Y_{\text {pro-étalée }}$, see Sites, Proposition 7.15.6. In fact, we obtain a commutative diagram of morphisms of sites

where $\epsilon$ is as in Section 51.18. In particular we have $\epsilon^{-1} f_{\text {étale }}^{-1}=f_{\text {pro-étale }}^{-1} \epsilon^{-1}$. Here is the corresponding result for pushforward.

09A6 Lemma 51.21.1. Let $f: X \rightarrow Y$ be a morphism of schemes.
(1) Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$. Then we have $f_{\text {pro-étale,* }} \epsilon^{-1} \mathcal{F}=$ $\epsilon^{-1} f_{\text {étale }, *} \mathcal{F}$.
(2) Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. Then we have $R f_{\text {pro-étale, },} \epsilon^{-1} \mathcal{F}=$ $\epsilon^{-1} R f_{\text {étale }, *} \mathcal{F}$.
Proof. Proof of (1). Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$. There is a canonical map $\epsilon^{-1} f_{\text {étale }, *} \mathcal{F} \rightarrow f_{\text {pro-étale }, *} \epsilon^{-1} \mathcal{F}$, see Sites, Section 7.44 To show it is an isomorphism we may work (Zariski) locally on $Y$, hence we may assume $Y$ is affine. In this case every object of $Y_{\text {pro-étale }}$ has a covering by objects $V=\lim V_{i}$ which are limits of affine schemes $V_{i}$ étale over $Y$ (by Proposition 51.9.1 for example). Evaluating the map $\epsilon^{-1} f_{\text {étale }, *} \mathcal{F} \rightarrow f_{\text {pro-étale }, *} \epsilon^{-1} \mathcal{F}$ on $V$ we obtain a map

$$
\operatorname{colim} \Gamma\left(X \times_{Y} V_{i}, \mathcal{F}\right) \longrightarrow \Gamma\left(X \times_{Y} V, \epsilon^{*} \mathcal{F}\right)
$$

see Lemma 51.18.1 for the left hand side. By Lemma 51.18.1 we have

$$
\Gamma\left(X \times_{Y} V, \epsilon^{*} \mathcal{F}\right)=\Gamma\left(X \times_{Y} V, \mathcal{F}\right)
$$

Hence the result holds by Étale Cohomology, Lemma 49.52.3
Proof of (2). Arguing in exactly the same manner as above we see that it suffices to show that

$$
\operatorname{colim} H_{\text {étale }}^{i}\left(X \times_{Y} V_{i}, \mathcal{F}\right) \longrightarrow H_{\text {étale }}^{i}\left(X \times_{Y} V, \mathcal{F}\right)
$$

which follows once more from Étale Cohomology, Lemma 49.52.3.

### 51.22. Finite morphisms and pro-étale sites

09A7 It is not clear that a finite morphism of schemes determines an exact pushforward on abelian pro-étale sheaves.

09A8 Lemma 51.22.1. Let $f: Z \rightarrow X$ be a finite morphism of schemes which is locally of finite presentation. Then $f_{\text {pro-étale,* }}: A b\left(Z_{\text {pro-étale }}\right) \rightarrow A b\left(X_{\text {pro-étale }}\right)$ is exact.
Proof. The prove this we may work (Zariski) locally on $X$ and assume that $X$ is affine, say $X=\operatorname{Spec}(A)$. Then $Z=\operatorname{Spec}(B)$ for some finite $A$-algebra $B$ of finite presentation. The construction in the proof of Proposition 51.10.3 produces a faithfully flat, ind-étale ring map $A \rightarrow D$ with $D$ w-contractible. We may check exactness of a sequence of sheaves by evaluating on $U=\operatorname{Spec}(D)$ be such an object. Then $f_{\text {pro-étale,* }} \mathcal{F}$ evaluated at $U$ is equal to $\mathcal{F}$ evaluated at $V=\operatorname{Spec}\left(D \otimes_{A} B\right)$. Since $D \otimes_{A} B$ is w-contractible by Lemma 51.10 .6 evaluation at $V$ is exact.

### 51.23. Closed immersions and pro-étale sites

09A9 It is not clear (and likely false) that a closed immersion of schemes determines an exact pushforward on abelian pro-étale sheaves.

09BK Lemma 51.23.1. Let $i: Z \rightarrow X$ be a closed immersion morphism of affine schemes. Denote $X_{a p p}$ and $Z_{a p p}$ the sites introduced in Lemma51.11.24. The base change functor

$$
u: X_{\text {app }} \rightarrow Z_{\text {app }}, \quad U \longmapsto u(U)=U \times_{X} Z
$$

is continuous and has a fully faithful left adjoint $v$. For $V$ in $Z_{\text {app }}$ the morphism $V \rightarrow v(V)$ is a closed immersion identifying $V$ with $u(v(V))=v(V) \times_{X} Z$ and every point of $v(V)$ specializes to a point of $V$. The functor $v$ is cocontinuous and sends coverings to coverings.

Proof. The existence of the adjoint follows immediately from Lemma 51.7.7 and the definitions. It is clear that $u$ is continuous from the definition of coverings in $X_{a p p}$.

Write $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(A / I)$. Let $V=\operatorname{Spec}(\bar{C})$ be an object of $Z_{\text {app }}$ and let $v(V)=\operatorname{Spec}(C)$. We have seen in the statement of Lemma 51.7.7 that $V$ equals $v(V) \times{ }_{X} Z=\operatorname{Spec}(C / I C)$. Any $g \in C$ which maps to an invertible element of $C / I C=\bar{C}$ is invertible in $C$. Namely, we have the $A$-algebra maps $C \rightarrow C_{g} \rightarrow C / I C$ and by adjointness we obtain an $C$-algebra map $C_{g} \rightarrow C$. Thus every point of $v(V)$ specializes to a point of $V$.

Suppose that $\left\{V_{i} \rightarrow V\right\}$ is a covering in $Z_{\text {app }}$. Then $\left\{v\left(V_{i}\right) \rightarrow v(V)\right\}$ is a finite family of morphisms of $Z_{\text {app }}$ such that every point of $V \subset v(V)$ is in the image of one of the maps $v\left(V_{i}\right) \rightarrow v(V)$. As the morphisms $v\left(V_{i}\right) \rightarrow v(V)$ are flat (since they are weakly étale) we conclude that $\left\{v\left(V_{i}\right) \rightarrow v(V)\right\}$ is jointly surjective. This proves that $v$ sends coverings to coverings.

Let $V$ be an object of $Z_{a p p}$ and let $\left\{U_{i} \rightarrow v(V)\right\}$ be a covering in $X_{a p p}$. Then we see that $\left\{u\left(U_{i}\right) \rightarrow u(v(V))=V\right\}$ is a covering of $Z_{\text {app }}$. By adjointness we obtain morphisms $v\left(u\left(U_{i}\right)\right) \rightarrow U_{i}$. Thus the family $\left\{v\left(u\left(U_{i}\right)\right) \rightarrow v(V)\right\}$ refines the given covering and we conclude that $v$ is cocontinuous.

09BL Lemma 51.23.2. Let $Z \rightarrow X$ be a closed immersion morphism of affine schemes. The corresponding morphism of topoi $i=i_{\text {pro-étale }}$ is equal to the morphism of topoi associated to the fully faithful cocontinuous functor $v: Z_{\text {app }} \rightarrow X_{\text {app }}$ of Lemma 51.23.1. It follows that
(1) $i^{-1} \mathcal{F}$ is the sheaf associated to the presheaf $V \mapsto \mathcal{F}(v(V))$,
(2) for a weakly contractible object $V$ of $Z_{\text {app }}$ we have $i^{-1} \mathcal{F}(V)=\mathcal{F}(v(V))$,
(3) $i^{-1}: S h\left(X_{\text {pro-étale }}\right) \rightarrow \operatorname{Sh}\left(Z_{\text {pro-étale }}\right)$ has a left adjoint $i_{!}^{S h}$,
(4) $i^{-1}: A b\left(X_{\text {pro-étale }}\right) \rightarrow A b\left(Z_{\text {pro-étale }}\right)$ has a left adjoint $i_{!}$,
(5) $i d \rightarrow i^{-1} i_{!}^{S h}$, id $\rightarrow i^{-1} i_{!}$, and $i^{-1} i_{*} \rightarrow$ id are isomorphisms, and
(6) $i_{*}, i_{!}^{S h}$ and $i_{!}$are fully faithful.

Proof. By Lemma 51.11 .24 we may describe $i_{\text {pro-étale }}$ in terms of the morphism of sites $u: X_{a p p} \rightarrow Z_{a p p}, V \mapsto V \times_{X} Z$. The first statement of the lemma follows from Sites, Lemma 7.21.2 (but with the roles of $u$ and $v$ reversed).
Proof of (1). By the description of $i$ as the morphism of topoi associated to $v$ this holds by the construction, see Sites, Lemma 7.20.1.

Proof of (2). Since the functor $v$ sends coverings to coverings by Lemma 51.23.1 we see that the presheaf $\mathcal{G}: V \mapsto \mathcal{F}(v(V))$ is a separated presheaf (Sites, Definition 7.10.9). Hence the sheafification of $\mathcal{G}$ is $\mathcal{G}^{+}$, see Sites, Theorem 7.10.10. Next, let $V$ be a weakly contractible object of $Z_{\text {app }}$. Let $\mathcal{V}=\left\{V_{i} \rightarrow V\right\}_{i=1, \ldots, n}$ be any covering in $Z_{\text {app }}$. Set $\mathcal{V}^{\prime}=\left\{\coprod V_{i} \rightarrow V\right\}$. Since $v$ commutes with finite disjoint unions (as a left adjoint or by the construction) and since $\mathcal{F}$ sends finite disjoint unions into products, we see that

$$
H^{0}(\mathcal{V}, \mathcal{G})=H^{0}\left(\mathcal{V}^{\prime}, \mathcal{G}\right)
$$

(notation as in Sites, Section7.10. compare with Étale Cohomology, Lemma 49.22.1). Thus we may assume the covering is given by a single morphism, like so $\left\{V^{\prime} \rightarrow V\right\}$. Since $V$ is weakly contractible, this covering can be refined by the trivial covering
$\{V \rightarrow V\}$. It therefore follows that the value of $\mathcal{G}^{+}=i^{-1} \mathcal{F}$ on $V$ is simply $\mathcal{F}(v(V))$ and (2) is proved.
Proof of (3). Every object of $Z_{\text {app }}$ has a covering by weakly contractible objects (Lemma 51.11.27). By the above we see that we would have $i_{!}^{S h} h_{V}=h_{v(V)}$ for $V$ weakly contractible if $i_{!}^{S h}$ existed. The existence of $i_{!}^{S h}$ then follows from Sites, Lemma 7.23.1.

Proof of (4). Existence of $i_{!}$follows in the same way by setting $i_{!} \mathbf{Z}_{V}=\mathbf{Z}_{v(V)}$ for $V$ weakly contractible in $Z_{\text {app }}$, using similar for direct sums, and applying Homology, Lemma 12.25.6. Details omitted.
Proof of (5). Let $V$ be a contractible object of $Z_{\text {app }}$. Then $i^{-1} i_{!}^{S h} h_{V}=i^{-1} h_{v(V)}=$ $h_{u(v(V))}=h_{V}$. (It is a general fact that $i^{-1} h_{U}=h_{u(U)}$.) Since the sheaves $h_{V}$ for $V$ contractible generate $\operatorname{Sh}\left(Z_{\text {app }}\right)$ (Sites, Lemma 7.13.5) we conclude id $\rightarrow i^{-1} i_{!}^{S h}$ is an isomorphism. Similarly for the map id $\rightarrow i^{-1} i_{i!}$. Then $\left(i^{-1} i_{*} \mathcal{H}\right)(V)=i_{*} \mathcal{H}(v(V))=$ $\mathcal{H}(u(v(V)))=\mathcal{H}(V)$ and we find that $i^{-1} i_{*} \rightarrow$ id is an isomorphism.
The fully faithfulness statements of (6) now follow from Categories, Lemma 4.24.3.

09AA Lemma 51.23.3. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Then
(1) $i_{\text {pro-étale }}^{-1}$ commutes with limits,
(2) $i_{\text {pro-étale,* }}$ is fully faithful, and
(3) $i_{\text {pro-étale }}^{-1} i_{\text {pro-étale }, *} \cong i d_{S h\left(Z_{\text {pro-étale }}\right)}$.

Proof. Assertions (2) and (3) are equivalent by Sites, Lemma 7.40.1. Parts (1) and (3) are (Zariski) local on $X$, hence we may assume that $X$ is affine. In this case the result follows from Lemma 51.23.2

09AB Lemma 51.23.4. Let $i: Z \rightarrow X$ be an integral universally injective and surjective morphism of schemes. Then $i_{\text {pro-étale,* }}$ and $i_{\text {pro-étale }}^{-1}$ are quasi-inverse equivalences of categories of pro-étale topoi.

Proof. There is an immediate reduction to the case that $X$ is affine. Then $Z$ is affine too. Set $A=\mathcal{O}(X)$ and $B=\mathcal{O}(Z)$. Then the categories of étale algebras over $A$ and $B$ are equivalent, see Étale Cohomology, Theorem 49.46.1 and Remark 49.46.2. Thus the categories of ind-étale algebras over $A$ and $B$ are equivalent. In other words the categories $X_{a p p}$ and $Z_{a p p}$ of Lemma 51.11 .24 are equivalent. We omit the verification that this equivalence sends coverings to coverings and vice versa. Thus the result as Lemma 51.11.24 tells us the pro-étale topos is the topos of sheaves on $X_{a p p}$.
09AC Lemma 51.23.5. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $U \rightarrow X$ be an object of $X_{\text {pro-étale }}$ such that
(1) $U$ is affine and weakly contractible, and
(2) every point of $U$ specializes to a point of $U \times_{X} Z$.

Then $i_{\text {pro-étale }}^{-1} \mathcal{F}\left(U \times_{X} Z\right)=\mathcal{F}(U)$ for all abelian sheaves on $X_{\text {pro-étale }}$.
Proof. Since pullback commutes with restriction, we may replace $X$ by $U$. Thus we may assume that $X$ is affine and weakly contractible and that every point of $X$ specializes to a point of $Z$. By Lemma 51.23 .2 part (1) it suffices to show that $v(Z)=X$ in this case. Thus we have to show: If $A$ is a w-contractible ring, $I \subset A$
an ideal contained in the radical of $A$ and $A \rightarrow B \rightarrow A / I$ is a factorization with $A \rightarrow B$ ind-étale, then there is a unique section $B \rightarrow A$ compatible with maps to $A / I$. Observe that $B / I B=A / I \times R$ as $A / I$-algebras. After replacing $B$ by a localization we may assume $B / I B=A / I$. Note that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective as the image contains $V(I)$ and hence all closed points and is closed under specialization. Since $A$ is w-contractible there is a section $B \rightarrow A$. Since $B / I B=A / I$ this section is compatible with the map to $A / I$. We omit the proof of uniqueness (hint: use that $A$ and $B$ have isomorphic local rings at maximal ideals of $A$ ).

09BM Lemma 51.23.6. Let $i: Z \rightarrow X$ be a closed immersion of schemes. If $X \backslash i(Z)$ is a retrocompact open of $X$, then $i_{\text {pro-étale,* }}$ is exact.

Proof. The question is local on $X$ hence we may assume $X$ is affine. Say $X=$ $\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(A / I)$. There exist $f_{1}, \ldots, f_{r} \in I$ such that $Z=V\left(f_{1}, \ldots, f_{r}\right)$ set theoretically, see Algebra, Lemma 10.28.1. By Lemma 51.23.4 we may assume that $Z=\operatorname{Spec}\left(A /\left(f_{1}, \ldots, f_{r}\right)\right)$. In this case the functor $i_{\text {pro-étale,* }}$ is exact by Lemma 51.22.1.

### 51.24. Extension by zero

09AD The general material in Modules on Sites, Section 18.19 allows us to make the following definition.

09AE Definition 51.24.1. Let $j: U \rightarrow X$ be a weakly étale morphism of schemes.
(1) The restriction functor $j^{-1}: S h\left(X_{\text {pro-étale }}\right) \rightarrow S h\left(U_{\text {pro-étale }}\right)$ has a left adjoint $j_{!}^{S h}: S h\left(X_{\text {pro-étale }}\right) \rightarrow S h\left(U_{\text {pro-étale }}\right)$.
(2) The restriction functor $j^{-1}: A b\left(X_{\text {pro-étale }}\right) \rightarrow A b\left(U_{\text {pro-étale }}\right)$ has a left adjoint which is denoted $j!: A b\left(U_{\text {pro-étale }}\right) \rightarrow A b\left(X_{\text {pro-étale }}\right)$ and called extension by zero.
(3) Let $\Lambda$ be a ring. The functor $j^{-1}: \operatorname{Mod}\left(X_{\text {pro-étale }}, \Lambda\right) \rightarrow \operatorname{Mod}\left(U_{\text {pro-étale }}, \Lambda\right)$ has a left adjoint $j_{!}: \operatorname{Mod}\left(U_{\text {pro-étale }}, \Lambda\right) \rightarrow \operatorname{Mod}\left(X_{\text {pro-étale }}, \Lambda\right)$ and called extension by zero.

As usual we compare this to what happens in the étale case.
09AF Lemma 51.24.2. Let $j: U \rightarrow X$ be an étale morphism of schemes. Let $\mathcal{G}$ be an abelian sheaf on $U_{\text {étale }}$. Then $\epsilon^{-1} j_{!} \mathcal{G}=j!\epsilon^{-1} \mathcal{G}$ as sheaves on $X_{\text {pro-étale }}$.

Proof. This is true because both are left adjoints to $j_{\text {pro-étale, } *} \epsilon^{-1}=\epsilon^{-1} j_{\text {étale, }, *}$, see Lemma 51.21.1.

09AG Lemma 51.24.3. Let $j: U \rightarrow X$ be a weakly étale morphism of schemes. Let $i: Z \rightarrow X$ be a closed immersion such that $U \times_{X} Z=\emptyset$. Let $V \rightarrow X$ be an affine object of $X_{\text {pro-étale }}$ such that every point of $V$ specializes to a point of $V_{Z}=Z \times{ }_{X} V$. Then $j_{!} \mathcal{F}(V)=0$ for all abelian sheaves on $U_{\text {pro-étale }}$.

Proof. Let $\left\{V_{i} \rightarrow V\right\}$ be a pro-étale covering. The lemma follows if we can refine this covering to a covering where the members have no morphisms into $U$ over $X$ (see construction of $j$ ! in Modules on Sites, Section 18.19). First refine the covering to get a finite covering with $V_{i}$ affine. For each $i$ let $V_{i}=\operatorname{Spec}\left(A_{i}\right)$ and let $Z_{i} \subset V_{i}$ be the inverse image of $Z$. Set $W_{i}=\operatorname{Spec}\left(A_{i, Z_{i}}^{\sim}\right)$ with notation as in Lemma 51.5.1. Then $\coprod W_{i} \rightarrow V$ is weakly étale and the image contains all points of $V_{Z}$. Hence
the image contains all points of $V$ by our assumption on specializations. Thus $\left\{W_{i} \rightarrow V\right\}$ is a pro-étale covering refining the given one. But each point in $W_{i}$ specializes to a point lying over $Z$, hence there are no morphisms $W_{i} \rightarrow U$ over $X$.

09BN Lemma 51.24.4. Let $j: U \rightarrow X$ be an open immersion of schemes. Then $i d \cong j^{-1} j_{!}$and $j^{-1} j_{*} \cong i d$ and the functors $j_{!}$and $j_{*}$ are fully faithful.

Proof. See Sites, Lemma 7.26.4 and Categories, Lemma 4.24.3
Here is the relationship between extension by zero and restriction to the complementary closed subscheme.

09AH Lemma 51.24.5. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme and let $U \subset X$ be the complement. Denote $i: Z \rightarrow X$ and $j: U \rightarrow X$ the inclusion morphisms. Assume that $j$ is a quasi-compact morphism. For every abelian sheaf on $X_{\text {pro-étale }}$ there is a canonical short exact sequence

$$
0 \rightarrow j!j^{-1} \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_{*} i^{-1} \mathcal{F} \rightarrow 0
$$

on $X_{\text {pro-étale }}$ where all the functors are for the pro-étale topology.
Proof. We obtain the maps by the adjointness properties of the functors involved. It suffices to show that $X_{\text {pro-étale }}$ has enough objects (Sites, Definition 7.39.2) on which the sequence evaluates to a short exact sequence. Let $V=\operatorname{Spec}(A)$ be an affine object of $X_{\text {pro-étale }}$ such that $A$ is w-contractible (there are enough objects of this type). Then $V \times_{X} Z$ is cut out by an ideal $I \subset A$. The assumption that $j$ is quasi-compact implies there exist $f_{1}, \ldots, f_{r} \in I$ such that $V(I)=V\left(f_{1}, \ldots, f_{r}\right)$. We obtain a faithfully flat, ind-Zariski ring map

$$
A \longrightarrow A_{f_{1}} \times \ldots \times A_{f_{r}} \times A_{V(I)}^{\sim}
$$

with $A_{V(I)}^{\sim}$ as in Lemma 51.5.1. Since $V_{i}=\operatorname{Spec}\left(A_{f_{i}}\right) \rightarrow X$ factors through $U$ we have

$$
j!j^{-1} \mathcal{F}\left(V_{i}\right)=\mathcal{F}\left(V_{i}\right) \quad \text { and } \quad i_{*} i^{-1} \mathcal{F}\left(V_{i}\right)=0
$$

On the other hand, for the scheme $V^{\sim}=\operatorname{Spec}\left(A_{V(I)}^{\sim}\right)$ we have

$$
j!j^{-1} \mathcal{F}\left(V^{\sim}\right)=0 \quad \text { and } \quad \mathcal{F}\left(V^{\sim}\right)=i_{*} i^{-1} \mathcal{F}\left(V^{\sim}\right)
$$

the first equality by Lemma 51.24 .3 and the second by Lemmas 51.23 .5 and 51.10 .7 . Thus the sequence evaluates to an exact sequence on $\operatorname{Spec}\left(A_{f_{1}} \times \ldots \times A_{f_{r}} \times A_{V(I)}^{\sim}\right)$ and the lemma is proved.

09BP Lemma 51.24.6. Let $j: U \rightarrow X$ be a quasi-compact open immersion morphism of schemes. The functor $j_{!}: A b\left(U_{\text {pro-étale }}\right) \rightarrow A b\left(X_{\text {pro-étale }}\right)$ commutes with limits.

Proof. Since $j_{\text {! }}$ is exact it suffices to show that $j_{!}$commutes with products. The question is local on $X$, hence we may assume $X$ affine. Let $\mathcal{G}$ be an abelian sheaf on $U_{\text {pro-étale }}$. Note that there always is a canonical map

$$
j_{!} \mathcal{G} \rightarrow j_{*} \mathcal{G}
$$

see Modules on Sites, Remark 18.19.7. In our particular case this map can be obtained from the fact that $j^{-1} j_{*} \mathcal{G}=\mathcal{G}$. Hence applying the exact sequence of Lemma 51.24.5 we get

$$
0 \rightarrow j_{!} \mathcal{G} \rightarrow j_{*} \mathcal{G} \rightarrow i_{*} i^{-1} j_{*} \mathcal{G} \rightarrow 0
$$

where $i: Z \rightarrow X$ is the inclusion of the reduced induced scheme structure on the complement $Z=X \backslash U$. The functors $j_{*}$ and $i_{*}$ commute with products as right adjoints. The functor $i^{-1}$ commutes with products by Lemma 51.23.3. Hence $j_{\text {! }}$ does because on the pro-étale site products are exact (Cohomology on Sites, Proposition 21.39.2.

### 51.25. Constructible sheaves on the pro-étale site

09 AI We stick to constructible sheaves of $\Lambda$-modules for a Noetherian ring. In the future we intend to discuss constructible sheaves of sets, groups, etc.

09AJ Definition 51.25.1. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. A sheaf of $\Lambda$-modules on $X_{\text {pro-étale }}$ is constructible if for every affine open $U \subset X$ there exists a finite decomposition of $U$ into constructible locally closed subschemes $U=\coprod_{i} U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is of finite type and locally constant for all $i$.

Again this does not give anything "new".
09AK Lemma 51.25.2. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. The functor $\epsilon^{-1}$ defines an equivalence of categories

$$
\left\{\begin{array}{c}
\text { constructible sheaves of } \\
\Lambda \text {-modules on } X_{\text {étale }}
\end{array}\right\} \longleftrightarrow\left\{\begin{array}{c}
\text { constructible sheaves of } \\
\Lambda \text {-modules on } X_{\text {pro-étale }}
\end{array}\right\}
$$

between constructible sheaves of $\Lambda$-modules on $X_{\text {étale }}$ and constructible sheaves of $\Lambda$-modules on $X_{\text {pro-étale }}$.

Proof. By Lemma 51.18 .2 the functor $\epsilon^{-1}$ is fully faithful and commutes with pullback (restriction) to the strata. Hence $\epsilon^{-1}$ of a constructible étale sheaf is a constructible pro-étale sheaf. To finish the proof let $\mathcal{F}$ be a constructible sheaf of $\Lambda$-modules on $X_{\text {pro-étale }}$ as in Definition 51.25.1. There is a canonical map

$$
\epsilon^{-1} \epsilon_{*} \mathcal{F} \longrightarrow \mathcal{F}
$$

We will show this map is an isomorphism. This will prove that $\mathcal{F}$ is in the essential image of $\epsilon^{-1}$ and finish the proof (details omitted).

To prove this we may assume that $X$ is affine. In this case we have a finite partition $X=\coprod_{i} X_{i}$ by constructible locally closed strata such that $\left.\mathcal{F}\right|_{X_{i}}$ is locally constant of finite type. Let $U \subset X$ be one of the open strata in the partition and let $Z \subset X$ be the reduced induced structure on the complement. By Lemma 51.24.5 we have a short exact sequence

$$
0 \rightarrow j!j^{-1} \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_{*} i^{-1} \mathcal{F} \rightarrow 0
$$

on $X_{\text {pro-étale }}$. Functoriality gives a commutative diagram

By induction on the length of the partition we know that on the one hand $\epsilon^{-1} \epsilon_{*} i^{-1} \mathcal{F} \rightarrow$ $i^{-1} \mathcal{F}$ and $\epsilon^{-1} \epsilon_{*} j^{-1} \mathcal{F} \rightarrow j^{-1} \mathcal{F}$ are isomorphisms and on the other that $i^{-1} \mathcal{F}=\epsilon^{-1} \mathcal{A}$
and $j^{-1} \mathcal{F}=\epsilon^{-1} \mathcal{B}$ for some constructible sheaves of $\Lambda$-modules $\mathcal{A}$ on $Z_{\text {étale }}$ and $\mathcal{B}$ on $U_{\text {étale }}$. Then

$$
\epsilon^{-1} \epsilon_{*} j!j^{-1} \mathcal{F}=\epsilon^{-1} \epsilon_{*} j_{!} \epsilon^{-1} \mathcal{B}=\epsilon^{-1} \epsilon_{*} \epsilon^{-1} j!\mathcal{B}=\epsilon^{-1} j_{!} \mathcal{B}=j!\epsilon^{-1} \mathcal{B}=j!j^{-1} \mathcal{F}
$$

the second equality by Lemma 51.24.2, the third equality by Lemma 51.18.2, and the fourth equality by Lemma 51.24 .2 again. Similarly, we have

$$
\epsilon^{-1} \epsilon_{*} i_{*} i^{-1} \mathcal{F}=\epsilon^{-1} \epsilon_{*} i_{*} \epsilon^{-1} \mathcal{A}=\epsilon^{-1} \epsilon_{*} \epsilon^{-1} i_{*} \mathcal{A}=\epsilon^{-1} i_{*} \mathcal{A}=i_{*} \epsilon^{-1} \mathcal{A}=i_{*} i^{-1} \mathcal{F}
$$

this time using Lemma 51.21.1. By the five lemma we conclude the vertical map in the middle of the big diagram is an isomorphism.

09B5 Lemma 51.25.3. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. The category of constructible sheaves of $\Lambda$-modules on $X_{\text {pro-étale }}$ is a weak Serre subcategory of $\operatorname{Mod}\left(X_{\text {pro-étale }}, \Lambda\right)$.

Proof. This is a formal consequence of Lemmas 51.25 .2 and 51.18 .7 and the result for the étale site (Étale Cohomology, Lemma 49.68.6).

09AL Lemma 51.25.4. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $D_{c}\left(X_{\text {étale }}, \Lambda\right)$, resp. $D_{c}\left(X_{\text {pro-étale }}, \Lambda\right)$ be the full subcategory of $D\left(X_{\text {étale }}, \Lambda\right)$, resp. $D\left(X_{\text {pro-étale }}, \Lambda\right)$ consisting of those complexes whose cohomology sheaves are constructible sheaves of $\Lambda$-modules. Then

$$
\epsilon^{-1}: D_{c}^{+}\left(X_{\text {étale }}, \Lambda\right) \longrightarrow D_{c}^{+}\left(X_{\text {pro-étale }}, \Lambda\right)
$$

is an equivalence of categories.
Proof. The categories $D_{c}\left(X_{\text {étale }}, \Lambda\right)$ and $D_{c}\left(X_{\text {pro-étale }}, \Lambda\right)$ are strictly full, saturated, triangulated subcategories of $D\left(X_{\text {étale }}, \Lambda\right)$ and $D\left(X_{\text {pro-étale }}, \Lambda\right)$ by Étale Cohomology, Lemma 49.68 .6 and Lemma 51.25 .3 and Derived Categories, Section 13.13 . The statement of the lemma follows by combining Lemmas 51.18.7 and 51.25 .2

09BQ Lemma 51.25.5. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $K, L \in$ $D_{c}^{-}\left(X_{\text {pro-étale }}, \Lambda\right)$. Then $K \otimes_{\Lambda}^{\mathrm{L}} L$ is in $D_{c}^{-}\left(X_{\text {pro-étale }}, \Lambda\right)$.
Proof. Note that $H^{i}\left(K \otimes_{\Lambda}^{\mathbf{L}} L\right)$ is the same as $H^{i}\left(\tau_{\geq i-1} K \otimes_{\Lambda}^{\mathbf{L}} \tau_{\geq i-1} L\right)$. Thus we may assume $K$ and $L$ are bounded. In this case we can apply Lemma 51.25.4 to reduce to the case of the étale site, see Étale Cohomology, Lemma 49.89.6.

09BR Lemma 51.25.6. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $K$ be an object of $D\left(X_{\text {pro-étale }}, \Lambda\right)$. Set $K_{n}=K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}$. If $K_{1}$ is in $D_{c}^{-}\left(X_{\text {pro-étale }}, \Lambda / I\right)$, then $K_{n}$ is in $D_{c}^{-}\left(X_{\text {pro-étale }}, \Lambda / I^{n}\right)$ for all $n$.

Proof. Consider the distinguished triangles

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}} \rightarrow K_{n+1} \rightarrow K_{n} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}[1]
$$

and the isomorphisms

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}=K_{1} \otimes_{\Lambda / I}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}
$$

By Lemma 51.25.5 we see that this tensor product has constructible cohomology sheaves (and vanishing when $K_{1}$ has vanishing cohomology). Hence by induction on $n$ using Lemma 51.25 .3 we see that each $K_{n}$ has constructible cohomology sheaves.

### 51.26. Constructible adic sheaves

09BS In this section we define the notion of a constructible $\Lambda$-sheaf as well as some variants.

09BT Definition 51.26.1. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $X$ be a scheme. Let $\mathcal{F}$ be a sheaf of $\Lambda$-modules on $X_{\text {pro-étale }}$.
(1) We say $\mathcal{F}$ is a constructible $\Lambda$-sheaf if $\mathcal{F}=\lim \mathcal{F} / I^{n} \mathcal{F}$ and each $\mathcal{F} / I^{n} \mathcal{F}$ is a constructible sheaf of $\Lambda / I^{n}$-modules.
(2) If $\mathcal{F}$ is a constructible $\Lambda$-sheaf, then we say $\mathcal{F}$ is lisse if each $\mathcal{F} / I^{n} \mathcal{F}$ is locally constant.
(3) We say $\mathcal{F}$ is adic liss $\uplus^{3}$ if there exists a $I$-adically complete $\Lambda$-module $M$ with $M / I M$ finite such that $\mathcal{F}$ is locally isomorphic to

$$
\underline{M}^{\wedge}=\lim \underline{M / I^{n} M}
$$

(4) We say $\mathcal{F}$ is adic constructibl $\oint^{4}$ if for every affine open $U \subset X$ there exists a decomposition $U=\coprod U_{i}$ into constructible locally closed subschemes such that $\left.\mathcal{F}\right|_{U_{i}}$ is adic lisse.

The definition of a constructible $\Lambda$-sheaf is equivalent to the one in Gro77, Exposé VI, Definition 1.1.1] when $\Lambda=\mathbf{Z}_{\ell}$ and $I=(\ell)$. It is clear that we have the implications

The vertical arrows can be inverted in some cases (see Lemmas 51.26.2 and 51.26.5). In general neither the category of adic constructible sheaves nor the category of adic constructible sheaves is closed under kernels and cokernels.

Namely, let $X$ be an affine scheme whose underlying topological space $|X|$ is homeomorphic to $\Lambda=\mathbf{Z}_{\ell}$, see Example 51.6.3. Denote $f:|X| \rightarrow \mathbf{Z}_{\ell}=\Lambda$ a homeomorphism. We can think of $f$ as a section of $\underline{\Lambda}^{\wedge}$ over $X$ and multiplication by $f$ then defines a two term complex

$$
\underline{\Lambda}^{\wedge} \xrightarrow{f} \underline{\Lambda}^{\wedge}
$$

on $X_{\text {pro-étale }}$. The sheaf $\underline{\Lambda}^{\wedge}$ is adic lisse. However, the cokernel of the map above, is not adic constructible, as the isomorphism type of the stalks of this cokernel attains infinitely many values: $\mathbf{Z} / \ell^{n} \mathbf{Z}$ and $\mathbf{Z}_{\ell}$. The cokernel is a constructible $\mathbf{Z}_{\ell}$-sheaf. However, the kernel is not even a constructible $\mathbf{Z}_{\ell}$-sheaf as it is zero a non-quasi-compact open but not zero.

09BU Lemma 51.26.2. Let $X$ be a Noetherian scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $\mathcal{F}$ be a constructible $\Lambda$-sheaf on $X_{\text {pro-étale }}$. Then there exists a finite partition $X=\coprod X_{i}$ by locally closed subschemes such that the restriction $\left.\mathcal{F}\right|_{X_{i}}$ is lisse.

[^146]Proof. Let $R=\bigoplus I^{n} / I^{n+1}$. Observe that $R$ is a Noetherian ring. Since each of the sheaves $\mathcal{F} / I^{n} \mathcal{F}$ is a constructible sheaf of $\Lambda / I^{n} \Lambda$-modules also $I^{n} \mathcal{F} / I^{n+1} \mathcal{F}$ is a constructible sheaf of $\Lambda / I$-modules and hence the pullback of a constructible sheaf $\mathcal{G}_{n}$ on $X_{\text {étale }}$ by Lemma 51.25 .2 . Set $\mathcal{G}=\bigoplus \mathcal{G}_{n}$. This is a sheaf of $R$-modules on $X_{\text {étale }}$ and the map

$$
\mathcal{G}_{0} \otimes_{\Lambda / I} \underline{R} \longrightarrow \mathcal{G}
$$

is surjective because the maps

$$
\mathcal{F} / I \mathcal{F} \otimes \underline{I^{n} / I^{n+1}} \rightarrow I^{n} \mathcal{F} / I^{n+1} \mathcal{F}
$$

are surjective. Hence $\mathcal{G}$ is a constructible sheaf of $R$-modules by Étale Cohomology, Proposition 49.71.1. Choose a partition $X=\coprod X_{i}$ such that $\left.\mathcal{G}\right|_{X_{i}}$ is a locally constant sheaf of $R$-modules of finite type (Étale Cohomology, Lemma 49.68.2). We claim this is a partition as in the lemma. Namely, replacing $X$ by $X_{i}$ we may assume $\mathcal{G}$ is locally constant. It follows that each of the sheaves $I^{n} \mathcal{F} / I^{n+1} \mathcal{F}$ is locally constant. Using the short exact sequences

$$
0 \rightarrow I^{n} \mathcal{F} / I^{n+1} \mathcal{F} \rightarrow \mathcal{F} / I^{n+1} \mathcal{F} \rightarrow \mathcal{F} / I^{n} \mathcal{F} \rightarrow 0
$$

induction and Modules on Sites, Lemma 18.42 .5 the lemma follows.
09BV Lemma 51.26.3. Let $X$ be a weakly contractible affine scheme. Let $\Lambda$ be a Noetherian ring and $I \subset \Lambda$ be an ideal. Let $\mathcal{F}$ be a sheaf of $\Lambda$-modules on $X_{\text {pro-étale }}$ such that
(1) $\mathcal{F}=\lim \mathcal{F} / I^{n} \mathcal{F}$,
(2) $\mathcal{F} / I^{n} \mathcal{F}$ is a constant sheaf of $\Lambda / I^{n}$-modules,
(3) $\mathcal{F} / I \mathcal{F}$ is of finite type.

Then $\mathcal{F} \cong \underline{M}^{\wedge}$ where $M$ is a finite $\Lambda^{\wedge}$-module.
Proof. Pick a $\Lambda / I^{n}$-module $M_{n}$ such that $\mathcal{F} / I^{n} \mathcal{F} \cong M_{n}$. Since we have the surjections $\mathcal{F} / I^{n+1} \mathcal{F} \rightarrow \mathcal{F} / I^{n} \mathcal{F}$ we conclude that there exist surjections $M_{n+1} \rightarrow$ $M_{n}$ inducing isomorphisms $M_{n+1} / I^{n} M_{n+1} \rightarrow M_{n}$. Fix a choice of such surjections and set $M=\lim M_{n}$. Then $M$ is an $I$-adically complete $\Lambda$-module with $M / I^{n} M=$ $M_{n}$, see Algebra, Lemma 10.97.1. Since $M_{1}$ is a finite type $\Lambda$-module (Modules on Sites, Lemma 18.41.5 we see that $M$ is a finite $\Lambda^{\wedge}$-module. Consider the sheaves

$$
\mathcal{I}_{n}=\operatorname{Isom}\left(\underline{M_{n}}, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

on $X_{\text {pro-étale. }}$. Modding out by $I^{n}$ defines a transition map

$$
\mathcal{I}_{n+1} \longrightarrow \mathcal{I}_{n}
$$

By our choice of $M_{n}$ the sheaf $\mathcal{I}_{n}$ is a torsor under

$$
\operatorname{Isom}\left(\underline{M_{n}}, \underline{M_{n}}\right)=\underline{\operatorname{Isom}_{\Lambda}\left(M_{n}, M_{n}\right)}
$$

(Modules on Sites, Lemma 18.42.4) since $\mathcal{F} / I^{n} \mathcal{F}$ is (étale) locally isomorphic to $M_{n}$. It follows from More on Algebra, Lemma 15.77.1 that the system of sheaves $\overline{\left(\mathcal{I}_{n}\right)}$ is Mittag-Leffler. For each $n$ let $\mathcal{I}_{n}^{\prime} \subset \mathcal{I}_{n}$ be the image of $\mathcal{I}_{N} \rightarrow \mathcal{I}_{n}$ for all $N \gg n$. Then

$$
\ldots \rightarrow \mathcal{I}_{3}^{\prime} \rightarrow \mathcal{I}_{2}^{\prime} \rightarrow \mathcal{I}_{1}^{\prime} \rightarrow *
$$

is a sequence of sheaves of sets on $X_{\text {pro-étale }}$ with surjective transition maps. Since $*(X)$ is a singleton (not empty) and since evaluating at $X$ transforms surjective maps of sheaves of sets into surjections of sets, we can pick $s \in \lim \mathcal{I}_{n}^{\prime}(X)$. The sections define isomorphisms $\underline{M}^{\wedge} \rightarrow \lim \mathcal{F} / I^{n} \mathcal{F}=\mathcal{F}$ and the proof is done.

09BW Lemma 51.26.4. Let $X$ be a connected scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. If $\mathcal{F}$ is a lisse constructible $\Lambda$-sheaf on $X_{\text {pro-étale }}$, then $\mathcal{F}$ is adic lisse.

Proof. By Lemma 51.18 .8 we have $\mathcal{F} / I^{n} \mathcal{F}=\epsilon^{-1} \mathcal{G}_{n}$ for some locally constant sheaf $\mathcal{G}_{n}$ of $\Lambda / I^{n}$-modules. By Étale Cohomology, Lemma 49.67 .8 there exists a finite $\Lambda / I^{n}$-module $M_{n}$ such that $\mathcal{G}_{n}$ is locally isomorphic to $M_{n}$. Choose a covering $\left\{W_{t} \rightarrow X\right\}_{t \in T}$ with each $W_{t}$ affine and weakly contractible. Then $\left.\mathcal{F}\right|_{W_{t}}$ satisfies the assumptions of Lemma 51.26 .3 and hence $\left.\mathcal{F}\right|_{W_{t}} \cong N_{t}^{\wedge}$ for some finite $\Lambda^{\wedge}$-module $N_{t}$. Note that $N_{t} / I^{n} N_{t} \cong M_{n}$ for all $t$ and $n$. Hence $N_{t} \cong N_{t^{\prime}}$ for all $t, t^{\prime} \in T$, see More on Algebra, Lemma 15.77.2. This proves that $\mathcal{F}$ is adic lisse.

09BX Lemma 51.26.5. Let $X$ be a Noetherian scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $\mathcal{F}$ be a constructible $\Lambda$-sheaf on $X_{\text {pro-étale }} . T$ Then $\mathcal{F}$ is adic constructible.

Proof. This is a consequence of Lemmas 51.26 .2 and 51.26.4 the fact that a Noetherian scheme is locally connected (Topology, Lemma 5.8.6), and the definitions.

It will be useful to identify the constructible $\Lambda$-sheaves inside the category of derived complete sheaves of $\Lambda$-modules. It turns out that the naive analogue of More on Algebra, Lemma 15.74 .5 is wrong in this setting. However, here is the analogue of More on Algebra, Lemma 15.74.4.
09BY Lemma 51.26.6. Let $X$ be a scheme. Let $\Lambda$ be a ring and let $I \subset \Lambda$ be a finitely generated ideal. Let $\mathcal{F}$ be a sheaf of $\Lambda$-modules on $X_{\text {pro-étale. If } \mathcal{F} \text { is derived }}$ complete and $\mathcal{F} / I \mathcal{F}=0$, then $\mathcal{F}=0$.

Proof. Assume that $\mathcal{F} / I \mathcal{F}$ is zero. Let $I=\left(f_{1}, \ldots, f_{r}\right)$. Let $i<r$ be the largest integer such that $\mathcal{G}=\mathcal{F} /\left(f_{1}, \ldots, f_{i}\right) \mathcal{F}$ is nonzero. If $i$ does not exist, then $\mathcal{F}=0$ which is what we want to show. Then $\mathcal{G}$ is derived complete as a cokernel of a map between derived complete modules, see Proposition 51.17.1. By our choice of $i$ we have that $f_{i+1}: \mathcal{G} \rightarrow \mathcal{G}$ is surjective. Hence

$$
\lim \left(\ldots \rightarrow \mathcal{G} \xrightarrow{f_{i+1}} \mathcal{G} \xrightarrow{f_{i+1}} \mathcal{G}\right)
$$

is nonzero, contradicting the derived completeness of $\mathcal{G}$.
09BZ Lemma 51.26.7. Let $X$ be a weakly contractible affine scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $\mathcal{F}$ be a derived complete sheaf of $\Lambda$ modules on $X_{\text {pro-étale }}$ with $\mathcal{F} / I \mathcal{F}$ a locally constant sheaf of $\Lambda / I$-modules of finite type. Then there exists an integer $t$ and a surjective map

$$
\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t} \rightarrow \mathcal{F}
$$

Proof. Since $X$ is weakly contractible, there exists a finite disjoint open covering $X=\coprod U_{i}$ such that $\mathcal{F} /\left.I \mathcal{F}\right|_{U_{i}}$ is isomorphic to the constant sheaf associated to a finite $\Lambda / I$-module $M_{i}$. Choose finitely many generators $m_{i j}$ of $M_{i}$. We can find sections $s_{i j} \in \mathcal{F}(X)$ restricting to $m_{i j}$ viewed as a section of $\mathcal{F} / I \mathcal{F}$ over $U_{i}$. Let $t$ be the total number of $s_{i j}$. Then we obtain a map

$$
\alpha: \underline{\Lambda}^{\oplus t} \longrightarrow \mathcal{F}
$$

which is surjective modulo $I$ by construction. By Lemma 51.16.1 the derived completion of $\underline{\Lambda}^{\oplus t}$ is the sheaf $\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}$. Since $\mathcal{F}$ is derived complete we see that $\alpha$ factors through a map

$$
\alpha^{\wedge}:\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t} \longrightarrow \mathcal{F}
$$

Then $\mathcal{Q}=\operatorname{Coker}\left(\alpha^{\wedge}\right)$ is a derived complete sheaf of $\Lambda$-modules by Proposition 51.17 .1 . By construction $\mathcal{Q} / I \mathcal{Q}=0$. It follows from Lemma 51.26.6 that $\mathcal{Q}=0$ which is what we wanted to show.

### 51.27. A suitable derived category

09 C 0 Let $X$ be a scheme. It will turn out that for many schemes $X$ a suitable derived category of $\ell$-adic sheaves can be gotten by considering the derived complete objects $K$ of $D\left(X_{\text {pro-étale }}, \Lambda\right)$ with the property that $K \otimes{ }_{\Lambda}^{\mathrm{L}} \mathbf{F}_{\ell}$ is bounded with constructible cohomology sheaves. Here is the general definition.

09C1 Definition 51.27.1. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $X$ be a scheme. An object $K$ of $D\left(X_{\text {pro-étale }}, \Lambda\right)$ is called constructible if
(1) $K$ is derived complete with respect to $I$,
(2) $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I}$ has constructible cohomology sheaves and locally has finite tor dimension.
We denote $D_{\text {cons }}(X, \Lambda)$ the full subcategory of constructible $K$ in $D\left(X_{\text {pro-étale }}, \Lambda\right)$.
Recall that with our conventions a complex of finite tor dimension is bounded (Cohomology on Sites, Definition 21.36.1). In fact, let's collect everything proved so far in a lemma.

09C2 Lemma 51.27.2. In the situation above suppose $K$ is in $D_{\text {cons }}(X, \Lambda)$ and $X$ is quasi-compact. Set $K_{n}=K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}$. There exist $a, b$ such that
(1) $K=R \lim K_{n}$ and $H^{i}(K)=0$ for $i \notin[a, b]$,
(2) each $K_{n}$ has tor amplitude in $[a, b]$,
(3) each $K_{n}$ has constructible cohomology sheaves,
(4) each $K_{n}=\epsilon^{-1} L_{n}$ for some $L_{n} \in D_{c t f}\left(X_{\text {étale }}, \Lambda / I^{n}\right)$ (Étale Cohomology, Definition 49.89.7.

Proof. By definition of local having finite tor dimension, we can find $a, b$ such that $K_{1}$ has tor amplitude in $[a, b]$. Part (2) follows from Cohomology on Sites, Lemma 21.36.8. Then (1) follows as $K$ is derived complete by the description of limits in Cohomology on Sites, Proposition 21.39 .2 and the fact that $H^{b}\left(K_{n+1}\right) \rightarrow H^{b}\left(K_{n}\right)$ is surjective as $K_{n}=K_{n+1} \otimes_{\Lambda}^{\mathrm{L}} \Lambda / I^{n}$. Part (3) follows from Lemma 51.25.6. Part (4) follows from Lemma 51.25 .4 and the fact that $L_{n}$ has finite tor dimension because $K_{n}$ does (small argument omitted).

09C3 Lemma 51.27.3. Let $X$ be a weakly contractible affine scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $K$ be an object of $D_{\text {cons }}(X, \Lambda)$ such that the cohomology sheaves of $K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I$ are locally constant. Then there exists a finite disjoint open covering $X=\coprod \overline{U_{i}}$ and for each $i$ a finite collection of finite projective $\Lambda^{\wedge}$-modules $M_{a}, \ldots, M_{b}$ such that $\left.K\right|_{U_{i}}$ is represented by a complex

$$
\left(\underline{M^{a}}\right)^{\wedge} \rightarrow \ldots \rightarrow\left(\underline{M^{b}}\right)^{\wedge}
$$

in $D\left(U_{i, p r o-e ́ t a l e}, \Lambda\right)$ for some maps of sheaves of $\Lambda$-modules $\left(\underline{M^{i}}\right)^{\wedge} \rightarrow\left(\underline{M^{i+1}}\right)^{\wedge}$.

Proof. We freely use the results of Lemma 51.27 .2 . Choose $a, b$ as in that lemma. We will prove the lemma by induction on $b-a$. Let $\mathcal{F}=H^{b}(K)$. Note that $\mathcal{F}$ is a derived complete sheaf of $\Lambda$-modules by Proposition 51.17.1. Moreover $\mathcal{F} / I \mathcal{F}$ is a locally constant sheaf of $\Lambda / I$-modules of finite type. Apply Lemma 51.26.7 to get a surjection $\rho:\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t} \rightarrow \mathcal{F}$.

If $a=b$, then $K=\mathcal{F}[-b]$. In this case we see that

$$
\mathcal{F} \otimes_{\Lambda}^{\mathrm{L}} \underline{\Lambda / I}=\mathcal{F} / I \mathcal{F}
$$

As $X$ is weakly contractible and $\mathcal{F} / I \mathcal{F}$ locally constant, we can find a finite disjoint union decomposition $X=\coprod U_{i}$ by affine opens $U_{i}$ and $\Lambda / I$-modules $\bar{M}_{i}$ such that $\mathcal{F} / I \mathcal{F}$ restricts to $\bar{M}_{i}$ on $U_{i}$. After refining the covering we may assume the map

$$
\left.\rho\right|_{U_{i}} \bmod I: \underline{\Lambda / I^{\oplus t}} \longrightarrow \underline{\bar{M}_{i}}
$$

is equal to $\alpha_{i}$ for some surjective module map $\alpha_{i}: \Lambda / I^{\oplus t} \rightarrow \bar{M}_{i}$, see Modules on Sites, Lemma 18.42 .3 . Note that each $\bar{M}_{i}$ is a finite $\Lambda / I$-module. Since $\mathcal{F} / I \mathcal{F}$ has tor amplitude in $[0,0]$ we conclude that $\bar{M}_{i}$ is a flat $\Lambda / I$-module. Hence $\bar{M}_{i}$ is finite projective (Algebra, Lemma 10.77.2). Hence we can find a projector $\bar{p}_{i}:(\Lambda / I)^{\oplus t} \rightarrow$ $(\Lambda / I)^{\oplus t}$ whose image maps isomorphically to $\bar{M}_{i}$ under the map $\alpha_{i}$. We can lift $\bar{p}_{i}$ to a projector $p_{i}:\left(\Lambda^{\wedge}\right)^{\oplus t} \rightarrow\left(\Lambda^{\wedge}\right)^{\oplus \star}{ }^{5}$. Then $M_{i}=\operatorname{Im}\left(p_{i}\right)$ is a finite $I$-adically complete $\Lambda^{\wedge}$-module with $M_{i} / I M_{i}=\bar{M}_{i}$. Over $U_{i}$ consider the maps

$$
\left.{\underline{M_{i}}}^{\wedge} \rightarrow\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t} \rightarrow \mathcal{F}\right|_{U_{i}}
$$

By construction the composition induces an isomorphism modulo $I$. The source and target are derived complete, hence so are the cokernel $\mathcal{Q}$ and the kernel $\mathcal{K}$. We have $\mathcal{Q} / I \mathcal{Q}=0$ by construction hence $\mathcal{Q}$ is zero by Lemma 51.26.6. Then

$$
0 \rightarrow \mathcal{K} / I \mathcal{K} \rightarrow \underline{\bar{M}_{i}} \rightarrow \mathcal{F} / I \mathcal{F} \rightarrow 0
$$

is exact by the vanishing of Tor $_{1}$ see at the start of this paragraph; also use that $\underline{\Lambda}^{\wedge} / I \bar{\Lambda}^{\wedge}$ by Modules on Sites, Lemma 18.41 .4 to see that $\underline{M i}^{\wedge} / I \underline{M_{i}}{ }^{\wedge}=\underline{\bar{M}_{i}}$. Hence $\mathcal{K} / I \mathcal{K}=0$ by construction and we conclude that $\mathcal{K}=0$ as before. This proves the result in case $a=b$.

If $b>a$, then we lift the map $\rho$ to a map

$$
\tilde{\rho}:\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}[-b] \longrightarrow K
$$

in $D\left(X_{\text {pro-étale }}, \Lambda\right)$. This is possible as we can think of $K$ as a complex of $\underline{\Lambda}^{\wedge}$ modules by discussion in the introduction to Section 51.16 and because $X_{\text {pro-étale }}$ is weakly contractible hence there is no obstruction to lifting the elements $\rho\left(e_{s}\right) \in$ $H^{0}(X, \mathcal{F})$ to elements of $H^{b}(X, K)$. Fitting $\tilde{\rho}$ into a distinguished triangle

$$
\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}[-b] \rightarrow K \rightarrow L \rightarrow\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}[-b+1]
$$

we see that $L$ is an object of $D_{\text {cons }}(X, \Lambda)$ such that $L \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I$ has tor amplitude contained in $[a, b-1]$ (details omitted). By induction we can describe $L$ locally as stated in the lemma, say $L$ is isomorphic to

$$
\left(\underline{M^{a}}\right)^{\wedge} \rightarrow \ldots \rightarrow\left(\underline{M^{b-1}}\right)^{\wedge}
$$

[^147]The map $L \rightarrow\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}[-b+1]$ corresponds to a map $\left(\underline{M}^{b-1}\right)^{\wedge} \rightarrow\left(\underline{\Lambda}^{\wedge}\right)^{\oplus t}$ which allows us to extend the complex by one. The corresponding complex is isomorphic to $K$ in the derived category by the properties of triangulated categories. This finishes the proof.

Motivated by what happens for constructible $\Lambda$-sheaves we introduce the following notion.

09C4 Definition 51.27.4. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $K \in D\left(X_{\text {pro-étale }}, \Lambda\right)$.
(1) We say $K$ is adic liss $\oint^{6}$ if there exists a finite complex of finite projective $\Lambda^{\wedge}$-modules $M^{\bullet}$ such that $K$ is locally isomorphic to

$$
\underline{M}^{a \wedge} \rightarrow \ldots \rightarrow \underline{M}^{b^{\wedge}}
$$

(2) We say $K$ is adic constructibl $\varnothing^{7}$ if for every affine open $U \subset X$ there exists a decomposition $U=\coprod U_{i}$ into constructible locally closed subschemes such that $\left.K\right|_{U_{i}}$ is adic lisse.

The difference between the local structure obtained in Lemma 51.27.3 and the structure of an adic lisse complex is that the maps $\underline{M}^{i^{\wedge}} \rightarrow \underline{M^{i+1^{\wedge}}}$ in Lemma 51.27 .3 need not be constant, whereas in the definition above they are required to be constant.

09C5 Lemma 51.27.5. Let $X$ be a weakly contractible affine scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $K$ be an object of $D_{\text {cons }}(X, \Lambda)$ such that $K \otimes{ }_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}$ is isomorphic in $D\left(X_{\text {pro-étale }}, \Lambda / I^{n}\right)$ to a complex of constant sheaves of $\Lambda / \overline{I^{n}-m o d u l e s . ~ T h e n ~}$

$$
H^{0}\left(X, K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}\right)
$$

has the Mittag-Leffler condition.
Proof. Say $K \otimes_{\Lambda}^{\mathrm{L}} \underline{\Lambda / I^{n}}$ is isomorphic to $\underline{E_{n}}$ for some object $E_{n}$ of $D\left(\Lambda / I^{n}\right)$. Since $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I}$ has finite tor dimension and has finite type cohomology sheaves we see that $\overline{E_{1}}$ is perfect (see More on Algebra, Lemma 15.61.2). The transition maps

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n+1}} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}
$$

locally come from (possibly many distinct) maps of complexes $E_{n+1} \rightarrow E_{n}$ in $D\left(\Lambda / I^{n+1}\right)$ see Cohomology on Sites, Lemma 21.41.3. For each $n$ choose one such map and observe that it induces an isomorphism $E_{n+1} \otimes_{\Lambda / I^{n+1}}^{\mathrm{L}} \Lambda / I^{n} \rightarrow E_{n}$ in $D\left(\Lambda / I^{n}\right)$. By More on Algebra, Lemma 15.75 .3 we can find a finite complex $M^{\bullet}$ of finite projective $\Lambda^{\wedge}$-modules and isomorphisms $M^{\bullet} / I^{n} M^{\bullet} \rightarrow E_{n}$ in $D\left(\Lambda / I^{n}\right)$ compatible with the transition maps.

Now observe that for each finite collection of indices $n>m>k$ the triple of maps

$$
H^{0}\left(X, K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}\right) \rightarrow H^{0}\left(X, K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{m}\right) \rightarrow H^{0}\left(X, K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{k}\right)
$$

is isomorphic to

$$
H^{0}\left(X, \underline{M^{\bullet} / I^{n} M^{\bullet}}\right) \rightarrow H^{0}\left(X, \underline{M^{\bullet}} / I^{m} M^{\bullet}\right) \rightarrow H^{0}\left(X, M^{\bullet} / I^{k} M^{\bullet}\right)
$$

[^148]Namely, choose any isomorphism

$$
M^{\bullet} / I^{n} M^{\bullet} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}
$$

induces similar isomorphisms module $I^{m}$ and $I^{k}$ and we see that the assertion is true. Thus to prove the lemma it suffices to show that the system $H^{0}\left(X, \underline{M^{\bullet} / I^{n} M^{\bullet}}\right)$ has Mittag-Leffler. Since taking sections over $X$ is exact, it suffices to prove that the system of $\Lambda$-modules

$$
H^{0}\left(M^{\bullet} / I^{n} M^{\bullet}\right)
$$

has Mittag-Leffler. Set $A=\Lambda^{\wedge}$ and consider the spectral sequence

$$
\operatorname{Tor}_{-p}^{A}\left(H^{q}\left(M^{\bullet}\right), A / I^{n} A\right) \Rightarrow H^{p+q}\left(M^{\bullet} / I^{n} M^{\bullet}\right)
$$

By More on Algebra, Lemma 15.21 .3 the pro-systems $\left\{\operatorname{Tor}_{-p}^{A}\left(H^{q}\left(M^{\bullet}\right), A / I^{n} A\right)\right\}$ are zero for $p>0$. Thus the pro-system $\left\{H^{0}\left(M^{\bullet} / I^{n} M^{\bullet}\right)\right\}$ is equal to the prosystem $\left\{H^{0}\left(M^{\bullet}\right) / I^{n} H^{0}\left(M^{\bullet}\right)\right\}$ and the lemma is proved.
09C6 Lemma 51.27.6. Let $X$ be a connected scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. If $K$ is in $D_{\text {cons }}(X, \Lambda)$ such that $K \otimes_{\Lambda} \Lambda / I$ has locally constant cohomology sheaves, then $K$ is adic lisse (Definition 51.27.4).
Proof. Write $K_{n}=K \otimes_{\Lambda}^{\mathrm{L}} \Lambda / I^{n}$. We will use the results of Lemma 51.27 .2 without further mention. By Cohomology on Sites, Lemma 21.41 .5 we see that $K_{n}$ has locally constant cohomology sheaves for all $n$. We have $K_{n}=\epsilon^{-1} L_{n}$ some $L_{n}$ in $D_{c t f}\left(X_{\text {étale }}, \Lambda / I^{n}\right)$ with locally constant cohomology sheaves. By Étale Cohomology, Lemma 49.89 .14 there exist perfect $M_{n} \in D\left(\Lambda / I^{n}\right)$ such that $L_{n}$ is étale locally isomorphic to $\underline{M}_{n}$. The maps $L_{n+1} \rightarrow L_{n}$ corresponding to $K_{n+1} \rightarrow K_{n}$ induces isomorphisms $\overline{L_{n+1}} \otimes_{\Lambda / I^{n+1}}^{\mathbf{L}} \underline{\Lambda / I^{n}} \rightarrow L_{n}$. Looking locally on $X$ we conclude that there exist maps $M_{n+1} \rightarrow M_{n}$ in $D\left(\Lambda / I^{n+1}\right)$ inducing isomorphisms $M_{n+1} \otimes_{\Lambda / I^{n+1}} \Lambda / I^{n} \rightarrow M_{n}$, see Cohomology on Sites, Lemma 21.41.3 Fix a choice of such maps. By More on Algebra, Lemma 15.75 .3 we can find a finite complex $M^{\bullet}$ of finite projective $\Lambda^{\wedge}$-modules and isomorphisms $M^{\bullet} / I^{n} M^{\bullet} \rightarrow M_{n}$ in $D\left(\Lambda / I^{n}\right)$ compatible with the transition maps. To finish the proof we will show that $K$ is locally isomorphic to

$$
{\underline{M^{\bullet}}}^{\bullet}=\lim M^{\bullet} / I^{n} M^{\bullet}=R \lim \underline{M^{\bullet} / I^{n} M^{\bullet}}
$$

Let $E^{\bullet}$ be the dual complex to $M^{\bullet}$, see More on Algebra, Lemma 15.61.14 and its proof. Consider the objects

$$
H_{n}=R \mathcal{H o m}_{\Lambda / I^{n}}\left(M^{\bullet} / I^{n} M^{\bullet}, K_{n}\right)=\underline{E^{\bullet} / I^{n} E^{\bullet}} \otimes_{\Lambda / I^{n}}^{\mathbf{L}} K_{n}
$$

of $D\left(X_{\text {pro-étale }}, \Lambda / I^{n}\right)$. Modding out by $I^{n}$ defines a transition map $H_{n+1} \rightarrow H_{n}$. Set $H=R \lim H_{n}$. Then $H$ is an object of $D_{\text {cons }}(X, \Lambda)$ (details omitted) with $H \otimes{ }_{\Lambda}^{\mathrm{L}} \underline{\Lambda / I^{n}}=H_{n}$. Choose a covering $\left\{W_{t} \rightarrow X\right\}_{t \in T}$ with each $W_{t}$ affine and weakly contractible. By our choice of $M^{\bullet}$ we see that

$$
\begin{aligned}
\left.H_{n}\right|_{W_{t}} & \cong R \mathcal{H o m} M_{\Lambda / I^{n}}\left(M^{\bullet} / I^{n} M^{\bullet}, M^{\bullet} / I^{n} M^{\bullet}\right) \\
& =\underline{\operatorname{Tot}\left(E^{\bullet} / I^{n} E^{\bullet} \otimes_{\Lambda / I^{n}} M^{\bullet} / I^{n} M^{\bullet}\right)}
\end{aligned}
$$

Thus we may apply Lemma 51.27 .5 to $H=R \lim H_{n}$. We conclude the system $H^{0}\left(W_{t}, H_{n}\right)$ satisfies Mittag-Leffler. Since for all $n \gg 1$ there is an element of $H^{0}\left(W_{t}, H_{n}\right)$ which maps to an isomorphism in

$$
H^{0}\left(W_{t}, H_{1}\right)=\operatorname{Hom}\left(\underline{M^{\bullet} / I M^{\bullet}}, K_{1}\right)
$$

we find an element $\left(\varphi_{t, n}\right)$ in the inverse limit which produces an isomorphism mod $I$. Then

$$
R \lim \varphi_{t, n}:\left.{\underline{M^{\bullet}}}^{\bullet}\right|_{W_{t}}=\left.\left.R \lim \underline{M^{\bullet} / I^{n} M^{\bullet}}\right|_{W_{t}} \longrightarrow R \lim K_{n}\right|_{W_{t}}=\left.K\right|_{W_{t}}
$$

is an isomorphism. This finishes the proof.
09C7 Proposition 51.27.7. Let $X$ be a Noetherian scheme. Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $K$ be an object of $D_{\text {cons }}(X, \Lambda)$. Then $K$ is adic constructible (Definition 51.27.4).

Proof. This is a consequence of Lemma 51.27.6 and the fact that a Noetherian scheme is locally connected (Topology, Lemma 5.8.6), and the definitions.

### 51.28. Proper base change

09C8 In this section we explain how to prove the proper base change theorem for derived complete objects on the pro-étale site using the proper base change theorem for étale cohomology following the general theme that we use the pro-étale topology only to deal with "limit issues" and we use results proved for the étale topology to handle everything else.
09C9 Theorem 51.28.1. Let $f: X \rightarrow Y$ be a proper morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of schemes giving rise to the base change diagram

Let $\Lambda$ be a Noetherian ring and let $I \subset \Lambda$ be an ideal such that $\Lambda / I$ is torsion. Let $K$ be an object of $D\left(X_{\text {pro-étale }}\right)$ such that
(1) $K$ is derived complete, and
(2) $K \otimes \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}$ is bounded below with cohomology sheaves coming from $X_{\text {étale }}$,

Then the base change map

$$
L g_{c o m p}^{*} R f_{*} K \longrightarrow R f_{*}^{\prime} L\left(g^{\prime}\right)_{c o m p}^{*} K
$$

is an isomorphism.
Proof. We omit the construction of the base change map (this uses only formal properties of derived pushforward and completed derived pullback, compare with Cohomology on Sites, Remark 21.19.2p. Write $K_{n}=K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I^{n}$. By Lemma 51.16.1 we have $K=R \lim K_{n}$ because $K$ is derived complete. By Lemmas 51.16.2 and 51.16.1 we can unwind the left hand side

$$
L g_{\text {comp }}^{*} R f_{*} K=R \lim L g^{*}\left(R f_{*} K\right) \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}=R \lim L g^{*} R f_{*} K_{n}
$$

the last equality because $\Lambda / I^{n}$ is a perfect module and the projection formula (Cohomology on Sites, Lemma 21.38.1). Using Lemma 51.16.2 we can unwind the right hand side

$$
R f_{*}^{\prime} L\left(g^{\prime}\right)_{c o m p}^{*} K=R f_{*}^{\prime} R \lim L\left(g^{\prime}\right)^{*} K_{n}=R \lim R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} K_{n}
$$

[^149]the last equality because $R f_{*}^{\prime}$ commutes with $R$ lim (Cohomology on Sites, Lemma 21.21.2). Thus it suffices to show the maps
$$
L g^{*} R f_{*} K_{n} \longrightarrow R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} K_{n}
$$
are isomorphisms. By Lemma 51.18 .7 and our second condition we can write $K_{n}=$ $\epsilon^{-1} L_{n}$ for some $L_{n} \in D^{+}\left(X_{\text {étale }}, \Lambda / I^{n}\right)$. By Lemma 51.21.1 and the fact that $\epsilon^{-1}$ commutes with pullbacks we obtain
$$
L g^{*} R f_{*} K_{n}=L g^{*} R f_{*} \epsilon^{*} L_{n}=L g^{*} \epsilon^{-1} R f_{*} L_{n}=\epsilon^{-1} L g^{*} R f_{*} L_{n}
$$
and
$$
R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} K_{n}=R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} \epsilon^{-1} L_{n}=R f_{*}^{\prime} \epsilon^{-1} L\left(g^{\prime}\right)^{*} L_{n}=\epsilon^{-1} R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} L_{n}
$$
(this also uses that $L_{n}$ is bounded below). Finally, by the proper base change theorem for étale cohomology (Étale Cohomology, Theorem 49.76.11) we have
$$
L g^{*} R f_{*} L_{n}=R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} L_{n}
$$
(again using that $L_{n}$ is bounded below) and the theorem is proved.

## CHAPTER 52

## Algebraic Spaces

### 52.1. Introduction

025S Algebraic spaces were first introduced by Michael Artin, see Art69b, Art70, Art73, Art71b, Art71a, Art69a, Art69c, and Art74. Some of the foundational material was developed jointly with Knutson, who produced the book [Knu71]. Artin defined (see Art69c, Definition 1.3]) an algebraic space as a sheaf for the étale topology which is locally in the étale topology representable. In most of Artin's work the categories of schemes considered are schemes locally of finite type over a fixed excellent Noetherian base.

Our definition is slightly different. First of all we consider sheaves for the fppf topology. This is just a technical point and scarcely makes any difference. Second, we include the condition that the diagonal is representable.

After defining algebraic spaces we make some foundational observations. The main result in this chapter is that with our definitions an algebraic space is the same thing as an étale equivalence relation, see the discussion in Section 52.9 and Theorem 52.10.5. The analogue of this theorem in Artin's setting is Art69c, Theorem 1.5], or Knu71, Proposition II.1.7]. In other words, the sheaf defined by an étale equivalence relation has a representable diagonal. It follows that our definition agrees with Artin's original definition in a broad sense. It also means that one can give examples of algebraic spaces by simply writing down an étale equivalence relation.

In Section 52.13 we introduce various separation axioms on algebraic spaces that we have found in the literature. Finally in Section 52.14 we give some weird and not so weird examples of algebraic spaces.

### 52.2. General remarks

025 T We work in a suitable big fppf site $S c h_{f p p f}$ as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of $S c h_{f p p f}$. We will record elsewhere what changes if you change the big fppf site (insert future reference here).

We will always work relative to a base $S$ contained in $S c h_{f p p f}$. And we will then work with the big fppf site $(S c h / S)_{f p p f}$, see Topologies, Definition 33.7.8 The absolute case can be recovered by taking $S=\operatorname{Spec}(\mathbf{Z})$.
If $U, T$ are schemes over $S$, then we denote $U(T)$ for the set of $T$-valued points over $S$. In a formula: $U(T)=\operatorname{Mor}_{S}(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see Descent, Lemma 34.9.3. Hence the topology on $S c h_{f p p f}$ is weaker than the canonical topology and all representable presheaves are sheaves.

### 52.3. Representable morphisms of presheaves

025 U Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a representable transformation of functors, see Categories, Definition 4.8.2. This means that for every $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and any $\xi \in G(U)$ the fiber product $h_{U} \times_{\xi, G} F$ is representable. Choose a representing object $V_{\xi}$ and an isomorphism $h_{V_{\xi}} \rightarrow h_{U} \times_{G} F$. By the Yoneda lemma, see Categories, Lemma 4.3.5. the projection $h_{V_{\xi}} \rightarrow h_{U} \times_{G} F \rightarrow h_{U}$ comes from a unique morphism of schemes $a_{\xi}: V_{\xi} \rightarrow U$. Suggestively we could represent this by the diagram

where the squiggly arrows represent the Yoneda embedding. Here are some lemmas about this notion that work in great generality.

02W9 Lemma 52.3.1. Let $S, X, Y$ be objects of $S_{\text {Sch }}^{\text {fppf }}$. Let $f: X \rightarrow Y$ be a morphism of schemes. Then

$$
h_{f}: h_{X} \longrightarrow h_{Y}
$$

is a representable transformation of functors.
Proof. This is formal and relies only on the fact that the category $(S c h / S)_{f p p f}$ has fibre products.

02WA Lemma 52.3.2. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: G \rightarrow H$ be representable transformations of functors. Then

$$
b \circ a: F \longrightarrow H
$$

is a representable transformation of functors.
Proof. This is entirely formal and works in any category.
02WB Lemma 52.3.3. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a representable transformations of functors. Let $b: H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram

Then the base change $a^{\prime}$ is a representable transformation of functors.
Proof. This is entirely formal and works in any category.

02WC Lemma 52.3.4. Let $S$ be a scheme contained in $S_{\text {ch }}^{\text {fppf }}$. Let $F_{i}, G_{i}:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets, $i=1,2$. Let $a_{i}: F_{i} \rightarrow G_{i}, i=1,2$ be representable transformations of functors. Then

$$
a_{1} \times a_{2}: F_{1} \times F_{2} \longrightarrow G_{1} \times G_{2}
$$

is a representable transformation of functors.
Proof. Write $a_{1} \times a_{2}$ as the composition $F_{1} \times F_{2} \rightarrow G_{1} \times F_{2} \rightarrow G_{1} \times G_{2}$. The first arrow is the base change of $a_{1}$ by the map $G_{1} \times F_{2} \rightarrow G_{1}$, and the second arrow is the base change of $a_{2}$ by the map $G_{1} \times G_{2} \rightarrow G_{2}$. Hence this lemma is a formal consequence of Lemmas 52.3.2 and 52.3.3.
02WD Lemma 52.3.5. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a representable transformation of functors. If $G$ is a sheaf, then so is $F$.

Proof. Let $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ be a covering of the site $(S c h / S)_{f p p f}$. Let $s_{i} \in F\left(T_{i}\right)$ which satisfy the sheaf condition. Then $\sigma_{i}=a\left(s_{i}\right) \in G\left(T_{i}\right)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_{i}=\left.\sigma\right|_{T_{i}}$. By assumption $F^{\prime}=h_{T} \times_{\sigma, G, a} F$ is a representable presheaf and hence (see remarks in Section 52.2) a sheaf. Note that $\left(\varphi_{i}, s_{i}\right) \in F^{\prime}\left(T_{i}\right)$ satisfy the sheaf condition also, and hence come from some unique $\left(\mathrm{id}_{T}, s\right) \in F^{\prime}(T)$. Clearly $s$ is the section of $F$ we are looking for.
05L9 Lemma 52.3.6. Let $S$ be a scheme contained in $S_{\text {Lch }}^{\text {fppf }}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a representable transformation of functors. Then $\Delta_{F / G}$ : $F \rightarrow F \times{ }_{G} F$ is representable.
Proof. Let $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$. Let $\xi=\left(\xi_{1}, \xi_{2}\right) \in\left(F \times_{G} F\right)(U)$. Set $\xi^{\prime}=$ $a\left(\xi_{1}\right)=a\left(\xi_{2}\right) \in G(U)$. By assumption there exist a scheme $V$ and a morphism $V \rightarrow U$ representing the fibre product $h_{U} \times_{\xi^{\prime}, G} F$. In particular, the elements $\xi_{1}, \xi_{2}$ give morphisms $f_{1}, f_{2}: U \rightarrow V$ over $U$. Because $V$ represents the fibre product $h_{U} \times{ }_{\xi^{\prime}, G} F$ and because $\xi^{\prime}=a \circ \xi_{1}=a \circ \xi_{2}$ we see that if $g: U^{\prime} \rightarrow U$ is a morphism then

$$
g^{*} \xi_{1}=g^{*} \xi_{2} \Leftrightarrow f_{1} \circ g=f_{2} \circ g .
$$

In other words, we see that $h_{U} \times_{\xi, F \times{ }_{G} F} F$ is represented by $V \times_{\Delta, V \times V,\left(f_{1}, f_{2}\right)} U$ which is a scheme.
52.4. Lists of useful properties of morphisms of schemes

02 WE For ease of reference we list in the following remarks the properties of morphisms which possess some of the properties required of them in later results.

02WF Remark 52.4.1. Here is a list of properties/types of morphisms which are stable under arbitrary base change:
(1) closed, open, and locally closed immersions, see Schemes, Lemma 25.18.2,
(2) quasi-compact, see Schemes, Lemma 25.19 .3
(3) universally closed, see Schemes, Definition 25.20 .1
(4) (quasi-)separated, see Schemes, Lemma 25.21 .13
(5) monomorphism, see Schemes, Lemma 25.23 .5
(6) surjective, see Morphisms, Lemma 28.10.4
(7) universally injective, see Morphisms, Lemma 28.11.2.
(8) affine, see Morphisms, Lemma 28.12.8.
(9) quasi-affine, see Morphisms, Lemma 28.13.5,
(10) (locally) of finite type, see Morphisms, Lemma 28.15.4,
(11) (locally) quasi-finite, see Morphisms, Lemma 28.20.13,
(12) (locally) of finite presentation, see Morphisms, Lemma 28.21.4.
(13) locally of finite type of relative dimension $d$, see Morphisms, Lemma 28.29 .2
(14) universally open, see Morphisms, Definition 28.23.1,
(15) flat, see Morphisms, Lemma 28.25.7.
(16) syntomic, see Morphisms, Lemma 28.31 .4 ,
(17) smooth, see Morphisms, Lemma 28.34.5.
(18) unramified (resp. G-unramified), see Morphisms, Lemma 28.35.5,
(19) étale, see Morphisms, Lemma 28.36.4.
(20) proper, see Morphisms, Lemma 28.41.5,
(21) H-projective, see Morphisms, Lemma 28.42.9,
(22) (locally) projective, see Morphisms, Lemma 28.42 .10,
(23) finite or integral, see Morphisms, Lemma 28.43.6,
(24) finite locally free, see Morphisms, Lemma 28.45.4.

Add more as needed.
02WG Remark 52.4.2. Of the properties of morphisms which are stable under base change (as listed in Remark 52.4.1) the following are also stable under compositions:
(1) closed, open and locally closed immersions, see Schemes, Lemma 25.24.3.
(2) quasi-compact, see Schemes, Lemma 25.19.4
(3) universally closed, see Morphisms, Lemma 28.41 .4 .
(4) (quasi-)separated, see Schemes, Lemma 25.21.13.
(5) monomorphism, see Schemes, Lemma 25.23 .4 .
(6) surjective, see Morphisms, Lemma 28.10.2
(7) universally injective, see Morphisms, Lemma 28.11.5.
(8) affine, see Morphisms, Lemma 28.12.7,
(9) quasi-affine, see Morphisms, Lemma 28.13.4,
(10) (locally) of finite type, see Morphisms, Lemma 28.15 .3
(11) (locally) quasi-finite, see Morphisms, Lemma 28.20.12,
(12) (locally) of finite presentation, see Morphisms, Lemma 28.21.3,
(13) universally open, see Morphisms, Lemma 28.23.3.
(14) flat, see Morphisms, Lemma 28.25.5.
(15) syntomic, see Morphisms, Lemma 28.31 .3 .
(16) smooth, see Morphisms, Lemma 28.34.4,
(17) unramified (resp. G-unramified), see Morphisms, Lemma 28.35.4.
(18) étale, see Morphisms, Lemma 28.36.3,
(19) proper, see Morphisms, Lemma 28.41.4,
(20) H-projective, see Morphisms, Lemma 28.42 .8 ,
(21) finite or integral, see Morphisms, Lemma 28.43.5,
(22) finite locally free, see Morphisms, Lemma 28.45.3.

Add more as needed.
02WH Remark 52.4.3. Of the properties mentioned which are stable under base change (as listed in Remark 52.4.1) the following are also fpqc local on the base (and a fortiori fppf local on the base):
(1) for immersions we have this for
(a) closed immersions, see Descent, Lemma 34.19.17,
(b) open immersions, see Descent, Lemma 34.19.14 and
(c) quasi-compact immersions, see Descent, Lemma 34.19.19,
(2) quasi-compact, see Descent, Lemma 34.19.1.
(3) universally closed, see Descent, Lemma 34.19.3,
(4) (quasi-)separated, see Descent, Lemmas 34.19.2, and 34.19.5.
(5) monomorphism, see Descent, Lemma 34.19.29,
(6) surjective, see Descent, Lemma 34.19.6,
(7) universally injective, see Descent, Lemma 34.19.7.
(8) affine, see Descent, Lemma 34.19.16,
(9) quasi-affine, see Descent, Lemma 34.19.18.
(10) (locally) of finite type, see Descent, Lemmas 34.19.8, and 34.19.10.
(11) (locally) quasi-finite, see Descent, Lemma 34.19.22.
(12) (locally) of finite presentation, see Descent, Lemmas 34.19.9, and 34.19.11.
(13) locally of finite type of relative dimension $d$, see Descent, Lemma 34.19.23.
(14) universally open, see Descent, Lemma 34.19.4
(15) flat, see Descent, Lemma 34.19.13
(16) syntomic, see Descent, Lemma 34.19 .24 ,
(17) smooth, see Descent, Lemma 34.19.25,
(18) unramified (resp. G-unramified), see Descent, Lemma 34.19.26
(19) étale, see Descent, Lemma 34.19.27.
(20) proper, see Descent, Lemma 34.19.12.
(21) finite or integral, see Descent, Lemma 34.19.21,
(22) finite locally free, see Descent, Lemma 34.19.28.

Note that the property of being an "immersion" may not be fpqc local on the base, but in Descent, Lemma 34.20 .1 we proved that it is fppf local on the base.

### 52.5. Properties of representable morphisms of presheaves

02WI Here is the definition that makes this work.
025 V Definition 52.5.1. With $S$, and $a: F \rightarrow G$ representable as above. Let $\mathcal{P}$ be a property of morphisms of schemes which
(1) is preserved under any base change, see Schemes, Definition 25.18.3, and
(2) is fppf local on the base, see Descent, Definition 34.18.1

In this case we say that $a$ has property $\mathcal{P}$ if for every $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and any $\xi \in G(U)$ the resulting morphism of schemes $V_{\xi} \rightarrow U$ has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

02YN Remark 52.5.2. Consider the property $\mathcal{P}=$ "surjective". In this case there could be some ambiguity if we say "let $F \rightarrow G$ be a surjective map". Namely, we could mean the notion defined in Definition 52.5.1 above, or we could mean a surjective map of presheaves, see Sites, Definition 7.3.1, or, if both $F$ and $G$ are sheaves, we could mean a surjective map of sheaves, see Sites, Definition 7.12.1, If not mentioned otherwise when discussing morphisms of algebraic spaces we will always mean the
first. See Lemma 52.5 .9 for a case where surjectivity implies surjectivity as a map of sheaves.

Here is a sanity check.
02WJ Lemma 52.5.3. Let $S, X, Y$ be objects of $S_{\text {. }}^{\text {. }}$ fppf. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{P}$ be as in Definition 52.5.1. Then $h_{X} \longrightarrow h_{Y}$ has property $\mathcal{P}$ if and only if $f$ has property $\mathcal{P}$.
Proof. Note that the lemma makes sense by Lemma 52.3.1. Proof omitted.
02WK Lemma 52.5.4. Let $S$ be a scheme contained in $S_{\text {. }}^{\text {fppf }}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $\mathcal{P}$ be a property as in Definition 52.5.1 which is stable under composition. Let $a: F \rightarrow G, b: G \rightarrow H$ be representable transformations of functors. If $a$ and $b$ have property $\mathcal{P}$ so does $b \circ a: F \longrightarrow H$.
Proof. Note that the lemma makes sense by Lemma 52.3.2. Proof omitted.
02WL Lemma 52.5.5. Let $S$ be a scheme contained in $S_{\text {. }}^{\text {fppf }}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $\mathcal{P}$ be a property as in Definition 52.5.1. Let $a: F \rightarrow G$ be a representable transformations of functors. Let $b: H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram

If a has property $\mathcal{P}$ then also the base change $a^{\prime}$ has property $\mathcal{P}$.
Proof. Note that the lemma makes sense by Lemma 52.3.3. Proof omitted.
03KD Lemma 52.5.6. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G, H:(S c h / S)_{\text {fppf }}^{o p p} \rightarrow$ Sets. Let $\mathcal{P}$ be a property as in Definition 52.5.1. Let $a: F \rightarrow G$ be a representable transformations of functors. Let $b: H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram

Assume that b induces a surjective map of fppf sheaves $H^{\#} \rightarrow G^{\#}$. In this case, if $a^{\prime}$ has property $\mathcal{P}$, then also a has property $\mathcal{P}$.

Proof. First we remark that by Lemma 52.3 .3 the transformation $a^{\prime}$ is representable. Let $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, and let $\xi \in G(U)$. By assumption there exists an fppf covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ and elements $\xi_{i} \in H\left(U_{i}\right)$ mapping to $\left.\xi\right|_{U}$ via $b$. From general category theory it follows that for each $i$ we have a fibre product diagram

By assumption the left vertical arrow is a morphism of schemes which has property $\mathcal{P}$. Since $\mathcal{P}$ is local in the fppf topology this implies that also the right vertical arrow has property $\mathcal{P}$ as desired.
02WM Lemma 52.5.7. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F_{i}, G_{i}:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets, $i=1,2$. Let $a_{i}: F_{i} \rightarrow G_{i}, i=1,2$ be representable transformations of functors. Let $\mathcal{P}$ be a property as in Definition 52.5.1 which is stable under composition. If $a_{1}$ and $a_{2}$ have property $\mathcal{P}$ so does $a_{1} \times a_{2}: F_{1} \times F_{2} \longrightarrow G_{1} \times G_{2}$.

Proof. Note that the lemma makes sense by Lemma 52.3.4. Proof omitted.
02 YO Lemma 52.5.8. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G$ be a representable transformation of functors. Let $\mathcal{P}, \mathcal{P}^{\prime}$ be properties as in Definition 52.5.1. Suppose that for any morphism of schemes $f: X \rightarrow Y$ we have $\mathcal{P}(f) \Rightarrow \mathcal{P}^{\prime}(f)$. If a has property $\mathcal{P}$ then a has property $\mathcal{P}^{\prime}$.

Proof. Formal.
05VM Lemma 52.5.9. Let $S$ be a scheme. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be sheaves. Let $a: F \rightarrow G$ be representable, flat, locally of finite presentation, and surjective. Then $a: F \rightarrow G$ is surjective as a map of sheaves.

Proof. Let $T$ be a scheme over $S$ and let $g: T \rightarrow G$ be a $T$-valued point of $G$. By assumption $T^{\prime}=F \times_{G} T$ is (representable by) a scheme and the morphism $T^{\prime} \rightarrow T$ is a flat, locally of finite presentation, and surjective. Hence $\left\{T^{\prime} \rightarrow T\right\}$ is an fppf covering such that $\left.g\right|_{T^{\prime}} \in G\left(T^{\prime}\right)$ comes from an element of $F\left(T^{\prime}\right)$, namely the map $T^{\prime} \rightarrow F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 7.12.1

Here is a characterization of those functors for which the diagonal is representable.
025W Lemma 52.5.10. Let $S$ be a scheme contained in $S_{\text {S }}^{\text {fppf }}$. Let $F$ be a presheaf of sets on $(S c h / S)_{\text {fppf }}$. The following are equivalent:
(1) The diagonal $F \rightarrow F \times F$ is representable.
(2) For every scheme $U$ over $S, U / S \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and any $\xi \in F(U)$ the map $\xi: h_{U} \rightarrow F$ is representable.

Proof. This is completely formal, see Categories, Lemma 4.8.4. It depends only on the fact that the category $(S c h / S)_{f p p f}$ has products of pairs of objects and fibre products, see Topologies, Lemma 33.7.10.

In the situation of the lemma, for any morphism $\xi: h_{U} \rightarrow F$ as in the lemma, it makes sense to say that $\xi$ has property $\mathcal{P}$, for any property as in Definition 52.5.1. In particular this holds for $\mathcal{P}=$ "surjective" and $\mathcal{P}=$ "étale", see Remark 52.4.3 above. We will use these in the definition of algebraic spaces below.

### 52.6. Algebraic spaces

025X Here is the definition.
025Y Definition 52.6.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. An algebraic space over $S$ is a presheaf

$$
F:(S c h / S)_{f p p f}^{o p p} \longrightarrow \text { Sets }
$$

with the following properties
(1) The presheaf $F$ is a sheaf.
(2) The diagonal morphism $F \rightarrow F \times F$ is representable.
(3) There exists a scheme $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a map $h_{U} \rightarrow F$ which is surjective, and étale.

There are two differences with the "usual" definition, for example the definition in Knutson's book Knu71.

The first is that we require $F$ to be a sheaf in the fppf topology. One reason for doing this is that many natural examples of algebraic spaces satisfy the sheaf condition for the fppf coverings (and even for fpqc coverings). Also, one of the reasons that algebraic spaces have been so useful is via Michael Artin's results on algebraic spaces. Built into his method is a condition which guarantees the result is locally of finite presentation over $S$. Combined it somehow seems to us that the fppf topology is the natural topology to work with. In the end the category of algebraic spaces ends up being the same. See Bootstrap, Section 67.12.
The second is that we only require the diagonal map for $F$ to be representable, whereas in Knu71 it is required that it also be quasi-compact. If $F=h_{U}$ for some scheme $U$ over $S$ this corresponds to the condition that $U$ be quasi-separated. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of $F$ be representable, and simply add an addition hypothesis wherever this is necessary. In any case it has the pleasing consequence that the following lemma is true.

025Z Lemma 52.6.2. A scheme is an algebraic space. More precisely, given a scheme $T \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ the representable functor $h_{T}$ is an algebraic space.
Proof. The functor $h_{T}$ is a sheaf by our remarks in Section 52.2. The diagonal $h_{T} \rightarrow h_{T} \times h_{T}=h_{T \times T}$ is representable because $(S c h / S)_{f p p f}$ has fibre products. The identity map $h_{T} \rightarrow h_{T}$ is surjective étale.

0260 Definition 52.6.3. Let $F, F^{\prime}$ be algebraic spaces over $S$. A morphism $f: F \rightarrow F^{\prime}$ of algebraic spaces over $S$ is a transformation of functors from $F$ to $F^{\prime}$.

The category of algebraic spaces over $S$ contains the category $(S c h / S)_{f p p f}$ as a full subcategory via the Yoneda embedding $T / S \mapsto h_{T}$. From now on we no longer distinguish between a scheme $T / S$ and the algebraic space it represents. Thus when we say "Let $f: T \rightarrow F$ be a morphism from the scheme $T$ to the algebraic space $F$ ", we mean that $T \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, that $F$ is an algebraic space over $S$, and that $f: h_{T} \rightarrow F$ is a morphism of algebraic spaces over $S$.

### 52.7. Fibre products of algebraic spaces

04 T 8 The category of algebraic spaces over $S$ has both products and fibre products.
02X0 Lemma 52.7.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F, G$ be algebraic spaces over $S$. Then $F \times G$ is an algebraic space, and is a product in the category of algebraic spaces over $S$.
Proof. It is clear that $H=F \times G$ is a sheaf. The diagonal of $H$ is simply the product of the diagonals of $F$ and $G$. Hence it is representable by Lemma 52.3.4. Finally, if $U \rightarrow F$ and $V \rightarrow G$ are surjective étale morphisms, with $U, V \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, then $U \times V \rightarrow F \times G$ is surjective étale by Lemma 52.5.7.

04 T 9 Lemma 52.7.2. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $H$ be a sheaf on $(S c h / S)_{\text {fppf }}$ whose diagonal is representable. Let $F, G$ be algebraic spaces over $S$. Let $F \rightarrow H, G \rightarrow H$ be maps of sheaves. Then $F \times_{H} G$ is an algebraic space.

Proof. We check the 3 conditions of Definition52.6.1. A fibre product of sheaves is a sheaf, hence $F \times_{H} G$ is a sheaf. The diagonal of $F \times_{H} G$ is the left vertical arrow in

which is cartesian. Hence $\Delta$ is representable as the base change of the morphism on the right which is representable, see Lemmas 52.3.4 and 52.3.3. Finally, let $U, V \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and $a: U \rightarrow F, b: V \rightarrow G$ be surjective and étale. As $\Delta_{H}$ is representable, we see that $U \times_{H} V$ is a scheme. The morphism

$$
U \times_{H} V \longrightarrow F \times_{H} G
$$

is surjective and étale as a composition of the base changes $U \times_{H} V \rightarrow U \times_{H} G$ and $U \times_{H} G \rightarrow F \times_{H} G$ of the étale surjective morphisms $U \rightarrow F$ and $V \rightarrow G$, see Lemmas 52.3 .2 and 52.3.3. This proves the last condition of Definition 52.6 .1 holds and we conclude that $F \times{ }_{H} G$ is an algebraic space.

02X2 Lemma 52.7.3. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F \rightarrow H, G \rightarrow H$ be morphisms of algebraic spaces over $S$. Then $F \times_{H} G$ is an algebraic space, and is a fibre product in the category of algebraic spaces over $S$.

Proof. It follows from the stronger Lemma 52.7 .2 that $F \times_{H} G$ is an algebraic space. It is clear that $F \times_{H} G$ is a fibre product in the category of algebraic spaces over $S$ since that is a full subcategory of the category of (pre)sheaves of sets on $(S c h / S)_{f p p f}$.

### 52.8. Glueing algebraic spaces

02 WN In this section we really start abusing notation and not distinguish between schemes and the spaces they represent.

02WO Lemma 52.8.1. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$. Let $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$. Given a set $I$ and sheaves $F_{i}$ on $\mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$, if $U \cong \coprod_{i \in I} F_{i}$ as sheaves, then each $F_{i}$ is representable by an open and closed subscheme $U_{i}$ and $U \cong \coprod U_{i}$ as schemes.

Proof. By assumption this means there exists an fppf covering $\left\{U_{j} \rightarrow U\right\}_{j \in J}$ such that each $U_{j} \rightarrow U$ factors through $F_{i(j)}$ for some $i(j) \in I$. Denote $V_{j}=\operatorname{Im}\left(U_{j} \rightarrow\right.$ $U)$. This is an open of $U$ by Morphisms, Lemma 28.25.9, and $\left\{U_{j} \rightarrow V_{j}\right\}$ is an fppf covering. Hence it follows that $V_{j} \rightarrow U$ factors through $F_{i(j)}$ since $F_{i(j)}$ is a subsheaf. It follows from $F_{i} \cap F_{i^{\prime}}=\emptyset, i \neq i^{\prime}$ that $V_{j} \cap V_{j^{\prime}}=\emptyset$ unless $i(j)=i\left(j^{\prime}\right)$. Hence we can take $U_{i}=\bigcup_{j, i(j)=i} V_{j}$ and everything is clear.

02WP Lemma 52.8.2. Let $S \in \mathrm{Ob}\left(S_{\text {L }}^{\text {fppf }}\right)$. Let $F$ be an algebraic space over $S$. Given a set $I$ and sheaves $F_{i}$ on $\mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, if $F \cong \coprod_{i \in I} F_{i}$ as sheaves, then each $F_{i}$ is an algebraic space over $S$.

Proof. It follows directly from the representability of $F \rightarrow F \times F$ that each diagonal morphism $F_{i} \rightarrow F_{i} \times F_{i}$ is representable. Choose a scheme $U$ in $(S c h / S)_{f p p f}$ and a surjective étale morphism $U \rightarrow \coprod F_{i}$ (this exist by hypothesis). By considering the inverse image of $F_{i}$ we get a decomposition of $U$ (as a sheaf) into a coproduct of sheaves. By Lemma 52.8.1 we get correspondingly $U \cong \coprod U_{i}$. Then it follows easily that $U_{i} \rightarrow F_{i}$ is surjective and étale (from the corresponding property of $U \rightarrow F)$.

The condition on the size of $I$ and the $F_{i}$ in the following lemma may be ignored by those not worried about set theoretic questions.

02WQ Lemma 52.8.3. Let $S \in \mathrm{Ob}\left(\right.$ Sch $\left._{\text {fppf }}\right)$. Suppose given a set $I$ and algebraic spaces $F_{i}, i \in I$. Then $F=\coprod_{i \in I} F_{i}$ is an algebraic space provided $I$, and the $F_{i}$ are not too "large": for example if we can choose surjective étale morphisms $U_{i} \rightarrow F_{i}$ such that $\coprod_{i \in I} U_{i}$ is isomorphic to an object of $(S c h / S)_{\text {fppf }}$, then $F$ is an algebraic space.

Proof. By construction $F$ is a sheaf. We omit the verification that the diagonal morphism of $F$ is representable. Finally, if $U$ is an object of $(S c h / S)_{f p p f}$ isomorphic to $\coprod_{i \in I} U_{i}$ then it is straightforward to verify that the resulting map $U \rightarrow \coprod F_{i}$ is surjective and étale.

Here is the analogue of Schemes, Lemma 25.15.4.
02WR Lemma 52.8.4. Let $S \in \mathrm{Ob}\left(S_{\text {Lch }}^{\text {fppf }}\right.$ ). Let $F$ be a presheaf of sets on $(S c h / S)_{\text {fppf }}$. Assume
(1) $F$ is a sheaf,
(2) there exists an index set $I$ and subfunctors $F_{i} \subset F$ such that
(a) each $F_{i}$ is an algebraic space,
(b) each $F_{i} \rightarrow F$ is a representable,
(c) each $F_{i} \rightarrow F$ is an open immersion (see Definition 52.5.1),
(d) the map $\coprod F_{i} \rightarrow F$ is surjective as a map of sheaves, and
(e) $\amalg F_{i}$ is an algebraic space (set theoretic condition, see Lemma 52.8.3).

Then $F$ is an algebraic space.
Proof. Let $T$ be an object of $(S c h / S)_{\text {fppf }}$. Let $T \rightarrow F$ be a morphism. By assumption (2)(b) and (2)(c) the fibre product $F_{i} \times_{F} T$ is representable by an open subscheme $V_{i} \subset T$. It follows that $\left(\amalg F_{i}\right) \times{ }_{F} T$ is represented by the scheme $\coprod V_{i}$ over $T$. By assumption (2)(d) there exists an fppf covering $\left\{T_{j} \rightarrow T\right\}_{j \in J}$ such that $T_{j} \rightarrow T \rightarrow F$ factors through $F_{i}, i=i(j)$. Hence $T_{j} \rightarrow T$ factors through the open subscheme $V_{i(j)} \subset T$. Since $\left\{T_{j} \rightarrow T\right\}$ is jointly surjective, it follows that $T=\bigcup V_{i}$ is an open covering. In particular, the transformation of functors $\left\lfloor F_{i} \rightarrow F\right.$ is representable and surjective in the sense of Definition 52.5.1 (see Remark 52.5.2 for a discussion).

Next, let $T^{\prime} \rightarrow F$ be a second morphism from an object in $(S c h / S)_{f p p f}$. Write as above $T^{\prime}=\bigcup V_{i}^{\prime}$ with $V_{i}^{\prime}=T^{\prime} \times_{F} F_{i}$. To show that the diagonal $F \rightarrow F \times F$ is representable we have to show that $G=T \times{ }_{F} T^{\prime}$ is representable, see Lemma 52.5.10. Consider the subfunctors $G_{i}=G \times{ }_{F} F_{i}$. Note that $G_{i}=V_{i} \times_{F_{i}} V_{i}^{\prime}$, and hence is representable as $F_{i}$ is an algebraic space. By the above the $G_{i}$ form a Zariski covering of $F$. Hence by Schemes, Lemma 25.15.4 we see $G$ is representable.

Choose a scheme $U \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $U \rightarrow \amalg F_{i}$ (this exist by hypothesis). We may write $U=\coprod U_{i}$ with $U_{i}$ the inverse image of $F_{i}$, see Lemma 52.8.1. We claim that $U \rightarrow F$ is surjective and étale. Surjectivity follows as $\coprod F_{i} \rightarrow F$ is surjective (see first paragraph of the proof) by applying Lemma 52.5.4 Consider the fibre product $U \times_{F} T$ where $T \rightarrow F$ is as above. We have to show that $U \times_{F} T \rightarrow T$ is étale. Since $U \times_{F} T=\coprod U_{i} \times_{F} T$ it suffices to show each $U_{i} \times{ }_{F} T \rightarrow T$ is étale. Since $U_{i} \times{ }_{F} T=U_{i} \times{ }_{F_{i}} V_{i}$ this follows from the fact that $U_{i} \rightarrow F_{i}$ is étale and $V_{i} \rightarrow T$ is an open immersion (and Morphisms, Lemmas 28.36.9 and 28.36.3.

### 52.9. Presentations of algebraic spaces

0261 Given an algebraic space we can find a "presentation" of it.
0262 Lemma 52.9.1. Let $F$ be an algebraic space over $S$. Let $f: U \rightarrow F$ be a surjective étale morphism from a scheme to $F$. Set $R=U \times_{F} U$. Then
(1) $j: R \rightarrow U \times{ }_{S} U$ defines an equivalence relation on $U$ over $S$ (see Groupoids, Definition 38.3.1).
(2) the morphisms $s, t: R \rightarrow U$ are étale, and
(3) the diagram

$$
R \longrightarrow U \longrightarrow F
$$

is a coequalizer diagram in $\operatorname{Sh}\left((S c h / S)_{f p p f}\right)$.
Proof. Let $T / S$ be an object of $(S c h / S)_{f p p f}$. Then $R(T)=\{(a, b) \in U(T) \times U(T) \mid$ $f \circ a=f \circ b\}$ which is clearly defines an equivalence relation on $U(T)$. The morphisms $s, t: R \rightarrow U$ are étale because the morphism $U \rightarrow F$ is étale.

To prove (3) we first show that $U \rightarrow F$ is a surjection of sheaves, see Sites, Definition 7.12.1. Let $\xi \in F(T)$ with $T$ as above. Let $V=T \times_{\xi, F, f} U$. By assumption $V$ is a scheme and $V \rightarrow T$ is surjective étale. Hence $\{V \rightarrow T\}$ is a covering for the fppf topology. Since $\left.\xi\right|_{V}$ factors through $U$ by construction we conclude $U \rightarrow F$ is surjective. Surjectivity implies that $F$ is the coequalizer of the diagram by Sites, Lemma 7.12.3.

This lemma suggests the following definitions.
02WS Definition 52.9.2. Let $S$ be a scheme. Let $U$ be a scheme over $S$. An étale equivalence relation on $U$ over $S$ is an equivalence relation $j: R \rightarrow U \times_{S} U$ such that $s, t: R \rightarrow U$ are étale morphisms of schemes.

0263 Definition 52.9.3. Let $F$ be an algebraic space over $S$. A presentation of $F$ is given by a scheme $U$ over $S$ and an étale equivalence relation $R$ on $U$ over $S$, and a surjective étale morphism $U \rightarrow F$ such that $R=U \times{ }_{F} U$.

Equivalently we could ask for the existence of an isomorphism

$$
U / R \cong F
$$

where the quotient $U / R$ is as defined in Groupoids, Section 38.20. To construct algebraic spaces we will study the converse question, namely, for which equivalence relations the quotient sheaf $U / R$ is an algebraic space. It will finally turn out this is always the case if $R$ is an étale equivalence relation on $U$ over $S$, see Theorem 52.10.5.

### 52.10. Algebraic spaces and equivalence relations

0264 Suppose given a scheme $U$ over $S$ and an étale equivalence relation $R$ on $U$ over $S$. We would like to show this defines an algebraic space. We will produce a series of lemmas that prove the quotient sheaf $U / R$ (see Groupoids, Definition 38.20.1) has all the properties required of it in Definition 52.6.1.

02WT Lemma 52.10.1. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j=(s, t)$ : $R \rightarrow U \times_{S} U$ be an étale equivalence relation on $U$ over $S$. Let $U^{\prime} \rightarrow U$ be an étale morphism. Let $R^{\prime}$ be the restriction of $R$ to $U^{\prime}$, see Groupoids, Definition 38.3.3. Then $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times{ }_{S} U^{\prime}$ is an étale equivalence relation also.

Proof. It is clear from the description of $s^{\prime}, t^{\prime}$ in Groupoids, Lemma 38.18.1 that $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are étale as compositions of base changes of étale morphisms (see Morphisms, Lemma 28.36.4 and 28.36.3.

We will often use the following lemma to find open subspaces of algebraic spaces. A slight improvement (with more general hypotheses) of this lemma is Bootstrap, Lemma 67.7.1.

02WU Lemma 52.10.2. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j=(s, t)$ : $R \rightarrow U \times_{S} U$ be a pre-relation. Let $g: U^{\prime} \rightarrow U$ be a morphism. Assume
(1) $j$ is an equivalence relation,
(2) $s, t: R \rightarrow U$ are surjective, flat and locally of finite presentation,
(3) $g$ is flat and locally of finite presentation.

Let $R^{\prime}=\left.R\right|_{U^{\prime}}$ be the restriction of $R$ to $U$. Then $U^{\prime} / R^{\prime} \rightarrow U / R$ is representable, and is an open immersion.

Proof. By Groupoids, Lemma 38.3 .2 the morphism $j^{\prime}=\left(t^{\prime}, s^{\prime}\right): R^{\prime} \rightarrow U^{\prime} \times_{S} U^{\prime}$ defines an equivalence relation. Since $g$ is flat and locally of finite presentation we see that $g$ is universally open as well (Morphisms, Lemma 28.25.9). For the same reason $s, t$ are universally open as well. Let $W^{1}=g\left(U^{\prime}\right) \subset U$, and let $W=t\left(s^{-1}\left(W^{1}\right)\right)$. Then $W^{1}$ and $W$ are open in $U$. Moreover, as $j$ is an equivalence relation we have $t\left(s^{-1}(W)\right)=W$ (see Groupoids, Lemma 38.19 .2 for example).

By Groupoids, Lemma 38.20.5 the map of sheaves $F^{\prime}=U^{\prime} / R^{\prime} \rightarrow F=U / R$ is injective. Let $a: T \rightarrow F$ be a morphism from a scheme into $U / R$. We have to show that $T \times{ }_{F} F^{\prime}$ is representable by an open subscheme of $T$.

The morphism $a$ is given by the following data: an fppf covering $\left\{\varphi_{j}: T_{j} \rightarrow T\right\}_{j \in J}$ of $T$ and morphisms $a_{j}: T_{j} \rightarrow U$ such that the maps

$$
a_{j} \times a_{j^{\prime}}: T_{j} \times_{T} T_{j^{\prime}} \longrightarrow U \times_{S} U
$$

factor through $j: R \rightarrow U \times{ }_{S} U$ via some (unique) maps $r_{j j^{\prime}}: T_{j} \times_{T} T_{j^{\prime}} \rightarrow R$. The system $\left(a_{j}\right)$ corresponds to $a$ in the sense that the diagrams

commute.

Consider the open subsets $W_{j}=a_{j}^{-1}(W) \subset T_{j}$. Since $t\left(s^{-1}(W)\right)=W$ we see that

$$
W_{j} \times_{T} T_{j^{\prime}}=r_{j j^{\prime}}^{-1}\left(t^{-1}(W)\right)=r_{j j^{\prime}}^{-1}\left(s^{-1}(W)\right)=T_{j} \times_{T} W_{j^{\prime}} .
$$

By Descent, Lemma 34.9.2 this means there exists an open $W_{T} \subset T$ such that $\varphi_{j}^{-1}\left(W_{T}\right)=W_{j}$ for all $j \in J$. We claim that $W_{T} \rightarrow T$ represents $T \times{ }_{F} F^{\prime} \rightarrow T$.
First, let us show that $W_{T} \rightarrow T \rightarrow F$ is an element of $F^{\prime}\left(W_{T}\right)$. Since $\left\{W_{j} \rightarrow\right.$ $\left.W_{T}\right\}_{j \in J}$ is an fppf covering of $W_{T}$, it is enough to show that each $W_{j} \rightarrow U \rightarrow F$ is an element of $F^{\prime}\left(W_{j}\right)$ (as $F^{\prime}$ is a sheaf for the fppf topology). Consider the commutative diagram

where $W_{j}^{\prime}=W_{j} \times_{W} s^{-1}\left(W^{1}\right) \times_{W^{1}} U^{\prime}$. Since $t$ and $g$ are surjective, flat and locally of finite presentation, so is $W_{j}^{\prime} \rightarrow W_{j}$. Hence the restriction of the element $W_{j} \rightarrow U \rightarrow F$ to $W_{j}^{\prime}$ is an element of $F^{\prime}$ as desired.
Suppose that $f: T^{\prime} \rightarrow T$ is a morphism of schemes such that $\left.a\right|_{T^{\prime}} \in F^{\prime}\left(T^{\prime}\right)$. We have to show that $f$ factors through the open $W_{T}$. Since $\left\{T^{\prime} \times_{T} T_{j} \rightarrow T\right\}$ is an fppf covering of $T^{\prime}$ it is enough to show each $T^{\prime} \times_{T} T_{j} \rightarrow T$ factors through $W_{T}$. Hence we may assume $f$ factors as $\varphi_{j} \circ f_{j}: T^{\prime} \rightarrow T_{j} \rightarrow T$ for some $j$. In this case the condition $\left.a\right|_{T^{\prime}} \in F^{\prime}\left(T^{\prime}\right)$ means that there exists some fppf covering $\left\{\psi_{i}: T_{i}^{\prime} \rightarrow T^{\prime}\right\}_{i \in I}$ and some morphisms $b_{i}: T_{i}^{\prime} \rightarrow U^{\prime}$ such that

is commutative. This commutativity means that there exists a morphism $r_{i}^{\prime}: T_{i}^{\prime} \rightarrow$ $R$ such that $t \circ r_{i}^{\prime}=a_{j} \circ f_{j} \circ \psi_{i}$, and $s \circ r_{i}^{\prime}=g \circ b_{i}$. This implies that $\operatorname{Im}\left(f_{j} \circ \psi_{i}\right) \subset W_{j}$ and we win.

The following lemma is not completely trivial although it looks like it should be trivial.

02WV Lemma 52.10.3. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j=(s, t)$ : $R \rightarrow U \times_{S} U$ be an étale equivalence relation on $U$ over $S$. If the quotient $U / R$ is an algebraic space, then $U \rightarrow U / R$ is étale and surjective. Hence $(U, R, U \rightarrow U / R)$ is a presentation of the algebraic space $U / R$.

Proof. Denote $c: U \rightarrow U / R$ the morphism in question. Let $T$ be a scheme and let $a: T \rightarrow U / R$ be a morphism. We have to show that the morphism (of schemes) $\pi: T \times a, U / R, c] \rightarrow T$ is étale and surjective. The morphism $a$ corresponds to an fppf covering $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ and morphisms $a_{i}: T_{i} \rightarrow U$ such
that $a_{i} \times a_{i^{\prime}}: T_{i} \times_{T} T_{i^{\prime}} \rightarrow U \times_{S} U$ factors through $R$, and such that $c \circ a_{i}=\varphi_{i} \circ a$. Hence

$$
T_{i} \times_{\varphi_{i}, T} T \times_{a, U / R, c} U=T_{i} \times_{c \circ a_{i}, U / R, c} U=T_{i} \times_{a_{i}, U} U \times_{c, U / R, c} U=T_{i} \times_{a_{i}, U, t} R .
$$

Since $t$ is étale and surjective we conclude that the base change of $\pi$ to $T_{i}$ is surjective and étale. Since the property of being surjective and étale is local on the base in the fpqc topology (see Remark 52.4.3) we win.

0265 Lemma 52.10.4. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j=(s, t)$ : $R \rightarrow U \times_{S} U$ be an étale equivalence relation on $U$ over $S$. Assume that $U$ is affine. Then the quotient $F=U / R$ is an algebraic space, and $U \rightarrow F$ is étale and surjective.

Proof. Since $j: R \rightarrow U \times_{S} U$ is a monomorphism we see that $j$ is separated (see Schemes, Lemma 25.23.3). Since $U$ is affine we see that $U \times_{S} U$ (which comes equipped with a monomorphism into the affine scheme $U \times U$ ) is separated. Hence we see that $R$ is separated. In particular the morphisms $s, t$ are separated as well as étale.

Since the composition $R \rightarrow U \times{ }_{S} U \rightarrow U$ is locally of finite type we conclude that $j$ is locally of finite type (see Morphisms, Lemma 28.15.8. As $j$ is also a monomorphism it has finite fibres and we see that $j$ is locally quasi-finite by Morphisms, Lemma 28.20.7. Altogether we see that $j$ is separated and locally quasi-finite.

Our first step is to show that the quotient map $c: U \rightarrow F$ is representable. Consider a scheme $T$ and a morphism $a: T \rightarrow F$. We have to show that the sheaf $G=$ $T \times{ }_{a, F, c} U$ is representable. As seen in the proofs of Lemmas 52.10 .2 and 52.10.3 there exists an fppf covering $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ and morphisms $a_{i}: T_{i} \rightarrow \bar{U}$ such that $a_{i} \times a_{i^{\prime}}: T_{i} \times_{T} T_{i^{\prime}} \rightarrow U \times_{S} U$ factors through $R$, and such that $c \circ a_{i}=\varphi_{i} \circ a$. As in the proof of Lemma 52.10 .3 we see that

$$
\begin{aligned}
T_{i} \times_{\varphi_{i}, T} G & =T_{i} \times_{\varphi_{i}, T} T \times_{a, U / R, c} U \\
& =T_{i} \times{ }_{c o a_{i}, U / R, c} U \\
& =T_{i} \times_{a_{i}, U} U \times_{c, U / R, c} U \\
& =T_{i} \times_{a_{i}, U, t} R
\end{aligned}
$$

Since $t$ is separated and étale, and in particular separated and locally quasi-finite (by Morphisms, Lemmas 28.35 .10 and 28.36 .16 ) we see that the restriction of $G$ to each $T_{i}$ is representable by a morphism of schemes $X_{i} \rightarrow T_{i}$ which is separated and locally quasi-finite. By Descent, Lemma 34.35.1 we obtain a descent datum $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ relative to the fppf-covering $\left\{T_{i} \rightarrow T\right\}$. Since each $X_{i} \rightarrow T_{i}$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 36.39.1 that this descent datum is effective. Hence by Descent, Lemma 34.35.1(2) we conclude that $G$ is representable as desired.

The second step of the proof is to show that $U \rightarrow F$ is surjective and étale. This is clear from the above since in the first step above we saw that $G=T \times{ }_{a, F, c} U$ is a scheme over $T$ which base changes to schemes $X_{i} \rightarrow T_{i}$ which are surjective and étale. Thus $G \rightarrow T$ is surjective and étale (see Remark 52.4.3). Alternatively one can reread the proof of Lemma 52.10.3 in the current situation.

The third and final step is to show that the diagonal map $F \rightarrow F \times F$ is representable. We first observe that the diagram

is a fibre product square. By Lemma 52.3 .4 the morphism $U \times{ }_{S} U \rightarrow F \times F$ is representable (note that $h_{U} \times h_{U}=h_{U \times_{S} U}$ ). Moreover, by Lemma 52.5.7 the morphism $U \times{ }_{S} U \rightarrow F \times F$ is surjective and étale (note also that étale and surjective occur in the lists of Remarks 52.4.3 and 52.4.2. It follows either from Lemma 52.3 .3 and the diagram above, or by writing $R \rightarrow F$ as $R \rightarrow U \rightarrow F$ and Lemmas 52.3.1 and 52.3.2 that $R \rightarrow F$ is representable as well. Let $T$ be a scheme and let $a: T \rightarrow F \times F$ be a morphism. We have to show that $G=T \times{ }_{a, F \times F, \Delta} F$ is representable. By what was said above the morphism (of schemes)

$$
T^{\prime}=\left(U \times_{S} U\right) \times_{F \times F, a} T \longrightarrow T
$$

is surjective and étale. Hence $\left\{T^{\prime} \rightarrow T\right\}$ is an étale covering of $T$. Note also that

$$
T^{\prime} \times_{T} G=T^{\prime} \times_{U \times_{S} U, j} R
$$

as can be seen contemplating the following cube

Hence we see that the restriction of $G$ to $T^{\prime}$ is representable by a scheme $X$, and moreover that the morphism $X \rightarrow T^{\prime}$ is a base change of the morphism $j$. Hence $X \rightarrow T^{\prime}$ is separated and locally quasi-finite (see second paragraph of the proof). By Descent, Lemma 34.35.1 we obtain a descent datum $(X, \varphi)$ relative to the fppfcovering $\left\{T^{\prime} \rightarrow T\right\}$. Since $X \rightarrow T$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 36.39.1 that this descent datum is effective. Hence by Descent, Lemma 34.35.1 (2) we conclude that $G$ is representable as desired.

02WW Theorem 52.10.5. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j=(s, t)$ : $R \rightarrow U \times_{S} U$ be an étale equivalence relation on $U$ over $S$. Then the quotient $U / R$ is an algebraic space, and $U \rightarrow U / R$ is étale and surjective, in other words $(U, R, U \rightarrow U / R)$ is a presentation of $U / R$.

Proof. By Lemma 52.10 .3 it suffices to prove that $U / R$ is an algebraic space. Let $U^{\prime} \rightarrow U$ be a surjective, étale morphism. Then $\left\{U^{\prime} \rightarrow U\right\}$ is in particular an fppf covering. Let $R^{\prime}$ be the restriction of $R$ to $U^{\prime}$, see Groupoids, Definition 38.3.3. According to Groupoids, Lemma 38.20 .6 we see that $U / R \cong U^{\prime} / R^{\prime}$. By Lemma $52.10 .1 R^{\prime}$ is an étale equivalence relation on $U^{\prime}$. Thus we may replace $U$ by $U^{\prime}$.

We apply the previous remark to $U^{\prime}=\coprod U_{i}$, where $U=\bigcup U_{i}$ is an affine open covering of $S$. Hence we may and do assume that $U=\coprod U_{i}$ where each $U_{i}$ is an affine scheme.

Consider the restriction $R_{i}$ of $R$ to $U_{i}$. By Lemma 52.10.1 this is an étale equivalence relation. Set $F_{i}=U_{i} / R_{i}$ and $F=U / R$. It is clear that $\coprod F_{i} \rightarrow F$ is surjective. By Lemma 52.10 .2 each $F_{i} \rightarrow F$ is representable, and an open immersion. By Lemma 52.10 .4 applied to $\left(U_{i}, R_{i}\right)$ we see that $F_{i}$ is an algebraic space. Then by Lemma 52.10 .3 we see that $U_{i} \rightarrow F_{i}$ is étale and surjective. From Lemma 52.8.3 it follows that $\coprod F_{i}$ is an algebraic space. Finally, we have verified all hypotheses of Lemma 52.8 .4 and it follows that $F=U / R$ is an algebraic space.

### 52.11. Algebraic spaces, retrofitted

02WX We start building our arsenal of lemmas dealing with algebraic spaces. The first result says that in Definition 52.6.1 we can weaken the condition on the diagonal as follows.

0BGQ Lemma 52.11.1. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F$ be a sheaf on $(S c h / S)_{\text {fppf }}$ such that there exists $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a map $U \rightarrow F$ which is representable, surjective, and étale. Then $F$ is an algebraic space.

Proof. Set $R=U \times_{F} U$. This is a scheme as $U \rightarrow F$ is assumed representable. The projections $s, t: R \rightarrow U$ are étale as $U \rightarrow F$ is assumed étale. The map $j=(t, s): R \rightarrow U \times_{S} U$ is a monomorphism and an equivalence relation as $R=U \times_{F} U$. By Theorem 52.10 .5 the quotient sheaf $F^{\prime}=U / R$ is an algebraic space and $U \rightarrow F^{\prime}$ is surjective and étale. Again since $R=U \times{ }_{F} U$ we obtain a canonical factorization $U \rightarrow F^{\prime} \rightarrow F$ and $F^{\prime} \rightarrow F$ is an injective map of sheaves. On the other hand, $U \rightarrow F$ is surjective as a map of sheaves by Lemma 52.5.9. Thus $F^{\prime} \rightarrow F$ is also surjective and we conclude $F^{\prime}=F$ is an algebraic space.

0BGR Lemma 52.11.2. Let $S$ be a scheme contained in $S c h_{\text {fppf }}$. Let $G$ be an algebraic space over $S$, let $F$ be a sheaf on $(S c h / S)_{f p p f}$, and let $G \rightarrow F$ be a representable transformation of functors which is surjective and étale. Then $F$ is an algebraic space.

Proof. Pick a scheme $U$ and a surjective étale morphism $U \rightarrow G$. Since $G$ is an algebraic space $U \rightarrow G$ is representable. Hence the composition $U \rightarrow G \rightarrow F$ is representable, surjective, and étale. See Lemmas 52.3.2 and 52.5.4. Thus $F$ is an algebraic space by Lemma 52.11.1.

02WY Lemma 52.11.3. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F$ be an algebraic space over $S$. Let $G \rightarrow F$ be a representable transformation of functors. Then $G$ is an algebraic space.

Proof. By Lemma 52.3.5 we see that $G$ is a sheaf. The diagram

is cartesian. Hence we see that $G \times{ }_{F} G \rightarrow G \times G$ is representable by Lemma 52.3.3. By Lemma 52.3.6 we see that $G \rightarrow G \times_{F} G$ is representable. Hence $\Delta_{G}$ :
$G \rightarrow G \times G$ is representable as a composition of representable transformations, see Lemma 52.3.2. Finally, let $U$ be an object of $(S c h / S)_{f p p f}$ and let $U \rightarrow F$ be surjective and étale. By assumption $U \times_{F} G$ is representable by a scheme $U^{\prime}$. By Lemma 52.5 .5 the morphism $U^{\prime} \rightarrow G$ is surjective and étale. This verifies the final condition of Definition 52.6.1 and we win.

02WZ Lemma 52.11.4. Let $S$ be a scheme contained in $S_{\text {Sh }}^{\text {fppf }}$. Let $F, G$ be algebraic spaces over $S$. Let $G \rightarrow F$ be a representable morphism. Let $U \in \operatorname{Ob}\left((S c h / S)_{\text {fppf }}\right)$, and $q: U \rightarrow F$ surjective and étale. Set $V=G \times_{F} U$. Finally, let $\mathcal{P}$ be a property of morphisms of schemes as in Definition 52.5.1. Then $G \rightarrow F$ has property $\mathcal{P}$ if and only if $V \rightarrow U$ has property $\mathcal{P}$.

Proof. (This lemma follows from Lemmas 52.5.5 and 52.5.6 but we give a direct proof here also.) It is clear from the definitions that if $G \rightarrow F$ has property $\mathcal{P}$, then $V \rightarrow U$ has property $\mathcal{P}$. Conversely, assume $V \rightarrow U$ has property $\mathcal{P}$. Let $T \rightarrow F$ be a morphism from a scheme to $F$. Let $T^{\prime}=T \times{ }_{F} G$ which is a scheme since $G \rightarrow F$ is representable. We have to show that $T^{\prime} \rightarrow T$ has property $\mathcal{P}$. Consider the commutative diagram of schemes

where both squares are fibre product squares. Hence we conclude the middle arrow has property $\mathcal{P}$ as a base change of $V \rightarrow U$. Finally, $\left\{T \times_{F} U \rightarrow T\right\}$ is a fppf covering as it is surjective étale, and hence we conclude that $T^{\prime} \rightarrow T$ has property $\mathcal{P}$ as it is local on the base in the fppf topology.

03I2 Lemma 52.11.5. Let $S$ be a scheme contained in $S_{\text {sch }}^{\text {fppf }}$. Let $G \rightarrow F$ be a transformation of presheaves on $(S c h / S)_{\text {fppf }}$. Let $\mathcal{P}$ be a property of morphisms of schemes. Assume
(1) $\mathcal{P}$ is preserved under any base change, fppf local on the base, and morphisms of type $\mathcal{P}$ satisfy descent for fppf coverings, see Descent, Definition 34.32.1.
(2) $G$ is a sheaf,
(3) $F$ is an algebraic space,
(4) there exists a $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and a surjective étale morphism $U \rightarrow$ $F$ such that $V=G \times_{F} U$ is representable, and
(5) $V \rightarrow U$ has $\mathcal{P}$.

Then $G$ is an algebraic space, $G \rightarrow F$ is representable and has property $\mathcal{P}$.
Proof. Let $R=U \times_{F} U$, and denote $t, s: R \rightarrow U$ the projection morphisms as usual. Let $T$ be a scheme and let $T \rightarrow F$ be a morphism. Then $U \times_{F} T \rightarrow T$ is surjective étale, hence $\left\{U \times{ }_{F} T \rightarrow T\right\}$ is a covering for the étale topology. Consider

$$
W=G \times_{F}\left(U \times_{F} T\right)=V \times_{F} T=V \times_{U}\left(U \times_{F} T\right) .
$$

It is a scheme since $F$ is an algebraic space. The morphism $W \rightarrow U \times{ }_{F} T$ has property $\mathcal{P}$ since it is a base change of $V \rightarrow U$. There is an isomorphism

$$
\begin{aligned}
W \times_{T}\left(U \times_{F} T\right) & =\left(G \times_{F}\left(U \times_{F} T\right)\right) \times_{T}\left(U \times_{F} T\right) \\
& =\left(U \times_{F} T\right) \times_{T}\left(G \times_{F}\left(U \times_{F} T\right)\right) \\
& =\left(U \times_{F} T\right) \times_{T} W
\end{aligned}
$$

over $\left(U \times_{F} T\right) \times_{T}\left(U \times_{F} T\right)$. The middle equality maps $\left(\left(g,\left(u_{1}, t\right)\right),\left(u_{2}, t\right)\right)$ to $\left(\left(u_{1}, t\right),\left(g,\left(u_{2}, t\right)\right)\right)$. This defines a descent datum for $W / U \times_{F} T / T$, see Descent, Definition 34.30.1. This follows from Descent, Lemma 34.35.1. Namely we have a sheaf $G \times{ }_{F} T$, whose base change to $U \times{ }_{F} T$ is represented by $W$ and the isomorphism above is the one from the proof of Descent, Lemma 34.35.1. By assumption on $\mathcal{P}$ the descent datum above is representable. Hence by the last statement of Descent, Lemma 34.35.1 we see that $G \times{ }_{F} T$ is representable. This proves that $G \rightarrow F$ is a representable transformation of functors.
As $G \rightarrow F$ is representable, we see that $G$ is an algebraic space by Lemma 52.11 .3 . The fact that $G \rightarrow F$ has property $\mathcal{P}$ now follows from Lemma 52.11.4.

02X1 Lemma 52.11.6. Let $S$ be a scheme contained in $S c h_{\text {fppf }}$. Let $F, G$ be algebraic spaces over $S$. Let $a: F \rightarrow G$ be a morphism. Given any $V \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and a surjective étale morphism $q: V \rightarrow G$ there exists a $U \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ and a commutative diagram

with $p$ surjective and étale.
Proof. First choose $W \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ with surjective étale morphism $W \rightarrow$ $F$. Next, put $U=W \times{ }_{G} V$. Since $G$ is an algebraic space we see that $U$ is isomorphic to an object of $(S c h / S)_{f p p f}$. As $q$ is surjective étale, we see that $U \rightarrow W$ is surjective étale (see Lemma 52.5.5). Thus $U \rightarrow F$ is surjective étale as a composition of surjective étale morphisms (see Lemma 52.5.4).

### 52.12. Immersions and Zariski coverings of algebraic spaces

02 YT At this point an interesting phenomenon occurs. We have already defined the notion of an open immersion of algebraic spaces (through Definition 52.5.1) but we have yet to define the notion of a poin ${ }^{11}$. Thus the Zariski topology of an algebraic space has already been defined, but there is no space yet!
Perhaps superfluously we formally introduce immersions as follows.
02YU Definition 52.12.1. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$ be a scheme. Let $F$ be an algebraic space over $S$.
(1) A morphism of algebraic spaces over $S$ is called an open immersion if it is representable, and an open immersion in the sense of Definition 52.5.1.
(2) An open subspace of $F$ is a subfunctor $F^{\prime} \subset F$ such that $F^{\prime}$ is an algebraic space and $F^{\prime} \rightarrow F$ is an open immersion.

[^150](3) A morphism of algebraic spaces over $S$ is called a closed immersion if it is representable, and a closed immersion in the sense of Definition 52.5.1.
(4) A closed subspace of $F$ is a subfunctor $F^{\prime} \subset F$ such that $F^{\prime}$ is an algebraic space and $F^{\prime} \rightarrow F$ is a closed immersion.
(5) A morphism of algebraic spaces over $S$ is called an immersion if it is representable, and an immersion in the sense of Definition 52.5.1.
(6) A locally closed subspace of $F$ is a subfunctor $F^{\prime} \subset F$ such that $F^{\prime}$ is an algebraic space and $F^{\prime} \rightarrow F$ is an immersion.

We note that these definitions make sense since an immersion is in particular a monomorphism (see Schemes, Lemma 25.23.7 and Lemma 52.5.8, and hence the image of an immersion $G \rightarrow F$ of algebraic spaces is a subfunctor $F^{\prime} \subset F$ which is (canonically) isomorphic to $G$. Thus some of the discussion of Schemes, Section 25.10 carries over to the setting of algebraic spaces.

02YV Lemma 52.12.2. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$ be a scheme. A composition of (closed, resp. open) immersions of algebraic spaces over $S$ is a (closed, resp. open) immersion of algebraic spaces over $S$.
Proof. See Lemma 52.5 .4 and Remarks 52.4 .3 (see very last line of that remark) and 52.4.2

02YW Lemma 52.12.3. Let $S \in \operatorname{Ob}\left(S h_{f p p f}\right)$ be a scheme. A base change of a (closed, resp. open) immersion of algebraic spaces over $S$ is a (closed, resp. open) immersion of algebraic spaces over $S$.

Proof. See Lemma 52.5 .5 and Remark 52.4 .3 (see very last line of that remark).
02YX Lemma 52.12.4. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$ be a scheme. Let $F$ be an algebraic space over $S$. Let $F_{1}, F_{2}$ be locally closed subspaces of $F$. If $F_{1} \subset F_{2}$ as subfunctors of $F$, then $F_{1}$ is a locally closed subspace of $F_{2}$. Similarly for closed and open subspaces.

Proof. Let $T \rightarrow F_{2}$ be a morphism with $T$ a scheme. Since $F_{2} \rightarrow F$ is a monomorphism, we see that $T \times{ }_{F_{2}} F_{1}=T \times{ }_{F} F_{1}$. The lemma follows formally from this.

Let us formally define the notion of a Zariski open covering of algebraic spaces. Note that in Lemma 52.8 .4 we have already encountered such open coverings as a method for constructing algebraic spaces.
02YY Definition 52.12.5. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$ be a scheme. Let $F$ be an algebraic space over $S$. A Zariski covering $\left\{F_{i} \subset F\right\}_{i \in I}$ of $F$ is given by a set $I$, a collection of open subspaces $F_{i} \subset F$ such that $\coprod F_{i} \rightarrow F$ is a surjective map of sheaves.
Note that if $T$ is a schemes, and $a: T \rightarrow F$ is a morphism, then each of the fibre products $T \times{ }_{F} F_{i}$ is identified with an open subscheme $T_{i} \subset T$. The final condition of the definition signifies exactly that $T=\bigcup_{i \in I} T_{i}$.
It is clear that the collection $F_{Z a r}$ of open subspaces of $F$ is a set $\left(\right.$ as $(S c h / S)_{f p p f}$ is a site, hence a set). Moreover, we can turn $F_{Z a r}$ into a category by letting the morphisms be inclusions of subfunctors (which are automatically open immersions by Lemma 52.12.4. Finally, Definition 52.12 .5 provides the notion of a Zariski covering $\left\{F_{i} \rightarrow F^{\prime}\right\}_{i \in I}$ in the category $F_{Z a r}$. Hence, just as in the case of a topological space (see Sites, Example 7.6.4 by suitably choosing a set of coverings we may obtain a Zariski site of the algebraic space $F$.

02YZ Definition 52.12.6. Let $S \in \mathrm{Ob}\left(S c h_{f p p f}\right)$ be a scheme. Let $F$ be an algebraic space over $S$. A small Zariski site $F_{Z a r}$ of an algebraic space $F$ is one of the sites described above.

Hence this gives a notion of what it means for something to be true Zariski locally on an algebraic space, which is how we will use this notion. In general the Zariski topology is not fine enough for our purposes. For example we can consider the category of Zariski sheaves on an algebraic space. It will turn out that this is not the correct thing to consider, even for quasi-coherent sheaves. One only gets the desired result when using the étale or fppf site of $F$ to define quasi-coherent sheaves.

### 52.13. Separation conditions on algebraic spaces

02X3 A separation condition on an algebraic space $F$ is a condition on the diagonal morphism $F \rightarrow F \times F$. Let us first list the properties the diagonal has automatically. Since the diagonal is representable by definition the following lemma makes sense (through Definition 52.5.1).
02X4 Lemma 52.13.1. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F$ be an algebraic space over $S$. Let $\Delta: F \rightarrow F \times F$ be the diagonal morphism. Then
(1) $\Delta$ is locally of finite type,
(2) $\Delta$ is a monomorphism,
(3) $\Delta$ is separated, and
(4) $\Delta$ is locally quasi-finite.

Proof. Let $F=U / R$ be a presentation of $F$. As in the proof of Lemma 52.10.4 the diagram

is cartesian. Hence according to Lemma 52.11 .4 it suffices to show that $j$ has the properties listed in the lemma. (Note that each of the properties (1) - (4) occur in the lists of Remarks 52.4 .1 and 52.4.3.) Since $j$ is an equivalence relation it is a monomorphism. Hence it is separated by Schemes, Lemma 25.23.3. As $R$ is an étale equivalence relation we see that $s, t: R \rightarrow U$ are étale. Hence $s, t$ are locally of finite type. Then it follows from Morphisms, Lemma 28.15.8 that $j$ is locally of finite type. Finally, as it is a monomorphism its fibres are finite. Thus we conclude that it is locally quasi-finite by Morphisms, Lemma 28.20 .7 .

Here are some common types of separation conditions, relative to the base scheme $S$. There is also an absolute notion of these conditions which we will discuss in Properties of Spaces, Section 53.3. Moreover, we will discuss separation conditions for a morphism of algebraic spaces in Morphisms of Spaces, Section 54.4.

02X5 Definition 52.13.2. Let $S$ be a scheme contained in $S c h_{f p p f}$. Let $F$ be an algebraic space over $S$. Let $\Delta: F \rightarrow F \times F$ be the diagonal morphism.
(1) We say $F$ is separated over $S$ if $\Delta$ is a closed immersion.
(2) We say $F$ is locally separated over $S^{2}$ if $\Delta$ is an immersion.
(3) We say $F$ is quasi-separated over $S$ if $\Delta$ is quasi-compact.

[^151](4) We say $F$ is Zariski locally quasi-separated over $S^{3}$ if there exists a Zariski covering $F=\bigcup_{i \in I} F_{i}$ such that each $F_{i}$ is quasi-separated.

Note that if the diagonal is quasi-compact (when $F$ is separated or quasi-separated) then the diagonal is actually quasi-finite and separated, hence quasi-affine (by More on Morphisms, Lemma 36.31.2.

### 52.14. Examples of algebraic spaces

$02 Z 0$ In this section we construct some examples of algebraic spaces. Some of these were suggested by B. Conrad. Since we do not yet have a lot of theory at our disposal the discussion is a bit awkward in some places.

02Z1 Example 52.14.1. Let $k$ be a field of characteristic $\neq 2$. Let $U=\mathbf{A}_{k}^{1}$. Set

$$
j: R=\Delta \amalg \Gamma \longrightarrow U \times_{k} U
$$

where $\Delta=\left\{(x, x) \mid x \in \mathbf{A}_{k}^{1}\right\}$ and $\Gamma=\left\{(x,-x) \mid x \in \mathbf{A}_{k}^{1}, x \neq 0\right\}$. It is clear that $s, t: R \rightarrow U$ are étale, and hence $j$ is an étale equivalence relation. The quotient $X=U / R$ is an algebraic space by Theorem 52.10.5. Since $R$ is quasi-compact we see that $X$ is quasi-separated. On the other hand, $X$ is not locally separated because the morphism $j$ is not an immersion.
03FN Example 52.14.2. Let $k$ be a field. Let $k \subset k^{\prime}$ be a degree 2 Galois extension with $\operatorname{Gal}\left(k^{\prime} / k\right)=\{1, \sigma\}$. Let $S=\operatorname{Spec}(k[x])$ and $U=\operatorname{Spec}\left(k^{\prime}[x]\right)$. Note that

$$
U \times_{S} U=\operatorname{Spec}\left(\left(k^{\prime} \otimes_{k} k^{\prime}\right)[x]\right)=\Delta(U) \amalg \Delta^{\prime}(U)
$$

where $\Delta^{\prime}=(1, \sigma): U \rightarrow U \times_{S} U$. Take

$$
R=\Delta(U) \amalg \Delta^{\prime}\left(U \backslash\left\{0_{U}\right\}\right)
$$

where $0_{U} \in U$ denotes the $k^{\prime}$-rational point whose $x$-coordinate is zero. It is easy to see that $R$ is an étale equivalence relation on $U$ over $S$ and hence $X=U / R$ is an algebraic space by Theorem 52.10.5. Here are some properties of $X$ (some of which will not make sense until later):
(1) $X \rightarrow S$ is an isomorphism over $S \backslash\left\{0_{S}\right\}$,
(2) the morphism $X \rightarrow S$ is étale (see Properties of Spaces, Definition53.15.2)
(3) the fibre $0_{X}$ of $X \rightarrow S$ over $0_{S}$ is isomorphic to $\operatorname{Spec}\left(k^{\prime}\right)=0_{U}$,
(4) $X$ is not a scheme because if it where, then $\mathcal{O}_{X, 0_{X}}$ would be a local domain $(\mathcal{O}, \mathfrak{m}, \kappa)$ with fraction field $k(x)$, with $x \in \mathfrak{m}$ and residue field $\kappa=k^{\prime}$ which is impossible,
(5) $X$ is not separated, but it is locally separated and quasi-separated,
(6) there exists a surjective, finite, étale morphism $S^{\prime} \rightarrow S$ such that the base change $X^{\prime}=S^{\prime} \times_{S} X$ is a scheme (namely, if we base change to $S^{\prime}=$ $\operatorname{Spec}\left(k^{\prime}[x]\right)$ then $U$ splits into two copies of $S^{\prime}$ and $X^{\prime}$ becomes isomorphic to the affine line with 0 doubled, see Schemes, Example 25.14.3), and
(7) if we think of $X$ as a finite type algebraic space over $\operatorname{Spec}(k)$, then similarly the base change $X_{k^{\prime}}$ is a scheme but $X$ is not a scheme.
In particular, this gives an example of a descent datum for schemes relative to the covering $\left\{\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)\right\}$ which is not effective.

[^152]See also Examples, Lemma 88.56.1, which shows that descent data need not be effective even for a projective morphism of schemes. That example gives a smooth separated algebraic space of dimension 3 over $\mathbf{C}$ which is not a scheme.
We will use the following lemma as a convenient way to construct algebraic spaces as quotients of schemes by free group actions.

02Z2 Lemma 52.14.3. Let $U \rightarrow S$ be a morphism of $S_{\text {Sch }}^{\text {fppf }}$. Let $G$ be an abstract group. Let $G \rightarrow A u t_{S}(U)$ be a group homomorphism. Assume
$(*)$ if $u \in U$ is a point, and $g(u)=u$ for some non-identity element $g \in G$, then $g$ induces a nontrivial automorphism of $\kappa(u)$.
Then

$$
j: R=\coprod_{g \in G} U \longrightarrow U \times_{S} U, \quad(g, x) \longmapsto(g(x), x)
$$

is an étale equivalence relation and hence

$$
F=U / R
$$

is an algebraic space by Theorem 52.10.5.
Proof. In the statement of the lemma the symbol $\operatorname{Aut}_{S}(U)$ denotes the group of automorphisms of $U$ over $S$. Assume ( $*$ ) holds. Let us show that

$$
j: R=\coprod_{g \in G} U \longrightarrow U \times_{S} U, \quad(g, x) \longmapsto(g(x), x)
$$

is a monomorphism. This signifies that if $T$ is a nonempty scheme, and $h: T \rightarrow U$ is a $T$-valued point such that $g \circ h=g^{\prime} \circ h$ then $g=g^{\prime}$. Suppose $T \neq \emptyset, h: T \rightarrow U$ and $g \circ h=g^{\prime} \circ h$. Let $t \in T$. Consider the composition $\operatorname{Spec}(\kappa(t)) \rightarrow \operatorname{Spec}(\kappa(h(t))) \rightarrow U$. Then we conclude that $g^{-1} \circ g^{\prime}$ fixes $u=h(t)$ and acts as the identity on its residue field. Hence $g=g^{\prime}$ by $(*)$.

Thus if $(*)$ holds we see that $j$ is a relation (see Groupoids, Definition 38.3.1). Moreover, it is an equivalence relation since on $T$-valued points for a connected scheme $T$ we see that $R(T)=G \times U(T) \rightarrow U(T) \times U(T)$ (recall that we always work over $S$ ). Moreover, the morphisms $s, t: R \rightarrow U$ are étale since $R$ is a disjoint product of copies of $U$. This proves that $j: R \rightarrow U \times{ }_{S} U$ is an étale equivalence relation.

Given a scheme $U$ and an action of a group $G$ on $U$ we say the action of $G$ on $U$ is free if condition $(*)$ of Lemma 52.14 .3 holds. This is equivalent to the notion of a free action of the constant group scheme $G_{S}$ on $U$ as defined in Groupoids, Definition 38.10 .2 . The lemma can be interpreted as saying that quotients of schemes by free actions of groups exist in the category of algebraic spaces.

02 Z 3 Definition 52.14.4. Notation $U \rightarrow S, G, R$ as in Lemma 52.14.3. If the action of $G$ on $U$ satisfies $(*)$ we say $G$ acts freely on the scheme $U$. In this case the algebraic space $U / R$ is denoted $U / G$ and is called the quotient of $U$ by $G$.

This notation is consistent with the notation $U / G$ introduced in Groupoids, Definition 38.20 .1 . We will later make sense of the quotient as an algebraic stack without any assumptions on the action whatsoever; when we do this we will use the notation $[U / G]$. Before we discuss the examples we prove some more lemmas to facilitate the discussion. Here is a lemma discussing the various separation conditions for this quotient when $G$ is finite.

02Z4 Lemma 52.14.5. Notation and assumptions as in Lemma 52.14.3. Assume $G$ is finite. Then
(1) if $U \rightarrow S$ is quasi-separated, then $U / G$ is quasi-separated over $S$, and
(2) if $U \rightarrow S$ is separated, then $U / G$ is separated over $S$.

Proof. In the proof of Lemma 52.13.1 we saw that it suffices to prove the corresponding properties for the morphism $j: R \rightarrow U \times{ }_{S} U$. If $U \rightarrow S$ is quasi-separated, then for every affine open $V \subset U$ which maps into an affine of $S$ the opens $g(V) \cap V$ are quasi-compact. It follows that $j$ is quasi-compact. If $U \rightarrow S$ is separated, the diagonal $\Delta_{U / S}$ is a closed immersion. Hence $j: R \rightarrow U \times{ }_{S} U$ is a finite coproduct of closed immersions with disjoint images. Hence $j$ is a closed immersion.

02Z5 Lemma 52.14.6. Notation and assumptions as in Lemma 52.14.3. If $\operatorname{Spec}(k) \rightarrow$ $U / G$ is a morphism, then there exist
(1) a finite Galois extension $k \subset k^{\prime}$,
(2) a finite subgroup $H \subset G$,
(3) an isomorphism $H \rightarrow \operatorname{Gal}\left(k^{\prime} / k\right)$, and
(4) an $H$-equivariant morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow U$.

Conversely, such data determine a morphism $\operatorname{Spec}(k) \rightarrow U / G$.
Proof. Consider the fibre product $V=\operatorname{Spec}(k) \times_{U / G} U$. Here is a diagram

This is a nonempty scheme étale over $\operatorname{Spec}(k)$ and hence is a disjoint union of spectra of fields finite separable over $k$ (Morphisms, Lemma 28.36.7). So write $V=$ $\coprod_{i \in I} \operatorname{Spec}\left(k_{i}\right)$. The action of $G$ on $U$ induces an action of $G$ on $V=\coprod \operatorname{Spec}\left(k_{i}\right)$. Pick an $i$, and let $H \subset G$ be the stabilizer of $i$. Since

$$
V \times_{\operatorname{Spec}(k)} V=\operatorname{Spec}(k) \times_{U / G} U \times_{U / G} U=\operatorname{Spec}(k) \times_{U / G} U \times G=V \times G
$$

we see that (a) the orbit of $\operatorname{Spec}\left(k_{i}\right)$ is $V$ and (b) $\operatorname{Spec}\left(k_{i} \otimes_{k} k_{i}\right)=\operatorname{Spec}\left(k_{i}\right) \times H$. Thus $H$ is finite and is the Galois group of $k_{i} / k$. We omit the converse construction.

It follows from this lemma for example that if $k^{\prime} / k$ is a finite Galois extension, then $\operatorname{Spec}\left(k^{\prime}\right) / \operatorname{Gal}\left(k^{\prime} / k\right) \cong \operatorname{Spec}(k)$. What happens if the extension is infinite? Here is an example.
02 Z 6 Example 52.14.7. Let $S=\operatorname{Spec}(\mathbf{Q})$. Let $U=\operatorname{Spec}(\overline{\mathbf{Q}})$. Let $G=\operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q})$ with obvious action on $U$. Then by construction property (*) of Lemma 52.14 .3 holds and we obtain an algebraic space

$$
X=\operatorname{Spec}(\overline{\mathbf{Q}}) / G \longrightarrow S=\operatorname{Spec}(\mathbf{Q})
$$

Of course this is totally ridiculous as an approximation of $S!$ Namely, by the ArtinSchreier theorem, see Jac64, Theorem 17, page 316], the only finite subgroups of $\operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q})$ are $\{1\}$ and the conjugates of the order two group $\operatorname{Gal}(\overline{\mathbf{Q}} / \overline{\mathbf{Q}} \cap \mathbf{R})$. Hence, if $\operatorname{Spec}(k) \rightarrow X$ is a morphism with $k$ algebraic over $\mathbf{Q}$, then it follows from Lemma 52.14 .6 and the theorem just mentioned that either $k$ is $\overline{\mathbf{Q}}$ or isomorphic to $\overline{\mathbf{Q}} \cap \mathbf{R}$.

What is wrong with the example above is that the Galois group comes equipped with a topology, and this should somehow be part of any construction of a quotient of $\operatorname{Spec}(\overline{\mathbf{Q}})$. The following example is much more reasonable in my opinion and may actually occur in "nature".
02 Z 7 Example 52.14.8. Let $k$ be a field of characteristic zero. Let $U=\mathbf{A}_{k}^{1}$ and let $G=\mathbf{Z}$. As action we take $n(x)=x+n$, i.e., the action of $\mathbf{Z}$ on the affine line by translation. The only fixed point is the generic point and it is clearly the case that $\mathbf{Z}$ injects into the automorphism group of the field $k(x)$. (This is where we use the characteristic zero assumption.) Consider the morphism

$$
\gamma: \operatorname{Spec}(k(x)) \longrightarrow X=\mathbf{A}_{k}^{1} / \mathbf{Z}
$$

of the generic point of the affine line into the quotient. We claim that this morphism does not factor through any monomorphism $\operatorname{Spec}(L) \rightarrow X$ of the spectrum of a field to $X$. (Contrary to what happens for schemes, see Schemes, Section 25.13.) In fact, since $\mathbf{Z}$ does not have any finite subgroups we see from Lemma 52.14 .6 that for any such factorization $k(x)=L$. Finally, $\gamma$ is not a monomorphism since

$$
\operatorname{Spec}(k(x)) \times_{\gamma, X, \gamma} \operatorname{Spec}(k(x)) \cong \operatorname{Spec}(k(x)) \times \mathbf{Z} .
$$

This example suggests that in order to define points of an algebraic space $X$ we should consider equivalence classes of morphisms from spectra of fields into $X$ and not the set of monomorphisms from spectra of fields.
We finish with a truly awful example.
02 Z 8 Example 52.14.9. Let $k$ be a field. Let $A=\prod_{n \in \mathbf{N}} k$ be the infinite product. Set $U=\operatorname{Spec}(A)$ seen as a scheme over $S=\operatorname{Spec}(k)$. Note that the projection maps $\operatorname{pr}_{n}: A \rightarrow k$ define open and closed immersions $f_{n}: S \rightarrow U$. Set

$$
R=U \amalg \coprod_{(n, m) \in \mathbf{N}^{2}, n \neq m} S
$$

with morphism $j$ equal to $\Delta_{U / S}$ on the component $U$ and $j=\left(f_{n}, f_{m}\right)$ on the component $S$ corresponding to $(n, m)$. It is clear from the remark above that $s, t$ are étale. It is also clear that $j$ is an equivalence relation. Hence we obtain an algebraic space

$$
X=U / R
$$

To see what this means we specialize to the case where the field $k$ is finite with $q$ elements. Let us first discuss the topological space $|U|$ associated to the scheme $U$ a little bit. All elements of $A$ satisfy $x^{q}=x$. Hence every residue field of $A$ is isomorphic to $k$, and all points of $U$ are closed. But the topology on $U$ isn't the discrete topology. Let $u_{n} \in|U|$ be the point corresponding to $f_{n}$. As mentioned above the points $u_{n}$ are the open points (and hence isolated). This implies there have to be other points since we know $U$ is quasi-compact, see Algebra, Lemma 10.16 .10 (hence not equal to an infinite discrete set). Another way to see this is because the (proper) ideal

$$
I=\left\{x=\left(x_{n}\right) \in A \mid \text { all but a finite number of } x_{n} \text { are zero }\right\}
$$

is contained in a maximal ideal. Note also that every element $x$ of $A$ is of the form $x=u e$ where $u$ is a unit and $e$ is an idempotent. Hence a basis for the topology of $A$ consists of open and closed subsets (see Algebra, Lemma 10.20.1.) So the topology on $|U|$ is totally disconnected, but nontrivial. Finally, note that $\left\{u_{n}\right\}$ is dense in $|U|$.

We will later define a topological space $|X|$ associated to $X$, see Properties of Spaces, Section 53.4. What can we say about $|X|$ ? It turns out that the map $|U| \rightarrow|X|$ is surjective and continuous. All the points $u_{n}$ map to the same point $x_{0}$ of $|X|$, and none of the other points get identified. Since $\left\{u_{n}\right\}$ is dense in $|U|$ we conclude that the closure of $x_{0}$ in $|X|$ is $|X|$. In other words $|X|$ is irreducible and $x_{0}$ is a generic point of $|X|$. This seems bizarre since also $x_{0}$ is the image of a section $S \rightarrow X$ of the structure morphism $X \rightarrow S$ (and in the case of schemes this would imply it was a closed point, see Morphisms, Lemma 28.20.2.

Whatever you think is actually going on in this example, it certainly shows that some care has to be exercised when defining irreducible components, connectedness, etc of algebraic spaces.

### 52.15. Change of big site

03 FO In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. Here is a precise statement of the result.

03FP Lemma 52.15.1. Suppose given big sites $S_{\text {sch }}^{f p p f}$ and $S c h_{f p p f}^{\prime}$. Assume that Sch $h_{f p p f}$ is contained in $S c h_{f p p f}^{\prime}$, see Topologies, Section 33.10. Let $S$ be an object of $S_{c h} h_{f p p f}$. Let

$$
\begin{gathered}
g: S h\left((S c h / S)_{f p p f}\right) \longrightarrow S h\left(\left(S c h^{\prime} / S\right)_{f p p f}\right) \\
f: S h\left(\left(S c h^{\prime} / S\right)_{f p p f}\right) \longrightarrow S h\left((S c h / S)_{f p p f}\right)
\end{gathered}
$$

be the morphisms of topoi of Topologies, Lemma 33.10.2. Let $F$ be a sheaf of sets on $(S c h / S)_{\text {fppf }}$. Then
(1) if $F$ is representable by a scheme $X \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$ over $S$, then $f^{-1} F$ is representable too, in fact it is representable by the same scheme $X$, now viewed as an object of $\left(S c h^{\prime} / S\right)_{\text {fppf }}$, and
(2) if $F$ is an algebraic space over $S$, then $f^{-1} F$ is an algebraic space over $S$ also.

Proof. Let $X \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$. Let us write $h_{X}$ for the representable sheaf on $(S c h / S)_{\text {fppf }}$ associated to $X$, and $h_{X}^{\prime}$ for the representable sheaf on $\left(S c h^{\prime} / S\right)_{f p p f}$ associated to $X$. By the description of $f^{-1}$ in Topologies, Section 33.10 we see that $f^{-1} h_{X}=h_{X}^{\prime}$. This proves (1).
Next, suppose that $F$ is an algebraic space over $S$. By Lemma 52.9.1 this means that $F=h_{U} / h_{R}$ for some étale equivalence relation $R \rightarrow U \times_{S} U$ in $(S c h / S)_{f p p f}$. Since $f^{-1}$ is an exact functor we conclude that $f^{-1} F=h_{U}^{\prime} / h_{R}^{\prime}$. Hence $f^{-1} F$ is an algebraic space over $S$ by Theorem 52.10.5.

Note that this lemma is purely set theoretical and has virtually no content. Moreover, it is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.

04W1 Lemma 52.15.2. Suppose $S c h_{\text {fppf }}$ is contained in $S c h_{f p p f}^{\prime}$. Let $S$ be an object of Schfppf. Denote Spaces/ $S$ the category of algebraic spaces over $S$ defined using
$S_{\text {ch }}^{\text {fppf }}$. Similarly, denote Spaces ${ }^{\prime} / S$ the category of algebraic spaces over $S$ defined using Sch fppf. The construction of Lemma 52.15.1 defines a fully faithful functor

$$
\text { Spaces } / S \longrightarrow \text { Spaces }^{\prime} / S
$$

whose essential image consists of those $X^{\prime} \in \mathrm{Ob}\left(\right.$ Spaces $\left.^{\prime} / S\right)$ such that there exist $U, R \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)^{4}$ and morphisms

$$
U \longrightarrow X^{\prime} \quad \text { and } \quad R \longrightarrow U \times_{X^{\prime}} U
$$

in $\operatorname{Sh}\left(\left(S c h^{\prime} / S\right)_{\text {fppf }}\right)$ which are surjective as maps of sheaves (for example if the displayed morphisms are surjective and étale).

Proof. In Sites, Lemma 7.20 .8 we have seen that the functor $f^{-1}: S h\left((S c h / S)_{f p p f}\right) \rightarrow$ $S h\left(\left(S c h^{\prime} / S\right)_{f p p f}\right)$ is fully faithful (see discussion in Topologies, Section 33.10). Hence we see that the displayed functor of the lemma is fully faithful.
Suppose that $X^{\prime} \in \mathrm{Ob}\left(\right.$ Spaces $\left.^{\prime} / S\right)$ such that there exists $U \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a map $U \rightarrow X^{\prime}$ in $\operatorname{Sh}\left(\left(S c h^{\prime} / S\right)_{f p p f}\right)$ which is surjective as a map of sheaves. Let $U^{\prime} \rightarrow X^{\prime}$ be a surjective étale morphism with $U^{\prime} \in \mathrm{Ob}\left(\left(S c h^{\prime} / S\right)_{f p p f}\right)$. Let $\kappa=\operatorname{size}(U)$, see Sets, Section 3.9. Then $U$ has an affine open covering $U=\bigcup_{i \in I} U_{i}$ with $|I| \leq \kappa$. Observe that $U^{\prime} \times_{X^{\prime}} U \rightarrow U$ is étale and surjective. For each $i$ we can pick a quasi-compact open $U_{i}^{\prime} \subset U^{\prime}$ such that $U_{i}^{\prime} \times{ }_{X^{\prime}} U_{i} \rightarrow U_{i}$ is surjective (because the scheme $U^{\prime} \times{ }_{X^{\prime}} U_{i}$ is the union of the Zariski opens $W \times{ }_{X^{\prime}} U_{i}$ for $W \subset U^{\prime}$ affine and because $U^{\prime} \times{ }_{X^{\prime}} U_{i} \rightarrow U_{i}$ is étale hence open). Then $\coprod_{i \in I} U_{i}^{\prime} \rightarrow X$ is surjective étale because of our assumption that $U \rightarrow X$ and hence $\coprod U_{i} \rightarrow X$ is a surjection of sheaves (details omitted). Because $U_{i}^{\prime} \times{ }_{X^{\prime}} U \rightarrow U_{i}^{\prime}$ is a surjection of sheaves and because $U_{i}^{\prime}$ is quasi-compact, we can find a quasi-compact open $W_{i} \subset U_{i}^{\prime} \times{ }_{X^{\prime}} U$ such that $W_{i} \rightarrow U_{i}^{\prime}$ is surjective as a map of sheaves (details omitted). Then $W_{i} \rightarrow U$ is étale and we conclude that $\operatorname{size}\left(W_{i}\right) \leq \operatorname{size}(U)$, see Sets, Lemma 3.9.7. By Sets, Lemma 3.9 .11 we conclude that $\operatorname{size}\left(U_{i}^{\prime}\right) \leq \operatorname{size}(U)$. Hence $\coprod_{i \in I} U_{i}^{\prime}$ is isomorphic to an object of $(S c h / S)_{f p p f}$ by Sets, Lemma 3.9.5.
Now let $X^{\prime}, U \rightarrow X^{\prime}$ and $R \rightarrow U \times_{X^{\prime}} U$ be as in the statement of the lemma. In the previous paragraph we have seen that we can find $U^{\prime} \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ and a surjective étale morphism $U^{\prime} \rightarrow X^{\prime}$ in $S h\left(\left(S c h^{\prime} / S\right)_{f p p f}\right)$. Then $U^{\prime} \times_{X^{\prime}} U \rightarrow U^{\prime}$ is a surjection of sheaves, i.e., we can find an fppf covering $\left\{U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ such that $U_{i}^{\prime} \rightarrow U^{\prime}$ factors through $U^{\prime} \times{ }_{X^{\prime}} U \rightarrow U^{\prime}$. By Sets, Lemma 3.9.12 we can find $\tilde{U} \rightarrow U^{\prime}$ which is surjective, flat, and locally of finite presentation, with $\operatorname{size}(\tilde{U}) \leq \operatorname{size}\left(U^{\prime}\right)$, such that $\tilde{U} \rightarrow U^{\prime}$ factors through $U^{\prime} \times{ }_{X^{\prime}} U \rightarrow U^{\prime}$. Then we consider

The squares are cartesian. We know the objects of the bottom row are represented by objects of $(S c h / S)_{f p p f}$. By the result of the argument of the previous paragraph,

[^153]the same is true for $U \times{ }_{X^{\prime}} U$ (as we have the surjection of sheaves $R \rightarrow U \times{ }_{X^{\prime}} U$ by assumption). Since $(S c h / S)_{f p p f}$ is closed under fibre products (by construction), we see that $\tilde{U} \times_{X^{\prime}} \tilde{U}$ is represented by an object of $(S c h / S)_{f p p f}$. Finally, the map $\tilde{U} \times{ }_{X^{\prime}} \tilde{U} \rightarrow U^{\prime} \times_{X^{\prime}} U^{\prime}$ is a surjection of fppf sheaves as $\tilde{U} \rightarrow U^{\prime}$ is so. Thus we can once more apply the result of the previous paragraph to conclude that $R^{\prime}=U^{\prime} \times{ }_{X^{\prime}} U^{\prime}$ is represented by an object of $(S c h / S)_{f p p f}$. At this point Lemma 52.9 .1 and Theorem 52.10.5 imply that $X=h_{U^{\prime}} / h_{R^{\prime}}$ is an object of Spaces/S such that $f^{-1} X \cong X^{\prime}$ as desired.

### 52.16. Change of base scheme

03I3 In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \rightarrow S^{\prime}$ of base schemes, any algebraic space over $S$ can be viewed as an algebraic space over $S^{\prime}$. And, given an algebraic space $F^{\prime}$ over $S^{\prime}$ there is a base change $F_{S}^{\prime}$ which is an algebraic space over $S$. We explain only what happens in case $S \rightarrow S^{\prime}$ is a morphism of the big fppf site under consideration, if only $S$ or $S^{\prime}$ is contained in the big site, then one first enlarges the big site as in Section 52.15

03I4 Lemma 52.16.1. Suppose given a big site Sch $_{\text {fppf }}$. Let $g: S \rightarrow S^{\prime}$ be morphism of Sch fppf. Let $j:(S c h / S)_{f p p f} \rightarrow\left(S c h / S^{\prime}\right)_{f p p f}$ be the corresponding localization functor. Let $F$ be a sheaf of sets on $(S c h / S)_{\text {fppf }}$. Then
(1) for a scheme $T^{\prime}$ over $S^{\prime}$ we have $j_{!} F\left(T^{\prime} / S^{\prime}\right)=\coprod_{\varphi: T^{\prime} \rightarrow S} F\left(T^{\prime} \xrightarrow{\varphi} S\right)$,
(2) if $F$ is representable by a scheme $X \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$, then $j_{!} F$ is representable by $j(X)$ which is $X$ viewed as a scheme over $S^{\prime}$, and
(3) if $F$ is an algebraic space over $S$, then $j$ ! $F$ is an algebraic space over $S^{\prime}$, and if $F=U / R$ is a presentation, then $j!F=j(U) / j(R)$ is a presentation.
Let $F^{\prime}$ be a sheaf of sets on $\left(S c h / S^{\prime}\right)_{f p p f}$. Then
(4) for a scheme $T$ over $S$ we have $j^{-1} F^{\prime}(T / S)=F^{\prime}\left(T / S^{\prime}\right)$,
(5) if $F^{\prime}$ is representable by a scheme $X^{\prime} \in \mathrm{Ob}\left(\left(S c h / S^{\prime}\right)_{f p p f}\right)$, then $j^{-1} F^{\prime}$ is representable, namely by $X_{S}^{\prime}=S \times_{S^{\prime}} X^{\prime}$, and
(6) if $F^{\prime}$ is an algebraic space, then $j^{-1} F^{\prime}$ is an algebraic space, and if $F^{\prime}=$ $U^{\prime} / R^{\prime}$ is a presentation, then $j^{-1} F^{\prime}=U_{S}^{\prime} / R_{S}^{\prime}$ is a presentation.

Proof. The functors $j_{!}, j_{*}$ and $j^{-1}$ are defined in Sites, Lemma 7.24 .7 where it is also shown that $j=j_{S / S^{\prime}}$ is the localization of $\left(S c h / S^{\prime}\right)_{f p p f}$ at the object $S / S^{\prime}$. Hence all of the material on localization functors is available for $j$. The formula in (1) is Sites, Lemma 7.26.1. By definition $j$ ! is the left adjoint to restriction $j^{-1}$, hence $j_{\text {! }}$ is right exact. By Sites, Lemma 7.24 .5 it also commutes with fibre products and equalizers. By Sites, Lemma 7.24 .3 we see that $j_{!} h_{X}=h_{j(X)}$ hence (2) holds. If $F$ is an algebraic space over $S$, then we can write $F=U / R$ (Lemma 52.9.1) and we get

$$
j!F=j(U) / j(R)
$$

because $j$ ! being right exact commutes with coequalizers, and moreover $j(R)=$ $j(U) \times{ }_{j!F} j(U)$ as $j!$ commutes with fibre products. Since the morphisms $j(s), j(t)$ : $j(R) \rightarrow j(U)$ are simply the morphisms $s, t: R \rightarrow U$ (but viewed as morphisms of schemes over $S^{\prime}$ ), they are still étale. Thus $(j(U), j(R), s, t)$ is an étale equivalence relation. Hence by Theorem 52.10.5 we conclude that $j!F$ is an algebraic space.

Proof of (4), (5), and (6). The description of $j^{-1}$ is in Sites, Section 7.24 . The restriction of the representable sheaf associated to $X^{\prime} / S^{\prime}$ is the representable sheaf associated to $X_{S}^{\prime}=S \times{ }_{S^{\prime}} Y^{\prime}$ by Sites, Lemma 7.26.2. The restriction functor $j^{-1}$ is exact, hence $j^{-1} F^{\prime}=U_{S}^{\prime} / R_{S}^{\prime}$. Again by exactness the sheaf $R_{S}^{\prime}$ is still an equivalence relation on $U_{S}^{\prime}$. Finally the two maps $R_{S}^{\prime} \rightarrow U_{S}^{\prime}$ are étale as base changes of the étale morphisms $R^{\prime} \rightarrow U^{\prime}$. Hence $j^{-1} F^{\prime}=U_{S}^{\prime} / R_{S}^{\prime}$ is an algebraic space by Theorem 52.10 .5 and we win.

Note how the presentation $j_{!} F=j(U) / j(R)$ is just the presentation of $F$ but viewed as a presentation by schemes over $S^{\prime}$. Hence the following definition makes sense.

03 I5 Definition 52.16.2. Let $S c h_{f p p f}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site.
(1) If $F^{\prime}$ is an algebraic space over $S^{\prime}$, then the base change of $F^{\prime}$ to $S$ is the algebraic space $j^{-1} F^{\prime}$ described in Lemma 52.16.1. We denote it $F_{S}^{\prime}$.
(2) If $F$ is an algebraic space over $S$, then $F$ viewed as an algebraic space over $S^{\prime}$ is the algebraic space $j!F$ over $S^{\prime}$ described in Lemma 52.16.1 We often simply denote this $F$; if not then we will write $j!F$.
The algebraic space $j_{!} F$ comes equipped with a canonical morphism $j_{!} F \rightarrow S$ of algebraic spaces over $S^{\prime}$. This is true simply because the sheaf $j!F$ maps to $h_{S}$ (see for example the explicit description in Lemma 52.16.1). In fact, in Sites, Lemma 7.24 .4 we have seen that the category of sheaves on $(S c h / S)_{f p p f}$ is equivalent to the category of pairs $\left(\mathcal{F}^{\prime}, \mathcal{F}^{\prime} \rightarrow h_{S}\right)$ consisting of a sheaf on $\left(S c h / S^{\prime}\right)_{\text {fppf }}$ and a map of sheaves $\mathcal{F}^{\prime} \rightarrow h_{S}$. The equivalence assigns to the sheaf $\mathcal{F}$ the pair $\left(j_{!} \mathcal{F}, j_{!} \mathcal{F} \rightarrow h_{S}\right)$. This, combined with the above, leads to the following result for categories of algebraic spaces.
04SG Lemma 52.16.3. Let $S c h_{f p p f}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. The construction above give an equivalence of categories

$$
\left\{\begin{array}{c}
\text { category of algebraic } \\
\text { spaces over } S
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { category of pairs }\left(F^{\prime}, F^{\prime} \rightarrow S\right) \text { consisting } \\
\text { of an algebraic space } F^{\prime} \text { over } S^{\prime} \text { and a } \\
\text { morphism } F^{\prime} \rightarrow S \text { of algebraic spaces over } S^{\prime}
\end{array}\right\}
$$

Proof. Let $F$ be an algebraic space over $S$. The functor from left to right assigns the pair $\left(j_{!} F, j_{!} F \rightarrow S\right)$ ot $F$ which is an object of the right hand side by Lemma 52.16.1. Since this defines an equivalence of categories of sheaves by Sites, Lemma 7.24 .4 to finish the proof it suffices to show: if $F$ is a sheaf and $j!F$ is an algebraic space, then $F$ is an algebraic space. To do this, write $j_{!} F=U^{\prime} / R^{\prime}$ as in Lemma 52.9 .1 with $U^{\prime}, R^{\prime} \in \mathrm{Ob}\left(\left(S c h / S^{\prime}\right)_{f p p f}\right)$. Then the compositions $U^{\prime} \rightarrow j!F \rightarrow S$ and $R^{\prime} \rightarrow j_{!} F \rightarrow S$ are morphisms of schemes over $S^{\prime}$. Denote $U, R$ the corresponding objects of $(S c h / S)_{f p p f}$. The two morphisms $R^{\prime} \rightarrow U^{\prime}$ are morphisms over $S$ and hence correspond to morphisms $R \rightarrow U$. Since these are simply the same morphisms (but viewed over $S$ ) we see that we get an étale equivalence relation over $S$. As $j$ ! defines an equivalence of categories of sheaves (see reference above) we see that $F=U / R$ and by Theorem 52.10.5 we see that $F$ is an algebraic space.

The following lemma is a slight rephrasing of the above.
04SH Lemma 52.16.4. Let $S_{\text {fch }} h_{f p f}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. Let $F^{\prime}$ be a sheaf on $\left(S c h / S^{\prime}\right)_{f p p f}$. The following are equivalent:
(1) The restriction $\left.F^{\prime}\right|_{(S c h / S)_{f p p f}}$ is an algebraic space over $S$, and
(2) the sheaf $h_{S} \times F^{\prime}$ is an algebraic space over $S^{\prime}$.

Proof. The restriction and the product match under the equivalence of categories of Sites, Lemma 7.24.4 so that Lemma 52.16 .3 above gives the result.

We finish this section with a lemma on a compatibility.
03I6 Lemma 52.16.5. Let $S_{\text {. }}^{\text {fppf }}$ be a big fppf site. Let $S \rightarrow S^{\prime}$ be a morphism of this site. Let $F$ be an algebraic space over $S$. Let $T$ be a scheme over $S$ and let $f: T \rightarrow F$ be a morphism over $S$. Let $f^{\prime}: T^{\prime} \rightarrow F^{\prime}$ be the morphism over $S^{\prime}$ we get from $f$ by applying the equivalence of categories described in Lemma 52.16.3. For any property $\mathcal{P}$ as in Definition 52.5.1 we have $\mathcal{P}\left(f^{\prime}\right) \Leftrightarrow \mathcal{P}(f)$.

Proof. Suppose that $U$ is a scheme over $S$, and $U \rightarrow F$ is a surjective étale morphism. Denote $U^{\prime}$ the scheme $U$ viewed as a scheme over $S^{\prime}$. In Lemma 52.16.1 we have seen that $U^{\prime} \rightarrow F^{\prime}$ is surjective étale. Since

$$
j\left(T \times_{f, F} U\right)=T^{\prime} \times_{f^{\prime}, F^{\prime}} U^{\prime}
$$

the morphism of schemes $T \times{ }_{f, F} U \rightarrow U$ is identified with the morphism of schemes $T^{\prime} \times{ }_{f^{\prime}, F^{\prime}} U^{\prime} \rightarrow U^{\prime}$. It is the same morphism, just viewed over different base schemes. Hence the lemma follows from Lemma 52.11.4.

## CHAPTER 53

## Properties of Algebraic Spaces

### 53.1. Introduction

03BP Please see Spaces, Section 52.1 for a brief introduction to algebraic spaces, and please read some of that chapter for our basic definitions and conventions concerning algebraic spaces. In this chapter we start introducing some basic notions and properties of algebraic spaces. A fundamental reference for the case of quasiseparated algebraic spaces is Knu71.

The discussion is somewhat awkward at times since we made the design decision to first talk about properties of algebraic spaces by themselves, and only later about properties of morphisms of algebraic spaces. We make an exception for this rule regarding étale morphisms of algebraic spaces, which we introduce in Section 53.15. But until that section whenever we say a morphism has a certain property, it automatically means the source of the morphism is a scheme (or perhaps the morphism is representable).

Some of the material in the chapter (especially regarding points) will be improved upon in the chapter on decent algebraic spaces.

### 53.2. Conventions

03BQ The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.

Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$. The reason is that we want to avoid confusion when changing base schemes, as in Spaces, Section 52.16 .

### 53.3. Separation axioms

03BR In this section we collect all the "absolute" separation conditions of algebraic spaces. Since in our language any algebraic space is an algebraic space over some definite base scheme, any absolute property of $X$ over $S$ corresponds to a conditions imposed on $X$ viewed as an algebraic space over $\operatorname{Spec}(\mathbf{Z})$. Here is the precise formulation.

03BS Definition 53.3.1. (Compare Spaces, Definition 52.13.2) Consider a big fppf site $S c h_{f p p f}=(S c h / \operatorname{Spec}(\mathbf{Z}))_{f p p f}$. Let $X$ be an algebraic space over $\operatorname{Spec}(\mathbf{Z})$. Let $\Delta: X \rightarrow X \times X$ be the diagonal morphism.
(1) We say $X$ is separated if $\Delta$ is a closed immersion.
(2) We say $X$ is locally separated $1^{1}$ if $\Delta$ is an immersion.
(3) We say $X$ is quasi-separated if $\Delta$ is quasi-compact.
(4) We say $X$ is Zariski locally quasi-separated ${ }^{2}$ if there exists a Zariski covering $X=\bigcup_{i \in I} X_{i}$ (see Spaces, Definition 52.12.5) such that each $X_{i}$ is quasi-separated.
Let $S$ is a scheme contained in $S c h_{f p p f}$, and let $X$ be an algebraic space over $S$. Then we say $X$ is separated, locally separated, quasi-separated, or Zariski locally quasi-separated if $X$ viewed as an algebraic space over $\operatorname{Spec}(\mathbf{Z})$ (see Spaces, Definition 52.16.2 has the corresponding property.

It is true that an algebraic space $X$ over $S$ which is separated (in the absolute sense above) is separated over $S$ (and similarly for the other absolute separation properties above). This will be discussed in great detail in Morphisms of Spaces, Section 54.4. We will see in Lemma 53.6.6 that being Zariski locally separated is independent of the base scheme (hence equivalent to the absolute notion).

03DY Lemma 53.3.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We have the following implications among the separation axioms of Definition 53.3.1:
(1) separated implies all the others,
(2) quasi-separated implies Zariski locally quasi-separated.

Proof. Omitted.
0AHR Lemma 53.3.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) $X$ is a quasi-separated algebraic space,
(2) for $U \rightarrow X, V \rightarrow X$ with $U$, $V$ quasi-compact schemes the fibre product $U \times_{X} V$ is quasi-compact,
(3) for $U \rightarrow X, V \rightarrow X$ with $U, V$ affine the fibre product $U \times_{X} V$ is quasicompact.

Proof. Using Spaces, Lemma 52.16 .3 we see that we may assume $S=\operatorname{Spec}(\mathbf{Z})$. Since $U \times{ }_{X} V=X \times{ }_{X \times X}(U \times V)$ and since $U \times V$ is quasi-compact if $U$ and $V$ are so, we see that (1) implies (2). It is clear that (2) implies (3). Assume (3). Choose a scheme $W$ and a surjective étale morphism $W \rightarrow X$. Then $W \times W \rightarrow X \times X$ is surjective étale. Hence it suffices to show that

$$
j: W \times_{X} W=X \times_{(X \times X)}(W \times W) \rightarrow W \times W
$$

is quasi-compact, see Spaces, Lemma 52.5.6. If $U \subset W$ and $V \subset W$ are affine opens, then $j^{-1}(U \times V)=U \times_{X} V$ is quasi-compact by assumption. Since the affine opens $U \times V$ form an affine open covering of $W \times W$ (Schemes, Lemma 25.17.4 we conclude by Schemes, Lemma 25.19.2.

0AHS Lemma 53.3.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) $X$ is a separated algebraic space,

[^154](2) for $U \rightarrow X, V \rightarrow X$ with $U$, $V$ affine the fibre product $U \times_{X} V$ is affine and
$$
\mathcal{O}(U) \otimes_{\mathbf{z}} \mathcal{O}(V) \longrightarrow \mathcal{O}\left(U \times_{X} V\right)
$$
is surjective.
Proof. Using Spaces, Lemma 52.16 .3 we see that we may assume $S=\operatorname{Spec}(\mathbf{Z})$. Since $U \times_{X} V=X \times_{X \times X}(U \times V)$ and since $U \times V$ is affine if $U$ and $V$ are so, we see that (1) implies (2). Assume (2). Choose a scheme $W$ and a surjective étale morphism $W \rightarrow X$. Then $W \times W \rightarrow X \times X$ is surjective étale. Hence it suffices to show that
$$
j: W \times_{X} W=X \times_{(X \times X)}(W \times W) \rightarrow W \times W
$$
is a closed immersion, see Spaces, Lemma 52.5.6. If $U \subset W$ and $V \subset W$ are affine opens, then $j^{-1}(U \times V)=U \times_{X} V$ is affine by assumption and the map $U \times_{X} V \rightarrow U \times V$ is a closed immersion because the corresponding ring map is surjective. Since the affine opens $U \times V$ form an affine open covering of $W \times W$ (Schemes, Lemma 25.17.4) we conclude by Morphisms, Lemma 28.2.1.

### 53.4. Points of algebraic spaces

03BT As is clear from Spaces, Example 52.14 .8 a point of an algebraic space should not be defined as a monomorphism from the spectrum of a field. Instead we define them as equivalence classes of morphisms of spectra of fields exactly as explained in Schemes, Section 25.13.

Let $S$ be a scheme. Let $F$ be a presheaf on $(S c h / S)_{f p p f}$. Let $K$ is a field. Consider a morphism

$$
\operatorname{Spec}(K) \longrightarrow F
$$

By the Yoneda Lemma this is given by an element $p \in F(\operatorname{Spec}(K))$. We say that two such pairs $(\operatorname{Spec}(K), p)$ and $(\operatorname{Spec}(L), q)$ are equivalent if there exists a third field $\Omega$ and a commutative diagram

In other words, there are field extensions $K \rightarrow \Omega$ and $L \rightarrow \Omega$ such that $p$ and $q$ map to the same element of $F(\operatorname{Spec}(\Omega))$. We omit the verification that this defines an equivalence relation.
03BU Definition 53.4.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A point of $X$ is an equivalence class of morphisms from spectra of fields into $X$. The set of points of $X$ is denoted $|X|$.

Note that if $f: X \rightarrow Y$ is a morphism of algebraic spaces over $S$, then there is an induced map $|f|:|X| \rightarrow|Y|$ which maps a representative $x: \operatorname{Spec}(K) \rightarrow X$ to the representative $f \circ x: \operatorname{Spec}(K) \rightarrow Y$.

03BV Lemma 53.4.2. Let $S$ be a scheme. Let $X$ be a scheme over $S$. The points of $X$ as a scheme are in canonical 1-1 correspondence with the points of $X$ as an algebraic space.
Proof. This is Schemes, Lemma 25.13.3.

03H4 Lemma 53.4.3. Let $S$ be a scheme. Let

be a cartesian diagram of algebraic spaces. Then the map of sets of points

$$
\left|Z \times_{Y} X\right| \longrightarrow|Z| \times_{|Y|}|X|
$$

is surjective.
Proof. Namely, suppose given fields $K, L$ and morphisms $\operatorname{Spec}(K) \rightarrow X, \operatorname{Spec}(L) \rightarrow$ $Z$, then the assumption that they agree as elements of $|Y|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $\operatorname{Spec}(M) \rightarrow \operatorname{Spec}(K) \rightarrow X \rightarrow Y$ and $\operatorname{Spec}(M) \rightarrow \operatorname{Spec}(L) \rightarrow Z \rightarrow Y$ agree. And this is exactly the condition which says you get a morphism $\operatorname{Spec}(M) \rightarrow Z \times_{Y} X$.

03H5 Lemma 53.4.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $f: T \rightarrow X$ be a morphism from a scheme to $X$. The following are equivalent
(1) $f: T \rightarrow X$ is surjective (according to Spaces, Definition 52.5.1), and
(2) $|f|:|T| \rightarrow|X|$ is surjective.

Proof. Assume (1). Let $x: \operatorname{Spec}(K) \rightarrow X$ be a morphism from the spectrum of a field into $X$. By assumption the morphism of $\operatorname{schemes} \operatorname{Spec}(K) \times{ }_{X} T \rightarrow$ $\operatorname{Spec}(K)$ is surjective. Hence there exists a field extension $K \subset K^{\prime}$ and a morphism $\operatorname{Spec}\left(K^{\prime}\right) \rightarrow \operatorname{Spec}(K) \times{ }_{X} T$ such that the left square in the diagram

is commutative. This shows that $|f|:|T| \rightarrow|X|$ is surjective.
Assume (2). Let $Z \rightarrow X$ be a morphism where $Z$ is a scheme. We have to show that the morphism of schemes $Z \times_{X} T \rightarrow T$ is surjective, i.e., that $\left|Z \times_{X} T\right| \rightarrow|Z|$ is surjective. This follows from (2) and Lemma 53.4.3.

03BW Lemma 53.4.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $X=U / R$ be a presentation of $X$, see Spaces, Definition 52.9.3. Then the image of $|R| \rightarrow|U| \times|U|$ is an equivalence relation and $|X|$ is the quotient of $|U|$ by this equivalence relation.

Proof. The assumption means that $U$ is a scheme, $p: U \rightarrow X$ is a surjective, étale morphism, $R=U \times_{X} U$ is a scheme and defines an étale equivalence relation on $U$ such that $X=U / R$ as sheaves. By Lemma 53.4.4 we see that $|U| \rightarrow|X|$ is surjective. By Lemma 53.4.3 the map

$$
|R| \longrightarrow|U| \times_{|X|}|U|
$$

is surjective. Hence the image of $|R| \rightarrow|U| \times|U|$ is exactly the set of pairs $\left(u_{1}, u_{2}\right) \in$ $|U| \times|U|$ such that $u_{1}$ and $u_{2}$ have the same image in $|X|$. Combining these two statements we get the result of the lemma.

03BX Lemma 53.4.6. Let $S$ be a scheme. There exists a unique topology on the sets of points of algebraic spaces over $S$ with the following properties:
(1) for every morphism of algebraic spaces $X \rightarrow Y$ over $S$ the map $|X| \rightarrow|Y|$ is continuous, and
(2) for every étale morphism $U \rightarrow X$ with $U$ a scheme the map of topological spaces $|U| \rightarrow|X|$ is continuous and open.

Proof. Let $X$ be an algebraic space over $S$. Let $p: U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme over $S$. We define $W \subset|X|$ is open if and only if $|p|^{-1}(W)$ is an open subset of $|U|$. This is a topology on $|X|$ (it is the quotient topology on $|X|$, see Topology, Lemma 5.5.2.
Let us prove that the topology is independent of the choice of the presentation. To do this it suffices to show that if $U^{\prime}$ is a scheme, and $U^{\prime} \rightarrow X$ is an étale morphism, then the map $\left|U^{\prime}\right| \rightarrow|X|$ (with topology on $|X|$ defined using $U \rightarrow X$ as above) is open and continuous; which in addition will prove that (2) holds. Set $U^{\prime \prime}=U \times_{X} U^{\prime}$, so that we have the commutative diagram

As $U \rightarrow X$ and $U^{\prime} \rightarrow X$ are étale we see that both $U^{\prime \prime} \rightarrow U$ and $U^{\prime \prime} \rightarrow U^{\prime}$ are étale morphisms of schemes. Moreover, $U^{\prime \prime} \rightarrow U^{\prime}$ is surjective. Hence we get a commutative diagram of maps of sets

The lower horizontal arrow is surjective (see Lemma 53.4.4 or Lemma 53.4.5) and continuous by definition of the topology on $|X|$. The top horizontal arrow is surjective, continuous, and open by Morphisms, Lemma 28.36.13. The left vertical arrow is continuous and open (by Morphisms, Lemma 28.36 .13 again.) Hence it follows formally that the right vertical arrow is continuous and open.
To finish the proof we prove (1). Let $a: X \rightarrow Y$ be a morphism of algebraic spaces. According to Spaces, Lemma 52.11.6 we can find a diagram

where $U$ and $V$ are schemes, and $p$ and $q$ are surjective and étale. This gives rise to the diagram

where all but the lower horizontal arrows are known to be continuous and the two vertical arrows are surjective and open. It follows that the lower horizontal arrow is continuous as desired.

03BY Definition 53.4.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The underlying topological space of $X$ is the set of points $|X|$ endowed with the topology constructed in Lemma 53.4.6.

It turns out that this topological space carries the same information as the small Zariski site $X_{Z a r}$ of Spaces, Definition 52.12 .6

03BZ Lemma 53.4.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) The rule $X^{\prime} \mapsto\left|X^{\prime}\right|$ defines an inclusion preserving bijection between open subspaces $X^{\prime}$ (see Spaces, Definition52.12.1) of $X$, and opens of the topological space $|X|$.
(2) A family $\left\{X_{i} \subset X\right\}_{i \in I}$ of open subspaces of $X$ is a Zariski covering (see Spaces, Definition 52.12.5) if and only if $|X|=\bigcup\left|X_{i}\right|$.
In other words, the small Zariski site $X_{Z a r}$ of $X$ is canonically identified with a site associated to the topological space $|X|$ (see Sites, Example 7.6.4).
Proof. In order to prove (1) let us construct the inverse of the rule. Namely, suppose that $W \subset|X|$ is open. Choose a presentation $X=U / R$ corresponding to the surjective étale map $p: U \rightarrow X$ and étale maps $s, t: R \rightarrow U$. By construction we see that $|p|^{-1}(W)$ is an open of $U$. Denote $W^{\prime} \subset U$ the corresponding open subscheme. It is clear that $R^{\prime}=s^{-1}\left(W^{\prime}\right)=t^{-1}\left(W^{\prime}\right)$ is a Zariski open of $R$ which defines an étale equivalence relation on $W^{\prime}$. By Spaces, Lemma 52.10 .2 the morphism $X^{\prime}=W^{\prime} / R^{\prime} \rightarrow X$ is an open immersion. Hence $X^{\prime}$ is an algebraic space by Spaces, Lemma 52.11.3. By construction $\left|X^{\prime}\right|=W$, i.e., $X^{\prime}$ is a subspace of $X$ corresponding to $W$. Thus (1) is proved.
To prove (2), note that if $\left\{X_{i} \subset X\right\}_{i \in I}$ is a collection of open subspaces, then it is a Zariski covering if and only if the $U=\bigcup U \times_{X} X_{i}$ is an open covering. This follows from the definition of a Zariski covering and the fact that the morphism $U \rightarrow X$ is surjective as a map of presheaves on $(S c h / S)_{\text {fppff }}$. On the other hand, we see that $|X|=\bigcup\left|X_{i}\right|$ if and only if $U=\bigcup U \times_{X} X_{i}$ by Lemma 53.4.5 (and the fact that the projections $U \times_{X} X_{i} \rightarrow X_{i}$ are surjective and étale). Thus the equivalence of (2) follows.

03IE Lemma 53.4.9. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Let $X^{\prime} \subset X$ be an open subspace. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Then $f$ factors through $X^{\prime}$ if and only if $|f|:|Y| \rightarrow|X|$ factors through $\left|X^{\prime}\right| \subset|X|$.
Proof. By Spaces, Lemma 52.12.3 we see that $Y^{\prime}=Y \times_{X} X^{\prime} \rightarrow Y$ is an open immersion. If $|f|(|Y|) \subset\left|X^{\prime}\right|$, then clearly $\left|Y^{\prime}\right|=|Y|$. Hence $Y^{\prime}=Y$ by Lemma 53.4 .8 .

06NF Lemma 53.4.10. Let $S$ be a scheme. Let $X$ be an algebraic spaces over $S$. Let $U$ be a scheme and let $f: U \rightarrow X$ be an étale morphism. Let $X^{\prime} \subset X$ be the open subspace corresponding to the open $|f|(|U|) \subset|X|$ via Lemma 53.4.8. Then $f$ factors through a surjective étale morphism $f^{\prime}: U \rightarrow X^{\prime}$. Moreover, if $R=U \times_{X} U$, then $R=U \times_{X^{\prime}} U$ and $X^{\prime}$ has the presentation $X^{\prime}=U / R$.

Proof. The existence of the factorization follows from Lemma 53.4.9. The morphism $f^{\prime}$ is surjective according to Lemma 53.4.4. To see $f^{\prime}$ is étale, suppose that $T \rightarrow X^{\prime}$ is a morphism where $T$ is a scheme. Then $T \times_{X} U=T \times{ }_{X^{\prime}} U$ as $X " \rightarrow X$ is a monomorphism of sheaves. Thus the projection $T \times{ }_{X^{\prime}} U \rightarrow T$ is étale as we assumed $f$ étale. We have $U \times_{X} U=U \times_{X^{\prime}} U$ as $X^{\prime} \rightarrow X$ is a monomorphism. Then $X^{\prime}=U / R$ follows from Spaces, Lemma 52.9.1.
03E1 Lemma 53.4.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Consider the map

$$
\{\operatorname{Spec}(k) \rightarrow X \text { monomorphism }\} \longrightarrow|X|
$$

This map is injective.
Proof. Suppose that $\varphi_{i}: \operatorname{Spec}\left(k_{i}\right) \rightarrow X$ are monomorphisms for $i=1,2$. If $\varphi_{1}$ and $\varphi_{2}$ define the same point of $|X|$, then we see that the scheme

$$
Y=\operatorname{Spec}\left(k_{1}\right) \times_{\varphi_{1}, X, \varphi_{2}} \operatorname{Spec}\left(k_{2}\right)
$$

is nonempty. Since the base change of a monomorphism is a monomorphism this means that the projection morphisms $Y \rightarrow \operatorname{Spec}\left(k_{i}\right)$ are monomorphisms. Hence $\operatorname{Spec}\left(k_{1}\right)=Y=\operatorname{Spec}\left(k_{2}\right)$ as schemes over $X$, see Schemes, Lemma 25.23.10. We conclude that $\varphi_{1}=\varphi_{2}$, which proves the lemma.
We will see in Decent Spaces, Lemma 55.10 .1 that this map is a bijection when $X$ is decent.

### 53.5. Quasi-compact spaces

03E2
03E3 Definition 53.5.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We say $X$ is quasi-compact if there exists a surjective étale morphism $U \rightarrow X$ with $U$ quasi-compact.

03E4 Lemma 53.5.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $X$ is quasi-compact if and only if $|X|$ is quasi-compact.
Proof. Choose a scheme $U$ and an étale surjective morphism $U \rightarrow X$. We will use Lemma 53.4.4. If $U$ is quasi-compact, then since $|U| \rightarrow|X|$ is surjective we conclude that $|X|$ is quasi-compact. If $|X|$ is quasi-compact, then since $|U| \rightarrow|X|$ is open we see that there exists a quasi-compact open $U^{\prime} \subset U$ such that $\left|U^{\prime}\right| \rightarrow|X|$ is surjective (and still étale). Hence we win.

040T Lemma 53.5.3. A finite disjoint union of quasi-compact algebraic spaces is a quasi-compact algebraic space.
Proof. This is clear from Lemma 53.5.2 and the corresponding topological fact.
03 IO Example 53.5.4. The space $\mathbf{A}_{\mathbf{Q}}^{1} / \mathbf{Z}$ is a quasi-compact algebraic space.
04NN Lemma 53.5.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Every point of $|X|$ has a fundamental system of open quasi-compact neighbourhoods. In particular $|X|$ is locally quasi-compact in the sense of Topology, Definition55.12.1.
Proof. This follows formally from the fact that there exists a scheme $U$ and a surjective, open, continuous map $U \rightarrow|X|$ of topological spaces. To be a bit more precise, if $u \in U$ maps to $x \in|X|$, then the images of the affine neighbourhoods of $u$ will give a fundamental system of quasi-compact open neighbourhoods of $x$.

### 53.6. Special coverings

$03 F W$ In this section we collect some straightforward lemmas on the existence of étale surjective coverings of algebraic spaces.

03FX Lemma 53.6.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. There exists a surjective étale morphism $U \rightarrow X$ where $U$ is a disjoint union of affine schemes. We may in addition assume each of these affines maps into an affine open of $S$.

Proof. Let $V \rightarrow X$ be a surjective étale morphism. Let $V=\bigcup_{i \in I} V_{i}$ be a Zariski open covering such that each $V_{i}$ maps into an affine open of $S$. Then set $U=\coprod_{i \in I} V_{i}$ with induced morphism $U \rightarrow V \rightarrow X$. This is étale and surjective as a composition of étale and surjective representable transformations of functors (via the general principle Spaces, Lemma 52.5.4 and Morphisms, Lemmas 28.10.2 and 28.36.3.

03FY Lemma 53.6.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. There exists a Zariski covering $X=\bigcup X_{i}$ such that each algebraic space $X_{i}$ has a surjective étale covering by an affine scheme. We may in addition assume each $X_{i}$ maps into an affine open of $S$.

Proof. By Lemma 53.6.1 we can find a surjective étale morphism $U=\coprod U_{i} \rightarrow X$, with $U_{i}$ affine and mapping into an affine open of $S$. Let $X_{i} \subset X$ be the open subspace of $X$ such that $U_{i} \rightarrow X$ factors through an étale surjective morphism $U_{i} \rightarrow X_{i}$, see Lemma 53.4.10. Since $U=\bigcup U_{i}$ we see that $X=\bigcup X_{i}$. As $U_{i} \rightarrow X_{i}$ is surjective it follows that $X_{i} \rightarrow S$ maps into an affine open of $S$.

03H6 Lemma 53.6.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $X$ is quasi-compact if and only if there exists an étale surjective morphism $U \rightarrow X$ with $U$ an affine scheme.

Proof. If there exists an étale surjective morphism $U \rightarrow X$ with $U$ affine then $X$ is quasi-compact by Definition 53.5.1. Conversely, if $X$ is quasi-compact, then $|X|$ is quasi-compact. Let $U=\coprod_{i \in I} U_{i}$ be a disjoint union of affine schemes with an étale and surjective map $\varphi: U \rightarrow X$ (Lemma 53.6.1). Then $|X|=\bigcup \varphi\left(\left|U_{i}\right|\right)$ and by quasi-compactness there is a finite subset $i_{1}, \ldots, i_{n}$ such that $|X|=\bigcup \varphi\left(\left|U_{i_{j}}\right|\right)$. Hence $U_{i_{1}} \cup \ldots \cup U_{i_{n}}$ is an affine scheme with a finite surjective morphism towards $X$.

The following lemma will be obsoleted by the discussion of separated morphisms in the chapter on morphisms of algebraic spaces.

03FZ Lemma 53.6.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U$ be a separated scheme and $U \rightarrow X$ étale. Then $U \rightarrow X$ is separated, and $R=U \times{ }_{X} U$ is a separated scheme.

Proof. Let $X^{\prime} \subset X$ be the open subscheme such that $U \rightarrow X$ factors through an étale surjection $U \rightarrow X^{\prime}$, see Lemma 53.4.10 If $U \rightarrow X^{\prime}$ is separated, then so is $U \rightarrow X$, see Spaces, Lemma 52.5.4 (as the open immersion $X^{\prime} \rightarrow X$ is separated by Spaces, Lemma 52.5.8 and Schemes, Lemma 25.23.7). Moreover, since $U \times_{X^{\prime}} U=U \times_{X} U$ it suffices to prove the result after replacing $X$ by $X^{\prime}$,
i.e., we may assume $U \rightarrow X$ surjective. Consider the commutative diagram

In the proof of Spaces, Lemma 52.13.1 we have seen that $j: R \rightarrow U \times{ }_{S} U$ is separated. The morphism of schemes $U \rightarrow S$ is separated as $U$ is a separated scheme, see Schemes, Lemma 25.21.14. Hence $U \times_{S} U \rightarrow U$ is separated as a base change, see Schemes, Lemma 25.21.13. Hence the scheme $U \times_{S} U$ is separated (by the same lemma). Since $j$ is separated we see in the same way that $R$ is separated. Hence $R \rightarrow U$ is a separated morphism (by Schemes, Lemma 25.21.14 again). Thus by Spaces, Lemma 52.11 .4 and the diagram above we conclude that $U \rightarrow X$ is separated.
07S4 Lemma 53.6.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If there exists a quasi-separated scheme $U$ and a surjective étale morphism $U \rightarrow X$ such that either of the projections $U \times_{X} U \rightarrow U$ is quasi-compact, then $X$ is quasi-separated.

Proof. We may think of $X$ as an algebraic space over Z. Consider the cartesian diagram

Since $U$ is quasi-separated the projection $U \times U \rightarrow U$ is quasi-separated (as a base change of a quasi-separated morphism of schemes, see Schemes, Lemma 25.21.13). Hence the assumption in the lemma implies $j$ is quasi-compact by Schemes, Lemma 25.21.15. By Spaces, Lemma 52.11.4 we see that $\Delta$ is quasi-compact as desired.

03W7 Lemma 53.6.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) $X$ is Zariski locally quasi-separated over $S$,
(2) $X$ is Zariski locally quasi-separated,
(3) there exists a Zariski open covering $X=\bigcup X_{i}$ such that for each $i$ there exists an affine scheme $U_{i}$ and a quasi-compact surjective étale morphism $U_{i} \rightarrow X_{i}$, and
(4) there exists a Zariski open covering $X=\bigcup X_{i}$ such that for each $i$ there exists an affine scheme $U_{i}$ which maps into an affine open of $S$ and a quasi-compact surjective étale morphism $U_{i} \rightarrow X_{i}$.
Proof. Assume $U_{i} \rightarrow X_{i} \subset X$ are as in (3). To prove (4) choose for each $i$ a finite affine open covering $U_{i}=U_{i 1} \cup \ldots \cup U_{i n_{i}}$ such that each $U_{i j}$ maps into an affine open of $S$. The compositions $U_{i j} \rightarrow U_{i} \rightarrow X_{i}$ are étale and quasi-compact (see Spaces, Lemma 52.5.4). Let $X_{i j} \subset X_{i}$ be the open subspace corresponding to the image of $\left|U_{i j}\right| \rightarrow\left|X_{i}\right|$, see Lemma 53.4.10 Note that $U_{i j} \rightarrow X_{i j}$ is quasi-compact as $X_{i j} \subset X_{i}$ is a monomorphism and as $U_{i j} \rightarrow X$ is quasi-compact. Then $X=\bigcup X_{i j}$ is a covering as in (4). The implication (4) $\Rightarrow(3)$ is immediate.
Assume (4). To show that $X$ is Zariski locally quasi-separated over $S$ it suffices to show that $X_{i}$ is quasi-separated over $S$. Hence we may assume there exists an
affine scheme $U$ mapping into an affine open of $S$ and a quasi-compact surjective étale morphism $U \rightarrow X$. Consider the fibre product square

The right vertical arrow is surjective étale (see Spaces, Lemma 52.5.7) and $U \times{ }_{S} U$ is affine (as $U$ maps into an affine open of $S$, see Schemes, Section 25.17), and $U \times_{X} U$ is quasi-compact because the projection $U \times_{X} U \rightarrow U$ is quasi-compact as a base change of $U \rightarrow X$. It follows from Spaces, Lemma 52.11.4 that $\Delta_{X / S}$ is quasi-compact as desired.

Assume (1). To prove (3) there is an immediate reduction to the case where $X$ is quasi-separated over $S$. By Lemma 53.6 .2 we can find a Zariski open covering $X=\bigcup X_{i}$ such that each $X_{i}$ maps into an affine open of $S$, and such that there exist affine schemes $U_{i}$ and surjective étale morphisms $U_{i} \rightarrow X_{i}$. Since $U_{i} \rightarrow S$ maps into an affine open of $S$ we see that $U_{i} \times_{S} U_{i}$ is affine, see Schemes, Section 25.17. As $X$ is quasi-separated over $S$, the morphisms

$$
R_{i}=U_{i} \times_{X_{i}} U_{i}=U_{i} \times_{X} U_{i} \longrightarrow U_{i} \times_{S} U_{i}
$$

as base changes of $\Delta_{X / S}$ are quasi-compact. Hence we conclude that $R_{i}$ is a quasicompact scheme. This in turn implies that each projection $R_{i} \rightarrow U_{i}$ is quasicompact. Hence, applying Spaces, Lemma 52.11.4 to the covering $U_{i} \rightarrow X_{i}$ and the morphism $U_{i} \rightarrow X_{i}$ we conclude that the morphisms $U_{i} \rightarrow X_{i}$ are quasi-compact as desired.
At this point we see that (1), (3), and (4) are equivalent. Since (3) does not refer to the base scheme we conclude that these are also equivalent with (2).

The following lemma will turn out to be quite useful.
03IJ Lemma 53.6.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U$ be a scheme. Let $\varphi: U \rightarrow X$ be an étale morphism such that the projections $R=U \times_{X} U \rightarrow U$ are quasi-compact; for example if $\varphi$ is quasi-compact. Then the fibres of

$$
|U| \rightarrow|X| \quad \text { and } \quad|R| \rightarrow|X|
$$

are finite.
Proof. Denote $R=U \times_{X} U$, and $s, t: R \rightarrow U$ the projections. Let $u \in U$ be a point, and let $x \in|X|$ be its image. The fibre of $|U| \rightarrow|X|$ over $x$ is equal to $s\left(t^{-1}(\{u\})\right)$ by Lemma 53.4.3, and the fibre of $|R| \rightarrow|X|$ over $x$ is $t^{-1}\left(s\left(t^{-1}(\{u\})\right)\right)$. Since $t: R \rightarrow U$ is étale and quasi-compact, it has finite fibres (as its fibres are disjoint unions of spectra of fields by Morphisms, Lemma 28.36.7 and quasi-compact). Hence we win.

### 53.7. Properties of Spaces defined by properties of schemes

03E5 Any étale local property of schemes gives rise to a corresponding property of algebraic spaces via the following lemma.

03E8 Lemma 53.7.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{P}$ be a property of schemes which is local in the étale topology, see Descent, Definition 34.11.1. The following are equivalent
(1) for some scheme $U$ and surjective étale morphism $U \rightarrow X$ the scheme $U$ has property $\mathcal{P}$, and
(2) for every scheme $U$ and every étale morphism $U \rightarrow X$ the scheme $U$ has property $\mathcal{P}$.
If $X$ is representable this is equivalent to $\mathcal{P}(X)$.
Proof. The implication $(2) \Rightarrow(1)$ is immediate. For the converse, choose a surjective étale morphism $U \rightarrow X$ with $U$ a scheme that has $\mathcal{P}$ and let $V$ be an étale $X$-scheme. Then $U \times_{X} V \rightarrow V$ is an étale surjection of schemes, so $V$ inherits $\mathcal{P}$ from $U \times_{X} V$, which in turn inherits $\mathcal{P}$ from $U$ (see discussion following Descent, Definition 34.11.1). The last claim is clear from (1) and Descent, Definition 34.11.1.

03E6 Definition 53.7.2. Let $\mathcal{P}$ be a property of schemes which is local in the étale topology. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We say $X$ has property $\mathcal{P}$ if any of the equivalent conditions of Lemma 53.7.1 hold.

03E7 Remark 53.7.3. Here is a list of properties which are local for the étale topology (keep in mind that the fpqc, fppf, syntomic, and smooth topologies are stronger than the étale topology):
(1) locally Noetherian, see Descent, Lemma 34.12.1,
(2) Jacobson, see Descent, Lemma 34.12.2,
(3) locally Noetherian and $\left(S_{k}\right)$, see Descent, Lemma 34.13.1,
(4) Cohen-Macaulay, see Descent, Lemma 34.13.2,
(5) reduced, see Descent, Lemma 34.14.1.
(6) normal, see Descent, Lemma 34.14.2,
(7) locally Noetherian and $\left(R_{k}\right)$, see Descent, Lemma 34.14.3,
(8) regular, see Descent, Lemma 34.14.4,
(9) Nagata, see Descent, Lemma 34.14.5.

Any étale local property of germs of schemes gives rise to a corresponding property of algebraic spaces. Here is the obligatory lemma.

04N2 Lemma 53.7.4. Let $\mathcal{P}$ be a property of germs of schemes which is étale local, see Descent, Definition 34.17.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point of $X$. Consider étale morphisms $a: U \rightarrow X$ where $U$ is a scheme. The following are equivalent
(1) for any $U \rightarrow X$ as above and $u \in U$ with $a(u)=x$ we have $\mathcal{P}(U, u)$, and
(2) for some $U \rightarrow X$ as above and $u \in U$ with $a(u)=x$ we have $\mathcal{P}(U, u)$.

If $X$ is representable, then this is equivalent to $\mathcal{P}(X, x)$.
Proof. Omitted.
04RC Definition 53.7.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. Let $\mathcal{P}$ be a property of germs of schemes which is étale local. We say $X$ has property $\mathcal{P}$ at $x$ if any of the equivalent conditions of Lemma 53.7.4 hold.

0BBL Remark 53.7.6. Let $P$ be a property of local rings. Assume that for any étale ring map $A \rightarrow B$ and $\mathfrak{q}$ is a prime of $B$ lying over the prime $\mathfrak{p}$ of $A$, then $P\left(A_{\mathfrak{p}}\right) \Leftrightarrow$ $P\left(B_{\mathfrak{q}}\right)$. Then we obtain an étale local property of germs $(U, u)$ of schemes by setting $\mathcal{P}(U, u)=P\left(\mathcal{O}_{U, u}\right)$. In this situation we will use the terminology "the local ring of $X$ at $x$ has $P "$ to mean $X$ has property $\mathcal{P}$ at $x$. Here is a list of such properties $P$ :
(1) Noetherian, see More on Algebra, Lemma 15.35.1
(2) dimension $d$, see More on Algebra, Lemma 15.35.2,
(3) regular, see More on Algebra, Lemma 15.35.3.
(4) discrete valuation ring, follows from (2), (3), and Algebra, Lemma 10.118.7.
(5) reduced, see More on Algebra, Lemma 15.36.4,
(6) normal, see More on Algebra, Lemma 15.36.6,
(7) Noetherian and depth $k$, see More on Algebra, Lemma 15.36.8,
(8) Noetherian and Cohen-Macaulay, see More on Algebra, Lemma 15.36.9.

There are more properties for which this holds, for example G-ring and Nagata. If we every need these we will add them here as well as references to detailed proofs of the corresponding algebra facts.

### 53.8. Dimension at a point

04N3 We can use Descent, Lemma 34.17 .2 to define the dimension of an algebraic space $X$ at a point $x$. This will give us a different notion than the topological one (i.e., the dimension of $|X|$ at $x)$.

04N5 Definition 53.8.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point of $X$. We define the dimension of $X$ at $x$ to be the element $\operatorname{dim}_{x}(X) \in\{0,1,2, \ldots, \infty\}$ such that $\operatorname{dim}_{x}(X)=\operatorname{dim}_{u}(U)$ for any (equivalently some) pair ( $a: U \rightarrow X, u$ ) consisting of an étale morphism $a: U \rightarrow X$ from a scheme to $X$ and a point $u \in U$ with $a(u)=x$. See Definition 53.7.5. Lemma 53.7.4, and Descent, Lemma 34.17.2.

Warning: It is not the case that $\operatorname{dim}_{x}(X)=\operatorname{dim}_{x}(|X|)$ in general. A counter example is the algebraic space $X$ of Spaces, Example 52.14.9. Namely, in this example we have $\operatorname{dim}_{x}(X)=0$ and $\operatorname{dim}_{x}(|X|)=1$ (this holds for any $x \in|X|$ ). In particular, it also means that the dimension of $X$ (as defined below) is different from the dimension of $|X|$.

04N6 Definition 53.8.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The dimension $\operatorname{dim}(X)$ of $X$ is defined by the rule

$$
\operatorname{dim}(X)=\sup _{x \in|X|} \operatorname{dim}_{x}(X)
$$

By Properties, Lemma 27.10 .2 we see that this is the usual notion if $X$ is a scheme. There is another integer that measures the dimension of a scheme at a point, namely the dimension of the local ring. This invariant is compatible with étale morphisms also, see Section 53.9

### 53.9. Dimension of local rings

04 N 7 The dimension of the local ring of an algebraic space is a well defined concept.
0BAM Lemma 53.9.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. Let $d \in\{0,1,2, \ldots, \infty\}$. The following are equivalent
(1) for some scheme $U$ and étale morphism $a: U \rightarrow X$ and point $u \in U$ with $a(u)=x$ we have $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=d$,
(2) for any scheme $U$, any étale morphism $a: U \rightarrow X$, and any point $u \in U$ with $a(u)=x$ we have $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=d$.
If $X$ is a scheme, this is equivalent to $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=d$.
Proof. Combine Lemma 53.7.4 and Descent, Lemma 34.17.3.
04NA Definition 53.9.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. The dimension of the local ring of $X$ at $x$ is the element $d \in\{0,1,2, \ldots, \infty\}$ satisfying the equivalent conditions of Lemma 53.9.1. In this case we will also say $x$ is a point of codimension $d$ on $X$.

Besides the lemma below we also point the reader to Lemmas 53.21.4 and 53.21.5.
0BAN Lemma 53.9.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following quantities are equal:
(1) The dimension of $X$.
(2) The supremum of the dimensions of the local rings of $X$.
(3) The supremum of $\operatorname{dim}_{x}(X)$ for $x \in|X|$.

Proof. The numbers in (1) and (3) are equal by Definition 53.8.2, Let $U \rightarrow X$ be a surjective étale morphism from a scheme $U$. The supremum of $\operatorname{dim}_{x}(X)$ for $x \in|X|$ is the same as the supremum of $\operatorname{dim}_{u}(U)$ for points $u$ of $U$ by definition. This is the same as the supremu of $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)$ by Properties, Lemma 27.10.2. This in turn is the same as (2) by definition.

### 53.10. Generic points

0BAP Let $T$ be a topological space. According to the second edition of EGA I, a maximal point of $T$ is a generic point of an irreducible component of $T$. If $T=|X|$ is the topological space associated to an algebraic space $X$, there are at least two notions of maximal points: we can look at maximal points of $T$ viewed as a topological space, or we can look at images of maximal points of $U$ where $U \rightarrow X$ is an étale morphism and $U$ is a scheme. The second notion corresponds to the set of points of codimension 0 (Lemma 53.10.1). The codimension 0 points are easier to work with for general algebraic spaces; the two notions agree for quasi-separated and more generally decent algebraic spaces (Decent Spaces, Lemma 55.18.1).
0BAQ Lemma 53.10.1. Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Let $x \in|X|$. Consider étale morphisms $a: U \rightarrow X$ where $U$ is a scheme. The following are equivalent
(1) $x$ is a point of codimension 0 on $X$,
(2) for some $U \rightarrow X$ as above and $u \in U$ with $a(u)=x$, the point $u$ is the generic point of an irreducible component of $U$, and
(3) for any $U \rightarrow X$ as above and any $u \in U$ mapping to $x$, the point $u$ is the generic point of an irreducible component of $U$.
If $X$ is representable, this is equivalent to $x$ being a generic point of an irreducible component of $|X|$.
Proof. Observe that a point $u$ of a scheme $U$ is a generic point of an irreducible component of $U$ if and only if $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=0$ (Properties, Lemma 27.10.4). Hence
this follows from the definition of the codimension of a point on $X$ (Definition 53.9.2.

0BAR Lemma 53.10.2. Let $S$ be a scheme and let $X$ be an algebraic space over $S$. The set of codimension 0 points of $X$ is dense in $|X|$.

Proof. If $U$ is a scheme, then the set of generic points of irreducible components is dense in $U$ (holds for any quasi-sober topological space). Thus if $U \rightarrow X$ is a surjective étale morphism, then the set of codimension 0 points of $X$ is the image of a dense subset of $|U|$ (Lemma 53.10.1). Since $|X|$ has the quotient topology for $|U| \rightarrow|X|$ we conclude.

### 53.11. Reduced spaces

03IP We have already defined reduced algebraic spaces in Section 53.7. Here we just prove some simple lemmas regarding reduced algebraic spaces.

0BGS Lemma 53.11.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) $X$ is reduced,
(2) for every $x \in|X|$ the local ring of $X$ at $x$ is reduced (Remark53.7.6).

In this case $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a reduced ring and if $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$ has $X=V(f)$, then $f=0$.

Proof. The equivalence of (1) and (2) follows from Properties, Lemma 27.3.2 applied to affine schemes étale over $X$. The final statements follow the cited lemma and fact that $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a subring of $\Gamma\left(U, \mathcal{O}_{U}\right)$ for some reduced scheme $U$ étale over $X$.

0ABJ Lemma 53.11.2. Let $S$ be a scheme. Let $Z \rightarrow X$ be an immersion of algebraic spaces. Then $|Z| \rightarrow|X|$ is a homeomorphism of $|Z|$ onto a locally closed subset of $|X|$.

Proof. Let $U$ be a scheme and $U \rightarrow X$ a surjective étale morphism. Then $Z \times{ }_{X}$ $U \rightarrow U$ is an immersion of schemes, hence gives a homeomorphism of $\left|Z \times_{X} U\right|$ with a locally closed subset $T^{\prime}$ of $|U|$. By Lemma 53.4 .3 the subset $T^{\prime}$ is the inverse image of the image $T$ of $|Z| \rightarrow|X|$. The map $|Z| \rightarrow|X|$ is injective because the transformation of functors $Z \rightarrow X$ is injective, see Spaces, Section 52.12. By Topology, Lemma 5.5.4 we see that $T$ is locally closed in $|X|$. Moreover, the continuous map $|Z| \rightarrow T$ is a homeomorphism as the map $\left|Z \times_{X} U\right| \rightarrow T^{\prime}$ is a homeomorphism and $\left|Z \times_{Y} U\right| \rightarrow|Z|$ is submersive.

The following lemma will help us construct (locally) closed subspaces.
07TW Lemma 53.11.3. Let $S$ be a scheme. Let $j: R \rightarrow U \times{ }_{S} U$ be an étale equivalence relation. Let $X=U / R$ be the associated algebraic space (Spaces, Theorem 52.10.5). There is a canonical bijection
$R$-invariant locally closed subschemes $Z^{\prime}$ of $U \leftrightarrow$ locally closed subspaces $Z$ of $X$
Moreover, if $Z \rightarrow X$ is closed (resp. open) if and only if $Z^{\prime} \rightarrow U$ is closed (resp. open).

Proof. Denote $\varphi: U \rightarrow X$ the canonical map. The bijection sends $Z \rightarrow X$ to $Z^{\prime}=Z \times_{X} U \rightarrow U$. It is immediate from the definition that $Z^{\prime} \rightarrow U$ is an immersion, resp. closed immersion, resp. open immersion if $Z \rightarrow X$ is so. It is also clear that $Z^{\prime}$ is $R$-invariant (see Groupoids, Definition 38.19.1).
Conversely, assume that $Z^{\prime} \rightarrow U$ is an immersion which is $R$-invariant. Let $R^{\prime}$ be the restriction of $R$ to $Z^{\prime}$, see Groupoids, Definition 38.18.2. Since $R^{\prime}=R \times_{s, U} Z^{\prime}=$ $Z^{\prime} \times_{U, t} R$ in this case we see that $R^{\prime}$ is an étale equivalence relation on $Z^{\prime}$. By Spaces, Theorem 52.10.5 we see $Z=Z^{\prime} / R^{\prime}$ is an algebraic space. By construction we have $U \times_{X} Z=Z^{\prime}$, so $U \times_{X} Z \rightarrow Z$ is an immersion. Note that the property "immersion" is preserved under base change and fppf local on the base (see Spaces, Section 52.4). Moreover, immersions are separated and locally quasi-finite (see Schemes, Lemma 25.23 .7 and Morphisms, Lemma 28.20.15. Hence by More on Morphisms, Lemma 36.39 .1 immersions satisfy descent for fppf covering. This means all the hypotheses of Spaces, Lemma 52.11.5 are satisfied for $Z \rightarrow X, \mathcal{P}=$ "immersion", and the étale surjective morphism $U \rightarrow X$. We conclude that $Z \rightarrow X$ is representable and an immersion, which is the definition of a subspace (see Spaces, Definition 52.12.1).

It is clear that these constructions are inverse to each other and we win.
03IQ Lemma 53.11.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. There exists a unique closed subspace $Z \subset X$ with the following properties: (a) we have $|Z|=T$, and (b) $Z$ is reduced.
Proof. Let $U \rightarrow X$ be a surjective étale morphism, where $U$ is a scheme. Set $R=U \times_{X} U$, so that $X=U / R$, see Spaces, Lemma 52.9.1. As usual we denote $s, t: R \rightarrow U$ the two projection morphisms. By Lemma 53.4.5 we see that $T$ corresponds to a closed subset $T^{\prime} \subset|U|$ such that $s^{-1}\left(T^{\prime}\right)=t^{-1}\left(T^{\prime}\right)$. Let $Z^{\prime} \subset U$ be the reduced induced scheme structure on $T^{\prime}$. In this case the fibre products $Z^{\prime} \times_{U, t} R$ and $Z^{\prime} \times_{U, s} R$ are closed subschemes of $R$ (Schemes, Lemma 25.18.2) which are étale over $Z^{\prime}$ (Morphisms, Lemma 28.36.4), and hence reduced (because being reduced is local in the étale topology, see Remark 53.7.3. Since they have the same underlying topological space (see above) we conclude that $Z^{\prime} \times_{U, t} R=Z^{\prime} \times_{U, s} R$. Thus we can apply Lemma 53.11 .3 to obtain a closed subspace $Z \subset X$ whose pullback to $U$ is $Z^{\prime}$. By construction $|Z|=T$ and $Z$ is reduced. This proves existence. We omit the proof of uniqueness.

