where $Q^{\prime \prime}=\operatorname{Coker}\left(Q \rightarrow Q^{\prime}\right)$. Above we have seen that the inverse systems of Tor's are essentially constant with value 0 . It follows from Homology, Lemma 12.27.7 that the inverse limit of the right most maps is injective.

0AGW Lemma 15.21.5. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Assume
(1) I is finitely generated,
(2) $R / I$ is Noetherian,
(3) $M / I M$ is flat over $R / I$,
(4) $\operatorname{Tor}_{1}^{R}(M, R / I)=0$.

Then the $I$-adic completion $R^{\wedge}$ is a Noetherian ring and $M^{\wedge}$ is flat over $R^{\wedge}$.
Proof. By Algebra, Lemma 10.98 .8 the modules $M / I^{n} M$ are flat over $R / I^{n}$ for all $n$. By Algebra, Lemma 10.95 .5 we have (a) $R^{\wedge}$ and $M^{\wedge}$ are $I$-adically complete and (b) $R / I^{n}=R^{\wedge} / I^{n} R^{\wedge}$ for all $n$. By Algebra, Lemma 10.96 .5 the ring $R^{\wedge}$ is Noetherian. Applying Lemma 15.21 .4 we conclude that $M^{\wedge}=\lim M / I^{n} M$ is flat as an $R^{\wedge}$-module.

### 15.22. The Koszul complex

0621 We define the Koszul complex as follows.
0622 Definition 15.22.1. Let $R$ be a ring. Let $\varphi: E \rightarrow R$ be an $R$-module map. The Koszul complex $K_{\bullet}(\varphi)$ associated to $\varphi$ is the commutative differential graded algebra defined as follows:
(1) the underlying graded algebra is the exterior algebra $K_{\bullet}(\varphi)=\wedge(E)$,
(2) the differential $d: K_{\bullet}(\varphi) \rightarrow K_{\bullet}(\varphi)$ is the unique derivation such that $d(e)=\varphi(e)$ for all $e \in E=K_{1}(\varphi)$.

Explicitly, if $e_{1} \wedge \ldots \wedge e_{n}$ is one of the generators of degree $n$ in $K_{\bullet}(\varphi)$, then

$$
d\left(e_{1} \wedge \ldots \wedge e_{n}\right)=\sum_{i=1, \ldots, n}(-1)^{i+1} \varphi\left(e_{i}\right) e_{1} \wedge \ldots \wedge \widehat{e}_{i} \wedge \ldots \wedge e_{n}
$$

It is straightforward to see that this gives a well defined derivation on the tensor algebra, which annihilates $e \otimes e$ and hence factors through the exterior algebra.
We often assume that $E$ is a finite free module, say $E=R^{\oplus n}$. In this case the map $\varphi$ is given by a sequence of elements $f_{1}, \ldots, f_{n} \in R$.

0623 Definition 15.22.2. Let $R$ be a ring and let $f_{1}, \ldots, f_{r} \in R$. The Koszul complex on $f_{1}, \ldots, f_{r}$ is the Koszul complex associated to the map $\left(f_{1}, \ldots, f_{r}\right): R^{\oplus r} \rightarrow R$. Notation $K_{\bullet}\left(f_{\bullet}\right), K_{\bullet}\left(f_{1}, \ldots, f_{r}\right), K_{\bullet}\left(R, f_{1}, \ldots, f_{r}\right)$, or $K_{\bullet}\left(R, f_{\bullet}\right)$.

Of course, if $E$ is finite locally free, then $K_{\bullet}(\varphi)$ is locally on $\operatorname{Spec}(R)$ isomorphic to a Koszul complex $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$. This complex has many interesting formal properties.

0624 Lemma 15.22.3. Let $\varphi: E \rightarrow R$ and $\varphi^{\prime}: E^{\prime} \rightarrow R$ be $R$-module maps. Let $\psi: E \rightarrow$ $E^{\prime}$ be an $R$-module map such that $\varphi^{\prime} \circ \psi=\varphi$. Then $\psi$ induces a homomorphism of differential graded algebras $K_{\bullet}(\varphi) \rightarrow K_{\bullet}\left(\varphi^{\prime}\right)$.

Proof. This is immediate from the definitions.
0625 Lemma 15.22.4. Let $f_{1}, \ldots, f_{r} \in R$ be a sequence. Let $\left(x_{i j}\right)$ be an invertible $r \times r$-matrix with coefficients in $R$. Then the complexes $K_{\bullet}\left(f_{\bullet}\right)$ and

$$
K_{\bullet}\left(\sum x_{1 j} f_{j}, \sum x_{2 j} f_{j}, \ldots, \sum x_{r j} f_{j}\right)
$$

are isomorphic.
Proof. Set $g_{i}=\sum x_{i j} f_{j}$. The matrix $\left(x_{j i}\right)$ gives an isomorphism $x: R^{\oplus r} \rightarrow R^{\oplus r}$ such that $\left(g_{1}, \ldots, g_{r}\right)=\left(f_{1}, \ldots, f_{r}\right) \circ x$. Hence this follows from the functoriality of the Koszul complex described in Lemma 15.22 .3

0626 Lemma 15.22.5. Let $R$ be a ring. Let $\varphi: E \rightarrow R$ be an $R$-module map. Let $e \in E$ with image $f=\varphi(e)$ in $R$. Then

$$
f=d e+e d
$$

as endomorphisms of $K_{\bullet}(\varphi)$.
Proof. This is true because $d(e a)=d(e) a-e d(a)=f a-e d(a)$.
0663 Lemma 15.22.6. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$ be a sequence. Multiplication by $f_{i}$ on $K_{\bullet}\left(f_{\bullet}\right)$ is homotopic to zero, and in particular the cohomology modules $H_{i}\left(K_{\bullet}\left(f_{\bullet}\right)\right)$ are annihilated by the ideal $\left(f_{1}, \ldots, f_{r}\right)$.

Proof. Special case of Lemma 15.22 .5 .
In Derived Categories, Section 13.9 we defined the cone of a morphism of cochain complexes. The cone $C(f)$ • of a morphism of chain complexes $f: A_{\bullet} \rightarrow B_{\bullet}$ is the complex $C(f)$ • given by $C(f)_{n}=B_{n} \oplus A_{n-1}$ and differential

0627

$$
d_{C(f), n}=\left(\begin{array}{cc}
d_{B, n} & f_{n-1}  \tag{15.22.6.1}\\
0 & -d_{A, n-1}
\end{array}\right)
$$

It comes equipped with canonical morphisms of complexes $i: B_{\bullet} \rightarrow C(f) \bullet$ and $p: C(f) \bullet A_{\bullet}[-1]$ induced by the obvious maps $B_{n} \rightarrow C(f)_{n} \rightarrow A_{n-1}$.

0628 Lemma 15.22.7. Let $R$ be a ring. Let $\varphi: E \rightarrow R$ be an $R$-module map. Let $f \in R$. Set $E^{\prime}=E \oplus R$ and define $\varphi^{\prime}: E^{\prime} \rightarrow R$ by $\varphi$ on $E$ and multiplication by $f$ on $R$. The complex $K_{\bullet}\left(\varphi^{\prime}\right)$ is isomorphic to the cone of the map of complexes

$$
f: K_{\bullet}(\varphi) \longrightarrow K_{\bullet}(\varphi)
$$

Proof. Denote $e_{0} \in E^{\prime}$ the element $1 \in R \subset R \oplus E$. By our definition of the cone above we see that

$$
C(f)_{n}=K_{n}(\varphi) \oplus K_{n-1}(\varphi)=\wedge^{n}(E) \oplus \wedge^{n-1}(E)=\wedge^{n}\left(E^{\prime}\right)
$$

where in the last $=$ we $\operatorname{map}\left(0, e_{1} \wedge \ldots \wedge e_{n-1}\right)$ to $e_{0} \wedge e_{1} \wedge \ldots \wedge e_{n-1}$ in $\wedge^{n}\left(E^{\prime}\right)$. A computation shows that this isomorphism is compatible with differentials. Namely, this is clear for elements of the first summand as $\left.\varphi^{\prime}\right|_{E}=\varphi$ and $d_{C(f)}$ restricted to the first summand is just $d_{K_{\bullet}(\varphi)}$. On the other hand, if $e_{1} \wedge \ldots \wedge e_{n-1}$ is in the first summand, then

$$
d_{C(f)}\left(0, e_{1} \wedge \ldots \wedge e_{n-1}\right)=f e_{1} \wedge \ldots \wedge e_{n-1}-d_{K \bullet(\varphi)}\left(e_{1} \wedge \ldots \wedge e_{n-1}\right)
$$

and on the other hand

$$
\begin{aligned}
& d_{K \cdot\left(\varphi^{\prime}\right)}\left(e_{0} \wedge e_{1} \wedge \ldots \wedge e_{n-1}\right) \\
& =\sum_{i=0, \ldots, n-1}(-1)^{i} \varphi^{\prime}\left(e_{i}\right) e_{0} \wedge \ldots \wedge \widehat{e_{i}} \wedge \ldots \wedge e_{n-1} \\
& =f e_{1} \wedge \ldots \wedge e_{n-1}+\sum_{i=1, \ldots, n-1}(-1)^{i} \varphi\left(e_{i}\right) e_{0} \wedge \ldots \wedge \widehat{e_{i}} \wedge \ldots \wedge e_{n-1} \\
& =f e_{1} \wedge \ldots \wedge e_{n-1}-e_{0}\left(\sum_{i=1, \ldots, n-1}(-1)^{i+1} \varphi\left(e_{i}\right) e_{1} \wedge \ldots \wedge \widehat{e_{i}} \wedge \ldots \wedge e_{n-1}\right)
\end{aligned}
$$

which is the image of the result of the previous computation.
0629 Lemma 15.22.8. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r}$ be a sequence of elements of $R$. The complex $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ is isomorphic to the cone of the map of complexes

$$
f_{n}: K_{\bullet}\left(f_{1}, \ldots, f_{r-1}\right) \longrightarrow K_{\bullet}\left(f_{1}, \ldots, f_{r-1}\right) .
$$

Proof. Special case of Lemma 15.22.7.
062A Lemma 15.22.9. Let $R$ be a ring. Let $A \bullet$ be a complex of $R$-modules. Let $f, g \in R$. Let $C(f) \bullet$ be the cone of $f: A_{\bullet} \rightarrow A_{\bullet}$. Define similarly $C(g) \bullet$ and $C(f g)$ • Then $C(f g)$. is homotopy equivalent to the cone of a map

$$
C(f) \bullet[1] \longrightarrow C(g) \bullet
$$

Proof. We first prove this if $A_{\bullet}$ is the complex consisting of $R$ placed in degree 0 . In this case the map we use is

The cone of this is the chain complex consisting of $R \oplus R$ placed in degrees 1 and 0 and differential 15.22.6.1

$$
\left(\begin{array}{cc}
g & 1 \\
0 & -f
\end{array}\right): R^{\oplus 2} \longrightarrow R^{\oplus 2}
$$

We leave it to the reader to show this this chain complex is homotopic to the complex $f g: R \rightarrow R$. In general we write $C(f)$ • and $C(g)$ • as the total complex of the double complexes

$$
(R \stackrel{f}{\rightarrow} R) \otimes_{R} A_{\bullet} \quad \text { and } \quad(R \xrightarrow{g} R) \otimes_{R} A_{\bullet}
$$

and in this way we deduce the result from the special case discussed above. Some details omitted.

062B Lemma 15.22.10. Let $R$ be a ring. Let $\varphi: E \rightarrow R$ be an $R$-module map. Let $f, g \in R$. Set $E^{\prime}=E \oplus R$ and define $\varphi_{f}^{\prime}, \varphi_{g}^{\prime}, \varphi_{f g}^{\prime}: E^{\prime} \rightarrow R$ by $\varphi$ on $E$ and multiplication by $f, g, f g$ on $R$. The complex $K_{\bullet}\left(\varphi_{f g}^{\prime}\right)$ is isomorphic to the cone of a map of complexes

$$
K_{\bullet}\left(\varphi_{f}^{\prime}\right)[1] \longrightarrow K_{\bullet}\left(\varphi_{g}^{\prime}\right) .
$$

Proof. By Lemma 15.22 .7 the complex $K_{\bullet}\left(\varphi_{f}^{\prime}\right)$ is isomorphic to the cone of multiplication by $f$ on $K_{\bullet}(\varphi)$ and similarly for the other two cases. Hence the lemma follows from Lemma 15.22 .9

062C Lemma 15.22.11. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r-1}$ be a sequence of elements of $R$. Let $f, g \in R$. The complex $K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, f g\right)$ is homotopy equivalent to the cone of a map of complexes

$$
K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, f\right)[1] \longrightarrow K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, g\right)
$$

Proof. Special case of Lemma 15.22 .10 .
0664 Lemma 15.22.12. Let $A$ be a ring. Let $f_{1}, \ldots, f_{r}, g_{1}, \ldots, g_{s}$ be elements of $A$. Then there is an isomorphism of Koszul complexes

$$
K_{\bullet}\left(A, f_{1}, \ldots, f_{r}, g_{1}, \ldots, g_{s}\right)=\operatorname{Tot}\left(K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right) \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{s}\right)\right)
$$

Proof. Omitted. Hint: If $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right)$ is generated as a differential graded algebra by $x_{1}, \ldots, x_{r}$ with $\mathrm{d}\left(x_{i}\right)=f_{i}$ and $K_{\bullet}\left(A, g_{1}, \ldots, g_{s}\right)$ is generated as a differential graded algebra by $y_{1}, \ldots, y_{s}$ with $\mathrm{d}\left(y_{j}\right)=g_{j}$, then we can think of $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}, g_{1}, \ldots, g_{s}\right)$ as the differential graded algebra generated by the sequence of elements $x_{1}, \ldots, x_{r}, y_{1}, \ldots, y_{r}$ with $\mathrm{d}\left(x_{i}\right)=f_{i}$ and $\mathrm{d}\left(y_{j}\right)=g_{j}$.

0913 Lemma 15.22.13. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$. The extended alternating Cech complex

$$
R \rightarrow \prod_{i_{0}} R_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} R_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow R_{f_{1} \ldots f_{r}}
$$

is a colimit of the Koszul complexes $K\left(R, f_{1}^{n}, \ldots, f_{r}^{n}\right)$.
Proof. The transition maps $K\left(R, f_{1}^{n}, \ldots, f_{r}^{n}\right) \rightarrow K\left(R, f_{1}^{n+1}, \ldots, f_{r}^{n+1}\right)$ are the maps sending $e_{i_{1}} \wedge \ldots \wedge e_{i_{p}}$ to $f_{i_{p+1}} \ldots f_{i_{r}} e_{i_{1}} \wedge \ldots \wedge e_{i_{p}}$ where the indices are such that $\{1, \ldots, r\}=\left\{i_{1}, \ldots, i_{r}\right\}$. In particular the transition maps are always 1 in degree $r$ and equal to $f_{1} \ldots f_{r}$ in degree 0 . The terms of the colimit are equal to the terms of the extended alternating Cech complex by Algebra, Lemma 10.9.9.

### 15.23. Koszul regular sequences

062D Please take a look at Algebra, Sections 10.6710 .68 , and 10.71 before looking at this one.
062 E Definition 15.23.1. Let $R$ be a ring. Let $r \geq 0$ and let $f_{1}, \ldots, f_{r} \in R$ be a sequence of elements. Let $M$ be an $R$-module. The sequence $f_{1}, \ldots, f_{r}$ is called
(1) $M$-Koszul-regular if $H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{R} M\right)=0$ for all $i \neq 0$,
(2) $M$ - $H_{1}$-regular if $H_{1}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{R} M\right)=0$,
(3) Koszul-regular if $H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right)=0$ for all $i \neq 0$, and
(4) $H_{1}$-Koszul-regular if $H_{1}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right)=0$.

We will see in Lemmas 15.23 .2 and 15.23 .5 that for elements $f_{1}, \ldots, f_{r}$ of a ring $R$ we have the following implications

$$
\begin{aligned}
f_{1}, \ldots, f_{r} \text { is a regular sequence } & \Rightarrow f_{1}, \ldots, f_{r} \text { is a Koszul-regular sequence } \\
& \Rightarrow f_{1}, \ldots, f_{r} \text { is an } H_{1} \text {-regular sequence } \\
& \Rightarrow f_{1}, \ldots, f_{r} \text { is a quasi-regular sequence. }
\end{aligned}
$$

In general none of these implications can be reversed, but if $R$ is a Noetherian local ring and $f_{1}, \ldots, f_{r} \in \mathfrak{m}_{R}$, then the four conditions are all equivalent (Lemma 15.23.6. If $f=f_{1} \in R$ is a length 1 sequence then it is clear that the following are all equivalent
(1) $f$ is a regular sequence of length one,
(2) $f$ is a Koszul-regular sequence of length one, and
(3) $f$ is a $H_{1}$-regular sequence of length one.

It is also clear that these imply that $f$ is a quasi-regular sequence of length one. But there do exist quasi-regular sequences of length 1 which are not regular sequences. Namely, let

$$
R=k\left[x, y_{0}, y_{1}, \ldots\right] /\left(x y_{0}, x y_{1}-y_{0}, x y_{2}-y_{1}, \ldots\right)
$$

and let $f$ be the image of $x$ in $R$. Then $f$ is a zerodivisor, but $\bigoplus_{n \geq 0}\left(f^{n}\right) /\left(f^{n+1}\right) \cong$ $k[x]$ is a polynomial ring.
062F Lemma 15.23.2. An $M$-regular sequence is $M$-Koszul-regular. A regular sequence is Koszul-regular.
Proof. Let $R$ be a ring and let $M$ be an $R$-module. It is immediate that an $M$ regular sequence of length 1 is $M$-Koszul-regular. Let $f_{1}, \ldots, f_{r}$ be an $M$-regular sequence. Then $f_{1}$ is a nonzerodivisor on $M$. Hence
$0 \rightarrow K_{\bullet}\left(f_{2}, \ldots, f_{r}\right) \otimes M \xrightarrow{f_{1}} K_{\bullet}\left(f_{2}, \ldots, f_{r}\right) \otimes M \rightarrow K_{\bullet}\left(\bar{f}_{2}, \ldots, \bar{f}_{r}\right) \otimes M / f_{1} M \rightarrow 0$ is a short exact sequence of complexes where $\bar{f}_{i}$ is the image of $f_{i}$ in $R /\left(f_{1}\right)$. By Lemma 15.22 .8 the complex $K_{\bullet}\left(R, f_{1}, \ldots, f_{r}\right)$ is isomorphic to the cone of multiplication by $f_{1}$ on $K_{\bullet}\left(f_{2}, \ldots, f_{r}\right)$. Thus $K_{\bullet}\left(R, f_{1}, \ldots, f_{r}\right) \otimes M$ is isomorphic to the cone on the first map. Hence $K_{\bullet}\left(\bar{f}_{2}, \ldots, \bar{f}_{r}\right) \otimes M / f_{1} M$ is quasi-isomorphic to $K \bullet\left(f_{1}, \ldots, f_{r}\right) \otimes M$. As $\bar{f}_{2}, \ldots, \bar{f}_{r}$ is an $M / f_{1} M$-regular sequence in $R /\left(f_{1}\right)$ the result follows from the case $r=1$ and induction.

062G Lemma 15.23.3. Let $f_{1}, \ldots, f_{r-1} \in R$ be a sequence and $f, g \in R$. Let $M$ be an $R$-module.
(1) If $f_{1}, \ldots, f_{r-1}, f$ and $f_{1}, \ldots, f_{r-1}, g$ are $M$ - $H_{1}$-regular then $f_{1}, \ldots, f_{r-1}, f g$ is $M-H_{1}$-regular too.
(2) If $f_{1}, \ldots, f_{r-1}, f$ and $f_{1}, \ldots, f_{r-1}, f$ are $M$-Koszul-regular then $f_{1}, \ldots, f_{r-1}, f g$ is M-Koszul-regular too.
Proof. By Lemma 15.22.11 we have exact sequences
$H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, f\right) \otimes M\right) \rightarrow H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, f g\right) \otimes M\right) \rightarrow H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r-1}, g\right) \otimes M\right)$ for all $i$.

062H Lemma 15.23.4. Let $\varphi: R \rightarrow S$ be a flat ring map. Let $f_{1}, \ldots, f_{r} \in R$. Let $M$ be an $R$-module and set $N=M \otimes_{R} S$.
(1) If $f_{1}, \ldots, f_{r}$ in $R$ is an $M-H_{1}$-regular sequence, then $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{r}\right)$ is an $N$ - $H_{1}$-regular sequence in $S$.
(2) If $f_{1}, \ldots, f_{r}$ is an $M$-Koszul-regular sequence in $R$, then $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{r}\right)$ is an $N$-Koszul-regular sequence in $S$.

Proof. This is true because $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{R} S=K_{\bullet}\left(\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{r}\right)\right)$ and therefore $\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{R} M\right) \otimes_{R} S=K_{\bullet}\left(\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{r}\right)\right) \otimes_{S} N$.

062 Lemma 15.23.5. An $M$ - $H_{1}$-regular sequence is $M$-quasi-regular.
Proof. Let $R$ be a ring and let $M$ be an $R$-module. Let $f_{1}, \ldots, f_{r}$ be an $M-H_{1}$ regular sequence. Denote $J=\left(f_{1}, \ldots, f_{r}\right)$. The assumption means that we have an exact sequence

$$
\wedge^{2}\left(R^{r}\right) \otimes M \rightarrow R^{\oplus r} \otimes M \rightarrow J M \rightarrow 0
$$

where the first arrow is given by $e_{i} \wedge e_{j} \otimes m \mapsto\left(f_{i} e_{j}-f_{j} e_{i}\right) \otimes m$. In particular this implies that

$$
J M / J^{2} M=J M \otimes_{R} R / J=(M / J M)^{\oplus r}
$$

is a finite free module. To finish the proof we have to prove for every $n \geq 2$ the following: if

$$
\xi=\sum_{|I|=n, I=\left(i_{1}, \ldots, i_{r}\right)} m_{I} f_{1}^{i_{1}} \ldots f_{r}^{i_{r}} \in J^{n+1} M
$$

then $m_{I} \in J M$ for all $I$. Note that $f_{1}, \ldots, f_{r-1}, f_{r}^{n}$ is an $M$ - $H_{1}$-regular sequence by Lemma 15.23.3. Hence we see that the required result holds for the multi-index $I=(0, \ldots, 0, n)$. It turns out that we can reduce the general case to this case as follows.

Let $S=R\left[x_{1}, x_{2}, \ldots, x_{r}, 1 / x_{r}\right]$. The ring map $R \rightarrow S$ is faithfully flat, hence $f_{1}, \ldots, f_{r}$ is an $M-H_{1}$-regular sequence in $S$, see Lemma 15.23.4. By Lemma 15.22 .4 we see that

$$
g_{1}=f_{1}-x_{1} / x_{r} f_{r}, \ldots g_{r-1}=f_{r-1}-x_{r-1} / x_{r} f_{r}, g_{r}=\left(1 / x_{r}\right) f_{r}
$$

is an $M$ - $H_{1}$-regular sequence in $S$. Finally, note that our element $\xi$ can be rewritten

$$
\xi=\sum_{|I|=n, I=\left(i_{1}, \ldots, i_{r}\right)} m_{I}\left(g_{1}+x_{r} g_{r}\right)^{i_{1}} \ldots\left(g_{r-1}+x_{r} g_{r}\right)^{i_{r-1}}\left(x_{r} g_{r}\right)^{i_{r}}
$$

and the coefficient of $g_{r}^{n}$ in this expression is

$$
\sum m_{I} x_{1}^{i_{1}} \ldots x_{r}^{i_{r}} \in J\left(M \otimes_{R} S\right)
$$

Since the monomials $x_{1}^{i_{1}} \ldots x_{r}^{i_{r}}$ form part of an $R$-basis of $S$ over $R$ we conclude that $m_{I} \in J$ for all $I$ as desired.

For nonzero finite modules over Noetherian local rings all of the types of regular sequences introduced so far are equivalent.

09CC Lemma 15.23.6. Let $(R, \mathfrak{m})$ be a Noetherian local ring. Let $M$ be a nonzero finite $R$-module. Let $f_{1}, \ldots, f_{r} \in \mathfrak{m}$. The following are equivalent
(1) $f_{1}, \ldots, f_{r}$ is an $M$-regular sequence,
(2) $f_{1}, \ldots, f_{r}$ is a $M$-Koszul-regular sequence,
(3) $f_{1}, \ldots, f_{r}$ is an $M-H_{1}$-regular sequence,
(4) $f_{1}, \ldots, f_{r}$ is an $M$-quasi-regular sequence.

In particular the sequence $f_{1}, \ldots, f_{r}$ is a regular sequence in $R$ if and only if it is a Koszul regular sequence, if and only if it is a $H_{1}$-regular sequence, if and only if it is a quasi-regular sequence.

Proof. The implication $(1) \Rightarrow(2)$ is Lemma 15.23.2. The implication $(2) \Rightarrow(3)$ is immediate. The implication $(3) \Rightarrow(4)$ is Lemma 15.23.5. The implication $(4) \Rightarrow$ (1) is Algebra, Lemma 10.68.6.

0665 Lemma 15.23.7. Let $A$ be a ring. Let $I \subset A$ be an ideal. Let $g_{1}, \ldots, g_{m}$ be a sequence in $A$ whose image in $A / I$ is $H_{1}$-regular. Then $I \cap\left(g_{1}, \ldots, g_{m}\right)=$ $I\left(g_{1}, \ldots, g_{m}\right)$.

Proof. Consider the exact sequence of complexes

$$
0 \rightarrow I \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right) \rightarrow K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right) \rightarrow K_{\bullet}\left(A / I, g_{1}, \ldots, g_{m}\right) \rightarrow 0
$$

Since the complex on the right has $H_{1}=0$ by assumption we see that

$$
\operatorname{Coker}\left(I^{\oplus m} \rightarrow I\right) \longrightarrow \operatorname{Coker}\left(A^{\oplus m} \rightarrow A\right)
$$

is injective. This is equivalent to the assertion of the lemma.
0666 Lemma 15.23.8. Let $A$ be a ring. Let $I \subset J \subset A$ be ideals. Assume that $J / I \subset A / I$ is generated by an $H_{1}$-regular sequence. Then $I \cap J^{2}=I J$.

Proof. To prove this choose $g_{1}, \ldots, g_{m} \in J$ whose images in $A / I$ form a $H_{1}$-regular sequence which generates $J / I$. In particular $J=I+\left(g_{1}, \ldots, g_{m}\right)$. Suppose that $x \in I \cap J^{2}$. Because $x \in J^{2}$ can write

$$
x=\sum a_{i j} g_{i} g_{j}+\sum a_{j} g_{j}+a
$$

with $a_{i j} \in A, a_{j} \in I$ and $a \in I^{2}$. Then $\sum a_{i j} g_{i} g_{j} \in I \cap\left(g_{1}, \ldots, g_{m}\right)$ hence by Lemma 15.23 .7 we see that $\sum a_{i j} g_{i} g_{j} \in I\left(g_{1}, \ldots, g_{m}\right)$. Thus $x \in I J$ as desired.

0667 Lemma 15.23.9. Let $A$ be a ring. Let $I$ be an ideal generated by a quasi-regular sequence $f_{1}, \ldots, f_{n}$ in $A$. Let $g_{1}, \ldots, g_{m} \in A$ be elements whose images $\bar{g}_{1}, \ldots, \bar{g}_{m}$ form an $H_{1}$-regular sequence in $A / I$. Then $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is a quasi-regular sequence in $A$.

Proof. We claim that $g_{1}, \ldots, g_{m}$ forms an $H_{1}$-regular sequence in $A / I^{d}$ for every d. By induction assume that this holds in $A / I^{d-1}$. We have a short exact sequence of complexes

$$
0 \rightarrow K_{\bullet}\left(A, g_{\bullet}\right) \otimes_{A} I^{d-1} / I^{d} \rightarrow K_{\bullet}\left(A / I^{d}, g_{\bullet}\right) \rightarrow K_{\bullet}\left(A / I^{d-1}, g_{\bullet}\right) \rightarrow 0
$$

Since $f_{1}, \ldots, f_{n}$ is quasi-regular we see that the first complex is a direct sum of copies of $K_{\bullet}\left(A / I, g_{1}, \ldots, g_{m}\right)$ hence acyclic in degree 1 . By induction hypothesis the last complex is acyclic in degree 1. Hence also the middle complex is. In particular, the sequence $g_{1}, \ldots, g_{m}$ forms a quasi-regular sequence in $A / I^{d}$ for every $d \geq 1$, see

Lemma 15.23.5. Now we are ready to prove that $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is a quasiregular sequence in $A$. Namely, set $J=\left(f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}\right)$ and suppose that (with multinomial notation)

$$
\sum_{|N|+|M|=d} a_{N, M} f^{N} g^{M} \in J^{d+1}
$$

for some $a_{N, M} \in A$. We have to show that $a_{N, M} \in J$ for all $N, M$. Let $e \in$ $\{0,1, \ldots, d\}$. Then

$$
\sum_{|N|=d-e,|M|=e} a_{N, M} f^{N} g^{M} \in\left(g_{1}, \ldots, g_{m}\right)^{e+1}+I^{d-e+1}
$$

Because $g_{1}, \ldots, g_{m}$ is a quasi-regular sequence in $A / I^{d-e+1}$ we deduce

$$
\sum_{|N|=d-e} a_{N, M} f^{N} \in\left(g_{1}, \ldots, g_{m}\right)+I^{d-e+1}
$$

for each $M$ with $|M|=e$. By Lemma 15.23 .7 applied to $I^{d-e} / I^{d-e+1}$ in the ring $A / I^{d-e+1}$ this implies $\sum_{|N|=d-e} a_{N, M} f^{N} \in I^{d-e}\left(g_{1}, \ldots, g_{m}\right)$. Since $f_{1}, \ldots, f_{n}$ is quasi-regular in $A$ this implies that $a_{N, M} \in J$ for each $N, M$ with $|N|=d-e$ and $|M|=e$. This proves the lemma.

0668 Lemma 15.23.10. Let $A$ be a ring. Let I be an ideal generated by an $H_{1}$-regular sequence $f_{1}, \ldots, f_{n}$ in $A$. Let $g_{1}, \ldots, g_{m} \in A$ be elements whose images $\bar{g}_{1}, \ldots, \bar{g}_{m}$ form an $H_{1}$-regular sequence in $A / I$. Then $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is an $H_{1}$-regular sequence in $A$.

Proof. We have to show that $H_{1}\left(A, f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}\right)=0$. To do this consider the commutative diagram

Consider an element $\left(a_{1}, \ldots, a_{n+m}\right) \in A^{\oplus n+m}$ which maps to zero in $A$. Because $\bar{g}_{1}, \ldots, \bar{g}_{m}$ form an $H_{1}$-regular sequence in $A / I$ we see that $\left(\bar{a}_{n+1}, \ldots, \bar{a}_{n+m}\right)$ is the image of some element $\bar{\alpha}$ of $\wedge^{2}\left(A / I^{\oplus m}\right)$. We can lift $\bar{\alpha}$ to an element $\alpha \in$ $\wedge^{2}\left(A^{\oplus n+m}\right)$ and substract the image of it in $A^{\oplus n+m}$ from our element $\left(a_{1}, \ldots, a_{n+m}\right)$. Thus we may assume that $a_{n+1}, \ldots, a_{n+m} \in I$. Since $I=\left(f_{1}, \ldots, f_{n}\right)$ we can modify our element $\left(a_{1}, \ldots, a_{n+m}\right)$ by linear combinations of the elements

$$
\left(0, \ldots, g_{j}, 0, \ldots, 0, f_{i}, 0, \ldots, 0\right)
$$

in the image of the top left horizontal arrow to reduce to the case that $a_{n+1}, \ldots, a_{n+m}$ are zero. In this case $\left(a_{1}, \ldots, a_{n}, 0, \ldots, 0\right)$ defines an element of $H_{1}\left(A, f_{1}, \ldots, f_{n}\right)$ which we assumed to be zero.

068L Lemma 15.23.11. Let $A$ be a ring. Let $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m} \in A$ be an $H_{1-}$ regular sequence. Then the images $\bar{g}_{1}, \ldots, \bar{g}_{m}$ in $A /\left(f_{1}, \ldots, f_{n}\right)$ form an $H_{1}$-regular sequence.
Proof. Set $I=\left(f_{1}, \ldots, f_{n}\right)$. We have to show that any relation $\sum_{j=1, \ldots, m} \bar{a}_{j} \bar{g}_{j}$ in $A / I$ is a linear combination of trivial relations. Because $I=\left(f_{1}, \ldots, f_{n}\right)$ we can lift this relation to a relation

$$
\sum_{j=1, \ldots, m} a_{j} g_{j}+\sum_{i=1, \ldots, n} b_{i} f_{i}=0
$$

in $A$. By assumption this relation in $A$ is a linear combination of trivial relations. Taking the image in $A / I$ we obtain what we want.

0669 Lemma 15.23.12. Let $A$ be a ring. Let $I$ be an ideal generated by a Koszulregular sequence $f_{1}, \ldots, f_{n}$ in $A$. Let $g_{1}, \ldots, g_{m} \in A$ be elements whose images $\bar{g}_{1}, \ldots, \bar{g}_{m}$ form a Koszul-regular sequence in $A / I$. Then $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is a Koszul-regular sequence in $A$.

Proof. Our assumptions say that $K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right)$ is a finite free resolution of $A / I$ and $K_{\bullet}\left(A / I, \bar{g}_{1}, \ldots, \bar{g}_{m}\right)$ is a finite free resolution of $A /\left(f_{i}, g_{j}\right)$ over $A / I$. Then

$$
\begin{aligned}
K_{\bullet}\left(A, f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}\right) & =\operatorname{Tot}\left(K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right) \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right)\right) \\
& \cong A / I \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right) \\
& =K_{\bullet}\left(A / I, \bar{g}_{1}, \ldots, \bar{g}_{m}\right) \\
& \cong A /\left(f_{i}, g_{j}\right)
\end{aligned}
$$

The first equality by Lemma 15.22 .12 . The first quasi-isomorphism $\cong$ by (the dual of) Homology, Lemma 12.22 .7 as the $q$ th row of the double complex $K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right) \otimes_{A}$ $K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right)$ is a resolution of $A / I \otimes_{A} K_{q}\left(A, g_{1}, \ldots, g_{m}\right)$. The second equality is clear. The last quasi-isomorphism by assumption. Hence we win.

To conclude in the following lemma it is necessary to assume that both $f_{1}, \ldots, f_{n}$ and $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ are Koszul-regular. A counter example to dropping the assumption that $f_{1}, \ldots, f_{n}$ is Koszul-regular is Examples, Lemma 88.13.1.

068 M Lemma 15.23.13. Let $A$ be a ring. Let $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m} \in A$. If both $f_{1}, \ldots, f_{n}$ and $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ are Koszul-regular sequences in $A$, then $\bar{g}_{1}, \ldots, \bar{g}_{m}$ in $A /\left(f_{1}, \ldots, f_{n}\right)$ form a Koszul-regular sequence.
Proof. Set $I=\left(f_{1}, \ldots, f_{n}\right)$. Our assumptions say that $K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right)$ is a finite free resolution of $A / I$ and $K_{\bullet}\left(A, f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}\right)$ is a finite free resolution of $A /\left(f_{i}, g_{j}\right)$ over $A$. Then

$$
\begin{aligned}
A /\left(f_{i}, g_{j}\right) & \cong K_{\bullet}\left(A, f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}\right) \\
& =\operatorname{Tot}\left(K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right) \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right)\right) \\
& \cong A / I \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right) \\
& =K_{\bullet}\left(A / I, \bar{g}_{1}, \ldots, \bar{g}_{m}\right)
\end{aligned}
$$

The first quasi-isomorphism $\cong$ by assumption. The first equality by Lemma 15.22 .12 . The second quasi-isomorphism by (the dual of) Homology, Lemma 12.22.7 as the $q$ th row of the double complex $K_{\bullet}\left(A, f_{1}, \ldots, f_{n}\right) \otimes_{A} K_{\bullet}\left(A, g_{1}, \ldots, g_{m}\right)$ is a resolution of $A / I \otimes_{A} K_{q}\left(A, g_{1}, \ldots, g_{m}\right)$. The second equality is clear. Hence we win.

066A Lemma 15.23.14. Let $R$ be a ring. Let $I$ be an ideal generated by $f_{1}, \ldots, f_{r} \in R$.
(1) If I can be generated by a quasi-regular sequence of length $r$, then $f_{1}, \ldots, f_{r}$ is a quasi-regular sequence.
(2) If I can be generated by an $H_{1}$-regular sequence of length $r$, then $f_{1}, \ldots, f_{r}$ is an $H_{1}$-regular sequence.
(3) If I can be generated by a Koszul-regular sequence of length $r$, then $f_{1}, \ldots, f_{r}$ is a Koszul-regular sequence.

Proof. If $I$ can be generated by a quasi-regular sequence of length $r$, then $I / I^{2}$ is free of rank $r$ over $R / I$. Since $f_{1}, \ldots, f_{r}$ generate by assumption we see that the images $\bar{f}_{i}$ form a basis of $I / I^{2}$ over $R / I$. It follows that $f_{1}, \ldots, f_{r}$ is a quasiregular sequence as all this means, besides the freeness of $I / I^{2}$, is that the maps $\operatorname{Sym}_{R / I}^{n}\left(I / I^{2}\right) \rightarrow I^{n} / I^{n+1}$ are isomorphisms.
We continue to assume that $I$ can be generated by a quasi-regular sequence, say $g_{1}, \ldots, g_{r}$. Write $g_{j}=\sum a_{i j} f_{i}$. As $f_{1}, \ldots, f_{r}$ is quasi-regular according to the previous paragraph, we see that $\operatorname{det}\left(a_{i j}\right)$ is invertible $\bmod I$. The matrix $a_{i j}$ gives a $\operatorname{map} R^{\oplus r} \rightarrow R^{\oplus r}$ which induces a map of Koszul complexes $\alpha: K_{\bullet}\left(R, f_{1}, \ldots, f_{r}\right) \rightarrow$ $K_{\bullet}\left(R, g_{1}, \ldots, g_{r}\right)$, see Lemma 15.22 .3 . This map becomes an isomorphism on inverting $\operatorname{det}\left(a_{i j}\right)$. Since the cohomology modules of both $K_{\bullet}\left(R, f_{1}, \ldots, f_{r}\right)$ and $K_{\bullet}\left(R, g_{1}, \ldots, g_{r}\right)$ are annihilated by $I$, see Lemma 15.22 .6 , we see that $\alpha$ is a quasiisomorphism. Hence if $g_{1}, \ldots, g_{r}$ is $H_{1}$-regular, then so is $f_{1}, \ldots, f_{r}$. Similarly for Koszul-regular.

063Q Lemma 15.23.15. Let $A \rightarrow B$ be a ring map. Let $f_{1}, \ldots, f_{r}$ be a sequence in $B$ such that $B /\left(f_{1}, \ldots, f_{r}\right)$ is $A$-flat. Let $A \rightarrow A^{\prime}$ be a ring map. Then the canonical map

$$
H_{1}\left(K_{\bullet}\left(B, f_{1}, \ldots, f_{r}\right)\right) \otimes_{A} A^{\prime} \longrightarrow H_{1}\left(K_{\bullet}\left(B^{\prime}, f_{1}^{\prime}, \ldots, f_{r}^{\prime}\right)\right)
$$

is surjective, where $B^{\prime}=B \otimes_{A} A^{\prime}$ and $f_{i}^{\prime} \in B^{\prime}$ is the image of $f_{i}$.
Proof. The sequence

$$
\wedge^{2}\left(B^{\oplus r}\right) \rightarrow B^{\oplus r} \rightarrow B \rightarrow B / J \rightarrow 0
$$

is a complex of $A$-modules with $B / J$ flat over $A$ and cohomology group $H_{1}=$ $H_{1}\left(K_{\bullet}\left(B, f_{1}, \ldots, f_{r}\right)\right)$ in the spot $B^{\oplus r}$. If we tensor this with $A^{\prime}$ we obtain a complex

$$
\wedge^{2}\left(\left(B^{\prime}\right)^{\oplus r}\right) \rightarrow\left(B^{\prime}\right)^{\oplus r} \rightarrow B^{\prime} \rightarrow B^{\prime} / J^{\prime} \rightarrow 0
$$

which is exact at $B^{\prime}$ and $B^{\prime} / J^{\prime}$. In order to compute its cohomology group $H_{1}^{\prime}=$ $H_{1}\left(K_{\bullet}\left(B^{\prime}, f_{1}^{\prime}, \ldots, f_{r}^{\prime}\right)\right)$ at $\left(B^{\prime}\right)^{\oplus r}$ we split the first sequence above into short exact sequences $0 \rightarrow J \rightarrow B \rightarrow B / J \rightarrow 0$ and $0 \rightarrow K \rightarrow B^{\oplus r} \rightarrow J \rightarrow 0$ and $\wedge^{2}\left(B^{\oplus r}\right) \rightarrow$ $K \rightarrow H_{1} \rightarrow 0$. Tensoring with $A^{\prime}$ over $A$ we obtain the exact sequences

$$
\begin{gathered}
0 \rightarrow J \otimes_{A} A^{\prime} \rightarrow B \otimes_{A} A^{\prime} \rightarrow(B / J) \otimes_{A} A^{\prime} \rightarrow 0 \\
K \otimes_{A} A^{\prime} \rightarrow B^{\oplus r} \otimes_{A} A^{\prime} \rightarrow J \otimes_{A} A^{\prime} \rightarrow 0 \\
\wedge^{2}\left(B^{\oplus r}\right) \otimes_{A} A^{\prime} \rightarrow K \otimes_{A} A^{\prime} \rightarrow H_{1} \otimes_{A} A^{\prime} \rightarrow 0
\end{gathered}
$$

where the first one is exact as $B / J$ is flat over $A$, see Algebra, Lemma 10.38 .12 , Hence we conclude what we want.

068P Lemma 15.23.16. Let $R$ be a ring. Let $a_{1}, \ldots, a_{n} \in R$ be elements such that $R \rightarrow$ $R^{\oplus n}, x \mapsto\left(x a_{1}, \ldots, x a_{n}\right)$ is injective. Then the element $\sum a_{i} t_{i}$ of the polynomial ring $R\left[t_{1}, \ldots, t_{n}\right]$ is a nonzerodivisor.
Proof. If one of the $a_{i}$ is a unit this is just the statement that any element of the form $t_{1}+a_{2} t_{2}+\ldots+a_{n} t_{n}$ is a nonzerodivisor in the polynomial ring over $R$.
Case I: $R$ is Noetherian. Let $\mathfrak{q}_{j}, j=1, \ldots, m$ be the associated primes of $R$. We have to show that each of the maps

$$
\sum a_{i} t_{i}: \operatorname{Sym}^{d}\left(R^{\oplus n}\right) \longrightarrow \operatorname{Sym}^{d+1}\left(R^{\oplus n}\right)
$$

is injective. As $\operatorname{Sym}^{d}\left(R^{\oplus n}\right)$ is a free $R$-module its associated primes are $\mathfrak{q}_{j}, j=$ $1, \ldots, m$. For each $j$ there exists an $i=i(j)$ such that $a_{i} \notin \mathfrak{q}_{j}$ because there exists an $x \in R$ with $\mathfrak{q}_{j} x=0$ but $a_{i} x \neq 0$ for some $i$ by assumption. Hence $a_{i}$ is a unit in $R_{\mathfrak{q}_{j}}$ and the map is injective after localizing at $\mathfrak{q}_{j}$. Thus the map is injective, see Algebra, Lemma 10.62.19.

Case II: $R$ general. We can write $R$ as the union of Noetherian rings $R_{\lambda}$ with $a_{1}, \ldots, a_{n} \in R_{\lambda}$. For each $R_{\lambda}$ the result holds, hence the result holds for $R$.

068Q Lemma 15.23.17. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n}$ be a Koszul-regular sequence in $R$. Consider the faithfully flat, smooth ring map

$$
R \longrightarrow S=R\left[\left\{t_{i j}\right\}_{i \leq j}, t_{11}^{-1}, t_{22}^{-1}, \ldots, t_{n n}^{-1}\right]
$$

For $1 \leq i \leq n$ set

$$
g_{i}=\sum_{i \leq j} t_{i j} f_{j} \in S
$$

Then $g_{1}, \ldots, g_{n}$ is a regular sequence in $S$ and $\left(f_{1}, \ldots, f_{n}\right) S=\left(g_{1}, \ldots, g_{n}\right)$.
Proof. The equality of ideals is obvious as the matrix

$$
\left(\begin{array}{cccc}
t_{11} & t_{12} & t_{13} & \ldots \\
0 & t_{22} & t_{23} & \ldots \\
0 & 0 & t_{33} & \ldots \\
\cdots & \cdots & \cdots & \ldots
\end{array}\right)
$$

is invertible in $S$. Because $f_{1}, \ldots, f_{n}$ is a Koszul-regular sequence we see that the kernel of $R \rightarrow R^{\oplus n}, x \mapsto\left(x f_{1}, \ldots, x f_{n}\right)$ is zero (as it computes the $n$ the Koszul homology of $R$ w.r.t. $f_{1}, \ldots, f_{n}$ ). Hence by Lemma 15.23 .16 we see that $g_{1}=f_{1} t_{11}+\ldots+f_{n} t_{1 n}$ is a nonzerodivisor in $S^{\prime}=R\left[t_{11}, t_{12}, \ldots, t_{1 n}, t_{11}^{-1}\right]$. We see that $g_{1}, f_{2}, \ldots, f_{n}$ is a Koszul-sequence in $S^{\prime}$ by Lemma 15.23 .4 and 15.23 .14 We conclude that $\bar{f}_{2}, \ldots, \bar{f}_{n}$ is a Koszul-regular sequence in $S^{\prime} /\left(g_{2}\right)$ by Lemma 15.23.13. Hence by induction on $n$ we see that the images $\bar{g}_{2}, \ldots, \bar{g}_{n}$ of $g_{2}, \ldots, g_{n}$ in $S^{\prime} /\left(g_{2}\right)\left[\left\{t_{i j}\right\}_{2 \leq i \leq j}, t_{22}^{-1}, \ldots, t_{n n}^{-1}\right]$ form a regular sequence. This in turn means that $g_{1}, \ldots, g_{n}$ forms a regular sequence in $S$.

### 15.24. Regular ideals

07 CU We will discuss the notion of a regular ideal sheaf in great generality in Divisors, Section 30.17. Here we define the corresponding notion in the affine case, i.e., in the case of an ideal in a ring.

07 CV Definition 15.24.1. Let $R$ be a ring and let $I \subset R$ be an ideal.
(1) We say $I$ is a regular ideal if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and a regular sequence $f_{1}, \ldots, f_{r} \in R_{g}$ such that $I_{g}$ is generated by $f_{1}, \ldots, f_{r}$.
(2) We say $I$ is a Koszul-regular ideal if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R, g \notin \mathfrak{p}$ and a Koszul-regular sequence $f_{1}, \ldots, f_{r} \in R_{g}$ such that $I_{g}$ is generated by $f_{1}, \ldots, f_{r}$.
(3) We say $I$ is a $H_{1}$-regular ideal if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and an $H_{1}$-regular sequence $f_{1}, \ldots, f_{r} \in R_{g}$ such that $I_{g}$ is generated by $f_{1}, \ldots, f_{r}$.
(4) We say $I$ is a quasi-regular ideal if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R, g \notin \mathfrak{p}$ and a quasi-regular sequence $f_{1}, \ldots, f_{r} \in R_{g}$ such that $I_{g}$ is generated by $f_{1}, \ldots, f_{r}$.
It is clear that given $I \subset R$ we have the implications

$$
\begin{aligned}
I \text { is a regular ideal } & \Rightarrow I \text { is a Koszul-regular ideal } \\
& \Rightarrow I \text { is a } H_{1} \text {-regular ideal } \\
& \Rightarrow I \text { is a quasi-regular ideal }
\end{aligned}
$$

see Lemmas 15.23 .2 and 15.23 .5 . Such an ideal is always finitely generated.
07CW Lemma 15.24.2. A quasi-regular ideal is finitely generated.
Proof. Let $I \subset R$ be a quasi-regular ideal. Since $V(I)$ is quasi-compact, there exist $g_{1}, \ldots, g_{m} \in R$ such that $V(I) \subset D\left(g_{1}\right) \cup \ldots \cup D\left(g_{m}\right)$ and such that $I_{g_{j}}$ is generated by a quasi-regular sequence $g_{j 1}, \ldots, g_{j r_{j}} \in R_{g_{j}}$. Write $g_{j i}=g_{j i}^{\prime} / g_{j}^{e_{i j}}$ for some $g_{i j}^{\prime} \in I$. Write $1+x=\sum g_{j} h_{j}$ for some $x \in I$ which is possible as $V(I) \subset D\left(g_{1}\right) \cup \ldots \cup D\left(g_{m}\right)$. Note that $\operatorname{Spec}(R)=D\left(g_{1}\right) \cup \ldots \cup D\left(g_{m}\right) \cup D(x)$ Then $I$ is generated by the elements $g_{i j}^{\prime}$ and $x$ as these generate on each of the pieces of the cover, see Algebra, Lemma 10.23.2.
08RK Lemma 15.24.3. Let $I \subset R$ be a quasi-regular ideal of a ring. Then $I / I^{2}$ is a finite projective $R / I$-module.
Proof. This follows from Algebra, Lemma 10.77 .2 and the definitions.
We prove flat descent for Koszul-regular, $H_{1}$-regular, quasi-regular ideals.
068 N Lemma 15.24.4. Let $A \rightarrow B$ be a faithfully flat ring map. Let $I \subset A$ be an ideal. If IB is a Koszul-regular (resp. $H_{1}$-regular, resp. quasi-regular) ideal in $B$, then $I$ is a Koszul-regular (resp. $H_{1}$-regular, resp. quasi-regular) ideal in $A$.

Proof. We fix the prime $\mathfrak{p} \supset I$ throughout the proof. Assume $I B$ is quasi-regular. By Lemma $15.24 .2 I B$ is a finite module, hence $I$ is a finite $A$-module by Algebra, Lemma 10.82.2. As $A \rightarrow B$ is flat we see that

$$
I / I^{2} \otimes_{A / I} B / I B=I / I^{2} \otimes_{A} B=I B /(I B)^{2}
$$

As $I B$ is quasi-regular, the $B / I B$-module $I B /(I B)^{2}$ is finite locally free. Hence $I / I^{2}$ is finite projective, see Algebra, Proposition 10.82.3. In particular, after replacing $A$ by $A_{f}$ for some $f \in A, f \notin \mathfrak{p}$ we may assume that $I / I^{2}$ is free of rank $r$. Pick $f_{1}, \ldots, f_{r} \in I$ which give a basis of $I / I^{2}$. By Nakayama's lemma (see Algebra, Lemma 10.19.1 we see that, after another replacement $A \rightsquigarrow A_{f}$ as above, $I$ is generated by $f_{1}, \ldots, f_{r}$.
Proof of the "quasi-regular" case. Above we have seen that $I / I^{2}$ is free on the $r$-generators $f_{1}, \ldots, f_{r}$. To finish the proof in this case we have to show that the maps $\operatorname{Sym}^{d}\left(I / I^{2}\right) \rightarrow I^{d} / I^{d+1}$ are isomorphisms for each $d \geq 2$. This is clear as the faithfully flat base changes $\operatorname{Sym}^{d}\left(I B /(I B)^{2}\right) \rightarrow(I B)^{d} /(I B)^{d+1}$ are isomorphisms locally on $B$ by assumption. Details omitted.
Proof of the " $H_{1}$-regular" and "Koszul-regular" case. Consider the sequence of elements $f_{1}, \ldots, f_{r}$ generating $I$ we constructed above. By Lemma 15.23 .14 we see that $f_{1}, \ldots, f_{r}$ map to a $H_{1}$-regular or Koszul-regular sequence in $B_{g}$ for any $g \in B$ such that $I B$ is generated by an $H_{1}$-regular or Koszul-regular sequence.

Hence $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right) \otimes_{A} B_{g}$ has vanishing $H_{1}$ or $H_{i}, i>0$. Since the homology of $K_{\bullet}\left(B, f_{1}, \ldots, f_{r}\right)=K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right) \otimes_{A} B$ is annihilated by $I B$ (see Lemma 15.22 .6 and since $V(I B) \subset \bigcup_{g \text { as above }} D(g)$ we conclude that $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right) \otimes_{A}$ $B$ has vanishing homology in degree 1 or all positive degrees. Using that $A \rightarrow B$ is faithfully flat we conclude that the same is true for $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right)$.
07CX Lemma 15.24.5. Let $A$ be a ring. Let $I \subset J \subset A$ be ideals. Assume that $J / I \subset A / I$ is a $H_{1}$-regular ideal. Then $I \cap J^{2}=I J$.

Proof. Follows immediately from Lemma 15.23 .8 by localizing.

### 15.25. Local complete intersection maps

07 CY We can use the material above to define a local complete intersection map between rings using presentations by (finite) polynomial algebras.

07 CZ Lemma 15.25.1. Let $A \rightarrow B$ be a finite type ring map. If for some presentation $\alpha: A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ the kernel $I$ is a Koszul-regular ideal then for any presentation $\beta: A\left[y_{1}, \ldots, y_{m}\right] \rightarrow B$ the kernel $J$ is a Koszul-regular ideal.
Proof. Choose $f_{j} \in A\left[x_{1}, \ldots, x_{n}\right]$ with $\alpha\left(f_{j}\right)=\beta\left(y_{j}\right)$ and $g_{i} \in A\left[y_{1}, \ldots, y_{m}\right]$ with $\beta\left(g_{i}\right)=\alpha\left(x_{i}\right)$. Then we get a commutative diagram

Note that the kernel $K$ of $A\left[x_{i}, y_{j}\right] \rightarrow B$ is equal to $K=\left(I, y_{j}-f_{j}\right)=\left(J, x_{i}-f_{i}\right)$. In particular, as $I$ is finitely generated by Lemma 15.24 .2 we see that $J=K /\left(x_{i}-f_{i}\right)$ is finitely generated too.
Pick a prime $\mathfrak{q} \subset B$. Since $I / I^{2} \oplus B^{\oplus m}=J / J^{2} \oplus B^{\oplus n}$ (Algebra, Lemma 10.132.15) we see that

$$
\operatorname{dim} J / J^{2} \otimes_{B} \kappa(\mathfrak{q})+n=\operatorname{dim} I / I^{2} \otimes_{B} \kappa(\mathfrak{q})+m
$$

Pick $p_{1}, \ldots, p_{t} \in I$ which map to a basis of $I / I^{2} \otimes \kappa(\mathfrak{q})=I \otimes_{A\left[x_{i}\right]} \kappa(\mathfrak{q})$. Pick $q_{1}, \ldots, q_{s} \in J$ which map to a basis of $J / J^{2} \otimes \kappa(\mathfrak{q})=J \otimes_{A\left[y_{j}\right]} \kappa(\mathfrak{q})$. So $s+n=t+m$. By Nakayama's lemma there exist $h \in A\left[x_{i}\right]$ and $h^{\prime} \in A\left[y_{j}\right]$ both mapping to a nonzero element of $\kappa(\mathfrak{q})$ such that $I_{h}=\left(p_{1}, \ldots, p_{t}\right)$ in $A\left[x_{i}, 1 / h\right]$ and $J_{h^{\prime}}=$ $\left(q_{1}, \ldots, q_{s}\right)$ in $A\left[y_{j}, 1 / h^{\prime}\right]$. As $I$ is Koszul-regular we may also assume that $I_{h}$ is generated by a Koszul regular sequence. This sequence must necessarily have length $t=\operatorname{dim} I / I^{2} \otimes_{B} \kappa(\mathfrak{q})$, hence we see that $p_{1}, \ldots, p_{t}$ is a Koszul-regular sequence by Lemma 15.23 .14 As also $y_{1}-f_{1}, \ldots, y_{m}-f_{m}$ is a regular sequence we conclude

$$
y_{1}-f_{1}, \ldots, y_{m}-f_{m}, p_{1}, \ldots, p_{t}
$$

is a Koszul-regular sequence in $A\left[x_{i}, y_{j}, 1 / h\right]$ (see Lemma 15.23.12). This sequence generates the ideal $K_{h}$. Hence the ideal $K_{h h^{\prime}}$ is generated by a Koszul-regular sequence of length $m+t=n+s$. But it is also generated by the sequence

$$
x_{1}-g_{1}, \ldots, x_{n}-g_{n}, q_{1}, \ldots, q_{s}
$$

of the same length which is thus a Koszul-regular sequence by Lemma 15.23 .14 . Finally, by Lemma 15.23 .13 we conclude that the images of $q_{1}, \ldots, q_{s}$ in

$$
A\left[x_{i}, y_{j}, 1 / h h^{\prime}\right] /\left(x_{1}-g_{1}, \ldots, x_{n}-g_{n}\right) \cong A\left[y_{j}, 1 / h^{\prime \prime}\right]
$$

form a Koszul-regular sequence generating $J_{h^{\prime \prime}}$. Since $h^{\prime \prime}$ is the image of $h h^{\prime}$ it doesn't map to zero in $\kappa(\mathfrak{q})$ and we win.
This lemma allows us to make the following definition.
07D0 Definition 15.25.2. A ring map $A \rightarrow B$ is called a local complete intersection if it is of finite type and for some (equivalently any) presentation $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ the ideal $I$ is Koszul-regular.

This notion is local.
07D1 Lemma 15.25.3. Let $R \rightarrow S$ be a ring map. Let $g_{1}, \ldots, g_{m} \in S$ generate the unit ideal. If each $R \rightarrow S_{g_{j}}$ is a local complete intersection so is $R \rightarrow S$.
Proof. Let $S=R\left[x_{1}, \ldots, x_{n}\right] / I$ be a presentation. Pick $h_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$ mapping to $g_{j}$ in $S$. Then $R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(I, x_{n+1} h_{j}-1\right)$ is a presentation of $S_{g_{j}}$. Hence $I_{j}=\left(I, x_{n+1} h_{j}-1\right)$ is a Koszul-regular ideal in $R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right]$. Pick a prime $I \subset \mathfrak{q} \subset R\left[x_{1}, \ldots, x_{n}\right]$. Then $h_{j} \notin \mathfrak{q}$ for some $j$ and $\mathfrak{q}_{j}=\left(\mathfrak{q}, x_{n+1} h_{j}-1\right)$ is a prime ideal of $V\left(I_{j}\right)$ lying over $\mathfrak{q}$. Pick $f_{1}, \ldots, f_{r} \in I$ which map to a basis of $I / I^{2} \otimes \kappa(\mathfrak{q})$. Then $x_{n+1} h_{j}-1, f_{1}, \ldots, f_{r}$ is a sequence of elements of $I_{j}$ which map to a basis of $I_{j} \otimes \kappa\left(\mathfrak{q}_{j}\right)$. By Nakayama's lemma there exists an $h \in R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right]$ such that $\left(I_{j}\right)_{h}$ is generated by $x_{n+1} h_{j}-1, f_{1}, \ldots, f_{r}$. We may also assume that $\left(I_{j}\right)_{h}$ is generated by a Koszul regular sequence of some length $e$. Looking at the dimension of $I_{j} \otimes \kappa\left(\mathfrak{q}_{j}\right)$ we see that $e=r+1$. Hence by Lemma 15.23 .14 we see that $x_{n+1} h_{j}-1, f_{1}, \ldots, f_{r}$ is a Koszul-regular sequence generating $\left(I_{j}\right)_{h}$ for some $h \in R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right], h \notin \mathfrak{q}_{j}$. By Lemma 15.23 .13 we see that $I_{h^{\prime}}$ is generated by a Koszul-regular sequence for some $h^{\prime} \in R\left[x_{1}, \ldots, x_{n}\right], h^{\prime} \notin \mathfrak{q}$ as desired.

07D2 Lemma 15.25.4. Let $R$ be a ring. Let $R\left[x_{1}, \ldots, x_{n}\right]$. If $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ be a relative global complete intersection. Then $f_{1}, \ldots, f_{c}$ is a Koszul regular sequence.
Proof. Recall that the homology groups $H_{i}\left(K_{\bullet}\left(f_{\bullet}\right)\right)$ are annihilated by the ideal $\left(f_{1}, \ldots, f_{c}\right)$. Hence it suffices to show that $H_{i}\left(K_{\bullet}\left(f_{\bullet}\right)\right)_{\mathfrak{q}}$ is zero for all primes $\mathfrak{q} \subset$ $R\left[x_{1}, \ldots, x_{n}\right]$ containing $\left(f_{1}, \ldots, f_{c}\right)$. This follows from Algebra, Lemma 10.134.13 and the fact that a regular sequence is Koszul regular (Lemma 15.23.2).

07D3 Lemma 15.25.5. A syntomic ring map is a local complete intersection.
Proof. Combine Lemmas 15.25 .4 and 15.25 .3 and Algebra, Lemma 10.134.15.
For a local complete intersection $R \rightarrow S$ we have $H_{n}\left(L_{S / R}\right)=0$ for $n \geq 2$. Since we haven't (yet) defined the full cotangent complex we can't state and prove this, but we can deduce one of the consequences.
07D4 Lemma 15.25.6. Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $B \rightarrow C$ is a local complete intersection homomorphism. Choose a presentation $\alpha: A\left[x_{s}, s \in S\right] \rightarrow B$ with kernel $I$. Choose a presentation $\beta: B\left[y_{1}, \ldots, y_{m}\right] \rightarrow C$ with kernel J. Let $\gamma: A\left[x_{s}, y_{t}\right] \rightarrow C$ be the induced presentation of $C$ with kernel $K$. Then we get $a$ canonical commutative diagram

with exact rows. In particular, the six term exact sequence of Algebra, Lemma 10.132 .4 can be completed with a zero on the left, i.e., the sequence
$0 \rightarrow H_{1}\left(N L_{B / A} \otimes_{B} C\right) \rightarrow H_{1}\left(L_{C / A}\right) \rightarrow H_{1}\left(L_{C / B}\right) \rightarrow \Omega_{B / A} \otimes_{B} C \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0$
is exact.
Proof. The only thing to prove is the injectivity of the map $I / I^{2} \otimes C \rightarrow K / K^{2}$. By assumption the ideal $J$ is Koszul-regular. Hence we have $I A\left[x_{s}, y_{j}\right] \cap K^{2}=I K$ by Lemma 15.24 .5 . This means that the kernel of $K / K^{2} \rightarrow J / J^{2}$ is isomorphic to $I A\left[x_{s}, y_{j}\right] / I K$. Since $I / I^{2} \otimes_{A} C=I A\left[x_{s}, y_{j}\right] / I K$ this provides us with the desired injectivity of $I / I^{2} \otimes_{A} C \rightarrow K / K^{2}$ so that the result follows from the snake lemma, see Homology, Lemma 12.5.17.

07D5 Lemma 15.25.7. Let $A \rightarrow B \rightarrow C$ be ring maps. If $B \rightarrow C$ is a filtered colimit of local complete intersection homomorphisms then the conclusion of Lemma 15.25.6 remains valid.

Proof. Follows from Lemma 15.25.6 and Algebra, Lemma 10.132.9.

### 15.26. Cartier's equality and geometric regularity

07 E 0 A reference for this section and the next is Mat70a, Section 39]. In order to comfortably read this section the reader should be familiar with the naive cotangent complex and its properties, see Algebra, Section 10.132 .

07E1 Lemma 15.26.1 (Cartier equality). Let $K / k$ be a finitely generated field extension. Then $\Omega_{K / k}$ and $H_{1}\left(L_{K / k}\right)$ are finite dimensional and $\operatorname{trdeg}_{k}(K)=\operatorname{dim}_{K} \Omega_{K / k}-$ $\operatorname{dim}_{K} H_{1}\left(L_{K / k}\right)$.
Proof. We can find a global complete intersection $A=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ over $k$ such that $K$ is isomorphic to the fraction field of $A$, see Algebra, Lemma 10.150 .11 and its proof. In this case we see that $N L_{K / k}$ is homotopy equivalent to the complex

$$
\bigoplus_{j=1, \ldots, c} K \longrightarrow \bigoplus_{i=1, \ldots, n} K \mathrm{~d} x_{i}
$$

by Algebra, Lemmas 10.132 .2 and 10.132 .13 . The transcendence degree of $K$ over $k$ is the dimension of $A$ (by Algebra, Lemma 10.115.1) which is $n-c$ and we win.

07E2 Lemma 15.26.2. Let $K \subset L \subset M$ be field extensions. Then the Jacobi-Zariski sequence
$0 \rightarrow H_{1}\left(L_{L / K}\right) \otimes_{L} M \rightarrow H_{1}\left(L_{M / K}\right) \rightarrow H_{1}\left(L_{M / L}\right) \rightarrow \Omega_{L / K} \otimes_{L} M \rightarrow \Omega_{M / K} \rightarrow \Omega_{M / L} \rightarrow 0$
is exact.
Proof. Combine Lemma 15.25 .7 with Algebra, Lemma 10.150.11.
07E3 Lemma 15.26.3. Given a commutative diagram of fields

with $k \subset k^{\prime}$ and $K \subset K^{\prime}$ finitely generated field extensions the kernel and cokernel of the maps

$$
\alpha: \Omega_{K / k} \otimes_{K} K^{\prime} \rightarrow \Omega_{K^{\prime} / k^{\prime}} \quad \text { and } \quad \beta: H_{1}\left(L_{K / k}\right) \otimes_{K} K^{\prime} \rightarrow H_{1}\left(L_{K^{\prime} / k^{\prime}}\right)
$$

are finite dimensional and
$\operatorname{dim} \operatorname{Ker}(\alpha)-\operatorname{dim} \operatorname{Coker}(\alpha)-\operatorname{dim} \operatorname{Ker}(\beta)+\operatorname{dim} \operatorname{Coker}(\beta)=\operatorname{trdeg}_{k}\left(k^{\prime}\right)-\operatorname{trdeg}_{K}\left(K^{\prime}\right)$
Proof. The Jacobi-Zariski sequences for $k \subset k^{\prime} \subset K^{\prime}$ and $k \subset K \subset K^{\prime}$ are $0 \rightarrow H_{1}\left(L_{k^{\prime} / k}\right) \otimes K^{\prime} \rightarrow H_{1}\left(L_{K^{\prime} / k}\right) \rightarrow H_{1}\left(L_{K^{\prime} / k^{\prime}}\right) \rightarrow \Omega_{k^{\prime} / k} \otimes K^{\prime} \rightarrow \Omega_{K^{\prime} / k} \rightarrow \Omega_{K^{\prime} / k} \rightarrow 0$
and
$0 \rightarrow H_{1}\left(L_{K / k}\right) \otimes K^{\prime} \rightarrow H_{1}\left(L_{K^{\prime} / k}\right) \rightarrow H_{1}\left(L_{K^{\prime} / K}\right) \rightarrow \Omega_{K / k} \otimes K^{\prime} \rightarrow \Omega_{K^{\prime} / k} \rightarrow \Omega_{K^{\prime} / K} \rightarrow 0$
By Lemma 15.26 .1 the vector spaces $\Omega_{k^{\prime} / k}, \Omega_{K^{\prime} / K}, H_{1}\left(L_{K^{\prime} / K}\right)$, and $H_{1}\left(L_{k^{\prime} / k}\right)$ are finite dimensional and the alternating sum of their dimensions is $\operatorname{trdeg}_{k}\left(k^{\prime}\right)-$ $\operatorname{trdeg}_{K}\left(K^{\prime}\right)$. The lemma follows.

### 15.27. Geometric regularity

07 E 4 Let $k$ be a field. Let $(A, \mathfrak{m}, K)$ be a Noetherian local $k$-algebra. The Jacobi-Zariski sequence (Algebra, Lemma 10.132.4) is a canonical exact sequence

$$
H_{1}\left(L_{K / k}\right) \rightarrow \mathfrak{m} / \mathfrak{m}^{2} \rightarrow \Omega_{A / k} \otimes_{A} K \rightarrow \Omega_{K / k} \rightarrow 0
$$

because $H_{1}\left(L_{K / A}\right)=\mathfrak{m} / \mathfrak{m}^{2}$ by Algebra, Lemma 10.132 .6 . We will show that exactness on the left of this sequence characterizes whether or not a regular local ring $A$ is geometrically regular over $k$. We will link this to the notion of formal smoothness in Section 15.31 .

07E5 Proposition 15.27.1. Let $k$ be a field of characteristic $p>0$. Let $(A, \mathfrak{m}, K)$ be a Noetherian local $k$-algebra. The following are equivalent
(1) $A$ is geometrically regular over $k$,
(2) for all $k \subset k^{\prime} \subset k^{1 / p}$ finite over $k$ the $\operatorname{ring} A \otimes_{k} k^{\prime}$ is regular,
(3) $A$ is regular and the canonical map $H_{1}\left(L_{K / k}\right) \rightarrow \mathfrak{m} / \mathfrak{m}^{2}$ is injective, and
(4) $A$ is regular and the map $\Omega_{k / \mathbf{F}_{p}} \otimes_{k} K \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K$ is injective.

Proof. Proof of $(3) \Rightarrow(1)$. Assume (3). Let $k \subset k^{\prime}$ be a finite purely inseparable extension. Set $A^{\prime}=A \otimes_{k} k^{\prime}$. This is a local ring with maximal ideal $\mathfrak{m}^{\prime}$. Set $K^{\prime}=A^{\prime} / \mathfrak{m}^{\prime}$. We get a commutative diagram

with exact rows. The third vertical arrow is an isomorphism by base change for modules of differentials (Algebra, Lemma 10.130.12). Thus $\alpha$ is surjective. By Lemma 15.26 .3 we have

$$
\operatorname{dim} \operatorname{Ker}(\alpha)-\operatorname{dim} \operatorname{Ker}(\beta)+\operatorname{dim} \operatorname{Coker}(\beta)=0
$$

(and these dimensions are all finite). A diagram chase shows that $\operatorname{dim} \mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2} \leq$ $\operatorname{dim} \mathfrak{m} / \mathfrak{m}^{2}$. However, since $A \rightarrow A^{\prime}$ is finite flat we see that $\operatorname{dim}(A)=\operatorname{dim}\left(A^{\prime}\right)$, see Algebra, Lemma 10.111.6. Hence $A^{\prime}$ is regular by definition.

Equivalence of (3) and (4). Consider the Jacobi-Zariski sequences for rows of the commutative diagram

to get a commutative diagram

with exact rows. We have used that $H_{1}\left(L_{K / A}\right)=\mathfrak{m} / \mathfrak{m}^{2}$ and that $H_{1}\left(L_{K / \mathbf{F}_{p}}\right)=0$ as $K / \mathbf{F}_{p}$ is separable, see Algebra, Proposition 10.150 .9 . Thus it is clear that the kernels of $H_{1}\left(L_{K / k}\right) \rightarrow \mathfrak{m} / \mathfrak{m}^{2}$ and $\Omega_{k / \mathbf{F}_{p}} \otimes_{k} K \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K$ have the same dimension.

Proof of $(2) \Rightarrow(4)$ following Faltings, see Fal78a. Let $a_{1}, \ldots, a_{n} \in k$ be elements such that $\mathrm{d} a_{1}, \ldots, \mathrm{~d} a_{n}$ are linearly independent in $\Omega_{k / \mathbf{F}_{p}}$. Consider the field extension $k^{\prime}=k\left(a_{1}^{1 / p}, \ldots, a_{n}^{1 / p}\right)$. By Algebra, Lemma 10.150 .3 we see that $k^{\prime}=k\left[x_{1}, \ldots, x_{n}\right] /\left(x_{1}^{p}-a_{1}, \ldots, x_{n}^{p}-a_{n}\right)$. In particular we see that the naive cotangent complex of $k^{\prime} / k$ is homotopic to the complex $\bigoplus_{j=1, \ldots, n} k^{\prime} \rightarrow \bigoplus_{i=1, \ldots, n} k^{\prime}$ with the zero differential as $\mathrm{d}\left(x_{j}^{p}-a_{j}\right)=0$ in $\Omega_{k\left[x_{1}, \ldots, x_{n}\right] / k}$. Set $A^{\prime}=A \otimes_{k} k^{\prime}$ and $K^{\prime}=A^{\prime} / \mathfrak{m}^{\prime}$ as above. By Algebra, Lemma 10.132 .8 we see that $N L_{A^{\prime} / A}$ is homotopy equivalent to the complex $\bigoplus_{j=1, \ldots, n} A^{\prime} \rightarrow \bigoplus_{i=1, \ldots, n} A^{\prime}$ with the zero differential, i.e., $H_{1}\left(L_{A^{\prime} / A}\right)$ and $\Omega_{A^{\prime} / A}$ are free of rank $n$. The Jacobi-Zariski sequence for $\mathbf{F}_{p} \rightarrow A \rightarrow A^{\prime}$ is

$$
H_{1}\left(L_{A^{\prime} / A}\right) \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} A^{\prime} \rightarrow \Omega_{A^{\prime} / \mathbf{F}_{p}} \rightarrow \Omega_{A^{\prime} / A} \rightarrow 0
$$

Using the presentation $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow A^{\prime}$ with kernel $\left(x_{j}^{p}-a_{j}\right)$ we see, unwinding the maps in Algebra, Lemma 10.132.4, that the $j$ th basis vector of $H_{1}\left(L_{A^{\prime} / A}\right)$ maps to $\mathrm{d} a_{j} \otimes 1$ in $\Omega_{A / \mathbf{F}_{p}} \otimes A^{\prime}$. As $\Omega_{A^{\prime} / A}$ is free (hence flat) we get on tensoring with $K^{\prime}$ an exact sequence

$$
K^{\prime \oplus n} \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K^{\prime} \xrightarrow{\beta} \Omega_{A^{\prime} / \mathbf{F}_{p}} \otimes_{A^{\prime}} K^{\prime} \rightarrow K^{\prime \oplus n} \rightarrow 0
$$

We conclude that the elements $\mathrm{d} a_{j} \otimes 1$ generate $\operatorname{Ker}(\beta)$ and we have to show that are linearly independent, i.e., we have to show $\operatorname{dim}(\operatorname{Ker}(\beta))=n$. Consider the following big diagram

By Lemma 15.26.1 and the Jacobi-Zariski sequence for $\mathbf{F}_{p} \rightarrow K \rightarrow K^{\prime}$ we see that the kernel and cokernel of $\gamma$ have the same finite dimension. By assumption $A^{\prime}$ is regular (and of the same dimension as $A$, see above) hence the kernel and cokernel
of $\alpha$ have the same dimension. It follows that the kernel and cokernel of $\beta$ have the same dimension which is what we wanted to show.
The implication $(1) \Rightarrow(2)$ is trivial. This finishes the proof of the proposition.
07E6 Lemma 15.27.2. Let $k$ be a field of characteristic $p>0$. Let $(A, \mathfrak{m}, K)$ be a Noetherian local $k$-algebra. Assume $A$ is geometrically regular over $k$. Let $k \subset F \subset$ $K$ be a finitely generated subextension. Let $\varphi: k\left[y_{1}, \ldots, y_{m}\right] \rightarrow A$ be a $k$-algebra map such that $y_{i}$ maps to an element of $F$ in $K$ and such that $d y_{1}, \ldots, d y_{m}$ map to $a$ basis of $\Omega_{F / k}$. Set $\mathfrak{p}=\varphi^{-1}(\mathfrak{m})$. Then

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow A
$$

is flat and $A / \mathfrak{p} A$ is regular.
Proof. Set $A_{0}=k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}$ with maximal ideal $\mathfrak{m}_{0}$ and residue field $K_{0}$. Note that $\Omega_{A_{0} / k}$ is free of rank $m$ and $\Omega_{A_{0} / k} \otimes K_{0} \rightarrow \Omega_{K_{0} / k}$ is an isomorphism. It is clear that $A_{0}$ is geometrically regular over $k$. Hence $H_{1}\left(L_{K_{0} / k}\right) \rightarrow \mathfrak{m}_{0} / \mathfrak{m}_{0}^{2}$ is an isomorphism, see Proposition 15.27.1. Now consider

Since the left vertical arrow is injective by Lemma 15.26 .2 and the lower horizontal by Proposition 15.27 .1 we conclude that the right vertical one is too. Hence a regular system of parameters in $A_{0}$ maps to part of a regular system of parameters in $A$. We win by Algebra, Lemmas 10.127 .2 and 10.105 .3 .

### 15.28. Topological rings and modules

07E7 Let's quickly discuss some properties of topological abelian groups. An abelian group $M$ is a topological abelian group if $M$ is endowed with a topology such that addition $M \times M \rightarrow M,(x, y) \mapsto x+y$ and inverse $M \rightarrow M, x \mapsto-x$ are continuous. A homomorphism of topological abelian groups is just a homomorphism of abelian groups which is continuous. The category of commutative topological groups is additive and has kernels and cokernels, but is not abelian (as the axiom $\mathrm{Im}=\mathrm{Coim}$ doesn't hold). If $N \subset M$ is a subgroup, then we think of $N$ and $M / N$ as topological groups also, namely using the induced topology on $N$ and the quotient topology on $M / N$ (i.e., such that $M \rightarrow M / N$ is submersive). Note that if $N \subset M$ is an open subgroup, then the topology on $M / N$ is discrete.
We say the topology on $M$ is linear if there exists a fundamental system of neighbourhoods of 0 consisting of subgroups. If so then these subgroups are also open. An example is the following. Let $I$ be a directed partially ordered set and let $G_{i}$ be an inverse system of (discrete) abelian groups over $I$. Then

$$
G=\lim _{i \in I} G_{i}
$$

with the inverse limit topology is linearly topologized with a fundamental system of neighbourhoods of 0 given by $\operatorname{Ker}\left(G \rightarrow G_{i}\right)$. Conversely, let $M$ be a linearly topologized abelian group. Choose any fundamental system of open subgroups $U_{i} \subset M, i \in I$ (i.e., the $U_{i}$ form a fundamental system of open neighbourhoods and
each $U_{i}$ is a subgroup of $\left.M\right)$. Setting $i \geq i^{\prime} \Leftrightarrow U_{i} \subset U_{i^{\prime}}$ we see that $I$ is a directed partially ordered set. We obtain a homomorphism of linearly topologized abelian groups

$$
c: M \longrightarrow \lim _{i \in I} M / U_{i} .
$$

It is clear that $M$ is separated (as a topological space) if and only if $c$ is injective. We say that $M$ is complete if $c$ is an isomorphisn ${ }^{2}$. We leave it to the reader to check that this condition is independent of the choice of fundamental system of open subgroups $\left\{U_{i}\right\}_{i \in I}$ chosen above. In fact the topological abelian group $M^{\wedge}=$ $\lim _{i \in I} M / U_{i}$ is independent of this choice and is sometimes called the completion of $M$. Any $G=\lim G_{i}$ as above is complete, in particular, the completion $M^{\wedge}$ is always complete.

07E8 Definition 15.28.1 (Topological rings). Let $R$ be a ring and let $M$ be an $R$ module.

GD60, Sections 7.1 and 7.2]
(1) We say $R$ is a topological ring if $R$ is endowed with a topology such that both addition and multiplication are continuous as maps $R \times R \rightarrow R$ where $R \times R$ has the product topology. In this case we say $M$ is a topological module if $M$ is endowed with a topology such that addition $M \times M \rightarrow M$ and scalar multiplication $R \times M \rightarrow M$ are continuous.
(2) A homomorphism of topological modules is just a continuous $R$-module map. A homomorphism of topological rings is a ring homomorphism which is continuous for the given topologies.
(3) We say $M$ is linearly topologized if 0 has a fundamental system of neighbourhoods consisting of submodules. We say $R$ is linearly topologized if 0 has a fundamental system of neighbourhoods consisting of ideals.
(4) If $R$ is linearly topologized, we say that $I \subset R$ is an ideal of definition if $I$ is open and if every neighbourhood of 0 contains $I^{n}$ for some $n$.
(5) If $R$ is linearly topologized, we say that $R$ is pre-admissible if $R$ has an ideal of definition.
(6) If $R$ is linearly topologized, we say that $R$ is admissible if it is preadmissible and complet $\$^{3}$
(7) If $R$ is linearly topologized, we say that $R$ is pre-adic if there exists an ideal of definition $I$ such that $\left\{I^{n}\right\}_{n \geq 0}$ forms a fundamental system of neighbourhoods of 0 .
(8) If $R$ is linearly topologized, we say that $R$ is adic if $R$ is pre-adic and complete.
Note that a (pre)adic topological ring is the same thing as a (pre)admissible topological ring which has an ideal of definition $I$ such that $I^{n}$ is open for all $n \geq 1$.

Let $R$ be a ring and let $M$ be an $R$-module. Let $I \subset R$ be an ideal. Then we can consider the linear topology on $R$ which has $\left\{I^{n}\right\}_{n \geq 0}$ as a fundamental system of neighbourhoods of 0 . This topology is called the $I$-adic topology; $R$ is a pre-adic topological ring in the $I$-adic topology. Moreover, the linear topology on $M$ which has $\left\{I^{n} M\right\}_{n \geq 0}$ as a fundamental system of open neighbourhoods of 0 turns $M$ into

[^39]a topological $R$-module. This is called the $I$-adic topology on $M$. We see that $M$ is $I$-adically complete (as defined in Algebra, Definition 10.95.3) if and only $M$ is complete in the $I$-adic topology ${ }^{5}$ In particular, we see that $R$ is $I$-adically complete if and only if $R$ is an adic topological ring in the $I$-adic topology.
As a special case, note that the discrete topology is the 0-adic topology and that any ring in the discrete topology is adic.

07E9 Lemma 15.28.2. Let $\varphi: R \rightarrow S$ be a ring map. Let $I \subset R$ and $J \subset S$ be ideals and endow $R$ with the $I$-adic topology and $S$ with the $J$-adic topology. Then $\varphi$ is a homomorphism of topological rings if and only if $\varphi\left(I^{n}\right) \subset J$ for some $n \geq 1$.
Proof. Omitted.

### 15.29. Formally smooth maps of topological rings

07EA There is a version of formal smoothness which applies to homomorphisms of topological rings.

07EB Definition 15.29.1. Let $R \rightarrow S$ be a homomorphism of topological rings with $R$ and $S$ linearly topologized. We say $S$ is formally smooth over $R$ if for every commutative solid diagram

of homomorphisms of topological rings where $A$ is a discrete ring and $J \subset A$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute.

We will mostly use this notion when given ideals $\mathfrak{m} \subset R$ and $\mathfrak{n} \subset S$ and we endow $R$ with the $\mathfrak{m}$-adic topology and $S$ with the $\mathfrak{n}$-adic topology. Continuity of $\varphi: R \rightarrow S$ holds if and only if $\varphi\left(\mathfrak{m}^{m}\right) \subset \mathfrak{n}$ for some $m \geq 1$, see Lemma 15.28.2. It turns out that in this case only the topology on $S$ is relevant.
07EC Lemma 15.29.2. Let $\varphi: R \rightarrow S$ be a ring map.
(1) If $R \rightarrow S$ is formally smooth in the sense of Algebra, Definition 10.136.1. then $R \rightarrow S$ is formally smooth for any linear topology on $R$ and any pre-adic topology on $S$ such that $R \rightarrow S$ is continuous.
(2) Let $\mathfrak{n} \subset S$ and $\mathfrak{m} \subset R$ ideals such that $\varphi$ is continuous for the $\mathfrak{m}$-adic topology on $R$ and the $\mathfrak{n}$-adic topology on $S$. Then the following are equivalent
(a) $\varphi$ is formally smooth for the $\mathfrak{m}$-adic topology on $R$ and the $\mathfrak{n}$-adic topology on $S$, and
(b) $\varphi$ is formally smooth for the discrete topology on $R$ and the $\mathfrak{n}$-adic topology on $S$.

Proof. Assume $R \rightarrow S$ is formally smooth in the sense of Algebra, Definition 10.136 .1 . If $S$ has a pre-adic topology, then there exists an ideal $\mathfrak{n} \subset S$ such that $S$ has the $\mathfrak{n}$-adic topology. Suppose given a solid commutative diagram as in

[^40]Definition 15.29.1. Continuity of $S \rightarrow A / J$ means that $\mathfrak{n}^{k}$ maps to zero in $A / J$ for some $k \geq 1$, see Lemma 15.28.2. We obtain a ring map $\psi: S \rightarrow A$ from the assumed formal smoothness of $S$ over $R$. Then $\psi\left(\mathfrak{n}^{k}\right) \subset J$ hence $\psi\left(\mathfrak{n}^{2 k}\right)=0$ as $J^{2}=0$. Hence $\psi$ is continuous by Lemma 15.28 .2 . This proves (1).

The proof of $(2)(\mathrm{b}) \Rightarrow(2)(\mathrm{a})$ is the same as the proof of (1). Assume (2)(a). Suppose given a solid commutative diagram as in Definition 15.29.1 where we use the discrete topology on $R$. Since $\varphi$ is continuous we see that $\varphi\left(\mathfrak{m}^{n}\right) \subset \mathfrak{n}$ for some $m \geq 1$. As $S \rightarrow A / J$ is continuous we see that $\mathfrak{n}^{k}$ maps to zero in $A / J$ for some $k \geq 1$. Hence $\mathfrak{m}^{n k}$ maps into $J$ under the map $R \rightarrow A$. Thus $\mathfrak{m}^{2 n k}$ maps to zero in $A$ and we see that $R \rightarrow A$ is continuous in the $\mathfrak{m}$-adic topology. Thus (2)(a) gives a dotted arrow as desired.

07NI Definition 15.29.3. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{n} \subset S$ be an ideal. If the equivalent conditions (2)(a) and (2)(b) of Lemma 15.29 .2 hold, then we say $R \rightarrow S$ is formally smooth for the $\mathfrak{n}$-adic topology.

This property is inherited by the completions.
07ED Lemma 15.29.4. Let $(R, \mathfrak{m})$ and $(S, \mathfrak{n})$ be rings endowed with finitely generated ideals. Endow $R$ and $S$ with the $\mathfrak{m}$-adic and $\mathfrak{n}$-adic topologies. Let $R \rightarrow S$ be $a$ homomorphism of topological rings. The following are equivalent
(1) $R \rightarrow S$ is formally smooth for the $\mathfrak{n}$-adic topology,
(2) $R \rightarrow S^{\wedge}$ is formally smooth for the $\mathfrak{n}^{\wedge}$-adic topology,
(3) $R^{\wedge} \rightarrow S^{\wedge}$ is formally smooth for the $\mathfrak{n}^{\wedge}$-adic topology.

Here $R^{\wedge}$ and $S^{\wedge}$ are the $\mathfrak{m}$-adic and $\mathfrak{n}$-adic completions of $R$ and $S$.
Proof. The assumption that $\mathfrak{m}$ is finitely generated implies that $R^{\wedge}$ is $\mathfrak{m} R^{\wedge}$-adically complete, that $\mathfrak{m} R^{\wedge}=\mathfrak{m}^{\wedge}$ and that $R^{\wedge} / \mathfrak{m}^{n} R^{\wedge}=R / \mathfrak{m}^{n}$, see Algebra, Lemma 10.95 .5 and its proof. Similarly for $(S, \mathfrak{n})$. Thus it is clear that diagrams as in Definition 15.29 .1 for the cases (1), (2), and (3) are in 1-to-1 correspondence.

The advantage of working with adic rings is that one gets a stronger lifting property.
07NJ Lemma 15.29.5. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{n}$ be an ideal of $S$. Assume that $R \rightarrow S$ is formally smooth in the $\mathfrak{n}$-adic topology. Consider a solid commutative diagram

of homomorphisms of topological rings where $A$ is adic and $A / J$ is the quotient (as topological ring) of $A$ by a closed ideal $J \subset A$ such that $J^{t}$ is contained in an ideal of definition of $A$ for some $t \geq 1$. Then there exists a dotted arrow in the category of topological rings which makes the diagram commute.

Proof. Let $I \subset A$ be an ideal of definition so that $I \supset J^{t}$ for some $n$. Then $A=\lim A / I^{n}$ and $A / J=\lim A / J+I^{n}$ because $J$ is assumed closed. Consider the
following diagram of discrete $R$ algebras $A_{n, m}=A / J^{n}+I^{m}$ :

Note that each of the commutative squares defines a surjection

$$
A_{n+1, m+1} \longrightarrow A_{n+1, m} \times_{A_{n, m}} A_{n, m+1}
$$

of $R$-algebras whose kernel has square zero. We will inductively construct $R$-algebra maps $\varphi_{n, m}: S \rightarrow A_{n, m}$. Namely, we have the maps $\varphi_{1, m}=\psi \bmod J+I^{m}$. Note that each of these maps is continuous as $\psi$ is. We can inductively choose the maps $\varphi_{n, 1}$ by starting with our choice of $\varphi_{1,1}$ and lifting up, using the formal smoothness of $S$ over $R$, along the right column of the diagram above. We construct the remaining maps $\varphi_{n, m}$ by induction on $n+m$. Namely, we choose $\varphi_{n+1, m+1}$ by lifting the pair $\left(\varphi_{n+1, m}, \varphi_{n, m+1}\right)$ along the displayed surjection above (again using the formal smoothness of $S$ over $R$ ). In this way all of the maps $\varphi_{n, m}$ are compatible with the transition maps of the system. As $J^{t} \subset I$ we see that for example $\varphi_{n}=\varphi_{n t, n} \bmod I^{n}$ induces a $\operatorname{map} S \rightarrow A / I^{n}$. Taking the $\operatorname{limit} \varphi=\lim \varphi_{n}$ we obtain a map $S \rightarrow A=\lim A / I^{n}$. The composition into $A / J$ agrees with $\psi$ as we have seen that $A / J=\lim A / J+I^{n}$. Finally we show that $\varphi$ is continuous. Namely, we know that $\psi\left(\mathfrak{n}^{r}\right) \subset J+I^{r} / J$ for some $r$ by our assumption that $\psi$ is a morphism of topological rings, see Lemma 15.28.2. Hence $\varphi\left(\mathfrak{n}^{r}\right) \subset J+I$ hence $\varphi\left(\mathfrak{n}^{r t}\right) \subset I$ as desired.

07EE Lemma 15.29.6. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{n} \subset \mathfrak{n}^{\prime} \subset S$ be ideals. If $R \rightarrow S$ is formally smooth for the $\mathfrak{n}$-adic topology, then $R \rightarrow S$ is formally smooth for the $\mathfrak{n}^{\prime}$-adic topology.

Proof. Omitted.
07EF Lemma 15.29.7. A composition of formally smooth continuous homomorphisms of linearly topologized rings is formally smooth.

Proof. Omitted. (Hint: This is completely formal, and follows from considering a suitable diagram.)

07EG Lemma 15.29.8. Let $R, S$ be rings. Let $\mathfrak{n} \subset S$ be an ideal. Let $R \rightarrow S$ be formally smooth for the $\mathfrak{n}$-adic topology. Let $R \rightarrow R^{\prime}$ be any ring map. Then $R^{\prime} \rightarrow S^{\prime}=S \otimes_{R} R^{\prime}$ is formally smooth in the $\mathfrak{n}^{\prime}=\mathfrak{n} S^{\prime}$-adic topology.

Proof. Let a solid diagram

as in Definition 15.29 .1 be given. Then the composition $S \rightarrow S^{\prime} \rightarrow A / J$ is continuous. By assumption the longer dotted arrow exists. By the universal property of tensor product we obtain the shorter dotted arrow.

We have seen descent for formal smoothness along faithfully flat ring maps in Algebra, Lemma 10.136.15. Something similar holds in the current setting of topological rings. However, here we just prove the following very simple and easy to prove version which is already quite useful.

07EH Lemma 15.29.9. Let $R, S$ be rings. Let $\mathfrak{n} \subset S$ be an ideal. Let $R \rightarrow R^{\prime}$ be a ring map. Set $S^{\prime}=S \otimes_{R} R^{\prime}$ and $\mathfrak{n}^{\prime}=\mathfrak{n} S$. If
(1) the map $R \rightarrow R^{\prime}$ embeds $R$ as a direct summand of $R^{\prime}$ as an $R$-module, and
(2) $R^{\prime} \rightarrow S^{\prime}$ is formally smooth for the $\mathfrak{n}^{\prime}$-adic topology, then $R \rightarrow S$ is formally smooth in the $\mathfrak{n}$-adic topology.

Proof. Let a solid diagram

as in Definition 15.29 .1 be given. Set $A^{\prime}=A \otimes_{R} R^{\prime}$ and $J^{\prime}=\operatorname{Im}\left(J \otimes_{R} R^{\prime} \rightarrow A^{\prime}\right)$. The base change of the diagram above is the diagram

with continuous arrows. By condition (2) we obtain the dotted arrow $\psi^{\prime}: S^{\prime} \rightarrow A^{\prime}$. Using condition (1) choose a direct summand decomposition $R^{\prime}=R \oplus C$ as $R$ modules. (Warning: $C$ isn't an ideal in $R^{\prime}$.) Then $A^{\prime}=A \oplus A \otimes_{R} C$. Set

$$
J^{\prime \prime}=\operatorname{Im}\left(J \otimes_{R} C \rightarrow A \otimes_{R} C\right) \subset J^{\prime} \subset A^{\prime}
$$

Then $J^{\prime}=J \oplus J^{\prime \prime}$ as $A$-modules. The image of the composition $\psi: S \rightarrow A^{\prime}$ of $\psi^{\prime}$ with $S \rightarrow S^{\prime}$ is contained in $A+J^{\prime}=A \oplus J^{\prime \prime}$. However, in the ring $A+J^{\prime}=A \oplus J^{\prime \prime}$ the $A$-submodule $J^{\prime \prime}$ is an ideal! (Use that $J^{2}=0$.) Hence the composition $S \rightarrow A+J^{\prime} \rightarrow\left(A+J^{\prime}\right) / J^{\prime \prime}=A$ is the arrow we were looking for.

The following lemma will be improved on in Section 15.31.
07EI Lemma 15.29.10. Let $k$ be a field and let $(A, \mathfrak{m}, K)$ be a Noetherian local $k$ algebra. If $k \rightarrow A$ is formally smooth for the $\mathfrak{m}$-adic topology, then $A$ is a regular local ring.

Proof. Let $k_{0} \subset k$ be the prime field. Then $k_{0}$ is perfect, hence $k / k_{0}$ is separable, hence formally smooth by Algebra, Lemma 10.150.7. By Lemmas 15.29 .2 and 15.29 .7 we see that $k_{0} \rightarrow A$ is formally smooth for the $\mathfrak{m}$-adic topology on $A$. Hence we may assume $k=\mathbf{Q}$ or $k=\mathbf{F}_{p}$.
By Algebra, Lemmas 10.96 .3 and 10.109 .9 it suffices to prove the completion $A^{\wedge}$ is regular. By Lemma 15.29 .4 we may replace $A$ by $A^{\wedge}$. Thus we may assume that $A$ is a Noetherian complete local ring. By the Cohen structure theorem (Algebra,

Theorem 10.152.8 there exist a map $K \rightarrow A$. As $k$ is the prime field we see that $K \rightarrow A$ is a $k$-algebra map.
Let $x_{1}, \ldots, x_{n} \in \mathfrak{m}$ be elements whose images form a basis of $\mathfrak{m} / \mathfrak{m}^{2}$. Set $T=$ $K\left[\left[X_{1}, \ldots, X_{n}\right]\right]$. Note that

$$
A / \mathfrak{m}^{2} \cong K\left[x_{1}, \ldots, x_{n}\right] /\left(x_{i} x_{j}\right)
$$

and

$$
T / \mathfrak{m}_{T}^{2} \cong K\left[X_{1}, \ldots, X_{n}\right] /\left(X_{i} X_{j}\right)
$$

Let $A / \mathfrak{m}^{2} \rightarrow T / m_{T}^{2}$ be the local $K$-algebra isomorphism given by mapping the class of $x_{i}$ to the class of $X_{i}$. Denote $f_{1}: A \rightarrow T / \mathfrak{m}_{T}^{2}$ the composition of this isomorphism with the quotient map $A \rightarrow A / \mathfrak{m}^{2}$. The assumption that $k \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology means we can lift $f_{1}$ to a map $f_{2}: A \rightarrow T / \mathfrak{m}_{T}^{3}$, then to a map $f_{3}: A \rightarrow T / \mathfrak{m}_{T}^{4}$, and so on, for all $n \geq 1$. Warning: the maps $f_{n}$ are continuous $k$-algebra maps and may not be $K$-algebra maps. We get an induced $\operatorname{map} f: A \rightarrow T=\lim T / \mathfrak{m}_{T}^{n}$ of local $k$-algebras. By our choice of $f_{1}$, the map $f$ induces an isomorphism $\mathfrak{m} / \mathfrak{m}^{2} \rightarrow \mathfrak{m}_{T} / \mathfrak{m}_{T}^{2}$ hence each $f_{n}$ is surjective and we conclude $f$ is surjective as $A$ is complete. This implies $\operatorname{dim}(A) \geq \operatorname{dim}(T)=n$. Hence $A$ is regular by definition. (It also follows that $f$ is an isomorphism.)

The following result will be improved on in Section 15.31
07EJ Lemma 15.29.11. Let $k$ be a field. Let $(A, \mathfrak{m}, K)$ be a regular local $k$-algebra such that $K / k$ is separable. Then $k \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology.
Proof. It suffices to prove that the completion of $A$ is formally smooth over $k$, see Lemma 15.29 .4 Hence we may assume that $A$ is a complete local regular $k$ algebra with residue field $K$ separable over $k$. Since $K$ is formally smooth over $k$ by Algebra, Proposition 10.150 .9 we can successively find maps

of $k$-algebras. Since $A$ is complete this defines a $k$-algebra map $K \rightarrow A$. Pick $a_{1}, \ldots, a_{n} \in \mathfrak{m}$ which map to a $K$-basis of $\mathfrak{m} / \mathfrak{m}^{2}$. Consider the $K$-algebra map

$$
c: K\left[\left[x_{1}, \ldots, x_{n}\right]\right] \longrightarrow A
$$

which maps $x_{i}$ to $a_{i}$ (existence of $c$ follows from the universal property of the powerseries ring). By construction the maps $K\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A / \mathfrak{m}^{e}$ are surjective for all $e \geq 1$. Since $K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is complete we see that $c$ is surjective. Since $\operatorname{dim}(A)=n$ as $A$ is regular and since $K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is a domain of dimension $n$ we see that the kernel of $c$ is zero. Hence $c$ is an isomorphism.

We win because the power series ring $K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is formally smooth over $k$. Namely, $K$ is formally smooth over $k$ and $K\left[x_{1}, \ldots, x_{n}\right]$ is formally smooth over $K$ as a polynomial algebra. Hence $K\left[x_{1}, \ldots, x_{n}\right]$ is formally smooth over $k$ by Algebra, Lemma 10.136.3. It follows that $k \rightarrow K\left[x_{1}, \ldots, x_{n}\right]$ is formally smooth for the $\left(x_{1}, \ldots, x_{n}\right)$-adic topology by Lemma 15.29 .2 . Finally, it follows that $k \rightarrow$ $K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is formally smooth for the $\left(x_{1}, \ldots, x_{n}\right)$-adic topology by Lemma 15.29 .4

07VH Lemma 15.29.12. Let $A \rightarrow B$ be a finite type ring map with $A$ Noetherian. Let $\mathfrak{q} \subset B$ be a prime ideal lying over $\mathfrak{p} \subset A$. The following are equivalent
(1) $A \rightarrow B$ is smooth at $\mathfrak{q}$, and
(2) $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth in the $\mathfrak{q}$-adic topology.

Proof. The implication $(2) \Rightarrow(1)$ follows from Algebra, Lemma 10.139.2 Conversely, if $A \rightarrow B$ is smooth at $\mathfrak{q}$, then $A \rightarrow B_{g}$ is smooth for some $g \in B$, $g \notin \mathfrak{q}$. Then $A \rightarrow B_{g}$ is formally smooth by Algebra, Proposition 10.136.13. Hence $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth as localization preserves formal smoothness (for example by the criterion of Algebra, Proposition 10.136 .8 and the fact that the cotangent complex behaves well with respect to localization, see Algebra, Lemmas 10.132.11 and 10.132 .13 . Finally, Lemma 15.29 .2 implies that $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth in the $\mathfrak{q}$-adic topology.

### 15.30. Some results on power series rings

07NK Questions on formally smooth maps between Noetherian local rings can often be reduced to questions on maps between power series rings. In this section we prove some helper lemmas to facilitate this kind of argument.

07NL Lemma 15.30.1. Let $K$ be a field of characteristic 0 and $A=K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Let $L$ be a field of characteristic $p>0$ and $B=L\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Let $\Lambda$ be a Cohen ring. Let $C=\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right]$.
(1) $\mathbf{Q} \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology.
(2) $\mathbf{F}_{p} \rightarrow B$ is formally smooth in the $\mathfrak{m}$-adic topology.
(3) $\mathbf{Z} \rightarrow C$ is formally smooth in the $\mathfrak{m}$-adic topology.

Proof. By the universal property of power series rings it suffices to prove:
(1) $\mathbf{Q} \rightarrow K$ is formally smooth.
(2) $\mathbf{F}_{p} \rightarrow L$ is formally smooth.
(3) $\mathbf{Z} \rightarrow \Lambda$ is formally smooth in the $\mathfrak{m}$-adic topology.

The first two are Algebra, Proposition 10.150 .9 . The third follows from Algebra, Lemma 10.152 .7 since for any test diagram as in Definition 15.29 .1 some power of $p$ will be zero in $A / J$ and hence some power of $p$ will be zero in $A$.

07 NM Lemma 15.30.2. Let $K$ be a field and $A=K\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Let $\Lambda$ be a Cohen ring and let $B=\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right]$.
(1) If $y_{1}, \ldots, y_{n} \in A$ is a regular system of parameters then $K\left[\left[y_{1}, \ldots, y_{n}\right]\right] \rightarrow$ $A$ is an isomorphism.
(2) If $z_{1}, \ldots, z_{r} \in A$ form part of a regular system of parameters for $A$, then $r \leq n$ and $A /\left(z_{1}, \ldots, z_{r}\right) \cong K\left[\left[y_{1}, \ldots, y_{n-r}\right]\right]$.
(3) If $p, y_{1}, \ldots, y_{n} \in B$ is a regular system of parameters then $\Lambda\left[\left[y_{1}, \ldots, y_{n}\right]\right] \rightarrow$ $B$ is an isomorphism.
(4) If $p, z_{1}, \ldots, z_{r} \in B$ form part of a regular system of parameters for $B$, then $r \leq n$ and $B /\left(z_{1}, \ldots, z_{r}\right) \cong \Lambda\left[\left[y_{1}, \ldots, y_{n-r}\right]\right]$.

Proof. Proof of (1). Set $A^{\prime}=K\left[\left[y_{1}, \ldots, y_{n}\right]\right]$. It is clear that the map $A^{\prime} \rightarrow A$ induces an isomorphism $A^{\prime} / \mathfrak{m}_{A^{\prime}}^{n} \rightarrow A / \mathfrak{m}_{A}^{n}$ for all $n \geq 1$. Since $A$ and $A^{\prime}$ are both complete we deduce that $A^{\prime} \rightarrow A$ is an isomorphism. Proof of (2). Extend $z_{1}, \ldots, z_{r}$ to a regular system of parameters $z_{1}, \ldots, z_{r}, y_{1}, \ldots, y_{n-r}$ of $A$. Consider the map $A^{\prime}=K\left[\left[z_{1}, \ldots, z_{r}, y_{1}, \ldots, y_{n-r}\right]\right] \rightarrow A$. This is an isomorphism by (1). Hence (2)
follows as it is clear that $A^{\prime} /\left(z_{1}, \ldots, z_{r}\right) \cong K\left[\left[y_{1}, \ldots, y_{n-r}\right]\right]$. The proofs of (3) and (4) are exactly the same as the proofs of (1) and (2).

07 NN Lemma 15.30.3. Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. Then there exists a commutative diagram

with the following properties:
(1) the horizontal arrows are surjective,
(2) if the characteristic of $A / \mathfrak{m}_{A}$ is zero, then $S$ and $R$ are power series rings over fields,
(3) if the characteristic of $A / \mathfrak{m}_{A}$ is $p>0$, then $S$ and $R$ are power series rings over Cohen rings, and
(4) $R \rightarrow S$ maps a regular system of parameters of $R$ to part of a regular system of parameters of $S$.
In particular $R \rightarrow S$ is flat (see Algebra, Lemma 10.127.2) with regular fibre $S / \mathfrak{m}_{R} S$ (see Algebra, Lemma 10.105.3).
Proof. Use the Cohen structure theorem (Algebra, Theorem 10.152.8) to choose a surjection $S \rightarrow B$ as in the statement of the lemma where we choose $S$ to be a power series over a Cohen ring if the residue characteristic is $p>0$ and a power series over a field else. Let $J \subset S$ be the kernel of $S \rightarrow B$. Next, choose a surjection $R=\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A$ where we choose $\Lambda$ to be a Cohen ring if the residue characteristic of $A$ is $p>0$ and $\Lambda$ equal to the residue field of $A$ otherwise. We lift the composition $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A \rightarrow B$ to a map $\varphi: R \rightarrow S$. This is possible because $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is formally smooth over $\mathbf{Z}$ in the $\mathfrak{m}$-adic topology (see Lemma 15.30.1) by an application of Lemma 15.29.5. Finally, we replace $\varphi$ by the $\operatorname{map} \varphi^{\prime}: R=\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow S^{\prime}=S\left[\left[y_{1}, \ldots, y_{n}\right]\right]$ with $\left.\varphi^{\prime}\right|_{\Lambda}=\left.\varphi\right|_{\Lambda}$ and $\varphi^{\prime}\left(x_{i}\right)=\varphi\left(x_{i}\right)+y_{i}$. We also replace $S \rightarrow B$ by the map $S^{\prime} \rightarrow B$ which maps $y_{i}$ to zero. After this replacement it is clear that a regular system of parameters of $R$ maps to part of a regular sequence in $S^{\prime}$ and we win.

There should be an elementary proof of the following lemma.
09Q8 Lemma 15.30.4. Let $S \rightarrow R$ and $S^{\prime} \rightarrow R$ be surjective maps of complete Noetherian local rings. Then $S \times_{R} S^{\prime}$ is a complete Noetherian local ring.

Proof. Let $k$ be the residue field of $R$. If the characteristic of $k$ is $p>0$, then we denote $\Lambda$ a Cohen ring (Algebra, Definition 10.152.5) with residue field $k$ (Algebra, Lemma 10.152.6. If the characteristic of $k$ is 0 we set $\Lambda=k$. Choose a surjection $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow R$ (as in the Cohen structure theorem, see Algebra, Theorem 10.152 .8 and lift this to maps $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow S$ and $\varphi: \Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow S$ and $\varphi^{\prime}: \Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow S^{\prime}$ using Lemmas 15.30 .1 and 15.29.5. Next, choose $f_{1}, \ldots, f_{m} \in S$ generating the kernel of $S \rightarrow R$ and $f_{1}^{\prime}, \ldots, f_{m^{\prime}}^{\prime} \in S^{\prime}$ generating the kernel of $S^{\prime} \rightarrow R$. Then the map

$$
\Lambda\left[\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}, z_{1}, \ldots, z_{m^{\prime}}\right]\right] \longrightarrow S \times_{R} S
$$

which sends $x_{i}$ to $\left(\varphi\left(x_{i}\right), \varphi^{\prime}\left(x_{i}\right)\right)$ and $y_{j}$ to $\left(f_{j}, 0\right)$ and $z_{j^{\prime}}$ to $\left(0, f_{j}^{\prime}\right)$ is surjective. Thus $S \times{ }_{R} S^{\prime}$ is a quotient of a complete local ring, whence complete.

### 15.31. Geometric regularity and formal smoothness

07 EK In this section we combine the results of the previous sections to prove the following characterization of geometrically regular local rings over fields. We then recycle some of our arguments to prove a characterization of formally smooth maps in the $\mathfrak{m}$-adic topology between Noetherian local rings.

07EL Theorem 15.31.1. Let $k$ be a field. Let $(A, \mathfrak{m}, K)$ be a Noetherian local $k$-algebra. If the characteristic of $k$ is zero then the following are equivalent
(1) $A$ is a regular local ring, and
(2) $k \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology.

If the characteristic of $k$ is $p>0$ then the following are equivalent
(1) $A$ is geometrically regular over $k$,
(2) $k \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology.
(3) for all $k \subset k^{\prime} \subset k^{1 / p}$ finite over $k$ the ring $A \otimes_{k} k^{\prime}$ is regular,
(4) $A$ is regular and the canonical map $H_{1}\left(L_{K / k}\right) \rightarrow \mathfrak{m} / \mathfrak{m}^{2}$ is injective, and
(5) $A$ is regular and the map $\Omega_{k / \mathbf{F}_{p}} \otimes_{k} K \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K$ is injective.

Proof. If the characteristic of $k$ is zero, then the equivalence of (1) and (2) follows from Lemmas 15.29 .10 and 15.29 .11
If the characteristic of $k$ is $p>0$, then it follows from Proposition 15.27 .1 that (1), (3), (4), and (5) are equivalent. Assume (2) holds. By Lemma 15.29.8 we see that $k^{\prime} \rightarrow A^{\prime}=A \otimes_{k} k^{\prime}$ is formally smooth for the $\mathfrak{m}^{\prime}=\mathfrak{m} A$-adic topology. Hence if $k \subset k^{\prime}$ is finite purely inseparable, then $A^{\prime}$ is a regular local ring by Lemma 15.29 .10 . Thus we see that (1) holds.

Finally, we will prove that (5) implies (2). Choose a solid diagram

as in Definition 15.29.1. As $J^{2}=0$ we see that $J$ has a canonical $B / J$ module structure and via $\psi$ an $A$-module structure. As $\bar{\psi}$ is continuous for the $\mathfrak{m}$-adic topology we see that $\mathfrak{m}^{n} J=0$ for some $n$. Hence we can filter $J$ by $B / J$-submodules $0 \subset J_{1} \subset J_{2} \subset \ldots \subset J_{n}=J$ such that each quotient $J_{t+1} / J_{t}$ is annihilated by $\mathfrak{m}$. Considering the sequence of ring maps $B \rightarrow B / J_{1} \rightarrow B / J_{2} \rightarrow \ldots \rightarrow B / J$ we see that it suffices to prove the existence of the dotted arrow when $J$ is annihilated by $\mathfrak{m}$, i.e., when $J$ is a $K$-vector space.
Assume given a diagram as above such that $J$ is annihilated by $\mathfrak{m}$. By Lemma 15.29 .11 we see that $\mathbf{F}_{p} \rightarrow A$ is formally smooth in the $\mathfrak{m}$-adic topology. Hence we can find a ring map $\psi: A \rightarrow B$ such that $\pi \circ \psi=\bar{\psi}$. Then $\psi \circ i, \varphi: k \rightarrow B$ are two maps whose compositions with $\pi$ are equal. Hence $D=\psi \circ i-\varphi: k \rightarrow J$ is a derivation. By Algebra, Lemma 10.130 .3 we can write $D=\xi \circ \mathrm{d}$ for some $k$-linear map $\xi: \Omega_{k / \mathbf{F}_{p}} \rightarrow J$. Using the $K$-vector space structure on $J$ we extend $\xi$ to a $K$-linear map $\xi^{\prime}: \Omega_{k / \mathbf{F}_{p}} \otimes_{k} K \rightarrow J$. Using (5) we can find a $K$-linear map $\xi^{\prime \prime}: \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K$ whose restriction to $\Omega_{k / \mathbf{F}_{p}} \otimes_{k} K$ is $\xi^{\prime}$. Write

$$
D^{\prime}: A \xrightarrow{\mathrm{~d}} \Omega_{A / \mathbf{F}_{p}} \rightarrow \Omega_{A / \mathbf{F}_{p}} \otimes_{A} K \xrightarrow{\xi^{\prime \prime}} J .
$$

Finally, set $\psi^{\prime}=\psi-D^{\prime}: A \rightarrow B$. The reader verifies that $\psi^{\prime}$ is a ring map such that $\pi \circ \psi^{\prime}=\bar{\psi}$ and such that $\psi^{\prime} \circ i=\varphi$ as desired.

07EM Example 15.31.2. Let $k$ be a field of characteristic $p>0$. Suppose that $a \in k$ is an element which is not a $p$ th power. A standard example of a geometrically regular local $k$-algebra whose residue field is purely inseparable over $k$ is the ring

$$
A=k[x, y]_{\left(x, y^{p}-a\right)} /\left(y^{p}-a-x\right)
$$

Namely, $A$ is a localization of a smooth algebra over $k$ hence $k \rightarrow A$ is formally smooth, hence $k \rightarrow A$ is formally smooth for the $\mathfrak{m}$-adic topology. A closely related example is the following. Let $k=\mathbf{F}_{p}(s)$ and $K=\mathbf{F}_{p}(t)^{\text {perf }}$. We claim the ring map

$$
k \longrightarrow A=K[[x]], \quad s \longmapsto t+x
$$

is formally smooth for the ( $x$ )-adic topology on $A$. Namely, $\Omega_{k / \mathbf{F}_{p}}$ is 1-dimensional with basis $\mathrm{d} s$. It maps to the element $\mathrm{d} x+\mathrm{d} t=\mathrm{d} x$ in $\Omega_{A / \mathbf{F}_{p}}$. We leave it to the reader to show that $\Omega_{A / \mathbf{F}_{p}}$ is free on $\mathrm{d} x$ as an $A$-module. Hence we see that condition (5) of Theorem 15.31 .1 holds and we conclude that $k \rightarrow A$ is formally smooth in the ( $x$ )-adic topology.

07NP Lemma 15.31.3. Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Assume $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology. Then $A \rightarrow B$ is flat.

Proof. We may assume that $A$ and $B$ a Noetherian complete local rings by Lemma 15.29 .4 and Algebra, Lemma 10.96 .6 (this also uses Algebra, Lemma 10.38 .9 and 10.96 .3 to see that flatness of the map on completions implies flatness of $A \rightarrow B$ ). Choose a commutative diagram

as in Lemma 15.30 .3 with $R \rightarrow S$ flat. Let $I \subset R$ be the kernel of $R \rightarrow A$. Because $B$ is formally smooth over $A$ we see that the $A$-algebra map

$$
S / I S \longrightarrow B
$$

has a section, see Lemma 15.29 .5 . Hence $B$ is a direct summand of the flat $A$ module $S / I S$ (by base change of flatness, see Algebra, Lemma 10.38.7), whence flat.

07NQ Proposition 15.31.4. Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Let $k$ be the residue field of $A$ and $\bar{B}=B \otimes_{A} k$ the special fibre. The following are equivalent
(1) $A \rightarrow B$ is flat and $\bar{B}$ is geometrically regular over $k$,
(2) $A \rightarrow B$ is flat and $k \rightarrow \bar{B}$ is formally smooth in the $\mathfrak{m}_{\bar{B}}$-adic topology, and
(3) $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology.

Proof. The equivalence of (1) and (2) follows from Theorem 15.31.1.
Assume (3). By Lemma 15.31 .3 we see that $A \rightarrow B$ is flat. By Lemma 15.29 .8 we see that $k \rightarrow \bar{B}$ is formally smooth in the $\mathfrak{m}_{\bar{B}}$-adic topology. Thus (2) holds.

Assume (2). Lemma 15.29 .4 tells us formal smoothness is preserved under completion. The same is true for flatness by Algebra, Lemma 10.96.3. Hence we may replace $A$ and $B$ by their respective completions and assume that $A$ and $B$ are Noetherian complete local rings. In this case choose a diagram

as in Lemma 15.30.3. We will use all of the properties of this diagram without further mention. Fix a regular system of parameters $t_{1}, \ldots, t_{d}$ of $R$ with $t_{1}=p$ in case the characteristic of $k$ is $p>0$. Set $\bar{S}=S \otimes_{R} k$. Consider the short exact sequence

$$
0 \rightarrow J \rightarrow S \rightarrow B \rightarrow 0
$$

Since $B$ is flat over $A$ we see that $J \otimes_{R} k$ is the kernel of $\bar{S} \rightarrow \bar{B}$. As $\bar{B}$ and $\bar{S}$ are regular we see that $J \otimes_{R} k$ is generated by elements $\bar{x}_{1}, \ldots, \bar{x}_{r}$ which form part of a regular system of parameters of $\bar{S}$, see Algebra, Lemma 10.105.4. Lift these elements to $x_{1}, \ldots, x_{r} \in J$. Then $t_{1}, \ldots, t_{d}, x_{1}, \ldots, x_{r}$ is part of a regular system of parameters for $S$. Hence $S /\left(x_{1}, \ldots, x_{r}\right)$ is a power series ring over a field (if the characteristic of $k$ is zero) or a power series ring over a Cohen ring (if the characteristic of $k$ is $p>0$ ), see Lemma 15.30.2. Moreover, it is still the case that $R \rightarrow S /\left(x_{1}, \ldots, x_{r}\right)$ maps $t_{1}, \ldots, t_{d}$ to a part of a regular system of parameters of $S /\left(x_{1}, \ldots, x_{r}\right)$. In other words, we may replace $S$ by $S /\left(x_{1}, \ldots, x_{r}\right)$ and assume we have a diagram

as in Lemma 15.30 .3 with moreover $\bar{S}=\bar{B}$. In this case the map

$$
S \otimes_{R} A \longrightarrow B
$$

is an isomorphism as it is surjective and an isomorphism on special fibres, see Algebra, Lemma 10.98.1. Thus by Lemma 15.29 .8 it suffices to show that $R \rightarrow S$ is formally smooth in the $\mathfrak{m}_{S}$-adic topology. Of course, since $\bar{S}=\bar{B}$, we have that $\bar{S}$ is formally smooth over $k=R / \mathfrak{m}_{R}$.

Choose elements $y_{1}, \ldots, y_{m} \in S$ such that $t_{1}, \ldots, t_{d}, y_{1}, \ldots, y_{m}$ is a regular system of parameters for $S$. If the characteristic of $k$ is zero, choose a coefficient field $K \subset S$ and if the characteristic of $k$ is $p>0$ choose a Cohen ring $\Lambda \subset S$ with residue field $K$. At this point the map $K\left[\left[t_{1}, \ldots, t_{d}, y_{1}, \ldots, y_{m}\right]\right] \rightarrow S$ (characteristic zero case) or $\Lambda\left[\left[t_{2}, \ldots, t_{d}, y_{1}, \ldots, y_{m}\right]\right] \rightarrow S$ (characteristic $p>0$ case) is an isomorphism, see Lemma 15.30 .2 . From now on we think of $S$ as the above power series ring.

The rest of the proof is analogous to the argument in the proof of Theorem 15.31 .1 . Choose a solid diagram

as in Definition 15.29.1. As $J^{2}=0$ we see that $J$ has a canonical $N / J$ module structure and via $\psi$ a $S$-module structure. As $\bar{\psi}$ is continuous for the $\mathfrak{m}_{S}$-adic topology we see that $\mathfrak{m}_{S}^{n} J=0$ for some $n$. Hence we can filter $J$ by $N / J$-submodules $0 \subset J_{1} \subset J_{2} \subset \ldots \subset J_{n}=J$ such that each quotient $J_{t+1} / J_{t}$ is annihilated by $\mathfrak{m}_{S}$. Considering the sequence of ring maps $N \rightarrow N / J_{1} \rightarrow N / J_{2} \rightarrow \ldots \rightarrow N / J$ we see that it suffices to prove the existence of the dotted arrow when $J$ is annihilated by $\mathfrak{m}_{S}$, i.e., when $J$ is a $K$-vector space.

Assume given a diagram as above such that $J$ is annihilated by $\mathfrak{m}_{S}$. As $\mathbf{Q} \rightarrow S$ (characteristic zero case) or $\mathbf{Z} \rightarrow S$ (characteristic $p>0$ case) is formally smooth in the $\mathfrak{m}_{S}$-adic topology (see Lemma 15.30.1), we can find a ring map $\psi: S \rightarrow N$ such that $\pi \circ \psi=\bar{\psi}$. Since $S$ is a power series ring in $t_{1}, \ldots, t_{d}$ (characteristic zero) or $t_{2}, \ldots, t_{d}$ (characteristic $p>0$ ) over a subring, it follows from the universal property of power series rings that we can change our choice of $\psi$ so that $\psi\left(t_{i}\right)$ equals $\varphi\left(t_{i}\right)$ (automatic for $t_{1}=p$ in the characteristic $p$ case). Then $\psi \circ i$ and $\varphi: R \rightarrow N$ are two maps whose compositions with $\pi$ are equal and which agree on $t_{1}, \ldots, t_{d}$. Hence $D=\psi \circ i-\varphi: R \rightarrow J$ is a derivation which annihilates $t_{1}, \ldots, t_{d}$. By Algebra, Lemma 10.130 .3 we can write $D=\xi \circ \mathrm{d}$ for some $R$-linear $\operatorname{map} \xi: \Omega_{R / \mathbf{Z}} \rightarrow J$ which annihilates $\mathrm{d} t_{1}, \ldots, \mathrm{~d} t_{d}$ (by construction) and $\mathfrak{m}_{R} \Omega_{R / \mathbf{Z}}$ (as $J$ is annihilated by $\mathfrak{m}_{R}$ ). Hence $\xi$ factors as a composition

$$
\Omega_{R / \mathbf{Z}} \rightarrow \Omega_{k / \mathbf{Z}} \xrightarrow{\xi^{\prime}} J
$$

where $\xi^{\prime}$ is $k$-linear. Using the $K$-vector space structure on $J$ we extend $\xi^{\prime}$ to a $K$-linear map

$$
\xi^{\prime \prime}: \Omega_{k / \mathbf{Z}} \otimes_{k} K \longrightarrow J .
$$

Using that $\bar{S} / k$ is formally smooth we see that

$$
\Omega_{k / \mathbf{Z}} \otimes_{k} K \rightarrow \Omega_{\bar{S} / \mathbf{Z}} \otimes_{S} K
$$

is injective by Theorem 15.31 .1 (this is true also in the characteristic zero case as it is even true that $\Omega_{k / \mathbf{Z}} \rightarrow \Omega_{K / \mathbf{Z}}$ is injective in characteristic zero, see Algebra, Proposition 10.150 .9 . Hence we can find a $K$-linear map $\xi^{\prime \prime \prime}: \Omega_{\bar{S} / \mathbf{Z}} \otimes_{S} K \rightarrow J$ whose restriction to $\Omega_{k / \mathbf{Z}} \otimes_{k} K$ is $\xi^{\prime \prime}$. Write

$$
D^{\prime}: S \xrightarrow{\mathrm{~d}} \Omega_{S / \mathbf{Z}} \rightarrow \Omega_{\bar{S} / \mathbf{Z}} \rightarrow \Omega_{\bar{S} / \mathbf{Z}} \otimes_{S} K \xrightarrow{\xi^{\prime \prime \prime}} J
$$

Finally, set $\psi^{\prime}=\psi-D^{\prime}: S \rightarrow N$. The reader verifies that $\psi^{\prime}$ is a ring map such that $\pi \circ \psi^{\prime}=\bar{\psi}$ and such that $\psi^{\prime} \circ i=\varphi$ as desired.

As an application of the result above we prove that deformations of formally smooth algebras are unobstructed.

07NR Lemma 15.31.5. Let $A$ be a Noetherian complete local ring with residue field $k$. Let $B$ be a Noetherian complete local $k$-algebra. Assume $k \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology. Then there exists a Noetherian complete local ring $C$ and a local homomorphism $A \rightarrow C$ which is formally smooth in the $\mathfrak{m}_{C}$-adic topology such that $C \otimes_{A} k \cong B$.

Proof. Choose a diagram

as in Lemma 15.30.3. Let $t_{1}, \ldots, t_{d}$ be a regular system of parameters for $R$ with $t_{1}=p$ in case the characteristic of $k$ is $p>0$. As $B$ and $\bar{S}=S \otimes_{A} k$ are regular we see that $\operatorname{Ker}(\bar{S} \rightarrow B)$ is generated by elements $\bar{x}_{1}, \ldots, \bar{x}_{r}$ which form part of a regular system of parameters of $\bar{S}$, see Algebra, Lemma 10.105.4. Lift these elements to $x_{1}, \ldots, x_{r} \in S$. Then $t_{1}, \ldots, t_{d}, x_{1}, \ldots, x_{r}$ is part of a regular system of parameters for $S$. Hence $S /\left(x_{1}, \ldots, x_{r}\right)$ is a power series ring over a field (if the characteristic of $k$ is zero) or a power series ring over a Cohen ring (if the characteristic of $k$ is $p>0$ ), see Lemma 15.30 .2 . Moreover, it is still the case that $R \rightarrow S /\left(x_{1}, \ldots, x_{r}\right)$ maps $t_{1}, \ldots, t_{d}$ to a part of a regular system of parameters of $S /\left(x_{1}, \ldots, x_{r}\right)$. In other words, we may replace $S$ by $S /\left(x_{1}, \ldots, x_{r}\right)$ and assume we have a diagram

as in Lemma 15.30.3 with moreover $\bar{S}=B$. In this case $R \rightarrow S$ is formally smooth in the $\mathfrak{m}_{S}$-adic topology by Proposition 15.31.4. Hence the base change $C=S \otimes_{R} A$ is formally smooth over $A$ in the $\mathfrak{m}_{C}$-adic topology by Lemma 15.29 .8 .
07NS Remark 15.31.6. The assertion of Lemma 15.31 .5 is quite strong. Namely, suppose that we have a diagram

of local homomorphisms of Noetherian complete local rings where $A \rightarrow A^{\prime}$ induces an isomorphism of residue fields $k=A / \mathfrak{m}_{A}=A^{\prime} / \mathfrak{m}_{A^{\prime}}$ and with $B \otimes_{A^{\prime}} k$ formally smooth over $k$. Then we can extend this to a commutative diagram

of local homomorphisms of Noetherian complete local rings where $A \rightarrow C$ is formally smooth in the $\mathfrak{m}_{C}$-adic topology and where $C \otimes_{A} k \cong B \otimes_{A^{\prime}} k$. Namely, pick $A \rightarrow C$ as in Lemma 15.31 .5 lifting $B \otimes_{A^{\prime}} k$ over $k$. By formal smoothness we can find the arrow $C \rightarrow B$, see Lemma 15.29 .5 Denote $C \otimes_{A}^{\wedge} A^{\prime}$ the completion of $C \otimes_{A} A^{\prime}$ with respect to the ideal $C \otimes_{A} \mathfrak{m}_{A^{\prime}}$. Note that $C \otimes_{A}^{\wedge} A^{\prime}$ is a Noetherian complete local ring (see Algebra, Lemma 10.96.5) which is flat over $A^{\prime}$ (see Algebra, Lemma 10.98.11. We have moreover
(1) $C \otimes_{A}^{\wedge} A^{\prime} \rightarrow B$ is surjective,
(2) if $A \rightarrow A^{\prime}$ is surjective, then $C \rightarrow B$ is surjective,
(3) if $A \rightarrow A^{\prime}$ is finite, then $C \rightarrow B$ is finite, and
(4) if $A^{\prime} \rightarrow B$ is flat, then $C \otimes_{A}^{\wedge} A^{\prime} \cong B$.

Namely, by Nakayama's lemma for nilpotent ideals (see Algebra, Lemma 10.19.1) we see that $C \otimes_{A} k \cong B \otimes_{A^{\prime}} k$ implies that $C \otimes_{A} A^{\prime} / \mathfrak{m}_{A^{\prime}}^{n} \rightarrow B / \mathfrak{m}_{A^{\prime}}^{n} B$ is surjective for all $n$. This proves (1). Parts (2) and (3) follow from part (1). Part (4) follows from Algebra, Lemma 10.98.1.

### 15.32. Regular ring maps

07BY Let $k$ be a field. Recall that a Noetherian $k$-algebra $A$ is said to be geometrically regular over $k$ if and only if $A \otimes_{k} k^{\prime}$ is regular for all finite purely inseparable extensions $k^{\prime}$ of $k$, see Algebra, Definition 10.158.2. Moreover, if this is the case then $A \otimes_{k} k^{\prime}$ is regular for every finitely generated field extension $k \subset k^{\prime}$, see Algebra, Lemma 10.158.1. We use this notion in the following definition.
07BZ Definition 15.32.1. A ring map $R \rightarrow \Lambda$ is regular if it is flat and for every prime $\mathfrak{p} \subset R$ the fibre ring

$$
\Lambda \otimes_{R} \kappa(\mathfrak{p})=\Lambda_{\mathfrak{p}} / \mathfrak{p} \Lambda_{\mathfrak{p}}
$$

is Noetherian and geometrically regular over $\kappa(\mathfrak{p})$.
If $R \rightarrow \Lambda$ is a ring map with $\Lambda$ Noetherian, then the fibre rings are always Noetherian.
07C0 Lemma 15.32.2 (Regular is a local property). Let $R \rightarrow \Lambda$ be a ring map with $\Lambda$ Noetherian. The following are equivalent
(1) $R \rightarrow \Lambda$ is regular,
(2) $R_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is regular for all $\mathfrak{q} \subset \Lambda$ lying over $\mathfrak{p} \subset R$, and
(3) $R_{\mathfrak{m}} \rightarrow \Lambda_{\mathfrak{m}^{\prime}}$ is regular for all maximal ideals $\mathfrak{m}^{\prime} \subset \Lambda$ lying over $\mathfrak{m}$ in $R$.

Proof. This is true because a Noetherian ring is regular if and only if all the local rings are regular local rings, see Algebra, Definition 10.109 .7 and a ring map is flat if and only if all the induced maps of local rings are flat, see Algebra, Lemma 10.38.19.

07C1 Lemma 15.32.3 (Regular maps and base change). Let $R \rightarrow \Lambda$ be a regular ring map. For any finite type ring map $R \rightarrow R^{\prime}$ the base change $R^{\prime} \rightarrow \Lambda \otimes_{R} R^{\prime}$ is regular too.
Proof. Flatness is preserved under any base change, see Algebra, Lemma 10.38.7. Consider a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p} \subset R$. The residue field extension $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{p}^{\prime}\right)$ is finitely generated as $R^{\prime}$ is of finite type over $R$. Hence the fibre ring

$$
\left(\Lambda \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)=\Lambda \otimes_{R} \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right)
$$

is Noetherian by Algebra, Lemma 10.30 .7 and the assumption on the fibre rings of $R \rightarrow \Lambda$. Geometric regularity of the fibres is preserved by Algebra, Lemma 10.158.1.

07QI Lemma 15.32.4 (Composition of regular maps). Let $A \rightarrow B \rightarrow C$ be regular ring maps. If the fibre rings of $A \rightarrow C$ are Noetherian, then $A \rightarrow C$ is regular.
Proof. Let $\mathfrak{p} \subset A$ be a prime. Let $\kappa(\mathfrak{p}) \subset k$ be a finite purely inseparable extension. We have to show that $C \otimes_{A} k$ is regular. By Lemma 15.32 .3 we may assume that $A=k$ and we reduce to proving that $C$ is regular. The assumption is that $B$ is regular and that $B \rightarrow C$ is flat with regular fibres. Then $C$ is regular by Algebra, Lemma 10.111.8 Some details omitted.

07EP Lemma 15.32.5. Let $R$ be a ring. Let $\left(A_{i}, \varphi_{i i^{\prime}}\right)$ be a directed system of smooth $R$-algebras. Set $\Lambda=\operatorname{colim} A_{i}$. If the fibre rings $\Lambda \otimes_{R} \kappa(\mathfrak{p})$ are Noetherian for all $\mathfrak{p} \subset R$, then $R \rightarrow \Lambda$ is regular.
Proof. Note that $\Lambda$ is flat over $R$ by Algebra, Lemmas 10.38 .3 and 10.135.10. Let $\kappa(\mathfrak{p}) \subset k$ be a finite purely inseparable extension. Note that

$$
\Lambda \otimes_{R} \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} k=\Lambda \otimes_{R} k=\operatorname{colim} A_{i} \otimes_{R} k
$$

is a colimit of smooth $k$-algebras, see Algebra, Lemma 10.135 .4 Since each local ring of a smooth $k$-algebra is regular by Algebra, Lemma 10.138 .3 we conclude that all local rings of $\Lambda \otimes_{R} k$ are regular by Algebra, Lemma 10.105.8. This proves the lemma.

Let's see when a field extension defines a regular ring map.
07EQ Lemma 15.32.6. Let $k \subset K$ be a field extension. Then $k \rightarrow K$ is a regular ring map if and only if $K$ is a separable field extension of $k$.

Proof. If $k \rightarrow K$ is regular, then $K$ is geometrically reduced over $k$, hence $K$ is separable over $k$ by Algebra, Proposition 10.150.9. Conversely, if $K / k$ is separable, then $K$ is a colimit of smooth $k$-algebras, see Algebra, Lemma 10.150.11 hence is regular by Lemma 15.32 .5 .

07 NT Lemma 15.32.7. Let $A \rightarrow B \rightarrow C$ be ring maps. If $A \rightarrow C$ is regular and $B \rightarrow C$ is flat and surjective on spectra, then $A \rightarrow B$ is regular.
Proof. By Algebra, Lemma 10.38 .10 we see that $A \rightarrow B$ is flat. Let $\mathfrak{p} \subset A$ be a prime. The ring map $B \otimes_{A} \kappa(\mathfrak{p}) \rightarrow C \otimes_{A} \kappa(\mathfrak{p})$ is flat and surjective on spectra. Hence $B \otimes_{A} \kappa(\mathfrak{p})$ is geometrically regular by Algebra, Lemma 10.158.3.

### 15.33. Ascending properties along regular ring maps

07QJ This section is the analogue of Algebra, Section 10.155 but where the ring map $R \rightarrow S$ is regular.

07QK Lemma 15.33.1. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is regular,
(2) $S$ is Noetherian, and
(3) $R$ is Noetherian and reduced.

Then $S$ is reduced.
Proof. For Noetherian rings being reduced is the same as having properties $\left(S_{1}\right)$ and $\left(R_{0}\right)$, see Algebra, Lemma 10.149.3. Hence we may apply Algebra, Lemmas 10.155 .4 and 10.155 .5

0BFK Lemma 15.33.2. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is regular,
(2) $S$ is Noetherian, and
(3) $R$ is Noetherian and normal.

Then $S$ is normal.
Proof. For Noetherian rings being reduced is the same as having properties $\left(S_{2}\right)$ and $\left(R_{1}\right)$, see Algebra, Lemma 10.149.4. Hence we may apply Algebra, Lemmas 10.155 .4 and 10.155 .5 .

### 15.34. Permanence of properties under completion

07 NU Given a Noetherian local ring $(A, \mathfrak{m})$ we denote $A^{\wedge}$ the completion of $A$ with respect to $\mathfrak{m}$. We will use without further mention that $A^{\wedge}$ is a Noetherian complete local ring with maximal ideal $\mathfrak{m}^{\wedge}=\mathfrak{m} A^{\wedge}$ and that $A \rightarrow A^{\wedge}$ is faithfully flat. See Algebra, Lemmas 10.96.6, 10.96.4, and 10.96.3.

07 NV Lemma 15.34.1. Let $A$ be a Noetherian local ring. Then $\operatorname{dim}(A)=\operatorname{dim}\left(A^{\wedge}\right)$.
Proof. By Algebra, Lemma 10.96 .4 the map $A \rightarrow A^{\wedge}$ induces isomorphisms $A / \mathfrak{m}^{n}=A^{\wedge} /\left(\mathfrak{m}^{\wedge}\right)^{n}$ for $n \geq 1$. By Algebra, Lemma 10.51 .12 this implies that

$$
\operatorname{length}_{A}\left(A / \mathfrak{m}^{n}\right)=\operatorname{length}_{A^{\wedge}}\left(A^{\wedge} /\left(\mathfrak{m}^{\wedge}\right)^{n}\right)
$$

for all $n \geq 1$. Thus $d(A)=d\left(A^{\wedge}\right)$ and we conclude by Algebra, Proposition 10.59 .8 An alternative proof is to use Algebra, Lemma 10.111.7.
07 NW Lemma 15.34.2. Let $A$ be a Noetherian local ring. Then $\operatorname{depth}(A)=\operatorname{depth}\left(A^{\wedge}\right)$.
Proof. See Algebra, Lemma 10.155.2.
07NX Lemma 15.34.3. Let $A$ be a Noetherian local ring. Then $A$ is Cohen-Macaulay if and only if $A^{\wedge}$ is so.

Proof. A local ring $A$ is Cohen-Macaulay if and only $\operatorname{dim}(A)=\operatorname{depth}(A)$. As both of these invariants are preserved under completion (Lemmas 15.34.1 and 15.34 .2 ) the claim follows.

07NY Lemma 15.34.4. Let $A$ be a Noetherian local ring. Then $A$ is regular if and only if $A^{\wedge}$ is so.

Proof. If $A^{\wedge}$ is regular, then $A$ is regular by Algebra, Lemma 10.109.9. Assume $A$ is regular. Let $\mathfrak{m}$ be the maximal ideal of $A$. Then $\operatorname{dim}_{\kappa(\mathfrak{m})} \mathfrak{m} / \mathfrak{m}^{2}=\operatorname{dim}(A)=$ $\operatorname{dim}\left(A^{\wedge}\right)$ (Lemma 15.34.1). On the other hand, $\mathfrak{m} A^{\wedge}$ is the maximal ideal of $A^{\wedge}$ and hence $\mathfrak{m}_{A^{\wedge}}$ is generated by at most $\operatorname{dim}\left(A^{\wedge}\right)$ elements. Thus $A^{\wedge}$ is regular. (You can also use Algebra, Lemma 10.111.8.)

0AP1 Lemma 15.34.5. Let $A$ be a Noetherian local ring. Then $A$ is a discrete valuation ring if and only if $A^{\wedge}$ is so.

Proof. This follows from Lemmas 15.34.1 and 15.34.4 and Algebra, Lemma 10.118.7

07NZ Lemma 15.34.6. Let $A$ be a Noetherian local ring.
(1) If $A^{\wedge}$ is reduced, then so is $A$.
(2) In general $A$ reduced does not imply $A^{\wedge}$ is reduced.
(3) If $A$ is Nagata, then $A$ is reduced if and only if $A^{\wedge}$ is reduced.

Proof. As $A \rightarrow A^{\wedge}$ is faithfully flat we have (1) by Algebra, Lemma 10.156.2, For (2) see Algebra, Example 10.118.5 (there are also examples in characteristic zero, see Algebra, Remark 10.118.6). For (3) see Algebra, Lemmas 10.154 .13 and 10.154 .10

0AGX Lemma 15.34.7. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings such that $\mathfrak{m}_{A} B=\mathfrak{m}_{B}$ and $\kappa\left(\mathfrak{m}_{A}\right)=\kappa\left(\mathfrak{m}_{B}\right)$. Then $A \rightarrow B$ induces an isomorphism $A^{\wedge} \rightarrow B^{\wedge}$ of completions.

Proof. By Algebra, Lemma 10.96 .7 we see that $B^{\wedge}$ is the $\mathfrak{m}_{A^{-}}$-adic completion of $B$ and that $A^{\wedge} \rightarrow B^{\wedge}$ is finite. Since $A \rightarrow B$ is flat we have $\operatorname{Tor}_{1}^{A}\left(B, \kappa\left(\mathfrak{m}_{A}\right)\right)=0$. Hence we see that $B^{\wedge}$ is flat over $A^{\wedge}$ by Lemma 15.21 .5 . Thus $B^{\wedge}$ is a free $A^{\wedge}$ module by Algebra, Lemma 10.77.4. Since $A^{\wedge} \rightarrow B^{\wedge}$ induces an isomorphism $\kappa\left(\mathfrak{m}_{A}\right)=A^{\wedge} / \mathfrak{m}_{A} A^{\wedge} \rightarrow B^{\wedge} / \mathfrak{m}_{A} B^{\wedge}=B^{\wedge} / \mathfrak{m}_{B} B^{\wedge}=\kappa\left(\mathfrak{m}_{B}\right)$ by our assumptions (and Algebra, Lemma 10.95.5), we see that $B^{\wedge}$ is free of rank 1. Thus $A^{\wedge} \rightarrow B^{\wedge}$ is an isomorphism.

### 15.35. Permanence of properties under étale maps

$0 A G Y$ In this section we consider an étale ring map $\varphi: A \rightarrow B$ and we study which properties of $A$ are inherited by $B$ and which properties of the local ring of $B$ at $\mathfrak{q}$ are inherited by the local ring of $A$ at $\mathfrak{p}=\varphi^{-1}(\mathfrak{q})$. Basically, this section reviews and collects earlier results and does not add any new material.

We will use without further mention that an étale ring map is flat (Algebra, Lemma 10.141.3) and that a flat local homomorphism of local rings is faithfully flat (Algebra, Lemma 10.38.17.
0AGZ Lemma 15.35.1. If $A \rightarrow B$ is an étale ring map and $\mathfrak{q}$ is a prime of $B$ lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is Noetherian if and only if $B_{\mathfrak{q}}$ is Noetherian.
Proof. Since $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is faithfully flat we see that $B_{\mathfrak{q}}$ Noetherian implies that $A_{\mathfrak{p}}$ is Noetherian, see Algebra, Lemma 10.156.1. Conversly, if $A_{\mathfrak{p}}$ is Noetherian, then $B_{\mathfrak{q}}$ is Noetherian as it is a localization of a finite type $A_{\mathfrak{p}}$-algebra.

07QP Lemma 15.35.2. If $A \rightarrow B$ is an étale ring map and $\mathfrak{q}$ is a prime of $B$ lying over $\mathfrak{p} \subset A$, then $\operatorname{dim}\left(A_{\mathfrak{p}}\right)=\operatorname{dim}\left(B_{\mathfrak{q}}\right)$.

Proof. Namely, because $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is flat we have going down, and hence the inequality $\operatorname{dim}\left(A_{\mathfrak{p}}\right) \leq \operatorname{dim}\left(B_{\mathfrak{q}}\right)$, see Algebra, Lemma 10.111.1. On the other hand, suppose that $\mathfrak{q}_{0} \subset \mathfrak{q}_{1} \subset \ldots \subset \mathfrak{q}_{n}$ is a chain of primes in $B_{\mathfrak{q}}$. Then the corresponding sequence of primes $\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{n}$ (with $\mathfrak{p}_{i}=\mathfrak{q}_{i} \cap A_{\mathfrak{p}}$ ) is chain also (i.e., no equalities in the sequence) as an étale ring map is quasi-finite (see Algebra, Lemma 10.141.6 and a quasi-finite ring map induces a map of spectra with discrete fibres (by definition). This means that $\operatorname{dim}\left(A_{\mathfrak{p}}\right) \geq \operatorname{dim}\left(B_{\mathfrak{q}}\right)$ as desired.
0AH0 Lemma 15.35.3. If $A \rightarrow B$ is an étale ring map and $\mathfrak{q}$ is a prime of $B$ lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is regular if and only if $B_{\mathfrak{q}}$ is regular.
Proof. By Lemma 15.35 .1 we may assume both $A_{\mathfrak{p}}$ and $B_{\mathfrak{q}}$ are Noetherian in order to prove the equivalence. Let $x_{1}, \ldots, x_{t} \in \mathfrak{p} A_{\mathfrak{p}}$ be a minimal set of generators. As $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is faithfully flat we see that the images $y_{1}, \ldots, y_{t}$ in $B_{\mathfrak{q}}$ form a minimal system of generators for $\mathfrak{p} B_{\mathfrak{q}}=\mathfrak{q} B_{\mathfrak{q}}$ (Algebra, Lemma 10.141.5. Regularity of $A_{\mathfrak{p}}$ by definition means $t=\operatorname{dim}\left(A_{\mathfrak{p}}\right)$ and similarly for $B_{\mathfrak{q}}$. Hence the lemma follows from the equality $\operatorname{dim}\left(A_{\mathfrak{p}}\right)=\operatorname{dim}\left(B_{\mathfrak{q}}\right)$ of Lemma 15.35.2.

0AP2 Lemma 15.35.4. If $A \rightarrow B$ is an étale ring map and $A$ is a Dedekind domain, then $B$ is a finite product of Dedekind domains. In particular, the localizations $B_{\mathfrak{q}}$ for $\mathfrak{q} \subset B$ maximal are discrete valuation rings.

Proof. The statement on the local rings follows from Lemmas 15.35 .2 and 15.35 .3 and Algebra, Lemma 10.118.7. It follows that $B$ is a Noetherian normal ring of dimension 1. By Algebra, Lemma 10.36 .15 we conclude that $B$ is a finite procuct of
normal domains of dimension 1. These are Dedekind domains by Algebra, Lemma 10.119.15.

### 15.36. Permanence of properties under henselization

07QL Given a local ring $R$ we denote $R^{h}$, resp. $R^{\text {sh }}$ the henselization, resp. strict henselization of $R$, see Algebra, Definition 10.148.18. Many of the properties of $R$ are reflected in $R^{h}$ and $R^{s h}$ as we will show in this section.

07QM Lemma 15.36.1. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Then we have the following
(1) $R \rightarrow R^{h} \rightarrow R^{\text {sh }}$ are faithfully flat ring maps,
(2) $\mathfrak{m} R^{h}=\mathfrak{m}^{h}$ and $\mathfrak{m} R^{s h}=\mathfrak{m}^{h} R^{s h}=\mathfrak{m}^{s h}$,
(3) $R / \mathfrak{m}^{n}=R^{h} / \mathfrak{m}^{n} R^{h}$ for all $n$,
(4) there exist elements $x_{i} \in R^{\text {sh }}$ such that $R^{\text {sh }} / \mathfrak{m}^{n} R^{\text {sh }}$ is a free $R / \mathfrak{m}^{n}$-module on $x_{i} \bmod \mathfrak{m}^{n} R^{s h}$.

Proof. By construction $R^{h}$ is a colimit of étale $R$-algebras, see Algebra, Lemma 10.148.16. Since étale ring maps are flat (Algebra, Lemma 10.141.3) we see that $R^{h}$ is flat over $R$ by Algebra, Lemma 10.38.3. As a flat local ring homomorphism is faithfully flat (Algebra, Lemma 10.38.17) we see that $R \rightarrow R^{h}$ is faithfully flat. The ring map $R^{h} \rightarrow R^{s h}$ is a colimit of finite étale ring maps, see proof of Algebra, Lemma 10.148.17 Hence the same arguments as above show that $R^{h} \rightarrow R^{\text {sh }}$ is faithfully flat.

Part (2) follows from Algebra, Lemmas 10.148 .16 and 10.148.17. Part (3) follows from Algebra, Lemma 10.100.1 because $R / \mathfrak{m} \rightarrow R^{h} / \mathfrak{m} R^{h}$ is an isomorphism and $R / \mathfrak{m}^{n} \rightarrow R^{h} / \mathfrak{m}^{n} R^{h}$ is flat as a base change of the flat ring map $R \rightarrow R^{h}$ (Algebra, Lemma 10.38.7. Let $\kappa^{s e p}$ be the residue field of $R^{s h}$ (it is a separable algebraic closure of $\kappa$ ). Choose $x_{i} \in R^{s h}$ mapping to a basis of $\kappa^{\text {sep }}$ as a $\kappa$-vector space. Then (4) follows from Algebra, Lemma 10.100.1 in exactly the same way as above.

07QN Lemma 15.36.2. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Then
(1) $R \rightarrow R^{h}$, $R^{h} \rightarrow R^{s h}$, and $R \rightarrow R^{\text {sh }}$ are formally étale,
(2) $R \rightarrow R^{h}, R^{h} \rightarrow R^{\text {sh }}$, resp. $R \rightarrow R^{\text {sh }}$ are formally smooth in the $\mathfrak{m}^{h}, \mathfrak{m}^{\text {sh }}$, resp. $\mathfrak{m}^{\text {sh }}$-topology.
Proof. Part (1) follows from the fact that $R^{h}$ and $R^{s h}$ are directed colimits of étale algebras (by construction), that étale algebras are formally étale (Algebra, Lemma 10.146 .2 ), and that colimits of formally étale algebras are formally étale (Algebra, Lemma 10.146.3). Part (2) follows from the fact that a formally étale ring map is formally smooth and Lemma 15.29.2.

06LJ Lemma 15.36.3. Let $R$ be a local ring. The following are equivalent
(1) $R$ is Noetherian,
(2) $R^{h}$ is Noetherian, and
(3) $R^{\text {sh }}$ is Noetherian.

In this case we have
(a) $\left(R^{h}\right)^{\wedge}$ and $\left(R^{s h}\right)^{\wedge}$ are Noetherian complete local rings,
(b) $R^{\wedge} \rightarrow\left(R^{h}\right)^{\wedge}$ is an isomorphism,
(c) $R^{h} \rightarrow\left(R^{h}\right)^{\wedge}$ and $R^{s h} \rightarrow\left(R^{s h}\right)^{\wedge}$ are flat,
(d) $R^{\wedge} \rightarrow\left(R^{s h}\right)^{\wedge}$ is formally smooth in the $\mathfrak{m}_{\left(R^{s h}\right)^{\wedge}}$-adic topology.

Proof. Since $R \rightarrow R^{h} \rightarrow R^{s h}$ are faithfully flat (Lemma 15.36.1), we see that $R^{h}$ or $R^{s h}$ being Noetherian implies that $R$ is Noetherian, see Algebra, Lemma 10.156.1. In the rest of the proof we assume $R$ is Noetherian.
As $\mathfrak{m} \subset R$ is finitely generated it follows that $\mathfrak{m}^{h}=\mathfrak{m} R^{h}$ and $\mathfrak{m}^{s h}=\mathfrak{m} R^{s h}$ are finitely generated, see Lemma 15.36.1. Hence $\left(R^{h}\right)^{\wedge}$ and $\left(R^{s h}\right)^{\wedge}$ are Noetherian by Algebra, Lemma 10.152.3. This proves (a).
Note that (b) is immediate from Lemma 15.36.1. In particular we see that $\left(R^{h}\right)^{\wedge}$ is flat over $R$, see Algebra, Lemma 10.96.3.
Next, we show that $R^{h} \rightarrow\left(R^{h}\right)^{\wedge}$ is flat. Write $R^{h}=\operatorname{colim}_{i} R_{i}$ as a directed colimit of localizations of étale $R$-algebras. By Algebra, Lemma 10.38 .6 if $\left(R^{h}\right)^{\wedge}$ is flat over each $R_{i}$, then $R^{h} \rightarrow\left(R^{h}\right)^{\wedge}$ is flat. Note that $R^{h}=R_{i}^{h}$ (by construction). Hence $R_{i}^{\wedge}=\left(R^{h}\right)^{\wedge}$ by part (b) is flat over $R_{i}$ as desired. To finish the proof of (c) we show that $R^{s h} \rightarrow\left(R^{s h}\right)^{\wedge}$ is flat. To do this, by a limit argument as above, it suffices to show that $\left(R^{s h}\right)^{\wedge}$ is flat over $R$. Note that it follows from Lemma 15.36.1 that $\left(R^{s h}\right)^{\wedge}$ is the completion of a free $R$-module. By Lemma 15.21 .2 we see this is flat over $R$ as desired. This finishes the proof of (c).
At this point we know (c) is true and that $\left(R^{h}\right)^{\wedge}$ and $\left(R^{s h}\right)^{\wedge}$ are Noetherian. It follows from Algebra, Lemma 10.156.1 that $R^{h}$ and $R^{s h}$ are Noetherian.
Part (d) follows from Lemma 15.36.2 and Lemma 15.29 .4
06DH Lemma 15.36.4. Let $R$ be a local ring. The following are equivalent: $R$ is reduced, the henselization $R^{h}$ of $R$ is reduced, and the strict henselization $R^{\text {sh }}$ of $R$ is reduced.
Proof. The ring maps $R \rightarrow R^{h} \rightarrow R^{s h}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 10.156.2. Conversely, assume $R$ is reduced. Since $R^{h}$ and $R^{s h}$ are filtered colimits of étale, hence smooth $R$-algebras, the result follows from Algebra, Lemma 10.155.6.

0ASE Lemma 15.36.5. Let $R$ be a local ring. Let nil $(R)$ denote the ideal of nilpotent elements of $R$. Then $\operatorname{nil}(R) R^{h}=\operatorname{nil}\left(R^{h}\right)$ and $\operatorname{nil}(R) R^{s h}=\operatorname{nil}\left(R^{s h}\right)$.

Proof. Note that $\operatorname{nil}(R)$ is the biggest ideal consisting of nilpotent elements such that the quotient $R / \operatorname{nil}(R)$ is reduced. Note that $\operatorname{nil}(R) R^{h}$ consists of nilpotent elements by Algebra, Lemma 10.31.2. Also, note that $R^{h} / \operatorname{nil}(R) R^{h}$ is the henselization of $R / \operatorname{nil}(R)$ by Algebra, Lemma 10.148.24. Hence $R^{h} / \operatorname{nil}(R) R^{h}$ is reduced by Lemma 15.36.4 We conclude that $n i l(R) R^{h}=\operatorname{nil}\left(R^{h}\right)$ as desired. Similarly for the strict henselization but using Algebra, Lemma 10.148.30.

06DI Lemma 15.36.6. Let $R$ be a local ring. The following are equivalent: $R$ is a normal domain, the henselization $R^{h}$ of $R$ is a normal domain, and the strict henselization $R^{\text {sh }}$ of $R$ is a normal domain.

Proof. A preliminary remark is that a local ring is normal if and only if it is a normal domain (see Algebra, Definition 10.36.11). The ring maps $R \rightarrow R^{h} \rightarrow R^{s h}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 10.156.3. Conversely, assume $R$ is normal. Since $R^{h}$ and $R^{s h}$ are filtered colimits of étale, hence smooth $R$-algebras, the result follows from Algebra, Lemma 10.155 .7 .

06LK Lemma 15.36.7. Given any local ring $R$ we have $\operatorname{dim}(R)=\operatorname{dim}\left(R^{h}\right)=\operatorname{dim}\left(R^{\text {sh }}\right)$.

Proof. Since $R \rightarrow R^{s h}$ is faithfully flat (Lemma 15.36.1) we see that $\operatorname{dim}\left(R^{s h}\right) \geq$ $\operatorname{dim}(R)$ by going down, see Algebra, Lemma 10.111.1. For the converse, we write $R^{s h}=\operatorname{colim} R_{i}$ as a directed colimit of local rings $R_{i}$ each of which is a localization of an étale $R$-algebra. Now if $\mathfrak{q}_{0} \subset \mathfrak{q}_{1} \subset \ldots \subset \mathfrak{q}_{n}$ is a chain of prime ideals in $R^{s h}$, then for some sufficiently large $i$ the sequence

$$
R_{i} \cap \mathfrak{q}_{0} \subset R_{i} \cap \mathfrak{q}_{1} \subset \ldots \subset R_{i} \cap \mathfrak{q}_{n}
$$

is a chain of primes in $R_{i}$. Thus we see that $\operatorname{dim}\left(R^{s h}\right) \leq \sup _{i} \operatorname{dim}\left(R_{i}\right)$. But by the result of Lemma 15.35 .2 we have $\operatorname{dim}\left(R_{i}\right)=\operatorname{dim}(R)$ for each $i$ and we win.
06LL Lemma 15.36.8. Given a Noetherian local ring $R$ we have $\operatorname{depth}(R)=\operatorname{depth}\left(R^{h}\right)=$ $\operatorname{depth}\left(R^{s h}\right)$.
Proof. By Lemma 15.36 .3 we know that $R^{h}$ and $R^{s h}$ are Noetherian. Hence the lemma follows from Algebra, Lemma 10.155.2.

06LM Lemma 15.36.9. Let $R$ be a Noetherian local ring. The following are equivalent: $R$ is Cohen-Macaulay, the henselization $R^{h}$ of $R$ is Cohen-Macaulay, and the strict henselization $R^{s h}$ of $R$ is Cohen-Macaulay.
Proof. By Lemma 15.36 .3 we know that $R^{h}$ and $R^{s h}$ are Noetherian, hence the lemma makes sense. Since we have $\operatorname{depth}(R)=\operatorname{depth}\left(R^{h}\right)=\operatorname{depth}\left(R^{s h}\right)$ and $\operatorname{dim}(R)=\operatorname{dim}\left(R^{h}\right)=\operatorname{dim}\left(R^{\text {sh }}\right)$ by Lemmas 15.36 .8 and 15.36 .7 we conclude.
06LN Lemma 15.36.10. Let $R$ be a Noetherian local ring. The following are equivalent: $R$ is a regular local ring, the henselization $R^{h}$ of $R$ is a regular local ring, and the strict henselization $R^{\text {sh }}$ of $R$ is a regular local ring.
Proof. By Lemma 15.36 .3 we know that $R^{h}$ and $R^{s h}$ are Noetherian, hence the lemma makes sense. Let $\mathfrak{m}$ be the maximal ideal of $R$. Let $x_{1}, \ldots, x_{t} \in \mathfrak{m}$ be a minimal system of generators of $\mathfrak{m}$, i.e., such that the images in $\mathfrak{m} / \mathfrak{m}^{2}$ form a basis over $\kappa=R / \mathfrak{m}$. Because $R \rightarrow R^{h}$ and $R \rightarrow R^{s h}$ are faithfully flat, it follows that the images $x_{1}^{h}, \ldots, x_{t}^{h}$ in $R^{h}$, resp. $x_{1}^{s h}, \ldots, x_{t}^{s h}$ in $R^{s h}$ are a minimal system of generators for $\mathfrak{m}^{h}=\mathfrak{m} R^{h}$, resp. $\mathfrak{m}^{s h}=\mathfrak{m} R^{s h}$. Regularity of $R$ by definition means $t=\operatorname{dim}(R)$ and similarly for $R^{h}$ and $R^{s h}$. Hence the lemma follows from the equality of $\operatorname{dimensions} \operatorname{dim}(R)=\operatorname{dim}\left(R^{h}\right)=\operatorname{dim}\left(R^{s h}\right)$ of Lemma 15.36.7
0AP3 Lemma 15.36.11. Let $R$ be a Noetherian local ring. Then $R$ is a discrete valuation ring if and only if $R^{h}$ is a discrete valuation ring if and only if $R^{s h}$ is a discrete valuation ring.
Proof. This follows from Lemmas 15.36.7 and 15.36.10 and Algebra, Lemma 10.118.7.

0AH1 Lemma 15.36.12. Let $A$ be a ring. Let $B$ be a filtered colimit of étale $A$-algebras. Let $\mathfrak{p}$ be a prime of $A$. If $B$ is Noetherian, then there are finitely many primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ lying over $\mathfrak{p}$, we have $B \otimes_{A} \kappa(\mathfrak{p})=\prod \kappa\left(\mathfrak{q}_{i}\right)$, and each of the field extensions $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{q}_{i}\right)$ is separable algebraic.

Proof. Write $B$ as a filtered colimit $B=\operatorname{colim} B_{i}$ with $A \rightarrow B_{i}$ étale. Then on the one hand $B \otimes_{A} \kappa(\mathfrak{p})=\operatorname{colim} B_{i} \otimes_{A} \kappa(\mathfrak{p})$ is a filtered colimit of étale $\kappa(\mathfrak{p})$-algebras, and on the other hand it is Noetherian. An étale $\kappa(\mathfrak{p})$-algebra is a finite product of finite separable field extensions (Algebra, Lemma 10.141.4. Hence there are no nontrivial specializations between the primes (which are all maximal and minimal
primes) of the algebras $B_{i} \otimes_{A} \kappa(\mathfrak{p})$ and hence there are no nontrivial specializations between the primes of $B \otimes_{A} \kappa(\mathfrak{p})$. Thus $B \otimes_{A} \kappa(\mathfrak{p})$ is reduced and has finitely many primes which all minimal. Thus it is a finite product of fields (use Algebra, Lemma 10.24 .4 or Algebra, Proposition 10.59.6). Each of these fields is a colimit of finite separable extensions and hence the final statement of the lemma follows.

07QQ Lemma 15.36.13. Let $R$ be a Noetherian local ring. Let $\mathfrak{p} \subset R$ be a prime. Then

$$
R^{h} \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1, \ldots, t} \kappa\left(\mathfrak{q}_{i}\right) \quad \text { resp. } \quad R^{s h} \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1, \ldots, s} \kappa\left(\mathfrak{r}_{i}\right)
$$

where $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, resp. $\mathfrak{r}_{1}, \ldots, \mathfrak{r}_{s}$ are the prime of $R^{h}$, resp. $R^{\text {sh }}$ lying over $\mathfrak{p}$. Moreover, the field extensions $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{q}_{i}\right)$ resp. $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{q}_{i}\right)$ are separable algebraic.

Proof. This can be deduced from the more general Lemma 15.36 .12 using that the henselization and strict henselization are Noetherian (as we've seen above). But we also give a direct proof as follows.
We will use without further mention the results of Lemmas 15.36 .1 and 15.36 .3 , Note that $R^{h} / \mathfrak{p} R^{h}$, resp. $R^{s h} / \mathfrak{p} R^{s h}$ is the henselization, resp. strict henselization of $R / \mathfrak{p}$, see Algebra, Lemma 10.148 .24 resp. Algebra, Lemma 10.148 .30 . Hence we may replace $R$ by $R / \mathfrak{p}$ and assume that $R$ is a Noetherian local domain and that $\mathfrak{p}=(0)$. Since $R^{h}$, resp. $R^{s h}$ is Noetherian, it has finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, resp. $\mathfrak{r}_{1}, \ldots, \mathfrak{r}_{s}$. Since $R \rightarrow R^{h}$, resp. $R \rightarrow R^{s h}$ is flat these are exactly the primes lying over $\mathfrak{p}=(0)$ (by going down). Finally, as $R$ is a domain, we see that $R^{h}$, resp. $R^{s h}$ is reduced, see Lemma 15.36.4. Thus we see that $R^{h} \otimes_{R} f . f .(R)=R^{h} \otimes_{R} \kappa(\mathfrak{p})$ resp. $R^{s h} \otimes_{R} f . f .(R)=R^{s h} \otimes_{R} \kappa(\mathfrak{p})$ is a reduced Noetherian ring with finitely many primes, all of which are minimal (and hence maximal). Thus these rings are Artinian and are products of their localizations at maximal ideals, each necessarily a field (see Algebra, Proposition 10.59.6 and Algebra, Lemma 10.24.1).
The final statement follows from the fact that $R \rightarrow R^{h}$, resp. $R \rightarrow R^{s h}$ is a colimit of étale ring maps and hence the induced residue field extensions are colimits of finite separable extensions, see Algebra, Lemma 10.141.5.

### 15.37. Field extensions, revisited

07P0 In this section we study some peculiarities of field extensions in characteristic $p>0$.
07P1 Definition 15.37.1. Let $p$ be a prime number. Let $k \rightarrow K$ be an extension of fields of characteristic $p$. Denote $k K^{p}$ the compositum of $k$ and $K^{p}$ in $K$.
(1) A subset $\left\{x_{i}\right\} \subset K$ is called $p$-independent over $k$ if the elements $x^{E}=$ $\prod x_{i}^{e_{i}}$ where $0 \leq e_{i}<p$ are linearly independent over $k K^{p}$.
(2) A subset $\left\{x_{i}\right\}$ of $K$ is called a $p$-basis of $K$ over $k$ if the elements $x^{E}$ form a basis of $K$ over $k K^{p}$.

This is related to the notion of a $p$-basis of a $\mathbf{F}_{p}$-algebra which we will discuss later (insert future reference here).

07P2 Lemma 15.37.2. Let $k \subset K$ be a field extension. Assume $k$ has characteristic $p>0$. Let $\left\{x_{i}\right\}$ be a subset of $K$. The following are equivalent
(1) the elements $\left\{x_{i}\right\}$ are p-independent over $k$, and
(2) the elements $d x_{i}$ are $K$-linearly independent in $\Omega_{K / k}$.

Any p-independent collection can be extended to a p-basis of $K$ over $k$. In particular, the field $K$ has a p-basis over $k$. Moreover, the following are equivalent:
(a) $\left\{x_{i}\right\}$ is a p-basis of $K$ over $k$, and
(b) $d x_{i}$ is a basis of the $K$-vector space $\Omega_{K / k}$.

Proof. Assume (2) and suppose that $\sum a_{E} x^{E}=0$ is a linear relation with $a_{E} \in$ $k K^{p}$. Let $\theta_{i}: K \rightarrow K$ be a $k$-derivation such that $\theta_{i}\left(x_{j}\right)=\delta_{i j}$ (Kronecker delta). Note that any $k$-derivation of $K$ annihilates $k K^{p}$. Applying $\theta_{i}$ to the given relation we obtain new relations

$$
\sum_{E, e_{i}>0} e_{i} a_{E} x_{1}^{e_{1}} \ldots x_{i}^{e_{i}-1} \ldots x_{n}^{e_{n}}=0
$$

Hence if we pick $\sum a_{E} x^{E}$ as the relation with minimal total degree $|E|=\sum e_{i}$ for some $a_{E} \neq 0$, then we get a contradiction. Hence (2) holds.
If $\left\{x_{i}\right\}$ is a $p$-basis for $K$ over $k$, then $K \cong k K^{p}\left[X_{i}\right] /\left(X_{i}^{p}-x_{i}^{p}\right)$. Hence we see that $\mathrm{d} x_{i}$ forms a basis for $\Omega_{K / k}$ over $K$. Thus (a) implies (b).
Let $\left\{x_{i}\right\}$ be a $p$-independent subset of $K$ over $k$. An application of Zorn's lemma shows that we can enlarge this to a maximal $p$-independent subset of $K$ over $k$. We claim that any maximal $p$-independent subset $\left\{x_{i}\right\}$ of $K$ is a $p$-basis of $K$ over $k$. The claim will imply that (1) implies (2) and establish the existence of $p$-bases. To prove the claim let $L$ be the subfield of $K$ generated by $k K^{p}$ and the $x_{i}$. We have to show that $L=K$. If $x \in K$ but $x \notin L$, then $x^{p} \in L$ and $L(x) \cong L[z] /\left(z^{p}-x\right)$. Hence $\left\{x_{i}\right\} \cup\{x\}$ is $p$-independent over $k$, a contradiction.
Finally, we have to show that (b) implies (a). By the equivalence of (1) and (2) we see that $\left\{x_{i}\right\}$ is a maximal $p$-independent subset of $K$ over $k$. Hence by the claim above it is a $p$-basis.

07P3 Lemma 15.37.3. Let $k \subset K$ be a field extension. Let $\left\{K_{\alpha}\right\}_{\alpha \in A}$ be a collection of subfields of $K$ with the following properties
(1) $k \subset K_{\alpha}$ for all $\alpha \in A$,
(2) $k=\bigcap_{\alpha \in A} K_{\alpha}$,
(3) for $\alpha, \alpha^{\prime} \in A$ there exists an $\alpha^{\prime \prime} \in A$ such that $K_{\alpha^{\prime \prime}} \subset K_{\alpha} \cap K_{\alpha^{\prime}}$.

Then for $n \geq 1$ and $V \subset K^{\oplus n}$ a $K$-vector space we have $V \cap k^{\oplus n} \neq 0$ if and only if $V \cap K_{\alpha}^{\oplus n} \neq 0$ for all $\alpha \in A$.

Proof. By induction on $n$. The case $n=1$ follows from the assumptions. Assume the result proven for subspaces of $K^{\oplus n-1}$. Assume that $V \subset K^{\oplus n}$ has nonzero intersection with $K_{\alpha}^{\oplus n}$ for all $\alpha \in A$. If $V \cap 0 \oplus k^{\oplus n-1}$ is nonzero then we win. Hence we may assume this is not the case. By induction hypothesis we can find an $\alpha$ such that $V \cap 0 \oplus K_{\alpha}^{\oplus n-1}$ is zero. Let $v=\left(x_{1}, \ldots, x_{n}\right) \in V \cap K_{\alpha}$ be a nonzero element. By our choice of $\alpha$ we see that $x_{1}$ is not zero. Replace $v$ by $x_{1}^{-1} v$ so that $v=\left(1, x_{2}, \ldots, x_{n}\right)$. Note that if $v^{\prime}=\left(x_{1}^{\prime}, \ldots, x_{n}^{\prime}\right) \in V \cap K_{\alpha}$, then $v^{\prime}-x_{1}^{\prime} v=0$ by our choice of $\alpha$. Hence we see that $V \cap K_{\alpha}^{\oplus n}=K_{\alpha} v$. If we choose some $\alpha^{\prime}$ such that $K_{\alpha^{\prime}} \subset K_{\alpha}$, then we see that necessarily $v \in V \cap K_{\alpha^{\prime}}^{\oplus n}$ (by the same arguments applied to $\alpha^{\prime}$ ). Hence

$$
x_{2}, \ldots, x_{n} \in \bigcap_{\alpha^{\prime} \in A, K_{\alpha^{\prime}} \subset K_{\alpha}} K_{\alpha^{\prime}}
$$

which equals $k$ by (2) and (3).