03JJ Lemma 53.11.5. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Let $Z \subset X$ be a closed subspace. Assume $Y$ is reduced. A morphism $f: Y \rightarrow X$ factors through $Z$ if and only if $f(|Y|) \subset|Z|$.

Proof. Assume $f(|Y|) \subset|Z|$. Choose a diagram

where $U, V$ are schemes, and the vertical arrows are surjective and étale. The scheme $V$ is reduced, see Lemma 53.7.1. Hence $h$ factors through $a^{-1}(Z)$ by Schemes, Lemma 25.12.6. So $a \circ h$ factors through $Z$. As $Z \subset X$ is a subsheaf, and $V \rightarrow Y$ is a surjection of sheaves on $(S c h / S)_{f p p f}$ we conclude that $X \rightarrow Y$ factors through $Z$.

047X Definition 53.11.6. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. Let $Z \subset|X|$ be a closed subset. An algebraic space structure on $Z$ is given by a closed subspace $Z^{\prime}$ of $X$ with $\left|Z^{\prime}\right|$ equal to $Z$. The reduced induced algebraic space structure on $Z$ is the one constructed in Lemma 53.11.4. The reduction $X_{\text {red }}$ of $X$ is the reduced induced algebraic space structure on $|X|$.

### 53.12. The schematic locus

03JG Every algebraic space has a largest open subspace which is a scheme; this is more or less clear but we also write out the proof below. Of course this subspace may be empty, for example if $X=\mathbf{A}_{\mathbf{Q}}^{1} / \mathbf{Z}$ (the universal counter example). On the other hand, if $X$ is for example quasi-separated, then this largest open subscheme is actually dense in $X$ !
03JH Lemma 53.12.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. There exists a largest open subspace $X^{\prime} \subset X$ which is a scheme.

Proof. Let $U \rightarrow X$ be an étale surjective morphism, where $U$ is a scheme. Let $R=U \times_{X} U$. The open subspaces of $X$ correspond $1-1$ with open subschemes of $U$ which are $R$-invariant. Hence there is a set of them. Let $X_{i}, i \in I$ be the set of open subspaces of $X$ which are schemes, i.e., are representable. Consider the open subspace $X^{\prime} \subset X$ whose underlying set of points is the open $\bigcup\left|X_{i}\right|$ of $|X|$. By Lemma 53.4.4 we see that

$$
\coprod X_{i} \longrightarrow X^{\prime}
$$

is a surjective map of sheaves on $(S c h / S)_{f p p f}$. But since each $X_{i} \rightarrow X^{\prime}$ is representable by open immersions we see that in fact the map is surjective in the Zariski topology. Namely, if $T \rightarrow X^{\prime}$ is a morphism from a scheme into $X^{\prime}$, then $X_{i} \times_{X}^{\prime} T$ is an open subscheme of $T$. Hence we can apply Schemes, Lemma 25.15.4 to see that $X^{\prime}$ is a scheme.

In the rest of this section we say that an open subspace $X^{\prime}$ of an algebraic space $X$ is dense if the corresponding open subset $\left|X^{\prime}\right| \subset|X|$ is dense.

0BAS Lemma 53.12.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If there exists a finite, étale, surjective morphism $U \rightarrow X$ where $U$ is a quasi-separated scheme, then there exists a dense open subspace $X^{\prime}$ of $X$ which is a scheme. More precisely, every point $x \in|X|$ of codimension 0 in $X$ is contained in $X^{\prime}$.

Proof. Let $X^{\prime} \subset X$ be the maximal open subspace which is a scheme (Lemma 53.12.1). Let $x \in|X|$ be a point of codimension 0 on $X$. By Lemma 53.10 .2 it suffices to show $x \in X^{\prime}$. Let $U \rightarrow X$ be as in the statement of the lemma. Write $R=U \times_{X} U$ and denote $s, t: R \rightarrow U$ the projections as usual. Note that $s, t$ are surjective, finite and étale. By Lemma 53.6.7 the fibre of $|U| \rightarrow|X|$ over $x$ is finite, say $\left\{\eta_{1}, \ldots, \eta_{n}\right\}$. By Lemma 53.10.1 each $\eta_{i}$ is the generic point of an irreducible component of $U$. By Properties, Lemma 27.29.1 we can find an affine open $W \subset U$ containing $\left\{\eta_{1}, \ldots, \eta_{n}\right\}$ (this is where we use that $U$ is quasi-separated). By Groupoids, Lemma 38.24 .1 we may assume that $W$ is $R$ invariant. Since $W \subset U$ is an $R$-invariant affine open, the restriction $R_{W}$ of $R$ to $W$ equals $R_{W}=s^{-1}(W)=t^{-1}(W)$ (see Groupoids, Definition 38.19.1 and discussion following it). In particular the maps $R_{W} \rightarrow W$ are finite étale also. It follows that $R_{W}$ is affine. Thus we see that $W / R_{W}$ is a scheme, by Groupoids, Proposition
38.23.8. On the other hand, $W / R_{W}$ is an open subspace of $X$ by Spaces, Lemma 52.10 .2 and it contains $x$ by construction.

We will improve the following proposition to the case of decent algebraic spaces in Decent Spaces, Theorem 55.9.2.
06 NH Proposition 53.12.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is Zariski locally quasi-separated (for example if $X$ is quasi-separated), then there exists a dense open subspace of $X$ which is a scheme. More precisely, every point $x \in|X|$ of codimension 0 on $X$ is contained in $X^{\prime}$.

Proof. The question is local on $X$ by Lemma 53.12.1. Thus by Lemma 53.6.6 we may assume that there exists an affine scheme $U$ and a surjective, quasi-compact, étale morphism $U \rightarrow X$. Moreover $U \rightarrow X$ is separated (Lemma 53.6.4. Set $R=$ $U \times{ }_{X} U$ and denote $s, t: R \rightarrow U$ the projections as usual. Then $s, t$ are surjective, quasi-compact, separated, and étale. Hence $s, t$ are also quasi-finite and have finite fibres (Morphisms, Lemmas 28.36.6, 28.20.9, and 28.20.10). By Morphisms, Lemma 28.47.1 for every $\eta \in U$ which is the generic point of an irreducible component of $U$, there exists an open neighbourhood $V \subset U$ of $\eta$ such that $s^{-1}(V) \rightarrow V$ is finite. By Descent, Lemma 34.19 .21 being finite is fpqc (and in particular étale) local on the target. Hence we may apply More on Groupoids, Lemma 39.5.4 which says that the largest open $W \subset U$ over which $s$ is finite is $R$-invariant. By the above $W$ contains every generic point of an irreducible component of $U$. The restriction $R_{W}$ of $R$ to $W$ equals $R_{W}=s^{-1}(W)=t^{-1}(W)$ (see Groupoids, Definition 38.19.1 and discussion following it). By construction $s_{W}, t_{W}: R_{W} \rightarrow W$ are finite étale. Consider the open subspace $X^{\prime}=W / R_{W} \subset X$ (see Spaces, Lemma 52.10.2). By construction the inclusion map $X^{\prime} \rightarrow X$ induces a bijection on points of codimension 0 . This reduces us to Lemma 53.12.2.

### 53.13. Obtaining a scheme

07S5 We have used in the previous section that the quotient $U / R$ of an affine scheme $U$ by an equivalence relation $R$ is a scheme if the morphisms $s, t: R \rightarrow U$ are finite étale. This is a special case of the following result.
07S6 Proposition 53.13.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume
(1) $s, t: R \rightarrow U$ finite locally free,
(2) $j=(t, s)$ is an equivalence, and
(3) for a dense set of points $u \in U$ the $R$-equivalence class $t\left(s^{-1}(\{u\})\right)$ is contained in an affine open of $U$.
Then there exists a finite locally free morphism $U \rightarrow M$ of schemes over $S$ such that $R=U \times_{M} U$ and such that $M$ represents the quotient sheaf $U / R$ in the fppf topology.

Proof. By assumption (3) and Groupoids, Lemma 38.24 .1 we can find an open covering $U=\bigcup U_{i}$ such that each $U_{i}$ is an $R$-invariant affine open of $U$. Set $R_{i}=\left.R\right|_{U_{i}}$. Consider the fppf sheaves $F=U / R$ and $F_{i}=U_{i} / R_{i}$. By Spaces, Lemma 52.10 .2 the morphisms $F_{i} \rightarrow F$ are representable and open immersions. By Groupoids, Proposition 38.23 .8 the sheaves $F_{i}$ are representable by affine schemes. If $T$ is a scheme and $T \rightarrow F$ is a morphism, then $V_{i}=F_{i} \times_{F} T$ is open in $T$ and we claim that $T=\bigcup V_{i}$. Namely, fppf locally on $T$ we can lift $T \rightarrow F$ to a
morphism $f: T \rightarrow U$ and in that case $f^{-1}\left(U_{i}\right) \subset V_{i}$. Hence we conclude that $F$ is representable by a scheme, see Schemes, Lemma 25.15.4.

For example, if $U$ is isomorphic to a locally closed subscheme of an affine scheme or isomorphic to a locally closed subscheme of $\operatorname{Proj}(A)$ for some graded ring $A$, then the third assumption holds by Properties, Lemma 27.29.5. In particular we can apply this to free actions of finite groups and finite group schemes on quasi-affine or quasi-projective schemes. For example, the quotient $X / G$ of a quasi-projective variety $X$ by a free action of a finite group $G$ is a scheme. Here is a detailed statement.

07S7 Lemma 53.13.2. Let $S$ be a scheme. Let $G \rightarrow S$ be a group scheme. Let $X \rightarrow S$ be a morphism of schemes. Let $a: G \times{ }_{S} X \rightarrow X$ be an action. Assume that
(1) $G \rightarrow S$ is finite locally free,
(2) the action a is free,
(3) $X \rightarrow S$ is affine, or quasi-affine, or projective, or quasi-projective, or $X$ is isomorphic to an open subscheme of an affine scheme or isomorphic to an open subscheme of $\operatorname{Proj}(A)$ for some graded ring $A$.
Then the fppf quotient sheaf $X / G$ is a scheme.
Proof. Since the action is free the morphism $j=(a, \mathrm{pr}): G \times{ }_{S} X \rightarrow X \times{ }_{S} X$ is a monomorphism and hence an equivalence relation, see Groupoids, Lemma 38.10.3. The maps $s, t: G \times{ }_{S} X \rightarrow X$ are finite locally free as we've assumed that $G \rightarrow S$ is finite locally free. To conclude it now suffices to prove the last assumption of Proposition 53.13 .1 holds. Since the action of $G$ is over $S$ it suffices to prove that any finite set of points in a fibre of $X \rightarrow S$ is contained in an affine open of $X$. If $X$ is isomorphic to an open subscheme of an affine scheme or isomorphic to an open subscheme of $\operatorname{Proj}(A)$ for some graded ring $A$ this follows from Properties, Lemma 27.29.5. In the remaining cases, we may replace $S$ by an affine open and we get back to the case we just dealt with. Some details omitted.

0BBM Lemma 53.13.3. Notation and assumptions as in Proposition 53.13.1. Then
(1) if $U$ is quasi-separated over $S$, then $U / R$ is quasi-separated over $S$,
(2) if $U$ is quasi-separated, then $U / R$ is quasi-separated,
(3) if $U$ is separated over $S$, then $U / R$ is separated over $S$,
(4) if $U$ is separated, then $U / R$ is separated, and
(5) add more here.

Similar results hold in the setting of Lemma 53.13.2.
Proof. Since $M$ represents the quotient sheaf we have a cartesian diagram

of schemes. Since $U \times_{S} U \rightarrow M \times_{S} M$ is surjective finite locally free, to show that $M \rightarrow M \times{ }_{S} M$ is quasi-compact, resp. a closed immersion, it suffices to show that $j: R \rightarrow U \times_{S} U$ is quasi-compact, resp. a closed immersion, see Descent, Lemmas 34.19.1 and 34.19.17. Since $j: R \rightarrow U \times_{S} U$ is a morphism over $U$ and since $R$ is finite over $U$, we see that $j$ is quasi-compact as soon as the projection $U \times{ }_{S} U \rightarrow U$
is quasi-separated (Schemes, Lemma 25.21.15. Since $j$ is a monomorphism and locally of finite type, we see that $j$ is a closed immersion as soon as it is proper (Étale Morphisms, Lemma 40.7.2 which will be the case as soon as the projection $U \times{ }_{S} U \rightarrow U$ is separated (Morphisms, Lemma 28.41.7). This proves (1) and (3). To prove (2) and (4) we replace $S$ by $\operatorname{Spec}(\mathbf{Z})$, see Definition 53.3.1. Since Lemma 53.13 .2 is proved through an application of Proposition 53.13.1 the final statement is clear too.

### 53.14. Points on quasi-separated spaces

06 NI Points can behave very badly on algebraic spaces in the generality introduced in the stacks project. However, for quasi-separated spaces their behaviour is mostly like the behaviour of points on schemes. We prove a few results on this in this section; the chapter on decent spaces contains many more results on this, see for example Decent Spaces, Section 55.10 .
06NJ Lemma 53.14.1. Let $S$ be a scheme. Let $X$ be a Zariski locally quasi-separated algebraic space over $S$. Then the topological space $|X|$ is sober (see Topology, Definition 5.7.4.).
Proof. Combining Topology, Lemma 5.7.6 and Lemma 53.6.6 we see that we may assume that there exists an affine scheme $U$ and a surjective, quasi-compact, étale morphism $U \rightarrow X$. Set $R=U \times_{X} U$ with projection maps $s, t: R \rightarrow U$. Applying Lemma 53.6.7 we see that the fibres of $s, t$ are finite. It follows all the assumptions of Topology, Lemma 5.18.7 are met, and we conclude that $|X|$ is Kolmogoror ${ }^{3}$
It remains to show that every irreducible closed subset $T \subset|X|$ has a generic point. By Lemma 53.11 .4 there exists a closed subspace $Z \subset X$ with $|Z|=|T|$. Note that $U \times_{X} Z \rightarrow Z$ is a quasi-compact, surjective, étale morphism from an affine scheme to $Z$, hence $Z$ is Zariski locally quasi-separated by Lemma 53.6.6. By Proposition 53.12 .3 we see that there exists an open dense subspace $Z^{\prime} \subset Z$ which is a scheme. This means that $\left|Z^{\prime}\right| \subset T$ is open dense. Hence the topological space $\left|Z^{\prime}\right|$ is irreducible, which means that $Z^{\prime}$ is an irreducible scheme. By Schemes, Lemma 25.11.1 we conclude that $\left|Z^{\prime}\right|$ is the closure of a single point $\eta \in\left|Z^{\prime}\right| \subset T$ and hence also $T=\overline{\{\eta\}}$, and we win.
0A4G Lemma 53.14.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. The topological space $|X|$ is a spectral space.
Proof. By Topology, Definition 5.22.1 we have to check that $|X|$ is sober, quasicompact, has a basis of quasi-compact opens, and the intersection of any two quasicompact opens is quasi-compact. By Lemma 53.14.1 we see that $|X|$ is sober. By Lemma 53.5 .2 we see that $|X|$ is quasi-compact. By Lemma 53.6 .3 there exists an affine scheme $U$ and a surjective étale morphism $f: U \rightarrow X$. Since $|f|:|U| \rightarrow|X|$ is open and continuous and since $|U|$ has a basis of quasi-compact opens, we conclude that $|X|$ has a basis of quasi-compact opens. Finally, suppose that $A, B \subset|X|$ are quasi-compact open. Then $A=\left|X^{\prime}\right|$ and $B=\left|X^{\prime \prime}\right|$ for some open subspaces $X^{\prime}, X^{\prime \prime} \subset X$ (Lemma 53.4.8) and we can choose affine schemes $V$ and $W$ and surjective étale morphisms $V \rightarrow X^{\prime}$ and $W \rightarrow X^{\prime \prime}$ (Lemma 53.6.3. Then $A \cap B$ is

[^155]the image of $\left|V \times_{X} W\right| \rightarrow|X|$ (Lemma 53.4.3). Since $V \times_{X} W$ is quasi-compact as $X$ is quasi-separated (Lemma 53.3.3) we conclude that $A \cap B$ is quasi-compact and the proof is finished.

The following lemma can be used to prove that an algebraic space is isomorphic to the spectrum of a field.
03DZ Lemma 53.14.3. Let $S$ be a scheme. Let $k$ be a field. Let $X$ be an algebraic space over $S$ and assume that there exists a surjective étale morphism $\operatorname{Spec}(k) \rightarrow X$. If $X$ is quasi-separated, then $X \cong \operatorname{Spec}\left(k^{\prime}\right)$ where $k^{\prime} \subset k$ is a finite separable extension.

Proof. Set $R=\operatorname{Spec}(k) \times_{X} \operatorname{Spec}(k)$, so that we have a fibre product diagram

By Spaces, Lemma 52.9 .1 we know $X=\operatorname{Spec}(k) / R$ is the quotient sheaf. Because $\operatorname{Spec}(k) \rightarrow X$ is étale, the morphisms $s$ and $t$ are étale. Hence $R=\coprod_{i \in I} \operatorname{Spec}\left(k_{i}\right)$ is a disjoint union of spectra of fields, and both $s$ and $t$ induce finite separable field extensions $s, t: k \subset k_{i}$, see Morphisms, Lemma 28.36.7. Because

$$
R=\operatorname{Spec}(k) \times_{X} \operatorname{Spec}(k)=\left(\operatorname{Spec}(k) \times_{S} \operatorname{Spec}(k)\right) \times_{X \times_{S} X, \Delta} X
$$

and since $\Delta$ is quasi-compact by assumption we conclude that $R \rightarrow \operatorname{Spec}(k) \times{ }_{S}$ $\operatorname{Spec}(k)$ is quasi-compact. Hence $R$ is quasi-compact as $\operatorname{Spec}(k) \times_{S} \operatorname{Spec}(k)$ is affine. We conclude that $I$ is finite. This implies that $s$ and $t$ are finite locally free morphisms. Hence by Groupoids, Proposition 38.23 .8 we conclude that $\operatorname{Spec}(k) / R$ is represented by $\operatorname{Spec}\left(k^{\prime}\right)$, with $k^{\prime} \subset k$ finite locally free where

$$
k^{\prime}=\left\{x \in k \mid s_{i}(x)=t_{i}(x) \text { for all } i \in I\right\}
$$

It is easy to see that $k^{\prime}$ is a field.
03E0 Remark 53.14.4. Lemma 53.14 .3 holds for decent algebraic spaces, see Decent Spaces, Lemma 55.10.12. In fact a decent algebraic space with one point is a scheme, see Decent Spaces, Lemma 55.12.2. This also holds when $X$ is locally separated, because a locally separated algebraic space is decent, see Decent Spaces, Lemma 55.13.2.

### 53.15. Étale morphisms of algebraic spaces

03 FQ This section really belongs in the chapter on morphisms of algebraic spaces, but we need the notion of an algebraic space étale over another in order to define the small étale site of an algebraic space. Thus we need to do some preliminary work on étale morphisms from schemes to algebraic spaces, and étale morphisms between algebraic spaces. For more about étale morphisms of algebraic spaces, see Morphisms of Spaces, Section 54.38 .
03EC Lemma 53.15.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U$, $U^{\prime}$ be schemes over $S$.
(1) If $U \rightarrow U^{\prime}$ is an étale morphism of schemes, and if $U^{\prime} \rightarrow X$ is an étale morphism from $U^{\prime}$ to $X$, then the composition $U \rightarrow X$ is an étale morphism from $U$ to $X$.
(2) If $\varphi: U \rightarrow X$ and $\varphi^{\prime}: U^{\prime} \rightarrow X$ are étale morphisms towards $X$, and if $\chi: U \rightarrow U^{\prime}$ is a morphism of schemes such that $\varphi=\varphi^{\prime} \circ \chi$, then $\chi$ is an étale morphism of schemes.

Proof. Recall that our definition of an étale morphism from a scheme into an algebraic space comes from Spaces, Definition 52.5.1 via the fact that any morphism from a scheme into an algebraic space is representable. Part (1) of the lemma follows from this, the fact that étale morphisms are preserved under composition (Morphisms, Lemma 28.36.3) and Spaces, Lemmas 52.5.4 and 52.5.3 (which are formal). To prove part (2) choose a scheme $W$ over $S$ and a surjective étale morphism $W \rightarrow X$. Consider the base change $\chi_{W}: W \times_{X} U \rightarrow W \times_{X} U^{\prime}$ of $\chi$. As $W \times_{X} U$ and $W \times{ }_{X} U^{\prime}$ are étale over $W$, we conclude that $\chi_{W}$ is étale, by Morphisms, Lemma 28.36 .19 . On the other hand, in the commutative diagram

the two vertical arrows are étale and surjective. Hence by Descent, Lemma 34.10.4 we conclude that $U \rightarrow U^{\prime}$ is étale.

03FR Definition 53.15.2. Let $S$ be a scheme. A morphism $f: X \rightarrow Y$ between algebraic spaces over $S$ is called étale if and only if for every étale morphism $\varphi$ : $U \rightarrow X$ where $U$ is a scheme, the composition $\varphi \circ f$ is étale also.

If $X$ and $Y$ are schemes, then this agree with the usual notion of an étale morphism of schemes. In fact, whenever $X \rightarrow Y$ is a representable morphism of algebraic spaces, then this agrees with the notion defined via Spaces, Definition 52.5.1. This follows by combining Lemma 53.15.3 below and Spaces, Lemma 52.11.4.

03FS Lemma 53.15.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is étale,
(2) there exists a surjective étale morphism $\varphi: U \rightarrow X$, where $U$ is a scheme, such that the composition $f \circ \varphi$ is étale (as a morphism of algebraic spaces),
(3) there exists a surjective étale morphism $\psi: V \rightarrow Y$, where $V$ is a scheme, such that the base change $V \times_{X} Y \rightarrow V$ is étale (as a morphism of algebraic spaces),
(4) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and the left vertical arrow is surjective such that the horizontal arrow is étale.

Proof. Let us prove that (4) implies (1). Assume a diagram as in (4) given. Let $W \rightarrow X$ be an étale morphism with $W$ a scheme. Then we see that $W \times_{X} U \rightarrow U$ is étale. Hence $W \times_{X} U \rightarrow V$ is étale, and also $W \times_{X} U \rightarrow Y$ is étale by Lemma
53.15 .1 (1). Since also the projection $W \times_{X} U \rightarrow W$ is surjective and étale, we conclude from Lemma 53.15.1 (2) that $W \rightarrow Y$ is étale.
Let us prove that (1) implies (4). Assume (1). Choose a commutative diagram

where $U \rightarrow X$ and $V \rightarrow Y$ are surjective and étale, see Spaces, Lemma 52.11.6. By assumption the morphism $U \rightarrow Y$ is étale, and hence $U \rightarrow V$ is étale by Lemma 53.15.1 (2).

We omit the proof that (2) and (3) are also equivalent to (1).
03FT Lemma 53.15.4. The composition of two étale morphisms of algebraic spaces is étale.

Proof. This is immediate from the definition.
03FU Lemma 53.15.5. The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.

Proof. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces over $S$. Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Then $U \rightarrow Y$ is étale, hence in the diagram

the top horizontal arrow is étale. Moreover, the left vertical arrow is surjective and étale (verification omitted). Hence we conclude that the lower horizontal arrow is étale by Lemma 53.15.3.

03FV Lemma 53.15.6. Let $S$ be a scheme. Let $X, Y, Z$ be algebraic spaces. Let $g$ : $X \rightarrow Z, h: Y \rightarrow Z$ be étale morphisms and let $f: X \rightarrow Y$ be a morphism such that $h \circ f=g$. Then $f$ is étale.

Proof. Choose a commutative diagram

where $U \rightarrow X$ and $V \rightarrow Y$ are surjective and étale, see Spaces, Lemma 52.11.6, By assumption the morphisms $\varphi: U \rightarrow X \rightarrow Z$ and $\psi: V \rightarrow Y \rightarrow Z$ are étale. Moreover, $\psi \circ \chi=\varphi$ by our assumption on $f, g, h$. Hence $U \rightarrow V$ is étale by Lemma 53.15.1 part (2).

03IR Lemma 53.15.7. Let $S$ be a scheme. If $X \rightarrow Y$ is an étale morphism of algebraic spaces over $S$, then the associated map $|X| \rightarrow|Y|$ of topological spaces is open.

Proof. This is clear from the diagram in Lemma 53.15 .3 and Lemma 53.4.6
Finally, here is a fun lemma. It is not true that an algebraic space with an étale morphism towards a scheme is a scheme, see Spaces, Example 52.14.2. But it is true if the target is the spectrum of a field.

03KX Lemma 53.15.8. Let $S$ be a scheme. Let $X \rightarrow \operatorname{Spec}(k)$ be étale morphism over $S$, where $k$ is a field. Then $X$ is a scheme.

Proof. Let $U$ be an affine scheme, and let $U \rightarrow X$ be an étale morphism. By Definition 53.15.2 we see that $U \rightarrow \operatorname{Spec}(k)$ is an étale morphism. Hence $U=$ $\coprod_{i=1, \ldots, n} \operatorname{Spec}\left(k_{i}\right)$ is a finite disjoint union of spectra of finite separable extensions $k_{i}$ of $k$, see Morphisms, Lemma 28.36.7. The $R=U \times_{X} U \rightarrow U \times_{\operatorname{Spec}(k)} U$ is a monomorphism and $U \times_{\operatorname{Spec}(k)} U$ is also a finite disjoint union of spectra of finite separable extensions of $k$. Hence by Schemes, Lemma 25.23 .10 we see that $R$ is similarly a finite disjoint union of spectra of finite separable extensions of $k$. This $U$ and $R$ are affine and both projections $R \rightarrow U$ are finite locally free. Hence $U / R$ is a scheme by Groupoids, Proposition 38.23 .8 . By Spaces, Lemma 52.10.2 it is also an open subspace of $X$. By Lemma 53.12.1 we conclude that $X$ is a scheme.

### 53.16. Spaces and fpqc coverings

03 W 8 Let $S$ be a scheme. An algebraic space over $S$ is defined as a sheaf in the fppf topology with additional properties. Hence it is not immediately clear that it satisfies the sheaf property for the fpqc topology (see Topologies, Definition 33.8.12). In this section we give Gabber's argument showing this is true. However, when we say that the algebraic space $X$ satisfies the sheaf property for the fpqc topology we really only consider fpqc coverings $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ such that $T, T_{i}$ are objects of the big site $(S c h / S)_{\text {fppf }}$ (as per our conventions, see Section 53.2 .

0APL Proposition 53.16.1 (Gabber). Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $X$ satisfies the sheaf property for the fpqc topology.

Proof. Since $X$ is a sheaf for the Zariski topology it suffices to show the following. Given a surjective flat morphism of affines $f: T^{\prime} \rightarrow T$ we have: $X(T)$ is the equalizer of the two maps $X\left(T^{\prime}\right) \rightarrow X\left(T^{\prime} \times_{T} T^{\prime}\right)$. See Topologies, Lemma 33.8.13 (there is a little argument omitted here because the lemma cited is formulated for functors defined on the category of all schemes).
Let $a, b: T \rightarrow X$ be two morphisms such that $a \circ f=b \circ f$. We have to show $a=b$. Consider the fibre product

$$
E=X \times_{\Delta_{X / S}, X \times_{S} X,(a, b)} T
$$

By Spaces, Lemma 52.13 .1 the morphism $\Delta_{X / S}$ is a representable monomorphism. Hence $E \rightarrow T$ is a monomorphism of schemes. Our assumption that $a \circ f=b \circ f$ implies that $T^{\prime} \rightarrow T$ factors (uniquely) through $E$. Consider the commutative diagram

Since the projection $T^{\prime} \times_{T} E \rightarrow T^{\prime}$ is a monomorphism with a section we conclude it is an isomorphism. Hence we conclude that $E \rightarrow T$ is an isomorphism by Descent, Lemma 34.19.15 This means $a=b$ as desired.

Next, let $c: T^{\prime} \rightarrow X$ be a morphism such that the two compositions $T^{\prime} \times_{T} T^{\prime} \rightarrow$ $T^{\prime} \rightarrow X$ are the same. We have to find a morphism $a: T \rightarrow X$ whose composition with $T^{\prime} \rightarrow T$ is $c$. Choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow|X|$ contains the image of $|c|:\left|T^{\prime}\right| \rightarrow|X|$. This is possible by Lemmas 53.4.6 and 53.6.1, the fact that a finite union of affines is affine, and the fact that $\left|T^{\prime}\right|$ is quasi-compact (small argument omitted). Since $U \rightarrow X$ is separated (Lemma 53.6.4), we see that

$$
V=U \times_{X, c} T^{\prime} \longrightarrow T^{\prime}
$$

is a surjective, étale, separated morphism of schemes (to see that it is surjective use Lemma 53.4 .3 and our choice of $U \rightarrow X$ ). The fact that $c \circ \mathrm{pr}_{0}=c \circ \mathrm{pr}_{1}$ means that we obtain a descent datum on $V / T^{\prime} / T$ (Descent, Definition 34.30.1) because

$$
\begin{aligned}
V \times_{T^{\prime}}\left(T^{\prime} \times_{T} T^{\prime}\right) & =U \times_{X, c o \mathrm{pr}_{0}}\left(T^{\prime} \times_{T} T^{\prime}\right) \\
& =\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{c \circ \mathrm{pr}_{1}, X} U \\
& =\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{T^{\prime}} V
\end{aligned}
$$

The morphism $V \rightarrow T^{\prime}$ is ind-quasi-affine by More on Morphisms, Lemma 36.48.4 (because étale morphisms are locally quasi-finite, see Morphisms, Lemma 28.36.6). By More on Groupoids, Lemma 39.14 .3 the descent datum is effective. Say $W \rightarrow T$ is a morphism such that there is an isomorphism $\alpha: T^{\prime} \times_{T} W \rightarrow V$ compatible with the given descent datum on $V$ and the canonical descent datum on $T^{\prime} \times_{T} W$. Then $W \rightarrow T$ is surjective and étale (Descent, Lemmas 34.19.6 and 34.19.27). Consider the composition

$$
b^{\prime}: T^{\prime} \times_{T} W \longrightarrow V=U \times_{X, c} T^{\prime} \longrightarrow U
$$

The two compositions $c^{\prime} \circ\left(\mathrm{pr}_{0}, 1\right), c^{\prime} \circ\left(\mathrm{pr}_{1}, 1\right):\left(T^{\prime} \times_{T} T^{\prime}\right) \times_{T} W \rightarrow T^{\prime} \times_{T} W \rightarrow U$ agree by our choice of $\alpha$ and the corresponding property of $c$ (computation omitted). Hence $b^{\prime}$ descends to a morphism $b: W \rightarrow U$ by Descent, Lemma 34.9.3. The diagram

is commutative. What this means is that we have proved the existence of $a$ étale locally on $T$, i.e., we have an $a^{\prime}: W \rightarrow X$. However, since we have proved uniqueness in the first paragraph, we find that this étale local solutions satisfy the glueing condition, i.e., we have $\mathrm{pr}_{0}^{*} a^{\prime}=\operatorname{pr}_{1}^{*} a^{\prime}$ as elements of $X\left(W \times_{T} W\right)$. Since $X$ is an étale sheaf we find an unique $a \in X(T)$ restricting to $a^{\prime}$ on $W$.

### 53.17. The étale site of an algebraic space

03 EB In this section we define the small étale site of an algebraic space. This is the analogue of the small étale site $S_{\text {étale }}$ of a scheme. Lemma 53.15.1 implies that in the definition below any morphism between objects of the étale site of $X$ is étale, and that any scheme étale over an object of $X_{\text {étale }}$ is also an object of $X_{\text {étale }}$.

03ED Definition 53.17.1. Let $S$ be a scheme. Let $S c h_{f p p f}$ be a big fppf site containing $S$, and let $S c h_{e ́ t a l e}$ be the corresponding big étale site (i.e., having the same underlying category). Let $X$ be an algebraic space over $S$. The small étale site $X_{\text {étale }}$ of $X$ is defined as follows:
(1) An object of $X_{\text {étale }}$ is a morphism $\varphi: U \rightarrow X$ where $U \in \mathrm{Ob}\left((S c h / S)_{\text {étale }}\right)$ is a scheme and $\varphi$ is an étale morphism,
(2) a morphism $(\varphi: U \rightarrow X) \rightarrow\left(\varphi^{\prime}: U^{\prime} \rightarrow X\right)$ is given by a morphism of schemes $\chi: U \rightarrow U^{\prime}$ such that $\varphi=\varphi^{\prime} \circ \chi$, and
(3) a family of morphisms $\left\{\left(U_{i} \rightarrow X\right) \rightarrow(U \rightarrow X)\right\}_{i \in I}$ of $X_{e ́ t a l e}$ is a covering if and only if $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering of $(S c h / S)_{\text {étale }}$.

A consequence of our choice is that the étale site of an algebraic space in general does not have a final object! On the other hand, if $X$ happens to be a scheme, then the definition above agrees with Topologies, Definition 33.4.8.

There are several other choices we could have made here. For example we could have considered all algebraic spaces $U$ which are étale over $X$, or we could have considered all affine schemes $U$ which are étale over $X$. We decided not to do so, since we like to think of plain old schemes as the fundamental objects of algebraic geometry. On the other hand, we do need these notions also, since the small étale site of an algebraic space is not sufficiently flexible, especially when discussing functoriality of the small étale site, see Lemma 53.17 .7 below.
03G0 Definition 53.17.2. Let $S$ be a scheme. Let $S c h_{f p p f}$ be a big fppf site containing $S$, and let $S_{\text {chétale }}$ be the corresponding big étale site (i.e., having the same underlying category). Let $X$ be an algebraic space over $S$. The site $X_{\text {spaces,étale }}$ of $X$ is defined as follows:
(1) An object of $X_{\text {spaces,étale }}$ is a morphism $\varphi: U \rightarrow X$ where $U$ is an algebraic space over $S$ and $\varphi$ is an étale morphism of algebraic spaces over $S$,
(2) a morphism $(\varphi: U \rightarrow X) \rightarrow\left(\varphi^{\prime}: U^{\prime} \rightarrow X\right)$ of $X_{\text {spaces,étale }}$ is given by a morphism of algebraic spaces $\chi: U \rightarrow U^{\prime}$ such that $\varphi=\varphi^{\prime} \circ \chi$, and
(3) a family of morphisms $\left\{\varphi_{i}:\left(U_{i} \rightarrow X\right) \rightarrow(U \rightarrow X)\right\}_{i \in I}$ of $X_{\text {spaces,étale }}$ is a covering if and only if $|U|=\bigcup \varphi_{i}\left(\left|U_{i}\right|\right)$.
(As usual we choose a set of coverings of this type, including at least the coverings in $X_{\text {étale }}$, as in Sets, Lemma 3.11.1 to turn $X_{\text {spaces,étale }}$ into a site.)

Since the identity morphism of $X$ is étale it is clear that $X_{\text {spaces,étale }}$ does have a final object. Let us show right away that the corresponding topos equals the small étale topos of $X$.

## 03G1

Lemma 53.17.3. The functor

$$
X_{\text {étale }} \longrightarrow X_{\text {spaces,étale }}, \quad U / X \longmapsto U / X
$$

is a special cocontinuous functor (Sites, Definition 7.28.2) and hence induces an equivalence of topoi $\operatorname{Sh}\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(X_{\text {spaces,étale }}\right)$.
Proof. We have to show that the functor satisfies the assumptions (1) - (5) of Sites, Lemma 7.28.1. It is clear that the functor is continuous and cocontinuous, which proves assumptions (1) and (2). Assumptions (3) and (4) hold simply because the functor is fully faithful. Assumption (5) holds, because an algebraic space by definition has a covering by a scheme.

03H7 Remark 53.17.4. Let us explain the meaning of Lemma 53.17.3. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a sheaf on the small étale site $X_{\text {étale }}$ of $X$. The lemma says that there exists a unique sheaf $\mathcal{F}^{\prime}$ on $X_{\text {spaces,étale }}$ which restricts back to $\mathcal{F}$ on the subcategory $X_{\text {étale }}$. If $U \rightarrow X$ is an étale morphism of algebraic spaces, then how do we compute $\mathcal{F}^{\prime}(U)$ ? Well, by definition of an algebraic space there exists a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow U$. Then $\left\{U^{\prime} \rightarrow U\right\}$ is a covering in $X_{\text {spaces,étale }}$ and hence we get an equalizer diagram

$$
\mathcal{F}^{\prime}(U) \longrightarrow \mathcal{F}\left(U^{\prime}\right) \longrightarrow \mathcal{F}\left(U^{\prime} \times_{U} U^{\prime}\right)
$$

Note that $U^{\prime} \times_{U} U^{\prime}$ is a scheme, and hence we may write $\mathcal{F}$ and not $\mathcal{F}^{\prime}$. Thus we see how to compute $\mathcal{F}^{\prime}$ when given the sheaf $\mathcal{F}$.

04JS Lemma 53.17.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $X_{a f f i n e, e ́ t a l e}$ denote the full subcategory of $X_{\text {étale }}$ whose objects are those $U / X \in$ $\mathrm{Ob}\left(X_{\text {étale }}\right)$ with $U$ affine. A covering of $X_{\text {affine,étale }}$ will be a standard étale covering, see Topologies, Definition 33.4.5. Then restriction

$$
\left.\mathcal{F} \longmapsto \mathcal{F}\right|_{X_{\text {affine, } \text { etale }}}
$$

defines an equivalence of topoi $\operatorname{Sh}\left(S_{\text {étale }}\right) \cong \operatorname{Sh}\left(S_{\text {affine, étale }}\right)$.
Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 7.28 .1 by checking that the inclusion functor $X_{\text {affine, étale }} \rightarrow X_{\text {étale }}$ is a special cocontinuous functor as in Sites, Definition 7.28.2.

04JT Definition 53.17.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The étale topos of $X$, or more precisely the small étale topos of $X$ is the category $S h\left(X_{\text {étale }}\right)$ of sheaves of sets on $X_{\text {étale }}$.

By Lemma 53.17.3 we have $\operatorname{Sh}\left(X_{\text {étale }}\right)=\operatorname{Sh}\left(X_{\text {spaces,étale }}\right)$, so we can also think of this as the category of sheaves of sets on $X_{\text {spaces,étale }}$. Similarly, by Lemma 53.17 .5 we see that $\operatorname{Sh}\left(X_{\text {étale }}\right)=\operatorname{Sh}\left(X_{\text {affine,étale }}\right)$. It turns out that the topos is functorial with respect to morphisms of algebraic spaces. Here is a precise statement.
03G2 Lemma 53.17.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) The continuous functor

$$
Y_{\text {spaces,étale }} \longrightarrow X_{\text {spaces,étale }}, \quad V \longmapsto X \times_{Y} V
$$

induces a morphism of sites

$$
f_{\text {spaces,étale }}: X_{\text {spaces,étale }} \rightarrow Y_{\text {spaces,étale }}
$$

(2) The rule $f \mapsto f_{\text {spaces,étale }}$ is compatible with compositions, in other words $(f \circ g)_{\text {spaces,étale }}=f_{\text {spaces,étale }} \circ g_{\text {spaces,étale }}$ (see Sites, Definition 7.15.4).
(3) The morphism of topoi associated to $f_{\text {spaces,étale }}$ induces, via Lemma 53.17.3, a morphism of topoi $f_{\text {small }}: S h\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(Y_{\text {étale }}\right)$ whose construction is compatible with compositions.
(4) If $f$ is a representable morphism of algebraic spaces, then $f_{\text {small }}$ comes from a morphism of sites $X_{\text {étale }} \rightarrow Y_{\text {étale }}$, corresponding to the continuous functor $V \mapsto X \times_{Y} V$.

Proof. Let us show that the functor described in (1) satisfies the assumptions of Sites, Proposition 7.15.6. Thus we have to show that $Y_{\text {spaces, étale }}$ has a final object (namely $Y$ ) and that the functor transforms this into a final object in $X_{\text {spaces,étale }}$ (namely $X$ ). This is clear as $X \times_{Y} Y=X$ in any category. Next, we have to show that $Y_{\text {spaces,étale }}$ has fibre products. This is true since the category of algebraic spaces has fibre products, and since $V \times_{Y} V^{\prime}$ is étale over $Y$ if $V$ and $V^{\prime}$ are étale over $Y$ (see Lemmas 53.15 .4 and 53.15 .5 above). OK, so the proposition applies and we see that we get a morphism of sites as described in (1).

Part (2) you get by unwinding the definitions. Part (3) is clear by using the equivalences for $X$ and $Y$ from Lemma 53.17.3 above. Part (4) follows, because if $f$ is representable, then the functors above fit into a commutative diagram

of categories.
We can do a little bit better than the lemma above in describing the relationship between sheaves on $X$ and sheaves on $Y$. Namely, we can formulate this in turns of $f$-maps, compare Sheaves, Definition 6.21.7, as follows.

03G3 Definition 53.17.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$ and let $\mathcal{G}$ be a sheaf of sets on $Y_{\text {étale }}$. An $f$-map $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ is a collection of maps $\varphi_{(U, V, g)}: \mathcal{G}(V) \rightarrow \mathcal{F}(U)$ indexed by commutative diagrams

where $U \in X_{\text {étale }}, V \in Y_{\text {étale }}$ such that whenever given an extended diagram

with $V^{\prime} \rightarrow V$ and $U^{\prime} \rightarrow U$ étale morphisms of schemes the diagram

commutes.
03G4 Lemma 53.17.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$ and let $\mathcal{G}$ be a sheaf of sets on $Y_{\text {étale }}$. There are canonical bijections between the following three sets:
(1) The set of maps $\mathcal{G} \rightarrow f_{\text {small }, *} \mathcal{F}$.
(2) The set of maps $f_{\text {small }}^{-1} \mathcal{G} \rightarrow \mathcal{F}$.
(3) The set of $f$-maps $\varphi: \mathcal{G} \rightarrow \mathcal{F}$.

Proof. Note that (1) and (2) are the same because the functors $f_{\text {small,* }}$ and $f_{\text {small }}^{-1}$ are a pair of adjoint functors. Suppose that $\alpha: f_{\text {small }}^{-1} \mathcal{G} \rightarrow \mathcal{F}$ is a map of sheaves on $Y_{\text {étale }}$. Let a diagram

as in Definition 53.17 .8 be given. By the commutativity of the diagram we also get a map $g_{\text {small }}^{-1}\left(j_{V}\right)^{-1} \mathcal{G} \rightarrow\left(j_{U}\right)^{-1} \mathcal{F}$ (compare Sites, Section 7.24 for the description of the localization functors). Hence we certainly get a map $\varphi_{(V, U, g)}: \mathcal{G}(V)=$ $\left(j_{V}\right)^{-1} \mathcal{G}(V) \rightarrow\left(j_{U}\right)^{-1} \mathcal{F}(U)=\mathcal{F}(U)$. We omit the verification that this rule is compatible with further restrictions and defines an $f$-map from $\mathcal{G}$ to $\mathcal{F}$.
Conversely, suppose that we are given an $f$-map $\varphi=\left(\varphi_{(U, V, g)}\right)$. Let $\mathcal{G}^{\prime}\left(\right.$ resp. $\left.\mathcal{F}^{\prime}\right)$ denote the extension of $\mathcal{G}$ (resp. $\mathcal{F}$ ) to $Y_{\text {spaces,étale }}$ (resp. $X_{\text {spaces,étale }}$ ), see Lemma 53.17.3. Then we have to construct a map of sheaves

$$
\mathcal{G}^{\prime} \longrightarrow\left(f_{\text {spaces,étale }}\right)_{*} \mathcal{F}^{\prime}
$$

To do this, let $V \rightarrow Y$ be an étale morphism of algebraic spaces. We have to construct a map of sets

$$
\mathcal{G}^{\prime}(V) \rightarrow \mathcal{F}^{\prime}\left(X \times_{Y} V\right)
$$

Choose an étale surjective morphism $V^{\prime} \rightarrow V$ with $V^{\prime}$ a scheme, and after that choose an étale surjective morphism $U^{\prime} \rightarrow X \times_{U} V^{\prime}$ with $U^{\prime}$ a scheme. We get a morphism of schemes $g^{\prime}: U^{\prime} \rightarrow V^{\prime}$ and also a morphism of schemes

$$
g^{\prime \prime}: U^{\prime} \times_{X \times_{Y} V} U^{\prime} \longrightarrow V^{\prime} \times_{V} V^{\prime}
$$

Consider the following diagram

The compatibility of the maps $\varphi_{\ldots}$ with restriction shows that the two right squares commute. The definition of coverings in $X_{\text {spaces,étale }}$ shows that the horizontal rows are equalizer diagrams. Hence we get the dotted arrow. We leave it to the reader to show that these arrows are compatible with the restriction mappings.

If the morphism of algebraic spaces $X \rightarrow Y$ is étale, then the morphism of topoi $\operatorname{Sh}\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(Y_{\text {étale }}\right)$ is a localization. Here is a statement.
03LP Lemma 53.17.10. Let $S$ be a scheme, and let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is étale. In this case there is a functor

$$
j: X_{\text {étale }} \rightarrow Y_{\text {étale }}, \quad(\varphi: U \rightarrow X) \mapsto(f \circ \varphi: U \rightarrow Y)
$$

which is cocontinuous. The morphism of topoi $f_{\text {small }}$ is the morphism of topoi associated to $j$, see Sites, Lemma 7.20.1. Moreover, $j$ is continuous as well, hence Sites, Lemma 7.20.5 applies. In particular $f_{\text {small }}^{-1} \mathcal{G}(U)=\mathcal{G}(j U)$ for all sheaves $\mathcal{G}$ on $Y_{\text {étale }}$.

Proof. Note that by our very definition of an étale morphism of algebraic spaces (Definition 53.15.2) it is indeed the case that the rule given defines a functor $j$ as indicated. It is clear that $j$ is cocontinuous and continuous, simply because a covering $\left\{U_{i} \rightarrow U\right\}$ of $j(\varphi: U \rightarrow X)$ in $Y_{\text {étale }}$ is the same thing as a covering of $(\varphi: U \rightarrow X)$ in $X_{\text {étale }}$. It remains to show that $j$ induces the same morphism of topoi as $f_{\text {small }}$. To see this we consider the diagram

of categories. Here the functor $j_{\text {spaces }}$ is the obvious extension of $j$ to the category $X_{\text {spaces,étale }}$. Thus the inner square is commutative. In fact $j_{\text {spaces }}$ can be identified with the localization functor $j_{X}: Y_{\text {spaces,étale }} / X \rightarrow Y_{\text {spaces,étale }}$ discussed in Sites, Section 7.24. Hence, by Sites, Lemma 7.26 .2 the cocontinuous functor $j_{\text {spaces }}$ and the functor $v$ of the diagram induce the same morphism of topoi. By Sites, Lemma 7.20 .2 the commutativity of the inner square (consisting of cocontinuous functors between sites) gives a commutative diagram of associated morphisms of topoi. Hence, by the construction of $f_{\text {small }}$ in Lemma 53.17.7 we win.

The lemma above says that the pullback of $\mathcal{G}$ via an étale morphism $f: X \rightarrow Y$ of algebraic spaces is simply the restriction of $\mathcal{G}$ to the category $X_{\text {étale }}$. We will often use the short hand

03LQ

$$
\begin{equation*}
\left.\mathcal{G}\right|_{\text {Xétale }}=f_{\text {small }}^{-1} \mathcal{G} \tag{53.17.10.1}
\end{equation*}
$$

to indicate this. Note that the functor $j: X_{\text {étale }} \rightarrow Y_{\text {étale }}$ of the lemma in this situation is faithful, but not fully faithful in general. We will discuss this in a more technical fashion in Section 53.26

03LR Lemma 53.17.11. Let $S$ be a scheme. Let

be a cartesian square of algebraic spaces over $S$. Let $\mathcal{F}$ be a sheaf on $X_{\text {étale }}$. If $g$ is étale, then
(1) $f_{\text {small }, *}^{\prime}\left(\left.\mathcal{F}\right|_{X^{\prime}}\right)=\left.\left(f_{\text {small }, *} \mathcal{F}\right)\right|_{Y^{\prime}}$ in $\operatorname{Sh}\left(Y_{\text {étale }}^{\prime}\right)^{4}$, and
(2) if $\mathcal{F}$ is an abelian sheaf, then $R^{i} f_{\text {small }, *}^{\prime}\left(\left.\mathcal{F}\right|_{X^{\prime}}\right)=\left.\left(R^{i} f_{\text {small }, *} \mathcal{F}\right)\right|_{Y^{\prime}}$.

Proof. Consider the following diagram of functors

[^156]The horizontal arrows are localizations and the vertical arrows induce morphisms of sites. Hence the last statement of Sites, Lemma 7.27.1 gives (1). To see (2) apply (1) to an injective resolution of $\mathcal{F}$ and use that restriction is exact and preserves injectives (see Cohomology on Sites, Lemma 21.8.1.

The following lemma says that you can think of a sheaf on the small étale site of an algebraic space as a compatible collection of sheaves on the small étale sites of schemes étale over the space. Please note that all the comparison mappings $c_{f}$ in the lemma are isomorphisms, which is compatible with Topologies, Lemma 33.4.18 and the fact that all morphisms between objects of $X_{\text {étale }}$ are étale.
03LS Lemma 53.17.12. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A sheaf $\mathcal{F}$ on $X_{\text {étale }}$ is given by the following data:
(1) for every $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ a sheaf $\mathcal{F}_{U}$ on $U_{\text {étale }}$,
(2) for every $f: U^{\prime} \rightarrow U$ in $X_{\text {étale }}$ an isomorphism $c_{f}: f_{\text {small }}^{-1} \mathcal{F}_{U} \rightarrow \mathcal{F}_{U^{\prime}}$.

These data are subject to the condition that given any $f: U^{\prime} \rightarrow U$ and $g: U^{\prime \prime} \rightarrow U^{\prime}$ in $X_{\text {étale }}$ the composition $g_{\text {small }}^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$.
Proof. Given a sheaf $\mathcal{F}$ on $X_{\text {étale }}$ and an object $\varphi: U \rightarrow X$ of $X_{\text {étale }}$ we set $\mathcal{F}_{U}=\varphi_{\text {small }}^{-1} \mathcal{F}$. If $\varphi^{\prime}: U^{\prime} \rightarrow X$ is a second object of $X_{\text {étale }}$, and $f: U^{\prime} \rightarrow U$ is a morphism between them, then the isomorphism $c_{f}$ comes from the fact that $f_{\text {small }}^{-1} \circ \varphi_{\text {small }}^{-1}=\left(\varphi^{\prime}\right)_{\text {small }}^{-1}$, see Lemma 53.17.7. The condition on the transitivity of the isomorphisms $c_{f}$ follows from the functoriality of the small étale sites also; verification omitted.

Conversely, suppose we are given a collection of data $\left(\mathcal{F}_{U}, c_{f}\right)$ as in the lemma. In this case we simply define $\mathcal{F}$ by the rule $U \mapsto \mathcal{F}_{U}(U)$. Details omitted.
Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $X=U / R$ be a presentation of $X$ coming from any surjective étale morphism $\varphi: U \rightarrow X$, see Spaces, Definition52.9.3. In particular, we obtain a groupoid ( $U, R, s, t, c, e, i$ ) such that $j=(t, s): R \rightarrow U \times_{S} U$, see Groupoids, Lemma 38.13.3.
$05 Y$ Lemma 53.17.13. With $S, \varphi: U \rightarrow X$, and $(U, R, s, t, c, e, i)$ as above. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ the shea $\mathcal{G}=\varphi^{-1} \mathcal{F}$ comes equipped with a canonical isomorphism

$$
\alpha: t^{-1} \mathcal{G} \longrightarrow s^{-1} \mathcal{G}
$$

such that the diagram

is a commutative. The functor $\mathcal{F} \mapsto(\mathcal{G}, \alpha)$ defines an equivalence of categories between sheaves on $X_{\text {étale }}$ and pairs $(\mathcal{G}, \alpha)$ as above.

[^157]First proof of Lemma 53.17.13. Let $\mathcal{C}=X_{\text {spaces,étale }}$. By Lemma 53.17.10 and its proof we have $U_{\text {spaces,étale }}=\mathcal{C} / U$ and the pullback functor $\varphi^{-1}$ is just the restriction functor. Moreover, $\{U \rightarrow X\}$ is a covering of the site $\mathcal{C}$ and $R=U \times_{X} U$. The isomorphism $\alpha$ is just the canonical identification

$$
\left.\left(\left.\mathcal{F}\right|_{\mathcal{C} / U}\right)\right|_{\mathcal{C} / U \times_{X} U}=\left.\left(\left.\mathcal{F}\right|_{\mathcal{C} / U}\right)\right|_{\mathcal{C} / U \times_{X} U}
$$

and the commutativity of the diagram is the cocycle condition for glueing data. Hence this lemma is a special case of glueing of sheaves, see Sites, Section 7.25 .

Second proof of Lemma 53.17.13. The existence of $\alpha$ comes from the fact that $\varphi \circ t=\varphi \circ s$ and that pullback is functorial in the morphism, see Lemma 53.17.7. In exactly the same way, i.e., by functoriality of pullback, we see that the isomorphism $\alpha$ fits into the commutative diagram. The construction $\mathcal{F} \mapsto\left(\varphi^{-1} \mathcal{F}, \alpha\right)$ is clearly functorial in the sheaf $\mathcal{F}$. Hence we obtain the functor.
Conversely, suppose that $(\mathcal{G}, \alpha)$ is a pair. Let $V \rightarrow X$ be an object of $X_{\text {étale }}$. In this case the morphism $V^{\prime}=U \times_{X} V \rightarrow V$ is a surjective étale morphism of schemes, and hence $\left\{V^{\prime} \rightarrow V\right\}$ is an étale covering of $V$. Set $\mathcal{G}^{\prime}=\left(V^{\prime} \rightarrow V\right)^{-1} \mathcal{G}$. Since $R=U \times_{X} U$ with $t=\operatorname{pr}_{0}$ and $s=\operatorname{pr}_{0}$ we see that $V^{\prime} \times_{V} V^{\prime}=R \times_{X} V$ with projection maps $s^{\prime}, t^{\prime}: V^{\prime} \times_{V} V^{\prime} \rightarrow V^{\prime}$ equal to the pullbacks of $t$ and $s$. Hence $\alpha$ pulls back to an isomorphism $\alpha^{\prime}:\left(t^{\prime}\right)^{-1} \mathcal{G}^{\prime} \rightarrow\left(s^{\prime}\right)^{-1} \mathcal{G}^{\prime}$. Having said this we simply define

$$
\mathcal{F}(V)=\operatorname{Equalizer}\left(\mathcal{G}\left(V^{\prime}\right) \longrightarrow \mathcal{G}\left(V^{\prime} \times_{V} V^{\prime}\right)\right.
$$

We omit the verification that this defines a sheaf. To see that $\mathcal{G}(V)=\mathcal{F}(V)$ if there exists a morphism $V \rightarrow U$ note that in this case the equalizer is $H^{0}\left(\left\{V^{\prime} \rightarrow\right.\right.$ $V\}, \mathcal{G})=\mathcal{G}(V)$.

### 53.18. Points of the small étale site

04 JU This section is the analogue of Étale Cohomology, Section 49.29.
0486 Definition 53.18.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) A geometric point of $X$ is a morphism $\bar{x}: \operatorname{Spec}(k) \rightarrow X$, where $k$ is an algebraically closed field. We often abuse notation and write $\bar{x}=\operatorname{Spec}(k)$.
(2) For every geometric point $\bar{x}$ we have the corresponding "image" point $x \in|X|$. We say that $\bar{x}$ is a geometric point lying over $x$.
It turns out that we can take stalks of sheaves on $X_{\text {étale }}$ at geometric point exactly in the same way as was done in the case of the small étale site of a scheme. In order to do this we define the notion of an étale neighbourhood as follows.

04JV Definition 53.18.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$.
(1) An étale neighborhood of $\bar{x}$ of $X$ is a commutative diagram

where $\varphi$ is an étale morphism of algebraic spaces over $S$. We will use the notation $\varphi:(U, \bar{u}) \rightarrow(X, \bar{x})$ to indicate this situation.
(2) A morphism of étale neighborhoods $(U, \bar{u}) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right)$ is an $X$-morphism $h: U \rightarrow U^{\prime}$ such that $\bar{u}^{\prime}=h \circ \bar{u}$.

Note that we allow $U$ to be an algebraic space. When we take stalks of a sheaf on $X_{e ́ t a l e}$ we have to restrict to those $U$ which are in $X_{e ́ t a l e}$, and so in this case we will only consider the case where $U$ is a scheme. Alternately we can work with the site $X_{\text {space,étale }}$ and consider all étale neighbourhoods. And there won't be any difference because of the last assertion in the following lemma.

04JW Lemma 53.18.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$. The category of étale neighborhoods is cofiltered. More precisely:
(1) Let $\left(U_{i}, \bar{u}_{i}\right)_{i=1,2}$ be two étale neighborhoods of $\bar{x}$ in $X$. Then there exists a third étale neighborhood $(U, \bar{u})$ and morphisms $(U, \bar{u}) \rightarrow\left(U_{i}, \bar{u}_{i}\right), i=1,2$.
(2) Let $h_{1}, h_{2}:(U, \bar{u}) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right)$ be two morphisms between étale neighborhoods of $\bar{s}$. Then there exist an étale neighborhood $\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right)$ and a morphism $h:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow(U, \bar{u})$ which equalizes $h_{1}$ and $h_{2}$, i.e., such that $h_{1} \circ h=h_{2} \circ h$.
Moreover, given any étale neighbourhood $(U, \bar{u}) \rightarrow(X, \bar{x})$ there exists a morphism of étale neighbourhoods $\left(U^{\prime}, \bar{u}^{\prime}\right) \rightarrow(U, \bar{u})$ where $U^{\prime}$ is a scheme.
Proof. For part (1), consider the fibre product $U=U_{1} \times_{X} U_{2}$. It is étale over both $U_{1}$ and $U_{2}$ because étale morphisms are preserved under base change and composition, see Lemmas 53.15.5 and 53.15.4. The map $\bar{u} \rightarrow U$ defined by ( $\bar{u}_{1}, \bar{u}_{2}$ ) gives it the structure of an étale neighborhood mapping to both $U_{1}$ and $U_{2}$.

For part (2), define $U^{\prime \prime}$ as the fibre product

Since $\bar{u}$ and $\bar{u}^{\prime}$ agree over $X$ with $\bar{x}$, we see that $\bar{u}^{\prime \prime}=\left(\bar{u}, \bar{u}^{\prime}\right)$ is a geometric point of $U^{\prime \prime}$. In particular $U^{\prime \prime} \neq \emptyset$. Moreover, since $U^{\prime}$ is étale over $X$, so is the fibre product $U^{\prime} \times_{X} U^{\prime}$ (as seen above in the case of $U_{1} \times_{X} U_{2}$ ). Hence the vertical arrow $\left(h_{1}, h_{2}\right)$ is étale by Lemma 53.15.6. Therefore $U^{\prime \prime}$ is étale over $U^{\prime}$ by base change, and hence also étale over $X$ (because compositions of étale morphisms are étale). Thus ( $U^{\prime \prime}, \bar{u}^{\prime \prime}$ ) is a solution to the problem posed by (2).
To see the final assertion, choose any surjective étale morphism $U^{\prime} \rightarrow U$ where $U^{\prime}$ is a scheme. Then $U^{\prime} \times_{U} \bar{u}$ is a scheme surjective and étale over $\bar{u}=\operatorname{Spec}(k)$ with $k$ algebraically closed. It follows (see Morphisms, Lemma 28.36.7) that $U^{\prime} \times{ }_{U} \bar{u} \rightarrow \bar{u}$ has a section which gives us the desired $\bar{u}^{\prime}$.

05VN Lemma 53.18.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\overline{\bar{x}}: \operatorname{Spec}(k) \rightarrow X$ be a geometric point of $X$ lying over $x \in|X|$. Let $\varphi: U \rightarrow X$ be an étale morphism of algebraic spaces and let $u \in|U|$ with $\varphi(u)=x$. Then there exists a geometric point $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ lying over $u$ with $\bar{x}=f \circ \bar{u}$.
Proof. Choose an affine scheme $U^{\prime}$ with $u^{\prime} \in U^{\prime}$ and an étale morphism $U^{\prime} \rightarrow U$ which maps $u^{\prime}$ to $u$. If we can prove the lemma for $\left(U^{\prime}, u^{\prime}\right) \rightarrow(X, x)$ then the lemma
follows. Hence we may assume that $U$ is a scheme, in particular that $U \rightarrow X$ is representable. Then look at the cartesian diagram

The projection $\mathrm{pr}_{1}$ is the base change of an étale morphisms so it is étale, see Lemma 53.15.5. Therefore, the scheme $\operatorname{Spec}(k) \times_{\bar{x}, X, \varphi} U$ is a disjoint union of finite separable extensions of $k$, see Morphisms, Lemma 28.36.7. But $k$ is algebraically closed, so all these extensions are trivial, so $\operatorname{Spec}(k) \times_{\bar{x}, X, \varphi} U$ is a disjoint union of copies of $\operatorname{Spec}(k)$ and each of these corresponds to a geometric point $\bar{u}$ with $f \circ \bar{u}=\bar{x}$. By Lemma 53.4.3 the map

$$
\left|\operatorname{Spec}(k) \times_{\bar{x}, X, \varphi} U\right| \longrightarrow|\operatorname{Spec}(k)| \times_{|X|}|U|
$$

is surjective, hence we can pick $\bar{u}$ to lie over $u$.
04JX Lemma 53.18.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$. Let $(U, \bar{u})$ an étale neighborhood of $\bar{x}$. Let $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be an étale covering in $X_{\text {spaces,étale }}$. Then there exist $i \in I$ and $\bar{u}_{i}: \bar{x} \rightarrow U_{i}$ such that $\varphi_{i}:\left(U_{i}, \bar{u}_{i}\right) \rightarrow(U, \bar{u})$ is a morphism of étale neighborhoods.
Proof. Let $u \in|U|$ be the image of $\bar{u}$. As $|U|=\bigcup_{i \in I} \varphi_{i}\left(\left|U_{i}\right|\right)$ there exists an $i$ and a point $u_{i} \in U_{i}$ mapping to $x$. Apply Lemma 53.18.4 to $\left(U_{i}, u_{i}\right) \rightarrow(U, u)$ and $\bar{u}$ to get the desired geometric point.

04JY Definition 53.18.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a presheaf on $X_{\text {étale }}$. Let $\bar{x}$ be a geometric point of $X$. The stalk of $\mathcal{F}$ at $\bar{x}$ is

$$
\mathcal{F}_{\bar{x}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{F}(U)
$$

where $(U, \bar{u})$ runs over all étale neighborhoods of $\bar{x}$ in $X$ with $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$.
By Lemma53.18.3, this colimit is over a filtered index category, namely the opposite of the category of étale neighborhoods in $X_{\text {étale }}$. More precisely Lemma 53.18.3 says the opposite of the category of all étale neighbourhoods is filtered, and the full subcategory of those which are in $X_{\text {étale }}$ is a cofinal subcategory hence also filtered.
This means an element of $\mathcal{F}_{\bar{x}}$ can be thought of as a triple $(U, \bar{u}, \sigma)$ where $U \in$ $\mathrm{Ob}\left(X_{\text {étale }}\right)$ and $\sigma \in \mathcal{F}(U)$. Two triples $(U, \bar{u}, \sigma),\left(U^{\prime}, \bar{u}^{\prime}, \sigma^{\prime}\right)$ define the same element of the stalk if there exists a third étale neighbourhood $\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right), U^{\prime \prime} \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ and morphisms of étale neighbourhoods $h:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow(U, \bar{u}), h^{\prime}:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow$ $\left(U^{\prime}, \bar{u}^{\prime}\right)$ such that $h^{*} \sigma=\left(h^{\prime}\right)^{*} \sigma^{\prime}$ in $\mathcal{F}\left(U^{\prime \prime}\right)$. See Categories, Section 4.19.
This also implies that if $\mathcal{F}^{\prime}$ is the sheaf on $X_{\text {spaces,étale }}$ corresponding to $\mathcal{F}$ on $X_{\text {étale }}$, then
04JZ

$$
\begin{equation*}
\mathcal{F}_{\bar{x}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{F}^{\prime}(U) \tag{53.18.6.1}
\end{equation*}
$$

where now the colimit is over all the étale neighbourhoods of $\bar{x}$. We will often jump between the point of view of using $X_{\text {étale }}$ and $X_{\text {spaces,étale }}$ without further mention.
In particular this means that if $\mathcal{F}$ is a presheaf of abelian groups, rings, etc then $\mathcal{F}_{\bar{x}}$ is an abelian group, ring, etc simply by the usual way of defining the group structure on a directed colimit of abelian groups, rings, etc.

04K0 Lemma 53.18.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$. Consider the functor

$$
u: X_{\text {étale }} \longrightarrow \text { Sets, } \quad U \longmapsto\left|U_{\bar{x}}\right|
$$

Then $u$ defines a point $p$ of the site $X_{\text {étale }}$ (Sites, Definition 7.31.2) and its associated stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ (Sites, Equation 7.31.1.1) is the functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ defined above.

Proof. In the proof of Lemma 53.18 .5 we have seen that the scheme $U_{\bar{x}}$ is a disjoint union of schemes isomorphic to $\bar{x}$. Thus we can also think of $\left|U_{\bar{x}}\right|$ as the set of geometric points of $U$ lying over $\bar{x}$, i.e., as the collection of morphisms $\bar{u}: \bar{x} \rightarrow U$ fitting into the diagram of Definition 53.18.1. From this it follows that $u(X)$ is a singleton, and that $u\left(U \times_{V} W\right)=u(U) \times_{u(V)} u(W)$ whenever $U \rightarrow V$ and $W \rightarrow V$ are morphisms in $X_{\text {étale }}$. And, given a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $X_{\text {étale }}$ we see that $\coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective by Lemma 53.18.5. Hence Sites, Proposition 7.32.2 applies, so $p$ is a point of the site $X_{\text {étale }}$. Finally, the our functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ is given by exactly the same colimit as the functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ associated to $p$ in Sites, Equation 7.31.1.1 which proves the final assertion.

04K1 Lemma 53.18.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$.
(1) The stalk functor $\operatorname{PAb}\left(X_{\text {étale }}\right) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is exact.
(2) We have $\left(\mathcal{F}^{\#}\right)_{\bar{x}}=\mathcal{F}_{\bar{x}}$ for any presheaf of sets $\mathcal{F}$ on $X_{\text {étale }}$.
(3) The functor $A b\left(X_{\text {étale }}\right) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is exact.
(4) Similarly the functors $\operatorname{PSh}\left(X_{\text {étale }}\right) \rightarrow$ Sets and $\operatorname{Sh}\left(X_{\text {étale }}\right) \rightarrow$ Sets given by the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ are exact (see Categories, Definition 4.23.1) and commute with arbitrary colimits.

Proof. This result follows from the general material in Modules on Sites, Section 18.35. This is true because $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ comes from a point of the small étale site of $X$, see Lemma 53.18.7. See the proof of Étale Cohomology, Lemma 49.29 .9 for a direct proof of some of these statements in the setting of the small étale site of a scheme.

We will see below that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is really the pullback along the morphism $\bar{x}$. In that sense the following lemma is a generalization of the lemma above.

04K2 Lemma 53.18.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) The functor $f_{\text {small }}^{-1}: A b\left(Y_{\text {étale }}\right) \rightarrow A b\left(X_{\text {étale }}\right)$ is exact.
(2) The functor $f_{\text {small }}^{-1}: \operatorname{Sh}\left(Y_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(X_{\text {étale }}\right)$ is exact, i.e., it commutes with finite limits and colimits, see Categories, Definition 4.23.1.
(3) For any étale morphism $V \rightarrow Y$ of algebraic spaces we have $f_{\text {small }}^{-1} h_{V}=$ $h_{X \times_{Y} V}$.
(4) Let $\bar{x} \rightarrow X$ be a geometric point. Let $\mathcal{G}$ be a sheaf on $Y_{\text {étale. }}$. Then there is a canonical identification

$$
\left(f_{\text {small }}^{-1} \mathcal{G}\right)_{\bar{x}}=\mathcal{G}_{\bar{y}}
$$

where $\bar{y}=f \circ \bar{x}$.

Proof. Recall that $f_{\text {small }}$ is defined via $f_{\text {spaces,small }}$ in Lemma53.17.7. Parts (1), (2) and (3) are general consequences of the fact that $f_{\text {spaces,étale }}: X_{\text {spaces,étale }} \rightarrow$ $Y_{\text {spaces,étale }}$ is a morphism of sites, see Sites, Definition 7.15.1 for (2), Modules on Sites, Lemma 18.30 .2 for (1), and Sites, Lemma 7.14 .5 for (3).
Proof of (4). This statement is a special case of Sites, Lemma 7.33.1 via Lemma 53.18.7. We also provide a direct proof. Note that by Lemma 53.18.8. taking stalks commutes with sheafification. Let $\mathcal{G}^{\prime}$ be the sheaf on $Y_{\text {spaces, étale }}$ whose restriction to $Y_{\text {étale }}$ is $\mathcal{G}$. Recall that $f_{\text {spaces,étale }}^{-1} \mathcal{G}^{\prime}$ is the sheaf associated to the presheaf

$$
U \longrightarrow \operatorname{colim}_{U \rightarrow X \times_{Y} V} \mathcal{G}^{\prime}(V),
$$

see Sites, Sections 7.14 and 7.5 . Thus we have

$$
\begin{aligned}
\left(f_{\text {spaces,étale }}^{-1} \mathcal{G}^{\prime}\right)_{\bar{x}} & =\operatorname{colim}_{(U, \bar{u})} f_{\text {spaces,étale }}^{-1} \mathcal{G}^{\prime}(U) \\
& =\operatorname{colim}_{(U, \bar{u})} \operatorname{colim}_{a: U \rightarrow X \times_{Y} V} \mathcal{G}^{\prime}(V) \\
& =\operatorname{colim}_{(V, \bar{v})} \mathcal{G}^{\prime}(V) \\
& =\mathcal{G}_{\bar{y}}^{\prime}
\end{aligned}
$$

in the third equality the pair $(U, \bar{u})$ and the map $a: U \rightarrow X \times_{Y} V$ corresponds to the pair $(V, a \circ \bar{u})$. Since the stalk of $\mathcal{G}^{\prime}$ (resp. $\left.f_{\text {spaces,étale }}^{-1} \mathcal{G}^{\prime}\right)$ agrees with the stalk of $\mathcal{G}$ (resp. $\left.f_{\text {small }}^{-1} \mathcal{G}\right)$, see Equation 53.18 .6 .1 the result follows.

04K3 Remark 53.18.10. This remark is the analogue of Étale Cohomology, Remark 49.56.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}: \operatorname{Spec}(k) \rightarrow$ $X$ be a geometric point of $X$. By Étale Cohomology, Theorem 49.56 .3 the category of sheaves on $\operatorname{Spec}(k)_{\text {étale }}$ is equivalent to the category of sets (by taking a sheaf to its global sections). Hence it follows from Lemma 53.18.9 part (4) applied to the morphism $\bar{x}$ that the functor

$$
\text { Sh }\left(X_{\text {étale }}\right) \longrightarrow \text { Sets, }, \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{x}}
$$

is isomorphic to the functor

$$
\operatorname{Sh}\left(X_{\text {étale }}\right) \longrightarrow \operatorname{Sh}\left(\operatorname{Spec}(k)_{\text {étale }}\right)=\text { Sets }, \quad \mathcal{F} \longmapsto \bar{x}^{*} \mathcal{F}
$$

Hence we may view the stalk functors as pullback functors along geometric morphisms (and not just some abstract morphisms of topoi as in the result of Lemma 53.18.7)

04K4 Remark 53.18.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. We claim that for any pair of geometric points $\bar{x}$ and $\bar{x}^{\prime}$ lying over $x$ the stalk functors are isomorphic. By definition of $|X|$ we can find a third geometric point $\bar{x}^{\prime \prime}$ so that there exists a commutative diagram

Since the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is given by pullback along the morphism $\bar{x}$ (and similarly for the others) we conclude by functoriality of pullbacks.

The following theorem says that the small étale site of an algebraic space has enough points.

04K5 Theorem 53.18.12. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A map $a: \mathcal{F} \rightarrow \mathcal{G}$ of sheaves of sets is injective (resp. surjective) if and only if the map on stalks $a_{\bar{x}}: \mathcal{F}_{\bar{x}} \rightarrow \mathcal{G}_{\bar{x}}$ is injective (resp. surjective) for all geometric points of $X$. A sequence of abelian sheaves on $X_{\text {étale }}$ is exact if and only if it is exact on all stalks at geometric points of $S$.

Proof. We know the theorem is true if $X$ is a scheme, see Étale Cohomology, Theorem 49.29.10. Choose a surjective étale morphism $f: U \rightarrow X$ where $U$ is a scheme. Since $\{U \rightarrow X\}$ is a covering (in $X_{\text {spaces,étale }}$ ) we can check whether a map of sheaves is injective, or surjective by restricting to $U$. Now if $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ is a geometric point of $U$, then $\left(\left.\mathcal{F}\right|_{U}\right)_{\bar{u}}=\mathcal{F}_{\bar{x}}$ where $\bar{x}=f \circ \bar{u}$. (This is clear from the colimits defining the stalks at $\bar{u}$ and $\bar{x}$, but it also follows from Lemma 53.18.9.) Hence the result for $U$ implies the result for $X$ and we win.

The following lemma should be skipped on a first reading.
04K6 Lemma 53.18.13. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $p: S h(p t) \rightarrow S h\left(X_{\text {étale }}\right)$ be a point of the small étale topos of $X$. Then there exists a geometric point $\bar{x}$ of $X$ such that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ is isomorphic to the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$.

Proof. By Sites, Lemma 7.31.7 there is a one to one correspondence between points of the site and points of the associated topos. Hence we may assume that $p$ is given by a functor $u: X_{\text {étale }} \rightarrow$ Sets which defines a point of the site $X_{\text {étale }}$. Let $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ be an object whose structure morphism $j: U \rightarrow X$ is surjective. Note that $h_{U}$ is a sheaf which surjects onto the final sheaf. Since taking stalks is exact we see that $\left(h_{U}\right)_{p}=u(U)$ is not empty (use Sites, Lemma 7.31.3). Pick $x \in u(U)$. By Sites, Lemma 7.34.1 we obtain a point $q: S h(p t) \rightarrow S h\left(U_{\text {étale }}\right)$ such that $p=j_{\text {small }} \circ q$, so that $\mathcal{F}_{p}=\left(\left.\mathcal{F}\right|_{U}\right)_{q}$ functorially. By Étale Cohomology, Lemma 49.29 .12 there is a geometric point $\bar{u}$ of $U$ and a functorial isomorphism $\mathcal{G}_{q}=\mathcal{G}_{\bar{u}}$ for $\mathcal{G} \in \operatorname{Sh}\left(U_{\text {étale }}\right)$. Set $\bar{x}=j \circ \bar{u}$. Then we see that $\mathcal{F}_{\bar{x}} \cong\left(\left.\mathcal{F}\right|_{U}\right)_{\bar{u}}$ functorially in $\mathcal{F}$ on $X_{\text {étale }}$ by Lemma 53.18.9 and we win.

### 53.19. Supports of abelian sheaves

04K7 First we talk about supports of local sections.
04K8 Lemma 53.19.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a subsheaf of the final object of the étale topos of $X$ (see Sites, Example 7.10.2). Then there exists a unique open $W \subset X$ such that $\mathcal{F}=h_{W}$.

Proof. The condition means that $\mathcal{F}(U)$ is a singleton or empty for all $\varphi: U \rightarrow$ $X$ in $\operatorname{Ob}\left(X_{\text {spaces,étale }}\right)$. In particular local sections always glue. If $\mathcal{F}(U) \neq \emptyset$, then $\mathcal{F}(\varphi(U)) \neq \emptyset$ because $\varphi(U) \subset X$ is an open subspace (Lemma 53.15.7) and $\{\varphi: U \rightarrow \varphi(U)\}$ is a covering in $X_{\text {spaces,étale. }}$. Take $W=\bigcup_{\varphi: U \rightarrow S, \mathcal{F}(U) \neq \emptyset} \varphi(U)$ to conclude.

04K9 Lemma 53.19.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {spaces,étale. }}$ Let $\sigma \in \mathcal{F}(U)$ be a local section. There exists an open subspace $W \subset U$ such that
(1) $W \subset U$ is the largest open subspace of $U$ such that $\left.\sigma\right|_{W}=0$,
(2) for every $\varphi: V \rightarrow U$ in $X_{\text {étale }}$ we have

$$
\left.\sigma\right|_{V}=0 \Leftrightarrow \varphi(V) \subset W
$$

(3) for every geometric point $\bar{u}$ of $U$ we have

$$
(U, \bar{u}, \sigma)=0 \text { in } \mathcal{F}_{\bar{s}} \Leftrightarrow \bar{u} \in W
$$

where $\bar{s}=(U \rightarrow S) \circ \bar{u}$.
Proof. Since $\mathcal{F}$ is a sheaf in the étale topology the restriction of $\mathcal{F}$ to $U_{\text {Zar }}$ is a sheaf on $U$ in the Zariski topology. Hence there exists a Zariski open $W$ having property (1), see Modules, Lemma 17.5.2. Let $\varphi: V \rightarrow U$ be an arrow of $X_{\text {étale }}$. Note that $\varphi(V) \subset U$ is an open subspace (Lemma 53.15.7) and that $\{V \rightarrow \varphi(V)\}$ is an étale covering. Hence if $\left.\sigma\right|_{V}=0$, then by the sheaf condition for $\mathcal{F}$ we see that $\left.\sigma\right|_{\varphi(V)}=0$. This proves (2). To prove (3) we have to show that if $(U, \bar{u}, \sigma)$ defines the zero element of $\mathcal{F}_{\bar{s}}$, then $\bar{u} \in W$. This is true because the assumption means there exists a morphism of étale neighbourhoods $(V, \bar{v}) \rightarrow(U, \bar{u})$ such that $\left.\sigma\right|_{V}=0$. Hence by (2) we see that $V \rightarrow U$ maps into $W$, and hence $\bar{u} \in W$.

Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. Let $\mathcal{F}$ be a sheaf on $X_{\text {étale }}$. By Remark 53.18.11 the isomorphism class of the stalk of the sheaf $\mathcal{F}$ at a geometric points lying over $x$ is well defined.

04KA Definition 53.19.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$.
(1) The support of $\mathcal{F}$ is the set of points $x \in|X|$ such that $\mathcal{F}_{\bar{x}} \neq 0$ for any (some) geometric point $\bar{x}$ lying over $x$.
(2) Let $\sigma \in \mathcal{F}(U)$ be a section. The support of $\sigma$ is the closed subset $U \backslash W$, where $W \subset U$ is the largest open subset of $U$ on which $\sigma$ restricts to zero (see Lemma 53.19.2.

04KB Lemma 53.19.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. Let $U \in \operatorname{Ob}\left(X_{\text {étale }}\right)$ and $\sigma \in \mathcal{F}(U)$.
(1) The support of $\sigma$ is closed in $|X|$.
(2) The support of $\sigma+\sigma^{\prime}$ is contained in the union of the supports of $\sigma, \sigma^{\prime} \in$ $\mathcal{F}(X)$.
(3) If $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a map of abelian sheaves on $X_{\text {étale }}$, then the support of $\varphi(\sigma)$ is contained in the support of $\sigma \in \mathcal{F}(U)$.
(4) The support of $\mathcal{F}$ is the union of the images of the supports of all local sections of $\mathcal{F}$.
(5) If $\mathcal{F} \rightarrow \mathcal{G}$ is surjective then the support of $\mathcal{G}$ is a subset of the support of $\mathcal{F}$.
(6) If $\mathcal{F} \rightarrow \mathcal{G}$ is injective then the support of $\mathcal{F}$ is a subset of the support of $\mathcal{G}$.

Proof. Part (1) holds by definition. Parts (2) and (3) hold because they holds for the restriction of $\mathcal{F}$ and $\mathcal{G}$ to $U_{Z a r}$, see Modules, Lemma 17.5.2. Part (4) is a direct consequence of Lemma 53.19 .2 part (3). Parts (5) and (6) follow from the other parts.

04KC Lemma 53.19.5. The support of a sheaf of rings on the small étale site of an algebraic space is closed.

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1=0$, and hence the support of a sheaf of rings is the support of the unit section.

### 53.20. The structure sheaf of an algebraic space

04KD The structure sheaf of an algebraic space is the sheaf of rings of the following lemma.
03G6 Lemma 53.20.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The rule $U \mapsto \Gamma\left(U, \mathcal{O}_{U}\right)$ defines a sheaf of rings on $X_{\text {étale }}$.

Proof. Immediate from the definition of a covering and Descent, Lemma 34.7.1.

03G7 Definition 53.20.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The structure sheaf of $X$ is the sheaf of rings $\mathcal{O}_{X}$ on the small étale site $X_{\text {étale }}$ described in Lemma 53.20.1.

According to Lemma 53.17 .12 the sheaf $\mathcal{O}_{X}$ corresponds to a system of étale sheaves $\left(\mathcal{O}_{X}\right)_{U}$ for $U$ ranging through the objects of $X_{\text {étale }}$. It is clear from the proof of that lemma and our definition that we have simply $\left(\mathcal{O}_{X}\right)_{U}=\mathcal{O}_{U}$ where $\mathcal{O}_{U}$ is the structure sheaf of $U_{\text {étale }}$ as introduced in Descent, Definition 34.7.2. In particular, if $X$ is a scheme we recover the sheaf $\mathcal{O}_{X}$ on the small étale site of $X$.

Via the equivalence $\operatorname{Sh}\left(X_{\text {étale }}\right)=\operatorname{Sh}\left(X_{\text {spaces,étale }}\right)$ of Lemma 53.17 .3 we may also think of $\mathcal{O}_{X}$ as a sheaf of rings on $X_{\text {spaces,étale }}$. It is explained in Remark 53.17.4 how to compute $\mathcal{O}_{X}(Y)$, and in particular $\mathcal{O}_{X}(X)$, when $Y \rightarrow X$ is an object of $X_{\text {spaces,étale }}$.

03G8 Lemma 53.20.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then there is a canonical map $f^{\sharp}: f_{\text {small }}^{-1} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$ such that

$$
\left(f_{\text {small }}, f^{\sharp}\right):\left(X_{\text {étale }}, \mathcal{O}_{X}\right) \longrightarrow\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right)
$$

is a morphism of ringed topoi. Furthermore,
(1) The construction $f \mapsto\left(f_{\text {small }}, f^{\sharp}\right)$ is compatible with compositions.
(2) If $f$ is a morphism of schemes, then $f^{\sharp}$ is the map described in Descent, Remark 34.7.4.

Proof. By Lemma 53.17 .9 it suffices to give an $f$-map from $\mathcal{O}_{Y}$ to $\mathcal{O}_{X}$. In other words, for every commutative diagram

where $U \in X_{\text {étale }}, V \in Y_{\text {étale }}$ we have to give a map of rings $\left(f^{\sharp}\right)_{(U, V, g)}: \Gamma\left(V, \mathcal{O}_{V}\right) \rightarrow$ $\Gamma\left(U, \mathcal{O}_{U}\right)$. Of course we just take $\left(f^{\sharp}\right)_{(U, V, g)}=g^{\sharp}$. It is clear that this is compatible with restriction mappings and hence indeed gives an $f$-map. We omit checking compatibility with compositions and agreement with the construction in Descent, Remark 34.7.4

### 53.21. Stalks of the structure sheaf

04 KE This section is the analogue of Étale Cohomology, Section 49.33.
04KF Lemma 53.21.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$. Let $(U, \bar{u})$ be an étale neighbourhood of $\bar{x}$ where $U$ is a scheme. Then we have

$$
\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{U, \bar{u}}=\mathcal{O}_{U, u}^{s h}
$$

where the left hand side is the stalk of the structure sheaf of $X$, and the right hand side is the strict henselization of the local ring of $U$ at the point $u$ at which $\bar{u}$ is centered.

Proof. We know that the structure sheaf $\mathcal{O}_{U}$ on $U_{\text {étale }}$ is the restriction of the structure sheaf of $X$. Hence the first equality follows from Lemma 53.18.9 part (4). The second equality is explained in Étale Cohomology, Lemma 49.33.1.

04KG Definition 53.21.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$ lying over the point $x \in|X|$.
(1) The étale local ring of $X$ at $\bar{x}$ is the stalk of the structure sheaf $\mathcal{O}_{X}$ on $X_{\text {étale }}$ at $\bar{x}$. Notation: $\mathcal{O}_{X, \bar{x}}$.
(2) The strict henselization of $X$ at $\bar{x}$ is the scheme $\operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right)$.

The isomorphism type of the strict henselization of $X$ at $\bar{x}$ (as a scheme over $X$ ) depends only on the point $x \in|X|$ and not on the choice of the geometric point lying over $x$, see Remark 53.18.11.

04KH Lemma 53.21.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The small étale site $X_{\text {étale }}$ endowed with its structure sheaf $\mathcal{O}_{X}$ is a locally ringed site, see Modules on Sites, Definition 18.39.4.

Proof. This follows because the stalks $\mathcal{O}_{X, \bar{x}}$ are local, and because $S_{\text {étale }}$ has enough points, see Lemmas 53.21.1 and Theorem 53.18.12. See Modules on Sites, Lemma 18.39 .2 and 18.39 .3 for the fact that this implies the small étale site is locally ringed.

04N9 Lemma 53.21.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. Let $d \in\{0,1,2, \ldots, \infty\}$. The following are equivalent
(1) the dimension of the local ring of $X$ at $x$ (Definition 53.9.2) is $d$,
(2) $\operatorname{dim}\left(\mathcal{O}_{X, \bar{x}}\right)=d$ for some geometric point $\bar{x}$ lying over $x$, and
(3) $\operatorname{dim}\left(\mathcal{O}_{X, \bar{x}}\right)=d$ for any geometric point $\bar{x}$ lying over $x$.

Proof. The equivalence of (2) and (3) follows from the fact that the isomorphism type of $\mathcal{O}_{X, \bar{x}}$ only depends on $x \in|X|$, see Remark 53.18.11. Using Lemma 53.21.1 the equivalence of $(1)$ and $(2)+(3)$ comes down to the following statement: Given any local ring $R$ we have $\operatorname{dim}(R)=\operatorname{dim}\left(R^{s h}\right)$. This is More on Algebra, Lemma 15.36 .7

0A4H Lemma 53.21.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an étale morphism of algebraic spaces over $S$. Let $x \in X$. Then (1) $\operatorname{dim}_{x}(X)=\operatorname{dim}_{f(x)}(Y)$ and (2) the dimension of the local ring of $X$ at $x$ equals the dimension of the local ring of $Y$ at $f(x)$. If $f$ is surjective, then (3) $\operatorname{dim}(X)=\operatorname{dim}(Y)$.

Proof. Choose a scheme $U$ and a point $u \in U$ and an étale morphism $U \rightarrow X$ which maps $u$ to $x$. Then the composition $U \rightarrow Y$ is also étale and maps $u$ to $f(x)$. Thus the statements (1) and (2) follow as the relevant integers are defined in terms of the behaviour of the scheme $U$ at $u$. See Definition 53.8.1 for (1). Part (3) is an immediate consequence of (1), see Definition 53.8.2.

### 53.22. Local irreducibility

06DJ A point on an algebraic space has a well defined étale local ring, which corresponds to the strict henselization of the local ring in the case of a scheme. In general we cannot see how many irreducible components of the algebraic space pass through the given point from the étale local ring. Here is something we can do.

06DK Lemma 53.22.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. The following are equivalent
(1) for any scheme $U$ and étale morphism $a: U \rightarrow X$ and $u \in U$ with $a(u)=x$ the local ring $\mathcal{O}_{U, u}$ has a unique minimal prime,
(2) for any scheme $U$ and étale morphism $a: U \rightarrow X$ and $u \in U$ with $a(u)=x$ there is a unique irreducible component of $U$ through $u$, and
(3) $\mathcal{O}_{X, \bar{x}}$ has a unique minimal prime for any geometric point $\bar{x}$ lying over $x$.

Proof. The equivalence of (1) and (2) follows from the fact that irreducible components of $U$ passing through $u$ are in $1-1$ correspondence with minimal primes of the local ring of $U$ at $u$. Let $a: U \rightarrow X$ and $u \in U$ be as in (1). Then $\mathcal{O}_{U, u} \rightarrow \mathcal{O}_{X, \bar{x}}$ is flat in particular injective. Hence if $f, g \in \mathcal{O}_{U, u}$ are non-nilpotent elements such that $f g=0$, then the same is true in $\mathcal{O}_{X, \bar{x}}$. Conversely, suppose that $f, g \in \mathcal{O}_{X, \bar{x}}$ are non-nilpotent such that $f g=0$. Since $\mathcal{O}_{X, \bar{x}}$ is the filtered colimit of the rings $\mathcal{O}_{U, u}$ we see that $f, g$ are the images of elements of $\mathcal{O}_{U, u}$ for some choice of $a: U \rightarrow X$. Hence we see that $\mathcal{O}_{U, u}$ doesn't have a unique minimal prime. In this way we see the equivalence of (1) and (3).

06DL Definition 53.22.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. We say that $X$ is geometrically unibranch at $x$ if the equivalent conditions of Lemma 53.22.1 hold. We say that $X$ is geometrically unibranch if $X$ is geometrically unibranch at every $x \in|X|$.

This is consistent with the definition for schemes (Properties, Definition 27.15.1) by More on Algebra, Lemma 15.79.3.

### 53.23. Noetherian spaces

03E9 We have already defined locally Noetherian algebraic spaces in Section 53.7.
03EA Definition 53.23.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We say $X$ is Noetherian if $X$ is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic space $X$ is not just quasi-compact and locally Noetherian, but also quasi-separated. This does not conflict with the definition of a Noetherian scheme, as a locally Noetherian scheme is quasi-separated, see Properties, Lemma 27.5.4. This does not hold for algebraic spaces. Namely, $X=$ $\mathbf{A}_{k}^{1} / \mathbf{Z}$, see Spaces, Example 52.14 .8 is locally Noetherian and quasi-compact but not quasi-separated (hence not Noetherian according to our definitions).

A consequence of the choice made above is that an algebraic space of finite type over a Noetherian algebraic space is not automatically Noetherian, i.e., the analogue of Morphisms, Lemma 28.15 .6 does not hold. The correct statement is that an algebraic space of finite presentation over a Noetherian algebraic space is Noetherian (see Morphisms of Spaces, Lemma 54.28.6).
A Noetherian algebraic space $X$ is very close to being a scheme. In the rest of this section we collect some lemmas to illustrate this.

04ZF Lemma 53.23.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X$ is locally Noetherian then $|X|$ is a locally Noetherian topological space.
(2) If $X$ is quasi-compact and locally Noetherian, then $|X|$ is a Noetherian topological space.

Proof. Assume $X$ is locally Noetherian. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. As $X$ is locally Noetherian we see that $U$ is locally Noetherian. By Properties, Lemma 27.5 .5 this means that $|U|$ is a locally Noetherian topological space. Since $|U| \rightarrow|X|$ is open and surjective we conclude that $|X|$ is locally Noetherian by Topology, Lemma 5.8.3. This proves (1). If $X$ is quasi-compact and locally Noetherian, then $|X|$ is quasi-compact and locally Noetherian. Hence $|X|$ is Noetherian by Topology, Lemma 5.11.14.

04ZG Lemma 53.23.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is Noetherian, then $|X|$ is a sober Noetherian topological space.

Proof. A quasi-separated algebraic space has an underlying sober topological space, see Lemma 53.14.1. It is Noetherian by Lemma 53.23.2.

08AH Lemma 53.23.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\bar{x}$ be a geometric point of $X$. Then $\mathcal{O}_{X, \bar{x}}$ is a Noetherian local ring.
Proof. Choose an étale neighbourhood $(U, \bar{u})$ of $\bar{x}$ where $U$ is a scheme. Then $\mathcal{O}_{X, \bar{x}}$ is the strict henselization of the local ring of $U$ at $u$, see Lemma 53.21.1. By our definition of Noetherian spaces the scheme $U$ is Noetherian. Hence we conclude by More on Algebra, Lemma 15.36.3.

### 53.24. Regular algebraic spaces

06LP We have already defined regular algebraic spaces in Section 53.7.
06LQ Lemma 53.24.1. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. The following are equivalent
(1) $X$ is regular, and
(2) every étale local ring $\mathcal{O}_{X, \bar{x}}$ is regular.

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By assumption $U$ is locally Noetherian. Moreover, every étale local ring $\mathcal{O}_{X, \bar{x}}$ is the strict henselization of a local ring on $U$ and conversely, see Lemma53.21.1. Thus by More on Algebra, Lemma 15.36 .10 we see that (2) is equivalent to every local ring of $U$ being regular, i.e., $U$ being a regular scheme (see Properties, Lemma 27.9.2). This equivalent to (1) by Definition 53.7.2.

We can use Descent, Lemma 34.17.4 to define what it means for an algebraic space $X$ to be regular at a point $x$.

0AH9 Definition 53.24.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. We say $X$ is regular at $x$ if $\mathcal{O}_{U, u}$ is a regular local ring for any (equivalently some) pair ( $a: U \rightarrow X, u$ ) consisting of an étale morphism $a: U \rightarrow X$ from a scheme to $X$ and a point $u \in U$ with $a(u)=x$.
See Definition 53.7.5, Lemma 53.7.4, and Descent, Lemma 34.17.4
0AHA Lemma 53.24.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$ be a point. The following are equivalent
(1) $X$ is regular at $x$, and
(2) the étale local ring $\mathcal{O}_{X, \bar{x}}$ is regular for any (equivalently some) geometric point $\bar{x}$ lying over $x$.

Proof. Let $U$ be a scheme, $u \in U$ a point, and let $a: U \rightarrow X$ be an étale morphism mapping $u$ to $x$. For any geometric point $\bar{x}$ of $X$ lying over $x$, the étale local ring $\mathcal{O}_{X, \bar{x}}$ is the strict henselization of a local ring on $U$ at $u$, see Lemma 53.21.1. Thus we conclude by More on Algebra, Lemma 15.36 .10

0BGT Lemma 53.24.4. A regular algebraic space is normal.
Proof. This follows from the definitions and the case of schemes See Properties, Lemma 27.9.4

### 53.25. Sheaves of modules on algebraic spaces

03LT If $X$ is an algebraic space, then a sheaf of modules on $X$ is a sheaf of $\mathcal{O}_{X}$-modules on the small étale site of $X$ where $\mathcal{O}_{X}$ is the structure sheaf of $X$. The category of sheaves of modules is denoted $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$.
Given a morphism $f: X \rightarrow Y$ of algebraic spaces, by Lemma 53.20.3 we get a morphism of ringed topoi and hence by Modules on Sites, Definition 18.13.1 we get well defined pullback and direct image functors
$03 \mathrm{LU} \quad(53.25 .0 .1) \quad f^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right), \quad f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$
which are adjoint in the usual way. If $g: Y \rightarrow Z$ is another morphism of algebraic spaces over $S$, then we have $(g \circ f)^{*}=f^{*} \circ g^{*}$ and $(g \circ f)_{*}=g_{*} \circ f_{*}$ simply because the morphisms of ringed topoi compose in the corresponding way (by the lemma).
03LV Lemma 53.25.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an étale morphism of algebraic spaces over $S$. Then $f^{-1} \mathcal{O}_{Y}=\mathcal{O}_{X}$, and $f^{*} \mathcal{G}=f_{\text {small }}^{-1} \mathcal{G}$ for any sheaf of $\mathcal{O}_{Y}$-modules $\mathcal{G}$. In particular, $f^{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$ is exact.
Proof. By the description of inverse image in Lemma 53.17 .10 and the definition of the structure sheaves it is clear that $f_{\text {small }}^{-1} \mathcal{O}_{Y}=\mathcal{O}_{X}$. Since the pullback

$$
f^{*} \mathcal{G}=f_{\text {small }}^{-1} \mathcal{G} \otimes_{f_{\text {small }}^{-1} \mathcal{O}_{Y}} \mathcal{O}_{X}
$$

by definition we conclude that $f^{*} \mathcal{G}=f_{\text {small }}^{-1} \mathcal{G}$. The exactness is clear because $f_{\text {small }}^{-1}$ is exact, as $f_{\text {small }}$ is a morphism of topoi.

We continue our abuse of notation introduced in Equation 53.17.10.1 by writing
03LW

$$
\left.\mathcal{G}\right|_{X_{\text {étale }}}=f^{*} \mathcal{G}=f_{\text {small }}^{-1} \mathcal{G}
$$

in the situation of the lemma above. We will discuss this in a more technical fashion in Section 53.26.

03LX Lemma 53.25.2. Let $S$ be a scheme. Let

be a cartesian square of algebraic spaces over $S$. Let $\mathcal{F} \in \operatorname{Mod}\left(\mathcal{O}_{X}\right)$. If $g$ is étale, then $f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{X^{\prime}}\right)=\left.\left(f_{*} \mathcal{F}\right)\right|_{Y}{ }^{6}$ and $R^{i} f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{X^{\prime}}\right)=\left.\left(R^{i} f_{*} \mathcal{F}\right)\right|_{Y^{\prime}}$ in $\operatorname{Mod}\left(\mathcal{O}_{Y^{\prime}}\right)$.
Proof. This is a reformulation of Lemma 53.17.11 in the case of modules.
03LY Lemma 53.25.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A sheaf $\mathcal{F}$ of $\mathcal{O}_{X}$-modules is given by the following data:
(1) for every $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ a sheaf $\mathcal{F}_{U}$ of $\mathcal{O}_{U}$-modules on $U_{\text {étale }}$,
(2) for every $f: U^{\prime} \rightarrow U$ in $X_{\text {étale }}$ an isomorphism $c_{f}: f_{\text {small }}^{*} \mathcal{F}_{U} \rightarrow \mathcal{F}_{U^{\prime}}$. These data are subject to the condition that given any $f: U^{\prime} \rightarrow U$ and $g: U^{\prime \prime} \rightarrow U^{\prime}$ in $X_{\text {étale }}$ the composition $g_{\text {small }}^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$.
Proof. Combine Lemmas 53.25.1 and 53.17.12, and use the fact that any morphism between objects of $X_{\text {étale }}$ is an étale morphism of schemes.

### 53.26. Étale localization

04LX Reading this section should be avoided at all cost.
Let $X \rightarrow Y$ be an étale morphism of algebraic spaces. Then $X$ is an object of $Y_{\text {spaces,étale }}$ and it is immediate from the definitions, see also the proof of Lemma 53.17.10, that

04LY (53.26.0.1)

$$
X_{\text {spaces,étale }}=Y_{\text {spaces,étale }} / X
$$

where the right hand side is the localization of the site $Y_{\text {spaces,étale }}$ at the object $X$, see Sites, Definition 7.24.1. Moreover, this identification is compatible with the structure sheaves by Lemma 53.25.1. Hence the ringed site $\left(X_{\text {spaces,étale }}, \mathcal{O}_{X}\right)$ is identified with the localization of the ringed site $\left(Y_{\text {spaces,étale }}, \mathcal{O}_{Y}\right)$ at the object $X$ :
04LZ (53.26.0.2)

$$
\left(X_{\text {spaces,étale }}, \mathcal{O}_{X}\right)=\left(Y_{\text {spaces,étale }} / X,\left.\mathcal{O}_{Y}\right|_{Y_{\text {spaces,étale }} / X}\right)
$$

The localization of a ringed site used on the right hand side is defined in Modules on Sites, Definition 18.19.1.
Assume now $X \rightarrow Y$ is an étale morphism of algebraic spaces and $X$ is a scheme. Then $X$ is an object of $Y_{\text {étale }}$ and it follows that
04M0 (53.26.0.3)

$$
X_{\text {étale }}=Y_{\text {étale }} / X
$$

and
04M1 (53.26.0.4)

$$
\left(X_{\text {étale }}, \mathcal{O}_{X}\right)=\left(Y_{\text {étale }} / X,\left.\mathcal{O}_{Y}\right|_{Y_{\text {étale }} / X}\right)
$$

as above.
Finally, if $X \rightarrow Y$ is an étale morphism of algebraic spaces and $X$ is an affine scheme, then $X$ is an object of $Y_{\text {affine, étale }}$ and
04M2 (53.26.0.5)

$$
X_{\text {affine,étale }}=Y_{\text {affine,étale }} / X
$$

[^158]and
04M3
\[

$$
\begin{equation*}
\left(X_{a f f i n e, \text { étale }}, \mathcal{O}_{X}\right)=\left(Y_{\text {affine,étale }} / X,\left.\mathcal{O}_{Y}\right|_{Y_{\text {affine }, \text { etale }} / X}\right) \tag{53.26.0.6}
\end{equation*}
$$

\]

as above.
Next, we show that these localizations are compatible with morphisms.
04M4 Lemma 53.26.1. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$ with $p$ and $q$ étale. Via the identifications (53.26.0.2) for $U \rightarrow X$ and $V \rightarrow Y$ the morphism of ringed topoi

$$
\left(g_{\text {spaces,étale }}, g^{\sharp}\right):\left(S h\left(U_{\text {spaces,étale }}\right), \mathcal{O}_{U}\right) \longrightarrow\left(S h\left(V_{\text {spaces,étale }}\right), \mathcal{O}_{V}\right)
$$

is 2-isomorphic to the morphism $\left(f_{\text {spaces,étale }, c}, f_{c}^{\sharp}\right)$ constructed in Modules on Sites, Lemma 18.20.2 starting with the morphism of ringed sites ( $f_{\text {spaces,étale }}, f^{\sharp}$ ) and the map $c: \bar{U} \rightarrow V \times_{Y} X$ corresponding to $g$.

Proof. The morphism $\left(f_{\text {spaces }, \text { étale }, c}, f_{c}^{\sharp}\right)$ is defined as a composition $f^{\prime} \circ j$ of a localization and a base change map. Similarly $g$ is a composition $U \rightarrow V \times_{Y} X \rightarrow V$. Hence it suffices to prove the lemma in the following two cases: (1) $f=\mathrm{id}$, and (2) $U=X \times_{Y} V$. In case (1) the morphism $g: U \rightarrow V$ is étale, see Lemma 53.15.6. Hence $\left(g_{\text {spaces,étale }}, g^{\sharp}\right)$ is a localization morphism by the discussion surrounding Equations 53.26.0.1 and 53.26.0.2 which is exactly the content of the lemma in this case. In case (2) the morphism $g_{\text {spaces, étale }}$ comes from the morphism of ringed sites given by the functor $V_{\text {spaces,étale }} \rightarrow U_{\text {spaces,étale, }}, V^{\prime} / V \mapsto V^{\prime} \times_{V} U / U$ which is also what the morphism $f^{\prime}$ is defined by, see Sites, Lemma 7.27.1. We omit the verification that $\left(f^{\prime}\right)^{\sharp}=g^{\sharp}$ in this case (both are the restriction of $f^{\sharp}$ to $\left.U_{\text {spaces,étale }}\right)$.

04M5 Lemma 53.26.2. Same notation and assumptions as in Lemma 53.26.1 except that we also assume $U$ and $V$ are schemes. Via the identifications (53.26.0.4) for $U \rightarrow X$ and $V \rightarrow Y$ the morphism of ringed topoi

$$
\left(g_{\text {small }}, g^{\sharp}\right):\left(S h\left(U_{\text {étale }}\right), \mathcal{O}_{U}\right) \longrightarrow\left(S h\left(V_{\text {étale }}\right), \mathcal{O}_{V}\right)
$$

is 2-isomorphic to the morphism $\left(f_{\text {small }, s}, f_{s}^{\sharp}\right)$ constructed in Modules on Sites, Lemma 18.22.3 starting with $\left(f_{\text {small }}, f^{\sharp}\right)$ and the map $s: h_{U} \rightarrow f_{\text {small }}^{-1} h_{V}$ corresponding to $g$.

Proof. Note that $\left(g_{\text {small }}, g^{\sharp}\right)$ is 2 -isomorphic as a morphism of ringed topoi to the morphism of ringed topoi associated to the morphism of ringed sites $\left(g_{\text {spaces,étale }}, g^{\sharp}\right)$. Hence we conclude by Lemma 53.26.1 and Modules on Sites, Lemma 18.22.4.

### 53.27. Recovering morphisms

04 KI In this section we prove that the rule which associates to an algebraic space its locally ringed small étale topos is fully faithful in a suitable sense, see Theorem 53.27 .4

04KJ Lemma 53.27.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The morphism of ringed topoi $\left(f_{\text {small }}, f^{\sharp}\right)$ associated to $f$ is a morphism of locally ringed topoi, see Modules on Sites, Definition 18.39.9.

Proof. Note that the assertion makes sense since we have seen that ( $X_{\text {étale }}, \mathcal{O}_{X_{\text {étale }}}$ ) and ( $Y_{\text {étale }}, \mathcal{O}_{Y_{\text {étale }}}$ ) are locally ringed sites, see Lemma 53.21.3. Moreover, we know that $X_{\text {étale }}$ has enough points, see Theorem53.18.12. Hence it suffices to prove that $\left(f_{\text {small }}, f^{\sharp}\right)$ satisfies condition (3) of Modules on Sites, Lemma 18.39.8. To see this take a point $p$ of $X_{\text {étale }}$. By Lemma $53.18 .13 p$ corresponds to a geometric point $\bar{x}$ of $X$. By Lemma 53.18 .9 the point $q=f_{\text {small }} \circ p$ corresponds to the geometric point $\bar{y}=f \circ \bar{x}$ of $Y$. Hence the assertion we have to prove is that the induced map of étale local rings

$$
\mathcal{O}_{Y, \bar{y}} \longrightarrow \mathcal{O}_{X, \bar{x}}
$$

is a local ring map. You can prove this directly, but instead we deduce it from the corresponding result for schemes. To do this choose a commutative diagram

where $U$ and $V$ are schemes, and the vertical arrows are surjective étale (see Spaces, Lemma 52.11.6). Choose a lift $\bar{u}: \bar{x} \rightarrow U$ (possible by Lemma 53.18.5). Set $\bar{v}=\psi \circ \bar{u}$. We obtain a commutative diagram of étale local rings

By Étale Cohomology, Lemma 49.41.1 the top horizontal arrow is a local ring map. Finally by Lemma 53.21.1 the vertical arrows are isomorphisms. Hence we win.

04KK Lemma 53.27.2. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $t$ be a 2 -morphism from $\left(f_{\text {small }}, f^{\sharp}\right)$ to itself, see Modules on Sites, Definition 18.8.1. Then $t=i d$.

Proof. Let $X^{\prime}$, resp. $Y^{\prime}$ be $X$ viewed as an algebraic space over $\operatorname{Spec}(\mathbf{Z})$, see Spaces, Definition 52.16.2 It is clear from the construction that $\left(X_{\text {small }}, \mathcal{O}\right)$ is equal to $\left(X_{\text {small }}^{\prime}, \mathcal{O}\right)$ and similarly for $Y$. Hence we may work with $X^{\prime}$ and $Y^{\prime}$. In other words we may assume that $S=\operatorname{Spec}(\mathbf{Z})$.
Assume $S=\operatorname{Spec}(\mathbf{Z}), f: X \rightarrow Y$ and $t$ are as in the lemma. This means that $t: f_{\text {small }}^{-1} \rightarrow f_{\text {small }}^{-1}$ is a transformation of functors such that the diagram

is commutative. Suppose $V \rightarrow Y$ is étale with $V$ affine. Write $V=\operatorname{Spec}(B)$. Choose generators $b_{j} \in B, j \in J$ for $B$ as a Z $\mathbf{Z}$-algebra. Set $T=\operatorname{Spec}\left(\mathbf{Z}\left[\left\{x_{j}\right\}_{j \in J}\right]\right)$. In the following we will use that $\operatorname{Mor}_{S c h}(U, T)=\prod_{j \in J} \Gamma\left(U, \mathcal{O}_{U}\right)$ for any scheme $U$
without further mention. The surjective ring map $\mathbf{Z}\left[x_{j}\right] \rightarrow B, x_{j} \mapsto b_{j}$ corresponds to a closed immersion $V \rightarrow T$. We obtain a monomorphism

$$
i: V \longrightarrow T_{Y}=T \times Y
$$

of algebraic spaces over $Y$. In terms of sheaves on $Y_{\text {étale }}$ the morphism $i$ induces an injection $h_{i}: h_{V} \rightarrow \prod_{j \in J} \mathcal{O}_{Y}$ of sheaves. The base change $i^{\prime}: X \times_{Y} V \rightarrow T_{X}$ of $i$ to $X$ is a monomorphism too (Spaces, Lemma 52.5.5). Hence $i^{\prime}: X \times_{Y} V \rightarrow T_{X}$ is a monomorphism, which in turn means that $h_{i^{\prime}}: h_{X \times_{Y} V} \rightarrow \prod_{j \in J} \mathcal{O}_{X}$ is an injection of sheaves. Via the identification $f_{\text {small }}^{-1} h_{V}=h_{X \times_{Y} V}$ of Lemma 53.18.9 the map $h_{i^{\prime}}$ is equal to

$$
f_{\text {small }}^{-1} h_{V} \xrightarrow{f^{-1} h_{i}} \prod_{j \in J} f_{\text {small }}^{-1} \mathcal{O}_{Y} \xrightarrow{\Pi f^{\sharp}} \prod_{j \in J} \mathcal{O}_{X}
$$

(verification omitted). This means that the map $t: f_{\text {small }}^{-1} h_{V} \rightarrow f_{\text {small }}^{-1} h_{V}$ fits into the commutative diagram

The commutativity of the right square holds by our assumption on $t$ explained above. Since the composition of the horizontal arrows is injective by the discussion above we conclude that the left vertical arrow is the identity map as well. Any sheaf of sets on $Y_{\text {étale }}$ admits a surjection from a (huge) coproduct of sheaves of the form $h_{V}$ with $V$ affine (combine Lemma 53.17.5 with Sites, Lemma 7.13.5. Thus we conclude that $t: f_{\text {small }}^{-1} \rightarrow f_{\text {small }}^{-1}$ is the identity transformation as desired.

04M6 Lemma 53.27.3. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Any two morphisms $a, b: X \rightarrow Y$ of algebraic spaces over $S$ for which there exists $a$ 2 -isomorphism $\left(a_{\text {small }}, a^{\sharp}\right) \cong\left(b_{\text {small }}, b^{\sharp}\right)$ in the 2 -category of ringed topoi are equal.

Proof. Let $t: a_{\text {small }}^{-1} \rightarrow b_{\text {small }}^{-1}$ be the 2-isomorphism. We may equivalently think of $t$ as a transformation $t: a_{\text {spaces, étale }}^{-1} \rightarrow b_{\text {spaces,étale }}^{-1}$ since there is not difference between sheaves on $X_{\text {étale }}$ and sheaves on $X_{\text {spaces,étale }}$. Choose a commutative diagram

where $U$ and $V$ are schemes, and $p$ and $q$ are surjective étale. Consider the diagram

Since the sheaf $b_{\text {spaces,étale }}^{-1} h_{V}$ is isomorphic to $h_{V \times_{Y, b} X}$ we see that the dotted arrow comes from a morphism of schemes $\beta: U \rightarrow V$ fitting into a commutative diagram

We claim that there exists a sequence of 2-isomorphisms

$$
\begin{aligned}
\left(\alpha_{\text {small }}, \alpha^{\sharp}\right) & \cong\left(\alpha_{\text {spaces }, \text { étale }}, \alpha^{\sharp}\right) \\
& \cong\left(a_{\text {spaces,étale }, c}, a_{c}^{\sharp}\right) \\
& \cong\left(b_{\text {spaces,étale }, d}, b_{d}^{\sharp}\right) \\
& \cong\left(\beta_{\text {spaces,étale }}, \beta^{\sharp}\right) \\
& \cong\left(\beta_{\text {small }}, \beta^{\sharp}\right)
\end{aligned}
$$

The first and the last 2-isomorphisms come from the identifications between sheaves on $U_{\text {spaces,étale }}$ and sheaves on $U_{\text {étale }}$ and similarly for $V$. The second and fourth 2-isomorphisms are those of Lemma 53.26.1 with $c: U \rightarrow X \times_{a, Y} V$ induced by $\alpha$ and $d: U \rightarrow X \times_{b, Y} V$ induced by $\beta$. The middle 2 -isomorphism comes from the transformation $t$. Namely, the functor $a_{\text {spaces,étale, } c}^{-1}$ corresponds to the functor

$$
\left(\mathcal{H} \rightarrow h_{V}\right) \longmapsto\left(a_{\text {spaces,étale }}^{-1} \mathcal{H} \times_{a_{\text {spaces,étale }}^{-1} h_{V}, \alpha} h_{U} \rightarrow h_{U}\right)
$$

and similarly for $b_{\text {spaces,étale, } d}^{-1}$, see Sites, Lemma 7.27.3. This uses the identification of sheaves on $Y_{\text {spaces,étale }} / V$ as arrows $\left(\mathcal{H} \rightarrow h_{V}\right)$ in $S h\left(Y_{\text {spaces,étale }}\right)$ and similarly for $U / X$, see Sites, Lemma 7.24.4. Via this identification the structure sheaf $\mathcal{O}_{V}$ corresponds to the pair $\left(\mathcal{O}_{Y} \times h_{V} \rightarrow h_{V}\right)$ and similarly for $\mathcal{O}_{U}$, see Modules on Sites, Lemma 18.21.3. Since $t$ switches $\alpha$ and $\beta$ we see that $t$ induces an isomorphism

$$
t: a_{\text {spaces,étale }}^{-1} \mathcal{H} \times_{a_{\text {spaces,étale }}^{-1} h_{V}, \alpha} h_{U} \longrightarrow b_{\text {spaces,étale }}^{-1} \mathcal{H} \times_{b_{\text {spaces,étale }}^{-1} h_{V}, \beta} h_{U}
$$

over $h_{U}$ functorially in $\left(\mathcal{H} \rightarrow h_{V}\right)$. Also, $t$ is compatible with $a_{c}^{\sharp}$ and $b_{d}^{\sharp}$ as $t$ is compatible with $a^{\sharp}$ and $b^{\sharp}$ by our description of the structure sheaves $\mathcal{O}_{U}$ and $\mathcal{O}_{V}$ above. Hence, the morphisms of ringed topoi $\left(\alpha_{\text {small }}, \alpha^{\sharp}\right)$ and $\left(\beta_{\text {small }}, \beta^{\sharp}\right)$ are 2 -isomorphic. By Étale Cohomology, Lemma 49.41 .3 we conclude $\alpha=\beta$ ! Since $p: U \rightarrow X$ is a surjection of sheaves it follows that $a=b$.

Here is the main result of this section.
04KL Theorem 53.27.4. Let $X, Y$ be algebraic spaces over $\operatorname{Spec}(\mathbf{Z})$. Let

$$
\left(g, g^{\sharp}\right):\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right) \longrightarrow\left(S h\left(Y_{\text {étale }}\right), \mathcal{O}_{Y}\right)
$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of algebraic spaces $f: X \rightarrow Y$ such that $\left(g, g^{\sharp}\right)$ is isomorphic to $\left(f_{\text {small }}, f^{\sharp}\right)$. In other words, the construction

$$
\text { Spaces } / \operatorname{Spec}(\mathbf{Z}) \longrightarrow \text { Locally ringed topoi, } \quad X \longrightarrow\left(X_{\text {étale }}, \mathcal{O}_{X}\right)
$$

is fully faithful (morphisms up to 2-isomorphisms on the right hand side).

Proof. The uniqueness we have seen in Lemma 53.27.3. Thus it suffices to prove existence. In this proof we will freely use the identifications of Equation 53.26.0.4 as well as the result of Lemma 53.26.2
Let $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$, let $V \in \mathrm{Ob}\left(Y_{\text {étale }}\right)$ and let $s \in g^{-1} h_{V}(U)$ be a section. We may think of $s$ as a map of sheaves $s: h_{U} \rightarrow g^{-1} h_{V}$. By Modules on Sites, Lemma 18.22 .3 we obtain a commutative diagram of morphisms of ringed topoi

By Étale Cohomology, Theorem 49.41.5 we obtain a unique morphism of schemes $f_{s}: U \rightarrow V$ such that $\left(g_{s}, g_{s}^{\sharp}\right)$ is 2-isomorphic to $\left(f_{s, s m a l l}, f_{s}^{\sharp}\right)$. The construction $(U, V, s) \rightsquigarrow f_{s}$ just explained satisfies the following functoriality property: Suppose given morphisms $a: U^{\prime} \rightarrow U$ in $X_{\text {étale }}$ and $b: V^{\prime} \rightarrow V$ in $Y_{\text {étale }}$ and a map $s^{\prime}: h_{U^{\prime}} \rightarrow g^{-1} h_{V^{\prime}}$ such that the diagram

commutes. Then the diagram

of schemes commutes. The reason this is true is that the same condition holds for the morphisms $\left(g_{s}, g_{s}^{\sharp}\right)$ constructed in Modules on Sites, Lemma 18.22 .3 and the uniqueness in Étale Cohomology, Theorem 49.41.5.

The problem is to glue the morphisms $f_{s}$ to a morphism of algebraic spaces. To do this first choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. This means that $h_{V} \rightarrow *$ is surjective and hence $g^{-1} h_{V} \rightarrow *$ is surjective too. This means there exists a scheme $U$ and a surjective étale morphism $U \rightarrow X$ and a morphism $s: h_{U} \rightarrow g^{-1} h_{V}$. Next, set $R=V \times_{Y} V$ and $R^{\prime}=U \times_{X} U$. Then we get $g^{-1} h_{R}=g^{-1} h_{V} \times g^{-1} h_{V}$ as $g^{-1}$ is exact. Thus $s$ induces a morphism $s \times s: h_{R^{\prime}} \rightarrow g^{-1} h_{R}$. Applying the constructions above we see that we get a commutative diagram of morphisms of schemes

Since we have $X=U / R^{\prime}$ and $Y=V / R$ (see Spaces, Lemma 52.9.1 we conclude that this diagram defines a morphism of algebraic spaces $f: X \rightarrow Y$ fitting into an obvious commutative diagram. Now we still have to show that $\left(f_{\text {small }}, f^{\sharp}\right)$ is 2 -isomorphic to $\left(g, g^{\sharp}\right)$. Let $t_{V}: f_{s, s m a l l}^{-1} \rightarrow g_{s}^{-1}$ and $t_{R}: f_{s \times s, s m a l l}^{-1} \rightarrow g_{s \times s}^{-1}$ be the

2-isomorphisms which are given to us by the construction above. Let $\mathcal{G}$ be a sheaf on $Y_{\text {étale }}$. Then we see that $t_{V}$ defines an isomorphism

$$
\left.f_{\text {small }}^{-1} \mathcal{G}\right|_{U_{\text {étale }}}=\left.\left.f_{s, \text { small }}^{-1} \mathcal{G}\right|_{V_{\text {étale }}} \xrightarrow{t_{V}} g_{s}^{-1} \mathcal{G}\right|_{V_{\text {étale }}}=\left.g^{-1} \mathcal{G}\right|_{U_{\text {étale }}}
$$

Moreover, this isomorphism pulled back to $R^{\prime}$ via either projection $R^{\prime} \rightarrow U$ is the isomorphism

$$
\left.f_{\text {small }}^{-1} \mathcal{G}\right|_{R_{\text {étale }}^{\prime}} ^{\prime}=\left.\left.f_{s \times s, \text { small }}^{-1} \mathcal{G}\right|_{R_{\text {étale }}} \xrightarrow{t_{R}} g_{s \times s}^{-1} \mathcal{G}\right|_{R_{\text {étale }}}=\left.g^{-1} \mathcal{G}\right|_{R_{\text {étale }}^{\prime}}
$$

Since $\{U \rightarrow X\}$ is a covering in the site $X_{\text {spaces,étale }}$ this means the first displayed isomorphism descends to an isomorphism $t: f_{\text {small }}^{-1} \mathcal{G} \rightarrow g^{-1} \mathcal{G}$ of sheaves (small detail omitted). The isomorphism is functorial in $\mathcal{G}$ since $t_{V}$ and $t_{R}$ are transformations of functors. Finally, $t$ is compatible with $f^{\sharp}$ and $g^{\sharp}$ as $t_{V}$ and $t_{R}$ are (some details omitted). This finishes the proof of the theorem.

05YZ Lemma 53.27.5. Let $X, Y$ be algebraic spaces over $Z$. If

$$
\left(g, g^{\sharp}\right):\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right) \longrightarrow\left(S h\left(Y_{\text {étale }}\right), \mathcal{O}_{Y}\right)
$$

is an isomorphism of ringed topoi, then there exists a unique morphism $f: X \rightarrow Y$ of algebraic spaces such that $\left(g, g^{\sharp}\right)$ is isomorphic to $\left(f_{\text {small }}, f^{\sharp}\right)$ and moreover $f$ is an isomorphism of algebraic spaces.

Proof. By Theorem 53.27.4 it suffices to show that $\left(g, g^{\sharp}\right)$ is a morphism of locally ringed topoi. By Modules on Sites, Lemma 18.39 .8 (and since the site $X_{\text {étale }}$ has enough points) it suffices to check that the map $\mathcal{O}_{Y, q} \rightarrow \mathcal{O}_{X, p}$ induced by $g^{\sharp}$ is a local ring map where $q=f \circ p$ and $p$ is any point of $X_{\text {étale }}$. As it is an isomorphism this is clear.

### 53.28. Quasi-coherent sheaves on algebraic spaces

03G5 In Descent, Section 34.7 we have seen that for a scheme $U$, there is no difference between a quasi-coherent $\mathcal{O}_{U}$-module on $U$, or a quasi-coherent $\mathcal{O}$-module on the small étale site of $U$. Hence the following definition is compatible with our original notion of a quasi-coherent sheaf on a scheme (Schemes, Section 25.24), when applied to a representable algebraic space.

03G9 Definition 53.28.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A quasi-coherent $\mathcal{O}_{X}$-module is a quasi-coherent module on the ringed site ( $X_{\text {étale }}, \mathcal{O}_{X}$ ) in the sense of Modules on Sites, Definition 18.23.1. The category of quasi-coherent sheaves on $X$ is denoted $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$.

Note that as being quasi-coherent is an intrinsic notion (see Modules on Sites, Lemma 18.23 .2 this is equivalent to saying that the corresponding $\mathcal{O}_{X}$-module on $X_{\text {spaces, étale }}$ is quasi-coherent.

As usual, quasi-coherent sheaves behave well with respect to pullback.
03GA Lemma 53.28.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The pullback functor $f^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ preserves quasicoherent sheaves.

Proof. This is a general fact, see Modules on Sites, Lemma 18.23.4.

Note that this pullback functor agrees with the usual pullback functor between quasi-coherent sheaves of modules if $X$ and $Y$ happen to be schemes, see Descent, Proposition 34.7.14. Here is the obligatory lemma comparing this with quasi-coherent sheaves on the objects of the small étale site of $X$.

03LZ Lemma 53.28.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ is given by the following data:
(1) for every $U \in \operatorname{Ob}\left(X_{\text {étale }}\right)$ a quasi-coherent $\mathcal{O}_{U}$-module $\mathcal{F}_{U}$ on $U_{\text {étale }}$,
(2) for every $f: U^{\prime} \rightarrow U$ in $X_{\text {étale }}$ an isomorphism $c_{f}: f_{\text {small }}^{*} \mathcal{F}_{U} \rightarrow \mathcal{F}_{U^{\prime}}$.

These data are subject to the condition that given any $f: U^{\prime} \rightarrow U$ and $g: U^{\prime \prime} \rightarrow U^{\prime}$ in $X_{\text {étale }}$ the composition $g_{\text {small }}^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$.
Proof. Combine Lemmas 53.28.2 and 53.25.3.
05VP Lemma 53.28.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in|X|$ be a point and let $\bar{x}$ be a geometric point lying over $x$. Finally, let $\varphi:(U, \bar{u}) \rightarrow(X, \bar{x})$ be an étale neighbourhood where $U$ is a scheme. Then

$$
\left(\varphi^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}}=\mathcal{F}_{\bar{x}}
$$

where $u \in U$ is the image of $\bar{u}$.
Proof. Note that $\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{U, u}^{s h}$ by Lemma 53.21 .1 hence the tensor product makes sense. Moreover, from Definition 53.18.6 it is clear that

$$
\mathcal{F}_{\bar{u}}=\operatorname{colim}\left(\varphi^{*} \mathcal{F}\right)_{u}
$$

where the colimit is over $\varphi:(U, \bar{u}) \rightarrow(X, \bar{x})$ as in the lemma. Hence there is a canonical map from left to right in the statement of the lemma. We have a similar colimit description for $\mathcal{O}_{X, \bar{x}}$ and by Lemma 53.28.3 we have

$$
\left(\left(\varphi^{\prime}\right)^{*} \mathcal{F}\right)_{u^{\prime}}=\left(\varphi^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{U^{\prime}, u^{\prime}}
$$

whenever $\left(U^{\prime}, \bar{u}^{\prime}\right) \rightarrow(U, \bar{u})$ is a morphism of étale neighbourhoods. To complete the proof we use that $\otimes$ commutes with colimits.

05VQ Lemma 53.28.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{Y}$-module. Let $\bar{x}$ be a geometric point of $X$ and let $\bar{y}=f \circ \bar{x}$ be the image in $Y$. Then there is a canonical isomorphism

$$
\left(f^{*} \mathcal{G}\right)_{\bar{x}}=\mathcal{G}_{\bar{y}} \otimes_{\mathcal{O}_{Y, \bar{y}}} \mathcal{O}_{X, \bar{x}}
$$

of the stalk of the pullback with the tensor product of the stalk with the local ring of $X$ at $\bar{x}$.

Proof. Since $f^{*} \mathcal{G}=f_{\text {small }}^{-1} \mathcal{G} \otimes_{f_{\text {small }}^{-1} \mathcal{O}_{Y}} \mathcal{O}_{X}$ this follows from the description of stalks of pullbacks in Lemma 53.18.9 and the fact that taking stalks commutes with tensor products. A more direct way to see this is as follows. Choose a commutative diagram

where $U$ and $V$ are schemes, and $p$ and $q$ are surjective étale. By Lemma 53.18.4 we can choose a geometric point $\bar{u}$ of $U$ such that $\bar{x}=p \circ \bar{u}$. Set $\bar{v}=\alpha \circ \bar{u}$. Then we see that

$$
\begin{aligned}
\left(f^{*} \mathcal{G}\right)_{\bar{x}} & =\left(p^{*} f^{*} \mathcal{G}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}} \\
& =\left(\alpha^{*} q^{*} \mathcal{G}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}} \\
& =\left(q^{*} \mathcal{G}\right)_{v} \otimes_{\mathcal{O}_{V, v}} \mathcal{O}_{U, u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}} \\
& =\left(q^{*} \mathcal{G}\right)_{v} \otimes_{\mathcal{O}_{V, v}} \mathcal{O}_{X, \bar{x}} \\
& =\left(q^{*} \mathcal{G}\right)_{v} \otimes_{\mathcal{O}_{V, v}} \mathcal{O}_{Y, \bar{y}} \otimes_{\mathcal{O}_{Y, \bar{y}}} \mathcal{O}_{X, \bar{x}} \\
& =\mathcal{G}_{\bar{y}} \otimes_{\mathcal{O}_{Y, \bar{y}}} \mathcal{O}_{X, \bar{x}}
\end{aligned}
$$

Here we have used Lemma 53.28 .4 (twice) and the corresponding result for pullbacks of quasi-coherent sheaves on schemes, see Sheaves, Lemma 6.26.4.

03M0 Lemma 53.28.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. The following are equivalent
(1) $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module,
(2) there exists an étale morphism $f: Y \rightarrow X$ of algebraic spaces over $S$ with $|f|:|Y| \rightarrow|X|$ surjective such that $f^{*} \mathcal{F}$ is quasi-coherent on $Y$,
(3) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that $\varphi^{*} \mathcal{F}$ is a quasi-coherent $\mathcal{O}_{U}$-module, and
(4) for every affine scheme $U$ and étale morphism $\varphi: U \rightarrow X$ the restriction $\varphi^{*} \mathcal{F}$ is a quasi-coherent $\mathcal{O}_{U}$-module.
Proof. It is clear that (1) implies (2) by considering $\operatorname{id}_{X}$. Assume $f: Y \rightarrow X$ is as in (2), and let $V \rightarrow Y$ be a surjective étale morphism from a scheme towards $Y$. Then the composition $V \rightarrow X$ is surjective étale as well and by Lemma 53.28.2 the pullback of $\mathcal{F}$ to $V$ is quasi-coherent as well. Hence we see that (2) implies (3).
Let $U \rightarrow X$ be as in (3). Let us use the abuse of notation introduced in Equation (53.25.1.1). As $\left.\mathcal{F}\right|_{U_{\text {étale }}}$ is quasi-coherent there exists an étale covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\mathcal{F}\right|_{U_{i, \text { étale }}}$ has a global presentation, see Modules on Sites, Definition 18.17.1 and Lemma 18.23.3. Let $V \rightarrow X$ be an object of $X_{\text {étale. }}$. Since $U \rightarrow X$ is surjective and étale, the family of maps $\left\{U_{i} \times_{X} V \rightarrow V\right\}$ is an étale covering of $V$. Via the morphisms $U_{i} \times_{x} V \rightarrow U_{i}$ we can restrict the global presentations of $\left.\mathcal{F}\right|_{U_{i, \text { étale }}}$ to get a global presentation of $\left.\mathcal{F}\right|_{\left(U_{i} \times{ }_{X} V\right)_{\text {étale }}}$ Hence the sheaf $\mathcal{F}$ on $X_{\text {étale }}$ satisfies the condition of Modules on Sites, Definition 18.23.1 and hence is quasi-coherent.
The equivalence of (3) and (4) comes from the fact that any scheme has an affine open covering.
03M1 Lemma 53.28.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ of quasi-coherent sheaves on $X$ has the following properties:
(1) Any direct sum of quasi-coherent sheaves is quasi-coherent.
(2) Any colimit of quasi-coherent sheaves is quasi-coherent.
(3) The kernel and cokernel of a morphism of quasi-coherent sheaves is quasicoherent.
(4) Given a short exact sequence of $\mathcal{O}_{X}$-modules $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ if two out of three are quasi-coherent so is the third.
(5) Given two quasi-coherent $\mathcal{O}_{X}$-modules the tensor product is quasi-coherent.
(6) Given two quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{F}, \mathcal{G}$ such that $\mathcal{F}$ is of finite presentation (see Section 53.29), then the internal hom $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is quasicoherent.

Proof. Note that we have the corresponding result for quasi-coherent modules on schemes, see Schemes, Section 25.24 . We will reduce the lemma to this case by étale localization. Choose a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. In order to formulate this proof correctly, we temporarily go back to making the (pedantic) distinction between a quasi-coherent sheaf $\mathcal{G}$ on the scheme $U$ and the associated quasi-coherent sheaf $\mathcal{G}^{a}$ (see Descent, Definition 34.7.2) on $U_{\text {étale }}$ We have a commutative diagram

The bottom horizontal arrow is the restriction functor 53.25.1.1) $\left.\mathcal{G} \mapsto \mathcal{G}\right|_{U_{\text {étale }}}$. This functor has both a left adjoint and a right adjoint, see Modules on Sites, Section 18.19, hence commutes with all limits and colimits. Moreover, we know that an object of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ if and only if its restriction to $U$ is in $Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)$, see Lemma 53.28 .6 Let $\mathcal{F}_{i}$ be a family of quasi-coherent $\mathcal{O}_{X^{-}}$ modules. Then $\bigoplus \mathcal{F}_{i}$ is an $\mathcal{O}_{X}$-module whose restriction to $U$ is the direct sum of the restrictions. Let $\mathcal{G}_{i}$ be a quasi-coherent sheaf on $U$ with $\left.\mathcal{F}_{i}\right|_{U_{\text {étale }}}=\mathcal{G}_{i}^{a}$. Combining the above with Descent, Lemma 34.7.13 we see that

$$
\left.\left(\bigoplus \mathcal{F}_{i}\right)\right|_{U_{\text {étale }}}=\left.\bigoplus \mathcal{F}_{i}\right|_{U_{\text {étale }}}=\bigoplus \mathcal{G}_{i}^{a}=\left(\bigoplus \mathcal{G}_{i}\right)^{a}
$$

hence $\bigoplus \mathcal{F}_{i}$ is quasi-coherent and (1) follows. The other statements are proved just so (using the same references).

It is in general not the case that the pushforward of a quasi-coherent sheaf along a morphism of algebraic spaces is quasi-coherent. We will return to this issue in Morphisms of Spaces, Section 54.11.

### 53.29. Properties of modules

05VR In Modules on Sites, Sections 18.17, 18.23, and Definition 18.28.1 we have defined a number of intrinsic properties of modules of $\mathcal{O}$-module on any ringed topos. If $X$ is an algebraic space, we will apply these notions freely to modules on the ringed site $\left(X_{\text {étale }}, \mathcal{O}_{X}\right)$, or equivalently on the ringed site $\left(X_{\text {spaces,étale }}, \mathcal{O}_{X}\right)$.
Global properties $\mathcal{P}$ :
(a) free,
(b) finite free,
(c) generated by global sections,
(d) generated by finitely many global sections,
(e) having a global presentation, and
(f) having a global finite presentation.

Local properties $\mathcal{P}$ :
(g) locally free,
(f) finite locally free,
(h) locally generated by sections,
(i) locally generated by $r$ sections,
(j) finite type,
(k) quasi-coherent (see Section 53.28),
(l) of finite presentation,
(m) coherent, and
(n) flat.

Here are some results which follow immediately from the definitions:
(1) In each case, except for $\mathcal{P}=$ "coherent", the property is preserved under pullback, see Modules on Sites, Lemmas 18.17.2, 18.23.4 and 18.38 .3 .
(2) Each of the properties above (including coherent) are preserved under pullbacks by étale morphisms of algebraic spaces (because in this case pullback is given by restriction, see Lemma 53.17.10).
(3) Assume $f: Y \rightarrow X$ is a surjective étale morphism of algebraic spaces. For each of the local properties $(\mathrm{g})-(\mathrm{m})$, the fact that $f^{*} \mathcal{F}$ has $\mathcal{P}$ implies that $\mathcal{F}$ has $\mathcal{P}$. This follows as $\{Y \rightarrow X\}$ is a covering in $X_{\text {spaces,étale }}$ and Modules on Sites, Lemma 18.23.3.
(4) If $X$ is a scheme, $\mathcal{F}$ is a quasi-coherent module on $X_{\text {étale }}$, and $\mathcal{P}$ any property except "coherent" or "locally free", then $\mathcal{P}$ for $\mathcal{F}$ on $X_{\text {étale }}$ is equivalent to the corresponding property for $\left.\mathcal{F}\right|_{X_{Z_{a r}}}$, i.e., it corresponds to $\mathcal{P}$ for $\mathcal{F}$ when we think of it as a quasi-coherent sheaf on the scheme $X$. See Descent, Lemma 34.7.12.
(5) If $X$ is a locally Noetherian scheme, $\mathcal{F}$ is a quasi-coherent module on $X_{\text {étale }}$, then $\mathcal{F}$ is coherent on $X_{\text {étale }}$ if and only if $\left.\mathcal{F}\right|_{X_{Z a r}}$ is coherent, i.e., it corresponds to the usual notion of a coherent sheaf on the scheme $X$ being coherent. See Descent, Lemma 34.7.12.

### 53.30. Locally projective modules

060P Recall that in Properties, Section 27.21 we defined the notion of a locally projective quasi-coherent module.

060Q Lemma 53.30.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) for some scheme $U$ and surjective étale morphism $U \rightarrow X$ the restriction $\left.\mathcal{F}\right|_{U}$ is locally projective on $U$, and
(2) for any scheme $U$ and any étale morphism $U \rightarrow X$ the restriction $\left.\mathcal{F}\right|_{U}$ is locally projective on $U$.
Proof. Let $U \rightarrow X$ be as in (1) and let $V \rightarrow X$ be étale where $V$ is a scheme. Then $\left\{U \times_{X} V \rightarrow V\right\}$ is an fppf covering of schemes. Hence if $\left.\mathcal{F}\right|_{U}$ is locally projective, then $\left.\mathcal{F}\right|_{U \times_{X} V}$ is locally projective (see Properties, Lemma 27.21.3) and hence $\left.\mathcal{F}\right|_{V}$ is locally projective, see Descent, Lemma 34.6.7.

060R Definition 53.30.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. We say $\mathcal{F}$ is locally projective if the equivalent conditions of Lemma 53.30.1 are satisfied.
060S Lemma 53.30.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{Y}$-module. If $\mathcal{G}$ is locally projective on $Y$, then $f^{*} \mathcal{G}$ is locally projective on $X$.

Proof. Choose a surjective étale morphism $V \rightarrow Y$ with $V$ a scheme. Choose a surjective étale morphism $U \rightarrow V \times_{Y} X$ with $U$ a scheme. Denote $\psi: U \rightarrow V$ the induced morphism. Then

$$
\left.f^{*} \mathcal{G}\right|_{U}=\psi^{*}\left(\left.\mathcal{G}\right|_{V}\right)
$$

Hence the lemma follows from the definition and the result in the case of schemes, see Properties, Lemma 27.21.3.

### 53.31. Quasi-coherent sheaves and presentations

03M2 Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $X=U / R$ be a presentation of $X$ coming from any surjective étale morphism $\varphi: U \rightarrow X$, see Spaces, Definition 52.9.3. In particular, we obtain a groupoid ( $U, R, s, t, c$ ), such that $j=(t, s): R \rightarrow U \times{ }_{S} U$, see Groupoids, Lemma 38.13.3. In Groupoids, Definition 38.14.1 we have the defined the notion of a quasi-coherent sheaf on an arbitrary groupoid. With these notions in place we have the following observation.

03M3 Proposition 53.31.1. With $S, \varphi: U \rightarrow X$, and $(U, R, s, t, c)$ as above. For any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the sheaf $\varphi^{*} \mathcal{F}$ comes equipped with a canonical isomorphism

$$
\alpha: t^{*} \varphi^{*} \mathcal{F} \longrightarrow s^{*} \varphi^{*} \mathcal{F}
$$

which satisfies the conditions of Groupoids, Definition 38.14.1 and therefore defines a quasi-coherent sheaf on $(U, R, s, t, c)$. The functor $\mathcal{F} \mapsto\left(\varphi^{*} \mathcal{F}, \alpha\right)$ defines an equivalence of categories

$$
\begin{gathered}
\text { Quasi-coherent } \\
\mathcal{O}_{X} \text {-modules }
\end{gathered} \longleftrightarrow \begin{gathered}
\text { Quasi-coherent modules } \\
\text { on }(U, R, s, t, c)
\end{gathered}
$$

Proof. In the statement of the proposition, and in this proof we think of a quasicoherent sheaf on a scheme as a quasi-coherent sheaf on the small étale site of that scheme. This is permissible by the results of Descent, Section 34.7.
The existence of $\alpha$ comes from the fact that $\varphi \circ t=\varphi \circ s$ and that pullback is functorial in the morphism, see discussion surrounding Equation 53.25.0.1). In exactly the same way, i.e., by functoriality of pullback, we see that the isomorphism $\alpha$ satisfies condition (1) of Groupoids, Definition 38.14.1. To see condition (2) of the definition it suffices to see that $\alpha$ is an isomorphism which is clear. The construction $\mathcal{F} \mapsto\left(\varphi^{*} \mathcal{F}, \alpha\right)$ is clearly functorial in the quasi-coherent sheaf $\mathcal{F}$. Hence we obtain the functor from left to right in the displayed formula of the lemma.
Conversely, suppose that $(\mathcal{F}, \alpha)$ is a quasi-coherent sheaf on $(U, R, s, t, c)$. Let $V \rightarrow X$ be an object of $X_{\text {étale }}$. In this case the morphism $V^{\prime}=U \times_{X} V \rightarrow V$ is a surjective étale morphism of schemes, and hence $\left\{V^{\prime} \rightarrow V\right\}$ is an étale covering of $V$. Moreover, the quasi-coherent sheaf $\mathcal{F}$ pulls back to a quasi-coherent sheaf $\mathcal{F}^{\prime}$ on $V^{\prime}$. Since $R=U \times_{X} U$ with $t=\operatorname{pr}_{0}$ and $s=\operatorname{pr}_{0}$ we see that $V^{\prime} \times_{V} V^{\prime}=R \times_{X} V$ with projection maps $V^{\prime} \times_{V} V^{\prime} \rightarrow V^{\prime}$ equal to the pullbacks of $t$ and $s$. Hence $\alpha$ pulls back to an isomorphism $\alpha^{\prime}: \operatorname{pr}_{0}^{*} \mathcal{F}^{\prime} \rightarrow \operatorname{pr}_{1}^{*} \mathcal{F}^{\prime}$, and the pair $\left(\mathcal{F}^{\prime}, \alpha^{\prime}\right)$ is a descend datum for quasi-coherent sheaves with respect to $\left\{V^{\prime} \rightarrow V\right\}$. By Descent, Proposition 34.5.2 this descent datum is effective, and we obtain a quasi-coherent $\mathcal{O}_{V}$-module $\mathcal{F}_{V}$ on $V_{\text {étale }}$. To see that this gives a quasi-coherent sheaf on $X_{\text {étale }}$ we have to show (by Lemma 53.28.3 that for any morphism $f: V_{1} \rightarrow V_{2}$ in $X_{\text {étale }}$ there is a canonical isomorphism $c_{f}: \mathcal{F}_{V_{1}} \rightarrow \mathcal{F}_{V_{2}}$ compatible with compositions of morphisms. We omit the verification. We also omit the verification that this
defines a functor from the category on the right to the category on the left which is inverse to the functor described above.

077V Proposition 53.31.2. Let $S$ be a scheme Let $X$ be an algebraic space over $S$.
(1) The category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category. Consequently, $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ has enough injectives and all limits.
(2) The inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ has a right adjoin $7^{7}$

$$
Q: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

such that for every quasi-coherent sheaf $\mathcal{F}$ the adjunction mapping $Q(\mathcal{F}) \rightarrow$ $\mathcal{F}$ is an isomorphism.
Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 27.23.4. We advise the reader to read that proof first.
Part (1) means $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Lemma 53.28.7 colimits in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ exist and agree with colimits in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. By Modules on Sites, Lemma 18.14 .2 filtered colimits are exact. Hence (a) and (b) hold.

To construct a generator, choose a presentation $X=U / R$ so that $(U, R, s, t, c)$ is an étale groupoid scheme and in particular $s$ and $t$ are flat morphisms of schemes. Pick a cardinal $\kappa$ as in Groupoids, Lemma 38.15.6. Pick a collection $\left(\mathcal{E}_{t}, \alpha_{t}\right)_{t \in T}$ of $\kappa$ generated quasi-coherent modules on $(U, R, s, t, c)$ as in Groupoids, Lemma 38.15.5. Let $\mathcal{F}_{t}$ be the quasi-coherent module on $X$ which corresponds to the quasi-coherent module $\left(\mathcal{E}_{t}, \alpha_{t}\right)$ via the equivalence of categories of Proposition 53.31.1. Then we see that every quasi-coherent module $\mathcal{H}$ is the directed colimit of its quasi-coherent submodules which are isomorphic to one of the $\mathcal{F}_{t}$. Thus $\bigoplus_{t} \mathcal{F}_{t}$ is a generator of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ and we conclude that (c) holds. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11.6 and Lemma 19.13.2.

Proof of (2). To construct $Q$ we use the following general procedure. Given an object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ we consider the functor

$$
Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)^{\text {opp }} \longrightarrow \text { Sets, } \quad \mathcal{G} \longmapsto \operatorname{Hom}_{X}(\mathcal{G}, \mathcal{F})
$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\operatorname{Hom}_{X}(\mathcal{G}, \mathcal{F})=\operatorname{Hom}_{X}(\mathcal{G}, Q(\mathcal{F}))$ for $\mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. By the Yoneda lemma (Categories, Lemma 4.3.5 the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in $\mathcal{F}$. By construction $Q$ is a right adjoint to the inclusion functor. The fact that $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when $\mathcal{F}$ is quasi-coherent is a formal consequence of the fact that the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is fully faithful.

### 53.32. Morphisms towards schemes

05Z0 Here is the analogue of Schemes, Lemma 25.6.4
05Z1 Lemma 53.32.1. Let $X$ be an algebraic space over $\mathbf{Z}$. Let $T$ be an affine scheme. The map

$$
\operatorname{Mor}(X, T) \longrightarrow \operatorname{Hom}\left(\Gamma\left(T, \mathcal{O}_{T}\right), \Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

which maps $f$ to $f^{\sharp}$ (on global sections) is bijective.

[^159]Proof. We construct the inverse of the map. Let $\varphi: \Gamma\left(T, \mathcal{O}_{T}\right) \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$ be a ring map. Choose a presentation $X=U / R$, see Spaces, Definition 52.9.3. By Schemes, Lemma 25.6.4 the composition

$$
\Gamma\left(T, \mathcal{O}_{T}\right) \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)
$$

corresponds to a unique morphism of schemes $g: U \rightarrow T$. By the same lemma the two compositions $R \rightarrow U \rightarrow T$ are equal. Hence we obtain a morphism $f: X=$ $U / R \rightarrow T$ such that $U \rightarrow X \rightarrow T$ equals $g$. By construction the diagram

commutes. Hence $f^{\sharp}$ equals $\varphi$ because $U \rightarrow X$ is an étale covering and $\mathcal{O}_{X}$ is a sheaf on $X_{\text {étale }}$. The uniqueness of $f$ follows from the uniqueness of $g$.

### 53.33. Quotients by free actions

071R Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $G$ be an abstract group. Let $a: G \rightarrow \operatorname{Aut}(X)$ be a homomorphism, i.e., $a$ is an action of $G$ on $X$. We will say the action is free if for every scheme $T$ over $S$ the map

$$
G \times X(T) \longrightarrow X(T)
$$

is free. (We cannot use a criterion as in Spaces, Lemma 52.14 .3 because points may not have well defined residue fields.) In case the action is free we're going to construct the quotient $X / G$ as an algebraic space. This is a special case of the general Bootstrap, Lemma 67.11.7 that we will prove later.

071S Lemma 53.33.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $G$ be an abstract group with a free action on $X$. Then the quotient sheaf $X / G$ is an algebraic space.

Proof. The statement means that the sheaf $F$ associated to the presheaf

$$
T \longmapsto X(T) / G
$$

is an algebraic space. To see this we will construct a presentation. Namely, choose a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. Set $V=\coprod_{g \in G} U$ and set $\psi: V \rightarrow X$ equal to $a(g) \circ \varphi$ on the component corresponding to $g \in G$. Let $G$ act on $V$ by permuting the components, i.e., $g_{0} \in G$ maps the component corresponding to $g$ to the component corresponding to $g_{0} g$ via the identity morphism of $U$. Then $\psi$ is a $G$-equivariant morphism, i.e., we reduce to the case dealt with in the next paragraph.
Assume that there exists a $G$-action on $U$ and that $U \rightarrow X$ is surjective, étale and $G$-equivariant. In this case there is an induced action of $G$ on $R=U \times{ }_{X} U$ compatible with the projection mappings $t, s: R \rightarrow U$. Now we claim that

$$
X / G=U / \coprod_{g \in G} R
$$

where the map

$$
j: \coprod_{g \in G} R \longrightarrow U \times_{S} U
$$

is given by $(r, g) \mapsto(t(r), g(s(r)))$. Note that $j$ is a monomorphism: If $(t(r), g(s(r)))=$ $\left(t\left(r^{\prime}\right), g^{\prime}\left(s\left(r^{\prime}\right)\right)\right.$, then $t(r)=t\left(r^{\prime}\right)$, hence $r$ and $r^{\prime}$ have the same image in $X$ under both $s$ and $t$, hence $g=g^{\prime}$ (as $G$ acts freely on $X$ ), hence $s(r)=s\left(r^{\prime}\right)$, hence $r=r^{\prime}$ (as $R$ is an equivalence relation on $U$ ). Moreover $j$ is an equivalence relation (details omitted). Both projections $\coprod_{g \in G} R \rightarrow U$ are étale, as $s$ and $t$ are étale. Thus $j$ is an étale equivalence relation and $U / \coprod_{g \in G} R$ is an algebraic space by Spaces, Theorem 52.10.5. There is a map

$$
U / \coprod_{g \in G} R \longrightarrow X / G
$$

induced by the map $U \rightarrow X$. We omit the proof that it is an isomorphism of sheaves.

# Morphisms of Algebraic Spaces 

03H8

### 54.1. Introduction

03H9 In this chapter we introduce some types of morphisms of algebraic spaces. A reference is Knu71.
The goal is to extend the definition of each of the types of morphisms of schemes defined in the chapters on schemes, and on morphisms of schemes to the category of algebraic spaces. Each case is slightly different and it seems best to treat them all separately.

### 54.2. Conventions

040 V The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.

Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times{ }_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 54.3. Properties of representable morphisms

03HA Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces. In Spaces, Section 52.5 we defined what it means for $f$ to have property $\mathcal{P}$ in case $\mathcal{P}$ is a property of morphisms of schemes which
(1) is preserved under any base change, see Schemes, Definition 25.18.3, and
(2) is fppf local on the base, see Descent, Definition 34.18.1.

Namely, in this case we say $f$ has property $\mathcal{P}$ if and only if for every scheme $U$ and any morphism $U \rightarrow Y$ the morphism of schemes $X \times_{Y} U \rightarrow U$ has property $\mathcal{P}$.

According to the lists in Spaces, Section 52.4 this applies to the following properties: (1)(a) closed immersions, (1)(b) open immersions, (1)(c) quasi-compact immersions, (2) quasi-compact, (3) universally-closed, (4) (quasi-)separated, (5) monomorphism, (6) surjective, (7) universally injective, (8) affine, (9) quasi-affine, (10) (locally) of finite type, (11) (locally) quasi-finite, (12) (locally) of finite presentation, (13) locally of finite type of relative dimension $d$, (14) universally open, (15) flat, (16) syntomic, (17) smooth, (18) unramified (resp. G-unramified), (19) étale, (20) proper, (21) finite or integral, (22) finite locally free, and (23) immersion.

In this chapter we will redefine these notions for not necessarily representable morphisms of algebraic spaces. Whenever we do this we will make sure that the new definition agrees with the old one, in order to avoid ambiguity.
Note that the definition above applies whenever $X$ is a scheme, since a morphism from a scheme to an algebraic space is representable. And in particular it applies when both $X$ and $Y$ are schemes. In Spaces, Lemma 52.5.3 we have seen that in this case the definitions match, and no ambiguity arise.

Furthermore, in Spaces, Lemma 52.5.5 we have seen that the property of representable morphisms of algebraic spaces so defined is stable under arbitrary base change by a morphism of algebraic spaces. And finally, in Spaces, Lemmas 52.5.4 and 52.5.7 we have seen that if $\mathcal{P}$ is stable under compositions, which holds for the properties $(1)(a),(1)(b),(1)(c),(2)-(23)$, except (13) above, then taking products of representable morphisms preserves property $\mathcal{P}$ and compositions of representable morphisms preserves property $\mathcal{P}$.

We will use these facts below, and whenever we do we will simply refer to this section as a reference.

### 54.4. Separation axioms

03 HJ It makes sense to list some a priori properties of the diagonal of a morphism of algebraic spaces.

03HK Lemma 54.4.1. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ be the diagonal morphism. Then
(1) $\Delta_{X / Y}$ is representable,
(2) $\Delta_{X / Y}$ is locally of finite type,
(3) $\Delta_{X / Y}$ is a monomorphism,
(4) $\Delta_{X / Y}$ is separated, and
(5) $\Delta_{X / Y}$ is locally quasi-finite.

Proof. We are going to use the fact that $\Delta_{X / S}$ is representable (by definition of an algebraic space) and that it satisfies properties (2) - (5), see Spaces, Lemma 52.13.1 Note that we have a factorization

$$
X \longrightarrow X \times_{Y} X \longrightarrow X \times_{S} X
$$

of the diagonal $\Delta_{X / S}: X \rightarrow X \times{ }_{S} X$. Since $X \times_{Y} X \rightarrow X \times{ }_{S} X$ is a monomorphism, and since $\Delta_{X / S}$ is representable, it follows formally that $\Delta_{X / Y}$ is representable. In particular, the rest of the statements now make sense, see Section 54.3.

Choose a surjective étale morphism $U \rightarrow X$, with $U$ a scheme. Consider the diagram

Both squares are cartesian, hence so is the outer rectangle. The top row consists of schemes, and the vertical arrows are surjective étale morphisms. By Spaces, Lemma 52.11 .4 the properties (2) - (5) for $\Delta_{X / Y}$ are equivalent to those of $R \rightarrow U \times_{Y} U$. In
the proof of Spaces, Lemma 52.13.1 we have seen that $R \rightarrow U \times{ }_{S} U$ has properties (2) - (5). The morphism $U \times_{Y} U \rightarrow U \times_{S} U$ is a monomorphism of schemes. These facts imply that $R \rightarrow U \times_{Y} U$ have properties (2) - (5).
Namely: For (3), note that $R \rightarrow U \times_{Y} U$ is a monomorphism as the composition $R \rightarrow U \times{ }_{S} U$ is a monomorphism. For (2), note that $R \rightarrow U \times_{Y} U$ is locally of finite type, as the composition $R \rightarrow U \times_{S} U$ is locally of finite type (Morphisms, Lemma 28.15 .8 . A monomorphism which is locally of finite type is locally quasi-finite because it has finite fibres (Morphisms, Lemma 28.20.7), hence (5). A monomorphism is separated (Schemes, Lemma 25.23.3), hence (4).

03HL Definition 54.4.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ be the diagonal morphism.
(1) We say $f$ is separated if $\Delta_{X / Y}$ is a closed immersion.
(2) We say $f$ is locally separated ${ }^{11}$ if $\Delta_{X / Y}$ is an immersion.
(3) We say $f$ is quasi-separated if $\Delta_{X / Y}$ is quasi-compact.

This definition makes sense since $\Delta_{X / Y}$ is representable, and hence we know what it means for it to have one of the properties described in the definition. We will see below (Lemma 54.4.13) that this definition matches the ones we already have for morphisms of schemes and representable morphisms.

03KK Lemma 54.4.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is separated, then $f$ is locally separated and $f$ is quasi-separated.
Proof. This is true, via the general principle Spaces, Lemma 52.5.8, because a closed immersion of schemes is an immersion and is quasi-compact.

03KL Lemma 54.4.4. All of the separation axioms listed in Definition 54.4.2 are stable under base change.

Proof. Let $f: X \rightarrow Y$ and $Y^{\prime} \rightarrow Y$ be morphisms of algebraic spaces. Let $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ be the base change of $f$ by $Y^{\prime} \rightarrow Y$. Then $\Delta_{X^{\prime} / Y^{\prime}}$ is the base change of $\Delta_{X / Y}$ by the morphism $X^{\prime} \times_{Y^{\prime}} X^{\prime} \rightarrow X \times_{Y} X$. By the results of Section 54.3 each of the properties of the diagonal used in Definition 54.4.2 is stable under base change. Hence the lemma is true.
03KN Lemma 54.4.5. Let $S$ be a scheme. Let $f: X \rightarrow Z, g: Y \rightarrow Z$ and $Z \rightarrow T$ be morphisms of algebraic spaces over $S$. Consider the induced morphism $i: X \times{ }_{Z} Y \rightarrow$ $X \times_{T} Y$. Then
(1) $i$ is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,
(2) if $Z \rightarrow T$ is locally separated, then $i$ is an immersion,
(3) if $Z \rightarrow T$ is separated, then $i$ is a closed immersion, and
(4) if $Z \rightarrow T$ is quasi-separated, then $i$ is quasi-compact.

Proof. By general category theory the following diagram

[^160]is a fibre product diagram. Hence $i$ is the base change of the diagonal morphism $\Delta_{Z / T}$. Thus the lemma follows from Lemma 54.4.1. and the material in Section 54.3

03KO Lemma 54.4.6. Let $S$ be a scheme. Let $T$ be an algebraic space over $S$. Let $g: X \rightarrow Y$ be a morphism of algebraic spaces over $T$. Consider the graph $i: X \rightarrow$ $X \times_{T} Y$ of $g$. Then
(1) $i$ is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,
(2) if $Y \rightarrow T$ is locally separated, then $i$ is an immersion,
(3) if $Y \rightarrow T$ is separated, then $i$ is a closed immersion, and
(4) if $Y \rightarrow T$ is quasi-separated, then $i$ is quasi-compact.

Proof. This is a special case of Lemma 54.4.5 applied to the morphism $X=$ $X \times_{Y} Y \rightarrow X \times_{T} Y$.

03KP Lemma 54.4.7. Let $S$ be a scheme. Let $f: X \rightarrow T$ be a morphism of algebraic spaces over $S$. Let $s: T \rightarrow X$ be a section of $f$ (in a formula $f \circ s=i d_{T}$ ). Then
(1) $s$ is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,
(2) if $f$ is locally separated, then $s$ is an immersion,
(3) if $f$ is separated, then $s$ is a closed immersion, and
(4) if $f$ is quasi-separated, then $s$ is quasi-compact.

Proof. This is a special case of Lemma 54.4.6 applied to $g=s$ so the morphism $i=s: T \rightarrow T \times_{T} X$.

03KQ Lemma 54.4.8. All of the separation axioms listed in Definition 54.4.2 are stable under composition of morphisms.

Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces to which the axiom in question applies. The diagonal $\Delta_{X / Z}$ is the composition

$$
X \longrightarrow X \times_{Y} X \longrightarrow X \times_{Z} X
$$

Our separation axiom is defined by requiring the diagonal to have some property $\mathcal{P}$. By Lemma 54.4 .5 above we see that the second arrow also has this property. Hence the lemma follows since the composition of (representable) morphisms with property $\mathcal{P}$ also is a morphism with property $\mathcal{P}$, see Section 54.3 .

04ZH Lemma 54.4.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) If $Y$ is separated and $f$ is separated, then $X$ is separated.
(2) If $Y$ is quasi-separated and $f$ is quasi-separated, then $X$ is quasi-separated.
(3) If $Y$ is locally separated and $f$ is locally separated, then $X$ is locally separated.
(4) If $Y$ is separated over $S$ and $f$ is separated, then $X$ is separated over $S$.
(5) If $Y$ is quasi-separated over $S$ and $f$ is quasi-separated, then $X$ is quasiseparated over $S$.
(6) If $Y$ is locally separated over $S$ and $f$ is locally separated, then $X$ is locally separated over $S$.

Proof. Parts (4), (5), and (6) follow immediately from Lemma 54.4.8 and Spaces, Definition 52.13.2. Parts (1), (2), and (3) reduce to parts (4), (5), and (6) by thinking of $X$ and $Y$ as algebraic spaces over $\operatorname{Spec}(\mathbf{Z})$, see Properties of Spaces, Definition 53.3.1.

03KR Lemma 54.4.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$.
(1) If $g \circ f$ is separated then so is $f$.
(2) If $g \circ f$ is locally separated then so is $f$.
(3) If $g \circ f$ is quasi-separated then so is $f$.

Proof. Consider the factorization

$$
X \rightarrow X \times_{Y} X \rightarrow X \times_{Z} X
$$

of the diagonal morphism of $g \circ f$. In any case the last morphism is a monomorphism. Hence for any scheme $T$ and morphism $T \rightarrow X \times_{Y} X$ we have the equality

$$
X \times_{\left(X \times_{Y} X\right)} T=X \times_{\left(X \times_{Z} X\right)} T
$$

Hence the result is clear.
04ZI Lemma 54.4.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X$ is separated then $X$ is separated over $S$.
(2) If $X$ is locally separated then $X$ is locally separated over $S$.
(3) If $X$ is quasi-separated then $X$ is quasi-separated over $S$.

Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(4) If $X$ is separated over $S$ then $f$ is separated.
(5) If $X$ is locally separated over $S$ then $f$ is locally separated.
(6) If $X$ is quasi-separated over $S$ then $f$ is quasi-separated.

Proof. Parts (4), (5), and (6) follow immediately from Lemma 54.4.10 and Spaces, Definition 52.13.2. Parts (1), (2), and (3) follow from parts (4), (5), and (6) by thinking of $X$ and $Y$ as algebraic spaces over $\operatorname{Spec}(\mathbf{Z})$, see Properties of Spaces, Definition 53.3.1.

03KM Lemma 54.4.12. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{P}$ be any of the separation axioms of Definition 54.4.2. The following are equivalent
(1) $f$ is $\mathcal{P}$,
(2) for every scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is $\mathcal{P}$,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is $\mathcal{P}$,
(4) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the algebraic space $Z \times_{Y} X$ is $\mathcal{P}$ (see Properties of Spaces, Definition 53.3.1),
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_{Y} X \rightarrow V$ has $\mathcal{P}$, and
(6) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ has $\mathcal{P}$.

Proof. We will repeatedly use Lemma 54.4 .4 without further mention. In particular, it is clear that (1) implies (2) and (2) implies (3).

Let us prove that (3) and (4) are equivalent. Note that if $Z$ is an affine scheme, then the morphism $Z \rightarrow \operatorname{Spec}(\mathbf{Z})$ is a separated morphism as a morphism of algebraic spaces over $\operatorname{Spec}(\mathbf{Z})$. If $Z \times_{Y} X \rightarrow Z$ is $\mathcal{P}$, then $Z \times_{Y} X \rightarrow \operatorname{Spec}(\mathbf{Z})$ is $\mathcal{P}$ as a composition (see Lemma 54.4.8). Hence the algebraic space $Z \times_{Y} X$ is $\mathcal{P}$. Conversely, if the algebraic space $Z \times_{Y} X$ is $\mathcal{P}$, then $Z \times_{Y} X \rightarrow \operatorname{Spec}(\mathbf{Z})$ is $\mathcal{P}$, and hence by Lemma 54.4.10 we see that $Z \times_{Y} X \rightarrow Z$ is $\mathcal{P}$.

Let us prove that (3) implies (5). Assume (3). Let $V$ be a scheme and let $V \rightarrow Y$ be étale surjective. We have to show that $V \times_{Y} X \rightarrow V$ has property $\mathcal{P}$. In other words, we have to show that the morphism

$$
V \times_{Y} X \longrightarrow\left(V \times_{Y} X\right) \times_{V}\left(V \times_{Y} X\right)=V \times_{Y} X \times_{Y} X
$$

has the corresponding property (i.e., is a closed immersion, immersion, or quasicompact). Let $V=\bigcup V_{j}$ be an affine open covering of $V$. By assumption we know that each of the morphisms

$$
V_{j} \times_{Y} X \longrightarrow V_{j} \times_{Y} X \times_{Y} X
$$

does have the corresponding property. Since being a closed immersion, immersion, quasi-compact immersion, or quasi-compact is Zariski local on the target, and since the $V_{j}$ cover $V$ we get the desired conclusion.
Let us prove that (5) implies (1). Let $V \rightarrow Y$ be as in (5). Then we have the fibre product diagram

By assumption the left vertical arrow is a closed immersion, immersion, quasicompact immersion, or quasi-compact. It follows from Spaces, Lemma 52.5.6 that also the right vertical arrow is a closed immersion, immersion, quasi-compact immersion, or quasi-compact.

It is clear that (1) implies (6) by taking the covering $Y=Y$. Assume $Y=\bigcup Y_{i}$ is as in (6). Choose schemes $V_{i}$ and surjective étale morphisms $V_{i} \rightarrow Y_{i}$. Note that the morphisms $V_{i} \times_{Y} X \rightarrow V_{i}$ have $\mathcal{P}$ as they are base changes of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$. Set $V=\coprod V_{i}$. Then $V \rightarrow Y$ is a morphism as in (5) (details omitted). Hence (6) implies (5) and we are done.

03KY Lemma 54.4.13. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$.
(1) The morphism $f$ is locally separated.
(2) The morphism $f$ is (quasi-)separated in the sense of Definition 54.4.2 above if and only if $f$ is (quasi-) separated in the sense of Section54.3.
In particular, if $f: X \rightarrow Y$ is a morphism of schemes over $S$, then $f$ is (quasi)separated in the sense of Definition 54.4.2 if and only if $f$ is (quasi-) separated as a morphism of schemes.

Proof. This is the equivalence of (1) and (2) of Lemma 54.4 .12 combined with the fact that any morphism of schemes is locally separated, see Schemes, Lemma 25.21 .2 .

### 54.5. Surjective morphisms

03 MC We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be surjective.

03MD Lemma 54.5.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is surjective if and only if $|f|:|X| \rightarrow|Y|$ is surjective.

Proof. Namely, if $f: X \rightarrow Y$ is representable, then it is surjective if and only if for every scheme $T$ and every morphism $T \rightarrow Y$ the base change $f_{T}: T \times_{Y} X \rightarrow T$ of $f$ is a surjective morphism of schemes, in other words, if and only if $\left|f_{T}\right|$ is surjective. By Properties of Spaces, Lemma 53.4 .3 the map $\left|T \times_{Y} X\right| \rightarrow|T| \times_{|Y|}|X|$ is always surjective. Hence $\left|f_{T}\right|:\left|T \times_{Y} X\right| \rightarrow|T|$ is surjective if $|f|:|X| \rightarrow|Y|$ is surjective. Conversely, if $\left|f_{T}\right|$ is surjective for every $T \rightarrow Y$ as above, then by taking $T$ to be the spectrum of a field we conclude that $|X| \rightarrow|Y|$ is surjective.

This clears the way for the following definition.
03ME Definition 54.5.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is surjective if the map $|f|:|X| \rightarrow|Y|$ of associated topological spaces is surjective.

03MF Lemma 54.5.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is surjective,
(2) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times{ }_{Y} X \rightarrow Z$ is surjective,
(3) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is surjective,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a surjective morphism,
(5) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is surjective,
(6) there exists a commutative diagram

where $U, V$ are schemes and the vertical arrows are surjective étale such that the top horizontal arrow is surjective, and
(7) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is surjective.
Proof. Omitted.
03MG Lemma 54.5.4. The composition of surjective morphisms is surjective.

Proof. This is immediate from the definition.
03MH Lemma 54.5.5. The base change of a surjective morphism is surjective.
Proof. Follows immediately from Properties of Spaces, Lemma 53.4.3.

### 54.6. Open morphisms

03 Z 0 For a representable morphism of algebraic spaces we have already defined (in Section 54.3 what it means to be universally open. Hence before we give the natural definition we check that it agrees with this in the representable case.

03Z1 Lemma 54.6.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is universally open, and
(2) for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces $\left|Z \times_{Y} X\right| \rightarrow|Z|$ is open.

Proof. Assume (1), and let $Z \rightarrow Y$ be as in (2). Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. By assumption the morphism of schemes $V \times_{Y} X \rightarrow V$ is universally open. By Properties of Spaces, Section 53.4 in the commutative diagram

the horizontal arrows are open and surjective, and moreover

$$
\left|V \times_{Y} X\right| \longrightarrow|V| \times_{|Z|}\left|Z \times_{Y} X\right|
$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication $(2) \Rightarrow(1)$ is immediate from the definitions.

Thus we may use the following natural definition.
03Z2 Definition 54.6.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is open if the map of topological spaces $|f|:|X| \rightarrow|Y|$ is open.
(2) We say $f$ is universally open if for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces

$$
\left|Z \times_{Y} X\right| \rightarrow|Z|
$$

is open, i.e., the base change $Z \times_{Y} X \rightarrow Z$ is open.
Note that an étale morphism of algebraic spaces is universally open, see Properties of Spaces, Definition 53.15 .2 and Lemmas 53.15.7 and 53.15.5.
$03 Z 3$ Lemma 54.6.3. The base change of a universally open morphism of algebraic spaces by any morphism of algebraic spaces is universally open.

Proof. This is immediate from the definition.
03Z4 Lemma 54.6.4. The composition of a pair of (universally) open morphisms of algebraic spaces is (universally) open.

Proof. Omitted.
03Z5 Lemma 54.6.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is universally open,
(2) for every scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $\left|Z \times_{Y} X\right| \rightarrow$ $|Z|$ is open,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $\left|Z \times_{Y} X\right| \rightarrow|Z|$ is open, and
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a universally open morphism of algebraic spaces, and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is universally open.

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).
Assume (3). Choose a surjective étale morphism $V \rightarrow Y$. We are going to show that $V \times_{Y} X \rightarrow V$ is a universally open morphism of algebraic spaces. Let $Z \rightarrow V$ be a morphism from an algebraic space to $V$. Let $W \rightarrow Z$ be a surjective étale morphism where $W=\coprod W_{i}$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 53.6.1. Then we have the following commutative diagram

We have to show the south-east arrow is open. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 53.15.7. By assumption (3), and the fact that $W_{i}$ is affine we see that the left vertical arrows are open. Hence it follows that the right vertical arrow is open.
Assume $V \rightarrow Y$ is as in (4). We will show that $f$ is universally open. Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Consider the diagram

The south-west arrow is open by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 53.15.7). It follows that the right vertical arrow is open.
Of course (1) implies (5) by taking the covering $Y=Y$. Assume $Y=\bigcup Y_{i}$ is as in (5). Then for any $Z \rightarrow Y$ we get a corresponding Zariski covering $Z=\bigcup Z_{i}$ such that the base change of $f$ to $Z_{i}$ is open. By a simple topological argument this implies that $Z \times_{Y} X \rightarrow Z$ is open. Hence (1) holds.

06DN Lemma 54.6.6. Let $S$ be a scheme. Let $p: X \rightarrow \operatorname{Spec}(k)$ be a morphism of algebraic spaces over $S$ where $k$ is a field. Then $p: X \rightarrow \operatorname{Spec}(k)$ is universally open.

Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. The composition $U \rightarrow \operatorname{Spec}(k)$ is universally open (as a morphism of schemes) by Morphisms, Lemma 28.23.4 Let $Z \rightarrow \operatorname{Spec}(k)$ be a morphism of schemes. Then $U \times_{\operatorname{Spec}(k)} Z \rightarrow X \times_{\operatorname{Spec}(k)} Z$ is surjective, see Lemma 54.5.5. Hence the first of the maps

$$
\left|U \times_{\operatorname{Spec}(k)} Z\right| \rightarrow\left|X \times_{\operatorname{Spec}(k)} Z\right| \rightarrow|Z|
$$

is surjective. Since the composition is open by the above we conclude that the second map is open as well. Whence $p$ is universally open by Lemma 54.6.5.

### 54.7. Submersive morphisms

0412 Definition 54.7.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is submersiv $\epsilon^{2}$ if the continuous map $|X| \rightarrow|Y|$ is submersive, see Topology, Definition 5.5.3
(2) We say $f$ is universally submersive if for every morphism of algebraic spaces $Y^{\prime} \rightarrow Y$ the base change $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is submersive.

We note that a submersive morphism is in particular surjective.

### 54.8. Quasi-compact morphisms

03 HC By Section 54.3 we know what it means for a representable morphism of algebraic spaces to be quasi-compact. In order to formulate the definition for a general morphism of algebraic spaces we make the following observation.

03HD Lemma 54.8.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is quasi-compact, and
(2) for every quasi-compact algebraic space $Z$ and any morphism $Z \rightarrow Y$ the algebraic space $Z \times_{Y} X$ is quasi-compact.

Proof. Assume (1), and let $Z \rightarrow Y$ be a morphism of algebraic spaces with $Z$ quasicompact. By Properties of Spaces, Definition 53.5.1 there exists a quasi-compact scheme $U$ and a surjective étale morphism $U \rightarrow Z$. Since $f$ is representable and quasi-compact we see by definition that $U \times_{Y} X$ is a scheme, and that $U \times_{Y} X \rightarrow$ $U$ is quasi-compact. Hence $U \times_{Y} X$ is a quasi-compact scheme. The morphism $U \times_{Y} X \rightarrow Z \times_{Y} X$ is étale and surjective (as the base change of the representable étale and surjective morphism $U \rightarrow Z$, see Section 54.3. Hence by definition $Z \times_{Y} X$ is quasi-compact.

Assume (2). Let $Z \rightarrow Y$ be a morphism, where $Z$ is a scheme. We have to show that $p: Z \times_{Y} X \rightarrow Z$ is quasi-compact. Let $U \subset Z$ be affine open. Then $p^{-1}(U)=U \times_{Y} Z$ and the scheme $U \times_{Y} Z$ is quasi-compact by assumption (2). Hence $p$ is quasi-compact, see Schemes, Section 25.19 .

This motivates the following definition.

[^161]03HE Definition 54.8.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is quasi-compact if for every quasi-compact algebraic space $Z$ and morphism $Z \rightarrow Y$ the fibre product $Z \times_{Y} X$ is quasi-compact.

By Lemma 54.8.1 above this agrees with the already existing notion for representable morphisms of algebraic spaces.

03HF Lemma 54.8.3. The base change of a quasi-compact morphism of algebraic spaces by any morphism of algebraic spaces is quasi-compact.

Proof. Omitted. Hint: Transitivity of fibre products.
03 HG Lemma 54.8.4. The composition of a pair of quasi-compact morphisms of algebraic spaces is quasi-compact.

Proof. Omitted. Hint: Transitivity of fibre products.
040W Lemma 54.8.5. Let $S$ be a scheme.
(1) If $X \rightarrow Y$ is a surjective morphism of algebraic spaces over $S$, and $X$ is quasi-compact then $Y$ is quasi-compact.
(2) If

is a commutative diagram of morphisms of algebraic spaces over $S$ and $f$ is surjective and $p$ is quasi-compact, then $q$ is quasi-compact.

Proof. Assume $X$ is quasi-compact and $X \rightarrow Y$ is surjective. By Definition 54.5.2 the map $|X| \rightarrow|Y|$ is surjective, hence we see $Y$ is quasi-compact by Properties of Spaces, Lemma 53.5 .2 and the topological fact that the image of a quasi-compact space under a continuous map is quasi-compact, see Topology, Lemma 5.11.7. Let $f, p, q$ be as in (2). Let $T \rightarrow Z$ be a morphism whose source is a quasi-compact algebraic space. By assumption $T \times_{Z} X$ is quasi-compact. By Lemma 54.5.5 the morphism $T \times{ }_{Z} X \rightarrow T \times{ }_{Z} Y$ is surjective. Hence by part (1) we see $T \times{ }_{Z} Y$ is quasi-compact too. Thus $q$ is quasi-compact.
04ZJ Lemma 54.8.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $g: Y^{\prime} \rightarrow Y$ be a universally open and surjective morphism of algebraic spaces such that the base change $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is quasi-compact. Then $f$ is quasi-compact.

Proof. Let $Z \rightarrow Y$ be a morphism of algebraic spaces with $Z$ quasi-compact. As $g$ is universally open and surjective, we see that $Y^{\prime} \times_{Y} Z \rightarrow Z$ is open and surjective. As every point of $\left|Y^{\prime} \times_{Y} Z\right|$ has a fundamental system of quasi-compact open neighbourhoods (see Properties of Spaces, Lemma 53.5.5) we can find a quasicompact open $W \subset\left|Y^{\prime} \times_{Y} Z\right|$ which surjects onto $Z$. Denote $f^{\prime \prime}: W \times_{Y} X \rightarrow W$ the base change of $f^{\prime}$ by $W \rightarrow Y^{\prime}$. By assumption $W \times_{Y} X$ is quasi-compact. As $W \rightarrow Z$ is surjective we see that $W \times_{Y} X \rightarrow Z \times_{Y} X$ is surjective. Hence $Z \times_{Y} X$ is quasi-compact by Lemma 54.8.5. Thus $f$ is quasi-compact.

03KG Lemma 54.8.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is quasi-compact,
(2) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism of algebraic spaces $Z \times_{Y} X \rightarrow Z$ is quasi-compact,
(3) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the algebraic space $Z \times_{Y} X$ is quasi-compact,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a quasi-compact morphism of algebraic spaces, and
(5) there exists a surjective étale morphism $Y^{\prime} \rightarrow Y$ of algebraic spaces such that $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is a quasi-compact morphism of algebraic spaces, and
(6) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is quasi-compact.

Proof. We will use Lemma 54.8.3 without further mention. It is clear that (1) implies (2) and that (2) implies (3). Assume (3). Let $Z$ be a quasi-compact algebraic space over $S$, and let $Z \rightarrow Y$ be a morphism. By Properties of Spaces, Lemma 53.6 .3 there exists an affine scheme $U$ and a surjective étale morphism $U \rightarrow Z$. Then $U \times_{Y} X \rightarrow Z \times_{Y} X$ is a surjective morphism of algebraic spaces, see Lemma 54.5.5. By assumption $\left|U \times_{Y} X\right|$ is quasi-compact. It surjects onto $\left|Z \times_{Y} X\right|$, hence we conclude that $\left|Z \times_{Y} X\right|$ is quasi-compact, see Topology, Lemma 5.11.7. This proves that (3) implies (1).
The implications $(1) \Rightarrow(4),(4) \Rightarrow(5)$ are clear. The implication (5) $\Rightarrow(1)$ follows from Lemma 54.8 .6 and the fact that an étale morphism of algebraic spaces is universally open (see discussion following Definition 54.6.2.
Of course (1) implies (6) by taking the covering $Y=Y$. Assume $Y=\bigcup Y_{i}$ is as in (6). Let $Z$ be affine and let $Z \rightarrow Y$ be a morphism. Then there exists a finite standard affine covering $Z=Z_{1} \cup \ldots \cup Z_{n}$ such that each $Z_{j} \rightarrow Y$ factors through $Y_{i_{j}}$ for some $i_{j}$. Hence the algebraic space

$$
Z_{j} \times_{Y} X=Z_{j} \times_{Y_{i_{j}}} f^{-1}\left(Y_{i_{j}}\right)
$$

is quasi-compact. Since $Z \times_{Y} X=\bigcup_{j=1, \ldots, n} Z_{j} \times_{Y} X$ is a Zariski covering we see that $\left|Z \times_{Y} X\right|=\bigcup_{j=1, \ldots, n}\left|Z_{j} \times_{Y} X\right|$ (see Properties of Spaces, Lemma 53.4.8) is a finite union of quasi-compact spaces, hence quasi-compact. Thus we see that (6) implies (3).

The following (and the next) lemma guarantees in particular that a morphism $X \rightarrow \operatorname{Spec}(A)$ is quasi-compact as soon as $X$ is a quasi-compact algebraic space

03KS Lemma 54.8.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. If $g \circ f$ is quasi-compact and $g$ is quasi-separated then $f$ is quasi-compact.

Proof. This is true because $f$ equals the composition $(1, f): X \rightarrow X \times{ }_{Z} Y \rightarrow Y$. The first map is quasi-compact by Lemma 54.4.7 because it is a section of the quasiseparated morphism $X \times_{Z} Y \rightarrow X$ (a base change of $g$, see Lemma 54.4.4). The second map is quasi-compact as it is the base change of $f$, see Lemma 54.8.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 54.8.4

073B Lemma 54.8.9. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over a scheme $S$.
(1) If $X$ is quasi-compact and $Y$ is quasi-separated, then $f$ is quasi-compact.
(2) If $X$ is quasi-compact and quasi-separated and $Y$ is quasi-separated, then $f$ is quasi-compact and quasi-separated.
(3) A fibre product of quasi-compact and quasi-separated algebraic spaces is quasi-compact and quasi-separated.
Proof. Part (1) follows from Lemma 54.8 .8 with $Z=S=\operatorname{Spec}(\mathbf{Z})$. Part (2) follows from (1) and Lemma 54.4.10. For (3) let $X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of quasi-compact and quasi-separated algebraic spaces. Then $X \times_{Y} Z \rightarrow Z$ is quasi-compact and quasi-separated as a base change of $X \rightarrow Y$ using (2) and Lemmas 54.8.3 and 54.4.4. Hence $X \times_{Y} Z$ is quasi-compact and quasi-separated as an algebraic space quasi-compact and quasi-separated over $Z$, see Lemmas 54.4.9 and 54.8.4

### 54.9. Universally closed morphisms

03 HH For a representable morphism of algebraic spaces we have already defined (in Section 54.3 what it means to be universally closed. Hence before we give the natural definition we check that it agrees with this in the representable case.
03XD Lemma 54.9.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is universally closed, and
(2) for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces $\left|Z \times_{Y} X\right| \rightarrow|Z|$ is closed.

Proof. Assume (1), and let $Z \rightarrow Y$ be as in (2). Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. By assumption the morphism of schemes $V \times_{Y} X \rightarrow V$ is universally closed. By Properties of Spaces, Section 53.4 in the commutative diagram

the horizontal arrows are open and surjective, and moreover

$$
\left|V \times_{Y} X\right| \longrightarrow|V| \times_{|Z|}\left|Z \times_{Y} X\right|
$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication $(2) \Rightarrow(1)$ is immediate from the definitions.

Thus we may use the following natural definition.
03HI Definition 54.9.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is closed if the map of topological spaces $|X| \rightarrow|Y|$ is closed.
(2) We say $f$ is universally closed if for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces

$$
\left|Z \times_{Y} X\right| \rightarrow|Z|
$$

is closed, i.e., the base change $Z \times_{Y} X \rightarrow Z$ is closed.

03IS Lemma 54.9.3. The base change of a universally closed morphism of algebraic spaces by any morphism of algebraic spaces is universally closed.

Proof. This is immediate from the definition.
03IU Lemma 54.9.4. The composition of a pair of (universally) closed morphisms of algebraic spaces is (universally) closed.

Proof. Omitted.
03IT Lemma 54.9.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is universally closed,
(2) for every scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $\left|Z \times_{Y} X\right| \rightarrow$ $|Z|$ is closed,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $\left|Z \times_{Y} X\right| \rightarrow|Z|$ is closed,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a universally closed morphism of algebraic spaces, and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is universally closed.

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).
Assume (3). Choose a surjective étale morphism $V \rightarrow Y$. We are going to show that $V \times_{Y} X \rightarrow V$ is a universally closed morphism of algebraic spaces. Let $Z \rightarrow V$ be a morphism from an algebraic space to $V$. Let $W \rightarrow Z$ be a surjective étale morphism where $W=\coprod W_{i}$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 53.6.1. Then we have the following commutative diagram

We have to show the south-east arrow is closed. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 53.15.7). By assumption (3), and the fact that $W_{i}$ is affine we see that the left vertical arrows are closed. Hence it follows that the right vertical arrow is closed.

Assume (4). We will show that $f$ is universally closed. Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Consider the diagram

The south-west arrow is closed by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 53.15.7). It follows that the right vertical arrow is closed.

Of course (1) implies (5) by taking the covering $Y=Y$. Assume $Y=\bigcup Y_{i}$ is as in (5). Then for any $Z \rightarrow Y$ we get a corresponding Zariski covering $Z=\bigcup Z_{i}$ such that the base change of $f$ to $Z_{i}$ is closed. By a simple topological argument this implies that $Z \times_{Y} X \rightarrow Z$ is closed. Hence (1) holds.

03IV Example 54.9.6. Strange example of a universally closed morphism. Let $\mathbf{Q} \subset k$ be a field of characteristic zero. Let $X=\mathbf{A}_{k}^{1} / \mathbf{Z}$ as in Spaces, Example 52.14.8. We claim the structure morphism $p: X \rightarrow \operatorname{Spec}(k)$ is universally closed. Namely, if $Z / k$ is a scheme, and $T \subset\left|X \times_{k} Z\right|$ is closed, then $T$ corresponds to a Z-invariant closed subset of $T^{\prime} \subset\left|\mathbf{A}^{1} \times Z\right|$. It is easy to see that this implies that $T^{\prime}$ is the inverse image of a subset $T^{\prime \prime}$ of $Z$. By Morphisms, Lemma 28.25 .10 we have that $T^{\prime \prime} \subset Z$ is closed. Of course $T^{\prime \prime}$ is the image of $T$. Hence $p$ is universally closed by Lemma 54.9.5

04XW Lemma 54.9.7. Let $S$ be a scheme. A universally closed morphism of algebraic spaces over $S$ is quasi-compact.

Proof. This proof is a repeat of the proof in the case of schemes, see Morphisms, Lemma 28.41.10. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that $f$ is not quasi-compact. Our goal is to show that $f$ is not universally closed. By Lemma 54.8.7 there exists an affine scheme $Z$ and a morphism $Z \rightarrow Y$ such that $Z \times_{Y} X \rightarrow Z$ is not quasi-compact. To achieve our goal it suffices to show that $Z \times_{Y} X \rightarrow Z$ is not universally closed, hence we may assume that $Y=\operatorname{Spec}(B)$ for some ring $B$.

Write $X=\bigcup_{i \in I} X_{i}$ where the $X_{i}$ are quasi-compact open subspaces of $X$. For example, choose a surjective étale morphism $U \rightarrow X$ where $U$ is a scheme, choose an affine open covering $U=\bigcup U_{i}$ and let $X_{i} \subset X$ be the image of $U_{i}$. We will use later that the morphisms $X_{i} \rightarrow Y$ are quasi-compact, see Lemma 54.8.8. Let $T=\operatorname{Spec}\left(B\left[a_{i} ; i \in I\right]\right)$. Let $T_{i}=D\left(a_{i}\right) \subset T$. Let $Z \subset T \times_{Y} X$ be the reduced closed subspace whose underlying closed set of points is $\left|T \times_{Y} Z\right| \backslash \bigcup_{i \in I}\left|T_{i} \times_{Y} X_{i}\right|$, see Properties of Spaces, Lemma 53.11.4. (Note that $T_{i} \times{ }_{Y} X_{i}$ is an open subspace of $T \times_{Y} X$ as $T_{i} \rightarrow T$ and $X_{i} \rightarrow X$ are open immersions, see Spaces, Lemmas 52.12 .3 and 52.12 .2 .) Here is a diagram

It suffices to prove that the image $f_{T}(|Z|)$ is not closed in $|T|$.
We claim there exists a point $y \in Y$ such that there is no affine open neighborhood $V$ of $y$ in $Y$ such that $X_{V}$ is quasi-compact. If not then we can cover $Y$ with finitely many such $V$ and for each $V$ the morphism $Y_{V} \rightarrow V$ is quasi-compact by Lemma 54.8.8 and then Lemma 54.8.7 implies $f$ quasi-compact, a contradiction. Fix a $y \in Y$ as in the claim.

Let $t \in T$ be the point lying over $y$ with $\kappa(t)=\kappa(y)$ such that $a_{i}=1$ in $\kappa(t)$ for all $i$. Suppose $z \in|Z|$ with $f_{T}(z)=t$. Then $q(t) \in X_{i}$ for some $i$. Hence $f_{T}(z) \notin T_{i}$ by construction of $Z$, which contradicts the fact that $t \in T_{i}$ by construction. Hence we see that $t \in|T| \backslash f_{T}(|Z|)$.

Assume $f_{T}(|Z|)$ is closed in $|T|$. Then there exists an element $g \in B\left[a_{i} ; i \in I\right]$ with $f_{T}(|Z|) \subset V(g)$ but $t \notin V(g)$. Hence the image of $g$ in $\kappa(t)$ is nonzero. In particular some coefficient of $g$ has nonzero image in $\kappa(y)$. Hence this coefficient is invertible on some affine open neighborhood $V$ of $y$. Let $J$ be the finite set of $j \in I$ such that the variable $a_{j}$ appears in $g$. Since $X_{V}$ is not quasi-compact and each $X_{i, V}$ is quasi-compact, we may choose a point $x \in\left|X_{V}\right| \backslash \bigcup_{j \in J}\left|X_{j, V}\right|$. In other words, $x \in|X| \backslash \bigcup_{j \in J}\left|X_{j}\right|$ and $x$ lies above some $v \in V$. Since $g$ has a coefficient that is invertible on $V$, we can find a point $t^{\prime} \in T$ lying above $v$ such that $t^{\prime} \notin V(g)$ and $t^{\prime} \in V\left(a_{i}\right)$ for all $i \notin J$. This is true because $V\left(a_{i} ; i \in I \backslash J\right)=\operatorname{Spec}\left(B\left[a_{j} ; j \in J\right]\right)$ and the set of points of this scheme lying over $v$ is bijective with $\operatorname{Spec}\left(\kappa(v)\left[a_{j} ; j \in J\right]\right)$ and $g$ restricts to a nonzero element of this polynomial ring by construction. In other words $t^{\prime} \notin T_{i}$ for each $i \notin J$. By Properties of Spaces, Lemma 53.4.3 we can find a point $z$ of $X \times_{Y} T$ mapping to $x \in X$ and to $t^{\prime} \in T$. Since $x \notin\left|X_{j}\right|$ for $j \in J$ and $t^{\prime} \notin T_{i}$ for $i \in I \backslash J$ we see that $z \in|Z|$. On the other hand $f_{T}(z)=t^{\prime} \notin V(g)$ which contradicts $f_{T}(Z) \subset V(g)$. Thus the assumption " $f_{T}(|Z|)$ closed" is wrong and we conclude indeed that $f_{T}$ is not closed as desired.

The target of a separated algebraic space under a surjective universally closed morphism is separated.

05Z2 Lemma 54.9.8. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $f: X \rightarrow Y$ be a surjective universally closed morphism of algebraic spaces over $B$.
(1) If $X$ is quasi-separated, then $Y$ is quasi-separated.
(2) If $X$ is separated, then $Y$ is separated.
(3) If $X$ is quasi-separated over $B$, then $Y$ is quasi-separated over $B$.
(4) If $X$ is separated over $B$, then $Y$ is separated over $B$.

Proof. Parts (1) and (2) are a consequence of (3) and (4) for $S=B=\operatorname{Spec}(\mathbf{Z})$ (see Properties of Spaces, Definition 53.3.1. Consider the commutative diagram

The left vertical arrow is surjective (i.e., universally surjective). The right vertical arrow is universally closed as a composition of the universally closed morphisms $X \times_{B} X \rightarrow X \times_{B} Y \rightarrow Y \times_{B} Y$. Hence it is also quasi-compact, see Lemma 54.9.7.

Assume $X$ is quasi-separated over $B$, i.e., $\Delta_{X / B}$ is quasi-compact. Then if $Z$ is quasi-compact and $Z \rightarrow Y \times_{B} Y$ is a morphism, then $Z \times_{Y \times_{B} Y} X \rightarrow Z \times_{Y \times_{B} Y} Y$ is surjective and $Z \times_{Y \times{ }_{B} Y} X$ is quasi-compact by our remarks above. We conclude that $\Delta_{Y / B}$ is quasi-compact, i.e., $Y$ is quasi-separated over $B$.
Assume $X$ is separated over $B$, i.e., $\Delta_{X / B}$ is a closed immersion. Then if $Z$ is affine, and $Z \rightarrow Y \times_{B} Y$ is a morphism, then $Z \times_{Y \times{ }_{B} Y} X \rightarrow Z \times_{Y \times{ }_{B} Y} Y$ is surjective and $Z \times_{Y \times{ }_{B} Y} X \rightarrow Z$ is universally closed by our remarks above. We conclude that $\Delta_{Y / B}$ is universally closed. It follows that $\Delta_{Y / B}$ is representable, locally of finite type, a monomorphism (see Lemma 54.4.1) and universally closed, hence a closed immersion, see Étale Morphisms, Lemma 40.7.2 (and also the abstract principle Spaces, Lemma 52.5.8). Thus $Y$ is separated over $B$.

### 54.10. Monomorphisms

042K A representable morphism $X \rightarrow Y$ of algebraic spaces is a monomorphism according to Section 54.3 if for every scheme $Z$ and morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is representable by a monomorphism of schemes. This means exactly that $Z \times_{Y} X \rightarrow Z$ is an injective map of sheaves on $(S c h / S)_{f p p f}$. Since this is supposed to hold for all $Z$ and all maps $Z \rightarrow Y$ this is in turn equivalent to the map $X \rightarrow Y$ being an injective map of sheaves on $(S c h / S)_{f p p f}$. Thus we may define a monomorphism of a (possibly nonrepresentabl ${ }^{3}$ ) morphism of algebraic spaces as follows.

042L Definition 54.10.1. Let $S$ be a scheme. A morphism of algebraic spaces over $S$ is called a monomorphism if it is an injective map of sheaves, i.e., a monomorphism in the category of sheaves on $(S c h / S)_{f p p f}$.
The following lemma shows that this also means that it is a monomorphism in the category of algebraic spaces over $S$.
042M Lemma 54.10.2. Let $S$ be a scheme. Let $j: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $j$ is a monomorphism (as in Definition 54.10.1),
(2) $j$ is a monomorphism in the category of algebraic spaces over $S$, and
(3) the diagonal morphism $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is an isomorphism.

Proof. Note that $X \times_{Y} X$ is both the fibre product in the category of sheaves on $(S c h / S)_{f p p f}$ and the fibre product in the category of algebraic spaces over $S$, see Spaces, Lemma 52.7.3. The equivalence of (1) and (3) is a general characterization of injective maps of sheaves on any site. The equivalence of (2) and (3) is a characterization of monomorphisms in any category with fibre products.

042N Lemma 54.10.3. A monomorphism of algebraic spaces is separated.
Proof. This is true because an isomorphism is a closed immersion, and Lemma 54.10 .2 above.

042 O Lemma 54.10.4. A composition of monomorphisms is a monomorphism.
Proof. True because a composition of injective sheaf maps is injective.
042P Lemma 54.10.5. The base change of a monomorphism is a monomorphism.
Proof. This is a general fact about fibre products in a category of sheaves.
042Q Lemma 54.10.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is a monomorphism,
(2) for every scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is a monomorphism,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is a monomorphism,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_{Y} X \rightarrow V$ is a monomorphism, and

[^162](5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is a monomorphism.

Proof. We will use without further mention that a base change of a monomorphism is a monomorphism, see Lemma 54.10.5. In particular it is clear that $(1) \Rightarrow(2)$ $\Rightarrow(3) \Rightarrow(4)$ (by taking $V$ to be a disjoint union of affine schemes étale over $Y$, see Properties of Spaces, Lemma 53.6.1). Let $V$ be a scheme, and let $V \rightarrow Y$ be a surjective étale morphism. If $V \times_{Y} X \rightarrow V$ is a monomorphism, then it follows that $X \rightarrow Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

$$
\mathcal{F}=\mathcal{H} \times_{\mathcal{I}} \mathcal{G}
$$

if $c$ is a surjection of sheaves, and $a$ is injective, then also $d$ is injective. Thus (4) implies (1). Proof of the equivalence of (5) and (1) is omitted.

042R Lemma 54.10.7. An immersion of algebraic spaces is a monomorphism. In particular, any immersion is separated.

Proof. Let $f: X \rightarrow Y$ be an immersion of algebraic spaces. For any morphism $Z \rightarrow Y$ with $Z$ representable the base change $Z \times_{Y} X \rightarrow Z$ is an immersion of schemes, hence a monomorphism, see Schemes, Lemma 25.23.7. Hence $f$ is representable, and a monomorphism.

We will improve on the following lemma in Decent Spaces, Lemma 55.17.1.
06MG Lemma 54.10.8. Let $S$ be a scheme. Let $k$ be a field and let $Z \rightarrow \operatorname{Spec}(k)$ be a monomorphism of algebraic spaces over $S$. Then either $Z=\emptyset$ or $Z=\operatorname{Spec}(k)$.

Proof. By Lemmas 54.10.3 and 54.4.9 we see that $Z$ is a separated algebraic space. Hence there exists an open dense subspace $Z^{\prime} \subset Z$ which is a scheme, see Properties of Spaces, Proposition 53.12.3. By Schemes, Lemma 25.23 .10 we see that either $Z^{\prime}=\emptyset$ or $Z^{\prime} \cong \operatorname{Spec}(k)$. In the first case we conclude that $Z=\emptyset$ and in the second case we conclude that $Z^{\prime}=Z=\operatorname{Spec}(k)$ as $Z \rightarrow \operatorname{Spec}(k)$ is a monomorphism which is an isomorphism over $Z^{\prime}$.
06RV Lemma 54.10.9. Let $S$ be a scheme. If $X \rightarrow Y$ is a monomorphism of algebraic spaces over $S$, then $|X| \rightarrow|Y|$ is injective.
Proof. Immediate from the definitions.

### 54.11. Pushforward of quasi-coherent sheaves

03M7 We first prove a simple lemma that relates pushforward of sheaves of modules for a morphism of algebraic spaces to pushforward of sheaves of modules for a morphism of schemes.

03M8 Lemma 54.11.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $U \rightarrow X$ be a surjective étale morphism from a scheme to $X$. Set $R=U \times_{X} U$ and denote $t, s: R \rightarrow U$ the projection morphisms as usual. Denote $a: U \rightarrow Y$ and $b: R \rightarrow Y$ the induced morphisms. For any object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ there exists an exact sequence

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow a_{*}\left(\left.\mathcal{F}\right|_{U}\right) \rightarrow b_{*}\left(\left.\mathcal{F}\right|_{R}\right)
$$

where the second arrow is the difference $t^{*}-s^{*}$.
Proof. We denote $\mathcal{F}$ also its extension to a sheaf of modules on $X_{\text {spaces,étale }}$, see Properties of Spaces, Remark 53.17.4. Let $V \rightarrow Y$ be an object of $Y_{\text {étale }}$. Then $V \times_{Y} X$ is an object of $X_{\text {spaces,étale }}$, and by definition $f_{*} \mathcal{F}(V)=\mathcal{F}\left(V \times_{Y} X\right)$. Since $U \rightarrow X$ is surjective étale, we see that $\left\{V \times_{Y} U \rightarrow V \times_{Y} X\right\}$ is a covering. Also, we have $\left(V \times_{Y} U\right) \times{ }_{X}\left(V \times_{Y} U\right)=V \times_{Y} R$. Hence, by the sheaf condition of $\mathcal{F}$ on $X_{\text {spaces,étale }}$ we have a short exact sequence

$$
0 \rightarrow \mathcal{F}\left(V \times_{Y} X\right) \rightarrow \mathcal{F}\left(V \times_{Y} U\right) \rightarrow \mathcal{F}\left(V \times_{Y} R\right)
$$

where the second arrow is the difference of restricting via $t$ or $s$. This exact sequence is functorial in $V$ and hence we obtain the lemma.

Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces $X$ and $Y$ over $S$. By Descent, Proposition 34.7 .14 the functor $f_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$ agrees with the usual functor if we think of $X$ and $Y$ as schemes.
More generally, suppose $f: X \rightarrow Y$ is a representable, quasi-compact, and quasiseparated morphism of algebraic spaces over $S$. Let $V$ be a scheme and let $V \rightarrow Y$ be an étale surjective morphism. Let $U=V \times_{Y} X$ and let $f^{\prime}: U \rightarrow V$ be the base change of $f$. Then for any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have

04CF

$$
f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)=\left.\left(f_{*} \mathcal{F}\right)\right|_{V}
$$

see Properties of Spaces, Lemma 53.25.2 And because $f^{\prime}: U \rightarrow V$ is a quasicompact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)$ by thinking of $\left.\mathcal{F}\right|_{U}$ as a quasi-coherent sheaf on the scheme $U$, and $f^{\prime}$ as a morphism of schemes. We will frequently use this without further mention.

The next level of generality is to consider an arbitrary quasi-compact and quasiseparated morphism of algebraic spaces.

03M9 Lemma 54.11.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is quasi-compact and quasi-separated, then $f_{*}$ transforms quasicoherent $\mathcal{O}_{X}$-modules into quasi-coherent $\mathcal{O}_{Y}$-modules.
Proof. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. We have to show that $f_{*} \mathcal{F}$ is a quasi-coherent sheaf on $Y$. For this it suffices to show that for any affine scheme $V$ and étale morphism $V \rightarrow Y$ the restriction of $f_{*} \mathcal{F}$ to $V$ is quasi-coherent, see Properties of Spaces, Lemma 53.28.6. Let $f^{\prime}: V \times_{Y} X \rightarrow V$ be the base change of $f$ by $V \rightarrow Y$. Note that $f^{\prime}$ is also quasi-compact and quasi-separated, see Lemmas 54.8 .3 and 54.4.4. By 54.11 .1 .1 we know that the restriction of $f_{*} \mathcal{F}$ to $V$ is $f_{*}^{\prime}$ of the restriction of $\mathcal{F}$ to $V \times_{Y} X$. Hence we may replace $f$ by $f^{\prime}$, and assume that $Y$ is an affine scheme.
Assume $Y$ is an affine scheme. Since $f$ is quasi-compact we see that $X$ is quasicompact. Thus we may choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 53.6.3. By Lemma 54.11.1 we get an exact sequence

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow a_{*}\left(\left.\mathcal{F}\right|_{U}\right) \rightarrow b_{*}\left(\left.\mathcal{F}\right|_{R}\right)
$$

where $R=U \times_{X} U$. As $X \rightarrow Y$ is quasi-separated we see that $R \rightarrow U \times_{Y} U$ is a quasi-compact monomorphism. This implies that $R$ is a quasi-compact separated
scheme (as $U$ and $Y$ are affine at this point). Hence $a: U \rightarrow Y$ and $b: R \rightarrow Y$ are quasi-compact and quasi-separated morphisms of schemes. Thus by Descent, Proposition 34.7 .14 the sheaves $a_{*}\left(\left.\mathcal{F}\right|_{U}\right)$ and $b_{*}\left(\left.\mathcal{F}\right|_{R}\right)$ are quasi-coherent (see also the discussion preceding this lemma). This implies that $f_{*} \mathcal{F}$ is a kernel of quasicoherent modules, and hence itself quasi-coherent, see Properties of Spaces, Lemma 53.28 .7

Higher direct images are discussed in Cohomology of Spaces, Section 56.3.

### 54.12. Immersions

03 HB Open, closed and locally closed immersions of algebraic spaces were defined in Spaces, Section 52.12. Namely, a morphism of algebraic spaces is a closed immersion (resp. open immersion, resp. immersion) if it is representable and a closed immersion (resp. open immersion, resp. immersion) in the sense of Section 54.3 .
In particular these types of morphisms are stable under base change and compositions of morphisms in the category of algebraic spaces over $S$, see Spaces, Lemmas 52.12 .2 and 52.12.3.

03M4 Lemma 54.12.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is a closed immersion (resp. open immersion, resp. immersion),
(2) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is a closed immersion (resp. open immersion, resp. immersion),
(3) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is a closed immersion (resp. open immersion, resp. immersion),
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a closed immersion (resp. open immersion, resp. immersion), and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is a closed immersion (resp. open immersion, resp. immersion).

Proof. Using that a base change of a closed immersion (resp. open immersion, resp. immersion) is another one it is clear that (1) implies (2) and (2) implies (3). Also (3) implies (4) since we can take $V$ to be a disjoint union of affines, see Properties of Spaces, Lemma 53.6.1.
Assume $V \rightarrow Y$ is as in (4). Let $\mathcal{P}$ be the property closed immersion (resp. open immersion, resp. immersion) of morphisms of schemes. Note that property $\mathcal{P}$ is preserved under any base change and fppf local on the base (see Section 54.3). Moreover, morphisms of type $\mathcal{P}$ are separated and locally quasi-finite (in each of the three cases, see Schemes, Lemma 25.23.7, and Morphisms, Lemma 28.20.15). Hence by More on Morphisms, Lemma 36.39.1 the morphisms of type $\mathcal{P}$ satisfy descent for fppf covering. Thus Spaces, Lemma 52.11 .5 applies and we see that $X \rightarrow Y$ is representable and has property $\mathcal{P}$, in other words (1) holds.
The equivalence of (1) and (5) follows from the fact that $\mathcal{P}$ is Zariski local on the target (since we saw above that $\mathcal{P}$ is in fact fppf local on the target).
0AGC Lemma 54.12.2. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over $S$.
(1) If $Z \rightarrow X$ is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism, then $Z \rightarrow Y$ is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism.
(2) If $Z \rightarrow X$ is an immersion and $Y \rightarrow X$ is locally separated, then $Z \rightarrow Y$ is an immersion.
(3) If $Z \rightarrow X$ is a closed immersion and $Y \rightarrow X$ is separated, then $Z \rightarrow Y$ is a closed immersion.

Proof. In each case the proof is to contemplate the commutative diagram

where the composition of the top horizontal arrows is the identity. Let us prove (1). The first horizontal arrow is a section of $Y \times_{X} Z \rightarrow Z$, whence representable, locally of finite type, locally quasi-finite, separated, and a monomorphism by Lemma 54.4.7. The arrow $Y \times_{X} Z \rightarrow Y$ is a base change of $Z \rightarrow X$ hence is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism (as each of these properties of morphisms of schemes is stable uynder base change, see Spaces, Remark 52.4.1). Hence the same is true for the composition (as each of these properties of morphisms of schemes is stable under composition, see Spaces, Remark 52.4.2). This proves (1). The other results are proved in exactly the same manner.

04CD Lemma 54.12.3. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Then $|i|:|Z| \rightarrow|X|$ is a homeomorphism onto a locally closed subset, and $i$ is a closed immersion if and only if the image $|i|(|Z|) \subset|X|$ is a closed subset.

Proof. The first statement is Properties of Spaces, Lemma 53.11.2. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By assumption $T=U \times_{X} Z$ is a scheme and the morphism $j: T \rightarrow U$ is an immersion of schemes. By Lemma 54.12 .1 the morphism $i$ is a closed immersion if and only if $j$ is a closed immersion. By Schemes, Lemma 25.10 .4 this is true if and only if $j(T)$ is closed in $U$. However, the subset $j(T) \subset U$ is the inverse image of $|i|(|Z|) \subset|X|$, see Properties of Spaces, Lemma 53.4.3. This finishes the proof.

04CE Remark 54.12.4. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Since $i$ is a monomorphism we may think of $|Z|$ as a subset of $|X|$; in the rest of this remark we do so. Let $\partial|Z|$ be the boundary of $|Z|$ in the topological space $|X|$. In a formula

$$
\partial|Z|=\overline{|Z|} \backslash|Z|
$$

Let $\partial Z$ be the reduced closed subspace of $X$ with $|\partial Z|=\partial|Z|$ obtained by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 53.11.6. By construction we see that $|Z|$ is closed in $|X| \backslash|\partial Z|=|X \backslash \partial Z|$. Hence it is true that any immersion of algebraic spaces can be factored as a closed immersion followed by an open immersion (but not the other way in general, see Morphisms, Example 28.3.4.

06EC Remark 54.12.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a locally closed subset. Let $\partial T$ be the boundary of $T$ in the topological space $|X|$. In a formula

$$
\partial T=\bar{T} \backslash T
$$

Let $U \subset X$ be the open subspace of $X$ with $|U|=|X| \backslash \partial T$, see Properties of Spaces, Lemma 53.4.8. Let $Z$ be the reduced closed subspace of $U$ with $|Z|=T$ obtained by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 53.11.6. By construction $Z \rightarrow U$ is a closed immersion of algebraic spaces and $U \rightarrow X$ is an open immersion, hence $Z \rightarrow X$ is an immersion of algebraic spaces over $S$ (see Spaces, Lemma 52.12 .2 ). Note that $Z$ is a reduced algebraic space and that $|Z|=T$ as subsets of $|X|$. We sometimes say $Z$ is the reduced induced subspace structure on $T$.

081U Lemma 54.12.6. Let $S$ be a scheme. Let $Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Assume $Z \rightarrow X$ is quasi-compact. There exists a factorization $Z \rightarrow$ $\bar{Z} \rightarrow X$ where $Z \rightarrow \bar{Z}$ is an open immersion and $\bar{Z} \rightarrow X$ is a closed immersion.

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be surjective étale. As usual denote $R=U \times{ }_{X} U$ with projections $s, t: R \rightarrow U$. Set $T=Z \times_{U} X$. Let $\bar{T} \subset U$ be the scheme theoretic image of $T \rightarrow U$. Note that $s^{-1} \bar{T}=t^{-1} \bar{T}$ as taking scheme theoretic images of quasi-compact morphisms commute with flat base change, see Morphisms, Lemma 28.25.14 Hence we obtain a closed subspace $\bar{Z} \subset X$ whose pullback to $U$ is $\bar{T}$, see Properties of Spaces, Lemma 53.11.3. By Morphisms, Lemma 28.7.7 the morphism $T \rightarrow \bar{T}$ is an open immersion. It follows that $Z \rightarrow \bar{Z}$ is an open immersion and we win.

### 54.13. Closed immersions

03MA In this section we elucidate some of the results obtained previously on immersions of algebraic spaces. See Spaces, Section 52.12 and Section 54.12 in this chapter. This section is the analogue of Morphisms, Section 28.2 for algebraic spaces.

03MB Lemma 54.13.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. For every closed immersion $i: Z \rightarrow X$ the sheaf $i_{*} \mathcal{O}_{Z}$ is a quasi-coherent $\mathcal{O}_{X}$-module, the map $i^{\#}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective and its kernel is a quasi-coherent sheaf of ideals. The rule $Z \mapsto \operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}\right)$ defines an inclusion reversing bijection

$$
\begin{gathered}
\text { closed subspaces } \\
Z \subset X
\end{gathered} \longrightarrow \begin{gathered}
\text { quasi-coherent sheaves } \\
\text { of ideals } \mathcal{I} \subset \mathcal{O}_{X}
\end{gathered}
$$

Moreover, given a closed subscheme $Z$ corresponding to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ a morphism of algebraic spaces $h: Y \rightarrow X$ factors through $Z$ if and only if the map $h^{*} \mathcal{I} \rightarrow h^{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ is zero.

Proof. Let $U \rightarrow X$ be a surjective étale morphism whose source is a scheme. Consider the diagram

By Lemma 54.12.1 we see that $i$ is a closed immersion if and only if $i^{\prime}$ is a closed immersion. By Properties of Spaces, Lemma 53.25 .2 we see that $i_{*}^{\prime} \mathcal{O}_{U \times_{x} Z}$ is the
restriction of $i_{*} \mathcal{O}_{Z}$ to $U$. Hence the assertions on $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ are equivalent to the corresponding assertions on $\mathcal{O}_{U} \rightarrow i_{*}^{\prime} \mathcal{O}_{U \times_{X} Z}$. And since $i^{\prime}$ is a closed immersion of schemes, these results follow from Morphisms, Lemma 28.2.1.

Let us prove that given a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ the formula

$$
Z(T)=\left\{h: T \rightarrow X \mid h^{*} \mathcal{I} \rightarrow \mathcal{O}_{T} \text { is zero }\right\}
$$

defines a closed subspace of $X$. It is clearly a subfunctor of $X$. To show that $Z \rightarrow X$ is representable by closed immersions, let $\varphi: U \rightarrow X$ be a morphism from a scheme towards $X$. Then $Z \times_{X} U$ is represented by the analogous subfunctor of $U$ corresponding to the sheaf of ideals $\operatorname{Im}\left(\varphi^{*} \mathcal{I} \rightarrow \mathcal{O}_{U}\right)$. By Properties of Spaces, Lemma 53.28 .2 the $\mathcal{O}_{U}$-module $\varphi^{*} \mathcal{I}$ is quasi-coherent on on $U$, and hence $\operatorname{Im}\left(\varphi^{*} \mathcal{I} \rightarrow \mathcal{O}_{U}\right)$ is a quasi-coherent sheaf of ideals on $U$. By Schemes, Lemma 25.4.6 we conclude that $Z \times{ }_{X} U$ is represented by the closed subscheme of $U$ associated to $\operatorname{Im}\left(\varphi^{*} \mathcal{I} \rightarrow \mathcal{O}_{U}\right)$. Thus $Z$ is a closed subspace of $X$.

In the formula for $Z$ above the inputs $T$ are schemes since algebraic spaces are sheaves on $(S c h / S)_{\text {fppf }}$. We omit the verification that the same formula remains true if $T$ is an algebraic space.

083Q Definition 54.13.2. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ be a closed subspace. The inverse image $f^{-1}(Z)$ of the closed subspace $Z$ is the closed subspace $Z \times_{X} Y$ of $Y$.

This definition makes sense by Lemma 54.12.1. If $\mathcal{I} \subset \mathcal{O}_{X}$ is the quasi-coherent sheaf of ideals corresponding to $Z$ via Lemma 54.13.1 then $f^{-1} \mathcal{I} \mathcal{O}_{Y}=\operatorname{Im}\left(f^{*} \mathcal{I} \rightarrow\right.$ $\left.\mathcal{O}_{Y}\right)$ is the sheaf of ideals corresponding to $f^{-1}(Z)$.

04CG Lemma 54.13.3. A closed immersion of algebraic spaces is quasi-compact.
Proof. This follows from Schemes, Lemma 25.19 .5 by general principles, see Spaces, Lemma 52.5.8.

04 CH Lemma 54.13.4. A closed immersion of algebraic spaces is separated.
Proof. This follows from Schemes, Lemma 25.23 .7 by general principles, see Spaces, Lemma 52.5.8.

04E5 Lemma 54.13.5. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$.
(1) The functor

$$
i_{\text {small }, *}: S h\left(Z_{\text {étale }}\right) \longrightarrow S h\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $X_{\text {étale }}$ whose restriction to $X \backslash Z$ is isomorphic to *, and
(2) the functor

$$
i_{\text {small }, *}: A b\left(Z_{\text {étale }}\right) \longrightarrow A b\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those abelian sheaves on $X_{\text {étale }}$ whose support is contained in $Z$.
In both cases $i_{\text {small }}^{-1}$ is a left inverse to the functor $i_{\text {small,** }}$.

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be surjective étale. Set $V=Z \times{ }_{X} U$. Then $V$ is a scheme and $i^{\prime}: V \rightarrow U$ is a closed immersion of schemes. By Properties of Spaces, Lemma 53.17.11 for any sheaf $\mathcal{G}$ on $Z$ we have

$$
\left.\left(i_{\text {small }}^{-1} i_{\text {small }, *} \mathcal{G}\right)\right|_{V}=\left(i^{\prime}\right)_{\text {small }}^{-1} i_{\text {small }, *}^{\prime}\left(\left.\mathcal{G}\right|_{V}\right)
$$

By Étale Cohomology, Proposition 49.47 .4 the map $\left.\left(i^{\prime}\right)_{\text {small }}^{-1} i_{\text {small }, *}^{\prime}\left(\left.\mathcal{G}\right|_{V}\right) \rightarrow \mathcal{G}\right|_{V}$ is an isomorphism. Since $V \rightarrow Z$ is surjective and étale this implies that $i_{\text {small }}^{-1} i_{\text {small }, *} \mathcal{G} \rightarrow$ $\mathcal{G}$ is an isomorphism. This clearly implies that $i_{s m a l l, *}$ is fully faithful, see Sites, Lemma 7.40.1 To prove the statement on the essential image, consider a sheaf of sets $\mathcal{F}$ on $X_{\text {étale }}$ whose restriction to $X \backslash Z$ is isomorphic to $*$. As in the proof of Étale Cohomology, Proposition 49.47.4 we consider the adjunction mapping

$$
\mathcal{F} \longrightarrow i_{\text {small }, *} i_{\text {small }}^{-1} \mathcal{F}
$$

As in the first part we see that the restriction of this map to $U$ is an isomorphism by the corresponding result for the case of schemes. Since $U$ is an étale covering of $X$ we conclude it is an isomorphism.

The following lemma holds more generally in the setting of a closed immersion of topoi (insert future reference here).

04G0 Lemma 54.13.6. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{A}$ be a sheaf of rings on $X_{\text {étale }}$. Let $\mathcal{B}$ be a sheaf of rings on $Z_{\text {étale }}$. Let $\varphi: \mathcal{A} \rightarrow i_{\text {small,* }} \mathcal{B}$ (or what is the same thing $\varphi: i_{\text {small }}^{-1} \mathcal{A} \rightarrow \mathcal{B}$ ) be a homomorphism of sheaves of rings. Then for any sheaf of $\mathcal{A}$-modules $\mathcal{F}$ the adjunction mapping $\mathcal{F} \rightarrow i_{\text {small }, *} i_{\text {small }}^{-1} \mathcal{F}$ induces an isomorphism

$$
\mathcal{F} \otimes_{\mathcal{A}} i_{\text {small }, *} \mathcal{B} \longrightarrow i_{\text {small }, *}\left(i_{\text {small }}^{-1} \mathcal{F} \otimes_{i_{\text {small }}^{-1} \mathcal{A}} \mathcal{B}\right)
$$

Proof. During this proof we drop the subscript small from the notation. There is a map $i^{-1} \mathcal{F} \rightarrow i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}$ to which we can apply $i_{*}$ and compose with the adjunction map:

$$
\mathcal{F} \longrightarrow i_{*}\left(i^{-1} \mathcal{F}\right) \longrightarrow i_{*}\left(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}\right)
$$

The composition is $\mathcal{A}$-linear where $\mathcal{A}$ acts on the target via $\varphi$. Note that this target $i_{*}\left(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}\right)$ has a canonical $i_{*} \mathcal{B}$-module structure. Hence by the universal property of tensor product we obtain a map as in the lemma.

Let $\mathcal{G}$ be a sheaf of $i_{*} \mathcal{B}$-modules on $X_{\text {étale }}$. Since the support of the sheaf of rings $i_{*} \mathcal{B}$ is contained in $Z$ we see that the support of $\mathcal{G}$ is contained in $Z$. Hence by Lemma 54.13.5 we conclude that there exists a unique sheaf of $\mathcal{B}$-modules $\mathcal{H}$ and an isomorphism $i_{*} \mathcal{H}=\mathcal{G}$ as $i_{*} \mathcal{B}$-modules. To show that the map of the lemma is an isomorphism we show that the right hand side of the arrow satisfies the universal property enjoyed by the tensor product on the left (i.e., we will use Yoneda's lemma, see Categories, Lemma 4.3.5). To see this we have to show that maps into $\mathcal{G}$ agree.

This can be seen using the following sequence of canonical isomorphisms

$$
\begin{aligned}
\operatorname{Hom}_{i_{*} \mathcal{B}}\left(\mathcal{F} \otimes_{\mathcal{A}} i_{*} \mathcal{B}, \mathcal{G}\right) & =\operatorname{Hom}_{\mathcal{A}}(\mathcal{F}, \mathcal{G}) \\
& =\operatorname{Hom}_{\mathcal{A}}\left(\mathcal{F}, i_{*}(\mathcal{H})\right) \\
& =\operatorname{Hom}_{i^{-1} \mathcal{A}}\left(i^{-1} \mathcal{F}, \mathcal{H}\right) \\
& =\operatorname{Hom}_{\mathcal{B}}\left(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}, \mathcal{H}\right) \\
& =\operatorname{Hom}_{i_{*} \mathcal{B}}\left(i_{*}\left(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}\right), i_{*} \mathcal{H}\right) \\
& =\operatorname{Hom}_{i_{*} \mathcal{B}}\left(i_{*}\left(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}\right), \mathcal{G}\right)
\end{aligned}
$$

The fifth equality holds because of the equivalence of categories in Lemma 54.13.5.

### 54.14. Closed immersions and quasi-coherent sheaves

04CI This section is the analogue of Morphisms, Section 28.4 .
Lemma 54.14.1. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals cutting out $Z$.
(1) For any $\mathcal{O}_{X}$-module $\mathcal{F}$ the adjunction map $\mathcal{F} \rightarrow i_{*} i^{*} \mathcal{F}$ induces an isomorphism $\mathcal{F} / \mathcal{I} \mathcal{F} \cong i_{*} i^{*} \mathcal{F}$.
(2) The functor $i^{*}$ is a left inverse to $i_{*}$, i.e., for any $\mathcal{O}_{Z}$-module $\mathcal{G}$ the adjunction map $i^{*} i_{*} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism.
(3) The functor

$$
i_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

is exact, fully faithful, with essential image those quasi-coherent $\mathcal{O}_{X^{-}}$ modules $\mathcal{F}$ such that $\mathcal{I \mathcal { F }}=0$.

Proof. During this proof we work exclusively with sheaves on the small étale sites, and we use $i_{*}, i^{-1}, \ldots$ to denote pushforward and pullback of sheaves of abelian groups instead of $i_{\text {small }, *}, i_{\text {small }}^{-1}$.
Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. By Lemma 54.13 .6 we see that $i_{*} i^{*} \mathcal{F}=\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{Z}$. By Lemma 54.13.1 we see that we have a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z} \rightarrow 0
$$

It follows from properties of the tensor product that $\mathcal{F} \otimes_{\mathcal{O}_{X}} i_{*} \mathcal{O}_{Z}=\mathcal{F} / \mathcal{I} \mathcal{F}$. This proves (1) (except that we omit the verification that the map is induced by the adjunction mapping).
Let $\mathcal{G}$ be any $\mathcal{O}_{Z}$-module. By Lemma 54.13 .5 we see that $i^{-1} i_{*} \mathcal{G}=\mathcal{G}$. Hence to prove (2) we have to show that the canonical map $\mathcal{G} \otimes_{i^{-1}} \mathcal{O}_{X} \mathcal{O}_{Z} \rightarrow \mathcal{G}$ is an isomorphism. This follows from general properties of tensor products if we can show that $i^{-1} \mathcal{O}_{X} \rightarrow \mathcal{O}_{Z}$ is surjective. By Lemma 54.13 .5 it suffices to prove that $i_{*} i^{-1} \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. Since the surjective map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ factors through this map we see that (2) holds.
Finally we prove the most interesting part of the lemma, namely part (3). A closed immersion is quasi-compact and separated, see Lemmas 54.13.3 and 54.13.4 Hence Lemma 54.11.2 applies and the pushforward of a quasi-coherent sheaf on $Z$ is indeed a quasi-coherent sheaf on $X$. Thus we obtain our functor $i_{*}^{Q C o h}: Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right) \rightarrow$
$Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. It is clear from part (2) that $i_{*}^{Q C o h}$ is fully faithful since it has a left inverse, namely $i^{*}$.

Now we turn to the description of the essential image of the functor $i_{*}$. It is clear that $\mathcal{I}\left(i_{*} \mathcal{G}\right)=0$ for any $\mathcal{O}_{Z}$-module, since $\mathcal{I}$ is the kernel of the map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ which is the map we use to put an $\mathcal{O}_{X}$-module structure on $i_{*} \mathcal{G}$. Next, suppose that $\mathcal{F}$ is any quasi-coherent $\mathcal{O}_{X}$-module such that $\mathcal{I} \mathcal{F}=0$. Then we see that $\mathcal{F}$ is an $i_{*} \mathcal{O}_{Z}$-module because $i_{*} \mathcal{O}_{Z}=\mathcal{O}_{X} / \mathcal{I}$. Hence in particular its support is contained in $Z$. We apply Lemma 54.13 .5 to see that $\mathcal{F} \cong i_{*} \mathcal{G}$ for some $\mathcal{O}_{Z}$-module $\mathcal{G}$. The only small detail left over is to see why $\mathcal{G}$ is quasi-coherent. This is true because $\mathcal{G} \cong i^{*} \mathcal{F}$ by part (2) and Properties of Spaces, Lemma53.28.2.

Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces. Because of the lemma above we often, by abuse of notation, denote $\mathcal{F}$ the sheaf $i_{*} \mathcal{F}$ on $X$.

04CK Lemma 54.14.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{G} \subset \mathcal{F}$ be a $\mathcal{O}_{X}$-submodule. There exists a unique quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{G}^{\prime} \subset \mathcal{G}$ with the following property: For every quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{H}$ the map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{H}, \mathcal{G}^{\prime}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{H}, \mathcal{G})
$$

is bijective. In particular $\mathcal{G}^{\prime}$ is the largest quasi-coherent $\mathcal{O}_{X}$-submodule of $\mathcal{F}$ contained in $\mathcal{G}$.

Proof. Let $\mathcal{G}_{a}, a \in A$ be the set of quasi-coherent $\mathcal{O}_{X}$-submodules contained in $\mathcal{G}$. Then the image $\mathcal{G}^{\prime}$ of

$$
\bigoplus_{a \in A} \mathcal{G}_{a} \longrightarrow \mathcal{F}
$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on $X$ is quasicoherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see Properties of Spaces, Lemma 53.28.7. The module $\mathcal{G}^{\prime}$ is contained in $\mathcal{G}$. Hence this is the largest quasi-coherent $\mathcal{O}_{X}$-module contained in $\mathcal{G}$.

To prove the formula, let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{X}$-module and let $\alpha: \mathcal{H} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-module map. The image of the composition $\mathcal{H} \rightarrow \mathcal{G} \rightarrow \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in $\mathcal{G}^{\prime}$. Hence $\alpha$ factors through $\mathcal{G}^{\prime}$ as desired.

04CL Lemma 54.14.3. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. There is a functor ${ }^{4} i^{!}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right)$ which is a right adjoint to $i_{*}$. (Compare Modules, Lemma 17.6.3.)

Proof. Given quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{G}$ we consider the subsheaf $\mathcal{H}_{Z}(\mathcal{G})$ of $\mathcal{G}$ of local sections annihilated by $\mathcal{I}$. By Lemma 54.14 .2 there is a canonical largest quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{H}_{Z}(\mathcal{G})^{\prime}$. By construction we have

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{F}, \mathcal{H}_{Z}(\mathcal{G})^{\prime}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{F}, \mathcal{G}\right)
$$

for any quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{F}$. Hence we can set $i^{!} \mathcal{G}=i^{*}\left(\mathcal{H}_{Z}(\mathcal{G})^{\prime}\right)$. Details omitted.

[^163]
### 54.15. Supports of modules

07 TX In this section we collect some elementary results on supports of quasi-coherent modules on algebraic spaces. Let $X$ be an algebraic space. The support of an abelian sheaf on $X_{\text {étale }}$ has been defined in Properties of Spaces, Section 53.19 . We use the same definition for supports of modules. The following lemma tells us this agrees with the notion as defined for quasi-coherent modules on schemes.

07TY Lemma 54.15.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $U$ be a scheme and let $\varphi: U \rightarrow X$ be an étale morphism. Then

$$
\operatorname{Supp}\left(\varphi^{*} \mathcal{F}\right)=|\varphi|^{-1}(\operatorname{Supp}(\mathcal{F}))
$$

where the left hand side is the support of $\varphi^{*} \mathcal{F}$ as a quasi-coherent module on the scheme $U$.

Proof. Let $u \in U$ be a (usual) point and let $\bar{x}$ be a geometric point lying over $u$. By Properties of Spaces, Lemma 53.28 .4 we have $\left(\varphi^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}}=\mathcal{F}_{\bar{x}}$. Since $\mathcal{O}_{U, u} \rightarrow \mathcal{O}_{X, \bar{x}}$ is the strict henselization by Properties of Spaces, Lemma 53.21.1 we see that it is faithfully flat (see More on Algebra, Lemma 15.36.1). Thus we see that $\left(\varphi^{*} \mathcal{F}\right)_{u}=0$ if and only if $\mathcal{F}_{\bar{x}}=0$. This proves the lemma.

For finite type quasi-coherent modules the support is closed, can be checked on fibres, and commutes with base change.

07TZ Lemma 54.15.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Then
(1) The support of $\mathcal{F}$ is closed.
(2) For a geometric point $\bar{x}$ lying over $x \in|X|$ we have

$$
x \in \operatorname{Supp}(\mathcal{F}) \Leftrightarrow \mathcal{F}_{\bar{x}} \neq 0 \Leftrightarrow \mathcal{F}_{\bar{x}} \otimes_{\mathcal{O}_{X, \bar{x}}} \kappa(\bar{x}) \neq 0 .
$$

(3) For any morphism of algebraic spaces $f: Y \rightarrow X$ the pullback $f^{*} \mathcal{F}$ is of finite type as well and we have $\operatorname{Supp}\left(f^{*} \mathcal{F}\right)=f^{-1}(\operatorname{Supp}(\mathcal{F}))$.
Proof. Choose a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. By Lemma 54.15.1 the inverse image of the support of $\mathcal{F}$ is the support of $\varphi^{*} \mathcal{F}$ which is closed by Morphisms, Lemma 28.5.3. Thus (1) follows from the definition of the topology on $|X|$.

The first equivalence in (2) is the definition of support. The second equivalence follows from Nakayama's lemma, see Algebra, Lemma 10.19.1.
Let $f: Y \rightarrow X$ be as in (3). Note that $f^{*} \mathcal{F}$ is of finite type by Properties of Spaces, Section 53.29. For the final assertion, let $\bar{y}$ be a geometric point of $Y$ mapping to the geometric point $\bar{x}$ on $X$. Recall that

$$
\left(f^{*} \mathcal{F}\right)_{\bar{y}}=\mathcal{F}_{\bar{x}} \otimes_{\mathcal{O}_{X, \bar{x}}} \mathcal{O}_{Y, \bar{y}}
$$

see Properties of Spaces, Lemma 53.28.5. Hence $\left(f^{*} \mathcal{F}\right)_{\bar{y}} \otimes \kappa(\bar{y})$ is nonzero if and only if $\mathcal{F}_{\bar{x}} \otimes \kappa(\bar{x})$ is nonzero. By (2) this implies $x \in \operatorname{Supp}(\mathcal{F})$ if and only if $y \in \operatorname{Supp}\left(f^{*} \mathcal{F}\right)$, which is the content of assertion (3).
Our next task is to show that the scheme theoretic support of a finite type quasicoherent module (see Morphisms, Definition 28.5.5) also makes sense for finite type quasi-coherent modules on algebraic spaces.

07U0 Lemma 54.15.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. There exists a smallest closed subspace $i: Z \rightarrow X$ such that there exists a quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{G}$ with $i_{*} \mathcal{G} \cong \mathcal{F}$. Moreover:
(1) If $U$ is a scheme and $\varphi: U \rightarrow X$ is an étale morphism then $Z \times_{X} U$ is the scheme theoretic support of $\varphi^{*} \mathcal{F}$.
(2) The quasi-coherent sheaf $\mathcal{G}$ is unique up to unique isomorphism.
(3) The quasi-coherent sheaf $\mathcal{G}$ is of finite type.
(4) The support of $\mathcal{G}$ and of $\mathcal{F}$ is $Z$.

Proof. Choose a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. Let $R=U \times{ }_{X} U$ with projections $s, t: R \rightarrow U$. Let $i^{\prime}: Z^{\prime} \rightarrow U$ be the scheme theoretic support of $\varphi^{*} \mathcal{F}$ and let $\mathcal{G}^{\prime}$ be the (unique up to unique isomorphism) finite type quasi-coherent $\mathcal{O}_{Z^{\prime}}$-module with $i_{*}^{\prime} \mathcal{G}^{\prime}=\varphi^{*} \mathcal{F}$, see Morphisms, Lemma 28.5.4. As $s^{*} \varphi^{*} \mathcal{F}=t^{*} \varphi^{*} \mathcal{F}$ we see that $R^{\prime}=s^{-1} Z^{\prime}=t^{-1} Z^{\prime}$ as closed subschemes of $R$ by Morphisms, Lemma 28.25.12. Thus we may apply Properties of Spaces, Lemma 53.11 .3 to find a closed subspace $i: Z \rightarrow X$ whose pullback to $U$ is $Z^{\prime}$. Writing $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow Z^{\prime}$ the projections and $j^{\prime}: R^{\prime} \rightarrow R$ the given closed immersion, we see that

$$
j_{*}^{\prime}\left(s^{\prime}\right)^{*} \mathcal{G}^{\prime}=s^{*} i_{*}^{\prime} \mathcal{G}^{\prime}=s^{*} \varphi^{*} \mathcal{F}=t^{*} \varphi^{*} \mathcal{F}=t^{*} i_{*}^{\prime} \mathcal{G}^{\prime}=j_{*}^{\prime}\left(t^{\prime}\right)^{*} \mathcal{G}^{\prime}
$$

(the first and the last equality by Cohomology of Schemes, Lemma 29.5.2. Hence the uniqueness of Morphisms, Lemma 28.25 .12 applied to $R^{\prime} \rightarrow R$ gives an isomorphism $\alpha:\left(t^{\prime}\right)^{*} \mathcal{G}^{\prime} \rightarrow\left(s^{\prime}\right)^{*} \mathcal{G}^{\prime}$ compatible with the canonical isomorphism $t^{*} \varphi^{*} \mathcal{F}=$ $s^{*} \varphi^{*} \mathcal{F}$ via $j_{*}^{\prime}$. Clearly $\alpha$ satisfies the cocycle condition, hence we may apply Properties of Spaces, Proposition 53.31.1 to obtain a quasi-coherent module $\mathcal{G}$ on $Z$ whose restriction to $Z^{\prime}$ is $\mathcal{G}^{\prime}$ compatible with $\alpha$. Again using the equivalence of the proposition mentioned above (this time for $X$ ) we conclude that $i_{*} \mathcal{G} \cong \mathcal{F}$.
This proves existence. The other properties of the lemma follow by comparing with the result for schemes using Lemma 54.15.1. Detailed proofs omitted.

07U1 Definition 54.15.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. The scheme theoretic support of $\mathcal{F}$ is the closed subspace $Z \subset X$ constructed in Lemma 54.15.3.

In this situation we often think of $\mathcal{F}$ as a quasi-coherent sheaf of finite type on $Z$ (via the equivalence of categories of Lemma 54.14.1).

### 54.16. Scheme theoretic image

082 W Caution: Some of the material in this section is ultra-general and behaves differently from what you might expect.

082X Lemma 54.16.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. There exists a closed subspace $Z \subset Y$ such that $f$ factors through $Z$ and such that for any other closed subspace $Z^{\prime} \subset Y$ such that $f$ factors through $Z^{\prime}$ we have $Z \subset Z^{\prime}$.

Proof. Let $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}\right)$. If $\mathcal{I}$ is quasi-coherent then we just take $Z$ to be the closed subscheme determined by $\mathcal{I}$, see Lemma 54.13.1. In general the lemma requires us to show that there exists a largest quasi-coherent sheaf of ideals $\mathcal{I}^{\prime}$ contained in $\mathcal{I}$. This follows from Lemma 54.14.2.

Suppose that in the situation of Lemma 54.16.1 above $X$ and $Y$ are representable. Then the closed subspace $Z \subset Y$ found in the lemma agrees with the closed subscheme $Z \subset Y$ found in Morphisms, Lemma 28.6.1. The reason is that closed subspaces (or subschemes) are in a inclusion reversing correspondence with quasicoherent ideal sheaves on $X_{\text {étale }}$ and $X$. As the category of quasi-coherent modules on $X_{\text {étale }}$ and $X$ are the same (Properties of Spaces, Section 53.28) we conclude. Thus the following definition agrees with the earlier definition for morphisms of schemes.

082Y Definition 54.16.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The scheme theoretic image of $f$ is the smallest closed subspace $Z \subset Y$ through which $f$ factors, see Lemma 54.16.1 above.

We often just denote $f: X \rightarrow Z$ the factorization of $f$. If the morphism $f$ is not quasi-compact, then (in general) the construction of the scheme theoretic image does not commute with restriction to open subspaces of $Y$.

082 Z Lemma 54.16.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $Z \subset Y$ be the scheme theoretic image of $f$. If $f$ is quasi-compact then
(1) the sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}\right)$ is quasi-coherent,
(2) the scheme theoretic image $Z$ is the closed subspace corresponding to $\mathcal{I}$,
(3) for any étale morphism $V \rightarrow Y$ the scheme theoretic image of $X \times_{Y} V \rightarrow V$ is equal to $Z \times_{Y} V$, and
(4) the image $|f|(|X|) \subset|Z|$ is a dense subset of $|Z|$.

Proof. To prove (3) it suffices to prove (1) since the formation of $\mathcal{I}$ commutes with étale localization. If (1) holds then in the proof of Lemma 54.16.1 we showed (2). Let us prove that $\mathcal{I}$ is quasi-coherent. Since the property of being quasi-coherent is étale local we may assume $Y$ is an affine scheme. As $f$ is quasi-compact, we can find an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. Denote $f^{\prime}$ the composition $U \rightarrow X \rightarrow Y$. Then $f_{*} \mathcal{O}_{X}$ is a subsheaf of $f_{*}^{\prime} \mathcal{O}_{U}$, and hence $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow \mathcal{O}_{X^{\prime}}\right)$. By Lemma 54.11.2 the sheaf $f_{*}^{\prime} \mathcal{O}_{U}$ is quasi-coherent on $Y$. Hence $\mathcal{I}$ is quasi-coherent as a kernel of a map between coherent modules. Finally, part (4) follows from parts (1), (2), and (3) as the ideal $\mathcal{I}$ will be the unit ideal in any point of $|Y|$ which is not contained in the closure of $|f|(|X|)$.

0830 Lemma 54.16.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $X$ is reduced. Then
(1) the scheme theoretic image $Z$ of $f$ is the reduced induced algebraic space structure on $\overline{|f|(|X|)}$, and
(2) for any étale morphism $V \rightarrow Y$ the scheme theoretic image of $X \times{ }_{Y} V \rightarrow V$ is equal to $Z \times_{Y} V$.

Proof. Part (1) is true because the reduced induced algebraic space structure on $\overline{|f|(|X|)}$ is the smallest closed subspace of $Y$ through which $f$ factors, see Properties of Spaces, Lemma 53.11.5. Part (2) follows from (1), the fact that $|V| \rightarrow|Y|$ is open, and the fact that being reduced is preserved under étale localization.

089B Lemma 54.16.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact morphism of algebraic spaces over $S$. Let $Z$ be the scheme theoretic image of $f$. Let $z \in|Z|$.

There exists a valuation ring $A$ with fraction field $K$ and a commutative diagram

such that the closed point of $\operatorname{Spec}(A)$ maps to $z$.
Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Let $Z^{\prime} \subset V$ be the scheme theoretic image of $X \times_{Y} V \rightarrow V$. By Lemma 54.16.3 $Z^{\prime}=Z \times_{Y} V$. Thus we can choose a point $z^{\prime} \in Z^{\prime}$ mapping to $z$. By Morphisms, Lemma 28.6.5 we can choose a diagram

such that the closed point of $\operatorname{Spec}(A)$ maps to $z^{\prime}$. Composing with the projections $Z^{\prime} \rightarrow Z$ and $X \times_{Y} V \rightarrow X$ we obtain a solution.

### 54.17. Scheme theoretic closure and density

0831 This section is the analogue of Morphisms, Section 28.7
0832 Lemma 54.17.1. Let $S$ be a scheme. Let $W \subset S$ be a scheme theoretically dense open subscheme (Morphisms, Definition 28.7.1). Let $f: X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, and locally quasi-finite. Then $f^{-1}(W)$ is scheme theoretically dense in $X$.

Proof. We will use the characterization of Morphisms, Lemma 28.7.5. Assume $V \subset X$ is an open and $g \in \Gamma\left(V, \mathcal{O}_{V}\right)$ is a function which restricts to zero on $f^{-1}(W) \cap V$. We have to show that $g=0$. Assume $g \neq 0$ to get a contradiction. By More on Morphisms, Lemma 36.31.11 we may shrink $V$, find an open $U \subset S$ fitting into a commutative diagram

a quasi-coherent subsheaf $\mathcal{F} \subset \mathcal{O}_{U}$, an integer $r>0$, and an injective $\mathcal{O}_{U}$-module $\operatorname{map} \mathcal{F}^{\oplus r} \rightarrow \pi_{*} \mathcal{O}_{V}$ whose image contains $\left.g\right|_{V}$. Say $\left(g_{1}, \ldots, g_{r}\right) \in \Gamma\left(U, \mathcal{F}^{\oplus r}\right)$ maps to $g$. Then we see that $\left.g_{i}\right|_{W \cap U}=0$ because $\left.g\right|_{f^{-1} W \cap V}=0$. Hence $g_{i}=0$ because $\mathcal{F} \subset \mathcal{O}_{U}$ and $W$ is scheme theoretically dense in $S$. This implies $g=0$ which is the desired contradiction.
0833 Lemma 54.17.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \subset X$ be an open subspace. The following are equivalent
(1) for every étale morphism $\varphi: V \rightarrow X$ (of algebraic spaces) the scheme theoretic closure of $\varphi^{-1}(U)$ in $V$ is equal to $V$,
(2) there exists a scheme $V$ and a surjective étale morphism $\varphi: V \rightarrow X$ such that the scheme theoretic closure of $\varphi^{-1}(U)$ in $V$ is equal to $V$,

Proof. Observe that if $V \rightarrow V^{\prime}$ is a morphism of algebraic spaces étale over $X$, and $Z \subset V$, resp. $Z^{\prime} \subset V^{\prime}$ is the scheme theoretic closure of $U \times{ }_{X} V$, resp. $U \times{ }_{X} V^{\prime}$ in $V$, resp. $V^{\prime}$, then $Z$ maps into $Z^{\prime}$. Thus if $V \rightarrow V^{\prime}$ is surjective and étale then $Z=V$ implies $Z^{\prime}=V^{\prime}$. Next, note that an étale morphism is flat, locally of finite presentation, and locally quasi-finite (see Morphisms, Section 28.36). Thus Lemma 54.17.1 implies that if $V$ and $V^{\prime}$ are schemes, then $Z^{\prime}=V^{\prime}$ implies $Z=V$. A formal argument using that every algebraic space has an étale covering by a scheme shows that (1) and (2) are equivalent.

It follows from Lemma 54.17 .2 that the following definition is compatible with the definition in the case of schemes.

0834 Definition 54.17.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \subset X$ be an open subspace.
(1) The scheme theoretic image of the morphism $U \rightarrow X$ is called the scheme theoretic closure of $U$ in $X$.
(2) We say $U$ is scheme theoretically dense in $X$ if the equivalent conditions of Lemma 54.17.2 are satisfied.

With this definition it is not the case that $U$ is scheme theoretically dense in $X$ if and only if the scheme theoretic closure of $U$ is $X$. This is somewhat inelegant. But with suitable finiteness conditions we will see that it does hold.

0835 Lemma 54.17.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \subset X$ be an open subspace. If $U \rightarrow X$ is quasi-compact, then $U$ is scheme theoretically dense in $X$ if and only if the scheme theoretic closure of $U$ in $X$ is $X$.

Proof. Follows from Lemma 54.16.3 part (3).
0836 Lemma 54.17.5. Let $S$ be a scheme. Let $j: U \rightarrow X$ be an open immersion of algebraic spaces over $S$. Then $U$ is scheme theoretically dense in $X$ if and only if $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is injective.

Proof. If $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is injective, then the same is true when restricted to any algebraic space $V$ étale over $X$. Hence the scheme theoretic closure of $U \times_{X} V$ in $V$ is equal to $V$, see proof of Lemma 54.16.1. Conversely, assume the scheme theoretic closure of $U \times_{X} V$ is equal to $V$ for all $V$ étale over $X$. Suppose that $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is not injective. Then we can find an affine, say $V=\operatorname{Spec}(A)$, étale over $X$ and a nonzero element $f \in A$ such that $f$ maps to zero in $\Gamma\left(V \times_{X} U, \mathcal{O}\right)$. In this case the scheme theoretic closure of $V \times_{X} U$ in $V$ is clearly contained in $\operatorname{Spec}(A /(f))$ a contradiction.

0837 Lemma 54.17.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $U$, $V$ are scheme theoretically dense open subspaces of $X$, then so is $U \cap V$.

Proof. Let $W \rightarrow X$ be any étale morphism. Consider the map $\mathcal{O}(W) \rightarrow \mathcal{O}\left(W \times_{X}\right.$ $V) \rightarrow \mathcal{O}\left(W \times_{X}(V \cap U)\right)$. By Lemma 54.17 .5 both maps are injective. Hence the composite is injective. Hence by Lemma 54.17.5 $U \cap V$ is scheme theoretically dense in $X$.

088G Lemma 54.17.7. Let $S$ be a scheme. Let $h: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Assume either $Z \rightarrow X$ is quasi-compact or $Z$ is reduced. Let $\bar{Z} \subset X$ be the scheme theoretic image of $h$. Then the morphism $Z \rightarrow \bar{Z}$ is an
open immersion which identifies $Z$ with a scheme theoretically dense open subspace of $\bar{Z}$. Moreover, $Z$ is topologically dense in $\bar{Z}$.

Proof. In both cases the formation of $Z$ commutes with étale localization, see Lemmas 54.16 .3 and 54.16 .4 . Hence this lemma follows from the case of schemes, see Morphisms, Lemma 28.7.7

084N Lemma 54.17.8. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $f, g: X \rightarrow Y$ be morphisms of algebraic spaces over $B$. Let $U \subset X$ be an open subspace such that $\left.f\right|_{U}=\left.g\right|_{U}$. If the scheme theoretic closure of $U$ in $X$ is $X$ and $Y \rightarrow B$ is separated, then $f=g$.

Proof. As $Y \rightarrow B$ is separated the fibre product $Y \times_{\Delta, Y \times{ }_{B} Y,(f, g)} X$ is a closed subspace $Z \subset X$. As $\left.f\right|_{U}=\left.g\right|_{U}$ we see that $U \subset Z$. Hence $Z=X$ as $U$ is assumed scheme theoretically dense in $X$.

### 54.18. Dominant morphisms

0ABK We copy the definition of a dominant morphism of schemes to get the notion of a dominant morphism of algebraic spaces. We caution the reader that this definition is not well behaved unless the morphism is quasi-compact and the algebraic spaces satisfy some separation axioms.

0ABL Definition 54.18.1. Let $S$ be a scheme. A morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ is called dominant if the image of $|f|:|X| \rightarrow|Y|$ is dense in $|Y|$.

### 54.19. Universally injective morphisms

03MT We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be universally injective. For a field $K$ over $S$ (recall this means that we are given a structure morphism $\operatorname{Spec}(K) \rightarrow S$ ) and an algebraic space $X$ over $S$ we write $X(K)=\operatorname{Mor}_{S}(\operatorname{Spec}(K), X)$. We first translate the condition for representable morphisms into a condition on the functor of points.

03MU Lemma 54.19.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is universally injective if and only if for all fields $K$ the map $X(K) \rightarrow Y(K)$ is injective.

Proof. We are going to use Morphisms, Lemma 28.11 .2 without further mention. Suppose that $f$ is universally injective. Then for any field $K$ and any morphism $\operatorname{Spec}(K) \rightarrow Y$ the morphism of $\operatorname{schemes} \operatorname{Spec}(K) \times_{Y} X \rightarrow \operatorname{Spec}(K)$ is universally injective. Hence there exists at most one section of the morphism $\operatorname{Spec}(K) \times_{Y} X \rightarrow$ $\operatorname{Spec}(K)$. Hence the map $X(K) \rightarrow Y(K)$ is injective. Conversely, suppose that for every field $K$ the map $X(K) \rightarrow Y(K)$ is injective. Let $T \rightarrow Y$ be a morphism from a scheme into $Y$, and consider the base change $f_{T}: T \times_{Y} X \rightarrow T$. For any field $K$ we have

$$
\left(T \times_{Y} X\right)(K)=T(K) \times_{Y(K)} X(K)
$$

by definition of the fibre product, and hence the injectivity of $X(K) \rightarrow Y(K)$ guarantees the injectivity of $\left(T \times_{Y} X\right)(K) \rightarrow T(K)$ which means that $f_{T}$ is universally injective as desired.

Next, we translate the property that the transformation between field valued points is injective into something more geometric.

040X Lemma 54.19.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) the map $X(K) \rightarrow Y(K)$ is injective for every field $K$ over $S$
(2) for every morphism $Y^{\prime} \rightarrow Y$ of algebraic spaces over $S$ the induced map $\left|Y^{\prime} \times_{Y} X\right| \rightarrow\left|Y^{\prime}\right|$ is injective, and
(3) the diagonal morphism $X \rightarrow X \times_{Y} X$ is surjective.

Proof. Assume (1). Let $g: Y^{\prime} \rightarrow Y$ be a morphism of algebraic spaces, and denote $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ the base change of $f$. Let $K_{i}, i=1,2$ be fields and let $\varphi_{i}: \operatorname{Spec}\left(K_{i}\right) \rightarrow Y^{\prime} \times_{Y} X$ be morphisms such that $f^{\prime} \circ \varphi_{1}$ and $f^{\prime} \circ \varphi_{2}$ define the same element of $\left|Y^{\prime}\right|$. By definition this means there exists a field $\Omega$ and embeddings $\alpha_{i}: K_{i} \subset \Omega$ such that the two morphisms $f^{\prime} \circ \varphi_{i} \circ \alpha_{i}: \operatorname{Spec}(\Omega) \rightarrow Y^{\prime}$ are equal. Here is the corresponding commutative diagram

In particular the compositions $g \circ f^{\prime} \circ \varphi_{i} \circ \alpha_{i}$ are equal. By assumption (1) this implies that the morphism $g^{\prime} \circ \varphi_{i} \circ \alpha_{i}$ are equal, where $g^{\prime}: Y^{\prime} \times_{Y} X \rightarrow X$ is the projection. By the universal property of the fibre product we conclude that the morphisms $\varphi_{i} \circ \alpha_{i}: \operatorname{Spec}(\Omega) \rightarrow Y^{\prime} \times_{Y} X$ are equal. In other words $\varphi_{1}$ and $\varphi_{2}$ define the same point of $Y^{\prime} \times_{Y} X$. We conclude that (2) holds.

Assume (2). Let $K$ be a field over $S$, and let $a, b: \operatorname{Spec}(K) \rightarrow X$ be two morphisms such that $f \circ a=f \circ b$. Denote $c: \operatorname{Spec}(K) \rightarrow Y$ the common value. By assumption $\left|\operatorname{Spec}(K) \times{ }_{c, Y} X\right| \rightarrow|\operatorname{Spec}(K)|$ is injective. This means there exists a field $\Omega$ and embeddings $\alpha_{i}: K \rightarrow \Omega$ such that

is commutative. Composing with the projection to $\operatorname{Spec}(K)$ we see that $\alpha_{1}=\alpha_{2}$. Denote the common value $\alpha$. Then we see that $\{\alpha: \operatorname{Spec}(\Omega) \rightarrow \operatorname{Spec}(K)\}$ is a fpqc covering of $\operatorname{Spec}(K)$ such that the two morphisms $a, b$ become equal on the members of the covering. By Properties of Spaces, Proposition 53.16.1 we conclude that $a=b$. We conclude that (1) holds.

Assume (3). Let $x, x^{\prime} \in|X|$ be a pair of points such that $f(x)=f\left(x^{\prime}\right)$ in $|Y|$. By Properties of Spaces, Lemma 53.4.3 we see there exists a $x^{\prime \prime} \in\left|X \times_{Y} X\right|$ whose projections are $x$ and $x^{\prime}$. By assumption and Properties of Spaces, Lemma 53.4.4 there exists a $x^{\prime \prime \prime} \in|X|$ with $\Delta_{X / Y}\left(x^{\prime \prime \prime}\right)=x^{\prime \prime}$. Thus $x=x^{\prime}$. In other words $f$ is injective. Since condition (3) is stable under base change we see that $f$ satisfies (2).

Assume (2). Then in particular $\left|X \times_{Y} X\right| \rightarrow|X|$ is injective which implies immediately that $\left|\Delta_{X / Y}\right|:|X| \rightarrow\left|X \times_{Y} X\right|$ is surjective, which implies that $\Delta_{X / Y}$ is surjective by Properties of Spaces, Lemma 53.4.4.

By the two lemmas above the following definition does not conflict with the already defined notion of a universally injective representable morphism of algebraic spaces.

03MV Definition 54.19.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is universally injective if for every morphism $Y^{\prime} \rightarrow Y$ the induced map $\left|Y^{\prime} \times_{Y} X\right| \rightarrow\left|Y^{\prime}\right|$ is injective.

To be sure this means that any or all of the equivalent conditions of Lemma 54.19.2 hold.

05 VS Remark 54.19.4. A universally injective morphism of schemes is separated, see Morphisms, Lemma 28.11.3. This is not the case for morphisms of algebraic spaces. Namely, the algebraic space $X=\mathbf{A}_{k}^{1} /\{x \sim-x \mid x \neq 0\}$ constructed in Spaces, Example 52.14.1 comes equipped with a morphism $X \rightarrow \mathbf{A}_{k}^{1}$ which maps the point with coordinate $x$ to the point with coordinate $x^{2}$. This is an isomorphism away from 0 , and there is a unique point of $X$ lying above 0 . As $X$ isn't separated this is a universally injective morphism of algebraic spaces which is not separated.

03MW Lemma 54.19.5. The base change of a universally injective morphism is universally injective.

Proof. Omitted. Hint: This is formal.
03MX Lemma 54.19.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is universally injective,
(2) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is universally injective,
(3) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is universally injective,
(4) there exists a scheme $Z$ and a surjective morphism $Z \rightarrow Y$ such that $Z \times_{Y} X \rightarrow Z$ is universally injective, and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is universally injective.

Proof. We will use that being universally injective is preserved under base change (Lemma 54.19.5) without further mention in this proof. It is clear that (1) $\Rightarrow$ (2) $\Rightarrow(3) \Rightarrow(4)$.

Assume $g: Z \rightarrow Y$ as in (4). Let $y: \operatorname{Spec}(K) \rightarrow Y$ be a morphism from the spectrum of a field into $Y$. By assumption we can find an extension field $\alpha: K \subset K^{\prime}$ and a morphism $z: \operatorname{Spec}\left(K^{\prime}\right) \rightarrow Z$ such that $y \circ \alpha=g \circ z$ (with obvious abuse of notation). By assumption the morphism $Z \times_{Y} X \rightarrow Z$ is universally injective, hence there is at most one lift of $g \circ z: \operatorname{Spec}\left(K^{\prime}\right) \rightarrow Y$ to a morphism into $X$. Since $\left\{\alpha: \operatorname{Spec}\left(K^{\prime}\right) \rightarrow \operatorname{Spec}(K)\right\}$ is a fpqc covering this implies there is at most one lift of $y: \operatorname{Spec}(K) \rightarrow Y$ to a morphism into $X$, see Properties of Spaces, Proposition 53.16.1. Thus we see that (1) holds.

We omit the verification that (5) is equivalent to (1).

03MY Lemma 54.19.7. A composition of universally injective morphisms is universally injective.

Proof. Omitted.

### 54.20. Affine morphisms

03WD We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be affine.

03WE Lemma 54.20.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is affine if and only if for all affine schemes $Z$ and morphisms $Z \rightarrow Y$ the scheme $X \times_{Y} Z$ is affine.
Proof. This follows directly from the definition of an affine morphism of schemes (Morphisms, Definition 28.12.1).

This clears the way for the following definition.
03WF Definition 54.20.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is affine if for every affine scheme $Z$ and morphism $Z \rightarrow Y$ the algebraic space $X \times_{Y} Z$ is representable by an affine scheme.

03WG Lemma 54.20.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is representable and affine,
(2) $f$ is affine,
(3) for every affine scheme $V$ and étale morphism $V \rightarrow Y$ the scheme $X \times{ }_{Y} V$ is affine,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is affine, and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is affine.
Proof. It is clear that (1) implies (2), that (2) implies (3), and that (3) implies (4) by taking $V$ to be a disjoint union of affines étale over $Y$, see Properties of Spaces, Lemma 53.6.1. Assume $V \rightarrow Y$ is as in (4). Then for every affine open $W$ of $V$ we see that $W \times_{Y} X$ is an affine open of $V \times_{Y} X$. Hence by Properties of Spaces, Lemma 53.12.1 we conclude that $V \times_{Y} X$ is a scheme. Moreover the morphism $V \times_{Y} X \rightarrow V$ is affine. This means we can apply Spaces, Lemma 52.11.5 because the class of affine morphisms satisfies all the required properties (see Morphisms, Lemmas 28.12 .8 and Descent, Lemmas 34.19.16 and 34.33.1). The conclusion of applying this lemma is that $f$ is representable and affine, i.e., (1) holds.
The equivalence of (1) and (5) follows from the fact that being affine is Zariski local on the target (the reference above shows that being affine is in fact fpqc local on the target).

03WH Lemma 54.20.4. The composition of affine morphisms is affine.
Proof. Omitted. Hint: Transitivity of fibre products.
03WI Lemma 54.20.5. The base change of an affine morphism is affine.
Proof. Omitted. Hint: Transitivity of fibre products.

07U2 Lemma 54.20.6. A closed immersion is affine.
Proof. Follows immediately from the corresponding statement for morphisms of schemes, see Morphisms, Lemma 28.12.9.

081V Lemma 54.20.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. There is an anti-equivalence of categories

$$
\begin{gathered}
\text { algebraic space } \\
\text { affine over } X
\end{gathered} \longleftrightarrow \begin{gathered}
\text { quasi-coherent sheaves } \\
\text { of } \mathcal{O}_{X} \text {-algebras }
\end{gathered}
$$

which associates to $f: Y \rightarrow X$ the sheaf $f_{*} \mathcal{O}_{Y}$. Moreover, this equivalence is compatible with arbitrary base change.

Proof. This lemma is the analogue of Morphisms, Lemma 28.12.5. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. We will construct an affine morphism of algebraic spaces $\pi: Y=\underline{\operatorname{Spec}}_{X}(\mathcal{A}) \rightarrow X$ with $\pi_{*} \mathcal{O}_{Y} \cong \mathcal{A}$. To do this, choose a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. As usual denote $R=U \times{ }_{X} U$ with projections $s, t: R \rightarrow U$. Denote $\psi: R \rightarrow X$ the composition $\psi=\varphi \circ s=$ $\varphi \circ t$. By the aforementioned lemma there exists an affine morphisms of schemes $\pi_{0}: V \rightarrow U$ and $\pi_{1}: W \rightarrow R$ with $\pi_{0, *} \mathcal{O}_{V} \cong \varphi^{*} \mathcal{A}$ and $\pi_{1, *} \mathcal{O}_{W} \cong \psi^{*} \mathcal{A}$. Since the construction is compatible with base change there exist morphisms $s^{\prime}, t^{\prime}: W \rightarrow V$ such that the diagrams

and

are cartesian. It follows that $s^{\prime}, t^{\prime}$ are étale. It is a formal consequence of the above that $\left(t^{\prime}, s^{\prime}\right): W \rightarrow V \times_{S} V$ is a monomorphism. We omit the verification that $W \rightarrow V \times_{S} V$ is an equivalence relation (hint: think about the pullback of $\mathcal{A}$ to $\left.U \times_{X} U \times_{X} U=R \times_{s, U, t} R\right)$. The quotient sheaf $Y=V / W$ is an algebraic space, see Spaces, Theorem 52.10.5. By Groupoids, Lemma 38.20 .7 we see that $Y \times{ }_{X} U \cong V$. Hence $Y \rightarrow X$ is affine by Lemma 54.20.3. Finally, the isomorphism of

$$
\left(Y \times_{X} U \rightarrow U\right)_{*} \mathcal{O}_{Y \times_{X} U}=\pi_{0, *} \mathcal{O}_{V} \cong \varphi^{*} \mathcal{A}
$$

is compatible with glueing isomorphisms, whence $(Y \rightarrow X)_{*} \mathcal{O}_{Y} \cong \mathcal{A}$ by Properties of Spaces, Proposition 53.31.1. We omit the verification that this construction is compatible with base change.
081W Definition 54.20.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. The relative spectrum of $\mathcal{A}$ over $X$, or simply the spectrum of $\mathcal{A}$ over $X$ is the affine morphism $\operatorname{Spec}(\mathcal{A}) \rightarrow X$ corresponding to $\mathcal{A}$ under the equivalence of categories of Lemma 54.20.7.

Forming the relative spectrum commutes with arbitrary base change.
081X Remark 54.20.9. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Then $f$ has a canonical factorization

$$
Y \longrightarrow \underline{\operatorname{Spec}}_{X}\left(f_{*} \mathcal{O}_{Y}\right) \longrightarrow X
$$

This makes sense because $f_{*} \mathcal{O}_{Y}$ is quasi-coherent by Lemma 54.11.2. The morphism $Y \rightarrow \underline{\operatorname{Spec}}_{X}\left(f_{*} \mathcal{O}_{Y}\right)$ comes from the canonical $\mathcal{O}_{Y}$-algebra map $f^{*} f_{*} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{Y}$
which corresponds to a canonical morphism $Y \rightarrow Y \times_{X} \underline{\operatorname{Spec}}_{X}\left(f_{*} \mathcal{O}_{Y}\right)$ over $Y$ (see Lemma 54.20.7 whence a factorization of $f$ as above.

08AI Lemma 54.20.10. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be an affine morphism of algebraic spaces over $S$. Let $\mathcal{A}=f_{*} \mathcal{O}_{Y}$. The functor $\mathcal{F} \mapsto f_{*} \mathcal{F}$ induces an equivalence of categories

$$
\left\{\begin{array}{c}
\text { category of quasi-coherent } \\
\mathcal{O}_{Y} \text {-modules }
\end{array}\right\} \longrightarrow\left\{\begin{array}{c}
\text { category of quasi-coherent } \\
\mathcal{A} \text {-modules }
\end{array}\right\}
$$

Moreover, an $\mathcal{A}$-module is quasi-coherent as an $\mathcal{O}_{X}$-module if and only if it is quasi-coherent as an $\mathcal{A}$-module.

Proof. Omitted.
08GB Lemma 54.20.11. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Suppose $g: X \rightarrow Y$ is a morphism of algebraic spaces over $B$.
(1) If $X$ is affine over $B$ and $\Delta: Y \rightarrow Y \times_{B} Y$ is affine, then $g$ is affine.
(2) If $X$ is affine over $B$ and $Y$ is separated over $B$, then $g$ is affine.
(3) A morphism from an affine scheme to an algebraic space with affine diagonal is affine.
(4) A morphism from an affine scheme to a separated algebraic space is affine.

Proof. Proof of (1). The base change $X \times_{B} Y \rightarrow Y$ is affine by Lemma 54.20.5. The morphism $(1, g): X \rightarrow X \times_{B} Y$ is the base change of $Y \rightarrow Y \times_{B} Y$ by the morphism $X \times_{B} Y \rightarrow Y \times_{B} Y$. Hence it is affine by Lemma 54.20.5. The composition of affine morphisms is affine (see Lemma 54.20.4) and (1) follows. Part (2) follows from (1) as a closed immersion is affine (see Lemma 54.20.6) and $Y / B$ separated means $\Delta$ is a closed immersion. Parts (3) and (4) are special cases of (1) and (2).

09TF Lemma 54.20.12. Let $S$ be a scheme. Let $X$ be a quasi-separated algebraic space over $S$. Let $A$ be an Artinian ring. Any morphism $\operatorname{Spec}(A) \rightarrow X$ is affine.

Proof. Let $U \rightarrow X$ be an étale morphism with $U$ affine. To prove the lemma we have to show that $\operatorname{Spec}(A) \times{ }_{X} U$ is affine, see Lemma 54.20.3. Since $X$ is quasiseparated the scheme $\operatorname{Spec}(A) \times_{X} U$ is quasi-compact. Moreover, the projection morphism $\operatorname{Spec}(A) \times_{X} U \rightarrow \operatorname{Spec}(A)$ is étale. Hence this morphism has finite discrete fibers and moreover the topology on $\operatorname{Spec}(A)$ is discrete. Thus $\operatorname{Spec}(A) \times{ }_{X}$ $U$ is a scheme whose underlying topological space is a finite discrete set. We are done by Schemes, Lemma 25.11.7.

### 54.21. Quasi-affine morphisms

03WJ We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be quasi-affine.

03WK Lemma 54.21.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is quasi-affine if and only if for all affine schemes $Z$ and morphisms $Z \rightarrow Y$ the scheme $X \times_{Y} Z$ is quasi-affine.

Proof. This follows directly from the definition of a quasi-affine morphism of schemes (Morphisms, Definition 28.13.1).

This clears the way for the following definition.

03WL Definition 54.21.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is quasi-affine if for every affine scheme $Z$ and morphism $Z \rightarrow Y$ the algebraic space $X \times_{Y} Z$ is representable by a quasi-affine scheme.

03WM Lemma 54.21.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is representable and quasi-affine,
(2) $f$ is quasi-affine,
(3) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is quasi-affine, and
(4) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is quasi-affine.
Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking $V$ to be a disjoint union of affines étale over $Y$, see Properties of Spaces, Lemma 53.6.1, Assume $V \rightarrow Y$ is as in (3). Then for every affine open $W$ of $V$ we see that $W \times_{Y} X$ is a quasi-affine open of $V \times_{Y} X$. Hence by Properties of Spaces, Lemma 53.12.1 we conclude that $V \times_{Y} X$ is a scheme. Moreover the morphism $V \times_{Y} X \rightarrow V$ is quasi-affine. This means we can apply Spaces, Lemma 52.11.5 because the class of quasi-affine morphisms satisfies all the required properties (see Morphisms, Lemmas 28.13 .5 and Descent, Lemmas 34.19 .18 and 34.34.1. The conclusion of applying this lemma is that $f$ is representable and quasi-affine, i.e., (1) holds.
The equivalence of (1) and (4) follows from the fact that being quasi-affine is Zariski local on the target (the reference above shows that being quasi-affine is in fact fpqc local on the target).

03WN Lemma 54.21.4. The composition of quasi-affine morphisms is quasi-affine.
Proof. Omitted.
03WO Lemma 54.21.5. The base change of a quasi-affine morphism is quasi-affine.
Proof. Omitted.
086S Lemma 54.21.6. Let $S$ be a scheme. A quasi-compact and quasi-separated morphism of algebraic spaces $f: Y \rightarrow X$ is quasi-affine if and only if the canonical factorization $Y \rightarrow \underline{\operatorname{Spec}}_{X}\left(f_{*} \mathcal{O}_{Y}\right)$ (Remark 54.20.9) is an open immersion.
Proof. Let $U \rightarrow X$ be a surjective morphism where $U$ is a scheme. Since we may check whether $f$ is quasi-affine after base change to $U$ (Lemma 54.21.3), since $\left.f_{*} \mathcal{O}_{Y}\right|_{V}$ is equal to $\left(Y \times_{X} U \rightarrow U\right)_{*} \mathcal{O}_{Y \times_{X} U}$ (Properties of Spaces, Lemma 53.25.2), and since formation of relative spectrum commutes with base change (Lemma 54.20.7), we see that the assertion reduces to the case that $X$ is a scheme. If $X$ is a scheme and either $f$ is quasi-affine or $Y \rightarrow \operatorname{Spec}_{X}\left(f_{*} \mathcal{O}_{Y}\right)$ is an open immersion, then $Y$ is a scheme as well. Thus we reduce to Morphisms, Lemma 28.13.3.

### 54.22. Types of morphisms étale local on source-and-target

03 MI Given a property of morphisms of schemes which is étale local on the source-andtarget, see Descent, Definition 34.28 .3 we may use it to define a corresponding property of morphisms of algebraic spaces, namely by imposing either of the equivalent conditions of the lemma below.

03MJ Lemma 54.22.1. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Consider commutative diagrams

where $U$ and $V$ are schemes and the vertical arrows are étale. The following are equivalent
(1) for any diagram as above the morphism $h$ has property $\mathcal{P}$, and
(2) for some diagram as above with $a: U \rightarrow X$ surjective the morphism $h$ has property $\mathcal{P}$.
If $X$ and $Y$ are representable, then this is also equivalent to $f$ (as a morphism of schemes) having property $\mathcal{P}$. If $\mathcal{P}$ is also preserved under any base change, and fppf local on the base, then for representable morphisms $f$ this is also equivalent to $f$ having property $\mathcal{P}$ in the sense of Section 54.3.

Proof. Let us prove the equivalence of (1) and (2). The implication (1) $\Rightarrow(2)$ is immediate (taking into account Spaces, Lemma 52.11.6. Assume

are two diagrams as in the lemma. Assume $U \rightarrow X$ is surjective and $h$ has property $\mathcal{P}$. To show that (2) implies (1) we have to prove that $h^{\prime}$ has $\mathcal{P}$. To do this consider the diagram

By Descent, Lemma 34.28 .5 we see that $h$ has $\mathcal{P}$ implies $\left(h, h^{\prime}\right)$ has $\mathcal{P}$ and since $U \times_{X} U^{\prime} \rightarrow U^{\prime}$ is surjective this implies (by the same lemma) that $h^{\prime}$ has $\mathcal{P}$.
If $X$ and $Y$ are representable, then Descent, Lemma 34.28 .5 applies which shows that (1) and (2) are equivalent to $f$ having $\mathcal{P}$.
Finally, suppose $f$ is representable, and $U, V, a, b, h$ are as in part (2) of the lemma, and that $\mathcal{P}$ is preserved under arbitrary base change. We have to show that for any scheme $Z$ and morphism $Z \rightarrow X$ the base change $Z \times_{Y} X \rightarrow Z$ has property $\mathcal{P}$. Consider the diagram

Note that the top horizontal arrow is a base change of $h$ and hence has property $\mathcal{P}$. The left vertical arrow is étale and surjective and the right vertical arrow is étale.

Thus Descent, Lemma 34.28 .5 once again kicks in and shows that $Z \times_{Y} X \rightarrow Z$ has property $\mathcal{P}$.

04RD Definition 54.22.2. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. We say a morphism $f: X \rightarrow$ $Y$ of algebraic spaces over $S$ has property $\mathcal{P}$ if the equivalent conditions of Lemma 54.22 .1 hold.

Here are a couple of obvious remarks.
0AML Remark 54.22.3. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Suppose that moreover $\mathcal{P}$ is stable under compositions. Then the class of morphisms of algebraic spaces having property $\mathcal{P}$ is stable under composition.
0 AMM Remark 54.22.4. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Suppose that moreover $\mathcal{P}$ is stable under base change. Then the class of morphisms of algebraic spaces having property $\mathcal{P}$ is stable under base change.

Given a property of morphisms of germs of schemes which is étale local on the source-and-target, see Descent, Definition 34.29.1 we may use it to define a corresponding property of morphisms of algebraic spaces at a point, namely by imposing either of the equivalent conditions of the lemma below.
04NC Lemma 54.22.5. Let $\mathcal{Q}$ be a property of morphisms of germs which is étale local on the source-and-target. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$ be a point of $X$. Consider the diagrams

where $U$ and $V$ are schemes, $a, b$ are étale, and $u, v, x, y$ are points of the corresponding spaces. The following are equivalent
(1) for any diagram as above we have $\mathcal{Q}((U, u) \rightarrow(V, v))$, and
(2) for some diagram as above we have $\mathcal{Q}((U, u) \rightarrow(V, v))$.

If $X$ and $Y$ are representable, then this is also equivalent to $\mathcal{Q}((X, x) \rightarrow(Y, y))$.
Proof. Omitted. Hint: Very similar to the proof of Lemma 54.22.1.
04RE Definition 54.22.6. Let $\mathcal{Q}$ be a property of morphisms of germs of schemes which is étale local on the source-and-target. Let $S$ be a scheme. Given a morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ and a point $x \in|X|$ we say that $f$ has property $\mathcal{Q}$ at $x$ if the equivalent conditions of Lemma 54.22.5 hold.

The following lemma should not be used blindly to go from a property of morphisms to a property of morphisms at a point. For example if $\mathcal{P}$ is the property of being flat, then the property $Q$ in the following lemma means " $f$ is flat in an open neighbourhood of $x$ " which is not the same as " $f$ is flat at $x$ ".
04RF Lemma 54.22.7. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property $\mathcal{Q}$ of morphisms of germs associated to $\mathcal{P}$ in Descent, Lemma 34.29.2. Then
(1) $\mathcal{Q}$ is étale local on the source-and-target.
(2) given a morphism of algebraic spaces $f: X \rightarrow Y$ and $x \in|X|$ the following are equivalent
(a) $f$ has $\mathcal{Q}$ at $x$, and
(b) there is an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $X^{\prime} \rightarrow Y$ has $\mathcal{P}$.
(3) given a morphism of algebraic spaces $f: X \rightarrow Y$ the following are equivalent:
(a) $f$ has $\mathcal{P}$,
(b) for every $x \in|X|$ the morphism $f$ has $\mathcal{Q}$ at $x$.

Proof. See Descent, Lemma 34.29 .2 for (1). The implication (1)(a) $\Rightarrow$ (2)(b) follows on letting $X^{\prime}=a(U) \subset X$ given a diagram as in Lemma 54.22.5. The implication $(2)(\mathrm{b}) \Rightarrow(1)(\mathrm{a})$ is clear. The equivalence of $(3)(\mathrm{a})$ and $(3)(\mathrm{b})$ follows from the corresponding result for morphisms of schemes, see Descent, Lemma 34.29.3.
04RG Remark 54.22.8. We will apply Lemma 54.22 .7 above to all cases listed in Descent, Remark 34.28.7 except "flat". In each case we will do this by defining $f$ to have property $\mathcal{P}$ at $x$ if $f$ has $\mathcal{P}$ in a neighbourhood of $x$.

### 54.23. Morphisms of finite type

03XE The property "locally of finite type" of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.15.4, and Descent, Lemmas 34.19.8. Hence, by Lemma 54.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03XF Definition 54.23.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ locally of finite type if the equivalent conditions of Lemma 54.22.1 hold with $\mathcal{P}=$ locally of finite type.
(2) Let $x \in|X|$. We say $f$ is of finite type at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is locally of finite type.
(3) We say $f$ is of finite type if it is locally of finite type and quasi-compact. Consider the algebraic space $\mathbf{A}_{k}^{1} / \mathbf{Z}$ of Spaces, Example 52.14 .8 . The morphism $\mathbf{A}_{k}^{1} / \mathbf{Z} \rightarrow \operatorname{Spec}(k)$ is of finite type.
03XG Lemma 54.23.2. The composition of finite type morphisms is of finite type. The same holds for locally of finite type.

Proof. See Remark 54.22.3 and Morphisms, Lemma 28.15.3.
03XH Lemma 54.23.3. A base change of a finite type morphism is finite type. The same holds for locally of finite type.
Proof. See Remark 54.22.4 and Morphisms, Lemma 28.15.4.
040Y Lemma 54.23.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is locally of finite type,
(2) for every $x \in|X|$ the morphism $f$ is of finite type at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is locally of finite type,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is locally of finite type,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is locally of finite type,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is locally of finite type,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite type,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, $U \rightarrow X$ is surjective, and the top horizontal arrow is locally of finite type, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is locally of finite type.
Proof. Each of the conditions (2), (3), (4), (5), (6), (7), and (9) imply condition (8) in a straightforward manner. For example, if (5) holds, then we can choose a scheme $V$ which is a disjoint union of affines and a surjective morphism $V \rightarrow Y$ (see Properties of Spaces, Lemma 53.6.1). Then $V \times_{Y} X \rightarrow V$ is locally of finite type by (5). Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Then $U \rightarrow V$ is locally of finite type by Lemma 54.23.2. Hence (8) is true.

The conditions (1), (7), and (8) are equivalent by definition.
To finish the proof, we show that (1) implies all of the conditions (2), (3), (4), (5), (6), and (9). For (2) this is immediate. For (3), (4), (5), and (9) this follows from the fact that being locally of finite type is preserved under base change, see Lemma 54.23.3. For (6) we can take $U=X$ and we're done.

04ZK Lemma 54.23.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type and $Y$ is locally Noetherian, then $X$ is locally Noetherian.

Proof. Let

be a commutative diagram where $U, V$ are schemes and the vertical arrows are surjective étale. If $f$ is locally of finite type, then $U \rightarrow V$ is locally of finite type. If $Y$ is locally Noetherian, then $V$ is locally Noetherian. By Morphisms, Lemma 28.15.6 we see that $U$ is locally Noetherian, which means that $X$ is locally Noetherian.

0462 Lemma 54.23.6. Let $S$ be a scheme. Let $f: X \rightarrow Y, g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. If $g \circ f: X \rightarrow Z$ is locally of finite type, then $f: X \rightarrow Y$ is locally of finite type.

Proof. We can find a diagram

where $U, V, W$ are schemes, the vertical arrows are étale and surjective, see Spaces, Lemma 52.11.6. At this point we can use Lemma 54.23.4 and Morphisms, Lemma 28.15 .8 to conclude.

06ED Lemma 54.23.7. An immersion is locally of finite type.
Proof. Follows from the general principle Spaces, Lemma 52.5.8 and Morphisms, Lemmas 28.15.5.

### 54.24. Points and geometric points

0485 In this section we make some remarks on points and geometric points (see Properties of Spaces, Definition 53.18.1). One way to think about a geometric point of $X$ is to consider a geometric point $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ of $S$ and a lift of $\bar{s}$ to a morphism $\bar{x}$ into $X$. Here is a diagram

We often say "let $k$ be an algebraically closed field over $S$ " to indicate that $\operatorname{Spec}(k)$ comes equipped with a morphism $\operatorname{Spec}(k) \rightarrow S$. In this situation we write

$$
X(k)=\operatorname{Mor}_{S}(\operatorname{Spec}(k), X)=\{\bar{x} \in X \text { lying over } \bar{s}\}
$$

for the set of $k$-valued points of $X$. In this case the map $X(k) \rightarrow|X|$ maps into the subset $\left|X_{s}\right| \subset|X|$. Here $X_{s}=\operatorname{Spec}(\kappa(s)) \times_{S} X$, where $s \in S$ is the point corresponding to $\bar{s}$. As $\operatorname{Spec}(\kappa(s)) \rightarrow S$ is a monomorphism, also the base change $X_{s} \rightarrow X$ is a monomorphism, and $\left|X_{s}\right|$ is indeed a subset of $|X|$.

0487 Lemma 54.24.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type. The following are equivalent:
(1) $f$ is surjective, and
(2) for every algebraically closed field $k$ over $S$ the induced map $X(k) \rightarrow Y(k)$ is surjective.

Proof. Choose a diagram

with $U, V$ schemes over $S$ and vertical arrows surjective and étale, see Spaces, Lemma 52.11.6. Since $f$ is locally of finite type we see that $U \rightarrow V$ is locally of finite type.

Assume (1) and let $\bar{y} \in Y(k)$. Then $U \rightarrow Y$ is surjective and locally of finite type by Lemmas 54.5 .4 and 54.23 .2 . Let $Z=U \times_{Y, \bar{y}} \operatorname{Spec}(k)$. This is a scheme. The projection $Z \rightarrow \operatorname{Spec}(k)$ is surjective and locally of finite type by Lemmas 54.5.5 and 54.23.3. It follows from Varieties, Lemma 32.12 .1 that $Z$ has a $k$ valued point $\bar{z}$. The image $\bar{x} \in X(k)$ of $\bar{z}$ maps to $\bar{y}$ as desired.

Assume (2). By Properties of Spaces, Lemma 53.4.4 it suffices to show that $|X| \rightarrow$ $|Y|$ is surjective. Let $y \in|Y|$. Choose a $u \in U$ mapping to $y$. Let $k \supset \kappa(u)$ be an algebraic closure. Denote $\bar{u} \in U(k)$ the corresponding point and $\bar{y} \in Y(k)$ its image. By assumption there exists a $\bar{x} \in X(k)$ mapping to $\bar{y}$. Then it is clear that the image $x \in|X|$ of $\bar{x}$ maps to $y$.

In order to state the next lemma we introduce the following notation. Given a scheme $T$ we denote

$$
\lambda(T)=\sup \left\{\aleph_{0},|\kappa(t)| ; t \in T\right\}
$$

In words $\lambda(T)$ is the smallest infinite cardinal bounding all the cardinalities of residue fields of $T$. Note that if $R$ is a ring then the cardinality of any residue field $\kappa(\mathfrak{p})$ of $R$ is bounded by the cardinality of $R$ (details omitted). This implies that $\lambda(T) \leq \operatorname{size}(T)$ where $\operatorname{size}(T)$ is the size of the scheme $T$ as introduced in Sets, Section 3.9 If $K \subset L$ is a finitely generated field extension then $|K| \leq|L| \leq$ $\max \left\{\aleph_{0},|K|\right\}$. It follows that if $T^{\prime} \rightarrow T$ is a morphism of schemes which is locally of finite type then $\lambda\left(T^{\prime}\right) \leq \lambda(T)$, and if $T^{\prime} \rightarrow T$ is also surjective then equality holds. Next, suppose that $S$ is a scheme and that $X$ is an algebraic space over $S$. In this case we define

$$
\lambda(X):=\lambda(U)
$$

where $U$ is any scheme over $S$ which has a surjective étale morphism towards $X$. The reason that this is independent of the choice of $U$ is that given a pair of such schemes $U$ and $U^{\prime}$ the fibre product $U \times{ }_{X} U^{\prime}$ is a scheme which admits a surjective étale morphism to both $U$ and $U^{\prime}$, whence $\lambda(U)=\lambda\left(U \times_{X} U^{\prime}\right)=\lambda\left(U^{\prime}\right)$ by the discussion above.

0488 Lemma 54.24.2. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$.
(1) As $k$ ranges over all algebraically closed fields over $S$ the collection of geometric points $\bar{y} \in Y(k)$ cover all of $|Y|$.
(2) As $k$ ranges over all algebraically closed fields over $S$ with $|k| \geq \lambda(Y)$ and $|k|>\lambda(X)$ the geometric points $\bar{y} \in Y(k)$ cover all of $|Y|$.
(3) For any geometric point $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ where $k$ has cardinality $>\lambda(X)$ the map

$$
X(k) \longrightarrow\left|X_{s}\right|
$$

is surjective.
(4) Let $X \rightarrow Y$ be a morphism of algebraic spaces over $S$. For any geometric point $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ where $k$ has cardinality $>\lambda(X)$ the map

$$
X(k) \longrightarrow|X| \times_{|Y|} Y(k)
$$

is surjective.
(5) Let $X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(a) the map $X \rightarrow Y$ is surjective,
(b) for all algebraically closed fields $k$ over $S$ with $|k|>\lambda(X)$, and $|k| \geq$ $\lambda(Y)$ the map $X(k) \rightarrow Y(k)$ is surjective.

Proof. To prove part (1) choose a surjective étale morphism $V \rightarrow Y$ where $V$ is a scheme. For each $v \in V$ choose an algebraic closure $\kappa(v) \subset k_{v}$. Consider the morphisms $\bar{x}: \operatorname{Spec}\left(k_{v}\right) \rightarrow V \rightarrow Y$. By construction of $|Y|$ these cover $|Y|$.
To prove part (2) we will use the following two facts whose proofs we omit: (i) If $K$ is a field and $\bar{K}$ is algebraic closure then $|\bar{K}| \leq \max \left\{\aleph_{0},|K|\right\}$. (ii) For any algebraically closed field $k$ and any cardinal $\aleph, \aleph \geq|k|$ there exists an extension of algebraically closed fields $k \subset k^{\prime}$ with $\left|k^{\prime}\right|=\aleph$. Now we set $\aleph=\max \{\lambda(X), \lambda(Y)\}^{+}$. Here $\lambda^{+}>\lambda$ indicates the next bigger cardinal, see Sets, Section 3.6. Now (i) implies that the fields $k_{u}$ constructed in the first paragraph of the proof all have cardinality bounded by $\lambda(X)$. Hence by (ii) we can find extensions $k_{u} \subset k_{u}^{\prime}$ such that $\left|k_{u}^{\prime}\right|=\aleph$. The morphisms $\bar{x}^{\prime}: \operatorname{Spec}\left(k_{u}^{\prime}\right) \rightarrow X$ cover $|X|$ as desired. To really finish the proof of (2) we need to show that the schemes $\operatorname{Spec}\left(k_{u}^{\prime}\right)$ are (isomorphic to) objects of $S_{\text {chep }}$ because our conventions are that all schemes are objects of $S c h_{f p p f}$; the rest of this paragraph should be skipped by anyone who is not interested in set theoretical considerations. By construction there exists an object $T$ of $S c h_{\text {fppf }}$ such that $\lambda(X)$ and $\lambda(Y)$ are bounded by size $(T)$. By our construction of the category $S_{\text {ch }} h_{f p p}$ in Topologies, Definitions 33.7 .6 as the category $S c h_{\alpha}$ constructed in Sets, Lemma 3.9 .2 we see that any scheme whose size is $\leq \operatorname{size}(T)^{+}$is isomorphic to an object of $S c h_{f p p f}$. See the expression for the function Bound in Sets, Equation (3.9.1.1). Since $\aleph \leq \operatorname{size}(T)^{+}$we conclude.

The notation $X_{s}$ in part (3) means the fibre product $\operatorname{Spec}(\kappa(s)) \times{ }_{S} X$, where $s \in S$ is the point corresponding to $\bar{s}$. Hence part (2) follows from (4) with $Y=\operatorname{Spec}(\kappa(s))$.
Let us prove (4). Let $X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $k$ be an algebraically closed field over $S$ of cardinality $>\lambda(X)$. Let $\bar{y} \in Y(k)$ and $x \in|X|$ which map to the same element $y$ of $|Y|$. We have to find $\bar{x} \in X(k)$ mapping to $x$ and $\bar{y}$. Choose a commutative diagram

with $U, V$ schemes over $S$ and vertical arrows surjective and étale, see Spaces, Lemma 52.11.6. Choose a $u \in|U|$ which maps to $x$, and denote $v \in|V|$ the image. We will think of $u=\operatorname{Spec}(\kappa(u))$ and $v=\operatorname{Spec}(\kappa(v))$ as schemes. Note that $V \times_{Y} \operatorname{Spec}(k)$ is a scheme étale over $k$. Hence it is a disjoint union of spectra of finite separable extensions of $k$, see Morphisms, Lemma 28.36.7. As $v$ maps to $y$ we see that $v \times_{Y} \operatorname{Spec}(k)$ is a nonempty scheme. As $v \rightarrow V$ is a monomorphism, we
see that $v \times_{Y} \operatorname{Spec}(k) \rightarrow V \times_{Y} \operatorname{Spec}(k)$ is a monomorphism. Hence $v \times_{Y} \operatorname{Spec}(k)$ is a disjoint union of spectra of finite separable extensions of $k$, by Schemes, Lemma 25.23.10. We conclude that the morphism $v \times_{Y} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ has a section, i.e., we can find a morphism $\bar{v}: \operatorname{Spec}(k) \rightarrow V$ lying over $v$ and over $\bar{y}$. Finally we consider the scheme

$$
u \times_{V, \bar{v}} \operatorname{Spec}(k)=\operatorname{Spec}\left(\kappa(u) \otimes_{\kappa(v)} k\right)
$$

where $\kappa(v) \rightarrow k$ is the field map defining the morphism $\bar{v}$. Since the cardinality of $k$ is larger than the cardinality of $\kappa(u)$ by assumption we may apply Algebra, Lemma 10.34 .12 to see that any maximal ideal $\mathfrak{m} \subset \kappa(u) \otimes_{\kappa(v)} k$ has a residue field which is algebraic over $k$ and hence equal to $k$. Such a maximal ideal will hence produce a morphism $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ lying over $u$ and mapping to $\bar{v}$. The composition $\operatorname{Spec}(k) \rightarrow U \rightarrow X$ will be the desired geometric point $\bar{x} \in X(k)$. This concludes the proof of part (4).
Part (5) is a formal consequence of parts (2) and (4) and Properties of Spaces, Lemma 53.4.4.

### 54.25. Points of finite type

06 EE Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. A finite type point $x \in|X|$ is a point which can be represented by a morphism $\operatorname{Spec}(k) \rightarrow X$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always "enough of them" for example.

06EF Lemma 54.25.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The following are equivalent:
(1) There exists a morphism $\operatorname{Spec}(k) \rightarrow X$ which is locally of finite type and represents $x$.
(2) There exists a scheme $U$, a closed point $u \in U$, and an étale morphism $\varphi: U \rightarrow X$ such that $\varphi(u)=x$.

Proof. Let $u \in U$ and $U \rightarrow X$ be as in (2). Then $\operatorname{Spec}(\kappa(u)) \rightarrow U$ is of finite type, and $U \rightarrow X$ is representable and locally of finite type (by the general principle Spaces, Lemma 52.5.8 and Morphisms, Lemmas 28.36.11 and 28.21.8. Hence we see (1) holds by Lemma 54.23.2.
Conversely, assume $\operatorname{Spec}(k) \rightarrow X$ is locally of finite type and represents $x$. Let $U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme. By assumption $U \times_{X} \operatorname{Spec}(k) \rightarrow U$ is locally of finite type. Pick a finite type point $v$ of $U \times{ }_{X} \operatorname{Spec}(k)$ (there exists at least one, see Morphisms, Lemma 28.16.4). By Morphisms, Lemma 28.16 .5 the image $u \in U$ of $v$ is a finite type point of $U$. Hence by Morphisms, Lemma 28.16.4 after shrinking $U$ we may assume that $u$ is a closed point of $U$, i.e., (2) holds.

06EG Definition 54.25.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We say a point $x \in|X|$ is a finite type poin ${ }^{5}$ if the equivalent conditions of Lemma 54.25 .1 are satisfied. We denote $X_{\mathrm{ft}-\mathrm{pts}}$ the set of finite type points of $X$.

[^164]We can describe the set of finite type points as follows.
06 EH Lemma 54.25.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We have

$$
X_{f t-p t s}=\bigcup_{\varphi: U \rightarrow X \text { étale }}|\varphi|\left(U_{0}\right)
$$

where $U_{0}$ is the set of closed points of $U$. Here we may let $U$ range over all schemes étale over $X$ or over all affine schemes étale over $X$.

Proof. Immediate from Lemma 54.25.1.
06EI Lemma 54.25.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type, then $f\left(X_{f t-p t s}\right) \subset Y_{f t-p t s}$.

Proof. Take $x \in X_{\text {ft-pts. }}$. Represent $x$ by a locally finite type morphism $x$ : $\operatorname{Spec}(k) \rightarrow X$. Then $f \circ x$ is locally of finite type by Lemma 54.23.2. Hence $f(x) \in Y_{\mathrm{ft}-\mathrm{pts}}$.

06EJ Lemma 54.25.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type and surjective, then $f\left(X_{f t-p t s}\right)=Y_{f t-p t s}$.

Proof. We have $f\left(X_{\mathrm{ft}-\mathrm{pts}}\right) \subset Y_{\mathrm{ft}-\mathrm{pts}}$ by Lemma 54.25.4. Let $y \in|Y|$ be a finite type point. Represent $y$ by a morphism $\operatorname{Spec}(k) \rightarrow \bar{Y}$ which is locally of finite type. As $f$ is surjective the algebraic space $X_{k}=\operatorname{Spec}(k) \times_{Y} X$ is nonempty, therefore has a finite type point $x \in\left|X_{k}\right|$ by Lemma 54.25.3. Now $X_{k} \rightarrow X$ is a morphism which is locally of finite type as a base change of $\operatorname{Spec}(k) \rightarrow Y$ (Lemma 54.23.3). Hence the image of $x$ in $X$ is a finite type point by Lemma 54.25.4 which maps to $y$ by construction.

06EK Lemma 54.25.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. For any locally closed subset $T \subset|X|$ we have

$$
T \neq \emptyset \Rightarrow T \cap X_{f t-p t s} \neq \emptyset
$$

In particular, for any closed subset $T \subset|X|$ we see that $T \cap X_{f t-p t s}$ is dense in $T$.
Proof. Let $i: Z \rightarrow X$ be the reduced induce subspace structure on $T$, see Remark 54.12 .5 . Any immersion is locally of finite type, see Lemma 54.23.7. Hence by Lemma 54.25 .4 we see $Z_{\mathrm{ft}-\mathrm{pts}} \subset X_{\mathrm{ft}-\mathrm{pts}} \cap T$. Finally, any nonempty affine scheme $U$ with an étale morphism towards $Z$ has at least one closed point. Hence $Z$ has at least one finite type point by Lemma 54.25.3. The lemma follows.

Here is another, more technical, characterization of a finite type point on an algebraic space.

06EL Lemma 54.25.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The following are equivalent:
(1) $x$ is a finite type point,
(2) there exists an algebraic space $Z$ whose underlying topological space $|Z|$ is a singleton, and a morphism $f: Z \rightarrow X$ which is locally of finite type such that $\{x\}=|f|(|Z|)$, and
(3) there exists an algebraic space $Z$ and a morphism $f: Z \rightarrow X$ with the following properties:
(a) there is a surjective étale morphism $z: \operatorname{Spec}(k) \rightarrow Z$ where $k$ is a field,
(b) $f$ is locally of finite type,
(c) $f$ is a monomorphism, and
(d) $x=f(z)$.

Proof. Assume $x$ is a finite type point. Choose an affine scheme $U$, a closed point $u \in U$, and an étale morphism $\varphi: U \rightarrow X$ with $\varphi(u)=x$, see Lemma 54.25.3. Set $u=\operatorname{Spec}(\kappa(u))$ as usual. The projection morphisms $u \times_{X} u \rightarrow u$ are the compositions

$$
u \times_{X} u \rightarrow u \times_{X} U \rightarrow u \times_{X} X=u
$$

where the first arrow is a closed immersion (a base change of $u \rightarrow U$ ) and the second arrow is étale (a base change of the étale morphism $U \rightarrow X$ ). Hence $u \times{ }_{X} U$ is a disjoint union of spectra of finite separable extensions of $k$ (see Morphisms, Lemma 28.36.7 and therefore the closed subscheme $u \times_{X} u$ is a disjoint union of finite separable extension of $k$, i.e., $u \times_{X} u \rightarrow u$ is étale. By Spaces, Theorem 52.10.5 we see that $Z=u / u \times_{X} u$ is an algebraic space. By construction the diagram

is commutative with étale vertical arrows. Hence $Z \rightarrow X$ is locally of finite type (see Lemma 54.23.4. By construction the morphism $Z \rightarrow X$ is a monomorphism and the image of $z$ is $x$. Thus (3) holds.
It is clear that (3) implies (2). If (2) holds then $x$ is a finite type point of $X$ by Lemma 54.25 .4 (and Lemma 54.25 .6 to see that $Z_{\mathrm{ft}-\mathrm{pts}}$ is nonempty, i.e., the unique point of $Z$ is a finite type point of $Z$ ).

### 54.26. Nagata spaces

0BAT See Properties of Spaces, Section 53.7 for the definition of a Nagata algebraic space.
0BAU Lemma 54.26.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $Y$ is Nagata and $f$ locally of finite type then $X$ is Nagata.
Proof. Let $V$ be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. Let $U$ be a scheme and let $U \rightarrow X \times_{Y} V$ be a surjective étale morphism. If $Y$ is Nagata, then $V$ is a Nagata scheme. If $X \rightarrow Y$ is locally of finite type, then $U \rightarrow V$ is locally of finite type. Hence $V$ is a Nagata scheme by Morphisms, Lemma 28.18.1. Then $X$ is Nagata by definition.

0BAV Lemma 54.26.2. The following types of algebraic spaces are Nagata.
(1) Any algebraic space locally of finite type over a Nagata scheme.
(2) Any algebraic space locally of finite type over a field.
(3) Any algebraic space locally of finite type over a Noetherian complete local ring.
(4) Any algebraic space locally of finite type over $\mathbf{Z}$.
(5) Any algebraic space locally of finite type over a Dedekind ring of characteristic zero.
(6) And so on.

Proof. The first property holds by Lemma 54.26.1. Thus the others hold as well, see Morphisms, Lemma 28.18.2.

### 54.27. Quasi-finite morphisms

03XI The property "locally quasi-finite" of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.20.13, and Descent, Lemma 34.19.22. Hence, by Lemma 54.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally quasi-finite as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03XJ Definition 54.27.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is locally quasi-finite if the equivalent conditions of Lemma 54.22 .1 hold with $\mathcal{P}=$ locally quasi-finite.
(2) Let $x \in|X|$. We say $f$ is quasi-finite at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is locally quasi-finite.
(3) A morphism of algebraic spaces $f: X \rightarrow Y$ is quasi-finite if it is locally quasi-finite and quasi-compact.

The last part is compatible with the notion of quasi-finiteness for morphisms of schemes by Morphisms, Lemma 28.20.9.

0ABM Lemma 54.27.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y^{\prime} \rightarrow Y$ be morphisms of algebraic spaces over $S$. Denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$ by $g$. Denote $g^{\prime}: X^{\prime} \rightarrow X$ the projection. Assume $f$ is locally of finite type. Let $W \subset|X|$, resp. $W^{\prime} \subset\left|X^{\prime}\right|$ be the set of points where $f$, resp. $f^{\prime}$ is quasi-finite.
(1) $W \subset|X|$ and $W^{\prime} \subset\left|X^{\prime}\right|$ are open,
(2) $W^{\prime}=\left(g^{\prime}\right)^{-1}(W)$, i.e., formation of the locus where $f$ is quasi-finite commutes with base change,
(3) the base change of a locally quasi-finite morphism is locally quasi-finite, and
(4) the base change of a quasi-finite morphism is quasi-finite.

Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow Y^{\prime} \times_{Y} V$. Set $U^{\prime}=V^{\prime} \times_{V} U$ so that $U^{\prime} \rightarrow X^{\prime}$ is a surjective étale morphism as well. Picture

lying over

Choose $u \in|U|$ with image $x \in|X|$. The property of being "locally quasi-finite" is étale local on the source-and-target, see Descent, Remark 34.28.7. Hence Lemmas 54.22 .5 and 54.22 .7 apply and we see that $f: X \rightarrow Y$ is quasi-finite at $x$ if and only if $U \rightarrow V$ is quasi-finite at $u$. Similarly for $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ and the morphism $U^{\prime} \rightarrow V^{\prime}$. Hence parts (1), (2), and (3) reduce to Morphisms, Lemmas 28.20.13 and 28.50.2. Part (4) follows from (3) and Lemma 54.8.3.

03XK Lemma 54.27.3. The composition of quasi-finite morphisms is quasi-finite. The same holds for locally quasi-finite.

Proof. See Remark 54.22.3 and Morphisms, Lemma 28.20.12
03XL Lemma 54.27.4. A base change of a quasi-finite morphism is quasi-finite. The same holds for locally quasi-finite.

Proof. Immediate consequence of Lemma 54.27.2.
The following lemma characterizes locally quasi-finite morphisms as those morphisms which are locally of finite type and have "discrete fibres". However, this is not the same thing as asking $|X| \rightarrow|Y|$ to have discrete fibres as the discussion in Examples, Section 88.42 shows.

06RW Lemma 54.27.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. Assume $f$ is locally of finite type. The following are equivalent
(1) $f$ is locally quasi-finite,
(2) for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where $k$ is a field the space $\left|X_{k}\right|$ is discrete. Here $X_{k}=\operatorname{Spec}(k) \times_{Y} X$.

Proof. Assume $f$ is locally quasi-finite. Let $\operatorname{Spec}(k) \rightarrow Y$ be as in (2). Choose a surjective étale morphism $U \rightarrow X$ where $U$ is a scheme. Then $U_{k}=\operatorname{Spec}(k) \times_{Y} U \rightarrow$ $X_{k}$ is an étale morphism of algebraic spaces by Properties of Spaces, Lemma53.15.5. By Lemma 54.27 .4 we see that $X_{k} \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite. By definition this means that $U_{k} \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite. Hence $\left|U_{k}\right|$ is discrete by Morphisms, Lemma 28.20.8. Since $\left|U_{k}\right| \rightarrow\left|X_{k}\right|$ is surjective and open we conclude that $\left|X_{k}\right|$ is discrete.
Conversely, assume (2). Choose a surjective étale morphism $V \rightarrow Y$ where $V$ is a scheme. Choose a surjective étale morphism $U \rightarrow V \times_{Y} X$ where $U$ is a scheme. Note that $U \rightarrow V$ is locally of finite type as $f$ is locally of finite type. Picture

If $f$ is not locally quasi-finite then $U \rightarrow V$ is not locally quasi-finite. Hence there exists a specialization $u \rightsquigarrow u^{\prime}$ for some $u, u^{\prime} \in U$ lying over the same point $v \in V$, see Morphisms, Lemma 28.20.6. We claim that $u, u^{\prime}$ do not have the same image in $X_{v}=\operatorname{Spec}(\kappa(v)) \times_{Y} X$ which will contradict the assumption that $\left|X_{v}\right|$ is discrete as desired. Let $d=\operatorname{trdeg}_{\kappa(v)}(\kappa(u))$ and $d^{\prime}=\operatorname{trdeg}_{\kappa(v)}\left(\kappa\left(u^{\prime}\right)\right)$. Then we see that $d>d^{\prime}$ by Morphisms, Lemma 28.28.6. Note that $U_{v}$ (the fibre of $U \rightarrow V$ over $v$ ) is the fibre product of $U$ and $X_{v}$ over $X \times_{Y} V$, hence $U_{v} \rightarrow X_{v}$ is étale (as a base change of the étale morphism $U \rightarrow X \times_{Y} V$ ). If $u, u^{\prime} \in U_{v}$ map to the same element of $\left|X_{v}\right|$ then there exists a point $r \in R_{v}=U_{v} \times_{X_{v}} U_{v}$ with $t(r)=u$ and $s(r)=u^{\prime}$, see Properties of Spaces, Lemma 53.4.3. Note that $s, t: R_{v} \rightarrow U_{v}$ are étale morphisms of schemes over $\kappa(v)$, hence $\kappa(u) \subset \kappa(r) \supset \kappa\left(u^{\prime}\right)$ are finite separable extensions of fields over $\kappa(v)$ (see Morphisms, Lemma 28.36.7). We conclude that the transcendence degrees are equal. This contradiction finishes the proof.

040Z Lemma 54.27.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is locally quasi-finite,
(2) for every $x \in|X|$ the morphism $f$ is quasi-finite at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is locally quasi-finite,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is locally quasi-finite,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is locally quasi-finite,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is locally quasi-finite,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is locally quasi-finite,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is locally quasi-finite, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is locally quasi-finite.
Proof. Omitted.
03XM Lemma 54.27.7. An immersion is locally quasi-finite.
Proof. Omitted.
03XN Lemma 54.27.8. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. If $X \rightarrow Z$ is locally quasi-finite, then $X \rightarrow Y$ is locally quasi-finite.

Proof. Choose a commutative diagram

with vertical arrows étale and surjective. (See Spaces, Lemma 52.11.6.) Apply Morphisms, Lemma 28.20 .16 to the top row.

0ABN Lemma 54.27.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a finite type morphism of algebraic spaces over $S$. Let $y \in|Y|$. There are at most finitely many points of $|X|$ lying over $y$ at which $f$ is quasi-finite.

Proof. Choose a field $k$ and a morphism $\operatorname{Spec}(k) \rightarrow Y$ in the equivalence class determined by $y$. The fibre $X_{k}=\operatorname{Spec}(k) \times_{Y} X$ is an algebraic space of finite type over a field, in particular quasi-compact. The map $\left|X_{k}\right| \rightarrow|X|$ surjects onto the fibre of $|X| \rightarrow|Y|$ over $y$ (Properties of Spaces, Lemma 53.4.3). Moreover, the
set of points where $X_{k} \rightarrow \operatorname{Spec}(k)$ is quasi-finite maps onto the set of points lying over $y$ where $f$ is quasi-finite by Lemma 54.27.2. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X_{k}$ (Properties of Spaces, Lemma 53.6.3). Then $U \rightarrow \operatorname{Spec}(k)$ is a morphism of finite type and there are at most a finite number of points where this morphism is quasi-finite, see Morphisms, Lemma 28.20.14. Since $X_{k} \rightarrow \operatorname{Spec}(k)$ is quasi-finite at a point $x^{\prime}$ if and only if it is the image of a point of $U$ where $U \rightarrow \operatorname{Spec}(k)$ is quasi-finite, we conclude.

0463 Lemma 54.27.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type and a monomorphism, then $f$ is separated and locally quasi-finite.

Proof. A monomorphism is separated, see Lemma 54.10.3. By Lemma 54.27.6 it suffices to prove the lemma after performing a base change by $Z \rightarrow Y$ with $Z$ affine. Hence we may assume that $Y$ is an affine scheme. Choose an affine scheme $U$ and an étale morphism $U \rightarrow X$. Since $X \rightarrow Y$ is locally of finite type the morphism of affine schemes $U \rightarrow Y$ is of finite type. Since $X \rightarrow Y$ is a monomorphism we have $U \times_{X} U=U \times_{Y} U$. In particular the maps $U \times_{Y} U \rightarrow U$ are étale. Let $y \in Y$. Then either $U_{y}$ is empty, or $\operatorname{Spec}(\kappa(u)) \times_{\operatorname{Spec}(\kappa(y))} U_{y}$ is isomorphic to the fibre of $U \times_{Y} U \rightarrow U$ over $u$ for some $u \in U$ lying over $y$. This implies that the fibres of $U \rightarrow Y$ are finite discrete sets (as $U \times_{Y} U \rightarrow U$ is an étale morphism of affine schemes, see Morphisms, Lemma 28.36.7). Hence $U \rightarrow Y$ is quasi-finite, see Morphisms, Lemma 28.20.6. As $U \rightarrow X$ was an arbitrary étale morphism with $U$ affine this implies that $X \rightarrow Y$ is locally quasi-finite.

### 54.28. Morphisms of finite presentation

03XO The property "locally of finite presentation" of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.21.4, and Descent, Lemma 34.19.9. Hence, by Lemma 54.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03XP Definition 54.28.1. Let $S$ be a scheme. Let $X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is locally of finite presentation if the equivalent conditions of Lemma 54.22 .1 hold with $\mathcal{P}=$ "locally of finite presentation".
(2) Let $x \in|X|$. We say $f$ is of finite presentation at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is locally of finite presentation ${ }^{6}$
(3) A morphism of algebraic spaces $f: X \rightarrow Y$ is of finite presentation if it is locally of finite presentation, quasi-compact and quasi-separated.
Note that a morphism of finite presentation is not just a quasi-compact morphism which is locally of finite presentation.

[^165]03XQ Lemma 54.28.2. The composition of morphisms of finite presentation is of finite presentation. The same holds for locally of finite presentation.

Proof. See Remark 54.22 .3 and Morphisms, Lemma 28.21.3. Also use the result for quasi-compact and for quasi-separated morphisms (Lemmas 54.8.4 and 54.4.8.

03XR Lemma 54.28.3. A base change of a morphism of finite presentation is of finite presentation The same holds for locally of finite presentation.
Proof. See Remark 54.22.4 and Morphisms, Lemma 28.21 .4 . Also use the result for quasi-compact and for quasi-separated morphisms (Lemmas 54.8.3 and 54.4.4).

0410 Lemma 54.28.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is locally of finite presentation,
(2) for every $x \in|X|$ the morphism $f$ is of finite presentation at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times{ }_{Y} X \rightarrow Z$ is locally of finite presentation,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is locally of finite presentation,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is locally of finite presentation,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is locally of finite presentation,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite presentation,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is locally of finite presentation, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is locally of finite presentation.
Proof. Omitted.
0464 Lemma 54.28.5. A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.
Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces which is locally of finite presentation. This means there exists a diagram as in Lemma 54.22.1 with $h$ locally of finite presentation and surjective vertical arrow $a$. By Morphisms,

Lemma $28.21 .8 h$ is locally of finite type. Hence $X \rightarrow Y$ is locally of finite type by definition. If $f$ is of finite presentation then it is quasi-compact and it follows that $f$ is of finite type.

04ZL Lemma 54.28.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is of finite presentation and $Y$ is Noetherian, then $X$ is Noetherian.

Proof. Assume $f$ is of finite presentation and $Y$ Noetherian. By Lemmas 54.28 .5 and 54.23 .5 we see that $X$ is locally Noetherian. As $f$ is quasi-compact and $Y$ is quasi-compact we see that $X$ is quasi-compact. As $f$ is of finite presentation it is quasi-separated (see Definition 54.28.1) and as $Y$ is Noetherian it is quasiseparated (see Properties of Spaces, Definition 53.23.1). Hence $X$ is quasi-separated by Lemma 54.4.9. Hence we have checked all three conditions of Properties of Spaces, Definition 53.23.1 and we win.

06G4 Lemma 54.28.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) If $Y$ is locally Noetherian and $f$ locally of finite type then $f$ is locally of finite presentation.
(2) If $Y$ is locally Noetherian and $f$ of finite type and quasi-separated then $f$ is of finite presentation.

Proof. Assume $f: X \rightarrow Y$ locally of finite type and $Y$ locally Noetherian. This means there exists a diagram as in Lemma 54.22.1 with $h$ locally of finite type and surjective vertical arrow $a$. By Morphisms, Lemma $28.21 .9 h$ is locally of finite presentation. Hence $X \rightarrow Y$ is locally of finite presentation by definition. This proves (1). If $f$ is of finite type and quasi-separated then it is also quasi-compact and quasi-separated and (2) follows immediately.

06G5 Lemma 54.28.8. Let $S$ be a scheme. Let $Y$ be an algebraic space over $S$ which is quasi-compact and quasi-separated. If $X$ is of finite presentation over $Y$, then $X$ is quasi-compact and quasi-separated.

Proof. Omitted.
05WT Lemma 54.28.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. If $X$ is locally of finite presentation over $Z$, and $Y$ is locally of finite type over $Z$, then $f$ is locally of finite presentation.

Proof. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Then choose a scheme $V$ and a surjective étale morphism $V \rightarrow W \times_{Z} Y$. Finally choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. By definition $U$ is locally of finite presentation over $W$ and $V$ is locally of finite type over $W$. By Morphisms, Lemma 28.21 .11 the morphism $U \rightarrow V$ is locally of finite presentation. Hence $f$ is locally of finite presentation.

084P Lemma 54.28.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ with diagonal $\Delta: X \rightarrow X \times_{Y} X$. If $f$ is locally of finite type then $\Delta$ is locally of finite presentation. If $f$ is quasi-separated and locally of finite type, then $\Delta$ is of finite presentation.

Proof. Note that $\Delta$ is a morphism over $X$ (via the second projection $X \times_{Y} X \rightarrow$ $X)$. Assume $f$ is locally of finite type. Note that $X$ is of finite presentation over $X$ and $X \times_{Y} X$ is of finite type over $X$ (by Lemma 54.23.3). Thus the first statement holds by Lemma 54.28.9. The second statement follows from the first, the definitions, and the fact that a diagonal morphism is separated (Lemma 54.4.1).
06CN Lemma 54.28.11. An open immersion of algebraic spaces is locally of finite presentation.

Proof. An open immersion is by definition representable, hence we can use the general principle Spaces, Lemma 52.5.8 and Morphisms, Lemma 28.21.5.

084Q Lemma 54.28.12. A closed immersion $i: Z \rightarrow X$ is of finite presentation if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}\right)$ is of finite type (as an $\mathcal{O}_{X}$-module).

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By Lemma 54.28.4 we see that $i^{\prime}: Z \times_{X} U \rightarrow U$ is of finite presentation if and only if $i$ is. By Properties of Spaces, Section 53.29 we see that $\mathcal{I}$ is of finite type if and only if $\left.\mathcal{I}\right|_{U}=\operatorname{Ker}\left(\mathcal{O}_{U} \rightarrow i_{*}^{\prime} \mathcal{O}_{Z \times_{X} U}\right)$ is. Hence the result follows from the case of schemes, see Morphisms, Lemma 28.21.7.

### 54.29. Flat morphisms

03MK The property "flat" of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.25.7 and Descent, Lemma 34.19.13. Hence, by Lemma 54.22.1 above, we may define the notion of a flat morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03ML Definition 54.29.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is flat if the equivalent conditions of Lemma54.22.1 with $\mathcal{P}=$ "flat".
(2) Let $x \in|X|$. We say $f$ is flat at $x$ if the equivalent conditions of Lemma 54.22 .5 holds with $\mathcal{Q}=$ "induced map local rings is flat".

Note that the second part makes sense by Descent, Lemma 34.29.4.
We do a quick sanity check.
08EW Lemma 54.29.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then $f$ is flat if and only if $f$ is flat at all points of $|X|$.
Proof. Choose a commutative diagram

where $U$ and $V$ are schemes, the vertical arrows are étale, and $a$ is surjective. By definition $f$ is flat if and only $h$ is flat (Definition54.22.2). By definition $f$ is flat at $x \in|X|$ if and only if $h$ is flat at some (equivalently any) $u \in U$ which maps to $x$ (Definition 54.22.6). Thus the lemma follows from the fact that a morphism
of schemes is flat if and only if it is flat at all points of the source (Morphisms, Definition 28.25.1.

03MN Lemma 54.29.3. The composition of flat morphisms is flat.
Proof. See Remark 54.22.3 and Morphisms, Lemma 28.25.5.
03MO Lemma 54.29.4. The base change of a flat morphism is flat.
Proof. See Remark 54.22.4 and Morphisms, Lemma 28.25.7.
03MM Lemma 54.29.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is flat,
(2) for every $x \in|X|$ the morphism $f$ is flat at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is flat,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is flat,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is flat,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is flat,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is flat,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is flat, and
(9) there exists a Zariski coverings $Y=\bigcup Y_{i}$ and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is flat.
Proof. Omitted.
042S Lemma 54.29.6. A flat morphism locally of finite presentation is universally open.

Proof. Let $f: X \rightarrow Y$ be a flat morphism locally of finite presentation of algebraic spaces over $S$. Choose a diagram

where $U$ and $V$ are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 52.11.6. By Lemmas 54.29.5 and 54.28.4 the morphism $\alpha$ is flat and locally of finite presentation. Hence by Morphisms, Lemma 28.25 .9 we see that $\alpha$ is universally open. Hence $X \rightarrow Y$ is universally open according to Lemma 54.6.5.

0413 Lemma 54.29.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a flat, quasi-compact, surjective morphism of algebraic spaces over $S$. A subset $T \subset|Y|$ is open (resp. closed) if and only $f^{-1}(|T|)$ is open (resp. closed) in $|X|$. In other words $f$ is submersive, and in fact universally submersive.

Proof. Choose affine schemes $V_{i}$ and étale morphisms $V_{i} \rightarrow Y$ such that $V=$ $\coprod V_{i} \rightarrow Y$ is surjective, see Properties of Spaces, Lemma 53.6.1. For each $i$ the algebraic space $V_{i} \times_{Y} X$ is quasi-compact. Hence we can find an affine scheme $U_{i}$ and a surjective étale morphism $U_{i} \rightarrow V_{i} \times_{Y} X$, see Properties of Spaces, Lemma 53.6.3. Then the composition $U_{i} \rightarrow V_{i} \times_{Y} X \rightarrow V_{i}$ is a surjective, flat morphism of affines. Of course then $U=\coprod U_{i} \rightarrow X$ is surjective and étale and $U=V \times_{Y} X$. Moreover, the morphism $U \rightarrow V$ is the disjoint union of the morphisms $U_{i} \rightarrow V_{i}$. Hence $U \rightarrow V$ is surjective, quasi-compact and flat. Consider the diagram

By definition of the topology on $|Y|$ the set $T$ is closed (resp. open) if and only if $g^{-1}(T) \subset|V|$ is closed (resp. open). The same holds for $f^{-1}(T)$ and its inverse image in $|U|$. Since $U \rightarrow V$ is quasi-compact, surjective, and flat we win by Morphisms, Lemma 28.25.10.

04NG Lemma 54.29.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\bar{x}$ be a geometric point of $X$ lying over the point $x \in|X|$. Let $\bar{y}=f \circ \bar{x}$. The following are equivalent
(1) $f$ is flat at $x$, and
(2) the map on étale local rings $\mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{X, \bar{x}}$ is flat.

Proof. Choose a commutative diagram

where $U$ and $V$ are schemes, $a, b$ are étale, and $u \in U$ mapping to $x$. We can find a geometric point $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ lying over $u$ with $\bar{x}=a \circ \bar{u}$, see Properties of Spaces, Lemma 53.18.4. Set $\bar{v}=h \circ \bar{u}$ with image $v \in V$. We know that

$$
\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{U, u}^{s h} \quad \text { and } \quad \mathcal{O}_{Y, \bar{y}}=\mathcal{O}_{V, v}^{s h}
$$

see Properties of Spaces, Lemma 53.21.1. We obtain a commutative diagram

of local rings with flat horizontal arrows. We have to show that the left vertical arrow is flat if and only if the right vertical arrow is. Algebra, Lemma 10.38 .9 tells us $\mathcal{O}_{U, u}$ is flat over $\mathcal{O}_{V, v}$ if and only if $\mathcal{O}_{X, \bar{x}}$ is flat over $\mathcal{O}_{V, v}$. Hence the result follows from More on Flatness, Lemma 37.2.5.

073C Lemma 54.29.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then $f$ is flat if and only if the morphism of sites $\left(f_{\text {small }}, f^{\sharp}\right)$ : $\left(X_{\text {étale }}, \mathcal{O}_{X}\right) \rightarrow\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right)$ associated to $f$ is flat.
Proof. Flatness of $\left(f_{\text {small }}, f^{\sharp}\right)$ is defined in terms of flatness of $\mathcal{O}_{X}$ as a $f_{\text {small }}^{-1} \mathcal{O}_{Y^{-}}$ module. This can be checked at stalks, see Modules on Sites, Lemma 18.38 .2 and Properties of Spaces, Theorem 53.18.12. But we've already seen that flatness of $f$ can be checked on stalks, see Lemma 54.29 .8 .

089C Lemma 54.29.10. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module with scheme theoretic support $Z \subset X$. If $f$ is flat, then $f^{-1}(Z)$ is the scheme theoretic support of $f^{*} \mathcal{F}$.

Proof. Using the characterization of the scheme theoretic support as given in Lemma 54.15 .3 and using the characterization of flat morphisms in terms of étale coverings in Lemma 54.29 .5 we reduce to the case of schemes which is Morphisms, Lemma 28.25.12

089D Lemma 54.29.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a flat morphism of algebraic spaces over $S$. Let $V \rightarrow Y$ be a quasi-compact open immersion. If $V$ is scheme theoretically dense in $Y$, then $f^{-1} V$ is scheme theoretically dense in $X$.

Proof. Using the characterization of scheme theoretically dense opens in Lemma 54.17 .2 and using the characterization of flat morphisms in terms of étale coverings in Lemma 54.29 .5 we reduce to the case of schemes which is Morphisms, Lemma 28.25 .13 .

089E Lemma 54.29.12. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a flat morphism of algebraic spaces over $S$. Let $g: V \rightarrow Y$ be a quasi-compact morphism of algebraic spaces. Let $Z \subset Y$ be the scheme theoretic image of $g$ and let $Z^{\prime} \subset X$ be the scheme theoretic image of the base change $V \times_{Y} X \rightarrow X$. Then $Z^{\prime}=f^{-1} Z$.

Proof. Let $Y^{\prime} \rightarrow Y$ be a surjective étale morphism such that $Y^{\prime}$ is a disjoint union of affine schemes (Properties of Spaces, Lemma 53.6.1). Let $X^{\prime} \rightarrow X \times_{Y} Y^{\prime}$ be a surjective étale morphism such that $X^{\prime}$ is a disjoint union of affine schemes. By Lemma 54.29.5 the morphism $X^{\prime} \rightarrow Y^{\prime}$ is flat. Set $V^{\prime}=V \times_{Y} Y^{\prime}$. By Lemma 54.16.3 the inverse image of $Z$ in $Y^{\prime}$ is the scheme theoretic image of $V^{\prime} \rightarrow Y^{\prime}$ and the inverse image of $Z^{\prime}$ in $X^{\prime}$ is the scheme theoretic image of $V^{\prime} \times_{Y^{\prime}} X^{\prime} \rightarrow X^{\prime}$. Since $X^{\prime} \rightarrow X$ is surjective étale, it suffices to prove the result in the case of the morphisms $X^{\prime} \rightarrow Y^{\prime}$ and $V^{\prime} \rightarrow Y^{\prime}$. Thus we may assume $X$ and $Y$ are affine
schemes. In this case $V$ is a quasi-compact algebraic space. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow V$ (Properties of Spaces, Lemma 53.6.3). It is clear that the scheme theoretic image of $V \rightarrow Y$ agrees with the scheme theoretic image of $W \rightarrow Y$ and similarly for $V \times_{Y} X \rightarrow Y$ and $W \times_{Y} X \rightarrow X$. Thus we reduce to the case of schemes which is Morphisms, Lemma 28.25.14.

### 54.30. Flat modules

05 VT In this section we define what it means for a module to be flat at a point. To do this we will use the notion of the stalk of a sheaf on the small étale site $X_{\text {étale }}$ of an algebraic space, see Properties of Spaces, Definition 53.18.6.

05VU Lemma 54.30.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $x \in|X|$. The following are equivalent
(1) for some commutative diagram

where $U$ and $V$ are schemes, $a, b$ are étale, and $u \in U$ mapping to $x$ the module $a^{*} \mathcal{F}$ is flat at $u$ over $V$,
(2) the stalk $\mathcal{F}_{\bar{x}}$ is flat over the étale local ring $\mathcal{O}_{Y, \bar{y}}$ where $\bar{x}$ is any geometric point lying over $x$ and $\bar{y}=f \circ \bar{x}$.

Proof. During this proof we fix a geometric proof $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ over $x$ and we denote $\bar{y}=f \circ \bar{x}$ its image in $Y$. Given a diagram as in (1) we can find a geometric point $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ lying over $u$ with $\bar{x}=a \circ \bar{u}$, see Properties of Spaces, Lemma 53.18.4 Set $\bar{v}=h \circ \bar{u}$ with image $v \in V$. We know that

$$
\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{U, u}^{s h} \quad \text { and } \quad \mathcal{O}_{Y, \bar{y}}=\mathcal{O}_{V, v}^{s h}
$$

see Properties of Spaces, Lemma 53.21.1. We obtain a commutative diagram

of local rings. Finally, we have

$$
\mathcal{F}_{\bar{x}}=\left(\varphi^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}}
$$

by Properties of Spaces, Lemma 53.28.4. Thus Algebra, Lemma 10.38 .9 tells us $\left(\varphi^{*} \mathcal{F}\right)_{u}$ is flat over $\mathcal{O}_{V, v}$ if and only if $\mathcal{F}_{\bar{x}}$ is flat over $\mathcal{O}_{V, v}$. Hence the result follows from More on Flatness, Lemma 37.2.5.

05VV Definition 54.30.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$.
(1) Let $x \in|X|$. We say $\mathcal{F}$ is flat at $x$ over $Y$ if the equivalent conditions of Lemma 54.30.1 hold.
(2) We say $\mathcal{F}$ is flat over $Y$ if $\mathcal{F}$ is flat over $Y$ at all $x \in|X|$.

Having defined this we have the obligatory base change lemma. This lemma implies that formation of the flat locus of a quasi-coherent sheaf commutes with flat base change.

05VW Lemma 54.30.3. Let $S$ be a scheme. Let

be a cartesian diagram of algebraic spaces over $S$. Let $x^{\prime} \in\left|X^{\prime}\right|$ with image $x \in|X|$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$ and denote $\mathcal{F}^{\prime}=\left(g^{\prime}\right)^{*} \mathcal{F}$.
(1) If $\mathcal{F}$ is flat at $x$ over $Y$ then $\mathcal{F}^{\prime}$ is flat at $x^{\prime}$ over $Y^{\prime}$.
(2) If $g$ is flat at $f^{\prime}\left(x^{\prime}\right)$ and $\mathcal{F}^{\prime}$ is flat at $x^{\prime}$ over $Y^{\prime}$, then $\mathcal{F}$ is flat at $x$ over $Y$.
In particular, if $\mathcal{F}$ is flat over $Y$, then $\mathcal{F}^{\prime}$ is flat over $Y^{\prime}$.
Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow V \times_{Y} Y^{\prime}$. Then $U^{\prime}=V^{\prime} \times_{V} U$ is a scheme endowed with a surjective étale morphism $U^{\prime}=V^{\prime} \times_{V} U \rightarrow Y^{\prime} \times_{Y} X=X^{\prime}$. Pick $u^{\prime} \in U^{\prime}$ mapping to $x^{\prime} \in\left|X^{\prime}\right|$. Then we can check flatness of $\mathcal{F}^{\prime}$ at $x^{\prime}$ over $Y^{\prime}$ in terms of flatness of $\left.\mathcal{F}^{\prime}\right|_{U^{\prime}}$ at $u^{\prime}$ over $V^{\prime}$. Hence the lemma follows from More on Morphisms, Lemma 36.12.2.

The following lemma discusses "composition" of flat morphisms in terms of modules. It also shows that flatness satisfies a kind of top down descent.

05VX Lemma 54.30.4. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $x \in|X|$ with image $y \in|Y|$.
(1) If $\mathcal{F}$ is flat at $x$ over $Y$ and $Y$ is flat at $y$ over $Z$, then $\mathcal{F}$ is flat at $x$ over $Z$.
(2) Let $x: \operatorname{Spec}(K) \rightarrow X$ be a representative of $x$. If
(a) $\mathcal{F}$ is flat at $x$ over $Y$,
(b) $x^{*} \mathcal{F} \neq 0$, and
(c) $\mathcal{F}$ is flat at $x$ over $Z$, then $Y$ is flat at $y$ over $Z$.
(3) Let $\bar{x}$ be a geometric point of $X$ lying over $x$ with image $\bar{y}$ in $Y$. If $\mathcal{F}_{\bar{x}}$ is a faithfully flat $\mathcal{O}_{Y, \bar{y}}$-module and $\mathcal{F}$ is flat at $x$ over $Z$, then $Y$ is flat at $y$ over $Z$.

Proof. Pick $\bar{x}$ and $\bar{y}$ as in part (3) and denote $\bar{z}$ the induced geometric point of $Z$. Via the characterization of flatness in Lemmas 54.30.1 and 54.29.8 the lemma reduces to a purely algebraic question on the local ring map $\mathcal{O}_{Z, \bar{z}} \rightarrow \mathcal{O}_{Y, \bar{y}}$ and the module $\mathcal{F}_{\bar{x}}$. Part (1) follows from Algebra, Lemma 10.38.4. We remark that condition (2)(b) guarantees that $\mathcal{F}_{\bar{x}} / \mathfrak{m}_{\bar{y}} \mathcal{F}_{\bar{x}}$ is nonzero. Hence (2)(a) $+(2)(\mathrm{b})$ imply that $\mathcal{F}_{\bar{x}}$ is a faithfully flat $\mathcal{O}_{Y, \bar{y} \text {-module, see Algebra, Lemma } 10.38 .15 \text {. Thus (2) is }}$ a special case of (3). Finally, (3) follows from Algebra, Lemma 10.38.10
Sometimes the base change happens "up on top". Here is a precise statement.

05VY Lemma 54.30.5. Let $S$ be a scheme. Let $f: X \rightarrow Y, g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $Y$. Let $x \in|X|$ with image $y \in|Y|$. If $f$ is flat at $x$, then
$\mathcal{G}$ flat over $Z$ at $y \Leftrightarrow f^{*} \mathcal{G}$ flat over $Z$ at $x$.
In particular: If $f$ is surjective and flat, then $\mathcal{G}$ is flat over $Z$, if and only if $f^{*} \mathcal{G}$ is flat over $Z$.

Proof. Pick a geometric point $\bar{x}$ of $X$ and denote $\bar{y}$ the image in $Y$ and $\bar{z}$ the image in $Z$. Via the characterization of flatness in Lemmas 54.30.1 and 54.29.8 and the description of the stalk of $f^{*} \mathcal{G}$ at $\bar{x}$ of Properties of Spaces, Lemma 53.28 .5 the lemma reduces to a purely algebraic question on the local ring maps $\mathcal{O}_{Z, \bar{z}} \rightarrow$ $\mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{X, \bar{x}}$ and the module $\mathcal{G}_{\bar{y}}$. This algebraic statement is Algebra, Lemma 10.38.9.

### 54.31. Generic flatness

06QR This section is the analogue of Morphisms, Section 28.27 .
06QS Proposition 54.31.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. Assume
(1) $Y$ is reduced,
(2) $f$ is of finite type, and
(3) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_{W} \rightarrow$ $W$ of $f$ is flat, locally of finite presentation, and quasi-compact and such that $\left.\mathcal{F}\right|_{X_{W}}$ is flat over $W$ and of finite presentation over $\mathcal{O}_{X_{W}}$.

Proof. Let $V$ be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. Let $X_{V}=V \times_{Y} X$ and let $\mathcal{F}_{V}$ be the restriction of $\mathcal{F}$ to $X_{V}$. Suppose that the result holds for the morphism $X_{V} \rightarrow V$ and the sheaf $\mathcal{F}_{V}$. Then there exists an open subscheme $V^{\prime} \subset V$ such that $X_{V^{\prime}} \rightarrow V^{\prime}$ is flat and of finite presentation and $\mathcal{F}_{V^{\prime}}$ is an $\mathcal{O}_{X_{V^{\prime}}}$-module of finite presentation flat over $V^{\prime}$. Let $W \subset Y$ be the image of the étale morphism $V^{\prime} \rightarrow Y$, see Properties of Spaces, Lemma 53.4.10. Then $V^{\prime} \rightarrow W$ is a surjective étale morphism, hence we see that $X_{W} \rightarrow W$ is flat, locally of finite presentation, and quasi-compact by Lemmas 54.28.4, 54.29.5 and 54.8.7. By the discussion in Properties of Spaces, Section 53.29 we see that $\mathcal{F}_{W}$ is of finite presentation as a $\mathcal{O}_{X_{W}}$-module and by Lemma 54.30 .3 we see that $\mathcal{F}_{W}$ is flat over $W$. This argument reduces the proposition to the case where $Y$ is a scheme.
Suppose we can prove the proposition when $Y$ is an affine scheme. Let $f: X \rightarrow Y$ be a finite type morphism of algebraic spaces over $S$ with $Y$ a scheme, and let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_{X}$-module. Choose an affine open covering $Y=\bigcup V_{j}$. By assumption we can find dense open $W_{j} \subset V_{j}$ such that $X_{W_{j}} \rightarrow W_{j}$ is flat, locally of finite presentation, and quasi-compact and such that $\left.\mathcal{F}\right|_{X_{W_{j}}}$ is flat over $W_{j}$ and of finite presentation as an $\mathcal{O}_{X_{W_{j}}}$-module. In this situation we simply take $W=\bigcup W_{j}$ and we win. Hence we reduce the proposition to the case where $Y$ is an affine scheme.
Let $Y$ be an affine scheme over $S$, let $f: X \rightarrow Y$ be a finite type morphism of algebraic spaces over $S$, and let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_{X}$-module. Since $f$ is of finite type it is quasi-compact, hence $X$ is quasi-compact. Thus we
can find an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 53.6.3. Note that $U \rightarrow Y$ is of finite type (this is what it means for $f$ to be of finite type in this case). Hence we can apply Morphisms, Proposition 28.27 .2 to see that there exists a dense open $W \subset Y$ such that $U_{W} \rightarrow W$ is flat and of finite presentation and such that $\left.\mathcal{F}\right|_{U_{W}}$ is flat over $W$ and of finite presentation as an $\mathcal{O}_{U_{W}}$-module. According to our definitions this means that the base change $X_{W} \rightarrow W$ of $f$ is flat, locally of finite presentation, and quasi-compact and $\left.\mathcal{F}\right|_{X_{W}}$ is flat over $W$ and of finite presentation over $\mathcal{O}_{X_{W}}$.

We cannot improve the result of the lemma above to requiring $X_{W} \rightarrow W$ to be of finite presentation as $\mathbf{A}_{\mathbf{Q}}^{1} / \mathbf{Z} \rightarrow \operatorname{Spec}(\mathbf{Q})$ gives a counter example. The problem is that the diagonal morphism $\Delta_{X / Y}$ may not be quasi-compact, i.e., $f$ may not be quasi-separated. Clearly, this is also the only problem.

06QT Proposition 54.31.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. Assume
(1) $Y$ is reduced,
(2) $f$ is quasi-separated,
(3) $f$ is of finite type, and
(4) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_{W} \rightarrow$ $W$ of $f$ is flat and of finite presentation and such that $\left.\mathcal{F}\right|_{X_{W}}$ is flat over $W$ and of finite presentation over $\mathcal{O}_{X_{W}}$.

Proof. This follows immediately from Proposition 54.31 .1 and the fact that "of finite presentation" $=$ "locally of finite presentation" + "quasi-compact" + "quasiseparated".

### 54.32. Relative dimension

04 NH In this section we define the relative dimension of a morphism of algebraic spaces at a point, and some closely related properties.

04NM Definition 54.32.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$. Let $d, r \in\{0,1,2, \ldots, \infty\}$.
(1) We say the dimension of the local ring of the fibre of $f$ at $x$ is $d$ if the equivalent conditions of Lemma 54.22 .5 hold for the property $\mathcal{P}_{d}$ described in Descent, Lemma 34.29.6
(2) We say the transcendence degree of $x / f(x)$ is $r$ if the equivalent conditions of Lemma 54.22.5 hold for the property $\mathcal{P}_{r}$ described in Descent, Lemma 34.29 .7
(3) We say the $f$ has relative dimension $d$ at $x$ if the equivalent conditions of Lemma 54.22 .5 hold for the property $\mathcal{P}_{d}$ described in Descent, Lemma 34.29 .8 .

Let us spell out what this means. Namely, choose some diagrams

as in Lemma 54.22.5. Then we have

$$
\begin{aligned}
\text { relative dimension of } f \text { at } x & =\operatorname{dim}_{u}\left(U_{v}\right) \\
\text { dimension of local ring of the fibre of } f \text { at } x & =\operatorname{dim}_{\left(\mathcal{O}_{U_{v}, u}\right)} \\
\text { transcendence degree of } x / f(x) & =\operatorname{trdeg}_{\kappa(v)}(\kappa(u))
\end{aligned}
$$

Note that if $Y=\operatorname{Spec}(k)$ is the spectrum of a field, then the relative dimension of $X / Y$ at $x$ is the same as $\operatorname{dim}_{x}(X)$, the transcendence degree of $x / f(x)$ is the transcendence degree over $k$, and the dimension of the local ring of the fibre of $f$ at $x$ is just the dimension of the local ring at $x$, i.e., the relative notions become absolute notions in that case.

06LR Definition 54.32.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $d \in\{0,1,2, \ldots\}$.
(1) We say $f$ has relative dimension $\leq d$ if $f$ has relative dimension $\leq d$ at all $x \in|X|$.
(2) We say $f$ has relative dimension $d$ if $f$ has relative dimension $d$ at all $x \in|X|$.

Having relative dimension equal to $d$ means roughly speaking that all nonempty fibres are equidimensional of dimension $d$.

06RX Lemma 54.32.3. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $x \in|X|$ and let $y \in|Y|, z \in|Z|$ be the images. Assume $X \rightarrow Y$ is locally quasi-finite and $Y \rightarrow Z$ locally of finite type. Then the transcendence degree of $x / z$ is equal to the transcendence degree of $y / z$.

Proof. We can choose commutative diagrams

where $U, V, W$ are schemes and the vertical arrows are étale. By definition the morphism $U \rightarrow V$ is locally quasi-finite which implies that $\kappa(v) \subset \kappa(u)$ is finite, see Morphisms, Lemma 28.20.5. Hence the result is clear.

0AFH Lemma 54.32.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian algebraic spaces over $S$ which is flat, locally of finite type and of relative dimension $d$. For every point $x$ in $|X|$ with image $y$ in $|Y|$ we have $\operatorname{dim}_{x}(X)=$ $\operatorname{dim}_{y}(Y)+d$.

Proof. By definition of the dimension of an algebraic space at a point (Properties of Spaces, Definition 53.8.1 and by definition of having relative dimension $d$, this reduces to the corresponding statement for schemes (Morphisms, Lemma 28.29.6).

### 54.33. Morphisms and dimensions of fibres

04NP This section is the analogue of Morphisms, Section 28.28. The formulations in this section are a bit awkward since we do not have local rings of algebraic spaces at points.

04NQ Lemma 54.33.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$. Assume $f$ is locally of finite type. Then we have
relative dimension of $f$ at $x$
$=$
dimension of local ring of the fibre of $f$ at $x$
$+$
transcendence degree of $x / f(x)$
where the notation is as in Definition 54.32.1.
Proof. This follows immediately from Morphisms, Lemma 28.28.1 applied to $h$ : $U \rightarrow V$ and $u \in U$ as in Lemma 54.22.5.

04NR Lemma 54.33.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $x \in|X|$ and set $y=f(x)$. Assume $f$ and $g$ locally of finite type. Then

> relative dimension of $g \circ f$ at $x$
> $\leq$
> relative dimension of $f$ at $x$
> +
> relative dimension of $g$ at $y$

Moreover, equality holds if for some morphism $\operatorname{Spec}(k) \rightarrow Z$ from the spectrum of a field in the class of $g(f(x))=g(y)$ the morphism $X_{k} \rightarrow Y_{k}$ is flat at $x$. This holds for example if $f$ is flat at $x$.

Proof. Choose a diagram

with $U, V, W$ schemes and vertical arrows étale and surjective. (See Spaces, Lemma 52.11.6.) Choose $u \in U$ mapping to $x$. Set $v, w$ equal to the images of $u$ in $V, W$. Apply Morphisms, Lemma 28.28.2 to the top row and the points $u, v, w$. Details omitted.

04NS Lemma 54.33.3. Let $S$ be a scheme. Let

be a fibre product diagram of algebraic spaces over $S$. Let $x^{\prime} \in\left|X^{\prime}\right|$. Set $x=g^{\prime}\left(x^{\prime}\right)$. Assume $f$ locally of finite type. Then we have

$$
\begin{gathered}
\text { relative dimension of } f \text { at } x \\
= \\
\text { relative dimension of } f^{\prime} \text { at } x^{\prime}
\end{gathered}
$$

Proof. Choose a surjective étale morphism $V \rightarrow Y$ with $V$ a scheme. By Spaces, Lemma 52.11 .6 we may choose morphisms of schemes $V^{\prime} \rightarrow V$ lifting the morphism $g$ and $U \rightarrow V$ lifting the morphism $f$ such that $V^{\prime} \rightarrow Y^{\prime}$ and $U \rightarrow X$ are also surjective and étale. Set $U^{\prime}=V^{\prime} \times_{V} U$. Then the induced morphism $U^{\prime} \rightarrow X^{\prime}$ is also surjective and étale (argument omitted). Hence we can choose a $u^{\prime} \in U^{\prime}$ mapping to $x^{\prime}$. At this point the result follows by applying Morphisms, Lemma 28.28 .3 to the diagram of schemes involving $U^{\prime}, U, V^{\prime}, V$ and the point $u^{\prime}$.

04NT Lemma 54.33.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $n \geq 0$. Assume $f$ is locally of finite type. The set

$$
W_{n}=\{x \in|X| \text { such that the relative dimension of } f \text { at } x \leq n\}
$$

is open in $|X|$.
Proof. Choose a diagram

where $U$ and $V$ are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma52.11.6. By Morphisms, Lemma 28.28 .4 the set $U_{n}$ of points where $h$ has relative dimension $\leq n$ is open in $U$. By our definition of relative dimension for morphisms of algebraic spaces at points we see that $U_{n}=a^{-1}\left(W_{n}\right)$. The lemma follows by definition of the topology on $|X|$.
04NU Lemma 54.33.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ Let $n \geq 0$. Assume $f$ is locally of finite presentation. The open

$$
W_{n}=\{x \in|X| \text { such that the relative dimension of } f \text { at } x \leq n\}
$$

of Lemma 54.33.4 is retrocompact in $|X|$. (See Topology, Definition 5.11.1.)
Proof. Choose a diagram

where $U$ and $V$ are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 52.11.6. In the proof of Lemma 54.33.4 we have seen that $a^{-1}\left(W_{n}\right)=U_{n}$ is the corresponding set for the morphism $h$. By Morphisms, Lemma 28.28 .5 we see that $U_{n}$ is retrocompact in $U$. The lemma follows by definition of the topology on $|X|$, compare with Properties of Spaces, Lemma 53.5.5 and its proof.

04NV Lemma 54.33.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type. Then $f$ is locally quasi-finite if and only if $f$ has relative dimension 0 at each $x \in|X|$.
Proof. Choose a diagram

where $U$ and $V$ are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 52.11.6. The definitions imply that $h$ is locally quasi-finite if and only if $f$ is locally quasi-finite, and that $f$ has relative dimension 0 at all $x \in|X|$ if and only if $h$ has relative dimension 0 at all $u \in U$. Hence the result follows from the result for $h$ which is Morphisms, Lemma 28.29.5.

04NW Lemma 54.33.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type. Then there exists a canonical open subspace $X^{\prime} \subset X$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is locally quasi-finite, and such that the relative dimension of $f$ at any $x \in|X|, x \notin\left|X^{\prime}\right|$ is $\geq 1$. Formation of $X^{\prime}$ commutes with arbitrary base change.
Proof. Combine Lemmas 54.33.4, 54.33.6, and 54.33.3.
06LS Lemma 54.33.8. Let $S$ be a scheme. Consider a cartesian diagram

where $X \rightarrow Y$ is a morphism of algebraic spaces over $S$ which is locally of finite type and where $k$ is a field over $S$. Let $z \in|F|$ be such that $\operatorname{dim}_{z}(F)=0$. Then, after replacing $X$ by an open subspace containing $p(z)$, the morphism

$$
X \longrightarrow Y
$$

is locally quasi-finite.
Proof. Let $X^{\prime} \subset X$ be the open subspace over which $f$ is locally quasi-finite found in Lemma 54.33.7. Since the formation of $X^{\prime}$ commutes with arbitrary base change we see that $z \in X^{\prime} \times_{Y} \operatorname{Spec}(k)$. Hence the lemma is clear.

### 54.34. The dimension formula

0BAW The analog of the dimension formula (Morphisms, Lemma 28.30.1) is a bit tricky to formulate, because we would have to define integral algebraic spaces (we do this later) as well as universally catenary algebraic spaces. However, the following version is straightforward.

0BAX Lemma 54.34.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $Y$ is locally Noetherian and $f$ locally of finite type. Let $x \in|X|$ with image $y \in|Y|$. Then we have

> the dimension of the local ring of $X$ at $x \leq$
> the dimension of the local ring of $Y$ at $y+E-$
> the transcendence degree of $x / y$

Here $E$ is the maximum of the transcendence degrees of $\xi / f(\xi)$ where $\xi \in|X|$ runs over the points specializing to $x$ at which the local ring of $X$ has dimension 0 .

Proof. Choose an affine scheme $V$, an étale morphism $V \rightarrow Y$, and a point $v \in V$ mapping to $y$. Choose an affine scheme $U$, an étale morphism $U \rightarrow X \times_{Y} V$ and
a point $u \in U$ mapping to $v$ in $V$ and $x$ in $X$. Unwinding Definition 54.32.1 and Properties of Spaces, Definition 53.9.2 we have to show that

$$
\operatorname{dim}\left(\mathcal{O}_{U, u}\right) \leq \operatorname{dim}\left(\mathcal{O}_{V, v}\right)+E-\operatorname{trdeg}_{\kappa(v)}(\kappa(u))
$$

Let $\xi_{U} \in U$ be a generic point of an irreducible component of $U$ which contains $u$. Then $\xi_{U}$ maps to a point $\xi \in|X|$ which is in the list used to define the quantity $E$ and in fact every $\xi$ used in the definition of $E$ occurs in this manner (small detail omitted). In particular, there are only a finite number of these $\xi$ and we can take the maximum (i.e., it really is a maximum and not a supremum). The transcendence degree of $\xi$ over $f(\xi)$ is $\operatorname{trdeg}_{\kappa\left(\xi_{V}\right)}\left(\kappa\left(\xi_{U}\right)\right)$ where $\xi_{V} \in V$ is the image of $\xi_{U}$. Thus the lemma follows from Morphisms, Lemma 28.30.2,

0BAY Lemma 54.34.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $Y$ is locally Noetherian and $f$ is locally of finite type. Then

$$
\operatorname{dim}(X) \leq \operatorname{dim}(Y)+E
$$

where $E$ is the supremum of the transcendence degrees of $\xi / f(\xi)$ where $\xi$ runs through the points at which the local ring of $X$ has dimension 0.

Proof. Immediate consequence of Lemma 54.34.1 and Properties of Spaces, Lemma 53.9.3.

### 54.35. Syntomic morphisms

03Z6 The property "syntomic" of morphisms of schemes is étale local on the source-andtarget, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.31.4 and Descent, Lemma 34.19.24, Hence, by Lemma 54.22.1 above, we may define the notion of a syntomic morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.
03Z7 Definition 54.35.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is syntomic if the equivalent conditions of Lemma 54.22.1 hold with $\mathcal{P}=$ "syntomic".
(2) Let $x \in|X|$. We say $f$ is syntomic at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is syntomic.
$03 Z 8$ Lemma 54.35.2. The composition of syntomic morphisms is syntomic.
Proof. See Remark 54.22.3 and Morphisms, Lemma 28.31.3.
03Z9 Lemma 54.35.3. The base change of a syntomic morphism is syntomic.
Proof. See Remark 54.22 .4 and Morphisms, Lemma 28.31.4,
03ZA Lemma 54.35.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is syntomic,
(2) for every $x \in|X|$ the morphism $f$ is syntomic at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is syntomic,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is syntomic,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a syntomic morphism,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is syntomic,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is syntomic,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is syntomic, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is syntomic.
Proof. Omitted.

### 54.36. Smooth morphisms

03ZB The property "smooth" of morphisms of schemes is étale local on the source-andtarget, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.34.5 and Descent, Lemma 34.19.25. Hence, by Lemma 54.22 .1 above, we may define the notion of a smooth morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03ZC Definition 54.36.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is smooth if the equivalent conditions of Lemma 54.22.1 hold with $\mathcal{P}=$ "smooth".
(2) Let $x \in|X|$. We say $f$ is smooth at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is smooth.

03ZD Lemma 54.36.2. The composition of smooth morphisms is smooth.
Proof. See Remark 54.22.3 and Morphisms, Lemma 28.34.4.
03ZE Lemma 54.36.3. The base change of a smooth morphism is smooth.
Proof. See Remark 54.22.4 and Morphisms, Lemma 28.34.5.
03ZF Lemma 54.36.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is smooth,
(2) for every $x \in|X|$ the morphism $f$ is smooth at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is smooth,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is smooth,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is a smooth morphism,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is smooth,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is smooth,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is smooth, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is smooth.
Proof. Omitted.
04AJ Lemma 54.36.5. A smooth morphism of algebraic spaces is locally of finite presentation.

Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 54.22 .1 with $h$ smooth and surjective vertical arrow $a$. By Morphisms, Lemma $28.34 .8 ~ h$ is locally of finite presentation. Hence $X \rightarrow Y$ is locally of finite presentation by definition.

06MH Lemma 54.36.6. A smooth morphism of algebraic spaces is locally of finite type.
Proof. Combine Lemmas 54.36.5 and 54.28.5
04TA Lemma 54.36.7. A smooth morphism of algebraic spaces is flat.
Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 54.22.1 with $h$ smooth and surjective vertical arrow $a$. By Morphisms, Lemma $28.34 .8 h$ is flat. Hence $X \rightarrow Y$ is flat by definition.

06CP Lemma 54.36.8. A smooth morphism of algebraic spaces is syntomic.
Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 54.22 .1 with $h$ smooth and surjective vertical arrow $a$. By Morphisms, Lemma 28.34.7 $h$ is syntomic. Hence $X \rightarrow Y$ is syntomic by definition.

0AFI Lemma 54.36.9. Let $X$ and $Y$ be locally Noetherian algebraic spaces over a scheme $S$, and let $f: X \rightarrow Y$ be a smooth morphism. For every point $x \in|X|$ with image $y \in|Y|$,

$$
\operatorname{dim}_{x}(X)=\operatorname{dim}_{y}(Y)+\operatorname{dim}_{x}\left(X_{y}\right)
$$

where $\operatorname{dim}_{x}\left(X_{y}\right)$ is the relative dimension of $f$ at $x$ as in Definition 54.32.1.
Proof. By definition of the dimension of an algebraic space at a point (Properties of Spaces, Definition53.8.1), this reduces to the corresponding statement for schemes (Morphisms, Lemma 28.34.21).

### 54.37. Unramified morphisms

03ZG The property "unramified" (resp. "G-unramified") of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.35.5 and Descent, Lemma 34.19.26. Hence, by Lemma 54.22.1 above, we may define the notion of an unramified morphism (resp. G-unramified morphism) of algebraic spaces as follows and it agrees with the already existing notion defined in Section 54.3 when the morphism is representable.

03ZH Definition 54.37.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ is unramified if the equivalent conditions of Lemma 54.22.1 hold with $\mathcal{P}=$ unramified.
(2) Let $x \in|X|$. We say $f$ is unramified at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is unramified.
(3) We say $f$ is $G$-unramified if the equivalent conditions of Lemma 54.22.1 hold with $\mathcal{P}=$ G-unramified.
(4) Let $x \in|X|$. We say $f$ is $G$-unramified at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is G-unramified.
Because of the following lemma, from here on we will only develop theory for unramified morphisms, and whenever we want to use a G-unramified morphism we will simply say "an unramified morphism locally of finite presentation".

04G1 Lemma 54.37.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then $f$ is G-unramified if and only if $f$ is unramified and locally of finite presentation.

Proof. Consider any diagram as in Lemma 54.22.1. Then all we are saying is that the morphism $h$ is G-unramified if and only if it is unramified and locally of finite presentation. This is clear from Morphisms, Definition 28.35.1.

03ZI Lemma 54.37.3. The composition of unramified morphisms is unramified.
Proof. See Remark 54.22.3 and Morphisms, Lemma 28.35.4.
03ZJ Lemma 54.37.4. The base change of an unramified morphism is unramified.
Proof. See Remark 54.22.4 and Morphisms, Lemma 28.35.5.
03ZK Lemma 54.37.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is unramified,
(2) for every $x \in|X|$ the morphism $f$ is unramified at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y} X \rightarrow Z$ is unramified,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is unramified,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is an unramified morphism,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is unramified,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is unramified,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is unramified, and
(9) there exist Zariski coverings $Y=\bigcup_{i \in I} Y_{i}$, and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is unramified.
Proof. Omitted.
05VZ Lemma 54.37.6. An unramified morphism of algebraic spaces is locally of finite type.
Proof. Via a diagram as in Lemma 54.22.1 this translates into Morphisms, Lemma 28.35.9

05W0 Lemma 54.37.7. If $f$ is unramified at $x$ then $f$ is quasi-finite at $x$. In particular, an unramified morphism is locally quasi-finite.

Proof. Via a diagram as in Lemma 54.22.1 this translates into Morphisms, Lemma 28.35 .10 .

06CQ Lemma 54.37.8. An immersion of algebraic spaces is unramified.
Proof. Let $i: X \rightarrow Y$ be an immersion of algebraic spaces. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Then $V \times_{Y} X \rightarrow V$ is an immersion of schemes, hence unramified (see Morphisms, Lemmas 28.35.7 and 28.35.8. Thus by definition $i$ is unramified.

05W1 Lemma 54.37.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) If $f$ is unramified, then the diagonal morphism $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is an open immersion.
(2) If $f$ is locally of finite type and $\Delta_{X / Y}$ is an open immersion, then $f$ is unramified.

Proof. We know in any case that $\Delta_{X / Y}$ is a representable monomorphism, see Lemma 54.4.1. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. Consider the commutative diagram

with cartesian right square. The left vertical arrow is surjective étale. The right vertical arrow is étale as a morphism between schemes étale over $Y$, see Properties of Spaces, Lemma 53.15.6. Hence the middle vertical arrow is étale too (but it need not be surjective).

Assume $f$ is unramified. Then $U \rightarrow V$ is unramified, hence $\Delta_{U / V}$ is an open immersion by Morphisms, Lemma 28.35.13. Looking at the left square of the diagram above we conclude that $\Delta_{X / Y}$ is an étale morphism, see Properties of Spaces, Lemma 53.15.3. Hence $\Delta_{X / Y}$ is a representable étale monomorphism, which implies that it is an open immersion by Étale Morphisms, Theorem 40.14.1. (See also Spaces, Lemma 52.5 .8 for the translation from schemes language into the language of functors.)

Assume that $f$ is locally of finite type and that $\Delta_{X / Y}$ is an open immersion. This implies that $U \rightarrow V$ is locally of finite type too (by definition of a morphism of algebraic spaces which is locally of finite type). Looking at the displayed diagram above we conclude that $\Delta_{U / V}$ is étale as a morphism between schemes étale over $X \times_{Y} X$, see Properties of Spaces, Lemma 53.15.6. But since $\Delta_{U / V}$ is the diagonal of a morphism between schemes we see that it is in any case an immersion, see Schemes, Lemma 25.21.2. Hence it is an open immersion, and we conclude that $U \rightarrow V$ is unramified by Morphisms, Lemma 28.35.13. This in turn means that $f$ is unramified by definition.

05W2 Lemma 54.37.10. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$. Assume that $X \rightarrow Z$ is locally of finite type. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset|X|$ is the set of points where $f$ is unramified. Moreover, for any morphism of algebraic spaces $Z^{\prime} \rightarrow Z$, if $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$ by $Z^{\prime} \rightarrow Z$, then $U\left(f^{\prime}\right)$ is the inverse image of $U(f)$ under the projection $X^{\prime} \rightarrow X$.

Proof. This lemma is the analogue of Morphisms, Lemma 28.35 .15 and in fact we will deduce the lemma from it. By Definition 54.37.1 the set $\{x \in|X|$ :
$f$ is unramified at $x\}$ is open in $X$. Hence we only need to prove the final statement. By Lemma 54.23 .6 the morphism $X \rightarrow Y$ is locally of finite type. By Lemma 54.23 .3 the morphism $X^{\prime} \rightarrow Y^{\prime}$ is locally of finite type.

Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow W \times{ }_{Z} Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Finally, choose a scheme $W^{\prime}$ and a surjective étale morphism $W^{\prime} \rightarrow W \times{ }_{Z} Z^{\prime}$. Set $V^{\prime}=W^{\prime} \times{ }_{W} V$ and $U^{\prime}=W^{\prime} \times{ }_{W} U$, so that we obtain surjective étale morphisms $V^{\prime} \rightarrow Y^{\prime}$ and $U^{\prime} \rightarrow X^{\prime}$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 53.15.7). This combined with Lemma 54.37 .5 implies that $U(f)$ is the image in $|X|$ of the set $T$ of points in $U$ where the morphism $U \rightarrow V$ is unramified. Similarly, $U\left(f^{\prime}\right)$ is the image in $\left|X^{\prime}\right|$ of the set $T^{\prime}$ of points in $U^{\prime}$ where the morphism $U^{\prime} \rightarrow V^{\prime}$ is unramified. Now, by construction the diagram

is cartesian (in the category of schemes). Hence the aforementioned Morphisms, Lemma 28.35 .15 applies to show that $T^{\prime}$ is the inverse image of $T$. Since $\left|U^{\prime}\right| \rightarrow\left|X^{\prime}\right|$ is surjective this implies the lemma.

06G6 Lemma 54.37.11. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. If $X \rightarrow Z$ is unramified, then $X \rightarrow Y$ is unramified.

Proof. Choose a commutative diagram

with vertical arrows étale and surjective. (See Spaces, Lemma 52.11.6.) Apply Morphisms, Lemma 28.35 .16 to the top row.

### 54.38. Étale morphisms

03XS The notion of an étale morphism of algebraic spaces was defined in Properties of Spaces, Definition 53.15.2. Here is what it means for a morphism to be étale at a point.

04RH Definition 54.38.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$. We say $f$ is étale at $x$ if there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is étale

03XT Lemma 54.38.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is étale,
(2) for every $x \in|X|$ the morphism $f$ is étale at $x$,
(3) for every scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times{ }_{Y} X \rightarrow Z$ is étale,
(4) for every affine scheme $Z$ and any morphism $Z \rightarrow Y$ the morphism $Z \times_{Y}$ $X \rightarrow Z$ is étale,
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is an étale morphism,
(6) there exists a scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$ such that the composition $f \circ \varphi$ is étale,
(7) for every commutative diagram

where $U, V$ are schemes and the vertical arrows are étale the top horizontal arrow is étale,
(8) there exists a commutative diagram

where $U, V$ are schemes, the vertical arrows are étale, and $U \rightarrow X$ surjective such that the top horizontal arrow is étale, and
(9) there exist Zariski coverings $Y=\bigcup Y_{i}$ and $f^{-1}\left(Y_{i}\right)=\bigcup X_{i j}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ is étale.
Proof. Combine Properties of Spaces, Lemmas 53.15.3, 53.15.5 and 53.15.4. Some details omitted.

0465 Lemma 54.38.3. The composition of two étale morphisms of algebraic spaces is étale.

Proof. This is a copy of Properties of Spaces, Lemma 53.15.4.
0466 Lemma 54.38.4. The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.

Proof. This is a copy of Properties of Spaces, Lemma 53.15.5.
03XU Lemma 54.38.5. An étale morphism of algebraic spaces is locally quasi-finite.
Proof. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces, see Properties of Spaces, Definition 53.15.2. By Properties of Spaces, Lemma 53.15.3 we see this means there exists a diagram as in Lemma 54.22 .1 with $h$ étale and surjective vertical arrow $a$. By Morphisms, Lemma $28.36 .6 h$ is locally quasi-finite. Hence $X \rightarrow Y$ is locally quasi-finite by definition.

04XX Lemma 54.38.6. An étale morphism of algebraic spaces is smooth.
Proof. The proof is identical to the proof of Lemma 54.38.5. It uses the fact that an étale morphism of schemes is smooth (by definition of an étale morphism of schemes).

0467 Lemma 54.38.7. An étale morphism of algebraic spaces is flat.

Proof. The proof is identical to the proof of Lemma 54.38.5. It uses Morphisms, Lemma 28.36.12
0468 Lemma 54.38.8. An étale morphism of algebraic spaces is locally of finite presentation.

Proof. The proof is identical to the proof of Lemma 54.38.5. It uses Morphisms, Lemma 28.36.11.

06LT Lemma 54.38.9. An étale morphism of algebraic spaces is locally of finite type.
Proof. An étale morphism is locally of finite presentation and a morphism locally of finite presentation is locally of finite type, see Lemmas 54.38 .8 and 54.28.5.

06CR Lemma 54.38.10. An étale morphism of algebraic spaces is unramified.
Proof. The proof is identical to the proof of Lemma 54.38.5. It uses Morphisms, Lemma 28.36.5.

05W3 Lemma 54.38.11. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces étale over an algebraic space $Z$. Any morphism $X \rightarrow Y$ over $Z$ is étale.

Proof. This is a copy of Properties of Spaces, Lemma 53.15.6.
06LU Lemma 54.38.12. A locally finitely presented, flat, unramified morphism of algebraic spaces is étale.

Proof. Let $X \rightarrow Y$ be a locally finitely presented, flat, unramified morphism of algebraic spaces. By Properties of Spaces, Lemma 53.15 .3 we see this means there exists a diagram as in Lemma 54.22 .1 with $h$ locally finitely presented, flat, unramified and surjective vertical arrow $a$. By Morphisms, Lemma 28.36.16 $h$ is étale. Hence $X \rightarrow Y$ is étale by definition.

### 54.39. Proper morphisms

03ZL The notion of a proper morphism plays an important role in algebraic geometry. Here is the definition of a proper morphism of algebraic spaces.

03ZM Definition 54.39.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is proper if $f$ is separated, finite type, and universally closed.

083R Lemma 54.39.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is proper,
(2) for every scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $Z \times_{Y} X \rightarrow$ $Z$ is proper,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the projection $Z \times_{Y} X \rightarrow Z$ is proper,
(4) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is proper, and
(5) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is proper.

Proof. Combine Lemmas 54.4.12, 54.23.4 54.8.7, and 54.9.5.

04WP Lemma 54.39.3. A base change of a proper morphism is proper.
Proof. See Lemmas 54.4.4, 54.23.3, and 54.9.3.
04XY Lemma 54.39.4. A composition of proper morphisms is proper.
Proof. See Lemmas 54.4.8, 54.23.2, and 54.9.4
04XZ Lemma 54.39.5. A closed immersion of algebraic spaces is a proper morphism of algebraic spaces.
Proof. As a closed immersion is by definition representable this follows from Spaces, Lemma 52.5 .8 and the corresponding result for morphisms of schemes, see Morphisms, Lemma 28.41.6.
04NX Lemma 54.39.6. Let $S$ be a scheme. Consider a commutative diagram of algebraic spaces

over $S$.
(1) If $X \rightarrow B$ is universally closed and $Y \rightarrow B$ is separated, then the morphism $X \rightarrow Y$ is universally closed. In particular, the image of $|X|$ in $|Y|$ is closed.
(2) If $X \rightarrow B$ is proper and $Y \rightarrow B$ is separated, then the morphism $X \rightarrow Y$ is proper.

Proof. Assume $X \rightarrow B$ is universally closed and $Y \rightarrow B$ is separated. We factor the morphism as $X \rightarrow X \times_{B} Y \rightarrow Y$. The first morphism is a closed immersion, see Lemma 54.4.6 hence universally closed. The projection $X \times_{B} Y \rightarrow Y$ is the base change of a universally closed morphism and hence universally closed, see Lemma 54.9.3. Thus $X \rightarrow Y$ is universally closed as the composition of universally closed morphisms, see Lemma 54.9.4. This proves (1). To deduce (2) combine (1) with Lemmas 54.4.10, 54.8.8, and 54.23.6.

08AJ Lemma 54.39.7. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $B$. If $X$ is universally closed over $B$ and $f$ is surjective then $Y$ is universally closed over $B$. In particular, if also $Y$ is separated and of finite type over $B$, then $Y$ is proper over $B$.
Proof. Assume $X$ is universally closed and $f$ surjective. Denote $p: X \rightarrow B$, $q: Y \rightarrow B$ the structure morphisms. Let $B^{\prime} \rightarrow B$ be a morphism of algebraic spaces over $S$. The base change $f^{\prime}: X_{B^{\prime}} \rightarrow Y_{B^{\prime}}$ is surjective (Lemma 54.5.5), and the base change $p^{\prime}: X_{B^{\prime}} \rightarrow B^{\prime}$ is closed. If $T \subset Y_{B^{\prime}}$ is closed, then $\left(f^{\prime}\right)^{-1}(T) \subset X_{B^{\prime}}$ is closed, hence $p^{\prime}\left(\left(f^{\prime}\right)^{-1}(T)\right)=q^{\prime}(T)$ is closed. So $q^{\prime}$ is closed.

0AGD Lemma 54.39.8. Let $S$ be a scheme. Let

be a commutative diagram of morphism of algebraic spaces over $S$. Assume
(1) $X \rightarrow B$ is a proper morphism,
(2) $Y \rightarrow B$ is separated and locally of finite type,

Then the scheme theoretic image $Z \subset Y$ of $h$ is proper over $B$ and $X \rightarrow Z$ is surjective.

Proof. The scheme theoretic image of $h$ is constructed in Section 54.16. Observe that $h$ is quasi-compact (Lemma 54.8.9 hence $|h|(|X|) \subset|Z|$ is dense (Lemma 54.16.3). On the other hand $|h|(|X|)$ is closed in $|Y|$ (Lemma 54.39.6) hence $X \rightarrow Z$ is surjective. Thus $Z \rightarrow B$ is a proper (Lemma 54.39.7).

04Y0 Lemma 54.39.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is separated,
(2) $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is universally closed, and
(3) $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is proper.

Proof. The implication $(1) \Rightarrow(3)$ follows from Lemma 54.39 .5 . We will use Spaces, Lemma 52.5 .8 without further mention in the rest of the proof. Recall that $\Delta_{X / Y}$ is a representable monomorphism which is locally of finite type, see Lemma 54.4.1. Since proper $\Rightarrow$ universally closed for morphisms of schemes we conclude that (3) implies (2). If $\Delta_{X / Y}$ is universally closed then Étale Morphisms, Lemma 40.7.2 implies that it is a closed immersion. Thus $(2) \Rightarrow(1)$ and we win.

### 54.40. Valuative criteria

03IW We first formally state the definition and then we discuss how this differs from the case of morphisms of schemes.

03IX Definition 54.40.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ satisfies the uniqueness part of the valuative criterion if given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists at most one dotted arrow (without requiring existence). We say $f$ satisfies the existence part of the valuative criterion if given any solid diagram as above there exists an extension $K \subset$ $K^{\prime}$ of fields, a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$ and a morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ such that the following diagram commutes

We say $f$ satisfies the valuative criterion if $f$ satisfies both the existence and uniqueness part.

The formulation of the existence part of the valuative criterion is slightly different for morphisms of algebraic spaces, since it may be necessary to extend the fraction field of the valuation ring. In practice this difference almost never plays a role.
(1) Checking the uniqueness part of the valuative criterion never involves any fraction field extensions, hence this is exactly the same as in the case of schemes.
(2) It is necessary to allow for field extensions in general, see Example 54.40.6.
(3) For morphisms of algebraic spaces it always sufffices to take a finite separable extensions $K \subset K^{\prime}$ in the existence part of the valuative criterion, see Lemma 54.40.3,
(4) If $f: X \rightarrow Y$ is a separated morphism of algebraic spaces, then we can always take $K=K^{\prime}$ when we check the existence part of the valuative criterion, see Lemma 54.40.5.
(5) In particular, for a quasi-compact and quasi-separated morphism $f: X \rightarrow$ $Y$, we get an equivalence between " $f$ is separated and universally closed" and " $f$ satisfies the usual valuative criterion", see Decent Spaces, Lemma 55.14 .4 In particular, the valuative criterion for properness is the usual one, see Decent Spaces, Lemma 55.14.5.
The results of (5) come later because their proof uses an argument concerning specializations of points on algebraic spaces, which is a topic we address in great detail in the chapter on decent spaces.
As a first step in the theory, we show that the criterion is identical to the criterion as formulated for morphisms of schemes in case the morphism of algebraic spaces is representable.

03K8 Lemma 54.40.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is representable. The following are equivalent
(1) $f$ satisfies the existence part of the valuation criterion as in Definition 54.40.1.
(2) given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a dotted arrow, i.e., $f$ satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.

Proof. It suffices to show that given a commutative diagram of the form

as in Definition54.40.1, then we can find a morphism $\operatorname{Spec}(A) \rightarrow X$ fitting into the diagram too. Set $X_{A}=\operatorname{Spec}(A) \times_{Y} Y$. As $f$ is representable we see that $X_{A}$ is a scheme. The morphism $\varphi$ gives a morphism $\varphi^{\prime}: \operatorname{Spec}\left(A^{\prime}\right) \rightarrow X_{A}$. Let $x \in X_{A}$ be
the image of the closed point of $\varphi^{\prime}: \operatorname{Spec}\left(A^{\prime}\right) \rightarrow X_{A}$. Then we have the following commutative diagram of rings

Since $A$ is a valuation ring, and since $A^{\prime}$ dominates $A$, we see that $K \cap A^{\prime}=A$. Hence the ring map $\mathcal{O}_{X_{A}, x} \rightarrow K$ has image contained in $A$. Whence a morphism $\operatorname{Spec}(A) \rightarrow X_{A}$ (see Schemes, Section 25.13 ) as desired.

03KH Lemma 54.40.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ satisfies the existence part of the valuation criterion as in Definition 54.40.1.
(2) $f$ satisfies the existence part of the valuation criterion as in Definition 54.40 .1 modified by requiring the extension $K \subset K^{\prime}$ to be finite separable.

Proof. We have to show that (1) implies (2). Suppose given a diagram

as in Definition 54.40 .1 with $K \subset K^{\prime}$ arbitrary. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Then

$$
\operatorname{Spec}\left(A^{\prime}\right) \times_{X} U \longrightarrow \operatorname{Spec}\left(A^{\prime}\right)
$$

is surjective étale. Let $p$ be a point of $\operatorname{Spec}\left(A^{\prime}\right) \times_{X} U$ mapping to the closed point of $\operatorname{Spec}\left(A^{\prime}\right)$. Let $p^{\prime} \rightsquigarrow p$ be a generalization of $p$ mapping to the generic point of $\operatorname{Spec}\left(A^{\prime}\right)$. Such a generalization exists because generalizations lift along flat morphisms of schemes, see Morphisms, Lemma 28.25.8. Then $p^{\prime}$ corresponds to a point of the scheme $\operatorname{Spec}\left(K^{\prime}\right) \times_{X} U$. Note that

$$
\operatorname{Spec}\left(K^{\prime}\right) \times_{X} U=\operatorname{Spec}\left(K^{\prime}\right) \times_{\operatorname{Spec}(K)}\left(\operatorname{Spec}(K) \times_{X} U\right)
$$

Hence $p^{\prime}$ maps to a point $q^{\prime} \in \operatorname{Spec}(K) \times{ }_{X} U$ whose residue field is a finite separable extension of $K$. Finally, $p^{\prime} \rightsquigarrow p$ maps to a specialization $u^{\prime} \rightsquigarrow u$ on the scheme $U$. With all this notation we get the following diagram of rings

This means that the ring $B \subset \kappa\left(q^{\prime}\right)$ generated by the images of $A$ and $\mathcal{O}_{U, u}$ maps to a subring of $\kappa\left(p^{\prime}\right)$ contained in the image $B^{\prime}$ of $\mathcal{O}_{\operatorname{Spec}\left(A^{\prime}\right) \times{ }_{X} U, p} \rightarrow \kappa\left(p^{\prime}\right)$. Note that $B^{\prime}$ is a local ring. Let $\mathfrak{m} \subset B$ be the maximal ideal. By construction $A \cap \mathfrak{m}$,
(resp. $\mathcal{O}_{U, u} \cap \mathfrak{m}$, resp. $A^{\prime} \cap \mathfrak{m}$ ) is the maximal ideal of $A$ (resp. $\mathcal{O}_{U, u}$, resp. $A^{\prime}$ ). Set $\mathfrak{q}=B \cap \mathfrak{m}$. This is a prime ideal such that $A \cap \mathfrak{q}$ is the maximal ideal of $A$. Hence $B_{\mathfrak{q}} \subset \kappa\left(q^{\prime}\right)$ is a local ring dominating $A$. By Algebra, Lemma 10.49 .2 we can find a valuation ring $A_{1} \subset \kappa\left(q^{\prime}\right)$ with field of fractions $\kappa\left(q^{\prime}\right)$ dominating $B_{\mathfrak{q}}$. The (local) ring map $\mathcal{O}_{U, u} \rightarrow A_{1}$ gives a morphism $\operatorname{Spec}\left(A_{1}\right) \rightarrow U \rightarrow X$ such that the diagram

is commutative. Since $f . f .\left(A_{1}\right)=\kappa\left(q^{\prime}\right) \supset K$ is finite separable by construction the lemma is proved.

0ARH Lemma 54.40.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a separated morphism of algebraic spaces over $S$. Suppose given a diagram

as in Definition 54.40.1 with $K \subset K^{\prime}$ arbitrary. Then the dotted arrow exists making the diagram commute.

Proof. We have to show that we can find a morphism $\operatorname{Spec}(A) \rightarrow X$ fitting into the diagram.
Consider the base change $X_{A}=\operatorname{Spec}(A) \times_{Y} X$ of $X$. Then $X_{A} \rightarrow \operatorname{Spec}(A)$ is a separated morphism of algebraic spaces (Lemma 54.4.4). Base changing all the morphisms of the diagram above we obtain

Thus we may replace $X$ by $X_{A}$, assume that $Y=\operatorname{Spec}(A)$ and that we have a diagram as above. We may and do replace $X$ by a quasi-compact open subspace containing the image of $\left|\operatorname{Spec}\left(A^{\prime}\right)\right| \rightarrow|X|$.
The morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ is quasi-compact by Lemma 54.8.8. Let $Z \subset X$ be the scheme theoretic image of $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$. Then $Z$ is a reduced (Lemma 54.16.4), quasi-compact (as a closed subspace of $X$ ), separated (as a closed subspace of $X$ ) algebraic space over $A$. Consider the base change

$$
\operatorname{Spec}\left(K^{\prime}\right)=\operatorname{Spec}\left(A^{\prime}\right) \times_{\operatorname{Spec}(A)} \operatorname{Spec}(K) \rightarrow X \times_{\operatorname{Spec}(A)} \operatorname{Spec}(K)=X_{K}
$$

of the morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ by the flat morphism of schemes $\operatorname{Spec}(K) \rightarrow$ $\operatorname{Spec}(A)$. By Lemma 54.29 .12 we see that the scheme theoretic image of this morphism is the base change $Z_{K}$ of $Z$. On the other hand, by assumption (i.e., the commutative diagram above) this morphism factors through a morphism $\operatorname{Spec}(K) \rightarrow$ $Z_{K}$ which is a section to the structure morphism $Z_{K} \rightarrow \operatorname{Spec}(K)$. As $Z_{K}$ is
separated, this section is a closed immersion (Lemma 54.4.7). We conclude that $Z_{K}=\operatorname{Spec}(K)$.
Let $V \rightarrow Z$ be a surjective étale morphism with $V$ an affine scheme (Properties of Spaces, Lemma 53.6.3). Say $V=\operatorname{Spec}(B)$. Then $V \times{ }_{Z} \operatorname{Spec}\left(A^{\prime}\right)=\operatorname{Spec}(C)$ is affine as $Z$ is separated. Note that $B \rightarrow C$ is injective as $V$ is the scheme theoretic image of $V \times_{Z} \operatorname{Spec}\left(A^{\prime}\right) \rightarrow V$ by Lemma 54.16.3. On the other hand, $A^{\prime} \rightarrow C$ is étale as corresponds to the base change of $V \rightarrow Z$. Since $A^{\prime}$ is a torsion free $A$-module, the flatness of $A^{\prime} \rightarrow C$ implies $C$ is a torsion free $A$-module, hence $B$ is a torsion freee $A$-module. Note that being torsion free as an $A$-module is equivalent to being flat (More on Algebra, Lemma 15.16.10. Next, we write

$$
V \times_{Z} V=\operatorname{Spec}\left(B^{\prime}\right)
$$

Note that the two ring maps $B \rightarrow B^{\prime}$ are étale as $V \rightarrow Z$ is étale. The canonical surjective map $B \otimes_{A} B \rightarrow B^{\prime}$ becomes an isomorphism after tensoring with $K$ over $A$ because $Z_{K}=\operatorname{Spec}(K)$. Howeover, $B \otimes_{A} B$ is torsion free as an $A$-module by our remarks above. Thus $B^{\prime}=B \otimes_{A} B$. It follows that the base change of the ring map $A \rightarrow B$ by the faithfully flat ring map $A \rightarrow B$ is étale (note that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective as $X \rightarrow \operatorname{Spec}(A)$ is surjective). Hence $A \rightarrow B$ is étale (Descent, Lemma 34.19.27), in other words, $V \rightarrow X$ is étale. Since we have $V \times_{Z} V=V \times_{\operatorname{Spec}(A)} V$ we conclude that $Z=\operatorname{Spec}(A)$ as algebraic spaces (for example by Spaces, Lemma 52.9.1 and the proof is complete.
0A3W Lemma 54.40.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a separated morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ satisfies the existence part of the valuation criterion as in Definition 54.40.1.
(2) given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a dotted arrow, i.e., $f$ satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.
Proof. We have to show that (1) implies (2). Suppose given a commutative diagram

as in part (2). By (1) there exists a commutative diagram

as in Definition 54.40 .1 with $K \subset K^{\prime}$ arbitrary. By Lemma 54.40 .4 we can find a morphism $\operatorname{Spec}(A) \rightarrow X$ fitting into the diagram, i.e., (2) holds.

03KI Example 54.40.6. Consider the algebraic space $X$ constructed in Spaces, Example 52.14.2. Recall that it is the affine line with zero doubled in a Galois twisted relative to a degree two Galois extension $k \subset k^{\prime}$. As such it comes with a morphism

$$
\pi: X \longrightarrow S=\mathbf{A}_{k}^{1}
$$

which is quasi-compact. We claim that $\pi$ is universally closed. Namely, after base change by $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ the morphism $\pi$ is identified with the morphism
affine line with zero doubled $\longrightarrow$ affine line
which is universally closed (some details omitted). Since the morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow$ $\operatorname{Spec}(k)$ is universally closed and surjective, a diagram chase shows that $\pi$ is universally closed. On the other hand, consider the diagram

Since the unique point of $X$ above $0 \in \mathbf{A}_{k}^{1}$ corresponds to a monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ it is clear there cannot exist a dotted arrow! This shows that a finite separable field extension is needed in general.

03IY Lemma 54.40.7. The base change of a morphism of algebraic spaces which satisfies the existence part of (resp. uniqueness part of) the valuative criterion by any morphism of algebraic spaces satisfies the existence part of (resp. uniqueness part of) the valuative criterion.

Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over the scheme $S$. Let $Z \rightarrow Y$ be any morphism of algebraic spaces over $S$. Consider a solid commutative diagram of the following shape

Then the set of north-west dotted arrows making the diagram commute is in 1-1 correspondence with the set of west-north-west dotted arrows making the diagram commute. This proves the lemma in the case of "uniqueness". For the existence part, assume $f$ satisfies the existence part of the valuative criterion. If we are given a solid commutative diagram as above, then by assumption there exists an extension $K \subset K^{\prime}$ of fields and a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$ and a morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ fitting into the following commutative diagram

And by the remarks above the skew arrow corresponds to an arrow $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow$ $Z \times_{Y} X$ as desired.

03IZ Lemma 54.40.8. The composition of two morphisms of algebraic spaces which satisfy the (existence part of, resp. uniqueness part of) the valuative criterion satisfies the (existence part of, resp. uniqueness part of) the valuative criterion.

Proof. Let $f: X \rightarrow Y, g: Y \rightarrow Z$ be morphisms of algebraic spaces over the scheme $S$. Consider a solid commutative diagram of the following shape

If we have the uniqueness part for $g$, then there exists at most one north-west dotted arrow making the diagram commute. If we also have the uniqueness part for $f$, then we have at most one north-north-west dotted arrow making the diagram commute. The proof in the existence case comes from contemplating the following diagram

Namely, the existence part for $g$ gives us the extension $K^{\prime}$, the valuation ring $A^{\prime}$ and the arrow $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow Y$, whereupon the existence part for $f$ gives us the extension $K^{\prime \prime}$, the valuation ring $A^{\prime \prime}$ and the arrow $\operatorname{Spec}\left(A^{\prime \prime}\right) \rightarrow X$.

### 54.41. Valuative criterion for universal closedness

03K9 The existence part of the valuative criterion implies universal closedness for quasicompact morphisms, see Lemma 54.41.1. In the case of schemes, this is an "if and only if" statement, but for morphisms of algebraic spaces this is wrong. Example 54.9 .6 shows that $\mathbf{A}_{k}^{1} / \mathbf{Z} \rightarrow \operatorname{Spec}(k)$ is universally closed, but it is easy to see that the existence part of the valuative criterion fails. We revisit this topic in Decent Spaces, Section 55.14 and show the converse holds if the source of the morphism is a decent space (see also Decent Spaces, Lemma 55.15.11 for a relative version).

03KA Lemma 54.41.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ is quasi-compact, and
(2) $f$ satisfies the existence part of the valuative criterion.

Then $f$ is universally closed.

Proof. By Lemmas 54.8.3 and 54.40.7 properties (1) and (2) are preserved under any base change. By Lemma 54.9 .5 we only have to show that $T \times_{Y} X \rightarrow T$ is universally closed, whenever $T$ is an affine scheme over $S$ mapping into $Y$. Hence it suffices to prove: If $Y$ is an affine scheme, $f: X \rightarrow Y$ is quasi-compact and satisfies the existence part of the valuative criterion, then $f:|X| \rightarrow|Y|$ is closed. In this situation $X$ is a quasi-compact algebraic space. By Properties of Spaces, Lemma 53.6 .3 there exists an affine scheme $U$ and a surjective étale morphism $\varphi: U \rightarrow X$. Let $T \subset|X|$ closed. The inverse image $\varphi^{-1}(T) \subset U$ is closed, and hence is the set of points of an affine closed subscheme $Z \subset U$. Thus, by Algebra, Lemma 10.40 .5 we see that $f(T)=f(\varphi(|Z|)) \subset|Y|$ is closed if it is closed under specialization.
Let $y^{\prime} \rightsquigarrow y$ be a specialization in $Y$ with $y^{\prime} \in f(T)$. Choose a point $x^{\prime} \in T \subset|X|$ mapping to $y^{\prime}$ under $f$. We may represent $x^{\prime}$ by a morphism $\operatorname{Spec}(K) \rightarrow X$ for some field $K$. Thus we have the following diagram

see Schemes, Section 25.13 for the existence of the left vertical map. Choose a valuation ring $A \subset K$ dominating the image of the ring map $\mathcal{O}_{Y, y} \rightarrow K$ (this is possible since the image is a local ring and not a field as $y^{\prime} \neq y$, see Algebra, Lemma 10.49.2. By assumption there exists a field extension $K \subset K^{\prime}$ and a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$, and a morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ fitting into the commutative diagram. Since $A^{\prime}$ dominates $A$, and $A$ dominates $\mathcal{O}_{Y, y}$ we see that the closed point of $\operatorname{Spec}\left(A^{\prime}\right)$ maps to a point $x \in X$ with $f(x)=y$ which is a specialization of $x^{\prime}$. Hence $x \in T$ as $T$ is closed, and hence $y \in f(T)$ as desired.

089F Lemma 54.41.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a flat morphism of algebraic spaces over $S$. Let $\operatorname{Spec}(A) \rightarrow Y$ be a morphism where $A$ is a valuation ring. If the closed point of $\operatorname{Spec}(A)$ maps to a point of $|Y|$ in the image of $|X| \rightarrow|Y|$, then there exists a commutative diagram

where $A \rightarrow A^{\prime}$ is a local ring map of valuation rings.
Proof. The base change $X_{A} \rightarrow \operatorname{Spec}(A)$ is flat (Lemma 54.29.4) and the closed point of $\operatorname{Spec}(A)$ is in the image of $\left|X_{A}\right| \rightarrow|\operatorname{Spec}(A)|$ (Properties of Spaces, Lemma 53.4.3). Thus we may assume $Y=\operatorname{Spec}(A)$. Let $U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme. Let $u \in U$ map to the closed point of $\operatorname{Spec}(A)$. Consider the flat local ring map $A \rightarrow B=\mathcal{O}_{U, u}$. By Algebra, Lemmas 10.38.16 there exists a prime ideal $\mathfrak{q} \subset B$ such that $\mathfrak{q}$ lies over $(0) \subset A$. By Algebra, Lemma 10.49 .2 we can find a valuation ring $A^{\prime} \subset f . f .(B / \mathfrak{q})$ dominating $B / \mathfrak{q}$. The induced morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow U \rightarrow X$ is a solution to the problem posed by the lemma.
089G Lemma 54.41.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $h: U \rightarrow Y$ be morphisms of algebraic spaces over $S$. If
(1) $f$ and $h$ are quasi-compact,
(2) $|h|(|U|)$ is dense in $|X|$, and
given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$
(3) there exists at most one dotted arrow making the diagram commute, and
(4) there exists an extension $K \subset K^{\prime}$ of fields, a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$ and a morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ such that the following diagram commutes

then $f$ is universally closed. If moreover
(5) $f$ is quasi-separated
then $f$ is separated and universally closed.
Proof. Assume (1), (2), (3), and (4). We will verify the existence part of the valuative criterion for $f$ which will imply $f$ is universally closed by Lemma 54.41.1. To do this, consider a commutative diagram

089H

where $A$ is a valuation ring and $K$ is the fraction field of $A$. Note that since valuation rings and fields are reduced, we may replace $U, X$, and $S$ by their respective reductions by Properties of Spaces, Lemma 53.11.5. In this case the assumption that $h(U)$ is dense means that the scheme theoretic image of $h: U \rightarrow X$ is $X$, see Lemma 54.16.4.
Reduction to the case $Y$ affine. Choose an étale morphism $\operatorname{Spec}(R) \rightarrow Y$ such that the closed point of $\operatorname{Spec}(A)$ maps to an element of $\operatorname{Im}(|\operatorname{Spec}(R)| \rightarrow|Y|)$. By Lemma 54.41 .2 we can find a local ring map $A \rightarrow A^{\prime}$ of valuation rings and a morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ fitting into a commutative diagram

Since in Definition 54.40.1 we allow for extensions of valuation rings it is clear that we may replace $A$ by $A^{\prime}, Y$ by $\operatorname{Spec}(R), X$ by $X \times_{Y} \operatorname{Spec}(R)$ and $U$ by $U \times_{Y} \operatorname{Spec}(R)$.

From now on we assume that $Y=\operatorname{Spec}(R)$ is an affine scheme. Let $\operatorname{Spec}(B) \rightarrow X$ be an étale morphism from an affine scheme such that the morphism $\operatorname{Spec}(K) \rightarrow X$ is in the image of $|\operatorname{Spec}(B)| \rightarrow|X|$. Since we may replace $K$ by an extension $K^{\prime} \supset K$ and $A$ by a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$ (which exists by Algebra, Lemma 10.49 .2 , we may assume the morphism $\operatorname{Spec}(K) \rightarrow X$ factors through $\operatorname{Spec}(B)$ (by definition of $|X|$ ). In other words, we may think of $K$ as a $B$-algebra. Choose a polynomial algebra $P$ over $B$ and a $B$-algebra surjection $P \rightarrow K$. Then $\operatorname{Spec}(P) \rightarrow X$ is flat as a composition $\operatorname{Spec}(P) \rightarrow \operatorname{Spec}(B) \rightarrow X$. Hence the scheme theoretic image of the morphism $U \times_{X} \operatorname{Spec}(P) \rightarrow \operatorname{Spec}(P)$ is $\operatorname{Spec}(P)$ by Lemma 54.29.12. By Lemma 54.16.5 we can find a commutative diagram

where $A^{\prime}$ is a valuation ring and $K^{\prime}$ is the fraction field of $A^{\prime}$ such that the closed point of $\operatorname{Spec}\left(A^{\prime}\right)$ maps to $\operatorname{Spec}(K) \subset \operatorname{Spec}(P)$. In other words, there is a $B$-algebra map $\varphi: K \rightarrow A^{\prime} / \mathfrak{m}_{A^{\prime}}$. Choose a valuation ring $A^{\prime \prime} \subset A^{\prime} / \mathfrak{m}_{A^{\prime}}$ dominating $\varphi(A)$ with field of fractions $K^{\prime \prime}=A^{\prime} / \mathfrak{m}_{A^{\prime}}$ (Algebra, Lemma 10.49.2). We set

$$
C=\left\{\lambda \in A^{\prime} \mid \lambda \bmod \mathfrak{m}_{A^{\prime}} \in A^{\prime \prime}\right\}
$$

which is a valuation ring by Algebra, Lemma 10.49 .9 . As $C$ is an $R$-algebra with fraction field $K^{\prime}$, we obtain a solid commutative diagram

as in the statement of the lemma. Thus assumption (4) produces $C \rightarrow C_{1}$ and the dotted arrows making the diagram commute. Let $A_{1}^{\prime}=\left(C_{1}\right)_{\mathfrak{p}}$ be the localization of $C_{1}$ at a prime $\mathfrak{p} \subset C_{1}$ lying over $\mathfrak{m}_{A^{\prime}} \subset C$. Since $C \rightarrow C_{1}$ is flat by More on Algebra, Lemma 15.16 .10 such a prime $\mathfrak{p}$ exists by Algebra, Lemmas 10.38 .17 and 10.38.16. Note that $A^{\prime}$ is the localization of $C$ at $\mathfrak{m}_{A^{\prime}}$ and that $A_{1}^{\prime}$ is a valuation ring (Algebra, Lemma 10.49.8). In other words, $A^{\prime} \rightarrow A_{1}^{\prime}$ is a local ring map of valuation rings. Assumption (3) implies

commutes. Hence the restriction of the morphism $\operatorname{Spec}\left(C_{1}\right) \rightarrow X$ to $\operatorname{Spec}\left(C_{1} / \mathfrak{p}\right)$ restricts to the composition

$$
\operatorname{Spec}(\kappa(\mathfrak{p})) \rightarrow \operatorname{Spec}\left(A^{\prime} / \mathfrak{m}_{A^{\prime}}\right)=\operatorname{Spec}\left(K^{\prime \prime}\right) \rightarrow \operatorname{Spec}(K) \rightarrow X
$$

on the generic point of $\operatorname{Spec}\left(C_{1} / \mathfrak{p}\right)$. Moreover, $C_{1} / \mathfrak{p}$ is a valuation ring (Algebra, Lemma 10.49.8 dominating $A^{\prime \prime}$ which dominates $A$. Thus the morphism $\operatorname{Spec}\left(C_{1} / \mathfrak{p}\right) \rightarrow X$ witnesses the existence part of the valuative criterion for the diagram 54.41.3.1 as desired.

Next, suppose that (5) is satisfied as well, i.e., the morphism $\Delta: X \rightarrow X \times{ }_{S} X$ is quasi-compact. In this case assumptions (1) - (4) hold for $h$ and $\Delta$. Hence the first part of the proof shows that $\Delta$ is universally closed. By Lemma 54.39 .9 we conclude that $f$ is separated.

### 54.42. Valuative criterion of separatedness

03KT
03KU Lemma 54.42.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is separated, then $f$ satisfies the uniqueness part of the valuative criterion.

Proof. Let a diagram as in Definition 54.40 .1 be given. Suppose there are two distinct morphisms $a, b: \operatorname{Spec}(A) \rightarrow X$ fitting into the diagram. Let $Z \subset \operatorname{Spec}(A)$ be the equalizer of $a$ and $b$. Then $Z=\operatorname{Spec}(A) \times_{(a, b), X \times_{Y} X, \Delta} X$. If $f$ is separated, then $\Delta$ is a closed immersion, and this is a closed subscheme of $\operatorname{Spec}(A)$. By assumption it contains the generic point of $\operatorname{Spec}(A)$. Since $A$ is a domain this implies $Z=\operatorname{Spec}(A)$. Hence $a=b$ as desired.

03KV Lemma 54.42.2 (Valuative criterion separatedness). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) the morphism $f$ is quasi-separated, and
(2) the morphism $f$ satisfies the uniqueness part of the valuative criterion.

Then $f$ is separated.
Proof. Assumption (1) means $\Delta_{X / Y}$ is quasi-compact. We claim the morphism $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ satisfies the existence part of the valuative criterion. Let a solid commutative diagram

be given. The lower right arrow corresponds to a pair of morphisms $a, b: \operatorname{Spec}(A) \rightarrow$ $X$ over $Y$. By assumption (2) we see that $a=b$. Hence using $a$ as the dotted arrow works. Hence Lemma 54.41 .1 applies, and we see that $\Delta_{X / Y}$ is universally closed. Since always $\Delta_{X / Y}$ is locally of finite type and separated, we conclude from More on Morphisms, Lemma 36.31.4 that $\Delta_{X / Y}$ is a finite morphism (also, use the general principle of Spaces, Lemma 52.5 .8 . At this point $\Delta_{X / Y}$ is a representable, finite monomorphism, hence a closed immersion by Morphisms, Lemma 28.43.13.

### 54.43. Integral and finite morphisms

03ZN We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be integral (resp. finite).

03ZO Lemma 54.43.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is integral (resp. finite) if and only if for all affine schemes $Z$ and morphisms $Z \rightarrow Y$ the scheme $X \times_{Y} Z$ is affine and integral (resp. finite) over $Z$.

Proof. This follows directly from the definition of an integral (resp. finite) morphism of schemes (Morphisms, Definition 28.43.1).
This clears the way for the following definition.
03ZP Definition 54.43.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say that $f$ is integral if for every affine scheme $Z$ and morphisms $Z \rightarrow Y$ the algebraic space $X \times_{Y} Z$ is representable by an affine scheme integral over $Z$.
(2) We say that $f$ is finite if for every affine scheme $Z$ and morphisms $Z \rightarrow Y$ the algebraic space $X \times_{Y} Z$ is representable by an affine scheme finite over $Z$.
03ZQ Lemma 54.43.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is representable and integral (resp. finite),
(2) $f$ is integral (resp. finite),
(3) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is integral (resp. finite), and
(4) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each of the morphisms $f^{-1}\left(Y_{i}\right) \rightarrow Y_{i}$ is integral (resp. finite).
Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking $V$ to be a disjoint union of affines étale over $Y$, see Properties of Spaces, Lemma 53.6.1. Assume $V \rightarrow Y$ is as in (3). Then for every affine open $W$ of $V$ we see that $W \times_{Y} X$ is an affine open of $V \times_{Y} X$. Hence by Properties of Spaces, Lemma 53.12.1 we conclude that $V \times_{Y} X$ is a scheme. Moreover the morphism $V \times_{Y} X \rightarrow V$ is affine. This means we can apply Spaces, Lemma 52.11.5 because the class of integral (resp. finite) morphisms satisfies all the required properties (see Morphisms, Lemmas 28.43 .6 and Descent, Lemmas 34.19.20, 34.19.21, and 34.33.1). The conclusion of applying this lemma is that $f$ is representable and integral (resp. finite), i.e., (1) holds.
The equivalence of (1) and (4) follows from the fact that being integral (resp. finite) is Zariski local on the target (the reference above shows that being integral or finite is in fact fpqc local on the target).
03ZR Lemma 54.43.4. The composition of integral (resp. finite) morphisms is integral (resp. finite).
Proof. Omitted.
03ZS Lemma 54.43.5. The base change of an integral (resp. finite) morphism is integral (resp. finite).
Proof. Omitted.
0414 Lemma 54.43.6. A finite morphism of algebraic spaces is integral. An integral morphism of algebraic spaces which is locally of finite type is finite.
Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into $Y$, see Lemmas 54.43.3. Hence this lemma follows from the same lemma for the case of schemes, see Morphisms, Lemma 28.43.4

0415 Lemma 54.43.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is integral, and
(2) $f$ is affine and universally closed.

Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into $Y$, see Lemmas 54.43 .3 , 54.20 .3 and 54.9.5. Hence the result follows from Morphisms, Lemma 28.43.7.

04NY Lemma 54.43.8. A finite morphism of algebraic spaces is quasi-finite.
Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. By Definition 54.43 .2 and Lemmas 54.8.7 and 54.27.6 both properties may be checked after base change to an affine over $Y$, i.e., we may assume $Y$ affine. If $f$ is finite then $X$ is a scheme. Hence the result follows from the corresponding result for schemes, see Morphisms, Lemma 28.43.9.

04NZ Lemma 54.43.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent
(1) $f$ is finite, and
(2) $f$ is affine and proper.

Proof. In both cases the morphism is representable, and you can check the condition after base change to an affine scheme mapping into $Y$, see Lemmas 54.43 .3 , 54.20 .3 , and 54.39.2. Hence the result follows from Morphisms, Lemma 28.43.10.

081 Y Lemma 54.43.10. A closed immersion is finite (and a fortiori integral).
Proof. Omitted.
081Z Lemma 54.43.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$.
(1) If $g \circ f$ is finite and $g$ separated then $f$ is finite.
(2) If $g \circ f$ is integral and $g$ separated then $f$ is integral.

Proof. Assume $g \circ f$ is finite (resp. integral) and $g$ separated. The base change $X \times_{Z} Y \rightarrow Y$ is finite (resp. integral) by Lemma 54.43.5. The morphism $X \rightarrow$ $X \times_{Z} Y$ is a closed immersion as $Y \rightarrow Z$ is separated, see Lemma 54.4.7. A closed immersion is finite (resp. integral), see Lemma 54.43.10. The composition of finite (resp. integral) morphisms is finite (resp. integral), see Lemma 54.43.4. Thus we win.

### 54.44. Finite locally free morphisms

03ZT We have already defined in Section 54.3 what it means for a representable morphism of algebraic spaces to be finite locally free.

03ZU Lemma 54.44.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is finite locally free if and only if $f$ is affine and the sheaf $f_{*} \mathcal{O}_{X}$ is a finite locally free $\mathcal{O}_{Y}$-module.

Proof. Assume $f$ is finite locally free (as defined in Section 54.3). This means that for every morphism $V \rightarrow Y$ whose source is a scheme the base change $f^{\prime}$ : $V \times_{Y} X \rightarrow V$ is a finite locally free morphism of schemes. This in turn means (by the definition of a finite locally free morphism of schemes) that $f_{*}^{\prime} \mathcal{O}_{V \times_{Y} X}$ is a finite locally free $\mathcal{O}_{V}$-module. We may choose $V \rightarrow Y$ to be surjective and étale. By Properties of Spaces, Lemma 53.25 .2 we conclude the restriction of $f_{*} \mathcal{O}_{X}$ to $V$ is finite locally free. Hence by Modules on Sites, Lemma 18.23 .3 applied to the sheaf $f_{*} \mathcal{O}_{X}$ on $Y_{\text {spaces,étale }}$ we conclude that $f_{*} \mathcal{O}_{X}$ is finite locally free.
Conversely, assume $f$ is affine and that $f_{*} \mathcal{O}_{X}$ is a finite locally free $\mathcal{O}_{Y}$-module. Let $V$ be a scheme, and let $V \rightarrow Y$ be a surjective étale morphism. Again by Properties of Spaces, Lemma 53.25 .2 we see that $f_{*}^{\prime} \mathcal{O}_{V \times_{Y} X}$ is finite locally free. Hence $f^{\prime}: V \times_{Y} X \rightarrow V$ is finite locally free (as it is also affine). By Spaces, Lemma 52.11 .5 we conclude that $f$ is finite locally free (use Morphisms, Lemma 28.45.4 Descent, Lemmas 34.19.28 and 34.33.1). Thus we win.

This clears the way for the following definition.
03ZV Definition 54.44.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say that $f$ is finite locally free if $f$ is affine and $f_{*} \mathcal{O}_{X}$ is a finite locally free $\mathcal{O}_{Y}$-module. In this case we say $f$ is has rank or degree $d$ if the sheaf $f_{*} \mathcal{O}_{X}$ is finite locally free of rank $d$.

03ZW Lemma 54.44.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is representable and finite locally free,
(2) $f$ is finite locally free,
(3) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that $V \times_{Y} X \rightarrow V$ is finite locally free, and
(4) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each morphism $f^{-1}\left(Y_{i}\right) \rightarrow$ $Y_{i}$ is finite locally free.

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking $V$ to be a disjoint union of affines étale over $Y$, see Properties of Spaces, Lemma 53.6.1. Assume $V \rightarrow Y$ is as in (3). Then for every affine open $W$ of $V$ we see that $W \times_{Y} X$ is an affine open of $V \times_{Y} X$. Hence by Properties of Spaces, Lemma 53.12.1 we conclude that $V \times_{Y} X$ is a scheme. Moreover the morphism $V \times_{Y} X \rightarrow V$ is affine. This means we can apply Spaces, Lemma 52.11.5 because the class of finite locally free morphisms satisfies all the required properties (see Morphisms, Lemma 28.45.4 Descent, Lemmas 34.19 .28 and 34.33.1). The conclusion of applying this lemma is that $f$ is representable and finite locally free, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being finite locally free is Zariski local on the target (the reference above shows that being finite locally free is in fact fpqc local on the target).

03ZX Lemma 54.44.4. The composition of finite locally free morphisms is finite locally free.

Proof. Omitted.
03ZY Lemma 54.44.5. The base change of a finite locally free morphism is finite locally free.

Proof. Omitted.
0416 Lemma 54.44.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is finite locally free,
(2) $f$ is finite, flat, and locally of finite presentation.

If $Y$ is locally Noetherian these are also equivalent to
(3) $f$ is finite and flat.

Proof. In each of the three cases the morphism is representable and you can check the property after base change by a surjective étale morphism $V \rightarrow Y$, see Lemmas 54.43 .3 , 54.44.3, 54.29.5, and 54.28.4. If $Y$ is locally Noetherian, then $V$ is locally Noetherian. Hence the result follows from the corresponding result in the schemes case, see Morphisms, Lemma 28.45.2

### 54.45. Relative normalization of algebraic spaces

0BAZ This section is the analogue of Morphisms, Section 28.48 .
0820 Lemma 54.45.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. There exists a quasi-coherent sheaf of $\mathcal{O}_{X}-$ algebras $\mathcal{A}^{\prime} \subset \mathcal{A}$ such that for any affine object $U$ of $X_{\text {étale }}$ the ring $\mathcal{A}^{\prime}(U) \subset \mathcal{A}(U)$ is the integral closure of $\mathcal{O}_{X}(U)$ in $\mathcal{A}(U)$.

Proof. By Properties of Spaces, Lemma 53.17 .5 it suffices to prove that the rule given above defines a quasi-coherent module on $X_{a f f i n e, e ́ t a l e}$. To see this it suffices to show the following: Let $U_{1} \rightarrow U_{2}$ be a morphism of affine objects of $X_{\text {étale }}$. Say $U_{i}=\operatorname{Spec}\left(R_{i}\right)$. Say $\left.\mathcal{A}\right|_{\left(U_{1}\right)_{\text {étale }}}$ is the quasi-coherent sheaf associated to the $R_{2}$-algebra $A$. Let $A^{\prime} \subset A$ be the integral closure of $R_{2}$ in $A$. Then $A^{\prime} \otimes_{R_{2}} R_{1}$ is the integral closure of $R_{1}$ in $A \otimes_{R_{2}} R_{1}$. This is Algebra, Lemma 10.143.2.

0821 Definition 54.45.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. The integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$ is the quasi-coherent $\mathcal{O}_{X}$-subalgebra $\mathcal{A}^{\prime} \subset \mathcal{A}$ constructed in Lemma 54.45.1 above.

We will apply this in particular when $\mathcal{A}=f_{*} \mathcal{O}_{Y}$ for a quasi-compact and quasiseparated morphism of algebraic spaces $f: Y \rightarrow X$ (see Lemma 54.11.2). We can then take the relative spectrum of the quasi-coherent $\mathcal{O}_{X}$-algebra (Lemma 54.20 .7 ) to obtain the normalization of $X$ in $Y$.

0822 Definition 54.45.3. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $\mathcal{O}^{\prime}$ be the integral closure of $\mathcal{O}_{X}$ in $f_{*} \mathcal{O}_{Y}$. The normalization of $X$ in $Y$ is the morphism of algebraic spaces

$$
\nu: X^{\prime}=\underline{\operatorname{Spec}}_{X}\left(\mathcal{O}^{\prime}\right) \rightarrow X
$$

over $S$. It comes equipped with a natural factorization

$$
Y \xrightarrow{f^{\prime}} X^{\prime} \xrightarrow{\nu} X
$$

of the initial morphism $f$.
To get the factorization, use Remark 54.20 .9 and functoriality of the Spec construction.

0ABP Lemma 54.45.4. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $Y \rightarrow X^{\prime} \rightarrow X$ be the normalization of $X$ in $Y$.
(1) If $W \rightarrow X$ is an étale morphism of algebraic spaces over $S$, then $W \times{ }_{X} X^{\prime}$ is the normalization of $W$ in $W \times_{X} Y$.
(2) If $Y$ and $X$ are representable, then $Y^{\prime}$ is representable and is canonically isomorphic to the normalization of the scheme $X$ in the scheme $Y$ as constructed in Morphisms, Section 28.49.
Proof. It is immediate from the construction that the formation of the normalization of $X$ in $Y$ commutes with étale base change, i.e., part (1) holds. On the other hand, if $X$ and $Y$ are schemes, then for $U \subset X$ affine open, $f_{*} \mathcal{O}_{Y}(U)=\mathcal{O}_{Y}\left(f^{-1}(U)\right)$ and hence $\nu^{-1}(U)$ is the spectrum of exactly the same ring as we get in the corresponding construction for schemes.

Here is a characterization of this construction.
0823 Lemma 54.45.5. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. The factorization $f=\nu \circ f^{\prime}$, where $\nu: X^{\prime} \rightarrow X$ is the normalization of $X$ in $Y$ is characterized by the following two properties:
(1) the morphism $\nu$ is integral, and
(2) for any factorization $f=\pi \circ g$, with $\pi: Z \rightarrow X$ integral, there exists a commutative diagram

for a unique morphism $h: X^{\prime} \rightarrow Z$.
Moreover, in (2) the morphism $h: X^{\prime} \rightarrow Z$ is the normalization of $Z$ in $Y$.
Proof. Let $\mathcal{O}^{\prime} \subset f_{*} \mathcal{O}_{Y}$ be the integral closure of $\mathcal{O}_{X}$ as in Definition 54.45.3. The morphism $\nu$ is integral by construction, which proves (1). Assume given a factorization $f=\pi \circ g$ with $\pi: Z \rightarrow X$ integral as in (2). By Definition 54.43.2 $\pi$ is affine, and hence $Z$ is the relative spectrum of a quasi-coherent sheaf of $\mathcal{O}_{X^{-}}$ algebras $\mathcal{B}$. The morphism $g: X \rightarrow Z$ corresponds to a map of $\mathcal{O}_{X}$-algebras $\chi: \mathcal{B} \rightarrow f_{*} \mathcal{O}_{Y}$. Since $\mathcal{B}(U)$ is integral over $\mathcal{O}_{X}(U)$ for every affine $U$ étale over $X$ (by Definition 54.43.2) we see from Lemma 54.45.1 that $\chi(\mathcal{B}) \subset \mathcal{O}^{\prime}$. By the functoriality of the relative spectrum Lemma 54.20 .7 this provides us with a unique morphism $h: X^{\prime} \rightarrow Z$. We omit the verification that the diagram commutes.
It is clear that (1) and (2) characterize the factorization $f=\nu \circ f^{\prime}$ since it characterizes it as an initial object in a category. The morphism $h$ in (2) is integral by Lemma 54.43.11. Given a factorization $g=\pi^{\prime} \circ g^{\prime}$ with $\pi^{\prime}: Z^{\prime} \rightarrow Z$ integral, we get a factorization $f=\left(\pi \circ \pi^{\prime}\right) \circ g^{\prime}$ and we get a morphism $h^{\prime}: X^{\prime} \rightarrow Z^{\prime}$. Uniqueness implies that $\pi^{\prime} \circ h^{\prime}=h$. Hence the characterization (1), (2) applies to the morphism $h: X^{\prime} \rightarrow Z$ which gives the last statement of the lemma.
0AYF Lemma 54.45.6. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasiseparated morphism of algebraic spaces over $S$. Let $X^{\prime} \rightarrow X$ be the normalization of $X$ in $Y$. If $Y$ is reduced, so is $X^{\prime}$.

Proof. This follows from the fact that a subring of a reduced ring is reduced. Some details omitted.

0AYG Lemma 54.45.7. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $X^{\prime} \rightarrow X$ be the normalization of $X$ in $Y$. If $x^{\prime} \in\left|X^{\prime}\right|$ is a point of codimension 0 (Properties of Spaces, Definition 53.9.2), then $x^{\prime}$ is the image of some $y \in|Y|$ of codimension 0 .
Proof. By Lemma 54.45.4 and the definitions, we may assume that $X=\operatorname{Spec}(A)$ is affine. Then $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ where $A^{\prime}$ is the integral closure of $A$ in $\Gamma\left(Y, \mathcal{O}_{Y}\right)$ and $x^{\prime}$ corresponds to a minimal prime of $A^{\prime}$. Choose a surjective étale morphism $V \rightarrow Y$ where $V=\operatorname{Spec}(B)$ is affine. Then $A^{\prime} \rightarrow B$ is injective, hence every minimal prime of $A^{\prime}$ is the image of a minimal prime of $B$, see Algebra, Lemma 10.29.5. The lemma follows.

0824 Lemma 54.45.8. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Suppose that $Y=Y_{1} \amalg Y_{2}$ is a disjoint union of two algebraic spaces. Write $f_{i}=\left.f\right|_{Y_{i}}$. Let $X_{i}^{\prime}$ be the normalization of $X$ in $Y_{i}$. Then $X_{1}^{\prime} \amalg X_{2}^{\prime}$ is the normalization of $X$ in $Y$.

Proof. Omitted.
0A0Q Lemma 54.45.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact, quasiseparated and universally closed morphisms of algebraic spaces over $S$. Then $f_{*} \mathcal{O}_{X}$ is integral over $\mathcal{O}_{Y}$. In other words, the normalization of $Y$ in $X$ is equal to the factorization

$$
X \longrightarrow \underline{\operatorname{Spec}}_{Y}\left(f_{*} \mathcal{O}_{X}\right) \longrightarrow Y
$$

of Remark 54.20.9.
Proof. The question is étale local on $Y$, hence we may reduce to the case where $Y=\operatorname{Spec}(R)$ is affine. Let $h \in \Gamma\left(X, \mathcal{O}_{X}\right)$. We have to show that $h$ satisfies a monic equation over $R$. Think of $h$ as a morphism as in the following commutative diagram

Let $Z \subset \mathbf{A}_{Y}^{1}$ be the scheme theoretic image of $h$, see Definition 54.16.2. The morphism $h$ is quasi-compact as $f$ is quasi-compact and $\mathbf{A}_{Y}^{1} \rightarrow Y$ is separated, see Lemma 54.8.8. By Lemma 54.16.3 the morphism $X \rightarrow Z$ has dense image on underlying topological spaces. By Lemma 54.39 .6 the morphism $X \rightarrow Z$ is closed. Hence $h(X)=Z$ (set theoretically). Thus we can use Lemma 54.39 .7 to conclude that $Z \rightarrow Y$ is universally closed (and even proper). Since $Z \subset \mathbf{A}_{Y}^{1}$, we see that $Z \rightarrow Y$ is affine and proper, hence integral by Lemma 54.43.7. Writing $\mathbf{A}_{Y}^{1}=\operatorname{Spec}(R[T])$ we conclude that the ideal $I \subset R[T]$ of $Z$ contains a monic polynomial $P(T) \in R[T]$. Hence $P(h)=0$ and we win.

0825 Lemma 54.45.10. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be an integral morphism of algebraic spaces over $S$. Then the integral closure of $X$ in $Y$ is equal to $Y$.

Proof. By Lemma 54.43.7 this is a special case of Lemma 54.45.9.

0BB0 Lemma 54.45.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that
(1) $Y$ is Nagata,
(2) $f$ is quasi-separated of finite type,
(3) $X$ is reduced.

Then the normalization $\nu: X^{\prime} \rightarrow X$ of $X$ in $Y$ is finite.
Proof. The question is étale local on $Y$, see Lemma 54.45.4. Thus we may assume $Y=\operatorname{Spec}(R)$ is affine. Then $R$ is a Noetherian Nagata ring and we have to show that the integral closure of $R$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is finite over $R$. Since $f$ is quasi-compact we see that $X$ is quasi-compact. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma 53.6.3). Then $\Gamma\left(X, \mathcal{O}_{X}\right) \subset \Gamma\left(U, \mathcal{O}_{X}\right)$. Since $R$ is Noetherian it suffices to show that the integral closure of $R$ in $\Gamma\left(U, \mathcal{O}_{U}\right)$ is finite over $R$. As $U \rightarrow Y$ is of finite type this follows from Morphisms, Lemma 28.48.14.

### 54.46. Normalization

07U3 This section is the analogue of Morphisms, Section 28.49 .
0BB1 Lemma 54.46.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) there is a surjective étale morphism $U \rightarrow X$ where $U$ is as scheme such that every quasi-compact open of $U$ has finitely many irreducible components,
(2) for every scheme $U$ and every étale morphism $U \rightarrow X$ every quasi-compact open of $U$ has finitely many irreducible components, and
(3) for every quasi-compact algebraic space $Y$ étale over $X$ the space $|Y|$ has finitely many irreducible components.
If $X$ is representable this means that every quasi-compact open of $X$ has finitely many irreducible components.
Proof. The equivalence of (1) and (2) and the final statement follow from Descent, Lemma 34.12.3 and Properties of Spaces, Lemma 53.7.1. It is clear that (3) implies (1) and (2). Conversely, assume (2) and let $Y \rightarrow X$ be an étale morphism of algebraic spaces with $Y$ quasi-compact. Then we can choose an affine scheme $V$ and a surjective étale morphism $V \rightarrow Y$ (Properties of Spaces, Lemma 53.6.3). Since $V$ has finitely many irreducible components by (2) and since $|V| \rightarrow|Y|$ is surjective and continuous, we conclude that $|Y|$ has finitely many irreducible components.

07U4 Lemma 54.46.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ satisfying the equivalent conditions of Lemma54.46.1. Then there exists an integral morphism of algebraic spaces

$$
X^{\nu} \longrightarrow X
$$

such that for every scheme $U$ and étale morphism $U \rightarrow X$ the fibre product $X^{\nu} \times{ }_{X} U$ is the normalization of $U$.

Proof. Let $U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme. Set $R=U \times_{X} U$ with projections $s, t: R \rightarrow U$ and $j=(t, s): R \rightarrow U \times_{S} U$ so that $X=U / R$, see Spaces, Lemma 52.9.1. The assumption on $X$ means that the
normalization $U^{\nu}$ of $U$ is defined, see Morphisms, Definition 28.49.1. By More on Morphisms, Lemma 36.14 .3 taking normalization commutes with étale morphisms of schemes. Thus we see that the normalization $R^{\nu}$ of $R$ is isomorphic to both $R \times_{s, U} U^{\nu}$ and $U^{\nu} \times_{U, t} R$. Thus we obtain two étale morphisms $s^{\nu}: R^{\nu} \rightarrow U^{\nu}$ and $t^{\nu}: R^{\nu} \rightarrow U^{\nu}$ of schemes. The induced morphism $j^{\nu}: R^{\nu} \rightarrow U^{\nu} \times{ }_{S} U^{\nu}$ is a monomorphism as $R^{\nu}$ is a subscheme of the restriction of $R$ to $U^{\nu}$. A formal computation with fibre products shows that $R^{\nu} \times{ }_{s^{\nu}, U^{\nu}, t^{\nu}} R^{\nu}$ is the normalization of $R \times_{s, U, t} R$. Hence the (étale) morphism $c: R \times_{s, U, t} R \rightarrow R$ extends to $c^{\nu}$ as well. Combined we see that we obtain an étale equivalence relation. Setting $X^{\nu}=U^{\nu} / R^{\nu}$ (Spaces, Theorem 52.10.5 we see that we have $U^{\nu}=X^{\nu} \times_{X} U$ by Groupoids, Lemma 38.20.7. We omit the verification that this property then holds for every étale morphism from a scheme to $X$.

This leads us to the following definition.
0BB2 Definition 54.46.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ satisfying the equivalent conditions of Lemma 54.46.1. We define the normalization of $X$ as the morphism

$$
\nu: X^{\nu} \longrightarrow X
$$

constructed in Lemma 54.46.2.
Any locally Noetherian scheme has a locally finite set of irreducible components. Hence the definition applies to locally Noetherian algebraic spaces. Usually the normalization is defined only for reduced algebraic spaces. With the definition above the normalization of $X$ is the same as the normalization of the reduction $X_{\text {red }}$ of $X$.

0BB3 Lemma 54.46.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ satisfying the equivalent conditions of Lemma54.46.1. The normalization morphism $\nu$ factors through the reduction $X_{\text {red }}$ and $X^{\nu} \rightarrow X_{\text {red }}$ is the normalization of $X_{\text {red }}$.

Proof. We may check this étale locally on $X$ and hence reduce to the case of schemes which is Morphisms, Lemma 28.49.2. Some details omitted.

0BB4 Lemma 54.46.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ satisfying the equivalent conditions of Lemma 54.46.1.
(1) The normalization $X^{\nu}$ is normal.
(2) The morphism $\nu: X^{\nu} \rightarrow X$ is integral and surjective.
(3) The map $|\nu|:\left|X^{\nu}\right| \rightarrow|X|$ induces a bijection between the sets of points of codimension 0 (Properties of Spaces, Definition 53.9.2).
(4) Let $Z \rightarrow X$ be a morphism. Assume $Z$ is a normal algebraic space and that for $z \in|Z|$ we have: $z$ has codimension 0 in $Z \Rightarrow f(z)$ has codimension 0 in $X$. Then there exists a unique factorization $Z \rightarrow X^{\nu} \rightarrow X$.

Proof. Properties (1), (2), and (3) follow from the corresponding results for schemes (Morphisms, Lemma 28.49.4) combined with the fact that a point of a scheme is a generic point of an irreducible component if and only if the dimension of the local ring is zero (Properties, Lemma 27.10.4).
Let $Z \rightarrow X$ be a morphism as in (4). Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow$ $U \times_{X} Z$. The condition on geometric points assures us that $V \rightarrow U$ maps generic
points of irreducible components of $V$ to generic points of irreducible components of $U$. Thus we obtain a unique factorization $V \rightarrow U^{\nu} \rightarrow U$ by Morphisms, Lemma 28.49.4. The uniqueness guarantees us that the two maps

$$
V \times_{U \times_{X} Z} V \rightarrow V \rightarrow U^{\nu}
$$

agree because these maps are the unique factorization of the map $V \times_{U \times_{X} Z} V \rightarrow$ $V \rightarrow U$. Since the algebraic space $U \times_{X} Z$ is equal to the quotient $V / V \times_{U \times_{x} Z} V$ (see Spaces, Section 52.9) we find a canonical morphism $U \times_{X} Z \rightarrow U^{\nu}$. Picture

To obtain the dotted arrow we note that the construction of the arrow $U \times_{X} Z$ is functorial in the étale morphism $U \rightarrow X$ (precise formulation and proof omitted). Hence if we set $R=U \times_{X} U$ with projections $s, t: R \rightarrow U$, then we obtain a morphism $R \times_{X} Z \rightarrow R^{\nu}$ commuting with $s, t: R \rightarrow U$ and $s^{\nu}, t^{\nu}: R^{\nu} \rightarrow U^{\nu}$. Recall that $X^{\nu}=U^{\nu} / R^{\nu}$, see proof of Lemma 54.46.2. Since $X=U / R$ a simple sheaf theoretic argument shows that $Z=\left(U \times_{X} Z\right) /\left(R \times_{X} Z\right)$. Thus the morphisms $U \times_{X} Z \rightarrow U^{\nu}$ and $R \times_{X} Z \rightarrow R^{\nu}$ define a morphism $Z \rightarrow X^{\nu}$ as desired.

0BB5 Lemma 54.46.6. Let $S$ be a scheme. Let $X$ be a Nagata algebraic space over $S$. The normalization $\nu: X^{\nu} \rightarrow X$ is a finite morphism.

Proof. Since $X$ being Nagata is locally Noetherian, Definition 54.46.3 applies. By construction of $X^{\nu}$ in Lemma 54.46 .2 we immediately reduce to the case of schemes which is Morphisms, Lemma 28.49.7.

### 54.47. Separated, locally quasi-finite morphisms

0417 In this section we prove that an algebraic space which is locally quasi-finite and separated over a scheme, is representable. This implies that a separated and locally quasi-finite morphism is representable (see Lemma 54.48.1). But first... a lemma (which will be obsoleted by Proposition 54.47.2.

03XW Lemma 54.47.1. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$. Assume
(1) $T^{\prime} \rightarrow T$ is an étale morphism of affine schemes,
(2) $X \rightarrow T$ is a separated, locally quasi-finite morphism,
(3) $V^{\prime}$ is an open subspace of $T^{\prime} \times_{T} X$, and
(4) $V^{\prime} \rightarrow T^{\prime}$ is quasi-affine.

In this situation the image $U$ of $V^{\prime}$ in $X$ is a quasi-compact open subspace of $X$ which is representable.

Proof. We first make some trivial observations. Note that $V^{\prime}$ is representable by Lemma 54.21.3 It is also quasi-compact (as a quasi-affine scheme over an affine scheme, see Morphisms, Lemma 28.13.2). Since $T^{\prime} \times_{T} X \rightarrow X$ is étale (Properties of Spaces, Lemma 53.15.5) the map $\left|T^{\prime} \times_{T} X\right| \rightarrow|X|$ is open, see Properties of Spaces, Lemma 53.15.7. Let $U \subset X$ be the open subspace corresponding to the image of $\left|V^{\prime}\right|$, see Properties of Spaces, Lemma 53.4.8. As $\left|V^{\prime}\right|$ is quasi-compact we see that $|U|$ is quasi-compact, hence $U$ is a quasi-compact algebraic space, by Properties of Spaces, Lemma 53.5.2.
By Morphisms, Lemma 28.51 .8 the morphism $T^{\prime} \rightarrow T$ is universally bounded. Hence we can do induction on the integer $n$ bounding the degree of the fibres of $T^{\prime} \rightarrow T$, see Morphisms, Lemma 28.51.7 for a description of this integer in the case of an étale morphism. If $n=1$, then $T^{\prime} \rightarrow T$ is an open immersion (see Étale Morphisms, Theorem40.14.1, and the result is clear. Assume $n>1$.
Consider the affine scheme $T^{\prime \prime}=T^{\prime} \times_{T} T^{\prime}$. As $T^{\prime} \rightarrow T$ is étale we have a decomposition (into open and closed affine subschemes) $T^{\prime \prime}=\Delta\left(T^{\prime}\right) \amalg T^{*}$. Namely $\Delta=\Delta_{T^{\prime} / T}$ is open by Morphisms, Lemma 28.35 .13 and closed because $T^{\prime} \rightarrow T$ is separated as a morphism of affines. As a base change the degrees of the fibres of the second projection $\mathrm{pr}_{1}: T^{\prime} \times_{T} T^{\prime} \rightarrow T^{\prime}$ are bounded by $n$, see Morphisms, Lemma 28.51.4 On the other hand, $\left.\operatorname{pr}_{1}\right|_{\Delta\left(T^{\prime}\right)}: \Delta\left(T^{\prime}\right) \rightarrow T^{\prime}$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 28.51.7 we conclude the degrees of the fibres of the restriction $\left.\mathrm{pr}_{1}\right|_{T^{*}}: T^{*} \rightarrow T^{\prime}$ are bounded by $n-1$. Hence the induction hypothesis applied to the diagram

gives that $p_{1}\left(p_{0}^{-1}\left(V^{\prime}\right) \cap X^{*}\right)$ is a quasi-compact scheme. Here we set $X^{\prime \prime}=T^{\prime \prime} \times_{T}$ $X, X^{*}=T^{*} \times_{T} X$, and $X^{\prime}=T^{\prime} \times_{T} X$, and $p_{0}, p_{1}: X^{\prime \prime} \rightarrow X^{\prime}$ are the base changes of $\mathrm{pr}_{0}, \mathrm{pr}_{1}$. Most of the hypotheses of the lemma imply by base change the corresponding hypothesis for the diagram above. For example $p_{0}^{-1}\left(V^{\prime}\right)=T^{\prime \prime} \times_{T^{\prime}} V^{\prime}$ is a scheme quasi-affine over $T^{\prime \prime}$ as a base change. Some verifications omitted.

By Properties of Spaces, Lemma 53.12.1 we conclude that

$$
p_{1}\left(p_{0}^{-1}\left(V^{\prime}\right)\right)=V^{\prime} \cup p_{1}\left(p_{0}^{-1}\left(V^{\prime}\right) \cap X^{*}\right)
$$

is a quasi-compact scheme. Moreover, it is clear that $p_{1}\left(p_{0}^{-1}\left(V^{\prime}\right)\right)$ is the inverse image of the quasi-compact open subspace $U \subset X$ discussed in the first paragraph of the proof. In other words, $T^{\prime} \times_{T} U$ is a scheme! Note that $T^{\prime} \times_{T} U$ is quasicompact and separated and locally quasi-finite over $T^{\prime}$, as $T^{\prime} \times_{T} X \rightarrow T^{\prime}$ is locally quasi-finite and separated being a base change of the original morphism $X \rightarrow T$ (see Lemmas 54.4.4 and 54.27.4). This implies by More on Morphisms, Lemma 36.31.2 that $T^{\prime} \times_{T} U \rightarrow T^{\prime}$ is quasi-affine.

By Descent, Lemma 34.35.1 this gives a descent datum on $T^{\prime} \times_{T} U / T^{\prime}$ relative to the étale covering $\left\{T^{\prime} \rightarrow W\right\}$, where $W \subset T$ is the image of the morphism $T^{\prime} \rightarrow T$. Because $U^{\prime}$ is quasi-affine over $T^{\prime}$ we see from Descent, Lemma 34.34.1 that this datum is effective, and by the last part of Descent, Lemma 34.35.1 this implies that $U$ is a scheme as desired. Some minor details omitted.

03XX Proposition 54.47.2. Let $S$ be a scheme. Let $f: X \rightarrow T$ be a morphism of algebraic spaces over $S$. Assume
(1) $T$ is representable,
(2) $f$ is locally quasi-finite, and
(3) $f$ is separated.

Then $X$ is representable.
Proof. Let $T=\bigcup T_{i}$ be an affine open covering of the scheme $T$. If we can show that the open subspaces $X_{i}=f^{-1}\left(T_{i}\right)$ are representable, then $X$ is representable, see Properties of Spaces, Lemma53.12.1. Note that $X_{i}=T_{i} \times_{T} X$ and that locally quasi-finite and separated are both stable under base change, see Lemmas 54.4.4 and 54.27.4. Hence we may assume $T$ is an affine scheme.
By Properties of Spaces, Lemma 53.6.2 there exists a Zariski covering $X=\bigcup X_{i}$ such that each $X_{i}$ has a surjective étale covering by an affine scheme. By Properties of Spaces, Lemma 53.12.1 again it suffices to prove the proposition for each $X_{i}$. Hence we may assume there exists an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. This reduces us to the situation in the next paragraph.

Assume we have

$$
U \longrightarrow X \longrightarrow T
$$

where $U$ and $T$ are affine schemes, $U \rightarrow X$ is étale surjective, and $X \rightarrow T$ is separated and locally quasi-finite. By Lemmas 54.38 .5 and 54.27 .3 the morphism $U \rightarrow T$ is locally quasi-finite. Since $U$ and $T$ are affine it is quasi-finite. Set $R=U \times_{X} U$. Then $X=U / R$, see Spaces, Lemma 52.9.1. As $X \rightarrow T$ is separated the morphism $R \rightarrow U \times_{T} U$ is a closed immersion, see Lemma 54.4.5. In particular $R$ is an affine scheme also. As $U \rightarrow X$ is étale the projection morphisms $t, s: R \rightarrow U$ are étale as well. In particular $s$ and $t$ are quasi-finite, flat and of finite presentation (see Morphisms, Lemmas 28.36.6, 28.36.12 and 28.36.11).
Let $(U, R, s, t, c)$ be the groupoid associated to the étale equivalence relation $R$ on $U$. Let $u \in U$ be a point, and denote $p \in T$ its image. We are going to use More on Groupoids, Lemma 39.12 .2 for the groupoid ( $U, R, s, t, c$ ) over the scheme $T$ with points $p$ and $u$ as above. By the discussion in the previous paragraph all the assumptions $(1)-(7)$ of that lemma are satisfied. Hence we get an étale neighbourhood $\left(T^{\prime}, p^{\prime}\right) \rightarrow(T, p)$ and disjoint union decompositions

$$
U_{T^{\prime}}=U^{\prime} \amalg W, \quad R_{T^{\prime}}=R^{\prime} \amalg W^{\prime}
$$

and $u^{\prime} \in U^{\prime}$ satisfying conclusions (a), (b), (c), (d), (e), (f), (g), and (h) of the aforementioned More on Groupoids, Lemma 39.12.2. We may and do assume that $T^{\prime}$ is affine (after possibly shrinking $T^{\prime}$ ). Conclusion (h) implies that $R^{\prime}=U^{\prime} \times_{X_{T^{\prime}}}$ $U^{\prime}$ with projection mappings identified with the restrictions of $s^{\prime}$ and $t^{\prime}$. Thus $\left(U^{\prime}, R^{\prime},\left.s^{\prime}\right|_{R^{\prime}},\left.t^{\prime}\right|_{R^{\prime}},\left.c^{\prime}\right|_{R^{\prime} \times t^{\prime}, U^{\prime}, s^{\prime}} R^{\prime}\right)$ of conclusion (g) is an étale equivalence relation. By Spaces, Lemma 52.10.2 we conclude that $U^{\prime} / R^{\prime}$ is an open subspace of $X_{T^{\prime}}$. By conclusion (d) the schemes $U^{\prime}, R^{\prime}$ are affine and the morphisms $\left.s^{\prime}\right|_{R^{\prime}},\left.t^{\prime}\right|_{R^{\prime}}$ are finite étale. Hence Groupoids, Proposition 38.23 .8 kicks in and we see that $U^{\prime} / R^{\prime}$ is an affine scheme.

We conclude that for every pair of points $(u, p)$ as above we can find an étale neighbourhood $\left(T^{\prime}, p^{\prime}\right) \rightarrow(T, p)$ with $\kappa(p)=\kappa\left(p^{\prime}\right)$ and a point $u^{\prime} \in U_{T^{\prime}}$ mapping to $u$ such that the image $x^{\prime}$ of $u^{\prime}$ in $\left|X_{T^{\prime}}\right|$ has an open neighbourhood $V^{\prime}$ in $X_{T^{\prime}}$
which is an affine scheme. We apply Lemma 54.47.1 to obtain an open subspace $W \subset X$ which is a scheme, and which contains $x$ (the image of $u$ in $|X|$ ). Since this works for every $x$ we see that $X$ is a scheme by Properties of Spaces, Lemma 53.12.1. This ends the proof.

### 54.48. Applications

05 W 4 An alternative proof of the following lemma is to see it as a consequence of Zariski's main theorem for (nonrepresentable) morphisms of algebraic spaces as discussed in More on Morphisms of Spaces, Section 63.25. Namely, More on Morphisms of Spaces, Lemma 63.25 .2 implies that a quasi-finite and separated morphism of algebraic spaces is quasi-affine and therefore representable.
0418 Lemma 54.48.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally quasi-finite and separated, then $f$ is representable.
Proof. This is immediate from Proposition 54.47 .2 and the fact that being locally quasi-finite and separated is preserved under any base change, see Lemmas 54.27.4 and 54.4.4

05W5 Lemma 54.48.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an étale and universally injective morphism of algebraic spaces over $S$. Then $f$ is an open immersion.

Proof. Let $T \rightarrow Y$ be a morphism from a scheme into $Y$. If we can show that $X \times_{Y} T \rightarrow T$ is an open immersion, then we are done. Since being étale and being universally injective are properties of morphisms stable under base change (see Lemmas 54.38.4 and 54.19.5 we may assume that $Y$ is a scheme. Note that the diagonal $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is étale, a monomorphism, and surjective by Lemma 54.19.2. Hence we see that $\Delta_{X / Y}$ is an isomorphism (see Spaces, Lemma 52.5 .9 , in particular we see that $X$ is separated over $Y$. It follows that $X$ is a scheme too, by Proposition 54.47.2. Finally, $X \rightarrow Y$ is an open immersion by the fundamental theorem for étale morphisms of schemes, see Étale Morphisms, Theorem 40.14.1.