07P4 Lemma 15.37.4. Let $K$ be a field of characteristic p. Let $\left\{K_{\alpha}\right\}_{\alpha \in A}$ be a collection of subfields of $K$ with the following properties
(1) $K^{p} \subset K_{\alpha}$ for all $\alpha \in A$,
(2) $K^{p}=\bigcap_{\alpha \in A} K_{\alpha}$,
(3) for $\alpha, \alpha^{\prime} \in A$ there exists an $\alpha^{\prime \prime} \in A$ such that $K_{\alpha^{\prime \prime}} \subset K_{\alpha} \cap K_{\alpha^{\prime}}$.

Then
(1) the intersection of the kernels of the maps $\Omega_{K / \mathbf{F}_{p}} \rightarrow \Omega_{K / K_{\alpha}}$ is zero,
(2) for any finite extension $K \subset L$ we have $L^{p}=\bigcap_{\alpha \in A} L^{p} K_{\alpha}$.

Proof. Proof of (1). Choose a $p$-basis $\left\{x_{i}\right\}$ for $K$ over $\mathbf{F}_{p}$. Suppose that $\eta=$ $\sum_{i \in I^{\prime}} y_{i} \mathrm{~d} x_{i}$ maps to zero in $\Omega_{K / K_{\alpha}}$ for every $\alpha \in A$. Here the index set $I^{\prime}$ is finite. By Lemma 15.37 .2 this means that for every $\alpha$ there exists a relation

$$
\sum_{E} a_{E, \alpha} x^{E}, \quad a_{E, \alpha} \in K_{\alpha}
$$

where $E$ runs over multi-indices $E=\left(e_{i}\right)_{i \in I^{\prime}}$ with $0 \leq e_{i}<p$. On the other hand, Lemma 15.37 .2 guarantees there is no such relation $\sum a_{E} x^{E}=0$ with $a_{E} \in K^{p}$. This is a contradiction by Lemma 15.37 .3 .
Proof of (2). Suppose that we have a tower $K \subset M \subset L$ of finite extensions of fields. Set $M_{\alpha}=M^{p} K_{\alpha}$ and $L_{\alpha}=L^{p} K_{\alpha}=L^{p} M_{\alpha}$. Then we can first prove that $M^{p}=\bigcap_{\alpha \in A} M_{\alpha}$, and after that prove that $L^{p}=\bigcap_{\alpha \in A} L_{\alpha}$. Hence it suffices to prove (2) for primitive field extensions having no nontrivial subfields. First, assume that $L=K(\theta)$ is separable over $K$. Then $L$ is generated by $\theta^{p}$ over $K$, hence we may assume that $\theta \in L^{p}$. In this case we see that

$$
L^{p}=K^{p} \oplus K^{p} \theta \oplus \ldots K^{p} \theta^{d-1} \quad \text { and } \quad L^{p} K_{\alpha}=K_{\alpha} \oplus K_{\alpha} \theta \oplus \ldots K_{\alpha} \theta^{d-1}
$$

where $d=[L: K]$. Thus the conclusion is clear in this case. The other case is where $L=K(\theta)$ with $\theta^{p}=t \in K, t \notin K^{p}$. In this case we have

$$
L^{p}=K^{p} \oplus K^{p} t \oplus \ldots K^{p} t^{p-1} \quad \text { and } \quad L^{p} K_{\alpha}=K_{\alpha} \oplus K_{\alpha} t \oplus \ldots K_{\alpha} t^{p-1}
$$

Again the result is clear.
07P5 Lemma 15.37.5. Let $k$ be a field of characteristic $p>0$. Let $n, m \geq 0$. As $k^{\prime}$ ranges through all subfields $k^{p} \subset k^{\prime} \subset k$ with $\left[k: k^{\prime}\right]<\infty$ the subfields

$$
f . f .\left(k^{\prime}\left[\left[x_{1}^{p}, \ldots, x_{n}^{p}\right]\right]\left[y_{1}^{p}, \ldots, y_{m}^{p}\right]\right) \subset f \cdot f \cdot\left(k\left[\left[x_{1}, \ldots, x_{d}\right]\right]\left[y_{1}, \ldots, y_{m}\right]\right)
$$

form a family of subfields as in Lemma 15.37.4. Moreover, each of the ring extensions $k^{\prime}\left[\left[x_{1}^{p}, \ldots, x_{n}^{p}\right]\right]\left[y_{1}^{p}, \ldots, y_{m}^{p}\right] \subset k\left[\left[x_{1}, \ldots, x_{n}\right]\right]\left[y_{1}, \ldots, y_{m}\right]$ is finite.

Proof. Write $A=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]\left[y_{1}, \ldots, y_{m}\right]$ and $A^{\prime}=k^{\prime}\left[\left[x_{1}^{p}, \ldots, x_{n}^{p}\right]\right]\left[y_{1}^{p}, \ldots, y_{m}^{p}\right]$. We also set $K=f . f .(A)$ and $K^{\prime}=f . f .\left(A^{\prime}\right)$. The ring extension $k^{\prime}\left[\left[x_{1}^{p}, \ldots, x_{d}^{p}\right]\right] \subset$ $k\left[\left[x_{1}, \ldots, x_{d}\right]\right]$ is finite by Algebra, Lemma 10.96 .7 which implies that $A \rightarrow A^{\prime}$ is finite. For $f \in A$ we see that $f^{p} \in A^{\prime}$. Hence $K^{p} \subset K^{\prime}$. Any element of $K^{\prime}$ can be written as $a / b^{p}$ with $a \in A^{\prime}$ and $b \in A$ nonzero. Suppose that $f / g^{p} \in K, f, g \in A$, $g \neq 0$ is contained in $K^{\prime}$ for every choice of $k^{\prime}$. Fix a choice of $k^{\prime}$ for the moment. By the above we see $f / g^{p}=a / b^{p}$ for some $a \in A^{\prime}$ and some nonzero $b \in A$. Hence $b^{p} f \in A^{\prime}$. For any $A^{\prime}$-derivation $D: A \rightarrow A$ we see that $0=D\left(b^{p} f\right)=b^{p} D(f)$ hence $D(f)=0$ as $A$ is a domain. Taking $D=\partial_{x_{i}}$ and $D=\partial_{y_{j}}$ we conclude that that $f \in k\left[\left[x_{1}^{p}, \ldots, x_{n}^{p}\right]\right]\left[y_{1}^{p}, \ldots, y_{d}^{p}\right]$. Applying a $k^{\prime}$-derivation $\theta: k \rightarrow k$ we similarly conclude that all coefficients of $f$ are in $k^{\prime}$, i.e., $f \in A^{\prime}$. Since it is clear that $A=\bigcap_{k^{\prime}} A^{\prime}$ where $k^{\prime}$ ranges over all subfields as in the lemma we win.

### 15.38. The singular locus

07P6 Let $R$ be a Noetherian ring. The regular locus $\operatorname{Reg}(X)$ of $X=\operatorname{Spec}(R)$ is the set of primes $\mathfrak{p}$ such that $R_{\mathfrak{p}}$ is a regular local ring. The singular locus $\operatorname{Sing}(X)$ of $X=\operatorname{Spec}(R)$ is the complement $X \backslash \operatorname{Reg}(X)$, i.e., the set of primes $\mathfrak{p}$ such that $R_{\mathfrak{p}}$ is not a regular local ring. By the discussion preceding Algebra, Definition 10.109.7 we see that $\operatorname{Reg}(X)$ is stable under generalization In the section we study conditions that guarantee that $\operatorname{Reg}(X)$ is open.

07P7 Definition 15.38.1. Let $R$ be a Noetherian ring. Let $X=\operatorname{Spec}(R)$.
(1) We say $R$ is $J-0$ if $\operatorname{Reg}(X)$ contains a nonempty open.
(2) We say $R$ is $J-1$ if $\operatorname{Reg}(X)$ is open.
(3) We say $R$ is $J$-2 if any finite type $R$-algebra is J-1.

The ring $\mathbf{Q}[x] /\left(x^{2}\right)$ does not satisfy J-0. On the other hand J-1 implies J-0 for domains and even reduced rings as such a ring is regular at the minimal primes. Here is a characterization of the J-1 property.

07P8 Lemma 15.38.2. Let $R$ be a Noetherian ring. Let $X=\operatorname{Spec}(R)$. The ring $R$ is $J-1$ if and only if $V(\mathfrak{p}) \cap \operatorname{Reg}(X)$ contains a nonempty open subset of $V(\mathfrak{p})$ for all $\mathfrak{p} \in \operatorname{Reg}(X)$.
Proof. This follows immediately from Topology, Lemma 5.15.5.
07P9 Lemma 15.38.3. Let $R$ be a Noetherian ring. Let $X=\operatorname{Spec}(R)$. Assume that for all $\mathfrak{p} \subset R$ the ring $R / \mathfrak{p}$ is J-0. Then $R$ is J-1.

Proof. We will show that the criterion of Lemma 15.38 .2 applies. Let $\mathfrak{p} \in \operatorname{Reg}(X)$ be a prime of height $r$. Pick $f_{1}, \ldots, f_{r} \in \mathfrak{p}$ which map to generators of $\mathfrak{p} R_{\mathfrak{p}}$. Since $\mathfrak{p} \in \operatorname{Reg}(X)$ we see that $f_{1}, \ldots, f_{r}$ maps to a regular sequence in $R_{\mathfrak{p}}$, see Algebra, Lemma 10.105.3. Thus by Algebra, Lemma 10.67 .6 we see that after replacing $R$ by $R_{g}$ for some $g \in R, g \notin \mathfrak{p}$ the sequence $f_{1}, \ldots, f_{r}$ is a regular sequence in $R$. Next, let $\mathfrak{p} \subset \mathfrak{q}$ be a prime ideal such that $(R / \mathfrak{p})_{\mathfrak{q}}$ is a regular local ring. By the assumption of the lemma there exists a non-empty open subset of $V(\mathfrak{p})$ consisting of such primes, hence it suffices to prove $R_{\mathfrak{q}}$ is regular. Note that $f_{1}, \ldots, f_{r}$ is a regular sequence in $R_{\mathfrak{q}}$ such that $R_{\mathfrak{q}} /\left(f_{1}, \ldots, f_{r}\right) R_{\mathfrak{q}}$ is regular. Hence $R_{\mathfrak{q}}$ is regular by Algebra, Lemma 10.105.7.

07PA Lemma 15.38.4. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R$ is a Noetherian domain,
(2) $R \rightarrow S$ is injective and of finite type, and
(3) $S$ is a domain and $J-0$.

Then $R$ is $J-0$.
Proof. After replacing $S$ by $S_{g}$ for some nonzero $g \in S$ we may assume that $S$ is a regular ring. By generic flatness we may assume that also $R \rightarrow S$ is faithfully flat, see Algebra, Lemma 10.117.1. Then $R$ is regular by Algebra, Lemma 10.156.4.

07PB Lemma 15.38.5. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R$ is a Noetherian domain and $J-0$,
(2) $R \rightarrow S$ is injective and of finite type, and
(3) $S$ is a domain and $f . f .(R) \rightarrow f . f .(S)$ is separable.

Then $S$ is $J-0$.

Proof. We may replace $R$ by a principal localization and assume $R$ is a regular ring. By Algebra, Lemma 10.138 .9 the ring map $R \rightarrow S$ is smooth at (0). Hence after replacing $S$ by a principal localization we may assume that $S$ is smooth over $R$. Then $S$ is regular too, see Algebra, Lemma 10.155 .8 .

07PC Lemma 15.38.6. Let $R$ be a Noetherian ring. The following are equivalent
(1) $R$ is $J-2$,
(2) every finite type $R$-algebra which is a domain is $J-0$,
(3) every finite $R$-algebra is $J-1$,
(4) for every prime $\mathfrak{p}$ and every finite purely inseparable extension $\kappa(\mathfrak{p}) \subset L$ there exists a finite $R$-algebra $R^{\prime}$ which is a domain, which is J-0, and whose field of fractions is $L$.
Proof. It is clear that we have the implications $(1) \Rightarrow(2)$ and $(2) \Rightarrow(4)$. Recall that a domain which is $\mathrm{J}-1$ is $\mathrm{J}-0$. Hence we also have the implications $(1) \Rightarrow(3)$ and $(3) \Rightarrow(4)$.
Let $R \rightarrow S$ be a finite type ring map and let's try to show $S$ is J-1. By Lemma 15.38 .3 it suffices to prove that $S / \mathfrak{q}$ is J-0 for every prime $\mathfrak{q}$ of $S$. In this way we see (2) $\Rightarrow(1)$.

Assume (4). We will show that (2) holds which will finish the proof. Let $R \rightarrow S$ be a finite type ring map with $S$ a domain. Let $\mathfrak{p}=\operatorname{Ker}(R \rightarrow S)$. Set $K=f . f .(S)$. There exists a diagram of fields

where the horizontal arrows are finite purely inseparable field extensions and where $K^{\prime} / L$ is separable, see Algebra, Lemma 10.41.4. Choose $R^{\prime} \subset L$ as in (4) and let $S^{\prime}$ be the image of the map $S \otimes_{R} R^{\prime} \rightarrow K^{\prime}$. Then $S^{\prime}$ is a domain whose fraction field is $K^{\prime}$, hence $S^{\prime}$ is J-0 by Lemma 15.38 .5 and our choice of $R^{\prime}$. Then we apply Lemma 15.38 .4 to see that $S$ is J-0 as desired.

### 15.39. Regularity and derivations

07PD Let $R \rightarrow S$ be a ring map. Let $D: R \rightarrow R$ be a derivation. We say that $D$ extends to $S$ if there exists a derivation $D^{\prime}: S \rightarrow S$ such that

is commutative.
07PE Lemma 15.39.1. Let $R$ be a ring. Let $D: R \rightarrow R$ be a derivation.
(1) For any ideal $I \subset R$ the derivation $D$ extends canonically to a derivation $D^{\wedge}: R^{\wedge} \rightarrow R^{\wedge}$ on the I-adic completion.
(2) For any multiplicative subset $S \subset R$ the derivation $D$ extends uniquely to the localization $S^{-1} R$ of $R$.

If $R \subset R^{\prime}$ is an finite type extension of rings such that $R_{g} \cong R_{g}^{\prime}$ for some nonzerodivisor $g \in R$, then $g^{N} D$ extends to $R^{\prime}$ for some $N \geq 0$.

Proof. Proof of (1). For $n \geq 2$ we have $D\left(I^{n}\right) \subset I^{n-1}$ by the Leibniz rule. Hence $D$ induces maps $D_{n}: R / I^{n} \rightarrow R / I^{n-1}$. Taking the limit we obtain $D^{\wedge}$. We omit the verification that $D^{\wedge}$ is a derivation.
Proof of (2). To extend $D$ to $S^{-1} R$ just set $D(r / s)=D(r) / s-r D(s) / s^{2}$ and check the axioms.

Proof of the final statement. Let $x_{1}, \ldots, x_{n} \in R^{\prime}$ be generators of $R^{\prime}$ over $R$. Choose an $N$ such that $g^{N} x_{i} \in R$. Consider $g^{N+1} D$. By (2) this extends to $R_{g}$. Moreover, by the Leibniz rule and our construction of the extension above we have

$$
g^{N+1} D\left(x_{i}\right)=g^{N+1} D\left(g^{-N} g^{N} x_{i}\right)=-N g^{N} x_{i} D(g)+g D\left(g^{N} x_{i}\right)
$$

and both terms are in $R$. This implies that

$$
g^{N+1} D\left(x_{1}^{e_{1}} \ldots x_{n}^{e_{n}}\right)=\sum e_{i} x_{1}^{e_{1}} \ldots x_{i}^{e_{i}-1} \ldots x_{n}^{e_{n}} g^{N+1} D\left(x_{i}\right)
$$

is an element of $R^{\prime}$. Hence every element of $R^{\prime}$ (which can be written as a sum of monomials in the $x_{i}$ with coefficients in $R$ ) is mapped to an element of $R^{\prime}$ by $g^{N+1} D$ and we win.

07PF Lemma 15.39.2. Let $R$ be a regular ring. Let $f \in R$. Assume there exists a derivation $D: R \rightarrow R$ such that $D(f)$ is a unit of $R /(f)$. Then $R /(f)$ is regular.

Proof. It suffices to prove this when $R$ is a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. In this case it suffices to prove that $f \notin \mathfrak{m}^{2}$, see Algebra, Lemma 10.105.3. However, if $f \in \mathfrak{m}^{2}$ then $D(f) \in \mathfrak{m}$ by the Leibniz rule, a contradiction.

07PG Lemma 15.39.3. Let $R$ be a regular $\mathbf{F}_{p}$-algebra. Let $f \in R$. Assume there exists a derivation $D: R \rightarrow R$ such that $D(f)$ is a unit of $R$. Then $R[z] /\left(z^{p}-f\right)$ is regular.

Proof. Apply Lemma 15.39 .2 to the extension of $D$ to $R[z]$ which maps $z$ to zero.

07PH Lemma 15.39.4. Let $p$ be a prime number. Let $B$ be a domain with $p=0$ in $B$. Let $f \in B$ be an element which is not a pth power in the fraction field of $B$. If $B$ is of finite type over a Noetherian complete local ring, then there exists a derivation $D: B \rightarrow B$ such that $D(f)$ is not zero.

Proof. Let $R$ be a Noetherian complete local ring such that there exists a finite type ring map $R \rightarrow B$. Of course we may replace $R$ by its image in $B$, hence we may assume $R$ is a domain of characteristic $p>0$ (as well as Noetherian complete local). By Algebra, Lemma 10.152 .10 we can write $R$ as a finite extension of $k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ for some field $k$ and integer $n$. Hence we may replace $R$ by $k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. Next, we use Algebra, Lemma 10.114.7 to factor $R \rightarrow B$ as

$$
R \subset R\left[y_{1}, \ldots, y_{d}\right] \subset B^{\prime} \subset B
$$

with $B^{\prime}$ finite over $R\left[y_{1}, \ldots, y_{d}\right]$ and $B_{g}^{\prime} \cong B_{g}$ for some nonzero $g \in R$. Note that $f^{\prime}=g^{p N} f \in B^{\prime}$ for some large integer $N$. It is clear that $f^{\prime}$ is not a $p$ th power in $f . f .\left(B^{\prime}\right)=f . f .(B)$. If we can find a derivation $D^{\prime}: B^{\prime} \rightarrow B^{\prime}$ with $D^{\prime}\left(f^{\prime}\right) \neq 0$, then Lemma 15.39.1 guarantees that $D=g^{M} D^{\prime}$ extends to $S$ for some $M>0$. Then
$D(f)=g^{N} D^{\prime}(f)=g^{M} D^{\prime}\left(g^{-p N} f^{\prime}\right)=g^{M-p N} D^{\prime}\left(f^{\prime}\right)$ is nonzero. Thus it suffices to prove the lemma in case $B$ is a finite extension of $A=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]\left[y_{1}, \ldots, y_{m}\right]$.

Note that $\mathrm{d} f$ is not zero in $\Omega_{f . f .(B) / \mathbf{F}_{p}}$, see Algebra, Lemma 10.150.2. We apply Lemma 15.37 .5 to find a subfield $k^{\prime} \subset k$ of finite index such that with $A^{\prime}=$ $k^{\prime}\left[\left[x_{1}^{p}, \ldots, x_{n}^{p}\right]\right]\left[y_{1}^{p}, \ldots, y_{m}^{p}\right]$ the element $\mathrm{d} f$ does not map to zero in $\Omega_{f . f .(B) / f . f .\left(A^{\prime}\right)}$. Thus we can choose a $f . f .\left(A^{\prime}\right)$-derivation $D^{\prime}: f . f .(B) \rightarrow f . f .(B)$ with $D^{\prime}(f) \neq 0$. Since $A^{\prime} \subset A$ and $A \subset B$ are finite by construction we see that $A^{\prime} \subset B$ is finite. Choose $b_{1}, \ldots, b_{t} \in B$ which generate $B$ as an $A^{\prime}$-module. Then $D^{\prime}\left(b_{i}\right)=f_{i} / g_{i}$ for some $f_{i}, g_{i} \in B$ with $g_{i} \neq 0$. Setting $D=g_{1} \ldots g_{t} D^{\prime}$ we win.

07PI Lemma 15.39.5. Let $A$ be a Noetherian complete local domain. Then $A$ is $J-0$.
Proof. By Algebra, Lemma 10.152 .10 we can find a regular subring $A_{0} \subset A$ with $A$ finite over $A_{0}$. If $f . f .\left(A_{0}\right) \subset f . f .(A)$ is separable, then we are done by Lemma 15.38.5. If not, then $A_{0}$ and $A$ have characteristic $p>0$. For any subextension $f . f .\left(A_{0}\right) \subset M \subset f . f .(A)$ there exists a finite subextension $A_{0} \subset B \subset A$ such that $f . f .(B)=M$. Hence, arguing by induction on $\left[f . f .(A): f . f .\left(A_{0}\right)\right]$ we may assume there exists $A_{0} \subset B \subset A$ such that $B$ is J-0 and $f . f .(B) \subset f . f .(A)$ has no nontrivial subextensions. In this case, if $f . f .(B) \subset f . f .(A)$ is separable, then we see that $A$ is $\mathrm{J}-0$ by Lemma 15.38 .5 . If not, then $f . f .(A)=f . f .(B)[z] /\left(z^{p}-b\right)$ for some $b \in B$ which is not a $p$ th power in $f . f .(B)$. By Lemma 15.39 .4 we can find a derivation $D: B \rightarrow B$ with $D(f) \neq 0$. Applying Lemma 15.39.3 we see that $A_{\mathfrak{p}}$ is regular for any prime $\mathfrak{p}$ of $A$ lying over a regular prime of $B$ and not containing $D(f)$. As $B$ is $\mathrm{J}-0$ we conclude $A$ is too.

07PJ Proposition 15.39.6. The following types of rings are J-2:
(1) fields,
(2) Noetherian complete local rings,
(3) $\mathbf{Z}$,
(4) Dedekind domains with fraction field of characteristic zero,
(5) finite type ring extensions of any of the above.

Proof. For fields, $\mathbf{Z}$ and Dedekind domains of characteristic zero you just check condition (4) of Lemma 15.38.6. In the case of Noetherian complete local rings, note that if $R \rightarrow R^{\prime}$ is finite and $R$ is a Noetherian complete local ring, then $R^{\prime}$ is a product of Noetherian complete local rings, see Algebra, Lemma 10.152.2. Hence it suffices to prove that a Noetherian complete local ring which is a domain is J-0, which is Lemma 15.39 .5 .

### 15.40. Formal smoothness and regularity

07PK The title of this section refers to Proposition 15.40.2.
07PL Lemma 15.40.1. Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Let $D: A \rightarrow A$ be a derivation. Assume that $B$ is complete and $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology. Then there exists an extension $D^{\prime}: B \rightarrow B$ of $D$.

Proof. Denote $B[\epsilon]=B[x] /\left(x^{2}\right)$ the ring of dual numbers over $B$. Consider the ring map $\psi: A \rightarrow B[\epsilon], a \mapsto a+\epsilon D(a)$. Consider the commutative diagram

By Lemma 15.29 .5 and the assumption of formal smoothness of $B / A$ we find a map $\varphi: B \rightarrow B[\epsilon]$ fitting into the diagram. Write $\varphi(b)=b+\epsilon D^{\prime}(b)$. Then $D^{\prime}: B \rightarrow B$ is the desired extension.

07PM Proposition 15.40.2. Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. The following are equivalent
(1) $A \rightarrow B$ is regular,
(2) $A \rightarrow B$ is flat and $\bar{B}$ is geometrically regular over $k$,
(3) $A \rightarrow B$ is flat and $k \rightarrow \bar{B}$ is formally smooth in the $\mathfrak{m}_{\bar{B}}$-adic topology, and
(4) $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology.

Proof. We have seen the equivalence of (2), (3), and (4) in Proposition 15.31 .4 It is clear that (1) implies (2). Thus we assume the equivalent conditions (2), (3), and (4) hold and we prove (1).
Let $\mathfrak{p}$ be a prime of $A$. We will show that $B \otimes_{A} \kappa(\mathfrak{p})$ is geometrically regular over $\kappa(\mathfrak{p})$. By Lemma 15.29 .8 we may replace $A$ by $A / \mathfrak{p}$ and $B$ by $B / \mathfrak{p} B$. Thus we may assume that $A$ is a domain and that $\mathfrak{p}=(0)$.
Choose $A_{0} \subset A$ as in Algebra, Lemma 10.152.10. We will use all the properties stated in that lemma without further mention. As $A_{0} \rightarrow A$ induces an isomorphism on residue fields, and as $B / \mathfrak{m}_{A} B$ is geometrically regular over $A / \mathfrak{m}_{A}$ we can find a diagram

with $A_{0} \rightarrow C$ formally smooth in the $\mathfrak{m}_{C}$-adic topology such that $B=C \otimes_{A_{0}} A$, see Remark 15.31.6. (Completion in the tensor product is not needed as $A_{0} \rightarrow A$ is finite, see Algebra, Lemma 10.96.1.) Hence it suffices to show that $C \otimes_{A_{0}} f . f .\left(A_{0}\right)$ is a geometrically regular algebra over $f . f .\left(A_{0}\right)$.
The upshot of the preceding paragraph is that we may assume that $A=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ where $k$ is a field or $A=\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ where $\Lambda$ is a Cohen ring. In this case $B$ is a regular ring, see Algebra, Lemma 10.111.8, Hence $B \otimes_{A} f . f .(A)$ is a regular ring too and we win if the characteristic of $f . f .(A)$ is zero.

Thus we are left with the case where $A=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ and $k$ is a field of characteristic $p>0$. Set $K=f . f .(A)$. Let $L \supset K$ be a finite purely inseparable field extension. We will show by induction on $[L: K]$ that $B \otimes_{A} L$ is regular. The base case is $L=K$ which we've seen above. Let $K \subset M \subset L$ be a subfield such that $L$ is a degree $p$ extension of $M$ obtained by adjoining a $p$ th root of an element $f \in M$. Let $A^{\prime}$ be a finite $A$-subalgebra of $M$ with fraction field $M$. Clearing denominators,
we may and do assume $f \in A^{\prime}$. Set $A^{\prime \prime}=A^{\prime}[z] /\left(z^{p}-f\right)$ and note that $A^{\prime} \subset A^{\prime \prime}$ is finite and that the fraction field of $A^{\prime \prime}$ is $L$. By induction we know that $B \otimes_{A} M$ ring is regular. We have

$$
B \otimes_{A} L=B \otimes_{A} M[z] /\left(z^{p}-f\right)
$$

By Lemma 15.39 .4 we know there exists a derivation $D: A^{\prime} \rightarrow A^{\prime}$ such that $D(f) \neq$ 0 . As $A^{\prime} \rightarrow B \otimes_{A} A^{\prime}$ is formally smooth in the $\mathfrak{m}$-adic topology by Lemma 15.29 .9 we can use Lemma 15.40 .1 to extend $D$ to a derivation $D^{\prime}: B \otimes_{A} A^{\prime} \rightarrow B \otimes_{A} A^{\prime}$. Note that $D^{\prime}(f)=\bar{D}(f)$ is a unit in $B \otimes_{A} M$ as $D(f)$ is not zero in $A^{\prime} \subset M$. Hence $B \otimes_{A} L$ is regular by Lemma 15.39 .3 and we win.

### 15.41. G-rings

07 GG Let $A$ be a Noetherian local ring $A$. In Section 15.34 we have seen that some but not all properties of $A$ are reflected in the completion $A^{\wedge}$ of $A$. To study this further we introduce some terminology. For a prime $\mathfrak{q}$ of $A$ the fibre ring

$$
A^{\wedge} \otimes_{A} \kappa(\mathfrak{q})=\left(A^{\wedge}\right)_{\mathfrak{q}} / \mathfrak{q}\left(A^{\wedge}\right)_{\mathfrak{q}}=(A / \mathfrak{q})^{\wedge} \otimes_{A / q} \kappa(\mathfrak{q})
$$

is called a formal fibre of $A$. We think of the formal fibre as an algebra over $\kappa(\mathfrak{q})$. Thus $A \rightarrow A^{\wedge}$ is a regular ring homomorphism if and only if all the formal fibres are geometrically regular algebras.

07GH Definition 15.41.1. A ring $R$ is called a $G$-ring if $R$ is Noetherian and for every prime $\mathfrak{p}$ of $R$ the ring map $R_{\mathfrak{p}} \rightarrow\left(R_{\mathfrak{p}}\right)^{\wedge}$ is regular.

By the discussion above we see that $R$ is a G-ring if and only if every local ring $R_{\mathfrak{p}}$ has geometrically regular formal fibres. Note that if $\mathbf{Q} \subset R$, then it suffices to check the formal fibres are regular. Another way to express the G-ring condition is described in the following lemma.

07PN Lemma 15.41.2. Let $R$ be a Noetherian ring. Then $R$ is a $G$-ring if and only if for every pair of primes $\mathfrak{q} \subset \mathfrak{p} \subset R$ the algebra

$$
(R / \mathfrak{q})_{\mathfrak{p}}^{\wedge} \otimes_{R / \mathfrak{q}} \kappa(\mathfrak{q})
$$

is geometrically regular over $\kappa(\mathfrak{q})$.
Proof. This follows from the fact that

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})=(R / \mathfrak{q})_{\mathfrak{p}}^{\wedge} \otimes_{R / \mathfrak{q}} \kappa(\mathfrak{q})
$$

as algebras over $\kappa(\mathfrak{q})$.
07PP Lemma 15.41.3. Let $R \rightarrow R^{\prime}$ be a finite type map of Noetherian rings and let

be primes. Assume $R \rightarrow R^{\prime}$ is quasi-finite at $\mathfrak{p}^{\prime}$.
(1) If the formal fibre $R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})$ is geometrically regular over $\kappa(\mathfrak{q})$, then the formal fibre $R_{\mathfrak{p}^{\prime}}^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)$ is geometrically regular over $\kappa\left(\mathfrak{q}^{\prime}\right)$.
(2) If the formal fibres of $R_{\mathfrak{p}}$ are geometrically regular, then the formal fibres of $R_{\mathfrak{p}^{\prime}}^{\prime}$ are geometrically regular.
(3) If $R \rightarrow R^{\prime}$ is quasi-finite and $R$ is a $G$-ring, then $R^{\prime}$ is a $G$-ring.

Proof. It is clear that $(1) \Rightarrow(2) \Rightarrow(3)$. Assume $R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})$ is geometrically regular over $\kappa(\mathfrak{q})$. By Algebra, Lemma 10.123 .3 we see that

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} R^{\prime}=\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge} \times B
$$

for some $R_{\mathfrak{p}}^{\wedge}$-algebra $B$. Hence $R_{\mathfrak{p}^{\prime}}^{\prime} \rightarrow\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge}$ is a factor of a base change of the map $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$. It follows that $\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)$ is a factor of

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)=R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} \kappa\left(\mathfrak{q}^{\prime}\right) .
$$

Thus the result follows as extension of base field preserves geometric regularity, see Algebra, Lemma 10.158.1.
07 PQ Lemma 15.41.4. Let $R$ be a Noetherian ring. Then $R$ is a $G$-ring if and only if for every finite free ring map $R \rightarrow S$ the formal fibres of $S$ are regular rings.
Proof. Assume that for any finite free ring map $R \rightarrow S$ the ring $S$ has regular formal fibres. Let $\mathfrak{q} \subset \mathfrak{p} \subset R$ be primes and let $\kappa(\mathfrak{q}) \subset L$ be a finite purely inseparable extension. To show that $R$ is a G-ring it suffices to show that

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} L
$$

is a regular ring. Choose a finite free extension $R \rightarrow R^{\prime}$ such that $\mathfrak{q}^{\prime}=\mathfrak{q} R^{\prime}$ is a prime and such that $\kappa\left(\mathfrak{q}^{\prime}\right)$ is isomorphic to $L$ over $\kappa(\mathfrak{q})$, see Algebra, Lemma 10.151.3 By Algebra, Lemma 10.96.8 we have

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} R^{\prime}=\prod\left(R_{\mathfrak{p}_{i}^{\prime}}^{\prime}\right)^{\wedge}
$$

where $\mathfrak{p}_{i}^{\prime}$ are the primes of $R^{\prime}$ lying over $\mathfrak{p}$. Thus we have

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} L=R_{\hat{p}}^{\wedge} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)=\prod\left(R_{\mathfrak{p}_{i}^{\prime}}^{\prime}\right)^{\wedge} \otimes_{R_{\mathfrak{p}_{i}^{\prime}}^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)
$$

Our assumption is that the rings on the right are regular, hence the ring on the left is regular too. Thus $R$ is a G -ring. The converse follows from Lemma 15.41.3.
07 PR Lemma 15.41.5. Let $k$ be a field of characteristic $p$. Let $A=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]\left[y_{1}, \ldots, y_{n}\right]$ and denote $K=f . f .(A)$. Let $\mathfrak{p} \subset A$ be a prime. Then $A_{\mathfrak{p}}^{\wedge} \otimes_{A} K$ is geometrically regular over $K$.
Proof. Let $L \supset K$ be a finite purely inseparable field extension. We will show by induction on $[L: K]$ that $A_{\hat{\jmath}}^{\wedge} \otimes L$ is regular. The base case is $L=K:$ as $A$ is regular, $A_{\hat{\mathfrak{p}}}^{\wedge}$ is regular (Lemma 15.34 .4 , hence the localization $A_{\hat{\mathfrak{p}}}^{\wedge} \otimes K$ is regular. Let $K \subset M \subset L$ be a subfield such that $L$ is a degree $p$ extension of $M$ obtained by adjoining a $p$ th root of an element $f \in M$. Let $B$ be a finite $A$-subalgebra of $M$ with fraction field $M$. Clearing denominators, we may and do assume $f \in B$. Set $C=B[z] /\left(z^{p}-f\right)$ and note that $B \subset C$ is finite and that the fraction field of $C$ is $L$. Since $A \subset B \subset C$ are finite and $L / M / K$ are purely inseparable we see that for every element of $B$ or $C$ some power of it lies in $A$. Hence there is a unique prime $\mathfrak{r} \subset B$, resp. $\mathfrak{q} \subset C$ lying over $\mathfrak{p}$. Note that

$$
A_{\mathfrak{p}}^{\wedge} \otimes_{A} M=B_{\mathfrak{r}}^{\wedge} \otimes_{B} M
$$

see Algebra, Lemma 10.96.8. By induction we know that this ring is regular. In the same manner we have

$$
A_{\mathfrak{p}}^{\wedge} \otimes_{A} L=C_{\mathfrak{r}}^{\wedge} \otimes_{C} L=B_{\mathfrak{r}}^{\wedge} \otimes_{B} M[z] /\left(z^{p}-f\right)
$$

the last equality because the completion of $C=B[z] /\left(z^{p}-f\right)$ equals $B_{\mathfrak{r}}^{\wedge}[z] /\left(z^{p}-f\right)$. By Lemma 15.39 .4 we know there exists a derivation $D: B \rightarrow B$ such that $D(f) \neq$ 0. In other words, $g=D(f)$ is a unit in $M$ ! By Lemma 15.39.1 $D$ extends to a derivation of $B_{\mathfrak{r}}, B_{\mathfrak{r}}^{\wedge}$ and $B_{\mathfrak{r}}^{\wedge} \otimes_{B} M$ (successively extending through a localization, a completion, and a localization). Since it is an extension we end up with a derivation of $B_{\mathfrak{r}}^{\wedge} \otimes_{B} M$ which maps $f$ to $g$ and $g$ is a unit of the ring $B_{\mathfrak{r}}^{\wedge} \otimes_{B} M$. Hence $A_{\mathfrak{p}}^{\wedge} \otimes_{A} L$ is regular by Lemma 15.39 .3 and we win.

07PS Proposition 15.41.6. A Noetherian complete local ring is a G-ring.
Proof. Let $A$ be a Noetherian complete local ring. By Lemma 15.41 .2 it suffices to check that $B=A / \mathfrak{q}$ has geometrically regular formal fibres over the minimal prime (0) of $B$. Thus we may assume that $A$ is a domain and it suffices to check the condition for the formal fibres over the minimal prime (0) of $A$. Set $K=f . f(A)$.

We can choose a subring $A_{0} \subset A$ which is a regular complete local ring such that $A$ is finite over $A_{0}$, see Algebra, Lemma 10.152.10. Moreover, we may assume that $A_{0}$ is a power series ring over a field or a Cohen ring. By Lemma 15.41 .3 we see that it suffices to prove the result for $A_{0}$.

Assume that $A$ is a power series ring over a field or a Cohen ring. Since $A$ is regular the localizations $A_{\mathfrak{p}}$ are regular (see Algebra, Definition 10.109 .7 and the discussion preceding it). Hence the completions $A_{\mathfrak{p}}^{\wedge}$ are regular, see Lemma 15.34 .4 . Hence the fibre $A_{\mathfrak{p}}^{\wedge} \otimes_{A} K$ is, as a localization of $A_{\mathfrak{p}}^{\wedge}$, also regular. Thus we are done if the characteristic of $K$ is 0 . The positive characteristic case is the case $A=k\left[\left[x_{1}, \ldots, x_{d}\right]\right]$ which is a special case of Lemma 15.41.5.

07PT Lemma 15.41.7. Let $R$ be a Noetherian ring. Then $R$ is a $G$-ring if and only if $R_{\mathfrak{m}}$ has geometrically regular formal fibres for every maximal ideal $\mathfrak{m}$ of $R$.

Proof. Assume $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is regular for every maximal ideal $\mathfrak{m}$ of $R$. Let $\mathfrak{p}$ be a prime of $R$ and choose a maximal ideal $\mathfrak{p} \subset \mathfrak{m}$. Since $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is faithfully flat we can choose a prime $\mathfrak{p}^{\prime}$ if $R_{\mathfrak{m}}^{\wedge}$ lying over $\mathfrak{p} R_{\mathfrak{m}}$. Consider the commutative diagram

By assumption the ring map $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is regular. By Proposition $15.41 .6\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}} \rightarrow$ $\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ is regular. The localization $R_{\mathfrak{m}}^{\wedge} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}$ is regular. Hence $R_{\mathfrak{m}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ is regular by Lemma 15.32 .4 . Since it factors through the localization $R_{\mathfrak{p}}$, also the ring map $R_{\mathfrak{p}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\lambda}$ is regular. Thus we may apply Lemma 15.32 .7 to see that $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$ is regular.

07QR Lemma 15.41.8. Let $R$ be a Noetherian local ring ring which is a $G$-ring. Then the henselization $R^{h}$ and the strict henselization $R^{\text {sh }}$ are $G$-rings.

Proof. We will use the criterion of Lemma 15.41.7. Let $\mathfrak{q} \subset R^{h}$ be a prime and set $\mathfrak{p}=R \cap \mathfrak{q}$. Set $\mathfrak{q}_{1}=\mathfrak{q}$ and let $\mathfrak{q}_{2}, \ldots, \mathfrak{q}_{t}$ be the other primes of $R^{h}$ lying over $\mathfrak{p}$, so that $R^{h} \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1, \ldots, t} \kappa\left(\mathfrak{q}_{i}\right)$, see Lemma 15.36 .13 . Using that $\left(R^{h}\right)^{\wedge}=R^{\wedge}$
(Lemma 15.36.3) we see

$$
\prod_{i=1, \ldots, t}\left(R^{h}\right)^{\wedge} \otimes_{R^{h}} \kappa\left(\mathfrak{q}_{i}\right)=\left(R^{h}\right)^{\wedge} \otimes_{R^{h}}\left(R^{h} \otimes_{R} \kappa(\mathfrak{p})\right)=R^{\wedge} \otimes_{R} \kappa(\mathfrak{p})
$$

Hence $\left(R^{h}\right)^{\wedge} \otimes_{R^{h}} \kappa\left(\mathfrak{q}_{i}\right)$ is geometrically regular over $\kappa(\mathfrak{p})$ by assumption. Since $\kappa\left(\mathfrak{q}_{i}\right)$ is separable algebraic over $\kappa(\mathfrak{p})$ it follows from Algebra, Lemma 10.158.6 that $\left(R^{h}\right)^{\wedge} \otimes_{R^{h}} \kappa\left(\mathfrak{q}_{i}\right)$ is geometrically regular over $\kappa\left(\mathfrak{q}_{i}\right)$.

Let $\mathfrak{r} \subset R^{s h}$ be a prime and set $\mathfrak{p}=R \cap \mathfrak{r}$. Set $\mathfrak{r}_{1}=\mathfrak{r}$ and let $\mathfrak{r}_{2}, \ldots, \mathfrak{r}_{s}$ be the other primes of $R^{s h}$ lying over $\mathfrak{p}$, so that $R^{s h} \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1, \ldots, t} \kappa\left(\mathfrak{q}_{i}\right)$, see Lemma 15.36.13. Then we see that

$$
\prod_{i=1, \ldots, t}\left(R^{s h}\right)^{\wedge} \otimes_{R^{s h}} \kappa\left(\mathfrak{r}_{i}\right)=\left(R^{s h}\right)^{\wedge} \otimes_{R^{s h}}\left(R^{s h} \otimes_{R} \kappa(\mathfrak{p})\right)=\left(R^{s h}\right)^{\wedge} \otimes_{R} \kappa(\mathfrak{p})
$$

Note that $R^{\wedge} \rightarrow\left(R^{s h}\right)^{\wedge}$ is formally smooth in the $\mathfrak{m}_{\left(R^{s h}\right)^{\wedge}}$-adic topology, see Lemma 15.36.3. Hence $R^{\wedge} \rightarrow\left(R^{s h}\right)^{\wedge}$ is regular by Proposition 15.40.2. We conclude that $\left(R^{s h}\right)^{\wedge} \otimes_{R^{h}} \kappa\left(\mathfrak{q}_{i}\right)$ is regular over $\kappa(\mathfrak{p})$ by Lemma 15.32.4 as $R^{\wedge} \otimes_{R} \kappa(\mathfrak{p})$ is regular over $\kappa(\mathfrak{p})$ by assumption. Since $\kappa\left(\mathfrak{r}_{i}\right)$ is separable algebraic over $\kappa(\mathfrak{p})$ it follows from Algebra, Lemma 10.158 .6 that $\left(R^{s h}\right)^{\wedge} \otimes_{R^{s h}} \kappa\left(\mathfrak{r}_{i}\right)$ is geometrically regular over $\kappa\left(\mathfrak{r}_{i}\right)$.

07PU Lemma 15.41.9. Let $p$ be a prime number. Let $A$ be a Noetherian complete local domain with fraction field $K$ of characteristic $p$. Let $\mathfrak{q} \subset A[x]$ be a maximal ideal lying over the maximal ideal of $A$ and let $(0) \neq \mathfrak{r} \subset \mathfrak{q}$ be a prime lying over $(0) \subset A$. Then $A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A[x]} \kappa(\mathfrak{r})$ is geometrically regular over $\kappa(\mathfrak{r})$.

Proof. Note that $K \subset \kappa(\mathfrak{r})$ is finite. Hence, given a finite purely inseparable extension $\kappa(\mathfrak{r}) \subset L$ there exists a finite extension of Noetherian complete local domains $A \subset B$ such that $\kappa(\mathfrak{r}) \otimes_{A} B$ surjects onto $L$. Namely, you take $B \subset L$ a finite $A$-subalgebra whose field of fractions is $L$. Denote $\mathfrak{r}^{\prime} \subset B[x]$ the kernel of the map $B[x]=A[x] \otimes_{A} B \rightarrow \kappa(\mathfrak{r}) \otimes_{A} B \rightarrow L$ so that $\kappa\left(\mathfrak{r}^{\prime}\right)=L$. Then

$$
A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A[x]} L=A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A[x]} B[x] \otimes_{B[x]} \kappa\left(\mathfrak{r}^{\prime}\right)=\prod B[x]_{\mathfrak{q}_{i}}^{\wedge_{i}} \otimes_{B[x]} \kappa\left(\mathfrak{r}^{\prime}\right)
$$

where $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ are the primes of $B[x]$ lying over $\mathfrak{q}$, see Algebra, Lemma 10.96.8. Thus we see that it suffices to prove the rings $B[x]_{\mathfrak{q}_{i}}^{\wedge} \otimes_{B[x]} \kappa\left(\mathfrak{r}^{\prime}\right)$ are regular. This reduces us to showing that $A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A[x]} \kappa(\mathfrak{r})$ is regular in the special case that $K=\kappa(\mathfrak{r})$.

Assume $K=\kappa(\mathfrak{r})$. In this case we see that $\mathfrak{r} K[x]$ is generated by $x-f$ for some $f \in K$ and

$$
A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A[x]} \kappa(\mathfrak{r})=\left(A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A} K\right) /(x-f)
$$

The derivation $D=\mathrm{d} / \mathrm{d} x$ of $A[x]$ extends to $K[x]$ and maps $x-f$ to a unit of $K[x]$. Moreover $D$ extends to $A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A} K$ by Lemma 15.39.1. As $A \rightarrow A[x]_{\mathfrak{q}}^{\wedge}$ is formally smooth (see Lemmas 15.29 .2 and 15.29 .4 ) the ring $A[x]_{\mathfrak{q}}^{\wedge} \otimes_{A} K$ is regular by Proposition 15.40 .2 (the arguments of the proof of that proposition simplify significantly in this particular case). We conclude by Lemma 15.39.2.

07PV Proposition 15.41.10. Let $R$ be a G-ring. If $R \rightarrow S$ is essentially of finite type then $S$ is a $G$-ring.

Proof. Since being a G-ring is a property of the local rings it is clear that a localization of a G-ring is a G-ring. Conversely, if every localization at a prime is a G-ring, then the ring is a G-ring. Thus it suffices to show that $S_{\mathfrak{q}}$ is a G-ring for every finite type $R$-algebra $S$ and every prime $\mathfrak{q}$ of $S$. Writing $S$ as a quotient of $R\left[x_{1}, \ldots, x_{n}\right]$ we see from Lemma 15.41 .3 that it suffices to prove that $R\left[x_{1}, \ldots, x_{n}\right]$ is a G-ring. By induction on $n$ it suffices to prove that $R[x]$ is a G-ring. Let $\mathfrak{q} \subset R[x]$ be a maximal ideal. By Lemma 15.41 .7 it suffices to show that

$$
R[x]_{\mathfrak{q}} \longrightarrow R[x]_{\mathfrak{q}}^{\wedge}
$$

is regular. If $\mathfrak{q}$ lies over $\mathfrak{p} \subset R$, then we may replace $R$ by $R_{\mathfrak{p}}$. Hence we may assume that $R$ is a Noetherian local G-ring with maximal ideal $\mathfrak{m}$ and that $\mathfrak{q} \subset R[x]$ lies over $\mathfrak{m}$. Note that there is a unique prime $\mathfrak{q}^{\prime} \subset R^{\wedge}[x]$ lying over $\mathfrak{q}$. Consider the diagram

Since $R$ is a G-ring the lower horizontal arrow is regular (as a localization of a base change of the regular ring map $R \rightarrow R^{\wedge}$ ). Suppose we can prove the right vertical arrow is regular. Then it follows that the composition $R[x]_{\mathfrak{q}} \rightarrow\left(R^{\wedge}[x]_{\mathfrak{q}^{\prime}}\right)^{\wedge}$ is regular, and hence the left vertical arrow is regular by Lemma 15.32.7. Hence we see that we may assume $R$ is a Noetherian complete local ring and $\mathfrak{q}$ a prime lying over the maximal ideal of $R$.

Let $R$ be a Noetherian complete local ring and let $\mathfrak{q} \subset R[x]$ be a maximal ideal lying over the maximal ideal of $R$. Let $\mathfrak{r} \subset \mathfrak{q}$ be a prime ideal. We want to show that $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is a geometrically regular algebra over $\kappa(\mathfrak{r})$. Set $\mathfrak{p}=R \cap \mathfrak{r}$. Then we can replace $R$ by $R / \mathfrak{p}$ and $\mathfrak{q}$ and $\mathfrak{r}$ by their images in $R / \mathfrak{p}[x]$, see Lemma 15.41.2. Hence we may assume that $R$ is a domain and that $\mathfrak{r} \cap R=(0)$.

By Algebra, Lemma 10.152 .10 we can find $R_{0} \subset R$ which is regular and such that $R$ is finite over $R_{0}$. Applying Lemma 15.41 .3 we see that it suffices to prove $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is geometrically regular over $\kappa(r)$ when, in addition to the above, $R$ is a regular complete local ring.
Now $R$ is a regular complete local ring, we have $\mathfrak{q} \subset \mathfrak{r} \subset R[x]$, we have $(0)=R \cap \mathfrak{r}$ and $\mathfrak{q}$ is a maximal ideal lying over the maximal ideal of $R$. Since $R$ is regular the ring $R[x]$ is regular (Algebra, Lemma 10.155.8). Hence the localization $R[x]_{\mathfrak{q}}$ is regular. Hence the completions $R[x]_{\mathfrak{q}}^{\wedge}$ are regular, see Lemma 15.34 .4 . Hence the fibre $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is, as a localization of $R[x]_{\mathfrak{q}}^{\wedge}$, also regular. Thus we are done if the characteristic of $f . f .(R)$ is 0 .

If the characteristic of $R$ is positive, then $R=k\left[\left[x_{1}, \ldots, x_{n}\right]\right]$. In this case we split the argument in two subcases:
(1) The case $\mathfrak{r}=(0)$. The result is a direct consequence of Lemma 15.41.5.
(2) The case $\mathfrak{r} \neq(0)$. This is Lemma 15.41 .9 .

07PW Remark 15.41.11. Let $R$ be a G-ring and let $I \subset R$ be an ideal. In general it is not the case that the $I$-adic completion $R^{\wedge}$ is a G-ring. An example was given
by Nishimura in Nis81. A generalization and, in some sense, clarification of this example can be found in the last section of Dum00.

07PX Proposition 15.41.12. The following types of rings are $G$-rings:
(1) fields,
(2) Noetherian complete local rings,
(3) $\mathbf{Z}$,
(4) Dedekind domains with fraction field of characteristic zero,
(5) finite type ring extensions of any of the above.

Proof. For fields, $\mathbf{Z}$ and Dedekind domains of characteristic zero this follows immediately from the definition and the fact that the completion of a discrete valuation ring is a discrete valuation ring. A Noetherian complete local ring is a G-ring by Proposition 15.41 .6 . The statement on finite type overrings is Proposition 15.41.10.

0A41 Lemma 15.41.13. Let $(A, \mathfrak{m})$ be a henselian local ring. Then $A$ is a filtered colimit of a system of henselian local $G$-rings with local transition maps.

Proof. Write $A=\operatorname{colim} A_{i}$ as a filtered colimit of finite type $\mathbf{Z}$-algebras. Let $\mathfrak{p}_{i}$ be the prime ideal of $A_{i}$ lying under $\mathfrak{m}$. We may replace $A_{i}$ by the localization of $A_{i}$ at $\mathfrak{p}_{i}$. Then $A_{i}$ is a Noetherian local G-ring (Proposition 15.41.12). By Lemma 15.8.17 we see that $A=\operatorname{colim} A_{i}^{h}$. By Lemma 15.41 .8 the rings $A_{i}^{h}$ are G-rings.

0AH2 Lemma 15.41.14. Let $A$ be a G-ring. Let $I \subset A$ be an ideal and let $A^{\wedge}$ be the completion of $A$ with respect to $I$. Then $A \rightarrow A^{\wedge}$ is regular.

Mat70a, Theorem 79]

Proof. The ring map $A \rightarrow A^{\wedge}$ is flat by Algebra, Lemma 10.96.2. The ring $A^{\wedge}$ is Noetherian by Algebra, Lemma 10.96.6. Thus it suffices to check the third condition of Lemma 15.32.2. Let $\mathfrak{m}^{\prime} \subset A^{\wedge}$ be a maximal ideal lying over $\mathfrak{m} \subset A$. By Algebra, Lemma 10.95.6 we have $I A^{\wedge} \subset \mathfrak{m}^{\prime}$. Since $A^{\wedge} / I A^{\wedge}=A / I$ we see that $I \subset \mathfrak{m}$, $\mathfrak{m} / I=\mathfrak{m}^{\prime} / I A^{\wedge}$, and $A / \mathfrak{m}=A^{\wedge} / \mathfrak{m}^{\prime}$. Since $A^{\wedge} / \mathfrak{m}^{\prime}$ is a field, we conclude that $\mathfrak{m}$ is a maximal ideal as well. Then $A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}^{\prime}}^{\wedge}$ is a flat local ring homomorphism of Noetherian local rings which identifies residue fields and such that $\mathfrak{m} A_{\mathfrak{m}^{\prime}}^{\wedge}=\mathfrak{m}^{\prime} A_{\mathfrak{m}^{\prime}}^{\wedge}$. Thus it induces an isomorphism on complete local rings, see Lemma 15.34.7. Let $\left(A_{\mathfrak{m}}\right)^{\wedge}$ be the completion of $A_{\mathfrak{m}}$ with respect to its maximal ideal. The ring map

$$
\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}} \rightarrow\left(\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}}\right)^{\wedge}=\left(A_{\mathfrak{m}}\right)^{\wedge}
$$

is faithfully flat (Algebra, Lemma 10.96.3). Thus we can apply Lemma 15.32 .7 to the ring maps

$$
A_{\mathfrak{m}} \rightarrow\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}} \rightarrow\left(A_{\mathfrak{m}}\right)^{\wedge}
$$

to conclude because $A_{\mathfrak{m}} \rightarrow\left(A_{\mathfrak{m}}\right)^{\wedge}$ is regular as $A$ is a G-ring.
0AH3 Lemma 15.41.15. Let $A$ be a $G$-ring. Let $I \subset A$ be an ideal. Let $\left(A^{h}, I^{h}\right)$ be the henselization of the pair $(A, I)$, see Lemma 15.8.13. Then $A^{h}$ is a $G$-ring.

Proof. Let $\mathfrak{m}^{h} \subset A^{h}$ be a maximal ideal. We have to show that the map from $A_{\mathfrak{m}^{h}}^{h}$ to its completion has geometrically regular fibres, see Lemma 15.41.7. Let $\mathfrak{m}$ be the inverse image of $\mathfrak{m}^{h}$ in $A$. Note that $I^{h} \subset \mathfrak{m}^{h}$ and hence $I \subset \mathfrak{m}$ as $\left(A^{h}, I^{h}\right)$ is a henselian pair. Recall that $A^{h}$ is Noetherian, $I^{h}=I A^{h}$, and that $A \rightarrow A^{h}$
induces an isomorphism on $I$-adic completions, see Lemma 15.8.16. Then the local homomorphism of Noetherian local rings

$$
A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}^{h}}^{h}
$$

induces an isomorphism on completions at maximal ideals by Lemma 15.34 .7 (details omitted). Let $\mathfrak{q}^{h}$ be a prime of $A_{\mathfrak{m}^{h}}^{h}$ lying over $\mathfrak{q} \subset A_{\mathfrak{m}}$. Set $\mathfrak{q}_{1}=\mathfrak{q}^{h}$ and let $\mathfrak{q}_{2}, \ldots, \mathfrak{q}_{t}$ be the other primes of $A^{h}$ lying over $\mathfrak{q}$, so that $A^{h} \otimes_{A} \kappa(\mathfrak{q})=$ $\prod_{i=1, \ldots, t} \kappa\left(\mathfrak{q}_{i}\right)$, see Lemma 15.36.12. Using that $\left(A^{h}\right)_{\mathfrak{m}^{h}}^{\wedge}=\left(A_{\mathfrak{m}}\right)^{\wedge}$ as discussed above we see

$$
\prod_{i=1, \ldots, t}\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathfrak{m}^{h} h}^{h}} \kappa\left(\mathfrak{q}_{i}\right)=\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathfrak{m}^{h}}^{h}}\left(A_{\mathfrak{m}^{h}}^{h} \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})\right)=\left(A_{\mathfrak{m}}\right)^{\wedge} \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})
$$

Hence, as one of the components, the ring

$$
\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathfrak{m}^{h}}^{h}} \kappa\left(\mathfrak{q}^{h}\right)
$$

is geometrically regular over $\kappa(\mathfrak{q})$ by assumption on $A$. Since $\kappa\left(\mathfrak{q}^{h}\right)$ is separable algebraic over $\kappa(\mathfrak{q})$ it follows from Algebra, Lemma 10.158.6 that

$$
\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathfrak{m} h}^{h}} \kappa\left(\mathfrak{q}^{h}\right)
$$

is geometrically regular over $\kappa\left(\mathfrak{q}^{h}\right)$ as desired.

### 15.42. Properties of formal fibres

0 BIR In this section we redo some of the arguments of Section 15.41 for to be able to talk intelligently about properties of the formal fibres of Noetherian rings.
Let $P$ be a property of ring maps $k \rightarrow R$ where $k$ is a field and $R$ is Noetherian. We say $P$ holds for the fibres of a ring homomorphism $A \rightarrow B$ with $B$ Noetherian if $P$ holds for $\kappa(\mathfrak{q}) \rightarrow B \otimes_{A} \kappa(\mathfrak{q})$ for all primes $\mathfrak{q}$ of $A$. In the following we will use the following assertions
(A) $P(k \rightarrow R) \Rightarrow P\left(k^{\prime} \rightarrow R \otimes_{k} k^{\prime}\right)$ for finitely generated field extensions $k^{\prime} / k$,
(B) $P\left(k \rightarrow R_{\mathfrak{p}}\right), \forall \mathfrak{p} \in \operatorname{Spec}(R) \Leftrightarrow P(k \rightarrow R)$,
(C) given flat maps $A \rightarrow B \rightarrow C$ of Noetherian rings, if the fibres of $A \rightarrow B$ have $P$ and $B \rightarrow C$ is regular, then the fibres of $A \rightarrow C$ have $P$,
(D) given flat maps $A \rightarrow B \rightarrow C$ of Noetherian rings if the fibres of $A \rightarrow C$ have $P$ and $B \rightarrow C$ is faithfully flat, then the fibres of $A \rightarrow B$ have $P$,
(E) add more here.

Given a Noetherian local ring $A$ we say "the formal fibres of $A$ have $P$ " if $P$ holds for the fibres of $A \rightarrow A^{\wedge}$. We say that $R$ is a $P$-ring if $R$ is Noetherian and for all primes $\mathfrak{p}$ of $R$ the formal fibres of $R_{\mathfrak{p}}$ have $P$.

0BIS Lemma 15.42.1. Let $R$ be a Noetherian ring. Let $P$ be a property as above. Then $R$ is a $P$-ring if and only if for every pair of primes $\mathfrak{q} \subset \mathfrak{p} \subset R$ the $\kappa(\mathfrak{q})$-algebra

$$
(R / \mathfrak{q})_{\mathfrak{p}}^{\wedge} \otimes_{R / \mathfrak{q}} \kappa(\mathfrak{q})
$$

has property $P$.
Proof. This follows from the fact that

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})=(R / \mathfrak{q})_{\mathfrak{p}}^{\wedge} \otimes_{R / \mathfrak{q}} \kappa(\mathfrak{q})
$$

as algebras over $\kappa(\mathfrak{q})$.

0BK8 Lemma 15.42.2. Let $R \rightarrow \Lambda$ be a homomorphism of Noetherian rings. Assume $P$ has property (B). The following are equivalent
(1) the fibres of $R \rightarrow \Lambda$ have $P$,
(2) the fibres of $R_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ have $P$ for all $\mathfrak{q} \subset \Lambda$ lying over $\mathfrak{p} \subset R$, and
(3) the fibres of $R_{\mathfrak{m}} \rightarrow \Lambda_{\mathfrak{m}^{\prime}}$ have $P$ for all maximal ideals $\mathfrak{m}^{\prime} \subset \Lambda$ lying over $\mathfrak{m}$ in $R$.

Proof. Let $\mathfrak{p} \subset R$ be a prime. Then the fibre over $\mathfrak{p}$ is the ring $\Lambda \otimes_{R} \kappa(\mathfrak{p})$ whose spectrum maps bijectively onto the subset of $\operatorname{Spec}(\Lambda)$ consisting of primes $\mathfrak{q}$ lying over $\mathfrak{p}$, see Algebra, Remark 10.16 .8 . For such a prime $\mathfrak{q}$ choose a maximal ideal $\mathfrak{q} \subset \mathfrak{m}^{\prime}$ and set $\mathfrak{m}=R \cap \mathfrak{m}^{\prime}$. Then $\mathfrak{p} \subset \mathfrak{m}$ and we have

$$
\left(\Lambda \otimes_{R} \kappa(\mathfrak{p})\right)_{\mathfrak{q}} \cong\left(\Lambda_{\mathfrak{m}^{\prime}} \otimes_{R_{\mathfrak{m}}} \kappa(\mathfrak{p})\right)_{\mathfrak{q}}
$$

as $\kappa(\mathfrak{q})$-algebras. Thus (1), (2), and (3) are equivalent because by (B) we can check property $P$ on local rings.

0BIT Lemma 15.42.3. Let $R \rightarrow R^{\prime}$ be a finite type map of Noetherian rings and let

be primes. Assume $R \rightarrow R^{\prime}$ is quasi-finite at $\mathfrak{p}^{\prime}$. Assume $P$ satisfies ( $A$ ) and ( $B$ ).
(1) If $\kappa(\mathfrak{q}) \rightarrow R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})$ has $P$, then $\kappa\left(\mathfrak{q}^{\prime}\right) \rightarrow R_{\mathfrak{p}^{\prime}}^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)$ has $P$.
(2) If the formal fibres of $R_{\mathfrak{p}}$ have $P$, then the formal fibres of $R_{\mathfrak{p}^{\prime}}^{\prime}$ have $P$.
(3) If $R \rightarrow R^{\prime}$ is quasi-finite and $R$ is a $P$-ring, then $R^{\prime}$ is a $P$-ring.

Proof. It is clear that $(1) \Rightarrow(2) \Rightarrow(3)$. Assume $P$ holds for $\kappa(\mathfrak{q}) \rightarrow R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q})$. By Algebra, Lemma 10.123 .3 we see that

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} R^{\prime}=\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge} \times B
$$

for some $R_{\mathfrak{p}}^{\wedge}$-algebra $B$. Hence $R_{\mathfrak{p}^{\prime}}^{\prime} \rightarrow\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge}$ is a factor of a base change of the $\operatorname{map} R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$. It follows that $\left(R_{\mathfrak{p}^{\prime}}^{\prime}\right)^{\wedge} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)$ is a factor of

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{q}^{\prime}\right)=R_{\mathfrak{p}}^{\wedge} \otimes_{R} \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} \kappa\left(\mathfrak{q}^{\prime}\right)
$$

Thus the result follows from the assumptions on $P$.
0BIU Lemma 15.42.4. Let $R$ be a Noetherian ring. Assume $P$ satisfies $(C)$ and ( $D$ ). Then $R$ is a $P$-ring if and only if the formal fibres of $R_{\mathfrak{m}}$ have $P$ for every maximal ideal $\mathfrak{m}$ of $R$.

Proof. Assume the formal fibres of $R_{\mathfrak{m}}$ have $P$ for all maximal ideals $\mathfrak{m}$ of $R$. Let $\mathfrak{p}$ be a prime of $R$ and choose a maximal ideal $\mathfrak{p} \subset \mathfrak{m}$. Since $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is faithfully flat we can choose a prime $\mathfrak{p}^{\prime}$ if $R_{\mathfrak{m}}^{\wedge}$ lying over $\mathfrak{p} R_{\mathfrak{m}}$. Consider the commutative diagram

By assumption the fibres of the ring map $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ have $P$. By Proposition 15.41.6 $\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ is regular. The localization $R_{\mathfrak{m}}^{\wedge} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}$ is regular. Hence $R_{\mathfrak{m}}^{\wedge} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right) \hat{\mathfrak{p}^{\prime}}$ is regular by Lemma 15.32 .4 . Hence the fibres of $R_{\mathfrak{m}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ have $P$ by (C). Since $R_{\mathfrak{m}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ factors through the localization $R_{\mathfrak{p}}$, also the fibres of $R_{\mathfrak{p}} \rightarrow\left(R_{\mathfrak{m}}^{\wedge}\right)_{\mathfrak{p}^{\prime}}^{\wedge}$ have $P$. Thus we may apply (D) to see that the fibres of $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$ have $P$.

0BIV Proposition 15.42.5. Let $R$ be a $P$-ring where $P$ satisfies $(A),(B),(C)$, and (D). If $R \rightarrow S$ is essentially of finite type then $S$ is a $P$-ring.

Proof. Since being a $P$-ring is a property of the local rings it is clear that a localization of a $P$-ring is a $P$-ring. Conversely, if every localization at a prime is a $P$-ring, then the ring is a $P$-ring. Thus it suffices to show that $S_{\mathfrak{q}}$ is a $P$-ring for every finite type $R$-algebra $S$ and every prime $\mathfrak{q}$ of $S$. Writing $S$ as a quotient of $R\left[x_{1}, \ldots, x_{n}\right]$ we see from Lemma 15.42 .3 that it suffices to prove that $R\left[x_{1}, \ldots, x_{n}\right]$ is a $P$-ring. By induction on $n$ it suffices to prove that $R[x]$ is a $P$-ring. Let $\mathfrak{q} \subset R[x]$ be a maximal ideal. By Lemma 15.42 .4 it suffices to show that the fibres of

$$
R[x]_{\mathfrak{q}} \longrightarrow R[x]_{\mathfrak{q}}^{\wedge}
$$

have $P$. If $\mathfrak{q}$ lies over $\mathfrak{p} \subset R$, then we may replace $R$ by $R_{\mathfrak{p}}$. Hence we may assume that $R$ is a Noetherian local $P$-ring with maximal ideal $\mathfrak{m}$ and that $\mathfrak{q} \subset R[x]$ lies over $\mathfrak{m}$. Note that there is a unique prime $\mathfrak{q}^{\prime} \subset R^{\wedge}[x]$ lying over $\mathfrak{q}$. Consider the diagram

Since $R$ is a $P$-ring the fibres of $R[x] \rightarrow R^{\wedge}[x]$ have $P$ because they are base changes of the fibres of $R \rightarrow R^{\wedge}$ by a finitely generated field extension so (A) applies. Hence the fibres of the lower horizontal arrow have $P$ for example by Lemma 15.42.2, The right vertical arrow is regular because $R^{\wedge}$ is a G-ring (Propositions 15.41 .6 and 15.41.10). It follows that the fibres of the composition $R[x]_{\mathfrak{q}} \rightarrow\left(R^{\wedge}[x]_{\mathfrak{q}^{\prime}}\right)^{\wedge}$ have $P$ by (C). Hence the fibres of the left vertical arrow have $P$ by (D) and the proof is complete.

0BK9 Lemma 15.42.6. Let $A$ be a P-ring where $P$ satisfies (B) and ( $D$ ). Let $I \subset A$ be an ideal and let $A^{\wedge}$ be the completion of $A$ with respect to $I$. Then the fibres of $A \rightarrow A^{\wedge}$ have $P$.

Proof. The ring map $A \rightarrow A^{\wedge}$ is flat by Algebra, Lemma 10.96.2. The ring $A^{\wedge}$ is Noetherian by Algebra, Lemma 10.96 .6 . Thus it suffices to check the third condition of Lemma 15.42 .2 . Let $\mathfrak{m}^{\prime} \subset A^{\wedge}$ be a maximal ideal lying over $\mathfrak{m} \subset A$. By Algebra, Lemma 10.95 .6 we have $I A^{\wedge} \subset \mathfrak{m}^{\prime}$. Since $A^{\wedge} / I A^{\wedge}=A / I$ we see that $I \subset \mathfrak{m}$, $\mathfrak{m} / I=\mathfrak{m}^{\prime} / I A^{\wedge}$, and $A / \mathfrak{m}=A^{\wedge} / \mathfrak{m}^{\prime}$. Since $A^{\wedge} / \mathfrak{m}^{\prime}$ is a field, we conclude that $\mathfrak{m}$ is a maximal ideal as well. Then $A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}^{\prime}}^{\wedge}$ is a flat local ring homomorphism of Noetherian local rings which identifies residue fields and such that $\mathfrak{m} A_{\mathfrak{m}^{\prime}}^{\wedge}=\mathfrak{m}^{\prime} A_{\mathfrak{m}^{\prime}}^{\wedge}$. Thus it induces an isomorphism on complete local rings, see Lemma 15.34.7. Let $\left(A_{\mathfrak{m}}\right)^{\wedge}$ be the completion of $A_{\mathfrak{m}}$ with respect to its maximal ideal. The ring map

$$
\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}} \rightarrow\left(\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}}\right)^{\wedge}=\left(A_{\mathfrak{m}}\right)^{\wedge}
$$

is faithfully flat (Algebra, Lemma 10.96.3). Thus we can apply (D) to the ring maps

$$
A_{\mathfrak{m}} \rightarrow\left(A^{\wedge}\right)_{\mathfrak{m}^{\prime}} \rightarrow\left(A_{\mathfrak{m}}\right)^{\wedge}
$$

to conclude because the fibres of $A_{\mathfrak{m}} \rightarrow\left(A_{\mathfrak{m}}\right)^{\wedge}$ have $P$ as $A$ is a $P$-ring.
0BKA Lemma 15.42.7. Let $A$ be a $P$-ring where $P$ satisfies ( $A$ ), ( $B$ ), ( $C$ ), and ( $D$ ). Let $I \subset A$ be an ideal. Let $\left(A^{h}, I^{h}\right)$ be the henselization of the pair $(A, I)$, see Lemma 15.8.13. Then $A^{h}$ is a $P$-ring.

Proof. Let $\mathfrak{m}^{h} \subset A^{h}$ be a maximal ideal. We have to show that the fibres of $A_{\mathfrak{m}^{h}}^{h} \rightarrow\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge}$ have $P$, see Lemma 15.42.4. Let $\mathfrak{m}$ be the inverse image of $\mathfrak{m}^{h}$ in
 that $A^{h}$ is Noetherian, $I^{h}=I A^{h}$, and that $A \rightarrow A^{h}$ induces an isomorphism on $I$ adic completions, see Lemma 15.8.16 Then the local homomorphism of Noetherian local rings

$$
A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}^{h}}^{h}
$$

induces an isomorphism on completions at maximal ideals by Lemma 15.34 .7 (details omitted). Let $\mathfrak{q}^{h}$ be a prime of $A_{\mathfrak{m}^{h}}^{h}$ lying over $\mathfrak{q} \subset A_{\mathfrak{m}}$. Set $\mathfrak{q}_{1}=\mathfrak{q}^{h}$ and let $\mathfrak{q}_{2}, \ldots, \mathfrak{q}_{t}$ be the other primes of $A^{h}$ lying over $\mathfrak{q}$, so that $A^{h} \otimes_{A} \kappa(\mathfrak{q})=$ $\prod_{i=1, \ldots, t} \kappa\left(\mathfrak{q}_{i}\right)$, see Lemma 15.36.12. Using that $\left(A^{h}\right)_{\mathfrak{m}^{h}}^{\wedge}=\left(A_{\mathfrak{m}}\right)^{\wedge}$ as discussed above we see
$\prod_{i=1, \ldots, t}\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathbf{m}^{h}}^{h}} \kappa\left(\mathfrak{q}_{i}\right)=\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathbf{m}^{h}}^{h}}\left(A_{\mathfrak{m}^{h}}^{h} \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})\right)=\left(A_{\mathfrak{m}}\right)^{\wedge} \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})$
Hence, looking at local rings and using (B), we see that

$$
\kappa(\mathfrak{q}) \longrightarrow\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathbf{m}^{h}}^{h}} \kappa\left(\mathfrak{q}^{h}\right)
$$

has $P$ as $\kappa(\mathfrak{q}) \rightarrow\left(A_{\mathfrak{m}}\right)^{\wedge} \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})$ does by assumption on $A$. By (A) we see that

$$
\kappa\left(\mathfrak{q}^{h}\right) \longrightarrow\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathfrak{m}^{h}}^{h}} \kappa\left(\mathfrak{q}^{h}\right) \otimes_{\kappa(\mathfrak{q})} \kappa\left(\mathfrak{q}^{h}\right)
$$

has property $P$. Since $\kappa\left(\mathfrak{q}^{h}\right)$ is separable algebraic over $\kappa(\mathfrak{q})$ we see that $\kappa\left(\mathfrak{q}^{h}\right) \otimes_{\kappa(\mathfrak{q})}$ $\kappa\left(\mathfrak{q}^{h}\right)$ contains $\kappa\left(\mathfrak{q}^{h}\right)$ as a factor. Hence applying (B) once more we find that

$$
\kappa\left(\mathfrak{q}^{h}\right) \rightarrow\left(A_{\mathfrak{m}^{h}}^{h}\right)^{\wedge} \otimes_{A_{\mathbf{m}^{h}}^{h}} \kappa\left(\mathfrak{q}^{h}\right)
$$

has $P$ as desired.
0BIW Lemma 15.42.8. Properties (A), (B), (C), and (D) hold for $P(k \rightarrow R)=" R$ is geometrically reduced over $k$ ".
Proof. Part (A) follows from the definition of geometrically reduced algebras (Algebra, Definition 10.42.11. Part (B) follows too: a ring is reduced if and only if all local rings are reduced. Part (C). This follows from Lemma 15.33.1. Part (D). This follows from Algebra, Lemma 10.156.2.
0BIX Lemma 15.42.9. Properties (A), (B), (C), and (D) hold for $P(k \rightarrow R)=" R$ is geometrically normal over $k$ ".
Proof. Part (A) follows from the definition of geometrically normal algebras (Algebra, Definition 10.157.22. Part (B) follows too: a ring is normal if and only if all of its local rings are normal. Part (C). This follows from Lemma 15.33.2. Part (D). This follows from Algebra, Lemma 10.156.3.

0BIY Lemma 15.42.10. Fix $n \geq 1$. Properties (A), (B), (C), and (D) hold for $P(k \rightarrow$ $R)=$ " $R$ has $\left(S_{n}\right)$ ".
Proof. Let $k \rightarrow R$ be a ring map where $k$ is a field and $R$ a Noetherian ring. Let $k \subset k^{\prime}$ be a finitely generated field extension. Then the fibres of the ring map $R \rightarrow R \otimes_{k} k^{\prime}$ are Cohen-Macaulay by Algebra, Lemma 10.159.1. Hence we may apply Algebra, Lemma 10.155 .4 to the ring map $R \rightarrow R \otimes_{k} k^{\prime}$ to see that if $R$ has $\left(S_{n}\right)$ so does $R \otimes_{k} k^{\prime}$. This proves (A). Part (B) follows too: a Noetherian rings has $\left(S_{n}\right)$ if and only if all of its local rings have $\left(S_{n}\right)$. Part (C). This follows from Algebra, Lemma 10.155 .4 as the fibres of a regular homomorphism are regular and in particular Cohen-Macaulay. Part (D). This follows from Algebra, Lemma 10.156 .5

0BJ9 Lemma 15.42.11. Fix $n \geq 1$. Properties $(A),(B),(C)$, and ( $D$ ) hold for $P(k \rightarrow$ $R)=$ " $R$ is Cohen-Macaulay".
Proof. Follows immediately from Lemma 15.42 .10 and the trivial fact that a Noetherian ring is Cohen-Macaulay if and only if it satisfies conditions $\left(S_{n}\right)$ for all $n$.

0BIZ Lemma 15.42.12. Fix $n \geq 0$. Properties (A), (B), (C), and (D) hold for $P(k \rightarrow$ $R)=" R \otimes_{k} k^{\prime}$ has $\left(R_{n}\right)$ for all finite extensions $k^{\prime} / k$ ".

Proof. Let $k \rightarrow R$ be a ring map where $k$ is a field and $R$ a Noetherian ring. Assume $P(k \rightarrow R)$ is true. Let $k \subset K$ be a finitely generated field extension. By Algebra, Lemma 10.44 .3 we can find a diagram

where $k \subset k^{\prime}, K \subset K^{\prime}$ are finite purely inseparable field extensions such that $k^{\prime} \subset$ $K^{\prime}$ is separable. By Algebra, Lemma 10.150 .10 there exists a smooth $k^{\prime}$-algebra $B$ such that $K^{\prime}$ is the fraction field of $B$. Now we can argue as follows: Step 1: $R \otimes_{k} k^{\prime}$ satisfies $\left(S_{n}\right)$ because we assumed $P$ for $k \rightarrow R$. Step $2: R \otimes_{k} k^{\prime} \rightarrow R \otimes_{k} k^{\prime} \otimes_{k^{\prime}} B$ is a smooth ring map (Algebra, Lemma 10.135.4) and we conclude $R \otimes_{k} k^{\prime} \otimes_{k^{\prime}} B$ satisfies $\left(S_{n}\right)$ by Algebra, Lemma 10.155.5 (and using Algebra, Lemma 10.138 .3 to see that the hypotheses are satisfied). Step $3 . R \otimes_{k} k^{\prime} \otimes_{k^{\prime}} K^{\prime}=R \otimes_{k} K^{\prime}$ satisfies $\left(R_{n}\right)$ as it is a localization of a ring having $\left(R_{n}\right)$. Step 4. Finally $R \otimes_{k} K$ satisfies $\left(R_{n}\right)$ by descent of $\left(R_{n}\right)$ along the faithfully flat ring map $K \otimes_{k} A \rightarrow K^{\prime} \otimes_{k} A$ (Algebra, Lemma 10.156.6). This proves (A). Part (B) follows too: a Noetherian ring has $\left(R_{n}\right)$ if and only if all of its local rings have $\left(R_{n}\right)$. Part (C). This follows from Algebra, Lemma 10.155 .5 as the fibres of a regular homomorphism are regular (small detail omitted). Part (D). This follows from Algebra, Lemma 10.156.6 (small detail omitted).

### 15.43. Excellent rings

07QS In this section we discuss Grothendieck's notion of excellent rings. For the definitions of G-rings, J-2 rings, and universally catenary rings we refer to Definition 15.41.1. Definition 15.38.1, and Algebra, Definition 10.104.3.

07QT Definition 15.43.1. Let $R$ be a ring.
(1) We say $R$ is quasi-excellent if $R$ is Noetherian, a G-ring, and J-2.
(2) We say $R$ is excellent if $R$ is quasi-excellent and universally catenary.

Thus a Noetherian ring is quasi-excellent if it has geometrically regular formal fibres and if any finite type algebra over it has closed singular set. For such a ring to be excellent we require in addition that there exists (locally) a good dimension function.

07QU Lemma 15.43.2. Any localization of a finite type ring over a (quasi-)excellent ring is (quasi-)excellent.

Proof. For finite type algebras this follows from the definitions for the properties J-2 and universally catenary. For G-rings, see Proposition 15.41.10. We omit the proof that localization preserves (quasi-)excellency.

07QW Proposition 15.43.3. The following types of rings are excellent:
(1) fields,
(2) Noetherian complete local rings,
(3) $\mathbf{Z}$,
(4) Dedekind domains with fraction field of characteristic zero,
(5) finite type ring extensions of any of the above.

Proof. See Propositions 15.41 .12 and 15.39 .6 to see that these rings are G-rings and have J-2. Any Cohen-Macaulay ring is universally catenary, see Algebra, Lemma 10.104.8. In particular fields, Dedekind rings, and more generally regular rings are universally catenary. Via the Cohen structure theorem we see that complete local rings are universally catenary, see Algebra, Remark 10.152.9.

The material developed above has some consequences for Nagata rings.
0BJ0 Lemma 15.43.4. Let $(A, \mathfrak{m})$ be a Noetherian local ring. The following are equivalent
(1) A is Nagata, and
(2) the formal fibres of $A$ are geometrically reduced.

Proof. Assume (2). By Algebra, Lemma 10.154.14 we have to show that if $A \rightarrow B$ is finite, $B$ is a domain, and $\mathfrak{m}^{\prime} \subset B$ is a maximal ideal, then $B_{\mathfrak{m}^{\prime}}$ is analytically unramified. Combining Lemma 15.42 .8 and 15.42 .4 and Proposition 15.42 .5 we see that the formal fibres of $B_{\mathfrak{m}^{\prime}}$ are geometrically reduced. In particular $\bar{B}_{\mathfrak{m}^{\prime}}^{\wedge} \otimes_{B} f . f .(B)$ is reduced and it follows that $B_{\mathfrak{m}^{\prime}}^{\wedge}$ is reduced, i.e., $B_{\mathfrak{m}^{\prime}}$ is analytically unramified.
Assume (1). Let $\mathfrak{q} \subset A$ be a prime ideal and let $\kappa(\mathfrak{q}) \subset K$ be a finite extension. We have to show that $A^{\wedge} \otimes_{A} K$ is reduced. Let $A / \mathfrak{q} \subset B \subset K$ be a local subring finite over $A$ whose fraction field is $K$. To construct $B$ choose $x_{1}, \ldots, x_{n} \in K$ which generate $K$ over $\kappa(\mathfrak{q})$ and which satisfy monic polynomials $P_{i}(T)=T^{d_{i}}+$ $a_{i, 1} T^{d_{i}-1}+\ldots+a_{i, d_{i}}=0$ with $a_{i, j} \in \mathfrak{m}$. Then let $B$ be the $A$-subalgebra of $K$ generated by $x_{1}, \ldots, x_{n}$. (For more details see the proof of Algebra, Lemma 10.154.14.) Then

$$
A^{\wedge} \otimes_{A} K=\left(A^{\wedge} \otimes_{A} B\right)_{\mathfrak{q}}=B_{\mathfrak{q}}^{\wedge}
$$

Since $B^{\wedge}$ is reduced by Algebra, Lemma 10.154 .14 the proof is complete.
07QV Lemma 15.43.5. A quasi-excellent ring is Nagata.

Proof. Let $R$ be quasi-excellent. Using that a finite type algebra over $R$ is quasiexcellent (Lemma 15.43.2) we see that it suffices to show that any quasi-excellent domain is $\mathrm{N}-1$, see Algebra, Lemma 10.154.3. Applying Algebra, Lemma 10.153 .15 (and using that a quasi-excellent ring is $\mathrm{J}-2$ ) we reduce to showing that a quasiexcellent local domain $R$ is $\mathrm{N}-1$. As $R \rightarrow R^{\wedge}$ is regular we see that $R^{\wedge}$ is reduced by Lemma 15.33.1. In other words, $R$ is analytically unramified. Hence $R$ is N-1 by Algebra, Lemma 10.154.10.

### 15.44. Abelian categories of modules

0AZ5 Let $R$ be a ring. The category $\operatorname{Mod}_{R}$ of $R$-modules is an abelian category. Here are some examples of subcategories of $\operatorname{Mod}_{R}$ which are abelian (we use the terminology introduced in Homology, Definition 12.9.1 as well as Homology, Lemmas 12.9 .2 and 12.9.3):
(1) The category of coherent $R$-modules is a weak Serre subcategory of $\operatorname{Mod}_{R}$. This follows from Algebra, Lemma 10.89.2.
(2) Let $S \subset R$ be a multiplicative subset. The full subcategory consisting of $R$-modules $M$ such that multiplication by $s \in S$ is an isomorphism on $M$ is a Serre subcategory of $\operatorname{Mod}_{R}$. This follows from Algebra, Lemma 10.9.5.
(3) Let $I \subset R$ be a finitely generated ideal. The full subcategory of $I$-power torsion modules is a Serre subcategory of $\operatorname{Mod}_{R}$. See Lemma 15.69.5.
(4) In some texts a torsion module is defined as a module $M$ such that for all $x \in M$ there exists a nonzerodivisor $f \in R$ such that $f x=0$. The full subcategory of torsion modules is a Serre subcategory of $\operatorname{Mod}_{R}$.
(5) If $R$ is not Noetherian, then the category $\operatorname{Mod}_{R}^{f g}$ of finitely generated $R$ modules is not abelian. Namely, if $I \subset R$ is a non-finitely generated ideal, then the map $R \rightarrow R / I$ does not have a kernel in $\operatorname{Mod}_{R}^{f g}$.
(6) If $R$ is Noetherian, then coherent $R$-modules agree with finitely generated (i.e., finite) $R$-modules, see Algebra, Lemmas 10.89.4 10.89.3, and 10.30.4 Hence $\operatorname{Mod}_{R}^{f g}$ is abelian by (1) above, but in fact,in this case the category $\operatorname{Mod}_{R}^{f g}$ is a (strong) Serre subcategory of $\operatorname{Mod}_{R}$.

### 15.45. Injective abelian groups

01D6 In this section we show the category of abelian groups has enough injectives. Recall that an abelian group $M$ is divisible if and only if for every $x \in M$ and every $n \in \mathbf{N}$ there exists a $y \in M$ such that $n y=x$.

01D7 Lemma 15.45.1. An abelian group $J$ is an injective object in the category of abelian groups if and only if $J$ is divisible.

Proof. Suppose that $J$ is not divisible. Then there exists an $x \in J$ and $n \in \mathbf{N}$ such that there is no $y \in J$ with $n y=x$. Then the morphism $\mathbf{Z} \rightarrow J, m \mapsto m x$ does not extend to $\frac{1}{n} \mathbf{Z} \supset \mathbf{Z}$. Hence $J$ is not injective.
Let $A \subset B$ be abelian groups. Assume that $J$ is a divisible abelian group. Let $\varphi: A \rightarrow J$ be a morphism. Consider the set of homomorphisms $\varphi^{\prime}: A^{\prime} \rightarrow J$ with $A \subset A^{\prime} \subset B$ and $\left.\varphi^{\prime}\right|_{A}=\varphi$. Define $\left(A^{\prime}, \varphi^{\prime}\right) \geq\left(A^{\prime \prime}, \varphi^{\prime \prime}\right)$ if and only if $A^{\prime} \supset A^{\prime \prime}$ and $\left.\varphi^{\prime}\right|_{A^{\prime \prime}}=\varphi^{\prime \prime}$. If $\left(A_{i}, \varphi_{i}\right)_{i \in I}$ is a totally ordered collection of such pairs, then we obtain a map $\bigcup_{i \in I} A_{i} \rightarrow J$ defined by $a \in A_{i}$ maps to $\varphi_{i}(a)$. Thus Zorn's lemma
applies. To conclude we have to show that if the pair $\left(A^{\prime}, \varphi^{\prime}\right)$ is maximal then $A^{\prime}=B$. In other words, it suffices to show, given any subgroup $A \subset B, A \neq B$ and any $\varphi: A \rightarrow J$, then we can find $\varphi^{\prime}: A^{\prime} \rightarrow J$ with $A \subset A^{\prime} \subset B$ such that (a) the inclusion $A \subset A^{\prime}$ is strict, and (b) the morphism $\varphi^{\prime}$ extends $\varphi$.
To prove this, pick $x \in B, x \notin A$. If there exists no $n \in \mathbf{N}$ such that $n x \in A$, then $A \oplus \mathbf{Z} \cong A+\mathbf{Z} x$. Hence we can extend $\varphi$ to $A^{\prime}=A+\mathbf{Z} x$ by using $\varphi$ on $A$ and mapping $x$ to zero for example. If there does exist an $n \in \mathbf{N}$ such that $n x \in A$, then let $n$ be the minimal such integer. Let $z \in J$ be an element such that $n z=\varphi(n x)$. Define a morphism $\tilde{\varphi}: A \oplus \mathbf{Z} \rightarrow J$ by $(a, m) \mapsto \varphi(a)+m z$. By our choice of $z$ the kernel of $\tilde{\varphi}$ contains the kernel of the map $A \oplus \mathbf{Z} \rightarrow B,(a, m) \mapsto a+m x$. Hence $\tilde{\varphi}$ factors through the image $A^{\prime}=A+\mathbf{Z} x$, and this extends the morphism $\varphi$.

We can use this lemma to show that every abelian group can be embedded in a injective abelian group. But this is a special case of the result of the following section.

### 15.46. Injective modules

01D8 Some lemmas on injective modules.
0AVD Definition 15.46.1. Let $R$ be a ring. An $R$-module $J$ is injective if and only if the functor $\operatorname{Hom}_{R}(-, J): \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ is an exact functor.

The functor $\operatorname{Hom}_{R}(-, M)$ is left exact for any $R$-module $M$, see Algebra, Lemma 10.10.1. Hence the condition for $J$ to be injective really signifies that given an injection of $R$-modules $M \rightarrow M^{\prime}$ the $\operatorname{map} \operatorname{Hom}_{R}\left(M^{\prime}, J\right) \rightarrow \operatorname{Hom}_{R}(M, J)$ is surjective.
Before we reformulate this in terms of Ext-modules we discuss the relationship between $\operatorname{Ext}_{R}^{1}(M, N)$ and extensions as in Homology, Section 12.6

0AUL Lemma 15.46.2. Let $R$ be a ring. Let $\mathcal{A}$ be the abelian category of $R$-modules. There is a canonical isomorphism $\operatorname{Ext}_{\mathcal{A}}(M, N)=\operatorname{Ext}_{R}^{1}(M, N)$ compatible with the long exact sequences of Algebra, Lemmas 10.70.6 and 10.70 .7 and the 6 -term exact sequences of Homology, Lemma 12.6.4.

Proof. Omitted.
0AVE Lemma 15.46.3. Let $R$ be a ring. Let $J$ be an $R$-module. The following are equivalent
(1) $J$ is injective,
(2) $\operatorname{Ext}_{R}^{1}(M, J)=0$ for every $R$-module $M$.

Proof. Let $0 \rightarrow M^{\prime \prime} \rightarrow M^{\prime} \rightarrow M \rightarrow 0$ be a short exact sequence of $R$-modules. Consider the long exact sequence

$$
\begin{aligned}
& 0 \rightarrow \operatorname{Hom}_{R}(M, J) \rightarrow \operatorname{Hom}_{R}\left(M^{\prime}, J\right) \rightarrow \operatorname{Hom}_{R}\left(M^{\prime \prime}, J\right) \\
& \quad \rightarrow \operatorname{Ext}_{R}^{1}(M, J) \rightarrow \operatorname{Ext}_{R}^{1}\left(M^{\prime}, J\right) \rightarrow \operatorname{Ext}_{R}^{1}\left(M^{\prime \prime}, J\right) \rightarrow \ldots
\end{aligned}
$$

of Algebra, Lemma 10.70.7. Thus we see that (2) implies (1). Conversely, if $J$ is injective then the Ext-group is zero by Homology, Lemma 12.23 .2 and Lemma 15.46.2.

0AVF Lemma 15.46.4. Let $R$ be a ring. Let $J$ be an $R$-module. The following are equivalent
(1) $J$ is injective,
(2) $\operatorname{Ext}_{R}^{1}(R / I, J)=0$ for every ideal $I \subset R$, and
(3) for an ideal $I \subset R$ and module map $I \rightarrow J$ there exists an extension $R \rightarrow J$.

Proof. We have seen the implication $(1) \Rightarrow(2)$ in Lemma 15.46 .3 . Given a module map $I \rightarrow J$ as in (3) we obtain an extension of $R / I$ by $J$ by pushout

If (2) holds, then the lower short exact sequence is split by Homology, Lemma 12.23 .2 By choosing a splitting $E \rightarrow J$, we obtain an extension $R \rightarrow E \rightarrow J$ of the given map $I \rightarrow J$. Thus $(2) \Rightarrow(3)$.
Assume (3). Let $M \subset N$ be an inclusion of $R$-modules. Let $\varphi: M \rightarrow J$ be a homomorphism. We will show that $\varphi$ extends to $N$ which finishes the proof of the lemma. Consider the set of homomorphisms $\varphi^{\prime}: M^{\prime} \rightarrow J$ with $M \subset M^{\prime} \subset N$ and $\left.\varphi^{\prime}\right|_{M}=\varphi$. Define $\left(M^{\prime}, \varphi^{\prime}\right) \geq\left(M^{\prime \prime}, \varphi^{\prime \prime}\right)$ if and only if $M^{\prime} \supset M^{\prime \prime}$ and $\left.\varphi^{\prime}\right|_{M^{\prime \prime}}=\varphi^{\prime \prime}$. If $\left(M_{i}, \varphi_{i}\right)_{i \in I}$ is a totally ordered collection of such pairs, then we obtain a map $\bigcup_{i \in I} M_{i} \rightarrow J$ defined by $a \in M_{i}$ maps to $\varphi_{i}(a)$. Thus Zorn's lemma applies. To conclude we have to show that if the pair $\left(M^{\prime}, \varphi^{\prime}\right)$ is maximal then $M^{\prime}=N$. In other words, it suffices to show, given any subgroup $M \subset N, M \neq N$ and any $\varphi: M \rightarrow J$, then we can find $\varphi^{\prime}: M^{\prime} \rightarrow J$ with $M \subset M^{\prime} \subset N$ such that (a) the inclusion $M \subset M^{\prime}$ is strict, and (b) the morphism $\varphi^{\prime}$ extends $\varphi$.
To prove this, pick $x \in N, x \notin M$. Let $I=\{f \in R \mid f x \in M\}$. This is an ideal of $R$. Define a homomorphism $\psi: I \rightarrow J$ by $f \mapsto \varphi(f x)$. Extend to a map $\tilde{\psi}: R \rightarrow J$ which is possible by assumption (3). By our choice of $I$ the kernel of $M \oplus R \rightarrow J$, $(y, f) \mapsto y-\tilde{\psi}(f)$ contains the kernel of the map $M \oplus R \rightarrow N,(y, f) \mapsto y+f x$. Hence this homomorphism factors through the image $M^{\prime}=M+R x$ and this extends the given homomorphism as desired.

In the rest of this section we prove that there are enough injective modules over a ring $R$. We start with the fact that $\mathbf{Q} / \mathbf{Z}$ is an injective abelian group. This follows from Lemma 15.45.1.

01D9 Definition 15.46.5. Let $R$ be a ring.
(1) For any $R$-module $M$ over $R$ we denote $M^{\vee}=\operatorname{Hom}(M, \mathbf{Q} / \mathbf{Z})$ with its natural $R$-module structure. We think of $M \mapsto M^{\vee}$ as a contravariant functor from the category of $R$-modules to itself.
(2) For any $R$-module $M$ we denote

$$
F(M)=\bigoplus_{m \in M} R[m]
$$

the free module with basis given by the elements $[m]$ with $m \in M$. We let $F(M) \rightarrow M, \sum f_{i}\left[m_{i}\right] \mapsto \sum f_{i} m_{i}$ be the natural surjection of $R$-modules. We think of $M \mapsto(F(M) \rightarrow M)$ as a functor from the category of $R$ modules to the category of arrows in $R$-modules.

01DA Lemma 15.46.6. Let $R$ be a ring. The functor $M \mapsto M^{\vee}$ is exact.

Proof. This because $\mathbf{Q} / \mathbf{Z}$ is an injective abelian group by Lemma 15.45.1.
There is a canonical map ev:M $\rightarrow\left(M^{\vee}\right)^{\vee}$ given by evaluation: given $x \in M$ we let $e v(x) \in\left(M^{\vee}\right)^{\vee}=\operatorname{Hom}\left(M^{\vee}, \mathbf{Q} / \mathbf{Z}\right)$ be the $\operatorname{map} \varphi \mapsto \varphi(x)$.

01DB Lemma 15.46.7. For any $R$-module $M$ the evaluation map ev : $M \rightarrow\left(M^{\vee}\right)^{\vee}$ is injective.

Proof. You can check this using that $\mathbf{Q} / \mathbf{Z}$ is an injective abelian group. Namely, if $x \in M$ is not zero, then let $M^{\prime} \subset M$ be the cyclic group it generates. There exists a nonzero map $M^{\prime} \rightarrow \mathbf{Q} / \mathbf{Z}$ which necessarily does not annihilate $x$. This extends to $\operatorname{a~map} \varphi: M \rightarrow \mathbf{Q} / \mathbf{Z}$ and then $\operatorname{ev}(x)(\varphi)=\varphi(x) \neq 0$.

The canonical surjection $F(M) \rightarrow M$ of $R$-modules turns into a canonical injection, see above, of $R$-modules

$$
\left(M^{\vee}\right)^{\vee} \longrightarrow\left(F\left(M^{\vee}\right)\right)^{\vee}
$$

Set $J(M)=\left(F\left(M^{\vee}\right)\right)^{\vee}$. The composition of ev with this the displayed map gives $M \rightarrow J(M)$ functorially in $M$.

01DC Lemma 15.46.8. Let $R$ be a ring. For every $R$-module $M$ the $R$-module $J(M)$ is injective.

Proof. Note that $J(M) \cong \prod_{\varphi \in M^{\vee}} R^{\vee}$ as an $R$-module. As the product of injective modules is injective, it suffices to show that $R^{\vee}$ is injective. For this we use that

$$
\operatorname{Hom}_{R}\left(N, R^{\vee}\right)=\operatorname{Hom}_{R}\left(N, \operatorname{Hom}_{\mathbf{Z}}(R, \mathbf{Q} / \mathbf{Z})\right)=N^{\vee}
$$

and the fact that $(-)^{\vee}$ is an exact functor by Lemma 15.46.6.
01DD Lemma 15.46.9. Let $R$ be a ring. The construction above defines a covariant functor $M \mapsto(M \rightarrow J(M))$ from the category of $R$-modules to the category of arrows of $R$-modules such that for every module $M$ the output $M \rightarrow J(M)$ is an injective map of $M$ into an injective $R$-module $J(M)$.

Proof. Follows from the above.
In particular, for any map of $R$-modules $M \rightarrow N$ there is an associated morphism $J(M) \rightarrow J(N)$ making the following diagram commute:

This is the kind of construction we would like to have in general. In Homology, Section 12.23 we introduced terminology to express this. Namely, we say this means that the category of $R$-modules has functorial injective embeddings.

### 15.47. Derived categories of modules

0914 In this section we put some generalities concerning the derived category of modules over a ring.
Let $A$ be a ring. The category of $A$-modules has products and products are exact. The category of $A$-modules has enough injectives by Lemma 15.46.9. Hence every
complex of $A$-modules is quasi-isomorphic to a K-injective complex (Derived Categories, Lemma 13.32.5). It follows that $D(A)$ has countable products (Derived Categories, Lemma 13.32.2) and in fact arbitrary products (Injectives, Lemma 19.13.4). This implies that every inverse system of objects of $D(A)$ has a derived limit (well defined up to isomorphism), see Derived Categories, Section 13.32 ,

0915 Lemma 15.47.1. Let $R \rightarrow S$ be a flat ring map. If $I^{\bullet}$ is a K-injective complex of $S$-modules, then $I^{\bullet}$ is $K$-injective as a complex of $R$-modules.

Proof. This is true because $\operatorname{Hom}_{K(R)}\left(M^{\bullet}, I^{\bullet}\right)=\operatorname{Hom}_{K(S)}\left(M^{\bullet} \otimes_{R} S, I^{\bullet}\right)$ by Algebra, Lemma 10.13 .3 and the fact that tensoring with $S$ is exact.

0916 Lemma 15.47.2. Let $R \rightarrow S$ be an epimorphism of rings. Let $I^{\bullet}$ be a complex of $S$-modules. If $I^{\bullet}$ is $K$-injective as a complex of $R$-modules, then $I^{\bullet}$ is a $K$-injective complex of $S$-modules.

Proof. This is true because $\operatorname{Hom}_{K(R)}\left(N^{\bullet}, I^{\bullet}\right)=\operatorname{Hom}_{K(S)}\left(N^{\bullet}, I^{\bullet}\right)$ for any complex of $S$-modules $N^{\bullet}$, see Algebra, Lemma 10.106 .14

0917 Lemma 15.47.3. Let $A \rightarrow B$ be a ring map. If $I^{\bullet}$ is a $K$-injective complex of $A$-modules, then $\operatorname{Hom}_{A}\left(B, I^{\bullet}\right)$ is a $K$-injective complex of $B$-modules.

Proof. This is true because $\operatorname{Hom}_{K(B)}\left(N^{\bullet}, \operatorname{Hom}_{A}\left(B, I^{\bullet}\right)\right)=\operatorname{Hom}_{K(A)}\left(N^{\bullet}, I^{\bullet}\right)$ by Algebra, Lemma 10.13 .4 .

### 15.48. Computing Tor

064 F Let $R$ be a ring. We denote $D(R)$ the derived category of the abelian category $\operatorname{Mod}_{R}$ of $R$-modules. Note that $\operatorname{Mod}_{R}$ has enough projectives as every free $R$ module is projective. Thus we can define the left derived functors of any additive functor from $\operatorname{Mod}_{R}$ to any abelian category.

This applies in particular to the functor $-\otimes_{R} M: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ whose right derived functors are the Tor functors $\operatorname{Tor}_{i}^{R}(-, M)$, see Algebra, Section 10.74. There is also a total right derived functor

064G (15.48.0.1)

$$
-\otimes_{R}^{\mathbf{L}} M: D^{-}(R) \longrightarrow D^{-}(R)
$$

which is denoted $-\otimes_{R}^{\mathbf{L}} M$. Its satellites are the Tor modules, i.e., we have

$$
H^{-p}\left(N \otimes_{R}^{\mathbf{L}} M\right)=\operatorname{Tor}_{p}^{R}(N, M)
$$

A special situation occurs when we consider the tensor product with an $R$-algebra $A$. In this case we think of $-\otimes_{R} A$ as a functor from $\operatorname{Mod}_{R}$ to $\operatorname{Mod}_{A}$. Hence the total right derived functor

064H

$$
\begin{equation*}
-\otimes_{R}^{\mathbf{L}} A: D^{-}(R) \longrightarrow D^{-}(A) \tag{15.48.0.2}
\end{equation*}
$$

which is denoted $-\otimes_{R}^{\mathbf{L}} A$. Its satellites are the tor groups, i.e., we have

$$
H^{-p}\left(N \otimes_{R}^{\mathbf{L}} A\right)=\operatorname{Tor}_{p}^{R}(N, A)
$$

In particular these Tor groups naturally have the structure of $A$-modules.

### 15.49. Derived tensor product

06XY We can construct the derived tensor product in greater generality. In fact, it turns out that the boundedness assumptions are not necessary, provided we choose Kflat resolutions. In this section we use Homology, Example 12.22 .2 and Homology, Definition 12.22 .3 to turn a pair of complexes of modules into a double complex and its associated total complex.

064I Lemma 15.49.1. Let $R$ be a ring. Let $P^{\bullet}$ be a complex of $R$-modules. Let $\alpha, \beta: L^{\bullet} \rightarrow M^{\bullet}$ be homotopy equivalent maps of complexes. Then $\alpha$ and $\beta$ induce homotopy equivalent maps

$$
\operatorname{Tot}\left(\alpha \otimes i d_{P}\right), \operatorname{Tot}\left(\beta \otimes i d_{P}\right): \operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(M^{\bullet} \otimes_{R} P^{\bullet}\right)
$$

In particular the construction $L^{\bullet} \mapsto \operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)$ defines an endo-functor of the homotopy category of complexes.

Proof. Say $\alpha=\beta+d h+h d$ for some homotopy $h$ defined by $h^{n}: L^{n} \rightarrow M^{n-1}$. Set

$$
H^{n}=\bigoplus_{a+b=n} h^{a} \otimes \operatorname{id}_{P^{b}}: \bigoplus_{a+b=n} L^{a} \otimes_{R} P^{b} \longrightarrow \bigoplus_{a+b=n} M^{a-1} \otimes_{R} P^{b}
$$

Then a straightforward computation shows that

$$
\operatorname{Tot}\left(\alpha \otimes \operatorname{id}_{P}\right)=\operatorname{Tot}\left(\beta \otimes \operatorname{id}_{P}\right)+d H+H d
$$

as maps $\operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right) \rightarrow \operatorname{Tot}\left(M^{\bullet} \otimes_{R} P^{\bullet}\right)$.
064J Lemma 15.49.2. Let $R$ be a ring. Let $P^{\bullet}$ be a complex of $R$-modules. The functor

$$
K\left(\operatorname{Mod}_{R}\right) \longrightarrow K\left(\operatorname{Mod}_{R}\right), \quad L^{\bullet} \longmapsto \operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)
$$

is an exact functor of triangulated categories.
Proof. By our definition of the triangulated structure on $K\left(\operatorname{Mod}_{R}\right)$ we have to check that our functor maps a termwise split short exact sequence of complexes to a termwise split short exact sequence of complexes. As the terms of $\operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)$ are direct sums of the tensor products $L^{a} \otimes_{R} P^{b}$ this is clear.

The following definition will allow us to think intelligently about derived tensor products of unbounded complexes.

06XZ Definition 15.49.3. Let $R$ be a ring. A complex $K^{\bullet}$ is called $K$-flat if for every acyclic complex $M^{\bullet}$ the total complex $\operatorname{Tot}\left(M^{\bullet} \otimes_{R} K^{\bullet}\right)$ is acyclic.

06 Y 0 Lemma 15.49.4. Let $R$ be a ring. Let $K^{\bullet}$ be a $K$-flat complex. Then the functor

$$
K\left(\operatorname{Mod}_{R}\right) \longrightarrow K\left(\operatorname{Mod}_{R}\right), \quad L^{\bullet} \longmapsto \operatorname{Tot}\left(L^{\bullet} \otimes_{R} K^{\bullet}\right)
$$

transforms quasi-isomorphisms into quasi-isomorphisms.
Proof. Follows from Lemma 15.49 .2 and the fact that quasi-isomorphisms in $K\left(\operatorname{Mod}_{R}\right)$ and $K\left(\operatorname{Mod}_{A}\right)$ are characterized by having acyclic cones.

06Y1 Lemma 15.49.5. Let $R \rightarrow R^{\prime}$ be a ring map. If $K^{\bullet}$ is a $K$-flat complex of $R$-modules, then $K^{\bullet} \otimes_{R} R^{\prime}$ is a $K$-flat complex of $R^{\prime}$-modules.

Proof. Follows from the definitions and the fact that $\left(K^{\bullet} \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}} L^{\bullet}=K^{\bullet} \otimes_{R} L^{\bullet}$ for any complex $L^{\bullet}$ of $R^{\prime}$-modules.

0795 Lemma 15.49.6. Let $R$ be a ring. If $K^{\bullet}, L^{\bullet}$ are $K$-flat complexes of $R$-modules, then $\operatorname{Tot}\left(K^{\bullet \bullet} \otimes_{R} L^{\bullet}\right)$ is a $K$-flat complex of $R$-modules.

Proof. Follows from the isomorphism

$$
\operatorname{Tot}\left(M^{\bullet} \otimes_{R} \operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)=\operatorname{Tot}\left(\operatorname{Tot}\left(M^{\bullet} \otimes_{R} K^{\bullet}\right) \otimes_{R} L^{\bullet}\right)
$$

and the definition.
06Y2 Lemma 15.49.7. Let $R$ be a ring. Let $\left(K_{1}^{\bullet}, K_{2}^{\bullet}, K_{3}^{\bullet}\right)$ be a distinguished triangle in $K\left(M o d_{R}\right)$. If two out of three of $K_{i}^{\bullet}$ are $K$-flat, so is the third.
Proof. Follows from Lemma 15.49 .2 and the fact that in a distinguished triangle in $K\left(\operatorname{Mod}_{A}\right)$ if two out of three are acyclic, so is the third.

064K Lemma 15.49.8. Let $R$ be a ring. Let $P^{\bullet}$ be a bounded above complex of flat $R$-modules. Then $P^{\bullet}$ is $K$-flat.

Proof. Let $L^{\bullet}$ be an acyclic complex of $R$-modules. Let $\xi \in H^{n}\left(\operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)\right)$. We have to show that $\xi=0$. Since $\operatorname{Tot}^{n}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)$ is a direct sum with terms $L^{a} \otimes_{R} P^{b}$ we see that $\xi$ comes from an element in $H^{n}\left(\operatorname{Tot}\left(\tau_{\leq m} L^{\bullet} \otimes_{R} P^{\bullet}\right)\right)$ for some $m \in \mathbf{Z}$. Since $\tau_{\leq m} L^{\bullet}$ is also acyclic we may replace $L^{\bullet}$ by $\tau_{\leq m} L^{\bullet}$. Hence we may assume that $L^{\bullet}$ is bounded above. In this case the spectral sequence of Homology, Lemma 12.22 .6 has

$$
{ }^{\prime} E_{1}^{p, q}=H^{p}\left(L^{\bullet} \otimes_{R} P^{q}\right)
$$

which is zero as $P^{q}$ is flat and $L^{\bullet}$ acyclic. Hence $H^{*}\left(\operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right)\right)=0$.
In the following lemma by a colimit of a system of complexes we mean the termwise colimit.
06Y3 Lemma 15.49.9. Let $R$ be a ring. Let $K_{1}^{\bullet} \rightarrow K_{2}^{\bullet} \rightarrow \ldots$ be a system of $K$-flat complexes. Then $\operatorname{colim}_{i} K_{i}^{\bullet}$ is $K$-flat.

Proof. Because we are taking termwise colimits it is clear that

$$
\operatorname{colim}_{i} \operatorname{Tot}\left(M^{\bullet} \otimes_{R} K_{i}^{\bullet}\right)=\operatorname{Tot}\left(M^{\bullet} \otimes_{R} \operatorname{colim}_{i} K_{i}^{\bullet}\right)
$$

Hence the lemma follows from the fact that filtered colimits are exact.
06Y4 Lemma 15.49.10. Let $R$ be a ring. For any complex $M^{\bullet}$ there exists a $K$-flat complex $K^{\bullet}$ and a quasi-isomorphism $K^{\bullet} \rightarrow M^{\bullet}$. Moreover each $K^{n}$ is a flat $R$-module.

Proof. Let $\mathcal{P} \subset \mathrm{Ob}\left(\operatorname{Mod}_{R}\right)$ be the class of flat $R$-modules. By Derived Categories, Lemma 13.28.1 there exists a system $K_{1}^{\bullet} \rightarrow K_{2}^{\bullet} \rightarrow \ldots$ and a diagram

with the properties (1), (2), (3) listed in that lemma. These properties imply each complex $K_{i}^{\bullet}$ is a bounded above complex of flat modules. Hence $K_{i}^{\bullet}$ is K-flat by Lemma 15.49 .8 . The induced map $\operatorname{colim}_{i} K_{i}^{\bullet} \rightarrow M^{\bullet}$ is a quasi-isomorphism by construction. The complex $\operatorname{colim}_{i} K_{i}^{\bullet}$ is K-flat by Lemma 15.49.9. The final assertion of the lemma is true because the colimit of a system of flat modules is flat, see Algebra, Lemma 10.38 .3 .

09PB Remark 15.49.11. In fact, we can do better than Lemma 15.49.10. Namely, we can find a quasi-isomorphism $P^{\bullet} \rightarrow M^{\bullet}$ where $P^{\bullet}$ is a complex of $A$-modules endowed with a filtration

$$
0=F_{-1} P^{\bullet} \subset F_{0} P^{\bullet} \subset F_{1} P^{\bullet} \subset \ldots \subset P^{\bullet}
$$

by subcomplexes such that
(1) $P^{\bullet}=\bigcup F_{p} P^{\bullet}$,
(2) the inclusions $F_{i} P^{\bullet} \rightarrow F_{i+1} P^{\bullet}$ are termwise split injections,
(3) the quotients $F_{i+1} P^{\bullet} / F_{i} P^{\bullet}$ are isomorphic to direct sums of shifts $A[k]$ (as complexes, so differentials are zero).
This was shown in Differential Graded Algebra, Lemma 22.13.4. Moreover, given such a complex we obtain a distinguished triangle

$$
\bigoplus F_{i} P^{\bullet} \rightarrow \bigoplus F_{i} P^{\bullet} \rightarrow M^{\bullet} \rightarrow \bigoplus F_{i} P^{\bullet}[1]
$$

in $D(A)$. Using this we can sometimes reduce statements about general complexes to statements about $A[k]$ (this of course only works if the statement is preserved under taking direct sums). More precisely, let $T$ be a property of objects of $D(A)$. Suppose that
(1) if $K_{i} \in D(A), i \in I$ is a family of objects with $T\left(K_{i}\right)$ for all $i \in I$, then $T\left(\bigoplus K_{i}\right)$,
(2) if $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle and $T$ holds for two, then $T$ holds for the third object,
(3) $T(A[k])$ holds for all $k$.

Then $T$ holds for all objects of $D(A)$.
064L Lemma 15.49.12. Let $R$ be a ring. Let $\alpha: P^{\bullet} \rightarrow Q^{\bullet}$ be a quasi-isomorphism of $K$-flat complexes of $R$-modules. For every complex $L^{\bullet}$ of $R$-modules the induced map

$$
\operatorname{Tot}\left(i d_{L} \otimes \alpha\right): \operatorname{Tot}\left(L^{\bullet} \otimes_{R} P^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(L^{\bullet} \otimes_{R} Q^{\bullet}\right)
$$

is a quasi-isomorphism.
Proof. Choose a quasi-isomorphism $K^{\bullet} \rightarrow L^{\bullet}$ with $K^{\bullet}$ a K-flat complex, see Lemma 15.49.10 Consider the commutative diagram

The result follows as by Lemma 15.49 .4 the vertical arrows and the top horizontal arrow are quasi-isomorphisms.

Let $R$ be a ring. Let $M^{\bullet}$ be an object of $D(R)$. Choose a K-flat resolution $K^{\bullet} \rightarrow$ $M^{\bullet}$, see Lemma 15.49 .10 . By Lemmas 15.49 .1 and 15.49 .2 we obtain an exact functor of triangulated categories

$$
K\left(\operatorname{Mod}_{R}\right) \longrightarrow K\left(\operatorname{Mod}_{R}\right), \quad L^{\bullet} \longmapsto \operatorname{Tot}\left(L^{\bullet} \otimes_{R} K^{\bullet}\right)
$$

By Lemma 15.49 .4 this functor induces a functor $D(R) \rightarrow D(R)$ simply because $D(R)$ is the localization of $K\left(\operatorname{Mod}_{R}\right)$ at quasi-isomorphism. By Lemma 15.49 .12 the resulting functor (up to isomorphism) does not depend on the choice of the K-flat resolution.

064M Definition 15.49.13. Let $R$ be a ring. Let $M^{\bullet}$ be an object of $D(R)$. The derived tensor product

$$
-\otimes_{R}^{\mathbf{L}} M^{\bullet}: D(R) \longrightarrow D(R)
$$

is the exact functor of triangulated categories described above.
This functor extends the functor 15.48 .0 .1 . It is clear from our explicit constructions that there is a canonical isomorphism

$$
M^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet} \cong L^{\bullet} \otimes_{R}^{\mathbf{L}} M^{\bullet}
$$

whenever both $L^{\bullet}$ and $M^{\bullet}$ are in $D(R)$. Hence when we write $M^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

### 15.50. Derived change of rings

06Y5 Let $R \rightarrow A$ be a ring map. Let $N$ be an $A$-module. We can also use K-flat resolutions to define a functor

$$
-\otimes_{R}^{\mathbf{L}} N: D(R) \rightarrow D(A)
$$

which is the left derived functor of the functor $\operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{A}, M \mapsto M \otimes_{R} N$. In particular, taking $N=A$ we obtain a derived base change functor

$$
-\otimes_{R}^{\mathbf{L}} A: D(R) \rightarrow D(A)
$$

extending the functor 15.48 .0 .2 . Namely, for every complex of $R$-modules $M^{\bullet}$ we can choose a K-flat resolution $K^{\bullet} \rightarrow M^{\bullet}$ and set $M^{\bullet} \otimes_{R}^{\mathbf{L}} N=K^{\bullet} \otimes_{R} N$. You can use Lemmas 15.49 .10 and 15.49 .12 to see that this is well defined. However, to cross all the t's and dot all the i's it is perhaps more convenient to use some general theory.

06Y6 Lemma 15.50.1. The construction above is independent of choices and defines an exact functor of triangulated categories $-\otimes_{R}^{\mathbf{L}} N: D(R) \rightarrow D(A)$. There is a functorial isomorphism

$$
E \otimes_{R}^{\mathbf{L}} N=\left(E \otimes_{R}^{\mathbf{L}} A\right) \otimes_{A}^{\mathbf{L}} N
$$

for $E$ in $D(R)$.
Proof. To prove the existence of the derived functor $-\otimes_{R}^{\mathrm{L}} N$ we use the general theory developed in Derived Categories, Section 13.15. Set $\mathcal{D}=K\left(\operatorname{Mod}_{R}\right)$ and $\mathcal{D}^{\prime}=D(A)$. Let us write $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ the exact functor of triangulated categories defined by the rule $F\left(M^{\bullet}\right)=M^{\bullet} \otimes_{R} N$. We let $S$ be the set of quasi-isomorphisms in $\mathcal{D}=K\left(\operatorname{Mod}_{R}\right)$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15 .2 applies. We claim that $L F$ is everywhere defined. This follows from Derived Categories, Lemma 13.15 .15 with $\mathcal{P} \subset \mathrm{Ob}(\mathcal{D})$ the collection of K-flat complexes: (1) follows from Lemma 15.49.10 and (2) follows from Lemma 15.49.12. Thus we obtain a derived functor

$$
L F: D(R)=S^{-1} \mathcal{D} \longrightarrow \mathcal{D}^{\prime}=D(A)
$$

see Derived Categories, Equation 13.15.9.1. Finally, Derived Categories, Lemma 13.15.15 guarantees that $L F\left(K^{\bullet}\right)=F\left(K^{\bullet}\right)=K^{\bullet} \otimes_{R} N$ when $K^{\bullet}$ is K-flat, i.e., $L F$ is indeed computed in the way described above. Moreover, by Lemma 15.49 .5 the complex $K^{\bullet} \otimes_{R} A$ is a K-flat complex of $A$-modules. Hence

$$
\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} A\right) \otimes_{A}^{\mathbf{L}} N=\left(K^{\bullet} \otimes_{R} A\right) \otimes_{A} N=K^{\bullet} \otimes_{A} N=K^{\bullet} \otimes_{A}^{\mathbf{L}} N
$$

which proves the final statement of the lemma.
08YT Remark 15.50.2 (Warning). Let $R \rightarrow A$ be a ring map, and let $N$ and $N^{\prime}$ be $A$-modules. Denote $N_{R}$ and $N_{R}^{\prime}$ the restriction of $N$ and $N^{\prime}$ to $R$-modules, see Algebra, Section 10.13 In this situation, the objects $N_{R} \otimes_{R}^{\mathbf{L}} N^{\prime}$ and $N \otimes_{R}^{\mathbf{L}} N_{R}^{\prime}$ of $D(A)$ are in general not isomorphic! In other words, one has to pay careful attention as to which of the two sides is being used to provide the $A$-module structure.
For a specific example, set $R=k[x, y], A=R /(x y), N=R /(x)$ and $N^{\prime}=A=$ $R /(x y)$. The resolution $0 \rightarrow R \xrightarrow{x y} R \rightarrow N_{R}^{\prime} \rightarrow 0$ shows that $N \otimes_{R}^{\mathbf{L}} N_{R}^{\prime}=N[1] \oplus N$ in $D(A)$. The resolution $0 \rightarrow R \xrightarrow{x} R \rightarrow N_{R} \rightarrow 0$ shows that $N_{R} \otimes_{R}^{\mathbf{L}} N^{\prime}$ is represented by the complex $A \xrightarrow{x} A$. To see these two complexes are not isomorphic, one can show that the second complex is not isomorphic in $D(A)$ to the direct sum of its cohomology groups, or one can show that the first complex is not a perfect object of $D(A)$ whereas the second one is. Some details omitted.

08YU Lemma 15.50.3. Let $A \rightarrow B \rightarrow C$ be ring maps. Let $M$ be an $A$-module, $N a$ $B$-module, and $K$ a $C$-module. Then

$$
\left(M \otimes_{A}^{\mathbf{L}} N\right) \otimes_{B}^{\mathbf{L}} K=\left(M \otimes_{A}^{\mathbf{L}} K\right) \otimes_{C}^{\mathbf{L}}\left(N \otimes_{B}^{\mathbf{L}} C\right)=\left(M \otimes_{A}^{\mathbf{L}} C\right) \otimes_{C}^{\mathbf{L}}\left(N \otimes_{B}^{\mathbf{L}} K\right)
$$

in $D(C)$.
Proof. Let $M^{\bullet} \rightarrow M$ be a free resolution of $M$ as an $A$-module and let $N^{\bullet}$ be a free resolution of $N$ as a $B$-module. We have

$$
\begin{aligned}
M \otimes_{A}^{\mathbf{L}} N & =M^{\bullet} \otimes_{A} N \\
& =M^{\bullet} \otimes_{A} B \otimes_{B} N \\
& \leftarrow \operatorname{Tot}\left(\left(M^{\bullet} \otimes_{A} B\right) \otimes_{B} N^{\bullet}\right) \\
& =\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet}\right)
\end{aligned}
$$

Here the arrow is a quasi-isomorphism in $D(B)$ as $M^{\bullet} \otimes_{A} B$ is a bounded above complex of free $B$-modules, hence K-flat (Lemma 15.49.8) and hence Lemma 15.49 .4 applies. Now the complex $\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet}\right)$ is a complex of free $B$-modules hence we see that

$$
\left(M \otimes_{A}^{\mathbf{L}} N\right) \otimes_{B}^{\mathbf{L}} K=\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet}\right) \otimes_{B} K=\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet} \otimes_{B} K\right)
$$

On the other hand,

$$
M \otimes_{A}^{\mathbf{L}} K=M^{\bullet} \otimes_{A} K \quad \text { and } \quad N \otimes_{B}^{\mathbf{L}} C=N^{\bullet} \otimes_{B} C
$$

and the second is a bounded above complex of free $C$-modules hence we see that
$\left(M \otimes_{A}^{\mathbf{L}} K\right) \otimes_{C}^{\mathbf{L}}\left(N \otimes_{B}^{\mathbf{L}} C\right)=\operatorname{Tot}\left(\left(M^{\bullet} \otimes_{A} K\right) \otimes_{C}\left(N^{\bullet} \otimes_{B} C\right)\right)=\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet} \otimes_{B} K\right)$ which proves the first equality of the statement of the lemma. To prove the second we use that

$$
M \otimes_{A}^{\mathbf{L}} C=M^{\bullet} \otimes_{A} C \quad \text { and } \quad N \otimes_{B}^{\mathbf{L}} K=N^{\bullet} \otimes_{B} K
$$

and the first is a bounded above complex of free $C$-modules so that

$$
\left(M \otimes_{A}^{\mathbf{L}} C\right) \otimes_{C}^{\mathbf{L}}\left(N \otimes_{B}^{\mathbf{L}} K\right)=\operatorname{Tot}\left(\left(M^{\bullet} \otimes_{A} C\right) \otimes_{C}\left(N^{\bullet} \otimes_{B} K\right)\right)=\operatorname{Tot}\left(M^{\bullet} \otimes_{A} N^{\bullet} \otimes_{B} K\right)
$$ as before.

### 15.51. Tor independence

065Y Consider a commutative diagram

of rings. Given an object $K$ of $D(A)$ we can consider its restriction to an object of $D(R)$. We can then consider take the derived change of rings of $K$ to an object of $D\left(A^{\prime}\right)$ and $D\left(R^{\prime}\right)$. We claim there is a functorial comparison map

$$
\begin{equation*}
K \otimes_{R}^{\mathbf{L}} R^{\prime} \longrightarrow K \otimes_{A}^{\mathbf{L}} A^{\prime} \tag{15.51.0.1}
\end{equation*}
$$

in $D\left(R^{\prime}\right)$. To construct this comparison map choose a K-flat complex $K^{\bullet}$ of $A$ modules representing $K$. Next, choose a quasi-isomorphism $E^{\bullet} \rightarrow K^{\bullet}$ where $E^{\bullet}$ is a K-flat complex of $R$-modules. The map above is the map

$$
K \otimes_{R}^{\mathbf{L}} R^{\prime}=E^{\bullet} \otimes_{R} R^{\prime} \longrightarrow K^{\bullet} \otimes_{A} A^{\prime}=K \otimes_{A}^{\mathbf{L}} A^{\prime}
$$

In general there is no chance that this map is an isomorphism.
However, we often encounter the situation where the diagram above is a "base change" diagram of rings, i.e., $A^{\prime}=A \otimes_{R} R^{\prime}$. In this situation, for any $A$-module $M$ we have $M \otimes_{A} A^{\prime}=M \otimes_{R} R^{\prime}$. Thus $-\otimes_{R} R^{\prime}$ is equal to $-\otimes_{A} A^{\prime}$ as a functor $\operatorname{Mod}_{A} \rightarrow \operatorname{Mod}_{A^{\prime}}$. In general this equality does not extend to derived tensor products. In other words, the comparison map is not an isomorphism. A simple example is to take $R=k[x], A=R^{\prime}=A^{\prime}=k[x] /(x)=k$ and $K^{\bullet}=A[0]$. Clearly, a necessary condition is that $\operatorname{Tor}_{p}^{R}\left(A, R^{\prime}\right)=0$ for all $p>0$.

0660 Definition 15.51.1. Let $R$ be a ring. Let $A, B$ be $R$-algebras. We say $A$ and $B$ are Tor independent over $R$ if $\operatorname{Tor}_{p}^{R}(A, B)=0$ for all $p>0$.
0661 Lemma 15.51.2. The comparison map 15.51.0.1) is an isomorphism if $A^{\prime}=$ $A \otimes_{R} R^{\prime}$ and $A$ and $R^{\prime}$ are Tor independent over $R$.

Proof. To prove this we choose a free resolution $F^{\bullet} \rightarrow R^{\prime}$ of $R^{\prime}$ as an $R$-module. Because $A$ and $R^{\prime}$ are Tor independent over $R$ we see that $F^{\bullet} \otimes_{R} A$ is a free $A$ module resolution of $A^{\prime}$ over $A$. By our general construction of the derived tensor product above we see that
$K^{\bullet} \otimes_{A} A^{\prime} \cong \operatorname{Tot}\left(K^{\bullet} \otimes_{A}\left(F^{\bullet} \otimes_{R} A\right)\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{R} F^{\bullet}\right) \cong \operatorname{Tot}\left(E^{\bullet} \otimes_{R} F^{\bullet}\right) \cong E^{\bullet} \otimes_{R} R^{\prime}$ as desired.

08HW Lemma 15.51.3. Consider a commutative diagram of rings

Assume that $R^{\prime}$ is flat over $R$ and $A^{\prime}$ is flat over $A \otimes_{R} R^{\prime}$ and $B^{\prime}$ is flat over $R^{\prime} \otimes_{R} B$. Then

$$
\operatorname{Tor}_{i}^{R}(A, B) \otimes_{\left(A \otimes_{R} B\right)}\left(A^{\prime} \otimes_{R^{\prime}} B^{\prime}\right)=\operatorname{Tor}_{i}^{R^{\prime}}\left(A^{\prime}, B^{\prime}\right)
$$

Proof. By Algebra, Section 10.75 there are canonical maps

$$
\operatorname{Tor}_{i}^{R}(A, B) \longrightarrow \operatorname{Tor}_{i}^{R^{\prime}}\left(A \otimes_{R} R^{\prime}, B \otimes_{R} R^{\prime}\right) \longrightarrow \operatorname{Tor}_{i}^{R^{\prime}}\left(A^{\prime}, B^{\prime}\right)
$$

These induce a map from left to right in the formula of the lemma.
Take a free resolution $F_{\bullet} \rightarrow A$ of $A$ as an $R$-module. Then we see that $F_{\bullet} \otimes_{R} R^{\prime}$ is a resolution of $A \otimes_{R} R^{\prime}$. Hence $\operatorname{Tor}_{i}^{R^{\prime}}\left(A \otimes_{R} R^{\prime}, B \otimes_{R} R^{\prime}\right)$ is computed by $F_{\bullet} \otimes_{R} B \otimes_{R} R^{\prime}$. By our assumption that $R^{\prime}$ is flat over $R$, this computes $\operatorname{Tor}_{i}^{R}(A, B) \otimes_{R} R^{\prime}$. Thus $\operatorname{Tor}_{i}^{R^{\prime}}\left(A \otimes_{R} R^{\prime}, B \otimes_{R} R^{\prime}\right)=\operatorname{Tor}_{i}^{R}(A, B) \otimes_{R} R^{\prime}$ (uses only flatness of $R^{\prime}$ over $R$ ).
By Lazard's theorem (Algebra, Theorem 10.80.4 we can write $A^{\prime}$, resp. $B^{\prime}$ as a filtered colimit of finite free $A \otimes_{R} R^{\prime}$, resp. $B \otimes_{R} R^{\prime}$-modules. Say $A^{\prime}=\operatorname{colim} M_{i}$ and $B^{\prime}=\operatorname{colim} N_{j}$. The result above gives

$$
\operatorname{Tor}_{i}^{R^{\prime}}\left(M_{i}, N_{j}\right)=\operatorname{Tor}_{i}^{R}(A, B) \otimes_{A \otimes_{R} B}\left(M_{i} \otimes_{R^{\prime}} N_{j}\right)
$$

as one can see by writing everything out in terms of bases. Taking the colimit we get the result of the lemma.

08HX Lemma 15.51.4. Let $R$ be a ring. Let $A, B$ be $R$-algebras. The following are equivalent
(1) $A$ and $B$ are Tor independent over $R$,
(2) for every pair of primes $\mathfrak{p} \subset A$ and $\mathfrak{q} \subset B$ lying over the same prime $\mathfrak{r} \subset R$ the rings $A_{\mathfrak{p}}$ and $B_{\mathfrak{q}}$ are Tor independent over $R_{\mathfrak{r}}$, and
(3) For every prime $\mathfrak{s}$ of $A \otimes_{R} B$ the module

$$
\operatorname{Tor}_{i}^{R}(A, B)_{\mathfrak{s}}=\operatorname{Tor}_{i}^{R_{\mathfrak{r}}}\left(A_{\mathfrak{p}}, B_{\mathfrak{q}}\right)_{\mathfrak{s}}
$$

(where $\mathfrak{p}=A \cap \mathfrak{s}, \mathfrak{q}=B \cap \mathfrak{s}$ and $\mathfrak{r}=R \cap \mathfrak{s}$ ) is zero.
Proof. Let $\mathfrak{s}$ be a prime of $A \otimes_{R} B$ as in (3). The equality

$$
\operatorname{Tor}_{i}^{R}(A, B)_{\mathfrak{s}}=\operatorname{Tor}_{i}^{R_{\mathfrak{r}}}\left(A_{\mathfrak{p}}, B_{\mathfrak{q}}\right)_{\mathfrak{s}}
$$

where $\mathfrak{p}=A \cap \mathfrak{s}, \mathfrak{q}=B \cap \mathfrak{s}$ and $\mathfrak{r}=R \cap \mathfrak{s}$ follows from Lemma 15.51.3. Hence (2) implies (3). Since we can test the vanishing of modules by localizing at primes (Algebra, Lemma 10.23.1) we conclude that (3) implies (1). For (1) $\Rightarrow$ (2) we use that

$$
\operatorname{Tor}_{i}^{R_{\mathfrak{r}}}\left(A_{\mathfrak{p}}, B_{\mathfrak{q}}\right)=\operatorname{Tor}_{i}^{R}(A, B) \otimes_{\left(A \otimes_{R} B\right)}\left(A_{\mathfrak{p}} \otimes_{R_{\mathfrak{r}}} B_{\mathfrak{q}}\right)
$$

again by Lemma 15.51 .3 .

### 15.52. Spectral sequences for Tor

061 Y In this section we collect various spectral sequences that come up when considering the Tor functors.
$061 Z$ Example 15.52.1. Let $R$ be a ring. Let $K_{\bullet}$ be a bounded above chain complex of $R$-modules. Let $M$ be an $R$-module. Then there is a spectral sequence with $E_{2}$-page

$$
\operatorname{Tor}_{i}^{R}\left(H_{j}\left(K_{\bullet}\right), M\right) \Rightarrow H_{i+j}\left(K_{\bullet} \otimes_{R}^{\mathbf{L}} M\right)
$$

and another spectral sequence with $E_{1}$-page

$$
\operatorname{Tor}_{i}^{R}\left(K_{j}, M\right) \Rightarrow H_{i+j}\left(K_{\bullet} \otimes_{R}^{\mathbf{L}} M\right)
$$

This follows from the dual to Derived Categories, Lemma 13.21 .3 .

068F Example 15.52.2. Let $R \rightarrow S$ be a ring map. Let $M$ be an $R$-module and let $N$ be an $S$-module. Then there is a spectral sequence

$$
\operatorname{Tor}_{n}^{S}\left(\operatorname{Tor}_{m}^{R}(M, S), N\right) \Rightarrow \operatorname{Tor}_{n+m}^{R}(M, N)
$$

To construct it choose a $R$-free resolution $P_{\bullet}$ of $M$. Then we have

$$
M \otimes_{R}^{\mathbf{L}} N=P^{\bullet} \otimes_{R} N=\left(P^{\bullet} \otimes_{R} S\right) \otimes_{S} N
$$

and then apply the first spectral sequence of Example 15.52.1.
0620
Example 15.52.3. Consider a commutative diagram

and $B$-modules $M, N$. Set $M^{\prime}=M \otimes_{A} A^{\prime}=M \otimes_{B} B^{\prime}$ and $N^{\prime}=N \otimes_{A} A^{\prime}=N \otimes_{B} B^{\prime}$. Assume that $A \rightarrow B$ is flat and that $M$ and $N$ are $A$-flat. Then there is a spectral sequence

$$
\operatorname{Tor}_{i}^{A}\left(\operatorname{Tor}_{j}^{B}(M, N), A^{\prime}\right) \Rightarrow \operatorname{Tor}_{i+j}^{B^{\prime}}\left(M^{\prime}, N^{\prime}\right)
$$

The reason is as follows. Choose free resolution $F_{\bullet} \rightarrow M$ as a $B$-module. As $B$ and $M$ are $A$-flat we see that $F_{\bullet} \otimes_{A} A^{\prime}$ is a free $B^{\prime}$-resolution of $M^{\prime}$. Hence we see that the groups $\operatorname{Tor}_{n}^{B^{\prime}}\left(M^{\prime}, N^{\prime}\right)$ are computed by the complex

$$
\left(F \bullet \otimes_{A} A^{\prime}\right) \otimes_{B^{\prime}} N^{\prime}=\left(F \bullet \otimes_{B} N\right) \otimes_{A} A^{\prime}=\left(F \bullet \otimes_{B} N\right) \otimes_{A}^{\mathbf{L}} A^{\prime}
$$

the last equality because $F_{\bullet} \otimes_{B} N$ is a complex of flat $A$-modules as $N$ is flat over $A$. Hence we obtain the spectral sequence by applying the spectral sequence of Example 15.52.1.

0662 Example 15.52.4. Let $K^{\bullet}, L^{\bullet}$ be objects of $D^{-}(R)$. Then there are spectral sequences

$$
E_{2}^{p, q}=H^{p}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} H^{q}\left(L^{\bullet}\right)\right) \Rightarrow H^{p+q}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}\right)
$$

with $d_{2}^{p, q}: E_{2}^{p, q} \rightarrow E_{2}^{p+2, q-1}$ and

$$
H^{q}\left(H^{p}\left(K^{\bullet}\right) \otimes_{R}^{\mathbf{L}} L^{\bullet}\right) \Rightarrow H^{p+q}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}\right)
$$

After replacing $K^{\bullet}$ and $L^{\bullet}$ by bounded above complexes of projectives, these spectral sequences are simply the two spectral sequences for computing the cohomology of $\operatorname{Tot}\left(K^{\bullet} \otimes L^{\bullet}\right)$ discussed in Homology, Section 12.22 .

### 15.53. Products and Tor

068G The simplest example of the product maps comes from the following situation. Suppose that $K^{\bullet}, L^{\bullet} \in D(R)$. Then there are maps
068H (15.53.0.1)

$$
H^{i}\left(K^{\bullet}\right) \otimes_{R} H^{j}\left(L^{\bullet}\right) \longrightarrow H^{i+j}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}\right)
$$

Namely, to define these maps we may assume that one of $K^{\bullet}, L^{\bullet}$ is a K-flat complex of $R$-modules (for example a bounded above complex of free or projective $R$ modules). In that case $K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}$ is represented by the complex $\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)$, see Section 15.49 (or Section 15.48). Next, suppose that $\xi \in H^{i}\left(K^{\bullet}\right)$ and $\zeta \in H^{j}\left(L^{\bullet}\right)$. Choose $k \in \operatorname{Ker}\left(K^{i} \rightarrow K^{i+1}\right)$ and $l \in \operatorname{Ker}\left(L^{j} \rightarrow L^{j+1}\right)$ representing $\xi$ and $\zeta$. Then we set

$$
\xi \cup \zeta=\text { class of } k \otimes l \text { in } H^{i+j}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)
$$

This make sense because the formula (see Homology, Definition 12.22.3) for the differential d on the total complex shows that $k \otimes l$ is a cocycle. Moreover, if $k^{\prime}=$ $d_{K}\left(k^{\prime \prime}\right)$ for some $k^{\prime \prime} \in K^{i-1}$, then $k^{\prime} \otimes l=\mathrm{d}\left(k^{\prime \prime} \otimes l\right)$ because $l$ is a cocycle. Similarly, altering the choice of $l$ representing $\zeta$ does not change the class of $k \otimes l$. It is equally clear that $\cup$ is bilinear, and hence to a general element of $H^{i}\left(K^{\bullet}\right) \otimes_{R} H^{j}\left(L^{\bullet}\right)$ we assign

$$
\sum \xi_{i} \otimes \zeta_{i} \longmapsto \sum \xi_{i} \cup \zeta_{i}
$$

in $H^{i+j}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)$.
Let $R \rightarrow A$ be a ring map. Let $K^{\bullet}, L^{\bullet} \in D(R)$. Then we have a canonical identification
068 I (15.53.0.2)

$$
\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} A\right) \otimes_{A}^{\mathbf{L}}\left(L^{\bullet} \otimes_{R}^{\mathbf{L}} A\right)=\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}\right) \otimes_{R}^{\mathbf{L}} A
$$

in $D(A)$. It is constructed as follows. First, choose K-flat resolutions $P^{\bullet} \rightarrow K^{\bullet}$ and $Q^{\bullet} \rightarrow L^{\bullet}$ over $R$. Then the left hand side is represented by the complex $\operatorname{Tot}\left(\left(P^{\bullet} \otimes_{R}\right.\right.$ $\left.A) \otimes_{A}\left(Q^{\bullet} \otimes_{R} A\right)\right)$ and the right hand side by the complex $\operatorname{Tot}\left(P^{\bullet} \otimes_{R} Q^{\bullet}\right) \otimes_{R} A$. These complexes are canonically isomorphic. Thus the construction above induces products

$$
\operatorname{Tor}_{n}^{R}\left(K^{\bullet}, A\right) \otimes_{A} \operatorname{Tor}_{m}^{R}\left(L^{\bullet}, A\right) \longrightarrow \operatorname{Tor}_{n+m}^{R}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} L^{\bullet}, A\right)
$$

which are occasionally useful.
Let $M, N$ be $R$-modules. Using the general construction above, the canonical map $M \otimes_{R}^{\mathrm{L}} N \rightarrow M \otimes_{R} N$ and functoriality of Tor we obtain canonical maps
068J

$$
\begin{equation*}
\operatorname{Tor}_{n}^{R}(M, A) \otimes_{A} \operatorname{Tor}_{m}^{R}(N, A) \longrightarrow \operatorname{Tor}_{n+m}^{R}\left(M \otimes_{R} N, A\right) \tag{15.53.0.3}
\end{equation*}
$$

Here is a direct construction using projective resolutions. First, choose projective resolutions

$$
P_{\bullet} \rightarrow M, \quad Q_{\bullet} \rightarrow N, \quad T_{\bullet} \rightarrow M \otimes_{R} N
$$

over $R$. We have $H_{0}\left(\operatorname{Tot}\left(P_{\bullet} \otimes_{R} Q_{\bullet}\right)\right)=M \otimes_{R} N$ by right exactness of $\otimes_{R}$. Hence Derived Categories, Lemmas 13.19 .6 and 13.19 .7 guarantee the existence and uniqueness of a map of complexes $\mu: \operatorname{Tot}\left(P \bullet \otimes_{R} Q_{\bullet}\right) \rightarrow T_{\bullet}$ such that $H_{0}(\mu)=\operatorname{id}_{M \otimes_{R} N}$. This induces a canonical map

$$
\begin{aligned}
\left(M \otimes_{R}^{\mathbf{L}} A\right) \otimes_{A}^{\mathbf{L}}\left(N \otimes_{R}^{\mathbf{L}} A\right) & =\operatorname{Tot}\left(\left(P_{\bullet} \otimes_{R} A\right) \otimes_{A}\left(Q \bullet \otimes_{R} A\right)\right) \\
& =\operatorname{Tot}\left(P \bullet \otimes_{R} Q \bullet\right) \otimes_{R} A \\
& \rightarrow T \bullet \otimes_{R} A \\
& =\left(M \otimes_{R} N\right) \otimes_{R}^{\mathbf{L}} A
\end{aligned}
$$

in $D(A)$. Hence the products 15.53 .0 .3 above are constructed using (15.53.0.1) over $A$ to construct

$$
\operatorname{Tor}_{n}^{R}(M, A) \otimes_{A} \operatorname{Tor}_{m}^{R}(N, A) \rightarrow H^{-n-m}\left(\left(M \otimes_{R}^{\mathbf{L}} A\right) \otimes_{A}^{\mathbf{L}}\left(N \otimes_{R}^{\mathbf{L}} A\right)\right)
$$

and then composing by the displayed map above to end up in $\operatorname{Tor}_{n+m}^{R}\left(M \otimes_{R} N, A\right)$.
An interesting special case of the above occurs when $M=N=B$ where $B$ is an $R$-algebra. In this case we obtain maps

$$
\operatorname{Tor}_{n}^{R}(B, A) \otimes_{A} \operatorname{Tor}_{m}^{R}(B, A) \longrightarrow \operatorname{Tor}_{n}^{R}\left(B \otimes_{R} B, A\right) \longrightarrow \operatorname{Tor}_{n}^{R}(B, A)
$$

the second arrow being induced by the multiplication map $B \otimes_{R} B \rightarrow B$ via functoriality for Tor. In other words we obtain an $A$-algebra structure on $\operatorname{Tor}_{\star}^{R}(B, A)$.

This algebra structure has many intriguing properties (associativity, graded commutative, $B$-algebra structure, divided powers in some case, etc) which we will discuss elsewhere (insert future reference here).
068K Lemma 15.53.1. Let $R$ be a ring. Let $A, B, C$ be $R$-algebras and let $B \rightarrow C$ be an $R$-algebra map. Then the induced map

$$
\operatorname{Tor}_{\star}^{R}(B, A) \longrightarrow \operatorname{Tor}_{\star}^{R}(C, A)
$$

is an A-algebra homomorphism.
Proof. Omitted. Hint: You can prove this by working through the definitions, writing all the complexes explicitly.

### 15.54. Pseudo-coherent modules

064 N Suppose that $R$ is a ring. Recall that an $R$-module $M$ is of finite type if there exists a surjection $R^{\oplus a} \rightarrow M$ and of finite presentation if there exists a presentation $R^{\oplus a_{1}} \rightarrow R^{\oplus a_{0}} \rightarrow M \rightarrow 0$. Similarly, we can consider those $R$-modules for which there exists a length $n$ resolution
064P

$$
\begin{equation*}
R^{\oplus a_{n}} \rightarrow R^{\oplus a_{n-1}} \rightarrow \ldots \rightarrow R^{\oplus a_{0}} \rightarrow M \rightarrow 0 \tag{15.54.0.1}
\end{equation*}
$$

by finite free $R$-modules. A module is called pseudo-coherent of we can find such a resolution for every $n$. Here is the formal definition.
064Q Definition 15.54.1. Let $R$ be a ring. Denote $D(R)$ its derived category. Let $m \in \mathbf{Z}$.
(1) An object $K^{\bullet}$ of $D(R)$ is m-pseudo-coherent if there exists a bounded complex $E^{\bullet}$ of finite free $R$-modules and a morphism $\alpha: E^{\bullet} \rightarrow K^{\bullet}$ such that $H^{i}(\alpha)$ is an isomorphism for $i>m$ and $H^{m}(\alpha)$ is surjective.
(2) An object $K^{\bullet}$ of $D(R)$ is pseudo-coherent if it is quasi-isomorphic to a bounded above complex of finite free $R$-modules.
(3) An $R$-module $M$ is called $m$-pseudo-coherent if if $M[0]$ is an $m$-pseudocoherent object of $D(R)$.
(4) An $R$-module $M$ is called pseudo-coheren ${ }^{6}{ }^{6}$ if $M[0]$ is a pseudo-coherent object of $D(R)$.

As usual we apply this terminology also to complexes of $R$-modules. Since any morphism $E^{\bullet} \rightarrow K^{\bullet}$ in $D(R)$ is represented by an actual map of complexes, see Derived Categories, Lemma 13.19.8, there is no ambiguity. It turns out that $K^{\bullet}$ is pseudo-coherent if and only if $K^{\bullet}$ is $m$-pseudo-coherent for all $m \in \mathbf{Z}$, see Lemma 15.54.5. Also, if the ring is Noetherian the condition can be understood as a finite generation condition on the cohomology, see Lemma 15.54.16. Let us first relate this to the informal discussion above.

064R Lemma 15.54.2. Let $R$ be a ring and $m \in \mathbf{Z}$. Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle in $D(R)$.
(1) If $K^{\bullet}$ is $(m+1)$-pseudo-coherent and $L^{\bullet}$ is m-pseudo-coherent then $M^{\bullet}$ is $m$-pseudo-coherent.
(2) If $K^{\bullet}, M^{\bullet}$ are m-pseudo-coherent, then $L^{\bullet}$ is m-pseudo-coherent.
(3) If $L^{\bullet}$ is $(m+1)$-pseudo-coherent and $M^{\bullet}$ is $m$-pseudo-coherent, then $K^{\bullet}$ is $(m+1)$-pseudo-coherent.

[^41]Proof. Proof of (1). Choose $\alpha: P^{\bullet} \rightarrow K^{\bullet}$ with $P^{\bullet}$ a bounded complex of finite free modules such that $H^{i}(\alpha)$ is an isomorphism for $i>m+1$ and surjective for $i=m+1$. We may replace $P^{\bullet}$ by $\sigma_{\geq m+1} P^{\bullet}$ and hence we may assume that $P^{i}=0$ for $i<m+1$. Choose $\beta: E^{\bullet} \rightarrow L^{\bullet}$ with $E^{\bullet}$ a bounded complex of finite free modules such that $H^{i}(\beta)$ is an isomorphism for $i>m$ and surjective for $i=m$. By Derived Categories, Lemma 13.19.11 we can find a map $\alpha: P^{\bullet} \rightarrow E^{\bullet}$ such that the diagram

is commutative in $D(R)$. The cone $C(\alpha)^{\bullet}$ is a bounded complex of finite free $R$-modules, and the commutativity of the diagram implies that there exists a morphism of distinguished triangles

$$
\left(P^{\bullet}, E^{\bullet}, C(\alpha)^{\bullet}\right) \longrightarrow\left(K^{\bullet}, L^{\bullet}, M^{\bullet}\right)
$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5 .19 and 12.5 .20 that $C(\alpha)^{\bullet} \rightarrow M^{\bullet}$ induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. Hence $M^{\bullet}$ is $m$-pseudocoherent.
Assertions (2) and (3) follow from (1) by rotating the distinguished triangle.
064S Lemma 15.54.3. Let $R$ be a ring. Let $K^{\bullet}$ be a complex of $R$-modules. Let $m \in \mathbf{Z}$.
(1) If $K^{\bullet}$ is m-pseudo-coherent and $H^{i}\left(K^{\bullet}\right)=0$ for $i>m$, then $H^{m}\left(K^{\bullet}\right)$ is a finite type $R$-module.
(2) If $K^{\bullet}$ is $m$-pseudo-coherent and $H^{i}\left(K^{\bullet}\right)=0$ for $i>m+1$, then $H^{m+1}\left(K^{\bullet}\right)$ is a finitely presented $R$-module.

Proof. Proof of (1). Choose a bounded complex $E^{\bullet}$ of finite projective $R$-modules and a map $\alpha: E^{\bullet} \rightarrow K^{\bullet}$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. It is clear that it suffices to prove the result for $E^{\bullet}$. Let $n$ be the largest integer such that $E^{n} \neq 0$. If $n=m$, then the result is clear. If $n>m$, then $E^{n-1} \rightarrow E^{n}$ is surjective as $H^{n}\left(E^{\bullet}\right)=0$. As $E^{n}$ is finite projective we see that $E^{n-1}=E^{\prime} \oplus E^{n}$. Hence it suffices to prove the result for the complex $\left(E^{\prime}\right)^{\bullet}$ which is the same as $E^{\bullet}$ except has $E^{\prime}$ in degree $n-1$ and 0 in degree $n$. We win by induction on $n$.

Proof of (2). Choose a bounded complex $E^{\bullet}$ of finite projective $R$-modules and a $\operatorname{map} \alpha: E^{\bullet} \rightarrow K^{\bullet}$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. As in the proof of (1) we can reduce to the case that $E^{i}=0$ for $i>m+1$. Then we see that $H^{m+1}\left(K^{\bullet}\right) \cong H^{m+1}\left(E^{\bullet}\right)=\operatorname{Coker}\left(E^{m} \rightarrow\right.$ $E^{m+1}$ ) which is of finite presentation.

064 Lemma 15.54.4. Let $R$ be a ring. Let $M$ be an $R$-module. Then
(1) $M$ is 0-pseudo-coherent if and only if $M$ is a finite type $R$-module,
(2) $M$ is (-1)-pseudo-coherent if and only if $M$ is a finitely presented $R$ module,
(3) $M$ is $(-d)$-pseudo-coherent if and only if there exists a resolution

$$
R^{\oplus a_{d}} \rightarrow R^{\oplus a_{d-1}} \rightarrow \ldots \rightarrow R^{\oplus a_{0}} \rightarrow M \rightarrow 0
$$

of length d, and
(4) $M$ is pseudo-coherent if and only if there exists an infinite resolution

$$
\cdots \rightarrow R^{\oplus a_{1}} \rightarrow R^{\oplus a_{0}} \rightarrow M \rightarrow 0
$$

by finite free $R$-modules.
Proof. If $M$ is of finite type (resp. of finite presentation), then $M$ is 0 -pseudocoherent (resp. ( -1 )-pseudo-coherent) as follows from the discussion preceding Definition 15.54.1 Conversely, if $M$ is 0 -pseudo-coherent, then $M=H^{0}(M[0])$ is of finite type by Lemma 15.54 .3 . If $M$ is $(-1)$-pseudo-coherent, then it is 0 -pseudo-coherent hence of finite type. Choose a surjection $R^{\oplus a} \rightarrow M$ and denote $K=\operatorname{Ker}\left(R^{\oplus a} \rightarrow M\right)$. By Lemma 15.54 .2 we see that $K$ is 0 -pseudo-coherent, hence of finite type, whence $M$ is of finite presentation.
To prove the third and fourth statement use induction and an argument similar to the above (details omitted).
064 Lemma 15.54.5. Let $R$ be a ring. Let $K^{\bullet}$ be a complex of $R$-modules. The following are equivalent
(1) $K^{\bullet}$ is pseudo-coherent,
(2) $K^{\bullet}$ is $m$-pseudo-coherent for every $m \in \mathbf{Z}$, and
(3) $K^{\bullet}$ is quasi-isomorphic to a bounded above complex of finite projective $R$-modules.
If (1), (2), and (3) hold and $H^{i}\left(K^{\bullet}\right)=0$ for $i>b$, then we can find a quasiisomorphism $F^{\bullet} \rightarrow K^{\bullet}$ with $F^{i}$ finite free $R$-modules and $F^{i}=0$ for $i>b$.
Proof. We see that $(1) \Rightarrow(3)$ as a finite free module is a finite projective $R$-module. Conversely, suppose $P^{\bullet}$ is a bounded above complex of finite projective $R$-modules. Say $P^{i}=0$ for $i>n_{0}$. We choose a direct sum decompositions $F^{n_{0}}=P^{n_{0}} \oplus C^{n_{0}}$ with $F^{n_{0}}$ a finite free $R$-module, and inductively

$$
F^{n-1}=P^{n-1} \oplus C^{n} \oplus C^{n-1}
$$

for $n \leq n_{0}$ with $F^{n_{0}}$ a finite free $R$-module. As a complex $F^{\bullet}$ has maps $F^{n-1} \rightarrow F^{n}$ which agree with $P^{n-1} \rightarrow P^{n}$, induce the identity $C^{n} \rightarrow C^{n}$, and are zero on $C^{n-1}$. The map $F^{\bullet} \rightarrow P^{\bullet}$ is a quasi-isomorphism (even a homotopy equivalence) and hence (3) implies (1).

Assume (1). Let $E^{\bullet}$ be a bounded above complex of finite free $R$-modules and let $E^{\bullet} \rightarrow K^{\bullet}$ be a quasi-isomorphism. Then the induced maps $\sigma_{\geq m} E^{\bullet} \rightarrow K^{\bullet}$ from the stupid truncation of $E^{\bullet}$ to $K^{\bullet}$ show that $K^{\bullet}$ is $m$-pseudo-coherent. Hence (1) implies (2).
Assume (2). Since $K^{\bullet}$ is 0 -pseudo-coherent we see in particular that $K^{\bullet}$ is bounded above. Let $b$ be an integer such that $H^{i}\left(K^{\bullet}\right)=0$ for $i>b$. By descending induction on $n \in \mathbf{Z}$ we are going to construct finite free $R$-modules $F^{i}$ for $i \geq n$, differentials $d^{i}: F^{i} \rightarrow F^{i+1}$ for $i \geq n$, maps $\alpha: F^{i} \rightarrow K^{i}$ compatible with differentials, such that (1) $H^{i}(\alpha)$ is an isomorphism for $i>n$ and surjective for $i=n$, and (2) $F^{i}=0$ for $i>b$. Picture

The base case is $n=b+1$ where we can take $F^{i}=0$ for all $i$. Induction step. Let $C^{\bullet}$ be the cone on $\alpha$ (Derived Categories, Definition 13.9.1). The long exact sequence of cohomology shows that $H^{i}\left(C^{\bullet}\right)=0$ for $i \geq n$. By Lemma 15.54 .2 we see that $C^{\bullet}$ is $(n-1)$-pseudo-coherent. By Lemma 15.54 .3 we see that $H^{n-1}\left(C^{\bullet}\right)$ is a finite $R$-module. Choose a finite free $R$-module $F^{n-1}$ and a map $\beta: F^{n-1} \rightarrow C^{n-1}$ such that the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^{n}$ is zero and such that $F^{n-1}$ surjects onto $H^{n-1}\left(C^{\bullet}\right)$. Since $C^{n-1}=K^{n-1} \oplus F^{n}$ we can write $\beta=\left(\alpha^{n-1},-d^{n-1}\right)$. The vanishing of the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^{n}$ implies these maps fit into a morphism of complexes

Moreover, these maps define a morphism of distinguished triangles

Hence our choice of $\beta$ implies that the map of complexes $\left(F^{n-1} \rightarrow \ldots\right) \rightarrow K^{\bullet}$ induces an isomorphism on cohomology in degrees $\geq n$ and a surjection in degree $n-1$. This finishes the proof of the lemma.

064 V Lemma 15.54.6. Let $R$ be a ring. Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle in $D(R)$. If two out of three of $K^{\bullet}, L^{\bullet}, M^{\bullet}$ are pseudo-coherent then the third is also pseudo-coherent.

Proof. Combine Lemmas 15.54 .2 and 15.54 .5 .
064W
Lemma 15.54.7. Let $R$ be a ring. Let $K^{\bullet}$ be a complex of $R$-modules. Let $m \in \mathbf{Z}$.
(1) If $H^{i}\left(K^{\bullet}\right)=0$ for all $i \geq m$, then $K^{\bullet}$ is m-pseudo-coherent.
(2) If $H^{i}\left(K^{\bullet}\right)=0$ for $i>m$ and $H^{m}\left(K^{\bullet}\right)$ is a finite $R$-module, then $K^{\bullet}$ is m-pseudo-coherent.
(3) If $H^{i}\left(K^{\bullet}\right)=0$ for $i>m+1$, the module $H^{m+1}\left(K^{\bullet}\right)$ is of finite presentation, and $H^{m}\left(K^{\bullet}\right)$ is of finite type, then $K^{\bullet}$ is m-pseudo-coherent.

Proof. It suffices to prove (3). Set $M=H^{m+1}\left(K^{\bullet}\right)$. Note that $\tau_{\geq m+1} K^{\bullet}$ is quasi-isomorphic to $M[-m-1]$. By Lemma 15.54 .4 we see that $M[-m-1]$ is $m$-pseudo-coherent. Since we have the distinguished triangle

$$
\left(\tau_{\leq m} K^{\bullet}, K^{\bullet}, \tau_{\geq m+1} K^{\bullet}\right)
$$

(Derived Categories, Remark 13.12 .4 by Lemma 15.54 .2 it suffices to prove that $\tau_{\leq m} K^{\bullet}$ is pseudo-coherent. By assumption $H^{m}\left(\tau_{\leq m} K^{\bullet}\right)$ is a finite type $R$-module. Hence we can find a finite free $R$-module $E$ and a map $E \rightarrow \operatorname{Ker}\left(d_{K}^{m}\right)$ such that the composition $E \rightarrow \operatorname{Ker}\left(d_{K}^{m}\right) \rightarrow H^{m}\left(\tau_{\leq m} K^{\bullet}\right)$ is surjective. Then $E[-m] \rightarrow \tau_{\leq m} K^{\bullet}$ witnesses the fact that $\tau_{\leq m} K^{\bullet}$ is $m$-pseudo-coherent.

064X Lemma 15.54.8. Let $R$ be a ring. Let $m \in \mathbf{Z}$. If $K^{\bullet} \oplus L^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) so are $K^{\bullet}$ and $L^{\bullet}$.

Proof. In this proof we drop the superscript •. Assume that $K \oplus L$ is $m$-pseudocoherent. It is clear that $K, L \in D^{-}(R)$. Note that there is a distinguished triangle

$$
(K \oplus L, K \oplus L, L \oplus L[1])=(K, K, 0) \oplus(L, L, L \oplus L[1])
$$

see Derived Categories, Lemma 13.4 .9 By Lemma 15.54 .2 we see that $L \oplus L[1]$ is $m$-pseudo-coherent. Hence also $L[1] \oplus L[2]$ is $m$-pseudo-coherent. By induction $L[n] \oplus L[n+1]$ is $m$-pseudo-coherent. By Lemma 15.54 .7 we see that $L[n]$ is $m$ -pseudo-coherent for large $n$. Hence working backwards, using the distinguished triangles

$$
(L[n], L[n] \oplus L[n-1], L[n-1])
$$

we conclude that $L[n], L[n-1], \ldots, L$ are $m$-pseudo-coherent as desired. The pseudo-coherent case follows from this and Lemma 15.54.5.

064Y Lemma 15.54.9. Let $R$ be a ring. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a bounded above complex of $R$-modules such that $K^{i}$ is $(m-i)$-pseudo-coherent for all $i$. Then $K^{\bullet}$ is $m$ -pseudo-coherent. In particular, if $K^{\bullet}$ is a bounded above complex of pseudo-coherent $R$-modules, then $K^{\bullet}$ is pseudo-coherent.

Proof. We may replace $K^{\bullet}$ by $\sigma_{\geq m-1} K^{\bullet}$ (for example) and hence assume that $K^{\bullet}$ is bounded. Then the complex $K^{\bullet}$ is $m$-pseudo-coherent as each $K^{i}[-i]$ is $m$ -pseudo-coherent by induction on the length of the complex: use Lemma 15.54 .2 and the stupid truncations. For the final statement, it suffices to prove that $K^{\bullet}$ is $m$-pseudo-coherent for all $m \in \mathbf{Z}$, see Lemma 15.54.5. This follows from the first part.

066B Lemma 15.54.10. Let $R$ be a ring. Let $m \in \mathbf{Z}$. Let $K^{\bullet} \in D^{-}(R)$ such that $H^{\imath}\left(K^{\bullet}\right)$ is $(m-i)$-pseudo-coherent (resp. pseudo-coherent) for all $i$. Then $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent).
Proof. Assume $K^{\bullet}$ is an object of $D^{-}(R)$ such that each $H^{i}\left(K^{\bullet}\right)$ is $(m-i)$-pseudocoherent. Let $n$ be the largest integer such that $H^{n}\left(K^{\bullet}\right)$ is nonzero. We will prove the lemma by induction on $n$. If $n<m$, then $K^{\bullet}$ is $m$-pseudo-coherent by Lemma 15.54.7. If $n \geq m$, then we have the distinguished triangle

$$
\left(\tau_{\leq n-1} K^{\bullet}, K^{\bullet}, H^{n}\left(K^{\bullet}\right)[-n]\right)
$$

(Derived Categories, Remark 13.12.4) Since $H^{n}\left(K^{\bullet}\right)[-n]$ is $m$-pseudo-coherent by assumption, we can use Lemma 15.54 .2 to see that it suffices to prove that $\tau_{\leq n-1} K^{\bullet}$ is $m$-pseudo-coherent. By induction on $n$ we win. (The pseudo-coherent case follows from this and Lemma 15.54.5.)

064 Z Lemma 15.54.11. Let $A \rightarrow B$ be a ring map. Assume that $B$ is pseudo-coherent as an $A$-module. Let $K^{\bullet}$ be a complex of $B$-modules. The following are equivalent
(1) $K^{\bullet}$ is m-pseudo-coherent as a complex of $B$-modules, and
(2) $K^{\bullet}$ is m-pseudo-coherent as a complex of $A$-modules.

The same equivalence holds for pseudo-coherence.
Proof. Assume (1). Choose a bounded complex of finite free $B$-modules $E^{\bullet}$ and a map $\alpha: E^{\bullet} \rightarrow K^{\bullet}$ which is an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. Consider the distinguished triangle $\left(E^{\bullet}, K^{\bullet}, C(\alpha)^{\bullet}\right)$. By Lemma $15.54 .7 C(\alpha)^{\bullet}$ is $m$-pseudo-coherent as a complex of $A$-modules. Hence it suffices to prove that $E^{\bullet}$ is pseudo-coherent as a complex of $A$-modules, which
follows from Lemma 15.54 .9 . The pseudo-coherent case of $(1) \Rightarrow(2)$ follows from this and Lemma 15.54.5
Assume (2). Let $n$ be the largest integer such that $H^{n}\left(K^{\bullet}\right) \neq 0$. We will prove that $K^{\bullet}$ is $m$-pseudo-coherent as a complex of $B$-modules by induction on $n-m$. The case $n<m$ follows from Lemma 15.54.7. Choose a bounded complex of finite free $A$-modules $E^{\bullet}$ and a map $\alpha: E^{\bullet} \rightarrow K^{\bullet}$ which is an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. Consider the induced map of complexes

$$
\alpha \otimes 1: E^{\bullet} \otimes_{A} B \rightarrow K^{\bullet}
$$

Note that $C(\alpha \otimes 1)^{\bullet}$ is acyclic in degrees $\geq n$ as $H^{n}(E) \rightarrow H^{n}\left(E^{\bullet} \otimes_{A} B\right) \rightarrow H^{n}\left(K^{\bullet}\right)$ is surjective by construction and since $H^{i}\left(E^{\bullet} \otimes_{A} B\right)=0$ for $i>n$ by the spectral sequence of Example 15.52.4. On the other hand, $C(\alpha \otimes 1)^{\bullet}$ is $m$-pseudo-coherent as a complex of $A$-modules because both $K^{\bullet}$ and $E^{\bullet} \otimes_{A} B$ (see Lemma 15.54.9) are so, see Lemma 15.54.2. Hence by induction we see that $C(\alpha \otimes 1)^{\bullet}$ is $m$-pseudo-coherent as a complex of $B$-modules. Finally another application of Lemma 15.54 .2 shows that $K^{\bullet}$ is $m$-pseudo-coherent as a complex of $B$-modules (as clearly $E^{\bullet} \otimes_{A} B$ is pseudo-coherent as a complex of $B$-modules). The pseudo-coherent case of $(2) \Rightarrow$ (1) follows from this and Lemma 15.54 .5 .

0650 Lemma 15.54.12. Let $A \rightarrow B$ be a ring map. Let $K^{\bullet}$ be an m-pseudo-coherent (resp. pseudo-coherent) complex of $A$-modules. Then $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ is an m-pseudocoherent (resp. pseudo-coherent) complex of $B$-modules.

Proof. First we note that the statement of the lemma makes sense as $K^{\bullet}$ is bounded above and hence $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ is defined by Equation 15.48.0.2). Having said this, choose a bounded complex $E^{\bullet}$ of finite free $A$-modules and $\alpha: E^{\bullet} \rightarrow K^{\bullet}$ with $H^{i}(\alpha)$ an isomorphism for $i>m$ and surjective for $i=m$. Then the cone $C(\alpha)^{\bullet}$ is acyclic in degrees $\geq m$. Since $-\otimes_{A}^{\mathbf{L}} B$ is an exact functor we get a distinguished triangle

$$
\left(E^{\bullet} \otimes_{A}^{\mathbf{L}} B, K^{\bullet} \otimes_{A}^{\mathbf{L}} B, C(\alpha)^{\bullet} \otimes_{A}^{\mathbf{L}} B\right)
$$

of complexes of $B$-modules. By the dual to Derived Categories, Lemma 13.17.1 we see that $H^{i}\left(C(\alpha)^{\bullet} \otimes_{A}^{\mathbf{L}} B\right)=0$ for $i \geq m$. Since $E^{\bullet}$ is a complex of projective $R$-modules we see that $E^{\bullet} \otimes_{A}^{\mathbf{L}} B=E^{\bullet} \otimes_{A} B$ and hence

$$
E^{\bullet} \otimes_{A} B \longrightarrow K^{\bullet} \otimes_{A}^{\mathbf{L}} B
$$

is a morphism of complexes of $B$-modules that witnesses the fact that $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ is $m$-pseudo-coherent. The case of pseudo-coherent complexes follows from the case of $m$-pseudo-coherent complexes via Lemma 15.54.5.

066C Lemma 15.54.13. Let $A \rightarrow B$ be a flat ring map. Let $M$ be an m-pseudo-coherent (resp. pseudo-coherent) A-module. Then $M \otimes_{A} B$ is an m-pseudo-coherent (resp. pseudo-coherent) $B$-module.
Proof. Immediate consequence of Lemma 15.54 .12 and the fact that $M \otimes_{A}^{\mathbf{L}} B=$ $M \otimes_{A} B$ because $B$ is flat over $A$.

The following lemma also follows from the stronger Lemma 15.54.14.
066D Lemma 15.54.14. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$ be elements which generate the unit ideal. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $R$-modules. If for each $i$ the
complex $K^{\bullet} \otimes_{R} R_{f_{i}}$ is m-pseudo-coherent (resp. pseudo-coherent), then $K^{\bullet}$ is $m$ -pseudo-coherent (resp. pseudo-coherent).

Proof. We will use without further mention that $-\otimes_{R} R_{f_{i}}$ is an exact functor and that therefore

$$
H^{i}\left(K^{\bullet}\right)_{f_{i}}=H^{i}\left(K^{\bullet}\right) \otimes_{R} R_{f_{i}}=H^{i}\left(K^{\bullet} \otimes_{R} R_{f_{i}}\right)
$$

Assume $K^{\bullet} \otimes_{R} R_{f_{i}}$ is $m$-pseudo-coherent for $i=1, \ldots, r$. Let $n \in \mathbf{Z}$ be the largest integer such that $H^{n}\left(K^{\bullet} \otimes_{R} R_{f_{i}}\right)$ is nonzero for some $i$. This implies in particular that $H^{i}\left(K^{\bullet}\right)=0$ for $i>n$ (and that $H^{n}\left(K^{\bullet}\right) \neq 0$ ) see Algebra, Lemma 10.23.2. We will prove the lemma by induction on $n-m$. If $n<m$, then the lemma is true by Lemma 15.54.7. If $n \geq m$, then $H^{n}\left(K^{\bullet}\right)_{f_{i}}$ is a finite $R_{f_{i}}$-module for each $i$, see Lemma 15.54 .3 Hence $H^{n}\left(K^{\bullet}\right)$ is a finite $R$-module, see Algebra, Lemma 10.23.2. Choose a finite free $R$-module $E$ and a surjection $E \rightarrow H^{n}\left(K^{\bullet}\right)$. As $E$ is projective we can lift this to a map of complexes $\alpha: E[-n] \rightarrow K^{\bullet}$. Then the cone $C(\alpha)^{\bullet}$ has vanishing cohomology in degrees $\geq n$. On the other hand, the complexes $C(\alpha)^{\bullet} \otimes_{R} R_{f_{i}}$ are $m$-pseudo-coherent for each $i$, see Lemma 15.54 .2 , Hence by induction we see that $C(\alpha)^{\bullet}$ is $m$-pseudo-coherent as a complex of $R$ modules. Applying Lemma 15.54 .2 once more we conclude.

068R Lemma 15.54.15. Let $R$ be a ring. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $R$ modules. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. If the complex $K^{\bullet} \otimes_{R} R^{\prime}$ is m-pseudo-coherent (resp. pseudo-coherent), then $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent).
Proof. We will use without further mention that $-\otimes_{R} R^{\prime}$ is an exact functor and that therefore

$$
H^{i}\left(K^{\bullet}\right) \otimes_{R} R^{\prime}=H^{i}\left(K^{\bullet} \otimes_{R} R^{\prime}\right)
$$

Assume $K^{\bullet} \otimes_{R} R^{\prime}$ is $m$-pseudo-coherent. Let $n \in \mathbf{Z}$ be the largest integer such that $H^{n}\left(K^{\bullet}\right)$ is nonzero; then $n$ is also the largest integer such that $H^{n}\left(K^{\bullet} \otimes_{R} R^{\prime}\right)$ is nonzero. We will prove the lemma by induction on $n-m$. If $n<m$, then the lemma is true by Lemma 15.54 .7 . If $n \geq m$, then $H^{n}\left(K^{\bullet}\right) \otimes_{R} R^{\prime}$ is a finite $R^{\prime}$-module, see Lemma 15.54.3. Hence $H^{n}\left(K^{\bullet}\right)$ is a finite $R$-module, see Algebra, Lemma 10.82 .2 , Choose a finite free $R$-module $E$ and a surjection $E \rightarrow H^{n}\left(K^{\bullet}\right)$. As $E$ is projective we can lift this to a map of complexes $\alpha: E[-n] \rightarrow K^{\bullet}$. Then the cone $C(\alpha)^{\bullet}$ has vanishing cohomology in degrees $\geq n$. On the other hand, the complex $C(\alpha)^{\bullet} \otimes_{R} R^{\prime}$ is $m$-pseudo-coherent, see Lemma 15.54 .2 . Hence by induction we see that $C(\alpha)^{\bullet}$ is $m$-pseudo-coherent as a complex of $R$-modules. Applying Lemma 15.54 .2 once more we conclude.

066E Lemma 15.54.16. Let $R$ be a Noetherian ring. Then
(1) A complex of $R$-modules $K^{\bullet}$ is m-pseudo-coherent if and only if $K^{\bullet} \in$ $D^{-}(R)$ and $H^{i}\left(K^{\bullet}\right)$ is a finite $R$-module for $i \geq m$.
(2) A complex of $R$-modules $K^{\bullet}$ is pseudo-coherent if and only if $K^{\bullet} \in D^{-}(R)$ and $H^{i}\left(K^{\bullet}\right)$ is a finite $R$-module for all $i$.
(3) An $R$-module is pseudo-coherent if and only if it is finite.

Proof. In Algebra, Lemma 10.70 .1 we have seen that any finite $R$-module is pseudo-coherent. On the other hand, a pseudo-coherent module is finite, see Lemma 15.54.4. Hence (3) holds. Suppose that $K^{\bullet}$ is an $m$-pseudo-coherent complex. Then there exists a bounded complex of finite free $R$-modules $E^{\bullet}$ such that $H^{i}\left(K^{\bullet}\right)$ is
isomorphic to $H^{i}\left(E^{\bullet}\right)$ for $i>m$ and such that $H^{m}\left(K^{\bullet}\right)$ is a quotient of $H^{m}\left(E^{\bullet}\right)$. Thus it is clear that each $H^{i}\left(K^{\bullet}\right), i \geq m$ is a finite module. The converse implication in (1) follows from Lemma 15.54 .10 and part (3). Part (2) follows from (1) and Lemma 15.54 .5 .

087Q Remark 15.54.17. Let $R$ be ring map. Let $L, M, N$ be $R$-modules. Consider the canonical map

$$
\operatorname{Hom}_{R}(M, N) \otimes_{R} L \rightarrow \operatorname{Hom}_{R}\left(M, N \otimes_{R} L\right)
$$

Choose a two term free resolution $F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0$. Assuming $L$ flat over $R$ we obtain a commutative diagram

with exact rows. We conclude that if $F_{0}$ and $F_{1}$ are finite free, i.e., if $M$ is finitely presented, then the first displayed map is an isomorphism. Similarly, if $M$ is $(-m)$ -pseudo-coherent and still assuming $L$ is flat over $R$, then the map

$$
\operatorname{Ext}_{R}^{i}(M, N) \otimes_{R} L \rightarrow \operatorname{Ext}_{R}^{i}\left(M, N \otimes_{R} L\right)
$$

is an isomorphism for $i<m$.
087R Remark 15.54.18. Let $R$ be ring map. Let $M, N$ be $R$-modules. Let $R \rightarrow R^{\prime}$ be a flat ring map. By Algebra, Lemma 10.72.1 we have $\operatorname{Ext}_{R^{\prime}}^{i}\left(M \otimes_{R} R^{\prime}, N \otimes_{R} R^{\prime}\right)=$ $\operatorname{Ext}_{R}^{i}\left(M, N \otimes_{R} R^{\prime}\right)$. Combined with Remark 15.54 .17 we conclude that

$$
\operatorname{Hom}_{R}(M, N) \otimes_{R} R^{\prime}=\operatorname{Hom}_{R^{\prime}}\left(M \otimes_{R} R^{\prime}, N \otimes_{R} R^{\prime}\right)
$$

if $M$ is a finitely presented $R$-module and that

$$
\operatorname{Ext}_{R}^{i}(M, N) \otimes_{R} R^{\prime}=\operatorname{Ext}_{R^{\prime}}^{i}\left(M \otimes_{R} R^{\prime}, N \otimes_{R} R^{\prime}\right)
$$

is an isomorphism for $i<m$ if $M$ is $(-m)$-pseudo-coherent. In particular if $R$ is Noetherian and $M$ is a finite module this holds for all $i$.

### 15.55. Tor dimension

0651 Instead of resolving by projective modules we can look at resolutions by flat modules. This leads to the following concept.

0652 Definition 15.55.1. Let $R$ be a ring. Denote $D(R)$ its derived category. Let $a, b \in \mathbf{Z}$.
(1) An object $K^{\bullet}$ of $D(R)$ has tor-amplitude in $[a, b]$ if $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} M\right)=0$ for all $R$-modules $M$ and all $i \notin[a, b]$.
(2) An object $K^{\bullet}$ of $D(R)$ has finite tor dimension if it has tor-amplitude in $[a, b]$ for some $a, b$.
(3) An $R$-module $M$ has tor dimension $\leq d$ if if $M[0]$ as an object of $D(R)$ has tor-amplitude in $[-d, 0]$.
(4) An $R$-module $M$ has finite tor dimension if $M[0]$ as an object of $D(R)$ has finite tor dimension.

We observe that if $K^{\bullet}$ has finite tor dimension, then $K^{\bullet} \in D^{b}(R)$.

0653 Lemma 15.55.2. Let $R$ be a ring. Let $K^{\bullet}$ be a bounded above complex of flat $R$-modules with tor-amplitude in $[a, b]$. Then $\operatorname{Coker}\left(d_{K}^{a-1}\right)$ is a flat $R$-module.

Proof. As $K^{\bullet}$ is a bounded above complex of flat modules we see that $K^{\bullet} \otimes_{R} M=$ $K^{\bullet} \otimes_{R}^{\mathbf{L}} M$. Hence for every $R$-module $M$ the sequence

$$
K^{a-2} \otimes_{R} M \rightarrow K^{a-1} \otimes_{R} M \rightarrow K^{a} \otimes_{R} M
$$

is exact in the middle. Since $K^{a-2} \rightarrow K^{a-1} \rightarrow K^{a} \rightarrow \operatorname{Coker}\left(d_{K}^{a-1}\right) \rightarrow 0$ is a flat resolution this implies that $\operatorname{Tor}_{1}^{R}\left(\operatorname{Coker}\left(d_{K}^{a-1}\right), M\right)=0$ for all $R$-modules $M$. This means that $\operatorname{Coker}\left(d_{K}^{a-1}\right)$ is flat, see Algebra, Lemma 10.74.8.

0654 Lemma 15.55.3. Let $R$ be a ring. Let $K^{\bullet}$ be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent
(1) $K^{\bullet}$ has tor-amplitude in $[a, b]$.
(2) $K^{\bullet}$ is quasi-isomorphic to a complex $E^{\bullet}$ of flat $R$-modules with $E^{i}=0$ for $i \notin[a, b]$.

Proof. If (2) holds, then we may compute $K^{\bullet} \otimes_{R}^{\mathbf{L}} M=E^{\bullet} \otimes_{R} M$ and it is clear that (1) holds. Assume that (1) holds. We may replace $K^{\bullet}$ by a projective resolution. Let $n$ be the largest integer such that $K^{n} \neq 0$. If $n>b$, then $K^{n-1} \rightarrow K^{n}$ is surjective as $H^{n}\left(K^{\bullet}\right)=0$. As $K^{n}$ is projective we see that $K^{n-1}=K^{\prime} \oplus K^{n}$. Hence it suffices to prove the result for the complex $\left(K^{\prime}\right)^{\bullet}$ which is the same as $K^{\bullet}$ except has $K^{\prime}$ in degree $n-1$ and 0 in degree $n$. Thus, by induction on $n$, we reduce to the case that $K^{\bullet}$ is a complex of projective $R$-modules with $K^{i}=0$ for $i>b$.

Set $E^{\bullet}=\tau_{\geq a} K^{\bullet}$. Everything is clear except that $E^{a}$ is flat which follows immediately from Lemma 15.55 .2 and the definitions.

0655 Lemma 15.55.4. Let $R$ be a ring. Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle in $D(R)$. Let $a, b \in \mathbf{Z}$.
(1) If $K^{\bullet}$ has tor-amplitude in $[a+1, b+1]$ and $L^{\bullet}$ has tor-amplitude in $[a, b]$ then $M^{\bullet}$ has tor-amplitude in $[a, b]$.
(2) If $K^{\bullet}, M^{\bullet}$ have tor-amplitude in $[a, b]$, then $L^{\bullet}$ has tor-amplitude in $[a, b]$.
(3) If $L^{\bullet}$ has tor-amplitude in $[a+1, b+1]$ and $M^{\bullet}$ has tor-amplitude in $[a, b]$, then $K^{\bullet}$ has tor-amplitude in $[a+1, b+1]$.

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_{R}^{\mathbf{L}} M$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation.

066F Lemma 15.55.5. Let $R$ be a ring. Let $M$ be an $R$-module. Let $d \geq 0$. The following are equivalent
(1) $M$ has tor dimension $\leq d$, and
(2) there exists a resolution

$$
0 \rightarrow F_{d} \rightarrow \ldots \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

with $F_{i}$ a flat $R$-module.
In particular an $R$-module has tor dimension 0 if and only if it is a flat $R$-module.

Proof. Assume (2). Then the complex $E^{\bullet}$ with $E^{-i}=F_{i}$ is quasi-isomorphic to $M$. Hence the Tor dimension of $M$ is at most $d$ by Lemma 15.55 .3 . Conversely, assume (1). Let $P^{\bullet} \rightarrow M$ be a projective resolution of $M$. By Lemma 15.55 .2 we see that $\tau_{\geq-d} P^{\bullet}$ is a flat resolution of $M$ of length $d$, i.e., (2) holds.

066G Lemma 15.55.6. Let $R$ be a ring. Let $a, b \in \mathbf{Z}$. If $K^{\bullet} \oplus L^{\bullet}$ has tor amplitude in $[a, b]$ so do $K^{\bullet}$ and $L^{\bullet}$.
Proof. Clear from the fact that the Tor functors are additive.
066 H Lemma 15.55.7. Let $R$ be a ring. Let $K^{\bullet}$ be a bounded complex of $R$-modules such that $K^{i}$ has tor amplitude in $[a-i, b-i]$ for all $i$. Then $K^{\bullet}$ has tor amplitude in $[a, b]$. In particular if $K^{\bullet}$ is a finite complex of $R$-modules of finite tor dimension, then $K^{\bullet}$ has finite tor dimension.

Proof. Follows by induction on the length of the finite complex: use Lemma 15.55.4 and the stupid truncations.

066I Lemma 15.55.8. Let $R$ be a ring. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet} \in D^{b}(R)$ such that $H^{\imath}\left(K^{\bullet}\right)$ has tor amplitude in $[a-i, b-i]$ for all $i$. Then $K^{\bullet}$ has tor amplitude in $[a, b]$. In particular if $K^{\bullet} \in D^{-}(R)$ and all its cohomology groups have finite tor dimension then $K^{\bullet}$ has finite tor dimension.

Proof. Follows by induction on the length of the finite complex: use Lemma 15.55 .4 and the canonical truncations.

0B66 Lemma 15.55.9. Let $A \rightarrow B$ be a ring map. Let $K^{\bullet}$ and $L^{\bullet}$ be complexes of $B$-modules. Let $a, b, c, d \in \mathbf{Z}$. If
(1) $K^{\bullet}$ as a complex of $B$-modules has tor amplitude in $[a, b]$,
(2) $L^{\bullet}$ as a complex of $A$-modules has tor amplitude in $[c, d]$,
then $K^{\bullet} \otimes_{B}^{\mathbf{L}} L^{\bullet}$ as a complex of $A$-modules has tor amplitude in $[a+c, b+d]$.
Proof. We may assume that $K^{\bullet}$ is a complex of flat $B$-modules with $K^{i}=0$ for $i \notin[a, b]$, see Lemma 15.55 .3 . Let $M$ be an $A$-module. Choose a free resolution $F^{\bullet} \rightarrow M$. Then

$$
\left(K^{\bullet} \otimes_{B}^{\mathbf{L}} L^{\bullet}\right) \otimes_{A}^{\mathbf{L}} M=\operatorname{Tot}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{B} L^{\bullet}\right) \otimes_{A} F^{\bullet}\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{B} \operatorname{Tot}\left(L^{\bullet} \otimes_{A} F^{\bullet}\right)\right)
$$

see Homology, Remark 12.22 .8 for the second equality. By assumption (2) the complex $\operatorname{Tot}\left(L^{\bullet} \otimes_{A} F^{\bullet}\right)$ has nonzero cohomology only in degrees $[c, d]$. Hence the spectral sequence of Homology, Lemma 12.22 .4 for the double complex $K^{\bullet} \otimes_{B}$ $\operatorname{Tot}\left(L^{\bullet} \otimes_{A} F^{\bullet}\right)$ proves that $\left(K^{\bullet} \otimes_{B}^{\mathbf{L}} L^{\bullet}\right) \otimes_{A}^{\mathbf{L}} M$ has nonzero cohomology only in degrees $[a+c, b+d]$.
066J Lemma 15.55.10. Let $A \rightarrow B$ be a ring map. Assume that $B$ is flat as an $A$ module. Let $K^{\bullet}$ be a complex of $B$-modules. Let $a, b \in \mathbf{Z}$. If $K^{\bullet}$ as a complex of $B$-modules has tor amplitude in $[a, b]$, then $K^{\bullet}$ as a complex of $A$-modules has tor amplitude in $[a, b]$.

Proof. This is a special case of Lemma 15.55 .9 , but can also be seen directly as follows. We have $K^{\bullet} \otimes_{A}^{\mathbf{L}} M=K^{\bullet} \otimes_{B}^{\mathbf{L}}\left(M \otimes_{A} B\right)$ since any projective resolution of $K^{\bullet}$ as a complex of $B$-modules is a flat resolution of $K^{\bullet}$ as a complex of $A$-modules and can be used to compute $K^{\bullet} \otimes_{A}^{\mathrm{L}} M$.

066K Lemma 15.55.11. Let $A \rightarrow B$ be a ring map. Assume that $B$ has tor dimension $\leq d$ as an $A$-module. Let $K^{\bullet}$ be a complex of $B$-modules. Let $a, b \in \mathbf{Z}$. If $K^{\bullet}$ as a complex of $B$-modules has tor amplitude in $[a, b]$, then $K^{\bullet}$ as a complex of $A$-modules has tor amplitude in $[a-d, b]$.
Proof. This is a special case of Lemma 15.55 .9 , but can also be seen directly as follows. Let $M$ be an $A$-module. Choose a free resolution $F^{\bullet} \rightarrow M$. Then

$$
K^{\bullet} \otimes_{A}^{\mathbf{L}} M=\operatorname{Tot}\left(K^{\bullet} \otimes_{A} F^{\bullet}\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{B}\left(F^{\bullet} \otimes_{A} B\right)\right)=K^{\bullet} \otimes_{B}^{\mathbf{L}}\left(M \otimes_{A}^{\mathbf{L}} B\right)
$$

By our assumption on $B$ as an $A$-module we see that $M \otimes_{A}^{\mathbf{L}} B$ has cohomology only in degrees $-d,-d+1, \ldots, 0$. Because $K^{\bullet}$ has tor amplitude in $[a, b]$ we see from the spectral sequence in Example 15.52 .4 that $K^{\bullet} \otimes_{B}^{\mathbf{L}}\left(M \otimes_{A}^{\mathbf{L}} B\right)$ has cohomology only in degrees $[-d+a, b]$ as desired.

066L Lemma 15.55.12. Let $A \rightarrow B$ be a ring map. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $A$-modules with tor amplitude in $[a, b]$. Then $K^{\bullet} \otimes{ }_{A}^{\mathbf{L}} B$ as a complex of $B$-modules has tor amplitude in $[a, b]$.

Proof. By Lemma 15.55 .3 we can find a quasi-isomorphism $E^{\bullet} \rightarrow K^{\bullet}$ where $E^{\bullet}$ is a complex of flat $A$-modules with $E^{i}=0$ for $i \notin[a, b]$. Then $E^{\bullet} \otimes_{A} B$ computes $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ by construction and each $E^{i} \otimes_{A} B$ is a flat $B$-module by Algebra, Lemma 10.38.7. Hence we conclude by Lemma 15.55 .3 .

066M Lemma 15.55.13. Let $A \rightarrow B$ be a flat ring map. Let $d \geq 0$. Let $M$ be an $A$-module of tor dimension $\leq d$. Then $M \otimes_{A} B$ is a $B$-module of tor dimension $\leq d$.

Proof. Immediate consequence of Lemma 15.55 .12 and the fact that $M \otimes_{A}^{\mathbf{L}} B=$ $M \otimes_{A} B$ because $B$ is flat over $A$.

0B67 Lemma 15.55.14. Let $A \rightarrow B$ be a ring map. Let $K^{\bullet}$ be a complex of $B$-modules. Let $a, b \in \mathbf{Z}$. The following are equivalent
(1) $K^{\bullet}$ has tor amplitude in $[a, b]$ as a complex of $A$-modules,
(2) $K_{\mathfrak{q}}^{\bullet}$ has tor amplitude in $[a, b]$ as a complex of $A_{\mathfrak{p}}$-modules for every prime $\mathfrak{q} \subset B$ with $\mathfrak{p}=A \cap \mathfrak{q}$,
(3) $K_{\mathfrak{m}}^{\bullet}$ has tor amplitude in $[a, b]$ as a complex of $A_{\mathfrak{p}}$-modules for every maximal ideal $\mathfrak{m} \subset B$ with $\mathfrak{p}=A \cap \mathfrak{m}$.

Proof. Assume (3) and let $M$ be an $A$-module. Then $H^{i}=H^{i}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} M\right)$ is a $B$-module and $\left(H^{i}\right)_{\mathfrak{m}}=H^{i}\left(K_{\mathfrak{m}}^{\bullet} \otimes_{A_{\mathfrak{p}}}^{\mathbf{L}} M_{\mathfrak{p}}\right)$. Hence $H^{i}=0$ for $i \notin[a, b]$ by Algebra, Lemma 10.23 .1 . Thus $(3) \Rightarrow(1)$. We omit the proofs of $(1) \Rightarrow(2)$ and $(2) \Rightarrow$ (3).

066N Lemma 15.55.15. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$ be elements which generate the unit ideal. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $R$-modules. If for each $i$ the complex $K^{\bullet} \otimes_{R} R_{f_{i}}$ has tor amplitude in $[a, b]$, then $K^{\bullet}$ has tor amplitude in $[a, b]$.
Proof. This follows immediately from Lemma 15.55 .14 but can also be seen directly as follows. Note that $-\otimes_{R} R_{f_{i}}$ is an exact functor and that therefore

$$
H^{i}\left(K^{\bullet}\right)_{f_{i}}=H^{i}\left(K^{\bullet}\right) \otimes_{R} R_{f_{i}}=H^{i}\left(K^{\bullet} \otimes_{R} R_{f_{i}}\right)
$$

and similarly for every $R$-module $M$ we have

$$
H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} M\right)_{f_{i}}=H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} M\right) \otimes_{R} R_{f_{i}}=H^{i}\left(K^{\bullet} \otimes_{R} R_{f_{i}} \otimes_{R_{f_{i}}}^{\mathbf{L}} M_{f_{i}}\right)
$$

Hence the result follows from the fact that an $R$-module $N$ is zero if and only if $N_{f_{i}}$ is zero for each $i$, see Algebra, Lemma 10.23 .2 .

068S Lemma 15.55.16. Let $R$ be a ring. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $R$ modules. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. If the complex $K^{\bullet} \otimes_{R} R^{\prime}$ has tor amplitude in $[a, b]$, then $K^{\bullet}$ has tor amplitude in $[a, b]$.

Proof. Let $M$ be an $R$-module. Since $R \rightarrow R^{\prime}$ is flat we see that

$$
\left(M \otimes_{R}^{\mathbf{L}} K^{\bullet}\right) \otimes_{R} R^{\prime}=\left(\left(M \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}}^{\mathbf{L}}\left(K^{\bullet} \otimes_{R} R^{\prime}\right)\right.
$$

and taking cohomology commutes with tensoring with $R^{\prime}$. Hence $\operatorname{Tor}_{i}^{R}\left(M, K^{\bullet}\right)=$ $\operatorname{Tor}_{i}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, K^{\bullet} \otimes_{R} R^{\prime}\right)$. Since $R \rightarrow R^{\prime}$ is faithfully flat, the vanishing of $\operatorname{Tor}_{i}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, K^{\bullet} \otimes_{R} R^{\prime}\right)$ for $i \notin[a, b]$ implies the same thing for $\operatorname{Tor}_{i}^{R}\left(M, K^{\bullet}\right)$.

066P Lemma 15.55.17. Let $R$ be a ring of finite global dimension $d$. Then
(1) every module has finite tor dimension $\leq d$,
(2) a complex of $R$-modules $K^{\bullet}$ with $H^{i}\left(K^{\bullet}\right) \neq 0$ only if $i \in[a, b]$ has tor amplitude in $[a-d, b]$, and
(3) a complex of $R$-modules $K^{\bullet}$ has finite tor dimension if and only if $K^{\bullet} \in$ $D^{b}(R)$.

Proof. The assumption on $R$ means that every module has a finite projective resolution of length at most $d$, in particular every module has finite tor dimension. The second statement follows from Lemma 15.55 .8 and the definitions. The third statement is a rephrasing of the second.

### 15.56. Spectral sequences for Ext

0AVG In this section we collect various spectral sequences that come up when considering the Ext functors. For any pair of objects $L, K$ of the derived category $D(R)$ of a ring $R$ we denote

$$
\operatorname{Ext}_{R}^{n}(L, K)=\operatorname{Hom}_{D(R)}(L, K[n])
$$

according to our general conventions in Derived Categories, Section 13.27.
For $M$ an $R$-module and $K \in D^{+}(R)$ there is a spectral sequence
0AVH (15.56.0.1)

$$
\operatorname{Ext}_{R}^{j}\left(M, H^{i}(K)\right) \Rightarrow \operatorname{Ext}_{R}^{i+j}(M, K)
$$

and if $K$ is represented by the bounded below complex $K^{\bullet}$ of $R$-modules there is a spectral sequence
0AVI (15.56.0.2)

$$
\operatorname{Ext}_{R}^{j}\left(M, K^{i}\right) \Rightarrow \operatorname{Ext}_{R}^{i+j}(M, K)
$$

### 15.57. Projective dimension

$0 A 5 \mathrm{M}$ We defined the projective dimension of a module in Algebra, Definition 10.108.2.
0A5N Definition 15.57.1. Let $R$ be a ring. Let $K$ be an object of $D(R)$. We say $K$ has finite projective dimension if $K$ can be represented by a finite complex of projective modules. We say $K$ as projective-amplitude in $[a, b]$ if $K$ is quasi-isomorphic to a complex

$$
\ldots \rightarrow 0 \rightarrow P^{a} \rightarrow P^{a+1} \rightarrow \ldots \rightarrow P^{b-1} \rightarrow P^{b} \rightarrow 0 \rightarrow \ldots
$$

where $P^{i}$ is a projective $R$-module for all $i \in \mathbf{Z}$.

Clearly, $K$ has bounded projective dimension if and only if $K$ has projectiveamplitude in $[a, b]$ for some $a, b \in \mathbf{Z}$. Furthermore, if $K$ has bounded projective dimension, then $K$ is bounded. Here is the obligatory lemma.

0A5P Lemma 15.57.2. Let $R$ be a ring. Let $K$ be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent
(1) $K$ has projective-amplitude in $[a, b]$,
(2) $E x t_{R}^{i}(K, N)=0$ for all $R$-modules $N$ and all $i \notin[-b,-a]$.

Proof. Assume (1). We may assume $K$ is the complex

$$
\ldots \rightarrow 0 \rightarrow P^{a} \rightarrow P^{a+1} \rightarrow \ldots \rightarrow P^{b-1} \rightarrow P^{b} \rightarrow 0 \rightarrow \ldots
$$

where $P^{i}$ is a projective $R$-module for all $i \in \mathbf{Z}$. In this case we can compute the ext groups by the complex

$$
\ldots \rightarrow 0 \rightarrow \operatorname{Hom}_{R}\left(P^{b}, N\right) \rightarrow \ldots \rightarrow \operatorname{Hom}_{R}\left(P^{a}, N\right) \rightarrow 0 \rightarrow \ldots
$$

and we obtain (2).
Assume (2) holds. Choose an injection $H^{n}(K) \rightarrow I$ where $I$ is an injective $R$-module. Since $\operatorname{Hom}_{R}(-, I)$ is an exact functor, we see that $\operatorname{Ext}^{-n}(K, I)=$ $\operatorname{Hom}_{R}\left(H^{n}(K), I\right)$. We conclude that $H^{n}(K)$ is zero for $n \notin[a, b]$. In particular, $K$ is bounded above and we can choose a quasi-isomorphism

$$
P^{\bullet} \rightarrow K
$$

with $P^{i}$ projective (for example free) for all $i \in \mathbf{Z}$ and $P^{i}=0$ for $i>b$. See Derived Categories, Lemma 13.16.5. Let $Q=\operatorname{Coker}\left(P^{a-1} \rightarrow P^{a}\right)$. Then $K$ is quasi-isomorphic to the complex

$$
\ldots \rightarrow 0 \rightarrow Q \rightarrow P^{a+1} \rightarrow \ldots \rightarrow P^{b} \rightarrow 0 \rightarrow \ldots
$$

Denote $K^{\prime}=\left(P^{a+1} \rightarrow \ldots \rightarrow P^{b}\right)$ the corresponding object of $D(R)$. We obtain a distinguished triangle

$$
K^{\prime} \rightarrow K \rightarrow Q[-a] \rightarrow K^{\prime}[1]
$$

in $D(R)$. Thus for every $R$-module $N$ an exact sequence

$$
\operatorname{Ext}^{-a}\left(K^{\prime}, N\right) \rightarrow \operatorname{Ext}^{1}(Q, N) \rightarrow \operatorname{Ext}^{1-a}(K, N)
$$

By assumption the term on the right vanishes. By the implication (1) $\Rightarrow(2)$ the term on the left vanishes. Thus $Q$ is a projective $R$-module by Algebra, Lemma 10.76 .2 .

0A5Q Example 15.57.3. Let $k$ be a field and let $R$ be the ring of dual numbers over $k$, i.e., $R=k[x] /\left(x^{2}\right)$. Denote $\epsilon \in R$ the class of $x$. Let $M=R /(\epsilon)$. Then $M$ is quasi-isomorphic to the complex

$$
R \xrightarrow{\epsilon} R \xrightarrow{\epsilon} R \rightarrow \ldots
$$

but $M$ does not have finite projective dimension as defined in Algebra, Definition 10.108 .2 . This explains why we consider bounded (in both directions) complexes of projective modules in our definition of bounded projective dimension of objects of $D(R)$.

### 15.58. Injective dimension

$0 A 5 R$ This section is the dual of the section on projective dimension.
0A5S Definition 15.58.1. Let $R$ be a ring. Let $K$ be an object of $D(R)$. We say $K$ has finite injective dimension if $K$ can be represented by a finite complex of injective $R$-modules. We say $K$ has injective-amplitude in $[a, b]$ if $K$ is isomorphic to a complex

$$
\ldots \rightarrow 0 \rightarrow I^{a} \rightarrow I^{a+1} \rightarrow \ldots \rightarrow I^{b-1} \rightarrow I^{b} \rightarrow 0 \rightarrow \ldots
$$

with $I^{i}$ an injective $R$-module for all $i \in \mathbf{Z}$.
Clearly, $K$ has bounded injective dimension if and only if $K$ has injective-amplitude in $[a, b]$ for some $a, b \in \mathbf{Z}$. Furthermore, if $K$ has bounded injective dimension, then $K$ is bounded. Here is the obligatory lemma.
0A5T Lemma 15.58.2. Let $R$ be a ring. Let $K$ be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent
(1) $K$ has injective-amplitude in $[a, b]$,
(2) $E x t_{R}^{i}(N, K)=0$ for all $R$-modules $N$ and all $i \notin[a, b]$,
(3) $E x t^{i}(R / I, K)=0$ for all ideals $I \subset R$ and all $i \notin[a, b]$.

Proof. Assume (1). We may assume $K$ is the complex

$$
\ldots \rightarrow 0 \rightarrow I^{a} \rightarrow I^{a+1} \rightarrow \ldots \rightarrow I^{b-1} \rightarrow I^{b} \rightarrow 0 \rightarrow \ldots
$$

where $P^{i}$ is a injective $R$-module for all $i \in \mathbf{Z}$. In this case we can compute the ext groups by the complex

$$
\ldots \rightarrow 0 \rightarrow \operatorname{Hom}_{R}\left(N, I^{a}\right) \rightarrow \ldots \rightarrow \operatorname{Hom}_{R}\left(N, I^{b}\right) \rightarrow 0 \rightarrow \ldots
$$

and we obtain (2). It is clear that (2) implies (3).
Assume (3) holds. Choose a nonzero map $R \rightarrow H^{n}(K)$. Since $\operatorname{Hom}_{R}(R,-)$ is an exact functor, we see that $\operatorname{Ext}_{R}^{n}(R, K)=\operatorname{Hom}_{R}\left(R, H^{n}(K)\right)=H^{n}(K)$. We conclude that $H^{n}(K)$ is zero for $n \notin[a, b]$. In particular, $K$ is bounded below and we can choose a quasi-isomorphism

$$
K \rightarrow I^{\bullet}
$$

with $I^{i}$ injective for all $i \in \mathbf{Z}$ and $I^{i}=0$ for $i<a$. See Derived Categories, Lemma 13.16.4. Let $J=\operatorname{Ker}\left(I^{b} \rightarrow I^{b+1}\right)$. Then $K$ is quasi-isomorphic to the complex

$$
\ldots \rightarrow 0 \rightarrow I^{a} \rightarrow \ldots \rightarrow I^{b-1} \rightarrow J \rightarrow 0 \rightarrow \ldots
$$

Denote $K^{\prime}=\left(I^{a} \rightarrow \ldots \rightarrow I^{b-1}\right)$ the corresponding object of $D(R)$. We obtain a distinguished triangle

$$
J[-b] \rightarrow K \rightarrow K^{\prime} \rightarrow J[1-b]
$$

in $D(R)$. Thus for every ideal $I \subset R$ an exact sequence

$$
\operatorname{Ext}^{b}\left(R / I, K^{\prime}\right) \rightarrow \operatorname{Ext}^{1}(R / I, J) \rightarrow \operatorname{Ext}^{1+b}(R / I, K)
$$

By assumption the term on the right vanishes. By the implication $(1) \Rightarrow(2)$ the term on the left vanishes. Thus $J$ is a injective $R$-module by Lemma 15.46 .4 .

0A5U Example 15.58.3. Let $k$ be a field and let $R$ be the ring of dual numbers over $k$, i.e., $R=k[x] /\left(x^{2}\right)$. Denote $\epsilon \in R$ the class of $x$. Let $M=R /(\epsilon)$. Then $M$ is quasi-isomorphic to the complex

$$
\ldots \rightarrow R \xrightarrow{\epsilon} R \xrightarrow{\epsilon} R
$$

and $R$ is an injective $R$-module. However one usually does not consider $M$ to have finite injective dimension in this situation. This explains why we consider bounded (in both directions) complexes of injective modules in our definition of bounded injective dimension of objects of $D(R)$.

0A5V Lemma 15.58.4. Let $R$ be a ring. Let $K \in D(R)$.
(1) If $K$ is in $D^{b}(R)$ and $H^{i}(K)$ has finite injective dimension for all $i$, then $K$ has finite injective dimension.
(2) If $K^{\bullet}$ represents $K$, is a bounded complex of $R$-modules, and $K^{i}$ has finite injective dimension for all $i$, then $K$ has finite injective dimension.
Proof. Omitted. Hint: Apply the spectral sequences of Derived Categories, Lemma 13.21 .3 to the functor $F=\operatorname{Hom}_{R}(N,-)$ to get a computation of $\operatorname{Ext}_{A}^{i}(N, K)$ and use the criterion of Lemma 15.58.2

0 LVJ Lemma 15.58.5. Let $(R, \mathfrak{m}, \kappa)$ be a local Noetherian ring. Let $K \in D^{+}(R)$ have finite cohomology modules. Then the following are equivalent
(1) $K$ has finite injective dimension, and
(2) $E x t_{R}^{i}(\kappa, K)=0$ for $i \gg 0$.

Proof. Say $H^{i}(K)=0$ for $i<a$. Then $\operatorname{Ext}^{i}(M, K)=0$ for $i<a$ and all $R$-modules $M$. Say $\operatorname{Ext}_{R}^{i}(\kappa, K)=0$ for $i>b$. We will show by induction on $\operatorname{dim}(\operatorname{Supp}(M))$ that $\operatorname{Ext}^{i}(M, K)=0$ for all finite $R$-modules $M$. This will prove the lemma by Lemma 15.58 .2 . We will use that the modules $\operatorname{Ext}^{i}(M, K)$ are finite by our assumption on $K$ (bounded below with finite cohomology modules), the spectral sequence 15.56.0.1), and Algebra, Lemma 10.70.9.
The base case. If $\operatorname{dim}(\operatorname{Supp}(M))=0$ then we can use induction on the length of $M$, see Algebra, Lemma 10.61 .3 . If the length is 1 , then $M=\kappa$ and the result holds. If length $(M)>1$, then we can find an exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow \kappa \rightarrow 0$ with length $\left(M^{\prime}\right)<$ length $(M)$ and the result for $M$ follows from the result for $M^{\prime}$ and $\kappa$ by the long exact sequence of Ext's.

Assume $\operatorname{dim}(\operatorname{Supp}(M))>0$. Consider the exact sequence $0 \rightarrow C \rightarrow M \rightarrow M^{\prime} \rightarrow 0$ of Algebra, Lemma 10.66 .2 . Using the long exact sequence of Ext's and the induction hypothesis for $C$, we see that it suffices to prove the vanishing for $M^{\prime}$. Thus we may assume $M$ has no embedded associated primes. Let $f \in \mathfrak{m}$ be an element which is not contained in any associated primes of $M$ (to find $f$ use $\operatorname{dim}(\operatorname{Supp}(M))>0$, use $M$ has no embedded associated primes, and use Algebra, Lemma 10.14.2. Then $f$ is a nonzerodivisor on $M$ (Algebra, Lemma 10.62.9) and we can consider the short exact sequence

$$
0 \rightarrow M \rightarrow M \rightarrow M / f M \rightarrow 0
$$

This produces the long exact sequence

$$
\ldots \rightarrow \operatorname{Ext}^{b}(M, K) \xrightarrow{f} \operatorname{Ext}^{b}(M, K) \rightarrow \operatorname{Ext}^{b+1}(M / f M, K) \rightarrow \ldots
$$

By induction hypothesis for $M / f M$ we see that $\operatorname{Ext}^{b+1}(M / f M, K)$ is zero. Since $f \in \mathfrak{m}$ and $\operatorname{Ext}^{b}(M, K)$ is finite, we conclude by Nakayama's lemma (Algebra, Lemma 10.19.1 that $\operatorname{Ext}^{b}(M, K)$ is zero.

### 15.59. Hom complexes

0 A 8 H Let $R$ be a ring. Let $L^{\bullet}$ and $M^{\bullet}$ be two complexes of $R$-modules. We construct a complex $\operatorname{Hom}^{\bullet}\left(L^{\bullet}, M^{\bullet}\right)$. Namely, for each $n$ we set

$$
\operatorname{Hom}^{n}\left(L^{\bullet}, M^{\bullet}\right)=\prod_{n=p+q} \operatorname{Hom}_{R}\left(L^{-q}, M^{p}\right)
$$

It is a good idea to think of $\operatorname{Hom}^{n}$ as the $R$-module of all $R$-linear maps from $L^{\bullet}$ to $M^{\bullet}$ (viewed as graded modules) which are homogenous of degree $n$. In this terminology, we define the differential by the rule

$$
\mathrm{d}(f)=\mathrm{d}_{M} \circ f-(-1)^{n} f \circ \mathrm{~d}_{L}
$$

for $f \in \operatorname{Hom}^{n}\left(L^{\bullet}, M^{\bullet}\right)$. We omit the verification that $\mathrm{d}^{2}=0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have

0A5X (15.59.0.1)

$$
H^{n}\left(\operatorname{Hom}^{\bullet}\left(L^{\bullet}, M^{\bullet}\right)\right)=\operatorname{Hom}_{K(R)}\left(L^{\bullet}, M^{\bullet}[n]\right)
$$

for all $n \in \mathbf{Z}$.
0A5Y Lemma 15.59.1. Let $R$ be a ring. Given complexes $K^{\bullet}, L^{\bullet}, M^{\bullet}$ of $R$-modules there is a canonical isomorphism

$$
\operatorname{Hom}^{\bullet}\left(K^{\bullet}, \operatorname{Hom}^{\bullet}\left(L^{\bullet}, M^{\bullet}\right)\right)=\operatorname{Hom}^{\bullet}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right), M^{\bullet}\right)
$$

of complexes of $R$-modules.
Proof. Let $\alpha$ be an element of degree $n$ on the left hand side. Thus

$$
\alpha=\left(\alpha^{p, q}\right) \in \prod_{p+q=n} \operatorname{Hom}_{R}\left(K^{-q}, \operatorname{Hom}^{p}\left(L^{\bullet}, M^{\bullet}\right)\right)
$$

Each $\alpha^{p, q}$ is an element

$$
\alpha^{p, q}=\left(\alpha^{r, s, q}\right) \in \prod_{r+s+q=n} \operatorname{Hom}_{R}\left(K^{-q}, \operatorname{Hom}_{R}\left(L^{-s}, M^{r}\right)\right)
$$

If we make the identifications
0A5Z (15.59.1.1)

$$
\operatorname{Hom}_{R}\left(K^{-q}, \operatorname{Hom}_{R}\left(L^{-s}, M^{r}\right)\right)=\operatorname{Hom}_{R}\left(K^{-q} \otimes_{R} L^{-s}, M^{r}\right)
$$

then by our sign rules we get

$$
\begin{aligned}
\mathrm{d}\left(\alpha^{r, s, q}\right) & =\mathrm{d}_{\mathrm{Hom} \bullet(L \bullet, M \bullet)} \circ \alpha^{r, s, q}-(-1)^{n} \alpha^{r, s, q} \circ \mathrm{~d}_{K} \\
& =\mathrm{d}_{M} \circ \alpha^{r, s, q}-(-1)^{r+s} \alpha^{r, s, q} \circ \mathrm{~d}_{L}-(-1)^{r+s+q} \alpha^{r, s, q} \circ \mathrm{~d}_{K}
\end{aligned}
$$

On the other hand, if $\beta$ is an element of degree $n$ of the right hand side, then

$$
\beta=\left(\beta^{r, s, q}\right) \in \prod_{r+s+q=n} \operatorname{Hom}_{R}\left(K^{-q} \otimes_{R} L^{-s}, M^{r}\right)
$$

and by our sign rule (Homology, Definition 12.22.3) we get

$$
\begin{aligned}
\mathrm{d}\left(\beta^{r, s, q}\right) & =\mathrm{d}_{M} \circ \beta^{r, s, q}-(-1)^{n} \beta^{r, s, q} \circ \mathrm{~d}_{\operatorname{Tot}(K \bullet \otimes L \bullet)} \\
& =\mathrm{d}_{M} \circ \beta^{r, s, q}-(-1)^{r+s+q}\left(\beta^{r, s, q} \circ \mathrm{~d}_{K}+(-1)^{-q} \beta^{r, s, q} \circ \mathrm{~d}_{L}\right)
\end{aligned}
$$

Thus we see that the map induced by the identifications 15.59.1.1 indeed is a morphism of complexes.

0A8I Lemma 15.59.2. Let $R$ be a ring. Given complexes $K^{\bullet}, L^{\bullet}, M^{\bullet}$ of $R$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\operatorname{Hom}^{\bullet}\left(L^{\bullet}, M^{\bullet}\right) \otimes_{R} \operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right)\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(K^{\bullet}, M^{\bullet}\right)
$$

of complexes of $R$-modules.
Proof. An element $\alpha$ of degree $n$ of the left hand side is

$$
\alpha=\left(\alpha^{p, q}\right) \in \bigoplus_{p+q=n} \operatorname{Hom}^{p}\left(L^{\bullet}, M^{\bullet}\right) \otimes_{R} \operatorname{Hom}^{q}\left(K^{\bullet}, L^{\bullet}\right)
$$

The element $\alpha^{p, q}$ is a finite sum $\alpha^{p, q}=\sum \beta_{i}^{p} \otimes \gamma_{i}^{q}$ with

$$
\beta_{i}^{p}=\left(\beta_{i}^{r, s}\right) \in \prod_{r+s=p} \operatorname{Hom}_{R}\left(L^{-s}, M^{r}\right)
$$

and

$$
\gamma_{i}^{q}=\left(\gamma_{i}^{u, v}\right) \in \prod_{u+v=q} \operatorname{Hom}_{R}\left(K^{-v}, L^{u}\right)
$$

The map is given by sending $\alpha$ to $\delta=\left(\delta^{r, v}\right)$ with

$$
\delta^{r, v}=\sum_{i, s} \beta_{i}^{r, s} \circ \gamma_{i}^{-s, v} \in \operatorname{Hom}_{R}\left(K^{-v}, M^{r}\right)
$$

For given $r+v=n$ this sum is finite as there are only finitely many nonzero $\alpha^{p, q}$, hence only finitely many nonzero $\beta_{i}^{p}$ and $\gamma_{i}^{q}$. By our sign rules we have

$$
\begin{aligned}
& \mathrm{d}\left(\alpha^{p, q}\right)= \mathrm{d}_{\mathrm{Hom} \bullet(L \bullet, M \bullet)}\left(\alpha^{p, q}\right)+(-1)^{p} \mathrm{~d}_{\mathrm{Hom}} \bullet\left(K_{\bullet}, L \bullet\right) \\
&= \sum\left(\alpha^{p, q}\right) \\
&\left.+(-1)^{p} \sum \beta_{i}^{p} \circ \gamma_{i}^{q}-(-1)^{p} \beta_{i}^{p} \circ \mathrm{~d}_{L} \circ \gamma_{i}^{q}\right) \\
&= \sum\left(\beta_{i}^{p} \circ \mathrm{~d}_{L} \circ \gamma_{i}^{q}-(-1)^{q} \beta_{i}^{p} \circ \gamma_{i}^{q} \circ \mathrm{~d}_{K}\right) \\
&\left.\mathrm{d}_{M} \circ \beta_{i}^{p} \circ \gamma_{i}^{q}-(-1)^{n} \beta_{i}^{p} \circ \gamma_{i}^{q} \circ \mathrm{~d}_{K}\right)
\end{aligned}
$$

It follows that the rules $\alpha \mapsto \delta$ is compatible with differentials and the lemma is proved.
0 A60 Lemma 15.59.3. Let $R$ be a ring. Given complexes $K^{\bullet}, L^{\bullet}, M^{\bullet}$ of $R$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\operatorname{Hom}^{\bullet}\left(L^{\bullet}, M^{\bullet}\right) \otimes_{R} K^{\bullet}\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right), M^{\bullet}\right)
$$

of complexes of $R$-modules functorial in all three complexes.
Proof. Consider an element $\beta$ of degree $n$ of the right hand side. Then

$$
\beta=\left(\beta^{p, q}\right) \in \prod_{p+q=n} \operatorname{Hom}_{R}\left(\operatorname{Hom}^{-q}\left(K^{\bullet}, L^{\bullet}\right), M^{p}\right)
$$

Each $\beta^{p, q}$ is an element

$$
\beta^{p, q}=\left(\beta^{p, r, s}\right) \in \prod_{p+r+s=n} \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}\left(K^{s}, L^{-r}\right), M^{p}\right)
$$

We can apply the differentials $\mathrm{d}_{M}$ and $\mathrm{d}_{\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L \bullet\right)}$ to the element $\beta^{p, q}$ and we can apply the differentials $\mathrm{d}_{K}, \mathrm{~d}_{L}, \mathrm{~d}_{M}$ to the element $\beta^{p, r, s}$. We omit the precise definitions. The our sign rules tell us that

$$
\begin{aligned}
\mathrm{d}\left(\beta^{p, r, s}\right) & =\mathrm{d}_{M}\left(\beta^{p, r, s}\right)-(-1)^{n} \mathrm{~d}_{\operatorname{Hom} \bullet(K \bullet, L \bullet}\left(\beta^{p, r, s}\right) \\
& =\mathrm{d}_{M}\left(\beta^{p, r, s}\right)-(-1)^{n}\left(\mathrm{~d}_{L}\left(\beta^{p, r, s}\right)-(-1)^{r+s} \mathrm{~d}_{K}\left(\beta^{p, r, s}\right)\right) \\
& =\mathrm{d}_{M}\left(\beta^{p, r, s}\right)-(-1)^{n} \mathrm{~d}_{L}\left(\beta^{p, r, s}\right)+(-1)^{p} \mathrm{~d}_{K}\left(\beta^{p, r, s}\right)
\end{aligned}
$$

On the other hand, an element $\alpha$ of degree $n$ of the left hand side looks like

$$
\alpha=\left(\alpha^{t, s}\right) \in \bigoplus_{t+s=n} \operatorname{Hom}^{t}\left(L^{\bullet}, M^{\bullet}\right) \otimes K^{s}
$$

Each $\alpha^{t, s}$ maps to an element

$$
\alpha^{t, s} \mapsto\left(\alpha^{p, r, s}\right) \in \prod_{p+r+s=n} \operatorname{Hom}_{R}\left(L^{-r}, M^{p}\right) \otimes_{R} K^{s}
$$

By our sign rules and with conventions as above we get

$$
\begin{aligned}
\mathrm{d}\left(\alpha^{p, r, s}\right) & =\mathrm{d}_{\mathrm{Hom} \cdot(L \cdot, M \bullet)}\left(\alpha^{p, r, s}\right)+(-1)^{p+r} \mathrm{~d}_{K}\left(\alpha^{p, r, s}\right) \\
& =\mathrm{d}_{M}\left(\alpha^{p, r, s}\right)-(-1)^{p+r} \mathrm{~d}_{L}\left(\alpha^{p, r, s}\right)+(-1)^{p+r} \mathrm{~d}_{K}\left(\alpha^{p, r, s}\right)
\end{aligned}
$$

To define our map we will use the canonical maps

$$
c_{p, r, s}: \operatorname{Hom}_{R}\left(L^{-r}, M^{p}\right) \otimes_{R} K^{s} \longrightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}\left(K^{s}, L^{-r}\right), M^{p}\right)
$$

which sends $\varphi \otimes k$ to the map $\psi \mapsto \varphi(\psi(k))$. This is functorial in all three variables. However, since the signs above do not match we need to use instead some map

$$
\epsilon_{p, r, s} c_{p, r, s}
$$

for some sign $\epsilon_{p, r, s}$. Looking at the signs above we find that we need to find a solution for the equations

$$
\epsilon_{p, r, s}=\epsilon_{p+1, r, s}, \quad \epsilon_{p, r, s}(-1)^{s}=\epsilon_{p, r+1, s}, \quad \epsilon_{p, r, s}(-1)^{r}=\epsilon_{p, r, s+1}
$$

A good solution is to take $\epsilon_{p, r, s}=(-1)^{r s}$. The choice of this sign is explained in the remark following the proof.

0A61 Remark 15.59.4. In the yoga of super vector spaces the sign used in the proof of Lemma 15.59 .3 above can be explained as follows. A super vector space is just a vector space $V$ which comes with a direct sum decomposition $V=V^{+} \oplus V^{-}$. Here we think of the elements of $V^{+}$as the even elements and the elements of $V^{-}$as the odd ones. Given two super vector spaces $V$ and $W$ we set

$$
(V \otimes W)^{+}=\left(V^{+} \otimes W^{+}\right) \oplus\left(V^{-} \otimes W^{-}\right)
$$

and similarly for the odd part. In the category of super vector spaces the isomorphism

$$
V \otimes W \longrightarrow W \otimes V
$$

is defined to be the usual one, except that on the summand $V^{-} \otimes W^{-}$we use the negative of the usual identification. In this way we obtain a tensor category (where $\otimes$ is symmetric and associative with 1). The category of super vector spaces has an internal hom which we denote $V^{\vee}$. One checks that the canonical isomorphisms $\operatorname{Hom}(V, W)=W \otimes V^{\vee}$ and $\operatorname{Hom}(V, W)^{\vee}=V \otimes W^{\vee}$ do not involve signs. Finally, given three super vector spaces $U, V, W$ we can consider the analogue

$$
c: \operatorname{Hom}(V, W) \otimes U \longrightarrow \operatorname{Hom}(\operatorname{Hom}(U, V), W)
$$

of the maps $c_{p, r, s}$ which occur in the lemma above. Using the formulae given above (which do not involve signs) this becomes a map

$$
W \otimes V^{\vee} \otimes U \longrightarrow W \otimes U \otimes V^{\vee}
$$

which involves a $(-1)$ on elements $w \otimes v^{\vee} \otimes u$ if $v^{\vee}$ and $u$ are odd.

0A62 Lemma 15.59.5. Let $R$ be a ring. Given complexes $K^{\bullet}, L^{\bullet}$ of $R$-modules there is a canonical morphism

$$
K^{\bullet} \longrightarrow \operatorname{Hom}^{\bullet}\left(L^{\bullet}, \operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)
$$

of complexes of $R$-modules functorial in both complexes.
Proof. Let $\alpha$ be an element of degree $n$ of the right hand side. Thus

$$
\alpha=\left(\alpha^{p, q}\right) \in \prod_{p+q=n} \operatorname{Hom}_{R}\left(L^{-q}, \operatorname{Tot}^{p}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)
$$

Each $\alpha^{p, q}$ is an element

$$
\alpha^{p, q}=\left(\alpha^{r, s, q}\right) \in \bigoplus_{r+s+q=n} \operatorname{Hom}_{R}\left(L^{-q}, K^{r} \otimes_{R} L^{s}\right)
$$

By our sign rules we get

$$
\begin{aligned}
\mathrm{d}\left(\alpha^{r, s, q}\right) & =\mathrm{d}_{\operatorname{Tot}\left(K \bullet \otimes_{R} L \bullet\right)} \circ \alpha^{r, s, q}-(-1)^{n} \alpha^{r, s, q} \circ \mathrm{~d}_{L} \\
& =\mathrm{d}_{K} \circ \alpha^{r, s, q}+(-1)^{r} \mathrm{~d}_{L} \circ \alpha^{r, s, q}-(-1)^{n} \alpha^{r, s, q} \circ \mathrm{~d}_{L}
\end{aligned}
$$

Now an element $\beta \in K^{n}$ we send to $\alpha$ with $\alpha^{n, n-q, q}=\beta \otimes \operatorname{id}_{L^{-q}}$ and $\alpha^{r, s, q}=0$ if $r \neq n$. This is indeed an element as above, as for fixed $q$ there is only one nonzero $\alpha^{r, s, q}$. The description of the differential shows this is compatible with differentials.

### 15.60. Derived hom

0A5W Let $R$ be a ring. The derived hom we will define in this section is a functor

$$
D(R)^{o p p} \times D(R) \longrightarrow D(R), \quad(K, L) \longmapsto R \operatorname{Hom}(K, L)
$$

We will sometimes write $R \operatorname{Hom}_{R}(K, L)$ if we want to indicate the ring that is being used. This is an internal hom in the derived category of $R$-modules in the sense that it is characterized by the formula
0A63 (15.60.0.1)

$$
\operatorname{Hom}_{D(R)}(K, R \operatorname{Hom}(L, M))=\operatorname{Hom}_{D(R)}\left(K \otimes_{R}^{\mathbf{L}} L, M\right)
$$

for objects $K, L, M$ of $D(R)$. Note that this formula characterizes the objects up to unique isomorphism by the Yoneda lemma. A construction can be given as follows. Choose a K-injective complex $I^{\bullet}$ of $R$-modules representing $M$, choose a complex $L^{\bullet}$ representing $L$, and set

$$
R \operatorname{Hom}(L, M)=\operatorname{Hom}^{\bullet}\left(L^{\bullet}, I^{\bullet}\right)
$$

with notation as in Section 15.59 . A generalization of this construction is discussed in Differential Graded Algebra, Section 22.21. From 15.59.0.1) and Derived Categories, Lemma 13.29 .2 that we have

0A64

$$
\begin{equation*}
H^{n}(R \operatorname{Hom}(L, M))=\operatorname{Hom}_{D(R)}(L, M[n]) \tag{15.60.0.2}
\end{equation*}
$$

for all $n \in \mathbf{Z}$. In particular, the object $R \operatorname{Hom}(L, M)$ of $D(R)$ is well defined, i.e., independent of the choice of the K-injective complex $I^{\bullet}$.
0A65 Lemma 15.60.1. Let $R$ be a ring. Let $K, L, M$ be objects of $D(R)$. There is a canonical isomorphism

$$
R \operatorname{Hom}(K, R \operatorname{Hom}(L, M))=R \operatorname{Hom}\left(K \otimes_{R}^{\mathbf{L}} L, M\right)
$$

in $D(R)$ functorial in $K, L, M$ which recovers 15.60.0.1) by taking $H^{0}$.

Proof. Choose a K-injective complex $I^{\bullet}$ representing $M$ and a K-flat complex of $R$-modules $L^{\bullet}$ representing $L$. For any complex of $R$-modules $K^{\bullet}$ we have

$$
\operatorname{Hom}^{\bullet}\left(K^{\bullet}, \operatorname{Hom}^{\bullet}\left(L^{\bullet}, I^{\bullet}\right)\right)=\operatorname{Hom}^{\bullet}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right), I^{\bullet}\right)
$$

by Lemma 15.59 .1 The lemma follows by the definition of $R$ Hom and because $\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)$ represents the derived tensor product.

0A66 Lemma 15.60.2. Let $R$ be a ring. Let $P^{\bullet}$ be a bounded above complex of projective $R$-modules. Let $L^{\bullet}$ be a complex of $R$-modules. Then $R \operatorname{Hom}\left(P^{\bullet}, L^{\bullet}\right)$ is represented by the complex $\operatorname{Hom}^{\bullet}\left(P^{\bullet}, L^{\bullet}\right)$.

Proof. By 15.59 .0 .1 and Derived Categories, Lemma 13.19 .8 the cohomology groups of the complex are "correct". Hence if we choose a quasi-isomorphism $L^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ a K-injective complex of $R$-modules then the induced map

$$
\operatorname{Hom}^{\bullet}\left(P^{\bullet}, L^{\bullet}\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(P^{\bullet}, I^{\bullet}\right)
$$

is a quasi-isomorphism. As the right hand side is our definition of $R \operatorname{Hom}\left(P^{\bullet}, L^{\bullet}\right)$ we win.

0 A67 Lemma 15.60.3. Let $R$ be a ring. Let $K, L, M$ be objects of $D(R)$. There is a canonical morphism

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathbf{L}} K \longrightarrow R \operatorname{Hom}(R \operatorname{Hom}(K, L), M)
$$

in $D(R)$ functorial in $K, L, M$.
Proof. Choose a K-injective complex $I^{\bullet}$ representing $M$, a K-injective complex $J^{\bullet}$ representing $L$, and a K-flat complex $K^{\bullet}$ representing $K$. The map is defined using the map

$$
\operatorname{Tot}\left(\operatorname{Hom}^{\bullet}\left(J^{\bullet}, I^{\bullet}\right) \otimes_{R} K^{\bullet}\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(\operatorname{Hom}^{\bullet}\left(K^{\bullet}, J^{\bullet}\right), I^{\bullet}\right)
$$

of Lemma 15.59 .3 . We omit the proof that this is functorial in all three objects of $D(R)$.

0A8J Lemma 15.60.4. Let $R$ be a ring. Given $K, L, M$ in $D(R)$ there is a canonical morphism

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathbf{L}} R \operatorname{Hom}(K, L) \longrightarrow R \operatorname{Hom}(K, M)
$$

in $D(R)$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 15.59.2. Instead, we use the maps

gotten by applying Lemma 15.60 .3 , then $R \rightarrow R \operatorname{Hom}(K, K)$ induces the next arrow, then apply Lemma 15.60 .3 , then $R \rightarrow R \operatorname{Hom}(L, L)$ induces the final arrow. Finally, we use Lemma 15.60 .1 to translate the composition

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathbf{L}} R \operatorname{Hom}(K, L) \otimes_{R}^{\mathbf{L}} K \longrightarrow M
$$

into a map as in the statement of the lemma.
0A6B Lemma 15.60.5. Let $R$ be a ring. Given complexes $K, L$ in $D(R)$ there is a canonical morphism

$$
K \longrightarrow R \operatorname{Hom}\left(L, K \otimes_{R}^{\mathrm{L}} L\right)
$$

in $D(R)$ functorial in both $K$ and $L$.
Proof. Choose a K-flat complexes $K^{\bullet}$ and $L^{\bullet}$ representing $K$ and $L$. Choose a quasi-isomorphism $\operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right) \rightarrow I^{\bullet}$ where $I^{\bullet}$ is K-injective. Then we use the map

$$
K^{\bullet} \rightarrow \operatorname{Hom}^{\bullet}\left(L^{\bullet}, \operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right) \rightarrow \operatorname{Hom}^{\bullet}\left(L^{\bullet}, I^{\bullet}\right)
$$

where the first map is the map from Lemma 15.59 .5 .

### 15.61. Perfect complexes

0656 A perfect complex is a pseudo-coherent complex of finite tor dimension. We will not use this as the definition, but define perfect complexes over a ring directly as follows.

0657 Definition 15.61.1. Let $R$ be a ring. Denote $D(R)$ the derived category of the abelian category of $R$-modules.
(1) An object $K$ of $D(R)$ is perfect if it is quasi-isomorphic to a bounded complex of finite projective $R$-modules.
(2) An $R$-module $M$ is perfect if $M[0]$ is a perfect object in $D(R)$.

For example, over a Noetherian ring a finite module is perfect if and only if it has finite projective dimension, see Lemma 15.61 .3 and Algebra, Definition 10.108.2,
0658
Lemma 15.61.2. Let $K^{\bullet}$ be an object of $D(R)$. The following are equivalent
(1) $K^{\bullet}$ is perfect, and
(2) $K^{\bullet}$ is pseudo-coherent and has finite tor dimension.

If (1) and (2) hold and $K^{\bullet}$ has tor-amplitude in $[a, b]$, then $K^{\bullet}$ is quasi-isomorphic to a complex $E^{\bullet}$ of finite projective $R$-modules with $E^{i}=0$ for $i \notin[a, b]$.

Proof. It is clear that (1) implies (2), see Lemmas 15.54 .5 and 15.55 .3 . Assume (2) holds and that $K^{\bullet}$ has tor-amplitude in $[a, b]$. In particular, $H^{i}\left(K^{\bullet}\right)=0$ for $i>b$. Choose a complex $F^{\bullet}$ of finite free $R$-modules with $F^{i}=0$ for $i>b$ and a quasi-isomorphism $F^{\bullet} \rightarrow K^{\bullet}$ (Lemma 15.54.5). Set $E^{\bullet}=\tau_{\geq a} F^{\bullet}$. Note that $E^{i}$ is finite free except $E^{a}$ which is a finitely presented $R$-module. By Lemma 15.55.2 $E^{a}$ is flat. Hence by Algebra, Lemma 10.77 .2 we see that $E^{a}$ is finite projective.

066Q Lemma 15.61.3. Let $M$ be a module over a ring $R$. The following are equivalent
(1) $M$ is a perfect module, and
(2) there exists a resolution

$$
0 \rightarrow F_{d} \rightarrow \ldots \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

with each $F_{i}$ a finite projective $R$-module.
Proof. Assume (2). Then the complex $E^{\bullet}$ with $E^{-i}=F_{i}$ is quasi-isomorphic to $M[0]$. Hence $M$ is perfect. Conversely, assume (1). By Lemmas 15.61 .2 and 15.54 .4 we can find resolution $E^{\bullet} \rightarrow M$ with $E^{-i}$ a finite free $R$-module. By Lemma 15.55 .2 we see that $F_{d}=\operatorname{Coker}\left(E^{d-1} \rightarrow E^{d}\right)$ is flat for some $d$ sufficiently large. By Algebra, Lemma 10.77 .2 we see that $F_{d}$ is finite projective. Hence

$$
0 \rightarrow F_{d} \rightarrow E^{-d+1} \rightarrow \ldots \rightarrow E^{0} \rightarrow M \rightarrow 0
$$

is the desired resolution.
066R Lemma 15.61.4. Let $R$ be a ring. Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle in $D(R)$. If two out of three of $K^{\bullet}, L^{\bullet}, M^{\bullet}$ are perfect then the third is also perfect.

Proof. Combine Lemmas 15.61.2, 15.54.6, and 15.55 .4
066S Lemma 15.61.5. Let $R$ be a ring. If $K^{\bullet} \oplus L^{\bullet}$ is perfect, then so are $K^{\bullet}$ and $L^{\bullet}$.
Proof. Follows from Lemmas 15.61.2, 15.54.8, and 15.55.6.
066T Lemma 15.61.6. Let $R$ be a ring. Let $K^{\bullet}$ be a bounded complex of perfect $R$ modules. Then $K^{\bullet}$ is a perfect complex.

Proof. Follows by induction on the length of the finite complex: use Lemma 15.61.4 and the stupid truncations.

066U Lemma 15.61.7. Let $R$ be a ring. If $K^{\bullet} \in D^{b}(R)$ and all its cohomology modules are perfect, then $K^{\bullet}$ is perfect.

Proof. Follows by induction on the length of the finite complex: use Lemma 15.61 .4 and the canonical truncations.

066 V Lemma 15.61.8. Let $A \rightarrow B$ be a ring map. Assume that $B$ is perfect as an A-module. Let $K^{\bullet}$ be a perfect complex of $B$-modules. Then $K^{\bullet}$ is perfect as a complex of $A$-modules.

Proof. Using Lemma 15.61 .2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.55.11 and Lemma 15.54 .11 for those results.
066W Lemma 15.61.9. Let $A \rightarrow B$ be a ring map. Let $K^{\bullet}$ be a perfect complex of A-modules. Then $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ is a perfect complex of $B$-modules.
Proof. Using Lemma 15.61 .2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.55.12 and Lemma 15.54 .12 for those results.

066X Lemma 15.61.10. Let $A \rightarrow B$ be a flat ring map. Let $M$ be a perfect $A$-module. Then $M \otimes_{A} B$ is a perfect $B$-module.
Proof. By Lemma 15.61 .3 the assumption implies that $M$ has a finite resolution $F_{\bullet}$ by finite projective $R$-modules. As $A \rightarrow B$ is flat the complex $F_{\bullet} \otimes_{A} B$ is a finite length resolution of $M \otimes_{A} B$ by finite projective modules over $B$. Hence $M \otimes_{A} B$ is perfect.

066Y Lemma 15.61.11. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$ be elements which generate the unit ideal. Let $K^{\bullet}$ be a complex of $R$-modules. If for each $i$ the complex $K^{\bullet} \otimes_{R}$ $R_{f_{i}}$ is perfect, then $K^{\bullet}$ is perfect.
Proof. Using Lemma 15.61 .2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.55.15 and Lemma 15.54.14 for those results.

068 T Lemma 15.61.12. Let $R$ be a ring. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $R$ modules. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. If the complex $K^{\bullet} \otimes_{R} R^{\prime}$ has tor amplitude in $[a, b]$, then $K^{\bullet}$ has tor amplitude in $[a, b]$.
Proof. Using Lemma 15.61 .2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.55.16 and Lemma 15.54 .15 for those results.
066Z Lemma 15.61.13. Let $R$ be a regular ring of finite dimension. Then
(1) an $R$-module is perfect if and only if it is a finite $R$-module, and
(2) a complex of $R$-modules $K^{\bullet}$ is perfect if and only if $K^{\bullet} \in D^{b}(R)$ and each $H^{i}\left(K^{\bullet}\right)$ is a finite $R$-module.
Proof. By Algebra, Lemma 10.109 .8 the assumption on $R$ means that $R$ has finite global dimension. Hence every module has finite tor dimension, see Lemma 15.55.17. On the other hand, as $R$ is Noetherian, a module is pseudo-coherent if and only if it is finite, see Lemma 15.54 .16 . This proves part (1).
Let $K^{\bullet}$ be a complex of $R$-modules. If $K^{\bullet}$ is perfect, then it is in $D^{b}(R)$ and it is quasi-isomorphic to a finite complex of finite projective $R$-modules so certainly each $H^{i}\left(K^{\bullet}\right)$ is a finite $R$-module (as $R$ is Noetherian). Conversely, suppose that $K^{\bullet}$ is in $D^{b}(R)$ and each $H^{i}\left(K^{\bullet}\right)$ is a finite $R$-module. Then by (1) each $H^{i}\left(K^{\bullet}\right)$ is a perfect $R$-module, whence $K^{\bullet}$ is perfect by Lemma 15.61 .7

07 VI Lemma 15.61.14. Let $A$ be a ring. Let $K \in D(A)$ be perfect. Then $K^{\vee}=$ $R \operatorname{Hom}(K, A)$ is a perfect complex and $K=\left(K^{\vee}\right)^{\vee}$. There are functorial isomorphisms

$$
K^{\vee} \otimes_{A}^{\mathbf{L}} L=R \operatorname{Hom}(K, L) \quad \text { and } \quad H^{0}\left(K^{\vee} \otimes_{A}^{\mathbf{L}} L\right)=\operatorname{Ext}_{A}^{0}(K, L)
$$

for $L \in D(A)$.
Proof. We can represent $K$ by a complex $K^{\bullet}$ of finite projective $A$-modules. By Lemma 15.60 .2 the object $K^{\vee}$ is represented by the complex $E^{\bullet}=\operatorname{Hom}^{\bullet}\left(K^{\bullet}, A\right)$. Note that $E^{n}=\operatorname{Hom}_{A}\left(K^{-n}, A\right)$ and the differentials of $E^{\bullet}$ are the transpose of the differentials of $K^{\bullet}$. Thus the formula $\left(K^{\vee}\right)^{\vee}=K$ is clear from the fact that the double dual of a finite projective module is itself.
The second equality follows from the first by Lemma 15.60 .1 and Derived Categories, Lemma 13.19 .8 as well as the definition of Ext groups, see Derived Categories, Section 13.27. Let us prove the first equality.

Let $L^{\bullet}$ be a complex of $A$-modules representing $L$. The object on the left of the first equality is represented by $\operatorname{Tot}\left(E^{\bullet} \otimes_{A} L^{\bullet}\right)$. The object on the right of the first equality sign is represented by the complex $\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right)$ by the same lemma as before. Thus the equality follows from the fact that

$$
\operatorname{Hom}_{A}\left(K^{n}, A\right) \otimes_{A} L^{m}=\operatorname{Hom}_{A}\left(K^{n}, L^{m}\right)
$$

for all $n, m$ because $K^{n}$ is finite projective. To be a bit more precise we define the map on the level of complexes

$$
\operatorname{Tot}\left(E^{\bullet} \otimes_{A} L^{\bullet}\right)=\operatorname{Tot}\left(\operatorname{Hom}^{\bullet}\left(A, L^{\bullet}\right) \otimes_{A} \operatorname{Hom}^{\bullet}\left(K^{\bullet}, A\right)\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right)
$$

using Lemma 15.59 .2 and then the statement above shows this is an isomorphism of complexes.

0BKB Lemma 15.61.15. Let $A$ be a ring. Let $\left(K_{n}\right)_{n \in \mathbf{N}}$ be a system of perfect objects of $D(A)$. Let $K=$ hocolimK $K_{n}$ be the derived colimit (Derived Categories, Definition 13.31.1). Then for any object $E$ of $D(A)$ we have

$$
R \mathcal{H} o m(K, E)=R \lim E \otimes_{\mathcal{O}}^{\mathbf{L}} K_{n}^{\vee}
$$

where $\left(K_{n}^{\vee}\right)$ is the inverse system of dual perfect complexes.
Proof. By Lemma 15.61 .14 we have $R \lim E \otimes_{A}^{\mathbf{L}} K_{n}^{\vee}=R \lim R \mathcal{H o m}\left(K_{n}, E\right)$ which fits into the distinguished triangle

$$
R \lim R \mathcal{H o m}\left(K_{n}, E\right) \rightarrow \prod R \mathcal{H o m}\left(K_{n}, E\right) \rightarrow \prod R \mathcal{H o m}\left(K_{n}, E\right)
$$

Because $K$ similarly fits into the distinguished triangle $\bigoplus K_{n} \rightarrow \bigoplus K_{n} \rightarrow K$ it suffices to show that $\prod R \mathcal{H} \operatorname{lom}\left(K_{n}, E\right)=R \mathcal{H o m}\left(\bigoplus K_{n}, E\right)$. This is a formal consequence of 15.60 .0 .1 ) and the fact that derived tensor product commutes with direct sums.

0BC7 Lemma 15.61.16. Let $R=\operatorname{colim}_{i \in I} R_{i}$ be a filtered colimit of rings.
(1) Given a perfect $K$ in $D(R)$ there exists an $i \in I$ and a perfect $K_{i}$ in $D\left(R_{i}\right)$ such that $K \cong K_{i} \otimes_{R_{i}}^{\mathbf{L}} R$ in $D(R)$.
(2) Given $0 \in I$ and $K_{0}, L_{0} \in D(R)$ with $K_{0}$ perfect, we have

$$
\operatorname{Hom}_{D(R)}\left(K_{0} \otimes_{R_{0}}^{\mathbf{L}} R, L_{0} \otimes_{R_{0}}^{\mathbf{L}} R\right)=\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(R_{i}\right)}\left(K_{0} \otimes_{R_{0}}^{\mathbf{L}} R_{i}, L_{0} \otimes_{R_{0}}^{\mathbf{L}} R_{i}\right)
$$

In other words, the triangulated category of perfect complexes over $R$ is the colimit of the triangulated categories of perfect complexes over $R_{i}$.

Proof. We will use the results of Algebra, Lemmas 10.126 .3 and 10.126 .4 without further mention. These lemmas in particular say that the category of finitely presented $R$-modules is the colimit of the categories of finitely presented $R_{i}$-modules. Since finite projective modules can be characterized as summands of finite free modules (Algebra, Lemma 10.77.2) we see that the same is true for the category of finite projective modules. This proves (1) by our definition of perfect objects of $D(R)$.

To prove (2) we may represent $K_{0}$ by a bounded complex $K_{0}^{\bullet}$ of finite projective $R_{0}$-modules. We may represent $L_{0}$ by a K-flat complex $L_{0}^{\bullet}$ (Lemma 15.49.10). Then we have

$$
\operatorname{Hom}_{D(R)}\left(K_{0} \otimes_{R_{0}}^{\mathbf{L}} R, L_{0} \otimes_{R_{0}}^{\mathbf{L}} R\right)=\operatorname{Hom}_{K(R)}\left(K_{0}^{\bullet} \otimes_{R_{0}} R, L_{0}^{\bullet} \otimes_{R_{0}} R\right)
$$

by Derived Categories, Lemma 13.19.8. Similarly for the Hom with $R$ replaced by $R_{i}$. Since in the right hand side only a finite number of terms are involved, since

$$
\operatorname{Hom}_{R}\left(K_{0}^{p} \otimes_{R_{0}} R, L_{0}^{q} \otimes_{R_{0}} R\right)=\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{R_{i}}\left(K_{0}^{p} \otimes_{R_{0}} R_{i}, L_{0}^{q} \otimes_{R_{0}} R_{i}\right)
$$

by the lemmas cited at the beginning of the proof, and since filtered colimits are exact (Algebra, Lemma 10.8.9) we conclude that (2) holds as well.

### 15.62. Lifting complexes

0BC8 Let $R$ be a ring. Let $I \subset R$ be an ideal. The lifting problem we will consider is the following. Suppose given an object $K$ of $D(R)$ and a complex $E^{\bullet}$ of $R / I$-modules such that $E^{\bullet}$ represents $K \otimes{ }_{R}^{\mathbf{L}} R / I$ in $D(R)$. Question: Does there exist a complex of $R$-modules $P^{\bullet}$ lifting $E^{\bullet}$ representing $K$ in $D(R)$ ? In general the answer to this question is no, but in good cases something can be done. We first discuss lifting acyclic complexes.

0BC9 Lemma 15.62.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $\mathcal{P}$ be a class of $R$-modules. Assume
(1) each $P \in \mathcal{P}$ is a projective $R$-module,
(2) if $P_{1} \in \mathcal{P}$ and $P_{1} \oplus P_{2} \in \mathcal{P}$, then $P_{2} \in \mathcal{P}$, and
(3) if $f: P_{1} \rightarrow P_{2}, P_{1}, P_{2} \in \mathcal{P}$ is surjective modulo $I$, then $f$ is surjective.

Then given any bounded above acyclic complex $E^{\bullet}$ whose terms are of the form $P / I P$ for $P \in \mathcal{P}$ there exists a bounded above acyclic complex $P^{\bullet}$ whose terms are in $\mathcal{P}$ lifting $E^{\bullet}$.

Proof. Say $E^{i}=0$ for $i>b$. Assume given $n$ and a morphism of complexes

with $P^{i} \in \mathcal{P}$, with $P^{n} \rightarrow P^{n+1} \rightarrow \ldots \rightarrow P^{b}$ acyclic in degrees $\geq n+1$, and with vertical maps inducing isomorphisms $P^{i} / I P^{i} \rightarrow E^{i}$. In this situation one can inductively choose isomorphisms $P^{i}=Z^{i} \oplus Z^{i+1}$ such that the maps $P^{i} \rightarrow P^{i+1}$ are given by $Z^{i} \oplus Z^{i+1} \rightarrow Z^{i+1} \rightarrow Z^{i+1} \oplus Z^{i+2}$. By property (2) and arguing inductively we see that $Z^{i} \in \mathcal{P}$. Choose $P^{n-1} \in \mathcal{P}$ and an isomorphism $P^{n-1} / I P^{n-1} \rightarrow E^{n-1}$. Since $P^{n-1}$ is projective and since $Z^{n} / I Z^{n}=\operatorname{Im}\left(E^{n-1} \rightarrow E^{n}\right)$, we can lift the map $P^{n-1} \rightarrow E^{n-1} \rightarrow E^{n}$ to a map $P^{n-1} \rightarrow Z^{n}$. By property (3) the map $P^{n-1} \rightarrow Z^{n}$
is surjective. Thus we obtain an extension of the diagram by adding $P^{n-1}$ and the maps just constructed to the left of $P^{n}$. Since a diagram of the desired form exists for $n>b$ we conclude by induction on $n$.

0BCA Lemma 15.62.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $\mathcal{P}$ be a class of $R$-modules. Let $K \in D(R)$ and let $E^{\bullet}$ be a complex of $R / I$-modules representing $K \otimes{ }_{R}^{\mathbf{L}} R / I$. Assume
(1) each $P \in \mathcal{P}$ is a projective $R$-module,
(2) $P_{1} \in \mathcal{P}$ and $P_{1} \oplus P_{2} \in \mathcal{P}$ if and only if $P_{1}, P_{2} \in \mathcal{P}$,
(3) if $f: P_{1} \rightarrow P_{2}, P_{1}, P_{2} \in \mathcal{P}$ is surjective modulo $I$, then $f$ is surjective,
(4) $E^{\bullet}$ is bounded above and $E^{i}$ is of the form $P / I P$ for $P \in \mathcal{P}$, and
(5) $K$ can be represented by a bounded above complex whose terms are in $\mathcal{P}$.

Then there exists a bounded above complex $P^{\bullet}$ whose terms are in $\mathcal{P}$ with $P^{\bullet} / I P^{\bullet}$ isomorphic to $E^{\bullet}$ and representing $K$ in $D(R)$.

Proof. By assumption (5) we can represent $K$ by a bounded above complex $K^{\bullet}$ whose terms are in $\mathcal{P}$. Then $K \otimes_{R}^{\mathbf{L}} R / I$ is represented by $K^{\bullet} / I K^{\bullet}$. Since $E^{\bullet}$ is a bounded above complex of projective $R / I$-modules by (4), we can choose a quasiisomorphism $\delta: E^{\bullet} \rightarrow K^{\bullet} / I K^{\bullet}$ (Derived Categories, Lemma 13.19.8). Let $C^{\bullet}$ be cone on $\delta$. (Derived Categories, Definition 13.9.1). The module $C^{i}$ is the direct sum of $K^{i} / I K^{i} \oplus E^{i+1}$ hence is of the form $P / I P$ for some $P \in \mathcal{P}$ as (2) says in particular that $\mathcal{P}$ is preserved under taking sums. Since $C^{\bullet}$ is acyclic, we can apply Lemma 15.62 .1 and find a acyclic lift $A^{\bullet}$ of $C^{\bullet}$. The complex $A^{\bullet}$ is bounded above and has terms in $\mathcal{P}$. In

we can find the dotted arrow making the diagram commute by Derived Categories, Lemma 13.19 .6 . We will show below that it follows from (1), (2), (3) that $K^{i} \rightarrow A^{i}$ is the inclusion of a direct summand for every $i$. By property (2) we see that $P^{i}=\operatorname{Coker}\left(K^{i} \rightarrow A^{i}\right)$ is in $\mathcal{P}$. Thus we can take $P^{\bullet}=\operatorname{Coker}\left(K^{\bullet} \rightarrow A^{\bullet}\right)[-1]$ to conclude.

To finish the proof we have to show the following: Let $f: P_{1} \rightarrow P_{2}, P_{1}, P_{2} \in \mathcal{P}$ and $P_{1} / I P_{1} \rightarrow P_{2} / I P_{2}$ is split injective with cokernel of the form $P_{3} / I P_{3}$ for some $P_{3} \in \mathcal{P}$, then $f$ is split injective. Write $E_{i}=P_{i} / I P_{i}$. Then $E_{2}=E_{1} \oplus E_{3}$. Since $P_{2}$ is projective we can choose a map $g: P_{2} \rightarrow P_{3}$ lifting the map $E_{2} \rightarrow E_{3}$. By condition (3) the map $g$ is surjective, hence split as $P_{3}$ is projective. Set $P_{1}^{\prime}=\operatorname{Ker}(g)$ and choose a splitting $P_{2}=P_{1}^{\prime} \oplus P_{3}$. Then $P_{1}^{\prime} \in \mathcal{P}$ by (2). We do not know that $g \circ f=0$, but we can consider the map

$$
P_{1} \xrightarrow{f} P_{2} \xrightarrow{\text { projection }} P_{1}^{\prime}
$$

The composition modulo $I$ is an isomorphism. Since $P_{1}^{\prime}$ is projective we can split $P_{1}=T \oplus P_{1}^{\prime}$. If $T=0$, then we are done, because then $P_{2} \rightarrow P_{1}^{\prime}$ is a splitting of $f$. We see that $T \in \mathcal{P}$ by (2). Calculating modulo $I$ we see that $T / I T=0$. Since $0 \in \mathcal{P}$ (as the summand of any $P$ in $\mathcal{P}$ ) we see the map $0 \rightarrow T$ is surjective and we conclude that $T=0$ as desired.

09 AR Lemma 15.62.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $E^{\bullet}$ be a complex of $R / I$-modules. Let $K$ be an object of $D(R)$. Assume that
(1) $E^{\bullet}$ is a bounded above complex of projective $R / I$-modules,
(2) $K \otimes_{R}^{\mathbf{L}} R / I$ is represented by $E^{\bullet}$ in $D(R / I)$, and
(3) $I$ is a nilpotent ideal.

Then there exists a bounded above complex $P^{\bullet}$ of projective $R$-modules representing $K$ in $D(R)$ such that $P^{\bullet} \otimes_{R} R / I$ is isomorphic to $E^{\bullet}$.

Proof. We apply Lemma 15.62 .2 using the class $\mathcal{P}$ of all projective $R$-modules. Properties (1) and (2) of the lemma are immediate. Property (3) follows from Nakayama's lemma (Algebra, Lemma 10.19.1). Property (4) follows from the fact that we can lift projective $R / I$-modules to projective $R$-modules, see Algebra, Lemma 10.76.4 To see that (5) holds it suffices to show that $K$ is in $D^{-}(R)$. We are given that $K \otimes_{R}^{\mathbf{L}} R / I$ is in $D^{-}(R / I)$ (because $E^{\bullet}$ is bounded above). We will show by induction on $n$ that $K \otimes_{R}^{\mathbf{L}} R / I^{n}$ is in $D^{-}\left(R / I^{n}\right)$. This will finish the proof because $I$ being nilpotent exactly means that $I^{n}=0$ for some $n$. We may represent $K$ by a K-flat complex $K^{\bullet}$ with flat terms (Lemma 15.49.10). Then derived tensor products are represented by usual tensor products. Thus we consider the exact sequence

$$
0 \rightarrow K^{\bullet} \otimes_{R} I^{n} / I^{n+1} \rightarrow K^{\bullet} \otimes_{R} R / I^{n+1} \rightarrow K^{\bullet} \otimes_{R} R / I^{n} \rightarrow 0
$$

Thus the cohomology of $K \otimes_{R}^{\mathbf{L}} R / I^{n+1}$ sits in a long exact sequence with the cohomology of $K \otimes_{R}^{\mathbf{L}} R / I^{n}$ and the cohomology of

$$
K \otimes_{R}^{\mathbf{L}} I^{n} / I^{n+1}=K \otimes_{R}^{\mathbf{L}} R / I \otimes_{R / I}^{\mathbf{L}} I^{n} / I^{n+1}
$$

The first cohomologies vanish above a certain degree by induction assumption and the second cohomologies vanish above a certain degree because $K^{\bullet} \otimes{ }_{R}^{\mathbf{L}} R / I$ is bounded above and $I^{n} / I^{n+1}$ is in degree 0 .

0BCB Lemma 15.62.4. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $E^{\bullet}$ be a complex of $R / I$-modules. Let $K$ be an object of $D(R)$. Assume that
(1) $E^{\bullet}$ is a bounded above complex of finite stably free $R / I$-modules,
(2) $K \otimes{ }_{R}^{\mathbf{L}} R / I$ is represented by $E^{\bullet}$ in $D(R / I)$,
(3) $K^{\bullet}$ is pseudo-coherent, and
(4) every element of $1+I$ is invertible.

Then there exists a bounded above complex $P^{\bullet}$ of finite stably free $R$-modules representing $K$ in $D(R)$ such that $P^{\bullet} \otimes_{R} R / I$ is isomorphic to $E^{\bullet}$. Moreover, if $E^{i}$ is free, then $P^{i}$ is free.

Proof. We apply Lemma 15.62 .2 using the class $\mathcal{P}$ of all finite stably free $R$ modules. Property (1) of the lemma is immediate. Property (2) follows from Lemma 15.3.2. Property (3) follows from Nakayama's lemma (Algebra, Lemma 10.19.1. Property (4) follows from the fact that we can lift finite stably free $R / I$ modules to finite stably free $R$-modules, see Lemma 15.3.3. Part (5) holds because a pseudo-coherent complex can be represented by a bounded above complex of finite free $R$-modules. The final assertion of the lemma follows from Lemma 15.3.4

0BCC Lemma 15.62.5. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $K \in D(R)$ be pseudo-coherent. Set $d_{i}=\operatorname{dim}_{\kappa} H^{i}\left(K \otimes_{R}^{\mathbf{L}} \kappa\right)$. Then $d_{i}<\infty$ and for some $b \in \mathbf{Z}$ we have $d_{i}=0$ for
$i>b$. Then there exists a complex

$$
\ldots \rightarrow R^{\oplus d_{b-2}} \rightarrow R^{\oplus d_{b-1}} \rightarrow R^{\oplus d_{b}} \rightarrow 0 \rightarrow \ldots
$$

representing $K$ in $D(R)$.
Proof. Observe that $K \otimes_{R}^{\mathbf{L}} \kappa$ is pseudo-coherent as an object of $D(\kappa)$, see Lemma 15.54.12. Hence the cohomology spaces are finite dimensional and vanish above some cutoff. Every object of $D(\kappa)$ is isomorphic in $D(\kappa)$ to a complex $E^{\bullet}$ with zero differentials. In particular $E^{i} \cong \kappa^{\oplus d_{i}}$ is finite free. Applying Lemma 15.62.4 we obtain the desired result.

0BCD Lemma 15.62.6. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime. Let $K \in D(R)$ be perfect. Set $d_{i}=\operatorname{dim}_{\kappa(\mathfrak{p})} H^{i}\left(K \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)$. Then $d_{i}<\infty$ and only a finite number are nonzero. Then there exists an $f \in R, f \notin \mathfrak{p}$ and a complex

$$
\ldots \rightarrow 0 \rightarrow R_{f}^{\oplus d_{a}} \rightarrow R_{f}^{\oplus d_{a+1}} \rightarrow \ldots \rightarrow R_{f}^{\oplus d_{b-1}} \rightarrow R_{f}^{\oplus d_{b}} \rightarrow 0 \rightarrow \ldots
$$

representing $K \otimes{ }_{R}^{\mathbf{L}} R_{f}$ in $D\left(R_{f}\right)$.
Proof. Observe that $K \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})$ is perfect as an object of $D(\kappa(\mathfrak{p}))$, see Lemma 15.61.9. Hence only a finite number of $d_{i}$ are nonzero and they are all finite. Applying Lemma 15.62 .5 we get a complex representing $K$ having the desired shape over the local ring $R_{\mathfrak{p}}$. We have $R_{\mathfrak{p}}=\operatorname{colim} R_{f}$ for $f \in R, f \notin \mathfrak{p}$ (Algebra, Lemma 10.9.9. We conclude by Lemma 15.61.16. Some details omitted.

0BCE Lemma 15.62.7. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $E^{\bullet}$ be a complex of $R / I$-modules. Let $K$ be an object of $D(R)$. Assume that
(1) $E^{\bullet}$ is a bounded above complex of finite projective $R / I$-modules,
(2) $K \otimes \otimes_{R}^{\mathbf{L}} R / I$ is represented by $E^{\bullet}$ in $D(R / I)$,
(3) $K$ is pseudo-coherent, and
(4) $(R, I)$ is a henselian pair.

Then there exists a bounded above complex $P^{\bullet}$ of finite projective $R$-modules representing $K$ in $D(R)$ such that $P^{\bullet} \otimes_{R} R / I$ is isomorphic to $E^{\bullet}$. Moreover, if $E^{i}$ is free, then $P^{i}$ is free.

Proof. We apply Lemma 15.62 .2 using the class $\mathcal{P}$ of all finite projective $R$ modules. Properties (1) and (2) of the lemma are immediate. Property (3) follows from Nakayama's lemma (Algebra, Lemma 10.19.1). Property (4) follows from the fact that we can lift finite projective $R / I$-modules to finite projective $R$-modules, see Lemma 15.7.10, observe that since $(R, I)$ is a henselian pair, any étale ring map $R \rightarrow \overline{R^{\prime}}$ such that $R / I \cong R^{\prime} / I R^{\prime}$ has a section. Part (5) holds because a pseudo-coherent complex can be represented by a bounded above complex of finite free $R$-modules. The final assertion of the lemma follows from Lemma 15.3.4

### 15.63. Splitting complexes

0BCF In this section we discuss conditions which imply an object of the derived category of a ring is a direct sum of its truncations. Our method is to use the following lemma (under suitable hypotheses) to split the canonical distinguised triangles

$$
\tau_{\leq i} K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq i+1} K^{\bullet} \rightarrow\left(\tau_{\leq i} K^{\bullet}\right)[1]
$$

in $D(R)$, see Derived Categories, Remark 13.12 .4 .

0BCG Lemma 15.63.1. Let $R$ be a ring. Let $K^{\bullet}$ and $L^{\bullet}$ be complexes of $R$-modules such that $L^{\bullet}$ is perfect of tor-amplitude in $[a, b]$.
(1) If $H^{i}\left(K^{\bullet}\right)=0$ for $i \geq a$, then $\operatorname{Hom}_{D(R)}\left(L^{\bullet}, K^{\bullet}\right)=0$.
(2) If $H^{i}\left(K^{\bullet}\right)=0$ for $i \geq a+1$, then given any distinguished triangle $K^{\bullet} \rightarrow$ $M^{\bullet} \rightarrow L^{\bullet} \rightarrow K^{\bullet}[1]$ there is an isomorphism $M^{\bullet} \cong K^{\bullet} \oplus L^{\bullet}$ in $D(R)$ compatible with the maps in the distinguished triangle.
(3) If $H^{i}\left(K^{\bullet}\right)=0$ for $i \geq a$, then the isomorphism in (2) exists and is unique.

Proof. We may assume $L^{\bullet}$ is a finite complex of finite free $R$-modules with $L^{i}=0$ for $i \notin[a, b]$, see Lemma 15.61.2. If $H^{i}\left(K^{\bullet}\right)=0$ for $i \geq a$, then $K^{\bullet}$ is quasiisomorphic to $\tau_{\leq a-1} K^{\bullet}$, hence we may assume that $K^{i}=0$ for $i \geq a$. Then we obtain

$$
\operatorname{Hom}_{D(R)}\left(L^{\bullet}, K^{\bullet}\right)=\operatorname{Hom}_{K(R)}\left(L^{\bullet}, K^{\bullet}\right)=0
$$

by Derived Categories, Lemma 13.19 .8 . This proves (1). Under the hypotheses of (2) we see that $\operatorname{Hom}_{D(R)}\left(L^{\bullet}, K^{\bullet}[1]\right)=0$ by (1), hence the distinguished triangle is split by Derived Categories, Lemma 13.4.10. The uniqueness of (3) follows from (1).

0A1U Lemma 15.63.2. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $K^{\bullet}$ be a pseudo-coherent complex of $R$-modules. Assume that for some $i \in \mathbf{Z}$ the map

$$
H^{i}\left(K^{\bullet}\right) \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)
$$

is surjective. Then there exists an $f \in R, f \notin \mathfrak{p}$ such that $\tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right)$ is a perfect object of $D\left(R_{f}\right)$ with tor amplitude in $[i+1, \infty]$. Thus a canonical isomorphism

$$
K^{\bullet} \otimes_{R} R_{f} \cong \tau_{\leq i}\left(K^{\bullet} \otimes_{R} R_{f}\right) \oplus \tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right)
$$

in $D\left(R_{f}\right)$.
Proof. In this proof all tensor products are over $R$ and we write $\kappa=\kappa(\mathfrak{p})$. We may assume that $K^{\bullet}$ is a bounded above complex of finite free $R$-modules. Let us inspect what is happening in degree $i$ :

$$
\ldots \rightarrow K^{i-1} \xrightarrow{d^{i-1}} K^{i} \xrightarrow{d^{i}} K^{i+1} \rightarrow \ldots
$$

Let $0 \subset V \subset W \subset K^{i} \otimes \kappa$ be defined by the formulas

$$
V=\operatorname{Im}\left(K^{i-1} \otimes \kappa \rightarrow K^{i} \otimes \kappa\right) \quad \text { and } \quad W=\operatorname{Ker}\left(K^{i} \otimes \kappa \rightarrow K^{i+1} \otimes \kappa\right)
$$

Set $\operatorname{dim}(V)=r, \operatorname{dim}(W / V)=s$, and $\operatorname{dim}\left(K^{i} \otimes \kappa / W\right)=t$. We can pick $x_{1}, \ldots, x_{r} \in$ $K^{i-1}$ which map by $d^{i-1}$ to a basis of $V$. By our assumption we can pick $y_{1}, \ldots, y_{s} \in$ $\operatorname{Ker}\left(d^{i}\right)$ mapping to a basis of $W / V$. Finally, choose $z_{1}, \ldots, z_{t} \in K^{i}$ mapping to a basis of $K^{i} \otimes \kappa / W$. Then we see that the elements $d^{i}\left(z_{1}\right), \ldots, d^{i}\left(z_{t}\right) \in K^{i+1}$ are linearly independent in $K^{i+1} \otimes_{R} \kappa$. By Algebra, Lemma 10.78 .3 we may after replacing $R$ by $R_{f}$ for some $f \in R, f \notin \mathfrak{p}$ assume that
(1) $d^{i}\left(x_{a}\right), y_{b}, z_{c}$ is an $R$-basis of $K^{i}$,
(2) $d^{i}\left(z_{1}\right), \ldots, d^{i}\left(z_{t}\right)$ are $R$-linearly independent in $K^{i+1}$, and
(3) the quotient $E^{i+1}=K^{i+1} / \sum R d^{i}\left(z_{c}\right)$ is finite projective.

Since $d^{i}$ annihilates $d^{i-1}\left(x_{a}\right)$ and $y_{b}$, we deduce from condition (2) that $E^{i+1}=$ $\operatorname{Coker}\left(d^{i}: K^{i} \rightarrow K^{i+1}\right)$. Thus we see that

$$
\tau_{\geq i+1} K^{\bullet}=\left(\ldots \rightarrow 0 \rightarrow E^{i+1} \rightarrow K^{i+2} \rightarrow \ldots\right)
$$

is a bounded complex of finite projective modules sitting in degrees $[i+1, b]$ for some $b$. Thus $\tau_{\geq i+1} K^{\bullet}$ is perfect of amplitude $[i+1, b]$. Since $\tau_{\leq i} K^{\bullet}$ has no cohomology in degrees $>i$, we may apply Lemma 15.63 .1 to the distinguished triangle

$$
\tau_{\leq i} K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq i+1} K^{\bullet} \rightarrow\left(\tau_{\leq i} K^{\bullet}\right)[1]
$$

(Derived Categories, Remark 13.12.4) to conclude.
0A1V Lemma 15.63.3. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $K^{\bullet}$ be a pseudo-coherent complex of $R$-modules. Assume that for some $i \in \mathbf{Z}$ the maps
$H^{i}\left(K^{\bullet}\right) \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right) \quad$ and $\quad H^{i-1}\left(K^{\bullet}\right) \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow H^{i-1}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)$ are surjective. Then there exists an $f \in R, f \notin \mathfrak{p}$ such that
(1) $\tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right)$ is a perfect object of $D\left(R_{f}\right)$ with tor amplitude in $[i+$ $1, \infty]$,
(2) $H^{i}\left(K^{\bullet}\right)_{f}$ is a finite free $R_{f}$-module, and
(3) there is a canonical direct sum decomposition

$$
\begin{aligned}
& K^{\bullet} \otimes_{R} R_{f} \cong \tau_{\leq i-1}\left(K^{\bullet} \otimes_{R} R_{f}\right) \oplus H^{i}\left(K^{\bullet}\right)_{f} \oplus \tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right) \\
& \text { in } D\left(R_{f}\right) .
\end{aligned}
$$

Proof. We get (1) from Lemma 15.63 .2 as well as a splitting $K^{\bullet} \otimes_{R} R_{f}=\tau_{\leq i} K^{\bullet} \otimes_{R}$ $R_{f} \oplus \tau_{\geq i+1} K^{\bullet} \otimes_{R} R_{f}$ in $D\left(R_{f}\right)$. Applying Lemma 15.63 .2 once more to $\tau_{\leq i} K^{\bullet} \otimes_{R} R_{f}$ we obtain (after suitably choosing $f$ ) a splitting $\tau_{\leq i} K^{\bullet} \otimes_{R} R_{f}=\tau_{\leq i-1} K^{\bullet} \otimes_{R} R_{f} \oplus$ $H^{i}\left(K^{\bullet}\right)_{f}$ in $D\left(R_{f}\right)$ as well as the conclusion that $H^{i}(K)_{f}$ is a flat perfect module, i.e., finite projective.

068 U Lemma 15.63.4. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $i \in \mathbf{Z}$. Let $K^{\bullet}$ be a pseudo-coherent complex of $R$-modules such that $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)=0$. Then there exists an $f \in R, f \notin \mathfrak{p}$ and a canonical direct sum decomposition

$$
K^{\bullet} \otimes_{R} R_{f}=\tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right) \oplus \tau_{\leq i-1}\left(K^{\bullet} \otimes_{R} R_{f}\right)
$$

in $D\left(R_{f}\right)$ with $\tau_{\geq i+1}\left(K^{\bullet} \otimes_{R} R_{f}\right)$ a perfect complex with tor-amplitude in $[i+1, \infty]$.
Proof. This is an often used special case of Lemma 15.63.2. A direct proof is as follows. We may assume that $K^{\bullet}$ is a bounded above complex of finite free $R$-modules. Let us inspect what is happening in degree $i$ :

$$
\ldots \rightarrow K^{i-2} \rightarrow R^{\oplus l} \rightarrow R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow K^{i+2} \rightarrow \ldots
$$

Let $A$ be the $m \times l$ matrix corresponding to $K^{i-1} \rightarrow K^{i}$ and let $B$ be the $n \times m$ matrix corresponding to $K^{i} \rightarrow K^{i+1}$. The assumption is that $A \bmod \mathfrak{p}$ has rank $r$ and that $B \bmod \mathfrak{p}$ has rank $m-r$. In other words, there is some $r \times r$ minor $a$ of $A$ which is not in $\mathfrak{p}$ and there is some $(m-r) \times(m-r)$-minor $b$ of $B$ which is not in $\mathfrak{p}$. Set $f=a b$. Then after inverting $f$ we can find direct sum decompositions $K^{i-1}=R^{\oplus l-r} \oplus R^{\oplus r}, K^{i}=R^{\oplus r} \oplus R^{\oplus m-r}, K^{i+1}=R^{\oplus m-r} \oplus R^{\oplus n-m+r}$ such that the module map $K^{i-1} \rightarrow K^{i}$ kills of $R^{\oplus l-r}$ and induces an isomorphism of $R^{\oplus r}$ onto the corresponding summand of $K^{i}$ and such that the module map $K^{i} \rightarrow K^{i+1}$ kills of $R^{\oplus r}$ and induces an isomorphism of $R^{\oplus m-r}$ onto the corresponding summand of $K^{i+1}$. Thus $K^{\bullet}$ becomes quasi-isomorphic to

$$
\ldots \rightarrow K^{i-2} \rightarrow R^{\oplus l-r} \rightarrow 0 \rightarrow R^{\oplus n-m+r} \rightarrow K^{i+2} \rightarrow \ldots
$$

and everything is clear.

068V Lemma 15.63.5. Let $R$ be a ring. Let $a, b \in \mathbf{Z}$. Let $K^{\bullet}$ be a pseudo-coherent complex of $R$-modules. The following are equivalent
(1) $K^{\bullet}$ is perfect with tor amplitude in $[a, b]$,
(2) for every prime $\mathfrak{p}$ we have $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)=0$ for all $i \notin[a, b]$, and
(3) for every maximal ideal $\mathfrak{m}$ we have $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{m})\right)=0$ for all $i \notin[a, b]$.

Proof. We omit the proof of the implications $(1) \Rightarrow(2) \Rightarrow(3)$. Assume (3). Let $i \in \mathbf{Z}$ with $i \notin[a, b]$. By Lemma 15.63 .4 we see that the assumption implies that $H^{i}\left(K^{\bullet}\right)_{\mathfrak{m}}=0$ for all maximal ideals of $R$. Hence $H^{i}\left(K^{\bullet}\right)=0$, see Algebra, Lemma 10.23.1. Moreover, Lemma 15.63 .4 now also implies that for every maximal ideal $\mathfrak{m}$ there exists an element $f \in R, f \notin \mathfrak{m}$ such that $K^{\bullet} \otimes_{R} R_{f}$ is perfect with tor amplitude in $[a, b]$. Hence we conclude by appealing to Lemmas 15.61 .11 and 15.55.15

068W Lemma 15.63.6. Let $R$ be a ring. Let $K^{\bullet}$ be a pseudo-coherent complex of $R$ modules. Consider the following conditions
(1) $K^{\bullet}$ is perfect,
(2) for every prime ideal $\mathfrak{p}$ the complex $K^{\bullet} \otimes_{R} R_{\mathfrak{p}}$ is perfect,
(3) for every maximal ideal $\mathfrak{m}$ the complex $K^{\bullet} \otimes_{R} R_{\mathfrak{m}}$ is perfect,
(4) for every prime $\mathfrak{p}$ we have $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{p})\right)=0$ for all $i \ll 0$,
(5) for every maximal ideal $\mathfrak{m}$ we have $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa(\mathfrak{m})\right)=0$ for all $i \ll 0$.

We always have the implications

$$
(1) \Rightarrow(2) \Leftrightarrow(3) \Leftrightarrow(3) \Leftrightarrow(4) \Leftrightarrow(5)
$$

If $K^{\bullet}$ is in $D^{-}(R)$, then all conditions are equivalent.
Proof. By Lemma 15.61 .9 we see that (1) implies (2). It is immediate that (2) $\Rightarrow$ (3). Since every prime $\mathfrak{p}$ is contained in a maximal ideal $\mathfrak{m}$, we can apply Lemma 15.61 .9 to the map $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{p}}$ to see that (3) implies (2). Applying Lemma 15.61 .9 to the residue maps $R_{\mathfrak{p}} \rightarrow \kappa(\mathfrak{p})$ and $R_{\mathfrak{m}} \rightarrow \kappa(\mathfrak{m})$ we see that (2) implies (4) and (3) implies (5).

Assume $R$ is local with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. We will show that if $H^{i}\left(K^{\bullet} \otimes^{\mathbf{L}} \kappa\right)=0$ for $i<a$ for some $a$, then $K$ is perfect. This will show that (4) implies (2) and (5) implies (3) whence the first part of the lemma. First we apply Lemma 15.63 .4 with $i=a-1$ to see that $K^{\bullet}=\tau_{\leq a-1} K^{\bullet} \oplus \tau_{\geq a} K^{\bullet}$ in $D(R)$ with $\tau_{\geq a} K^{\bullet}$ perfect of tor-amplitude contained in $[a, \infty]$. To finish we need to show that $\tau_{\leq a-1} K$ is zero, i.e., that its cohomology groups are zero. If not let $i$ be the largest index such that $M=H^{i}\left(\tau_{\leq a-1} K\right)$ is not zero. Then $M$ is a finite $R$-module because $\tau_{\leq a-1} K^{\bullet}$ is pseudo-coherent (Lemmas 15.54 .3 and 15.54 .8 . Thus by Nakayama's lemma (Algebra, Lemma 10.19.1) we find that $M \otimes_{R} \kappa$ is nonzero. This implies that

$$
H^{i}\left(\left(\tau_{\leq a-1} K^{\bullet}\right) \otimes_{R}^{\mathbf{L}} \kappa\right)=H^{i}\left(K^{\bullet} \otimes_{R}^{\mathbf{L}} \kappa\right)
$$

is nonzero which is a contradiction.
Assume the equivalent conditions (2) - (5) hold and that $K^{\bullet}$ is in $D^{-}(R)$. Say $H^{i}\left(K^{\bullet}\right)=0$ for $i<a$. Pick a maximal ideal $\mathfrak{m}$ of $R$. It suffices to show there exists an $f \in R, f \notin \mathfrak{m}$ such that $K^{\bullet} \otimes_{R}^{\mathbf{L}} R_{f}$ is perfect (Lemma 15.61.11 and Algebra, Lemma 10.16 .10 . After possibly choosing a smaller $a$ we may assume that also $H^{i}\left(K^{\bullet} \otimes_{R}^{\mathrm{L}} \kappa\right)=0$ for $i<a$. By Lemma 15.63 .4 after replacing $R$ by $R_{f}$ for some
$f \in R, f \notin \mathfrak{m}$ we can write $K^{\bullet}=\tau_{\leq a-1} K^{\bullet} \oplus \tau_{\geq a} K^{\bullet}$ in $D(R)$. Since $H^{i}\left(K^{\bullet}\right)=0$ for $i<a$ we see that $\tau_{\leq a-1} K^{\bullet}=0$ in $D(R)$ as desired.

The following lemma useful in order to find perfect complexes over a polynomial $\operatorname{ring} B=A\left[x_{1}, \ldots, x_{d}\right]$.

068X Lemma 15.63.7. Let $A \rightarrow B$ be a ring map. Let $a, b \in \mathbf{Z}$. Let $d \geq 0$. Let $K^{\bullet}$ be a complex of $B$-modules. Assume
(1) the ring map $A \rightarrow B$ is flat,
(2) for every prime $\mathfrak{p} \subset A$ the ring $B \otimes_{A} \kappa(\mathfrak{p})$ has finite global dimension $\leq d$,
(3) $K^{\bullet}$ is pseudo-coherent as a complex of $B$-modules, and
(4) $K^{\bullet}$ has tor amplitude in $[a, b]$ as a complex of $A$-modules.

Then $K^{\bullet}$ is perfect as a complex of $B$-modules with tor amplitude in $[a-d, b]$.
Proof. We may assume that $K^{\bullet}$ is a bounded above complex of finite free $B$ modules. In particular, $K^{\bullet}$ is flat as a complex of $A$-modules and $K^{\bullet} \otimes_{A} M=$ $K^{\bullet} \otimes_{A}^{\mathbf{L}} M$ for any $A$-module $M$. For every prime $\mathfrak{p}$ of $A$ the complex

$$
K^{\bullet} \otimes_{A} \kappa(\mathfrak{p})
$$

is a bounded above complex of finite free modules over $B \otimes_{A} \kappa(\mathfrak{p})$ with vanishing $H^{i}$ except for $i \in[a, b]$. As $B \otimes_{A} \kappa(\mathfrak{p})$ has global dimension $d$ we see from Lemma 15.55.17 that $K^{\bullet} \otimes_{A} \kappa(\mathfrak{p})$ has tor amplitude in $[a-d, b]$. Let $\mathfrak{q}$ be a prime of $B$ lying over $\mathfrak{p}$. Since $K^{\bullet} \otimes_{A} \kappa(\mathfrak{p})$ is a bounded above complex of free $B \otimes_{A} \kappa(\mathfrak{p})$-modules we see that

$$
\begin{aligned}
K^{\bullet} \otimes_{B}^{\mathbf{L}} \kappa(\mathfrak{q}) & =K^{\bullet} \otimes_{B} \kappa(\mathfrak{q}) \\
& =\left(K^{\bullet} \otimes_{A} \kappa(\mathfrak{p})\right) \otimes_{B \otimes_{A} \kappa(\mathfrak{p})} \kappa(\mathfrak{q}) \\
& =\left(K^{\bullet} \otimes_{A} \kappa(\mathfrak{p})\right) \otimes_{B \otimes_{A} \kappa(\mathfrak{p})}^{\mathbf{L}} \kappa(\mathfrak{q})
\end{aligned}
$$

Hence the arguments above imply that $H^{i}\left(K^{\bullet} \otimes_{B}^{\mathbf{L}} \kappa(\mathfrak{q})\right)=0$ for $i \notin[a-d, b]$. We conclude by Lemma 15.63 .5 .

The following lemma is a local version of Lemma 15.63.7. It can be used to find perfect complexes over reglar local rings.

09PC Lemma 15.63.8. Let $A \rightarrow B$ be a local ring homomorphism. Let $a, b \in \mathbf{Z}$. Let $d \geq 0$. Let $K^{\bullet}$ be a complex of $B$-modules. Assume
(1) the ring map $A \rightarrow B$ is flat,
(2) the ring $B / \mathfrak{m}_{A} B$ is regular of dimension $d$,
(3) $K^{\bullet}$ is pseudo-coherent as a complex of $B$-modules, and
(4) $K^{\bullet}$ has tor amplitude in $[a, b]$ as a complex of $A$-modules, in fact it suffices if $H^{i}\left(K^{\bullet} \otimes_{A}^{\mathbf{L}} \kappa\left(\mathfrak{m}_{A}\right)\right)$ is nonzero only for $i \in[a, b]$.
Then $K^{\bullet}$ is perfect as a complex of $B$-modules with tor amplitude in $[a-d, b]$.
Proof. By (3) we may assume that $K^{\bullet}$ is a bounded above complex of finite free $B$-modules. We compute

$$
\begin{aligned}
K^{\bullet} \otimes_{B}^{\mathbf{L}} \kappa\left(\mathfrak{m}_{B}\right) & =K^{\bullet} \otimes_{B} \kappa\left(\mathfrak{m}_{B}\right) \\
& =\left(K^{\bullet} \otimes_{A} \kappa\left(\mathfrak{m}_{A}\right)\right) \otimes_{B / \mathfrak{m}_{A} B} \kappa\left(\mathfrak{m}_{B}\right) \\
& =\left(K^{\bullet} \otimes_{A} \kappa\left(\mathfrak{m}_{A}\right)\right) \otimes_{B / \mathfrak{m}_{A} B}^{\mathbf{L}} \kappa\left(\mathfrak{m}_{B}\right)
\end{aligned}
$$

The first equality because $K^{\bullet}$ is a bounded above complex of flat $B$-modules. The second equality follows from basic properties of the tensor product. The third equality holds because $K^{\bullet} \otimes_{A} \kappa\left(\mathfrak{m}_{A}\right)=K^{\bullet} / \mathfrak{m}_{A} K^{\bullet}$ is a bounded above complex of flat $B / \mathfrak{m}_{A} B$-modules. Since $K^{\bullet}$ is a bounded above complex of flat $A$-modules by (1), the cohomology modules $H^{i}$ of the complex $K^{\bullet} \otimes_{A} \kappa\left(\mathfrak{m}_{A}\right)$ are nonzero only for $i \in[a, b]$ by assumption (4). Thus the spectral sequence of Example 15.52.1 and the fact that $B / \mathfrak{m}_{A} B$ has finite global dimension $d$ (by (2) and Algebra, Proposition 10.109.1) shows that $H^{j}\left(K^{\bullet} \otimes_{B}^{\mathbf{L}} \kappa\left(\mathfrak{m}_{B}\right)\right)$ is zero for $j \notin[a-d, b]$. This finishes the proof by Lemma 15.63 .5

### 15.64. Characterizing perfect complexes

07 LQ In this section we prove that the perfect complexes are exactly the compact objects of the derived category of a ring. First we show the following.

0 LTI Lemma 15.64.1. Let $R$ be a ring. The full subcategory $D_{p e r f}(R) \subset D(R)$ of perfect objects is the smallest strictly full, saturated, triangulated subcategory containing $R=R[0]$. In other words $D_{\text {perf }}(R)=\langle R\rangle$. In particular, $R$ is a classical generator for $D_{\text {perf }}(R)$.

Proof. To see what the statement means, please look at Derived Categories, Definitions 13.6 .1 and 13.33 .2 It was shown in Lemmas 15.61 .4 and 15.61 .5 that $D_{\text {perf }}(R) \subset D(R)$ is a strictly full, saturated, triangulated subcategory of $D(R)$. Of course $R \in D_{\text {perf }}(R)$.

Recall that $\langle R\rangle=\bigcup\langle R\rangle_{n}$. To finish the proof we will show that if $M \in D_{\text {perf }}(R)$ is represented by

$$
\ldots \rightarrow 0 \rightarrow M^{a} \rightarrow M^{a+1} \rightarrow \ldots \rightarrow M^{b} \rightarrow 0 \rightarrow \ldots
$$

with $M^{i}$ finite projective, then $M \in\langle R\rangle_{b-a+1}$. The proof is by induction on $b-a$. By definition $\langle R\rangle_{1}$ contains any finite projective $R$-module placed in any degree; this deals with the base case $b-a=1$ of the induction. In general, we consider the distinguished triangle

$$
M_{b}[-b] \rightarrow M^{\bullet} \rightarrow \sigma_{\leq b-1} M^{\bullet} \rightarrow M_{b}[-b+1]
$$

By induction the truncated complex $\sigma_{\leq b-1} M^{\bullet}$ is in $\langle R\rangle_{b-a}$ and $M_{b}[-b]$ is in $\langle R\rangle_{1}$. Hence $M^{\bullet} \in\langle R\rangle_{b-a+1}$ by definition.

Let $R$ be a ring. Recall that $D(R)$ has direct sums which are given simply by taking direct sums of complexes, see Derived Categories, Lemma 13.31.2. We will use this in the lemmas of this section without further mention.

07LR Lemma 15.64.2. Let $R$ be a ring. Let $K \in D(R)$ be an object such that for every countable set of objects $E_{n} \in D(R)$ the canonical map

$$
\bigoplus \operatorname{Hom}_{D(R)}\left(K, E_{n}\right) \longrightarrow \operatorname{Hom}_{D(R)}\left(K, \bigoplus E_{n}\right)
$$

is a bijection. Then, given any system $L_{n}^{\bullet}$ of complexes over $\mathbf{N}$ we have that

$$
\operatorname{colim}_{\operatorname{Hom}_{D(R)}}\left(K, L_{n}^{\bullet}\right) \longrightarrow \operatorname{Hom}_{D(R)}\left(K, L^{\bullet}\right)
$$

is a bijection, where $L^{\bullet}$ is the termwise colimit, i.e., $L^{m}=\operatorname{colim} L_{n}^{m}$ for all $m \in \mathbf{Z}$.

Proof. Consider the short exact sequence of complexes

$$
0 \rightarrow \bigoplus L_{n}^{\bullet} \rightarrow \bigoplus L_{n}^{\bullet} \rightarrow L^{\bullet} \rightarrow 0
$$

where the first map is given by $1-t_{n}$ in degree $n$ where $t_{n}: L_{n}^{\bullet} \rightarrow L_{n+1}^{\bullet}$ is the transition map. By Derived Categories, Lemma 13.12 .1 this is a distinguished triangle in $D(R)$. Apply the homological functor $\operatorname{Hom}_{D(R)}(K,-)$, see Derived Categories, Lemma 13.4.2. Thus a long exact cohomology sequence

Since we have assumed that $\operatorname{Hom}_{D(R)}\left(K, \bigoplus L_{n}^{\bullet}\right)$ is equal to $\bigoplus \operatorname{Hom}_{D(R)}\left(K, L_{n}^{\bullet}\right)$ we see that the first map on every row of the diagram is injective (by the explicit description of this map as the sum of the maps induced by $1-t_{n}$ ). Hence we conclude that $\operatorname{Hom}_{D(R)}\left(K, \operatorname{colim} L_{n}^{\bullet}\right)$ is the cokernel of the first map of the middle row in the diagram above which is what we had to show.

The following proposition, characterizing perfect complexes as the compact objects (Derived Categories, Definition 13.34.1) of the derived category, shows up in various places. See for example Ric89b proof of Proposition 6.3] (this treats the bounded case), TT90, Theorem 2.4.3] (the statement doesn't match exactly), and [BN93, Proposition 6.4] (watch out for horrendous notational conventions).

07LT Proposition 15.64.3. Let $R$ be a ring. For an object $K$ of $D(R)$ the following are equivalent
(1) $K$ is perfect, and
(2) $K$ is a compact object of $D(R)$.

Proof. Assume $K$ is perfect, i.e., $K$ is quasi-isomorphic to a bounded complex $P^{\bullet}$ of finite projective modules, see Definition 15.61.1. If $E_{i}$ is represented by the complex $E_{i}^{\bullet}$, then $\bigoplus E_{i}$ is represented by the complex whose degree $n$ term is $\bigoplus E_{i}^{n}$. On the other hand, as $P^{n}$ is projective for all $n$ we have $\operatorname{Hom}_{D(R)}\left(P^{\bullet}, K^{\bullet}\right)=$ $\operatorname{Hom}_{K(R)}\left(P^{\bullet}, K^{\bullet}\right)$ for every complex of $R$-modules $K^{\bullet}$, see Derived Categories, Lemma 13.19.8. Thus $\operatorname{Hom}_{D(R)}\left(P^{\bullet}, E^{\bullet}\right)$ is the cohomology of the complex

$$
\prod \operatorname{Hom}_{R}\left(P^{n}, E^{n-1}\right) \rightarrow \prod \operatorname{Hom}_{R}\left(P^{n}, E^{n}\right) \rightarrow \prod \operatorname{Hom}_{R}\left(P^{n}, E^{n+1}\right)
$$

Since $P^{\bullet}$ is bounded we see that we may replace the $\prod$ signs by $\bigoplus$ signs in the complex above. Since each $P^{n}$ is a finite $R$-module we see that $\operatorname{Hom}_{R}\left(P^{n}, \bigoplus_{i} E_{i}^{m}\right)=$ $\bigoplus_{i} \operatorname{Hom}_{R}\left(P^{n}, E_{i}^{m}\right)$ for all $n, m$. Combining these remarks we see that the map of Derived Categories, Definition 13.34.1 is a bijection.
Conversely, assume $K$ is compact. Represent $K$ by a complex $K^{\bullet}$ and consider the map

$$
K^{\bullet} \longrightarrow \bigoplus_{n \geq 0} \tau_{\geq n} K^{\bullet}
$$

where we have used the canonical truncations, see Homology, Section 12.13 . This makes sense as in each degree the direct sum on the right is finite. By assumption this map factors through a finite direct sum. We conclude that $K \rightarrow \tau_{\geq n} K$ is zero for at least one $n$, i.e., $K$ is in $D^{-}(R)$.
Since $K \in D^{-}(R)$ and since every $R$-module is a quotient of a free module, we may represent $K$ by a bounded above complex $K^{\bullet}$ of free $R$-modules, see Derived Categories, Lemma 13.16.5. Note that we have

$$
K^{\bullet}=\bigcup_{n \leq 0} \sigma_{\geq n} K^{\bullet}
$$

where we have used the stupid truncations, see Homology, Section 12.13. Hence by Lemma 15.64 .2 we see that $1: K^{\bullet} \rightarrow K^{\bullet}$ factors through $\sigma_{\geq n} K^{\bullet} \rightarrow K^{\bullet}$ in $D(R)$. Thus we see that $1: K^{\bullet} \rightarrow K^{\bullet}$ factors as

$$
K^{\bullet} \xrightarrow{\varphi} L^{\bullet} \xrightarrow{\psi} K^{\bullet}
$$

in $D(R)$ for some complex $L^{\bullet}$ which is bounded and whose terms are free $R$-modules. Say $L^{i}=0$ for $i \notin[a, b]$. Fix $a, b$ from now on. Let $c$ be the largest integer $\leq b+1$ such that we can find a factorization of $1_{K}$ • as above with $L^{i}$ is finite free for $i<c$. We will show by induction that $c=b+1$. Namely, write $L^{c}=\bigoplus_{\lambda \in \Lambda} R$. Since $L^{c-1}$ is finite free we can find a finite subset $\Lambda^{\prime} \subset \Lambda$ such that $L^{c-1} \rightarrow L^{c}$ factors through $\bigoplus_{\lambda \in \Lambda^{\prime}} R \subset L^{c}$. Consider the map of complexes

$$
\pi: L^{\bullet} \longrightarrow\left(\bigoplus_{\lambda \in \Lambda \backslash \Lambda^{\prime}} R\right)[-i]
$$

given by the projection onto the factors corresponding to $\Lambda \backslash \Lambda^{\prime}$ in degree $i$. By our assumption on $K$ we see that, after possibly replacing $\Lambda^{\prime}$ by a larger finite subset, we may assume that $\pi \circ \varphi=0$ in $D(R)$. Let $\left(L^{\prime}\right)^{\bullet} \subset L^{\bullet}$ be the kernel of $\pi$. Since $\pi$ is surjective we get a short exact sequence of complexes, which gives a distinguished triangle in $D(R)$ (see Derived Categories, Lemma 13.12.1). Since $\operatorname{Hom}_{D(R)}(K,-)$ is homological (see Derived Categories, Lemma 13.4.2) and $\pi \circ \varphi=0$, we can find a morphism $\varphi^{\prime}: K^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}$ in $D(R)$ whose composition with $\left(L^{\prime}\right)^{\bullet} \rightarrow L^{\bullet}$ gives $\varphi$. Setting $\psi^{\prime}$ equal to the composition of $\psi$ with $\left(L^{\prime}\right)^{\bullet} \rightarrow L^{\bullet}$ we obtain a new factorization. Since $\left(L^{\prime}\right)^{\bullet}$ agrees with $L^{\bullet}$ except in degree $c$ and since $\left(L^{\prime}\right)^{c}=\bigoplus_{\lambda \in \Lambda^{\prime}} R$ the induction step is proved.

The conclusion of the discussion of the preceding paragraph is that $1_{K}: K \rightarrow K$ factors as

$$
K \xrightarrow{\varphi} L \xrightarrow{\psi} K
$$

in $D(R)$ where $L$ can be represented by a finite complex of free $R$-modules. In particular we see that $L$ is perfect. Note that $e=\varphi \circ \psi \in \operatorname{End}_{D(R)}(L)$ is an idempotent. By Derived Categories, Lemma 13.4 .12 we see that $L=\operatorname{Ker}(e) \oplus$ $\operatorname{Ker}(1-e)$. The map $\varphi: K \rightarrow L$ induces an isomorphism with $\operatorname{Ker}(1-e)$ in $D(R)$. Hence we finally conclude that $K$ is perfect by Lemma 15.61 .5 .

07LU Lemma 15.64.4. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $K$ be an object of $D(R)$. Assume that
(1) $K \otimes{ }_{R}^{\mathbf{L}} R / I$ is perfect in $D(R / I)$, and
(2) $I$ is a nilpotent ideal.

Then $K$ is perfect in $D(R)$.

Proof. Choose a finite complex $\bar{P}^{\bullet}$ of finite projective $R / I$-modules representing $K \otimes{ }_{R}^{\mathbf{L}} R / I$, see Definition 15.61.1. By Lemma 15.62 .3 there exists a complex $P^{\bullet}$ of projective $R$-modules representing $K$ such that $\bar{P}=P^{\bullet} / I P^{\bullet}$. It follows from Nakayama's lemma (Algebra, Lemma 10.19.1) that $P^{\bullet}$ is a finite complex of finite projective $R$-modules.

09AS Lemma 15.64.5. Let $R$ be a ring. Let $I, J \subset R$ be ideals. Let $K$ be an object of $D(R)$. Assume that
(1) $K \otimes \otimes_{R}^{\mathbf{L}} R / I$ is perfect in $D(R / I)$, and
(2) $K \otimes \otimes_{R}^{\mathbf{L}} R / J$ is perfect in $D(R / J)$.

Then $K \otimes_{R}^{\mathbf{L}} R / I J$ is perfect in $D(R / I J)$.
Proof. It is clear that we may assume replace $R$ by $R / I J$ and $K$ by $K \otimes_{R}^{\mathbf{L}} R / I J$. Then $R \rightarrow R /(I \cap J)$ is a surjection whose kernel has square zero. Hence by Lemma 15.64 .4 it suffices to prove that $K \otimes_{R}^{\mathbf{L}} R /(I \cap J)$ is perfect. Thus we may assume that $I \cap J=0$.

We prove the lemma in case $I \cap J=0$. First, we may represent $K$ by a K-flat complex $K^{\bullet}$ with all $K^{n}$ flat, see Lemma 15.49 .10 . Then we see that we have a short exact sequence of complexes

$$
0 \rightarrow K^{\bullet} \rightarrow K^{\bullet} / I K^{\bullet} \oplus K^{\bullet} / J K^{\bullet} \rightarrow K^{\bullet} /(I+J) K^{\bullet} \rightarrow 0
$$

Note that $K^{\bullet} / I K^{\bullet}$ represents $K \otimes_{R}^{\mathbf{L}} R / I$ by construction of the derived tensor product. Similarly for $K^{\bullet} / J K^{\bullet}$ and $K^{\bullet} /(I+J) K^{\bullet}$. Note that $K^{\bullet} /(I+J) K^{\bullet}$ is a perfect complex of $R /(I+J)$-modules, see Lemma 15.61.9. Hence the complexes $K^{\bullet} / I K^{\bullet}$, and $K^{\bullet} / J K^{\bullet}$ and $K^{\bullet} /(I+J) K^{\bullet}$ have finitely many nonzero cohomology groups (since a perfect complex has finite Tor-amplitude, see Lemma 15.61.2). We conclude that $K \in D^{b}(R)$ by the long exact cohomology sequence associated to short exact sequence of complexes displayed above. In particular we assume $K^{\bullet}$ is a bounded above complex of free $R$-modules (see Derived Categories, Lemma 13.16.5.

We will now show that $K$ is perfect using the criterion of Proposition 15.64 .3 . Thus we let $E_{j} \in D(R)$ be a family of objects parametrized by a set $J$. We choose complexes $E_{j}^{\bullet}$ with flat terms representing $E_{j}$, see for example Lemma 15.49.10. It is clear that

$$
0 \rightarrow E_{j}^{\bullet} \rightarrow E_{j}^{\bullet} / I E_{j}^{\bullet} \oplus E_{j}^{\bullet} / J E_{j}^{\bullet} \rightarrow E_{j}^{\bullet} /(I+J) E_{j}^{\bullet} \rightarrow 0
$$

is a short exact sequence of complexes. Taking direct sums we obtain a similar short exact sequence

$$
0 \rightarrow \bigoplus E_{j}^{\bullet} \rightarrow \bigoplus E_{j}^{\bullet} / I E_{j}^{\bullet} \oplus E_{j}^{\bullet} / J E_{j}^{\bullet} \rightarrow \bigoplus E_{j}^{\bullet} /(I+J) E_{j}^{\bullet} \rightarrow 0
$$

(Note that $-\otimes_{R} R / I$ commutes with direct sums.) This short exact sequence determines a distinguished triangle in $D(R)$, see Derived Categories, Lemma 13.12.1, Apply the homological functor $\operatorname{Hom}_{D(R)}(K,-)$ (see Derived Categories, Lemma
13.4.2 to get a commutative diagram

with exact columns. It is clear that, for any complex $E^{\bullet}$ of $R$-modules we have

$$
\begin{aligned}
\operatorname{Hom}_{D(R)}\left(K^{\bullet}, E^{\bullet} / I\right) & =\operatorname{Hom}_{K(R)}\left(K^{\bullet}, E^{\bullet} / I\right) \\
& =\operatorname{Hom}_{K(R / I)}\left(K^{\bullet} / I K^{\bullet}, E^{\bullet} / I\right) \\
& =\operatorname{Hom}_{D(R / I)}\left(K^{\bullet} / I K^{\bullet}, E^{\bullet} / I\right)
\end{aligned}
$$

and similarly for when dividing by $J$ or $I+J$, see Derived Categories, Lemma 13.19.8. Derived Categories. Thus all the horizontal arrows, except for possibly the middle one, are isomorphisms as the complexes $K^{\bullet} / I K^{\bullet}, K^{\bullet} / J K^{\bullet}, K^{\bullet} /(I+J) K^{\bullet}$ are perfect complexes of $R / I, R / J, R /(I+J)$-modules, see Proposition 15.64.3. It follows from the 5 -lemma (Homology, Lemma 12.5.20) that the middle map is an isomorphism and the lemma follows by Proposition 15.64.3.

### 15.65. Relatively finitely presented modules

0659 Let $R$ be a ring. Let $A \rightarrow B$ be a finite map of finite type $R$-algebras. Let $M$ be a finite $B$-module. In this case it is not true that
$M$ of finite presentation over $B \Leftrightarrow M$ of finite presentation over $A$
A counter example is $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right], A=R, B=R /\left(x_{i}\right)$, and $M=B$. To "fix" this we introduce a relative notion of finite presentation.

05GY Lemma 15.65.1. Let $R \rightarrow A$ be a ring map of finite type. Let $M$ be an $A$-module. The following are equivalent
(1) for some presentation $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ the module $M$ is a finitely presented $R\left[x_{1}, \ldots, x_{n}\right]$-module,
(2) for all presentations $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ the module $M$ is a finitely presented $R\left[x_{1}, \ldots, x_{n}\right]$-module, and
(3) for any surjection $A^{\prime} \rightarrow A$ where $A^{\prime}$ is a finitely presented $R$-algebra, the module $M$ is finitely presented as $A^{\prime}$-module.
In this case $M$ is a finitely presented $A$-module.

Proof. If $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ and $\beta: R\left[y_{1}, \ldots, y_{m}\right] \rightarrow A$ are presentations. Choose $f_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$ with $\alpha\left(f_{j}\right)=\beta\left(y_{j}\right)$ and $g_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ with $\beta\left(g_{i}\right)=$ $\alpha\left(x_{i}\right)$. Then we get a commutative diagram

Hence the equivalence of (1) and (2) follows by applying Algebra, Lemmas 10.6.4 and 10.35 .21 . The equivalence of (2) and (3) follows by choosing a presentation $A^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and using Algebra, Lemma 10.35 .21 to show that $M$ is finitely presented as $A^{\prime}$-module if and only if $M$ is finitely presented as a $R\left[x_{1}, \ldots, x_{n}\right]$-module.

05GZ Definition 15.65.2. Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$ module. We say $M$ is an $A$-module finitely presented relative to $R$ if the equivalent conditions of Lemma 15.65 .1 hold.

Note that if $R \rightarrow A$ is of finite presentation, then $M$ is an $A$-module finitely presented relative to $R$ if and only if $M$ is a finitely presented $A$-module. It is equally clear that $A$ as an $A$-module is finitely presented relative to $R$ if and only if $A$ is of finite presentation over $R$. If $R$ is Noetherian the notion is uninteresting. Now we can formulate the result we were looking for.

05H0 Lemma 15.65.3. Let $R$ be a ring. Let $A \rightarrow B$ be a finite map of finite type $R$ algebras. Let $M$ be a $B$-module. Then $M$ is an $A$-module finitely presented relative to $R$ if and only if $M$ is a $B$-module finitely presented relative to $R$.

Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Choose $y_{1}, \ldots, y_{m} \in B$ which generate $B$ over $A$. As $A \rightarrow B$ is finite each $y_{i}$ satisfies a monic equation with coefficients in $A$. Hence we can find monic polynomials $P_{j}(T) \in R\left[x_{1}, \ldots, x_{n}\right][T]$ such that $P_{j}\left(y_{j}\right)=0$ in $B$. Then we get a commutative diagram

Since the top arrow is a finite and finitely presented ring map we conclude by Algebra, Lemma 10.35.21 and the definition.

With this result in hand we see that the relative notion makes sense and behaves well with regards to finite maps of rings of finite type over $R$. It is also stable under localization, stable under base change, and "glues" well.

065A Lemma 15.65.4. Let $R$ be a ring, $f \in R$ an element, $R_{f} \rightarrow A$ is a finite type ring map, $g \in A$, and $M$ an $A$-module. If $M$ of finite presentation relative to $R_{f}$, then $M_{g}$ is an $A_{g}$-module of finite presentation relative to $R$.

Proof. Choose a presentation $R_{f}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. We write $R_{f}=R\left[x_{0}\right] /\left(f x_{0}-\right.$ 1). Consider the presentation $R\left[x_{0}, x_{1}, \ldots, x_{n}, x_{n+1}\right] \rightarrow A_{g}$ which extends the
given map, maps $x_{0}$ to the image of $1 / f$, and maps $x_{n+1}$ to $1 / g$. Choose $g^{\prime} \in$ $R\left[x_{0}, x_{1}, \ldots, x_{n}\right]$ which maps to $g$ (this is possible). Suppose that

$$
R_{f}\left[x_{1}, \ldots, x_{n}\right]^{\oplus s} \rightarrow R_{f}\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \rightarrow 0
$$

is a presentation of $M$ given by a matrix $\left(h_{i j}\right)$. Pick $h_{i j}^{\prime} \in R\left[x_{0}, x_{1}, \ldots, x_{n}\right]$ which map to $h_{i j}$. Then

$$
R\left[x_{0}, x_{1}, \ldots, x_{n}, x_{n+1}\right]^{\oplus s+2 t} \rightarrow R\left[x_{0}, x_{1}, \ldots, x_{n}, x_{n+1}\right]^{\oplus t} \rightarrow M_{g} \rightarrow 0
$$

is a presentation of $M_{f}$. Here the $t \times(s+2 t)$ matrix defining the map has a first $t \times s$ block consisting of the matrix $h_{i j}^{\prime}$, a second $t \times t$ block which is $\left(x_{0} f-\right) I_{t}$, and a third block which is $\left(x_{n+1} g^{\prime}-1\right) I_{t}$.

065B Lemma 15.65.5. Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$-module finitely presented relative to $R$. For any ring map $R \rightarrow R^{\prime}$ the $A \otimes_{R} R^{\prime}$-module

$$
M \otimes_{A} A^{\prime}=M \otimes_{R} R^{\prime}
$$

is finitely presented relative to $R^{\prime}$.
Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Choose a presentation

$$
R\left[x_{1}, \ldots, x_{n}\right]^{\oplus s} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \rightarrow 0
$$

Then

$$
R^{\prime}\left[x_{1}, \ldots, x_{n}\right]^{\oplus s} \rightarrow R^{\prime}\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \otimes_{R} R^{\prime} \rightarrow 0
$$

is a presentation of the base change and we win.
0670 Lemma 15.65.6. Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$-module finitely presented relative to $R$. Let $A \rightarrow A^{\prime}$ be a ring map of finite presentation. The $A^{\prime}$-module $M \otimes_{A} A^{\prime}$ is finitely presented relative to $R$.
Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Choose a presentation $A^{\prime}=$ $A\left[y_{1}, \ldots, y_{m}\right] /\left(g_{1}, \ldots, g_{l}\right)$. Pick $g_{i}^{\prime} \in R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$ mapping to $g_{i}$. Say

$$
R\left[x_{1}, \ldots, x_{n}\right]^{\oplus s} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \rightarrow 0
$$

is a presentation of $M$ given by a matrix $\left(h_{i j}\right)$. Then

$$
R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]^{\oplus s+t l} \rightarrow R\left[x_{0}, x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]^{\oplus t} \rightarrow M \otimes_{A} A^{\prime} \rightarrow 0
$$

is a presentation of $M \otimes_{A} A^{\prime}$. Here the $t \times(s+l t)$ matrix defining the map has a first $t \times s$ block consisting of the matrix $h_{i j}$, followed by $l$ blocks of size $t \times t$ which are $g_{i}^{\prime} I_{t}$.

065C Lemma 15.65.7. Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let $M$ be a $B$-module. If $M$ is finitely presented relative to $A$ and $A$ is of finite presentation over $R$, then $M$ is finitely presented relative to $R$.
Proof. Choose a surjection $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$. Choose a presentation

$$
A\left[x_{1}, \ldots, x_{n}\right]^{\oplus s} \rightarrow A\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \rightarrow 0
$$

given by a matrix $\left(h_{i j}\right)$. Choose a presentation

$$
A=R\left[y_{1}, \ldots, y_{m}\right] /\left(g_{1}, \ldots, g_{u}\right) .
$$

Choose $h_{i j}^{\prime} \in R\left[y_{1}, \ldots, y_{m}, x_{1}, \ldots, x_{n}\right]$ mapping to $h_{i j}$. Then we obtain the presentation

$$
R\left[y_{1}, \ldots, y_{m}, x_{1}, \ldots, x_{n}\right]^{\oplus s+t u} \rightarrow R\left[y_{1}, \ldots, y_{m}, x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow M \rightarrow 0
$$

where the $t \times(s+t u)$-matrix is given by a first $t \times s$ block consisting of $h_{i j}^{\prime}$ followed by $u$ blocks of size $t \times t$ given by $g_{i} I_{t}, i=1, \ldots, u$.
065D Lemma 15.65.8. Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$-module. Let $f_{1}, \ldots, f_{r} \in A$ generate the unit ideal. The following are equivalent
(1) each $M_{f_{i}}$ is finitely presented relative to $R$, and
(2) $M$ is finitely presented relative to $R$.

Proof. The implication $(2) \Rightarrow(1)$ is in Lemma 15.65.4. Assume (1). Write $1=$ $\sum f_{i} g_{i}$ in $A$. Choose a surjection $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right] \rightarrow A$. such that $y_{i}$ maps to $f_{i}$ and $z_{i}$ maps to $g_{i}$. Then we see that there exists a surjection

$$
P=R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right] /\left(\sum y_{i} z_{i}-1\right) \longrightarrow A
$$

By Lemma 15.65 .1 we see that $M_{f_{i}}$ is a finitely presented $A_{f_{i}}$-module, hence by Algebra, Lemma 10.23 .2 we see that $M$ is a finitely presented $A$-module. Hence $M$ is a finite $P$-module (with $P$ as above). Choose a surjection $P^{\oplus t} \rightarrow M$. We have to show that the kernel $K$ of this map is a finite $P$-module. Since $P_{y_{i}}$ surjects onto $A_{f_{i}}$ we see by Lemma 15.65 .1 and Algebra, Lemma 10.5 .3 that the localization $K_{y_{i}}$ is a finitely generated $P_{y_{i}}$-module. Choose elements $k_{i, j} \in K, i=1, \ldots, r, j=1, \ldots, s_{i}$ such that the images of $k_{i, j}$ in $K_{y_{i}}$ generate. Set $K^{\prime} \subset K$ equal to the $P$-module generated by the elements $k_{i, j}$. Then $K / K^{\prime}$ is a module whose localization at $y_{i}$ is zero for all $i$. Since $\left(y_{1}, \ldots, y_{r}\right)=P$ we see that $K / K^{\prime}=0$ as desired.

0671 Lemma 15.65.9. Let $R \rightarrow A$ be a finite type ring map. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow$ $M^{\prime \prime} \rightarrow 0$ be a short exact sequence of $A$-modules.
(1) If $M^{\prime}, M^{\prime \prime}$ are finitely presented relative to $R$, then so is $M$.
(2) If $M^{\prime}$ is a finite type $A$-module and $M$ is finitely presented relative to $R$, then $M^{\prime \prime}$ is finitely presented relative to $R$.

Proof. Follows immediately from Algebra, Lemma 10.5.3.
0672 Lemma 15.65.10. Let $R \rightarrow A$ be a finite type ring map. Let $M, M^{\prime}$ be $A$-modules. If $M \oplus M^{\prime}$ is finitely presented relative to $R$, then so are $M$ and $M^{\prime}$.
Proof. Omitted.

### 15.66. Relatively pseudo-coherent modules

065E This section is the analogue of Section 15.65 for pseudo-coherence.
065F Lemma 15.66.1. Let $R$ be a ring. Let $K^{\bullet}$ be an object of $D^{-}(R)$. Consider the $R$-algebra map $R[x] \rightarrow R$ which maps $x$ to zero. Then

$$
K^{\bullet} \otimes_{R[x]}^{\mathrm{L}} R \cong K^{\bullet} \oplus K^{\bullet}[1]
$$

in $D(R)$.
Proof. Choose a projective resolution $P^{\bullet} \rightarrow K^{\bullet}$ over $R$. Then

$$
P^{\bullet} \otimes_{R} R[x] \xrightarrow{x} P^{\bullet} \otimes_{R} R[x]
$$

is a double complex of projective $R[x]$-modules whose associated total complex is quasi-isomorphic to $P^{\bullet}$. Hence

$$
\begin{aligned}
K^{\bullet} \otimes_{R[x]}^{\mathrm{L}} R & \cong \operatorname{Tot}\left(P^{\bullet} \otimes_{R} R[x] \xrightarrow{x} P^{\bullet} \otimes_{R} R[x]\right) \otimes_{R[x]} R=\operatorname{Tot}\left(P^{\bullet} \xrightarrow{0} P^{\bullet}\right) \\
& =P^{\bullet} \oplus P^{\bullet}[1] \cong K^{\bullet} \oplus K^{\bullet}[1]
\end{aligned}
$$

as desired.
065G Lemma 15.66.2. Let $R$ be a ring and $K^{\bullet}$ a complex of $R$-modules. Let $m \in \mathbf{Z}$. Consider the $R$-algebra map $R[x] \rightarrow R$ which maps $x$ to zero. Then $K^{\bullet}$ is $m$ -pseudo-coherent as a complex of $R$-modules if and only if $K^{\bullet}$ is m-pseudo-coherent as a complex of $R[x]$-modules.

Proof. This is a special case of Lemma 15.54.11. We also prove it in another way as follows.

Note that $0 \rightarrow R[x] \rightarrow R[x] \rightarrow R \rightarrow 0$ is exact. Hence $R$ is pseudo-coherent as an $R[x]$-module. Thus one implication of the lemma follows from Lemma 15.54.11. To prove the other implication, assume that $K^{\bullet}$ is $m$-pseudo-coherent as a complex of $R[x]$-modules. By Lemma 15.54 .12 we see that $K^{\bullet} \otimes_{R[x]}^{\mathrm{L}} R$ is $m$-pseudo-coherent as a complex of $R$-modules. By Lemma 15.66 .1 we see that $K^{\bullet} \oplus K^{\bullet}[1]$ is $m$-pseudocoherent as a complex of $R$-modules. Finally, we conclude that $K^{\bullet}$ is $m$-pseudocoherent as a complex of $R$-modules from Lemma 15.54.8.

065H Lemma 15.66.3. Let $R \rightarrow A$ be a ring map of finite type. Let $K^{\bullet}$ be a complex of A-modules. Let $m \in \mathbf{Z}$. The following are equivalent
(1) for some presentation $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ the complex $K^{\bullet}$ is an $m$ -pseudo-coherent complex of $R\left[x_{1}, \ldots, x_{n}\right]$-modules,
(2) for all presentations $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ the complex $K^{\bullet}$ is an $m$ -pseudo-coherent complex of $R\left[x_{1}, \ldots, x_{n}\right]$-modules.
In particular the same equivalence holds for pseudo-coherence.
Proof. If $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ and $\beta: R\left[y_{1}, \ldots, y_{m}\right] \rightarrow A$ are presentations. Choose $f_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$ with $\alpha\left(f_{j}\right)=\beta\left(y_{j}\right)$ and $g_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ with $\beta\left(g_{i}\right)=$ $\alpha\left(x_{i}\right)$. Then we get a commutative diagram

After a change of coordinates the ring homomorphism $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] \rightarrow$ $R\left[x_{1}, \ldots, x_{n}\right]$ is isomorphic to the ring homomorphism which maps each $y_{i}$ to zero. Similarly for the left vertical map in the diagram. Hence, by induction on the number of variables this lemma follows from Lemma 15.66.2. The pseudo-coherent case follows from this and Lemma 15.54 .5 .

065I Definition 15.66.4. Let $R \rightarrow A$ be a finite type ring map. Let $K^{\bullet}$ be a complex of $A$-modules. Let $M$ be an $A$-module. Let $m \in \mathbf{Z}$.
(1) We say $K^{\bullet}$ is $m$-pseudo-coherent relative to $R$ if the equivalent conditions of Lemma 15.66 .3 hold.
(2) We say $K^{\bullet}$ is pseudo-coherent relative to $R$ if $K^{\bullet}$ is m-pseudo-coherent relative to $R$ for all $m \in \mathbf{Z}$.
(3) We say $M$ is $m$-pseudo-coherent relative to $R$ if $M[0]$ is $m$-pseudo-coherent.
(4) We say $M$ is pseudo-coherent relative to $R$ if $M[0]$ is pseudo-coherent relative to $R$.

Part (2) means that $K^{\bullet}$ is pseudo-coherent as a complex of $R\left[x_{1}, \ldots, x_{n}\right]$-modules for any surjection $R\left[y_{1}, \ldots, y_{m}\right] \rightarrow A$, see Lemma 15.54.5. This definition has the following pleasing property.
0673 Lemma 15.66.5. Let $R$ be a ring. Let $A \rightarrow B$ be a finite map of finite type $R$-algebras. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $B$-modules. Then $K^{\bullet}$ is m-pseudocoherent (resp. pseudo-coherent) relative to $R$ if and only if $K^{\bullet}$ seen as a complex of $A$-modules is m-pseudo-coherent (pseudo-coherent) relative to $R$.

Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Choose $y_{1}, \ldots, y_{m} \in B$ which generate $B$ over $A$. As $A \rightarrow B$ is finite each $y_{i}$ satisfies a monic equation with coefficients in $A$. Hence we can find monic polynomials $P_{j}(T) \in R\left[x_{1}, \ldots, x_{n}\right][T]$ such that $P_{j}\left(y_{j}\right)=0$ in $B$. Then we get a commutative diagram

The top horizontal arrow and the top right vertical arrow satisfy the assumptions of Lemma 15.54.11. Hence $K^{\bullet}$ is $m$-pseudo-coherent (resp. pseudo-coherent) as a complex of $R\left[x_{1}, \ldots, x_{n}\right]$-modules if and only if $K^{\bullet}$ is $m$-pseudo-coherent (resp. pseudo-coherent) as a complex of $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$-modules.

0674 Lemma 15.66.6. Let $R$ be a ring. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle in $D(A)$.
(1) If $K^{\bullet}$ is $(m+1)$-pseudo-coherent relative to $R$ and $L^{\bullet}$ is m-pseudo-coherent relative to $R$ then $M^{\bullet}$ is $m$-pseudo-coherent relative to $R$.
(2) If $K^{\bullet}, M^{\bullet}$ are m-pseudo-coherent relative to $R$, then $L^{\bullet}$ is m-pseudocoherent relative to $R$.
(3) If $L^{\bullet}$ is $(m+1)$-pseudo-coherent relative to $R$ and $M^{\bullet}$ is m-pseudocoherent relative to $R$, then $K^{\bullet}$ is $(m+1)$-pseudo-coherent relative to $R$.
Moreover, if two out of three of $K^{\bullet}, L^{\bullet}, M^{\bullet}$ are pseudo-coherent relative to $R$, the so is the third.
Proof. Follows immediately from Lemma 15.54 .2 and the definitions.
0675 Lemma 15.66.7. Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$-module. Then
(1) $M$ is 0-pseudo-coherent relative to $R$ if and only if $M$ is a finite type A-module,
(2) $M$ is ( -1 )-pseudo-coherent relative to $R$ if and only if $M$ is a finitely presented relative to $R$,
(3) $M$ is $(-d)$-pseudo-coherent relative to $R$ if and only if for every surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ there exists a resolution
$R\left[x_{1}, \ldots, x_{n}\right]^{\oplus a_{d}} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus a_{d-1}} \rightarrow \ldots \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus a_{0}} \rightarrow M \rightarrow 0$
of length $d$, and
(4) $M$ is pseudo-coherent relative to $R$ if and only if for every presentation $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ there exists an infinite resolution

$$
\ldots \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus a_{1}} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus a_{0}} \rightarrow M \rightarrow 0
$$

by finite free $R\left[x_{1}, \ldots, x_{n}\right]$-modules.
Proof. Follows immediately from Lemma 15.54 .4 and the definitions.
0676 Lemma 15.66.8. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^{\bullet}, L^{\bullet} \in$ $D(A)$. If $K^{\bullet} \oplus L^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$ so are $K^{\bullet}$ and $L^{\bullet}$.

Proof. Immediate from Lemma 15.54 .8 and the definitions.
0677 Lemma 15.66.9. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a bounded above complex of $A$-modules such that $K^{i}$ is $(m-i)$-pseudo-coherent relative to $R$ for all $i$. Then $K^{\bullet}$ is $m$-pseudo-coherent relative to $R$. In particular, if $K^{\bullet}$ is a bounded above complex of $A$-modules pseudo-coherent relative to $R$, then $K^{\bullet}$ is pseudo-coherent relative to $R$.

Proof. Immediate from Lemma 15.54 .9 and the definitions.
0678 Lemma 15.66.10. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^{\bullet} \in D^{-}(A)$ such that $H^{i}\left(K^{\bullet}\right)$ is $(m-i)$-pseudo-coherent (resp. pseudo-coherent) relative to $R$ for all $i$. Then $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$.

Proof. Immediate from Lemma 15.54 .10 and the definitions.
0679 Lemma 15.66.11. Let $R$ be a ring, $f \in R$ an element, $R_{f} \rightarrow A$ is a finite type ring map, $g \in A$, and $K^{\bullet}$ a complex of $A$-modules. If $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R_{f}$, then $K^{\bullet} \otimes_{A} A_{g}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$.

Proof. First we show that $K^{\bullet}$ is $m$-pseudo-coherent relative to $R$. Namely, suppose $R_{f}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ is surjective. Write $R_{f}=R\left[x_{0}\right] /\left(f x_{0}-1\right)$. Then $R\left[x_{0}, x_{1}, \ldots, x_{n}\right] \rightarrow A$ is surjective, and $R_{f}\left[x_{1}, \ldots, x_{n}\right]$ is pseudo-coherent as an $R\left[x_{0}, \ldots, x_{n}\right]$-module. Hence by Lemma 15.54 .11 we see that $K^{\bullet}$ is $m$-pseudocoherent as a complex of $R\left[x_{0}, x_{1}, \ldots, x_{n}\right]$-modules.

Choose an element $g^{\prime} \in R\left[x_{0}, x_{1}, \ldots, x_{n}\right]$ which maps to $g \in A$. By Lemma 15.54.12 we see that

$$
\begin{aligned}
K^{\bullet} \otimes_{R\left[x_{0}, x_{1}, \ldots, x_{n}\right]}^{\mathbf{L}} R\left[x_{0}, x_{1}, \ldots, x_{n}, \frac{1}{g^{\prime}}\right] & =K^{\bullet} \otimes_{R\left[x_{0}, x_{1}, \ldots, x_{n}\right]} R\left[x_{0}, x_{1}, \ldots, x_{n}, \frac{1}{g^{\prime}}\right] \\
& =K^{\bullet} \otimes_{A} A_{f}
\end{aligned}
$$

is $m$-pseudo-coherent as a complex of $R\left[x_{0}, x_{1}, \ldots, x_{n}, \frac{1}{g^{\prime}}\right]$-modules. write

$$
R\left[x_{0}, x_{1}, \ldots, x_{n}, \frac{1}{g^{\prime}}\right]=R\left[x_{0}, \ldots, x_{n}, x_{n+1}\right] /\left(x_{n+1} g^{\prime}-1\right)
$$

As $R\left[x_{0}, x_{1}, \ldots, x_{n}, \frac{1}{q^{\prime}}\right]$ is pseudo-coherent as a $R\left[x_{0}, \ldots, x_{n}, x_{n+1}\right]$-module we conclude (see Lemma 15.54 .11 that $K^{\bullet} \otimes_{A} A_{g}$ is $m$-pseudo-coherent as a complex of $R\left[x_{0}, \ldots, x_{n}, x_{n+1}\right]$-modules as desired.

067A Lemma 15.66.12. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $A$-modules which is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$. Let $R \rightarrow R^{\prime}$ be a ring map such that $A$ and $R^{\prime}$ are Tor independent over $R$. Set $A^{\prime}=A \otimes_{R} R^{\prime}$. Then $K^{\bullet} \otimes_{A}^{\mathbf{L}} A^{\prime}$ is is m-pseudo-coherent (resp. pseudo-coherent) relative to $R^{\prime}$.

Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Note that

$$
K^{\bullet} \otimes_{A}^{\mathbf{L}} A^{\prime}=K^{\bullet} \otimes_{R}^{\mathbf{L}} R^{\prime}=K^{\bullet} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]}^{\mathbf{L}} R^{\prime}\left[x_{1}, \ldots, x_{n}\right]
$$

by Lemma 15.51 .2 applied twice. Hence we win by Lemma 15.54.12,
067B Lemma 15.66.13. Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of $A$-modules. Assume $B$ as a $B$-module is pseudo-coherent relative to A. If $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$, then $K^{\bullet} \otimes_{A}^{\mathbf{L}} B$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$.

Proof. Choose a surjection $A\left[y_{1}, \ldots, y_{m}\right] \rightarrow B$. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow$ $A$. Combined we get a surjection $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots y_{m}\right] \rightarrow B$. Choose a resolution $E^{\bullet} \rightarrow B$ of $B$ by a complex of finite free $A\left[y_{1}, \ldots, y_{n}\right]$-modules (which is possible by our assumption on the ring map $A \rightarrow B$ ). We may assume that $K^{\bullet}$ is a bounded above complex of flat $A$-modules. Then

$$
\begin{aligned}
K^{\bullet} \otimes_{A}^{\mathbf{L}} B & =\operatorname{Tot}\left(K^{\bullet} \otimes_{A} B[0]\right) \\
& =\operatorname{Tot}\left(K^{\bullet} \otimes_{A} A\left[y_{1}, \ldots, y_{m}\right] \otimes_{A\left[y_{1}, \ldots, y_{m}\right]} B[0]\right) \\
& \cong \operatorname{Tot}\left(\left(K^{\bullet} \otimes_{A} A\left[y_{1}, \ldots, y_{m}\right]\right) \otimes_{A\left[y_{1}, \ldots, y_{m}\right]} E^{\bullet}\right) \\
& =\operatorname{Tot}\left(K^{\bullet} \otimes_{A} E^{\bullet}\right)
\end{aligned}
$$

in $D\left(A\left[y_{1}, \ldots, y_{m}\right]\right)$. The quasi-isomorphism $\cong$ comes from an application of Lemma 15.49.8. Thus we have to show that $\operatorname{Tot}\left(K^{\bullet} \otimes_{A} E^{\bullet}\right)$ is $m$-pseudo-coherent as a complex of $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots y_{m}\right]$-modules. Note that $\operatorname{Tot}\left(K^{\bullet} \otimes_{A} E^{\bullet}\right)$ has a filtration by subcomplexes with successive quotients the complexes $K^{\bullet} \otimes_{A} E^{i}[-i]$. Note that for $i \ll 0$ the complexes $K^{\bullet} \otimes_{A} E^{i}[-i]$ have zero cohomology in degrees $\leq m$ and hence are $m$-pseudo-coherent (over any ring). Hence, applying Lemma 15.66 .6 and induction, it suffices to show that $K^{\bullet} \otimes_{A} E^{i}[-i]$ is pseudo-coherent relative to $R$ for all $i$. Note that $E^{i}=0$ for $i>0$. Since also $E^{i}$ is finite free this reduces to proving that $K^{\bullet} \otimes_{A} A\left[y_{1}, \ldots, y_{m}\right]$ is $m$-pseudo-coherent relative to $R$ which follows from Lemma 15.66 .12 for instance.

067C Lemma 15.66.14. Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let $m \in \mathbf{Z}$. Let $M$ be an $A$-module. Assume $B$ is flat over $A$ and $B$ as a $B$-module is pseudo-coherent relative to $A$. If $M$ is $m$-pseudo-coherent (resp. pseudo-coherent) relative to $R$, then $M \otimes_{A} B$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$.

Proof. Immediate from Lemma 15.66.13.
067D Lemma 15.66.15. Let $R$ be a ring. Let $A \rightarrow B$ be a map of finite type $R$-algebras. Let $m \in \mathbf{Z}$. Let $K^{\bullet}$ be a complex of B-modules. Assume $A$ is pseudo-coherent relative to $R$. Then the following are equivalent
(1) $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $A$, and
(2) $K^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) relative to $R$.

Proof. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. Choose a surjection $A\left[y_{1}, \ldots, y_{m}\right] \rightarrow$ $B$. Then we get a surjection

$$
R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] \rightarrow A\left[y_{1}, \ldots, y_{m}\right]
$$

which is a flat base change of $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$. By assumption $A$ is a pseudocoherent module over $R\left[x_{1}, \ldots, x_{n}\right]$ hence by Lemma 15.54 .13 we see that $A\left[y_{1}, \ldots, y_{m}\right]$ is pseudo-coherent over $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$. Thus the lemma follows from Lemma 15.54.11 and the definitions.

Lemma 15.66.16. Let $R \rightarrow A$ be a finite type ring map. Let $K^{\bullet}$ be a complex of $A$-modules. Let $m \in \mathbf{Z}$. Let $f_{1}, \ldots, f_{r} \in A$ generate the unit ideal. The following are equivalent
(1) each $K^{\bullet} \otimes_{A} A_{f_{i}}$ is m-pseudo-coherent relative to $R$, and
(2) $K^{\bullet}$ is m-pseudo-coherent relative to $R$.

The same equivalence holds for pseudo-coherence.
Proof. The implication (2) $\Rightarrow(1)$ is in Lemma 15.66.11. Assume (1). Write $1=\sum f_{i} g_{i}$ in $A$. Choose a surjection $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right] \rightarrow A$. such that $y_{i}$ maps to $f_{i}$ and $z_{i}$ maps to $g_{i}$. Then we see that there exists a surjection

$$
P=R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right] /\left(\sum y_{i} z_{i}-1\right) \longrightarrow A
$$

Note that $P$ is pseudo-coherent as an $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right]$-module and that $P\left[1 / y_{i}\right]$ is pseudo-coherent as an $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}, 1 / y_{i}\right]$ module. Hence by Lemma 15.54 .11 we see that $K^{\bullet} \otimes_{A} A_{f_{i}}$ is an $m$-pseudo-coherent complex of $P\left[1 / y_{i}\right]$-modules for each $i$. Thus by Lemma 15.54 .14 we see that $K^{\bullet}$ is pseudo-coherent as a complex of $P$-modules, and Lemma 15.54 .11 shows that $K^{\bullet}$ is pseudo-coherent as a complex of $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z_{1}, \ldots, z_{r}\right]$-modules.

067F Lemma 15.66.17. Let $R$ be a Noetherian ring. Let $R \rightarrow A$ be a finite type ring map. Then
(1) A complex of $A$-modules $K^{\bullet}$ is m-pseudo-coherent relative to $R$ if and only if $K^{\bullet} \in D^{-}(A)$ and $H^{i}\left(K^{\bullet}\right)$ is a finite $A$-module for $i \geq m$.
(2) A complex of $A$-modules $K^{\bullet}$ is pseudo-coherent relative to $R$ if and only if $K^{\bullet} \in D^{-}(A)$ and $H^{i}\left(K^{\bullet}\right)$ is a finite $A$-module for all $i$.
(3) An $A$-module is pseudo-coherent relative to $R$ if and only if it is finite.

Proof. Immediate consequence of Lemma 15.54 .16 and the definitions.

### 15.67. Pseudo-coherent and perfect ring maps

067G We can define these types of ring maps as follows.
067 H Definition 15.67.1. Let $A \rightarrow B$ be a ring map.
(1) We say $A \rightarrow B$ is a pseudo-coherent ring map if it is of finite type and $B$, as a $B$-module, is pseudo-coherent relative to $A$.
(2) We say $A \rightarrow B$ is a perfect ring map if it is a pseudo-coherent ring map such that $B$ as an $A$-module has finite tor dimension.

This terminology may be nonstandard. Using Lemma 15.66 .7 we see that $A \rightarrow B$ is pseudo-coherent if and only if $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ and $B$ as an $A\left[x_{1}, \ldots, x_{n}\right]$ module has a resolution by finite free $A\left[x_{1}, \ldots, x_{n}\right]$-modules. The motivation for
the definition of a perfect ring map is Lemma 15.61.2. The following lemmas gives a more useful and intuitive characterization of a perfect ring map.

068Y Lemma 15.67.2. A ring map $A \rightarrow B$ is perfect if and only if $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ and $B$ as an $A\left[x_{1}, \ldots, x_{n}\right]$-module has a finite resolution by finite projective $A\left[x_{1}, \ldots, x_{n}\right]$ modules.

Proof. If $A \rightarrow B$ is perfect, then $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ and $B$ is pseudo-coherent as an $A\left[x_{1}, \ldots, x_{n}\right]$-module and has finite tor dimension as an $A$-module. Hence Lemma 15.63 .7 implies that $B$ is perfect as a $A\left[x_{1}, \ldots, x_{n}\right]$-module, i.e., it has a finite resolution by finite projective $A\left[x_{1}, \ldots, x_{n}\right]$-modules (Lemma 15.61.3). Conversely, if $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ and $B$ as an $A\left[x_{1}, \ldots, x_{n}\right]$-module has a finite resolution by finite projective $A\left[x_{1}, \ldots, x_{n}\right]$-modules then $B$ is pseudo-coherent as an $A\left[x_{1}, \ldots, x_{n}\right]$-module, hence $A \rightarrow B$ is pseudo-coherent. Moreover, the given resolution over $A\left[x_{1}, \ldots, x_{n}\right]$ is a finite resolution by flat $A$-modules and hence $B$ has finite tor dimension as an $A$-module.

Lots of the results of the preceding sections can be reformulated in terms of this terminology. We also refer to More on Morphisms, Sections 36.42 and 36.43 for the corresponding discussion concerning morphisms of schemes.

067I Lemma 15.67.3. A finite type ring map of Noetherian rings is pseudo-coherent.
Proof. See Lemma 15.66.17.
067J Lemma 15.67.4. A ring map which is flat and of finite presentation is perfect.
Proof. Let $A \rightarrow B$ be a ring map which is flat and of finite presentation. It is clear that $B$ has finite tor dimension. By Algebra, Lemma 10.160 .1 there exists a finite type $\mathbf{Z}$-algebra $A_{0} \subset A$ and a flat finite type ring map $A_{0} \rightarrow B_{0}$ such that $B=B_{0} \otimes_{A_{0}} A$. By Lemma 15.66 .17 we see that $A_{0} \rightarrow B_{0}$ is pseudo-coherent. As $A_{0} \rightarrow B_{0}$ is flat we see that $B_{0}$ and $A$ are tor independent over $A_{0}$, hence we may use Lemma 15.66 .12 to conclude that $A \rightarrow B$ is pseudo-coherent.

067K Lemma 15.67.5. Let $A \rightarrow B$ be a finite type ring map with $A$ a regular ring of finite dimension. Then $A \rightarrow B$ is perfect.

Proof. By Algebra, Lemma 10.109 .8 the assumption on $A$ means that $A$ has finite global dimension. Hence every module has finite tor dimension, see Lemma 15.55.17, in particular $B$ does. By Lemma 15.67 .3 the map is pseudo-coherent.

07EN Lemma 15.67.6. A local complete intersection homomorphism is perfect.
Proof. Let $A \rightarrow B$ he a local complete intersection homomorphism. By Definition 15.25 .2 this means that $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ where $I$ is a Koszul ideal in $A\left[x_{1}, \ldots, x_{n}\right]$. By Lemmas 15.67 .2 and 15.61 .3 it suffices to show that $I$ is a perfect module over $A\left[x_{1}, \ldots, x_{n}\right]$. By Lemma 15.61 .11 this is a local question. Hence we may assume that $I$ is generated by a Koszul-regular sequence (by Definition 15.24.1. Of course this means that $I$ has a finite free resolution and we win.

### 15.68. Rlim of abelian groups and modules

07 KV We briefly discuss $R$ lim on abelian groups and modules. In this section we will denote $A b(\mathbf{N})$ the abelian category of inverse systems of abelian groups. This makes sense as an inverse system of abelian groups is the same thing as a sheaf of
groups on the category $\mathbf{N}$ (with a unique morphism $i \rightarrow j$ if $i \leq j$ ), see Remark 15.68.4 Many of the arguments in this section duplicate the arguments used to construct the cohomological machinery for modules on ringed sites.

07KW Lemma 15.68.1. The functor $\lim : A b(\mathbf{N}) \rightarrow A b$ has a right derived functor
(15.68.1.1) $\quad R \lim : D(A b(\mathbf{N})) \longrightarrow D(A b)$

As usual we set $R^{p} \lim (K)=H^{p}(R \lim (K))$. Moreover, we have
(1) for any $\left(A_{n}\right)$ in $A b(\mathbf{N})$ we have $R^{p} \lim A_{n}=0$ for $p>1$,
(2) the object $R \lim A_{n}$ of $D(A b)$ is represented by the complex

$$
\prod A_{n} \rightarrow \prod A_{n}, \quad\left(x_{n}\right) \mapsto\left(x_{n}-f_{n+1}\left(x_{n+1}\right)\right)
$$

sitting in degrees 0 and 1,
(3) if $\left(A_{n}\right)$ is $M L$, then $R^{1} \lim A_{n}=0$, i.e., $\left(A_{n}\right)$ is right acyclic for lim,
(4) every $K^{\bullet} \in D(A b(\mathbf{N}))$ is quasi-isomorphic to a complex whose terms are right acyclic for lim, and
(5) if each $K^{p}=\left(K_{n}^{p}\right)$ is right acyclic for $\lim$, i.e., of $R^{1} \lim _{n} K_{n}^{p}=0$, then $R \lim K$ is represented by the complex whose term in degree $p$ is $\lim _{n} K_{n}^{p}$.

Proof. Let $\left(A_{n}\right)$ be an arbitrary inverse system. Let $\left(B_{n}\right)$ be the inverse system with

$$
B_{n}=A_{n} \oplus A_{n-1} \oplus \ldots \oplus A_{1}
$$

and transition maps given by projections. Let $A_{n} \rightarrow B_{n}$ be given by $\left(1, f_{n}, f_{n-1} \circ\right.$ $f_{n}, \ldots, f_{2} \circ \ldots \circ f_{n}$ where $f_{i}: A_{i} \rightarrow A_{i-1}$ are the transition maps. In this way we see that every inverse system is a subobject of a ML system (Homology, Section 12.27). It follows from Derived Categories, Lemma 13.16.6using Homology, Lemma 12.27 .3 that every ML system is right acyclic for lim, i.e., (3) holds. This already implies that $R F$ is defined on $D^{+}(A b(\mathbf{N}))$, see Derived Categories, Proposition 13.17.8. Set $C_{n}=A_{n-1} \oplus \ldots \oplus A_{1}$ for $n>1$ and $C_{1}=0$ with transition maps given by projections as well. Then there is a short exact sequence of inverse systems $0 \rightarrow\left(A_{n}\right) \rightarrow\left(B_{n}\right) \rightarrow\left(C_{n}\right) \rightarrow 0$ where $B_{n} \rightarrow C_{n}$ is given by $\left(x_{i}\right) \mapsto\left(x_{i}-f_{i+1}\left(x_{i+1}\right)\right)$. Since ( $C_{n}$ ) is ML as well, we conclude that (2) holds (by proposition reference above) which also implies (1). Finally, this implies by Derived Categories, Lemma 13.30.2 that $R \lim$ is in fact defined on all of $D(A b(\mathbf{N}))$. In fact, the proof of Derived Categories, Lemma 13.30 .2 proceeds by proving assertions (4) and (5).

We give two simple applications. The first is the "correct" formulation of Homology, Lemma 12.27.7.

0918
Lemma 15.68.2. Let

$$
\left(A_{n}^{-2} \rightarrow A_{n}^{-1} \rightarrow A_{n}^{0} \rightarrow A_{n}^{1}\right)
$$

be an inverse system of complexes of abelian groups and denote $A^{-2} \rightarrow A^{-1} \rightarrow$ $A^{0} \rightarrow A^{1}$ its limit. Denote $\left(H_{n}^{-1}\right),\left(H_{n}^{0}\right)$ the inverse systems of cohomologies, and denote $H^{-1}$, $H^{0}$ the cohomologies of $A^{-2} \rightarrow A^{-1} \rightarrow A^{0} \rightarrow A^{1}$. If
(1) $\left(A_{n}^{-2}\right)$ and $\left(A_{n}^{-1}\right)$ have vanishing $R^{1} \mathrm{lim}$,
(2) $\left(H_{n}^{-1}\right)$ has vanishing $R^{1} \mathrm{lim}$, then $H^{0}=\lim H_{i}^{0}$.

Proof. Let $K \in D(A b(\mathbf{N}))$ be the object represented by the system of complexes whose $n$th constituent is the complex $A_{n}^{-2} \rightarrow A_{n}^{-1} \rightarrow A_{n}^{0} \rightarrow A_{n}^{1}$. We will compute $H^{0}(R \lim K)$ using both spectral sequences ${ }^{7}$ of Derived Categories, Lemma 13.21.3. The first has $E_{1}$-page

$$
\begin{array}{cccc}
0 & 0 & R^{1} \lim A_{n}^{0} & R^{1} \lim _{A^{-2}} A_{n}^{1} \\
A^{-1} & A^{0} & A^{1}
\end{array}
$$

with horizontal differentials and all higher differentials are zero. The second has $E_{2}$ page

$$
\begin{array}{cccc}
R^{1} \lim H_{n}^{-2} & 0 & R^{1} \lim H_{n}^{0} & R^{1} \lim H_{n}^{1} \\
\lim H_{n}^{-2} & \lim H_{n}^{-1} & \lim H_{n}^{0} & \lim H_{n}^{1}
\end{array}
$$

and degenerates at this point. The result follows.
0919 Lemma 15.68.3. Let $\mathcal{D}$ be a triangulated category. Let $\left(K_{n}\right)$ be an inverse system of objects of $\mathcal{D}$. Let $K$ be a derived limit of the system $\left(K_{n}\right)$. Then for every $L$ in $\mathcal{D}$ we have short exact sequences

$$
0 \rightarrow R^{1} \lim \operatorname{Hom}_{\mathcal{D}}\left(L, K_{n}[1]\right) \rightarrow \operatorname{Hom}_{\mathcal{D}}(L, K) \rightarrow \lim \operatorname{Hom}_{\mathcal{D}}\left(L, K_{n}\right) \rightarrow 0
$$

Proof. This follows from Derived Categories, Definition 13.32.1 and Lemma 13.4.2, and the description of $\lim$ and $R^{1} \lim$ in Lemma 15.68 .1 above.