### 54.49. Zariski's Main Theorem (representable case)

$0 A B Q$ This is the version you can prove using that normalization commutes with étale localization. Before we can prove more powerful versions (for non-representable morphisms) we need to develop more tools. See More on Morphisms of Spaces, Section 63.25.

0ABR Lemma 54.49.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is representable, of finite type, and separated. Let $Y^{\prime}$ be the normalization of $Y$ in $X$. Picture:

Then there exists an open subspace $U^{\prime} \subset Y^{\prime}$ such that
(1) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \rightarrow U^{\prime}$ is an isomorphism, and
(2) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \subset X$ is the set of points at which $f$ is quasi-finite.

Proof. Let $W \rightarrow Y$ be a surjective étale morphism where $W$ is a scheme. Then $W \times_{Y} X$ is a scheme as well. By Lemma 54.45.4 the algebraic space $W \times_{Y} Y^{\prime}$ is representable and is the normalization of the scheme $W$ in the scheme $W \times_{Y} X$. Picture

By More on Morphisms, Lemma 36.31.1 the result of the lemma holds over $W$. Let $V^{\prime} \subset W \times_{Y} Y^{\prime}$ be the open subscheme such that
(1) $\left(1, f^{\prime}\right)^{-1}\left(V^{\prime}\right) \rightarrow V^{\prime}$ is an isomorphism, and
(2) $\left(1, f^{\prime}\right)^{-1}\left(V^{\prime}\right) \subset W \times_{Y} X$ is the set of points at which $(1, f)$ is quasi-finite.

By Lemma 54.33 .7 there is a maximal open set of points $U \subset X$ where $f$ is quasifinite and $W \times_{Y} U=\left(1, f^{\prime}\right)^{-1}\left(V^{\prime}\right)$. The morphism $\left.f^{\prime}\right|_{U}: U \rightarrow Y^{\prime}$ is an open immersion by Lemma 54.12 .1 as its base change to $W$ is the isomorphism $\left(1, f^{\prime}\right)^{-1}\left(V^{\prime}\right) \rightarrow$ $V^{\prime}$ followed by the open immersion $V^{\prime} \rightarrow W \times_{Y} Y^{\prime}$. Setting $U^{\prime}=\operatorname{Im}\left(U \rightarrow Y^{\prime}\right)$ finishes the proof (omitted: the verification that $\left.\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)=U\right)$.

In the following lemma we can drop the assumption of being representable as we've shown that a locally quasi-finite separated morphism is representable.

0ABS Lemma 54.49.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-finite and separated. Let $Y^{\prime}$ be the normalization of $Y$ in $X$. Picture:

Then $f^{\prime}$ is a quasi-compact open immersion and $\nu$ is integral. In particular $f$ is quasi-affine.

Proof. By Lemma 54.48.1 the morphism $f$ is representable. Hence we may apply Lemma54.49.1. Thus there exists an open subspace $U^{\prime} \subset Y^{\prime}$ such that $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)=$ $X(!)$ and $X \rightarrow U^{\prime}$ is an isomorphism! In other words, $f^{\prime}$ is an open immersion. Note that $f^{\prime}$ is quasi-compact as $f$ is quasi-compact and $\nu: Y^{\prime} \rightarrow Y$ is separated (Lemma 54.8.8). Hence for every affine scheme $Z$ and morphism $Z \rightarrow Y$ the fibre product $Z \times_{Y} X$ is a quasi-compact open subscheme of the affine scheme $Z \times_{Y} Y^{\prime}$. Hence $f$ is quasi-affine by definition.

### 54.50. Universal homeomorphisms

05Z3 In Morphisms, Section 28.44 we have shown that a morphism of schemes is a universal homeomorphism if and only if it is integral, universally injective, and surjective. In particular the class of universal homeomorphisms of schemes is closed under composition and arbitrary base change and is fppf local on the base (as this is true for integral, universally injective, and surjective morphisms). Thus, if we apply the discussion in Section 54.3 to this notion we see that we know what it means for a representable morphism of algebraic spaces to be a universal homeomorphism.

05Z4 Lemma 54.50.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a representable morphism of algebraic spaces over $S$. Then $f$ is a universal homeomorphism (as discussed above) if and only if for every morphism of algebraic spaces $Z \rightarrow Y$ the base change map $Z \times_{Y} X \rightarrow Z$ induces a homeomorphism $\left|Z \times_{Y} X\right| \rightarrow|Z|$.
Proof. If for every morphism of algebraic spaces $Z \rightarrow Y$ the base change map $Z \times{ }_{Y}$ $X \rightarrow Z$ induces a homeomorphism $\left|Z \times_{Y} X\right| \rightarrow|Z|$, then the same is true whenever $Z$ is a scheme, which formally implies that $f$ is a universal homeomorphism in the sense of Section 54.3. Conversely, if $f$ is a universal homeomorphism in the sense of Section 54.3 then $X \rightarrow Y$ is integral, universally injective and surjective (by Spaces, Lemma 52.5.8 and Morphisms, Lemma 28.44.3). Hence $f$ is universally closed, see Lemma 54.43.7 and universally injective and (universally) surjective, i.e., $f$ is a universal homeomorphism.

05Z5 Definition 54.50.2. Let $S$ be a scheme. A morphisms $f: X \rightarrow Y$ of algebraic spaces over $S$ is called a universal homeomorphism if and only if for every morphism of algebraic spaces $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ induces a homeomorphism $\left|Z \times_{Y} X\right| \rightarrow|Z|$.

This definition does not clash with the pre-existing definition for representable morphisms of algebraic spaces by our Lemma 54.50.1. For morphisms of algebraic spaces it is not the case that universal homeomorphisms are always integral.

05Z6 Example 54.50.3. This is a continuation of Remark 54.19.4 Consider the algebraic space $X=\mathbf{A}_{k}^{1} /\{x \sim-x \mid x \neq 0\}$. There are morphisms

$$
\mathbf{A}_{k}^{1} \longrightarrow X \longrightarrow \mathbf{A}_{k}^{1}
$$

such that the first arrow is étale surjective, the second arrow is universally injective, and the composition is the map $x \mapsto x^{2}$. Hence the composition is universally closed. Thus it follows that the map $X \rightarrow \mathbf{A}_{k}^{1}$ is a universal homeomorphism, but $X \rightarrow \mathbf{A}_{k}^{1}$ is not separated.
Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a universal homeomorphism of algebraic spaces over $S$. Then $f$ is universally closed, hence is quasi-compact, see Lemma 54.9.7. But $f$ need not be separated (see example above), and not even quasi-separated: an example is to take infinite dimensional affine space $\mathbf{A}^{\infty}=$ $\operatorname{Spec}\left(k\left[x_{1}, x_{2}, \ldots\right]\right)$ modulo the equivalence relation given by flipping finitely many signs of nonzero coordinates (details omitted).
08AK Lemma 54.50.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The canonical closed immersion $X_{\text {red }} \rightarrow X$ (see Properties of Spaces, Definition 53.11.6) is a universal homeomorphism.

Proof. Omitted.
We put the following result here as we do not currently have a better place to put it.

0AEH Lemma 54.50.5. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a universally injective, integral morphism of algebraic spaces over $S$.
(1) The functor

$$
f_{\text {small }, *}: S h\left(Y_{\text {étale }}\right) \longrightarrow S h\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $X_{\text {étale }}$ whose restriction to $|X| \backslash f(|Y|)$ is isomorphic to $*$, and
(2) the functor

$$
f_{\text {small }, *}: A b\left(Y_{\text {étale }}\right) \longrightarrow A b\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those abelian sheaves on $Y_{\text {étale }}$ whose support is contained in $f(|Y|)$.
In both cases $f_{\text {small }}^{-1}$ is a left inverse to the functor $f_{\text {small,** }}$.
Proof. Since $f$ is integral it is universally closed (Lemma 54.43.7). In particular, $f(|Y|)$ is a closed subset of $|X|$ and the statements make sense. The rest of the proof is identical to the proof of Lemma 54.13 .5 except that we use Étale Cohomology, Proposition 49.48.1 instead of Étale Cohomology, Proposition 49.47.4

## CHAPTER 55

## Decent Algebraic Spaces

06NK

### 55.1. Introduction

06 NL In this chapter we study "local" properties of general algebraic spaces, i.e., those algebraic spaces which aren't quasi-separated. Quasi-separated algebraic spaces are studied in Knu71. It turns out that essentially new phenomena happen, especially regarding points and specializations of points, on more general algebraic spaces. On the other hand, for most basic results on algebraic spaces, one needn't worry about these phenomena, which is why we have decided to have this material in a separate chapter following the standard development of the theory.

### 55.2. Conventions

06 NM The standing assumption is that all schemes are contained in a big fppf site $S_{\text {ch }} h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 55.3. Universally bounded fibres

03JK We briefly discuss what it means for a morphism from a scheme to an algebraic space to have universally bounded fibres. Please refer to Morphisms, Section 28.51 for similar definitions and results on morphisms of schemes.

03JL Definition 55.3.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$, and let $U$ be a scheme over $S$. Let $f: U \rightarrow X$ be a morphism over $S$. We say the fibres of $f$ are universally bounded ${ }^{11}$ if there exists an integer $n$ such that for all fields $k$ and all morphisms $\operatorname{Spec}(k) \rightarrow X$ the fibre product $\operatorname{Spec}(k) \times_{X} U$ is a finite scheme over $k$ whose degree over $k$ is $\leq n$.
This definition makes sense because the fibre product $\operatorname{Spec}(k) \times_{Y} X$ is a scheme. Moreover, if $Y$ is a scheme we recover the notion of Morphisms, Definition 28.51.1 by virtue of Morphisms, Lemma 28.51.2.

03JM Lemma 55.3.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $V \rightarrow U$ be a morphism of schemes over $S$, and let $U \rightarrow X$ be a morphism from $U$ to $X$. If the fibres of $V \rightarrow U$ and $U \rightarrow X$ are universally bounded, then so are the fibres of $V \rightarrow X$.

[^166]Proof. Let $n$ be an integer which works for $V \rightarrow U$, and let $m$ be an integer which works for $U \rightarrow X$ in Definition 55.3.1. Let $\operatorname{Spec}(k) \rightarrow X$ be a morphism, where $k$ is a field. Consider the morphisms

$$
\operatorname{Spec}(k) \times_{X} V \longrightarrow \operatorname{Spec}(k) \times_{X} U \longrightarrow \operatorname{Spec}(k)
$$

By assumption the $\operatorname{scheme} \operatorname{Spec}(k) \times_{X} U$ is finite of degree at most $m$ over $k$, and $n$ is an integer which bounds the degree of the fibres of the first morphism. Hence by Morphisms, Lemma 28.51.3 we conclude that $\operatorname{Spec}(k) \times_{X} V$ is finite over $k$ of degree at most $n m$.

03JN Lemma 55.3.3. Let $S$ be a scheme. Let $Y \rightarrow X$ be a representable morphism of algebraic spaces over $S$. Let $U \rightarrow X$ be a morphism from a scheme to $X$. If the fibres of $U \rightarrow X$ are universally bounded, then the fibres of $U \times_{X} Y \rightarrow Y$ are universally bounded.

Proof. This is clear from the definition, and properties of fibre products. (Note that $U \times_{X} Y$ is a scheme as we assumed $Y \rightarrow X$ representable, so the definition applies.)

03JO Lemma 55.3.4. Let $S$ be a scheme. Let $g: Y \rightarrow X$ be a representable morphism of algebraic spaces over $S$. Let $f: U \rightarrow X$ be a morphism from a scheme towards $X$. Let $f^{\prime}: U \times_{X} Y \rightarrow Y$ be the base change of $f$. If

$$
\operatorname{Im}(|f|:|U| \rightarrow|X|) \subset \operatorname{Im}(|g|:|Y| \rightarrow|X|)
$$

and $f^{\prime}$ has universally bounded fibres, then $f$ has universally bounded fibres.
Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibre products $\operatorname{Spec}(k) \times_{Y}$ $\left(U \times_{X} Y\right)$ as in Definition 55.3.1 for the morphism $f^{\prime}$. We claim that $n$ works for $f$ also. Namely, suppose that $x: \operatorname{Spec}(k) \rightarrow X$ is a morphism from the spectrum of a field. Then either $\operatorname{Spec}(k) \times_{X} U$ is empty (and there is nothing to prove), or $x$ is in the image of $|f|$. By Properties of Spaces, Lemma 53.4.3 and the assumption of the lemma we see that this means there exists a field extension $k \subset k^{\prime}$ and a commutative diagram

Hence we see that

$$
\operatorname{Spec}\left(k^{\prime}\right) \times_{Y}\left(U \times_{X} Y\right)=\operatorname{Spec}\left(k^{\prime}\right) \times_{\operatorname{Spec}(k)}\left(\operatorname{Spec}(k) \times_{X} U\right)
$$

Since the scheme $\operatorname{Spec}\left(k^{\prime}\right) \times_{Y}\left(U \times_{X} Y\right)$ is assumed finite of degree $\leq n$ over $k^{\prime}$ it follows that also $\operatorname{Spec}(k) \times{ }_{X} U$ is finite of degree $\leq n$ over $k$ as desired. (Some details omitted.)

03JP Lemma 55.3.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Consider a commutative diagram

where $U$ and $V$ are schemes. If $g$ has universally bounded fibres, and $f$ is surjective and flat, then also $h$ has universally bounded fibres.

Proof. Assume $g$ has universally bounded fibres, and $f$ is surjective and flat. Say $n \geq 0$ is an integer which bounds the degrees of the $\operatorname{schemes} \operatorname{Spec}(k) \times_{X} U$ as in Definition 55.3.1. We claim $n$ also works for $h$. Let $\operatorname{Spec}(k) \rightarrow X$ be a morphism from the spectrum of a field to $X$. Consider the morphism of schemes

$$
\operatorname{Spec}(k) \times_{X} V \longrightarrow \operatorname{Spec}(k) \times_{X} U
$$

It is flat and surjective. By assumption the scheme on the left is finite of degree $\leq n$ over $\operatorname{Spec}(k)$. It follows from Morphisms, Lemma 28.51 .9 that the degree of the scheme on the right is also bounded by $n$ as desired.

03JQ Lemma 55.3.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$, and let $U$ be a scheme over $S$. Let $\varphi: U \rightarrow X$ be a morphism over $S$. If the fibres of $\varphi$ are universally bounded, then there exists an integer $n$ such that each fibre of $|U| \rightarrow|X|$ has at most $n$ elements.

Proof. The integer $n$ of Definition 55.3.1 works. Namely, pick $x \in|X|$. Represent $x$ by a morphism $x: \operatorname{Spec}(k) \rightarrow X$. Then we get a commutative diagram

which shows (via Properties of Spaces, Lemma 53.4.3) that the inverse image of $x$ in $|U|$ is the image of the top horizontal arrow. Since $\operatorname{Spec}(k) \times{ }_{X} U$ is finite of degree $\leq n$ over $k$ it has at most $n$ points.

### 55.4. Finiteness conditions and points

$03 J R$ In this section we elaborate on the question of when points can be represented by monomorphisms from spectra of fields into the space.

03II Remark 55.4.1. Before we give the proof of the next lemma let us recall some facts about étale morphisms of schemes:
(1) An étale morphism is flat and hence generalizations lift along an étale morphism (Morphisms, Lemmas 28.36.12 and 28.25.8.
(2) An étale morphism is unramified, an unramified morphism is locally quasifinite, hence fibres are discrete (Morphisms, Lemmas 28.36.16, 28.35.10, and 28.20.6).
(3) A quasi-compact étale morphism is quasi-finite and in particular has finite fibres (Morphisms, Lemmas 28.20.9 and 28.20.10.
(4) An étale scheme over a field $k$ is a disjoint union of spectra of finite separable field extension of $k$ (Morphisms, Lemma 28.36.7).
For a general discussion of étale morphisms, please see Étale Morphisms, Section 40.11

03JS Lemma 55.4.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The following are equivalent:
(1) there exists a family of schemes $U_{i}$ and étale morphisms $\varphi_{i}: U_{i} \rightarrow X$ such that $\coprod \varphi_{i}: \coprod U_{i} \rightarrow X$ is surjective, and such that for each $i$ the fibre of $\left|U_{i}\right| \rightarrow|X|$ over $x$ is finite, and
(2) for every affine scheme $U$ and étale morphism $\varphi: U \rightarrow X$ the fibre of $|U| \rightarrow|X|$ over $x$ is finite .

Proof. The implication $(2) \Rightarrow(1)$ is trivial. Let $\varphi_{i}: U_{i} \rightarrow X$ be a family of étale morphisms as in (1). Let $\varphi: U \rightarrow X$ be an étale morphism from an affine scheme towards $X$. Consider the fibre product diagrams

Since $q_{i}$ is étale it is open (see Remark 55.4.1). Moreover, the morphism $\coprod q_{i}$ is surjective. Hence there exist finitely many indices $i_{1}, \ldots, i_{n}$ and a quasi-compact opens $W_{i_{j}} \subset U \times_{X} U_{i_{j}}$ which surject onto $U$. The morphism $p_{i}$ is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 28.51 .8 to see the fibres of $p_{i_{j}} \mid W_{i_{j}}: W_{i_{j}} \rightarrow U_{i}$ are finite. Hence by Properties of Spaces, Lemma 53.4.3 and the assumption on $\varphi_{i}$ we conclude that the fibre of $\varphi$ over $x$ is finite. In other words (2) holds.

03JU Lemma 55.4.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The following are equivalent:
(1) there exists a scheme $U$, an étale morphism $\varphi: U \rightarrow X$, and points $u, u^{\prime} \in U$ mapping to $x$ such that setting $R=U \times_{X} U$ the fibre of

$$
|R| \rightarrow|U| \times_{|X|}|U|
$$

over $\left(u, u^{\prime}\right)$ is finite,
(2) for every scheme $U$, étale morphism $\varphi: U \rightarrow X$ and any points $u, u^{\prime} \in U$ mapping to $x$ setting $R=U \times_{X} U$ the fibre of

$$
|R| \rightarrow|U| \times_{|X|}|U|
$$

over ( $u, u^{\prime}$ ) is finite,
(3) there exists a morphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ a field in the equivalence class of $x$ such that the projections $\operatorname{Spec}(k) \times_{X} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ are étale and quasi-compact, and
(4) there exists a monomorphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ a field in the equivalence class of $x$.

Proof. Assume (1), i.e., let $\varphi: U \rightarrow X$ be an étale morphism from a scheme towards $X$, and let $u, u^{\prime}$ be points of $U$ lying over $x$ such that the fibre of $|R| \rightarrow$ $|U| \times_{|X|}|U|$ over $\left(u, u^{\prime}\right)$ is a finite set. In this proof we think of a point $u=$ $\operatorname{Spec}(\kappa(u))$ as a scheme. Note that $u \rightarrow U, u^{\prime} \rightarrow U$ are monomorphisms (see Schemes, Lemma 25.23.6, hence $u \times_{X} u^{\prime} \rightarrow R=U \times_{X} U$ is a monomorphism. In this language the assumption really means that $u \times_{X} u^{\prime}$ is a scheme whose underlying topological space has finitely many points. Let $\psi: W \rightarrow X$ be an étale morphism from a scheme towards $X$. Let $w, w^{\prime} \in W$ be points of $W$ mapping to
$x$. We have to show that $w \times_{X} w^{\prime}$ is a scheme whose underlying topological space has finitely many points. Consider the fibre product diagram

As $x$ is the image of $u$ and $u^{\prime}$ we may pick points $\tilde{w}, \tilde{w}^{\prime}$ in $W \times{ }_{X} U$ with $q(\tilde{w})=w$, $q\left(\tilde{w}^{\prime}\right)=w^{\prime}, u=p(\tilde{w})$ and $u^{\prime}=p\left(\tilde{w}^{\prime}\right)$, see Properties of Spaces, Lemma 53.4.3. As $p, q$ are étale the field extensions $\kappa(w) \subset \kappa(\tilde{w}) \supset \kappa(u)$ and $\kappa\left(w^{\prime}\right) \subset \kappa\left(\tilde{w}^{\prime}\right) \supset \kappa\left(u^{\prime}\right)$ are finite separable, see Remark 55.4.1. Then we get a commutative diagram

where the squares are fibre product squares. The lower horizontal morphisms are étale and quasi-compact, as any scheme of the form $\operatorname{Spec}(k) \times_{S} \operatorname{Spec}\left(k^{\prime}\right)$ is affine, and by our observations about the field extensions above. Thus we see that the top horizontal arrows are étale and quasi-compact and hence have finite fibres. We have seen above that $\left|u \times_{X} u^{\prime}\right|$ is finite, so we conclude that $\left|w \times_{X} w^{\prime}\right|$ is finite. In other words, (2) holds.

Assume (2). Let $U \rightarrow X$ be an étale morphism from a scheme $U$ such that $x$ is in the image of $|U| \rightarrow|X|$. Let $u \in U$ be a point mapping to $x$. Then we have seen in the previous paragraph that $u=\operatorname{Spec}(\kappa(u)) \rightarrow X$ has the property that $u \times_{X} u$ has a finite underlying topological space. On the other hand, the projection maps $u \times_{X} u \rightarrow u$ are the composition

$$
u \times_{X} u \longrightarrow u \times_{X} U \longrightarrow u \times_{X} X=u
$$

i.e., the composition of a monomorphism (the base change of the monomorphism $u \rightarrow U)$ by an étale morphism (the base change of the étale morphism $U \rightarrow X$ ). Hence $u \times_{X} U$ is a disjoint union of spectra of fields finite separable over $\kappa(u)$ (see Remark 55.4.1. Since $u \times_{X} u$ is finite the image of it in $u \times_{X} U$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. By Schemes, Lemma 25.23.10 we conclude that $u \times_{X} u$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. In other words, we see that $u \times_{X} u \rightarrow u$ is quasi-compact and étale. This means that (3) holds.

Let us prove that (3) implies (4). Let $\operatorname{Spec}(k) \rightarrow X$ be a morphism from the spectrum of a field into $X$, in the equivalence class of $x$ such that the two projections $t, s: R=\operatorname{Spec}(k) \times_{X} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ are quasi-compact and étale. This means in particular that $R$ is an étale equivalence relation on $\operatorname{Spec}(k)$. By Spaces, Theorem 52.10 .5 we know that the quotient sheaf $X^{\prime}=\operatorname{Spec}(k) / R$ is an algebraic space. By Groupoids, Lemma 38.20 .6 the map $X^{\prime} \rightarrow X$ is a monomorphism. Since $s, t$ are quasi-compact, we see that $R$ is quasi-compact and hence Properties of Spaces, Lemma 53.14.3 applies to $X^{\prime}$, and we see that $X^{\prime}=\operatorname{Spec}\left(k^{\prime}\right)$ for some field $k^{\prime}$. Hence we get a factorization

$$
\operatorname{Spec}(k) \longrightarrow \operatorname{Spec}\left(k^{\prime}\right) \longrightarrow X
$$

which shows that $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ is a monomorphism mapping to $x \in|X|$. In other words (4) holds.
Finally, we prove that (4) implies (1). Let $\operatorname{Spec}(k) \rightarrow X$ be a monomorphism with $k$ a field in the equivalence class of $x$. Let $U \rightarrow X$ be a surjective étale morphism from a scheme $U$ to $X$. Let $u \in U$ be a point over $x$. Since $\operatorname{Spec}(k) \times_{X} u$ is nonempty, and since $\operatorname{Spec}(k) \times_{X} u \rightarrow u$ is a monomorphism we conclude that $\operatorname{Spec}(k) \times_{X} u=u$ (see Schemes, Lemma 25.23.10). Hence $u \rightarrow U \rightarrow X$ factors through $\operatorname{Spec}(k) \rightarrow X$, here is a picture

Since the right vertical arrow is étale this implies that $k \subset \kappa(u)$ is a finite separable extension. Hence we conclude that

$$
u \times_{X} u=u \times_{\operatorname{Spec}(k)} u
$$

is a finite scheme, and we win by the discussion of the meaning of property (1) in the first paragraph of this proof.

040U Lemma 55.4.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. Let $U$ be a scheme and let $\varphi: U \rightarrow X$ be an étale morphism. The following are equivalent:
(1) $x$ is in the image of $|U| \rightarrow|X|$, and setting $R=U \times{ }_{X} U$ the fibres of both

$$
|U| \longrightarrow|X| \quad \text { and } \quad|R| \longrightarrow|X|
$$

over $x$ are finite,
(2) there exists a monomorphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ a field in the equivalence class of $x$, and the fibre product $\operatorname{Spec}(k) \times_{X} U$ is a finite nonempty scheme over $k$.

Proof. Assume (1). This clearly implies the first condition of Lemma 55.4.3 and hence we obtain a monomorphism $\operatorname{Spec}(k) \rightarrow X$ in the class of $x$. Taking the fibre product we see that $\operatorname{Spec}(k) \times{ }_{X} U \rightarrow \operatorname{Spec}(k)$ is a scheme étale over $\operatorname{Spec}(k)$ with finitely many points, hence a finite nonempty scheme over $k$, i.e., (2) holds.
Assume (2). By assumption $x$ is in the image of $|U| \rightarrow|X|$. The finiteness of the fibre of $|U| \rightarrow|X|$ over $x$ is clear since this fibre is equal to $\left|\operatorname{Spec}(k) \times{ }_{X} U\right|$ by Properties of Spaces, Lemma 53.4.3. The finiteness of the fibre of $|R| \rightarrow|X|$ above $x$ is also clear since it is equal to the set underlying the scheme

$$
\left(\operatorname{Spec}(k) \times_{X} U\right) \times_{\operatorname{Spec}(k)}\left(\operatorname{Spec}(k) \times_{X} U\right)
$$

which is finite over $k$. Thus (1) holds.
03JV Lemma 55.4.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The following are equivalent:
(1) for every affine scheme $U$, any étale morphism $\varphi: U \rightarrow X$ setting $R=$ $U \times{ }_{X} U$ the fibres of both

$$
|U| \longrightarrow|X| \quad \text { and } \quad|R| \longrightarrow|X|
$$

over $x$ are finite,
(2) there exist schemes $U_{i}$ and étale morphisms $U_{i} \rightarrow X$ such that $\coprod U_{i} \rightarrow X$ is surjective and for each $i$, setting $R_{i}=U_{i} \times{ }_{X} U_{i}$ the fibres of both

$$
\left|U_{i}\right| \longrightarrow|X| \quad \text { and } \quad\left|R_{i}\right| \longrightarrow|X|
$$

over $x$ are finite,
(3) there exists a monomorphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ a field in the equivalence class of $x$, and for any affine scheme $U$ and étale morphism $U \rightarrow X$ the fibre product $\operatorname{Spec}(k) \times_{X} U$ is a finite scheme over $k$, and
(4) there exists a quasi-compact monomorphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ a field in the equivalence class of $x$.
Proof. The equivalence of (1) and (3) follows on applying Lemma 55.4.4 to every étale morphism $U \rightarrow X$ with $U$ affine. It is clear that (3) implies (2). Assume $U_{i} \rightarrow X$ and $R_{i}$ are as in (2). We conclude from Lemma 55.4 .2 that for any affine scheme $U$ and étale morphism $U \rightarrow X$ the fibre of $|U| \rightarrow|X|$ over $x$ is finite. Say this fibre is $\left\{u_{1}, \ldots, u_{n}\right\}$. Then, as Lemma 55.4.3 (1) applies to $U_{i} \rightarrow X$ for some $i$ such that $x$ is in the image of $\left|U_{i}\right| \rightarrow|X|$, we see that the fibre of $\left|R=U \times_{X} U\right| \rightarrow|U| \times_{|X|}|U|$ is finite over $\left(u_{a}, u_{b}\right), a, b \in\{1, \ldots, n\}$. Hence the fibre of $|R| \rightarrow|X|$ over $x$ is finite. In this way we see that (1) holds. At this point we know that (1), (2), and (3) are equivalent.
If (4) holds, then for any affine scheme $U$ and étale morphism $U \rightarrow X$ the scheme $\operatorname{Spec}(k) \times_{X} U$ is on the one hand étale over $k$ (hence a disjoint union of spectra of finite separable extensions of $k$ by Remark 55.4.1) and on the other hand quasicompact over $U$ (hence quasi-compact). Thus we see that (3) holds. Conversely, if $U_{i} \rightarrow X$ is as in (2) and $\operatorname{Spec}(k) \rightarrow X$ is a monomorphism as in (3), then

$$
\coprod \operatorname{Spec}(k) \times_{X} U_{i} \longrightarrow \coprod U_{i}
$$

is quasi-compact (because over each $U_{i}$ we see that $\operatorname{Spec}(k) \times_{X} U_{i}$ is a finite disjoint union spectra of fields). Thus $\operatorname{Spec}(k) \rightarrow X$ is quasi-compact by Morphisms of Spaces, Lemma 54.8.7.

03JT Lemma 55.4.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent:
(1) there exist schemes $U_{i}$ and étale morphisms $U_{i} \rightarrow X$ such that $\coprod U_{i} \rightarrow X$ is surjective and each $U_{i} \rightarrow X$ has universally bounded fibres, and
(2) for every affine scheme $U$ and étale morphism $\varphi: U \rightarrow X$ the fibres of $U \rightarrow X$ are universally bounded.
Proof. The implication $(2) \Rightarrow(1)$ is trivial. Assume (1). Let $\left(\varphi_{i}: U_{i} \rightarrow X\right)_{i \in I}$ be a collection of étale morphisms from schemes towards $X$, covering $X$, such that each $\varphi_{i}$ has universally bounded fibres. Let $\psi: U \rightarrow X$ be an étale morphism from an affine scheme towards $X$. For each $i$ consider the fibre product diagram

Since $q_{i}$ is étale it is open (see Remark 55.4.1). Moreover, we have $U=\bigcup \operatorname{Im}\left(q_{i}\right)$, since the family $\left(\varphi_{i}\right)_{i \in I}$ is surjective. Since $U$ is affine, hence quasi-compact we can finite finitely many $i_{1}, \ldots, i_{n} \in I$ and quasi-compact opens $W_{j} \subset U \times_{X} U_{i_{j}}$
such that $U=\bigcup p_{i_{j}}\left(W_{j}\right)$. The morphism $p_{i_{j}}$ is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 28.51 .8 to see the fibres of $\left.p_{i_{j}}\right|_{W_{j}}: W_{j} \rightarrow U_{i_{j}}$ are universally bounded. Hence by Lemma 55.3 .2 we see that the fibres of $W_{j} \rightarrow X$ are universally bounded. Thus also $\coprod_{j=1, \ldots, n} W_{j} \rightarrow X$ has universally bounded fibres. Since $\coprod_{j=1, \ldots, n} W_{j} \rightarrow X$ factors through the surjective étale map $\left\lfloor\left. q_{i_{j}}\right|_{W_{j}}: \coprod_{j=1, \ldots, n} W_{j} \rightarrow U\right.$ we see that the fibres of $U \rightarrow X$ are universally bounded by Lemma 55.3.5. In other words (2) holds.

03IH Lemma 55.4.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent:
(1) there exists a Zariski covering $X=\bigcup X_{i}$ and for each $i$ a scheme $U_{i}$ and a quasi-compact surjective étale morphism $U_{i} \rightarrow X_{i}$, and
(2) there exist schemes $U_{i}$ and étale morphisms $U_{i} \rightarrow X$ such that the projections $U_{i} \times_{X} U_{i} \rightarrow U_{i}$ are quasi-compact and $\coprod U_{i} \rightarrow X$ is surjective.

Proof. If (1) holds then the morphisms $U_{i} \rightarrow X_{i} \rightarrow X$ are étale (combine Morphisms, Lemma 28.36.3 and Spaces, Lemmas 52.5.4 and 52.5.3 ). Moreover, as $U_{i} \times_{X} U_{i}=U_{i} \times{ }_{X_{i}} U_{i}$, both projections $U_{i} \times{ }_{X} U_{i} \rightarrow U_{i}$ are quasi-compact.

If (2) holds then let $X_{i} \subset X$ be the open subspace corresponding to the image of the open map $\left|U_{i}\right| \rightarrow|X|$, see Properties of Spaces, Lemma 53.4.10. The morphisms $U_{i} \rightarrow X_{i}$ are surjective. Hence $U_{i} \rightarrow X_{i}$ is surjective étale, and the projections $U_{i} \times_{X_{i}} U_{i} \rightarrow U_{i}$ are quasi-compact, because $U_{i} \times_{X_{i}} U_{i}=U_{i} \times_{X} U_{i}$. Thus by Spaces, Lemma 52.11 .4 the morphisms $U_{i} \rightarrow X_{i}$ are quasi-compact.

### 55.5. Conditions on algebraic spaces

03JW In this section we discuss the relationship between various natural conditions on algebraic spaces we have seen above. Please read Section 55.6 to get a feeling for the meaning of these conditions.

03JX Lemma 55.5.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Consider the following conditions on $X$ :
( $\alpha$ ) For every $x \in|X|$, the equivalent conditions of Lemma 55.4.2 hold.
( $\beta$ ) For every $x \in|X|$, the equivalent conditions of Lemma 55.4.3 hold.
$(\gamma)$ For every $x \in|X|$, the equivalent conditions of Lemma 55.4.5 hold.
( $\delta$ ) The equivalent conditions of Lemma 55.4.6 hold.
( $\epsilon$ ) The equivalent conditions of Lemma 55.4.7 hold.
$(\zeta)$ The space $X$ is Zariski locally quasi-separated.
$(\eta)$ The space $X$ is quasi-separated
( $\theta$ ) The space $X$ is representable, i.e., $X$ is a scheme.
$(\iota)$ The space $X$ is a quasi-separated scheme.

We have

Proof. The implication $(\gamma) \Leftrightarrow(\alpha)+(\beta)$ is immediate. The implications in the diamond on the left are clear from the definitions.

Assume ( $\zeta$ ), i.e., that $X$ is Zariski locally quasi-separated. Then ( $\epsilon$ ) holds by Properties of Spaces, Lemma 53.6.6
Assume ( $\epsilon$ ). By Lemma 55.4.7 there exists a Zariski open covering $X=\bigcup X_{i}$ such that for each $i$ there exists a scheme $U_{i}$ and a quasi-compact surjective étale morphism $U_{i} \rightarrow X_{i}$. Choose an $i$ and an affine open subscheme $W \subset U_{i}$. It suffices to show that $W \rightarrow X$ has universally bounded fibres, since then the family of all these morphisms $W \rightarrow X$ covers $X$. To do this we consider the diagram

Since $W \rightarrow X$ factors through $X_{i}$ we see that $W \times_{X} U_{i}=W \times_{X_{i}} U_{i}$, and hence $q$ is quasi-compact. Since $W$ is affine this implies that the scheme $W \times_{X} U_{i}$ is quasicompact. Thus we may apply Morphisms, Lemma 28.51 .8 and we conclude that $p$ has universally bounded fibres. From Lemma 55.3 .4 we conclude that $W \rightarrow X$ has universally bounded fibres as well.
Assume ( $\delta$ ). Let $U$ be an affine scheme, and let $U \rightarrow X$ be an étale morphism. By assumption the fibres of the morphism $U \rightarrow X$ are universally bounded. Thus also the fibres of both projections $R=U \times_{X} U \rightarrow U$ are universally bounded, see Lemma 55.3.3. And by Lemma 55.3.2 also the fibres of $R \rightarrow X$ are universally bounded. Hence for any $x \in X$ the fibres of $|U| \rightarrow|X|$ and $|R| \rightarrow|X|$ over $x$ are finite, see Lemma 55.3.6 In other words, the equivalent conditions of Lemma 55.4 .5 hold. This proves that $(\delta) \Rightarrow(\gamma)$.

03KE Lemma 55.5.2. Let $S$ be a scheme. Let $\mathcal{P}$ be one of the properties $(\alpha),(\beta),(\gamma)$, $(\delta),(\epsilon),(\zeta)$, or $(\theta)$ of algebraic spaces listed in Lemma 55.5.1. Then if $X$ is an algebraic space over $S$, and $X=\bigcup X_{i}$ is a Zariski open covering such that each $X_{i}$ has $\mathcal{P}$, then $X$ has $\mathcal{P}$.

Proof. Let $X$ be an algebraic space over $S$, and let $X=\bigcup X_{i}$ is a Zariski open covering such that each $X_{i}$ has $\mathcal{P}$.
The case $\mathcal{P}=(\alpha)$. The condition $(\alpha)$ for $X_{i}$ means that for every $x \in\left|X_{i}\right|$ and every affine scheme $U$, and étale morphism $\varphi: U \rightarrow X_{i}$ the fibre of $\varphi:|U| \rightarrow\left|X_{i}\right|$ over $x$ is finite. Consider $x \in X$, an affine scheme $U$ and an étale morphism $U \rightarrow X$. Since $X=\bigcup X_{i}$ is a Zariski open covering there exits a finite affine open covering $U=U_{1} \cup \ldots \cup U_{n}$ such that each $U_{j} \rightarrow X$ factors through some $X_{i_{j}}$. By assumption
the fibres of $\left|U_{j}\right| \rightarrow\left|X_{i_{j}}\right|$ over $x$ are finite for $j=1, \ldots, n$. Clearly this means that the fibre of $|U| \rightarrow|X|$ over $x$ is finite. This proves the result for $(\alpha)$.
The case $\mathcal{P}=(\beta)$. The condition $(\beta)$ for $X_{i}$ means that every $x \in\left|X_{i}\right|$ is represented by a monomorphism from the spectrum of a field towards $X_{i}$. Hence the same follows for $X$ as $X_{i} \rightarrow X$ is a monomorphism and $X=\bigcup X_{i}$.

The case $\mathcal{P}=(\gamma)$. Note that $(\gamma)=(\alpha)+(\beta)$ by Lemma 55.5.1 hence the lemma for $(\gamma)$ follows from the cases treated above.
The case $\mathcal{P}=(\delta)$. The condition ( $\delta$ ) for $X_{i}$ means there exist schemes $U_{i j}$ and étale morphisms $U_{i j} \rightarrow X_{i}$ with universally bounded fibres which cover $X_{i}$. These schemes also give an étale surjective morphism $\coprod U_{i j} \rightarrow X$ and $U_{i j} \rightarrow X$ still has universally bounded fibres.

The case $\mathcal{P}=(\epsilon)$. The condition $(\epsilon)$ for $X_{i}$ means we can find a set $J_{i}$ and morphisms $\varphi_{i j}: U_{i j} \rightarrow X_{i}$ such that each $\varphi_{i j}$ is étale, both projections $U_{i j} \times{ }_{X_{i}}$ $U_{i j} \rightarrow U_{i j}$ are quasi-compact, and $\coprod_{j \in J_{i}} U_{i j} \rightarrow X_{i}$ is surjective. In this case the compositions $U_{i j} \rightarrow X_{i} \rightarrow X$ are étale (combine Morphisms, Lemmas 28.36.3 and 28.36 .9 and Spaces, Lemmas 52.5.4 and 52.5.3 ). Since $X_{i} \subset X$ is a subspace we see that $U_{i j} \times_{X_{i}} U_{i j}=U_{i j} \times_{X} U_{i j}$, and hence the condition on fibre products is preserved. And clearly $\coprod_{i, j} U_{i j} \rightarrow X$ is surjective. Hence $X$ satisfies $(\epsilon)$.
The case $\mathcal{P}=(\zeta)$. The condition $(\zeta)$ for $X_{i}$ means that $X_{i}$ is Zariski locally quasi-separated. It is immediately clear that this means $X$ is Zariski locally quasiseparated.
For $(\theta)$, see Properties of Spaces, Lemma 53.12.1.
03 KF Lemma 55.5.3. Let $S$ be a scheme. Let $\mathcal{P}$ be one of the properties $(\beta),(\gamma),(\delta)$, $(\epsilon)$, or $(\theta)$ of algebraic spaces listed in Lemma 55.5.1. Let $X, Y$ be algebraic spaces over $S$. Let $X \rightarrow Y$ be a representable morphism. If $Y$ has property $\mathcal{P}$, so does $X$.

Proof. Assume $f: X \rightarrow Y$ is a representable morphism of algebraic spaces, and assume that $Y$ has $\mathcal{P}$. Let $x \in|X|$, and set $y=f(x) \in|Y|$.

The case $\mathcal{P}=(\beta)$. Condition $(\beta)$ for $Y$ means there exists a monomorphism $\operatorname{Spec}(k) \rightarrow Y$ representing $y$. The fibre product $X_{y}=\operatorname{Spec}(k) \times_{Y} X$ is a scheme, and $x$ corresponds to a point of $X_{y}$, i.e., to a monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X_{y}$. As $X_{y} \rightarrow X$ is a monomorphism also we see that $x$ is represented by the monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X_{y} \rightarrow X$. In other words $(\beta)$ holds for $X$.
The case $\mathcal{P}=(\gamma)$. Since $(\gamma) \Rightarrow(\beta)$ we have seen in the preceding paragraph that $y$ and $x$ can be represented by monomorphisms as in the following diagram

Also, by definition of property $(\gamma)$ via Lemma 55.4.5 (2) there exist schemes $V_{i}$ and étale morphisms $V_{i} \rightarrow Y$ such that $\amalg V_{i} \rightarrow Y$ is surjective and for each $i$, setting $R_{i}=V_{i} \times_{Y} V_{i}$ the fibres of both

$$
\left|V_{i}\right| \longrightarrow|Y| \quad \text { and } \quad\left|R_{i}\right| \longrightarrow|Y|
$$

over $y$ are finite. This means that the schemes $\left(V_{i}\right)_{y}$ and $\left(R_{i}\right)_{y}$ are finite schemes over $y=\operatorname{Spec}(k)$. As $X \rightarrow Y$ is representable, the fibre products $U_{i}=V_{i} \times_{Y} X$ are schemes. The morphisms $U_{i} \rightarrow X$ are étale, and $\coprod U_{i} \rightarrow X$ is surjective. Finally, for each $i$ we have

$$
\left(U_{i}\right)_{x}=\left(V_{i} \times_{Y} X\right)_{x}=\left(V_{i}\right)_{y} \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)
$$

and

$$
\left(U_{i} \times_{X} U_{i}\right)_{x}=\left(\left(V_{i} \times_{Y} X\right) \times_{X}\left(V_{i} \times_{Y} X\right)\right)_{x}=\left(R_{i}\right)_{y} \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)
$$

hence these are finite over $k^{\prime}$ as base changes of the finite schemes $\left(V_{i}\right)_{y}$ and $\left(R_{i}\right)_{y}$. This implies that $(\gamma)$ holds for $X$, again via the second condition of Lemma 55.4.5.

The case $\mathcal{P}=(\delta)$. Let $V \rightarrow Y$ be an étale morphism with $V$ an affine scheme. Since $Y$ has property $(\delta)$ this morphism has universally bounded fibres. By Lemma 55.3 .3 the base change $V \times_{Y} X \rightarrow X$ also has universally bounded fibres. Hence the first part of Lemma 55.4.6 applies and we see that $Y$ also has property $(\delta)$.

The case $\mathcal{P}=(\epsilon)$. We will repeatedly use Spaces, Lemma 52.5.5. Let $V_{i} \rightarrow Y$ be as in Lemma 55.4.7 (2). Set $U_{i}=X \times_{Y} V_{i}$. The morphisms $U_{i} \rightarrow X$ are étale, and $\coprod U_{i} \rightarrow X$ is surjective. Because $U_{i} \times{ }_{X} U_{i}=X \times_{Y}\left(V_{i} \times_{Y} V_{i}\right)$ we see that the projections $U_{i} \times_{Y} U_{i} \rightarrow U_{i}$ are base changes of the projections $V_{i} \times_{Y} V_{i} \rightarrow V_{i}$, and so quasi-compact as well. Hence $X$ satisfies Lemma 55.4.7 (2).

The case $\mathcal{P}=(\theta)$. In this case the result is Categories, Lemma 4.8.3.

### 55.6. Reasonable and decent algebraic spaces

03I7 In Lemma 55.5.1 we have seen a number of conditions on algebraic spaces related to the behaviour of étale morphisms from affine schemes into $X$ and related to the existence of special étale coverings of $X$ by schemes. We tabulate the different types of conditions here:

| $(\alpha)$ | fibres of etale morphisms from affines are finite |
| :--- | :---: |
| $(\beta)$ | points come from monomorphisms of spectra of fields |
| $(\gamma)$ | points come from quasi-compact monomorphisms of spectra of fields |
| $(\delta)$ | fibres of etale morphisms from affines are universally bounded |
| $(\epsilon)$ | cover by etale morphisms from schemes quasi-compact onto their image |

The conditions in the following definition are not exactly conditions on the diagonal of $X$, but they are in some sense separation conditions on $X$.

03 I8 Definition 55.6.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) We say $X$ is decent if for every point $x \in X$ the equivalent conditions of Lemma 55.4 .5 hold, in other words property $(\gamma)$ of Lemma 55.5 .1 holds.
(2) We say $X$ is reasonable if the equivalent conditions of Lemma 55.4.6 hold, in other words property $(\delta)$ of Lemma 55.5.1 holds.
(3) We say $X$ is very reasonable if the equivalent conditions of Lemma 55.4.7 hold, i.e., property $(\epsilon)$ of Lemma 55.5.1 holds.

We have the following implications among these conditions on algebraic spaces:

The notion of a very reasonable algebraic space is obsolete. It was introduced because the assumption was needed to prove some results which are now proven for the class of decent spaces. The class of decent spaces is the largest class of spaces $X$ where one has a good relationship between the topology of $|X|$ and properties of $X$ itself.

03ID Example 55.6.2. The algebraic space $\mathbf{A}_{\mathbf{Q}}^{1} / \mathbf{Z}$ constructed in Spaces, Example 52.14 .8 is not decent as its "generic point" cannot be represented by a monomorphism from the spectrum of a field.
03JY Remark 55.6.3. Reasonable algebraic spaces are technically easier to work with than very reasonable algebraic spaces. For example, if $X \rightarrow Y$ is a quasi-compact étale surjective morphism of algebraic spaces and $X$ is reasonable, then so is $Y$, see Lemma 55.15 .8 but we don't know if this is true for the property "very reasonable". Below we give another technical property enjoyed by reasonable algebraic spaces.

03K0 Lemma 55.6.4. Let $S$ be a scheme. Let $X$ be a quasi-compact reasonable algebraic space. Then there exists a directed system of quasi-compact and quasi-separated algebraic spaces $X_{i}$ such that $X=\operatorname{colim}_{i} X_{i}$ (colimit in the category of sheaves).
Proof. We sketch the proof. By Properties of Spaces, Lemma 53.6.3 we have $X=U / R$ with $U$ affine. In this case, reasonable means $U \rightarrow X$ is universally bounded. Hence there exists an integer $N$ such that the "fibres" of $U \rightarrow X$ have degree at most $N$, see Definition55.3.1. Denote $s, t: R \rightarrow U$ and $c: R \times_{s, U, t} R \rightarrow R$ the groupoid structural maps.
Claim: for every quasi-compact open $A \subset R$ there exists an open $R^{\prime} \subset R$ such that
(1) $A \subset R^{\prime}$,
(2) $R^{\prime}$ is quasi-compact, and
(3) $\left(U, R^{\prime},\left.s\right|_{R^{\prime}},\left.t\right|_{R^{\prime}},\left.c\right|_{R^{\prime} \times_{s, U, t} R^{\prime}}\right)$ is a groupoid scheme.

Note that $e: U \rightarrow R$ is open as it is a section of the étale morphism $s: R \rightarrow U$, see Étale Morphisms, Proposition 40.6.1. Moreover $U$ is affine hence quasi-compact. Hence we may replace $A$ by $A \cup e(U) \subset R$, and assume that $A$ contains $e(U)$. Next, we define inductively $A^{1}=A$, and

$$
A^{n}=c\left(A^{n-1} \times_{s, U, t} A\right) \subset R
$$

for $n \geq 2$. Arguing inductively, we see that $A^{n}$ is quasi-compact for all $n \geq 2$, as the image of the quasi-compact fibre product $A^{n-1} \times_{s, U, t} A$. If $k$ is an algebraically closed field over $S$, and we consider $k$-points then

$$
A^{n}(k)=\left\{\left(u, u^{\prime}\right) \in U(k): \begin{array}{c}
\text { there exist } u=u_{1}, u_{2}, \ldots, u_{n} \in U(k) \text { with } \\
\left(u_{i}, u_{i+1}\right) \in A \text { for all } i=1, \ldots, n-1
\end{array}\right\}
$$

But as the fibres of $U(k) \rightarrow X(k)$ have size at most $N$ we see that if $n>$ $N$ then we get a repeat in the sequence above, and we can shorten it proving $A^{N}=A^{n}$ for all $n \geq N$. This implies that $R^{\prime}=A^{N}$ gives a groupoid scheme $\left(U, R^{\prime},\left.s\right|_{R^{\prime}},\left.t\right|_{R^{\prime}},\left.c\right|_{R^{\prime} \times s, U, t} R^{\prime}\right)$, proving the claim above.
Consider the map of sheaves on $(S c h / S)_{f p p f}$

$$
\operatorname{colim}_{R^{\prime} \subset R} U / R^{\prime} \longrightarrow U / R
$$

where $R^{\prime} \subset R$ runs over the quasi-compact open subschemes of $R$ which give étale equivalence relations as above. Each of the quotients $U / R^{\prime}$ is an algebraic space (see Spaces, Theorem 52.10.5. Since $R^{\prime}$ is quasi-compact, and $U$ affine the morphism $R^{\prime} \rightarrow U \times_{\operatorname{Spec}(\mathbf{Z})} U$ is quasi-compact, and hence $U / R^{\prime}$ is quasi-separated. Finally, if $T$ is a quasi-compact scheme, then

$$
\operatorname{colim}_{R^{\prime} \subset R} U(T) / R^{\prime}(T) \longrightarrow U(T) / R(T)
$$

is a bijection, since every morphism from $T$ into $R$ ends up in one of the open subrelations $R^{\prime}$ by the claim above. This clearly implies that the colimit of the sheaves $U / R^{\prime}$ is $U / R$. In other words the algebraic space $X=U / R$ is the colimit of the quasi-separated algebraic spaces $U / R^{\prime}$.

0ABT Lemma 55.6.5. Let $S$ be a scheme. Let $X, Y$ be algebraic spaces over $S$. Let $X \rightarrow Y$ be a representable morphism. If $Y$ is decent (resp. reasonable), then so is $X$.

Proof. Translation of Lemma 55.5.3.
0ABU Lemma 55.6.6. Let $S$ be a scheme. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces over $S$. If $Y$ is decent, resp. reasonable, then so is $X$.

Proof. Let $U$ be an affine scheme and $U \rightarrow X$ an étale morphism. Set $R=U \times{ }_{X} U$ and $R^{\prime}=U \times_{Y} U$. Note that $R \rightarrow R^{\prime}$ is a monomorphism.
Let $x \in|X|$. To show that $X$ is decent, we have to show that the fibres of $|U| \rightarrow|X|$ and $|R| \rightarrow|X|$ over $x$ are finite. But if $Y$ is decent, then the fibres of $|U| \rightarrow|Y|$ and $\left|R^{\prime}\right| \rightarrow|Y|$ are finite. Hence the result for "decent".
To show that $X$ is reasonable, we have to show that the fibres of $U \rightarrow X$ are universally bounded. However, if $Y$ is reasonable, then the fibres of $U \rightarrow Y$ are universally bounded, which immediately implies the same thing for the fibres of $U \rightarrow X$. Hence the result for "reasonable".

### 55.7. Points and specializations

03K1 There exists an étale morphism of algebraic spaces $f: X \rightarrow Y$ and a nontrivial specializations between points in a fibre of $|f|:|X| \rightarrow|Y|$, see Examples, Lemma 88.42.1. If the source of the morphism is a scheme we can avoid this by imposing condition $(\alpha)$ on $Y$.
03IM Lemma 55.7.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \rightarrow X$ be an étale morphism from a scheme to $X$. Assume $u, u^{\prime} \in|U|$ map to the same point $x$ of $|X|$, and $u^{\prime} \rightsquigarrow u$. If the pair $(X, x)$ satisfies the equivalent conditions of Lemma 55.4.2 then $u=u^{\prime}$.

Proof. Assume the pair $(X, x)$ satisfies the equivalent conditions for Lemma 55.4.2. Let $U$ be a scheme, $U \rightarrow X$ étale, and let $u, u^{\prime} \in|U|$ map to $x$ of $|X|$, and $u^{\prime} \rightsquigarrow u$. We may and do replace $U$ by an affine neighbourhood of $u$. Let $t, s: R=U \times_{X} U \rightarrow$ $U$ be the étale projection maps.
Pick a point $r \in R$ with $t(r)=u$ and $s(r)=u^{\prime}$. This is possible by Properties of Spaces, Lemma 53.4.5. Because generalizations lift along the étale morphism $t$ (Remark 55.4.1 we can find a specialization $r^{\prime} \rightsquigarrow r$ with $t\left(r^{\prime}\right)=u^{\prime}$. Set $u^{\prime \prime}=s\left(r^{\prime}\right)$. Then $u^{\prime \prime} \rightsquigarrow u^{\prime}$. Thus we may repeat and find $r^{\prime \prime} \rightsquigarrow r^{\prime}$ with $t\left(r^{\prime \prime}\right)=u^{\prime \prime}$. Set $u^{\prime \prime \prime}=s\left(r^{\prime \prime}\right)$, and so on. Here is a picture:

In Remark 55.4.1 we have seen that there are no specializations among points in the fibres of the étale morphism $s$. Hence if $u^{(n+1)}=u^{(n)}$ for some $n$, then also $r^{(n)}=r^{(n-1)}$ and hence also (by taking $\left.t\right) u^{(n)}=u^{(n-1)}$. This then forces the whole tower to collapse, in particular $u=u^{\prime}$. Thus we see that if $u \neq u^{\prime}$, then all the specializations are strict and $\left\{u, u^{\prime}, u^{\prime \prime}, \ldots\right\}$ is an infinite set of points in $U$ which map to the point $x$ in $|X|$. As we chose $U$ affine this contradicts the second part of Lemma 55.4.2, as desired.

03K2 Lemma 55.7.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x, x^{\prime} \in|X|$ and assume $x^{\prime} \rightsquigarrow x$, i.e., $x$ is a specialization of $x^{\prime}$. Assume the pair $\left(X, x^{\prime}\right)$ satisfies the equivalent conditions of Lemma 55.4.5. Then for every étale morphism $\varphi: U \rightarrow X$ from a scheme $U$ and any $u \in U$ with $\varphi(u)=x$, exists $a$ point $u^{\prime} \in U, u^{\prime} \rightsquigarrow u$ with $\varphi\left(u^{\prime}\right)=x^{\prime}$.

Proof. We may replace $U$ by an affine open neighbourhood of $u$. Hence we may assume that $U$ is affine. As $x$ is in the image of the open map $|U| \rightarrow|X|$, so is $x^{\prime}$. Thus we may replace $X$ by the Zariski open subspace corresponding to the image of $|U| \rightarrow|X|$, see Properties of Spaces, Lemma 53.4.10. In other words we may assume that $U \rightarrow X$ is surjective and étale. Let $s, t: R=U \times{ }_{X} U \rightarrow U$ be the projections. By our assumption that $\left(X, x^{\prime}\right)$ satisfies the equivalent conditions of Lemma 55.4.5 we see that the fibres of $|U| \rightarrow|X|$ and $|R| \rightarrow|X|$ over $x^{\prime}$ are finite. Say $\left\{u_{1}^{\prime}, \ldots, u_{n}^{\prime}\right\} \subset U$ and $\left\{r_{1}^{\prime}, \ldots, r_{m}^{\prime}\right\} \subset R$ form the complete inverse image of $\left\{x^{\prime}\right\}$. Consider the closed sets

$$
T=\overline{\left\{u_{1}^{\prime}\right\}} \cup \ldots \cup \overline{\left\{u_{n}^{\prime}\right\}} \subset|U|, \quad T^{\prime}=\overline{\left\{r_{1}^{\prime}\right\}} \cup \ldots \cup \overline{\left\{r_{m}^{\prime}\right\}} \subset|R|
$$

Trivially we have $s\left(T^{\prime}\right) \subset T$. Because $R$ is an equivalence relation we also have $t\left(T^{\prime}\right)=s\left(T^{\prime}\right)$ as the set $\left\{r_{j}^{\prime}\right\}$ is invariant under the inverse of $R$ by construction. Let $w \in T$ be any point. Then $u_{i}^{\prime} \rightsquigarrow w$ for some $i$. Choose $r \in R$ with $s(r)=w$. Since generalizations lift along $s: R \rightarrow U$, see Remark 55.4.1 we can find $r^{\prime} \rightsquigarrow r$
with $s\left(r^{\prime}\right)=u_{i}^{\prime}$. Then $r^{\prime}=r_{j}^{\prime}$ for some $j$ and we conclude that $w \in s\left(T^{\prime}\right)$. Hence $T=s\left(T^{\prime}\right)=t\left(T^{\prime}\right)$ is an $|R|$-invariant closed set in $|U|$. This means $T$ is the inverse image of a closed (!) subset $T^{\prime \prime}=\varphi(T)$ of $|X|$, see Properties of Spaces, Lemmas 53.4.5 and 53.4.6. Hence $T^{\prime \prime}=\overline{\left\{x^{\prime}\right\}}$. Thus $T$ contains some point $u_{1}$ mapping to $x$ as $x \in T^{\prime \prime}$. I.e., we see that for some $i$ there exists a specialization $u_{i}^{\prime} \rightsquigarrow u_{1}$ which maps to the given specialization $x^{\prime} \rightsquigarrow x$.
To finish the proof, choose a point $r \in R$ such that $s(r)=u$ and $t(r)=u_{1}$ (using Properties of Spaces, Lemma 53.4.3. As generalizations lift along $t$, and $u_{i}^{\prime} \rightsquigarrow u_{1}$ we can find a specialization $r^{\prime} \rightsquigarrow r$ such that $t\left(r^{\prime}\right)=u_{i}^{\prime}$. Set $u^{\prime}=s\left(r^{\prime}\right)$. Then $u^{\prime} \rightsquigarrow u$ and $\varphi\left(u^{\prime}\right)=x^{\prime}$ as desired.

0B7W Lemma 55.7.3. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a flat morphism of algebraic spaces over $S$. Let $x, x^{\prime} \in|X|$ and assume $x^{\prime} \rightsquigarrow x$, i.e., $x$ is a specialization of $x^{\prime}$. Assume the pair $\left(X, x^{\prime}\right)$ satisfies the equivalent conditions of Lemma 55.4.5 (for example if $X$ is decent, $X$ is quasi-separated, or $X$ is representable). Then for every $y \in|Y|$ with $f(y)=x$, there exists a point $y^{\prime} \in|Y|, y^{\prime} \rightsquigarrow y$ with $f\left(y^{\prime}\right)=x^{\prime}$.

Proof. (The parenthetical statement holds by the definition of decent spaces and the implications between the different separation conditions mentioned in Section 55.6.) Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose $v \in V$ mapping to $y$. Then we see that it suffices to prove the lemma for $V \rightarrow X$. Thus we may assume $Y$ is a scheme. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Choose $u \in U$ mapping to $x$. By Lemma 55.7.2 we may choose $u^{\prime} \rightsquigarrow u$ mapping to $x^{\prime}$. By Properties of Spaces, Lemma 53.4.3 we may choose $z \in U \times_{X} Y$ mapping to $y$ and $u$. Thus we reduce to the case of the flat morphism of schemes $U \times_{X} Y \rightarrow U$ which is Morphisms, Lemma 28.25.8.

### 55.8. Stratifying algebraic spaces by schemes

$0 A 4 I$ In this section we prove that a quasi-compact and quasi-separated algebraic space has a finite stratification by locally closed subspaces each of which is a scheme and such that the glueing of the parts is by elementary distinguihsed squares. We first prove a slightly weaker result for reasonable algebraic spaces.

07S8 Lemma 55.8.1. Let $S$ be a scheme. Let $W \rightarrow X$ be a morphism of a scheme $W$ to an algebraic space $X$ which is flat, locally of finite presentation, separated, locally quasi-finite with universally bounded fibres. There exist reduced closed subspaces

$$
\emptyset=Z_{-1} \subset Z_{0} \subset Z_{1} \subset Z_{2} \subset \ldots \subset Z_{n}=X
$$

such that with $X_{r}=Z_{r} \backslash Z_{r-1}$ the stratification $X=\coprod_{r=0, \ldots, n} X_{r}$ is characterized by the following universal property: Given $g: T \rightarrow X$ the projection $W \times_{X} T \rightarrow T$ is finite locally free of degree $r$ if and only if $g(|T|) \subset\left|X_{r}\right|$.

Proof. Let $n$ be an integer bounding the degrees of the fibres of $W \rightarrow X$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Apply More on Morphisms, Lemma 36.31 .8 to $W \times_{X} U \rightarrow U$. We obtain closed subsets

$$
\emptyset=Y_{-1} \subset Y_{0} \subset Y_{1} \subset Y_{2} \subset \ldots \subset Y_{n}=U
$$

characterized by the property stated in the lemma for the morphism $W \times{ }_{X} U \rightarrow U$. Clearly, the formation of these closed subsets commutes with base change. Setting
$R=U \times{ }_{X} U$ with projection maps $s, t: R \rightarrow U$ we conclude that

$$
s^{-1}\left(Y_{r}\right)=t^{-1}\left(Y_{r}\right)
$$

as closed subsets of $R$. In other words the closed subsets $Y_{r} \subset U$ are $R$-invariant. This means that $\left|Y_{r}\right|$ is the inverse image of a closed subset $Z_{r} \subset|X|$. Denote $Z_{r} \subset X$ also the reduced induced algebraic space structure, see Properties of Spaces, Definition 53.11.6.

Let $g: T \rightarrow X$ be a morphism of algebraic spaces. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow T$. To prove the final assertion of the lemma it suffices to prove the assertion for the composition $V \rightarrow X$ (by our definition of finite locally free morphisms, see Morphisms of Spaces, Section 54.44. Similarly, the morphism of schemes $W \times_{X} V \rightarrow V$ is finite locally free of degree $r$ if and only if the morphism of schemes

$$
W \times_{X}\left(U \times_{X} V\right) \longrightarrow U \times_{X} V
$$

is finite locally free of degree $r$ (see Descent, Lemma 34.19.28). By construction this happens if and only if $\left|U \times_{X} V\right| \rightarrow|U|$ maps into $\left|Y_{r}\right|$, which is true if and only if $|V| \rightarrow|X|$ maps into $\left|Z_{r}\right|$.

086 T Lemma 55.8.2. Let $S$ be a scheme. Let $W \rightarrow X$ be a morphism of a scheme $W$ to an algebraic space $X$ which is flat, locally of finite presentation, separated, and locally quasi-finite. Then there exist open subspaces

$$
X=X_{0} \supset X_{1} \supset X_{2} \supset \ldots
$$

such that a morphism $\operatorname{Spec}(k) \rightarrow X$ factors through $X_{d}$ if and only if $W \times{ }_{X} \operatorname{Spec}(k)$ has degree $\geq d$ over $k$.

Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Apply More on Morphisms, Lemma 36.31 .10 to $W \times{ }_{X} U \rightarrow U$. We obtain open subschemes

$$
U=U_{0} \supset U_{1} \supset U_{2} \supset \ldots
$$

characterized by the property stated in the lemma for the morphism $W \times{ }_{X} U \rightarrow U$. Clearly, the formation of these closed subsets commutes with base change. Setting $R=U \times_{X} U$ with projection maps $s, t: R \rightarrow U$ we conclude that

$$
s^{-1}\left(U_{d}\right)=t^{-1}\left(U_{d}\right)
$$

as open subschemes of $R$. In other words the open subschemes $U_{d} \subset U$ are $R$ invariant. This means that $U_{d}$ is the inverse image of an open subspace $X_{d} \subset X$ (Properties of Spaces, Lemma 53.11.3).

0BBN Lemma 55.8.3. Let $S$ be a scheme. Let $X$ be a quasi-compact algebraic space over $S$. There exist open subspaces

$$
\ldots \subset U_{4} \subset U_{3} \subset U_{2} \subset U_{1}=X
$$

with the following properties:
(1) setting $T_{p}=U_{p} \backslash U_{p+1}$ (with reduced induced subspace structure) there exists a separated scheme $V_{p}$ and a surjective étale morphism $f_{p}: V_{p} \rightarrow U_{p}$ such that $f_{p}^{-1}\left(T_{p}\right) \rightarrow T_{p}$ is an isomorphism,
(2) if $x \in|X|$ can be represented by a quasi-compact morphism $\operatorname{Spec}(k) \rightarrow X$ from a field, then $x \in T_{p}$ for some $p$.

Proof. By Properties of Spaces, Lemma 53.6.3 we can choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. For $p \geq 0$ set

$$
W_{p}=U \times_{X} \ldots \times_{X} U \backslash \text { all diagonals }
$$

where the fibre product has $p$ factors. Since $U$ is separated, the morphism $U \rightarrow X$ is separated and all fibre products $U \times_{X} \ldots \times_{X} U$ are separated schemes. Since $U \rightarrow X$ is separated the diagonal $U \rightarrow U \times{ }_{X} U$ is a closed immersion. Since $U \rightarrow X$ is étale the diagonal $U \rightarrow U \times_{X} U$ is an open immersion, see Morphisms of Spaces, Lemmas 54.38 .10 and 54.37.9. Similarly, all the diagonal morphisms are open and closed immersions and $W_{p}$ is an open and closed subscheme of $U \times_{X} \ldots \times_{X} U$. Moreover, the morphism

$$
U \times_{X} \ldots \times_{X} U \longrightarrow U \times_{\operatorname{Spec}(\mathbf{Z})} \ldots \times_{\operatorname{Spec}(\mathbf{Z})} U
$$

is locally quasi-finite and separated (Morphisms of Spaces, Lemma 54.4.5) and its target is an affine scheme. Hence every finite set of points of $U \times_{X} \ldots \times_{X} U$ is contained in an affine open, see More on Morphisms, Lemma 36.31.12. Therefore, the same is true for $W_{p}$. There is a free action of the symmetric group $S_{p}$ on $W_{p}$ over $X$ (because we threw out the fix point locus from $U \times_{X} \ldots \times_{X} U$ ). By the above and Properties of Spaces, Proposition 53.13.1 the quotient $V_{p}=W_{p} / S_{p}$ is a scheme. Since the action of $S_{p}$ on $W_{p}$ was over $X$, there is a morphism $V_{p} \rightarrow X$. Since $W_{p} \rightarrow X$ is étale and since $W_{p} \rightarrow V_{p}$ is surjective étale, it follows that also $V_{p} \rightarrow X$ is étale, see Properties of Spaces, Lemma 53.15.3. Observe that $V_{p}$ is a separated scheme by Properties of Spaces, Lemma 53.13.3.
We let $U_{p} \subset X$ be the open subspace which is the image of $V_{p} \rightarrow X$. By construction a morphism $\operatorname{Spec}(k) \rightarrow X$ with $k$ algebraically closed, factors through $U_{p}$ if and only if $U \times_{X} \operatorname{Spec}(k)$ has $\geq p$ points; as usual observe that $U \times_{X} \operatorname{Spec}(k)$ is scheme theoretically a disjoint union of (possibly infinitely many) copies of $\operatorname{Spec}(k)$, see Remark 55.4.1. It follows that the $U_{p}$ give a filtration of $X$ as stated in the lemma. Moreover, our morphism $\operatorname{Spec}(k) \rightarrow X$ factors through $T_{p}$ if and only if $U \times_{X}$ $\operatorname{Spec}(k)$ has exactly $p$ points. In this case we see that $V_{p} \times_{X} \operatorname{Spec}(k)$ has exactly one point. Set $Z_{p}=f_{p}^{-1}\left(T_{p}\right) \subset V_{p}$. This is a closed subscheme of $V_{p}$. Then $Z_{p} \rightarrow T_{p}$ is an étale morphism between algebraic spaces which induces a bijection on $k$-valued points for any algebraically closed field $k$. To be sure this implies that $Z_{p} \rightarrow T_{p}$ is universally injective, whence an open immersion by Morphisms of Spaces, Lemma 54.48 .2 hence an isomorphism and (1) has been proved.

Let $x: \operatorname{Spec}(k) \rightarrow X$ be a quasi-compact morphism where $k$ is a field. Then the composition $\operatorname{Spec}(\bar{k}) \rightarrow \operatorname{Spec}(k) \rightarrow X$ is quasi-compact as well (Morphisms of Spaces, Lemma 54.8.4. In this case the scheme $U \times_{X} \operatorname{Spec}(\bar{k})$ is quasi-compact. In view of the fact (seen above) that it is a disjoint union of copies of $\operatorname{Spec}(\bar{k})$ we find that it has finitely many points. If the number of points is $p$, then we see that indeed $x \in T_{p}$ and the proof is finished.

07S9 Lemma 55.8.4. Let $S$ be a scheme. Let $X$ be a quasi-compact, reasonable algebraic space over $S$. There exist an integer $n$ and open subspaces

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

with the following property: setting $T_{p}=U_{p} \backslash U_{p+1}$ (with reduced induced subspace structure) there exists a separated scheme $V_{p}$ and a surjective étale morphism $f_{p}$ : $V_{p} \rightarrow U_{p}$ such that $f_{p}^{-1}\left(T_{p}\right) \rightarrow T_{p}$ is an isomorphism.

Proof. The proof of this lemma is identical to the proof of Lemma 55.8.3. Let $n$ be an integer bounding the degrees of the fibres of $U \rightarrow X$ which exists as $X$ is reasonable, see Definition 55.6.1. Then we see that $U_{n+1}=\emptyset$ and the proof is complete.

07SA Lemma 55.8.5. Let $S$ be a scheme. Let $X$ be a quasi-compact, reasonable algebraic space over $S$. There exist an integer $n$ and open subspaces

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

such that each $T_{p}=U_{p} \backslash U_{p+1}$ (with reduced induced subspace structure) is a scheme.
Proof. Immediate consequence of Lemma 55.8.4
The following result is almost identical to GR71, Proposition 5.7.8].
07ST Lemma 55.8.6. Let $X$ be a quasi-compact and quasi-separated algebraic space over $\operatorname{Spec}(\mathbf{Z})$. There exist an integer $n$ and open subspaces

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

with the following property: setting $T_{p}=U_{p} \backslash U_{p+1}$ (with reduced induced subspace structure) there exists a quasi-compact separated scheme $V_{p}$ and a surjective étale morphism $f_{p}: V_{p} \rightarrow U_{p}$ such that $f_{p}^{-1}\left(T_{p}\right) \rightarrow T_{p}$ is an isomorphism.

Proof. The proof of this lemma is identical to the proof of Lemma 55.8.3. Observe that a quasi-separated space is reasonable, see Lemma 55.5.1 and Definition 55.6.1. Hence we find that $U_{n+1}=\emptyset$ as in Lemma 55.8.4. At the end of the argument we add that since $X$ is quasi-separated the schemes $U \times{ }_{X} \ldots \times_{X} U$ are all quasi-compact. Hence the schemes $W_{p}$ are quasi-compact. Hence the schemes $V_{p}=W_{p} / S_{p}$ are quasi-compact.

### 55.9. Schematic locus

06 NN In this section we prove that a decent algebraic space has a dense open subspace which is a scheme. We first prove this for reasonable algebraic spaces.

03JI Proposition 55.9.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is reasonable, then there exists a dense open subspace of $X$ which is a scheme.

Proof. By Properties of Spaces, Lemma 53.12.1 the question is local on $X$. Hence we may assume there exists an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma 53.6.1). Let $n$ be an integer bounding the degrees of the fibres of $U \rightarrow X$ which exists as $X$ is reasonable, see Definition 55.6.1. We will argue by induction on $n$ that whenever
(1) $U \rightarrow X$ is a surjective étale morphism whose fibres have degree $\leq n$, and
(2) $U$ is isomorphic to a locally closed subscheme of an affine scheme
then the schematic locus is dense in $X$.
Let $X_{n} \subset X$ be the open subspace which is the complement of the closed subspace $Z_{n-1} \subset X$ constructed in Lemma 55.8.1 using the morphism $U \rightarrow X$. Let $U_{n} \subset U$ be the inverse image of $X_{n}$. Then $U_{n} \rightarrow X_{n}$ is finite locally free of degree $n$. Hence $X_{n}$ is a scheme by Properties of Spaces, Proposition 53.13.1 (and the fact that any finite set of points of $U_{n}$ is contained in an affine open of $U_{n}$, see Properties, Lemma 27.29.5.

This result is almost identical to GR71, Proposition 5.7.8].

Let $X^{\prime} \subset X$ be the open subspace such that $\left|X^{\prime}\right|$ is the interior of $\left|Z_{n-1}\right|$ in $|X|$ (see Topology, Definition5.20.1). Let $U^{\prime} \subset U$ be the inverse image. Then $U^{\prime} \rightarrow X^{\prime}$ is surjective étale and has degrees of fibres bounded by $n-1$. By induction we see that the schematic locus of $X^{\prime}$ is an open dense $X^{\prime \prime} \subset X^{\prime}$. By elementary topology we see that $X^{\prime \prime} \cup X_{n} \subset X$ is open and dense and we win.

086U Theorem 55.9.2 (David Rydh). Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is decent, then there exists a dense open subspace of $X$ which is a scheme.

Proof. Assume $X$ is a decent algebraic space for which the theorem is false. By Properties of Spaces, Lemma 53.12.1 there exists a largest open subspace $X^{\prime} \subset X$ which is a scheme. Since $X^{\prime}$ is not dense in $X$, there exists an open subspace $X^{\prime \prime} \subset X$ such that $\left|X^{\prime \prime}\right| \cap\left|X^{\prime}\right|=\emptyset$. Replacing $X$ by $X^{\prime \prime}$ we get a nonempty decent algebraic space $X$ which does not contain any open subspace which is a scheme.
Choose a nonempty affine scheme $U$ and an étale morphism $U \rightarrow X$. We may and do replace $X$ by the open subscheme corresponding to the image of $|U| \rightarrow|X|$. Consider the sequence of open subspaces

$$
X=X_{0} \supset X_{1} \supset X_{2} \ldots
$$

constructed in Lemma 55.8 .2 for the morphism $U \rightarrow X$. Note that $X_{0}=X_{1}$ as $U \rightarrow X$ is surjective. Let $U=U_{0}=U_{1} \supset U_{2} \ldots$ be the induced sequence of open subschemes of $U$.
Choose a nonempty open affine $V_{1} \subset U_{1}$ (for example $V_{1}=U_{1}$ ). By induction we will construct a sequence of nonempty affine opens $V_{1} \supset V_{2} \supset \ldots$ with $V_{n} \subset U_{n}$. Namely, having constructed $V_{1}, \ldots, V_{n-1}$ we can always choose $V_{n}$ unless $V_{n-1} \cap$ $U_{n}=\emptyset$. But if $V_{n-1} \cap U_{n}=\emptyset$, then the open subspace $X^{\prime} \subset X$ with $\left|X^{\prime}\right|=$ $\operatorname{Im}\left(\left|V_{n-1}\right| \rightarrow|X|\right)$ is contained in $|X| \backslash\left|X_{n}\right|$. Hence $V_{n-1} \rightarrow X^{\prime}$ is an étale morphism whose fibres have degree bounded by $n-1$. In other words, $X^{\prime}$ is reasonable (by definition), hence $X^{\prime}$ contains a nonempty open subscheme by Proposition 55.9.1. This is a contradiction which shows that we can pick $V_{n}$.
By Limits, Lemma 31.3 .4 the limit $V_{\infty}=\lim V_{n}$ is a nonempty scheme. Pick a morphism $\operatorname{Spec}(k) \rightarrow V_{\infty}$. The composition $\operatorname{Spec}(k) \rightarrow V_{\infty} \rightarrow U \rightarrow X$ has image contained in all $X_{d}$ by construction. In other words, the fibred $U \times_{X} \operatorname{Spec}(k)$ has infinite degree which contradicts the definition of a decent space. This contradiction finishes the proof of the theorem.

0BA1 Lemma 55.9.3. Let $S$ be a scheme. Let $X \rightarrow Y$ be a surjective finite locally free morphism of algebraic spaces over $S$. For $y \in|Y|$ the following are equivalent
(1) $y$ is in the schematic locus of $Y$, and
(2) there exists an affine open $U \subset X$ containing the preimage of $y$.

Proof. If $y \in Y$ is in the schematic locus, then it has an affine open neighbourhood $V \subset Y$ and the inverse image $U$ of $V$ in $X$ is an open finite over $V$, hence affine. Thus (1) implies (2).
Conversely, assume that $U \subset X$ as in (2) is given. Set $R=X \times_{Y} X$ and denote the projections $s, t: R \rightarrow X$. Consider $Z=R \backslash s^{-1}(U) \cap t^{-1}(U)$. This is a closed subset of $R$. The image $t(Z)$ is a closed subset of $X$ which can loosely be described as the set of points of $X$ which are $R$-equivalent to a point of $X \backslash U$. Hence $U^{\prime}=X \backslash t(Z)$
is an $R$-invariant, open subspace of $X$ contained in $U$ which contains the fibre of $X \rightarrow Y$ over $y$. Since $X \rightarrow Y$ is open (Morphisms of Spaces, Lemma 54.29.6) the image of $U^{\prime}$ is an open subspace $V^{\prime} \subset Y$. Since $U^{\prime}$ is $R$-invariant and $R=X \times_{Y} X$, we see that $U^{\prime}$ is the inverse image of $V^{\prime}$ (use Properties of Spaces, Lemma 53.4.3). After replacing $Y$ by $V^{\prime}$ and $X$ by $U^{\prime}$ we see that we may assume $X$ is a scheme isomorphic to an open subscheme of an affine scheme.

Assume $X$ is a scheme isomorphic to an open subscheme of an affine scheme. In this case the fppf quotient sheaf $X / R$ is a scheme, see Properties of Spaces, Proposition 53.13.1. Since $Y$ is a sheaf in the fppf topology, obtain a canonical map $X / R \rightarrow Y$ factoring $X \rightarrow Y$. Since $X \rightarrow Y$ is surjective finite locally free, it is surjective as a map of sheaves (Spaces, Lemma 52.5.9). We conclude that $X / R \rightarrow Y$ is surjective as a map of sheaves. On the other hand, since $R=X \times_{Y} X$ as sheaves we conclude that $X / R \rightarrow Y$ is injective as a map of sheaves. Hence $X / R \rightarrow Y$ is an isomorphism and we see that $Y$ is representable.

At this point we have several different ways for proving the following lemma.
06 NG Lemma 55.9.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If there exists a finite, étale, surjective morphism $U \rightarrow X$ where $U$ is a scheme, then there exists a dense open subspace of $X$ which is a scheme.

First proof. The morphism $U \rightarrow X$ is finite locally free. Hence there is a decomposition of $X$ into open and closed subspaces $X_{d} \subset X$ such that $U \times_{X} X_{d} \rightarrow X_{d}$ is finite locally free of degree $d$. Thus we may assume $U \rightarrow X$ is finite locally free of degree $d$. In this case, let $U_{i} \subset U, i \in I$ be the set of affine opens. For each $i$ the morphism $U_{i} \rightarrow X$ is étale and has universally bounded fibres (namely, bounded by $d$ ). In other words, $X$ is reasonable and the result follows from Proposition 55.9.1.

Second proof. The question is local on $X$ (Properties of Spaces, Lemma 53.12.1), hence may assume $X$ is quasi-compact. Then $U$ is quasi-compact. Then there exists a dense open subscheme $W \subset U$ which is separated (Properties, Lemma 27.29.3). Set $Z=U \backslash W$. Let $R=U \times_{X} U$ and $s, t: R \rightarrow U$ the projections. Then $t^{-1}(Z)$ is nowhere dense in $R$ (Topology, Lemma 5.20.6) and hence $\Delta=s\left(t^{-1}(Z)\right)$ is an $R$-invariant closed nowhere dense subset of $U$ (Morphisms, Lemma 28.45.7). Let $u \in U \backslash \Delta$ be a generic point of an irreducible component. Since these points are dense in $U \backslash \Delta$ and since $\Delta$ is nowhere dense, it suffices to show that the image $x \in X$ of $u$ is in the schematic locus of $X$. Observe that $t\left(s^{-1}(\{u\})\right) \subset W$ is a finite set of generic points of irreducible components of $W$ (compare with Properties of Spaces, Lemma 53.10.1. By Properties, Lemma 27.29 .1 we can find an affine open $V \subset W$ such that $t\left(s^{-1}(\{u\})\right) \subset V$. Since $t\left(s^{-1}(\{u\})\right)$ is the fibre of $|U| \rightarrow|X|$ over $x$, we conclude by Lemma 55.9.3.

Third proof. (This proof is essentially the same as the second proof, but uses fewer references.) Assume $X$ is an algebraic space, $U$ a scheme, and $U \rightarrow X$ is a finite étale surjective morphism. Write $R=U \times_{X} U$ and denote $s, t: R \rightarrow U$ the projections as usual. Note that $s, t$ are surjective, finite and étale. Claim: The union of the $R$-invariant affine opens of $U$ is topologically dense in $U$.
Proof of the claim. Let $W \subset U$ be an affine open. Set $W^{\prime}=t\left(s^{-1}(W)\right) \subset U$. Since $s^{-1}(W)$ is affine (hence quasi-compact) we see that $W^{\prime} \subset U$ is a quasi-compact
open. By Properties, Lemma 27.29 .3 there exists a dense open $W^{\prime \prime} \subset W^{\prime}$ which is a separated scheme. Set $\Delta^{\prime}=W^{\prime} \backslash W^{\prime \prime}$. This is a nowhere dense closed subset of $W^{\prime \prime}$. Since $\left.t\right|_{s^{-1}(W)}: s^{-1}(W) \rightarrow W^{\prime}$ is open (because it is étale) we see that the inverse image $\left(\left.t\right|_{s^{-1}(W)}\right)^{-1}\left(\Delta^{\prime}\right) \subset s^{-1}(W)$ is a nowhere dense closed subset (see Topology, Lemma 5.20.6). Hence, by Morphisms, Lemma 28.45.7 we see that

$$
\Delta=s\left(\left(\left.t\right|_{s^{-1}(W)}\right)^{-1}\left(\Delta^{\prime}\right)\right)
$$

is a nowhere dense closed subset of $W$. Pick any point $\eta \in W, \eta \notin \Delta$ which is a generic point of an irreducible component of $W$ (and hence of $U$ ). By our choices above the finite set $t\left(s^{-1}(\{\eta\})\right)=\left\{\eta_{1}, \ldots, \eta_{n}\right\}$ is contained in the separated scheme $W^{\prime \prime}$. Note that the fibres of $s$ is are finite discrete spaces, and that generalizations lift along the étale morphism $t$, see Morphisms, Lemmas 28.36 .12 and 28.25.8. In this way we see that each $\eta_{i}$ is a generic point of an irreducible component of $W^{\prime \prime}$. Thus, by Properties, Lemma 27.29 .1 we can find an affine open $V \subset W^{\prime \prime}$ such that $\left\{\eta_{1}, \ldots, \eta_{n}\right\} \subset V$. By Groupoids, Lemma 38.24.1 this implies that $\eta$ is contained in an $R$-invariant affine open subscheme of $U$. The claim follows as $W$ was chosen as an arbitrary affine open of $U$ and because the set of generic points of irreducible components of $W \backslash \Delta$ is dense in $W$.

Using the claim we can finish the proof. Namely, if $W \subset U$ is an $R$-invariant affine open, then the restriction $R_{W}$ of $R$ to $W$ equals $R_{W}=s^{-1}(W)=t^{-1}(W)$ (see Groupoids, Definition 38.19.1 and discussion following it). In particular the maps $R_{W} \rightarrow W$ are finite étale also. It follows in particular that $R_{W}$ is affine. Thus we see that $W / R_{W}$ is a scheme, by Groupoids, Proposition 38.23.8. On the other hand, $W / R_{W}$ is an open subspace of $X$ by Spaces, Lemma 52.10.2. Hence having a dense collection of points contained in $R$-invariant affine open of $U$ certainly implies that the schematic locus of $X$ (see Properties of Spaces, Lemma 53.12.1) is open dense in $X$.

### 55.10. Points on spaces

03IG In this section we prove some properties of points on decent algebraic spaces.
03K4 Lemma 55.10.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Consider the map

$$
\{\operatorname{Spec}(k) \rightarrow X \text { monomorphism }\} \longrightarrow|X|
$$

This map is always injective. If $X$ is decent then this map is a bijection.
Proof. We have seen in Properties of Spaces, Lemma 53.4.11 that the map is an injection in general. By Lemma 55.5.1 it is surjective when $X$ is decent (actually one can say this is part of the definition of being decent).

The following lemma tells us that the henselian local ring of a point on a decent algebraic space is defined.
0BBP Lemma 55.10.2. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. For every point $x \in|X|$ there exists an étale morphism

$$
(U, u) \longrightarrow(X, x)
$$

where $U$ is an affine scheme, $u$ is the only point of $U$ lying over $x$, and the induced morphism $\operatorname{Spec}(\kappa(u)) \rightarrow X$ is a monomorphism.

Proof. We may assume that $X$ is quasi-compact by replacing $X$ with a quasicompact open containing $x$. Recall that $x$ can be represented by a quasi-compact (mono)morphism from the spectrum a field (by definition of decent spaces). Thus the lemma follows from Lemma 55.8.3.

0BGU Definition 55.10.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in X$ be a point. An elementary étale neighbourhood is an étale morphism $(U, u) \rightarrow$ $(X, x)$ where $U$ is a scheme, $u \in U$ is a point mapping to $x$, and $\operatorname{Spec}(\kappa(u)) \rightarrow X$ is a monomorphism. A morphism of elementary étale neighbourhoods $(U, u) \rightarrow\left(U^{\prime}, u^{\prime}\right)$ is defined as a morphism $U \rightarrow U^{\prime}$ over $X$ mapping $u$ to $u^{\prime}$.

If $X$ is not decent then the category of elementary étale neighbourhoods may be empty.

0BGV Lemma 55.10.4. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x$ be a point of $X$. The category of elementary étale neighborhoods of $(X, x)$ is cofiltered (see Categories, Definition 4.20.1).

Proof. The category is nonempty by Lemma 55.10.2. Suppose that we have two elementary étale neighbourhoods $\left(U_{i}, u_{i}\right) \rightarrow(X, x)$. Then consider $U=U_{1} \times_{X} U_{2}$. Since $\operatorname{Spec}\left(\kappa\left(u_{i}\right)\right) \rightarrow X, i=1,2$ are both monomorphisms in the class of $x$, we see that

$$
u=\operatorname{Spec}\left(\kappa\left(u_{1}\right)\right) \times_{X} \operatorname{Spec}\left(\kappa\left(u_{2}\right)\right)
$$

is the spectrum of a field $\kappa(u)$ such that the induced maps $\kappa\left(u_{i}\right) \rightarrow \kappa(u)$ are isomorphisms. Then $u \rightarrow U$ is a point of $U$ and we see that $(U, u) \rightarrow(X, x)$ is an elementary étale neighbourhood dominating $\left(U_{i}, u_{i}\right)$. If $a, b:\left(U_{1}, u_{1}\right) \rightarrow\left(U_{2}, u_{2}\right)$ are two morphisms between our elementary étale neighbourhoods, then we consider the scheme

$$
U=U_{1} \times{ }_{(a, b),\left(U_{2} \times_{X} U_{2}\right), \Delta} U_{2}
$$

Using Properties of Spaces, Lemma 53.15.6 we see that $U \rightarrow X$ is étale. Moreover, in exactly the same manner as before we see that $U$ has a point $u$ such that $(U, u) \rightarrow$ $(X, x)$ is an elementary étale neighbourhood. Finally, $U \rightarrow U_{1}$ equalizes $a$ and $b$ and the proof is finished.

0BGW Definition 55.10.5. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x \in|X|$. The henselian local ring of $X$ at $x$, is

$$
\mathcal{O}_{X, x}^{h}=\operatorname{colim} \Gamma\left(U, \mathcal{O}_{U}\right)
$$

where the colimit is over the elementary étale neighbourhoods $(U, u) \rightarrow(X, x)$.
To be sure, the henselian local ring of $X$ at $x$ is equal to the henselization $\mathcal{O}_{U, u}^{h}$ of the local ring $\mathcal{O}_{U, u}$ of any elementary étale neighbourhood. This follows from the definition, Lemma 55.10.4 and More on Morphisms, Lemma 36.27.5.
The following lemma shows that specialization of points behaves well on decent algebraic spaces. Spaces, Example 52.14 .9 shows that this is not true in general.
03K5 Lemma 55.10.6. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $U \rightarrow X$ be an étale morphism from a scheme to $X$. If $u, u^{\prime} \in|U|$ map to the same point of $|X|$, and $u^{\prime} \rightsquigarrow u$, then $u=u^{\prime}$.
Proof. Combine Lemmas 55.5.1 and 55.7.1.

03IL Lemma 55.10.7. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x, x^{\prime} \in|X|$ and assume $x^{\prime} \rightsquigarrow x$, i.e., $x$ is a specialization of $x^{\prime}$. Then for every étale morphism $\varphi: U \rightarrow X$ from a scheme $U$ and any $u \in U$ with $\varphi(u)=x$, exists a point $u^{\prime} \in U, u^{\prime} \rightsquigarrow u$ with $\varphi\left(u^{\prime}\right)=x^{\prime}$.

Proof. Combine Lemmas 55.5.1 and 55.7.2.
03K3 Lemma 55.10.8. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Then $|X|$ is Kolmogorov (see Topology, Definition 5.7.4).

Proof. Let $x_{1}, x_{2} \in|X|$ with $x_{1} \rightsquigarrow x_{2}$ and $x_{2} \rightsquigarrow x_{1}$. We have to show that $x_{1}=x_{2}$. Pick a scheme $U$ and an étale morphism $U \rightarrow X$ such that $x_{1}, x_{2}$ are both in the image of $|U| \rightarrow|X|$. By Lemma 55.10 .7 we can find a specialization $u_{1} \rightsquigarrow u_{2}$ in $U$ mapping to $x_{1} \rightsquigarrow x_{2}$. By Lemma 55.10.7 we can find $u_{2}^{\prime} \rightsquigarrow u_{1}$ mapping to $x_{2} \rightsquigarrow x_{1}$. This means that $u_{2}^{\prime} \rightsquigarrow u_{2}$ is a specialization between points of $U$ mapping to the same point of $X$, namely $x_{2}$. This is not possible, unless $u_{2}^{\prime}=u_{2}$, see Lemma 55.10.6. Hence also $u_{1}=u_{2}$ as desired.

03K6 Proposition 55.10.9. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Then the topological space $|X|$ is sober (see Topology, Definition 5.7.4).

Proof. We have seen in Lemma 55.10 .8 that $|X|$ is Kolmogorov. Hence it remains to show that every irreducible closed subset $T \subset|X|$ has a generic point. By Properties of Spaces, Lemma 53.11.4 there exists a closed subspace $Z \subset X$ with $|Z|=|T|$. By definition this means that $Z \rightarrow X$ is a representable morphism of algebraic spaces. Hence $Z$ is a decent algebraic space by Lemma 55.5.3. By Theorem 55.9.2 we see that there exists an open dense subspace $Z^{\prime} \subset Z$ which is a scheme. This means that $\left|Z^{\prime}\right| \subset T$ is open dense. Hence the topological space $\left|Z^{\prime}\right|$ is irreducible, which means that $Z^{\prime}$ is an irreducible scheme. By Schemes, Lemma 25.11.1 we conclude that $\left|Z^{\prime}\right|$ is the closure of a single point $\eta \in T$ and hence also $T=\{\eta\}$, and we win.

For decent algebraic spaces dimension works as expected.
0A4J Lemma 55.10.10. Let $S$ be a scheme. Dimension as defined in Properties of Spaces, Section 53.8 behaves well on decent algebraic spaces $X$ over $S$.
(1) If $x \in|X|$, then $\operatorname{dim}_{x}(|X|)=\operatorname{dim}_{x}(X)$, and
(2) $\operatorname{dim}(|X|)=\operatorname{dim}(X)$.

Proof. Proof of (1). Choose a scheme $U$ with a point $u \in U$ and an étale morphism $h: U \rightarrow X$ mapping $u$ to $x$. By definition the dimension of $X$ at $x$ is $\operatorname{dim}_{u}(|U|)$. Thus we may pick $U$ such that $\operatorname{dim}_{x}(X)=\operatorname{dim}(|U|)$. Let $d$ be an integer. If $\operatorname{dim}(U) \geq d$, then there exists a sequence of nontrivial specializations $u_{d} \rightsquigarrow \ldots \rightsquigarrow u_{0}$ in $U$. Taking the image we find a corresponding sequence $h\left(u_{d}\right) \rightsquigarrow \ldots \rightsquigarrow h\left(u_{0}\right)$ each of which is nontrivial by Lemma 55.10.6. Hence we see that the image of $|U|$ in $|X|$ has dimension at least $d$. Conversely, suppose that $x_{d} \rightsquigarrow \ldots \rightsquigarrow x_{0}$ is a sequence of specializations in $|X|$ with $x_{0}$ in the image of $|U| \rightarrow|X|$. Then we can lift this to a sequence of specializations in $U$ by Lemma 55.10.7.

Part (2) is an immediate consequence of part (1), Topology, Lemma 5.9.2, and Properties of Spaces, Section 53.8.

0ABW Lemma 55.10.11. Let $S$ be a scheme. Let $X \rightarrow Y$ be a locally quasi-finite morphism of algebraic spaces over $S$. Let $x \in|X|$ with image $y \in|Y|$. Then the dimension of the local ring of $Y$ at $y$ is $\geq$ to the dimension of the local ring of $X$ at $x$.

Proof. The definition of the dimension of the local ring of a point on an algebraic space is given in Properties of Spaces, Definition 53.9.2. Choose an étale morphism $(V, v) \rightarrow(Y, y)$ where $V$ is a scheme. Choose an étale morphism $U \rightarrow V \times_{Y} X$ and a point $u \in U$ mapping to $x \in|X|$ and $v \in V$. Then $U \rightarrow V$ is locally quasi-finite and we have to prove that

$$
\operatorname{dim}\left(\mathcal{O}_{V, v}\right) \geq \operatorname{dim}\left(\mathcal{O}_{U, u}\right)
$$

This is Algebra, Lemma 10.124 .4
The following lemma is a tiny bit stronger than Properties of Spaces, Lemma 53.14.3. We will improve this lemma in Lemma 55.12.2.

03IK Lemma 55.10.12. Let $S$ be a scheme. Let $k$ be a field. Let $X$ be an algebraic space over $S$ and assume that there exists a surjective étale morphism $\operatorname{Spec}(k) \rightarrow X$. If $X$ is decent, then $X \cong \operatorname{Spec}\left(k^{\prime}\right)$ where $k^{\prime} \subset k$ is a finite separable extension.

Proof. The assumption implies that $|X|=\{x\}$ is a singleton. Since $X$ is decent we can find a quasi-compact monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ whose image is $x$. Then the projection $U=\operatorname{Spec}\left(k^{\prime}\right) \times_{X} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ is a monomorphism, whence $U=\operatorname{Spec}(k)$, see Schemes, Lemma 25.23.10. Hence the projection $\operatorname{Spec}(k)=U \rightarrow$ $\operatorname{Spec}\left(k^{\prime}\right)$ is étale and we win.

### 55.11. Reduced singleton spaces

06 QU A singleton space is an algebraic space $X$ such that $|X|$ is a singleton. It turns out that these can be more interesting than just being the spectrum of a field, see Spaces, Example 52.14.7. We develop a tiny bit of machinery to be able to talk about these.

06QV Lemma 55.11.1. Let $S$ be a scheme. Let $Z$ be an algebraic space over $S$. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow Z$ be surjective and flat. Then any morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow Z$ where $k^{\prime}$ is a field is surjective and flat.

Proof. Consider the fibre square

Note that $T \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ is flat and surjective hence $T$ is not empty. On the other hand $T \rightarrow \operatorname{Spec}(k)$ is flat as $k$ is a field. Hence $T \rightarrow Z$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 54.30 .5 that $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow Z$ is flat. It is surjective as by assumption $|Z|$ is a singleton.

06QW Lemma 55.11.2. Let $S$ be a scheme. Let $Z$ be an algebraic space over $S$. The following are equivalent
(1) $Z$ is reduced and $|Z|$ is a singleton,
(2) there exists a surjective flat morphism $\operatorname{Spec}(k) \rightarrow Z$ where $k$ is a field, and
(3) there exists a locally of finite type, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow Z$ where $k$ is a field.

Proof. Assume (1). Let $W$ be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Then $W$ is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of $W$. Since $W$ is reduced we have $\mathcal{O}_{W, \eta}=\kappa(\eta)$. It follows that the canonical morphism $\eta=\operatorname{Spec}(\kappa(\eta)) \rightarrow W$ is flat. We see that the composition $\eta \rightarrow Z$ is flat (see Morphisms of Spaces, Lemma 54.29.3). It is also surjective as $|Z|$ is a singleton. In other words (2) holds.

Assume (2). Let $W$ be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Choose a field $k$ and a surjective flat morphism $\operatorname{Spec}(k) \rightarrow Z$. Then $W{ }_{{ }_{Z}} \operatorname{Spec}(k)$ is a scheme étale over $k$. Hence $W \times_{Z} \operatorname{Spec}(k)$ is a disjoint union of spectra of fields (see Remark 55.4.1), in particular reduced. Since $W \times{ }_{Z} \operatorname{Spec}(k) \rightarrow W$ is surjective and flat we conclude that $W$ is reduced (Descent, Lemma 34.15.1). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme $W$ and an étale morphism $W \rightarrow Z$. Pick a closed point $w \in W$ and set $k=\kappa(w)$. The composition

$$
\operatorname{Spec}(k) \xrightarrow{w} W \longrightarrow Z
$$

is locally of finite type by Morphisms of Spaces, Lemmas 54.23.2 and 54.38.9. It is also flat and surjective by Lemma 55.11.1. Hence (3) holds.

The following lemma singles out a slightly better class of singleton algebraic spaces than the preceding lemma.
06QX Lemma 55.11.3. Let $S$ be a scheme. Let $Z$ be an algebraic space over $S$. The following are equivalent
(1) $Z$ is reduced, locally Noetherian, and $|Z|$ is a singleton, and
(2) there exists a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow$ $Z$ where $k$ is a field.

Proof. Assume (2) holds. By Lemma 55.11 .2 we see that $Z$ is reduced and $|Z|$ is a singleton. Let $W$ be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Choose a field $k$ and a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow$ $Z$. Then $W \times_{Z} \operatorname{Spec}(k)$ is a scheme étale over $k$, hence a disjoint union of spectra of fields (see Remark 55.4.1), hence locally Noetherian. Since $W \times{ }_{Z} \operatorname{Spec}(k) \rightarrow W$ is flat, surjective, and locally of finite presentation, we see that $\left\{W \times{ }_{Z} \operatorname{Spec}(k) \rightarrow W\right\}$ is an fppf covering and we conclude that $W$ is locally Noetherian (Descent, Lemma 34.12.1). In other words (1) holds.

Assume (1). Pick a nonempty affine scheme $W$ and an étale morphism $W \rightarrow Z$. Pick a closed point $w \in W$ and set $k=\kappa(w)$. Because $W$ is locally Noetherian the morphism $w: \operatorname{Spec}(k) \rightarrow W$ is of finite presentation, see Morphisms, Lemma 28.21.7. Hence the composition

$$
\operatorname{Spec}(k) \xrightarrow{w} W \longrightarrow Z
$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 54.28 .2 and 54.38.8. It is also flat and surjective by Lemma 55.11.1. Hence (2) holds.

06QY Lemma 55.11.4. Let $S$ be a scheme. Let $Z^{\prime} \rightarrow Z$ be a monomorphism of algebraic spaces over $S$. Assume there exists a field $k$ and a locally finitely presented, surjective, flat morphism $\operatorname{Spec}(k) \rightarrow Z$. Then either $Z^{\prime}$ is empty or $Z^{\prime}=Z$.
Proof. We may assume that $Z^{\prime}$ is nonempty. In this case the fibre product $T=Z^{\prime} \times{ }_{Z} \operatorname{Spec}(k)$ is nonempty, see Properties of Spaces, Lemma 53.4.3. Now $T$ is an algebraic space and the projection $T \rightarrow \operatorname{Spec}(k)$ is a monomorphism. Hence $T=\operatorname{Spec}(k)$, see Morphisms of Spaces, Lemma 54.10.8. We conclude that $\operatorname{Spec}(k) \rightarrow Z$ factors through $Z^{\prime}$. But as $\operatorname{Spec}(k) \rightarrow Z$ is surjective, flat and locally of finite presentation, we see that $\operatorname{Spec}(k) \rightarrow Z$ is surjective as a map of sheaves on $(S c h / S)_{\text {fppf }}$ (see Spaces, Remark 52.5.2) and we conclude that $Z^{\prime}=Z$.

The following lemma says that to each point of an algebraic space we can associate a canonical reduced, locally Noetherian singleton algebraic space.

06QZ Lemma 55.11.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. Then there exists a unique monomorphism $Z \rightarrow X$ of algebraic spaces over $S$ such that $Z$ is an algebraic space which satisfies the equivalent conditions of Lemma 55.11 .3 and such that the image of $|Z| \rightarrow|X|$ is $\{x\}$.
Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Set $R=$ $U \times{ }_{X} U$ so that $X=U / R$ is a presentation (see Spaces, Section 52.9). Set

$$
U^{\prime}=\coprod_{u \in U \text { lying over } x} \operatorname{Spec}(\kappa(u))
$$

The canonical morphism $U^{\prime} \rightarrow U$ is a monomorphism. Let

$$
R^{\prime}=U^{\prime} \times_{X} U^{\prime}=R \times_{\left(U \times_{S} U\right)}\left(U^{\prime} \times_{S} U^{\prime}\right)
$$

Because $U^{\prime} \rightarrow U$ is a monomorphism we see that the projections $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ factor as a monomorphism followed by an étale morphism. Hence, as $U^{\prime}$ is a disjoint union of spectra of fields, using Remark 55.4.1, and using Schemes, Lemma 25.23.10 we conclude that $R^{\prime}$ is a disjoint union of spectra of fields and that the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are étale. Hence $Z=U^{\prime} / R^{\prime}$ is an algebraic space by Spaces, Theorem 52.10.5. As $R^{\prime}$ is the restriction of $R$ by $U^{\prime} \rightarrow U$ we see $Z \rightarrow X$ is a monomorphism by Groupoids, Lemma 38.20.6. Since $Z \rightarrow X$ is a monomorphism we see that $|Z| \rightarrow|X|$ is injective, see Morphisms of Spaces, Lemma 54.10.9. By Properties of Spaces, Lemma 53.4.3 we see that

$$
\left|U^{\prime}\right|=\left|Z \times_{X} U^{\prime}\right| \rightarrow|Z| \times_{|X|}\left|U^{\prime}\right|
$$

is surjective which implies (by our choice of $U^{\prime}$ ) that $|Z| \rightarrow|X|$ has image $\{x\}$. We conclude that $|Z|$ is a singleton. Finally, by construction $U^{\prime}$ is locally Noetherian and reduced, i.e., we see that $Z$ satisfies the equivalent conditions of Lemma 55.11.3.
Let us prove uniqueness of $Z \rightarrow X$. Suppose that $Z^{\prime} \rightarrow X$ is a second such monomorphism of algebraic spaces. Then the projections

$$
Z^{\prime} \longleftarrow Z^{\prime} \times_{X} Z \longrightarrow Z
$$

are monomorphisms. The algebraic space in the middle is nonempty by Properties of Spaces, Lemma 53.4.3. Hence the two projections are isomorphisms by Lemma 55.11 .4 and we win.

We introduce the following terminology which foreshadows the residual gerbes we will introduce later, see Properties of Stacks, Definition 82.11.8.

06R0 Definition 55.11.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. The residual space of $X$ at $x^{2}$ is the monomorphism $Z_{x} \rightarrow X$ constructed in Lemma 55.11.5
In particular we know that $Z_{x}$ is a locally Noetherian, reduced, singleton algebraic space and that there exists a field and a surjective, flat, locally finitely presented morphism

$$
\operatorname{Spec}(k) \longrightarrow Z_{x} .
$$

It turns out that $Z_{x}$ is a regular algebraic space as follows from the following lemma.
06R1 Lemma 55.11.7. A reduced, locally Noetherian singleton algebraic space $Z$ is regular.

Proof. Let $Z$ be a reduced, locally Noetherian singleton algebraic space over a scheme $S$. Let $W \rightarrow Z$ be a surjective étale morphism where $W$ is a scheme. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow Z$ be surjective, flat, and locally of finite presentation (see Lemma 55.11.3). The scheme $T=W \times{ }_{Z} \operatorname{Spec}(k)$ is étale over $k$ in particular regular, see Remark 55.4.1. Since $T \rightarrow W$ is locally of finite presentation, flat, and surjective it follows that $W$ is regular, see Descent, Lemma 34.15.2. By definition this means that $Z$ is regular.

### 55.12. Decent spaces

047 Y In this section we collect some useful facts on decent spaces.
0BB6 Lemma 55.12.1. Any localy Noetherian decent algebraic space is quasi-separated.
Proof. Namely, let $X$ be an algebraic space (over some base scheme, for example over $\mathbf{Z}$ ) which is decent and locally Noetherian. Let $U \rightarrow X$ and $V \rightarrow X$ be étale morphisms with $U$ and $V$ affine schemes. We have to show that $W=U \times_{X} V$ is quasi-compact (Properties of Spaces, Lemma 53.3.3). Since $X$ is locally Noetherian, the schemes $U, V$ are Noetherian and $W$ is locally Noetherian. Since $X$ is decent, the fibres of the morphism $W \rightarrow U$ are finite. Namely, we can represent any $x \in|X|$ by a quasi-compact monomorphism $\operatorname{Spec}(k) \rightarrow X$. Then $U_{k}$ and $V_{k}$ are finite disjoint unions of spectra of finite separable extensions of $k$ (Remark 55.4.1) and we see that $W_{k}=U_{k} \times_{\operatorname{Spec}(k)} V_{k}$ is finite. Let $n$ be the maximum degree of a fibre of $W \rightarrow U$ at a generic point of an irreducible component of $U$. Consider the stratification

$$
U=U_{0} \supset U_{1} \supset U_{2} \supset \ldots
$$

associated to $W \rightarrow U$ in More on Morphisms, Lemma 36.31.10. By our choice of $n$ above we conclude that $U_{n+1}$ is empty. Hence we see that the fibres of $W \rightarrow U$ are universally bounded. Then we can apply More on Morphisms, Lemma 36.31.8 to find a stratification

$$
\emptyset=Z_{-1} \subset Z_{0} \subset Z_{1} \subset Z_{2} \subset \ldots \subset Z_{n}=U
$$

by closed subsets such that with $S_{r}=Z_{r} \backslash Z_{r-1}$ the morphism $W \times_{U} S_{r} \rightarrow S_{r}$ is finite locally free. Since $U$ is Noetherian, the schemes $S_{r}$ are Noetherian, whence the schemes $W \times_{U} S_{r}$ are Noetherian, whence $W=\coprod W \times_{U} S_{r}$ is quasi-compact as desired.

047Z Lemma 55.12.2. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$.

[^167](1) If $|X|$ is a singleton then $X$ is a scheme.
(2) If $|X|$ is a singleton and $X$ is reduced, then $X \cong \operatorname{Spec}(k)$ for some field $k$.

Proof. Assume $|X|$ is a singleton. It follows immediately from Theorem 55.9.2 that $X$ is a scheme, but we can also argue directly as follows. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. Set $R=U \times_{X} U$. Then $U$ and $R$ have finitely many points by Lemma 55.4.5 (and the definition of a decent space). All of these points are closed in $U$ and $R$ by Lemma 55.10.6. It follows that $U$ and $R$ are affine schemes. We may shrink $U$ to a singleton space. Then $U$ is the spectrum of a henselian local ring, see Algebra, Lemma 10.148.11. The projections $R \rightarrow U$ are étale, hence finite étale because $U$ is the spectrum of a 0 -dimensional henselian local ring, see Algebra, Lemma 10.148.3. It follows that $X$ is a scheme by Groupoids, Proposition 38.23.8.
Part (2) follows from (1) and the fact that a reduced singleton scheme is the spectrum of a field.

049D Remark 55.12.3. We will see in Limits of Spaces, Lemma 57.15 .3 that an algebraic space whose reduction is a scheme is a scheme.

07U5 Lemma 55.12.4. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Consider a commutative diagram

Assume that the image point $s \in S$ of $\operatorname{Spec}(k) \rightarrow S$ is a closed point and that $\kappa(s) \subset k$ is algebraic. Then the image $x$ of $\operatorname{Spec}(k) \rightarrow X$ is a closed point of $|X|$.

Proof. Suppose that $x \rightsquigarrow x^{\prime}$ for some $x^{\prime} \in|X|$. Choose an étale morphism $U \rightarrow X$ where $U$ is a scheme and a point $u^{\prime} \in U^{\prime}$ mapping to $x^{\prime}$. Choose a specialization $u \rightsquigarrow u^{\prime}$ in $U$ with $u$ mapping to $x$ in $X$, see Lemma 55.10.7. Then $u$ is the image of a point $w$ of the scheme $W=\operatorname{Spec}(k) \times{ }_{X} U$. Since the projection $W \rightarrow \operatorname{Spec}(k)$ is étale we see that $\kappa(w) \supset k$ is finite. Hence $\kappa(w) \supset \kappa(s)$ is algebraic. Hence $\kappa(u) \supset \kappa(s)$ is algebraic. Thus $u$ is a closed point of $U$ by Morphisms, Lemma 28.20.2. Thus $u=u^{\prime}$, whence $x=x^{\prime}$.

08AL Lemma 55.12.5. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Consider a commutative diagram

Assume that the image point $s \in S$ of $\operatorname{Spec}(k) \rightarrow S$ is a closed point and that $\kappa(s) \subset k$ is finite. Then $\operatorname{Spec}(k) \rightarrow X$ is finite morphism. If $\kappa(s)=k$ then $\operatorname{Spec}(k) \rightarrow X$ is closed immersion.
Proof. By Lemma 55.12 .4 the image point $x \in|X|$ is closed. Let $Z \subset X$ be the reduced closed subspace with $|Z|=\{x\}$ (Properties of Spaces, Lemma 53.11.4).

Note that $Z$ is a decent algebraic space by Lemma 55.6.5. By Lemma 55.12.2 we see that $Z=\operatorname{Spec}\left(k^{\prime}\right)$ for some field $k^{\prime}$. Of course $k \supset k^{\prime} \supset \kappa(s)$. Then $\operatorname{Spec}(k) \rightarrow Z$ is a finite morphism of schemes and $Z \rightarrow X$ is a finite morphism as it is a closed immersion. Hence $\operatorname{Spec}(k) \rightarrow X$ is finite (Morphisms of Spaces, Lemma 54.43.4). If $k=\kappa(s)$, then $\operatorname{Spec}(k)=Z$ and $\operatorname{Spec}(k) \rightarrow X$ is a closed immersion.

0AHB Lemma 55.12.6. Let $S$ be a scheme. Suppose $X$ is a decent algebraic space over $S$. Let $x \in|X|$ be a closed point. Then $x$ can be represented by a closed immersion $i: \operatorname{Spec}(k) \rightarrow X$ from the spectrum of a field.

Proof. We know that $x$ can be represented by a quasi-compact monomorphism $i: \operatorname{Spec}(k) \rightarrow X$ where $k$ is a field (Definition 55.6.1). Let $U \rightarrow X$ be an étale morphism where $U$ is an affine scheme. As $x$ is closed and $X$ decent, the fibre $F$ of $|U| \rightarrow|X|$ over $x$ consists of closed points (Lemma 55.10.6). As $i$ is a monomorphism, so is $U_{k}=U \times_{X} \operatorname{Spec}(k) \rightarrow U$. In particular, the map $\left|U_{k}\right| \rightarrow F$ is injective. Since $U_{k}$ is quasi-compact and étale over a field, we see that $U_{k}$ is a finite disjoint union of spectra of fields (Remark 55.4.1). Say $U_{k}=\operatorname{Spec}\left(k_{1}\right) \amalg \ldots \amalg \operatorname{Spec}\left(k_{r}\right)$. Since $\operatorname{Spec}\left(k_{i}\right) \rightarrow U$ is a monomorphism, we see that its image $u_{i}$ has residue field $\kappa\left(u_{i}\right)=k_{i}$. Since $u_{i} \in F$ is a closed point we conclude the morphism $\operatorname{Spec}\left(k_{i}\right) \rightarrow U$ is a closed immersion. As the $u_{i}$ are pairwise distinct, $U_{k} \rightarrow U$ is a closed immersion. Hence $i$ is a closed immersion (Morphisms of Spaces, Lemma 54.12.1). This finishes the proof.

### 55.13. Locally separated spaces

088 H It turns out that a locally separated algebraic space is decent.
088 L Lemma 55.13.1. Let $A$ be a ring. Let $k$ be a field. Let $\mathfrak{p}_{n}, n \geq 1$ be a sequence of pairwise distinct primes of $A$. Moreover, for each $n$ let $k \rightarrow \kappa\left(\mathfrak{p}_{n}\right)$ be an embedding. Then the closure of the image of

$$
\coprod_{n \neq m} \operatorname{Spec}\left(\kappa\left(\mathfrak{p}_{n}\right) \otimes_{k} \kappa\left(\mathfrak{p}_{m}\right)\right) \longrightarrow \operatorname{Spec}(A \otimes A)
$$

meets the diagonal.
Proof. Set $k_{n}=\kappa\left(\mathfrak{p}_{n}\right)$. We may assume that $A=\prod k_{n}$. Denote $x_{n}=\operatorname{Spec}\left(k_{n}\right)$ the open and closed point corresponding to $A \rightarrow k_{n}$. Then $\operatorname{Spec}(A)=Z \amalg\left\{x_{n}\right\}$ where $Z$ is a nonempty closed subset. Namely, $Z=V\left(e_{n} ; n \geq 1\right)$ where $e_{n}$ is the idempotent of $A$ corresponding to the factor $k_{n}$ and $Z$ is nonempty as the ideal generated by the $e_{n}$ is not equal to $A$. We will show that the closure of the image contains $\Delta(Z)$. The kernel of the map

$$
\left(\prod k_{n}\right) \otimes_{k}\left(\prod k_{m}\right) \longrightarrow \prod_{n \neq m} k_{n} \otimes_{k} k_{m}
$$

is the ideal generated by $e_{n} \otimes e_{n}, n \geq 1$. Hence the closure of the image of the map on spectra is $V\left(e_{n} \otimes e_{n} ; n \geq 1\right)$ whose intersection with $\Delta(\operatorname{Spec}(A))$ is $\Delta(Z)$. Thus it suffices to show that

$$
\coprod_{n \neq m} \operatorname{Spec}\left(k_{n} \otimes_{k} k_{m}\right) \longrightarrow \operatorname{Spec}\left(\prod_{n \neq m} k_{n} \otimes_{k} k_{m}\right)
$$

has dense image. This follows as the family of ring maps $\prod_{n \neq m} k_{n} \otimes_{k} k_{m} \rightarrow k_{n} \otimes_{k} k_{m}$ is jointly injective.

088J Lemma 55.13.2 (David Rydh). A locally separated algebraic space is decent.

Proof. Let $S$ be a scheme and let $X$ be a locally separated algebraic space over $S$. We may assume $S=\operatorname{Spec}(\mathbf{Z})$, see Properties of Spaces, Definition 53.3.1. Unadorned fibre products will be over Z. Let $x \in|X|$. Choose a scheme $U$, an étale morphism $U \rightarrow X$, and a point $u \in U$ mapping to $x$ in $|X|$. As usual we identify $u=\operatorname{Spec}(\kappa(u))$. As $X$ is locally separated the morphism

$$
u \times_{X} u \rightarrow u \times u
$$

is an immersion (Morphisms of Spaces, Lemma 54.4.5. Hence More on Groupoids, Lemma 39.10 .5 tells us that it is a closed immersion (use Schemes, Lemma 25.10.4). As $u \times{ }_{X} u \rightarrow u \times{ }_{X} U$ is a monomorphism (base change of $u \rightarrow U$ ) and as $u \times{ }_{X} U \rightarrow u$ is étale we conclude that $u \times_{X} u$ is a disjoint union of spectra of fields (see Remark 55.4 .1 and Schemes, Lemma 25.23.10). Since it is also closed in the affine scheme $u \times u$ we conclude $u \times_{X} u$ is a finite disjoint union of spectra of fields. Thus $x$ can be represented by a monomorphism $\operatorname{Spec}(k) \rightarrow X$ where $k$ is a field, see Lemma 55.4.3.

Next, let $U=\operatorname{Spec}(A)$ be an affine scheme and let $U \rightarrow X$ be an étale morphism. To finish the proof it suffices to show that $F=U \times_{X} \operatorname{Spec}(k)$ is finite. Write $F=\coprod_{i \in I} \operatorname{Spec}\left(k_{i}\right)$ as the disjoint union of finite separable extensions of $k$. We have to show that $I$ is finite. Set $R=U \times_{X} U$. As $X$ is locally separated, the morphism $j: R \rightarrow U \times U$ is an immersion. Let $U^{\prime} \subset U \times U$ be an open such that $j$ factors through a closed immersion $j^{\prime}: R \rightarrow U^{\prime}$. Let $e: U \rightarrow R$ be the diagonal map. Using that $e$ is a morphism between schemes étale over $U$ such that $\Delta=j \circ e$ is a closed immersion, we conclude that $R=e(U) \amalg W$ for some open and closed subscheme $W \subset R$. Since $j^{\prime}$ is a closed immersion we conclude that $j^{\prime}(W) \subset U^{\prime}$ is closed and disjoint from $j^{\prime}(e(U))$. Therefore $\overline{j(W)} \cap \Delta(U)=\emptyset$ in $U \times U$. Note that $W$ contains $\operatorname{Spec}\left(k_{i} \otimes_{k} k_{i^{\prime}}\right)$ for all $i \neq i^{\prime}, i, i^{\prime} \in I$. By Lemma 55.13.1 we conclude that $I$ is finite as desired.

### 55.14. Valuative criterion

06 NP For a quasi-compact morphism from a decent space the valuative criterion is necessary in order for the morphism to be universally closed.
03KJ Proposition 55.14.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-compact, and $X$ is decent. Then $f$ is universally closed if and only if the existence part of the valuative criterion holds.

Proof. In Morphisms of Spaces, Lemma 54.41.1 we have seen one of the implications. To prove the other, assume that $f$ is universally closed. Let

be a diagram as in Morphisms of Spaces, Definition 54.40.1. Let $X_{A}=\operatorname{Spec}(A) \times_{Y}$ $X$, so that we have

By Morphisms of Spaces, Lemma 54.8.3 we see that $X_{A} \rightarrow \operatorname{Spec}(A)$ is quasicompact. Since $X_{A} \rightarrow X$ is representable, we see that $X_{A}$ is decent also, see Lemma 55.5.3. Moreover, as $f$ is universally closed, we see that $X_{A} \rightarrow \operatorname{Spec}(A)$ is universally closed. Hence we may and do replace $X$ by $X_{A}$ and $Y$ by $\operatorname{Spec}(A)$.
Let $x^{\prime} \in|X|$ be the equivalence class of $\operatorname{Spec}(K) \rightarrow X$. Let $y \in|Y|=|\operatorname{Spec}(A)|$ be the closed point. Set $y^{\prime}=f\left(x^{\prime}\right)$; it is the generic point of $\operatorname{Spec}(A)$. Since $f$ is universally closed we see that $f\left(\overline{\left\{x^{\prime}\right\}}\right)$ contains $\overline{\left\{y^{\prime}\right\}}$, and hence contains $y$. Let $x \in \overline{\left\{x^{\prime}\right\}}$ be a point such that $f(x)=y$. Let $U$ be a scheme, and $\varphi: U \rightarrow X$ an étale morphism such that there exists a $u \in U$ with $\varphi(u)=x$. By Lemma 55.7.2 and our assumption that $X$ is decent there exists a specialization $u^{\prime} \rightsquigarrow u$ on $U$ with $\varphi\left(u^{\prime}\right)=x^{\prime}$. This means that there exists a common field extension $K \subset K^{\prime} \supset \kappa\left(u^{\prime}\right)$ such that

is commutative. This gives the following commutative diagram of rings

By Algebra, Lemma 10.49 .2 we can find a valuation ring $A^{\prime} \subset K^{\prime}$ dominating the image of $\mathcal{O}_{U, u}$ in $K^{\prime}$. Since by construction $\mathcal{O}_{U, u}$ dominates $A$ we see that $A^{\prime}$ dominates $A$ also. Hence we obtain a diagram resembling the second diagram of Morphisms of Spaces, Definition 54.40.1 and the proposition is proved.

The following lemma is a special case of the more general Lemma 55.15.11.
0A3X Lemma 55.14.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-compact and quasi-separated. Then $f$ is universally closed if and only if the existence part of the valuative criterion holds (Morphisms of Spaces, Definition 54.40.1).
Proof. This is a combination of Morphisms of Spaces, Lemma 54.41.1 and Proposition 55.14.1 Namely, the implication in one direction is given by Morphisms of Spaces, Lemma 54.41.1. For the converse, assume $f$ is quasi-separated, quasicompact, and universally closed and assume given a diagram

as in Morphisms of Spaces, Definition 54.40.1. A formal argument shows that the existence of the desired diagram

can be reduced to the case of the morphism $X_{A} \rightarrow \operatorname{Spec}(A)$. In this case the algebraic space $X_{A}$ is quasi-separated, hence decent (property $(\gamma)$ of Lemma 55.5.1). Hence the existence of $A \subset A^{\prime}$ and the arrow $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X_{A}$ follows from Proposition 55.14.1.

0A3Y Lemma 55.14.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-compact and separated. Then the following are equivalent
(1) $f$ is universally closed,
(2) the existence part of the valuative criterion holds as in Morphisms of Spaces, Definition 54.40.1, and
(3) given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a dotted arrow, i.e., $f$ satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.

Proof. Since $f$ is separated parts (2) and (3) are equivalent by Morphisms of Spaces, Lemma 54.40.5. The equivalence of (3) and (1) follows from Lemma 55.14.2.

0A3Z Lemma 55.14.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-compact and quasi-separated. Then the following are equivalent
(1) $f$ is separated and universally closed,
(2) the valuative criterion holds as in Morphisms of Spaces, Definition 54.40.1,
(3) given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a unique dotted arrow, i.e., $f$ satisfies the valuative criterion as in Schemes, Definition 25.20.3.

Proof. Since $f$ is quasi-separated, the uniqueness part of the valutative criterion implies $f$ is separated (Morphisms of Spaces, Lemma 54.42.2). Conversely, if $f$ is
separated, then it satisfies the uniqueness part of the valuative criterion (Morphisms of Spaces, Lemma 54.42.1. Having said this, we see that in each of the three cases the morphism $f$ is separated and satisfies the uniqueness part of the valuative criterion. In this case the lemma is a formal consequence of Lemma 55.14.3.

0A40 Lemma 55.14.5 (Valuative criterion for properness). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is of finite type and quasi-separated. Then the following are equivalent
(1) $f$ is proper,
(2) the valuative criterion holds as in Morphisms of Spaces, Definition 54.40.1,
(3) given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a unique dotted arrow, i.e., $f$ satisfies the valuative criterion as in Schemes, Definition 25.20.3.

Proof. Formal consequence of Lemma 55.14 .4 and the definitions.

### 55.15. Relative conditions

03 KW This is a (yet another) technical section dealing with conditions on algebraic spaces having to do with points. It is probably a good idea to skip this section.

03KZ Definition 55.15.1. Let $S$ be a scheme. We say an algebraic space $X$ over $S$ has property ( $\beta$ ) if $X$ has the corresponding property of Lemma 55.5.1. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$.
(1) We say $f$ has property $(\beta)$ if for any scheme $T$ and morphism $T \rightarrow Y$ the fibre product $T \times_{Y} X$ has property $(\beta)$.
(2) We say $f$ is decent if for any scheme $T$ and morphism $T \rightarrow Y$ the fibre product $T \times_{Y} X$ is a decent algebraic space.
(3) We say $f$ is reasonable if for any scheme $T$ and morphism $T \rightarrow Y$ the fibre product $T \times_{Y} X$ is a reasonable algebraic space.
(4) We say $f$ is very reasonable if for any scheme $T$ and morphism $T \rightarrow Y$ the fibre product $T \times_{Y} X$ is a very reasonable algebraic space.

We refer to Remark 55.15 .10 for an informal discussion. It will turn out that the class of very reasonable morphisms is not so useful, but that the classes of decent and reasonable morphisms are useful.

03M5 Lemma 55.15.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We have the following implications among the conditions on $f$ :

Proof. This is clear from the definitions, Lemma 55.5.1 and Morphisms of Spaces, Lemma 54.4.12.

Here is another sanity check.
0ABX Lemma 55.15.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $X$ is decent (resp. is reasonable, resp. has property $(\beta)$ of Lemma 55.5.1), then $f$ is decent (resp. reasonable, resp. has property $(\beta)$ ).

Proof. Let $T$ be a scheme and let $T \rightarrow Y$ be a morphism. Then $T \rightarrow Y$ is representable, hence the base change $T \times_{Y} X \rightarrow X$ is representable. Hence if $X$ is decent (or reasonable), then so is $T \times_{Y} X$, see Lemma 55.6.5. Similarly, for property $(\beta)$, see Lemma 55.5.3.

03L0 Lemma 55.15.4. Having property $(\beta)$, being decent, or being reasonable is preserved under arbitrary base change.

Proof. This is immediate from the definition.
0ABY Lemma 55.15.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\omega \in\{\beta$, decent, reasonable $\}$. Suppose that $Y$ has property $(\omega)$ and $f: X \rightarrow Y$ has $(\omega)$. Then $X$ has $(\omega)$.

Proof. Let us prove the lemma in case $\omega=\beta$. In this case we have to show that any $x \in|X|$ is represented by a monomorphism from the spectrum of a field into $X$. Let $y=f(x) \in|Y|$. By assumption there exists a field $k$ and a monomorphism $\operatorname{Spec}(k) \rightarrow Y$ representing $y$. Then $x$ corresponds to a point $x^{\prime}$ of $\operatorname{Spec}(k) \times_{Y} X$. By assumption $x^{\prime}$ is represented by a monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k) \times_{Y} X$. Clearly the composition $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ is a monomorphism representing $x$.

Let us prove the lemma in case $\omega=$ decent. Let $x \in|X|$ and $y=f(x) \in|Y|$. By the result of the preceding paragraph we can choose a diagram

whose horizontal arrows monomorphisms. As $Y$ is decent the morphism $y$ is quasicompact. As $f$ is decent the algebraic space $\operatorname{Spec}(k) \times_{Y} X$ is decent. Hence the
monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k) \times_{Y} X$ is quasi-compact. Then the monomor$\operatorname{phism} x: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ is quasi-compact as a composition of quasi-compact morphisms (use Morphisms of Spaces, Lemmas 54.8.3 and 54.8.4). As the point $x$ was arbitrary this implies $X$ is decent.
Let us prove the lemma in case $\omega=$ reasonable. Choose $V \rightarrow Y$ étale with $V$ an affine scheme. Choose $U \rightarrow V \times_{Y} X$ étale with $U$ an affine scheme. By assumption $V \rightarrow Y$ has universally bounded fibres. By Lemma 55.3.3 the morphism $V \times_{Y} X \rightarrow X$ has universally bounded fibres. By assumption on $f$ we see that $U \rightarrow V \times_{Y} X$ has universally bounded fibres. By Lemma 55.3 .2 the composition $U \rightarrow X$ has universally bounded fibres. Hence there exists sufficiently many étale morphisms $U \rightarrow X$ from schemes with universally bounded fibres, and we conclude that $X$ is reasonable.

03L1 Lemma 55.15.6. Having property ( $\beta$ ), being decent, or being reasonable is preserved under compositions.

Proof. Let $\omega \in\{\beta$, decent, reasonable $\}$. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of algebraic spaces over the scheme $S$. Assume $f$ and $g$ both have property $(\omega)$. Then we have to show that for any scheme $T$ and morphism $T \rightarrow Z$ the space $T \times{ }_{Z} X$ has $(\omega)$. By Lemma 55.15 .4 this reduces us to the following claim: Suppose that $Y$ is an algebraic space having property $(\omega)$, and that $f: X \rightarrow Y$ is a morphism with $(\omega)$. Then $X$ has $(\omega)$. This is the content of Lemma 55.15.5.

0ABZ Lemma 55.15.7. Let $S$ be a scheme. Let $f: X \rightarrow Y, g: Z \rightarrow Y$ be morphisms of algebraic spaces over $S$. If $X$ and $Z$ are decent (resp. reasonable, resp. have property $(\beta)$ of Lemma 55.5.1), then so does $X \times_{Y} Z$.

Proof. Namely, by Lemma 55.15.3 the morphism $X \rightarrow Y$ has the property. Then the base change $X \times_{Y} Z \rightarrow Z$ has the property by Lemma 55.15.4. And finally this implies $X \times_{Y} Z$ has the property by Lemma 55.15.5.

03L2 Lemma 55.15.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{P} \in\{(\beta)$, decent, reasonable $\}$. Assume
(1) $f$ is quasi-compact,
(2) $f$ is étale,
(3) $|f|:|X| \rightarrow|Y|$ is surjective, and
(4) the algebraic space $X$ has property $\mathcal{P}$.

Then $Y$ has property $\mathcal{P}$.
Proof. Let us prove this in case $\mathcal{P}=(\beta)$. Let $y \in|Y|$ be a point. We have to show that $y$ can be represented by a monomorphism from a field. Choose a point $x \in|X|$ with $f(x)=y$. By assumption we may represent $x$ by a monomorphism $\operatorname{Spec}(k) \rightarrow X$, with $k$ a field. By Lemma 55.4.3 it suffices to show that the projections $\operatorname{Spec}(k) \times_{Y} \operatorname{Spec}(k) \rightarrow \operatorname{Spec}(k)$ are étale and quasi-compact. We can factor the first projection as

$$
\operatorname{Spec}(k) \times_{Y} \operatorname{Spec}(k) \longrightarrow \operatorname{Spec}(k) \times_{Y} X \longrightarrow \operatorname{Spec}(k)
$$

The first morphism is a monomorphism, and the second is étale and quasi-compact. By Properties of Spaces, Lemma 53.15.8 we see that $\operatorname{Spec}(k) \times_{Y} X$ is a scheme. Hence it is a finite disjoint union of spectra of finite separable field extensions of $k$. By Schemes, Lemma 25.23 .10 we see that the first arrow identifies $\operatorname{Spec}(k) \times_{Y}$
$\operatorname{Spec}(k)$ with a finite disjoint union of spectra of finite separable field extensions of $k$. Hence the projection morphism is étale and quasi-compact.
Let us prove this in case $\mathcal{P}=$ decent. We have already seen in the first paragraph of the proof that this implies that every $y \in|Y|$ can be represented by a monomorphism $y: \operatorname{Spec}(k) \rightarrow Y$. Pick such a $y$. Pick an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow|Y|$ contains $y$. By Lemma 55.4 .5 it suffices to show that $U_{y}$ is a finite scheme over $k$. The fibre product $X_{y}=\operatorname{Spec}(k) \times_{Y} X$ is a quasi-compact étale algebraic space over $k$. Hence by Properties of Spaces, Lemma 53.15.8 it is a scheme. So it is a finite disjoint union of spectra of finite separable extensions of $k$. Say $X_{y}=\left\{x_{1}, \ldots, x_{n}\right\}$ so $x_{i}$ is given by $x_{i}: \operatorname{Spec}\left(k_{i}\right) \rightarrow X$ with $\left[k_{i}: k\right]<\infty$. By assumption $X$ is decent, so the schemes $U_{x_{i}}=\operatorname{Spec}\left(k_{i}\right) \times_{X} U$ are finite over $k_{i}$. Finally, we note that $U_{y}=\coprod U_{x_{i}}$ as a scheme and we conclude that $U_{y}$ is finite over $k$ as desired.
Let us prove this in case $\mathcal{P}=$ reasonable. Pick an affine scheme $V$ and an étale morphism $V \rightarrow Y$. We have the show the fibres of $V \rightarrow Y$ are universally bounded. The algebraic space $V \times_{Y} X$ is quasi-compact. Thus we can find an affine scheme $W$ and a surjective étale morphism $W \rightarrow V \times_{Y} X$, see Properties of Spaces, Lemma 53.6.3. Here is a picture (solid diagram)

The morphism $W \rightarrow X$ is universally bounded by our assumption that the space $X$ is reasonable. Let $n$ be an integer bounding the degrees of the fibres of $W \rightarrow X$. We claim that the same integer works for bounding the fibres of $V \rightarrow Y$. Namely, suppose $y \in|Y|$ is a point. Then there exists a $x \in|X|$ with $f(x)=y$ (see above). This means we can find a field $k$ and morphisms $x, y$ given as dotted arrows in the diagram above. In particular we get a surjective étale morphism

$$
\operatorname{Spec}(k) \times_{x, X} W \rightarrow \operatorname{Spec}(k) \times_{x, X}\left(V \times_{Y} X\right)=\operatorname{Spec}(k) \times_{y, Y} V
$$

which shows that the degree of $\operatorname{Spec}(k) \times_{y, Y} V$ over $k$ is less than or equal to the degree of $\operatorname{Spec}(k) \times_{x, X} W$ over $k$, i.e., $\leq n$, and we win. (This last part of the argument is the same as the argument in the proof of Lemma 55.3.4. Unfortunately that lemma is not general enough because it only applies to representable morphisms.)

03L3 Lemma 55.15.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{P} \in\{(\beta)$, decent, reasonable, very reasonable $\}$. The following are equivalent
(1) $f$ is $\mathcal{P}$,
(2) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ is $\mathcal{P}$,
(3) for every affine scheme $Z$ and every morphism $Z \rightarrow Y$ the algebraic space $Z \times_{Y} X$ is $\mathcal{P}$, and
(4) there exists a Zariski covering $Y=\bigcup Y_{i}$ such that each morphism $f^{-1}\left(Y_{i}\right) \rightarrow$ $Y_{i}$ has $\mathcal{P}$.
If $\mathcal{P} \in\{(\beta)$, decent, reasonable $\}$, then this is also equivalent to
(5) there exists a scheme $V$ and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_{Y} X \rightarrow V$ has $\mathcal{P}$.
Proof. The implications $(1) \Rightarrow(2) \Rightarrow(3) \Rightarrow(4)$ are trivial. The implication (3) $\Rightarrow(1)$ can be seen as follows. Let $Z \rightarrow Y$ be a morphism whose source is a scheme over $S$. Consider the algebraic space $Z \times_{Y} X$. If we assume (3), then for any affine open $W \subset Z$, the open subspace $W \times_{Y} X$ of $Z \times_{Y} X$ has property $\mathcal{P}$. Hence by Lemma 55.5 .2 the space $Z \times_{Y} X$ has property $\mathcal{P}$, i.e., (1) holds. A similar argument (omitted) shows that (4) implies (1).

The implication (1) $\Rightarrow(5)$ is trivial. Let $V \rightarrow Y$ be an étale morphism from a scheme as in (5). Let $Z$ be an affine scheme, and let $Z \rightarrow Y$ be a morphism. Consider the diagram

Since $p$ is étale, and hence open, we can choose finitely many affine open subschemes $W_{i} \subset Z \times_{Y} V$ such that $Z=\bigcup p\left(W_{i}\right)$. Consider the commutative diagram

We know $V \times_{Y} X$ has property $\mathcal{P}$. By Lemma 55.5 .3 we see that ( $\left.\amalg W_{i}\right) \times_{Y} X$ has property $\mathcal{P}$. Note that the morphism $\left(\coprod W_{i}\right) \times_{Y} X \rightarrow Z \times_{Y} X$ is étale and quasi-compact as the base change of $\amalg W_{i} \rightarrow Z$. Hence by Lemma 55.15 .8 we conclude that $Z \times_{Y} X$ has property $\mathcal{P}$.

03L4 Remark 55.15.10. An informal description of the properties ( $\beta$ ), decent, reasonable, very reasonable was given in Section 55.6. A morphism has one of these properties if (very) loosely speaking the fibres of the morphism have the corresponding properties. Being decent is useful to prove things about specializations of points on $|X|$. Being reasonable is a bit stronger and technically quite easy to work with.

Here is a lemma we promised earlier which uses decent morphisms.
03M6 Lemma 55.15.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-compact and decent. (For example if $f$ is representable, or quasi-separated, see Lemma 55.15.2.) Then $f$ is universally closed if and only if the existence part of the valuative criterion holds.

Proof. In Morphisms of Spaces, Lemma 54.41.1 we proved that any quasi-compact morphism which satisfies the existence part of the valuative criterion is universally closed. To prove the other, assume that $f$ is universally closed. In the proof of Proposition 55.14.1 we have seen that it suffices to show, for any valuation ring $A$, and any morphism $\operatorname{Spec}(A) \rightarrow Y$, that the base change $f_{A}: X_{A} \rightarrow \operatorname{Spec}(A)$ satisfies the existence part of the valuative criterion. By definition the algebraic space $X_{A}$ has property $(\gamma)$ and hence Proposition 55.14.1 applies to the morphism $f_{A}$ and we win.

### 55.16. Points of fibres

0AC0 Let $S$ be a scheme. Consider a cartesian diagram
0AC1 (55.16.0.1)

of algebraic spaces over $S$. Let $x \in|X|$ and $z \in|Z|$ be points mapping to the same point $y \in|Y|$. We may ask: When is the set

0AC2 (55.16.0.2) $\quad F_{x, z}=\{w \in|W|$ such that $p(w)=x$ and $q(w)=z\}$
finite?
0AC3 Example 55.16.1. If $X, Y, Z$ are schemes, then the set $F_{x, z}$ is equal to the spectrum of $\kappa(x) \otimes_{\kappa(y)} \kappa(z)$ (Schemes, Lemma 25.17.5). Thus we obtain a finite set if either $\kappa(y) \subset \kappa(x)$ is finite or if $\kappa(y) \subset \kappa(z)$ is finite. In particular, this is always the case if $g$ is quasi-finite at $z$ (Morphisms, Lemma 28.20.5).

0AC4 Example 55.16.2. Let $K$ be a characteristic 0 field endowed with an automorphism $\sigma$ of infinite order. Set $Y=\operatorname{Spec}(K) / \mathbf{Z}$ and $X=\mathbf{A}_{K}^{1} / \mathbf{Z}$ where $\mathbf{Z}$ acts on $K$ via $\sigma$ and on $\mathbf{A}_{K}^{1}=\operatorname{Spec}(K[t])$ via $t \mapsto t+1$. Let $Z=\operatorname{Spec}(K)$. Then $W=\mathbf{A}_{K}^{1}$. Picture

Take $x$ corresponding to $t=0$ and $z$ the unique point of $\operatorname{Spec}(K)$. Then we see that $F_{x, z}=\mathbf{Z}$ as a set.

0AC5 Lemma 55.16.3. In the situation of 55.16.0.1) if $Z^{\prime} \rightarrow Z$ is a morphism and $z^{\prime} \in\left|Z^{\prime}\right|$ maps to $z$, then the induced map $F_{x, z^{\prime}} \rightarrow F_{x, z}$ is surjective.

Proof. Set $W^{\prime}=X \times_{Y} Z^{\prime}=W \times_{Z} Z^{\prime}$. Then $\left|W^{\prime}\right| \rightarrow|W| \times_{|Z|}\left|Z^{\prime}\right|$ is surjective by Properties of Spaces, Lemma 53.4.3. Hence the surjectivity of $F_{x, z^{\prime}} \rightarrow F_{x, z}$.

0AC6 Lemma 55.16.4. In diagram 55.16.0.1 the set 55.16.0.2 is finite if $f$ is of finite type and $f$ is quasi-finite at $x$.

Proof. The morphism $q$ is quasi-finite at every $w \in F_{x, z}$, see Morphisms of Spaces, Lemma 54.27.2. Hence the lemma follows from Morphisms of Spaces, Lemma 54.27 .9

0AC7 Lemma 55.16.5. In diagram (55.16.0.1) the set 55.16.0.2 is finite if $y$ can be represented by a monomorphism $\operatorname{Spec}(k) \rightarrow Y$ where $k$ is a field and $g$ is quasi-finite at $z$. (Special case: $Y$ is decent and $g$ is étale.)

Proof. By Lemma 55.16 .3 applied twice we may replace $Z$ by $Z_{k}=\operatorname{Spec}(k) \times_{Y} Z$ and $X$ by $X_{k}=\operatorname{Spec}(k) \times_{Y} X$. We may and do replace $Y$ by $\operatorname{Spec}(k)$ as well. Note that $Z_{k} \rightarrow \operatorname{Spec}(k)$ is quasi-finite at $z$ by Morphisms of Spaces, Lemma 54.27.2. Choose a scheme $V$, a point $v \in V$, and an étale morphism $V \rightarrow Z_{k}$ mapping $v$ to
z. Choose a scheme $U$, a point $u \in U$, and an étale morphism $U \rightarrow X_{k}$ mapping $u$ to $x$. Again by Lemma 55.16 .3 it suffices to show $F_{u, v}$ is finite for the diagram

The morphism $V \rightarrow \operatorname{Spec}(k)$ is quasi-finite at $v$ (follows from the general discussion in Morphisms of Spaces, Section 54.22 and the definition of being quasi-finite at a point). At this point the finiteness follows from Example 55.16.1. The parenthetical remark of the statement of the lemma follows from the fact that on decent spaces points are represented by monomorphisms from fields and from the fact that an étale morphism of algebraic spaces is locally quasi-finite.

0AC8 Lemma 55.16.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $y \in|Y|$ and assume that $y$ is represented by a quasicompact monomorphism $\operatorname{Spec}(k) \rightarrow Y$. Then $\left|X_{k}\right| \rightarrow|X|$ is a homeomorphism onto $f^{-1}(\{y\}) \subset|X|$ with induced topology.

Proof. We will use Properties of Spaces, Lemma 53.15.7 and Morphisms of Spaces, Lemma 54.10 .9 without further mention. Let $V \rightarrow Y$ be an étale morphism with $V$ affine such that there exists a $v \in V$ mapping to $y$. Since $\operatorname{Spec}(k) \rightarrow Y$ is quasicompact there are a finite number of points of $V$ mapping to $y$ (Lemma 55.4.5). After shrinking $V$ we may assume $v$ is the only one. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Consider the commutative diagram

Since $U_{v} \rightarrow U_{V}$ identifies $U_{v}$ with a subset of $U_{V}$ with the induced topology (Schemes, Lemma 25.18.5), and since $\left|U_{V}\right| \rightarrow\left|X_{V}\right|$ and $\left|U_{v}\right| \rightarrow\left|X_{v}\right|$ are surjective and open, we see that $\left|X_{v}\right| \rightarrow\left|X_{V}\right|$ is a homeomorphism onto its image (with induced topology). On the other hand, the inverse image of $f^{-1}(\{y\})$ under the open map $\left|X_{V}\right| \rightarrow|X|$ is equal to $\left|X_{v}\right|$. We conclude that $\left|X_{v}\right| \rightarrow f^{-1}(\{y\})$ is open. The morphism $X_{v} \rightarrow X$ factors through $X_{k}$ and $\left|X_{k}\right| \rightarrow|X|$ is injective with image $f^{-1}(\{y\})$ by Properties of Spaces, Lemma 53.4.3. Using $\left|X_{v}\right| \rightarrow\left|X_{k}\right| \rightarrow f^{-1}(\{y\})$ the lemma follows because $X_{v} \rightarrow X_{k}$ is surjective.

0AC9 Lemma 55.16.7. Let $X$ be an algebraic space locally of finite type over a field $k$. Let $x \in|X|$. Consider the conditions
(1) $\operatorname{dim}_{x}(|X|)=0$,
(2) $x$ is closed in $|X|$ and if $x^{\prime} \rightsquigarrow x$ in $|X|$ then $x^{\prime}=x$,
(3) $x$ is an isolated point of $|X|$,
(4) $\operatorname{dim}_{x}(X)=0$,
(5) $X \rightarrow \operatorname{Spec}(k)$ is quasi-finite at $x$.

Then (2), (3), (4), and (5) are equivalent. If $X$ is decent, then (1) is equivalent to the others.

Proof. Parts (4) and (5) are equivalent for example by Morphisms of Spaces, Lemmas 54.33.7 and 54.33.8.

Let $U \rightarrow X$ be an étale morphism where $U$ is an affine scheme and let $u \in U$ be a point mapping to $x$. Moreover, if $x$ is a closed point, e.g., in case (2) or (3), then we may and do assume that $u$ is a closed point. Observe that $\operatorname{dim}_{u}(U)=\operatorname{dim}_{x}(X)$ by definition and that this is equal to $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)$ if $u$ is a closed point, see Algebra, Lemma 10.113 .6
If $\operatorname{dim}_{x}(X)>0$ and $u$ is closed, by the arguments above we can choose a nontrivial specialization $u^{\prime} \rightsquigarrow u$ in $U$. Then the transcendence degree of $\kappa\left(u^{\prime}\right)$ over $k$ exceeds the transcendence degree of $\kappa(u)$ over $k$. It follows that the images $x$ and $x^{\prime}$ in $X$ are distinct, because the transcendence degree of $x / k$ and $x^{\prime} / k$ are well defined, see Morphisms of Spaces, Definition 54.32.1. This applies in particular in cases (2) and (3) and we conclude that (2) and (3) imply (4).

Conversely, if $X \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite at $x$, then $U \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite at $u$, hence $u$ is an isolated point of $U$ (Morphisms, Lemma 28.20.6). It follows that (5) implies (2) and (3) as $|U| \rightarrow|X|$ is continuous and open.
Assume $X$ is decent and (1) holds. Then $\operatorname{dim}_{x}(X)=\operatorname{dim}_{x}(|X|)$ by Lemma 55.10.10 and the proof is complete.

0ACA Lemma 55.16.8. Let $X$ be an algebraic space locally of finite type over a field $k$. Consider the conditions
(1) $|X|$ is a finite set,
(2) $|X|$ is a discrete space,
(3) $\operatorname{dim}(|X|)=0$,
(4) $\operatorname{dim}(X)=0$,
(5) $X \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite,

Then (2), (3), (4), and (5) are equivalent. If $X$ is decent, then (1) implies the others.

Proof. Parts (4) and (5) are equivalent for example by Morphisms of Spaces, Lemma 54.33.7.
Let $U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme.
If $\operatorname{dim}(U)>0$, then choose a nontrivial specialization $u \rightsquigarrow u^{\prime}$ in $U$ and the transcendence degree of $\kappa(u)$ over $k$ exceeds the transcendence degree of $\kappa\left(u^{\prime}\right)$ over $k$. It follows that the images $x$ and $x^{\prime}$ in $X$ are distinct, because the transcendence degree of $x / k$ and $x^{\prime} / k$ is well defined, see Morphisms of Spaces, Definition 54.32.1. We conclude that (2) and (3) imply (4).
Conversely, if $X \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite, then $U$ is locally Noetherian (Morphisms, Lemma 28.15.6) of dimension 0 (Morphisms, Lemma 28.29.5 and hence is a disjoint union of spectra of Artinian local rings (Properties, Lemma 27.10.5. Hence $U$ is a discrete topological space, and since $|U| \rightarrow|X|$ is continuous and open, the same is true for $|X|$. In other words, (4) implies (2) and (3).
Assume $X$ is decent and (1) holds. Then we may choose $U$ above to be affine. The fibres of $|U| \rightarrow|X|$ are finite (this is a part of the defining property of decent
spaces). Hence $U$ is a finite type scheme over $k$ with finitely many points. Hence $U$ is quasi-finite over $k$ (Morphisms, Lemma 28.20.7) which by definition means that $X \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite.

0ACB Lemma 55.16.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is locally of finite type. Let $x \in|X|$ with image $y \in|Y|$. Let $F=f^{-1}(\{y\})$ with induced topology from $|X|$. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow Y$ be in the equivalence class defining $y$. Set $X_{k}=\operatorname{Spec}(k) \times_{Y} X$. Let $\tilde{x} \in\left|X_{k}\right|$ map to $x \in|X|$. Consider the following conditions

```
\(0 \mathrm{ACC} \quad(1) \operatorname{dim}_{x}(F)=0\),
0ACD
0ACE
0ACF
0ACG
0ACH
0ACI
0ACJ
(2) \(x\) is isolated in \(F\),
(3) \(x\) is closed in \(F\) and if \(x^{\prime} \rightsquigarrow x\) in \(F\), then \(x=x^{\prime}\),
(4) \(\operatorname{dim}_{\tilde{x}}\left(\left|X_{k}\right|\right)=0\),
(5) \(\tilde{x}\) is isolated in \(\left|X_{k}\right|\),
(6) \(\tilde{x}\) is closed in \(\left|X_{k}\right|\) and if \(\tilde{x}^{\prime} \rightsquigarrow \tilde{x}\) in \(\left|X_{k}\right|\), then \(\tilde{x}=\tilde{x}^{\prime}\),
(7) \(\operatorname{dim}_{\tilde{x}}\left(X_{k}\right)=0\),
(8) \(f\) is quasi-finite at \(x\).
```

Then we have

$$
\text { (4) } \underset{f \text { decent }}{ }(5) \Longleftrightarrow(6) \Longleftrightarrow(7) \Longleftrightarrow(8)
$$

If $Y$ is decent, then conditions (2) and (3) are equivalent to each other and to conditions (5), (6), (7), and (8). If $Y$ and $X$ are decent, then all conditions are equivalent.

Proof. By Lemma 55.16 .7 conditions (5), (6), and (7) are equivalent to each other and to the condition that $X_{k} \rightarrow \operatorname{Spec}(k)$ is quasi-finite at $\tilde{x}$. Thus by Morphisms of Spaces, Lemma 54.27 .2 they are also equivalent to (8). If $f$ is decent, then $X_{k}$ is a decent algebraic space and Lemma 55.16 .7 shows that (4) implies (5).

If $Y$ is decent, then we can pick a quasi-compact monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow Y$ in the equivalence class of $y$. In this case Lemma 55.16 .6 tells us that $\left|X_{k^{\prime}}\right| \rightarrow F$ is a homeomorphism. Combined with the arguments given above this implies the remaining statements of the lemma; details omitted.

0ACK Lemma 55.16.10. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is locally of finite type. Let $y \in|Y|$. Let $k$ be a field and let $\operatorname{Spec}(k) \rightarrow Y$ be in the equivalence class defining $y$. Set $X_{k}=\operatorname{Spec}(k) \times_{Y} X$ and let $F=f^{-1}(\{y\})$ with the induced topology from $|X|$. Consider the following conditions

0ACL (1) $F$ is finite,
0ACM (2) $F$ is a discrete topological space,
$0 \mathrm{ACN} \quad(3) \operatorname{dim}(F)=0$,
$0 \mathrm{ACP} \quad$ (4) $\left|X_{k}\right|$ is a finite set,
0ACQ (5) $\left|X_{k}\right|$ is a discrete space,
$0 \mathrm{ACR} \quad(6) \operatorname{dim}\left(\left|X_{k}\right|\right)=0$,
$0 \mathrm{ACS} \quad(7) \operatorname{dim}\left(X_{k}\right)=0$,
0ACT
(8) $f$ is quasi-finite at all points of $|X|$ lying over $y$.

Then we have

$$
(1) \Longleftarrow(4) \underset{\text { f decent }}{ }(5) \Longleftrightarrow(6) \Longleftrightarrow(7) \Longleftrightarrow(8)
$$

If $Y$ is decent, then conditions (2) and (3) are equivalent to each other and to conditions (5), (6), (7), and (8). If $Y$ and $X$ are decent, then (1) implies all the other conditions.

Proof. By Lemma 55.16 .8 conditions (5), (6), and (7) are equivalent to each other and to the condition that $X_{k} \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite. Thus by Morphisms of Spaces, Lemma 54.27 .2 they are also equivalent to (8). If $f$ is decent, then $X_{k}$ is a decent algebraic space and Lemma 55.16 .8 shows that (4) implies (5).

The map $\left|X_{k}\right| \rightarrow F$ is surjective by Properties of Spaces, Lemma 53.4.3 and we see (4) $\Rightarrow$ (1).

If $Y$ is decent, then we can pick a quasi-compact monomorphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow Y$ in the equivalence class of $y$. In this case Lemma 55.16.6 tells us that $\left|X_{k^{\prime}}\right| \rightarrow F$ is a homeomorphism. Combined with the arguments given above this implies the remaining statements of the lemma; details omitted.

### 55.17. Monomorphisms

06RY Here is another case where monomorphisms are representable. Please see More on Morphisms of Spaces, Section 63.4 for more information.

06RZ Lemma 55.17.1. Let $S$ be a scheme. Let $Y$ be a disjoint union of spectra of zero dimensional local rings over $S$. Let $f: X \rightarrow Y$ be a monomorphism of algebraic spaces over $S$. Then $f$ is representable, i.e., $X$ is a scheme.

Proof. This immediately reduces to the case $Y=\operatorname{Spec}(A)$ where $A$ is a zero dimensional local ring, i.e., $\operatorname{Spec}(A)=\left\{\mathfrak{m}_{A}\right\}$ is a singleton. If $X=\emptyset$, then there is nothing to prove. If not, choose a nonempty affine scheme $U=\operatorname{Spec}(B)$ and an étale morphism $U \rightarrow X$. As $|X|$ is a singleton (as a subset of $|Y|$, see Morphisms of Spaces, Lemma 54.10.9) we see that $U \rightarrow X$ is surjective. Note that $U \times_{X} U=$ $U \times_{Y} U=\operatorname{Spec}\left(B \otimes_{A} B\right)$. Thus we see that the ring maps $B \rightarrow B \otimes_{A} B$ are étale. Since

$$
\left(B \otimes_{A} B\right) / \mathfrak{m}_{A}\left(B \otimes_{A} B\right)=\left(B / \mathfrak{m}_{A} B\right) \otimes_{A / \mathfrak{m}_{A}}\left(B / \mathfrak{m}_{A} B\right)
$$

we see that $B / \mathfrak{m}_{A} B \rightarrow\left(B \otimes_{A} B\right) / \mathfrak{m}_{A}\left(B \otimes_{A} B\right)$ is flat and in fact free of rank equal to the dimension of $B / \mathfrak{m}_{A} B$ as a $A / \mathfrak{m}_{A}$-vector space. Since $B \rightarrow B \otimes_{A} B$ is étale, this can only happen if this dimension is finite (see for example Morphisms, Lemmas 28.51.7 and 28.51.8. Every prime of $B$ lies over $\mathfrak{m}_{A}$ (the unique prime of $A$ ). Hence $\operatorname{Spec}(B)=\operatorname{Spec}\left(B / \mathfrak{m}_{A}\right)$ as a topological space, and this space is a finite discrete set as $B / \mathfrak{m}_{A} B$ is an Artinian ring, see Algebra, Lemmas 10.52 .2 and 10.52 .6 Hence all prime ideals of $B$ are maximal and $B=B_{1} \times \ldots \times B_{n}$ is a product of finitely many local rings of dimension zero, see Algebra, Lemma 10.52.5. Thus $B \rightarrow B \otimes_{A} B$ is finite étale as all the local rings $B_{i}$ are henselian by Algebra, Lemma 10.148.11. Thus $X$ is an affine scheme by Groupoids, Proposition 38.23.8.

### 55.18. Generic points

0BB7 This section is a continuation of Properties of Spaces, Section 53.10 .
0ABV Lemma 55.18.1. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x \in|X|$. The following are equivalent
(1) $x$ is a generic point of an irreducible component of $|X|$,
(2) for any étale morphism $(Y, y) \rightarrow(X, x)$ of pointed algebraic spaces, $y$ is a generic point of an irreducible component of $|Y|$,
(3) for some étale morphism $(Y, y) \rightarrow(X, x)$ of pointed algebraic spaces, $y$ is a generic point of an irreducible component of $|Y|$,
(4) the dimension of the local ring of $X$ at $x$ is zero, and
(5) $x$ is a point of codimension 0 on $X$

Proof. Conditions (4) and (5) are equivalent for any algebraic space by definition, see Properties of Spaces, Definition53.9.2. Observe that any $Y$ as in (2) and (3) is decent by Lemma 55.6.6. Thus it suffices to prove the equivalence of (1) and (4) as then the equivalence with (2) and (3) follows since the dimension of the local ring of $Y$ at $y$ is equal to the dimension of the local ring of $X$ at $x$. Let $f: U \rightarrow X$ be an étale morphism from an affine scheme and let $u \in U$ be a point mapping to $x$.
Assume (1). Let $u^{\prime} \rightsquigarrow u$ be a specialization in $U$. Then $f\left(u^{\prime}\right)=f(u)=x$. By Lemma 55.10.6 we see that $u^{\prime}=u$. Hence $u$ is a generic point of an irreducible component of $U$. Thus $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=0$ and we see that (4) holds.
Assume (4). The point $x$ is contained in an irreducible component $T \subset|X|$. Since $|X|$ is sober (Proposition 55.10.9) we $T$ has a generic point $x^{\prime}$. Of course $x^{\prime} \rightsquigarrow$ $x$. Then we can lift this specialization to $u^{\prime} \rightsquigarrow u$ in $U$ (Lemma 55.10.7). This contradicts the assumption that $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=0$ unless $u^{\prime}=u$, i.e., $x^{\prime}=x$.
0BB8 Lemma 55.18.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume
(1) every quasi-compact scheme étale over $X$ has finitely many irreducible components, and
(2) every $x \in|X|$ of codimension 0 on $X$ can be represented by a monomorphism $\operatorname{Spec}(k) \rightarrow X$.
Then $X$ is a reasonable algebraic space.
Proof. Let $U$ be an affine scheme and let $a: U \rightarrow X$ be an étale morphism. We have to show that the fibres of $a$ are universally bounded. By assumption (1) the scheme $U$ has finitely many irreducible components. Let $u_{1}, \ldots, u_{n} \in U$ be the generic points of these irreducible components. Let $\left\{x_{1}, \ldots, x_{m}\right\} \subset|X|$ be the image of $\left\{u_{1}, \ldots, u_{n}\right\}$. Each $x_{j}$ is a point of codimension 0 . By assumption (2) we may choose a monomorphism $\operatorname{Spec}\left(k_{j}\right) \rightarrow X$ representing $x_{j}$. Then

$$
U \times_{X} \operatorname{Spec}\left(k_{j}\right)=\coprod_{a\left(u_{i}\right)=x_{j}} \operatorname{Spec}\left(\kappa\left(u_{i}\right)\right)
$$

is finite over $\operatorname{Spec}\left(k_{j}\right)$ of degree $d_{j}=\sum_{a\left(u_{i}\right)=x_{j}}\left[\kappa\left(u_{i}\right): k_{j}\right]$. Set $n=\max d_{j}$.
Observe that $a$ is separated (Properties of Spaces, Lemma 53.6.4. Consider the stratification

$$
X=X_{0} \supset X_{1} \supset X_{2} \supset \ldots
$$

associated to $U \rightarrow X$ in Lemma 55.8.2. By our choice of $n$ above we conclude that $X_{n+1}$ is empty. Namely, if not, then $a^{-1}\left(X_{n+1}\right)$ is a nonempty open of $U$ and hence
would contain one of the $x_{i}$. This would mean that $X_{n+1}$ contains $x_{j}=a\left(u_{i}\right)$ which is impossible. Hence we see that the fibres of $U \rightarrow X$ are universally bounded (in fact by the integer $n$ ).
0BB9 Lemma 55.18.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The following are equivalent
(1) $X$ is decent and $|X|$ has finitely many irreducible components,
(2) every quasi-compact scheme étale over $X$ has finitely many irreducible components, there are finitely many $x \in|X|$ of codimension 0 on $X$, and each of these can be represented by a monomorphism $\operatorname{Spec}(k) \rightarrow X$,
(3) there exists a dense open $X^{\prime} \subset X$ which is a scheme, $X^{\prime}$ has finitely many irreducible components with generic points $\left\{x_{1}^{\prime}, \ldots, x_{m}^{\prime}\right\}$, and the morphism $x_{j}^{\prime} \rightarrow X$ is quasi-compact for $j=1, \ldots, m$.
Moreover, if these conditions hold, then $X$ is reasonable and the points $x_{j}^{\prime} \in|X|$ are the generic points of the irreducible components of $|X|$.

Proof. In the proof we use Properties of Spaces, Lemma 53.10.1 without further mention. Assume (1). Then $X$ has a dense open subscheme $X^{\prime}$ by Theorem 55.9.2 Since the closure of an irreducible component of $\left|X^{\prime}\right|$ is an irreducible component of $|X|$, we see that $\left|X^{\prime}\right|$ has finitely many irreducible components. Thus (3) holds.

Assume $X^{\prime} \subset X$ is as in (3). Let $\left\{x_{1}^{\prime}, \ldots, x_{m}^{\prime}\right\}$ be the generic points of the irreducible components of $X^{\prime}$. Let $a: U \rightarrow X$ be an étale morphism with $U$ a quasi-compact scheme. It suffices to show that $U$ has finitely many irreducible components whose generic points lie over $\left\{x_{1}^{\prime}, \ldots, x_{m}^{\prime}\right\}$. It suffices to prove this for the members of a finite affine open cover of $U$, hence we may and do assume $U$ is affine. Note that $U^{\prime}=a^{-1}\left(X^{\prime}\right) \subset U$ is a dense open. The generic points of irreducible components of $U^{\prime}$ are the points lying over $\left\{x_{1}^{\prime}, \ldots, x_{m}^{\prime}\right\}$ and since $x_{j}^{\prime} \rightarrow X$ is quasi-compact there are finitely many points of $U$ lying over $x_{j}^{\prime}$ (Lemma 55.4.5). Hence $U^{\prime}$ has finitely many irreducible components, which implies that the closures of these irreducible components are the irreducible components of $U$. Thus (2) holds.

Assume (2). This implies (1) and the final statement by Lemma 55.18.2. (We also use that a reasonable algebraic space is decent, see discussion following Definition 55.6.1.)

### 55.19. Generically finite morphisms

0BBA This section discusses for morphisms of algebraic spaces the material discussed in Morphisms, Section 28.47 and Varieties, Section 32.15 for morphisms of schemes.
0ACZ Lemma 55.19.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that $f$ is quasi-separated of finite type. Let $y \in|Y|$ be a point of codimension 0 on $Y$. The following are equivalent:
(1) the space $\left|X_{k}\right|$ is finite where $\operatorname{Spec}(k) \rightarrow Y$ represents $y$,
(2) $X \rightarrow Y$ is quasi-finite at all points of $|X|$ over $y$,
(3) there exists an open subspace $Y^{\prime} \subset Y$ with $y \in\left|Y^{\prime}\right|$ such that $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is finite.
If $Y$ is decent these are also equivalent to
(4) the set $f^{-1}(\{y\})$ is finite.

Proof. The equivalence of (1) and (2) follows from Lemma 55.16 .10 (and the fact that a quasi-separated morphism is decent by Lemma 55.15.2.

Assume the equivalent conditions of (1) and (2). Choose an affine scheme $V$ and an étale morphism $V \rightarrow Y$ mapping a point $v \in V$ to $y$. Then $v$ is a generic point of an irreducible component of $V$ by Properties of Spaces, Lemma 53.10.1. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Then $U \rightarrow V$ is of finite type. The morphism $U \rightarrow V$ is quasi-finite at every point lying over $v$ by (2). It follows that the fibre of $U \rightarrow V$ over $v$ is finite (Morphisms, Lemma 28.20.14). By Morphisms, Lemma 28.47.1 after shrinking $V$ we may assume that $U \rightarrow V$ is finite. Let

$$
R=U \times_{V \times_{Y} X} U
$$

Since $f$ is quasi-separated, we see that $V \times_{Y} X$ is quasi-separated and hence $R$ is a quasi-compact scheme. Moreover the morphisms $R \rightarrow V$ is quasi-finite as the composition of an étale morphism $R \rightarrow U$ and a finite morphism $U \rightarrow V$. Hence we may apply Morphisms, Lemma 28.47 .1 once more and after shrinking $V$ we may assume that $R \rightarrow V$ is finite as well. This of course implies that the two projections $R \rightarrow V$ are finite étale. It follows that $V / R=V \times_{Y} X$ is an affine scheme, see Groupoids, Proposition 38.23.8. By Morphisms, Lemma 28.41 .8 we conclude that $V \times_{Y} X \rightarrow V$ is proper and by Morphisms, Lemma 28.43 .10 we conclude that $V \times_{Y} X \rightarrow V$ is finite. Finally, we let $Y^{\prime} \subset Y$ be the open subspace of $Y$ corresponding to the image of $|V| \rightarrow|Y|$. By Morphisms of Spaces, Lemma 54.43 .3 we conclude that $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is finite as the base change to $V$ is finite and as $V \rightarrow Y^{\prime}$ is a surjective étale morphism.

If $Y$ is decent and $f$ is quasi-separated, then we see that $X$ is decent too; use Lemmas 55.15.2 and 55.15.5. Hence Lemma 55.16.10 applies to show that (4) implies (1) and (2). On the other hand, we see that (2) implies (4) by Morphisms of Spaces, Lemma 54.27.9.

0AD0 Lemma 55.19.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that $f$ is quasi-separated and locally of finite type and $Y$ quasi-separated. Let $y \in|Y|$ be a point of codimension 0 on $Y$. The following are equivalent:
(1) the set $f^{-1}(\{y\})$ is finite,
(2) the space $\left|X_{k}\right|$ is finite where $\operatorname{Spec}(k) \rightarrow Y$ represents $y$,
(3) there exist open subspaces $X^{\prime} \subset X$ and $Y^{\prime} \subset Y$ with $f\left(X^{\prime}\right) \subset Y^{\prime}, y \in\left|Y^{\prime}\right|$, and $f^{-1}(\{y\}) \subset\left|X^{\prime}\right|$ such that $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y^{\prime}$ is finite.

Proof. Since quasi-separated algebraic spaces are decent, the equivalence of (1) and (2) follows from Lemma 55.16.10. To prove that (1) and (2) imply (3) we may and do replace $Y$ by a quasi-compact open containing $y$. Since $f^{-1}(\{y\})$ is finite, we can find a quasi-compact open subspace of $X^{\prime} \subset X$ containing the fibre. The restriction $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is quasi-compact and quasi-separated by Morphisms of Spaces, Lemma 54.8 .9 (this is where we use that $Y$ is quasi-separated). Applying Lemma 55.19 .1 to $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ we see that (3) holds. We omit the proof that (3) implies (2).

0BBB Lemma 55.19.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type. Let $X^{0} \subset|X|$, resp. $Y^{0} \subset|Y|$
denote the set of codimension 0 points of $X$, resp. $Y$. Let $y \in Y^{0}$. The following are equivalent
(1) $f^{-1}(\{y\}) \subset X^{0}$,
(2) $f$ is quasi-finite at all points lying over $y$,
(3) $f$ is quasi-finite at all $x \in X^{0}$ lying over $y$.

Proof. Let $V$ be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. Let $U$ be a scheme and let $U \rightarrow V \times_{Y} X$ be a surjective étale morphism. Then $f$ is quasi-finite at the image $x$ of a point $u \in U$ if and only if $U \rightarrow V$ is quasi-finite at $u$. Moreover, $x \in X^{0}$ if and only if $u$ is the generic point of an irreducible component of $U$ (Properties of Spaces, Lemma 53.10.1). Thus the lemma reduces to the case of the morphism $U \rightarrow V$, i.e., to Morphisms, Lemma 28.47.4

0BBC Lemma 55.19.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type. Let $X^{0} \subset|X|$, resp. $Y^{0} \subset|Y|$ denote the set of codimension 0 points of $X$, resp. $Y$. Assume
(1) $Y$ is decent,
(2) $X^{0}$ and $Y^{0}$ are finite and $f^{-1}\left(Y^{0}\right)=X^{0}$,
(3) either $f$ is quasi-compact or $f$ is separated.

Then there exists a dense open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.
Proof. By Lemmas 55.18.3 and 55.18.1 we may assume $Y$ is a scheme with finitely many irreducible components. Shrinking further we may assume $Y$ is an irreducible affine scheme with generic point $y$. Then the fibre of $f$ over $y$ is finite.
Assume $f$ is quasi-compact and $Y$ affine irreducible. Then $X$ is quasi-compact and we may choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. Then $U \rightarrow Y$ is of finite type and the fibre of $U \rightarrow Y$ over $y$ is the set $U^{0}$ of generic points of irreducible components of $U$ (Properties of Spaces, Lemma 53.10.1). Hence $U^{0}$ is finite (Morphisms, Lemma 28.20.14) and after shrinking $Y$ we may assume that $U \rightarrow Y$ is finite (Morphisms, Lemma 28.47.1. Next, consider $R=U \times_{X} U$. Since the projection $s: R \rightarrow U$ is étale we see that $R^{0}=s^{-1}\left(U^{0}\right)$ lies over $y$. Since $R \rightarrow U \times_{Y} U$ is a monomorphism, we conclude that $R^{0}$ is finite as $U \times_{Y} U \rightarrow Y$ is finite. And $R$ is separated (Properties of Spaces, Lemma 53.6.4). Thus we may shrink $Y$ once more to reach the situation where $R$ is finite over $Y$ (Morphisms, Lemma 28.47.5. In this case it follows that $X=U / R$ is finite over $Y$ by exactly the same arguments as given in the proof of Lemma 55.19 .1 (or we can simply apply that lemma because it follows immediately that $X$ is quasi-separated as well).
Assume $f$ is separated and $Y$ affine irreducible. Choose $V \subset Y$ and $U \subset X$ as in Lemma 55.19.2. Since $\left.f\right|_{U}: U \rightarrow V$ is finite, we see that $U \subset f^{-1}(V)$ is closed as well as open (Morphisms of Spaces, Lemmas 54.39.6 and 54.43.9. Thus $f^{-1}(V)=U \amalg W$ for some open subspace $W$ of $X$. However, since $U$ contains all the codimension 0 points of $X$ we conclude that $W=\emptyset$ (Properties of Spaces, Lemma 53.10.2 as desired.

### 55.20. Birational morphisms

$0 A C U$ The following definition of a birational morphism of algebraic spaces seems to be the closest to our definition (Morphisms, Definition 28.46.1) of a birational morphism of schemes.

0ACV Definition 55.20.1. Let $S$ be a scheme. Let $X$ and $Y$ algebraic spaces over $S$. Assume $X$ and $Y$ are decent and that $|X|$ and $|Y|$ have finitely many irreducible components. We say a morphism $f: X \rightarrow Y$ is birational if
(1) $|f|$ induces a bijection between the set of generic points of irreducible components of $|X|$ and the set of generic points of the irreducible components of $|Y|$, and
(2) for every generic point $x \in|X|$ of an irreducible component the local ring $\operatorname{map} \mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is an isomorphism (see clarification below).
Clarification: Since $X$ and $Y$ are decent the topological spaces $|X|$ and $|Y|$ are sober (Proposition 55.10.9). Hence condition (1) makes sense. Moreover, because we have assumed that $|X|$ and $|Y|$ have finitely many irreducible components, we see that the generic points $x_{1}, \ldots, x_{n} \in|X|$, resp. $y_{1}, \ldots, y_{n} \in|Y|$ are contained in any dense open of $|X|$, resp. $|Y|$. In particular, they are contained in the schematic locus of $X$, resp. $Y$ by Theorem 55.9.2. Thus we can define $\mathcal{O}_{X, x_{i}}$, resp. $\mathcal{O}_{Y, y_{i}}$ to be the local ring of this scheme at $x_{i}$, resp. $y_{i}$.
We conclude that if the morphism $f: X \rightarrow Y$ is birational, then there exist dense open subspaces $X^{\prime} \subset X$ and $Y^{\prime} \subset Y$ such that
(1) $f\left(X^{\prime}\right) \subset Y^{\prime}$,
(2) $X^{\prime}$ and $Y^{\prime}$ are representable, and
(3) $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y^{\prime}$ is birational in the sense of Morphisms, Definition 28.46.1.

However, we do insist that $X$ and $Y$ are decent with finitely many irreducible components. Other ways to characterize decent algebraic spaces with finitely many irreducible components are given in Lemma 55.18.3. In most cases birational morphisms are isomorphisms over dense opens.

0ACW Lemma 55.20.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which are decent and have finitely many irreducible components. If $f$ is birational then $f$ is dominant.
Proof. Follows immediately from the definitions. See Morphisms of Spaces, Definition 54.18.1

0BBD Lemma 55.20.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a birational morphism of algebraic spaces over $S$ which are decent and have finitely many irreducible components. If $y \in Y$ is the generic point of an irreducible component, then the base change $X \times_{Y} \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ is an isomorphism.

Proof. Let $X^{\prime} \subset X$ and $Y^{\prime} \subset Y$ be the maximal open subspaces which are representable, see Lemma 55.18.3. By Lemma 55.19.3 the fibre of $f$ over $y$ is consists of of points of codimension 0 of $X$ and is therefore contained in $X^{\prime}$. Hence $X \times_{Y} \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)=X^{\prime} \times_{Y^{\prime}} \operatorname{Spec}\left(\mathcal{O}_{Y^{\prime}, y}\right)$ and the result follows from Morphisms, Lemma 28.46.3.

0BBE Lemma 55.20.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a birational morphism of algebraic spaces over $S$ which are decent and have finitely many irreducible components. Assume one of the following conditions is satisfied
(1) $f$ is locally of finite type and $Y$ reduced (i.e., integral),
(2) $f$ is locally of finite presentation.

Then there exist dense opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $\left.f\right|_{U}:$ $U \rightarrow V$ is an isomorphism.

Proof. By Lemma 55.18 .3 we may assume that $X$ and $Y$ are schemes. In this case the result is Morphisms, Lemma 28.46.5.
0BBF Lemma 55.20.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a birational morphism of algebraic spaces over $S$ which are decent and have finitely many irreducible components. Assume
(1) either $f$ is quasi-compact or $f$ is separated, and
(2) either $f$ is locally of finite type and $Y$ is reduced or $f$ is locally of finite presentation.
Then there exists a dense open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is an isomorphism.
Proof. By Lemma 55.18.3 we may assume $Y$ is a scheme. By Lemma 55.19.4 we may assume that $f$ is finite. Then $X$ is a scheme too and the result follows from Morphisms, Lemma 28.47.6.
0B4D Lemma 55.20.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which are decent and have finitely many irreducible components. If $f$ is birational and $V \rightarrow Y$ is an étale morphism with $V$ affine, then $X \times_{Y} V$ is decent with finitely many irreducible components and $X \times_{Y} V \rightarrow V$ is birational.

Proof. The algebraic space $U=X \times_{Y} V$ is decent (Lemma 55.6.6). The generic points of $V$ and $U$ are the elements of $|V|$ and $|U|$ which lie over generic points of $|Y|$ and $|X|$ (Lemma 55.18.1). Since $Y$ is decent we conclude there are finitely many generic points on $V$. Let $\xi \in|X|$ be a generic point of an irreducible component. By the discussion following Definition 55.20.1 we have a cartesian square

whose horizontal morphisms are monomorphisms identifying local rings and where the left vertical arrow is an isomorphism. It follows that in the diagram

the vertical arrow on the left is an isomorphism. The horizonal arrows have image contained in the schematic locus of $U$ and $V$ and identify local rings (some details omitted). Since the image of the horizontal arrows are the points of $|U|$, resp. $|V|$ lying over $\xi$, resp. $f(\xi)$ we conclude.
0BBG Lemma 55.20.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a birational morphism between algebraic spaces over $S$ which are decent and have finitely many irreducible components. Then the normalizations $X^{\nu} \rightarrow X$ and $Y^{\nu} \rightarrow Y$ exist and there is a commutative diagram

of algebraic spaces over $S$. The morphism $X^{\nu} \rightarrow Y^{\nu}$ is birational.
Proof. By Lemma 55.18 .3 we see that $X$ and $Y$ satisfy the equivalent conditions of Morphisms of Spaces, Lemma 54.46.1 and the normalizations are defined. By Morphisms of Spaces, Lemma 54.46.5 the algebraic space $X^{\nu}$ is normal and maps codimension 0 points to codimension 0 points. Since $f$ maps codimension 0 points to codimension 0 points (this is the same as generic points on decent spaces by Lemma 55.18.1 we obtain from Morphisms of Spaces, Lemma 54.46.5 a factorization of the composition $X^{\nu} \rightarrow X \rightarrow Y$ through $Y^{\nu}$.

Observe that $X^{\nu}$ and $Y^{\nu}$ are decent for example by Lemma 55.6.5. Moreover the maps $X^{\nu} \rightarrow X$ and $Y^{\nu} \rightarrow Y$ induce bijections on irreducible components (see references above) hence $X^{\nu}$ and $Y^{\nu}$ both have a finite number of irreducible components and the map $X^{\nu} \rightarrow Y^{\nu}$ induces a bijection between their generic points. To prove that $X^{\nu} \rightarrow Y^{\nu}$ is birational, it therefore suffices to show it induces an isomorphism on local rings at these points. To do this we may replace $X$ and $Y$ by open neighbourhoods of their generic points, hence we may assume $X$ and $Y$ are affine irreducible schemes with generic points $x$ and $y$. Since $f$ is birational the map $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{Y, y}$ is an isomorphism. Let $x^{\nu} \in X^{\nu}$ and $y^{\nu} \in Y^{\nu}$ be the points lying over $x$ and $y$. By construction of the normalization we see that $\mathcal{O}_{X^{\nu}, x^{\nu}}=\mathcal{O}_{X, x} / \mathfrak{m}_{x}$ and similarly on $Y$. Thus the map $\mathcal{O}_{X^{\nu}, x^{\nu}} \rightarrow \mathcal{O}_{Y^{\nu}, y^{\nu}}$ is an isomorphism as well.

0B4E Lemma 55.20.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $X$ and $Y$ are decent and have finitely many irreducible components,
(2) $f$ is integral and birational,
(3) $Y$ is normal, and
(4) $X$ is reduced.

Then $f$ is an isomorphism.
Proof. Let $V \rightarrow Y$ be an étale morphism with $V$ affine. It suffices to show that $U=X \times_{Y} V \rightarrow V$ is an isomorphism. By Lemma 55.20 .6 and its proof we see that $U$ and $V$ are decent and have finitely many irreducible components and that $U \rightarrow V$ is birational. By Properties, Lemma 27.7.5 $V$ is a finite disjoint union of integral schemes. Thus we may assume $V$ is integral. As $f$ is birational, we see that $U$ is irreducible and reduced, i.e., integral (note that $U$ is a scheme as $f$ is integral, hence representable). Thus we may assume that $X$ and $Y$ are integral schemes and the result follows from the case of schemes, see Morphisms, Lemma 28.49.5.

0 BBH Lemma 55.20.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an integral birational morphism of decent algebraic spaces over $S$ which have finitely many irreducible components. Then there exists a factorization $Y^{\nu} \rightarrow X \rightarrow Y$ and $Y^{\nu} \rightarrow X$ is the normalization of $X$.

Proof. Consider the map $X^{\nu} \rightarrow Y^{\nu}$ of Lemma 55.20.7. This map is integral by Morphisms of Spaces, Lemma 54.43.11. Hence it is an isomorphism by Lemma 55.20 .8

### 55.21. Jacobson spaces

We have defined the Jacobson property for algebraic spaces in Properties of Spaces, Remark 53.7.3. For representable algebraic spaces it agrees with the property discussed in Properties, Section 27.6. The relationship between the Jacobson property and the behaviour of the topological space $|X|$ is not evident for general algebraic spaces $|X|$. However, a decent (for example quasi-separated or locally separated) algebraic space $X$ is Jacobson if and only if $|X|$ is Jacobson (see Lemma 55.21.4).

0BA3 Lemma 55.21.1. Let $S$ be a scheme. Let $X$ be a Jacobson algebraic space over $S$. Any algebraic space locally of finite type over $X$ is Jacobson.

Proof. Let $U \rightarrow X$ be a surjective étale morphism where $U$ is a scheme. Then $U$ is Jacobson (by definition) and for a morphism of schemes $V \rightarrow U$ which is locally of finite type we see that $V$ is Jacobson by the corresponding result for schemes (Morphisms, Lemma 28.16.9). Thus if $Y \rightarrow X$ is a morphism of algebraic spaces which is locally of finite type, then setting $V=U \times_{X} Y$ we see that $Y$ is Jacobson by definition.

0BA4 Lemma 55.21.2. Let $S$ be a scheme. Let $X$ be a Jacobson algebraic space over $S$. For $x \in X_{f t-p t s}$ and $g: W \rightarrow X$ locally of finite type with $W$ a scheme, if $x \in \operatorname{Im}(|g|)$, then there exists a closed point of $W$ mapping to $x$.

Proof. Let $U \rightarrow X$ be an étale morphism with $U$ a scheme and with $u \in U$ closed mapping to $x$, see Morphisms of Spaces, Lemma54.25.3. Observe that $W, W \times_{X} U$, and $U$ are Jacobson schemes by Lemma 55.21.1. Hence finite type points on these schemes are the same thing as closed points by Morphisms, Lemma 28.16.8. The inverse image $T \subset W \times_{X} U$ of $u$ is a nonempty (as $x$ in the image of $W \rightarrow X$ ) closed subset. By Morphisms, Lemma 28.16.7 there is a closed point $t$ of $W \times_{X} U$ which maps to $u$. As $W \times_{X} U \rightarrow W$ is locally of finite type the image of $t$ in $W$ is closed by Morphisms, Lemma 28.16.8.

0BA5 Lemma 55.21.3. Let $S$ be a scheme. Let $X$ be a decent Jacobson algebraic space over $S$. Then $X_{f t-p t s} \subset|X|$ is the set of closed points.

Proof. If $x \in|X|$ is closed, then we can represent $x$ by a closed immersion $\operatorname{Spec}(k) \rightarrow X$, see Lemma 55.12.6. Hence $x$ is certainly a finite type point.

Conversely, let $x \in|X|$ be a finite type point. We know that $x$ can be represented by a quasi-compact monomorphism $\operatorname{Spec}(k) \rightarrow X$ where $k$ is a field (Definition 55.6.1). On the other hand, by definition, there exists a morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ which is locally of finite type and represents $x$ (Morphisms, Definition 28.16.3). We obtain a factorization $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k) \rightarrow X$. Let $U \rightarrow X$ be any étale morphism with $U$ affine and consider the morphisms

$$
\operatorname{Spec}\left(k^{\prime}\right) \times_{X} U \rightarrow \operatorname{Spec}(k) \times_{X} U \rightarrow U
$$

The quasi-compact $\operatorname{scheme} \operatorname{Spec}(k) \times_{X} U$ is étale over $\operatorname{Spec}(k)$ hence is a finite disjoint union of spectra of fields (Remark 55.4.1). Moreover, the first morphism is surjective and locally of finite type (Morphisms, Lemma 28.15.8) hence surjective on finite type points (Morphisms, Lemma 28.16.6) and the composition (which is locally of finite type) sends finite type points to closed points as $U$ is Jacobson (Morphisms, Lemma 28.16.8). Thus the image of $\operatorname{Spec}(k) \times_{X} U \rightarrow U$ is a finite set of closed points hence closed. Since this is true for every affine $U$ and étale morphism $U \rightarrow X$, we conclude that $x \in|X|$ is closed.

0BA6 Lemma 55.21.4. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Then $X$ is Jacobson if and only if $|X|$ is Jacobson.
Proof. Assume $X$ is Jacobson and that $T \subset|X|$ is a closed subset. By Morphisms of Spaces, Lemma 54.25 .6 we see that $T \cap X_{\mathrm{ft}-\mathrm{pts}}$ is dense in $T$. By Lemma 55.21 .3 we see that $X_{\mathrm{ft}-\mathrm{pts}}$ are the closed points of $|X|$. Thus $|X|$ is indeed Jacobson.
Assume $|X|$ is Jacobson. Let $f: U \rightarrow X$ be an étale morphism with $U$ an affine scheme. We have to show that $U$ is Jacobson. If $x \in|X|$ is closed, then the fibre $F=f^{-1}(\{x\})$ is a finite (by definition of decent) closed (by construction of the topology on $|X|$ ) subset of $U$. Since there are no specializations between points of $F$ (Lemma 55.10.6) we conclude that every point of $F$ is closed in $U$. If $U$ is not Jacobson, then there exists a non-closed point $u \in U$ such that $\{u\}$ is locally closed (Topology, Lemma 5.17.3). We will show that $f(u) \in|X|$ is closed; by the above $u$ is closed in $U$ which is a contradiction and finishes the proof. To prove this we may replace $U$ by an affine open neighbourhood of $u$. Thus we may assume that $\{u\}$ is closed in $U$. Let $R=U \times_{X} U$ with projections $s, t: R \rightarrow U$. Then $s^{-1}(\{u\})=\left\{r_{1}, \ldots, r_{m}\right\}$ is finite (by definition of decent spaces). After replacing $U$ by a smaller affine open neighbourhood of $u$ we may assume that $t\left(r_{j}\right)=u$ for $j=1, \ldots, m$. It follows that $\{u\}$ is an $R$-invariant closed subset of $U$. Hence $\{f(u)\}$ is a locally closed subset of $X$ as it is closed in the open $|f|(|U|)$ of $|X|$. Since $|X|$ is Jacobson we conclude that $f(u)$ is closed in $|X|$ as desired.

## CHAPTER 56

## Cohomology of Algebraic Spaces

### 56.1. Introduction

071 U In this chapter we write about cohomology of algebraic spaces. Although we prove some results on cohomology of abelian sheaves, we focus mainly on cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapter "Cohomology of Schemes". Some of the results in this chapter can be found in Knu71.

An important missing ingredient in this chapter is the induction principle, i.e., the analogue for quasi-compact and quasi-separated algebraic spaces of Cohomology of Schemes, Lemma 29.4.1. This is formulated precisely and proved in detail in Derived Categories of Spaces, Section 62.8. Instead of the induction principle, in this chapter we use the alternating Čech complex, see Section 56.5. It is designed to prove vanishing statements such as Proposition 56.6.2, but in some cases the induction principle is a more powerful and perhaps more "standard" tool. We encourage the reader to take a look at the induction principle after reading some of the material in this section.

### 56.2. Conventions

071 V The standing assumption is that all schemes are contained in a big fppf site $S_{c c_{f p p f}}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 56.3. Higher direct images

071Y Before discussing what happens with higher direct images of quasi-coherent sheaves we formulate and prove a result which holds for all abelian sheaves (in particular also quasi-coherent modules).

0A4K Lemma 56.3.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an integral (for example finite) morphism of algebraic spaces. Then $f_{*}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ is an exact functor and $R^{p} f_{*}=0$ for $p>0$.

Proof. By Properties of Spaces, Lemma 53.17.11we may compute the higher direct images on an étale cover of $Y$. Hence we may assume $Y$ is a scheme. This implies that $X$ is a scheme (Morphisms of Spaces, Lemma 54.43.3). In this case we may
apply Étale Cohomology, Lemma 49.44.5. For the finite case the reader may wish to consult the less technical Étale Cohomology, Proposition 49.55.2.

Let $S$ be a scheme. Let $X$ be a representable algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent module on $X$ (see Properties of Spaces, Section 53.28). By Descent, Proposition 34.7.10 the cohomology groups $H^{i}(X, \mathcal{F})$ agree with the usual cohomology group computed in the Zariski topology of the corresponding quasicoherent module on the scheme representing $X$.

More generally, let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces $X$ and $Y$. Let $\mathcal{F}$ be a quasi-coherent module on $X$. By Descent, Lemma 34.7 .15 the sheaf $R^{i} f_{*} \mathcal{F}$ agrees with the usual higher direct image computed for the Zariski topology of the quasi-coherent module on the scheme representing $X$ mapping to the scheme representing $Y$.

More generally still, suppose $f: X \rightarrow Y$ is a representable, quasi-compact, and quasi-separated morphism of algebraic spaces over $S$. Let $V$ be a scheme and let $V \rightarrow Y$ be an étale surjective morphism. Let $U=V \times_{Y} X$ and let $f^{\prime}: U \rightarrow V$ be the base change of $f$. Then for any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have

$$
\begin{equation*}
R^{i} f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)=\left.\left(R^{i} f_{*} \mathcal{F}\right)\right|_{V}, \tag{56.3.1.1}
\end{equation*}
$$

see Properties of Spaces, Lemma 53.25.2 And because $f^{\prime}: U \rightarrow V$ is a quasicompact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $R^{i} f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)$ by thinking of $\left.\mathcal{F}\right|_{U}$ as a quasi-coherent sheaf on the scheme $U$, and $f^{\prime}$ as a morphism of schemes. We will frequently use this without further mention.

Next, we prove that higher direct images of quasi-coherent sheaves are quasicoherent for any quasi-compact and quasi-separated morphism of algebraic spaces. In the proof we use a trick; a "better" proof would use a relative Cech complex, as discussed in Sheaves on Stacks, Sections 78.17 and 78.18 ff.

0720 Lemma 56.3.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is quasi-compact and quasi-separated, then $R^{i} f_{*}$ transforms quasi-coherent $\mathcal{O}_{X}$-modules into quasi-coherent $\mathcal{O}_{Y}$-modules.

Proof. Let $V \rightarrow Y$ be an étale morphism where $V$ is an affine scheme. Set $U=V \times_{Y} X$ and denote $f^{\prime}: U \rightarrow V$ the induced morphism. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. By Properties of Spaces, Lemma 53.25 .2 we have $R^{i} f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)=\left.\left(R^{i} f_{*} \mathcal{F}\right)\right|_{V}$. Since the property of being a quasi-coherent module is local in the étale topology on $Y$ (see Properties of Spaces, Lemma 53.28.6) we may replace $Y$ by $V$, i.e., we may assume $Y$ is an affine scheme.

Assume $Y$ is affine. Since $f$ is quasi-compact we see that $X$ is quasi-compact. Thus we may choose an affine scheme $U$ and a surjective étale morphism $g: U \rightarrow X$, see Properties of Spaces, Lemma 53.6.3. Picture

The morphism $g: U \rightarrow X$ is representable, separated and quasi-compact because $X$ is quasi-separated. Hence the lemma holds for $g$ (by the discussion above the lemma). It also holds for $f \circ g: U \rightarrow Y$ (as this is a morphism of affine schemes).
In the situation described in the previous paragraph we will show by induction on $n$ that $I H_{n}$ : for any quasi-coherent sheaf $\mathcal{F}$ on $X$ the sheaves $R^{i} f \mathcal{F}$ are quasicoherent for $i \leq n$. The case $n=0$ follows from Morphisms of Spaces, Lemma 54.11.2. Assume $I H_{n}$. In the rest of the proof we show that $I H_{n+1}$ holds.

Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{U}$-module. Consider the Leray spectral sequence

$$
E_{2}^{p, q}=R^{p} f_{*} R^{q} g_{*} \mathcal{H} \Rightarrow R^{p+q}(f \circ g)_{*} \mathcal{H}
$$

Cohomology on Sites, Lemma 21.14.7. As $R^{q} g_{*} \mathcal{H}$ is quasi-coherent by $I H_{n}$ all the sheaves $R^{p} f_{*} R^{q} g_{*} \mathcal{H}$ are quasi-coherent for $p \leq n$. The sheaves $R^{p+q}(f \circ g)_{*} \mathcal{H}$ are all quasi-coherent (in fact zero for $p+q>0$ but we do not need this). Looking in degrees $\leq n+1$ the only module which we do not yet know is quasi-coherent is $E_{2}^{n+1,0}=R^{n+1} f_{*} g_{*} \mathcal{H}$. Moreover, the differentials $d_{r}^{n+1,0}: E_{r}^{n+1,0} \rightarrow E_{r}^{n+1+r, 1-r}$ are zero as the target is zero. Using that $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ (Properties of Spaces, Lemma 53.28.7) it follows that $R^{n+1} f_{*} g_{*} \mathcal{H}$ is quasi-coherent (details omitted).
Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Set $\mathcal{H}=g^{*} \mathcal{F}$. The adjunction mapping $\mathcal{F} \rightarrow g_{*} g^{*} \mathcal{F}=g_{*} \mathcal{H}$ is injective as $U \rightarrow X$ is surjective étale. Consider the exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow g_{*} \mathcal{H} \rightarrow \mathcal{G} \rightarrow 0
$$

where $\mathcal{G}$ is the cokernel of the first map and in particular quasi-coherent. Applying the long exact cohomology sequence we obtain

$$
R^{n} f_{*} g_{*} \mathcal{H} \rightarrow R^{n} f_{*} \mathcal{G} \rightarrow R^{n+1} f_{*} \mathcal{F} \rightarrow R^{n+1} f_{*} g_{*} \mathcal{H} \rightarrow R^{n+1} f_{*} \mathcal{G}
$$

The cokernel of the first arrow is quasi-coherent and we have seen above that $R^{n+1} f_{*} g_{*} \mathcal{H}$ is quasi-coherent. Thus $R^{n+1} f_{*} \mathcal{F}$ has a 2 -step filtration where the first step is quasi-coherent and the second a submodule of a quasi-coherent sheaf. Since $\mathcal{F}$ is an arbitrary quasi-coherent $\mathcal{O}_{X}$-module, this result also holds for $\mathcal{G}$. Thus we can choose an exact sequence $0 \rightarrow \mathcal{A} \rightarrow R^{n+1} f_{*} \mathcal{G} \rightarrow \mathcal{B}$ with $\mathcal{A}, \mathcal{B}$ quasi-coherent $\mathcal{O}_{Y}$-modules. Then the kernel $\mathcal{K}$ of $R^{n+1} f_{*} g_{*} \mathcal{H} \rightarrow R^{n+1} f_{*} \mathcal{G} \rightarrow \mathcal{B}$ is quasi-coherent, whereupon we obtain a map $\mathcal{K} \rightarrow \mathcal{A}$ whose kernel $\mathcal{K}^{\prime}$ is quasi-coherent too. Hence $R^{n+1} f_{*} \mathcal{F}$ sits in an exact sequence

$$
R^{n} f_{*} g_{*} \mathcal{H} \rightarrow R^{n} f_{*} \mathcal{G} \rightarrow R^{n+1} f_{*} \mathcal{F} \rightarrow \mathcal{K}^{\prime} \rightarrow 0
$$

with all modules quasi-coherent except for possibly $R^{n+1} f_{*} \mathcal{F}$. We conclude that $R^{n+1} f_{*} \mathcal{F}$ is quasi-coherent, i.e., $I H_{n+1}$ holds as desired.

08EX Lemma 56.3.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over $S$. For any quasi-coherent $\mathcal{O}_{X}$ module $\mathcal{F}$ and any affine object $V$ of $Y_{\text {étale }}$ we have

$$
H^{q}\left(V \times_{Y} X, \mathcal{F}\right)=H^{0}\left(V, R^{q} f_{*} \mathcal{F}\right)
$$

for all $q \in \mathbf{Z}$.
Proof. Since formation of $R f_{*}$ commutes with étale localization (Properties of Spaces, Lemma 53.25.2 we may replace $Y$ by $V$ and assume $Y=V$ is affine. Consider the Leray spectral sequence $E_{2}^{p, q}=H^{p}\left(Y, R^{q} f_{*} \mathcal{F}\right)$ converging to $H^{p+q}(X, \mathcal{F})$,
see Cohomology on Sites, Lemma 21.14.5. By Lemma 56.3.2 we see that the sheaves $R^{q} f_{*} \mathcal{F}$ are quasi-coherent. By Cohomology of Schemes, Lemma 29.2.2 we see that $E_{2}^{p, q}=0$ when $p>0$. Hence the spectral sequence degenerates at $E_{2}$ and we win.

### 56.4. Colimits and cohomology

073D The following lemma in particular applies to diagrams of quasi-coherent sheaves.
073E Lemma 56.4.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X$ is quasi-compact and quasi-separated, then

$$
\operatorname{colim}_{i} H^{p}\left(X, \mathcal{F}_{i}\right) \longrightarrow H^{p}\left(X, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

is an isomorphism for every filtered diagram of abelian sheaves on $X_{\text {étale }}$.
Proof. This follows from Cohomology on Sites, Lemma 21.16.1. Namely, let $\mathcal{B} \subset$ $\mathrm{Ob}\left(X_{\text {spaces,étale }}\right)$ be the set of quasi-compact and quasi-separated spaces étale over $X$. Note that if $U \in \mathcal{B}$ then, because $U$ is quasi-compact, the collection of finite coverings $\left\{U_{i} \rightarrow U\right\}$ with $U_{i} \in \mathcal{B}$ is cofinal in the set of coverings of $U$ in $X_{e ́ t a l e}$. By Morphisms of Spaces, Lemma 54.8.9 the set $\mathcal{B}$ satisfies all the assumptions of Cohomology on Sites, Lemma 21.16.1 Since $X \in \mathcal{B}$ we win.

07U6 Lemma 56.4.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ be a filtered colimit of abelian sheaves on $X_{\text {étale }}$. Then for any $p \geq 0$ we have

$$
R^{p} f_{*} \mathcal{F}=\operatorname{colim} R^{p} f_{*} \mathcal{F}_{i}
$$

Proof. Recall that $R^{p} f_{*} \mathcal{F}$ is the sheaf on $Y_{\text {spaces, étale }}$ associated to $V \mapsto H^{p}\left(V \times_{Y}\right.$ $X, \mathcal{F})$, see Cohomology on Sites, Lemma 21.8.4 and Properties of Spaces, Lemma 53.17 .7 . Recall that the colimit is the sheaf associated to the presheaf colimit. Hence we can apply Lemma 56.4.1 to $H^{p}\left(V \times_{Y} X,-\right)$ where $V$ is affine to conclude (because when $V$ is affine, then $V \times_{Y} X$ is quasi-compact and quasi-separated). Strictly speaking this also uses Properties of Spaces, Lemma 53.17.5 to see that there exist enough affine objects.

The following lemma tells us that finitely presented modules behave as expected in quasi-compact and quasi-separated algebraic spaces.

07U7 Lemma 56.4.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let I be a partially ordered set and let $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ be a system over I of quasi-coherent $\mathcal{O}_{X}$-modules. Let $\mathcal{G}$ be an $\mathcal{O}_{X}$-module of finite presentation. Then we have

$$
\operatorname{colim}_{i} \operatorname{Hom}_{X}\left(\mathcal{G}, \mathcal{F}_{i}\right)=\operatorname{Hom}_{X}\left(\mathcal{G}, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

Proof. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$. Set $R=U \times_{X} U$. Note that $R$ is a quasi-compact (as $X$ is quasi-separated and $U$ quasi-compact) and separated (as $U$ is separated) scheme. Hence we have

$$
\operatorname{colim}_{i} \operatorname{Hom}_{U}\left(\left.\mathcal{G}\right|_{U},\left.\mathcal{F}_{i}\right|_{U}\right)=\operatorname{Hom}_{U}\left(\left.\mathcal{G}\right|_{U},\left.\operatorname{colim}_{i} \mathcal{F}_{i}\right|_{U}\right)
$$

by Modules, Lemma 17.11 .6 (and the material on restriction to schemes étale over $X$, see Properties of Spaces, Sections 53.28 and 53.29 ). Similarly for $R$. Since $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)=Q \operatorname{Coh}(U, R, s, t, c)$ (see Properties of Spaces, Proposition 53.31.1) the result follows formally.

### 56.5. The alternating Čech complex

0721 Let $S$ be a scheme. Let $f: U \rightarrow X$ be an étale morphism of algebraic spaces over $S$. The functor

$$
j: U_{\text {spaces,étale }} \longrightarrow X_{\text {spaces,étale }}, \quad V / U \longmapsto V / X
$$

induces an equivalence of $U_{\text {spaces, étale }}$ with the localization $X_{\text {spaces,étale }} / U$, see Properties of Spaces, Section 53.26 . Hence there exist functors

$$
f_{!}: A b\left(U_{\text {étale }}\right) \longrightarrow A b\left(X_{\text {étale }}\right), \quad f_{!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right),
$$

which are left adjoint to

$$
f^{-1}: A b\left(X_{\text {étale }}\right) \longrightarrow A b\left(U_{\text {étale }}\right), \quad f^{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{U}\right)
$$

see Modules on Sites, Section 18.19. Warning: This functor, a priori, has nothing to do with cohomology with compact supports! We dubbed this functor "extension by zero" in the reference above. Note that the two versions of $f$ ! agree as $f^{*}=f^{-1}$ for sheaves of $\mathcal{O}_{X}$-modules.

As we are going to use this construction below let us recall some of its properties. Given an abelian sheaf $\mathcal{G}$ on $U_{\text {étale }}$ the sheaf $f_{!}$is the sheafification of the presheaf

$$
V / X \longmapsto f_{!} \mathcal{G}(V)=\bigoplus_{\varphi \in \operatorname{Mor}_{X}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)
$$

see Modules on Sites, Lemma 18.19.2. Moreover, if $\mathcal{G}$ is an $\mathcal{O}_{U}$-module, then $f_{!} \mathcal{G}$ is the sheafification of the exact same presheaf of abelian groups which is endowed with an $\mathcal{O}_{X}$-module structure in an obvious way (see loc. cit.). Let $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ be a geometric point. Then there is a canonical identification

$$
\left(f_{!} \mathcal{G}\right)_{\bar{x}}=\bigoplus_{\bar{u}} \mathcal{G}_{\bar{u}}
$$

where the sum is over all $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ such that $f \circ \bar{u}=\bar{x}$, see Modules on Sites, Lemma 18.37 .1 and Properties of Spaces, Lemma 53.18.13. In the following we are going to study the sheaf $f_{!} \underline{\mathbf{Z}}$. Here $\underline{\mathbf{Z}}$ denotes the constant sheaf on $X_{\text {étale }}$ or $U_{\text {étale }}$.

0722 Lemma 56.5.1. Let $S$ be a scheme. Let $f_{i}: U_{i} \rightarrow X$ be étale morphisms of algebraic spaces over $S$. Then there are isomorphisms

$$
f_{1,!} \underline{\mathbf{Z}} \otimes_{\mathbf{z}} f_{2,!} \underline{\mathbf{Z}} \longrightarrow f_{12,!} \underline{\mathbf{Z}}
$$

where $f_{12}: U_{1} \times_{X} U_{2} \rightarrow X$ is the structure morphism and

$$
\left(f_{1} \amalg f_{2}\right)!\underline{\mathbf{Z}} \longrightarrow f_{1,!} \underline{\mathbf{Z}} \oplus f_{2,!} \underline{\mathbf{Z}}
$$

Proof. Once we have defined the map it will be an isomorphism by our description of stalks above. To define the map it suffices to work on the level of presheaves. Thus we have to define a map

$$
\left(\bigoplus_{\varphi_{1} \in \operatorname{Mor}_{X}\left(V, U_{1}\right)} \mathbf{Z}\right) \otimes_{\mathbf{Z}}\left(\bigoplus_{\varphi_{2} \in \operatorname{Mor}_{X}\left(V, U_{2}\right)} \mathbf{Z}\right) \longrightarrow \bigoplus_{\varphi \in \operatorname{Mor}_{X}\left(V, U_{1} \times_{X} U_{2}\right)} \mathbf{Z}
$$

We map the element $1_{\varphi_{1}} \otimes 1_{\varphi_{2}}$ to the element $1_{\varphi_{1} \times \varphi_{2}}$ with obvious notation. We omit the proof of the second equality.

Another important feature is the trace map

$$
\operatorname{Tr}_{f}: f_{!} \underline{\mathbf{Z}} \longrightarrow \underline{\mathbf{Z}}
$$

The trace map is adjoint to the map $\mathbf{Z} \rightarrow f^{-1} \underline{\mathbf{Z}}$ (which is an isomorphism). If $\bar{x}$ is above, then $\operatorname{Tr}_{f}$ on stalks at $\bar{x}$ is the map

$$
\left(\operatorname{Tr}_{f}\right)_{\bar{x}}:(f!\underline{\mathbf{Z}})_{\bar{x}}=\bigoplus_{\bar{u}} \mathbf{Z} \longrightarrow \mathbf{Z}=\underline{\mathbf{Z}}_{\bar{x}}
$$

which sums the given integers. This is true because it is adjoint to the map $1: \mathbf{Z} \rightarrow$ $f^{-1} \underline{\mathbf{Z}}$. In particular, if $f$ is surjective as well as étale then $\operatorname{Tr}_{f}$ is surjective.
Assume that $f: U \rightarrow X$ is a surjective étale morphism of algebraic spaces. Consider the Koszul complex associated to the trace map we discussed above

$$
\ldots \rightarrow \wedge^{3} f!\underline{\mathbf{Z}} \rightarrow \wedge^{2} f!\underline{\mathbf{Z}} \rightarrow f_{!} \underline{\mathbf{Z}} \rightarrow \underline{\mathbf{Z}} \rightarrow 0
$$

Here the exterior powers are over the sheaf of rings $\underline{\mathbf{Z}}$. The maps are defined by the rule

$$
e_{1} \wedge \ldots \wedge e_{n} \longmapsto \sum_{i=1, \ldots, n}(-1)^{i+1} \operatorname{Tr}_{f}\left(e_{i}\right) e_{1} \wedge \ldots \wedge \widehat{e}_{i} \wedge \ldots \wedge e_{n}
$$

where $e_{1}, \ldots, e_{n}$ are local sections of $f_{!} \underline{\mathbf{Z}}$. Let $\bar{x}$ be a geometric point of $X$ and set $M_{\bar{x}}=\left(f_{!} \underline{\mathbf{Z}}\right)_{\bar{x}}=\bigoplus_{\bar{u}} \mathbf{Z}$. Then the stalk of the complex above at $\bar{x}$ is the complex

$$
\ldots \rightarrow \wedge^{3} M_{\bar{x}} \rightarrow \wedge^{2} M_{\bar{x}} \rightarrow M_{\bar{x}} \rightarrow \mathbf{Z} \rightarrow 0
$$

which is exact because $M_{\bar{x}} \rightarrow \mathbf{Z}$ is surjective, see More on Algebra, Lemma 15.22.5. Hence if we let $K^{\bullet}=K^{\bullet}(f)$ be the complex with $K^{i}=\wedge^{i+1} f!\underline{\mathbf{Z}}$, then we obtain a quasi-isomorphism
0723

$$
\begin{equation*}
K^{\bullet} \longrightarrow \underline{\mathbf{Z}}[0] \tag{56.5.1.1}
\end{equation*}
$$

We use the complex $K^{\bullet}$ to define what we call the alternating Čech complex associated to $f: U \rightarrow X$.
0724 Definition 56.5.2. Let $S$ be a scheme. Let $f: U \rightarrow X$ be a surjective étale morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be an object of $A b\left(X_{\text {étale }}\right)$. The alternating Čech complex $\breve{1}^{1} \breve{\mathcal{C}}_{\text {alt }}^{\bullet}(f, \mathcal{F})$ associated to $\mathcal{F}$ and $f$ is the complex

$$
\operatorname{Hom}\left(K^{0}, \mathcal{F}\right) \rightarrow \operatorname{Hom}\left(K^{1}, \mathcal{F}\right) \rightarrow \operatorname{Hom}\left(K^{2}, \mathcal{F}\right) \rightarrow \ldots
$$

with Hom groups computed in $A b\left(X_{\text {étale }}\right)$.
The reader may verify that if $U=\coprod U_{i}$ and $\left.f\right|_{U_{i}}: U_{i} \rightarrow X$ is the open immersion of a subspace, then $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(f, \mathcal{F})$ agrees with the complex introduced in Cohomology, Section 20.24 for the Zariski covering $X=\bigcup U_{i}$ and the restriction of $\mathcal{F}$ to the Zariski site of $X$. What is more important however, is to relate the cohomology of the alternating Čech complex to the cohomology.
0725 Lemma 56.5.3. Let $S$ be a scheme. Let $f: U \rightarrow X$ be a surjective étale morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be an object of $A b\left(X_{\text {étale }}\right)$. There exists a canonical map

$$
\check{\mathcal{C}}_{a l t}^{\bullet}(f, \mathcal{F}) \longrightarrow R \Gamma(X, \mathcal{F})
$$

in $D(A b)$. Moreover, there is a spectral sequence with $E_{1}$-page

$$
E_{1}^{p, q}=E x t_{A b\left(X_{\text {étale })}\right.}^{q}\left(K^{p}, \mathcal{F}\right)
$$

converging to $H^{p+q}(X, \mathcal{F})$ where $K^{p}=\wedge^{p+1} f_{!}^{\mathbf{Z}}$.

[^168]Proof. Recall that we have the quasi-isomorphism $K^{\bullet} \rightarrow \underline{\mathbf{Z}}[0]$, see (56.5.1.1). Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in $A b\left(X_{\text {étale }}\right)$. Consider the double complex $A^{\bullet \bullet}, \bullet$ with terms

$$
A^{p, q}=\operatorname{Hom}\left(K^{p}, \mathcal{I}^{q}\right)
$$

where the differential $d_{1}^{p, q}: A^{p, q} \rightarrow A^{p+1, q}$ is the one coming from the differential $K^{p+1} \rightarrow K^{p}$ and the differential $d_{2}^{p, q}: A^{p, q} \rightarrow A^{p, q+1}$ is the one coming from the differential $\mathcal{I}^{q} \rightarrow \mathcal{I}^{q+1}$. Denote $s A^{\bullet}$ the total complex associated to the double complex $A^{\bullet \bullet \bullet}$. We will use the two spectral sequences ( ${ }^{\prime} E_{r},{ }^{\prime} d_{r}$ ) and ( ${ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}$ ) associated to this double complex, see Homology, Section 12.22 ,
Because $K^{\bullet}$ is a resolution of $\underline{\mathbf{Z}}$ we see that the complexes

$$
A^{\bullet, q}: \operatorname{Hom}\left(K^{0}, \mathcal{I}^{q}\right) \rightarrow \operatorname{Hom}\left(K^{1}, \mathcal{I}^{q}\right) \rightarrow \operatorname{Hom}\left(K^{2}, \mathcal{I}^{q}\right) \rightarrow \ldots
$$

are acyclic in positive degrees and have $H^{0}$ equal to $\Gamma\left(X, \mathcal{I}^{q}\right)$. Hence by Homology, Lemma 12.22 .7 and its proof the spectral sequence ( ${ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}$ ) degenerates, and the natural map

$$
\mathcal{I}^{\bullet}(X) \longrightarrow s A^{\bullet}
$$

is a quasi-isomorphism of complexes of abelian groups. In particular we conclude that $H^{n}\left(s A^{\bullet}\right)=H^{n}(X, \mathcal{F})$.

The map $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(f, \mathcal{F}) \rightarrow R \Gamma(X, \mathcal{F})$ of the lemma is the composition of $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(f, \mathcal{F}) \rightarrow$ $S A^{\bullet}$ with the inverse of the displayed quasi-isomorphism.

Finally, consider the spectral sequence ( $\left.{ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)$. We have

$$
E_{1}^{p, q}=q \text { th cohomology of } \operatorname{Hom}\left(K^{p}, \mathcal{I}^{0}\right) \rightarrow \operatorname{Hom}\left(K^{p}, \mathcal{I}^{1}\right) \rightarrow \operatorname{Hom}\left(K^{p}, \mathcal{I}^{2}\right) \rightarrow \ldots
$$

This proves the lemma.
It follows from the lemma that it is important to understand the ext groups $\operatorname{Ext}_{A b\left(X_{\text {étale }}\right)}\left(K^{p}, \mathcal{F}\right)$, i.e., the right derived functors of $\mathcal{F} \mapsto \operatorname{Hom}\left(K^{p}, \mathcal{F}\right)$.

0726 Lemma 56.5.4. Let $S$ be a scheme. Let $f: U \rightarrow X$ be a surjective, étale, and separated morphism of algebraic spaces over $S$. For $p \geq 0$ set

$$
W_{p}=U \times_{X} \ldots \times_{X} U \backslash \text { all diagonals }
$$

where the fibre product has $p+1$ factors. There is a free action of $S_{p+1}$ on $W_{p}$ over $X$ and

$$
\operatorname{Hom}\left(K^{p}, \mathcal{F}\right)=S_{p+1} \text {-anti-invariant elements of } \mathcal{F}\left(W_{p}\right)
$$

functorially in $\mathcal{F}$ where $K^{p}=\wedge^{p+1} f!\underline{\mathbf{Z}}$.
Proof. Because $U \rightarrow X$ is separated the diagonal $U \rightarrow U \times_{X} U$ is a closed immersion. Since $U \rightarrow X$ is étale the diagonal $U \rightarrow U \times_{X} U$ is an open immersion, see Morphisms of Spaces, Lemmas 54.38 .10 and 54.37.9. Hence $W_{p}$ is an open and closed subspace of $U^{p+1}=U \times_{X} \ldots \times_{X} U$. The action of $S_{p+1}$ on $W_{p}$ is free as we've thrown out the fixed points of the action. By Lemma 56.5.1 we see that

$$
\left(f_{!} \underline{\mathbf{Z}}\right)^{\otimes p+1}=f_{!}^{p+1} \underline{\mathbf{Z}}=\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}} \oplus \text { Rest }
$$

where $f^{p+1}: U^{p+1} \rightarrow X$ is the structure morphism. Looking at stalks over a geometric point $\bar{x}$ of $X$ we see that

$$
\left(\bigoplus_{\bar{u} \mapsto \bar{x}} \mathbf{Z}\right)^{\otimes p+1} \longrightarrow\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}}_{\bar{x}}
$$

is the quotient whose kernel is generated by all tensors $1_{\bar{u}_{0}} \otimes \ldots \otimes 1_{\bar{u}_{p}}$ where $\bar{u}_{i}=\bar{u}_{j}$ for some $i \neq j$. Thus the quotient map

$$
\left(f_{!} \underline{\mathbf{Z}}\right)^{\otimes p+1} \longrightarrow \wedge^{p+1} f_{!} \underline{\mathbf{Z}}
$$

factors through $\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}}$, i.e., we get

$$
(f!\underline{\mathbf{Z}})^{\otimes p+1} \longrightarrow\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}} \longrightarrow \wedge^{p+1} f!\underline{\mathbf{Z}}
$$

This already proves that $\operatorname{Hom}\left(K^{p}, \mathcal{F}\right)$ is (functorially) a subgroup of

$$
\operatorname{Hom}\left(\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}}, \mathcal{F}\right)=\mathcal{F}\left(W_{p}\right)
$$

To identify it with the $S_{p+1}$-anti-invariants we have to prove that the surjection $\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}} \rightarrow \wedge^{p+1} f!\underline{\mathbf{Z}}$ is the maximal $S_{p+1}$-anti-invariant quotient. In other words, we have to show that $\wedge^{p+1} f!\underline{\mathbf{Z}}$ is the quotient of $\left(W_{p} \rightarrow X\right)!\underline{\mathbf{Z}}$ by the subsheaf generated by the local sections $s-\operatorname{sign}(\sigma) \sigma(s)$ where $s$ is a local section of $\left(W_{p} \rightarrow X\right)$ ! $\underline{\mathbf{Z}}$. This can be checked on the stacks, where it is clear.