091A Remark 15.68.4 (Rlim as cohomology). Consider the category $\mathbf{N}$ whose objects are natural numbers and whose morphisms are unique arrows $i \rightarrow j$ if $j \geq i$. Endow $\mathbf{N}$ with the chaotic topology (Sites, Example 7.6.6) so that a sheaf $\mathcal{F}$ is the same thing as an inverse system

$$
\mathcal{F}_{1} \leftarrow \mathcal{F}_{2} \leftarrow \mathcal{F}_{3} \leftarrow \ldots
$$

of sets over $\mathbf{N}$. Note that $\Gamma(\mathbf{N}, \mathcal{F})=\lim \mathcal{F}_{n}$. For an inverse system of abelian groups $\mathcal{F}_{n}$ we have

$$
R^{p} \lim \mathcal{F}_{n}=H^{p}(\mathbf{N}, \mathcal{F})
$$

because both sides are the higher right derived functors of $\mathcal{F} \mapsto \lim \mathcal{F}_{n}=H^{0}(\mathbf{N}, \mathcal{F})$. Thus the existence of $R$ lim also follows from the general material in Cohomology on Sites, Sections 21.3 and 21.19 .

Warning. An object of $D(A b(\mathbf{N}))$ is a complex of inverse systems of abelian groups. You can also think of this as an inverse system $\left(K_{n}^{\bullet}\right)$ of complexes. However, this is not the same thing as an inverse system of objects of $D(A b)$; we will come back and explain the difference later.

The products in the following lemma can be seen as termwise products of complexes or as products in the derived category $D(A b)$, see Derived Categories, Lemma 13.32.2. This lemma in particular shows the notation in this section is compatible with the notation introduced in Derived Categories, Section 13.32. See Remark 15.68 .16 for more explanation.

[^42]07KX Lemma 15.68.5. Let $K=\left(K_{n}^{\bullet}\right)$ be an object of $D(A b(\mathbf{N}))$. There exists a canonical distinguished triangle

$$
R \lim K \rightarrow \prod_{n} K_{n}^{\bullet} \rightarrow \prod_{n} K_{n}^{\bullet} \rightarrow R \lim K[1]
$$

in $D(A b)$ where the middle map fits into the commutative diagrams

whose vertical maps are projections and where $\pi: K_{n+1}^{\bullet} \rightarrow K_{n}^{\bullet}$ is the transition map of the system.

Proof. Suppose that for each $p$ the inverse system $\left(K_{n}^{p}\right)$ is right acyclic for lim. By Lemma 15.68.1 this gives a short exact sequence

$$
0 \rightarrow \lim _{n} K_{n}^{p} \rightarrow \prod_{n} K_{n}^{p} \rightarrow \prod_{n} K_{n}^{p} \rightarrow 0
$$

for each $p$. Since the complex consisting of $\lim _{n} K_{n}^{p}$ computes $R \lim K$ by Lemma 15.68 .1 we see that the lemma holds in this case.

Next, assume $K=\left(K_{n}^{\bullet}\right)$ is general. By Lemma 15.68 .1 there is a quasi-isomorphism $K \rightarrow L$ in $D(A b(\mathbf{N}))$ such that $\left(L_{n}^{p}\right)$ is acyclic for each $p$. Then $\Pi K_{n}^{\bullet}$ is quasiisomorphic to $\prod L_{n}^{\bullet}$ as products are exact in $A b$, whence the result for $L$ (proved above) implies the result for $K$.

07KY Lemma 15.68.6. With notation as in Lemma 15.68 .5 the long exact cohomology sequence associated to the distinguished triangle breaks up into short exact sequences

$$
0 \rightarrow R^{1} \lim _{n} H^{p-1}\left(K_{n}^{\bullet}\right) \rightarrow H^{p}(R \lim K) \rightarrow \lim _{n} H^{p}\left(K_{n}^{\bullet}\right) \rightarrow 0
$$

Proof. The long exact sequence of the distinguished triangle is

$$
\ldots \rightarrow H^{p}(R \lim K) \rightarrow \prod_{n} H^{p}\left(K_{n}^{\bullet}\right) \rightarrow \prod_{n} H^{p}\left(K_{n}^{\bullet}\right) \rightarrow H^{p+1}(R \lim K) \rightarrow \ldots
$$

The map in the middle has kernel $\lim _{n} H^{p}\left(K_{n}^{\bullet}\right)$ by its explicit description given in the lemma. The cokernel of this map is $R^{1} \lim _{n} H^{p}\left(K_{n}^{\bullet}\right)$ by Lemma 15.68.1.
091B Lemma 15.68.7. Let $E \rightarrow D$ be a morphism of $D(A b(\mathbf{N}))$. Let $\left(E_{n}\right)$, resp. $\left(D_{n}\right)$ be the system of objects of $D(A b)$ associated to $E$, resp. D. If $\left(E_{n}\right) \rightarrow\left(D_{n}\right)$ is an isomorphism of pro-objects, then $R \lim E \rightarrow R \lim D$ is an isomorphism in $D(A b)$.
Proof. The assumption in particular implies that the pro-objects $H^{p}\left(E_{n}\right)$ and $H^{p}\left(D_{n}\right)$ are isomorphic. By the short exact sequences of Lemma 15.68 .6 it suffices to show that given a map $\left(A_{n}\right) \rightarrow\left(B_{n}\right)$ of inverse systems of abelian groupsc which induces an isomorphism of pro-objects, then $\lim A_{n} \cong \lim B_{n}$ and $R^{1} \lim A_{n} \cong$ $R^{1} \lim B_{n}$.

The assumption implies there are $1 \leq m_{1}<m_{2}<m_{3}<\ldots$ and maps $\varphi_{n}: B_{m_{n}} \rightarrow$ $A_{n}$ such that $\left(\varphi_{n}\right):\left(B_{m_{n}}\right) \rightarrow\left(A_{n}\right)$ is a map of systems which is inverse to the given $\operatorname{map} \psi=\left(\psi_{n}\right):\left(A_{n}\right) \rightarrow\left(B_{n}\right)$ as a morphism of pro-objects. What this means is that (after possibly replacing $m_{n}$ by larger integers) we may assume that the compositions $A_{m_{n}} \rightarrow B_{m_{n}} \rightarrow A_{n}$ and $B_{m_{n}} \rightarrow A_{n} \rightarrow B_{n}$ are equal to the transition maps of the inverse systems. Now, if $\left(b_{n}\right) \in \lim B_{n}$ we can set $a_{n}=\varphi_{m_{n}}\left(b_{m_{n}}\right)$.

This defines an inverse $\lim B_{n} \rightarrow \lim A_{n}$ (computation omitted). Let us use the cokernel of the map

$$
\prod B_{n} \longrightarrow \prod B_{n}
$$

as an avatar of $R^{1} \lim B_{n}$ (Lemma 15.68.1). Any element in this cokernel can be represented by an element $\left(b_{i}\right)$ with $b_{i}=0$ if $i \neq m_{n}$ for some $n$ (computation omitted). We can define a map $R^{1} \lim B_{n} \rightarrow R^{1} \lim A_{n}$ by mapping the class of such a special element $\left(b_{n}\right)$ to the class of $\left(\varphi_{n}\left(b_{m_{n}}\right)\right)$. We omit the verification this map is inverse to the map $R^{1} \lim A_{n} \rightarrow R^{1} \lim B_{n}$.

091C Lemma 15.68.8. Let $\left(A_{n}\right)$ be an inverse system of abelian groups. The following are equivalent
(1) $\left(A_{n}\right)$ is zero as a pro-object,
(2) $\lim A_{n}=0$ and $R^{1} \lim A_{n}=0$ and the same holds for $\bigoplus_{i \in \mathbf{N}}\left(A_{n}\right)$.

Proof. It follows from Lemma 15.68 .7 that (1) implies (2). For $m \geq n$ let $A_{n, m}=$ $\operatorname{Im}\left(A_{m} \rightarrow A_{n}\right)$ so that $A_{n}=A_{n, n} \supset A_{n, n+1} \supset \ldots$ Note that $\left(A_{n}\right)$ is zero as a pro-object if and only if for every $n$ there is an $m \geq n$ such that $A_{n, m}=0$. Note that $\left(A_{n}\right)$ is ML if and only if for every $n$ there is an $m_{n} \geq n$ such that $A_{n, m}=A_{n, m+1}=\ldots$. In the ML case it is clear that $\lim A_{n}=0$ implies that $A_{n, m_{n}}=0$ because the maps $A_{n+1, m_{n+1}} \rightarrow A_{n, m}$ are surjective.
Assume $\left(A_{n}\right)$ is not zero as a pro-object and not ML. Then we can pick an $n$ and a sequence of integers $n<m_{1}<m_{2}<\ldots$ and elements $x_{i} \in A_{m_{i}}$ whose image $y_{i} \in A_{n}$ is not in $A_{n, m_{i}+1}$. Set $B_{n}=\bigoplus_{i \in \mathbf{N}} A_{n}$. Let $\xi=\left(\xi_{n}\right) \in \prod B_{n}$ be the element with $\xi_{n}=0$ unless $n=m_{i}$ and $\xi_{m_{i}}=\left(0, \ldots, 0, x_{i}, 0, \ldots\right)$ with $x_{i}$ placed in the $i$ th summand. We claim that $\xi$ is not in the image of the map $\prod B_{n} \rightarrow \prod B_{n}$ of Lemma 15.68.1. This shows that $R^{1} \lim B_{n}$ is nonzero and finishes the proof. Namely, suppose that $\xi$ is the image of $\eta=\left(z_{1}, z_{2}, \ldots\right)$ with $z_{n}=\sum z_{n, i} \in \bigoplus_{i} A_{n}$. Observe that $x_{i}=z_{m_{i}, i} \bmod A_{m_{i}, m_{i}+1}$. Then $z_{m_{i}-1, i}$ is the image of $z_{m_{i}, i}$ under $A_{m_{i}} \rightarrow A_{m_{i}-1}$, and so on, and we conclude that $z_{n, i}$ is the image of $z_{m_{i}, i}$ under $A_{m_{i}} \rightarrow A_{n}$. We conclude that $z_{n, i}$ is congruent to $y_{i}$ modulo $A_{n, m_{i}+1}$. In particular $z_{n, i} \neq 0$. This is impossible as $\sum z_{n, i} \in \bigoplus_{i} A_{n}$ hence only a finite number of $z_{n, i}$ can be nonzero.

Let $\left(A_{n}\right)$ be an inverse system of rings. We will denote $\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)$ the category of inverse systems $\left(M_{n}\right)$ of abelian groups such that each $M_{n}$ is given the structure of a $A_{n}$-module and the transition maps $M_{n+1} \rightarrow M_{n}$ are $A_{n+1}$-module maps. This is an abelian category. Set $A=\lim A_{n}$. Given an object $\left(M_{n}\right)$ of $\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)$ the $\operatorname{limit} \lim M_{n}$ is an $A$-module.
091D Lemma 15.68.9. In the situation above. The functor $\lim : \operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right) \rightarrow$ $\mathrm{Mod}_{A}$ has a right derived functor

$$
R \lim : D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right) \longrightarrow D(A)
$$

As usual we set $R^{p} \lim (K)=H^{p}(R \lim (K))$. Moreover, we have
(1) for any $\left(A_{n}\right)$ in $\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right.$ ) we have $R^{p} \lim A_{n}=0$ for $p>1$,
(2) the object $R \lim A_{n}$ of $D\left(\operatorname{Mod}_{A}\right)$ is represented by the complex

$$
\prod A_{n} \rightarrow \prod A_{n}, \quad\left(x_{n}\right) \mapsto\left(x_{n}-f_{n+1}\left(x_{n+1}\right)\right)
$$

sitting in degrees 0 and 1,
(3) if $\left(A_{n}\right)$ is $M L$, then $R^{1} \lim A_{n}=0$, i.e., $\left(A_{n}\right)$ is right acyclic for lim,
(4) every $K^{\bullet} \in D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ is quasi-isomorphic to a complex whose terms are right acyclic for lim, and
(5) if each $K^{p}=\left(K_{n}^{p}\right)$ is right acyclic for $\lim$, i.e., of $R^{1} \lim _{n} K_{n}^{p}=0$, then $R \lim K$ is represented by the complex whose term in degree $p$ is $\lim _{n} K_{n}^{p}$.
Proof. The proof of this is word for word the same as the proof of Lemma 15.68.1.

091E Remark 15.68.10. This remark is a continuation of Remark 15.68 .4 A sheaf of rings on $\mathbf{N}$ is just an inverse system of rings $\left(A_{n}\right)$. A sheaf of modules over $\left(A_{n}\right)$ is exactly the same thing as an object of the category $\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)$ defined above. The derived functor $R$ lim of Lemma 15.68 .9 is simply $R \Gamma(\mathbf{N},-)$ from the derived category of modules to the derived category of modules over the global sections of the structure sheaf. is true in general that cohomology of groups and modules agree, see Cohomology on Sites, Lemma 21.12.4

091 Lemma 15.68.11. Let $\left(A_{n}\right)$ be an inverse system of rings. Every $K \in D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ can be represented by a system of complexes $\left(M_{n}^{\bullet}\right)$ such that all the transition maps $M_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ are surjective.

Proof. Let $K$ be represented by the system $\left(K_{n}^{\bullet}\right)$. Set $M_{1}^{\bullet}=K_{1}^{\bullet}$. Suppose we have constructed surjective maps of complexes $M_{n}^{\bullet} \rightarrow M_{n-1}^{\bullet} \rightarrow \ldots \rightarrow M_{1}^{\bullet}$ and homotopy equivalences $\psi_{e}: K_{e}^{\bullet} \rightarrow M_{e}^{\bullet}$ such that the diagrams

commute for all $e<n$. Then we consider the diagram

By Derived Categories, Lemma 13.9 .8 we can factor the composition $K_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ as $K_{n+1}^{\bullet} \rightarrow M_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ such that the first arrow is a homotopy equivalence and the second a termwise split surjection. The lemma follows from this and induction.

091 L Lemma 15.68.12. Let $\left(A_{n}\right)$ be an inverse system of rings. Every $K \in D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ can be represented by a system of complexes $\left(K_{n}^{\bullet}\right)$ such that each $K_{n}^{\bullet}$ is $K$-flat.

Proof. First use Lemma 15.68 .11 to represent $K$ by a system of complexes $\left(M_{n}^{\bullet}\right)$ such that all the transition maps $M_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ are surjective. Next, let $K_{1}^{\bullet} \rightarrow M_{1}^{\bullet}$ be a quasi-isomorphism with $K_{1}^{\bullet}$ a K-flat complex of $A_{1}$-modules (Lemma 15.49.10). Suppose we have constructed $K_{n}^{\bullet} \rightarrow K_{n-1}^{\bullet} \rightarrow \ldots \rightarrow K_{1}^{\bullet}$ and maps of complexes $\psi_{e}: K_{e}^{\bullet} \rightarrow M_{e}^{\bullet}$ such that

commutes for all $e<n$. Then we consider the diagram

in $D\left(A_{n+1}\right)$. As $M_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ is termwise surjective, the complex $C^{\bullet}$ fitting into the left upper corner with terms

$$
C^{p}=M_{n+1}^{p} \times{ }_{M_{n}^{p}} K_{n}^{p}
$$

is quasi-isomorphic to $M_{n+1}^{\bullet}$ (details omitted). Choose a quasi-isomorphism $K_{n+1}^{\bullet} \rightarrow$ $C^{\bullet}$ with $K_{n+1}^{\bullet}$ K-flat. Thus the lemma holds by induction.

091 H Lemma 15.68.13. Let $\left(A_{n}\right)$ be an inverse system of rings. Given $K, L \in D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ there is a canonical derived tensor product $K \otimes^{\mathbf{L}} L$ in $D\left(\mathbf{N},\left(A_{n}\right)\right)$ compatible with the maps to $D\left(A_{n}\right)$. The construction is symmetric in $K$ and $L$ and an exact functor of triangulated categories in each variable.

Proof. Choose a representive $\left(K_{n}^{\bullet}\right)$ for $K$ such that each $K_{n}^{\bullet}$ is a K-flat complex (Lemma 15.68.12). Then you can define $K \otimes^{\mathbf{L}} L$ as the object represented by the system of complexes

$$
\left(\operatorname{Tot}\left(K_{n}^{\bullet} \otimes_{A_{n}} L_{n}^{\bullet}\right)\right)
$$

for any choice of representative $\left(L_{n}^{\bullet}\right)$ for $L$. This is well defined in both variables by Lemmas 15.49 .4 and 15.49 .12 Compatibility with the map to $D\left(A_{n}\right)$ is clear. Exactness follows exactly as in Lemma 15.49.2.

As in the case of abelian groups an object $M=\left(M_{n}^{\bullet}\right)$ of $D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ is an inverse system of complexes of modules, which is not the same thing as an inverse system of objects in the derived categories. In the following lemma we show how an inverse system of objects in derived categories always lifts to an object of $D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$.

091 Lemma 15.68.14. Let $\left(A_{n}\right)$ be an inverse system of rings. Suppose that we are given
(1) for every $n$ an object $K_{n}^{\bullet}$ of $D\left(A_{n}\right)$, and
(2) for every $n$ a map $\varphi_{n}: K_{n+1}^{\bullet} \rightarrow K_{n}^{\bullet}$ of $D\left(A_{n+1}\right)$ where we think of $K_{n}^{\bullet}$ as an object of $D\left(A_{n+1}\right)$ by restriction via the restriction map $A_{n+1} \rightarrow A_{n}$.
There exists an object $M=\left(M_{n}^{\bullet}\right) \in D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right)$ and isomorphisms $\psi_{n}$ : $M_{n}^{\bullet} \rightarrow K_{n}^{\bullet}$ in $D\left(A_{n}\right)$ such that the diagrams

commute in $D\left(A_{n+1}\right)$.

Proof. Namely, set $M_{1}^{\bullet}=K_{1}^{\bullet}$. Suppose we have constructed $M_{n}^{\bullet} \rightarrow M_{n-1}^{\bullet} \rightarrow$ $\ldots \rightarrow M_{1}^{\bullet}$ and maps of complexes $\psi_{e}: M_{e}^{\bullet} \rightarrow K_{e}^{\bullet}$ such that the diagrams above commute for all $e<n$. Then we consider the diagram

in $D\left(A_{n+1}\right)$. By the definition of morphisms in $D\left(A_{n+1}\right)$ we can find a quasiisomorphism $\psi_{n+1}: M_{n+1}^{\bullet} \rightarrow K_{n+1}^{\bullet}$ of complexes of $A_{n+1}$-modules such that there exists a morphism of complexes $M_{n+1}^{\bullet} \rightarrow M_{n}^{\bullet}$ of $A_{n+1}$-modules representing the composition $\psi_{n}^{-1} \circ \varphi_{n} \circ \psi_{n+1}$ in $D\left(A_{n+1}\right)$. Thus the lemma holds by induction.

07KZ Remark 15.68.15. With assumptions as in Lemma 15.68.14 A priori there are many isomorphism classes of objects $M$ of $D\left(\operatorname{Mod}\left(\mathbf{N},\left(A_{n}\right)\right)\right.$ which give rise to the system $\left(K_{n}^{\bullet}, \varphi_{n}\right)$ as above. For each such $M$ we can consider the complex $R \lim M \in D(A)$ where $A=\lim A_{n}$. By Lemma 15.68 .5 there exists a canonical distinguished triangle

$$
R \lim M \rightarrow \prod_{n} K_{n}^{\bullet} \rightarrow \prod_{n} K_{n}^{\bullet} \rightarrow R \lim M[1]
$$

in $D(A)$. Hence we see that the isomorphism class of $R \lim M$ in $D(A)$ is independent of the choices made in constructing $M$, by axiom TR3 of triangulated categories and Derived Categories, Lemma 13.4.3.

08U5 Remark 15.68.16. Let $\left(K_{n}\right)$ be an inverse system of objects of $D(A b)$. Let $K=R \lim K_{n}$ be a derived limit of this system (see Derived Categories, Section 13.32 . Such a derived limit exists because $D(A b)$ has countable products (Derived Categories, Lemma 13.32.2). By Lemma 15.68 .14 we can also lift $\left(K_{n}\right)$ to an object $M$ of $D(\mathbf{N})$. Then $K \cong R \lim M$ where $R \lim$ is the functor 15.68.1.1 because $R \lim M$ is also a derived limit of the system $\left(K_{n}\right)$ (by Lemma 15.68.5) and derived limits are unique up to isomorphism. In particular for every $p \in \mathbf{Z}$ there is a canonical short exact sequence

$$
0 \rightarrow R^{1} \lim H^{p-1}\left(K_{n}\right) \rightarrow H^{p}(K) \rightarrow \lim H^{p}\left(K_{n}\right) \rightarrow 0
$$

as follows from Lemma 15.68 .5 for $M$. This can also been seen directly, without invoking the existence of $M$, by applying the argument of the proof of Lemma 15.68 .5 to the (defining) distinguished triangle $K \rightarrow \prod K_{n} \rightarrow \prod K_{n} \rightarrow K[1]$.

091J Remark 15.68.17. Let $A$ be a ring. Let $\left(E_{n}\right)$ be an inverse system of objects of $D(A)$. We've seen above that a derived $\operatorname{limit} R \lim E_{n}$ exists. Thus for every object $K$ of $D(A)$ also the derived $\operatorname{limit} R \lim \left(K \otimes_{A}^{\mathbf{L}} E_{n}\right)$ exists. It turns out that we can construct these derived limits functorially in $K$ and obtain an exact functor

$$
R \lim \left(-\otimes_{A}^{\mathbf{L}} E_{n}\right): D(A) \longrightarrow D(A)
$$

of triangulated categories. Namely, we first lift $\left(E_{n}\right)$ to an object $E$ of $D(\mathbf{N}, A)$, see Lemma 15.68.14. (The functor will depend on the choice of this lift.) Next, observe that there is a "diagonal" or "constant" functor

$$
\Delta: D(A) \longrightarrow D(\mathbf{N}, A)
$$

mapping the complex $K^{\bullet}$ to the constant inverse system of complexes with value $K^{\bullet}$. Then we simply define

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}} E_{n}\right)=R \lim \left(\Delta(K) \otimes^{\mathbf{L}} E\right)
$$

where on the right hand side we use the functor $R$ lim of Lemma 15.68 .9 and the functor $-\otimes^{\mathbf{L}}-$ of Lemma 15.68 .13 .

091K Lemma 15.68.18. Let $A$ be a ring. Let $E \rightarrow D \rightarrow F \rightarrow E[1]$ be a distinguished triangle of $D(\mathbf{N}, A)$. Let $\left(E_{n}\right)$, resp. $\left(D_{n}\right)$, resp. $\left(F_{n}\right)$ be the system of objects of $D(A)$ associated to $E$, resp. $D$, resp. $F$. Then for every $K \in D(A)$ there is a canonical distinguished triangle

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}} E_{n}\right) \rightarrow R \lim \left(K \otimes_{A}^{\mathbf{L}} D_{n}\right) \rightarrow R \lim \left(K \otimes_{A}^{\mathbf{L}} F_{n}\right) \rightarrow R \lim \left(K \otimes_{A}^{\mathbf{L}} E_{n}\right)[1]
$$

in $D(A)$ with notation as in Remark 15.68.17.
Proof. This is clear from the construction in Remark 15.68 .17 and the fact that $\Delta$ : $D(A) \rightarrow D(\mathbf{N}, A),-\otimes^{\mathbf{L}}-$, and $R$ lim are exact functors of triangulated categories.

091L Lemma 15.68.19. Let $A$ be a ring. Let $E \rightarrow D$ be a morphism of $D(\mathbf{N}, A)$. Let $\left(E_{n}\right)$, resp. $\left(D_{n}\right)$ be the system of objects of $D(A)$ associated to $E$, resp. $D$. If $\left(E_{n}\right) \rightarrow\left(D_{n}\right)$ is an isomorphism of pro-objects, then for every $K \in D(A)$ the corresponding map

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}} E_{n}\right) \longrightarrow R \lim \left(K \otimes_{A}^{\mathbf{L}} D_{n}\right)
$$

in $D(A)$ is an isomorphism (notation as in Remark 15.68.17).
Proof. Follows from the definitions and Lemma 15.68 .7

### 15.69. Torsion modules

0ALX In this section "torsion modules" will refer to modules supported on a given closed subset $V(I)$ of an affine scheme $\operatorname{Spec}(R)$. This is different, but analogous to, the notion of a torsion module over a domain (Definition 15.16.1).

05E6 Definition 15.69.1. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) Let $I \subset R$ be an ideal. We say $M$ is an $I$-power torsion module if for every $m \in M$ there exists an $n>0$ such that $I^{n} m=0$.
(2) Let $f \in R$. We say $M$ is an $f$-power torsion module if for each $m \in M$, there exists an $n>0$ such that $f^{n} m=0$.

Thus an $f$-power torsion module is the same thing as a $I$-power torsion module for $I=(f)$. We will use the notation

$$
M\left[I^{n}\right]=\left\{m \in M \mid I^{n} m=0\right\}
$$

and

$$
M\left[I^{\infty}\right]=\bigcup M\left[I^{n}\right]
$$

for an $R$-module $M$. Thus $M$ is $I$-power torsion if and only if $M=M\left[I^{\infty}\right]$ if and only if $M=\bigcup M\left[I^{n}\right]$.

05E8 Lemma 15.69.2. Let $R$ be a ring. Let $I$ be an ideal of $R$. Let $M$ be an $I$-power torsion module. Then $M$ admits a resolution

$$
\ldots \rightarrow K_{2} \rightarrow K_{1} \rightarrow K_{0} \rightarrow M \rightarrow 0
$$

with each $K_{i}$ a direct sum of copies of $R / I^{n}$ for $n$ variable.
Proof. There is a canonical surjection

$$
\oplus_{m \in M} R / I^{n_{m}} \rightarrow M \rightarrow 0
$$

where $n_{m}$ is the smallest positive integer such that $I^{n_{m}} \cdot m=0$. The kernel of the preceding surjection is also an $I$-power torsion module. Proceeding inductively, we construct the desired resolution of $M$.

05EA Lemma 15.69.3. Let $R$ be a ring. Let $I$ be an ideal of $R$. For any $R$-module $M$ set $M\left[I^{n}\right]=\left\{m \in M \mid I^{n} m=0\right\}$. If $I$ is finitely generated then the following are equivalent
(1) $M[I]=0$,
(2) $M\left[I^{n}\right]=0$ for all $n \geq 1$, and
(3) if $I=\left(f_{1}, \ldots, f_{t}\right)$, then the $\operatorname{map} M \rightarrow \bigoplus M_{f_{i}}$ is injective.

Proof. This follows from Algebra, Lemma 10.22.4
05EB Lemma 15.69.4. Let $R$ be a ring. Let $I$ be a finitely generated ideal of $R$.
(1) For any $R$-module $M$ we have $\left(M / M\left[I^{\infty}\right]\right)[I]=0$.
(2) An extension of I-power torsion modules is I-power torsion.

Proof. Let $m \in M$. If $m$ maps to an element of $\left(M / M\left[I^{\infty}\right]\right)[I]$ then $I m \subset M\left[I^{\infty}\right]$. Write $I=\left(f_{1}, \ldots, f_{t}\right)$. Then we see that $f_{i} m \in M\left[I^{\infty}\right]$, i.e., $I^{n_{i}} f_{i} m=0$ for some $n_{i}>0$. Thus we see that $I^{N} m=0$ with $N=\sum n_{i}+2$. Hence $m$ maps to zero in $\left(M / M\left[I^{\infty}\right]\right)$ which proves the first statement of the lemma.
For the second, suppose that $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ is a short exact sequence of modules with $M^{\prime}$ and $M^{\prime \prime}$ both $I$-power torsion modules. Then $M\left[I^{\infty}\right] \supset M^{\prime}$ and hence $M / M\left[I^{\infty}\right]$ is a quotient of $M^{\prime \prime}$ and therefore $I$-power torsion. Combined with the first statement and Lemma 15.69 .3 this implies that it is zero
0A6K Lemma 15.69.5. Let I be a finitely generated ideal of a ring $R$. The I-power torsion modules form a Serre subcategory of the abelian category $\operatorname{Mod}_{R}$, see Homology, Definition 12.9.1.

Proof. It is clear that a submodule and a quotient module of an $I$-power torsion module is $I$-power torsion. Moreover, the extension of two $I$-power torsion modules is $I$-power torsion by Lemma 15.69 .4 . Hence the statement of the lemma by Homology, Lemma 12.9.2.

0953 Lemma 15.69.6. Let $R$ be a ring and let $I \subset R$ be a finitely generated ideal. The subcategory $I^{\infty}$-torsion $\subset \operatorname{Mod}_{R}$ depends only on the closed subset $Z=V(I) \subset$ $\operatorname{Spec}(R)$. In fact, an $R$-module $M$ is I-power torsion if and only if its support is contained in $Z$.

Proof. Let $M$ be an $R$-module. Let $x \in M$. If $x \in M\left[I^{\infty}\right]$, then $x$ maps to zero in $M_{f}$ for all $f \in I$. Hence $x$ maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \not \supset I$. Conversely, if $x$ maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \not \supset I$, then $x$ maps to zero in $M_{f}$ for all $f \in I$. Hence if $I=\left(f_{1}, \ldots, f_{r}\right)$, then $f_{i}^{n_{i}} x=0$ for some $n_{i} \geq 1$. It follows that $x \in M\left[I^{\sum n_{i}}\right]$.

Thus $M\left[I^{\infty}\right]$ is the kernel of $M \rightarrow \prod_{\mathfrak{p} \notin Z} M_{\mathfrak{p}}$. The second statement of the lemma follows and it implies the first.

### 15.70. Formal glueing of module categories

05E5 Fix a noetherian scheme $X$, and a closed subscheme $Z$ with complement $U$. Our goal is to explain how coherent sheaves on $X$ can be constructed (uniquely) from coherent sheaves on the formal completion of $X$ along $Z$, and those on $U$ with a suitable compatibility on the overlap. We first do this using only commutative algebra (this section) and later we explain this in the setting of algebraic spaces (Pushouts of Spaces, Section 64.3).
Here are some references treating some of the material in this section: Art70, Section 2], FR70, Appendix], BL95, MB96, and dJ95, Section 4.6].

05E7 Lemma 15.70.1. Let $\varphi: R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. The following are equivalent
(1) $\varphi$ is flat and $R / I \rightarrow S / I S$ is faithfully flat,
(2) $\varphi$ is flat, and the map $\operatorname{Spec}(S / I S) \rightarrow \operatorname{Spec}(R / I)$ is surjective.
(3) $\varphi$ is flat, and the base change functor $M \mapsto M \otimes_{R} S$ is faithful on modules annihilated by I, and
(4) $\varphi$ is flat, and the base change functor $M \mapsto M \otimes_{R} S$ is faithful on I-power torsion modules.

Proof. If $R \rightarrow S$ is flat, then $R / I^{n} \rightarrow S / I^{n} S$ is flat for every $n$, see Algebra, Lemma 10.38.7. Hence (1) and (2) are equivalent by Algebra, Lemma 10.38.16. The equivalence of (1) with (3) follows by identifying $I$-torsion $R$-modules with $R / I$-modules, using that

$$
M \otimes_{R} S=M \otimes_{R / I} S / I S
$$

for $R$-modules $M$ annihilated by $I$, and Algebra, Lemma 10.38.14. The implication (4) $\Rightarrow(3)$ is immediate. Assume (3). We have seen above that $R / I^{n} \rightarrow S / I^{n} S$ is flat, and by assumption it induces a surjection on spectra, as $\operatorname{Spec}\left(R / I^{n}\right)=$ $\operatorname{Spec}(R / I)$ and similarly for $S$. Hence the base change functor is faithful on modules annihilated by $I^{n}$. Since any $I$-power torsion module $M$ is the union $M=\bigcup M_{n}$ where $M_{n}$ is annihilated by $I^{n}$ we see that the base change functor is faithful on the category of all $I$-power torsion modules (as tensor product commutes with colimits).

05E9 Lemma 15.70.2. Assume $(\varphi: R \rightarrow S, I)$ satisfies the equivalent conditions of Lemma 15.70.1. The following are equivalent
(1) for any I-power torsion module $M$, the natural map $M \rightarrow M \otimes_{R} S$ is an isomorphism, and
(2) $R / I \rightarrow S / I S$ is an isomorphism.

Proof. The implication (1) $\Rightarrow(2)$ is immediate. Assume (2). First assume that $M$ is annihilated by $I$. In this case, $M$ is an $R / I$-module. Hence, we have an isomorphism

$$
M \otimes_{R} S=M \otimes_{R / I} S / I S=M \otimes_{R / I} R / I=M
$$

proving the claim. Next we prove by induction that $M \rightarrow M \otimes_{R} S$ is an isomorphism for any module $M$ is annihilated by $I^{n}$. Assume the induction hypothesis holds for
$n$ and assume $M$ is annihilated by $I^{n+1}$. Then we have a short exact sequence

$$
0 \rightarrow I^{n} M \rightarrow M \rightarrow M / I^{n} M \rightarrow 0
$$

and as $R \rightarrow S$ is flat this gives rise to a short exact sequence

$$
0 \rightarrow I^{n} M \otimes_{R} S \rightarrow M \otimes_{R} S \rightarrow M / I^{n} M \otimes_{R} S \rightarrow 0
$$

Using that the canonical map is an isomorphism for $M^{\prime}=I^{n} M$ and $M^{\prime \prime}=M / I^{n} M$ (by induction hypothesis) we conclude the same thing is true for $M$. Finally, suppose that $M$ is a general $I$-power torsion module. Then $M=\bigcup M_{n}$ where $M_{n}$ is annihilated by $I^{n}$ and we conclude using that tensor products commute with colimits.

05EC Lemma 15.70.3. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R / I \rightarrow S / I S$ is an isomorphism. Then
(1) for any $R$-module $M$ the map $M \rightarrow M \otimes_{R} S$ induces an isomorphism $M\left[I^{\infty}\right] \rightarrow\left(M \otimes_{R} S\right)\left[(I S)^{\infty}\right]$ of I-power torsion submodules,
(2) the natural map

$$
\operatorname{Hom}_{R}(M, N) \longrightarrow \operatorname{Hom}_{S}\left(M \otimes_{R} S, N \otimes_{R} S\right)
$$

is an isomorphism if either $M$ or $N$ is $I$-power torsion, and
(3) the base change functor $M \mapsto M \otimes_{R} S$ defines an equivalence of categories between I-power torsion modules and IS-power torsion modules.

Proof. Note that the equivalent conditions of both Lemma 15.70 .1 and Lemma 15.70 .2 are satisfied. We will use these without further mention. We first prove (1). Let $M$ be any $R$-module. Set $M^{\prime}=M / M\left[I^{\infty}\right]$ and consider the exact sequence

$$
0 \rightarrow M\left[I^{\infty}\right] \rightarrow M \rightarrow M^{\prime} \rightarrow 0
$$

As $M\left[I^{\infty}\right]=M\left[I^{\infty}\right] \otimes_{R} S$ we see that it suffices to show that $\left(M^{\prime} \otimes_{R} S\right)\left[(I S)^{\infty}\right]=0$. Write $I=\left(f_{1}, \ldots, f_{t}\right)$. By Lemma 15.69.4 we see that $M^{\prime}\left[I^{\infty}\right]=0$. Hence for every $n>0$ the map

$$
M^{\prime} \longrightarrow \bigoplus_{i=1, \ldots t} M^{\prime}, \quad x \longmapsto\left(f_{1}^{n} x, \ldots, f_{t}^{n} x\right)
$$

is injective. As $S$ is flat over $R$ also the corresponding map $M^{\prime} \otimes_{R} S \rightarrow \bigoplus_{i=1, \ldots t} M^{\prime} \otimes_{R}$ $S$ is injective. This means that $\left(M^{\prime} \otimes_{R} S\right)\left[I^{n}\right]=0$ as desired.
Next we prove (2). If $N$ is $I$-power torsion, then $N \otimes_{R} S=N$ and the displayed map of (2) is an isomorphism by Algebra, Lemma 10.13 .3 . If $M$ is $I$-power torsion, then the image of any map $M \rightarrow N$ factors through $M\left[I^{\infty}\right]$ and the image of any $\operatorname{map} M \otimes_{R} S \rightarrow N \otimes_{R} S$ factors through $\left(N \otimes_{R} S\right)\left[(I S)^{\infty}\right]$. Hence in this case part (1) guarantees that we may replace $N$ by $N\left[I^{\infty}\right]$ and the result follows from the case where $N$ is $I$-power torsion we just discussed.
Next we prove (3). The functor is fully faithful by (2). For essential surjectivity, we simply note that for any $I S$-power torsion $S$-module $N$, the natural map $N \otimes_{R} S \rightarrow$ $N$ is an isomorphism.

091M Lemma 15.70.4. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R / I \rightarrow S / I S$ is an isomorphism. For any $f_{1}, \ldots, f_{r} \in R$ such that $V\left(f_{1}, \ldots, f_{r}\right)=V(I)$
(1) the map of Koszul complexes $K\left(R, f_{1}, \ldots, f_{r}\right) \rightarrow K\left(S, f_{1}, \ldots, f_{r}\right)$ is a quasi-isomorphism, and
(2) The map of extended alternating Čech complexes

is a quasi-isomorphism.
Proof. In both cases we have a complex $K_{\bullet}$ of $R$ modules and we want to show that $K_{\bullet} \rightarrow K_{\bullet} \otimes_{R} S$ is a quasi-isomorphism. By Lemma 15.70 .2 and the flatness of $R \rightarrow S$ this will hold as soon as all homology groups of $K$ are $I$-power torsion. This is true for the Koszul complex by Lemma 15.22.6. Since the alternating Čech complex is a colimit of Koszul complexes (Lemma 15.22.13) the case of the Koszul complex implies the second statement too.

05ED Lemma 15.70.5. Let $R$ be a ring. Let $I=\left(f_{1}, \ldots, f_{n}\right)$ be a finitely generated ideal of $R$. Let $M$ be the $R$-module generated by elements $e_{1}, \ldots, e_{n}$ subject to the relations $f_{i} e_{j}-f_{j} e_{i}=0$. There exists a short exact sequence

$$
0 \rightarrow K \rightarrow M \rightarrow I \rightarrow 0
$$

such that $K$ is annihilated by $I$.
Proof. This is just a truncation of the Koszul complex. The map $M \rightarrow I$ is is determined by the rule $e_{i} \mapsto f_{i}$. If $m=\sum a_{i} e_{i}$ is in the kernel of $M \rightarrow I$, i.e., $\sum a_{i} f_{i}=0$, then $f_{j} m=\sum f_{j} a_{i} e_{i}=\left(\sum f_{i} a_{i}\right) e_{j}=0$.

05EE Lemma 15.70.6. Let $R$ be a ring. Let $I=\left(f_{1}, \ldots, f_{n}\right)$ be a finitely generated ideal of $R$. For any $R$-module $N$ set

$$
H_{1}\left(N, f_{\bullet}\right)=\frac{\left\{\left(x_{1}, \ldots, x_{n}\right) \in N^{\oplus n} \mid f_{i} x_{j}=f_{j} x_{i}\right\}}{\left.\left\{f_{1} x, \ldots, f_{n} x\right) \mid x \in N\right\}}
$$

For any $R$-module $N$ there exists a canonical short exact sequence

$$
0 \rightarrow \operatorname{Ext}_{R}(R / I, N) \rightarrow H_{1}\left(N, f_{\bullet}\right) \rightarrow \operatorname{Hom}_{R}(K, N)
$$

where $K$ is as in Lemma 15.70.5.
Proof. The notation above indicates the Ext-groups in $\operatorname{Mod}_{R}$ as defined in Homology, Section 12.6. These are denoted $\operatorname{Ext}_{R}(M, N)$. Using the long exact sequence of Homology, Lemma 12.6 .4 associated to the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow$ $R / I \rightarrow 0$ and the fact that $\operatorname{Ext}_{R}(R, N)=0$ we see that

$$
\operatorname{Ext}_{R}(R / I, N)=\operatorname{Coker}(N \longrightarrow \operatorname{Hom}(I, N))
$$

Using the short exact sequence of Lemma 15.70 .5 we see that we get a complex

$$
N \rightarrow \operatorname{Hom}(M, N) \rightarrow \operatorname{Hom}_{R}(K, N)
$$

whose homology in the middle is canonically isomorphic to $\operatorname{Ext}_{R}(R / I, N)$. The proof of the lemma is now complete as the cokernel of the first map is canonically isomorphic to $H_{1}\left(N, f_{\bullet}\right)$.

05EF Lemma 15.70.7. Let $R$ be a ring. Let $I=\left(f_{1}, \ldots, f_{n}\right)$ be a finitely generated ideal of $R$. For any $R$-module $N$ the Koszul homology group $H_{1}\left(N, f_{\bullet}\right)$ defined in Lemma 15.70 .6 is annihilated by $I$.

Proof. Let $\left(x_{1}, \ldots, x_{n}\right) \in N^{\oplus n}$ with $f_{i} x_{j}=f_{j} x_{i}$. Then we have $f_{i}\left(x_{1}, \ldots, x_{n}\right)=$ $\left(f_{i} x_{i}, \ldots, f_{i} x_{n}\right)$. In other words $f_{i}$ annihilates $H_{1}\left(N, f_{\bullet}\right)$.

We can improve on the full faithfulness of Lemma 15.70 .3 by showing that Extgroups whose source is $I$-power torsion are insensitive to passing to $S$ as well. See Dualizing Complexes, Lemma 45.9 .9 for a derived version of the following lemma.

05EG Lemma 15.70.8. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R / I \rightarrow S / I S$ is an isomorphism. Let $M, N$ be $R$-modules. Assume $M$ is $I$-power torsion. Given an short exact sequence

$$
0 \rightarrow N \otimes_{R} S \rightarrow \tilde{E} \rightarrow M \otimes_{R} S \rightarrow 0
$$

there exists a commutative diagram

with exact rows.
Proof. As $M$ is $I$-power torsion we see that $M \otimes_{R} S=M$, see Lemma 15.70 .2 , We will use this identification without further mention. As $R \rightarrow S$ is flat, the base change functor is exact and we obtain a functorial map of Ext-groups

$$
\operatorname{Ext}_{R}(M, N) \longrightarrow \operatorname{Ext}_{S}\left(M \otimes_{R} S, N \otimes_{R} S\right)
$$

see Homology, Lemma 12.7.2. The claim of the lemma is that this map is surjective when $M$ is $I$-power torsion. In fact we will show that it is an isomorphism. By Lemma 15.69 .2 we can find a surjection $M^{\prime} \rightarrow M$ with $M^{\prime}$ a direct sum of modules of the form $R / I^{n}$. Using the long exact sequence of Homology, Lemma 12.6 .4 we see that it suffices to prove the lemma for $M^{\prime}$. Using compatibility of Ext with direct sums (details omitted) we reduce to the case where $M=R / I^{n}$ for some $n$.
Let $f_{1}, \ldots, f_{t}$ be generators for $I^{n}$. By Lemma 15.70 .6 we have a commutative diagram

with exact rows where $K$ is as in Lemma 15.70.5. Hence it suffices to prove that the two right vertical arrows are isomorphisms. Since $K$ is annihilated by $I^{n}$ we see that $\operatorname{Hom}_{R}(K, N)=\operatorname{Hom}_{S}\left(K \otimes_{R} S, N \otimes_{R} S\right)$ by Lemma 15.70.3. As $R \rightarrow S$ is flat we have $H_{1}\left(N, f_{\bullet}\right) \otimes_{R} S=H_{1}\left(N \otimes_{R} S, f_{\bullet}\right)$. As $H_{1}\left(N, f_{\bullet}\right)$ is annihilated by $I^{n}$, see Lemma 15.70.7 we have $H_{1}\left(N, f_{\bullet}\right) \otimes_{R} S=H_{1}\left(N, f_{\bullet}\right)$ by Lemma 15.70.2.

Let $R \rightarrow S$ be a ring map. Let $f_{1}, \ldots, f_{t} \in R$ and $I=\left(f_{1}, \ldots, f_{t}\right)$. Then for any $R$-module $M$ we can define a complex

05EJ

$$
\begin{equation*}
0 \rightarrow M \xrightarrow{\alpha} M \otimes_{R} S \times \prod M_{f_{i}} \xrightarrow{\beta} \prod\left(M \otimes_{R} S\right)_{f_{i}} \times \prod M_{f_{i} f_{j}} \tag{15.70.8.1}
\end{equation*}
$$

where $\alpha(m)=(m \otimes 1, m / 1, \ldots, m / 1)$ and
$\beta\left(m^{\prime}, m_{1}, \ldots, m_{t}\right)=\left(\left(m^{\prime} / 1-m_{1} \otimes 1, \ldots, m^{\prime} / 1-m_{t} \otimes 1\right),\left(m_{1}-m_{2}, \ldots, m_{t-1}-m_{t}\right)\right.$.

We would like to know when this complex is exact.
05EK Lemma 15.70.9. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I=\left(f_{1}, \ldots, f_{t}\right) \subset R$ is an ideal such that $R / I \rightarrow S / I S$ is an isomorphism. Let $M$ be an $R$-module. Then the complex 15.70.8.1 is exact.

Proof. First proof. Denote $\check{\mathcal{C}}_{R} \rightarrow \check{\mathcal{C}}_{S}$ the quasi-isomorphism of extended alternating Čech complexes of Lemma 15.70.4 Since these complexes are bounded with flat terms, we see that $M \otimes_{R} \check{\mathcal{C}}_{R} \rightarrow M \otimes_{R} \check{\mathcal{C}}_{S}$ is a quasi-isomorphism too (Lemmas 15.49 .8 and 15.49 .12 . Now the complex 15.70 .8 .1 is a truncation of the cone of the map $M \otimes_{R} \dot{\mathcal{C}}_{R} \rightarrow M \otimes_{R} \check{\mathcal{C}}_{S}$ and we win.

Second computational proof. Let $m \in M$. If $\alpha(m)=0$, then $m \in M\left[I^{\infty}\right]$, see Lemma 15.69.3. Pick $n$ such that $I^{n} m=0$ and consider the map $\varphi: R / I^{n} \rightarrow M$. If $m \otimes 1=0$, then $\varphi \otimes 1_{S}=0$, hence $\varphi=0$ (see Lemma 15.70.3) hence $m=0$. In this way we see that $\alpha$ is injective.

Let $\left(m^{\prime}, m_{1}^{\prime}, \ldots, m_{t}^{\prime}\right) \in \operatorname{Ker}(\beta)$. Write $m_{i}^{\prime}=m_{i} / f_{i}^{n}$ for some $n>0$ and $m_{i} \in M$. We may, after possibly enlarging $n$ assume that $f_{i}^{n} m^{\prime}=m_{i} \otimes 1$ in $M \otimes_{R} S$ and $f_{j}^{n} m_{i}-f_{i}^{n} m_{j}=0$ in $M$. In particular we see that $\left(m_{1}, \ldots, m_{t}\right)$ defines an element $\xi$ of $H_{1}\left(M,\left(f_{1}^{n}, \ldots, f_{t}^{n}\right)\right)$. Since $H_{1}\left(M,\left(f_{1}^{n}, \ldots, f_{t}^{n}\right)\right)$ is annihilated by $I^{t n+1}$ (see Lemma 15.70.7 and since $R \rightarrow S$ is flat we see that

$$
H_{1}\left(M,\left(f_{1}^{n}, \ldots, f_{t}^{n}\right)\right)=H_{1}\left(M,\left(f_{1}^{n}, \ldots, f_{t}^{n}\right)\right) \otimes_{R} S=H_{1}\left(M \otimes_{R} S,\left(f_{1}^{n}, \ldots, f_{t}^{n}\right)\right)
$$

by Lemma 15.70 .2 The existence of $m^{\prime}$ implies that $\xi$ maps to zero in the last group, i.e., the element $\xi$ is zero. Thus there exists an $m \in M$ such that $m_{i}=f_{i}^{n} m$. Then $\left(m^{\prime}, m_{1}^{\prime}, \ldots, m_{t}^{\prime}\right)-\alpha(m)=\left(m^{\prime \prime}, 0, \ldots, 0\right)$ for some $m^{\prime \prime} \in\left(M \otimes_{R} S\right)\left[(I S)^{\infty}\right]$. By Lemma 15.70 .3 we conclude that $m^{\prime \prime} \in M\left[I^{\infty}\right]$ and we win.

05EL Remark 15.70.10. In this remark we define a category of glueing data. Let $R \rightarrow S$ be a ring map. Let $f_{1}, \ldots, f_{t} \in R$ and $I=\left(f_{1}, \ldots, f_{t}\right)$. Consider the category $\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ as the category whose
(1) objects are systems $\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$, where $M^{\prime}$ is an $S$-module, $M_{i}$ is an $R_{f_{i}}$-module, $\alpha_{i}:\left(M^{\prime}\right)_{f_{i}} \rightarrow M_{i} \otimes_{R} S$ is an isomorphism, and $\alpha_{i j}$ : $\left(M_{i}\right)_{f_{j}} \rightarrow\left(M_{j}\right)_{f_{i}}$ are isomorphisms such that
(a) $\alpha_{i j} \circ \alpha_{i}=\alpha_{j}$ as maps $\left(M^{\prime}\right)_{f_{i} f_{j}} \rightarrow\left(M_{j}\right)_{f_{i}}$, and
(b) $\alpha_{j k} \circ \alpha_{i j}=\alpha_{i k}$ as maps $\left(M_{i}\right)_{f_{j} f_{k}} \rightarrow\left(M_{k}\right)_{f_{i} f_{j}}$ (cocycle condition).
(2) morphisms $\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right) \rightarrow\left(N^{\prime}, N_{i}, \beta_{i}, \beta_{i j}\right)$ are given by maps $\varphi^{\prime}$ : $M^{\prime} \rightarrow N^{\prime}$ and $\varphi_{i}: M_{i} \rightarrow N_{i}$ compatible with the given maps $\alpha_{i}, \beta_{i}, \alpha_{i j}, \beta_{i j}$.
There is a canonical functor

$$
\text { Can : } \operatorname{Mod}_{R} \longrightarrow \operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right), \quad M \longmapsto\left(M \otimes_{R} S, M_{f_{i}}, \operatorname{can}_{i}, \operatorname{can}_{i j}\right)
$$

where $\operatorname{can}_{i}:\left(M \otimes_{R} S\right)_{f_{i}} \rightarrow M_{f_{i}} \otimes_{R} S$ and $\operatorname{can}_{i j}:\left(M_{f_{i}}\right)_{f_{j}} \rightarrow\left(M_{f_{j}}\right)_{f_{i}}$ are the canonical isomorphisms. For any object $\mathbf{M}=\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$ of the category Glue $\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ we define

$$
H^{0}(\mathbf{M})=\left\{\left(m^{\prime}, m_{i}\right) \mid \alpha_{i}\left(m^{\prime}\right)=m_{i} \otimes 1, \alpha_{i j}\left(m_{i}\right)=m_{j}\right\}
$$

in other words defined by the exact sequence

$$
0 \rightarrow H^{0}(\mathbf{M}) \rightarrow M^{\prime} \times \prod M_{i} \rightarrow \prod M_{f_{i}}^{\prime} \times \prod\left(M_{i}\right)_{f_{j}}
$$

similar to 15.70 .8 .1 . We think of $H^{0}(\mathbf{M})$ as an $R$-module. Thus we also get a functor

$$
H^{0}: \operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right) \longrightarrow \operatorname{Mod}_{R}
$$

Our next goal is to show that the functors Can and $H^{0}$ are sometimes quasi-inverse to each other.

05EM Lemma 15.70.11. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I=\left(f_{1}, \ldots, f_{t}\right) \subset R$ is an ideal such that $R / I \rightarrow S / I S$ is an isomorphism. Then the functor $H^{0}$ is a left quasi-inverse to the functor Can of Remark 15.70.10.

Proof. This is a reformulation of Lemma 15.70.9.
05EN Lemma 15.70.12. Assume $\varphi: R \rightarrow S$ is a flat ring map and let $I=\left(f_{1}, \ldots, f_{t}\right) \subset$ $R$ be an ideal. Then $\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ is an abelian category, and the functor Can is exact and commutes with arbitrary colimits.

Proof. Given a morphism $\left(\varphi^{\prime}, \varphi_{i}\right):\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right) \rightarrow\left(N^{\prime}, N_{i}, \beta_{i}, \beta_{i j}\right)$ of the category Glue $\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ we see that its kernel exists and is equal to the object $\left(\operatorname{Ker}\left(\varphi^{\prime}\right), \operatorname{Ker}\left(\varphi_{i}\right), \alpha_{i}, \alpha_{i j}\right)$ and its cokernel exists and is equal to the object ( $\operatorname{Coker}\left(\varphi^{\prime}\right)$, $\left.\operatorname{Coker}\left(\varphi_{i}\right), \beta_{i}, \beta_{i j}\right)$. This works because $R \rightarrow S$ is flat, hence taking kernels/cokernels commutes with $-\otimes_{R} S$. Details omitted. The exactness follows from the $R$-flatness of $R_{f_{i}}$ and $S$, while commuting with colimits follows as tensor products commute with colimits.

05EP Lemma 15.70.13. Let $\varphi: R \rightarrow S$ be a flat ring map and $\left(f_{1}, \ldots, f_{t}\right)=R$. Then Can and $H^{0}$ are quasi-inverse equivalences of categories

$$
\operatorname{Mod}_{R}=\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)
$$

Proof. Consider an object $\mathbf{M}=\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$ of $\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$. By Algebra, Lemma 10.23 .4 there exists a unique module $M$ and isomorphisms $M_{f_{i}} \rightarrow$ $M_{i}$ which recover the glueing data $\alpha_{i j}$. Then both $M^{\prime}$ and $M \otimes_{R} S$ are $S$-modules which recover the modules $M_{i} \otimes_{R} S$ upon localizing at $f_{i}$. Whence there is a canonical isomorphism $M \otimes_{R} S \rightarrow M^{\prime}$. This shows that $\mathbf{M}$ is in the essential image of Can. Combined with Lemma 15.70.11 the lemma follows.

05EQ Lemma 15.70.14. Let $\varphi: R \rightarrow S$ be a flat ring map and $I=\left(f_{1}, \ldots, f_{t}\right)$ and ideal. Let $R \rightarrow R^{\prime}$ be a flat ring map, and set $S^{\prime}=S \otimes_{R} R^{\prime}$. Then we obtain $a$ commutative diagram of categories and functors

Proof. Omitted.
05ER Proposition 15.70.15. Assume $\varphi: R \rightarrow S$ is a flat ring map and $I=\left(f_{1}, \ldots, f_{t}\right) \subset$ $R$ is an ideal such that $R / I \rightarrow S / I S$ is an isomorphism. Then Can and $H^{0}$ are quasi-inverse equivalences of categories

$$
\operatorname{Mod}_{R}=\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)
$$

Proof. We have already seen that $H^{0} \circ$ Can is isomorphic to the identity functor, see Lemma 15.70.11. Consider an object $\mathbf{M}=\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$ of Glue $(R \rightarrow$ $\left.S, f_{1}, \ldots, f_{t}\right)$. We get a natural morphism

$$
\Psi:\left(H^{0}(\mathbf{M}) \otimes_{R} S, H^{0}(\mathbf{M})_{f_{i}}, \operatorname{can}_{i}, \operatorname{can}_{i j}\right) \longrightarrow\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)
$$

Namely, by definition $H^{0}(\mathbf{M})$ comes equipped with compatible $R$-module maps $H^{0}(\mathbf{M}) \rightarrow M^{\prime}$ and $H^{0}(\mathbf{M}) \rightarrow M_{i}$. We have to show that this map is an isomorphism.
Pick an index $i$ and set $R^{\prime}=R_{f_{i}}$. Combining Lemmas 15.70 .14 and 15.70 .13 we see that $\Psi \otimes_{R} R^{\prime}$ is an isomorphism. Hence the kernel, resp. cokernel of $\Psi$ is a system of the form $(K, 0,0,0)$, resp. $(Q, 0,0,0)$. Note that $H^{0}((K, 0,0,0))=K$, that $H^{0}$ is left exact, and that by construction $H^{0}(\Psi)$ is bijective. Hence we see $K=0$, i.e., the kernel of $\Psi$ is zero.

The conclusion of the above is that we obtain a short exact sequence

$$
0 \rightarrow H^{0}(\mathbf{M}) \otimes_{R} S \rightarrow M^{\prime} \rightarrow Q \rightarrow 0
$$

and that $M_{i}=H^{0}(\mathbf{M})_{f_{i}}$. Note that we may think of $Q$ as an $R$-module which is $I$-power torsion so that $Q=Q \otimes_{R} S$. By Lemma 15.70 .8 we see that there exists a commutative diagram

with exact rows. This clearly determines an isomorphism $\operatorname{Can}(E) \rightarrow\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$ in the category Glue $\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ and we win. (Of course, a posteriori we have $Q=0$.)

0ALK Lemma 15.70.16. Let $\varphi: R \rightarrow S$ be a flat ring map and let $I \subset R$ be a finitely generated ideal such that $R / I \rightarrow S / I S$ is an isomorphism.
(1) Given an $R$-module $N$, an $S$-module $M^{\prime}$ and an $S$-module map $\varphi: M^{\prime} \rightarrow$ $N \otimes_{R} S$ whose kernel and cokernel are I-power torsion, there exists an $R$ module map $\psi: M \rightarrow N$ and an isomorphism $M \otimes_{R} S=M^{\prime}$ compatible with $\varphi$ and $\psi$.
(2) Given an $R$-module $M$, an $S$-module $N^{\prime}$ and an $S$-module map $\varphi: M \otimes_{R}$ $S \rightarrow N^{\prime}$ whose kernel and cokernel are $I$-power torsion, there exists an $R$-module map $\psi: M \rightarrow N$ and an isomorphism $N \otimes_{R} S=N^{\prime}$ compatible with $\varphi$ and $\psi$.
In both cases we have $\operatorname{Ker}(\varphi) \cong \operatorname{Ker}(\psi)$ and $\operatorname{Coker}(\varphi) \cong \operatorname{Coker}(\psi)$.
Proof. Proof of (1). Say $I=\left(f_{1}, \ldots, f_{t}\right)$. It is clear that the localization $\varphi_{f_{i}}$ is an isomorphism. Thus we see that $\left(M^{\prime}, N_{f_{i}}, \varphi_{f_{i}}\right.$, can $\left._{i j}\right)$ is an object of Glue $(R \rightarrow$ $S, f_{1}, \ldots, f_{t}$, see Remark 15.70 .10 . By Proposition 15.70 .15 we conclude that there exists an $R$-module $M$ such that $M^{\prime}=M \otimes_{R} S$ and $N_{f_{i}}=M_{f_{i}}$ compatibly with the isomorphisms $\varphi_{f_{i}}$ and $c a n_{i j}$. There is a morphism

$$
\left(M \otimes_{R} S, M_{f_{i}}, \operatorname{can}_{i}, \operatorname{can}_{i j}\right)=\left(M^{\prime}, N_{f_{i}}, \varphi_{f_{i}}, \operatorname{can}_{i j}\right) \rightarrow\left(N \otimes_{R} S, N_{f_{i}}, \operatorname{can}_{i}, \operatorname{can}_{i j}\right)
$$

of $\operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ which uses $\varphi$ in the first component. This corresponds to an $R$-module map $\psi: M \rightarrow N$ (by the equivalence of categories of Proposition
15.70.15). The composition of the base change of $M \rightarrow N$ with the isomorphism $M^{\prime} \cong M \otimes_{R} S$ is $\varphi$, in other words $M \rightarrow N$ is compatible with $\varphi$.
Proof of (2). This is just the dual of the argument above. Namely, the localization $\varphi_{f_{i}}$ is an isomorphism. Thus we see that $\left(N^{\prime}, M_{f_{i}}, \varphi_{f_{i}}^{-1}, c a n_{i j}\right)$ is an object of Glue $\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$, see Remark 15.70.10. By Proposition 15.70 .15 we conclude that there exists an $R$-module $N$ such that $N^{\prime}=N \otimes_{R} S$ and $N_{f_{i}}=M_{f_{i}}$ compatibly with the isomorphisms $\varphi_{f_{i}}^{-1}$ and $c a n_{i j}$. There is a morphism

$$
\left(M \otimes_{R} S, M_{f_{i}}, \operatorname{can}_{i}, c a n_{i j}\right) \rightarrow\left(N^{\prime}, M_{f_{i}}, \varphi_{f_{i}}, \operatorname{can}_{i j}\right)=\left(N \otimes_{R} S, N_{f_{i}}, \operatorname{can}_{i}, \operatorname{can}_{i j}\right)
$$

of Glue $\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right)$ which uses $\varphi$ in the first component. This corresponds to an $R$-module map $\psi: M \rightarrow N$ (by the equivalence of categories of Proposition 15.70.15). The composition of the base change of $M \rightarrow N$ with the isomorphism $N^{\prime} \cong N \otimes_{R} S$ is $\varphi$, in other words $M \rightarrow N$ is compatible with $\varphi$.

The final statement follows for example from Lemma 15.70 .3
Next, we specialize Proposition 15.70 .15 to get something more useable. Namely, if $I=(f)$ is a principal ideal then the objects of $\operatorname{Glue}(R \rightarrow S, f)$ are simply triples ( $M^{\prime}, M_{1}, \alpha_{1}$ ) and there is no cocycle condition to check!

05ES Theorem 15.70.17. Let $R$ be a ring, and let $f \in R$. Let $\varphi: R \rightarrow S$ be a flat ring map inducing an isomorphism $R / f R \rightarrow S / f S$. Then the functor

$$
\operatorname{Mod}_{R} \longrightarrow \operatorname{Mod}_{S} \times_{\operatorname{Mod}_{S_{f}}} \operatorname{Mod}_{R_{f}}, \quad M \longmapsto\left(M \otimes_{R} S, M_{f}, \text { can }\right)
$$

is an equivalence.
Proof. The category appearing on the right side of the arrow is the category of triples $\left(M^{\prime}, M_{1}, \alpha_{1}\right)$ where $M^{\prime}$ is an $S$-module, $M_{1}$ is a $R_{f}$-module, and $\alpha_{1}: M_{f}^{\prime} \rightarrow$ $M_{1} \otimes_{R} S$ is a $S_{f}$-isomorphism, see Categories, Example 4.30.3. Hence this theorem is a special case of Proposition 15.70 .15 .

A useful special case of Theorem 15.70 .17 is when $R$ is noetherian, and $S$ is a completion of $R$ at an element $f$. The completion $R \rightarrow S$ is flat, and the functor $M \mapsto M \otimes_{R} S$ can be identified with the $f$-adic completion functor when $M$ is finitely generated. To state this more precisely, let $\operatorname{Mod}_{R}^{f g}$ denote the category of finitely generated $R$-modules.
05ET Proposition 15.70.18. Let $R$ be a noetherian ring. Let $f \in R$ be an element. Let $R^{\wedge}$ be the $f$-adic completion of $R$. Then the functor $M \mapsto\left(M^{\wedge}, M_{f}\right.$, can $)$ defines an equivalence

$$
\operatorname{Mod}_{R}^{f g} \longrightarrow \operatorname{Mod}_{R^{\wedge}}^{f g} \times_{\operatorname{Mod}_{\left(R^{\wedge}\right)_{f}}^{f g}} \operatorname{Mod}_{R_{f}}^{f g}
$$

Proof. The ring map $R \rightarrow R^{\wedge}$ is flat by Algebra, Lemma 10.96.2 It is clear that $R / f R=R^{\wedge} / f R^{\wedge}$. By Algebra, Lemma 10.96.1 the completion of a finite $R$-module $M$ is equal to $M \otimes_{R} R^{\wedge}$. Hence the displayed functor of the proposition is equal to the functor occurring in Theorem 15.70.17. In particular it is fully faithful. Let $\left(M_{1}, M_{2}, \psi\right)$ be an object of the right hand side. By Theorem 15.70.17 there exists an $R$-module $M$ such that $M_{1}=M \otimes_{R} R^{\wedge}$ and $M_{2}=M_{f}$. As $R \rightarrow$ $R^{\wedge} \times R_{f}$ is faithfully flat we conclude from Algebra, Lemma 10.23 .2 that $M$ is finitely generated, i.e., $M \in \operatorname{Mod}_{R}^{f g}$. This proves the proposition.

05EU Remark 15.70.19. The equivalences of Proposition 15.70.15. Theorem 15.70 .17 and Proposition 15.70 .18 preserve properties of modules. For example if $M$ corresponds to $\mathbf{M}=\left(M^{\prime}, M_{i}, \alpha_{i}, \alpha_{i j}\right)$ then $M$ is finite, or finitely presented, or flat, or projective over $R$ if and only if $M^{\prime}$ and $M_{i}$ have the corresponding property over $S$ and $R_{f_{i}}$. This follows from the fact that $R \rightarrow S \times \prod R_{f_{i}}$ is faithfully flat and descend and ascent of these properties along faithfully flat maps, see Algebra, Lemma 10.82 .2 and Theorem 10.94.5. These functors also preserve the $\otimes$-structures on either side. Thus, it defines equivalences of various categories built out of the pair $\left(\operatorname{Mod}_{R}, \otimes\right)$, such as the category of algebras.

05EV Remark 15.70.20. Given a differential manifold $X$ with a compact closed submanifold $Z$ having complement $U$, specifying a sheaf on $X$ is the same as specifying a sheaf on $U$, a sheaf on an unspecified tubular neighbourhood $T$ of $Z$ in $X$, and an isomorphism between the two resulting sheaves along $T \cap U$. Tubular neighbourhoods do not exist in algebraic geometry as such, but results such as Proposition 15.70 .15 . Theorem 15.70.17, and Proposition 15.70 .18 allow us to work with formal neighbourhoods instead.

### 15.71. The Beauville-Laszlo theorem

0 BNI Let $R$ be a ring and let $f$ be an element of $R$. Denote $R^{\wedge}=\lim R / f^{n} R$ the $f$-adic completion of $R$. In this section we discuss a slight generalization of a theorem of Beauville and Laszlo BL95. The theorem of Beauville and Laszlo in turn can be compared with Theorem 15.70 .17 taken with $S=R^{\wedge}$ and its specialization Proposition 15.70.18. The theorem asserts that under suitable conditions, a module over $R$ can be constructed by "glueing together" modules over $R^{\wedge}$ and $R_{f}$ along an isomorphism between the base extensions to $\left(R^{\wedge}\right)_{f}$. For a comparison with flat descent, please see Remark 15.71 .6 .

In BL95 it is assumed that $f$ is a nonzerodivisor on both $R$ and $M$. In fact one only needs to assume that

$$
R\left[f^{\infty}\right] \longrightarrow R^{\wedge}\left[f^{\infty}\right]
$$

is bijective and that

$$
M\left[f^{\infty}\right] \longrightarrow M \otimes_{R} R^{\wedge}
$$

is injective. This optimization was partly inspired by an alternate approach to glueing introduced in KL15, §1.3] for use in the theory of nonarchimedean analytic spaces. One can establish similar results even without any restrictions on $R$ and $M$, but for this one must work at the level of derived categories. See Bha14, §5] for more details.

0BNJ Lemma 15.71.1. Let $R$ be a ring and let $f \in R$. For every positive integer $n$ the map $R / f^{n} R \rightarrow R^{\wedge} / f^{n} R^{\wedge}$ is an isomorphism.
Proof. This is a special case of Algebra, Lemma 10.95.5.
We will use the notation introduced in Section 15.69 . Thus for an $R$-module $M$, we denote $M\left[f^{n}\right]$ the submodule of $M$ annihilated by $f^{n}$ and we put

$$
M\left[f^{\infty}\right]=\bigcup_{n=1}^{\infty} M\left[f^{n}\right]=\operatorname{ker}\left(M \rightarrow M_{f}\right)
$$

If $M=M\left[f^{\infty}\right]$, we say that $M$ is an $f$-power torsion module.

0BNK Lemma 15.71.2. Let $R$ be a ring and $f \in R$. For any $f$-power torsion $R$-module $M$, we have $M \cong M \otimes_{R} R^{\wedge}$.
Proof. By Lemma 15.71.1 we see that if $M$ is annihilated by $f^{n}$, then

$$
M \otimes_{R} R^{\wedge}=M \otimes_{R / f^{n} R} R^{\wedge} / f^{n} R^{\wedge}=M \otimes_{R / f^{n} R} R / f^{n} R=M
$$

Since $M=\bigcup M\left[f^{n}\right]$ and since tensor products commute with colimits (Algebra, Lemma 10.11.9), we obtain the desired isomorphism.

0BNL Lemma 15.71.3. Let $R$ be a ring and $f \in R$. The $R$-module $R^{\wedge} \oplus R_{f}$ is faithful: for every nonzero $R$-module $M$, the module $M \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)$ is also nonzero.
However, the map $M \rightarrow M \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)$ need not be injective; see Example 15.71.10.

Proof. If $M \neq 0$ but $M \otimes_{R} R_{f}=0$, then $M$ is $f$-power torsion. By Lemma 15.71 .2 we find that $M \otimes_{R} R^{\wedge} \cong M \neq 0$.

0BNM Lemma 15.71.4. Let $R$ be a ring and $f \in R$. The map $\operatorname{Spec}\left(R^{\wedge}\right) \amalg \operatorname{Spec}\left(R_{f}\right) \rightarrow$ $\operatorname{Spec}(R)$ is surjective.

Proof. Recall that $\operatorname{Spec}(R)=V(f) \amalg D(f)$ where $V(f)=\operatorname{Spec}(R / f R)$ and $D(f)=$ $\operatorname{Spec}\left(R_{f}\right)$, see Algebra, Section 10.16 and especially Lemmas 10.16 .7 and 10.16 .6 Thus the lemma follows as the map $R \rightarrow R / f R$ factors through $R^{\wedge}$.

0BNN Lemma 15.71.5. Let $R$ be a ring and $f \in R$. Let $M$ be an $R$-module. If $M \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)$ is finitely generated as a module over $R^{\wedge} \oplus R_{f}$, then $M$ is a finitely generated $R$-module.
Proof. If $M \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)$ is finitely generated, then (by writing each generator as a sum of simple tensors) it admits a finite generating set consisting of elements of $M$. That is, there exists a morphism from a finite free $R$-module to $M$ whose cokernel is killed by tensoring with $R^{\wedge} \oplus R_{f}$; we may thus deduce the claim by applying Lemma 15.71 .3 to this cokernel.

0BNP Remark 15.71.6. While $R \rightarrow R_{f}$ is always flat, $R \rightarrow R^{\wedge}$ is typically not flat unless $R$ is Noetherian (see Algebra, Lemma 10.96 .2 and the discussion in Examples, Section 88.11. Consequently, we cannot in general apply faithfully flat descent as discussed in Descent, Section 34.3 to the morphism $R \rightarrow R^{\wedge} \oplus R_{f}$. Moreover, even in the Noetherian case, the usual definition of a descent datum for this morphism refers to the ring $R^{\wedge} \otimes_{R} R^{\wedge}$, which we will avoid considering in this section.
Let $R$ be a ring and let $f \in R$. We now introduce a key restriction on the pair $(R, f)$. Consider the sequence
0BNQ $\quad(15.71 .6 .1) \quad 0 \rightarrow R \rightarrow R^{\wedge} \oplus R_{f} \rightarrow\left(R^{\wedge}\right)_{f} \rightarrow 0$,
in which the map on the right is the difference between the two canonical homomorphisms. If this sequence is exact, then we say that $(R, f)$ is a glueing pair.

0BNR Lemma 15.71.7. Let $R$ be a ring and let $f \in R$. The sequence 15.71.6.1 is
(1) exact on the right,
(2) exact on the left if and only if $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is injective, and
(3) exact in the middle if and only if $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is surjective.

In particular, $(R, f)$ is a glueing pair if and only if $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is bijective.

Proof. Let $x \in\left(R^{\wedge}\right)_{f}$. Write $x=x^{\prime} / f^{n}$ with $x^{\prime} \in R^{\wedge}$. Write $x^{\prime}=x^{\prime \prime}+f^{n} y$ with $x^{\prime \prime} \in R$ and $y \in R^{\wedge}$ using that $R / f^{n} R=R^{\wedge} / f^{n} R^{\wedge}$ by Lemma 15.71.1. Then we see that $\left(y,-x^{\prime \prime} / f^{n}\right)$ maps to $x$. Thus (1) holds.
Part (2) follows from the fact that $\operatorname{Ker}\left(R \rightarrow R_{f}\right)=R\left[f^{\infty}\right]$.
If the sequence is exact in the middle, then elements of the form $(x, 0)$ with $x \in$ $R^{\wedge}\left[f^{\infty}\right]$ are in the image of the first arrow. This implies that $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is surjective. Conversely, assume that $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is surjective. Let $(x, y)$ be an element in the middle which maps to zero on the right. Write $y=y^{\prime} / f^{n}$ for some $y^{\prime} \in R$. Then we see that $f^{n} x-y^{\prime}$ is annihilated by some power of $f$ in $R^{\wedge}$. By assumption we can write $f^{n} x-y^{\prime}=z$ for some $z \in R\left[f^{\infty}\right]$. Then $y=y^{\prime \prime} / f^{n}$ where $y^{\prime \prime}=y^{\prime}+z$ is in the kernel of $R \rightarrow R / f^{n} R$. Hence we see that $y$ can be represented as $y^{\prime \prime \prime} / 1$ for some $y^{\prime \prime \prime} \in R$. Then $x-y^{\prime \prime \prime}$ is in $R^{\wedge}\left[f^{\infty}\right]$. Thus $x-y^{\prime \prime \prime}=z^{\prime} \in R\left[f^{\infty}\right]$. Then $\left(x, y^{\prime \prime \prime} / 1\right)=\left(y^{\prime \prime \prime}+z^{\prime},\left(y^{\prime \prime \prime}+z^{\prime}\right) / 1\right)$ as desired.

0BNS Remark 15.71.8. Suppose that $f$ is a nonzerodivisor. Then Algebra, Lemma 10.95.2 shows that $f$ is a nonzerodivisor in $R^{\wedge}$. Hence $(R, f)$ is a glueing pair.

0BNT Remark 15.71.9. If $R \rightarrow R^{\wedge}$ is flat, then for each positive integer $n$ tensoring the sequence $0 \rightarrow R\left[f^{n}\right] \rightarrow R \rightarrow R$ with $R^{\wedge}$ gives the sequence $0 \rightarrow R\left[f^{n}\right] \otimes_{R} R^{\wedge} \rightarrow$ $R^{\wedge} \rightarrow R^{\wedge}$. Combined with Lemma 15.71 .2 we conclude that $R\left[f^{n}\right] \rightarrow R^{\wedge}\left[f^{n}\right]$ is an isomorphism. Thus $(R, f)$ is a glueing pair. This holds in particular if $R$ is Noetherian, see Algebra, Lemma 10.96.2.

0BNU Example 15.71.10. Let $k$ be a field and put

$$
R=k\left[f, T_{1}, T_{2}, \ldots\right] /\left(f T_{1}, f T_{2}-T_{1}, f T_{3}-T_{2}, \ldots\right)
$$

Then $(R, f)$ is not a glueing pair because the map $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is not injective as the image of $T_{1}$ is $f$-divisible in $R^{\wedge}$. For

$$
R=k\left[f, T_{1}, T_{2}, \ldots\right] /\left(f T_{1}, f^{2} T_{2}, \ldots\right)
$$

the map $R\left[f^{\infty}\right] \rightarrow R^{\wedge}\left[f^{\infty}\right]$ is not surjective as the element $T_{1}+f T_{2}+f^{2} T_{3}+\ldots$ is not in the image. In particular, by Remark 15.71 .9 , these are both examples where $R \rightarrow R^{\wedge}$ is not flat.

By analogy with the definition of a glueing pair, we make a similar definition for modules. Let $R$ be a ring and let $f \in R$. For any $R$-module $M$, we may tensor 15.71.6.1 with $M$ to obtain a sequence

0BNV $\quad(15.71 .10 .1) \quad 0 \rightarrow M \rightarrow\left(M \otimes_{R} R^{\wedge}\right) \oplus\left(M \otimes_{R} R_{f}\right) \rightarrow M \otimes_{R}\left(R^{\wedge}\right)_{f} \rightarrow 0$
Observe that $M \otimes_{R} R_{f}=M_{f}$ and that $M \otimes_{R}\left(R^{\wedge}\right)_{f}=\left(M \otimes_{R} R^{\wedge}\right)_{f}$. If this sequence is exact, we say that $M$ is glueable.

0BNW Lemma 15.71.11. Let $R$ be a ring and let $f \in R$. Let $M$ be an $R$-module. The sequence (15.71.10.1) is
(1) exact on the right,
(2) exact on the left if and only if $M\left[f^{\infty}\right] \rightarrow\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is injective, and
(3) exact in the middle if and only if $M\left[f^{\infty}\right] \rightarrow\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is surjective.

Thus $M$ is glueable if and only if $M\left[f^{\infty}\right] \rightarrow\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is bijective. If $(R, f)$ is a glueing pair, then $M$ is glueable if $M\left[f^{\infty}\right] \rightarrow\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is injective.

Proof. We will use the results of Lemma 15.71 .7 without further mention. The functor $M \otimes_{R}$ - is right exact (Algebra, Lemma 10.11.10) hence we get (1).
The kernel of $M \rightarrow M \otimes_{R} R_{f}=M_{f}$ is $M\left[f^{\infty}\right]$. Thus (2) follows.
If the sequence is exact in the middle, then elements of the form $(x, 0)$ with $x \in$ $\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ are in the image of the first arrow. This implies that $M\left[f^{\infty}\right] \rightarrow$ $\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is surjective. Conversely, assume that $M\left[f^{\infty}\right] \rightarrow\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$ is surjective. Let $(x, y)$ be an element in the middle which maps to zero on the right. Write $y=y^{\prime} / f^{n}$ for some $y^{\prime} \in M$. Then we see that $f^{n} x-y^{\prime}$ is annihilated by some power of $f$ in $M \otimes_{R} R^{\wedge}$. By assumption we can write $f^{n} x-y^{\prime}=z$ for some $z \in M\left[f^{\infty}\right]$. Then $y=y^{\prime \prime} / f^{n}$ where $y^{\prime \prime}=y^{\prime}+z$ is in the kernel of $M \rightarrow M / f^{n} M$. Hence we see that $y$ can be represented as $y^{\prime \prime \prime} / 1$ for some $y^{\prime \prime \prime} \in M$. Then $x-y^{\prime \prime \prime}$ is in $\left(M \otimes_{R} R^{\wedge}\right)\left[f^{\infty}\right]$. Thus $x-y^{\prime \prime \prime}=z^{\prime} \in M\left[f^{\infty}\right]$. Then $\left(x, y^{\prime \prime \prime} / 1\right)=$ $\left(y^{\prime \prime \prime}+z^{\prime},\left(y^{\prime \prime \prime}+z^{\prime}\right) / 1\right)$ as desired.
If $(R, f)$ is a glueing pair, then 15.71 .10 .1 is exact in the middle for any $M$ by Algebra, Lemma 10.11 .10 . This gives the final statement of the lemma.

0BNX Remark 15.71.12. Let $(R, f)$ be a glueing pair and let $M$ be an $R$-module. Here are some observations which can be used to determine whether $M$ is glueable.
(1) By Lemma 15.71 .11 we see that $M$ is glueable if and only if $M\left[f^{\infty}\right] \rightarrow$ $M \otimes_{R} R^{\wedge}$ is injective. This holds if $M[f] \rightarrow M^{\wedge}$ is injective, i.e., when $M[f] \cap \bigcap_{n=1}^{\infty} f^{n} M=0$.
(2) If $\operatorname{Tor}_{1}^{R}\left(M,\left(R^{\wedge}\right)_{f}\right)=0$, then $M$ is glueable (use Algebra, Lemma 10.74.2. This is equivalent to saying that $\operatorname{Tor}_{1}^{R}\left(M, R^{\wedge}\right)$ is $f$-power torsion. In particular, any flat $R$-module is glueable.
(3) If $R \rightarrow R^{\wedge}$ is flat, then $\operatorname{Tor}_{1}^{R}\left(M, R^{\wedge}\right)=0$ for every $R$-module so every $R$-module is glueable. This holds in particular when $R$ is Noetherian, see Algebra, Lemma 10.96 .2

0BNY Example 15.71.13 (Non glueable module). Let $R$ be the ring of germs at 0 of $C^{\infty}$ functions on $\mathbf{R}$. Let $f \in R$ be the function $f(x)=x$. Then $f$ is a nonzerodivisor in $R$, so $(R, f)$ is a glueing pair and $R^{\wedge} \cong \mathbf{R}[[x]]$. Let $\varphi \in R$ be the function $\varphi(x)=\exp \left(-1 / x^{2}\right)$. Then $\varphi$ has zero Taylor series, so $\varphi \in \operatorname{Ker}\left(R \rightarrow R^{\wedge}\right)$. Since $\varphi(x) \neq 0$ for $x \neq 0$, we see that $\varphi$ is a nonzerodivisor in $R$. The function $\varphi / f$ also has zero Taylor series, so its image in $M=R / \varphi R$ is a nonzero element of $M[f]$ which maps to zero in $M \otimes_{R} R^{\wedge}=R^{\wedge} / \varphi R^{\wedge}=R^{\wedge}$. Hence $M$ is not glueable.
We next make some calculations of Tor groups.
0BNZ Lemma 15.71.14. Let $(R, f)$ be a glueing pair. For each positive integer n, we have $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, f^{n} R\right)=0$.

Proof. From the exact sequence $0 \rightarrow R\left[f^{n}\right] \rightarrow R \rightarrow f^{n} R \rightarrow 0$ we see that it suffices to check that $R\left[f^{n}\right] \otimes_{R} R^{\wedge} \rightarrow R^{\wedge}$ is injective. By Lemma 15.71 .2 we have $R\left[f^{n}\right] \otimes_{R} R^{\wedge}=R\left[f^{n}\right]$ and by Lemma 15.71 .7 we see that $R\left[f^{n}\right] \rightarrow R^{\wedge}$ is injective as $(R, f)$ is a glueing pair.
0BP0 Lemma 15.71.15. Let $(R, f)$ be a glueing pair. Then $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, R / R\left[f^{\infty}\right]\right)=0$.
Proof. We have $R / R\left[f^{\infty}\right]=\operatorname{colim} R / R\left[f^{n}\right]=\operatorname{colim} f^{n} R$. As formation of Tor groups commutes with filtered colimits (Algebra, Lemma 10.75.2) we may apply Lemma 15.71 .14

BL95 §4, Remarques]

0BP1 Lemma 15.71.16. Let $(R, f)$ be a glueing pair. For every $R$-module $M$, we have $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, \operatorname{Coker}\left(M \rightarrow M_{f}\right)\right)=0$.

Proof. Set $M^{\prime}=M / M\left[f^{\infty}\right]$. Then $\operatorname{Coker}\left(M \rightarrow M_{f}\right) \cong \operatorname{Coker}\left(M^{\prime} \rightarrow M_{f}^{\prime}\right)$ hence we may and do assume that $f$ is a nonzerodivisor on $M$. In this case $M \subset M_{f}$ and $M_{f} / M=\operatorname{colim} M / f^{n} M$ where the transition maps are given by multiplication by $f$. Since formation of Tor groups commutes with colimits (Algebra, Lemma 10.75.2 it suffices to show that $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, M / f^{n} M\right)=0$.

We first treat the case $M=R / R\left[f^{\infty}\right]$. By Lemma 15.71 .7 we have $M \otimes_{R} R^{\wedge}=$ $R^{\wedge} / R^{\wedge}\left[f^{\infty}\right]$. From the short exact sequence $0 \rightarrow M \rightarrow M \rightarrow M / f^{n} M \rightarrow 0$ we obtain the exact sequence

by Algebra, Lemma 10.74.2. Here the diagonal arrow is injective. Since the first group $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, R / R\left[f^{\infty}\right]\right)$ is zero by Lemma 15.71.15, we deduce that $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, M / f^{n} M\right)=$ 0 as desired.

To treat the general case, choose a surjection $F \rightarrow M$ with $F$ a free $R / R\left[f^{\infty}\right]$ module, and form an exact sequence

$$
0 \rightarrow N \rightarrow F / f^{n} F \rightarrow M / f^{n} M \rightarrow 0
$$

By Lemma 15.71 .2 this sequence remains unchanged, and hence exact, upon tensoring with $R^{\wedge}$. Since $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, F / f^{n} F\right)=0$ by the previous paragraph, we deduce that $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, M / f^{n} M\right)=0$ as desired.

Let $(R, f)$ be a glueing pair. This means that the diagram
is cocartesian. Consider the category $\operatorname{Glue}\left(R \rightarrow R^{\wedge}, f\right)$ introduced in Remark 15.70.10. We will call an object $\left(M^{\prime}, M_{1}, \alpha_{1}\right)$ of $\operatorname{Glue}\left(R \rightarrow R^{\wedge}, f\right)$ a glueing datum. It consists of an $R^{\wedge}$-module $M^{\prime}$, a $R_{f}$-module $M_{1}$, and an isomorphism $\alpha_{1}:\left(M^{\prime}\right)_{f} \rightarrow M_{1} \otimes_{R} R^{\wedge}$. There is an obvious functor

$$
\text { Can : } \operatorname{Mod}_{R} \longrightarrow \operatorname{Glue}\left(R \rightarrow R^{\wedge}, f\right), \quad M \longmapsto\left(M \otimes_{R} R^{\wedge}, M_{f}, \text { can }\right)
$$

and there is a functor

$$
H^{0}: \operatorname{Glue}\left(R \rightarrow S, f_{1}, \ldots, f_{t}\right) \longrightarrow \operatorname{Mod}_{R}, \quad\left(M^{\prime}, M_{1}, \alpha_{1}\right) \longmapsto \operatorname{Ker}\left(M^{\prime} \oplus M_{1} \rightarrow\left(M^{\prime}\right)_{f}\right)
$$

in the reverse direction, see Remark 15.70 .10 .
0BP2 Theorem 15.71.17. Let $(R, f)$ be a glueing pair. The functor Can : $\operatorname{Mod}_{R} \longrightarrow$ Glue $\left(R \rightarrow R^{\wedge}, f\right)$ determines an equivalence of the full subcategory of glueable $R$ modules to the category $\operatorname{Glue}\left(R \rightarrow R^{\wedge}, f\right)$ of glueing data.

Slight generalization of BL95, Lemme 3(a)]

Proof. The functor is fully faithful due to the exactness of (15.71.10.1) for glueable modules, which tells us exactly that $H^{0} \circ$ Can $=$ id on the full subcategory of glueable modules. Hence it suffices to check essential surjectivity. That is, we must show that an arbitrary glueing datum ( $M^{\prime}, M_{1}, \alpha_{1}$ ) arises from some glueable $R$-module.

We first check that the map $M^{\prime} \oplus M_{1} \rightarrow\left(M^{\prime}\right)_{f}$ used in the definition of the functor $H^{0}$ is surjective. Observe that $(x, y) \in M^{\prime} \oplus M_{1}$ maps to $\mathrm{d}(x, y)=x / 1-\alpha_{1}^{-1}(y \otimes 1)$ in $\left(M^{\prime}\right)_{f}$. If $z \in\left(M^{\prime}\right)_{f}$, then we can write $\alpha_{1}(z)=\sum y_{i} \otimes g_{i}$ with $g_{i} \in R^{\wedge}$ and $y_{i} \in M_{1}$. Write $\alpha_{i}^{-1}\left(y_{i} \otimes 1\right)=y_{i}^{\prime} / f^{n}$ for some $y_{i}^{\prime} \in M^{\prime}$ and $n \geq 0$ (we can pick the same $n$ for all $i$ ). Write $g_{i}=a_{i}+f^{n} b_{i}$ with $a_{i} \in R$ and $b_{i} \in R^{\wedge}$. Then with $y=\sum a_{i} y_{i} \in M_{1}$ and $x=\sum b_{i} y_{i}^{\prime} \in M^{\prime}$ we have $\mathrm{d}(x,-y)=z$ as desired.

Put $M=H^{0}\left(\left(M^{\prime}, M_{1}, \alpha_{1}\right)\right)=\operatorname{Ker}(\mathrm{d})$. We obtain an exact sequence of $R$-modules
0BP3

$$
\begin{equation*}
0 \rightarrow M \rightarrow M^{\prime} \oplus M_{1} \rightarrow\left(M^{\prime}\right)_{f} \rightarrow 0 \tag{15.71.17.1}
\end{equation*}
$$

We will prove that the maps $M \rightarrow M^{\prime}$ and $M \rightarrow M_{1}$ induce isomorphisms $M \otimes_{R}$ $R^{\wedge} \rightarrow M^{\prime}$ and $M \otimes_{R} R_{f} \rightarrow M_{1}$. This will imply that $M$ is a glueable $R$-module giving rise to the original glueing datum.
Since $f$ is a nonzerodivisor on $M_{1}$, we have $M\left[f^{\infty}\right] \cong M^{\prime}\left[f^{\infty}\right]$. This yields an exact sequence

0BP4

$$
\begin{equation*}
0 \rightarrow M / M\left[f^{\infty}\right] \rightarrow M_{1} \rightarrow\left(M^{\prime}\right)_{f} / M^{\prime} \rightarrow 0 \tag{15.71.17.2}
\end{equation*}
$$

Since $R \rightarrow R_{f}$ is flat, we may tensor this exact sequence with $R_{f}$ to deduce that $M \otimes_{R} R_{f}=\left(M / M\left[f^{\infty}\right]\right) \otimes_{R} R_{f} \rightarrow M_{1}$ is an isomorphism.

We now have an isomorphism $M_{f} \rightarrow M_{1}$, hence an isomorphism $M \otimes_{R}\left(R^{\wedge}\right)_{f} \rightarrow$ $M_{1} \otimes_{R} R^{\wedge}$, and thus using $\alpha_{1}$ and Lemma 15.71 .11 a surjection $M \otimes_{R}\left(R^{\wedge} \oplus\right.$ $\left.R_{f}\right) \rightarrow\left(M^{\prime}\right)_{f}$. Thus given $z \in M^{\prime}$ we can write $z / 1=z^{\prime}+z_{1}$ in $\left(M^{\prime}\right)_{f}$ for some $z^{\prime} \in M \otimes_{R} R^{\wedge}$ and $z_{1} \in M_{f}$. Then $\left(z-z^{\prime}, z_{1}\right) \in M=\operatorname{Ker}(\mathrm{d})$. Hence $z-z^{\prime}$ and $z^{\prime}$ are in the image of $M \otimes_{R} R^{\wedge} \rightarrow M^{\prime}$. It follows that $M \otimes_{R} R^{\wedge} \rightarrow M^{\prime}$ is surjective.
By Lemma 15.71 .16 we have $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, \operatorname{Coker}\left(M^{\prime} \rightarrow\left(M^{\prime}\right)_{f}\right)\right)=0$. The sequence 15.71.17.2 thus remains exact upon tensoring over $R$ with $R^{\wedge}$. Using $\alpha_{1}$ and Lemma 15.71 .2 the resulting exact sequence can be written as
0BP5 $\quad(15.71 .17 .3) \quad 0 \rightarrow\left(M / M\left[f^{\infty}\right]\right) \otimes_{R} R^{\wedge} \rightarrow\left(M^{\prime}\right)_{f} \rightarrow\left(M^{\prime}\right)_{f} / M^{\prime} \rightarrow 0$
This yields an isomorphism $\left(M / M\left[f^{\infty}\right]\right) \otimes_{R} R^{\wedge} \cong M^{\prime} / M^{\prime}\left[f^{\infty}\right]$. This implies that in the diagram

the third vertical arrow is an isomorphism. Since the rows are exact and the first vertical arrow is an isomorphism by Lemma 15.71 .2 and $M\left[f^{\infty}\right]=M^{\prime}\left[f^{\infty}\right]$, the five lemma implies that $M \otimes_{R} R^{\wedge} \rightarrow M^{\prime}$ is injective. This completes the proof.

0BP9 Remark 15.71.18. Let $(R, f)$ be a glueing pair. Let $M$ be a (not necessarily glueable) $R$-module. Setting $M^{\prime}=M \otimes_{R} R^{\wedge}$ and $M_{1}=M_{f}$ we obtain the glueing
datum $\operatorname{Can}(M)=\left(M^{\prime}, M_{1}\right.$, can $)$. Then $\tilde{M}=H^{0}\left(M^{\prime}, M_{1}\right.$, can $)$ is a glueable $R$ module and the canonical map $M \rightarrow \tilde{M}$ gives isomorphisms $M \otimes_{R} R^{\wedge} \rightarrow \tilde{M} \otimes_{R} R^{\wedge}$ and $M_{f} \rightarrow \tilde{M}_{f}$, see Theorem 15.71 .17 . From the exactness of the sequences

$$
M \rightarrow M \otimes_{R} R^{\wedge} \oplus M_{f} \rightarrow M \otimes_{R}\left(R^{\wedge}\right)_{f} \rightarrow 0
$$

and

$$
0 \rightarrow \tilde{M} \rightarrow \tilde{M} \otimes_{R} R^{\wedge} \oplus \tilde{M}_{f} \rightarrow \tilde{M} \otimes_{R}\left(R^{\wedge}\right)_{f} \rightarrow 0
$$

we conclude that $M \rightarrow \tilde{M}$ is surjective.
Recall that flat $R$-modules over a glueing pair $(R, f)$ are glueable (Remark 15.71.12). Hence the following lemma shows that Theorem 15.71 .17 determines an equivalence between the category of flat $R$-modules and the category of glueing data ( $M^{\prime}, M_{1}, \alpha_{1}$ ) where $M^{\prime}$ and $M_{1}$ are flat over $R^{\wedge}$ and $R_{f}$.
0BP7 Lemma 15.71.19. Let $(R, f)$ be a glueing pair. Let $M$ be a (not necessarily glueable) $R$-module. Then $M$ is flat if and only if $M \otimes_{R} R^{\wedge}$ is flat over $R^{\wedge}$ and $M_{f}$ is flat over $R_{f}$.
Proof. One direction of the lemma follows from Algebra, Lemma 10.38.7. For the other direction, assume $M \otimes_{R} R^{\wedge}$ is flat over $R^{\wedge}$ and $M_{f}$ is flat over $R_{f}$. Let $\tilde{M}$ be as in Remark 15.71.18. If $\tilde{M}$ is flat over $R$, then applying Algebra, Lemma 10.38.12 to the short exact sequence $0 \rightarrow \operatorname{Ker}(M \rightarrow \tilde{M}) \rightarrow M \rightarrow \tilde{M} \rightarrow 0$ we find that $\operatorname{Ker}(M \rightarrow \tilde{M}) \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)$ is zero. Hence $M=\tilde{M}$ by Lemma 15.71 .3 and we conclude. In other words, we may replace $M$ by $\tilde{M}$ and assume $M$ is glueable. Let $N$ be a second $R$-module. It suffices to prove that $\operatorname{Tor}_{1}^{R}(M, N)=0$, see Algebra, Lemma 10.74.8.

The long the exact sequence of Tors associated to the short exact sequence $0 \rightarrow$ $R \rightarrow R^{\wedge} \oplus R_{f} \rightarrow\left(R^{\wedge}\right)_{f} \rightarrow 0$ and $N$ gives an exact sequence

$$
0 \rightarrow \operatorname{Tor}_{1}^{R}\left(R^{\wedge}, N\right) \rightarrow \operatorname{Tor}_{1}^{R}\left(\left(R^{\wedge}\right)_{f}, N\right)
$$

and isomorphisms $\operatorname{Tor}_{i}^{R}\left(R^{\wedge}, N\right)=\operatorname{Tor}_{i}^{R}\left(\left(R^{\wedge}\right)_{f}, N\right)$ for $i \geq 2$. Since $\operatorname{Tor}_{i}\left(\left(R^{\wedge}\right)_{f}, N\right)=$ $\operatorname{Tor}_{i}^{R}\left(R^{\wedge}, N\right)_{f}$ we conclude that $f$ is a nonzerodivisor on $\operatorname{Tor}_{1}^{R}\left(R^{\wedge}, N\right)$ and invertible on $\operatorname{Tor}_{i}^{R}\left(R^{\wedge}, N\right)$ for $i \geq 2$. Since $M \otimes_{R} R^{\wedge}$ is flat over $R^{\wedge}$ we have

$$
\operatorname{Tor}_{i}^{R}\left(M \otimes_{R} R^{\wedge}, N\right)=\left(M \otimes_{R} R^{\wedge}\right) \otimes_{R^{\wedge}} \operatorname{Tor}_{i}^{R}\left(R^{\wedge}, N\right)
$$

by the spectral sequence of Example 15.52 .2 . Writing $M \otimes_{R} R^{\wedge}$ as a filtered colimit of finite free $R^{\wedge}$-modules (Algebra, Theorem 10.80.4) we conclude that $f$ is a nonzerodivisor on $\operatorname{Tor}_{1}^{R}\left(M \otimes_{R} R^{\wedge}, N\right)$ and invertible on $\operatorname{Tor}_{i}^{R}\left(M \otimes_{R} R^{\wedge}, N\right)$. Next, we consider the exact sequence $0 \rightarrow M \rightarrow M \otimes_{R} R^{\wedge} \oplus M_{f} \rightarrow M \otimes_{R}\left(R^{\wedge}\right)_{f} \rightarrow 0$ coming from the fact that $M$ is glueable and the associated long exact sequence of Tor. The relevant part is

We conclude that $\operatorname{Tor}_{1}^{R}(M, N)=0$ by our remarks above on the action on $f$ on $\operatorname{Tor}_{i}^{R}\left(M \otimes_{R} R^{\wedge}, N\right)$.

Observe that we have seen the result of the following lemma for "finitely generated" in Lemma 15.71 .5

0BP6 Lemma 15.71.20. Let $(R, f)$ be a glueing pair. Let $M$ be a (not necessarily glueable) $R$-module. Then $M$ is a finite projective $R$-module if and only if $M \otimes_{R} R^{\wedge}$ is finite projective over $R^{\wedge}$ and $M_{f}$ is finite projective over $R_{f}$.

First proof. Assume that $M \otimes_{R} R^{\wedge}$ is a finite projective module over $R^{\wedge}$ and that $M_{f}$ is a finite projective module over $R_{f}$. Our task is to prove that $M$ is finite projective over $R$. We will use Algebra, Lemma 10.77 .2 without further mention. By Lemma 15.71 .19 we see that $M$ is flat. By Lemma 15.71 .5 we see that $M$ is finite. Choose a short exact sequence $0 \rightarrow K \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. Since a finite projective module is of finite presentation and since the sequence remains exact after tensoring with $R^{\wedge}$ (by Algebra, Lemma 10.38 .12 ) and $R_{f}$, we conclude that $K \otimes_{R} R^{\wedge}$ and $K_{f}$ are finite modules. Using the lemma above we conclude that $K$ is finitely generated. Hence $M$ is finitely presented and hence finite projective.

Second proof. Assume that $M \otimes_{R} R^{\wedge}$ is a finite projective module over $R^{\wedge}$ and that $M_{f}$ is a finite projective module over $R_{f}$. Our task is to prove that $M$ is finite projective over $R$.

Case I: Assume that $M \otimes_{R} R^{\wedge} \cong\left(R^{\wedge}\right)^{\oplus n}$ and $M_{f} \cong R_{f}^{\oplus n}$ for some $n$. Choose a presentation

$$
\bigoplus_{i \in I} R \rightarrow R^{\oplus m} \rightarrow M \rightarrow 0
$$

This is possible because $M$ is a finite $R$-module by the first case of the lemma. Let $A=\left(a_{i j}\right)$ be the matrix of the first map so that $\operatorname{Fit}_{k}(M)$ is generated by the $(m-k) \times(m-k)$-minors of $A$. By our assumption we see that $\operatorname{Fit}_{n-1}(M)$, resp. Fit $_{n}(M)$ generates the zero, resp. unit ideal in $R^{\wedge}$ and $R_{f}$, see Lemma 15.6.7. Since $\operatorname{Spec}\left(R^{\wedge}\right) \amalg \operatorname{Spec}\left(R_{f}\right) \rightarrow \operatorname{Spec}(R)$ is surjective (Lemma 15.71.4) we conclude that $\operatorname{Fit}_{n}(M)$ generates the unit ideal in $R$. Since $R \rightarrow R^{\wedge} \oplus R_{f}$ is injective, we see that $\operatorname{Fit}_{n-1}(M)$ is zero. Hence $M$ is finite locally free of rank $n$ by the lemma cited above.

Case II: general case. Choose an $n$ and isomorphisms $\left(R^{\wedge}\right)^{\oplus n}=M \otimes_{R} R^{\wedge} \oplus C^{\prime}$ and $R_{f}^{\oplus n}=M_{f} \oplus C_{1}$. Then we have

$$
\left(C^{\prime}\right)_{f} \oplus\left(R^{\wedge}\right)_{f}^{\oplus n}=\left(C^{\prime}\right)_{f} \oplus M_{f} \otimes_{R} R^{\wedge} \oplus C_{1} \otimes_{R} R^{\wedge}=\left(R^{\wedge}\right)_{f}^{\oplus n} \oplus C_{1} \otimes_{R} R^{\wedge}
$$

In other words, the $\left(R^{\wedge}\right)_{f}$-modules $\left(C^{\prime}\right)_{f}$ and $C_{1} \otimes_{R} R^{\wedge}$ become isomorphic after adding $n$ copies of the free module. This gives a glueing datum

$$
\left(\left(C^{\prime}\right)_{f} \oplus\left(R^{\wedge}\right)^{\oplus n}, C_{1} \oplus R_{f}^{\oplus n}, \alpha_{1}\right)
$$

such that in $\operatorname{Glue}\left(R \rightarrow R^{\wedge}, f\right)$ we have

$$
\left(\left(R^{\wedge}\right)^{\oplus 2 n}, R_{f}^{\oplus 2 n}, \alpha_{1} \oplus \mathrm{can}\right)=\left(\left(C^{\prime}\right)_{f} \oplus\left(R^{\wedge}\right)^{\oplus n}, C_{1} \oplus R_{f}^{\oplus n}, \alpha_{1}\right) \oplus\left(M \otimes_{R} R^{\wedge}, M_{f}, \text { can }\right)
$$

By Case I we see that $H^{0}\left(\left(R^{\wedge}\right)^{\oplus 2 n}, R_{f}^{\oplus 2 n}, \alpha_{1} \oplus\right.$ can $)$ is a finite projective $R$-module and hence the summand $\tilde{M}=H^{0}\left(M \otimes_{R} R^{\wedge}, M_{f}\right.$, can $)$ is a finite projective $R$-module as well. By Remark 15.71 .18 we see that $M \rightarrow \tilde{M}$ is surjective. Let $K$ be the kernel of this map; since $M$ is a flat $R$-module, we must have $K \otimes_{R}\left(R^{\wedge} \oplus R_{f}\right)=0$. By Lemma 15.71.3 this forces $K=0$, so $M \cong \tilde{M}$.

0BP8 Remark 15.71.21. In BL95 it is assumed that $f$ is a nonzerodivisor in $R$. Even in this setting Theorem 15.71 .17 says something new: the results of [BL95] only apply to modules on which $f$ is a nonzerodivisor (and hence glueable in our sense). Lemma 15.71 .20 also provides a slight extension of the results of BL95]: not only can we allow $M$ to have nonzero $f$-power torsion, we do not even require it to be glueable.

### 15.72. Derived Completion

091 N Some references for the material in this section are DG02, GM92, Lur11 (especially Chapter 4). Our exposition follows BS13. The analogue (or "dual") of this section for torsion modules is Dualizing Complexes, Section 45.9. The relationship between the derived category of complexes with torsion cohomology and derived complete complexes can be found in Dualizing Complexes, Section 45.12 .

Let $K \in D(A)$. Let $f \in A$. We denote $T(K, f)$ a derived limit of the system

$$
\ldots \rightarrow K \xrightarrow{f} K \xrightarrow{f} K
$$

in $D(A)$.
091P Lemma 15.72.1. Let $A$ be a ring. Let $f \in A$. Let $K \in D(A)$. The following are equivalent
(1) $\operatorname{Ext}_{A}^{n}\left(A_{f}, K\right)=0$ for all $n$,
(2) $\operatorname{Hom}_{D(A)}(E, K)=0$ for all $E$ in $D\left(A_{f}\right)$,
(3) $T(K, f)=0$,
(4) for every $p \in \mathbf{Z}$ we have $T\left(H^{p}(K), f\right)=0$,
(5) for every $p \in \mathbf{Z}$ we have $\operatorname{Hom}_{A}\left(A_{f}, H^{p}(K)\right)=0$ and $E x t_{A}^{1}\left(A_{f}, H^{p}(K)\right)=$ 0,
(6) $R \operatorname{Hom}\left(A_{f}, K\right)=0$,
(7) add more here.

Proof. It is clear that (2) implies (1) and that (1) is equivalent to (6). Assume (1). Let $I^{\bullet}$ be a K-injective complex of $A$-modules representing $K$. Condition (1) signifies that $\operatorname{Hom}_{A}\left(A_{f}, I^{\bullet}\right)$ is acyclic. Let $M^{\bullet}$ be a complex of $A_{f}$-modules representing $E$. Then

$$
\operatorname{Hom}_{D(A)}(E, K)=\operatorname{Hom}_{K(A)}\left(M^{\bullet}, I^{\bullet}\right)=\operatorname{Hom}_{K\left(A_{f}\right)}\left(M^{\bullet}, \operatorname{Hom}_{A}\left(A_{f}, I^{\bullet}\right)\right)
$$

by Algebra, Lemma 10.13 .4 As $\operatorname{Hom}_{A}\left(A_{f}, I^{\bullet}\right)$ is a K-injective complex of $A_{f^{-}}$ modules by Lemma 15.47 .3 the fact that it is acyclic implies that it is homotopy equivalent to zero (Derived Categories, Lemma 13.29.2. Thus we get (2).

A free resolution of the $A$-module $A_{f}$ is given by

$$
0 \rightarrow \bigoplus_{n \in \mathbf{N}} A \rightarrow \bigoplus_{n \in \mathbf{N}} A \rightarrow A_{f} \rightarrow 0
$$

where the first map sends the $\left(x_{0}, x_{1}, \ldots\right)$ to $\left(f x_{0}-x_{1}, f x_{1}-x_{2}, \ldots\right)$ and the second map sends $\left(x_{0}, x_{1}, \ldots\right)$ to $x_{0}+x_{1} / f+x_{2} / f^{2}+\ldots$ Applying $\operatorname{Hom}_{A}\left(-, I^{\bullet}\right)$ we get

$$
0 \rightarrow \operatorname{Hom}_{A}\left(A_{f}, I^{\bullet}\right) \rightarrow \prod I^{\bullet} \rightarrow \prod I^{\bullet} \rightarrow 0
$$

This means that the object $T(K, f)$ is a representative of $R \operatorname{Hom}_{A}\left(A_{f}, K\right)$ in $D(A)$. Thus the equivalence of (1) and (3).

There is a spectral sequence

$$
E_{2}^{p, q}=\operatorname{Ext}_{A}^{q}\left(A_{f}, H^{p}(K)\right) \Rightarrow \operatorname{Ext}_{A}^{p+q}\left(A_{f}, K\right)
$$

(details omitted). This spectral sequence degenerates at $E_{2}$ because $A_{f}$ has a length 1 resolution by projective $A$-modules (see above) hence the $E_{2}$-page has only 2 nonzero rows. Thus we obtain short exact sequences

$$
0 \rightarrow \operatorname{Ext}_{A}^{1}\left(A_{f}, H^{p-1}(K)\right) \rightarrow \operatorname{Ext}_{A}^{p}\left(A_{f}, K\right) \rightarrow \operatorname{Hom}_{A}\left(A_{f}, H^{p}(K)\right) \rightarrow 0
$$

This proves (4) and (5) are equivalent to (1).
091Q Lemma 15.72.2. Let $A$ be a ring. Let $K \in D(A)$. The set $I$ of $f \in A$ such that $T(K, f)=0$ is a radical ideal of $A$.

Proof. We will use the results of Lemma 15.72.1 without further mention. If $f \in I$, and $g \in A$, then $A_{g f}$ is an $A_{f}$-module hence $\operatorname{Ext}_{A}^{n}\left(A_{g f}, K\right)=0$ for all $n$, hence $g f \in I$. Suppose $f, g \in I$. Then there is a short exact sequence

$$
0 \rightarrow A_{f+g} \rightarrow A_{f(f+g)} \oplus A_{g(f+g)} \rightarrow A_{g f(f+g)} \rightarrow 0
$$

because $f, g$ generate the unit ideal in $A_{f+g}$. This follows from Algebra, Lemma 10.22 .1 and the easy fact that the last arrow is surjective. From the long exact sequence of Ext and the vanishing of $\operatorname{Ext}_{A}^{n}\left(A_{f(f+g)}, K\right), \operatorname{Ext}_{A}^{n}\left(A_{g(f+g)}, K\right)$, and $\operatorname{Ext}_{A}^{n}\left(A_{g f(f+g)}, K\right)$ for all $n$ we deduce the vanishing of $\operatorname{Ext}_{A}^{n}\left(A_{f+g}, K\right)$ for all $n$. Finally, if $f^{n} \in I$ for some $n>0$, then $f \in I$ because $T(K, f)=T\left(K, f^{n}\right)$ or because $A_{f} \cong A_{f^{n}}$.

091R Lemma 15.72.3. Let $A$ be a ring. Let $I \subset A$ be an ideal. Let $M$ be an $A$-module.
(1) If $M$ is $I$-adically complete, then $T(M, f)=0$ for all $f \in I$.
(2) Conversely, if $T(M, f)=0$ for all $f \in I$ and $I$ is finitely generated, then $M \rightarrow \lim M / I^{n} M$ is surjective.

Proof. Proof of (1). Assume $M$ is $I$-adically complete. By Lemma 15.72.1 it suffices to prove $\operatorname{Ext}_{A}^{1}\left(A_{f}, M\right)=0$ and $\operatorname{Hom}_{A}\left(A_{f}, M\right)=0$. Since $M=\lim M / I^{n} M$ and since $\operatorname{Hom}_{A}\left(A_{f}, M / I^{n} M\right)=0$ it follows that $\operatorname{Hom}_{A}\left(A_{f}, M\right)=0$. Suppose we have an extension

$$
0 \rightarrow M \rightarrow E \rightarrow A_{f} \rightarrow 0
$$

For $n \geq 0$ pick $e_{n} \in E$ mapping to $1 / f^{n}$. Set $\delta_{n}=f e_{n+1}-e_{n} \in M$ for $n \geq 0$. Replace $e_{n}$ by

$$
e_{n}^{\prime}=e_{n}+\delta_{n}+f \delta_{n+1}+f^{2} \delta_{n+2}+\ldots
$$

The infinite sum exists as $M$ is complete with respect to $I$ and $f \in I$. A simple calculation shows that $f e_{n+1}^{\prime}=e_{n}^{\prime}$. Thus we get a splitting of the extension by mapping $1 / f^{n}$ to $e_{n}^{\prime}$.
Proof of (2). Assume that $I=\left(f_{1}, \ldots, f_{r}\right)$ and that $T\left(M, f_{i}\right)=0$ for $i=1, \ldots, r$. By Algebra, Lemma 10.95.7 we may assume $I=(f)$ and $T(M, f)=0$. Let $x_{n} \in M$ for $n \geq 0$. Consider the extension

$$
0 \rightarrow M \rightarrow E \rightarrow A_{f} \rightarrow 0
$$

given by

$$
E=M \oplus \bigoplus A e_{n} /\left\langle x_{n}-f e_{n+1}+e_{n}\right\rangle
$$

mapping $e_{n}$ to $1 / f^{n}$ in $A_{f}$ (see above). By assumption and Lemma 15.72.1 this extension is split, hence we obtain an element $x+e_{0}$ which generates a copy of $A_{f}$ in $E$. Then

$$
x+e_{0}=x-x_{0}+f e_{1}=x-x_{0}-x_{1}+f^{2} e_{2}=\ldots
$$

Since $M / f^{n} M=E / f^{n} E$ by the snake lemma, we see that $x=x_{0}+f x_{1}+\ldots+$ $f^{n-1} x_{n-1}$ modulo $f^{n} M$. In other words, the $\operatorname{map} M \rightarrow \lim M / f^{n} M$ is surjective as desired.

Motivated by the results above we make the following definition.
091 S Definition 15.72.4. Let $A$ be a ring. Let $K \in D(A)$. Let $I \subset A$ be an ideal. We say $K$ is derived complete with respect to $I$ if for every $f \in I$ we have $T(K, f)=0$. If $M$ is an $A$-module, then we say $M$ is derived complete with respect to $I$ if $M[0] \in$ $D(A)$ is derived complete with respect to $I$.

The full subcategory $D_{\text {comp }}(A)=D_{\text {comp }}(A, I) \subset D(A)$ consisting of derived complete objects is a strictly full, saturated triangulated subcategory, see Derived Categories, Definitions 13.3 .4 and 13.6 .1 . By Lemma 15.72 .2 the subcategory $D_{\text {comp }}(A, I)$ depends only on the radical $\sqrt{I}$ of $I$, in other words it depends only on the closed subset $Z=V(I)$ of $\operatorname{Spec}(A)$. The subcategory $D_{\text {comp }}(A, I)$ is preserved under products and homotopy limits in $D(A)$. But it is not preserved under countable direct sums in general. We will often simply say $M$ is a derived complete module if the choice of the ideal $I$ is clear from the context.

091T Proposition 15.72.5. Let $I \subset A$ be a finitely generated ideal of a ring $A$. Let $M$ be an A-module. The following are equivalent
(1) $M$ is I-adically complete, and
(2) $M$ is derived complete with respect to $I$ and $\bigcap I^{n} M=0$.

Proof. This is clear from the results of Lemma 15.72 .3 .
The next lemma shows that the category $\mathcal{C}$ of derived complete modules is abelian. It turns out that $\mathcal{C}$ is not a Grothendieck abelian category, see Examples, Section 88.10

091U Lemma 15.72.6. Let $I$ be an ideal of a ring $A$.
(1) The derived complete $A$-modules form a weak Serre subcategory $\mathcal{C}$ of $\operatorname{Mod}_{A}$.
(2) $D_{\mathcal{C}}(A) \subset D(A)$ is the full subcategory of derived complete objects.

Proof. Part (2) is immediate from Lemma 15.72.1 and the definitions. For part (1), suppose that $M \rightarrow N$ is a map of derived complete modules. Denote $K=(M \rightarrow N)$ the corresponding object of $D(A)$. Pick $f \in I$. Then $\operatorname{Ext}_{A}^{n}\left(A_{f}, K\right)$ is zero for all $n$ because $\operatorname{Ext}_{A}^{n}\left(A_{f}, M\right)$ and $\operatorname{Ext}_{A}^{n}\left(A_{f}, N\right)$ are zero for all $n$. Hence $K$ is derived complete. By (2) we see that $\operatorname{Ker}(M \rightarrow N)$ and $\operatorname{Coker}(M \rightarrow N)$ are objects of $\mathcal{C}$. Finally, suppose that $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ is a short exact sequence of $A$-modules and $M_{1}, M_{3}$ are derived complete. Then it follows from the long exact sequence of Ext's that $M_{2}$ is derived complete. Thus $\mathcal{C}$ is a weak Serre subcategory by Homology, Lemma 12.9.3.

If the ring is $I$-adically complete, then one obtains an ample supply of derived complete complexes.

0 A 05 Lemma 15.72.7. Let $A$ be a ring and $I \subset A$ an ideal. If $A$ is $I$-adically complete then any pseudo-coherent object of $D(A)$ is derived complete.

Proof. Let $K$ be a pseudo-coherent object of $D(A)$. By definition this means $K$ is represented by a bounded above complex $K^{\bullet}$ of finite free $A$-modules. Since $A$ is $I$-adically complete, hence derived complete (Lemma 15.72.3). It follows that $H^{n}(K)$ is derived complete for all $n$, by part (1) of Lemma 15.72.6. This in turn implies that $K$ is derived complete by part (2) of the same lemma.

0A6C Lemma 15.72.8. Let $A$ be a ring. Let $f, g \in A$. Then for $K \in D(A)$ we have $R \operatorname{Hom}\left(A_{f}, R \operatorname{Hom}\left(A_{g}, K\right)\right)=R \operatorname{Hom}\left(A_{f g}, K\right)$.
Proof. This follows from Lemma 15.60 .1
091V Lemma 15.72.9. Let $I$ be a finitely generated ideal of a ring $A$. The inclusion functor $D_{\text {comp }}(A, I) \rightarrow D(A)$ has a left adjoint, i.e., given any object $K$ of $D(A)$ there exists a map $K \rightarrow K^{\wedge}$ of $K$ into a derived complete object of $D(A)$ such that the map

$$
\operatorname{Hom}_{D(A)}\left(K^{\wedge}, E\right) \longrightarrow \operatorname{Hom}_{D(A)}(K, E)
$$

is bijective whenever $E$ is a derived complete object of $D(A)$. In fact, if $I$ is generated by $f_{1}, \ldots, f_{r} \in A$, then we have

$$
K^{\wedge}=R \operatorname{Hom}\left(\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0} f_{i_{1}}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right), K\right)
$$

functorially in $K$.
Proof. Define $K^{\wedge}$ by the last displayed formula of the lemma. There is a map of complexes

$$
\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right) \longrightarrow A
$$

which induces a map $K \rightarrow K^{\wedge}$. It suffices to prove that $K^{\wedge}$ is derived complete and that $K \rightarrow K^{\wedge}$ is an isomorphism if $K$ is derived complete.
Let $f \in A$. By Lemma 15.72 .8 the object $R \operatorname{Hom}\left(A_{f}, K^{\wedge}\right)$ is equal to

$$
R \operatorname{Hom}\left(\left(A_{f} \rightarrow \prod_{i_{0}} A_{f f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f f_{1} \ldots f_{r}}\right), K\right)
$$

If $f \in I$, then $f_{1}, \ldots, f_{r}$ generate the unit ideal in $A_{f}$, hence the extended alternating Čech complex

$$
A_{f} \rightarrow \prod_{i_{0}} A_{f f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f f_{1} \ldots f_{r}}
$$

is zero in $D(A)$ by Lemma 15.22.13. (In fact, if $f=f_{i}$ for some $i$, then this complex is homotopic to zero; this is the only case we need.) Hence $R \operatorname{Hom}\left(A_{f}, K^{\wedge}\right)=0$ and we conclude that $K^{\wedge}$ is derived complete by Lemma 15.72.1.
Conversely, if $K$ is derived complete, then $R \operatorname{Hom}\left(A_{f}, K\right)$ is zero for all $f=$ $f_{i_{0}} \ldots f_{i_{p}}, p \geq 0$. Thus $K \rightarrow K^{\wedge}$ is an isomorphism in $D(A)$.
0A6D Lemma 15.72.10. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K^{\bullet}$ be a complex of $A$-modules such that $f: K^{\bullet} \rightarrow K^{\bullet}$ is an isomorphism for some $f \in I$, i.e., $K^{\bullet}$ is a complex of $A_{f}$-modules. Then the derived completion of $K^{\bullet}$ is zero.

Proof. Indeed, in this case the $R \operatorname{Hom}(K, L)$ is zero for any derived complete complex $L$, see Lemma 15.72 .1 . Hence $K^{\wedge}$ is zero by the universal property in Lemma 15.72 .9 .

0A6E Lemma 15.72.11. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K, L \in D(A)$. Then

$$
R \operatorname{Hom}(K, L)^{\wedge}=R \operatorname{Hom}\left(K, L^{\wedge}\right)=R \operatorname{Hom}\left(K^{\wedge}, L^{\wedge}\right)
$$

Proof. By Lemma 15.72 .9 we know that derived completion is given by $R \operatorname{Hom}(C,-)$ for some $C \in D(A)$. Then

```
\(R \operatorname{Hom}(C, R \operatorname{Hom}(K, L))=R \operatorname{Hom}\left(C \otimes^{\mathbf{L}} K, L\right)=R \operatorname{Hom}(K, R \operatorname{Hom}(C, L))\)
```

by Lemma 15.60.1. This proves the first equation. The map $K \rightarrow K^{\wedge}$ induces a map

$$
R \operatorname{Hom}\left(K^{\wedge}, L^{\wedge}\right) \rightarrow R \operatorname{Hom}\left(K, L^{\wedge}\right)
$$

which is an isomorphism in $D(A)$ by definition of the derived completion as the left adjoint to the inclusion functor.

091W Lemma 15.72.12. Let $A$ be a ring and let $I \subset A$ be an ideal. Let $\left(K_{n}\right)$ be an inverse system of objects of $D(A)$ such that for all $f \in I$ and $n$ there exists an $e=e(n, f)$ such that $f^{e}$ is zero on $K_{n}$. Then for $K \in D(A)$ the object $K^{\prime}=$ $R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}\right)$ is derived complete with respect to $I$.

Proof. Since the category of derived complete objects is preserved under $R$ lim it suffices to show that each $K \otimes_{A}^{\mathbf{L}} K_{n}$ is derived complete. By assumption for all $f \in I$ there is an $e$ such that $f^{e}$ is zero on $K \otimes_{A}^{\mathbf{L}} K_{n}$. Of course this implies that $T\left(K \otimes_{A}^{\mathbf{L}} K_{n}, f\right)=0$ and we win.

0BKC Situation 15.72.13. Let $A$ be a ring. Let $I=\left(f_{1}, \ldots, f_{r}\right) \subset A$. Let $K_{n}^{\bullet}=$ $K_{\bullet}\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ be the Koszul complex on $f_{1}^{n}, \ldots, f_{r}^{n}$ viewed as a cochain complex in degrees $-r,-r+1, \ldots, 0$. Using the functoriality of Lemma 15.22 .3 we obtain an inverse system

$$
\ldots \rightarrow K_{3}^{\bullet} \rightarrow K_{2}^{\bullet} \rightarrow K_{1}^{\bullet}
$$

compatible with the inverse system $H^{0}\left(K_{n}^{\bullet}\right)=A /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)$ and compatible with the maps $A \rightarrow K_{n}^{\bullet}$.

A key feature of the discussion below will use that for $m>n$ the map

$$
K_{m}^{-p}=\wedge^{p}\left(A^{\oplus r}\right) \rightarrow \wedge^{p}\left(A^{\oplus r}\right)=K_{n}^{-p}
$$

is given by multiplication by $f_{i_{1}}^{m-n} \ldots f_{i_{p}}^{m-n}$ on the basis element $e_{i_{1}} \wedge \ldots \wedge e_{i_{p}}$.
091Y Lemma 15.72.14. In Situation 15.72.13. For $K \in D(A)$ the object $K^{\prime}=$ $R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)$ is derived complete with respect to $I$.

Proof. This is a special case of Lemma 15.72 .12 because $f_{i}^{n}$ acts by an endomorphism of $K_{n}^{\bullet}$ which is homotopic to zero by Lemma 15.22 .6 .

091Z Lemma 15.72.15. In Situation 15.72.13. Let $K \in D(A)$. The following are equivalent
(1) $K$ is derived complete with respect to $I$, and
(2) the canonical map $K \rightarrow R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)$ is an isomorphism of $D(A)$.

Proof. If (2) holds, then $K$ is derived complete with respect to $I$ by Lemma 15.72.14. Conversely, assume that $K$ is derived complete with respect to $I$. Consider the filtrations

$$
K_{n}^{\bullet} \supset \sigma_{\geq-r+1} K_{n}^{\bullet} \supset \sigma_{\geq-r+2} K_{n}^{\bullet} \supset \ldots \supset \sigma_{\geq-1} K_{n}^{\bullet} \supset \sigma_{\geq 0} K_{n}^{\bullet}=A
$$

by stupid truncations (Homology, Section 12.13). Because the construction $R \lim (K \otimes$ $E$ ) is exact in the second variable (Lemma 15.68.18) we see that it suffices to show

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}}\left(\sigma_{\geq p} K_{n}^{\bullet} / \sigma_{\geq p+1} K_{n}^{\bullet}\right)\right)=0
$$

for $p<0$. The explicit description of the Koszul complexes above shows that

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}}\left(\sigma_{\geq p} K_{n}^{\bullet} / \sigma_{\geq p+1} K_{n}^{\bullet}\right)\right)=\bigoplus_{i_{1}, \ldots, i_{-p}} T\left(K, f_{i_{1}} \ldots f_{i_{-p}}\right)
$$

which is zero for $p<0$ by assumption on $K$.
0920 Lemma 15.72.16. In Situation 15.72 .13 . The functor which sends $K \in D(A)$ to the derived limit $K^{\prime}=R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)$ is the left adjoint to the inclusion functor $D_{\text {comp }}(A) \rightarrow D(A)$ constructed in Lemma 15.72.9.

First proof. The assignment $K \rightsquigarrow K^{\prime}$ is a functor and $K^{\prime}$ is derived complete with respect to $I$ by Lemma 15.72.14. By a formal argument (omitted) we see that it suffices to show $K \rightarrow K^{\prime}$ is an isomorphism if $K$ is derived complete with respect to $I$. This is Lemma 15.72 .15 ,

Second proof. Denote $K \mapsto K^{\wedge}$ the adjoint constructed in Lemma 15.72.9. By that lemma we have

$$
K^{\wedge}=R \operatorname{Hom}\left(\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0} f_{i_{1}}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right), K\right)
$$

In Lemma 15.22 .13 we have seen that the extended alternating Čech complex

$$
A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}
$$

is a colimit of the Koszul complexes $K^{n}=K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ sitting in degrees $0, \ldots, r$. Note that $K^{n}$ is a finite chain complex of finite free $A$-modules with dual (as in Lemma 15.61.14 $R \operatorname{Hom}_{A}\left(K^{n}, A\right)=K_{n}$ where $K_{n}$ is the Koszul cochain complex sitting in degrees $-r, \ldots, 0$ (as usual). Thus it suffices to show that

$$
R \operatorname{Hom}\left(\operatorname{hocolim} K^{n}, K\right)=R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}\right)
$$

This follows from Lemma 15.61 .15
As an application of the relationship with the Koszul complex we obtain that derived completion has finite cohomological dimension.

OAAJ Lemma 15.72.17. Let $A$ be a ring and let $I \subset A$ be an ideal which can be generated by $r$ elements. Then derived completion has finite cohomological dimension:
(1) If $K \rightarrow L$ is a morphism of $D(A)$ which induces an isomorphism on $H^{i}(K) \rightarrow H^{i}(L)$ for $i \geq 0$ then $H^{i}\left(K^{\wedge}\right) \rightarrow H^{i}\left(L^{\wedge}\right)$ is an isomorphism for $i \geq 1$.
(2) If $K \rightarrow L$ is a morphism of $D(A)$ which induces an isomorphism on $H^{i}(K) \rightarrow H^{i}(L)$ for $i \leq 0$ then $H^{i}\left(K^{\wedge}\right) \rightarrow H^{i}\left(L^{\wedge}\right)$ is an isomorphism for $i \leq-r-1$.

Proof. Say $I$ is generated by $f_{1}, \ldots, f_{r}$. By Lemma 15.72 .16 we have

$$
H^{i}\left(K^{\wedge}\right)=H^{i}\left(R \lim K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)
$$

and hence this fits into a short exact sequence

$$
0 \rightarrow R^{1} \lim H^{i-1}\left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right) \rightarrow H^{i}\left(K^{\wedge}\right) \rightarrow \lim H^{i}\left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right) \rightarrow 0
$$

by Lemma 15.68 .6 . Thus it suffices to prove that $H^{i}\left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)$ only depends on $H^{j}(K)$ for $j \in\{i, \ldots, i+r\}$. As $K_{n}^{\bullet}$ is a complex of finite free modules sitting in degrees $-r, \ldots, 0$ this follows from an straightforward argument which we omit.

0BKD Lemma 15.72.18. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K^{\bullet}$ be a filtered complex of $A$-modules. There exists a canonical spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 1}$ of bigraded derived complete $A$-modules with $d_{r}$ of bidegree $(r,-r+1)$ and with

$$
E_{1}^{p, q}=H^{p+q}\left(\left(g r^{p} K^{\bullet}\right)^{\wedge}\right)
$$

If the filtration on each $K^{n}$ is finite, then the spectral sequence is bounded and converges to $H^{*}\left(\left(K^{\bullet}\right)^{\wedge}\right)$.
Proof. By Lemma 15.72 .9 we know that derived completion is given by $R \operatorname{Hom}(C,-)$ for some $C \in D^{b}(A)$. By Lemmas 15.72 .17 and 15.57 .2 we see that $C$ has finite projective dimension. Thus we may choose a bounded complex of projective modules $P^{\bullet}$ representing $C$. Then

$$
M^{\bullet}=\operatorname{Hom}^{\bullet}\left(P^{\bullet}, K^{\bullet}\right)
$$

is a complex of $A$-modules representing $\left(K^{\bullet}\right)^{\wedge}$. It comes with a filtration given by $F^{p} M^{\bullet}=\operatorname{Hom}^{\bullet}\left(P^{\bullet}, F^{p} K^{\bullet}\right)$. We see that $F^{p} M^{\bullet}$ represents $\left(F^{p} K^{\bullet}\right)^{\wedge}$ and hence $\operatorname{gr}^{p} M^{\bullet}$ represents $\left(\operatorname{gr} K^{\bullet}\right)^{\wedge}$. Thus we find our spectral sequence by taking the spectral sequence of the filtered complex $M^{\bullet}$, see Homology, Section 12.21. If the filtration on each $K^{n}$ is finite, then the filtration on each $M^{n}$ is finite because $P^{\bullet}$ is a bounded complex. Hence the final statement follows from Homology, Lemma 12.21.11.

0BKE Example 15.72.19. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K^{\bullet}$ be a complex of $A$-modules. We can apply Lemma 15.72 .18 with $F^{p} K^{\bullet}=\tau_{\leq-p} K^{\bullet}$. Then we get a bounded spectral sequence

$$
E_{1}^{p, q}=H^{p+q}\left(H^{-p}\left(K^{\bullet}\right)^{\wedge}[p]\right)=H^{2 p+q}\left(H^{-p}\left(K^{\bullet}\right)^{\wedge}\right)
$$

converging to $H^{p+q}\left(\left(K^{\bullet}\right)^{\wedge}\right)$. After renumbering $p=-j$ and $q=i+2 j$ we find that for any $K \in D(A)$ there is a bounded spectral sequence $\left(E_{r}^{\prime}, d_{r}^{\prime}\right)_{r \geq 2}$ of bigraded derived complete modules with $d_{r}^{\prime}$ of bidegree $(r,-r+1)$, with

$$
\left(E_{2}^{\prime}\right)^{i, j}=H^{i}\left(H^{j}(K)^{\wedge}\right)
$$

and converging to $H^{i+j}\left(K^{\wedge}\right)$.
0924 Lemma 15.72.20. Let $A \rightarrow B$ be a ring map. Let $I \subset A$ be an ideal. The inverse image of $D_{\text {comp }}(A, I)$ under the restriction functor $D(B) \rightarrow D(A)$ is $D_{\text {comp }}(B, I B)$.
Proof. Using Lemma 15.72 .2 we see that $L \in D(B)$ is in $D_{\text {comp }}(B, I B)$ if and only if $T(L, f)$ is zero for every local section $f \in I$. Observe that the cohomology of $T(L, f)$ is computed in the category of abelian groups, so it doesn't matter whether we think of $f$ as an element of $A$ or take the image of $f$ in $B$. The lemma follows immediately from this and the definition of derived complete objects.

0925 Lemma 15.72.21. Let $A \rightarrow B$ be a ring map. Let $I \subset A$ be a finitely generated ideal. If $A \rightarrow B$ is flat and $A / I \cong B / I B$, then the restriction functor $D(B) \rightarrow$ $D(A)$ induces an equivalence $D_{\text {comp }}(B, I B) \rightarrow D_{\text {comp }}(A, I)$.

Proof. Choose generators $f_{1}, \ldots, f_{r}$ of $I$. Denote $\check{\mathcal{C}}_{\dot{\bullet}}^{\bullet} \rightarrow \check{\mathcal{C}}_{B}^{\bullet}$ the quasi-isomorphism of extended alternating Čech complexes of Lemma 15.70.4. Let $K \in D_{\text {comp }}(A, I)$. Let $I^{\bullet}$ be a K-injective complex of $A$-modules representing $K$. Since $\operatorname{Ext}_{A}^{n}\left(A_{f}, K\right)$ and $\operatorname{Ext}_{A}^{n}\left(B_{f}, K\right)$ are zero for all $f \in I$ and $n \in \mathbf{Z}$ (Lemma 15.72.1) we conclude that $\check{\mathcal{C}}_{A}^{\bullet} \rightarrow A$ and $\check{\mathcal{C}}_{B}^{\bullet} \rightarrow B$ induce quasi-isomorphisms

$$
I^{\bullet}=\operatorname{Hom}_{A}\left(A, I^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\operatorname{Hom}_{A}\left(\check{\mathcal{C}}_{A}^{\bullet}, I^{\bullet}\right)\right)
$$

and

$$
\operatorname{Hom}_{A}\left(B, I^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\operatorname{Hom}_{A}\left(\check{\mathcal{C}}_{B}^{\bullet}, I^{\bullet}\right)\right)
$$

Some details omitted. Since $\check{\mathcal{C}}_{A}^{\bullet} \rightarrow \check{\mathcal{C}}_{B}^{\bullet}$ is a quasi-isomorphism and $I^{\bullet}$ is K-injective we conclude that $\operatorname{Hom}_{A}\left(B, I^{\bullet}\right) \rightarrow I^{\bullet}$ is a quasi-isomorphism. As the complex $\operatorname{Hom}_{A}\left(B, I^{\bullet}\right)$ is a complex of $B$-modules we conclude that $K$ is in the image of the restriction map, i.e., the functor is essentially surjective

In fact, the argument shows that $F: D_{\text {comp }}(A, I) \rightarrow D_{c o m p}(B, I B), K \mapsto \operatorname{Hom}_{A}\left(B, I^{\bullet}\right)$ is a left inverse to restriction. Finally, suppose that $L \in D_{\text {comp }}(B, I B)$. Represent $L$ by a K-injective complex $J^{\bullet}$ of $B$-modules. Then $J^{\bullet}$ is also K-injective as a complex of $A$-modules (Lemma 15.47.1) hence $F($ restriction of $L)=\operatorname{Hom}_{A}\left(B, J^{\bullet}\right)$. There is a map $J^{\bullet} \rightarrow \operatorname{Hom}_{A}\left(B, J^{\bullet}\right)$ of complexes of $B$-modules, whose composition with $\operatorname{Hom}_{A}\left(B, J^{\bullet}\right) \rightarrow J^{\bullet}$ is the identity. We conclude that $F$ is also a right inverse to restriction and the proof is finished.

### 15.73. Derived completion for a principal ideal

0BKF In this section we discuss what happens with derived completion when the ideal is generated by a single element.

091X Lemma 15.73.1. Let $A$ be a ring. Let $f \in A$. If there exists an integer $c \geq 1$ such that $A\left[f^{c}\right]=A\left[f^{c+1}\right]=A\left[f^{c+2}\right]=\ldots$ (for example if $A$ is Noetherian), then for all $n \geq 1$ there exist maps

$$
\left(A \xrightarrow{f^{n}} A\right) \longrightarrow A /\left(f^{n}\right), \quad \text { and } \quad A /\left(f^{n+c}\right) \longrightarrow\left(A \xrightarrow{f^{n}} A\right)
$$

in $D(A)$ inducing an isomorphism of the pro-objects $\left\{A /\left(f^{n}\right)\right\}$ and $\left\{\left(f^{n}: A \rightarrow A\right)\right\}$ in $D(A)$.

Proof. The first displayed arrow is obvious. We can define the second arrow of the lemma by the diagram

Since the top horizontal arrow is injective the complex in the top row is quasiisomorphic to $A / f^{n+c} A$. We omit the calculation of compositions needed to show the statement on pro objects.

0923 Lemma 15.73.2. Let $A$ be a ring and $f \in A$. Set $I=(f)$. In this situation we have the naive derived completion $K \mapsto K^{\prime}=R \lim \left(K \otimes{ }_{A}^{\mathbf{L}} A / f^{n} A\right)$ and the derived completion

$$
K \mapsto K^{\wedge}=R \lim \left(K \otimes_{A}^{\mathbf{L}}\left(A \xrightarrow{f^{n}} A\right)\right)
$$

of Lemma 15.72.16. The natural transformation of functors $K^{\wedge} \rightarrow K^{\prime}$ is an isomorphism if and only if the $f$-power torsion of is bounded.

Proof. If the $f$-power torsion is bounded, then the pro-objects $\left\{\left(f^{n}: A \rightarrow A\right)\right\}$ and $\left\{A / f^{n} A\right\}$ are isomorphic by Lemma 15.73.1. Hence the functors are isomorphic by Lemma 15.68 .7 . Conversely, we see from Lemma 15.68 .18 that the condition is exactly that

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}} A\left[f^{n}\right]\right)
$$

is zero for all $K \in D(A)$. Here the maps of the system $\left(A\left[f^{n}\right]\right)$ are given by multiplication by $f$. Taking $K=A$ and $K=\bigoplus_{i \in \mathbf{N}} A$ we see from Lemma 15.68 .8 this implies $\left(A\left[f^{n}\right]\right)$ is zero as a pro-object, i.e., $f^{n-1} A\left[f^{n}\right]=0$ for some $n$, i.e., $A\left[f^{n-1}\right]=A\left[f^{n}\right]$, i.e., the $f$-power torsion is bounded.

09AT Example 15.73.3. Let $A$ be a ring. Let $f \in A$ be a nonzerodivisor. An example to keep in mind is $A=\mathbf{Z}_{p}$ and $f=p$. Let $M$ be an $A$-module. Claim: $M$ is derived complete with respect to $f$ if and only if there exists a short exact sequence

$$
0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0
$$

where $K, L$ are $f$-adically complete modules whose $f$-torsion is zero. Namely, if there is a such a short exact sequence, then

$$
M \otimes_{A}^{\mathbf{L}}\left(A \xrightarrow{f^{n}} A\right)=\left(K / f^{n} K \rightarrow L / f^{n} L\right)
$$

because $f$ is a nonzerodivisor on $K$ and $L$ and we conclude that $R \lim \left(M \otimes_{A}^{\mathbf{L}}\left(A \xrightarrow{f^{n}}\right.\right.$ $A)$ ) is quasi-isomorphic to $K \rightarrow L$, i.e., $M$. This shows that $M$ is derived complete by Lemma 15.72 .15 . Conversely, suppose that $M$ is derived complete. Choose a surjection $F \rightarrow M$ where $F$ is a free $A$-module. Since $f$ is a nonzerodivisor on $F$ the derived completion of $F$ is $L=\lim F / f^{n} F$. Note that $L$ is $f$-torsion free: if $\left(x_{n}\right)$ with $x_{n} \in F$ represents an element $\xi$ of $L$ and $f \xi=0$, then $x_{n}=x_{n+1}+f^{n} z_{n}$ and $f x_{n}=f^{n} y_{n}$ for some $z_{n}, y_{n} \in F$. Then $f^{n} y_{n}=f x_{n}=f x_{n+1}+f^{n+1} z_{n}=$ $f^{n+1} y_{n+1}+f^{n+1} z_{n}$ and since $f$ is a nonzerodivisor on $F$ we see that $y_{n} \in f F$ which implies that $x_{n} \in f^{n} F$, i.e., $\xi=0$. Since $L$ is the derived completion, the universal property gives a map $L \rightarrow M$ factoring $F \rightarrow M$. Let $K=\operatorname{Ker}(L \rightarrow M)$ be the kernel. Again $K$ is $f$-torsion free, hence the derived completion of $K$ is $\lim K / f^{n} K$. On the other hand, both $K$ and $L$ are derived complete, hence $K$ is too by Lemma 15.72.6. It follows that $K=\lim K / f^{n} K$ and the claim is proved.

0BKG Example 15.73.4. Let $A$ be a ring and let $f \in A$. Denote $K \mapsto K^{\wedge}$ the derived completion with respect to $(f)$. Let $M$ be an $A$-module. Using that

$$
M^{\wedge}=\lim \left(M \xrightarrow{f^{n}} M\right)
$$

by Lemma 15.72 .16 and using Lemma 15.68 .6 we obtain

$$
H^{-1}\left(M^{\wedge}\right)=\lim M\left[f^{n}\right]=T_{f}(M)
$$

the $f$-adic Tate module of $M$. Here the maps $M\left[f^{n}\right] \rightarrow M\left[f^{n-1}\right]$ are given by multiplication by $f$. Then there is a short exact sequence

$$
0 \rightarrow R^{1} \lim M\left[f^{n}\right] \rightarrow H^{0}\left(M^{\wedge}\right) \rightarrow \lim M / f^{n} M \rightarrow 0
$$

describing $H^{0}\left(M^{\wedge}\right)$. We have $H^{1}\left(M^{\wedge}\right)=R^{1} \lim M / f^{n} M=0$ as the transition maps are surjective (Lemma 15.68.1). All the other cohomologies of $M^{\wedge}$ are zero for trivial reasons. We claim that for $K \in D(A)$ there are short exact sequences

$$
0 \rightarrow H^{0}\left(H^{n}(K)^{\wedge}\right) \rightarrow H^{n}\left(K^{\wedge}\right) \rightarrow T_{f}\left(H^{n+1}(K)\right) \rightarrow 0
$$

Namely this follows from the spectral sequence of Example 15.72 .19 because it degenerates at $E_{2}$ (as only $i=-1,0$ give nonzero terms).

### 15.74. Derived completion for Noetherian rings

0 BKH Let $A$ be a ring and let $I \subset A$ be an ideal. For any $K \in D(A)$ we can consider the derived limit

$$
K^{\prime}=R \lim \left(K \otimes_{A}^{\mathbf{L}} A / I^{n}\right)
$$

This is a functor in $K$, see Remark 15.68 .17 The system of maps $A \rightarrow A / I^{n}$ induces a map $K \rightarrow K^{\prime}$ and $K^{\prime}$ is derived complete with respect to $I$ (Lemma 15.72.12). This "naive" derived completion construction does not agree with the adjoint of Lemma 15.72 .9 in general. For example, if $A=\mathbf{Z}_{p} \oplus \mathbf{Q}_{p} / \mathbf{Z}_{p}$ with the second summand an ideal of square zero, $K=A[0]$, and $I=(p)$, then the naive derived completion gives $\mathbf{Z}_{p}[0]$, but the construction of Lemma 15.72 .9 gives $K^{\wedge} \cong$ $\mathbf{Z}_{p}[1] \oplus \mathbf{Z}_{p}[0]$ (computation omitted).
The main goal of this section is the show that the naive derived completion is equal to derived completion if $A$ is Noetherian.

0921 Lemma 15.74.1. In Situation 15.72.13. If $A$ is Noetherian, then for every $n$ there exists an $m \geq n$ such that $K_{m}^{\bullet} \rightarrow K_{n}^{\bullet}$ factors through the map $K_{m}^{\bullet} \rightarrow$ $A /\left(f_{1}^{m}, \ldots, f_{r}^{m}\right)$. In other words, the pro-objects $\left\{K_{n}^{\bullet}\right\}$ and $\left\{A /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)\right\}$ of $D(A)$ are isomorphic.

Proof. Note that the Koszul complexes have length $r$. Thus the dual of Derived Categories, Lemma 13.12 .5 implies it suffices to show that for every $p<0$ and $n \in \mathbf{N}$ there exists an $m \geq n$ such that $H^{p}\left(K_{m}^{\bullet}\right) \rightarrow H^{p}\left(K_{n}^{\bullet}\right)$ is zero. Since $A$ is Noetherian, we see that

$$
H^{p}\left(K_{n}^{\bullet}\right)=\frac{\operatorname{Ker}\left(K_{n}^{p} \rightarrow K_{n}^{p+1}\right)}{\operatorname{Im}\left(K_{n}^{p-1} \rightarrow K_{n}^{p}\right)}
$$

is a finite $A$-module. Moreover, the map $K_{m}^{p} \rightarrow K_{n}^{p}$ is given by a diagonal matrix whose entries are in the ideal $\left(f_{1}^{m-n}, \ldots, f_{r}^{m-n}\right)$ if $p<0$ (in fact they are in the $|p|$ th power of that ideal). Note that $H^{p}\left(K_{n}^{\bullet}\right)$ is annihilated by $I=\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)$, see Lemma 15.22.6. Now $I^{t} \subset\left(f_{1}^{m-n}, \ldots, f_{r}^{m-n}\right)$ for $m=n+t r$. Thus by ArtinRees (Algebra, Lemma 10.50.2) for some $m$ large enough we see that the image of $K_{m}^{p} \rightarrow K_{n}^{p}$ intersected with $\operatorname{Ker}\left(K_{n}^{p} \rightarrow K_{n}^{p+1}\right)$ is contained in $I \operatorname{Ker}\left(K_{n}^{p} \rightarrow K_{n}^{p+1}\right)$. For this $m$ we get the zero map.

0922 Proposition 15.74.2. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. The functor which sends $K \in D(A)$ to the derived limit $K^{\prime}=R \lim \left(K \otimes_{A}^{\mathbf{L}} A / I^{n}\right)$ is the left adjoint to the inclusion functor $D_{\text {comp }}(A) \rightarrow D(A)$ constructed in Lemma 15.72.9.

Proof. Say $\left(f_{1}, \ldots, f_{r}\right)=I$ and let $K_{n}^{\bullet}$ be the Koszul complex with respect to $f_{1}^{n}, \ldots, f_{r}^{n}$. By Lemma 15.72 .16 it suffices to prove that

$$
R \lim \left(K \otimes_{A}^{\mathbf{L}} K_{n}^{\bullet}\right)=R \lim \left(K \otimes_{A}^{\mathbf{L}} A /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)\right)=R \lim \left(K \otimes_{A}^{\mathbf{L}} A / I^{n}\right)
$$

By Lemma 15.74 .1 the pro-objects $\left\{K_{n}^{\bullet}\right\}$ and $\left\{A /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)\right\}$ of $D(A)$ are isomorphic. It is clear that the pro-objects $\left\{A /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right)\right\}$ and $\left\{A / I^{n}\right\}$ are isomorphic. Thus the map from left to right is an isomorphism by Lemma 15.68.19.

As an application of the proposition above we identify the derived completion in the Noetherian case for pseudo-coherent complexes.

0 A06 Lemma 15.74.3. Let $A$ be a Noetherian ring and $I \subset A$ an ideal. Let $K$ be an object of $D(A)$ such that $H^{n}(A)$ a finite $A$-module for all $n \in \mathbf{Z}$. Then the cohomology modules $H^{n}\left(K^{\wedge}\right)$ of the derived completion are the I-adic completions of the cohomology modules $H^{n}(K)$.

Proof. The complex $\tau_{\leq m} K$ is pseudo-coherent for all $m$ by Lemma 15.54.16. Thus $\tau_{\leq m} K$ is represented by a bounded above complex $P^{\bullet}$ of finite free $A$-modules. Then $\tau_{\leq m} K \otimes_{A}^{\mathbf{L}} A / I^{n}=P^{\bullet} / I^{n} P^{\bullet}$. Hence $\left(\tau_{\leq m} K\right)^{\wedge}=R \lim P^{\bullet} / I^{n} P^{\bullet}$ (Proposition 15.74.2) and since the $R$ lim is just given by termwise lim (Lemma 15.68.9) and since $I$-adic completion is an exact functor on finite $A$-modules (Algebra, Lemma 10.96 .2 we conclude the result holds for $\tau_{\leq m} K$. Hence the result holds for $K$ as derived completion has finite cohomological dimension, see Lemma 15.72.17.

09B9 Lemma 15.74.4. Let $I$ be a finitely generated ideal of a ring $A$. Let $M$ be $a$ derived complete $A$-module. If $M / I M=0$, then $M=0$.

Proof. Assume that $M / I M$ is zero. Let $I=\left(f_{1}, \ldots, f_{r}\right)$. Let $i<r$ be the largest integer such that $N=M /\left(f_{1}, \ldots, f_{i}\right) M$ is nonzero. If $i$ does not exist, then $M=0$ which is what we want to show. Then $N$ is derived complete as a cokernel of a map between derived complete modules, see Lemma 15.72.6. By our choice of $i$ we have that $f_{i+1}: N \rightarrow N$ is surjective. Hence

$$
\lim \left(\ldots \rightarrow N \xrightarrow{f_{i+1}} N \xrightarrow{f_{i+1}} N\right)
$$

is nonzero, contradicting the derived completeness of $N$.

09BA Lemma 15.74.5. Let $I$ be an ideal of a Noetherian ring $A$. Let $M$ be a derived complete $A$-module. If $M / I M$ is a finite $A / I$-module, then $M=\lim M / I^{n} M$ and $M$ is a finite $A^{\wedge}$-module.

Proof. Assume $M / I M$ is finite. Pick $x_{1}, \ldots, x_{t} \in M$ which map to generators of $M / I M$. We obtain a map $A^{\oplus t} \rightarrow M$ mapping the $i$ th basis vector to $x_{i}$. By Proposition 15.74 .2 the derived completion of $A$ is $A^{\wedge}=\lim A / I^{n}$. As $M$ is derived complete, we see that our map factors through a map $q:\left(A^{\wedge}\right)^{\oplus t} \rightarrow M$. The module $\operatorname{Coker}(q)$ is zero by Lemma 15.74.4. Thus $M$ is a finite $A^{\wedge}$-module. Since $A^{\wedge}$ is Noetherian and complete with respect to $I A^{\wedge}$, it follows that $M$ is $I$-adically complete (use Algebra, Lemmas 10.96.5, 10.95.11, and 10.50.2.

### 15.75. Taking limits of complexes

09B6 In this section we discuss what happens when we have a "formal deformation" of a complex and we take its limit. More precisely, we have a ring $A$ an ideal $I$ and objects $K_{n} \in D\left(A / I^{n}\right)$ which fit together in the sense that

$$
K_{n}=K_{n+1} \otimes_{A / I^{n+1}}^{\mathbf{L}} A / I^{n}
$$

Under some additional hypotheses we can show that $K=R \lim K_{n}$ reproduces the system in the sense that $K_{n}=K \otimes_{A}^{\mathbf{L}} A / I^{n}$. We do not know if the following lemma holds for unbounded complexes.
09AU Lemma 15.75.1. Let $A$ be a ring and $I \subset A$ an ideal. Suppose given $K_{n} \in$ $D\left(A / I^{n}\right)$ and maps $K_{n+1} \rightarrow K_{n}$ in $D\left(A / I^{n+1}\right)$. If
(1) A is Noetherian,
(2) $K_{1}$ is bounded above, and
(3) the maps induce isomorphisms $K_{n+1} \otimes_{A / I^{n+1}}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$,
then $K=R \lim K_{n}$ is a derived complete object of $D^{-}(A)$ and $K \otimes_{A}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$ is an isomorphism for all $n$.

Proof. Suppose that $H^{i}\left(K_{1}\right)=0$ for $i>b$. Then we can find a complex of free $A / I$-modules $P_{1}^{\bullet}$ representing $K_{1}$ with $P_{1}^{i}=0$ for $i>b$. By Lemma 15.62 .3 we can, by induction on $n>1$, find complexes $P_{n}^{\bullet}$ of free $A / I^{n}$-modules representing $K_{n}$ and maps $P_{n}^{\bullet} \rightarrow P_{n-1}^{\bullet}$ representing the maps $K_{n} \rightarrow K_{n-1}$ inducing isomorphisms (!) of complexes $P_{n}^{\bullet} / I^{n-1} P_{n}^{\bullet} \rightarrow P_{n-1}^{\bullet}$.
Thus we have arrived at the situation where $R \lim K_{n}$ is represented by $P^{\bullet}=$ $\lim P_{n}^{\bullet}$, see Lemma 15.68 .9 and Remark 15.68 .15 . The complexes $P_{n}^{\bullet}$ are uniformly bounded above complexes of flat $A / I^{n}$-modules and the transition maps are termwise surjective. Then $P^{\bullet}$ is a bounded above complex of flat $A$-modules by Lemma 15.21.4. It follows that $K \otimes_{A}^{\mathbf{L}} A / I^{t}$ is represented by $P^{\bullet} \otimes_{A} A / I^{t}$. We have $P^{\bullet} \otimes_{A} A / I^{t}=\lim P_{n}^{\bullet} \otimes_{A} A / I^{t}$ termwise by Lemma 15.21.4. The transition $\operatorname{maps} P_{n+1}^{\bullet} \otimes_{A} A / I^{t} \rightarrow P_{n}^{\bullet} \otimes_{A} A / I^{t}$ are isomorphisms for $n \geq t$. Hence we have $\lim P_{n}^{\bullet} \otimes_{A} A / I^{t}=R \lim P_{n}^{\bullet} \otimes_{A} A / I^{t}$. By assumption and our choice of $P_{n}^{\bullet}$ the complex $P_{n}^{\bullet} \otimes_{A} A / I^{t}=P_{n}^{\bullet} \otimes_{A / I^{n}} A / I^{t}$ represents $K_{n} \otimes_{A / I^{n}}^{\mathbf{L}} A / I^{t}=K_{t}$ for all $n \geq t$. We conclude

$$
P^{\bullet} \otimes_{A} A / I^{t}=R \lim P_{n}^{\bullet} \otimes_{A} A / I^{t}=R \lim K_{t}=K_{t}
$$

In other words, we have $K \otimes_{A}^{\mathbf{L}} A / I^{t}=K_{t}$. This proves the lemma as it follows that $K$ is derived complete by Proposition 15.74.2.

09AV Lemma 15.75.2. Let $A$ be a ring and $I \subset A$ an ideal. Suppose given $K_{n} \in$ $D\left(A / I^{n}\right)$ and maps $K_{n+1} \rightarrow K_{n}$ in $D\left(A / I^{n+1}\right)$. Assume
(1) $A$ is I-adically complete,
(2) $K_{1}$ is pseudo-coherent, and
(3) the maps induce isomorphisms $K_{n+1} \otimes_{A / I^{n+1}}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$.

Then $K=R \lim K_{n}$ is a pseudo-coherent, derived complete object of $D(A)$ and $K \otimes{ }_{A}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$ is an isomorphism for all $n$.
Proof. By assumption we can find a bounded above complex of finite free $A / I$ modules $P_{1}^{\bullet}$ representing $K_{1}$, see Definition 15.54.1. By Lemma 15.62 .3 we can, by induction on $n>1$, find complexes $P_{n}^{\bullet}$ of finite free $A / I^{n}$-modules representing $K_{n}$
and maps $P_{n}^{\bullet} \rightarrow P_{n-1}^{\bullet}$ representing the maps $K_{n} \rightarrow K_{n-1}$ inducing isomorphisms (!) of complexes $P_{n}^{\bullet} / I^{n-1} P_{n}^{\bullet} \rightarrow P_{n-1}^{\bullet}$.
Thus $R \lim K_{n}$ is represented by $P^{\bullet}=\lim P_{n}^{\bullet}$, see Lemma 15.68 .9 and Remark 15.68.15. Since $A$ is $I$-adically complete the modules $P^{i}$ are finite free $A$-modules. Thus $K$ is pseudo-coherent. Moreover, $P^{\bullet}$ is a bounded above complex of flat $A$ modules. It follows that $K \otimes_{A}^{\mathbf{L}} A / I^{t}$ is represented by $P^{\bullet} \otimes_{A} A / I^{t}$. We have $P^{\bullet} \otimes_{A}$ $A / I^{t}=\lim P_{n}^{\bullet} \otimes_{A} A / I^{t}$ termwise. The transition maps $P_{n+1}^{\bullet} \otimes_{A} A / I^{t} \rightarrow P_{n}^{\bullet} \otimes_{A} A / I^{t}$ are isomorphisms for $n \geq t$. Hence we have $\lim P_{n}^{\bullet} \otimes_{A} A / I^{t}=R \lim P_{n}^{\bullet} \otimes_{A} A / I^{t}$. By assumption and our choice of $P_{n}^{\bullet}$ the complex $P_{n}^{\bullet} \otimes_{A} A / I^{t}=P_{n}^{\bullet} \otimes_{A / I^{n}} A / I^{t}$ represents $K_{n} \otimes_{A / I^{n}}^{\mathbf{L}} A / I^{t}=K_{t}$ for all $n \geq t$. We conclude

$$
P^{\bullet} \otimes_{A} A / I^{t}=R \lim P_{n}^{\bullet} \otimes_{A} A / I^{t}=R \lim K_{t}=K_{t}
$$

In other words, we have $K \otimes_{A}^{\mathbf{L}} A / I^{t}=K_{t}$. Finally, $K_{n}$ is a derived complete object of $D(A)$ as it is annihilated by $I^{n}$. Since the category of derived objects is preserved under homotopy limits we see that $K$ is derived complete. This proves the lemma.

09AW Lemma 15.75.3. Let $A$ be a ring and $I \subset A$ an ideal. Suppose given $K_{n} \in$ $D\left(A / I^{n}\right)$ and maps $K_{n+1} \rightarrow K_{n}$ in $D\left(A / I^{n+1}\right)$. Assume
(1) $A$ is I-adically complete,
(2) $K_{1}$ is a perfect object, and
(3) the maps induce isomorphisms $K_{n+1} \otimes_{A / I^{n+1}}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$.

Then $K=R \lim K_{n}$ is a perfect, derived complete object of $D(A)$ and $K \otimes{ }_{A}^{\mathbf{L}} A / I^{n} \rightarrow$ $K_{n}$ is an isomorphism for all $n$.

Proof. By Lemma 15.75 .2 we see that $K$ is bounded above, pseudo-coherent, and that $K \otimes{ }_{A}^{\mathbf{L}} A / I^{n} \rightarrow K_{n}$ is an isomorphism for all $n$. Thus it suffices to show that $H^{i}\left(K \otimes_{A}^{\mathbf{L}} \kappa\right)=0$ for $i \ll 0$ and every surjective map $A \rightarrow \kappa$ whose kernel is a maximal ideal $\mathfrak{m}$, see Lemma 15.63 .6 . Since $A$ is $I$-adically complete we have $I \subset \mathfrak{m}$, see Algebra, Lemma 10.95.6. Hence

$$
K \otimes_{A}^{\mathbf{L}} \kappa=K \otimes_{A}^{\mathbf{L}} A / I \otimes_{A / I}^{\mathbf{L}} \kappa=K_{1} \otimes_{A / I}^{\mathbf{L}} \kappa
$$

and we get what we want as $K_{1}$ has finite tor dimension by Lemma 15.61.2.

### 15.76. Some evaluation maps

0ATJ In this section we prove that certain canonical maps of $R$ Hom's are isomorphisms for suitable types of complexes.

0A68 Lemma 15.76.1. Let $R$ be a ring. Let $K, L, M$ be objects of $D(R)$. the map

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathrm{L}} K \longrightarrow R \operatorname{Hom}(R \operatorname{Hom}(K, L), M)
$$

of Lemma 15.60 .3 is an isomorphism in the following two cases
(1) $K$ perfect, or
(2) $K$ is pseudo-coherent, $L \in D^{+}(R)$, and $M$ finite injective dimension.

Proof. Choose a K-injective complex $I^{\bullet}$ representing $M$, a K-injective complex $J^{\bullet}$ representing $L$, and a bounded above complex of finite projective modules $K^{\bullet}$ representing $K$. Consider the map of complexes

$$
\operatorname{Tot}\left(\operatorname{Hom}^{\bullet}\left(J^{\bullet}, I^{\bullet}\right) \otimes_{R} K^{\bullet}\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(\operatorname{Hom}^{\bullet}\left(K^{\bullet}, J^{\bullet}\right), I^{\bullet}\right)
$$

of Lemma 15.59.3 Note that

$$
\left(\prod_{p+r=t} \operatorname{Hom}_{R}\left(J^{-r}, I^{p}\right)\right) \otimes_{R} K^{s}=\prod_{p+r=t} \operatorname{Hom}_{R}\left(J^{-r}, I^{p}\right) \otimes_{R} K^{s}
$$

because $K^{s}$ is finite projective. The map is given by the maps

$$
c_{p, r, s}: \operatorname{Hom}_{R}\left(J^{-r}, I^{p}\right) \otimes_{R} K^{s} \longrightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}\left(K^{s}, J^{-r}\right), I^{p}\right)
$$

which are isomorphisms as $K^{s}$ is finite projective. For every element $\alpha=\left(\alpha^{p, r, s}\right)$ of degree $n$ of the left hand side, there are only finitely many values of $s$ such that $\alpha^{p, r, s}$ is nonzero (for some $p, r$ with $n=p+r+s$ ). Hence our map is an isomorphism if the same vanishing condition is forced on the elements $\beta=\left(\beta^{p, r, s}\right)$ of the right hand side. If $K^{\bullet}$ is a bounded complex of finite projective modules, this is clear. On the other hand, if we can choose $I^{\bullet}$ bounded and $J^{\bullet}$ bounded below, then $\beta^{p, r, s}$ is zero for $p$ outside a fixed range, for $s \gg 0$, and for $r \gg 0$. Hence among solutions of $n=p+r+s$ with $\beta^{p, r, s}$ nonzero only a finite number of $s$ values occur.

0A69 Lemma 15.76.2. Let $R$ be a ring. Let $K, L, M$ be objects of $D(R)$. the map

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathbf{L}} K \longrightarrow R \operatorname{Hom}(R \operatorname{Hom}(K, L), M)
$$

of Lemma 15.60 .3 is an isomorphism if the following three conditions are satisfied
(1) $L, M$ have finite injective dimension,
(2) $R \operatorname{Hom}(L, M)$ has finite tor dimension,
(3) for every $n \in \mathbf{Z}$ the truncation $\tau_{{ }^{n}} K$ is pseudo-coherent

Proof. Pick an integer $n$ and consider the distinguished triangle

$$
\tau_{\leq n} K \rightarrow K \rightarrow \tau_{\geq n+1} K \rightarrow \tau_{\leq n} K[1]
$$

see Derived Categories, Remark 13.12.4. By assumption (3) and Lemma 15.76.1 the map is an isomorphism for $\tau_{\leq_{n} K} K$. Hence it suffices to show that both

$$
R \operatorname{Hom}(L, M) \otimes_{R}^{\mathbf{L}} \tau_{\geq n+1} K \quad \text { and } \quad R \operatorname{Hom}\left(R \operatorname{Hom}\left(\tau_{\geq n+1} K, L\right), M\right)
$$

have vanishing cohomology in degrees $\leq n-c$ for some $c$. This follows immediately from assumptions (2) and (1).

0A6A Lemma 15.76.3. Let $R \rightarrow R^{\prime}$ be a flat ring map. Let $K, L \in D(R)$. If $K$ is pseudo-coherent and $L \in D^{+}(R)$, then there is a canonical isomorphism

$$
R \operatorname{Hom}(K, L) \otimes_{R} R^{\prime} \longrightarrow R \operatorname{Hom}\left(K \otimes_{R} R^{\prime}, L \otimes_{R} R^{\prime}\right)
$$

in $D\left(R^{\prime}\right)$.
Proof. We represent $K$ by a bounded above complex $K^{\bullet}$ of finite free $R$-modules. We represent $L$ by a bounded below complex $L^{\bullet}$ of $R$-modules. Then we see that $R \operatorname{Hom}(K, L)$ is represented by $\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right)$ and that $R \operatorname{Hom}\left(K \otimes_{R} R^{\prime}, L \otimes_{R} R^{\prime}\right)$ is represented by $\operatorname{Hom}^{\bullet}\left(K^{\bullet} \otimes_{R} R^{\prime}, L^{\bullet} \otimes_{R} R^{\prime}\right)$. See Lemma 15.60 .2 . Thus it suffices to observe that the canonical map

$$
\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right) \otimes_{R} R^{\prime} \longrightarrow \operatorname{Hom}^{\bullet}\left(K^{\bullet} \otimes_{R} R^{\prime}, L^{\bullet} \otimes_{R} R^{\prime}\right)
$$

coming from the maps on components

$$
\operatorname{Hom}_{R}\left(K^{-q}, L^{p}\right) \otimes_{R} R^{\prime} \longrightarrow \operatorname{Hom}_{R^{\prime}}\left(K^{-q} \otimes_{R} R^{\prime}, L^{p} \otimes_{R} R^{\prime}\right)
$$

is an isomorphism. Each of the component maps is an isomorphism as $K^{-q}$ is finite free and the map in total is an isomorphism as the products in the definition of $\operatorname{Hom}^{\bullet}\left(K^{\bullet}, L^{\bullet}\right)$ are finite (whence commute with tensor products) by the boundedness properties of the complexes $K^{\bullet}$ and $L^{\bullet}$.

0ATK Lemma 15.76.4. Let $R$ be a ring. Let $K, L, M$ be objects of $D(R)$. There is a canonical map

$$
K \otimes_{R}^{\mathrm{L}} R \operatorname{Hom}(M, L) \longrightarrow R \operatorname{Hom}\left(M, K \otimes_{R}^{\mathrm{L}} L\right)
$$

which is an isomorphism in the following cases
(1) $M$ perfect, or
(2) $K$ is perfect, or
(3) $M$ is pseudo-coherent, $L \in D^{+}(R)$, and $K$ has finite tor dimension.

Proof. The map is obtained as the composition
$K \otimes_{R}^{\mathbf{L}} R \operatorname{Hom}(M, L) \rightarrow R \operatorname{Hom}\left(L, K \otimes_{R}^{\mathbf{L}} L\right) \otimes_{R}^{\mathbf{L}} R \operatorname{Hom}(M, L) \rightarrow R \operatorname{Hom}\left(M, K \otimes_{R}^{\mathbf{L}} L\right)$
where we have used the maps of Lemmas 15.60 .5 and 15.60 .4 .
Proof in case $M$ is perfect. Note that both sides of the arrow transform distinguished triangles in $M$ into distinguished triangles and commute with direct sums. Hence it suffices to check it holds when $M=R[n]$, see Derived Categories, Remark 13.33 .5 and Lemma 15.64.1. In this case the result is obvious.

Proof in case $K$ is perfect. Same argument as in the previous case.
Proof in case (3). We may represent $K$ by a finite complex $K^{\bullet}$ of flat $R$-modules, see Lemma 15.55.3. We represent $M$ by a bounded above complex $M^{\bullet}$ of finite free $R$-modules, see Definition 15.54 .1 . We represent $L$ by a bounded below complex $L^{\bullet}$ of injectives. Then the object on the LHS is represented by

$$
\operatorname{Tot}\left(K^{\bullet} \otimes_{R} \operatorname{Hom}^{\bullet}\left(M^{\bullet}, L^{\bullet}\right)\right)
$$

and the object on the RHS by

$$
\operatorname{Hom}^{\bullet}\left(M^{\bullet}, \operatorname{Tot}\left(K^{\bullet} \otimes_{R} L^{\bullet}\right)\right)
$$

Both complexes have in degree $n$ the module

$$
\bigoplus_{p+q+r=n} K^{p} \otimes \operatorname{Hom}_{R}\left(M^{-r}, L^{q}\right)=\bigoplus_{p+q+r=n} \operatorname{Hom}_{R}\left(M^{-r}, K^{p} \otimes_{R} L^{q}\right)
$$

because $M^{-r}$ is finite free (as well these are finite direct sums). We omit the verification that the map defined above induces the canonical isomorphism between these modules.

### 15.77. Miscellany

0926 Some results which do not fit anywhere else.
09BB Lemma 15.77.1. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $M$, $N$ be finite $A$-modules. Set $M_{n}=M / I^{n} M$ and $N_{n}=N / I^{n} N$. Then the systems $\left(\operatorname{Hom}_{A}\left(M_{n}, N_{n}\right)\right)$ and $\left(\operatorname{Isom}_{A}\left(M_{n}, N_{n}\right)\right)$ are Mittag-Leffler.

Proof. Note that $\operatorname{Hom}_{A}\left(M_{n}, N_{n}\right)=\operatorname{Hom}_{A}\left(M, N_{n}\right)$. Choose a presentation

$$
A^{\oplus t} \xrightarrow{T} A^{\oplus s} \rightarrow M \rightarrow 0
$$

The transpose of $T$ induces a map $\varphi: N^{\oplus s} \rightarrow N^{\oplus t}$ such that

$$
\operatorname{Hom}_{A}\left(M, N_{n}\right)=\varphi^{-1}\left(I^{n} N^{\oplus t}\right) / I^{n} N^{\oplus s}
$$

By Artin-Rees there exists an integer $c$ such that

$$
\varphi^{-1}\left(I^{n} N^{\oplus t}\right)=\operatorname{Ker}(\varphi)+I^{n-c} \varphi^{-1}\left(I^{c} N^{\oplus t}\right)
$$

for all $n \geq c$, see Algebra, Lemma 10.50.3. Thus it is clear that the images of $\operatorname{Hom}_{A}\left(M, N_{n}\right) \rightarrow \operatorname{Hom}_{A}\left(M, N_{m}\right)$ stabilize for $n \geq m+c$.