0727 Lemma 56.5.5. Let $S$ be a scheme. Let $W$ be an algebraic space over $S$. Let $G$ be a finite group acting freely on $W$. Let $U=W / G$, see Properties of Spaces, Lemma 53.33.1. Let $\chi: G \rightarrow\{+1,-1\}$ be a character. Then there exists a rank 1 locally free sheaf of $\mathbf{Z}$-modules $\underline{\mathbf{Z}}(\chi)$ on $U_{\text {étale }}$ such that for every abelian sheaf $\mathcal{F}$ on $U_{\text {étale }}$ we have

$$
H^{0}\left(W,\left.\mathcal{F}\right|_{W}\right)^{\chi}=H^{0}(U, \mathcal{F} \otimes \mathbf{z} \underline{\mathbf{Z}}(\chi))
$$

Proof. The quotient morphism $q: W \rightarrow U$ is a $G$-torsor, i.e., there exists a surjective étale morphism $U^{\prime} \rightarrow U$ such that $W \times_{U} U^{\prime}=\coprod_{g \in G} U^{\prime}$ as spaces with $G$-action over $U^{\prime}$. (Namely, $U^{\prime}=W$ works.) Hence $q_{*} \underline{\mathbf{Z}}$ is a finite locally free Z-module with an action of $G$. For any geometric point $\bar{u}$ of $U$, then we get $G$ equivariant isomorphisms

$$
\left(q_{*} \underline{\mathbf{Z}}\right)_{\bar{u}}=\bigoplus_{\bar{w} \mapsto \bar{u}} \mathbf{Z}=\bigoplus_{g \in G} \mathbf{Z}=\mathbf{Z}[G]
$$

where the second $=$ uses a geometric point $\bar{w}_{0}$ lying over $\bar{u}$ and maps the summand corresponding to $g \in G$ to the summand corresponding to $g\left(\bar{w}_{0}\right)$. We have

$$
H^{0}\left(W,\left.\mathcal{F}\right|_{W}\right)=H^{0}\left(U, \mathcal{F} \otimes_{\mathbf{Z}} q_{*} \underline{\mathbf{Z}}\right)
$$

because $\left.q_{*} \mathcal{F}\right|_{W}=\mathcal{F} \otimes_{\mathbf{Z}} q_{*} \underline{\mathbf{Z}}$ as one can check by restricting to $U^{\prime}$. Let

$$
\underline{\mathbf{Z}}(\chi)=\left(q_{*} \underline{\mathbf{Z}}\right)^{\chi} \subset q_{*} \underline{\mathbf{Z}}
$$

be the subsheaf of sections that transform according to $\chi$. For any geometric point $\bar{u}$ of $U$ we have

$$
\underline{\mathbf{Z}}(\chi)_{\bar{u}}=\mathbf{Z} \cdot \sum_{g} \chi(g) g \subset \mathbf{Z}[G]=\left(q_{*} \underline{\mathbf{Z}}\right)_{\bar{u}}
$$

It follows that $\underline{\mathbf{Z}}(\chi)$ is locally free of rank 1 (more precisely, this should be checked after restricting to $U^{\prime}$ ). Note that for any $\mathbf{Z}$-module $M$ the $\chi$-semi-invariants of $M[G]$ are the elements of the form $m \cdot \sum_{g} \chi(g) g$. Thus we see that for any abelian sheaf $\mathcal{F}$ on $U$ we have

$$
\left(\mathcal{F} \otimes_{\mathbf{Z}} q_{*} \underline{\mathbf{Z}}\right)^{\chi}=\mathcal{F} \otimes_{\mathbf{z}} \underline{\mathbf{Z}}(\chi)
$$

because we have equality at all stalks. The result of the lemma follows by taking global sections.

Now we can put everything together and obtain the following pleasing result.

0728 Lemma 56.5.6. Let $S$ be a scheme. Let $f: U \rightarrow X$ be a surjective, étale, and separated morphism of algebraic spaces over $S$. For $p \geq 0$ set

$$
W_{p}=U \times_{X} \ldots \times_{X} U \backslash \text { all diagonals }
$$

(with $p+1$ factors) as in Lemma 56.5.4. Let $\chi_{p}: S_{p+1} \rightarrow\{+1,-1\}$ be the sign character. Let $U_{p}=W_{p} / S_{p+1}$ and $\underline{\mathbf{Z}}\left(\chi_{p}\right)$ be as in Lemma 56.5.5. Then the spectral sequence of Lemma 56.5.3 has $E_{1}$-page

$$
E_{1}^{p, q}=H^{q}\left(U_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes_{\mathbf{z}} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)
$$

and converges to $H^{p+q}(X, \mathcal{F})$.
Proof. Note that since the action of $S_{p+1}$ on $W_{p}$ is over $X$ we do obtain a morphism $U_{p} \rightarrow X$. Since $W_{p} \rightarrow X$ is étale and since $W_{p} \rightarrow U_{p}$ is surjective étale, it follows that also $U_{p} \rightarrow X$ is étale, see Morphisms of Spaces, Lemma 54.38.2. Therefore an injective object of $A b\left(X_{\text {étale }}\right)$ restricts to an injective object of $A b\left(U_{p, \text { étale }}\right)$, see Cohomology on Sites, Lemma 21.8.1. Moreover, the functor $\left.\mathcal{G} \mapsto \mathcal{G} \otimes \mathbf{z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)$ is an auto-equivalence of $A b\left(U_{p}\right)$, whence transforms injective objects into injective objects and is exact (because $\underline{\mathbf{Z}}\left(\chi_{p}\right)$ is an invertible $\underline{\mathbf{Z}}$-module). Thus given an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in $A b\left(X_{\text {étale }}\right)$ the complex

$$
\Gamma\left(U_{p},\left.\mathcal{I}^{0}\right|_{U_{p}} \otimes \mathbf{Z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right) \rightarrow \Gamma\left(U_{p},\left.\mathcal{I}^{1}\right|_{U_{p}} \otimes \mathbf{\mathbf { Z }} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right) \rightarrow \Gamma\left(U_{p},\left.\mathcal{I}^{2}\right|_{U_{p}} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right) \rightarrow \ldots
$$

computes $H^{*}\left(U_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)$. On the other hand, by Lemma 56.5 .5 it is equal to the complex of $S_{p+1}$-anti-invariants in

$$
\Gamma\left(W_{p}, \mathcal{I}^{0}\right) \rightarrow \Gamma\left(W_{p}, \mathcal{I}^{1}\right) \rightarrow \Gamma\left(W_{p}, \mathcal{I}^{2}\right) \rightarrow \ldots
$$

which by Lemma 56.5.4 is equal to the complex

$$
\operatorname{Hom}\left(K^{p}, \mathcal{I}^{0}\right) \rightarrow \operatorname{Hom}\left(K^{p}, \mathcal{I}^{1}\right) \rightarrow \operatorname{Hom}\left(K^{p}, \mathcal{I}^{2}\right) \rightarrow \ldots
$$

which computes $\operatorname{Ext}_{A b\left(X_{e ́ t a l e}\right)}^{*}\left(K^{p}, \mathcal{F}\right)$. Putting everything together we win.

### 56.6. Higher vanishing for quasi-coherent sheaves

0729 In this section we show that given a quasi-compact and quasi-separated algebraic space $X$ there exists an integer $n=n(X)$ such that the cohomology of any quasicoherent sheaf on $X$ vanishes beyond degree $n$.

072A Lemma 56.6.1. With $S, W, G, U, \chi$ as in Lemma 56.5.5. If $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{U}$-module, then so is $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$.

Proof. The $\mathcal{O}_{U}$-module structure is clear. To check that $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$ is quasicoherent it suffices to check étale locally. Hence the lemma follows as $\underline{\mathbf{Z}}(\chi)$ is finite locally free as a $\underline{\mathbf{Z}}$-module.

The following proposition is interesting even if $X$ is a scheme. It is the natural generalization of Cohomology of Schemes, Lemma 29.4.2. Before we state it, observe that given an étale morphism $f: U \rightarrow X$ from an affine scheme towards a quasiseparated algebraic space $X$ the fibres of $f$ are universally bounded, in particular there exists an integer $d$ such that the fibres of $|U| \rightarrow|X|$ all have size at most $d$; this is the implication $(\eta) \Rightarrow(\delta)$ of Decent Spaces, Lemma 55.5.1.

072B Proposition 56.6.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume $X$ is quasi-compact and separated. Let $U$ be an affine scheme, and let $f: U \rightarrow X$ be a surjective étale morphism. Let $d$ be an upper bound for the size of the fibres of $|U| \rightarrow|X|$. Then for any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{q}(X, \mathcal{F})=0$ for $q \geq d$.
Proof. We will use the spectral sequence of Lemma 56.5.6. The lemma applies since $f$ is separated as $U$ is separated, see Morphisms of Spaces, Lemma 54.4.10. Since $X$ is separated the scheme $U \times_{X} \ldots \times_{X} U$ is a closed subscheme of $U \times_{\operatorname{Spec}(\mathbf{Z})}$ $\ldots \times_{\operatorname{Spec}(\mathbf{Z})} U$ hence is affine. Thus $W_{p}$ is affine. Hence $U_{p}=W_{p} / S_{p+1}$ is an affine scheme by Groupoids, Proposition 38.23.8. The discussion in Section 56.3 shows that cohomology of quasi-coherent sheaves on $W_{p}$ (as an algebraic space) agrees with the cohomology of the corresponding quasi-coherent sheaf on the underlying affine scheme, hence vanishes in positive degrees by Cohomology of Schemes, Lemma 29.2.2. By Lemma 56.6 .1 the sheaves $\left.\mathcal{F}\right|_{U_{p}} \otimes \mathbf{z} \underline{\mathbf{Z}}\left(\chi_{p}\right)$ are quasi-coherent. Hence $H^{q}\left(W_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes \mathbf{Z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)$ is zero when $q>0$. By our definition of the integer $d$ we see that $W_{p}=\emptyset$ for $p \geq d$. Hence also $H^{0}\left(W_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes \mathbf{Z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)$ is zero when $p \geq d$. This proves the proposition.
In the following lemma we establish that a quasi-compact and quasi-separated algebraic space has finite cohomological dimension for quasi-coherent modules. We are explicit about the bound only because we will use it later to prove a similar result for higher direct images.

072C Lemma 56.6.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume $X$ is quasi-compact and quasi-separated. Then we can choose
(1) an affine scheme $U$,
(2) a surjective étale morphism $f: U \rightarrow X$,
(3) an integer $d$ bounding the degrees of the fibres of $U \rightarrow X$,
(4) for every $p=0,1, \ldots, d$ a surjective étale morphism $V_{p} \rightarrow U_{p}$ from an affine scheme $V_{p}$ where $U_{p}$ is as in Lemma 56.5.6, and
(5) an integer $d_{p}$ bounding the degree of the fibres of $V_{p} \rightarrow U_{p}$.

Moreover, whenever we have (1) - (5), then for any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{q}(X, \mathcal{F})=0$ for $q \geq \max \left(d_{p}+p\right)$.
Proof. Since $X$ is quasi-compact we can find a surjective étale morphism $U \rightarrow X$ with $U$ affine, see Properties of Spaces, Lemma 53.6.3. By Decent Spaces, Lemma 55.5 .1 the fibres of $f$ are universally bounded, hence we can find $d$. We have $U_{p}=W_{p} / S_{p+1}$ and $W_{p} \subset U \times_{X} \ldots \times_{X} U$ is open and closed. Since $X$ is quasiseparated the schemes $W_{p}$ are quasi-compact, hence $U_{p}$ is quasi-compact. Since $U$ is separated, the schemes $W_{p}$ are separated, hence $U_{p}$ is separated by (the absolute version of) Spaces, Lemma 52.14.5. By Properties of Spaces, Lemma 53.6.3 we can find the morphisms $V_{p} \rightarrow W_{p}$. By Decent Spaces, Lemma 55.5.1 we can find the integers $d_{p}$.
At this point the proof uses the spectral sequence

$$
E_{1}^{p, q}=H^{q}\left(U_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes \mathbf{z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right) \Rightarrow H^{p+q}(X, \mathcal{F})
$$

see Lemma 56.5.6. By definition of the integer $d$ we see that $U_{p}=0$ for $p \geq d$. By Proposition 56.6.2 and Lemma 56.6.1 we see that $H^{q}\left(U_{p},\left.\mathcal{F}\right|_{U_{p}} \otimes \mathbf{Z} \underline{\mathbf{Z}}\left(\chi_{p}\right)\right)$ is zero for $q \geq d_{p}$ for $p=0, \ldots, d$. Whence the lemma.

### 56.7. Vanishing for higher direct images

073 F We apply the results of Section 56.6 to obtain vanishing of higher direct images of quasi-coherent sheaves for quasi-compact and quasi-separated morphisms. This is useful because it allows one to argue by descending induction on the cohomological degree in certain situations.
073G Lemma 56.7.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that
(1) $f$ is quasi-compact and quasi-separated, and
(2) $Y$ is quasi-compact.

Then there exists an integer $n(X \rightarrow Y)$ such that for any algebraic space $Y^{\prime}$, any morphism $Y^{\prime} \rightarrow Y$ and any quasi-coherent sheaf $\mathcal{F}^{\prime}$ on $X^{\prime}=Y^{\prime} \times_{Y} X$ the higher direct images $R^{i} f_{*}^{\prime} \mathcal{F}^{\prime}$ are zero for $i \geq n(X \rightarrow Y)$.

Proof. Let $V \rightarrow Y$ be a surjective étale morphism where $V$ is an affine scheme, see Properties of Spaces, Lemma 53.6.3. Suppose we prove the result for the base change $f_{V}: V \times_{Y} X \rightarrow V$. Then the result holds for $f$ with $n(X \rightarrow Y)=n\left(X_{V} \rightarrow\right.$ $V$ ). Namely, if $Y^{\prime} \rightarrow Y$ and $\mathcal{F}^{\prime}$ are as in the lemma, then $\left.R^{i} f_{*}^{\prime} \mathcal{F}^{\prime}\right|_{V \times_{Y} Y^{\prime}}$ is equal to $\left.R^{i} f_{V, *}^{\prime} \mathcal{F}^{\prime}\right|_{X_{V}^{\prime}} ^{\prime}$ where $f_{V}^{\prime}: X_{V}^{\prime}=V \times_{Y} Y^{\prime} \times_{Y} X \rightarrow V \times_{Y} Y^{\prime}=Y_{V}^{\prime}$, see Properties of Spaces, Lemma 53.25.2. Thus we may assume that $Y$ is an affine scheme.
Moreover, to prove the vanishing for all $Y^{\prime} \rightarrow Y$ and $\mathcal{F}^{\prime}$ it suffices to do so when $Y^{\prime}$ is an affine scheme. In this case, $R^{i} f_{*}^{\prime} \mathcal{F}^{\prime}$ is quasi-coherent by Lemma 56.3.2. Hence it suffices to prove that $H^{i}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=0$, because $H^{i}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=H^{0}\left(Y^{\prime}, R^{i} f_{*}^{\prime} \mathcal{F}^{\prime}\right)$ by Cohomology on Sites, Lemma 21.14 .6 and the vanishing of higher cohomology of quasi-coherent sheaves on affine algebraic spaces (Proposition 56.6.2).
Choose $U \rightarrow X, d, V_{p} \rightarrow U_{p}$ and $d_{p}$ as in Lemma56.6.3. For any affine scheme $Y^{\prime}$ and morphism $Y^{\prime} \rightarrow Y$ denote $X^{\prime}=Y^{\prime} \times_{Y} X, U^{\prime}=Y^{\prime} \times_{Y} U, V_{p}^{\prime}=Y^{\prime} \times_{Y} V_{p}$. Then $U^{\prime} \rightarrow X^{\prime}, d^{\prime}=d, V_{p}^{\prime} \rightarrow U_{p}^{\prime}$ and $d_{p}^{\prime}=d$ is a collection of choices as in Lemma 56.6.3 for the algebraic space $X^{\prime}$ (details omitted). Hence we see that $H^{i}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=0$ for $i \geq \max \left(p+d_{p}\right)$ and we win.
073H Lemma 56.7.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Then $R^{i} f_{*} \mathcal{F}=0$ for $i>0$ and any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$.

Proof. Recall that an affine morphism of algebraic spaces is representable. Hence this follows from 56.3.1.1 and Cohomology of Schemes, Lemma 29.2.3.

### 56.8. Cohomology with support in a closed subspace

0A4L This section is the analogue of Cohomology, Section 20.22 and Étale Cohomology, Section 49.72 for abelian sheaves on algebraic spaces.
Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ and let $Z \subset X$ be a closed subspace. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. We let

$$
\Gamma_{Z}(X, \mathcal{F})=\{s \in \mathcal{F}(X) \mid \operatorname{Supp}(s) \subset Z\}
$$

be the sections with support in $Z$ (Properties of Spaces, Definition 53.19.3). This is a left exact functor which is not exact in general. Hence we obtain a derived functor

$$
R \Gamma_{Z}(X,-): D\left(X_{\text {étale }}\right) \longrightarrow D(A b)
$$

and cohomology groups with support in $Z$ defined by $H_{Z}^{q}(X, \mathcal{F})=R^{q} \Gamma_{Z}(X, \mathcal{F})$.
Let $\mathcal{I}$ be an injective abelian sheaf on $X_{\text {étale }}$. Let $U \subset X$ be the open subspace which is the complement of $Z$. Then the restriction map $\mathcal{I}(X) \rightarrow \mathcal{I}(U)$ is surjective (Cohomology on Sites, Lemma 21.12.6) with kernel $\Gamma_{Z}(X, \mathcal{I})$. It immediately follows that for $K \in D\left(X_{\text {étale }}\right)$ there is a distinguished triangle

$$
R \Gamma_{Z}(X, K) \rightarrow R \Gamma(X, K) \rightarrow R \Gamma(U, K) \rightarrow R \Gamma_{Z}(X, K)[1]
$$

in $D(A b)$. As a consequence we obtain a long exact cohomology sequence

$$
\ldots \rightarrow H_{Z}^{i}(X, K) \rightarrow H^{i}(X, K) \rightarrow H^{i}(U, K) \rightarrow H_{Z}^{i+1}(X, K) \rightarrow \ldots
$$

for any $K$ in $D\left(X_{\text {étale }}\right)$.
For an abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we can consider the subsheaf of sections with support in $Z$, denoted $\mathcal{H}_{Z}(\mathcal{F})$, defined by the rule

$$
\mathcal{H}_{Z}(\mathcal{F})(U)=\left\{s \in \mathcal{F}(U) \mid \operatorname{Supp}(s) \subset U \times_{X} Z\right\}
$$

Here we use the support of a section from Properties of Spaces, Definition 53.19.3. Using the equivalence of Morphisms of Spaces, Lemma 54.13.5 we may view $\mathcal{H}_{Z}(\mathcal{F})$ as an abelian sheaf on $Z_{\text {étale }}$. Thus we obtain a functor

$$
A b\left(X_{\text {étale }}\right) \longrightarrow A b\left(Z_{\text {étale }}\right), \quad \mathcal{F} \longmapsto \mathcal{H}_{Z}(\mathcal{F})
$$

which is left exact, but in general not exact.
0A4M Lemma 56.8.1. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{I}$ be an injective abelian sheaf on $X_{\text {étale }}$. Then $\mathcal{H}_{Z}(\mathcal{I})$ is an injective abelian sheaf on $Z_{\text {étale }}$.

Proof. Observe that for any abelian sheaf $\mathcal{G}$ on $Z_{\text {étale }}$ we have

$$
\operatorname{Hom}_{Z}\left(\mathcal{G}, \mathcal{H}_{Z}(\mathcal{F})\right)=\operatorname{Hom}_{X}\left(i_{*} \mathcal{G}, \mathcal{F}\right)
$$

because after all any section of $i_{*} \mathcal{G}$ has support in $Z$. Since $i_{*}$ is exact (Lemma 56.3.1) and as $\mathcal{I}$ is injective on $X_{\text {étale }}$ we conclude that $\mathcal{H}_{Z}(\mathcal{I})$ is injective on $Z_{\text {étale }}$.

Denote

$$
R \mathcal{H}_{Z}: D\left(X_{\text {étale }}\right) \longrightarrow D\left(Z_{\text {étale }}\right)
$$

the derived functor. We set $\mathcal{H}_{Z}^{q}(\mathcal{F})=R^{q} \mathcal{H}_{Z}(\mathcal{F})$ so that $\mathcal{H}_{Z}^{0}(\mathcal{F})=\mathcal{H}_{Z}(\mathcal{F})$. By the lemma above we have a Grothendieck spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(Z, \mathcal{H}_{Z}^{q}(\mathcal{F})\right) \Rightarrow H_{Z}^{p+q}(X, \mathcal{F})
$$

0A4N Lemma 56.8.2. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{G}$ be an injective abelian sheaf on $Z_{\text {étale }}$. Then $\mathcal{H}_{Z}^{p}\left(i_{*} \mathcal{G}\right)=0$ for $p>0$.

Proof. This is true because the functor $i_{*}$ is exact (Lemma 56.3.1) and transforms injective abelian sheaves into injective abelian sheaves (Cohomology on Sites, Lemma 21.14.2.
0A4P Lemma 56.8.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an étale morphism of algebraic spaces over $S$. Let $Z \subset Y$ be a closed subspace such that $f^{-1}(Z) \rightarrow Z$ is an isomorphism of algebraic spaces. Let $\mathcal{F}$ be an abelian sheaf on $X$. Then

$$
\mathcal{H}_{Z}^{q}(\mathcal{F})=\mathcal{H}_{f^{-1}(Z)}^{q}\left(f^{-1} \mathcal{F}\right)
$$

as abelian sheaves on $Z=f^{-1}(Z)$ and we have $H_{Z}^{q}(Y, \mathcal{F})=H_{f^{-1}(Z)}^{q}\left(X, f^{-1} \mathcal{F}\right)$.
Proof. Because $f$ is étale an injective resolution of $\mathcal{F}$ pulls back to an injective resolution of $f^{-1} \mathcal{F}$. Hence it suffices to check the equality for $\mathcal{H}_{Z}(-)$ which follows from the definitions. The proof for cohomology with supports is the same. Some details omitted.

Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset. We denote $D_{T}$ ( $\left.X_{\text {étale }}\right)$ the strictly full saturated triangulated subcategory of $D\left(X_{\text {étale }}\right)$ consisting of objects whose cohomology sheaves are supported on $T$.

0AEI Lemma 56.8.4. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. The map $R i_{*}=i_{*}: D\left(Z_{\text {étale }}\right) \rightarrow D\left(X_{\text {étale }}\right)$ induces an equivalence $D\left(Z_{\text {étale }}\right) \rightarrow D_{|Z|}\left(X_{\text {étale }}\right)$ with quasi-inverse

$$
\left.i^{-1}\right|_{D_{Z}\left(X_{\text {étale }}\right)}=\left.R \mathcal{H}_{Z}\right|_{D_{|Z|}\left(X_{\text {étale }}\right)}
$$

Proof. Recall that $i^{-1}$ and $i_{*}$ is an adjoint pair of exact functors such that $i^{-1} i_{*}$ is isomorphic to the identify functor on abelian sheaves. See Properties of Spaces, Lemma 53.18 .9 and Morphisms of Spaces, Lemma 54.13.5. Thus $i_{*}: D\left(Z_{\text {étale }}\right) \rightarrow$ $D_{Z}\left(X_{\text {étale }}\right)$ is fully faithfull and $i^{-1}$ determines a left inverse. On the other hand, suppose that $K$ is an object of $D_{Z}\left(X_{\text {étale }}\right)$ and consider the adjunction map $K \rightarrow$ $i_{*} i^{-1} K$. Using exactness of $i_{*}$ and $i^{-1}$ this induces the adjunction maps $H^{n}(K) \rightarrow$ $i_{*} i^{-1} H^{n}(K)$ on cohomology sheaves. Since these cohomology sheaves are supported on $Z$ we see these adjunction maps are isomorphisms and we conclude that $D\left(Z_{\text {étale }}\right) \rightarrow D_{Z}\left(X_{\text {étale }}\right)$ is an equivalence.
To finish the proof we have to show that $R \mathcal{H}_{Z}(K)=i^{-1} K$ if $K$ is an object of $D_{Z}\left(X_{\text {étale }}\right)$. To do this we can use that $K=i_{*} i^{-1} K$ as we've just proved this is the case. Then we can choose a K-injective representative $\mathcal{I}^{\bullet}$ for $i^{-1} K$. Since $i_{*}$ is the right adjoint to the exact functor $i^{-1}$, the complex $i_{*} \mathcal{I}^{\bullet}$ is K-injective (Derived Categories, Lemma 13.29.9. We see that $R \mathcal{H}_{Z}(K)$ is computed by $\mathcal{H}_{Z}\left(i_{*} \mathcal{I}^{\bullet}\right)=\mathcal{I}^{\bullet}$ as desired.

### 56.9. Vanishing above the dimension

0A4Q Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. In this case $|X|$ is a spectral space, see Properties of Spaces, Lemma 53.14 .2 . Moreover, the dimension of $X$ (as defined in Properties of Spaces, Definition 53.8.2) is equal to the Krull dimension of $|X|$, see Decent Spaces, Lemma 55.10.10. We will show that for quasi-coherent sheaves on $X$ we have vanishing of cohomology above the dimension. This result is already interesting for quasi-separated algebraic spaces of finite type over a field.

0A4R Lemma 56.9.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Assume $\operatorname{dim}(X) \leq d$ for some integer $d$. Let $\mathcal{F}$ be a quasicoherent sheaf $\mathcal{F}$ on $X$.
(1) $H^{q}(X, \mathcal{F})=0$ for $q>d$,
(2) $H^{d}(X, \mathcal{F}) \rightarrow H^{d}(U, \mathcal{F})$ is surjective for any quasi-compact open $U \subset X$,
(3) $H_{Z}^{q}(X, \mathcal{F})=0$ for $q>d$ for any closed subspace $Z \subset X$ whose complement is quasi-compact.

Proof. By Properties of Spaces, Lemma 53.21.5 every algebraic space $Y$ étale over $X$ has dimension $\leq d$. If $Y$ is quasi-separated, the dimension of $Y$ is equal to the Krull dimension of $|Y|$ by Decent Spaces, Lemma 55.10.10. Also, if $Y$ is a scheme, then étale cohomology of $\mathcal{F}$ over $Y$, resp. étale cohomology of $\mathcal{F}$ with support in a closed subscheme, agrees with usual cohomology of $\mathcal{F}$, resp. usual cohomology with support in the closed subscheme. See Descent, Proposition 34.7.10 and Étale Cohomology, Lemma 49.72.5. We will use these facts without further mention.

By Decent Spaces, Lemma 55.8.6 there exist an integer $n$ and open subspaces

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

with the following property: setting $T_{p}=U_{p} \backslash U_{p+1}$ (with reduced induced subspace structure) there exists a quasi-compact separated scheme $V_{p}$ and a surjective étale morphism $f_{p}: V_{p} \rightarrow U_{p}$ such that $f_{p}^{-1}\left(T_{p}\right) \rightarrow T_{p}$ is an isomorphism.

As $U_{n}=V_{n}$ is a scheme, our initial remarks imply the cohomology of $\mathcal{F}$ over $U_{n}$ vanishes in degrees $>d$ by Cohomology, Proposition 20.23.4. Suppose we have shown, by induction, that $H^{q}\left(U_{p+1},\left.\mathcal{F}\right|_{U_{p+1}}\right)=0$ for $q>d$. It suffices to show $H_{T_{p}}^{q}\left(U_{p}, \mathcal{F}\right)$ for $q>d$ is zero in order to conclude the vanishing of cohomology of $\mathcal{F}$ over $U_{p}$ in degrees $>d$. However, we have

$$
H_{T_{p}}^{q}\left(U_{p}, \mathcal{F}\right)=H_{f_{p}^{-1}\left(T_{p}\right)}^{q}\left(V_{p}, \mathcal{F}\right)
$$

by Lemma 56.8 .3 and as $V_{p}$ is a scheme we obtain the desired vanishing from Cohomology, Proposition 20.23.4. In this way we conclude that (1) is true.

To prove (2) let $U \subset X$ be a quasi-compact open subspace. Consider the open subspace $U^{\prime}=U \cup U_{n}$. Let $Z=U^{\prime} \backslash U$. Then $g: U_{n} \rightarrow U^{\prime}$ is an étale morphism such that $g^{-1}(Z) \rightarrow Z$ is an isomorphism. Hence by Lemma 56.8.3 we have $H_{Z}^{q}\left(U^{\prime}, \mathcal{F}\right)=$ $H_{Z}^{q}\left(U_{n}, \mathcal{F}\right)$ which vanishes in degree $>d$ because $U_{n}$ is a scheme and we can apply Cohomology, Proposition 20.23.4. We conclude that $H^{d}\left(U^{\prime}, \mathcal{F}\right) \rightarrow H^{d}(U, \mathcal{F})$ is surjective. Assume, by induction, that we have reduced our problem to the case where $U$ contains $U_{p+1}$. Then we set $U^{\prime}=U \cup U_{p}$, set $Z=U^{\prime} \backslash U$, and we argue using the morphism $f_{p}: V_{p} \rightarrow U^{\prime}$ which is étale and has the property that $f_{p}^{-1}(Z) \rightarrow Z$ is an isomorphism. In other words, we again see that

$$
H_{Z}^{q}\left(U^{\prime}, \mathcal{F}\right)=H_{f_{p}^{-1}(Z)}^{q}\left(V_{p}, \mathcal{F}\right)
$$

and we again see this vanishes in degrees $>d$. We conclude that $H^{d}\left(U^{\prime}, \mathcal{F}\right) \rightarrow$ $H^{d}(U, \mathcal{F})$ is surjective. Eventually we reach the stage where $U_{1}=X \subset U$ which finishes the proof.

A formal argument shows that (2) implies (3).

### 56.10. Cohomology and base change, I

073I Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Suppose further that $g: Y^{\prime} \rightarrow Y$ is a morphism of algebraic spaces over $S$. Denote $X^{\prime}=X_{Y^{\prime}}=Y^{\prime} \times_{Y} X$ the base change of $X$ and denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$. Also write $g^{\prime}: X^{\prime} \rightarrow X$ the projection,
and set $\mathcal{F}^{\prime}=\left(g^{\prime}\right)^{*} \mathcal{F}$. Here is a diagram representing the situation:

073J (56.10.0.1)

Here is the basic result for a flat base change.
073K Lemma 56.10.1. In the situation above, assume that $g$ is flat and that $f$ is quasi-compact and quasi-separated. Then we have

$$
R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}=g^{*} R^{p} f_{*} \mathcal{F}
$$

for all $p \geq 0$ with notation as in 56.10.0.1.
Proof. The morphism $g^{\prime}$ is flat by Morphisms of Spaces, Lemma 54.29.4 Note that flatness of $g$ and $g^{\prime}$ is equivalent to flatness of the morphisms of small étale ringed sites, see Morphisms of Spaces, Lemma 54.29.9. Hence we can apply Cohomology on Sites, Lemma 21.15.1 to obtain a base change map

$$
g^{*} R^{p} f_{*} \mathcal{F} \longrightarrow R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}
$$

To prove this map is an isomorphism we can work locally in the étale topology on $Y^{\prime}$. Thus we may assume that $Y$ and $Y^{\prime}$ are affine schemes. Say $Y=\operatorname{Spec}(A)$ and $Y^{\prime}=\operatorname{Spec}(B)$. In this case we are really trying to show that the map

$$
H^{p}(X, \mathcal{F}) \otimes_{A} B \longrightarrow H^{p}\left(X_{B}, \mathcal{F}_{B}\right)
$$

is an isomorphism where $X_{B}=\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} X$ and $\mathcal{F}_{B}$ is the pullback of $\mathcal{F}$ to $X_{B}$.

Fix $A \rightarrow B$ a flat ring map and let $X$ be a quasi-compact and quasi-separated algebraic space over $A$. Note that $g^{\prime}: X_{B} \rightarrow X$ is affine as a base change of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$. Hence the higher direct images $R^{i}\left(g^{\prime}\right)_{*} \mathcal{F}_{B}$ are zero by Lemma 56.7.2. Thus $H^{p}\left(X_{B}, \mathcal{F}_{B}\right)=H^{p}\left(X, g_{*}^{\prime} \mathcal{F}_{B}\right)$, see Cohomology on Sites, Lemma 21.14.6. Moreover, we have

$$
g_{*}^{\prime} \mathcal{F}_{B}=\mathcal{F} \otimes_{\underline{A}} \underline{B}
$$

where $\underline{A}, \underline{B}$ denotes the constant sheaf of rings with value $A, B$. Namely, it is clear that there is a map from right to left. For any affine scheme $U$ étale over $X$ we have

$$
\begin{aligned}
g_{*}^{\prime} \mathcal{F}_{B}(U) & =\mathcal{F}_{B}\left(\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} U\right) \\
& =\Gamma\left(\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} U,\left.\left(\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} U \rightarrow U\right)^{*} \mathcal{F}\right|_{U}\right) \\
& =B \otimes_{A} \mathcal{F}(U)
\end{aligned}
$$

hence the map is an isomorphism. Write $B=\operatorname{colim} M_{i}$ as a filtered colimit of finite free $A$-modules $M_{i}$ using Lazard's theorem, see Algebra, Theorem 10.80.4.

We deduce that

$$
\begin{aligned}
H^{p}\left(X, g_{*}^{\prime} \mathcal{F}_{B}\right) & =H^{p}\left(X, \mathcal{F} \otimes_{\underline{A}} \underline{B}\right) \\
& =H^{p}\left(X, \operatorname{colim}_{i} \mathcal{F} \otimes_{\underline{A}} \underline{M_{i}}\right) \\
& =\operatorname{colim}_{i} H^{p}\left(X, \mathcal{F} \otimes_{\underline{A}} \underline{M_{i}}\right) \\
& =\operatorname{colim}_{i} H^{p}(X, \mathcal{F}) \otimes_{A} M_{i} \\
& =H^{p}(X, \mathcal{F}) \otimes_{A} \operatorname{colim}_{i} M_{i} \\
& =H^{p}(X, \mathcal{F}) \otimes_{A} B
\end{aligned}
$$

The first equality because $g_{*}^{\prime} \mathcal{F}_{B}=\mathcal{F} \otimes_{\underline{A}} \underline{B}$ as seen above. The second because $\otimes$ commutes with colimits. The third equality because cohomology on $X$ commutes with colimits (see Lemma 56.4.1). The fourth equality because $M_{i}$ is finite free (i.e., because cohomology commutes with finite direct sums). The fifth because $\otimes$ commutes with colimits. The sixth by choice of our system.

07U8 Lemma 56.10.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. In this case $f_{*} \mathcal{F} \cong R f_{*} \mathcal{F}$ is a quasi-coherent sheaf, and for every diagram 56.10.0.1 we have $g^{*} f_{*} \mathcal{F}=f_{*}^{\prime}\left(g^{\prime}\right)^{*} \mathcal{F}$.

Proof. By the discussion surrounding (56.3.1.1 this reduces to the case of an affine morphism of schemes which is treated in Cohomology of Schemes, Lemma 29.5 .1

### 56.11. Coherent modules on locally Noetherian algebraic spaces

07U9 This section is the analogue of Cohomology of Schemes, Section 29.9. In Modules on Sites, Definition 18.23 .1 we have defined coherent modules on any ringed topos. We use this notion to define coherent modules on locally Noetherian algebraic spaces. Although it is possible to work with coherent modules more generally we resist the urge to do so.

07UA Definition 56.11.1. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. A quasi-coherent module $\mathcal{F}$ on $X$ is called coherent if $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module on the site $X_{\text {étale }}$ in the sense of Modules on Sites, Definition 18.23.1,

Of course this definition is a bit hard to work with. We usually use the characterization given in the lemma below.

07UB Lemma 56.11.2. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is coherent,
(2) $\mathcal{F}$ is a quasi-coherent, finite type $\mathcal{O}_{X}$-module,
(3) $\mathcal{F}$ is a finitely presented $\mathcal{O}_{X}$-module,
(4) for any étale morphism $\varphi: U \rightarrow X$ where $U$ is a scheme the pullback $\varphi^{*} \mathcal{F}$ is a coherent module on $U$, and
(5) there exists a surjective étale morphism $\varphi: U \rightarrow X$ where $U$ is a scheme such that the pullback $\varphi^{*} \mathcal{F}$ is a coherent module on $U$.
In particular $\mathcal{O}_{X}$ is coherent, any invertible $\mathcal{O}_{X}$-module is coherent, and more generally any finite locally free $\mathcal{O}_{X}$-module is coherent.

Proof. To be sure, if $X$ is a locally Noetherian algebraic space and $U \rightarrow X$ is an étale morphism, then $U$ is locally Noetherian, see Properties of Spaces, Section 53.7 . The lemma then follows from the points (1) - (5) made in Properties of Spaces, Section 53.29 and the corresponding result for coherent modules on locally Noetherian schemes, see Cohomology of Schemes, Lemma 29.9.1.

07UC Lemma 56.11.3. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. The category of coherent $\mathcal{O}_{X}$-modules is abelian. More precisely, the kernel and cokernel of a map of coherent $\mathcal{O}_{X}$-modules are coherent. Any extension of coherent sheaves is coherent.

Proof. Choose a scheme $U$ and a surjective étale morphism $f: U \rightarrow X$. Pullback $f^{*}$ is an exact functor as it equals a restriction functor, see Properties of Spaces, Equation 53.25.1.1). By Lemma 56.11 .2 we can check whether an $\mathcal{O}_{X}$-module $\mathcal{F}$ is coherent by checking whether $f^{*} \mathcal{F}$ is coherent. Hence the lemma follows from the case of schemes which is Cohomology of Schemes, Lemma 29.9.2.

Coherent modules form a Serre subcategory of the category of quasi-coherent $\mathcal{O}_{X^{-}}$ modules. This does not hold for modules on a general ringed topos.

07UD Lemma 56.11.4. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Any quasi-coherent submodule of $\mathcal{F}$ is coherent. Any quasi-coherent quotient module of $\mathcal{F}$ is coherent.

Proof. Choose a scheme $U$ and a surjective étale morphism $f: U \rightarrow X$. Pullback $f^{*}$ is an exact functor as it equals a restriction functor, see Properties of Spaces, Equation (53.25.1.1). By Lemma 56.11 .2 we can check whether an $\mathcal{O}_{X}$-module $\mathcal{G}$ is coherent by checking whether $f^{*} \mathcal{H}$ is coherent. Hence the lemma follows from the case of schemes which is Cohomology of Schemes, Lemma 29.9.3.

07UE Lemma 56.11.5. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$, Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. The $\mathcal{O}_{X}$-modules $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$ and $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ are coherent.
Proof. Via Lemma 56.11 .2 this follows from the result for schemes, see Cohomology of Schemes, Lemma 29.9.4.

07UF Lemma 56.11.6. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of $\mathcal{O}_{X}$-modules. Let $\bar{x}$ be a geometric point of $X$ lying over $x \in|X|$.
(1) If $\mathcal{F}_{\bar{x}}=0$ then there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.\mathcal{F}\right|_{X^{\prime}}=0$.
(2) If $\varphi_{\bar{x}}: \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is injective, then there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.\varphi\right|_{X^{\prime}}$ is injective.
(3) If $\varphi_{\bar{x}}: \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is surjective, then there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.\varphi\right|_{X^{\prime}}$ is surjective.
(4) If $\varphi_{\bar{x}}: \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is bijective, then there exists an open neighbourhood $X^{\prime} \subset X$ of $x$ such that $\left.\varphi\right|_{X^{\prime}}$ is an isomorphism.

Proof. Let $\varphi: U \rightarrow X$ be an étale morphism where $U$ is a scheme and let $u \in U$ be a point mapping to $x$. By Properties of Spaces, Lemmas 53.28.4 and 53.21.1 as well as More on Algebra, Lemma 15.36 .1 we see that $\varphi_{\bar{x}}$ is injective, surjective, or bijective if and only if $\varphi_{u}: \varphi^{*} \mathcal{F}_{u} \rightarrow \varphi^{*} \mathcal{G}_{u}$ has the corresponding property. Thus we
can apply the schemes version of this lemma to see that (after possibly shrinking $U)$ the $\operatorname{map} \varphi^{*} \mathcal{F} \rightarrow \varphi^{*} \mathcal{G}$ is injective, surjective, or an isomorphism. Let $X^{\prime} \subset X$ be the open subspace corresponding to $|\varphi|(|U|) \subset|X|$, see Properties of Spaces, Lemma 53.4.8. Since $\left\{U \rightarrow X^{\prime}\right\}$ is a covering for the étale topology, we conclude that $\left.\varphi\right|_{X^{\prime}}$ is injective, surjective, or an isomorphism as desired. Finally, observe that (1) follows from (2) by looking at the map $\mathcal{F} \rightarrow 0$.

07UG Lemma 56.11.7. Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Let $i: Z \rightarrow X$ be the scheme theoretic support of $\mathcal{F}$ and $\mathcal{G}$ the quasi-coherent $\mathcal{O}_{Z}$-module such that $i_{*} \mathcal{G}=\mathcal{F}$, see Morphisms of Spaces, Definition 54.15.4. Then $\mathcal{G}$ is a coherent $\mathcal{O}_{Z}$-module.

Proof. The statement of the lemma makes sense as a coherent module is in particular of finite type. Moreover, as $Z \rightarrow X$ is a closed immersion it is locally of finite type and hence $Z$ is locally Noetherian, see Morphisms of Spaces, Lemmas 54.23.7 and 54.23.5. Finally, as $\mathcal{G}$ is of finite type it is a coherent $\mathcal{O}_{Z}$-module by Lemma 56.11 .2

08AM Lemma 56.11.8. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of locally Noetherian algebraic spaces over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals cutting out $Z$. The functor $i_{*}$ induces an equivalence between the category of coherent $\mathcal{O}_{X}$-modules annihilated by $\mathcal{I}$ and the category of coherent $\mathcal{O}_{Z}$-modules.

Proof. The functor is fully faithful by Morphisms of Spaces, Lemma 54.14.1. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module annihilated by $\mathcal{I}$. By Morphisms of Spaces, Lemma 54.14.1 we can write $\mathcal{F}=i_{*} \mathcal{G}$ for some quasi-coherent sheaf $\mathcal{G}$ on $Z$. To check that $\mathcal{G}$ is coherent we can work étale locally (Lemma 56.11.2). Choosing an étale covering by a scheme we conclude that $\mathcal{G}$ is coherent by the case of schemes (Cohomology of Schemes, Lemma 29.9.8). Hence the functor is fully faithful and the proof is done.

07UH Lemma 56.11.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a finite morphism of algebraic spaces over $S$ with $Y$ locally Noetherian. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Assume $f$ is finite and $Y$ locally Noetherian. Then $R^{p} f_{*} \mathcal{F}=0$ for $p>0$ and $f_{*} \mathcal{F}$ is coherent.

Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Then $V \times_{Y}$ $X \rightarrow V$ is a finite morphism of locally Noetherian schemes. By (56.3.1.1) we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.9.9.

### 56.12. Coherent sheaves on Noetherian spaces

07 UI In this section we mention some properties of coherent sheaves on Noetherian algebraic spaces.

07UJ Lemma 56.12.1. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The ascending chain condition holds for quasi-coherent submodules of $\mathcal{F}$. In other words, given any sequence

$$
\mathcal{F}_{1} \subset \mathcal{F}_{2} \subset \ldots \subset \mathcal{F}
$$

of quasi-coherent submodules, then $\mathcal{F}_{n}=\mathcal{F}_{n+1}=\ldots$ for some $n \geq 0$.

Proof. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 53.6.3). Then $U$ is a Noetherian scheme (by Morphisms of Spaces, Lemma 54.23.5). If $\left.\mathcal{F}_{n}\right|_{U}=\left.\mathcal{F}_{n+1}\right|_{U}=\ldots$ then $\mathcal{F}_{n}=\mathcal{F}_{n+1}=\ldots$. Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.1.

07UK Lemma 56.12.2. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals corresponding to a closed subspace $Z \subset X$. Then there is some $n \geq 0$ such that $\mathcal{I}^{n} \mathcal{F}=0$ if and only if $\operatorname{Supp}(\mathcal{F}) \subset Z$ (set theoretically).

Proof. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 53.6.3). Then $U$ is a Noetherian scheme (by Morphisms of Spaces, Lemma 54.23.5). Note that $\left.\mathcal{I}^{n} \mathcal{F}\right|_{U}=0$ if and only if $\mathcal{I}^{n} \mathcal{F}=0$ and similarly for the condition on the support. Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.2.
07UL Lemma 56.12.3 (Artin-Rees). Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $\mathcal{G} \subset \mathcal{F}$ be a quasi-coherent subsheaf. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Then there exists a $c \geq 0$ such that for all $n \geq c$ we have

$$
\mathcal{I}^{n-c}\left(\mathcal{I}^{c} \mathcal{F} \cap \mathcal{G}\right)=\mathcal{I}^{n} \mathcal{F}
$$

Proof. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 53.6.3). Then $U$ is a Noetherian scheme (by Morphisms of Spaces, Lemma 54.23.5). The equality of the lemma holds if and only if it holds after restricting to $U$. Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.3.
07UM Lemma 56.12.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Denote $Z \subset X$ the corresponding closed subspace and set $U=X \backslash Z$. There is a canonical isomorphism

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n} \mathcal{G}, \mathcal{F}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{G}\right|_{U},\left.\mathcal{F}\right|_{U}\right)
$$

In particular we have an isomorphism

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n}, \mathcal{F}\right) \longrightarrow \Gamma(U, \mathcal{F})
$$

Proof. Let $W$ be an affine scheme and let $W \rightarrow X$ be a surjective étale morphism (see Properties of Spaces, Lemma 53.6.3). Set $R=W \times_{X} W$. Then $W$ and $R$ are Noetherian schemes, see Morphisms of Spaces, Lemma 54.23.5. Hence the result hold for the restrictions of $\mathcal{F}, \mathcal{G}$, and $\mathcal{I}, U, Z$ to $W$ and $R$ by Cohomology of Schemes, Lemma 29.10.4. It follows formally that the result holds over $X$.

### 56.13. Devissage of coherent sheaves

07UN This section is the analogue of Cohomology of Schemes, Section 29.12.
07UP Lemma 56.13.1. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Suppose that $\operatorname{Supp}(\mathcal{F})=Z \cup Z^{\prime}$ with $Z, Z^{\prime}$ closed. Then there exists a short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow 0
$$

with $\operatorname{Supp}\left(\mathcal{G}^{\prime}\right) \subset Z^{\prime}$ and $\operatorname{Supp}(\mathcal{G}) \subset Z$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the sheaf of ideals defining the reduced induced closed subspace structure on $Z$, see Properties of Spaces, Lemma 53.11.4. Consider the subsheaves $\mathcal{G}_{n}^{\prime}=\mathcal{I}^{n} \mathcal{F}$ and the quotients $\mathcal{G}_{n}=\mathcal{F} / \mathcal{I}^{n} \mathcal{F}$. For each $n$ we have a short exact sequence

$$
0 \rightarrow \mathcal{G}_{n}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{G}_{n} \rightarrow 0
$$

For every geometric point $\bar{x}$ of $Z^{\prime} \backslash Z$ we have $\mathcal{I}_{\bar{x}}=\mathcal{O}_{X, \bar{x}}$ and hence $\mathcal{G}_{n, \bar{x}}=0$. Thus we see that $\operatorname{Supp}\left(\mathcal{G}_{n}\right) \subset Z$. Note that $X \backslash Z^{\prime}$ is a Noetherian algebraic space. Hence by Lemma 56.12 .2 there exists an $n$ such that $\left.\mathcal{G}_{n}^{\prime}\right|_{X \backslash Z^{\prime}}=\left.\mathcal{I}^{n} \mathcal{F}\right|_{X \backslash Z^{\prime}}=0$. For such an $n$ we see that $\operatorname{Supp}\left(\mathcal{G}_{n}^{\prime}\right) \subset Z^{\prime}$. Thus setting $\mathcal{G}^{\prime}=\mathcal{G}_{n}^{\prime}$ and $\mathcal{G}=\mathcal{G}_{n}$ works.

In the following we will freely use the scheme theoretic support of finite type modules as defined in Morphisms of Spaces, Definition 54.15.4.

07UQ Lemma 56.13.2. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Assume that the scheme theoretic support of $\mathcal{F}$ is a reduced $Z \subset X$ with $|Z|$ irreducible. Then there exist an integer $r>0$, a nonzero sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$, and an injective map of coherent sheaves

$$
i_{*}\left(\mathcal{I}^{\oplus r}\right) \rightarrow \mathcal{F}
$$

whose cokernel is supported on a proper closed subspace of $Z$.
Proof. By assumption there exists a coherent $\mathcal{O}_{Z}$-module $\mathcal{G}$ with support $Z$ and $\mathcal{F} \cong i_{*} \mathcal{G}$, see Lemma 56.11.7. Hence it suffices to prove the lemma for the case $Z=X$ and $i=\mathrm{id}$.

By Properties of Spaces, Proposition 53.12 .3 there exists a dense open subspace $U \subset X$ which is a scheme. Note that $U$ is a Noetherian integral scheme. After shrinking $U$ we may assume that $\left.\mathcal{F}\right|_{U} \cong \mathcal{O}_{U}^{\oplus r}$ (for example by Cohomology of Schemes, Lemma 29.12 .2 or by a direct algebra argument). Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals whose associated closed subspace is the complement of $U$ in $X$ (see for example Properties of Spaces, Section 53.11). By Lemma 56.12.4 there exists an $n \geq 0$ and a morphism $\mathcal{I}^{n}\left(\mathcal{O}_{X}^{\oplus r}\right) \rightarrow \mathcal{F}$ which recovers our isomorphism over $U$. Since $\mathcal{I}^{n}\left(\mathcal{O}_{X}^{\oplus r}\right)=\left(\mathcal{I}^{n}\right)^{\oplus r}$ we get a map as in the lemma. It is injective: namely, if $\sigma$ is a nonzero section of $\mathcal{I}^{\oplus r}$ over a scheme $W$ étale over $X$, then because $X$ hence $W$ is reduced the support of $\sigma$ contains a nonempty open of $W$. But the kernel of $\left(\mathcal{I}^{n}\right)^{\oplus r} \rightarrow \mathcal{F}$ is zero over a dense open, hence $\sigma$ cannot be a section of the kernel.

07UR Lemma 56.13.3. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X$. There exists a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that for each $j=1, \ldots, m$ there exists a reduced closed subspace $Z_{j} \subset X$ with $\left|Z_{j}\right|$ irreducible and a sheaf of ideals $\mathcal{I}_{j} \subset \mathcal{O}_{Z_{j}}$ such that

$$
\mathcal{F}_{j} / \mathcal{F}_{j-1} \cong\left(Z_{j} \rightarrow X\right)_{*} \mathcal{I}_{j}
$$

Proof. Consider the collection

$$
\mathcal{T}=\left\{\begin{array}{c}
T \subset|X| \text { closed such that there exists a coherent sheaf } \mathcal{F} \\
\text { with } \operatorname{Supp}(\mathcal{F})=T \text { for which the lemma is wrong }
\end{array}\right\}
$$

We are trying to show that $\mathcal{T}$ is empty. If not, then because $|X|$ is Noetherian (Properties of Spaces, Lemma 53.23.2) we can choose a minimal element $T \in \mathcal{T}$. This means that there exists a coherent sheaf $\mathcal{F}$ on $X$ whose support is $T$ and for which the lemma does not hold. Clearly $T \neq \emptyset$ since the only sheaf whose support is empty is the zero sheaf for which the lemma does hold (with $m=0$ ).
If $T$ is not irreducible, then we can write $T=Z_{1} \cup Z_{2}$ with $Z_{1}, Z_{2}$ closed and strictly smaller than $T$. Then we can apply Lemma 56.13 .1 to get a short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{G}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{G}_{2} \rightarrow 0
$$

with $\operatorname{Supp}\left(\mathcal{G}_{i}\right) \subset Z_{i}$. By minimality of $T$ each of $\mathcal{G}_{i}$ has a filtration as in the statement of the lemma. By considering the induced filtration on $\mathcal{F}$ we arrive at a contradiction. Hence we conclude that $T$ is irreducible.
Suppose $T$ is irreducible. Let $\mathcal{J}$ be the sheaf of ideals defining the reduced induced closed subspace structure on $T$, see Properties of Spaces, Lemma 53.11.4. By Lemma 56.12 .2 we see there exists an $n \geq 0$ such that $\mathcal{J}^{n} \mathcal{F}=0$. Hence we obtain a filtration

$$
0=\mathcal{I}^{n} \mathcal{F} \subset \mathcal{I}^{n-1} \mathcal{F} \subset \ldots \subset \mathcal{I F} \subset \mathcal{F}
$$

each of whose successive subquotients is annihilated by $\mathcal{J}$. Hence if each of these subquotients has a filtration as in the statement of the lemma then also $\mathcal{F}$ does. In other words we may assume that $\mathcal{J}$ does annihilate $\mathcal{F}$.
Assume $T$ is irreducible and $\mathcal{J F}=0$ where $\mathcal{J}$ is as above. Then the scheme theoretic support of $\mathcal{F}$ is $T$, see Morphisms of Spaces, Lemma 54.14.1. Hence we can apply Lemma 56.13.2. This gives a short exact sequence

$$
0 \rightarrow i_{*}\left(\mathcal{I}^{\oplus r}\right) \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0
$$

where the support of $\mathcal{Q}$ is a proper closed subset of $T$. Hence we see that $\mathcal{Q}$ has a filtration of the desired type by minimality of $T$. But then clearly $\mathcal{F}$ does too, which is our final contradiction.

07US Lemma 56.13.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$. Assume
(1) For any short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

if $\mathcal{F}_{i}, i=1,2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) For every reduced closed subspace $Z \subset X$ with $|Z|$ irreducible and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $i_{*} \mathcal{I}$.
Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. First note that if $\mathcal{F}$ is a coherent sheaf with a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that each of $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. This follows from the property (1) for $\mathcal{P}$. On the other hand, by Lemma 56.13 .3 we can filter any $\mathcal{F}$ with successive subquotients as in (2). Hence the lemma follows.

Here is a more useful variant of the lemma above.
07UT Lemma 56.13.5. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$. Assume
(1) For any short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

if $\mathcal{F}_{i}, i=1,2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every reduced closed subspace $i: Z \rightarrow X$ with $|Z|$ irreducible there exists a coherent sheaf $\mathcal{G}$ on $Z$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z$,
(b) for every nonzero quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ there exists a quasi-coherent subsheaf $\mathcal{G}^{\prime} \subset \mathcal{I G}$ such that $\operatorname{Supp}\left(\mathcal{G} / \mathcal{G}^{\prime}\right)$ is proper closed in $Z$ and such that $\mathcal{P}$ holds for $i_{*} \mathcal{G}^{\prime}$.
Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. Consider the collection

$$
\mathcal{T}=\left\{\begin{array}{c}
T \subset|X| \text { closed such that there exists a coherent sheaf } \mathcal{F} \\
\text { with } \operatorname{Supp}(\mathcal{F})=T \text { for which the lemma is wrong }
\end{array}\right\}
$$

We are trying to show that $\mathcal{T}$ is empty. If not, then because $|X|$ is Noetherian (Properties of Spaces, Lemma 53.23 .2 ) we can choose a minimal element $T \in \mathcal{T}$. This means that there exists a coherent sheaf $\mathcal{F}$ on $X$ whose support is $T$ and for which the lemma does not hold. Clearly $T \neq \emptyset$ because the only sheaf with support in $\emptyset$ for which $\mathcal{P}$ does hold (by property (2)).

If $T$ is not irreducible, then we can write $T=Z_{1} \cup Z_{2}$ with $Z_{1}, Z_{2}$ closed and strictly smaller than $T$. Then we can apply Lemma 56.13 .1 to get a short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{G}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{G}_{2} \rightarrow 0
$$

with $\operatorname{Supp}\left(\mathcal{G}_{i}\right) \subset Z_{i}$. By minimality of $T$ each of $\mathcal{G}_{i}$ has $\mathcal{P}$. Hence $\mathcal{F}$ has property $\mathcal{P}$ by (1), a contradiction.

Suppose $T$ is irreducible. Let $\mathcal{J}$ be the sheaf of ideals defining the reduced induced closed subspace structure on $T$, see Properties of Spaces, Lemma 53.11.4. By Lemma 56.12.2 we see there exists an $n \geq 0$ such that $\mathcal{J}^{n} \mathcal{F}=0$. Hence we obtain a filtration

$$
0=\mathcal{I}^{n} \mathcal{F} \subset \mathcal{I}^{n-1} \mathcal{F} \subset \ldots \subset \mathcal{I} \mathcal{F} \subset \mathcal{F}
$$

each of whose successive subquotients is annihilated by $\mathcal{J}$. Hence if each of these subquotients has a filtration as in the statement of the lemma then also $\mathcal{F}$ does. In other words we may assume that $\mathcal{J}$ does annihilate $\mathcal{F}$.

Assume $T$ is irreducible and $\mathcal{J F}=0$ where $\mathcal{J}$ is as above. Denote $i: Z \rightarrow X$ the closed subspace corresponding to $\mathcal{J}$. Then $\mathcal{F}=i_{*} \mathcal{H}$ for some coherent $\mathcal{O}_{Z}$-module $\mathcal{H}$, see Morphisms of Spaces, Lemma 54.14.1 and Lemma 56.11.7. Let $\mathcal{G}$ be the coherent sheaf on $Z$ satisfying (3)(a) and (3)(b). We apply Lemma 56.13.2 to get injective maps

$$
\mathcal{I}_{1}^{\oplus r_{1}} \rightarrow \mathcal{H} \quad \text { and } \quad \mathcal{I}_{2}^{\oplus r_{2}} \rightarrow \mathcal{G}
$$

where the support of the cokernels are proper closed in $Z$. Hence we find an nonempty open $V \subset Z$ such that

$$
\mathcal{H}_{V}^{\oplus r_{2}} \cong \mathcal{G}_{V}^{\oplus r_{1}}
$$

Let $\mathcal{I} \subset \mathcal{O}_{Z}$ be a quasi-coherent ideal sheaf cutting out $Z \backslash V$ we obtain (Lemma 56.12.4 a map

$$
\mathcal{I}^{n} \mathcal{G}^{\oplus r_{1}} \longrightarrow \mathcal{H}^{\oplus r_{2}}
$$

which is an isomorphism over $V$. The kernel is supported on $Z \backslash V$ hence annihilated by some power of $\mathcal{I}$, see Lemma 56.12 .2 . Thus after increasing $n$ we may assume the displayed map is injective, see Lemma 56.12.3. Applying (3)(b) we find $\mathcal{G}^{\prime} \subset \mathcal{I}^{n} \mathcal{G}$ such that

$$
\left(i_{*} \mathcal{G}^{\prime}\right)^{\oplus r_{1}} \longrightarrow i_{*} \mathcal{H}^{\oplus r_{2}}=\mathcal{F}^{\oplus r_{2}}
$$

is injective with cokernel supported in a proper closed subset of $Z$ and such that property $\mathcal{P}$ holds for $i_{*} \mathcal{G}^{\prime}$. By (1) property $\mathcal{P}$ holds for $\left(i_{*} \mathcal{G}^{\prime}\right)^{\oplus r_{1}}$. By (1) and minimality of $T=|Z|$ property $\mathcal{P}$ holds for $\mathcal{F}^{\oplus r_{2}}$. And finally by (2) property $\mathcal{P}$ holds for $\mathcal{F}$ which is the desired contradiction.

08AN Lemma 56.13.6. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$. Assume
(1) For any short exact sequence of coherent sheaves on $X$ if two out of three have property $\mathcal{P}$ so does the third.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every reduced closed subspace $i: Z \rightarrow X$ with $|Z|$ irreducible there exists a coherent sheaf $\mathcal{G}$ on $X$ whose scheme theoretic support is $Z$ such that $\mathcal{P}$ holds for $\mathcal{G}$.
Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. We will show that conditions (1) and (2) of Lemma 56.13 .4 hold. This is clear for condition (1). To show that (2) holds, let

$$
\mathcal{T}=\left\{\begin{array}{c}
i: Z \rightarrow X \text { reduced closed subspace with }|Z| \text { irreducible such } \\
\text { that } i_{*} \mathcal{I} \text { does not have } \mathcal{P} \text { for some quasi-coherent } \mathcal{I} \subset \mathcal{O}_{Z}
\end{array}\right\}
$$

If $\mathcal{T}$ is nonempty, then since $X$ is Noetherian, we can find an $i: Z \rightarrow X$ which is minimal in $\mathcal{T}$. We will show that this leads to a contradiction.

Let $\mathcal{G}$ be the sheaf whose scheme theoretic support is $Z$ whose existence is assumed in assumption (3). Let $\varphi: i_{*} \mathcal{I}^{\oplus r} \rightarrow \mathcal{G}$ be as in Lemma 56.13.2. Let

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\operatorname{Coker}(\varphi)
$$

be a filtration as in Lemma 56.13.3. By minimality of $Z$ and assumption (1) we see that $\operatorname{Coker}(\varphi)$ has property $\mathcal{P}$. As $\varphi$ is injective we conclude using assumption (1) once more that $i_{*} \mathcal{I}^{\oplus r}$ has property $\mathcal{P}$. Using assumption (2) we conclude that $i_{*} \mathcal{I}$ has property $\mathcal{P}$.

Finally, if $\mathcal{J} \subset \mathcal{O}_{Z}$ is a second quasi-coherent sheaf of ideals, set $\mathcal{K}=\mathcal{I} \cap \mathcal{J}$ and consider the short exact sequences

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{I} \rightarrow \mathcal{I} / \mathcal{K} \rightarrow 0 \quad \text { and } \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{J} \rightarrow \mathcal{J} / \mathcal{K} \rightarrow 0
$$

Arguing as above, using the minimality of $Z$, we see that $i_{*} \mathcal{I} / \mathcal{K}$ and $i_{*} \mathcal{J} / \mathcal{K}$ satisfy $\mathcal{P}$. Hence by assumption (1) we conclude that $i_{*} \mathcal{K}$ and then $i_{*} \mathcal{J}$ satisfy $\mathcal{P}$. In other words, $Z$ is not an element of $\mathcal{T}$ which is the desired contradiction.

### 56.14. Limits of coherent modules

07UU A colimit of coherent modules (on a locally Noetherian algebraic space) is typically not coherent. But it is quasi-coherent as any colimit of quasi-coherent modules on an algebraic space is quasi-coherent, see Properties of Spaces, Lemma 53.28.7. Conversely, if the algebraic space is Noetherian, then every quasi-coherent module is a filtered colimit of coherent modules.

07UV Lemma 56.14.1. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Every quasi-coherent $\mathcal{O}_{X}$-module is the filtered colimit of its coherent submodules.

Proof. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$-module. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are coherent $\mathcal{O}_{X^{-}}$ submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another coherent $\mathcal{O}_{X}$-submodule which contains both of them (see Lemmas 56.11 .3 and 56.11.4). In this way we see that the system is directed. Hence it now suffices to show that $\mathcal{F}$ can be written as a filtered colimit of coherent modules, as then we can take the images of these modules in $\mathcal{F}$ to conclude there are enough of them.

Let $U$ be an affine scheme and $U \rightarrow X$ a surjective étale morphism. Set $R=$ $U \times{ }_{X} U$ so that $X=U / R$ as usual. By Properties of Spaces, Proposition 53.31.1 we see that $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)=Q \operatorname{Coh}(U, R, s, t, c)$. Hence we reduce to showing the corresponding thing for $Q \operatorname{Coh}(U, R, s, t, c)$. Thus the result follows from the more general Groupoids, Lemma 38.15.3.

07UW Lemma 56.14.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$ with $Y$ Noetherian. Then every quasi-coherent $\mathcal{O}_{X}$-module is a filtered colimit of finitely presented $\mathcal{O}_{X}$-modules.

Proof. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Write $f_{*} \mathcal{F}=\operatorname{colim} \mathcal{H}_{i}$ with $\mathcal{H}_{i}$ a coherent $\mathcal{O}_{Y}$-module, see Lemma 56.14.1. By Lemma 56.11 .2 the modules $\mathcal{H}_{i}$ are $\mathcal{O}_{Y}$-modules of finite presentation. Hence $f^{*} \mathcal{H}_{i}$ is an $\mathcal{O}_{X}$-module of finite presentation, see Properties of Spaces, Section 53.29. We claim the map

$$
\operatorname{colim} f^{*} \mathcal{H}_{i}=f^{*} f_{*} \mathcal{F} \rightarrow \mathcal{F}
$$

is surjective as $f$ is assumed affine, Namely, choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Set $U=X \times_{Y} V$. Then $U$ is a scheme, $f^{\prime}: U \rightarrow V$ is affine, and $U \rightarrow X$ is surjective étale. By Properties of Spaces, Lemma 53.25.2 we see that $f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right)=\left.f_{*} \mathcal{F}\right|_{V}$ and similarly for pullbacks. Thus the restriction of $f^{*} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ to $U$ is the map

$$
\left.\left.f^{*} f_{*} \mathcal{F}\right|_{U}=\left.\left(f^{\prime}\right)^{*}\left(f_{*} \mathcal{F}\right)\right|_{V}\right)=\left.\left(f^{\prime}\right)^{*} f_{*}^{\prime}\left(\left.\mathcal{F}\right|_{U}\right) \rightarrow \mathcal{F}\right|_{U}
$$

which is surjective as $f^{\prime}$ is an affine morphism of schemes. Hence the claim holds.
We conclude that every quasi-coherent module on $X$ is a quotient of a filtered colimit of finitely presented modules. In particular, we see that $\mathcal{F}$ is a cokernel of a map

$$
\operatorname{colim}_{j \in J} \mathcal{G}_{j} \longrightarrow \operatorname{colim}_{i \in I} \mathcal{H}_{i}
$$

with $\mathcal{G}_{j}$ and $\mathcal{H}_{i}$ finitely presented. Note that for every $j \in I$ there exist $i \in I$ and a morphism $\alpha: \mathcal{G}_{j} \rightarrow \mathcal{H}_{i}$ such that

commutes, see Lemma 56.4.3. In this situation $\operatorname{Coker}(\alpha)$ is a finitely presented $\mathcal{O}_{X}$-module which comes endowed with a map $\operatorname{Coker}(\alpha) \rightarrow \mathcal{F}$. Consider the set $K$ of triples $(i, j, \alpha)$ as above. We say that $(i, j, \alpha) \leq\left(i^{\prime}, j^{\prime}, \alpha^{\prime}\right)$ if and only if $i \leq i^{\prime}$, $j \leq j^{\prime}$, and the diagram

commutes. It follows from the above that $K$ is a directed partially ordered set,

$$
\mathcal{F}=\operatorname{colim}_{(i, j, \alpha) \in K} \operatorname{Coker}(\alpha),
$$

and we win.

### 56.15. Vanishing cohomology

07UX In this section we show that a quasi-compact and quasi-separated algebraic space is affine if it has vanishing higher cohomology for all quasi-coherent sheaves. We do this in a sequence of lemmas all of which will become obsolete once we prove Proposition 56.15.9.

07UY Situation 56.15.1. Here $S$ is a scheme and $X$ is a quasi-compact and quasiseparated algebraic space over $S$ with the following property: For every quasicoherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{1}(X, \mathcal{F})=0$. We set $A=\Gamma\left(X, \mathcal{O}_{X}\right)$.
We would like to show that the canonical morphism

$$
p: X \longrightarrow \operatorname{Spec}(A)
$$

(see Properties of Spaces, Lemma 53.32.1) is an isomorphism. If $M$ is an $A$-module we denote $M \otimes_{A} \mathcal{O}_{X}$ the quasi-coherent module $p^{*} \tilde{M}$.

07UZ Lemma 56.15.2. In Situation 56.15.1 for an $A$-module $M$ we have $p_{*}\left(M \otimes_{A}\right.$ $\left.\mathcal{O}_{X}\right)=M$ and $\Gamma\left(X, M \otimes_{A} \mathcal{O}_{X}\right)=M$.

Proof. The equality $p_{*}\left(M \otimes_{A} \mathcal{O}_{X}\right)=\widetilde{M}$ follows from the equality $\Gamma\left(X, M \otimes_{A}\right.$ $\left.\mathcal{O}_{X}\right)=M$ as $p_{*}\left(M \otimes_{A} \mathcal{O}_{X}\right)$ is a quasi-coherent module on $\operatorname{Spec}(A)$ by Morphisms of Spaces, Lemma 54.11.2. Observe that $\Gamma\left(X, \bigoplus_{i \in I} \mathcal{O}_{X}\right)=\bigoplus_{i \in I} A$ by Lemma 56.4.1. Hence the emma holds for free modules. Choose a short exact sequence $F_{1} \rightarrow F_{0} \rightarrow M$ where $F_{0}, F_{1}$ are free $A$-modules. Since $H^{1}(X,-)$ is zero the global sections functor is right exact. Moreover the pullback $p^{*}$ is right exact as well. Hence we see that

$$
\Gamma\left(X, F_{1} \otimes_{A} \mathcal{O}_{X}\right) \rightarrow \Gamma\left(X, F_{0} \otimes_{A} \mathcal{O}_{X}\right) \rightarrow \Gamma\left(X, M \otimes_{A} \mathcal{O}_{X}\right) \rightarrow 0
$$

is exact. The result follows.

The following lemma shows that Situation 56.15 .1 is preserved by base change of $X \rightarrow \operatorname{Spec}(A)$ by $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)$.
07V0 Lemma 56.15.3. In Situation 56.15.1.
(1) Given an affine morphism $X^{\prime} \rightarrow X$ of algebraic spaces, we have $H^{1}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=$ 0 for every quasi-coherent $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$.
(2) Given an A-algebra $A^{\prime}$ setting $X^{\prime}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\prime}\right)$ the morphism $X^{\prime} \rightarrow X$ is affine and $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)=A^{\prime}$.
Proof. Part (1) follows from Lemma 56.7 .2 and the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.5). Let $A \rightarrow A^{\prime}$ be as in (2). Then $X^{\prime} \rightarrow X$ is affine because affine morphisms are preserved under base change (Morphisms of Spaces, Lemma 54.20.5 and the fact that a morphism of affine schemes is affine. The equality $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)=A^{\prime}$ follows as $\left(X^{\prime} \rightarrow X\right)_{*} \mathcal{O}_{X^{\prime}}=A^{\prime} \otimes_{A} \mathcal{O}_{X}$ by Lemma 56.10 .2 and thus

$$
\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)=\Gamma\left(X,\left(X^{\prime} \rightarrow X\right)_{*} \mathcal{O}_{X^{\prime}}\right)=\Gamma\left(X, A^{\prime} \otimes_{A} \mathcal{O}_{X}\right)=A^{\prime}
$$

by Lemma 56.15.2.
07V1 Lemma 56.15.4. In Situation 56.15.1. Let $Z_{0}, Z_{1} \subset|X|$ be disjoint closed subsets. Then there exists an $a \in A$ such that $Z_{0} \subset V(a)$ and $Z_{1} \subset V(a-1)$.

Proof. We may and do endow $Z_{0}, Z_{1}$ with the reduced induced subspace structure (Properties of Spaces, Definition 53.11.6) and we denote $i_{0}: Z_{0} \rightarrow X$ and $i_{1}: Z_{1} \rightarrow$ $X$ the corresponding closed immersions. Since $Z_{0} \cap Z_{1}=\emptyset$ we see that the canonical map of quasi-coherent $\mathcal{O}_{X}$-modules

$$
\mathcal{O}_{X} \longrightarrow i_{0, *} \mathcal{O}_{Z_{0}} \oplus i_{1, *} \mathcal{O}_{Z_{1}}
$$

is surjective (look at stalks at geometric points). Since $H^{1}(X,-)$ is zero on the kernel of this map the induced map of global sections is surjective. Thus we can find $a \in A$ which maps to the global section $(0,1)$ of the right hand side.
07V2 Lemma 56.15.5. In Situation 56.15.1 the morphism $p: X \rightarrow \operatorname{Spec}(A)$ is surjective.

Proof. Let $A \rightarrow k$ be a ring homomorphism where $k$ is a field. It suffices to show that $X_{k}=\operatorname{Spec}(k) \times_{\operatorname{Spec}(A)} X$ is nonempty. By Lemma 56.15.3 we have $\Gamma\left(X_{k}, \mathcal{O}\right)=k$. Hence $X_{k}$ is nonempty.
07 V 3 Lemma 56.15.6. In Situation 56.15.1 the morphism $p: X \rightarrow \operatorname{Spec}(A)$ is universally closed.
Proof. Let $Z \subset|X|$ be a closed subset. We may and do endow $Z$ with the reduced induced subspace structure (Properties of Spaces, Definition 53.11.6) and we denote $i: Z \rightarrow X$ the corresponding closed immersions. Then $i$ is affine (Morphisms of Spaces, Lemma 54.20.6). Hence $Z$ is another algebraic space as in Situation 56.15.1 by Lemma 56.15.3. Set $B=\Gamma\left(Z, \mathcal{O}_{Z}\right)$. Since $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective, we see that $A \rightarrow B$ is surjective by the vanishing of $H^{1}$ of the kernel. Consider the commutative diagram

By Lemma 56.15 .5 the map $Z \rightarrow \operatorname{Spec}(B)$ is surjective and by the above $\operatorname{Spec}(B) \rightarrow$ $\operatorname{Spec}(A)$ is a closed immersion. Thus $p$ is closed.

By Lemma 56.15 .3 we see that the base change of $p$ by $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)$ is closed for every ring map $A \rightarrow A^{\prime}$. Hence $p$ is universally closed by Morphisms of Spaces, Lemma 54.9.5.

07V4 Lemma 56.15.7. In Situation 56.15.1 the morphism $p: X \rightarrow \operatorname{Spec}(A)$ is universally injective.

Proof. Let $A \rightarrow k$ be a ring homomorphism where $k$ is a field. It suffices to show that $\operatorname{Spec}(k) \times_{\operatorname{Spec}(A)} X$ has at most one point (see Morphisms of Spaces, Lemma 54.19.6). Using Lemma 56.15 .3 we may assume that $A$ is a field and we have to show that $|X|$ has at most one point.

Let's think of $X$ as an algebraic space over $\operatorname{Spec}(k)$ and let's use the notation $X(K)$ to denote $K$-valued points of $X$ for any extension $k \subset K$, see Morphisms of Spaces, Section 54.24. If $k \subset K$ is an algebraically closed field extension of large transcendence degree, then we see that $X(K) \rightarrow|X|$ is surjective, see Morphisms of Spaces, Lemma 54.24.2. Hence, after replacing $k$ by $K$, we see that it suffices to prove that $X(k)$ is a singleton (in the case $A=k$ ).
Let $x, x^{\prime} \in X(k)$. By Decent Spaces, Lemma 55.12.4 we see that $x$ and $x^{\prime}$ are closed points of $|X|$. Hence $x$ and $x^{\prime}$ map to distinct points of $\operatorname{Spec}(k)$ if $x \neq x^{\prime}$ by Lemma 56.15.4. We conclude that $x=x^{\prime}$ as desired.

07V5 Lemma 56.15.8. In Situation 56.15.1 the morphism $p: X \rightarrow \operatorname{Spec}(A)$ is separated.

Proof. We will use the results of Lemmas 56.15.2, 56.15.3 56.15.5, 56.15.6 and 56.15 .7 without further mention. We will use the valuative criterion of separatedness, see Morphisms of Spaces, Lemma 54.42.2. Let $R$ be a valuation ring over $A$ with fraction field $K$. Let $\operatorname{Spec}(K) \rightarrow X$ be a morphism over $\operatorname{Spec}(A)$. We have to show that we can extend this to a morphism $\operatorname{Spec}(R) \rightarrow X$ in at most one way. We may replace $A$ by $R$ and $X$ by $\operatorname{Spec}(R) \times{ }_{\operatorname{Spec}(A)} X$. Hence we may assume that $A=R$ is a valuation ring with field of fractions $K$ and that we have a $K$-point $x$ in $X$.

Let $X^{\prime} \subset X$ be the scheme theoretic image of $x: \operatorname{Spec}(K) \rightarrow X$. Then $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is a subring of $K$ containing $A$. If not equal to $A$, then there is no extension of $x$ at all and the result is true. If not, then we may replace $X$ by $X^{\prime}$ by one of the lemmas mentioned at the start of the proof.

Let $U=\operatorname{Spec}(B)$ be an affine scheme and let $U \rightarrow X$ be a surjective étale morphism. Then $U \times_{X, x} \operatorname{Spec}(K)$ is a quasi-compact scheme étale over $K$. Hence $U \times_{X, x}$ $\operatorname{Spec}(K)=\operatorname{Spec}(C)$ is affine and

$$
C=K_{1} \times \ldots \times K_{n}
$$

with each $K_{i}$ a finite separable extension of $K$ (Morphisms, Lemma 28.36.7). The scheme theoretic image of $U \times_{X, x} \operatorname{Spec}(K) \rightarrow U$ is $U$ (Morphisms of Spaces, Lemma 54.16.3). which implies that $B \subset C$ (Morphisms, Example 28.6.4). Thus $B$ is a reduced flat $A$-algebra (use More on Algebra, Lemma 15.16.10). Choose a finite Galois extension $K \subset K^{\prime}$ such that each $K_{i}$ embeds into $K^{\prime}$ over $K$ and choose
a valuation ring $A^{\prime} \subset K^{\prime}$ dominating $A$ (see Algebra, Lemma 10.49.2. After replacing $A$ by $A^{\prime}, X$ by $\operatorname{Spec}\left(A^{\prime}\right) \times_{\operatorname{Spec}(A)} X, x$ by the morphism

$$
x^{\prime}: \operatorname{Spec}\left(K^{\prime}\right) \longrightarrow \operatorname{Spec}\left(A^{\prime}\right) \times_{\operatorname{Spec}(A)} \operatorname{Spec}(K) \xrightarrow{(1, x)} \operatorname{Spec}\left(A^{\prime}\right) \times_{\operatorname{Spec}(A)} X,
$$

and $U$ by $\operatorname{Spec}\left(A^{\prime}\right) \times_{\operatorname{Spec}(A)} U$ we may assume that $K_{i}=K$ for all $i$ (small detail omitted; note in particular that it still suffices to show that $x^{\prime}$ has at most one extension).

If $X$ is normal then $B$ is a finite product $B=B_{1} \times \ldots \times B_{n}$ of normal domains (see Algebra, Lemma 10.36.15. Each of these has fraction field $K$ by the above. One of these rings $B_{i}$, say $B_{1}$ has a prime ideal lying over $\mathfrak{m}_{A}$ because $X \rightarrow \operatorname{Spec}(A)$ is surjective. Then $A=B_{1}$ as $A$ is a valuation ring. Thus we see that there exists an étale morphism $\operatorname{Spec}(A) \rightarrow X$ ! Of course this implies that $X=\operatorname{Spec}(A)$ (for example by Morphisms of Spaces, Lemma 54.48 .2 and the fact that $\operatorname{Spec}(A) \rightarrow X$ is surjective as $|X|=|\operatorname{Spec}(A)|)$ and we win in the case that $X$ is normal.

In the general (possibly nonnormal) case we see that $U=\operatorname{Spec}(B)$ has finitely many irreducible components (as all minimal primes of $B$ lie over $(0) \subset A$ by flatness of $A \rightarrow B$ ). Thus we may consider the normalization $X^{\nu} \rightarrow X$ of $X$, see Morphisms of Spaces, Lemma 54.46.2. Note that $X^{\nu} \rightarrow X$ is integral hence affine and universally closed (see Morphisms of Spaces, Lemma 54.43.7). Note that $X^{\nu} \times_{X} U=U^{\nu}$, in particular $X^{\nu} \rightarrow \operatorname{Spec}(A)$ is flat (as the integral closure of $B$ in its total quotient ring is torsion free over $A$ hence flat $)$. Set $A^{\nu}=\Gamma\left(X^{\nu}, \mathcal{O}_{X^{\nu}}\right)$ and consider the diagram

By the lemmas mentioned at the beginning of the proof, the left vertical arrow is (universally) surjective and the right vertical arrow is universally closed. Since the top horizontal arrow is universally closed by construction we conclude that $\operatorname{Spec}\left(A^{\nu}\right) \rightarrow \operatorname{Spec}(A)$ is universally closed. Hence $A \subset A^{\nu}$ is integral, see Morphisms, Lemma 28.43.7. Finally, $A^{\nu}$ is a torsion free $A$-algebra with $A^{\nu} \otimes_{A} K=K$ (as $\operatorname{Spec}(K)$ maps onto $\left.X_{K}=X_{K}^{\nu}\right)$. Hence $A=A^{\nu}$. Observe that $x: \operatorname{Spec}(K) \rightarrow X$ lifts to $x^{\nu}: \operatorname{Spec}(K) \rightarrow X^{\nu}$ and that

$$
U^{\nu} \times_{X^{\nu}, x^{\nu}} \operatorname{Spec}(K)=X \times_{U, x} \operatorname{Spec}(K)=\coprod_{i=1, \ldots, n} \operatorname{Spec}(K)
$$

as normalization does not chance the scheme $U$ over its generic points. Finally, as $X^{\nu} \rightarrow X$ is universally closed any morphism $\operatorname{Spec}(A) \rightarrow X$ extending $x$ lifts to a morphism into $X^{\nu}$ extending $x^{\nu}$ (see Decent Spaces, Proposition 55.14.1). Thus it suffices there is at most one morphism $\operatorname{Spec}(A) \rightarrow X^{\nu}$ extending $x^{\nu}$. This was proved above.

07V6 Proposition 56.15.9. A quasi-compact and quasi-separated algebraic space is affine if and only if all higher cohomology groups of quasi-coherent sheaves vanish. More precisely, any algebraic space as in Situation 56.15.1 is an affine scheme.

Proof. Choose an affine scheme $U=\operatorname{Spec}(B)$ and a surjective étale morphism $\varphi: U \rightarrow X$. Set $R=U \times_{X} U$. As $p$ is separated (Lemma 56.15.8) we see that $R$ is
a closed subscheme of $U \times_{\operatorname{Spec}(A)} U=\operatorname{Spec}\left(B \otimes_{A} B\right)$. Hence $R=\operatorname{Spec}(C)$ is affine too and the ring map

$$
B \otimes_{A} B \longrightarrow C
$$

is surjective. Let us denote the two maps $s, t: B \rightarrow C$ as usual. Pick $g_{1}, \ldots, g_{m} \in B$ such that $s\left(g_{1}\right), \ldots, s\left(g_{m}\right)$ generate $C$ over $t: B \rightarrow C$ (which is possible as $t: B \rightarrow C$ is of finite presentation and the displayed map is surjective). Then $g_{1}, \ldots, g_{m}$ give global sections of $\varphi_{*} \mathcal{O}_{U}$ and the map

$$
\mathcal{O}_{X}\left[z_{1}, \ldots, z_{n}\right] \longrightarrow \varphi_{*} \mathcal{O}_{U}, \quad z_{j} \longmapsto g_{j}
$$

is surjective: you can check this by restricting to $U$. Namely, $\varphi^{*} \varphi_{*} \mathcal{O}_{U}=t_{*} \mathcal{O}_{R}$ (by Lemma 56.10.1) hence you get exactly the condition that $s\left(g_{i}\right)$ generate $C$ over $t: B \rightarrow C$. By the vanishing of $H^{1}$ of the kernel we see that

$$
\Gamma\left(X, \mathcal{O}_{X}\left[x_{1}, \ldots, x_{n}\right]\right)=A\left[x_{1}, \ldots, x_{n}\right] \longrightarrow \Gamma\left(X, \varphi_{*} \mathcal{O}_{U}\right)=\Gamma\left(U, \mathcal{O}_{U}\right)=B
$$

is surjective. Thus we conclude that $B$ is a finite type $A$-algebra. Hence $X \rightarrow$ $\operatorname{Spec}(A)$ is of finite type and separated. By Lemma 56.15.7 and Morphisms of Spaces, Lemma 54.27 .5 it is also locally quasi-finite. Hence $X \rightarrow \operatorname{Spec}(A)$ is representable by Morphisms of Spaces, Lemma 54.48.1 and $X$ is a scheme. Finally $X$ is affine, hence equal to $\operatorname{Spec}(A)$, by an application of Cohomology of Schemes, Lemma 29.3.1.

### 56.16. Finite morphisms and affines

07 VN This section is the analogue of Cohomology of Schemes, Section 29.13
07VP Lemma 56.16.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ finite,
(2) $f$ surjective,
(3) $Y$ affine, and
(4) $X$ Noetherian.

Then $X$ is affine.
Proof. We will prove that under the assumptions of the lemma for any coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{1}(X, \mathcal{F})=0$. This implies that $H^{1}(X, \mathcal{F})=0$ for every quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ by Lemmas 56.14.1 and 56.4.1. Then it follows that $X$ is affine from Proposition 56.15.9.
Let $\mathcal{P}$ be the property of coherent sheaves $\mathcal{F}$ on $X$ defined by the rule

$$
\mathcal{P}(\mathcal{F}) \Leftrightarrow H^{1}(X, \mathcal{F})=0
$$

We are going to apply Lemma 56.13.5. Thus we have to verify (1), (2) and (3) of that lemma for $\mathcal{P}$. Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves. Property (2) follows since $H^{1}(X,-)$ is an additive functor. To see (3) let $i: Z \rightarrow X$ be a reduced closed subspace with $|Z|$ irreducible. Let $W=Z \times_{X} Y$ and denote $i^{\prime}: W \rightarrow Y$ the corresponding closed immersion. Denote $f^{\prime}: W \rightarrow Z$ the other projection which is a finite morphism of algebraic spaces. Since $W$ is a closed subscheme of $Y$, it is affine. We claim that $\mathcal{G}=f_{*} i_{*}^{\prime} \mathcal{O}_{W}=i_{*} f_{*}^{\prime} \mathcal{O}_{W}$ satisfies properties (3)(a) and (3)(b) of Lemma 56.13 .5 which will finish the proof. Property (3)(a) is clear as $W \rightarrow Z$ is surjective
(because $f$ is surjective). To see (3)(b) let $\mathcal{I}$ be a nonzero quasi-coherent sheaf of ideals on $Z$. We simply take $\mathcal{G}^{\prime}=\mathcal{I} \mathcal{G}$. Namely, we have

$$
\mathcal{I} \mathcal{G}=f_{*}^{\prime}\left(\mathcal{I}^{\prime}\right)
$$

where $\mathcal{I}^{\prime}=\operatorname{Im}\left(\left(f^{\prime}\right)^{*} \mathcal{I} \rightarrow \mathcal{O}_{W}\right)$. This is true because $f^{\prime}$ is a (representable) affine morphism of algebraic spaces and hence the result can be checked on an étale covering of $Z$ by a scheme in which case the result is Cohomology of Schemes, Lemma 29.13.2. Finally, $f^{\prime}$ is affine, hence $R^{1} f_{*}^{\prime} \mathcal{I}^{\prime}=0$ by Lemma 56.7.2. As $W$ is affine we have $H^{1}\left(W, \mathcal{I}^{\prime}\right)=0$ hence the Leray spectral sequence (in the form Cohomology on Sites, Lemma 21.14.6) implies that $H^{1}\left(Z, f_{*}^{\prime} \mathcal{I}^{\prime}\right)=0$. Since $i: Z \rightarrow X$ is affine we conclude that $R^{1} i_{*} f_{*}^{\prime} \mathcal{I}^{\prime}=0$ hence $H^{1}\left(X, i_{*} f_{*}^{\prime} \mathcal{I}^{\prime}\right)=0$ by Leray again and we win.

### 56.17. A weak version of Chow's lemma

089I In this section we quickly prove the following lemma in order to help us prove the basic results on cohomology of coherent modules on proper algebraic spaces.

089J Lemma 56.17.1. Let $A$ be a ring. Let $X$ be an algebraic space over $\operatorname{Spec}(A)$ whose structure morphism $X \rightarrow \operatorname{Spec}(A)$ is separated of finite type. Then there exists a proper surjective morphism $X^{\prime} \rightarrow X$ where $X^{\prime}$ is a scheme which is $H$ -quasi-projective over $\operatorname{Spec}(A)$.

Proof. Let $W$ be an affine scheme and let $f: W \rightarrow X$ be a surjective étale morphism. There exists an integer $d$ such that all geometric fibres of f have $\leq d$ points (because $X$ is a separated algebraic hence reasonable, see Decent Spaces, Lemma 55.5.1. Picking $d$ minimal we get a nonempty open $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite étale of degree $d$, see Decent Spaces, Lemma 55.8.1. Let

$$
V \subset W \times_{X} W \times_{X} \ldots \times_{X} W
$$

( $d$ factors in the fibre product) be the complement of all the diagonals. Because $W \rightarrow X$ is separated the diagonal $W \rightarrow W \times_{X} W$ is a closed immersion. Since $W \rightarrow X$ is étale the diagonal $W \rightarrow W \times_{X} W$ is an open immersion, see Morphisms of Spaces, Lemmas 54.38 .10 and 54.37 .9 . Hence the diagonals are open and closed subschemes of the quasi-compact scheme $W \times_{X} \ldots \times_{X} W$. In particular we conclude $V$ is a quasi-compact scheme. Choose an open immersion $W \subset Y$ with $Y \mathrm{H}$ projective over $A$ (this is possible as $W$ is affine and of finite type over $A$; for example we can use Morphisms, Lemmas 28.39.2 and 28.42.12. Let

$$
Z \subset Y \times_{A} Y \times_{A} \ldots \times_{A} Y
$$

be the scheme theoretic image of the composition $V \rightarrow W \times_{X} \ldots \times_{X} W \rightarrow Y \times_{A}$ $\ldots \times_{A} Y$. Observe that this morphism is quasi-compact since $V$ is quasi-compact and $Y \times_{A} \ldots \times_{A} Y$ is separated. Note that $V \rightarrow Z$ is an open immersion as $V \rightarrow Y \times_{A} \ldots \times_{A} Y$ is an immersion, see Morphisms, Lemma 28.7.7. The projection morphisms give $d$ morphisms $g_{i}: Z \rightarrow Y$. These morphisms $g_{i}$ are projective as $Y$ is projective over $A$, see material in Morphisms, Section 28.42. We set

$$
X^{\prime}=\bigcup g_{i}^{-1}(W) \subset Z
$$

There is a morphism $X^{\prime} \rightarrow X$ whose restriction to $g_{i}^{-1}(W)$ is the composition $g_{i}^{-1}(W) \rightarrow W \rightarrow X$. Namely, these morphisms agree over $V$ hence agree over
$g_{i}^{-1}(W) \cap g_{j}^{-1}(W)$ by Morphisms of Spaces, Lemma 54.17.8. Claim: the morphism $X^{\prime} \rightarrow X$ is proper.
If the claim holds, then the lemma follows by induction on $d$. Namely, by construction $X^{\prime}$ is H-quasi-projective over $\operatorname{Spec}(A)$. The image of $X^{\prime} \rightarrow X$ contains the open $U$ as $V$ surjects onto $U$. Denote $T$ the reduced induced algebraic space structure on $X \backslash U$. Then $T \times_{X} W$ is a closed subscheme of $W$, hence affine. Moreover, the morphism $T \times_{X} W \rightarrow T$ is étale and every geometric fibre has $<d$ points. By induction hypothesis there exists a proper surjective morphism $T^{\prime} \rightarrow T$ where $T^{\prime}$ is a scheme H-quasi-projective over $\operatorname{Spec}(A)$. Since $T$ is a closed subspace of $X$ we see that $T^{\prime} \rightarrow X$ is a proper morphism. Thus the lemma follows by taking the proper surjective morphism $X^{\prime} \amalg T^{\prime} \rightarrow X$.
Proof of the claim. By construction the morphism $X^{\prime} \rightarrow X$ is separated and of finite type. We will check conditions (1) - (4) of Morphisms of Spaces, Lemma 54.41 .3 for the morphisms $V \rightarrow X^{\prime}$ and $X^{\prime} \rightarrow X$. Conditions (1) and (2) we have seen above. Condition (3) holds as $X^{\prime} \rightarrow X$ is separated (as a morphism whose source is a separated algebraic space). Thus it suffices to check liftability to $X^{\prime}$ for diagrams

where $R$ is a valuation ring with fraction field $K$. Note that the top horizontal map is given by $d$ pairwise distinct $K$-valued points $w_{1}, \ldots, w_{d}$ of $W$. In fact, this is a complete set of inverse images of the point $x \in X(K)$ coming from the diagram. Since $W \rightarrow X$ is surjective, we can, after possibly replacing $R$ by an extension of valuation rings, lift the morphism $\operatorname{Spec}(R) \rightarrow X$ to a morphism $w: \operatorname{Spec}(R) \rightarrow W$, see Morphisms of Spaces, Lemma 54.41.2. Since $w_{1}, \ldots, w_{d}$ is a complete collection of inverse images of $x$ we see that $\left.w\right|_{\operatorname{Spec}(K)}$ is equal to one of them, say $w_{i}$. Thus we see that we get a commutative diagram

By the valuative criterion of properness for the projective morphism $g_{i}$ we can lift $w$ to $z: \operatorname{Spec}(R) \rightarrow Z$, see Morphisms, Lemma 28.42 .5 and Schemes, Proposition 25.20.6. The image of $z$ is in $g_{i}^{-1}(W) \subset X^{\prime}$ and the proof is complete.

### 56.18. Noetherian valuative criterion

0ARI We prove a version of the valuative criterion for properness using discrete valuation rings. A lot more can be added here. In particular, we should formulate and prove the analogues to Limits, Lemmas 31.12.1, 31.12.2, 31.12.3, 31.13.2, and 31.13.3.
0ARJ Lemma 56.18.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. Assume
(1) $Y$ is locally Noetherian,
(2) $f$ is locally of finite type and quasi-separated,
(3) for every commutative diagram

where $A$ is a discrete valuation ring and $K$ its fraction field, there is at most one dotted arrow making the diagram commute.
Then $f$ is separated.
Proof. To prove $f$ is separated, we may work étale locally on $Y$ (Morphisms of Spaces, Lemma 54.4.12. Choose an affine scheme $U$ and an étale morphism $U \rightarrow$ $X \times_{Y} X$. Set $V=X \times_{\Delta, X \times_{Y} X} U$ which is quasi-compact because $f$ is quasiseparated. Consider a commutative diagram

We can interpret the composition $\operatorname{Spec}(A) \rightarrow U \rightarrow X \times_{Y} X$ as a pair of morphisms $a, b: \operatorname{Spec}(A) \rightarrow X$ agreeing as morphisms into $Y$ and equal when restricted to $\operatorname{Spec}(K)$. Hence our assumption (3) guarantees $a=b$ and we find the dotted arrow in the diagram. By Limits, Lemma 31.12 .3 we conclude that $V \rightarrow U$ is proper. In other words, $\Delta$ is proper. Since $\Delta$ is a monomorphism, we find that $\Delta$ is a closed immersion (Étale Morphisms, Lemma 40.7.2 as desired.

0ARK Lemma 56.18.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. Assume
(1) $Y$ is locally Noetherian,
(2) $f$ is of finite type and quasi-separated,
(3) for every commutative diagram

where $A$ is a discrete valuation ring and $K$ its fraction field, there is a unique dotted arrow making the diagram commute.
Then $f$ is proper.
Proof. It suffices to prove $f$ is universally closed because $f$ is separated by Lemma 56.18.1. To do this we may work étale locally on $Y$ (Morphisms of Spaces, Lemma 54.9.5). Hence we may assume $Y$ is a Noetherian affine scheme. Choose $X^{\prime} \rightarrow X$ as in the weak form of Chow's lemma (Lemma 56.17.1). We claim that $X^{\prime} \rightarrow \operatorname{Spec}(A)$ is universally closed. The claim implies the lemma by Morphisms of Spaces, Lemma 54.39.7. To prove this, according to Limits, Lemma 31.13.3 it suffices to prove that
in every solid commutative diagram

where $A$ is a dvr with fraction field $K$ we can find the dotted arrow $a$. By assumption we can find the dotted arrow $b$. Then the morphism $X^{\prime} \times_{X, b} \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(A)$ is a proper morphism of schemes and by the valuative criterion for morphisms of schemes we can lift $b$ to the desired morphism $a$.

0ARL Remark 56.18.3 (Variant for complete discrete valuation rings). In Lemmas 56.18 .1 and 56.18 .2 it suffices to consider complete discrete valuation rings. To be precise in Lemma 56.18.1 we can replace condition (3) by the following condition: Given any commutative diagram

where $A$ is a complete discrete valuation ring with fraction field $K$ there exists at most one dotted arrow making the diagram commute. Namely, given any diagram as in Lemma 56.18.1 (3) the completion $A^{\wedge}$ is a discrete valuation ring (More on Algebra, Lemma 15.34.5 and the uniqueness of the arrow $\operatorname{Spec}\left(A^{\wedge}\right) \rightarrow X$ implies the uniqueness of the arrow $\operatorname{Spec}(A) \rightarrow X$ for example by Properties of Spaces, Proposition 53.16.1. Similarly in Lemma 56.18 .2 we can replace condition (3) by the following condition: Given any commutative diagram

where $A$ is a complete discrete valuation ring with fraction field $K$ there exists an extension $A \subset A^{\prime}$ of complete discrete valuation rings inducing a fraction field extension $K \subset K^{\prime}$ such that there exists a unique arrow $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow X$ making the diagram

commute. Namely, given any diagram as in Lemma 56.18 .2 part (3) the existence of any commutative diagram

for any extension $A \subset B$ of discrete valuation rings will imply there exists an arrow $\operatorname{Spec}(A) \rightarrow X$ fitting into the diagram. This was shown in Morphisms of Spaces, Lemma 54.40.4 In fact, it follows from these considerations that it suffices to look for dotted arrows in diagrams for any class of discrete valuation rings such that, given any discrete valuation ring, there is an extension of it that is in the class. For example, we could take complete discrete valuation rings with algebraically closed residue field.

### 56.19. Higher direct images of coherent sheaves

08AP In this section we prove the fundamental fact that the higher direct images of a coherent sheaf under a proper morphism are coherent. First we prove a helper lemma.

08AQ Lemma 56.19.1. Let $S$ be a scheme. Consider a commutative diagram

of algebraic spaces over $S$. Assume $i$ is a closed immersion and $Y$ Noetherian. Set $\mathcal{L}=i^{*} \mathcal{O}_{\mathbf{P}_{Y}^{n}}(1)$. Let $\mathcal{F}$ be a coherent module on $X$. Then there exists an integer $d_{0}$ such that for all $d \geq d_{0}$ we have $R^{p} f_{*}\left(\mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes d}\right)=0$ for all $p>0$.

Proof. Checking whether $R^{p} f_{*}\left(\mathcal{F} \otimes \mathcal{L}^{\otimes d}\right)$ is zero can be done étale locally on $Y$, see Equation 56.3.1.1). Hence we may assume $Y$ is the spectrum of a Noetherian ring. In this case $X$ is a scheme and the result follows from Cohomology of Schemes, Lemma 29.15.2.

08AR Lemma 56.19.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper morphism of algebraic spaces over $S$ with $Y$ locally Noetherian. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $R^{i} f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{Y}$-module for all $i \geq 0$.

Proof. We first remark that $X$ is a locally Noetherian algebraic space by Morphisms of Spaces, Lemma 54.23.5. Hence the statement of the lemma makes sense. Moreover, computing $R^{i} f_{*} \mathcal{F}$ commutes with étale localization on $Y$ (Properties of Spaces, Lemma 53.25.2 and checking whether $R^{i} f_{*} \mathcal{F}$ coherent can be done étale locally on $Y$ (Lemma 56.11.2). Hence we may assume that $Y=\operatorname{Spec}(A)$ is a Noetherian affine scheme.

Assume $Y=\operatorname{Spec}(A)$ is an affine scheme. Note that $f$ is locally of finite presentation (Morphisms of Spaces, Lemma 54.28.7). Thus it is of finite presentation, hence $X$ is Noetherian (Morphisms of Spaces, Lemma 54.28.6). Thus Lemma 56.13 .6 applies to the category of coherent modules of $X$. For a coherent sheaf $\mathcal{F}$ on $X$ we say $\mathcal{P}$ holds if and only if $R^{i} f_{*} \mathcal{F}$ is a coherent module on $\operatorname{Spec}(A)$. We will show that conditions (1), (2), and (3) of Lemma 56.13 .6 hold for this property thereby finishing the proof of the lemma.

Verification of condition (1). Let

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

be a short exact sequence of coherent sheaves on $X$. Consider the long exact sequence of higher direct images

$$
R^{p-1} f_{*} \mathcal{F}_{3} \rightarrow R^{p} f_{*} \mathcal{F}_{1} \rightarrow R^{p} f_{*} \mathcal{F}_{2} \rightarrow R^{p} f_{*} \mathcal{F}_{3} \rightarrow R^{p+1} f_{*} \mathcal{F}_{1}
$$

Then it is clear that if 2 -out-of- 3 of the sheaves $\mathcal{F}_{i}$ have property $\mathcal{P}$, then the higher direct images of the third are sandwiched in this exact complex between two coherent sheaves. Hence these higher direct images are also coherent by Lemmas 56.11 .3 and 56.11.4. Hence property $\mathcal{P}$ holds for the third as well.

Verification of condition (2). This follows immediately from the fact that $R^{i} f_{*}\left(\mathcal{F}_{1} \oplus\right.$ $\left.\mathcal{F}_{2}\right)=R^{i} f_{*} \mathcal{F}_{1} \oplus R^{i} f_{*} \mathcal{F}_{2}$ and that a summand of a coherent module is coherent (see lemmas cited above).
Verification of condition (3). Let $i: Z \rightarrow X$ be a closed immersion with $Z$ reduced and $|Z|$ irreducible. Set $g=f \circ i: Z \rightarrow \operatorname{Spec}(A)$. Let $\mathcal{G}$ be a coherent module on $Z$ whose scheme theoretic support is equal to $Z$ such that $R^{p} g_{*} \mathcal{G}$ is coherent for all $p$. Then $\mathcal{F}=i_{*} \mathcal{G}$ is a coherent module on $X$ whose support scheme theoretic support is $Z$ such that $R^{p} f_{*} \mathcal{F}=R^{p} g_{*} \mathcal{G}$. To see this use the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.7) and the fact that $R^{q} i_{*} \mathcal{G}=0$ for $q>0$ by Lemma 56.7 .2 and the fact that a closed immersion is affine. (Morphisms of Spaces, Lemma 54.20.6). Thus we reduce to finding a coherent sheaf $\mathcal{G}$ on $Z$ with support equal to $Z$ such that $R^{p} g_{*} \mathcal{G}$ is coherent for all $p$.
We apply Lemma 56.17 .1 to the morphism $Z \rightarrow \operatorname{Spec}(A)$. Thus we get a diagram

with $\pi: Z^{\prime} \rightarrow Z$ proper surjective and $i$ an immersion. Since $Z \rightarrow \operatorname{Spec}(A)$ is proper we conclude that $g^{\prime}$ is proper (Morphisms of Spaces, Lemma 54.39.4). Hence $i$ is a closed immersion (Morphisms of Spaces, Lemmas 54.39.6 and 54.12.3). It follows that the morphism $i^{\prime}=(i, \pi): \mathbf{P}_{A}^{n} \times{ }_{\operatorname{Spec}(A)} Z^{\prime}=\mathbf{P}_{Z}^{n}$ is a closed immersion (Morphisms of Spaces, Lemma 54.4.6). Set

$$
\mathcal{L}=i^{*} \mathcal{O}_{\mathbf{P}_{A}^{n}}(1)=\left(i^{\prime}\right)^{*} \mathcal{O}_{\mathbf{P}_{Z}^{n}}(1)
$$

We may apply Lemma 56.19.1 to $\mathcal{L}$ and $\pi$ as well as $\mathcal{L}$ and $g^{\prime}$. Hence for all $d \gg 0$ we have $R^{p} \pi_{*} \mathcal{L}^{\otimes d}=0$ for all $p>0$ and $R^{p}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes d}=0$ for all $p>0$. Set $\mathcal{G}=\pi_{*} \mathcal{L}^{\otimes d}$. By the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.7) we have

$$
E_{2}^{p, q}=R^{p} g_{*} R^{q} \pi_{*} \mathcal{L}^{\otimes d} \Rightarrow R^{p+q}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes d}
$$

and by choice of $d$ the only nonzero terms in $E_{2}^{p, q}$ are those with $q=0$ and the only nonzero terms of $R^{p+q}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes d}$ are those with $p=q=0$. This implies that $R^{p} g_{*} \mathcal{G}=0$ for $p>0$ and that $g_{*} \mathcal{G}=\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}$. Applying Cohomology of Schemes, Lemma 29.15.3 we see that $g_{*} \mathcal{G}=\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes d}$ is coherent.
We still have to check that the support of $\mathcal{G}$ is $Z$. This follows from the fact that $\mathcal{L}^{\otimes d}$ has lots of global sections. We spell it out here. Note that $\mathcal{L}^{\otimes d}$ is globally generated for all $d \geq 0$ because the same is true for $\mathcal{O}_{\mathbf{P}^{n}}(d)$. Pick a point $z \in Z^{\prime}$ mapping to the generic point $\xi$ of $Z$ which we can do as $\pi$ is surjective. (Observe that $Z$ does indeed have a generic point as $|Z|$ is irreducible and $Z$ is Noetherian, hence quasi-separated,
hence $|Z|$ is a sober topological space by Properties of Spaces, Lemma53.14.1.) Pick $s \in \Gamma\left(Z^{\prime}, \mathcal{L}^{\otimes d}\right)$ which does not vanish at $z$. Since $\Gamma(Z, \mathcal{G})=\Gamma\left(Z^{\prime}, \mathcal{L}^{\otimes d}\right)$ we may think of $s$ as a global section of $\mathcal{G}$. Choose a geometric point $\bar{z}$ of $Z^{\prime}$ lying over $z$ and denote $\bar{\xi}=g^{\prime} \circ \bar{z}$ the corresponding geometric point of $Z$. The adjunction map

$$
\left(g^{\prime}\right)^{*} \mathcal{G}=\left(g^{\prime}\right)^{*} g_{*}^{\prime} \mathcal{L}^{\otimes d} \longrightarrow \mathcal{L}^{\otimes d}
$$

induces a map of stalks $\mathcal{G}_{\bar{\xi}} \rightarrow \mathcal{L}_{\bar{z}}$, see Properties of Spaces, Lemma 53.28.5 Moreover the adjunction map sends the pullback of $s$ (viewed as a section of $\mathcal{G}$ ) to $s$ (viewed as a section of $\mathcal{L}^{\otimes d}$ ). Thus the image of $s$ in the vector space which is the source of the arrow

$$
\mathcal{G}_{\bar{\xi}} \otimes \kappa(\bar{\xi}) \longrightarrow \mathcal{L}_{\bar{z}}^{\otimes d} \otimes \kappa(\bar{z})
$$

isn't zero since by choice of $s$ the image in the target of the arrow is nonzero. Hence $\xi$ is in the support of $\mathcal{G}$ (Morphisms of Spaces, Lemma 54.15.2). Since $|Z|$ is irreducible and $Z$ is reduced we conclude that the scheme theoretic support of $\mathcal{G}$ is all of $Z$ as desired.

08GC Remark 56.19.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type and $Y$ locally Noetherian. Then $X$ is locally Noetherian (Morphisms of Spaces, Lemma 54.23.5). Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Assume the scheme theoretic support $Z$ of $\mathcal{F}$ is proper over $Y$. we claim $R^{p} f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{Y}$-module for all $p \geq 0$. Namely, Let $i: Z \rightarrow X$ be the closed immersion and write $\mathcal{F}=i_{*} \mathcal{G}$ for some coherent module $\mathcal{G}$ on $Z$ (Lemma 56.11.7. Denoting $g: Z \rightarrow S$ the composition $f \circ i$ we see that $R^{p} g_{*} \mathcal{G}$ is coherent on $S$ by Lemma 56.19.2. On the other hand, $R^{q} i_{*} \mathcal{G}=0$ for $q>0$ (Lemma 56.11.9). By Cohomology on Sites, Lemma 21.14.7 we get $R^{p} f_{*} \mathcal{F}=R^{p} g_{*} \mathcal{G}$ and the claim.
08AS Lemma 56.19.4. Let $A$ be a Noetherian ring. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of algebraic spaces. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $H^{i}(X, \mathcal{F})$ is finite $A$-module for all $i \geq 0$.
Proof. This is just the affine case of Lemma 56.19.2. Namely, by Lemma 56.3.2 we know that $R^{i} f_{*} \mathcal{F}$ is a quasi-coherent sheaf. Hence it is the quasi-coherent sheaf associated to the $A$-module $\Gamma\left(\operatorname{Spec}(A), R^{i} f_{*} \mathcal{F}\right)=H^{i}(X, \mathcal{F})$. The equality holds by Cohomology on Sites, Lemma 21.14 .6 and vanishing of higher cohomology groups of quasi-coherent modules on affine schemes (Cohomology of Schemes, Lemma 29.2.2). By Lemma 56.11.2 we see $R^{i} f_{*} \mathcal{F}$ is a coherent sheaf if and only if $H^{i}(X, \mathcal{F})$ is an $A$-module of finite type. Hence Lemma 56.19 .2 gives us the conclusion.

08AT Lemma 56.19.5. Let $A$ be a Noetherian ring. Let $B$ be a finitely generated graded A-algebra. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of algebraic spaces. Set $\mathcal{B}=f^{*} \widetilde{B}$. Let $\mathcal{F}$ be a quasi-coherent graded $\mathcal{B}$-module of finite type. For every $p \geq 0$ the graded $B$-module $H^{p}(X, \mathcal{F})$ is a finite $B$-module.
Proof. To prove this we consider the fibre product diagram

Note that $f^{\prime}$ is a proper morphism, see Morphisms of Spaces, Lemma 54.39.3. Also, $B$ is a finitely generated $A$-algebra, and hence Noetherian (Algebra, Lemma
10.30.1). This implies that $X^{\prime}$ is a Noetherian algebraic space (Morphisms of Spaces, Lemma 54.28.6). Note that $X^{\prime}$ is the relative spectrum of the quasi-coherent $\mathcal{O}_{X^{-}}$-algebra $\mathcal{B}$ by Morphisms of Spaces, Lemma 54.20.7. Since $\mathcal{F}$ is a quasi-coherent $\mathcal{B}$-module we see that there is a unique quasi-coherent $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$ such that $\pi_{*} \mathcal{F}^{\prime}=\mathcal{F}$, see Morphisms of Spaces, Lemma 54.20.10. Since $\mathcal{F}$ is finite type as a $\mathcal{B}$-module we conclude that $\mathcal{F}^{\prime}$ is a finite type $\mathcal{O}_{X^{\prime}-\text { module (details omitted). In }}$ other words, $\mathcal{F}^{\prime}$ is a coherent $\mathcal{O}_{X^{\prime}}$-module (Lemma 56.11.2). Since the morphism $\pi: X^{\prime} \rightarrow X$ is affine we have

$$
H^{p}(X, \mathcal{F})=H^{p}\left(X^{\prime}, \mathcal{F}^{\prime}\right)
$$

by Lemma 56.7.2 and Cohomology on Sites, Lemma 21.14.6. Thus the lemma follows from Lemma 56.19.4

### 56.20. The theorem on formal functions

08AU This section is the analogue of Cohomology of Schemes, Section 29.19. We encourage the reader to read that section first.

08AV Situation 56.20.1. Here $A$ is a Noetherian ring and $I \subset A$ is an ideal. Also, $f: X \rightarrow \operatorname{Spec}(A)$ is a proper morphism of algebraic spaces and $\mathcal{F}$ is a coherent sheaf on $X$.

In this situation we denote $I^{n} \mathcal{F}$ the quasi-coherent submodule of $\mathcal{F}$ generated as an $\mathcal{O}_{X}$-module by products of local sections of $\mathcal{F}$ and elements of $I^{n}$. In other words, it is the image of the map $f^{*} \widetilde{I} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{F}$.
08AW Lemma 56.20.2. In Situation 56.20.1. Set $B=\bigoplus_{n \geq 0} I^{n}$. Then for every $p \geq 0$ the graded $B$-module $\bigoplus_{n \geq 0} H^{p}\left(\bar{X}, I^{n} \mathcal{F}\right)$ is a finite $B$-module.
Proof. Let $\mathcal{B}=\bigoplus I^{n} \mathcal{O}_{X}=f^{*} \widetilde{B}$. Then $\bigoplus I^{n} \mathcal{F}$ is a finite type graded $\mathcal{B}$-module. Hence the result follows from Lemma 56.19.5.
08AX Lemma 56.20.3. In Situation 56.20.1. For every $p \geq 0$ there exists an integer $c \geq 0$ such that
(1) the multiplication map $I^{n-c} \otimes H^{p}\left(X, I^{c} \mathcal{F}\right) \rightarrow H^{p}\left(X, I^{n} \mathcal{F}\right)$ is surjective for all $n \geq c$, and
(2) the image of $H^{p}\left(X, I^{n+m} \mathcal{F}\right) \rightarrow H^{p}\left(X, I^{n} \mathcal{F}\right)$ is contained in the submodule $I^{m-c} H^{p}\left(X, I^{n} \mathcal{F}\right)$ for all $n \geq 0, m \geq c$.
Proof. By Lemma 56.20 .2 we can find $d_{1}, \ldots, d_{t} \geq 0$, and $x_{i} \in H^{p}\left(X, I^{d_{i}} \mathcal{F}\right)$ such that $\bigoplus_{n \geq 0} H^{p}\left(X, I^{n} \mathcal{F}\right)$ is generated by $x_{1}, \ldots, x_{t}$ over $B=\bigoplus_{n \geq 0} I^{n}$. Take $c=\max \left\{d_{i}\right\}$. It is clear that (1) holds. For (2) let $b=\max (0, n-c)$. Consider the commutative diagram of $A$-modules

By part (1) of the lemma the composition of the horizontal arrows is surjective if $n+m \geq c$. On the other hand, it is clear that $n+m-c-b \geq m-c$. Hence part (2).

08AY Lemma 56.20.4. In Situation 56.20.1. Fix $p \geq 0$.
(1) There exists a $c_{1} \geq 0$ such that for all $n \geq c_{1}$ we have

$$
\operatorname{Ker}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right) \subset I^{n-c_{1}} H^{p}(X, \mathcal{F})
$$

(2) The inverse system

$$
\left(H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)_{n \in \mathbf{N}}
$$

satisfies the Mittag-Leffler condition (see Homology, Definition 12.27.2).
(3) In fact for any $p$ and $n$ there exists a $c_{2}(n) \geq n$ such that
$\operatorname{Im}\left(H^{p}\left(X, \mathcal{F} / I^{k} \mathcal{F}\right) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)$ for all $k \geq c_{2}(n)$.

Proof. Let $c_{1}=\max \left\{c_{p}, c_{p+1}\right\}$, where $c_{p}, c_{p+1}$ are the integers found in Lemma 56.20 .3 for $H^{p}$ and $H^{p+1}$. We will use this constant in the proofs of (1), (2) and (3).

Let us prove part (1). Consider the short exact sequence

$$
0 \rightarrow I^{n} \mathcal{F} \rightarrow \mathcal{F} \rightarrow \mathcal{F} / I^{n} \mathcal{F} \rightarrow 0
$$

From the long exact cohomology sequence we see that

$$
\operatorname{Ker}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}\left(X, I^{n} \mathcal{F}\right) \rightarrow H^{p}(X, \mathcal{F})\right)
$$

Hence by our choice of $c_{1}$ we see that this is contained in $I^{n-c_{1}} H^{p}(X, \mathcal{F})$ for $n \geq c_{1}$.
Note that part (3) implies part (2) by definition of the Mittag-Leffler condition.
Let us prove part (3). Fix an $n$ throughout the rest of the proof. Consider the commutative diagram

This gives rise to the following commutative diagram

If $m \geq c_{1}$ we see that the image of $a$ is contained in $I^{m-c_{1}} H^{p+1}\left(X, I^{n} \mathcal{F}\right)$. By the Artin-Rees lemma (see Algebra, Lemma 10.50.3) there exists an integer $c_{3}(n)$ such that

$$
I^{N} H^{p+1}\left(X, I^{n} \mathcal{F}\right) \cap \operatorname{Im}(\delta) \subset \delta\left(I^{N-c_{3}(n)} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)
$$

for all $N \geq c_{3}(n)$. As $H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)$ is annihilated by $I^{n}$, we see that if $m \geq$ $c_{3}(n)+c_{1}+n$, then

$$
\operatorname{Im}\left(H^{p}\left(X, \mathcal{F} / I^{n+m} \mathcal{F}\right) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)
$$

In other words, part (3) holds with $c_{2}(n)=c_{3}(n)+c_{1}+n$.

08AZ Theorem 56.20.5 (Theorem on formal functions). In Situation 56.20.1. Fix $p \geq 0$. The system of maps

$$
H^{p}(X, \mathcal{F}) / I^{n} H^{p}(X, \mathcal{F}) \longrightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

define an isomorphism of limits

$$
H^{p}(X, \mathcal{F})^{\wedge} \longrightarrow \lim _{n} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

where the left hand side is the completion of the $A$-module $H^{p}(X, \mathcal{F})$ with respect to the ideal I, see Algebra, Section 10.95. Moreover, this is in fact a homeomorphism for the limit topologies.

Proof. In fact, this follows immediately from Lemma 56.20.4. We spell out the details. Set $M=H^{p}(X, \mathcal{F})$ and $M_{n}=H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)$. Denote $N_{n}=\operatorname{Im}(M \rightarrow$ $M_{n}$ ). By the description of the limit in Homology, Section 12.27 we have

$$
\lim _{n} M_{n}=\left\{\left(x_{n}\right) \in \prod M_{n} \mid \varphi_{i}\left(x_{n}\right)=x_{n-1}, n=2,3, \ldots\right\}
$$

Pick an element $x=\left(x_{n}\right) \in \lim _{n} M_{n}$. By Lemma56.20.4 part (3) we have $x_{n} \in N_{n}$ for all $n$ since by definition $x_{n}$ is the image of some $x_{n+m} \in M_{n+m}$ for all $m$. By Lemma 56.20.4 part (1) we see that there exists a factorization

$$
M \rightarrow N_{n} \rightarrow M / I^{n-c_{1}} M
$$

of the reduction map. Denote $y_{n} \in M / I^{n-c_{1}} M$ the image of $x_{n}$ for $n \geq c_{1}$. Since for $n^{\prime} \geq n$ the composition $M \rightarrow M_{n^{\prime}} \rightarrow M_{n}$ is the given map $M \rightarrow M_{n}$ we see that $y_{n^{\prime}}$ maps to $y_{n}$ under the canonical map $M / I^{n^{\prime}-c_{1}} M \rightarrow M / I^{n-c_{1}} M$. Hence $y=\left(y_{n+c_{1}}\right)$ defines an element of $\lim _{n} M / I^{n} M$. We omit the verification that $y$ maps to $x$ under the map

$$
M^{\wedge}=\lim _{n} M / I^{n} M \longrightarrow \lim _{n} M_{n}
$$

of the lemma. We also omit the verification on topologies.
08B0 Lemma 56.20.6. Let $A$ be a ring. Let $I \subset A$ be an ideal. Assume $A$ is Noetherian and complete with respect to $I$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of algebraic spaces. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then

$$
H^{p}(X, \mathcal{F})=\lim _{n} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

for all $p \geq 0$.
Proof. This is a reformulation of the theorem on formal functions (Theorem 56.20.5) in the case of a complete Noetherian base ring. Namely, in this case the $A$-module $H^{p}(X, \mathcal{F})$ is finite (Lemma 56.19.4) hence $I$-adically complete (Algebra, Lemma 10.96.1 and we see that completion on the left hand side is not necessary.

08B1 Lemma 56.20.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ and let $\mathcal{F}$ be a quasi-coherent sheaf on $Y$. Assume
(1) Y locally Noetherian,
(2) $f$ proper, and
(3) $\mathcal{F}$ coherent.

Let $\bar{y}$ be a geometric point of $Y$. Consider the "infinitesimal neighbourhoods"

of the fibre $X_{1}=X_{\bar{y}}$ and set $\mathcal{F}_{n}=i_{n}^{*} \mathcal{F}$. Then we have

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}^{\wedge} \cong \lim _{n} H^{p}\left(X_{n}, \mathcal{F}_{n}\right)
$$

as $\mathcal{O}_{Y, \bar{y}}^{\wedge}$-modules.
Proof. This is just a reformulation of a special case of the theorem on formal functions, Theorem 56.20.5. Let us spell it out. Note that $\mathcal{O}_{Y, \bar{y}}$ is a Noetherian local ring, see Properties of Spaces, Lemma 53.23.4. Consider the canonical morphism $c: \operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}}\right) \rightarrow Y$. This is a flat morphism as it identifies local rings. Denote $f^{\prime}:$ $X^{\prime} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}}\right)$ the base change of $f$ to this local ring. We see that $c^{*} R^{p} f_{*} \mathcal{F}=$ $R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}$ by Lemma 56.10.1. Moreover, we have canonical identifications $X_{n}=X_{n}^{\prime}$ for all $n \geq 1$.
Hence we may assume that $Y=\operatorname{Spec}(A)$ is the spectrum of a strictly henselian Noetherian local ring $A$ with maximal ideal $\mathfrak{m}$ and that $\bar{y} \rightarrow Y$ is equal to $\operatorname{Spec}(A / \mathfrak{m}) \rightarrow$ $Y$. It follows that

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}=\Gamma\left(Y, R^{p} f_{*} \mathcal{F}\right)=H^{p}(X, \mathcal{F})
$$

because $(Y, \bar{y})$ is an initial object in the category of étale neighbourhoods of $\bar{y}$. The morphisms $c_{n}$ are each closed immersions. Hence their base changes $i_{n}$ are closed immersions as well. Note that $i_{n, *} \mathcal{F}_{n}=i_{n, *} i_{n}^{*} \mathcal{F}=\mathcal{F} / \mathfrak{m}^{n} \mathcal{F}$. By the Leray spectral sequence for $i_{n}$, and Lemma 56.11.9 we see that

$$
H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=H^{p}\left(X, i_{n, *} \mathcal{F}\right)=H^{p}\left(X, \mathcal{F} / \mathfrak{m}^{n} \mathcal{F}\right)
$$

Hence we may indeed apply the theorem on formal functions to compute the limit in the statement of the lemma and we win.

Here is a lemma which we will generalize later to fibres of dimension $>0$, namely the next lemma.

0A4S Lemma 56.20.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\bar{y}$ be a geometric point of $Y$. Assume
(1) Y locally Noetherian,
(2) $f$ is proper, and
(3) $X_{\bar{y}}$ has discrete underlying topological space.

Then for any coherent sheaf $\mathcal{F}$ on $X$ we have $\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}=0$ for all $p>0$.
Proof. Let $\kappa(\bar{y})$ be the residue field of the local ring of $\mathcal{O}_{Y, \bar{y}}$. As in Lemma 56.20.7 we set $X_{\bar{y}}=X_{1}=\operatorname{Spec}(\kappa(\bar{y})) \times_{Y} X$. By Morphisms of Spaces, Lemma 54.33.8 the morphism $f: X \rightarrow Y$ is quasi-finite at each of the points of the fibre of $X \rightarrow Y$ over $\bar{y}$. It follows that $X_{\bar{y}} \rightarrow \bar{y}$ is separated and quasi-finite. Hence $X_{\bar{y}}$ is a scheme by Morphisms of Spaces, Proposition 54.47.2. Since it is quasi-compact its underlying topological space is a finite discrete space. Then it is an affine scheme by Schemes, Lemma 25.11.7. By Lemma 56.16.1 it follows that the algebraic spaces $X_{n}$ are affine schemes as well. Moreover, the underlying topological of each $X_{n}$ is the same
as that of $X_{1}$. Hence it follows that $H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=0$ for all $p>0$. Hence we see that $\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}^{\wedge}=0$ by Lemma 56.20.7. Note that $R^{p} f_{*} \mathcal{F}$ is coherent by Lemma 56.19 .2 and hence $R^{p} f_{*} \mathcal{F}_{\bar{y}}$ is a finite $\mathcal{O}_{Y, \bar{y}}$-module. By Algebra, Lemma 10.96.1 this implies that $\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}=0$.
0A4T Lemma 56.20.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\bar{y}$ be a geometric point of $Y$. Assume
(1) Y locally Noetherian,
(2) $f$ is proper, and
(3) $\operatorname{dim}\left(X_{\bar{y}}\right)=d$.

Then for any coherent sheaf $\mathcal{F}$ on $X$ we have $\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}=0$ for all $p>d$.
Proof. Let $\kappa(\bar{y})$ be the residue field of the local ring of $\mathcal{O}_{Y, \bar{y}}$. As in Lemma 56.20 .7 we set $X_{\bar{y}}=X_{1}=\operatorname{Spec}(\kappa(\bar{y})) \times_{Y} X$. Moreover, the underlying topological space of each infinitesimal neighbourhood $X_{n}$ is the same as that of $X_{\bar{y}}$. Hence $H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=0$ for all $p>d$ by Lemma 56.9.1. Hence we see that $\left(R^{p} f_{*} \mathcal{F}\right) \wedge=0$ by Lemma 56.20 .7 for $p>d$. Note that $R^{p} f_{*} \mathcal{F}$ is coherent by Lemma 56.19 .2 and hence $R^{p} f_{*} \mathcal{F}_{\bar{y}}$ is a finite $\mathcal{O}_{Y, \bar{y}}$-module. By Algebra, Lemma 10.96 .1 this implies that $\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{y}}=0$.

### 56.21. Applications of the theorem on formal functions

0A4U We will add more here as needed.
0A4V Lemma 56.21.1. (For a more general version see More on Morphisms of Spaces, Lemma 63.25.5). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $Y$ is locally Noetherian. The following are equivalent
(1) $f$ is finite, and
(2) $f$ is proper and $\left|X_{k}\right|$ is a discrete space for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where $k$ is a field.

Proof. A finite morphism is proper according to Morphisms of Spaces, Lemma 54.43.9. A finite morphism is quasi-finite according to Morphisms of Spaces, Lemma 54.43.8. A quasi-finite morphism has discrete fibres $X_{k}$, see Morphisms of Spaces, Lemma 54.27.5. Hence a finite morphism is proper and has discrete fibres $X_{k}$.

Assume $f$ is proper with discrete fibres $X_{k}$. We want to show $f$ is finite. In fact it suffices to prove $f$ is affine. Namely, if $f$ is affine, then it follows that $f$ is integral by Morphisms of Spaces, Lemma 54.43.7 whereupon it follows from Morphisms of Spaces, Lemma 54.43.6 that $f$ is finite.
To show that $f$ is affine we may assume that $Y$ is affine, and our goal is to show that $X$ is affine too. Since $f$ is proper we see that $X$ is separated and quasi-compact. We will show that for any coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{1}(X, \mathcal{F})=0$. This implies that $H^{1}(X, \mathcal{F})=0$ for every quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ by Lemmas 56.14 .1 and 56.4.1 Then it follows that $X$ is affine from Proposition 56.15.9. By Lemma 56.20.8 we conclude that the stalks of $R^{1} f_{*} \mathcal{F}$ are zero for all geometric points of $Y$. In other words, $R^{1} f_{*} \mathcal{F}=0$. Hence we see from the Leray Spectral Sequence for $f$ that $H^{1}(X, \mathcal{F})=H^{1}\left(Y, f_{*} \mathcal{F}\right)$. Since $Y$ is affine, and $f_{*} \mathcal{F}$ is quasicoherent (Morphisms of Spaces, Lemma 54.11 .2 we conclude $H^{1}\left(Y, f_{*} \mathcal{F}\right)=0$ from Cohomology of Schemes, Lemma 29.2.2. Hence $H^{1}(X, \mathcal{F})=0$ as desired.

As a consequence we have the following useful result.

0A4W Lemma 56.21.2. (For a more general version see More on Morphisms of Spaces, Lemma 63.25.6). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\bar{y}$ be a geometric point of $Y$. Assume
(1) $Y$ is locally Noetherian,
(2) $f$ is proper, and
(3) $\left|X_{\bar{y}}\right|$ is finite.

Then there exists an open neighbourhood $V \subset Y$ of $\bar{y}$ such that $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow$ $V$ is finite.

Proof. The morphism $f$ is quasi-finite at all the geometric points of $X$ lying over $\bar{y}$ by Morphisms of Spaces, Lemma 54.33.8. By Morphisms of Spaces, Lemma 54.33 .7 the set of points at which $f$ is quasi-finite is an open subspace $U \subset X$. Let $Z=X \backslash U$. Then $\bar{y} \notin f(Z)$. Since $f$ is proper the set $f(Z) \subset Y$ is closed. Choose any open neighbourhood $V \subset Y$ of $\bar{y}$ with $Z \cap V=\emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence $f^{-1}(V) \rightarrow V$ has discrete fibres $X_{k}$ (Morphisms of Spaces, Lemma 54.27.5 which are quasi-compact hence finite. Thus $f^{-1}(V) \rightarrow V$ is finite by Lemma 56.21.1.

## CHAPTER 57

## Limits of Algebraic Spaces

### 57.1. Introduction

07 SC In this chapter we put material related to limits of algebraic spaces. A first topic is the characterization of algebraic spaces $F$ locally of finite presentation over the base $S$ as limit preserving functors. We continue with a study of limits of inverse systems over directed partially ordered sets with affine transition maps. We discuss absolute Noetherian approximation for quasi-compact and quasi-separated algebraic spaces following CLO12. Another approach is due to David Rydh (see Ryd08) whose results also cover absolute Noetherian approximation for certain algebraic stacks.

### 57.2. Conventions

07 SD The standing assumption is that all schemes are contained in a big fppf site $S_{c c_{f p p f}}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.

Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 57.3. Morphisms of finite presentation

049I In this section we generalize Limits, Proposition 31.5.1 to morphisms of algebraic spaces. The motivation for the following definition comes from the proposition just cited.

049J Definition 57.3.1. Let $S$ be a scheme.
(1) A functor $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets is said to be locally of finite presentation or limit preserving if for every affine scheme $T$ over $S$ which is a limit $T=\lim T_{i}$ of a directed inverse system of affine schemes $T_{i}$ over $S$, we have

$$
F(T)=\operatorname{colim} F\left(T_{i}\right) .
$$

We sometimes say that $F$ is locally of finite presentation over $S$.
(2) Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. A transformation of functors $a: F \rightarrow G$ is locally of finite presentation if for every scheme $T$ over $S$ and every $y \in G(T)$ the functor

$$
F_{y}:(S c h / T)_{f p p f}^{o p p} \longrightarrow \text { Sets, } \quad T^{\prime} / T \longmapsto\left\{x \in F\left(T^{\prime}\right)|a(x)=y|_{T^{\prime}}\right\}
$$

is locally of finite presentation over $T$. We sometimes say that $F$ is relatively limit preserving over $G$.

The functor $F_{y}$ is in some sense the fiber of $a: F \rightarrow G$ over $y$, except that it is a presheaf on the big fppf site of $T$. A formula for this functor is:

049K

$$
\begin{equation*}
F_{y}=\left.F\right|_{(S c h / T)_{f p p f}} \times\left.\right|_{\left.G\right|_{(S c h / T)_{f p p f}}} * \tag{57.3.1.1}
\end{equation*}
$$

Here $*$ is the final object in the category of (pre)sheaves on $(S c h / T)_{f p p f}$ (see Sites, Example 7.10 .2 and the map $\left.* \rightarrow G\right|_{(S c h / T)_{f p p f}}$ is given by $y$. Note that if $j$ : $(S c h / T)_{f p p f} \rightarrow(S c h / S)_{f p p f}$ is the localization functor, then the formula above becomes $F_{y}=j^{-1} F \times_{j^{-1} G} *$ and $j!F_{y}$ is just the fiber product $F \times_{G, y} T$. (See Sites, Section 7.24, for information on localization, and especially Sites, Remark 7.24 .9 for information on $j$ ! for presheaves.)

At this point we temporarily have two definitions of what it means for a morphism $X \rightarrow Y$ of algebraic spaces over $S$ to be locally of finite presentation. Namely, one by Morphisms of Spaces, Definition 54.28.1 and one using that $X \rightarrow Y$ is a transformation of functors so that Definition 57.3 .1 applies. We will show in Proposition 57.3.9 that these two definitions agree.

06BC Lemma 57.3.2. Let $S$ be a scheme. Let $a: F \rightarrow G$ be a transformation of functors $(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. The following are equivalent
(1) $F$ is relatively limit preserving over $G$, and
(2) for every every affine scheme $T$ over $S$ which is a limit $T=\lim T_{i}$ of a directed inverse system of affine schemes $T_{i}$ over $S$ the diagram of sets

is a fibre product diagram.
Proof. Assume (1). Consider $T=\lim _{i \in I} T_{i}$ as in (2). Let ( $y, x_{T}$ ) be an element of the fibre product $\operatorname{colim}_{i} G\left(T_{i}\right) \times{ }_{G(T)} F(T)$. Then $y$ comes from $y_{i} \in G\left(T_{i}\right)$ for some $i$. Consider the functor $F_{y_{i}}$ on $\left(S c h / T_{i}\right)_{f p p f}$ as in Definition 57.3.1. We see that $x_{T} \in F_{y_{i}}(T)$. Moreover $T=\lim _{i^{\prime} \geq i} T_{i^{\prime}}$ is a directed system of affine schemes over $T_{i}$. Hence (1) implies that $x_{T}$ the image of a unique element $x$ of $\operatorname{colim}_{i^{\prime} \geq i} F_{y_{i}}\left(T_{i^{\prime}}\right)$. Thus $x$ is the unique element of colim $F\left(T_{i}\right)$ which maps to the pair $\left(y, x_{T}\right)$. This proves that (2) holds.

Assume (2). Let $T$ be a scheme and $y_{T} \in G(T)$. We have to show that $F_{y_{T}}$ is limit preserving. Let $T^{\prime}=\lim _{i \in I} T_{i}^{\prime}$ be an affine scheme over $T$ which is the directed limit of affine scheme $T_{i}^{\prime}$ over $T$. Let $x_{T^{\prime}} \in F_{y_{T}}$. Pick $i \in I$ which is possible as $I$ is a directed partially ordered set. Denote $y_{i} \in F\left(T_{i}^{\prime}\right)$ the image of $y_{T^{\prime}}$. Then we see that $\left(y_{i}, x_{T^{\prime}}\right)$ is an element of the fibre product $\operatorname{colim}_{i} G\left(T_{i}^{\prime}\right) \times_{G\left(T^{\prime}\right)} F\left(T^{\prime}\right)$. Hence by (2) we get a unique element $x$ of $\operatorname{colim}_{i} F\left(T_{i}^{\prime}\right)$ mapping to $\left(y_{i}, x_{T^{\prime}}\right)$. It is clear that $x$ defines an element of $\operatorname{colim}_{i} F_{y}\left(T_{i}^{\prime}\right)$ mapping to $x_{T^{\prime}}$ and we win.

[^169]049L Lemma 57.3.3. Let $S$ be a scheme contained in $S_{\text {sch }}^{f p p f .}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: G \rightarrow H$ be transformations of functors. If $a$ and $b$ are locally of finite presentation, then

$$
b \circ a: F \longrightarrow H
$$

is locally of finite presentation.
Proof. Let $T=\lim _{i \in I} T_{i}$ as in characterization (2) of Lemma 57.3.2. Consider the diagram

By assumption the two squares are fibre product squares. Hence the outer rectangle is a fibre product diagram too which proves the lemma.
049M Lemma 57.3.4. Let $S$ be a scheme contained in Sch fppf . Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: H \rightarrow G$ be transformations of functors. Consider the fibre product diagram

If $a$ is locally of finite presentation, then the base change $a^{\prime}$ is locally of finite presentation.

Proof. Omitted. Hint: This is formal.
049N Lemma 57.3.5. Let $T$ be an affine scheme which is written as a limit $T=$ $\lim _{i \in I} T_{i}$ of a directed inverse system of affine schemes.
(1) Let $\mathcal{V}=\left\{V_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ be a standard fppf covering of $T$, see Topologies, Definition 33.7.5. Then there exists an index $i$ and a standard fppf covering $\mathcal{V}_{i}=\left\{V_{i, j} \rightarrow T_{i}\right\}_{j=1, \ldots, m}$ whose base change $T \times_{T_{i}} \mathcal{V}_{i}$ to $T$ is isomorphic to $\mathcal{V}$.
(2) Let $\mathcal{V}_{i}, \mathcal{V}_{i}^{\prime}$ be a pair of standard fppf coverings of $T_{i}$. If $f: T \times_{T_{i}} \mathcal{V} \rightarrow$ $T \times_{T_{i}} \mathcal{V}_{i}^{\prime}$ is a morphism of coverings of $T$, then there exists an index $i^{\prime} \geq i$ and a morphism $f_{i^{\prime}}: T_{i^{\prime}} \times_{T_{i}} \mathcal{V} \rightarrow T_{i^{\prime}} \times_{T_{i}} \mathcal{V}_{i}^{\prime}$ whose base change to $T$ is $f$.
(3) If $f, g: \mathcal{V} \rightarrow \mathcal{V}_{i}^{\prime}$ are morphisms of standard fppf coverings of $T_{i}$ whose base changes $f_{T}, g_{T}$ to $T$ are equal then there exists an index $i^{\prime} \geq i$ such that $f_{T_{i^{\prime}}}=g_{T_{i^{\prime}}}$.
In other words, the category of standard fppf coverings of $T$ is the colimit over I of the categories of standard fppf coverings of $T_{i}$

Proof. By Limits, Lemma 31.9.1 the category of schemes of finite presentation over $T$ is the colimit over $I$ of the categories of finite presentation over $T_{i}$. By Limits, Lemmas 31.7 .2 and 31.7 .6 the same is true for category of schemes which
are affine, flat and of finite presentation over $T$. To finish the proof of the lemma it suffices to show that if $\left\{V_{j, i} \rightarrow T_{i}\right\}_{j=1, \ldots, m}$ is a finite family of flat finitely presented morphisms with $V_{j, i}$ affine, and the base change $\coprod_{j} T \times_{T_{i}} V_{j, i} \rightarrow T$ is surjective, then for some $i^{\prime} \geq i$ the morphism $\coprod T_{i^{\prime}} \times_{T_{i}} V_{j, i} \rightarrow T_{i^{\prime}}$ is surjective. Denote $W_{i^{\prime}} \subset T_{i^{\prime}}$, resp. $W \subset T$ the image. Of course $W=T$ by assumption. Since the morphisms are flat and of finite presentation we see that $W_{i}$ is a quasi-compact open of $T_{i}$, see Morphisms, Lemma 28.25.9. Moreover, $W=T \times_{T_{i}} W_{i}$ (formation of image commutes with base change). Hence by Limits, Lemma 31.3.8 we conclude that $W_{i^{\prime}}=T_{i^{\prime}}$ for some large enough $i^{\prime}$ and we win.

049 O Lemma 57.3.6. Let $S$ be a scheme contained in $S_{\text {Sch }}^{\text {fppf }}$. Let $F:(S c h / S)_{f p p f}^{\text {opp }} \rightarrow$ Sets be a functor. If $F$ is locally of finite presentation over $S$ then its sheafification $F^{\#}$ is locally of finite presentation over $S$.

Proof. Assume $F$ is locally of finite presentation. It suffices to show that $F^{+}$is locally of finite presentation, since $F^{\#}=\left(F^{+}\right)^{+}$, see Sites, Theorem 7.10.10. Let $T$ be an affine scheme over $S$, and let $T=\lim T_{i}$ be written as the directed limit of an inverse system of affine $S$ schemes. Recall that $F^{+}(T)$ is the colimit of $\check{H}^{0}(\mathcal{V}, F)$ where the limit is over all coverings of $T$ in $(S c h / S)_{f p p f}$. Any fppf covering of an affine scheme can be refined by a standard fppf covering, see Topologies, Lemma 33.7.4. Hence we can write

$$
F^{+}(T)=\operatorname{colim}_{\mathcal{V} \text { standard covering } T} \check{H}^{0}(\mathcal{V}, F)
$$

By Lemma 57.3.5 we may rewrite this as

$$
\operatorname{colim}_{i \in I} \operatorname{colim}_{\mathcal{V}_{i} \text { standard covering } T_{i}} \check{H}^{0}\left(T \times_{T_{i}} \mathcal{V}_{i}, F\right)
$$

(The order of the colimits is irrelevant by Categories, Lemma 4.14.9.) Given a standard fppf covering $\mathcal{V}_{i}=\left\{V_{j} \rightarrow T_{i}\right\}_{j=1, \ldots, m}$ of $T_{i}$ we see that

$$
T \times_{T_{i}} V_{j}=\lim _{i^{\prime} \geq i} T_{i^{\prime}} \times_{T} V_{j}
$$

by Limits, Lemma 31.2.3, and similarly

$$
T \times_{T_{i}}\left(V_{j} \times_{T_{i}} V_{j^{\prime}}\right)=\lim _{i^{\prime} \geq i} T_{i^{\prime}} \times_{T}\left(V_{j} \times_{T_{i}} V_{j^{\prime}}\right)
$$

As the presheaf $F$ is locally of finite presentation this means that

$$
\check{H}^{0}\left(T \times_{T_{i}} \mathcal{V}_{i}, F\right)=\operatorname{colim}_{i^{\prime} \geq i} \check{H}^{0}\left(T_{i^{\prime}} \times_{T_{i}} \mathcal{V}_{i}, F\right)
$$

Hence the colimit expression for $F^{+}(T)$ above collapses to

$$
\operatorname{colim}_{i \in I} \operatorname{colim}_{\mathcal{V} \text { standard covering } T_{i}}^{\check{H}^{0}(\mathcal{V}, F) .=\operatorname{colim}_{i \in I} F^{+}\left(T_{i}\right) . . . . . . . .}
$$

In other words $F^{+}(T)=\operatorname{colim}_{i} F^{+}\left(T_{i}\right)$ and hence the lemma holds.
049P Lemma 57.3.7. Let $S$ be a scheme. Let $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be a functor. Assume that
(1) $F$ is a sheaf, and
(2) there exists an fppf covering $\left\{U_{j} \rightarrow S\right\}_{j \in J}$ such that $\left.F\right|_{\left(S c h / U_{j}\right)_{f p p f}}$ is locally of finite presentation.
Then $F$ is locally of finite presentation.

Proof. Let $T$ be an affine scheme over $S$. Let $I$ be a directed partially ordered set, and let $T_{i}$ be an inverse system of affine schemes over $S$ such that $T=\lim T_{i}$. We have to show that the canonical map colim $F\left(T_{i}\right) \rightarrow F(T)$ is bijective.
Choose some $0 \in I$ and choose a standard fppf covering $\left\{V_{0, k} \rightarrow T_{0}\right\}_{k=1, \ldots, m}$ which refines the pullback $\left\{U_{j} \times{ }_{S} T_{0} \rightarrow T_{0}\right\}$ of the given fppf covering of $S$. For each $i \geq 0$ we set $V_{i, k}=T_{i} \times_{T_{0}} V_{0, k}$, and we set $V_{k}=T \times_{T_{0}} V_{0, k}$. Note that $V_{k}=\lim _{i \geq 0} V_{i, k}$, see Limits, Lemma 31.2.3.

Suppose that $x, x^{\prime} \in \operatorname{colim} F\left(T_{i}\right)$ map to the same element of $F(T)$. Say $x, x^{\prime}$ are given by elements $x_{i}, x_{i}^{\prime} \in F\left(T_{i}\right)$ for some $i \in I$ (we may choose the same $i$ for both as $I$ is directed). By assumption (2) and the fact that $x_{i}, x_{i}^{\prime}$ map to the same element of $F(T)$ this implies that

$$
\left.x_{i}\right|_{V_{i^{\prime}, k}}=\left.x_{i}^{\prime}\right|_{V_{i^{\prime}, k}}
$$

for some suitably large $i^{\prime} \in I$. We can choose the same $i^{\prime}$ for each $k$ as $k \in$ $\{1, \ldots, m\}$ ranges over a finite set. Since $\left\{V_{i^{\prime}, k} \rightarrow T_{i^{\prime}}\right\}$ is an fppf covering and $F$ is a sheaf this implies that $\left.x_{i}\right|_{T_{i^{\prime}}}=\left.x_{i}^{\prime}\right|_{T_{i^{\prime}}}$ as desired. This proves that the map colim $F\left(T_{i}\right) \rightarrow F(T)$ is injective.

To show surjectivity we argue in a similar fashion. Let $x \in F(T)$. By assumption (2) for each $k$ we can choose a $i$ such that $\left.x\right|_{V_{k}}$ comes from an element $x_{i, k} \in F\left(V_{i, k}\right)$. As before we may choose a single $i$ which works for all $k$. By the injectivity proved above we see that

$$
\left.x_{i, k}\right|_{V_{i^{\prime}, k} \times{ }_{T_{i}} V_{i^{\prime}, l}}=\left.x_{i, l}\right|_{V_{i^{\prime}, k} \times{ }_{T_{i^{\prime}}},} V_{i^{\prime}, l}
$$

for some large enough $i^{\prime}$. Hence by the sheaf condition of $F$ the elements $\left.x_{i, k}\right|_{V_{i^{\prime}, k}}$ glue to an element $x_{i^{\prime}} \in F\left(T_{i^{\prime}}\right)$ as desired.

049Q Lemma 57.3.8. Let $S$ be a scheme contained in $S_{\text {ch }}^{f p p f}$. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets be functors. If $a: F \rightarrow G$ is a transformation which is locally of finite presentation, then the induced transformation of sheaves $F^{\#} \rightarrow G^{\#}$ is of finite presentation.

Proof. Suppose that $T$ is a scheme and $y \in G^{\#}(T)$. We have to show the functor $F_{y}^{\#}:(S c h / T)_{f p p f}^{o p p} \rightarrow$ Sets constructed from $F^{\#} \rightarrow G^{\#}$ and $y$ as in Definition 57.3.1 is locally of finite presentation. By Equation 57.3.1.1 we see that $F_{y}^{\#}$ is a sheaf. Choose an fppf covering $\left\{V_{j} \rightarrow T\right\}_{j \in J}$ such that $\left.y\right|_{V_{j}}$ comes from an element $y_{j} \in F\left(V_{j}\right)$. Note that the restriction of $F^{\#}$ to $\left(S c h / V_{j}\right)_{\text {fppf }}$ is just $F_{y_{j}}^{\#}$. If we can show that $F_{y_{j}}^{\#}$ is locally of finite presentation then Lemma 57.3.7 guarantees that $F_{y}^{\#}$ is locally of finite presentation and we win. This reduces us to the case $y \in G(T)$.
Let $y \in G(T)$. In this case we claim that $F_{y}^{\#}=\left(F_{y}\right)^{\#}$. This follows from Equation (57.3.1.1). Thus this case follows from Lemma 57.3.6.

04AK Proposition 57.3.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) The morphism $f$ is a morphism of algebraic spaces which is locally of finite presentation, see Morphisms of Spaces, Definition 54.28.1.
(2) The morphism $f: X \rightarrow Y$ is locally of finite presentation as a transformation of functors, see Definition 57.3.1.

Proof. Assume (1). Let $T$ be a scheme and let $y \in Y(T)$. We have to show that $T \times{ }_{X} Y$ is locally of finite presentation over $T$ in the sense of Definition57.3.1. Hence we are reduced to proving that if $X$ is an algebraic space which is locally of finite presentation over $S$ as an algebraic space, then it is locally of finite presentation as a functor $X:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. To see this choose a presentation $X=U / R$, see Spaces, Definition 52.9.3. It follows from Morphisms of Spaces, Definition 54.28.1 that both $U$ and $R$ are schemes which are locally of finite presentation over $S$. Hence by Limits, Proposition 31.5.1 we have

$$
U(T)=\operatorname{colim} U\left(T_{i}\right), \quad R(T)=\operatorname{colim} R\left(T_{i}\right)
$$

whenever $T=\lim _{i} T_{i}$ in $(S c h / S)_{f p p f}$. It follows that the presheaf

$$
(S c h / S)_{f p p f}^{o p p} \longrightarrow S e t s, \quad W \longmapsto U(W) / R(W)
$$

is locally of finite presentation. Hence by Lemma57.3.6 its sheafification $X=U / R$ is locally of finite presentation too.

Assume (2). Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Next, choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. By Lemma 57.3 .4 the transformation of functors $V \times_{Y} X \rightarrow V$ is locally of finite presentation. By Morphisms of Spaces, Lemma 54.38.8 the morphism of algebraic spaces $U \rightarrow$ $V \times_{Y} X$ is locally of finite presentation, hence locally of finite presentation as a transformation of functors by the first part of the proof. By Lemma 57.3.3 the composition $U \rightarrow V \times_{Y} X \rightarrow V$ is locally of finite presentation as a transformation of functors. Hence the morphism of schemes $U \rightarrow V$ is locally of finite presentation by Limits, Proposition 31.5.1 (modulo a set theoretic remark, see last paragraph of the proof). This means, by definition, that (1) holds.

Set theoretic remark. Let $U \rightarrow V$ be a morphism of $(S c h / S)_{f p p f}$. In the statement of Limits, Proposition 31.5 .1 we characterize $U \rightarrow V$ as being locally of finite presentation if for all directed inverse systems $\left(T_{i}, f_{i i^{\prime}}\right)$ of affine schemes over $V$ we have $U(T)=$ colim $V\left(T_{i}\right)$, but in the current setting we may only consider affine schemes $T_{i}$ over $V$ which are (isomorphic to) an object of $(S c h / S)_{f p p f}$. So we have to make sure that there are enough affines in $(S c h / S)_{\text {fppf }}$ to make the proof work. Inspecting the proof of $(2) \Rightarrow(1)$ of Limits, Proposition 31.5.1 we see that the question reduces to the case that $U$ and $V$ are affine. Say $U=\operatorname{Spec}(A)$ and $V=\operatorname{Spec}(B)$. By construction of $(S c h / S)_{\text {fppf }}$ the spectrum of any ring of cardinality $\leq|B|$ is isomorphic to an object of $(S c h / S)_{f p p f}$. Hence it suffices to observe that in the "only if" part of the proof of Algebra, Lemma 10.126 .2 only $A$-algebras of cardinality $\leq|B|$ are used.

05N0 Remark 57.3.10. Here is an important special case of Proposition 57.3.9. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $X$ is locally of finite presentation over $S$ if and only if $X$, as a functor $(S c h / S)^{o p p} \rightarrow$ Sets, is limit preserving. Compare with Limits, Remark 31.5.2

### 57.4. Limits of algebraic spaces

07 SE The following lemma explains how we think of limits of algebraic spaces in this chapter. We will use (without further mention) that the base change of an affine morphism of algebraic spaces is affine (see Morphisms of Spaces, Lemma 54.20.5).

07SF Lemma 57.4.1. Let $S$ be a scheme. Let I be a directed partially ordered set. Let $\left(X_{i}, f_{i i^{\prime}}\right)$ be an inverse system over $I$ in the category of algebraic spaces over $S$. If the morphisms $f_{i i^{\prime}}: X_{i} \rightarrow X_{i^{\prime}}$ are affine, then the limit $X=\lim _{i} X_{i}$ (as an fppf sheaf) is an algebraic space. Moreover,
(1) each of the morphisms $f_{i}: X \rightarrow X_{i}$ is affine,
(2) for any $i \in I$ and any morphism of algebraic spaces $T \rightarrow X_{i}$ we have

$$
X \times_{X_{i}} T=\lim _{i^{\prime} \geq i} X_{i^{\prime}} \times_{X_{i}} T
$$

as algebraic spaces over $S$.
Proof. Part (2) is a formal consequence of the existence of the limit $X=\lim X_{i}$ as an algebraic space over $S$. Choose an element $0 \in I$ (this is possible as a directed partially ordered set is nonempty). Choose a scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $R_{0}=U_{0} \times_{X_{0}} U_{0}$ so that $X_{0}=U_{0} / R_{0}$. For $i \geq 0$ set $U_{i}=X_{i} \times_{X_{0}} U_{0}$ and $R_{i}=X_{i} \times_{X_{0}} R_{0}=U_{i} \times_{X_{i}} U_{i}$. By Limits, Lemma 31.2.2 we see that $U=\lim _{i \geq 0} U_{i}$ and $R=\lim _{i \geq 0} R_{i}$ are schemes. Moreover, the two morphisms $s, t: R \rightarrow \bar{U}$ are the base change of the two projections $R_{0} \rightarrow U_{0}$ by the morphism $U \rightarrow U_{0}$, in particular étale. The morphism $R \rightarrow U \times_{S} U$ defines an equivalence relation as directed a limit of equivalence relations is an equivalence relation. Hence the morphism $R \rightarrow U \times_{S} U$ is an étale equivalence relation. We claim that the natural map

07SG

$$
\begin{equation*}
U / R \longrightarrow \lim X_{i} \tag{57.4.1.1}
\end{equation*}
$$

is an isomorphism of fppf sheaves on the category of schemes over $S$. The claim implies $X=\lim X_{i}$ is an algebraic space by Spaces, Theorem 52.10.5
Let $Z$ be a scheme and let $a: Z \rightarrow \lim X_{i}$ be a morphism. Then $a=\left(a_{i}\right)$ where $a_{i}: Z \rightarrow X_{i}$. Set $W_{0}=Z \times_{a_{0}, X_{0}} U_{0}$. Note that $W_{0}=Z \times_{a_{i}, X_{i}} U_{i}$ for all $i \geq 0$ by our choice of $U_{i} \rightarrow X_{i}$ above. Hence we obtain a morphism $W_{0} \rightarrow \lim _{i \geq 0} U_{i}=U$. Since $W_{0} \rightarrow Z$ is surjective and étale, we conclude that (57.4.1.1) is a surjective map of sheaves. Finally, suppose that $Z$ is a scheme and that $a, b: Z \rightarrow U / R$ are two morphisms which are equalized by (57.4.1.1). We have to show that $a=b$. After replacing $Z$ by the members of an fppf covering we may assume there exist morphisms $a^{\prime}, b^{\prime}: Z \rightarrow U$ which give rise to $a$ and $b$. The condition that $a, b$ are equalized by 57.4.1.1 means that for each $i \geq 0$ the compositions $a_{i}^{\prime}, b_{i}^{\prime}: Z \rightarrow U \rightarrow$ $U_{i}$ are equal as morphisms into $U_{i} / R_{i}=X_{i}$. Hence $\left(a_{i}^{\prime}, b_{i}^{\prime}\right): Z \rightarrow U_{i} \times_{S} U_{i}$ factors through $R_{i}$, say by some morphism $c_{i}: Z \rightarrow R_{i}$. Since $R=\lim _{i \geq 0} R_{i}$ we see that $c=\lim c_{i}: Z \rightarrow R$ is a morphism which shows that $a, b$ are equal as morphisms of $Z$ into $U / R$.
Part (1) follows as we have seen above that $U_{i} \times{ }_{X_{i}} X=U$ and $U \rightarrow U_{i}$ is affine by construction.

07SH Lemma 57.4.2. Let $S$ be a scheme. Let $I$ be a directed partially ordered set. Let $\left(X_{i}, f_{i i^{\prime}}\right)$ be an inverse system over $I$ of algebraic spaces over $S$ with affine transition maps. Let $X=\lim _{i} X_{i}$. Let $0 \in I$. Suppose that $T \rightarrow X_{0}$ is a morphism of algebraic spaces. Then

$$
T \times_{X_{0}} X=\lim _{i \geq 0} T \times_{X_{0}} X_{i}
$$

as algebraic spaces over $S$.

Proof. The limit $X$ is an algebraic space by Lemma57.4.1. The equality is formal, see Categories, Lemma 4.14.9.

### 57.5. Descending properties

0826 This section is the analogue of Limits, Section 31.3 .
084R Situation 57.5.1. Let $S$ be a scheme. Let $X=\lim _{i \in I} X_{i}$ be a limit of a directed system of algebraic spaces over $S$ with affine transition morphisms (Lemma 57.4.1). We assume that $X_{i}$ is quasi-compact and quasi-separated for all $i \in I$. We also choose an element $0 \in I$.

The following lemma holds a little bit more generally (namely when we just assume each $X_{i}$ is a decent algebraic space).
086 V Lemma 57.5.2. In Situation 57.5.1 we have $|X|=\lim \left|X_{i}\right|$.
Proof. There is a canonical map $|X| \rightarrow \lim \left|X_{i}\right|$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U_{i}=X_{i} \times_{X_{0}} U_{0}$ and $U=X \times_{X_{0}} U_{0}$. Set $R_{i}=U_{i} \times_{X_{i}} U_{i}$ and $R=U \times_{X} U$. Recall that $U=\lim U_{i}$ and $R=\lim R_{i}$, see proof of Lemma 57.4.1. Recall that $|X|=|U| /|R|$ and $\left|X_{i}\right|=\left|U_{i}\right| /\left|R_{i}\right|$. By Limits, Lemma 31.3.2 we have $|U|=\lim \left|U_{i}\right|$ and $|R|=\lim \left|R_{i}\right|$.

Surjectivity of $|X| \rightarrow \lim \left|X_{i}\right|$. Let $\left(x_{i}\right) \in \lim \left|X_{i}\right|$. Denote $S_{i} \subset\left|U_{i}\right|$ the inverse image of $x_{i}$. This is a finite nonempty set by Properties of Spaces, Lemma 53.6.7. Hence $\lim S_{i}$ is nonempty, see Categories, Lemma 4.21.5. Let $\left(u_{i}\right) \in \lim S_{i} \subset$ $\lim \left|U_{i}\right|$. By the above this determines a point $u \in|U|$ which maps to an $x \in|X|$ mapping to the given element $\left(x_{i}\right)$ of $\lim \left|X_{i}\right|$.

Injectivity of $|X| \rightarrow \lim \left|X_{i}\right|$. Suppose that $x, x^{\prime} \in|X|$ map to the same point of $\lim \left|X_{i}\right|$. Choose lifts $u, u^{\prime} \in|U|$ and denote $u_{i}, u_{i}^{\prime} \in\left|U_{i}\right|$ the images. For each $i$ let $T_{i} \subset\left|R_{i}\right|$ be the set of points mapping to $\left(u_{i}, u_{i}^{\prime}\right) \in\left|U_{i}\right| \times\left|U_{i}\right|$. This is a finite set by Properties of Spaces, Lemma 53.6.7 which is nonempty as we've assumed that $x$ and $x^{\prime}$ map to the same point of $X_{i}$. Hence $\lim T_{i}$ is nonempty, see Categories, Lemma 4.21.5. As before let $r \in|R|=\lim \left|R_{i}\right|$ be a point corresponding to an element of $\lim T_{i}$. Then $r$ maps to $\left(u, u^{\prime}\right)$ in $|U| \times|U|$ by construction and we see that $x=x^{\prime}$ in $|X|$ as desired.

086W Lemma 57.5.3. In Situation 57.5.1, if each $X_{i}$ is nonempty, then $|X|$ is nonempty.
Proof. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U_{i}=X_{i} \times_{X_{0}} U_{0}$ and $U=X \times_{X_{0}} U_{0}$. Then each $U_{i}$ is a nonempty affine scheme. Hence $U=\lim U_{i}$ is nonempty (Limits, Lemma 31.3.4) and thus $X$ is nonempty.

07SI Lemma 57.5.4. Notation and assumptions as in Situation 57.5.1. Suppose that $\mathcal{F}_{0}$ is a quasi-coherent sheaf on $X_{0}$. Set $\mathcal{F}_{i}=f_{0 i}^{*} \mathcal{F}_{0}$ for $i \geq 0$ and set $\mathcal{F}=f_{0}^{*} \mathcal{F}_{0}$. Then

$$
\Gamma(X, \mathcal{F})=\operatorname{colim}_{i \geq 0} \Gamma\left(X_{i}, \mathcal{F}_{i}\right)
$$

Proof. Choose a surjective étale morphism $U_{0} \rightarrow X_{0}$ where $U_{0}$ is an affine scheme (Properties of Spaces, Lemma 53.6.3). Set $U_{i}=X_{i} \times_{X_{0}} U_{0}$. Set $R_{0}=U_{0} \times{ }_{X_{0}} U_{0}$ and $R_{i}=R_{0} \times_{X_{0}} X_{i}$. In the proof of Lemma 57.4.1 we have seen that there exists a presentation $X=U / R$ with $U=\lim U_{i}$ and $R=\lim R_{i}$. Note that $U_{i}$
and $U$ are affine and that $R_{i}$ and $R$ are quasi-compact and separated (as $X_{i}$ is quasi-separated). Hence Limits, Lemma 31.3.3 implies that

$$
\mathcal{F}(U)=\operatorname{colim} \mathcal{F}_{i}\left(U_{i}\right) \quad \text { and } \quad \mathcal{F}(R)=\operatorname{colim} \mathcal{F}_{i}\left(R_{i}\right)
$$

The lemma follows as $\Gamma(X, \mathcal{F})=\operatorname{Ker}(\mathcal{F}(U) \rightarrow \mathcal{F}(R))$ and similarly $\Gamma\left(X_{i}, \mathcal{F}_{i}\right)=$ $\operatorname{Ker}\left(\mathcal{F}_{i}\left(U_{i}\right) \rightarrow \mathcal{F}_{i}\left(R_{i}\right)\right)$

0827 Lemma 57.5.5. Notation and assumptions as in Situation 57.5.1. For any quasicompact open subspace $U \subset X$ there exists an $i$ and a quasi-compact open $U_{i} \subset X_{i}$ whose inverse image in $X$ is $U$.

Proof. Follows formally from the construction of limits in Lemma 57.4.1 and the corresponding result for schemes: Limits, Lemma 31.3.8.

The following lemma will be superseded by the stronger Lemma 57.6.9.
084S Lemma 57.5.6. Notation and assumptions as in Situation 57.5.1. Let $f_{0}: Y_{0} \rightarrow$ $Z_{0}$ be a morphism of algebraic spaces over $X_{0}$. Assume (a) $Y_{0} \rightarrow X_{0}$ and $Z_{0} \rightarrow X_{0}$ are representable, (b) $Y_{0}, Z_{0}$ quasi-compact and quasi-separated, (c) $f_{0}$ locally of finite presentation, and (d) $Y_{0} \times_{X_{0}} X \rightarrow Z_{0} \times_{X_{0}} X$ an isomorphism. Then there exists an $i \geq 0$ such that $Y_{0} \times_{X_{0}} X_{i} \rightarrow Z_{0} \times_{X_{0}} X_{i}$ is an isomorphism.
Proof. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U_{i}=U_{0} \times_{X_{0}} X_{i}$ and $U=U_{0} \times_{X_{0}} X$. Apply Limits, Lemma 31.7.9 to see that $Y_{0} \times{ }_{X_{0}} U_{i} \rightarrow Z_{0} \times{ }_{X_{0}} U_{i}$ is an isomorphism of schemes for some $i \geq 0$ (details omitted). As $U_{i} \rightarrow X_{i}$ is surjective étale, it follows that $Y_{0} \times{ }_{X_{0}} X_{i} \rightarrow Z_{0} \times{ }_{X_{0}} X_{i}$ is an isomorphism (details omitted).

084T Lemma 57.5.7. Notation and assumptions as in Situation 57.5.1. If $X$ is separated, then $X_{i}$ is separated for some $i \in I$.

Proof. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. For $i \geq 0$ set $U_{i}=U_{0} \times_{X_{0}} X_{i}$ and set $U=U_{0} \times_{X_{0}} X$. Note that $U_{i}$ and $U$ are affine schemes which come equipped with surjective étale morphisms $U_{i} \rightarrow X_{i}$ and $U \rightarrow X$. Set $R_{i}=U_{i} \times_{X_{i}} U_{i}$ and $R=U \times_{X} U$ with projections $s_{i}, t_{i}: R_{i} \rightarrow U_{i}$ and $s, t: R \rightarrow U$. Note that $R_{i}$ and $R$ are quasi-compact separated schemes (as the algebraic spaces $X_{i}$ and $X$ are quasi-separated). The maps $s_{i}: R_{i} \rightarrow U_{i}$ and $s: R \rightarrow U$ are of finite type. By definition $X_{i}$ is separated if and only if $\left(t_{i}, s_{i}\right): R_{i} \rightarrow U_{i} \times U_{i}$ is a closed immersion, and since $X$ is separated by assumption, the morphism $(t, s): R \rightarrow U \times U$ is a closed immersion. Since $R \rightarrow U$ is of finite type, there exists an $i$ such that the morphism $R \rightarrow U_{i} \times U$ is a closed immersion (Limits, Lemma 31.3.13). Fix such an $i \in I$. Apply Limits, Lemma 31.7.4 to the system of morphisms $R_{i^{\prime}} \rightarrow U_{i} \times U_{i^{\prime}}$ for $i^{\prime} \geq i$ (this is permissible as indeed $R_{i^{\prime}}=R_{i} \times U_{U_{i} \times U_{i}} U_{i} \times U_{i^{\prime}}$ ) to see that $R_{i^{\prime}} \rightarrow U_{i} \times U_{i^{\prime}}$ is a closed immersion for $i^{\prime}$ sufficiently large. This implies immediately that $R_{i^{\prime}} \rightarrow U_{i^{\prime}} \times U_{i^{\prime}}$ is a closed immersion finishing the proof of the lemma.

07SQ Lemma 57.5.8. Notation and assumptions as in Situation 57.5.1. If $X$ is affine, then there exists an $i$ such that $X_{i}$ is affine.

Proof. Choose $0 \in I$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U=U_{0} \times_{X_{0}} X$ and $U_{i}=U_{0} \times_{X_{0}} X_{i}$ for $i \geq 0$. Since the transition morphisms are affine, the algebraic spaces $U_{i}$ and $U$ are affine. Thus $U \rightarrow X$ is an
étale morphism of affine schemes. Hence we can write $X=\operatorname{Spec}(A), U=\operatorname{Spec}(B)$ and

$$
B=A\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{n}\right)
$$

such that $\Delta=\operatorname{det}\left(\partial g_{\lambda} / \partial x_{\mu}\right)$ is invertible in $B$, see Algebra, Lemma 10.141.2 Set $A_{i}=\mathcal{O}_{X_{i}}\left(X_{i}\right)$. We have $A=\operatorname{colim} A_{i}$ by Lemma 57.5.4. After increasing 0 we may assume we have $g_{1, i}, \ldots, g_{n, i} \in A_{i}\left[x_{1}, \ldots, x_{n}\right]$ mapping to $g_{1}, \ldots, g_{n}$. Set

$$
B_{i}=A_{i}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1, i}, \ldots, g_{n, i}\right)
$$

for all $i \geq 0$. Increasing 0 if necessary we may assume that $\Delta_{i}=\operatorname{det}\left(\partial g_{\lambda, i} / \partial x_{\mu}\right)$ is invertible in $B_{i}$ for all $i \geq 0$. Thus $A_{i} \rightarrow B_{i}$ is an étale ring map. After increasing 0 we may assume also that $\operatorname{Spec}\left(B_{i}\right) \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is surjective, see Limits, Lemma 31.7.11. Increasing 0 yet again we may choose elements $h_{1, i}, \ldots, h_{n, i} \in \mathcal{O}_{U_{i}}\left(U_{i}\right)$ which map to the classes of $x_{1}, \ldots, x_{n}$ in $B=\mathcal{O}_{U}(U)$ and such that $g_{\lambda, i}\left(h_{\nu, i}\right)=0$ in $\mathcal{O}_{U_{i}}\left(U_{i}\right)$. Thus we obtain a commutative diagram

084U

By construction $B_{i}=B_{0} \otimes_{A_{0}} A_{i}$ and $B=B_{0} \otimes_{A_{0}} A$. Consider the morphism

$$
f_{0}: U_{0} \longrightarrow X_{0} \times_{\operatorname{Spec}\left(A_{0}\right)} \operatorname{Spec}\left(B_{0}\right)
$$

This is a morphism of quasi-compact and quasi-separated algebraic spaces representable, separated and étale over $X_{0}$. The base change of $f_{0}$ to $X$ is an isomorphism by our choices. Hence Lemma 57.5.6 guarantees that there exists an $i$ such that the base change of $f_{0}$ to $X_{i}$ is an isomorphism, in other words the diagram 57.5.8.1 is cartesian. Thus Descent, Lemma 34.35.1 applied to the fppf covering $\left\{\operatorname{Spec}\left(B_{i}\right) \rightarrow \operatorname{Spec}\left(A_{i}\right)\right\}$ combined with Descent, Lemma 34.33.1 give that $X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is representable by a scheme affine over $\operatorname{Spec}\left(A_{i}\right)$ as desired. (Of course it then also follows that $X_{i}=\operatorname{Spec}\left(A_{i}\right)$ but we don't need this.)

07SR Lemma 57.5.9. Notation and assumptions as in Situation 57.5.1. If $X$ is a scheme, then there exists an $i$ such that $X_{i}$ is a scheme.

Proof. Choose a finite affine open covering $X=\bigcup W_{j}$. By Lemma 57.5.5 we can find an $i \in I$ and open subspaces $W_{j, i} \subset X_{i}$ whose base change to $X$ is $W_{j} \rightarrow X$. By Lemma 57.5 .8 we may assume that each $W_{j, i}$ is an affine scheme. This means that $X_{i}$ is a scheme (see for example Properties of Spaces, Section 53.12).

0828 Lemma 57.5.10. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X=\lim X_{i}$ be a directed limit of algebraic spaces over $B$ with affine transition morphisms. Let $Y \rightarrow X$ be a morphism of algebraic spaces over $B$.
(1) If $Y \rightarrow X$ is a closed immersion, $X_{i}$ quasi-compact, and $Y \rightarrow B$ locally of finite type, then $Y \rightarrow X_{i}$ is a closed immersion for $i$ large enough.
(2) If $Y \rightarrow X$ is an immersion, $X_{i}$ quasi-separated, $Y \rightarrow B$ locally of finite type, and $Y$ quasi-compact, then $Y \rightarrow X_{i}$ is an immersion for $i$ large enough.
(3) If $Y \rightarrow X$ is an isomorphism, $X_{i}$ quasi-compact, $X_{i} \rightarrow B$ locally of finite type, the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are closed immersions, and $Y \rightarrow B$ is locally of finite presentation, then $Y \rightarrow X_{i}$ is an isomorphism for $i$ large enough.
(4) If $Y \rightarrow X$ is a monomorphism, $X_{i}$ quasi-separated, $Y \rightarrow B$ locally of finite type, and $Y$ quasi-compact, then $Y \rightarrow X_{i}$ is a monomorphism for $i$ large enough.

Proof. Proof of (1). Choose $0 \in I$. As $X_{0}$ is quasi-compact, we can choose an affine scheme $W$ and an étale morphism $W \rightarrow B$ such that the image of $\left|X_{0}\right| \rightarrow|B|$ is contained in $|W| \rightarrow|B|$. Choose an affine scheme $U_{0}$ and an étale morphism $U_{0} \rightarrow X_{0} \times_{B} W$ such that $U_{0} \rightarrow X_{0}$ is surjective. (This is possible by our choice of $W$ and the fact that $X_{0}$ is quasi-compact; details omitted.) Let $V \rightarrow Y$, resp. $U \rightarrow X$, resp. $U_{i} \rightarrow X_{i}$ be the base change of $U_{0} \rightarrow X_{0}$ (for $i \geq 0$ ). It suffices to prove that $V \rightarrow U_{i}$ is a closed immersion for $i$ sufficiently large. Thus we reduce to proving the result for $V \rightarrow U=\lim U_{i}$ over $W$. This follows from the case of schemes, which is Limits, Lemma 31.3.13.
Proof of (2). Choose $0 \in I$. Choose a quasi-compact open subspace $X_{0}^{\prime} \subset X_{0}$ such that $Y \rightarrow X_{0}$ factors through $X_{0}^{\prime}$. After replacing $X_{i}$ by the inverse image of $X_{0}^{\prime}$ for $i \geq 0$ we may assume all $X_{i}^{\prime}$ are quasi-compact and quasi-separated. Let $U \subset X$ be a quasi-compact open such that $Y \rightarrow X$ factors through a closed immersion $Y \rightarrow U(U$ exists as $Y$ is quasi-compact). By Lemma 57.5.5 we may assume that $U=\lim U_{i}$ with $U_{i} \subset X_{i}$ quasi-compact open. By part (1) we see that $Y \rightarrow U_{i}$ is a closed immersion for some $i$. Thus (2) holds.

Proof of (3). Choose $0 \in I$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U_{i}=X_{i} \times_{X_{0}} U_{0}, U=X \times_{X_{0}} U_{0}=Y \times_{X_{0}} U_{0}$. Then $U=\lim U_{i}$ is a limit of affine schemes, the transition maps of the system are closed immersions, and $U \rightarrow U_{0}$ is of finite presentation (because $U \rightarrow B$ is locally of finite presentation and $U_{0} \rightarrow B$ is locally of finite type and Morphisms of Spaces, Lemma 54.28.9. Thus we've reduced to the following algebra fact: If $A=\lim A_{i}$ is a directed colimit of $R$-algebras with surjective transition maps and $A$ of finite presentation over $A_{0}$, then $A=A_{i}$ for some $i$. Namely, write $A=A_{0} /\left(f_{1}, \ldots, f_{n}\right)$. Pick $i$ such that $f_{1}, \ldots, f_{n}$ map to zero under the surjective map $A_{0} \rightarrow A_{i}$.
Proof of (4). Set $Z_{i}=Y \times_{X_{i}} Y$. As the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are affine hence separated, the transition morphisms $Z_{i^{\prime}} \rightarrow Z_{i}$ are closed immersions, see Morphisms of Spaces, Lemma 54.4.5. We have $\lim Z_{i}=Y \times_{X} Y=Y$ as $Y \rightarrow X$ is a monomorphism. Choose $0 \in I$. Since $Y \rightarrow X_{0}$ is locally of finite type (Morphisms of Spaces, Lemma 54.23.6) the morphism $Y \rightarrow Z_{0}$ is locally of finite presentation (Morphisms of Spaces, Lemma 54.28.10). The morphisms $Z_{i} \rightarrow Z_{0}$ are locally of finite type (they are closed immersions). Finally, $Z_{i}=Y \times_{X_{i}} Y$ is quasi-compact as $X_{i}$ is quasi-separated and $Y$ is quasi-compact. Thus part (3) applies to $Y=\lim _{i \geq 0} Z_{i}$ over $Z_{0}$ and we conclude $Y=Z_{i}$ for some $i$. This proves (4) and the lemma.

086X Lemma 57.5.11. Let $S$ be a scheme. Let $Y$ be an algebraic space over $S$. Let $X=\lim X_{i}$ be a directed limit of algebraic spaces over $Y$ with affine transition morphisms. Assume
(1) $Y$ is quasi-separated,
(2) $X_{i}$ is quasi-compact and quasi-separated,
(3) the morphism $X \rightarrow Y$ is separated.

Then $X_{i} \rightarrow Y$ is separated for all $i$ large enough.
Proof. Let $0 \in I$. Choose an affine scheme $W$ and an étale morphism $W \rightarrow Y$ such that the image of $|W| \rightarrow|Y|$ contains the image of $\left|X_{0}\right| \rightarrow|Y|$. This is possible as $X_{0}$ is quasi-compact. It suffices to check that $W \times_{Y} X_{i} \rightarrow W$ is separated for some $i \geq 0$ because the diagonal of $W \times_{Y} X_{i}$ over $W$ is the base change of $X_{i} \rightarrow X_{i} \times_{Y} X_{i}$ by the surjective étale morphism $\left(X_{i} \times_{Y} X_{i}\right) \times_{Y} W \rightarrow X_{i} \times_{Y} X_{i}$. Since $Y$ is quasi-separated the algebraic spaces $W \times_{Y} X_{i}$ are quasi-compact (as well as quasi-separated). Thus we may base change to $W$ and assume $Y$ is an affine scheme. When $Y$ is an affine scheme, we have to show that $X_{i}$ is a separated algebraic space for $i$ large enough and we are given that $X$ is a separated algebraic space. Thus this case follows from Lemma 57.5.7.

0A0R Lemma 57.5.12. Let $S$ be a scheme. Let $Y$ be an algebraic space over $S$. Let $X=\lim X_{i}$ be a directed limit of algebraic spaces over $Y$ with affine transition morphisms. Assume
(1) $Y$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) $X \rightarrow Y$ affine.

Then $X_{i} \rightarrow Y$ is affine for $i$ large enough.
Proof. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow Y$. Then $X \times_{Y} W$ is affine and it suffices to check that $X_{i} \times_{Y} W$ is affine for some $i$ (Morphisms of Spaces, Lemma 54.20.3). This follows from Lemma 57.5.8.

0A0S Lemma 57.5.13. Let $S$ be a scheme. Let $Y$ be an algebraic space over $S$. Let $X=\lim X_{i}$ be a directed limit of algebraic spaces over $Y$ with affine transition morphisms. Assume
(1) $Y$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are finite,
(4) $X_{i} \rightarrow Y$ locally of finite type
(5) $X \rightarrow Y$ integral.

Then $X_{i} \rightarrow Y$ is finite for $i$ large enough.
Proof. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow Y$. Then $X \times_{Y} W$ is finite over $W$ and it suffices to check that $X_{i} \times_{Y} W$ is finite over $W$ for some $i$ (Morphisms of Spaces, Lemma 54.43.3). By Lemma 57.5.9 this reduces us to the case of schemes. In the case of schemes it follows from Limits, Lemma 31.3 .16

0A0T Lemma 57.5.14. Let $S$ be a scheme. Let $Y$ be an algebraic space over $S$. Let $X=\lim X_{i}$ be a directed limit of algebraic spaces over $Y$ with affine transition morphisms. Assume
(1) $Y$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are closed immersions,
(4) $X_{i} \rightarrow Y$ locally of finite type
(5) $X \rightarrow Y$ is a closed immersion.

Then $X_{i} \rightarrow Y$ is a closed immersion for $i$ large enough.
Proof. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow Y$. Then $X \times_{Y} W$ is a closed subspace of $W$ and it suffices to check that $X_{i} \times_{Y} W$ is a closed subspace $W$ for some $i$ (Morphisms of Spaces, Lemma 54.12.1). By Lemma 57.5.9 this reduces us to the case of schemes. In the case of schemes it follows from Limits, Lemma 31.3.17.

### 57.6. Descending properties of morphisms

084 V This section is the analogue of Section 57.5 for properties of morphisms. We will work in the following situation.

084W Situation 57.6.1. Let $S$ be a scheme. Let $B=\lim B_{i}$ be a limit of a directed system of algebraic spaces over $S$ with affine transition morphisms (Lemma 57.4.1). Let $0 \in I$ and let $f_{0}: X_{0} \rightarrow Y_{0}$ be a morphism of algebraic spaces over $B_{0}$. Assume $B_{0}, X_{0}, Y_{0}$ are quasi-compact and quasi-separated. Let $f_{i}: X_{i} \rightarrow Y_{i}$ be the base change of $f_{0}$ to $B_{i}$ and let $f: X \rightarrow Y$ be the base change of $f_{0}$ to $B$.
07SL Lemma 57.6.2. With notation and assumptions as in Situation 57.6.1. If
(1) $f$ is étale,
(2) $f_{0}$ is locally of finite presentation,
then $f_{i}$ is étale for some $i \geq 0$.
Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow V_{0} \times_{Y_{0}} X_{0}$. Diagram

The vertical arrows are surjective and étale by construction. We can base change this diagram to $B_{i}$ or $B$ to get

Note that $U_{i}, V_{i}, U, V$ are affine schemes, the vertical morphisms are surjective étale, and the limit of the morphisms $U_{i} \rightarrow V_{i}$ is $U \rightarrow V$. Recall that $X_{i} \rightarrow Y_{i}$ is étale if and only if $U_{i} \rightarrow V_{i}$ is étale and similarly $X \rightarrow Y$ is étale if and only if $U \rightarrow V$ is étale (Morphisms of Spaces, Definition 54.38.1). Since $f_{0}$ is locally of finite presentation, so is the morphism $U_{0} \rightarrow V_{0}$. Hence the lemma follows from Limits, Lemma 31.7.8.

07SN Lemma 57.6.3. With notation and assumptions as in Situation 57.6.1. If
(1) $f$ is surjective,
(2) $f_{0}$ is locally of finite presentation,
then $f_{i}$ is surjective for some $i \geq 0$.

Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow V_{0} \times_{Y_{0}} X_{0}$. Diagram

The vertical arrows are surjective and étale by construction. We can base change this diagram to $B_{i}$ or $B$ to get

and

Note that $U_{i}, V_{i}, U, V$ are affine schemes, the vertical morphisms are surjective étale, the limit of the morphisms $U_{i} \rightarrow V_{i}$ is $U \rightarrow V$, and the morphisms $U_{i} \rightarrow X_{i} \times_{Y_{i}} V_{i}$ and $U \rightarrow X \times_{Y} V$ are surjective (as base changes of $U_{0} \rightarrow X_{0} \times_{Y_{0}} V_{0}$ ). In particular, we see that $X_{i} \rightarrow Y_{i}$ is surjective if and only if $U_{i} \rightarrow V_{i}$ is surjective and similarly $X \rightarrow Y$ is surjective if and only if $U \rightarrow V$ is surjective. Since $f_{0}$ is locally of finite presentation, so is the morphism $U_{0} \rightarrow V_{0}$. Hence the lemma follows from the case of schemes (Limits, Lemma 31.7.11).

084X Lemma 57.6.4. Notation and assumptions as in Situation 57.6.1. If
(1) $f$ is universally injective,
(2) $f_{0}$ is locally of finite type,
then $f_{i}$ is universally injective for some $i \geq 0$.
Proof. Recall that a morphism $X \rightarrow Y$ is universally injective if and only if the diagonal $X \rightarrow X \times_{Y} X$ is surjective (Morphisms of Spaces, Definition 54.19.3 and Lemma 54.19.2. Observe that $X_{0} \rightarrow X_{0} \times_{Y_{0}} X_{0}$ is of locally of finite presentation (Morphisms of Spaces, Lemma 54.28.10). Hence the lemma follows from Lemma 57.6 .3 by considering the morphism $X_{0} \rightarrow X_{0} \times_{Y_{0}} X_{0}$.

084Y Lemma 57.6.5. Notation and assumptions as in Situation 57.6.1. If $f$ is affine, then $f_{i}$ is affine for some $i \geq 0$.

Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Set $V_{i}=V_{0} \times_{Y_{0}} Y_{i}$ and $V=V_{0} \times_{Y_{0}} Y$. Since $f$ is affine we see that $V \times_{Y} X=\lim V_{i} \times_{Y_{i}} X_{i}$ is affine. By Lemma 57.5 .8 we see that $V_{i} \times_{Y_{i}} X_{i}$ is affine for some $i \geq 0$. For this $i$ the morphism $f_{i}$ is affine (Morphisms of Spaces, Lemma 54.20.3).

084Z Lemma 57.6.6. Notation and assumptions as in Situation 57.6.1. If
(1) $f$ is finite,
(2) $f_{0}$ is locally of finite type,
then $f_{i}$ is finite for some $i \geq 0$.
Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Set $V_{i}=V_{0} \times_{Y_{0}} Y_{i}$ and $V=V_{0} \times_{Y_{0}} Y$. Since $f$ is finite we see that $V \times_{Y} X=\lim V_{i} \times_{Y_{i}} X_{i}$ is a scheme finite over $V$. By Lemma 57.5 .8 we see that $V_{i} \times_{Y_{i}} X_{i}$ is affine for some $i \geq 0$. Increasing $i$ if necessary we find that $V_{i} \times_{Y_{i}} X_{i} \rightarrow V_{i}$ is finite by Limits,

Lemma 31.7.3. For this $i$ the morphism $f_{i}$ is finite (Morphisms of Spaces, Lemma 54.43.3).

0850 Lemma 57.6.7. Notation and assumptions as in Situation 57.6.1. If
(1) $f$ is a closed immersion,
(2) $f_{0}$ is locally of finite type,
then $f_{i}$ is a closed immersion for some $i \geq 0$.
Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Set $V_{i}=V_{0} \times_{Y_{0}} Y_{i}$ and $V=V_{0} \times_{Y_{0}} Y$. Since $f$ is a closed immersion we see that $V \times_{Y} X=\lim V_{i} \times_{Y_{i}} X_{i}$ is a closed subscheme of the affine scheme $V$. By Lemma 57.5 .8 we see that $V_{i} \times_{Y_{i}} X_{i}$ is affine for some $i \geq 0$. Increasing $i$ if necessary we find that $V_{i} \times_{Y_{i}} X_{i} \rightarrow V_{i}$ is a closed immersion by Limits, Lemma 31.7.4. For this $i$ the morphism $f_{i}$ is a closed immersion (Morphisms of Spaces, Lemma 54.43.3).

0851 Lemma 57.6.8. Notation and assumptions as in Situation 57.6.1. If $f$ is separated, then $f_{i}$ is separated for some $i \geq 0$.

Proof. Apply Lemma 57.6.7 to the diagonal morphism $\Delta_{X_{0} / Y_{0}}: X_{0} \rightarrow X_{0} \times_{Y_{0}} X_{0}$. (Diagonal morphisms are locally of finite type and the fibre product $X_{0} \times{ }_{Y_{0}} X_{0}$ is quasi-compact and quasi-separated. Some details omitted.)

0852 Lemma 57.6.9. Notation and assumptions as in Situation 57.6.1. If
(1) $f$ is a isomorphism,
(2) $f_{0}$ is locally of finite presentation,
then $f_{i}$ is a isomorphism for some $i \geq 0$.
Proof. Being an isomorphism is equivalent to being étale, universally injective, and surjective, see Morphisms of Spaces, Lemma 54.48.2. Thus the lemma follows from Lemmas 57.6.2, 57.6.3, and 57.6.4

07SM Lemma 57.6.10. Notation and assumptions as in Situation 57.6.1. If
(1) $f$ is a monomorphism,
(2) $f_{0}$ is locally of finite type,
then $f_{i}$ is a monomorphism for some $i \geq 0$.
Proof. Recall that a morphism is a monomorphism if and only if the diagonal is an isomorphism. The morphism $X_{0} \rightarrow X_{0} \times_{Y_{0}} X_{0}$ is locally of finite presentation by Morphisms of Spaces, Lemma 54.28.10. Since $X_{0} \times_{Y_{0}} X_{0}$ is quasi-compact and quasi-separated we conclude from Lemma 57.6 .9 that $\Delta_{i}: X_{i} \rightarrow X_{i} \times_{Y_{i}} X_{i}$ is an isomorphism for some $i \geq 0$. For this $i$ the morphism $f_{i}$ is a monomorphism.

08K0 Lemma 57.6.11. Notation and assumptions as in Situation 57.6.1. Let $\mathcal{F}_{0}$ be a quasi-coherent $\mathcal{O}_{X_{0}}$-module and denote $\mathcal{F}_{i}$ the pullback to $X_{i}$ and $\mathcal{F}$ the pullback to X. If
(1) $\mathcal{F}$ is flat over $Y$,
(2) $\mathcal{F}_{0}$ is of finite presentation, and
(3) $f_{0}$ is locally of finite presentation,
then $\mathcal{F}_{i}$ is flat over $Y_{i}$ for some $i \geq 0$. In particular, if $f_{0}$ is locally of finite presentation and $f$ is flat, then $f_{i}$ is flat for some $i \geq 0$.

Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow V_{0} \times_{Y_{0}} X_{0}$. Diagram

The vertical arrows are surjective and étale by construction. We can base change this diagram to $B_{i}$ or $B$ to get

Note that $U_{i}, V_{i}, U, V$ are affine schemes, the vertical morphisms are surjective étale, and the limit of the morphisms $U_{i} \rightarrow V_{i}$ is $U \rightarrow V$. Recall that $\mathcal{F}_{i}$ is flat over $Y_{i}$ if and only if $\left.\mathcal{F}_{i}\right|_{U_{i}}$ is flat over $V_{i}$ and similarly $\mathcal{F}$ is flat over $Y$ if and only if $\left.\mathcal{F}\right|_{U}$ is flat over $V$ (Morphisms of Spaces, Definition 54.29.1. Since $f_{0}$ is locally of finite presentation, so is the morphism $U_{0} \rightarrow V_{0}$. Hence the lemma follows from Limits, Lemma 31.9.4

08K1 Lemma 57.6.12. Assumptions and notation as in Situation 57.6.1. If
(1) $f$ is proper, and
(2) $f_{0}$ is locally of finite type,
then there exists an $i$ such that $f_{i}$ is proper.
Proof. Choose an affine scheme $V_{0}$ and a surjective étale morphism $V_{0} \rightarrow Y_{0}$. Set $V_{i}=Y_{i} \times_{Y_{0}} V_{0}$ and $V=Y \times_{Y_{0}} V_{0}$. It suffices to prove that the base change of $f_{i}$ to $V_{i}$ is proper, see Morphisms of Spaces, Lemma 54.39.2. Thus we may assume $Y_{0}$ is affine.

By Lemma 57.6 .8 we see that $f_{i}$ is separated for some $i \geq 0$. Replacing 0 by $i$ we may assume that $f_{0}$ is separated. Observe that $f_{0}$ is quasi-compact. Thus $f_{0}$ is separated and of finite type. By Cohomology of Spaces, Lemma 56.17.1 we can choose a diagram

where $X_{0}^{\prime} \rightarrow \mathbf{P}_{Y_{0}}^{n}$ is an immersion, and $\pi: X_{0}^{\prime} \rightarrow X_{0}$ is proper and surjective. Introduce $X^{\prime}=X_{0}^{\prime} \times{ }_{Y_{0}} Y$ and $X_{i}^{\prime}=X_{0}^{\prime} \times_{Y_{0}} Y_{i}$. By Morphisms of Spaces, Lemmas 54.39 .4 and 54.39 .3 we see that $X^{\prime} \rightarrow Y$ is proper. Hence $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion (Morphisms of Spaces, Lemma 54.39.6). By Morphisms of Spaces, Lemma 54.39 .7 it suffices to prove that $X_{i}^{\prime} \rightarrow Y_{i}$ is proper for some $i$. By Lemma 57.6.7 we find that $X_{i}^{\prime} \rightarrow \mathbf{P}_{Y_{i}}^{n}$ is a closed immersion for $i$ large enough. Then $X_{i}^{\prime} \rightarrow Y_{i}$ is proper and we win.

### 57.7. Descending relative objects

07 SJ The following lemma is typical of the type of results in this section.
07SK Lemma 57.7.1. Let $S$ be a scheme. Let I be a directed partially ordered set. Let $\left(X_{i}, f_{i i^{\prime}}\right)$ be an inverse system over I of algebraic spaces over $S$. Assume
(1) the morphisms $f_{i i^{\prime}}: X_{i} \rightarrow X_{i^{\prime}}$ are affine,
(2) the spaces $X_{i}$ are quasi-compact and quasi-separated.

Let $X=\lim _{i} X_{i}$. Then the category of algebraic spaces of finite presentation over $X$ is the colimit over $I$ of the categories of algebraic spaces of finite presentation over $X_{i}$.

Proof. Pick $0 \in I$. Choose a surjective étale morphism $U_{0} \rightarrow X_{0}$ where $U_{0}$ is an affine scheme (Properties of Spaces, Lemma 53.6.3). Set $U_{i}=X_{i} \times{ }_{X_{0}} U_{0}$. Set $R_{0}=U_{0} \times_{X_{0}} U_{0}$ and $R_{i}=R_{0} \times_{X_{0}} X_{i}$. Denote $s_{i}, t_{i}: R_{i} \rightarrow U_{i}$ and $s, t: R \rightarrow U$ the two projections. In the proof of Lemma 57.4.1 we have seen that there exists a presentation $X=U / R$ with $U=\lim U_{i}$ and $R=\lim R_{i}$. Note that $U_{i}$ and $U$ are affine and that $R_{i}$ and $R$ are quasi-compact and separated (as $X_{i}$ is quasiseparated). Let $Y$ be an algebraic space over $S$ and let $Y \rightarrow X$ be a morphism of finite presentation. Set $V=U \times_{X} Y$. This is an algebraic space of finite presentation over $U$. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow V$. Then $W \rightarrow Y$ is surjective étale as well. Set $R^{\prime}=W \times_{Y} W$ so that $Y=W / R^{\prime}$ (see Spaces, Section 52.9). Note that $W$ is a scheme of finite presentation over $U$ and that $R^{\prime}$ is a scheme of finite presentation over $R$ (details omitted). By Limits, Lemma 31.9.1 we can find an index $i$ and a morphism of schemes $W_{i} \rightarrow U_{i}$ of finite presentation whose base change to $U$ gives $W \rightarrow U$. Similarly we can find, after possibly increasing $i$, a scheme $R_{i}^{\prime}$ of finite presentation over $R_{i}$ whose base change to $R$ is $R^{\prime}$. The projection morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow W$ are morphisms over the projection morphisms $s, t: R \rightarrow U$. Hence we can view $s^{\prime}$, resp. $t^{\prime}$ as a morphism between schemes of finite presentation over $U$ (with structure morphism $R^{\prime} \rightarrow U$ given by $R^{\prime} \rightarrow R$ followed by $s$, resp. $t$ ). Hence we can apply Limits, Lemma 31.9.1 again to see that, after possibly increasing $i$, there exist morphisms $s_{i}^{\prime}, t_{i}^{\prime}: R_{i}^{\prime} \rightarrow W_{i}$, whose base change to $U$ is $S^{\prime}, t^{\prime}$. By Limits, Lemmas 31.7.8 and 31.7.10 we may assume that $s_{i}^{\prime}, t_{i}^{\prime}$ are étale and that $j_{i}^{\prime}: R_{i}^{\prime} \rightarrow W_{i} \times_{X_{i}} W_{i}$ is a monomorphism (here we view $j_{i}^{\prime}$ as a morphism of schemes of finite presentation over $U_{i}$ via one of the projections - it doesn't matter which one). Setting $Y_{i}=W_{i} / R_{i}^{\prime}$ (see Spaces, Theorem 52.10.5) we obtain an algebraic space of finite presentation over $X_{i}$ whose base change to $X$ is isomorphic to $Y$.

This shows that every algebraic space of finite presentation over $X$ comes from an algebraic space of finite presentation over some $X_{i}$, i.e., it shows that the functor of the lemma is essentially surjective. To show that it is fully faithful, consider an index $0 \in I$ and two algebraic spaces $Y_{0}, Z_{0}$ of finite presentation over $X_{0}$. Set $Y_{i}=X_{i} \times_{X_{0}} Y_{0}, Y=X \times_{X_{0}} Y_{0}, Z_{i}=X_{i} \times_{X_{0}} Z_{0}$, and $Z=X \times_{X_{0}} Z_{0}$. Let $\alpha: Y \rightarrow Z$ be a morphism of algebraic spaces over $X$. Choose a surjective étale morphism $V_{0} \rightarrow Y_{0}$ where $V_{0}$ is an affine scheme. Set $V_{i}=V_{0} \times_{Y_{0}} Y_{i}$ and $V=V_{0} \times_{Y_{0}} Y$ which are affine schemes endowed with surjective étale morphisms to $Y_{i}$ and $Y$. The composition $V \rightarrow Y \rightarrow Z \rightarrow Z_{0}$ comes from a (essentially unique) morphism $V_{i} \rightarrow Z_{0}$ for some $i \geq 0$ by Proposition 57.3 .9 (applied to $Z_{0} \rightarrow X_{0}$ which
is of finite presentation by assumption). After increasing $i$ the two compositions

$$
V_{i} \times_{Y_{i}} V_{i} \rightarrow V_{i} \rightarrow Z_{0}
$$

are equal as this is true in the limit. Hence we obtain a (essentially unique) morphism $Y_{i} \rightarrow Z_{0}$. Since this is a morphism over $X_{0}$ it induces a morphism into $Z_{i}=Z_{0} \times_{X_{0}} X_{i}$ as desired.
07V7 Lemma 57.7.2. With notation and assumptions as in Lemma 57.7.1. The category of $\mathcal{O}_{X}$-modules of finite presentation is the colimit over I of the categories $\mathcal{O}_{X_{i}}$-modules of finite presentation.
Proof. Choose $0 \in I$. Choose an affine scheme $U_{0}$ and a surjective étale morphism $U_{0} \rightarrow X_{0}$. Set $U_{i}=X_{i} \times_{X_{0}} U_{0}$. Set $R_{0}=U_{0} \times_{X_{0}} U_{0}$ and $R_{i}=R_{0} \times_{X_{0}} X_{i}$. Denote $s_{i}, t_{i}: R_{i} \rightarrow U_{i}$ and $s, t: R \rightarrow U$ the two projections. In the proof of Lemma 57.4.1 we have seen that there exists a presentation $X=U / R$ with $U=\lim U_{i}$ and $R=\lim R_{i}$. Note that $U_{i}$ and $U$ are affine and that $R_{i}$ and $R$ are quasi-compact and separated (as $X_{i}$ is quasi-separated). Moreover, it is also true that $R \times_{s, U, t}$ $R=\operatorname{colim} R_{i} \times{ }_{s_{i}, U_{i}, t_{i}} R_{i}$. Thus we know that $Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)=\operatorname{colim} Q \operatorname{Coh}\left(\mathcal{O}_{U_{i}}\right)$, $Q \operatorname{Coh}\left(\mathcal{O}_{R}\right)=\operatorname{colim} Q \operatorname{Coh}\left(\mathcal{O}_{R_{i}}\right)$, and $Q \operatorname{Coh}\left(\mathcal{O}_{R \times_{s, U, t} R}\right)=\operatorname{colim} Q \operatorname{Coh}\left(\mathcal{O}_{R_{i} \times_{s_{i}, U_{i}, t_{i}} R_{i}}\right)$ by Limits, Lemma 31.9.2. We have $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)=Q \operatorname{Coh}(U, R, s, t, c)$ and $Q \operatorname{Coh}\left(\mathcal{O}_{X_{i}}\right)=$ $Q \operatorname{Coh}\left(U_{i}, R_{i}, s_{i}, t_{i}, c_{i}\right)$, see Properties of Spaces, Proposition 53.31.1. Thus the result follows formally.

### 57.8. Absolute Noetherian approximation

07SS The following result is CLO12, Theorem 1.2.2]. A key ingredient in the proof is Decent Spaces, Lemma 55.8.6.

07SU Proposition 57.8.1. Let $X$ be a quasi-compact and quasi-separated algebraic space over $\operatorname{Spec}(\mathbf{Z})$. There exist a directed partially ordered set I and an inverse system of algebraic spaces $\left(X_{i}, f_{i i^{\prime}}\right)$ over $I$ such that
(1) the transition morphisms $f_{i i^{\prime}}$ are affine
(2) each $X_{i}$ is quasi-separated and of finite type over $\mathbf{Z}$, and
(3) $X=\lim X_{i}$.

Proof. We apply Decent Spaces, Lemma 55.8.6 to get open subspaces $U_{p} \subset X$, schemes $V_{p}$, and morphisms $f_{p}: V_{p} \rightarrow U_{p}$ with properties as stated. Note that $f_{n}: V_{n} \rightarrow U_{n}$ is an étale morphism of algebraic spaces whose restriction to the inverse image of $T_{n}=\left(V_{n}\right)_{\text {red }}$ is an isomorphism. Hence $f_{n}$ is an isomorphism, for example by Morphisms of Spaces, Lemma 54.48.2. In particular $U_{n}$ is a quasicompact and separated scheme. Thus we can write $U_{n}=\lim U_{n, i}$ as a directed limit of schemes of finite type over $\mathbf{Z}$ with affine transition morphisms, see Limits, Proposition 31.4.4. Thus, applying descending induction on $p$, we see that we have reduced to the problem posed in the following paragraph.
Here we have $U \subset X, U=\lim U_{i}, Z \subset X$, and $f: V \rightarrow X$ with the following properties
(1) $X$ is a quasi-compact and quasi-separated algebraic space,
(2) $V$ is a quasi-compact and separated scheme,
(3) $U \subset X$ is a quasi-compact open subspace,
(4) $\left(U_{i}, g_{i i^{\prime}}\right)$ is a directed system of quasi-separated algebraic spaces of finite type over $\mathbf{Z}$ with affine transition morphisms whose limit is $U$,

Our proof follows closely the proof given in CLO12 Theorem 1.2.2].
(5) $Z \subset X$ is a closed subspace such that $|X|=|U| \amalg|Z|$,
(6) $f: V \rightarrow X$ is a surjective étale morphism such that $f^{-1}(Z) \rightarrow Z$ is an isomorphism.
Problem: Show that the conclusion of the proposition holds for $X$.
Note that $W=f^{-1}(U) \subset V$ is a quasi-compact open subscheme étale over $U$. Hence we may apply Lemmas 57.7 .1 and 57.6 .2 to find an index $0 \in I$ and an étale morphism $W_{0} \rightarrow U_{0}$ of finite presentation whose base change to $U$ produces $W$. Setting $W_{i}=W_{0} \times_{U_{0}} U_{i}$ we see that $W=\lim _{i \geq 0} W_{i}$. After increasing 0 we may assume the $W_{i}$ are schemes, see Lemma 57.5.9. Moreover, $W_{i}$ is of finite type over Z.

Apply Limits, Lemma 31.4 .3 to $W=\lim _{i \geq 0} W_{i}$ and the inclusion $W \subset V$. Replace $I$ by the directed partially ordered set $J$ found in that lemma. This allows us to write $V$ as a directed limit $V=\lim V_{i}$ of finite type schemes over $\mathbf{Z}$ with affine transition maps such that each $V_{i}$ contains $W_{i}$ as an open subscheme (compatible with transition morphisms). For each $i$ we can form the push out

in the category of schemes. Namely, the left vertical and upper horizontal arrows are open immersions of schemes. In other words, we can construct $R_{i}$ as the glueing of $V_{i}$ and $W_{i} \times_{U_{i}} W_{i}$ along the common open $W_{i}$ (see Schemes, Section 25.14). Note that the étale projection maps $W_{i} \times_{U_{i}} W_{i} \rightarrow W_{i}$ extend to étale morphisms $s_{i}, t_{i}: R_{i} \rightarrow V_{i}$. It is clear that the morphism $j_{i}=\left(t_{i}, s_{i}\right): R_{i} \rightarrow V_{i} \times V_{i}$ is an étale equivalence relation on $V_{i}$. Note that $W_{i} \times_{U_{i}} W_{i}$ is quasi-compact (as $U_{i}$ is quasi-separated and $W_{i}$ quasi-compact) and $V_{i}$ is quasi-compact, hence $R_{i}$ is quasi-compact. For $i \geq i^{\prime}$ the diagram

07SV

is cartesian because

$$
\left(W_{i^{\prime}} \times_{U_{i^{\prime}}} W_{i^{\prime}}\right) \times_{U_{i^{\prime}}} U_{i}=W_{i^{\prime}} \times_{U_{i^{\prime}}} U_{i} \times_{U_{i}} U_{i} \times_{U_{i^{\prime}}} W_{i^{\prime}}=W_{i} \times_{U_{i}} W_{i}
$$

Consider the algebraic space $X_{i}=V_{i} / R_{i}$ (see Spaces, Theorem 52.10.5). As $V_{i}$ is of finite type over $\mathbf{Z}$ and $R_{i}$ is quasi-compact we see that $X_{i}$ is quasi-separated and of finite type over Z (see Properties of Spaces, Lemma 53.6.5 and Morphisms of Spaces, Lemmas 54.8.5 and 54.23.4). As the construction of $R_{i}$ above is compatible with transition morphisms, we obtain morphisms of algebraic spaces $X_{i} \rightarrow X_{i^{\prime}}$ for $i \geq i^{\prime}$. The commutative diagrams

are cartesian as 57.8.1.1 is cartesian, see Groupoids, Lemma 38.20.7. Since $V_{i} \rightarrow$ $V_{i^{\prime}}$ is affine, this implies that $X_{i} \rightarrow X_{i^{\prime}}$ is affine, see Morphisms of Spaces, Lemma 54.20.3. Thus we can form the limit $X^{\prime}=\lim X_{i}$ by Lemma 57.4.1. We claim that $X \cong X^{\prime}$ which finishes the proof of the proposition.
Proof of the claim. Set $R=\lim R_{i}$. By construction the algebraic space $X^{\prime}$ comes equipped with a surjective étale morphism $V \rightarrow X^{\prime}$ such that

$$
V \times_{X^{\prime}} V \cong R
$$

(use Lemma 57.4.1). By construction $\lim W_{i} \times_{U_{i}} W_{i}=W \times_{U} W$ and $V=\lim V_{i}$ so that $R$ is the union of $W \times_{U} W$ and $V$ glued along $W$. Property (6) implies the projections $V \times_{X} V \rightarrow V$ are isomorphisms over $f^{-1}(Z) \subset V$. Hence the scheme $V \times_{X} V$ is the union of the opens $\Delta_{V / X}(V)$ and $W \times_{U} W$ which intersect along $\Delta_{W / X}(W)$. We conclude that there exists a unique isomorphism $R \cong V \times_{X} V$ compatible with the projections to $V$. Since $V \rightarrow X$ and $V \rightarrow X^{\prime}$ are surjective étale we see that

$$
X=V / V \times_{X} V=V / R=V / V \times_{X^{\prime}} V=X^{\prime}
$$

by Spaces, Lemma 52.9.1 and we win.

### 57.9. Applications

07V8 The following lemma can also be deduced directly from Decent Spaces, Lemma 55.8 .6 without passing through absolute Noetherian approximation.

07V9 Lemma 57.9.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Every quasi-coherent $\mathcal{O}_{X}$-module is a filtered colimit of finitely presented $\mathcal{O}_{X}$-modules.
Proof. We may view as an algebraic space over $\operatorname{Spec}(\mathbf{Z})$, see Spaces, Definition 52.16 .2 and Properties of Spaces, Definition 53.3.1. Thus we may apply Proposition 57.8.1 and write $X=\lim X_{i}$ with $X_{i}$ of finite presentation over Z. Thus $X_{i}$ is a Noetherian algebraic space, see Morphisms of Spaces, Lemma 54.28.6. The morphism $X \rightarrow X_{i}$ is affine, see Lemma 57.4.1. Conclusion by Cohomology of Spaces, Lemma 56.14.2.

The rest of this section consists of straightforward applications of Lemma 57.9.1.
0829 Lemma 57.9.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is the directed colimit of its finite type quasi-coherent submodules.
Proof. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are finite type quasi-coherent $\mathcal{O}_{X}$-submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another finite type quasi-coherent $\mathcal{O}_{X}$-submodule which contains both of them. In this way we see that the system is directed. To show that $\mathcal{F}$ is the colimit of this system, write $\mathcal{F}=\operatorname{colim}_{i} \mathcal{F}_{i}$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 57.9.1. Then the images $\mathcal{G}_{i}=\operatorname{Im}\left(\mathcal{F}_{i} \rightarrow \mathcal{F}\right)$ are finite type quasi-coherent subsheaves of $\mathcal{F}$. Since $\mathcal{F}$ is the colimit of these the result follows.

086Y Lemma 57.9.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Then we can write $\mathcal{F}=\lim \mathcal{F}_{i}$ where each $\mathcal{F}_{i}$ is an $\mathcal{O}_{X}$-module of finite presentation and all transition maps $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ surjective.

Proof. Write $\mathcal{F}=\operatorname{colim} \mathcal{G}_{i}$ as a filtered colimit of finitely presented $\mathcal{O}_{X}$-modules (Lemma 57.9.1). We claim that $\mathcal{G}_{i} \rightarrow \mathcal{F}$ is surjective for some $i$. Namely, choose an étale surjection $U \rightarrow X$ where $U$ is an affine scheme. Choose finitely many sections $s_{k} \in \mathcal{F}(U)$ generating $\left.\mathcal{F}\right|_{U}$. Since $U$ is affine we see that $s_{k}$ is in the image of $\mathcal{G}_{i} \rightarrow \mathcal{F}$ for $i$ large enough. Hence $\mathcal{G}_{i} \rightarrow \mathcal{F}$ is surjective for $i$ large enough. Choose such an $i$ and let $\mathcal{K} \subset \mathcal{G}_{i}$ be the kernel of the map $\mathcal{G}_{i} \rightarrow \mathcal{F}$. Write $\mathcal{K}=\operatorname{colim} \mathcal{K}_{a}$ as the filtered colimit of its finite type quasi-coherent submodules (Lemma 57.9.2). Then $\mathcal{F}=\operatorname{colim} \mathcal{G}_{i} / \mathcal{K}_{a}$ is a solution to the problem posed by the lemma.

Let $X$ be an algebraic space. In the following lemma we use the notion of a finitely presented quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$. This means that for every affine $U=$ $\operatorname{Spec}(R)$ étale over $X$ we have $\left.\mathcal{A}\right|_{U}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is of finite presentation as an $R$-algebra.

082A Lemma 57.9.4. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_{X}$-algebra. Then $\mathcal{A}$ is a directed colimit of finitely presented quasi-coherent $\mathcal{O}_{X}$-algebras.

Proof. First we write $\mathcal{A}=\operatorname{colim}_{i} \mathcal{F}_{i}$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 57.9.1. For each $i$ let $\mathcal{B}_{i}=\operatorname{Sym}\left(\mathcal{F}_{i}\right)$ be the symmetric algebra on $\mathcal{F}_{i}$ over $\mathcal{O}_{X}$. Write $\mathcal{I}_{i}=\operatorname{Ker}\left(\mathcal{B}_{i} \rightarrow \mathcal{A}\right)$. Write $\mathcal{I}_{i}=\operatorname{colim}_{j} \mathcal{F}_{i, j}$ where $\mathcal{F}_{i, j}$ is a finite type quasi-coherent submodule of $\mathcal{I}_{i}$, see Lemma 57.9.2. Set $\mathcal{I}_{i, j} \subset \mathcal{I}_{i}$ equal to the $\mathcal{B}_{i}$-ideal generated by $\mathcal{F}_{i, j}$. Set $\mathcal{A}_{i, j}=\mathcal{B}_{i} / \mathcal{I}_{i, j}$. Then $\mathcal{A}_{i, j}$ is a quasi-coherent finitely presented $\mathcal{O}_{X}$-algebra. Define $(i, j) \leq\left(i^{\prime}, j^{\prime}\right)$ if $i \leq i^{\prime}$ and the map $\mathcal{B}_{i} \rightarrow \mathcal{B}_{i^{\prime}}$ maps the ideal $\mathcal{I}_{i, j}$ into the ideal $\mathcal{I}_{i^{\prime}, j^{\prime}}$. Then it is clear that $\mathcal{A}=\operatorname{colim}_{i, j} \mathcal{A}_{i, j}$.

Let $X$ be an algebraic space. In the following lemma we use the notion of a quasicoherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$ of finite type. This means that for every affine $U=\operatorname{Spec}(R)$ étale over $X$ we have $\left.\mathcal{A}\right|_{U}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is of finite type as an $R$-algebra.

082B Lemma 57.9.5. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_{X}$-algebra. Then $\mathcal{A}$ is the directed colimit of its finite type quasi-coherent $\mathcal{O}_{X}$-subalgebras.

Proof. Omitted. Hint: Compare with the proof of Lemma 57.9.2,
Let $X$ be an algebraic space. In the following lemma we use the notion of a finite (resp. integral) quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$. This means that for every affine $U=\operatorname{Spec}(R)$ étale over $X$ we have $\left.\mathcal{A}\right|_{U}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is finite (resp. integral) as an $R$-algebra.

086Z Lemma 57.9.6. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be a finite quasi-coherent $\mathcal{O}_{X}$-algebra. Then $\mathcal{A}=$ $\operatorname{colim} \mathcal{A}_{i}$ is a directed colimit of finite and finitely presented quasi-coherent $\mathcal{O}_{X^{-}}$ algebras with surjective transition maps.

Proof. By Lemma 57.9.3 there exists a finitely presented $\mathcal{O}_{X}$-module $\mathcal{F}$ and a surjection $\mathcal{F} \rightarrow \mathcal{A}$. Using the algebra structure we obtain a surjection

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F}) \longrightarrow \mathcal{A}
$$

Denote $\mathcal{J}$ the kernel. Write $\mathcal{J}=\operatorname{colim} \mathcal{E}_{i}$ as a filtered colimit of finite type $\mathcal{O}_{X^{-}}$ submodules $\mathcal{E}_{i}$ (Lemma 57.9.2). Set

$$
\mathcal{A}_{i}=\operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F}) /\left(\mathcal{E}_{i}\right)
$$

where $\left(\mathcal{E}_{i}\right)$ indicates the ideal sheaf generated by the image of $\mathcal{E}_{i} \rightarrow \operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F})$. Then each $\mathcal{A}_{i}$ is a finitely presented $\mathcal{O}_{X}$-algebra, the transition maps are surjective, and $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$. To finish the proof we still have to show that $\mathcal{A}_{i}$ is a finite $\mathcal{O}_{X^{-}}$ algebra for $i$ sufficiently large. To do this we choose an étale surjective map $U \rightarrow X$ where $U$ is an affine scheme. Take generators $f_{1}, \ldots, f_{m} \in \Gamma(U, \mathcal{F})$. As $\mathcal{A}(U)$ is a finite $\mathcal{O}_{X}(U)$-algebra we see that for each $j$ there exists a monic polynomial $P_{j} \in \mathcal{O}(U)[T]$ such that $P_{j}\left(f_{j}\right)$ is zero in $\mathcal{A}(U)$. Since $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ by construction, we have $P_{j}\left(f_{j}\right)=0$ in $\mathcal{A}_{i}(U)$ for all sufficiently large $i$. For such $i$ the algebras $\mathcal{A}_{i}$ are finite.

082C Lemma 57.9.7. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be an integral quasi-coherent $\mathcal{O}_{X}$-algebra. Then
(1) $\mathcal{A}$ is the directed colimit of its finite quasi-coherent $\mathcal{O}_{X}$-subalgebras, and
(2) $\mathcal{A}$ is a directed colimit of finite and finitely presented $\mathcal{O}_{X}$-algebras.

Proof. By Lemma 57.9.5 we have $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ where $\mathcal{A}_{i} \subset \mathcal{A}$ runs through the quasi-coherent $\mathcal{O}_{X^{-}}$-sub algebras of finite type. Any finite type quasi-coherent $\mathcal{O}_{X^{-}}$ subalgebra of $\mathcal{A}$ is finite (use Algebra, Lemma 10.35 .5 on affine schemes étale over $X)$. This proves (1).