The result for isomorphisms follows from the case of homomorphisms applied to both $\left(\operatorname{Hom}\left(M_{n}, N_{n}\right)\right)$ and $\left(\operatorname{Hom}\left(N_{n}, M_{n}\right)\right)$ and the following fact: for $n>m>0$, if we have maps $\alpha: M_{n} \rightarrow N_{n}$ and $\beta: N_{n} \rightarrow M_{n}$ which induce an isomorphisms $M_{m} \rightarrow N_{m}$ and $N_{m} \rightarrow M_{m}$, then $\alpha$ and $\beta$ are isomorphisms. Namely, then $\alpha \circ \beta$ is surjective by Nakayama's lemma (Algebra, Lemma 10.19.1) hence $\alpha \circ \beta$ is an isomorphism by Algebra, Lemma 10.15.4.

09BC Lemma 15.77.2. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $M, N$ be finite $A$-modules. Set $M_{n}=M / I^{n} M$ and $N_{n}=N / I^{n} N$. If $M_{n} \cong N_{n}$ for all $n$, then $M^{\wedge} \cong N^{\wedge}$ as $A^{\wedge}$-modules.

Proof. By Lemma 15.77 .1 the system $\left(\operatorname{Isom}_{A}\left(M_{n}, N_{n}\right)\right)$ is Mittag-Leffler. By assumption each of the sets $\operatorname{Isom}_{A}\left(M_{n}, N_{n}\right)$ is nonempty. Hence $\lim \operatorname{Isom}_{A}\left(M_{n}, N_{n}\right)$ is nonempty. Since $\lim \operatorname{Isom}_{A}\left(M_{n}, N_{n}\right)=\operatorname{Isom}\left(M^{\wedge}, N^{\wedge}\right)$ (use Algebra, Lemma 10.97.1 we obtain an isomorphism.

0927 Lemma 15.77.3. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $M, N$ be finite $A$-modules with $N$ annihilated by $I$. For each $p>0$ there exists an $n$ such that the $\operatorname{map} E x t_{A}^{p}(M, N) \rightarrow E x t_{A}^{p}\left(I^{n} M, N\right)$ is zero.

Proof. The result is clear for $p=0$ (with $n=1$ ). Choose a short exact sequence $0 \rightarrow K \rightarrow A^{\oplus t} \rightarrow M \rightarrow 0$. For $n$ pick a short exact sequence $0 \rightarrow L \rightarrow A^{\oplus s} \rightarrow$ $I^{n} M \rightarrow 0$. It is clear that we can construct a map of short exact sequences

such that $A^{\oplus s} \rightarrow A^{\oplus t}$ has image in $\left(I^{n}\right)^{\oplus t}$. By Artin-Rees (Algebra, Lemma 10.50 .2 we see that $L \rightarrow K$ has image contained in $I^{n-c} K$ if $n \geq c$. At this point the exact sequence

$$
\operatorname{Hom}_{A}\left(A^{\oplus t}, N\right) \rightarrow \operatorname{Hom}_{A}(K, N) \rightarrow \operatorname{Ext}_{A}^{1}(M, N) \rightarrow 0
$$

and the corresponding sequence for $\operatorname{Ext}_{A}^{1}\left(I^{n} M, N\right)$ show that the lemma holds for $p=1$ with $n=c+1$. Moreover, we see that the result for $p-1$ and the module $K$
implies the result for $p$ and the module $M$ by the commutativity of the diagram

for $p>1$. Some details omitted.

0928 Lemma 15.77.4. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $M$ be a finite $A$-module. There exists an integer $n>0$ such that $I^{n} M \rightarrow M$ factors through the map $I \otimes_{A}^{\mathbf{L}} M \rightarrow M$ in $D(A)$.

Proof. Consider the distinguished triangle

$$
I \otimes_{A}^{\mathbf{L}} M \rightarrow M \rightarrow A / I \otimes_{A}^{\mathbf{L}} M \rightarrow I \otimes_{A}^{\mathbf{L}} M[1]
$$

By the axioms of a triangulated category it suffices to prove that $I^{n} M \rightarrow A / I \otimes_{A}^{\mathbf{L}}$ $M$ is zero in $D(A)$ for some $n$. Choose generators $f_{1}, \ldots, f_{r}$ of $I$ and let $K=$ $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right)$ be the Koszul complex. and consider the factorization $A \rightarrow K \rightarrow$ $A / I$ of the quotient map. Then we see that it suffices to show that $I^{n} M \rightarrow K \otimes_{A} M$ is zero in $D(A)$ for some $n>0$. Suppose that we have found an $n>0$ such that $I^{n} M \rightarrow K \otimes_{A} M$ factors through $\tau_{\geq t}\left(K \otimes_{A} M\right)$ in $D(A)$. Then the obstruction to factoring through $\tau_{\geq t+1}\left(K \otimes_{A} M\right)$ is an element in $\operatorname{Ext}^{t}\left(I^{n} M, H_{t}\left(K \otimes_{A} M\right)\right)$. The finite $A$-module $\bar{H}_{t}\left(K \otimes_{A} M\right)$ is annihilated by $I$. Then by Lemma 15.77.3 we can after increasing $n$ assume this obstruction element is zero. Repeating this a finite number of times we find $n$ such that $I^{n} M \rightarrow K \otimes_{A} M$ factors through $0=\tau_{\geq r+1}\left(K \otimes_{A} M\right)$ in $D(A)$ and we win.

0929 Lemma 15.77.5. Let $R$ be a Noetherian local ring. Let $I \subset R$ be an ideal and let $E$ be a nonzero module over $R / I$. If $R / I$ has finite projective dimension and $E$ has finite projective dimension over $R / I$, then $E$ has finite projective dimension over $R$ and

$$
p d_{R}(E)=p d_{R}(R / I)+p d_{R / I}(E)
$$

Proof. We will use that, for a finite module, having finite projective dimension over $R$, resp. $R / I$ is the same as being a perfect module, see discussion following Definition 15.61.1. We see that $E$ has finite projective dimension over $R$ by Lemma 15.61.7. Thus we can apply Auslander-Buchsbaum (Algebra, Proposition 10.110.1) to see that

$$
\operatorname{pd}_{R}(E)+\operatorname{depth}(E)=\operatorname{depth}(R), \quad \operatorname{pd}_{R / I}(E)+\operatorname{depth}(E)=\operatorname{depth}(R / I)
$$

and

$$
\operatorname{pd}_{R}(R / I)+\operatorname{depth}(R / I)=\operatorname{depth}(R)
$$

Note that in the first equation we take the depth of $E$ as an $R$-module and in the second as an $R / I$-module. However these depths are the same (this is trivial but also follows from Algebra, Lemma 10.71.9). This concludes the proof.

### 15.78. Weakly étale ring maps

092A Most of the results in this section are from the paper Oli83 by Olivier. See also the related paper Fer67.
092B Definition 15.78.1. A ring $A$ is called absolutely flat if every $A$-module is flat over $A$. A ring map $A \rightarrow B$ is weakly étale or absolutely flat if both $A \rightarrow B$ and $B \otimes_{A} B \rightarrow B$ are flat.

For example a localization is weakly étale. An étale ring map is weakly étale. Here is a simple, yet key property.

092C Lemma 15.78.2. Let $A \rightarrow B$ be a ring map such that $B \otimes_{A} B \rightarrow B$ is flat. Let $N$ be a $B$-module. If $N$ is flat as an $A$-module, then $N$ is flat as a $B$-module.

Proof. Assume $N$ is a flat as an $A$-module. Then the functor

$$
\operatorname{Mod}_{B} \longrightarrow \operatorname{Mod}_{B \otimes_{A} B}, \quad N^{\prime} \mapsto N \otimes_{A} N^{\prime}
$$

is exact. As $B \otimes_{A} B \rightarrow B$ is flat we conclude that the functor

$$
\operatorname{Mod}_{B} \longrightarrow \operatorname{Mod}_{B}, \quad N^{\prime} \mapsto\left(N \otimes_{A} N^{\prime}\right) \otimes_{B \otimes_{A} B} B=N \otimes_{B} N^{\prime}
$$

is exact, hence $N$ is flat over $B$.
092D Definition 15.78.3. Let $A$ be a ring. Let $d \geq 0$ be an integer. We say that $A$ has weak dimension $\leq d$ if every $A$-module has tor dimension $\leq d$.
092E Lemma 15.78.4. Let $A \rightarrow B$ be a weakly étale ring map. If $A$ has weak dimension at most d, then so does $B$.

Proof. Let $N$ be a $B$-module. If $d=0$, then $N$ is flat as an $A$-module, hence flat as a $B$-module by Lemma 15.78 .2 . Assume $d>0$. Choose a resolution $F_{\bullet} \rightarrow N$ by free $B$-modules. Our assumption implies that $K=\operatorname{Im}\left(F_{d} \rightarrow F_{d-1}\right)$ is $A$-flat, see Lemma 15.55 .2 . Hence it is $B$-flat by Lemma 15.78 .2 . Thus $0 \rightarrow K \rightarrow F_{d-1} \rightarrow$ $\ldots \rightarrow F_{0} \rightarrow N \rightarrow 0$ is a flat resolution of length $d$ and we see that $N$ has tor dimension at most $d$.

092F Lemma 15.78.5. Let $A$ be a ring. The following are equivalent
(1) A has weak dimension $\leq 0$,
(2) $A$ is absolutely flat, and
(3) $A$ is reduced and every prime is maximal.

In this case every local ring of $A$ is a field.
Proof. The equivalence of (1) and (2) is immediate. Assume $A$ is absolutely flat. This implies every ideal of $A$ is pure, see Algebra, Definition 10.107.1. Hence every finitely generated ideal is generated by an idempotent by Algebra, Lemma 10.107.5. If $f \in A$, then $(f)=(e)$ for some idempotent $e \in A$ and $D(f)=D(e)$ is open and closed (Algebra, Lemma 10.20.1). This already implies every ideal of $A$ is maximal for example by Algebra, Lemma 10.25.5. Moreover, if $f$ is nilpotent, then $e=0$ hence $f=0$. Thus $A$ is reduced.

Assume $A$ is reduced and every prime of $A$ is maximal. Let $M$ be an $A$-module. Our goal is to show that $M$ is flat. We may write $M$ as a filtered colimit of finite $A$-modules, hence we may assume $M$ is finite (Algebra, Lemma 10.38.3). There is a finite filtration of $M$ by modules of the form $A / I$ (Algebra, Lemma 10.5.4, hence
we may assume that $M=A / I$ (Algebra, Lemma 10.38.13). Thus it suffices to show every ideal of $A$ is pure. Since $A$ every local ring of $A$ is a field (by Algebra, Lemma 10.24.1 and the fact that every prime of $A$ is minimal), we see that every ideal $I \subset A$ is radical. Note that every closed $\operatorname{subset}$ of $\operatorname{Spec}(A)$ is closed under specialization. Thus every (radical) ideal of $A$ is pure by Algebra, Lemma 10.107.4

092G Lemma 15.78.6. A product of fields is an absolutely flat ring.
Proof. Let $K_{i}$ be a family of fields. If $f=\left(f_{i}\right) \in \prod K_{i}$, then the ideal generated by $f$ is the same as the ideal generated by the idempotent $e=\left(e_{i}\right)$ with $e_{i}=0,1$ according to whether $f_{i}$ is 0,1 . Thus $D(f)=D(e)$ is open and closed and we conclude by Lemma 15.78 .5 and Algebra, Lemma 10.25 .5 .

092 H Lemma 15.78.7. Let $A \rightarrow B$ and $A \rightarrow A^{\prime}$ be ring maps. Let $B^{\prime}=B \otimes_{A} A^{\prime}$ be the base change of $B$.
(1) If $B \otimes_{A} B \rightarrow B$ is flat, then $B^{\prime} \otimes_{A^{\prime}} B^{\prime} \rightarrow B^{\prime}$ is flat.
(2) If $A \rightarrow B$ is weakly étale, then $A^{\prime} \rightarrow B^{\prime}$ is weakly étale.

Proof. Assume $B \otimes_{A} B \rightarrow B$ is flat. The ring map $B^{\prime} \otimes_{A^{\prime}} B^{\prime} \rightarrow B^{\prime}$ is the base change of $B \otimes_{A} B \rightarrow B$ by $A \rightarrow A^{\prime}$. Hence it is flat by Algebra, Lemma 10.38.7. This proves (1). Part (2) follows from (1) and the fact (just used) that the base change of a flat ring map is flat.
092I Lemma 15.78.8. Let $A \rightarrow B$ be a ring map such that $B \otimes_{A} B \rightarrow B$ is flat.
(1) If $A$ is an absolutely flat ring, then so is $B$.
(2) If $A$ is reduced and $A \rightarrow B$ is weakly étale, then $B$ is reduced.

Proof. Part (1) follows immediately from Lemma 15.78 .2 and the definitions. If $A$ is reduced, then there exists an injection $A \rightarrow A^{\prime}=\prod_{\mathfrak{p} \subset A \text { minimal }} A_{\mathfrak{p}}$ of $A$ into an absolutely flat ring (Algebra, Lemma 10.24 .2 and Lemma 15.78.6). If $A \rightarrow B$ is flat, then the induced map $B \rightarrow B^{\prime}=B \otimes_{A} A^{\prime}$ is injective too. By Lemma 15.78.7 the ring $\operatorname{map} A^{\prime} \rightarrow B^{\prime}$ is weakly étale. By part (1) we see that $B^{\prime}$ is absolutely flat. By Lemma 15.78 .5 the ring $B^{\prime}$ is reduced. Hence $B$ is reduced.

092J Lemma 15.78.9. Let $A \rightarrow B$ and $B \rightarrow C$ be ring maps.
(1) If $B \otimes_{A} B \rightarrow B$ and $C \otimes_{B} C \rightarrow C$ are flat, then $C \otimes_{A} C \rightarrow C$ is flat.
(2) If $A \rightarrow B$ and $B \rightarrow C$ are weakly étale, then $A \rightarrow C$ is weakly étale.

Proof. Part (1) follows from the factorization

$$
C \otimes_{A} C \longrightarrow C \otimes_{B} C \longrightarrow C
$$

of the multiplication map, the fact that

$$
C \otimes_{B} C=\left(C \otimes_{A} C\right) \otimes_{B \otimes_{A} B} B,
$$

the fact that a base change of a flat map is flat, and the fact that the composition of flat ring maps is flat. See Algebra, Lemmas 10.38.7 and 10.38.4. Part (2) follows from (1) and the fact (just used) that the composition of flat ring maps is flat.

092K Lemma 15.78.10. Let $A \rightarrow B \rightarrow C$ be ring maps.
(1) If $B \rightarrow C$ is faithfully flat and $C \otimes_{A} C \rightarrow C$ is flat, then $B \otimes_{A} B \rightarrow B$ is flat.
(2) If $B \rightarrow C$ is faithfully flat and $A \rightarrow C$ is weakly étale, then $A \rightarrow B$ is weakly étale.

Proof. Assume $B \rightarrow C$ is faithfully flat and $C \otimes_{A} C \rightarrow C$ is flat. Consider the commutative diagram

The vertical arrows are flat, the top horizontal arrow is flat. Hence $C$ is flat as a $B \otimes_{A} B$-module. The map $B \rightarrow C$ is faithfully flat and $C=B \otimes_{B} C$. Hence $B$ is flat as a $B \otimes_{A} B$-module by Algebra, Lemma 10.38.9. This proves (1). Part (2) follows from (1) and the fact that $A \rightarrow B$ is flat if $A \rightarrow C$ is flat and $B \rightarrow C$ is faithfully flat (Algebra, Lemma 10.38.9).

092L Lemma 15.78.11. Let $A$ be a ring. Let $B \rightarrow C$ be an $A$-algebra map of weakly étale A-algebras. Then $B \rightarrow C$ is weakly étale.
Proof. Write $B \rightarrow C$ as the composition $B \rightarrow B \otimes_{A} C \rightarrow C$. The first map is flat as the base change of the flat ring map $A \rightarrow C$. The second is the base change of the flat ring map $B \otimes_{A} B \rightarrow B$ by the ring map $B \otimes_{A} B \rightarrow B \otimes_{A} C$, hence flat. Thus $B \rightarrow C$ is flat. The ring map $C \otimes_{A} C \rightarrow C \otimes_{B} C$ is surjective, hence an epimorphism. Thus Lemma 15.78 .2 implies, that since $C$ is flat over $C \otimes_{A} C$ it follows that $C$ is flat over $C \otimes_{B} C$.

092 M Lemma 15.78.12. Let $A \rightarrow B$ be a ring map such that $B \otimes_{A} B \rightarrow B$ is flat. Then $\Omega_{B / A}=0$, i.e., $B$ is formally unramified over $A$.
Proof. Let $I \subset B \otimes_{A} B$ be the kernel of the flat surjective map $B \otimes_{A} B \rightarrow B$. Then $I$ is a pure ideal (Algebra, Definition 10.107.1), so $I^{2}=I$ (Algebra, Lemma 10.107.2). Since $\Omega_{B / A}=I / I^{2}$ (Algebra, Lemma 10.130.13) we obtain the vanishing. This means $B$ is formally unramified over $A$ by Algebra, Lemma 10.144.2.

092N Lemma 15.78.13. Let $A \rightarrow B$ be a ring map. Then $A \rightarrow B$ is weakly étale in each of the following cases
(1) $B=S^{-1} A$ is a localization of $A$,
(2) $A \rightarrow B$ is étale,
(3) $B$ is a filtered colimit of weakly étale $A$-algebras.

Proof. An étale ring map is flat and the map $B \otimes_{A} B \rightarrow B$ is also étale as a map between étale $A$-algebras (Algebra, Lemma 10.141.9). This proves (2).
Let $B_{i}$ be a directed system of weakly étale $A$-algebras. Then $B=\operatorname{colim} B_{i}$ is flat over $A$ by Algebra, Lemma 10.38.3. Note that the transition maps $B_{i} \rightarrow B_{i^{\prime}}$ are flat by Lemma 15.78 .11 . Hence $B$ is flat over $B_{i}$ for each $i$, and we see that $B$ is flat over $B_{i} \otimes_{A} B_{i}$ by Algebra, Lemma 10.38.4. Thus $B$ is flat over $B \otimes_{A} B=\operatorname{colim} B_{i} \otimes_{A} B_{i}$ by Algebra, Lemma 10.38 .6
Part (1) can be proved directly, but also follows by combining (2) and (3).
092P Lemma 15.78.14. Let $K \subset L$ be an extension of fields. If $L \otimes_{K} L \rightarrow L$ is flat, then $L$ is an algebraic separable extension of $K$.
Proof. By Lemma 15.78 .10 we see that any subfield $K \subset L^{\prime} \subset L$ the map $L^{\prime} \otimes_{K}$ $L^{\prime} \rightarrow L^{\prime}$ is flat. Thus we may assume $L$ is a finitely generated field extension of $K$. In this case the fact that $L / K$ is formally unramified (Lemma 15.78 .12 ) implies that $L / K$ is finite separable, see Algebra, Lemma 10.150.1.

092Q Lemma 15.78.15. Let $K$ be a field. Let $K \rightarrow B$ be a ring map such that $B \otimes_{K} B \rightarrow$ $B$ is flat. Then $B$ is a filtered colimit of étale $K$-algebras.

Proof. A field is absolutely flat ring, hence $B$ is a absolutely flat ring by Lemma 15.78.8. Hence $B$ is reduced and every local ring is a field, see Lemma 15.78.5.

Let $\mathfrak{q} \subset B$ be a prime. The ring map $B \rightarrow B_{\mathfrak{q}}$ is weakly étale, hence $B_{\mathfrak{q}}$ is weakly étale over $K$ (Lemma 15.78.9). Thus $B_{\mathfrak{p}}$ is a separable algebraic extension of $K$ by Lemma 15.78 .14
Let $K \subset A \subset B$ be a finitely generated $K$-sub algebra. Then every minimal prime $\mathfrak{p} \subset A$ is the image of a prime $\mathfrak{q}$ of $B$, see Algebra, Lemma 10.29.5. Thus $\kappa(\mathfrak{p})$ as a subfield of $B_{\mathfrak{q}}=\kappa(\mathfrak{q})$ is separable algebraic over $K$. Hence every generic point of $\operatorname{Spec}(A)$ is closed (Algebra, Lemma 10.34.9). Thus $\operatorname{dim}(A)=0$. Then $A$ is the product of its local rings, e.g., by Algebra, Proposition 10.59.6. Moreover, since $A$ is reduced, all local rings are equal to their residue fields wich are finite separable over $K$. This means that $A$ is étale over $K$ by Algebra, Lemma 10.141 .4 and finishes the proof.

092R Lemma 15.78.16. Let $A \rightarrow B$ be a ring map. If $A \rightarrow B$ is weakly étale, then $A \rightarrow B$ induces separable algebraic residue field extensions.
Proof. Let $\mathfrak{p}$ be a prime of $A$. Then $\kappa(\mathfrak{p}) \rightarrow B \otimes_{A} \kappa(\mathfrak{p})$ is weakly étale by Lemma 15.78.7. Hence $B \otimes_{A} \kappa(\mathfrak{p})$ is a filtered colimit of étale $\kappa(\mathfrak{p})$-algebras by Lemma 15.78.15. Hence for $\mathfrak{q} \subset B$ lying over $\mathfrak{p}$ the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is a filtered colimit of finite separable extensions by Algebra, Lemma 10.141.4.

092S Lemma 15.78.17. Let $A$ be a ring. The following are equivalent
(1) A has weak dimension $\leq 1$,
(2) every ideal of $A$ is flat,
(3) every finitely generated ideal of $A$ is flat,
(4) every submodule of a flat A-module is flat, and
(5) every local ring of $A$ is a valuation ring.

Proof. If $A$ has weak dimension $\leq 1$, then the resolution $0 \rightarrow I \rightarrow A \rightarrow A / I \rightarrow 0$ shows that every ideal $I$ is is flat by Lemma 15.55.2. Hence $(1) \Rightarrow(2)$.
Assume (4). Let $M$ be an $A$-module. Choose a surjection $F \rightarrow M$ where $F$ is a free $A$-module. Then $\operatorname{Ker}(F \rightarrow M)$ is flat by assumption, and we see that $M$ has tor dimension $\leq 1$ by Lemma 15.55.5. Hence $(4) \Rightarrow(1)$.
Every ideal is the union of the finitely generated ideals contained in it. Hence (3) implies (2) by Algebra, Lemma 10.38.3. Thus (3) $\Leftrightarrow(2)$.
Assume (2). Suppose that $N \subset M$ with $M$ a flat $A$-module. We will prove that $N$ is flat. We can write $M=\operatorname{colim} M_{i}$ with each $M_{i}$ finite free, see Algebra, Theorem 10.80.4 Setting $N_{i} \subset M_{i}$ the inverse image of $N$ we see that $N=\operatorname{colim} N_{i}$. By Algebra, Lemma 10.38 .3 , it suffices to prove $N_{i}$ is flat and we reduce to the case $M=R^{\oplus n}$. In this case the module $N$ has a finite filtration by the submodules $R^{\oplus j} \cap N$ whose subquotients are ideals. By (2) these ideals are flat and hence $N$ is flat by Algebra, Lemma 10.38 .13 . Thus $(2) \Rightarrow(4)$.
Assume $A$ satisfies (1) and let $\mathfrak{p} \subset A$ be a prime ideal. By Lemmas 15.78 .13 and 15.78 .4 we see that $A_{\mathfrak{p}}$ satisfies (1). We will show $A$ is a valuation ring if $A$ is a local ring satisfying (3). Let $f \in \mathfrak{m}$ be a nonzero element. Then $(f)$ is a flat
nonzero module generated by one element. Hence it is a free $A$-module by Algebra, Lemma 10.77.4 It follows that $f$ is a nonzerodivisor and $A$ is a domain. If $I \subset A$ is a finitely generated ideal, then we similarly see that $I$ is a finite free $A$-module, hence (by considering the rank) free of rank 1 and $I$ is a principal ideal. Thus $A$ is a valuation ring by Algebra, Lemma 10.49.15. Thus $(1) \Rightarrow(5)$.

Assume (5). Let $I \subset A$ be a finitely generated ideal. Then $I_{\mathfrak{p}} \subset A_{\mathfrak{p}}$ is a finitely generated ideal in a valuation ring, hence principal (Algebra, Lemma 10.49.15), hence flat. Thus $I$ is flat by Algebra, Lemma 10.38 .19 . Thus (5) $\Rightarrow$ (3). This finishes the proof of the lemma.

092T Lemma 15.78.18. Let $J$ be a set. For each $j \in J$ let $A_{j}$ be a valuation ring with fraction field $K_{j}$. Set $A=\prod A_{j}$ and $K=\prod K_{j}$. Then $A$ has weak dimension at most 1 and $A \rightarrow K$ is a localization.

Proof. Let $I \subset A$ be a finitely generated ideal. By Lemma 15.78.17 it suffices to show that $I$ is a flat $A$-module. Let $I_{j} \subset A_{j}$ be the image of $I$. Observe that $I_{j}=I \otimes_{A} A_{j}$, hence $I \rightarrow \prod I_{j}$ is surjective by Algebra, Proposition 10.88.2. Thus $I=\prod I_{j}$. Since $A_{j}$ is a valuation ring, the ideal $I_{j}$ is generated by a single element (Algebra, Lemma 10.49.15). Say $I_{j}=\left(f_{j}\right)$. Then $I$ is generated by the element $f=\left(f_{j}\right)$. Let $e \in A$ be the idempotent which has a 0 or 1 in $A_{j}$ depending on whether $f_{j}$ is 0 or 1 . Then $f=g e$ for some nonzerodivisor $g \in A$ : take $g=\left(g_{j}\right)$ with $g_{j}=1$ if $f_{j}=0$ and $g_{j}=f_{j}$ else. Thus $I \cong(e)$ as a module. We conclude $I$ is flat as $(e)$ is a direct summand of $A$. The final statement is true because $K=S^{-1} A$ where $S=\prod\left(A_{j} \backslash\{0\}\right)$.

092U Lemma 15.78.19. Let $A$ be a normal domain with fraction field $K$. There exists a cartesian diagram

of rings where $V$ has weak dimension at most 1 and $V \rightarrow L$ is a flat, injective, epimorphism of rings.

Proof. For every $x \in K, x \notin A$ pick $V_{x} \subset K$ as in Algebra, Lemma 10.49.11. Set $V=\prod_{x \in K \backslash A} V_{x}$ and $L=\prod_{x \in K \backslash A} K$. The ring $V$ has weak dimension at most 1 by Lemma 15.78 .18 which also shows that $V \rightarrow K$ is a localization. A localization is flat and an epimorphism, see Algebra, Lemmas 10.38.19 and 10.106.5.

092 V Lemma 15.78.20. Let $A$ be a ring of weak dimension at most 1 . If $A \rightarrow B$ is a flat, injective, epimorphism of rings, then $A$ is integrally closed in $B$.

Proof. Let $x \in B$ be integral over $A$. Let $A^{\prime}=A[x] \subset B$. Then $A^{\prime}$ is a finite ring extension of $A$ by Algebra, Lemma 10.35.5. To show $A=A^{\prime}$ it suffices to show $A \rightarrow A^{\prime}$ is an epimorphism by Algebra, Lemma 10.106 .6 . Note that $A^{\prime}$ is flat over $A$ by assumption on $A$ and the fact that $B$ is flat over $A$ (Lemma 15.78.17). Hence the composition

$$
A^{\prime} \otimes_{A} A^{\prime} \rightarrow B \otimes_{A} A^{\prime} \rightarrow B \otimes_{A} B \rightarrow B
$$

is injective, i.e., $A^{\prime} \otimes_{A} A^{\prime} \cong A^{\prime}$ and the lemma is proved.

092W Lemma 15.78.21. Let $A$ be a normal domain with fraction field $K$. Let $A \rightarrow B$ be weakly étale. Then $B$ is integrally closed in $B \otimes_{A} K$.
Proof. Choose a diagram as in Lemma 15.78.19. As $A \rightarrow B$ is flat, the base change gives a cartesian diagram

of rings. Note that $V \rightarrow B \otimes_{A} V$ is weakly étale (Lemma 15.78.7), hence $B \otimes_{A} V$ has weak dimension at most 1 by Lemma 15.78 .4 . Note that $B \otimes_{A} V \rightarrow B \otimes_{A} L$ is a flat, injective, epimorphism of rings as a flat base change of such (Algebra, Lemmas 10.38 .7 and 10.106 .3 . By Lemma 15.78 .20 we see that $B \otimes_{A} V$ is integrally closed in $B \otimes_{A} L$. It follows from the cartesian property of the diagram that $B$ is integrally closed in $B \otimes_{A} K$.

092X Lemma 15.78.22. Let $A \rightarrow B$ be a ring homomorphism. Assume
(1) $A$ is a henselian local ring,
(2) $A \rightarrow B$ is integral,
(3) $B$ is a domain.

Then $B$ is a henselian local ring and $A \rightarrow B$ is a local homomorphism. If $A$ is strictly henselian, then $B$ is a strictly henselian local ring and the extension $\kappa\left(\mathfrak{m}_{A}\right) \subset \kappa\left(\mathfrak{m}_{B}\right)$ of residue fields is purely inseparable.
Proof. Write $B$ as a filtered colimit $B=\operatorname{colim} B_{i}$ of finite $A$-sub algebras. If we prove the results for each $B_{i}$, then the result follows for $B$. See Algebra, Lemma 10.148.5. If $A \rightarrow B$ is finite, then $B$ is a product of local henselian rings by Algebra, Lemma 10.148.4. Since $B$ is a domain we see that $B$ is a local ring. The maximal ideal of $B$ lies over the maximal ideal of $A$ by going up for $A \rightarrow B$ (Algebra, Lemma 10.35.20. If $A$ is strictly henselian, then the field extension $\kappa\left(\mathfrak{m}_{A}\right) \subset \kappa\left(\mathfrak{m}_{B}\right)$ being algebraic, has to be purely inseparable. Of course, then $\kappa\left(\mathfrak{m}_{B}\right)$ is separably algebraically closed and $B$ is strictly henselian.

092Y Lemma 15.78.23. Let $A \rightarrow B$ and $A \rightarrow C$ be local homomorphisms of local rings. If $A \rightarrow C$ is integral and either $\kappa\left(\mathfrak{m}_{A}\right) \subset \kappa\left(\mathfrak{m}_{C}\right)$ or $\kappa\left(\mathfrak{m}_{A}\right) \subset \kappa\left(\mathfrak{m}_{B}\right)$ is purely inseparable, then $D=B \otimes_{A} C$ is a local ring and $B \rightarrow D$ and $C \rightarrow D$ are local.
Proof. Any maximal ideal of $D$ lies over the maximal ideal of $B$ by going up for the integral ring map $B \rightarrow D$ (Algebra, Lemma 10.35.20). Now $D / \mathfrak{m}_{B} D=$ $\kappa\left(\mathfrak{m}_{B}\right) \otimes_{A} C=\kappa\left(\mathfrak{m}_{B}\right) \otimes_{\kappa\left(\mathfrak{m}_{A}\right)} C / \mathfrak{m}_{A} C$. The spectrum of $C / \mathfrak{m}_{A} C$ consists of a single point, namely $\mathfrak{m}_{C}$. Thus the spectrum of $D / \mathfrak{m}_{B} D$ is the same as the spectrum of $\kappa\left(\mathfrak{m}_{B}\right) \otimes_{\kappa\left(\mathfrak{m}_{A}\right)} \kappa\left(\mathfrak{m}_{C}\right)$ which is a single point by our assumption that either $\kappa\left(\mathfrak{m}_{A}\right) \subset$ $\kappa\left(\mathfrak{m}_{C}\right)$ or $\kappa\left(\mathfrak{m}_{A}\right) \subset \kappa\left(\mathfrak{m}_{B}\right)$ is purely inseparable. This proves that $D$ is local and that the ring maps $B \rightarrow D$ and $C \rightarrow D$ are local.

092Z Theorem 15.78.24 (Olivier). Let $A \rightarrow B$ be a local homomorphism of local rings. If $A$ is strictly henselian and $A \rightarrow B$ is weakly étale, then $A=B$.

Proof. We will show that for all $\mathfrak{p} \subset A$ there is a unique prime $\mathfrak{q} \subset B$ lying over $\mathfrak{p}$ and $\kappa(\mathfrak{p})=\kappa(\mathfrak{q})$. This implies that $B \otimes_{A} B \rightarrow B$ is bijective on spectra as well as surjective and flat. Hence it is an isomorphism for example by the description
of pure ideals in Algebra, Lemma 10.107.4 Hence $A \rightarrow B$ is a faithfully flat epimorphism of rings. We get $A=B$ by Algebra, Lemma 10.106.7.
Note that the fibre ring $B \otimes_{A} \kappa(\mathfrak{p})$ is a colimit of étale extensions of $\kappa(\mathfrak{p})$ by Lemmas 15.78 .7 and 15.78 .15 . Hence, if there exists more than one prime lying over $\mathfrak{p}$ or if $\kappa(\mathfrak{p}) \neq \kappa(\mathfrak{q})$ for some $\mathfrak{q}$, then $B \otimes_{A} L$ has a nontrivial idempotent for some (separable) algebraic field extension $L \supset \kappa(\mathfrak{p})$.

Let $\kappa(\mathfrak{p}) \subset L$ be an algebraic field extension. Let $A^{\prime} \subset L$ be the integral closure of $A / \mathfrak{p}$ in $L$. By Lemma 15.78 .22 we see that $A^{\prime}$ is a strictly henselian local ring whose residue field is a purely inseparable extension of the residue field of $A$. Thus $B \otimes_{A} A^{\prime}$ is a local ring by Lemma 15.78.23. On the other hand, $B \otimes_{A} A^{\prime}$ is integrally closed in $B \otimes_{A} L$ by Lemma 15.78 .21 . Since $B \otimes_{A} A^{\prime}$ is local, it follows that the ring $B \otimes_{A} L$ does not have nontrivial idempotents which is what we wanted to prove.

### 15.79. Local irreducibility

06DT The following definition seems to be the generally accepted one. To parse it, observe that if $A \subset B$ is an integral extension of local domains, then $A \rightarrow B$ is a local ring homomorphism by going up (Algebra, Lemma 10.35.20).

0BPZ Definition 15.79.1. Let $A$ be a local ring. We say $A$ is unibranch if the reduction $A_{\text {red }}$ is a domain and if the integral closure $A^{\prime}$ of $A_{\text {red }}$ in its field of fractions is local. We say $A$ is geometrically unibranch if $A$ is unibranch and moreover the residue field of $A^{\prime}$ is purely inseparable over the residue field of $A$.

Let $A$ be a local ring. Here is an equivalent formulation
(1) $A$ is unibranch if $A$ has a unique minimal prime $\mathfrak{p}$ and the integral closure of $A / \mathfrak{p}$ in its fraction field is a local ring, and
(2) $A$ is geometrically unibranch if $A$ has a unique minimal prime $\mathfrak{p}$ and the integral closure of $A / \mathfrak{p}$ in its fraction field is a local ring whose residue field is purely inseparable over the residue field of $A$.
A local ring which is normal is geometrically unibranch (follows from Definition 15.79.1 and Algebra, Definition 10.36.11). The following two lemmas suggest that being (geometrically) unibranch is a reasonable property to look at.
0BQ0 Lemma 15.79.2. Let $A$ be a local ring. Let $A^{h}$ be the henselization of $A$. The following are equivalent
(1) $A$ is unibranch, and
(2) $A^{h}$ has a unique minimal prime.

Proof. Denote $\mathfrak{m}$ the maximal ideal of the ring $A$. Recall that the residue field $\kappa=A / \mathfrak{m}$ is the same as the residue field of $A^{h}$.
Assume (2). Let $\mathfrak{p}^{h}$ be the unique minimal prime of $A^{h}$. The flatness of $A \rightarrow A^{h}$ implies that $\mathfrak{p}=A \cap \mathfrak{p}^{h}$ is the unique minimal prime of $A$ (by going down, see Algebra, Lemma 10.38.18. Also, since $A^{h} / \mathfrak{p} A^{h}=(A / \mathfrak{p})^{h}$ (see Algebra, Lemma 10.148.30 is reduced by Lemma 15.36 .4 we see that $\mathfrak{p}^{h}=\mathfrak{p} A^{h}$. Let $A^{\prime}$ be the integral closure of $A / \mathfrak{p}$ in its fraction field. We have to show that $A^{\prime}$ is local. Since $A \rightarrow A^{\prime}$ is integral, every maximal ideal of $A^{\prime}$ lies over $\mathfrak{m}$ (by going up for integral ring maps, see Algebra, Lemma 10.35 .20 . If $A^{\prime}$ is not local, then we can find distinct maximal ideals $\mathfrak{m}_{1}, \mathfrak{m}_{2}$. Choose elements $f_{1}, f_{2} \in A^{\prime}$ with $f_{i} \in \mathfrak{m}_{i}$ and

GD67, Chapter 0 (23.2.1)]

GD67, Chapter IV
Proposition 18.6.12]
$f_{i} \notin \mathfrak{m}_{3-i}$. We find a finite subalgebra $B=A\left[f_{1}, f_{2}\right] \subset A^{\prime}$ with distinct maximal ideals $B \cap \mathfrak{m}_{i}, i=1,2$. Note that the inclusions

$$
A / \mathfrak{p} \subset B \subset \kappa(\mathfrak{p})
$$

give, on tensoring with the flat ring map $A \rightarrow A^{h}$ the inclusions

$$
A^{h} / \mathfrak{p}^{h} \subset B \otimes_{A} A^{h} \subset \kappa(\mathfrak{p}) \otimes_{A} A^{h} \subset \kappa\left(\mathfrak{p}^{h}\right)
$$

the last inclusion because $\kappa(\mathfrak{p}) \otimes_{A} A^{h}=\kappa(\mathfrak{p}) \otimes_{A / \mathfrak{p}} A^{h} / \mathfrak{p}^{h}$ is a localization of the domain $A^{h} / \mathfrak{p}^{h}$. Note that $B \otimes_{A} \kappa$ has at least two maximal ideals because $B / \mathfrak{m} B$ has two maximal ideals. Hence, as $A^{h}$ is henselian we see that $B \otimes_{A} A^{h}$ is a product of $\geq 2$ local rings, see Algebra, Lemma 10.148.6. But we've just seen that $B \otimes_{A} A^{h}$ is a subring of a domain and we get a contradiction.

Assume (1). Let $\mathfrak{p} \subset A$ be the unique minimal prime and let $A^{\prime}$ be the integral closure of $A / \mathfrak{p}$ in its fraction field. Let $A \rightarrow B$ be a local map of local rings inducing an isomorphism of residue fields which is a localization of an étale $A$-algebra. In particular $\mathfrak{m}_{B}$ is the unique prime containing $\mathfrak{m} B$. Then $B^{\prime}=A^{\prime} \otimes_{A} B$ is integral over $B$ and the assumption that $A \rightarrow A^{\prime}$ is local implies that $B^{\prime}$ is local (Lemma 15.78.23). On the other hand, $A^{\prime} \rightarrow B^{\prime}$ is the localization of an étale ring map, hence $B^{\prime}$ is normal, see Algebra, Lemma 10.155.7. Thus $B^{\prime}$ is a (local) normal domain. Finally, we have

$$
B / \mathfrak{p} B \subset B \otimes_{A} \kappa(\mathfrak{p})=B^{\prime} \otimes_{A^{\prime}} f . f .\left(A^{\prime}\right) \subset f . f .\left(B^{\prime}\right)
$$

Hence $B / \mathfrak{p} B$ is a domain, which implies that $B$ has a unique minimal prime (since by flatness of $A \rightarrow B$ these all have to lie over $\mathfrak{p}$ ). Since $A^{h}$ is a filtered colimit of the local rings $B$ it follows that $A^{h}$ has a unique minimal prime. Namely, if $f g=0$ in $A^{h}$ for some non-nilpotent elements $f, g$, then we can find a $B$ as above containing both $f$ and $g$ which leads to a contradiction.

06DM Lemma 15.79.3. Let $A$ be a local ring. Let $A^{\text {sh }}$ be a strict henselization of $A$. The following are equivalent
(1) A is geometrically unibranch, and
(2) $A^{\text {sh }}$ has a unique minimal prime.

Proof. This proof is almost exactly the same as the proof of Lemma 15.79 .2 , Denote $\mathfrak{m}$ the maximal ideal of the ring $A$. Denote $\kappa, \kappa^{s h}$ the residue field of $A$, $A^{s h}$.
Assume (2). Let $\mathfrak{p}^{s h}$ be the unique minimal prime of $A^{s h}$. The flatness of $A \rightarrow A^{\text {sh }}$ implies that $\mathfrak{p}=A \cap \mathfrak{p}^{s h}$ is the unique minimal prime of $A$ (by going down, see Algebra, Lemma 10.38.18). Also, since $A^{s h} / \mathfrak{p} A^{s h}=(A / \mathfrak{p})^{\text {sh }}$ (see Algebra, Lemma 10.148.30 is reduced by Lemma 15.36 .4 we see that $\mathfrak{p}^{s h}=\mathfrak{p} A^{s h}$. Let $A^{\prime}$ be the integral closure of $A / \mathfrak{p}$ in its fraction field. We have to show that $A^{\prime}$ is local and that its residue field is purely inseparable over $\kappa$. Since $A \rightarrow A^{\prime}$ is integral, every maximal ideal of $A^{\prime}$ lies over $\mathfrak{m}$ (by going up for integral ring maps, see Algebra, Lemma 10.35.20. If $A^{\prime}$ is not local, then we can find distinct maximal ideals $\mathfrak{m}_{1}, \mathfrak{m}_{2}$. Choosing elements $f_{1}, f_{2} \in A^{\prime}$ with $f_{i} \in \mathfrak{m}_{i}, f_{i} \notin \mathfrak{m}_{3-i}$ we find a finite subalgebra $B=A\left[f_{1}, f_{2}\right] \subset A^{\prime}$ with distinct maximal ideals $B \cap \mathfrak{m}_{i}, i=1,2$. If $A^{\prime}$ is local with maximal ideal $\mathfrak{m}^{\prime}$, but $A / \mathfrak{m} \subset A^{\prime} / \mathfrak{m}^{\prime}$ is not purely inseparable, then we can find $f \in A^{\prime}$ whose image in $A^{\prime} / \mathfrak{m}^{\prime}$ generates a finite, not purely inseparable extension

Art66, Lemma 2.2] and GD67,
Chapter IV
Proposition 18.8.15]
of $A / \mathfrak{m}$ and we find a finite local subalgebra $B=A[f] \subset A^{\prime}$ whose residue field is not a purely inseparable extension of $A / \mathfrak{m}$. Note that the inclusions

$$
A / \mathfrak{p} \subset B \subset \kappa(\mathfrak{p})
$$

give, on tensoring with the flat ring map $A \rightarrow A^{\text {sh }}$ the inclusions

$$
A^{s h} / \mathfrak{p}^{s h} \subset B \otimes_{A} A^{s h} \subset \kappa(\mathfrak{p}) \otimes_{A} A^{s h} \subset \kappa\left(\mathfrak{p}^{s h}\right)
$$

the last inclusion because $\kappa(\mathfrak{p}) \otimes_{A} A^{s h}=\kappa(\mathfrak{p}) \otimes_{A / \mathfrak{p}} A^{s h} / \mathfrak{p}^{s h}$ is a localization of the domain $A^{s h} / \mathfrak{p}^{s h}$. Note that $B \otimes_{A} \kappa^{s h}$ has at least two maximal ideals because $B / \mathfrak{m} B$ either has two maximal ideals or one whose residue field is not purely inseparable over $\kappa$, and because $\kappa^{s h}$ is separably algebraically closed. Hence, as $A^{s h}$ is strictly henselian we see that $B \otimes_{A} A^{\text {sh }}$ is a product of $\geq 2$ local rings, see Algebra, Lemma 10.148.7. But we've just seen that $B \otimes_{A} A^{s h}$ is a subring of a domain and we get a contradiction.

Assume (1). Let $\mathfrak{p} \subset A$ be the unique minimal prime and let $A^{\prime}$ be the integral closure of $A / \mathfrak{p}$ in its fraction field. Let $A \rightarrow B$ be a local map of local rings which is a localization of an étale $A$-algebra. In particular $\mathfrak{m}_{B}$ is the unique prime containing $\mathfrak{m}_{A} B$. Then $B^{\prime}=A^{\prime} \otimes_{A} B$ is integral over $B$ and the assumption that $A \rightarrow A^{\prime}$ is local with purely inseparable residue field extension implies that $B^{\prime}$ is local (Lemma 15.78.23). On the other hand, $A^{\prime} \rightarrow B^{\prime}$ is the localization of an étale ring map, hence $B^{\prime}$ is normal, see Algebra, Lemma 10.155.7. Thus $B^{\prime}$ is a (local) normal domain. Finally, we have

$$
B / \mathfrak{p} B \subset B \otimes_{A} \kappa(\mathfrak{p})=B^{\prime} \otimes_{A^{\prime}} f . f .\left(A^{\prime}\right) \subset f . f .\left(B^{\prime}\right)
$$

Hence $B / \mathfrak{p} B$ is a domain, which implies that $B$ has a unique minimal prime (since by flatness of $A \rightarrow B$ these all have to lie over $\mathfrak{p}$ ). Since $A^{s h}$ is a filtered colimit of the local rings $B$ it follows that $A^{s h}$ has a unique minimal prime. Namely, if $f g=0$ in $A^{s h}$ for some non-nilpotent elements $f, g$, then we can find a $B$ as above containing both $f$ and $g$ which leads to a contradiction.

06DU Lemma 15.79.4. Let $k$ be an algebraically closed field. Let $A, B$ be strictly henselian local $k$-algebras with residue field equal to $k$. Let $C$ be the strict henselization of $A \otimes_{k} B$ at the maximal ideal $\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}$. Then the minimal primes of $C$ correspond 1-to-1 to pairs of minimal primes of $A$ and $B$.

Proof. First note that a minimal prime $\mathfrak{r}$ of $C$ maps to a minimal prime $\mathfrak{p}$ in $A$ and to a minimal prime $\mathfrak{q}$ of $B$ because the ring maps $A \rightarrow C$ and $B \rightarrow C$ are flat (by going down for flat ring map Algebra, Lemma 10.38.18). Hence it suffices to show that the strict henselization of $\left(A / \mathfrak{p} \otimes_{k} B / \mathfrak{q}\right)_{\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}}$ has a unique minimal prime ideal. By Algebra, Lemma 10.148 .30 the rings $A / \mathfrak{p}, B / \mathfrak{q}$ are strictly henselian. Hence we may assume that $A$ and $B$ are strictly henselian local domains and our goal is to show that $C$ has a unique minimal prime. By Lemma 15.79 .3 the integral closure $A^{\prime}$ of $A$ in its fraction field is a normal local domain with residue field $k$. Similarly for the integral closure $B^{\prime}$ of $B$ into its fraction field. By Algebra, Lemma 10.157 .4 we see that $A^{\prime} \otimes_{k} B^{\prime}$ is a normal ring. Hence its localization

$$
R=\left(A^{\prime} \otimes_{k} B^{\prime}\right)_{\mathfrak{m}_{A^{\prime}} \otimes_{k} B^{\prime}+A^{\prime} \otimes_{k} \mathfrak{m}_{B^{\prime}}}
$$

is a normal local domain. Note that $A \otimes_{k} B \rightarrow A^{\prime} \otimes_{k} B^{\prime}$ is integral (hence gong up holds - Algebra, Lemma 10.35 .20 and that $\mathfrak{m}_{A^{\prime}} \otimes_{k} B^{\prime}+A^{\prime} \otimes_{k} \mathfrak{m}_{B^{\prime}}$ is the unique
maximal ideal of $A^{\prime} \otimes_{k} B^{\prime}$ lying over $\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}$. Hence we see that

$$
R=\left(A^{\prime} \otimes_{k} B^{\prime}\right)_{\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}}
$$

by Algebra, Lemma 10.40.11. It follows that

$$
\left(A \otimes_{k} B\right)_{\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}} \longrightarrow R
$$

is integral. We conclude that $R$ is the integral closure of $\left(A \otimes_{k} B\right)_{\mathfrak{m}_{A} \otimes_{k} B+A \otimes_{k} \mathfrak{m}_{B}}$ in its fraction field, and by Lemma 15.79 .3 once again we conclude that $C$ has a unique prime ideal.

### 15.80. Group actions and integral closure

0BRE This section is in some sense a continuation of Algebra, Section 10.37
0BRF Lemma 15.80.1. Let $\varphi: A \rightarrow B$ be a surjection of rings. Let $G$ be a finite group or order $n$ acting on $\varphi: A \rightarrow B$. If $b \in B^{G}$, then there exists a monic polynomial $P \in A^{G}[T]$ which maps to $(T-b)^{n}$ in $B^{G}[T]$.

Proof. Choose $a \in A$ lifting $b$ and set $P=\prod_{\sigma \in G}(T-\sigma(a))$.
09EG Lemma 15.80.2. Let $R$ be a ring. Let $G$ be a finite group acting on $R$. Let $I \subset R$ be an ideal such that $\sigma(I) \subset I$ for all $\sigma \in G$. Then $R^{G} / I^{G} \subset(R / I)^{G}$ is an integral extension of rings which induces homeomorphisms on spectra and purely inseparable extensions of residue fields.
Proof. Since $I^{G}=R^{G} \cap I$ it is clear that the map is injective. Lemma 15.80.1 shows that Algebra, Lemma 10.45 .10 applies.

0BRG Lemma 15.80.3. Let $R$ be a ring. Let $G$ be a finite group of order $n$ action on $R$. Let $A$ be an $R^{G}$-algebra.
(1) for $b \in\left(A \otimes_{R^{G}} R\right)^{G}$ there exists a monic polynomial $P \in A[T]$ whose image in $\left(A \otimes_{R^{G}} R\right)^{G}[T]$ is $(T-b)^{n}$,
(2) for $a \in A$ mapping to zero in $\left(A \otimes_{R^{G}} R\right)^{G}$ we have $(T-a)^{n^{2}}=T^{n^{2}}$ in $A[T]$.
Proof. Write $A$ as the quotient of a polynomial algebra $P$ over $R^{G}$. Then $\left(P \otimes_{R^{G}}\right.$ $R)^{G}=P$ because $P$ is free as an $R^{G}$-module. Hence part (1) follows from Lemma 15.80.1.

Let $J=\operatorname{Ker}(P \rightarrow A)$. Lift $a$ as in (2) to an element $f \in P$. Then $f \otimes 1$ maps to zero in $A \otimes_{R^{G}} R$. Hence $f \otimes 1$ is in $\left(J^{\prime}\right)^{G}$ where $J^{\prime} \subset P \otimes_{R^{G}} R$ is the image of the map $J \otimes_{R^{G}} R \rightarrow P \otimes_{R^{G}} R$. Apply Lemma 15.80 .1 to $f \otimes 1$ and the surjective ring map

$$
\operatorname{Sym}_{R^{G}}^{*}(J) \otimes_{R^{G}} R \longrightarrow A^{\prime} \subset \operatorname{Sym}_{R^{G}}^{*}(P) \otimes_{R^{G}} R
$$

which defines $A^{\prime}$. We obtain $P \in\left(\operatorname{Sym}_{R^{G}}^{*}(J) \otimes_{R^{G}} R\right)^{G}[T]$ mapping to $(T-f \otimes 1)^{n}$ in $A^{\prime}[T]$. Apply part (1) to see that there exists a $P^{\prime} \in \operatorname{Sym}_{R^{G}}^{*}(J)\left[T, T^{\prime}\right]$ whose image is $\left(T^{\prime}-P\right)^{n}$. Since $\operatorname{Sym}_{R^{G}}^{*}(P)$ is still free over $R^{G}$ we conclude that $P^{\prime}$ maps to $\left(T^{\prime}-(T-f)^{n}\right)^{n}$ in $\operatorname{Sym}_{R^{G}}^{*}(P)$. On the other hand, tracing through the construction of the polynomials $P$ and $P^{\prime}$ in Lemma 15.80 .1 we see that $P^{\prime}$ is congruent to $\left(T^{\prime}-T^{n}\right)^{n}$ modulo the irrelevant ideal of the graded ring $\operatorname{Sym}_{R^{G}}^{*}(J)$. It follows that

$$
\left(T^{\prime}-(T-a)^{n}\right)^{n}=\left(T^{\prime}-T^{n}\right)^{n}
$$

in $A\left[T^{\prime}, T\right]$. Setting $T^{\prime}=0$ for example we obtain the statement of the lemma.

0BRH Lemma 15.80.4. Let $R$ be a ring. Let $G$ be a finite group acting on $R$. Let $R^{G} \rightarrow A$ be a ring map. The map

$$
A \rightarrow\left(A \otimes_{R^{G}} R\right)^{G}
$$

is an isomorphism if $R^{G} \rightarrow A$ is flat. In general the map is integral, induces a homeomorphism on spectra, and induces purely inseparable residue field extensions.
Proof. The first statement follows from Lemma 15.80 .3 and Algebra, Lemma 10.45.10. To see the second consider the exact sequence $0 \rightarrow R^{G} \rightarrow R \rightarrow \bigoplus_{\sigma \in G} R$ where the second map sends $x$ to $(\sigma(x)-x)$. Tensoring with $A$ the sequence remains exact if $R^{G} \rightarrow A$ is flat.

0BRI Lemma 15.80.5. Let $G$ be a finite group acting on a ring R. For any two primes $\mathfrak{q}, \mathfrak{q}^{\prime} \subset R$ lying over the same prime in $R^{G}$ there exists a $\sigma \in G$ with $\sigma(\mathfrak{q})=\mathfrak{q}^{\prime}$.
Proof. The extension $R^{G} \subset R$ is integral because every $x \in R$ is a root of the monic polynomial $\prod_{\sigma \in G}(T-\sigma(x))$ in $R^{G}[T]$. Thus there are no inclusion relations among the primes lying over a given prime $\mathfrak{p}$ (Algebra, Lemma 10.35.18). If the lemma is wrong, then we can choose $x \in \mathfrak{q}^{\prime}, x \notin \sigma(\mathfrak{q})$ for all $\sigma \in G$. See Algebra, Lemma 10.14.2. Then $y=\prod_{\sigma \in G} \sigma(x)$ is in $R^{G}$ and in $\mathfrak{p}=R^{G} \cap \mathfrak{q}^{\prime}$. On the other hand, $x \notin \sigma(\mathfrak{q})$ for all $\sigma$ means $\sigma(x) \notin \mathfrak{q}$ for all $\sigma$. Hence $y \notin \mathfrak{q}$ as $\mathfrak{q}$ is a prime ideal. This is impossible as $y \in \mathfrak{p} \subset \mathfrak{q}$.
0BRJ Lemma 15.80.6. Let $G$ be a finite group acting on a ring $R$. Let $\mathfrak{q} \subset R$ be a prime lying over $\mathfrak{p} \subset R^{G}$. Then $\kappa(\mathfrak{q}) / \kappa(\mathfrak{p})$ is an algebraic normal extension and the map

$$
D=\{\sigma \in G \mid \sigma(\mathfrak{q})=\mathfrak{q}\} \longrightarrow \operatorname{Aut}(\kappa(\mathfrak{q}) / \kappa(\mathfrak{p}))
$$

is surjective ${ }^{8}$,
Proof. With $A=\left(R^{G}\right)_{\mathfrak{p}}$ and $B=A \otimes_{R^{G}} R$ we see that $A=B^{G}$ as localization is flat, see Lemma 15.80 .4 . Observe that $\mathfrak{p} A$ and $\mathfrak{q} B$ are prime ideals, $D$ is the stabilizer of $\mathfrak{q} B$, and $\kappa(\mathfrak{p})=\kappa(\mathfrak{p} A)$ and $\kappa(\mathfrak{q})=\kappa(\mathfrak{q} B)$. Thus we may replace $R$ by $B$ and assume that $\mathfrak{p}$ is a maximal ideal. Since $R \subset R^{G}$ is an integral ring extension, we find that the maximal ideals of $R$ are exactly the primes lying over $\mathfrak{p}$ (follows from Algebra, Lemmas 10.35 .18 and 10.35 .20 . By Lemma 15.80 .5 there are finitely many of them $\mathfrak{q}=\mathfrak{q}_{1}, \mathfrak{q}_{2}, \ldots, \mathfrak{q}_{m}$ and they form a single orbit for $G$. By the Chinese remainder theorem (Algebra, Lemma 10.14 .3 the map $R \rightarrow \prod_{j=1, \ldots, m} R / \sigma\left(\mathfrak{q}_{j}\right)$ is surjective.
First we prove that the extension is normal. Pick an element $\alpha \in \kappa(\mathfrak{q})$. We have to show that the minimal polynomial $P$ of $\alpha$ over $\kappa(\mathfrak{p})$ splits completely. By the above we can choose $a \in \mathfrak{q}_{2} \cap \ldots \cap \mathfrak{q}_{m}$ mapping to $\alpha$ in $\kappa(\mathfrak{q})$. Consider the polynomial $Q=\prod_{\sigma \in G}(T-\sigma(a))$ in $R^{G}[T]$. The image of $Q$ in $R[T]$ splits completely into linear factors, hence the same is true for its image in $\kappa(\mathfrak{q})[T]$. Since $P$ divides the image of $Q$ in $\kappa(\mathfrak{p})[T]$ we conclude that $P$ splits completely into linear factors over $\kappa(\mathfrak{q})$ as desired.
Since $\kappa(\mathfrak{q}) / \kappa(\mathfrak{p})$ is normal we may assume $\kappa(\mathfrak{q})=\kappa_{1} \otimes_{\kappa(\mathfrak{p})} \kappa_{2}$ with $\kappa(\mathfrak{p}) \subset \kappa_{1}$ purely inseparable and $\kappa(\mathfrak{p}) \subset \kappa_{2}$ Galois, see Fields, Lemma 9.26.3, $\alpha \in \kappa_{2}$ which generates $\kappa_{2}$ over $\kappa(\mathfrak{p})$ if it is finite and a subfield of degree $>|G|$ if it is infinite (to get a contradiction). This is possible by Fields, Lemma 9.18.1. Pick $a, P$, and

[^43]$Q$ as in the previous paragraph. If $\alpha^{\prime} \in \kappa_{2}$ is a Galois conjugate of $\alpha$, then the above shows there exists a $\sigma \in G$ such that $\sigma(a)$ maps to $\alpha^{\prime}$. By our choice of $a$ (vanishing at other maximal ideals) this implies $\sigma \in D$ and that the image of $\sigma$ in $\operatorname{Aut}(\kappa(\mathfrak{q}) / \kappa(\mathfrak{p}))$ maps $\alpha$ to $\alpha^{\prime}$. Hence the surjectivity or the desired absurdity in case $\alpha$ has degree $>|G|$ over $\kappa(\mathfrak{p})$.
0BRK Lemma 15.80.7. Let $A$ be a normal domain with fraction field $K$. Let $L / K$ be a (possibly infinite) Galois extension. Let $G=G a l(L / K)$ and let $B$ be the integral closure of $A$ in $L$.
(1) For any two primes $\mathfrak{q}, \mathfrak{q}^{\prime} \subset B$ lying over the same prime in $A$ there exists $a \sigma \in G$ with $\sigma(\mathfrak{q})=\mathfrak{q}^{\prime}$.
(2) Let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{p} \subset A$. Then $\kappa(\mathfrak{q}) / \kappa(\mathfrak{p})$ is an algebraic normal extension and the map
$$
D=\{\sigma \in G \mid \sigma(\mathfrak{q})=\mathfrak{q}\} \longrightarrow \operatorname{Aut}(\kappa(\mathfrak{q}) / \kappa(\mathfrak{p}))
$$
is surjective.
Proof. Proof of (1). Consider pairs $(M, \sigma)$ where $K \subset M \subset L$ is a subfield such that $M / K$ is Galois, $\sigma \in \operatorname{Gal}(M / K)$ with $\sigma(\mathfrak{q} \cap M)=\mathfrak{q}^{\prime} \cap M$. We say $\left(M^{\prime}, \sigma^{\prime}\right) \geq(M, \sigma)$ if and only if $M \subset M^{\prime}$ and $\left.\sigma^{\prime}\right|_{M}=\sigma$. Observe that $\left(K, \operatorname{id}_{K}\right)$ is such a pair as $A=K \cap B$ since $A$ is a normal domain. The collection of these pairs satisfies the hypotheses of Zorn's lemma, hence there exists a maximal pair $(M, \sigma)$. If $M \neq L$, then we can find $M \subset M^{\prime} \subset L$ with $M^{\prime} / M$ finite and $M^{\prime} / K$ Galois (Fields, Lemma 9.15.5). Choose $\sigma^{\prime} \in \operatorname{Gal}\left(M^{\prime} / K\right)$ whose restriction to $M$ is $\sigma$ (Fields, Lemma 9.21.2). Then the primes $\sigma^{\prime}\left(\mathfrak{q} \cap M^{\prime}\right)$ and $\mathfrak{q}^{\prime} \cap M^{\prime}$ restrict to the same prime of $B \cap M$. Since $B \cap M=\left(B \cap M^{\prime}\right)^{\operatorname{Gal}\left(M^{\prime} / M\right)}$ we can use Lemma 15.80.5 to find $\tau \in \operatorname{Gal}\left(M^{\prime} / M\right)$ with $\tau\left(\sigma^{\prime}\left(\mathfrak{q} \cap M^{\prime}\right)\right)=\mathfrak{q}^{\prime} \cap M^{\prime}$. Hence $\left(M^{\prime}, \tau \circ \sigma^{\prime}\right)>(M, \sigma)$ contradicting the maximality of $(M, \sigma)$.
Part (2) is proved in exactly the same manner as part (1). We write out the details. Pick $\bar{\sigma} \in \operatorname{Aut}(\kappa(\mathfrak{q}) / \kappa(\mathfrak{p}))$. Consider pairs $(M, \sigma)$ where $K \subset M \subset L$ is a subfield such that $M / K$ is Galois, $\sigma \in \operatorname{Gal}(M / K)$ with $\sigma(\mathfrak{q} \cap M)=\mathfrak{q} \cap M$ and

commutes. We say $\left(M^{\prime}, \sigma^{\prime}\right) \geq(M, \sigma)$ if and only if $M \subset M^{\prime}$ and $\left.\sigma^{\prime}\right|_{M}=\sigma$. As above $\left(K, \mathrm{id}_{K}\right)$ is such a pair. The collection of these pairs satisfies the hypotheses of Zorn's lemma, hence there exists a maximal pair $(M, \sigma)$. If $M \neq L$, then we can find $M \subset M^{\prime} \subset L$ with $M^{\prime} / M$ finite and $M^{\prime} / K$ Galois (Fields, Lemma 9.15.5). Choose $\sigma^{\prime} \in \operatorname{Gal}\left(M^{\prime} / K\right)$ whose restriction to $M$ is $\sigma$ (Fields, Lemma 9.21.2). Then the primes $\sigma^{\prime}\left(\mathfrak{q} \cap M^{\prime}\right)$ and $\mathfrak{q} \cap M^{\prime}$ restrict to the same prime of $B \cap \bar{M}$. Adjusting the choice of $\sigma^{\prime}$ as in the first paragraph, we may assume that $\sigma^{\prime}\left(\mathfrak{q} \cap M^{\prime}\right)=\mathfrak{q} \cap M^{\prime}$. Then $\sigma^{\prime}$ and $\bar{\sigma}$ define maps $\kappa\left(\mathfrak{q} \cap M^{\prime}\right) \rightarrow \kappa(\mathfrak{q})$ which agree on $\kappa(\mathfrak{q} \cap M)$. Since $B \cap M=\left(B \cap M^{\prime}\right)^{\operatorname{Gal}\left(M^{\prime} / M\right)}$ we can use Lemma 15.80 .6 to find $\tau \in \operatorname{Gal}\left(M^{\prime} / M\right)$ with $\tau\left(\mathfrak{q} \cap M^{\prime}\right)=\mathfrak{q} \cap M^{\prime}$ such that $\tau \circ \sigma$ and $\bar{\sigma}$ induce the same map on $\kappa\left(\mathfrak{q} \cap M^{\prime}\right)$. There is a small detail here in that the lemma first guarantees that $\kappa\left(\mathfrak{q} \cap M^{\prime}\right) / \kappa(\mathfrak{q} \cap$ $M)$ is normal, which then tells us that the difference between the maps is an automorphism of this extension (Fields, Lemma 9.14.9), to which we can apply
the lemma to get $\tau$. Hence $\left(M^{\prime}, \tau \circ \sigma^{\prime}\right)>(M, \sigma)$ contradicting the maximality of $(M, \sigma)$.

### 15.81. Ramification theory

09 E 3 In this section and the next we use the following definitions.
09E4 Definition 15.81.1. We say that $A \rightarrow B$ or $A \subset B$ is an extension of discrete valuation rings if $A$ and $B$ are discrete valuation rings and $A \rightarrow B$ is injective and local. In particular, if $\pi_{A}$ and $\pi_{B}$ are uniformizers of $A$ and $B$, then $\pi_{A}=u \pi_{B}^{e}$ for some $e \geq 1$ and unit $u$ of $B$. The integer $e$ does not depend on the choice of the uniformizers as it is also the unique integer $\geq 1$ such that

$$
\mathfrak{m}_{A} B=\mathfrak{m}_{B}^{e}
$$

The integer $e$ is called the ramification index of $B$ over $A$. We say that $B$ is weakly unramified over $A$ if $e=1$. If the extension of residue fields $\kappa_{A}=A / \mathfrak{m}_{A} \subset \kappa_{B}=$ $B / \mathfrak{m}_{B}$ is finite, then we set $f=\left[\kappa_{B}: \kappa_{A}\right]$ and we call it the residual degree or residue degree of the extension $A \subset B$.

Note that we do not require the extension of fraction fields to be finite.
09E5 Lemma 15.81.2. Let $A \subset B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If the extension $K \subset L$ is finite, then the residue field extension is finite and we have ef $\leq[L: K]$.

Proof. Finiteness of the residue field extension is Algebra, Lemma 10.118.10. The inequality follows from Algebra, Lemmas 10.118 .9 and 10.51 .12 ,

0BRL Lemma 15.81.3. Let $A \subset B \subset C$ be extensions of discrete valuation rings. Then the ramification indices of $B / A$ and $C / B$ multiply to give the ramification index of $C / A$. In a formula $e_{C / A}=e_{B / A} e_{C / B}$. Similarly for the residual degrees in case they are finite.

Proof. This is immediate from the definitions and Fields, Lemma 9.7.6
09E6 Lemma 15.81.4. Let $A \subset B$ be an extension of discrete valuation rings inducing the field extension $K \subset L$. If the characteristic of $K$ is $p>0$ and $L$ is purely inseparable over $K$, then the ramification index e is a power of $p$.
Proof. Write $\pi_{A}=u \pi_{B}^{e}$ for some $u \in B^{*}$. On the other hand, we have $\pi_{B}^{q} \in K$ for some $p$-power $q$. Write $\pi_{B}^{q}=v \pi_{A}^{k}$ for some $v \in A^{*}$ and $k \in \mathbf{Z}$. Then $\pi_{A}^{q}=u^{q} \pi_{B}^{q e}=$ $u^{q} v^{e} \pi_{A}^{k e}$. Taking valuations in $B$ we conclude that $k e=q$.
In the following lemma we discuss what it means for an extension $A \subset B$ of discrete valuation rings to be "unramified", i.e., have ramification index 1 and separable (possibly nonalgebraic) extension of residue fields. However, we cannot use the term "unramified" itself because there already exists a notion of an unramified ring map, see Algebra, Section 10.147 . We will say " $A \subset B$ is formally smooth" to indicate this situation.

09E7 Lemma 15.81.5. Let $A \subset B$ be an extension of discrete valuation rings. The following are equivalent
(1) $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology, and
(2) $A \rightarrow B$ is weakly unramified and $\kappa_{A} \subset \kappa_{B}$ is a separable field extension.

Proof. This follows from Proposition 15.31 .4 and Algebra, Proposition 10.150 .9 .

09E8 Remark 15.81.6. Let $A$ be a discrete valuation ring with fraction field $K$. Let $K \subset L$ be a finite separable field extension. Let $B \subset L$ be the integral closure of $A$ in $L$. Picture:

By Algebra, Lemma 10.153 .8 the ring extension $A \subset B$ is finite, hence $B$ is Noetherian. By Algebra, Lemma 10.111 .4 the dimension of $B$ is 1 , hence $B$ is a Dedekind domain, see Algebra, Lemma 10.119.15. Let $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}$ be the maximal ideals of $B$ (i.e., the primes lying over $\mathfrak{m}_{A}$ ). We obtain extensions of discrete valuation rings

$$
A \subset B_{\mathfrak{m}_{i}}
$$

and hence ramification indices $e_{i}$ and residue degrees $f_{i}$. We have

$$
[L: K]=\sum_{i=1, \ldots, n} e_{i} f_{i}
$$

by Algebra, Lemma 10.120 .8 applied to a uniformizer in $A$. We observe that $n=1$ if $A$ is henselian (by Algebra, Lemma 10.148.4), e.g. if $A$ is complete.

09E9 Definition 15.81.7. Let $A$ be a discrete valuation ring with fraction field $K$. Let $L \supset K$ be a finite separable extension. With $B$ and $\mathfrak{m}_{i}, i=1, \ldots, n$ as in Remark 15.81 .6 we say the extension $L / K$ is
(1) unramified with respect to $A$ if $e_{i}=1$ and the extension $\kappa_{A} \subset \kappa\left(\mathfrak{m}_{i}\right)$ is separable for all $i$,
(2) totally ramified with respect to $A$ if $n=1$ and the residue field extension $\kappa_{A} \subset \kappa\left(\mathfrak{m}_{1}\right)$ is trivial,
(3) tamely ramified with respect to $A$ if either the characteristic of $\kappa_{A}$ is 0 or the characteristic of $\kappa_{A}$ is $p>0$, the field extensions $\kappa_{A} \subset \kappa\left(\mathfrak{m}_{i}\right)$ are separable, and the ramification indices $e_{i}$ are prime to $p$.
If the discrete valuation ring $A$ is clear from context, then we sometimes say $L / K$ is unramified, totally ramified, or tamely ramified for short.

09EA Lemma 15.81.8. Let $A$ be a discrete valuation ring with fraction field $K$. Let $K \subset L$ be a Galois extension with Galois group $G$. Then $G$ acts on the ring $B$ of Remark 15.81 .6 and acts transitively on the set of maximal ideals of $B$.
Proof. Observe that $A=B^{G}$ as $A$ is integrally closed in $K$ and $K=L^{G}$. Hence this lemma is a special case of Lemma 15.80 .5 .

09EB Lemma 15.81.9. Let $A$ be a discrete valuation ring with fraction field $K$. Let $K \subset L$ be a Galois extension. Then there are $e \geq 1$ and $f \geq 1$ such that $e_{i}=e$ and $f_{i}=f$ for all $i$ (notation as in Remark 15.81.6). In particular $[L: K]=n e f$.
Proof. Immediate consequence of Lemma 15.81 .8 and the definitions.
09EC Definition 15.81.10. Let $A$ be a discrete valuation ring with fraction field $K$. Let $K \subset L$ be a Galois extension with Galois group $G$. Let $B$ be the integral closure of $A$ in $L$.
(1) For a maximal ideal $\mathfrak{m} \subset B$ the decomposition group associated to $\mathfrak{m}$ is the subgroup $D=\{\sigma \in G \mid \sigma(\mathfrak{m})=\mathfrak{m}\}$ of $G$.
(2) The kernel $I$ of the map $D \rightarrow \operatorname{Aut}\left(\kappa(\mathfrak{m}) / \kappa_{A}\right)$ is called the inertia group. Note that the field $\kappa(\mathfrak{m})$ may be inseparable over $\kappa_{A}$. In particular the field extension $\kappa_{A} \subset \kappa(\mathfrak{m})$ need not be Galois. If $\kappa_{A}$ is perfect, then it is.

09ED Lemma 15.81.11. Let $A$ be a discrete valuation ring with fraction field $K$ and residue field $\kappa$. Let $K \subset L$ be a Galois extension with Galois group $G$. Let $B$ be the integral closure of $A$ in $L$. Let $\mathfrak{m}$ be a maximal ideal of $B$. Then
(1) the field extension $\kappa \subset \kappa(\mathfrak{m})$ is normal, and
(2) $D \rightarrow \operatorname{Aut}(\kappa(\mathfrak{m}) / \kappa)$ is surjective.

If for some (equivalently all) maximal ideal(s) $\mathfrak{m} \subset B$ the field extension $\kappa \subset \kappa(\mathfrak{m})$ is separable, then
(3) $\kappa \subset \kappa(\mathfrak{m})$ is Galois, and
(4) $D \rightarrow \operatorname{Gal}(\kappa(\mathfrak{m}) / \kappa)$ is surjective.

Here $D \subset G$ is the decomposition group of $\mathfrak{m}$.
Proof. Observe that $A=B^{G}$ as $A$ is integrally closed in $K$ and $K=L^{G}$. Thus parts (1) and (2) follow from Lemma 15.80.6. The "equivalently all" part of the lemma follows from Lemma 15.81.8. Assume $\kappa_{A} \subset \kappa(\mathfrak{m})$ is separable. Then parts (3) and (4) follow immediately from (1) and (2).

09EE Lemma 15.81.12. Let $A$ be a discrete valuation ring with fraction field $K$. Let $K \subset L$ be a Galois extension with Galois group $G$. Let $B$ be the integral closure of $A$ in L. Let $\mathfrak{m} \subset B$ be a maximal ideal. The inertia group $I$ of $\mathfrak{m}$ has the following structure
(1) if the characteristic of $\kappa_{A}$ is 0 , then $I$ is finite cyclic of order e,
(2) if the characteristic of $\kappa_{A}$ is $p>0$, then there is a short exact sequence of groups $1 \rightarrow P \rightarrow I \rightarrow I_{t} \rightarrow 0$ where $P$ is a $p$-group and $I_{t}$ is cyclic of order prime to $p$. In fact, the order of $I_{t}$ is the prime to $p$ part of the integer $e$.
Here $e$ is the integer of Lemma 15.81.9.
Proof. Recall that $|G|=[L: K]=n e f$, see Lemma 15.81.9. Since $G$ acts transitively on the set $\left\{\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}\right\}$ of maximal ideals of $B$ (Lemma 15.81.8) and since $D$ is the stabilizer of an element we see that $|D|=e f$. By Lemma 15.81.11 we have

$$
e f=|D|=|I| \cdot\left|\operatorname{Aut}\left(\kappa(\mathfrak{m}) / \kappa_{A}\right)\right|
$$

As $\kappa(\mathfrak{m})$ is normal over $\kappa_{A}$ the order of $\operatorname{Aut}\left(\kappa(\mathfrak{m}) / \kappa_{A}\right)$ differs from $f$ by a power of $p$ (small detail omitted). Hence the prime to $p$ part of $|I|$ is equal to the prime to $p$ part of $e$.
Set $C=B_{\mathfrak{m}}$. Then $I$ acts on $C$ over $A$ and trivially on the residue field of $C$. Let $\pi_{A} \in A$ and $\pi_{C} \in C$ be uniformizers. Write $\pi_{A}=u \pi_{C}^{e}$ for some unit $u$ in $C$. For $\sigma \in I$ write $\sigma\left(\pi_{C}\right)=u_{\sigma} \pi_{C}$ for some unit $u_{\sigma}$ in $C$. Then we have

$$
\pi_{A}=\sigma\left(\pi_{A}\right)=\sigma(u)\left(u_{\sigma} \pi_{C}\right)^{e}=\sigma(u) u_{\sigma}^{e} \pi_{C}^{e}=\frac{\sigma(u)}{u} u_{\sigma}^{e} \pi_{A}
$$

Since $\sigma(u) \equiv u \bmod \mathfrak{m}_{C}$ as $\sigma \in I$ we see that $u_{\sigma}$ maps to an $e$ th root of unity in $\kappa_{C}$. We obtain a homomorphism

$$
\chi: I \longrightarrow \mu_{e}\left(\kappa_{C}\right)
$$

Since $\kappa_{C}$ has characteristic $p$, the group $\mu_{e}\left(\kappa_{C}\right)$ is cyclic of order at most the prime to $p$ part of $e$ (see Fields, Section 9.16). Thus it suffices to prove that the kernel of $\chi$ is a $p$-group. Let $\sigma$ be a nontrivial element of the kernel. Then $\sigma\left(\mathfrak{m}_{C}^{i}\right) \subset \mathfrak{m}_{C}^{i+1}$ for all $i$. Let $m$ be the order of $\sigma$. Pick $c \in C$ such that $\sigma(c) \neq c$. Then $\sigma(c)-c \in \mathfrak{m}_{C}^{i}$, $\sigma(c)-c \notin \mathfrak{m}_{C}^{i+1}$ for some $i$ and we have

$$
\begin{aligned}
0 & =\sigma^{m}(c)-c \\
& =\sigma^{m}(c)-\sigma^{m-1}(c)+\ldots+\sigma(c)-c \\
& =\sum_{j=0, \ldots, m-1} \sigma^{j}(\sigma(c)-c) \\
& \equiv m(\sigma(c)-c) \bmod \mathfrak{m}_{C}^{i+1}
\end{aligned}
$$

It follows that $p \mid m$ (or $m=0$ if $p=1$ ). Thus every element of the kernel of $\chi$ has order divisible by $p$, i.e., $\operatorname{Ker}(\chi)$ is a $p$-group.

09EH Lemma 15.81.13. Let $A$ be a discrete valuation ring with fraction field $K$. Let $L$ be a Galois extension of $K$. Let $\mathfrak{m} \subset B$ be a maximal ideal of the integral closure of $A$ in $L$. Let $I \subset G$ be the corresponding inertia subgroup. Then $B^{I}$ is the integral closure of $A$ in $L^{I}$ and $A \rightarrow\left(B^{I}\right)_{B^{I} \cap \mathfrak{m}}$ is étale.
Proof. It follows from the definitions that $B^{I}$ is the integral closure of $A$ in $L^{I}$.
We first prove the final statement in case $B$ is a discrete valuation ring, i.e., when $G$ is the decomposition group of $\mathfrak{m}$. As $I$ acts trivially on $\kappa_{B}$ it follows from Lemma 15.80 .2 that the extension $\kappa_{B^{I}}=B^{I} /\left(B^{I} \cap \mathfrak{m}\right) \subset \kappa_{B}$ is purely inseparable. Since $G / I$ acts faithfully on $\kappa_{B}$, we conclude that $G / I$ acts faithfully on $\kappa_{B^{I}}$ over $\kappa_{A}$. By Galois theory we see that $\left[\kappa_{B^{I}}: \kappa_{A}\right] \geq|G / I|$. On the other hand, we have $\left[L^{I}: K\right]=|G / I|$ by Galois theory. By Lemma 15.81 .2 we see that $A \subset B^{I}$ is weakly unramified and that $\left[\kappa_{B^{I}}: \kappa_{A}\right]=|G / I|$. Thus $\kappa_{B^{I}}$ is Galois over $\kappa_{A}$ (with group $G / I$ ), in particular separable. By Algebra, Lemma 10.141 .7 we find that $A \rightarrow B^{I}$ is étale. (In particular, $L^{I} / K$ is unramified with respect to $A$.)
In general we reduce to the case discussed in the previous paragraph by splitting $B$ using Algebra, Lemma 10.141.23. (An alternative is to use completion to do this.) We omit the details.

09EI Lemma 15.81.14 (Krasner's lemma). Let $A$ be a complete local domain of dimension 1. Let $P(t) \in A[t]$ be a polynomial with coefficients in $A$. Let $\alpha \in A$ be $a$ root of $P$ but not a root of the derivative $P^{\prime}=d P / d t$. For every $c \geq 0$ there exists an integer $n$ such that for any $Q \in A[t]$ whose coefficients are in $\mathfrak{m}_{A}^{n}$ the polynomial $P+Q$ has a root $\beta \in A$ with $\beta-\alpha \in \mathfrak{m}_{A}^{c}$.

Proof. Choose a nonzero $\pi \in \mathfrak{m}$. Since the dimension of $A$ is 1 we have $\mathfrak{m}=\sqrt{(\pi)}$. By assumption we may write $P^{\prime}(\alpha)^{-1}=\pi^{-m} a$ for some $m \geq 0$ and $a \in A$. We may and do assume that $c \geq m+1$. Pick $n$ such that $\mathfrak{m}_{A}^{n} \subset\left(\pi^{c+m}\right)$. Pick any $Q$ as in the statement. For later use we observe that we can write

$$
P(x+y)=P(x)+P^{\prime}(x) y+R(x, y) y^{2}
$$

for some $R(x, y) \in A[x, y]$. We will show by induction that we can find a sequence $\alpha_{m}, \alpha_{m+1}, \alpha_{m+2}, \ldots$ such that
(1) $\alpha_{k} \equiv \alpha \bmod \pi^{c}$,
(2) $\alpha_{k+1}-\alpha_{k} \in\left(\pi^{k}\right)$, and
(3) $(P+Q)\left(\alpha_{k}\right) \in\left(\pi^{m+k}\right)$.

Setting $\beta=\lim \alpha_{k}$ will finish the proof.
Base case. Since the coefficients of $Q$ are in $\left(\pi^{c+m}\right)$ we have $(P+Q)(\alpha) \in\left(\pi^{c+m}\right)$. Hence $\alpha_{m}=\alpha$ works. This choice guarantees that $\alpha_{k} \equiv \alpha \bmod \pi^{c}$ for all $k \geq m$.

Induction step. Given $\alpha_{k}$ we write $\alpha_{k+1}=\alpha_{k}+\delta$ for some $\delta \in\left(\pi^{k}\right)$. Then we have

$$
(P+Q)\left(\alpha_{k+1}\right)=P\left(\alpha_{k}+\delta\right)+Q\left(\alpha_{k}+\delta\right)
$$

Because the coefficients of $Q$ are in $\left(\pi^{c+m}\right)$ we see that $Q\left(\alpha_{k}+\delta\right) \equiv Q\left(\alpha_{k}\right) \bmod$ $\pi^{c+m+k}$. On the other hand we have

$$
P\left(\alpha_{k}+\delta\right)=P\left(\alpha_{k}\right)+P^{\prime}\left(\alpha_{k}\right) \delta+R\left(\alpha_{k}, \delta\right) \delta^{2}
$$

Note that $P^{\prime}\left(\alpha_{k}\right) \equiv P^{\prime}(\alpha) \bmod \left(\pi^{m+1}\right)$ as $\alpha_{k} \equiv \alpha \bmod \pi^{m+1}$. Hence we obtain

$$
P\left(\alpha_{k}+\delta\right) \equiv P\left(\alpha_{k}\right)+P^{\prime}(\alpha) \delta \bmod \pi^{k+m+1}
$$

Recombining the two terms we see that

$$
(P+Q)\left(\alpha_{k+1}\right) \equiv(P+Q)\left(\alpha_{k}\right)+P^{\prime}(\alpha) \delta \bmod \pi^{k+m+1}
$$

Thus a solution is to take $\delta=-P^{\prime}(\alpha)^{-1}(P+Q)\left(\alpha_{k}\right)=-\pi^{-m} a(P+Q)\left(\alpha_{k}\right)$ which is contained in $\left(\pi^{k}\right)$ by induction assumption.

09EJ Lemma 15.81.15. Let $A$ be a discrete valuation ring with field of fractions $K$. Let $A^{\wedge}$ be the completion of $A$ with fraction field $K^{\wedge}$. If $K^{\wedge} \subset M$ is a finite separable extension, then there exists a finite separable extension $K \subset L$ such that $M=K^{\wedge} \otimes_{K} L$.

Proof. Note that $A^{\wedge}$ is a discrete valuation ring too (by Lemmas 15.34 .4 and 15.34.1). In particular $A^{\wedge}$ is a domain. The proof will work more generally for Noetherian local rings $A$ such that $A^{\wedge}$ is a local domain of dimension 1.

Let $\theta \in M$ be an element that generates $M$ over $K^{\wedge}$. (Theorem of the primitive element.) Let $P(t) \in K^{\wedge}[t]$ be the minimal polynomial of $\theta$ over $K^{\wedge}$. Let $\pi \in \mathfrak{m}_{A}$ be a nonzero element. After replacing $\theta$ by $\pi^{n} \theta$ we may assume that the coefficients of $P(t)$ are in $A^{\wedge}$. Let $B=A^{\wedge}[\theta]=A^{\wedge}[t] /(P(t))$. Note that $B$ is a complete local domain of dimension 1 because it is finite over $A$ and contained in $M$. Since $M$ is separable over $K$ the element $\theta$ is not a root of the derivative of $P$. For any integer $n$ we can find a monic polynomial $P_{1} \in A[t]$ such that $P-P_{1}$ has coefficients in $\pi^{n} A^{\wedge}[t]$. By Krasner's lemma (Lemma 15.81.14) we see that $P_{1}$ has a root $\beta$ in $B$ for $n$ sufficiently large. Moreover, we may assume (if $n$ is chosen large enough) that $\theta-\beta \in \pi B$. Consider the map $\Phi: A^{\wedge}[t] /\left(P_{1}\right) \rightarrow B$ of $A^{\wedge}$-algebras which maps $t$ to $\beta$. Since $B=\pi B+\sum_{i<\operatorname{deg}(P)} A^{\wedge} \theta^{i}$, the map $\Phi$ is surjective by Nakayama's lemma. As $\operatorname{deg}\left(P_{1}\right)=\operatorname{deg}(P)$ it follows that $\Phi$ is an isomorphism. We conclude that the ring extension $L=K[t] /\left(P_{1}(t)\right)$ satisfies $K^{\wedge} \otimes_{K} L \cong M$. This implies that $L$ is a field and the proof is complete.

09EK Definition 15.81.16. Let $A$ be a discrete valuation ring. We say $A$ has mixed characteristic if the characteristic of the residue field of $A$ is $p>0$ and the characteristic of the fraction field of $A$ is 0 . In this case we obtain an extension of discrete valuation rings $\mathbf{Z}_{(p)} \subset A$ and the absolute ramification index of $A$ is the ramification index of this extension.

### 15.82. Eliminating ramification

09 EL In this section we discuss a result of Helmut Epp, see Epp73. We strongly encourage the reader to read the original. Our approach is slightly different as we try to handle the mixed and equicharacteristic cases by the same method. For related results, see also Pon98, Pon99, Kuh03, and ZK99.

09EM Remark 15.82.1. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Let $K \subset K_{1}$ be a finite extension of fields. Let $A_{1} \subset K_{1}$ be the integral closure of $A$ in $K_{1}$. On the other hand, let $L_{1}=\left(L \otimes_{K} K_{1}\right)_{\text {red }}$. Then $L_{1}$ is a nonempty finite product of finite field extensions of $L$. Let $B_{1}$ be the integral closure of $B$ in $L_{1}$. We obtain compatible commutative diagrams

and

In this situation we have the following
(1) By Algebra, Lemma 10.119 .16 the ring $A_{1}$ is a Dedekind domain and $B_{1}$ is a finite product of Dedekind domains.
(2) Note that $L \otimes_{K} K_{1}=\left(B \otimes_{A} A_{1}\right)_{\pi}$ where $\pi \in A$ is a uniformizer and that $\pi$ is a nonzerodivisor on $B \otimes_{A} A_{1}$. Thus the ring map $B \otimes_{A} A_{1} \rightarrow B_{1}$ is integral with kernel consisting of nilpotent elements. Hence $\operatorname{Spec}\left(B_{1}\right) \rightarrow$ $\operatorname{Spec}\left(B \otimes_{A} A_{1}\right)$ is surjective on spectra (Algebra, Lemma 10.35.15). The $\operatorname{map} \operatorname{Spec}\left(B \otimes_{A} A_{1}\right) \rightarrow \operatorname{Spec}\left(A_{1}\right)$ is surjective as $A_{1} / \mathfrak{m}_{A} A_{1} \rightarrow B / \mathfrak{m}_{A} B \otimes_{\kappa_{A}}$ $A_{1} / \mathfrak{m}_{A} A_{1}$ is an injective ring map with $A_{1} / \mathfrak{m}_{A} A_{1}$ Artinian. We conclude that $\operatorname{Spec}\left(B_{1}\right) \rightarrow \operatorname{Spec}\left(A_{1}\right)$ is surjective.
(3) Let $\mathfrak{m}_{i}, i=1, \ldots n$ with $n \geq 1$ be the maximal ideals of $A_{1}$. For each $i=1, \ldots, n$ let $\mathfrak{m}_{i j}, j=1, \ldots, m_{i}$ with $m_{i} \geq 1$ be the maximal ideals of $B_{1}$ lying over $\mathfrak{m}_{i}$. We obtain diagrams

of extensions of discrete valuation rings.
(4) If $A$ is henselian (for example complete), then $A_{1}$ is a discrete valuation ring, i.e., $n=1$. Namely, $A_{1}$ is a union of finite extensions of $A$ which are domains, hence local by Algebra, Lemma 10.148.4.
(5) If $B$ is henselian (for example complete), then $B_{1}$ is a product of discrete valuation rings, i.e., $m_{i}=1$ for $i=1, \ldots, n$.
(6) If $K \subset K_{1}$ is purely inseparable, then $A_{1}$ and $B_{1}$ are both discrete valuation rings, i.e., $n=1$ and $m_{1}=1$. This is true because for every $b \in B_{1}$ a $p$-power power of $b$ is in $B$, hence $B_{1}$ can only have one maximal ideal.
(7) If $K \subset K_{1}$ is finite separable, then $L_{1}=L \otimes_{K} K_{1}$ and is a finite product of finite separable extensions too. Hence $A \subset A_{1}$ and $B \subset B_{1}$ are finite by Algebra, Lemma 10.153.8.
(8) If $A$ is Nagata, then $A \subset A_{1}$ is finite.
(9) If $B$ is Nagata, then $B \subset B_{1}$ is finite.

Let $A \subset B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. The goal in this section is to find extensions $K \subset K_{1}$ as in such that the extensions $\left(A_{1}\right)_{\mathfrak{m}_{i}} \subset\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ of Remark 15.82 .1 are all weakly unramified or even formally smooth.
The simplest (but nontrivial) example of this is Abhyankar's lemma (Lemma 15.82.6).
09EN Definition 15.82.2. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$.
(1) We say a finite field extension $K \subset K_{1}$ is a weak solution for $A \subset B$ if all the extensions $\left(A_{1}\right)_{\mathfrak{m}_{i}} \subset\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ of Remark 15.82 .1 are weakly unramified.
(2) We say a finite field extension $K \subset K_{1}$ is a solution for $A \subset B$ if each extension $\left(A_{1}\right)_{\mathfrak{m}_{i}} \subset\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ of Remark 15.82 .1 is formally smooth in the $\mathfrak{m}_{i j}$-adic topology.
We say a solution $K \subset K_{1}$ is a separable solution if $K \subset K_{1}$ is separable.
In general (weak) solutions do not exist; there is an example in Epp73. We will prove the existence of weak solutions in Theorem 15.82 .23 following Epp73 in case the residue field extension satisfies a mild condition. We will then deduce the existence of solutions and sometimes separable solutions in geometrically meaningful cases in Proposition 15.82 .25 and Lemma 15.82.9. The following example shows that in general one needs inseparable extensions to get a solution.
09 EP Example 15.82.3. Let $k$ be a perfect field of characteristic $p>0$. Let $A=k[[x]]$ and $K=k((x))$. Let $B=A\left[x^{1 / p}\right]$. Any weak solution $K \subset K_{1}$ for $A \rightarrow B$ is inseparable (and any finite inseparable extension of $K$ is a solution). We omit the proof.
Solutions are stable under further extensions (follows from Lemma 15.82.4). This may not be true for weak solutions. Weak solutions are in some sense stable under totally ramified extensions, see Lemma 15.82.7.

09EQ Lemma 15.82.4. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume that $A \rightarrow B$ is formally smooth in the $\mathfrak{m}_{B}$-adic topology. Then for any finite extension $K \subset K_{1}$ we have $L_{1}=L \otimes_{K} K_{1}, B_{1}=$ $B \otimes_{A} A_{1}$, and each extension $\left(A_{1}\right)_{\mathfrak{m}_{i}} \subset\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ (see Remark 15.82.1) is formally smooth in the $\mathfrak{m}_{i j}$-adic topology.
Proof. We will use the equivalence of Lemma 15.81 .5 without further mention. Let $\pi \in A$ and $\pi_{i} \in\left(A_{1}\right)_{\mathfrak{m}_{i}}$ be uniformizers. As $\kappa_{A} \subset \kappa_{B}$ is separable, the ring

$$
\left(B \otimes_{A}\left(A_{1}\right)_{\mathfrak{m}_{i}}\right) / \pi_{i}\left(B \otimes_{A}\left(A_{1}\right)_{\mathfrak{m}_{i}}\right)=B / \pi B \otimes_{A / \pi A}\left(A_{1}\right)_{\mathfrak{m}_{i}} / \pi_{i}\left(A_{1}\right)_{\mathfrak{m}_{i}}
$$

is a product of fields each separable over $\kappa_{\mathfrak{m}_{i}}$. Hence the element $\pi_{i}$ in $B \otimes_{A}\left(A_{1}\right)_{\mathfrak{m}_{i}}$ is a nonzerodivisor and the quotient by this element is a product of fields. It follows that $B \otimes_{A} A_{1}$ is a Dedekind domain in particular reduced. Thus $B \otimes_{A} A_{1} \subset B_{1}$ is an equality.
09EV Lemma 15.82.5. Let $A$ be a discrete valuation ring with uniformizer $\pi$. Let $n \geq 2$. Then $K_{1}=K\left[\pi^{1 / n}\right]$ is a degree $n$ extension of $K$ and the integral closure $A_{1}$ of $A$ in $K_{1}$ is the ring $A\left[\pi^{1 / n}\right]$ which is a discrete valuation ring with ramification index $n$ over $A$.

Proof. This lemma proves itself.

The following lemma is a very general version of Abhyankar's lemma for discrete valuation rings. Observe that $\kappa_{B} / \kappa_{A}$ is not assumed to be an algebraic extension of fields.

0BRM Lemma 15.82.6 (Abhyankar's lemma). Let $A \subset B$ be an extension of valuation rings. Assume that either the residue characteristic of $A$ is 0 or it is $p$, the ramification index $e$ is prime to $p$, and $\kappa_{B} / \kappa_{A}$ is a separable field extension. Let $K_{1} / K$ be a finite extension. Using the notation of Remark 15.82 .1 assume $e$ divides the ramification index of $A \subset\left(A_{1}\right)_{m_{i}}$ for some $i$. Then $\left(A_{1}\right)_{\mathfrak{m}_{i}} \subset\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ is formally smooth for all $j=1, \ldots, m_{i}$.

Proof. Let $\pi \in A$ be a uniformizer. Let $\pi_{1}$ be a uniformizer of $\left(A_{1}\right)_{m_{i}}$. Write $\pi=u \pi_{1}^{e_{1}}$ with $u$ a unit of $\left(A_{1}\right)_{m_{i}}$ and $e_{1}$ the ramification index of $A \subset\left(A_{1}\right)_{\mathfrak{m}_{i}}$.

Claim: we may assume that $u$ is an eth power in $K_{1}$. Namely, let $K_{2}$ be an extension of $K_{1}$ obtained by adjoining a root of $x^{e}=u$; thus $K_{2}$ is a factor of $K_{1}[x] /\left(x^{e}-u\right)$. Then $K_{2} / K_{1}$ is a finite separable extension (by our assumption on $e$ ) and hence $A_{1} \subset A_{2}$ is finite. Since $\left(A_{1}\right)_{\mathfrak{m}_{i}} \rightarrow\left(A_{1}\right)_{\mathfrak{m}_{i}}[x] /\left(x^{e}-u\right)$ is finite étale (as $e$ is prime to the residue characteristic and $u$ a unit) we conclude that $\left(A_{2}\right)_{\mathfrak{m}_{i}}$ is a factor of a finite étale extension of $\left(A_{1}\right)_{\mathfrak{m}_{i}}$ hence finite étale over $\left(A_{1}\right)_{\mathfrak{m}_{1}}$ itself. The same reasoning shows that $B_{1} \subset B_{2}$ induces finite étale extensions $\left(B_{1}\right)_{\mathfrak{m}_{i j}} \subset\left(B_{2}\right)_{\mathfrak{m}_{i j}}$. Pick a maximal ideal $\mathfrak{m}_{i j}^{\prime} \subset B_{2}$ lying over $\mathfrak{m}_{i j} \subset B_{1}$ (of course there may be more than one) and consider

where $\mathfrak{m}_{i}^{\prime} \subset A_{2}$ is the image. Now the horizontal arrows have ramification index 1 and induce finite separable residue field extensions. Thus, using the equivalence of Lemma 15.81.5. we see that it suffices to show that the right vertical arrow is formally smooth. Since $u$ has a $e$ th root in $K_{2}$ we obtain the claim.
Assume $u$ has an $e$ th root in $K_{1}$. Since $e \mid e_{1}$ and since $u$ has a $e$ th root in $K_{1}$ we see that $\pi=\theta^{e}$ for some $\theta \in K_{1}$. Let $K[\theta] \subset K_{1}$ be the subfield generated by $\theta$. By Lemma 15.82 .5 the integral closure of $A$ in $K[\theta]$ is the discrete valuation ring $A[\theta]$. If we can prove the lemma for the extension $K \subset K[\theta]$, then $K \subset K[\theta]$ is a solution for $A \subset B$ and we conclude by Lemma 15.82 .4

Assume $K_{1}=K\left[\pi^{1 / e}\right]$ and set $\theta=\pi^{1 / e}$. Let $\pi_{B}$ be a uniformizer for $B$ and write $\pi=w \pi_{B}^{e}$ for some unit $w$ of $B$. Then we see that $L_{1}=L \otimes_{K} K_{1}$ is obtained by adjoining $\pi_{B} / \theta$ which is an $e$ th root of the unit $w$. Thus $B \subset B_{1}$ is finite étale. Thus for any maximal ideal $\mathfrak{m} \subset B_{1}$ consider the commutative diagram

Here the numbers along the arrows are the ramification indices. By multiplicativity of ramification indices (Lemma 15.81 .3 ) we conclude $?=1$. Looking at the residue field extensions we find that $\kappa(\mathfrak{m})$ is a finite separable extension of $\kappa_{B}$ which is
separable over $\kappa_{A}$. Therefore $\kappa(\mathfrak{m})$ is separable over $\kappa_{A}$ which is equal to the residue field of $A_{1}$ and we win by Lemma 15.81 .5

09ER Lemma 15.82.7. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume that $A \rightarrow B$ is weakly unramified. Then for any finite separable extension $K_{1} / K$ totally ramified with respect to $A$ we have that $L_{1}=L \otimes_{K} K_{1}$ is a field, $A_{1}$ and $B_{1}=B \otimes_{A} A_{1}$ are discrete valuation rings, and the extension $A_{1} \subset B_{1}$ (see Remark 15.82.1) is weakly unramified.

Proof. Let $\pi \in A$ and $\pi_{1} \in A_{1}$ be uniformizers. As $K_{1} / K$ is totally ramified with respect to $A$ we have $\pi_{1}^{e}=u_{1} \pi$ for some unit $u_{1}$ in $A_{1}$. Hence $A_{1}$ is generated by $\pi_{1}$ over $A$ and the minimal polynomial $P(t)$ of $\pi_{1}$ over $K$ has the form

$$
P(t)=t^{e}+a_{e-1} t^{e-1}+\ldots+a_{0}
$$

with $a_{i} \in(\pi)$ and $a_{0}=u \pi$ for some unit $u$ of $A$. Note that $e=\left[K_{1}: K\right]$ as well. Since $A \rightarrow B$ is weakly unramified we see that $\pi$ is a uniformizer of $B$ and hence $B_{1}=B[t] /(P(t))$ is a discrete valuation ring with uniformizer the class of $t$. Thus the lemma is clear.

09ES Lemma 15.82.8. Let $A \rightarrow B \rightarrow C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Let $K \subset K_{1}$ be a finite extension.
(1) If $K_{1}$ is a (weak) solution for $A \rightarrow C$, then $K_{1}$ is a (weak) solution for $A \rightarrow B$.
(2) If $K_{1}$ is a (weak) solution for $A \rightarrow B$ and $L_{1}=\left(L \otimes_{K} K_{1}\right)_{\text {red }}$ is a product of fields which are (weak) solutions for $B \rightarrow C$, then $K_{1}$ is a weak solution for $A \rightarrow C$.

Proof. Let $L_{1}=\left(L \otimes_{K} K_{1}\right)_{\text {red }}$ and $M_{1}=\left(M \otimes_{K} K_{1}\right)_{\text {red }}$ and let $B_{1} \subset L_{1}$ and $C_{1} \subset M_{1}$ be the integral closure of $B$ and $C$. Note that $M_{1}=\left(M \otimes_{L} L_{1}\right)_{\text {red }}$ and that $L_{1}$ is a (nonempty) finite product of finite extensions of $L$. Hence the ring map $B_{1} \rightarrow C_{1}$ is a finite product of ring maps of the form discussed in Remark 15.82.1. In particular, the map $\operatorname{Spec}\left(C_{1}\right) \rightarrow \operatorname{Spec}\left(B_{1}\right)$ is surjective. Choose a maximal ideal $\mathfrak{m} \subset C_{1}$ and consider the extensions of discrete valuation rings

$$
\left(A_{1}\right)_{A_{1} \cap \mathfrak{m}} \rightarrow\left(B_{1}\right)_{B_{1} \cap \mathfrak{m}} \rightarrow\left(C_{1}\right)_{\mathfrak{m}}
$$

If the composition is weakly unramified, so is the map $\left(A_{1}\right)_{A_{1} \cap \mathfrak{m}} \rightarrow\left(B_{1}\right)_{B_{1} \cap \mathfrak{m}}$. If the residue field extension $\kappa_{A_{1} \cap \mathfrak{m}} \rightarrow \kappa_{\mathfrak{m}}$ is separable, so is the subextension $\kappa_{A_{1} \cap \mathfrak{m}} \rightarrow \kappa_{B_{1} \cap \mathfrak{m}}$. Taking into account Lemma 15.81 .5 this proves (1). A similar argument works for (2).

0BRN Lemma 15.82.9. Let $A \subset B$ be an extension of discrete valuation rings. Assume
(1) the extension $K \subset L$ of fraction fields is separable,
(2) $B$ is Nagata, and
(3) there exists a solution for $A \subset B$.

Then there exists a separable solution for $A \subset B$.
Proof. The lemma is trivial if the characteristic of $K$ is zero; thus we may and do assume that the characteristic of $K$ is $p>0$.
Let $K \subset K_{1}$ be a finite extension. Since $L / K$ is separable, the algebra $L \otimes_{K} K_{1}$ is reduced (Algebra, Lemma 10.42.6). Since $B$ is Nagata, the ring extension $B \subset B_{1}$ is finite (Remark 15.82.1) and $B_{1}$ is a Nagata ring. Moreover, if $K \subset K_{1} \subset K_{2}$
is a tower of finite extensions, then the same thing is true, i.e., the ring extension $B_{1} \subset B_{2}$ is finite too where $B_{2}$ is the integral closure of $B$ (or $B_{1}$ ) in $L \otimes_{K} K_{2}$.
Let $K \subset K_{2}$ be a solution for $A \rightarrow B$. There exists a subfield $K \subset K_{1} \subset K_{2}$ such that $K_{1} / K$ is separable and $K_{2} / K_{1}$ is purely inseparable (Fields, Lemma 9.13.6). Thus it suffices to show that if we have $K \subset K_{1} \subset K_{2}$ with $K_{2} / K_{1}$ purely inseparable of degree $p$, then $K \subset K_{1}$ is a solution for $A \subset B$. Using the remarks above, we may replace $A$ by a localization $\left(A_{1}\right)_{\mathfrak{m}_{i}}$ and $B$ by $\left(B_{1}\right)_{\mathfrak{m}_{i j}}$ (notation as in Remark 15.82 .1 ) and reduce to the problem discussed in the following paragraph.

Assume that $K \subset K_{1}$ is a purely inseparable extension of degree $p$ which is a solution for $A \subset B$. Problem: show that $A \rightarrow B$ is formally smooth. By the discussion in Remark 15.82 .1 we see that $A_{1}$ and $B_{1}$ are discrete valuation rings and as discussed above $B \subset B_{1}$ is finite. Consider the diagrams

of extensions of discrete valuation rings and residue fields. Here $e, e_{u}, e_{d}, 1$ denote ramification indices, so $e e_{u}=e_{d}$. Also $d, d_{u}, d_{d}, 1$ denote the inseparable degrees (Fields, Definition 9.13.7), so $d d_{u}=d_{d}$ (Fields, Lemma 9.13.9). By Algebra, Lemma 10.120 .8 and the fact that $L \subset L \otimes_{K} K_{1}$ is a degree $p$ field extension, we see that $e_{u} d_{u}=p$ (this is where we really use that $B$ is Nagata; this need not be true if the extension $B \subset B_{1}$ is not finite). We have $e_{d} d_{d} \leq p$ by Lemma 15.81.2. Thus it follows that $e=d=1$ as desired.

09ET Lemma 15.82.10. Let $A \rightarrow B$ be an extension of discrete valuation rings. There exists a commutative diagram

of extensions of discrete valuation rings such that
(1) the extensions $K \subset K^{\prime}$ and $L \subset L^{\prime}$ of fraction fields are separable algebraic,
(2) the residue fields of $A^{\prime}$ and $B^{\prime}$ are separable algebraic closures of the residue fields of $A$ and $B$, and
(3) if a solution, weak solution, or separable solution exists for $A^{\prime} \rightarrow B^{\prime}$, then a solution, weak solution, or separable solution exists for $A \rightarrow B$.

Proof. By Algebra, Lemma 10.151 .2 there exists an extension $A \subset A^{\prime}$ which is a filtered colimit of finite étale extensions such that the residue field of $A^{\prime}$ is a separable algebraic closure of the residue field of $A$. Then $A \subset A^{\prime}$ is an extension of discrete valuation rings such that the induced extension $K \subset K^{\prime}$ of fraction fields is separable algebraic.
Let $B \subset B^{\prime}$ be a strict henselization of $B$. Then $B \subset B^{\prime}$ is an extension of discrete valuation rings whose fraction field extension is separable algebraic. By Algebra, Lemma 10.148 .25 there exists a commutative diagram as in the statement of the lemma. Parts (1) and (2) of the lemma are clear.

Let $K^{\prime} \subset K_{1}^{\prime}$ be a (weak) solution for $A^{\prime} \rightarrow B^{\prime}$. Since $A^{\prime}$ is a colimit, we can find a finite étale extension $A \subset A_{1}^{\prime}$ and a finite extension $f . f .\left(A_{1}^{\prime}\right) \subset K_{1}$ such that $K_{1}^{\prime}=K^{\prime} \otimes_{f . f .\left(A_{1}^{\prime}\right)} K_{1}$. As $A \subset A_{1}^{\prime}$ is finite étale and $B^{\prime}$ strictly henselian, it follows that $B^{\prime} \otimes_{A} A_{1}^{\prime}$ is a finite product of rings isomorphic to $B^{\prime}$. Hence

$$
L^{\prime} \otimes_{K} K_{1}=L^{\prime} \otimes_{K} f . f .\left(A_{1}^{\prime}\right) \otimes_{f . f .\left(A_{1}^{\prime}\right)} K_{1}
$$

is a finite product of rings isomorphic to $L^{\prime} \otimes_{K^{\prime}} K_{1}^{\prime}$. Thus we see that $K \subset K_{1}$ is a (weak) solution for $A \rightarrow B^{\prime}$. Hence it is also a (weak) solution for $A \rightarrow B$ by Lemma 15.82 .8 .

09EU Lemma 15.82.11. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Let $K \subset K_{1}$ be a normal extension. Say $G=\operatorname{Aut}\left(K_{1} / K\right)$. Then $G$ acts on the rings $K_{1}, L_{1}, A_{1}$ and $B_{1}$ of Remark 15.82 .1 and acts transitively on the set of maximal ideals of $B_{1}$.

Proof. Everything is clear apart from the last assertion. If there are two or more orbits of the action, then we can find an element $b \in B_{1}$ which vanishes at all the maximal ideals of one orbit and has residue 1 at all the maximal ideals in another orbit. Then $b^{\prime}=\prod_{\sigma \in G} \sigma(b)$ is a $G$-invariant element of $B_{1} \subset L_{1}=\left(L \otimes_{K} K_{1}\right)_{\text {red }}$ which is in some maximal ideals of $B_{1}$ but not in all maximal ideals of $B_{1}$. Lifting it to an element of $L \otimes_{K} K_{1}$ and raising to a high power we obtain a $G$-invariant element $b^{\prime \prime}$ of $L \otimes_{K} K_{1}$ mapping to $\left(b^{\prime}\right)^{N}$ for some $N>0$; in fact, we only need to do this in case the characteristic is $p>0$ and in this case raising to a suitably large $p$-power $q$ defines a canonical map $\left(L \otimes_{K} K_{1}\right)_{\text {red }} \rightarrow L \otimes_{K} K_{1}$. Since $K=\left(K_{1}\right)^{G}$ we conclude that $b^{\prime \prime} \in L$. Since $b^{\prime \prime}$ maps to an element of $B_{1}$ we see that $b^{\prime \prime} \in B$ (as $B$ is normal). Then on the one hand it must be true that $b^{\prime \prime} \in \mathfrak{m}_{B}$ as $b^{\prime}$ is in some maximal ideal of $B_{1}$ and on the other hand it must be true that $b^{\prime \prime} \notin \mathfrak{m}_{B}$ as $b^{\prime}$ is not in all maximal ideals of $B_{1}$. This contradiction finishes the proof of the lemma.

09EW Lemma 15.82.12. Let $A$ be a discrete valuation ring with uniformizer $\pi$. If the residue characteristic of $A$ is $p>0$, then for every $n>1$ and $p$-power $q$ there exists a degree $q$ separable extension $L / K$ totally ramified with respect to $A$ such that the integral closure $B$ of $A$ in $L$ has ramification index $q$ and a uniformizer $\pi_{B}$ such that $\pi_{B}^{q}=\pi+\pi^{n} b$ and $\pi_{B}^{q}=\pi+\left(\pi_{B}\right)^{n q} b^{\prime}$ for some $b, b^{\prime} \in B$.

Proof. If the characteristic of $K$ is zero, then we can take the extension given by $\pi_{B}^{q}=\pi$, see Lemma 15.82 .5 . If the characteristic of $K$ is $p>0$, then we can take the extension of $K$ given by $z^{q}-\pi^{n} z=\pi^{1-q}$. Namely, then we see that $y^{q}-\pi^{n+q-1} y=\pi$ where $y=\pi z$. Taking $\pi_{B}=y$ we obtain the desired result.

09EX Lemma 15.82.13. Let $A$ be a discrete valuation ring. Assume the reside field $\kappa_{A}$ has characteristic $p>0$ and that $a \in A$ is an element whose residue class in $\kappa_{A}$ is not a pth power. Then a is not a pth power in $K$ and the integral closure of $A$ in $K\left[a^{1 / p}\right]$ is the ring $A\left[a^{1 / p}\right]$ which is a discrete valuation ring weakly unramified over $A$.

Proof. This lemma proves itself.
09 EY Lemma 15.82.14. Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Let $\pi \in A$ be a uniformizer. Assume
(1) $B$ is a Nagata ring,
(2) $A \subset B$ is weakly unramified,
(3) $M$ is a degree $p$ purely inseparable extension of $L$.

Then either
(1) $A \rightarrow C$ is weakly unramified, or
(2) $C=B\left[\pi^{1 / p}\right]$, or
(3) there exists a degree $p$ separable extension $K_{1} / K$ totally ramified with respect to $A$ such that $L_{1}=L \otimes_{K} K_{1}$ and $M_{1}=M \otimes_{K} K_{1}$ are fields and the maps of integral closures $A_{1} \rightarrow B_{1} \rightarrow C_{1}$ are weakly unramified extensions of discrete valuation rings.

Proof. Let $e$ be the ramification index of $C$ over $B$. If $e=1$, then we are done. If not, then $e=p$ by Lemmas 15.81 .2 and 15.81 .4 . This in turn implies that the residue fields of $B$ and $C$ agree. Choose a uniformizer $\pi_{C}$ of $C$. Write $\pi_{C}^{p}=u \pi$ for some unit $u$ of $C$. Since $\pi_{C}^{p} \in L$, we see that $u \in B^{*}$. Also $M=L\left[\pi_{C}\right]$.
Suppose there exists an integer $m \geq 0$ such that

$$
u=\sum_{0 \leq i<m} b_{i}^{p} \pi^{i}+b \pi^{m}
$$

with $b_{i} \in B$ and with $b \in B$ an element whose image in $\kappa_{B}$ is not a $p$ th power. Choose an extension $K \subset K_{1}$ as in Lemma 15.82 .12 with $n=m+2$ and denote $\pi^{\prime}$ the uniformizer of the integral closure $A_{1}$ of $A$ in $K_{1}$ such that $\pi=\left(\pi^{\prime}\right)^{p}+\left(\pi^{\prime}\right)^{n p} a$ for some $a \in A_{1}$. Let $B_{1}$ be the integral closure of $B$ in $L \otimes_{K} K_{1}$. Observe that $A_{1} \rightarrow B_{1}$ is weakly unramified by Lemma 15.82.7. In $B_{1}$ we have

$$
u \pi=\left(\sum_{0 \leq i<m} b_{i}\left(\pi^{\prime}\right)^{i+1}\right)^{p}+b\left(\pi^{\prime}\right)^{(m+1) p}+\left(\pi^{\prime}\right)^{n p} b_{1}
$$

for some $b_{1} \in B_{1}$ (computation omitted). We conclude that $M_{1}$ is obtained from $L_{1}$ by adjoining a $p$ th root of

$$
b+\left(\pi^{\prime}\right)^{n-m-1} b_{1}
$$

Since the residue field of $B_{1}$ equals the residue field of $B$ we see from Lemma 15.82 .13 that $M_{1} / L_{1}$ has degree $p$ and the integral closure $C_{1}$ of $B_{1}$ is weakly unramified over $B_{1}$. Thus we conclude in this case.
If there does not exist an integer $m$ as in the preceding paragraph, then $u$ is a $p$ th power in the $\pi$-adic completion of $B_{1}$. Since $B$ is Nagata, this means that $u$ is a $p$ th power in $B_{1}$ by Algebra, Lemma 10.154.18. Whence the second case of the statement of the lemma holds.

09EZ Lemma 15.82.15. Let A be a local ring annihilated by a prime $p$ whose maximal ideal is nilpotent. There exists a ring map $\sigma: \kappa_{A} \rightarrow A$ which is a section to the residue map $A \rightarrow \kappa_{A}$. If $A \rightarrow A^{\prime}$ is a local homomorphism of local rings, then we can choose a similar ring map $\sigma^{\prime}: \kappa_{A^{\prime}} \rightarrow A^{\prime}$ compatible with $\sigma$ provided that the extension $\kappa_{A} \subset \kappa_{A^{\prime}}$ is separable.
Proof. Separable extensions are formally smooth by Algebra, Proposition 10.150 .9 Thus the existence of $\sigma$ follows from the fact that $\mathbf{F}_{p} \rightarrow \kappa_{A}$ is separable. Similarly for the existence of $\sigma^{\prime}$ compatible with $\sigma$.

09F0 Lemma 15.82.16. Let $A$ be a discrete valuation ring with fraction field $K$ of characteristic $p>0$. Let $\xi \in K$. Let $L$ be an extension of $K$ obtained by adjoining a root of $z^{p}-z=\xi$. Then $L / K$ is Galois and one of the following happens
(1) $L=K$,
(2) $L / K$ is unramified with respect to $A$ of degree $p$,
(3) $L / K$ is totally ramified with respect to $A$ with ramification index $p$, and
(4) the integral closure $B$ of $A$ in $L$ is a discrete valuation ring, $A \subset B$ is weakly unramified, and $A \rightarrow B$ induces a purely inseparable residue field extension of degree $p$.
Let $\pi$ be a uniformizer of $A$. We have the following implications:
(A) If $\xi \in A$, then we are in case (1) or (2).
(B) If $\xi=\pi^{-n}$ a where $n>0$ is not divisible by $p$ and $a$ is a unit in $A$, then we are in case (3)
(C) If $\xi=\pi^{-n}$ a where $n>0$ is divisible by $p$ and the image of a in $\kappa_{A}$ is not a pth power, then we are in case (4).

Proof. The extension is Galois of order dividing $p$ by the discussion in Fields, Section 9.24 . It immediately follows from the discussion in Section 15.81 that we are in one of the cases (1) - (4) listed in the lemma.

Case (A). Here we see that $A \rightarrow A[x] /\left(x^{p}-x-\xi\right)$ is a finite étale ring extension. Hence we are in cases (1) or (2).

Case (B). Write $\xi=\pi^{-n} a$ where $p$ does not divide $n$. Let $B \subset L$ be the integral closure of $A$ in $L$. If $C=B_{\mathfrak{m}}$ for some maximal ideal $\mathfrak{m}$, then it is clear that $\operatorname{pord}_{C}(z)=-n \operatorname{ord}_{C}(\pi)$. In particular $A \subset C$ has ramification index divisible by $p$. It follows that it is $p$ and that $B=C$.

Case (C). Set $k=n / p$. Then we can rewrite the equation as

$$
\left(\pi^{k} z\right)^{p}-\pi^{n-k}\left(\pi^{k} z\right)=a
$$

Since $A[y] /\left(y^{p}-\pi^{n-k} y-a\right)$ is a discrete valuation ring weakly unramified over $A$, the lemma follows.

09F1 Lemma 15.82.17. Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Assume
(1) $A \subset B$ weakly unramified,
(2) the characteristic of $K$ is $p$,
(3) $M$ is a degree $p$ Galois extension of $L$, and
(4) $\kappa_{A}=\bigcap_{n \geq 1} \kappa_{B}^{p^{n}}$.

Then there exists a Galois extension $K_{1} / K$ totally ramified with respect to $A$ which is a weak solution for $A \rightarrow C$.

Proof. Since the characteristic of $L$ is $p$ we know that $M$ is an Artin-Schreier extension of $L$ (Fields, Lemma 9.24.1). Thus we may pick $z \in M, z \notin L$ such that $\xi=z^{p}-z \in L$. Choose $n \geq 0$ such that $\pi^{n} \xi \in B$. We pick $z$ such that $n$ is minimal. If $n=0$, then $M / L$ is unramified with respect to $B$ (Lemma 15.82.16) and we are done. Thus we have $n>0$.

Assumption (4) implies that $\kappa_{A}$ is perfect. Thus we may choose compatible ring maps $\bar{\sigma}: \kappa_{A} \rightarrow A / \pi^{n} A$ and $\bar{\sigma}: \kappa_{B} \rightarrow B / \pi^{n} B$ as in Lemma 15.82.15. We lift the
second of these to a map of sets $\sigma: \kappa_{B} \rightarrow B^{9}$. Then we can write

$$
\xi=\sum_{i=n, \ldots, 1} \sigma\left(\lambda_{i}\right) \pi^{-i}+b
$$

for some $\lambda_{i} \in \kappa_{B}$ and $b \in B$. Let

$$
I=\left\{i \in\{n, \ldots, 1\} \mid \lambda_{i} \in \kappa_{A}\right\}
$$

and

$$
J=\left\{j \in\{n, \ldots, 1\} \mid \lambda_{i} \notin \kappa_{A}\right\}
$$

We will argue by induction on the size of the finite set $J$.
The case $J=\emptyset$. Here for all $i \in\{n, \ldots, 1\}$ we have $\sigma\left(\lambda_{i}\right)=a_{i}+\pi^{n} b_{i}$ for some $a_{i} \in A$ and $b_{i} \in B$ by our choice of $\sigma$. Thus $\xi=\pi^{-n} a+b$ for some $a \in A$ and $b \in B$. If $p \mid n$, then we write $a=a_{0}^{p}+\pi a_{1}$ for some $a_{0}, a_{1} \in A$ (as the residue field of $A$ is perfect). We compute

$$
\left(z-\pi^{-n / p} a_{0}\right)^{p}-\left(z-\pi^{-n / p} a_{0}\right)=\pi^{-(n-1)}\left(a_{1}+\pi^{n-1-n / p} a_{0}\right)+b^{\prime}
$$

for some $b^{\prime} \in B$. This would contradict the minimality of $n$. Thus $p$ does not divide $n$. Consider the degree $p$ extension $K_{1}$ of $K$ given by $w^{p}-w=\pi^{-n} a$. By Lemma 15.82 .16 this extension is Galois and totally ramified with respect to $A$. Thus $L_{1}=L \otimes_{K} K_{1}$ is a field and $A_{1} \subset B_{1}$ is weakly unramified (Lemma 15.82.7). By Lemma 15.82 .16 the ring $M_{1}=M \otimes_{K} K_{1}$ is either a product of $p$ copies of $L_{1}$ (in which case we are done) or a field extension of $L_{1}$ of degree $p$. Moreover, in the second case, either $C_{1}$ is weakly unramified over $B_{1}$ (in which case we are done) or $M_{1} / L_{1}$ is degree $p$, Galois, and totally ramified with respect to $B_{1}$. In this last case the extension $M_{1} / L_{1}$ is generated by the element $z-w$ and

$$
(z-w)^{p}-(z-w)=z^{p}-z-\left(w^{p}-w\right)=b
$$

with $b \in B$ (see above). Thus by Lemma 15.82 .16 once more the extension $M_{1} / L_{1}$ is unramified with respect to $B_{1}$ and we conclude that $K_{1}$ is a weak solution for $A \rightarrow C$. From now on we assume $J \neq \emptyset$.
Suppose that $j^{\prime}, j \in J$ such that $j^{\prime}=p^{r} j$ for some $r>0$. Then we change our choice of $z$ into

$$
z^{\prime}=z-\left(\sigma\left(\lambda_{j}\right) \pi^{-j}+\sigma\left(\lambda_{j}^{p}\right) \pi^{-p j}+\ldots+\sigma\left(\lambda_{j}^{p^{r-1}}\right) \pi^{-p^{r-1} j}\right)
$$

Then $\xi$ changes into $\xi^{\prime}=\left(z^{\prime}\right)^{p}-\left(z^{\prime}\right)$ as follows

$$
\xi^{\prime}=\xi-\sigma\left(\lambda_{j}\right) \pi^{-j}+\sigma\left(\lambda_{j}^{p^{r}}\right) \pi^{-j^{\prime}}+\text { something in } B
$$

Writing $\xi^{\prime}=\sum_{i=n, \ldots, 1} \sigma\left(\lambda_{i}^{\prime}\right) \pi^{-i}+b^{\prime}$ as before we find that $\lambda_{i}^{\prime}=\lambda_{i}$ for $i \neq j, j^{\prime}$ and $\lambda_{j}^{\prime}=0$. Thus the set $J$ has gotten smaller. By induction on the size of $J$ we may assume no such pair $j, j^{\prime}$ exists. (Please observe that in this procedure we may get thrown back into the case that $J=\emptyset$ we treated above.)
For $j \in J$ write $\lambda_{j}=\mu_{j}^{p^{r_{j}}}$ for some $r_{j} \geq 0$ and $\mu_{j} \in \kappa_{B}$ which is not a $p$ th power. This is possible by our assumption (4). Let $j \in J$ be the unique index such that $j p^{-r_{j}}$ is maximal. (The index is unique by the result of the preceding paragraph.) Choose $r>\max \left(r_{j}+1\right)$ and such that $j p^{r-r_{j}}>n$ for $j \in J$. Choose a separable extension $K_{1} / K$ totally ramified with respect to $A$ of degree $p^{r}$ such that the corresponding discrete valuation ring $A_{1} \subset K_{1}$ has uniformizer $\pi^{\prime}$ with

[^44]$\left(\pi^{\prime}\right)^{p^{r}}=\pi+\pi^{n+1} a$ for some $a \in A_{1}$ (Lemma 15.82.12). Observe that $L_{1}=L \otimes_{K} K_{1}$ is a field and that $L_{1} / L$ is totally ramified with respect to $B$ (Lemma 15.82.7). Computing in the integral closure $B_{1}$ we get
$$
\xi=\sum_{i \in I} \sigma\left(\lambda_{i}\right)\left(\pi^{\prime}\right)^{-i p^{r}}+\sum_{j \in J} \sigma\left(\mu_{j}\right)^{p^{r_{j}}}\left(\pi^{\prime}\right)^{-j p^{r}}+b_{1}
$$
for some $b_{1} \in B_{1}$. Note that $\sigma\left(\lambda_{i}\right)$ for $i \in I$ is a $q$ th power modulo $\pi^{n}$, i.e., modulo $\left(\pi^{\prime}\right)^{n p^{r}}$. Hence we can rewrite the above as
$$
\xi=\sum_{i \in I} x_{i}^{p^{r}}\left(\pi^{\prime}\right)^{-i p^{r}}+\sum_{j \in J} \sigma\left(\mu_{j}\right)^{p^{r_{j}}}\left(\pi^{\prime}\right)^{-j p^{r}}+b_{1}
$$

As in the previous paragraph we change our choice of $z$ into

$$
\begin{aligned}
z^{\prime} & =z \\
& -\sum_{i \in I}\left(x_{i}\left(\pi^{\prime}\right)^{-i}+\ldots+x_{i}^{p^{r-1}}\left(\pi^{\prime}\right)^{-i p^{r-1}}\right) \\
& -\sum_{j \in J}\left(\sigma\left(\mu_{j}\right)\left(\pi^{\prime}\right)^{-j p^{r-r_{j}}}+\ldots+\sigma\left(\mu_{j}\right)^{p^{r_{j}-1}}\left(\pi^{\prime}\right)^{-j p^{r-1}}\right)
\end{aligned}
$$

to obtain

$$
\left(z^{\prime}\right)^{p}-z^{\prime}=\sum_{i \in I} x_{i}\left(\pi^{\prime}\right)^{-i}+\sum_{j \in J} \sigma\left(\mu_{j}\right)\left(\pi^{\prime}\right)^{-j p^{r-r_{j}}}+b_{1}^{\prime}
$$

for some $b_{1}^{\prime} \in B_{1}$. Since there is a unique $j$ such that $j p^{r-r_{j}}$ is maximal and since $j p^{r-r_{j}}$ is bigger than $i \in I$ and divisible by $p$, we see that $M_{1} / L_{1}$ falls into case (C) of Lemma 15.82 .16 . This finishes the proof.

09F2 Lemma 15.82.18. Let $A$ be a ring which contains a primitive pth root of unity $\zeta$. Set $w=1-\zeta$. Then

$$
P(z)=\frac{(1+w z)^{p}-1}{w^{p}}=z^{p}-z+\sum_{0<i<p} a_{i} z^{i}
$$

is an element of $A[z]$ and in fact $a_{i} \in(w)$. Moreover, we have

$$
P\left(z_{1}+z_{2}+w z_{1} z_{2}\right)=P\left(z_{1}\right)+P\left(z_{2}\right)+w^{p} P\left(z_{1}\right) P\left(z_{2}\right)
$$

in the polynomial ring $A\left[z_{1}, z_{2}\right]$.
Proof. It suffices to prove this when

$$
A=\mathbf{Z}[\zeta]=\mathbf{Z}[x] /\left(x^{p-1}+\ldots+x+1\right)
$$

is the ring of integers of the cyclotomic field. The polynomial identity $t^{p}-1=$ $(t-1)(t-\zeta) \ldots\left(t-\zeta^{p-1}\right)$ (which is proved by looking at the roots on both sides) shows that $t^{p-1}+\ldots+t+1=(t-\zeta) \ldots\left(t-\zeta^{p-1}\right)$. Substituting $t=1$ we obtain $p=(1-\zeta)\left(1-\zeta^{2}\right) \ldots\left(1-\zeta^{p-1}\right)$. The maximal ideal $(p, w)=(w)$ is the unique prime ideal of $A$ lying over $p$ (as fields of characteristic $p$ do not have nontrivial $p$ th roots of 1 ). It follows that $p=u w^{p-1}$ for some unit $u$. This implies that

$$
a_{i}=\frac{1}{p}\binom{p}{i} u w^{i-1}
$$

for $p>i>1$ and $-1+a_{1}=p w / w^{p}=u$. Since $P(-1)=0$ we see that $0=(-1)^{p}-u$ modulo $(w)$. Hence $a_{1} \in(w)$ and the proof if the first part is done. The second part follows from a direct computation we omit.

09F3 Lemma 15.82.19. Let $A$ be a discrete valuation ring of mixed characteristic $(0, p)$ which contains a primitive pth root of 1 . Let $P(t) \in A[t]$ be the polynomial of Lemma 15.82.18. Let $\xi \in K$. Let $L$ be an extension of $K$ obtained by adjoining a root of $\overline{P(z)}=\xi$. Then $L / K$ is Galois and one of the following happens
(1) $L=K$,
(2) $L / K$ is unramified with respect to $A$ of degree $p$,
(3) $L / K$ is totally ramified with respect to $A$ with ramification index $p$, and
(4) the integral closure $B$ of $A$ in $L$ is a discrete valuation ring, $A \subset B$ is weakly unramified, and $A \rightarrow B$ induces a purely inseparable residue field extension of degree $p$.
Let $\pi$ be a uniformizer of $A$. We have the following implications:
(A) If $\xi \in A$, then we are in case (1) or (2).
(B) If $\xi=\pi^{-n}$ a where $n>0$ is not divisible by $p$ and $a$ is a unit in $A$, then we are in case (3)
(C) If $\xi=\pi^{-n}$ a where $n>0$ is divisible by $p$ and the image of $a$ in $\kappa_{A}$ is not a pth power, then we are in case (4).
Proof. Adjoining a root of $P(z)=\xi$ is the same thing as adjoining a root of $y^{p}=w^{p}(1+\xi)$. Since $K$ contains a primitive $p$ th root of 1 the extension is Galois of order dividing $p$ by the discussion in Fields, Section 9.23 . It immediately follows from the discussion in Section 15.81 that we are in one of the cases (1) - (4) listed in the lemma.

Case (A). Here we see that $A \rightarrow A[x] /(P(x)-\xi)$ is a finite étale ring extension. Hence we are in cases (1) or (2).
Case (B). Write $\xi=\pi^{-n} a$ where $p$ does not divide $n$. Let $B \subset L$ be the integral closure of $A$ in $L$. If $C=B_{\mathfrak{m}}$ for some maximal ideal $\mathfrak{m}$, then it is clear that $\operatorname{pord}_{C}(z)=-\operatorname{nord}_{C}(\pi)$. In particular $A \subset C$ has ramification index divisible by $p$. It follows that it is $p$ and that $B=C$.
Case (C). Set $k=n / p$. Then we can rewrite the equation as

$$
\left(\pi^{k} z\right)^{p}-\pi^{n-k}\left(\pi^{k} z\right)+\sum a_{i} \pi^{n-i k}\left(\pi^{k} z\right)^{i}=a
$$

Since $A[y] /\left(y^{p}-\pi^{n-k} y-\sum a_{i} \pi^{n-i k} y^{i}-a\right)$ is a discrete valuation ring weakly unramified over $A$, the lemma follows.

Let $A$ be a discrete valuation ring of mixed characteristic $(0, p)$ containing a primitive $p$ th root of 1 . Let $w \in A$ and $P(t) \in A[t]$ be as in Lemma 15.82.18. Let $L$ be a finite extension of $K$. We say $L / K$ is a degree $p$ extension of finite level if $L$ is a degree $p$ extension of $K$ obtained by adjoining a root of the equation $P(z)=\xi$ where $\xi \in K$ is an element with $w^{p} \xi \in \mathfrak{m}_{A}$.
This definition is relevant to the discussion in this section due to the following straightforward lemma.

09F4 Lemma 15.82.20. Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Assume that
(1) A has mixed characteristic $(0, p)$,
(2) $A \subset B$ is weakly unramified,
(3) $B$ contains a primitive $p$ th root of 1 , and
(4) $M / L$ is Galois of degree $p$.

Then there exists a Galois extension $K_{1} / K$ totally ramified with respect to $A$ which is either a weak solution for $A \rightarrow C$ or is such that $M_{1} / L_{1}$ is a degree $p$ extension of finite level.
Proof. Let $\pi \in A$ be a uniformizer. By Kummer theory (Fields, Lemma 9.23.1) $M$ is obtained from $L$ by adjoining the root of $y^{p}=b$ for some $b \in L$.

If $\operatorname{ord}_{B}(b)$ is prime to $p$, then we choose a degree $p$ separable extension $K \subset K_{1}$ totally ramified with respect to $A$ (for example using Lemma 15.82.12. Let $A_{1}$ be the integral closure of $A$ in $K_{1}$. By Lemma 15.82 .7 the integral closure $B_{1}$ of $B$ in $L_{1}=L \otimes_{K} K_{1}$ is a discrete valuation ring weakly unramified over $A_{1}$. If $K \subset K_{1}$ is not a weak solution for $A \rightarrow C$, then the integral closure $C_{1}$ of $C$ in $M_{1}=M \otimes_{K} K_{1}$ is a discrete valuation ring and $B_{1} \rightarrow C_{1}$ has ramification index $p$. In this case, the field $M_{1}$ is obtained from $L_{1}$ by adjoining the $p$ th root of $b$ with $\operatorname{ord}_{B_{1}}(b)$ divisible by $p$. Replacing $A$ by $A_{1}$, etc we may assume that $b=\pi^{n} u$ where $u \in B$ is a unit and $n$ is divisible by $p$. Of course, in this case the extension $M$ is obtained from $L$ by adjoining the $p$ th root of a unit.

Suppose $M$ is obtained from $L$ by adjoining the root of $y^{p}=u$ for some unit $u$ of $B$. If the residue class of $u$ in $\kappa_{B}$ is not a $p$ th power, then $B \subset C$ is weakly unramified (Lemma 15.82.13) and we are done. Otherwise, we can replace our choice of $y$ by $y / v$ where $v^{p}$ and $u$ have the same image in $\kappa_{B}$. After such a replacement we have

$$
y^{p}=1+\pi b
$$

for some $b \in B$. Then we see that $P(z)=\pi b / w^{p}$ where $z=(y-1) / w$. Thus we see that the extension is a degree $p$ extension of finite level with $\xi=\pi b / w^{p}$.

Let $A$ be a discrete valuation ring of mixed characteristic $(0, p)$ containing a primitive $p$ th root of 1 . Let $w \in A$ and $P(t) \in A[t]$ be as in Lemma 15.82.18. Let $L$ be a degree $p$ extension of $K$ of finite level. Choose $z \in L$ generating $L$ over $K$ with $\xi=P(z) \in K$. Choose a uniformizer $\pi$ for $A$ and write $w=u \pi^{e_{1}}$ for some integer $e_{1}=\operatorname{ord}_{A}(w)$ and unit $u \in A$. Finally, pick $n \geq 0$ such that

$$
\pi^{n} \xi \in A
$$

The level of $L / K$ is the smallest value of the quantity $n / e_{1}$ taking over all $z$ generating $L / K$ with $\xi=P(z) \in K$.
We make a couple of remarks. Since the extension is of finite level we know that we can choose $z$ such that $n<p e_{1}$. Thus the level is a rational number contained in $[0, p)$. If the level is zero then $L / K$ is unramified with respect to $A$ by Lemma 15.82.19. Our next goal is to lower the level.

09F5 Lemma 15.82.21. Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Assume
(1) A has mixed characteristic $(0, p)$,
(2) $A \subset B$ weakly unramified,
(3) $B$ contains a primitive pth root of 1 ,
(4) $M / L$ is a degree $p$ extension of finite level $l>0$,
(5) $\kappa_{A}=\bigcap_{n \geq 1} \kappa_{B}^{p^{n}}$.

Then there exists a finite separable extension $K_{1}$ of $K$ totally ramified with respect to $A$ such that either $K_{1}$ is a weak solution for $A \rightarrow C$, or the extension $M_{1} / L_{1}$ is a degree $p$ extension of finite level $\leq \max (0, l-1,2 l-p)$.

Proof. Let $\pi \in A$ be a uniformizer. Let $w \in B$ and $P \in B[t]$ be as in Lemma 15.82 .18 (for $B$ ). Set $e_{1}=\operatorname{ord}_{B}(w)$, so that $w$ and $\pi^{e_{1}}$ are associates in $B$. Pick $z \in M$ generating $M$ over $L$ with $\xi=P(z) \in K$ and $n$ such that $\pi^{n} \xi \in B$ as in the definition of the level of $M$ over $L$, i.e., $l=n / e_{1}$.
The proof of this lemma is completely similar to the proof of Lemma 15.82.17. To explain what is going on, observe that

$$
\begin{equation*}
P(z) \equiv z^{p}-z \bmod \pi^{-n+e_{1}} B \tag{15.82.21.1}
\end{equation*}
$$

for any $z \in L$ such that $\pi^{-n} P(z) \in B$ (use that $z$ has valuation at worst $-n / p$ and the shape of the polynomial $P$ ). Moreover, we have

$$
\begin{equation*}
\xi_{1}+\xi_{2}+w^{p} \xi_{1} \xi_{2} \equiv \xi_{1}+\xi_{2} \bmod \pi^{-2 n+p e_{1}} B \tag{15.82.21.2}
\end{equation*}
$$

for $\xi_{1}, \xi_{2} \in \pi^{-n} B$. Finally, observe that $n-e_{1}=(l-1) / e_{1}$ and $-2 n+p e_{1}=$ $-(2 l-p) e_{1}$. Write $m=n-e_{1} \max (0, l-1,2 l-p)$. The above shows that doing calculations in $\pi^{-n} B / \pi^{-n+m} B$ the polynomial $P$ behaves exactly as the polynomial $z^{p}-z$. This explains why the lemma is true but we also give the details below.

Assumption (4) implies that $\kappa_{A}$ is perfect. Observe that $m \leq e_{1}$ and hence $A / \pi^{m}$ is annihilated by $w$ and hence $p$. Thus we may choose compatible ring maps $\bar{\sigma}$ : $\kappa_{A} \rightarrow A / \pi^{m} A$ and $\bar{\sigma}: \kappa_{B} \rightarrow B / \pi^{m} B$ as in Lemma 15.82 .15 . We lift the second of these to a map of sets $\sigma: \kappa_{B} \rightarrow B$. Then we can write

$$
\xi=\sum_{i=n, \ldots, n-m+1} \sigma\left(\lambda_{i}\right) \pi^{-i}+\pi^{-n+m)} b
$$

for some $\lambda_{i} \in \kappa_{B}$ and $b \in B$. Let

$$
I=\left\{i \in\{n, \ldots, n-m+1\} \mid \lambda_{i} \in \kappa_{A}\right\}
$$

and

$$
J=\left\{j \in\{n, \ldots, n-m+1\} \mid \lambda_{i} \notin \kappa_{A}\right\}
$$

We will argue by induction on the size of the finite set $J$.
The case $J=\emptyset$. Here for all $i \in\{n, \ldots, n-m+1\}$ we have $\sigma\left(\lambda_{i}\right)=a_{i}+\pi^{n-m} b_{i}$ for some $a_{i} \in A$ and $b_{i} \in B$ by our choice of $\bar{\sigma}$. Thus $\xi=\pi^{-n} a+\pi^{-n+m} b$ for some $a \in A$ and $b \in B$. If $p \mid n$, then we write $a=a_{0}^{p}+\pi a_{1}$ for some $a_{0}, a_{1} \in A$ (as the residue field of $A$ is perfect). Set $z_{1}=-\pi^{-n / p} a_{0}$. Note that $P\left(z_{1}\right) \in \pi^{-n} B$ and that $z+z_{1}+w z z_{1}$ is an element generating $M$ over $L$ (note that $w z_{1} \neq-1$ as $n<p e_{1}$ ). Moveover, by Lemma 15.82 .18 we have

$$
P\left(z+z_{1}+w z z_{1}\right)=P(z)+P\left(z_{1}\right)+w^{p} P(z) P\left(z_{1}\right) \in K
$$

and by equations 15.82 .21 .1 and 15.82 .21 .2 we have

$$
P(z)+P\left(z_{1}\right)+w^{p} P(z) P\left(z_{1}\right) \equiv \xi+z_{1}^{p}-z_{1} \bmod \pi^{-n+m} B
$$

for some $b^{\prime} \in B$. This contradict the minimality of $n$ ! Thus $p$ does not divide $n$. Consider the degree $p$ extension $K_{1}$ of $K$ given by $P(y)=-\pi^{-n} a$. By Lemma 15.82 .19 this extension is separable and totally ramified with respect to $A$. Thus $L_{1}=L \otimes_{K} K_{1}$ is a field and $A_{1} \subset B_{1}$ is weakly unramified (Lemma 15.82.7). By Lemma 15.82 .19 the ring $M_{1}=M \otimes_{K} K_{1}$ is either a product of $p$ copies of $L_{1}$ (in which case we are done) or a field extension of $L_{1}$ of degree $p$. Moreover, in the second case, either $C_{1}$ is weakly unramified over $B_{1}$ (in which case we are done) or $M_{1} / L_{1}$ is degree $p$, Galois, totally ramified with respect to $B_{1}$. In this last case
the extension $M_{1} / L_{1}$ is generated by the element $z+y+w z y$ and we see that $P(z+y+w z y) \in L_{1}$ and

$$
\begin{aligned}
P(z+y+w z y) & =P(z)+P(y)+w^{p} P(z) P(y) \\
& \equiv \xi-\pi^{-n} a \bmod \pi^{-n+m} B_{1} \\
& \equiv 0 \bmod \pi^{-n+m} B_{1}
\end{aligned}
$$

in exactly the same manner as above. By our choice of $m$ this means exactly that $M_{1} / L_{1}$ has level at most $\max (0, l-1,2 l-p)$. From now on we assume that $J \neq \emptyset$.

Suppose that $j^{\prime}, j \in J$ such that $j^{\prime}=p^{r} j$ for some $r>0$. Then we set

$$
z_{1}=-\sigma\left(\lambda_{j}\right) \pi^{-j}-\sigma\left(\lambda_{j}^{p}\right) \pi^{-p j}-\ldots-\sigma\left(\lambda_{j}^{p^{r-1}}\right) \pi^{-p^{r-1} j}
$$

and we change $z$ into $z^{\prime}=z+z_{1}+w z z_{1}$. Observe that $z^{\prime} \in M$ generates $M$ over $L$ and that we have $\xi^{\prime}=P\left(z^{\prime}\right)=P(z)+P\left(z_{1}\right)+w P(z) P\left(z_{1}\right) \in L$ with

$$
\xi^{\prime} \equiv \xi-\sigma\left(\lambda_{j}\right) \pi^{-j}+\sigma\left(\lambda_{j}^{p^{r}}\right) \pi^{-j^{\prime}} \bmod \pi^{-n+m} B
$$

by using equations 15.82 .21 .1 and 15.82 .21 .2 as above. Writing

$$
\xi^{\prime}=\sum_{i=n, \ldots, n-m+1} \sigma\left(\lambda_{i}^{\prime}\right) \pi^{-i}+\pi^{-n+m} b^{\prime}
$$

as before we find that $\lambda_{i}^{\prime}=\lambda_{i}$ for $i \neq j, j^{\prime}$ and $\lambda_{j}^{\prime}=0$. Thus the set $J$ has gotten smaller. By induction on the size of $J$ we may assume there is no pair $j, j^{\prime}$ of $J$ such that $j^{\prime} / j$ is a power of $p$. (Please observe that in this procedure we may get thrown back into the case that $J=\emptyset$ we treated above.)
For $j \in J$ write $\lambda_{j}=\mu_{j}^{p^{r_{j}}}$ for some $r_{j} \geq 0$ and $\mu_{j} \in \kappa_{B}$ which is not a $p$ th power. This is possible by our assumption (4). Let $j \in J$ be the unique index such that $j p^{-r_{j}}$ is maximal. (The index is unique by the result of the preceding paragraph.) Choose $r>\max \left(r_{j}+1\right)$ and such that $j p^{r-r_{j}}>n$ for $j \in J$. Let $K_{1} / K$ be the extension of degree $p^{r}$, totally ramified with respect to $A$, defined by $\left(\pi^{\prime}\right)^{p^{r}}=\pi$. Observe that $\pi^{\prime}$ is the uniformizer of the corresponding discrete valuation ring $A_{1} \subset K_{1}$. Observe that $L_{1}=L \otimes_{K} K_{1}$ is a field and $L_{1} / L$ is totally ramified with respect to $B$ (Lemma 15.82.7). Computing in the integral closure $B_{1}$ we get

$$
\xi=\sum_{i \in I} \sigma\left(\lambda_{i}\right)\left(\pi^{\prime}\right)^{-i p^{r}}+\sum_{j \in J} \sigma\left(\mu_{j}\right)^{p^{r_{j}}}\left(\pi^{\prime}\right)^{-j p^{r}}+\pi^{-n+m} b_{1}
$$

for some $b_{1} \in B_{1}$. Note that $\sigma\left(\lambda_{i}\right)$ for $i \in I$ is a $q$ th power modulo $\pi^{m}$, i.e., modulo $\left(\pi^{\prime}\right)^{m p^{r}}$. Hence we can rewrite the above as

$$
\xi=\sum_{i \in I} x_{i}^{p^{r}}\left(\pi^{\prime}\right)^{-i p^{r}}+\sum_{j \in J} \sigma\left(\mu_{j}\right)^{p^{r_{j}}}\left(\pi^{\prime}\right)^{-j p^{r}}+\pi^{-n+m} b_{1}
$$

Similar to our choice in the previous paragraph we set

$$
\begin{aligned}
z_{1} & -\sum_{i \in I}\left(x_{i}\left(\pi^{\prime}\right)^{-i}+\ldots+x_{i}^{p^{r-1}}\left(\pi^{\prime}\right)^{-i p^{r-1}}\right) \\
& -\sum_{j \in J}\left(\sigma\left(\mu_{j}\right)\left(\pi^{\prime}\right)^{-j p^{r-r_{j}}}+\ldots+\sigma\left(\mu_{j}\right)^{p^{r_{j}-1}}\left(\pi^{\prime}\right)^{-j p^{r-1}}\right)
\end{aligned}
$$

and we change our choice of $z$ into $z^{\prime}=z+z_{1}+w z z_{1}$. Then $z^{\prime}$ generates $M_{1}$ over $L_{1}$ and $\xi^{\prime}=P\left(z^{\prime}\right)=P(z)+P\left(z_{1}\right)+w^{p} P(z) P\left(z_{1}\right) \in L_{1}$ and a calculation shows that

$$
\xi^{\prime} \equiv \sum_{i \in I} x_{i}\left(\pi^{\prime}\right)^{-i}+\sum_{j \in J} \sigma\left(\mu_{j}\right)\left(\pi^{\prime}\right)^{-j p^{r-r_{j}}}+\left(\pi^{\prime}\right)^{(-n+m) p^{r}} b_{1}^{\prime}
$$

for some $b_{1}^{\prime} \in B_{1}$. There is a unique $j$ such that $j p^{r-r_{j}}$ is maximal and $j p^{r-r_{j}}$ is bigger than $i \in I$. If $j p^{r-r_{j}} \leq(n-m) p^{r}$ then the level of the extension $M_{1} / L_{1}$ is less than $\max (0, l-1,2 l-p)$. If not, then, as $p$ divides $j p^{r-r_{j}}$, we see that $M_{1} / L_{1}$ falls into case (C) of Lemma 15.82.19. This finishes the proof.

09F8 Lemma 15.82.22. Let $A \subset B \subset C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Assume
(1) the residue field $k$ of $A$ is algebraically closed of characteristic $p>0$,
(2) $A$ and $B$ are complete,
(3) $A \rightarrow B$ is weakly unramified,
(4) $M$ is a finite extension of $L$,
(5) $k=\bigcap_{n \geq 1} \kappa_{B}^{p^{n}}$

Then there exists a finite extension $K \subset K_{1}$ which is a weak solution for $A \rightarrow C$.
Proof. Let $M^{\prime}$ be any finite extension of $L$ and consider the integral closure $C^{\prime}$ of $B$ in $M^{\prime}$. Then $C^{\prime}$ is finite over $B$ as $B$ is Nagata by Algebra, Lemma 10.154.8. Moreover, $C^{\prime}$ is a discrete valuation ring, see discussion in Remark 15.82.1. Moreover $C^{\prime}$ is complete as a $B$-module, hence complete as a discrete valuation ring, see Algebra, Section 10.95 . It follows in particular that $C$ is the integral closure of $B$ in $M$ (by definition of valuation rings as maximal for the relation of domination).
Let $M \subset M^{\prime}$ be a finite extension and let $C^{\prime} \subset M^{\prime}$ be the integral closure of $B$ as above. By Lemma 15.82 .8 it suffices to prove the result for $A \rightarrow B \rightarrow C^{\prime}$. Hence we may assume that $M / L$ is normal, see Fields, Lemma 9.15.3.

If $M / L$ is normal, we can find a chain of finite extensions

$$
L=L^{0} \subset L^{1} \subset L^{2} \subset \ldots \subset L^{r}=M
$$

such that each extension $L^{j+1} / L^{j}$ is either:
(a) purely inseparable of degree $p$,
(b) totally ramified with respect to $B^{j}$ and Galois of degree $p$,
(c) totally ramified with respect to $B^{j}$ and Galois cyclic of order prime to $p$,
(d) Galois and unramified with respect to $B^{j}$.

Here $B^{j}$ is the integral closure of $B$ in $L^{j}$. Namely, since $M / L$ is normal we can write it as a compositum of a Galois extension and a purely inseparable extension (Fields, Lemma 9.26.3). For the purely inseparable extension the existence of the filtration is clear. In the Galois case, note that $G$ is "the" decomposition group and let $I \subset G$ be the inertia group. Then on the one hand $I$ is solvable by Lemma 15.81 .12 and on the other hand the extension $M^{I} / L$ is unramified with respect to $B$ by Lemma 15.81.13. This proves we have a filtration as stated.

We are going to argue by induction on the integer $r$. Suppose that we can find a finite extension $K \subset K_{1}$ which is a weak solution for $A \rightarrow B^{1}$ where $B^{1}$ is the integral closure of $B$ in $L^{1}$. Let $K_{1}^{\prime}$ be the normal closure of $K_{1} / K$ (Fields, Lemma 9.15.3). Since $A$ is complete and the residue field of $A$ is algebraically closed we see that $K_{1}^{\prime} / K_{1}$ is separable and totally ramified with respect to $A_{1}$ (some details omitted). Hence $K \subset K_{1}^{\prime}$ is a weak solution for $A \rightarrow B^{1}$ as well by Lemma 15.82.7. In other words, we may and do assume that $K_{1}$ is a normal extension of $K$. Having done so we consider the sequence

$$
L_{1}^{0}=\left(L^{0} \otimes_{K} K_{1}\right)_{r e d} \subset L_{1}^{1}=\left(L^{1} \otimes_{K} K_{1}\right)_{r e d} \subset \ldots \subset L_{1}^{r}=\left(L^{r} \otimes_{K} K_{1}\right)_{r e d}
$$

and the corresponding integral closures $B_{1}^{i}$. Note that $C_{1}=B_{1}^{r}$ is a product of discrete valuation rings which are transitively permuted by $G=\operatorname{Aut}\left(K_{1} / K\right)$ by Lemma 15.82.11. In particular all the extensions of discrete valuation rings $A_{1} \rightarrow\left(C_{1}\right)_{\mathfrak{m}}$ are isomorphic and a solution for one will be a solution for all of them. We can apply the induction hypothesis to the sequence

$$
A_{1} \rightarrow\left(B_{1}^{1}\right)_{B_{1}^{1} \cap \mathfrak{m}} \rightarrow\left(B_{1}^{2}\right)_{B_{1}^{2} \cap \mathfrak{m}} \rightarrow \ldots \rightarrow\left(B_{1}^{r}\right)_{B_{1}^{r} \cap \mathfrak{m}}=\left(C_{1}\right)_{\mathfrak{m}}
$$

to get a solution $K_{1} \subset K_{2}$ for $A_{1} \rightarrow\left(C_{1}\right)_{\mathfrak{m}}$. The extension $K \subset K_{2}$ will then be a solution for $A \rightarrow C$ by what we said before. Note that the induction hypothesis applies: the ring map $A_{1} \rightarrow\left(B_{1}^{1}\right)_{B_{1}^{1} \cap \mathfrak{m}}$ is weakly unramified by our choice of $K_{1}$ and the sequence of fraction field extensions each still have one of the properties (a), (b), (c), or (d) listed above. Moreover, observe that for any finite extension $\kappa_{B} \subset \kappa$ we still have $k=\bigcap \kappa^{p^{n}}$.

Thus everything boils down to finding a weak solution for $A \subset C$ when the field extension $L \subset M$ satisfies one of the properties (a), (b), (c), or (d).
Case (d). This case is trivial as here $B \rightarrow C$ is unramified already.
Case (c). Say $M / L$ is cyclic of order $n$ prime to $p$. Because $M / L$ is totally ramified with respect to $B$ we see that the ramification index of $B \subset C$ is $n$ and hence the ramication index of $A \subset C$ is $n$ as well. Choose a uniformizer $\pi \in A$ and set $K_{1}=K\left[\pi^{1 / n}\right]$. Then $K_{1} / K$ is a solution for $A \subset C$ by Abhyankar's lemma (Lemma 15.82.6).

Case (b). We divide this case into the mixed characteristic case and the equicharacteristic case. In the equicharacteristic case this is Lemma 15.82 .17 . In the mixed characteristic case, we first replace $K$ by a finite extension to get to the situation where $M / L$ is a degree $p$ extension of finite level using Lemma 15.82.20. Then the level is a rational number $l \in[0, p)$, see discussion preceding Lemma 15.82.21. If the level is 0 , then $B \rightarrow C$ is weakly unramified and we're done. If not, then we can replacing the field $K$ by a finite extension to obtain a new situation with level $l^{\prime} \leq \max (0, l-1,2 l-p)$ by Lemma 15.82.21. If $l=p-\epsilon$ for $\epsilon<1$ then we see that $l^{\prime} \leq p-2 \epsilon$. Hence after a finite number of replacements we obtain a case with level $\leq p-1$. Then after at most $p-1$ more such replacements we reach the situation where the level is zero.

Case (a) is Lemma 15.82 .14 . This is the only case where we possibly need a purely inseparable extension of $K$, namely, in case (2) of the statement of the lemma we win by adjoining a $p$ th power of the element $\pi$. This finishes the proof of the lemma.

At this point we have collected all the lemmas we need to prove the main result of this section.

09F9 Theorem 15.82.23 (Epp). Let $A \subset B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If the characteristic of $\kappa_{A}$ is $p>0$, assume that every element of

$$
\bigcap_{n \geq 1} \kappa_{B}^{p^{n}}
$$

is separable algebraic over $\kappa_{A}$. Then there exists a finite extension $K \subset K_{1}$ which is a weak solution for $A \rightarrow B$ as defined in Definition 15.82.2.

Proof. If the characteristic of $\kappa_{A}$ is zero or if the residue characteristic is $p$, the ramification index is prime to $p$, and the residue field extension is separable, then this follows from Abhyankar's lemma (Lemma 15.82.6). Namely, suppose the ramification index is $e$. Choose a uniformizer $\pi \in A$. Let $K_{1} / K$ be be the extension obtained by adjoining an $e$ th root of $\pi$. By Lemma 15.82 .5 we see that the integral closure $A_{1}$ of $A$ in $K_{1}$ is a discrete valuation ring with ramification index over $A$. Thus $A_{1} \rightarrow\left(B_{1}\right)_{\mathfrak{m}}$ is formally smooth for all maximal ideals $\mathfrak{m}$ of $B_{1}$ by Lemma 15.82 .6 and a fortiori these are weakly unramified extensions of discrete valuation rings.

From now on we let $p$ be a prime number and we assume that $\kappa_{A}$ has characteristic $p$. We first apply Lemma 15.82 .10 to reduce to the case that $A$ and $B$ have separably closed residue fields. Since $\kappa_{A}$ and $\kappa_{B}$ are replaced by their separable algebraic closures by this procedure we see that we obtain

$$
\kappa_{A} \supset \bigcap_{n \geq 1} \kappa_{B}^{p^{n}}
$$

from the condition of the theorem.
Let $\pi \in A$ be a uniformizer. Let $A^{\wedge}$ and $B^{\wedge}$ be the completions of $A$ and $B$. We have a commutative diagram

of extensions of discrete valuation rings. Let $K^{\wedge}$ be the fraction field of $A^{\wedge}$. Suppose that we can find a finite extension $K^{\wedge} \subset M$ which is (a) a weak solution for $A^{\wedge} \rightarrow B^{\wedge}$ and (b) a compositum of a separable extension and an extension obtained by adjoining a $p$-power root of $\pi$. Then by Lemma 15.81 .15 we can find a finite extension $K \subset K_{1}$ such that $K^{\wedge} \otimes_{K} K_{1}=M$. Let $A_{1}$, resp. $A_{1}^{\wedge}$ be the integral closure of $A$, resp. $A^{\wedge}$ in $K_{1}$, resp. $M$. Since $A \rightarrow A^{\wedge}$ is formally smooth (Lemma 15.81.5 we see that $A_{1} \rightarrow A_{1}^{\wedge}$ is formally smooth (Lemma 15.82 .4 and $A_{1}$ and $A_{1}^{\wedge}$ are discrete valuation rings by discussion in Remark 15.82.1). We conclude from Lemma 15.82 .8 part (2) that $K \subset K_{1}$ is a weak solution for $A \rightarrow B^{\wedge}$. Applying Lemma 15.82 .8 part (1) we see that $K \subset K_{1}$ is a weak solution for $A \rightarrow B$.
Thus we may assume $A$ and $B$ are complete discrete valuation rings with separably closed residue fields of characteristic $p$ and with $\kappa_{A} \supset \bigcap_{n \geq 1} \kappa_{B}^{p^{n}}$. We are also given a uniformizer $\pi \in A$ and we have to find a weak solution for $A \rightarrow B$ which is a compositum of a separable extension and a field obtained by taking $p$-power roots of $\pi$. Note that the second condition is automatic if $A$ has mixed characteristic.
Set $k=\bigcap_{n \geq 1} \kappa_{B}^{p^{n}}$. Observe that $k$ is an algebraically closed field of characteristic $p$. If $A$ has mixed characteristic let $\Lambda$ be a Cohen ring for $k$ and in the equicharacteristic case set $\Lambda=k[[t]]$. We can choose a ring map $\Lambda \rightarrow A$ which maps $t$ to $\pi$ in the equicharacteristic case. In the equicharacteristic case this follows from the Cohen structure theorem (Algebra, Theorem 10.152.8) and in the mixed characteristic case this follows as $\mathbf{Z}_{p} \rightarrow \Lambda$ is formally smooth in the adic topology (Lemmas 15.81 .5 and 15.29 .5 . Applying Lemma 15.82 .8 we see that it suffices to prove the existence of a weak solution for $\Lambda \rightarrow B$ which in the equicharacteristic $p$ case is a compositum of a separable extension and a field obtained by taking $p$-power roots of $t$. However,
since $\Lambda=k[[t]]$ in the equicharacteristic case and any extension of $k((t))$ is such a compositum, we can now drop this requirement!

Thus we arrive at the situation where $A$ and $B$ are complete, the residue field $k$ of $A$ is algebraically closed of characteristic $p>0$, we have $k=\bigcap \kappa_{B}^{p^{n}}$, and in the mixed characteristic case $p$ is a uniformizer of $A$ (i.e., $A$ is a Cohen ring for $k$ ). If $A$ has mixed characteristic choose a Cohen ring $\Lambda$ for $\kappa_{B}$ and in the equicharacteristic case set $\Lambda=\kappa_{B}[[t]]$. Arguing as above we may choose a ring map $A \rightarrow \Lambda$ lifting $k \rightarrow \kappa_{B}$ and mapping a uniformizer to a uniformizer. Since $k \subset \kappa_{B}$ is separable the ring map $A \rightarrow \Lambda$ is formally smooth in the adic topology (Lemma 15.81.5). Hence we can find a ring map $\Lambda \rightarrow B$ such that the composition $A \rightarrow \Lambda \rightarrow B$ is the given ring map $A \rightarrow B$ (see Lemma 15.29.5. Since $\Lambda$ and $B$ are complete discrete valuation rings with the same residue field, $B$ is finite over $\Lambda$ (Algebra, Lemma 10.95.12). This reduces us to the special case discussed in Lemma 15.82 .22

09IH Lemma 15.82.24. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume $B$ is essentially of finite type over $A$. Let $K \subset K^{\prime}$ be an algebraic extension of fields such that the integral closure $A^{\prime}$ of $A$ in $K^{\prime}$ is Noetherian. Then the integral closure $B^{\prime}$ of $B$ in $L^{\prime}=\left(L \otimes_{K} K^{\prime}\right)_{\text {red }}$ is Noetherian as well. Moreover, the map $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ is surjective and the corresponding residue field extensions are finitely generated field extensions.

Proof. Let $A \rightarrow C$ be a finite type ring map such that $B$ is a localization of $C$ at a prime $\mathfrak{p}$. Then $C^{\prime}=C \otimes_{A} A^{\prime}$ is a finite type $A^{\prime}$-algebra, in particular Noetherian. Since $A \rightarrow A^{\prime}$ is integral, so is $C \rightarrow C^{\prime}$. Thus $B=C_{\mathfrak{p}} \subset C_{\mathfrak{p}}^{\prime}$ is integral too. It follows that the dimension of $C_{\mathfrak{p}}^{\prime}$ is 1 (Algebra, Lemma 10.111.4. Of course $C_{\mathfrak{p}}^{\prime}$ is Noetherian. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{n}$ be the minimal primes of $C_{\mathfrak{p}}^{\prime \prime}$. Let $B_{i}^{\prime}$ be the integral closure of $B=C_{\mathfrak{p}}$, or equivalently by the above of $C_{\mathfrak{p}}^{\prime}$ in the field of fractions of $C_{\mathfrak{p}^{\prime}}^{\prime} / \mathfrak{q}_{i}$. It follows from Krull-Akizuki (Algebra, Lemma 10.118 .12 applied to the finitely many localizations of $C_{\mathfrak{p}}^{\prime}$ at its maximal ideals) that each $B_{i}^{\prime}$ is Noetherian. Moreover the residue field extensions in $C_{\mathfrak{p}}^{\prime} \rightarrow B_{i}^{\prime}$ are finite by Algebra, Lemma 10.118.10. Finally, we observe that $B^{\prime}=\prod B_{i}^{\prime}$ is the integral closure of $B$ in $L^{\prime}=\left(L \otimes_{K} K^{\prime}\right)_{\text {red }}$.

09II Proposition 15.82.25. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If $B$ is essentially of finite type over $A$, then there exists a finite extension $K \subset K_{1}$ which is a solution for $A \rightarrow B$ as defined in Definition 15.82.2

Proof. Observe that a weak solution is a solution if the residue field of $A$ is perfect, see Lemma 15.81.5. Thus the proposition follows immediately from Theorem 15.82 .23 if the residue characteristic of $A$ is 0 (and in fact we do not need the assumption that $A \rightarrow B$ is essentially of finite type). If the residue characteristic of $A$ is $p>0$ we will also deduce it from Epp's theorem.

Let $x_{i} \in A, i \in I$ be a set of elements mapping to a $p$-base of the residue field $\kappa$ of A. Set

$$
A^{\prime}=\bigcup_{n \geq 1} A\left[t_{i, n}\right] /\left(t_{i, n}^{p^{n}}-x_{i}\right)
$$

where the transition maps send $t_{i, n+1}$ to $t_{i, n}^{p}$. Observe that $A^{\prime}$ is a filtered colimit of weakly unramified finite extensions of discrete valuation rings over $A$. Thus $A^{\prime}$

See dJ96, Lemma 2.13] for a special case.
is a discrete valuation ring and $A \rightarrow A^{\prime}$ is weakly unramified. By construction the residue field $\kappa^{\prime}=A^{\prime} / \mathfrak{m}_{A} A^{\prime}$ is the perfection of $\kappa$.
Let $K^{\prime}=f . f .\left(A^{\prime}\right)$. We may apply Lemma 15.82 .24 to the extension $K \subset K^{\prime}$. Thus $B^{\prime}$ is a finite product of Dedekind domains. Let $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}$ be the maximal ideals of $B^{\prime}$. Using Epp's theorem (Theorem 15.82 .23 we find a weak solution $K^{\prime}=f . f .\left(A^{\prime}\right) \subset K_{i}^{\prime}$ for each of the extensions $A^{\prime} \subset B_{\mathfrak{m}_{i}}^{\prime}$. Since the residue field of $A^{\prime}$ is perfect, these are actually solutions. Let $K^{\prime} \subset K_{1}^{\prime}$ be a finite extension which contains each $K_{i}^{\prime}$. Then $K^{\prime} \subset K_{1}^{\prime}$ is still a solution for each $A^{\prime} \subset B_{\mathfrak{m}_{i}}^{\prime}$ by Lemma 15.82.4.

Let $A_{1}^{\prime}$ be the integral closure of $A$ in $K_{1}^{\prime}$. Note that $A_{1}^{\prime}$ is a Dedekind domain by the discussion in Remark 15.82 .1 applied to $K^{\prime} \subset K_{1}^{\prime}$. Thus Lemma 15.82 .24 applies to $K \subset K_{1}^{\prime}$. Therefore the integral closure $B_{1}^{\prime}$ of $B$ in $L_{1}^{\prime}=\left(L \otimes_{K} K_{1}^{\prime}\right)_{\text {red }}$ is a Dedekind domain and because $K^{\prime} \subset K_{1}^{\prime}$ is a solution for each $A^{\prime} \subset B_{\mathfrak{m}_{i}}^{\prime}$ we see that $\left(A_{1}^{\prime}\right)_{A_{1}^{\prime} \cap \mathfrak{m}} \rightarrow\left(B_{1}^{\prime}\right)_{\mathfrak{m}}$ is formally smooth for each maximal ideal $\mathfrak{m} \subset B_{1}^{\prime}$.

By construction, the field $K_{1}^{\prime}$ is a filtered colimit of finite extensions of $K$. Say $K_{1}^{\prime}=\operatorname{colim}_{i \in I} K_{i}$. For each $i$ let $A_{i}$, resp. $B_{i}$ be the integral closure of $A$, resp. $B$ in $K_{i}$, resp. $L_{i}=\left(L \otimes_{K} K_{i}\right)_{\text {red }}$. Then it is clear that

$$
A_{1}^{\prime}=\operatorname{colim} A_{i} \quad \text { and } \quad B_{1}^{\prime}=\operatorname{colim} B_{i}
$$

Since the ring maps $A_{i} \rightarrow A_{1}^{\prime}$ and $B_{i} \rightarrow B_{1}^{\prime}$ are injective integral ring maps and since $A_{1}^{\prime}$ and $B_{1}^{\prime}$ have finite spectra, we see that for all $i$ large enough the ring $\operatorname{maps} A_{i} \rightarrow A_{1}^{\prime}$ and $B_{i} \rightarrow B_{1}^{\prime}$ are bijective on spectra. Once this is true, for all $i$ large enough the maps $A_{i} \rightarrow A_{1}^{\prime}$ and $B_{i} \rightarrow B_{1}^{\prime}$ will be weakly unramified (once the uniformizer is in the image). It follows from multiplicativity of ramification indices that $A_{i} \rightarrow B_{i}$ induces weakly unramified maps on all localizations at maximal ideals of $B_{i}$ for such $i$. Increasing $i$ a bit more we see that

$$
B_{i} \otimes_{A_{i}} A_{1}^{\prime} \longrightarrow B_{1}^{\prime}
$$

induces surjective maps on residue fields (because the residue fields of $B_{1}^{\prime}$ are finitely generated over those of $A_{1}^{\prime}$ by Lemma 15.82.24. Picture of residue fields at maximal ideals lying under a chosen maximal ideal of $B_{1}^{\prime}$ :

Thus $\kappa_{B_{i}}$ is a finitely generated extension of $\kappa_{A_{i}}$ such that the compositum of $\kappa_{B_{i}}$ and $\kappa_{A_{1}^{\prime}}$ in $\kappa_{B_{1}^{\prime}}$ is separable over $\kappa_{A_{1}^{\prime}}$. Then that happens already at a finite stage: for example, say $\kappa_{B_{1}^{\prime}}$ is finite separable over $\kappa_{A_{1}^{\prime}}\left(x_{1}, \ldots, x_{n}\right)$, then just increase $i$ such that $x_{1}, \ldots, x_{n}$ are in $\kappa_{B_{i}}$ and such that all generators satisfy separable polynomial equations over $\kappa_{A_{i}}\left(x_{1}, \ldots, x_{n}\right)$. This means that $A_{i} \rightarrow B_{i}$ is formally smooth at all maximal ideals of $B_{i}$ and the proof is complete.