To prove (2), write $\mathcal{A}=\operatorname{colim} \mathcal{F}_{i}$ as a colimit of finitely presented $\mathcal{O}_{X}$-modules using Lemma 57.9.1. For each $i$, let $\mathcal{J}_{i}$ be the kernel of the map

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) \longrightarrow \mathcal{A}
$$

For $i^{\prime} \geq i$ there is an induced map $\mathcal{J}_{i} \rightarrow \mathcal{J}_{i^{\prime}}$ and we have $\mathcal{A}=\operatorname{colim} \operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) / \mathcal{J}_{i}$. Moreover, the quasi-coherent $\mathcal{O}_{X}$-algebras $\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) / \mathcal{J}_{i}$ are finite (see above). Write $\mathcal{J}_{i}=\operatorname{colim} \mathcal{E}_{i k}$ as a colimit of finitely presented $\mathcal{O}_{X}$-modules. Given $i^{\prime} \geq i$ and $k$ there exists a $k^{\prime}$ such that we have a map $\mathcal{E}_{i k} \rightarrow \mathcal{E}_{i^{\prime} k^{\prime}}$ making

commute. This follows from Cohomology of Spaces, Lemma 56.4.3. This induces a map

$$
\mathcal{A}_{i k}=\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) /\left(\mathcal{E}_{i k}\right) \longrightarrow \operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i^{\prime}}\right) /\left(\mathcal{E}_{i^{\prime} k^{\prime}}\right)=\mathcal{A}_{i^{\prime} k^{\prime}}
$$

where $\left(\mathcal{E}_{i k}\right)$ denotes the ideal generated by $\mathcal{E}_{i k}$. The quasi-coherent $\mathcal{O}_{X}$-algebras $\mathcal{A}_{k i}$ are of finite presentation and finite for $k$ large enough (see proof of Lemma 57.9.6. Finally, we have

$$
\operatorname{colim} \mathcal{A}_{i k}=\operatorname{colim} \mathcal{A}_{i}=\mathcal{A}
$$

Namely, the first equality was shown in the proof of Lemma 57.9 .6 and the second equality because $\mathcal{A}$ is the colimit of the modules $\mathcal{F}_{i}$.

0853 Lemma 57.9.8. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U \subset X$ be a quasi-compact open. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left.\mathcal{G} \subset \mathcal{F}\right|_{U}$ be a quasi-coherent $\mathcal{O}_{U}$-submodule which is of
finite type. Then there exists a quasi-coherent submodule $\mathcal{G}^{\prime} \subset \mathcal{F}$ which is of finite type such that $\left.\mathcal{G}^{\prime}\right|_{U}=\mathcal{G}$.
Proof. Denote $j: U \rightarrow X$ the inclusion morphism. As $X$ is quasi-separated and $U$ quasi-compact, the morphism $j$ is quasi-compact. Hence $\left.j_{*} \mathcal{G} \subset j_{*} \mathcal{F}\right|_{U}$ are quasi-coherent modules on $X$ (Morphisms of Spaces, Lemma 54.11.2). Let $\mathcal{H}=\operatorname{Ker}\left(\left.j_{*} \mathcal{G} \oplus \mathcal{F} \rightarrow j_{*} \mathcal{F}\right|_{U}\right)$. Then $\left.\mathcal{H}\right|_{U}=\mathcal{G}$. By Lemma 57.9 .2 we can find a finite type quasi-coherent submodule $\mathcal{H}^{\prime} \subset \mathcal{H}$ such that $\left.\mathcal{H}^{\prime}\right|_{U}=\left.\mathcal{H}\right|_{U}=\mathcal{G}$. Set $\mathcal{G}^{\prime}=\operatorname{Im}\left(\mathcal{H}^{\prime} \rightarrow \mathcal{F}\right)$ to conclude.

### 57.10. Relative approximation

09NR The title of this section refers to the following result.
09NS Lemma 57.10.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that
(1) $X$ is quasi-compact and quasi-separated, and
(2) $Y$ is quasi-separated.

Then $X=\lim X_{i}$ is a limit of a directed system of algebraic spaces $X_{i}$ of finite presentation over $Y$ with affine transition morphisms over $Y$.

Proof. Since $|f|(|X|)$ is quasi-compact we may replace $Y$ by a quasi-compact open subspace whose set of points contains $|f|(|X|)$. Hence we may assume $Y$ is quasicompact as well. Write $X=\lim X_{a}$ and $Y=\lim Y_{b}$ as in Proposition 57.8.1. i.e., with $X_{a}$ and $Y_{b}$ of finite type over $\mathbf{Z}$ and with affine transition morphisms. By Proposition 57.3.9 we find that for each $b$ there exists an $a$ and a morphism $f_{a, b}: X_{a} \rightarrow Y_{b}$ making the diagram

commute. Moreover the same proposition implies that, given a second triple $\left(a^{\prime}, b^{\prime}, f_{a^{\prime}, b^{\prime}}\right)$, there exists an $a^{\prime \prime} \geq a^{\prime}$ such that the compositions $X_{a^{\prime \prime}} \rightarrow X_{a} \rightarrow X_{b}$ and $X_{a^{\prime \prime}} \rightarrow X_{a^{\prime}} \rightarrow X_{b^{\prime}} \rightarrow X_{b}$ are equal. Consider the set of triples $\left(a, b, f_{a, b}\right)$ endowed with the partial ordering

$$
\left(a, b, f_{a, b}\right) \geq\left(a^{\prime}, b^{\prime}, f_{a^{\prime}, b^{\prime}}\right) \Leftrightarrow a \geq a^{\prime}, b^{\prime} \geq b, \text { and } f_{a^{\prime}, b^{\prime}} \circ h_{a, a^{\prime}}=g_{b^{\prime}, b} \circ f_{a, b}
$$

where $h_{a, a^{\prime}}: X_{a} \rightarrow X_{a^{\prime}}$ and $g_{b^{\prime}, b}: Y_{b^{\prime}} \rightarrow Y_{b}$ are the transition morphisms. The remarks above show that this system is directed. It follows formally from the equalities $X=\lim X_{a}$ and $Y=\lim Y_{b}$ that

$$
X=\lim _{\left(a, b, f_{a, b}\right)} X_{a} \times_{f_{a, b}, Y_{b}} Y
$$

where the limit is over our directed system above. The transition morphisms $X_{a} \times{ }_{Y_{b}}$ $Y \rightarrow X_{a^{\prime}} \times_{Y_{b^{\prime}}} Y$ are affine as the composition

$$
X_{a} \times_{Y_{b}} Y \rightarrow X_{a} \times_{Y_{b^{\prime}}} Y \rightarrow X_{a^{\prime}} \times_{Y_{b^{\prime}}} Y
$$

where the first morphism is a closed immersion (by Morphisms of Spaces, Lemma 54.4.5) and the second is a base change of an affine morphism (Morphisms of Spaces, Lemma 54.20.5) and the composition of affine morphisms is affine (Morphisms of Spaces, Lemma 54.20.4). The morphisms $f_{a, b}$ are of finite presentation (Morphisms
of Spaces, Lemmas 54.28.7 and 54.28.9 and hence the base changes $X_{a} \times{ }_{f_{a, b}, S_{b}} S \rightarrow$ $S$ are of finite presentation (Morphisms of Spaces, Lemma 54.28.3).

### 57.11. Finite type closed in finite presentation

07SP This section is the analogue of Limits, Section 31.8 .
0870 Lemma 57.11.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. If $Y$ quasi-compact and quasi-separated, then $X$ is a directed limit $X=\lim X_{i}$ with each $X_{i}$ affine and of finite presentation over $Y$.

Proof. Consider the quasi-coherent $\mathcal{O}_{Y}$-module $\mathcal{A}=f_{*} \mathcal{O}_{X}$. By Lemma 57.9.4 we can write $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ as a directed colimit of finitely presented $\mathcal{O}_{Y}$-algebras $\mathcal{A}_{i}$. Set $X_{i}=\underline{\operatorname{Spec}}_{Y}\left(\mathcal{A}_{i}\right)$, see Morphisms of Spaces, Definition 54.20.8. By construction $X_{i} \rightarrow Y$ is affine and of finite presentation and $X=\lim X_{i}$.

09YA Lemma 57.11.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an integral morphism of algebraic spaces over $S$. Assume $Y$ quasi-compact and quasi-separated. Then $X$ can be written as a directed limit $X=\lim X_{i}$ where $X_{i}$ are finite and of finite presentation over $Y$.

Proof. Consider the finite quasi-coherent $\mathcal{O}_{Y}$-module $\mathcal{A}=f_{*} \mathcal{O}_{X}$. By Lemma 57.9 .7 we can write $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ as a directed colimit of finite and finitely presented $\mathcal{O}_{Y \text {-algebras }} \mathcal{A}_{i}$. Set $X_{i}=\operatorname{Spec}_{Y}\left(\mathcal{A}_{i}\right)$, see Morphisms of Spaces, Definition 54.20.8. By construction $X_{i} \rightarrow Y$ is finite and of finite presentation and $X=\lim X_{i}$.

07VR Lemma 57.11.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a finite morphism of algebraic spaces over $S$. Assume $Y$ quasi-compact and quasi-separated. Then $X$ can be written as a directed limit $X=\lim X_{i}$ where the transition maps are closed immersions and the objects $X_{i}$ are finite and of finite presentation over $Y$.

Proof. Consider the finite quasi-coherent $\mathcal{O}_{Y}$-module $\mathcal{A}=f_{*} \mathcal{O}_{X}$. By Lemma 57.9 .6 we can write $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ as a directed colimit of finite and finitely presented $\mathcal{O}_{Y}$-algebras $\mathcal{A}_{i}$ with surjective transition maps. Set $X_{i}=\underline{\operatorname{Spec}}_{Y}\left(\mathcal{A}_{i}\right)$, see Morphisms of Spaces, Definition 54.20.8. By construction $X_{i} \rightarrow Y$ is finite and of finite presentation, the transition maps are closed immersions, and $X=\lim X_{i}$.

0A0U Lemma 57.11.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a closed immersion of algebraic spaces over $S$. Assume $Y$ quasi-compact and quasi-separated. Then $X$ can be written as a directed limit $X=\lim X_{i}$ where the transition maps are closed immersions and the morphisms $X_{i} \rightarrow Y$ are closed immersions of finite presentation.

Proof. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be the quasi-coherent sheaf of ideals defining $X$ as a closed subspace of $Y$. By Lemma 57.9 .2 we can write $\mathcal{I}=\operatorname{colim} \mathcal{I}_{i}$ as the filtered colimit of its finite type quasi-coherent submodules. Let $X_{i}$ be the closed subspace of $X$ cut out by $\mathcal{I}_{i}$. Then $X_{i} \rightarrow Y$ is a closed immersion of finite presentation, and $X=\lim X_{i}$. Some details omitted.

0871 Lemma 57.11.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ is locally of finite type and quasi-affine, and
(2) $Y$ is quasi-compact and quasi-separated.

Then there exists a morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow Y$ and a closed immersion $X \rightarrow X^{\prime}$ over $Y$.

Proof. By Morphisms of Spaces, Lemma 54.21 .6 we can find a factorization $X \rightarrow$ $Z \rightarrow Y$ where $X \rightarrow Z$ is a quasi-compact open immersion and $Z \rightarrow Y$ is affine. Write $Z=\lim Z_{i}$ with $Z_{i}$ affine and of finite presentation over $Y$ (Lemma 57.11.1). For some $0 \in I$ we can find a quasi-compact open $U_{0} \subset Z_{0}$ such that $X$ is isomorphic to the inverse image of $U_{0}$ in $Z$ (Lemma 57.5.5). Let $U_{i}$ be the inverse image of $U_{0}$ in $Z_{i}$, so $U=\lim U_{i}$. By Lemma 57.5.10 we see that $X \rightarrow U_{i}$ is a closed immersion for some $i$ large enough. Setting $X^{\prime}=U_{i}$ finishes the proof.

0872 Lemma 57.11.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume:
(1) $f$ is of locally of finite type.
(2) $X$ is quasi-compact and quasi-separated, and
(3) $Y$ is quasi-compact and quasi-separated.

Then there exists a morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow Y$ and a closed immersion $X \rightarrow X^{\prime}$ of algebraic spaces over $Y$.

Proof. By Proposition 57.8.1 we can write $X=\lim _{i} X_{i}$ with $X_{i}$ quasi-separated of finite type over $\mathbf{Z}$ and with transition morphisms $f_{i i^{\prime}}: X_{i} \rightarrow X_{i^{\prime}}$ affine. Consider the commutative diagram

Note that $X_{i}$ is of finite presentation over $\operatorname{Spec}(\mathbf{Z})$, see Morphisms of Spaces, Lemma 54.28.7. Hence the base change $X_{i, Y} \rightarrow Y$ is of finite presentation by Morphisms of Spaces, Lemma54.28.3. Observe that $\lim X_{i, Y}=X \times Y$ and that $X \rightarrow X \times Y$ is a monomorphism. By Lemma 57.5.10 we see that $X \rightarrow X_{i, Y}$ is a monomorphism for $i$ large enough. Fix such an $i$. Note that $X \rightarrow X_{i, Y}$ is locally of finite type (Morphisms of Spaces, Lemma 54.23.6) and a monomorphism, hence separated and locally quasi-finite (Morphisms of Spaces, Lemma 54.27.10. Hence $X \rightarrow X_{i, Y}$ is representable. Hence $X \rightarrow X_{i, Y}$ is quasi-affine because we can use the principle Spaces, Lemma 52.5 .8 and the result for morphisms of schemes More on Morphisms, Lemma 36.31.2. Thus Lemma 57.11.5 gives a factorization $X \rightarrow X^{\prime} \rightarrow X_{i, Y}$ with $X \rightarrow X^{\prime}$ a closed immersion and $X^{\prime} \rightarrow X_{i, Y}$ of finite presentation. Finally, $X^{\prime} \rightarrow$ $Y$ is of finite presentation as a composition of morphisms of finite presentation (Morphisms of Spaces, Lemma 54.28.2).

0873 Proposition 57.11.7. Let $S$ be a scheme. $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ is of finite type and separated, and
(2) $Y$ is quasi-compact and quasi-separated.

Then there exists a separated morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow Y$ and $a$ closed immersion $X \rightarrow X^{\prime}$ over $Y$.

Proof. By Lemma 57.11 .6 there is a closed immersion $X \rightarrow Z$ with $Z / Y$ of finite presentation. Let $\mathcal{I} \subset \mathcal{O}_{Z}$ be the quasi-coherent sheaf of ideals defining $X$ as a
closed subscheme of $Y$. By Lemma 57.9.2 we can write $\mathcal{I}$ as a directed colimit $\mathcal{I}=\operatorname{colim}_{a \in A} \mathcal{I}_{a}$ of its quasi-coherent sheaves of ideals of finite type. Let $X_{a} \subset Z$ be the closed subspace defined by $\mathcal{I}_{a}$. These form an inverse system indexed by $A$. The transition morphisms $X_{a} \rightarrow X_{a^{\prime}}$ are affine because they are closed immersions. Each $X_{a}$ is quasi-compact and quasi-separated since it is a closed subspace of $Z$ and $Z$ is quasi-compact and quasi-separated by our assumptions. We have $X=\lim _{a} X_{a}$ as follows directly from the fact that $\mathcal{I}=\operatorname{colim}_{a \in A} \mathcal{I}_{a}$. Each of the morphisms $X_{a} \rightarrow Z$ is of finite presentation, see Morphisms, Lemma 28.21.7. Hence the morphisms $X_{a} \rightarrow Y$ are of finite presentation. Thus it suffices to show that $X_{a} \rightarrow Y$ is separated for some $a \in A$. This follows from Lemma 57.5.11 as we have assumed that $X \rightarrow Y$ is separated.

### 57.12. Approximating proper morphisms

0 A 0 V
0A0W Lemma 57.12.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper morphism of algebraic spaces over $S$ with $Y$ quasi-compact and quasi-separated. Then $X=$ $\lim X_{i}$ with $X_{i} \rightarrow Y$ proper and of finite presentation.

Proof. By Proposition 57.11.7 we can find a closed immersion $X \rightarrow X^{\prime}$ with $X^{\prime}$ separated and of finite presentation over $Y$. By Lemma 57.11.4 we can write $X=\lim X_{i}$ with $X_{i} \rightarrow X^{\prime}$ a closed immersion of finite presentation. We claim that for all $i$ large enough the morphism $X_{i} \rightarrow Y$ is proper which finishes the proof.
To prove this we may assume that $Y$ is an affine scheme, see Morphisms of Spaces, Lemma 54.39.2. Next, we use the weak version of Chow's lemma, see Cohomology of Spaces, Lemma 56.17.1, to find a diagram

where $X^{\prime \prime} \rightarrow \mathbf{P}_{Y}^{n}$ is an immersion, and $\pi: X^{\prime \prime} \rightarrow X^{\prime}$ is proper and surjective. Denote $X_{i}^{\prime} \subset X^{\prime \prime}$, resp. $\pi^{-1}(X)$ the scheme theoretic inverse image of $X_{i} \subset X^{\prime}$, resp. $X \subset X^{\prime}$. Then $\lim X_{i}^{\prime}=\pi^{-1}(X)$. Since $\pi^{-1}(X) \rightarrow Y$ is proper (Morphisms of Spaces, Lemmas 54.39.4, we see that $\pi^{-1}(X) \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion (Morphisms of Spaces, Lemmas 54.39 .6 and 54.12 .3 ). Hence for $i$ large enough we find that $X_{i}^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion by Lemma 57.5.14. Thus $X_{i}^{\prime}$ is proper over $Y$. For such $i$ the morphism $X_{i} \rightarrow Y$ is proper by Morphisms of Spaces, Lemma 54.39.7.

0A0X Lemma 57.12.2. Let $f: X \rightarrow Y$ be a proper morphism of algebraic spaces over $\mathbf{Z}$ with $Y$ quasi-compact and quasi-separated. Then $(X \rightarrow Y)=\lim \left(X_{i} \rightarrow Y_{i}\right)$ with $Y_{i}$ of finite presentation over $\mathbf{Z}$ and $X_{i} \rightarrow Y_{i}$ proper and of finite presentation.

Proof. By Lemma 57.12.1 we can write $X=\lim _{k \in K} X_{k}$ with $X_{k} \rightarrow Y$ proper and of finite presentation. Next, by absolute Noetherian approximation (Proposition 57.8.1 we can write $Y=\lim _{j \in J} Y_{j}$ with $Y_{j}$ of finite presentation over Z. For each $k$ there exists a $j$ and a morphism $X_{k, j} \rightarrow Y_{j}$ of finite presentation with $X_{k} \cong Y \times_{Y_{j}} X_{k, j}$ as algebraic spaces over $Y$, see Lemma 57.7.1. After increasing $j$ we may assume $X_{k, j} \rightarrow Y_{j}$ is proper, see Lemma 57.6.12 The set $I$ will be
consist of these pairs $(k, j)$ and the corresponding morphism is $X_{k, j} \rightarrow Y_{j}$. For every $k^{\prime} \geq k$ we can find a $j^{\prime} \geq j$ and a morphism $X_{j^{\prime}, k^{\prime}} \rightarrow X_{j, k}$ over $Y_{j^{\prime}} \rightarrow Y_{j}$ whose base change to $Y$ gives the morphism $X_{k^{\prime}} \rightarrow X_{k}$ (follows again from Lemma 57.7.1). These morphisms form the transition morphisms of the system. Some details omitted.

Recall the scheme theoretic support of a finite type quasi-coherent module, see Morphisms of Spaces, Definition 54.15.4

08K2 Lemma 57.12.3. Assumptions and notation as in Situation 57.6.1. Let $\mathcal{F}_{0}$ be a quasi-coherent $\mathcal{O}_{X_{0}}$-module. Denote $\mathcal{F}$ and $\mathcal{F}_{i}$ the pullbacks of $\mathcal{F}_{0}$ to $X$ and $X_{i}$. Assume
(1) $f_{0}$ is locally of finite type,
(2) $\mathcal{F}_{0}$ is of finite type,
(3) the scheme theoretic support of $\mathcal{F}$ is proper over $Y$.

Then the scheme theoretic support of $\mathcal{F}_{i}$ is proper over $Y_{i}$ for some $i$.
Proof. We may replace $X_{0}$ by the scheme theoretic support of $\mathcal{F}_{0}$. By Morphisms of Spaces, Lemma 54.15 .2 this guarantees that $X_{i}$ is the support of $\mathcal{F}_{i}$ and $X$ is the support of $\mathcal{F}$. Then, if $Z \subset X$ denotes the scheme theoretic support of $\mathcal{F}$, we see that $Z \rightarrow X$ is a universal homeomorphism. We conclude that $X \rightarrow Y$ is proper as this is true for $Z \rightarrow Y$ by assumption, see Morphisms, Lemma 28.41.8, By Lemma 57.6 .12 we see that $X_{i} \rightarrow Y$ is proper for some $i$. Then it follows that the scheme theoretic support $Z_{i}$ of $\mathcal{F}_{i}$ is proper over $Y$ by Morphisms of Spaces, Lemmas 54.39.5 and 54.39.4.

### 57.13. Embedding into affine space

088K Some technical lemmas to be used in the proof of Chow's lemma later.
088L Lemma 57.13.1. Let $S$ be a scheme. Let $f: U \rightarrow X$ be a morphism of algebraic spaces over $S$. Assume $U$ is an affine scheme, $f$ is locally of finite type, and $X$ quasi-separated and locally separated. Then there exists an immersion $U \rightarrow \mathbf{A}_{X}^{n}$ over $X$.

Proof. Say $U=\operatorname{Spec}(A)$. Write $A=\operatorname{colim} A_{i}$ as a filtered colimit of finite type Z-subalgebras. For each $i$ the morphism $U \rightarrow U_{i}=\operatorname{Spec}\left(A_{i}\right)$ induces a morphism

$$
U \longrightarrow X \times U_{i}
$$

over $X$. In the limit the morphism $U \rightarrow X \times U$ is an immersion as $X$ is locally separated, see Morphisms of Spaces, Lemma 54.4.6. By Lemma 57.5.10 we see that $U \rightarrow X \times U_{i}$ is an immersion for some $i$. Since $U_{i}$ is isomorphic to a closed subscheme of $\mathbf{A}_{\mathbf{Z}}^{n}$ the lemma follows.

088M Remark 57.13.2. We have seen in Examples, Section 88.22 that Lemma 57.13 .1 does not hold if we drop the assumption that $X$ be locally separated. This raises the question: Does Lemma 57.13 .1 hold if we drop the assumption that $X$ be quasi-separated? If you know the answer, please email stacks.project@gmail.com.

088N Lemma 57.13.3. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Assume $X$ Noetherian and $f$ of finite presentation. Then there exists a dense open $V \subset Y$ and an immersion $V \rightarrow \mathbf{A}_{X}^{n}$.

Proof. The assumptions imply that $Y$ is Noetherian (Morphisms of Spaces, Lemma 54.28.6). Then $Y$ is quasi-separated, hence has a dense open subscheme (Properties of Spaces, Proposition 53.12.3). Thus we may assume that $Y$ is a Noetherian scheme. By removing intersections of irreducible components of $Y$ (use Topology, Lemma 5.8 .2 and Properties, Lemma 27.5 .5 we may assume that $Y$ is a disjoint union of irreducible Noetherian schemes. Since there is an immersion

$$
\mathbf{A}_{X}^{n} \amalg \mathbf{A}_{X}^{m} \longrightarrow \mathbf{A}_{X}^{\max (n, m)+1}
$$

(details omitted) we see that it suffices to prove the result in case $Y$ is irreducible.
Assume $Y$ is an irreducible scheme. Let $T \subset|X|$ be the closure of the image of $f: Y \rightarrow X$. Note that since $|Y|$ and $|X|$ are sober topological spaces (Properties of Spaces, Lemma 53.14.1 $T$ is irreducible with a unique generic point $\xi$ which is the image of the generic point $\eta$ of $Y$. Let $\mathcal{I} \subset X$ be a quasi-coherent sheaf of ideals cutting out the reduced induced space structure on $T$ (Properties of Spaces, Definition 53.11.6). Since $\mathcal{O}_{Y, \eta}$ is an Artinian local ring we see that for some $n>0$ we have $f^{-1} \mathcal{I}^{n} \mathcal{O}_{Y, \eta}=0$. As $f^{-1} \mathcal{I} \mathcal{O}_{Y}$ is a finite type quasi-coherent ideal we conclude that $f^{-1} \mathcal{I}^{n} \mathcal{O}_{V}=0$ for some nonempty open $V \subset Y$. Let $Z \subset X$ be the closed subspace cut out by $\mathcal{I}^{n}$. By construction $V \rightarrow Y \rightarrow X$ factors through $Z$. Because $\mathbf{A}_{Z}^{n} \rightarrow \mathbf{A}_{X}^{n}$ is an immersion, we may replace $X$ by $Z$ and $Y$ by $V$. Hence we reach the situation where $Y$ and $X$ are irreducible and $Y \rightarrow X$ maps the generic point of $Y$ onto the generic point of $X$.

Assume $Y$ and $X$ are irreducible, $Y$ is a scheme, and $Y \rightarrow X$ maps the generic point of $Y$ onto the generic point of $X$. By Properties of Spaces, Proposition 53.12 .3 $X$ has a dense open subscheme $U \subset X$. Choose a nonempty affine open $V \subset Y$ whose image in $X$ is contained in $U$. By Morphisms, Lemma 28.39 .2 we may factor $V \rightarrow U$ as $V \rightarrow \mathbf{A}_{U}^{n} \rightarrow U$. Composing with $\mathbf{A}_{U}^{n} \rightarrow \mathbf{A}_{X}^{n}$ we obtain the desired immersion.

### 57.14. Sections with support in a closed subset

0854 This section is the analogue of Properties, Section 27.24 .
0855 Lemma 57.14.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space. Let $U \subset X$ be an open subspace. The following are equivalent:
(1) $U \rightarrow X$ is quasi-compact,
(2) $U$ is quasi-compact, and
(3) there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ such that $|X| \backslash|U|=|V(\mathcal{I})|$.

Proof. Let $W$ be an affine scheme and let $\varphi: W \rightarrow X$ be a surjective étale morphism, see Properties of Spaces, Lemma53.6.3. If (1) holds, then $\varphi^{-1}(U) \rightarrow W$ is quasi-compact, hence $\varphi^{-1}(U)$ is quasi-compact, hence $U$ is quasi-compact (as $\left|\varphi^{-1}(U)\right| \rightarrow|U|$ is surjective $)$. If (2) holds, then $\varphi^{-1}(U)$ is quasi-compact because $\varphi$ is quasi-compact since $X$ is quasi-separated (Morphisms of Spaces, Lemma 54.8.9). Hence $\varphi^{-1}(U) \rightarrow W$ is a quasi-compact morphism of schemes by Properties, Lemma 27.24.1. It follows that $U \rightarrow X$ is quasi-compact by Morphisms of Spaces, Lemma 54.8.7. Thus (1) and (2) are equivalent.

Assume (1) and (2). By Properties of Spaces, Lemma 53.11.4 there exists a unique quasi-coherent sheaf of ideals $\mathcal{J}$ cutting out the reduced induced closed subspace structure on $|X| \backslash|U|$. Note that $\left.\mathcal{J}\right|_{U}=\mathcal{O}_{U}$ which is an $\mathcal{O}_{U}$-modules of finite type. As $U$ is quasi-compact it follows from Lemma 57.9 .2 that there exists a quasi-coherent subsheaf $\mathcal{I} \subset \mathcal{J}$ which is of finite type and has the property that $\left.\mathcal{I}\right|_{U}=\left.\mathcal{J}\right|_{U}$. Then $|X| \backslash|U|=|V(\mathcal{I})|$ and we obtain (3). Conversely, if $\mathcal{I}$ is as in (3), then $\varphi^{-1}(U) \subset W$ is a quasi-compact open by the lemma for schemes (Properties, Lemma 27.24.1 applied to $\varphi^{-1} \mathcal{I}$ on $W$. Thus (2) holds.

0856 Lemma 57.14.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Consider the sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\prime}$ which associates to every object $U$ of $X_{\text {étale }}$ the module

$$
\mathcal{F}^{\prime}(U)=\{s \in \mathcal{F}(U) \mid \mathcal{I} s=0\}
$$

Assume $\mathcal{I}$ is of finite type. Then
(1) $\mathcal{F}^{\prime}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules,
(2) for affine $U$ in $X_{\text {étale }}$ we have $\mathcal{F}^{\prime}(U)=\{s \in \mathcal{F}(U) \mid \mathcal{I}(U) s=0\}$, and
(3) $\mathcal{F}_{x}^{\prime}=\left\{s \in \mathcal{F}_{x} \mid \mathcal{I}_{x} s=0\right\}$.

Proof. It is clear that the rule defining $\mathcal{F}^{\prime}$ gives a subsheaf of $\mathcal{F}$. Hence we may work étale locally on $X$ to verify the other statements. Thus the lemma reduces to the case of schemes which is Properties, Lemma 27.24.2.

0857 Definition 57.14.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The subsheaf $\mathcal{F}^{\prime} \subset \mathcal{F}$ defined in Lemma 57.14 .2 above is called the subsheaf of sections annihilated by $\mathcal{I}$.

0858 Lemma 57.14.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a quasicoherent sheaf of ideals of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf of sections annihilated by $f^{-1} \mathcal{I} \mathcal{O}_{X}$. Then $f_{*} \mathcal{F}^{\prime} \subset f_{*} \mathcal{F}$ is the subsheaf of sections annihilated by $\mathcal{I}$.

Proof. Omitted. Hint: The assumption that $f$ is quasi-compact and quasi-separated implies that $f_{*} \mathcal{F}$ is quasi-coherent (Morphisms of Spaces, Lemma 54.11.2) so that Lemma 57.14 .2 applies to $\mathcal{I}$ and $f_{*} \mathcal{F}$.

Next we come to the sheaf of sections supported in a closed subset. Again this isn't always a quasi-coherent sheaf, but if the complement of the closed is "retrocompact" in the given algebraic space, then it is.

0859 Lemma 57.14.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset and let $U \subset X$ be the open subspace such that $T \amalg|U|=$ $|X|$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Consider the sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\prime}$ which associates to every object $\varphi: W \rightarrow X$ of $X_{\text {étale }}$ the module

$$
\mathcal{F}^{\prime}(W)=\left\{s \in \mathcal{F}(W) \mid \text { the support of } s \text { is contained in }|\varphi|^{-1}(T)\right\}
$$

If $U \rightarrow X$ is quasi-compact, then
(1) for $W$ affine there exist a finitely generated ideal $I \subset \mathcal{O}_{X}(W)$ such that $|\varphi|^{-1}(T)=V(I)$,
(2) for $W$ and $I$ as in (1) we have $\mathcal{F}^{\prime}(W)=\left\{x \in \mathcal{F}(W) \mid I^{n} x=0\right.$ for some $\left.n\right\}$,
(3) $\mathcal{F}^{\prime}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules.

Proof. It is clear that the rule defining $\mathcal{F}^{\prime}$ gives a subsheaf of $\mathcal{F}$. Hence we may work étale locally on $X$ to verify the other statements. Thus the lemma reduces to the case of schemes which is Properties, Lemma 27.24.5.

085A Definition 57.14.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $T \subset|X|$ be a closed subset whose complement corresponds to an open subspace $U \subset X$ with quasi-compact inclusion morphism $U \rightarrow X$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The quasi-coherent subsheaf $\mathcal{F}^{\prime} \subset \mathcal{F}$ defined in Lemma 57.14 .5 above is called the subsheaf of sections supported on $T$.

085B Lemma 57.14.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $T \subset|Y|$ be a closed subset. Assume $|Y| \backslash T$ corresponds to an open subspace $V \subset Y$ such that $V \rightarrow Y$ is quasi-compact. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf of sections supported on $|f|^{-1} T$. Then $f_{*} \mathcal{F}^{\prime} \subset f_{*} \mathcal{F}$ is the subsheaf of sections supported on $T$.

Proof. Omitted. Hints: $|X| \backslash|f|^{-1} T$ is the support of the open subspace $U=$ $f^{-1} V \subset X$. Since $V \rightarrow Y$ is quasi-compact, so is $U \rightarrow X$ (by base change). The assumption that $f$ is quasi-compact and quasi-separated implies that $f_{*} \mathcal{F}$ is quasi-coherent. Hence Lemma 57.14 .5 applies to $T$ and $f_{*} \mathcal{F}$ as well as to $|f|^{-1} T$ and $\mathcal{F}$. The equality of the given quasi-coherent modules is immediate from the definitions.

### 57.15. Characterizing affine spaces

07 VQ This section is the analogue of Limits, Section 31.10 .
07VS Lemma 57.15.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that $f$ is surjective and finite, and assume that $X$ is affine. Then $Y$ is affine.

Proof. We may and do view $f: X \rightarrow Y$ as a morphism of algebraic space over $\operatorname{Spec}(\mathbf{Z})$ (see Spaces, Definition 52.16.2). Note that a finite morphism is affine and universally closed, see Morphisms of Spaces, Lemma 54.43.7. By Morphisms of Spaces, Lemma 54.9.8 we see that $Y$ is a separated algebraic space. As $f$ is surjective and $X$ is quasi-compact we see that $Y$ is quasi-compact.

By Lemma 57.11.3 we can write $X=\lim X_{a}$ with each $X_{a} \rightarrow Y$ finite and of finite presentation. By Lemma 57.5 .8 we see that $X_{a}$ is affine for $a$ large enough. Hence we may and do assume that $f: X \rightarrow Y$ is finite, surjective, and of finite presentation.
By Proposition 57.8.1 we may write $Y=\lim Y_{i}$ as a directed limit of algebraic spaces of finite presentation over $\mathbf{Z}$. By Lemma 57.7.1 we can find $0 \in I$ and a morphism $X_{0} \rightarrow Y_{0}$ of finite presentation such that $X_{i}=X_{0} \times_{Y_{0}} Y_{i}$ for $i \geq 0$ and such that $X=\lim _{i} X_{i}$. By Lemma 57.6.6 we see that $X_{i} \rightarrow Y_{i}$ is finite for $i$ large enough. By Lemma 57.6.3 we see that $X_{i} \rightarrow Y_{i}$ is surjective for $i$ large enough. By Lemma 57.5 .8 we see that $X_{i}$ is affine for $i$ large enough. Hence for $i$ large enough we can apply Cohomology of Spaces, Lemma 56.16.1 to conclude that $Y_{i}$ is affine. This implies that $Y$ is affine and we conclude.

07VT Proposition 57.15.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that $f$ is surjective and integral, and assume that $X$ is affine. Then $Y$ is affine.

Proof. We may and do view $f: X \rightarrow Y$ as a morphism of algebraic space over $\operatorname{Spec}(\mathbf{Z})$ (see Spaces, Definition 52.16.2. Note that integral morphisms are affine and universally closed, see Morphisms of Spaces, Lemma 54.43.7. By Morphisms of Spaces, Lemma 54.9 .8 we see that $Y$ is a separated algebraic space. As $f$ is surjective and $X$ is quasi-compact we see that $Y$ is quasi-compact.

Consider the sheaf $\mathcal{A}=f_{*} \mathcal{O}_{X}$. This is a quasi-coherent sheaf of $\mathcal{O}_{Y}$-algebras, see Morphisms of Spaces, Lemma54.11.2. By Lemma57.9.1 we can write $\mathcal{A}=\operatorname{colim}_{i} \mathcal{F}_{i}$ as a filtered colimit of finite type $\mathcal{O}_{Y}$-modules. Let $\mathcal{A}_{i} \subset \mathcal{A}$ be the $\mathcal{O}_{Y}$-subalgebra generated by $\mathcal{F}_{i}$. Since the map of algebras $\mathcal{O}_{Y} \rightarrow \mathcal{A}$ is integral, we see that each $\mathcal{A}_{i}$ is a finite quasi-coherent $\mathcal{O}_{Y}$-algebra. Hence

$$
X_{i}=\underline{\operatorname{Spec}}_{Y}\left(\mathcal{A}_{i}\right) \longrightarrow Y
$$

is a finite morphism of algebraic spaces. (Insert future reference to Spec construction for algebraic spaces here.) It is clear that $X=\lim _{i} X_{i}$. Hence by Lemma 57.5 .8 we see that for $i$ sufficiently large the scheme $X_{i}$ is affine. Moreover, since $X \rightarrow Y$ factors through each $X_{i}$ we see that $X_{i} \rightarrow Y$ is surjective. Hence we conclude that $Y$ is affine by Lemma 57.15.1.

The following corollary of the result above can be found in CLO12.
07VU Lemma 57.15.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $X_{\text {red }}$ is a scheme, then $X$ is a scheme.

Proof. Let $U^{\prime} \subset X_{\text {red }}$ be an open affine subscheme. Let $U \subset X$ be the open subspace corresponding to the open $\left|U^{\prime}\right| \subset\left|X_{r e d}\right|=|X|$. Then $U^{\prime} \rightarrow U$ is surjective and integral. Hence $U$ is affine by Proposition57.15.2. Thus every point is contained in an open subscheme of $X$, i.e., $X$ is a scheme.

07VV Lemma 57.15.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is integral and induces a bijection $|X| \rightarrow|Y|$. Then $X$ is a scheme if and only if $Y$ is a scheme.

Proof. An integral morphism is representable by definition, hence if $Y$ is a scheme, so is $X$. Conversely, assume that $X$ is a scheme. Let $U \subset X$ be an affine open. An integral morphism is closed and $|f|$ is bijective, hence $|f|(|U|) \subset|Y|$ is open as the complement of $|f|(|X| \backslash|U|)$. Let $V \subset Y$ be the open subspace with $|V|=|f|(|U|)$, see Properties of Spaces, Lemma 53.4.8. Then $U \rightarrow V$ is integral and surjective, hence $V$ is an affine scheme by Proposition 57.15.2. This concludes the proof.

08B2 Lemma 57.15.5. Let $S$ be a scheme. Let $f: X \rightarrow B$ and $B^{\prime} \rightarrow B$ be morphisms of algebraic spaces over $S$. Assume
(1) $B^{\prime} \rightarrow B$ is a closed immersion,
(2) $\left|B^{\prime}\right| \rightarrow|B|$ is bijective,
(3) $X \times_{B} B^{\prime} \rightarrow B^{\prime}$ is a closed immersion, and
(4) $X \rightarrow B$ is of finite type or $B^{\prime} \rightarrow B$ is of finite presentation.

Then $f: X \rightarrow B$ is a closed immersion.

Proof. Assumptions (1) and (2) imply that $B_{r e d}=B_{r e d}^{\prime}$. Set $X^{\prime}=X \times{ }_{B} B^{\prime}$. Then $X^{\prime} \rightarrow X$ is closed immersion and $X_{\text {red }}^{\prime}=X_{\text {red }}$. Let $U \rightarrow B$ be an étale morphism with $U$ affine. Then $X^{\prime} \times_{B} U \rightarrow X \times_{B} U$ is a closed immersion of algebraic spaces inducing an isomorphism on underlying reduced spaces. Since $X^{\prime} \times{ }_{B} U$ is a scheme (as $B^{\prime} \rightarrow B$ and $X^{\prime} \rightarrow B^{\prime}$ are representable) so is $X \times_{B} U$ by Lemma 57.15.3. Hence $X \rightarrow B$ is representable too. Thus we reduce to the case of schemes, see Morphisms, Lemma 28.44.5.

### 57.16. Finite cover by a scheme

0ACX As an application of Zariski's main theorem and the limit results of this chapter, we prove that given any quasi-compact and quasi-separated algebraic space $X$, there is a scheme $Y$ and a surjective, finite morphism $Y \rightarrow X$. The following lemma will be obsoleted by the full result later on.

09YB Lemma 57.16.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$.
(1) There exists a surjective integral morphism $Y \rightarrow X$ where $Y$ is a scheme,
(2) given a surjective étale morphism $U \rightarrow X$ we may choose $Y \rightarrow X$ such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through $U$.

Proof. Part (1) is the special case of part (2) where $U=X$. Choose a surjective étale morphism $U^{\prime} \rightarrow U$ where $U^{\prime}$ is a scheme. It is clear that we may replace $U$ by $U^{\prime}$ and hence we may assume $U$ is a scheme. Since $X$ is quasi-compact, there exist finitely many affine opens $U_{i} \subset U$ such that $U^{\prime}=\coprod U_{i} \rightarrow X$ is surjective. After replacing $U$ by $U^{\prime}$ again, we see that we may assume $U$ is affine. Since $X$ is quasi-separated, hence reasonable, there exists an integer $d$ bounding the degree of the geometric fibres of $U \rightarrow X$ (see Decent Spaces, Lemma 55.5.1). We will prove the lemma by induction on $d$ for all quasi-compact and separated schemes $U$ mapping surjective and étale onto $X$. If $d=1$, then $U=X$ and the result holds with $Y=U$. Assume $d>1$.

We apply Morphisms of Spaces, Lemma 54.49 .2 and we obtain a factorization

with $\pi$ integral and $j$ a quasi-compact open immersion. We may and do assume that $j(U)$ is scheme theoretically dense in $Y$. Note that

$$
U \times_{X} Y=U \amalg W
$$

where the first summand is the image of $U \rightarrow U \times_{X} Y$ (which is closed by Morphisms of Spaces, Lemma 54.4 .6 and open because it is étale as a morphism between algebraic spaces étale over $Y$ ) and the second summand is the (open and closed) complement. The image $V \subset Y$ of $W$ is an open subspace containing $Y \backslash U$.
The étale morphism $W \rightarrow Y$ has geometric fibres of cardinality $<d$. Namely, this is clear for geometric points of $U \subset Y$ by inspection. Since $|U| \subset|Y|$ is dense, it holds for all geometric points of $Y$ for example by Decent Spaces, Lemma 55.8.1 (the degree of the fibres of a quasi-compact étale morphism does not go up under
specialization). Thus we may apply the induction hypothesis to $W \rightarrow V$ and find a surjective integral morphism $Z \rightarrow V$ with $Z$ a scheme, which Zariski locally factors through $W$. Choose a factorization $Z \rightarrow Z^{\prime} \rightarrow Y$ with $Z^{\prime} \rightarrow Y$ integral and $Z \rightarrow Z^{\prime}$ open immersion (Morphisms of Spaces, Lemma 54.49.2). After replacing $Z^{\prime}$ by the scheme theoretic closure of $Z$ in $Z^{\prime}$ we may assume that $Z$ is scheme theoretically dense in $Z^{\prime}$. After doing this we have $Z^{\prime} \times_{Y} V=Z$. Finally, let $T \subset Y$ be the induced closed subspace structure on $Y \backslash V$. Consider the morphism

$$
Z^{\prime} \amalg T \longrightarrow X
$$

This is a surjective integral morphism by construction. Since $T \subset U$ it is clear that the morphism $T \rightarrow X$ factors through $U$. On the other hand, let $z \in Z^{\prime}$ be a point. If $z \notin Z$, then $z$ maps to a point of $Y \backslash V \subset U$ and we find a neighbourhood of $z$ on which the morphism factors through $U$. If $z \in Z$, then we have a neighbourhood $V \subset Z$ which factors through $W \subset U \times_{X} Y$ and hence through $U$.

09YC Proposition 57.16.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$.
(1) There exists a surjective finite morphism $Y \rightarrow X$ of finite presentation where $Y$ is a scheme,
(2) given a surjective étale morphism $U \rightarrow X$ we may choose $Y \rightarrow X$ such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through $U$.
Proof. Part (1) is the special case of (2) with $U=X$. Let $Y \rightarrow X$ be as in Lemma 57.16.1. Choose a finite affine open covering $Y=\bigcup V_{j}$ such that $V_{j} \rightarrow X$ factors through $U$. We can write $Y=\lim Y_{i}$ with $Y_{i} \rightarrow X$ finite and of finite presentation, see Lemma 57.11.2 For large enough $i$ the algebraic space $Y_{i}$ is a scheme, see Lemma 57.5.9. For large enough $i$ we can find affine opens $V_{i, j} \subset Y_{i}$ whose inverse image in $Y$ recovers $V_{j}$, see Lemma 57.5.5. For even larger $i$ the morphisms $V_{j} \rightarrow U$ over $X$ come from morphisms $V_{i, j} \rightarrow U$ over $X$, see Proposition 57.3.9. This finishes the proof.

### 57.17. Obtaining schemes

0B7X A few more techniques to show an algebraic space is a scheme. The first is that we can show there is a minimal closed subspace which is not a scheme.
0B7Y Lemma 57.17.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. If $X$ is not a scheme, then there exists a closed subspace $Z \subset X$ such that $Z$ is not a scheme, but every proper closed subspace $Z^{\prime} \subset Z$ is a scheme.

Proof. We prove this by Zorn's lemma. Let $\mathcal{Z}$ be the set of closed subspaces $Z$ which are not schemes ordered by inclusion. By assumption $\mathcal{Z}$ contains $X$, hence is nonempty. If $Z_{\alpha}$ is a totally ordered subset of $\mathcal{Z}$, then $Z=\bigcap Z_{\alpha}$ is in $\mathcal{Z}$. Namely,

$$
Z=\lim Z_{\alpha}
$$

and the transition morphisms are affine. Thus we may apply Lemma 57.5 .9 to see that if $Z$ were a scheme, then so would one of the $Z_{\alpha}$. (This works even if $Z=\emptyset$, but note that by Lemma 57.5 .3 this cannot happen.) Thus $\mathcal{Z}$ has minimal elements by Zorn's lemma.

Now we can prove a little bit about these minimal non-schemes.
0B7Z Lemma 57.17.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Assume that every proper closed subspace $Z \subset X$ is a scheme, but $X$ is not a scheme. Then $X$ is reduced and irreducible.

Proof. We see that $X$ is reduced by Lemma 57.15.3. Choose closed subsets $T_{1} \subset$ $|X|$ and $T_{2} \subset|X|$ such that $|X|=T_{1} \cup T_{2}$. If $T_{1}$ and $T_{2}$ are proper closed subsets, then the corresponding reduced induced closed subspaces $Z_{1}, Z_{2} \subset X$ (Properties of Spaces, Definition 53.11.6) are schemes and so is $Z=Z_{1} \times_{X} Z_{2}=Z_{1} \cap Z_{2}$ as a closed subscheme of either $Z_{1}$ or $Z_{2}$. Observe that the coproduct $Z_{1} \amalg_{Z} Z_{2}$ exists in the category of schemes, see More on Morphisms, Lemma 36.11.2. One way to proceed, is to show that $Z_{1} \amalg_{Z} Z_{2}$ is isomorphic to $X$, but we cannot use this here as the material on pushouts of algebraic spaces comes later in the theory. Instead we will use Lemma 57.15 .1 to find an affine neighbourhood of every point. Namely, let $x \in|X|$. If $x \notin Z_{1}$, then $x$ has a neighbourhood which is a scheme, namely, $X \backslash Z_{1}$. Similarly if $x \notin Z_{2}$. If $x \in Z=Z_{1} \cap Z_{2}$, then we choose an affine open $U \subset Z_{1} \amalg_{Z} Z_{2}$ containing $z$. Then $U_{1}=Z_{1} \cap U$ and $U_{2}=Z_{2} \cap U$ are affine opens whose intersections with $Z$ agree. Since $\left|Z_{1}\right|=T_{1}$ and $\left|Z_{2}\right|=T_{2}$ are closed subsets of $|X|$ which intersect in $|Z|$, we find an open $W \subset|X|$ with $W \cap T_{1}=\left|U_{1}\right|$ and $W \cap T_{2}=\left|U_{2}\right|$. Let $W$ denote the corresponding open subspace of $X$. Then $x \in|W|$ and the morphism $U_{1} \amalg U_{2} \rightarrow W$ is a surjective finite morphism whose source is an affine scheme. Thus $W$ is an affine scheme by Lemma 57.15.1.

A key point in the following lemma is that we only need to check the condition in the images of points of $X$.
0B80 Lemma 57.17.3. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism from an algebraic space to a scheme $S$. If for every $x \in|X|$ with image $s=f(x) \in S$ the algebraic space $X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ is a scheme, then $X$ is a scheme.

Proof. Let $x \in|X|$. It suffices to find an open neighbourhood $U$ of $s=f(x)$ such that $X \times_{S} U$ is a scheme. As $X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ is a scheme, then, since $\mathcal{O}_{S, s}=\operatorname{colim} \mathcal{O}_{S}(U)$ where the colimit is over affine open neighbourhoods of $s$ in $S$ we see that

$$
X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)=\lim X \times_{S} U
$$

By Lemma 57.5.9 we see that $X \times{ }_{S} U$ is a scheme for some $U$.
Instead of restricting to local rings as in Lemma 57.17.3, we can restrict to closed subschemes of the base.

0B81 Lemma 57.17.4. Let $\varphi: X \rightarrow \operatorname{Spec}(A)$ be a quasi-compact and quasi-separated morphism from an algebraic space to an affine scheme. If $X$ is not a scheme, then there exists an ideal $I \subset A$ such that the base change $X_{A / I}$ is not a scheme, but for every $I \subset I^{\prime}, I \neq I^{\prime}$ the base change $X_{A / I^{\prime}}$ is a scheme.

Proof. We prove this by Zorn's lemma. Let $\mathcal{I}$ be the set of ideals $I$ such that $X_{A / I}$ is not a scheme. By assumption $\mathcal{I}$ contains (0). If $I_{\alpha}$ is a chain of ideals in $\mathcal{I}$, then $I=\bigcup I_{\alpha}$ is in $\mathcal{I}$. Namely, $A / I=\operatorname{colim} A / I_{\alpha}$, hence

$$
X_{A / I}=\lim X_{A / I_{\alpha}}
$$

Thus we may apply Lemma 57.5 .9 to see that if $X_{A / I}$ were a scheme, then so would be one of the $X_{A / I_{\alpha}}$. Thus $\mathcal{I}$ has maximal elements by Zorn's lemma.

### 57.18. Application to modifications

0BGX Using limits we can describe the category of modifications of a decent algebraic space over a closed point in terms of the henselian local ring.
0BGY Lemma 57.18.1. Let $S$ be a scheme. Consider a separated étale morphism $f$ : $V \rightarrow W$ of algebraic spaces over $S$. Assume there exists a closed subspace $T \subset W$ such that $f^{-1} T \rightarrow T$ is an isomorphism. Then, with $W^{0}=W \backslash T$ and $V^{0}=f^{-1} W^{0}$ the base change functor
$\left\{\begin{array}{c}g: X \rightarrow W \text { morphism of algebraic spaces } \\ g^{-1}\left(W^{0}\right) \rightarrow W^{0} \text { is an isomorphism }\end{array}\right\} \longrightarrow\left\{\begin{array}{c}h: Y \rightarrow V \text { morphism of algebraic spaces } \\ h^{-1}\left(V^{0}\right) \rightarrow V^{0} \text { is an isomorphism }\end{array}\right\}$
is an equivalence of categories.
Proof. Since $V \rightarrow W$ is separated we see that $V \times_{W} V=\Delta(V) \amalg U$ for some open and closed subspace $U$ of $V \times_{W} V$. By the assumption that $f^{-1} T \rightarrow T$ is an isomorphism we see that $U \times{ }_{W} T=\emptyset$, i.e., the two projections $U \rightarrow V$ maps into $V^{0}$.

Given $h: Y \rightarrow V$ in the right hand category, consider the contravariant functor $X$ on $(S c h / S)_{\text {fppf }}$ defined by the rule

$$
X(T)=\left\{(w, y) \mid w: T \rightarrow W, y: T \times_{w, W} V \rightarrow Y \text { morphism over } V\right\}
$$

Denote $g: X \rightarrow W$ the map sending $(w, y) \in X(T)$ to $w \in W(T)$. Since $h^{-1} V^{0} \rightarrow$ $V^{0}$ is an isomorphism, we see that if $w: T \rightarrow W$ maps into $W^{0}$, then there is a unique choice for $h$. In other words $X \times_{g, W} W^{0}=W^{0}$. On the other hand, consider a $T$-valued point $(w, y, v)$ of $X \times_{g, W, f} V$. Then $w=f \circ v$ and

$$
y: T \times_{f \circ v, W} V \longrightarrow V
$$

is a morphism over $V$. Consider the morphism

$$
T \times_{f \circ v, W} V \xrightarrow{\left(v, \mathrm{id}_{V}\right)} V \times_{W} V=V \amalg U
$$

The inverse image of $V$ is $T$ embedded via $\left(\mathrm{id}_{T}, v\right): T \rightarrow T \times{ }_{f \circ v, W} V$. The composition $y^{\prime}=y \circ\left(\mathrm{id}_{T}, v\right): T \rightarrow Y$ is a morphism with $v=h \circ y^{\prime}$ which determines $y$ because the restriction of $y$ to the other part is uniquely determined as $U$ maps into $V^{0}$ by the second projection. It follows that $X \times_{g, W, f} V \rightarrow Y$, $(w, y, v) \mapsto y^{\prime}$ is an isomorphism.
Thus if we can show that $X$ is an algebraic space, then we are done. Since $V \rightarrow W$ is separated and étale it is representable by Morphisms of Spaces, Lemma 54.48.1 (and Morphisms of Spaces, Lemma 54.38.5). Of course $W^{0} \rightarrow W$ is representable and étale as it is an open immersion. Thus

$$
W^{0} \amalg Y=X \times_{g, W} W^{0} \amalg X \times_{g, W, f} V=X \times_{g, W}\left(W^{0} \amalg V\right) \longrightarrow X
$$

is representable, surjective, and étale by Spaces, Lemmas 52.3.3 and 52.5.5 Thus $X$ is an algebraic space by Spaces, Lemma 52.11.2.

0BGZ Lemma 57.18.2. Notation and assumptions as in Lemma 57.18.1. Let $g: X \rightarrow$ $W$ correspond to $h: Y \rightarrow V$ via the equivalence. Then $g$ is quasi-compact, quasiseparated, separated, locally of finite presentation, of finite presentation, locally of finite type, of finite type, proper, integral, finite, and add more here if and only if $h$ is so.

Proof. If $g$ is quasi-compact, quasi-separated, separated, locally of finite presentation, of finite presentation, locally of finite type, of finite type, proper, finite, so is $h$ as a base change of $g$ by Morphisms of Spaces, Lemmas 54.8.3 54.4.4 54.28.3. 54.23 .3 , 54.39.3, 54.43.5. Conversely, let $P$ be a property of morphisms of algebraic spaces which is étale local on the base and which holds for the identity morphism of any algebraic space. Since $\left\{W^{0} \rightarrow W, V \rightarrow W\right\}$ is an étale covering, to prove that $g$ has $P$ it suffices to show that $h$ has $P$. Thus we conclude using Morphisms of Spaces, Lemmas 54.8.7, 54.4.12, 54.28.4, 54.23.4, 54.39.2, 54.43.3.

0BH0 Lemma 57.18.3. Let $S$ be a scheme. Let $X$ be a decent algebraic space over $S$. Let $x \in|X|$ be a closed point such that $U=X \backslash\{x\} \rightarrow X$ is quasi-compact. With $V=\operatorname{Spec}\left(\mathcal{O}_{X, x}^{h}\right) \backslash\left\{\mathfrak{m}_{x}^{h}\right\}$ the base change functor
$\left\{\begin{array}{l}f: Y \rightarrow X \text { of finite presentation } \\ f^{-1}(U) \rightarrow U \text { is an isomorphism }\end{array}\right\} \rightarrow\left\{\begin{array}{c}g: Y \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x}^{h}\right) \text { of finite presentation } \\ g^{-1}(V) \rightarrow V \text { is an isomorphism }\end{array}\right\}$
is an equivalence of categories.
Proof. Let $a:(W, w) \rightarrow(X, x)$ be an elementary étale neighbourhood of $x$ with $W$ affine as in Decent Spaces, Lemma55.10.2. Since $x$ is a closed point of $X$ and $w$ is the unique point of $W$ lying over $x$, we see that $w$ is a closed point of $W$. Since $a$ is étale and identifies residue fields at $x$ and $w$, it follows that $a$ induces an isomorphism $a^{-1} x \rightarrow x$ (as closed subspaces of $X$ and $W$ ). Thus we may apply Lemma 57.18 .1 and 57.18 .2 to reduce the problem to the case where $X$ is an affine scheme.
Assume $X$ is an affine scheme. Recall that $\mathcal{O}_{X, x}^{h}$ is the colimit of $\Gamma\left(U, \mathcal{O}_{U}\right)$ over affine elementary étale neighbourhoods $(U, u) \rightarrow(X, x)$. Recall that the category of these neighbourhoods is cofiltered, see Decent Spaces, Lemma 55.10.4 or More on Morphisms, Lemma 36.27.4. Then $\operatorname{Spec}\left(\mathcal{O}_{X, x}^{h}\right)=\lim U$ and $V=\lim U \backslash\{u\}$ (Lemma 57.4.1) where the limits are taken over the same category. Thus by Lemma 57.7.1 The category on the right is the colimit of the categories for the pairs $(U, u)$. And by the material in the first paragraph, each of these categories is equivalent to the category for the pair $(X, x)$. This finishes the proof.

## CHAPTER 58

## Divisors on Algebraic Spaces

### 58.1. Introduction

0839 In this chapter we study divisors on algebraic spaces and related topics. A basic reference for algebraic spaces is Knu71.

### 58.2. Effective Cartier divisors

083A For some reason it seem convenient to define the notion of an effective Cartier divisor before anything else. Note that in Morphisms of Spaces, Section 54.13 we discussed the correspondence between closed subspaces and quasi-coherent sheaves of ideals. Moreover, in Properties of Spaces, Section 53.29, we discussed properties of quasi-coherent modules, in particular "locally generated by 1 element". These references show that the following definition is compatible with the definition for schemes.

083B Definition 58.2.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) A locally principal closed subspace of $X$ is a closed subspace whose sheaf of ideals is locally generated by 1 element.
(2) An effective Cartier divisor on $X$ is a closed subspace $D \subset X$ such that the ideal sheaf $\mathcal{I}_{D} \subset \mathcal{O}_{X}$ is an invertible $\mathcal{O}_{X}$-module.

Thus an effective Cartier divisor is a locally principal closed subspace, but the converse is not always true. Effective Cartier divisors are closed subspaces of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zerodivisor. In particular they are nowhere dense.

083C Lemma 58.2.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be a closed subspace. The following are equivalent:
(1) The subspace $D$ is an effective Cartier divisor on $X$.
(2) For some scheme $U$ and surjective étale morphism $U \rightarrow X$ the inverse image $D \times_{X} U$ is an effective Cartier divisor on $U$.
(3) For every scheme $U$ and every étale morphism $U \rightarrow X$ the inverse image $D \times_{X} U$ is an effective Cartier divisor on $U$.
(4) For every $x \in|D|$ there exists an étale morphism $(U, u) \rightarrow(X, x)$ of pointed algebraic spaces such that $U=\operatorname{Spec}(A)$ and $D \times{ }_{X} U=\operatorname{Spec}(A /(f))$ with $f \in A$ not a zerodivisor.

Proof. The equivalence of $(1)-(3)$ follows from Definition 58.2 .1 and the references preceding it. Assume (1) and let $x \in|D|$. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow X$. Choose $w \in D \times{ }_{X} W$ mapping to $x$. By (3) $D \times_{X} W$ is an
effective Cartier divisor on $W$. Hence we can find affine étale neighbourhood $U$ by choosing an affine open neighbourhood of $w$ in $W$ as in Divisors, Lemma 30.11.2.
Assume (4). Then we see that $\left.\mathcal{I}_{D}\right|_{U}$ is invertible by Divisors, Lemma 30.11.2. Since we can find an étale covering of $X$ by the collection of all such $U$ and $X \backslash D$, we conclude that $\mathcal{I}_{D}$ is an invertible $\mathcal{O}_{X}$-module.

083D Lemma 58.2.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z \subset X$ be a locally principal closed subspace. Let $U=X \backslash Z$. Then $U \rightarrow X$ is an affine morphism.
Proof. The question is étale local on $X$, see Morphisms of Spaces, Lemmas 54.20 .3 and Lemma 58.2.2. Thus this follows from the case of schemes which is Divisors, Lemma 30.11.3.

083 Lemma 58.2.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Let $U=X \backslash D$. Then $U \rightarrow X$ is an affine morphism and $U$ is scheme theoretically dense in $X$.

Proof. Affineness is Lemma 58.2.3. The density question is étale local on $X$ by Morphisms of Spaces, Definition 54.17.3. Thus this follows from the case of schemes which is Divisors, Lemma 30.11.4.

083T Lemma 58.2.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Let $x \in|D|$. If $\operatorname{dim}_{x}(X)<\infty$, then $\operatorname{dim}_{x}(D)<\operatorname{dim}_{x}(X)$.
Proof. Both the definition of an effective Cartier divisor and of the dimension of an an algebraic space at a point (Properties of Spaces, Definition 53.8.1) are étale local. Hence this lemma follows from the case of schemes which is Divisors, Lemma 30.11 .5

083U Definition 58.2.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Given effective Cartier divisors $D_{1}, D_{2}$ on $X$ we set $D=D_{1}+D_{2}$ equal to the closed subspace of $X$ corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_{1}} \mathcal{I}_{D_{2}} \subset \mathcal{O}_{S}$. We call this the sum of the effective Cartier divisors $D_{1}$ and $D_{2}$.

It is clear that we may define the sum $\sum n_{i} D_{i}$ given finitely many effective Cartier divisors $D_{i}$ on $X$ and nonnegative integers $n_{i}$.

083V Lemma 58.2.7. The sum of two effective Cartier divisors is an effective Cartier divisor.

Proof. Omitted. Étale locally this reduces to the following simple algebra fact: if $f_{1}, f_{2} \in A$ are nonzerodivisors of a ring $A$, then $f_{1} f_{2} \in A$ is a nonzerodivisor.

083W Lemma 58.2.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z, Y$ be two closed subspaces of $X$ with ideal sheaves $\mathcal{I}$ and $\mathcal{J}$. If $\mathcal{I} \mathcal{J}$ defines an effective Cartier divisor $D \subset X$, then $Z$ and $Y$ are effective Cartier divisors and $D=Z+Y$.

Proof. By Lemma 58.2.2 this reduces to the case of schemes which is Divisors, Lemma 30.11.9.

Recall that we have defined the inverse image of a closed subspace under any morphism of algebraic spaces in Morphisms of Spaces, Definition 54.13.2.

083X Lemma 58.2.9. Let $S$ be a scheme. Let $f: X^{\prime} \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ be a locally principal closed subspace. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subspace of $X^{\prime}$.
Proof. Omitted.
083 Y Definition 58.2.10. Let $S$ be a scheme. Let $f: X^{\prime} \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $D \subset X$ be an effective Cartier divisor. We say the pullback of $D$ by $f$ is defined if the closed subspace $f^{-1}(D) \subset X^{\prime}$ is an effective Cartier divisor. In this case we denote it either $f^{*} D$ or $f^{-1}(D)$ and we call it the pullback of the effective Cartier divisor.

The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice.

083Z Lemma 58.2.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $D \subset Y$ be an effective Cartier divisor. The pullback of $D$ by $f$ is defined in each of the following cases:
(1) $f$ is flat, and
(2) add more here as needed.

Proof. Omitted.
0840 Lemma 58.2.12. Let $S$ be a scheme. Let $f: X^{\prime} \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $D_{1}, D_{2}$ be effective Cartier divisors on $X$. If the pullbacks of $D_{1}$ and $D_{2}$ are defined then the pullback of $D=D_{1}+D_{2}$ is defined and $f^{*} D=$ $f^{*} D_{1}+f^{*} D_{2}$.

Proof. Omitted.
0841 Definition 58.2.13. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ and let $D \subset X$ be an effective Cartier divisor. The invertible sheaf $\mathcal{O}_{X}(D)$ associated to $D$ is given by

$$
\mathcal{O}_{X}(D):=\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{I}_{D}, \mathcal{O}_{X}\right)=\mathcal{I}_{D}^{\otimes-1}
$$

The canonical section, usually denoted 1 or $1_{D}$, is the global section of $\mathcal{O}_{X}(D)$ corresponding to the inclusion mapping $\mathcal{I}_{D} \rightarrow \mathcal{O}_{X}$.
0B4F Lemma 58.2.14. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Then for the conormal sheaf we have $\mathcal{C}_{D / X}=\mathcal{I}_{D}\left|D=\mathcal{O}_{X}(D)^{\otimes-1}\right|_{D}$.
Proof. Omitted.
0842 Lemma 58.2.15. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D_{1}$, $D_{2}$ be effective Cartier divisors on $X$. Let $D=D_{1}+D_{2}$. Then there is a unique isomorphism

$$
\mathcal{O}_{X}\left(D_{1}\right) \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}\left(D_{2}\right) \longrightarrow \mathcal{O}_{X}(D)
$$

which maps $1_{D_{1}} \otimes 1_{D_{2}}$ to $1_{D}$.
Proof. Omitted.
0843 Definition 58.2.16. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{L}$ be an invertible sheaf on $X$. A global section $s \in \Gamma(X, \mathcal{L})$ is called a regular section if the map $\mathcal{O}_{X} \rightarrow \mathcal{L}, f \mapsto f s$ is injective.

0844 Lemma 58.2.17. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. The following are equivalent:
(1) $f$ is a regular section, and
(2) for any $x \in X$ the image $f \in \mathcal{O}_{X, \bar{x}}$ is not a zerodivisor.
(3) for any affine $U=\operatorname{Spec}(A)$ étale over $X$ the restriction $\left.f\right|_{U}$ is a nonzerodivisor of $A$, and
(4) there exists a scheme $U$ and a surjective étale morphism $U \rightarrow X$ such that $\left.f\right|_{U}$ is a regular section of $\mathcal{O}_{U}$.
Proof. Omitted.
Note that a global section $s$ of an invertible $\mathcal{O}_{X^{-}}$module $\mathcal{L}$ may be seen as an $\mathcal{O}_{X^{-}}$ module $\operatorname{map} s: \mathcal{O}_{X} \rightarrow \mathcal{L}$. Its dual is therefore a map $s: \mathcal{L}^{\otimes-1} \rightarrow \mathcal{O}_{X}$. (See Modules on Sites, Lemma 18.31.4 for the dual invertible sheaf.)

0845 Definition 58.2.18. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$. The zero scheme of $s$ is the closed subspace $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ which is the image of the map $s: \mathcal{L}^{\otimes-1} \rightarrow \mathcal{O}_{X}$.
0846 Lemma 58.2.19. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$.
(1) Consider closed immersions $i: Z \rightarrow X$ such that $\left.i^{*} s \in \Gamma\left(Z, i^{*} \mathcal{L}\right)\right)$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the maximal element of this ordered set.
(2) For any morphism of algebraic spaces $f: Y \rightarrow X$ over $S$ we have $f^{*} s=0$ in $\Gamma\left(Y, f^{*} \mathcal{L}\right)$ if and only if $f$ factors through $Z(s)$.
(3) The zero scheme $Z(s)$ is a locally principal closed subspace of $X$.
(4) The zero scheme $Z(s)$ is an effective Cartier divisor on $X$ if and only if $s$ is a regular section of $\mathcal{L}$.

Proof. Omitted.
0847 Lemma 58.2.20. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $D \subset X$ is an effective Cartier divisor, then the canonical section $1_{D}$ of $\mathcal{O}_{X}(D)$ is regular.
(2) Conversely, if $s$ is a regular section of the invertible sheaf $\mathcal{L}$, then there exists a unique effective Cartier divisor $D=Z(s) \subset X$ and a unique isomorphism $\mathcal{O}_{X}(D) \rightarrow \mathcal{L}$ which maps $1_{D}$ to $s$.
The constructions $D \mapsto\left(\mathcal{O}_{X}(D), 1_{D}\right)$ and $(\mathcal{L}, s) \mapsto Z(s)$ give mutually inverse maps $\{$ effective Cartier divisors on $X\} \leftrightarrow\left\{\begin{array}{c}\text { pairs }(\mathcal{L}, s) \text { consisting of an invertible } \\ \mathcal{O}_{X} \text {-module and a regular global section }\end{array}\right\}$
Proof. Omitted.
0B4G Lemma 58.2.21. Let $S$ be a scheme and let $X$ be a locally Noetherian algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. If $X$ is $\left(S_{k}\right)$, then $D$ is ( $S_{k-1}$ ).

Proof. By our definition of the property $\left(S_{k}\right)$ for algebraic spaces (Properties of Spaces, Section 53.7) and Lemma 58.2 .2 this follows from the case of schemes (Divisors, Lemma 30.12.5).

0B4H Lemma 58.2.22. Let $S$ be a scheme and let $X$ be a locally Noetherian normal algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Then $D$ is $\left(S_{1}\right)$.

Proof. By our definition of normality for algebraic spaces (Properties of Spaces, Section 53.7) and Lemma 58.2.2 this follows from the case of schemes (Divisors, Lemma 30.12.6.

### 58.3. Relative Proj

0848 This section revisits the construction of the relative proj in the setting of algebraic spaces. The material in this section corresponds to the material in Constructions, Section 26.16 and Divisors, Section 30.24 in the case of schemes.
0849 Situation 58.3.1. Here $S$ is a scheme, $X$ is an algebraic space over $S$, and $\mathcal{A}$ is a quasi-coherent graded $\mathcal{O}_{X}$-algebra.
In Situation 58.3.1 we are going to define a functor $F:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets which will turn out to be an algebraic space. We will follow (mutatis mutandis) the procedure of Constructions, Section 26.16. First, given a scheme $T$ over $S$ we define a quadruple over $T$ to be a system $(d, f: T \rightarrow S, \mathcal{L}, \psi)$
(1) $d \geq 1$ is an integer,
(2) $f: T \rightarrow X$ is a morphism over $S$,
(3) $\mathcal{L}$ is an invertible $\mathcal{O}_{T}$-module, and
(4) $\psi: f^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a homomorphism of graded $\mathcal{O}_{T}$-algebras such that $f^{*} \mathcal{A}_{d} \rightarrow \mathcal{L}$ is surjective.
We say two quadruples $(d, f, \mathcal{L}, \psi)$ and $\left(d^{\prime}, f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ are equivalen ${ }^{1}$ if and only if we have $f=f^{\prime}$ and for some positive integer $m=a d=a^{\prime} d^{\prime}$ there exists an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property that $\left.\beta \circ \psi\right|_{f^{*} \mathcal{A}(m)}$ and $\left.\psi^{\prime}\right|_{f^{*} \mathcal{A}^{(m)}}$ agree as graded ring maps $f^{*} \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0}\left(\mathcal{L}^{\prime}\right)^{\otimes m n}$. Given a quadruple $(d, f, \mathcal{L}, \psi)$ and a morphism $h: T^{\prime} \rightarrow T$ we have the pullback $\left(d, f \circ h, h^{*} \mathcal{L}, h^{*} \psi\right)$. Pullback preserves the equivalence relation. Finally, for a quasi-compact scheme $T$ over $S$ we set

$$
F(T)=\text { the set of equivalence classes of quadruples over } T
$$

and for an arbitrary scheme $T$ over $S$ we set

$$
F(T)=\lim _{V \subset T \text { quasi-compact open }} F(V)
$$

In other words, an element $\xi$ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_{V} \in F(V)$ where $V$ ranges over the quasi-compact opens of $T$. Thus we have defined our functor

084A

$$
\begin{equation*}
F: S c h^{o p p} \longrightarrow \text { Sets } \tag{58.3.1.1}
\end{equation*}
$$

There is a morphism $F \rightarrow X$ of functors sending the quadruple $(d, f, \mathcal{L}, \psi)$ to $f$.
084B Lemma 58.3.2. In Situation58.3.1. The functor $F$ above is an algebraic space. For any morphism $g: Z \rightarrow X$ where $Z$ is a scheme there is a canonical isomorphism $\underline{\operatorname{Proj}}_{Z}\left(g^{*} \mathcal{A}\right)=Z \times_{X} F$ compatible with further base change.

[^170]Proof. It suffices to prove the second assertion, see Spaces, Lemma 52.11.3. Let $g: Z \rightarrow X$ be a morphism where $Z$ is a scheme. Let $F^{\prime}$ be the functor of quadruples associated to the graded quasi-coherent $\mathcal{O}_{Z \text {-algebra }} g^{*} \mathcal{A}$. Then there is a canonical isomorphism $F^{\prime}=Z \times_{X} F$, sending a quadruple $(d, f: T \rightarrow Z, \mathcal{L}, \psi)$ for $F^{\prime}$ to $(d, g \circ f, \mathcal{L}, \psi)$ (details omitted, see proof of Constructions, Lemma 26.16.1). By Constructions, Lemmas 26.16.4, 26.16.5, and 26.16.6 and Definition 26.16.7 we see that $F^{\prime}$ is representable by $\underline{\operatorname{Proj}}_{Z}\left(g^{*} \mathcal{A}\right)$.
The lemma above tells us the following definition makes sense.
084C Definition 58.3.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{X}$-algebras. The relative homogeneous spectrum of $\mathcal{A}$ over $X$, or the homogeneous spectrum of $\mathcal{A}$ over $X$, or the relative Proj of $\mathcal{A}$ over $X$ is the algebraic space $F$ over $X$ of Lemma 58.3.2. We denote it $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$.
In particular the structure morphism of the relative Proj is representable by construction. We can also think about the relative Proj via glueing. Let $\varphi: U \rightarrow X$ be a surjective étale morphism, where $U$ is a scheme. Set $R=U \times_{X} U$ with projection morphisms $s, t: R \rightarrow U$. By Lemma 58.3 .2 there exists a canonical isomorphism

$$
\gamma: \underline{\operatorname{Proj}}_{U}\left(\varphi^{*} \mathcal{A}\right) \longrightarrow \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \times_{X} U
$$

over $U$. Let $\alpha: t^{*} \varphi^{*} \mathcal{A} \rightarrow s^{*} \varphi^{*} \mathcal{A}$ be the canonical isomorphism of Properties of Spaces, Proposition 53.31.1. Then the diagram

is commutative (the equal signs come from Constructions, Lemma 26.16.10). Thus, if we denote $\mathcal{A}_{U}, \mathcal{A}_{R}$ the pullback of $\mathcal{A}$ to $U, R$, then $P=\underline{\operatorname{Proj}}_{X}(\mathcal{A})$ has an étale covering by the scheme $P_{U}=\underline{\operatorname{Proj}_{U}}\left(\mathcal{A}_{U}\right)$ and $P_{U} \times_{P} P_{U}$ is equal to $P_{R}=$ $\underline{\operatorname{Proj}}_{R}\left(\mathcal{A}_{R}\right)$. Using these remarks we can argue in the usual fashion using étale localization to transfer results on the relative proj from the case of schemes to the case of algebraic spaces.
084D Lemma 58.3.4. In Situation 58.3.1. The relative Proj comes equipped with $a$ quasi-coherent sheaf of $\mathbf{Z}$-graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\text {Proj }_{X}(\mathcal{A})}(n)$ and a canonical homomorphism of graded algebras

$$
\psi: \pi^{*} \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{\underline{\operatorname{Proj}}_{X}(\mathcal{A})}(n)
$$

whose base change to any scheme over $X$ agrees with Constructions, Lemma 26.15.5.
Proof. As in the discussion following Definition 58.3.3 choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$, set $R=U \times_{X} U$ with projections $s, t: R \rightarrow U$, $\mathcal{A}_{U}=\left.\mathcal{A}\right|_{U}, \mathcal{A}_{R}=\left.\mathcal{A}\right|_{R}$, and $\pi: P=\underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X, \pi_{U}: P_{U}=\operatorname{Proj}_{U}\left(\mathcal{A}_{U}\right)$ and $\pi_{R}: P_{R}=\underline{\operatorname{Proj}}_{U}\left(\mathcal{A}_{R}\right)$. By the Constructions, Lemma 26.15.5 we have a
quasi-coherent sheaf of $\mathbf{Z}$-graded $\mathcal{O}_{P_{U}}$-algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{P_{U}}(n)$ and a canonical map $\psi_{U}: \pi_{U}^{*} \mathcal{A}_{U} \rightarrow \bigoplus_{n \geq 0} \mathcal{O}_{P_{U}}(n)$ and similarly for $P_{R}$. By Constructions, Lemma 26.16 .10 the pullback of $\mathcal{O}_{P_{U}}(n)$ and $\psi_{U}$ by either projection $P_{R} \rightarrow P_{U}$ is equal to $\mathcal{O}_{P_{R}}(n)$ and $\psi_{R}$. By Properties of Spaces, Proposition 53.31.1 we obtain $\mathcal{O}_{P}(n)$ and $\psi$. We omit the verification of compatibility with pullback to arbitrary schemes over $X$.

Having constructed the relative Proj we turn to some basic properties.
085C Lemma 58.3.5. Let $S$ be a scheme. Let $g: X^{\prime} \rightarrow X$ be a morphism of algebraic spaces over $S$ and let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{X}$-algebras. Then there is a canonical isomorphism

$$
r: \underline{\operatorname{Proj}}_{X^{\prime}}\left(g^{*} \mathcal{A}\right) \longrightarrow X^{\prime} \times_{X} \underline{\operatorname{Proj}}_{X}(\mathcal{A})
$$

as well as a corresponding isomorphism

$$
\theta: r^{*} p r_{2}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text { Proj }}_{X}(\mathcal{A})}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text { Proj }}_{X^{\prime}}\left(g^{*} \mathcal{A}\right)}(d)
$$

of $\mathbf{Z}$-graded $\mathcal{O}_{\text {Proj }_{X^{\prime}}\left(g^{*} \mathcal{A}\right)}$-algebras.
Proof. Let $F$ be the functor 58.3.1.1 and let $F^{\prime}$ be the corresponding functor defined using $g^{*} \mathcal{A}$ on $X^{\prime}$. We claim there is a canonical isomorphism $r: F^{\prime} \rightarrow$ $X^{\prime} \times_{X} F$ of functors (and of course $r$ is the isomorphism of the lemma). It suffices to construct the bijection $r: F^{\prime}(T) \rightarrow X^{\prime}(T) \times_{X(T)} F(T)$ for quasi-compact schemes $T$ over $S$. First, if $\xi=\left(d^{\prime}, f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ is a quadruple over $T$ for $F^{\prime}$, then we can set $r(\xi)=\left(f^{\prime},\left(d^{\prime}, g \circ f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)\right)$. This makes sense as $\left(g \circ f^{\prime}\right)^{*} \mathcal{A}^{(d)}=\left(f^{\prime}\right)^{*}\left(g^{*} \mathcal{A}\right)^{(d)}$. The inverse map sends the pair $\left(f^{\prime},(d, f, \mathcal{L}, \psi)\right)$ to the quadruple $\left(d, f^{\prime}, \mathcal{L}, \psi\right)$. We omit the proof of the final assertion (hint: reduce to the case of schemes by étale localization and apply Constructions, Lemma 26.16.10.

084E Lemma 58.3.6. In Situation58.3.1 the morphism $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ is separated.
Proof. By Morphisms of Spaces, Lemma 54.4.12 and the construction of the relative Proj this follows from the case of schemes which is Constructions, Lemma 26.16 .9 .

084F Lemma 58.3.7. In Situation 58.3.1. If one of the following holds
(1) $\mathcal{A}$ is of finite type as a sheaf of $\mathcal{A}_{0}$-algebras,
(2) $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ as an $\mathcal{A}_{0}$-algebra and $\mathcal{A}_{1}$ is a finite type $\mathcal{A}_{0}$-module,
(3) there exists a finite type quasi-coherent $\mathcal{A}_{0}$-submodule $\mathcal{F} \subset \mathcal{A}_{+}$such that $\mathcal{A}_{+} / \mathcal{F} \mathcal{A}$ is a locally nilpotent sheaf of ideals of $\mathcal{A} / \mathcal{F} \mathcal{A}$,
then $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ is quasi-compact.
Proof. By Morphisms of Spaces, Lemma 54.8.7 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.24.1.

084G Lemma 58.3.8. In Situation 58.3.1. If $\mathcal{A}$ is of finite type as a sheaf of $\mathcal{O}_{X^{-}}$ algebras, then $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ is of finite type.
Proof. By Morphisms of Spaces, Lemma 54.23 .4 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma30.24.2.

084H Lemma 58.3.9. In Situation 58.3.1. If $\mathcal{O}_{X} \rightarrow \mathcal{A}_{0}$ is an integral algebra mar ${ }^{2}$ and $\mathcal{A}$ is of finite type as an $\mathcal{A}_{0}$-algebra, then $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ is universally closed.

Proof. By Morphisms of Spaces, Lemma 54.9.5 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.24.3.

084I Lemma 58.3.10. In Situation 58.3.1. The following conditions are equivalent
(1) $\mathcal{A}_{0}$ is a finite type $\mathcal{O}_{X}$-module and $\mathcal{A}$ is of finite type as an $\mathcal{A}_{0}$-algebra,
(2) $\mathcal{A}_{0}$ is a finite type $\mathcal{O}_{X}$-module and $\mathcal{A}$ is of finite type as an $\mathcal{O}_{X}$-algebra. If these conditions hold, then $\pi: \underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ is proper.
Proof. By Morphisms of Spaces, Lemma 54.39 .2 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.24.3.

085D Lemma 58.3.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{X}$-modules generated as an $\mathcal{A}_{0}$-algebra by $\mathcal{A}_{1}$. With $P=\underline{\operatorname{Proj}}_{X}(\mathcal{A})$ we have
(1) $P$ represents the functor $F_{1}$ which associates to $T$ over $S$ the set of isomorphism classes of triples $(f, \mathcal{L}, \psi)$, where $f: T \rightarrow X$ is a morphism over $S, \mathcal{L}$ is an invertible $\mathcal{O}_{T}$-module, and $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a map of graded $\mathcal{O}_{T}$-algebras inducing a surjection $f^{*} \mathcal{A}_{1} \rightarrow \mathcal{L}$,
(2) the canonical map $\pi^{*} \mathcal{A}_{1} \rightarrow \mathcal{O}_{P}(1)$ is surjective, and
(3) each $\mathcal{O}_{P}(n)$ is invertible and the multiplication maps induce isomorphisms $\mathcal{O}_{P}(n) \otimes_{\mathcal{O}_{P}} \mathcal{O}_{P}(m)=\mathcal{O}_{P}(n+m)$.

Proof. Omitted. See Constructions, Lemma 26.16 .11 for the case of schemes.

### 58.4. Functoriality of relative proj

085E This section is the analogue of Constructions, Section 26.18.
085F Lemma 58.4.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\psi: \mathcal{A} \rightarrow \mathcal{B}$ be a map of quasi-coherent graded $\mathcal{O}_{X}$-algebras. Set $P=\operatorname{Proj}_{X}(\mathcal{A}) \rightarrow X$ and $Q=\underline{\operatorname{Proj}}_{X}(\mathcal{B}) \rightarrow X$. There is a canonical open subspace $U \overline{(\psi)} \subset Q$ and a canonical morphism of algebraic spaces

$$
r_{\psi}: U(\psi) \longrightarrow P
$$

over $X$ and a map of $\mathbf{Z}$-graded $\mathcal{O}_{U(\psi)}$-algebras

$$
\theta=\theta_{\psi}: r_{\psi}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{P}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d)
$$

The triple $\left(U(\psi), r_{\psi}, \theta\right)$ is characterized by the property that for any scheme $W$ étale over $X$ the triple

$$
\left(U(\psi) \times_{X} W,\left.\quad r_{\psi}\right|_{U(\psi) \times_{X} W}: U(\psi) \times_{X} W \rightarrow P \times_{X} W,\left.\quad \theta\right|_{U(\psi) \times_{X} W}\right)
$$

is equal to the triple associated to $\psi:\left.\left.\mathcal{A}\right|_{W} \rightarrow \mathcal{B}\right|_{W}$ of Constructions, Lemma 26.18.1.

Proof. This lemma follows from étale localization and the case of schemes, see discussion following Definition 58.3.3. Details omitted.

[^171]085G Lemma 58.4.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$, $\mathcal{B}$, and $\mathcal{C}$ be quasi-coherent graded $\mathcal{O}_{X}$-algebras. Set $P=\underline{\operatorname{Proj}}_{X}(\mathcal{A}), Q=\underline{\operatorname{Proj}}_{X}(\mathcal{B})$ and $R=\underline{\operatorname{Proj}}_{X}(\mathcal{C})$. Let $\varphi: \mathcal{A} \rightarrow \mathcal{B}, \psi: \mathcal{B} \rightarrow \mathcal{C}$ be graded $\mathcal{O}_{X}$-algebra maps. Then we have

$$
U(\psi \circ \varphi)=r_{\varphi}^{-1}(U(\psi)) \quad \text { and } \quad r_{\psi \circ \varphi}=\left.r_{\varphi} \circ r_{\psi}\right|_{U(\psi \circ \varphi)}
$$

In addition we have

$$
\theta_{\psi} \circ r_{\psi}^{*} \theta_{\varphi}=\theta_{\psi \circ \varphi}
$$

with obvious notation.
Proof. Omitted.
085H Lemma 58.4.3. With hypotheses and notation as in Lemma 58.4.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is surjective for $d \gg 0$. Then
(1) $U(\psi)=Q$,
(2) $r_{\psi}: Q \rightarrow R$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{P}(n) \rightarrow \mathcal{O}_{Q}(n)$ are surjective but not isomorphisms in general (even if $\mathcal{A} \rightarrow \mathcal{B}$ is surjective).

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.3) by étale localization.

085 I Lemma 58.4.4. With hypotheses and notation as in Lemma 58.4.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is an isomorphism for all $d \gg 0$. Then
(1) $U(\psi)=Q$,
(2) $r_{\psi}: Q \rightarrow P$ is an isomorphism, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{P}(n) \rightarrow \mathcal{O}_{Q}(n)$ are isomorphisms.

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.4) by étale localization.

085J Lemma 58.4.5. With hypotheses and notation as in Lemma 58.4.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is surjective for $d \gg 0$ and that $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$. Then
(1) $U(\psi)=Q$,
(2) $r_{\psi}: Q \rightarrow P$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{P}(n) \rightarrow \mathcal{O}_{Q}(n)$ are isomorphisms.

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.5) by étale localization.

### 58.5. Closed subspaces of relative proj

085 K Some auxiliary lemmas about closed subspaces of relative proj. This section is the analogue of Divisors, Section 30.25

085L Lemma 58.5.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{X}$-algebra. Let $\pi: P=\operatorname{Proj}_{X}(\mathcal{A}) \rightarrow X$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow P$ be a closed subspace. Denote $\mathcal{I} \subset \mathcal{A}$ the kernel of the canonical map

$$
\mathcal{A} \longrightarrow \bigoplus_{d \geq 0} \pi_{*}\left(\left(i_{*} \mathcal{O}_{Z}\right)(d)\right)
$$

If $\pi$ is quasi-compact, then there is an isomorphism $Z=\underline{\operatorname{Proj}}_{X}(\mathcal{A} / \mathcal{I})$.

Proof. The morphism $\pi$ is separated by Lemma 58.3.6. As $\pi$ is quasi-compact, $\pi_{*}$ transforms quasi-coherent modules into quasi-coherent modules, see Morphisms of Spaces, Lemma 54.11.2. Hence $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X}$-module. In particular, $\mathcal{B}=\mathcal{A} / \mathcal{I}$ is a quasi-coherent graded $\mathcal{O}_{X}$-algebra. The functoriality morphism $Z^{\prime}=\underline{\operatorname{Proj}_{X}}(\mathcal{B}) \rightarrow \underline{\operatorname{Proj}}_{X}(\mathcal{A})$ is everywhere defined and a closed immersion, see Lemma 58.4.3. Hence it suffices to prove $Z=Z^{\prime}$ as closed subspaces of $P$.
Having said this, the question is étale local on the base and we reduce to the case of schemes (Divisors, Lemma 30.25.1) by étale localization.

In case the closed subspace is locally cut out by finitely many equations we can define it by a finite type ideal sheaf of $\mathcal{A}$.

085M Lemma 58.5.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{X}$-algebra. Let $\pi: P=$ $\underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow P$ be a closed subscheme. If $\pi$ is quasi-compact and $i$ of finite presentation, then there exists a $d>0$ and $a$ quasi-coherent finite type $\mathcal{O}_{X}$-submodule $\mathcal{F} \subset \mathcal{A}_{d}$ such that $Z=\underline{\operatorname{Proj}}_{X}(\mathcal{A} / \mathcal{F} \mathcal{A})$.
Proof. The reader can redo the arguments used in the case of schemes. However, we will show the lemma follows from the case of schemes by a trick. Let $\mathcal{I} \subset \mathcal{A}$ be the quasi-coherent graded ideal cutting out $Z$ of Lemma 58.5.1. Choose an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 53.6.3 By the case of schemes (Divisors, Lemma 30.25.2) there exists a $d>0$ and a quasi-coherent finite type $\mathcal{O}_{U}$-submodule $\left.\left.\mathcal{F}^{\prime} \subset \overline{\mathcal{I}}_{d}\right|_{U} \subset \mathcal{A}_{d}\right|_{U}$ such that $Z \times_{X} U$ is equal to $\underline{\operatorname{Proj}}_{U}\left(\left.\mathcal{A}\right|_{U} /\left.\mathcal{F}^{\prime} \mathcal{A}\right|_{U}\right)$. By Limits of Spaces, Lemma 57.9.2 we can find a finite type quasi-coherent submodule $\mathcal{F} \subset \mathcal{I}_{d}$ such that $\left.\mathcal{F}^{\prime} \subset \mathcal{F}\right|_{U}$. Let $Z^{\prime}=\underline{\operatorname{Proj}}_{X}(\mathcal{A} / \mathcal{F} \mathcal{A})$. Then $Z^{\prime} \rightarrow P$ is a closed immersion (Lemma 58.4.5) and $Z \subset Z^{\prime}$ as $\mathcal{F} \mathcal{A} \subset \mathcal{I}$. On the other hand, $Z^{\prime} \times_{X} U \subset Z \times_{X} U$ by our choice of $\mathcal{F}$. Thus $Z=Z^{\prime}$ as desired.

085N Lemma 58.5.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{X}$-algebra. Let $\pi: P=$ $\underline{\operatorname{Proj}}_{X}(\mathcal{A}) \rightarrow X$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow X$ be a closed subspace. Let $\overline{U \subset} X$ be an open. Assume that
(1) $\pi$ is quasi-compact,
(2) $i$ of finite presentation,
(3) $|U| \cap|\pi|(|i|(|Z|))=\emptyset$,
(4) $U$ is quasi-compact,
(5) $\mathcal{A}_{n}$ is a finite type $\mathcal{O}_{X}$-module for all $n$.

Then there exists a $d>0$ and a quasi-coherent finite type $\mathcal{O}_{X}$-submodule $\mathcal{F} \subset \mathcal{A}_{d}$ with (a) $Z=\underline{\operatorname{Proj}}_{X}(\mathcal{A} / \mathcal{F} \mathcal{A})$ and (b) the support of $\mathcal{A}_{d} / \mathcal{F}$ is disjoint from $U$.

Proof. We use the same trick as in the proof of Lemma 58.5 .2 to reduce to the case of schemes. Let $\mathcal{I} \subset \mathcal{A}$ be the quasi-coherent graded ideal cutting out $Z$ of Lemma 58.5.1. Choose an affine scheme $W$ and a surjective étale morphism $W \rightarrow X$, see Properties of Spaces, Lemma 53.6.3 By the case of schemes (Divisors, Lemma 30.25 .3 there exists a $d>0$ and a quasi-coherent finite type $\mathcal{O}_{W}$-submodule $\mathcal{F}^{\prime} \subset$ $\left.\left.\mathcal{I}_{d}\right|_{W} \subset \mathcal{A}_{d}\right|_{W}$ such that (a) $Z \times_{X} W$ is equal to $\operatorname{Proj}_{W}\left(\left.\mathcal{A}\right|_{W} /\left.\mathcal{F}^{\prime} \mathcal{A}\right|_{W}\right)$ and (b) the support of $\mathcal{A}_{d} \mid W / \mathcal{F}^{\prime}$ is disjoint from $U \times_{X} W$. By Limits of Spaces, Lemma 57.9.2 we can find a finite type quasi-coherent submodule $\mathcal{F} \subset \mathcal{I}_{d}$ such that $\left.\mathcal{F}^{\prime} \subset \mathcal{F}\right|_{W}$.

Let $Z^{\prime}=\underline{\operatorname{Proj}}_{X}(\mathcal{A} / \mathcal{F} \mathcal{A})$. Then $Z^{\prime} \rightarrow P$ is a closed immersion (Lemma 58.4.5) and $Z \subset Z^{\prime}$ as $\mathcal{F} \mathcal{A} \subset \mathcal{I}$. On the other hand, $Z^{\prime} \times_{X} W \subset Z \times_{X} W$ by our choice of $\mathcal{F}$. Thus $Z=Z^{\prime}$. Finally, we see that $\mathcal{A}_{d} / \mathcal{F}$ is supported on $X \backslash U$ as $\left.\mathcal{A}_{d}\right|_{W} /\left.\mathcal{F}\right|_{W}$ is a quotient of $\left.\mathcal{A}_{d}\right|_{W} / \mathcal{F}^{\prime}$ which is supported on $W \backslash U \times_{X} W$. Thus the lemma follows.

0B4I Lemma 58.5.4. Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{O}_{X}$-module. There is a bijection

$$
\left\{\begin{array}{c}
\text { sections } \sigma \text { of the } \\
\text { morphism } \mathbf{P}(\mathcal{E}) \rightarrow X
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { surjections } \mathcal{E} \rightarrow \mathcal{L} \text { where } \\
\mathcal{L} \text { is an invertible } \mathcal{O}_{X} \text {-module }
\end{array}\right\}
$$

In this case $\sigma$ is a closed immersion and there is a canonical isomorphism

$$
\operatorname{Ker}(\mathcal{E} \rightarrow \mathcal{L}) \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes-1} \longrightarrow \mathcal{C}_{\sigma(X) / \mathbf{P}(\mathcal{E})}
$$

Both the bijection and isomorphism are compatible with base change.
Proof. Because the constructions are compatible with base change, it suffices to check the statement étale locally on $X$. Thus we may assume $X$ is a scheme and the result is Divisors, Lemma 30.25.4.

### 58.6. Blowing up

085P Blowing up is an important tool in algebraic geometry.
085Q Definition 58.6.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subscheme corresponding to $\mathcal{I}$ (Morphisms of Spaces, Lemma 54.13.1). The blowing up of $X$ along $Z$, or the blowing up of $X$ in the ideal sheaf $\mathcal{I}$ is the morphism

$$
b: \underline{\operatorname{Proj}}_{X}\left(\bigoplus_{n \geq 0} \mathcal{I}^{n}\right) \longrightarrow X
$$

The exceptional divisor of the blow up is the inverse image $b^{-1}(Z)$. Sometimes $Z$ is called the center of the blowup.
We will see later that the exceptional divisor is an effective Cartier divisor. Moreover, the blowing up is characterized as the "smallest" algebraic space over $X$ such that the inverse image of $Z$ is an effective Cartier divisor.

If $b: X^{\prime} \rightarrow X$ is the blow up of $X$ in $Z$, then we often denote $\mathcal{O}_{X^{\prime}}(n)$ the twists of the structure sheaf. Note that these are invertible $\mathcal{O}_{X^{\prime}}$-modules and that $\mathcal{O}_{X^{\prime}}(n)=$ $\mathcal{O}_{X^{\prime}}(1)^{\otimes n}$ because $X^{\prime}$ is the relative Proj of a quasi-coherent graded $\mathcal{O}_{X}$-algebra which is generated in degree 1 , see Lemma 58.3.11.

085R Lemma 58.6.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $U=\operatorname{Spec}(A)$ be an affine scheme étale over $X$ and let $I \subset A$ be the ideal corresponding to $\left.\mathcal{I}\right|_{U}$. If $X^{\prime} \rightarrow X$ is the blow up of $X$ in $\mathcal{I}$, then there is a canonical isomorphism

$$
U \times_{X} X^{\prime}=\operatorname{Proj}\left(\bigoplus_{d \geq 0} I^{d}\right)
$$

of schemes over $U$, where the right hand side is the homogeneous spectrum of the Rees algebra of $I$ in $A$. Moreover, $U \times_{X} X^{\prime}$ has an affine open covering by spectra of the affine blowup algebras $A\left[\frac{I}{a}\right]$.

Proof. Note that the restriction $\left.\mathcal{I}\right|_{U}$ is equal to the pullback of $\mathcal{I}$ via the morphism $U \rightarrow X$, see Properties of Spaces, Section 53.25. Thus the lemma follows on combining Lemma 58.3.2 with Divisors, Lemma 30.26.2.

085S Lemma 58.6.3. Let $S$ be a scheme. Let $X_{1} \rightarrow X_{2}$ be a flat morphism of algebraic spaces over $S$. Let $Z_{2} \subset X_{2}$ be a closed subspace. Let $Z_{1}$ be the inverse image of $Z_{2}$ in $X_{1}$. Let $X_{i}^{\prime}$ be the blow up of $Z_{i}$ in $X_{i}$. Then there exists a cartesian diagram

of algebraic spaces over $S$.
Proof. Let $\mathcal{I}_{2}$ be the ideal sheaf of $Z_{2}$ in $X_{2}$. Denote $g: X_{1} \rightarrow X_{2}$ the given morphism. Then the ideal sheaf $\mathcal{I}_{1}$ of $Z_{1}$ is the image of $g^{*} \mathcal{I}_{2} \rightarrow \mathcal{O}_{X_{1}}$ (see Morphisms of Spaces, Definition 54.13 .2 and discussion following the definition). By Lemma 58.3.5 we see that $X_{1} \times X_{2} X_{2}^{\prime}$ is the relative Proj of $\bigoplus_{n \geq 0} g^{*} \mathcal{I}_{2}^{n}$. Because $g$ is flat the map $g^{*} \mathcal{I}_{2}^{n} \rightarrow \mathcal{O}_{X_{1}}$ is injective with image $\mathcal{I}_{1}^{n}$. Thus we see that $X_{1} \times_{X_{2}} X_{2}^{\prime}=X_{1}^{\prime}$.
085 T Lemma 58.6.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z \subset X$ be a closed subspace. The blowing up $b: X^{\prime} \rightarrow X$ of $Z$ in $X$ has the following properties:
(1) $\left.b\right|_{b^{-1}(X \backslash Z)}: b^{-1}(X \backslash Z) \rightarrow X \backslash Z$ is an isomorphism,
(2) the exceptional divisor $E=b^{-1}(Z)$ is an effective Cartier divisor on $X^{\prime}$,
(3) there is a canonical isomorphism $\mathcal{O}_{X^{\prime}}(-1)=\mathcal{O}_{X^{\prime}}(E)$

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 58.6.3) we can prove each of these statements after base change to $U$. This reduces us to the case of schemes. In this case the result is Divisors, Lemma 30.26.4.

085U Lemma 58.6.5 (Universal property blowing up). Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z \subset X$ be a closed subspace. Let $\mathcal{C}$ be the full subcategory of (Spaces $/ X$ ) consisting of $Y \rightarrow X$ such that the inverse image of $Z$ is an effective Cartier divisor on $Y$. Then the blowing up $b: X^{\prime} \rightarrow X$ of $Z$ in $X$ is a final object of $\mathcal{C}$.

Proof. We see that $b: X^{\prime} \rightarrow X$ is an object of $\mathcal{C}$ according to Lemma 58.6.4. Let $f: Y \rightarrow X$ be an object of $\mathcal{C}$. We have to show there exists a unique morphism $Y \rightarrow X^{\prime}$ over $X$. Let $D=f^{-1}(Z)$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$ and let $\mathcal{I}_{D}$ be the ideal sheaf of $D$. Then $f^{*} \mathcal{I} \rightarrow \mathcal{I}_{D}$ is a surjection to an invertible $\mathcal{O}_{Y}$-module. This extends to a map $\psi: \bigoplus f^{*} \mathcal{I}^{d} \rightarrow \bigoplus \mathcal{I}_{D}^{d}$ of graded $\mathcal{O}_{Y}$-algebras. (We observe that $\mathcal{I}_{D}^{d}=\mathcal{I}_{D}^{\otimes d}$ as $D$ is an effective Cartier divisor.) By Lemma 58.3.11 the triple $\left(f: Y \rightarrow X, \mathcal{I}_{D}, \psi\right)$ defines a morphism $Y \rightarrow X^{\prime}$ over $X$. The restriction

$$
Y \backslash D \longrightarrow X^{\prime} \backslash b^{-1}(Z)=X \backslash Z
$$

is unique. The open $Y \backslash D$ is scheme theoretically dense in $Y$ according to Lemma 58.2.4. Thus the morphism $Y \rightarrow X^{\prime}$ is unique by Morphisms of Spaces, Lemma 54.17.8 (also $b$ is separated by Lemma 58.3.6).

085 V Lemma 58.6.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z \subset X$ be an effective Cartier divisor. The blowup of $X$ in $Z$ is the identity morphism of $X$.

Proof. Immediate from the universal property of blowups (Lemma 58.6.5).
085W Lemma 58.6.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. If $X$ is reduced, then the blow up $X^{\prime}$ of $X$ in $\mathcal{I}$ is reduced.

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 58.6.3) we can prove each of these statements after base change to $U$. This reduces us to the case of schemes. In this case the result is Divisors, Lemma 30.26.8.

0BH1 Lemma 58.6.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $b: X^{\prime} \rightarrow X$ be the blowup of $X$ is a closed subspace. If $X$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 54.46.1 then so does $X^{\prime}$.

Proof. Follows immediately from the lemma cited in the statement, the étale local description of blowing ups in Lemma 58.6.2, and Divisors, Lemma 30.26.10.

085X Lemma 58.6.9. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $b: X^{\prime} \rightarrow X$ be a blow up of $X$ in a closed subspace. For any effective Cartier divisor $D$ on $X$ the pullback $b^{-1} D$ is defined (see Definition 58.2.10).

Proof. By Lemmas 58.6 .2 and 58.2 .2 this reduces to the following algebra fact: Let $A$ be a ring, $I \subset A$ an ideal, $a \in I$, and $x \in A$ a nonzerodivisor. Then the image of $x$ in $A\left[\frac{I}{a}\right]$ is a nonzerodivisor. Namely, suppose that $x\left(y / a^{n}\right)=0$ in $A\left[\frac{I}{a}\right]$. Then $a^{m} x y=0$ in $A$ for some $m$. Hence $a^{m} y=0$ as $x$ is a nonzerodivisor. Whence $y / a^{n}$ is zero in $A\left[\frac{I}{a}\right]$ as desired.

085Y Lemma 58.6.10. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ and $\mathcal{J}$ be quasi-coherent sheaves of ideals. Let $b: X^{\prime} \rightarrow X$ be the blowing up of $X$ in $\mathcal{I}$. Let $b^{\prime}: X^{\prime \prime} \rightarrow X^{\prime}$ be the blowing up of $X^{\prime}$ in $b^{-1} \mathcal{J O}_{X^{\prime}}$. Then $X^{\prime \prime} \rightarrow X$ is canonically isomorphic to the blowing up of $X$ in $\mathcal{I J}$.

Proof. Let $E \subset X^{\prime}$ be the exceptional divisor of $b$ which is an effective Cartier divisor by Lemma 58.6.4. Then $\left(b^{\prime}\right)^{-1} E$ is an effective Cartier divisor on $X^{\prime \prime}$ by Lemma58.6.9. Let $E^{\prime} \subset X^{\prime \prime}$ be the exceptional divisor of $b^{\prime}$ (also an effective Cartier divisor). Consider the effective Cartier divisor $E^{\prime \prime}=E^{\prime}+\left(b^{\prime}\right)^{-1} E$. By construction the ideal of $E^{\prime \prime}$ is $\left(b \circ b^{\prime}\right)^{-1} \mathcal{I}\left(b \circ b^{\prime}\right)^{-1} \mathcal{J} \mathcal{O}_{X^{\prime \prime}}$. Hence according to Lemma 58.6.5 there is a canonical morphism from $X^{\prime \prime}$ to the blowup $c: Y \rightarrow X$ of $X$ in $\mathcal{I J}$. Conversely, as $\mathcal{I} \mathcal{J}$ pulls back to an invertible ideal we see that $c^{-1} \mathcal{I} \mathcal{O}_{Y}$ defines an effective Cartier divisor, see Lemma 58.2.8. Thus a morphism $c^{\prime}: Y \rightarrow X^{\prime}$ over $X$ by Lemma 58.6.5. Then $\left(c^{\prime}\right)^{-1} b^{-1} \mathcal{J} \mathcal{O}_{Y}=c^{-1} \mathcal{J} \mathcal{O}_{Y}$ which also defines an effective Cartier divisor. Thus a morphism $c^{\prime \prime}: Y \rightarrow X^{\prime \prime}$ over $X^{\prime}$. We omit the verification that this morphism is inverse to the morphism $X^{\prime \prime} \rightarrow Y$ constructed earlier.

085Z Lemma 58.6.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $b: X^{\prime} \rightarrow X$ be the blowing up of $X$ in the ideal sheaf $\mathcal{I}$. If $\mathcal{I}$ is of finite type, then $b: X^{\prime} \rightarrow X$ is a proper morphism.

Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 58.6.3) we can prove each of these statements after base change to $U$ (see Morphisms of Spaces, Lemma 54.39.2). This reduces us to the case of schemes. In this case the morphism $b$ is projective by Divisors, Lemma 30.26 .13 hence proper by Morphisms, Lemma 28.42.5.

0860 Lemma 58.6.12. Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Assume $X$ is quasi-compact and quasi-separated. Let $Z \subset X$ be a closed subspace of finite presentation. Let $b: X^{\prime} \rightarrow X$ be the blowing up with center $Z$. Let $Z^{\prime} \subset X^{\prime}$ be a closed subspace of finite presentation. Let $X^{\prime \prime} \rightarrow X^{\prime}$ be the blowing up with center $Z^{\prime}$. There exists a closed subspace $Y \subset X$ of finite presentation, such that
(1) $|Y|=|Z| \cup|b|\left(\left|Z^{\prime}\right|\right)$, and
(2) the composition $X^{\prime \prime} \rightarrow X$ is isomorphic to the blowing up of $X$ in $Y$.

Proof. The condition that $Z \rightarrow X$ is of finite presentation means that $Z$ is cut out by a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$, see Morphisms of Spaces, Lemma 54.28.12. Write $\mathcal{A}=\bigoplus_{n \geq 0} \mathcal{I}^{n}$ so that $X^{\prime}=\underline{\operatorname{Proj}}(\mathcal{A})$. Note that $X \backslash Z$ is a quasi-compact open subspace of $X$ by Limits of Spaces, Lemma 57.14.1. Since $b^{-1}(X \backslash Z) \rightarrow X \backslash Z$ is an isomorphism (Lemma 58.6.4) the same result shows that $b^{-1}(X \backslash Z) \backslash Z^{\prime}$ is quasi-compact open subspace in $X^{\prime}$. Hence $U=X \backslash\left(Z \cup b\left(Z^{\prime}\right)\right)$ is quasi-compact open subspace in $X$. By Lemma 58.5 .3 there exist a $d>0$ and a finite type $\mathcal{O}_{X}$-submodule $\mathcal{F} \subset \mathcal{I}^{d}$ such that $Z^{\prime}=\underline{\operatorname{Proj}}(\mathcal{A} / \mathcal{F} \mathcal{A})$ and such that the support of $\mathcal{I}^{d} / \mathcal{F}$ is contained in $X \backslash U$.

Since $\mathcal{F} \subset \mathcal{I}^{d}$ is an $\mathcal{O}_{X}$-submodule we may think of $\mathcal{F} \subset \mathcal{I}^{d} \subset \mathcal{O}_{X}$ as a finite type quasi-coherent sheaf of ideals on $X$. Let's denote this $\mathcal{J} \subset \mathcal{O}_{X}$ to prevent confusion. Since $\mathcal{I}^{d} / \mathcal{J}$ and $\mathcal{O} / \mathcal{I}^{d}$ are supported on $|X| \backslash|U|$ we see that $|V(\mathcal{J})|$ is contained in $|X| \backslash|U|$. Conversely, as $\mathcal{J} \subset \mathcal{I}^{d}$ we see that $|Z| \subset|V(\mathcal{J})|$. Over $X \backslash Z \cong X^{\prime} \backslash b^{-1}(Z)$ the sheaf of ideals $\mathcal{J}$ cuts out $Z^{\prime}$ (see displayed formula below). Hence $|V(\mathcal{J})|$ equals $|Z| \cup|b|\left(\left|Z^{\prime}\right|\right)$. It follows that also $|V(\mathcal{I} \mathcal{J})|=|Z| \cup|b|\left(\left|Z^{\prime}\right|\right)$. Moreover, $\mathcal{I} \mathcal{J}$ is an ideal of finite type as a product of two such. We claim that $X^{\prime \prime} \rightarrow X$ is isomorphic to the blowing up of $X$ in $\mathcal{I} \mathcal{J}$ which finishes the proof of the lemma by setting $Y=V(\mathcal{I} \mathcal{J})$.

First, recall that the blow up of $X$ in $\mathcal{I} \mathcal{J}$ is the same as the blow up of $X^{\prime}$ in $b^{-1} \mathcal{J} \mathcal{O}_{X^{\prime}}$, see Lemma 58.6.10. Hence it suffices to show that the blow up of $X^{\prime}$ in $b^{-1} \mathcal{J} \mathcal{O}_{X^{\prime}}$ agrees with the blow up of $X^{\prime}$ in $Z^{\prime}$. We will show that

$$
b^{-1} \mathcal{J} \mathcal{O}_{X^{\prime}}=\mathcal{I}_{E}^{d} \mathcal{I}_{Z^{\prime}}
$$

as ideal sheaves on $X^{\prime \prime}$. This will prove what we want as $\mathcal{I}_{E}^{d}$ cuts out the effective Cartier divisor $d E$ and we can use Lemmas 58.6.6 and 58.6.10

To see the displayed equality of the ideals we may work locally. With notation $A$, $I, a \in I$ as in Lemma 58.6 .2 we see that $\mathcal{F}$ corresponds to an $R$-submodule $M \subset I^{d}$ mapping isomorphically to an ideal $J \subset R$. The condition $Z^{\prime}=\operatorname{Proj}(\mathcal{A} / \mathcal{F} \mathcal{A})$ means that $Z^{\prime} \cap \operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right)$ is cut out by the ideal generated by the elements $m / a^{d}$, $m \in M$. Say the element $m \in M$ corresponds to the function $f \in J$. Then in the affine blowup algebra $A^{\prime}=A\left[\frac{I}{a}\right]$ we see that $f=\left(a^{d} m\right) / a^{d}=a^{d}\left(m / a^{d}\right)$. Thus the equality holds.

### 58.7. Strict transform

0861 This section is the analogue of Divisors, Section 30.27. Let $S$ be a scheme, let $B$ be an algebraic space over $S$, and let $Z \subset B$ be a closed subspace. Let $b: B^{\prime} \rightarrow B$ be the blowing up of $B$ in $Z$ and denote $E \subset B^{\prime}$ the exceptional divisor $E=b^{-1} Z$. In the following we will often consider an algebraic space $X$ over $B$ and form the cartesian diagram

Since $E$ is an effective Cartier divisor (Lemma 58.6.4 we see that $\operatorname{pr}_{B^{\prime}}^{-1} E \subset X \times{ }_{B} B^{\prime}$ is locally principal (Lemma 58.2.9). Thus the inclusion morphism of the complement of $\operatorname{pr}_{B^{\prime}}^{-1} E$ in $X \times{ }_{B} B^{\prime}$ is affine and in particular quasi-compact (Lemma 58.2.3). Consequently, for a quasi-coherent $\mathcal{O}_{X \times{ }_{B} B^{\prime} \text {-module } \mathcal{G} \text { the subsheaf of sections sup- }}$ ported on $\left|\mathrm{pr}_{B^{\prime}}^{-1} E\right|$ is a quasi-coherent submodule, see Limits of Spaces, Lemma 57.14 .5 . If $\mathcal{G}$ is a quasi-coherent sheaf of algebras, e.g., $\mathcal{G}=\mathcal{O}_{X \times{ }_{B} B^{\prime}}$, then this subsheaf is an ideal of $\mathcal{G}$.

0862 Definition 58.7.1. With $Z \subset B$ and $f: X \rightarrow B$ as above.
(1) Given a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the strict transform of $\mathcal{F}$ with respect to the blowup of $B$ in $Z$ is the quotient $\mathcal{F}^{\prime}$ of $\operatorname{pr}_{X}^{*} \mathcal{F}$ by the submodule of sections supported on $\left|\operatorname{pr}_{B^{\prime}}^{-1} E\right|$.
(2) The strict transform of $X$ is the closed subscheme $X^{\prime} \subset X \times_{B} B^{\prime}$ cut out by the quasi-coherent ideal of sections of $\mathcal{O}_{X \times{ }_{B} B^{\prime}}$ supported on $\left|\operatorname{pr}_{B^{\prime}}^{-1} E\right|$.
Note that taking the strict transform along a blowup depends on the closed subspace used for the blowup (and not just on the morphism $B^{\prime} \rightarrow B$ ).

0863 Lemma 58.7.2 (Étale localization and strict transform). In the situation of Definition 58.7.1. Let

be a commutative diagram of morphisms with $U$ and $V$ schemes and étale horizontal arrows. Let $V^{\prime} \rightarrow V$ be the blowup of $V$ in $Z \times_{B} V$. Then
(1) $V^{\prime}=V \times_{B} B^{\prime}$ and the maps $V^{\prime} \rightarrow B^{\prime}$ and $U \times_{V} V^{\prime} \rightarrow X \times{ }_{B} B^{\prime}$ are étale,
(2) the strict transform $U^{\prime}$ of $U$ relative to $V^{\prime} \rightarrow V$ is equal to $X^{\prime} \times{ }_{X} U$ where $X^{\prime}$ is the strict transform of $X$ relative to $B^{\prime} \rightarrow B$, and
(3) for a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the restriction of the strict transform $\mathcal{F}^{\prime}$ to $U \times_{V} V^{\prime}$ is the strict transform of $\left.\mathcal{F}\right|_{U}$ relative to $V^{\prime} \rightarrow V$.

Proof. Part (1) follows from the fact that blowup commutes with flat base change (Lemma 58.6.3), the fact that étale morphisms are flat, and that the base change of an étale morphism is étale. Part (3) then follows from the fact that taking the sheaf of sections supported on a closed commutes with pullback by étale morphisms, see Limits of Spaces, Lemma57.14.5. Part (2) follows from (3) applied to $\mathcal{F}=\mathcal{O}_{X}$.

0864 Lemma 58.7.3. In the situation of Definition 58.7.1.
(1) The strict transform $X^{\prime}$ of $X$ is the blowup of $X$ in the closed subspace $f^{-1} Z$ of $X$.
(2) For a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the strict transform $\mathcal{F}^{\prime}$ is canonically isomorphic to the pushforward along $X^{\prime} \rightarrow X \times_{B} B^{\prime}$ of the strict transform of $\mathcal{F}$ relative to the blowing up $X^{\prime} \rightarrow X$.

Proof. Let $X^{\prime \prime} \rightarrow X$ be the blowup of $X$ in $f^{-1} Z$. By the universal property of blowing up (Lemma 58.6.5) there exists a commutative diagram

whence a morphism $i: X^{\prime \prime} \rightarrow X \times_{B} B^{\prime}$. The first assertion of the lemma is that $i$ is a closed immersion with image $X^{\prime}$. The second assertion of the lemma is that $\mathcal{F}^{\prime}=i_{*} \mathcal{F}^{\prime \prime}$ where $\mathcal{F}^{\prime \prime}$ is the strict transform of $\mathcal{F}$ with respect to the blowing up $X^{\prime \prime} \rightarrow X$. We can check these assertions étale locally on $X$, hence we reduce to the case of schemes (Divisors, Lemma 30.27.2). Some details omitted.

0865 Lemma 58.7.4. In the situation of Definition 58.7.1.
(1) If $X$ is flat over $B$ at all points lying over $Z$, then the strict transform of $X$ is equal to the base change $X \times_{B} B^{\prime}$.
(2) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $\mathcal{F}$ is flat over $B$ at all points lying over $Z$, then the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ is equal to the pullback $p r_{X}^{*} \mathcal{F}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.27.3) by étale localization (Lemma 58.7.2).

0866 Lemma 58.7.5. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $b: B^{\prime} \rightarrow B$ be the blowing up of $Z$ in $B$. Let $g: X \rightarrow Y$ be an affine morphism of spaces over $B$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $g^{\prime}: X \times_{B} B^{\prime} \rightarrow Y \times_{B} B^{\prime}$ be the base change of $g$. Let $\mathcal{F}^{\prime}$ be the strict transform of $\mathcal{F}$ relative to $b$. Then $g_{*}^{\prime} \mathcal{F}^{\prime}$ is the strict transform of $g_{*} \mathcal{F}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.27.4) by étale localization (Lemma 58.7.2.

0867 Lemma 58.7.6. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $D \subset B$ be an effective Cartier divisor. Let $Z^{\prime} \subset B$ be the closed subspace cut out by the product of the ideal sheaves of $Z$ and $D$. Let $B^{\prime} \rightarrow B$ be the blowup of $B$ in $Z$.
(1) The blowup of $B$ in $Z^{\prime}$ is isomorphic to $B^{\prime} \rightarrow B$.
(2) Let $f: X \rightarrow B$ be a morphism of algebraic spaces and let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. If the subsheaf of $\mathcal{F}$ of sections supported on $\left|f^{-1} D\right|$ is zero, then the strict transform of $\mathcal{F}$ relative to the blowing up in $Z$ agrees with the strict transform of $\mathcal{F}$ relative to the blowing up of $B$ in $Z^{\prime}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.27.5) by étale localization (Lemma 58.7.2.

0868 Lemma 58.7.7. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $b: B^{\prime} \rightarrow B$ be the blowing up with center $Z$. Let $Z^{\prime} \subset B^{\prime}$ be a closed subspace. Let $B^{\prime \prime} \rightarrow B^{\prime}$ be the blowing up with center $Z^{\prime}$. Let $Y \subset B$ be a closed subscheme such that $|Y|=|Z| \cup|b|\left(\left|Z^{\prime}\right|\right)$ and the composition $B^{\prime \prime} \rightarrow B$ is isomorphic to the blowing up of $B$ in $Y$. In this situation, given any scheme $X$ over $B$ and $\mathcal{F} \in Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ we have
(1) the strict transform of $\mathcal{F}$ with respect to the blowing up of $B$ in $Y$ is equal to the strict transform with respect to the blowup $B^{\prime \prime} \rightarrow B^{\prime}$ in $Z^{\prime}$ of the strict transform of $\mathcal{F}$ with respect to the blowup $B^{\prime} \rightarrow B$ of $B$ in $Z$, and
(2) the strict transform of $X$ with respect to the blowing up of $B$ in $Y$ is equal to the strict transform with respect to the blowup $B^{\prime \prime} \rightarrow B^{\prime}$ in $Z^{\prime}$ of the strict transform of $X$ with respect to the blowup $B^{\prime} \rightarrow B$ of $B$ in $Z$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.27.6) by étale localization (Lemma 58.7.2.

0869 Lemma 58.7.8. In the situation of Definition 58.7.1. Suppose that

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

is an exact sequence of quasi-coherent sheaves on $X$ which remains exact after any base change $T \rightarrow B$. Then the strict transforms of $\mathcal{F}_{i}^{\prime}$ relative to any blowup $B^{\prime} \rightarrow B$ form a short exact sequence $0 \rightarrow \mathcal{F}_{1}^{\prime} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F}_{3}^{\prime} \rightarrow 0$ too.
Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.27.7) by étale localization (Lemma 58.7.2.

### 58.8. Admissible blowups

086A To have a bit more control over our blowups we introduce the following standard terminology.
086B Definition 58.8.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \subset X$ be an open subspace. A morphism $X^{\prime} \rightarrow X$ is called a $U$-admissible blowup if there exists a closed immersion $Z \rightarrow X$ of finite presentation with $Z$ disjoint from $U$ such that $X^{\prime}$ is isomorphic to the blow up of $X$ in $Z$.

We recall that $Z \rightarrow X$ is of finite presentation if and only if the ideal sheaf $\mathcal{I}_{Z} \subset \mathcal{O}_{X}$ is of finite type, see Morphisms of Spaces, Lemma 54.28.12. In particular, a $U$ admissible blowup is a proper morphism, see Lemma 58.6.11. Note that there can be multiple centers which give rise to the same morphism. Hence the requirement is just the existence of some center disjoint from $U$ which produces $X^{\prime}$. Finally, as the morphism $b: X^{\prime} \rightarrow X$ is an isomorphism over $U$ (see Lemma 58.6.4) we will often abuse notation and think of $U$ as an open subspace of $X^{\prime}$ as well.
086C Lemma 58.8.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U \subset X$ be a quasi-compact open subspace. Let $b: X^{\prime} \rightarrow$ $X$ be a $U$-admissible blowup. Let $X^{\prime \prime} \rightarrow X^{\prime}$ be a $U$-admissible blowup. Then the composition $X^{\prime \prime} \rightarrow X$ is a $U$-admissible blowup.
Proof. Immediate from the more precise Lemma 58.6.12.
086D Lemma 58.8.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space. Let $U, V \subset X$ be quasi-compact open subspaces. Let $b: V^{\prime} \rightarrow V$
be a $U \cap V$-admissible blowup. Then there exists a $U$-admissible blowup $X^{\prime} \rightarrow X$ whose restriction to $V$ is $V^{\prime}$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{V}$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I})$ is disjoint from $U \cap V$ and such that $V^{\prime}$ is isomorphic to the blow up of $V$ in $\mathcal{I}$. Let $\mathcal{I}^{\prime} \subset \mathcal{O}_{U \cup V}$ be the quasi-coherent sheaf of ideals whose restriction to $U$ is $\mathcal{O}_{U}$ and whose restriction to $V$ is $\mathcal{I}$. By Limits of Spaces, Lemma 57.9 .8 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$ whose restriction to $U \cup V$ is $\mathcal{I}^{\prime}$. The lemma follows.

086E Lemma 58.8.4. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U \subset X$ be a quasi-compact open subspace. Let $b_{i}$ : $X_{i} \rightarrow X, i=1, \ldots, n$ be $U$-admissible blowups. There exists a $U$-admissible blowup $b: X^{\prime} \rightarrow X$ such that (a) b factors as $X^{\prime} \rightarrow X_{i} \rightarrow X$ for $i=1, \ldots, n$ and (b) each of the morphisms $X^{\prime} \rightarrow X_{i}$ is a $U$-admissible blowup.

Proof. Let $\mathcal{I}_{i} \subset \mathcal{O}_{X}$ be the finite type quasi-coherent sheaf of ideals such that $V\left(\mathcal{I}_{i}\right)$ is disjoint from $U$ and such that $X_{i}$ is isomorphic to the blow up of $X$ in $\mathcal{I}_{i}$. Set $\mathcal{I}=\mathcal{I}_{1} \cdot \ldots \cdot \mathcal{I}_{n}$ and let $X^{\prime}$ be the blowup of $X$ in $\mathcal{I}$. Then $X^{\prime} \rightarrow X$ factors through $b_{i}$ by Lemma 58.6.10.

086F Lemma 58.8.5. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U, V$ be quasi-compact disjoint open subspaces of $X$. Then there exist a $U \cup V$-admissible blowup $b: X^{\prime} \rightarrow X$ such that $X^{\prime}$ is a disjoint union of open subspaces $X^{\prime}=X_{1}^{\prime} \amalg X_{2}^{\prime}$ with $b^{-1}(U) \subset X_{1}^{\prime}$ and $b^{-1}(V) \subset X_{2}^{\prime}$.

Proof. Choose a finite type quasi-coherent sheaf of ideals $\mathcal{I}$, resp. $\mathcal{J}$ such that $X \backslash U=V(\mathcal{I})$, resp. $X \backslash V=V(\mathcal{J})$, see Limits of Spaces, Lemma 57.14.1. Then $|V(\mathcal{I} \mathcal{J})|=|X|$. Hence $\mathcal{I} \mathcal{J}$ is a locally nilpotent sheaf of ideals. Since $\mathcal{I}$ and $\mathcal{J}$ are of finite type and $X$ is quasi-compact there exists an $n>0$ such that $\mathcal{I}^{n} \mathcal{J}^{n}=0$. We may and do replace $\mathcal{I}$ by $\mathcal{I}^{n}$ and $\mathcal{J}$ by $\mathcal{J}^{n}$. Whence $\mathcal{I} \mathcal{J}=0$. Let $b: X^{\prime} \rightarrow X$ be the blowing up in $\mathcal{I}+\mathcal{J}$. This is $U \cup V$-admissible as $|V(\mathcal{I}+\mathcal{J})|=|X| \backslash|U| \cup|V|$. We will show that $X^{\prime}$ is a disjoint union of open subspaces $X^{\prime}=X_{1}^{\prime} \amalg X_{2}^{\prime}$ as in the statement of the lemma.

Since $|V(\mathcal{I}+\mathcal{J})|$ is the complement of $|U \cup V|$ we conclude that $V \cup U$ is scheme theoretically dense in $X^{\prime}$, see Lemmas 58.6.4 and 58.2.4. Thus if such a decomposition $X^{\prime}=X_{1}^{\prime} \amalg X_{2}^{\prime}$ into open and closed subspaces exists, then $X_{1}^{\prime}$ is the scheme theoretic closure of $U$ in $X^{\prime}$ and similarly $X_{2}^{\prime}$ is the scheme theoretic closure of $V$ in $X^{\prime}$. Since $U \rightarrow X^{\prime}$ and $V \rightarrow X^{\prime}$ are quasi-compact taking scheme theoretic closures commutes with étale localization (Morphisms of Spaces, Lemma 54.16.3). Hence to verify the existence of $X_{1}^{\prime}$ and $X_{2}^{\prime}$ we may work étale locally on $X$. This reduces us to the case of schemes which is treated in the proof of Divisors, Lemma 30.28 .5 .

## Algebraic Spaces over Fields

06 DR

### 59.1. Introduction

06DS This chapter is the analogue of the chapter on varieties in the setting of algebraic spaces. A reference for algebraic spaces is Knu71.

### 59.2. Conventions

06LX The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 59.3. Generically finite morphisms

0ACY This section continues the discussion in Decent Spaces, Section 59.3 and the analogue for morphisms of algebraic spaces of Varieties, Section 32.15

0AD1 Lemma 59.3.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type and $Y$ is locally Noetherian. Let $y \in|Y|$ be a point of codimension $\leq 1$ on $Y$. Let $X^{0} \subset|X|$ be the set of points of codimension 0 on $X$. Assume in addition one of the following conditions is satisfied
(1) for every $x \in X^{0}$ the transcendence degree of $x / f(x)$ is 0 ,
(2) for every $x \in X^{0}$ with $f(x) \rightsquigarrow y$ the transcendence degree of $x / f(x)$ is 0 ,
(3) $f$ is quasi-finite at every $x \in X^{0}$,
(4) $f$ is quasi-finite at a dense set of points of $|X|$,
(5) add more here.

Then $f$ is quasi-finite at every point of $X$ lying over $y$.
Proof. We want to reduce the proof to the case of schemes. To do this we choose a commutative diagram

where $U, V$ are schemes and where the horizontal arrows are étale and surjective. Pick $v \in V$ mapping to $y$. Observe that $V$ is locally Noetherian and that $\operatorname{dim}\left(\mathcal{O}_{V, v}\right) \leq 1$ (see Properties of Spaces, Definitions 53.9.2 and Remark 53.7.3).

The fibre $U_{v}$ of $U \rightarrow V$ over $v$ surjects onto $f^{-1}(\{y\}) \subset|X|$. The inverse image of $X^{0}$ in $U$ is exactly the set of generic points of irreducible components of $U$ (Properties of Spaces, Lemma 53.10.11. If $\eta \in U$ is such a point with image $x \in X^{0}$, then the transcendence degree of $x / f(x)$ is the transcendence degree of $\kappa(\eta)$ over $\kappa(g(\eta))$ (Morphisms of Spaces, Definition 54.32.1). Observe that $U \rightarrow V$ is quasi-finite at $u \in U$ if and only if $f$ is quasi-finite at the image of $u$ in $X$.
Case (1). Here case (1) of Varieties, Lemma 32.15.1 applies and we conclude that $U \rightarrow V$ is quasi-finite at all points of $U_{v}$. Hence $f$ is quasi-finite at every point lying over $y$.
Case (2). Let $u \in U$ be a generic point of an irreducible component whose image in $V$ specializes to $v$. Then the image $x \in X^{0}$ of $u$ has the property that $f(x) \rightsquigarrow y$. Hence we see that case (2) of Varieties, Lemma 32.15.1 applies and we conclude as before.

Case (3) follows from case (3) of Varieties, Lemma 32.15.1.
In case (4), since $|U| \rightarrow|X|$ is open, we see that the set of points where $U \rightarrow V$ is quasi-finite is dense as well. Hence case (4) of Varieties, Lemma 32.15.1 applies.

0AD2 Lemma 59.3.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is proper and $Y$ is locally Noetherian. Let $y \in Y$ be a point of codimension $\leq 1$ in $Y$. Let $X^{0} \subset|X|$ be the set of points of codimension 0 on $X$. Assume in addition one of the following conditions is satisfied
(1) for every $x \in X^{0}$ the transcendence degree of $x / f(x)$ is 0 ,
(2) for every $x \in X^{0}$ with $f(x) \rightsquigarrow y$ the transcendence degree of $x / f(x)$ is 0 ,
(3) $f$ is quasi-finite at every $x \in X^{0}$,
(4) $f$ is quasi-finite at a dense set of points of $|X|$,
(5) add more here.

Then there exists an open subspace $Y^{\prime} \subset Y$ containing $y$ such that $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is finite.

Proof. By Lemma 59.3.1 the morphism $f$ is quasi-finite at every point lying over $y$. Let $\bar{y}: \operatorname{Spec}(k) \rightarrow Y$ be a geometric point lying over $y$. Then $\left|X_{\bar{y}}\right|$ is a discrete space (Decent Spaces, Lemma 55.16.10). Since $X_{\bar{y}}$ is quasi-compact as $f$ is proper we conclude that $\left|X_{\bar{y}}\right|$ is finite. Thus we can apply Cohomology of Spaces, Lemma 56.21 .2 to conclude.

0BBQ Lemma 59.3.3. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $f: Y \rightarrow X$ be a birational proper morphism of algebraic spaces with $Y$ reduced. Let $U \subset X$ be the maximal open over which $f$ is an isomorphism. Then $U$ contains
(1) every point of codimension 0 in $X$,
(2) every $x \in|X|$ of codimension 1 on $X$ such that the local ring of $X$ at $x$ is normal (Properties of Spaces, Remark 53.7.6), and
(3) every $x \in|X|$ such that the fibre of $|Y| \rightarrow|X|$ over $x$ is finite and such that the local ring of $X$ at $x$ is normal.
Proof. Part (1) follows from Decent Spaces, Lemma 55.20.5 (and the fact that the Noetherian algebraic spaces $X$ and $Y$ are quasi-separated and hence decent). Part (2) follows from part (3) and Lemma 59.3 .2 (and the fact that finite morphisms have finite fibres). Let $x \in|X|$ be as in (3). By Cohomology of Spaces, Lemma 56.21.2
(which applies by Decent Spaces, Lemma 55.16.10) we may assume $f$ is finite. Choose an affine scheme $X^{\prime}$ and an étale morphism $X^{\prime} \rightarrow X$ and a point $x^{\prime} \in X$ mapping to $x$. It suffices to show there exists an open neighbourhood $U^{\prime}$ of $x^{\prime} \in X^{\prime}$ such that $Y \times_{X} X^{\prime} \rightarrow X^{\prime}$ is an isomorphism over $U^{\prime}$ (namely, then $U$ contains the image of $U^{\prime}$ in $X$, see Spaces, Lemma 52.5.6). Then $Y \times_{X} X^{\prime} \rightarrow X$ is a finite birational (Decent Spaces, Lemma 55.20.6) morphism. Since a finite morphism is affine we reduce to the case of a finite birational morphism of Noetherian affine schemes $Y \rightarrow X$ and $x \in X$ such that $\mathcal{O}_{X, x}$ is a normal domain. This is treated in Varieties, Lemma 32.15.3.

### 59.4. Integral algebraic spaces

0AD3 We have not yet defined the notion of an integral algebraic space. The problem is that being integral is not an étale local property of schemes. We could use the property, that $X$ is reduced and $|X|$ is irreducible, given in Properties, Lemma 27.3 .4 to define integral algebraic spaces. In this case the algebraic space described in Spaces, Example 52.14 .9 would be integral which does not seem right. To avoid this type of patholopgy we will in addition assume that $X$ is a decent algebraic space, although perhaps a weaker alternative exists.

0AD4 Definition 59.4.1. Let $S$ be a scheme. We say an algebraic space $X$ over $S$ is integral if it is reduced, decent, and $|X|$ is irreducible.

In this case the irreducible topological space $|X|$ is sober (Decent Spaces, Proposition 55.10 .9 . Hence it has a unique generic point $x$. Then $x$ is contained in the schematic locus of $X$ (Decent Spaces, Theorem 55.9.2) and we can look at its residue field as a substitute for the function field of $X$ (not yet defined; insert future reference here). In Decent Spaces, Lemma 55.18 .3 we characterized decent algebraic spaces with finitely many irreducible components. Applying that lemma we see that an algebraic space $X$ is integral if it is reduced, has an irreducible dense open subscheme $X^{\prime}$ with generic point $x^{\prime}$ and the morphism $x^{\prime} \rightarrow X$ is quasi-compact.

0BH2 Lemma 59.4.2. Let $S$ be a scheme. Let $X$ be an integral algebraic space over $S$. Then $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a domain.

Proof. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. If $f, g \in R$ are nonzero and $f g=0$ then $X=V(f) \cup$ $V(g)$ where $V(f)$ denotes the closed subspace of $X$ cut out by $f$. Since $X$ is irreducible, we see that either $V(f)=X$ or $V(g)=X$. Then either $f=0$ or $g=0$ by Properties of Spaces, Lemma 53.11.1.

The following lemma characterizes dominant morphisms of finite degree between integral algebraic spaces.

0AD5 Lemma 59.4.3. Let $S$ be a scheme. Let $X, Y$ be integral algebraic spaces over $S$ Let $x \in|X|$ and $y \in|Y|$ be the generic points. Let $f: X \rightarrow Y$ be locally of finite type. Assume $f$ is dominant (Morphisms of Spaces, Definition 54.18.1). The following are equivalent:
(1) the transcendence degree of $x / y$ is 0 ,
(2) the extension $\kappa(x) \supset \kappa(y)$ (see proof) is finite,
(3) there exist nonempty affine opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $\left.f\right|_{U}: U \rightarrow V$ is finite,
(4) $f$ is quasi-finite at $x$, and
(5) $x$ is the only point of $|X|$ mapping to $y$.

If $f$ is separated or if $f$ is quasi-compact, then these are also equivalent to
(6) there exists a nonempty affine open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. By elementary topology, we see that $f(x)=y$ as $f$ is dominant. Let $Y^{\prime} \subset Y$ be the schematic locus of $Y$ and let $X^{\prime} \subset f^{-1}\left(Y^{\prime}\right)$ be the schematic locus of $f^{-1}\left(Y^{\prime}\right)$. By the discussion above, using Decent Spaces, Proposition 55.10 .9 and Theorem 55.9.2, we see that $x \in\left|X^{\prime}\right|$ and $y \in\left|Y^{\prime}\right|$. Then $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y^{\prime}$ is a morphism of integral schemes which is locally of finite type. Thus we see that (1), (2), (3) are equivalent by Morphisms, Lemma 28.47.7.

Condition (4) implies condition (1) by Morphisms of Spaces, Lemma 54.32 .3 applied to $X \rightarrow Y \rightarrow Y$. On the other hand, condition (3) implies condition (4) as a finite morphism is quasi-finite and as $x \in U$ because $x$ is the generic point. Thus (1) (4) are equivalent.

Assume the equivalent conditions (1) - (4). Suppose that $x^{\prime} \mapsto y$. Then $x \rightsquigarrow x^{\prime}$ is a specialization in the fibre of $|X| \rightarrow|Y|$ over $y$. If $x^{\prime} \neq x$, then $f$ is not quasi-finite at $x$ by Decent Spaces, Lemma 55.16.9. Hence $x=x^{\prime}$ and (5) holds. Conversely, if (5) holds, then (5) holds for the morphism of schemes $X^{\prime} \rightarrow Y^{\prime}$ (see above) and we can use Morphisms, Lemma 28.47.7 to see that (1) holds.

Observe that (6) implies the equivalent conditions (1) - (5) without any further assumptions on $f$. To finish the proof we have to show the equivalent conditions (1) - (5) imply (6). This follows from Decent Spaces, Lemma 55.19.4.

0AD6 Definition 59.4.4. Let $S$ be a scheme. Let $X$ and $Y$ be integral algebraic spaces over $S$. Let $f: X \rightarrow Y$ be locally of finite type and dominant. Assume any of the equivalent conditions (1) - (5) of Lemma 59.4.3. Let $x \in|X|$ and $y \in|Y|$ be the generic points. Then the positive integer

$$
\operatorname{deg}(X / Y)=[\kappa(x): \kappa(y)]
$$

is called the degree of $X$ over $Y$.
Here is a lemma about normal integral algebraic spaces.
0AYH Lemma 59.4.5. Let $S$ be a scheme. Let $X$ be a normal integral algebraic space over $S$. For every $x \in|X|$ there exists a normal integral affine scheme $U$ and an étale morphism $U \rightarrow X$ such that $x$ is in the image.
Proof. Choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that $x$ is in the image. Let $u_{i}, i \in I$ be the generic points of irreducible components of $U$. Then each $u_{i}$ maps to the generic point of $X$ (Decent Spaces, Lemma 55.18.1). By our definition of a decent space (Decent Spaces, Definition 55.6.1), we see that $I$ is finite. Hence $U=\operatorname{Spec}(A)$ where $A$ is a normal ring with finitely many minimal primes. Thus $A=\prod_{i \in I} A_{i}$ is a product of normal domains by Algebra, Lemma 10.36.15. Then $U=\coprod U_{i}$ with $U_{i}=\operatorname{Spec}\left(A_{i}\right)$ and $x$ is in the image of $U_{i} \rightarrow X$ for some $i$. This proves the lemma.

0BH3 Lemma 59.4.6. Let $S$ be a scheme. Let $X$ be a normal integral algebraic space over $S$. Then $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a normal domain.

Proof. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Then $R$ is a domain by Lemma 59.4.2. Let $f=a / b$ be an element of the fraction field of $R$ which is integral over $R$. For any $U \rightarrow X$ étale with $U$ a scheme there is at most one $f_{U} \in \Gamma\left(U, \mathcal{O}_{U}\right)$ with $\left.b\right|_{U} f_{U}=\left.a\right|_{U}$. Namely, $U$ is reduced and the generic points of $U$ map to the generic point of $X$ which implies that $\left.b\right|_{U}$ is a nonzerodivisor. For every $x \in|X|$ we choose $U \rightarrow X$ as in Lemma 59.4.5. Then there is a unique $f_{U} \in \Gamma\left(U, \mathcal{O}_{U}\right)$ with $\left.b\right|_{U} f_{U}=\left.a\right|_{U}$ because $\Gamma\left(U, \mathcal{O}_{U}\right)$ is a normal domain by Properties, Lemma 27.7.9. By the uniqueness mentioned above these $f_{U}$ glue and define a global section $f$ of the structure sheaf, i.e., of $R$.

### 59.5. Modifications and alterations

0AD7 Using our notion of an integral algebraic space we can define a modification as follows.

0AD8 Definition 59.5.1. Let $S$ be a scheme. Let $X$ be an integral algebraic space over S. A modification of $X$ is a birational proper morphism $f: X^{\prime} \rightarrow X$ of algebraic spaces over $S$ with $X^{\prime}$ integral.

For birational morphisms of algebraic spaces, see Decent Spaces, Definition 55.20.1.
0AD9 Lemma 59.5.2. Let $f: X^{\prime} \rightarrow X$ be a modification as in Definition 59.5.1. There exists a nonempty open $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is an isomorphism.
Proof. By Lemma 59.4 .3 there exists a nonempty $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite. By generic flatness (Morphisms of Spaces, Proposition 54.31.1) we may assume $f^{-1}(U) \rightarrow U$ is flat and of finite presentation. So $f^{-1}(U) \rightarrow U$ is finite locally free (Morphisms of Spaces, Lemma54.44.6). Since $f$ is birational, the degree of $X^{\prime}$ over $X$ is 1 . Hence $f^{-1}(U) \rightarrow U$ is finite locally free of degree 1 , in other words it is an isomorphism.

0ADA Definition 59.5.3. Let $S$ be a scheme. Let $X$ be an integral algebraic space over $S$. An alteration of $X$ is a proper dominant morphism $f: Y \rightarrow X$ of algebraic spaces over $S$ with $Y$ integral such that $f^{-1}(U) \rightarrow U$ is finite for some nonempty open $U \subset X$.

If $f: Y \rightarrow X$ is a dominant and proper morphism between integral algebraic spaces, then it is an alteration as soon as the induced extension of residue fields in generic points is finite. Here is the precise statement.
0ADB Lemma 59.5.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper dominant morphism of integral algebraic spaces over $S$. Then $f$ is an alteration if and only if any of the equivalent conditions (1) - (6) of Lemma 59.4.3 hold.

Proof. Immediate consequence of the lemma referenced in the statement.

### 59.6. Schematic locus

06 LY We have already proven a number of results on the schematic locus of an algebraic space. Here is a list of references:
(1) Properties of Spaces, Sections 53.12 and 53.13 .
(2) Decent Spaces, Section 55.9,
(3) Properties of Spaces, Lemma $53.14 .3 \Leftarrow$ Decent Spaces, Lemma 55.10.12 $\Leftarrow$ Decent Spaces, Lemma 55.12.2,
(4) Limits of Spaces, Section 57.15, and
(5) Limits of Spaces, Section 57.17

There are some cases where certain types of morphisms of algebraic spaces are automatically representable, for example separated, locally quasi-finite morphisms (Morphisms of Spaces, Lemma 54.48.1), and flat monomorphisms (More on Morphisms of Spaces, Lemma 63.4.1) In Section 59.7 we will study what happens with the schematic locus under extension of base field.

06LZ Lemma 59.6.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. In each of the following cases $X$ is a scheme:
(1) $X$ is quasi-compact and quasi-separated and $\operatorname{dim}(X)=0$,
(2) $X$ is locally of finite type over a field $k$ and $\operatorname{dim}(X)=0$,
(3) $X$ is Noetherian and $\operatorname{dim}(X)=0$, and
(4) add more here.

Proof. Cases (2) and (3) follow immediately from case (1) but we will give a separate proofs of (2) and (3) as these proofs use significantly less theory.
Proof of (3). Let $U$ be an affine scheme and let $U \rightarrow X$ be an étale morphism. Set $R=U \times{ }_{X} U$. The two projection morphisms $s, t: R \rightarrow U$ are étale morphisms of schemes. By Properties of Spaces, Definition 53.8 .2 we see that $\operatorname{dim}(U)=0$ and $\operatorname{dim}(R)=0$. Since $R$ is a locally Noetherian scheme of dimension 0 , we see that $R$ is a disjoint union of spectra of Artinian local rings (Properties, Lemma 27.10.5). Since we assumed that $X$ is Noetherian (so quasi-separated) we conclude that $R$ is quasi-compact. Hence $R$ is an affine scheme (use Schemes, Lemma 25.6.8. The étale morphisms $s, t: R \rightarrow U$ induce finite residue field extensions. Hence $s$ and $t$ are finite by Algebra, Lemma 10.53 .4 (small detail omitted). Thus Groupoids, Proposition 38.23 .8 shows that $X=U / R$ is an affine scheme.
Proof of (2) - almost identical to the proof of (4). Let $U$ be an affine scheme and let $U \rightarrow X$ be an étale morphism. Set $R=U \times_{X} U$. The two projection morphisms $s, t: R \rightarrow U$ are étale morphisms of schemes. By Properties of Spaces, Definition 53.8 .2 we see that $\operatorname{dim}(U)=0$ and similarly $\operatorname{dim}(R)=0$. On the other hand, the morphism $U \rightarrow \operatorname{Spec}(k)$ is locally of finite type as the composition of the étale morphism $U \rightarrow X$ and $X \rightarrow \operatorname{Spec}(k)$, see Morphisms of Spaces, Lemmas 54.23.2 and 54.38.9. Similarly, $R \rightarrow \operatorname{Spec}(k)$ is locally of finite type. Hence by Varieties, Lemma 32.17.2 we see that $U$ and $R$ are disjoint unions of spectra of local Artinian $k$-algebras finite over $k$. The same thing is therefore true of $U \times_{\operatorname{Spec}(k)} U$. As

$$
R=U \times_{X} U \longrightarrow U \times_{\operatorname{Spec}(k)} U
$$

is a monomorphism, we see that $R$ is a finite(!) union of spectra of finite $k$-algebras. It follows that $R$ is affine, see Schemes, Lemma 25.6.8. Applying Varieties, Lemma 32.17 .2 once more we see that $R$ is finite over $k$. Hence $s, t$ are finite, see Morphisms, Lemma 28.43.12. Thus Groupoids, Proposition 38.23 .8 shows that the open subspace $U / R$ of $X$ is an affine scheme. Since the schematic locus of $X$ is an open subspace (see Properties of Spaces, Lemma 53.12.1), and since $U \rightarrow X$ was an arbitrary étale morphism from an affine scheme we conclude that $X$ is a scheme.
Proof of (1). By Cohomology of Spaces, Lemma56.9.1 we have vanishing of higher cohomology groups for all quasi-coherent sheaves $\mathcal{F}$ on $X$. Hence $X$ is affine (in particular a scheme) by Cohomology of Spaces, Proposition 56.15.9.

The following lemma tells us that a quasi-separated algebraic space is a scheme away from codimension 1.
0ADC Lemma 59.6.2. Let $S$ be a scheme. Let $X$ be a quasi-separated algebraic space over $S$. Let $x \in|X|$. The following are equivalent
(1) $x$ is a point of codimension 0 on $X$,
(2) the local ring of $X$ at $x$ has dimension 0 , and
(3) $x$ is a generic point of an irreducible component of $|X|$.

If true, then there exists an open subspace of $X$ containing $x$ which is a scheme.
Proof. The equivalence of (1), (2), and (3) follows from Decent Spaces, Lemma 55.18 .1 and the fact that a quasi-separated algebraic space is decent (Decent Spaces, Section 55.6). However in the next paragraph we will give a more elementary proof of the equivalence.
Note that (1) and (2) are equivalent by definition (Properties of Spaces, Definition 53.9 .2 . To prove the equivalence of (1) and (3) we may assume $X$ is quasi-compact. Choose

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

and $f_{i}: V_{i} \rightarrow U_{i}$ as in Decent Spaces, Lemma 55.8.6. Say $x \in U_{i}, x \notin U_{i+1}$. Then $x=f_{i}(y)$ for a unique $y \in V_{i}$. If (1) holds, then $y$ is a generic point of an irreducible component of $V_{i}$ (Properties of Spaces, Lemma 53.10.1). Since $f_{i}^{-1}\left(U_{i+1}\right)$ is a quasicompact open of $V_{i}$ not containing $y$, there is an open neighbourhood $W \subset V_{i}$ of $y$ disjoint from $f_{i}^{-1}\left(V_{i}\right)$ (see Properties, Lemma 27.2 .2 or more simply Algebra, Lemma 10.25.4). Then $\left.f_{i}\right|_{W}: W \rightarrow X$ is an isomorphism onto its image and hence $x=f_{i}(y)$ is a generic point of $|X|$. Conversely, assume (3) holds. Then $f_{i}$ maps $\overline{\{y\}}$ onto the irreducible component $\overline{\{x\}}$ of $\left|U_{i}\right|$. Since $\left|f_{i}\right|$ is bijective over $\overline{\{x\}}$, it follows that $\overline{\{y\}}$ is an irreducible component of $U_{i}$. Thus $x$ is a point of codimension 0.

The final statement of the lemma is Properties of Spaces, Proposition 53.12.3.
The following lemma says that a separated locally Noetherian algebraic space is a scheme in codimension 1, i.e., away from codimension 2.

0ADD Lemma 59.6.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $x \in|X|$. If $X$ is separated, locally Noetherian, and the dimension of the local ring of $X$ at $x$ is $\leq 1$ (Properties of Spaces, Definition53.9.2), then there exists an open subspace of $X$ containing $x$ which is a scheme.

Proof. (Please see the remark below for a different approach avoiding the material on finite groupoids.) We can replace $X$ by an quasi-compact neighbourhood of $x$, hence we may assume $X$ is quasi-compact, separated, and Noetherian. There exists a scheme $U$ and a finite surjective morphism $U \rightarrow X$, see Limits of Spaces, Proposition 57.16.2. Let $R=U \times_{X} U$. Then $j: R \rightarrow U \times_{S} U$ is an equivalence relation and we obtain a groupoid scheme $(U, R, s, t, c)$ over $S$ with $s, t$ finite and $U$ Noetherian and separated. Let $\left\{u_{1}, \ldots, u_{n}\right\} \subset U$ be the set of points mapping to $x$. Then $\operatorname{dim}\left(\mathcal{O}_{U, u_{i}}\right) \leq 1$ by Decent Spaces, Lemma 55.10.11.
By More on Groupoids, Lemma 39.13 .10 there exists an $R$-invariant affine open $W \subset U$ containing the orbit $\left\{u_{1}, \ldots, u_{n}\right\}$. Since $U \rightarrow X$ is finite surjective the continuous map $|U| \rightarrow|X|$ is closed surjective, hence submersive by Topology,

Lemma 5.5.5. Thus $f(W)$ is open and there is an open subspace $X^{\prime} \subset X$ with $f$ : $W \rightarrow X^{\prime}$ a surjective finite morphism. Then $X^{\prime}$ is an affine scheme by Cohomology of Spaces, Lemma 56.16.1 and the proof is finished.

0ADE Remark 59.6.4. Here is a sketch of a proof of Lemma 59.6.3 which avoids using More on Groupoids, Lemma 39.13.10.

Step 1. We may assume $X$ is a reduced Noetherian separated algebraic space (for example by Cohomology of Spaces, Lemma 56.16.1 or by Limits of Spaces, Lemma 57.15 .3 and we may choose a finite surjective morphism $Y \rightarrow X$ where $Y$ is a Noetherian scheme (by Limits of Spaces, Proposition 57.16.2).

Step 2. After replacing $X$ by an open neighbourhood of $x$, there exists a birational finite morphism $X^{\prime} \rightarrow X$ and a closed subscheme $Y^{\prime} \subset X^{\prime} \times_{X} Y$ such that $Y^{\prime} \rightarrow X^{\prime}$ is surjective finite locally free. Namely, because $X$ is reduced there is a dense open subspace $U \subset X$ over which $Y$ is flat (Morphisms of Spaces, Proposition 54.31.1). Then we can choose a $U$-admissible blow up $b: \tilde{X} \rightarrow X$ such that the strict transform $\tilde{Y}$ of $Y$ is flat over $\tilde{X}$, see More on Morphisms of Spaces, Lemma 63.29.1. (An alternative is to use Hilbert schemes if one wants to avoid using the result on blow ups). Then we let $X^{\prime} \subset \tilde{X}$ be the scheme theoretic closure of $b^{-1}(U)$ and $Y^{\prime}=X^{\prime} \times_{\tilde{X}} \tilde{Y}$. Since $x$ is a codimension 1 point, we see that $X^{\prime} \rightarrow X$ is finite over a neighbourhood of $x$ (Lemma 59.3.2).

Step 3. After shrinking $X$ to a smaller neighbourhood of $x$ we get that $X^{\prime}$ is a scheme. This holds because $Y^{\prime}$ is a scheme and $Y^{\prime} \rightarrow X^{\prime}$ being finite locally free and because every finite set of codimension 1 points of $Y^{\prime}$ is contained in an affine open. Use Properties of Spaces, Proposition 53.13.1 and Varieties, Proposition 32.31 .7

Step 4. There exists an affine open $W^{\prime} \subset X^{\prime}$ containing all points lying over $x$ which is the inverse image of an open subspace of $X$. To prove this let $Z \subset X$ be the closure of the set of points where $X^{\prime} \rightarrow X$ is not an isomorphism. We may assume $x \in Z$ otherwise we are already done. Then $x$ is a generic point of an irreducible component of $Z$ and after shrinking $X$ we may assume $Z$ is an affine scheme (Lemma 59.6.2). Then the inverse image $Z^{\prime} \subset X^{\prime}$ is an affine scheme as well. Say $x_{1}, \ldots, x_{n} \in Z^{\prime}$ are the points mapping to $x$. Then we can find an affine open $W^{\prime}$ in $X^{\prime}$ whose intersection with $Z^{\prime}$ is the inverse image of a principal open of $Z$ containing $x$. Namely, we first pick an affine open $W^{\prime} \subset X^{\prime}$ containing $x_{1}, \ldots, x_{n}$ using Varieties, Proposition 32.31.7. Then we pick a principal open $D(f) \subset Z$ containing $x$ whose inverse image $D\left(\left.f\right|_{Z^{\prime}}\right)$ is contained in $W^{\prime} \cap Z^{\prime}$. Then we pick $f^{\prime} \in \Gamma\left(W^{\prime}, \mathcal{O}_{W^{\prime}}\right)$ restricting to $\left.f\right|_{Z^{\prime}}$ and we replace $W^{\prime}$ by $D\left(f^{\prime}\right) \subset W^{\prime}$. Since $X^{\prime} \rightarrow X$ is an isomorphism away from $Z^{\prime} \rightarrow Z$ the choice of $W^{\prime}$ guarantees that the image $W \subset X$ of $W^{\prime}$ is open with inverse image $W^{\prime}$ in $X^{\prime}$.

Step 5. Then $W^{\prime} \rightarrow W$ is a finite surjective morphism and $W$ is a scheme by Cohomology of Spaces, Lemma 56.16.1 and the proof is complete.

### 59.7. Schematic locus and field extension

0B82 It can happen that a nonrepresentable algebraic space over a field $k$ becomes representable (i.e., a scheme) after base change to an extension of $k$. See Spaces, Example 52.14.2. In this section we address this issue.

0B83 Lemma 59.7.1. Let $k$ be a field. Let $X$ be an algebraic space over $k$. If there exists a purely inseparable field extension $k \subset k^{\prime}$ such that $X_{k^{\prime}}$ is a scheme, then $X$ is a scheme.

Proof. The morphism $X_{k^{\prime}} \rightarrow X$ is integral, surjective, and universally injective. Hence this lemma follows from Limits of Spaces, Lemma 57.15.4.

0B84 Lemma 59.7.2. Let $k$ be a field with algebraic closure $\bar{k}$. Let $X$ be a quasiseparated algebraic space over $k$.
(1) If there exists a field extension $k \subset K$ such that $X_{K}$ is a scheme, then $X_{\bar{k}}$ is a scheme.
(2) If $X$ is quasi-compact and there exists a field extension $k \subset K$ such that $X_{K}$ is a scheme, then $X_{k^{\prime}}$ is a scheme for some finite separable extension $k^{\prime}$ of $k$.

Proof. Since every algebraic space is the union of its quasi-compact open subspaces, we see that the first part of the lemma follows from the second part (some details omitted). Thus we assume $X$ is quasi-compact and we assume given an extension $k \subset K$ with $K_{K}$ representable. Write $K=\bigcup A$ as the colimit of finitely generated $k$-subalgebras $A$. By Limits of Spaces, Lemma 57.5 .9 we see that $X_{A}$ is a scheme for some $A$. Choose a maximal ideal $\mathfrak{m} \subset A$. By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) the residue field $k^{\prime}=A / \mathfrak{m}$ is a finite extension of $k$. Thus we see that $X_{k^{\prime}}$ is a scheme. If $k^{\prime} \supset k$ is not separable, let $k^{\prime} \supset k^{\prime \prime} \supset k$ be the subextension found in Fields, Lemma 9.13.6. Since $k^{\prime} / k^{\prime \prime}$ is purely inseparable, by Lemma 59.7 .1 the algebraic space $X_{k^{\prime \prime}}$ is a scheme. Since $k^{\prime \prime} \mid k$ is separable the proof is complete.

0B86 Lemma 59.7.3. Let $k \subset k^{\prime}$ be a finite Galois extension with Galois group $G$. Let $X$ be an algebraic space over $k$. Then $G$ acts freely on the algebraic space $X_{k^{\prime}}$ and $X=X_{k^{\prime}} / G$ in the sense of Properties of Spaces, Lemma 53.33.1.
Proof. Omitted. Hints: First show that $\operatorname{Spec}(k)=\operatorname{Spec}\left(k^{\prime}\right) / G$. Then use compatinility of taking quotients with base change.
0B87 Lemma 59.7.4. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ and let $G$ be a finite group acting freely on $X$. Set $Y=X / G$ as in Properties of Spaces, Lemma 53.33.1. For $y \in|Y|$ the following are equivalent
(1) $y$ is in the schematic locus of $Y$, and
(2) there exists an affine open $U \subset X$ containing the preimage of $y$.

Proof. It follows from the construction of $Y=X / G$ in Properties of Spaces, Lemma 53.33.1 that the morphism $X \rightarrow Y$ is surjective and étale. Of course we have $X \times_{Y} X=X \times G$ hence the morphism $X \rightarrow Y$ is even finite étale. It is also surjective. Thus the lemma follows from Decent Spaces, Lemma 55.9.3.

0B85 Lemma 59.7.5. Let $k$ be a field. Let $X$ be a quasi-separated algebraic space over $k$. If there exists a purely transcendental field extension $k \subset K$ such that $X_{K}$ is a scheme, then $X$ is a scheme.

Proof. Since every algebraic space is the union of its quasi-compact open subspaces, we may assume $X$ is quasi-compact (some details omitted). Recall (Fields, Definition 9.25.1 that the assumption on the extension $K / k$ signifies that $K$ is the fraction field of a polynomial ring (in possibly infinitely many variables) over $k$.

Thus $K=\bigcup A$ is the union of subalgebras each of which is a localization of a finite polynomial algebra over $k$. By Limits of Spaces, Lemma 57.5.9 we see that $X_{A}$ is a scheme for some $A$. Write

$$
A=k\left[x_{1}, \ldots, x_{n}\right][1 / f]
$$

for some nonzero $f \in k\left[x_{1}, \ldots, x_{n}\right]$.
If $k$ is infinite then we can finish the proof as follows: choose $a_{1}, \ldots, a_{n} \in k$ with $f\left(a_{1}, \ldots, a_{n}\right) \neq 0$. Then $\left(a_{1}, \ldots, a_{n}\right)$ define an $k$-algebra map $A \rightarrow k$ mapping $x_{i}$ to $a_{i}$ and $1 / f$ to $1 / f\left(a_{1}, \ldots, a_{n}\right)$. Thus the base change $X_{A} \times \operatorname{Spec}(A) \operatorname{Spec}(k) \cong X$ is a scheme as desired.
In this paragraph we finish the proof in case $k$ is finite. In this case we write $X=\lim X_{i}$ with $X_{i}$ of finite presentation over $k$ and with affine transition morphisms (Limits of Spaces, Lemma 57.10.1). Using Limits of Spaces, Lemma 57.5.9 we see that $X_{i, A}$ is a scheme for some $i$. Thus we may assume $X \rightarrow \operatorname{Spec}(k)$ is of finite presentation. Let $x \in|X|$ be a closed point. We may represent $x$ by a closed immersion $\operatorname{Spec}(\kappa) \rightarrow X$ (Decent Spaces, Lemma 55.12.6). Then $\operatorname{Spec}(\kappa) \rightarrow \operatorname{Spec}(k)$ is of finite type, hence $\kappa$ is a finite extension of $k$ (by the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1; some details omitted). Say $[\kappa: k]=d$. Choose an integer $n \gg 0$ prime to $d$ and let $k \subset k^{\prime}$ be the extension of degree $n$. Then $k^{\prime} / k$ is Galois with $G=\operatorname{Aut}\left(k^{\prime} / k\right)$ cyclic of order $n$. If $n$ is large enough there will be $k$-algebra homomorphism $A \rightarrow k^{\prime}$ by the same reason as above. Then $X_{k^{\prime}}$ is a scheme and $X=X_{k^{\prime}} / G$ (Lemma 59.7.3). On the other hand, since $n$ and $d$ are relatively prime we see that

$$
\operatorname{Spec}(\kappa) \times_{X} X_{k^{\prime}}=\operatorname{Spec}(\kappa) \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)=\operatorname{Spec}\left(\kappa \otimes_{k} k^{\prime}\right)
$$

is the spectrum of a field. In other words, the fibre of $X_{k^{\prime}} \rightarrow X$ over $x$ consists of a single point. Thus by Lemma 59.7.4 we see that $x$ is in the schematic locus of $X$ as desired.

0BA7 Remark 59.7.6. Let $k$ be finite field. Let $K \supset k$ be a geometrically irreducible field extension. Then $K$ is the limit of geometrically irreducible finite type $k$ algebras $A$. Given $A$ the estimates of Lang and Weil [LW54, show that for $n \gg 0$ there exists an $k$-algebra homomorphism $A \rightarrow k^{\prime}$ with $k^{\prime} / k$ of degree $n$. Analyzing the argument given in the proof of Lemma 59.7.5 we see that if $X$ is a quasiseparated algebraic space over $k$ and $X_{K}$ is a scheme, then $X$ is a scheme. If we ever need this result we will precisely formulate it and prove it here.

0B88 Lemma 59.7.7. Let $k$ be a field with algebraic closure $\bar{k}$. Let $X$ be an algebraic space over $k$ such that
(1) $X$ is decent and locally of finite type over $k$,
(2) $X_{\bar{k}}$ is a scheme, and
(3) any finite set of $\bar{k}$-rational points of $X_{\bar{k}}$ are contained in an affine.

Then $X$ is a scheme.
Proof. If $k \subset K$ is an extension, then the base change $X_{K}$ is decent (Decent Spaces, Lemma 55.6.5 and locally of finite type over $K$ (Morphisms of Spaces, Lemma 54.23.3. By Lemma 59.7.1 it suffices to prove that $X$ becomes a scheme after base change to the perfection of $k$, hence we may assume $k$ is a perfect field (this step isn't strictly necessary, but makes the other arguments easier to think
about). By covering $X$ by quasi-compact opens we see that it suffices to prove the lemma in case $X$ is quasi-compact (small detail omitted). In this case $|X|$ is a sober topological space (Decent Spaces, Proposition 55.10.9). Hence it suffices to show that every closed point in $|X|$ is contained in the schematic locus of $X$ (use Properties of Spaces, Lemma 53.12.1 and Topology, Lemma 5.11.8.
Let $x \in|X|$ be a closed point. By Decent Spaces, Lemma 55.12 .6 we can find a closed immersion $\operatorname{Spec}(l) \rightarrow X$ representing $x$. Then $\operatorname{Spec}(l) \rightarrow \operatorname{Spec}(k)$ is of finite type (Morphisms of Spaces, Lemma 54.23.2) and we conclude that $l$ is a finite extension of $k$ by the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1). It is separable because $k$ is perfect. Thus the scheme

$$
\operatorname{Spec}(l) \times_{X} X_{\bar{k}}=\operatorname{Spec}(l) \times_{\operatorname{Spec}(k)} \operatorname{Spec}(\bar{k})=\operatorname{Spec}\left(l \otimes_{k} \bar{k}\right)
$$

is the disjoint union of a finite number of $\bar{k}$-rational points. By assumption (3) we can find an affine open $W \subset X_{\bar{k}}$ containing these points.
By Lemma 59.7.2 we see that $X_{k^{\prime}}$ is a scheme for some finite extension $k^{\prime} / k$. After enlarging $k^{\prime}$ we may assume that there exists an affine open $U^{\prime} \subset X_{k^{\prime}}$ whose base change to $\bar{k}$ recovers $W$ (use that $X_{\bar{k}}$ is the limit of the schemes $X_{k^{\prime \prime}}$ for $k^{\prime} \subset k^{\prime \prime} \subset \bar{k}$ finite and use Limits, Lemmas 31.3 .8 and 31.3.10. We may assume that $k^{\prime} / k$ is a Galois extension (take the normal closure Fields, Lemma 9.15 .3 and use that $k$ is perfect). Set $G=\operatorname{Gal}\left(k^{\prime} / k\right)$. By construction the $G$-invariant closed subscheme $\operatorname{Spec}(l) \times_{X} X_{k^{\prime}}$ is contained in $U^{\prime}$. Thus $x$ is in the schematic locus by Lemmas 59.7 .3 and 59.7.4

The following two lemmas should go somewhere else. Please compare the next lemma to Decent Spaces, Lemma 55.16.8.
06S0 Lemma 59.7.8. Let $k$ be a field. Let $X$ be an algebraic space over $k$. The following are equivalent
(1) $X$ is locally quasi-finite over $k$,
(2) $X$ is locally of finite type over $k$ and has dimension 0 ,
(3) $X$ is a scheme and is locally quasi-finite over $k$,
(4) $X$ is a scheme and is locally of finite type over $k$ and has dimension 0 , and
(5) $X$ is a disjoint union of spectra of Artinian local $k$-algebras A over $k$ with $\operatorname{dim}_{k}(A)<\infty$.

Proof. Because we are over a field relative dimension of $X / k$ is the same as the dimension of $X$. Hence by Morphisms of Spaces, Lemma 54.33.6 we see that (1) and (2) are equivalent. Hence it follows from Lemma 59.6.1 (and trivial implications) that (1) - (4) are equivalent. Finally, Varieties, Lemma 32.17 .2 shows that (1) (4) are equivalent with (5).

06S1 Lemma 59.7.9. Let $k$ be a field. Let $f: X \rightarrow Y$ be a monomorphism of algebraic spaces over $k$. If $Y$ is locally quasi-finite over $k$ so is $X$.

Proof. Assume $Y$ is locally quasi-finite over $k$. By Lemma 59.7.8 we see that $Y=\coprod \operatorname{Spec}\left(A_{i}\right)$ where each $A_{i}$ is an Artinian local ring finite over $k$. By Decent Spaces, Lemma 55.17.1 we see that $X$ is a scheme. Consider $X_{i}=f^{-1}\left(\operatorname{Spec}\left(A_{i}\right)\right)$. Then $X_{i}$ has either one or zero points. If $X_{i}$ has zero points there is nothing to prove. If $X_{i}$ has one point, then $X_{i}=\operatorname{Spec}\left(B_{i}\right)$ with $B_{i}$ a zero dimensional local
ring and $A_{i} \rightarrow B_{i}$ is an epimorphism of rings. In particular $A_{i} / \mathfrak{m}_{A_{i}}=B_{i} / \mathfrak{m}_{A_{i}} B_{i}$ and we see that $A_{i} \rightarrow B_{i}$ is surjective by Nakayama's lemma, Algebra, Lemma 10.19.1 (because $\mathfrak{m}_{A_{i}}$ is a nilpotent ideal!). Thus $B_{i}$ is a finite local $k$-algebra, and we conclude by Lemma 59.7 .8 that $X \rightarrow \operatorname{Spec}(k)$ is locally quasi-finite.

### 59.8. Geometrically connected algebraic spaces

0 A 0 Y If $X$ is a connected algebraic space over a field, then it can happen that $X$ becomes disconnected after extending the ground field. This does not happen for geometrically connected schemes.

0A0Z Definition 59.8.1. Let $X$ be an algebraic space over the field $k$. We say $X$ is geometrically connected over $k$ if the base change $X_{k^{\prime}}$ is connected for every field extension $k^{\prime}$ of $k$.

By convention a connected topological space is nonempty; hence a fortiori geometrically connected algebraic spaces are nonempty.

0 A10 Lemma 59.8.2. Let $X$ be an algebraic space over the field $k$. Let $k \subset k^{\prime}$ be a field extension. Then $X$ is geometrically connected over $k$ if and only if $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$.

Proof. If $X$ is geometrically connected over $k$, then it is clear that $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$. For the converse, note that for any field extension $k \subset k^{\prime \prime}$ there exists a common field extension $k^{\prime} \subset k^{\prime \prime \prime}$ and $k^{\prime \prime} \subset k^{\prime \prime \prime}$. As the morphism $X_{k^{\prime \prime \prime}} \rightarrow X_{k^{\prime \prime}}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the connectedness of $X_{k^{\prime \prime \prime}}$ implies the connectedness of $X_{k^{\prime \prime}}$. Thus if $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$ then $X$ is geometrically connected over $k$.

0 A11 Lemma 59.8.3. Let $k$ be a field. Let $X, Y$ be algebraic spaces over $k$. Assume $X$ is geometrically connected over $k$. Then the projection morphism

$$
p: X \times_{k} Y \longrightarrow Y
$$

induces a bijection between connected components.
Proof. Let $y \in|Y|$ be represented by a morphism $\operatorname{Spec}(K) \rightarrow Y$ be a morphism where $K$ is a field. The fibre of $\left|X \times_{k} Y\right| \rightarrow|Y|$ over $y$ is the image of $\left|Y_{K}\right| \rightarrow$ $\left|X \times_{k} Y\right|$ by Properties of Spaces, Lemma 53.4.3. Thus these fibres are connected by our assumption that $Y$ is geometrically connected. By Morphisms of Spaces, Lemma 54.6 .6 the map $|p|$ is open. Thus we may apply Topology, Lemma 5.6.5 to conclude.

0 A 12 Lemma 59.8.4. Let $k \subset k^{\prime}$ be an extension of fields. Let $X$ be an algebraic space over $k$. Assume $k$ separably algebraically closed. Then the morphism $X_{k^{\prime}} \rightarrow X$ induces a bijection of connected components. In particular, $X$ is geometrically connected over $k$ if and only if $X$ is connected.

Proof. Since $k$ is separably algebraically closed we see that $k^{\prime}$ is geometrically connected over $k$, see Algebra, Lemma 10.47.4. Hence $Z=\operatorname{Spec}\left(k^{\prime}\right)$ is geometrically connected over $k$ by Varieties, Lemma 32.5.5. Since $X_{k^{\prime}}=Z \times_{k} X$ the result is a special case of Lemma 59.8.3.

0 A 13 Lemma 59.8.5. Let $k$ be a field. Let $X$ be an algebraic space over $k$. Let $\bar{k}$ be a separable algebraic closure of $k$. Then $X$ is geometrically connected if and only if the base change $X_{\bar{k}}$ is connected.
Proof. Assume $X_{\bar{k}}$ is connected. Let $k \subset k^{\prime}$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}^{\prime}$ such that $k^{\prime}$ embeds into $\bar{k}^{\prime}$ as an extension of $k$. By Lemma 59.8 .4 we see that $X_{\bar{k}^{\prime}}$ is connected. Since $X_{\bar{k}^{\prime}} \rightarrow X_{k^{\prime}}$ is surjective we conclude that $X_{k^{\prime}}$ is connected as desired.

Let $k$ be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. For example $\bar{k}$ could be the separable algebraic closure of $k$. For any $\sigma \in \operatorname{Gal}(\bar{k} / k)$ we get a corresponding automorphism $\operatorname{Spec}(\sigma): \operatorname{Spec}(\bar{k}) \longrightarrow \operatorname{Spec}(\bar{k})$. Note that $\operatorname{Spec}(\sigma) \circ$ $\operatorname{Spec}(\tau)=\operatorname{Spec}(\tau \circ \sigma)$. Hence we get an action

$$
\operatorname{Gal}(\bar{k} / k)^{o p p} \times \operatorname{Spec}(\bar{k}) \longrightarrow \operatorname{Spec}(\bar{k})
$$

of the opposite group on the scheme $\operatorname{Spec}(\bar{k})$. Let $X$ be an algebraic space over $k$. Since $X_{\bar{k}}=\operatorname{Spec}(\bar{k}) \times_{\operatorname{Spec}(k)} X$ by definition we see that the action above induces a canonical action

0A14 (59.8.5.1) $\operatorname{Gal}(\bar{k} / k)^{o p p} \times X_{\bar{k}} \longrightarrow X_{\bar{k}}$.
0 A15 Lemma 59.8.6. Let $k$ be a field. Let $X$ be an algebraic space over $k$. Let $\bar{k}$ be a (possibly infinite) Galois extension of $k$. Let $V \subset X_{\bar{k}}$ be a quasi-compact open. Then
(1) there exists a finite subextension $k \subset k^{\prime} \subset \bar{k}$ and a quasi-compact open $V^{\prime} \subset X_{k^{\prime}}$ such that $V=\left(V^{\prime}\right)_{\bar{k}}$,
(2) there exists an open subgroup $H \subset G a l(\bar{k} / k)$ such that $\sigma(V)=V$ for all $\sigma \in H$.

Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. Choose a quasi-compact open $W \subset U_{\bar{k}}$ whose image in $X_{\bar{k}}$ is $V$. This is possible because $\left|U_{\bar{k}}\right| \rightarrow\left|X_{\bar{k}}\right|$ is continuous and because $\left|U_{\bar{k}}\right|$ has a basis of quasi-compact opens. We can apply Varieties, Lemma 32.5 .9 to $W \subset U_{\bar{k}}$ to obtain the lemma.
0 L16 Lemma 59.8.7. Let $k$ be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let $X$ be an algebraic space over $k$. Let $\bar{T} \subset\left|X_{\bar{k}}\right|$ have the following properties
(1) $\bar{T}$ is a closed subset of $\left|X_{\bar{k}}\right|$,
(2) for every $\sigma \in \operatorname{Gal}(\bar{k} / k)$ we have $\sigma(\bar{T})=\bar{T}$.

Then there exists a closed subset $T \subset|X|$ whose inverse image in $\left|X_{k^{\prime}}\right|$ is $\bar{T}$.
Proof. Let $T \subset|X|$ be the image of $\bar{T}$. Since $\left|X_{\bar{k}}\right| \rightarrow|X|$ is surjective, the statement means that $T$ is closed and that its inverse image is $\bar{T}$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. By the case of schemes (see Varieties, Lemma 32.5.10 there exists a closed subset $T^{\prime} \subset|U|$ whose inverse image in $\left|U_{\bar{k}}\right|$ is the inverse image of $\bar{T}$. Since $\left|U_{\bar{k}}\right| \rightarrow\left|X_{\bar{k}}\right|$ is surjective, we see that $T^{\prime}$ is the inverse image of $T$ via $|U| \rightarrow|X|$. By our construction of the topology on $|X|$ this means that $T$ is closed. In the same manner one sees that $\bar{T}$ is the inverse image of $T$.

0 A17 Lemma 59.8.8. Let $k$ be a field. Let $X$ be an algebraic space over $k$. The following are equivalent
(1) $X$ is geometrically connected,
(2) for every finite separable field extension $k \subset k^{\prime}$ the scheme $X_{k^{\prime}}$ is connected.

Proof. This proof is identical to the proof of Varieties, Lemma 32.5.11 except that we replace Varieties, Lemma 32.5.7 by Lemma 59.8.5, we replace Varieties, Lemma 32.5 .9 by Lemma 59.8.6, and we replace Varieties, Lemma 32.5.10 by Lemma 59.8.7. We urge the reader to read that proof in stead of this one.

It follows immediately from the definition that (1) implies (2). Assume that $X$ is not geometrically connected. Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. By Lemma 59.8 .5 it follows that $X_{\bar{k}}$ is disconnected. Say $X_{\bar{k}}=\bar{U} \amalg \bar{V}$ with $\bar{U}$ and $\bar{V}$ open, closed, and nonempty algebraic subspaces of $X_{\bar{k}}$.
Suppose that $W \subset X$ is any quasi-compact open subspace. Then $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are open and closed subspaces of $W_{\bar{k}}$. In particular $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are quasi-compact, and by Lemma 59.8.6 both $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are defined over a finite subextension and invariant under an open subgroup of $\operatorname{Gal}(\bar{k} / k)$. We will use this without further mention in the following.
Pick $W_{0} \subset X$ quasi-compact open subspace such that both $W_{0, \bar{k}} \cap \bar{U}$ and $W_{0, \bar{k}} \cap \bar{V}$ are nonempty. Choose a finite subextension $k \subset k^{\prime} \subset \bar{k}$ and a decomposition $W_{0, k^{\prime}}=U_{0}^{\prime} \amalg V_{0}^{\prime}$ into open and closed subsets such that $W_{0, \bar{k}} \cap \bar{U}=\left(U_{0}^{\prime}\right)_{\bar{k}}$ and $W_{0, \bar{k}} \cap \bar{V}=\left(V_{0}^{\prime}\right)_{\bar{k}}$. Let $H=\operatorname{Gal}\left(\bar{k} / k^{\prime}\right) \subset \operatorname{Gal}(\bar{k} / k)$. In particular $\sigma\left(W_{0, \bar{k}} \cap \bar{U}\right)=$ $W_{0, \bar{k}} \cap \bar{U}$ and similarly for $\bar{V}$.
Having chosen $W_{0}, k^{\prime}$ as above, for every quasi-compact open subspace $W \subset X$ we set

$$
U_{W}=\bigcap_{\sigma \in H} \sigma\left(W_{\bar{k}} \cap \bar{U}\right), \quad V_{W}=\bigcup_{\sigma \in H} \sigma\left(W_{\bar{k}} \cap \bar{V}\right)
$$

Now, since $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are fixed by an open subgroup of $\operatorname{Gal}(\bar{k} / k)$ we see that the union and intersection above are finite. Hence $U_{W}$ and $V_{W}$ are both open and closed subspaces. Also, by construction $W_{\bar{k}}=U_{W} \amalg V_{W}$.

We claim that if $W \subset W^{\prime} \subset X$ are quasi-compact open subspaces, then $W_{\bar{k}} \cap U_{W^{\prime}}=$ $U_{W}$ and $W_{\bar{k}} \cap V_{W^{\prime}}=V_{W}$. Verification omitted. Hence we see that upon defining $U=\bigcup_{W \subset X} U_{W}$ and $V=\bigcup_{W \subset X} V_{W}$ we obtain $X_{\bar{k}}=U \amalg V$ is a disjoint union of open and closed subsets. It is clear that $V$ is nonempty as it is constructed by taking unions (locally). On the other hand, $U$ is nonempty since it contains $W_{0} \cap \bar{U}$ by construction. Finally, $U, V \subset X_{\bar{k}}$ are closed and $H$-invariant by construction. Hence by Lemma 59.8.7 we have $U=\left(U^{\prime}\right)_{\bar{k}}$, and $V=\left(V^{\prime}\right)_{\bar{k}}$ for some closed $U^{\prime}, V^{\prime} \subset X_{k^{\prime}}$. Clearly $X_{k^{\prime}}=U^{\prime} \amalg V^{\prime}$ and we see that $X_{k^{\prime}}$ is disconnected as desired.

### 59.9. Spaces smooth over fields

06M1 Lemma 59.9.1. Let $k$ be a field. Let $X$ be an algebraic space smooth over $k$. Then $X$ is a regular algebraic space.

Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. The mor$\operatorname{phism} U \rightarrow \operatorname{Spec}(k)$ is smooth as a composition of an étale (hence smooth) morphism and a smooth morphism (see Morphisms of Spaces, Lemmas 54.38 .6 and
54.36 .2 . Hence $U$ is regular by Varieties, Lemma 32.20.3. By Properties of Spaces, Definition 53.7.2 this means that $X$ is regular.
07W4 Lemma 59.9.2. Let $k$ be a field. Let $X$ be an algebraic space smooth over $\operatorname{Spec}(k)$. The set of $x \in|X|$ which are image of morphisms $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow X$ with $k^{\prime} \supset k$ finite separable is dense in $|X|$.
Proof. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X$. The morphism $U \rightarrow \operatorname{Spec}(k)$ is smooth as a composition of an étale (hence smooth) morphism and a smooth morphism (see Morphisms of Spaces, Lemmas 54.38 .6 and 54.36.2. Hence we can apply Varieties, Lemma 32.20 .6 to see that the closed points of $U$ whose residue fields are finite separable over $k$ are dense. This implies the lemma by our definition of the topology on $|X|$.

## CHAPTER 60

## Topologies on Algebraic Spaces

### 60.1. Introduction

03 Y 5 In this chapter we introduce some topologies on the category of algebraic spaces. Compare with the material in Gro71, BLR90, LMB00 and Knu71. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 7.6.2 which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

### 60.2. The general procedure

03 Y 6 In this section we explain a general procedure for producing the sites we will be working with. This discussion will make little or no sense unless the reader has read Topologies, Section 33.2,

Let $S$ be a base scheme. Take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9.2 starting with $S$ and any set of schemes over $S$ you want to be included. Choose any set of coverings $\operatorname{Cov}_{f p p f}$ on $S c h_{\alpha}$ as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of fppf coverings. Let $S_{\text {ch }} h_{f p f}$ denote the big fppf site so obtained, and let $(S c h / S)_{f p p f}$ denote the corresponding big fppf site of $S$. (The above is entirely as prescribed in Topologies, Section 33.7.)
Given choices as above the category of algebraic spaces over $S$ has a set of isomorphism classes. One way to see this is to use the fact that any algebraic space over $S$ is of the form $U / R$ for some étale equivalence relation $j: R \rightarrow U \times{ }_{S} U$ with $U, R \in \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$, see Spaces, Lemma 52.9.1. Hence we can find a full subcategory Spaces/ $S$ of the category of algebraic spaces over $S$ which has a set of objects such that each algebraic space is isomorphic to an object of Spaces/S. We fix a choice of such a category.
In the sections below, given a topology $\tau$, the big site (Spaces $/ S)_{\tau}$ (resp. the big site $(\text { Spaces } / X)_{\tau}$ of an algebraic space $X$ over $S$ ) has as underlying category the category Spaces/S (resp. the subcategory Spaces/X of Spaces/ $S$, see Categories, Example 4.2.13). The procedure for turning this into a site is as usual by defining a class of $\tau$-coverings and using Sets, Lemma 3.11.1 to choose a sufficiently large set of coverings which defines the topology.

We point out that the small étale site $X_{\text {étale }}$ of an algebraic space $X$ has already been defined in Properties of Spaces, Definition 53.17.1. Its objects are schemes étale over $X$, of which there are plenty by definition of an algebraic spaces. However, a more natural site, from the perspective of this chapter (compare Topologies,

Definition 33.4.8 is the site $X_{\text {spaces,étale }}$ of Properties of Spaces, Definition 53.17 .2 , These two sites define the same topos, see Properties of Spaces, Lemma 53.17 .3 . We will not redefine these in this chapter; instead we will simply use them.
Finally, we intend not to define the Zariski sites, since these do not seem particularly useful (although the Zariski topology is occasionally useful).

### 60.3. Fpqc topology

03MP We briefly discuss the notion of an fpqc covering of algebraic spaces. Please compare with Topologies, Section 33.8. We will show in Descent on Spaces, Proposition 61.4 .1 that quasi-coherent sheaves descent along these.

03MQ Definition 60.3.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. An fpqc covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces such that each $f_{i}$ is flat and such that for every affine scheme $Z$ and morphism $h: Z \rightarrow X$ there exists a standard fpqc covering $\left\{g_{j}: Z_{j} \rightarrow Z\right\}_{j=1, \ldots, n}$ which refines the family $\left\{X_{i} \times_{X} Z \rightarrow Z\right\}_{i \in I}$.

In other words, there exists indices $i_{1}, \ldots, i_{n} \in I$ and morphisms $h_{j}: U_{j} \rightarrow X_{i_{j}}$ such that $f_{i_{j}} \circ h_{j}=h \circ g_{j}$. Note that if $X$ and all $X_{i}$ are representable, this is the same as a fpqc covering of schemes by Topologies, Lemma 33.8.11.

03MR Lemma 60.3.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is an fpqc covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering and for each $i$ we have an fpqc covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is an fpqc covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is an fpqc covering.

Proof. Part (1) is clear. Consider $g: X^{\prime} \rightarrow X$ and $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ an fpqc covering as in (3). By Morphisms of Spaces, Lemma 54.29 .4 the morphisms $X^{\prime} \times{ }_{X} X_{i} \rightarrow X^{\prime}$ are flat. If $h^{\prime}: Z \rightarrow X^{\prime}$ is a morphism from an affine scheme towards $X^{\prime}$, then set $h=g \circ h^{\prime}: Z \rightarrow X$. The assumption on $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ means there exists a standard fpqc covering $\left\{Z_{j} \rightarrow Z\right\}_{j=1, \ldots, n}$ and morphisms $Z_{j} \rightarrow X_{i(j)}$ covering $h$ for certain $i(j) \in I$. By the universal property of the fibre product we obtain morphisms $Z_{j} \rightarrow X^{\prime} \times_{X} X_{i(j)}$ over $h^{\prime}$ also. Hence $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is an fpqc covering. This proves (3).
Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ and $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$ be as in (2). Let $h: Z \rightarrow X$ be a morphism from an affine scheme towards $X$. By assumption there exists a standard fpqc covering $\left\{Z_{j} \rightarrow Z\right\}_{j=1, \ldots, n}$ and morphisms $h_{j}: Z_{j} \rightarrow X_{i(j)}$ covering $h$ for some indices $i(j) \in I$. By assumption there exist standard fpqc coverings $\left\{Z_{j, l} \rightarrow\right.$ $\left.Z_{j}\right\}_{l=1, \ldots, n(j)}$ and morphisms $Z_{j, l} \rightarrow X_{i(j) j(l)}$ covering $h_{j}$ for some indices $j(l) \in$ $J_{i(j)}$. By Topologies, Lemma 33.8.10 the family $\left\{Z_{j, l} \rightarrow Z\right\}$ is a standard fpqc covering. Hence we conclude that $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is an fpqc covering.

03MS Lemma 60.3.3. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. Suppose that $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is a family of morphisms of algebraic spaces with target $X$. Let $U \rightarrow X$ be a surjective étale morphism from a scheme towards $X$. Then $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering of $X$ if and only if $\left\{U \times_{X} X_{i} \rightarrow U\right\}_{i \in I}$ is an fpqc covering of $U$.

Proof. If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering, then so is $\left\{U \times_{X} X_{i} \rightarrow U\right\}_{i \in I}$ by Lemma 60.3.2. Assume that $\left\{U \times_{X} X_{i} \rightarrow U\right\}_{i \in I}$ is an fpqc covering. Let $h: Z \rightarrow X$ be a morphism from an affine scheme towards $X$. Then we see that $U \times_{X} Z \rightarrow Z$ is a surjective étale morphism of schemes, in particular open. Hence we can find finitely many affine opens $W_{1}, \ldots, W_{t}$ of $U \times_{X} Z$ whose images cover $Z$. For each $j$ we may apply the condition that $\left\{U \times_{X} X_{i} \rightarrow U\right\}_{i \in I}$ is an fpqc covering to the morphism $W_{j} \rightarrow U$, and obtain a standard fpqc covering $\left\{W_{j l} \rightarrow W_{j}\right\}$ which refines $\left\{W_{j} \times_{X} X_{i} \rightarrow W_{j}\right\}_{i \in I}$. Hence $\left\{W_{j l} \rightarrow Z\right\}$ is a standard fpqc covering of $Z$ (see Topologies, Lemma 33.8.10 which refines $\left\{Z \times_{X} X_{i} \rightarrow X\right\}$ and we win.

0419 Lemma 60.3.4. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. Suppose that $\mathcal{U}=\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is an fpqc covering of $X$. Then there exists a refinement $\mathcal{V}=\left\{g_{i}: T_{i} \rightarrow X\right\}$ of $\mathcal{U}$ which is an fpqc covering such that each $T_{i}$ is a scheme.

Proof. Omitted. Hint: For each $i$ choose a scheme $T_{i}$ and a surjective étale morphism $T_{i} \rightarrow X_{i}$. Then check that $\left\{T_{i} \rightarrow X\right\}$ is an fpqc covering.

To be continued...

### 60.4. Fppf topology

03 Y 7 In this section we discuss the notion of an fppf covering of algebraic spaces, and we define the big fppf site of an algebraic space. Please compare with Topologies, Section 33.7

03Y8 Definition 60.4.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. An fppf covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces over $S$ such that each $f_{i}$ is flat and locally of finite presentation and such that

$$
|X|=\bigcup_{i \in I}\left|f_{i}\right|\left(\left|X_{i}\right|\right)
$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.7.1. In particular, if $X$ and all the $X_{i}$ are schemes, then we recover the usual notion of an fppf covering of schemes.
$03 Y 9$ Lemma 60.4.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is an fppf covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is an fppf covering and for each $i$ we have an fppf covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is an fppf covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is an fppf covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is an fppf covering.

## Proof. Omitted.

042 T Lemma 60.4.3. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. Suppose that $\mathcal{U}=\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is an fppf covering of $X$. Then there exists $a$ refinement $\mathcal{V}=\left\{g_{i}: T_{i} \rightarrow X\right\}$ of $\mathcal{U}$ which is an fppf covering such that each $T_{i}$ is a scheme.

Proof. Omitted. Hint: For each $i$ choose a scheme $T_{i}$ and a surjective étale morphism $T_{i} \rightarrow X_{i}$. Then check that $\left\{T_{i} \rightarrow X\right\}$ is an fppf covering.

0469 Lemma 60.4.4. Let $S$ be a scheme. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering of algebraic spaces over $S$. Then the map of sheaves

$$
\coprod X_{i} \longrightarrow X
$$

is surjective.
Proof. This follows from Spaces, Lemma 52.5.9. See also Spaces, Remark 52.5.2 in case you are confused about the meaning of this lemma.

To be continued...

### 60.5. Syntomic topology

03YA In this section we discuss the notion of a syntomic covering of algebraic spaces, and we define the big syntomic site of an algebraic space. Please compare with Topologies, Section 33.6.

041A Definition 60.5.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. A syntomic covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces over $S$ such that each $f_{i}$ is syntomic and such that

$$
|X|=\bigcup_{i \in I}\left|f_{i}\right|\left(\left|X_{i}\right|\right)
$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.6.1. In particular, if $X$ and all the $X_{i}$ are schemes, then we recover the usual notion of a syntomic covering of schemes.

041B Lemma 60.5.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is a syntomic covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a syntomic covering and for each $i$ we have a syntomic covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is a syntomic covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a syntomic covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is a syntomic covering.

Proof. Omitted.
To be continued...

### 60.6. Smooth topology

03 YB In this section we discuss the notion of a smooth covering of algebraic spaces, and we define the big smooth site of an algebraic space. Please compare with Topologies, Section 33.5

041C Definition 60.6.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. A smooth covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces over $S$ such that each $f_{i}$ is smooth and such that

$$
|X|=\bigcup_{i \in I}\left|f_{i}\right|\left(\left|X_{i}\right|\right)
$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.5.1. In particular, if $X$ and all the $X_{i}$ are schemes, then we recover the usual notion of a smooth covering of schemes.
041D Lemma 60.6.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is a smooth covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a smooth covering and for each $i$ we have a smooth covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is a smooth covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a smooth covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is a smooth covering.
Proof. Omitted.
To be continued...

## 60.7. Étale topology

03 YC In this section we discuss the notion of a étale covering of algebraic spaces, and we define the big étale site of an algebraic space. Please compare with Topologies, Section 33.4

041E Definition 60.7.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. A étale covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces over $S$ such that each $f_{i}$ is étale and such that

$$
|X|=\bigcup_{i \in I}\left|f_{i}\right|\left(\left|X_{i}\right|\right)
$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.4.1. In particular, if $X$ and all the $X_{i}$ are schemes, then we recover the usual notion of a étale covering of schemes.

041F Lemma 60.7.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is a étale covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a étale covering and for each $i$ we have a étale covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is a étale covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a étale covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is a étale covering.
Proof. Omitted.
To be continued...

### 60.8. Zariski topology

$03 Y D$ In Spaces, Section 52.12 we introduced the notion of a Zariski covering of an algebraic space by open subspaces. Here is the corresponding notion with open subspaces replaces by open immersions.
041G Definition 60.8.1. Let $S$ be a scheme, and let $X$ be an algebraic space over $S$. A Zariski covering of $X$ is a family of morphisms $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces over $S$ such that each $f_{i}$ is an open immersion and such that

$$
|X|=\bigcup_{i \in I}\left|f_{i}\right|\left(\left|X_{i}\right|\right)
$$

i.e., the morphisms are jointly surjective.

Although Zariski coverings are occasionally useful the corresponding topology on the category of algebraic spaces is really too coarse, and not particularly useful. Still, it does define a site.

041H Lemma 60.8.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism then $\left\{X^{\prime} \rightarrow X\right\}$ is a Zariski covering of $X$.
(2) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a Zariski covering and for each $i$ we have a Zariski covering $\left\{X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is a Zariski covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a Zariski covering and $X^{\prime} \rightarrow X$ is a morphism of algebraic spaces then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is a Zariski covering.

Proof. Omitted.

## CHAPTER 61

## Descent and Algebraic Spaces

03YE

### 61.1. Introduction

03 YF In the chapter on topologies on algebraic spaces (see Topologies on Spaces, Section 60.1 we introduced étale, fppf, smooth, syntomic and fpqc coverings of algebraic spaces. In this chapter we discuss what kind of structures over algebraic spaces can be descended through such coverings. See for example Gro95a, Gro95b, Gro95e, Gro95f, Gro95c, and Gro95d].

### 61.2. Conventions

041I The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.

Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times{ }_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 61.3. Descent data for quasi-coherent sheaves

04W2 This section is the analogue of Descent, Section 34.2 for algebraic spaces. It makes sense to read that section first.

04W3 Definition 61.3.1. Let $S$ be a scheme. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be a family of morphisms of algebraic spaces over $S$ with fixed target $X$.
(1) A descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves with respect to the given family is given by a quasi-coherent sheaf $\mathcal{F}_{i}$ on $X_{i}$ for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{X_{i} \times_{X} X_{j}}$-modules $\varphi_{i j}: \operatorname{pr}_{0}^{*} \mathcal{F}_{i} \rightarrow \mathrm{pr}_{1}^{*} \mathcal{F}_{j}$ for each pair $(i, j) \in I^{2}$ such that for every triple of indices $(i, j, k) \in I^{3}$ the diagram

(2) A morphism $\psi:\left(\mathcal{F}_{i}, \varphi_{i j}\right) \rightarrow\left(\mathcal{F}_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data is given by a family $\psi=\left(\psi_{i}\right)_{i \in I}$ of morphisms of $\mathcal{O}_{X_{i}}$-modules $\psi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}_{i}^{\prime}$ such that all the diagrams

commute.
04W4 Lemma 61.3.2. Let $S$ be a scheme. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ and $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be families of morphisms of algebraic spaces over $S$ with fixed targets. Let $(g, \alpha$ : $\left.I \rightarrow J,\left(g_{i}\right)\right): \mathcal{U} \rightarrow \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Let $\left(\mathcal{F}_{j}, \varphi_{j j^{\prime}}\right)$ be a descent datum for quasi-coherent sheaves with respect to the family $\left\{V_{j} \rightarrow V\right\}_{j \in J}$. Then
(1) The system

$$
\left(g_{i}^{*} \mathcal{F}_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

is a descent datum with respect to the family $\left\{U_{i} \rightarrow U\right\}_{i \in I}$.
(2) This construction is functorial in the descent datum $\left(\mathcal{F}_{j}, \varphi_{j j^{\prime}}\right)$.
(3) Given a second morphism $\left(g^{\prime}, \alpha^{\prime}: I \rightarrow J,\left(g_{i}^{\prime}\right)\right)$ of families of maps with fixed target with $g=g^{\prime}$ there exists a functorial isomorphism of descent data

$$
\left(g_{i}^{*} \mathcal{F}_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right) \cong\left(\left(g_{i}^{\prime}\right)^{*} \mathcal{F}_{\alpha^{\prime}(i)},\left(g_{i}^{\prime} \times g_{i^{\prime}}^{\prime}\right)^{*} \varphi_{\alpha^{\prime}(i) \alpha^{\prime}\left(i^{\prime}\right)}\right)
$$

Proof. Omitted. Hint: The maps $g_{i}^{*} \mathcal{F}_{\alpha(i)} \rightarrow\left(g_{i}^{\prime}\right)^{*} \mathcal{F}_{\alpha^{\prime}(i)}$ which give the isomorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i) \alpha^{\prime}(i)}$ by the morphisms $\left(g_{i}, g_{i}^{\prime}\right): U_{i} \rightarrow V_{\alpha(i)} \times V V_{\alpha^{\prime}(i)}$.

Let $g: U \rightarrow V$ be a morphism of algebraic spaces. The lemma above tells us that there is a well defined pullback functor between the categories of descent data relative to families of maps with target $V$ and $U$ provided there is a morphism between those families of maps which "lives over $g$ ".

04W5 Definition 61.3.3. Let $S$ be a scheme. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms of algebraic spaces over $S$ with fixed target.
(1) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{U}$-module. We call the unique descent on $\mathcal{F}$ datum with respect to the covering $\{U \rightarrow U\}$ the trivial descent datum.
(2) The pullback of the trivial descent datum to $\left\{U_{i} \rightarrow U\right\}$ is called the canonical descent datum. Notation: $\left(\left.\mathcal{F}\right|_{U_{i}}\right.$, can $)$.
(3) A descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves with respect to the given family is said to be effective if there exists a quasi-coherent sheaf $\mathcal{F}$ on $U$ such that $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ is isomorphic to $\left(\left.\mathcal{F}\right|_{U_{i}}\right.$, can $)$.

04W6 Lemma 61.3.4. Let $S$ be a scheme. Let $U$ be an algebraic space over $S$. Let $\left\{U_{i} \rightarrow U\right\}$ be a Zariski covering of $U$, see Topologies on Spaces, Definition 60.8.1. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_{U}$-modules to the category of descent data with respect to $\left\{U_{i} \rightarrow U\right\}$ is fully faithful.

Proof. Omitted.

### 61.4. Fpqc descent of quasi-coherent sheaves

04W7 The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.

04W8 Proposition 61.4.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}$ be an fpqc covering of algebraic spaces over $S$, see Topologies on Spaces, Definition 60.3.1. Any descent datum on quasi-coherent sheaves for $\left\{X_{i} \rightarrow X\right\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_{X}$-modules to the category of descent data with respect to $\left\{X_{i} \rightarrow X\right\}$ is fully faithful.

Proof. This is more or less a formal consequence of the corresponding result for schemes, see Descent, Proposition 34.5.2. Here is a strategy for a proof:
(1) The fact that $\left\{X_{i} \rightarrow X\right\}$ is a refinement of the trivial covering $\{X \rightarrow X\}$ gives, via Lemma 61.3.2, a functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow D D\left(\left\{X_{i} \rightarrow X\right\}\right)$ from the category of quasi-coherent $\mathcal{O}_{X}$-modules to the category of descent data for the given family.
(2) In order to prove the proposition we will construct a quasi-inverse functor back: $D D\left(\left\{X_{i} \rightarrow X\right\}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$.
(3) Applying again Lemma 61.3.2 we see that there is a functor $D D\left(\left\{X_{i} \rightarrow\right.\right.$ $X\}) \rightarrow D D\left(\left\{T_{j} \rightarrow X\right\}\right)$ if $\left\{T_{j} \rightarrow X\right\}$ is a refinement of the given family. Hence in order to construct the functor back we may assume that each $X_{i}$ is a scheme, see Topologies on Spaces, Lemma 60.3.4. This reduces us to the case where all the $X_{i}$ are schemes.
(4) A quasi-coherent sheaf on $X$ is by definition a quasi-coherent $\mathcal{O}_{X}$-module on $X_{\text {étale }}$. Now for any $U \in \operatorname{Ob}\left(X_{\text {étale }}\right)$ we get an fppf covering $\left\{U_{i} \times_{X}\right.$ $\left.X_{i} \rightarrow U\right\}$ by schemes and a morphism $g:\left\{U_{i} \times_{X} X_{i} \rightarrow U\right\} \rightarrow\left\{X_{i} \rightarrow X\right\}$ of coverings lying over $U \rightarrow X$. Given a descent datum $\xi=\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ we obtain a quasi-coherent $\mathcal{O}_{U}$-module $\mathcal{F}_{\xi, U}$ corresponding to the pullback $g^{*} \xi$ of Lemma 61.3.2 to the covering of $U$ and using effectivity for fppf covering of schemes, see Descent, Proposition 34.5.2.
(5) Check that $\xi \mapsto \mathcal{F}_{\xi, U}$ is functorial in $\xi$. Omitted.
(6) Check that $\xi \mapsto \mathcal{F}_{\xi, U}$ is compatible with morphisms $U \rightarrow U^{\prime}$ of the site $X_{\text {étale }}$, so that the system of sheaves $\mathcal{F}_{\xi, U}$ corresponds to a quasi-coherent $\mathcal{F}_{\xi}$ on $X_{\text {étale }}$, see Properties of Spaces, Lemma 53.28.3. Details omitted.
(7) Check that back: $\xi \mapsto \mathcal{F}_{\xi}$ is quasi-inverse to the functor constructed in (1). Omitted.

This finishes the proof.

### 61.5. Descent of finiteness properties of modules

060T
This section is the analogue for the case of algebraic spaces of Descent, Section 34.6. The goal is to show that one can check a quasi-coherent module has a certain finiteness conditions by checking on the members of a covering. We will repeatedly use the following proof scheme. Suppose that $X$ is an algebraic space, and that $\left\{X_{i} \rightarrow X\right\}$ is a fppf (resp. fpqc) covering. Let $U \rightarrow X$ be a surjective étale morphism such that $U$ is a scheme. Then there exists an fppf (resp. fpqc) covering $\left\{Y_{j} \rightarrow X\right\}$ such that
(1) $\left\{Y_{j} \rightarrow X\right\}$ is a refinement of $\left\{X_{i} \rightarrow X\right\}$,
(2) each $Y_{j}$ is a scheme, and
(3) each morphism $Y_{j} \rightarrow X$ factors though $U$, and
(4) $\left\{Y_{j} \rightarrow U\right\}$ is an fppf (resp. fpqc) covering of $U$.

Namely, first refine $\left\{X_{i} \rightarrow X\right\}$ by an fppf (resp. fpqc) covering such that each $X_{i}$ is a scheme, see Topologies on Spaces, Lemma 60.4.3, resp. Lemma 60.3.4. Then set $Y_{i}=U \times_{X} X_{i}$. A quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ is of finite type, of finite presentation, etc if and only if the quasi-coherent $\mathcal{O}_{U}$-module $\left.\mathcal{F}\right|_{U}$ is of finite type, of finite presentation, etc. Hence we can use the existence of the refinement $\left\{Y_{j} \rightarrow X\right\}$ to reduce the proof of the following lemmas to the case of schemes. We will indicate this by saying that "the result follows from the case of schemes by étale localization".

060U Lemma 61.5.1. Let $X$ be an algebraic space over a scheme $S$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a finite type $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.1, by étale localization.

060V Lemma 61.5.2. Let $X$ be an algebraic space over a scheme $S$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is an $\mathcal{O}_{X_{i}}$-module of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation.
Proof. This follows from the case of schemes, see Descent, Lemma 34.6.3, by étale localization.

060W Lemma 61.5.3. Let $X$ be an algebraic space over a scheme $S$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a flat $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module.
Proof. This follows from the case of schemes, see Descent, Lemma 34.6.5, by étale localization.

060X Lemma 61.5.4. Let $X$ be an algebraic space over a scheme $S$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a finite locally free $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a finite locally free $\mathcal{O}_{X}$-module.

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.6, by étale localization.

The definition of a locally projective quasi-coherent sheaf can be found in Properties of Spaces, Section 53.30. It is also proved there that this notion is preserved under pullback.

060Y Lemma 61.5.5. Let $X$ be an algebraic space over a scheme $S$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a locally projective $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a locally projective $\mathcal{O}_{X}$-module.

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.7, by étale localization.

We also add here two results which are related to the results above, but are of a slightly different nature.

060Z Lemma 61.5.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume $f$ is a finite morphism. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite type if and only if $f_{*} \mathcal{F}$ is an $\mathcal{O}_{Y}$-module of finite type.
Proof. As $f$ is finite it is representable. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Then $U=V \times_{Y} X$ is a scheme with a surjective étale morphism towards $X$ and a finite morphism $\psi: U \rightarrow V$ (the base change of $f$ ). Since $\psi_{*}\left(\left.\mathcal{F}\right|_{U}\right)=\left.f_{*} \mathcal{F}\right|_{V}$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 34.6.9.

0610 Lemma 61.5.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume $f$ is finite and of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation if and only if $f_{*} \mathcal{F}$ is an $\mathcal{O}_{Y}$-module of finite presentation.

Proof. As $f$ is finite it is representable. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Then $U=V \times_{Y} X$ is a scheme with a surjective étale morphism towards $X$ and a finite morphism $\psi: U \rightarrow V$ (the base change of $f$ ). Since $\psi_{*}\left(\left.\mathcal{F}\right|_{U}\right)=\left.f_{*} \mathcal{F}\right|_{V}$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 34.6.10.

### 61.6. Fpqc coverings

04P0 This section is the analogue of Descent, Section 34.9. At the moment we do not know if all of the material for fpqc coverings of schemes holds also for algebraic spaces.

04P1 Lemma 61.6.1. Let $S$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of algebraic spaces over $S$. Suppose that for each $i$ we have an open subspace $W_{i} \subset T_{i}$ such that for all $i, j \in I$ we have $p r_{0}^{-1}\left(W_{i}\right)=p r_{1}^{-1}\left(W_{j}\right)$ as open subspaces of $T_{i} \times_{T} T_{j}$. Then there exists a unique open subspace $W \subset T$ such that $W_{i}=f_{i}^{-1}(W)$ for each $i$.

Proof. By Topologies on Spaces, Lemma 60.3.4 we may assume each $T_{i}$ is a scheme. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow T$. Then $\left\{T_{i} \times_{T} U \rightarrow U\right\}$ is an fpqc covering of $U$ and $T_{i} \times_{T} U$ is a scheme for each $i$. Hence we see that the collection of opens $W_{i} \times_{T} U$ comes from a unique open subscheme $W^{\prime} \subset U$ by Descent, Lemma 34.9.2 As $U \rightarrow X$ is open we can define $W \subset X$ the Zariski open which is the image of $W^{\prime}$, see Properties of Spaces, Section 53.4. We omit the verification that this works, i.e., that $W_{i}$ is the inverse image of $W$ for each $i$.
04P2 Lemma 61.6.2. Let $S$ be a scheme. Let $\left\{T_{i} \rightarrow T\right\}$ be an fpqc covering of algebraic spaces over $S$, see Topologies on Spaces, Definition60.3.1. Then given an algebraic space $B$ over $S$ the sequence

$$
\operatorname{Mor}_{S}(T, B) \longrightarrow \prod_{i} \operatorname{Mor}_{S}\left(T_{i}, B\right) \longrightarrow \prod_{i, j} \operatorname{Mor}_{S}\left(T_{i} \times_{T} T_{j}, B\right)
$$

is an equalizer diagram. In other words, every representable functor on the category of algebraic spaces over $S$ satisfies the sheaf condition for fpqc coverings.
Proof. We know this is true if $\left\{T_{i} \rightarrow T\right\}$ is an fpqc covering of schemes, see Properties of Spaces, Proposition 53.16.1. This is the key fact and we encourage the reader to skip the rest of the proof which is formal. Choose a scheme $U$ and a
surjective étale morphism $U \rightarrow T$. Let $U_{i}$ be a scheme and let $U_{i} \rightarrow T_{i} \times_{T} U$ be a surjective étale morphism. Then $\left\{U_{i} \rightarrow U\right\}$ is an fpqc covering. This follows from Topologies on Spaces, Lemmas 60.3.2 and 60.3.3. By the above we have the result for $\left\{U_{i} \rightarrow U\right\}$.
What this means is the following: Suppose that $b_{i}: T_{i} \rightarrow B$ is a family of morphisms with $b_{i} \circ \mathrm{pr}_{0}=b_{j} \circ \mathrm{pr}_{1}$ as morphisms $T_{i} \times_{T} T_{j} \rightarrow B$. Then we let $a_{i}: U_{i} \rightarrow B$ be the composition of $U_{i} \rightarrow T_{i}$ with $b_{i}$. By what was said above we find a unique morphism $a: U \rightarrow X$ such that $a_{i}$ is the composition of $a$ with $U_{i} \rightarrow U$. The uniqueness guarantees that $a \circ \operatorname{pr}_{0}=a \circ \operatorname{pr}_{1}$ as morphisms $U \times_{T} U \rightarrow B$. Then since $T=U /\left(U \times_{T} U\right)$ as a sheaf, we find that $a$ comes from a unique morphism $b: T \rightarrow B$. Chasing diagrams we find that $b$ is the morphism we are looking for.

### 61.7. Descent of finiteness properties of morphisms

06 NQ The following type of lemma is occasionally useful.
06NR Lemma 61.7.1. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphism of algebraic spaces. Let $P$ be one of the following properties of morphisms of algebraic spaces over $S$ : flat, locally finite type, locally finite presentation. Assume that $X \rightarrow Z$ has $P$ and that $X \rightarrow Y$ is a surjection of sheaves on $(S c h / S)_{f p p f}$. Then $Y \rightarrow Z$ is $P$.

Proof. Choose a scheme $W$ and a surjective étale morphism $W \rightarrow Z$. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow W \times{ }_{Z} Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. By assumption we can find an fppf covering $\left\{V_{i} \rightarrow V\right\}$ and lifts $V_{i} \rightarrow X$ of the morphism $V_{i} \rightarrow Y$. Since $U \rightarrow X$ is surjective étale we see that over the members of the fppf covering $\left\{V_{i} \times_{X} U \rightarrow V\right\}$ we have lifts into $U$. Hence $U \rightarrow V$ induces a surjection of sheaves on $(S c h / S)_{f p p f}$. By our definition of what it means to have property $P$ for a morphism of algebraic spaces (see Morphisms of Spaces, Definition 54.29.1, Definition 54.23.1, and Definition 54.28.1 we see that $U \rightarrow W$ has $P$ and we have to show $V \rightarrow W$ has $P$. Thus we reduce the question to the case of morphisms of schemes which is treated in Descent, Lemma 34.10.8.

A more standard case of the above lemma is the following. (The version with "flat" follows from Morphisms of Spaces, Lemma 54.30.5.)

0AHC Lemma 61.7.2. Let $S$ be a scheme. Let

be a commutative diagram of morphisms of algebraic spaces over $S$. Assume that $f$ is surjective, flat, and locally of finite presentation and assume that $p$ is locally of finite presentation (resp. locally of finite type). Then $q$ is locally of finite presentation (resp. locally of finite type).

Proof. Since $\{X \rightarrow Y\}$ is an fppf covering, it induces a surjection of fppf sheaves (Topologies on Spaces, Lemma 60.4.4) and the lemma is a special case of Lemma 61.7.1. On the other hand, an easier argument is to deduce it from the analogue for schemes. Namely, the problem is étale local on $B$ and $Y$ (Morphisms of Spaces, Lemmas 54.23.4 and 54.28.4. Hence we may assume that $B$ and $Y$ are affine
schemes. Since $|X| \rightarrow|Y|$ is open (Morphisms of Spaces, Lemma 54.29.6, we can choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.3.
0AHD Lemma 61.7.3. Let $S$ be a scheme. Let

be a commutative diagram of morphisms of algebraic spaces over $S$. Assume that
(1) $f$ is surjective, and syntomic (resp. smooth, resp. étale),
(2) $p$ is syntomic (resp. smooth, resp. étale).

Then $q$ is syntomic (resp. smooth, resp. étale).
Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on $B$ and $Y$ (Morphisms of Spaces, Lemmas 54.35.4, 54.36.4 and 54.38.2. Hence we may assume that $B$ and $Y$ are affine schemes. Since $|X| \rightarrow|Y|$ is open (Morphisms of Spaces, Lemma 54.29.6), we can choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.4.

Actually we can strengthen this result as follows.
0AHE Lemma 61.7.4. Let $S$ be a scheme. Let

be a commutative diagram of morphisms of algebraic spaces over $S$. Assume that
(1) $f$ is surjective, flat, and locally of finite presentation,
(2) $p$ is smooth (resp. étale).

Then $q$ is smooth (resp. étale).
Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on $B$ and $Y$ (Morphisms of Spaces, Lemmas 54.36.4 and 54.38.2). Hence we may assume that $B$ and $Y$ are affine schemes. Since $|X| \rightarrow|Y|$ is open (Morphisms of Spaces, Lemma 54.29.6, we can choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.5

0AHF Lemma 61.7.5. Let $S$ be a scheme. Let

be a commutative diagram of morphisms of algebraic spaces over $S$. Assume that
(1) $f$ is surjective, flat, and locally of finite presentation,
(2) $p$ is syntomic.

Then both $q$ and $f$ are syntomic.
Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on $B$ and $Y$ (Morphisms of Spaces, Lemma 54.35.4. Hence we may assume that $B$ and $Y$ are affine schemes. Since $|X| \rightarrow|Y|$ is open (Morphisms of Spaces, Lemma 54.29.6, we can choose an affine scheme $U$ and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.7

### 61.8. Descending properties of spaces

06 DP In this section we put some results of the following kind.
06DQ Lemma 61.8.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$. If $f$ is flat at $x$ and $X$ is geometrically unibranch at $x$, then $Y$ is geometrically unibranch at $f(x)$.

Proof. Consider the map of étale local rings $\mathcal{O}_{Y, f(\bar{x})} \rightarrow \mathcal{O}_{X, \bar{x}}$. By Morphisms of Spaces, Lemma 54.29.8 this is flat. Hence if $\mathcal{O}_{X, \bar{x}}$ has a unique minimal prime, so does $\mathcal{O}_{Y, f(\bar{x})}$ (by going down, see Algebra, Lemma 10.38.18.

06MI Lemma 61.8.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is flat and surjective and $X$ is reduced, then $Y$ is reduced.
Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. As $f$ is surjective and flat, the morphism of schemes $U \rightarrow V$ is surjective and flat. In this way we reduce the problem to the case of schemes (as reducedness of $X$ and $Y$ is defined in terms of reducedness of $U$ and $V$, see Properties of Spaces, Section 53.7). The case of schemes is Descent, Lemma 34.15.1.

06MJ Lemma 61.8.3. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. If $f$ is locally of finite presentation, flat, and surjective and $X$ is locally Noetherian, then $Y$ is locally Noetherian.
Proof. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. As $f$ is surjective, flat, and locally of finite presentation the morphism of schemes $U \rightarrow V$ is surjective, flat, and locally of finite presentation. In this way we reduce the problem to the case of schemes (as being locally Noetherian for $X$ and $Y$ is defined in terms of being locally Noetherian of $U$ and $V$, see Properties of Spaces, Section 53.7). In the case of schemes the result follows from Descent, Lemma 34.12.1.

06MK Lemma 61.8.4. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. If $f$ is locally of finite presentation, flat, and surjective and $X$ is regular, then $Y$ is regular.

Proof. By Lemma 61.8.3 we know that $Y$ is locally Noetherian. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. It suffices to prove that the local rings of $V$ are all regular local rings, see Properties, Lemma 27.9.2. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. As $f$ is surjective and flat the morphism of schemes $U \rightarrow V$ is surjective and flat. By assumption $U$ is a regular scheme in particular all of its local rings are regular (by the lemma above). Hence the lemma follows from Algebra, Lemma 10.109.9.

### 61.9. Descending properties of morphisms

03 YG In this section we introduce the notion of when a property of morphisms of algebraic spaces is local on the target in a topology. Please compare with Descent, Section 34.18

03YH Definition 61.9.1. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$. Let $\tau \in\{f p q c, f p p f$, syntomic, smooth, étale $\}$. We say $\mathcal{P}$ is $\tau$ local on the base, or $\tau$ local on the target, or local on the base for the $\tau$-topology if for any $\tau$-covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ of algebraic spaces and any morphism of algebraic spaces $f: X \rightarrow Y$ we have

$$
f \text { has } \mathcal{P} \Leftrightarrow \text { each } Y_{i} \times_{Y} X \rightarrow Y_{i} \text { has } \mathcal{P} .
$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \rightarrow Y$ if and only if it holds for any arrow $X^{\prime} \rightarrow Y^{\prime}$ isomorphic to $X \rightarrow Y$. If a property is $\tau$-local on the target then it is preserved by base changes by morphisms which occur in $\tau$-coverings. Here is a formal statement.

06EM Lemma 61.9.2. Let $S$ be a scheme. Let $\tau \in\{f p q c, f p p f$, syntomic, smooth, étale $\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$ which is $\tau$ local on the target. Let $f: X \rightarrow Y$ have property $\mathcal{P}$. For any morphism $Y^{\prime} \rightarrow Y$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ of $f$ has property $\mathcal{P}$.
Proof. This is true because we can fit $Y^{\prime} \rightarrow Y$ into a family of morphisms which forms a $\tau$-covering.
A simple often used consequence of the above is that if $f: X \rightarrow Y$ has property $\mathcal{P}$ which is $\tau$-local on the target and $f(X) \subset V$ for some open subspace $V \subset Y$, then also the induced morphism $X \rightarrow V$ has $\mathcal{P}$. Proof: The base change $f$ by $V \rightarrow Y$ gives $X \rightarrow V$.

06R2 Lemma 61.9.3. Let $S$ be a scheme. Let $\tau \in\{f p p f$, syntomic, smooth, étale $\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$ which is $\tau$ local on the target. For any morphism of algebraic spaces $f: X \rightarrow Y$ over $S$ there exists a largest open subspace $W(f) \subset Y$ such that the restriction $X_{W(f)} \rightarrow W(f)$ has $\mathcal{P}$. Moreover,
(1) if $g: Y^{\prime} \rightarrow Y$ is a morphism of algebraic spaces which is flat and locally of finite presentation, syntomic, smooth, or étale and the base change $f^{\prime}: X_{Y^{\prime}} \rightarrow Y^{\prime}$ has $\mathcal{P}$, then $g$ factors through $W(f)$,
(2) if $g: Y^{\prime} \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale, then $W\left(f^{\prime}\right)=g^{-1}(W(f))$, and
(3) if $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ is a $\tau$-covering, then $g_{i}^{-1}(W(f))=W\left(f_{i}\right)$, where $f_{i}$ is the base change of $f$ by $Y_{i} \rightarrow Y$.
Proof. Consider the union $W_{\text {set }} \subset|Y|$ of the images $g\left(\left|Y^{\prime}\right|\right) \subset|Y|$ of morphisms $g: Y^{\prime} \rightarrow Y$ with the properties:
(1) $g$ is flat and locally of finite presentation, syntomic, smooth, or étale, and
(2) the base change $Y^{\prime} \times_{g, Y} X \rightarrow Y^{\prime}$ has property $\mathcal{P}$.

Since such a morphism $g$ is open (see Morphisms of Spaces, Lemma 54.29.6) we see that $W_{\text {set }}$ is an open subset of $|Y|$. Denote $W \subset Y$ the open subspace whose underlying set of points is $W_{\text {set }}$, see Properties of Spaces, Lemma 53.4.8. Since $\mathcal{P}$
is local in the $\tau$ topology the restriction $X_{W} \rightarrow W$ has property $\mathcal{P}$ because we are given a covering $\left\{Y^{\prime} \rightarrow W\right\}$ of $W$ such that the pullbacks have $\mathcal{P}$. This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W\left(f^{\prime}\right) \supset g^{-1}(W(f))$ because $\mathcal{P}$ is stable under base change by flat and locally of finite presentation, syntomic, smooth, or étale morphisms, see Lemma 61.9.2, On the other hand, if $Y^{\prime \prime} \subset Y^{\prime}$ is an open such that $X_{Y^{\prime \prime}} \rightarrow Y^{\prime \prime}$ has property $\mathcal{P}$, then $Y^{\prime \prime} \rightarrow Y$ factors through $W$ by construction, i.e., $Y^{\prime \prime} \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each morphism $Y_{i} \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a $\tau$-covering.

041J Lemma 61.9.4. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$. Assume
(1) if $X_{i} \rightarrow Y_{i}, i=1,2$ have property $\mathcal{P}$ so does $X_{1} \amalg X_{2} \rightarrow Y_{1} \amalg Y_{2}$,
(2) a morphism of algebraic spaces $f: X \rightarrow Y$ has property $\mathcal{P}$ if and only if for every affine scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ of $f$ has property $\mathcal{P}$, and
(3) for any surjective flat morphism of affine schemes $Z^{\prime} \rightarrow Z$ over $S$ and a morphism $f: X \rightarrow Z$ from an algebraic space to $Z$ we have

$$
f^{\prime}: Z^{\prime} \times{ }_{Z} X \rightarrow Z^{\prime} \text { has } \mathcal{P} \Rightarrow f \text { has } \mathcal{P}
$$

Then $\mathcal{P}$ is fpqc local on the base.
Proof. If $\mathcal{P}$ has property (2), then it is automatically stable under any base change. Hence the direct implication in Definition 61.9.1.

Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fpqc covering of algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume each base change $f_{i}: Y_{i} \times{ }_{Y} X \rightarrow Y_{i}$ has property $\mathcal{P}$. Our goal is to show that $f$ has $\mathcal{P}$. Let $Z$ be an affine scheme, and let $Z \rightarrow Y$ be a morphism. By (2) it suffices to show that the morphism of algebraic spaces $Z \times_{Y} X \rightarrow Z$ has $\mathcal{P}$. Since $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ is an fpqc covering we know there exists a standard fpqc covering $\left\{Z_{j} \rightarrow Z\right\}_{j=1, \ldots, n}$ and morphisms $Z_{j} \rightarrow Y_{i_{j}}$ over $Y$ for suitable indices $i_{j} \in I$. Since $f_{i_{j}}$ has $\mathcal{P}$ we see that

$$
Z_{j} \times_{Y} X=Z_{j} \times_{Y_{i_{j}}}\left(Y_{i_{j}} \times_{Y} X\right) \longrightarrow Z_{j}
$$

has $\mathcal{P}$ as a base change of $f_{i_{j}}$ (see first remark of the proof). Set $Z^{\prime}=\coprod_{j=1, \ldots, n} Z_{j}$, so that $Z^{\prime} \rightarrow Z$ is a flat and surjective morphism of affine schemes over $S$. By (1) we conclude that $Z^{\prime} \times_{Y} X \rightarrow Z^{\prime}$ has property $\mathcal{P}$. Since this is the base change of the morphism $Z \times_{Y} X \rightarrow Z$ by the morphism $Z^{\prime} \rightarrow Z$ we conclude that $Z \times_{Y} X \rightarrow Z$ has property $\mathcal{P}$ as desired.

### 61.10. Descending properties of morphisms in the fpqc topology

041K In this section we find a large number of properties of morphisms of algebraic spaces which are local on the base in the fpqc topology. Please compare with Descent, Section 34.19 for the case of morphisms of schemes.

041L Lemma 61.10.1. Let $S$ be a scheme. The property $\mathcal{P}(f)=" f$ is quasi-compact" is fpqc local on the base on algebraic spaces over $S$.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma54.8.7. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is quasi-compact. We have to show that $f$ is quasi-compact. To see this, using Morphisms of Spaces, Lemma 54.8.7 again, it is enough to show that for every affine scheme $Y$ and morphism $Y \rightarrow Z$ the fibre product $Y \times_{Z} X$ is quasi-compact. Here is a picture:

Note that all squares are cartesian and the bottom square consists of affine schemes. The assumption that $f^{\prime}$ is quasi-compact combined with the fact that $Y \times_{Z} Z^{\prime}$ is affine implies that $Y \times_{Z} Z^{\prime} \times_{Z} X$ is quasi-compact. Since

$$
Y \times_{Z} Z^{\prime} \times_{Z} X \longrightarrow Y \times_{Z} X
$$

is surjective as a base change of $Z^{\prime} \rightarrow Z$ we conclude that $Y \times_{Z} X$ is quasi-compact, see Morphisms of Spaces, Lemma 54.8.5. This finishes the proof.

041N Lemma 61.10.2. Let $S$ be a scheme. The property $\mathcal{P}(f)=$ " $f$ is quasi-separated" is fpqc local on the base on algebraic spaces over $S$.

Proof. A base change of a quasi-separated morphism is quasi-separated, see Morphisms of Spaces, Lemma 54.4.4. Hence the direct implication in Definition 61.9.1.

Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fpqc covering of algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume each base change $X_{i}:=Y_{i} \times_{Y} X \rightarrow Y_{i}$ is quasi-separated. This means that each of the morphisms

$$
\Delta_{i}: X_{i} \longrightarrow X_{i} \times_{Y_{i}} X_{i}=Y_{i} \times_{Y}\left(X \times_{Y} X\right)
$$

is quasi-compact. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 60.3.2 hence $\left\{Y_{i} \times_{Y}\left(X \times_{Y} X\right) \rightarrow X \times_{Y} X\right\}$ is an fpqc covering of algebraic spaces. Moreover, each $\Delta_{i}$ is the base change of the morphism $\Delta: X \rightarrow X \times_{Y} X$. Hence it follows from Lemma 61.10.1 that $\Delta$ is quasi-compact, i.e., $f$ is quasi-separated.

041 O Lemma 61.10.3. Let $S$ be a scheme. The property $\mathcal{P}(f)=" f$ is universally closed" is fpqc local on the base on algebraic spaces over $S$.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma54.9.5. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is universally closed. We have to show that $f$ is universally closed. To see this, using Morphisms of

Spaces, Lemma 54.9.5 again, it is enough to show that for every affine scheme $Y$ and morphism $Y \rightarrow Z$ the map $\left|Y \times_{Z} X\right| \rightarrow|Y|$ is closed. Consider the cube 61.10.1.1). The assumption that $f^{\prime}$ is universally closed implies that $\left|Y \times_{Z} Z^{\prime} \times{ }_{Z} X\right| \rightarrow\left|Y \times{ }_{Z} Z^{\prime}\right|$ is closed. As $Y \times{ }_{Z} Z^{\prime} \rightarrow Y$ is surjective and flat as a base change of $Z^{\prime} \rightarrow Z$ we see the map $\left|Y \times{ }_{Z} Z^{\prime}\right| \rightarrow|Y|$ is submersive, see Morphisms, Lemma 28.25.10. Moreover the map

$$
\left|Y \times_{Z} Z^{\prime} \times_{Z} X\right| \longrightarrow\left|Y \times_{Z} Z^{\prime}\right| \times_{|Y|}\left|Y \times_{Z} X\right|
$$

is surjective, see Properties of Spaces, Lemma 53.4.3. It follows by elementary topology that $\left|Y \times{ }_{Z} X\right| \rightarrow|Y|$ is closed.
041P Lemma 61.10.4. Let $S$ be a scheme. The property $\mathcal{P}(f)=$ " $f$ is universally open" is fpqc local on the base on algebraic spaces over $S$.

Proof. The proof is the same as the proof of Lemma 61.10.3.
041Q Lemma 61.10.5. The property $\mathcal{P}(f)=$ " $f$ is surjective" is fpqc local on the base.
Proof. Omitted. (Hint: Use Properties of Spaces, Lemma 53.4.3.)
041R Lemma 61.10.6. The property $\mathcal{P}(f)=" f$ is universally injective" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.9.5. Let $Z^{\prime} \rightarrow Z$ be a flat surjective morphism of affine schemes over $S$ and let $f: X \rightarrow Z$ be a morphism from an algebraic space to $Z$. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow Z^{\prime}$ is universally injective. Let $K$ be a field, and let $a, b: \operatorname{Spec}(K) \rightarrow X$ be two morphisms such that $f \circ a=f \circ b$. As $Z^{\prime} \rightarrow Z$ is surjective there exists a field extension $K \subset K^{\prime}$ and a morphism $\operatorname{Spec}\left(K^{\prime}\right) \rightarrow Z^{\prime}$ such that the following solid diagram commutes

As the square is cartesian we get the two dotted arrows $a^{\prime}, b^{\prime}$ making the diagram commute. Since $X^{\prime} \rightarrow Z^{\prime}$ is universally injective we get $a^{\prime}=b^{\prime}$. This forces $a=b$ as $\left\{\operatorname{Spec}\left(K^{\prime}\right) \rightarrow \operatorname{Spec}(K)\right\}$ is an fpqc covering, see Properties of Spaces, Proposition 53.16.1. Hence $f$ is universally injective as desired.

041S Lemma 61.10.7. The property $\mathcal{P}(f)=" f$ is locally of finite type" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.23.4. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is locally of finite type. We have to show that $f$ is locally of finite type. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.23.4 again, it is enough to show that $U \rightarrow Z$ is locally of finite type. Since $f^{\prime}$ is locally
of finite type, and since $Z^{\prime} \times{ }_{Z} U$ is a scheme étale over $Z^{\prime} \times_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times_{Z} U \rightarrow Z^{\prime}$ is locally of finite type. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally of finite type by Descent, Lemma 34.19.8 as desired.

041T Lemma 61.10.8. The property $\mathcal{P}(f)=$ " $f$ is locally of finite presentation" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.28.4. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is locally of finite presentation. We have to show that $f$ is locally of finite presentation. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.28 .4 again, it is enough to show that $U \rightarrow Z$ is locally of finite presentation. Since $f^{\prime}$ is locally of finite presentation, and since $Z^{\prime} \times{ }_{Z} U$ is a scheme étale over $Z^{\prime} \times{ }_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times{ }_{Z} U \rightarrow Z^{\prime}$ is locally of finite presentation. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally of finite presentation by Descent, Lemma 34.19 .9 as desired.
041U Lemma 61.10.9. The property $\mathcal{P}(f)=$ " $f$ is of finite type" is fpqc local on the base.

Proof. Combine Lemmas 61.10.1 and 61.10.7
041V Lemma 61.10.10. The property $\mathcal{P}(f)=$ " $f$ is of finite presentation" is fpqc local on the base.

Proof. Combine Lemmas 61.10.1, 61.10.2 and 61.10.8.
041W Lemma 61.10.11. The property $\mathcal{P}(f)=" f$ is flat" is fpqc local on the base.
Proof. We will use Lemma 61.9 .4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.29.5. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is flat. We have to show that $f$ is flat. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.29 .5 again, it is enough to show that $U \rightarrow Z$ is flat. Since $f^{\prime}$ is flat, and since $Z^{\prime} \times_{Z} U$ is a scheme étale over $Z^{\prime} \times_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times{ }_{Z} U \rightarrow Z^{\prime}$ is flat. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is flat by Descent, Lemma 34.19.13 as desired.

041X Lemma 61.10.12. The property $\mathcal{P}(f)=$ " $f$ is an open immersion" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.12.1. Consider a cartesian diagram

of algebraic spaces over $S$ where $Z^{\prime} \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X^{\prime} \rightarrow Z^{\prime}$ is an open immersion. We have to show that $X \rightarrow Z$ is an open immersion. Note that $\left|X^{\prime}\right| \subset\left|Z^{\prime}\right|$ corresponds to an open subscheme $U^{\prime} \subset Z^{\prime}$ (isomorphic to $X^{\prime}$ ) with the property that $\operatorname{pr}_{0}^{-1}\left(U^{\prime}\right)=\operatorname{pr}_{1}^{-1}\left(U^{\prime}\right)$ as open subschemes of $Z^{\prime} \times{ }_{Z} Z^{\prime}$. Hence there exists an open subscheme $U \subset Z$ such that $X^{\prime}=\left(Z^{\prime} \rightarrow\right.$ $Z)^{-1}(U)$, see Descent, Lemma34.9.2. By Properties of Spaces, Proposition 53.16.1 we see that $X$ satisfies the sheaf condition for the fpqc topology. Now we have the fpqc covering $\mathcal{U}=\left\{U^{\prime} \rightarrow U\right\}$ and the element $U^{\prime} \rightarrow X^{\prime} \rightarrow X \in \check{H}^{0}(\mathcal{U}, X)$. By the sheaf condition we obtain a morphism $U \rightarrow X$ such that

is commutative. On the other hand, we know that for any scheme $T$ pver $S$ and $T$-valued point $T \rightarrow X$ the composition $T \rightarrow X \rightarrow Z$ is a morphism such that $Z^{\prime} \times{ }_{Z} T \rightarrow Z^{\prime}$ factors through $U^{\prime}$. Clearly this means that $T \rightarrow Z$ factors through $U$. In other words the map of sheaves $U \rightarrow X$ is bijective and we win.

041Y Lemma 61.10.13. The property $\mathcal{P}(f)=" f$ is an isomorphism" is fpqc local on the base.

Proof. Combine Lemmas 61.10.5 and 61.10.12,
041Z Lemma 61.10.14. The property $\mathcal{P}(f)=" f$ is affine" is fpqc local on the base.
Proof. We will use Lemma 61.9 .4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.20.3. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is affine. Let $X^{\prime}$ be a scheme representing $Z^{\prime} \times_{Z} X$. We obtain a canonical isomorphism

$$
\varphi: X^{\prime} \times_{Z} Z^{\prime} \longrightarrow Z^{\prime} \times_{Z} X^{\prime}
$$

since both schemes represent the algebraic space $Z^{\prime} \times{ }_{Z} Z^{\prime} \times{ }_{Z} X$. This is a descent datum for $X^{\prime} / Z^{\prime} / Z$, see Descent, Definition 34.30 .1 (verification omitted, compare with Descent, Lemma 34.35.1). Since $X^{\prime} \rightarrow Z^{\prime}$ is affine this descent datum is effective, see Descent, Lemma 34.33.1. Thus there exists a scheme $Y \rightarrow Z$ over $Z$ and an isomorphism $\psi: Z^{\prime} \times_{Z} Y \rightarrow X^{\prime}$ compatible with descent data. Of course $Y \rightarrow Z$ is affine (by construction or by Descent, Lemma 34.19.16). Note that $\mathcal{Y}=\left\{Z^{\prime} \times{ }_{Z} Y \rightarrow Y\right\}$ is a fpqc covering, and interpreting $\psi$ as an element of $X\left(Z^{\prime} \times{ }_{Z} Y\right)$ we see that $\psi \in \breve{H}^{0}(\mathcal{Y}, X)$. By the sheaf condition for $X$ with respect to this covering (see Properties of Spaces, Proposition 53.16.1) we obtain a morphism $Y \rightarrow X$. By construction the base change of this to $Z^{\prime}$ is an isomorphism, hence an isomorphism by Lemma 61.10 .13 . This proves that $X$ is representable by an affine scheme and we win.

0420 Lemma 61.10.15. The property $\mathcal{P}(f)=$ " $f$ is a closed immersion" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.12.1. Consider a cartesian diagram

of algebraic spaces over $S$ where $Z^{\prime} \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X^{\prime} \rightarrow Z^{\prime}$ is a closed immersion. We have to show that $X \rightarrow Z$ is a closed immersion. The morphism $X^{\prime} \rightarrow Z^{\prime}$ is affine. Hence by Lemma 61.10.14 we see that $X$ is a scheme and $X \rightarrow Z$ is affine. It follows from Descent, Lemma 34.19.17 that $X \rightarrow Z$ is a closed immersion as desired.

0421 Lemma 61.10.16. The property $\mathcal{P}(f)=" f$ is separated" is fpqc local on the base.
Proof. A base change of a separated morphism is separated, see Morphisms of Spaces, Lemma 54.4.4. Hence the direct implication in Definition 61.9.1.
Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fpqc covering of algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume each base change $X_{i}:=Y_{i} \times{ }_{Y} X \rightarrow Y_{i}$ is separated. This means that each of the morphisms

$$
\Delta_{i}: X_{i} \longrightarrow X_{i} \times_{Y_{i}} X_{i}=Y_{i} \times_{Y}\left(X \times_{Y} X\right)
$$

is a closed immersion. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 60.3 .2 hence $\left\{Y_{i} \times_{Y}\left(X \times_{Y} X\right) \rightarrow X \times_{Y} X\right\}$ is an fpqc covering of algebraic spaces. Moreover, each $\Delta_{i}$ is the base change of the morphism $\Delta: X \rightarrow X \times_{Y} X$. Hence it follows from Lemma 61.10.15 that $\Delta$ is a closed immersion, i.e., $f$ is separated.

0422 Lemma 61.10.17. The property $\mathcal{P}(f)=$ " $f$ is proper" is fpqc local on the base.
Proof. The lemma follows by combining Lemmas 61.10.3, 61.10.16 and 61.10.9.
0423 Lemma 61.10.18. The property $\mathcal{P}(f)=$ " $f$ is quasi-affine" is fpqc local on the base.

Proof. We will use Lemma 61.9 .4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.21.3. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times{ }_{Z} X \rightarrow Z^{\prime}$ is quasi-affine. Let $X^{\prime}$ be a scheme representing $Z^{\prime} \times_{Z} X$. We obtain a canonical isomorphism

$$
\varphi: X^{\prime} \times_{Z} Z^{\prime} \longrightarrow Z^{\prime} \times_{Z} X^{\prime}
$$

since both schemes represent the algebraic space $Z^{\prime} \times{ }_{Z} Z^{\prime} \times_{Z} X$. This is a descent datum for $X^{\prime} / Z^{\prime} / Z$, see Descent, Definition 34.30 .1 (verification omitted, compare with Descent, Lemma 34.35.1). Since $X^{\prime} \rightarrow Z^{\prime}$ is quasi-affine this descent datum is effective, see Descent, Lemma 34.34.1. Thus there exists a scheme $Y \rightarrow Z$ over $Z$ and an isomorphism $\psi: Z^{\prime} \times{ }_{Z} Y \rightarrow X^{\prime}$ compatible with descent data. Of course $Y \rightarrow Z$ is quasi-affine (by construction or by Descent, Lemma 34.19.18). Note that $\mathcal{Y}=\left\{Z^{\prime} \times{ }_{Z} Y \rightarrow Y\right\}$ is a fpqc covering, and interpreting $\psi$ as an element of $X\left(Z^{\prime} \times{ }_{Z} Y\right)$ we see that $\psi \in \check{H}^{0}(\mathcal{Y}, X)$. By the sheaf condition for $X$ (see Properties of Spaces, Proposition 53.16.1 we obtain a morphism $Y \rightarrow X$. By construction
the base change of this to $Z^{\prime}$ is an isomorphism, hence an isomorphism by Lemma 61.10 .13 . This proves that $X$ is representable by a quasi-affine scheme and we win.

0424 Lemma 61.10.19. The property $\mathcal{P}(f)=$ " $f$ is a quasi-compact immersion" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemmas 54.12.1 and 54.8.7. Consider a cartesian diagram

of algebraic spaces over $S$ where $Z^{\prime} \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X^{\prime} \rightarrow Z^{\prime}$ is a quasi-compact immersion. We have to show that $X \rightarrow Z$ is a closed immersion. The morphism $X^{\prime} \rightarrow Z^{\prime}$ is quasi-affine. Hence by Lemma 61.10 .18 we see that $X$ is a scheme and $X \rightarrow Z$ is quasi-affine. It follows from Descent, Lemma 34.19 .19 that $X \rightarrow Z$ is a quasi-compact immersion as desired.

0425 Lemma 61.10.20. The property $\mathcal{P}(f)=" f$ is integral" is fpqc local on the base.
Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms of Spaces, Lemma 54.43.7. Hence the lemma follows on combining Lemmas 61.10.3 and 61.10.14

0426 Lemma 61.10.21. The property $\mathcal{P}(f)=$ " $f$ is finite" is fpqc local on the base.
Proof. An finite morphism is the same thing as an integral, morphism which is locally of finite type. See Morphisms of Spaces, Lemma 54.43.6. Hence the lemma follows on combining Lemmas 61.10.7 and 61.10.20.

0427 Lemma 61.10.22. The properties $\mathcal{P}(f)=" f$ is locally quasi-finite" and $\mathcal{P}(f)=" f$ is quasi-finite" are fpqc local on the base.

Proof. We have already seen that "quasi-compact" is fpqc local on the base, see Lemma 61.10.1. Hence it is enough to prove the lemma for "locally quasi-finite". We will use Lemma 61.9 .4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.27.6. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is locally quasi-finite. We have to show that $f$ is locally quasi-finite. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.27.6 again, it is enough to show that $U \rightarrow Z$ is locally quasi-finite. Since $f^{\prime}$ is locally quasi-finite, and since $Z^{\prime} \times{ }_{Z} U$ is a scheme étale over $Z^{\prime} \times{ }_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times{ }_{Z} U \rightarrow Z^{\prime}$ is locally quasi-finite. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally quasi-finite by Descent, Lemma 34.19 .22 as desired.

0428 Lemma 61.10.23. The property $\mathcal{P}(f)=" f$ is syntomic" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.35.4. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is syntomic. We have to show that $f$ is syntomic. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.35.4 again, it is enough to show that $U \rightarrow Z$ is syntomic. Since $f^{\prime}$ is syntomic, and since $Z^{\prime} \times{ }_{Z} U$ is a scheme étale over $Z^{\prime} \times{ }_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times{ }_{Z} U \rightarrow Z^{\prime}$ is syntomic. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is syntomic by Descent, Lemma 34.19.24 as desired.

0429 Lemma 61.10.24. The property $\mathcal{P}(f)=$ " $f$ is smooth" is fpqc local on the base.
Proof. We will use Lemma 61.9 .4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.36.4. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is smooth. We have to show that $f$ is smooth. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.36.4 again, it is enough to show that $U \rightarrow Z$ is smooth. Since $f^{\prime}$ is smooth, and since $Z^{\prime} \times{ }_{Z} U$ is a scheme étale over $Z^{\prime} \times{ }_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times{ }_{Z} U \rightarrow Z^{\prime}$ is smooth. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is smooth by Descent, Lemma 34.19.25 as desired.

042A Lemma 61.10.25. The property $\mathcal{P}(f)=" f$ is unramified" is fpqc local on the base.

Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.37.5. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times{ }_{Z} X \rightarrow Z^{\prime}$ is unramified. We have to show that $f$ is unramified. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.37.5again, it is enough to show that $U \rightarrow Z$ is unramified. Since $f^{\prime}$ is unramified, and since $Z^{\prime} \times_{Z} U$ is a scheme étale over $Z^{\prime} \times_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times_{Z} U \rightarrow Z^{\prime}$ is unramified. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is unramified by Descent, Lemma 34.19 .26 as desired.

042B Lemma 61.10.26. The property $\mathcal{P}(f)=$ " $f$ is étale" is fpqc local on the base.
Proof. We will use Lemma 61.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 54.38.2. Let $Z^{\prime} \rightarrow Z$ be a surjective flat morphism of affine schemes over $S$. Let $f: X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f^{\prime}: Z^{\prime} \times_{Z} X \rightarrow Z^{\prime}$ is étale. We have to show that $f$ is étale. Let $U$ be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 54.38 .2 again, it is enough to show that $U \rightarrow Z$ is étale. Since $f^{\prime}$ is étale, and since $Z^{\prime} \times_{Z} U$ is a scheme étale over $Z^{\prime} \times_{Z} X$ we conclude (by the same lemma again) that $Z^{\prime} \times_{Z} U \rightarrow Z^{\prime}$ is étale. As $\left\{Z^{\prime} \rightarrow Z\right\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is étale by Descent, Lemma 34.19.27 as desired.

042C Lemma 61.10.27. The property $\mathcal{P}(f)=" f$ is finite locally free" is fpqc local on the base.

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms of Spaces, Lemma 54.44.6). Hence this follows from Lemmas 61.10.21, 61.10.11, and 61.10.8.

042D Lemma 61.10.28. The property $\mathcal{P}(f)=" f$ is a monomorphism" is fpqc local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. Let $\left\{Y_{i} \rightarrow Y\right\}$ be an fpqc covering, and assume each of the base changes $f_{i}: X_{i} \rightarrow Y_{i}$ of $f$ is a monomorphism. We have to show that $f$ is a monomorphism.

First proof. Note that $f$ is a monomorphism if and only if $\Delta: X \rightarrow X \times_{Y} X$ is an isomorphism. By applying this to $f_{i}$ we see that each of the morphisms

$$
\Delta_{i}: X_{i} \longrightarrow X_{i} \times_{Y_{i}} X_{i}=Y_{i} \times_{Y}\left(X \times_{Y} X\right)
$$

is an isomorphism. The base change of an fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 60.3.2 hence $\left\{Y_{i} \times_{Y}\left(X \times_{Y} X\right) \rightarrow X \times_{Y} X\right\}$ is an fpqc covering of algebraic spaces. Moreover, each $\Delta_{i}$ is the base change of the morphism $\Delta: X \rightarrow X \times_{Y} X$. Hence it follows from Lemma 61.10 .13 that $\Delta$ is an isomorphism, i.e., $f$ is a monomorphism.

Second proof. Let $V$ be a scheme, and let $V \rightarrow Y$ be a surjective étale morphism. If we can show that $V \times_{Y} X \rightarrow V$ is a monomorphism, then it follows that $X \rightarrow Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

if $c$ is a surjection of sheaves, and $a$ is injective, then also $d$ is injective. This reduces the problem to the case where $Y$ is a scheme. Moreover, in this case we may assume that the algebraic spaces $Y_{i}$ are schemes also, since we can always refine the covering to place ourselves in this situation, see Topologies on Spaces, Lemma 60.3.4.

Assume $\left\{Y_{i} \rightarrow Y\right\}$ is an fpqc covering of schemes. Let $a, b: T \rightarrow X$ be two morphisms such that $f \circ a=f \circ b$. We have to show that $a=b$. Since $f_{i}$ is a monomorphism we see that $a_{i}=b_{i}$, where $a_{i}, b_{i}: Y_{i} \times_{Y} T \rightarrow X_{i}$ are the base changes. In particular the compositions $Y_{i} \times_{Y} T \rightarrow T \rightarrow X$ are equal. Since $\left\{Y_{i} \times_{Y} T \rightarrow T\right\}$ is an fpqc covering we deduce that $a=b$ from Properties of Spaces, Proposition 53.16.1.

### 61.11. Descending properties of morphisms in the fppf topology

042 E In this section we find some properties of morphisms of algebraic spaces for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

042U Lemma 61.11.1. The property $\mathcal{P}(f)=" f$ is an immersion" is fppf local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fppf covering of $Y$. Let $f_{i}: X_{i} \rightarrow Y_{i}$ be the base change of $f$.
If $f$ is an immersion, then each $f_{i}$ is an immersion by Spaces, Lemma 52.12.3. This proves the direct implication in Definition 61.9.1.

Conversely, assume each $f_{i}$ is an immersion. By Morphisms of Spaces, Lemma 54.10 .7 this implies each $f_{i}$ is separated. By Morphisms of Spaces, Lemma 54.27.7 this implies each $f_{i}$ is locally quasi-finite. Hence we see that $f$ is locally quasifinite and separated, by applying Lemmas 61.10.16 and 61.10.22, By Morphisms of Spaces, Lemma 54.48.1 this implies that $f$ is representable!
By Morphisms of Spaces, Lemma 54.12.1 it suffices to show that for every scheme $Z$ and morphism $Z \rightarrow Y$ the base change $Z \times_{Y} X \rightarrow Z$ is an immersion. By Topologies on Spaces, Lemma 60.4.3 we can find an fppf covering $\left\{Z_{i} \rightarrow Z\right\}$ by schemes which refines the pullback of the covering $\left\{Y_{i} \rightarrow Y\right\}$ to $Z$. Hence we see that $Z \times_{Y} X \rightarrow Z$ (which is a morphism of schemes according to the result of the preceding paragraph) becomes an immersion after pulling back to the members of an fppf (by schemes) of $Z$. Hence $Z \times_{Y} X \rightarrow Z$ is an immersion by the result for schemes, see Descent, Lemma 34.20.1.

042F Lemma 61.11.2. The property $\mathcal{P}(f)=" f$ is locally separated" is fppf local on the base.

Proof. A base change of a locally separated morphism is locally separated, see Morphisms of Spaces, Lemma 54.4.4. Hence the direct implication in Definition 61.9 .1

Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fppf covering of algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume each base change $X_{i}:=Y_{i} \times{ }_{Y} X \rightarrow Y_{i}$ is locally separated. This means that each of the morphisms

$$
\Delta_{i}: X_{i} \longrightarrow X_{i} \times_{Y_{i}} X_{i}=Y_{i} \times_{Y}\left(X \times_{Y} X\right)
$$

is an immersion. The base change of a fppf covering is an fppf covering, see Topologies on Spaces, Lemma 60.4.2 hence $\left\{Y_{i} \times_{Y}\left(X \times_{Y} X\right) \rightarrow X \times_{Y} X\right\}$ is an fppf covering of algebraic spaces. Moreover, each $\Delta_{i}$ is the base change of the morphism $\Delta: X \rightarrow X \times_{Y} X$. Hence it follows from Lemma 61.11.1 that $\Delta$ is a immersion, i.e., $f$ is locally separated.

### 61.12. Properties of morphisms local on the source

06 EN In this section we define what it means for a property of morphisms of algebraic spaces to be local on the source. Please compare with Descent, Section 34.22 .
06EP Definition 61.12.1. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale $\}$. We say $\mathcal{P}$ is $\tau$ local on the source, or local on the source for the $\tau$-topology if for any morphism $f: X \rightarrow Y$ of algebraic spaces over $S$, and any $\tau$-covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ of algebraic spaces we have

$$
f \text { has } \mathcal{P} \Leftrightarrow \text { each } X_{i} \rightarrow Y \text { has } \mathcal{P} .
$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \rightarrow Y$ if and only if it holds for any arrow $X^{\prime} \rightarrow Y^{\prime}$ isomorphic to $X \rightarrow Y$. If a property is $\tau$-local on the source then it is preserved by precomposing with morphisms which occur in $\tau$-coverings. Here is a formal statement.
61.14. PROPERTIES OF MORPHISMS LOCAL IN THE FPPF TOPOLOGY ON THE SOUR88E6

06EQ Lemma 61.12.2. Let $S$ be a scheme. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale\}. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$ which is $\tau$ local on the source. Let $f: X \rightarrow Y$ have property $\mathcal{P}$. For any morphism $a: X^{\prime} \rightarrow$ $X$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. smooth, resp. étale, the composition $f \circ a: X^{\prime} \rightarrow Y$ has property $\mathcal{P}$.

Proof. This is true because we can fit $X^{\prime} \rightarrow X$ into a family of morphisms which forms a $\tau$-covering.

06ER Lemma 61.12.3. Let $S$ be a scheme. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale\}. Suppose that $\mathcal{P}$ is a property of morphisms of schemes over $S$ which is étale local on the source-and-target. Denote $\mathcal{P}_{\text {spaces }}$ the corresponding property of morphisms of algebraic spaces over S, see Morphisms of Spaces, Definition54.22.2. If $\mathcal{P}$ is local on the source for the $\tau$-topology, then $\mathcal{P}_{\text {spaces }}$ is local on the source for the $\tau$-topology.

Proof. Let $f: X \rightarrow Y$ be a morphism of of algebraic spaces over $S$. Let $\left\{X_{i} \rightarrow\right.$ $X\}_{i \in I}$ be a $\tau$-covering of algebraic spaces. Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. For each $i$ choose a scheme $U_{i}$ and a surjective étale morphism $U_{i} \rightarrow X_{i} \times_{X} U$.

Note that $\left\{X_{i} \times_{X} U \rightarrow U\right\}_{i \in I}$ is a $\tau$-covering. Note that each $\left\{U_{i} \rightarrow X_{i} \times_{X} U\right\}$ is an étale covering, hence a $\tau$-covering. Hence $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a $\tau$-covering of algebraic spaces over $S$. But since $U$ and each $U_{i}$ is a scheme we see that $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a $\tau$-covering of schemes over $S$.

Now we have

$$
\begin{aligned}
f \text { has } \mathcal{P}_{\text {spaces }} & \Leftrightarrow U \rightarrow V \text { has } \mathcal{P} \\
& \Leftrightarrow \text { each } U_{i} \rightarrow V \text { has } \mathcal{P} \\
& \Leftrightarrow \text { each } X_{i} \rightarrow Y \text { has } \mathcal{P}_{\text {spaces }} .
\end{aligned}
$$

the first and last equivalence by the definition of $\mathcal{P}_{\text {spaces }}$ the middle equivalence because we assumed $\mathcal{P}$ is local on the source in the $\tau$-topology.

### 61.13. Properties of morphisms local in the fpqc topology on the source

06ES Here are some properties of morphisms that are fpqc local on the source.
06ET Lemma 61.13.1. The property $\mathcal{P}(f)=$ " $f$ is flat" is fpqc local on the source.
Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.29.1 and Descent, Lemma 34.23.1.
61.14. Properties of morphisms local in the fppf topology on the source

06 EU Here are some properties of morphisms that are fppf local on the source.
06EV Lemma 61.14.1. The property $\mathcal{P}(f)=" f$ is locally of finite presentation" is fppf local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.28.1 and Descent, Lemma 34.24.1.

06EW Lemma 61.14.2. The property $\mathcal{P}(f)=$ " $f$ is locally of finite type" is fppf local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.23.1 and Descent, Lemma 34.24.2

06EX Lemma 61.14.3. The property $\mathcal{P}(f)=" f$ is open" is fppf local on the source.
Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.6.2 and Descent, Lemma 34.24.3.

06EY Lemma 61.14.4. The property $\mathcal{P}(f)=$ " $f$ is universally open" is fppf local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.6.2 and Descent, Lemma 34.24.4.

### 61.15. Properties of morphisms local in the syntomic topology on the source

06 EZ Here are some properties of morphisms that are syntomic local on the source.
06F0 Lemma 61.15.1. The property $\mathcal{P}(f)=" f$ is syntomic" is syntomic local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.35.1 and Descent, Lemma 34.25.1.

### 61.16. Properties of morphisms local in the smooth topology on the source

06F1 Here are some properties of morphisms that are smooth local on the source.
06F2 Lemma 61.16.1. The property $\mathcal{P}(f)=" f$ is smooth" is smooth local on the source. Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.36.1 and Descent, Lemma 34.26.1.

### 61.17. Properties of morphisms local in the étale topology on the source

06F3 Here are some properties of morphisms that are étale local on the source.
06F4 Lemma 61.17.1. The property $\mathcal{P}(f)=" f$ is étale" is étale local on the source.
Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.38.1 and Descent, Lemma 34.27.1.

06F5 Lemma 61.17.2. The property $\mathcal{P}(f)=" f$ is locally quasi-finite" is étale local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.27.1 and Descent, Lemma 34.27.2

06F6 Lemma 61.17.3. The property $\mathcal{P}(f)=$ " $f$ is unramified"is étale local on the source.

Proof. Follows from Lemma 61.12.3 using Morphisms of Spaces, Definition 54.37.1 and Descent, Lemma 34.27.3.

### 61.18. Properties of morphisms smooth local on source-and-target

06F7 Let $\mathcal{P}$ be a property of morphisms of algebraic spaces. There is an intuitive meaning to the phrase " $\mathcal{P}$ is smooth local on the source and target". However, it turns out that this notion is not the same as asking $\mathcal{P}$ to be both smooth local on the source and smooth local on the target. We have discussed a similar phenomenon (for the étale topology and the category of schemes) in great detail in Descent, Section 34.28 (for a quick overview take a look at Descent, Remark 34.28.8). However, there is an important difference between the case of the smooth and the étale topology. To see this difference we encourage the reader to ponder the difference between Descent, Lemma 34.28 .4 and Lemma 61.18 .2 as well as the difference between Descent, Lemma 34.28.5 and Lemma 61.18.3. Namely, in the étale setting the choice of the étale "covering" of the target is immaterial, whereas in the smooth setting it is not.

06F8 Definition 61.18.1. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$. We say $\mathcal{P}$ is smooth local on source-and-target if
(1) (stable under precomposing with smooth maps) if $f: X \rightarrow Y$ is smooth and $g: Y \rightarrow Z$ has $\mathcal{P}$, then $g \circ f$ has $\mathcal{P}$,
(2) (stable under smooth base change) if $f: X \rightarrow Y$ has $\mathcal{P}$ and $Y^{\prime} \rightarrow Y$ is smooth, then the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ has $\mathcal{P}$, and
(3) (locality) given a morphism $f: X \rightarrow Y$ the following are equivalent
(a) $f$ has $\mathcal{P}$,
(b) for every $x \in|X|$ there exists a commutative diagram

with smooth vertical arrows and $u \in|U|$ with $a(u)=x$ such that $h$ has $\mathcal{P}$.

The above serves as our definition. In the lemmas below we will show that this is equivalent to $\mathcal{P}$ being local on the target, local on the source, and stable under post-composing by smooth morphisms.

06F9 Lemma 61.18.2. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$ which is smooth local on source-and-target. Then
(1) $\mathcal{P}$ is smooth local on the source,
(2) $\mathcal{P}$ is smooth local on the target,
(3) $\mathcal{P}$ is stable under postcomposing with smooth morphisms: if $f: X \rightarrow Y$ has $\mathcal{P}$ and $g: Y \rightarrow Z$ is smooth, then $g \circ f$ has $\mathcal{P}$, and

Proof. We write everything out completely.
Proof of (1). Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a smooth covering of $X$. If each composition $h_{i}: X_{i} \rightarrow Y$ has $\mathcal{P}$, then for each $|x| \in X$ we can find an $i \in I$ and a point $x_{i} \in\left|X_{i}\right|$ mapping to $x$. Then $\left(X_{i}, x_{i}\right) \rightarrow(X, x)$ is a smooth morphism of pairs, and $\operatorname{id}_{Y}: Y \rightarrow Y$ is a smooth morphism, and $h_{i}$ is as in part (3) of Definition 61.18.1. Thus we see that $f$ has $\mathcal{P}$. Conversely, if $f$ has $\mathcal{P}$ then each $X_{i} \rightarrow Y$ has $\mathcal{P}$ by Definition 61.18.1 part (1).

Proof of (2). Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be a smooth covering of $Y$. Write $X_{i}=Y_{i} \times_{Y} X$ and $h_{i}: X_{i} \rightarrow Y_{i}$ for the base change of $f$. If each $h_{i}: X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$, then for each $x \in|X|$ we pick an $i \in I$ and a point $x_{i} \in\left|X_{i}\right|$ mapping to $x$. Then $\left(X_{i}, x_{i}\right) \rightarrow(X, x)$ is a smooth morphism of pairs, $Y_{i} \rightarrow Y$ is smooth, and $h_{i}$ is as in part (3) of Definition 61.18.1. Thus we see that $f$ has $\mathcal{P}$. Conversely, if $f$ has $\mathcal{P}$, then each $X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$ by Definition 61.18.1 part (2).

Proof of (3). Assume $f: X \rightarrow Y$ has $\mathcal{P}$ and $g: Y \rightarrow Z$ is smooth. For every $x \in|X|$ we can think of $(X, x) \rightarrow(X, x)$ as a smooth morphism of pairs, $Y \rightarrow Z$ is a smooth morphism, and $h=f$ is as in part (3) of Definition 61.18.1. Thus we see that $g \circ f$ has $\mathcal{P}$.

The following lemma is the analogue of Morphisms, Lemma 28.14.4
06FA Lemma 61.18.3. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$ which is smooth local on source-and-target. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(a) $f$ has property $\mathcal{P}$,
(b) for every $x \in|X|$ there exists a smooth morphism of pairs a : $(U, u) \rightarrow$ $(X, x)$, a smooth morphism $b: V \rightarrow Y$, and a morphism $h: U \rightarrow V$ such that $f \circ a=b \circ h$ and $h$ has $\mathcal{P}$,
(c) for some commutative diagram

with $a, b$ smooth and a surjective the morphism $h$ has $\mathcal{P}$,
(d) for any commutative diagram

with $b$ smooth and $U \rightarrow X \times_{Y} V$ smooth the morphism $h$ has $\mathcal{P}$,
(e) there exists a smooth covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ such that each base change $Y_{i} \times_{Y} X \rightarrow Y_{i}$ has $\mathcal{P}$,
(f) there exists a smooth covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ such that each composition $X_{i} \rightarrow Y$ has $\mathcal{P}$,
(g) there exists a smooth covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ and for each $i \in I$ a smooth covering $\left\{X_{i j} \rightarrow Y_{i} \times_{Y} X\right\}_{j \in J_{i}}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ has $\mathcal{P}$.

Proof. The equivalence of (a) and (b) is part of Definition61.18.1. The equivalence of (a) and (e) is Lemma 61.18.2 part (2). The equivalence of (a) and (f) is Lemma 61.18 .2 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).
It is clear that (c) implies (b). If (b) holds, then for any $x \in|X|$ we can choose a smooth morphism of pairs $a_{x}:\left(U_{x}, u_{x}\right) \rightarrow(X, x)$, a smooth morphism $b_{x}: V_{x} \rightarrow Y$, and a morphism $h_{x}: U_{x} \rightarrow V_{x}$ such that $f \circ a_{x}=b_{x} \circ h_{x}$ and $h_{x}$ has $\mathcal{P}$. Then
$h=\coprod h_{x}: \coprod U_{x} \rightarrow \coprod V_{x}$ with $a=\coprod a_{x}$ and $b=\coprod b_{x}$ is a diagram as in (c). (Note that $h$ has property $\mathcal{P}$ as $\left\{V_{x} \rightarrow \coprod V_{x}\right\}$ is a smooth covering and $\mathcal{P}$ is smooth local on the target.) Thus (b) is equivalent to (c).
Now we know that (a), (b), (c), (e), (f), and (g) are equivalent. Suppose (a) holds. Let $U, V, a, b, h$ be as in (d). Then $X \times_{Y} V \rightarrow V$ has $\mathcal{P}$ as $\mathcal{P}$ is stable under smooth base change, whence $U \rightarrow V$ has $\mathcal{P}$ as $\mathcal{P}$ is stable under precomposing with smooth morphisms. Conversely, if (d) holds, then setting $U=X$ and $V=Y$ we see that $f$ has $\mathcal{P}$.

06FB Lemma 61.18.4. Let $S$ be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over $S$. Assume
(1) $\mathcal{P}$ is smooth local on the source,
(2) $\mathcal{P}$ is smooth local on the target, and
(3) $\mathcal{P}$ is stable under postcomposing with smooth morphisms: if $f: X \rightarrow Y$ has $\mathcal{P}$ and $Y \subset Z$ is a smooth morphism then $X \rightarrow Z$ has $\mathcal{P}$.
Then $\mathcal{P}$ is smooth local on the source-and-target.
Proof. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 61.12.2 we see that $\mathcal{P}$ is stable under precomposing with smooth morphisms. By Lemma 61.9.2 we see that $\mathcal{P}$ is stable under smooth base change. Hence it suffices to prove part (3) of Definition 61.18 .1 holds.

More precisely, suppose that $f: X \rightarrow Y$ is a morphism of algebraic spaces over $S$ which satisfies Definition 61.18.1 part (3)(b). In other words, for every $x \in X$ there exists a smooth morphism $a_{x}: U_{x} \rightarrow X$, a point $u_{x} \in\left|U_{x}\right|$ mapping to $x$, a smooth morphism $b_{x}: V_{x} \rightarrow Y$, and a morphism $h_{x}: U_{x} \rightarrow V_{x}$ such that $f \circ a_{x}=b_{x} \circ h_{x}$ and $h_{x}$ has $\mathcal{P}$. The proof of the lemma is complete once we show that $f$ has $\mathcal{P}$. Set $U=\coprod U_{x}, a=\coprod a_{x}, V=\coprod V_{x}, b=\coprod b_{x}$, and $h=\coprod h_{x}$. We obtain a commutative diagram

with $a, b$ smooth, $a$ surjective. Note that $h$ has $\mathcal{P}$ as each $h_{x}$ does and $\mathcal{P}$ is smooth local on the target. Because $a$ is surjective and $\mathcal{P}$ is smooth local on the source, it suffices to prove that $b \circ h$ has $\mathcal{P}$. This follows as we assumed that $\mathcal{P}$ is stable under postcomposing with a smooth morphism and as $b$ is smooth.

06FC Remark 61.18.5. Using Lemma 61.18.4 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are smooth local on the source-and-target. In each case we list the lemma which implies the property is smooth local on the source and the lemma which implies the property is smooth local on the target. In each case the third assumption of Lemma 61.18.4 is trivial to check, and we omit it. Here is the list:
(1) flat, see Lemmas 61.13.1 and 61.10.11,
(2) locally of finite presentation, see Lemmas 61.14.1 and 61.10.8
(3) locally finite type, see Lemmas 61.14.2 and 61.10.7.
(4) universally open, see Lemmas 61.14.4 and 61.10.4
(5) syntomic, see Lemmas 61.15.1 and 61.10.23,
(6) smooth, see Lemmas 61.16.1 and 61.10.24,
(7) add more here as needed.

### 61.19. Descent data for spaces over spaces

0ADF This section is the analogue of Descent, Section 34.30 for algebraic spaces. Most of the arguments in this section are formal relying only on the definition of a descent datum.

0ADG Definition 61.19.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$.
(1) Let $V \rightarrow Y$ be a morphism of algebraic spaces. A descent datum for $V / Y / X$ is an isomorphism $\varphi: V \times_{X} Y \rightarrow Y \times_{X} V$ of algebraic spaces over $Y \times_{X} Y$ satisfying the cocycle condition that the diagram

commutes (with obvious notation).
(2) We also say that the pair $(V / Y, \varphi)$ is a descent datum relative to $Y \rightarrow X$.
(3) A morphism $f:(V / Y, \varphi) \rightarrow\left(V^{\prime} / Y, \varphi^{\prime}\right)$ of descent data relative to $Y \rightarrow X$ is a morphism $f: V \rightarrow V^{\prime}$ of algebraic spaces over $Y$ such that the diagram

commutes.
0ADH Remark 61.19.2. Let $S$ be a scheme. Let $Y \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $(V / Y, \varphi)$ be a descent datum relative to $Y \rightarrow X$. We may think of the isomorphism $\varphi$ as an isomorphism

$$
\left(Y \times_{X} Y\right) \times_{\mathrm{pr}_{0}, Y} V \longrightarrow\left(Y \times_{X} Y\right) \times_{\mathrm{pr}_{1}, Y} V
$$

of algebraic spaces over $Y \times_{X} Y$. So loosely speaking one may think of $\varphi$ as a map $\varphi: \operatorname{pr}_{0}^{*} V \rightarrow \operatorname{pr}_{1}^{*} V^{1}$. The cocycle condition then says that $\operatorname{pr}_{02}^{*} \varphi=\operatorname{pr}_{12}^{*} \varphi \circ \operatorname{pr}_{01}^{*} \varphi$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

Here is the definition in case you have a family of morphisms with fixed target.
0ADI Definition 61.19.3. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a family of morphisms of algebraic spaces over $S$ with fixed target $X$.
(1) A descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow X\right\}$ is given by an algebraic space $V_{i}$ over $X_{i}$ for each $i \in I$, an isomorphism $\varphi_{i j}: V_{i} \times{ }_{X} X_{j} \rightarrow$

[^172]$X_{i} \times_{X} V_{j}$ of algebraic spaces over $X_{i} \times_{X} X_{j}$ for each pair $(i, j) \in I^{2}$ such that for every triple of indices $(i, j, k) \in I^{3}$ the diagram

of algebraic spaces over $X_{i} \times{ }_{X} X_{j} \times_{X} X_{k}$ commutes (with obvious notation).
(2) A morphism $\psi:\left(V_{i}, \varphi_{i j}\right) \rightarrow\left(V_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data is given by a family $\psi=\left(\psi_{i}\right)_{i \in I}$ of morphisms $\psi_{i}: V_{i} \rightarrow V_{i}^{\prime}$ of algebraic spaces over $X_{i}$ such that all the diagrams

commute.
0ADJ Remark 61.19.4. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a family of morphisms of algebraic spaces over $S$ with fixed target $X$. Let $\left(V_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow X\right\}$. We may think of the isomorphisms $\varphi_{i j}$ as isomorphisms
$$
\left(X_{i} \times_{X} X_{j}\right) \times_{\operatorname{pr}_{0}, X_{i}} V_{i} \longrightarrow\left(X_{i} \times_{X} X_{j}\right) \times_{\operatorname{pr}_{1}, X_{j}} V_{j}
$$
of algebraic spaces over $X_{i} \times{ }_{X} X_{j}$. So loosely speaking one may think of $\varphi_{i j}$ as an isomorphism $\mathrm{pr}_{0}^{*} V_{i} \rightarrow \operatorname{pr}_{1}^{*} V_{j}$ over $X_{i} \times_{X} X_{j}$. The cocycle condition then says that $\operatorname{pr}_{02}^{*} \varphi_{i k}=\operatorname{pr}_{12}^{*} \varphi_{j k} \circ \operatorname{pr}_{01}^{*} \varphi_{i j}$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

The reason we will usually work with the version of a family consisting of a single morphism is the following lemma.

0ADK Lemma 61.19.5. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be a family of morphisms of algebraic spaces over $S$ with fixed target $X$. Set $Y=\coprod_{i \in I} X_{i}$. There is a canonical equivalence of categories

$$
\begin{gathered}
\text { category of descent data } \\
\text { relative to the family }\left\{X_{i} \rightarrow X\right\}_{i \in I}
\end{gathered} \longrightarrow \begin{gathered}
\text { category of descent data } \\
\text { relative to } Y / X
\end{gathered}
$$

which maps $\left(V_{i}, \varphi_{i j}\right)$ to $(V, \varphi)$ with $V=\coprod_{i \in I} V_{i}$ and $\varphi=\coprod \varphi_{i j}$.
Proof. Observe that $Y \times_{X} Y=\coprod_{i j} X_{i} \times_{X} X_{j}$ and similarly for higher fibre products. Giving a morphism $V \rightarrow Y$ is exactly the same as giving a family $V_{i} \rightarrow X_{i}$. And giving a descent datum $\varphi$ is exactly the same as giving a family $\varphi_{i j}$.

0ADL Lemma 61.19.6. Pullback of descent data. Let $S$ be a scheme.
(1) Let

be a commutative diagram of algebraic spaces over $S$. The construction

$$
(V \rightarrow Y, \varphi) \longmapsto f^{*}(V \rightarrow Y, \varphi)=\left(V^{\prime} \rightarrow Y^{\prime}, \varphi^{\prime}\right)
$$

where $V^{\prime}=Y^{\prime} \times_{Y} V$ and where $\varphi^{\prime}$ is defined as the composition

defines a functor from the category of descent data relative to $Y \rightarrow X$ to the category of descent data relative to $Y^{\prime} \rightarrow X^{\prime}$.
(2) Given two morphisms $f_{i}: Y^{\prime} \rightarrow Y, i=0,1$ making the diagram commute the functors $f_{0}^{*}$ and $f_{1}^{*}$ are canonically isomorphic.

Proof. We omit the proof of (1), but we remark that the morphism $\varphi^{\prime}$ is the morphism $(f \times f)^{*} \varphi$ in the notation introduced in Remark 61.19.2 For (2) we indicate which morphism $f_{0}^{*} V \rightarrow f_{1}^{*} V$ gives the functorial isomorphism. Namely, since $f_{0}$ and $f_{1}$ both fit into the commutative diagram we see there is a unique morphism $r: Y^{\prime} \rightarrow Y \times_{X} Y$ with $f_{i}=\operatorname{pr}_{i} \circ r$. Then we take

$$
\begin{aligned}
f_{0}^{*} V & =Y^{\prime} \times_{f_{0}, Y} V \\
& =Y^{\prime} \times_{\mathrm{pr}_{0} \circ r, Y} V \\
& =Y^{\prime} \times_{r, Y \times{ }_{X} Y}\left(Y \times_{X} Y\right) \times_{\mathrm{pr}_{0}, Y} V \\
& \underline{\rightarrow} \\
& =Y^{\prime} \times_{r, Y \times{ }_{X} Y}\left(Y \times_{X} Y\right) \times_{\mathrm{pr}_{1}, Y} V \\
& =Y^{\prime} \times_{\mathrm{pr}_{1} \circ r, Y} V \\
& =Y_{1}^{\prime} V
\end{aligned}
$$

We omit the verification that this works.
0ADM Definition 61.19.7. With $S, X, X^{\prime}, Y, Y^{\prime}, f, a, a^{\prime}, h$ as in Lemma 61.19.6 the functor

$$
(V, \varphi) \longmapsto f^{*}(V, \varphi)
$$

constructed in that lemma is called the pullback functor on descent data.
0ADN Lemma 61.19.8. Let $S$ be a scheme. Let $\mathcal{U}^{\prime}=\left\{X_{i}^{\prime} \rightarrow X^{\prime}\right\}_{i \in I^{\prime}}$ and $\mathcal{U}=\left\{X_{j} \rightarrow\right.$ $X\}_{i \in I}$ be families of morphisms with fixed target. Let $\alpha: I^{\prime} \rightarrow I, g: X^{\prime} \rightarrow X$ and $g_{i}: X_{i}^{\prime} \rightarrow X_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.
(1) Let $\left(V_{i}, \varphi_{i j}\right)$ be a descent datum relative to the family $\mathcal{U}$. The system

$$
\left(g_{i}^{*} V_{\alpha(i)},\left(g_{i} \times g_{j}\right)^{*} \varphi_{\alpha(i) \alpha(j)}\right)
$$

(with notation as in Remark 61.19.4) is a descent datum relative to $\mathcal{U}^{\prime}$.
(2) This construction defines a functor between the category of descent data relative to $\mathcal{U}$ and the category of descent data relative to $\mathcal{U}^{\prime}$.
(3) Given a second $\beta: I^{\prime} \rightarrow I, h: X^{\prime} \rightarrow X$ and $h_{i}^{\prime}: X_{i}^{\prime} \rightarrow X_{\beta(i)}$ morphism of families of maps with fixed target, then if $g=h$ the two resulting functors between descent data are canonically isomorphic.
(4) These functors agree, via Lemma 61.19.5, with the pullback functors constructed in Lemma 61.19.6.

Proof. This follows from Lemma 61.19.6 via the correspondence of Lemma 61.19.5.

0ADP Definition 61.19.9. With $\mathcal{U}^{\prime}=\left\{X_{i}^{\prime} \rightarrow X^{\prime}\right\}_{i \in I^{\prime}}, \mathcal{U}=\left\{X_{i} \rightarrow X\right\}_{i \in I}, \alpha: I^{\prime} \rightarrow I$, $g: X^{\prime} \rightarrow X$, and $g_{i}: X_{i}^{\prime} \rightarrow X_{\alpha(i)}$ as in Lemma 61.19.8 the functor

$$
\left(V_{i}, \varphi_{i j}\right) \longmapsto\left(g_{i}^{*} V_{\alpha(i)},\left(g_{i} \times g_{j}\right)^{*} \varphi_{\alpha(i) \alpha(j)}\right)
$$

constructed in that lemma is called the pullback functor on descent data.
If $\mathcal{U}$ and $\mathcal{U}^{\prime}$ have the same target $X$, and if $\mathcal{U}^{\prime}$ refines $\mathcal{U}$ (see Sites, Definition 7.8.1) but no explicit pair $\left(\alpha, g_{i}\right)$ is given, then we can still talk about the pullback functor since we have seen in Lemma 61.19.8 that the choice of the pair does not matter (up to a canonical isomorphism).

0ADQ Definition 61.19.10. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$.
(1) Given an algebraic space $U$ over $X$ we have the trivial descent datum of $U$ relative to id : $X \rightarrow X$, namely the identity morphism on $U$.
(2) By Lemma 61.19 .6 we get a canonical descent datum on $Y \times_{X} U$ relative to $Y \rightarrow X$ by pulling back the trivial descent datum via $f$. We often denote $\left(Y \times_{X} U\right.$, can $)$ this descent datum.
(3) A descent datum $(V, \varphi)$ relative to $Y / X$ is is called effective if $(V, \varphi)$ is isomorphic to the canonical descent datum $\left(Y \times_{X} U\right.$, can $)$ for some algebraic space $U$ over $X$.

Thus being effective means there exists an algebraic space $U$ over $X$ and an isomorphism $\psi: V \rightarrow Y \times_{X} U$ over $Y$ such that $\varphi$ is equal to the composition

$$
V \times_{X} Y \xrightarrow{\psi \times \mathrm{id}_{Y}} Y \times_{X} U \times_{S} Y=Y \times_{X} Y \times_{X} U \xrightarrow{\mathrm{id}_{Y} \times \psi^{-1}} Y \times_{X} V
$$

There is a slight problem here which is that this definition (in spirit) conflicts with the definition given in Descent, Definition 34.30 .10 in case $Y$ and $X$ are schemes. However, it will always be clear from context which version we mean.

0ADR Definition 61.19.11. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}$ be a family of morphisms of algebraic spaces over $S$ with fixed target $X$.
(1) Given an algebraic space $U$ over $X$ we have a canonical descent datum on the family of algebraic spaces $X_{i} \times{ }_{X} U$ by pulling back the trivial descent datum for $U$ relative to $\{\mathrm{id}: S \rightarrow S\}$. We denote this descent datum $\left(X_{i} \times_{X} U, c a n\right)$.
(2) A descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to $\left\{X_{i} \rightarrow S\right\}$ is called effective if there exists an algebraic space $U$ over $X$ such that $\left(V_{i}, \varphi_{i j}\right)$ is isomorphic to $\left(X_{i} \times{ }_{X} U, c a n\right)$.

### 61.20. Descent data in terms of sheaves

0ADS This section is the analogue of Descent, Section 34.35. It is slightly different as algebraic spaces are already sheaves.

0ADT Lemma 61.20.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an fpppf covering of algebraic spaces over $S$ (Topologies on Spaces, Definition 60.4.1). There is an equivalence of categories

$$
\left\{\begin{array}{l}
\text { descent data }\left(V_{i}, \varphi_{i j}\right) \\
\text { relative to }\left\{X_{i} \rightarrow X\right\}
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { sheaves } F \text { on }(S c h / S)_{\text {fppf }} \text { endowed } \\
\text { with a map } F \rightarrow X \text { such that each } \\
X_{i} \times_{X} F \text { is an algebraic space }
\end{array}\right\} .
$$

Moreover,
(1) the algebraic space $X_{i} \times_{X} F$ on the right hand side corresponds to $V_{i}$ on the left hand side, and
(2) the sheaf $F$ is an algebraic spac $\hbar^{2}$ if and only if the corresponding descent datum $\left(X_{i}, \varphi_{i j}\right)$ is effective.
Proof. Let us construct the functor from right to left. Let $F \rightarrow X$ be a map of sheaves on $(S c h / S)_{\text {fppf }}$ such that each $V_{i}=X_{i} \times_{X} F$ is an algebraic space. We have the projection $V_{i} \rightarrow X_{i}$. Then both $V_{i} \times_{X} X_{j}$ and $X_{i} \times_{X} V_{j}$ represent the sheaf $X_{i} \times_{X} F \times_{X} X_{j}$ and hence we obtain an isomorphism

$$
\varphi_{i i^{\prime}}: V_{i} \times_{X} X_{j} \rightarrow X_{i} \times_{X} V_{j}
$$

It is straightforward to see that the maps $\varphi_{i j}$ are morphisms over $X_{i} \times_{X} X_{j}$ and satisfy the cocycle condition. The functor from right to left is given by this construction $F \mapsto\left(V_{i}, \varphi_{i j}\right)$.
Let us construct a functor from left to right. The isomorphisms $\varphi_{i j}$ give isomorphisms

$$
\varphi_{i j}: V_{i} \times_{X} X_{j} \longrightarrow X_{i} \times_{X} V_{j}
$$

over $X_{i} \times X_{j}$. Set $F$ equal to the coequalizer in the following diagram

$$
\coprod_{i, i^{\prime}} V_{i} \times_{X} X_{j} \xrightarrow[\mathrm{pr}_{1} \circ \varphi_{i j}]{\mathrm{pr}_{0}} \coprod_{i} V_{i} \longrightarrow F
$$

The cocycle condition guarantees that $F$ comes with a map $F \rightarrow X$ and that $X_{i} \times{ }_{X}$ $F$ is isomorphic to $V_{i}$. The functor from left to right is given by this construction $\left(V_{i}, \varphi_{i j}\right) \mapsto F$.
We omit the verification that these constructions are mutually quasi-inverse functors. The final statements (1) and (2) follow from the constructions.

## Derived Categories of Spaces

08EY
62.1. Introduction

08 EZ In this chapter we discuss derived categories of modules on algebraic spaces. There do not seem to be good introductory references addressing this topic; it is covered in the literature by referring to papers dealing with derived categories of modules on algebraic stacks, for example see Ols07b.

### 62.2. Conventions

08F0 If $\mathcal{A}$ is an abelian category and $M$ is an object of $\mathcal{A}$ then we also denote $M$ the object of $K(\mathcal{A})$ and/or $D(\mathcal{A})$ corresponding to the complex which has $M$ in degree 0 and is zero in all other degrees.

If we have a ring $A$, then $K(A)$ denotes the homotopy category of complexes of $A$-modules and $D(A)$ the associated derived category. Similarly, if we have a ringed space $\left(X, \mathcal{O}_{X}\right)$ the symbol $K\left(\mathcal{O}_{X}\right)$ denotes the homotopy category of complexes of $\mathcal{O}_{X}$-modules and $D\left(\mathcal{O}_{X}\right)$ the associated derived category.

### 62.3. Generalities

08GD In this section we put some general results on cohomology of unbounded complexes of modules on algebraic spaces.
08GE Lemma 62.3.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Given an étale morphism $V \rightarrow Y$, set $U=V \times_{Y} X$ and denote $g: U \rightarrow V$ the projection morphism. Then $\left.\left(R f_{*} E\right)\right|_{V}=R g_{*}\left(\left.E\right|_{U}\right)$ for $E$ in $D\left(\mathcal{O}_{X}\right)$.
Proof. Represent $E$ by a K-injective complex $\mathcal{I}^{\bullet}$ of $\mathcal{O}_{X}$-modules. Then $R f_{*}(E)=$ $f_{*} \mathcal{I}^{\bullet}$ and $R g_{*}\left(\left.E\right|_{U}\right)=g_{*}\left(\left.\mathcal{I}^{\bullet}\right|_{U}\right)$ by Cohomology on Sites, Lemma 21.20.1. Hence the result follows from Properties of Spaces, Lemma 53.25.2.

08GF Definition 62.3.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $T \subset|X|$ be a closed subset. We say $E$ is supported on $T$ if the cohomology sheaves $H^{i}(E)$ are supported on $T$.

### 62.4. Derived category of quasi-coherent modules on the small étale site

071 P Let $X$ be a scheme. In this section we show that $D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)$ can be defined in terms of the small étale site $X_{\text {étale }}$ of $X$. Denote $\mathcal{O}_{\text {étale }}$ the structure sheaf on $X_{\text {étale }}$. Consider the morphism of ringed sites
08H7

$$
\begin{equation*}
\epsilon:\left(X_{\text {étale }}, \mathcal{O}_{\text {étale }}\right) \longrightarrow\left(X_{Z a r}, \mathcal{O}_{X}\right) . \tag{62.4.0.1}
\end{equation*}
$$

denoted id small,étale, Zar in Descent, Lemma 34.7.5
08H8 Lemma 62.4.1. The morphism $\epsilon$ of (62.4.0.1) is a flat morphism of ringed sites. In particular the functor $\epsilon^{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\text {étale }}\right)$ is exact. Moreover, if $\epsilon^{*} \mathcal{F}=0$, then $\mathcal{F}=0$.

Proof. The second assertion follows from the first by Modules on Sites, Lemma 18.30.2. To prove the first assertion we have to show that $\mathcal{O}_{\text {étale }}$ is a flat $\epsilon^{-1} \mathcal{O}_{X^{-}}$ module. To do this it suffices to check $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{\text {étale }, \bar{x}}$ is flat for any geometric point $\bar{x}$ of $X$, see Modules on Sites, Lemma 18.38.2. Sites, Lemma 7.33.1, and Étale Cohomology, Remarks 49.29.11. By Étale Cohomology, Lemma 49.33.1 we see that $\mathcal{O}_{\text {étale }, \bar{x}}$ is the strict henselization of $\mathcal{O}_{X, x}$. Thus $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{\text {étale }, \bar{x}}$ is faithfully flat by More on Algebra, Lemma 15.36.1. The final statement follows also: if $\epsilon^{*} \mathcal{F}=0$, then

$$
0=\epsilon^{*} \mathcal{F}_{\bar{x}}=\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{\text {étale }}
$$

(Modules on Sites, Lemma 18.35.4) for all geometric points $\bar{x}$. By faithful flatness of $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{\text {étale, }, \bar{x}}$ we conclude $\mathcal{F}_{x}=0$ for all $x \in X$.

Let $X$ be a scheme. Notation as in 62.4.0.1). Recall that $\epsilon^{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow$ $Q \operatorname{Coh}\left(\mathcal{O}_{\text {étale }}\right)$ is an equivalence by Descent, Proposition 34.7.11 and Remark 34.7.6. Moreover, $Q \operatorname{Coh}\left(\mathcal{O}_{\text {étale }}\right)$ forms a Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\text {étale }}\right)$ by Descent, Lemma 34.7.13. Hence we can let $D_{Q C o h}\left(\mathcal{O}_{\text {étale }}\right)$ be the triangulated subcategory of $D\left(\mathcal{O}_{\text {étale }}\right)$ whose objects are the complexes with quasi-coherent cohomology sheaves, see Derived Categories, Section 13.13. The functor $\epsilon^{*}$ is exact (Lemma 62.4.1) hence induces $\epsilon^{*}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{\text {étale }}\right)$ and since pullbacks of quasi-coherent modules are quasi-coherent also $\epsilon^{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\text {étale }}\right)$.

071 L Lemma 62.4.2. Let $X$ be a scheme. The functor $\epsilon^{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\text {étale }}\right)$ defined above is an equivalence.

Proof. We will prove this by showing the functor $R \epsilon_{*}: D\left(\mathcal{O}_{\text {étale }}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$ induces a quasi-inverse. We will use freely that $\epsilon_{*}$ is given by restriction to $X_{Z a r} \subset$ $X_{\text {étale }}$ and the description of $\epsilon^{*}=\mathrm{id}_{\text {small,étale,Zar }}^{*}$ in Descent, Lemma 34.7.5.
For a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the adjunction map $\mathcal{F} \rightarrow \epsilon_{*} \epsilon^{*} \mathcal{F}$ is an isomorphism by the fact that $\mathcal{F}^{a}$ (Descent, Definition 34.7.2) is a sheaf as proved in Descent, Lemma 34.7.1. Conversely, every quasi-coherent $\mathcal{O}_{\text {étale }}$-module $\mathcal{H}$ is of the form $\epsilon^{*} \mathcal{F}$ for some quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$, see Descent, Proposition 34.7.11, Then $\mathcal{F}=\epsilon_{*} \mathcal{H}$ by what we just said and we conclude that the adjunction map $\epsilon^{*} \epsilon_{*} \mathcal{H} \rightarrow \mathcal{H}$ is an isomorphism for all quasi-coherent $\mathcal{O}_{\text {étale-modules }} \mathcal{H}$.

Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{\text {étale }}\right)$ and denote $\mathcal{H}^{q}=H^{q}(E)$ its $q$ th cohomology sheaf. Let $\mathcal{B}$ be the set of affine objects of $X_{\text {étale. }}$. Then $H^{p}\left(U, \mathcal{H}^{q}\right)=0$ for all $p>0$, all $q \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. By Cohomology on Sites, Lemma 21.21 .6 this means that

$$
H^{q}(U, E)=H^{0}\left(U, \mathcal{H}^{q}\right)
$$

for all $U \in \mathcal{B}$. In particular, we find that this holds for affine opens $U \subset X$. It follows that the $q$ th cohomology of $R \epsilon_{*} E$ over $U$ is the value of the sheaf $\epsilon_{*} \mathcal{H}^{q}$ over $U$. Applying sheafification we obtain

$$
H^{q}\left(R \epsilon_{*} E\right)=\epsilon_{*} \mathcal{H}^{q}
$$

which in particular shows that $R \epsilon_{*}$ induces a functor $D_{Q C o h}\left(\mathcal{O}_{\text {étale }}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Since $\epsilon^{*}$ is exact we then obtain $H^{q}\left(\epsilon^{*} R \epsilon_{*} E\right)=\epsilon^{*} \epsilon_{*} \mathcal{H}^{q}=\mathcal{H}^{q}$ (by discussion above). Thus the adjunction map $\epsilon^{*} R \epsilon_{*} E \rightarrow E$ is an isomorphism.

Conversely, for $F \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the adjunction map $F \rightarrow R \epsilon_{*} \epsilon^{*} F$ is an isomorphism for the same reason, i.e., because the cohomology sheaves of $R \epsilon_{*} \epsilon^{*} F$ are isomorphic to $\epsilon_{*} H^{m}\left(\epsilon^{*} F\right)=\epsilon_{*} \epsilon^{*} H^{m}(F)=H^{m}(F)$.

### 62.5. Derived category of quasi-coherent modules

071 W Let $S$ be a scheme. Lemma 62.4.2 shows that the category $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ can be defined in terms of complexes of $\mathcal{O}_{S}$-modules on the scheme $S$ or by complexes of $\mathcal{O}$-modules on the small étale site of $S$. Hence the following definition is compatible with the definition in the case of schemes.

071X Definition 62.5.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The derived category of $\mathcal{O}_{X}$-modules with quasi-coherent cohomology sheaves is denoted $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

This makes sense by Properties of Spaces, Lemma 53.28.7 and Derived Categories, Section 13.13. Thus we obtain a canonical functor

08F1

$$
\begin{equation*}
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right) \tag{62.5.1.1}
\end{equation*}
$$

see Derived Categories, Equation 13.13.1.1.
Observe that a flat morphism $f: Y \rightarrow X$ of algebraic spaces induces an exact functor $f^{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$, see Morphisms of Spaces, Lemma 54.29.9 and Modules on Sites, Lemma 18.30 .2 In particular $L f^{*}: D\left(\mathcal{O}_{X}\right) \rightarrow \bar{D}\left(\mathcal{O}_{Y}\right)$ is computed on any representative complex (Derived Categories, Lemma 13.17.9). We will write $L f^{*}=f^{*}$ when $f$ is flat and we have $H^{i}\left(f^{*} E\right)=f^{*} H^{i}(E)$ for $E$ in $D\left(\mathcal{O}_{X}\right)$ in this case. We will use this often when $f$ is étale. Of course in the étale case the pullback functor is just the restriction to $Y_{\text {étale }}$, see Properties of Spaces, Equation 53.25.1.1.

08F2 Lemma 62.5.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. The following are equivalent
(1) $E$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$,
(2) for every étale morphism $\varphi: U \rightarrow X$ where $U$ is an affine scheme $\varphi^{*} E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$,
(3) for every étale morphism $\varphi: U \rightarrow X$ where $U$ is a scheme $\varphi^{*} E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$,
(4) there exists a surjective étale morphism $\varphi: U \rightarrow X$ where $U$ is a scheme such that $\varphi^{*} E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$, and
(5) there exists a surjective étale morphism of algebraic spaces $f: Y \rightarrow X$ such that $L f^{*} E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.

Proof. This follows immediately from the discussion preceding the lemma and Properties of Spaces, Lemma 53.28.6.

08F3 Lemma 62.5.3. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Then $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ has direct sums.

Proof. By Injectives, Lemma 19.13 .4 the derived category $D\left(\mathcal{O}_{X}\right)$ has direct sums and they are computed by taking termwise direct sums of any representatives. Thus it is clear that the cohomology sheaf of a direct sum is the direct sum of the cohomology sheaves as taking direct sums is an exact functor (in any Grothendieck abelian category). The lemma follows as the direct sum of quasi-coherent sheaves is quasi-coherent, see Properties of Spaces, Lemma 53.28.7.

08F4 Lemma 62.5.4. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a morphism of algebraic spaces over $S$. The functor $L f^{*}$ sends $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.

Proof. Choose a diagram

where $U$ and $V$ are schemes, the vertical arrows are étale, and $a$ is surjective. Since $a^{*} \circ L f^{*}=L h^{*} \circ b^{*}$ the result follows from Lemma 62.5 .2 and the case of schemes which is Derived Categories of Schemes, Lemma 35.3.7.

08F5 Lemma 62.5.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. For objects $K, L$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the derived tensor product $K \otimes^{\mathbf{L}} L$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Proof. Let $\varphi: U \rightarrow X$ be a surjective étale morphism from a scheme $U$. Since $\varphi^{*}\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)=\varphi^{*} K \otimes_{\mathcal{O}_{U}}^{\mathbf{L}} \varphi^{*} L$ we see from Lemma 62.5.2 that this follows from the case of schemes which is Derived Categories of Schemes, Lemma 35.3.8.

The following lemma will help us to "compute" a right derived functor on an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
08F6 Lemma 62.5.6. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Then the canonical map $E \rightarrow R \lim \tau_{\geq-n} E$ is an isomorphism ${ }^{1}$.

Proof. Denote $\mathcal{H}^{i}=H^{i}(E)$ the $i$ th cohomology sheaf of $E$. Let $\mathcal{B}$ be the set of affine objects of $X_{\text {étale }}$. Then $H^{p}\left(U, \mathcal{H}^{i}\right)=0$ for all $p>0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$ as $U$ is an affine scheme. See discussion in Cohomology of Spaces, Section 56.3 and Cohomology of Schemes, Lemma 29.2.2. Thus the lemma follows from Cohomology on Sites, Lemma 21.21.5.

08F7 Lemma 62.5.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $F: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow A b$ be a functor and $N \geq 0$ an integer. Assume that
(1) $F$ is left exact,
(2) $F$ commutes with countable direct products,
(3) $R^{p} F(\mathcal{F})=0$ for all $p \geq N$ and $\mathcal{F}$ quasi-coherent.

Then for $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the maps $R^{p} F(E) \rightarrow R^{p} F\left(\tau_{\geq p-N+1} E\right)$ are isomorphisms.
Proof. By shifting the complex we see it suffices to prove the assertion for $p=0$. Write $E_{n}=\tau_{\geq-n} E$. We have $E=R \lim E_{n}$, see for $p=0$. Write $E_{n}=\tau_{\geq-n} E$.

[^174]We have $E=R \lim E_{n}$, see Lemma62.5.6. Thus $R F(E)=R \lim R F\left(E_{n}\right)$ in $D(A b)$ by Injectives, Lemma 19.13.6. Thus we have a short exact sequence

$$
0 \rightarrow R^{1} \lim R^{-1} F\left(E_{n}\right) \rightarrow R^{0} F(E) \rightarrow \lim R^{0} F\left(E_{n}\right) \rightarrow 0
$$

see More on Algebra, Remark 15.68.16. To finish the proof we will show that the term on the left is zero and that the term on the right equals $R^{0} F\left(E_{N-1}\right)$.

We have a distinguished triangle

$$
H^{-n}(E)[n] \rightarrow E_{n} \rightarrow E_{n-1} \rightarrow H^{-n}(E)[n+1]
$$

(Derived Categories, Remark 13.12 .4 in $D\left(\mathcal{O}_{X}\right)$. Since $H^{-n}(E)$ is quasi-coherent we have

$$
R^{p} F\left(H^{-n}(E)[n]\right)=R^{p+n} F\left(H^{-n}(E)\right)=0
$$

for $p+n \geq N$ and

$$
R^{p} F\left(H^{-n}(E)[n+1]\right)=R^{p+n+1} F\left(H^{-n}(E)\right)=0
$$

for $p+n+1 \geq N$. We conclude that

$$
R^{p} F\left(E_{n}\right) \rightarrow R^{p} F\left(E_{n-1}\right)
$$

is an isomorphism for all $n \gg p$ and an isomorphism for $n \geq N$ for $p=0$. Thus the systems $R^{p} F\left(E_{n}\right)$ all satisfy the ML condition and $R^{1}$ lim gives zero (see discussion in More on Algebra, Section 15.68). Moreover, the system $R^{0} F\left(\tau_{\geq-n} E\right)$ is constant starting with $n=N-1$ as desired.

### 62.6. Total direct image

08F9 The following lemma is the analogue of Cohomology of Spaces, Lemma 56.7.1.
08FA Lemma 62.6.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over $S$.
(1) The functor $R f_{*}$ sends $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.
(2) If $Y$ is quasi-compact, there exists an integer $N=N(X, Y, f)$ such that for an object $E$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ with $H^{m}(E)=0$ for $m>0$ we have $H^{m}\left(R f_{*} E\right)=0$ for $m \geq N$.
(3) In fact, if $Y$ is quasi-compact we can find $N=N(X, Y, f)$ such that for every morphism of algebraic spaces $Y^{\prime} \rightarrow Y$ the same conclusion holds for the functor $R\left(f^{\prime}\right)_{*}$ where $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$.
Proof. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To prove (1) we have to show that $R f_{*} E$ has quasi-coherent cohomology sheaves. This question is local on $Y$, hence we may assume $Y$ is quasi-compact. Pick $N=N(X, Y, f)$ as in Cohomology of Spaces, Lemma 56.7.1. Thus $R^{p} f_{*} \mathcal{F}=0$ for all quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{F}$ and all $p \geq N$. Moreover $R^{p} f_{*} \mathcal{F}$ is quasi-coherent for all $p$ by Cohomology of Spaces, Lemma 56.3.2. These statements remain true after base change.

First, assume $E$ is bounded below. We will show (1) and (2) and (3) hold for such $E$ with our choice of $N$. In this case we can for example use the spectral sequence

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E
$$

(Derived Categories, Lemma 13.21.3), the quasi-coherence of $R^{p} f_{*} H^{q}(E)$, and the vanishing of $R^{p} f_{*} H^{q}(E)$ for $p \geq N$ to see that (1), (2), and (3) hold in this case.

Next we prove (2) and (3). Say $H^{m}(E)=0$ for $m>0$. Let $V$ be an affine object of $Y_{\text {étale. }}$. We have $H^{p}\left(V \times_{Y} X, \mathcal{F}\right)=0$ for $p \geq N$, see Cohomology of Spaces, Lemma 56.3.3. Hence we may apply Lemma 62.5.7 to the functor $\Gamma\left(V \times_{Y} X,-\right)$ to see that

$$
R \Gamma\left(V, R f_{*} E\right)=R \Gamma\left(V \times_{Y} X, E\right)
$$

has vanishing cohomology in degrees $\geq N$. Since this holds for all $V$ affine in $Y_{\text {étale }}$ we conclude that $H^{m}\left(R f_{*} E\right)=0$ for $m \geq N$.
Next, we prove (1) in the general case. Recall that there is a distinguished triangle

$$
\tau_{\leq-n-1} E \rightarrow E \rightarrow \tau_{\geq-n} E \rightarrow\left(\tau_{\leq-n-1} E\right)[1]
$$

in $D\left(\mathcal{O}_{X}\right)$, see Derived Categories, Remark 13.12 .4 By (2) we see that $R f_{*} \tau_{\leq-n-1} E$ has vanishing cohomology sheaves in degrees $\geq-n+N$. Thus, given an integer $q$ we see that $R^{q} f_{*} E$ is equal to $R^{q} f_{*} \tau_{\geq-n} E$ for some $n$ and the result above applies.

08FB Lemma 62.6.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over $S$. Then $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow$ $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ commutes with direct sums.
Proof. Let $E_{i}$ be a family of objects of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and set $E=\bigoplus E_{i}$. We want to show that the map

$$
\bigoplus R f_{*} E_{i} \longrightarrow R f_{*} E
$$

is an isomorphism. We will show it induces an isomorphism on cohomology sheaves in degree 0 which will imply the lemma. Choose an integer $N$ as in Lemma 62.6.1. Then $R^{0} f_{*} E=R^{0} f_{*} \tau_{\geq-N} E$ and $R^{0} f_{*} E_{i}=R^{0} f_{*} \tau_{\geq-N} E_{i}$ by the lemma cited. Observe that $\tau_{\geq-N} E=\bigoplus \tau_{\geq-N} E_{i}$. Thus we may assume all of the $E_{i}$ have vanishing cohomology sheaves in degrees $<-N$. Next we use the spectral sequences

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E \quad \text { and } \quad R^{p} f_{*} H^{q}\left(E_{i}\right) \Rightarrow R^{p+q} f_{*} E_{i}
$$

(Derived Categories, Lemma 13.21 .3 ) to reduce to the case of a direct sum of quasi-coherent sheaves. This case is handled by Cohomology of Spaces, Lemma 56.4.2.

08GH Remark 62.6.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces $X$ and $Y$ over $S$. Let $f_{0}: X_{0} \rightarrow Y_{0}$ be a morphism of schemes representing $f$ (awkward but temporary notation). Then we claim the diagrams

(Lemma 62.6.1 and Derived Categories of Schemes, Lemma 35.4.1) and

(Lemma 62.5.4 and Derived Categories of Schemes, Lemma 35.3.7) are commutative. The result for $L f^{*}$ and $L f_{0}^{*}$ follows as the equivalences $D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X_{0}}\right) \rightarrow$
$D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $D_{Q C o h}\left(\mathcal{O}_{Y_{0}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ of Lemma 62.4.2 come from pulling back by the (flat) morphisms of ringed sites $\epsilon: X_{\text {étale }} \rightarrow X_{0, Z}$ ar and $\epsilon: Y_{\text {étale }} \rightarrow$ $Y_{0, Z a r}$ and the diagram of ringed sites

is commutative (details omitted). In fact the commutativity of the first diagram also follows as the proof of Lemma 62.4.2 shows that the functor $R \epsilon_{*}$ gives the equivalences $D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$ and $D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y_{0}}\right)$.
08 Lemma 62.6.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Then $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ reflects isomorphisms.
Proof. The statement means that a morphism $\alpha: E \rightarrow F$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is an isomorphism if $R f_{*} \alpha$ is an isomorphism. We may check this on cohomology sheaves. In particular, the question is étale local on $Y$. Hence we may assume $Y$ and therefore $X$ is affine. In this case the problem reduces to the case of schemes (Derived Categories of Schemes, Lemma 35.5.1) via Lemma 62.4.2 and Remark 62.6 .3 .

08IJ Lemma 62.6.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. For $E$ in $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ we have $R f_{*} L f^{*} E=E \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} f_{*} \mathcal{O}_{X}$.

Proof. Since $f$ is affine the map $f_{*} \mathcal{O}_{X} \rightarrow R f_{*} \mathcal{O}_{X}$ is an isomorphism (Cohomology of Spaces, Lemma 56.7.2 . There is a canonical map $E \otimes^{\mathbf{L}} f_{*} \mathcal{O}_{X}=E \otimes^{\mathbf{L}} R f_{*} \mathcal{O}_{X} \rightarrow$ $R f_{*} L f^{*} E$ adjoint to the map

$$
L f^{*}\left(E \otimes^{\mathbf{L}} R f_{*} \mathcal{O}_{X}\right)=L f^{*} E \otimes^{\mathbf{L}} L f^{*} R f_{*} \mathcal{O}_{X} \longrightarrow L f^{*} E \otimes^{\mathbf{L}} \mathcal{O}_{X}=L f^{*} E
$$

coming from $1: L f^{*} E \rightarrow L f^{*} E$ and the canonical map $L f^{*} R f_{*} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}$. To check the map so constructed is an isomorphism we may work locally on $Y$. Hence we may assume $Y$ and therefore $X$ is affine. In this case the problem reduces to the case of schemes (Derived Categories of Schemes, Lemma 35.5.2 via Lemma 62.4.2 and Remark 62.6.3.

### 62.7. Derived category of coherent modules

08GI Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. In this case the category $\operatorname{Coh}\left(\mathcal{O}_{X}\right) \subset \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ of coherent $\mathcal{O}_{X}$-modules is a weak Serre subcategory, see Homology, Section 12.9 and Cohomology of Spaces, Lemma 56.11.3 Denote

$$
D_{C o h}\left(\mathcal{O}_{X}\right) \subset D\left(\mathcal{O}_{X}\right)
$$

the subcategory of complexes whose cohomology sheaves are coherent, see Derived Categories, Section 13.13 . Thus we obtain a canonical functor
08GJ (62.7.0.1)

$$
D\left(\operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{\operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

see Derived Categories, Equation 13.13.1.1.

08GK Lemma 62.7.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type and $Y$ is Noetherian. Let $E$ be an object of $D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$ such that the scheme theoretic support of $H^{i}(E)$ is proper over $Y$ for all $i$. Then $R f_{*} E$ is an object of $D_{C o h}^{b}\left(\mathcal{O}_{Y}\right)$.
Proof. Consider the spectral sequence

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E
$$

see Derived Categories, Lemma 13.21.3. By assumption and Cohomology of Spaces, Remark 56.19 .3 the sheaves $R^{p} f_{*} H^{q}(E)$ are coherent. Hence $R^{p+q} f_{*} E$ is coherent, i.e., $E \in D_{C o h}\left(\mathcal{O}_{S}\right)$. Boundedness from below is trivial. Boundedness from above follows from Cohomology of Spaces, Lemma 56.7.1 or from Lemma 62.6.1.

### 62.8. Induction principle

08GL In this section we discuss an induction principle for algebraic spaces analogues to what is Cohomology of Schemes, Lemma 29.4.1 for schemes. To formulate it we introduce the notion of an elementary distinguished square; this terminology is borrowed from MV99. The principle as formulated here is implicit in the paper GR71 by Raynaud and Gruson. A related principle for algebraic stacks is Ryd10, Theorem D] by David Rydh.
08GM Definition 62.8.1. Let $S$ be a scheme. A commutative diagram

of algebraic spaces over $S$ is called an elementary distinguished square if
(1) $U$ is an open subspace of $W$ and $j$ is the inclusion morphism,
(2) $f$ is étale, and
(3) setting $T=W \backslash U$ (with reduced induced subspace structure) the morphism $f^{-1}(T) \rightarrow T$ is an isomorphism.
We will indicate this by saying: "Let $(U \subset W, f: V \rightarrow W)$ be an elementary distinguished square."

Note that if $(U \subset W, f: V \rightarrow W)$ is an elementary distinguished square, then we have $W=U \cup f(V)$. Thus $\{U \rightarrow W, V \rightarrow W\}$ is an étale covering of $W$. It turns out that these étale coverings have nice properties and that in some sense there are "enough" of them.

08GN Lemma 62.8.2. Let $S$ be a scheme. Let $(U \subset W, f: V \rightarrow W)$ be an elementary distinguished square of algebraic spaces over $S$.
(1) If $V^{\prime} \subset V$ and $U \subset U^{\prime} \subset W$ are open subspaces and $W^{\prime}=U^{\prime} \cup f\left(V^{\prime}\right)$ then $\left(U^{\prime} \subset W^{\prime},\left.f\right|_{V^{\prime}}: V^{\prime} \rightarrow W^{\prime}\right)$ is an elementary distinguished square.
(2) If $p: W^{\prime} \rightarrow W$ is a morphism of algebraic spaces, then $\left(p^{-1}(U) \subset\right.$ $\left.W^{\prime}, V \times_{W} W^{\prime} \rightarrow W^{\prime}\right)$ is an elementary distinguished square.
Proof. Omitted.
08GP Lemma 62.8.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $P$ be a property of the quasi-compact and quasi-separated objects of $X_{\text {spaces,étale }}$. Assume that
(1) $P$ holds for every affine object of $X_{\text {spaces,étale }}$,
(2) for every elementary distinguished square $(U \subset W, f: V \rightarrow W)$ such that
(a) $W$ is a quasi-compact and quasi-separated object of $X_{\text {spaces,étale }}$,
(b) $U$ is quasi-compact,
(c) $V$ is affine, and
(d) $P$ holds for $U, V$, and $U \times_{W} V$,
then $P$ holds for $W$.
Then $P$ holds for every quasi-compact and quasi-separated object of $X_{\text {spaces,étale }}$ and in particular for $X$.
Proof. We first claim that $P$ holds for every representable quasi-compact and quasi-separated object of $X_{\text {spaces,étale }}$. Namely, suppose that $U \rightarrow X$ is étale and $U$ is a quasi-compact and quasi-separated scheme. By assumption (1) property $P$ holds for every affine open of $U$. Moreover, if $W, V \subset U$ are quasi-compact open with $V$ affine and $P$ holds for $W, V$, and $W \cap V$, then $P$ holds for $W \cup V$ by (2) (as the pair $(W \subset W \cup V, V \rightarrow W \cup V)$ is an elementary distinguished square). Thus $P$ holds for $U$ by the induction principle for schemes, see Cohomology of Schemes, Lemma 29.4.1.
To finish the proof it suffices to prove $P$ holds for $X$ (because we can simply replace $X$ by any quasi-compact and quasi-separated object of $X_{\text {spaces,étale }}$ we want to prove the result for). We will use the filtration

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

and the morphisms $f_{p}: V_{p} \rightarrow U_{p}$ of Decent Spaces, Lemma 55.8.6. We will prove that $P$ holds for $U_{p}$ by descending induction on $p$. Note that $P$ holds for $U_{n+1}$ by (1) as an empty algebraic space is affine. Assume $P$ holds for $U_{p+1}$. Note that $\left(U_{p+1} \subset U_{p}, f_{p}: V_{p} \rightarrow U_{p}\right)$ is an elementary distinguished square, but (2) may not apply as $V_{p}$ may not be affine. However, as $V_{p}$ is a quasi-compact scheme we may choose a finite affine open covering $V_{p}=V_{p, 1} \cup \ldots \cup V_{p, m}$. Set $W_{p, 0}=U_{p+1}$ and

$$
W_{p, i}=U_{p+1} \cup f_{p}\left(V_{p, 1} \cup \ldots \cup V_{p, i}\right)
$$

for $i=1, \ldots, m$. These are quasi-compact open subspaces of $X$. Then we have

$$
U_{p+1}=W_{p, 0} \subset W_{p, 1} \subset \ldots \subset W_{p, m}=U_{p}
$$

and the pairs

$$
\left(W_{p, 0} \subset W_{p, 1},\left.f_{p}\right|_{V_{p, 1}}\right),\left(W_{p, 1} \subset W_{p, 2},\left.f_{p}\right|_{V_{p, 2}}\right), \ldots,\left(W_{p, m-1} \subset W_{p, m},\left.f_{p}\right|_{V_{p, m}}\right)
$$

are elementary distinguished squares by Lemma 62.8.2. Note that $P$ holds for each $V_{p, 1}$ (as affine schemes) and for $W_{p, i} \times{ }_{W_{p, i+1}} V_{p, i+1}$ as this is a quasi-compact open of $V_{p, i+1}$ and hence $P$ holds for it by the first paragraph of this proof. Thus (2) applies to each of these and we inductively conclude $P$ holds for $W_{p, 1}, \ldots, W_{p, m}=U_{p}$.

08GQ Lemma 62.8.4. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $\mathcal{B} \subset \mathrm{Ob}\left(X_{\text {spaces,étale }}\right)$. Let $P$ be a property of the elements of $\mathcal{B}$. Assume that
(1) every $W \in \mathcal{B}$ is quasi-compact and quasi-separated,
(2) if $W \in \mathcal{B}$ and $U \subset W$ is quasi-compact open, then $U \in \mathcal{B}$,
(3) if $V \in \mathrm{Ob}\left(X_{\text {spaces,étale }}\right)$ is affine, then (a) $V \in \mathcal{B}$ and (b) $P$ holds for $V$,
(4) for every elementary distinguished square $(U \subset W, f: V \rightarrow W)$ such that
(a) $W \in \mathcal{B}$,
(b) $U$ is quasi-compact,
(c) $V$ is affine, and
(d) $P$ holds for $U, V$, and $U \times_{W} V$, then $P$ holds for $W$.
Then $P$ holds for every $W \in \mathcal{B}$.
Proof. This is proved in exactly the same manner as the proof of Lemma 62.8.3. (We remark that (4)(d) makes sense as $U \times_{W} V$ is a quasi-compact open of $V$ hence an element of $\mathcal{B}$ by conditions (2) and (3).)

08GR Remark 62.8.5. How to choose the collection $\mathcal{B}$ in Lemma 62.8.4. Here are some examples:
(1) If $X$ is quasi-compact and separated, then we can choose $\mathcal{B}$ to be the set of quasi-compact and separated objects of $X_{\text {spaces,étale }}$. Then $X \in \mathcal{B}$ and $\mathcal{B}$ satisfies (1), (2), and (3)(a). With this choice of $\mathcal{B}$ Lemma 62.8.4 reproduces Lemma 62.8.3.
(2) If $X$ is quasi-compact with affine diagonal, then we can choose $\mathcal{B}$ to be the set of objects of $X_{\text {spaces, étale }}$ which are quasi-compact and have affine diagonal. Again $X \in \mathcal{B}$ and $\mathcal{B}$ satisfies (1), (2), and (3)(a).
(3) If $X$ is quasi-compact and quasi-separated, then the smallest subset $\mathcal{B}$ which contains $X$ and satisfies (1), (2), and (3)(a) is given by the rule $W \in \mathcal{B}$ if and only if either $W$ is a quasi-compact open subspace of $X$, or $W$ is a quasi-compact open of an affine object of $X_{\text {spaces,étale }}$.

Here is a variant where we extend the truth from an open to larger opens.
09IT Lemma 62.8.6. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $W \subset X$ be a quasi-compact open subspace. Let $P$ be a property of quasi-compact open subspaces of $X$. Assume that
(1) $P$ holds for $W$, and
(2) for every elementary distinguished square $\left(W_{1} \subset W_{2}, f: V \rightarrow W_{2}\right)$ where such that
(a) $W_{1}, W_{2}$ are quasi-compact open subspaces of $X$,
(b) $W \subset W_{1}$,
(c) $V$ is affine, and
(d) $P$ holds for $W_{1}$, then $P$ holds for $W_{2}$.
Then $P$ holds for $X$.
Proof. We can deduce this from Lemma 62.8 .4 , but instead we will give a direct argument by eplicitly redoing the proof of Lemma 62.8.3. We will use the filtration

$$
\emptyset=U_{n+1} \subset U_{n} \subset U_{n-1} \subset \ldots \subset U_{1}=X
$$

and the morphisms $f_{p}: V_{p} \rightarrow U_{p}$ of Decent Spaces, Lemma 55.8.6. We will prove that $P$ holds for $W_{p}=W \cup U_{p}$ by descending induction on $p$. This will finish the proof as $W_{1}=X$. Note that $P$ holds for $W_{n+1}=W \cap U_{n+1}=W$ by (1). Assume $P$ holds for $W_{p+1}$. Observe that $W_{p} \backslash W_{p+1}$ (with reduced induced subspace structure) is a closed subspace of $U_{p} \backslash U_{p+1}$. Since ( $U_{p+1} \subset U_{p}, f_{p}: V_{p} \rightarrow U_{p}$ ) is an elementary distinguished square, the same is true for $\left(W_{p+1} \subset W_{p}, f_{p}: V_{p} \rightarrow W_{p}\right)$. However (2) may not apply as $V_{p}$ may not be affine. However, as $V_{p}$ is a quasi-compact scheme
we may choose a finite affine open covering $V_{p}=V_{p, 1} \cup \ldots \cup V_{p, m}$. Set $W_{p, 0}=W_{p+1}$ and

$$
W_{p, i}=W_{p+1} \cup f_{p}\left(V_{p, 1} \cup \ldots \cup V_{p, i}\right)
$$

for $i=1, \ldots, m$. These are quasi-compact open subspaces of $X$ containing $W$. Then we have

$$
W_{p+1}=W_{p, 0} \subset W_{p, 1} \subset \ldots \subset W_{p, m}=W_{p}
$$

and the pairs

$$
\left(W_{p, 0} \subset W_{p, 1},\left.f_{p}\right|_{V_{p, 1}}\right),\left(W_{p, 1} \subset W_{p, 2},\left.f_{p}\right|_{V_{p, 2}}\right), \ldots,\left(W_{p, m-1} \subset W_{p, m},\left.f_{p}\right|_{V_{p, m}}\right)
$$

are elementary distinguished squares by Lemma 62.8.2. Now (2) applies to each of these and we inductively conclude $P$ holds for $\bar{W}_{p, 1}, \ldots, W_{p, m}=W_{p}$.

### 62.9. Mayer-Vietoris

08GS In this section we prove that an elementary distinguished triangle gives rise to various Mayer-Vietoris sequences.

Let $S$ be a scheme. Let $U \rightarrow X$ be an étale morphism of algebraic spaces over $S$. In Properties of Spaces, Section 53.26 it was shown that $U_{\text {spaces,étale }}=X_{\text {spaces,étale }} / U$ compatible with structure sheaves. Hence in this situation we often think of the morphism $j_{U}: U \rightarrow X$ as a localization morphism (see Modules on Sites, Definition 18.19.1). In particular we think of pullback $j_{U}^{*}$ as restriction to $U$ and we often denote it by $\left.\right|_{U}$; this is compatible with Properties of Spaces, Equation 53.25.1.1). In particular we see that

08GT

$$
\begin{equation*}
\left(\left.\mathcal{F}\right|_{U}\right)_{\bar{u}}=\mathcal{F}_{\bar{x}} \tag{62.9.0.1}
\end{equation*}
$$

if $\bar{u}$ is a geometric point of $U$ and $\bar{x}$ the image of $\bar{u}$ in $X$. Moreover, restriction has an exact left adjoint $j_{U!}$, see Modules on Sites, Lemmas 18.19 .2 and 18.19 .3 . Finally, recall that if $\mathcal{G}$ is an $\mathcal{O}_{X}$-module, then
08GU

$$
\begin{equation*}
\left(j_{U} \mathcal{G}\right)_{\bar{x}}=\bigoplus_{\bar{u}} \mathcal{G}_{\bar{u}} \tag{62.9.0.2}
\end{equation*}
$$

for any geometric point $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ where the direct sum is over those morphism $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ such that $j_{U} \circ \bar{u}=\bar{x}$, see Modules on Sites, Lemma 18.37.1 and Properties of Spaces, Lemma 53.18.13.

08GV Lemma 62.9.1. Let $S$ be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$.
(1) For a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we have a short exact sequence

$$
\left.\left.\left.0 \rightarrow j_{U \times_{X} V!} \mathcal{F}\right|_{U \times_{X} V} \rightarrow j_{U!} \mathcal{F}\right|_{U} \oplus j_{V!} \mathcal{F}\right|_{V} \rightarrow \mathcal{F} \rightarrow 0
$$

(2) For an object $E$ of $D\left(\mathcal{O}_{X}\right)$ we have a distinguished triangle

$$
\begin{aligned}
& \left.\left.\left.\left.j_{U \times_{X} V!} E\right|_{U \times_{X} V} \rightarrow j_{U!} E\right|_{U} \oplus j_{V!} E\right|_{V} \rightarrow E \rightarrow j_{U \times_{X} V!} E\right|_{U \times_{X} V}[1] \\
& \text { in } D\left(\mathcal{O}_{X}\right) .
\end{aligned}
$$

Proof. To show the sequence of (1) is exact we may check on stalks at geometric points by Properties of Spaces, Theorem 53.18.12. Let $\bar{x}$ be a geometric point of $X$. By Equations 62.9.0.1 and 62.9.0.2 taking stalks at $\bar{x}$ we obtain the sequence

$$
0 \rightarrow \bigoplus_{(\bar{u}, \bar{v})} \mathcal{F}_{\bar{x}} \rightarrow \bigoplus_{\bar{u}} \mathcal{F}_{\bar{x}} \oplus \bigoplus_{\bar{v}} \mathcal{F}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}} \rightarrow 0
$$

This sequence is exact because for every $\bar{x}$ there either is exactly one $\bar{u}$ mapping to $\bar{x}$, or there is no $\bar{u}$ and exactly one $\bar{v}$ mapping to $\bar{x}$.
Proof of (2). We have seen in Cohomology on Sites, Section 21.20 that the restriction functors and the extension by zero functors on derived categories are computed by just applying the functor to any complex. Let $\mathcal{E} \bullet$ be a complex of $\mathcal{O}_{X}$-modules representing $E$. The distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes of $\mathcal{O}_{X}$-modules

$$
\left.\left.\left.0 \rightarrow j_{U \times_{X} V!} \mathcal{E}^{\bullet}\right|_{U \times_{X} V} \rightarrow j_{U!} \mathcal{E}^{\bullet}\right|_{U} \oplus j_{V!} \mathcal{E}^{\bullet}\right|_{V} \rightarrow \mathcal{E}^{\bullet} \rightarrow 0
$$

which is short exact by (1).
08GW Lemma 62.9.2. Let $S$ be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$.
(1) For every sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we have a short exact sequence

$$
\left.\left.0 \rightarrow \mathcal{F} \rightarrow j_{U, *} \mathcal{F}\right|_{U} \oplus j_{V, *} \mathcal{F}\right|_{V} \rightarrow j_{U \times X} V,\left.* \mathcal{F}\right|_{U \times_{X} V} \rightarrow 0
$$

(2) For any object $E$ of $D\left(\mathcal{O}_{X}\right)$ we have a distinguished triangle

$$
\left.\left.\left.E \rightarrow R j_{U, *} E\right|_{U} \oplus R j_{V, *} E\right|_{V} \rightarrow R j_{U \times_{X} V, *} E\right|_{U \times_{X} V} \rightarrow E[1]
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. Let $W$ be an object of $X_{\text {étale }}$. We claim the sequence

$$
0 \rightarrow \mathcal{F}(W) \rightarrow \mathcal{F}\left(W \times_{X} U\right) \oplus \mathcal{F}\left(W \times_{X} V\right) \rightarrow \mathcal{F}\left(W \times_{X} U \times_{X} V\right)
$$

is exact and that an element of the last group can locally on $W$ be lifted to the middle one. By Lemma 62.8 .2 the pair ( $W \times_{X} U \subset W, V \times_{X} W \rightarrow W$ ) is an elementary distinguished square. Thus we may assume $W=X$ and it suffices to prove the same thing for

$$
0 \rightarrow \mathcal{F}(X) \rightarrow \mathcal{F}(U) \oplus \mathcal{F}(V) \rightarrow \mathcal{F}\left(U \times_{X} V\right)
$$

We have seen that

$$
0 \rightarrow j_{U \times_{X} V!} \mathcal{O}_{U \times_{X} V} \rightarrow j_{U!} \mathcal{O}_{U} \oplus j_{V!} \mathcal{O}_{V} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

is a exact sequence of $\mathcal{O}_{X}$-modules in Lemma 62.9.1 and applying the right exact functor $\operatorname{Hom}_{\mathcal{O}_{X}}(-, \mathcal{F})$ gives the sequence above. This also means that the obstruction to lifting $s \in \mathcal{F}\left(U \times_{X} V\right)$ to an element of $\mathcal{F}(U) \oplus \mathcal{F}(V)$ lies in $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{O}_{X}, \mathcal{F}\right)=H^{1}(X, \mathcal{F})$. By locality of cohomology (Cohomology on Sites, Lemma 21.8.3 this obstruction vanishes étale locally on $X$ and the proof of (1) is complete.
Proof of (2). Choose a K-injective complex $\mathcal{I} \bullet$ representing $E$ whose terms $\mathcal{I}^{n}$ are injective objects of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. Then $\mathcal{I}^{\bullet} \mid U$ is a K-injective complex (Cohomology on Sites, Lemma 21.20.1). Hence $\left.R j_{U, *} E\right|_{U}$ is represented by $\left.j_{U, *} \mathcal{I}^{\bullet}\right|_{U}$. Similarly for $V$ and $U \times_{X} V$. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1 to the short exact sequence of complexes

$$
\left.\left.\left.0 \rightarrow \mathcal{I}^{\bullet} \rightarrow j_{U, *} \mathcal{I}^{\bullet}\right|_{U} \oplus j_{V, *} \mathcal{I}^{\bullet}\right|_{V} \rightarrow j_{U \times_{X} V, *} \mathcal{I}^{\bullet}\right|_{U \times_{X} V} \rightarrow 0
$$

This sequence is exact by (1).

08JK Lemma 62.9.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square. Denote $a=\left.f\right|_{U}: U \rightarrow Y, b=\left.f\right|_{V}: V \rightarrow Y$, and $c=\left.f\right|_{U \times_{X} V}: U \times_{X} V \rightarrow Y$ the restrictions. For every object $E$ of $D\left(\mathcal{O}_{X}\right)$ there exists a distinguished triangle

$$
R f_{*} E \rightarrow R a_{*}\left(\left.E\right|_{U}\right) \oplus R b_{*}\left(\left.E\right|_{V}\right) \rightarrow R c_{*}\left(\left.E\right|_{U \times_{X} V}\right) \rightarrow R f_{*} E[1]
$$

in $D\left(\mathcal{O}_{Y}\right)$. This triangle is functorial in $E$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $E$. We may assume $\mathcal{I}^{n}$ is an injective object of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ for all $n$, see Injectives, Theorem 19.12.6. Then $R f_{*} E$ is computed by $f_{*} \mathcal{I}^{\bullet}$. Similarly for $U, V$, and $U \cap V$ by Cohomology on Sites, Lemma 21.20.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1 to the short exact sequence of complexes

$$
\left.\left.\left.0 \rightarrow f_{*} \mathcal{I}^{\bullet} \rightarrow a_{*} \mathcal{I}^{\bullet}\right|_{U} \oplus b_{*} \mathcal{I}^{\bullet}\right|_{V} \rightarrow c_{*} \mathcal{I}^{\bullet}\right|_{U \times_{X} V} \rightarrow 0
$$

To see this is a short exact sequence of complexes we argue as follows. Pick an injective object $\mathcal{I}$ of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Apply $f_{*}$ to the short exact sequence

$$
\left.\left.\left.0 \rightarrow \mathcal{I} \rightarrow j_{U, *} \mathcal{I}\right|_{U} \oplus j_{V, *} \mathcal{I}\right|_{V} \rightarrow j_{U \times x V, *} \mathcal{I}\right|_{U \times_{X} V} \rightarrow 0
$$

of Lemma 62.9.2 and use that $R^{1} f_{*} \mathcal{I}=0$ to get a short exact sequence

$$
\left.\left.\left.0 \rightarrow f_{*} \mathcal{I} \rightarrow f_{*} j_{U, *} \mathcal{I}\right|_{U} \oplus f_{*} j_{V, *} \mathcal{I}\right|_{V} \rightarrow f_{*} j_{U \times_{X} V, *} \mathcal{I}\right|_{U \times_{X} V} \rightarrow 0
$$

The proof is finished by observing that $a_{*}=f_{*} j_{U, *}$ and similarly for $b_{*}$ and $c_{*}$.
08H9 Lemma 62.9.4. Let $S$ be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$. For objects $E, F$ of $D\left(\mathcal{O}_{X}\right)$ we have a Mayer-Vietoris sequence

$$
\begin{aligned}
& \ldots \operatorname{Ext}^{-1}\left(E_{U \times_{X} V}, F_{U \times_{X} V}\right) \\
& \operatorname{Hom}(E, F) \longleftrightarrow \operatorname{Hom}\left(E_{U}, F_{U}\right) \oplus \operatorname{Hom}\left(E_{V}, F_{V}\right) \longrightarrow \operatorname{Hom}\left(E_{U \times_{X} V}, F_{U \times_{X} V}\right)
\end{aligned}
$$

where the subscripts denote restrictions to the relevant opens and the Hom's are taken in the relevant derived categories.

Proof. Use the distinguished triangle of Lemma 62.9.1 to obtain a long exact sequence of Hom's (from Derived Categories, Lemma 13.4.2) and use that $\operatorname{Hom}\left(\left.j_{U!} E\right|_{U}, F\right)=$ $\operatorname{Hom}\left(\left.E\right|_{U},\left.F\right|_{U}\right)$ by Cohomology on Sites, Lemma 21.20 .2

08HA Lemma 62.9.5. Let $S$ be a scheme. Let $j: U \rightarrow X$ be a étale morphism of algebraic spaces over $S$. Given an étale morphism $V \rightarrow Y$, set $W=V \times_{X} U$ and denote $j_{W}: W \rightarrow V$ the projection morphism. Then $\left.\left(j_{!} E\right)\right|_{V}=j_{W!}\left(\left.E\right|_{W}\right)$ for $E$ in $D\left(\mathcal{O}_{U}\right)$.
Proof. This is true because $\left.\left(j_{!} \mathcal{F}\right)\right|_{V}=j_{W!}\left(\left.\mathcal{F}\right|_{W}\right)$ for an $\mathcal{O}_{X}$-module $\mathcal{F}$ as follows immediately from the construction of the functors $j_{!}$and $j_{W!}$, see Modules on Sites, Lemma 18.19.2.

08GG Lemma 62.9.6. Let $S$ be a scheme. Let $(U \subset X, j: V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$. Set $T=|X| \backslash|U|$.
(1) If $E$ is an object of $D\left(\mathcal{O}_{X}\right)$ supported on $T$, then (a) $E \rightarrow R j_{*}\left(\left.E\right|_{V}\right)$ and (b) $j_{!}\left(\left.E\right|_{V}\right) \rightarrow E$ are isomorphisms.
(2) If $F$ is an object of $D\left(\mathcal{O}_{V}\right)$ supported on $j^{-1} T$, then (a) $\left.F \rightarrow\left(j_{!} F\right)\right|_{V}$, (b) $\left.\left(R j_{*} F\right)\right|_{V} \rightarrow F$, and (c) $j_{!} F \rightarrow R j_{*} F$ are isomorphisms.
Proof. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$ whose cohomology sheaves are supported on $T$. Then we see that $\left.E\right|_{U}=0$ and $\left.E\right|_{U \times_{X} V}=0$ as $T$ doesn't meet $U$ and $j^{-1} T$ doesn't meet $U \times_{X} V$. Thus (1)(a) follows from Lemma 62.9.2. In exactly the same way (1)(b) follows from Lemma 62.9.1.

Let $F$ be an object of $D\left(\mathcal{O}_{V}\right)$ whose cohomology sheaves are supported on $j^{-1} T$. By Lemma 62.3.1 we have $\left.\left(R j_{*} F\right)\right|_{U}=R j_{W, *}\left(\left.F\right|_{W}\right)=0$ because $\left.F\right|_{W}=0$ by our assumption. Similarly $\left.\left(j_{!} F\right)\right|_{U}=j_{W!}\left(\left.F\right|_{W}\right)=0$ by Lemma 62.9.5. Thus $j_{!} F$ and $R j_{*} F$ are supported on $T$ and $\left.\left(j_{!} F\right)\right|_{V}$ and $\left.\left(R j_{*} F\right)\right|_{V}$ are supported on $j^{-1}(T)$. To check that the maps (2)(a), (b), (c) are isomorphisms in the derived category, it suffices to check that these map induce isomorphisms on stalks of cohomology sheaves at geometric points of $T$ and $j^{-1}(T)$ by Properties of Spaces, Theorem 53.18.12. This we may do after replacing $X$ by $V, U$ by $U \times_{X} V, V$ by $V \times_{X} V$ and $F$ by $\left.F\right|_{V \times_{X} V}$ (restriction via first projection), see Lemmas 62.3.1, 62.9.5, and 62.8.2. Since $V \times_{X} V \rightarrow V$ has a section this reduces (2) to the case that $j: V \rightarrow X$ has a section.

Assume $j$ has a section $\sigma: X \rightarrow V$. Set $V^{\prime}=\sigma(X)$. This is an open subspace of $V$. Set $U^{\prime}=j^{-1}(U)$. This is another open subspace of $V$. Then $\left(U^{\prime} \subset V, V^{\prime} \rightarrow V\right)$ is an elementary distinguished square. Observe that $\left.F\right|_{U^{\prime}}=0$ and $\left.F\right|_{V^{\prime} \cap U^{\prime}}=0$ because $F$ is supported on $j^{-1}(T)$. Denote $j^{\prime}: V^{\prime} \rightarrow V$ the open immersion and $j_{V^{\prime}}: V^{\prime} \rightarrow X$ the composition $V^{\prime} \rightarrow V \rightarrow X$ which is the inverse of $\sigma$. Set $F^{\prime}=\sigma^{*} F$. The distinguished triangles of Lemmas 62.9.1 and 62.9.2 show that $F=j_{!}^{\prime}\left(\left.F\right|_{V^{\prime}}\right)$ and $F=R j_{*}^{\prime}\left(\left.F\right|_{V^{\prime}}\right)$. It follows that $j_{!} F=j_{!} j_{!}^{\prime}\left(\left.F\right|_{V^{\prime}}\right)=j_{V^{\prime}!} F=F^{\prime}$ because $j_{V^{\prime}}: V^{\prime} \rightarrow X$ is an isomorphism and the inverse of $\sigma$. Similarly, $R j_{*} F=$ $R j_{*} R j_{*}^{\prime} F=R j_{V^{\prime}, *} F=F^{\prime}$. This proves (2)(c). To prove (2)(a) and (2)(b) it suffices to show that $F=\left.F^{\prime}\right|_{V}$. This is clear because both $F$ and $\left.F^{\prime}\right|_{V}$ restrict to zero on $U^{\prime}$ and $U^{\prime} \cap V^{\prime}$ and the same object on $V^{\prime}$.

We can glue complexes!
08HB Lemma 62.9.7. Let $S$ be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$. Suppose given
(1) an object $E$ of $D\left(\mathcal{O}_{X}\right)$,
(2) a morphism $a:\left.A \rightarrow E\right|_{U}$ of $D\left(\mathcal{O}_{U}\right)$,
(3) a morphism $b:\left.B \rightarrow E\right|_{V}$ of $D\left(\mathcal{O}_{V}\right)$,
(4) an isomorphism $c:\left.\left.A\right|_{U \times{ }_{X} V} \rightarrow B\right|_{U \times{ }_{X} V}$
such that

$$
\left.a\right|_{U \times_{X} V}=\left.b\right|_{U \times_{X} V} \circ c .
$$

Then there exists a morphism $F \rightarrow E$ in $D\left(\mathcal{O}_{X}\right)$ whose restriction to $U$ is isomorphic to $a$ and whose restriction to $V$ is isomorphic to $b$.

Proof. Denote $j_{U}, j_{V}, j_{U \times_{X} V}$ the corresponding morphisms towards $X$. Choose a distinguished triangle

$$
F \rightarrow R j_{U, *} A \oplus R j_{V, *} B \rightarrow R j_{U \times_{X} V, *}\left(\left.B\right|_{U \times_{X} V}\right) \rightarrow F[1]
$$

Here the map $R j_{V, *} B \rightarrow R j_{U \times_{X} V, *}\left(\left.B\right|_{U \times_{X} V}\right)$ is the obvious one. The map $R j_{U, *} A \rightarrow$ $R j_{U \times_{X} V, *}\left(\left.B\right|_{U \times_{X} V}\right)$ is the composition of $R j_{U, *} A \rightarrow R j_{U \times_{X} V, *}\left(\left.A\right|_{U \times_{X} V}\right)$ with $R j_{U \times{ }_{X} V, *} c$. Restricting to $U$ we obtain

$$
\left.\left.\left.\left.F\right|_{U} \rightarrow A \oplus\left(R j_{V, *} B\right)\right|_{U} \rightarrow\left(R j_{U \times_{X} V, *}\left(\left.B\right|_{U \times_{X} V}\right)\right)\right|_{U} \rightarrow F\right|_{U}[1]
$$

Denote $j: U \times_{X} V \rightarrow U$. Compatibility of restriction and total direct image (Lemma 62.3.1) shows that both $\left.\left(R j_{V, *} B\right)\right|_{U}$ and $\left.\left(R j_{U \times_{X} V, *}\left(\left.B\right|_{U \times_{X} V}\right)\right)\right|_{U}$ are canonically isomorphic to $R j_{*}\left(\left.B\right|_{U \times_{X} V}\right)$. Hence the second arrow of the last displayed equation has a section, and we conclude that the morphism $\left.F\right|_{U} \rightarrow A$ is an isomorphism.

To see that the morphism $\left.F\right|_{V} \rightarrow B$ is an isomorphism we will use a trick. Namely, choose a distinguished triangle

$$
\left.\left.F\right|_{V} \rightarrow B \rightarrow B^{\prime} \rightarrow F[1]\right|_{V}
$$

in $D\left(\mathcal{O}_{V}\right)$. Since $\left.F\right|_{U} \rightarrow A$ is an isomorphism, and since we have the isomorphism $c:\left.\left.A\right|_{U \times_{X} V} \rightarrow B\right|_{U \times_{X} V}$ the restriction of $\left.F\right|_{V} \rightarrow B$ is an isomorphism over $U \times_{X} V$. Thus $B^{\prime}$ is supported on $j_{V}^{-1}(T)$ where $T=|X| \backslash|U|$. On the other hand, there is a morphism of distinguished triangles

The all of the vertical maps in this diagram are isomorphisms, except for the map $\left.R j_{V, *} F\right|_{V} \rightarrow R j_{V, *} B$, hence that is an isomorphism too (Derived Categories, Lemma 13.4.3. This implies that $R j_{V, *} B^{\prime}=0$. Hence $B^{\prime}=0$ by Lemma 62.9.6.

The existence of the morphism $F \rightarrow E$ follows from the Mayer-Vietoris sequence for Hom, see Lemma 62.9.4.

### 62.10. The coherator

08GX Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The coherator is a functor

$$
Q_{X}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

which is right adjoint to the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$. It exists for any algebraic space $X$ and moreover the adjunction mapping $Q_{X}(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism for every quasi-coherent module $\mathcal{F}$, see Properties of Spaces, Proposition 53.31.2. Since $Q_{X}$ is left exact (as a right adjoint) we can consider its right derived extension

$$
R Q_{X}: D\left(\mathcal{O}_{X}\right) \longrightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)
$$

As this functor is constructed by applying $Q_{X}$ to a K-injective replacement we see that $R Q_{X}$ is a right adjoint to the canonical functor $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(\mathcal{O}_{X}\right)$.

08GY Lemma 62.10.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an affine morphism of algebraic spaces over $S$. Then $f_{*}$ defines a derived functor $f_{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow$
$D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$. This functor has the property that

commutes.
Proof. The functor $f_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$ is exact, see Cohomology of Spaces, Lemma 56.7.2. Hence $f_{*}$ defines a derived functor $f_{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow$ $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ by simply applying $f_{*}$ to any representative complex, see Derived Categories, Lemma 13.17 .9 . For any complex of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\bullet}$ there is a canonical $\operatorname{map} f_{*} \mathcal{F}^{\bullet} \rightarrow R f_{*} \mathcal{F}^{\bullet}$. To finish the proof we show this is a quasi-isomorphism when $\mathcal{F}^{\bullet}$ is a complex with each $\mathcal{F}^{n}$ quasi-coherent. The statement is étale local on $Y$ hence we may assume $Y$ affine. As an affine morphism is representable we reduce to the case of schemes by the compatibility of Remark 62.6.3. The case of schemes is Derived Categories of Schemes, Lemma 35.7.1.
08GZ Lemma 62.10.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume that
(1) $f$ is quasi-compact, quasi-separated, and flat, and
(2) denoting

$$
\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)
$$

the right derived functor of $f_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$ the diagram

commutes.
Then $R Q_{Y} \circ R f_{*}=\Phi \circ R Q_{X}$.
Proof. Since $f$ is quasi-compact and quasi-separated, we see that $f_{*}$ preserve quasi-coherence, see Morphisms of Spaces, Lemma 54.11.2. Recall that $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category (Properties of Spaces, Proposition 53.31.2). Hence any $K$ in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ can be represented by a K-injective complex $\mathcal{I}^{\bullet}$ of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. Then we can define $\Phi(K)=f_{*} \mathcal{I}^{\bullet}$.
Since $f$ is flat, the functor $f^{*}$ is exact. Hence $f^{*}$ defines $f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$ and also $f^{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. The functor $f^{*}=L f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow$ $D\left(\mathcal{O}_{X}\right)$ is left adjoint to $R f_{*}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{Y}\right)$, see Cohomology on Sites, Lemma 21.19.1. Similarly, the functor $f^{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ is left adjoint to $\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ by Derived Categories, Lemma 13.28.4.
Let $A$ be an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ and $E$ an object of $D\left(\mathcal{O}_{X}\right)$. Then

$$
\begin{aligned}
\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)}\left(A, R Q_{Y}\left(R f_{*} E\right)\right) & =\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(A, R f_{*} E\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(f^{*} A, E\right) \\
& =\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(f^{*} A, R Q_{X}(E)\right) \\
& =\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)}\left(A, \Phi\left(R Q_{X}(E)\right)\right)
\end{aligned}
$$

This implies what we want.
08H0 Lemma 62.10.3. Let $S$ be a scheme. Let $X$ be an affine algebraic space over $S$. Set $A=\Gamma\left(X, \mathcal{O}_{X}\right)$. Then
(1) $Q_{X}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is the functor which sends $\mathcal{F}$ to the quasicoherent $\mathcal{O}_{X}$-module associated to the $A$-module $\Gamma(X, \mathcal{F})$,
(2) $R Q_{X}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ is the functor which sends $E$ to the complex of quasi-coherent $\mathcal{O}_{X}$-modules associated to the object $R \Gamma(X, E)$ of $D(A)$,
(3) restricted to $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the functor $R Q_{X}$ defines a quasi-inverse to 62.5.1.1.

Proof. Let $X_{0}=\operatorname{Spec}(A)$ be the affine scheme representing $X$. Recall that there is a morphism of ringed sites $\epsilon: X_{\text {étale }} \rightarrow X_{0, Z a r}$ which induces equivalences

$$
Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \underset{\epsilon^{*}}{\stackrel{\epsilon_{*}}{\rightleftarrows}} Q \operatorname{Coh}\left(\mathcal{O}_{X_{0}}\right)
$$

see Lemma 62.4.2. Hence we see that $Q_{X}=\epsilon^{*} \circ Q_{X_{0}} \circ \epsilon_{*}$ by uniqueness of adjoint functors. Hence (1) follows from the description of $Q_{X_{0}}$ in Derived Categories of Schemes, Lemma 35.7 .3 and the fact that $\Gamma\left(X_{0}, \epsilon_{*} \mathcal{F}\right)=\Gamma(X, \mathcal{F})$. Part (2) follows from (1) and the fact that the functor from $A$-modules to quasi-coherent $\mathcal{O}_{X}$-modules is exact. The third assertion now follows from the result for schemes (Derived Categories of Schemes, Lemma 35.7.3) and Lemma 62.4.2.

08H1 Proposition 62.10.4. Let $S$ be a scheme. Let $X$ be a quasi-compact algebraic space over $S$ with affine diagonal. Then the functor 62.5.1.1)

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.
Proof. We first use the induction principle to prove $i_{X}$ is fully faithful. Let $\mathcal{B} \subset$ $\mathrm{Ob}\left(X_{\text {spaces,étale }}\right)$ be the set of objects which are quasi-compact and have affine diagonal. For $U \in \mathcal{B}$ let $P(U)=$ "the functor $i_{U}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{U}\right)$ is fully faithful". By Remark 62.8.5 conditions (1), (2), and (3)(a) of Lemma 62.8.4 hold and we are left with proving (3)(b) and (4). Condition (3)(b) holds by Lemma 62.10 .3

Let $(U \subset W, V \rightarrow W)$ be an elementary distinguished square with $V$ affine. Assume that $P$ holds for $U, V$, and $U \times_{W} V$. We have to show that $P$ holds for $W$. We may replace $X$ by $W$, i.e., we may assume $W=X$ (we do this just to simplify the notation).
Suppose that $A, B$ are objects of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. We want to show that

$$
\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}(A, B) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(i_{X}(A), i_{X}(B)\right)
$$

is bijective. Let $T=|X| \backslash|U|$.
Assume first $i_{X}(B)$ is supported on $T$. In this case the map

$$
i_{X}(B) \rightarrow R j_{V, *}\left(\left.i_{X}(B)\right|_{V}\right)=R j_{V, *}\left(i_{V}\left(\left.B\right|_{V}\right)\right)
$$

is a quasi-isomorphism (Lemma 62.9.6). The morphism $V \rightarrow X$ is affine as $V$ is affine and $X$ has affine diagonal (Morphisms of Spaces, Lemma 54.20.11). Thus we have an object $j_{V, *}\left(\left.B\right|_{V}\right)$ in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ and an isomorphism $i_{X}\left(j_{V, *}\left(\left.B\right|_{V}\right)\right) \rightarrow$ $R j_{V, *}\left(i_{V}\left(\left.B\right|_{V}\right)\right)$ in $D\left(\mathcal{O}_{X}\right)$ (Lemma 62.10.1). Moreover, $j_{V, *}$ and $-\left.\right|_{V}$ are adjoint
functors on the derived categories of quasi-coherent modules, see proof Lemma 62.10 .2 . The adjunction map $B \rightarrow j_{V, *}\left(\left.B\right|_{V}\right)$ becomes an isomorphism after applying $i_{X}$, whence is an isomorphism in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. Hence

$$
\begin{aligned}
\operatorname{Mor}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}(A, B) & =\operatorname{Mor}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(A, j_{V, *}\left(\left.B\right|_{V}\right)\right) \\
& =\operatorname{Mor}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{V}\right)\right)}\left(\left.A\right|_{V},\left.B\right|_{V}\right) \\
& =\operatorname{Mor}_{D\left(\mathcal{O}_{V}\right)}\left(i_{V}\left(\left.A\right|_{V}\right), i_{V}\left(\left.B\right|_{V}\right)\right) \\
& =\operatorname{Mor}_{D\left(\mathcal{O}_{X}\right)}\left(i_{X}(A), R j_{V, *}\left(i_{V}\left(\left.B\right|_{V}\right)\right)\right) \\
& =\operatorname{Mor}_{D\left(\mathcal{O}_{X}\right)}\left(i_{X}(A), i_{X}(B)\right)
\end{aligned}
$$

as desired.
In general, choose any complex $\mathcal{B}^{\bullet}$ of quasi-coherent $\mathcal{O}_{X}$-modules representing $B$. Next, choose any quasi-isomorphism $s:\left.\mathcal{B}^{\bullet}\right|_{U} \rightarrow \mathcal{C}^{\bullet}$ of complexes of quasi-coherent modules on $U$. As $j_{U}: U \rightarrow X$ is quasi-compact and quasi-separated the functor $j_{U, *}$ transforms quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 54.11.2). Thus there is a canonical map $\mathcal{B}^{\bullet} \rightarrow j_{U, *}\left(\left.\mathcal{B}^{\bullet}\right|_{U}\right) \rightarrow j_{U, *} \mathcal{C}^{\bullet}$ of complexes of quasi-coherent modules on $X$. Set $B^{\prime \prime}=j_{U, *} \mathcal{C}^{\bullet}$ in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ and choose a distinguished triangle

$$
B \rightarrow B^{\prime \prime} \rightarrow B^{\prime} \rightarrow B^{\bullet}[1]
$$

in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. Since the first arrow of the triangle restricts to an isomorphism over $U$ we see that $B^{\prime}$ is supported on $T$. Hence in the diagram

we have exact columns and the top and bottom horizontal arrows are bijective. Finally, choose a complex $\mathcal{A}^{\bullet}$ of quasi-coherent modules representing $A$.
Let $\alpha: i_{X}(A) \rightarrow i_{X}(B)$ be a morphism between in $D\left(\mathcal{O}_{X}\right)$. The restriction $\left.\alpha\right|_{U}$ comes from a morphism in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)$ by assumption. Hence there exists a choice of $s:\left.\mathcal{B}^{\bullet}\right|_{U} \rightarrow \mathcal{C}^{\bullet}$ as above such that $\left.\alpha\right|_{U}$ is represented by an actual map of complexes $\left.\mathcal{A}^{\bullet}\right|_{U} \rightarrow \mathcal{C}^{\bullet}$. This corresponds to a map of complexes $\mathcal{A} \rightarrow j_{U, *} \mathcal{C}^{\bullet}$. In other words, the image of $\alpha$ in $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(i_{X}(A), i_{X}\left(B^{\prime \prime}\right)\right)$ comes from an element of $\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(A, B^{\prime \prime}\right)$. A diagram chase then shows that $\alpha$ comes from a morphism $A \rightarrow B$ in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. Finally, suppose that $a: A \rightarrow B$ is a morphism of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ which becomes zero in $D\left(\mathcal{O}_{X}\right)$. After choosing $\mathcal{B}^{\bullet}$ suitably, we may assume $a$ is represented by a morphism of complexes $a^{\bullet}: \mathcal{A}^{\bullet} \rightarrow \mathcal{B}^{\bullet}$. Since $P$ holds for $U$ the restriction $\left.a^{\bullet}\right|_{U}$ is zero in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)$. Thus we can choose $s$ such that $\left.s \circ a^{\bullet}\right|_{U}:\left.\mathcal{A}^{\bullet}\right|_{U} \rightarrow \mathcal{C}^{\bullet}$ is homotopic to zero. Applying the functor $j_{U, *}$ we conclude that $\mathcal{A}^{\bullet} \rightarrow j_{U, *} \mathcal{C}^{\bullet}$ is homotopic to zero. Thus $a$ maps to zero in
$\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(A, B^{\prime \prime}\right)$. Thus we may assume that $a$ is the image of an element of $b \in \operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(A, B^{\prime}[-1]\right)$. The image of $b$ in $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(i_{X}(A), i_{X}\left(B^{\prime}\right)[-1]\right)$ comes from a $\gamma \in \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(A, B^{\prime \prime}[-1]\right)$ (as $a$ maps to zero in the group on the right). Since we've seen above the horizontal arrows are surjective, we see that $\gamma$ comes from a $c$ in $\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(A, B^{\prime \prime}[-1]\right)$ which implies $a=0$ as desired.
Since $i_{X}$ is fully faithful with right adjoint $R Q_{X}$ we see that $R Q_{X} \circ i_{X}=\mathrm{id}$ (Categories, Lemma 4.24.3). To finish the proof we show that for any $E$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the $\operatorname{map} i_{X}\left(R \overline{Q_{X}(E)}\right) \rightarrow E$ is an isomorphism. Choose a distinguished triangle

$$
i_{X}\left(R Q_{X}(E)\right) \rightarrow E \rightarrow E^{\prime} \rightarrow i_{X}\left(R Q_{X}(E)\right)[1]
$$

in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. A formal argument using the above shows that $i_{X}\left(R Q_{X}\left(E^{\prime}\right)\right)=0$. Thus it suffices to prove that for $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the condition $i_{X}\left(R Q_{X}(E)\right)=0$ implies that $E=0$. Consider an étale morphism $j: V \rightarrow X$ with $V$ affine. By Lemmas 62.10.3, 62.10.1, and 62.10.2 we have

$$
R j_{*}\left(\left.E\right|_{V}\right)=R j_{*}\left(i_{V}\left(R Q_{V}\left(\left.E\right|_{V}\right)\right)\right)=i_{X}\left(j_{*}\left(R Q_{V}\left(\left.E\right|_{V}\right)\right)\right)=i_{X}\left(R Q_{X}\left(R j_{*}\left(\left.E\right|_{V}\right)\right)\right)
$$

Choose a distinguished triangle

$$
E \rightarrow R j_{*}\left(\left.E\right|_{V}\right) \rightarrow E^{\prime} \rightarrow E[1]
$$

Apply $R Q_{X}$ to get a distinguished triangle

$$
0 \rightarrow R Q_{X}\left(R j_{*}\left(\left.E\right|_{V}\right)\right) \rightarrow R Q_{X}\left(E^{\prime}\right) \rightarrow 0[1]
$$

in other words the map in the middle is an isomorphism. Combined with the string of equalities above we find that our first distinghuished triangle becomes a distinguished triangle

$$
E \rightarrow i_{X}\left(R Q_{X}\left(E^{\prime}\right)\right) \rightarrow E^{\prime} \rightarrow E[1]
$$

where the middle morphism is the adjunction map. However, the composition $E \rightarrow$ $E^{\prime}$ is zero, hence $E \rightarrow i_{X}\left(R Q_{X}\left(E^{\prime}\right)\right)$ is zero by adjunction! Since this morphism is isomorphic to the morphism $E \rightarrow R j_{*}\left(\left.E\right|_{V}\right)$ adjoint to id : $\left.\left.E\right|_{V} \rightarrow E\right|_{V}$ we conclude that $\left.E\right|_{V}$ is zero. Since this holds for all affine $V$ étale over $X$ we conlude $E$ is zero as desired.

09TG Remark 62.10.5. Analyzing the proof of Proposition 62.10.4 we see that we have shown the following. Let $X$ be a quasi-compact and quasi-separated scheme. Suppose that for every étale morphism $j: V \rightarrow X$ with $V$ affine the right derived functor

$$
\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)
$$

of the left exact functor $j_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{V}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ fits into a commutative diagram

Then the functor 62.5.1.1

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.

### 62.11. The coherator for Noetherian spaces

09 TH We need a little bit more about injective modules to treat the case of a Noetherian algebraic space.
09TI Lemma 62.11.1. Let $S$ be a Noetherian affine scheme. Every injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$ is a filtered colimit $\operatorname{colim}_{i} \mathcal{F}_{i}$ of quasi-coherent sheaves of the form

$$
\mathcal{F}_{i}=\left(Z_{i} \rightarrow S\right)_{*} \mathcal{G}_{i}
$$

where $Z_{i}$ is the spectrum of an Artinian ring and $\mathcal{G}_{i}$ is a coherent module on $Z_{i}$.
Proof. Let $S=\operatorname{Spec}(A)$. Let $\mathcal{J}$ be an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$. Since $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$ is equivalent to the category of $A$-modules we see that $\mathcal{J}$ is equal to $\widetilde{J}$ for some injective $A$-module $J$. By Dualizing Complexes, Proposition 45.5.9 we can write $J=\bigoplus E_{\alpha}$ with $E_{\alpha}$ indecomposable and therefore isomorphic to the injective hull of a reside field at a point. Thus (because finite disjoint unions of Artinian schemes are Artinian) we may assume that $J$ is the injective hull of $\kappa(\mathfrak{p})$ for some prime $\mathfrak{p}$ of $A$. Then $J=\bigcup J\left[\mathfrak{p}^{n}\right]$ where $J\left[\mathfrak{p}^{n}\right]$ is the injective hull of $\kappa(\mathfrak{p})$ over $A / \mathfrak{p}^{n} A_{\mathfrak{p}}$, see Dualizing Complexes, Lemma 45.7.3. Thus $\widetilde{J}$ is the colimit of the sheaves $\left(Z_{n} \rightarrow X\right)_{*} \mathcal{G}_{n}$ where $Z_{n}=\operatorname{Spec}\left(A_{\mathfrak{p}} / \mathfrak{p}^{n} A_{\mathfrak{p}}\right)$ and $\mathfrak{G}_{n}$ the coherent sheaf associated to the finite $A / \mathfrak{p}^{n} A_{\mathfrak{p}}$-module $J\left[\mathfrak{p}^{n}\right]$. Finiteness follows from Dualizing Complexes, Lemma 45.6.1.

09TJ Lemma 62.11.2. Let $S$ be an affine scheme. Let $X$ be a Noetherian algebraic space over $S$. Every injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a direct summand of a filtered colimit $\operatorname{colim}_{i} \mathcal{F}_{i}$ of quasi-coherent sheaves of the form

$$
\mathcal{F}_{i}=\left(Z_{i} \rightarrow X\right)_{*} \mathcal{G}_{i}
$$

where $Z_{i}$ is the spectrum of an Artinian ring and $\mathcal{G}_{i}$ is a coherent module on $Z_{i}$.
Proof. Choose an affine scheme $U$ and a surjective étale morphism $j: U \rightarrow X$ (Properties of Spaces, Lemma 53.6.3). Then $U$ is a Noetherian affine scheme. Choose an injective object $\mathcal{J}^{\prime}$ of $Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)$ such that there exists an injection $\left.\mathcal{J}\right|_{U} \rightarrow \mathcal{J}^{\prime}$. Then

$$
\mathcal{J} \rightarrow j_{*} \mathcal{J}^{\prime}
$$

is an injective morphism in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, hence identifies $\mathcal{J}$ as a direct summand of $j_{*} \mathcal{J}^{\prime}$. Thus the result follows from the corresponding result for $\mathcal{J}^{\prime}$ proved in Lemma 62.11.1.

09TK Lemma 62.11.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a flat, quasi-compact, and quasi-separated morphism of algebraic spaces over $S$. If $\mathcal{J}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, then $f_{*} \mathcal{J}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$.

Proof. Since $f$ is quasi-compact and quasi-separated, the functor $f_{*}$ transforms quasi-coherent sheaves into quasi-coherent sheaves (Morphisms of Spaces, Lemma 54.11.2). The functor $f^{*}$ is a left adjoint to $f_{*}$ which transforms injections into injections. Hence the result follows from Homology, Lemma 12.25 .1

09TL Lemma 62.11.4. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. If $\mathcal{J}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, then
(1) $H^{p}\left(U,\left.\mathcal{J}\right|_{U}\right)=0$ for $p>0$ and for every quasi-compact and quasi-separated algebraic space $U$ étale over $X$,
(2) for any morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ with $Y$ quasiseparated we have $R^{p} f_{*} \mathcal{J}=0$ for $p>0$.
Proof. Proof of (1). Write $\mathcal{J}$ as a direct summand of $\operatorname{colim} \mathcal{F}_{i}$ with $\mathcal{F}_{i}=\left(Z_{i} \rightarrow\right.$ $X)_{*} \mathcal{G}_{i}$ as in Lemma 62.11.2. It is clear that it suffices to prove the vanishing for $\operatorname{colim} \mathcal{F}_{i}$. Since pullback commutes with colimits and since $U$ is quasi-compact and quasi-separated, it suffices to prove $H^{p}\left(U,\left.\mathcal{F}_{i}\right|_{U}\right)=0$ for $p>0$, see Cohomology of Spaces, Lemma56.4.1. Observe that $Z_{i} \rightarrow X$ is an affine morphism, see Morphisms of Spaces, Lemma 54.20.12. Thus

$$
\left.\mathcal{F}_{i}\right|_{U}=\left(Z_{i} \times_{X} U \rightarrow U\right)_{*} \mathcal{G}_{i}^{\prime}=R\left(Z_{i} \times_{X} U \rightarrow U\right)_{*} \mathcal{G}_{i}^{\prime}
$$

where $\mathcal{G}_{i}^{\prime}$ is the pullback of $\mathcal{G}_{i}$ to $Z_{i} \times{ }_{X} U$, see Cohomology of Spaces, Lemma 56.10 .2 . Since $Z_{i} \times_{X} U$ is affine we conlude that $\mathcal{G}_{i}^{\prime}$ has no higher cohomology on $Z_{i} \times{ }_{X} U$. By the Leray spectral sequence we conclude the same thing is true for $\left.\mathcal{F}_{i}\right|_{U}$ (Cohomology on Sites, Lemma 21.14.6).
Proof of (2). Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $V \rightarrow Y$ be an étale morphism with $V$ affine. Then $V \times_{Y} X \rightarrow X$ is an étale morphism and $V \times_{Y} X$ is a quasi-compact and quasi-separated algebraic space étale over $X$ (details omitted). Hence $H^{p}\left(V \times_{Y} X, \mathcal{J}\right)$ is zero by part (1). Since $R^{p} f_{*} \mathcal{J}$ is the sheaf associated to the presheaf $V \mapsto H^{p}\left(V \times_{Y} X, \mathcal{J}\right)$ the result is proved.

09TM Lemma 62.11.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of Noetherian algebraic spaces over $S$. Then $f_{*}$ on quasi-coherent sheaves has a right derived extension $\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ such that the diagram

commutes.
Proof. Since $X$ and $Y$ are Noetherian the morphism is quasi-compact and quasiseparated (see Morphisms of Spaces, Lemma 54.8.9). Thus $f_{*}$ preserve quasicoherence, see Morphisms of Spaces, Lemma 54.11.2. Next, Let $K$ be an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. Since $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category (Properties of Spaces, Proposition 53.31.2), we can represent $K$ by a K-injective complex $\mathcal{I}^{\bullet}$ such that each $\mathcal{I}^{n}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. Thus we see that the functor $\Phi$ is defined by setting

$$
\Phi(K)=f_{*} \mathcal{I}^{\bullet}
$$

where the right hand side is viewed as an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$. To finish the proof of the lemma it suffices to show that the canonical map

$$
f_{*} \mathcal{I}^{\bullet} \longrightarrow R f_{*} \mathcal{I}^{\bullet}
$$

is an isomorphism in $D\left(\mathcal{O}_{Y}\right)$. To see this it suffices to prove the map induces an isomorphism on cohomology sheaves. Pick any $m \in \mathbf{Z}$. Let $N=N(X, Y, f)$ be as in Lemma 62.6.1. Consider the short exact sequence

$$
0 \rightarrow \sigma_{\geq m-N-1} \mathcal{I}^{\bullet} \rightarrow \mathcal{I}^{\bullet} \rightarrow \sigma_{\leq m-N-2} \mathcal{I}^{\bullet} \rightarrow 0
$$

of complexes of quasi-coherent sheaves on $X$. By Lemma 62.6.1 we see that the cohomology sheaves of $R f_{*} \sigma_{\leq m-N-2} \mathcal{I}^{\bullet}$ are zero in degrees $\geq m-1$. Thus we see
that $R^{m} f_{*} \mathcal{I}^{\bullet}$ is isomorphic to $R^{m} f_{*} \sigma_{\geq m-N-1} \mathcal{I}^{\bullet}$. In other words, we may assume that $\mathcal{I}^{\bullet}$ is a bounded below complex of injective objects of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. This case follows from Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7 with required vanishing because of Lemma 62.11.4.
09TN Proposition 62.11.6. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Then the functor 62.5.1.1)

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.
Proof. This follows using the exact same argument as in the proof of Proposition 62.10 .4 using Lemma 62.11.5. See discussion in Remark 62.10.5.

### 62.12. Pseudo-coherent and perfect complexes

08 HC In this section we study the general notions defined in Cohomology on Sites, Sections 21.34, 21.35, 21.36, and 21.37 for the étale site of an algebraic space. In particular we match this with what happens for schemes.

First we compare the notion of a pseudo-coherent complex on a scheme and on its associated small étale site.
08HD Lemma 62.12.1. Let $X$ be a scheme. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is of finite type as an $\mathcal{O}_{X}$-module, and
 Here $\epsilon$ is as in 62.4.0.1.

Proof. The implication $(1) \Rightarrow(2)$ is a general fact, see Modules on Sites, Lemma 18.23.4. Assume (2). By assumption there exists an étale covering $\left\{f_{i}: X_{i} \rightarrow X\right\}$ such that $\left.\epsilon^{*} \mathcal{F}\right|_{\left(X_{i}\right)_{\text {etale }}}$ is generated by finitely many sections. Let $x \in X$. We will show that $\mathcal{F}$ is generated by finitely many sections in a neighbourhood of $x$. Say $x$ is in the image of $X_{i} \rightarrow X$ and denote $X^{\prime}=X_{i}$. Let $s_{1}, \ldots, s_{n} \in \Gamma\left(X^{\prime},\left.\epsilon^{*} \mathcal{F}\right|_{X_{\text {étale }}^{\prime}}\right)$ be generating sections. As $\epsilon^{*} \mathcal{F}=\epsilon^{-1} \mathcal{F} \otimes_{\epsilon^{-1}} \mathcal{O}_{X} \mathcal{O}_{\text {étale }}$ we can find an étale morphism $X^{\prime \prime} \rightarrow X^{\prime}$ such that $x$ is in the image of $X^{\prime} \rightarrow X$ and such that $\left.s_{i}\right|_{X^{\prime \prime}}=\sum s_{i j} \otimes a_{i j}$ for some sections $s_{i j} \in \epsilon^{-1} \mathcal{F}\left(X^{\prime \prime}\right)$ and $a_{i j} \in \mathcal{O}_{\text {étale }}\left(X^{\prime \prime}\right)$. Denote $U \subset X$ the image of $X^{\prime \prime} \rightarrow X$. This is an open subscheme as $f^{\prime \prime}: X^{\prime \prime} \rightarrow X$ is étale (Morphisms, Lemma 28.36.13). After possibly shrinking $X^{\prime \prime}$ more we may assume $s_{i j}$ come from elements $t_{i j} \in \mathcal{F}(U)$ as follows from the construction of the inverse image functor $\epsilon^{-1}$. Now we claim that $t_{i j}$ generate $\left.\mathcal{F}\right|_{U}$ which finishes the proof of the lemma. Namely, the corresponding $\left.\operatorname{map} \mathcal{O}_{U}^{\oplus N} \rightarrow \mathcal{F}\right|_{U}$ has the property that its pullback by $f^{\prime \prime}$ to $X^{\prime \prime}$ is surjective. Since $f^{\prime \prime}: X^{\prime \prime} \rightarrow U$ is a surjective flat morphism of schemes, this implies that $\left.\mathcal{O}_{U}^{\oplus} N \rightarrow \mathcal{F}\right|_{U}$ is surjective by looking at stalks and using that $\mathcal{O}_{U, f^{\prime \prime}(z)} \rightarrow \mathcal{O}_{X^{\prime \prime}, z}$ is faithfully flat for all $z \in X^{\prime \prime}$.

In the situation above the morphism of sites $\epsilon$ is flat hence defines a pullback on complexes of modules.
08 HE Lemma 62.12.2. Let $X$ be a scheme. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. The following are equivalent
(1) E is m-pseudo-coherent, and
(2) $\epsilon^{*} E$ is m-pseudo-coherent on the small étale site of $X$.

Here $\epsilon$ is as in 62.4.0.1.
Proof. The implication $(1) \Rightarrow(2)$ is a general fact, see Cohomology on Sites, Lemma 21.35.3. Assume $\epsilon^{*} E$ is $m$-pseudo-coherent. We will use without further mention that $\epsilon^{*}$ is an exact functor and that therefore

$$
\epsilon^{*} H^{i}(E)=H^{i}\left(\epsilon^{*} E\right)
$$

To show that $E$ is $m$-pseudo-coherent we may work locally on $X$, hence we may assume that $X$ is quasi-compact (for example affine). Since $X$ is quasi-compact every étale covering $\left\{U_{i} \rightarrow X\right\}$ has a finite refinement. Thus we see that $\epsilon^{*} E$ is an object of $D^{-}\left(\mathcal{O}_{\text {étale }}\right)$, see comments following Cohomology on Sites, Definition 21.35.1. By Lemma 62.4.1 it follows that $E$ is an object of $D^{-}\left(\mathcal{O}_{X}\right)$.

Let $n \in \mathbf{Z}$ be the largest integer such that $H^{n}(E)$ is nonzero; then $n$ is also the largest integer such that $H^{n}\left(\epsilon^{*} E\right)$ is nonzero. We will prove the lemma by induction on $n-m$. If $n<m$, then the lemma is clearly true. If $n \geq m$, then $H^{n}\left(\epsilon^{*} E\right)$ is a finite $\mathcal{O}_{\text {étale }}$-module, see Cohomology on Sites, Lemma 21.35.7. Hence $H^{n}(E)$ is a finite $\mathcal{O}_{X}$-module, see Lemma 62.12.1. After replacing $X$ by the members of an open covering, we may assume there exists a surjection $\mathcal{O}_{X}^{\oplus t} \rightarrow H^{n}(E)$. We may locally on $X$ lift this to a map of complexes $\alpha: \mathcal{O}_{X}^{\oplus t}[-n] \rightarrow E$ (details omitted). Choose a distinguished triangle

$$
\mathcal{O}_{X}^{\oplus t}[-n] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_{X}^{\oplus t}[-n+1]
$$

Then $C$ has vanishing cohomology in degrees $\geq n$. On the other hand, the complex $\epsilon^{*} C$ is $m$-pseudo-coherent, see Cohomology on Sites, Lemma 21.35.4. Hence by induction we see that $C$ is $m$-pseudo-coherent. Applying Cohomology on Sites, Lemma 21.35.4 once more we conclude.

08HF Lemma 62.12.3. Let $X$ be a scheme. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Then
(1) $E$ has tor amplitude in $[a, b]$ if and only if $\epsilon^{*} E$ has tor amplitude in $[a, b]$.
(2) $E$ has finite tor dimension if and only if $\epsilon^{*} E$ has finite tor dimension.

Here $\epsilon$ is as in 62.4.0.1.
Proof. The easy implication follows from the general result contained in Cohomology on Sites, Lemma 21.36 .4 (and the fact that the small étale site of $X$ has enough points, see Étale Cohomology, Remarks 49.29.11. For the converse, assume that $\epsilon^{*} E$ has tor amplitude in $[a, b]$ Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. As $\epsilon$ is a flat morphism of ringed sites (Lemma 62.4.1) we have

$$
\epsilon^{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)=\epsilon^{*} E \otimes_{\mathcal{O}_{\text {étale }}}^{\mathbf{L}} \epsilon^{*} \mathcal{F}
$$

Thus the (assumed) vanishing of cohomology sheaves on the right hand side implies the desired vanishing of the cohomology sheaves of $E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}$ via Lemma 62.4.1.
08HG Lemma 62.12.4. Let $X$ be a scheme. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Then $E$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ if and only if $\epsilon^{*} E$ is a perfect object of $D\left(\mathcal{O}_{\text {étale }}\right)$. Here $\epsilon$ is as in 62.4.0.1.
Proof. The easy implication follows from the general result contained in Cohomology on Sites, Lemma 21.37 .5 (and the fact that the small étale site of $X$ has enough points, see Étale Cohomology, Remarks 49.29.11. For the converse, we can use the equivalence of Cohomology on Sites, Lemma 21.37 .4 and the corresponding results
for pseudo-coherent and complexes of finite tor dimension, namely Lemmas 62.12.2 and 62.12.3. Some details omitted.

08JL Lemma 62.12.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. If $E$ is an m-pseudo-coherent object of $D\left(\mathcal{O}_{X}\right)$, then $H^{i}(E)$ is a quasi-coherent $\mathcal{O}_{X}$-module for $i>m$. If $E$ is pseudo-coherent, then $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
Proof. Locally $H^{i}(E)$ is isomorphic to $H^{i}\left(\mathcal{E}^{\bullet}\right)$ with $\mathcal{E}^{\bullet}$ strictly perfect. The sheaves $\mathcal{E}^{i}$ are direct summands of finite free modules, hence quasi-coherent. The lemma follows.

08IK Lemma 62.12.6. Let $S$ be a scheme. Let $X$ be a Noetherian algebraic space over $S$. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. For $m \in \mathbf{Z}$ the following are equivalent
(1) $H^{i}(E)$ is coherent for $i \geq m$ and zero for $i \gg 0$, and
(2) $E$ is m-pseudo-coherent.

In particular, $E$ is pseudo-coherent if and only if $E$ is an object of $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$.
Proof. As $X$ is quasi-compact we can find an affine scheme $U$ and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma 53.6.3). Observe that $U$ is Noetherian. Note that $E$ is $m$-pseudo-coherent if and only if $\left.E\right|_{U}$ is $m$-pseudocoherent (follows from the definition or from Cohomology on Sites, Lemma 21.35.2). Similarly, $H^{i}(E)$ is coherent if and only if $\left.H^{i}(E)\right|_{U}=H^{i}\left(\left.E\right|_{U}\right)$ is coherent (see Cohomology of Spaces, Lemma 56.11.2. Thus we may assume that $X$ is representable.
If $X$ is representable by a scheme $X_{0}$ then (Lemma 62.4.2) we can write $E=\epsilon^{*} E_{0}$ where $E_{0}$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$ and $\epsilon: X_{\text {étale }} \rightarrow\left(X_{0}\right)_{Z a r}$ is as in 62.4.0.1). In this case $E$ is $m$-pseudo-coherent if and only if $E_{0}$ is by Lemma 62.12.2, Similarly, $H^{i}\left(E_{0}\right)$ is of finite type (i.e., coherent) if and only if $H^{i}(E)$ is by Lemma 62.12.1. Finally, $H^{i}\left(E_{0}\right)=0$ if and only if $H^{i}(E)=0$ by Lemma 62.4.1. Thus we reduce to the case of schemes which is Derived Categories of Schemes, Lemma 35.10.4

08IL Lemma 62.12.7. Let $S$ be a scheme. Let $X$ be a quasi-separated algebraic space over $S$. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $a \leq b$. The following are equivalent
(1) E has tor amplitude in $[a, b]$, and
(2) for all $\mathcal{F}$ in $\operatorname{QCoh}\left(\mathcal{O}_{X}\right)$ we have $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)=0$ for $i \notin[a, b]$.

Proof. It is clear that (1) implies (2). Assume (2). Let $j: U \rightarrow X$ be an étale morphism with $U$ affine. As $X$ is quasi-separated $j: U \rightarrow X$ is quasi-compact and separated, hence $j_{*}$ transforms quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 54.11.2). Thus the functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow$ $Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)$ is essentially surjective. It follows that condition (2) implies the vanishing of $H^{i}\left(\left.E\right|_{U} \otimes_{\mathcal{O}_{U}}^{\mathbf{L}} \mathcal{G}\right)$ for $i \notin[a, b]$ for all quasi-coherent $\mathcal{O}_{U}$-modules $\mathcal{G}$. Since it suffices to prove that $\left.E\right|_{U}$ has tor amplitude in $[a, b]$ we reduce to the case where $X$ is representable.
If $X$ is representable by a scheme $X_{0}$ then (Lemma 62.4.2) we can write $E=\epsilon^{*} E_{0}$ where $E_{0}$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$ and $\epsilon: X_{\text {étale }} \rightarrow\left(X_{0}\right)_{Z a r}$ is as in 62.4.0.1). For every quasi-coherent module $\mathcal{F}_{0}$ on $X_{0}$ the module $\epsilon^{*} \mathcal{F}_{0}$ is quasi-coherent on $X$ and

$$
H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \epsilon^{*} \mathcal{F}_{0}\right)=\epsilon^{*} H^{i}\left(E_{0} \otimes_{\mathcal{O}_{X_{0}}}^{\mathbf{L}} \mathcal{F}_{0}\right)
$$

as $\epsilon$ is flat (Lemma 62.4.1). Moreover, the vanishing of these sheaves for $i \notin$ $[a, b]$ implies the same thing for $H^{i}\left(E_{0} \otimes_{\mathcal{O}_{X_{0}}}^{\mathbf{L}} \mathcal{F}_{0}\right)$ by the same lemma. Thus we've
reduced the problem to the case of schemes which is treated in Derived Categories of Schemes, Lemma 35.10.6.

08JP Lemma 62.12.8. Let $X$ be a scheme. Let $E, F$ be objects of $D\left(\mathcal{O}_{X}\right)$. Assume either
(1) $E$ is pseudo-coherent and $F$ lies in $D^{+}\left(\mathcal{O}_{X}\right)$, or
(2) $E$ is perfect and $F$ arbitrary,
then there is a canonical isomorphism

$$
\epsilon^{*} R \mathcal{H o m}(E, F) \longrightarrow R \mathcal{H o m}\left(\epsilon^{*} E, \epsilon^{*} F\right)
$$

Here $\epsilon$ is as in 62.4.0.1.
Proof. Recall that $\epsilon$ is flat (Lemma 62.4.1) and hence $\epsilon^{*}=L \epsilon^{*}$. There is a canonical map from left to right by Cohomology on Sites, Remark 21.26.10. To see this is an isomorphism we can work locally, i.e., we may assume $X$ is an affine scheme.

In case (1) we can represent $E$ by a bounded above complex $\mathcal{E} \bullet$ of finite free $\mathcal{O}_{X^{-}}$ modules, see Derived Categories of Schemes, Lemma 35.12.2. We may also represent $F$ by a bounded below complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X}$-modules. Applying Cohomology, Lemma 20.38 .10 we see that $R \mathcal{H}$ om $(E, F)$ is represented by the complex with terms

$$
\bigoplus_{n=-p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{p}, \mathcal{F}^{q}\right)
$$

Applying Cohomology on Sites, Lemma 21.34 .10 we see that $R \mathcal{H o m}\left(\epsilon^{*} E, \epsilon^{*} F\right)$ is represented by the complex with terms

$$
\bigoplus_{n=-p+q} \mathcal{H o m}_{\mathcal{O}_{\text {étale }}}\left(\epsilon^{*} \mathcal{E}^{p}, \epsilon^{*} \mathcal{F}^{q}\right)
$$

Thus the statement of the lemma boils down to the true fact that the canonical map

$$
\epsilon^{*} \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{E}, \mathcal{F}) \longrightarrow \mathcal{H o m}_{\mathcal{O}_{\text {etale }}}\left(\epsilon^{*} \mathcal{E}, \epsilon^{*} \mathcal{F}\right)
$$

is an isomorphism for any $\mathcal{O}_{X}$-module $\mathcal{F}$ and finite free $\mathcal{O}_{X}$-module $\mathcal{E}$.
In case (2) we can represent $E$ by a strictly perfect complex $\mathcal{E} \bullet$ of $\mathcal{O}_{X}$-modules, use Derived Categories of Schemes, Lemmas 35.3 .5 and 35.10 .7 and the fact that a perfect complex of modules is represented by a finite complex of finite projective modules. Thus we can do the exact same proof as above, replacing the reference to Cohomology, Lemma 20.38.10 by a reference to Cohomology, Lemma 20.38.9.

0A8A Lemma 62.12.9. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $L, K$ be objects of $D\left(\mathcal{O}_{X}\right)$. If either
(1) $L$ in $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ and $K$ is pseudo-coherent,
(2) $L$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K$ is perfect, then $R \mathcal{H o m}(K, L)$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Proof. This follows from the analogue for schemes (Derived Categories of Schemes, Lemma 35.10 .8 via the criterion of Lemma 62.5.2, the criterion of Lemmas 62.12 .2 and 62.12.4 and the result of Lemma 62.12.8.

### 62.13. Approximation by perfect complexes

08HH In this section we continue the discussion started in Derived Categories of Schemes, Section 35.13
08HI Definition 62.13.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Consider triples $(T, E, m)$ where
(1) $T \subset|X|$ is a closed subset,
(2) $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$, and
(3) $m \in \mathbf{Z}$.

We say approximation holds for the triple $(T, E, m)$ if there exists a perfect object $P$ of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ and a map $\alpha: P \rightarrow E$ which induces isomorphisms $H^{i}(P) \rightarrow H^{i}(E)$ for $i>m$ and a surjection $H^{m}(P) \rightarrow H^{m}(E)$.
Approximation cannot hold for every triple. Please read the remarks following Derived Categories of Schemes, Definition 35.13.1 to see why.

08HJ Definition 62.13.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. We say approximation by perfect complexes holds on $X$ if for any closed subset $T \subset|X|$ such that the morphism $X \backslash T \rightarrow X$ is quasi-compact there exists an integer $r$ such that for every triple $(T, E, m)$ as in Definition 62.13.1 with
(1) $E$ is $(m-r)$-pseudo-coherent, and
(2) $H^{i}(E)$ is supported on $T$ for $i \geq m-r$ approximation holds.

08HK Lemma 62.13.3. Let $S$ be a scheme. Let $(U \subset X, j: V \rightarrow X)$ be an elementary distinguished square of algebraic space over $S$. Let $E$ be a perfect object of $D\left(\mathcal{O}_{V}\right)$ supported on $j^{-1}(T)$ where $T=|X| \backslash|U|$. Then $R j_{*} E$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$.

Proof. Being perfect is local on $X_{\text {étale }}$. Thus it suffices to check that $R j_{*} E$ is perfect when restricted to $U$ and $V$. We have $\left.R j_{*} E\right|_{V}=E$ by Lemma 62.9.6 which is perfect. We have $\left.R j_{*} E\right|_{U}=0$ because $\left.E\right|_{V \backslash j^{-1}(T)}=0$ (use Lemma 62.3.1).
08HL Lemma 62.13.4. Let $S$ be a scheme. Let $(U \subset X, j: V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$. Let $T$ be a closed subset of $|X| \backslash|U|$ and let $(T, E, m)$ be a triple as in Definition 62.13.1. If
(1) approximation holds for $\left(j^{-1} T,\left.E\right|_{V}, m\right)$, and
(2) the sheaves $H^{i}(E)$ for $i \geq m$ are supported on $T$, then approximation holds for $(T, E, m)$.
Proof. Let $\left.P \rightarrow E\right|_{V}$ be an approximation of the triple $\left(j^{-1} T,\left.E\right|_{V}, m\right)$ over $V$. Then $R j_{*} P$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ by Lemma 62.13.3. On the other hand, $R j_{*} P=j_{!} P$ by Lemma 62.9.6. We see that $j_{!} P$ is supported on $T$ for example by 62.9.0.2). Hence we obtain an approximation $R j_{*} P=j_{!} P \rightarrow j_{!}\left(\left.E\right|_{V}\right) \rightarrow E$.

08HM Lemma 62.13.5. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ which is representable by an affine scheme. Then approximation holds for every triple $(T, E, m)$ as in Definition 62.13.1 such that there exists an integer $r \geq 0$ with
(1) $E$ is m-pseudo-coherent,
(2) $H^{i}(E)$ is supported on $T$ for $i \geq m-r+1$,
(3) $X \backslash T$ is the union of $r$ affine opens.

In particular, approximation by perfect complexes holds for affine schemes.

Proof. Let $X_{0}$ be an affine scheme representing $X$. Let $T_{0} \subset X_{0}$ by the closed subset corresponding to $T$. Let $\epsilon: X_{\text {étale }} \rightarrow X_{0, Z a r}$ be the morphism 62.4.0.1). We may write $E=\epsilon^{*} E_{0}$ for some object $E_{0}$ of $D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$, see Lemma 62.4.2. Then $E_{0}$ is $m$-pseudo-coherent, see Lemma 62.12.2. Comparing stalks of cohomology sheaves (see proof of Lemma 62.4.1 we see that $H^{i}\left(E_{0}\right)$ is supported on $T_{0}$ for $i \geq m-r+1$. By Derived Categories of Schemes, Lemma 35.13.4 there exists an approximation $P_{0} \rightarrow E_{0}$ of $\left(T_{0}, E_{0}, m\right)$. By Lemma 62.12.4 we see that $P=\epsilon^{*} P_{0}$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$. Pulling back we obtain an approximation $P=\epsilon^{*} P_{0} \rightarrow$ $\epsilon^{*} E_{0}=E$ as desired.

08HN Lemma 62.13.6. Let $S$ be a scheme. Let $(U \subset X, j: V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over $S$. Assume $U$ quasi-compact, $V$ affine, and $U \times_{X} V$ quasi-compact. If approximation by perfect complexes holds on $U$, then approximation by perfect complexes holds on $X$.

Proof. Let $T \subset|X|$ be a closed subset with $X \backslash T \rightarrow X$ quasi-compact. Let $r_{U}$ be the integer of Definition 62.13 .2 adapted to the pair $(U, T \cap|U|)$. Set $T^{\prime}=T \backslash|U|$. Endow $T^{\prime}$ with the induced reduced subspace structure. Since $\left|T^{\prime}\right|$ is contained in $|X| \backslash|U|$ we see that $j^{-1}\left(T^{\prime}\right) \rightarrow T^{\prime}$ is an isomorphism. Moreover, $V \backslash j^{-1}\left(T^{\prime}\right)$ is quasi-compact as it is the fibre product of $U \times_{X} V$ with $X \backslash T$ over $X$ and we've assumed $U \times_{X} V$ quasi-compact and $X \backslash T \rightarrow X$ quasi-compact. Let $r^{\prime}$ be the number of affines needed to cover $V \backslash j^{-1}\left(T^{\prime}\right)$. We claim that $r=\max \left(r_{U}, r^{\prime}\right)$ works for the pair $(X, T)$.
To see this choose a triple $(T, E, m)$ such that $E$ is $(m-r)$-pseudo-coherent and $H^{i}(E)$ is supported on $T$ for $i \geq m-r$. Let $t$ be the largest integer such that $\left.H^{t}(E)\right|_{U}$ is nonzero. (Such an integer exists as $U$ is quasi-compact and $\left.E\right|_{U}$ is ( $m-r$ )-pseudo-coherent.) We will prove that $E$ can be approximated by induction on $t$.

Base case: $t \leq m-r^{\prime}$. This means that $H^{i}(E)$ is supported on $T^{\prime}$ for $i \geq m-r^{\prime}$. Hence Lemma 62.13.5 guarantees the existence of an approximation $\left.P \rightarrow E\right|_{V}$ of $\left(T^{\prime},\left.E\right|_{V}, m\right)$ on $V$. Applying Lemma 62.13 .4 we see that $\left(T^{\prime}, E, m\right)$ can be approximated. Such an approximation is also an approximation of $(T, E, m)$.

Induction step. Choose an approximation $\left.P \rightarrow E\right|_{U}$ of $\left(T \cap|U|,\left.E\right|_{U}, m\right)$. This in particular gives a surjection $H^{t}(P) \rightarrow H^{t}\left(\left.E\right|_{U}\right)$. In the rest of the proof we will use the equivalence of Lemma 62.4.2 (and the compatibilities of Remark 62.6.3) for the representable algebraic spaces $V$ and $U \times_{X} V$. We will also use the fact that ( $m-r$ )-pseudo-coherence, resp. perfectness on the Zariski site and étale site agree, see Lemmas 62.12 .2 and 62.12 .4 . Thus we can use the results of Derived Categories of Schemes, Section 35.12 for the open immersion $U \times_{X} V \subset V$. In this way Derived Categories of Schemes, Lemma 35.12 .8 implies there exists a perfect object $Q$ in $D\left(\mathcal{O}_{V}\right)$ supported on $j^{-1}(T)$ and an isomorphism $\left.\left.Q\right|_{U \times_{X} V} \rightarrow(P \oplus P[1])\right|_{U{ }_{X_{X} V}}$. By Derived Categories of Schemes, Lemma 35.12.5 we can replace $Q$ by $Q \otimes^{\mathbf{L}} I$ and assume that the map

$$
\left.\left.\left.\left.Q\right|_{U \times_{X} V} \longrightarrow(P \oplus P[1])\right|_{U \times_{X} V} \longrightarrow P\right|_{U \times_{X} V} \longrightarrow E\right|_{U \times_{X} V}
$$

lifts to $\left.Q \rightarrow E\right|_{V}$. By Lemma 62.9.7 we find an morphism $a: R \rightarrow E$ of $D\left(\mathcal{O}_{X}\right)$ such that $\left.a\right|_{U}$ is isomorphic to $\left.P \oplus P[1] \rightarrow E\right|_{U}$ and $\left.a\right|_{V}$ isomorphic to $\left.Q \rightarrow E\right|_{V}$. Thus $R$ is perfect and supported on $T$ and the map $H^{t}(R) \rightarrow H^{t}(E)$ is surjective
on restriction to $U$. Choose a distinguised triangle

$$
R \rightarrow E \rightarrow E^{\prime} \rightarrow R[1]
$$

Then $E^{\prime}$ is $(m-r)$-pseudo-coherent (Cohomology on Sites, Lemma 21.35.4), $\left.H^{i}\left(E^{\prime}\right)\right|_{U}=$ 0 for $i \geq t$, and $H^{i}\left(E^{\prime}\right)$ is supported on $T$ for $i \geq m-r$. By induction we find an approximation $R^{\prime} \rightarrow E^{\prime}$ of $\left(T, E^{\prime}, m\right)$. Fit the composition $R^{\prime} \rightarrow E^{\prime} \rightarrow R[1]$ into a distringuished triangle $R \rightarrow R^{\prime \prime} \rightarrow R^{\prime} \rightarrow R[1]$ and extend the morphisms $R^{\prime} \rightarrow E^{\prime}$ and $R[1] \rightarrow R[1]$ into a morphism of distinguished triangles

using TR3. Then $R^{\prime \prime}$ is a perfect complex (Cohomology on Sites, Lemma 21.37.6) supported on $T$. An easy diagram chase shows that $R^{\prime \prime} \rightarrow E$ is the desired approximation.

08HP Theorem 62.13.7. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Then approximation by perfect complexes holds on $X$.

Proof. This follows from the induction principle of Lemma 62.8.3 and Lemmas 62.13 .6 and 62.13.5.

### 62.14. Generating derived categories

09 IU This section is the analogue of Derived Categories of Schemes, Section 35.14 . However, we first prove the following lemma which is the analogue of Derived Categories of Schemes, Lemma 35.12.9.

09IV Lemma 62.14.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $W \subset X$ be a quasi-compact open. Let $T \subset|X|$ be a closed subset such that $X \backslash T \rightarrow X$ is a quasi-compact morphism. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $\alpha:\left.P \rightarrow E\right|_{W}$ be a map where $P$ is a perfect object of $D\left(\mathcal{O}_{W}\right)$ supported on $T \cap W$. Then there exists a map $\beta: R \rightarrow E$ where $R$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ such that $P$ is a direct summand of $\left.R\right|_{W}$ in $D\left(\mathcal{O}_{W}\right)$ compatible $\alpha$ and $\left.\beta\right|_{W}$.

Proof. We will use the induction principle of Lemma 62.8.6 to prove this. Thus we immediately reduce to the case where we have an elementary distinguished square $(W \subset X, f: V \rightarrow X)$ with $V$ affine and $\left.P \rightarrow E\right|_{W}$ as in the statement of the lemma. In the rest of the proof we will use Lemma 62.4.2 (and the compatibilities of Remark 62.6 .3 for the representable algebraic spaces $V$ and $W \times_{X} V$. We will also use the fact that perfectness on the Zariski site and étale site agree, see Lemma 62.12 .4

By Derived Categories of Schemes, Lemma 35.12 .8 we can choose a perfect object $Q$ in $D\left(\mathcal{O}_{V}\right)$ supported on $f^{-1} T$ and an isomorphism $\left.\left.Q\right|_{W \times_{X} V} \rightarrow(P \oplus P[1])\right|_{W \times_{X} V}$. By Derived Categories of Schemes, Lemma 35.12 .5 we can replace $Q$ by $Q \otimes^{\mathbf{L}} I$ (still supported on $f^{-1} T$ ) and assume that the map

$$
\left.\left.\left.\left.Q\right|_{W \times x V} \rightarrow(P \oplus P[1])\right|_{W \times V} \longrightarrow P\right|_{W \times x V} \longrightarrow E\right|_{W \times x V}
$$

lifts to $\left.Q \rightarrow E\right|_{V}$. By Lemma 62.9.7 we find an morphism $a: R \rightarrow E$ of $D\left(\mathcal{O}_{X}\right)$ such that $\left.a\right|_{W}$ is isomorphic to $\left.P \oplus P[1] \rightarrow E\right|_{W}$ and $\left.a\right|_{V}$ isomorphic to $\left.Q \rightarrow E\right|_{V}$. Thus $R$ is perfect and supported on $T$ as desired.
09IW Remark 62.14.2. The proof of Lemma 62.14.1 shows that

$$
\left.R\right|_{W}=P \oplus P^{\oplus n_{1}}[1] \oplus \ldots \oplus P^{\oplus n_{m}}[m]
$$

for some $m \geq 0$ and $n_{j} \geq 0$. Thus the highest degree cohomology sheaf of $\left.R\right|_{W}$ equals that of $P$. By repeating the construction for the map $P^{\oplus n_{1}}[1] \oplus \ldots \oplus$ $\left.P^{\oplus n_{m}}[m] \rightarrow R\right|_{W}$, taking cones, and using induction we can achieve equality of cohomology sheaves of $\left.R\right|_{W}$ and $P$ above any given degree.
09IX Lemma 62.14.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $W$ be a quasi-compact open subspace of $X$. Let $P$ be a perfect object of $D\left(\mathcal{O}_{W}\right)$. Then $P$ is a direct summand of the restriction of a perfect object of $D\left(\mathcal{O}_{X}\right)$.
Proof. Special case of Lemma 62.14.1.
09IY Theorem 62.14.4. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. The category $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ can be generated by a single perfect object. More precisely, there exists a perfect object $P$ of $D\left(\mathcal{O}_{X}\right)$ such that for $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the following are equivalent
(1) $E=0$, and
(2) $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(P[n], E)=0$ for all $n \in \mathbf{Z}$.

Proof. We will prove this using the induction principle of Lemma 62.8.3
If $X$ is affine, then $\mathcal{O}_{X}$ is a perfect generator. This follows from Lemma 62.4.2 and Derived Categories of Schemes, Lemma 35.3.5.
Assume that $(U \subset X, f: V \rightarrow X)$ is an elementary distinguished square with $U$ quasi-compact such that the theorem holds for $U$ and $V$ is an affine scheme. Let $P$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$ which is a generator for $D_{Q C o h}\left(\mathcal{O}_{U}\right)$. Using Lemma 62.14.3 we may choose a perfect object $Q$ of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $U$ is a direct sum one of whose summands is $P$. Say $V=\operatorname{Spec}(A)$. Let $Z \subset V$ be the reduced closed subscheme which is the inverse image of $X \backslash U$ and maps isomorphically to it (see Definition 62.8.1). This is a retrocompact closed subset of $V$. Choose $f_{1}, \ldots, f_{r} \in A$ such that $Z=V\left(f_{1}, \ldots, f_{r}\right)$. Let $K \in D\left(\mathcal{O}_{V}\right)$ be the perfect object corresponding to the Koszul complex on $f_{1}, \ldots, f_{r}$ over $A$. Note that since $K$ is supported on $Z$, the pushforward $K^{\prime}=R f_{*} K$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $V$ is $K$ (see Lemmas 62.13.3 and 62.9.6). We claim that $Q \oplus K^{\prime}$ is a generator for $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ such that there are no nontrivial maps from any shift of $Q \oplus K^{\prime}$ into $E$. By Lemma 62.9.6 we have $K^{\prime}=f_{!} K$ and hence

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K^{\prime}[n], E\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{V}\right)}\left(K[n],\left.E\right|_{V}\right)
$$

Thus by Derived Categories of Schemes, Lemma 35.14 .2 (using also Lemma 62.4.2) the vanishing of these groups implies that $\left.E\right|_{V}$ is isomorphic to $R\left(U \times_{X} V \rightarrow\right.$ $V)\left._{*} E\right|_{U \times_{X} V}$. This implies that $E=\left.R(U \rightarrow X)_{*} E\right|_{U}$ (small detail omitted). If this is the case then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(Q[n], E)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.Q\right|_{U}[n],\left.E\right|_{U}\right)
$$

which contains $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(P[n],\left.E\right|_{U}\right)$ as a direct summand. Thus by our choice of $P$ the vanishing of these groups implies that $\left.E\right|_{U}$ is zero. Whence $E$ is zero.

The following result is an strengthening of Theorem62.14.4 proved using exactly the same methods. Let $T \subset|X|$ be a closed subset where $X$ is an algebraic space. Let's denote $D_{T}\left(\mathcal{O}_{X}\right)$ the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on $T$.

0AEC Lemma 62.14.5. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $T \subset|X|$ be a closed subset such that $|X| \backslash T$ is quasi-compact. With notation as above, the category $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is generated by a single perfect object.

Proof. We will prove this using the induction principle of Lemma 62.8.3. The property is true for representable quasi-compact and quasi-separated objects of the site $X_{\text {spaces,étale }}$ by Derived Categories of Schemes, Lemma 35.14.4.
Assume that $(U \subset X, f: V \rightarrow X)$ is an elementary distinguished square such that the lemma holds for $U$ and $V$ is affine. To finish the proof we have to show that the result holds for $X$. Let $P$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$ supported on $T \cap U$ which is a generator for $D_{Q C o h, T \cap U}\left(\mathcal{O}_{U}\right)$. Using Lemma 62.14.1 we may choose a perfect object $Q$ of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ whose restriction to $U$ is a direct sum one of whose summands is $P$. Write $V=\operatorname{Spec}(B)$. Let $Z=X \backslash U$. Then $f^{-1} Z$ is a closed subset of $V$ such that $V \backslash f^{-1} Z$ is quasi-compact. As $X$ is quasiseparated, it follows that $f^{-1} Z \cap f^{-1} T=f^{-1}(Z \cap T)$ is a closed subset of $V$ such that $W=V \backslash f^{-1}(Z \cap T)$ is quasi-compact. Thus we can choose $g_{1}, \ldots, g_{s} \in B$ such that $f^{-1}(Z \cap T)=V\left(g_{1}, \ldots, g_{r}\right)$. Let $K \in D\left(\mathcal{O}_{V}\right)$ be the perfect object corresponding to the Koszul complex on $g_{1}, \ldots, g_{s}$ over $B$. Note that since $K$ is supported on $f^{-1}(Z \cap T) \subset V$ closed, the pushforward $K^{\prime}=R(V \rightarrow X)_{*} K$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $V$ is $K$ (see Lemmas 62.13 .3 and 62.9.6). We claim that $Q \oplus K^{\prime}$ is a generator for $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$.

Let $E$ be an object of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ such that there are no nontrivial maps from any shift of $Q \oplus K^{\prime}$ into $E$. By Lemma 62.9.6 we have $K^{\prime}=R(V \rightarrow X)!K$ and hence

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K^{\prime}[n], E\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{V}\right)}\left(K[n],\left.E\right|_{V}\right)
$$

Thus by Derived Categories of Schemes, Lemma 35.14 .2 we have $\left.E\right|_{V}=\left.R j_{*} E\right|_{W}$ where $j: W \rightarrow V$ is the inclusion. Picture

Since $E$ is supported on $T$ we see that $\left.E\right|_{W}$ is supported on $f^{-1} T \cap W=f^{-1} T \cap$ $\left(V \backslash f^{-1} Z\right)$ which is closed in $W$. We conclude that

$$
\left.E\right|_{V}=R j_{*}\left(\left.E\right|_{W}\right)=R j_{*}\left(R j_{*}^{\prime}\left(\left.E\right|_{U \cap V}\right)\right)=R j_{*}^{\prime \prime}\left(\left.E\right|_{U \cap V}\right)
$$

Here the second equality is part (1) of Cohomology, Lemma 20.30.9 which applies because $V$ is a scheme and $E$ has quasi-coherent cohomology sheaves hence pushforward along the quasi-compact open immersion $j^{\prime}$ agrees with pushforward on
the underlying schemes, see Remark 62.6.3. This implies that $E=\left.R(U \rightarrow X)_{*} E\right|_{U}$ (small detail omitted). If this is the case then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(Q[n], E)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.Q\right|_{U}[n],\left.E\right|_{U}\right)
$$

which contains $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(P[n],\left.E\right|_{U}\right)$ as a direct summand. Thus by our choice of $P$ the vanishing of these groups implies that $\left.E\right|_{U}$ is zero. Whence $E$ is zero.

### 62.15. Compact and perfect objects

09M7 This section is the analogue of Derived Categories of Schemes, Section 35.16
09M8 Proposition 62.15.1. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. An object of $D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)$ is compact if and only if it is perfect.

Proof. By Cohomology on Sites, Lemma 21.40 .1 the perfect objects even define compact objects of $D\left(\mathcal{O}_{X}\right)$. Conversely, let $K$ be a compact object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To show that $K$ is perfect, it suffices to show that $\left.K\right|_{U}$ is perfect for every affine scheme $U$ étale over $X$, see Cohomology on Sites, Lemma 21.37.2. Observe that $j: U \rightarrow X$ is a quasi-compact and separated morphism. Hence $R j_{*}: D_{Q C o h}\left(\mathcal{O}_{U}\right) \rightarrow$ $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ commutes with direct sums, see Lemma 62.6.2. Thus the adjointness of restriction to $U$ and $R j_{*}$ implies that $\left.K\right|_{U}$ is a perfect object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$. Hence we reduce to the case that $X$ is affine, in particular a quasi-compact and quasi-separated scheme. Via Lemma 62.4 .2 and 62.12 .4 we reduce to the case of schemes, i.e., to Derived Categories of Schemes, Proposition 35.16.1

The following result is a strengthening of Proposition 62.15.1. Let $T \subset|X|$ be a closed subset where $X$ is an algebraic space. As before $D_{T}\left(\mathcal{O}_{X}\right)$ denotes the the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on $T$. Since taking direct sums commutes with taking cohomology sheaves, it follows that $D_{T}\left(\mathcal{O}_{X}\right)$ has direct sums and that they are equal to direct sums in $D\left(\mathcal{O}_{X}\right)$.
0AED Lemma 62.15.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $T \subset|X|$ be a closed subset such that $|X| \backslash T$ is quasi-compact. An object of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is compact if and only if it is perfect as an object of $D\left(\mathcal{O}_{X}\right)$.

Proof. We observe that $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is a triangulated category with direct sums by the remark preceding the lemma. By Cohomology on Sites, Lemma 21.40.1 the perfect objects define compact objects of $D\left(\mathcal{O}_{X}\right)$ hence a fortiori of any subcategory preserved under taking direct sums. For the converse we will use there exists a generator $E \in D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ which is a perfect complex of $\mathcal{O}_{X}$-modules, see Lemma 62.14.5. Hence by the above, $E$ is compact. Then it follows from Derived Categories, Proposition 13.34 .6 that $E$ is a classical generator of the full subcategory of compact objects of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$. Thus any compact object can be constructed out of $E$ by a finite sequence of operations consisting of (a) taking shifts, (b) taking finite direct sums, (c) taking cones, and (d) taking direct summands. Each of these operations preserves the property of being perfect and the result follows.

The following lemma is an application of the ideas that go into the proof of the preceding lemma.

0AEE Lemma 62.15.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $T \subset|X|$ be a closed subset such that the complement $U \subset X$ is quasi-compact. Let $\alpha: P \rightarrow E$ be a morphism of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ with either
(1) $P$ is perfect and $E$ supported on $T$, or
(2) $P$ pseudo-coherent, $E$ supported on $T$, and $E$ bounded below.

Then there exists a perfect complex of $\mathcal{O}_{X}$-modules $I$ and a map $I \rightarrow \mathcal{O}_{X}[0]$ such that $I \otimes^{\mathbf{L}} P \rightarrow E$ is zero and such that $\left.I\right|_{U} \rightarrow \mathcal{O}_{U}[0]$ is an isomorphism.

Proof. Set $\mathcal{D}=D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$. In both cases the complex $K=R \mathcal{H o m}(P, E)$ is an object of $\mathcal{D}$. See Lemma 62.12 .9 for quasi-coherence. It is clear that $K$ is supported on $T$ as formation of $R$ Hom commutes with restriction to opens. The map $\alpha$ defines an element of $H^{0}(K)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X}[0], K\right)$. Then it suffices to prove the result for the map $\alpha: \mathcal{O}_{X}[0] \rightarrow K$.
Let $E \in \mathcal{D}$ be a perfect generator, see Lemma 62.14.5. Write

$$
K=\operatorname{hocolim} K_{n}
$$

as in Derived Categories, Lemma 13.34 .3 using the generator $E$. Since the functor $\mathcal{D} \rightarrow D\left(\mathcal{O}_{X}\right)$ commutes with direct sums, we see that $K=\operatorname{hocolim} K_{n}$ also in $D\left(\mathcal{O}_{X}\right)$. Since $\mathcal{O}_{X}$ is a compact object of $D\left(\mathcal{O}_{X}\right)$ we find an $n$ and a morphism $\alpha_{n}: \mathcal{O}_{X} \rightarrow K_{n}$ which gives rise to $\alpha$. By Derived Categories, Lemma 13.34.4 applied to the morphism $\mathcal{O}_{X}[0] \rightarrow K_{n}$ in the ambient category $D\left(\mathcal{O}_{X}\right)$ we see that $\alpha_{n}$ factors as $\mathcal{O}_{X}[0] \rightarrow Q \rightarrow K_{n}$ where $Q$ is an object of $\langle E\rangle$. We conclude that $Q$ is a perfect complex supported on $T$.
Choose a distinguished triangle

$$
I \rightarrow \mathcal{O}_{X}[0] \rightarrow Q \rightarrow I[1]
$$

By construction $I$ is perfect, the map $I \rightarrow \mathcal{O}_{X}[0]$ restricts to an isomorphism over $U$, and the composition $I \rightarrow K$ is zero as $\alpha$ factors through $Q$. This proves the lemma.

### 62.16. Derived categories as module categories

09M9 The section is the analogue of Derived Categories of Schemes, Section 35.17.
09MA Lemma 62.16.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $K^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules whose cohomology sheaves are quasi-coherent. Let $(E, d)=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, K^{\bullet}\right)$ be the endomorphism differential graded algebra . Then the functor

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, d) \longrightarrow D\left(\mathcal{O}_{X}\right)
$$

of Differential Graded Algebra, Lemma 22.25.3 has image contained in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
Proof. Let $P$ be a differential graded $E$-module with property $P$. Let $F$ • be a filtration on $P$ as in Differential Graded Algebra, Section 22.13. Then we have

$$
P \otimes_{E} K^{\bullet}=\operatorname{hocolim} F_{i} P \otimes_{E} K^{\bullet}
$$

Each of the $F_{i} P$ has a finite filtration whose graded pieces are direct sums of $E[k]$. The result follows easily.
The following lemma can be strengthened (there is a uniformity in the vanishing over all $L$ with nonzero cohomology sheaves only in a fixed range).

09MB Lemma 62.16.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$ with $K$ perfect and $L$ in $D_{Q C o h}^{b}\left(\mathcal{O}_{X}\right)$. Then $\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{n}(K, L)$ is nonzero for only a finite number of $n$.

Proof. Since $K$ is perfect we have

$$
\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{i}(K, L)=H^{i}\left(X, K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)
$$

where $K^{\vee}$ is the "dual" perfect complex to $K$, see Cohomology on Sites, Lemma 21.37.9. Note that $P=K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ is in $D_{Q C o h}(X)$ by Lemmas 62.5.5 and 62.12.5 (to see that a perfect complex has quasi-coherent cohomology sheaves). On the other hand, the spectral sequence

$$
E_{1}^{p, q}=H^{p}\left(K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} H^{q}(L)\right) \Rightarrow H^{p+q}\left(K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)=H^{p+q}(P)
$$

the boundedness of $L$, and the finite tor amplitude of $K^{\vee}$ show that $P$ has only finitely many nonzero cohomology sheaves. It follows that $H^{n}(X, P)=0$ for $n \ll 0$. But also $H^{n}(X, P)=0$ for $n \gg 0$ by Cohomology of Spaces, Lemma 56.6.3 and the spectral sequence expressing $H^{n}\left(X, P^{\bullet}\right)$ in terms of $H^{p}\left(X, H^{q}\left(P^{\bullet}\right)\right)$ using that the cohomology sheaves of $P$ are quasi-coherent.

The following is the analogue of Derived Categories of Schemes, Theorem 35.17.3.
09MC Theorem 62.16.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasiseparated algebraic space over $S$. Then there exist a differential graded algebra $(E, d)$ with only a finite number of nonzero cohomology groups $H^{i}(E)$ such that $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is equivalent to $D(E, d)$.

Proof. Let $K^{\bullet}$ be a K-injective complex of $\mathcal{O}$-modules which is perfect and generates $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Such a thing exists by Theorem 62.14 .4 and the existence of K-injective resolutions. We will show the theorem holds with

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, K^{\bullet}\right)
$$

where Comp ${ }^{d g}\left(\mathcal{O}_{X}\right)$ is the differential graded category of complexes of $\mathcal{O}$-modules. Please see Differential Graded Algebra, Section 22.25 Since $K^{\bullet}$ is K-injective we have

09MD

$$
\begin{equation*}
H^{n}(E)=\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{n}\left(K^{\bullet}, K^{\bullet}\right) \tag{62.16.3.1}
\end{equation*}
$$

for all $n \in \mathbf{Z}$. Only a finite number of these Exts are nonzero by Lemma 62.16.2. Consider the functor

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, \mathrm{~d}) \longrightarrow D\left(\mathcal{O}_{X}\right)
$$

of Differential Graded Algebra, Lemma 22.25.3. Since $K^{\bullet}$ is perfect, it defines a compact object of $D\left(\mathcal{O}_{X}\right)$, see Proposition 62.15.1. Combined with 62.16.3.1 the functor above is fully faithful as follows from Differential Graded Algebra, Lemmas 22.25.5. It has a right adjoint

$$
R \operatorname{Hom}\left(K^{\bullet},-\right): D\left(\mathcal{O}_{X}\right) \longrightarrow D(E, \mathrm{~d})
$$

by Differential Graded Algebra, Lemmas 22.25 .4 which is a left quasi-inverse functor by generalities on adjoint functors. On the other hand, it follows from Lemma 62.16 .1 that we obtain

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, \mathrm{~d}) \longrightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)
$$

and by our choice of $K^{\bullet}$ as a generator of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the kernel of the adjoint restricted to $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is zero. A formal argument shows that we obtain the desired equivalence, see Derived Categories, Lemma 13.7.2.

### 62.17. Cohomology and base change, IV

08IM This section is the analogue of Derived Categories of Schemes, Section 35.18
08IN Lemma 62.17.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. For $E$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K$ in $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ we have

$$
R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K\right)
$$

Proof. Without any assumptions there is a map $R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K \rightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\right.$ $\left.L f^{*} K\right)$. Namely, it is the adjoint to the canonical map

$$
L f^{*}\left(R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K\right)=L f^{*}\left(R f_{*}(E)\right) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K \longrightarrow E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K
$$

coming from the map $L f^{*} R f_{*} E \rightarrow E$. See Cohomology on Sites, Lemmas 21.18.4 and 21.19.1. To check it is an isomorphism we may work étale locally on $Y$. Hence we reduce to the case that $Y$ is an affine scheme.
Suppose that $K=\bigoplus K_{i}$ is a direct sum of some complexes $K_{i} \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. If the statement holds for each $K_{i}$, then it holds for $K$. Namely, the functors $L f^{*}$ and $\otimes^{\mathbf{L}}$ preserve direct sums by construction and $R f_{*}$ commutes with direct sums (for complexes with quasi-coherent cohomology sheaves) by Lemma 62.6.2. Moreover, suppose that $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle in $D_{Q C o h}(Y)$. Then if the statement of the lemma holds for two of $K, L, M$, then it holds for the third (as the functors involved are exact functors of triangulated categories).
Assume $Y$ affine, say $Y=\operatorname{Spec}(A)$. The functor ${ }^{\sim}: D(A) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ is an equivalence by Lemma 62.4.2 and Derived Categories of Schemes, Lemma 35.3.5. Let $T$ be the property for $K \in D(A)$ that the statement of the lemma holds for $K$. The discussion above and More on Algebra, Remark 15.49 .11 shows that it suffices to prove $T$ holds for $A[k]$. This finishes the proof, as the statement of the lemma is clear for shifts of the structure sheaf.

08IP Definition 62.17.2. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X, Y$ be algebraic spaces over $B$. We say $X$ and $Y$ are Tor independent over $B$ if and only if for every commutative diagram

of geometric points the rings $\mathcal{O}_{X, \bar{x}}$ and $\mathcal{O}_{Y, \bar{y}}$ are Tor independent over $\mathcal{O}_{B, \bar{b}}$ (see More on Algebra, Definition 15.51.1.
The following lemma shows in particular that this definition agrees with our definition in the case of representable algebraic spaces.
08IQ Lemma 62.17.3. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X$, $Y$ be algebraic spaces over $B$. The following are equivalent
(1) $X$ and $Y$ are Tor independent over $B$,
(2) for every commutative diagram

with étale vertical arrows $U$ and $V$ are Tor independent over $W$,
(3) for some commutative diagram as in (2) with (a) $W \rightarrow B$ étale surjective, (b) $U \rightarrow X \times_{B} W$ étale surjective, (c) $V \rightarrow Y \times_{B} W$ étale surjective, the spaces $U$ and $V$ are Tor independent over $W$, and
(4) for some commutative diagram as in (3) with $U, V, W$ schemes, the schemes $U$ and $V$ are Tor independent over $W$ in the sense of Derived Categories of Schemes, Definition 35.18.2.

Proof. For an étale morphism $\varphi: U \rightarrow X$ of algebraic spaces and geometric point $\bar{u}$ the map of local rings $\mathcal{O}_{X, \varphi(\bar{u})} \rightarrow \mathcal{O}_{U, \bar{u}}$ is an isomorphism. Hence the equivalence of (1) and (2) follows. So does the implication (1) $\Rightarrow$ (3). Assume (3) and pick a diagram of geometric points as in Definition 62.17.2. The assumptions imply that we can first lift $\bar{b}$ to a geometric point $\bar{w}$ of $W$, then lift the geometric point $(\bar{x}, \bar{b})$ to a geometric point $\bar{u}$ of $U$, and finally lift the geometric point $(\bar{y}, \bar{b})$ to a geometric point $\bar{v}$ of $V$. Use Properties of Spaces, Lemma 53.18.4 to find the lifts. Using the remark on local rings above we conclude that the condition of the definition is satisfied for the given diagram.
Having made these initial points, it is clear that (4) comes down to the statement that Definition 62.17.2 agrees with Derived Categories of Schemes, Definition 35.18 .2 when $X, Y$, and $B$ are schemes.

Let $\bar{x}, \bar{b}, \bar{y}$ be as in Definition 62.17.2 lying over the points $x, y, b$. Recall that $\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{X, x}^{s h}$ (Properties of Spaces, Lemma 53.21.1) and similarly for the other two. By Algebra, Lemma 10.148 .28 we see that $\mathcal{O}_{X, \bar{x}}$ is a strict henselization of $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{B, \bar{b}}$. In particular, the ring map

$$
\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{B, \bar{b}} \longrightarrow \mathcal{O}_{X, \bar{x}}
$$

is flat (More on Algebra, Lemma 15.36.1). By More on Algebra, Lemma 15.51 .3 we see that

Hence it follows that if $X$ and $Y$ are Tor independent over $B$ as schemes, then $X$ and $Y$ are Tor independent as algebraic spaces over $B$.

For the converse, we may assume $X, Y$, and $B$ are affine. Observe that the ring map

$$
\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{Y, y} \longrightarrow \mathcal{O}_{X, \bar{x}} \otimes_{\mathcal{O}_{B, \bar{b}}} \mathcal{O}_{Y, \bar{y}}
$$

is flat by the observations given above. Moreover, the image of the map on spectra includes all primes $\mathfrak{s} \subset \mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{Y, y}$ lying over $\mathfrak{m}_{x}$ and $\mathfrak{m}_{y}$. Hence from this and the displayed formula of Tor's above we see that if $X$ and $Y$ are Tor independent over $B$ as algebraic spaces, then

$$
\operatorname{Tor}_{i}^{\mathcal{O}_{B, b}}\left(\mathcal{O}_{X, x}, \mathcal{O}_{Y, y}\right)_{\mathfrak{s}}=0
$$

for all $i>0$ and all $\mathfrak{s}$ as above. By More on Algebra, Lemma 15.51 .4 applied to the ring maps $\Gamma\left(B, \mathcal{O}_{B}\right) \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$ and $\Gamma\left(B, \mathcal{O}_{B}\right) \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$ this implies that $X$ and $Y$ are Tor independent over $B$.

08IR Lemma 62.17.4. Let $S$ be a scheme. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Consider the base change diagram

If $X$ and $Y^{\prime}$ are Tor independent over $Y$, then for all $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have $R f_{*}^{\prime} L h^{*} E=L g^{*} R f_{*} E$.

Proof. For any object $E$ of $D\left(\mathcal{O}_{X}\right)$ we can use Cohomology on Sites, Remark 21.19 .2 to get a canonical base change map $L g^{*} R f_{*} E \rightarrow R f_{*}^{\prime} L h^{*} E$. To check this is an isomorphism we may work étale locally on $Y^{\prime}$. Hence we may assume $g: Y^{\prime} \rightarrow Y$ is a morphism of affine schemes. In particular, $g$ is affine and it suffices to show that

$$
R g_{*} L g^{*} R f_{*} E \rightarrow R g_{*} R f_{*}^{\prime} L h^{*} E=R f_{*}\left(R h_{*} L h^{*} E\right)
$$

is an isomorphism, see Lemma 62.6.4 (and use Lemmas 62.5.4 62.5.5, and 62.6.1 to see that the objects $R f_{*}^{\prime} L h^{*} E$ and $L g^{*} R f_{*} E$ have quasi-coherent cohomology sheaves). Note that $h$ is affine as well (Morphisms of Spaces, Lemma 54.20.5. By Lemma 62.6.5 the map becomes a map

$$
R f_{*} E \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} g_{*} \mathcal{O}_{Y^{\prime}} \longrightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} h_{*} \mathcal{O}_{X^{\prime}}\right)
$$

Observe that $h_{*} \mathcal{O}_{X^{\prime}}=f^{*} g_{*} \mathcal{O}_{Y^{\prime}}$. Thus by Lemma 62.17.1 it suffices to prove that $L f^{*} g_{*} \mathcal{O}_{Y^{\prime}}=f^{*} g_{*} \mathcal{O}_{Y^{\prime}}$. This follows from our assumption that $X$ and $Y^{\prime}$ are Tor independent over $Y$. Namely, to check it we may work étale locally on $X$, hence we may also assume $X$ is affine. Say $X=\operatorname{Spec}(A), Y=\operatorname{Spec}(R)$ and $Y^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$. Our assumption implies that $A$ and $R^{\prime}$ are Tor independent over $R$ (see Lemma 62.17 .3 and More on Algebra, Lemma 15.51.4, i.e., $\operatorname{Tor}_{i}^{R}\left(A, R^{\prime}\right)=0$ for $i>0$. In other words $A \otimes_{R}^{\mathbf{L}} R^{\prime}=A \otimes_{R} R^{\prime}$ which exactly means that $L f^{*} g_{*} \mathcal{O}_{Y^{\prime}}=f^{*} g_{*} \mathcal{O}_{Y^{\prime}}$.
The following two lemmas remain true if we replace $\mathcal{G}$ with a bounded complex of quasi-coherent $\mathcal{O}_{X}$-modules each flat over $S$.
0A1K Lemma 62.17.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module flat over $Y$. Then formation of

$$
R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)
$$

commutes with arbitrary base change (see proof for precise statement).
Proof. The statement means the following. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of algebraic spaces and consider the base change diagram

in other words $X^{\prime}=Y^{\prime} \times_{Y} X$. Set $E^{\prime}=L h^{*} E$ and $\mathcal{G}^{\prime}=h^{*} \mathcal{G}$ (here we do not use the derived pullback). The lemma asserts that we have

$$
L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)=R f_{*}^{\prime}\left(E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}\right)
$$

To prove this, note that in Cohomology on Sites, Remark 21.19.2 we have constructed an arrow

$$
\left.L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \longrightarrow R\left(f^{\prime}\right)_{*}\left(L h^{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)\right)=R\left(f^{\prime}\right)_{*}\left(E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} l h^{*} \mathcal{G}\right)\right)
$$

which we can compose with the map $L h^{*} \mathcal{G} \rightarrow h^{*} \mathcal{G}$ to get a canonical map

$$
L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \longrightarrow R f_{*}^{\prime}\left(E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}\right)
$$

To check this map is an isomorphism we may work étale locally on $Y^{\prime}$. Hence we may assume $g: Y^{\prime} \rightarrow Y$ is a morphism of affine schemes. In this case, we will use the induction principle to prove this map is always an isomorphism for any quasi-compact and quasi-separated algebraic space $X$ over $Y$ (Lemma 62.8.3).

If $X$ is a scheme (for example affine), then the result holds. Namekly, $E$ comes from an object of the derived category of the underlying scheme by Lemma 62.4.2 Furthermore, the constructions $R f_{*}$ (derived pushforward) and $L g^{*}$ (derived pullback) are (in the current situation) compatible with pulling back from the Zariski site (Remark 62.6.3). Thus in this case the result follows from the case of schemes which is Derived Categories of Schemes, Lemma 35.18.4.
The induction step. Let $(U \subset X, f: V \rightarrow X)$ be an elementary distinguished square with $U, V, U \times_{X} V$ quasi-compact such that the result holds for the restriction of $E$ and $\mathcal{G}$ to $U, V$, and $U \times_{X} V$. Denote $a=\left.f\right|_{U}, b=\left.f\right|_{V}$ and $c=\left.f\right|_{U \times_{X} V}$. Let $a^{\prime}: U^{\prime} \rightarrow Y^{\prime}, b^{\prime}: V^{\prime} \rightarrow Y^{\prime}$ and $c^{\prime}: U^{\prime} \times_{X^{\prime}} V^{\prime} \rightarrow Y^{\prime}$ be the base changes of $a, b$, and $c$. Note that formation of $R$ Hom commutes with restriction (Cohomology on Sites, Lemma 21.26.3. Set $H=E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ and $H^{\prime}=E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}$. Using the distinguished triangles from relative Mayer-Vietoris (Lemma 62.9.3) we obtain a commutative diagram

Since the 2 nd and 3rd horizontal arrows are isomorphisms so is the first (Derived Categories, Lemma 13.4.3 and the proof of the lemma is finished.

08JQ Lemma 62.17.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over $S$. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module flat over $Y$. Then formation of

$$
R f_{*} R \mathcal{H o m}(E, \mathcal{G})
$$

commutes with arbitrary base change (see proof for precise statement).

Proof. The statement means the following. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of algebraic spaces and consider the base change diagram

in other words $X^{\prime}=Y^{\prime} \times_{Y} X$. Set $E^{\prime}=L h^{*} E$ and $\mathcal{G}^{\prime}=h^{*} \mathcal{G}$ (here we do not use the derived pullback). The lemma asserts that we have

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G})=R f_{*}^{\prime} R \mathcal{H o m}\left(E^{\prime}, \mathcal{G}^{\prime}\right)
$$

To prove this, note that in Cohomology on Sites, Remark 21.26.11 we have constructed an arrow

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G}) \longrightarrow R\left(f^{\prime}\right)_{*} R \mathcal{H o m}\left(L h^{*} E, L h^{*} \mathcal{G}\right)
$$

which we can compose with the $\operatorname{map} L h^{*} \mathcal{G} \rightarrow h^{*} \mathcal{G}$ to get a canonical map

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G}) \rightarrow R f_{*}^{\prime} R \mathcal{H o m}\left(E^{\prime}, \mathcal{G}^{\prime}\right)
$$

With these preliminaries out of the way, we deduce the result from Lemma 62.17.5. Namely, since $E$ is a perfect complex there exists a dual perfect complex $E_{d u a l}$, see Cohomology on Sites, Lemma 21.37.9, such that $\operatorname{RHom}(E, \mathcal{G})=E_{\text {dual }} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$. We omit the verification that the base change map of Lemma 62.17 .5 for $E_{d u a l}$ agrees with the base change map for $E$ constructed above.

### 62.18. Producing perfect complexes

0A1L The following lemma is our main technical tool for producing perfect complexes. Later versions of this result will reduce to this by Noetherian approximation.

08IS Lemma 62.18.1. Let $S$ be a scheme. Let $Y$ be a Noetherian algebraic space over $S$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D\left(\mathcal{O}_{X}\right)$ such that
(1) $E \in D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$,
(2) the scheme theoretic support of $H^{i}(E)$ is proper over $Y$ for all $i$,
(3) $E$ has finite tor dimension as an object of $D\left(f^{-1} \mathcal{O}_{Y}\right)$.

Then $R f_{*} E$ is a perfect object of $D\left(\mathcal{O}_{Y}\right)$.
Proof. By Lemma 62.7.1 we see that $R f_{*} E$ is an object of $D_{C o h}^{b}\left(\mathcal{O}_{Y}\right)$. Hence $R f_{*} E$ is pseudo-coherent (Lemma 62.12.6). Hence it suffices to show that $R f_{*} E$ has finite tor dimension, see Cohomology on Sites, Lemma 21.37.4. By Lemma 62.12 .7 it suffices to check that $R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} \mathcal{F}$ has universally bounded cohomology for all quasi-coherent sheaves $\mathcal{F}$ on $Y$. Bounded from above is clear as $R f_{*}(E)$ is bounded from above. Let $T \subset X$ be the union of the supports of $H^{i}(E)$ for all $i$. Then $T$ is proper over $Y$ by assumptions (1) and (2). In particular there exists a quasi-compact open subspace $X^{\prime} \subset X$ containing $T$. Setting $f^{\prime}=\left.f\right|_{X^{\prime}}$ we have $R f_{*}(E)=R f_{*}^{\prime}\left(\left.E\right|_{X^{\prime}}\right)$ because $E$ restricts to zero on $X \backslash T$. Thus we may replace $X$ by $X^{\prime}$ and assume $f$ is quasi-compact. We have assumed $f$ is quasi-separated. Thus

$$
R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} \mathcal{F}=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right)=R f_{*}\left(E \otimes_{f^{-1} \mathcal{O}_{Y}}^{\mathbf{L}} f^{-1} \mathcal{F}\right)
$$

by Lemma 62.17.1 and Cohomology on Sites, Lemma 21.18.5 By assumption (3) the complex $E \otimes_{f^{-1} \mathcal{O}_{Y}}^{\mathrm{L}} f^{-1} \mathcal{F}$ has cohomology sheaves in a given finite range, say $[a, b]$. Then $R f_{*}$ of it has cohomology in the range $[a, \infty)$ and we win.

### 62.19. Computing Ext groups and base change

08JM The results in this section will be used to verify one of Artin's criteria for Quot functors, Hilbert schemes, and other moduli problems.

0A1M Lemma 62.19.1. Let $S$ be a scheme. Let $B$ be a Noetherian algebraic space over $S$. Let $f: X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module flat over $B$ with scheme theoretic support proper over $B$. Then $K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)$ is a perfect object of $D\left(\mathcal{O}_{B}\right)$ and there are functorial isomorphisms

$$
H^{i}\left(B, K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}\right) \longrightarrow H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right)
$$

for $\mathcal{F}$ quasi-coherent on $B$ compatible with boundary maps (see proof).
Proof. We have

$$
\mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}=\mathcal{G} \otimes_{f^{-1} \mathcal{O}_{B}}^{\mathbf{L}} f^{-1} \mathcal{F}=\mathcal{G} \otimes_{f^{-1} \mathcal{O}_{B}} f^{-1} \mathcal{F}=\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}
$$

the first equality by Cohomology on Sites, Lemma 21.18.5, the second as $\mathcal{G}$ is a flat $f^{-1} \mathcal{O}_{B}$-module, and the third by definition of pullbacks. Hence we obtain

$$
\begin{aligned}
H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right) & =H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right) \\
& =H^{i}\left(B, R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right)\right) \\
& =H^{i}\left(B, R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}\right) \\
& =H^{i}\left(B, K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}\right)
\end{aligned}
$$

The first equality by the above, the second by Leray (Cohomology on Sites, Remark 21.14 .4 , and the third equality by Lemma 62.17.1. The object $K$ is perfect by Lemma 62.18.1. We check the lemma applies. Locally $E$ is isomorphic to a finite complex of finite free $\mathcal{O}_{X}$-modules. Hence locally $E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ is isomorphic to a finite complex whose terms are finite direct sums of copies of $\mathcal{G}$. This immediately implies the hypotheses on the cohomology sheaves $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)$. The hypothesis on finite tor dimension follows as $\mathcal{G}$ is flat over $f^{-1} \mathcal{O}_{B}$.
The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ then the isomorphisms fit into commutative diagrams

where the boundary maps come from the distinguished triangle

$$
K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{1} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{2} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{3} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{1}[1]
$$

and the distinguished triangle in $D\left(\mathcal{O}_{X}\right)$ associated to the short exact sequence

$$
0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{1} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{2} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{3} \rightarrow 0
$$

This sequence is exact because $\mathcal{G}$ is flat over $B$. We omit the verification of the commutativity of the displayed diagram.

08JN Lemma 62.19.2. Let $S$ be a scheme. Let $B$ be a Noetherian algebraic space over $S$. Let $f: X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module flat over $B$ with scheme theoretic support proper over $B$. Then

$$
K=R f_{*} R \mathcal{H o m}(E, \mathcal{G})
$$

is a perfect object of $D\left(\mathcal{O}_{B}\right)$ and there are functorial isomorphisms

$$
H^{i}\left(B, K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)
$$

for $\mathcal{F}$ quasi-coherent on $B$ compatible with boundary maps (see proof).
Proof. Since $E$ is a perfect complex there exists a dual perfect complex $E_{d u a l}$, see Cohomology on Sites, Lemma 21.37.9. Observe that $\operatorname{RHom}(E, \mathcal{G})=E_{\text {dual }} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ and that

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)=H^{i}\left(X, E_{\text {dual }} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right)
$$

by construction of $E_{\text {dual }}$. Thus the perfectness of $K$ and the isomorphisms follow from the corresponding results of Lemma 62.19.1 applied to $E_{d u a l}$ and $\mathcal{G}$.

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ then the isomorphisms fit into commutative diagrams

where the boundary maps come from the distinguished triangle

$$
K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{1} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{2} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{3} \rightarrow K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}_{1}[1]
$$

and the distinguished triangle in $D\left(\mathcal{O}_{X}\right)$ associated to the short exact sequence

$$
0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{1} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{2} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{3} \rightarrow 0
$$

This sequence is exact because $\mathcal{G}$ is flat over $B$. We omit the verification of the commutativity of the displayed diagram.

08JR Lemma 62.19.3. Let $S$ be a scheme. Let $B$ be a Noetherian algebraic space over $S$. Let $f: X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D\left(\mathcal{O}_{X}\right)$ and $\mathcal{G}$ an $\mathcal{O}_{X}$-module. Assume
(1) $E \in D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$, and
(2) $\mathcal{G}$ is a coherent $\mathcal{O}_{X}$-module flat over $B$ with scheme theoretic support proper over $B$.
Then for every $m \in \mathbf{Z}$ there exists a perfect object $K$ of $D\left(\mathcal{O}_{B}\right)$ and functorial maps

$$
\alpha_{\mathcal{F}}^{i}: E x t_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \longrightarrow H^{i}\left(B, K \otimes_{\mathcal{O}_{B}}^{\mathbf{L}} \mathcal{F}\right)
$$

for $\mathcal{F}$ quasi-coherent on $B$ compatible with boundary maps (see proof) such that $\alpha_{\mathcal{F}}^{i}$ is an isomorphism for $i \leq m$.

Proof. We may replace $X$ by a quasi-compact open neighbourhood of the support of $\mathcal{G}$, hence we may assume $X$ is Noetherian. In this case $X$ and $f$ are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow E$ by a perfect complex $P$ of $(X, E,-m-1)$ (possible by Theorem62.13.7). Then the induced map

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(P, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)
$$

is an isomorphism for $i \leq m$. Namely, the kernel, resp. cokernel of this map is a quotient, resp. submodule of

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(C, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \quad \text { resp. } \quad \operatorname{Ext}_{\mathcal{O}_{X}}^{i+1}\left(C, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)
$$

where $C$ is the cone of $P \rightarrow E$. Since $C$ has vanishing cohomology sheaves in degrees $\geq-m-1$ these Ext-groups are zero for $i \leq m+1$ by Derived Categories, Lemma 13.27 .3 . This reduces us to the case that $E$ is a perfect complex which is Lemma 62.19.2.

The statement on boundaries is explained in the proof of Lemma 62.19.2.

### 62.20. Limits and derived categories

09RG In this section we collect some results about the derived category of an algebraic space which is the limit of an inverse system of algebraic spaces. More precisely, we will work in the following setting.