0BRP Lemma 15.82.26. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume
(1) $B$ is essentially of finite type over $A$,
(2) either $A$ or $B$ is a Nagata ring, and
(3) $L / K$ is separable.

Then there exists a separable solution for $A \rightarrow B$ (Definition 15.82.2).
Proof. Observe that if $A$ is Nagata, then so is $B$ (Algebra, Lemma 10.154.6 and Proposition 10.154.15). Thus the lemma follows on combining Proposition 15.82.25 and Lemma 15.82.9.

### 15.83. Picard groups of rings

0AFW We first define invertible modules as follows.
0B8H Definition 15.83.1. Let $R$ be a ring. An $R$-module $M$ is invertible if the functor

$$
\operatorname{Mod}_{R} \longrightarrow \operatorname{Mod}_{R}, \quad N \longmapsto M \otimes_{R} N
$$

is an equivalence of categories. An invertible $R$-module is said to be trivial if it is isomorphic to $A$ as an $A$-module.

0B8I Lemma 15.83.2. Let $R$ be a ring. Let $M$ be an $R$-module. Equivalent are
(1) $M$ is finite locally free module of rank 1 ,
(2) $M$ is invertible, and
(3) there exists an $R$-module $N$ such that $M \otimes_{R} N \cong R$.

Moreover, in this case the module $N$ is (3) is isomorphic to $\operatorname{Hom}_{R}(M, R)$.
Proof. Assume (1). Consider the module $N=\operatorname{Hom}_{R}(M, R)$ and the evaluation $\operatorname{map} M \otimes_{R} N=M \otimes_{R} \operatorname{Hom}_{R}(M, R) \rightarrow R$. If $f \in R$ such that $M_{f} \cong R_{f}$, then the evaluation map becomes an isomorphism after localization at $f$ (details omitted). Thus we see the evaluation map is an isomorphism by Algebra, Lemma 10.23.2. Thus (1) $\Rightarrow$ (3).
Assume (3). Then the functor $K \mapsto K \otimes_{R} N$ is a quasi-inverse to the functor $K \mapsto K \otimes_{R} M$. Thus (3) $\Rightarrow$ (2). Conversely, if (2) holds, then $K \mapsto K \otimes_{R} M$ is essentially surjective and we see that (3) holds.
Assume the equivalence conditions (2) and (3) hold. Denote $\psi: M \otimes_{R} N \rightarrow R$ the isomorphism from (3). Choose an element $\xi=\sum_{i=1, \ldots, n} x_{i} \otimes y_{i}$ such that $\psi(\xi)=1$. Consider the isomorphisms

$$
M \rightarrow M \otimes_{R} M \otimes_{R} N \rightarrow M
$$

where the first arrow sends $x$ to $\sum x_{i} \otimes x \otimes y_{i}$ and the second arrow sends $x \otimes x^{\prime} \otimes y$ to $\psi\left(x^{\prime} \otimes y\right) x$. We conclude that $x \mapsto \sum \psi\left(x \otimes y_{i}\right) x_{i}$ is an automorphism of $M$. This automorphism factors as

$$
M \rightarrow R^{\oplus n} \rightarrow M
$$

where the first arrow is given by $x \mapsto\left(\psi\left(x \otimes y_{1}\right), \ldots, \psi\left(x \otimes y_{n}\right)\right)$ and the second arrow by $\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum a_{i} x_{i}$. In this way we conclude that $M$ is a direct summand of a finite free $R$-module. This means that $M$ is finite locally free (Algebra, Lemma 10.77 .2 . Since the same is true for $N$ by symmetry and since $M \otimes_{R} N \cong R$, we see that $M$ and $N$ both have to have rank 1.

The set of isomorphism classes of these modules is often called the class group or Picard group of $R$. The group structure is determined by assigning to the isomorphism classes of the invertible modules $L$ and $L^{\prime}$ the isomorphism class of $L \otimes_{R} L^{\prime}$. The inverse of an invertible module $L$ is the module

$$
L^{\otimes-1}=\operatorname{Hom}_{R}(L, R)
$$

because as seen in the proof of Lemma 15.83 .2 the evaluation map $L \otimes_{R} L^{\otimes-1} \rightarrow R$ is an isomorphism. Let us denote the Picard group of $R$ by $\operatorname{Pic}(R)$.
0BCH Lemma 15.83.3. Let $R$ be a UFD. Then $\operatorname{Pic}(R)$ is trivial.
Proof. Let $L$ be an invertible $R$-module. By Lemma 15.83 .2 we see that $L$ is a finite locally free $R$-module. In particular $L$ is torsion free and finite over $R$. Pick a nonzero element $\varphi \in \operatorname{Hom}_{R}(L, R)$ of the dual invertible module. Then $I=\varphi(L) \subset R$ is an ideal which is an invertible module. Pick a nonzero $f \in I$ and let

$$
f=u p_{1}^{e_{1}} \ldots p_{r}^{e_{r}}
$$

be the factorization into prime elements with $p_{i}$ pairwise distinct. Since $L$ is is finite locally free there exists a $a_{i} \in R, a_{i} \notin\left(p_{i}\right)$ such that $I_{a_{i}}=\left(g_{i}\right)$ for some $g_{i} \in R_{a_{i}}$. Then $p_{i}$ is still a prime element of the UFD $R_{a_{i}}$ and we can write $g_{i}=p_{i}^{c_{i}} g_{i}^{\prime}$ for some $g_{i}^{\prime} \in R_{a_{i}}$ not divisible by $p_{i}$. Since $f \in I_{a_{i}}$ we see that $e_{i} \geq c_{i}$. We claim that $I$ is generated by $h=p_{1}^{c_{1}} \ldots p_{r}^{c_{r}}$ which finishes the proof.
To prove the claim it suffices to show that $I_{a}$ is generated by $h$ for any $a \in R$ such that $I_{a}$ is a principal ideal (Algebra, Lemma 10.23.2). Say $I_{a}=(g)$. Let $J \subset\{1, \ldots, r\}$ be the set of $i$ such that $p_{i}$ is a nonunit (and hence a prime element) in $R_{a}$. Because $f \in I_{a}=(g)$ we find the prime factorization $g=v \prod_{i \in J} p_{j}^{b_{j}}$ with $v$ a unit and $b_{j} \leq e_{j}$. For each $j \in J$ we have $I_{a a_{j}}=g R_{a a_{j}}=g_{j} R_{a a_{j}}$, in other words $g$ and $g_{j}$ map to associates in $R_{a a_{j}}$. By uniqueness of factorization this implies that $b_{j}=c_{j}$ and the proof is complete.

Recall that we have defined in Algebra, Section 10.54 a group $K_{0}(R)$ as the free group on isomorphism classes of finite projective $R$-modules modulo the relations $\left[M^{\prime}\right]+\left[M^{\prime \prime}\right]=\left[M^{\prime} \oplus M^{\prime \prime}\right]$.

0AFX Lemma 15.83.4. Let $R$ be a ring. There is a map

$$
\operatorname{det}: K_{0}(R) \longrightarrow \operatorname{Pic}(R)
$$

which maps $[M]$ to the class of the invertible module $\wedge^{n}(M)$ if $M$ is a finite locally free module of rank $n$.

Proof. Let $M$ be a finite projective $R$-module. There exists a product decomposition $R=R_{0} \times \ldots \times R_{t}$ such that in the corresponding decomposition $M=$ $M_{0} \times \ldots \times M_{t}$ of $M$ we have that $M_{i}$ is finite locally free of rank $i$ over $R_{i}$. This follows from Algebra, Lemma 10.77 .2 (to see that the rank is locally constant) and Algebra, Lemmas 10.20 .3 and 10.22 .3 (to decompose $R$ into a product). In this situation we define

$$
\operatorname{det}(M)=\wedge_{R_{0}}^{0}\left(M_{0}\right) \times \ldots \times \wedge_{R_{t}}^{t}\left(M_{t}\right)
$$

as an $R$-module. This is a finite locally free module of rank 1 as each term is finite locally free of rank 1 . To finish the proof we have to show that

$$
\operatorname{det}\left(M^{\prime} \oplus M^{\prime \prime}\right) \cong \operatorname{det}\left(M^{\prime}\right) \otimes \operatorname{det}\left(M^{\prime \prime}\right)
$$

whenever $M^{\prime}$ and $M^{\prime \prime \prime}$ are finite projective $R$-modules. Decompose $R$ into a product of rings $R_{i j}$ such that $M^{\prime}=\prod M_{i j}^{\prime}$ and $M^{\prime \prime}=\prod M_{i j}^{\prime \prime}$ where $M_{i j}^{\prime}$ has rank $i$ and $M_{i j}^{\prime \prime}$ has rank $j$. This reduces us to the case where $M^{\prime}$ and $M^{\prime \prime}$ have constant rank say $i$ and $j$. In this case we have to prove that

$$
\wedge^{i+j}\left(M^{\prime} \oplus M^{\prime \prime}\right) \cong \wedge^{i}\left(M^{\prime}\right) \otimes \wedge^{j}\left(M^{\prime \prime}\right)
$$

the proof of which we omit.
0AFY Lemma 15.83.5. Let $R$ be a ring. There is a map

$$
c: \text { perfect complexes over } R \longrightarrow K_{0}(R)
$$

with the following properties
(1) $c(K[n])=(-1)^{n} c(K)$ for a perfect complex $K$,
(2) if $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle of perfect complexes, then $c(L)=c(K)+c(M)$,
(3) if $K$ is represented by a finite complex $M^{\bullet}$ consisting of finite projective modules, then $c(K)=\sum(-1)^{i}\left[M_{i}\right]$.
Proof. Let $K$ be a perfect object of $D(R)$. By definition we can represent $K$ by a finite complex $M^{\bullet}$ of finite projective $R$-modules. We define $c$ by setting

$$
c(K)=\sum(-1)^{n}\left[M^{n}\right]
$$

in $K_{0}(R)$. Of course we have to show that this is well defined, but once it is well defined, then (1) and (3) are immediate. For the moment we view the map $c$ as defined on complexes of finite projective $R$-modules.
Suppose that $L^{\bullet} \rightarrow M^{\bullet}$ is a surjective map of finite complexes of finite projective $R$-modules. Let $K^{\bullet}$ be the kernel. Then we obtain short exact sequences of $R$ modules

$$
0 \rightarrow K^{n} \rightarrow L^{n} \rightarrow M^{n} \rightarrow 0
$$

which are split because $M^{n}$ is projective. Hence $K^{\bullet}$ is also a finite complex of finite projective $R$-modules and $c\left(L^{\bullet}\right)=c\left(K^{\bullet}\right)+c\left(M^{\bullet}\right)$ in $K_{0}(R)$.
Suppose given finite complex $M^{\bullet}$ of finite projective $R$-modules which is acyclic. Say $M^{n}=0$ for $n \notin[a, b]$. Then we can break $M^{\bullet}$ into short exact sequences

$$
\begin{gathered}
0 \rightarrow M^{a} \rightarrow M^{a+1} \rightarrow N^{a+1} \rightarrow 0 \\
0 \rightarrow N^{a+1} \rightarrow M^{a+2} \rightarrow N^{a+3} \rightarrow 0 \\
0 \rightarrow N^{b-3} \rightarrow M^{b-2} \rightarrow N^{b-2} \rightarrow 0 \\
0 \rightarrow N^{b-2} \rightarrow M^{b-1} \rightarrow M^{b} \rightarrow 0
\end{gathered}
$$

Arguing by descending induction we see that $N^{b-2}, \ldots, N^{a+1}$ are finite projective $R$-modules, the sequences are split exact, and

$$
c\left(M^{\bullet}\right)=\sum(-1)\left[M^{n}\right]=\sum(-1)^{n}\left(\left[N^{n-1}\right]+\left[N^{n}\right]\right)=0
$$

Thus our construction gives zero on acyclic complexes.
It follows formally from the results of the preceding two paragraphs that $c$ is well defined and satisfies (2). Namely, suppose the finite complexes $M^{\bullet}$ and $L^{\bullet}$ of finite projective $R$-modules represent the same object of $D(R)$. Then we can represent the isomorphism by a map $f: M^{\bullet} \rightarrow L^{\bullet}$ of complexes, see Derived Categories, Lemma 13.19.8. We obtain a short exact sequence of complexes

$$
0 \rightarrow L^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow K^{\bullet}[1] \rightarrow 0
$$

see Derived Categories, Definition 13.9.1. Since $f$ is a quasi-isomorphism, the cone $C(f)^{\bullet}$ is acyclic (this follows for example from the discussion in Derived Categories, Section 13.12. Hence

$$
0=c\left(C(f)^{\bullet}\right)=c\left(L^{\bullet}\right)+c\left(K^{\bullet}[1]\right)=c\left(L^{\bullet}\right)-c\left(K^{\bullet}\right)
$$

as desired. We omit the proof of (2) which is similar.
0AFZ Lemma 15.83.6. Let $R$ be a regular local ring. Let $f \in R$. Then $\operatorname{Pic}\left(R_{f}\right)=0$.
Proof. Let $L$ be an invertible $R_{f}$-module. In particular $L$ is a finite $R_{f}$-module. There exists a finite $R$-module $M$ such that $M_{f} \cong L$, see Algebra, Lemma 10.125.3. By Algebra, Proposition 10.109 .1 we see that $M$ has a finite free resolution $F_{\bullet}$ over $R$. It follows that $L$ is quasi-isomorphic to a finite complex of free $R_{f}$-modules. Hence by Lemma 15.83 .5 we see that $[L]=n\left[R_{f}\right]$ in $K_{0}(R)$ for some $n \in \mathbf{Z}$. Applying the map of Lemma 15.83 .4 we see that $L$ is trivial.

0AG0 Lemma 15.83.7. A regular local ring is a UFD.
Proof. Recall that a regular local ring is a domain, see Algebra, Lemma 10.105.2 We will prove the unique factorization property by induction on the dimension of the regular local ring $R$. If $\operatorname{dim}(R)=0$, then $R$ is a field and in particular a UFD. Assume $\operatorname{dim}(R)>0$. Let $x \in \mathfrak{m}, x \notin \mathfrak{m}^{2}$. Then $R /(x)$ is regular by Algebra, Lemma 10.105.3, hence a domain by Algebra, Lemma 10.105.2, hence $x$ is a prime element. Let $\mathfrak{p} \subset R$ be a height 1 prime. We have to show that $\mathfrak{p}$ is principal, see Algebra, Lemma 10.119.6. We may assume $x \notin \mathfrak{p}$, since if $x \in \mathfrak{p}$, then $\mathfrak{p}=(x)$ and we are done. For every nonmaximal prime $\mathfrak{q} \subset R$ the local ring $R_{\mathfrak{q}}$ is a regular local ring, see Algebra, Lemma 10.109.6. By induction we see that $\mathfrak{p} R_{\mathfrak{q}}$ is principal. In particular, the $R_{x}$-module $\mathfrak{p}_{x}=\mathfrak{p} R_{x} \subset R_{x}$ is a finitely presented $R_{x}$-module whose localization at any prime is free of rank 1. By Algebra, Lemma 10.77 .2 we see that $\mathfrak{p}_{x}$ is an invertible $R_{x}$-module. By Lemma 15.83 .6 we see that $\mathfrak{p}_{x}=(y)$ for some $y \in R_{x}$. We can write $y=x^{e} f$ for some $f \in \mathfrak{p}$ and $e \in \mathbf{Z}$. Factor $f=a_{1} \ldots a_{r}$ into irreducible elements of $R$ (Algebra, Lemma 10.119.3). Since $\mathfrak{p}$ is prime, we see that $a_{i} \in \mathfrak{p}$ for some $i$. Since $\mathfrak{p}_{x}=(y)$ is prime and $a_{i} \mid y$ in $R_{x}$, it follows that $\mathfrak{p}_{x}$ is generated by $a_{i}$ in $R_{x}$, i.e., the image of $a_{i}$ in $R_{x}$ is prime. As $x$ is a prime element, we find that $a_{i}$ is prime in $R$ by Algebra, Lemma 10.119.7. Since $\left(a_{i}\right) \subset \mathfrak{p}$ and $\mathfrak{p}$ has height 1 we conclude that $\left(a_{i}\right)=\mathfrak{p}$ as desired.

### 15.84. Extensions of valuation rings

0ASF This section is the analogue of Section 15.81 for general valuation rings.
0ASG Definition 15.84.1. We say that $A \rightarrow B$ or $A \subset B$ is an extension of valuation rings if $A$ and $B$ are valuation rings and $A \rightarrow B$ is injective and local. Such an extension induces a commutative diagram

where $\Gamma_{A}$ and $\Gamma_{B}$ are the value groups. We say that $B$ is weakly unramified over $A$ if the lower horizontal arrow is a bijection. If the extension of residue fields $\kappa_{A}=A / \mathfrak{m}_{A} \subset \kappa_{B}=B / \mathfrak{m}_{B}$ is finite, then we set $f=\left[\kappa_{B}: \kappa_{A}\right]$ and we call it the residual degree or residue degree of the extension $A \subset B$.

Note that $\Gamma_{A} \rightarrow \Gamma_{B}$ is injective, because the units of $A$ are the inverse of the units of $B$ under the map $A \rightarrow B$. Note also, that we do not require the extension of fraction fields to be finite.

0ASH Lemma 15.84.2. Let $A \subset B$ be an extension of valuation rings with fraction fields $K \subset L$. If the extension $K \subset L$ is finite, then the residue field extension is finite, the index of $\Gamma_{A}$ in $\Gamma_{B}$ is finite, and

$$
\left[\Gamma_{B}: \Gamma_{A}\right]\left[\kappa_{B}: \kappa_{A}\right] \leq[L: K] .
$$

Proof. Let $b_{1}, \ldots, b_{n} \in B$ be units whose images in $\kappa_{B}$ are linearly independent over $\kappa_{A}$. Let $c_{1}, \ldots, c_{m} \in B$ be nonzero elements whose images in $\Gamma_{B} / \Gamma_{A}$ are pairwise distinct. We claim that $b_{i} c_{j}$ are $K$-linearly independent in $L$. Namely, we claim a sum

$$
\sum a_{i j} b_{i} c_{j}
$$

with $a_{i j} \in K$ not all zero cannot be zero. Choose $\left(i_{0}, j_{0}\right)$ with $v\left(a_{i_{0} j_{0}} b_{i_{0}} c_{j_{0}}\right)$ minimal. Replace $a_{i j}$ by $a_{i j} / a_{i_{0} j_{0}}$, so that $a_{i_{0} j_{0}}=1$. Let

$$
P=\left\{(i, j) \mid v\left(a_{i j} b_{i} c_{j}\right)=v\left(a_{i_{0} j_{0}} b_{i_{0}} c_{j_{0}}\right)\right\}
$$

By our choice of $c_{1}, \ldots, c_{m}$ we see that $(i, j) \in P$ implies $j=j_{0}$. Hence if $(i, j) \in P$, then $v\left(a_{i j}\right)=v\left(a_{i_{0} j_{0}}\right)=0$, i.e., $a_{i j}$ is a unit. By our choice of $b_{1}, \ldots, b_{n}$ we see that

$$
\sum_{(i, j) \in P} a_{i j} b_{i}
$$

is a unit in $B$. Thus the valuation of $\sum_{(i, j) \in P} a_{i j} b_{i} c_{j}$ is $v\left(c_{j_{0}}\right)=v\left(a_{i_{0} j_{0}} b_{i_{0}} c_{j_{0}}\right)$. Since the terms with $(i, j) \notin P$ in the first displayed sum have strictly bigger valuation, we conclude that this sum cannot be zero, thereby proving the lemma.

0ASI Lemma 15.84.3. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local normal domains. Let $f \in A$ and $h \in B$ such that $f=w h^{n}$ for some $n>1$ and some unit $w$ of $B$. Assume that for every height 1 prime $\mathfrak{p} \subset A$ there is a height 1 prime $\mathfrak{q} \subset B$ lying over $\mathfrak{p}$ such that the extension $A_{\mathfrak{p}} \subset B_{\mathfrak{q}}$ is weakly unramified. Then $f=u g^{n}$ for some $g \in A$ and unit $u$ of $A$.

Proof. The local rings of $A$ and $B$ at height 1 primes are discrete valuation rings (Algebra, Lemma 10.118.7). Thus the assumption makes sense (via Definition 15.81.1. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ be the primes of $A$ minimal over $f$. These have height 1 by Algebra, Lemma 10.59 .10 For each $i$ let $\mathfrak{q}_{i, j} \subset B, j=1, \ldots, r_{i}$ be the height 1 primes of $B$ lying over $\mathfrak{p}_{i}$. Say we number them so that $A_{\mathfrak{p}_{i}} \rightarrow B_{\mathfrak{q}_{i, 1}}$ is weakly unramified. Since $f$ maps to an $n$th power times a unit in $B_{\mathfrak{q}_{i, 1}}$ we see that the valuation $v_{i}$ of $f$ in $A_{\mathfrak{p}_{i}}$ is divisible by $n$. Consider the exact sequence

$$
0 \rightarrow I \rightarrow A \rightarrow \prod_{i=1, \ldots, r} A_{\mathfrak{p}_{i}} / \mathfrak{p}_{i}^{v_{i} / n} A_{\mathfrak{p}_{i}}
$$

Applying the exact functor $-\otimes_{A} B$ we obtain

$$
0 \rightarrow I \otimes_{A} B \rightarrow B \rightarrow \prod_{i=1, \ldots, r} \prod_{j=1, \ldots, r_{i}} B_{\mathfrak{q}_{i, j}} / \mathfrak{q}_{i, j}^{e_{i, j} v_{i} / n} A_{\mathfrak{p}_{i}}
$$

where $e_{i, j}$ is the ramification index of $A_{\mathfrak{p}_{i}} \rightarrow B_{\mathfrak{q}_{i, j}}$. It follows that $I \otimes_{A} B$ is the set of elements $h^{\prime}$ of $B$ which have valuation $\geq e_{i, j} v_{i} / n$ at $\mathfrak{q}_{i, j}$. Since $f=w h^{n}$ in $B$ we see that $h$ has valuation $e_{i, j} v_{i} / n$ at $\mathfrak{q}_{i, j}$. Thus $h^{\prime} / h \in B$ by Algebra, Lemma 10.149.6. It follows that $I \otimes_{A} B$ is a free $B$-module of rank 1 . Therefore $I$ is a free $A$-module of rank 1, see Algebra, Lemma 10.77.5. Let $g \in I$ be a generator. Then we see that $g$ and $h$ differ by a unit in $B$. Working backwards we conclude that the valuation of $g$ in $A_{\mathfrak{p}_{i}}$ is $v_{i} / n$. Hence $g^{n}$ and $f$ differ by a unit in $A$ (by Algebra, Lemma 10.149.6 as desired.

0ASJ Lemma 15.84.4. Let $A$ be a valuation ring. Let $A \rightarrow B$ be an étale ring map and let $\mathfrak{m} \subset B$ be a prime lying over the maximal ideal of $A$. Then $A \subset B_{\mathfrak{m}}$ is an extension of valuation rings which is weakly unramified.

Proof. The ring $A$ has weak dimension $\leq 1$ by Lemma 15.78.17. Then $B$ has weak dimension $\leq 1$ by Lemmas 15.78 .4 and 15.78 .13 . hence the local ring $B_{\mathfrak{m}}$ is a valuation ring by Lemma 15.78 .17 . Since the extension $f . f .(A) \subset f . f .\left(B_{\mathfrak{m}}\right)$ is finite, we see that the $\Gamma_{A}$ has finite index in the value group of $B_{\mathfrak{m}}$. Thus for every $h \in B_{\mathfrak{m}}$ there exists an $n>0$, an element $f \in A$, and a unit $w \in B_{\mathfrak{m}}$ such that $f=w h^{n}$ in $B_{\mathfrak{m}}$. We will show that this implies $f=u g^{n}$ for some $g \in A$ and unit $u \in A$; this will show that the value groups of $A$ and $B_{\mathfrak{m}}$ agree, as claimed in the lemma.

Write $A=$ colim $A_{i}$ as the colimit of its local subrings which are essentially of finite type over over Z. Since $A$ is a normal domain (Algebra, Lemma 10.49.10), we may assume that each $A_{i}$ is normal (here we use that taking normalizations the local rings remain essentially of finite type over $\mathbf{Z}$ by Algebra, Proposition 10.154.16). For some $i$ we can find an étale extension $A_{i} \rightarrow B_{i}$ such that $B=A \otimes_{A_{i}} B_{i}$, see Algebra, Lemma 10.141.3. Let $\mathfrak{m}_{i}$ be the intersection of $B_{i}$ with $\mathfrak{m}$. Then we may apply Lemma 15.84 .3 to the ring map $A_{i} \rightarrow\left(B_{i}\right)_{\mathfrak{m}_{i}}$ to conclude. The hypotheses of the lemma are satisfied because:
(1) $A_{i}$ and $\left(B_{i}\right)_{\mathfrak{m}_{i}}$ are Noetherian as they are essentially of finite type over $\mathbf{Z}$,
(2) $A_{i} \rightarrow\left(B_{i}\right)_{\mathfrak{m}_{i}}$ is flat as $A_{i} \rightarrow B_{i}$ is étale,
(3) $B_{i}$ is normal as $A_{i} \rightarrow B_{i}$ is étale, see Algebra, Lemma 10.155.7,
(4) for every height 1 prime of $A_{i}$ there exists a height 1 prime of $\left(B_{i}\right)_{\mathfrak{m}_{i}}$ lying over it by Algebra, Lemma 10.112 .2 and the fact that $\operatorname{Spec}\left(\left(B_{i}\right)_{\mathfrak{m}_{i}}\right) \rightarrow$ $\operatorname{Spec}\left(A_{i}\right)$ is surjective,
(5) the induced extensions $\left(A_{i}\right)_{\mathfrak{p}} \rightarrow\left(B_{i}\right)_{\mathfrak{q}}$ are unramified for every prime $\mathfrak{q}$ lying over a prime $\mathfrak{p}$ as $A_{i} \rightarrow B_{i}$ is étale.

This concludes the proof of the lemma.
0ASK Lemma 15.84.5. Let $A$ be a valuation ring. Let $A^{h}$, resp. $A^{\text {sh }}$ be its henselization, resp. strict henselization. Then

$$
A \subset A^{h} \subset A^{s h}
$$

are extensions of valuation rings which induce bijections on value groups, i.e., which are weakly unramified.

Proof. Write $A^{h}=\operatorname{colim}\left(B_{i}\right)_{\mathfrak{q}_{i}}$ where $A \rightarrow B_{i}$ is étale and $\mathfrak{q}_{i} \subset B_{i}$ is a prime ideal lying over $\mathfrak{m}_{A}$, see Algebra, Lemma 10.148.21. Then Lemma 15.84.4 tells us that $\left(B_{i}\right)_{\mathfrak{q}_{i}}$ is a valuation ring and that the induced map

$$
(A \backslash\{0\}) / A^{*} \longrightarrow\left(\left(B_{i}\right)_{\mathfrak{q}_{i}} \backslash\{0\}\right) /\left(B_{i}\right)_{\mathfrak{q}_{i}}^{*}
$$

is bijective. By Algebra, Lemma 10.49 .5 we conclude that $A^{h}$ is a valuation ring. It also follows that $(A \backslash\{0\}) / A^{*} \rightarrow\left(A^{h} \backslash\{0\}\right) /\left(A^{h}\right)^{*}$ is bijective. This proves the lemma for the inclusion $A \subset A^{h}$. To prove it for $A \subset A^{\text {sh }}$ we can use exactly the same argument except we replace Algebra, Lemma 10.148 .21 by Algebra, Lemma 10.148.27. Since $A^{s h}=\left(A^{h}\right)^{s h}$ we see that this also proves the assertions of the lemma for the inclusion $A^{h} \subset A^{s h}$.

### 15.85. Structure of modules over a PID

0ASL We work a little bit more generally (following the papers War69 and War70 by Warfield) so that the proofs work over valuation rings.

0ASM Lemma 15.85.1. Let $P$ be a module over a ring $R$. The following are equivalent
(1) $P$ is a direct summand of a direct sum of modules of the form $R / f R$, for $f \in R$ varying.
(2) for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of $R$-modules such that $f A=A \cap f B$ for all $f \in R$ the map $\operatorname{Hom}_{R}(P, B) \rightarrow \operatorname{Hom}_{R}(P, C)$ is surjective.

Proof. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be an exact sequence as in (2). To prove that (1) implies (2) it suffices to prove that $\operatorname{Hom}_{R}(R / f R, B) \rightarrow \operatorname{Hom}_{R}(R / f R, C)$ is surjective for every $f \in R$. Let $\psi: R / f R \rightarrow C$ be a map. Say $\psi(1)$ is the image of $b \in B$. Then $f b \in A$. Hence there exists an $a \in A$ such that $f a=f b$. Then $f(b-a)=0$ hence we get a morphism $\varphi: R / f R \rightarrow B$ mapping 1 to $b-a$ which lifts $\psi$.

Conversely, assume that (2) holds. Let $I$ be the set of pairs $(f, \varphi)$ where $f \in R$ and $\varphi: R / f R \rightarrow P$. For $i \in I$ denote $\left(f_{i}, \varphi_{i}\right)$ the corresponding pair. Consider the map

$$
B=\bigoplus_{i \in I} R / f_{i} R \longrightarrow P
$$

which sends the element $r$ in the summand $R / f_{i} R$ to $\varphi_{i}(r)$ in $P$. Let $A=\operatorname{Ker}(F \rightarrow$ $P)$. Then we see that (1) is true if the sequence

$$
0 \rightarrow A \rightarrow B \rightarrow P \rightarrow 0
$$

is an exact sequence as in (2). To see this suppose $f \in R$ and $a \in A$ maps to $f b$ in $B$. Write $b=\left(r_{i}\right)_{i \in I}$ with almost all $r_{i}=0$. Then we see that

$$
f \sum \varphi_{i}\left(r_{i}\right)=0
$$

in $P$. Hence there is an $i_{0} \in I$ such that $f_{i_{0}}=f$ and $\varphi_{i_{0}}(1)=\sum \varphi_{i}\left(r_{i}\right)$. Let $x_{i_{0}} \in R / f_{i_{0}} R$ be the class of 1 . Then we see that

$$
a=\left(r_{i}\right)_{i \in I}-\left(0, \ldots, 0, x_{i_{0}}, 0, \ldots\right)
$$

is an element of $A$ and $f a=b$ as desired.
0ASN Lemma 15.85.2 (Generalized valuation rings). Let $R$ be a ring. The following are equivalent
(1) For $a, b \in R$ either $a$ divides $b$ or $b$ divides $a$.
(2) Every finitely generated ideal is principal and $R$ is local.
(3) The set of ideals of $R$ are linearly ordered by inclusion.

This holds in particular if $R$ is a valuation ring.
Proof. Assume (2) and let $a, b \in R$. Then $(a, b)=(c)$. If $c=0$, then $a=b=0$ and $a$ divides $b$. Assume $c \neq 0$. Write $c=u a+v b$ and $a=w c$ and $b=z c$. Then $c(1-u w-v z)=0$. Since $R$ is local, this implies that $1-u w-v z \in \mathfrak{m}$. Hence either $w$ or $z$ is a unit, so either $a$ divides $b$ or $b$ divides $a$. Thus (2) implies (1).
Assume (1). If $R$ has two maximal ideals $\mathfrak{m}_{i}$ we can choose $a \in \mathfrak{m}_{1}$ with $a \notin \mathfrak{m}_{2}$ and $b \in \mathfrak{m}_{2}$ with $b \notin \mathfrak{m}_{1}$. Then $a$ does not divide $b$ and $b$ does not divide $a$. Hence

War69, Corollary 1]
$R$ has a unique maximal ideal and is local. It follows easily from condition (1) and induction that every finitely generated ideal is principal. Thus (1) implies (2).
It is straightforward to prove that (1) and (3) are equivalent. The final statement is Algebra, Lemma 10.49.3.

0ASP Lemma 15.85.3. Let $R$ be a ring satisfying the equivalent conditions of Lemma 15.85.2. Then every finitely presented $R$-module is isomorphic to a finite direct sum of modules of the form $R / f R$.
Proof. Let $M$ be a finitely presented $R$-module. Let $x_{1}, \ldots, x_{n} \in M$ be a minimal set of generators. Let $I \subset R$ be the annihilator of $M$ For some $i$ the annihilator $I_{i}$ of $x_{i}$ is $I$ : we have $I=\bigcap I_{i}$ and the set of ideals are linearly ordered. After renumbering we may assume $I_{1}=I$. We set $A=R x_{1} \subset M$. Consider the exact sequence $0 \rightarrow A \rightarrow M \rightarrow M / A \rightarrow 0$. Since $A$ is finite, we see that $M / A$ is a finitely presented $R$-module (Algebra, Lemma 10.5.3) with fewer generators. Hence $M / A \cong \bigoplus_{j=1, \ldots, m} R / f_{j} R$ by induction. On the other hand, we claim that $A \rightarrow M$ satisfies the property: if $f \in R$, then $f A=A \cap f M$. Namely, if $x \in A \cap f M$, then $x=\sum f r_{i} x_{i}$ and $x=g x_{1}$. Hence $g=f r_{1}$ and we see that $x \in f A$. By Lemma 15.85 .1 the sequence is split and we find $M \cong A \oplus \bigoplus_{j=1, \ldots, m} R / f_{j} R$. Then $A=R / I$ is finitely presented (as a summand of $M$ ) and hence $I$ is finitely generated, hence principal. This finishes the proof.
0ASQ Lemma 15.85.4. Let $R$ be a ring such that every local ring of $R$ at a maximal ideal satisfies the equivalent conditions of Lemma 15.85.2. Then every finitely presented $R$-module is a summand of a finite direct sum of modules of the form $R / f R$ for $f$ in $R$ varying.
Proof. Let $M$ be a finitely presented $R$-module. We first show that $M$ is a summand of a direct sum of modules of the form $R / f R$ and at the end we argue the direct sum can be taken to be finite. Let

$$
0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0
$$

be a short exact sequence of $R$-modules such that $f A=A \cap f B$ for all $f \in R$. By Lemma 15.85 .1 we have to show that $\operatorname{Hom}_{R}(M, B) \rightarrow \operatorname{Hom}_{R}(M, C)$ is surjective. It suffices to prove this after localization at maximal ideals $\mathfrak{m}$, see Algebra, Lemma 10.23.1. Note that the localized sequences $0 \rightarrow A_{\mathfrak{m}} \rightarrow B_{\mathfrak{m}} \rightarrow C_{\mathfrak{m}} \rightarrow 0$ satisfy the condition that $f A_{\mathfrak{m}}=A_{\mathfrak{m}} \cap f B_{\mathfrak{m}}$ for all $f \in R_{\mathfrak{m}}$ (because we can write $f=u f^{\prime}$ with $u \in R_{\mathfrak{m}}$ a unit and $f^{\prime} \in R$ and because localization is exact). Since $M$ is finitely presented, we see that

$$
\operatorname{Hom}_{R}(M, B)_{\mathfrak{m}}=\operatorname{Hom}_{R_{\mathfrak{m}}}\left(M_{\mathfrak{m}}, B_{\mathfrak{m}}\right) \quad \text { and } \quad \operatorname{Hom}_{R}(M, C)_{\mathfrak{m}}=\operatorname{Hom}_{R_{\mathfrak{m}}}\left(M_{\mathfrak{m}}, C_{\mathfrak{m}}\right)
$$

by Algebra, Lemma 10.10 .2 . The module $M_{\mathfrak{m}}$ is a finitely presented $R_{\mathfrak{m}}$-module. By Lemma 15.85 .3 we see that $M_{\mathfrak{m}}$ is a direct sum of modules of the form $R_{\mathfrak{m}} / f R_{\mathfrak{m}}$. Thus we conclude by Lemma 15.85 .1 that the map on localizations is surjective.
At this point we know that $M$ is a summand of $\bigoplus_{i \in I} R / f_{i} R$. Consider the map $M \rightarrow \bigoplus_{i \in I} R / f_{i} R$. Since $M$ is a finite $R$-module, the image is contained in $\bigoplus_{i \in I^{\prime}} R / f_{i} R$ for some finite subset $I^{\prime} \subset I$. This finishes the proof.

0ASR Definition 15.85.5. Let $R$ be a domain.
(1) We say $R$ is a Bézout domain if every finitely generated ideal of $R$ is principal.
(2) We say $R$ is an elementary divisor domain if for all $n, m \geq 1$ and every $n \times m$ matrix $A$, there exist invertible matrices $U, V$ of size $n \times n, m \times m$ such that

$$
U A V=\left(\begin{array}{cccc}
f_{1} & 0 & 0 & \ldots \\
0 & f_{2} & 0 & \ldots \\
0 & 0 & f_{3} & \ldots \\
\ldots & \ldots & \ldots & \ldots
\end{array}\right)
$$

with $f_{1}, \ldots, f_{\min (n, m)} \in R$ and $f_{1}\left|f_{2}\right| \ldots$
It is apparently still an open question as to whether every Bézout domain $R$ is an elementary divisor domain (or not). This is equivalent to the question of whether every finitely presented module over $R$ is a direct sum of cyclic modules. The converse implication is true.

0ASS Lemma 15.85.6. An elementary divisor domain is Bézout.
Proof. Let $a, b \in R$ be nonzero. Consider the $1 \times 2$ matrix $A=(a b)$. Then we see that $u(a b) V=(f 0)$ with $u \in R$ invertible and $V=\left(g_{i j}\right)$ an invertible $2 \times 2$ matrix. Then $f=u a g_{11}+u b g_{21}$ and $\left(g_{11}, g_{21}\right)=R$. It follows that $(a, b)=(f)$. An induction argument (omitted) then shows any finitely generated ideal in $R$ is generated by one element.

0AST Lemma 15.85.7. The localization of a Bézout domain is Bézout. Every local ring of a Bézout domain is a valuation ring. A local domain is Bézout if and only if it is a valuation ring.

Proof. We omit the proof of the statement on localizations. The final statement is Algebra, Lemma 10.49.15. The second statement follows from the other two.

0ASU Lemma 15.85.8. Let $R$ be a Bézout domain.
(1) Every finite submodule of a free module is finite free.
(2) Every finitely presented $R$-module $M$ is a direct sum of a finite free module and a torsion module $M_{\text {tors }}$ which is a summand of a module of the form $\bigoplus_{i=1, \ldots, n} R / f_{i} R$ with $f_{1}, \ldots, f_{n} \in R$ nonzero.

Proof. Proof of (1). Let $M \subset F$ be a finite submodule of a free module $F$. Since $M$ is finite, we may assume $F$ is a finite free module (details omitted). Say $F=R^{\oplus n}$. We argue by induction on $n$. If $n=1$, then $M$ is a finitely generated ideal, hence principal by our assumption that $R$ is Bézout. If $n>1$, then we consider the image $I$ of $M$ under the projection $R^{\oplus n} \rightarrow R$ onto the last summand. If $I=(0)$, then $M \subset R^{\oplus n-1}$ and we are done by induction. If $I \neq 0$, then $I=(f) \cong R$. Hence $M \cong R \oplus \operatorname{Ker}(M \rightarrow I)$ and we are done by induction as well.

Let $M$ be a finitely presented $R$-module. Since the localizations of $R$ are maximal ideals are valuation rings (Lemma 15.85.7) we may apply Lemma 15.85.4. Thus $M$ is a summand of a module of the form $R^{\oplus r} \oplus \bigoplus_{i=1, \ldots, n} R / f_{i} R$ with $f_{i} \neq 0$. Since taking the torsion submodule is a functor we see that $M_{\text {tors }}$ is a summand of the module $\bigoplus_{i=1, \ldots, n} R / f_{i} R$ and $M / M_{\text {tors }}$ is a summand of $R^{\oplus r}$. By the first part of the proof we see that $M / M_{\text {tors }}$ is finite free. Hence $M \cong M_{\text {tors }} \oplus M / M_{\text {tors }}$ as desired.

0ASV Lemma 15.85.9. Let $R$ be a PID. Every finite $R$-module $M$ is of isomorphic to a module of the form

$$
R^{\oplus r} \oplus \bigoplus_{i=1, \ldots, n} R / f_{i} R
$$

for some $r, n \geq 0$ and $f_{1}, \ldots, f_{n} \in R$ nonzero.
Proof. A PID is a Noetherian Bézout ring. By Lemma 15.85 .8 it suffices to prove the result if $M$ is torsion. Since $M$ is finite, this means that the annihilator of $M$ is nonzero. Say $f M=0$ for some $f \in R$ nonzero. Then we can think of $M$ as a module over $R / f R$. Since $R / f R$ is Noetherian of dimension 0 (small detail omitted) we see that $R / f R=\prod R_{j}$ is a finite product of Artinian local rings $R_{i}$ (Algebra, Proposition 10.59.6). Each $R_{i}$, being a local ring and a quotient of a PID, is a generalized valuation ring in the sense of Lemma 15.85 .2 (small detail omitted). Write $M=\prod M_{j}$ with $M_{j}=e_{j} M$ where $e_{j} \in R / f R$ is the idempotent corresponding to the factor $R_{j}$. By Lemma 15.85 .3 we see that $M_{j}=$ $\bigoplus_{i=1, \ldots, n_{j}} R_{j} / \bar{f}_{j i} R_{j}$ for some $\bar{f}_{j i} \in R_{j}$. Choose lifts $f_{j i} \in R$ and choose $g_{j i} \in R$ with $\left(g_{j i}\right)=\left(f_{j}, f_{j i}\right)$. Then we conclude that

$$
M \cong \bigoplus R / g_{j i} R
$$

as an $R$-module which finishes the proof.
One can also prove that a PID is a elementary divisor domain (insert future reference here), by proving lemmas similar to the following.
0ASW Lemma 15.85.10. Let $R$ be a Bézout domain. Let $n \geq 1$ and $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal. There exists an invertible $n \times n$ matrix in $R$ whose first row is $f_{1} \ldots f_{n}$.
Proof. This follows from Lemma 15.85 .8 but we can also prove it directly as follows. By induction on $n$. The result holds for $n=1$. Assume $n>1$. We may assume $f_{1} \neq 0$ after renumbering. Choose $f \in R$ such that $(f)=\left(f_{1}, \ldots, f_{n-1}\right)$. Let $A$ be an $(n-1) \times(n-1)$ matrix whose first row is $f_{1} / f, \ldots, f_{n-1} / f$. Choose $a, b \in R$ such that $a f-b f_{n}=1$ which is possible because $1 \in\left(f_{1}, \ldots, f_{n}\right)=\left(f, f_{n}\right)$. Then a solution is the matrix

$$
\left(\begin{array}{ccccc}
f & 0 & \ldots & 0 & f_{n} \\
0 & 1 & \ldots & 0 & 0 \\
& & \ldots & & \\
0 & 0 & \ldots & 1 & 0 \\
b & 0 & \ldots & 0 & a
\end{array}\right)\left(\begin{array}{cccc} 
& & & 0 \\
& A & & \\
& & & 0 \\
0 & \ldots & 0 & 1
\end{array}\right)
$$

Observe that the left matrix is invertible because it has determinant 1.

## CHAPTER 16

## Smoothing Ring Maps

07BW

### 16.1. Introduction

07BX The main result of this chapter is the following:
A regular map of Noetherian rings is a filtered colimit of smooth ones.
This theorem is due to Popescu, see Pop90. A readable exposition of Popescu's proof was given by Richard Swan, see [Swa98] who used notes by André and a paper of Ogoma, see Ogo94.

Our exposition follows Swan's, but we first prove an intermediate result which lets us work in a slightly simpler situation. Here is an overview. We first solve the following "lifting problem": A flat infinitesimal deformation of a filtered colimit of smooth algebras is a filtered colimit of smooth algebras. This result essentially says that it suffices to prove the main theorem for maps between reduced Noetherian rings. Next we prove two very clever lemmas called the "lifting lemma" and the "desingularization lemma". We show that these lemmas combined reduce the main theorem to proving a Noetherian, geometrically regular algebra $\Lambda$ over a field $k$ is a filtered limit of smooth $k$-algebras. Next, we discuss the necessary local tricks that go into the Popescu-Ogoma-Swan-André proof. Finally, in the last three sections we give the proof.

We end this introduction with some pointers to references. Let $A$ be a henselian Noetherian local ring. We say $A$ has the approximation property if for any $f_{1}, \ldots, f_{m} \in$ $A\left[x_{1}, \ldots, x_{n}\right]$ the system of equations $f_{1}=0, \ldots, f_{m}=0$ has a solution in the completion of $A$ if and only if it has a solution in $A$. This definition is due to Artin. Artin first proved the approximation property for analytic systems of equations, see Art68. In Art69a Artin proved the approximation property for local rings essentially of finite type over an excellent discrete valuation ring. Artin conjectured (page 26 of Art69a) that every excellent henselian local ring should have the approximation property.

At some point in time it became a conjecture that that every regular homomorphism of Noetherian rings is a filtered colimit of smooth algebras (see for example Ray72, Pop81, Art82, AD83). We're not sure who this conjecture ${ }^{1}$ is due to. The relationship with the approximation property is that if $A \rightarrow A^{\wedge}$ is a colimit of smooth algebras, then the approximation property holds (insert future reference here). Moreover, the main theorem applies to the map $A \rightarrow A^{\wedge}$ if $A$ is an excellent

[^45]local ring, as one of the conditions of an excellent local ring is that the formal fibres are geometrically regular. Note that excellent local rings were defined by Grothendieck and their definition appeared in print in 1965.
In Art82 it was shown that $R \rightarrow R^{\wedge}$ is a filtered colimit of smooth algebras for any local ring $R$ essentially of finite type over a field. In AR88 it was shown that $R \rightarrow R^{\wedge}$ is a filtered colimit of smooth algebras for any local ring $R$ essentially of finite type over an excellent discrete valuation ring. Finally, the main theorem was shown in Pop85, Pop86, Pop90, Ogo94, and Swa98 as discussed above.

Conversely, using some of the results above, in Rot90 it was shown that any local ring with the approximation property is excellent.
The paper Spi99 provides an alternative approach to the main theorem, but it seems hard to read (for example Spi99, Lemma 5.2] appears to be an incorrectly reformulated version of [Elk73, Lemma 3]). There is also a Bourbaki lecture about this material, see Tei95.

### 16.2. Colimits

In Categories, Section 4.19 we discuss filtered colimits. In particular, note that Categories, Lemma 4.21 .3 tells us that colimits over filtered index categories are the same thing as colimits over directed partially ordered sets.

07C3 Lemma 16.2.1. Let $R \rightarrow \Lambda$ be a ring map. Let $\mathcal{E}$ be a set of $R$-algebras such that each $A \in \mathcal{E}$ is of finite presentation over $R$. Then the following two statements are equivalent
(1) $\Lambda$ is a filtered colimit of elements of $\mathcal{E}$, and
(2) for any $R$ algebra map $A \rightarrow \Lambda$ with $A$ of finite presentation over $R$ we can find a factorization $A \rightarrow B \rightarrow \Lambda$ with $B \in \mathcal{E}$.

Proof. Suppose that $\mathcal{I} \rightarrow \mathcal{E}, i \mapsto A_{i}$ is a diagram such that $\Lambda=\operatorname{colim}_{i} A_{i}$. Let $A \rightarrow \Lambda$ with $A$ of finite presentation over $R$. Pick a presentation $A=$ $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Say $A \rightarrow \Lambda \operatorname{maps} x_{s}$ to $\lambda_{s} \in \Lambda$. We can find an $i \in \operatorname{Ob}(\mathcal{I})$ and elements $a_{s} \in A_{i}$ whose image in $\Lambda$ is $\lambda_{s}$. Increasing $i$ if necessary we may also assume that $f_{t}\left(a_{1}, \ldots, a_{n}\right)=0$ in $A_{i}$. Hence we can factor $A \rightarrow \Lambda$ through $A_{i}$ by mapping $x_{s}$ to $a_{s}$.

Conversely, suppose that (2) holds. Consider the category $\mathcal{I}$ whose objects are $R$ algebra maps $A \rightarrow \Lambda$ with $A \in \mathcal{E}$ and whose morphisms are commutative diagrams

of $R$-algebras. We claim that $\mathcal{I}$ is a filtered index category and that $\Lambda=\operatorname{colim}_{\mathcal{I}} A$. To see that $\mathcal{I}$ is filtered, let $A \rightarrow \Lambda$ and $A^{\prime} \rightarrow \Lambda$ be two objects. Then we can factor $A \otimes_{R} A^{\prime} \rightarrow \Lambda$ through an object of $\mathcal{I}$ by assumption (2) and the fact that the elements of $\mathcal{E}$ are of finite presentation over $R$. Suppose that $\varphi, \psi: A \rightarrow A^{\prime}$ are two morphisms of $\mathcal{I}$. Let $x_{1}, \ldots, x_{n}$ be generators of $A$ as an $R$-algebra. By assumption (2) we can factor the $R$-algebra map $A^{\prime} /\left(\varphi\left(x_{i}\right)-\psi\left(x_{i}\right)\right) \rightarrow \Lambda$ through an object of $\mathcal{I}$. This proves that $\mathcal{I}$ is filtered. We omit the proof that $\Lambda=\operatorname{colim}_{\mathcal{I}} A$.

### 16.3. Singular ideals

07C4 Let $R \rightarrow A$ be a ring map. The singular ideal of $A$ over $R$ is the radical ideal in $A$ cutting out the singular locus of the morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$. Here is a formal definition.

07C5 Definition 16.3.1. Let $R \rightarrow A$ be a ring map. The singular ideal of $A$ over $R$, denoted $H_{A / R}$ is the unique radical ideal $H_{A / R} \subset A$ with

$$
V\left(H_{A / R}\right)=\{\mathfrak{q} \in \operatorname{Spec}(A) \mid R \rightarrow A \text { not smooth at } \mathfrak{q}\}
$$

This makes sense because the set of primes where $R \rightarrow A$ is smooth is open, see Algebra, Definition 10.135.11. In order to find an explicit set of generators for the singular ideal we first prove the following lemma.
07C6 Lemma 16.3.2. Let $R$ be a ring. Let $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Let $\mathfrak{q} \subset A$. Assume $R \rightarrow A$ is smooth at $\mathfrak{q}$. Then there exists an $a \in A, a \notin \mathfrak{q}$, an integer $c$, $0 \leq c \leq \min (n, m)$, subsets $U \subset\{1, \ldots, n\}, V \subset\{1, \ldots, m\}$ of cardinality $c$ such that

$$
a=a^{\prime} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{j \in V, i \in U}
$$

for some $a^{\prime} \in A$ and

$$
a f_{\ell} \in\left(f_{j}, j \in V\right)+\left(f_{1}, \ldots, f_{m}\right)^{2}
$$

for all $\ell \in\{1, \ldots, m\}$.
Proof. Set $I=\left(f_{1}, \ldots, f_{m}\right)$ so that the naive cotangent complex of $A$ over $R$ is homotopy equivalent to $I / I^{2} \rightarrow \bigoplus A \mathrm{~d} x_{i}$, see Algebra, Lemma 10.132.2. We will use the formation of the naive cotangent complex commutes with localization, see Algebra, Section 10.132, especially Algebra, Lemma 10.132.13. By Algebra, Definitions 10.135.1 and 10.135.11 we see that $\left(I / I^{2}\right)_{a} \rightarrow \bigoplus A_{a} \mathrm{~d} x_{i}$ is a split injection for some $a \in A, a \notin \mathfrak{p}$. After renumbering $x_{1}, \ldots, x_{n}$ and $f_{1}, \ldots, f_{m}$ we may assume that $f_{1}, \ldots, f_{c}$ form a basis for the vector space $I / I^{2} \otimes_{A} \kappa(\mathfrak{q})$ and that $\mathrm{d} x_{c+1}, \ldots, \mathrm{~d} x_{n}$ map to a basis of $\Omega_{A / R} \otimes_{A} \kappa(\mathfrak{q})$. Hence after replacing $a$ by $a a^{\prime}$ for some $a^{\prime} \in A$, $a^{\prime} \notin \mathfrak{q}$ we may assume $f_{1}, \ldots, f_{c}$ form a basis for $\left(I / I^{2}\right)_{a}$ and that $\mathrm{d} x_{c+1}, \ldots, \mathrm{~d} x_{n}$ map to a basis of $\left(\Omega_{A / R}\right)_{a}$. In this situation $a^{N}$ for some large integer $N$ satisfies the conditions of the lemma (with $U=V=\{1, \ldots, c\}$ ).
We will use the notion of a strictly standard element in a $A$ over $R$. Our notion is slightly weaker than the one in Swan's paper [Swa98. We also define an elementary standard element to be one of the type we found in the lemma above. We compare the different types of elements in Lemma 16.4.7.

07C7 Definition 16.3.3. Let $R \rightarrow A$ be a ring map of finite presentation. We say an element $a \in A$ is elementary standard in $A$ over $R$ if there exists a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and $0 \leq c \leq \min (n, m)$ such that
07C8

$$
\begin{equation*}
a=a^{\prime} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c} \tag{16.3.3.1}
\end{equation*}
$$

for some $a^{\prime} \in A$ and
07C9

$$
\begin{equation*}
a f_{c+j} \in\left(f_{1}, \ldots, f_{c}\right)+\left(f_{1}, \ldots, f_{m}\right)^{2} \tag{16.3.3.2}
\end{equation*}
$$

for $j=1, \ldots, m-c$. We say $a \in A$ is strictly standard in $A$ over $R$ if there exists a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and $0 \leq c \leq \min (n, m)$ such that
07ER

$$
\begin{equation*}
a=\sum_{I \subset\{1, \ldots, n\},|I|=c} a_{I} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{j=1, \ldots, c, i \in I} \tag{16.3.3.3}
\end{equation*}
$$

for some $a_{I} \in A$ and
07ES
(16.3.3.4) $\quad a f_{c+j} \in\left(f_{1}, \ldots, f_{c}\right)+\left(f_{1}, \ldots, f_{m}\right)^{2}$
for $j=1, \ldots, m-c$.
The following lemma is useful to find implications of 16.3.3.3.
07ET Lemma 16.3.4. Let $R$ be a ring. Let $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and write $I=\left(f_{1}, \ldots, f_{n}\right)$. Let $a \in A$. Then (16.3.3.3) implies there exists an $A$-linear map $\psi: \bigoplus_{i=1, \ldots, n} A d x_{i} \rightarrow A^{\oplus c}$ such that the composition

$$
A^{\oplus c} \xrightarrow{\left(f_{1}, \ldots, f_{c}\right)} I / I^{2} \xrightarrow{f \mapsto d f} \bigoplus_{i=1, \ldots, n} A d x_{i} \xrightarrow{\psi} A^{\oplus c}
$$

is multiplication by a. Conversely, if such a $\psi$ exists, then $a^{c}$ satisfies 16.3.3.3).
Proof. This is a special case of Algebra, Lemma 10.14.4.
07CA Lemma 16.3.5 (Elkik). Let $R \rightarrow A$ be a ring map of finite presentation. The singular ideal $H_{A / R}$ is the radical of the ideal generated by strictly standard elements in $A$ over $R$ and also the radical of the ideal generated by elementary standard elements in $A$ over $R$.

Proof. Assume $a$ is strictly standard in $A$ over $R$. We claim that $A_{a}$ is smooth over $R$, which proves that $a \in H_{A / R}$. Namely, let $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$, $c$, and $a^{\prime} \in A$ be as in Definition 16.3.3. Write $I=\left(f_{1}, \ldots, f_{m}\right)$ so that the naive cotangent complex of $A$ over $R$ is given by $I / I^{2} \rightarrow \bigoplus A \mathrm{~d} x_{i}$. Assumption 16.3.3.4 implies that $\left(I / I^{2}\right)_{a}$ is generated by the classes of $f_{1}, \ldots, f_{c}$. Assumption 16.3.3.3 implies that the differential $\left(I / I^{2}\right)_{a} \rightarrow \bigoplus A_{a} \mathrm{~d} x_{i}$ has a left inverse, see Lemma 16.3.4. Hence $R \rightarrow A_{a}$ is smooth by definition and Algebra, Lemma 10.132.13.

Let $H_{e}, H_{s} \subset A$ be the radical of the ideal generated by elementary, resp. strictly standard elements of $A$ over $R$. By definition and what we just proved we have $H_{e} \subset H_{s} \subset H_{A / R}$. The inclusion $H_{A / R} \subset H_{e}$ follows from Lemma 16.3.2.

07 CB Example 16.3.6. The set of points where a finitely presented ring map is smooth needn't be a quasi-compact open. For example, let $R=k\left[x, y_{1}, y_{2}, y_{3}, \ldots\right] /\left(x y_{i}\right)$ and $A=R /(x)$. Then the smooth locus of $R \rightarrow A$ is $\bigcup D\left(y_{i}\right)$ which is not quasicompact.
07CC Lemma 16.3.7. Let $R \rightarrow A$ be a ring map of finite presentation. Let $R \rightarrow R^{\prime}$ be a ring map. If $a \in A$ is elementary, resp. strictly standard in $A$ over $R$, then $a \otimes 1$ is elementary, resp. strictly standard in $A \otimes_{R} R^{\prime}$ over $R^{\prime}$.

Proof. If $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ is a presentation of $A$ over $R$, then $A \otimes_{R}$ $R^{\prime}=R^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}^{\prime}, \ldots, f_{m}^{\prime}\right)$ is a presentation of $A \otimes_{R} R^{\prime}$ over $R^{\prime}$. Here $f_{j}^{\prime}$ is the image of $f_{j}$ in $R^{\prime}\left[x_{1}, \ldots, x_{n}\right]$. Hence the result follows from the definitions.

07EU Lemma 16.3.8. Let $R \rightarrow A \rightarrow \Lambda$ be ring maps with $A$ of finite presentation over $R$. Assume that $H_{A / R} \Lambda=\Lambda$. Then there exists a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ smooth over $R$.

Proof. Choose $f_{1}, \ldots, f_{r} \in H_{A / R}$ and $\lambda_{1}, \ldots, \lambda_{r} \in \Lambda$ such that $\sum f_{i} \lambda_{i}=1$ in $\Lambda$. Set $B=A\left[x_{1}, \ldots, x_{r}\right] /\left(f_{1} x_{1}+\ldots+f_{r} x_{r}-1\right)$ and define $B \rightarrow \Lambda$ by mapping $x_{i}$ to $\lambda_{i}$. Details omitted.

### 16.4. Presentations of algebras

07CD Some of the results in this section are due to Elkik. Note that the algebra $C$ in the following lemma is a symmetric algebra over $A$. Moreover, if $R$ is Noetherian, then $C$ is of finite presentation over $R$.
07CE Lemma 16.4.1. Let $R$ be a ring and let $A$ be a finitely presented $R$-algebra. There exists finite type $R$-algebra map $A \rightarrow C$ which has a retraction with the following two properties
(1) for each $a \in A$ such that $R \rightarrow A_{a}$ is a local complete intersection (More on Algebra, Definition 15.25.2) the ring $C_{a}$ is smooth over $A_{a}$ and has a presentation $C_{a}=R\left[y_{1}, \ldots, y_{m}\right] / J$ such that $J / J^{2}$ is free over $C_{a}$, and
(2) for each $a \in A$ such that $A_{a}$ is smooth over $R$ the module $\Omega_{C_{a} / R}$ is free over $C_{a}$.

Proof. Choose a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] / I$ and write $I=\left(f_{1}, \ldots, f_{m}\right)$. Define the $A$-module $K$ by the short exact sequence

$$
0 \rightarrow K \rightarrow A^{\oplus m} \rightarrow I / I^{2} \rightarrow 0
$$

where the $j$ th basis vector $e_{j}$ in the middle is mapped to the class of $f_{j}$ on the right. Set

$$
C=\operatorname{Sym}_{A}^{*}\left(I / I^{2}\right)
$$

The retraction is just the projection onto the degree 0 part of $C$. We have a surjection $R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] \rightarrow C$ which maps $y_{j}$ to the class of $f_{j}$ in $I / I^{2}$. The kernel $J$ of this map is generated by the elements $f_{1}, \ldots, f_{m}$ and by elements $\sum h_{j} y_{j}$ with $h_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$ such that $\sum h_{j} e_{j}$ defines an element of $K$. By Algebra, Lemma 10.132 .4 applied to $R \rightarrow A \rightarrow C$ and the presentations above and More on Algebra, Lemma 15.7 .11 there is a short exact sequence

$$
\begin{equation*}
I / I^{2} \otimes_{A} C \rightarrow J / J^{2} \rightarrow K \otimes_{A} C \rightarrow 0 \tag{16.4.1.1}
\end{equation*}
$$

of $C$-modules. Let $h \in R\left[x_{1}, \ldots, x_{n}\right]$ be an element with image $a \in A$. We will use as presentations for the localized rings

$$
A_{a}=R\left[x_{0}, x_{1}, \ldots, x_{n}\right] / I^{\prime} \quad \text { and } \quad C_{a}=R\left[x_{0}, x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] / J^{\prime}
$$

where $I^{\prime}=\left(h x_{0}-1, I\right)$ and $J^{\prime}=\left(h x_{0}-1, J\right)$. Hence $I^{\prime} /\left(I^{\prime}\right)^{2}=C_{a} \oplus I / I^{2} \otimes_{A} C_{a}$ and $J^{\prime} /\left(J^{\prime}\right)^{2}=C_{a} \oplus\left(J / J^{2}\right)_{a}$ as $C_{a}$-modules. Thus we obtain
07EX

$$
\begin{equation*}
C_{a} \oplus I / I^{2} \otimes_{A} C_{a} \rightarrow C_{a} \oplus\left(J / J^{2}\right)_{a} \rightarrow K \otimes_{A} C_{a} \rightarrow 0 \tag{16.4.1.2}
\end{equation*}
$$

as the sequence of Algebra, Lemma 10.132 .4 corresponding to $R \rightarrow A_{a} \rightarrow C_{a}$ and the presentations above.
Next, assume that $a \in A$ is such that $A_{a}$ is a local complete intersection over $R$. Then $\left(I / I^{2}\right)_{a}$ is finite projective over $A_{a}$, see More on Algebra, Lemma 15.24.3. Hence we see $K_{a} \oplus\left(I / I^{2}\right)_{a} \cong A_{a}^{\oplus m}$ is free. In particular $K_{a}$ is finite projective too. By More on Algebra, Lemma 15.25 .6 the sequence 16.4 .1 .2 is exact on the left. Hence

$$
J^{\prime} /\left(J^{\prime}\right)^{2} \cong C_{a} \oplus I / I^{2} \otimes_{A} C_{a} \oplus K \otimes_{A} C_{a} \cong C_{a}^{\oplus m+1}
$$

This proves (1). Finally, suppose that in addition $A_{a}$ is smooth over $R$. Then the same presentation shows that $\Omega_{C_{a} / R}$ is the cokernel of the map

$$
J^{\prime} /\left(J^{\prime}\right)^{2} \longrightarrow \bigoplus_{i} C_{a} \mathrm{~d} x_{i} \oplus \bigoplus_{j} C_{a} \mathrm{~d} y_{j}
$$

The summand $C_{a}$ of $J^{\prime} /\left(J^{\prime}\right)^{2}$ in the decomposition above corresponds to $h x_{0}-1$ and hence maps isomorphically to the summand $C_{a} \mathrm{~d} x_{0}$. The summand $I / I^{2} \otimes_{A} C_{a}$ of $J^{\prime} /\left(J^{\prime}\right)^{2}$ maps injectively to $\bigoplus_{i=1, \ldots, n} C_{a} \mathrm{~d} x_{i}$ with quotient $\Omega_{A_{a} / R} \otimes_{A_{a}} C_{a}$. The summand $K \otimes_{A} C_{a}$ maps injectively to $\bigoplus_{j \geq 1} C_{a} \mathrm{~d} y_{j}$ with quotient isomorphic to $I / I^{2} \otimes_{A} C_{a}$. Thus the cokernel of the last displayed map is the module $I / I^{2} \otimes_{A}$ $C_{a} \oplus \Omega_{A_{a} / R} \otimes_{A_{a}} C_{a}$. Since $\left(I / I^{2}\right)_{a} \oplus \Omega_{A_{a} / R}$ is free (from the definition of smooth ring maps) we see that (2) holds.

The following proposition was proved for smooth ring maps over henselian pairs by Elkik in Elk73. For smooth ring maps it can be found in Ara01, where it is also proven that ring maps between smooth algebras can be lifted.

07M8 Proposition 16.4.2. Let $R \rightarrow R_{0}$ be a surjective ring map with kernel $I$.
(1) If $R_{0} \rightarrow A_{0}$ is a syntomic ring map, then there exists a syntomic ring map $R \rightarrow A$ such that $A / I A \cong A_{0}$.
(2) If $R_{0} \rightarrow A_{0}$ is a smooth ring map, then there exists a smooth ring map $R \rightarrow A$ such that $A / I A \cong A_{0}$.

Proof. Assume $R_{0} \rightarrow A_{0}$ syntomic, in particular a local complete intersection (More on Algebra, Lemma 15.25.5). Choose a presentation $A_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] / J_{0}$. Set $C_{0}=\operatorname{Sym}_{A_{0}}^{*}\left(J_{0} / J_{0}^{2}\right)$. Note that $J_{0} / J_{0}^{2}$ is a finite projective $A_{0}$-module (Algebra, Lemma 10.134.16). By Lemma 16.4 .1 the ring map $A_{0} \rightarrow C_{0}$ is smooth and we can find a presentation $C_{0}=R_{0}\left[y_{1}, \ldots, y_{m}\right] / K_{0}$ with $K_{0} / K_{0}^{2}$ free over $C_{0}$. By Algebra, Lemma 10.134 .6 we can assume $C_{0}=R_{0}\left[y_{1}, \ldots, y_{m}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ where $\bar{f}_{1}, \ldots, \bar{f}_{c}$ maps to a basis of $K_{0} / K_{0}^{2}$ over $C_{0}$. Choose $f_{1}, \ldots, f_{c} \in R\left[y_{1}, \ldots, y_{c}\right]$ lifting $\bar{f}_{1}, \ldots, \bar{f}_{c}$ and set

$$
C=R\left[y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

By construction $C_{0}=C / I C$. By Algebra, Lemma 10.134.11 we can after replacing $C$ by $C_{g}$ assume that $C$ is a relative global complete intersection over $R$. We conclude that there exists a finite projective $A_{0}$-module $P_{0}$ such that $C_{0}=\operatorname{Sym}_{A_{0}}^{*}\left(P_{0}\right)$ is isomorphic to $C / I C$ for some syntomic $R$-algebra $C$.

Choose an integer $n$ and a direct sum decomposition $A_{0}^{\oplus n}=P_{0} \oplus Q_{0}$. By More on Algebra, Lemma 15.7 .10 we can find an étale ring map $C \rightarrow C^{\prime}$ which induces an isomorphism $C / I C \rightarrow C^{\prime} / I C^{\prime}$ and a finite projective $C^{\prime}$-module $Q$ such that $Q / I Q$ is isomorphic to $Q_{0} \otimes_{A_{0}} C / I C$. Then $D=\operatorname{Sym}_{C^{\prime}}^{*}(Q)$ is a smooth $C^{\prime}$-algebra (see More on Algebra, Lemma 15.7.12. Picture

Observe that our choice of $Q$ gives

$$
\begin{aligned}
D / I D & =\operatorname{Sym}_{C / I C}^{*}\left(Q_{0} \otimes_{A_{0}} C / I C\right) \\
& =\operatorname{Sym}_{A_{0}}^{*}\left(Q_{0}\right) \otimes_{A_{0}} C / I C \\
& =\operatorname{Sym}_{A_{0}}^{*}\left(Q_{0}\right) \otimes_{A_{0}} \operatorname{Sym}_{A_{0}}^{*}\left(P_{0}\right) \\
& =\operatorname{Sym}_{A_{0}}^{*}\left(Q_{0} \oplus P_{0}\right) \\
& =\operatorname{Sym}_{A_{0}}^{*}\left(A_{0}^{\oplus n}\right) \\
& =A_{0}\left[x_{1}, \ldots, x_{n}\right]
\end{aligned}
$$

Choose $f_{1}, \ldots, f_{n} \in D$ which map to $x_{1}, \ldots, x_{n}$ in $D / I D=A_{0}\left[x_{1}, \ldots, x_{n}\right]$. Set $A=D /\left(f_{1}, \ldots, f_{n}\right)$. Note that $A_{0}=A / I A$. We claim that $R \rightarrow A$ is syntomic in a neighbourhood of $V(I A)$. If the claim is true, then we can find a $f \in A$ mapping to $1 \in A_{0}$ such that $A_{f}$ is syntomic over $R$ and the proof of (1) is finished.

Proof of the claim. Observe that $R \rightarrow D$ is syntomic as a composition of the syntomic ring map $R \rightarrow C$, the étale ring map $C \rightarrow C^{\prime}$ and the smooth ring map $C^{\prime} \rightarrow D$ (Algebra, Lemmas 10.134 .17 and 10.135 .10 . The question is local on $\operatorname{Spec}(D)$, hence we may assume that $D$ is a relative global complete intersection (Algebra, Lemma 10.134.15). Say $D=R\left[y_{1}, \ldots, y_{m}\right] /\left(g_{1}, \ldots, g_{s}\right)$. Let $f_{1}^{\prime}, \ldots, f_{n}^{\prime} \in$ $R\left[y_{1}, \ldots, y_{m}\right]$ be lifts of $f_{1}, \ldots, f_{n}$. Then we can apply Algebra, Lemma 10.134.11 to get the claim.

Proof of (2). Since a smooth ring map is syntomic, we can find a syntomic ring map $R \rightarrow A$ such that $A_{0}=A / I A$. By assumption the fibres of $R \rightarrow A$ are smooth over primes in $V(I)$ hence $R \rightarrow A$ is smooth in an open neighbourhood of $V(I A)$ (Algebra, Lemma 10.135.16). Thus we can replace $A$ by a localization to obtain the result we want.

We know that any syntomic ring map $R \rightarrow A$ is locally a relative global complete intersection, see Algebra, Lemma 10.134.15. The next lemma says that a vector bundle over $\operatorname{Spec}(A)$ is a relative global complete intersection.

07CG Lemma 16.4.3. Let $R \rightarrow A$ be a syntomic ring map. Then there exists a smooth $R$-algebra map $A \rightarrow C$ with a retraction such that $C$ is a global relative complete intersection over $R$, i.e.,

$$
C \cong R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

flat over $R$ and all fibres of dimension $n-c$.
Proof. Apply Lemma 16.4.1 to get $A \rightarrow C$. By Algebra, Lemma 10.134.6 we can write $C=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ with $f_{i}$ mapping to a basis of $J / J^{2}$. The ring map $R \rightarrow C$ is syntomic (hence flat) as it is a composition of a syntomic and a smooth ring map. The dimension of the fibres is $n-c$ by Algebra, Lemma 10.133.4 (the fibres are local complete intersections, so the lemma applies).

07CH Lemma 16.4.4. Let $R \rightarrow A$ be a smooth ring map. Then there exists a smooth $R$-algebra map $A \rightarrow B$ with a retraction such that $B$ is standard smooth over $R$, i.e.,

$$
B \cong R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

and $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ is invertible in $B$.

Proof. Apply Lemma 16.4 .3 to get a smooth $R$-algebra map $A \rightarrow C$ with a retraction such that $C=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a relative global complete intersection over $R$. As $C$ is smooth over $R$ we have a short exact sequence

$$
0 \rightarrow \bigoplus_{j=1, \ldots, c} C f_{j} \rightarrow \bigoplus_{i=1, \ldots, n} C \mathrm{~d} x_{i} \rightarrow \Omega_{C / R} \rightarrow 0
$$

Since $\Omega_{C / R}$ is a projective $C$-module this sequence is split. Choose a left inverse $t$ to the first map. Say $t\left(\mathrm{~d} x_{i}\right)=\sum c_{i j} f_{j}$ so that $\sum_{i} \frac{\partial f_{j}}{\partial x_{i}} c_{i \ell}=\delta_{j \ell}$ (Kronecker delta). Let

$$
B^{\prime}=C\left[y_{1}, \ldots, y_{c}\right]=R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{c}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

The $R$-algebra map $C \rightarrow B^{\prime}$ has a retraction given by mapping $y_{j}$ to zero. We claim that the map

$$
R\left[z_{1}, \ldots, z_{n}\right] \longrightarrow B^{\prime}, \quad z_{i} \longmapsto x_{i}-\sum_{j} c_{i j} y_{j}
$$

is étale at every point in the image of $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}\left(B^{\prime}\right)$. In $\Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}$ we have

$$
0=\mathrm{d} f_{j}-\sum_{i} \frac{\partial f_{j}}{\partial x_{i}} \mathrm{~d} z_{i} \equiv \sum_{i, \ell} \frac{\partial f_{j}}{\partial x_{i}} c_{i \ell} \mathrm{~d} y_{\ell} \equiv \mathrm{d} y_{j} \bmod \left(y_{1}, \ldots, y_{c}\right) \Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}
$$

Since $0=\mathrm{d} z_{i}=\mathrm{d} x_{i}$ modulo $\sum B^{\prime} \mathrm{d} y_{j}+\left(y_{1}, \ldots, y_{c}\right) \Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}$ we conclude that

$$
\Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]} /\left(y_{1}, \ldots, y_{c}\right) \Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}=0
$$

As $\Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}$ is a finite $B^{\prime}$-module by Nakayama's lemma there exists a $g \in$ $1+\left(y_{1}, \ldots, y_{c}\right)$ that $\left(\Omega_{B^{\prime} / R\left[z_{1}, \ldots, z_{n}\right]}\right)_{g}=0$. This proves that $R\left[z_{1}, \ldots, z_{n}\right] \rightarrow B_{g}^{\prime}$ is unramified, see Algebra, Definition 10.147.1. For any ring map $R \rightarrow k$ where $k$ is a field we obtain an unramified ring map $k\left[z_{1}, \ldots, z_{n}\right] \rightarrow\left(B_{g}^{\prime}\right) \otimes_{R} k$ between smooth $k$-algebras of dimension $n$. It follows that $k\left[z_{1}, \ldots, z_{n}\right] \rightarrow\left(B_{g}^{\prime}\right) \otimes_{R} k$ is flat by Algebra, Lemmas 10.127.1 and 10.138.2. By the critère de platitude par fibre (Algebra, Lemma 10.127 .8 we conclude that $R\left[z_{1}, \ldots, z_{n}\right] \rightarrow B_{g}^{\prime}$ is flat. Finally, Algebra, Lemma 10.141 .7 implies that $R\left[z_{1}, \ldots, z_{n}\right] \rightarrow B_{g}^{\prime}$ is étale. Set $B=B_{g}^{\prime}$. Note that $C \rightarrow B$ is smooth and has a retraction, so also $A \rightarrow B$ is smooth and has a retraction. Moreover, $R\left[z_{1}, \ldots, z_{n}\right] \rightarrow B$ is étale. By Algebra, Lemma 10.141.2 we can write

$$
B=R\left[z_{1}, \ldots, z_{n}, w_{1}, \ldots, w_{c}\right] /\left(g_{1}, \ldots, g_{c}\right)
$$

with $\operatorname{det}\left(\partial g_{j} / \partial w_{i}\right)$ invertible in $B$. This proves the lemma.
07CI Lemma 16.4.5. Let $R \rightarrow \Lambda$ be a ring map. If $\Lambda$ is a filtered colimit of smooth $R$-algebras, then $\Lambda$ is a filtered colimit of standard smooth $R$-algebras.

Proof. Let $A \rightarrow \Lambda$ be an $R$-algebra map with $A$ of finite presentation over $R$. According to Lemma 16.2.1 we have to factor this map through a standard smooth algebra, and we know we can factor it as $A \rightarrow B \rightarrow \Lambda$ with $B$ smooth over $R$. Choose an $R$-algebra map $B \rightarrow C$ with a retraction $C \rightarrow B$ such that $C$ is standard smooth over $R$, see Lemma 16.4.4. Then the desired factorization is $A \rightarrow B \rightarrow C \rightarrow$ $B \rightarrow \Lambda$.

07 EY Lemma 16.4.6. Let $R \rightarrow A$ be a standard smooth ring map. Let $E \subset A$ be a finite subset of order $|E|=n$. Then there exists a presentation $A=R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$ with $c \geq n$, with $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ invertible in $A$, and such that $E$ is the set of congruence classes of $x_{1}, \ldots, x_{n}$.

Proof. Choose a presentation $A=R\left[y_{1}, \ldots, y_{m}\right] /\left(g_{1}, \ldots, g_{d}\right)$ such that the image of $\operatorname{det}\left(\partial g_{j} / \partial y_{i}\right)_{i, j=1, \ldots, d}$ is invertible in $A$. Choose an enumerations $E=$ $\left\{a_{1}, \ldots, a_{n}\right\}$ and choose $h_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ whose image in $A$ is $a_{i}$. Consider the presentation

$$
A=R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] /\left(x_{1}-h_{1}, \ldots, x_{n}-h_{n}, g_{1}, \ldots, g_{d}\right)
$$

and set $c=n+d$.
07EZ Lemma 16.4.7. Let $R \rightarrow A$ be a ring map of finite presentation. Let $a \in A$. Consider the following conditions on $a$ :
(1) $A_{a}$ is smooth over $R$,
(2) $A_{a}$ is smooth over $R$ and $\Omega_{A_{a} / R}$ is stably free,
(3) $A_{a}$ is smooth over $R$ and $\Omega_{A_{a} / R}$ is free,
(4) $A_{a}$ is standard smooth over $R$,
(5) $a$ is strictly standard in $A$ over $R$,
(6) $a$ is elementary standard in $A$ over $R$.

Then we have
(a) (4) $\Rightarrow(3) \Rightarrow(2) \Rightarrow(1)$,
(b) $(6) \Rightarrow(5)$,
(c) $(6) \Rightarrow$ (4),
(d) $(5) \Rightarrow$ (2),
(e) (2) $\Rightarrow$ the elements $a^{e}, e \geq e_{0}$ are strictly standard in $A$ over $R$,
(f) (4) $\Rightarrow$ the elements $a^{e}, e \geq e_{0}$ are elementary standard in $A$ over $R$.

Proof. Part (a) is clear from the definitions and Algebra, Lemma 10.135.7. Part (b) is clear from Definition 16.3.3.

Proof of (c). Choose a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ such that 16.3.3.1 and 16.3 .3 .2 hold. Choose $h \in R\left[x_{1}, \ldots, x_{n}\right]$ mapping to $a$. Then

$$
A_{a}=R\left[x_{0}, x_{1}, \ldots, x_{n}\right] /\left(x_{0} h-1, f_{1}, \ldots, f_{n}\right)
$$

Write $J=\left(x_{0} h-1, f_{1}, \ldots, f_{n}\right)$. By 16.3 .3 .2 we see that the $A_{a}$-module $J / J^{2}$ is generated by $x_{0} h-1, f_{1}, \ldots, f_{c}$ over $\overline{A_{a}}$. Hence, as in the proof of Algebra, Lemma 10.134.6, we can choose a $g \in 1+J$ such that

$$
A_{a}=R\left[x_{0}, \ldots, x_{n}, x_{n+1}\right] /\left(x_{0} h-1, f_{1}, \ldots, f_{n}, g x_{n+1}-1\right)
$$

At this point 16.3.3.1) implies that $R \rightarrow A_{a}$ is standard smooth (use the coordinates $x_{0}, x_{1}, \ldots, x_{c}, x_{n+1}$ to take derivatives).
Proof of (d). Choose a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ such that 16.3.3.3 and 16.3 .3 .4 hold. We already know that $A_{a}$ is smooth over $R$, see Lemma 16.3.5. As above we get a presentation $A_{a}=R\left[x_{0}, x_{1}, \ldots, x_{n}\right] / J$ with $J / J^{2}$ free. Then $\Omega_{A_{a} / R} \oplus J / J^{2} \cong A_{a}^{\oplus n+1}$ by the definition of smooth ring maps, hence we see that $\Omega_{A_{a} / R}$ is stably free.
Proof of (e). Choose a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] / I$ with $I$ finitely generated. By assumption we have a short exact sequence

$$
0 \rightarrow\left(I / I^{2}\right)_{a} \rightarrow \bigoplus_{i=1, \ldots, n} A_{a} \mathrm{~d} x_{i} \rightarrow \Omega_{A_{a} / R} \rightarrow 0
$$

which is split exact. Hence we see that $\left(I / I^{2}\right)_{a} \oplus \Omega_{A_{a} / R}$ is a free $A_{a}$-module. Since $\Omega_{A_{a} / R}$ is stably free we see that $\left(I / I^{2}\right)_{a}$ is stably free as well. Thus replacing the presentation chosen above by $A=R\left[x_{1}, \ldots, x_{n}, x_{n+1}, \ldots, x_{n+r}\right] / J$ with
$J=\left(I, x_{n+1}, \ldots, x_{n+r}\right)$ for some $r$ we get that $\left(J / J^{2}\right)_{a}$ is (finite) free. Choose $f_{1}, \ldots, f_{c} \in J$ which map to a basis of $\left(J / J^{2}\right)_{a}$. Extend this to a list of generators $f_{1}, \ldots, f_{m} \in J$. Consider the presentation $A=R\left[x_{1}, \ldots, x_{n+r}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Then 16.3.3.4 holds for $a^{e}$ for all sufficiently large $e$ by construction. Moreover, since $\left(J / J^{2}\right)_{a} \rightarrow \bigoplus_{i=1, \ldots, n} A_{a} \mathrm{~d} x_{i}$ is a split injection we can find an $A_{a}$-linear left inverse. Writing this left inverse in terms of the basis $f_{1}, \ldots, f_{c}$ and clearing denominators we find a linear map $\psi_{0}: A^{\oplus n} \rightarrow A^{\oplus c}$ such that

$$
A^{\oplus c} \xrightarrow{\left(f_{1}, \ldots, f_{c}\right)} J / J^{2} \xrightarrow{f \mapsto \mathrm{~d} f} \bigoplus_{i=1, \ldots, n} A \mathrm{~d} x_{i} \xrightarrow{\psi_{0}} A^{\oplus c}
$$

is multiplication by $a^{e_{0}}$ for some $e_{0} \geq 1$. By Lemma 16.3 .4 we see 16.3 .3 .3 holds for all $a^{c e_{0}}$ and hence for $a^{e}$ for all $e$ with $e \geq c e_{0}$.

Proof of (f). Choose a presentation $A_{a}=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ such that $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ is invertible in $A_{a}$. We may assume that for some $m<n$ the classes of the elements $x_{1}, \ldots, x_{m}$ correspond $a_{i} / 1$ where $a_{1}, \ldots, a_{m} \in A$ are generators of $A$ over $R$, see Lemma 16.4.6. After replacing $x_{i}$ by $a^{N} x_{i}$ for $m<i \leq n$ we may assume the class of $x_{i}$ is $a_{i} / 1 \in A_{a}$ for some $a_{i} \in A$. Consider the ring map

$$
\Psi: R\left[x_{1}, \ldots, x_{n}\right] \longrightarrow A, \quad x_{i} \longmapsto a_{i}
$$

This is a surjective ring map. By replacing $f_{j}$ by $a^{N} f_{j}$ we may assume that $f_{j} \in$ $R\left[x_{1}, \ldots, x_{n}\right]$ and that $\Psi\left(f_{j}\right)=0$ (since after all $f_{j}\left(a_{1} / 1, \ldots, a_{n} / 1\right)=0$ in $\left.A_{a}\right)$. Let $J=\operatorname{Ker}(\Psi)$. Then $A=R\left[x_{1}, \ldots, x_{n}\right] / J$ is a presentation and $f_{1}, \ldots, f_{c} \in J$ are elements such that $\left(J / J^{2}\right)_{a}$ is freely generated by $f_{1}, \ldots, f_{c}$ and such that $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ maps to an invertible element of $A_{a}$. It follows that 16.3.3.1) and 16.3.3.2 hold for $a^{e}$ and all large enough $e$ as desired.

### 16.5. Intermezzo: Néron desingularization

0BJ1 We interrupt the attack on the general case of Popescu's theorem to an easier but already very interesting case, namely, when $R \rightarrow \Lambda$ is a homomorphism of discrete valuation rings. This is discussed in Art69a, Section 4].

0BJ2 Situation 16.5.1. Here $R \subset \Lambda$ is an extension of discrete valuation rings with ramification index 1 (More on Algebra, Definition 15.81.1). Moreover, we assume given a factorization

$$
R \rightarrow A \xrightarrow{\varphi} \Lambda
$$

with $R \rightarrow A$ flat and of finite type. Let $\mathfrak{q}=\operatorname{ker}(\varphi)$ and $\mathfrak{p}=\varphi^{-1}\left(\mathfrak{m}_{\Lambda}\right)$.
In Situation 16.5.1 let $\pi \in R$ be a uniformizer. Recall that flatness of $A$ over $R$ signifies that $\pi$ is a nonzerodivisor on $A$ (More on Algebra, Lemma 15.16.10). By our assumption on $R \subset \Lambda$ we see that $\pi$ maps to uniformizer of $\Lambda$. Since $\pi \in \mathfrak{p}$ we can consider Néron's affine blowup algebra (see Algebra, Section 10.69 )

$$
\varphi^{\prime}: A^{\prime}=A\left[\frac{\mathfrak{p}}{\pi}\right] \longrightarrow \Lambda
$$

wich comes endowed with an induced map to $\Lambda$ sending $a / \pi^{n}, a \in \mathfrak{p}^{n}$ to $\pi^{-n} \varphi(a)$ in $\Lambda$. We will denote $\mathfrak{q}^{\prime} \subset \mathfrak{p}^{\prime} \subset A^{\prime}$ the corresponding prime ideals of $A^{\prime}$. Observe that the isomorphism class of $A^{\prime}$ does not depend on our choice of uniformizer. Repeating the construction we obtain a sequence

$$
A \rightarrow A^{\prime} \rightarrow A^{\prime \prime} \rightarrow \ldots \rightarrow \Lambda
$$

0BJ3 Lemma 16.5.2. In Situation 16.5.1 Néron's blowup is functorial in the following sense
(1) if $a \in A, a \notin \mathfrak{p}$, then Néron's blowup of $A_{a}$ is $A_{a}^{\prime}$, and
(2) if $B \rightarrow A$ is a surjection of flat finite type $R$-algebras with kernel $I$ then $A^{\prime}$ is the quotient of $B^{\prime} / I B^{\prime}$ by its $\pi$-power torsion.

Proof. Both (1) and (2) are special cases of Algebra, Lemma 10.69.3. In fact, whenever we have $A_{1} \rightarrow A_{2} \rightarrow \Lambda$ such that $\mathfrak{p}_{1} A_{2}=\mathfrak{p}_{2}$, we have that $A_{2}^{\prime}$ is the quotient of $A_{1}^{\prime} \otimes_{A_{1}} A_{2}$ by its $\pi$-power torsion.
0BJ4 Lemma 16.5.3. In Situation 16.5 .1 assume that $R \rightarrow A$ is smooth at $\mathfrak{p}$ and that $R / \pi R \subset \Lambda / \pi \Lambda$ is a separable field extension. Then $R \rightarrow A^{\prime}$ is smooth at $\mathfrak{p}^{\prime}$ and there is a short exact sequence

$$
\Omega_{A / R} \otimes_{A} A_{\mathfrak{p}^{\prime}}^{\prime} \rightarrow \Omega_{A^{\prime} / R, \mathfrak{p}^{\prime}} \rightarrow\left(A^{\prime} / \pi A^{\prime}\right)_{\mathfrak{p}^{\prime}}^{\oplus c} \rightarrow 0
$$

where $c=\operatorname{dim}\left((A / \pi A)_{\mathfrak{p}}\right)$.
Proof. By Lemma 16.5 .2 we may replace $A$ by a localization at an element not in $\mathfrak{p}$; we will use this without further mention. Write $\kappa=R / \pi R$. Since smoothness is stable under base change (Algebra, Lemma 10.135 .4 ) we see that $A / \pi A$ is smooth over $\kappa$ at $\mathfrak{p}$. Hence $(A / \pi A)_{\mathfrak{p}}$ is a regular local ring (Algebra, Lemma 10.138.3). Choose $g_{1}, \ldots, g_{c} \in \mathfrak{p}$ which map to a regular system of parameters in $(A / \pi A)_{\mathfrak{p}}$. Then we see that $\mathfrak{p}=\left(\pi, g_{1}, \ldots, g_{c}\right)$ after possibly replacing $A$ by a localization. Note that $\pi, g_{2}, \ldots, g_{c}$ is a regular sequence in $A_{\mathfrak{p}}$ (first $\pi$ is a nonzerodivisor and then Algebra, Lemma 10.105 .3 for the rest of the sequence). After replacing $A$ by a localization we may assume that $\pi, g_{1}, \ldots, g_{c}$ is a regular sequence in $A$ (Algebra, Lemma 10.67.6). It follows that

$$
A^{\prime}=A\left[y_{1}, \ldots, y_{c}\right] /\left(\pi y_{1}-g_{1}, \ldots, \pi y_{c}-g_{c}\right)
$$

by Algebra, Lemma 10.69.9. In particular, we obtain an exact sequence

$$
\left(A^{\prime}\right)^{\oplus c} \longrightarrow \Omega_{A / R} \otimes_{A} A^{\prime} \oplus A^{\prime} \mathrm{d} y_{i} \longrightarrow \Omega_{A^{\prime} / R} \rightarrow 0
$$

where the $i$ the basis element in the first module is mapped to $-\mathrm{d} g_{i}+\pi \mathrm{d} y_{i}$ in the second. To finish the proof it therefore suffices to show that $\mathrm{d} g_{1}, \ldots, \mathrm{~d} g_{c}$ forms part of a basis for $\Omega_{A / R, \mathfrak{p}}$. Since $\Omega_{A / R, \mathfrak{p}}$ is a finite free $A_{\mathfrak{p}}$-module (part of the definition of smoothness) it suffices to show that the images of $\mathrm{d} g_{i}$ are $\kappa(\mathfrak{p})$-linearly independent in $\Omega_{A / R, \mathfrak{p}} / \pi=\Omega_{(A / \pi A) / \kappa, \mathfrak{p}}$ (equality by Algebra, Lemma 10.130.12). Since $\kappa \subset \kappa(\mathfrak{p}) \subset \Lambda / \pi \Lambda$ we see that $\kappa(\mathfrak{p})$ is separable over $\kappa$ (Algebra, Definition 10.41.1). The desired linear independence now follows from Algebra, Lemma 10.138.4.
0BJ5 Lemma 16.5.4. In Situation 16.5.1 assume that $R \rightarrow A$ is smooth at $\mathfrak{q}$ and that we have a surjection of $R$-algebras $B \rightarrow A$ with kernel $I$. Assume $R \rightarrow B$ smooth at $\mathfrak{p}_{B}=(B \rightarrow A)^{-1} \mathfrak{p}$. If the cokernel of

$$
I / I^{2} \otimes_{A} \Lambda \rightarrow \Omega_{B / R} \otimes_{B} \Lambda
$$

is a free $\Lambda$-module, then $R \rightarrow A$ is smooth at $\mathfrak{p}$.
Proof. The cokernel of the map $I / I^{2} \rightarrow \Omega_{B / R} \otimes_{B} A$ is $\Omega_{A / R}$, see Algebra, Lemma 10.130.9. Let $d=\operatorname{dim}_{\mathfrak{q}}(A / R)$ be the relative dimension of $R \rightarrow A$ at $\mathfrak{q}$, i.e., the dimension of $\operatorname{Spec}(A[1 / \pi])$ at $\mathfrak{q}$. See Algebra, Definition 10.124.1. Then $\Omega_{A / R, \mathfrak{q}}$ is free over $A_{\mathfrak{q}}$ of rank $d$ (Algebra, Lemma 10.138.3). Thus if the hypothesis of the lemma holds, then $\Omega_{A / R} \otimes_{A} \Lambda$ is free of rank $d$. It follows that $\Omega_{A / R} \otimes_{A} \kappa(\mathfrak{p})$ has
dimension $d$ (as it is true upon tensoring with $\Lambda / \pi \Lambda$ ). Since $R \rightarrow A$ is flat and since $\mathfrak{p}$ is a specialization of $\mathfrak{q}$, we see that $\operatorname{dim}_{\mathfrak{p}}(A / R) \geq d$ by Algebra, Lemma 10.124.6. Then it follows that $R \rightarrow A$ is smooth at $\mathfrak{p}$ by Algebra, Lemmas 10.135.16 and 10.138.3.

0BJ6 Lemma 16.5.5. In Situation 16.5.1 assume that $R \rightarrow A$ is smooth at $\mathfrak{q}$ and that $R / \pi R \subset \Lambda / \pi \Lambda$ is a separable extension of fields. Then after a finite number of affine Néron blowups the algebra $A$ becomes smooth over $R$ at $\mathfrak{p}$.

Proof. We choose an $R$-algebra $B$ and a surjection $B \rightarrow A$. Set $\mathfrak{p}_{B}=(B \rightarrow$ $A)^{-1}(\mathfrak{p})$ and denote $r$ the relative dimension of $R \rightarrow B$ at $\mathfrak{p}_{B}$. We choose $B$ such that $R \rightarrow B$ is smooth at $\mathfrak{p}_{B}$. For example we can take $B$ to be a polynomial algebra in $r$ variables over $R$. Consider the complex

$$
I / I^{2} \otimes_{A} \Lambda \longrightarrow \Omega_{B / R} \otimes_{B} \Lambda
$$

of Lemma 16.5 .4 By the structure of finite modules over $\Lambda$ (More on Algebra, Lemma 15.85.9. we see that the cokernel looks like

$$
\Lambda^{\oplus d} \oplus \bigoplus_{i=1, \ldots, n} \Lambda / \pi^{e_{i}} \Lambda
$$

for some $d \geq 0, n \geq 0$, and $e_{i} \geq 1$. Observe that $d$ is the relative dimension of $A / R$ at $\mathfrak{q}$ (Algebra, Lemma 10.138 .3 ). If the defect $e=\sum_{i=1, \ldots, n} e_{i}$ is zero, then we are done by Lemma 16.5.4

Next, we consider what happens when we perform the Néron blowup. Recall that $A^{\prime}$ is the quotient of $B^{\prime} / I B^{\prime}$ by its $\pi$-power torsion (Lemma 16.5.2) and that $R \rightarrow B^{\prime}$ is smooth at $\mathfrak{p}_{B^{\prime}}$ (Lemma 16.5.3). Thus after blowup we have exactly the same setup. Picture

Since $I \subset \mathfrak{p}_{B}$, we see that $I \rightarrow I^{\prime}$ factors through $\pi I^{\prime}$. Hence if we look at the induced map of complexes we get

Let $c=\operatorname{dim}\left((B / \pi B)_{\mathfrak{p}_{B}}\right)$. Observe that $M \subset M^{\prime}$ are free $\Lambda$-modules of rank $r$. The quotient $M^{\prime} / M$ has length at most $c$ by Lemma 16.5 .3 . Let $N \subset M$ and $N^{\prime} \subset M^{\prime}$ be the images of the horizontal maps. Then $N \subset N^{\prime}$ are free $\Lambda$-modules of rank $r-d$. Since $I$ maps into $\pi I^{\prime}$ we see that $N \subset \pi N^{\prime}$. Hence $N^{\prime} / N$ has length at least $r-d$. We conclude by a simple lemma with modules over discrete valuation rings that $e$ decreases by at least $r-d-c$ (we will see below this quantity is $\geq 0$ ).
Since $B$ is smooth over $R$ of relative dimension $r$ at $\mathfrak{p}_{B}$ we see that $r=c+$ $\operatorname{trdeg}_{\kappa}\left(\kappa\left(\mathfrak{p}_{B}\right)\right)$ by Algebra, Lemma 10.115.3. Let $J=\operatorname{Ker}\left(A \rightarrow A_{\mathfrak{q}}\right)$ so that $A / J$ is a domain with $A_{\mathfrak{q}}=(A / J)_{\mathfrak{q}}$. It follows that $A_{g}=(A / J)_{g}$ for some $g \in A$, $g \notin \mathfrak{q}$ and hence $\operatorname{dim}_{\mathfrak{q}}((A / J) / R)$ is $d$ as this is true for $A$. By the same lemma as before applied twice, the fraction field of $A / J$ has transcendence degree $d$ over
$f . f .(R)=R[1 / \pi]$. Applying the dimension formula (Algebra, Lemma 10.112.1) to $R \rightarrow A / J$ we find

$$
1 \leq \operatorname{dim}\left((A / J)_{\mathfrak{p}}\right) \leq 1+d-\operatorname{trdeg}_{\kappa}(\kappa(\mathfrak{p}))=1+d-r+c
$$

First inequality as $(A / J)_{\mathfrak{p}}$ has at least two primes. Equality as $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}_{B}\right)$. Thus we see that $r-d-c \geq 0$ and zero if and only if $r=d+c$.

To finish the proof we have to show that $N^{\prime}$ is stricly bigger than $\pi^{-1} N$; this is the key computation one has to do in Néron's argument. To do this, we consider the exact sequence

$$
I / I^{2} \otimes_{B} \kappa\left(\mathfrak{p}_{B}\right) \rightarrow \Omega_{B / R} \otimes_{B} \kappa\left(\mathfrak{p}_{B}\right) \rightarrow \Omega_{A / R} \otimes_{A} \kappa(\mathfrak{p}) \rightarrow 0
$$

(follows from Algebra, Lemma 10.130.9). Since we may assume that $R \rightarrow A$ is not smooth at $\mathfrak{p}$ we see that the dimension $s$ of $\Omega_{A / R} \otimes_{A} \kappa(\mathfrak{p})$ is bigger than $d$. On the other hand the first arrow factors through the injective map

$$
\mathfrak{p} B_{\mathfrak{p}} / \mathfrak{p}^{2} B_{\mathfrak{p}} \rightarrow \Omega_{B / R} \otimes_{B} \kappa\left(\mathfrak{p}_{B}\right)
$$

of Algebra, Lemma 10.138 .4 note that $\kappa(\mathfrak{p})$ is separable over $k$ by our assumption on $R / \pi R \subset \Lambda / \pi \Lambda$. Hence we conclude that we can find generators $g_{1}, \ldots, g_{r} \in I$ such that $g_{j} \in \mathfrak{p}^{2}$ for $j>r-s$. Then the images of $g_{j}$ in $A^{\prime}$ are in $\pi^{2} I^{\prime}$ for $j>r-s$. Since $r-s<r-d$ we find that at least one of the minimal generators of $N$ becomes divisible by $\pi^{2}$ in $N^{\prime}$. Thus we see that $e$ decreases by at least 1 and we win.

If $R \rightarrow \Lambda$ is an extension of discrete valuation rings, then $R \rightarrow \Lambda$ is regular if and only if (a) the ramification index is 1 , (b) $f . f .(R) \subset f . f .(\Lambda)$ is separable, and (c) $R / \mathfrak{m}_{R} \subset \Lambda / \mathfrak{m}_{\Lambda}$ is separable. Thus the following result is a special case of general Néron desingularization in Theorem 16.13.1

0BJ7 Lemma 16.5.6. Let $R \subset \Lambda$ be an extension of discrete valuation rings which has ramification index 1 and induces a separable extension of residue fields and of fraction fields. Then $\Lambda$ is a filtered colimit of smooth $R$-algebras.

Proof. By Lemma 16.2 .1 it suffices to show that any $R \rightarrow A \rightarrow \Lambda$ as in Situation 16.5.1 can be factored as $A \rightarrow B \rightarrow \Lambda$ with $B$ a smooth $R$-algebra. After replacing $A$ by its image in $\Lambda$ we may assume that $A$ is a domain whose fraction field $f . f .(A)$ is a subfield of $f . f .(\Lambda)$. In particular, $f . f .(A)$ is separable over $f . f .(R)$ by our assumptions. Then $R \rightarrow A$ is smooth at $\mathfrak{q}=(0)$ by Algebra, Lemma 10.138.9. After a finite number of Néron blowups, we may assume $R \rightarrow A$ is smooth at $\mathfrak{p}$, see Lemma 16.5.4. Then, after replacing $A$ by a localization at an element $a \in A$, $a \notin \mathfrak{p}$ it becomes smooth over $R$ and the lemma is proved.

### 16.6. The lifting problem

07CJ The goal in this section is to prove (Proposition 16.6.3) that the collection of algebras which are filtered colimits of smooth algebras is closed under infinitesimal flat deformations. The proof is elementary and only uses the results on presentations of smooth algebras from Section 16.4 .

07CK Lemma 16.6.1. Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that
(1) $I^{2}=0$, and
(2) $\Lambda / I \Lambda$ is a filtered colimit of smooth $R / I$-algebras.

Let $\varphi: A \rightarrow \Lambda$ be an $R$-algebra map with $A$ of finite presentation over $R$. Then there exists a factorization

$$
A \rightarrow B / J \rightarrow \Lambda
$$

where $B$ is a smooth $R$-algebra and $J \subset I B$ is a finitely generated ideal.
Proof. Choose a factorization

$$
A / I A \rightarrow \bar{B} \rightarrow \Lambda / I \Lambda
$$

with $\bar{B}$ standard smooth over $R / I$; this is possible by assumption and Lemma 16.4.5. Write

$$
\bar{B}=A / I A\left[t_{1}, \ldots, t_{r}\right] /\left(\bar{g}_{1}, \ldots, \bar{g}_{s}\right)
$$

and say $\bar{B} \rightarrow \Lambda / I \Lambda$ maps $t_{i}$ to the class of $\lambda_{i}$ modulo $I \Lambda$. Choose $g_{1}, \ldots, g_{s} \in$ $A\left[t_{1}, \ldots, t_{r}\right]$ lifting $\bar{g}_{1}, \ldots, \bar{g}_{s}$. Write $\varphi\left(g_{i}\right)\left(\lambda_{1}, \ldots, \lambda_{r}\right)=\sum \epsilon_{i j} \mu_{i j}$ for some $\epsilon_{i j} \in I$ and $\mu_{i j} \in \Lambda$. Define

$$
A^{\prime}=A\left[t_{1}, \ldots, t_{r}, \delta_{i, j}\right] /\left(g_{i}-\sum \epsilon_{i j} \delta_{i j}\right)
$$

and consider the map

$$
A^{\prime} \longrightarrow \Lambda, \quad a \longmapsto \varphi(a), \quad t_{i} \longmapsto \lambda_{i}, \quad \delta_{i j} \longmapsto \mu_{i j}
$$

We have

$$
A^{\prime} / I A^{\prime}=A / I A\left[t_{1}, \ldots, t_{r}\right] /\left(\bar{g}_{1}, \ldots, \bar{g}_{s}\right)\left[\delta_{i j}\right] \cong \bar{B}\left[\delta_{i j}\right]
$$

This is a standard smooth algebra over $R / I$ as $\bar{B}$ is standard smooth. Choose a presentation $A^{\prime} / I A^{\prime}=R / I\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ with $\operatorname{det}\left(\partial \bar{f}_{j} / \partial x_{-}\right)_{i, j=1, \ldots, c}$ invertible in $A^{\prime} / I A^{\prime}$. Choose lifts $f_{1}, \ldots, f_{c} \in R\left[x_{1}, \ldots, x_{n}\right]$ of $\bar{f}_{1}, \ldots, \bar{f}_{c}$. Then

$$
B=R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, x_{n+1} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}-1\right)
$$

is smooth over $R$. Since smooth ring maps are formally smooth (Algebra, Proposition 10.136 .13 there exists an $R$-algebra map $B \rightarrow A^{\prime}$ which is an isomorphism modulo $I$. Then $B \rightarrow A^{\prime}$ is surjective by Nakayama's lemma (Algebra, Lemma 10.19.1). Thus $A^{\prime}=B / J$ with $J \subset I B$ finitely generated (see Algebra, Lemma 10.6.3).

07CL Lemma 16.6.2. Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that (1) $I^{2}=0$,
(2) $\Lambda / I \Lambda$ is a filtered colimit of smooth $R / I$-algebras, and
(3) $R \rightarrow \Lambda$ is flat.

Let $\varphi: B \rightarrow \Lambda$ be an $R$-algebra map with $B$ smooth over $R$. Let $J \subset I B$ be $a$ finitely generated ideal. Then there exists $R$-algebra maps

$$
B \xrightarrow{\alpha} B^{\prime} \xrightarrow{\beta} \Lambda
$$

such that $B^{\prime}$ is smooth over $R$, such that $\alpha(J)=0$ and such that $\beta \circ \alpha=\varphi \bmod I \Lambda$.
Proof. If we can prove the lemma in case $J=(h)$, then we can prove the lemma by induction on the number of generators of $J$. Namely, suppose that $J$ can be generated by $n$ elements $h_{1}, \ldots, h_{n}$ and the lemma holds for all cases where $J$ is generated by $n-1$ elements. Then we apply the case $n=1$ to produce $B \rightarrow B^{\prime} \rightarrow \Lambda$ where the first map kills of $h_{n}$. Then we let $J^{\prime}$ be the ideal of $B^{\prime}$ generated by the images of $h_{1}, \ldots, h_{n-1}$ and we apply the case for $n-1$ to produce $B^{\prime} \rightarrow B^{\prime \prime} \rightarrow \Lambda$. It is easy to verify that $B \rightarrow B^{\prime \prime} \rightarrow \Lambda$ does the job.

Assume $J=(h)$ and write $h=\sum \epsilon_{i} b_{i}$ for some $\epsilon_{i} \in I$ and $b_{i} \in B$. Note that $0=\varphi(h)=\sum \epsilon_{i} \varphi\left(b_{i}\right)$. As $\Lambda$ is flat over $R$, the equational criterion for flatness (Algebra, Lemma 10.38.11) implies that we can find $\lambda_{j} \in \Lambda, j=1, \ldots, m$ and $a_{i j} \in R$ such that $\varphi\left(b_{i}\right)=\sum_{j} a_{i j} \lambda_{j}$ and $\sum_{i} \epsilon_{i} a_{i j}=0$. Set

$$
C=B\left[x_{1}, \ldots, x_{m}\right] /\left(b_{i}-\sum a_{i j} x_{j}\right)
$$

with $C \rightarrow \Lambda$ given by $\varphi$ and $x_{j} \mapsto \lambda_{j}$. Choose a factorization

$$
C \rightarrow B^{\prime} / J^{\prime} \rightarrow \Lambda
$$

as in Lemma 16.6.1. Since $B$ is smooth over $R$ we can lift the map $B \rightarrow C \rightarrow B^{\prime} / J^{\prime}$ to a map $\psi: B \rightarrow B^{\prime}$. We claim that $\psi(h)=0$. Namely, the fact that $\psi$ agrees with $B \rightarrow C \rightarrow B^{\prime} / J^{\prime} \bmod I$ implies that

$$
\psi\left(b_{i}\right)=\sum a_{i j} \xi_{j}+\theta_{i}
$$

for some $\xi_{i} \in B^{\prime}$ and $\theta_{i} \in I B^{\prime}$. Hence we see that

$$
\psi(h)=\psi\left(\sum \epsilon_{i} b_{i}\right)=\sum \epsilon_{i} a_{i j} \xi_{j}+\sum \epsilon_{i} \theta_{i}=0
$$

because of the relations above and the fact that $I^{2}=0$.
07 CM Proposition 16.6.3. Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that
(1) I is nilpotent,
(2) $\Lambda / I \Lambda$ is a filtered colimit of smooth $R / I$-algebras, and
(3) $R \rightarrow \Lambda$ is flat.

Then $\Lambda$ is a colimit of smooth $R$-algebras.
Proof. Since $I^{n}=0$ for some $n$, it follows by induction on $n$ that it suffices to consider the case where $I^{2}=0$. Let $\varphi: A \rightarrow \Lambda$ be an $R$-algebra map with $A$ of finite presentation over $R$. We have to find a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ smooth over $R$, see Lemma 16.2.1. By Lemma 16.6.1 we may assume that $A=B / J$ with $B$ smooth over $R$ and $J \subset I B$ a finitely generated ideal. By Lemma 16.6.2 we can find a (possibly noncommutative) diagram

of $R$-algebras which commutes modulo $I$ and such that $\alpha(J)=0$. The map

$$
D: B \longrightarrow I \Lambda, \quad b \longmapsto \varphi(b)-\beta(\alpha(b))
$$

is a derivation over $R$ hence we can write it as $D=\xi \circ \mathrm{d}_{B / R}$ for some $B$-linear $\operatorname{map} \xi: \Omega_{B / R} \rightarrow I \Lambda$. Since $\Omega_{B / R}$ is a finite projective $B$-module we can write $\xi=\sum_{i=1, \ldots, n} \epsilon_{i} \Xi_{i}$ for some $\epsilon_{i} \in I$ and $B$-linear maps $\Xi_{i}: \Omega_{B / R} \rightarrow \Lambda$. (Details omitted. Hint: write $\Omega_{B / R}$ as a direct sum of a finite free module to reduce to the finite free case.) We define

$$
B^{\prime \prime}=\operatorname{Sym}_{B^{\prime}}^{*}\left(\bigoplus_{i=1, \ldots, n} \Omega_{B / R} \otimes_{B, \alpha} B^{\prime}\right)
$$

and we define $\beta^{\prime}: B^{\prime \prime} \rightarrow \Lambda$ by $\beta$ on $B^{\prime}$ and by

$$
\left.\beta^{\prime}\right|_{i \text { th summand }} \Omega_{B / R} \otimes_{B, \alpha} B^{\prime}=\Xi_{i} \otimes \beta
$$

and $\alpha^{\prime}: B \rightarrow B^{\prime \prime}$ by

$$
\alpha^{\prime}(b)=\alpha(b) \oplus \sum \epsilon_{i} \mathrm{~d}_{B / R}(b) \otimes 1 \oplus 0 \oplus \ldots
$$

At this point the diagram

does commute. Moreover, it is direct from the definitions that $\alpha^{\prime}(J)=0$ as $I^{2}=0$. Hence the desired factorization.

### 16.7. The lifting lemma

07CN
Here is a fiendishly clever lemma.
07CP Lemma 16.7.1. Let $R$ be a Noetherian ring. Let $\Lambda$ be an $R$-algebra. Let $\pi \in R$ and assume that $A n n_{R}(\pi)=A n n_{R}\left(\pi^{2}\right)$ and $A n n_{\Lambda}(\pi)=A n n_{\Lambda}\left(\pi^{2}\right)$. Suppose we have $R$-algebra maps $R / \pi^{2} R \rightarrow \bar{C} \rightarrow \Lambda / \pi^{2} \Lambda$ with $\bar{C}$ of finite presentation. Then there exists an $R$-algebra homomorphism $D \rightarrow \Lambda$ and a commutative diagram

with the following properties
(a) $D$ is of finite presentation,
(b) $R \rightarrow D$ is smooth at any prime $\mathfrak{q}$ with $\pi \notin \mathfrak{q}$,
(c) $R \rightarrow D$ is smooth at any prime $\mathfrak{q}$ with $\pi \in \mathfrak{q}$ lying over a prime of $\bar{C}$ where $R / \pi^{2} R \rightarrow \bar{C}$ is smooth, and
(d) $\bar{C} / \pi \bar{C} \rightarrow D / \pi D$ is smooth at any prime lying over a prime of $\bar{C}$ where $R / \pi^{2} R \rightarrow \bar{C}$ is smooth.

Proof. We choose a presentation

$$
\bar{C}=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)
$$

We also denote $I=\left(f_{1}, \ldots, f_{m}\right)$ and $\bar{I}$ the image of $I$ in $R / \pi^{2} R\left[x_{1}, \ldots, x_{n}\right]$. Since $R$ is Noetherian, so is $\bar{C}$. Hence the smooth locus of $R / \pi^{2} R \rightarrow \bar{C}$ is quasi-compact, see Topology, Lemma 5.8.2. Applying Lemma 16.3 .2 we may choose a finite list of elements $a_{1}, \ldots, a_{r} \in \bar{R}\left[x_{1}, \ldots, x_{n}\right]$ such that
(1) the union of the open subspaces $\operatorname{Spec}\left(\bar{C}_{a_{k}}\right) \subset \operatorname{Spec}(\bar{C})$ cover the smooth locus of $R / \pi^{2} R \rightarrow \bar{C}$, and
(2) for each $k=1, \ldots, r$ there exists a finite subset $E_{k} \subset\{1, \ldots, m\}$ such that $\left(\bar{I} / \bar{I}^{2}\right)_{a_{k}}$ is freely generated by the classes of $f_{j}, j \in E_{k}$.
Set $I_{k}=\left(f_{j}, j \in E_{k}\right) \subset I$ and denote $\bar{I}_{k}$ the image of $I_{k}$ in $R / \pi^{2} R\left[x_{1}, \ldots, x_{n}\right]$. By (2) and Nakayama's lemma we see that $\left(\bar{I} / \bar{I}_{k}\right)_{a_{k}}$ is annihilated by $1+b_{k}^{\prime}$ for some $b_{k}^{\prime} \in \bar{I}_{a_{k}}$. Suppose $b_{k}^{\prime}$ is the image of $b_{k} /\left(a_{k}\right)^{N}$ for some $b_{k} \in I$ and some integer $N$. After replacing $a_{k}$ by $a_{k} b_{k}$ we get
(3) $\left(\bar{I}_{k}\right)_{a_{k}}=(\bar{I})_{a_{k}}$.

Thus, after possibly replacing $a_{k}$ by a high power, we may write
(4) $a_{k} f_{\ell}=\sum_{j \in E_{k}} h_{k, \ell}^{j} f_{j}+\pi^{2} g_{k, \ell}$
for any $\ell \in\{1, \ldots, m\}$ and some $h_{i, \ell}^{j}, g_{i, \ell} \in R\left[x_{1}, \ldots, x_{n}\right]$. If $\ell \in E_{k}$ we choose $h_{k, \ell}^{j}=a_{k} \delta_{\ell, j}$ (Kronecker delta) and $g_{k, \ell}=0$. Set

$$
D=R\left[x_{1}, \ldots, x_{n}, z_{1}, \ldots, z_{m}\right] /\left(f_{j}-\pi z_{j}, p_{k, \ell}\right) .
$$

Here $j \in\{1, \ldots, m\}, k \in\{1, \ldots, r\}, \ell \in\{1, \ldots, m\}$, and

$$
p_{k, \ell}=a_{k} z_{\ell}-\sum_{j \in E_{k}} h_{k, \ell}^{j} z_{j}-\pi g_{k, \ell} .
$$

Note that for $\ell \in E_{k}$ we have $p_{k, \ell}=0$ by our choices above.
The map $R \rightarrow D$ is the given one. Say $\bar{C} \rightarrow \Lambda / \pi^{2} \Lambda$ maps $x_{i}$ to the class of $\lambda_{i}$ modulo $\pi^{2}$. For an element $f \in R\left[x_{1}, \ldots, x_{n}\right]$ we denote $f(\lambda) \in \Lambda$ the result of substituting $\lambda_{i}$ for $x_{i}$. Then we know that $f_{j}(\lambda)=\pi^{2} \mu_{j}$ for some $\mu_{j} \in \Lambda$. Define $D \rightarrow \Lambda$ by the rules $x_{i} \mapsto \lambda_{i}$ and $z_{j} \mapsto \pi \mu_{j}$. This is well defined because

$$
\begin{aligned}
p_{k, \ell} & \mapsto a_{k}(\lambda) \pi \mu_{\ell}-\sum_{j \in E_{k}} h_{k, \ell}^{j}(\lambda) \pi \mu_{j}-\pi g_{k, \ell}(\lambda) \\
& =\pi\left(a_{k}(\lambda) \mu_{\ell}-\sum_{j \in E_{k}} h_{k, \ell}^{j}(\lambda) \mu_{j}-g_{k, \ell}(\lambda)\right)
\end{aligned}
$$

Substituting $x_{i}=\lambda_{i}$ in (4) above we see that the expression inside the brackets is annihilated by $\pi^{2}$, hence it is annihilated by $\pi$ as we have assumed $\operatorname{Ann}_{\Lambda}(\pi)=$ $\operatorname{Ann}_{\Lambda}\left(\pi^{2}\right)$. The map $\bar{C} \rightarrow D / \pi D$ is determined by $x_{i} \mapsto x_{i}$ (clearly well defined). Thus we are done if we can prove (b), (c), and (d).
Using (4) we obtain the following key equality

$$
\begin{aligned}
\pi p_{k, \ell} & =\pi a_{k} z_{\ell}-\sum_{j \in E_{k}} \pi h_{k, \ell}^{j} z_{j}-\pi^{2} g_{k, \ell} \\
& =-a_{k}\left(f_{\ell}-\pi z_{\ell}\right)+a_{k} f_{\ell}+\sum_{j \in E_{k}} h_{k, \ell}^{j}\left(f_{j}-\pi z_{j}\right)-\sum_{j \in E_{k}} h_{k, \ell}^{j} f_{j}-\pi^{2} g_{k, \ell} \\
& =-a_{k}\left(f_{\ell}-\pi z_{\ell}\right)+\sum_{j \in E_{k}} h_{k, \ell}^{j}\left(f_{j}-\pi z_{j}\right)
\end{aligned}
$$

The end result is an element of the ideal generated by $f_{j}-\pi z_{j}$. In particular, we see that $D[1 / \pi]$ is isomorphic to $R[1 / \pi]\left[x_{1}, \ldots, x_{n}, z_{1}, \ldots, z_{m}\right] /\left(f_{j}-\pi z_{j}\right)$ which is isomorphic to $R[1 / \pi]\left[x_{1}, \ldots, x_{n}\right]$ hence smooth over $R$. This proves (b).
For fixed $k \in\{1, \ldots, r\}$ consider the ring

$$
D_{k}=R\left[x_{1}, \ldots, x_{n}, z_{1}, \ldots, z_{m}\right] /\left(f_{j}-\pi z_{j}, j \in E_{k}, p_{k, \ell}\right)
$$

The number of equations is $m=\left|E_{k}\right|+\left(m-\left|E_{k}\right|\right)$ as $p_{k, \ell}$ is zero if $\ell \in E_{k}$. Also, note that

$$
\begin{aligned}
\left(D_{k} / \pi D_{k}\right)_{a_{k}} & =R / \pi R\left[x_{1}, \ldots, x_{n}, 1 / a_{k}, z_{1}, \ldots, z_{m}\right] /\left(f_{j}, j \in E_{k}, p_{k, \ell}\right) \\
& =(\bar{C} / \pi \bar{C})_{a_{k}}\left[z_{1}, \ldots, z_{m}\right] /\left(a_{k} z_{\ell}-\sum_{j \in E_{k}} h_{k, \ell}^{j} z_{j}\right) \\
& \cong(\bar{C} / \pi \bar{C})_{a_{k}}\left[z_{j}, j \in E_{k}\right]
\end{aligned}
$$

In particular $\left(D_{k} / \pi D_{k}\right)_{a_{k}}$ is smooth over $(\bar{C} / \pi \bar{C})_{a_{k}}$. By our choice of $a_{k}$ we have that $(\bar{C} / \pi \bar{C})_{a_{k}}$ is smooth over $R / \pi R$ of relative dimension $n-\left|E_{k}\right|$, see (2). Hence for a prime $\mathfrak{q}_{k} \subset D_{k}$ containing $\pi$ and lying over $\operatorname{Spec}\left(\bar{C}_{a_{k}}\right)$ the fibre ring of $R \rightarrow D_{k}$ is smooth at $\mathfrak{q}_{k}$ of dimension $n$. Thus $R \rightarrow D_{k}$ is syntomic at $\mathfrak{q}_{k}$ by our count of the number of equations above, see Algebra, Lemma 10.134.11. Hence $R \rightarrow D_{k}$ is smooth at $\mathfrak{q}_{k}$, see Algebra, Lemma 10.135.16.

To finish the proof, let $\mathfrak{q} \subset D$ be a prime containing $\pi$ lying over a prime where $R / \pi^{2} R \rightarrow \bar{C}$ is smooth. Then $a_{k} \notin \mathfrak{q}$ for some $k$ by (1). We will show that the surjection $D_{k} \rightarrow D$ induces an isomorphism on local rings at $\mathfrak{q}$. Since we know that the ring maps $\bar{C} / \pi \bar{C} \rightarrow D_{k} / \pi D_{k}$ and $R \rightarrow D_{k}$ are smooth at the corresponding prime $\mathfrak{q}_{k}$ by the preceding paragraph this will prove (c) and (d) and thus finish the proof.

First, note that for any $\ell$ the equation $\pi p_{k, \ell}=-a_{k}\left(f_{\ell}-\pi z_{\ell}\right)+\sum_{j \in E_{k}} h_{k, \ell}^{j}\left(f_{j}-\pi z_{j}\right)$ proved above shows that $f_{\ell}-\pi z_{\ell}$ maps to zero in $\left(D_{k}\right)_{a_{k}}$ and in particular in $\left(D_{k}\right)_{\mathfrak{q}_{k}}$. The relations (4) imply that $a_{k} f_{\ell}=\sum_{j \in E_{k}} h_{k, \ell}^{j} f_{j}$ in $I / I^{2}$. Since $\left(\bar{I}_{k} / \bar{I}_{k}^{2}\right)_{a_{k}}$ is free on $f_{j}, j \in E_{k}$ we see that

$$
a_{k^{\prime}} h_{k, \ell}^{j}-\sum_{j^{\prime} \in E_{k^{\prime}}} h_{k^{\prime}, \ell}^{j^{\prime}} h_{k, j^{\prime}}^{j}
$$

is zero in $\bar{C}_{a_{k}}$ for every $k, k^{\prime}, \ell$ and $j \in E_{k}$. Hence we can find a large integer $N$ such that

$$
a_{k}^{N}\left(a_{k^{\prime}} h_{k, \ell}^{j}-\sum_{j^{\prime} \in E_{k^{\prime}}} h_{k^{\prime}, \ell}^{j^{\prime}} h_{k, j^{\prime}}^{j}\right)
$$

is in $I_{k}+\pi^{2} R\left[x_{1}, \ldots, x_{n}\right]$. Computing modulo $\pi$ we have

$$
\begin{aligned}
& a_{k} p_{k^{\prime}, \ell}-a_{k^{\prime}} p_{k, \ell}+\sum h_{k^{\prime}, \ell}^{j^{\prime}} p_{k, j^{\prime}} \\
& =-a_{k} \sum h_{k^{\prime}, \ell}^{j^{\prime}} z_{j^{\prime}}+a_{k^{\prime}} \sum h_{k, \ell}^{j} z_{j}+\sum h_{k^{\prime}, \ell}^{j^{\prime}} a_{k} z_{j^{\prime}}-\sum \sum h_{k^{\prime}, \ell}^{j^{\prime}} h_{k, j^{\prime}}^{j} z_{j} \\
& =\sum\left(a_{k^{\prime}} h_{k, \ell}^{j}-\sum h_{k^{\prime}, \ell}^{j^{\prime}} h_{k, j^{\prime}}^{j}\right) z_{j}
\end{aligned}
$$

with Einstein summation convention. Combining with the above we see $a_{k}^{N+1} p_{k^{\prime}, \ell}$ is contained in the ideal generated by $I_{k}$ and $\pi$ in $R\left[x_{1}, \ldots, x_{n}, z_{1}, \ldots, z_{m}\right]$. Thus $p_{k^{\prime}, \ell}$ maps into $\pi\left(D_{k}\right)_{a_{k}}$. On the other hand, the equation

$$
\pi p_{k^{\prime}, \ell}=-a_{k^{\prime}}\left(f_{\ell}-\pi z_{\ell}\right)+\sum_{j^{\prime} \in E_{k^{\prime}}} h_{k^{\prime}, \ell}^{j^{\prime}}\left(f_{j^{\prime}}-\pi z_{j^{\prime}}\right)
$$

shows that $\pi p_{k^{\prime}, \ell}$ is zero in $\left(D_{k}\right)_{a_{k}}$. Since we have assumed that $\operatorname{Ann}_{R}(\pi)=$ $\operatorname{Ann}_{R}\left(\pi^{2}\right)$ and since $\left(D_{k}\right)_{\mathfrak{q}_{k}}$ is smooth hence flat over $R$ we see that $\operatorname{Ann}_{\left(D_{k}\right)_{\mathfrak{q}_{k}}}(\pi)=$ $\operatorname{Ann}_{\left(D_{k}\right)_{\mathfrak{q}_{k}}}\left(\pi^{2}\right)$. We conclude that $p_{k^{\prime}, \ell}$ maps to zero as well, hence $D_{\mathfrak{q}}=\left(D_{k}\right)_{\mathfrak{q}_{k}}$ and we win.

### 16.8. The desingularization lemma

07 CQ Here is another fiendishly clever lemma.
07CR Lemma 16.8.1. Let $R$ be a Noetherian ring. Let $\Lambda$ be an $R$-algebra. Let $\pi \in R$ and assume that $A n n_{\Lambda}(\pi)=A n n_{\Lambda}\left(\pi^{2}\right)$. Let $A \rightarrow \Lambda$ be an $R$-algebra map with $A$ of finite presentation. Assume
(1) the image of $\pi$ is strictly standard in $A$ over $R$, and
(2) there exists a section $\rho: A / \pi^{4} A \rightarrow R / \pi^{4} R$ which is compatible with the map to $\Lambda / \pi^{4} \Lambda$.
Then we can find $R$-algebra maps $A \rightarrow B \rightarrow \Lambda$ with $B$ of finite presentation such that $\mathfrak{a} B \subset H_{B / R}$ where $\mathfrak{a}=A n n_{R}\left(A n n_{R}\left(\pi^{2}\right) / A n n_{R}(\pi)\right)$.

Proof. Choose a presentation

$$
A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)
$$

and $0 \leq c \leq \min (n, m)$ such that 16.3 .3 .3 holds for $\pi$ and such that
07CS

$$
\begin{equation*}
\pi f_{c+j} \in\left(f_{1}, \ldots, f_{c}\right)+\left(f_{1}, \ldots, f_{m}\right)^{2} \tag{16.8.1.1}
\end{equation*}
$$

for $j=1, \ldots, m-c$. Say $\rho$ maps $x_{i}$ to the class of $r_{i} \in R$. Then we can replace $x_{i}$ by $x_{i}-r_{i}$. Hence we may assume $\rho\left(x_{i}\right)=0$ in $R / \pi^{4} R$. This implies that $f_{j}(0) \in \pi^{4} R$ and that $A \rightarrow \Lambda$ maps $x_{i}$ to $\pi^{4} \lambda_{i}$ for some $\lambda_{i} \in \Lambda$. Write

$$
f_{j}=f_{j}(0)+\sum_{i=1, \ldots, n} r_{j i} x_{i}+\text { h.o.t. }
$$

This implies that the constant term of $\partial f_{j} / \partial x_{i}$ is $r_{j i}$. Apply $\rho$ to 16.3.3.3 for $\pi$ and we see that

$$
\pi=\sum_{I \subset\{1, \ldots, n\},|I|=c} r_{I} \operatorname{det}\left(r_{j i}\right)_{j=1, \ldots, c, i \in I} \bmod \pi^{4} R
$$

for some $r_{I} \in R$. Thus we have

$$
u \pi=\sum_{I \subset\{1, \ldots, n\},|I|=c} r_{I} \operatorname{det}\left(r_{j i}\right)_{j=1, \ldots, c, i \in I}
$$

for some $u \in 1+\pi^{3} R$. By Algebra, Lemma 10.14 .4 this implies there exists a $n \times c$ matrix $\left(s_{i k}\right)$ such that

$$
u \pi \delta_{j k}=\sum_{i=1, \ldots, n} r_{j i} c_{i k} \quad \text { for all } j, k=1, \ldots, c
$$

(Kronecker delta). We introduce auxiliary variables $v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}$ and we set

$$
h_{i}=x_{i}-\pi^{2} \sum_{j=1, \ldots c} s_{i j} v_{j}-\pi^{3} w_{i}
$$

In the following we will use that

$$
R\left[x_{1}, \ldots, x_{n}, v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right] /\left(h_{1}, \ldots, h_{n}\right)=R\left[v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right]
$$

without further mention. In $R\left[x_{1}, \ldots, x_{n}, v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right] /\left(h_{1}, \ldots, h_{n}\right)$ we have

$$
\begin{aligned}
f_{j} & =f_{j}\left(x_{1}-h_{1}, \ldots, x_{n}-h_{n}\right) \\
& =\sum_{i} \pi^{2} r_{j i} s_{i k} v_{k}+\sum_{i} \pi^{3} r_{j i} w_{i} \bmod \pi^{4} \\
& =\pi^{3} v_{j}+\sum \pi^{3} r_{j i} w_{i} \bmod \pi^{4}
\end{aligned}
$$

for $1 \leq j \leq c$. Hence we can choose elements $g_{j} \in R\left[v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right]$ such that $g_{j}=v_{j}+\sum r_{j i} w_{i} \bmod \pi$ and such that $f_{j}=\pi^{3} g_{j}$ in the $R$-algebra $R\left[x_{1}, \ldots, x_{n}, v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right] /\left(h_{1}, \ldots, h_{n}\right)$. We set

$$
B=R\left[x_{1}, \ldots, x_{n}, v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right] /\left(f_{1}, \ldots, f_{n}, h_{1}, \ldots, h_{n}, g_{1}, \ldots, g_{c}\right)
$$

The map $A \rightarrow B$ is clear. We define $B \rightarrow \Lambda$ by mapping $x_{i} \rightarrow \pi^{4} \lambda_{i}, v_{i} \mapsto 0$, and $w_{i} \mapsto \pi \lambda_{i}$. Then it is clear that the elements $f_{j}$ and $h_{i}$ are mapped to zero in $\Lambda$. Moreover, it is clear that $g_{i}$ is mapped to an element $t$ of $\pi \Lambda$ such that $\pi^{3} t=0$ (as $f_{i}=\pi^{3} g_{i}$ modulo the ideal generated by the $h$ 's). Hence our assumption that $\operatorname{Ann}_{\Lambda}(\pi)=\operatorname{Ann}_{\Lambda}\left(\pi^{2}\right)$ implies that $t=0$. Thus we are done if we can prove the statement about smoothness.

Note that $B_{\pi} \cong A_{\pi}\left[v_{1}, \ldots, v_{c}\right]$ because the equations $g_{i}=0$ are implied by $f_{i}=0$. Hence $B_{\pi}$ is smooth over $R$ as $A_{\pi}$ is smooth over $R$ by the assumption that $\pi$ is strictly standard in $A$ over $R$, see Lemma 16.3.5.
Set $B^{\prime}=R\left[v_{1}, \ldots, v_{c}, w_{1}, \ldots, w_{n}\right] /\left(g_{1}, \ldots, g_{c}\right)$. As $g_{i}=v_{i}+\sum r_{j i} w_{i} \bmod \pi$ we see that $B^{\prime} / \pi B^{\prime}=R / \pi R\left[w_{1}, \ldots, w_{n}\right]$. Hence $R \rightarrow B^{\prime}$ is smooth of relative dimension $n$ at every point of $V(\pi)$ by Algebra, Lemmas 10.134 .11 and 10.135 .16 (the first lemma shows it is syntomic at those primes, in particular flat, whereupon the second lemma shows it is smooth).

Let $\mathfrak{q} \subset B$ be a prime with $\pi \in \mathfrak{q}$ and for some $r \in \mathfrak{a}, r \notin \mathfrak{q}$. Denote $\mathfrak{q}^{\prime}=B^{\prime} \cap \mathfrak{q}$. We claim the surjection $B^{\prime} \rightarrow B$ induces an isomorphism of local rings $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}} \rightarrow B_{\mathfrak{q}}$. This will conclude the proof of the lemma. Note that $B_{\mathfrak{q}}$ is the quotient of $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ by the ideal generated by $f_{c+j}, j=1, \ldots, m-c$. We observe two things: first the image of $f_{c+j}$ in $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is divisible by $\pi^{2}$ and second the image of $\pi f_{c+j}$ in $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ can be written as $\sum b_{j_{1} j_{2}} f_{c+j_{1}} f_{c+j_{2}}$ by 16.8.1.1. Thus we see that the image of each $\pi f_{c+j}$ is contained in the ideal generated by the elements $\pi^{2} f_{c+j^{\prime}}$. Hence $\pi f_{c+j}=0$ in $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ as this is a Noetherian local ring, see Algebra, Lemma 10.50.4. As $R \rightarrow\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is flat we see that

$$
\left(\operatorname{Ann}_{R}\left(\pi^{2}\right) / \operatorname{Ann}_{R}(\pi)\right) \otimes_{R}\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}=\operatorname{Ann}_{\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}}\left(\pi^{2}\right) / \operatorname{Ann}_{\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}}(\pi)
$$

Because $r \in \mathfrak{a}$ is invertible in $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ we see that this module is zero. Hence we see that the image of $f_{c+j}$ is zero in $\left(B^{\prime}\right)_{\mathfrak{q}^{\prime}}$ as desired.

07CT Lemma 16.8.2. Let $R$ be a Noetherian ring. Let $\Lambda$ be an $R$-algebra. Let $\pi \in R$ and assume that $A n n_{R}(\pi)=A n n_{R}\left(\pi^{2}\right)$ and $A n n_{\Lambda}(\pi)=A n n_{\Lambda}\left(\pi^{2}\right)$. Let $A \rightarrow \Lambda$ and $D \rightarrow \Lambda$ be $R$-algebra maps with $A$ and $D$ of finite presentation. Assume
(1) $\pi$ is strictly standard in $A$ over $R$, and
(2) there exists an $R$-algebra map $A / \pi^{4} A \rightarrow D / \pi^{4} D$ compatible with the maps to $\Lambda / \pi^{4} \Lambda$.
Then we can find an $R$-algebra map $B \rightarrow \Lambda$ with $B$ of finite presentation and $R$-algebra maps $A \rightarrow B$ and $D \rightarrow B$ compatible with the maps to $\Lambda$ such that $H_{D / R} B \subset H_{B / D}$ and $H_{D / R} B \subset H_{B / R}$.

Proof. We apply Lemma 16.8.1 to

$$
D \longrightarrow A \otimes_{R} D \longrightarrow \Lambda
$$

and the image of $\pi$ in $D$. By Lemma 16.3 .7 we see that $\pi$ is strictly standard in $A \otimes_{R} D$ over $D$. As our section $\rho:\left(A \otimes_{R} D\right) / \pi^{4}\left(A \otimes_{R} D\right) \rightarrow D / \pi^{4} D$ we take the map induced by the map in (2). Thus Lemma 16.8 .1 applies and we obtain a factorization $A \otimes_{R} D \rightarrow B \rightarrow \Lambda$ with $B$ of finite presentation and $\mathfrak{a} B \subset H_{B / D}$ where

$$
\mathfrak{a}=\operatorname{Ann}_{D}\left(\operatorname{Ann}_{D}\left(\pi^{2}\right) / \operatorname{Ann}_{D}(\pi)\right)
$$

For any prime $\mathfrak{q}$ of $D$ such that $D_{\mathfrak{q}}$ is flat over $R$ we have $\operatorname{Ann}_{D_{\mathfrak{q}}}\left(\pi^{2}\right) / \operatorname{Ann}_{D_{\mathfrak{q}}}(\pi)=0$ because annihilators of elements commutes with flat base change and we assumed $\operatorname{Ann}_{R}(\pi)=\operatorname{Ann}_{R}\left(\pi^{2}\right)$. Because $D$ is Noetherian we see that $A n n_{D}\left(\pi^{2}\right) / \operatorname{Ann}_{D}(\pi)$ is a finite $D$-module, hence formation of its annihilator commutes with localization. Thus we see that $\mathfrak{a} \not \subset \mathfrak{q}$. Hence we see that $D \rightarrow B$ is smooth at any prime of $B$ lying over $\mathfrak{q}$. Since any prime of $D$ where $R \rightarrow D$ is smooth is one where $D_{\mathfrak{q}}$ is flat over $R$ we conclude that $H_{D / R} B \subset H_{B / D}$. The final inclusion $H_{D / R} B \subset H_{B / R}$
follows because compositions of smooth ring maps are smooth (Algebra, Lemma 10.135.14.

07F0 Lemma 16.8.3. Let $R$ be a Noetherian ring. Let $\Lambda$ be an $R$-algebra. Let $\pi \in R$ and assume that $A n n_{R}(\pi)=A n n_{R}\left(\pi^{2}\right)$ and $A n n_{\Lambda}(\pi)=A n n_{\Lambda}\left(\pi^{2}\right)$. Let $A \rightarrow \Lambda$ be an $R$-algebra map with $A$ of finite presentation and assume $\pi$ is strictly standard in $A$ over $R$. Let

$$
A / \pi^{8} A \rightarrow \bar{C} \rightarrow \Lambda / \pi^{8} \Lambda
$$

be a factorization with $\bar{C}$ of finite presentation. Then we can find a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ of finite presentation such that $R_{\pi} \rightarrow B_{\pi}$ is smooth and such that

$$
H_{\bar{C} /\left(R / \pi^{8} R\right)} \cdot \Lambda / \pi^{8} \Lambda \subset \sqrt{H_{B / R} \Lambda} \bmod \pi^{8} \Lambda
$$

Proof. Apply Lemma 16.7 .1 to get $R \rightarrow D \rightarrow \Lambda$ with a factorization $\bar{C} / \pi^{4} \bar{C} \rightarrow$ $D / \pi^{4} D \rightarrow \Lambda / \pi^{4} \Lambda$ such that $R \rightarrow D$ is smooth at any prime not containing $\pi$ and at any prime lying over a prime of $\bar{C} / \pi^{4} \bar{C}$ where $R / \pi^{8} R \rightarrow \bar{C}$ is smooth. By Lemma 16.8.2 we can find a finitely presented $R$-algebra $B$ and factorizations $A \rightarrow B \rightarrow \Lambda$ and $D \rightarrow B \rightarrow \Lambda$ such that $H_{D / R} B \subset H_{B / R}$. We omit the verification that this is a solution to the problem posed by the lemma.

### 16.9. Warmup: reduction to a base field

07F1 In this section we apply the lemmas in the previous sections to prove that it suffices to prove the main result when the base ring is a field, see Lemma 16.9.4
07F2 Situation 16.9.1. Here $R \rightarrow \Lambda$ is a regular ring map of Noetherian rings.
Let $R \rightarrow \Lambda$ be as in Situation 16.9.1. We say PT holds for $R \rightarrow \Lambda$ if $\Lambda$ is a filtered colimit of smooth $R$-algebras.

07F3 Lemma 16.9.2. Let $R_{i} \rightarrow \Lambda_{i}, i=1,2$ be as in Situation 16.9.1. If PT holds for $R_{i} \rightarrow \Lambda_{i}, i=1,2$, then PT holds for $R_{1} \times R_{2} \rightarrow \Lambda_{1} \times \Lambda_{2}$.

Proof. Omitted. Hint: A product of colimits is a colimit.
07F4 Lemma 16.9.3. Let $R \rightarrow A \rightarrow \Lambda$ be ring maps with $A$ of finite presentation over $R$. Let $S \subset R$ be a multiplicative set. Let $S^{-1} A \rightarrow B^{\prime} \rightarrow S^{-1} \Lambda$ be a factorization with $B^{\prime}$ smooth over $S^{-1} R$. Then we can find a factorization $A \rightarrow B \rightarrow \Lambda$ such that some $s \in S$ maps to an elementary standard element in $B$ over $R$.
Proof. We first apply Lemma 16.4 .4 to $S^{-1} R \rightarrow B^{\prime}$. Thus we may assume $B^{\prime}$ is standard smooth over $S^{-1} R$. Write $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{t}\right)$ and say $x_{i} \mapsto$ $\lambda_{i}$ in $\Lambda$. We may write $B^{\prime}=S^{-1} R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$ for some $c \geq n$ where $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ is invertible in $B^{\prime}$ and such that $A \rightarrow B^{\prime}$ is given by $x_{i} \mapsto x_{i}$, see Lemma 16.4.6. After multiplying $x_{i}, i>n$ by an element of $S$ and correspondingly modifying the equations $f_{j}$ we may assume $B^{\prime} \rightarrow S^{-1} \Lambda$ maps $x_{i}$ to $\lambda_{i} / 1$ for some $\lambda_{i} \in \Lambda$ for $i>n$. Choose a relation

$$
1=a_{0} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}+\sum_{j=1, \ldots, c} a_{j} f_{j}
$$

for some $a_{j} \in S^{-1} R\left[x_{1}, \ldots, x_{n+m}\right]$. Since each element of $S$ is invertible in $B^{\prime}$ we may (by clearing denominators) assume that $f_{j}, a_{j} \in R\left[x_{1}, \ldots, x_{n+m}\right]$ and that

$$
s_{0}=a_{0} \operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}+\sum_{j=1, \ldots, c} a_{j} f_{j}
$$

for some $s_{0} \in S$. Since $g_{j}$ maps to zero in $S^{-1} R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, x_{c}\right)$ we can find elements $s_{j} \in S$ such that $s_{j} g_{j}=0$ in $R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Since $f_{j}$ maps to zero in $S^{-1} \Lambda$ we can find $s_{j}^{\prime} \in S$ such that $s_{j}^{\prime} f_{j}\left(\lambda_{1}, \ldots, \lambda_{n+m}\right)=0$ in $\Lambda$. Consider the ring

$$
B=R\left[x_{1}, \ldots, x_{n+m}\right] /\left(s_{1}^{\prime} f_{1}, \ldots, s_{c}^{\prime} f_{c}, g_{1}, \ldots, g_{t}\right)
$$

and the factorization $A \rightarrow B \rightarrow \Lambda$ with $B \rightarrow \Lambda$ given by $x_{i} \mapsto \lambda_{i}$. We claim that $s=s_{0} s_{1} \ldots s_{t} s_{1}^{\prime} \ldots s_{c}^{\prime}$ is elementary standard in $B$ over $R$ which finishes the proof. Namely, $s_{j} g_{j} \in\left(f_{1}, \ldots, f_{c}\right)$ and hence $s g_{j} \in\left(s_{1}^{\prime} f_{1}, \ldots, s_{c}^{\prime} f_{c}\right)$. Finally, we have

$$
a_{0} \operatorname{det}\left(\partial s_{j}^{\prime} f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}+\sum_{j=1, \ldots, c}\left(s_{1}^{\prime} \ldots \hat{s}_{j}^{\prime} \ldots s_{c}^{\prime}\right) a_{j} s_{j}^{\prime} f_{j}=s_{0} s_{1}^{\prime} \ldots s_{c}^{\prime}
$$

which divides $s$ as desired.
07F5 Lemma 16.9.4. If for every Situation 16.9 .1 where $R$ is a field $P T$ holds, then PT holds in general.

Proof. Assume PT holds for any Situation 16.9 .1 where $R$ is a field. Let $R \rightarrow \Lambda$ be as in Situation 16.9.1 arbitrary. Note that $R / I \rightarrow \Lambda / I \Lambda$ is another regular ring map of Noetherian rings, see More on Algebra, Lemma 15.32 .3 . Consider the set of ideals

$$
\mathcal{I}=\{I \subset R \mid R / I \rightarrow \Lambda / I \Lambda \text { does not have } \mathrm{PT}\}
$$

We have to show that $\mathcal{I}$ is empty. If this set is nonempty, then it contains a maximal element because $R$ is Noetherian. Replacing $R$ by $R / I$ and $\Lambda$ by $\Lambda / I$ we obtain a situation where PT holds for $R / I \rightarrow \Lambda / I \Lambda$ for any nonzero ideal of $R$. In particular, we see by applying Proposition 16.6 .3 that $R$ is a reduced ring.

Let $A \rightarrow \Lambda$ be an $R$-algebra homomorphism with $A$ of finite presentation. We have to find a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ smooth over $R$, see Lemma 16.2.1.
Let $S \subset R$ be the set of nonzerodivisors and consider the total ring of fractions $Q=S^{-1} R$ of $R$. We know that $Q=K_{1} \times \ldots \times K_{n}$ is a product of fields, see Algebra, Lemmas 10.24 .4 and 10.30 .6 . By Lemma 16.9 .2 and our assumption PT holds for the ring map $S^{-1} R \rightarrow S^{-1} \Lambda$. Hence we can find a factorization $S^{-1} A \rightarrow B^{\prime} \rightarrow \Lambda$ with $B^{\prime}$ smooth over $S^{-1} R$.
We apply Lemma 16.9.3 and find a factorization $A \rightarrow B \rightarrow \Lambda$ such that some $\pi \in S$ is elementary standard in $B$ over $R$. After replacing $A$ by $B$ we may assume that $\pi$ is elementary standard, hence strictly standard in $A$. We know that $R / \pi^{8} R \rightarrow \Lambda / \pi^{8} \Lambda$ satisfies PT. Hence we can find a factorization $R / \pi^{8} R \rightarrow A / \pi^{8} A \rightarrow \bar{C} \rightarrow \Lambda / \pi^{8} \Lambda$ with $R / \pi^{8} R \rightarrow \bar{C}$ smooth. By Lemma 16.7.1 we can find an $R$-algebra map $D \rightarrow \Lambda$ with $D$ smooth over $R$ and a factorization $R / \pi^{4} R \rightarrow A / \pi^{4} A \rightarrow D / \pi^{4} D \rightarrow \Lambda / \pi^{4} \Lambda$. By Lemma 16.8 .2 we can find $A \rightarrow B \rightarrow \Lambda$ with $B$ smooth over $R$ which finishes the proof.

### 16.10. Local tricks

07F7 Situation 16.10.1. We are given a Noetherian ring $R$ and an $R$-algebra map $A \rightarrow \Lambda$ and a prime $\mathfrak{q} \subset \Lambda$. We assume $A$ is of finite presentation over $R$. In this situation we denote $\mathfrak{h}_{A}=\sqrt{H_{A / R} \Lambda}$.

Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1. We say $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved if there exists a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ of finite presentation and $\mathfrak{h}_{A} \subset \mathfrak{h}_{B} \not \subset \mathfrak{q}$. In this case we will call the factorization $A \rightarrow B \rightarrow \Lambda$ a resolution of $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

07F8 Lemma 16.10.2. Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1. Let $r \geq 1$ and $\pi_{1}, \ldots, \pi_{r} \in R$ map to elements of $\mathfrak{q}$. Assume
(1) for $i=1, \ldots, r$ we have

$$
A n n_{R /\left(\pi_{1}^{8}, \ldots, \pi_{i-1}^{8}\right) R}\left(\pi_{i}\right)=A n n_{R /\left(\pi_{1}^{8}, \ldots, \pi_{i-1}^{8}\right) R}\left(\pi_{i}^{2}\right)
$$

and

$$
A n n_{\Lambda /\left(\pi_{1}^{8}, \ldots, \pi_{i-1}^{8}\right) \Lambda}\left(\pi_{i}\right)=A n n_{\Lambda /\left(\pi_{1}^{8}, \ldots, \pi_{i-1}^{8}\right) \Lambda}\left(\pi_{i}^{2}\right)
$$

(2) for $i=1, \ldots, r$ the element $\pi_{i}$ maps to a strictly standard element in $A$ over $R$.
Then, if

$$
R /\left(\pi_{1}^{8}, \ldots, \pi_{r}^{8}\right) R \rightarrow A /\left(\pi_{1}^{8}, \ldots, \pi_{r}^{8}\right) A \rightarrow \Lambda /\left(\pi_{1}^{8}, \ldots, \pi_{r}^{8}\right) \Lambda \supset \mathfrak{q} /\left(\pi_{1}^{8}, \ldots, \pi_{r}^{8}\right) \Lambda
$$

can be resolved, so can $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.
Proof. We are going to prove this by induction on $r$.
The case $r=1$. Here the assumption is that there exists a factorization $A / \pi_{1}^{8} \rightarrow$ $\bar{C} \rightarrow \Lambda / \pi_{1}^{8}$ which resolves the situation modulo $\pi_{1}^{8}$. Conditions (1) and (2) are the assumptions needed to apply Lemma 16.8.3. Thus we can "lift" the resolution $\bar{C}$ to a resolution of $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

The case $r>1$. In this case we apply the induction hypothesis for $r-1$ to the situation $R / \pi_{1}^{8} \rightarrow A / \pi_{1}^{8} \rightarrow \Lambda / \pi_{1}^{8} \supset \mathfrak{q} / \pi_{1}^{8} \Lambda$. Note that property (2) is preserved by Lemma 16.3.7

07F9 Lemma 16.10.3. Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1. Let $\mathfrak{p}=R \cap \mathfrak{q}$. Assume that $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$ and that $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}}$ can be resolved. Then there exists a factorization $A \rightarrow C \rightarrow \Lambda$ with $C$ of finite presentation such that $H_{C / R} \Lambda \not \subset \mathfrak{q}$.

Proof. Let $A_{\mathfrak{p}} \rightarrow C \rightarrow \Lambda_{\mathfrak{q}}$ be a resolution of $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}}$. By our assumption that $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$ this means that $H_{C / R_{\mathfrak{p}}} \Lambda_{\mathfrak{q}}=\Lambda_{\mathfrak{q}}$. By Lemma 16.3 .8 we may assume that $C$ is smooth over $\Lambda_{\mathfrak{p}}$. By Lemma 16.4 .4 we may assume that $C$ is standard smooth over $R_{\mathfrak{p}}$. Write $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{t}\right)$ and say $A \rightarrow \Lambda$ is given by $x_{i} \mapsto \lambda_{i}$. Write $C=R_{\mathfrak{p}}\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$ for some $c \geq n$ such that $A \rightarrow C$ maps $x_{i}$ to $x_{i}$ and such that $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ is invertible in $C$, see Lemma 16.4.6. After clearing denominators we may assume $f_{1}, \ldots, f_{c}$ are elements of $R\left[x_{1}, \ldots, x_{n+m}\right]$. Of course $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{i, j=1, \ldots, c}$ is not invertible in $R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$ but it becomes invertible after inverting some element $s_{0} \in R, s_{0} \notin \mathfrak{p}$. As $g_{j}$ maps to zero under $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A \rightarrow C$ we can find $s_{j} \in R, s_{j} \notin \mathfrak{p}$ such that $s_{j} g_{j}$ is zero in $R\left[x_{1}, \ldots, x_{n+m}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Write $f_{j}=$ $F_{j}\left(x_{1}, \ldots, x_{n+m}, 1\right)$ for some polynomial $F_{j} \in R\left[x_{1}, \ldots, x_{n}, X_{n+1}, \ldots, X_{n+m+1}\right]$ homogeneous in $X_{n+1}, \ldots, X_{n+m+1}$. Pick $\lambda_{n+i} \in \Lambda, i=1, \ldots, m+1$ with $\lambda_{n+m+1} \notin \mathfrak{q}$
such that $x_{n+i}$ maps to $\lambda_{n+i} / \lambda_{n+m+1}$ in $\Lambda_{\mathfrak{q}}$. Then

$$
\begin{aligned}
F_{j}\left(\lambda_{1}, \ldots, \lambda_{n+m+1}\right) & =\left(\lambda_{n+m+1}\right)^{\operatorname{deg}\left(F_{j}\right)} F_{j}\left(\lambda_{1}, \ldots, \lambda_{n}, \frac{\lambda_{n+1}}{\lambda_{n+m+1}}, \ldots, \frac{\lambda_{n+m}}{\lambda_{n+m+1}}, 1\right) \\
& =\left(\lambda_{n+m+1}\right)^{\operatorname{deg}\left(F_{j}\right)} f_{j}\left(\lambda_{1}, \ldots, \lambda_{n}, \frac{\lambda_{n+1}}{\lambda_{n+m+1}}, \ldots, \frac{\lambda_{n+m}}{\lambda_{n+m+1}}\right) \\
& =0
\end{aligned}
$$

in $\Lambda_{\mathfrak{q}}$. Thus we can find $\lambda_{0} \in \Lambda, \lambda_{0} \notin \mathfrak{q}$ such that $\lambda_{0} F_{j}\left(\lambda_{1}, \ldots, \lambda_{n+m+1}\right)=0$ in $\Lambda$. Now we set $B$ equal to

$$
R\left[x_{0}, \ldots, x_{n+m+1}\right] /\left(g_{1}, \ldots, g_{t}, x_{0} F_{1}\left(x_{1}, \ldots, x_{n+m+1}\right), \ldots, x_{0} F_{c}\left(x_{1}, \ldots, x_{n+m+1}\right)\right)
$$

which we map to $\Lambda$ by mapping $x_{i}$ to $\lambda_{i}$. Let $b$ be the image of $x_{0} x_{1} s_{0} s_{1} \ldots s_{t}$ in $B$. Then $B_{b}$ is isomorphic to

$$
R_{s_{0} s_{1}}\left[x_{0}, x_{1}, \ldots, x_{n+m+1}, 1 / x_{0} x_{n+m+1}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

which is smooth over $R$ by construction. Since $b$ does not map to an element of $\mathfrak{q}$, we win.
07FA Lemma 16.10.4. Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1. Let $\mathfrak{p}=R \cap \mathfrak{q}$. Assume
(1) $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$,
(2) $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}}$ can be resolved, and
(3) $\operatorname{dim}\left(\Lambda_{\mathfrak{q}}\right)=0$.

Then $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.
Proof. By (3) the ring $\Lambda_{\mathfrak{q}}$ is Artinian local hence $\mathfrak{q} \Lambda_{\mathfrak{q}}$ is nilpotent. Thus $\left(\mathfrak{h}_{A}\right)^{N} \Lambda_{\mathfrak{q}}=$ 0 for some $N>0$. Thus there exists a $\lambda \in \Lambda, \lambda \notin \mathfrak{q}$ such that $\lambda\left(\mathfrak{h}_{A}\right)^{N}=0$ in $\Lambda$. Say $H_{A / R}=\left(a_{1}, \ldots, a_{r}\right)$ so that $\lambda a_{i}^{N}=0$ in $\Lambda$. By Lemma 16.10 .3 we can find a factorization $A \rightarrow C \rightarrow \Lambda$ with $C$ of finite presentation such that $\mathfrak{h}_{C} \not \subset \mathfrak{q}$. Write $C=A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Set

$$
B=A\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{r}, z, t_{i j}\right] /\left(f_{j}-\sum y_{i} t_{i j}, z y_{i}\right)
$$

where $t_{i j}$ is a set of $r m$ variables. Note that there is a map $B \rightarrow C\left[y_{i}, z\right] /\left(y_{i} z\right)$ given by setting $t_{i j}$ equal to zero. The map $B \rightarrow \Lambda$ is the composition $B \rightarrow$ $C\left[y_{i}, z\right] /\left(y_{i} z\right) \rightarrow \Lambda$ where $C\left[y_{i}, z\right] /\left(y_{i} z\right) \rightarrow \Lambda$ is the given map $C \rightarrow \Lambda$, maps $z$ to $\lambda$, and maps $y_{i}$ to the image of $a_{i}^{N}$ in $\Lambda$.
We claim that $B$ is a solution for $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$. First note that $B_{z}$ is isomorphic to $C\left[y_{1}, \ldots, y_{r}, z, z^{-1}\right]$ and hence is smooth. On the other hand, $B_{y_{\ell}} \cong$ $A\left[x_{i}, y_{i}, y_{\ell}^{-1}, t_{i j}, i \neq \ell\right]$ which is smooth over $A$. Thus we see that $z$ and $a_{\ell} y_{\ell}$ (compositions of smooth maps are smooth) are all elements of $H_{B / R}$. This proves the lemma.

### 16.11. Separable residue fields

07 FB In this section we explain how to solve a local problem in the case of a separable residue field extension.

07FC Lemma 16.11.1 (Ogoma). Let $A$ be a Noetherian ring and let $M$ be a finite A-module. Let $S \subset A$ be a multiplicative set. If $\pi \in A$ and $\operatorname{Ker}\left(\pi: S^{-1} M \rightarrow\right.$ $\left.S^{-1} M\right)=\operatorname{Ker}\left(\pi^{2}: S^{-1} M \rightarrow S^{-1} M\right)$ then there exists an $s \in S$ such that for any $n>0$ we have $\operatorname{Ker}\left(s^{n} \pi: M \rightarrow M\right)=\operatorname{Ker}\left(\left(s^{n} \pi\right)^{2}: M \rightarrow M\right)$.

Proof. Let $K=\operatorname{Ker}(\pi: M \rightarrow M)$ and $K^{\prime}=\left\{m \in M \mid \pi^{2} m=0\right.$ in $\left.S^{-1} M\right\}$ and $Q=K^{\prime} / K$. Note that $S^{-1} Q=0$ by assumption. Since $A$ is Noetherian we see that $Q$ is a finite $A$-module. Hence we can find an $s \in S$ such that $s$ annihilates $Q$. Then $s$ works.

07FD Lemma 16.11.2. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Let $I \subset \mathfrak{q}$ be a prime. Let $n, e$ be positive integers Assume that $\mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \subset I \Lambda_{\mathfrak{q}}$ and that $\Lambda_{\mathfrak{q}}$ is a regular local ring of dimension $d$. Then there exists an $n>0$ and $\pi_{1}, \ldots, \pi_{d} \in \Lambda$ such that
(1) $\left(\pi_{1}, \ldots, \pi_{d}\right) \Lambda_{\mathfrak{q}}=\mathfrak{q} \Lambda_{\mathfrak{q}}$,
(2) $\pi_{1}^{n}, \ldots, \pi_{d}^{n} \in I$, and
(3) for $i=1, \ldots, d$ we have

$$
A n n_{\Lambda /\left(\pi_{1}^{e}, \ldots, \pi_{i-1}^{e}\right) \Lambda}\left(\pi_{i}\right)=A n n_{\Lambda /\left(\pi_{1}^{e}, \ldots, \pi_{i-1}^{e}\right) \Lambda}\left(\pi_{i}^{2}\right)
$$

Proof. Set $S=\Lambda \backslash \mathfrak{q}$ so that $\Lambda_{\mathfrak{q}}=S^{-1} \Lambda$. First pick $\pi_{1}, \ldots, \pi_{d}$ with (1) which is possible as $\Lambda_{\mathfrak{q}}$ is regular. By assumption $\pi_{i}^{n} \in I \Lambda_{\mathfrak{q}}$. Thus we can find $s_{1}, \ldots, s_{d} \in S$ such that $s_{i} \pi_{i}^{n} \in I$. Replacing $\pi_{i}$ by $s_{i} \pi_{i}$ we get (2). Note that (1) and (2) are preserved by further multiplying by elements of $S$. Suppose that (3) holds for $i=1, \ldots, t$ for some $t \in\{0, \ldots, d\}$. Note that $\pi_{1}, \ldots, \pi_{d}$ is a regular sequence in $S^{-1} \Lambda$, see Algebra, Lemma 10.105.3. In particular $\pi_{1}^{e}, \ldots, \pi_{t}^{e}, \pi_{t+1}$ is a regular sequence in $S^{-1} \Lambda=\Lambda_{\mathfrak{q}}$ by Algebra, Lemma 10.67.8. Hence we see that

$$
\operatorname{Ann}_{S^{-1} \Lambda /\left(\pi_{1}^{e}, \ldots, \pi_{i-1}^{e}\right)}\left(\pi_{i}\right)=\operatorname{Ann}_{S^{-1} \Lambda /\left(\pi_{1}^{e}, \ldots, \pi_{i-1}^{e}\right)}\left(\pi_{i}^{2}\right)
$$

Thus we get (3) for $i=t+1$ after replacing $\pi_{t+1}$ by $s \pi_{t+1}$ for some $s \in S$ by Lemma 16.11.1. By induction on $t$ this produces a sequence satisfying (1), (2), and (3).

07FE Lemma 16.11.3. Let $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1 where
(1) $k$ is a field,
(2) $\Lambda$ is Noetherian,
(3) $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$,
(4) $\Lambda_{\mathfrak{q}}$ is a regular local ring, and
(5) the field extension $k \subset \kappa(\mathfrak{q})$ is separable.

Then $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.
Proof. Set $d=\operatorname{dim} \Lambda_{\mathfrak{q}}$. Set $R=k\left[x_{1}, \ldots, x_{d}\right]$. Choose $n>0$ such that $\mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \subset$ $\mathfrak{h}_{A} \Lambda_{\mathfrak{q}}$ which is possible as $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$. Choose generators $a_{1}, \ldots, a_{r}$ of $H_{A / R}$. Set

$$
B=A\left[x_{1}, \ldots, x_{d}, z_{i j}\right] /\left(x_{i}^{n}-\sum z_{i j} a_{j}\right)
$$

Each $B_{a_{j}}$ is smooth over $R$ it is a polynomial algebra over $A_{a_{j}}\left[x_{1}, \ldots, x_{d}\right]$ and $A_{a_{j}}$ is smooth over $k$. Hence $B_{x_{i}}$ is smooth over $R$. Let $B \rightarrow C$ be the $R$-algebra map constructed in Lemma 16.4.1 which comes with a $R$-algebra retraction $C \rightarrow B$. In particular a map $C \rightarrow \Lambda$ fitting into the diagram above. By construction $C_{x_{i}}$ is a smooth $R$-algebra with $\Omega_{C_{x_{i}} / R}$ free. Hence we can find $c>0$ such that $x_{i}^{c}$ is strictly standard in $C / R$, see Lemma 16.4.7. Now choose $\pi_{1}, \ldots, \pi_{d} \in \Lambda$ as in Lemma 16.11 .2 where $n=n, e=8 c, \mathfrak{q}=\mathfrak{q}$ and $I=\mathfrak{h}_{A}$. Write $\pi_{i}^{n}=\sum \lambda_{i j} a_{j}$ for some $\pi_{i j} \in \Lambda$. There is a map $B \rightarrow \Lambda$ given by $x_{i} \mapsto \pi_{i}$ and $z_{i j} \mapsto \lambda_{i j}$. Set
$R=k\left[x_{1}, \ldots, x_{d}\right]$. Diagram

Now we apply Lemma 16.10 .2 to $R \rightarrow C \rightarrow \Lambda \supset \mathfrak{q}$ and the sequence of elements $x_{1}^{c}, \ldots, x_{d}^{c}$ of $R$. Assumption (2) is clear. Assumption (1) holds for $R$ by inspection and for $\Lambda$ by our choice of $\pi_{1}, \ldots, \pi_{d}$. (Note that if $\operatorname{Ann}_{\Lambda}(\pi)=\operatorname{Ann}_{\Lambda}\left(\pi^{2}\right)$, then we have $\operatorname{Ann}_{\Lambda}(\pi)=\operatorname{Ann}_{\Lambda}\left(\pi^{c}\right)$ for all $c>0$.) Thus it suffices to resolve

$$
R /\left(x_{1}^{e}, \ldots, x_{d}^{e}\right) \rightarrow C /\left(x_{1}^{e}, \ldots, x_{d}^{e}\right) \rightarrow \Lambda /\left(\pi_{1}^{e}, \ldots, \pi_{d}^{e}\right) \supset \mathfrak{q} /\left(\pi_{1}^{e}, \ldots, \pi_{d}^{e}\right)
$$

for $e=8 c$. By Lemma 16.10 .4 it suffices to resolve this after localizing at $\mathfrak{q}$. But since $x_{1}, \ldots, x_{d}$ map to a regular sequence in $\Lambda_{\mathfrak{q}}$ we see that $R \rightarrow \Lambda$ is flat, see Algebra, Lemma 10.127.2. Hence

$$
R /\left(x_{1}^{e}, \ldots, x_{d}^{e}\right) \rightarrow \Lambda_{\mathfrak{q}} /\left(\pi_{1}^{e}, \ldots, \pi_{d}^{e}\right)
$$

is a flat ring map of Artinian local rings. Moreover, this map induces a separable field extension on residue fields by assumption. Thus this map is a filtered colimit of smooth algebras by Algebra, Lemma 10.150.11 and Proposition 16.6.3. Existence of the desired solution follows from Lemma 16.2.1

### 16.12. Inseparable residue fields

07 FF In this section we explain how to solve a local problem in the case of an inseparable residue field extension.

07FG Lemma 16.12.1. Let $k$ be a field of characteristic $p>0$. Let $(\Lambda, \mathfrak{m}, K)$ be an Artinian local $k$-algebra. Assume that $\operatorname{dim} H_{1}\left(L_{K / k}\right)<\infty$. Then $\Lambda$ is a filtered colimit of Artinian local $k$-algebras $A$ with each map $A \rightarrow \Lambda$ flat, with $\mathfrak{m}_{A} \Lambda=\mathfrak{m}$, and with $A$ essentially of finite type over $k$.

Proof. Note that the flatness of $A \rightarrow \Lambda$ implies that $A \rightarrow \Lambda$ is injective, so the lemma really tells us that $\Lambda$ is a directed union of these types of subrings $A \subset \Lambda$. Let $n$ be the minimal integer such that $\mathfrak{m}^{n}=0$. We will prove this lemma by induction on $n$. The case $n=1$ is clear as a field extension is a union of finitely generated field extensions.
Pick $\lambda_{1}, \ldots, \lambda_{d} \in \mathfrak{m}$ which generate $\mathfrak{m}$. As $K$ is formally smooth over $\mathbf{F}_{p}$ (see Algebra, Lemma 10.150 .7 we can find a ring map $\sigma: K \rightarrow \Lambda$ which is a section of the quotient map $\Lambda \rightarrow K$. In general $\sigma$ is not a $k$-algebra map. Given $\sigma$ we define

$$
\Psi_{\sigma}: K\left[x_{1}, \ldots, x_{d}\right] \longrightarrow \Lambda
$$

using $\sigma$ on elements of $K$ and mapping $x_{i}$ to $\lambda_{i}$. Claim: there exists a $\sigma: K \rightarrow \Lambda$ and a subfield $k \subset F \subset K$ finitely generated over $k$ such that the image of $k$ in $\Lambda$ is contained in $\Psi_{\sigma}\left(F\left[x_{1}, \ldots, x_{d}\right]\right)$.

We will prove the claim by induction on the least integer $n$ such that $\mathfrak{m}^{n}=0$. It is clear for $n=1$. If $n>1$ set $I=\mathfrak{m}^{n-1}$ and $\Lambda^{\prime}=\Lambda / I$. By induction we may assume given $\sigma^{\prime}: K \rightarrow \Lambda^{\prime}$ and $k \subset F^{\prime} \subset K$ finitely generated such that the image of $k \rightarrow$ $\Lambda \rightarrow \Lambda^{\prime}$ is contained in $A^{\prime}=\Psi_{\sigma^{\prime}}\left(F^{\prime}\left[x_{1}, \ldots, x_{d}\right]\right)$. Denote $\tau^{\prime}: k \rightarrow A^{\prime}$ the induced map. Choose a lift $\sigma: K \rightarrow \Lambda$ of $\sigma^{\prime}$ (this is possible by the formal smoothness of $K / \mathbf{F}_{p}$ we mentioned above). For later reference we note that we can change $\sigma$
to $\sigma+D$ for some derivation $D: K \rightarrow I$. Set $A=F\left[x_{1}, \ldots, x_{d}\right] /\left(x_{1}, \ldots, x_{d}\right)^{n}$. Then $\Psi_{\sigma}$ induces a ring map $\Psi_{\sigma}: A \rightarrow \Lambda$. The composition with the quotient $\operatorname{map} \Lambda \rightarrow \Lambda^{\prime}$ induces a surjective map $A \rightarrow A^{\prime}$ with nilpotent kernel. Choose a lift $\tau: k \rightarrow A$ of $\tau^{\prime}$ (possible as $k / \mathbf{F}_{p}$ is formally smooth). Thus we obtain two maps $k \rightarrow \Lambda$, namely $\Psi_{\sigma} \circ \tau: k \rightarrow \Lambda$ and the given map $i: k \rightarrow \Lambda$. These maps agree modulo $I$, whence the difference is a derivation $\theta=i-\Psi_{\sigma} \circ \tau: k \rightarrow I$. Note that if we change $\sigma$ into $\sigma+D$ then we change $\theta$ into $\theta-\left.D\right|_{k}$.

Choose a set of elements $\left\{y_{j}\right\}_{j \in J}$ of $k$ whose differentials $\mathrm{d} y_{j}$ form a basis of $\Omega_{k / \mathbf{F}_{p}}$. The Jacobi-Zariski sequence for $\mathbf{F}_{p} \subset k \subset K$ is

$$
0 \rightarrow H_{1}\left(L_{K / k}\right) \rightarrow \Omega_{k / \mathbf{F}_{p}} \otimes K \rightarrow \Omega_{K / \mathbf{F}_{p}} \rightarrow \Omega_{K / k} \rightarrow 0
$$

As $\operatorname{dim} H_{1}\left(L_{K / k}\right)<\infty$ we can find a finite subset $J_{0} \subset J$ such that the image of the first map is contained in $\bigoplus_{j \in J_{0}} K \mathrm{~d} y_{j}$. Hence the elements $\mathrm{d} y_{j}, j \in J \backslash J_{0}$ map to $K$-linearly independent elements of $\Omega_{K / \mathbf{F}_{p}}$. Therefore we can choose a $D: K \rightarrow I$ such that $\theta-\left.D\right|_{k}=\xi \circ \mathrm{d}$ where $\xi$ is a composition

$$
\Omega_{k / \mathbf{F}_{p}}=\bigoplus_{j \in J} k \mathrm{~d} y_{j} \longrightarrow \bigoplus_{j \in J_{0}} k \mathrm{~d} y_{j} \longrightarrow I
$$

Let $f_{j}=\xi\left(\mathrm{d} y_{j}\right) \in I$ for $j \in J_{0}$. Change $\sigma$ into $\sigma+D$ as above. Then we see that $\theta(a)=\sum_{j \in J_{0}} a_{j} f_{j}$ for $a \in k$ where $\mathrm{d} a=\sum a_{j} \mathrm{~d} y_{j}$ in $\Omega_{k / \mathbf{F}_{p}}$. Note that $I$ is generated by the monomials $\lambda^{E}=\lambda_{1}^{e_{1}} \ldots \lambda_{d}^{e_{d}}$ of total degree $|E|=\sum e_{i}=n-1$ in $\lambda_{1}, \ldots, \lambda_{d}$. Write $f_{j}=\sum_{E} c_{j, E} \lambda^{E}$ with $c_{j, E} \in K$. Replace $F^{\prime}$ by $F=F^{\prime}\left(c_{j, E}\right)$. Then the claim holds.

Choose $\sigma$ and $F$ as in the claim. The kernel of $\Psi_{\sigma}$ is generated by finitely many polynomials $g_{1}, \ldots, g_{t} \in K\left[x_{1}, \ldots, x_{d}\right]$ and we may assume their coefficients are in $F$ after enlarging $F$ by adjoining finitely many elements. In this case it is clear that the $\operatorname{map} A=F\left[x_{1}, \ldots, x_{d}\right] /\left(g_{1}, \ldots, g_{t}\right) \rightarrow K\left[x_{1}, \ldots, x_{d}\right] /\left(g_{1}, \ldots, g_{t}\right)=\Lambda$ is flat. By the claim $A$ is a $k$-subalgebra of $\Lambda$. It is clear that $\Lambda$ is the filtered colimit of these algebras, as $K$ is the filtered union of the subfields $F$. Finally, these algebras are essentially of finite type over $k$ by Algebra, Lemma 10.53.4

07FH Lemma 16.12.2. Let $k$ be a field of characteristic $p>0$. Let $\Lambda$ be a Noetherian geometrically regular $k$-algebra. Let $\mathfrak{q} \subset \Lambda$ be a prime ideal. Let $n \geq 1$ be an integer and let $E \subset \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ be a finite subset. Then we can find $m \geq 0$ and $\varphi: k\left[y_{1}, \ldots, y_{m}\right] \rightarrow \Lambda$ with the following properties
(1) setting $\mathfrak{p}=\varphi^{-1}(\mathfrak{q})$ we have $\mathfrak{q} \Lambda_{\mathfrak{q}}=\mathfrak{p} \Lambda_{\mathfrak{q}}$ and $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat,
(2) there is a factorization by homomorphisms of local Artinian rings

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow D \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$ where the first arrow is essentially smooth and the second is flat,

(3) $E$ is contained in $D$ modulo $\mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$.

Proof. Set $\bar{\Lambda}=\Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$. Note that $\operatorname{dim} H_{1}\left(L_{\kappa(\mathfrak{q}) / k}\right)<\infty$ by More on Algebra, Proposition 15.27.1 Pick $A \subset \bar{\Lambda}$ containing $E$ such that $A$ is local Artinian, essentially of finite type over $k$, the $\operatorname{map} A \rightarrow \bar{\Lambda}$ is flat, and $\mathfrak{m}_{A}$ generates the maximal ideal of $\bar{\Lambda}$, see Lemma 16.12.1. Denote $F=A / \mathfrak{m}_{A}$ the residue field so that $k \subset F \subset K$. Pick $\lambda_{1}, \ldots, \lambda_{t} \in \Lambda$ which map to elements of $A$ in $\bar{\Lambda}$ such that moreover the images of $\mathrm{d} \lambda_{1}, \ldots, \mathrm{~d} \lambda_{t}$ form a basis of $\Omega_{F / k}$. Consider the map $\varphi^{\prime}$ : $k\left[y_{1}, \ldots, y_{t}\right] \rightarrow \Lambda$ sending $y_{j}$ to $\lambda_{j}$. Set $\mathfrak{p}^{\prime}=\left(\varphi^{\prime}\right)^{-1}(\mathfrak{q})$. By More on Algebra, Lemma 15.27 .2 the ring map $k\left[y_{1}, \ldots, y_{t}\right]_{\mathfrak{p}^{\prime}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat and $\Lambda_{\mathfrak{q}} / \mathfrak{p}^{\prime} \Lambda_{\mathfrak{q}}$ is regular. Thus we
can choose further elements $\lambda_{t+1}, \ldots, \lambda_{m} \in \Lambda$ which map into $A \subset \bar{\Lambda}$ and which map to a regular system of parameters of $\Lambda_{\mathfrak{q}} / \mathfrak{p}^{\prime} \Lambda_{\mathfrak{q}}$. We obtain $\varphi: k\left[y_{1}, \ldots, y_{m}\right] \rightarrow \Lambda$ having property (1) such that $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow \bar{\Lambda}$ factors through A. Thus $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow A$ is flat by Algebra, Lemma 10.38.9, By construction the residue field extension $\kappa(\mathfrak{p}) \subset F$ is finitely generated and $\Omega_{F / \kappa(\mathfrak{p})}=0$. Hence it is finite separable by More on Algebra, Lemma 15.26.1. Thus $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow A$ is finite by Algebra, Lemma 10.53.4 Finally, we conclude that it is étale by Algebra, Lemma 10.141.7. Since an étale ring map is certainly essentially smooth we win.

Lemma 16.12.3. Let $\varphi: k\left[y_{1}, \ldots, y_{m}\right] \rightarrow \Lambda, n, \mathfrak{q}, \mathfrak{p}$ and

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} \rightarrow D \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

be as in Lemma 16.12.2. Then for any $\lambda \in \Lambda \backslash \mathfrak{q}$ there exists an integer $q>0$ and a factorization

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} \rightarrow D \rightarrow D^{\prime} \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

such that $D \rightarrow D^{\prime}$ is an essentially smooth map of local Artinian rings, the last arrow is flat, and $\lambda^{q}$ is in $D^{\prime}$.

Proof. Set $\bar{\Lambda}=\Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$. Let $\bar{\lambda}$ be the image of $\lambda$ in $\bar{\Lambda}$. Let $\alpha \in \kappa(\mathfrak{q})$ be the image of $\lambda$ in the residue field. Let $k \subset F \subset \kappa(\mathfrak{q})$ be the residue field of $D$. If $\alpha$ is in $F$ then we can find an $x \in D$ such that $x \bar{\lambda}=1 \bmod \mathfrak{q}$. Hence $(x \bar{\lambda})^{q}=1 \bmod (\mathfrak{q})^{q}$ if $q$ is divisible by $p$. Hence $\bar{\lambda}^{q}$ is in $D$. If $\alpha$ is transcendental over $F$, then we can take $D^{\prime}=(D[\bar{\lambda}])_{\mathfrak{m}}$ equal to the subring generated by $D$ and $\bar{\lambda}$ localized at $\mathfrak{m}=D[\bar{\lambda}] \cap \mathfrak{q} \bar{\Lambda}$. This works because $D[\bar{\lambda}]$ is in fact a polynomial algebra over $D$ in this case. Finally, if $\lambda \bmod \mathfrak{q}$ is algebraic over $F$, then we can find a $p$-power $q$ such that $\alpha^{q}$ is separable algebraic over $F$, see Fields, Section 9.27. Note that $D$ and $\bar{\Lambda}$ are henselian local rings, see Algebra, Lemma 10.148.11 Let $D \rightarrow D^{\prime}$ be a finite étale extension whose residue field extension is $F \subset F\left(\alpha^{q}\right)$, see Algebra, Lemma 10.148 .8 . Since $\bar{\Lambda}$ is henselian and $F\left(\alpha^{q}\right)$ is contained in its residue field we can find a factorization $D^{\prime} \rightarrow \bar{\Lambda}$. By the first part of the argument we see that $\bar{\lambda} q q^{\prime} \in D^{\prime}$ for some $q^{\prime}>0$.

07FJ Lemma 16.12.4. Let $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.10.1 where
(1) $k$ is a field of characteristic $p>0$,
(2) $\Lambda$ is Noetherian and geometrically regular over $k$,
(3) $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$.

Then $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.
Proof. The lemma is proven by the following steps in the given order. We will justify each of these steps below.
(1) Pick an integer $N>0$ such that $\mathfrak{q}^{N} \Lambda_{\mathfrak{q}} \subset H_{A / k} \Lambda_{\mathfrak{q}}$.
(2) Pick generators $a_{1}, \ldots, a_{t} \in A$ of the ideal $H_{A / R}$.

07FM
(3) Set $d=\operatorname{dim}\left(\Lambda_{\mathfrak{q}}\right)$.

07FN
(4) Set $B=A\left[x_{1}, \ldots, x_{d}, z_{i j}\right] /\left(x_{i}^{2 N}-\sum z_{i j} a_{j}\right)$.

07FQ
07FR
(5) Consider $B$ as a $k\left[x_{1}, \ldots, x_{d}\right]$-algebra and let $B \rightarrow C$ be as in Lemma 16.4.1. We also obtain a section $C \rightarrow B$.
(6) Choose $c>0$ such that each $x_{i}^{c}$ is strictly standard in $C$ over $k\left[x_{1}, \ldots, x_{d}\right]$.
(7) Set $n=N+d c$ and $e=8 c$.

07FS
(8) Let $E \subset \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ be the images of generators of $A$ as a $k$-algebra.
(9) Choose an integer $m$ and a $k$-algebra map $\varphi: k\left[y_{1}, \ldots, y_{m}\right] \rightarrow \Lambda$ and a factorization by local Artinian rings

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow D \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

such that the first arrow is essentially smooth, the second is flat, $E$ is contained in $D$, with $\mathfrak{p}=\varphi^{-1}(\mathfrak{q})$ the map $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat, and $\mathfrak{p} \Lambda_{\mathfrak{q}}=\mathfrak{q} \Lambda_{\mathfrak{q}}$.
(10) Choose $\pi_{1}, \ldots, \pi_{d} \in \mathfrak{p}$ which map to a regular system of parameters of $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}$.
(11) Let $R=k\left[y_{1}, \ldots, y_{m}, t_{1}, \ldots, t_{m}\right]$ and $\gamma_{i}=\pi_{i} t_{i}$.
(12) If necessary modify the choice of $\pi_{i}$ such that for $i=1, \ldots, d$ we have

$$
\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right) R}\left(\gamma_{i}\right)=\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right) R}\left(\gamma_{i}^{2}\right)
$$

(13) There exist $\delta_{1}, \ldots, \delta_{d} \in \Lambda, \delta_{i} \notin \mathfrak{q}$ and a factorization $D \rightarrow D^{\prime} \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ with $D^{\prime}$ local Artinian, $D \rightarrow D^{\prime}$ essentially smooth, the map $D^{\prime} \rightarrow$ $\Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ flat such that, with $\pi_{i}^{\prime}=\delta_{i} \pi_{i}$, we have for $i=1, \ldots, d$
(a) $\left(\pi_{i}^{\prime}\right)^{2 N}=\sum a_{j} \lambda_{i j}$ in $\Lambda$ where $\lambda_{i j} \bmod \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ is an element of $D^{\prime}$,
(b) $\operatorname{Ann}_{\Lambda /\left(\pi^{\prime}{ }_{1}, \ldots, \pi^{\prime}{ }_{i-1}\right)}\left(\pi^{\prime}{ }_{i}\right)=\operatorname{Ann}_{\Lambda /\left(\pi^{\prime}{ }_{1}, \ldots, \pi^{\prime e}{ }_{i-1}\right)}\left(\pi^{\prime 2}{ }_{i}\right)$,
(c) $\delta_{i} \bmod \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ is an element of $D^{\prime}$.
(14) Define $B \rightarrow \Lambda$ by sending $x_{i}$ to $\pi_{i}^{\prime}$ and $z_{i j}$ to $\lambda_{i j}$ found above. Define $C \rightarrow \Lambda$ by composing the map $B \rightarrow \Lambda$ with the retraction $C \rightarrow B$.
(15) Map $R \rightarrow \Lambda$ by $\varphi$ on $k\left[y_{1}, \ldots, y_{m}\right]$ and by sending $t_{i}$ to $\delta_{i}$. Further introduce a map

$$
k\left[x_{1}, \ldots, x_{d}\right] \longrightarrow R=k\left[y_{1}, \ldots, y_{m}, t_{1}, \ldots, t_{d}\right]
$$

by sending $x_{i}$ to $\gamma_{i}=\pi_{i} t_{i}$.
(16) It suffices to resolve

$$
R \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R \rightarrow \Lambda \supset \mathfrak{q}
$$

(17) Set $I=\left(\gamma_{1}^{e}, \ldots, \gamma_{d}^{e}\right) \subset R$.
(18) It suffices to resolve

$$
R / I \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R / I \rightarrow \Lambda / I \Lambda \supset \mathfrak{q} / I \Lambda
$$

(19) We denote $\mathfrak{r} \subset R=k\left[y_{1}, \ldots, y_{m}, t_{1}, \ldots, t_{d}\right]$ the inverse image of $\mathfrak{q}$.
(20) It suffices to resolve

$$
(R / I)_{\mathfrak{r}} \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}(R / I)_{\mathfrak{r}} \rightarrow \Lambda_{\mathfrak{q}} / I \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}} / I \Lambda_{\mathfrak{q}}
$$

(21) Set $J=\left(\pi_{1}^{e}, \ldots, \pi_{d}^{e}\right)$ in $k\left[y_{1}, \ldots, y_{m}\right]$.
(22) It suffices to resolve

$$
(R / J R)_{\mathfrak{p}} \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}(R / J R)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} / J \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}} / J \Lambda_{\mathfrak{q}}
$$

(23) It suffices to resolve

$$
\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

(24) It suffices to resolve

$$
\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow B \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

07G9

07GA
(25) The ring $D^{\prime}\left[t_{1}, \ldots, t_{d}\right]$ is given the structure of an $R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}$-algebra by the given map $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow D^{\prime}$ and by sending $t_{i}$ to $t_{i}$. It suffices to find a factorization

$$
B \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow D^{\prime}\left[t_{1}, \ldots, t_{d}\right] \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}
$$

where the second arrow sends $t_{i}$ to $\delta_{i}$ and induces the given homomorphism $D^{\prime} \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$.
(26) Such a factorization exists by our choice of $D^{\prime}$ above.

We now give the justification for each of the steps, except that we skip justifying the steps which just introduce notation.
Ad (11. This is possible as $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}=\sqrt{H_{A / k} \Lambda}$.
Ad (6). Note that $A_{a_{i}}$ is smooth over $k$. Hence $B_{a_{j}}$, which is isomorphic to a polynomial algebra over $A_{a_{j}}\left[x_{1}, \ldots, x_{d}\right]$, is smooth over $k\left[x_{1}, \ldots, x_{d}\right]$. Thus $B_{x_{i}}$ is smooth over $k\left[x_{1}, \ldots, x_{d}\right]$. By Lemma 16.4.1 we see that $C_{x_{i}}$ is smooth over $k\left[x_{1}, \ldots, x_{d}\right]$ with finite free module of differentials. Hence some power of $x_{i}$ is strictly standard in $C$ over $k\left[x_{1}, \ldots, x_{n}\right]$ by Lemma 16.4.7.
Ad (9). This follows by applying Lemma 16.12.2.
Ad (10). Since $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat and $\mathfrak{p} \Lambda_{\mathfrak{q}}=\mathfrak{q} \Lambda_{\mathfrak{q}}$ by construction we see that $\operatorname{dim}\left(k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}\right)=d$ by Algebra, Lemma 10.111.7. Thus we can find $\pi_{1}, \ldots, \pi_{d} \in \Lambda$ which map to a regular system of parameters in $\Lambda_{\mathfrak{q}}$.
Ad (12). By Algebra, Lemma 10.105 .3 any permutation of the sequence $\pi_{1}, \ldots, \pi_{d}$ is a regular sequence in $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}$. Hence $\gamma_{1}=\pi_{1} t_{1}, \ldots, \gamma_{d}=\pi_{d} t_{d}$ is a regular sequence in $R_{\mathfrak{p}}=k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}\left[t_{1}, \ldots, t_{d}\right]$, see Algebra, Lemma 10.67.9. Let $S=$ $k\left[y_{1}, \ldots, y_{m}\right] \backslash \mathfrak{p}$ so that $R_{\mathfrak{p}}=S^{-1} R$. Note that $\pi_{1}, \ldots, \pi_{d}$ and $\gamma_{1}, \ldots, \gamma_{d}$ remain regular sequences if we multiply our $\pi_{i}$ by elements of $S$. Suppose that

$$
\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right) R}\left(\gamma_{i}\right)=\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right) R}\left(\gamma_{i}^{2}\right)
$$

holds for $i=1, \ldots, t$ for some $t \in\{0, \ldots, d\}$. Note that $\gamma_{1}^{e}, \ldots, \gamma_{t}^{e}, \gamma_{t+1}$ is a regular sequence in $S^{-1} R$ by Algebra, Lemma 10.67.8. Hence we see that

$$
\operatorname{Ann}_{S^{-1} R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right)}\left(\gamma_{i}\right)=\operatorname{Ann}_{S^{-1} R /\left(\gamma_{1}^{e}, \ldots, \gamma_{i-1}^{e}\right)}\left(\gamma_{i}^{2}\right)
$$

Thus we get

$$
\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{t}^{e}\right) R}\left(\gamma_{t+1}\right)=\operatorname{Ann}_{R /\left(\gamma_{1}^{e}, \ldots, \gamma_{t}^{e}\right) R}\left(\gamma_{t+1}^{2}\right)
$$

after replacing $\pi_{t+1}$ by $s \pi_{t+1}$ for some $s \in S$ by Lemma 16.11.1. By induction on $t$ this produces the desired sequence.
Ad 13). Let $S=\Lambda \backslash \mathfrak{q}$ so that $\Lambda_{\mathfrak{q}}=S^{-1} \Lambda$. Set $\bar{\Lambda}=\Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$. Suppose that we have a $t \in\{0, \ldots, d\}$ and $\delta_{1}, \ldots, \delta_{t} \in S$ and a factorization $D \rightarrow D^{\prime} \rightarrow \bar{\Lambda}$ as in (13) such that (a), (b), (c) hold for $i=1, \ldots, t$. We have $\pi_{t+1}^{N} \in H_{A / k} \Lambda_{\mathfrak{q}}$ as $\mathfrak{q}^{N} \Lambda_{\mathfrak{q}} \subset H_{A / k} \Lambda_{\mathfrak{q}}$ by (1). Hence $\pi_{t+1}^{N} \in H_{A / k} \bar{\Lambda}$. Hence $\pi_{t+1}^{N} \in H_{A / k} D^{\prime}$ as $D^{\prime} \rightarrow \bar{\Lambda}$ is faithfully flat, see Algebra, Lemma 10.81.11. Recall that $H_{A / k}=\left(a_{1}, \ldots, a_{t}\right)$. Say $\pi_{t+1}^{N}=\sum a_{j} d_{j}$ in $D^{\prime}$ and choose $c_{j} \in \Lambda_{\mathfrak{q}}$ lifting $d_{j} \in D^{\prime}$. Then $\pi_{t+1}^{N}=\sum c_{j} a_{j}+\epsilon$ with $\epsilon \in \mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \subset \mathfrak{q}^{n-N} H_{A / k} \Lambda_{\mathfrak{q}}$. Write $\epsilon=\sum a_{j} c_{j}^{\prime}$ for some $c_{j}^{\prime} \in \mathfrak{q}^{n-N} \Lambda_{\mathfrak{q}}$. Hence $\pi_{t+1}^{2 N}=\sum\left(\pi_{t+1}^{N} c_{j}+\pi_{t+1}^{N} c_{j}^{\prime}\right) a_{j}$. Note that $\pi_{t+1}^{N} c_{j}^{\prime}$ maps to zero in $\bar{\Lambda}$; this trivial but key observation will ensure later that (a) holds. Now we choose $s \in S$ such that there exist $\mu_{t+1 j} \in \Lambda$ such that on the one hand $\pi_{t+1}^{N} c_{j}+\pi_{t+1}^{N} c_{j}^{\prime}=\mu_{t+1 j} / s^{2 N}$ in $S^{-1} \Lambda$ and on the other $\left(s \pi_{t+1}\right)^{2 N}=\sum \mu_{t+1 j} a_{j}$ in $\Lambda$ (minor detail omitted). We
may further replace $s$ by a power and enlarge $D^{\prime}$ such that $s$ maps to an element of $D^{\prime}$. With these choices $\mu_{t+1 j}$ maps to $s^{2 N} d_{j}$ which is an element of $D^{\prime}$. Note that $\pi_{1}, \ldots, \pi_{d}$ are a regular sequence of parameters in $S^{-1} \Lambda$ by our choice of $\varphi$. Hence $\pi_{1}, \ldots, \pi_{d}$ forms a regular sequence in $\Lambda_{\mathfrak{q}}$ by Algebra, Lemma 10.105.3. It follows that ${\pi^{\prime}}_{1}^{e}, \ldots, \pi^{\prime e}, s \pi_{t+1}$ is a regular sequence in $S^{-1} \Lambda$ by Algebra, Lemma 10.67 .8 . Thus we get

$$
\operatorname{Ann}_{S^{-1} \Lambda /\left(\pi_{1}^{\prime e}, \ldots, \pi^{\prime}{ }_{t}\right)}\left(s \pi_{t+1}\right)=\operatorname{Ann}_{S^{-1} \Lambda /\left(\pi^{\prime}{ }_{1}, \ldots, \pi^{\prime}{ }_{t}\right)}\left(\left(s \pi_{t+1}\right)^{2}\right)
$$

Hence we may apply Lemma 16.11 .1 to find an $s^{\prime} \in S$ such that

$$
\operatorname{Ann}_{\Lambda /\left(\pi_{1}^{\prime}, \ldots, \pi_{t}^{\prime e}\right)}\left(\left(s^{\prime}\right)^{q} s \pi_{t+1}\right)=\operatorname{Ann}_{\Lambda /\left(\pi_{1}^{\prime}, \ldots, \pi_{t}^{\prime e}\right)}\left(\left(\left(s^{\prime}\right)^{q} s \pi_{t+1}\right)^{2}\right)
$$

for any $q>0$. By Lemma 16.12 .3 we can choose $q$ and enlarge $D^{\prime}$ such that $\left(s^{\prime}\right)^{q}$ maps to an element of $D^{\prime}$. Setting $\delta_{t+1}=\left(s^{\prime}\right)^{q} s$ and we conclude that (a), (b), (c) hold for $i=1, \ldots, t+1$. For (a) note that $\lambda_{t+1 j}=\left(s^{\prime}\right)^{2 N q} \mu_{t+1 j}$ works. By induction on $t$ we win.

Ad (16). By construction the radical of $H_{\left(C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R\right) / R} \Lambda$ contains $\mathfrak{h}_{A}$. Namely, the elements $a_{j} \in H_{A / k}$ map to elements of $H_{B / k\left[x_{1}, \ldots, x_{n}\right]}$, hence map to elements of $H_{C / k\left[x_{1}, \ldots, x_{n}\right]}$, hence $a_{j} \otimes 1$ map to elements of $H_{C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R / R}$. Moreover, if we have a solution $C \otimes_{k\left[x_{1}, \ldots, x_{n}\right]} R \rightarrow T \rightarrow \Lambda$ of

$$
R \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R \rightarrow \Lambda \supset \mathfrak{q}
$$

then $H_{T / R} \subset H_{T / k}$ as $R$ is smooth over $k$. Hence $T$ will also be a solution for the original situation $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.
Ad (18). Follows on applying Lemma 16.10 .2 to $R \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R \rightarrow \Lambda \supset \mathfrak{q}$ and the sequence of elements $\gamma_{1}^{c}, \ldots, \gamma_{d}^{c}$. We note that since $x_{i}^{c}$ are strictly standard in $C$ over $k\left[x_{1}, \ldots, x_{d}\right]$ the elements $\gamma_{i}^{c}$ are strictly standard in $C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]} R$ over $R$ by Lemma 16.3.7. The other assumption of Lemma 16.10 .2 holds by steps 12 and (13).

Ad 20. Apply Lemma 16.10 .4 to the situation in 18. In the rest of the arguments the target ring is local Artinian, hence we are looking for a factorization by a smooth algebra $T$ over the source ring.
Ad 22 . Suppose that $C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}(R / J R)_{\mathfrak{p}} \rightarrow T \rightarrow \Lambda_{\mathfrak{q}} / J \Lambda_{\mathfrak{q}}$ is a solution to

$$
(R / J R)_{\mathfrak{p}} \rightarrow C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}(R / J R)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} / J \Lambda_{\mathfrak{q}} \supset \mathfrak{q} \Lambda_{\mathfrak{q}} / J \Lambda_{\mathfrak{q}}
$$

Then $C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}(R / I)_{\mathfrak{r}} \rightarrow T_{\mathfrak{r}} \rightarrow \Lambda_{\mathfrak{q}} / I \Lambda_{\mathfrak{q}}$ is a solution to the situation in 20 .
Ad 23. Our $n=N+d c$ is large enough so that $\mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} \subset J_{\mathfrak{p}}$ and $\mathfrak{q}^{n} \Lambda_{\mathfrak{q}} \subset J \Lambda_{\mathfrak{q}}$. Hence if we have a solution $C \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}\left(R / \mathfrak{p}^{n} R\right)_{\mathfrak{p}} \rightarrow T \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ of 22 then we can take $T / J T$ as the solution for 23 .
$\operatorname{Ad}(24)$. This is true because we have a section $C \rightarrow B$ in the category of $R$ algebras.

Ad 25). This is true because $D^{\prime}$ is essentially smooth over the local Artinian ring $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}$ and

$$
R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}=k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}} / \mathfrak{p}^{n} k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{p}}\left[t_{1}, \ldots, t_{d}\right]
$$

Hence $D^{\prime}\left[t_{1}, \ldots, t_{d}\right]$ is a filtered colimit of smooth $R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}$-algebras and $B \otimes_{k\left[x_{1}, \ldots, x_{d}\right]}$ $\left(R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}\right)$ factors through one of these.

Ad 26. The final twist of the proof is that we cannot just use the map $B \rightarrow D^{\prime}$ which maps $x_{i}$ to the image of $\pi_{i}^{\prime}$ in $D^{\prime}$ and $z_{i j}$ to the image of $\lambda_{i j}$ in $D^{\prime}$ because we need the diagram

to commute and we need the composition $B \rightarrow D^{\prime}\left[t_{1}, \ldots, t_{d}\right] \rightarrow \Lambda_{\mathfrak{q}} / \mathfrak{q}^{n} \Lambda_{\mathfrak{q}}$ to be the map of $(14)$. This requires us to map $x_{i}$ to the image of $\pi_{i} t_{i}$ in $D^{\prime}\left[t_{1}, \ldots, t_{d}\right]$. Hence we map $z_{i j}$ to the image of $\lambda_{i j} t_{i}^{2 N} / \delta_{i}^{2 N}$ in $D^{\prime}\left[t_{1}, \ldots, t_{d}\right]$ and everything is clear.

### 16.13. The main theorem

07GB In this section we wrap up the discussion.
07GC Theorem 16.13.1 (Popescu). Any regular homomorphism of Noetherian rings is a filtered colimit of smooth ring maps.

Proof. By Lemma 16.9 .4 it suffices to prove this for $k \rightarrow \Lambda$ where $\Lambda$ is Noetherian and geometrically regular over $k$. Let $k \rightarrow A \rightarrow \Lambda$ be a factorization with $A$ a finite type $k$-algebra. It suffices to construct a factorization $A \rightarrow B \rightarrow \Lambda$ with $B$ of finite type such that $\mathfrak{h}_{B}=\Lambda$, see Lemma 16.3 .8 . Hence we may perform Noetherian induction on the ideal $\mathfrak{h}_{A}$. Pick a prime $\mathfrak{q} \supset \mathfrak{h}_{A}$ such that $\mathfrak{q}$ is minimal over $\mathfrak{h}_{A}$. It now suffices to resolve $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ (as defined in the text following Situation 16.10 .1 . If the characteristic of $k$ is zero, this follows from Lemma 16.11.3. If the characteristic of $k$ is $p>0$, this follows from Lemma 16.12 .4

### 16.14. The approximation property for G-rings

07QX Let $R$ be a Noetherian local ring. In this case $R$ is a G-ring if and only if the ring $\operatorname{map} R \rightarrow R^{\wedge}$ is regular, see More on Algebra, Lemma 15.41.7. In this case it is true that the henselization $R^{h}$ and the strict henselization $R^{s h}$ of $R$ are G-rings, see More on Algebra, Lemma 15.41.8. Moreover, any algebra essentially of finite type over a field, over a complete local ring, over $\mathbf{Z}$, or over a characteristic zero Dedekind ring is a G-ring, see More on Algebra, Proposition 15.41.12, This gives an ample supply of rings to which the result below applies.

Let $R$ be a ring. Let $f_{1}, \ldots, f_{m} \in R\left[x_{1}, \ldots, x_{n}\right]$. Let $S$ be an $R$-algebra. In this situation we say a vector $\left(a_{1}, \ldots, a_{n}\right) \in S^{n}$ is a solution in $S$ if and only if

$$
f_{j}\left(a_{1}, \ldots, a_{n}\right)=0 \text { in } S, \text { for } j=1, \ldots, m
$$

Of course an important question in algebraic geometry is to see when systems of polynomial equations have solutions. The following theorem tells us that having solutions in the completion of a local Noetherian ring is often enough to show there exist solutions in the henselization of the ring.

07QY Theorem 16.14.1. Let $R$ be a Noetherian local ring. Let $f_{1}, \ldots, f_{m} \in R\left[x_{1}, \ldots, x_{n}\right]$. Suppose that $\left(a_{1}, \ldots, a_{n}\right) \in\left(R^{\wedge}\right)^{n}$ is a solution in $R^{\wedge}$. If $R$ is a henselian $G$-ring, then for every integer $N$ there exists a solution $\left(b_{1}, \ldots, b_{n}\right) \in R^{n}$ in $R$ such that $a_{i}-b_{i} \in \mathfrak{m}^{N} R^{\wedge}$.

Proof. Let $c_{i} \in R$ be an element such that $a_{i}-c_{i} \in \mathfrak{m}^{N}$. Choose generators $\mathfrak{m}^{N}=\left(d_{1}, \ldots, d_{M}\right)$. Write $a_{i}=c_{i}+\sum a_{i, l} d_{l}$. Consider the polynomial ring $R\left[x_{i, l}\right]$ and the elements

$$
g_{j}=f_{j}\left(c_{1}+\sum x_{1, l} d_{l}, \ldots, c_{n}+\sum x_{n, l} d_{n, l}\right) \in R\left[x_{i, l}\right]
$$

The system of equations $g_{j}=0$ has the solution $\left(a_{i, l}\right)$. Suppose that we can show that $g_{j}$ as a solution $\left(b_{i, l}\right)$ in $R$. Then it follows that $b_{i}=c_{i}+\sum b_{i, l} d_{l}$ is a solution of $f_{j}=0$ which is congruent to $a_{i}$ modulo $\mathfrak{m}^{N}$. Thus it suffices to show that solvability over $R^{\wedge}$ implies solvability over $R$.

Let $A \subset R^{\wedge}$ be the $R$-subalgebra generated by $a_{1}, \ldots, a_{n}$. Since we've assumed $R$ is a G-ring, i.e., that $R \rightarrow R^{\wedge}$ is regular, we see that there exists a factorization

$$
A \rightarrow B \rightarrow R^{\wedge}
$$

with $B$ smooth over $R$, see Theorem 16.13.1. Denote $\kappa=R / \mathfrak{m}$ the residue field. It is also the residue field of $R^{\wedge}$, so we get a commutative diagram

Since the vertical arrow is smooth, More on Algebra, Lemma 15.7.13 implies that there exists an étale ring map $R \rightarrow R^{\prime}$ which induces an isomorphism $R / \mathfrak{m} \rightarrow$ $R^{\prime} / \mathfrak{m} R^{\prime}$ and an $R$-algebra map $B \rightarrow R^{\prime}$ making the diagram above commute. Since $R$ is henselian we see that $R \rightarrow R^{\prime}$ has a section, see Algebra, Lemma 10.148.3. Let $b_{i} \in R$ be the image of $a_{i}$ under the ring maps $A \rightarrow B \rightarrow R^{\prime} \rightarrow R$. Since all of these maps are $R$-algebra maps, we see that $\left(b_{1}, \ldots, b_{n}\right)$ is a solution in $R$.

Given a Noetherian local ring $(R, \mathfrak{m})$, an étale ring map $R \rightarrow R^{\prime}$, and a maximal ideal $\mathfrak{m}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{m}$ with $\kappa(\mathfrak{m})=\kappa\left(\mathfrak{m}^{\prime}\right)$, then we have inclusions

$$
R \subset R_{\mathfrak{m}^{\prime}} \subset R^{h} \subset R^{\wedge}
$$

by Algebra, Lemma 10.148 .19 and More on Algebra, Lemma 15.36.3.
07QZ Theorem 16.14.2. Let $R$ be a Noetherian local ring. Let $f_{1}, \ldots, f_{m} \in R\left[x_{1}, \ldots, x_{n}\right]$. Suppose that $\left(a_{1}, \ldots, a_{n}\right) \in\left(R^{\wedge}\right)^{n}$ is a solution. If $R$ is a $G$-ring, then for every integer $N$ there exist
(1) an étale ring map $R \rightarrow R^{\prime}$,
(2) a maximal ideal $\mathfrak{m}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{m}$
(3) a solution $\left(b_{1}, \ldots, b_{n}\right) \in\left(R^{\prime}\right)^{n}$ in $R^{\prime}$
such that $\kappa(\mathfrak{m})=\kappa\left(\mathfrak{m}^{\prime}\right)$ and $a_{i}-b_{i} \in\left(\mathfrak{m}^{\prime}\right)^{N} R^{\wedge}$.
Proof. We could deduce this theorem from Theorem 16.14.1]using that the henselization $R^{h}$ is a G-ring by More on Algebra, Lemma 15.41 .8 and writing $R^{h}$ as a directed colimit of étale extension $R^{\prime}$. Instead we prove this by redoing the proof of the previous theorem in this case.
Let $c_{i} \in R$ be an element such that $a_{i}-c_{i} \in \mathfrak{m}^{N}$. Choose generators $\mathfrak{m}^{N}=$ $\left(d_{1}, \ldots, d_{M}\right)$. Write $a_{i}=c_{i}+\sum a_{i, l} d_{l}$. Consider the polynomial ring $R\left[x_{i, l}\right]$ and the elements

$$
g_{j}=f_{j}\left(c_{1}+\sum x_{1, l} d_{l}, \ldots, c_{n}+\sum x_{n, l} d_{n, l}\right) \in R\left[x_{i, l}\right]
$$

The system of equations $g_{j}=0$ has the solution $\left(a_{i, l}\right)$. Suppose that we can show that $g_{j}$ as a solution $\left(b_{i, l}\right)$ in $R^{\prime}$ for some étale ring map $R \rightarrow R^{\prime}$ endowed with a maximal ideal $\mathfrak{m}^{\prime}$ such that $\kappa(\mathfrak{m})=\kappa\left(\mathfrak{m}^{\prime}\right)$. Then it follows that $b_{i}=c_{i}+\sum b_{i, l} d_{l}$ is a solution of $f_{j}=0$ which is congruent to $a_{i}$ modulo $\left(\mathfrak{m}^{\prime}\right)^{N}$. Thus it suffices to show that solvability over $R^{\wedge}$ implies solvability over some étale ring extension which induces a trivial residue field extension at some prime over $\mathfrak{m}$.

Let $A \subset R^{\wedge}$ be the $R$-subalgebra generated by $a_{1}, \ldots, a_{n}$. Since we've assumed $R$ is a G-ring, i.e., that $R \rightarrow R^{\wedge}$ is regular, we see that there exists a factorization

$$
A \rightarrow B \rightarrow R^{\wedge}
$$

with $B$ smooth over $R$, see Theorem 16.13.1. Denote $\kappa=R / \mathfrak{m}$ the residue field. It is also the residue field of $R^{\wedge}$, so we get a commutative diagram

Since the vertical arrow is smooth, More on Algebra, Lemma 15.7 .13 implies that there exists an étale ring map $R \rightarrow R^{\prime}$ which induces an isomorphism $R / \mathfrak{m} \rightarrow$ $R^{\prime} / \mathfrak{m} R^{\prime}$ and an $R$-algebra map $B \rightarrow R^{\prime}$ making the diagram above commute. Let $b_{i} \in R^{\prime}$ be the image of $a_{i}$ under the ring maps $A \rightarrow B \rightarrow R^{\prime}$. Since all of these maps are $R$-algebra maps, we see that $\left(b_{1}, \ldots, b_{n}\right)$ is a solution in $R^{\prime}$.

0A1W Example 16.14.3. Let $(R, \mathfrak{m})$ be a Noetherian local ring with henselization $R^{h}$. The map on completions $R^{\wedge} \rightarrow\left(R^{h}\right)^{\wedge}$ is an isomorphism, see More on Algebra, Lemma 15.36.3. Since also $R^{h}$ is Noetherian (ibid.) we may think of $R^{h}$ as a subring of its completion (because the completion is faithfully flat). In this way we see that we may identify $R^{h}$ with a subring of $R^{\wedge}$.
Let us try to understand which elements of $R^{\wedge}$ are in $R^{h}$. For simplicity we assume $R$ is a domain with fraction field $K$. Clearly, every element $f$ of $R^{h}$ is algebraic over $R$, in the sense that there exists an equation of the form $a_{n} f^{n}+\ldots+a_{1} f+a_{0}=0$ for some $a_{i} \in R$ with $n>0$ and $a_{n} \neq 0$.

Conversely, assume that $f \in R^{\wedge}, n \in \mathbf{N}$, and $a_{0}, \ldots, a_{n} \in R$ with $a_{n} \neq 0$ such that $a_{n} f^{n}+\ldots+a_{1} f+a_{0}=0$. If $R$ is a G-ring, then, for every $N>0$ there exists an element $g \in R^{h}$ with $a_{n} g^{n}+\ldots+a_{1} g+a_{0}=0$ and $f-g \in \mathfrak{m}^{N} R^{\wedge}$, see Theorem 16.14.2. We'd like to conclude that $f=g$ when $N \gg 0$. If this is not true, then we find infinitely many roots $g$ of $P(T)$ in $R^{h}$. This is impossible because (1) $R^{h} \subset R^{h} \otimes_{R} K$ and (2) $R^{h} \otimes_{R} K$ is a finite product of field extensions of $K$. Namely, $R \rightarrow K$ is injective and $R \rightarrow R^{h}$ is flat, hence $R^{h} \rightarrow R^{h} \otimes_{R} K$ is injective and (2) follows from More on Algebra, Lemma 15.36 .13 .
Conclusion: If $R$ is a Noetherian local domain with fraction field $K$ and a G-ring, then $R^{h} \subset R^{\wedge}$ is the set of all elements which are algebraic over $K$.

### 16.15. Approximation for henselian pairs

0AH4 We can generalize the discussion of Section 16.14 to the case of henselian pairs. Henselian pairs where defined in More on Algebra, Section 15.8 ,

0AH5 Lemma 16.15.1. Let $(A, I)$ be a henselian pair with $A$ Noetherian. Let $A^{\wedge}$ be the I-adic completion of $A$. Assume at least one of the following conditions holds
(1) $A \rightarrow A^{\wedge}$ is a regular ring map,
(2) $A$ is a Noetherian $G$-ring, or
(3) $(A, I)$ is the henselization (More on Algebra, Lemma 15.8.13) of a pair $(B, J)$ where $B$ is a Noetherian $G$-ring.
Given $f_{1}, \ldots, f_{m} \in A\left[x_{1}, \ldots, x_{n}\right]$ and $\hat{a}_{1}, \ldots, \hat{a}_{n} \in A^{\wedge}$ such that $f_{j}\left(\hat{a}_{1}, \ldots, \hat{a}_{n}\right)=0$ for $j=1, \ldots, m$, for every $N \geq 1$ there exist $a_{1}, \ldots, a_{n} \in A$ such that $\hat{a}_{i}-a_{i} \in I^{N}$ and such that $f_{j}\left(a_{1}, \ldots, a_{n}\right)=0$ for $j=1, \ldots, m$.

Proof. By More on Algebra, Lemma 15.41 .15 we see that (3) implies (2). By More on Algebra, Lemma 15.41 .14 we see that (2) implies (1). Thus it suffices to prove the lemma in case $A \rightarrow A^{\wedge}$ is a regular ring map.
Let $\hat{a}_{1}, \ldots, \hat{a}_{n}$ be as in the statement of the lemma. By Theorem 16.13.1 we can find a factorization $A \rightarrow B \rightarrow A^{\wedge}$ with $A \rightarrow P$ smooth and $b_{1}, \ldots, b_{n} \in B$ with $f_{j}\left(b_{1}, \ldots, b_{n}\right)=0$ in $B$. Denote $\sigma: B \rightarrow A^{\wedge} \rightarrow A / I^{N}$ the composition. By More on Algebra, Lemma 15.7 .13 we can find an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I^{N} \rightarrow A^{\prime} / I^{N} A^{\prime}$ and an $A$-algebra map $\tilde{\sigma}: B \rightarrow A^{\prime}$ lifting $\sigma$. Since $(A, I)$ is henselian, there is an $A$-algebra map $\chi: A^{\prime} \rightarrow A$, see More on Algebra, Lemma 15.8.7. Then setting $a_{i}=\chi\left(\tilde{\sigma}\left(b_{i}\right)\right)$ gives a solution.

## CHAPTER 17

## Sheaves of Modules

01AC

### 17.1. Introduction

01 AD In this chapter we work out basic notions of sheaves of modules. This in particular includes the case of abelian sheaves, since these may be viewed as sheaves of $\underline{\mathbf{Z}}$ modules. Basic references are Ser55b, DG67 and AGV71.

We work out what happens for sheaves of modules on ringed topoi in another chapter (see Modules on Sites, Section 18.1), although there we will mostly just duplicate the discussion from this chapter.

### 17.2. Pathology

01 AE A ringed space is a pair consisting of a topological space $X$ and a sheaf of rings $\mathcal{O}$. We allow $\mathcal{O}=0$ in the definition. In this case the category of modules has a single object (namely 0 ). It is still an abelian category etc, but it is a little degenerate. Similarly the sheaf $\mathcal{O}$ may be zero over open subsets of $X$, etc.

This doesn't happen when considering locally ringed spaces (as we will do later).

### 17.3. The abelian category of sheaves of modules

01 AF Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space, see Sheaves, Definition 6.25.1. Let $\mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}_{X}$-modules, see Sheaves, Definition 6.10.1. Let $\varphi, \psi: \mathcal{F} \rightarrow \mathcal{G}$ be morphisms of sheaves of $\mathcal{O}_{X}$-modules. We define $\varphi+\psi: \mathcal{F} \rightarrow \mathcal{G}$ to be the map which on each open $U \subset X$ is the sum of the maps induced by $\varphi, \psi$. This is clearly again a map of sheaves of $\mathcal{O}_{X}$-modules. It is also clear that composition of maps of $\mathcal{O}_{X}$-modules is bilinear with respect to this addition. Thus $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is a pre-additive category, see Homology, Definition 12.3.1.

We will denote 0 the sheaf of $\mathcal{O}_{X}$-modules which has constant value $\{0\}$ for all open $U \subset X$. Clearly this is both a final and an initial object of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Given a morphism of $\mathcal{O}_{X}$-modules $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ the following are equivalent: (a) $\varphi$ is zero, (b) $\varphi$ factors through 0 , (c) $\varphi$ is zero on sections over each open $U$, and (d) $\varphi_{x}=0$ for all $x \in X$. See Sheaves, Lemma 6.16.1.

Moreover, given a pair $\mathcal{F}, \mathcal{G}$ of sheaves of $\mathcal{O}_{X}$-modules we may define the direct sum as

$$
\mathcal{F} \oplus \mathcal{G}=\mathcal{F} \times \mathcal{G}
$$

with obvious maps $(i, j, p, q)$ as in Homology, Definition 12.3.5. Thus $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is an additive category, see Homology, Definition 12.3.8.

Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of $\mathcal{O}_{X}$-modules. We may define $\operatorname{Ker}(\varphi)$ to be the subsheaf of $\mathcal{F}$ with sections

$$
\operatorname{Ker}(\varphi)(U)=\{s \in \mathcal{F}(U) \mid \varphi(s)=0 \operatorname{in} \mathcal{G}(U)\}
$$

for all open $U \subset X$. It is easy to see that this is indeed a kernel in the category of $\mathcal{O}_{X}$-modules. In other words, a morphism $\alpha: \mathcal{H} \rightarrow \mathcal{F}$ factors through $\operatorname{Ker}(\varphi)$ if and only if $\varphi \circ \alpha=0$. Moreover, on the level of stalks we have $\operatorname{Ker}(\varphi)_{x}=\operatorname{Ker}\left(\varphi_{x}\right)$.
On the other hand, we define $\operatorname{Coker}(\varphi)$ as the sheaf of $\mathcal{O}_{X}$-modules associated to the presheaf of $\mathcal{O}_{X}$-modules defined by the rule

$$
U \longmapsto \operatorname{Coker}(\mathcal{G}(U) \rightarrow \mathcal{F}(U))=\mathcal{F}(U) / \varphi(\mathcal{G}(U))
$$

Since taking stalks commutes with taking sheafification, see Sheaves, Lemma 6.17.2 we see that $\operatorname{Coker}(\varphi)_{x}=\operatorname{Coker}\left(\varphi_{x}\right)$. Thus the map $\mathcal{G} \rightarrow \operatorname{Coker}(\varphi)$ is surjective (as a map of sheaves of sets), see Sheaves, Section 6.16. To show that this is a cokernel, note that if $\beta: \mathcal{G} \rightarrow \mathcal{H}$ is a morphism of $\mathcal{O}_{X}$-modules such that $\beta \circ \varphi$ is zero, then you get for every open $U \subset X$ a map induced by $\beta$ from $\mathcal{G}(U) / \varphi(\mathcal{F}(U))$ into $\mathcal{H}(U)$. By the universal property of sheafification (see Sheaves, Lemma 6.20.1) we obtain a canonical map $\operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$ such that the original $\beta$ is equal to the composition $\mathcal{G} \rightarrow \operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$. The morphism $\operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$ is unique because of the surjectivity mentioned above.

01 AG Lemma 17.3.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The category $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is an abelian category. Moreover a complex

$$
\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}
$$

is exact at $\mathcal{G}$ if and only if for all $x \in X$ the complex

$$
\mathcal{F}_{x} \rightarrow \mathcal{G}_{x} \rightarrow \mathcal{H}_{x}
$$

is exact at $\mathcal{G}_{x}$.
Proof. By Homology, Definition 12.5.1 we have to show that image and coimage agree. By Sheaves, Lemma 6.16.1 it is enough to show that image and coimage have the same stalk at every $x \in X$. By the constructions of kernels and cokernels above these stalks are the coimage and image in the categories of $\mathcal{O}_{X, x}$-modules. Thus we get the result from the fact that the category of modules over a ring is abelian.

Actually the category $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ has many more properties. Here are two constructions we can do.
(1) Given any set $I$ and for each $i \in I$ a $\mathcal{O}_{X}$-module we can form the product

$$
\prod_{i \in 1} \varepsilon_{i}^{\beta_{i}}
$$

which is the sheaf that associates to each open $U$ the product of the modules $\mathcal{F}_{i}(U)$. This is also the categorical product, as in Categories, Definition 4.14.5.
(2) Given any set $I$ and for each $i \in I$ a $\mathcal{O}_{X}$-module we can form the direct sum

$$
\oplus_{i \in!} \mathcal{F}_{i}
$$

which is the sheafification of the presheaf that associates to each open $U$ the direct sum of the modules $\mathcal{F}_{i}(U)$. This is also the categorical
coproduct, as in Categories, Definition 4.14.6. To see this you use the universal property of sheafification.
Using these we conclude that all limits and colimits exist in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$.
01AH Lemma 17.3.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) All limits exist in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Limits are the same as the corresponding limits of presheaves of $\mathcal{O}_{X}$-modules (i.e., commute with taking sections over opens).
(2) All colimits exist in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Colimits are the sheafification of the corresponding colimit in the category of presheaves. Taking colimits commutes with taking stalks.
(3) Filtered colimits are exact.
(4) Finite direct sums are the same as the corresponding finite direct sums of presheaves of $\mathcal{O}_{X}$-modules.
Proof. As $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is abelian (Lemma 17.3.1) it has all finite limits and colimits (Homology, Lemma 12.5.5). Thus the existence of limits and colimits and their description follows from the existence of products and coproducts and their description (see discussion above) and Categories, Lemmas 4.14.10 and 4.14.11. Since sheafification commutes with taking stalks we see that colimits commute with taking stalks. Part (3) signifies that given a system $0 \rightarrow \mathcal{F}_{i} \rightarrow \mathcal{G}_{i} \rightarrow \mathcal{H}_{i} \rightarrow 0$ of exact sequences of $\mathcal{O}_{X}$-modules over a directed partially ordered set $I$ the sequence $0 \rightarrow \operatorname{colim} \mathcal{F}_{i} \rightarrow \operatorname{colim} \mathcal{G}_{i} \rightarrow \operatorname{colim} \mathcal{H}_{i} \rightarrow 0$ is exact as well. Since we can check exactness on stalks (Lemma 17.3.1) this follows from the case of modules which is Algebra, Lemma 10.8.9. We omit the proof of (4).

The existence of limits and colimits allows us to consider exactness properties of functors defined on the category of $\mathcal{O}$-modules in terms of limits and colimits, as in Categories, Section 4.23. See Homology, Lemma 12.7.1 for a description of exactness properties in terms of short exact sequences.

01AJ Lemma 17.3.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces.
(1) The functor $f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$ is left exact. In fact it commutes with all limits.
(2) The functor $f^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is right exact. In fact it commutes with all colimits.
(3) Pullback $f^{-1}: A b(Y) \rightarrow A b(X)$ on abelian sheaves is exact.

Proof. Parts (1) and (2) hold because $\left(f^{*}, f_{*}\right)$ is an adjoint pair of functors, see Sheaves, Lemma 6.26 .2 and Categories, Section 4.24 . Part (3) holds because exactness can be checked on stalks (Lemma 17.3.1) and the description of stalks of the pullback, see Sheaves, Lemma 6.22.1.

01AK Lemma 17.3.4. Let $j: U \rightarrow X$ be an open immersion of topological spaces. The functor $j_{!}: A b(U) \rightarrow A b(X)$ is exact.

Proof. Follows from the description of stalks given in Sheaves, Lemma 6.31.6.
01 AI Lemma 17.3.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $I$ be a set. For $i \in I$, let $\mathcal{F}_{i}$ be a sheaf of $\mathcal{O}_{X}$-modules. For $U \subset X$ quasi-compact open the map

$$
\bigoplus_{i \in I} \mathcal{F}_{i}(U) \longrightarrow\left(\bigoplus_{i \in I} \mathcal{F}_{i}\right)(U)
$$

is bijective.
Proof. If $s$ is an element of the right hand side, then there exists an open covering $U=\bigcup_{j \in J} U_{j}$ such that $\left.s\right|_{U_{j}}$ is a finite sum $\sum_{i \in I_{j}} s_{j i}$ with $s_{j i} \in \mathcal{F}_{i}\left(U_{j}\right)$. Because $U$ is quasi-compact we may assume that the covering is finite, i.e., that $J$ is finite. Then $I^{\prime}=\bigcup_{j \in J} I_{j}$ is a finite subset of $I$. Clearly, $s$ is a section of the subsheaf $\bigoplus_{i \in I^{\prime}} \mathcal{F}_{i}$. The result follows from the fact that for a finite direct sum sheafification is not needed, see Lemma 17.3 .2 above.

### 17.4. Sections of sheaves of modules

01 AL Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $s \in \Gamma(X, \mathcal{F})=$ $\mathcal{F}(X)$ be a global section. There is a unique map of $\mathcal{O}_{X}$-modules

$$
\mathcal{O}_{X} \longrightarrow \mathcal{F}, f \longmapsto f s
$$

associated to $s$. The notation above signifies that a local section $f$ of $\mathcal{O}_{X}$, i.e., a section $f$ over some open $U$, is mapped to the multiplication of $f$ with the restriction of $s$ to $U$. Conversely, any map $\varphi: \mathcal{O}_{X} \rightarrow \mathcal{F}$ gives rise to a section $s=\varphi(1)$ such that $\varphi$ is the morphism associated to $s$.
01 AM Definition 17.4.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is generated by global sections if there exist a set $I$, and global sections $s_{i} \in \Gamma(X, \mathcal{F}), i \in I$ such that the map

$$
\bigoplus_{i \in I} \mathcal{O}_{X} \longrightarrow \mathcal{F}
$$

which is the map associated to $s_{i}$ on the summand corresponding to $i$, is surjective. In this case we say that the sections $s_{i}$ generate $\mathcal{F}$.

We often use the abuse of notation introduced in Sheaves, Section 6.11 where, given a local section $s$ of $\mathcal{F}$ defined in an open neighbourhood of a point $x \in X$, we denote $s_{x}$, or even $s$ the image of $s$ in the stalk $\mathcal{F}_{x}$.

01AN Lemma 17.4.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let I be a set. Let $s_{i} \in \Gamma(X, \mathcal{F}), i \in I$ be global sections. The sections $s_{i}$ generate $\mathcal{F}$ if and only if for all $x \in X$ the elements $s_{i, x} \in \mathcal{F}_{x}$ generate the $\mathcal{O}_{X, x}$-module $\mathcal{F}_{x}$.
Proof. Omitted.
01 AO Lemma 17.4.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}_{X}$ modules. If $\mathcal{F}$ and $\mathcal{G}$ are generated by global sections then so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
Proof. Omitted.
01AP Lemma 17.4.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let I be a set. Let $s_{i}, i \in I$ be a collection of local sections of $\mathcal{F}$, i.e., $s_{i} \in \mathcal{F}\left(U_{i}\right)$ for some opens $U_{i} \subset X$. There exists a unique smallest subsheaf of $\mathcal{O}_{X}$-modules $\mathcal{G}$ such that each $s_{i}$ corresponds to a local section of $\mathcal{G}$.

Proof. Consider the subpresheaf of $\mathcal{O}_{X}$-modules defined by the rule $U \longmapsto\left\{\right.$ sums $\sum_{i \in J} f_{i}\left(\left.s_{i}\right|_{U}\right)$ where $J$ is finite, $U \subset U_{i}$ for $i \in J$, and $\left.f_{i} \in \mathcal{O}_{X}(U)\right\}$
Let $\mathcal{G}$ be the sheafification of this subpresheaf. This is a subsheaf of $\mathcal{F}$ by Sheaves, Lemma 6.16.3. Since all the finite sums clearly have to be in $\mathcal{G}$ this is the smallest subsheaf as desired.

01 AQ Definition 17.4.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. Given a set $I$, and local sections $s_{i}, i \in I$ of $\mathcal{F}$ we say that the subsheaf $\mathcal{G}$ of Lemma 17.4.4 above is the subsheaf generated by the $s_{i}$.
01AR Lemma 17.4.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Given a set $I$, and local sections $s_{i}, i \in I$ of $\mathcal{F}$. Let $\mathcal{G}$ be the subsheaf generated by the $s_{i}$ and let $x \in X$. Then $\mathcal{G}_{x}$ is the $\mathcal{O}_{X, x}$-submodule of $\mathcal{F}_{x}$ generated by the elements $s_{i, x}$ for those $i$ such that $s_{i}$ is defined at $x$.
Proof. This is clear from the construction of $\mathcal{G}$ in the proof of Lemma 17.4.4.

### 17.5. Supports of modules and sections

## 01AS

01AT Definition 17.5.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules.
(1) The support of $\mathcal{F}$ is the set of points $x \in X$ such that $\mathcal{F}_{x} \neq 0$.
(2) We denote $\operatorname{Supp}(\mathcal{F})$ the support of $\mathcal{F}$.
(3) Let $s \in \Gamma(X, \mathcal{F})$ be a global section. The support of $s$ is the set of points $x \in X$ such that the image $s_{x} \in \mathcal{F}_{x}$ of $s$ is not zero.

Of course the support of a local section is then defined also since a local section is a global section of the restriction of $\mathcal{F}$.

01AU Lemma 17.5.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $U \subset X$ open .
(1) The support of $s \in \mathcal{F}(U)$ is closed in $U$.
(2) The support of $f s$ is contained in the intersections of the supports of $f \in$ $\mathcal{O}_{X}(U)$ and $s \in \mathcal{F}(U)$.
(3) The support of $s+s^{\prime}$ is contained in the union of the supports of $s, s^{\prime} \in$ $\mathcal{F}(U)$.
(4) The support of $\mathcal{F}$ is the union of the supports of all local sections of $\mathcal{F}$.
(5) If $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of $\mathcal{O}_{X}$-modules, then the support of $\varphi(s)$ is contained in the support of $s \in \mathcal{F}(U)$.
Proof. This is true because if $s_{x}=0$, then $s$ is zero in an open neighbourhood of $x$ by definition of stalks. Similarly for $f$. Details omitted.

In general the support of a sheaf of modules is not closed. Namely, the sheaf could be an abelian sheaf on $\mathbf{R}$ (with the usual archimedean topology) which is the direct sum of infinitely many nonzero skyscraper sheaves each supported at a single point $p_{i}$ of $\mathbf{R}$. Then the support would be the set of points $p_{i}$ which may not be closed.
Another example is to consider the open immersion $j: U=(0, \infty) \rightarrow \mathbf{R}=X$, and the abelian sheaf $j!\underline{\mathbf{Z}}_{U}$. By Sheaves, Section 6.31 the support of this sheaf is exactly $U$.
01AV Lemma 17.5.3. Let $X$ be a topological space. The support of a sheaf of rings is closed.

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1=0$, and hence the support of a sheaf of rings is the support of the unit section.

### 17.6. Closed immersions and abelian sheaves

01AW Recall that we think of an abelian sheaf on a topological space $X$ as a sheaf of $\underline{\mathbf{Z}}_{X}$-modules. Thus we may apply any results, definitions for sheaves of modules to abelian sheaves.

01AX Lemma 17.6.1. Let $X$ be a topological space. Let $Z \subset X$ be a closed subset. Denote $i: Z \rightarrow X$ the inclusion map. The functor

$$
i_{*}: A b(Z) \longrightarrow A b(X)
$$

is exact, fully faithful, with essential image exactly those abelian sheaves whose support is contained in $Z$. The functor $i^{-1}$ is a left inverse to $i_{*}$.

Proof. Exactness follows from the description of stalks in Sheaves, Lemma 6.32.1 and Lemma 17.3.1. The rest was shown in Sheaves, Lemma 6.32.3.

Let $\mathcal{F}$ be a sheaf on $X$. There is a canonical subsheaf of $\mathcal{F}$ which consists of exactly those sections whose support is contained in $Z$. Here is the exact statement.

01AY Lemma 17.6.2. Let $X$ be a topological space. Let $Z \subset X$ be a closed subset. Let $\mathcal{F}$ be a sheaf on $X$. For $U \subset X$ open set
$\Gamma\left(U, \mathcal{H}_{Z}(\mathcal{F})\right)=\{s \in \mathcal{F}(U) \mid$ the support of $s$ is contained in $Z \cap U\}$
Then $\mathcal{H}_{Z}(\mathcal{F})$ is an abelian subsheaf of $\mathcal{F}$. It is the largest abelian subsheaf of $\mathcal{F}$ whose support is contained in $Z$. The construction $\mathcal{F} \mapsto \mathcal{H}_{Z}(\mathcal{F})$ is functorial in the abelian sheaf $\mathcal{F}$.

Proof. This follows from Lemma 17.5.2.
This seems like a good opportunity to show that the functor $i_{*}$ has a right adjoint on abelian sheaves.

01AZ Lemma 17.6.3. Let $i: Z \rightarrow X$ be the inclusion of a closed subset into the topological space $X$. Denot $\emptyset^{1} i^{!}: A b(X) \rightarrow A b(Z)$ the functor $\mathcal{F} \mapsto i^{-1} \mathcal{H}_{Z}(\mathcal{F})$. Then $i^{!}$is a right adjoint to $i_{*}$, in a formula

$$
\operatorname{Mor}_{A b(X)}\left(i_{*} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{A b(Z)}(\mathcal{G}, i!\mathcal{F})
$$

In particular $i_{*}$ commutes with arbitrary colimits.
Proof. Note that $i_{*}!^{!} \mathcal{F}=\mathcal{H}_{Z}(\mathcal{F})$. Since $i_{*}$ is fully faithful we are reduced to showing that

$$
\operatorname{Mor}_{A b(X)}\left(i_{*} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{A b(X)}\left(i_{*} \mathcal{G}, \mathcal{H}_{Z}(\mathcal{F})\right)
$$

This follows since the support of the image via any homomorphism of a section of $i_{*} \mathcal{G}$ is supported on $Z$, see Lemma 17.5 .2 .

01B0 Remark 17.6.4. In Sheaves, Remark 6.32 .5 we showed that $i_{*}$ as a functor on the categories of sheaves of sets does not have a right adjoint simply because it is not exact. However, it is very close to being true, in fact, the functor $i_{*}$ is exact on sheaves of pointed sets, sections with support in $Z$ can be defined for sheaves of pointed sets, and $i^{!}$makes sense and is a right adjoint to $i_{*}$.

[^46]
### 17.7. A canonical exact sequence

02US We give this exact sequence its own section.
02UT Lemma 17.7.1. Let $X$ be a topological space. Let $U \subset X$ be an open subset with complement $Z \subset X$. Denote $j: U \rightarrow X$ the open immersion and $i: Z \rightarrow X$ the closed immersion. For any sheaf of abelian groups $\mathcal{F}$ on $X$ the adjunction mappings $j!j^{*} \mathcal{F} \rightarrow \mathcal{F}$ and $\mathcal{F} \rightarrow i_{*} i^{*} \mathcal{F}$ give a short exact sequence

$$
0 \rightarrow j!j^{*} \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_{*} i^{*} \mathcal{F} \rightarrow 0
$$

of sheaves of abelian groups. For any morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of abelian sheaves on $X$ we obtain a morphism of short exact sequences

Proof. We may check exactness on stalks (Lemma 17.3.1). For a description of the stalks in question see Sheaves, Lemmas 6.31.6 and 6.32.1. We omit the proof of the functorial behaviour of the exact sequence.

### 17.8. Modules locally generated by sections

01B1 Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. In this and the following section we will often restrict sheaves to open subspaces $U \subset X$, see Sheaves, Section 6.31. In particular, we will often denote the open subspace by $\left(U, \mathcal{O}_{U}\right)$ instead of the more correct notation $\left(U,\left.\mathcal{O}_{X}\right|_{U}\right)$, see Sheaves, Definition 6.31.2.

Consider the open immersion $j: U=(0, \infty) \rightarrow \mathbf{R}=X$, and the abelian sheaf $j!\underline{\mathbf{Z}}_{U}$. By Sheaves, Section 6.31 the stalk of $j!\underline{\mathbf{Z}}_{U}$ at $x=0$ is 0 . In fact the sections of this sheaf over any open interval containing 0 are 0 . Thus there is no open neighbourhood of the point 0 over which the sheaf can be generated by sections.
01B2 Definition 17.8.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is locally generated by sections if for every $x \in X$ there exists an open neighbourhood $U$ such that $\left.\mathcal{F}\right|_{U}$ is globally generated as a sheaf of $\mathcal{O}_{U}$-modules.

In other words there exists a set $I$ and for each $i$ a section $s_{i} \in \mathcal{F}(U)$ such that the associated map

$$
\left.\bigoplus_{i \in I} \mathcal{O}_{U} \longrightarrow \mathcal{F}\right|_{U}
$$

is surjective.
01B3 Lemma 17.8.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback $f^{*} \mathcal{G}$ is locally generated by sections if $\mathcal{G}$ is locally generated by sections.
Proof. Given an open subspace $V$ of $Y$ we may consider the commutative diagram of ringed spaces

We know that $\left.f^{*} \mathcal{G}\right|_{f^{-1} V} \cong\left(f^{\prime}\right)^{*}\left(\left.\mathcal{G}\right|_{V}\right)$, see Sheaves, Lemma 6.26.3. Thus we may assume that $\mathcal{G}$ is globally generated.
We have seen that $f^{*}$ commutes with all colimits, and is right exact, see Lemma 17.3 .3 . Thus if we have a surjection

$$
\bigoplus_{i \in I} \mathcal{O}_{Y} \rightarrow \mathcal{G} \rightarrow 0
$$

then upon applying $f^{*}$ we obtain the surjection

$$
\bigoplus_{i \in I} \mathcal{O}_{X} \rightarrow f^{*} \mathcal{G} \rightarrow 0
$$

This implies the lemma.

### 17.9. Modules of finite type

01B4
01B5 Definition 17.9.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is of finite type if for every $x \in X$ there exists an open neighbourhood $U$ such that $\left.\mathcal{F}\right|_{U}$ is generated by finitely many sections.
01B6 Lemma 17.9.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback $f^{*} \mathcal{G}$ of a finite type $\mathcal{O}_{Y}$-module is a finite type $\mathcal{O}_{X}$-module.

Proof. Arguing as in the proof of Lemma 17.8 .2 we may assume $\mathcal{G}$ is globally generated by finitely many sections. We have seen that $f^{*}$ commutes with all colimits, and is right exact, see Lemma 17.3 .3 . Thus if we have a surjection

$$
\bigoplus_{i=1, \ldots, n} \mathcal{O}_{Y} \rightarrow \mathcal{G} \rightarrow 0
$$

then upon applying $f^{*}$ we obtain the surjection

$$
\bigoplus_{i=1, \ldots, n} \mathcal{O}_{X} \rightarrow f^{*} \mathcal{G} \rightarrow 0
$$

This implies the lemma.
01B7 Lemma 17.9.3. Let $X$ be a ringed space. The image of a morphism of $\mathcal{O}_{X^{-}}$ modules of finite type is of finite type. Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of $\mathcal{O}_{X}$-modules. If $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ are of finite type, so is $\mathcal{F}_{2}$.

Proof. The statement on images is trivial. The statement on short exact sequences comes from the fact that sections of $\mathcal{F}_{3}$ locally lift to sections of $\mathcal{F}_{2}$ and the corresponding result in the category of modules over a ring (applied to the stalks for example).

01B8 Lemma 17.9.4. Let $X$ be a ringed space. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of $\mathcal{O}_{X}$-modules. Let $x \in X$. Assume $\mathcal{F}$ of finite type and the map on stalks $\varphi_{x}: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ surjective. Then there exists an open neighbourhood $x \in U \subset X$ such that $\left.\varphi\right|_{U}$ is surjective.
Proof. Choose an open neighbourhood $U \subset X$ such that $\mathcal{F}$ is generated by $s_{1}, \ldots, s_{n} \in \mathcal{F}(U)$ over $U$. By assumption of surjectivity of $\varphi_{x}$, after shrinking $U$ we may assume that $s_{i}=\varphi\left(t_{i}\right)$ for some $t_{i} \in \mathcal{G}(U)$. Then $U$ works.

01B9 Lemma 17.9.5. Let $X$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Let $x \in X$. Assume $\mathcal{F}$ of finite type and $\mathcal{F}_{x}=0$. Then there exists an open neighbourhood $x \in U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is zero.

Proof. This is a special case of Lemma 17.9 .4 applied to the morphism $0 \rightarrow \mathcal{F}$.
01BA Lemma 17.9.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ is of finite type then support of $\mathcal{F}$ is closed.

Proof. This is a reformulation of Lemma 17.9 .5
01BB Lemma 17.9.7. Let $X$ be a ringed space. Let $I$ be a partially ordered set and let $\left(\mathcal{F}_{i}, f_{i i^{\prime}}\right)$ be a system over I consisting of sheaves of $\mathcal{O}_{X}$-modules (see Categories, Section 4.21). Let $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ be the colimit. Assume (a) I is directed, (b) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module, and (c) $X$ is quasi-compact. Then there exists an $i$ such that $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective. If the transition maps $f_{i i^{\prime}}$ are injective then we conclude that $\mathcal{F}=\mathcal{F}_{i}$ for some $i \in I$.

Proof. Let $x \in X$. There exists an open neighbourhood $U \subset X$ of $x$ and finitely many sections $s_{j} \in \mathcal{F}(U), j=1, \ldots, m$ such that $s_{1}, \ldots, s_{m}$ generate $\mathcal{F}$ as $\mathcal{O}_{U^{-}}$ module. After possibly shrinking $U$ to a smaller open neighbourhood of $x$ we may assume that each $s_{j}$ comes from a section of $\mathcal{F}_{i}$ for some $i \in I$. Hence, since $X$ is quasi-compact we can find a finite open covering $X=\bigcup_{j=1, \ldots, m} U_{j}$, and for each $j$ an index $i_{j}$ and finitely many sections $s_{j l} \in \mathcal{F}_{i_{j}}\left(U_{j}\right)$ whose images generate the restriction of $\mathcal{F}$ to $U_{j}$. Clearly, the lemma holds for any index $i \in I$ which is $\geq$ all $i_{j}$.

01BC Lemma 17.9.8. Let $X$ be a ringed space. There exists a set of $\mathcal{O}_{X}$-modules $\left\{\mathcal{F}_{i}\right\}_{i \in I}$ of finite type such that each finite type $\mathcal{O}_{X}$-module on $X$ is isomorphic to exactly one of the $\mathcal{F}_{i}$.

Proof. For each open covering $\mathcal{U}: X=\bigcup U_{j}$ consider the sheaves of $\mathcal{O}_{X}$-modules $\mathcal{F}$ such that each restriction $\left.\mathcal{F}\right|_{U_{j}}$ is a quotient of $\mathcal{O}_{U_{j}}^{\oplus r}$ for some $r_{j} \geq 0$. These are parametrized by subsheaves $\mathcal{K}_{i} \subset \mathcal{O}_{U_{j}}^{\oplus r_{j}}$ and glueing data

$$
\varphi_{j j^{\prime}}: \mathcal{O}_{U_{j} \cap U_{j^{\prime}}}^{\oplus r_{j}} /\left(\left.\mathcal{K}_{j}\right|_{U_{j} \cap U_{j^{\prime}}}\right) \longrightarrow \mathcal{O}_{U_{j} \cap U_{j^{\prime}}}^{\oplus r_{j^{\prime}}} /\left(\left.\mathcal{K}_{j^{\prime}}\right|_{U_{j} \cap U_{j^{\prime}}}\right)
$$

see Sheaves, Section 6.33. Note that the collection of all glueing data forms a set. The collection of all coverings $\mathcal{U}: X=\bigcup_{j \in J} U_{i}$ where $J \rightarrow \mathcal{P}(X), j \mapsto U_{j}$ is injective forms a set as well. Hence the collection of all sheaves of $\mathcal{O}_{X}$-modules gotten from glueing quotients as above forms a set $\mathcal{I}$. By definition every finite type $\mathcal{O}_{X}$-module is isomorphic to an element of $\mathcal{I}$. Choosing an element out of each isomorphism class inside $\mathcal{I}$ gives the desired set of sheaves (uses axiom of choice).

### 17.10. Quasi-coherent modules

01BD In this section we introduce an abstract notion of quasi-coherent $\mathcal{O}_{X}$-module. This notion is very useful in algebraic geometry, since quasi-coherent modules on a scheme have a good description on any affine open. However, we warn the reader that in the general setting of (locally) ringed spaces this notion is not well behaved at all. The category of quasi-coherent sheaves is not abelian in general, infinite direct sums of quasi-coherent sheaves aren't quasi-coherent, etc, etc.

01BE Definition 17.10.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules if for every point
$x \in X$ there exists an open neighbourhood $x \in U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is isomorphic to the cokernel of a map

$$
\bigoplus_{j \in J} \mathcal{O}_{U} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{U}
$$

The category of quasi-coherent $\mathcal{O}_{X}$-modules is denoted $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$.
The definition means that $X$ is covered by open sets $U$ such that $\left.\mathcal{F}\right|_{U}$ has a presentation of the form

$$
\left.\bigoplus_{j \in J} \mathcal{O}_{U} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U} \rightarrow 0
$$

Here presentation signifies that the displayed sequence is exact. In other words
(1) for every point $x$ of $X$ there exists an open neighbourhood such that $\left.\mathcal{F}\right|_{U}$ is generated by global sections, and
(2) for a suitable choice of these sections the kernel of the associated surjection is also generated by global sections.
01BF Lemma 17.10.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The direct sum of two quasicoherent $\mathcal{O}_{X}$-modules is a quasi-coherent $\mathcal{O}_{X}$-module.

Proof. Omitted.
02CF Remark 17.10.3. Warning: It is not true in general that an infinite direct sum of quasi-coherent $\mathcal{O}_{X}$-modules is quasi-coherent. For more esoteric behaviour of quasi-coherent modules see Example 17.10.9.
01BG Lemma 17.10.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback $f^{*} \mathcal{G}$ of a quasi-coherent $\mathcal{O}_{Y}$-module is quasi-coherent.

Proof. Arguing as in the proof of Lemma 17.8 .2 we may assume $\mathcal{G}$ has a global presentation by direct sums of copies of $\mathcal{O}_{Y}$. We have seen that $f^{*}$ commutes with all colimits, and is right exact, see Lemma 17.3.3. Thus if we have an exact sequence

$$
\bigoplus_{j \in J} \mathcal{O}_{Y} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{Y} \rightarrow \mathcal{G} \rightarrow 0
$$

then upon applying $f^{*}$ we obtain the exact sequence

$$
\bigoplus_{j \in J} \mathcal{O}_{X} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{X} \rightarrow f^{*} \mathcal{G} \rightarrow 0
$$

This implies the lemma.
This gives plenty of examples of quasi-coherent sheaves.
01BH Lemma 17.10.5. Let $\left(X, \mathcal{O}_{X}\right)$ be ringed space. Let $\alpha: R \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$ be a ring homomorphism from a ring $R$ into the ring of global sections on $X$. Let $M$ be an $R$-module. The following three constructions give canonically isomorphic sheaves of $\mathcal{O}_{X}$-modules:
(1) Let $\pi:\left(X, \mathcal{O}_{X}\right) \longrightarrow(\{*\}, R)$ be the morphism of ringed spaces with $\pi$ : $X \rightarrow\{*\}$ the unique map and with $\pi$-map $\pi^{\sharp}$ the given map $\alpha: R \rightarrow$ $\Gamma\left(X, \mathcal{O}_{X}\right)$. Set $\mathcal{F}_{1}=\pi^{*} M$.
(2) Choose a presentation $\bigoplus_{j \in J} R \rightarrow \bigoplus_{i \in I} R \rightarrow M \rightarrow 0$. Set

$$
\mathcal{F}_{2}=\operatorname{Coker}\left(\bigoplus_{j \in J} \mathcal{O}_{X} \rightarrow \bigoplus_{i \in I} \mathcal{O}_{X}\right)
$$

Here the map on the component $\mathcal{O}_{X}$ corresponding to $j \in J$ given by the section $\sum_{i} \alpha\left(r_{i j}\right)$ where the $r_{i j}$ are the matrix coefficients of the map in the presentation of $M$.
(3) Set $\mathcal{F}_{3}$ equal to the sheaf associated to the presheaf $U \mapsto \mathcal{O}_{X}(U) \otimes_{R} M$, where the map $R \rightarrow \mathcal{O}_{X}(U)$ is the composition of $\alpha$ and the restriction $\operatorname{map} \mathcal{O}_{X}(X) \rightarrow \mathcal{O}_{X}(U)$.
This construction has the following properties:
(1) The resulting sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}_{M}=\mathcal{F}_{1}=\mathcal{F}_{2}=\mathcal{F}_{3}$ is quasi-coherent.
(2) The construction gives a functor from the category of $R$-modules to the category of quasi-coherent sheaves on $X$ which commutes with arbitrary colimits.
(3) For any $x \in X$ we have $\mathcal{F}_{M, x}=\mathcal{O}_{X, x} \otimes_{R} M$ functorial in $M$.
(4) Given any $\mathcal{O}_{X}$-module $\mathcal{G}$ we have

$$
\operatorname{Mor}_{\mathcal{O}_{X}}\left(\mathcal{F}_{M}, \mathcal{G}\right)=\operatorname{Hom}_{R}(M, \Gamma(X, \mathcal{G}))
$$

where the $R$-module structure on $\Gamma(X, \mathcal{G})$ comes from the $\Gamma\left(X, \mathcal{O}_{X}\right)$-module structure via $\alpha$.

Proof. The isomorphism between $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ comes from the fact that $\pi^{*}$ is defined as the sheafification of the presheaf in (3), see Sheaves, Section 6.26. The isomorphism between the constructions in (2) and (1) comes from the fact that the functor $\pi^{*}$ is right exact, so $\pi^{*}\left(\bigoplus_{j \in J} R\right) \rightarrow \pi^{*}\left(\bigoplus_{i \in I} R\right) \rightarrow \pi^{*} M \rightarrow 0$ is exact, $\pi^{*}$ commutes with arbitrary direct sums, see Lemma 17.3.3, and finally the fact that $\pi^{*}(R)=\mathcal{O}_{X}$.

Assertion (1) is clear from construction (2). Assertion (2) is clear since $\pi^{*}$ has these properties. Assertion (3) follows from the description of stalks of pullback sheaves, see Sheaves, Lemma 6.26.4 Assertion (4) follows from adjointness of $\pi_{*}$ and $\pi^{*}$.

01BI Definition 17.10.6. In the situation of Lemma 17.10 .5 we say $\mathcal{F}_{M}$ is the sheaf associated to the module $M$ and the ring map $\alpha$. If $R=\Gamma\left(X, \mathcal{O}_{X}\right)$ and $\alpha=\mathrm{id}_{R}$ we simply say $\mathcal{F}_{M}$ is the sheaf associated to the module $M$.

01BJ Lemma 17.10.7. Let $\left(X, \mathcal{O}_{X}\right)$ be ringed space. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Let $M$ be an $R$-module. Let $\mathcal{F}_{M}$ be the quasi-coherent sheaf of $\mathcal{O}_{X}$-modules associated to $M$. If $g:\left(Y, \mathcal{O}_{Y}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ is a morphism of ringed spaces, then $g^{*} \mathcal{F}_{M}$ is the sheaf associated to the $\Gamma\left(Y, \mathcal{O}_{Y}\right)$-module $\Gamma\left(Y, \mathcal{O}_{Y}\right) \otimes_{R} M$.

Proof. The assertion follows from the first description of $\mathcal{F}_{M}$ in Lemma 17.10.5 as $\pi^{*} M$, and the following commutative diagram of ringed spaces

(Also use Sheaves, Lemma 6.26.3.)
01BK Lemma 17.10.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $x \in X$ be a point. Assume that $x$ has a fundamental system of quasi-compact neighbourhoods. Consider any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$. Then there exists an open neighbourhood $U$ of $x$ such
that $\left.\mathcal{F}\right|_{U}$ is isomorphic to the sheaf of modules $\mathcal{F}_{M}$ on $\left(U, \mathcal{O}_{U}\right)$ associated to some $\Gamma\left(U, \mathcal{O}_{U}\right)$-module $M$.

Proof. First we may replace $X$ by an open neighbourhood of $x$ and assume that $\mathcal{F}$ is isomorphic to the cokernel of a map

$$
\Psi: \bigoplus_{j \in J} \mathcal{O}_{X} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{X}
$$

The problem is that this map may not be given by a "matrix", because the module of global sections of a direct sum is in general different from the direct sum of the modules of global sections.

Let $x \in E \subset X$ be a quasi-compact neighbourhood of $x$ (note: $E$ may not be open). Let $x \in U \subset E$ be an open neighbourhood of $x$ contained in $E$. Next, we proceed as in the proof of Lemma 17.3 .5 For each $j \in J$ denote $s_{j} \in \Gamma\left(X, \bigoplus_{i \in I} \mathcal{O}_{X}\right)$ the image of the section 1 in the summand $\mathcal{O}_{X}$ corresponding to $j$. There exists a finite collection of opens $U_{j k}, k \in K_{j}$ such that $E \subset \bigcup_{k \in K_{j}} U_{j k}$ and such that each restriction $\left.s_{j}\right|_{U_{j k}}$ is a finite sum $\sum_{i \in I_{j k}} f_{j k i}$ with $I_{j k} \subset I$, and $f_{j k i}$ in the summand $\mathcal{O}_{X}$ corresponding to $i \in I$. Set $I_{j}=\bigcup_{k \in k_{J}} I_{j k}$. This is a finite set. Since $U \subset E \subset \bigcup_{k \in K_{j}} U_{j k}$ the section $\left.s_{j}\right|_{U}$ is a section of the finite direct sum $\bigoplus_{i \in I_{j}} \mathcal{O}_{X}$. By Lemma 17.3 .2 we see that actually $\left.s_{j}\right|_{U}$ is a sum $\sum_{i \in I_{j}} f_{i j}$ and $f_{i j} \in \mathcal{O}_{X}(U)=\Gamma\left(U, \mathcal{O}_{U}\right)$.

At this point we can define a module $M$ as the cokernel of the map

$$
\bigoplus_{j \in J} \Gamma\left(U, \mathcal{O}_{U}\right) \longrightarrow \bigoplus_{i \in I} \Gamma\left(U, \mathcal{O}_{U}\right)
$$

with matrix given by the $\left(f_{i j}\right)$. By construction (2) of Lemma 17.10 .5 we see that $\mathcal{F}_{M}$ has the same presentation as $\left.\mathcal{F}\right|_{U}$ and therefore $\left.\mathcal{F}_{M} \cong \mathcal{F}\right|_{U}$.

01BL Example 17.10.9. Let $X$ be countably many copies $L_{1}, L_{2}, L_{3}, \ldots$ of the real line all glued together at 0 ; a fundamental system of neighbourhoods of 0 being the collection $\left\{U_{n}\right\}_{n \in \mathbf{N}}$, with $U_{n} \cap L_{i}=(-1 / n, 1 / n)$. Let $\mathcal{O}_{X}$ be the sheaf of continuous real valued functions. Let $f: \mathbf{R} \rightarrow \mathbf{R}$ be a continuous function which is identically zero on $(-1,1)$ and identically 1 on $(-\infty,-2) \cup(2, \infty)$. Denote $f_{n}$ the continuous function on $X$ which is equal to $x \mapsto f(n x)$ on each $L_{j}=\mathbf{R}$. Let $1_{L_{j}}$ be the characteristic function of $L_{j}$. We consider the map

$$
\bigoplus_{j \in \mathbf{N}} \mathcal{O}_{X} \longrightarrow \bigoplus_{j, i \in \mathbf{N}} \mathcal{O}_{X}, \quad e_{j} \longmapsto \sum_{i \in \mathbf{N}} f_{j} 1_{L_{i}} e_{i j}
$$

with obvious notation. This makes sense because this sum is locally finite as $f_{j}$ is zero in a neighbourhood of 0 . Over $U_{n}$ the image of $e_{j}$, for $j>2 n$ is not a finite linear combination $\sum g_{i j} e_{i j}$ with $g_{i j}$ continuous. Thus there is no neighbourhood of $0 \in X$ such that the displayed map is given by a "matrix" as in the proof of Lemma 17.10 .8 above.

Note that $\bigoplus_{j \in \mathbf{N}} \mathcal{O}_{X}$ is the sheaf associated to the free module with basis $e_{j}$ and similarly for the other direct sum. Thus we see that a morphism of sheaves associated to modules in general even locally on $X$ does not come from a morphism of modules. Similarly there should be an example of a ringed space $X$ and a quasicoherent $\mathcal{O}_{X}$-module $\mathcal{F}$ such that $\mathcal{F}$ is not locally of the form $\mathcal{F}_{M}$. (Please email if you find one.) Moreover, there should be examples of locally compact spaces $X$
and maps $\mathcal{F}_{M} \rightarrow \mathcal{F}_{N}$ which also do not locally come from maps of modules (the proof of Lemma 17.10 .8 shows this cannot happen if $N$ is free).
17.11. Modules of finite presentation

01BM
01BN Definition 17.11.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is of finite presentation if for every point $x \in X$ there exists an open neighbourhood $x \in U \subset X$, and $n, m \in \mathbf{N}$ such that $\left.\mathcal{F}\right|_{U}$ is isomorphic to the cokernel of a map

$$
\bigoplus_{j=1, \ldots, m} \mathcal{O}_{U} \longrightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{U}
$$

This means that $X$ is covered by open sets $U$ such that $\left.\mathcal{F}\right|_{U}$ has a presentation of the form

$$
\left.\bigoplus_{j=1, \ldots, m} \mathcal{O}_{U} \longrightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U} \rightarrow 0
$$

Here presentation signifies that the displayed sequence is exact. In other words
(1) for every point $x$ of $X$ there exists an open neighbourhood such that $\left.\mathcal{F}\right|_{U}$ is generated by finitely many global sections, and
(2) for a suitable choice of these sections the kernel of the associated surjection is also generated by finitely many global sections.

01BO Lemma 17.11.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Any $\mathcal{O}_{X}$-module of finite presentation is quasi-coherent.

Proof. Immediate from definitions.
01BP Lemma 17.11.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a $\mathcal{O}_{X}$-module of finite presentation.
(1) If $\psi: \mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{F}$ is a surjection, then $\operatorname{Ker}(\psi)$ is of finite type.
(2) If $\theta: \mathcal{G} \rightarrow \mathcal{F}$ is surjective with $\mathcal{G}$ of finite type, then $\operatorname{Ker}(\theta)$ is of finite type.

Proof. Proof of (1). Let $x \in X$. Choose an open neighbourhood $U \subset X$ of $x$ such that there exists a presentation

$$
\left.\mathcal{O}_{U}^{\oplus m} \xrightarrow{\chi} \mathcal{O}_{U}^{\oplus n} \xrightarrow{\varphi} \mathcal{F}\right|_{U} \rightarrow 0 .
$$

Let $e_{k}$ be the section generating the $k$ th factor of $\mathcal{O}_{X}^{\oplus r}$. For every $k=1, \ldots, r$ we can, after shrinking $U$ to a small neighbourhood of $x$, lift $\psi\left(e_{k}\right)$ to a section $\tilde{e}_{k}$ of $\mathcal{O}_{U}^{\oplus n}$ over $U$. This gives a morphism of sheaves $\alpha: \mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{O}_{U}^{\oplus n}$ such that $\varphi \circ \alpha=\psi$. Similarly, after shrinking $U$, we can find a morphism $\beta: \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{O}_{U}^{\oplus r}$ such that $\psi \circ \beta=\varphi$. Then the map

$$
\mathcal{O}_{U}^{\oplus m} \oplus \mathcal{O}_{U}^{\oplus r} \xrightarrow{\beta \circ \chi, 1-\beta \circ \alpha} \mathcal{O}_{U}^{\oplus r}
$$

is a surjection onto the kernel of $\psi$.
To prove (2) we may locally choose a surjection $\eta: \mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{G}$. By part (1) we see $\operatorname{Ker}(\theta \circ \eta)$ is of finite type. Since $\operatorname{Ker}(\theta)=\eta(\operatorname{Ker}(\theta \circ \eta))$ we win.

01BQ Lemma 17.11.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback $f^{*} \mathcal{G}$ of a module of finite presentation is of finite presentation.

Proof. Exactly the same as the proof of Lemma 17.10 .4 but with finite index sets.

01BR Lemma 17.11.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Let $M$ be an $R$-module. The $\mathcal{O}_{X}$-module $\mathcal{F}_{M}$ associated to $M$ is a directed colimit of finitely presented $\mathcal{O}_{X}$-modules.
Proof. This follows immediately from Lemma 17.10 .5 and the fact that any module is a directed colimit of finitely presented modules, see Algebra, Lemma 10.8.13.

01BS Lemma 17.11.6. Let $X$ be a ringed space. Let $I$ be a partially ordered set and let $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ be a system over I consisting of sheaves of $\mathcal{O}_{X}$-modules (see Categories, Section 4.21). Assume
(1) I is directed,
(2) $\mathcal{G}$ is an $\mathcal{O}_{X}$-module of finite presentation, and
(3) $X$ has a cofinal system of open coverings $\mathcal{U}: X=\bigcup_{j \in J} U_{j}$ with $J$ finite and $U_{j} \cap U_{j^{\prime}}$ quasi-compact for all $j, j^{\prime} \in J$.
Then we have

$$
\operatorname{colim}_{i} \operatorname{Hom}_{X}\left(\mathcal{G}, \mathcal{F}_{i}\right)=\operatorname{Hom}_{X}\left(\mathcal{G}, \operatorname{colim}_{i} \mathcal{F}_{i}\right) .
$$

Proof. Let $\alpha$ be an element of the right hand side. For every point $x \in X$ we may choose an open neighbourhood $U \subset X$ and finitely many sections $s_{j} \in \mathcal{G}(U)$ which generate $\mathcal{G}$ over $U$ and finitely many relations $\sum f_{k j} s_{j}=0, k=1, \ldots, n$ with $f_{k j} \in \mathcal{O}_{X}(U)$ which generate the kernel of $\bigoplus_{j=1, \ldots, m} \mathcal{O}_{U} \rightarrow \mathcal{G}$. After possibly shrinking $U$ to a smaller open neighbourhood of $x$ we may assume there exists an index $i \in I$ such that the sections $\alpha\left(s_{j}\right)$ all come from sections $s_{j}^{\prime} \in \mathcal{F}_{i}(U)$. After possibly shrinking $U$ to a smaller open neighbourhood of $x$ and increasing $i$ we may assume the relations $\sum f_{k j} s_{j}^{\prime}=0$ hold in $\mathcal{F}_{i}(U)$. Hence we see that $\left.\alpha\right|_{U}$ lifts to a morphism $\left.\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{F}_{i}\right|_{U}$ for some index $i \in I$.
By condition (3) and the preceding arguments, we may choose a finite open covering $X=\bigcup_{j=1, \ldots, m} U_{j}$ such that (a) $\left.\mathcal{G}\right|_{U_{j}}$ is generated by finitely many sections $s_{j k} \in$ $\mathcal{G}\left(U_{j}\right)$, (b) the restriction $\left.\alpha\right|_{U_{j}}$ comes from a morphism $\alpha_{j}: \mathcal{G} \rightarrow \mathcal{F}_{i_{j}}$ for some $i_{j} \in I$, and (c) the intersections $U_{j} \cap U_{j^{\prime}}$ are all quasi-compact. For every pair $\left(j, j^{\prime}\right) \in\{1, \ldots, m\}^{2}$ and any $k$ we can find we can find an index $i \geq \max \left(i_{j}, i_{j^{\prime}}\right)$ such that

$$
\varphi_{i_{j} i}\left(\alpha_{j}\left(\left.s_{j k}\right|_{U_{j} \cap U_{j^{\prime}}}\right)\right)=\varphi_{i_{j^{\prime}} i}\left(\alpha_{j^{\prime}}\left(\left.s_{j k}\right|_{U_{j} \cap U_{j^{\prime}}}\right)\right)
$$

see Sheaves, Lemma 6.29.1 (2). Since there are finitely many of these pairs ( $j, j^{\prime}$ ) and finitely many $s_{j k}$ we see that we can find a single $i$ which works for all of them. For this index $i$ all of the maps $\varphi_{i_{j} i} \circ \alpha_{j}$ agree on the overlaps $U_{j} \cap U_{j^{\prime}}$ as the sections $s_{j k}$ generate $\mathcal{G}$ over this overlap. Hence we get a morphism $\mathcal{G} \rightarrow \mathcal{F}_{i}$ as desired.

01BT Remark 17.11.7. In the lemma above some condition beyond the condition that $X$ is quasi-compact is necessary. See Sheaves, Example 6.29.2.

0B8J Lemma 17.11.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a finitely presented $\mathcal{O}_{X^{-}}$ module. Let $x \in X$ such that $\mathcal{F}_{x} \cong \mathcal{O}_{X, x}^{\oplus r}$. Then there exists an open neighbourhood $U$ of $x$ such that $\left.\mathcal{F}\right|_{U} \cong \mathcal{O}_{U}^{\oplus r}$.
Proof. Choose $s_{1}, \ldots, s_{r} \in \mathcal{F}_{x}$ mapping to a basis of $\mathcal{O}_{X, x}^{\oplus r}$ by the isomorphism. Choose an open neighbourhood $U$ of $x$ such that $s_{i}$ lifts to $s_{i} \in \mathcal{F}(U)$. After
shrinking $U$ we see that the induced map $\psi:\left.\mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{F}\right|_{U}$ is surjective (Lemma 17.9.4. By Lemma 17.11 .3 we see that $\operatorname{Ker}(\psi)$ is of finite type. Then $\operatorname{Ker}(\psi)_{x}=0$ implies that $\operatorname{Ker}(\psi)$ becomes zero after shrinking $U$ once more (Lemma 17.9.5).

### 17.12. Coherent modules

01BU The category of coherent sheaves on a ringed space $X$ is a more reasonable object than the category of quasi-coherent sheaves, in the sense that it is at least an abelian subcategory of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ no matter what $X$ is. On the other hand, the pullback of a coherent module is "almost never" coherent in the general setting of ringed spaces.

01BV Definition 17.12.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules. We say that $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module if the following two conditions hold:
(1) $\mathcal{F}$ is of finite type, and
(2) for every open $U \subset X$ and every finite collection $s_{i} \in \mathcal{F}(U), i=1, \ldots, n$ the kernel of the associated map $\left.\bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U}$ is of finite type.
The category of coherent $\mathcal{O}_{X}$-modules is denoted $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$.
01BW Lemma 17.12.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Any coherent $\mathcal{O}_{X}$-module is of finite presentation and hence quasi-coherent.

Proof. Let $\mathcal{F}$ be a coherent sheaf on $X$. Pick a point $x \in X$. By (1) of the definition of coherent, we may find an open neighbourhood $U$ and sections $s_{i}$, $i=1, \ldots, n$ of $\mathcal{F}$ over $U$ such that $\Psi: \bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{F}$ is surjective. By (2) of the definition of coherent, we may find an open neighbourhood $V, x \in V \subset U$ and sections $t_{1}, \ldots, t_{m}$ of $\bigoplus_{i=1, \ldots, n} \mathcal{O}_{V}$ which generate the kernel of $\left.\Psi\right|_{V}$. Then over $V$ we get the presentation

$$
\left.\bigoplus_{j=1, \ldots, m} \mathcal{O}_{V} \longrightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{V} \rightarrow \mathcal{F}\right|_{V} \rightarrow 0
$$

as desired.
01BX Example 17.12.3. Suppose that $X$ is a point. In this case the definition above gives a notion for modules over rings. What does the definition of coherent mean? It is closely related to the notion of Noetherian, but it is not the same: Namely, the ring $R=\mathbf{C}\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ is coherent as a module over itself but not Noetherian as a module over itself. See Algebra, Section 10.89 for more discussion.

01BY Lemma 17.12.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) Any finite type subsheaf of a coherent sheaf is coherent.
(2) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism from a finite type sheaf $\mathcal{F}$ to a coherent sheaf $\mathcal{G}$. Then $\operatorname{Ker}(\varphi)$ is finite type.
(3) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of coherent $\mathcal{O}_{X}$-modules. Then $\operatorname{Ker}(\varphi)$ and $\operatorname{Coker}(\varphi)$ are coherent.
(4) Given a short exact sequence of $\mathcal{O}_{X}$-modules $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ if two out of three are coherent so is the third.
(5) The category $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. In particular, the category of coherent modules is abelian and the inclusion functor $\operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is exact.

Proof. Condition (2) of Definition 17.12 .1 holds for any subsheaf of a coherent sheaf. Thus we get (1).
Assume the hypotheses of (2). Let us show that $\operatorname{Ker}(\varphi)$ is of finite type. Pick $x \in X$. Choose an open neighbourhood $U$ of $x$ in $X$ such that $\left.\mathcal{F}\right|_{U}$ is generated by $s_{1}, \ldots, s_{n}$. By Definition 17.12 .1 the kernel $\mathcal{K}$ of the induced map $\bigoplus_{i=1}^{n} \mathcal{O}_{U} \rightarrow \mathcal{G}$, $e_{i} \mapsto \varphi\left(s_{i}\right)$ is of finite type. Hence $\operatorname{Ker}(\varphi)$ which is the image of the composition $\mathcal{K} \rightarrow \bigoplus_{i=1}^{n} \mathcal{O}_{U} \rightarrow \mathcal{F}$ is of finite type.

Assume the hypotheses of (3). By (2) the kernel of $\varphi$ is of finite type and hence by (1) it is coherent.

With the same hypotheses let us show that $\operatorname{Coker}(\varphi)$ is coherent. Since $\mathcal{G}$ is of finite type so is $\operatorname{Coker}(\varphi)$. Let $U \subset X$ be open and let $\bar{s}_{i} \in \operatorname{Coker}(\varphi)(U), i=$ $1, \ldots, n$ be sections. We have to show that the kernel of the associated morphism $\bar{\Psi}: \bigoplus_{i=1}^{n} \mathcal{O}_{U} \rightarrow \operatorname{Coker}(\varphi)$ has finite type. There exists an open covering of $U$ such that on each open all the sections $\bar{s}_{i}$ lift to sections $s_{i}$ of $\mathcal{G}$. Hence we may assume this is the case over $U$. Thus $\bar{\Psi}$ lifts to $\Psi: \bigoplus_{i=1}^{n} \mathcal{O}_{U} \rightarrow \mathcal{G}$ Consider the following diagram

By the snake lemma we get a short exact sequence $0 \rightarrow \operatorname{Ker}(\Psi) \rightarrow \operatorname{Ker}(\bar{\Psi}) \rightarrow$ $\operatorname{Im}(\varphi) \rightarrow 0$. Hence by Lemma 17.9 .3 we see that $\operatorname{Ker}(\bar{\Psi})$ has finite type.

Proof of part (4). Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of $\mathcal{O}_{X^{-}}$ modules. By part (3) it suffices to prove that if $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ are coherent so is $\mathcal{F}_{2}$. By Lemma 17.9 .3 we see that $\mathcal{F}_{2}$ has finite type. Let $s_{1}, \ldots, s_{n}$ be finitely many local sections of $\mathcal{F}_{2}$ defined over a common open $U$ of $X$. We have to show that the module of relations $\mathcal{K}$ between them is of finite type. Consider the following commutative diagram

with obvious notation. By the snake lemma we get a short exact sequence $0 \rightarrow \mathcal{K} \rightarrow$ $\mathcal{K}_{3} \rightarrow \mathcal{F}_{1}$ where $\mathcal{K}_{3}$ is the module of relations among the images of the sections $s_{i}$ in $\mathcal{F}_{3}$. Since $\mathcal{F}_{3}$ is coherent we see that $\mathcal{K}_{3}$ is finite type. Since $\mathcal{F}_{1}$ is coherent we see that the image $\mathcal{I}$ of $\mathcal{K}_{3} \rightarrow \mathcal{F}_{1}$ is coherent. Hence $\mathcal{K}$ is the kernel of the map $\mathcal{K}_{3} \rightarrow \mathcal{I}$ between a finite type sheaf and a coherent sheaves and hence finite type by (2).

Proof of (5). This follows because (3) and (4) show that Homology, Lemma 12.9.3 applies.

01BZ Lemma 17.12.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Assume $\mathcal{O}_{X}$ is a coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is coherent if and only if it is of finite presentation.

Proof. Omitted.
01C0 Lemma 17.12.6. Let $X$ be a ringed space. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of $\mathcal{O}_{X}$-modules. Let $x \in X$. Assume $\mathcal{G}$ of finite type, $\mathcal{F}$ coherent and the map on stalks $\varphi_{x}: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ injective. Then there exists an open neighbourhood $x \in U \subset X$ such that $\left.\varphi\right|_{U}$ is injective.

Proof. Denote $\mathcal{K} \subset \mathcal{G}$ the kernel of $\varphi$. By Lemma 17.12 .4 we see that $\mathcal{K}$ is a finite type $\mathcal{O}_{X}$-module. Our assumption is that $\mathcal{K}_{x}=0$. By Lemma 17.9 .5 there exists an open neighbourhood $U$ of $x$ such that $\left.\mathcal{K}\right|_{U}=0$. Then $U$ works.

### 17.13. Closed immersions of ringed spaces

01 C 1 When do we declare a morphism of ringed spaces $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ to be a closed immersion?

Motivated by the example of a closed immersion of normal topological spaces (ringed with the sheaf of continuous functors), or differential manifolds (ringed with the sheaf of differentiable functions), it seems natural to assume at least:
(1) The map $i$ is a closed immersion of topological spaces.
(2) The associated map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. Denote the kernel by $\mathcal{I}$.

Already these conditions imply a number of pleasing results: For example we prove that the category of $\mathcal{O}_{Z}$-modules is equivalent to the category of $\mathcal{O}_{X}$-modules annihilated by $\mathcal{I}$ generalizing the result on abelian sheaves of Section 17.6

However, in the Stacks project we choose the definition that guarantees that if $i$ is a closed immersion and $\left(X, \mathcal{O}_{X}\right)$ is a scheme, then also $\left(Z, \mathcal{O}_{Z}\right)$ is a scheme. Moreover, in this situation we want $i_{*}$ and $i^{*}$ to provide an equivalence between the category of quasi-coherent $\mathcal{O}_{Z}$-modules and the category of quasi-coherent $\mathcal{O}_{X^{-}}$ modules annihilated by $\mathcal{I}$. A minimal condition is that $i_{*} \mathcal{O}_{Z}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. A good way to guarantee that $i_{*} \mathcal{O}_{Z}$ is a quasi-coherent $\mathcal{O}_{X^{-}}$ module is to assume that $\mathcal{I}$ is locally generated by sections. We can interpret this condition as saying " $\left(Z, \mathcal{O}_{Z}\right)$ is locally on $\left(X, \mathcal{O}_{X}\right)$ defined by setting some regular functions $f_{i}$, i.e., local sections of $\mathcal{O}_{X}$, equal to zero". This leads to the following definition.

01C2 Definition 17.13.1. A closed immersion of ringed space $\downarrow^{2}$ is a morphism $i$ : $\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ with the following properties:
(1) The map $i$ is a closed immersion of topological spaces.
(2) The associated map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. Denote the kernel by $\mathcal{I}$.
(3) The $\mathcal{O}_{X}$-module $\mathcal{I}$ is locally generated by sections.

Actually, this definition still does not guarantee that $i_{*}$ of a quasi-coherent $\mathcal{O}_{Z^{-}}$ module is a quasi-coherent $\mathcal{O}_{X}$-module. The problem is that it is not clear how to convert a local presentation of a quasi-coherent $\mathcal{O}_{Z}$-module into a local presentation for the pushforward. However, the following is trivial.

01C3 Lemma 17.13.2. Let $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be a closed immersion of locally ringed spaces. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{Z}$-module. Then $i_{*} \mathcal{F}$ is locally on $X$ the cokernel of a map of quasi-coherent $\mathcal{O}_{X}$-modules.

[^47]Proof. This is true because $i_{*} \mathcal{O}_{Z}$ is quasi-coherent by definition. And locally on $Z$ the sheaf $\mathcal{F}$ is a cokernel of a map between direct sums of copies of $\mathcal{O}_{Z}$. Moreover, any direct sum of copies of the the same quasi-coherent sheaf is quasi-coherent. And finally, $i_{*}$ commutes with arbitrary colimits, see Lemma 17.6.3. Some details omitted.

01C4 Lemma 17.13.3. Let $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be a morphism of ringed spaces. Assume $i$ is a homeomorphism onto a closed subset of $X$ and that $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. Let $\mathcal{F}$ be an $\mathcal{O}_{Z}$-module. Then $i_{*} \mathcal{F}$ is of finite type if and only if $\mathcal{F}$ is of finite type.

Proof. Suppose that $\mathcal{F}$ is of finite type. Pick $x \in X$. If $x \notin Z$, then $i_{*} \mathcal{F}$ is zero in a neighbourhood of $x$ and hence finitely generated in a neighbourhood of $x$. If $x=i(z)$, then choose an open neighbourhood $z \in V \subset Z$ and sections $s_{1}, \ldots, s_{n} \in \mathcal{F}(V)$ which generate $\mathcal{F}$ over $V$. Write $V=Z \cap U$ for some open $U \subset X$. Note that $U$ is a neighbourhood of $x$. Clearly the sections $s_{i}$ give sections $s_{i}$ of $i_{*} \mathcal{F}$ over $U$. The resulting map

$$
\left.\bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \longrightarrow i_{*} \mathcal{F}\right|_{U}
$$

is surjective by inspection of what it does on stalks (here we use that $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective). Hence $i_{*} \mathcal{F}$ is of finite type.
Conversely, suppose that $i_{*} \mathcal{F}$ is of finite type. Choose $z \in Z$. Set $x=i(z)$. By assumption there exists an open neighbourhood $U \subset X$ of $x$, and sections $s_{1}, \ldots, s_{n} \in\left(i_{*} \mathcal{F}\right)(U)$ which generate $i_{*} \mathcal{F}$ over $U$. Set $V=Z \cap U$. By definition of $i_{*}$ the sections $s_{i}$ correspond to sections $s_{i}$ of $\mathcal{F}$ over $V$. The resulting map

$$
\left.\bigoplus_{i=1, \ldots, n} \mathcal{O}_{V} \longrightarrow \mathcal{F}\right|_{V}
$$

is surjective by inspection of what it does on stalks. Hence $\mathcal{F}$ is of finite type.
08 KS Lemma 17.13.4. Let $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be a morphism of ringed spaces. Assume $i$ is a homeomorphism onto a closed subset of $X$ and $i^{\sharp}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. Denote $\mathcal{I} \subset \mathcal{O}_{X}$ the kernel of $i^{\sharp}$. The functor

$$
i_{*}: \operatorname{Mod}\left(\mathcal{O}_{Z}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)
$$

is exact, fully faithful, with essential image those $\mathcal{O}_{X}$-modules $\mathcal{G}$ such that $\mathcal{I G}=0$.
Proof. We claim that for a $\mathcal{O}_{Z}$-module $\mathcal{F}$ the canonical map

$$
i^{*} i_{*} \mathcal{F} \longrightarrow \mathcal{F}
$$

is an isomorphism. We check this on stalks. Say $z \in Z$ and $x=i(z)$. We have

$$
\left(i^{*} i_{*} \mathcal{F}\right)_{z}=\left(i_{*} \mathcal{F}\right)_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{Z, z}=\mathcal{F}_{z} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{Z, z}=\mathcal{F}_{z}
$$

by Sheaves, Lemma 6.26.4, the fact that $\mathcal{O}_{Z, z}$ is a quotient of $\mathcal{O}_{X, x}$, and Sheaves, Lemma 6.32.1. It follows that $i_{*}$ is fully faithful.

Let $\mathcal{G}$ be a $\mathcal{O}_{X}$-module with $\mathcal{I G}=0$. If $x \in X, x \notin i(Z)$, then $\mathcal{G}_{x}=0$ because $\mathcal{I}_{x}=\mathcal{O}_{X, x}$ in this case. Thus we see that $\mathcal{G}$ us supported on $Z$. By Lemma 17.6.1 we can write $\mathcal{G}=i_{*} \mathcal{F}$ for a unique abelian sheaf $\mathcal{F}$ on $Z$. Let $W \subset Z$ be open, $f \in \mathcal{O}_{Z}(W)$ and $s \in \mathcal{F}(W)$. We define $f s \in \mathcal{F}(W)$. Since $i^{\sharp}$ is surjective we can find opens $U_{j} \subset X$ such that $W=\bigcup i^{-1}\left(U_{j}\right)$ and $f \mid i^{-1}\left(U_{j}\right)$ is the image of $f_{j} \in \mathcal{O}_{X}\left(U_{j}\right)$. Note that $\left.s\right|_{i^{-1}\left(U_{j}\right)}$ is an element of $\mathcal{F}\left(i^{-1}\left(U_{j}\right)\right)=\mathcal{G}\left(U_{i}\right)$. Thus we
can form $s_{j}=f_{j} s \in \mathcal{F}\left(i^{-1}\left(U_{j}\right)\right)=\mathcal{G}\left(U_{i}\right)$. By our assumption that $\mathcal{I} \mathcal{G}=0$ the sections $s_{j}$ are independent of the choice of $f_{j}$ lifting $f \mid i^{-1}\left(U_{j}\right)$ and glue to a section $f s$ of $\mathcal{F}$ over $W$. In this way $\mathcal{F}$ becomes an $\mathcal{O}_{Z}$-module such that $\mathcal{G} \cong i_{*} \mathcal{F}$.

### 17.14. Locally free sheaves

Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Our conventions allow (some of) the stalks $\mathcal{O}_{X, x}$ to be the zero ring. This means we have to be a little careful when defining the rank of a locally free sheaf.

01C6 Definition 17.14.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules.
(1) We say $\mathcal{F}$ is locally free if for every point $x \in X$ there exists a set $I$ and an open neighbourhood $x \in U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is isomorphic to $\left.\bigoplus_{i \in I} \mathcal{O}_{X}\right|_{U}$ as an $\left.\mathcal{O}_{X}\right|_{U \text {-module. }}$
(2) We say $\mathcal{F}$ is finite locally free if we may choose the index sets $I$ to be finite.
(3) We say $\mathcal{F}$ is finite locally free of rank $r$ if we may choose the index sets $I$ to have cardinality $r$.

A finite direct sum of (finite) locally free sheaves is (finite) locally free. However, it may not be the case that an infinite direct sum of locally free sheaves is locally free.

01 C 7 Lemma 17.14.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ is locally free then it is quasi-coherent.

Proof. Omitted.
01C8 Lemma 17.14.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. If $\mathcal{G}$ is a locally free $\mathcal{O}_{Y}$-module, then $f^{*} \mathcal{G}$ is a locally free $\mathcal{O}_{X}$-module.

Proof. Omitted.
01C9 Lemma 17.14.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Suppose that the support of $\mathcal{O}_{X}$ is $X$, i.e., all stalk of $\mathcal{O}_{X}$ are nonzero rings. Let $\mathcal{F}$ be a locally free sheaf of $\mathcal{O}_{X}$-modules. There exists a locally constant function

$$
\operatorname{rank}_{\mathcal{F}}: X \longrightarrow\{0,1,2, \ldots\} \cup\{\infty\}
$$

such that for any point $x \in X$ the cardinality of any set I such that $\mathcal{F}$ is isomorphic to $\bigoplus_{i \in I} \mathcal{O}_{X}$ in a neighbourhood of $x$ is $\operatorname{rank}_{\mathcal{F}}(x)$.

Proof. Under the assumption of the lemma the cardinality of $I$ can be read off from the rank of the free module $\mathcal{F}_{x}$ over the nonzero ring $\mathcal{O}_{X, x}$, and it is constant in a neighbourhood of $x$.

089Q Lemma 17.14.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $r \geq 0$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of finite locally free $\mathcal{O}_{X}$-modules of rank $r$. Then $\varphi$ is an isomorphism if and only if $\varphi$ is surjective.
Proof. Assume $\varphi$ is surjective. Pick $x \in X$. There exists an open neighbourhood $U$ of $x$ such that both $\left.\mathcal{F}\right|_{U}$ and $\left.\mathcal{G}\right|_{U}$ are isomorphic to $\mathcal{O}_{U}^{\oplus r}$. Pick lifts of the free generators of $\left.\mathcal{G}\right|_{U}$ to obtain a map $\psi:\left.\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ such that $\left.\varphi\right|_{U} \circ \psi=\mathrm{id}$. Hence we conclude that the map $\Gamma(U, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{G})$ induced by $\varphi$ is surjective. Since both
$\Gamma(U, \mathcal{F})$ and $\Gamma(U, \mathcal{G})$ are isomorphic to $\Gamma\left(U, \mathcal{O}_{U}\right)^{\oplus r}$ as an $\Gamma\left(U, \mathcal{O}_{U}\right)$-module we may apply Algebra, Lemma 10.15 .4 to see that $\Gamma(U, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{G})$ is injective. This finishes the proof.

0 BCI Lemma 17.14.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. If all stalks $\mathcal{O}_{X, x}$ are local rings, then any direct summand of a finite locally free $\mathcal{O}_{X}$-module is finite locally free.

Proof. Assume $\mathcal{F}$ is a direct summand of the finite locally free $\mathcal{O}_{X}$-module $\mathcal{H}$. Let $x \in X$ be a point. Then $\mathcal{H}_{x}$ is a finite free $\mathcal{O}_{X, x}$-module. Because $\mathcal{O}_{X, x}$ is local, we see that $\mathcal{F}_{x} \cong \mathcal{O}_{X, x}^{\oplus r}$ for some $r$, see Algebra, Lemma 10.77.2. By Lemma 17.11.8 we see that $\mathcal{F}$ is free of rank $r$ in an open neighbourhood of $x$. (Note that $\mathcal{F}$ is of finite presentation as a summand of $\mathcal{H}$.)

### 17.15. Tensor product

01 CA Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. We have briefly discussed the tensor product in the setting of change of rings in Sheaves, Sections 6.6 and 6.20. In exactly the same way we define first the tensor product presheaf

$$
\mathcal{F} \otimes_{p, \mathcal{O}_{X}} \mathcal{G}
$$

as the rule which assigns to $U \subset X$ open the $\mathcal{O}_{X}(U)$-module $\mathcal{F}(U) \otimes_{\mathcal{O}_{X}(U)} \mathcal{G}(U)$. Having defined this we define the tensor product sheaf as the sheafification of the above:

$$
\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}=\left(\mathcal{F} \otimes_{p, \mathcal{O}_{X}} \mathcal{G}\right)^{\#}
$$

This can be characterized as the sheaf of $\mathcal{O}_{X}$-modules such that for any third sheaf of $\mathcal{O}_{X}$-modules $\mathcal{H}$ we have

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}, \mathcal{H}\right)=\operatorname{Bilin}_{\mathcal{O}_{X}}(\mathcal{F} \times \mathcal{G}, \mathcal{H})
$$

Here the right hand side indicates the set of bilinear maps of sheaves of $\mathcal{O}_{X}$-modules (definition omitted).

The tensor product of modules $M, N$ over a ring $R$ satisfies symmetry, namely $M \otimes_{R} N=N \otimes_{R} M$, hence the same holds for tensor products of sheaves of modules, i.e., we have

$$
\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}=\mathcal{G} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

functorial in $\mathcal{F}, \mathcal{G}$. And since tensor product of modules satisfies associativity we also get canonical functorial isomorphisms

$$
\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}\right) \otimes_{\mathcal{O}_{X}} \mathcal{H}=\mathcal{F} \otimes_{\mathcal{O}_{X}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} \mathcal{H}\right)
$$

functorial in $\mathcal{F}, \mathcal{G}$, and $\mathcal{H}$.
01CB Lemma 17.15.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. Let $x \in X$. There is a canonical isomorphism of $\mathcal{O}_{X, x}$-modules

$$
\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}\right)_{x}=\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{G}_{x}
$$

functorial in $\mathcal{F}$ and $\mathcal{G}$.
Proof. Omitted.
05NA Lemma 17.15.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\prime}, \mathcal{G}^{\prime}$ be presheaves of $\mathcal{O}_{X}$-modules with sheafifications $\mathcal{F}, \mathcal{G}$. Then $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}=\left(\mathcal{F}^{\prime} \otimes_{p, \mathcal{O}_{X}} \mathcal{G}^{\prime}\right)^{\#}$.
Proof. Omitted.

01CC Lemma 17.15.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{G}$ be an $\mathcal{O}_{X}$-module. If $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is an exact sequence of $\mathcal{O}_{X}$-modules then the induced sequence

$$
\mathcal{F}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{F}_{3} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow 0
$$

is exact.
Proof. This follows from the fact that exactness may be checked at stalks (Lemma 17.3.1), the description of stalks (Lemma 17.15.1) and the corresponding result for tensor products of modules (Algebra, Lemma 10.11.10).

01CD Lemma 17.15.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{Y}$-modules. Then $f^{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{Y}} \mathcal{G}\right)=f^{*} \mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}$ functorially in $\mathcal{F}$, $\mathcal{G}$.

Proof. Omitted.
01CE Lemma 17.15.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}, \mathcal{G}$ are locally generated by sections, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
(2) If $\mathcal{F}, \mathcal{G}$ are of finite type, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
(3) If $\mathcal{F}, \mathcal{G}$ are quasi-coherent, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
(4) If $\mathcal{F}, \mathcal{G}$ are of finite presentation, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
(5) If $\mathcal{F}$ is of finite presentation and $\mathcal{G}$ is coherent, then $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$ is coherent.
(6) If $\mathcal{F}, \mathcal{G}$ are coherent, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.
(7) If $\mathcal{F}, \mathcal{G}$ are locally free, so is $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$.

Proof. We first prove that the tensor product of locally free $\mathcal{O}_{X}$-modules is locally free. This follows if we show that $\left(\bigoplus_{i \in I} \mathcal{O}_{X}\right) \otimes_{\mathcal{O}_{X}}\left(\bigoplus_{j \in J} \mathcal{O}_{X}\right) \cong \bigoplus_{(i, j) \in I \times J} \mathcal{O}_{X}$. The sheaf $\bigoplus_{i \in I} \mathcal{O}_{X}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{i \in I} \mathcal{O}_{X}(U)$. Hence the tensor product is the sheaf associated to the presheaf

$$
U \longmapsto\left(\bigoplus_{i \in I} \mathcal{O}_{X}(U)\right) \otimes_{\mathcal{O}_{X}(U)}\left(\bigoplus_{j \in J} \mathcal{O}_{X}(U)\right)
$$

We deduce what we want since for any ring $R$ we have $\left(\bigoplus_{i \in I} R\right) \otimes_{R}\left(\bigoplus_{j \in J} R\right)=$ $\bigoplus_{(i, j) \in I \times J} R$.
If $\mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow 0$ is exact, then by Lemma 17.15 .3 the complex $\mathcal{F}_{2} \otimes \mathcal{G} \rightarrow$ $\mathcal{F}_{1} \otimes \mathcal{G} \rightarrow \mathcal{F} \otimes \mathcal{G} \rightarrow 0$ is exact. Using this we can prove (5). Namely, in this case there exists locally such an exact sequence with $\mathcal{F}_{i}, i=1,2$ finite free. Hence the two terms $\mathcal{F}_{2} \otimes \mathcal{G}$ are isomorphic to finite direct sums of $\mathcal{G}$. Since finite direct sums are coherent sheaves, these are coherent and so is the cokernel of the map, see Lemma 17.12 .4 .

And if also $\mathcal{G}_{2} \rightarrow \mathcal{G}_{1} \rightarrow \mathcal{G} \rightarrow 0$ is exact, then we see that

$$
\mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \mathcal{G}_{1} \oplus \mathcal{F}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{G}_{2} \rightarrow \mathcal{F}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{G}_{1} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow 0
$$

is exact. Using this we can for example prove (3). Namely, the assumption means that we can locally find presentations as above with $\mathcal{F}_{i}$ and $\mathcal{G}_{i}$ free $\mathcal{O}_{X}$-modules. Hence the displayed presentation is a presentation of the tensor product by free sheaves as well.

The proof of the other statements is omitted.

05NB Lemma 17.15.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. For any $\mathcal{O}_{X}$-module $\mathcal{F}$ the functor

$$
\operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right), \quad \mathcal{G} \longmapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}
$$

commutes with arbitrary colimits.
Proof. Let $I$ be a partially ordered set and let $\left\{\mathcal{G}_{i}\right\}$ be a system over $I$. Set $\mathcal{G}=\operatorname{colim}_{i} \mathcal{G}_{i}$. Recall that $\mathcal{G}$ is the sheaf associated to the presheaf $\mathcal{G}^{\prime}: U \mapsto$ $\operatorname{colim}_{i} \mathcal{G}_{i}(U)$, see Sheaves, Section 6.29 By Lemma 17.15 .2 the tensor product $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$ is the sheafification of the presheaf

$$
U \longmapsto \mathcal{F}(U) \otimes_{\mathcal{O}_{X}(U)} \operatorname{colim}_{i} \mathcal{G}_{i}(U)=\operatorname{colim}_{i} \mathcal{F}(U) \otimes_{\mathcal{O}_{X}(U)} \mathcal{G}_{i}(U)
$$

where the equality sign is Algebra, Lemma 10.11.9. Hence the lemma follows from the description of colimits in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$.

### 17.16. Flat modules

05 NC We can define flat modules exactly as in the case of modules over rings.
05 ND Definition 17.16.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. An $\mathcal{O}_{X}$-module $\mathcal{F}$ is flat if the functor

$$
\operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}
$$

is exact.
We can characterize flatness by looking at the stalks.
05NE Lemma 17.16.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. An $\mathcal{O}_{X}$-module $\mathcal{F}$ is flat if and only if the stalk $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{X, x}$-module for all $x \in X$.

Proof. Assume $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{X, x}$-module for all $x \in X$. In this case, if $\mathcal{G} \rightarrow \mathcal{H} \rightarrow \mathcal{K}$ is exact, then also $\mathcal{G} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{H} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{K} \otimes_{\mathcal{O}_{X}} \mathcal{F}$ is exact because we can check exactness at stalks and because tensor product commutes with taking stalks, see Lemma 17.15.1. Conversely, suppose that $\mathcal{F}$ is flat, and let $x \in X$. Consider the skyscraper sheaves $i_{x, *} M$ where $M$ is a $\mathcal{O}_{X, x}$-module. Note that

$$
M \otimes_{\mathcal{O}_{X, x}} \mathcal{F}_{x}=\left(i_{x, *} M \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)_{x}
$$

again by Lemma 17.15.1. Since $i_{x, *}$ is exact, we see that the fact that $\mathcal{F}$ is flat implies that $M \mapsto M \otimes_{\mathcal{O}_{X, x}} \mathcal{F}_{x}$ is exact. Hence $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{X, x}$-module.

Thus the following definition makes sense.
05NF Definition 17.16.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $x \in X$. An $\mathcal{O}_{X}$-module $\mathcal{F}$ is flat at $x$ if $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{X, x}$-module.

Hence we see that $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module if and only if it is flat at every point.
05 NG Lemma 17.16.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. A filtered colimit of flat $\mathcal{O}_{X}-$ modules is flat. A direct sum of flat $\mathcal{O}_{X}$-modules is flat.

Proof. This follows from Lemma 17.15.6, Lemma 17.15.1, Algebra, Lemma 10.8.9, and the fact that we can check exactness at stalks.

05 NH Lemma 17.16.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $U \subset X$ be open. The sheaf $j_{U!} \mathcal{O}_{U}$ is a flat sheaf of $\mathcal{O}_{X}$-modules.
Proof. The stalks of $j_{U!} \mathcal{O}_{U}$ are either zero or equal to $\mathcal{O}_{X, x}$. Apply Lemma 17.16.2.

05NI Lemma 17.16.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) Any sheaf of $\mathcal{O}_{X}$-modules is a quotient of a direct sum $\bigoplus j_{U_{i}}!\mathcal{O}_{U_{i}}$.
(2) Any $\mathcal{O}_{X}$-module is a quotient of a flat $\mathcal{O}_{X}$-module.

Proof. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. For every open $U \subset X$ and every $s \in \mathcal{F}(U)$ we get a morphism $j_{U!} \mathcal{O}_{U} \rightarrow \mathcal{F}$, namely the adjoint to the morphism $\left.\mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U}$, $1 \mapsto s$. Clearly the map

$$
\bigoplus_{(U, s)}{ }^{j_{U} \cup \mathcal{O}_{U}} \longrightarrow \mathcal{F}
$$

is surjective, and the source is flat by combining Lemmas 17.16.4 and 17.16.5.
05NJ Lemma 17.16.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let

$$
0 \rightarrow \mathcal{F}^{\prime \prime} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

be a short exact sequence of $\mathcal{O}_{X}$-modules. Assume $\mathcal{F}$ is flat. Then for any $\mathcal{O}_{X^{-}}$ module $\mathcal{G}$ the sequence

$$
0 \rightarrow \mathcal{F}^{\prime \prime} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}^{\prime} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow 0
$$

is exact.
Proof. Using that $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{X, x}$-module for every $x \in X$ and that exactness can be checked on stalks, this follows from Algebra, Lemma 10.38.12,

05NK Lemma 17.16.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let

$$
0 \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0} \rightarrow 0
$$

be a short exact sequence of $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}_{2}$ and $\mathcal{F}_{0}$ are flat so is $\mathcal{F}_{1}$.
(2) If $\mathcal{F}_{1}$ and $\mathcal{F}_{0}$ are flat so is $\mathcal{F}_{2}$.

Proof. Since exactness and flatness may be checked at the level of stalks this follows from Algebra, Lemma 10.38.13.

05NL Lemma 17.16.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let

$$
\ldots \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0} \rightarrow \mathcal{Q} \rightarrow 0
$$

be an exact complex of $\mathcal{O}_{X}$-modules. If $\mathcal{Q}$ and all $\mathcal{F}_{i}$ are flat $\mathcal{O}_{X}$-modules, then for any $\mathcal{O}_{X}$-module $\mathcal{G}$ the complex

$$
\ldots \rightarrow \mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{F}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{F}_{0} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{Q} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow 0
$$

is exact also.
Proof. Follows from Lemma 17.16 .7 by splitting the complex into short exact sequences and using Lemma 17.16 .8 to prove inductively that $\operatorname{Im}\left(\mathcal{F}_{i+1} \rightarrow \mathcal{F}_{i}\right)$ is flat.

The following lemma gives one direction of the equational criterion of flatness (Algebra, Lemma 10.38.11.

08BK Lemma 17.16.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a flat $\mathcal{O}_{X}$-module. Let $U \subset X$ be open and let

$$
\left.\mathcal{O}_{U} \xrightarrow{\left(f_{1}, \ldots, f_{n}\right)} \mathcal{O}_{U}^{\oplus n} \xrightarrow{\left(s_{1}, \ldots, s_{n}\right)} \mathcal{F}\right|_{U}
$$

be a complex of $\mathcal{O}_{U}$-modules. For every $x \in U$ there exists an open neighbourhood $V \subset U$ of $x$ and a factorization

$$
\left.\mathcal{O}_{V}^{\oplus n} \xrightarrow{A} \mathcal{O}_{V}^{\oplus m} \xrightarrow{\left(t_{1}, \ldots, t_{m}\right)} \mathcal{F}\right|_{V}
$$

of $\left.\left(s_{1}, \ldots, s_{n}\right)\right|_{V}$ such that $\left.A \circ\left(f_{1}, \ldots, f_{n}\right)\right|_{V}=0$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the sheaf of ideals generated by $f_{1}, \ldots, f_{n}$. Then $\sum f_{i} \otimes s_{i}$ is a section of $\left.\mathcal{I} \otimes \mathcal{O}_{U} \mathcal{F}\right|_{U}$ which maps to zero in $\left.\mathcal{F}\right|_{U}$. As $\left.\mathcal{F}\right|_{U}$ is flat the map $\left.\left.\mathcal{I} \otimes_{\mathcal{O}_{U}} \mathcal{F}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ is injective. Since $\left.\mathcal{I} \otimes_{\mathcal{O}_{U}} \mathcal{F}\right|_{U}$ is the sheaf associated to the presheaf tensor product, we see there exists an open neighbourhood $V \subset U$ of $x$ such that $\left.\left.\sum f_{i}\right|_{V} \otimes s_{i}\right|_{V}$ is zero in $\mathcal{I}(V) \otimes_{\mathcal{O}(V)} \mathcal{F}(V)$. Unwinding the definitions using Algebra, Lemma 10.106 .10 we find $t_{1}, \ldots, t_{m} \in \mathcal{F}(V)$ and $a_{i j} \in \mathcal{O}(V)$ such that $\left.\sum a_{i j} f_{i}\right|_{V}=0$ and $\left.s_{i}\right|_{V}=\sum a_{i j} t_{j}$.

08BL Lemma 17.16.11. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be locally of finite presentation and flat. Then $\mathcal{F}$ is locally a direct summand of a finite free $\mathcal{O}_{X}-$ module.

Proof. After replacing $X$ by the members of an open covering, we may assume there exists a presentation

$$
\mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{F} \rightarrow 0
$$

Let $x \in X$. By Lemma 17.16 .10 we can, after shrinking $X$ to an open neighbourhood of $x$, assume there exists a factorization

$$
\mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{O}_{X}^{\oplus n_{1}} \rightarrow \mathcal{F}
$$

such that the composition $\mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{O}_{X}^{\oplus n_{1}}$ annihilates the first summand of $\mathcal{O}_{X}^{\oplus r}$. Repeating this argument $r-1$ more times we obtain a factorization

$$
\mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{O}_{X}^{\oplus n_{r}} \rightarrow \mathcal{F}
$$

such that the composition $\mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{O}_{X}^{\oplus n_{r}}$ is zero. This means that the surjection $\mathcal{O}_{X}^{\oplus n_{r}} \rightarrow \mathcal{F}$ has a section and we win.

### 17.17. Flat morphisms of ringed spaces

02N2 The pointwise definition is motivated by Lemma 17.16 .2 and Definition 17.16 .3 above.

02N3 Definition 17.17.1. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $x \in X$. We say $f$ is said to be flat at $x$ if the map of rings $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is flat. We say $f$ is flat if $f$ is flat at every $x \in X$.

Consider the map of sheaves of rings $f^{\sharp}: f^{-1} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$. We see that the stalk at $x$ is the ring map $f_{x}^{\sharp}: \mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$. Hence $f$ is flat at $x$ if and only if $\mathcal{O}_{X}$ is flat at $x$ as an $f^{-1} \mathcal{O}_{Y}$-module. And $f$ is flat if and only if $\mathcal{O}_{X}$ is flat as an $f^{-1} \mathcal{O}_{Y}$-module. A very special case of a flat morphism is an open immersion.

02N4 Lemma 17.17.2. Let $f: X \rightarrow Y$ be a flat morphism of ringed spaces. Then the pullback functor $f^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is exact.

Proof. The functor $f^{*}$ is the composition of the exact functor $f^{-1}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow$ $\operatorname{Mod}\left(f^{-1} \mathcal{O}_{Y}\right)$ and the change of rings functor

$$
\operatorname{Mod}\left(f^{-1} \mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right), \quad \mathcal{F} \longmapsto \mathcal{F} \otimes_{f^{-1}} \mathcal{O}_{Y} \mathcal{O}_{X}
$$

Thus the result follows from the discussion following Definition 17.17.1.
08KT Definition 17.17.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules.
(1) We say that $\mathcal{F}$ is flat over $Y$ at a point $x \in X$ if the stalk $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{Y, f(x)}$-module.
(2) We say that $\mathcal{F}$ is flat over $Y$ if $\mathcal{F}$ is flat over $Y$ at every point $x$ of $X$.

With this definition we see that $\mathcal{F}$ is flat over $Y$ at $x$ if and only if $\mathcal{F}$ is flat at $x$ as an $f^{-1} \mathcal{O}_{Y}$-module because $\left(f^{-1} \mathcal{O}_{Y}\right)_{x}=\mathcal{O}_{Y, f(x)}$ by Sheaves, Lemma 6.21.5.

### 17.18. Symmetric and exterior powers

01 CF Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-algebra. We define the tensor algebra of $\mathcal{F}$ to be the sheaf of noncommutative $\mathcal{O}_{X}$-algebras

$$
\mathrm{T}(\mathcal{F})=\mathrm{T}_{\mathcal{O}_{X}}(\mathcal{F})=\bigoplus_{n \geq 0} \mathrm{~T}^{n}(\mathcal{F})
$$

Here $\mathrm{T}^{0}(\mathcal{F})=\mathcal{O}_{X}, \mathrm{~T}^{1}(\mathcal{F})=\mathcal{F}$ and for $n \geq 2$ we have

$$
\mathrm{T}^{n}(\mathcal{F})=\mathcal{F} \otimes_{\mathcal{O}_{X}} \ldots \otimes_{\mathcal{O}_{X}} \mathcal{F} \quad(n \text { factors })
$$

We define $\wedge(\mathcal{F})$ to be the quotient of $\mathrm{T}(\mathcal{F})$ by the two sided ideal generated by local sections $s \otimes s$ of $\mathrm{T}^{2}(\mathcal{F})$ where $s$ is a local section of $\mathcal{F}$. This is called the exterior algebra of $\mathcal{F}$. Similarly, we define $\operatorname{Sym}(\mathcal{F})$ to be the quotient of $\mathrm{T}(\mathcal{F})$ by the two sided ideal generated by local sections of the form $s \otimes t-t \otimes s$ of $\mathrm{T}^{2}(\mathcal{F})$.
Both $\wedge(\mathcal{F})$ and $\operatorname{Sym}(\mathcal{F})$ are graded $\mathcal{O}_{X}$-algebras, with grading inherited from $\mathrm{T}(\mathcal{F})$. Moreover $\operatorname{Sym}(\mathcal{F})$ is commutative, and $\wedge(\mathcal{F})$ is graded commutative.
01 CG Lemma 17.18.1. In the situation described above. The sheaf $\wedge^{n} \mathcal{F}$ is the sheafification of the presheaf

$$
U \longmapsto \wedge_{\mathcal{O}_{X}(U)}^{n}(\mathcal{F}(U))
$$

See Algebra, Section 10.12. Similarly, the sheaf $S y m^{n} \mathcal{F}$ is the sheafification of the presheaf

$$
U \longmapsto \operatorname{Sym}_{\mathcal{O}_{X}(U)}^{n}(\mathcal{F}(U))
$$

Proof. Omitted. It may be more efficient to define $\operatorname{Sym}(\mathcal{F})$ and $\wedge(\mathcal{F})$ in this way instead of the method given above.

01 CH Lemma 17.18.2. In the situation described above. Let $x \in X$. There are canonical isomorphisms of $\mathcal{O}_{X, x}$-modules $T(\mathcal{F})_{x}=T\left(\mathcal{F}_{x}\right)$, $\operatorname{Sym}(\mathcal{F})_{x}=\operatorname{Sym}\left(\mathcal{F}_{x}\right)$, and $\wedge(\mathcal{F})_{x}=\wedge\left(\mathcal{F}_{x}\right)$.
Proof. Clear from Lemma 17.18.1 above, and Algebra, Lemma 10.12.4.
01CI Lemma 17.18.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{Y}$-modules. Then $f^{*} T(\mathcal{F})=T\left(f^{*} \mathcal{F}\right)$, and similarly for the exterior and symmetric algebras associated to $\mathcal{F}$.

Proof. Omitted.

01CJ Lemma 17.18.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow 0$ be an exact sequence of sheaves of $\mathcal{O}_{X}$-modules. For each $n \geq 1$ there is an exact sequence

$$
\mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \operatorname{Sym}^{n-1}\left(\mathcal{F}_{1}\right) \rightarrow \operatorname{Sym}^{n}\left(\mathcal{F}_{1}\right) \rightarrow \operatorname{Sym}^{n}(\mathcal{F}) \rightarrow 0
$$

and similarly an exact sequence

$$
\mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \wedge^{n-1}\left(\mathcal{F}_{1}\right) \rightarrow \wedge^{n}\left(\mathcal{F}_{1}\right) \rightarrow \wedge^{n}(\mathcal{F}) \rightarrow 0
$$

Proof. See Algebra, Lemma 10.12.2.
01CK Lemma 17.18.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}$ is locally generated by sections, then so is each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$.
(2) If $\mathcal{F}$ is of finite type, then so is each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$.
(3) If $\mathcal{F}$ is of finite presentation, then so is each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$.
(4) If $\mathcal{F}$ is coherent, then for $n>0$ each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$ is coherent.
(5) If $\mathcal{F}$ is quasi-coherent, then so is each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$.
(6) If $\mathcal{F}$ is locally free, then so is each $T^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$, and $\operatorname{Sym}^{n}(\mathcal{F})$.

Proof. These statements for $\mathrm{T}^{n}(\mathcal{F})$ follow from Lemma 17.15.5.
Statements (1) and (2) follow from the fact that $\wedge^{n}(\mathcal{F})$ and $\operatorname{Sym}^{n}(\mathcal{F})$ are quotients of $\mathrm{T}^{n}(\mathcal{F})$.

Statement (6) follows from Algebra, Lemma 10.12.1.
For (3) and (5) we will use Lemma 17.18 .4 above. By locally choosing a presentation $\mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow 0$ with $\mathcal{F}_{i}$ free, or finite free and applying the lemma we see that $\operatorname{Sym}^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$ has a similar presentation; here we use (6) and Lemma 17.15.5.
To prove (4) we will use Algebra, Lemma 10.12 .3 . We may localize on $X$ and assume that $\mathcal{F}$ is generated by a finite set $\left(s_{i}\right)_{i \in I}$ of global sections. The lemma mentioned above combined with Lemma 17.18.1 above implies that for $n \geq 2$ there exists an exact sequence

$$
\bigoplus_{j \in J} \mathrm{~T}^{n-2}(\mathcal{F}) \rightarrow \mathrm{T}^{n}(\mathcal{F}) \rightarrow \operatorname{Sym}^{n}(\mathcal{F}) \rightarrow 0
$$

where the index set $J$ is finite. Now we know that $\mathrm{T}^{n-2}(\mathcal{F})$ is finitely generated and hence the image of the first arrow is a coherent subsheaf of $\mathrm{T}^{n}(\mathcal{F})$, see Lemma 17.12.4. By that same lemma we conclude that $\operatorname{Sym}^{n}(\mathcal{F})$ is coherent.

01CL Lemma 17.18.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}$ is quasi-coherent, then so is each $T(\mathcal{F}), \wedge(\mathcal{F})$, and $\operatorname{Sym}(\mathcal{F})$.
(2) If $\mathcal{F}$ is locally free, then so is each $T(\mathcal{F}), \wedge(\mathcal{F})$, and $\operatorname{Sym}(\mathcal{F})$.

Proof. It is not true that an infinite direct sum $\bigoplus \mathcal{G}_{i}$ of locally free modules is locally free, or that an infinite direct sum of quasi-coherent modules is quasicoherent. The problem is that given a point $x \in X$ the open neighbourhoods $U_{i}$ of $x$ on which $\mathcal{G}_{i}$ becomes free (resp. has a suitable presentation) may have an intersection which is not an open neighbourhood of $x$. However, in the proof of Lemma 17.18 .5 we saw that once a suitable open neighbourhood for $\mathcal{F}$ has been chosen, then this open neighbourhood works for each of the sheaves $\mathrm{T}^{n}(\mathcal{F}), \wedge^{n}(\mathcal{F})$ and $\operatorname{Sym}^{n}(\mathcal{F})$. The lemma follows.

### 17.19. Internal Hom

01 CM Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. Consider the rule

$$
U \longmapsto \operatorname{Hom}_{\left.\mathcal{O}_{X}\right|_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)
$$

It follows from the discussion in Sheaves, Section 6.33 that this is a sheaf of abelian groups. In addition, given an element $\varphi \in \operatorname{Hom}_{\left.\mathcal{O}_{X}\right|_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)$ and a section $f \in \mathcal{O}_{X}(U)$ then we can define $f \varphi \in \operatorname{Hom}_{\left.\mathcal{O}_{X}\right|_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)$ by either precomposing with multiplication by $f$ on $\left.\mathcal{F}\right|_{U}$ or postcomposing with multiplication by $f$ on $\left.\mathcal{G}\right|_{U}$ (it gives the same result). Hence we in fact get a sheaf of $\mathcal{O}_{X}$-modules. We will denote this sheaf $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$. There is a canonical "evaluation" morphism

$$
\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}
$$

For every $x \in X$ there is also a canonical morphism

$$
\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})_{x} \rightarrow \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, \mathcal{G}_{x}\right)
$$

which is rarely an isomorphism.
01CN Lemma 17.19.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$, $\mathcal{H}$ be $\mathcal{O}_{X}$-modules. There is a canonical isomorphism

$$
\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}, \mathcal{H}\right) \longrightarrow \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{H})\right)
$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular, to give a morphism $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{H}$ is the same as giving a morphism $\mathcal{F} \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{H})$.

Proof. This is the analogue of Algebra, Lemma 10.11.8. The proof is the same, and is omitted.

01 CO Lemma 17.19.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow 0$ is an exact sequence of $\mathcal{O}_{X}$-modules, then
$0 \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}_{1}, \mathcal{G}\right) \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}_{2}, \mathcal{G}\right)$ is exact.
(2) If $0 \rightarrow \mathcal{G} \rightarrow \mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ is an exact sequence of $\mathcal{O}_{X}$-modules, then

$$
0 \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{G}_{1}\right) \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{G}_{2}\right)
$$

is exact.
Proof. Omitted.
01 CP Lemma 17.19.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ is finitely presented then the canonical map

$$
\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})_{x} \rightarrow \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, \mathcal{G}_{x}\right)
$$

is an isomorphism.
Proof. By localizing on $X$ we may assume that $\mathcal{F}$ has a presentation

$$
\bigoplus_{j=1, \ldots, m} \mathcal{O}_{X} \longrightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{X} \rightarrow \mathcal{F} \rightarrow 0
$$

By Lemma 17.19 .2 this gives an exact sequence $0 \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \rightarrow \bigoplus_{i=1, \ldots, n} \mathcal{G} \longrightarrow$ $\bigoplus_{j=1, \ldots, m} \mathcal{G}$. Taking stalks we get an exact sequence $0 \rightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})_{x} \rightarrow$ $\bigoplus_{i=1, \ldots, n} \mathcal{G}_{x} \longrightarrow \bigoplus_{j=1, \ldots, m} \mathcal{G}_{x}$ and the result follows since $\mathcal{F}_{x}$ sits in an exact
sequence $\bigoplus_{j=1, \ldots, m} \mathcal{O}_{X, x} \longrightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{X, x} \rightarrow \mathcal{F}_{x} \rightarrow 0$ which induces the exact sequence $0 \rightarrow \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, \mathcal{G}_{x}\right) \rightarrow \bigoplus_{i=1, \ldots, n} \mathcal{G}_{x} \longrightarrow \bigoplus_{j=1, \ldots, m} \mathcal{G}_{x}$ which is the same as the one above.

01 CQ Lemma 17.19.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ is finitely presented then the sheaf $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is locally a kernel of a map between finite direct sums of copies of $\mathcal{G}$. In particular, if $\mathcal{G}$ is coherent then $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is coherent too.

Proof. The first assertion we saw in the proof of Lemma 17.19.3. And the result for coherent sheaves then follows from Lemma 17.12.4.

0A6F Lemma 17.19.5. Let $X$ be a topological space. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. Then we have

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\mathcal{F}_{\mathcal{O}_{1}}, \mathcal{G}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{F}, \mathcal{H o m}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{G}\right)\right)
$$

bifunctorially in $\mathcal{F} \in \operatorname{Mod}\left(\mathcal{O}_{2}\right)$ and $\mathcal{G} \in \operatorname{Mod}\left(\mathcal{O}_{1}\right)$.
Proof. Omitted. This is the analogue of Algebra, Lemma 10.13 .4 and is proved in exactly the same way.

### 17.20. Koszul complexes

062J We suggest first reading the section on Koszul complexes in More on Algebra, Section 15.22 We define the Koszul complex in the category of $\mathcal{O}_{X}$-modules as follows.

062 K Definition 17.20.1. Let $X$ be a ringed space. Let $\varphi: \mathcal{E} \rightarrow \mathcal{O}_{X}$ be an $\mathcal{O}_{X}$-module map. The Koszul complex $K_{\bullet}(\varphi)$ associated to $\varphi$ is the sheaf of commutative differential graded algebras defined as follows:
(1) the underlying graded algebra is the exterior algebra $K_{\bullet}(\varphi)=\wedge(\mathcal{E})$,
(2) the differential $d: K_{\bullet}(\varphi) \rightarrow K_{\bullet}(\varphi)$ is the unique derivation such that $d(e)=\varphi(e)$ for all local sections $e$ of $\mathcal{E}=K_{1}(\varphi)$.

Explicitly, if $e_{1} \wedge \ldots \wedge e_{n}$ is a wedge product of local sections of $\mathcal{E}$, then

$$
d\left(e_{1} \wedge \ldots \wedge e_{n}\right)=\sum_{i=1, \ldots, n}(-1)^{i+1} \varphi\left(e_{i}\right) e_{1} \wedge \ldots \wedge \widehat{e_{i}} \wedge \ldots \wedge e_{n} .
$$

It is straightforward to see that this gives a well defined derivation on the tensor algebra, which annihilates $e \wedge e$ and hence factors through the exterior algebra.

062L Definition 17.20.2. Let $X$ be a ringed space and let $f_{1}, \ldots, f_{n} \in \Gamma\left(X, \mathcal{O}_{X}\right)$. The Koszul complex on $f_{1}, \ldots, f_{r}$ is the Koszul complex associated to the map $\left(f_{1}, \ldots, f_{n}\right): \mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{O}_{X}$. Notation $K_{\bullet}\left(\mathcal{O}_{X}, f_{1}, \ldots, f_{n}\right)$, or $K_{\bullet}\left(\mathcal{O}_{X}, f_{\bullet}\right)$.
Of course, given an $\mathcal{O}_{X}$-module map $\varphi: \mathcal{E} \rightarrow \mathcal{O}_{X}$, if $\mathcal{E}$ is finite locally free, then $K_{\bullet}(\varphi)$ is locally on $X$ isomorphic to a Koszul complex $K_{\bullet}\left(\mathcal{O}_{X}, f_{1}, \ldots, f_{n}\right)$.

### 17.21. Invertible modules

01 CR Similarly to the case of modules over rings (More on Algebra, Section 15.83) we have the following definition.

01CS Definition 17.21.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. An invertible $\mathcal{O}_{X}$-module is a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{L}$ such that the functor

$$
\operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right), \quad \mathcal{F} \longmapsto \mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

is an equivalence of categories. We say that $\mathcal{L}$ is trivial if it is isomorphic as an $\mathcal{O}_{X}$-module to $\mathcal{O}_{X}$.

Lemma 17.21 .4 below explains the relationship with locally free modules of rank 1.
0 B 8 K Lemma 17.21.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{L}$ be an $\mathcal{O}_{X}$-module. Equivalent are
(1) $\mathcal{L}$ is invertible, and
(2) there exists an $\mathcal{O}_{X}$-module $\mathcal{N}$ such that $\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N} \cong \mathcal{O}_{X}$.

In this case $\mathcal{L}$ is locally a direct summand of a finite free $\mathcal{O}_{X}$-module and the module $\mathcal{N}$ in (3) is isomorphic to $\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right)$.
Proof. Assume (1). Then the functor $-\otimes_{\mathcal{O}_{X}} \mathcal{L}$ is essentially surjective, hence there exists an $\mathcal{O}_{X}$-module $\mathcal{N}$ as in (2). If (2) holds, then the functor $-\otimes_{\mathcal{O}_{X}} \mathcal{N}$ is a quasi-inverse to the functor $-\otimes_{\mathcal{O}_{X}} \mathcal{L}$ and we see that (1) holds.

Assume (1) and (2) hold. Denote $\psi: \mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N} \rightarrow \mathcal{O}_{X}$ the given isomorphism. Let $x \in X$. Choose an open neighbourhood $U$ an integer $n \geq 1$ and sections $s_{i} \in \mathcal{L}(U)$, $t_{i} \in \mathcal{N}(U)$ such that $\psi\left(\sum s_{i} \otimes t_{i}\right)=1$. Consider the isomorphisms

$$
\left.\left.\left.\left.\left.\mathcal{L}\right|_{U} \rightarrow \mathcal{L}\right|_{U} \otimes_{\mathcal{O}_{U}} \mathcal{L}\right|_{U} \otimes_{\mathcal{O}_{U}} \mathcal{N}\right|_{U} \rightarrow \mathcal{L}\right|_{U}
$$

where the first arrow sends $x$ to $\sum s_{i} \otimes s \otimes t_{i}$ and the second arrow sends $s \otimes s^{\prime} \otimes t$ to $\psi\left(s^{\prime} \otimes t\right) s$. We conclude that $x \mapsto \sum \psi\left(s \otimes t_{i}\right) s_{i}$ is an automorphism of $\left.\mathcal{L}\right|_{U}$. This automorphism factors as

$$
\left.\left.\mathcal{L}\right|_{U} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{L}\right|_{U}
$$

where the first arrow is given by $s \mapsto\left(\psi\left(s \otimes t_{1}\right), \ldots, \psi\left(s \otimes t_{n}\right)\right)$ and the second arrow by $\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum a_{i} s_{i}$. In this way we conclude that $\left.\mathcal{L}\right|_{U}$ is a direct summand of a finite free $\mathcal{O}_{U}$-module.
Assume (1) and (2) hold. Consider the evaluation map

$$
\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{O}_{X}
$$

To finish the proof of the lemma we will show this is an isomorphism by checking it induces isomorphisms on stalks. Let $x \in X$. Since we know (by the previous paragraph) that $\mathcal{L}$ is a finitely presented $\mathcal{O}_{X}$-module we can use Lemma 17.19 .3 to see that it suffices to show that

$$
\mathcal{L}_{x} \otimes_{\mathcal{O}_{X, x}} \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{L}_{x}, \mathcal{O}_{X, x}\right) \longrightarrow \mathcal{O}_{X, x}
$$

is an isomorphism. Since $\mathcal{L}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{N}_{x}=\left(\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N}\right)_{x}=\mathcal{O}_{X, x}$ (Lemma 17.15.1) the desired result follows from More on Algebra, Lemma 15.83.2.

0B8L Lemma 17.21.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback $f^{*} \mathcal{L}$ of an inverible $\mathcal{O}_{Y}$-module is invertible.

Proof. By Lemma 17.21 .2 there exists an $\mathcal{O}_{Y}$-module $\mathcal{N}$ such that $\mathcal{L} \otimes \mathcal{O}_{Y} \mathcal{N} \cong \mathcal{O}_{Y}$. Pulling back we get $f^{*} \mathcal{L} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{N} \cong \mathcal{O}_{X}$ by Lemma 17.15.4. Thus $f^{*} \mathcal{L}$ is invertible by Lemma 17.21 .2 .

0B8M Lemma 17.21.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Any locally free $\mathcal{O}_{X}$-module of rank 1 is invertible. If all stalks $\mathcal{O}_{X, x}$ are local rings, then the converse holds as well (but in general this is not the case).

Proof. The parenthetical statement follows by considering a one point space $X$ with sheaf of rings $\mathcal{O}_{X}$ given by a ring $R$. Then invertible $\mathcal{O}_{X}$-modules correspond to invertible $R$-modules, hence as soon as $\operatorname{Pic}(R)$ is not the trivial group, then we get an example.

Assume $\mathcal{L}$ is locally free of rank 1 and consider the evaluation map

$$
\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{O}_{X}
$$

Looking over an open covering trivialization $\mathcal{L}$, we see that this map is an isomorphism. Hence $\mathcal{L}$ is invertible by Lemma 17.21 .2 .

Assume all stalks $\mathcal{O}_{X, x}$ are local rings and $\mathcal{L}$ invertible. In the proof of Lemma 17.21 .2 we have seen that $\mathcal{L}_{x}$ is an invertible $\mathcal{O}_{X, x}$-module for all $x \in X$. Since $\mathcal{O}_{X, x}$ is local, we see that $\mathcal{L}_{x} \cong \mathcal{O}_{X, x}$ (More on Algebra, Section 15.83). Since $\mathcal{L}$ is of finite presentation by Lemma 17.21 .2 we conclude that $\mathcal{L}$ is locally free of rank 1 by Lemma 17.11.8.

01CT Lemma 17.21.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) If $\mathcal{L}, \mathcal{N}$ are invertible $\mathcal{O}_{X}$-modules, then so is $\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N}$.
(2) If $\mathcal{L}$ is an invertible $\mathcal{O}_{X}$-module, then so is $\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right)$ and the evaluation map $\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right) \rightarrow \mathcal{O}_{X}$ is an isomorphism.

Proof. Part (1) is clear from the definition and part (2) follows from Lemma 17.21 .2 and its proof.

01 CU Definition 17.21.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given an invertible sheaf $\mathcal{L}$ on $X$ and $n \in \mathbf{Z}$ we define the $n$th tensor power $\mathcal{L}^{\otimes n}$ of $\mathcal{L}$ as the image of $\mathcal{O}_{X}$ under applying the equivalence $\mathcal{F} \mapsto \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}$ exactly $n$ times.

This makes sense also for negative $n$ as we've defined an invertible $\mathcal{O}_{X}$-module as one for which tensoring is an equivalence. More explicitly, we have

$$
\mathcal{L}^{\otimes n}=\left\{\begin{array}{ccc}
\mathcal{O}_{X} & \text { if } & n=0 \\
\mathcal{H} o m_{\mathcal{O}_{X}}\left(\mathcal{L}, \mathcal{O}_{X}\right) & \text { if } & n=-1 \\
\mathcal{L} \otimes_{\mathcal{O}_{X}} \cdots \otimes_{\mathcal{O}_{X}} \mathcal{L} & \text { if } & n>0 \\
\mathcal{L}^{\otimes-1} \otimes_{\mathcal{O}_{X}} \cdots \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes-1} & \text { if } & n<-1
\end{array}\right.
$$

see Lemma 17.21.5. With this definition we have canonical isomorphisms $\mathcal{L}^{\otimes n} \otimes_{\mathcal{O}_{X}}$ $\mathcal{L}^{\otimes m} \rightarrow \mathcal{L}^{\otimes n+m}$, and these isomorphisms satisfy a commutativity and an associativity constraint (formulation omitted).

Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. We can define a Z-graded ring structure on $\bigoplus \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ by mapping $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ and $t \in \Gamma\left(X, \mathcal{L}^{\otimes m}\right)$ to the section corresponding to $s \otimes t$ in $\Gamma\left(X, \mathcal{L}^{\otimes n+m}\right)$. We omit the verification that this defines a commutative and associative ring with 1. However, by our conventions in Algebra, Section 10.55 a graded ring has no nonzero elements in negative degrees. This leads to the following definition.

01CV Definition 17.21.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given an invertible sheaf $\mathcal{L}$ on $X$ we define the associated graded ring to be

$$
\Gamma_{*}(X, \mathcal{L})=\bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{L}^{\otimes n}\right)
$$

Given a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we set

$$
\Gamma_{*}(X, \mathcal{L}, \mathcal{F})=\bigoplus_{n \in \mathbf{Z}} \Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)
$$

which we think of as a graded $\Gamma_{*}(X, \mathcal{L})$-module.
We often write simply $\Gamma_{*}(\mathcal{L})$ and $\Gamma_{*}(\mathcal{F})$ (although this is ambiguous if $\mathcal{F}$ is invertible). The multiplication of $\Gamma_{*}(\mathcal{L})$ on $\Gamma_{*}(\mathcal{F})$ is defined using the isomorphisms above. If $\gamma: \mathcal{F} \rightarrow \mathcal{G}$ is a $\mathcal{O}_{X}$-module map, then we get an $\Gamma_{*}(\mathcal{L})$-module homomorphism $\gamma: \Gamma_{*}(\mathcal{F}) \rightarrow \Gamma_{*}(\mathcal{G})$. If $\alpha: \mathcal{L} \rightarrow \mathcal{N}$ is an $\mathcal{O}_{X}$-module map between invertible $\mathcal{O}_{X}$-modules, then we obtain a graded ring homomorphism $\Gamma_{*}(\mathcal{L}) \rightarrow \Gamma_{*}(\mathcal{N})$. If $f:\left(Y, \mathcal{O}_{Y}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ is a morphism of ringed spaces and if $\mathcal{L}$ is invertible on $X$, then we get an invertible sheaf $f^{*} \mathcal{L}$ on $Y$ (Lemma 17.21.3) and an induced homomorphism of graded rings

$$
f^{*}: \Gamma_{*}(X, \mathcal{L}) \longrightarrow \Gamma_{*}\left(Y, f^{*} \mathcal{L}\right)
$$

Furthermore, there are some compatibilities between the constructions above whose statements we omit.

01CW Lemma 17.21.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. There exists a set of invertible modules $\left\{\mathcal{L}_{i}\right\}_{i \in I}$ such that each invertible module on $X$ is isomorphic to exactly one of the $\mathcal{L}_{i}$.

Proof. Recall that any invertible $\mathcal{O}_{X}$-module is locally a direct summand of a finite free $\mathcal{O}_{X}$-module, see Lemma 17.21 .2 For each open covering $\mathcal{U}: X=\bigcup_{j \in J} U_{j}$ and map $r: J \rightarrow \mathbf{N}$ consider the sheaves of $\mathcal{O}_{X}$-modules $\mathcal{F}$ such that $\mathcal{F}_{j}=\left.\mathcal{F}\right|_{U_{j}}$ is a direct summand of $\mathcal{O}_{U_{j}}^{\oplus r(j)}$. The collection of isomorphism classes of $\mathcal{F}_{j}$ is a set, because $\operatorname{Hom}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U}^{\oplus r}, \mathcal{O}_{U}^{\oplus r}\right)$ is a set. The sheaf $\mathcal{F}$ is gotten by glueing $\mathcal{F}_{j}$, see Sheaves, Section 6.33. Note that the collection of all glueing data forms a set. The collection of all coverings $\mathcal{U}: X=\bigcup_{j \in J} U_{i}$ where $J \rightarrow \mathcal{P}(X), j \mapsto U_{j}$ is injective forms a set as well. For each covering there is a set of maps $r: J \rightarrow \mathbf{N}$. Hence the collection of all $\mathcal{F}$ forms a set.

This lemma says roughly speaking that the collection of isomorphism classes of invertible sheaves forms a set. Lemma 17.21 .5 says that tensor product defines the structure of an abelian group on this set.

01CX Definition 17.21.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The Picard group $\operatorname{Pic}(X)$ of $X$ is the abelian group whose elements are isomorphism classes of invertible $\mathcal{O}_{X}$-modules, with addition corresponding to tensor product.

01CY Lemma 17.21.10. Let $X$ be a ringed space. Assume that each stalk $\mathcal{O}_{X, x}$ is a local ring with maximal ideal $\mathfrak{m}_{x}$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. For any section $s \in \Gamma(X, \mathcal{L})$ the set

$$
X_{s}=\left\{x \in X \mid \text { image } s \notin \mathfrak{m}_{x} \mathcal{L}_{x}\right\}
$$

is open in $X$. The map $s:\left.\mathcal{O}_{X_{s}} \rightarrow \mathcal{L}\right|_{X_{s}}$ is an isomorphism, and there exists $a$ section $s^{\prime}$ of $\mathcal{L}^{\otimes-1}$ over $X_{s}$ such that $s^{\prime}\left(\left.s\right|_{X_{s}}\right)=1$.

Proof. Suppose $x \in X_{s}$. We have an isomorphism

$$
\mathcal{L}_{x} \otimes_{\mathcal{O}_{X, x}}\left(\mathcal{L}^{\otimes-1}\right)_{x} \longrightarrow \mathcal{O}_{X, x}
$$

by Lemma 17.21.5. Both $\mathcal{L}_{x}$ and $\left(\mathcal{L}^{\otimes-1}\right)_{x}$ are free $\mathcal{O}_{X, x}$-modules of rank 1 . We conclude from Algebra, Nakayama's Lemma 10.19.1 that $s_{x}$ is a basis for $\mathcal{L}_{x}$. Hence there exists a basis element $t_{x} \in\left(\mathcal{L}^{\otimes-1}\right)_{x}$ such that $s_{x} \otimes t_{x}$ maps to 1 . Choose an open neighbourhood $U$ of $x$ such that $t_{x}$ comes from a section $t$ of $\left(\mathcal{L}^{\otimes-1}\right)_{x}$ over $U$ and such that $s \otimes t$ maps to $1 \in \mathcal{O}_{X}(U)$. Clearly, for every $x^{\prime} \in U$ we see that $s$ generates the module $\mathcal{L}_{x^{\prime}}$. Hence $U \subset X_{s}$. This proves that $X_{s}$ is open. Moreover, the section $t$ constructed over $U$ above is unique, and hence these glue to give te section $s^{\prime}$ of the lemma.

It is also true that, given a morphism of locally ringed spaces $f: Y \rightarrow X$ (see Schemes, Definition 25.2.1) that the inverse image $f^{-1}\left(X_{s}\right)$ is equal to $Y_{f^{*} s}$, where $f^{*} s \in \Gamma\left(Y, f^{*} \mathcal{L}\right)$ is the pullback of $s$.

### 17.22. Rank and determinant

0 B 37 Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Consider the category $\mathcal{C}$ of finite locally free $\mathcal{O}_{X^{-}}$ modules. This is an exact category (see Injectives, Remark 19.9.6) whose admissible epimorphisms are surjections and whose admissible monomorphisms are kernels of surjections. Moreover, there is a set of isomorphism classes of objects of $\mathcal{C}$ (proof omitted). Thus we can form the Grothendieck $K$-group $K(\mathcal{C})$, which is often denoted $K_{0}^{\text {naive }}(X)$. Explicitly, in this case $K_{0}^{\text {naive }}(X)$ is the abelian group generated by $[\mathcal{E}]$ for $\mathcal{E}$ a finite locally free $\mathcal{O}_{X}$-module, subject to the relations

$$
\left[\mathcal{E}^{\prime}\right]=[\mathcal{E}]+\left[\mathcal{E}^{\prime \prime}\right]
$$

whenever there is a short exact sequence $0 \rightarrow \mathcal{E}^{\prime} \rightarrow \mathcal{E} \rightarrow \mathcal{E}^{\prime \prime} \rightarrow 0$ of finite locally free $\mathcal{O}_{X}$-modules.
Ranks. Given a finite locally free $\mathcal{O}_{X}$-module $\mathcal{E}$, the rank is a locally constant function

$$
r=r_{\mathcal{E}}: X \longrightarrow \mathbf{Z}_{\geq 0}, \quad x \longmapsto \operatorname{rank}_{\mathcal{O}_{X, x}} \mathcal{E}_{x}
$$

This makes sense as $\mathcal{E}_{x} \cong \mathcal{O}_{X, x}^{\oplus r(x)}$ and this uniquely determines $r(x)$. By definition of locally free modules the function $r$ is locally constant. If $0 \rightarrow \mathcal{E}^{\prime} \rightarrow \mathcal{E} \rightarrow \mathcal{E}^{\prime \prime} \rightarrow 0$ is a short exact sequence of finite locally free $\mathcal{O}_{X}$-modules, then $r_{\mathcal{E}}=r_{\mathcal{E}^{\prime}}+r_{\mathcal{E}^{\prime \prime}}$, Thus the rank defines a homomorphism

$$
K_{0}^{\text {naive }}(X) \longrightarrow \operatorname{Map}_{\text {cont }}(X, \mathbf{Z}), \quad[\mathcal{E}] \longmapsto r_{\mathcal{E}}
$$

Determinants. Given a finite locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ we obtain a disjoint union decomposition

$$
X=X_{0} \amalg X_{1} \amalg X_{2} \amalg \ldots
$$

with $X_{i}$ open and closed, such that $\mathcal{E}$ is finite locally free of rank $i$ on $X_{i}$ (this is exactly the same as saying the $r_{\mathcal{E}}$ is locally constant). In this case we $\operatorname{define} \operatorname{det}(\mathcal{E})$ as the invertible sheaf on $X$ which is equal to $\wedge^{i}\left(\left.\mathcal{E}\right|_{X_{i}}\right)$ on $X_{i}$ for all $i \geq 0$. Since the decomposition above is disjoint, there are no glueing conditions to check. By Lemma 17.22 .1 below this defines a homomorphism

$$
\operatorname{det}: K_{0}^{\text {naive }}(X) \longrightarrow \operatorname{Pic}(X), \quad[\mathcal{E}] \longmapsto \operatorname{det}(\mathcal{E})
$$

of abelian groups.

0B38 Lemma 17.22.1. Let $X$ be a ringed space. Let $0 \rightarrow \mathcal{E}^{\prime} \rightarrow \mathcal{E} \rightarrow \mathcal{E}^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite locally free $\mathcal{O}_{X}$-modules, Then there is a canonical isomorphism

$$
\operatorname{det}\left(\mathcal{E}^{\prime}\right) \otimes_{\mathcal{O}_{X}} \operatorname{det}\left(\mathcal{E}^{\prime \prime}\right) \longrightarrow \operatorname{det}(\mathcal{E})
$$

of $\mathcal{O}_{X}$-modules.
Proof. We can decompose $X$ into disjoint open and closed subsets such that both $\mathcal{E}^{\prime}$ and $\mathcal{E}^{\prime \prime}$ have constant rank on them. Thus we reduce to the case where $\mathcal{E}^{\prime}$ and $\mathcal{E}^{\prime \prime}$ have constant rank, say $r^{\prime}$ and $r^{\prime \prime}$. In this situation we define

$$
\wedge^{r^{\prime}}\left(\mathcal{E}^{\prime}\right) \otimes_{\mathcal{O}_{X}} \wedge^{r^{\prime \prime}}\left(\mathcal{E}^{\prime \prime}\right) \longrightarrow \wedge^{r^{\prime}+r^{\prime \prime}}(\mathcal{E})
$$

as follows. Given local sections $s_{1}^{\prime}, \ldots, s_{r^{\prime}}^{\prime}$ of $\mathcal{E}^{\prime}$ and local sections $s_{1}^{\prime \prime}, \ldots, s_{r^{\prime \prime}}^{\prime \prime}$ of $\mathcal{E}^{\prime \prime}$ we map

$$
s_{1}^{\prime} \wedge \ldots \wedge s_{r^{\prime}}^{\prime} \otimes s_{1}^{\prime \prime} \wedge \ldots \wedge s_{r^{\prime \prime}}^{\prime \prime} \quad \text { to } \quad s_{1}^{\prime} \wedge \ldots \wedge s_{r^{\prime}}^{\prime} \wedge \tilde{s}_{1}^{\prime \prime} \wedge \ldots \wedge \tilde{s}_{r^{\prime \prime}}^{\prime \prime}
$$

where $\tilde{s}_{i}^{\prime \prime}$ is a local lift of the section $s_{i}^{\prime \prime}$ to a section of $\mathcal{E}$. We omit the details.

### 17.23. Localizing sheaves of rings

01 CZ Let $X$ be a topological space and let $\mathcal{O}_{X}$ be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_{X}$ be a presheaf of sets contained in $\mathcal{O}_{X}$. Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_{X}(U)$ is a multiplicative subset, see Algebra, Definition 10.9.1. In this case we can consider the presheaf of rings

$$
\mathcal{S}^{-1} \mathcal{O}_{X}: U \longmapsto \mathcal{S}(U)^{-1} \mathcal{O}_{X}(U) .
$$

The restriction mapping sends the section $f / s, f \in \mathcal{O}_{X}(U), s \in \mathcal{S}(U)$ to $\left(\left.f\right|_{V}\right) /\left(\left.s\right|_{V}\right)$ if $V \subset U$ are opens of $X$.

01D0 Lemma 17.23.1. Let $X$ be a topological space and let $\mathcal{O}_{X}$ be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_{X}$ be a pre-sheaf of sets contained in $\mathcal{O}_{X}$. Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_{X}(U)$ is a multiplicative subset.
(1) There is a map of presheaves of rings $\mathcal{O}_{X} \rightarrow \mathcal{S}^{-1} \mathcal{O}_{X}$ such that every local section of $\mathcal{S}$ maps to an invertible section of $\mathcal{O}_{X}$.
(2) For any homomorphism of presheaves of rings $\mathcal{O}_{X} \rightarrow \mathcal{A}$ such that each local section of $\mathcal{S}$ maps to an invertible section of $\mathcal{A}$ there exists a unique factorization $\mathcal{S}^{-1} \mathcal{O}_{X} \rightarrow \mathcal{A}$.
(3) For any $x \in X$ we have

$$
\left(\mathcal{S}^{-1} \mathcal{O}_{X}\right)_{x}=\mathcal{S}_{x}^{-1} \mathcal{O}_{X, x}
$$

(4) The sheafification $\left(\mathcal{S}^{-1} \mathcal{O}_{X}\right)^{\#}$ is a sheaf of rings with a map of sheaves of rings $\left(\mathcal{O}_{X}\right)^{\#} \rightarrow\left(\mathcal{S}^{-1} \mathcal{O}_{X}\right)^{\#}$ which is universal for maps of $\left(\mathcal{O}_{X}\right)^{\#}$ into sheaves of rings such that each local section of $\mathcal{S}$ maps to an invertible section.
(5) For any $x \in X$ we have

$$
\left(\mathcal{S}^{-1} \mathcal{O}_{X}\right)_{x}^{\#}=\mathcal{S}_{x}^{-1} \mathcal{O}_{X, x}
$$

Proof. Omitted.

Let $X$ be a topological space and let $\mathcal{O}_{X}$ be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_{X}$ be a presheaf of sets contained in $\mathcal{O}_{X}$. Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_{X}(U)$ is a multiplicative subset. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{X}$-modules In this case we can consider the presheaf of $\mathcal{S}^{-1} \mathcal{O}_{X}$-modules

$$
\mathcal{S}^{-1} \mathcal{F}: U \longmapsto \mathcal{S}(U)^{-1} \mathcal{F}(U)
$$

The restriction mapping sends the section $t / s, t \in \mathcal{F}(U), s \in \mathcal{S}(U)$ to $\left(\left.t\right|_{V}\right) /\left(\left.s\right|_{V}\right)$ if $V \subset U$ are opens of $X$.