09 RH Situation 62.20.1. Let $S$ be a scheme. Let $X=\lim _{i \in I} X_{i}$ be a limit of a directed system of algebraic spaces over $S$ with affine transition morphisms $f_{i^{\prime} i}: X_{i^{\prime}} \rightarrow X_{i}$. We denote $f_{i}: X \rightarrow X_{i}$ the projection. We assume that $X_{i}$ is quasi-compact and quasi-separated for all $i \in I$. We also choose an element $0 \in I$.

09RI Lemma 62.20.2. In Situation 62.20.1. Let $E_{0}$ and $K_{0}$ be objects of $D\left(\mathcal{O}_{X_{0}}\right)$. Set $E_{i}=L f_{i 0}^{*} E_{0}$ and $K_{i}=L f_{i 0}^{*} K_{0}$ for $i \geq 0$ and set $E=L f_{0}^{*} E_{0}$ and $K=L f_{0}^{*} K_{0}$. Then the map

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(\mathcal{O}_{x_{i}}\right)}\left(E_{i}, K_{i}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(E, K)
$$

is an isomorphism if either
(1) $E_{0}$ is perfect and $K_{0} \in D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$, or
(2) $E_{0}$ is pseudo-coherent and $K_{0} \in D_{Q C o h}\left(\mathcal{O}_{X_{0}}\right)$ has finite tor dimension.

Proof. For every quasi-compact and quasi-separated object $U_{0}$ of $\left(X_{0}\right)_{\text {spaces,étale }}$ consider the condition $P$ that the canonical map

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(\mathcal{O}_{U_{i}}\right)}\left(\left.E_{i}\right|_{U_{i}},\left.K_{i}\right|_{U_{i}}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.E\right|_{U},\left.K\right|_{U}\right)
$$

is an isomorphism, where $U=X \times{ }_{X_{0}} U_{0}$ and $U_{i}=X_{i} \times_{X_{0}} U_{0}$. We will prove $P$ holds for each $U_{0}$ by the induction principle of Lemma 62.8.3. Condition (2) of this lemma follows immediately from Mayer-Vietoris for hom in the derived category, see Lemma 62.9.4. Thus it suffices to prove the lemma when $X_{0}$ is affine.
If $X_{0}$ is affine, then the result follows from the case of schemes, see Derived Categories of Schemes, Lemma 35.21.2. To see this use the equivalence of Lemma 62.4.2 and use the translation of properties explained in Lemmas 62.12.2, 62.12.3, and 62.12 .4

09RJ Lemma 62.20.3. In Situation 62.20.1 the category of perfect objects of $D\left(\mathcal{O}_{X}\right)$ is the colimit of the categories of perfect objects of $D\left(\mathcal{O}_{X_{i}}\right)$.

Proof. For every quasi-compact and quasi-separated object $U_{0}$ of $\left(X_{0}\right)_{\text {spaces,étale }}$ consider the condition $P$ that the functor

$$
\operatorname{colim}_{i \geq 0} D_{p e r f}\left(\mathcal{O}_{U_{i}}\right) \longrightarrow D_{p e r f}\left(\mathcal{O}_{U}\right)
$$

is an equivalence where perf indicates the full subcategory of perfect objects and where $U=X \times_{X_{0}} U_{0}$ and $U_{i}=X_{i} \times_{X_{0}} U_{0}$. We will prove $P$ holds for every $U_{0}$ by the induction principle of Lemma 62.8.3. First, we observe that we already know the functor is fully faithful by Lemma 62.20.2. Thus it suffices to prove essential surjectivity.
We first check condition (2) of the induction principle. Thus suppose that we have an elementary distinguished square $\left(U_{0} \subset X_{0}, V_{0} \rightarrow X_{0}\right)$ and that $P$ holds for $U_{0}$, $V_{0}$, and $U_{0} \times_{X_{0}} V_{0}$. Let $E$ be a perfect object of $D\left(\mathcal{O}_{X}\right)$. We can find $i \geq 0$ and $E_{U, i}$ perfect on $U_{i}$ and $E_{V, i}$ perfect on $V_{i}$ whose pullback to $U$ and $V$ are isomorphic to $\left.E\right|_{U}$ and $\left.E\right|_{V}$. Denote

$$
a:\left.E_{U, i} \rightarrow\left(R\left(X \rightarrow X_{i}\right)_{*} E\right)\right|_{U_{i}} \quad \text { and } \quad b:\left.E_{V, i} \rightarrow\left(R\left(X \rightarrow X_{i}\right)_{*} E\right)\right|_{V_{i}}
$$

the maps adjoint to the isomorphisms $\left.L\left(U \rightarrow U_{i}\right)^{*} E_{U, i} \rightarrow E\right|_{U}$ and $L(V \rightarrow$ $\left.V_{i}\right)\left.^{*} E_{V, i} \rightarrow E\right|_{V}$. By fully faithfulness, after increasing $i$, we can find an isomorphism $c:\left.\left.E_{U, i}\right|_{U_{i} \times X_{i} V_{i}} \rightarrow E_{V, i}\right|_{U_{i} \times X_{i} V_{i}}$ which pulls back to the identifications

$$
\left.\left.\left.L\left(U \rightarrow U_{i}\right)^{*} E_{U, i}\right|_{U \times_{X} V} \rightarrow E\right|_{U \times_{X} V} \rightarrow L\left(V \rightarrow V_{i}\right)^{*} E_{V, i}\right|_{U \times_{X} V}
$$

Apply Lemma 62.9.7 to get an object $E_{i}$ on $X_{i}$ and a map $d: E_{i} \rightarrow R\left(X \rightarrow X_{i}\right)_{*} E$ which restricts to the maps $a$ and $b$ over $U_{i}$ and $V_{i}$. Then it is clear that $E_{i}$ is perfect and that $d$ is adjoint to an isomorphism $L\left(X \rightarrow X_{i}\right)^{*} E_{i} \rightarrow E$.

Finally, we check condition (1) of the induction principle, in other words, we check the lemma holds when $X_{0}$ is affine. This follows from the case of schemes, see Derived Categories of Schemes, Lemma 35.21.3. To see this use the equivalence of Lemma 62.4.2 and use the translation of Lemma 62.12.4.

### 62.21. Cohomology and base change, V

0 A 1 N A final section on cohomology and base change continueing the discussion of Sections 62.17 and 62.18. An easy to grok special case is given in Remark 62.21.2.
0A1P Lemma 62.21.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of finite presentation between algebraic spaces over $S$. Let $E \in D\left(\mathcal{O}_{X}\right)$ be a perfect object. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module, flat over $Y$, with support proper over $Y$. Then

$$
K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)
$$

is a perfect object of $D\left(\mathcal{O}_{Y}\right)$ and its formation commutes with arbitrary base change.
Proof. The statement on base change is Lemma 62.17.5. Thus it suffices to show that $K$ is a perfect object. If $Y$ is Noetherian, then this follows from Lemma 62.19 .1 . We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.
The question is local on $Y$, hence we may assume $Y$ is affine. Say $Y=\operatorname{Spec}(R)$. We write $R=$ colim $R_{i}$ as a filtered colimit of Noetherian rings $R_{i}$. By Limits of Spaces, Lemma 57.7.1 there exists an $i$ and an algebraic space $X_{i}$ of finite presentation over $R_{i}$ whose base change to $R$ is $X$. By Limits of Spaces, Lemma 57.7.2 we may assume after increasing $i$, that there exists a finitely presented $\mathcal{O}_{X_{i}}$-module $\mathcal{G}_{i}$
whose pullback to $X$ is $\mathcal{G}$. After increasing $i$ we may assume $\mathcal{G}_{i}$ is flat over $R_{i}$, see Limits of Spaces, Lemma 57.6.11. After increasing $i$ we may assume the support of $\mathcal{G}_{i}$ is proper over $R_{i}$, see Limits of Spaces, Lemma 57.12.3. Finally, by Lemma 62.12 .4 we may, after increasing $i$, assume there exists a perfect object $E_{i}$ of $D\left(\mathcal{O}_{X_{i}}\right)$ whose pullback to $X$ is $E$. Applying Lemma 62.19 .1 to $X_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right), E_{i}, \mathcal{G}_{i}$ and using the base change property already shown we obtain the result.

0A1Q Remark 62.21.2. Let $R$ be a ring. Let $X$ be an algebraic space of finite presentation over $R$. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module flat over $R$ with scheme theoretic support proper over $R$. By Lemma 62.21.1 there exists a finite complex of finite projective $R$-modules $M^{\bullet}$ such that we have

$$
R \Gamma\left(X_{R^{\prime}}, \mathcal{G}_{R^{\prime}}\right)=M^{\bullet} \otimes_{R} R^{\prime}
$$

functorially in the $R$-algebra $R^{\prime}$.
0A1R Lemma 62.21.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of finite presentation between algebraic spaces over $S$. Let $E \in D\left(\mathcal{O}_{X}\right)$ be a perfect object. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module, flat over $Y$, with support proper over $Y$. Then

$$
K=R f_{*} R \mathcal{H o m}(E, \mathcal{G})
$$

is a perfect object of $D\left(\mathcal{O}_{Y}\right)$ and its formation commutes with arbitrary base change.
Proof. The statement on base change is Lemma 62.17.6. Thus it suffices to show that $K$ is a perfect object. If $Y$ is Noetherian, then this follows from Lemma 62.19 .2 . We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.
The question is local on $Y$, hence we may assume $Y$ is affine. Say $Y=\operatorname{Spec}(R)$. We write $R=$ colim $R_{i}$ as a filtered colimit of Noetherian rings $R_{i}$. By Limits of Spaces, Lemma 57.7.1 there exists an $i$ and an algebraic space $X_{i}$ of finite presentation over $R_{i}$ whose base change to $R$ is $X$. By Limits of Spaces, Lemma 57.7.2 we may assume after increasing $i$, that there exists a finitely presented $\mathcal{O}_{X_{i}}$-module $\mathcal{G}_{i}$ whose pullback to $X$ is $\mathcal{G}$. After increasing $i$ we may assume $\mathcal{G}_{i}$ is flat over $R_{i}$, see Limits of Spaces, Lemma 57.6.11. After increasing $i$ we may assume the support of $\mathcal{G}_{i}$ is proper over $R_{i}$, see Limits of Spaces, Lemma 57.12.3. Finally, by Lemma 62.12 .4 we may, after increasing $i$, assume there exists a perfect object $E_{i}$ of $D\left(\mathcal{O}_{X_{i}}\right)$ whose pullback to $X$ is $E$. Applying Lemma 62.19 .2 to $X_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right), E_{i}, \mathcal{G}_{i}$ and using the base change property already shown we obtain the result.

## More on Morphisms of Spaces

### 63.1. Introduction

049 G In this chapter we continue our study of properties of morphisms of algebraic spaces. A fundamental reference is Knu71.

### 63.2. Conventions

049H The standing assumption is that all schemes are contained in a big fppf site $S c h_{f p p f}$. And all rings $A$ considered have the property that $\operatorname{Spec}(A)$ is (isomorphic) to an object of this big site.
Let $S$ be a scheme and let $X$ be an algebraic space over $S$. In this chapter and the following we will write $X \times_{S} X$ for the product of $X$ with itself (in the category of algebraic spaces over $S$ ), instead of $X \times X$.

### 63.3. Radicial morphisms

0480 It turns out that a radicial morphism is not the same thing as a universally injective morphism, contrary to what happens with morphisms of schemes. In fact it is a bit stronger.
0481 Definition 63.3.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. We say $f$ is radicial if for any morphism $\operatorname{Spec}(K) \rightarrow Y$ where $K$ is a field the reduction $\left(\operatorname{Spec}(K) \times_{Y} X\right)_{\text {red }}$ is either empty or representable by the spectrum of a purely inseparable field extension of $K$.
0482 Lemma 63.3.2. A radicial morphism of algebraic spaces is universally injective.
Proof. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a radicial morphism of algebraic spaces over $S$. It is clear from the definition that given a morphism $\operatorname{Spec}(K) \rightarrow Y$ there is at most one lift of this morphism to a morphism into $X$. Hence we conclude that $f$ is universally injective by Morphisms of Spaces, Lemma 54.19.2.

0483 Example 63.3.3. It is no longer true that universally injective is equivalent to radicial. For example the morphism

$$
X=[\operatorname{Spec}(\overline{\mathbf{Q}}) / \operatorname{Gal}(\overline{\mathbf{Q}} / \mathbf{Q})] \longrightarrow S=\operatorname{Spec}(\mathbf{Q})
$$

of Spaces, Example 52.14.7 is universally injective, but is not radicial in the sense above.

Nonetheless it is often the case that the reverse implication holds.
0484 Lemma 63.3.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a universally injective morphism of algebraic spaces over $S$.
(1) If $f$ is decent then $f$ is radicial.
(2) If $f$ is quasi-separated then $f$ is radicial.
(3) If $f$ is locally separated then $f$ is radicial.

Proof. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is stable under base change and composition and holds for closed immersions. Assume $f: X \rightarrow Y$ has $\mathcal{P}$ and is universally injective. Then, in the situation of Definition 63.3.1 the morphism $\left(\operatorname{Spec}(K) \times_{Y} X\right)_{\text {red }} \rightarrow \operatorname{Spec}(K)$ is universally injective and has $\mathcal{P}$. This reduces the problem of proving

$$
\mathcal{P}+\text { universally injective } \Rightarrow \text { radicial }
$$

to the problem of proving that any nonempty reduced algebraic space $X$ over field whose structure morphism $X \rightarrow \operatorname{Spec}(K)$ is universally injective and $\mathcal{P}$ is representable by the spectrum of a field. Namely, then $X \rightarrow \operatorname{Spec}(K)$ will be a morphism of schemes and we conclude by the equivalence of radicial and universally injective for morphisms of schemes, see Morphisms, Lemma 28.11.2.
Let us prove (1). Assume $f$ is decent and universally injective. By Decent Spaces, Lemmas 55.15.4, 55.15.6, and 55.15.2 (to see that an immersion is decent) we see that the discussion in the first paragraph applies. Let $X$ be a nonempty decent reduced algebraic space universally injective over a field $K$. In particular we see that $|X|$ is a singleton. By Decent Spaces, Lemma 55.12 .2 we conclude that $X \cong \operatorname{Spec}(L)$ for some extension $K \subset L$ as desired.
A quasi-separated morphism is decent, see Decent Spaces, Lemma 55.15.2. Hence (1) implies (2).

Let us prove (3). Recall that the separation axioms are stable under base change and composition and that closed immersions are separated, see Morphisms of Spaces, Lemmas 54.4.4 54.4.8, and 54.10.7. Thus the discussion in the first paragraph of the proof applies. Let $X$ be a reduced algebraic space universally injective and locally separated over a field $K$. In particular $|X|$ is a singleton hence $X$ is quasicompact, see Properties of Spaces, Lemma 53.5.2. We can find a surjective étale morphism $U \rightarrow X$ with $U$ affine, see Properties of Spaces, Lemma 53.6.3. Consider the morphism of schemes

$$
j: U \times_{X} U \longrightarrow U \times_{\operatorname{Spec}(K)} U
$$

As $X \rightarrow \operatorname{Spec}(K)$ is universally injective $j$ is surjective, and as $X \rightarrow \operatorname{Spec}(K)$ is locally separated $j$ is an immersion. A surjective immersion is a closed immersion, see Schemes, Lemma 25.10.4. Hence $R=U \times_{X} U$ is affine as a closed subscheme of an affine scheme. In particular $R$ is quasi-compact. It follows that $X=U / R$ is quasi-separated, and the result follows from (2).
049E Remark 63.3.5. Let $X \rightarrow Y$ be a morphism of algebraic spaces. For some applications (of radicial morphisms) it is enough to require that for every $\operatorname{Spec}(K) \rightarrow Y$ where $K$ is a field
(1) the space $\left|\operatorname{Spec}(K) \times_{Y} X\right|$ is a singleton,
(2) there exists a monomorphism $\operatorname{Spec}(L) \rightarrow \operatorname{Spec}(K) \times_{Y} X$, and
(3) $K \subset L$ is purely inseparable.

If needed later we will may call such a morphism weakly radicial. For example if $X \rightarrow Y$ is a surjective weakly radicial morphism then $X(k) \rightarrow Y(k)$ is surjective for every algebraically closed field $k$. Note that the base change $X_{\overline{\mathbf{Q}}} \rightarrow \operatorname{Spec}(\overline{\mathbf{Q}})$ of
the morphism in Example 63.3 .3 is weakly radicial, but not radicial. The analogue of Lemma 63.3.4 is that if $X \rightarrow Y$ has property $(\beta)$ and is universally injective, then it is weakly radicial (proof omitted).
0AGE Lemma 63.3.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ is locally of finite type,
(2) for every étale morphism $V \rightarrow Y$ the map $\left|X \times_{Y} V\right| \rightarrow|V|$ is injective.

Then $f$ is universally injective.
Proof. The question is étale local on $Y$ by Morphisms of Spaces, Lemma 54.19.6. Hence we may assume that $Y$ is a scheme. Then $Y$ is in particular decent and by Decent Spaces, Lemma 55.16 .9 we see that $f$ is locally quasi-finite. Let $y \in Y$ be a point and let $X_{y}$ be the scheme theoretic fibre. Assume $X_{y}$ is not empty. By Spaces over Fields, Lemma 59.7.8 we see that $X_{y}$ is a scheme which is locally quasi-finite over $\kappa(y)$. Since $\left|X_{y}\right| \subset|X|$ is the fibre of $|X| \rightarrow|Y|$ over $y$ we see that $X_{y}$ has a unique point $x$. The same is true for $X_{y} \times{ }_{\operatorname{Spec}(\kappa(y))} \operatorname{Spec}(k)$ for any finite separable extension $\kappa(y) \subset k$ because we can realize $k$ as the residue field at a point lying over $y$ in an étale scheme over $Y$, see see More on Morphisms, Lemma 36.27.2. Thus $X_{y}$ is geometrically connected, see Varieties, Lemma 32.5.11. This implies that the finite extension $\kappa(y) \subset \kappa(x)$ is purely inseparable.

We conclude (in the case that $Y$ is a scheme) that for every $y \in Y$ either the fibre $X_{y}$ is empty, or $\left(X_{y}\right)_{r e d}=\operatorname{Spec}(\kappa(x))$ with $\kappa(y) \subset \kappa(x)$ purely inseparable. Hence $f$ is radicial (some details omitted), whence universally injective by Lemma 63.3 .2 .

### 63.4. Monomorphisms

0B89 This section is the continuation of Morphisms of Spaces, Section 54.10. We would like to know whether or not every monomorphism of algebraic spaces is representable. If you can prove this is true or have a counterexample, please email stacks.project@gmail.com. For the moment this is known in the following cases
(1) for monomorphisms which are locally of finite type (more generally any separated, locally quasi-finite morphism is representable by Morphisms of Spaces, Lemma 54.48.1 and a monomorphism which is locally of finite type is locally quasi-finite by Morphisms of Spaces, Lemma 54.27.10,
(2) if the target is a disjoint union of spectra of zero dimensional local rings (Decent Spaces, Lemma 55.17.1), and
(3) for flat monomorphisms (see below).

0B8A Lemma 63.4.1 (David Rydh). A flat monomorphism of algebraic spaces is representable by schemes.

Proof. Let $f: X \rightarrow Y$ be a flat morphism of algebraic spaces. To prove $f$ is representable, we have to show $X \times_{Y} V$ is a scheme for every scheme $V$ mapping to $Y$. Since being a scheme is local (Properties of Spaces, Lemma 53.12.1), we may assume $V$ is affine. Thus we may assume $Y=\operatorname{Spec}(B)$ is an affine scheme. Next, we can assume that $X$ is quasi-compact by replacing $X$ by a quasi-compact open. The space $X$ is separated as $X \rightarrow X \times_{\operatorname{Spec}(B)} X$ is an isomorphism. Applying Limits of Spaces, Lemma 57.17 .3 we reduce to the case where $B$ is local, $X \rightarrow \operatorname{Spec}(B)$
is a flat monomorphism, and there exists a point $x \in X$ mapping to the closed point of $\operatorname{Spec}(B)$. Then $X \rightarrow \operatorname{Spec}(B)$ is surjective as generalizations lift along flat morphisms of separated algebraic spaces, see Decent Spaces, Lemma 55.7.3. Hence we see that $\{X \rightarrow \operatorname{Spec}(B)\}$ is an fpqc cover. Then $X \rightarrow \operatorname{Spec}(B)$ is a morphism which becomes an isomorphism after base change by $X \rightarrow \operatorname{Spec}(B)$. Hence it is an isomorphism by fpqc descent, see Descent on Spaces, Lemma 61.10.13.

The following is (in some sense) a variant of the lemma above.
0B8B Lemma 63.4.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a quasi-compact monomorphism of algebraic spaces $f: X \rightarrow Y$ such that for every $T \rightarrow X$ the map

$$
\mathcal{O}_{T} \rightarrow f_{T, *} \mathcal{O}_{X \times_{Y} T}
$$

is injective. Then $f$ is an isomorphism (and hence representable by schemes).
Proof. The question is étale local on $Y$, hence we may assume $Y=\operatorname{Spec}(A)$ is affine. Then $X$ is quasi-compact and we may choose an affine scheme $U=\operatorname{Spec}(B)$ and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma53.6.3). Note that $U \times_{X} U=\operatorname{Spec}\left(B \otimes_{A} B\right)$. Hence the category of quasi-coherent $\mathcal{O}_{X}$-modules is equivalent to the category $D D_{B / A}$ of descent data on modules for $A \rightarrow B$. See Properties of Spaces, Proposition 53.31.1. Descent, Definition 34.3.1, and Descent, Subsection 34.4.14 On the other hand,

$$
A \rightarrow B
$$

is a universally injective ring map. Namely, given an $A$-module $M$ we see that $A \oplus M \rightarrow B \otimes_{A}(A \oplus M)$ is injective by the assumption of the lemma. Hence $D D_{B / A}$ is equivalent to the category of $A$-modules by Descent, Theorem 34.4.22, Thus pullback along $f: X \rightarrow \operatorname{Spec}(A)$ determines an equivalence of categories of quasi-coherent modules. In particular $f^{*}$ is exact on quasi-coherent modules and we see that $f$ is flat (small detail omitted). Moreover, it is clear that $f$ is surjective (for example because $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective). Hence we see that $\{X \rightarrow \operatorname{Spec}(A)\}$ is an fpqc cover. Then $X \rightarrow \operatorname{Spec}(A)$ is a morphism which becomes an isomorphism after base change by $X \rightarrow \operatorname{Spec}(A)$. Hence it is an isomorphism by fpqc descent, see Descent on Spaces, Lemma 61.10.13.

0B8C Lemma 63.4.3. A quasi-compact flat surjective monomorphism of algebraic spaces is an isomorphism.

Proof. Such a morphism satisfies the assumptions of Lemma 63.4.2.

### 63.5. Conormal sheaf of an immersion

04 CM Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the corresponding quasi-coherent sheaf of ideals, see Morphisms of Spaces, Lemma 54.13.1. Consider the short exact sequence

$$
0 \rightarrow \mathcal{I}^{2} \rightarrow \mathcal{I} \rightarrow \mathcal{I} / \mathcal{I}^{2} \rightarrow 0
$$

of quasi-coherent sheaves on $X$. Since the sheaf $\mathcal{I} / \mathcal{I}^{2}$ is annihilated by $\mathcal{I}$ it corresponds to a sheaf on $Z$ by Morphisms of Spaces, Lemma 54.14.1. This quasicoherent $\mathcal{O}_{Z}$-module is the conormal sheaf of $Z$ in $X$ and is often denoted $\mathcal{I} / \mathcal{I}^{2}$ by the abuse of notation mentioned in Morphisms of Spaces, Section 54.14.

In case $i: Z \rightarrow X$ is a (locally closed) immersion we define the conormal sheaf of $i$ as the conormal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$, see Morphisms of Spaces, Remark 54.12.4. It is often denoted $\mathcal{I} / \mathcal{I}^{2}$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$.
04CN Definition 63.5.1. Let $i: Z \rightarrow X$ be an immersion. The conormal sheaf $\mathcal{C}_{Z / X}$ of $Z$ in $X$ or the conormal sheaf of $i$ is the quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{I} / \mathcal{I}^{2}$ described above.

In DG67, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z / X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z / X}$ for the normal sheaf of the immersion. It is defined as

$$
\mathcal{N}_{Z / X}=\mathcal{H o m}_{\mathcal{O}_{Z}}\left(\mathcal{C}_{Z / X}, \mathcal{O}_{Z}\right)=\mathcal{H o m}_{\mathcal{O}_{Z}}\left(\mathcal{I} / \mathcal{I}^{2}, \mathcal{O}_{Z}\right)
$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

04CO Lemma 63.5.2. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion. Let $\varphi: U \rightarrow X$ be an étale morphism where $U$ is a scheme. Set $Z_{U}=U \times_{X} Z$ which is a locally closed subscheme of $U$. Then

$$
\left.\mathcal{C}_{Z / X}\right|_{Z_{U}}=\mathcal{C}_{Z_{U} / U}
$$

canonically and functorially in $U$.
Proof. Let $T \subset X$ be a closed subspace such that $i$ defines a closed immersion into $X \backslash T$. Let $\mathcal{I}$ be the quasi-coherent sheaf of ideals on $X \backslash T$ defining $Z$. Then the lemma just states that $\left.\mathcal{I}\right|_{U \backslash \varphi^{-1}(T)}$ is the sheaf of ideals of the immersion $Z_{U} \rightarrow U \backslash \varphi^{-1}(T)$. This is clear from the construction of $\mathcal{I}$ in Morphisms of Spaces, Lemma 54.13.1.

04CP Lemma 63.5.3. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$. Assume $i$, $i^{\prime}$ immersions. There is a canonical map of $\mathcal{O}_{Z}$-modules

$$
f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \longrightarrow \mathcal{C}_{Z / X}
$$

Proof. First find open subspaces $U^{\prime} \subset X^{\prime}$ and $U \subset X$ such that $g(U) \subset U^{\prime}$ and such that $i(Z) \subset U$ and $i\left(Z^{\prime}\right) \subset U^{\prime}$ are closed (proof existence omitted). Replacing $X$ by $U$ and $X^{\prime}$ by $U^{\prime}$ we may assume that $i$ and $i^{\prime}$ are closed immersions. Let $\mathcal{I}^{\prime} \subset \mathcal{O}_{X^{\prime}}$ and $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaves of ideals associated to $i^{\prime}$ and $i$, see Morphisms of Spaces, Lemma 54.13.1. Consider the composition

$$
g^{-1} \mathcal{I}^{\prime} \rightarrow g^{-1} \mathcal{O}_{X^{\prime}} \xrightarrow{g^{\sharp}} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / \mathcal{I}=i_{*} \mathcal{O}_{Z}
$$

Since $g(i(Z)) \subset Z^{\prime}$ we conclude this composition is zero (see statement on factorizations in Morphisms of Spaces, Lemma 54.13.1. Thus we obtain a commutative
diagram

The lower row is exact since $g^{-1}$ is an exact functor. By exactness we also see that $\left(g^{-1} \mathcal{I}^{\prime}\right)^{2}=g^{-1}\left(\left(\mathcal{I}^{\prime}\right)^{2}\right)$. Hence the diagram induces a map $g^{-1}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right) \rightarrow \mathcal{I} / \mathcal{I}^{2}$. Pulling back (using $i^{-1}$ for example) to $Z$ we obtain $i^{-1} g^{-1}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right) \rightarrow \mathcal{C}_{Z / X}$. Since $i^{-1} g^{-1}=f^{-1}\left(i^{\prime}\right)^{-1}$ this gives a map $f^{-1} \mathcal{C}_{Z^{\prime} / X^{\prime}} \rightarrow \mathcal{C}_{Z / X}$, which induces the desired map.

04G2 Lemma 63.5.4. Let $S$ be a scheme. The conormal sheaf of Definition 63.5.1, and its functoriality of Lemma 63.5.3 satisfy the following properties:
(1) If $Z \rightarrow X$ is an immersion of schemes over $S$, then the conormal sheaf agrees with the one from Morphisms, Definition 28.32.1.
(2) If in Lemma 63.5.3 all the spaces are schemes, then the map $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \rightarrow$ $\mathcal{C}_{Z / X}$ is the same as the one constructed in Morphisms, Lemma 28.32.3.
(3) Given a commutative diagram

then the map $\left(f^{\prime} \circ f\right)^{*} \mathcal{C}_{Z^{\prime \prime} / X^{\prime \prime}} \rightarrow \mathcal{C}_{Z / X}$ is the same as the composition of $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \rightarrow \mathcal{C}_{Z / X}$ with the pullback by $f$ of $\left(f^{\prime}\right)^{*} \mathcal{C}_{Z^{\prime \prime} / X^{\prime \prime}} \rightarrow \mathcal{C}_{Z^{\prime} / X^{\prime}}$
Proof. Omitted. Note that Part (1) is a special case of Lemma 63.5.2.
04CQ Lemma 63.5.5. Let $S$ be a scheme. Let

be a fibre product diagram of algebraic spaces over $S$. Assume $i, i^{\prime}$ immersions. Then the canonical map $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \rightarrow \mathcal{C}_{Z / X}$ of Lemma 63.5.3 is surjective. If $g$ is flat, then it is an isomorphism.

Proof. Choose a commutative diagram

where $U, U^{\prime}$ are schemes and the horizontal arrows are surjective and étale, see Spaces, Lemma 52.11.6. Then using Lemmas 63.5 .2 and 63.5 .4 we see that the
question reduces to the case of a morphism of schemes. In the schemes case this is Morphisms, Lemma 28.32.4.

06BD Lemma 63.5.6. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be immersions of algebraic spaces. Then there is a canonical exact sequence

$$
i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

where the maps come from Lemma 63.5.3 and $i: Z \rightarrow Y$ is the first morphism.
Proof. Let $U$ be a scheme and let $U \rightarrow X$ be a surjective étale morphism. Via Lemmas 63.5 .2 and 63.5 .4 the exactness of the sequence translates immediately into the exactness of the corresponding sequence for the immersions of schemes $Z \times_{X} U \rightarrow Y \times_{X} U \rightarrow U$. Hence the lemma follows from Morphisms, Lemma 28.32 .5

### 63.6. The normal cone of an immersion

09RM Let $S$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of algebraic spaces over $S$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the corresponding quasi-coherent sheaf of ideals, see Morphisms of Spaces, Lemma 54.13.1. Consider the quasi-coherent sheaf of graded $\mathcal{O}_{X}$-algebras $\bigoplus_{n>0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$. Since the sheaves $\mathcal{I}^{n} / \mathcal{I}^{n+1}$ are each annihilated by $\mathcal{I}$ this graded alge $\bar{b} r a$ corresponds to a quasi-coherent sheaf of graded $\mathcal{O}_{Z}$-algebras by Morphisms of Spaces, Lemma 54.14.1. This quasi-coherent graded $\mathcal{O}_{Z}$-algebra is called the conormal algebra of $Z$ in $X$ and is often simply denoted $\bigoplus_{n>0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ by the abuse of notation mentioned in Morphisms of Spaces, Section 54.14.

In case $i: Z \rightarrow X$ is a (locally closed) immersion we define the conormal algebra of $i$ as the conormal algebra of the closed immersion $i: Z \rightarrow X \backslash \partial Z$, see Morphisms of Spaces, Remark 54.12 .4 . It is often denoted $\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$.

09RN Definition 63.6.1. Let $i: Z \rightarrow X$ be an immersion. The conormal algebra $\mathcal{C}_{Z / X, *}$ of $Z$ in $X$ or the conormal algebra of $i$ is the quasi-coherent sheaf of graded $\mathcal{O}_{Z}$-algebras $\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ described above.
Thus $\mathcal{C}_{Z / X, 1}=\mathcal{C}_{Z / X}$ is the conormal sheaf of the immersion. Also $\mathcal{C}_{Z / X, 0}=\mathcal{O}_{Z}$ and $\mathcal{C}_{Z / X, n}$ is a quasi-coherent $\mathcal{O}_{Z}$-module characterized by the property

09RP (63.6.1.1)

$$
i_{*} \mathcal{C}_{Z / X, n}=\mathcal{I}^{n} / \mathcal{I}^{n+1}
$$

where $i: Z \rightarrow X \backslash \partial Z$ and $\mathcal{I}$ is the ideal sheaf of $i$ as above. Finally, note that there is a canonical surjective map
09RQ

$$
\begin{equation*}
\operatorname{Sym}^{*}\left(\mathcal{C}_{Z / X}\right) \longrightarrow \mathcal{C}_{Z / X, *} \tag{63.6.1.2}
\end{equation*}
$$

of quasi-coherent graded $\mathcal{O}_{Z}$-algebras which is an isomorphism in degrees 0 and 1 .
09RR Lemma 63.6.2. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Let $\varphi: U \rightarrow X$ be an étale morphism where $U$ is a scheme. Set $Z_{U}=U \times_{X} Z$ which is a locally closed subscheme of $U$. Then

$$
\left.\mathcal{C}_{Z / X, *}\right|_{Z_{U}}=\mathcal{C}_{Z_{U} / U, *}
$$

canonically and functorially in $U$.

Proof. Let $T \subset X$ be a closed subspace such that $i$ defines a closed immersion into $X \backslash T$. Let $\mathcal{I}$ be the quasi-coherent sheaf of ideals on $X \backslash T$ defining $Z$. Then the lemma follows from the fact that $\left.\mathcal{I}\right|_{U \backslash \varphi^{-1}(T)}$ is the sheaf of ideals of the immersion $Z_{U} \rightarrow U \backslash \varphi^{-1}(T)$. This is clear from the construction of $\mathcal{I}$ in Morphisms of Spaces, Lemma 54.13.1.

09RS Lemma 63.6.3. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$. Assume $i, i^{\prime}$ immersions. There is a canonical map of graded $\mathcal{O}_{Z}$-algebras

$$
f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}, *} \longrightarrow \mathcal{C}_{Z / X, *}
$$

Proof. First find open subspaces $U^{\prime} \subset X^{\prime}$ and $U \subset X$ such that $g(U) \subset U^{\prime}$ and such that $i(Z) \subset U$ and $i\left(Z^{\prime}\right) \subset U^{\prime}$ are closed (proof existence omitted). Replacing $X$ by $U$ and $X^{\prime}$ by $U^{\prime}$ we may assume that $i$ and $i^{\prime}$ are closed immersions. Let $\mathcal{I}^{\prime} \subset \mathcal{O}_{X^{\prime}}$ and $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaves of ideals associated to $i^{\prime}$ and $i$, see Morphisms of Spaces, Lemma 54.13.1. Consider the composition

$$
g^{-1} \mathcal{I}^{\prime} \rightarrow g^{-1} \mathcal{O}_{X^{\prime}} \xrightarrow{g^{\sharp}} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / \mathcal{I}=i_{*} \mathcal{O}_{Z}
$$

Since $g(i(Z)) \subset Z^{\prime}$ we conclude this composition is zero (see statement on factorizations in Morphisms of Spaces, Lemma 54.13.1). Thus we obtain a commutative diagram

The lower row is exact since $g^{-1}$ is an exact functor. By exactness we also see that $\left(g^{-1} \mathcal{I}^{\prime}\right)^{n}=g^{-1}\left(\left(\mathcal{I}^{\prime}\right)^{n}\right)$ for all $n \geq 1$. Hence the diagram induces a map $g^{-1}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right) \rightarrow \mathcal{I}^{n} / \mathcal{I}^{n+1}$. Pulling back (using $i^{-1}$ for example) to $Z$ we obtain $i^{-1} g^{-1}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right) \rightarrow \mathcal{C}_{Z / X, n}$. Since $i^{-1} g^{-1}=f^{-1}\left(i^{\prime}\right)^{-1}$ this gives maps $f^{-1} \mathcal{C}_{Z^{\prime} / X^{\prime}, n} \rightarrow \mathcal{C}_{Z / X, n}$, which induce the desired map.

09RT Lemma 63.6.4. Let $S$ be a scheme. Let

be a cartesion square of algebraic spaces over $S$ with $i$, $i^{\prime}$ immersions. Then the canonical map $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}, *} \rightarrow \mathcal{C}_{Z / X, *}$ of Lemma 63.6.3 is surjective. If $g$ is flat, then it is an isomorphism.

Proof. We may check the statement after étale localizing $X^{\prime}$. In this case we may assume $X^{\prime} \rightarrow X$ is a morphism of schemes, hence $Z$ and $Z^{\prime}$ are schemes and the result follows from the case of schemes, see Divisors, Lemma 30.16.4.

We use the same conventions for cones and vector bundles over algebraic spaces as we do for schemes (where we use the conventions of EGA), see Constructions, Sections 26.7 and 26.6. In particular, a vector bundle is a very general gadget (and not locally isomorphic to an affine space bundle).
09RU Definition 63.6.5. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. The normal cone $C_{Z} X$ of $Z$ in $X$ is

$$
C_{Z} X=\underline{\operatorname{Spec}}_{Z}\left(\mathcal{C}_{Z / X, *}\right)
$$

see Morphisms of Spaces, Definition 54.20.8. The normal bundle of $Z$ in $X$ is the vector bundle

$$
N_{Z} X=\underline{\operatorname{Spec}}_{Z}\left(\operatorname{Sym}\left(\mathcal{C}_{Z / X}\right)\right)
$$

Thus $C_{Z} X \rightarrow Z$ is a cone over $Z$ and $N_{Z} X \rightarrow Z$ is a vector bundle over $Z$. Moreover, the canonical surjection (63.6.1.2 of graded algebras defines a canonical closed immersion
09RV
$C_{Z} X \longrightarrow N_{Z} X$
of cones over $Z$.

### 63.7. Sheaf of differentials of a morphism

04 CR We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.130), the corresponding section in the chapter on morphism of schemes (Morphisms, Section 28.33) as well as Modules on Sites, Section 18.32 . We first show that the notion of sheaf of differentials for a morphism of schemes agrees with the corresponding morphism of small étale (ringed) sites.
To clearly state the following lemma we temporarily go back to denoting $\mathcal{F}^{a}$ the sheaf of $\mathcal{O}_{X_{\text {étale }}}$-modules associated to a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ on the scheme $X$, see Descent, Definition 34.7.2.
04CS Lemma 63.7.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $f_{\text {small }}: X_{\text {étale }} \rightarrow$ $Y_{\text {étale }}$ be the associated morphism of small étale sites, see Descent, Remark 34.7.4. Then there is a canonical isomorphism

$$
\left(\Omega_{X / Y}\right)^{a}=\Omega_{X_{\text {étale }} / Y_{\text {étale }}}
$$

compatible with universal derivations. Here the first module is the sheaf on $X_{\text {étale }}$ associated to the quasi-coherent $\mathcal{O}_{X}$-module $\Omega_{X / Y}$, see Morphisms, Definition 28.33.1, and the second module is the one from Modules on Sites, Definition 18.32.3.

Proof. Let $h: U \rightarrow X$ be an étale morphism. In this case the natural map $h^{*} \Omega_{X / Y} \rightarrow \Omega_{U / Y}$ is an isomorphism, see More on Morphisms, Lemma 36.7.7. This means that there is a natural $\mathcal{O}_{\text {Yétale }}$-derivation

$$
\mathrm{d}^{a}: \mathcal{O}_{X_{\text {étale }}} \longrightarrow\left(\Omega_{X / Y}\right)^{a}
$$

since we have just seen that the value of $\left(\Omega_{X / Y}\right)^{a}$ on any object $U$ of $X_{\text {étale }}$ is canonically identified with $\Gamma\left(U, \Omega_{U / Y}\right)$. By the universal property of $\mathrm{d}_{X / Y}: \mathcal{O}_{X_{\text {étale }}} \rightarrow$
 that $\mathrm{d}^{a}=c \circ \mathrm{~d}_{X / Y}$.
Conversely, suppose that $\mathcal{F}$ is an $\mathcal{O}_{X_{\text {étale }}}$-module and $D: \mathcal{O}_{X_{\text {étale }}} \rightarrow \mathcal{F}$ is a $\mathcal{O}_{Y_{\text {étale }}}$ derivation. Then we can simply restrict $D$ to the small Zariski site $X_{Z a r}$ of $X$.

Since sheaves on $X_{Z a r}$ agree with sheaves on $X$, see Descent, Remark 34.7.3, we see that $\left.D\right|_{X_{Z a r}}:\left.\mathcal{O}_{X} \rightarrow \mathcal{F}\right|_{X_{Z a r}}$ is just a "usual" $Y$-derivation. Hence we obtain a map $\psi:\left.\Omega_{X / Y} \longrightarrow \mathcal{F}\right|_{X_{Z a r}}$ such that $\left.D\right|_{X_{Z a r}}=\psi \circ \mathrm{d}$. In particular, if we apply this with $\mathcal{F}=\Omega_{X_{\text {étale }} / Y_{\text {étale }}}$ we obtain a map

$$
c^{\prime}:\left.\Omega_{X / Y} \longrightarrow \Omega_{X_{\text {étale }} / Y_{\text {étale }}}\right|_{X_{Z a r}}
$$

Consider the morphism of ringed sites $\mathrm{id}_{\text {small,étale, Zar }}: X_{\text {étale }} \rightarrow X_{Z a r}$ discussed in Descent, Remark 34.7.4 and Lemma 34.7.5. Since the restriction functor $\mathcal{F} \mapsto$ $\left.\mathcal{F}\right|_{X_{Z a r}}$ is equal to $\mathrm{id}_{\text {small,étale,Zar,* }}$, since $^{\mathrm{id}_{\text {small,étale, Zar }}^{*}}$ is left adjoint to $\mathrm{id}_{\text {small,étale, }}{ }_{\text {sar }, *}$ and since $\left(\Omega_{X / Y}\right)^{a}=\mathrm{id}_{\text {small,étale, } Z a r}^{*} \Omega_{X / Y}$ we see that $c^{\prime}$ is adjoint to a map

$$
c^{\prime \prime}:\left(\Omega_{X / Y}\right)^{a} \longrightarrow \Omega_{X_{\text {étale }} / Y_{\text {étale }}} .
$$

We claim that $c^{\prime \prime}$ and $c^{\prime}$ are mutually inverse. This claim finishes the proof of the lemma. To see this it is enough to show that $c^{\prime \prime}(\mathrm{d}(f))=\mathrm{d}_{X / Y}(f)$ and $c\left(\mathrm{~d}_{X / Y}(f)\right)=$ $\mathrm{d}(f)$ if $f$ is a local section of $\mathcal{O}_{X}$ over an open of $X$. We omit the verification.

This clears the way for the following definition. For an alternative, see Remark 63.7.5.

04CT Definition 63.7.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The sheaf of differentials $\Omega_{X / Y}$ of $X$ over $Y$ is sheaf of differentials (Modules on Sites, Definition 18.32.10) for the morphism of ringed topoi

$$
\left(f_{\text {small }}, f^{\sharp}\right):\left(X_{\text {étale }}, \mathcal{O}_{X}\right) \rightarrow\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right)
$$

of Properties of Spaces, Lemma 53.20.3. The universal $Y$-derivation will be denoted $\mathrm{d}_{X / Y}: \mathcal{O}_{X} \rightarrow \Omega_{X / Y}$.
By Lemma 63.7.1 this does not conflict with the already existing notion in case $X$ and $Y$ are representable. From now on, if $X$ and $Y$ are representable, we no longer distinguish between the sheaf of differentials defined above and the one defined in Morphisms, Definition 28.33.1. We want to relate this to the usual modules of differentials for morphisms of schemes. Here is the key lemma.
04CU Lemma 63.7.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Consider any commutative diagram

where the vertical arrows are étale morphisms of algebraic spaces. Then

$$
\left.\Omega_{X / Y}\right|_{U_{\text {étale }}}=\Omega_{U / V}
$$

In particular, if $U, V$ are schemes, then this is equal to the usual sheaf of differentials of the morphism of schemes $U \rightarrow V$.
Proof. By Properties of Spaces, Lemma 53.17.10 and Equation 53.17.10.1 we may think of the restriction of a sheaf on $X_{\text {étale }}$ to $U_{\text {étale }}$ as the pullback by $a_{\text {small }}$. Similarly for $b$. By Modules on Sites, Lemma 18.32 .6 we have

$$
\left.\Omega_{X / Y}\right|_{U_{\text {étale }}}=\Omega_{\mathcal{O}_{U_{\text {étale }} / a_{\text {small }}^{-1}} f_{\text {small }}^{-1} \mathcal{O}_{Y_{\text {étale }}}}
$$

Since $a_{\text {small }}^{-1} f_{\text {small }}^{-1} \mathcal{O}_{Y_{\text {étale }}}=\psi_{\text {small }}^{-1} b_{\text {small }}^{-1} \mathcal{O}_{Y_{\text {etale }}}=\psi_{\text {small }}^{-1} \mathcal{O}_{V_{\text {etale }}}$ we see that the lemma holds.

04CV Lemma 63.7.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Then $\Omega_{X / Y}$ is a quasi-coherent $\mathcal{O}_{X}$-module.
Proof. Choose a diagram as in Lemma 63.7.3 with $a$ and $b$ surjective and $U$ and $V$ schemes. Then we see that $\left.\left.\Omega_{X}\right|_{Y}\right|_{U}=\Omega_{U / V}$ which is quasi-coherent (for example by Morphisms, Lemma 28.33.7). Hence we conclude that $\Omega_{X / Y}$ is quasi-coherent by Properties of Spaces, Lemma 53.28.6.

04 CW Remark 63.7.5. Now that we know that $\Omega_{X / Y}$ is quasi-coherent we can attempt to construct it in another manner. For example we can use the result of Properties of Spaces, Section 53.31 to construct the sheaf of differentials by glueing. For example if $Y$ is a scheme and if $U \rightarrow X$ is a surjective étale morphism from a scheme towards $X$, then we see that $\Omega_{U / Y}$ is a quasi-coherent $\mathcal{O}_{U}$-module, and since $s, t: R \rightarrow U$ are étale we get an isomorphism

$$
\alpha: s^{*} \Omega_{U / Y} \rightarrow \Omega_{R / Y} \rightarrow t^{*} \Omega_{U / Y}
$$

by using Morphisms, Lemma 28.34.16. You check that this satisfies the cocycle condition and you're done. If $Y$ is not a scheme, then you define $\Omega_{U / Y}$ as the cokernel of the map $(U \rightarrow Y)^{*} \Omega_{Y / S} \rightarrow \Omega_{U / S}$, and proceed as before. This two step process is a little bit ugly. Another possibility is to glue the sheaves $\Omega_{U / V}$ for any diagram as in Lemma 63.7 .3 but this is not very elegant either. Both approaches will work however, and will give a slightly more elementary construction of the sheaf of differentials.

04CX Lemma 63.7.6. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces. The map $f^{\sharp}: \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X^{\prime}}$ composed with the map $f_{*} d_{X^{\prime} / Y^{\prime}}: f_{*} \mathcal{O}_{X^{\prime}} \rightarrow f_{*} \Omega_{X^{\prime} / Y^{\prime}}$ is a $Y$-derivation. Hence we obtain a canonical map of $\mathcal{O}_{X}$-modules $\Omega_{X / Y} \rightarrow f_{*} \Omega_{X^{\prime} / Y^{\prime}}$, and by adjointness of $f_{*}$ and $f^{*}$ a canonical $\mathcal{O}_{X^{\prime}}$-module homomorphism

$$
c_{f}: f^{*} \Omega_{X / Y} \longrightarrow \Omega_{X^{\prime} / Y^{\prime}}
$$

It is uniquely characterized by the property that $f^{*} d_{X / Y}(t)$ mapsto $d_{X^{\prime} / Y^{\prime}}\left(f^{*} t\right)$ for any local section $t$ of $\mathcal{O}_{X}$.
Proof. This is a special case of Modules on Sites, Lemma 18.32.11,
$05 Z 7$ Lemma 63.7.7. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$. Then we have

$$
c_{f \circ g}=c_{g} \circ g^{*} c_{f}
$$

as maps $(f \circ g)^{*} \Omega_{X / Y} \rightarrow \Omega_{X^{\prime \prime} / Y^{\prime \prime}}$.

Proof. Omitted. Hint: Use the characterization of $c_{f}, c_{g}, c_{f \circ g}$ in terms of the effect these maps have on local sections.

05Z8 Lemma 63.7.8. Let $S$ be a scheme. Let $f: X \rightarrow Y, g: Y \rightarrow B$ be morphisms of algebraic spaces over $S$. Then there is a canonical exact sequence

$$
f^{*} \Omega_{Y / B} \rightarrow \Omega_{X / B} \rightarrow \Omega_{X / Y} \rightarrow 0
$$

where the maps come from applications of Lemma 63.7.6.
Proof. Follows from the schemes version, see Morphisms, Lemma 28.33.9, of this result via étale localization, see Lemma 63.7.3

05Z9 Lemma 63.7.9. Let $S$ be a scheme. If $X \rightarrow Y$ is an immersion of algebraic spaces over $S$ then $\Omega_{X / S}$ is zero.
Proof. Follows from the schemes version, see Morphisms, Lemma 28.33.14, of this result via étale localization, see Lemma 63.7.3

05ZA Lemma 63.7.10. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $B$. There is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / B} \rightarrow \Omega_{Z / B} \rightarrow 0
$$

where the first arrow is induced by $d_{X / B}$ and the second arrow comes from Lemma 63.7.6.

Proof. This is the algebraic spaces version of Morphisms, Lemma 28.33 .15 and will be a consequence of that lemma by étale localization, see Lemmas 63.7.3 and 63.5.2. However, we should make sure we can define the first arrow globally. Hence we explain the meaning of "induced by $\mathrm{d}_{X / B}$ " here. Namely, we may assume that $i$ is a closed immersion after replacing $X$ by an open subspace. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals corresponding to $Z \subset X$. Then $\mathrm{d}_{X / S}: \mathcal{I} \rightarrow \Omega_{X / S}$ maps the subsheaf $\mathcal{I}^{2} \subset \mathcal{I}$ to $\mathcal{I} \Omega_{X / S}$. Hence it induces a map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{X / S} / \mathcal{I} \Omega_{X / S}$ which is $\mathcal{O}_{X} / \mathcal{I}$-linear. By Morphisms of Spaces, Lemma 54.14.1 this corresponds to a $\operatorname{map} \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S}$ as desired.
05ZB Lemma 63.7.11. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $B$, and assume $i$ (étale locally) has a left inverse. Then the canonical sequence

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / B} \rightarrow \Omega_{Z / B} \rightarrow 0
$$

of Lemma 63.7.10 is (étale locally) split exact.
Proof. Clarification: we claim that if $g: X \rightarrow Z$ is a left inverse of $i$ over $B$, then $i^{*} c_{g}$ is a right inverse of the map $i^{*} \Omega_{X / B} \rightarrow \Omega_{Z / B}$. Having said this, the result follows from the corresponding result for morphisms of schemes by étale localization, see Lemmas 63.7.3 and 63.5.2.

05ZC Lemma 63.7.12. Let $S$ be a scheme. Let $X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $X^{\prime}=X_{Y^{\prime}}$ be the base change of $X$. Denote $g^{\prime}: X^{\prime} \rightarrow X$ the projection. Then the map

$$
\left(g^{\prime}\right)^{*} \Omega_{X / Y} \rightarrow \Omega_{X^{\prime} / Y^{\prime}}
$$

of Lemma 63.7.6 is an isomorphism.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.33 .10 and étale localization, see Lemma 63.7.3.

05ZD Lemma 63.7.13. Let $S$ be a scheme. Let $f: X \rightarrow B$ and $g: Y \rightarrow B$ be morphisms of algebraic spaces over $S$ with the same target. Let $p: X \times_{B} Y \rightarrow X$ and $q: X \times_{B} Y \rightarrow Y$ be the projection morphisms. The maps from Lemma 63.7.6

$$
p^{*} \Omega_{X / B} \oplus q^{*} \Omega_{Y / B} \longrightarrow \Omega_{X \times_{B} Y / B}
$$

give an isomorphism.
Proof. Follows from the schemes version, see Morphisms, Lemma 28.33 .11 and étale localization, see Lemma 63.7.3.

05ZE Lemma 63.7.14. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type, then $\Omega_{X / Y}$ is a finite type $\mathcal{O}_{X}$-module.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.33 .12 and étale localization, see Lemma 63.7.3

05ZF Lemma 63.7.15. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type, then $\Omega_{X / Y}$ is an $\mathcal{O}_{X}$-module of finite presentation.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.33 .13 and étale localization, see Lemma 63.7.3

### 63.8. Topological invariance of the étale site

05ZG We show that the site $X_{\text {spaces,étale }}$ is a "topological invariant". It then follows that $X_{\text {étale }}$, which consists of the representable objects in $X_{\text {spaces,étale }}$, is a topological invariant too, see Lemma 63.8.2

05ZH Theorem 63.8.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is integral, universally injective and surjective. The functor

$$
V \longmapsto V_{X}=X \times_{Y} V
$$

defines an equivalence of categories $Y_{\text {spaces,étale }} \rightarrow X_{\text {spaces,étale }}$.
Proof. The morphism $f$ is representable and a universal homeomorphism, see Morphisms of Spaces, Section 54.50 .

We first prove that the functor is faithful. Suppose that $V^{\prime}, V$ are objects of $Y_{\text {spaces,étale }}$ and that $a, b: V^{\prime} \rightarrow V$ are distinct morphisms over $Y$. Since $V^{\prime}, V$ are étale over $Y$ the equalizer

$$
E=V^{\prime} \times_{(a, b), V \times_{Y} V, \Delta_{V / Y}} V
$$

of $a, b$ is étale over $Y$ also. Hence $E \rightarrow V^{\prime}$ is an étale monomorphism (i.e., an open immersion) which is an isomorphism if and only if it is surjective. Since $X \rightarrow Y$ is a universal homeomorphism we see that this is the case if and only if $E_{X}=V_{X}^{\prime}$, i.e., if and only if $a_{X}=b_{X}$.

Next, we prove that the functor is fully faithful. Suppose that $V^{\prime}, V$ are objects of $Y_{\text {spaces,étale }}$ and that $c: V_{X}^{\prime} \rightarrow V_{X}$ is a morphism over $X$. We want to construct a morphism $a: V^{\prime} \rightarrow V$ over $Y$ such that $a_{X}=c$. Let $a^{\prime}: V^{\prime \prime} \rightarrow V^{\prime}$ be a surjective
étale morphism such that $V^{\prime \prime}$ is a separated algebraic space. If we can construct a morphism $a^{\prime \prime}: V^{\prime \prime} \rightarrow V$ such that $a_{X}^{\prime \prime}=c \circ a_{X}^{\prime}$, then the two compositions

$$
V^{\prime \prime} \times_{V^{\prime}} V^{\prime \prime} \xrightarrow{\mathrm{pr}_{i}} V^{\prime \prime} \xrightarrow{a^{\prime \prime}} V
$$

will be equal by the faithfulness of the functor proved in the first paragraph. Hence $a^{\prime \prime}$ will factor through a unique morphism $a: V^{\prime} \rightarrow V$ as $V^{\prime}$ is (as a sheaf) the quotient of $V^{\prime \prime}$ by the equivalence relation $V^{\prime \prime} \times_{V^{\prime}} V^{\prime \prime}$. Hence we may assume that $V^{\prime}$ is separated. In this case the graph

$$
\Gamma_{c} \subset\left(V^{\prime} \times_{Y} V\right)_{X}
$$

is open and closed (details omitted). Since $X \rightarrow Y$ is a universal homeomorphism, there exists an open and closed subspace $\Gamma \subset V^{\prime} \times_{Y} V$ such that $\Gamma_{X}=\Gamma_{c}$. The projection $\Gamma \rightarrow V^{\prime}$ is an étale morphism whose base change to $X$ is an isomorphism. Hence $\Gamma \rightarrow V^{\prime}$ is étale, universally injective, and surjective, so an isomorphism by Morphisms of Spaces, Lemma 54.48.2. Thus $\Gamma$ is the graph of a morphism $a: V^{\prime} \rightarrow V$ as desired.

Finally, we prove that the functor is essentially surjective. Suppose that $U$ is an object of $X_{\text {spaces,étale }}$. We have to find an object $V$ of $Y_{\text {spaces,étale }}$ such that $V_{X} \cong U$. Let $U^{\prime} \rightarrow U$ be a surjective étale morphism such that $U^{\prime} \cong V_{X}^{\prime}$ and $U^{\prime} \times_{U} U^{\prime} \cong V_{X}^{\prime \prime}$ for some objects $V^{\prime \prime}, V^{\prime}$ of $Y_{\text {spaces,étale. }}$. Then by fully faithfulness of the functor we obtain morphisms $s, t: V^{\prime \prime} \rightarrow V^{\prime}$ with $t_{X}=\mathrm{pr}_{0}$ and $s_{X}=\mathrm{pr}_{1}$ as morphisms $U^{\prime} \times_{U} U^{\prime} \rightarrow U^{\prime}$. Using that $\left(\mathrm{pr}_{0}, \mathrm{pr}_{1}\right): U^{\prime} \times_{U} U^{\prime} \rightarrow U^{\prime} \times_{S} U^{\prime}$ is an étale equivalence relation, and that $U^{\prime} \rightarrow V^{\prime}$ and $U^{\prime} \times_{U} U^{\prime} \rightarrow V^{\prime \prime}$ are universally injective and surjective we deduce that $(t, s): V^{\prime \prime} \rightarrow V^{\prime} \times{ }_{S} V^{\prime}$ is an étale equivalence relation. Then the quotient $V=V^{\prime} / V^{\prime \prime}$ (see Spaces, Theorem 52.10.5) is an algebraic space $V$ over $Y$. There is a morphism $V^{\prime} \rightarrow V$ such that $V^{\prime \prime}=V^{\prime} \times{ }_{V} V^{\prime}$. Thus we obtain a morphism $V \rightarrow Y$ (see Descent on Spaces, Lemma 61.6.2). On base change to $X$ we see that we have a morphism $U^{\prime} \rightarrow V_{X}$ and a compatible isomorphism $U^{\prime} \times_{V_{X}} U^{\prime}=U^{\prime} \times_{U} U^{\prime}$, which implies that $V_{X} \cong U$ (by the lemma just cited once more).
Pick a scheme $W$ and a surjective étale morphism $W \rightarrow Y$. Pick a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow U \times_{X} W_{X}$. Note that $U^{\prime}$ and $U^{\prime} \times_{U} U^{\prime}$ are schemes étale over $X$ whose structure morphism to $X$ factors through the scheme $W_{X}$. Hence by Étale Cohomology, Theorem49.46.1 there exist schemes $V^{\prime}, V^{\prime \prime}$ étale over $W$ whose base change to $W_{X}$ is isomorphic to respectively $U^{\prime}$ and $U^{\prime} \times_{U} U^{\prime}$. This finishes the proof.

07VW Lemma 63.8.2. With assumption and notation as in Theorem 63.8.1 the equivalence of categories $Y_{\text {spaces,étale }} \rightarrow X_{\text {spaces,étale }}$ restricts to an equivalence of categories $Y_{\text {étale }} \rightarrow X_{\text {étale }}$.

Proof. This is just the statement that given an object $V \in Y_{\text {spaces,étale }}$ we have $V$ is a scheme if and only if $V \times_{Y} X$ is a scheme. Since $V \times_{Y} X \rightarrow V$ is integral, universally injective, and surjective (as a base change of $X \rightarrow Y$ ) this follows from Limits of Spaces, Lemma 57.15.4.

05ZI Remark 63.8.3. A universal homeomorphism of algebraic spaces need not be representable, see Morphisms of Spaces, Example 54.50.3. The argument in the proof of Theorem 63.8.1 above cannot be used in this case. In fact we do not
know whether given a universal homeomorphism of algebraic spaces $f: X \rightarrow Y$ the categories $X_{\text {spaces }, \text { étale }}$ and $Y_{\text {spaces,étale }}$ are equivalent. If you do, please email stacks.project@gmail.com.

### 63.9. Thickenings

05ZJ The following terminology may not be completely standard, but it is convenient.
Definition 63.9.1. Thickenings. Let $S$ be a scheme.
(1) We say an algebraic space $X^{\prime}$ is a thickening of an algebraic space $X$ if $X$ is a closed subspace of $X^{\prime}$ and the associated topological spaces are equal.
(2) We say $X^{\prime}$ is a first order thickening of $X$ if $X$ is a closed subspace of $X^{\prime}$ and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X^{\prime}}$ defining $X$ has square zero.
(3) Given two thickenings $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ a morphism of thickenings is a morphism $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ such that $f(X) \subset Y$, i.e., such that $\left.f^{\prime}\right|_{X}$ factors through the closed subspace $Y$. In this situation we set $f=\left.f^{\prime}\right|_{X}$ : $X \rightarrow Y$ and we say that $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ is a morphism of thickenings.
(4) Let $B$ be an algebraic space. We similarly define thickenings over $B$, and morphisms of thickenings over $B$. This means that the spaces $X, X^{\prime}, Y, Y^{\prime}$ above are algebraic spaces endowed with a structure morphism to $B$, and that the morphisms $X \rightarrow X^{\prime}, Y \rightarrow Y^{\prime}$ and $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ are morphisms over $B$.

The fundamental equivalence. Note that if $X \subset X^{\prime}$ is a thickening, then $X \rightarrow X^{\prime}$ is integral and universally bijective. This implies that

05ZL

$$
\begin{equation*}
X_{\text {spaces,étale }}=X_{\text {spaces,étale }}^{\prime} \tag{63.9.1.1}
\end{equation*}
$$

via the pullback functor, see Theorem 63.8.1. Hence we may think of $\mathcal{O}_{X^{\prime}}$ as a sheaf on $X_{\text {spaces,étale }}$. Thus a canonical equivalence of locally ringed topoi
05ZM

$$
\begin{equation*}
\left(\operatorname{Sh}\left(X_{\text {spaces,étale }}^{\prime}\right), \mathcal{O}_{X^{\prime}}\right) \cong\left(\operatorname{Sh}\left(X_{\text {spaces,étale }}\right), \mathcal{O}_{X^{\prime}}\right) \tag{63.9.1.2}
\end{equation*}
$$

Below we will frequently combine this with the fully faithfulness result of Properties of Spaces, Theorem 53.27.4. For example the closed immersion $i_{X}: X \rightarrow X^{\prime}$ corresponds to the surjective map $i_{X}^{\sharp}: \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X}$.
Let $S$ be a scheme, and let $B$ be an algebraic space over $S$. Let $\left(f, f^{\prime}\right):(X \subset$ $\left.X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of thickenings over $B$. Note that the diagram of continuous functors

is commutative and the vertical arrows are equivalences. Hence $f_{\text {spaces,étale }}, f_{\text {small }}$, $f_{\text {spaces,étale }}^{\prime}$, and $f_{\text {small }}^{\prime}$ all define the same morphism of topoi. Thus we may think of

$$
\left(f^{\prime}\right)^{\sharp}: f_{\text {spaces,étale }}^{-1} \mathcal{O}_{Y^{\prime}} \longrightarrow \mathcal{O}_{X^{\prime}}
$$

as a map of sheaves of $\mathcal{O}_{B}$-algebras fitting into the commutative diagram

Here $i_{X}: X \rightarrow X^{\prime}$ and $i_{Y}: Y \rightarrow Y^{\prime}$ are the names of the given closed immersions.
05ZN Lemma 63.9.2. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ be thickenings of algebraic spaces over $B$. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $B$. Given any map of $\mathcal{O}_{B}$-algebras

$$
\alpha: f_{\text {spaces,étale }}^{-1} \mathcal{O}_{Y^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}}
$$

such that

commutes, there exists a unique morphism of $\left(f, f^{\prime}\right)$ of thickenings over $B$ such that $\alpha=\left(f^{\prime}\right)^{\sharp}$.

Proof. To find $f^{\prime}$, by Properties of Spaces, Theorem 53.27.4 all we have to do is show that the morphism of ringed topoi

$$
\left(f_{\text {spaces,étale }}, \alpha\right):\left(S h\left(X_{\text {spaces,étale }}\right), \mathcal{O}_{X^{\prime}}\right) \longrightarrow\left(S h\left(Y_{\text {spaces,étale }}\right), \mathcal{O}_{Y^{\prime}}\right)
$$

is a morphism of locally ringed topoi. This follows directly from the definition of morphisms of locally ringed topoi (Modules on Sites, Definition 18.39.9), the fact that $\left(f, f^{\sharp}\right)$ is a morphism of locally ringed topoi (Properties of Spaces, Lemma 53.27.1, that $\alpha$ fits into the given commutative diagram, and the fact that the kernels of $i_{X}^{\sharp}$ and $i_{Y}^{\sharp}$ are locally nilpotent. Finally, the fact that $f^{\prime} \circ i_{X}=i_{Y} \circ f$ follows from the commutativity of the diagram and another application of Properties of Spaces, Theorem 53.27.4. We omit the verification that $f^{\prime}$ is a morphism over $B$.

05ZP Lemma 63.9.3. Let $S$ be a scheme. Let $X \subset X^{\prime}$ be a thickening of algebraic spaces over $S$. For any open subspace $U \subset X$ there exists a unique open subspace $U^{\prime} \subset X^{\prime}$ such that $U=X \times{ }_{X^{\prime}} U^{\prime}$.

Proof. Let $U^{\prime} \rightarrow X^{\prime}$ be the object of $X_{\text {spaces,étale }}^{\prime}$ corresponding to the object $U \rightarrow$ $X$ of $X_{\text {spaces,étale }}$ via (63.9.1.1). The morphism $U^{\prime} \rightarrow X^{\prime}$ is étale and universally injective, hence an open immersion, see Morphisms of Spaces, Lemma 54.48.2.

Finite order thickenings. Let $i_{X}: X \rightarrow X^{\prime}$ be a thickening of algebraic spaces. Any local section of the $\operatorname{kernel} \mathcal{I}=\operatorname{Ker}\left(i_{X}^{\sharp}\right) \subset \mathcal{O}_{X^{\prime}}$ is locally nilpotent. Let us say that $X \subset X^{\prime}$ is a finite order thickening if the ideal sheaf $\mathcal{I}$ is "globally" nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1}=0$. Technically the class of finite order thickenings $X \subset X^{\prime}$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$
0 \subset \mathcal{I}^{n} \subset \mathcal{I}^{n-1} \subset \ldots \subset \mathcal{I} \subset \mathcal{O}_{X^{\prime}}
$$

and we see that $X^{\prime}$ is filtered by closed subspaces

$$
X=X_{0} \subset X_{1} \subset \ldots \subset X_{n-1} \subset X_{n+1}=X^{\prime}
$$

such that each pair $X_{i} \subset X_{i+1}$ is a first order thickening over $B$. Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.

05ZQ Lemma 63.9.4. Let $S$ be a scheme. Let $X \subset X^{\prime}$ be a thickening of algebraic spaces over $S$. Let $U$ be an affine object of $X_{\text {spaces,étale }}$. Then

$$
\Gamma\left(U, \mathcal{O}_{X^{\prime}}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{X}\right)
$$

is surjective where we think of $\mathcal{O}_{X^{\prime}}$ as a sheaf on $X_{\text {spaces,étale }}$ via 63.9.1.2.
Proof. Let $U^{\prime} \rightarrow X^{\prime}$ be the étale morphism of algebraic spaces such that $U=$ $X \times{ }_{X^{\prime}} U^{\prime}$, see Theorem 63.8.1. By Limits of Spaces, Lemma 57.15.1 we see that $U^{\prime}$ is an affine scheme. Hence $\Gamma\left(U, \mathcal{O}_{X^{\prime}}\right)=\Gamma\left(U^{\prime}, \mathcal{O}_{U^{\prime}}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ is surjective as $U \rightarrow U^{\prime}$ is a closed immersion of affine schemes. Below we give a direct proof for finite order thickenings which is the case most used in practice.

Proof for finite order thickenings. We may assume that $X \subset X^{\prime}$ is a first order thickening by the principle explained above. Denote $\mathcal{I}$ the kernel of the surjection $\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X}$. As $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X^{\prime}}$-module and since $\mathcal{I}^{2}=0$ by the definition of a first order thickening we may apply Morphisms of Spaces, Lemma 54.14.1 to see that $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X}$-module. Hence the lemma follows from the long exact cohomology sequence associated to the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

and the fact that $H_{\text {étale }}^{1}(U, \mathcal{I})=0$ as $\mathcal{I}$ is quasi-coherent, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2.

05ZR Lemma 63.9.5. Let $S$ be a scheme. Let $X \subset X^{\prime}$ be a thickening of algebraic spaces over $S$. If $X$ is (representable by) a scheme, then so is $X^{\prime}$.

Proof. Note that $X_{r e d}^{\prime}=X_{\text {red }}$. Hence if $X$ is a scheme, then $X_{r e d}^{\prime}$ is a scheme. Thus the result follows from Limits of Spaces, Lemma 57.15.3. Below we give a direct proof for finite order thickenings which is the case most often used in practice.

Proof for finite order thickenings. It suffices to prove this when $X^{\prime}$ is a first order thickening of $X$. By Properties of Spaces, Lemma 53.12.1 there is a largest open subspace of $X^{\prime}$ which is a scheme. Thus we have to show that every point $x$ of $\left|X^{\prime}\right|=|X|$ is contained in an open subspace of $X^{\prime}$ which is a scheme. Using Lemma 63.9 .3 we may replace $X \subset X^{\prime}$ by $U \subset U^{\prime}$ with $x \in U$ and $U$ an affine scheme. Hence we may assume that $X$ is affine. Thus we reduce to the case discussed in the next paragraph.

Assume $X \subset X^{\prime}$ is a first order thickening where $X$ is an affine scheme. Set $A=\Gamma\left(X, \mathcal{O}_{X}\right)$ and $A^{\prime}=\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$. By Lemma 63.9.4 the map $A \rightarrow A^{\prime}$ is surjective. The kernel $I$ is an ideal of square zero. By Properties of Spaces, Lemma
53.32 .1 we obtain a canonical morphism $f: X^{\prime} \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ which fits into the following commutative diagram

Because the horizontal arrows are thickenings it is clear that $f$ is universally injective and surjective. Hence it suffices to show that $f$ is étale, since then Morphisms of Spaces, Lemma 54.48.2 will imply that $f$ is an isomorphism.
To prove that $f$ is étale choose an affine scheme $U^{\prime}$ and an étale morphism $U^{\prime} \rightarrow$ $X^{\prime}$. It suffices to show that $U^{\prime} \rightarrow X^{\prime} \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ is étale, see Properties of Spaces, Definition 53.15.2. Write $U^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. Set $U=X \times X^{\prime} U^{\prime}$. Since $U$ is a closed subspace of $U^{\prime}$, it is a closed subscheme, hence $U=\operatorname{Spec}(B)$ with $B^{\prime} \rightarrow B$ surjective. Denote $J=\operatorname{Ker}\left(B^{\prime} \rightarrow B\right)$ and note that $J=\Gamma(U, \mathcal{I})$ where $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X}\right)$ on $X_{\text {spaces,étale }}$ as in the proof of Lemma 63.9.4. The morphism $U^{\prime} \rightarrow X^{\prime} \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ induces a commutative diagram

Now, since $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X}$-module we have $\mathcal{I}=(\widetilde{I})^{a}$, see Descent, Definition 34.7 .2 for notation and Descent, Proposition 34.7.11 for why this is true. Hence we see that $J=I \otimes_{A} B$. Finally, note that $A \rightarrow B$ is étale as $U \rightarrow X$ is étale as the base change of the étale morphism $U^{\prime} \rightarrow X^{\prime}$. We conclude that $A^{\prime} \rightarrow B^{\prime}$ is étale by Algebra, Lemma 10.141 .12 .

05ZS Lemma 63.9.6. Let $S$ be a scheme. Let $X \subset X^{\prime}$ be a thickening of algebraic spaces over $S$. The functor

$$
V^{\prime} \longmapsto V=X \times_{X^{\prime}} V^{\prime}
$$

defines an equivalence of categories $X_{\text {étale }}^{\prime} \rightarrow X_{\text {étale }}$.
Proof. The functor $V^{\prime} \mapsto V$ defines an equivalence of categories $X_{\text {spaces,étale }}^{\prime} \rightarrow$ $X_{\text {spaces,étale }}$, see Theorem63.8.1. Thus it suffices to show that $V$ is a scheme if and only if $V^{\prime}$ is a scheme. This is the content of Lemma 63.9.5.

First order thickening are described as follows.
05ZT Lemma 63.9.7. Let $S$ be a scheme. Let $f: X \rightarrow B$ be a morphism of algebraic spaces over $S$. Consider a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

of sheaves on $X_{\text {étale }}$ where $\mathcal{A}$ is a sheaf of $f^{-1} \mathcal{O}_{B}$-algebras, $\mathcal{A} \rightarrow \mathcal{O}_{X}$ is a surjection of sheaves of $f^{-1} \mathcal{O}_{B}$-algebras, and $\mathcal{I}$ is its kernel. If
(1) $\mathcal{I}$ is an ideal of square zero in $\mathcal{A}$, and
(2) $\mathcal{I}$ is quasi-coherent as an $\mathcal{O}_{X}$-module
then there exists a first order thickening $X \subset X^{\prime}$ over $B$ and an isomorphism $\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{A}$ of $f^{-1} \mathcal{O}_{B}$-algebras compatible with the surjections to $\mathcal{O}_{X}$.

Proof. In this proof we redo some of the arguments used in the proofs of Lemmas 63.9 .4 and 63.9.5. We first handle the case $B=S=\operatorname{Spec}(\mathbf{Z})$. Let $U$ be an affine scheme, and let $U \rightarrow X$ be étale. Then

$$
0 \rightarrow \mathcal{I}(U) \rightarrow \mathcal{A}(U) \rightarrow \mathcal{O}_{X}(U) \rightarrow 0
$$

is exact as $H^{1}\left(U_{\text {étale }}, \mathcal{I}\right)=0$ as $\mathcal{I}$ is quasi-coherent, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. If $V \rightarrow U$ is a morphism of affine objects of $X_{\text {spaces, étale }}$ then

$$
\mathcal{I}(V)=\mathcal{I}(U) \otimes_{\mathcal{O}_{X}(U)} \mathcal{O}_{X}(V)
$$

since $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X}$-module, see Descent, Proposition 34.7.11. Hence $\mathcal{A}(U) \rightarrow \mathcal{A}(V)$ is an étale ring map, see Algebra, Lemma 10.141.12. Hence we see that

$$
U \longmapsto U^{\prime}=\operatorname{Spec}(\mathcal{A}(U))
$$

is a functor from $X_{a f f i n e, \text { étale }}$ to the category of affine schemes and étale morphisms. In fact, we claim that this functor can be extended to a functor $U \mapsto U^{\prime}$ on all of $X_{\text {étale }}$. To see this, if $U$ is an object of $X_{\text {étale }}$, note that

$$
\left.\left.\left.0 \rightarrow \mathcal{I}\right|_{U_{Z a r}} \rightarrow \mathcal{A}\right|_{U_{Z a r}} \rightarrow \mathcal{O}_{X}\right|_{U_{Z a r}} \rightarrow 0
$$

and $\left.\mathcal{I}\right|_{U_{Z_{a r}}}$ is a quasi-coherent sheaf on $U$, see Descent, Proposition 34.7.14. Hence by More on Morphisms, Lemma 36.2.2 we obtain a first order thickening $U \subset U^{\prime}$ of schemes such that $\mathcal{O}_{U^{\prime}}$ is isomorphic to $\left.\mathcal{A}\right|_{U_{Z a r}}$. It is clear that this construction is compatible with the construction for affines above.
Choose a presentation $X=U / R$, see Spaces, Definition 52.9 .3 so that $s, t: R \rightarrow U$ define an étale equivalence relation. Applying the functor above we obtain an étale equivalence relation $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ in schemes. Consider the algebraic space $X^{\prime}=$ $U^{\prime} / R^{\prime}$ (see Spaces, Theorem 52.10.5). The morphism $X=U / R \rightarrow U^{\prime} / R^{\prime}=X^{\prime}$ is a first order thickening. Consider $\mathcal{O}_{X^{\prime}}$ viewed as a sheaf on $X_{e ́ t a l e}$. By construction we have an isomorphism

$$
\gamma:\left.\left.\mathcal{O}_{X^{\prime}}\right|_{U_{\text {étale }}} \longrightarrow \mathcal{A}\right|_{U_{\text {étale }}}
$$

such that $s^{-1} \gamma$ agrees with $t^{-1} \gamma$ on $R_{\text {étale }}$. Hence by Properties of Spaces, Lemma 53.17 .13 this implies that $\gamma$ comes from a unique isomorphism $\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{A}$ as desired.

To handle the case of a general base algebraic space $B$, we first construct $X^{\prime}$ as an algebraic space over $\mathbf{Z}$ as above. Then we use the isomorphism $\mathcal{O}_{X^{\prime}} \rightarrow \mathcal{A}$ to define $f^{-1} \mathcal{O}_{B} \rightarrow \mathcal{O}_{X^{\prime}}$. According to Lemma 63.9 .2 this defines a morphism $X^{\prime} \rightarrow B$ compatible with the given morphism $X \rightarrow B$ and we are done.

09ZX Lemma 63.9.8. Let $S$ be a scheme. Let $Y \subset Y^{\prime}$ be a thickening of algebraic spaces over $S$. Let $X^{\prime} \rightarrow Y^{\prime}$ be a morphism and set $X=Y \times_{Y^{\prime}} X^{\prime}$. Then $(X \subset$ $\left.X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ is a morphism of thickenings. If $Y \subset Y^{\prime}$ is a first (resp. finite order) thickening, then $X \subset X^{\prime}$ is a first (resp. finite order) thickening.

Proof. Omitted.
0BPH Lemma 63.9.9. Let $S$ be a scheme. If $X \subset X^{\prime}$ and $X^{\prime} \subset X^{\prime \prime}$ are thickenings of algebraic spaces over $S$, then so is $X \subset X^{\prime \prime}$.

Proof. Omitted.

0BPI Lemma 63.9.10. The property of being a thickening is fpqc local. Similarly for first order thickenings.
Proof. The statement means the following: Let $S$ be a scheme and let $X \rightarrow X^{\prime}$ be a morphism of algebraic spaces over $S$. Let $\left\{g_{i}: X_{i}^{\prime} \rightarrow X^{\prime}\right\}$ be an fpqc covering of algebraic spaces such that the base change $X_{i} \rightarrow X_{i}^{\prime}$ is a thickening for all $i$. Then $X \rightarrow X^{\prime}$ is a thickening. Since the morphisms $g_{i}$ are jointly surjective we conclude that $X \rightarrow X^{\prime}$ is surjective. By Descent on Spaces, Lemma 61.10.15 we conclude that $X \rightarrow X^{\prime}$ is a closed immersion. Thus $X \rightarrow X^{\prime}$ is a thickening. We omit the proof in the case of first order thickenings.

09ZY Lemma 63.9.11. Let $S$ be a scheme. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of thickenings of algebraic spaces over $S$. Then
(1) $f$ is an affine morphism if and only if $f^{\prime}$ is an affine morphism,
(2) $f$ is a surjective morphism if and only if $f^{\prime}$ is a surjective morphism,
(3) $f$ is quasi-compact if and only if $f^{\prime}$ quasi-compact,
(4) $f$ is universally closed if and only if $f^{\prime}$ is universally closed,
(5) $f$ is integral if and only if $f^{\prime}$ is integral,
(6) $f$ is (quasi-)separated if and only if $f^{\prime}$ is (quasi-)separated,
(7) $f$ is universally injective if and only if $f^{\prime}$ is universally injective,
(8) $f$ is universally open if and only if $f^{\prime}$ is universally open,
(9) $f$ is representable if and only if $f^{\prime}$ is representable, and
(10) add more here.

Proof. Observe that $Y \rightarrow Y^{\prime}$ and $X \rightarrow X^{\prime}$ are integral and universal homeomorphisms. This immediately implies parts (2), (3), (4), (7), and (8). Part (1) follows from Limits of Spaces, Proposition 57.15 .2 which tells us that there is a 1-to-1 correspondence between affine schemes étale over $X$ and $X^{\prime}$ and between affine schemes étale over $Y$ and $Y^{\prime}$. Part (5) follows from (1) and (4) by Morphisms of Spaces, Lemma 54.43.7. Finally, note that

$$
X \times_{Y} X=X \times_{Y^{\prime}} X \rightarrow X \times_{Y^{\prime}} X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}
$$

is a thickening (the two arrows are thickenings by Lemma 63.9.8. Hence applying (3) and (4) to the morphism $\left(X \subset X^{\prime}\right) \rightarrow\left(X \times_{Y} X \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}\right)$ we obtain (6). Finally, part (9) follows from the fact that an algebraic space thickening of a scheme is again a scheme, see Lemma 63.9.5.

09ZZ Lemma 63.9.12. Let $S$ be a scheme. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of thickenings of algebraic spaces over $S$ such that $X=Y \times_{Y^{\prime}} X^{\prime}$. If $X \subset X^{\prime}$ is a finite order thickening, then
(1) $f$ is a closed immersion if and only if $f^{\prime}$ is a closed immersion,
(2) $f$ is locally of finite type if and only if $f^{\prime}$ is locally of finite type,
(3) $f$ is locally quasi-finite if and only if $f^{\prime}$ is locally quasi-finite,
(4) $f$ is locally of finite type of relative dimension $d$ if and only if $f^{\prime}$ is locally of finite type of relative dimension d,
(5) $\Omega_{X / Y}=0$ if and only if $\Omega_{X^{\prime} / Y^{\prime}}=0$,
(6) $f$ is unramified if and only if $f^{\prime}$ is unramified,
(7) $f$ is proper if and only if $f^{\prime}$ is proper,
(8) $f$ is a finite morphism if and only if $f^{\prime}$ is an finite morphism,
(9) $f$ is a monomorphism if and only if $f^{\prime}$ is a monomorphism,
(10) $f$ is an immersion if and only if $f^{\prime}$ is an immersion, and
(11) add more here.

Proof. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow Y^{\prime}$. Choose a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} V^{\prime}$. Set $V=Y \times_{Y^{\prime}} V^{\prime}$ and $U=X \times_{X^{\prime}} U^{\prime}$. Then for étale local properties of morphisms we can reduce to the morphism of thickenings of schemes $\left(U \subset U^{\prime}\right) \rightarrow\left(V \subset V^{\prime}\right)$ and apply More on Morphisms, Lemma 36.2.8. This proves (2), (3), (4), (5), and (6).

The properties of morphisms in (1), (7), (8), (9), (10) are stable under base change, hence if $f^{\prime}$ has property $\mathcal{P}$, then so does $f$. See Spaces, Lemma 52.12.3 and Morphisms of Spaces, Lemmas 54.39.3, 54.43.5, and 54.10.5
The interesting direction in (1), (7), (8), (9), (10) is to assume that $f$ has the property and deduce that $f^{\prime}$ has it too. By induction on the order of the thickening we may assume that $Y \subset Y^{\prime}$ is a first order thickening, see discussion on finite order thickenings above.

Proof of (1). Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow Y^{\prime}$. Set $V=Y \times_{Y^{\prime}} V^{\prime}, U^{\prime}=X^{\prime} \times_{Y^{\prime}} V^{\prime}$ and $U=X \times_{Y} V$. Then $U \rightarrow V$ is a closed immersion, which implies that $U$ is a scheme, which in turn implies that $U^{\prime}$ is a scheme (Lemma 63.9.5). Thus we can apply the lemma in the case of schemes (More on Morphisms, Lemma 36.2.8) to $\left(U \subset U^{\prime}\right) \rightarrow\left(V \subset V^{\prime}\right)$ to conclude.
Proof of (7). Follows by combining (2) with results of Lemma 63.9.11 and the fact that proper equals quasi-compact + separated + locally of finite type + universally closed.
Proof of (8). Follows by combining (2) with results of Lemma 63.9.11 and using the fact that finite equals integral + locally of finite type (Morphisms, Lemma 28.43.4).
Proof of (9). As $f$ is a monomorphism we have $X=X \times_{Y} X$. We may apply the results proved so far to the morphism of thickenings $\left(X \subset X^{\prime}\right) \rightarrow\left(X \times_{Y}\right.$ $\left.X \subset X^{\prime} \times_{Y^{\prime}} X^{\prime}\right)$. We conclude $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is a closed immersion by (1). In fact, it is a first order thickening as the ideal defining the closed immersion $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is contained in the pullback of the ideal $\mathcal{I} \subset \mathcal{O}_{Y^{\prime}}$ cutting out $Y$ in $Y^{\prime}$. Indeed, $X=X \times_{Y} X=\left(X^{\prime} \times_{Y^{\prime}} X^{\prime}\right) \times_{Y^{\prime}} Y$ is contained in $X^{\prime}$. The conormal sheaf of the closed immersion $\Delta: X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is equal to $\Omega_{X^{\prime} / Y^{\prime}}$ (this is the analogue of Morphisms, Lemma 28.33 .7 for algebraic spaces and follows either by étale localization or by combining Lemmas 63.7.11 and 63.7.13; some details omitted). Thus it suffices to show that $\Omega_{X^{\prime} / Y^{\prime}}=0$ which follows from (5) and the corresponding statement for $X / Y$.

Proof of (10). If $f: X \rightarrow Y$ is an immersion, then it factors as $X \rightarrow V \rightarrow Y$ where $V \rightarrow Y$ is an open subspace and $X \rightarrow V$ is a closed immersion, see Morphisms of Spaces, Remark 54.12.4 Let $V^{\prime} \subset Y^{\prime}$ be the open subspace whose underlying topological space $\left|V^{\prime}\right|$ is the same as $|V| \subset|Y|=\left|Y^{\prime}\right|$. Then $X^{\prime} \rightarrow Y^{\prime}$ factors through $V^{\prime}$ and we conclude that $X^{\prime} \rightarrow V^{\prime}$ is a closed immersion by part (1). This finishes the proof.

The following lemma is a variant on the preceding one. Rather than assume that the thickenings involved are finite order (which allows us to transfer the property of being locally of finite type from $f$ to $f^{\prime}$ ), we instead take as given that each of $f$ and $f^{\prime}$ is locally of finite type.

0BPJ Lemma 63.9.13. Let $S$ be a scheme. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \rightarrow Y^{\prime}\right)$ be a morphism of thickenings of algebraic spaces over $S$. Assume $f$ and $f^{\prime}$ are locally of finite type and $X=Y \times_{Y^{\prime}} X^{\prime}$. Then
(1) $f$ is locally quasi-finite if and only if $f^{\prime}$ is locally quasi-finite,
(2) $f$ is finite if and only if $f^{\prime}$ is finite,
(3) $f$ is a closed immersion if and only if $f^{\prime}$ is a closed immersion,
(4) $\Omega_{X / Y}=0$ if and only if $\Omega_{X^{\prime} / Y^{\prime}}=0$,
(5) $f$ is unramified if and only if $f^{\prime}$ is unramified,
(6) $f$ is a monomorphism if and only if $f^{\prime}$ is a monomorphism,
(7) $f$ is an immersion if and only if $f^{\prime}$ is an immersion,
(8) $f$ is proper if and only if $f^{\prime}$ is proper, and
(9) add more here.

Proof. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow Y^{\prime}$. Choose a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow X^{\prime} \times{ }_{Y^{\prime}} V^{\prime}$. Set $V=Y \times_{Y^{\prime}} V^{\prime}$ and $U=X \times{ }_{X^{\prime}} U^{\prime}$. Then for étale local properties of morphisms we can reduce to the morphism of thickenings of schemes $\left(U \subset U^{\prime}\right) \rightarrow\left(V \subset V^{\prime}\right)$ and apply More on Morphisms, Lemma 36.2.9. This proves (1), (4), and (5).

The properties in (2), (3), (6), (7), and (8) are stable under base change, hence if $f^{\prime}$ has property $\mathcal{P}$, then so does $f$. See Spaces, Lemma 52.12.3 and Morphisms of Spaces, Lemmas 54.39.3. 54.43.5 and 54.10.5. Hence in each case we need only to prove that if $f$ has the desired property, so does $f^{\prime}$.
A morphism of algebraic spaces is locally quasi-finite if and only if it is locally of finite type and the scheme theoretic fibres have underlying discrete topological spaces, see Morphisms of Spaces, Lemma 54.27.5. Since the underlying topological space is unchanged by passing to a thickening, we see that $f^{\prime}$ is locally quasi-finite if (and only if) $f$ is. This proves (1).

Case (2) follows from case (5) of Lemma 63.9.11 and the fact that the finite morphisms are precisely the integral morphisms that are locally of finite type (Morphisms of Spaces, Lemma 54.43.6.

Case (3). This follows immediately from Limits of Spaces, Lemma 57.15.5
Proof of (6). As $f$ is a monomorphism we have $X=X \times_{Y} X$. We may apply the results proved so far to the morphism of thickenings $\left(X \subset X^{\prime}\right) \rightarrow\left(X \times_{Y} X \subset\right.$ $X^{\prime} \times_{Y^{\prime}} X^{\prime}$. We conclude $\Delta_{X^{\prime} / Y^{\prime}}: X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is a closed immersion by (3). In fact $\Delta_{X^{\prime} / Y^{\prime}}$ induces a bijection $\left|X^{\prime}\right| \rightarrow\left|X^{\prime} \times_{Y^{\prime}} X^{\prime}\right|$, hence $\Delta_{X^{\prime} / Y^{\prime}}$ is a thickening. On the other hand $\Delta_{X^{\prime} / Y^{\prime}}$ is locally of finite presentation by Morphisms of Spaces, Lemma 54.28.10. In other words, $\Delta_{X^{\prime} / Y^{\prime}}\left(X^{\prime}\right)$ is cut out by a quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X^{\prime} \times_{Y^{\prime}} X^{\prime}}$ of finite type. Since $\Omega_{X^{\prime} / Y^{\prime}}=0$ by (5) we see that the conormal sheaf of $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is zero. (The conormal sheaf of the closed immersion $\Delta_{X^{\prime} / Y^{\prime}}$ is equal to $\Omega_{X^{\prime} / Y^{\prime}}$; this is the analogue of Morphisms, Lemma 28.33 .7 for algebraic spaces and follows either by étale localization or by combining Lemmas 63.7.11 and 63.7.13, some details omitted.) In other words, $\mathcal{J} / \mathcal{J}^{2}=0$. This implies $\Delta_{X^{\prime} / Y^{\prime}}$ is an isomorphism, for example by Algebra, Lemma 10.20 .5 .
Proof of (7). If $f: X \rightarrow Y$ is an immersion, then it factors as $X \rightarrow V \rightarrow Y$ where $V \rightarrow Y$ is an open subspace and $X \rightarrow V$ is a closed immersion, see Morphisms of Spaces, Remark 54.12.4 Let $V^{\prime} \subset Y^{\prime}$ be the open subspace whose underlying
topological space $\left|V^{\prime}\right|$ is the same as $|V| \subset|Y|=\left|Y^{\prime}\right|$. Then $X^{\prime} \rightarrow Y^{\prime}$ factors through $V^{\prime}$ and we conclude that $X^{\prime} \rightarrow V^{\prime}$ is a closed immersion by part (3).
Case (8) follows from Lemma 63.9 .11 and the definition of proper morphisms as being the quasi-compact, universally closed, and separated morphisms that are locally of finite type.

### 63.10. First order infinitesimal neighbourhood

05 ZU A natural construction of first order thickenings is the following. Suppose that $i: Z \rightarrow X$ be an immersion of algebraic spaces. Choose an open subspace $U \subset X$ such that $i$ identifies $Z$ with a closed subspace $Z \subset U$ (see Morphisms of Spaces, Remark 54.12.4. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the quasi-coherent sheaf of ideals defining $Z$ in $U$, see Morphisms of Spaces, Lemma 54.13.1. Then we can consider the closed subspace $Z^{\prime} \subset U$ defined by the quasi-coherent sheaf of ideals $\mathcal{I}^{2}$.
05ZV Definition 63.10.1. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces. The first order infinitesimal neighbourhood of $Z$ in $X$ is the first order thickening $Z \subset Z^{\prime}$ over $X$ described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open $U$ ).

05ZW Lemma 63.10.2. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces. The first order infinitesimal neighbourhood $Z^{\prime}$ of $Z$ in $X$ has the following universal property: Given any commutative diagram

where $T \subset T^{\prime}$ is a first order thickening over $X$, there exists a unique morphism $\left(a^{\prime}, a\right):\left(T \subset T^{\prime}\right) \rightarrow\left(Z \subset Z^{\prime}\right)$ of thickenings over $X$.

Proof. Let $U \subset X$ be the open subspace used in the construction of $Z^{\prime}$, i.e., an open such that $Z$ is identified with a closed subspace of $U$ cut out by the quasicoherent sheaf of ideals $\mathcal{I}$. Since $|T|=\left|T^{\prime}\right|$ we see that $|b|\left(\left|T^{\prime}\right|\right) \subset|U|$. Hence we can think of $b$ as a morphism into $U$, see Properties of Spaces, Lemma 53.4.9. Let $\mathcal{J} \subset \mathcal{O}_{T^{\prime}}$ be the square zero quasi-coherent sheaf of ideals cutting out $T$. By the commutativity of the diagram we have $\left.b\right|_{T}=i \circ a$ where $i: Z \rightarrow U$ is the closed immersion. We conclude that $b^{\sharp}\left(b^{-1} \mathcal{I}\right) \subset \mathcal{J}$ by Morphisms of Spaces, Lemma 54.13.1. As $T^{\prime}$ is a first order thickening of $T$ we see that $\mathcal{J}^{2}=0$ hence $b^{\sharp}\left(b^{-1}\left(\mathcal{I}^{2}\right)\right)=0$. By Morphisms of Spaces, Lemma 54.13.1 this implies that $b$ factors through $Z^{\prime}$. Letting $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$ be this factorization we win.

05ZX Lemma 63.10.3. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces. Let $Z \subset Z^{\prime}$ be the first order infinitesimal neighbourhood of $Z$ in $X$. Then the diagram

induces a map of conormal sheaves $\mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Z^{\prime}}$ by Lemma 63.5.3. This map is an isomorphism.

Proof. This is clear from the construction of $Z^{\prime}$ above.

### 63.11. Formally smooth, étale, unramified transformations

04G3 Recall that a ring map $R \rightarrow A$ is called formally smooth, resp. formally étale, resp. formally unramified (see Algebra, Definition 10.136.1, resp. Definition 10.146.1, resp. Definition 10.144.1 if for every commutative solid diagram

where $I \subset B$ is an ideal of square zero, there exists a, resp. exists a unique, resp. exists at most one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of algebraic spaces, and more generally functors.

049S Definition 63.11.1. Let $S$ be a scheme. Let $a: F \rightarrow G$ be a transformation of functors $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Consider commutative solid diagrams of the form

where $T$ and $T^{\prime}$ are affine schemes and $i$ is a closed immersion defined by an ideal of square zero.
(1) We say $a$ is formally smooth if given any solid diagram as above there exists a dotted arrow making the diagram commut $\AA^{1}$
(2) We say $a$ is formally étale if given any solid diagram as above there exists exactly one dotted arrow making the diagram commute.
(3) We say $a$ is formally unramified if given any solid diagram as above there exists at most one dotted arrow making the diagram commute.

04G4 Lemma 63.11.2. Let $S$ be a scheme. Let $a: F \rightarrow G$ be a transformation of functors $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Then a is formally étale if and only if $a$ is both formally smooth and formally unramified.
Proof. Formal from the definition.
049T Lemma 63.11.3. Composition.
(1) A composition of formally smooth transformations of functors is formally smooth.
(2) A composition of formally étale transformations of functors is formally étale.

[^175](3) A composition of formally unramified transformations of functors is formally unramified.

Proof. This is formal.
049U Lemma 63.11.4. Let $S$ be a scheme contained in $S_{\text {sch }}^{f p p f .}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: H \rightarrow G$ be transformations of functors. Consider the fibre product diagram

(1) If $a$ is formally smooth, then the base change $a^{\prime}$ is formally smooth.
(2) If $a$ is formally étale, then the base change $a^{\prime}$ is formally étale.
(3) If a is formally unramified, then the base change $a^{\prime}$ is formally unramified.

Proof. This is formal.

04AL Lemma 63.11.5. Let $S$ be a scheme. Let $F, G:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow$ $G$ be a representable transformation of functors.
(1) If $a$ is smooth then $a$ is formally smooth.
(2) If $a$ is étale, then $a$ is formally étale.
(3) If $a$ is unramified, then a is formally unramified.

Proof. Consider a solid commutative diagram

as in Definition 63.11.1. Then $F \times_{G} T^{\prime}$ is a scheme smooth (resp. étale, resp. unramified) over $T^{\prime}$. Hence by More on Morphisms, Lemma 36.9.7 (resp. Lemma 36.6 .9 , resp. Lemma 36.4.8 we can fill in (resp. uniquely fill in, resp. fill in in at most one way) the dotted arrow in the diagram

an hence we also obtain the corresponding assertion in the first diagram.
04CY Lemma 63.11.6. Let $S$ be a scheme contained in $S_{\text {Sch }}^{f p p f .}$. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: G \rightarrow H$ be transformations of functors. Assume that $a$ is representable, surjective, and étale.
(1) If $b$ is formally smooth, then $b \circ a$ is formally smooth.
(2) If $b$ is formally étale, then $b \circ a$ is formally étale.
(3) If $b$ is formally unramified, then $b \circ a$ is formally unramified.

Conversely, consider a solid commutative diagram

with $T^{\prime}$ an affine scheme over $S$ and $i: T \rightarrow T^{\prime}$ a closed immersion defined by an ideal of square zero.
(4) If $b \circ a$ is formally smooth, then for every $t \in T$ there exists an étale morphism of affines $U^{\prime} \rightarrow T^{\prime}$ and a morphism $U^{\prime} \rightarrow G$ such that

commutes and $t$ is in the image of $U^{\prime} \rightarrow T^{\prime}$.
(5) If $b \circ a$ is formally unramified, then there exists at most one dotted arrow in the diagram above, i.e., $b$ is formally unramified.
(6) If $b \circ a$ is formally étale, then there exists exactly one dotted arrow in the diagram above, i.e., b is formally étale.

Proof. Assume $b$ is formally smooth (resp. formally étale, resp. formally unramified). Since an étale morphism is both smooth and unramified we see that $a$ is representable and smooth (resp. étale, resp. unramified). Hence parts (1), (2) and (3) follow from a combination of Lemma 63.11.5 and Lemma 63.11.3.

Assume that $b \circ a$ is formally smooth. Consider a diagram as in the statement of the lemma. Let $W=F \times_{G} T$. By assumption $W$ is a scheme surjective étale over $T$. By Étale Morphisms, Theorem 40.15.2 there exists a scheme $W^{\prime}$ étale over $T^{\prime}$ such that $W=T \times_{T^{\prime}} W^{\prime}$. Choose an affine open subscheme $U^{\prime} \subset W^{\prime}$ such that $t$ is in the image of $U^{\prime} \rightarrow T^{\prime}$. Because $b \circ a$ is formally smooth we see that the exist morphisms $U^{\prime} \rightarrow F$ such that

commutes. Taking the composition $U^{\prime} \rightarrow F \rightarrow G$ gives a map as in part (5) of the lemma.

Assume that $f, g: T^{\prime} \rightarrow G$ are two dotted arrows fitting into the diagram of the lemma. Let $W=F \times_{G} T$. By assumption $W$ is a scheme surjective étale over $T$. By Étale Morphisms, Theorem 40.15.2 there exists a scheme $W^{\prime}$ étale over $T^{\prime}$ such that $W=T \times_{T^{\prime}} W^{\prime}$. Since $a$ is formally étale the compositions

$$
W^{\prime} \rightarrow T^{\prime} \xrightarrow{f} G \quad \text { and } \quad W^{\prime} \rightarrow T^{\prime} \xrightarrow{g} G
$$

lift to morphisms $f^{\prime}, g^{\prime}: W^{\prime} \rightarrow F$ (lift on affine opens and glue by uniqueness). Now if $b \circ a: F \rightarrow H$ is formally unramified, then $f^{\prime}=g^{\prime}$ and hence $f=g$ as $W^{\prime} \rightarrow T^{\prime}$ is an étale covering. This proves part (6) of the lemma.

Assume that $b \circ a$ is formally étale. Then by part (4) we can étale locally on $T^{\prime}$ find a dotted arrow fitting into the diagram and by part (5) this dotted arrow is unique. Hence we may glue the local solutions to get assertion (6). Some details omitted.

04 CZ Remark 63.11.7. It is tempting to think that in the situation of Lemma 63.11 .6 we have " $b$ formally smooth" $\Leftrightarrow " b \circ a$ formally smooth". However, this is likely not true in general.

04G5 Lemma 63.11.8. Let $S$ be a scheme. Let $F, G, H:(S c h / S)_{f p p f}^{o p p} \rightarrow$ Sets. Let $a: F \rightarrow G, b: G \rightarrow H$ be transformations of functors. Assume $b$ is formally unramified.
(1) If $b \circ a$ is formally unramified then $a$ is formally unramified.
(2) If $b \circ a$ is formally étale then $a$ is formally étale.
(3) If $b \circ a$ is formally smooth then $a$ is formally smooth.

Proof. Let $T \subset T^{\prime}$ be a closed immersion of affine schemes defined by an ideal of square zero. Let $g^{\prime}: T^{\prime} \rightarrow G$ and $f: T \rightarrow F$ be given such that $\left.g^{\prime}\right|_{T}=a \circ f$. Because $b$ is formally unramified, there is a one to one correspondence between

$$
\left\{f^{\prime}: T^{\prime} \rightarrow F\left|f=f^{\prime}\right|_{T} \text { and } a \circ f^{\prime}=g^{\prime}\right\}
$$

and

$$
\left\{f^{\prime}: T^{\prime} \rightarrow F\left|f=f^{\prime}\right|_{T} \text { and } b \circ a \circ f^{\prime}=b \circ g^{\prime}\right\}
$$

From this the lemma follows formally.

### 63.12. Formally unramified morphisms

04G6 In this section we work out what it means that a morphism of algebraic spaces is formally unramified.

04G7 Definition 63.12.1. Let $S$ be a scheme. A morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ is said to be formally unramified if it is formally unramified as a transformation of functors as in Definition 63.11.1.

We will not restate the results proved in the more general setting of formally unramified transformations of functors in Section 63.11. It turns out we can characterize this property in terms of vanishing of the module of relative differentials, see Lemma 63.12 .6

04G8 Lemma 63.12.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is formally unramified,
(2) for every diagram

where $U$ and $V$ are schemes and the vertical arrows are étale the morphism of schemes $\psi$ is formally unramified (as in More on Morphisms, Definition 36.4.1), and
(3) for one such diagram with surjective vertical arrows the morphism $\psi$ is formally unramified.

Proof. Assume $f$ is formally unramified. By Lemma 63.11 .5 the morphisms $U \rightarrow$ $X$ and $V \rightarrow Y$ are formally unramified. Thus by Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally unramified. Then it follows from Lemma 63.11 .8 that $U \rightarrow V$ is formally unramified. Thus (1) implies (2). And (2) implies (3) trivially
Assume given a diagram as in (3). By Lemma 63.11 .5 the morphism $V \rightarrow Y$ is formally unramified. Thus by Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally unramified. Then it follows from Lemma 63.11 .6 that $X \rightarrow Y$ is formally unramified, i.e., (1) holds.
05ZY Lemma 63.12.3. Let $S$ be a scheme. If $f: X \rightarrow Y$ is a formally unramified morphism of algebraic spaces over $S$, then given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of algebraic spaces over $S$ there exists at most one dotted arrow making the diagram commute. In other words, in Definition 63.12 .1 the condition that $T$ be an affine scheme may be dropped.

Proof. This is true because there exists a surjective étale morphism $U^{\prime} \rightarrow T^{\prime}$ where $U^{\prime}$ is a disjoint union of affine schemes (see Properties of Spaces, Lemma 53.6.1) and a morphism $T^{\prime} \rightarrow X$ is determined by its restriction to $U^{\prime}$.

05ZZ Lemma 63.12.4. A composition of formally unramified morphisms is formally unramified.

Proof. This is formal.
0600 Lemma 63.12.5. A base change of a formally unramified morphism is formally unramified.

Proof. This is formal.
04G9 Lemma 63.12.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is formally unramified, and
(2) $\Omega_{X / Y}=0$.

Proof. This is a combination of Lemma 63.12.2. More on Morphisms, Lemma 36.4.7, and Lemma 63.7.3.

04GA Lemma 63.12.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) The morphism $f$ is unramified,
(2) the morphism $f$ is locally of finite type and $\Omega_{X / Y}=0$, and
(3) the morphism $f$ is locally of finite type and formally unramified.

Proof. Choose a diagram

where $U$ and $V$ are schemes and the vertical arrows are étale and surjective. Then we see

$$
\begin{aligned}
f \text { unramified } & \Leftrightarrow \psi \text { unramified } \\
& \Leftrightarrow \psi \text { locally finite type and } \Omega_{U / V}=0 \\
& \Leftrightarrow f \text { locally finite type and } \Omega_{X / Y}=0 \\
& \Leftrightarrow f \text { locally finite type and formally unramified }
\end{aligned}
$$

Here we have used Morphisms, Lemma 28.35 .2 and Lemma 63.12.6.

05W6 Lemma 63.12.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is unramified and a monomorphism,
(2) $f$ is unramified and universally injective,
(3) $f$ is locally of finite type and a monomorphism,
(4) $f$ is universally injective, locally of finite type, and formally unramified.

Moreover, in this case $f$ is also representable, separated, and locally quasi-finite.
Proof. We have seen in Lemma 63.12.7 that being formally unramified and locally of finite type is the same thing as being unramified. Hence (4) is equivalent to (2). A monomorphism is certainly formally unramified hence (3) implies (4). It is clear that (1) implies (3). Finally, if (2) holds, then $\Delta: X \rightarrow X \times_{Y} X$ is both an open immersion (Morphisms of Spaces, Lemma 54.37.9) and surjective (Morphisms of Spaces, Lemma 54.19.2 hence an isomorphism, i.e., $f$ is a monomorphism. In this way we see that (2) implies (1). Finally, we see that $f$ is representable, separated, and locally quasi-finite by Morphisms of Spaces, Lemmas 54.27.10 and 54.48.1.

05W8 Lemma 63.12.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is a closed immersion,
(2) $f$ is universally closed, unramified, and a monomorphism,
(3) $f$ is universally closed, unramified, and universally injective,
(4) $f$ is universally closed, locally of finite type, and a monomorphism,
(5) $f$ is universally closed, universally injective, locally of finite type, and formally unramified.

Proof. The equivalence of $(2)-(5)$ follows immediately from Lemma 63.12 .8 , Moreover, if $(2)-(5)$ are satisfied then $f$ is representable. Similarly, if (1) is satisfied then $f$ is representable. Hence the result follows from the case of schemes, see Étale Morphisms, Lemma 40.7.2.

### 63.13. Universal first order thickenings

0601 Let $S$ be a scheme. Let $h: Z \rightarrow X$ be a morphism of algebraic spaces over $S$. A universal first order thickening of $Z$ over $X$ is a first order thickening $Z \subset Z^{\prime}$ over $X$ such that given any first order thickening $T \subset T^{\prime}$ over $X$ and a solid commutative
diagram

0602

there exists a unique dotted arrow making the diagram commute. Note that in this situation $\left(a, a^{\prime}\right):\left(T \subset T^{\prime}\right) \rightarrow\left(Z \subset Z^{\prime}\right)$ is a morphism of thickenings over $X$. Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if $h$ is formally unramified then it does. Before we prove this, let us show that a universal first order thickening in the category of schemes is a universal first order thickening in the category of algebraic spaces.

0603 Lemma 63.13.1. Let $S$ be a scheme. Let $h: Z \rightarrow X$ be a morphism of algebraic spaces over $S$. Let $Z \subset Z^{\prime}$ be a first order thickening over $X$. The following are equivalent
(1) $Z \subset Z^{\prime}$ is a universal first order thickening,
(2) for any diagram 63.13.0.1) with $T^{\prime}$ a scheme a unique dotted arrow exists making the diagram commute, and
(3) for any diagram 63.13.0.1) with $T^{\prime}$ an affine scheme a unique dotted arrow exists making the diagram commute.

Proof. The implications $(1) \Rightarrow(2) \Rightarrow(3)$ are formal. Assume (3) a assume given an arbitrary diagram 63.13.0.1. Choose a presentation $T^{\prime}=U^{\prime} / R^{\prime}$, see Spaces, Definition 52.9.3. We may assume that $U^{\prime}=\coprod U_{i}^{\prime}$ is a disjoint union of affines, so $R^{\prime}=U^{\prime} \times_{T^{\prime}} U^{\prime}=\coprod_{i, j} U_{i}^{\prime} \times{ }_{T}^{\prime} U_{j}^{\prime}$. For each pair $(i, j)$ choose an affine open covering $U_{i}^{\prime} \times_{T}^{\prime} U_{j}^{\prime}=\bigcup_{k} R_{i j k}^{\prime}$. Denote $U_{i}, R_{i j k}$ the fibre products with $T$ over $T^{\prime}$. Then each $U_{i} \subset U_{i}^{\prime}$ and $R_{i j k} \subset R_{i j k}^{\prime}$ is a first order thickening of affine schemes. Denote $a_{i}: U_{i} \rightarrow Z$, resp. $a_{i j k}: R_{i j k} \rightarrow Z$ the composition of $a: T \rightarrow Z$ with the morphism $U_{i} \rightarrow T$, resp. $R_{i j k} \rightarrow T$. By (3) applied to $a_{i}: U_{i} \rightarrow Z$ we obtain unique morphisms $a_{i}^{\prime}: U_{i}^{\prime} \rightarrow Z^{\prime}$. By (3) applied to $a_{i j k}$ we see that the two compositions $R_{i j k}^{\prime} \rightarrow R_{i}^{\prime} \rightarrow Z^{\prime}$ and $R_{i j k}^{\prime} \rightarrow R_{j}^{\prime} \rightarrow Z^{\prime}$ are equal. Hence $a^{\prime}=\coprod a_{i}^{\prime}: U^{\prime}=\coprod U_{i}^{\prime} \rightarrow Z^{\prime}$ descends to the quotient sheaf $T^{\prime}=U^{\prime} / R^{\prime}$ and we win.

0604 Lemma 63.13.2. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over $S$. If $Z \subset Z^{\prime}$ is a universal first order thickening of $Z$ over $Y$ and $Y \rightarrow X$ is formally étale, then $Z \subset Z^{\prime}$ is a universal first order thickening of $Z$ over $X$.

Proof. This is formal. Namely, by Lemma 63.13.1 it suffices to consider solid commutative diagrams 63.13 .0 .1 with $T^{\prime}$ an affine scheme. The composition $T \rightarrow$ $Z \rightarrow Y$ lifts uniquely to $T^{\prime} \rightarrow Y$ as $Y \rightarrow X$ is assumed formally étale. Hence the fact that $Z \subset Z^{\prime}$ is a universal first order thickening over $Y$ produces the desired morphism $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$.

0605 Lemma 63.13.3. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over $S$. Assume $Z \rightarrow Y$ is étale.
(1) If $Y \subset Y^{\prime}$ is a universal first order thickening of $Y$ over $X$, then the unique étale morphism $Z^{\prime} \rightarrow Y^{\prime}$ such that $Z=Y \times_{Y^{\prime}} Z^{\prime}$ (see Theorem 63.8.1) is a universal first order thickening of $Z$ over $X$.
(2) If $Z \rightarrow Y$ is surjective and $\left(Z \subset Z^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ is an étale morphism of first order thickenings over $X$ and $Z^{\prime}$ is a universal first order thickening of $Z$ over $X$, then $Y^{\prime}$ is a universal first order thickening of $Y$ over $X$.
Proof. Proof of (1). By Lemma 63.13.1 it suffices to consider solid commutative diagrams 63.13.0.1 with $T^{\prime}$ an affine scheme. The composition $T \rightarrow Z \rightarrow Y$ lifts uniquely to $T^{\prime} \rightarrow Y^{\prime}$ as $Y^{\prime}$ is the universal first order thickening. Then the fact that $Z^{\prime} \rightarrow Y^{\prime}$ is étale implies (see Lemma63.11.5) that $T^{\prime} \rightarrow Y^{\prime}$ lifts to the desired morphism $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$.
Proof of (2). Let $T \subset T^{\prime}$ be a first order thickening over $X$ and let $a: T \rightarrow Y$ be a morphism. Set $W=T \times_{Y} Z$ and denote $c: W \rightarrow Z$ the projection Let $W^{\prime} \rightarrow T^{\prime}$ be the unique étale morphism such that $W=T \times_{T^{\prime}} W^{\prime}$, see Theorem 63.8.1. Note that $W^{\prime} \rightarrow T^{\prime}$ is surjective as $Z \rightarrow Y$ is surjective. By assumption we obtain a unique morphism $c^{\prime}: W^{\prime} \rightarrow Z^{\prime}$ over $X$ restricting to $c$ on $W$. By uniqueness the two restrictions of $c^{\prime}$ to $W^{\prime} \times T^{\prime} W^{\prime}$ are equal (as the two restrictions of $c$ to $W \times_{T} W$ are equal). Hence $c^{\prime}$ descends to a unique morphism $a^{\prime}: T^{\prime} \rightarrow Y^{\prime}$ and we win.
0606 Lemma 63.13.4. Let $S$ be a scheme. Let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $S$. There exists a universal first order thickening $Z \subset Z^{\prime}$ of $Z$ over $X$.
Proof. Choose any commutative diagram

where $V$ and $U$ are schemes and the vertical arrows are étale. Note that $V \rightarrow U$ is a formally unramified morphism of schemes, see Lemma 63.12.2. Combining Lemma 63.13 .1 and More on Morphisms, Lemma 36.5.1 we see that a universal first order thickening $V \subset V^{\prime}$ of $V$ over $U$ exists. By Lemma 63.13.2 part (1) $V^{\prime}$ is a universal first order thickening of $V$ over $X$.
Fix a scheme $U$ and a surjective étale morphism $U \rightarrow X$. The argument above shows that for any $V \rightarrow Z$ étale with $V$ a scheme such that $V \rightarrow Z \rightarrow X$ factors through $U$ a universal first order thickening $V \subset V^{\prime}$ of $V$ over $X$ exists (but does not depend on the chosen factorization of $V \rightarrow X$ through $U$ ). Now we may choose $V$ such that $V \rightarrow Z$ is surjective étale (see Spaces, Lemma 52.11.6). Then $R=V \times{ }_{Z} V$ a scheme étale over $Z$ such that $R \rightarrow X$ factors through $U$ also. Hence we obtain universal first order thickenings $V \subset V^{\prime}$ and $R \subset R^{\prime}$ over $X$. As $V \subset V^{\prime}$ is a universal first order thickening, the two projections $s, t: R \rightarrow V$ lift to morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow V^{\prime}$. By Lemma 63.13.3 as $R^{\prime}$ is the universal first order thickening of $R$ over $X$ these morphisms are étale. Then $\left(t^{\prime}, s^{\prime}\right): R^{\prime} \rightarrow V^{\prime}$ is an étale equivalence relation and we can set $Z^{\prime}=V^{\prime} / R^{\prime}$. Since $V^{\prime} \rightarrow Z^{\prime}$ is surjective étale and $v^{\prime}$ is the universal first order thickening of $V$ over $X$ we conclude from Lemma 63.13.2 part (2) that $Z^{\prime}$ is a universal first order thickening of $Z$ over $X$.

0607 Definition 63.13.5. Let $S$ be a scheme. Let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $S$.
(1) The universal first order thickening of $Z$ over $X$ is the thickening $Z \subset Z^{\prime}$ constructed in Lemma 63.13.4.
(2) The conormal sheaf of $Z$ over $X$ is the conormal sheaf of $Z$ in its universal first order thickening $Z^{\prime}$ over $X$.
We often denote the conormal sheaf $\mathcal{C}_{Z / X}$ in this situation.
Thus we see that there is a short exact sequence of sheaves

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{O}_{Z^{\prime}} \rightarrow \mathcal{O}_{Z} \rightarrow 0
$$

on $Z_{\text {étale }}$ and $\mathcal{C}_{Z / X}$ is a quasi-coherent $\mathcal{O}_{Z \text {-module. The following lemma proves }}$ that there is no conflict between this definition and the definition in case $Z \rightarrow X$ is an immersion.

0608 Lemma 63.13.6. Let $S$ be a scheme. Let $i: Z \rightarrow X$ be an immersion of algebraic spaces over $S$. Then
(1) $i$ is formally unramified,
(2) the universal first order thickening of $Z$ over $X$ is the first order infinitesimal neighbourhood of $Z$ in $X$ of Definition 63.10.1,
(3) the conormal sheaf of $i$ in the sense of Definition 63.5.1 agrees with the conormal sheaf of $i$ in the sense of Definition 63.13.5.

Proof. An immersion of algebraic spaces is by definition a representable morphism. Hence by Morphisms, Lemmas 28.35.7 and 28.35.8 an immersion is unramified (via the abstract principle of Spaces, Lemma 52.5 .8 ). Hence it is formally unramified by Lemma 63.12.7. The other assertions follow by combining Lemmas 63.10 .2 and 63.10 .3 and the definitions.

0609 Lemma 63.13.7. Let $S$ be a scheme. Let $Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $S$. Then the universal first order thickening $Z^{\prime}$ is formally unramified over $X$.
Proof. Let $T \subset T^{\prime}$ be a first order thickening of affine schemes over $X$. Let

be a commutative diagram. Set $T_{0}=c^{-1}(Z) \subset T$ and $T_{a}^{\prime}=a^{-1}(Z)$ (scheme theoretically). Since $Z^{\prime}$ is a first order thickening of $Z$, we see that $T^{\prime}$ is a first order thickening of $T_{a}^{\prime}$. Moreover, since $c=\left.a\right|_{T}$ we see that $T_{0}=T \cap T_{a}^{\prime}$ (scheme theoretically). As $T^{\prime}$ is a first order thickening of $T$ it follows that $T_{a}^{\prime}$ is a first order thickening of $T_{0}$. Now $\left.a\right|_{T_{a}^{\prime}}$ and $\left.b\right|_{T_{a}^{\prime}}$ are morphisms of $T_{a}^{\prime}$ into $Z^{\prime}$ over $X$ which agree on $T_{0}$ as morphisms into $Z$. Hence by the universal property of $Z^{\prime}$ we conclude that $\left.a\right|_{T_{a}^{\prime}}=\left.b\right|_{T_{a}^{\prime}}$. Thus $a$ and $b$ are morphism from the first order thickening $T^{\prime}$ of $T_{a}^{\prime}$ whose restrictions to $T_{a}^{\prime}$ agree as morphisms into $Z$. Thus using the universal property of $Z^{\prime}$ once more we conclude that $a=b$. In other words, the defining property of a formally unramified morphism holds for $Z^{\prime} \rightarrow X$ as desired.

060A Lemma 63.13.8. Let $S$ be a scheme Consider a commutative diagram of algebraic spaces over $S$

with $h$ and $h^{\prime}$ formally unramified. Let $Z \subset Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. Let $W \subset W^{\prime}$ be the universal first order thickening of $W$ over $Y$. There exists a canonical morphism $\left(f, f^{\prime}\right):\left(Z, Z^{\prime}\right) \rightarrow\left(W, W^{\prime}\right)$ of thickenings over $Y$ which fits into the following commutative diagram

In particular the morphism $\left(f, f^{\prime}\right)$ of thickenings induces a morphism of conormal sheaves $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$.

Proof. The first assertion is clear from the universal property of $W^{\prime}$. The induced map on conormal sheaves is the map of Lemma 63.5.3 applied to $\left(Z \subset Z^{\prime}\right) \rightarrow(W \subset$ $W^{\prime}$ ).

060B Lemma 63.13.9. Let $S$ be a scheme. Let

be a fibre product diagram of algebraic spaces over $S$ with $h^{\prime}$ formally unramified. Then $h$ is formally unramified and if $W \subset W^{\prime}$ is the universal first order thickening of $W$ over $Y$, then $Z=X \times_{Y} W \subset X \times_{Y} W^{\prime}$ is the universal first order thickening of $Z$ over $X$. In particular the canonical map $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$ of Lemma 63.13.8 is surjective.

Proof. The morphism $h$ is formally unramified by Lemma 63.12.5. It is clear that $X \times_{Y} W^{\prime}$ is a first order thickening. It is straightforward to check that it has the universal property because $W^{\prime}$ has the universal property (by mapping properties of fibre products). See Lemma 63.5.5 for why this implies that the map of conormal sheaves is surjective.

060C Lemma 63.13.10. Let $S$ be a scheme. Let

be a fibre product diagram of algebraic spaces over $S$ with $h^{\prime}$ formally unramified and $g$ flat. In this case the corresponding map $Z^{\prime} \rightarrow W^{\prime}$ of universal first order thickenings is flat, and $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$ is an isomorphism.
Proof. Flatness is preserved under base change, see Morphisms of Spaces, Lemma 54.29 .4 Hence the first statement follows from the description of $W^{\prime}$ in Lemma 63.13 .9 . It is clear that $X \times_{Y} W^{\prime}$ is a first order thickening. It is straightforward to check that it has the universal property because $W^{\prime}$ has the universal property (by mapping properties of fibre products). See Lemma 63.5 .5 for why this implies that the map of conormal sheaves is an isomorphism.

060D Lemma 63.13.11. Taking the universal first order thickenings commutes with étale localization. More precisely, let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over a base scheme $S$. Let

be a commutative diagram with étale vertical arrows. Let $Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. Then $V \rightarrow U$ is formally unramified and the universal first order thickening $V^{\prime}$ of $V$ over $U$ is étale over $Z^{\prime}$. In particular, $\left.\mathcal{C}_{Z / X}\right|_{V}=\mathcal{C}_{V / U}$.
Proof. The first statement is Lemma 63.12.2. The compatibility of universal first order thickenings is a consequence of Lemmas 63.13 .2 and 63.13.3.

060E Lemma 63.13.12. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $B$. Let $Z \subset Z^{\prime}$ be the universal first order thickening of $Z$ over $X$ with structure morphism $h^{\prime}: Z^{\prime} \rightarrow X$. The canonical map

$$
d h^{\prime}:\left(h^{\prime}\right)^{*} \Omega_{X / B} \rightarrow \Omega_{Z^{\prime} / B}
$$

induces an isomorphism $h^{*} \Omega_{X / B} \rightarrow \Omega_{Z^{\prime} / B} \otimes \mathcal{O}_{Z}$.
Proof. The map $c_{h^{\prime}}$ is the map defined in Lemma63.7.6. If $i: Z \rightarrow Z^{\prime}$ is the given closed immersion, then $i^{*} c_{h^{\prime}}$ is a map $h^{*} \Omega_{X / S} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z}$. Checking that it is an isomorphism reduces to the case of schemes by étale localization, see Lemma 63.13 .11 and Lemma 63.7.3. In this case the result is More on Morphisms, Lemma 36.5.9.

060F Lemma 63.13.13. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $B$. There is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow h^{*} \Omega_{X / B} \rightarrow \Omega_{Z / B} \rightarrow 0
$$

The first arrow is induced by $d_{Z^{\prime} / B}$ where $Z^{\prime}$ is the universal first order neighbourhood of $Z$ over $X$.

Proof. We know that there is a canonical exact sequence

$$
\mathcal{C}_{Z / Z^{\prime}} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

see Lemma 63.7.10. Hence the result follows on applying Lemma 63.13.12.

06BE Lemma 63.13.14. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$ where $i$ and $j$ are formally unramified. Then there is a canonical exact sequence

$$
\mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$

where the first arrow comes from Lemma 63.13 .8 and the second from Lemma 63.13 .13 .

Proof. Since the maps have been defined, checking the sequence is exact reduces to the case of schemes by étale localization, see Lemma 63.13.11 and Lemma 63.7.3. In this case the result is More on Morphisms, Lemma 36.5.11.

06BF Lemma 63.13.15. Let $S$ be a scheme. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of algebraic spaces over $S$.
(1) If $Z \subset Z^{\prime}$ is the universal first order thickening of $Z$ over $X$ and $Y \subset Y^{\prime}$ is the universal first order thickening of $Y$ over $X$, then there is a morphism $Z^{\prime} \rightarrow Y^{\prime}$ and $Y \times_{Y^{\prime}} Z^{\prime}$ is the universal first order thickening of $Z$ over $Y$.
(2) There is a canonical exact sequence

$$
i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

where the maps come from Lemma 63.13 .8 and $i: Z \rightarrow Y$ is the first morphism.

Proof. The map $h: Z^{\prime} \rightarrow Y^{\prime}$ in (1) comes from Lemma 63.13.8. The assertion that $Y \times_{Y^{\prime}} Z^{\prime}$ is the universal first order thickening of $Z$ over $Y$ is clear from the universal properties of $Z^{\prime}$ and $Y^{\prime}$. By Lemma 63.5.6 we have an exact sequence

$$
\left(i^{\prime}\right)^{*} \mathcal{C}_{Y \times_{Y^{\prime}} Z^{\prime} / Z^{\prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}} \rightarrow \mathcal{C}_{Z / Y \times_{Y^{\prime}} Z^{\prime}} \rightarrow 0
$$

where $i^{\prime}: Z \rightarrow Y \times_{Y^{\prime}} Z^{\prime}$ is the given morphism. By Lemma 63.5.5 there exists a surjection $h^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{Y \times_{Y^{\prime}} Z^{\prime} / Z^{\prime}}$. Combined with the equalities $\mathcal{C}_{Y / Y^{\prime}}=\mathcal{C}_{Y / X}$, $\mathcal{C}_{Z / Z^{\prime}}=\mathcal{C}_{Z / X}$, and $\mathcal{C}_{Z / Y \times_{Y^{\prime}} Z^{\prime}}=\mathcal{C}_{Z / Y}$ this proves the lemma.

### 63.14. Formally étale morphisms

04GB In this section we work out what it means that a morphism of algebraic spaces is formally étale.

04GC Definition 63.14.1. Let $S$ be a scheme. A morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ is said to be formally étale if it is formally étale as a transformation of functors as in Definition 63.11.1.

We will not restate the results proved in the more general setting of formally étale transformations of functors in Section 63.11.

04GD Lemma 63.14.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is formally étale,
(2) for every diagram

where $U$ and $V$ are schemes and the vertical arrows are étale the morphism of schemes $\psi$ is formally étale (as in More on Morphisms, Definition 36.6.1), and
(3) for one such diagram with surjective vertical arrows the morphism $\psi$ is formally étale.

Proof. Assume $f$ is formally étale. By Lemma 63.11 .5 the morphisms $U \rightarrow X$ and $V \rightarrow Y$ are formally étale. Thus by Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally étale. Then it follows from Lemma 63.11 .8 that $U \rightarrow V$ is formally étale. Thus (1) implies (2). And (2) implies (3) trivially

Assume given a diagram as in (3). By Lemma 63.11.5 the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 63.11.3 the composition $U \rightarrow Y$ is formally étale. Then it follows from Lemma 63.11 .6 that $X \rightarrow Y$ is formally étale, i.e., (1) holds.

0611 Lemma 63.14.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a formally étale morphism of algebraic spaces over $S$. Then given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of algebraic spaces over $Y$ there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 63.14 .1 the condition that $T$ be affine may be dropped.

Proof. Let $U^{\prime} \rightarrow T^{\prime}$ be a surjective étale morphism where $U^{\prime}=\coprod U_{i}^{\prime}$ is a disjoint union of affine schemes. Let $U_{i}=T \times_{T^{\prime}} U_{i}^{\prime}$. Then we get morphisms $a_{i}^{\prime}: U_{i}^{\prime} \rightarrow X$ such that $\left.a_{i}^{\prime}\right|_{U_{i}}$ equals the composition $U_{i} \rightarrow T \rightarrow X$. By uniqueness (see Lemma 63.12 .3 we see that $a_{i}^{\prime}$ and $a_{j}^{\prime}$ agree on the fibre product $U_{i}^{\prime} \times_{T^{\prime}} U_{j}^{\prime}$. Hence $\coprod a_{i}^{\prime}$ : $U^{\prime} \rightarrow X$ descends to give a unique morphism $a^{\prime}: T^{\prime} \rightarrow X$.

0612 Lemma 63.14.4. A composition of formally étale morphisms is formally étale.
Proof. This is formal.
0613 Lemma 63.14.5. A base change of a formally étale morphism is formally étale.
Proof. This is formal.
0614 Lemma 63.14.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ The following are equivalent:
(1) $f$ is formally étale,
(2) $f$ is formally unramified and the universal first order thickening of $X$ over $Y$ is equal to $X$,
(3) $f$ is formally unramified and $\mathcal{C}_{X / Y}=0$, and
(4) $\Omega_{X / Y}=0$ and $\mathcal{C}_{X / Y}=0$.

Proof. Actually, the last assertion only make sense because $\Omega_{X / Y}=0$ implies that $\mathcal{C}_{X / Y}$ is defined via Lemma 63.12.6 and Definition63.13.5. This also makes it clear that (3) and (4) are equivalent.
Either of the assumptions (1), (2), and (3) imply that $f$ is formally unramified. Hence we may assume $f$ is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening $X^{\prime}$ of $X$ over $S$ and the fact that $X=X^{\prime} \Leftrightarrow \mathcal{C}_{X / Y}=0$ since after all by definition $\mathcal{C}_{X / Y}=\mathcal{C}_{X / X^{\prime}}$ is the ideal sheaf of $X$ in $X^{\prime}$.

0615 Lemma 63.14.7. An unramified flat morphism is formally étale.
Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.6.7 and étale localization, see Lemmas 63.12 .2 and 63.14 .2 and Morphisms of Spaces, Lemma 54.29.5.

0616 Lemma 63.14.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) The morphism $f$ is étale, and
(2) the morphism $f$ is locally of finite presentation and formally étale.

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.6.9 and étale localization, see Lemma 63.14.2 and Morphisms of Spaces, Lemmas 54.28 .4 and 54.38 .2 .

### 63.15. Infinitesimal deformations of maps

0617 In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening $X^{\prime}$ of $X$ can be seen as a sheaf on $X$, see Equations 63.9.1.1 and 63.9.1.2).

0618 Lemma 63.15.1. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ be two first order thickenings of algebraic spaces over $B$. Let $\left(a, a^{\prime}\right),\left(b, b^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be two morphisms of thickenings over $B$. Assume that
(1) $a=b$, and
(2) the two maps $a^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}($ Lemma 63.5.3) are equal.

Then the map $\left(a^{\prime}\right)^{\sharp}-\left(b^{\prime}\right)^{\#}$ factors as

$$
\mathcal{O}_{Y^{\prime}} \rightarrow \mathcal{O}_{Y} \xrightarrow{D} a_{*} \mathcal{C}_{X / X^{\prime}} \rightarrow a_{*} \mathcal{O}_{X^{\prime}}
$$

where $D$ is an $\mathcal{O}_{B}$-derivation.
Proof. Instead of working on $Y$ we work on $X$. The advantage is that the pullback functor $a^{-1}$ is exact. Using (1) and (2) we obtain a commutive diagram with exact rows

Now it is a general fact that in such a situation the difference of the $\mathcal{O}_{B}$-algebra maps $\left(a^{\prime}\right)^{\sharp}$ and $\left(b^{\prime}\right)^{\sharp}$ is an $\mathcal{O}_{B^{\prime}}$-derivation from $a^{-1} \mathcal{O}_{Y}$ to $\mathcal{C}_{X / X^{\prime}}$. By adjointness of
the functors $a^{-1}$ and $a_{*}$ this is the same thing as an $\mathcal{O}_{B}$-derivation from $\mathcal{O}_{Y}$ into $a_{*} \mathcal{C}_{X / X^{\prime}}$. Some details omitted.

Note that in the situation of the lemma above we may write $D$ as
0619

$$
\begin{equation*}
D=\mathrm{d}_{Y / B} \circ \theta \tag{63.15.1.1}
\end{equation*}
$$

where $\theta$ is an $\mathcal{O}_{Y}$-linear map $\theta: \Omega_{Y / B} \rightarrow a_{*} \mathcal{C}_{X / X^{\prime}}$. Of course, then by adjunction again we may view $\theta$ as an $\mathcal{O}_{X}$-linear map $\theta: a^{*} \Omega_{Y / B} \rightarrow \mathcal{C}_{X / X^{\prime}}$.

04D0 Lemma 63.15.2. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $\left(a, a^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of first order thickenings over $B$. Let

$$
\theta: a^{*} \Omega_{Y / B} \rightarrow \mathcal{C}_{X / X^{\prime}}
$$

be an $\mathcal{O}_{X}$-linear map. Then there exists a unique morphism of pairs $\left(b, b^{\prime}\right):(X \subset$ $\left.X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ such that (1) and (2) of Lemma 63.15.1 hold and the derivation $D$ and $\theta$ are related by Equation 63.15.1.1.

Proof. Consider the map

$$
\alpha=\left(a^{\prime}\right)^{\sharp}+D: a^{-1} \mathcal{O}_{Y^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}}
$$

where $D$ is as in Equation 63.15.1.1. As $D$ is an $\mathcal{O}_{B}$-derivation it follows that $\alpha$ is a map of sheaves of $\mathcal{O}_{B}$-algebras. By construction we have $i_{X}^{\sharp} \circ \alpha=a^{\sharp} \circ i_{Y}^{\sharp}$ where $i_{X}: X \rightarrow X^{\prime}$ and $i_{Y}: Y \rightarrow Y^{\prime}$ are the given closed immersions. By Lemma 63.9.2 we obtain a unique morphism $\left(a, b^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ of thickenings over $B$ such that $\alpha=\left(b^{\prime}\right)^{\sharp}$. Setting $b=a$ we win.

061A Lemma 63.15.3. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ be first order thickenings over $B$. Assume given a morphism $a: X \rightarrow Y$ and a map $A: a^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}$ of $\mathcal{O}_{X}$-modules. For an object $U^{\prime}$ of $\left(X^{\prime}\right)_{\text {spaces,étale }}$ with $U=X \times_{X^{\prime}} U^{\prime}$ consider morphisms $a^{\prime}: U^{\prime} \rightarrow Y^{\prime}$ such that
(1) $a^{\prime}$ is a morphism over $B$,
(2) $\left.a^{\prime}\right|_{U}=\left.a\right|_{U}$, and
(3) the induced map $\left.\left.a^{*} \mathcal{C}_{Y / Y^{\prime}}\right|_{U} \rightarrow \mathcal{C}_{X / X^{\prime}}\right|_{U}$ is the restriction of $A$ to $U$.

Then the rule

$$
\begin{equation*}
U^{\prime} \mapsto\left\{a^{\prime}: U^{\prime} \rightarrow Y^{\prime} \text { such that (1), (2), (3) hold. }\right\} \tag{63.15.3.1}
\end{equation*}
$$

defines a sheaf of sets on $\left(X^{\prime}\right)_{\text {spaces,étale }}$.
Proof. Denote $\mathcal{F}$ the rule of the lemma. The restriction mapping $\mathcal{F}\left(U^{\prime}\right) \rightarrow \mathcal{F}\left(V^{\prime}\right)$ for $V^{\prime} \subset U^{\prime} \subset X^{\prime}$ of $\mathcal{F}$ is really the restriction map $\left.a^{\prime} \mapsto a^{\prime}\right|_{V^{\prime}}$. With this definition in place it is clear that $\mathcal{F}$ is a sheaf since morphisms of algebraic spaces satisfy étale descent, see Descent on Spaces, Lemma 61.6.2.
061C Lemma 63.15.4. Same notation and assumptions as in Lemma 63.15.3. We identify sheaves on $X$ and $X^{\prime}$ via 63.9.1.1). There is an action of the sheaf

$$
\mathcal{H o m}_{\mathcal{O}_{X}}\left(a^{*} \Omega_{Y / B}, \mathcal{C}_{X / X^{\prime}}\right)
$$

on the sheaf 63.15.3.1). Moreover, the action is simply transitive for any object $U^{\prime}$ of $\left(X^{\prime}\right)_{\text {spaces,étale }}$ over which the sheaf 63.15.3.1) has a section.

Proof. This is a combination of Lemmas 63.15.1, 63.15.2, and 63.15.3.

061D Remark 63.15.5. A special case of Lemmas 63.15.1, 63.15.2, 63.15.3, and 63.15.4 is where $Y=Y^{\prime}$. In this case the map $A$ is always zero. The sheaf of Lemma 63.15 .3 is just given by the rule

$$
U^{\prime} \mapsto\left\{a^{\prime}: U^{\prime} \rightarrow Y \text { over } S \text { with }\left.a^{\prime}\right|_{U}=\left.a\right|_{U}\right\}
$$

and we act on this by the sheaf $\mathcal{H o m}_{\mathcal{O}_{X}}\left(a^{*} \Omega_{Y / B}, \mathcal{C}_{X / X^{\prime}}\right)$. The action of a local section $\theta$ on $a^{\prime}$ is sometimes indicated by $\theta \cdot a^{\prime}$. Note that this means nothing else than the fact that $\left(a^{\prime}\right)^{\sharp}$ and $\left(\theta \cdot a^{\prime}\right)^{\sharp}$ differ by a derivation $D$ which is related to $\theta$ by Equation 63.15.1.1.

### 63.16. Infinitesimal deformations of algebraic spaces

06BG The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

06BH Lemma 63.16.1. Let $S$ be a scheme. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of first order thickenings of algebraic spaces over $S$. Assume that $f$ is flat. Then the following are equivalent
(1) $f^{\prime}$ is flat and $X=Y \times_{Y^{\prime}} X^{\prime}$, and
(2) the canonical map $f^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}$ is an isomorphism.

Proof. Choose a scheme $V^{\prime}$ and a surjective étale morphism $V^{\prime} \rightarrow Y^{\prime}$. Choose a scheme $U^{\prime}$ and a surjective étale morphism $U^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} V^{\prime}$. Set $U=X \times_{X^{\prime}} U^{\prime}$ and $V=Y \times_{Y^{\prime}} V^{\prime}$. According to our definition of a flat morphism of algebraic spaces we see that the induced map $g: U \rightarrow V$ is a flat morphism of schemes and that $f^{\prime}$ is flat if and only if the corresponding morphism $g^{\prime}: U^{\prime} \rightarrow V^{\prime}$ is flat. Also, $X=Y \times_{Y^{\prime}} X^{\prime}$ if and only if $U=V \times_{V^{\prime}} V^{\prime}$. Finally, the map $f^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}$ is an isomorphism if and only if $g^{*} \mathcal{C}_{V / V^{\prime}} \rightarrow \mathcal{C}_{U / U^{\prime}}$ is an isomorphism. Hence the lemma follows from its analogue for morphisms of schemes, see More on Morphisms, Lemma 36.8.1.

### 63.17. Formally smooth morphisms

049R In this section we introduce the notion of a formally smooth morphism $X \rightarrow Y$ of algebraic spaces. Such a morphism is characterized by the property that $T$-valued points of $X$ lift to infinitesimal thickenings of $T$ provided $T$ is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma63.17.6. It turns out that this criterion is often easier to use than the Jacobian criterion.

060G Definition 63.17.1. Let $S$ be a scheme. A morphism $f: X \rightarrow Y$ of algebraic spaces over $S$ is said to be formally smooth if it is formally smooth as a transformation of functors as in Definition 63.11.1.

In the cases of formally unramified and formally étale morphisms the condition that $T^{\prime}$ be affine could be dropped, see Lemmas 63.12.3 and 63.14.3. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow étale locally on $T^{\prime}$. In fact, analyzing the proof of Lemma 63.17 .6 shows that this would be equivalent to the definition as it currently stands. It is also true that requiring the existence of the dotted arrow fppf locally on $T^{\prime}$ would be sufficient, but that is slightly more difficult to prove.

We will not restate the results proved in the more general setting of formally smooth transformations of functors in Section 63.11.

061E Lemma 63.17.2. A composition of formally smooth morphisms is formally smooth. Proof. Omitted.

061F Lemma 63.17.3. A base change of a formally smooth morphism is formally smooth.

Proof. Omitted, but see Algebra, Lemma 10.136 .2 for the algebraic version.
061G Lemma 63.17.4. Let $f: X \rightarrow S$ be a morphism of schemes. Then $f$ is formally étale if and only if $f$ is formally smooth and formally unramified.
Proof. Omitted.
Here is a helper lemma which will be superseded by Lemma 63.17.9
061H Lemma 63.17.5. Let $S$ be a scheme. Let

be a commutative diagram of morphisms of algebraic spaces over $S$. If the vertical arrows are étale and $f$ is formally smooth, then $\psi$ is formally smooth.

Proof. By Lemma 63.11.5 the morphisms $U \rightarrow X$ and $V \rightarrow Y$ are formally étale. By Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally smooth. By Lemma 63.11.8 we see $\psi: U \rightarrow V$ is formally smooth.

The following lemma is the main result of this section. It implies, combined with Limits of Spaces, Proposition 57.3.9, that we can recognize whether a morphism of algebraic spaces $f: X \rightarrow Y$ is smooth in terms of "simple" properties of the transformation of functors $X \rightarrow Y$.

04AM Lemma 63.17.6 (Infinitesimal lifting criterion). Let $S$ be a scheme. Let $f: X \rightarrow$ $Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) The morphism $f$ is smooth.
(2) The morphism $f$ is locally of finite presentation, and formally smooth.

Proof. Assume $f: X \rightarrow S$ is locally of finite presentation and formally smooth. Consider a commutative diagram

where $U$ and $V$ are schemes and the vertical arrows are étale and surjective. By Lemma 63.17 .5 we see $\psi: U \rightarrow V$ is formally smooth. By Morphisms of Spaces, Lemma 54.28.4 the morphism $\psi$ is locally of finite presentation. Hence by the case of schemes the morphism $\psi$ is smooth, see More on Morphisms, Lemma 36.9.7. Hence $f$ is smooth, see Morphisms of Spaces, Lemma 54.36.4.

Conversely, assume that $f: X \rightarrow Y$ is smooth. Consider a solid commutative diagram

as in Definition 63.17.1. We will show the dotted arrow exists thereby proving that $f$ is formally smooth. Let $\mathcal{F}$ be the sheaf of sets on $\left(T^{\prime}\right)_{\text {spaces,étale }}$ of Lemma 63.15.3. see also Remark 63.15.5. Let

$$
\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / Y}, \mathcal{C}_{T / T^{\prime}}\right)
$$

be the sheaf of $\mathcal{O}_{T}$-modules on $T_{\text {étale }}$ introduced in Lemma 63.15.4. The action $\mathcal{H} \times \mathcal{F} \rightarrow \mathcal{F}$ turns $\mathcal{F}$ into a pseudo $\mathcal{H}$-torsor, see Cohomology on Sites, Definition 21.5.1. Our goal is to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor. There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}$ has étale locally a section. (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^{1}\left(T_{\text {étale }}, \mathcal{H}\right)=0$, see Cohomology on Sites, Lemma 21.5.3.
First we prove (I). To see this choose a commutative diagram

where $U$ and $V$ are schemes and the vertical arrows are étale and surjective. As $f$ is assumed smooth we see that $\psi$ is smooth and hence formally smooth by Lemma 63.11 .5 . By the same lemma the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally smooth. Then (I) follows from Lemma 63.11.6 part (4).
Finally we prove (II). By Lemma 63.7 .15 we see that $\Omega_{X / S}$ is of finite presentation. Hence $a^{*} \Omega_{X / S}$ is of finite presentation (see Properties of Spaces, Section 53.29). Hence the sheaf $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / Y}, \mathcal{C}_{T / T^{\prime}}\right)$ is quasi-coherent by Properties of Spaces, Lemma 53.28.7. Thus by Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2 we have

$$
H^{1}\left(T_{\text {spaces,étale }}, \mathcal{H}\right)=H^{1}\left(T_{\text {étale }}, \mathcal{H}\right)=H^{1}(T, \mathcal{H})=0
$$

as desired.
We do a bit more work to show that being formally smooth is étale local on the source. To begin we show that a formally smooth morphism has a nice sheaf of differentials. The notion of a locally projective quasi-coherent module is defined in Properties of Spaces, Section 53.30

061I Lemma 63.17.7. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a formally smooth morphism of algebraic spaces over $S$. Then $\Omega_{X / Y}$ is locally projective on $X$.
Proof. Choose a diagram

where $U$ and $V$ are affine(!) schemes and the vertical arrows are étale. By Lemma 63.17 .5 we see $\psi: U \rightarrow V$ is formally smooth. Hence $\Gamma\left(V, \mathcal{O}_{V}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ is a formally smooth ring map, see More on Morphisms, Lemma 36.9.6. Hence by Algebra, Lemma 10.136 .7 the $\Gamma\left(U, \mathcal{O}_{U}\right)$-module $\Omega_{\Gamma\left(U, \mathcal{O}_{U}\right) / \Gamma\left(V, \mathcal{O}_{V}\right)}$ is projective. Hence $\Omega_{U / V}$ is locally projective, see Properties, Section 27.21 . Since $\left.\Omega_{X / Y}\right|_{U}=$ $\Omega_{U / V}$ we see that $\Omega_{X / Y}$ is locally projective too. (Because we can find an étale covering of $X$ by the affine $U$ 's fitting into diagrams as above - details omitted.)

061J Lemma 63.17.8. Let $T$ be an affine scheme. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent $\mathcal{O}_{T^{-}}$ modules on $T_{\text {étale }}$. Consider the internal hom sheaf $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}(\mathcal{F}, \mathcal{G})$ on $T_{\text {étale }}$. If $\mathcal{F}$ is locally projective, then $H^{1}\left(T_{\text {étale }}, \mathcal{H}\right)=0$.

Proof. By the definition of a locally projective sheaf on an algebraic space (see Properties of Spaces, Definition 53.30 .2 we see that $\mathcal{F}_{Z a r}=\left.\mathcal{F}\right|_{T_{Z a r}}$ is a locally projective sheaf on the scheme $T$. Thus $\mathcal{F}_{Z a r}$ is a direct summand of a free $\mathcal{O}_{T_{Z a r}}$-module. Whereupon we conclude (as $\mathcal{F}=\left(\mathcal{F}_{Z a r}\right)^{a}$, see Descent, Proposition 34.7.11) that $\mathcal{F}$ is a direct summand of a free $\mathcal{O}_{T}$-module on $T_{\text {étale }}$. Hence we may assume that $\mathcal{F}=\bigoplus_{i \in I} \mathcal{O}_{T}$ is a free module. In this case $\mathcal{H}=\prod_{i \in I} \mathcal{G}$ is a product of quasi-coherent modules. By Cohomology on Sites, Lemma 21.12 .5 we conclude that $H^{1}=0$ because the cohomology of a quasi-coherent sheaf on an affine scheme is zero, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2

061K Lemma 63.17.9. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is formally smooth,
(2) for every diagram

where $U$ and $V$ are schemes and the vertical arrows are étale the morphism of schemes $\psi$ is formally smooth (as in More on Morphisms, Definition 36.4.1), and
(3) for one such diagram with surjective vertical arrows the morphism $\psi$ is formally smooth.
Proof. We have seen that (1) implies (2) and (3) in Lemma 63.17.5. Assume (3). The proof that $f$ is formally smooth is entirely similar to the proof of $(1) \Rightarrow(2)$ of Lemma 63.17.6.
Consider a solid commutative diagram

as in Definition 63.17.1. We will show the dotted arrow exists thereby proving that $f$ is formally smooth. Let $\mathcal{F}$ be the sheaf of sets on $\left(T^{\prime}\right)_{\text {spaces,étale }}$ of Lemma 63.15 .3 see also Remark 63.15.5. Let

$$
\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / Y}, \mathcal{C}_{T / T^{\prime}}\right)
$$

be the sheaf of $\mathcal{O}_{T}$-modules on $T_{\text {étale }}$ introduced in Lemma 63.15.4 The action $\mathcal{H} \times \mathcal{F} \rightarrow \mathcal{F}$ turns $\mathcal{F}$ into a pseudo $\mathcal{H}$-torsor, see Cohomology on Sites, Definition 21.5.1. Our goal is to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor. There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}$ has étale locally a section. (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^{1}\left(T_{\text {étale }}, \mathcal{H}\right)=0$, see Cohomology on Sites, Lemma 21.5.3.
First we prove (I). To see this consider a diagram (which exists because we are assuming (3))

where $U$ and $V$ are schemes, the vertical arrows are étale and surjective, and $\psi$ is formally smooth. By Lemma 63.11.5 the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 63.11 .3 the composition $U \rightarrow Y$ is formally smooth. Then (I) follows from Lemma 63.11.6 part (4).

Finally we prove (II). By Lemma 63.17 .7 we see that $\Omega_{U / V}$ locally projective. Hence $\Omega_{X / Y}$ is locally projective, see Descent on Spaces, Lemma 61.5.5. Hence $a^{*} \Omega_{X / Y}$ is locally projective, see Properties of Spaces, Lemma 53.30.3. Hence

$$
H^{1}\left(T_{\text {étale }}, \mathcal{H}\right)=H^{1}\left(T_{\text {étale }}, \mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / Y}, \mathcal{C}_{T / T^{\prime}}\right)=0\right.
$$

by Lemma 63.17.8 as desired.
06CS Lemma 63.17.10. The property $\mathcal{P}(f)=$ " $f$ is formally smooth" is fpqc local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over a scheme $S$. Choose an index set $I$ and diagrams

with étale vertical arrows and $U_{i}, V_{i}$ affine schemes. Moreover, assume that $\coprod U_{i} \rightarrow$ $X$ and $\coprod V_{i} \rightarrow Y$ are surjective, see Properties of Spaces, Lemma 53.6.1. By Lemma 63.17 .9 we see that $f$ is formally smooth if and only if each of the morphisms $\psi_{i}$ are formally smooth. Hence we reduce to the case of a morphism of affine schemes. In this case the result follows from Algebra, Lemma 10.136.15 Some details omitted.

06BI Lemma 63.17.11. Let $S$ be a scheme. Let $f: X \rightarrow Y, g: Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Assume $f$ is formally smooth. Then

$$
0 \rightarrow f^{*} \Omega_{Y / Z} \rightarrow \Omega_{X / Z} \rightarrow \Omega_{X / Z} \rightarrow 0
$$

Lemma 63.7.8 is short exact.
Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.9.9, by étale localization, see Lemmas 63.17.9 and 63.7.3.

06BJ Lemma 63.17.12. Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $h: Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over $B$. Assume that $Z$ is formally smooth over $B$. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / B} \rightarrow \Omega_{Z / B} \rightarrow 0
$$

of Lemma 63.13.13 is short exact.
Proof. Let $Z \rightarrow Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. From the proof of Lemma 63.13 .13 we see that our sequence is identified with the sequence

$$
\overline{\mathcal{C}}_{Z / Z^{\prime}} \rightarrow \Omega_{Z^{\prime} / B} \otimes \mathcal{O}_{Z} \rightarrow \Omega_{Z / B} \rightarrow 0
$$

Since $Z \rightarrow S$ is formally smooth we can étale locally on $Z^{\prime}$ find a left inverse $Z^{\prime} \rightarrow Z$ over $B$ to the inclusion map $Z \rightarrow Z^{\prime}$. Thus the sequence is étale locally split, see Lemma 63.7.11.
06BK Lemma 63.17.13. Let $S$ be a scheme. Let

be a commutative diagram of algebraic spaces over $S$ where $i$ and $j$ are formally unramified and $f$ is formally smooth. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$

of Lemma 63.13.14 is exact and locally split.
Proof. Denote $Z \rightarrow Z^{\prime}$ the universal first order thickening of $Z$ over $X$. Denote $Z \rightarrow Z^{\prime \prime}$ the universal first order thickening of $Z$ over $Y$. By Lemma 63.13 .13 here is a canonical morphism $Z^{\prime} \rightarrow Z^{\prime \prime}$ so that we have a commutative diagram

The sequence above is identified with the sequence

$$
\mathcal{C}_{Z / Z^{\prime \prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}} \rightarrow\left(i^{\prime}\right)^{*} \Omega_{Z^{\prime} / Z^{\prime \prime}} \rightarrow 0
$$

via our definitions concerning conormal sheaves of formally unramified morphisms. Let $U^{\prime \prime} \rightarrow Z^{\prime \prime}$ be an étale morphism with $U^{\prime \prime}$ affine. Denote $U \rightarrow Z$ and $U^{\prime} \rightarrow Z^{\prime}$ the corresponding affine schemes étale over $Z$ and $Z^{\prime}$. As $f$ is formally smooth there exists a morphism $h: U^{\prime \prime} \rightarrow X$ which agrees with $i$ on $U$ and such that $f \circ h$ equals $\left.b\right|_{U^{\prime \prime}}$. Since $Z^{\prime}$ is the universal first order thickening we obtain a unique morphism $g: U^{\prime \prime} \rightarrow Z^{\prime}$ such that $g=a \circ h$. The universal property of $Z^{\prime \prime}$ implies that $k \circ g$ is the inclusion map $U^{\prime \prime} \rightarrow Z^{\prime \prime}$. Hence $g$ is a left inverse to $k$. Picture

Thus $g$ induces a map $\left.\left.\mathcal{C}_{Z / Z^{\prime}}\right|_{U} \rightarrow \mathcal{C}_{Z / Z^{\prime \prime}}\right|_{U}$ which is a left inverse to the map $\mathcal{C}_{Z / Z^{\prime \prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}}$ over $U$.

### 63.18. Smoothness over a Noetherian base

0APM This section is the analogue of More on Morphisms, Section 36.10.
0APN Lemma 63.18.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$. Assume that $Y$ is locally Noetherian and $f$ locally of finite type. The following are equivalent:
(1) $f$ is smooth at $x$,
(2) for every solid commutative diagram

where $B^{\prime} \rightarrow B$ is a surjection of local rings with $\operatorname{Ker}\left(B^{\prime} \rightarrow B\right)$ of square zero, and $\alpha$ mapping the closed point of $\operatorname{Spec}(B)$ to $x$ there exists a dotted arrow making the diagram commute, and
(3) same as in (2) but with $B^{\prime} \rightarrow B$ ranging over small extensions (see Algebra, Definition 10.139.1).

Proof. Condition (1) means there is an open subspace $X^{\prime} \subset X$ such that $X^{\prime} \rightarrow Y$ is smooth. Hence (1) implies conditions (2) and (3) by Lemma 63.17.6. Condition (2) implies condition (3) trivially. Assume (3). Choose a commutative diagram

with $U$ and $V$ affine, horizontal arrows étale and such that there is a point $u \in U$ mapping to $x$. Next, consider a diagram

as in (3) but for $u \in U \rightarrow V$. Let $\gamma: \operatorname{Spec}\left(B^{\prime}\right) \rightarrow X$ be the arrow we get from our assumption that (3) holds for $X$. Because $U \rightarrow X$ is étale and hence formally étale (Lemma 63.14.8) the morphism $\gamma$ has a unique lift to $U$ compatible with $\alpha$. Then because $V \rightarrow Y$ is étale hence formally étale this lift is compatible with $\beta$. Hence (3) holds for $u \in U \rightarrow V$ and we conclude that $U \rightarrow V$ is smooth at $u$ by More on Morphisms, Lemma 36.10.1. This proves that $X \rightarrow Y$ is smooth at $x$, thereby finishing the proof.

Sometimes it is useful to know that one only needs to check the lifting criterion for small extensions "centered" at points of finite type (see Morphisms of Spaces, Section 54.25.

0APP Lemma 63.18.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $Y$ is locally Noetherian and $f$ locally of finite type. The following are equivalent:
(1) $f$ is smooth,
(2) for every solid commutative diagram

where $B^{\prime} \rightarrow B$ is a small extension of Artinian local rings and $\beta$ of finite type (!) there exists a dotted arrow making the diagram commute.

Proof. If $f$ is smooth, then the infinitesimal lifting criterion (Lemma 63.17.6) says $f$ is formally smooth and (2) holds.

Assume $f$ is not smooth. The set of points $x \in X$ where $f$ is not smooth forms a closed subset $T$ of $|X|$. By Morphisms of Spaces, Lemma 54.25.6 there exists a point $x \in T \subset X$ with $x \in X_{\mathrm{ft} \text {-pts. }}$. Choose a commutative diagram

with $U$ and $V$ affine, horizontal arrows étale and such that there is a point $u \in U$ mapping to $x$. Then $u$ is a finite type point of $U$. Since $U \rightarrow V$ is not smooth at the point $u$, by More on Morphisms, Lemma 36.10.1 there is a diagram

with $B^{\prime} \rightarrow B$ a small extension of (Artinian) local rings such that the residue field of $B$ is equal to $\kappa(v)$ and such that the dotted arrow does not exist. Since $U \rightarrow V$ is of finite type, we see that $v$ is a finite type point of $V$. By Morphisms, Lemma 28.16 .2 the morphism $\beta$ is of finite type, hence the composition $\operatorname{Spec}(B) \rightarrow Y$ is of finite type also. Arguing exactly as in the proof of Lemma 63.18.1 (using that $U \rightarrow X$ and $V \rightarrow Y$ are étale hence formally étale) we see that there cannot be an arrow $\operatorname{Spec}(B) \rightarrow X$ fitting into the outer rectangle of the last displayed diagram. In other words, (2) doesn't hold and the proof is complete.

Here is a useful application.
0APQ Lemma 63.18.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is locally of finite type and $Y$ locally Noetherian. Let $Z \subset Y$ be a closed subspace with nth infinitesimal neighbourhood $Z_{n} \subset Y$. Set $X_{n}=Z_{n} \times_{Y} X$.
(1) If $X_{n} \rightarrow Z_{n}$ is smooth for all $n$, then $f$ is smooth at every point of $f^{-1}(Z)$.
(2) If $X_{n} \rightarrow Z_{n}$ is étale for all $n$, then $f$ is étale at every point of $f^{-1}(Z)$.

Proof. Assume $X_{n} \rightarrow Z_{n}$ is smooth for all $n$. Let $x \in X$ be a point lying over a point of $Z$. Given a small extension $B^{\prime} \rightarrow B$ and morphisms $\alpha, \beta$ as in Lemma 63.18.1 part (3) the maximal ideal of $B^{\prime}$ is nilpotent (as $B^{\prime}$ is Artinian) and hence
the morphism $\beta$ factors through $Z_{n}$ and $\alpha$ factors through $X_{n}$ for a suitable $n$. Thus the lifting property for $X_{n} \rightarrow Z_{n}$ kicks in to get the desired dotted arrow in the diagram. This proves (1). Part (2) follows from (1) and the fact that a morphism is étale if and only if it is smooth of relative dimension 0 .

### 63.19. Openness of the flat locus

05 WU This section is analogue of More on Morphisms, Section 36.12. Note that we have defined the notion of flatness for quasi-coherent modules on algebraic spaces in Morphisms of Spaces, Section 54.30 .

05WV Theorem 63.19.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Assume $f$ is locally of finite presentation and that $\mathcal{F}$ is an $\mathcal{O}_{X}$-module which is locally of finite presentation. Then

$$
\{x \in|X|: \mathcal{F} \text { is flat over } Y \text { at } x\}
$$

is open in $|X|$.
Proof. Choose a commutative diagram

with $U, V$ schemes and $p, q$ surjective and étale as in Spaces, Lemma 52.11.6. By More on Morphisms, Theorem 36.12.1 the set $U^{\prime}=\left\{u \in|U|: p^{*} \mathcal{F}\right.$ is flat over $V$ at $\left.u\right\}$ is open in $U$. By Morphisms of Spaces, Definition 54.30 .2 the image of $U^{\prime}$ in $|X|$ is the set of the theorem. Hence we are done because the map $|U| \rightarrow|X|$ is open, see Properties of Spaces, Lemma 53.4.6.

05WW Lemma 63.19.2. Let $S$ be a scheme. Let

be a cartesian diagram of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. Assume $g$ is flat, $f$ is locally of finite presentation, and $\mathcal{F}$ is locally of finite presentation. Then

$$
\left\{x^{\prime} \in\left|X^{\prime}\right|:\left(g^{\prime}\right)^{*} \mathcal{F} \text { is flat over } Y^{\prime} \text { at } x^{\prime}\right\}
$$

is the inverse image of the open subset of Theorem 63.19.1 under the continuous map $\left|g^{\prime}\right|:\left|X^{\prime}\right| \rightarrow|X|$.

Proof. This follows from Morphisms of Spaces, Lemma 54.30.3.

### 63.20. Critère de platitude par fibres

05WX Let $S$ be a scheme. Consider a commutative diagram of algebraic spaces over $S$

and a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$. Given a point $x \in|X|$ we consider the question as to whether $\mathcal{F}$ is flat over $Y$ at $x$. If $\mathcal{F}$ is flat over $Z$ at $x$, then the theorem below states this question is intimately related to the question of whether the restriction of $\mathcal{F}$ to the fibre of $X \rightarrow Z$ over $g(x)$ is flat over the fibre of $Y \rightarrow Z$ over $g(x)$. To make sense out of this we offer the following preliminary lemma.

05WY Lemma 63.20.1. In the situation above the following are equivalent
(1) Pick a geometric point $\bar{x}$ of $X$ lying over $x$. Set $\bar{y}=f \circ \bar{x}$ and $\bar{z}=g \circ \bar{x}$. Then the module $\mathcal{F}_{\bar{x}} / \mathfrak{m}_{\bar{z}} \mathcal{F}_{\bar{x}}$ is flat over $\mathcal{O}_{Y, \bar{y}} / \mathfrak{m}_{\bar{z}} \mathcal{O}_{Y, \bar{y}}$.
(2) Pick a morphism $x: \operatorname{Spec}(K) \rightarrow X$ in the equivalence class of $x$. Set $z=g \circ x, X_{z}=\operatorname{Spec}(K) \times_{z, Z} X, Y_{z}=\operatorname{Spec}(K) \times_{z, Z} Y$, and $\mathcal{F}_{z}$ the pullback of $\mathcal{F}$ to $X_{z}$. Then $\mathcal{F}_{z}$ is flat at $x$ over $Y_{z}$ (as defined in Morphisms of Spaces, Definition 54.30.2).
(3) Pick a commutative diagram

where $U, V, W$ are schemes, and $a, b, c$ are étale, and a point $u \in U$ mapping to $x$. Let $w \in W$ be the image of $u$. Let $\mathcal{F}_{w}$ be the pullback of $\mathcal{F}$ to the fibre $U_{w}$ of $U \rightarrow W$ at $w$. Then $\mathcal{F}_{w}$ is flat over $V_{w}$ at $u$.

Proof. Note that in (2) the morphism $x: \operatorname{Spec}(K) \rightarrow X$ defines a $K$-rational point of $X_{z}$, hence the statement makes sense. Moreover, the condition in (2) is independent of the choice of $\operatorname{Spec}(K) \rightarrow X$ in the equivalence class of $x$ (details omitted; this will also follow from the arguments below because the other conditions do not depend on this choice). Also note that we can always choose a diagram as in (3) by: first choosing a scheme $W$ and a surjective étale morphism $W \rightarrow Z$, then choosing a scheme $V$ and a surjective étale morphism $V \rightarrow W \times{ }_{Z} Y$, and finally choosing a scheme $U$ and a surjective étale morphism $U \rightarrow V \times_{Y} X$. Having made these choices we set $U \rightarrow W$ equal to the composition $U \rightarrow V \rightarrow W$ and we can pick a point $u \in U$ mapping to $x$ because the morphism $U \rightarrow X$ is surjective.
Suppose given both a diagram as in (3) and a geometric point $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ as in (1). By Properties of Spaces, Lemma 53.18 .4 we can choose a geometric point $\bar{u}: \operatorname{Spec}(k) \rightarrow U$ lying over $u$ such that $\bar{x}=a \circ \bar{u}$. Denote $\bar{v}: \operatorname{Spec}(k) \rightarrow V$ and $\bar{w}: \operatorname{Spec}(k) \rightarrow W$ the induced geometric points of $V$ and $W$. In this setting we know that $\mathcal{O}_{X, \bar{x}}=\mathcal{O}_{U, u}^{s h}$ and similarly for $Y$ and $Z$, see Properties of Spaces,

Lemma 53.21.1. In the same vein we have

$$
\mathcal{F}_{\bar{x}}=\left(a^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{U, u}^{s h}
$$

see Properties of Spaces, Lemma 53.28.4. Note that the stalk of $\mathcal{F}_{w}$ at $u$ is given by

$$
\left(\mathcal{F}_{w}\right)_{u}=\left(a^{*} \mathcal{F}\right)_{u} / \mathfrak{m}_{w}\left(a^{*} \mathcal{F}\right)_{u}
$$

and the local ring of $V_{w}$ at $v$ is given by

$$
\mathcal{O}_{V_{w}, v}=\mathcal{O}_{V, v} / \mathfrak{m}_{w} \mathcal{O}_{V, v}
$$

Since $\mathfrak{m}_{\bar{z}}=\mathfrak{m}_{w} \mathcal{O}_{Z, \bar{z}}=\mathfrak{m}_{w} \mathcal{O}_{W, w}^{s h}$ we see that

$$
\begin{aligned}
\mathcal{F}_{\bar{x}} / \mathfrak{m}_{\bar{z}} \mathcal{F}_{\bar{x}} & =\left(a^{*} \mathcal{F}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}} / \mathfrak{m}_{\bar{z}} \mathcal{O}_{X, \bar{x}} \\
& =\left(\mathcal{F}_{w}\right)_{u} \otimes_{\mathcal{O}_{U_{w}, u}} \mathcal{O}_{U, u}^{s h} / \mathfrak{m}_{w} \mathcal{O}_{U, u}^{s h} \\
& =\left(\mathcal{F}_{w}\right)_{u} \otimes_{\mathcal{O}_{U_{w}, u}} \mathcal{O}_{U_{w}, \bar{u}}^{s h} \\
& =\left(\mathcal{F}_{w}\right)_{\bar{u}}
\end{aligned}
$$

the penultimate equality by Algebra, Lemma 10.148 .30 and the last equality by Properties of Spaces, Lemma 53.28.4 The same arguments applied to the structure sheaves of $V$ and $Y$ show that

$$
\mathcal{O}_{V_{w}, \bar{v}}^{s h}=\mathcal{O}_{V, v}^{s h} / \mathfrak{m}_{w} \mathcal{O}_{V, v}^{s h}=\mathcal{O}_{Y, \bar{y}} / \mathfrak{m}_{\bar{z}} \mathcal{O}_{Y, \bar{y}}
$$

OK, and now we can use Morphisms of Spaces, Lemma 54.30.1 to see that (1) is equivalent to (3).
Finally we prove the equivalence of (2) and (3). To do this we pick a field extension $\tilde{K}$ of $K$ and and a morphism $\tilde{x}: \operatorname{Spec}(\tilde{K}) \rightarrow U$ which lies over $u$ (this is possible because $u \times_{X, x} \operatorname{Spec}(K)$ is a nonempty scheme). Set $\tilde{z}: \operatorname{Spec}(\tilde{K}) \rightarrow U \rightarrow W$ be the composition. We obtain a commutative diagram

where $z=\operatorname{Spec}(K)$ and $w=\operatorname{Spec}(\kappa(w))$. Now it is clear that $\mathcal{F}_{w}$ and $\mathcal{F}_{z}$ pull back to the same module on $U_{w} \times_{w} \tilde{z}$. This leads to a commutative diagram

both of whose squares are cartesian and whose bottom horizontal arrows are flat: the lower left horizontal arrow is the composition of the morphism $Y \times_{Z} \tilde{z} \rightarrow$ $Y \times_{Z} z=Y_{z}$ (base change of a flat morphism), the étale morphism $V \times_{Z} \tilde{z} \rightarrow Y \times_{Z} \tilde{z}$, and the étale morphism $V \times_{W} \tilde{z} \rightarrow V \times_{Z} \tilde{z}$. Thus it follows from Morphisms of Spaces, Lemma 54.30.3 that
$\mathcal{F}_{z}$ flat at $x$ over $\left.Y_{z} \Leftrightarrow \mathcal{F}\right|_{U_{w} \times w} \tilde{z}$ flat at $\tilde{x}$ over $V_{w} \times_{w} \tilde{z} \Leftrightarrow \mathcal{F}_{w}$ flat at $u$ over $V_{w}$
and we win.
05WZ Definition 63.20.2. Let $S$ be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in|X|$ be a point and denote $z \in|Z|$ its image.
(1) We say the restriction of $\mathcal{F}$ to its fibre over $z$ is flat at $x$ over the fibre of $Y$ over $z$ if the equivalent conditions of Lemma 63.20.1 are satisfied.
(2) We say the fibre of $X$ over $z$ is flat at $x$ over the fibre of $Y$ over $z$ if the equivalent conditions of Lemma 63.20.1 hold with $\mathcal{F}=\mathcal{O}_{X}$.
(3) We say the fibre of $X$ over $z$ is flat over the fibre of $Y$ over $z$ if for all $x \in|X|$ lying over $z$ the fibre of $X$ over $z$ is flat at $x$ over the fibre of $Y$ over $z$

With this definition in hand we can state a version of the criterion as follows. The Noetherian version can be found in Section 63.21 ,

05X0 Theorem 63.20.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be a morphisms of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X$ is locally of finite presentation over $Z$,
(2) $\mathcal{F}$ an $\mathcal{O}_{X}$-module of finite presentation, and
(3) $Y$ is locally of finite type over $Z$.

Let $x \in|X|$ and let $y \in|Y|$ and $z \in|Z|$ be the images of $x$. If $\mathcal{F}_{\bar{x}} \neq 0$, then the following are equivalent:
(1) $\mathcal{F}$ is flat over $Z$ at $x$ and the restriction of $\mathcal{F}$ to its fibre over $z$ is flat at $x$ over the fibre of $Y$ over $z$, and
(2) $Y$ is flat over $Z$ at $y$ and $\mathcal{F}$ is flat over $Y$ at $x$. Moreover, the set of points $x$ where (1) and (2) hold is open in $\operatorname{Supp}(\mathcal{F})$.

Proof. Choose a diagram as in Lemma63.20.1 part (3). It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^{*} \mathcal{F}$, and the point $u \in U$. Thus the theorem follows from the corresponding result for schemes which is More on Morphisms, Theorem 36.13.2.
05X1 Lemma 63.20.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over $S$. Assume
(1) $X$ is locally of finite presentation over $Z$,
(2) $X$ is flat over $Z$,
(3) for every $z \in|Z|$ the fibre of $X$ over $z$ is flat over the fibre of $Y$ over $z$, and
(4) $Y$ is locally of finite type over $Z$.

Then $f$ is flat. If $f$ is also surjective, then $Y$ is flat over $Z$.
Proof. This is a special case of Theorem 63.20.3.
05X2 Lemma 63.20.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be morphisms of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X$ is locally of finite presentation over $Z$,
(2) $\mathcal{F}$ an $\mathcal{O}_{X}$-module of finite presentation,
(3) $\mathcal{F}$ is flat over $Z$, and
(4) $Y$ is locally of finite type over $Z$.

Then the set

$$
A=\{x \in|X|: \mathcal{F} \text { flat at } x \text { over } Y\} .
$$

is open in $|X|$ and its formation commutes with arbitrary base change: If $Z^{\prime} \rightarrow Z$ is a morphism of algebraic spaces, and $A^{\prime}$ is the set of points of $X^{\prime}=X \times_{Z} Z^{\prime}$ where $\mathcal{F}^{\prime}=\mathcal{F} \times{ }_{Z} Z^{\prime}$ is flat over $Y^{\prime}=Y \times{ }_{Z} Z^{\prime}$, then $A^{\prime}$ is the inverse image of $A$ under the continuous map $\left|X^{\prime}\right| \rightarrow|X|$.

Proof. One way to prove this is to translate the proof as given in More on Morphisms, Lemma 36.13 .4 into the category of algebraic spaces. Instead we will prove this by reducing to the case of schemes. Namely, choose a diagram as in Lemma 63.20 .1 part (3) such that $a, b$, and $c$ are surjective. It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^{*} \mathcal{F}$, and the point $u \in U$. The only minor point to make is that given a morphism of algebraic spaces $Z^{\prime} \rightarrow Z$ we choose a scheme $W^{\prime}$ and a surjective étale morphism $W^{\prime} \rightarrow W \times{ }_{Z} Z^{\prime}$. Then we set $U^{\prime}=W^{\prime} \times_{W} U$ and $V^{\prime}=W^{\prime} \times_{W} V$. We write $a^{\prime}, b^{\prime}, c^{\prime}$ for the morphisms from $U^{\prime}, V^{\prime}, W^{\prime}$ to $X^{\prime}, Y^{\prime}, Z^{\prime}$. In this case $A$, resp. $A^{\prime}$ are images of the open subsets of $U$, resp. $U^{\prime}$ associated to $a^{*} \mathcal{F}$, resp. $\left(a^{\prime}\right)^{*} \mathcal{F}^{\prime}$. This indeed does reduce the lemma to More on Morphisms, Lemma 36.13.4.

05X3 Lemma 63.20.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over $S$. Assume
(1) $X$ is locally of finite presentation over $Z$,
(2) $X$ is flat over $Z$, and
(3) $Y$ is locally of finite type over $Z$.

Then the set

$$
\{x \in|X|: X \text { flat at } x \text { over } Y\}
$$

is open in $|X|$ and its formation commutes with arbitrary base change $Z^{\prime} \rightarrow Z$.
Proof. This is a special case of Lemma 63.20.5.

### 63.21. Flatness over a Noetherian base

08 VN Here is the "Critère de platitude par fibres" in the Noetherian case.
0APR Theorem 63.21.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be a morphisms of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X, Y, Z$ locally Noetherian, and
(2) $\mathcal{F}$ a coherent $\mathcal{O}_{X}$-module.

Let $x \in|X|$ and let $y \in|Y|$ and $z \in|Z|$ be the images of $x$. If $\mathcal{F}_{\bar{x}} \neq 0$, then the following are equivalent:
(1) $\mathcal{F}$ is flat over $Z$ at $x$ and the restriction of $\mathcal{F}$ to its fibre over $z$ is flat at $x$ over the fibre of $Y$ over $z$, and
(2) $Y$ is flat over $Z$ at $y$ and $\mathcal{F}$ is flat over $Y$ at $x$.

Proof. Choose a diagram as in Lemma 63.20.1 part (3). It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^{*} \mathcal{F}$, and the point $u \in U$. Thus the theorem follows from the corresponding result for schemes which is More on Morphisms, Theorem 36.13.1.

0APS Lemma 63.21.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over $S$. Assume
(1) $X, Y, Z$ locally Noetherian,
(2) $X$ is flat over $Z$,
(3) for every $z \in|Z|$ the fibre of $X$ over $z$ is flat over the fibre of $Y$ over $z$. Then $f$ is flat. If $f$ is also surjective, then $Y$ is flat over $Z$.

Proof. This is a special case of Theorem 63.21.1.
Just like for checking smoothness, if the base is Noetherian it suffices to check flatness over Artinian rings. Here is a sample statement.

08VP Lemma 63.21.3. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $X$ be an algebraic space locally of finite presentation over $S=\operatorname{Spec}(A)$. For $n \geq 1$ set $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$ and $X_{n}=S_{n} \times_{S} X$. Let $\mathcal{F}$ be coherent $\mathcal{O}_{X}$-module. If for every $n \geq 1$ the pullback $\mathcal{F}_{n}$ of $\mathcal{F}$ to $X$ is flat over $S_{n}$, then the (open) locus where $\mathcal{F}$ is flat over $X$ contains the inverse image of $V(I)$ under $X \rightarrow S$.

Proof. The locus where $\mathcal{F}$ is flat over $S$ is open in $|X|$ by Theorem 63.19.1. The statement is insensitive to replacing $X$ by the members of an étale covering, hence we may assume $X$ is an affine scheme. In this case the result follows immediately from Algebra, Lemma 10.98.11. Some details omitted.

### 63.22. Normalization revisited

082D Normalization commutes with smooth base change.
082E Lemma 63.22.1. Let $S$ be a scheme. Let $f: Y \rightarrow X$ be a smooth morphism of algebraic spaces over $S$. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. The integral closure of $\mathcal{O}_{Y}$ in $f^{*} \mathcal{A}$ is equal to $f^{*} \mathcal{A}^{\prime}$ where $\mathcal{A}^{\prime} \subset \mathcal{A}$ is the integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$.

Proof. By our construction of the integral closure, see Morphisms of Spaces, Definition 54.45.2, this reduces immediately to the case where $X$ and $Y$ are affine. In this case the result is Algebra, Lemma 10.143.4.

082F Lemma 63.22.2 (Normalization commutes with smooth base change). Let $S$ be a scheme. Let

be a fibre square of algebraic spaces over $S$. Assume $f$ is quasi-compact and quasiseparated and $\varphi$ is smooth. Let $Y_{i} \rightarrow X_{i}^{\prime} \rightarrow X_{i}$ be the normalization of $X_{i}$ in $Y_{i}$. Then $X_{2}^{\prime} \cong X_{2} \times{ }_{X_{1}} X_{1}^{\prime}$.

Proof. The base change of the factorization $Y_{1} \rightarrow X_{1}^{\prime} \rightarrow X_{1}$ to $X_{2}$ is a factorization $Y_{2} \rightarrow X_{2} \times_{X_{1}} X_{1}^{\prime} \rightarrow X_{1}$ and $X_{2} \times_{X_{1}} X_{1}^{\prime} \rightarrow X_{1}$ is integral (Morphisms of Spaces, Lemma 54.43.5. Hence we get a morphism $h: X_{2}^{\prime} \rightarrow X_{2} \times_{X_{1}} X_{1}^{\prime}$ by the universal property of Morphisms of Spaces, Lemma 54.45.5. Observe that $X_{2}^{\prime}$ is the relative spectrum of the integral closure of $\mathcal{O}_{X_{2}}$ in $f_{2, *} \mathcal{O}_{Y_{2}}$. If $\mathcal{A}^{\prime} \subset f_{1, *} \mathcal{O}_{Y_{1}}$ denotes the integral closure of $\mathcal{O}_{X_{2}}$, then $X_{2} \times_{X_{1}} X_{1}^{\prime}$ is the relative spectrum of $\varphi^{*} \mathcal{A}^{\prime}$ as the construction of the relative spectrum commutes with arbitrary base change. By

Cohomology of Spaces, Lemma 56.10.1 we know that $f_{2, *} \mathcal{O}_{Y_{2}}=\varphi^{*} f_{1, *} \mathcal{O}_{Y_{1}}$. Hence the result follows from Lemma 63.22 .1

### 63.23. Slicing Cohen-Macaulay morphisms

$06 \mathrm{LV} \quad$ Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $f_{1}, \ldots, f_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$. In this case we denote $V\left(f_{1}, \ldots, f_{r}\right)$ the closed subspace of $X$ cut out by $f_{1}, \ldots, f_{r}$. More precisely, we can define $V\left(f_{1}, \ldots, f_{r}\right)$ as the closed subspace of $X$ corresponding to the quasi-coherent sheaf of ideals generated by $f_{1}, \ldots, f_{r}$, see Morphisms of Spaces, Lemma 54.13.1. Alternatively, we can choose a presentation $X=U / R$ and consider the closed subscheme $Z \subset U$ cut out by $f_{1}\left|U, \ldots, f_{r}\right|_{U}$. It is clear that $Z$ is an $R$-invariant (see Groupoids, Definition 38.19.1) closed subscheme and we may set $V\left(f_{1}, \ldots, f_{r}\right)=Z / R_{Z}$.

06LW Lemma 63.23.1. Let $S$ be a scheme. Consider a cartesian diagram

where $X \rightarrow Y$ is a morphism of algebraic spaces over $S$ which is flat and locally of finite presentation, and where $k$ is a field over $S$. Let $f_{1}, \ldots, f_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$ and $z \in|F|$ such that $f_{1}, \ldots, f_{r}$ map to a regular sequence in the local ring $\mathcal{O}_{F, \bar{z}}$. Then, after replacing $X$ by an open subspace containing $p(z)$, the morphism

$$
V\left(f_{1}, \ldots, f_{r}\right) \longrightarrow Y
$$

is flat and locally of finite presentation.
Proof. Set $Z=V\left(f_{1}, \ldots, f_{r}\right)$. It is clear that $Z \rightarrow X$ is locally of finite presentation, hence the composition $Z \rightarrow Y$ is locally of finite presentation, see Morphisms of Spaces, Lemma 54.28.2. Hence it suffices to show that $Z \rightarrow Y$ is flat in a neighbourhood of $p(z)$. Let $k \subset k^{\prime}$ be an extension field. Then $F^{\prime}=F \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)$ is surjective and flat over $F$, hence we can find a point $z^{\prime} \in\left|F^{\prime}\right|$ mapping to $z$ and the local ring map $\mathcal{O}_{F, \bar{z}} \rightarrow \mathcal{O}_{F^{\prime}, \bar{z}^{\prime}}$ is flat, see Morphisms of Spaces, Lemma 54.29.8. Hence the image of $f_{1}, \ldots, f_{r}$ in $\mathcal{O}_{F^{\prime}, \bar{z}^{\prime}}$ is a regular sequence too, see Algebra, Lemma 10.67.5. Thus, during the proof we may replace $k$ by an extension field. In particular, we may assume that $z \in|F|$ comes from a section $z: \operatorname{Spec}(k) \rightarrow F$ of the structure morphism $F \rightarrow \operatorname{Spec}(k)$.

Choose a scheme $V$ and a surjective étale morphism $V \rightarrow Y$. Choose a scheme $U$ and a surjective étale morphism $U \rightarrow X \times_{Y} V$. After possibly enlarging $k$ once more we may assume that $\operatorname{Spec}(k) \rightarrow F \rightarrow X$ factors through $U$ (as $U \rightarrow X$ is surjective). Let $u: \operatorname{Spec}(k) \rightarrow U$ be such a factorization and denote $v \in V$ the image of $u$. Note that the morphisms

$$
U_{v} \times_{\operatorname{Spec}(\kappa(v))} \operatorname{Spec}(k)=U \times_{V} \operatorname{Spec}(k) \rightarrow U \times_{Y} \operatorname{Spec}(k) \rightarrow F
$$

are étale (the first as the base change of $V \rightarrow V \times_{Y} V$ and the second as the base change of $U \rightarrow X)$. Moreover, by construction the point $u: \operatorname{Spec}(k) \rightarrow U$ gives a point of the left most space which maps to $z$ on the right. Hence the elements
$f_{1}, \ldots, f_{r}$ map to a regular sequence in the local ring on the right of the following map

$$
\mathcal{O}_{U_{v}, u} \longrightarrow \mathcal{O}_{U_{v} \times \operatorname{Spec}(k(v)} \operatorname{Spec}(k), \bar{u}=\mathcal{O}_{U \times_{V} \operatorname{Spec}(k), \bar{u}}
$$

But since the displayed arrow is flat (combine More on Flatness, Lemma 37.2.5 and Morphisms of Spaces, Lemma 54.29.8 we see from Algebra, Lemma 10.67.5 that $f_{1}, \ldots, f_{r}$ maps to a regular sequence in $\mathcal{O}_{U_{v}, u}$. By More on Morphisms, Lemma 36.18 .2 we conclude that the morphism of schemes

$$
V\left(f_{1}, \ldots, f_{r}\right) \times_{X} U=V\left(\left.f_{1}\right|_{U}, \ldots,\left.f_{r}\right|_{U}\right) \rightarrow V
$$

is flat in an open neighbourhood $U^{\prime}$ of $u$. Let $X^{\prime} \subset X$ be the open subspace corresponding to the image of $\left|U^{\prime}\right| \rightarrow|X|$ (see Properties of Spaces, Lemmas 53.4.6 and 53.4.8. We conclude that $V\left(f_{1}, \ldots, f_{r}\right) \cap X^{\prime} \rightarrow Y$ is flat (see Morphisms of Spaces, Definition 54.29.1) as we have the commutative diagram

with $a, b$ étale and $a$ surjective.

### 63.24. Étale localization of morphisms

082G The section is the analogue of More on Morphisms, Section 36.30.
082H Lemma 63.24.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $y \in|Y|$. Let $x_{1}, \ldots, x_{n} \in|X|$ mapping to $y$. Assume that
(1) $f$ is locally of finite type,
(2) $f$ is separated,
(3) $f$ is quasi-finite at $x_{1}, \ldots, x_{n}$, and
(4) $f$ is quasi-compact or $Y$ is decent.

Then there exists an étale morphism $(U, u) \rightarrow(Y, y)$ of pointed algebraic spaces and a decomposition

$$
U \times_{Y} X=W \amalg V
$$

into open and closed subspaces such that the morphism $V \rightarrow U$ is finite, every point of the fibre of $|V| \rightarrow|U|$ over $u$ maps to an $x_{i}$, and the fibre of $|W| \rightarrow|U|$ over $u$ contains no point mapping to an $x_{i}$.

Proof. Let $(U, u) \rightarrow(Y, y)$ be an étale morphism of algebraic spaces and consider the set of $w \in\left|U \times_{Y} X\right|$ mapping to $u \in|U|$ and one of the $x_{i} \in|X|$. By Decent Spaces, Lemma 55.16.4 (if $f$ is of finite type) or Decent Spaces, Lemma 55.16.5 (if $Y$ is decent) this set is finite. It follows that we may replace $f$ by the base change $U \times_{Y} X \rightarrow U$ and $x_{1}, \ldots, x_{n}$ by the set of these $w$. In particular we may and do assume that $Y$ is an affine scheme, whence $X$ is a separated algebraic space.

Choose an affine scheme $Z$ and an étale morphism $Z \rightarrow X$ such that $x_{1}, \ldots, x_{n}$ are in the image of $|Z| \rightarrow|X|$. The fibres of $|Z| \rightarrow|X|$ are finite, see Properties of Spaces, Lemma 53.6 .7 (or the more general discussion in Decent Spaces, Section 55.6). Let $\left\{z_{1}, \ldots, z_{m}\right\} \subset|Z|$ be the preimage of $\left\{x_{1}, \ldots, x_{n}\right\}$. By More on Morphisms, Lemma 36.30 .4 there exists an étale morphism $(U, u) \rightarrow(Y, y)$ such that
$U \times_{Y} Z=Z_{1} \amalg Z_{2}$ with $Z_{1} \rightarrow U$ finite and $\left(Z_{1}\right)_{y}=\left\{z_{1}, \ldots, z_{m}\right\}$. We may assume that $U$ is affine and hence $Z_{1}$ is affine too.
Since $f$ is separated, the image $V$ of $Z_{1} \rightarrow X$ is both open and closed (Morphisms of Spaces, Lemma 54.39.6). Set $W=X \backslash V$ to get a decomposition as in the lemma. To finish the proof we have to show that $V \rightarrow U$ is finite. As $Z_{1} \rightarrow V$ is surjective and étale, $V$ is the quotient of $Z_{1}$ by the étale equivalence relation $R=Z_{1} \times{ }_{V} Z_{1}$, see Spaces, Lemma 52.9.1. Since $f$ is separated, $V \rightarrow U$ is separated and $R$ is closed in $Z_{1} \times_{U} Z_{1}$. Since $Z_{1} \rightarrow U$ is finite, the projections $s, t: R \rightarrow Z_{1}$ are finite. Thus $V$ is an affine scheme by Groupoids, Proposition 38.23.8. By Morphisms, Lemma 28.41.8 we conclude that $V \rightarrow U$ is proper and by Morphisms, Lemma 28.43.10 we conclude that $V \rightarrow U$ is finite, thereby finishing the proof.
0ADU Lemma 63.24.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $x \in|X|$ with image $y \in|Y|$. Assume that
(1) $f$ is locally of finite type,
(2) $f$ is separated, and
(3) $f$ is quasi-finite at $x$.

Then there exists an étale morphism $(U, u) \rightarrow(Y, y)$ of pointed algebraic spaces and a decomposition

$$
U \times_{Y} X=W \amalg V
$$

into open and closed subspaces such that the morphism $V \rightarrow U$ is finite and there exists a point $v \in|V|$ which maps to $x$ in $|X|$ and $u$ in $|U|$.

Proof. Pick a scheme $U$, a point $u \in U$, and an étale morphism $U \rightarrow Y$ mapping $u$ to $y$. There exists a point $x^{\prime} \in\left|U \times_{Y} X\right|$ mapping to $x$ in $|X|$ and $u$ in $|U|$ (Properties of Spaces, Lemma 53.4.3. To finish, apply Lemma 63.24.1 to the morphism $U \times_{Y} X \rightarrow U$ and the point $x^{\prime}$. It applies because $U$ is a scheme and hence $u$ comes from the monomorphism $\operatorname{Spec}(\kappa(u)) \rightarrow U$.

### 63.25. Zariski's Main Theorem

05W7 In this section we apply the results of the previous section to prove Zariski's main theorem for morphisms of algebraic spaces. This section is the analogue of More on Morphisms, Section 36.31 .

082I Lemma 63.25.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$ which is of finite type and separated. Let $Y^{\prime}$ be the normalization of $Y$ in $X$. Picture:

Then there exists an open subspace $U^{\prime} \subset Y^{\prime}$ such that
(1) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \rightarrow U^{\prime}$ is an isomorphism, and
(2) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \subset X$ is the set of points at which $f$ is quasi-finite.

Proof. By Morphisms of Spaces, Lemma 54.33.7 there is an open subspace $U \subset X$ corresponding to the points of $|X|$ where $f$ is quasi-finite. We have to prove
(a) the image of $|U| \rightarrow\left|Y^{\prime}\right|$ is $\left|U^{\prime}\right|$ for some open subspace $U^{\prime}$ of $Y^{\prime}$,
(b) $U=f^{-1}\left(U^{\prime}\right)$, and
(c) $U \rightarrow U^{\prime}$ is an isomorphism.

Since formation of $U$ commutes with arbitrary base change (Morphisms of Spaces, Lemma 54.33.7), since formation of the normalization $Y^{\prime}$ commutes with smooth base change (Lemma 63.22.2), since étale morphisms are open, and since "being an isomorphism" is fpqc local on the base (Descent on Spaces, Lemma 61.10.13), it suffices to prove (a), (b), (c) étale locally on $Y$ (some details omitted). Thus we may assume $Y$ is an affine scheme. This implies that $Y^{\prime}$ is an (affine) scheme as well.

Let $x \in|U|$. Claim: there exists an open neighbourhood $f^{\prime}(x) \in V \subset Y^{\prime}$ such that $\left(f^{\prime}\right)^{-1} V \rightarrow V$ is an isomorphism. We first prove the claim implies the lemma. Namely, then $\left(f^{\prime}\right)^{-1} V \cong V$ is a scheme (as an open of $Y^{\prime}$ ), locally of finite type over $Y$ (as an open subspace of $X$ ), and for $v \in V$ the residue field extension $\kappa(v) \supset \kappa\left(\nu(v)\right.$ ) is algebraic (as $V \subset Y^{\prime}$ and $Y^{\prime}$ is integral over $Y$ ). Hence the fibres of $V \rightarrow Y$ are discrete (Morphisms, Lemma 28.20.2) and $\left(f^{\prime}\right)^{-1} V \rightarrow Y$ is locally quasi-finite (Morphisms, Lemma 28.20.8). This implies $\left(f^{\prime}\right)^{-1} V \subset U$ and $V \subset U^{\prime}$. Since $x$ was arbitrary we see that (a), (b), and (c) are true.

Let $y=f(x) \in|Y|$. Let $(T, t) \rightarrow(Y, y)$ be an étale morphism of pointed schemes. Denote by a subscript ${ }_{T}$ the base change to $T$. Let $z \in X_{T}$ be a point in the fibre $X_{t}$ lying over $x$. Note that $U_{T} \subset X_{T}$ is the set of points where $f_{T}$ is quasi-finite, see Morphisms of Spaces, Lemma 54.33.7. Note that

$$
X_{T} \xrightarrow{f_{T}^{\prime}} Y_{T}^{\prime} \xrightarrow{\nu_{T}} T
$$

is the normalization of $T$ in $X_{T}$, see Lemma 63.22.2. Suppose that the claim holds for $z \in U_{T} \subset X_{T} \rightarrow Y_{T}^{\prime} \rightarrow T$, i.e., suppose that we can find an open neighbourhood $f_{T}^{\prime}(z) \in V^{\prime} \subset Y_{T}^{\prime}$ such that $\left(f_{T}^{\prime}\right)^{-1} V^{\prime} \rightarrow V^{\prime}$ is an isomorphism. The morphism $Y_{T}^{\prime} \rightarrow Y^{\prime}$ is étale hence the image $V \subset Y^{\prime}$ of $V^{\prime}$ is open. Observe that $f^{\prime}(x) \in V$ as $f_{T}^{\prime}(z) \in V^{\prime}$. Observe that

is a fibre square (as $Y_{T}^{\prime} \times Y^{\prime} X=X_{T}$ ). Since the left vertical arrow is an isomorphism and $\left\{V^{\prime} \rightarrow V\right\}$ is a étale covering, we conclude that the right vertical arrow is an isomorphism by Descent on Spaces, Lemma 61.10.13. In other words, the claim holds for $x \in U \subset X \rightarrow Y^{\prime} \rightarrow Y$.

By the result of the previous paragraph to prove the claim for $x \in|U|$, we may replace $Y$ by an étale neighbourhood $T$ of $y=f(x)$ and $x$ by any point lying over $x$ in $T \times_{Y} X$. Thus we may assume there is a decomposition

$$
X=V \amalg W
$$

into open and closed subspaces where $V \rightarrow Y$ is finite and $x \in V$, see Lemma 63.24 .1 Since $X$ is a disjoint union of $V$ and $W$ over $Y$ and since $V \rightarrow Y$ is finite we see that the normalization of $Y$ in $X$ is the morphism

$$
X=V \amalg W \longrightarrow V \amalg W^{\prime} \longrightarrow S
$$

where $W^{\prime}$ is the normalization of $Y$ in $W$, see Morphisms of Spaces, Lemmas 54.45.8 54.43.6 and 54.45.10. The claim follows and we win.

The following lemma is a duplicate of Morphisms of Spaces, Lemma 54.49.2. The reason for having two copies of the same lemma is that the proofs are somewhat different. The proof given below rests on Zariski's Main Theorem for nonrepresentable morphisms of algebraic spaces as presented above, whereas the proof of Morphisms of Spaces, Lemma 54.49.2 rests on Morphisms of Spaces, Proposition 54.47 .2 to reduce to the case of morphisms of schemes.

082J Lemma 63.25.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-finite and separated. Let $Y^{\prime}$ be the normalization of $Y$ in $X$. Picture:

Then $f^{\prime}$ is a quasi-compact open immersion and $\nu$ is integral. In particular $f$ is quasi-affine.
Proof. This follows from Lemma 63.25.1. Namely, by that lemma there exists an open subspace $U^{\prime} \subset Y^{\prime}$ such that $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)=X(!)$ and $X \rightarrow U^{\prime}$ is an isomorphism! In other words, $f^{\prime}$ is an open immersion. Note that $f^{\prime}$ is quasicompact as $f$ is quasi-compact and $\nu: Y^{\prime} \rightarrow Y$ is separated (Morphisms of Spaces, Lemma 54.8.8). Hence for every affine scheme $Z$ and morphism $Z \rightarrow Y$ the fibre product $Z \times_{Y} X$ is a quasi-compact open subscheme of the affine scheme $Z \times_{Y} Y^{\prime}$. Hence $f$ is quasi-affine by definition.

082K Lemma 63.25.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume $f$ is quasi-finite and separated and assume that $Y$ is quasicompact and quasi-separated. Then there exists a factorization

where $j$ is a quasi-compact open immersion and $\pi$ is finite.
Proof. Let $X \rightarrow Y^{\prime} \rightarrow Y$ be as in the conclusion of Lemma 63.25.2. By Limits of Spaces, Lemma 57.9.7 we can write $\nu_{*} \mathcal{O}_{Y^{\prime}}=\operatorname{colim}_{i \in I} \mathcal{A}_{i}$ as a directed colimit of finite quasi-coherent $\mathcal{O}_{X}$-algebras $\mathcal{A}_{i} \subset \nu_{*} \mathcal{O}_{Y^{\prime}}$. Then $\pi_{i}: T_{i}=\operatorname{Spec}_{Y}\left(\mathcal{A}_{i}\right) \rightarrow Y$ is a finite morphism for each $i$. Note that the transition morphisms $T_{i^{\prime}} \rightarrow T_{i}$ are affine and that $Y^{\prime}=\lim T_{i}$.

By Limits of Spaces, Lemma 57.5.5 there exists an $i$ and a quasi-compact open $U_{i} \subset T_{i}$ whose inverse image in $Y^{\prime}$ equals $f^{\prime}(X)$. For $i^{\prime} \geq i$ let $U_{i^{\prime}}$ be the inverse image of $U_{i}$ in $T_{i^{\prime}}$. Then $X \cong f^{\prime}(X)=\lim _{i^{\prime} \geq i} U_{i^{\prime}}$, see Limits of Spaces, Lemma 57.4.1. By Limits of Spaces, Lemma 57.5.10 we see that $X \rightarrow U_{i^{\prime}}$ is a closed immersion for some $i^{\prime} \geq i$. (In fact $X \cong U_{i^{\prime}}$ for sufficiently large $i^{\prime}$ but we don't need this.) Hence $X \rightarrow T_{i^{\prime}}$ is an immersion. By Morphisms of Spaces, Lemma 54.12 .6 we can factor this as $X \rightarrow T \rightarrow T_{i^{\prime}}$ where the first arrow is an open immersion and the second a closed immersion. Thus we win.

0874 Lemma 63.25.4. With notation and hypotheses as in Lemma 63.25.3. Assume moreover that $f$ is locally of finite presentation. Then we can choose the factorization such that $T$ is finite and of finite presentation over $Y$.
Proof. By Limits of Spaces, Lemma 57.11 .3 we can write $T=\lim T_{i}$ where all $T_{i}$ are finite and of finite presentation over $Y$ and the transition morphisms $T_{i^{\prime}} \rightarrow T_{i}$ are closed immersions. By Limits of Spaces, Lemma 57.5.5 there exists an $i$ and an open subscheme $U_{i} \subset T_{i}$ whose inverse image in $T$ is $X$. By Limits of Spaces, Lemma 57.5.10 we see that $X \cong U_{i}$ for large enough $i$. Replacing $T$ by $T_{i}$ finishes the proof.

0A4X Lemma 63.25.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. The following are equivalent:
(1) $f$ is finite,
(2) $f$ is proper and locally quasi-finite,
(3) $f$ is proper and $\left|X_{k}\right|$ is a discrete space for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where $k$ is a field,
(4) $f$ is universally closed, separated, locally of finite type and $\left|X_{k}\right|$ is a discrete space for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where $k$ is a field.
Proof. We have $(1) \Rightarrow(2)$ by Morphisms of Spaces, Lemmas 54.43.9, 54.43.8. We have $(2) \Rightarrow(3)$ by Morphisms of Spaces, Lemma 54.27.5. By definition (3) implies (4).

Assume (4). Since $f$ is universally closed it is quasi-compact (Morphisms of Spaces, Lemma 54.9.7. . Pick a point $y$ of $|Y|$. We represent $y$ by a morphism $\operatorname{Spec}(k) \rightarrow$ $Y$. Note that $\left|X_{k}\right|$ is finite discrete as a quasi-compact discrete space. The map $\left|X_{k}\right| \rightarrow|X|$ surjects onto the fibre of $|X| \rightarrow|Y|$ over $y$ (Properties of Spaces, Lemma 53.4.3. By Morphisms of Spaces, Lemma 54.33.8 we see that $X \rightarrow Y$ is quasi-finite at all the points of the fibre of $|X| \rightarrow|Y|$ over $y$. Choose an elementary étale neighbourhood $(U, u) \rightarrow(Y, y)$ and decomposition $X_{U}=V \amalg W$ as in Lemma 63.24 .1 adapted to all the points of $|X|$ lying over $y$. Note that $W_{u}=\emptyset$ because we used all the points in the fibre of $|X| \rightarrow|Y|$ over $y$. Since $f$ is universally closed we see that the image of $|W|$ in $|U|$ is a closed set not containing $u$. After shrinking $U$ we may assume that $W=\emptyset$. In other words we see that $X_{U}=V$ is finite over $U$. Since $y \in|Y|$ was arbitrary this means there exists a family $\left\{U_{i} \rightarrow Y\right\}$ of étale morphisms whose images cover $Y$ such that the base changes $X_{U_{i}} \rightarrow U_{i}$ are finite. We conclude that $f$ is finite by Morphisms of Spaces, Lemma 54.43.3.

As a consequence we have the following useful result.
0A4Y Lemma 63.25.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $y \in|Y|$. Assume
(1) $f$ is proper, and
(2) $f$ is quasi-finite at all $x \in|X|$ lying over $y$ (Decent Spaces, Lemma 55.16.10).

Then there exists an open neighbourhood $V \subset Y$ of $y$ such that $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow$ $V$ is finite.

Proof. By Morphisms of Spaces, Lemma 54.33 .7 the set of points at which $f$ is quasi-finite is an open $U \subset X$. Let $Z=X \backslash U$. Then $y \notin f(Z)$. Since $f$ is proper the set $f(Z) \subset Y$ is closed. Choose any open neighbourhood $V \subset Y$ of
$y$ with $Z \cap V=\emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence $f^{-1}(V) \rightarrow V$ is finite by Lemma 63.25.5.

0AEJ Lemma 63.25.7. Let $S$ be a scheme. Let

be a commutative diagram of morphism of algebraic spaces over $S$. Let $b \in B$ and let $\operatorname{Spec}(k) \rightarrow B$ be a morphism in the equivalence class of $b$. Assume
(1) $X \rightarrow B$ is a proper morphism,
(2) $Y \rightarrow B$ is separated and locally of finite type,
(3) one of the following is true
(a) the image of $\left|X_{k}\right| \rightarrow\left|Y_{k}\right|$ is finite,
(b) the image of $|f|^{-1}(\{b\})$ in $|Y|$ is finite and $B$ is decent.

Then there is an open subspace $B^{\prime} \subset B$ containing b such that $X_{B^{\prime}} \rightarrow Y_{B^{\prime}}$ factors through a closed subspace $Z \subset Y_{B^{\prime}}$ finite over $B^{\prime}$.

Proof. Let $Z \subset Y$ be the scheme theoretic image of $h$, see Morphisms of Spaces, Section 54.16. By Morphisms of Spaces, Lemma 54.39 .8 the morphism $X \rightarrow Z$ is surjective and $Z \rightarrow B$ is proper. Thus

$$
\{x \in|X| \text { lying over } b\} \rightarrow\{z \in|Z| \text { lying over } b\}
$$

and $\left|X_{k}\right| \rightarrow\left|Z_{k}\right|$ are surjective. We see that either (3)(a) or (3)(b) imply that $Z \rightarrow$ $B$ is quasi-finite all all points of $|Z|$ lying over $b$ by Decent Spaces, Lemma 55.16.10 Hence $Z \rightarrow B$ is finite in an open neighbourhood of $b$ by Lemma 63.25.6

### 63.26. Stein factorization

0 A18 Stein factorization is the statement that a proper morphism $f: X \rightarrow S$ with $f_{*} \mathcal{O}_{X}=\mathcal{O}_{S}$ has connected fibres.

0 A19 Lemma 63.26.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a universally closed, quasi-compact and quasi-separated morphism of algebraic spaces over $S$. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is universally closed, quasi-compact, quasi-separated and surjective,
(2) the morphism $\pi: Y^{\prime} \rightarrow Y$ is integral,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{Y^{\prime}}$,
(4) we have $Y^{\prime}=\underline{\operatorname{Spec}}_{Y}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $Y^{\prime}$ is the normalization of $Y$ in $X$ as defined in Morphisms of Spaces, Definition 54.45.3.

Proof. We just define $Y^{\prime}$ as the normalization of $Y$ in $X$, so (5) and (2) hold automatically. By Morphisms of Spaces, Lemma 54.45.9 we see that (4) holds. The morphism $f^{\prime}$ is universally closed by Morphisms of Spaces, Lemma 54.39.6. It is quasi-compact by Morphisms of Spaces, Lemma 54.8 .8 and quasi-separated by Morphisms of Spaces, Lemma 54.4.10.
To show the remaining statements we may assume the base $Y$ is affine (as taking normalization commutes with étale localization). Say $Y=\operatorname{Spec}(R)$. Then $Y^{\prime}=$ $\operatorname{Spec}(A)$ with $A=\Gamma\left(X, \mathcal{O}_{X}\right)$ an integral $R$-algebra. Thus it is clear that $f_{*}^{\prime} \mathcal{O}_{X}$ is $\mathcal{O}_{Y^{\prime}}$ (because $f_{*}^{\prime} \mathcal{O}_{X}$ is quasi-coherent, by Morphisms of Spaces, Lemma 54.11.2, and hence equal to $\widetilde{A})$. This proves (3).
Let us show that $f^{\prime}$ is surjective. As $f^{\prime}$ is universally closed (see above) the image of $f^{\prime}$ is a closed subset $V(I) \subset S^{\prime}=\operatorname{Spec}(A)$. Pick $h \in I$. Then $\left.h\right|_{X}=f^{\sharp}(h)$ is a global section of the structure sheaf of $X$ which vanishes at every point. As $X$ is quasi-compact this means that $\left.h\right|_{X}$ is a nilpotent section, i.e., $h^{n} \mid X=0$ for some $n>0$. But $A=\Gamma\left(X, \mathcal{O}_{X}\right)$, hence $h^{n}=0$. In other words $I$ is contained in the radical ideal of $A$ and we conclude that $V(I)=S^{\prime}$ as desired.

Let $f: X \rightarrow Y$ be a morphism of algebraic spaces and let $\bar{y}: \operatorname{Spec}(k) \rightarrow Y$ be a geometric point. Then the fibre of $f$ over $\bar{y}$ is the algebraic space $X_{\bar{y}}=$ $X \times_{Y, \bar{y}} \operatorname{Spec}(k)$ over $k$. If $Y$ is a scheme and $y \in Y$ is a point, then we denote $X_{y}=X \times_{Y} \operatorname{Spec}(\kappa(y))$ the fibre as usual.
0A1A Lemma 63.26.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\bar{y}$ be a geometric point of $Y$. Then $X_{\bar{y}}$ is connected, if and only if for every étale neighbourhood $(V, \bar{v}) \rightarrow(Y, \bar{y})$ where $V$ is a scheme the base change $X_{V} \rightarrow V$ has connected fibre $X_{v}$.

Proof. Since the category of étale neighbourhoods of $\bar{y}$ is cofiltered and contains a cofinal collection of schemes (Properties of Spaces, Lemma 53.18.3) we may replace $Y$ by one of these neighbourhoods and assume that $Y$ is a scheme. Let $y \in Y$ be the point corresponding to $\bar{y}$. Then $X_{y}$ is geometrically connected over $\kappa(y)$ if and only if $X_{\bar{y}}$ is connected and if and only if $\left(X_{y}\right)_{k^{\prime}}$ is connected for every finite separable extension $k^{\prime}$ of $\kappa(y)$. See Spaces over Fields, Section 59.8 and especially Lemma59.8.8. By More on Morphisms, Lemma 36.27.2 there exists an affine étale neighbourhood $(V, v) \rightarrow(Y, y)$ such that $\kappa(s) \subset \kappa(u)$ is identified with $\kappa(s) \subset k^{\prime}$ any given finite separable extension. The lemma follows.

0A1B Theorem 63.26.3 (Stein factorization; Noetherian case). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper morphism of algebraic spaces over $S$ with $Y$ locally Noetherian. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is proper with connected geometric fibres,
(2) the morphism $\pi: Y^{\prime} \rightarrow Y$ is finite,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{Y^{\prime}}$,
(4) we have $Y^{\prime}=\underline{\operatorname{Spec}}_{Y}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $Y^{\prime}$ is the normalization of $Y$ in $X$, see Morphisms, Definition 28.48.3.

Proof. Let $f=\pi \circ f^{\prime}$ be the factorization of Lemma 63.26.1. Note that besides the conclusions of Lemma 63.26.1 we also have that $f^{\prime}$ is separated (Morphisms of Spaces, Lemma 54.4.10) and finite type (Morphisms of Spaces, Lemma 54.23.6). Hence $f^{\prime}$ is proper. By Cohomology of Spaces, Lemma 56.19.2 we see that $f_{*} \mathcal{O}_{X}$ is a coherent $\mathcal{O}_{Y}$-module. Hence we see that $\pi$ is finite, i.e., (2) holds.

This proves all but the most interesting assertion, namely that the geometric fibres of $f^{\prime}$ are connected. It is clear from the discussion above that we may replace $Y$ by $Y^{\prime}$. Then $Y$ is locally Noetherian, $f: X \rightarrow Y$ is proper, and $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$. Let $\bar{y}$ be a geometric point of $Y$. At this point we apply the theorem on formal functions, more precisely Cohomology of Spaces, Lemma 56.20.7. It tells us that

$$
\mathcal{O}_{Y, \bar{y}}^{\wedge}=\lim _{n} H^{0}\left(X_{n}, \mathcal{O}_{X_{n}}\right)
$$

where $X_{n}=\operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}} / \mathfrak{m}_{\bar{y}}^{n}\right) \times_{Y} X$. Note that $X_{1}=X_{\bar{y}} \rightarrow X_{n}$ is a (finite order) thickening and hence the underlying topological space of $X_{n}$ is equal to that of $X_{\bar{y}}$. Thus, if $X_{\bar{y}}=T_{1} \amalg T_{2}$ is a disjoint union of nonempty open and closed subspaces, then similarly $X_{n}=T_{1, n} \amalg T_{2, n}$ for all $n$. And this in turn means $H^{0}\left(X_{n}, \mathcal{O}_{X_{n}}\right)$ contains a nontrivial idempotent $e_{1, n}$, namely the function which is identically 1 on $T_{1, n}$ and identically 0 on $T_{2, n}$. It is clear that $e_{1, n+1}$ restricts to $e_{1, n}$ on $X_{n}$. Hence $e_{1}=\lim e_{1, n}$ is a nontrivial idempotent of the limit. This contradicts the fact that $\mathcal{O}_{Y, \bar{y}}^{\wedge}$ is a local ring. Thus the assumption was wrong, i.e., $X_{\bar{y}}$ is connected as desired.

0A1C Theorem 63.26.4 (Stein factorization; general case). Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a proper morphism of algebraic spaces over $S$. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is proper with connected geometric fibres,
(2) the morphism $\pi: Y^{\prime} \rightarrow Y$ is integral,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{Y^{\prime}}$,
(4) we have $Y^{\prime}=\underline{\operatorname{Spec}}_{Y}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $Y^{\prime}$ is the normalization of $Y$ in $X$ (Morphisms of Spaces, Definition 54.45.3.)

Proof. We may apply Lemma 63.26.1 to get the morphism $f^{\prime}: X \rightarrow Y^{\prime}$. Note that besides the conclusions of Lemma 63.26.1 we also have that $f^{\prime}$ is separated (Morphisms of Spaces, Lemma 54.4.10) and finite type (Morphisms of Spaces, Lemma 54.23.6). Hence $f^{\prime}$ is proper. At this point we have proved all of the statements except for the statement that $f^{\prime}$ has connected geometric fibres.
It is clear from the discussion that we may replace $Y$ by $Y^{\prime}$. Then $f: X \rightarrow Y$ is proper and $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$. Note that these conditions are preserved under flat base change (Morphisms of Spaces, Lemma 54.39 .3 and Cohomology of Spaces, Lemma 56.10 .1 . Let $\bar{y}$ be a geometric point of $Y$. By Lemma 63.26 .2 and the remark just made we reduce to the case where $Y$ is a scheme, $y \in Y$ is a point, $f: X \rightarrow Y$ is a
proper algebraic space over $Y$ with $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$, and we have to show the fibre $X_{y}$ is connected. Replacing $Y$ by an affine neighbourhood of $y$ we may assume that $Y=\operatorname{Spec}(R)$ is affine. Then $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ signifies that the ring map $R \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$ is bijective.
By Limits of Spaces, Lemma 57.12 .2 we can write $(X \rightarrow Y)=\lim \left(X_{i} \rightarrow Y_{i}\right)$ with $X_{i} \rightarrow Y_{i}$ proper and of finite presentation and $Y_{i}$ Noetherian. For $i$ large enough $Y_{i}$ is affine (Limits of Spaces, Lemma 57.5.8. Say $Y_{i}=\operatorname{Spec}\left(R_{i}\right)$. Let $R_{i}^{\prime}=\Gamma\left(X_{i}, \mathcal{O}_{X_{i}}\right)$. Observe that we have ring maps $R_{i} \rightarrow R_{i}^{\prime} \rightarrow R$. Namely, we have the first because $X_{i}$ is an algebraic space over $R_{i}$ and the second because we have $X \rightarrow X_{i}$ and $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Note that $R=\operatorname{colim} R_{i}^{\prime}$ by Limits of Spaces, Lemma 57.5.4. Then

is commutative with $Y_{i}^{\prime}=\operatorname{Spec}\left(R_{i}^{\prime}\right)$. Let $y_{i}^{\prime} \in Y_{i}^{\prime}$ be the image of $y$. We have $X_{y}=\lim X_{i, y_{i}^{\prime}}$ because $X=\lim X_{i}, Y=\lim Y_{i}^{\prime}$, and $\kappa(y)=\operatorname{colim} \kappa\left(y_{i}^{\prime}\right)$. Now let $X_{y}=U \amalg V$ with $U$ and $V$ open and closed. Then $U, V$ are the inverse images of opens $U_{i}, V_{i}$ in $X_{i, y_{i}^{\prime}}$ (Limits of Spaces, Lemma 57.5.5). By Theorem 63.26.3 the fibres of $X_{i} \rightarrow Y_{i}^{\prime}$ are connected, hence either $U$ or $V$ is empty. This finishes the proof.

Here is an application.
0AYI Lemma 63.26.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Assume
(1) $f$ is proper,
(2) $Y$ is integral (Spaces over Fields, Definition 59.4.1) with generic point $\xi$,
(3) $Y$ is normal,
(4) $X$ is reduced,
(5) every generic point of an irreducible component of $|X|$ maps to $\xi$,
(6) we have $H^{0}\left(X_{\xi}, \mathcal{O}\right)=\kappa(\xi)$.

Then $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ and $f$ has geometrically connected fibres.
Proof. Apply Theorem 63.26.4 to get a factorization $X \rightarrow Y^{\prime} \rightarrow Y$. It is enough to show that $Y^{\prime}=Y$. It suffices to show that $Y^{\prime} \times_{Y} V \rightarrow V$ is an isomorphism, where $V \rightarrow Y$ is an étale morphism and $V$ an affine integral scheme, see Spaces over Fields, Lemma 59.4.5. The formation of $Y^{\prime}$ commutes with étale base change, see Morphisms of Spaces, Lemma 54.45.4. The generic points of $X \times_{Y} V$ lie over the generic points of $X$ (Decent Spaces, Lemma 55.18.1) hence map to the generic point of $V$ by assumption (5). Moreover, condition (6) is preserved under the base change by $V \rightarrow Y$, for example by flat base change (Cohomology of Spaces, Lemma 56.10.1). Thus it suffices to prove the lemma in case $Y$ is a normal integral affine scheme.