01D1 Lemma 17.23.2. Let $X$ be a topological space. Let $\mathcal{O}_{X}$ be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_{X}$ be a pre-sheaf of sets contained in $\mathcal{O}_{X}$. Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_{X}(U)$ is a multiplicative subset. For any presheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we have

$$
\mathcal{S}^{-1} \mathcal{F}=\mathcal{S}^{-1} \mathcal{O}_{X} \otimes_{p, \mathcal{O}_{X}} \mathcal{F}
$$

(see Sheaves, Section 6.6 for notation) and if $\mathcal{F}$ and $\mathcal{O}_{X}$ are sheaves then

$$
\left(\mathcal{S}^{-1} \mathcal{F}\right)^{\#}=\left(\mathcal{S}^{-1} \mathcal{O}_{X}\right)^{\#} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

(see Sheaves, Section 6.20 for notation).
Proof. Omitted.

### 17.24. Modules of differentials

08RL In this section we briefly explain how to define the module of relative differentials for a morphism of ringed spaces. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.130).

01UN Definition 17.24.1. Let $X$ be a topological space. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. Let $\mathcal{F}$ be an $\mathcal{O}_{2}$-module. A $\mathcal{O}_{1}$-derivation or more precisely a $\varphi$-derivation into $\mathcal{F}$ is a map $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ which is additive, annihilates the image of $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$, and satisfies the Leibniz rule

$$
D(a b)=a D(b)+D(a) b
$$

for all $a, b$ local sections of $\mathcal{O}_{2}$ (wherever they are both defined). We denote $\operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)$ the set of $\varphi$-derivations into $\mathcal{F}$.

This is the sheaf theoretic analogue of Algebra, Definition 17.24.1. Given a derivation $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ as in the definition the map on global sections

$$
D: \Gamma\left(X, \mathcal{O}_{2}\right) \longrightarrow \Gamma(X, \mathcal{F})
$$

is a $\Gamma\left(X, \mathcal{O}_{1}\right)$-derivation as in the algebra definition. Note that if $\alpha: \mathcal{F} \rightarrow \mathcal{G}$ is a map of $\mathcal{O}_{2}$-modules, then there is an induced map

$$
\operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right) \longrightarrow \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{G}\right)
$$

given by the rule $D \mapsto \alpha \circ D$. In other words we obtain a functor.
08RM Lemma 17.24.2. Let $X$ be a topological space. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. The functor

$$
\operatorname{Mod}\left(\mathcal{O}_{2}\right) \longrightarrow A b, \quad \mathcal{F} \longmapsto \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)
$$

is representable.

Proof. This is proved in exactly the same way as the analogous statement in algebra. During this proof, for any sheaf of sets $\mathcal{F}$ on $X$, let us denote $\mathcal{O}_{2}[\mathcal{F}]$ the sheafification of the presheaf $U \mapsto \mathcal{O}_{2}(U)[\mathcal{F}(U)]$ where this denotes the free $\mathcal{O}_{1}(U)$ module on the set $\mathcal{F}(U)$. For $s \in \mathcal{F}(U)$ we denote $[s]$ the corresponding section of $\mathcal{O}_{2}[\mathcal{F}]$ over $U$. If $\mathcal{F}$ is a sheaf of $\mathcal{O}_{2}$-modules, then there is a canonical map

$$
c: \mathcal{O}_{2}[\mathcal{F}] \longrightarrow \mathcal{F}
$$

which on the presheaf level is given by the rule $\sum f_{s}[s] \mapsto \sum f_{s} s$. We will employ the short hand $[s] \mapsto s$ to describe this map and similarly for other maps below. Consider the map of $\mathcal{O}_{2}$-modules

08RN

$$
\begin{array}{ccc}
\mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right] \oplus \mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right] \oplus \mathcal{O}_{2}\left[\mathcal{O}_{1}\right] & \longrightarrow & \mathcal{O}_{2}\left[\mathcal{O}_{2}\right] \\
{[(a, b)] \oplus[(f, g)] \oplus[h]} & \longmapsto & {[a+b]-[a]-[b]+}  \tag{17.24.2.1}\\
& & {[f g]-g[f]-f[g]+} \\
& & {[\varphi(h)]}
\end{array}
$$

with short hand notation as above. Set $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ equal to the cokernel of this map. Then it is clear that there exists a map of sheaves of sets

$$
\mathrm{d}: \mathcal{O}_{2} \longrightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}
$$

mapping a local section $f$ to the image of $[f]$ in $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$. By construction d is a $\mathcal{O}_{1}$-derivation. Next, let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{2}$-modules and let $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ be a $\mathcal{O}_{1}$-derivation. Then we can consider the $\mathcal{O}_{2}$-linear map $\mathcal{O}_{2}\left[\mathcal{O}_{2}\right] \rightarrow \mathcal{F}$ which sends $[g]$ to $D(g)$. It follows from the definition of a derivation that this map annihilates sections in the image of the map 17.24.2.1 and hence defines a map

$$
\alpha_{D}: \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \longrightarrow \mathcal{F}
$$

Since it is clear that $D=\alpha_{D} \circ \mathrm{~d}$ the lemma is proved.
08RP Definition 17.24.3. Let $X$ be a topological space. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings on $X$. The module of differentials of $\varphi$ is the object representing the functor $\mathcal{F} \mapsto \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)$ which exists by Lemma 17.24 .2 , It is denoted $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$, and the universal $\varphi$-derivation is denoted d: $\mathcal{O}_{2} \rightarrow \overline{\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}}$.

Note that $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the cokernel of the map 17.24 .2 .1 of $\mathcal{O}_{2}$-modules. Moreover the map d is described by the rule that $\mathrm{d} f$ is the image of the local section $[f]$.

08TD Lemma 17.24.4. Let $X$ be a topological space. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings on $X$. Then $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the sheaf associated to the presheaf $U \mapsto \Omega_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)}$.

Proof. Consider the map 17.24.2.1. There is a similar map of presheaves whose value on the open $U$ is

$$
\mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U) \times \mathcal{O}_{2}(U)\right] \oplus \mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U) \times \mathcal{O}_{2}(U)\right] \oplus \mathcal{O}_{2}(U)\left[\mathcal{O}_{1}(U)\right] \longrightarrow \mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U)\right]
$$

The cokernel of this map has value $\Omega_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)}$ over $U$ by the construction of the module of differentials in Algebra, Definition 10.130.2. On the other hand, the sheaves in 17.24 .2 .1 are the sheafifications of the presheaves above. Thus the result follows as sheafification is exact.

08RQ Lemma 17.24.5. Let $X$ be a topological space. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. For $U \subset X$ open there is a canonical isomorphism

$$
\Omega_{\mathcal{O}_{2} /\left.\mathcal{O}_{1}\right|_{U}}=\Omega_{\left(\left.\mathcal{O}_{2}\right|_{U}\right) /\left(\left.\mathcal{O}_{1}\right|_{U}\right)}
$$

compatible with universal derivations.
Proof. Holds because $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the cokernel of the map 17.24.2.1.
08RR Lemma 17.24.6. Let $f: Y \rightarrow X$ be a continuous map of topological spaces. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings on $X$. Then there is a canonical identification $f^{-1} \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}=\Omega_{f^{-1} \mathcal{O}_{2} / f^{-1} \mathcal{O}_{1}}$ compatible with universal derivations.
Proof. This holds because the sheaf $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the cokernel of the map 17.24.2.1 and a similar statement holds for $\Omega_{f^{-1} \mathcal{O}_{2} / f^{-1} \mathcal{O}_{1}}$, because the functor $f^{-1}$ is exact, and because $f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{2}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{2}\right], f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{2} \times\right.$ $\left.f^{-1} \mathcal{O}_{2}\right]$, and $f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{1}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{1}\right]$.

08 TE Lemma 17.24.7. Let $X$ be a topological space. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings on $X$. Let $x \in X$. Then we have $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}, x}=\Omega_{\mathcal{O}_{2, x} / \mathcal{O}_{1, x}}$.
Proof. This is a special case of Lemma 17.24 .6 for the inclusion map $\{x\} \rightarrow X$. An alternative proof is the use Lemma 17.24 .4 Sheaves, Lemma 6.17.2 and Algebra, Lemma 10.130 .4

08RS Lemma 17.24.8. Let $X$ be a topological space. Let

be a commutative diagram of sheaves of rings on $X$. The map $\mathcal{O}_{2} \rightarrow \mathcal{O}_{2}^{\prime}$ composed with the map d: $\mathcal{O}_{2}^{\prime} \rightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}^{\prime}}$ is a $\mathcal{O}_{1}$-derivation. Hence we obtain a canonical map of $\mathcal{O}_{2}$-modules $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \rightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}^{\prime}}$. It is uniquely characterized by the property that $d(f)$ mapsto $d(\varphi(f))$ for any local section $f$ of $\mathcal{O}_{2}$. In this way $\Omega_{-/-}$becomes a functor on the category of arrows of sheaves of rings.

Proof. This lemma proves itself.
08 TF Lemma 17.24.9. In Lemma 17.24 .8 suppose that $\mathcal{O}_{2} \rightarrow \mathcal{O}_{2}^{\prime}$ is surjective with kernel $\mathcal{I} \subset \mathcal{O}_{2}$ and assume that $\mathcal{O}_{1}=\mathcal{O}_{1}$. Then there is a canonical exact sequence of $\mathcal{O}_{2}^{\prime}$-modules

$$
\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \otimes_{\mathcal{O}_{2}} \mathcal{O}_{2}^{\prime} \longrightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}} \longrightarrow 0
$$

The leftmost map is characterized by the rule that a local section $f$ of $\mathcal{I}$ maps to $d f \otimes 1$.

Proof. For a local section $f$ of $\mathcal{I}$ denote $\bar{f}$ the image of $f$ in $\mathcal{I} / \mathcal{I}^{2}$. To show that the map $\bar{f} \mapsto \mathrm{~d} f \otimes 1$ is well defined we just have to check that $\mathrm{d} f_{1} f_{2} \otimes 1=0$ if $f_{1}, f_{2}$ are local sections of $\mathcal{I}$. And this is clear from the Leibniz rule $\mathrm{d} f_{1} f_{2} \otimes 1=$ $\left(f_{1} \mathrm{~d} f_{2}+f_{2} \mathrm{~d} f_{1}\right) \otimes 1=\mathrm{d} f_{2} \otimes f_{1}+\mathrm{d} f_{2} \otimes f_{1}=0$. A similar computation show this map is $\mathcal{O}_{2}^{\prime}=\mathcal{O}_{2} / \mathcal{I}$-linear. The map on the right is the one from Lemma 17.24.8. To see that the sequence is exact, we can check on stalks (Lemma 17.3.1). By Lemma 17.24 .7 this follows from Algebra, Lemma 10.130 .9 .

08RT Definition 17.24.10. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$ be a morphism of ringed spaces.
(1) Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. An $S$-derivation into $\mathcal{F}$ is a $f^{-1} \mathcal{O}_{S}$-derivation, or more precisely a $f^{\sharp}$-derivation in the sense of Definition 17.24.1. We denote $\operatorname{Der}_{S}\left(\mathcal{O}_{X}, \mathcal{F}\right)$ the set of $S$-derivations into $\mathcal{F}$.
(2) The sheaf of differentials $\Omega_{X / S}$ of $X$ over $S$ is the module of differentials $\Omega_{\mathcal{O}_{X} / f^{-1} \mathcal{O}_{S}}$ endowed with its universal $S$-derivation $\mathrm{d}_{X / S}: \mathcal{O}_{X} \rightarrow \Omega_{X / S}$.
Here is a particular situation where derivations come up naturally.
01UP Lemma 17.24.11. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(S, \mathcal{O}_{S}\right)$ be a morphism of ringed spaces. Consider a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

Here $\mathcal{A}$ is a sheaf of $f^{-1} \mathcal{O}_{S}$-algebras, $\pi: \mathcal{A} \rightarrow \mathcal{O}_{X}$ is a surjection of sheaves of $f^{-1} \mathcal{O}_{S^{-}}$-algebras, and $\mathcal{I}=\operatorname{Ker}(\pi)$ is its kernel. Assume $\mathcal{I}$ an ideal sheaf with square zero in $\mathcal{A}$. So $\mathcal{I}$ has a natural structure of an $\mathcal{O}_{X}$-module. A section $s: \mathcal{O}_{X} \rightarrow \mathcal{A}$ of $\pi$ is a $f^{-1} \mathcal{O}_{S}$-algebra map such that $\pi \circ s=i d$. Given any section $s: \mathcal{O}_{X} \rightarrow \mathcal{A}$ of $\pi$ and any $S$-derivation $D: \mathcal{O}_{X} \rightarrow \mathcal{I}$ the map

$$
s+D: \mathcal{O}_{X} \rightarrow \mathcal{A}
$$

is a section of $\pi$ and every section $s^{\prime}$ is of the form $s+D$ for a unique $S$-derivation D.

Proof. Recall that the $\mathcal{O}_{X}$-module structure on $\mathcal{I}$ is given by $h \tau=\tilde{h} \tau$ (multiplication in $\mathcal{A}$ ) where $h$ is a local section of $\mathcal{O}_{X}$, and $\tilde{h}$ is a local lift of $h$ to a local section of $\mathcal{A}$, and $\tau$ is a local section of $\mathcal{I}$. In particular, given $s$, we may use $\tilde{h}=s(h)$. To verify that $s+D$ is a homomorphism of sheaves of rings we compute

$$
\begin{aligned}
(s+D)(a b) & =s(a b)+D(a b) \\
& =s(a) s(b)+a D(b)+D(a) b \\
& =s(a) s(b)+s(a) D(b)+D(a) s(b) \\
& =(s(a)+D(a))(s(b)+D(b))
\end{aligned}
$$

by the Leibniz rule. In the same manner one shows $s+D$ is a $f^{-1} \mathcal{O}_{S^{-}}$algebra map because $D$ is an $S$-derivation. Conversely, given $s^{\prime}$ we set $D=s^{\prime}-s$. Details omitted.

08 RU Lemma 17.24.12. Let

be a commutative diagram of ringed spaces.
(1) The canonical map $\mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X^{\prime}}$ composed with $f_{*} d_{X^{\prime} / S^{\prime}}: f_{*} \mathcal{O}_{X^{\prime}} \rightarrow$ $f_{*} \Omega_{X^{\prime} / S^{\prime}}$ is a $S$-derivation and we obtain a canonical map of $\mathcal{O}_{X}$-modules $\Omega_{X / S} \rightarrow f_{*} \Omega_{X^{\prime} / S^{\prime}}$.
(2) The commutative diagram

induces by Lemmas 17.24.6 and 17.24 .8 a canonical map $f^{-1} \Omega_{X / S} \rightarrow$ $\Omega_{X^{\prime} / S^{\prime}}$.
These two maps correspond (via adjointness of $f_{*}$ and $f^{*}$ and via $f^{*} \Omega_{X / S}=$ $f^{-1} \Omega_{X / S} \otimes_{f^{-1}} \mathcal{O}_{X} \mathcal{O}_{X^{\prime}}$ and Sheaves, Lemma 6.20.2) to the same $\mathcal{O}_{X^{\prime}}$-module homomorphism

$$
c_{f}: f^{*} \Omega_{X / S} \longrightarrow \Omega_{X^{\prime} / S^{\prime}}
$$

which is uniquely characterized by the property that $f^{*} d_{X / S}\left(\right.$ a) mapsto $d_{X^{\prime} / S^{\prime}}\left(f^{*} a\right)$ for any local section $a$ of $\mathcal{O}_{X}$.

Proof. Omitted.
01UW Lemma 17.24.13. Let

be a commutative diagram of ringed spaces. With notation as in Lemma 17.24.12 we have

$$
c_{f \circ g}=c_{g} \circ g^{*} c_{f}
$$

as maps $(f \circ g)^{*} \Omega_{X / S} \rightarrow \Omega_{X^{\prime \prime} / S^{\prime \prime}}$.
Proof. Omitted.

### 17.25. The naive cotangent complex

08TG This section is the analogue of Algebra, Section 10.132 for morphisms of ringed spaces. We urge the reader to read that section first.

Let $X$ be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. In this section, for any sheaf of sets $\mathcal{E}$ on $X$ we denote $\mathcal{A}[\mathcal{E}]$ the sheafification of the presheaf $U \mapsto \mathcal{A}(U)[\mathcal{E}(U)]$. Here $\mathcal{A}(U)[\mathcal{E}(U)]$ denotes the polynomial algebra over $\mathcal{A}(U)$ whose variables correspond to the elements of $\mathcal{E}(U)$. We denote $[e] \in$ $\mathcal{A}(U)[\mathcal{E}(U)]$ the variable corresponding to $e \in \mathcal{E}(U)$. There is a canonical surjection of $\mathcal{A}$-algebras
08TH (17.25.0.1)

$$
\mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{B}, \quad[b] \longmapsto b
$$

whose kernel we denote $\mathcal{I} \subset \mathcal{A}[\mathcal{B}]$. It is a simple observation that $\mathcal{I}$ is generated by the local sections $[b]\left[b^{\prime}\right]-\left[b b^{\prime}\right]$ and $[a]-a$. According to Lemma 17.24 .9 there is a canonical map

08 TI (17.25.0.2)

$$
\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}
$$

whose cokernel is canonically isomorphic to $\Omega_{\mathcal{B} / \mathcal{A}}$.
08TJ Definition 17.25.1. Let $X$ be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. The naive cotangent complex $N L_{\mathcal{B} / \mathcal{A}}$ is the chain complex (17.25.0.2)

$$
N L_{\mathcal{B} / \mathcal{A}}=\left(\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}\right)
$$

with $\mathcal{I} / \mathcal{I}^{2}$ placed in (homological) degree 1 and $\Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$ placed in degree 0 .

This construction satisfies a functoriality similar to that discussed in Lemma 17.24 .8 for modules of differentials. Namely, given a commutative diagram

08TK
(17.25.1.1)

of sheaves of rings on $X$ there is a canonical $\mathcal{B}$-linear map of complexes

$$
N L_{\mathcal{B} / \mathcal{A}} \longrightarrow N L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}
$$

Namely, the maps in the commutative diagram give rise to a canonical map $\mathcal{A}[\mathcal{B}] \rightarrow$ $\mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right]$ which maps $\mathcal{I}$ into $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right] \rightarrow \mathcal{B}^{\prime}\right)$. Thus a map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}$ and a map between modules of differentials, which together give the desired map between the naive cotangent complexes.
We can choose a different presentation of $\mathcal{B}$ as a quotient of a polynomial algebra over $\mathcal{A}$ and still obtain the same object of $D(\mathcal{B})$. To explain this, suppose that $\mathcal{E}$ is a sheaves of sets on $X$ and $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ a map of sheaves of sets. Then we obtain an $\mathcal{A}$-algebra homomorphism $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$. Assume this map is surjective, and let $\mathcal{J} \subset \mathcal{A}[\mathcal{E}]$ be the kernel. Set

$$
N L(\alpha)=\left(\mathcal{J} / \mathcal{J}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}\right)
$$

Here is the result.
08TL Lemma 17.25.2. In the situation above there is a canonical isomorphism $N L(\alpha)=$ $N L_{\mathcal{B} / \mathcal{A}}$ in $D(\mathcal{B})$.

Proof. Observe that $N L_{\mathcal{B} / \mathcal{A}}=N L\left(\mathrm{id}_{\mathcal{B}}\right)$. Thus it suffices to show that given two maps $\alpha_{i}: \mathcal{E}_{i} \rightarrow \mathcal{B}$ as above, there is a canonical quasi-isomorphism $N L\left(\alpha_{1}\right)=$ $N L\left(\alpha_{2}\right)$ in $D(\mathcal{B})$. To see this set $\mathcal{E}=\mathcal{E}_{1} \amalg \mathcal{E}_{2}$ and $\alpha=\alpha_{1} \amalg \alpha_{2}: \mathcal{E} \rightarrow \mathcal{B}$. Set $\mathcal{J}_{i}=\operatorname{Ker}\left(\mathcal{A}\left[\mathcal{E}_{i}\right] \rightarrow \mathcal{B}\right)$ and $\mathcal{J}=\operatorname{Ker}(\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B})$. We obtain maps $\mathcal{A}\left[\mathcal{E}_{i}\right] \rightarrow \mathcal{A}[\mathcal{E}]$ which send $\mathcal{J}_{i}$ into $\mathcal{J}$. Thus we obtain canonical maps of complexes

$$
N L\left(\alpha_{i}\right) \longrightarrow N L(\alpha)
$$

and it suffices to show these maps are quasi-isomorphism. To see this it suffices to check on stalks (Lemma 17.3.1). Here by Lemma 17.24 .7 we see the result holds by Algebra, Lemma 10.132.2.
08TM Lemma 17.25.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $Y$. Then $f^{-1} N L_{\mathcal{B} / \mathcal{A}}=$ $N L_{f^{-1} \mathcal{B} / f^{-1} \mathcal{A}}$.
Proof. Omitted. Hint: Use Lemma 17.24.6.
The cotangent complex of a morphism of ringed spaces is defined in terms of the cotangent complex we defined above.

08TN Definition 17.25.4. The naive cotangent complex $N L_{f}=N L_{X / Y}$ of a morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ is $N L_{\mathcal{O}_{X} / f^{-1} \mathcal{O}_{Y}}$.

## CHAPTER 18

## Modules on Sites

### 18.1. Introduction

03A5 In this document we work out basic notions of sheaves of modules on ringed topoi or ringed sites. We first work out some basic facts on abelian sheaves. After this we introduce ringed sites and ringed topoi. We work through some of the very basic notions on (pre)sheaves of $\mathcal{O}$-modules, analogous to the material on (pre)sheaves of $\mathcal{O}$-modules in the chapter on sheaves on spaces. Having done this, we duplicate much of the discussion in the chapter on sheaves of modules (see Modules, Section 17.1. Basic references are Ser55b, DG67] and AGV71.

### 18.2. Abelian presheaves

03A6 Let $\mathcal{C}$ be a category. Abelian presheaves were introduced in Sites, Sections 7.2 and 7.7 and discussed a bit more in Sites, Section 7.43 . We will follow the convention of this last reference, in that we think of an abelian presheaf as a presheaf of sets endowed with addition rules on all sets of sections compatible with the restriction mappings. Recall that the category of abelian presheaves on $\mathcal{C}$ is denoted $\operatorname{PAb}(\mathcal{C})$.

The category $\operatorname{PAb}(\mathcal{C})$ is abelian as defined in Homology, Definition 12.5.1. Given a map of presheaves $\varphi: \mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ the kernel of $\varphi$ is the abelian presheaf $U \mapsto$ $\operatorname{Ker}\left(\mathcal{G}_{1}(U) \rightarrow \mathcal{G}_{2}(U)\right)$ and the cokernel of $\varphi$ is the presheaf $U \mapsto \operatorname{Coker}\left(\mathcal{G}_{1}(U) \rightarrow\right.$ $\left.\mathcal{G}_{2}(U)\right)$. Since the category of abelian groups is abelian it follows that Coim $=\operatorname{Im}$ because this holds over each $U$. A sequence of abelian presheaves

$$
\mathcal{G}_{1} \longrightarrow \mathcal{G}_{2} \longrightarrow \mathcal{G}_{3}
$$

is exact if and only if $\mathcal{G}_{1}(U) \rightarrow \mathcal{G}_{2}(U) \rightarrow \mathcal{G}_{3}(U)$ is an exact sequence of abelian groups for all $U \in \operatorname{Ob}(\mathcal{C})$. We leave the verifications to the reader.

03CL Lemma 18.2.1. Let $\mathcal{C}$ be a category.
(1) All limits and colimits exist in $\operatorname{PAb}(\mathcal{C})$.
(2) All limits and colimits commute with taking sections over objects of $\mathcal{C}$.

Proof. Let $\mathcal{I} \rightarrow \operatorname{PAb}(\mathcal{C}), i \mapsto \mathcal{F}_{i}$ be a diagram. We can simply define abelian presheaves $L$ and $C$ by the rules

$$
L: U \longmapsto \lim _{i} \mathcal{F}_{i}(U)
$$

and

$$
C: U \longmapsto \operatorname{colim}_{i} \mathcal{F}_{i}(U) .
$$

It is clear that there are maps of abelian presheaves $L \rightarrow \mathcal{F}_{i}$ and $\mathcal{F}_{i} \rightarrow C$, by using the corresponding maps on groups of sections over each $U$. It is straightforward
to check that $L$ and $C$ endowed with these maps are the limit and colimit of the diagram in $P A b(\mathcal{C})$. This proves (1) and (2). Details omitted.

### 18.3. Abelian sheaves

03 CM Let $\mathcal{C}$ be a site. The category of abelian sheaves on $\mathcal{C}$ is denoted $A b(\mathcal{C})$. It is the full subcategory of $\operatorname{PAb}(\mathcal{C})$ consisting of those abelian presheaves whose underlying presheaves of sets are sheaves. Properties $(\alpha)-(\zeta)$ of Sites, Section 7.43 hold, see Sites, Proposition 7.43.3. In particular the inclusion functor $A b(\mathcal{C}) \rightarrow P A b(\mathcal{C})$ has a left adjoint, namely the sheafification functor $\mathcal{G} \mapsto \mathcal{G}^{\#}$.
We suggest the reader prove the lemma on a piece of scratch paper rather than reading the proof.

03CN Lemma 18.3.1. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of abelian sheaves on $\mathcal{C}$.
(1) The category $A b(\mathcal{C})$ is an abelian category.
(2) The kernel $\operatorname{Ker}(\varphi)$ of $\varphi$ is the same as the kernel of $\varphi$ as a morphism of presheaves.
(3) The morphism $\varphi$ is injective (Homology, Definition 12.5.3) if and only if $\varphi$ is injective as a map of presheaves (Sites, Definition 7.3.1), if and only if $\varphi$ is injective as a map of sheaves (Sites, Definition 7.12.1).
(4) The cokernel Coker $(\varphi)$ of $\varphi$ is the sheafification of the cokernel of $\varphi$ as a morphism of presheaves.
(5) The morphism $\varphi$ is surjective (Homology, Definition 12.5.3) if and only if $\varphi$ is surjective as a map of sheaves (Sites, Definition 7.12.1).
(6) A complex of abelian sheaves

$$
\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}
$$

is exact at $\mathcal{G}$ if and only if for all $U \in \mathrm{Ob}(\mathcal{C})$ and all $s \in \mathcal{G}(U)$ mapping to zero in $\mathcal{H}(U)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $\mathcal{C}$ such that each $\left.s\right|_{U_{i}}$ is in the image of $\mathcal{F}\left(U_{i}\right) \rightarrow \mathcal{G}\left(U_{i}\right)$.

Proof. We claim that Homology, Lemma 12.7 .3 applies to the categories $\mathcal{A}=$ $A b(\mathcal{C})$ and $\mathcal{B}=\operatorname{PAb}(\mathcal{C})$, and the functors $a: \mathcal{A} \rightarrow \mathcal{B}$ (inclusion), and $b: \mathcal{B} \rightarrow \mathcal{A}$ (sheafification). Let us check the assumptions of Homology, Lemma 12.7.3. Assumption (1) is that $\mathcal{A}, \mathcal{B}$ are additive categories, $a, b$ are additive functors, and $a$ is right adjoint to $b$. The first two statements are clear and adjointness is Sites, Section $7.43(\epsilon)$. Assumption (2) says that $\operatorname{PAb}(\mathcal{C})$ is abelian which we saw in Section 18.2 and that sheafification is left exact, which is Sites, Section 7.43 ( $\zeta$ ). The final assumption is that $b a \cong \mathrm{id}_{\mathcal{A}}$ which is Sites, Section 7.43 ( $\delta$ ). Hence Homology, Lemma 12.7.3 applies and we conclude that $A b(\mathcal{C})$ is abelian.

In the proof of Homology, Lemma 12.7 .3 it is shown that $\operatorname{Ker}(\varphi)$ and $\operatorname{Coker}(\varphi)$ are equal to the sheafification of the kernel and cokernel of $\varphi$ as a morphism of abelian presheaves. This proves (4). Since the kernel is a equalizer (i.e., a limit) and since sheafification commutes with finite limits, we conclude that (2) holds.
Statement (2) implies (3). Statement (4) implies (5) by our description of sheafification. The characterization of exactness in (6) follows from (2) and (5), and the fact that the sequence is exact if and only if $\operatorname{Im}(\mathcal{F} \rightarrow \mathcal{G})=\operatorname{Ker}(\mathcal{G} \rightarrow \mathcal{H})$.

Another way to say part (6) of the lemma is that a sequence of abelian sheaves

$$
\mathcal{F}_{1} \longrightarrow \mathcal{F}_{2} \longrightarrow \mathcal{F}_{3}
$$

is exact if and only if the sheafification of $U \mapsto \mathcal{F}_{2}(U) / \mathcal{F}_{1}(U)$ is equal to the kernel of $\mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$.

03CO Lemma 18.3.2. Let $\mathcal{C}$ be a site.
(1) All limits and colimits exist in $A b(\mathcal{C})$.
(2) Limits are the same as the corresponding limits of abelian presheaves over $\mathcal{C}$ (i.e., commute with taking sections over objects of $\mathcal{C}$ ).
(3) Finite direct sums are the same as the corresponding finite direct sums in the category of abelian pre-sheaves over $\mathcal{C}$.
(4) A colimit is the sheafification of the corresponding colimit in the category of abelian presheaves.
(5) Filtered colimits are exact.

Proof. By Lemma 18.2 .1 limits and colimits of abelian presheaves exist, and are described by taking limits and colimits on the level of sections over objects.
Let $\mathcal{I} \rightarrow A b(\mathcal{C}), i \mapsto \mathcal{F}_{i}$ be a diagram. Let $\lim _{i} \mathcal{F}_{i}$ be the limit of the diagram as an abelian presheaf. By Sites, Lemma 7.10.1 this is an abelian sheaf. Then it is quite easy to see that $\lim _{i} \mathcal{F}_{i}$ is the limit of the diagram in $A b(\mathcal{C})$. This proves limits exist and (2) holds.
By Categories, Lemma 4.24.4, and because sheafification is left adjoint to the inclusion functor we see that $\operatorname{colim}_{i} \mathcal{F}$ exists and is the sheafification of the colimit in $P A b(\mathcal{C})$. This proves colimits exist and (4) holds.
Finite direct sums are the same thing as finite products in any abelian category. Hence (3) follows from (2).
Proof of (5). The statement means that given a system $0 \rightarrow \mathcal{F}_{i} \rightarrow \mathcal{G}_{i} \rightarrow \mathcal{H}_{i} \rightarrow 0$ of exact sequences of abelian sheaves over a directed partially ordered set $I$ the sequence $0 \rightarrow \operatorname{colim} \mathcal{F}_{i} \rightarrow \operatorname{colim} \mathcal{G}_{i} \rightarrow \operatorname{colim} \mathcal{H}_{i} \rightarrow 0$ is exact as well. A formal argument using Homology, Lemma 12.5 .8 and the definition of colimits shows that the sequence $\operatorname{colim} \mathcal{F}_{i} \rightarrow \operatorname{colim} \mathcal{G}_{i} \rightarrow \operatorname{colim} \mathcal{H}_{i} \rightarrow 0$ is exact. Note that $\operatorname{colim} \mathcal{F}_{i} \rightarrow$ colim $\mathcal{G}_{i}$ is the sheafification of the map of presheaf colimits which is injective as each of the maps $\mathcal{F}_{i} \rightarrow \mathcal{G}_{i}$ is injective. Since sheafification is exact we conclude.

### 18.4. Free abelian presheaves

03 CP In order to prepare notation for the following definition, let us agree to denote the free abelian group on a set $S$ as ${ }^{1} \mathbf{Z}[S]=\bigoplus_{s \in S} \mathbf{Z}$. It is characterized by the property

$$
\operatorname{Mor}_{A b}(\mathbf{Z}[S], A)=\operatorname{Mor}_{S e t s}(S, A)
$$

In other words the construction $S \mapsto \mathbf{Z}[S]$ is a left adjoint to the forgetful functor $A b \rightarrow$ Sets.
03A7 Definition 18.4.1. Let $\mathcal{C}$ be a category. Let $\mathcal{G}$ be a presheaf of sets. The free abelian presheaf $\mathbf{Z}_{\mathcal{G}}$ on $\mathcal{G}$ is the abelian presheaf defined by the rule

$$
U \longmapsto \mathbf{Z}[\mathcal{G}(U)] .
$$

[^48]In the special case $\mathcal{G}=h_{X}$ of a representable presheaf associated to an object $X$ of $\mathcal{C}$ we use the notation $\mathbf{Z}_{X}=\mathbf{Z}_{h_{X}}$. In other words

$$
\mathbf{Z}_{X}(U)=\mathbf{Z}\left[\operatorname{Mor}_{\mathcal{C}}(U, X)\right]
$$

This construction is clearly functorial in the presheaf $\mathcal{G}$. In fact it is adjoint to the forgetful functor $\operatorname{PAb}(\mathcal{C}) \rightarrow P S h(\mathcal{C})$. Here is the precise statement.

03A8 Lemma 18.4.2. Let $\mathcal{C}$ be a category. Let $\mathcal{G}, \mathcal{F}$ be a presheaves of sets. Let $\mathcal{A}$ be an abelian presheaf. Let $U$ be an object of $\mathcal{C}$. Then we have

$$
\begin{aligned}
& \operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U) \\
& \operatorname{Mor}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{\mathcal{G}}, \mathcal{A}\right)=\operatorname{Mor}_{P S h(\mathcal{C})}(\mathcal{G}, \mathcal{A}), \\
& \operatorname{Mor}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U}, \mathcal{A}\right)=\mathcal{A}(U)
\end{aligned}
$$

All of these equalities are functorial.
Proof. Omitted.
03A9 Lemma 18.4.3. Let $\mathcal{C}$ be a category. Let $I$ be a set. For each $i \in I$ let $\mathcal{G}_{i}$ be $a$ presheaf of sets. Then

$$
\mathbf{Z}_{\amalg_{i} \mathcal{G}_{i}}=\bigoplus_{i \in I} \mathbf{Z}_{\mathcal{G}_{i}}
$$

in $\operatorname{PAb}(\mathcal{C})$.
Proof. Omitted.

### 18.5. Free abelian sheaves

03 CQ Here is the notion of a free abelian sheaf on a sheaf of sets.
03AA Definition 18.5.1. Let $\mathcal{C}$ be a site. Let $\mathcal{G}$ be a presheaf of sets. The free abelian sheaf $\mathbf{Z}_{\mathcal{G}}^{\#}$ on $\mathcal{G}$ is the abelian sheaf $\mathbf{Z}_{\mathcal{G}}^{\#}$ which is the sheafification of the abelian presheaf on $\mathcal{G}$. In the special case $\mathcal{G}=h_{X}$ of a representable presheaf associated to an object $X$ of $\mathcal{C}$ we use the notation $\mathbf{Z}_{X}^{\#}$.

This construction is clearly functorial in the presheaf $\mathcal{G}$. In fact it provides an adjoint to the forgetful functor $A b(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{C})$. Here is the precise statement.

03AB Lemma 18.5.2. Let $\mathcal{C}$ be a site. Let $\mathcal{G}, \mathcal{F}$ be a sheaves of sets. Let $\mathcal{A}$ be an abelian sheaf. Let $U$ be an object of $\mathcal{C}$. Then we have

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right) & =\mathcal{F}(U) \\
\operatorname{Mor}_{A b(\mathcal{C})}\left(\mathbf{Z}_{\mathcal{G}}^{\#}, \mathcal{A}\right) & =\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{G}, \mathcal{A}) \\
\operatorname{Mor}_{A b(\mathcal{C})}\left(\mathbf{Z}_{U}^{\#}, \mathcal{A}\right) & =\mathcal{A}(U)
\end{aligned}
$$

All of these equalities are functorial.
Proof. Omitted.
03AC Lemma 18.5.3. Let $\mathcal{C}$ be a site. Let $\mathcal{G}$ be a presheaf of sets. Then $\mathbf{Z}_{\mathcal{G}}^{\#}=\left(\mathbf{Z}_{\mathcal{G}}\right)^{\#}$.
Proof. Omitted.

### 18.6. Ringed sites

04 KQ In this chapter we mainly work with sheaves of modules on a ringed site. Hence we need to define this notion.

03AD Definition 18.6.1. Ringed sites.
(1) A ringed site is a pair $(\mathcal{C}, \mathcal{O})$ where $\mathcal{C}$ is a site and $\mathcal{O}$ is a sheaf of rings on $\mathcal{C}$. The sheaf $\mathcal{O}$ is called the structure sheaf of the ringed site.
(2) Let $(\mathcal{C}, \mathcal{O}),\left(\mathcal{C}^{\prime}, \mathcal{O}^{\prime}\right)$ be ringed sites. A morphism of ringed sites

$$
\left(f, f^{\sharp}\right):(\mathcal{C}, \mathcal{O}) \longrightarrow\left(\mathcal{C}^{\prime}, \mathcal{O}^{\prime}\right)
$$

is given by a morphism of sites $f: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ (see Sites, Definition 7.15.1) together with a map of sheaves of rings $f^{\sharp}: f^{-1} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$, which by adjunction is the same thing as a map of sheaves of rings $f^{\sharp}: \mathcal{O}^{\prime} \rightarrow f_{*} \mathcal{O}$.
(3) Let $\left(f, f^{\sharp}\right):\left(\mathcal{C}_{1}, \mathcal{O}_{1}\right) \rightarrow\left(\mathcal{C}_{2}, \mathcal{O}_{2}\right)$ and $\left(g, g^{\sharp}\right):\left(\mathcal{C}_{2}, \mathcal{O}_{2}\right) \rightarrow\left(\mathcal{C}_{3}, \mathcal{O}_{3}\right)$ be morphisms of ringed sites. Then we define the composition of morphisms of ringed sites by the rule

$$
\left(g, g^{\sharp}\right) \circ\left(f, f^{\sharp}\right)=\left(g \circ f, f^{\sharp} \circ g^{\sharp}\right) .
$$

Here we use composition of morphisms of sites defined in Sites, Definition 7.15.4 and $f^{\sharp} \circ g^{\sharp}$ indicates the morphism of sheaves of rings

$$
\mathcal{O}_{3} \xrightarrow{g^{\sharp}} g_{*} \mathcal{O}_{2} \xrightarrow{g_{*} f^{\sharp}} g_{*} f_{*} \mathcal{O}_{1}=(g \circ f)_{*} \mathcal{O}_{1}
$$

### 18.7. Ringed topoi

01D2 A ringed topos is just a ringed site, except that the notion of a morphism of ringed topoi is different from the notion of a morphism of ringed sites.

01D3 Definition 18.7.1. Ringed topoi.
(1) A ringed topos is a pair $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ where $\mathcal{C}$ is a site and $\mathcal{O}$ is a sheaf of rings on $\mathcal{C}$. The sheaf $\mathcal{O}$ is called the structure sheaf of the ringed site.
(2) Let $(S h(\mathcal{C}), \mathcal{O}),\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be ringed topoi. A morphism of ringed topoi

$$
\left(f, f^{\sharp}\right):(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \longrightarrow\left(\operatorname{Sh}\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)
$$

is given by a morphism of topoi $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ (see Sites, Definition 7.16.1 together with a map of sheaves of rings $f^{\sharp}: f^{-1} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$, which by adjunction is the same thing as a map of sheaves of rings $f^{\sharp}: \mathcal{O}^{\prime} \rightarrow f_{*} \mathcal{O}$.
(3) Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}\left(\mathcal{C}_{1}\right), \mathcal{O}_{1}\right) \rightarrow\left(\operatorname{Sh}\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right)$ and $\left(g, g^{\sharp}\right):\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right) \rightarrow$ $\left(S h\left(\mathcal{C}_{3}\right), \mathcal{O}_{3}\right)$ be morphisms of ringed topoi. Then we define the composition of morphisms of ringed topoi by the rule

$$
\left(g, g^{\sharp}\right) \circ\left(f, f^{\sharp}\right)=\left(g \circ f, f^{\sharp} \circ g^{\sharp}\right) .
$$

Here we use composition of morphisms of topoi defined in Sites, Definition 7.16.1 and $f^{\sharp} \circ g^{\sharp}$ indicates the morphism of sheaves of rings

$$
\mathcal{O}_{3} \xrightarrow{g^{\sharp}} g_{*} \mathcal{O}_{2} \xrightarrow{g_{*} f^{\sharp}} g_{*} f_{*} \mathcal{O}_{1}=(g \circ f)_{*} \mathcal{O}_{1}
$$

Every morphism of ringed topoi is the composition of an equivalence of ringed topoi with a morphism of ringed topoi associated to a morphism of ringed sites. Here is the precise statement.

03CR Lemma 18.7.2. Let $\left(f, f^{\sharp}\right):\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. There exists a factorization

where
(1) $g: \operatorname{Sh}(\mathcal{C}) \rightarrow S h\left(\mathcal{C}^{\prime}\right)$ is an equivalence of topoi induced by a special cocontinuous functor $\mathcal{C} \rightarrow \mathcal{C}^{\prime}$ (see Sites, Definition 7.28.2),
(2) $e: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}\left(\mathcal{D}^{\prime}\right)$ is an equivalence of topoi induced by a special cocontinuous functor $\mathcal{D} \rightarrow \mathcal{D}^{\prime}$ (see Sites, Definition 7.28.2),
(3) $\mathcal{O}_{\mathcal{C}^{\prime}}=g_{*} \mathcal{O}_{\mathcal{C}}$ and $g^{\sharp}$ is the obvious map,
(4) $\mathcal{O}_{\mathcal{D}^{\prime}}=e_{*} \mathcal{O}_{\mathcal{D}}$ and $e^{\sharp}$ is the obvious map,
(5) the sites $\mathcal{C}^{\prime}$ and $\mathcal{D}^{\prime}$ have final objects and fibre products (i.e., all finite limits),
(6) $h$ is a morphism of sites induced by a continuous functor $u: \mathcal{D}^{\prime} \rightarrow \mathcal{C}^{\prime}$ which commutes with all finite limits (i.e., it satisfies the assumptions of Sites, Proposition 7.15.6), and
(7) given any set of sheaves $\mathcal{F}_{i}$ (resp. $\mathcal{G}_{j}$ ) on $\mathcal{C}$ (resp. $\mathcal{D}$ ) we may assume each of these is a representable sheaf on $\mathcal{C}^{\prime}$ (resp. $\mathcal{D}^{\prime}$ ).
Moreover, if $\left(f, f^{\sharp}\right)$ is an equivalence of ringed topoi, then we can choose the diagram such that $\mathcal{C}^{\prime}=\mathcal{D}^{\prime}, \mathcal{O}_{\mathcal{C}^{\prime}}=\mathcal{O}_{\mathcal{D}^{\prime}}$ and $\left(h, h^{\sharp}\right)$ is the identity.

Proof. This follows from Sites, Lemma 7.28.6, and Sites, Remarks 7.28.7 and 7.28.8. You just have to carry along the sheaves of rings. Some details omitted.

### 18.8. 2-morphisms of ringed topoi

04IB This is a brief section concerning the notion of a 2-morphism of ringed topoi.
04IC Definition 18.8.1. Let $f, g:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be two morphisms of ringed topoi. A 2-morphism from $f$ to $g$ is given by a transformation of functors $t: f_{*} \rightarrow g_{*}$ such that

is commutative.
Pictorially we sometimes represent $t$ as follows:

As in Sites, Section 7.35 giving a 2-morphism $t: f_{*} \rightarrow g_{*}$ is equivalent to giving $t: g^{-1} \rightarrow f^{-1}$ (usually denoted by the same symbol) such that the diagram

is commutative. As in Sites, Section 7.35 the axioms of a strict 2-category hold with horizontal and vertical compositions defined as explained in loc. cit.

### 18.9. Presheaves of modules

## 03CS

Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$. At this point we have not yet defined a presheaf of $\mathcal{O}$-modules. Thus we do so right now.
03CT Definition 18.9.1. Let $\mathcal{C}$ be a category, and let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$.
(1) A presheaf of $\mathcal{O}$-modules is given by an abelian presheaf $\mathcal{F}$ together with a map of presheaves of sets

$$
\mathcal{O} \times \mathcal{F} \longrightarrow \mathcal{F}
$$

such that for every object $U$ of $\mathcal{C}$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an $\mathcal{O}(U)$-module structure on the abelian group $\mathcal{F}(U)$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$-modules is a morphism of abelian presheaves $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ such that the diagram

commutes.
(3) The set of $\mathcal{O}$-module morphisms as above is denoted $\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$.
(4) The category of presheaves of $\mathcal{O}$-modules is denoted $\operatorname{PMod}(\mathcal{O})$.

Suppose that $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ is a morphism of presheaves of rings on the category $\mathcal{C}$. In this case, if $\mathcal{F}$ is a presheaf of $\mathcal{O}_{2}$-modules then we can think of $\mathcal{F}$ as a presheaf of $\mathcal{O}_{1}$-modules by using the composition

$$
\mathcal{O}_{1} \times \mathcal{F} \rightarrow \mathcal{O}_{2} \times \mathcal{F} \rightarrow \mathcal{F}
$$

We sometimes denote this by $\mathcal{F}_{\mathcal{O}_{1}}$ to indicate the restriction of rings. We call this the restriction of $\mathcal{F}$. We obtain the restriction functor

$$
\operatorname{PMod}\left(\mathcal{O}_{2}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{1}\right)
$$

On the other hand, given a presheaf of $\mathcal{O}_{1}$-modules $\mathcal{G}$ we can construct a presheaf of $\mathcal{O}_{2}$-modules $\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}$ by the rule

$$
U \longmapsto\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}\right)(U)=\mathcal{O}_{2}(U) \otimes_{\mathcal{O}_{1}(U)} \mathcal{G}(U)
$$

where $U \in \operatorname{Ob}(\mathcal{C})$, with obvious restriction mappings. The index $p$ stands for "presheaf" and not "point". This presheaf is called the tensor product presheaf. We obtain the change of rings functor

$$
\operatorname{PMod}\left(\mathcal{O}_{1}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{2}\right)
$$

03CU Lemma 18.9.2. With $\mathcal{C}, \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}, \mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\mathcal{G}, \mathcal{F}_{\mathcal{O}_{1}}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)
$$

In other words, the restriction and change of rings functors defined above are adjoint to each other.

Proof. This follows from the fact that for a ring map $A \rightarrow B$ the restriction functor and the change of ring functor are adjoint to each other.

### 18.10. Sheaves of modules

03CW Definition 18.10.1. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$.
(1) A sheaf of $\mathcal{O}$-modules is a presheaf of $\mathcal{O}$-modules $\mathcal{F}$, see Definition 18.9.1, such that the underlying presheaf of abelian groups $\mathcal{F}$ is a sheaf.
(2) A morphism of sheaves of $\mathcal{O}$-modules is a morphism of presheaves of $\mathcal{O}$ modules.
(3) Given sheaves of $\mathcal{O}$-modules $\mathcal{F}$ and $\mathcal{G}$ we $\operatorname{denote} \operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ the set of morphism of sheaves of $\mathcal{O}$-modules.
(4) The category of sheaves of $\mathcal{O}$-modules is denoted $\operatorname{Mod}(\mathcal{O})$.

This definition kind of makes sense even if $\mathcal{O}$ is just a presheaf of rings, although we do not know any examples where this is useful, and we will avoid using the terminology "sheaves of $\mathcal{O}$-modules" in case $\mathcal{O}$ is not a sheaf of rings.

### 18.11. Sheafification of presheaves of modules

03CX
03CY Lemma 18.11.1. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$ Let $\mathcal{F}$ be a presheaf $\mathcal{O}$-modules. Let $\mathcal{O}^{\#}$ be the sheafification of $\mathcal{O}$ as a presheaf of rings, see Sites, Section 7.43. Let $\mathcal{F}^{\#}$ be the sheafification of $\mathcal{F}$ as a presheaf of abelian groups. There exists a map of sheaves of sets

$$
\mathcal{O}^{\#} \times \mathcal{F}^{\#} \longrightarrow \mathcal{F}^{\#}
$$

which makes the diagram

commute and which makes $\mathcal{F}^{\#}$ into a sheaf of $\mathcal{O}^{\#}$-modules. In addition, if $\mathcal{G}$ is a sheaf of $\mathcal{O}^{\#}$-modules, then any morphism of presheaves of $\mathcal{O}$-modules $\mathcal{F} \rightarrow \mathcal{G}$ (into the restriction of $\mathcal{G}$ to a $\mathcal{O}$-module) factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$ where $\mathcal{F}^{\#} \rightarrow \mathcal{G}$ is a morphism of $\mathcal{O}^{\#}$-modules.

Proof. Omitted.
This actually means that the functor $i: \operatorname{Mod}\left(\mathcal{O}^{\#}\right) \rightarrow \operatorname{PMod}(\mathcal{O})$ (combining restriction and including sheaves into presheaves) and the sheafification functor of the lemma $\#: \operatorname{PMod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}^{\#}\right)$ are adjoint. In a formula

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}(\mathcal{F}, i \mathcal{G})=\operatorname{Mor}_{M o d(\mathcal{O} \#)}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

An important case happens when $\mathcal{O}$ is already a sheaf of rings. In this case the formula reads

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}(\mathcal{F}, i \mathcal{G})=\operatorname{Mor}_{\operatorname{Mod}(\mathcal{O})}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

because $\mathcal{O}=\mathcal{O}^{\#}$ in this case.
03EI Lemma 18.11.2. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$ The sheafification functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{Mod}\left(\mathcal{O}^{\#}\right), \quad \mathcal{F} \longmapsto \mathcal{F}^{\#}
$$

is exact.
Proof. This is true because it holds for sheafification $\operatorname{PAb}(\mathcal{C}) \rightarrow A b(\mathcal{C})$. See the discussion in Section 18.3 .

Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a morphism of sheaves of rings on $\mathcal{C}$. In Section 18.9 we defined a restriction functor and a change of rings functor on presheaves of modules associated to this situation.

If $\mathcal{F}$ is a sheaf of $\mathcal{O}_{2}$-modules then the restriction $\mathcal{F}_{\mathcal{O}_{1}}$ of $\mathcal{F}$ is clearly a sheaf of $\mathcal{O}_{1}$-modules. We obtain the restriction functor

$$
\operatorname{Mod}\left(\mathcal{O}_{2}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{1}\right)
$$

On the other hand, given a sheaf of $\mathcal{O}_{1}$-modules $\mathcal{G}$ the presheaf of $\mathcal{O}_{2}$-modules $\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}$ is in general not a sheaf. Hence we define the tensor product sheaf $\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}$ by the formula

$$
\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}=\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}\right)^{\#}
$$

as the sheafification of our construction for presheaves. We obtain the change of rings functor

$$
\operatorname{Mod}\left(\mathcal{O}_{1}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{2}\right)
$$

03CZ Lemma 18.11.3. With $X, \mathcal{O}_{1}, \mathcal{O}_{2}, \mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\mathcal{G}, \mathcal{F}_{\mathcal{O}_{1}}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)
$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from Lemma 18.9 .2 and the fact that $\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)=$ $\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)$ because $\mathcal{F}$ is a sheaf.

0930 Lemma 18.11.4. Let $\mathcal{C}$ be a site. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be an epimorphism of sheaves of rings. Let $\mathcal{G}_{1}, \mathcal{G}_{2}$ be $\mathcal{O}^{\prime}$-modules. Then

$$
\operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{G}_{1}, \mathcal{G}_{2}\right)=\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{G}_{1}, \mathcal{G}_{2}\right)
$$

In other words, the restriction functor $\operatorname{Mod}\left(\mathcal{O}^{\prime}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$ is fully faithful.
Proof. This is the sheaf version of Algebra, Lemma 10.106 .14 and is proved in exactly the same way.

### 18.12. Morphisms of topoi and sheaves of modules

03D0 All of this material is completely straightforward. We formulate everything in the case of morphisms of topoi, but of course the results also hold in the case of morphisms of sites.

03D1 Lemma 18.12.1. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. There is a natural map of sheaves of sets

$$
f_{*} \mathcal{O} \times f_{*} \mathcal{F} \longrightarrow f_{*} \mathcal{F}
$$

which turns $f_{*} \mathcal{F}$ into a sheaf of $f_{*} \mathcal{O}$-modules. This construction is functorial in $\mathcal{F}$.
Proof. Denote $\mu: \mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ the multiplication map. Recall that $f_{*}$ (on sheaves of sets) is left exact and hence commutes with products. Hence $f_{*} \mu$ is a map as indicated. This proves the lemma.

03D2 Lemma 18.12.2. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{D}$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. There is a natural map of sheaves of sets

$$
f^{-1} \mathcal{O} \times f^{-1} \mathcal{G} \longrightarrow f^{-1} \mathcal{G}
$$

which turns $f^{-1} \mathcal{G}$ into a sheaf of $f^{-1} \mathcal{O}$-modules. This construction is functorial in $\mathcal{G}$.

Proof. Denote $\mu: \mathcal{O} \times \mathcal{G} \rightarrow \mathcal{G}$ the multiplication map. Recall that $f^{-1}$ (on sheaves of sets) is exact and hence commutes with products. Hence $f^{-1} \mu$ is a map as indicated. This proves the lemma.

03D3 Lemma 18.12.3. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{D}$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{F}$ be $a$ sheaf of $f^{-1} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{M o d\left(f^{-1} \mathcal{O}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{\operatorname{Mod}(\mathcal{O})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 18.12.2 and 18.12.1, and we think of $f_{*} \mathcal{F}$ as an $\mathcal{O}$-module by restriction via $\mathcal{O} \rightarrow f_{*} f^{-1} \mathcal{O}$.
Proof. First we note that we have

$$
\operatorname{Mor}_{A b(\mathcal{C})}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{A b(\mathcal{D})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

by Sites, Proposition 7.43.3 Suppose that $\alpha: f^{-1} \mathcal{G} \rightarrow \mathcal{F}$ and $\beta: \mathcal{G} \rightarrow f_{*} \mathcal{F}$ are morphisms of abelian sheaves which correspond via the formula above. We have to show that $\alpha$ is $f^{-1} \mathcal{O}$-linear if and only if $\beta$ is $\mathcal{O}$-linear. For example, suppose $\alpha$ is $f^{-1} \mathcal{O}$-linear, then clearly $f_{*} \alpha$ is $f_{*} f^{-1} \mathcal{O}$-linear, and hence (as restriction is a functor) is $\mathcal{O}$-linear. Hence it suffices to prove that the adjunction map $\mathcal{G} \rightarrow f_{*} f^{-1} \mathcal{G}$ is $\mathcal{O}$-linear. Using that both $f_{*}$ and $f^{-1}$ commute with products (on sheaves of sets) this comes down to showing that

is commutative. This holds because the adjunction mapping $\operatorname{id}_{\operatorname{Sh}(\mathcal{D})} \rightarrow f_{*} f^{-1}$ is a transformation of functors. We omit the proof of the implication $\beta$ linear $\Rightarrow \alpha$ linear.

03D4 Lemma 18.12.4. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f: S h(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{G}$ be a sheaf of $f_{*} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{\operatorname{Mod}(\mathcal{O})}\left(\mathcal{O} \otimes_{f^{-1} f_{*} \mathcal{O}} f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{\operatorname{Mod}\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 18.12.2 and 18.12.1, and we use the canonical map $f^{-1} f_{*} \mathcal{O} \rightarrow$ $\mathcal{O}$ in the definition of the tensor product.

Proof. Note that we have

$$
\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{O} \otimes_{f^{-1} f_{*} \mathcal{O}} f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{\operatorname{Mod}\left(f^{-1} f_{*} \mathcal{O}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}_{f^{-1} f_{*} \mathcal{O}}\right)
$$

by Lemma 18.11.3. Hence the result follows from Lemma 18.12 .3

### 18.13. Morphisms of ringed topoi and modules

03D5 We have now introduced enough notation so that we are able to define the pullback and pushforward of modules along a morphism of ringed topoi.

03 D6 Definition 18.13.1. Let $\left(f, f^{\sharp}\right):\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi or ringed sites.
(1) Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{C}}$-modules. We define the pushforward of $\mathcal{F}$ as the sheaf of $\mathcal{O}_{\mathcal{D}}$-modules which as a sheaf of abelian groups equals $f_{*} \mathcal{F}$ and with module structure given by the restriction via $f^{\sharp}: \mathcal{O}_{\mathcal{D}} \rightarrow f_{*} \mathcal{O}_{\mathcal{C}}$ of the module structure

$$
f_{*} \mathcal{O}_{\mathcal{C}} \times f_{*} \mathcal{F} \longrightarrow f_{*} \mathcal{F}
$$

from Lemma 18.12.1.
(2) Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{\mathcal{D}}$-modules. We define the pullback $f^{*} \mathcal{G}$ to be the sheaf of $\mathcal{O}_{\mathcal{C}}$-modules defined by the formula

$$
f^{*} \mathcal{G}=\mathcal{O}_{\mathcal{C}} \otimes_{f^{-1} \mathcal{O}_{\mathcal{D}}} f^{-1} \mathcal{G}
$$

where the ring map $f^{-1} \mathcal{O}_{\mathcal{D}} \rightarrow \mathcal{O}_{\mathcal{C}}$ is $f^{\sharp}$, and where the module structure is given by Lemma 18.12 .2 .

Thus we have defined functors

$$
\begin{array}{rll}
f_{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right) & \longrightarrow & \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right) \\
f^{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right) & \longrightarrow & \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)
\end{array}
$$

The final result on these functors is that they are indeed adjoint as expected.
03D7 Lemma 18.13.2. Let $\left(f, f^{\sharp}\right):\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi or ringed sites. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{\mathcal{C}}$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{\mathcal{D}}$-modules. There is a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(f^{*} \mathcal{G}, \mathcal{F}\right)=\operatorname{Hom}_{\mathcal{O}_{\mathcal{D}}}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

In other words: the functor $f^{*}$ is the left adjoint to $f_{*}$.

Proof. This follows from the work we did before:

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(f^{*} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{M o d\left(\mathcal{O}_{\mathcal{C}}\right)}\left(\mathcal{O}_{\mathcal{C}} \otimes_{f^{-1} \mathcal{O}_{\mathcal{D}}} f^{-1} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{\operatorname{Mod}\left(f^{-1} \mathcal{O}_{\mathcal{D}}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}_{f^{-1} \mathcal{O}_{\mathcal{D}}}\right) \\
& =\operatorname{Hom}_{\mathcal{O}_{\mathcal{D}}}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

Here we use Lemmas 18.11.3 and 18.12.3.
03D8 Lemma 18.13.3. $\left(f, f^{\sharp}\right):\left(S h\left(\mathcal{C}_{1}\right), \mathcal{O}_{1}\right) \rightarrow\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right)$ and $\left(g, g^{\sharp}\right):\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right) \rightarrow$ $\left(\operatorname{Sh}\left(\mathcal{C}_{3}\right), \mathcal{O}_{3}\right)$ be morphisms of ringed topoi. There are canonical isomorphisms of functors $(g \circ f)_{*} \cong g_{*} \circ f_{*}$ and $(g \circ f)^{*} \cong f^{*} \circ g^{*}$.

Proof. This is clear from the definitions.

### 18.14. The abelian category of sheaves of modules

03D9 Let $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}$-modules, see Sheaves, Definition 6.10.1. Let $\varphi, \psi: \mathcal{F} \rightarrow \mathcal{G}$ be morphisms of sheaves of $\mathcal{O}$-modules. We define $\varphi+\psi: \mathcal{F} \rightarrow \mathcal{G}$ to be the sum of $\varphi$ and $\psi$ as morphisms of abelian sheaves. This is clearly again a map of $\mathcal{O}$-modules. It is also clear that composition of maps of $\mathcal{O}$-modules is bilinear with respect to this addition. Thus $\operatorname{Mod}(\mathcal{O})$ is a pre-additive category, see Homology, Definition 12.3.1.
We will denote 0 the sheaf of $\mathcal{O}$-modules which has constant value $\{0\}$ for all objects $U$ of $\mathcal{C}$. Clearly this is both a final and an initial object of $\operatorname{Mod}(\mathcal{O})$. Given a morphism of $\mathcal{O}$-modules $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ the following are equivalent: (a) $\varphi$ is zero, (b) $\varphi$ factors through $0,(c) \varphi$ is zero on sections over each object $U$.

Moreover, given a pair $\mathcal{F}, \mathcal{G}$ of sheaves of $\mathcal{O}$-modules we may define the direct sum as

$$
\mathcal{F} \oplus \mathcal{G}=\mathcal{F} \times \mathcal{G}
$$

with obvious maps $(i, j, p, q)$ as in Homology, Definition 12.3.5. Thus $\operatorname{Mod}(\mathcal{O})$ is an additive category, see Homology, Definition 12.3.8.
Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of $\mathcal{O}$-modules. We may define $\operatorname{Ker}(\varphi)$ to be the kernel of $\varphi$ as a map of abelian sheaves. By Section 18.3 this is the subsheaf of $\mathcal{F}$ with sections

$$
\operatorname{Ker}(\varphi)(U)=\{s \in \mathcal{F}(U) \mid \varphi(s)=0 \text { in } \mathcal{G}(U)\}
$$

for all objects $U$ of $\mathcal{C}$. It is easy to see that this is indeed a kernel in the category of $\mathcal{O}$-modules. In other words, a morphism $\alpha: \mathcal{H} \rightarrow \mathcal{F}$ factors through $\operatorname{Ker}(\varphi)$ if and only if $\varphi \circ \alpha=0$.
Similarly, we define $\operatorname{Coker}(\varphi)$ as the cokernel of $\varphi$ as a map of abelian sheaves. There is a unique multiplication map

$$
\mathcal{O} \times \operatorname{Coker}(\varphi) \longrightarrow \operatorname{Coker}(\varphi)
$$

such that the map $\mathcal{G} \rightarrow \operatorname{Coker}(\varphi)$ becomes a morphism of $\mathcal{O}$-modules (verification omitted). The map $\mathcal{G} \rightarrow \operatorname{Coker}(\varphi)$ is surjective (as a map of sheaves of sets, see Section 18.3). To show that $\operatorname{Coker}(\varphi)$ is a cokernel in $\operatorname{Mod}(\mathcal{O})$, note that if $\beta: \mathcal{G} \rightarrow \mathcal{H}$ is a morphism of $\mathcal{O}$-modules such that $\beta \circ \varphi$ is zero, then you get for every object $U$ of $\mathcal{C}$ a map induced by $\beta$ from $\mathcal{G}(U) / \varphi(\mathcal{F}(U))$ into $\mathcal{H}(U)$. By the universal property of sheafification (see Sheaves, Lemma 6.20.1) we obtain a canonical map $\operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$ such that the original $\beta$ is equal to the composition
$\mathcal{G} \rightarrow \operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$. The morphism $\operatorname{Coker}(\varphi) \rightarrow \mathcal{H}$ is unique because of the surjectivity mentioned above.

03DA Lemma 18.14.1. Let $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ be a ringed topos. The category $\operatorname{Mod}(\mathcal{O})$ is an abelian category. The forgetful functor $\operatorname{Mod}(\mathcal{O}) \rightarrow A b(\mathcal{C})$ is exact, hence kernels, cokernels and exactness of $\mathcal{O}$-modules, correspond to the corresponding notions for abelian sheaves.

Proof. Above we have seen that $\operatorname{Mod}(\mathcal{O})$ is an additive category, with kernels and cokernels and that $\operatorname{Mod}(\mathcal{O}) \rightarrow A b(\mathcal{C})$ preserves kernels and cokernels. By Homology, Definition 12.5.1 we have to show that image and coimage agree. This is clear because it is true in $A b(\mathcal{C})$. The lemma follows.

03 DB Lemma 18.14.2. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. All limits and colimits exist in $\operatorname{Mod}(\mathcal{O})$ and the forgetful functor $\operatorname{Mod}(\mathcal{O}) \rightarrow A b(\mathcal{C})$ commutes with them. Moreover, filtered colimits are exact.

Proof. The final statement follows from the first as filtered colimits are exact in $A b(\mathcal{C})$ by Lemma 18.3.2. Let $\mathcal{I} \rightarrow \operatorname{Mod}(\mathcal{C}), i \mapsto \mathcal{F}_{i}$ be a diagram. Let $\lim _{i} \mathcal{F}_{i}$ be the limit of the diagram in $A b(\mathcal{C})$. By the description of this limit in Lemma 18.3.2 we see immediately that there exists a multiplication

$$
\mathcal{O} \times \lim _{i} \mathcal{F}_{i} \longrightarrow \lim _{i} \mathcal{F}_{i}
$$

which turns $\lim _{i} \mathcal{F}_{i}$ into a sheaf of $\mathcal{O}$-modules. It is easy to see that this is the limit of the diagram in $\operatorname{Mod}(\mathcal{C})$. Let $\operatorname{colim}_{i} \mathcal{F}_{i}$ be the colimit of the diagram in $\operatorname{PAb}(\mathcal{C})$. By the description of this colimit in the proof of Lemma 18.2.1 we see immediately that there exists a multiplication

$$
\mathcal{O} \times \operatorname{colim}_{i} \mathcal{F}_{i} \longrightarrow \operatorname{colim}_{i} \mathcal{F}_{i}
$$

which turns $\operatorname{colim}_{i} \mathcal{F}_{i}$ into a presheaf of $\mathcal{O}$-modules. Applying sheafification we get a sheaf of $\mathcal{O}$-modules $\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)^{\#}$, see Lemma 18.11.1. It is easy to see that $\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)^{\#}$ is the colimit of the diagram in $\operatorname{Mod}(\mathcal{O})$, and by Lemma 18.3.2 forgetting the $\mathcal{O}$-module structure is the colimit in $A b(\mathcal{C})$.

The existence of limits and colimits allows us to consider exactness properties of functors defined on the category of $\mathcal{O}$-modules in terms of limits and colimits, as in Categories, Section 4.23. See Homology, Lemma 12.7.1 for a description of exactness properties in terms of short exact sequences.

03 DC Lemma 18.14.3. Let $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi.
(1) The functor $f_{*}$ is left exact. In fact it commutes with all limits.
(2) The functor $f^{*}$ is right exact. In fact it commutes with all colimits.

Proof. This is true because $\left(f^{*}, f_{*}\right)$ is an adjoint pair of functors, see Lemma 18.13.2. See Categories, Section 4.24.

05 V 3 Lemma 18.14.4. Let $\mathcal{C}$ be a site. If $\left\{p_{i}\right\}_{i \in I}$ is a conservative family of points, then we may check exactness of a sequence of abelian sheaves on the stalks at the points $p_{i}, i \in I$. If $\mathcal{C}$ has enough points, then exactness of a sequence of abelian sheaves may be checked on stalks.

Proof. This is immediate from Sites, Lemma 7.37.2.

### 18.15. Exactness of pushforward

04BC Some technical lemmas concerning exactness properties of pushforward.
04DA Lemma 18.15.1. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. The following are equivalent:
(1) $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is surjective for all $\mathcal{F}$ in $A b(\mathcal{C})$, and
(2) $f_{*}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ reflects surjections.

In this case the functor $f_{*}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ is faithful.
Proof. Assume (1). Suppose that $a: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is a map of abelian sheaves on $\mathcal{C}$ such that $f_{*} a$ is surjective. As $f^{-1}$ is exact this implies that $f^{-1} f_{*} a: f^{-1} f_{*} \mathcal{F} \rightarrow$ $f^{-1} f_{*} \mathcal{F}^{\prime}$ is surjective. Combined with (1) this implies that $a$ is surjective. This means that (2) holds.

Assume (2). Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. We have to show that the map $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is surjective. By (2) it suffices to show that $f_{*} f^{-1} f_{*} \mathcal{F} \rightarrow f_{*} \mathcal{F}$ is surjective. And this is true because there is a canonical map $f_{*} \mathcal{F} \rightarrow f_{*} f^{-1} f_{*} \mathcal{F}$ which is a one-sided inverse.

We omit the proof of the final assertion.
04DB Lemma 18.15.2. Let $f: S h(\mathcal{C}) \rightarrow S h(\mathcal{D})$ be a morphism of topoi. Assume at least one of the following properties holds
(1) $f_{*}$ transforms surjections of sheaves of sets into surjections,
(2) $f_{*}$ transforms surjections of abelian sheaves into surjections,
(3) $f_{*}$ commutes with coequalizers on sheaves of sets,
(4) $f_{*}$ commutes with pushouts on sheaves of sets,

Then $f_{*}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ is exact.
Proof. Since $f_{*}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ is a right adjoint we already know that it transforms a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ of abelian sheaves on $\mathcal{C}$ into an exact sequence

$$
0 \rightarrow f_{*} \mathcal{F}_{1} \rightarrow f_{*} \mathcal{F}_{2} \rightarrow f_{*} \mathcal{F}_{3}
$$

see Categories, Sections 4.23 and 4.24 and Homology, Section 12.7. Hence it suffices to prove that the map $f_{*} \mathcal{F}_{2} \rightarrow f_{*} \mathcal{F}_{3}$ is surjective. If (1), (2) holds, then this is clear from the definitions. By Sites, Lemma 7.40.1 we see that either (3) or (4) formally implies (1), hence in these cases we are done also.

04BD Lemma 18.15.3. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Assume $u$ is almost cocontinuous. Then
(1) $f_{*}: A b(\mathcal{D}) \rightarrow A b(\mathcal{C})$ is exact.
(2) if $f^{\sharp}: f^{-1} \mathcal{O}_{\mathcal{C}} \rightarrow \mathcal{O}_{\mathcal{D}}$ is given so that $f$ becomes a morphism of ringed sites, then $f_{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)$ is exact.

Proof. Part (2) follows from part (1) by Lemma 18.14.2. Part (1) follows from Sites, Lemmas 7.41.6 and 7.40.1.

### 18.16. Exactness of lower shriek

04 BE Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between sites. Assume that
(a) $u$ is cocontinuous, and
(b) $u$ is continuous.

Let $g: S h(\mathcal{C}) \rightarrow S h(\mathcal{D})$ be the morphism of topoi associated with $u$, see Sites, Lemma 7.20.1 Recall that $g^{-1}=u^{p}$, i.e., $g^{-1}$ is given by the simple formula $\left(g^{-1} \mathcal{G}\right)(U)=\mathcal{G}(u(U))$, see Sites, Lemma 7.20.5. We would like to show that $g^{-1}$ : $A b(\mathcal{D}) \rightarrow A b(\mathcal{C})$ has a left adjoint $g!$. By Sites, Lemma 7.20 .5 the functor $g_{!}^{S h}=$ $\left(u_{p}\right)^{\#}$ is a left adjoint on sheaves of sets. Moreover, we know that $g_{!}^{S h} \mathcal{F}$ is the sheaf associated to the presheaf

$$
V \longmapsto \operatorname{colim}_{V \rightarrow u(U)} \mathcal{F}(U)
$$

where the colimit is over $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ and is taken in the category of sets. Hence the following definition is natural.
04BF Definition 18.16.1. With $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfying (a), (b) above. For $\mathcal{F} \in \operatorname{PAb}(\mathcal{C})$ we define $g_{p!} \mathcal{F}$ as the presheaf

$$
V \longmapsto \operatorname{colim}_{V \rightarrow u(U)} \mathcal{F}(U)
$$

with colimits over $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ taken in $A b$. For $\mathcal{F} \in \operatorname{PAb}(\mathcal{C})$ we set $g_{!} \mathcal{F}=\left(g_{p!} \mathcal{F}\right)^{\#}$.
The reason for being so explicit with this is that the functors $g_{!}^{S h}$ and $g_{!}$are different. Whenever we use both we have to be careful to make the distinction clear.
04BG Lemma 18.16.2. The functor $g_{p!}$ is a left adjoint to the functor $u^{p}$. The functor $g_{!}$is a left adjoint to the functor $g^{-1}$. In other words the formulas

$$
\begin{aligned}
& \operatorname{Mor}_{P A b(\mathcal{C})}\left(\mathcal{F}, u^{p} \mathcal{G}\right)=\operatorname{Mor}_{P A b(\mathcal{D})}\left(g_{p!} \mathcal{F}, \mathcal{G}\right) \\
& \operatorname{Mor}_{A b(\mathcal{C})}\left(\mathcal{F}, g^{-1} \mathcal{G}\right)=\operatorname{Mor}_{A b(\mathcal{D})}\left(g_{!} \mathcal{F}, \mathcal{G}\right)
\end{aligned}
$$

hold bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
Proof. The second formula follows formally from the first, since if $\mathcal{F}$ and $\mathcal{G}$ are abelian sheaves then

$$
\begin{aligned}
\operatorname{Mor}_{A b(\mathcal{C})}\left(\mathcal{F}, g^{-1} \mathcal{G}\right) & =\operatorname{Mor}_{P A b(\mathcal{D})}\left(g_{p!} \mathcal{F}, \mathcal{G}\right) \\
& =\operatorname{Mor}_{A b(\mathcal{D})}\left(g_{!} \mathcal{F}, \mathcal{G}\right)
\end{aligned}
$$

by the universal property of sheafification.
To prove the first formula, let $\mathcal{F}, \mathcal{G}$ be abelian presheaves. To prove the lemma we will construct maps from the group on the left to the group on the right and omit the verification that these are mutually inverse.
Note that there is a canonical map of abelian presheaves $\mathcal{F} \rightarrow u^{p} g_{p!} \mathcal{F}$ which on sections over $U$ is the natural map $\mathcal{F}(U) \rightarrow \operatorname{colim}_{u(U) \rightarrow u\left(U^{\prime}\right)}^{\mathcal{F}}\left(U^{\prime}\right)$, see Sites, Lemma 7.5.3. Given a map $\alpha: g_{p!} \mathcal{F} \rightarrow \mathcal{G}$ we get $u^{p} \alpha: u^{p} g_{p!} \mathcal{F} \rightarrow u^{p} \mathcal{G}$. which we can precompose by the map $\mathcal{F} \rightarrow u^{p} g_{p!} \mathcal{F}$.
Note that there is a canonical map of abelian presheaves $g_{p!} u^{p} \mathcal{G} \rightarrow \mathcal{G}$ which on sections over $V$ is the natural map $\operatorname{colim}_{V \rightarrow u(U)} \mathcal{G}(u(U)) \rightarrow \mathcal{G}(V)$. It maps a section $s \in u(U)$ in the summand corresponding to $t: V \rightarrow u(U)$ to $t^{*} s \in \mathcal{G}(V)$. Hence, given a $\operatorname{map} \beta: \mathcal{F} \rightarrow u^{p} \mathcal{G}$ we get a map $g_{p!} \beta: g_{p!} \mathcal{F} \rightarrow g_{p!} u^{p} \mathcal{G}$ which we can postcompose with the map $g_{p!} u^{p} \mathcal{G} \rightarrow \mathcal{G}$ above.

04BH Lemma 18.16.3. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous,
(b) $u$ is continuous, and
(c) fibre products and equalizers exist in $\mathcal{C}$ and $u$ commutes with them.

In this case the functor $g_{!}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ is exact.
Proof. Compare with Sites, Lemma 7.20.6. Assume (a), (b), and (c). We already know that $g_{!}$is right exact as it is a left adjoint, see Categories, Lemma 4.24 .5 and Homology, Section 12.7 . We have $g_{!}=\left(g_{p!}\right)^{\#}$. We have to show that $g!$ transforms injective maps of abelian sheaves into injective maps of abelian presheaves. Recall that sheafification of abelian presheaves is exact, see Lemma 18.3.2. Thus it suffices to show that $g_{p!}$ transforms injective maps of abelian presheaves into injective maps of abelian presheaves. To do this it suffices that colimits over the categories $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ of Sites, Section 7.5 transform injective maps between diagrams into injections. This follows from Sites, Lemma 7.5.1 and Algebra, Lemma 10.8.11.

077I Lemma 18.16.4. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous,
(b) $u$ is continuous, and
(c) $u$ is fully faithful.

For $g$ and $g$ ! as above the canonical map $\mathcal{F} \rightarrow g^{-1} g!\mathcal{F}$ is an isomorphism for all abelian sheaves $\mathcal{F}$ on $\mathcal{C}$.

Proof. Pick $U \in \mathrm{Ob}(\mathcal{C})$. We will show that $g^{-1} g_{!} \mathcal{F}(U)=\mathcal{F}(U)$. First, note that $g^{-1} g_{!} \mathcal{F}(U)=g_{!} \mathcal{F}(u(U))$. Hence it suffices to show that $g_{!} \mathcal{F}(u(U))=\mathcal{F}(U)$. We know that $g_{!} \mathcal{F}$ is the (abelian) sheaf associated to the presheaf $g_{p!} \mathcal{F}$ which is defined by the rule

$$
V \longmapsto \operatorname{colim}_{V \rightarrow u\left(U^{\prime}\right)} \mathcal{F}\left(U^{\prime}\right)
$$

with colimit taken in $A b$. If $V=u(U)$, then, as $u$ is fully faithful this colimit is over $U \rightarrow U^{\prime}$. Hence we conclude that $g_{p!} \mathcal{F}(u(U)=\mathcal{F}(U)$. Since $u$ is cocontinuous and continuous any covering of $u(U)$ in $\mathcal{D}$ can be refined by a covering (!) $\left\{u\left(U_{i}\right) \rightarrow\right.$ $u(U)\}$ of $\mathcal{D}$ where $\left\{U_{i} \rightarrow U\right\}$ is a covering in $\mathcal{C}$. This implies that $\left(g_{p!} \mathcal{F}\right)^{+}(u(U))=$ $\mathcal{F}(U)$ also, since in the colimit defining the value of $\left(g_{p!} \mathcal{F}\right)^{+}$on $u(U)$ we may restrict to the cofinal system of coverings $\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}$ as above. Hence we see that $\left(g_{p!} \mathcal{F}\right)^{+}(u(U))=\mathcal{F}(U)$ for all objects $U$ of $\mathcal{C}$ as well. Repeating this argument one more time gives the equality $\left(g_{p!} \mathcal{F}\right)^{\#}(u(U))=\mathcal{F}(U)$ for all objects $U$ of $\mathcal{C}$. This produces the desired equality $g^{-1} g_{!} \mathcal{F}=\mathcal{F}$.
04BI Remark 18.16.5. In general the functor $g$ ! cannot be extended to categories of modules in case $g$ is (part of) a morphism of ringed topoi. Namely, given any ring map $A \rightarrow B$ the functor $M \mapsto B \otimes_{A} M$ has a right adjoint (restriction) but not in general a left adjoint (because its existence would imply that $A \rightarrow B$ is flat). We will see in Section 18.19 below that it is possible to define $j$ ! on sheaves of modules in the case of a localization of sites. We will discuss this in greater generality in Section 18.40 below.

08P3 Lemma 18.16.6. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the morphism of topoi associated to a continuous and cocontinuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$.
(1) If $u$ has a left adjoint $w$, then $g$ ! agrees with $g_{!}^{S h}$ on underlying sheaves of sets and $g$ ! is exact.
(2) If in addition $w$ is cocontinuous, then $g_{!}=h^{-1}$ and $g^{-1}=h_{*}$ where $h: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ is the morphism of topoi associated to $w$.
Proof. This Lemma is the analogue of Sites, Lemma 7.22.1. From Sites, Lemma 7.18 .3 we see that the categories $\mathcal{I}_{V}^{u}$ have an initial object. Thus the underlying set of a colimit of a system of abelian groups over $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ is the colimit of the underlying sets. Whence the agreement of $g_{!}^{S h}$ and $g_{!}$by our construction of $g_{!}$in Definition 18.16.1. The exactness and (2) follow immediately from the corresponding statements of Sites, Lemma 7.22.1.

### 18.17. Global types of modules

03DD
03DE Definition 18.17.1. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$ modules.
(1) We say $\mathcal{F}$ is a free $\mathcal{O}$-module if $\mathcal{F}$ is isomorphic as an $\mathcal{O}$-module to a sheaf of the form $\bigoplus_{i \in I} \mathcal{O}$.
(2) We say $\mathcal{F}$ is finite free if $\mathcal{F}$ is isomorphic as an $\mathcal{O}$-module to a sheaf of the form $\bigoplus_{i \in I} \mathcal{O}$ with a finite index set $I$.
(3) We say $\mathcal{F}$ is generated by global sections if there exists a surjection

$$
\bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F}
$$

from a free $\mathcal{O}$-module onto $\mathcal{F}$.
(4) Given $r \geq 0$ we say $\mathcal{F}$ is generated by $r$ global sections if there exists a surjection $\mathcal{O}^{\oplus r} \rightarrow \mathcal{F}$.
(5) We say $\mathcal{F}$ is generated by finitely many global sections if it is generated by $r$ global sections for some $r \geq 0$.
(6) We say $\mathcal{F}$ has a global presentation if there exists an exact sequence

$$
\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F} \longrightarrow 0
$$

of $\mathcal{O}$-modules.
(7) We say $\mathcal{F}$ has a global finite presentation if there exists an exact sequence

$$
\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F} \longrightarrow 0
$$

of $\mathcal{O}$-modules with $I$ and $J$ finite sets.
Note that for any set $I$ the direct sum $\bigoplus_{i \in I} \mathcal{O}$ exists (Lemma 18.14.2) and is the sheafification of the presheaf $U \mapsto \bigoplus_{i \in I} \mathcal{O}(U)$. This module is called the free $\mathcal{O}$-module on the set $I$.

03 DF Lemma 18.17.2. Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{D}}$-module.
(1) If $\mathcal{F}$ is free then $f^{*} \mathcal{F}$ is free.
(2) If $\mathcal{F}$ is finite free then $f^{*} \mathcal{F}$ is finite free.
(3) If $\mathcal{F}$ is generated by global sections then $f^{*} \mathcal{F}$ is generated by global sections.
(4) Given $r \geq 0$ if $\mathcal{F}$ is generated by $r$ global sections, then $f^{*} \mathcal{F}$ is generated by $r$ global sections.
(5) If $\mathcal{F}$ is generated by finitely many global sections then $f^{*} \mathcal{F}$ is generated by finitely many global sections.
(6) If $\mathcal{F}$ has a global presentation then $f^{*} \mathcal{F}$ has a global presentation.
(7) If $\mathcal{F}$ has a finite global presentation then $f^{*} \mathcal{F}$ has a finite global presentation.

Proof. This is true because $f^{*}$ commutes with arbitrary colimits (Lemma 18.14.3) and $f^{*} \mathcal{O}_{\mathcal{D}}=\mathcal{O}_{\mathcal{C}}$.

### 18.18. Intrinsic properties of modules

$03 D G$ Let $\mathcal{P}$ be a property of sheaves of modules on ringed topoi. We say $\mathcal{P}$ is an intrinsic property if we have $\mathcal{P}(\mathcal{F}) \Leftrightarrow \mathcal{P}\left(f^{*} \mathcal{F}\right)$ whenever $\left(f, f^{\sharp}\right):\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ is an equivalence of ringed topoi. For example, the property of being free is intrinsic. Indeed, the free $\mathcal{O}$-module on the set $I$ is characterized by the property that

$$
\operatorname{Mor}_{M o d(\mathcal{O})}\left(\bigoplus_{i \in I} \mathcal{O}, \mathcal{F}\right)=\prod_{i \in I} \operatorname{Mor}_{S h(\mathcal{C})}(\{*\}, \mathcal{F})
$$

for a variable $\mathcal{F}$ in $\operatorname{Mod}(\mathcal{O})$. Alternatively, we can also use Lemma 18.17 .2 to see that being free is intrinsic. In fact, each of the properties defined in Definition 18.17.1 is intrinsic for the same reason. How will we go about defining other intrinsic properties of $\mathcal{O}$-modules?

The upshot of Lemma 18.7 .2 is the following: Suppose you want to define an intrinsic property $\mathcal{P}$ of an $\mathcal{O}$-module on a topos. Then you can proceed as follows:
(1) Given any site $\mathcal{C}$, any sheaf of rings $\mathcal{O}$ on $\mathcal{C}$ and any $\mathcal{O}$-module $\mathcal{F}$ define the corresponding property $\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F})$.
(2) For any pair of sites $\mathcal{C}, \mathcal{C}^{\prime}$, any special cocontinuous functor $u: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$, any sheaf of rings $\mathcal{O}$ on $\mathcal{C}$ any $\mathcal{O}$-module $\mathcal{F}$, show that

$$
\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F}) \Leftrightarrow \mathcal{P}\left(\mathcal{C}^{\prime}, g_{*} \mathcal{O}, g_{*} \mathcal{F}\right)
$$

where $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ is the equivalence of topoi associated to $u$.
In this case, given any ringed topos $(S h(\mathcal{C}), \mathcal{O})$ and any sheaf of $\mathcal{O}$-modules $\mathcal{F}$ we simply say that $\mathcal{F}$ has property $\mathcal{P}$ if $\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F})$ is true. And Lemma 18.7.2 combined with (2) above guarantees that this is well defined.
Moreover, the same Lemma 18.7 .2 also guarantees that if in addition
(3) For any morphism of ringed sites $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ such that $f$ is given by a functor $u: \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Sites, Proposition 7.15.6, and any $\mathcal{O}_{\mathcal{D}}$-module $\mathcal{G}$ we have

$$
\mathcal{P}\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}, \mathcal{F}\right) \Rightarrow \mathcal{P}\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}, f^{*} \mathcal{F}\right)
$$

then it is true that $\mathcal{P}$ is preserved under pullback of modules w.r.t. arbitrary morphisms of ringed topoi.

We will use this method in the following sections to see that: locally free, locally generated by sections, locally generated by $r$ sections, finite type, finite presentation, quasi-coherent, and coherent are intrinsic properties of modules.

Perhaps a more satisfying method would be to find an intrinsic definition of these notions, rather than the laborious process sketched here. On the other hand, in many geometric situations where we want to apply these definitions we are given a definite ringed site, and a definite sheaf of modules, and it is nice to have a definition already adapted to this language.
18.19. Localization of ringed sites

03 DH Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \mathrm{Ob}(\mathcal{C})$. We explain the counterparts of the results in Sites, Section 7.24 in this setting.
Denote $\mathcal{O}_{U}=j_{U}^{-1} \mathcal{O}$ the restriction of $\mathcal{O}$ to the site $\mathcal{C} / U$. It is described by the simple rule $\mathcal{O}_{U}(V / U)=\mathcal{O}(V)$. With this notation the localization morphism $j_{U}$ becomes a morphism of ringed topoi

$$
\left(j_{U}, j_{U}^{\sharp}\right):\left(S h(\mathcal{C} / U), \mathcal{O}_{U}\right) \longrightarrow(S h(\mathcal{C}), \mathcal{O})
$$

namely, we take $j_{U}^{\sharp}: j_{U}^{-1} \mathcal{O} \rightarrow \mathcal{O}_{U}$ the identity map. Moreover, we obtain the following descriptions for pushforward and pullback of modules.
04IX Definition 18.19.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \mathrm{Ob}(\mathcal{C})$.
(1) The ringed site $\left(\mathcal{C} / U, \mathcal{O}_{U}\right)$ is called the localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object $U$.
(2) The morphism of ringed topoi $\left(j_{U}, j_{U}^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ is called the localization morphism.
(3) The functor $j_{U *}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$ is called the direct image functor.
(4) For a sheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{C}$ the sheaf $j_{U}^{*} \mathcal{F}$ is called the restriction of $\mathcal{F}$ to $\mathcal{C} / U$. We will sometimes denote it by $\left.\mathcal{F}\right|_{\mathcal{C} / U}$ or even $\left.\mathcal{F}\right|_{U}$. It is described by the simple rule $j_{U}^{*}(\mathcal{F})(X / U)=\mathcal{F}(X)$.
(5) The left adjoint $j_{U!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$ of restriction is called extension by zero. It exists and is exact by Lemmas 18.19.2 and 18.19.3.
As in the topological case, see Sheaves, Section 6.31 the extension by zero $j_{U}$ ! functor is different from extension by the empty set $j_{U}$ ! defined on sheaves of sets. Here is the lemma defining extension by zero.
03DI Lemma 18.19.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \operatorname{Ob}(\mathcal{C})$. The restriction functor $j_{U}^{*}: \operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{U}\right)$ has a left adjoint $j_{U!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$. So

$$
\operatorname{Mor}_{\operatorname{Mod}\left(\mathcal{O}_{U}\right)}\left(\mathcal{G}, j_{U}^{*} \mathcal{F}\right)=\operatorname{Mor}_{M o d(\mathcal{O})}\left(j_{U!\mathcal{G}} \mathcal{G}\right)
$$

for $\mathcal{F} \in \operatorname{Ob}(\operatorname{Mod}(\mathcal{O}))$ and $\mathcal{G} \in \operatorname{Ob}\left(\operatorname{Mod}\left(\mathcal{O}_{U}\right)\right)$. Moreover, the extension by zero $j_{U}!\mathcal{G}$ of $\mathcal{G}$ is the sheaf associated to the presheaf

$$
V \longmapsto \bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)
$$

with obvious restriction mappings and an obvious $\mathcal{O}$-module structure.
Proof. The $\mathcal{O}$-module structure on the presheaf is defined as follows. If $f \in \mathcal{O}(V)$ and $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$, then we define $f \cdot s=f s$ where $f \in \mathcal{O}_{U}(\varphi: V \rightarrow U)=\mathcal{O}(V)$ (because $\mathcal{O}_{U}$ is the restriction of $\mathcal{O}$ to $\left.\mathcal{C} / U\right)$.
Similarly, let $\alpha:\left.\mathcal{G} \rightarrow \mathcal{F}\right|_{U}$ be a morphism of $\mathcal{O}_{U}$-modules. In this case we can define a map from the presheaf of the lemma into $\mathcal{F}$ by mapping

$$
\bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U) \longrightarrow \mathcal{F}(V)
$$

by the rule that $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$ maps to $\alpha(s) \in \mathcal{F}(V)$. It is clear that this is $\mathcal{O}$ linear, and hence induces a morphism of $\mathcal{O}$-modules $\alpha^{\prime}: j_{U!} \mathcal{G} \rightarrow \mathcal{F}$ by the properties of sheafification of modules (Lemma 18.11.1.
Conversely, let $\beta: j_{U} \mathcal{G} \rightarrow \mathcal{F}$ by a map of $\mathcal{O}$-modules. Recall from Sites, Section 7.24 that there exists an extension by the empty set $j_{U!}^{S h}: \operatorname{Sh}(\mathcal{C} / U) \rightarrow \operatorname{Sh}(\mathcal{C})$ on
sheaves of sets which is left adjoint to $j_{U}^{-1}$. Moreover, $j_{U!}^{S h} \mathcal{G}$ is the sheaf associated to the presheaf

$$
V \longmapsto \coprod_{\varphi \in \operatorname{Mor}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)
$$

Hence there is a natural map $j_{U!}^{S h} \mathcal{G} \rightarrow j_{U!} \mathcal{G}$ of sheaves of sets. Hence precomposing $\beta$ by this map we get a map of sheaves of sets $j_{U!}^{S h} \mathcal{G} \rightarrow \mathcal{F}$ which by adjunction corresponds to a map of sheaves of sets $\beta^{\prime}:\left.\mathcal{G} \rightarrow \mathcal{F}\right|_{U}$. We claim that $\beta^{\prime}$ is $\mathcal{O}_{U}$-linear. Namely, suppose that $\varphi: V \rightarrow U$ is an object of $\mathcal{C} / U$ and that $s, s^{\prime} \in \mathcal{G}(\varphi: V \rightarrow U)$, and $f \in \mathcal{O}(V)=\mathcal{O}_{U}(\varphi: V \rightarrow U)$. Then by the discussion above we see that $\beta^{\prime}\left(s+s^{\prime}\right)$, resp. $\beta^{\prime}(f s)$ in $\left.\mathcal{F}\right|_{U}(\varphi: V \rightarrow U)$ correspond to $\beta\left(s+s^{\prime}\right)$, resp. $\beta(f s)$ in $\mathcal{F}(V)$. Since $\beta$ is a homomorphism we conclude.

To conclude the proof of the lemma we have to show that the constructions $\alpha \mapsto \alpha^{\prime}$ and $\beta \mapsto \beta^{\prime}$ are mutually inverse. We omit the verifications.

03DJ Lemma 18.19.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \operatorname{Ob}(\mathcal{C})$. The functor $j_{U!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$ is exact.

Proof. Since $j_{U}$ ! is a left adjoint to $j_{U}^{*}$ we see that it is right exact (see Categories, Lemma 4.24 .5 and Homology, Section 12.7). Hence it suffices to show that if $\mathcal{G}_{1} \rightarrow$ $\mathcal{G}_{2}$ is an injective map of $\mathcal{O}_{U}$-modules, then $j_{U} \mathcal{G}_{1} \rightarrow j_{U!} \mathcal{G}_{2}$ is injective. The map on sections of presheaves over an object $V$ (as in Lemma 18.19.2 is the map

$$
\bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}_{1}(V \stackrel{\varphi}{\longrightarrow} U) \longrightarrow \bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}_{2}(V \xrightarrow{\varphi} U)
$$

which is injective by assumption. Since sheafification is exact by Lemma 18.11.2 we conclude $j_{U!} \mathcal{G}_{1} \rightarrow j_{U}!\mathcal{G}_{2}$ is injective and we win.

04IY Lemma 18.19.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $f: V \rightarrow U$ be a morphism of $\mathcal{C}$. Then there exists a commutative diagram

of ringed topoi. Here $\left(j, j^{\sharp}\right)$ is the localization morphism associated to the object $U / V$ of the ringed site $\left(\mathcal{C} / V, \mathcal{O}_{V}\right)$.

Proof. The only thing to check is that $j_{V}^{\sharp}=j^{\sharp} \circ j^{-1}\left(j_{U}^{\sharp}\right)$, since everything else follows directly from Sites, Lemma 7.24.7 and Sites, Equation 7.24.7.1. We omit the verification of the equality.

08P4 Remark 18.19.5. In the situation of Lemma 18.19 .2 the diagram

commutes. This is clear from the explicit description of the functor $j_{U}$ ! in the lemma.

03EJ Remark 18.19.6. Localization and presheaves of modules; see Sites, Remark 7.24.9. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let $U$ be an object of $\mathcal{C}$. Strictly speaking the functors $j_{U}^{*}, j_{U *}$ and $j_{U!}$ have not been defined for presheaves of $\mathcal{O}$-modules. But of course, we can think of a presheaf as a sheaf for the chaotic topology on $\mathcal{C}$ (see Sites, Examples 7.6.6). Hence we also obtain a functor

$$
j_{U}^{*}: \operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{U}\right)
$$

and functors

$$
j_{U *}, j_{U!}: \operatorname{PMod}\left(\mathcal{O}_{U}\right) \longrightarrow \operatorname{PMod}(\mathcal{O})
$$

which are right, left adjoint to $j_{U}^{*}$. Inspecting the proof of Lemma 18.19 .2 we see that $j_{U!} \mathcal{G}$ is the presheaf

$$
V \longmapsto \bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \stackrel{\varphi}{\longrightarrow} U)
$$

In addition the functor $j_{U!}$ is exact (by Lemma 18.19 .3 in the case of the discrete topologies). Moreover, if $\mathcal{C}$ is actually a site, and $\mathcal{O}$ is actually a sheaf of rings, then the diagram

commutes.
0931 Remark 18.19.7 (Map from lower shriek to pushforward). Let $U$ be an object of $\mathcal{C}$. For any abelian sheaf $\mathcal{G}$ on $\mathcal{C} / U$ there is a canonical map

$$
c: j_{U!} \mathcal{G} \longrightarrow j_{U *} \mathcal{G}
$$

Namely, this is the same thing as a map $j_{U}^{-1} j_{U!} \mathcal{G} \rightarrow \mathcal{G}$. Note that restriction commutes with sheafification. Thus we can use the presheaf of Lemma 18.19.2. Hence it suffices to define for $V / U$ a map

$$
\bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V) \longrightarrow \mathcal{G}(V)
$$

compatible with restrictions. We simply take the map which is zero on all summands except for the one where $\varphi$ is the structure morphism $V \rightarrow U$ where we take 1. Moreover, if $\mathcal{O}$ is a sheaf of rings on $\mathcal{C}$ and $\mathcal{G}$ is an $\mathcal{O}_{U}$-module, then the displayed map above is a map of $\mathcal{O}$-modules.

### 18.20. Localization of morphisms of ringed sites

04IZ This section is the analogue of Sites, Section 7.27.
04J0 Lemma 18.20.1. Let $\left(f, f^{\sharp}\right):(\mathcal{C}, \mathcal{O}) \longrightarrow\left(\mathcal{D}, \mathcal{O}^{\prime}\right)$ be a morphism of ringed sites where $f$ is given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V$ be an object of $\mathcal{D}$ and set $U=u(V)$. Then there is a canonical map of sheaves of rings $\left(f^{\prime}\right)^{\sharp}$ such that the diagram of Sites, Lemma 7.27.1 is turned into a commutative diagram of ringed topoi

Moreover, in this situation we have $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$ and $f_{*}^{\prime} j_{U}^{*}=j_{V}^{*} f_{*}$.
Proof. Just take $\left(f^{\prime}\right)^{\sharp}$ to be

$$
\left(f^{\prime}\right)^{-1} \mathcal{O}_{V}^{\prime}=\left(f^{\prime}\right)^{-1} j_{V}^{-1} \mathcal{O}^{\prime}=j_{U}^{-1} f^{-1} \mathcal{O}^{\prime} \xrightarrow{j_{U}^{-1} f^{\sharp}} j_{U}^{-1} \mathcal{O}=\mathcal{O}_{U}
$$

and everything else follows from Sites, Lemma 7.27.1. (Note that $j^{-1}=j^{*}$ on sheaves of modules if $j$ is a localization morphism, hence the first equality of functors implies the second.)

04J1 Lemma 18.20.2. Let $\left(f, f^{\sharp}\right):(\mathcal{C}, \mathcal{O}) \longrightarrow\left(\mathcal{D}, \mathcal{O}^{\prime}\right)$ be a morphism of ringed sites where $f$ is given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \operatorname{Ob}(\mathcal{D}), U \in \operatorname{Ob}(\mathcal{C})$ and $c: U \rightarrow u(V)$ a morphism of $\mathcal{C}$. There exists a commutative diagram of ringed topoi

The morphism $\left(f_{c}, f_{c}^{\sharp}\right)$ is equal to the composition of the morphism

$$
\left(f^{\prime},\left(f^{\prime}\right)^{\sharp}\right):\left(S h(\mathcal{C} / u(V)), \mathcal{O}_{u(V)}\right) \longrightarrow\left(\operatorname{Sh}(\mathcal{D} / V), \mathcal{O}_{V}^{\prime}\right)
$$

of Lemma 18.20 .1 and the morphism

$$
\left(j, j^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{C} / u(V)), \mathcal{O}_{u(V)}\right)
$$

of Lemma 18.19.4. Given any morphisms $b: V^{\prime} \rightarrow V, a: U^{\prime} \rightarrow U$ and $c^{\prime}: U^{\prime} \rightarrow$ $u\left(V^{\prime}\right)$ such that

commutes, then the following diagram of ringed topoi
commutes.
Proof. On the level of morphisms of topoi this is Sites, Lemma 7.27.3. To check that the diagrams commute as morphisms of ringed topoi use Lemmas 18.19.4 and 18.20 .1 exactly as in the proof of Sites, Lemma 7.27.3.

### 18.21. Localization of ringed topoi

04ID This section is the analogue of Sites, Section 7.29 in the setting of ringed topoi.
04IE Lemma 18.21.1. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F} \in S h(\mathcal{C})$ be a sheaf. For a sheaf $\mathcal{H}$ on $\mathcal{C}$ denote $\mathcal{H}_{\mathcal{F}}$ the sheaf $\mathcal{H} \times \mathcal{F}$ seen as an object of the category $\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$. The pair $\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right)$ is a ringed topos and there is a canonical morphism of ringed topoi

$$
\left(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}\right):\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \longrightarrow(S h(\mathcal{C}), \mathcal{O})
$$

which is a localization as in Section 18.19 such that
(1) the functor $j_{\mathcal{F}}^{-1}$ is the functor $\mathcal{H} \mapsto \mathcal{H}_{\mathcal{F}}$,
(2) the functor $j_{\mathcal{F}}^{*}$ is the functor $\mathcal{H} \mapsto \mathcal{H}_{\mathcal{F}}$,
(3) the functor $j_{\mathcal{F} \text { ! }}$ on sheaves of sets is the forgetful functor $\mathcal{G} / \mathcal{F} \mapsto \mathcal{G}$,
(4) the functor $j_{\mathcal{F}}$ on sheaves of modules associates to the $\mathcal{O}_{\mathcal{F}}$-module $\varphi$ : $\mathcal{G} \rightarrow \mathcal{F}$ the $\mathcal{O}$-module which is the sheafification of the presheaf

$$
V \longmapsto \bigoplus_{s \in \mathcal{F}(V)}\{\sigma \in \mathcal{G}(V) \mid \varphi(\sigma)=s\}
$$

for $V \in \operatorname{Ob}(\mathcal{C})$.
Proof. By Sites, Lemma 7.29.1 we see that $S h(\mathcal{C}) / \mathcal{F}$ is a topos and that (1) and (3) are true. In particular this shows that $j_{\mathcal{F}}^{-1} \mathcal{O}=\mathcal{O}_{\mathcal{F}}$ and shows that $\mathcal{O}_{\mathcal{F}}$ is a sheaf of rings. Thus we may choose the map $j_{\mathcal{F}}^{\sharp}$ to be the identity, in particular we see that (2) is true. Moreover, the proof of Sites, Lemma 7.29.1 shows that we may assume $\mathcal{C}$ is a site with all finite limits and a subcanonical topology and that $\mathcal{F}=h_{U}$ for some object $U$ of $\mathcal{C}$. Then (4) follows from the description of $j_{\mathcal{F}!}$ in Lemma 18.19 .2 . Alternatively one could show directly that the functor described in (4) is a left adjoint to $j_{\mathcal{F}}^{*}$.

04 J 2 Definition 18.21.2. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F} \in \operatorname{Sh}(\mathcal{C})$.
(1) The ringed topos $\left(\operatorname{Sh}(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right)$ is called the localization of the ringed topos $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ at $\mathcal{F}$.
(2) The morphism of ringed topoi $\left(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}\right):\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ of Lemma 18.21.1 is called the localization morphism.

We continue the tradition, established in the chapter on sites, that we check the localization constructions on topoi are compatible with the constructions of localization on sites, whenever this makes sense.

04J3 Lemma 18.21.3. With $(S h(\mathcal{C}), \mathcal{O})$ and $\mathcal{F} \in \operatorname{Sh}(\mathcal{C})$ as in Lemma 18.21.1. If $\mathcal{F}=h_{U}^{\#}$ for some object $U$ of $\mathcal{C}$ then via the identification $\operatorname{Sh}(\mathcal{C} / U)=S h(\mathcal{C}) / h_{U}^{\#}$ of Sites, Lemma 7.24.4 we have
(1) canonically $\mathcal{O}_{U}=\mathcal{O}_{\mathcal{F}}$, and
(2) with these identifications we have $\left(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}\right)=\left(j_{U}, j_{U}^{\sharp}\right)$.

Proof. The assertion for underlying topoi is Sites, Lemma 7.29.5. Note that $\mathcal{O}_{U}$ is the restriction of $\mathcal{O}$ which by Sites, Lemma 7.24 .6 corresponds to $\mathcal{O} \times h_{U}^{\#}$ under the equivalence of Sites, Lemma 7.24.4. By definition of $\mathcal{O}_{\mathcal{F}}$ we get (1). What's left is to prove that $j_{\mathcal{F}}^{\sharp}=j_{U}^{\sharp}$ under this identification. We omit the verification.

Localization is functorial in the following two ways: We can "relocalize" a localization (see Lemma 18.21.4) or we can given a morphism of ringed topoi, localize upstairs at the inverse image of a sheaf downstairs and get a commutative diagram of locally ringed spaces (see Lemma 18.22.1).

04J4 Lemma 18.21.4. Let $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ be a ringed topos. If $s: \mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves on $\mathcal{C}$ then there exists a natural commutative diagram of morphisms of
ringed topoi

where $\left(j, j^{\sharp}\right)$ is the localization morphism of the ringed topos $\left(\operatorname{Sh}(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right)$ at the object $\mathcal{G} / \mathcal{F}$.

Proof. All assertions follow from Sites, Lemma 7.29 .6 except the assertion that $j_{\mathcal{G}}^{\sharp}=j^{\sharp} \circ j^{-1}\left(j_{\mathcal{F}}^{\sharp}\right)$. We omit the verification.

04J5 Lemma 18.21.5. With $(\operatorname{Sh}(\mathcal{C}), \mathcal{O}), s: \mathcal{G} \rightarrow \mathcal{F}$ as in Lemma 18.21.4. If there exist a morphism $f: V \rightarrow U$ of $\mathcal{C}$ such that $\mathcal{G}=h_{V}^{\#}$ and $\mathcal{F}=h_{U}^{\#}$ and $s$ is induced by $f$, then the diagrams of Lemma 18.19 .4 and Lemma 18.21.4 agree via the identifications $\left(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}\right)=\left(j_{U}, j_{U}^{\sharp}\right)$ and $\left(j_{\mathcal{G}}, j_{\mathcal{G}}^{\sharp}\right)=\left(j_{V}, j_{V}^{\sharp}\right)$ of Lemma 18.21.3.
Proof. All assertions follow from Sites, Lemma 7.29.7 except for the assertion that the two maps $j^{\sharp}$ agree. This holds since in both cases the map $j^{\sharp}$ is simply the identity. Some details omitted.

### 18.22. Localization of morphisms of ringed topoi

04J6 This section is the analogue of Sites, Section 7.30 .
04IF Lemma 18.22.1. Let

$$
f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \longrightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)
$$

be a morphism of ringed topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$. Set $\mathcal{F}=f^{-1} \mathcal{G}$. Then there exists a commutative diagram of ringed topoi

We have $f_{*}^{\prime} j_{\mathcal{F}}^{-1}=j_{\mathcal{G}}^{-1} f_{*}$ and $f_{*}^{\prime} j_{\mathcal{F}}^{*}=j_{\mathcal{G}}^{*} f_{*}$. Moreover, the morphism $f^{\prime}$ is characterized by the rule

$$
\left(f^{\prime}\right)^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G})=\left(f^{-1} \mathcal{H} \xrightarrow{f^{-1} \varphi} \mathcal{F}\right) .
$$

Proof. By Sites, Lemma 7.30.1 we have the diagram of underlying topoi, the equality $f_{*}^{\prime} j_{\mathcal{F}}^{-1}=j_{\mathcal{G}}^{-1} f_{*}$, and the description of $\left(f^{\prime}\right)^{-1}$. To define $\left(f^{\prime}\right)^{\sharp}$ we use the map

$$
\left(f^{\prime}\right)^{\sharp}: \mathcal{O}_{\mathcal{G}}^{\prime}=j_{\mathcal{G}}^{-1} \mathcal{O}^{\prime} \xrightarrow{j_{\mathcal{G}}^{-1} f^{\sharp}} j_{\mathcal{G}}^{-1} f_{*} \mathcal{O}=f_{*}^{\prime} j_{\mathcal{F}}^{-1} \mathcal{O}=f_{*}^{\prime} \mathcal{O}_{\mathcal{F}}
$$

or equivalently the map

$$
\left(f^{\prime}\right)^{\sharp}:\left(f^{\prime}\right)^{-1} \mathcal{O}_{\mathcal{G}}^{\prime}=\left(f^{\prime}\right)^{-1} j_{\mathcal{G}}^{-1} \mathcal{O}^{\prime}=j_{\mathcal{F}}^{-1} f^{-1} \mathcal{O}^{\prime} \xrightarrow{j_{\mathcal{F}}^{-1} f^{\sharp}} j_{\mathcal{F}}^{-1} \mathcal{O}=\mathcal{O}_{\mathcal{F}}
$$

We omit the verification that these two maps are indeed adjoint to each other. The second construction of $\left(f^{\prime}\right)^{\sharp}$ shows that the diagram commutes in the 2-category of ringed topoi (as the maps $j_{\mathcal{F}}^{\sharp}$ and $j_{\mathcal{G}}^{\sharp}$ are identities). Finally, the equality $f_{*}^{\prime} j_{\mathcal{F}}^{*}=$
$j_{\mathcal{G}}^{*} f_{*}$ follows from the equality $f_{*}^{\prime} j_{\mathcal{F}}^{-1}=j_{\mathcal{G}}^{-1} f_{*}$ and the fact that pullbacks of sheaves of modules and sheaves of sets agree, see Lemma 18.21.1.

04J7 Lemma 18.22.2. Let

$$
f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \longrightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)
$$

be a morphism of ringed topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$. Set $\mathcal{F}=f^{-1} \mathcal{G}$. If $f$ is given by a continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$ and $\mathcal{G}=h_{V}^{\#}$, then the commutative diagrams of Lemma 18.20.1 and Lemma 18.22.1 agree via the identifications of Lemma 18.21.3.

Proof. At the level of morphisms of topoi this is Sites, Lemma 7.30.2. This works also on the level of morphisms of ringed topoi since the formulas defining $\left(f^{\prime}\right)^{\sharp}$ in the proofs of Lemma 18.20.1 and Lemma 18.22.1 agree.

04J8 Lemma 18.22.3. Let $\left(f, f^{\sharp}\right):(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$, let $\mathcal{F}$ be a sheaf on $\mathcal{C}$, and let $s: \mathcal{F} \rightarrow f^{-1} \mathcal{G} a$ morphism of sheaves. There exists a commutative diagram of ringed topoi

The morphism $\left(f_{s}, f_{s}^{\sharp}\right)$ is equal to the composition of the morphism

$$
\left(f^{\prime},\left(f^{\prime}\right)^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}) / f^{-1} \mathcal{G}, \mathcal{O}_{f^{-1} \mathcal{G}}\right) \longrightarrow\left(\operatorname{Sh}(\mathcal{D}) / \mathcal{G}, \mathcal{O}_{\mathcal{G}}^{\prime}\right)
$$

of Lemma 18.22.1 and the morphism

$$
\left(j, j^{\sharp}\right):\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \rightarrow\left(S h(\mathcal{C}) / f^{-1} \mathcal{G}, \mathcal{O}_{f^{-1} \mathcal{G}}\right)
$$

of Lemma 18.21.4. Given any morphisms $b: \mathcal{G}^{\prime} \rightarrow \mathcal{G}, a: \mathcal{F}^{\prime} \rightarrow \mathcal{F}$, and $s^{\prime}: \mathcal{F}^{\prime} \rightarrow$ $f^{-1} \mathcal{G}^{\prime}$ such that

commutes, then the following diagram of ringed topoi

commutes.
Proof. On the level of morphisms of topoi this is Sites, Lemma 7.30.3. To check that the diagrams commute as morphisms of ringed topoi use the commutative diagrams of Lemmas 18.21 .4 and 18.22 .1 .

04J9 Lemma 18.22.4. Let $\left(f, f^{\sharp}\right):(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right), s: \mathcal{F} \rightarrow f^{-1} \mathcal{G}$ be as in Lemma 18.22.3. If $f$ is given by a continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$ and $\mathcal{G}=h_{V}^{\#}$, $\mathcal{F}=h_{U}^{\#}$ and $s$ comes from a morphism $c: U \rightarrow u(V)$, then the commutative
diagrams of Lemma 18.20 .2 and Lemma 18.22 .3 agree via the identifications of Lemma 18.21.3.
Proof. This is formal using Lemmas 18.21 .5 and 18.22 .2 .

### 18.23. Local types of modules

03DK According to our general strategy explained in Section 18.18 we first define the local types for sheaves of modules on a ringed site, and then we immediately show that these types are intrinsic, hence make sense for sheaves of modules on ringed topoi.

03DL Definition 18.23.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. We will freely use the notions defined in Definition 18.17.1.
(1) We say $\mathcal{F}$ is locally free if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is a free $\mathcal{O}_{U_{i}}$-module.
(2) We say $\mathcal{F}$ is finite locally free if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is a finite free $\mathcal{O}_{U_{i}}$-module.
(3) We say $\mathcal{F}$ is locally generated by sections if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is an $\mathcal{O}_{U_{i}}$-module generated by global sections.
(4) Given $r \geq 0$ we sat $\mathcal{F}$ is locally generated by $r$ sections if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is an $\mathcal{O}_{U_{i}}$-module generated by $r$ global sections.
(5) We say $\mathcal{F}$ is of finite type if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is an $\mathcal{O}_{U_{i}}$-module generated by finitely many global sections.
(6) We say $\mathcal{F}$ is quasi-coherent if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is an $\mathcal{O}_{U_{i}}$-module which has a global presentation.
(7) We say $\mathcal{F}$ is of finite presentation if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is an $\mathcal{O}_{U_{i}-}$ module which has a finite global presentation.
(8) We say $\mathcal{F}$ is coherent if and only if $\mathcal{F}$ is of finite type, and for every object $U$ of $\mathcal{C}$ and any $s_{1}, \ldots, s_{n} \in \mathcal{F}(U)$ the kernel of the map $\left.\bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U}$ is of finite type on $\left(\mathcal{C} / U, \mathcal{O}_{U}\right)$.

03DM Lemma 18.23.2. Any of the properties (1) - (8) of Definition 18.23.1 is intrinsic (see discussion in Section 18.18).
Proof. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a special cocontinuous functor. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on $\mathcal{C}$. Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the equivalence of topoi associated to $u$. Set $\mathcal{O}^{\prime}=g_{*} \mathcal{O}$, and let $g^{\sharp}: \mathcal{O}^{\prime} \rightarrow g_{*} \mathcal{O}$ be the identity. Finally, set $\mathcal{F}^{\prime}=g_{*} \mathcal{F}$. Let $\mathcal{P}_{l}$ be one of the properties (1) - (7) listed in Definition 18.23.1. (We will discuss the coherent case at the end of the proof.) Let $\mathcal{P}_{g}$ denote the corresponding property listed in Definition 18.17.1. We have already seen that $\mathcal{P}_{g}$ is intrinsic. We have to show that $\mathcal{P}_{l}(\mathcal{C}, \mathcal{O}, \mathcal{F})$ holds if and only if $\mathcal{P}_{l}\left(\mathcal{D}, \mathcal{O}^{\prime}, \mathcal{F}^{\prime}\right)$ holds.
Assume that $\mathcal{F}$ has $\mathcal{P}_{l}$. Let $V$ be an object of $\mathcal{D}$. One of the properties of a special cocontinuous functor is that there exists a covering $\left\{u\left(U_{i}\right) \rightarrow V\right\}_{i \in I}$ in the site $\mathcal{D}$.

By assumption, for each $i$ there exists a covering $\left\{U_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{U_{i j}}$ is $\mathcal{P}_{g}$. By Sites, Lemma 7.28 .3 we have commutative diagrams of ringed topoi

where the vertical arrows are equivalences. Hence we conclude that $\left.\mathcal{F}^{\prime}\right|_{u\left(U_{i j}\right)}$ has property $\mathcal{P}_{g}$ also. And moreover, $\left\{u\left(U_{i j}\right) \rightarrow V\right\}_{i \in I, j \in J_{i}}$ is a covering of the site $\mathcal{D}$. Hence $\mathcal{F}^{\prime}$ has property $\mathcal{P}_{l}$.
Assume that $\mathcal{F}^{\prime}$ has $\mathcal{P}_{l}$. Let $U$ be an object of $\mathcal{C}$. By assumption, there exists a covering $\left\{V_{i} \rightarrow u(U)\right\}_{i \in I}$ such that $\left.\mathcal{F}^{\prime}\right|_{V_{i}}$ has property $\mathcal{P}_{g}$. Because $u$ is cocontinuous we can refine this covering by a family $\left\{u\left(U_{j}\right) \rightarrow u(U)\right\}_{j \in J}$ where $\left\{U_{j} \rightarrow U\right\}_{j \in J}$ is a covering in $\mathcal{C}$. Say the refinement is given by $\alpha: J \rightarrow I$ and $u\left(U_{j}\right) \rightarrow V_{\alpha(j)}$. Restricting is transitive, i.e., $\left.\left(\left.\mathcal{F}^{\prime}\right|_{V_{\alpha(j)}}\right)\right|_{u\left(U_{j}\right)}=\left.\mathcal{F}^{\prime}\right|_{u\left(U_{j}\right)}$. Hence by Lemma 18.17 .2 we see that $\left.\mathcal{F}^{\prime}\right|_{u\left(U_{j}\right)}$ has property $\mathcal{P}_{g}$. Hence the diagram

where the vertical arrows are equivalences shows that $\left.\mathcal{F}\right|_{U_{j}}$ has property $\mathcal{P}_{g}$ also. Thus $\mathcal{F}$ has property $\mathcal{P}_{l}$ as desired.

Finally, we prove the lemma in case $\mathcal{P}_{l}=$ coherent ${ }^{2}$. Assume $\mathcal{F}$ is coherent. This implies that $\mathcal{F}$ is of finite type and hence $\mathcal{F}^{\prime}$ is of finite type also by the first part of the proof. Let $V$ be an object of $\mathcal{D}$ and let $s_{1}, \ldots, s_{n} \in \mathcal{F}^{\prime}(V)$. We have to show that the kernel $\mathcal{K}^{\prime}$ of $\left.\bigoplus_{j=1, \ldots, n} \mathcal{O}_{V} \rightarrow \mathcal{F}^{\prime}\right|_{V}$ is of finite type on $\mathcal{D} / V$. This means we have to show that for any $V^{\prime} / V$ there exists a covering $\left\{V_{i}^{\prime} \rightarrow V^{\prime}\right\}$ such that $\left.\mathcal{F}^{\prime}\right|_{V_{i}^{\prime}}$ is generated by finitely many sections. Replacing $V$ by $V^{\prime}$ (and restricting the sections $s_{j}$ to $V^{\prime}$ ) we reduce to the case where $V^{\prime}=V$. Since $u$ is a special cocontinuous functor, there exists a covering $\left\{u\left(U_{i}\right) \rightarrow V\right\}_{i \in I}$ in the site $\mathcal{D}$. Using the isomorphism of topoi $\operatorname{Sh}\left(\mathcal{C} / U_{i}\right)=\operatorname{Sh}\left(\mathcal{D} / u\left(U_{i}\right)\right)$ we see that $\left.\mathcal{K}^{\prime}\right|_{u\left(U_{i}\right)}$ corresponds to the kernel $\mathcal{K}_{i}$ of a map $\left.\bigoplus_{j=1, \ldots, n} \mathcal{O}_{U_{i}} \rightarrow \mathcal{F}\right|_{U_{i}}$. Since $\mathcal{F}$ is coherent we see that $\mathcal{K}_{i}$ is of finite type. Hence we conclude (by the first part of the proof again) that $\left.\mathcal{K}\right|_{u\left(U_{i}\right)}$ is of finite type. Thus there exist coverings $\left\{V_{i l} \rightarrow u\left(U_{i}\right)\right\}$ such that $\left.\mathcal{K}\right|_{V_{i l}}$ is generated by finitely many global sections. Since $\left\{V_{i l} \rightarrow V\right\}$ is a covering of $\mathcal{D}$ we conclude that $\mathcal{K}$ is of finite type as desired.

Assume $\mathcal{F}^{\prime}$ is coherent. This implies that $\mathcal{F}^{\prime}$ is of finite type and hence $\mathcal{F}$ is of finite type also by the first part of the proof. Let $U$ be an object of $\mathcal{C}$, and let $s_{1}, \ldots, s_{n} \in \mathcal{F}(U)$. We have to show that the kernel $\mathcal{K}$ of $\left.\bigoplus_{j=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U}$ is of finite type on $\mathcal{C} / U$. Using the isomorphism of topoi $\operatorname{Sh}(\mathcal{C} / U)=\operatorname{Sh}(\mathcal{D} / u(U))$ we see that $\left.\mathcal{K}\right|_{U}$ corresponds to the kernel $\mathcal{K}^{\prime}$ of a map $\left.\bigoplus_{j=1, \ldots, n} \mathcal{O}_{u(U)} \rightarrow \mathcal{F}^{\prime}\right|_{u(U)}$. As

[^49]$\mathcal{F}^{\prime}$ is coherent, we see that $\mathcal{K}^{\prime}$ is of finite type. Hence, by the first part of the proof again, we conclude that $\mathcal{K}$ is of finite type.

Hence from now on we may refer to the properties of $\mathcal{O}$-modules defined in Definition 18.23.1 without specifying a site.

03DN Lemma 18.23.3. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Assume that the site $\mathcal{C}$ has a final object $X$. Then
(1) The following are equivalent
(a) $\mathcal{F}$ is locally free,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a locally free $\mathcal{O}_{X_{i}}$-module, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a free $\mathcal{O}_{X_{i}}$-module.
(2) The following are equivalent
(a) $\mathcal{F}$ is finite locally free,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a finite locally free $\mathcal{O}_{X_{i}}$-module, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a finite free $\mathcal{O}_{X_{i}}$-module.
(3) The following are equivalent
(a) $\mathcal{F}$ is locally generated by sections,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module locally generated by sections, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module globally generated by sections.
(4) Given $r \geq 0$, the following are equivalent
(a) $\mathcal{F}$ is locally generated by $r$ sections,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C}^{\prime} X_{i}}$ is an $\mathcal{O}_{X_{i}}-$ module locally generated by $r$ sections, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C}_{X_{i}}}$ is an $\mathcal{O}_{X_{i}}$-module globally generated by $r$ sections.
(5) The following are equivalent
(a) $\mathcal{F}$ is of finite type,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module of finite type, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module globally generated by finitely many sections.
(6) The following are equivalent
(a) $\mathcal{F}$ is quasi-coherent,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a quasi-coherent $\mathcal{O}_{X_{i}}$-module, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C}_{X_{i}}}$ is an $\mathcal{O}_{X_{i}}$-module which has a global presentation.
(7) The following are equivalent
(a) $\mathcal{F}$ is of finite presentation,
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module of finite presentation, and
(c) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is an $\mathcal{O}_{X_{i}}$-module has a finite global presentation.
(8) The following are equivalent
(a) $\mathcal{F}$ is coherent, and
(b) there exists a covering $\left\{X_{i} \rightarrow X\right\}$ in $\mathcal{C}$ such that each restriction $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i}}$ is a coherent $\mathcal{O}_{X_{i}}-$ module.
Proof. In each case we have (a) $\Rightarrow(b)$. In each of the cases (1) - (6) condition (b) implies condition (c) by axiom (2) of a site (see Sites, Definition 7.6.2) and the definition of the local types of modules. Suppose $\left\{X_{i} \rightarrow X\right\}$ is a covering. Then for every object $U$ of $\mathcal{C}$ we get an induced covering $\left\{X_{i} \times_{X} U \rightarrow U\right\}$. Moreover, the global property for $\left.\mathcal{F}\right|_{\mathcal{C} X_{i}}$ in part (c) implies the corresponding global property for $\left.\mathcal{F}\right|_{\mathcal{C} / X_{i} \times_{X} U}$ by Lemma 18.17 .2 , hence the sheaf has property (a) by definition. We omit the proof of $(\mathrm{b}) \Rightarrow(\mathrm{a})$ in case (7).
03DO Lemma 18.23.4. Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{D}}$-module .
(1) If $\mathcal{F}$ is locally free then $f^{*} \mathcal{F}$ is locally free.
(2) If $\mathcal{F}$ is finite locally free then $f^{*} \mathcal{F}$ is finite locally free.
(3) If $\mathcal{F}$ is locally generated by sections then $f^{*} \mathcal{F}$ is locally generated by sections.
(4) If $\mathcal{F}$ is locally generated by $r$ sections then $f^{*} \mathcal{F}$ is locally generated by $r$ sections.
(5) If $\mathcal{F}$ is of finite type then $f^{*} \mathcal{F}$ is of finite type.
(6) If $\mathcal{F}$ is quasi-coherent then $f^{*} \mathcal{F}$ is quasi-coherent.
(7) If $\mathcal{F}$ is of finite presentation then $f^{*} \mathcal{F}$ is of finite presentation.

Proof. According to the discussion in Section 18.18 we need only check preservation under pullback for a morphism of ringed sites $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ such that $f$ is given by a left exact, continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$ between sites which have all finite limits. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{\mathcal{D}}$-modules which has one of the properties (1) - (6) of Definition 18.23.1. We know $\mathcal{D}$ has a final object $Y$ and $X=u(Y)$ is a final object for $\mathcal{C}$. By assumption we have a covering $\left\{Y_{i} \rightarrow Y\right\}$ such that $\left.\mathcal{G}\right|_{\mathcal{D} / Y_{i}}$ has the corresponding global property. Set $X_{i}=u\left(Y_{i}\right)$ so that $\left\{X_{i} \rightarrow X\right\}$ is a covering in $\mathcal{C}$. We get a commutative diagram of morphisms ringed sites

by Sites, Lemma 7.27 .2 . Hence by Lemma 18.17 .2 that $\left.f^{*} \mathcal{G}\right|_{X_{i}}$ has the corresponding global property. Hence we conclude that $\mathcal{G}$ has the local property we started out with by Lemma 18.23 .3 .

### 18.24. Basic results on local types of modules

082 S Basic lemmas related to the definitions made above.
082 T Lemma 18.24.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\theta: \mathcal{G} \rightarrow \mathcal{F}$ be a surjective $\mathcal{O}$-module map with $\mathcal{F}$ of finite presentation and $\mathcal{G}$ of finite type. Then $\operatorname{Ker}(\theta)$ is of finite type.

Proof. Omitted. Hint: See Modules, Lemma 17.11 .3 .

### 18.25. Closed immersions of ringed topoi

08 M 2 When do we declare a morphism of ringed topoi $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ to be a closed immersion? By analogy with the discussion in Modules, Section 17.13 it seems natural to assume at least:
(1) The functor $i$ is a closed immersion of topoi (Sites, Definition 7.42.7).
(2) The associated map $\mathcal{O}^{\prime} \rightarrow i_{*} \mathcal{O}$ is surjective.

These conditions already imply a number of pleasing results which we discuss in this section. However, it seems prudent to not actually define the notion of a closed immersion of ringed topoi as there are many different definitions we could use.

08M3 Lemma 18.25.1. Let $i:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Assume $i$ is a closed immersion of topi and $i^{\sharp}: \mathcal{O}^{\prime} \rightarrow i_{*} \mathcal{O}$ is surjective. Denote $\mathcal{I} \subset \mathcal{O}^{\prime}$ the kernel of $i^{\sharp}$. The functor

$$
i_{*}: \operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}\left(\mathcal{O}^{\prime}\right)
$$

is exact, fully faithful, with essential image those $\mathcal{O}^{\prime}$-modules $\mathcal{G}$ such that $\mathcal{I G}=0$.
Proof. By Lemma 18.15 .2 and Sites, Lemma 7.42 .8 we see that $i_{*}$ is exact. From the fact that $i_{*}$ is fully faithful on sheaves of sets, and the fact that $i^{\sharp}$ is surjective it follows that $i_{*}$ is fully faithful as a functor $\operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}^{\prime}\right)$. Namely, suppose that $\alpha: i_{*} \mathcal{F}_{1} \rightarrow i_{*} \mathcal{F}_{2}$ is an $\mathcal{O}^{\prime}$-module map. By the fully faithfulness of $i_{*}$ we obtain a map $\beta: \mathcal{F}_{1} \rightarrow \mathcal{F}_{2}$ of sheaves of sets. To prove $\beta$ is a map of modules we have to show that

commutes. It suffices to prove commutativity after applying $i_{*}$. Consider

We know the outer rectangle commutes. Since $i^{\#}$ is surjective we conclude.
To finish the proof we have to prove the statement on the essential image of $i_{*}$. It is clear that $i_{*} \mathcal{F}$ is annihilated by $\mathcal{I}$ for any $\mathcal{O}$-module $\mathcal{F}$. Conversely, let $\mathcal{G}$ be a $\mathcal{O}^{\prime}$-module with $\mathcal{I G}=0$. By definition of a closed subtopos there exists a subsheaf $\mathcal{U}$ of the final object of $\mathcal{D}$ such that the essential image of $i_{*}$ on sheaves of sets is the class of sheaves of sets $\mathcal{H}$ such that $\mathcal{H} \times \mathcal{U} \rightarrow \mathcal{U}$ is an isomorphism. In particular, $i_{*} \mathcal{O} \times \mathcal{U}=\mathcal{U}$. This implies that $\mathcal{I} \times \mathcal{U}=\mathcal{O} \times \mathcal{U}$. Hence our module $\mathcal{G}$ satisfies $\mathcal{G} \times \mathcal{U}=\{0\} \times \mathcal{U}=\mathcal{U}$ (because the zero module is isomorphic to the final object of sheaves of sets). Thus there exists a sheaf of sets $\mathcal{F}$ on $\mathcal{C}$ with $i_{*} \mathcal{F}=\mathcal{G}$. Since $i_{*}$ is fully faithful on sheaves of sets, we see that in order to define the addition $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ and the multiplication $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ it suffices to use the addition

$$
\mathcal{G} \times \mathcal{G} \longrightarrow \mathcal{G}
$$

(given to us as $\mathcal{G}$ is a $\mathcal{O}^{\prime}$-module) and the multiplication

$$
i_{*} \mathcal{O} \times \mathcal{G} \rightarrow \mathcal{G}
$$

which is given to us as we have the multiplication by $\mathcal{O}^{\prime}$ which annihilates $\mathcal{I}$ by assumption and $i_{*} \mathcal{O}=\mathcal{O}^{\prime} / \mathcal{I}$. By construction $\mathcal{G}$ is isomorphic to the pushforward of the $\mathcal{O}$-module $\mathcal{F}$ so constructed.

### 18.26. Tensor product

03EK In Sections 18.9 and 18.11 we defined the change of rings functor by a tensor product construction. To be sure this construction makes sense also to define the tensor product of presheaves of $\mathcal{O}$-modules. To be precise, suppose $\mathcal{C}$ is a category, $\mathcal{O}$ is a presheaf of rings, and $\mathcal{F}, \mathcal{G}$ are presheaves of $\mathcal{O}$-modules. In this case we define $\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}$ to be the presheaf

$$
U \longmapsto\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}\right)(U)=\mathcal{F}(U) \otimes_{\mathcal{O}(U)} \mathcal{G}(U)
$$

If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings and $\mathcal{F}, \mathcal{G}$ are sheaves of $\mathcal{O}$-modules then we define

$$
\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}=\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}\right)^{\#}
$$

to be the sheaf of $\mathcal{O}$-modules associated to the presheaf $\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}$.
Here are some formulas which we will use below without further mention:

$$
\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}\right) \otimes_{p, \mathcal{O}} \mathcal{H}=\mathcal{F} \otimes_{p, \mathcal{O}}\left(\mathcal{G} \otimes_{p, \mathcal{O}} \mathcal{H}\right)
$$

and similarly for sheaves. If $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ is a map of presheaves of rings, then

$$
\left(\mathcal{F} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}\right) \otimes_{p, \mathcal{O}_{1}} \mathcal{O}_{2}=\left(\mathcal{F} \otimes_{p, \mathcal{O}_{1}} \mathcal{O}_{2}\right) \otimes_{p, \mathcal{O}_{2}}\left(\mathcal{G} \otimes_{p, \mathcal{O}_{1}} \mathcal{O}_{2}\right)
$$

and similarly for sheaves. These follow from their algebraic counterparts and sheafification.

Let $\mathcal{C}$ be a site, let $\mathcal{O}$ be a sheaf of rings and let $\mathcal{F}, \mathcal{G}, \mathcal{H}$ be sheaves of $\mathcal{O}$-modules. In this case we define

$$
\operatorname{Bilin}_{\mathcal{O}}(\mathcal{F} \times \mathcal{G}, \mathcal{H})=\left\{\varphi \in \operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{F} \times \mathcal{G}, \mathcal{H}) \mid \varphi \text { is } \mathcal{O} \text {-bilinear }\right\}
$$

With this definition we have

$$
\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}\right)=\operatorname{Bilin}_{\mathcal{O}}(\mathcal{F} \times \mathcal{G}, \mathcal{H})
$$

In other words $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$ represents the functor which associates to $\mathcal{H}$ the set of bilinear maps $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{H}$. In particular, since the notion of a bilinear map makes sense for a pair of modules on a ringed topos, we see that the tensor product of sheaves of modules is intrinsic to the topos (compare the discussion in Section 18.18). In fact we have the following.

03EL Lemma 18.26.1. Let $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{\mathcal{D}}$-modules. Then $f^{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}\right)=f^{*} \mathcal{F} \otimes_{\mathcal{O}_{\mathcal{C}}} f^{*} \mathcal{G}$ functorially in $\mathcal{F}, \mathcal{G}$.

Proof. For a sheaf $\mathcal{H}$ of $\mathcal{O}_{\mathcal{C}}$ modules we have

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(f^{*}\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}\right), \mathcal{H}\right) & =\operatorname{Hom}_{\mathcal{O}_{\mathcal{D}}}\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, f_{*} \mathcal{H}\right) \\
& =\operatorname{Bilin}_{\mathcal{O}_{\mathcal{D}}}\left(\mathcal{F} \times \mathcal{G}, f_{*} \mathcal{H}\right) \\
& =\operatorname{Bilin}_{f^{-1} \mathcal{O}_{\mathcal{D}}}\left(f^{-1} \mathcal{F} \times f^{-1} \mathcal{G}, \mathcal{H}\right) \\
& =\operatorname{Hom}_{f^{-1} \mathcal{O}_{\mathcal{D}}}\left(f^{-1} \mathcal{F} \otimes_{f^{-1} \mathcal{O}_{\mathcal{D}}} f^{-1} \mathcal{G}, \mathcal{H}\right) \\
& =\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(f^{*} \mathcal{F} \otimes_{f^{*} \mathcal{O}_{\mathcal{D}}} f^{*} \mathcal{G}, \mathcal{H}\right)
\end{aligned}
$$

The interesting " $=$ " in this sequence of equalities is the third equality. It follows from the definition and adjointness of $f_{*}$ and $f^{-1}$ (as discussed in previous sections) in a straightforward manner.

03L6 Lemma 18.26.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}$-modules.
(1) If $\mathcal{F}, \mathcal{G}$ are locally free, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(2) If $\mathcal{F}, \mathcal{G}$ are finite locally free, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(3) If $\mathcal{F}, \mathcal{G}$ are locally generated by sections, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(4) If $\mathcal{F}, \mathcal{G}$ are of finite type, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(5) If $\mathcal{F}, \mathcal{G}$ are quasi-coherent, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(6) If $\mathcal{F}, \mathcal{G}$ are of finite presentation, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
(7) If $\mathcal{F}$ is of finite presentation and $\mathcal{G}$ is coherent, then $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$ is coherent.
(8) If $\mathcal{F}, \mathcal{G}$ are coherent, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.

Proof. Omitted. Hint: Compare with Sheaves of Modules, Lemma 17.15.5.

### 18.27. Internal Hom

04 TT Let $\mathcal{C}$ be a category and let $\mathcal{O}$ be a presheaf of rings. Let $\mathcal{F}, \mathcal{G}$ be presheaves of $\mathcal{O}$-modules. Consider the rule

$$
U \longmapsto \operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right) .
$$

For $\varphi: V \rightarrow U$ in $\mathcal{C}$ we define a restriction mapping

$$
\operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{V}}\left(\left.\mathcal{F}\right|_{V},\left.\mathcal{G}\right|_{V}\right)
$$

by restricting via the relocalization morphism $j: \mathcal{C} / V \rightarrow \mathcal{C} / U$, see Sites, Lemma 7.24.7. Hence this defines a presheaf $\mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$. In addition, given an element $\varphi \in \operatorname{Hom}_{\left.\mathcal{O}\right|_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)$ and a section $f \in \mathcal{O}(U)$ then we can define $f \varphi \in$ $\operatorname{Hom}_{\left.\mathcal{O}\right|_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)$ by either precomposing with multiplication by $f$ on $\left.\mathcal{F}\right|_{U}$ or postcomposing with multiplication by $f$ on $\left.\mathcal{G}\right|_{U}$ (it gives the same result). Hence we in fact get a presheaf of $\mathcal{O}$-modules. There is a canonical "evaluation" morphism

$$
\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}
$$

03EM Lemma 18.27.1. If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings, $\mathcal{F}$ is a presheaf of $\mathcal{O}$-modules, and $\mathcal{G}$ is a sheaf of $\mathcal{O}$-modules, then $\mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ is a sheaf of $\mathcal{O}$-modules.
Proof. Omitted. Hints: Note first that $\mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})=\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}^{\#}, \mathcal{G}\right)$, which reduces the question to the case where both $\mathcal{F}$ and $\mathcal{G}$ are sheaves. The result for sheaves of sets is Sites, Lemma 7.25.1.

In the situation of the lemma the "evaluation" morphism factors through the tensor product of sheaves of modules

$$
\mathcal{F} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}
$$

03EN Lemma 18.27.2. Internal hom and (co)limits. Let $\mathcal{C}$ be a category and let $\mathcal{O}$ be a presheaf of rings.
(1) For any presheaf of $\mathcal{O}$-modules $\mathcal{F}$ the functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{PMod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})
$$

commutes with arbitrary limits.
(2) For any presheaf of $\mathcal{O}$-modules $\mathcal{G}$ the functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{PMod}(\mathcal{O})^{o p p}, \quad \mathcal{F} \longmapsto \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})
$$

commutes with arbitrary colimits, in a formula

$$
\mathcal{H o m}_{\mathcal{O}}\left(\operatorname{colim}_{i} \mathcal{F}_{i}, \mathcal{G}\right)=\lim _{i} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}_{i}, \mathcal{G}\right)
$$

Suppose that $\mathcal{C}$ is a site, and $\mathcal{O}$ is a sheaf of rings.
(3) For any sheaf of $\mathcal{O}$-modules $\mathcal{F}$ the functor

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})
$$

commutes with arbitrary limits.
(4) For any sheaf of $\mathcal{O}$-modules $\mathcal{G}$ the functor

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}(\mathcal{O})^{o p p}, \quad \mathcal{F} \longmapsto \mathcal{H o m}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})
$$

commutes with arbitrary colimits, in a formula

$$
\mathcal{H o m}_{\mathcal{O}}\left(\operatorname{colim}_{i} \mathcal{F}_{i}, \mathcal{G}\right)=\lim _{i} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}_{i}, \mathcal{G}\right)
$$

Proof. Let $\mathcal{I} \rightarrow \operatorname{PMod}(\mathcal{O}), i \mapsto \mathcal{G}_{i}$ be a diagram. Let $U$ be an object of the category $\mathcal{C}$. As $j_{U}^{*}$ is both a left and a right adjoint we see that $\lim _{i} j_{U}^{*} \mathcal{G}_{i}=j_{U}^{*} \lim _{i} \mathcal{G}_{i}$. Hence we have

$$
\begin{aligned}
\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}, \lim _{i} \mathcal{G}_{i}\right)(U) & =\operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\lim _{i} \mathcal{G}_{i}\right|_{U}\right) \\
& =\lim _{i} \operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}_{i}\right|_{U}\right) \\
& =\lim _{i} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{G}_{i}\right)(U)
\end{aligned}
$$

by definition of a limit. This proves (1). Part (2) is proved in exactly the same way. Part (3) follows from (1) because the limit of a diagram of sheaves is the same as the limit in the category of presheaves. Finally, (4) follow because, in the formula we have

$$
\operatorname{Mor}_{\operatorname{Mod}(\mathcal{O})}\left(\operatorname{colim}_{i} \mathcal{F}_{i}, \mathcal{G}\right)=\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\operatorname{colim}_{i}^{P S h} \mathcal{F}_{i}, \mathcal{G}\right)
$$

as the colimit $\operatorname{colim}_{i} \mathcal{F}_{i}$ is the sheafification of the colimit $\operatorname{colim}_{i}^{P S h} \mathcal{F}_{i}$ in $\operatorname{PMod}(\mathcal{O})$. Hence (4) follows from (2) (by the remark on limits above again).

03EO Lemma 18.27.3. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings.
(1) Let $\mathcal{F}, \mathcal{G}, \mathcal{H}$ be presheaves of $\mathcal{O}$-modules. There is a canonical isomorphism

$$
\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}, \mathcal{H}\right) \longrightarrow \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{H o m}_{\mathcal{O}}(\mathcal{G}, \mathcal{H})\right)
$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular,

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}, \mathcal{H}\right)=\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\mathcal{F}, \operatorname{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{H})\right)
$$

(2) Suppose that $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings, and $\mathcal{F}, \mathcal{G}, \mathcal{H}$ are sheaves of $\mathcal{O}$-modules. There is a canonical isomorphism

$$
\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}\right) \longrightarrow \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}, \mathcal{H o m}_{\mathcal{O}}(\mathcal{G}, \mathcal{H})\right)
$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular,

$$
\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}\right)=\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{F}, \mathcal{H o m}_{\mathcal{O}}(\mathcal{G}, \mathcal{H})\right)
$$

Proof. This is the analogue of Algebra, Lemma 10.11.8. The proof is the same, and is omitted.

03EP Lemma 18.27.4. Tensor product and (co)limits. Let $\mathcal{C}$ be a category and let $\mathcal{O}$ be a presheaf of rings.
(1) For any presheaf of $\mathcal{O}$-modules $\mathcal{F}$ the functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{PMod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}
$$

commutes with arbitrary colimits.
(2) Suppose that $\mathcal{C}$ is a site, and $\mathcal{O}$ is a sheaf of rings. For any sheaf of $\mathcal{O}$-modules $\mathcal{F}$ the functor

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}
$$

commutes with arbitrary colimits.
Proof. This is because tensor product is adjoint to internal hom according to Lemma 18.27.3. See Categories, Lemma 4.24.4.
0932 Lemma 18.27.5. Let $\mathcal{C}$ be a category, resp. a site Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a map of presheaves, resp. sheaves of rings. Then

$$
\operatorname{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{F})=\operatorname{Hom}_{\mathcal{O}^{\prime}}\left(\mathcal{G}, \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}^{\prime}, \mathcal{F}\right)\right)
$$

for any $\mathcal{O}^{\prime}$-module $\mathcal{G}$ and $\mathcal{O}$-module $\mathcal{F}$.
Proof. This is the analogue of Algebra, Lemma 10.13.4. The proof is the same, and is omitted.

### 18.28. Flat modules

03 EQ We can define flat modules exactly as in the case of modules over rings.
03ER Definition 18.28.1. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings.
(1) A presheaf $\mathcal{F}$ of $\mathcal{O}$-modules is called flat if the functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{PMod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{p, \mathcal{O}} \mathcal{F}
$$

is exact.
(2) A map $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ of presheaves of rings is called flat if $\mathcal{O}^{\prime}$ is flat as a presheaf of $\mathcal{O}$-modules.
(3) If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings and $\mathcal{F}$ is a sheaf of $\mathcal{O}$-modules, then we say $\mathcal{F}$ is flat if the functor

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}
$$

is exact.
(4) A map $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ of sheaves of rings on a site is called flat if $\mathcal{O}^{\prime}$ is flat as a sheaf of $\mathcal{O}$-modules.

The notion of a flat module or flat ring map is intrinsic (Section 18.18).
03ES Lemma 18.28.2. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. If each $\mathcal{F}(U)$ is a flat $\mathcal{O}(U)$-module, then $\mathcal{F}$ is flat.

Proof. This is immediate from the definitions.
03ET Lemma 18.28.3. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. If $\mathcal{F}$ is a flat $\mathcal{O}$-module, then $\mathcal{F}^{\#}$ is a flat $\mathcal{O}^{\#}$-module.

Proof. Omitted. (Hint: Sheafification is exact.)
03EU Lemma 18.28.4. Colimits and tensor product.
(1) A filtered colimit of flat presheaves of modules is flat. A direct sum of flat presheaves of modules is flat.
(2) A filtered colimit of flat sheaves of modules is flat. A direct sum of flat sheaves of modules is flat.

Proof. Part (1) follows from Lemma 18.27 .4 and Algebra, Lemma 10.8.9 by looking at sections over objects. To see part (2), use Lemma 18.27 .4 and the fact that a filtered colimit of exact complexes is an exact complex (this uses that sheafification is exact and commutes with colimits). Some details omitted.

03EV Lemma 18.28.5. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let $U$ be an object of $\mathcal{C}$. Consider the functor $j_{U}: \mathcal{C} / U \rightarrow \mathcal{C}$.
(1) The presheaf of $\mathcal{O}$-modules $j_{U} \mathcal{O}_{U}$ (see Remark 18.19.6) is flat.
(2) If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings, $j_{U} \mathcal{O}_{U}$ is a flat sheaf of $\mathcal{O}$-modules.

Proof. Proof of (1). By the discussion in Remark 18.19.6 we see that

$$
j_{U!} \mathcal{O}_{U}(V)=\bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{O}(V)
$$

which is a flat $\mathcal{O}(V)$-module. Hence (1) follows from Lemma 18.28.2. Then (2) follows as $j_{U!} \mathcal{O}_{U}=\left(j_{U!} \mathcal{O}_{U}\right)^{\#}$ (the first $j_{U!}$ on sheaves, the second on presheaves) and Lemma 18.28.3.

03EW Lemma 18.28.6. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings.
(1) Any presheaf of $\mathcal{O}$-modules is a quotient of a direct sum $\bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}$.
(2) Any presheaf of $\mathcal{O}$-modules is a quotient of a flat presheaf of $\mathcal{O}$-modules.
(3) If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings, then any sheaf of $\mathcal{O}$-modules is a quotient of a direct sum $\bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}$.
(4) If $\mathcal{C}$ is a site, $\mathcal{O}$ is a sheaf of rings, then any sheaf of $\mathcal{O}$-modules is a quotient of a flat sheaf of $\mathcal{O}$-modules.

Proof. Proof of (1). For every object $U$ of $\mathcal{C}$ and every $s \in \mathcal{F}(U)$ we get a morphism $j_{U!} \mathcal{O}_{U} \rightarrow \mathcal{F}$, namely the adjoint to the morphism $\left.\mathcal{O}_{U} \rightarrow \mathcal{F}\right|_{U}, 1 \mapsto s$. Clearly the map

$$
\bigoplus_{(U, s)} j_{U!} \mathcal{O}_{U} \longrightarrow \mathcal{F}
$$

is surjective. The source is flat by combining Lemmas 18.28 .4 and 18.28 .5 which proves (2). The sheaf case follows from this either by sheafifying or repeating the same argument.

03EX Lemma 18.28.7. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let

$$
0 \rightarrow \mathcal{F}^{\prime \prime} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow 0
$$

be a short exact sequence of presheaves of $\mathcal{O}$-modules. Assume $\mathcal{F}$ is flat. Then
(1) For any presheaf $\mathcal{G}$ of $\mathcal{O}$-modules, the sequence

$$
0 \rightarrow \mathcal{F}^{\prime \prime} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}^{\prime} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow 0
$$

is exact.
(2) If $\mathcal{C}$ is a site, and $\mathcal{O}, \mathcal{F}, \mathcal{F}^{\prime}, \mathcal{F}^{\prime \prime}$, and $\mathcal{G}$ are all sheaves, the sequence

$$
0 \rightarrow \mathcal{F}^{\prime \prime} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}^{\prime} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow 0
$$

is exact.
Proof. Choose a flat presheaf of $\mathcal{O}$-modules $\mathcal{G}^{\prime}$ which surjects onto $\mathcal{G}$. This is possible by Lemma 18.28 .6 . Let $\mathcal{G}^{\prime \prime}=\operatorname{Ker}\left(\mathcal{G}^{\prime} \rightarrow \mathcal{G}\right)$. The lemma follows by applying the snake lemma to the following diagram

$$
\begin{array}{cccccccc}
0 & & 0 & & & 0 \\
\uparrow & & \uparrow & & & \\
\mathcal{F}^{\prime \prime} \otimes_{p, \mathcal{O}} \mathcal{G} & \rightarrow & \mathcal{F}^{\prime} \otimes_{p, \mathcal{O}} \mathcal{G} & \rightarrow & \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G} & \rightarrow & 0 \\
\uparrow & & \uparrow & & \uparrow & & \\
\mathcal{F}^{\prime \prime} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime} & \rightarrow & \mathcal{F}^{\prime} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime} & \rightarrow & \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime} & \rightarrow & 0 \\
\uparrow & & \uparrow & & & \uparrow & \uparrow & \\
\mathcal{F}^{\prime \prime} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime \prime} & \rightarrow & \mathcal{F}^{\prime} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime \prime} & \rightarrow & \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}^{\prime \prime} & \rightarrow & 0 \\
& & & & & \uparrow & & \\
& & & & 0 & & & \\
& & & & & & &
\end{array}
$$

with exact rows and columns. The middle row is exact because tensoring with the flat module $\mathcal{G}^{\prime}$ is exact. The sheaf case follows from the presheaf case as sheafification is exact.

03EY Lemma 18.28.8. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let

$$
0 \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0} \rightarrow 0
$$

be a short exact sequence of presheaves of $\mathcal{O}$-modules.
(1) If $\mathcal{F}_{2}$ and $\mathcal{F}_{0}$ are flat so is $\mathcal{F}_{1}$.
(2) If $\mathcal{F}_{1}$ and $\mathcal{F}_{0}$ are flat so is $\mathcal{F}_{2}$.

If $\mathcal{C}$ is a site and $\mathcal{O}$ is a sheaf of rings then the same result holds $\operatorname{Mod}(\mathcal{O})$.
Proof. Let $\mathcal{G} \bullet$ be an arbitrary exact complex of presheaves of $\mathcal{O}$-modules. Assume that $\mathcal{F}_{0}$ is flat. By Lemma 18.28 .7 we see that

$$
0 \rightarrow \mathcal{G}^{\bullet} \otimes_{p, \mathcal{O}} \mathcal{F}_{2} \rightarrow \mathcal{G}^{\bullet} \otimes_{p, \mathcal{O}} \mathcal{F}_{1} \rightarrow \mathcal{G}^{\bullet} \otimes_{p, \mathcal{O}} \mathcal{F}_{0} \rightarrow 0
$$

is a short exact sequence of complexes of presheaves of $\mathcal{O}$-modules. Hence (1) and (2) follow from the snake lemma. The case of sheaves of modules is proved in the same way.

03EZ Lemma 18.28.9. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings. Let

$$
\ldots \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0} \rightarrow \mathcal{Q} \rightarrow 0
$$

be an exact complex of presheaves of $\mathcal{O}$-modules. If $\mathcal{Q}$ and all $\mathcal{F}_{i}$ are flat $\mathcal{O}$-modules, then for any presheaf $\mathcal{G}$ of $\mathcal{O}$-modules the complex

$$
\ldots \rightarrow \mathcal{F}_{2} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}_{1} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}_{0} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow \mathcal{Q} \otimes_{p, \mathcal{O}} \mathcal{G} \rightarrow 0
$$

is exact also. If $\mathcal{C}$ is a site and $\mathcal{O}$ is a sheaf of rings then the same result holds $\operatorname{Mod}(\mathcal{O})$.
Proof. Follows from Lemma 18.28 .7 by splitting the complex into short exact sequences and using Lemma 18.28 .8 to prove inductively that $\operatorname{Im}\left(\mathcal{F}_{i+1} \rightarrow \mathcal{F}_{i}\right)$ is flat.
05V4 Lemma 18.28.10. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a map of sheaves of rings on a site $\mathcal{C}$. If $\mathcal{G}$ is a flat $\mathcal{O}_{1}$-module, then $\mathcal{G} \otimes \mathcal{O}_{1} \mathcal{O}_{2}$ is a flat $\mathcal{O}_{2}$-module.
Proof. This is true because

$$
\left(\mathcal{G} \otimes_{\mathcal{O}_{1}} \mathcal{O}_{2}\right) \otimes_{\mathcal{O}_{2}} \mathcal{H}=\mathcal{G} \otimes_{\mathcal{O}_{1}} \mathcal{F}
$$

(as sheaves of abelian groups for example).
The following lemma gives one direction of the equational criterion of flatness (Algebra, Lemma 10.38.11.
08FC Lemma 18.28.11. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a flat $\mathcal{O}$-module. Let $U$ be an object of $\mathcal{C}$ and let

$$
\left.\mathcal{O}_{U} \xrightarrow{\left(f_{1}, \ldots, f_{n}\right)} \mathcal{O}_{U}^{\oplus n} \xrightarrow{\left(s_{1}, \ldots, s_{n}\right)} \mathcal{F}\right|_{U}
$$

be a complex of $\mathcal{O}_{U}$-modules. There exists a covering $\left\{U_{i} \rightarrow U\right\}$ and for each $i$ a factorization

$$
\left.\mathcal{O}_{U_{i}}^{\oplus n} \xrightarrow{A} \mathcal{O}_{U_{i}}^{\oplus m} \xrightarrow{\left(t_{1}, \ldots, t_{m}\right)} \mathcal{F}\right|_{U_{i}}
$$

of $\left.\left(s_{1}, \ldots, s_{n}\right)\right|_{U_{i}}$ such that $\left.A \circ\left(f_{1}, \ldots, f_{n}\right)\right|_{U_{i}}=0$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the sheaf of ideals generated by $f_{1}, \ldots, f_{n}$. Then $\sum f_{j} \otimes s_{j}$ is a section of $\left.\mathcal{I} \otimes_{\mathcal{O}_{U}} \mathcal{F}\right|_{U}$ which maps to zero in $\left.\mathcal{F}\right|_{U}$. As $\left.\mathcal{F}\right|_{U}$ is flat the map $\mathcal{I} \otimes_{\mathcal{O}_{U}}$ $\left.\left.\mathcal{F}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ is injective. Since $\left.\mathcal{I} \otimes \mathcal{O}_{U} \mathcal{F}\right|_{U}$ is the sheaf associated to the presheaf tensor product, we see there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\left.\sum f_{j}\right|_{U_{i}} \otimes s_{j}\right|_{U_{i}}$ is zero in $\mathcal{I}\left(U_{i}\right) \otimes_{\mathcal{O}\left(U_{i}\right)} \mathcal{F}\left(U_{i}\right)$. Unwinding the definitions using Algebra, Lemma 10.106 .10 we find $t_{1}, \ldots, t_{m} \in \mathcal{F}\left(U_{i}\right)$ and $a_{j k} \in \mathcal{O}\left(U_{i}\right)$ such that $\left.\sum a_{j k} f_{j}\right|_{U_{i}}=0$ and $\left.s_{j}\right|_{U_{i}}=\sum a_{j k} t_{k}$.
08FD Lemma 18.28.12. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be locally of finite presentation and flat. Then given an object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is a direct summand of a finite free $\mathcal{O}_{U_{i}}$-module.
Proof. Choose an object $U$ of $\mathcal{C}$. After replacing $U$ by the members of a covering, we may assume there exists a presentation

$$
\mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{F} \rightarrow 0
$$

By Lemma 18.28 .11 we may assume, after replacing $U$ by the members of a covering, assume there exists a factorization

$$
\mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{O}_{U}^{\oplus n_{1}} \rightarrow \mathcal{F}
$$

such that the composition $\mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{O}_{U}^{\oplus n_{1}}$ annihilates the first summand of $\mathcal{O}_{U}^{\oplus r}$. Repeating this argument $r-1$ more times we obtain a factorization

$$
\mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{O}_{U}^{\oplus n_{r}} \rightarrow \mathcal{F}
$$

such that the composition $\mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{O}_{U}^{\oplus n_{r}}$ is zero. This means that the surjection $\mathcal{O}_{U}^{\oplus n_{r}} \rightarrow \mathcal{F}$ has a section and we win.

08M4 Lemma 18.28.13. Let $\mathcal{C}$ be a site. Let $\mathcal{O}^{\prime} \rightarrow \mathcal{O}$ be a surjection of sheaves of rings whose kernel $\mathcal{I}$ is an ideal of square zero. Let $\mathcal{F}^{\prime}$ be an $\mathcal{O}^{\prime}$-module and set $\mathcal{F}=\mathcal{F}^{\prime} / \mathcal{I} \mathcal{F}^{\prime}$. The following are equivalent
(1) $\mathcal{F}^{\prime}$ is a flat $\mathcal{O}^{\prime}$-module, and
(2) $\mathcal{F}$ is a flat $\mathcal{O}$-module and $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is injective.

Proof. If (1) holds, then $\mathcal{F}=\mathcal{F}^{\prime} \otimes_{\mathcal{O}^{\prime}} \mathcal{O}$ is flat over $\mathcal{O}$ by Lemma 18.28 .10 and we see the map $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is injective by applying $-\otimes_{\mathcal{O}^{\prime}} \mathcal{F}^{\prime}$ to the exact sequence $0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0$, see Lemma 18.28.7. Assume (2). In the rest of the proof we will use without further mention that $\mathcal{K} \otimes_{\mathcal{O}^{\prime}} \mathcal{F}^{\prime}=\mathcal{K} \otimes_{\mathcal{O}} \mathcal{F}$ for any $\mathcal{O}^{\prime}$-module $\mathcal{K}$ annihilated by $\mathcal{I}$. Let $\alpha: \mathcal{G}^{\prime} \rightarrow \mathcal{H}^{\prime}$ be an injective map of $\mathcal{O}^{\prime}$-modules. Let $\mathcal{G} \subset \mathcal{G}^{\prime}$, resp. $\mathcal{H} \subset \mathcal{H}^{\prime}$ be the subsheaf of sections annihilated by $\mathcal{I}$. Consider the diagram

Note that $\mathcal{G}^{\prime} / \mathcal{G}$ and $\mathcal{H}^{\prime} / \mathcal{H}$ are annihilated by $\mathcal{I}$ and that $\mathcal{G}^{\prime} / \mathcal{G} \rightarrow \mathcal{H}^{\prime} / \mathcal{H}$ is injective. Thus the right vertical arrow is injective as $\mathcal{F}$ is flat over $\mathcal{O}$. The same is true for the left vertical arrow. Hence the middle vertical arrow is injective and $\mathcal{F}^{\prime}$ is flat.

### 18.29. Towards constructible modules

0933 Recall that a quasi-compact object of a site is one such that every covering of it can be refined by a finite covering. It turns out that if every object of a site has a covering by quasi-compact objects, then the modules $j_{!} \mathcal{O}_{U}$ with $U$ quasi-compact form a particularly nice set of generators for the category of all modules.

0934 Lemma 18.29.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left\{U_{i} \rightarrow U\right\}$ be a covering of $\mathcal{C}$. Then the sequence

$$
\bigoplus j_{U_{i} \times_{U} U_{j}!} \mathcal{O}_{U_{i} \times_{U} U_{j}} \rightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}} \rightarrow j_{!} \mathcal{O}_{U} \rightarrow 0
$$

is exact.
Proof. This holds because for any $\mathcal{O}$-module $\mathcal{F}$ the functor $\operatorname{Hom}_{\mathcal{O}}(-, \mathcal{F})$ turns our sequence into the exact sequence $0 \rightarrow \mathcal{F}(U) \rightarrow \prod \mathcal{F}\left(U_{i}\right) \rightarrow \prod \mathcal{F}\left(U_{i} \times_{U} U_{j}\right)$. Then the lemma follows from Homology, Lemma 12.5.8.

Lemma 18.29.2. Let $\mathcal{C}$ be a site. Let $W$ be a quasi-compact object of $\mathcal{C}$.
(1) The functor $\operatorname{Sh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}(W)$ commutes with coproducts.
(2) Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. The functor $\operatorname{Mod}(\mathcal{O}) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}(W)$ commutes with direct sums.

Proof. Proof of (1). Taking sections over $W$ commutes with filtered colimits with injective transition maps by Sites, Lemma 7.11.2. If $\mathcal{F}_{i}$ is a family of sheaves of sets indexed by a set $I$. Then $\coprod \mathcal{F}_{i}$ is the filtered colimit over the partially ordered set of finite subsets $E \subset I$ of the coproducts $\mathcal{F}_{E}=\coprod_{i \in E} \mathcal{F}_{i}$. Since the transition maps are injective we conclude.
Proof of (2). Let $\mathcal{F}_{i}$ be a family of sheaves of $\mathcal{O}$-modules indexed by a set $I$. Then $\bigoplus \mathcal{F}_{i}$ is the filtered colimit over the partially ordered set of finite subsets $E \subset I$
of the direct sums $\mathcal{F}_{E}=\bigoplus_{i \in E} \mathcal{F}_{i}$. A filtered colimit of abelian sheaves can be computed in the category of sheaves of sets. Moreover, for $E \subset E^{\prime}$ the transition $\operatorname{map} \mathcal{F}_{E} \rightarrow \mathcal{F}_{E^{\prime}}$ is injective (as sheafification is exact and the injectivity is clear on underlying presheaves). Hence it suffices to show the result for a finite index set by Sites, Lemma 7.11.2. The finite case is dealt with in Lemma 18.3 .2 (it holds over any object of $\mathcal{C}$ ).
0936 Lemma 18.29.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be a quasi-compact object of $\mathcal{C}$. Then the functor $\operatorname{Hom}_{\mathcal{O}}\left(j_{!} \mathcal{O}_{U},-\right)$ commutes with direct sums.

Proof. This is true because $\operatorname{Hom}_{\mathcal{O}}\left(j_{!} \mathcal{O}_{U}, \mathcal{F}\right)=\mathcal{F}(U)$ and because the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ commutes with direct sums by Lemma 18.29 .2 .

In order to state the sharpest possible results in the following we introduce some notation.
0937 Situation 18.29.4. Let $\mathcal{C}$ be a site. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a set of objects. We consider the following conditions
0938 (1) Every object of $\mathcal{C}$ has a covering by elements of $\mathcal{B}$.
(2) Every $U \in \mathcal{B}$ is quasi-compact.
(3) For a finite covering $\left\{U_{i} \rightarrow U\right\}$ with $U_{i}, U \in \mathcal{B}$ the fibre products $U_{i} \times_{U} U_{j}$ are quasi-compact.
Lemma 18.29.5. In Situation 18.29.4 assume (1) holds.
(1) Every sheaf of sets is the target of a surjective map whose source is a coproduct $\coprod h_{U_{i}}^{\#}$ with $U_{i}$ in $\mathcal{B}$.
(2) If $\mathcal{O}$ is a sheaf of rings, then every $\mathcal{O}$-module is a quotient of a direct sum $\bigoplus j_{U_{i}}!\mathcal{O}_{U_{i}}$ with $U_{i}$ in $\mathcal{B}$.
Proof. Follows immediately from Lemmas 18.28 .6 and 18.29 .1 .

093D
Lemma 18.29.6. In Situation 18.29.4 assume (1) and (2) hold.
(1) Every sheaf of sets is a filtered colimit of sheaves of the form

$$
\begin{equation*}
\text { Coequalizer }\left(\coprod_{j=1, \ldots, m} h_{V_{j}}^{\#} \longrightarrow \coprod_{i=1, \ldots, n} h_{U_{i}}^{\#}\right) \tag{18.29.6.1}
\end{equation*}
$$

with $U_{i}$ and $V_{j}$ in $\mathcal{B}$.
(2) If $\mathcal{O}$ is a sheaf of rings, then every $\mathcal{O}$-module is a filtered colimit of sheaves of the form
(18.29.6.2)

$$
\operatorname{Coker}\left(\bigoplus_{j=1, \ldots, m} j_{V_{j}!} \mathcal{O}_{V_{j}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!} \mathcal{O}_{U_{i}}\right)
$$

with $U_{i}$ and $V_{j}$ in $\mathcal{B}$.
Proof. Proof of (1). By Lemma 18.29 .5 every sheaf of sets $\mathcal{F}$ is the target of a surjection whose source is a coprod $\mathcal{F}_{0}$ of sheaves the form $h_{U}^{\#}$ with $U \in \mathcal{B}$. Applying this to $\mathcal{F}_{0} \times \mathcal{F}_{\mathcal{F}} \mathcal{F}_{0}$ we find that $\mathcal{F}$ is a coequalizer of a pair of maps

$$
\coprod_{j \in J} h_{V_{j}}^{\#} \longrightarrow \coprod_{i \in I} h_{U_{i}}^{\#}
$$

for some index sets $I, J$ and $V_{j}$ and $U_{i}$ in $\mathcal{B}$. For every finite subset $J^{\prime} \subset J$ there is a finite subset $I^{\prime} \subset I$ such that the coproduct over $j \in J^{\prime}$ maps into the coprod over $i \in I^{\prime}$ via both maps, see Lemma 18.29 .3 . Thus our sheaf is the colimit of the cokernels of these maps between finite coproducts.

Proof of (2). By Lemma 18.29 .5 every module is a quotient of a direct sum of modules of the form $j_{U!} \mathcal{O}_{U}$ with $U \in \mathcal{B}$. Thus every module is a cokernel

$$
\operatorname{Coker}\left(\bigoplus_{j \in J} j_{V_{j}!} \mathcal{O}_{V_{j}} \longrightarrow \bigoplus_{i \in I} j_{U_{i}!} \mathcal{O}_{U_{i}}\right)
$$

for some index sets $I, J$ and $V_{j}$ and $U_{i}$ in $\mathcal{B}$. For every finite subset $J^{\prime} \subset J$ there is a finite subset $I^{\prime} \subset I$ such that the direct sum over $j \in J^{\prime}$ maps into the direct sum over $i \in I^{\prime}$, see Lemma 18.29 .3 . Thus our module is the colimit of the cokernels of these maps between finite direct sums.

093E Lemma 18.29.7. In Situation 18.29.4 assume (1) and (2) hold. Let $\mathcal{O}$ be a sheaf of rings. Then a cokernel of a map between modules as in 18.29.6.2) is another module as in (18.29.6.2).

Proof. Let $\mathcal{F}=\operatorname{Coker}\left(\bigoplus j_{V_{j}!} \mathcal{O}_{V_{j}} \rightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}\right)$ as in 18.29 .6 .2 . It suffices to show that the cokernel of $\operatorname{a~map} \varphi: j_{W!} \mathcal{O}_{W} \rightarrow \mathcal{F}$ with $W \in \mathcal{B}$ is another module of the same type. The map $\varphi$ corresponds to $s \in \mathcal{F}(W)$. Since $W$ is quasi-compact we can find a finite covering $\left\{W_{k} \rightarrow W\right\}$ with $W_{k} \in \mathcal{B}$ such that $\left.s\right|_{W_{k}}$ comes from a section $\sum s_{k i}$ of $\bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}$ ). This determines maps $j_{W_{k}!} \mathcal{O}_{W_{k}} \rightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}$. Since $\bigoplus j_{W_{k}}!\mathcal{O}_{W_{k}} \rightarrow j_{W!} \mathcal{O}_{W}$ is surjective (Lemma 18.29.1) we see that $\operatorname{Coker}(\varphi)$ is equal to

$$
\operatorname{Coker}\left(\bigoplus j_{W_{k}!} \mathcal{O}_{W_{k}} \oplus \bigoplus j_{V_{j}!} \mathcal{O}_{V_{j}} \longrightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}\right)
$$

as desired.
093F Lemma 18.29.8. In Situation 18.29.4 assume (1), (2), and (3) hold. Let $\mathcal{O}$ be a sheaf of rings. Then given a map

$$
\bigoplus_{j=1, \ldots, m} j_{V_{j}!} \mathcal{O}_{V_{j}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!} \mathcal{O}_{U_{i}}
$$

with $U_{i}$ and $V_{j}$ in $\mathcal{B}$, and finite coverings $\left\{U_{i k} \rightarrow U_{i}\right\}$ by $U_{i k} \in \mathcal{B}$, there exist a finite set of $W_{l} \in \mathcal{B}$ and a commutative diagram

inducing an isomorphism on cokernels of the horizontal maps.
Proof. Since $\bigoplus j_{U_{i k}!} \mathcal{O}_{U_{i k}} \rightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}}$ is surjective (Lemma 18.29.1), we can find finite coverings $\left\{V_{j m} \rightarrow V_{j}\right\}$ with $V_{j m} \in \mathcal{B}$ such that we can find a commutative diagram

Adding

$$
\bigoplus j_{U_{i k} \times U_{i} U_{i k^{\prime}}!} \mathcal{O}_{U_{i k} \times_{U_{i}} U_{i k^{\prime}}}
$$

to the upper left corner finishes the proof by Lemma 18.29.1.

093G Lemma 18.29.9. In Situation 18.29.4 assume (1), (2), and (3) hold. Let $\mathcal{O}$ be a sheaf of rings. Then an extension of modules as in 18.29.6.2) is another module as in 18.29.6.2.

Proof. Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of $\mathcal{O}$-modules with $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ as in 18.29.6.2. Choose presentations

$$
\bigoplus A_{V_{j}} \rightarrow \bigoplus A_{U_{i}} \rightarrow \mathcal{F}_{1} \rightarrow 0 \quad \text { and } \quad \bigoplus A_{T_{j}} \rightarrow \bigoplus A_{W_{i}} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

In this proof the direct sums are always finite, and we write $A_{U}=j_{U!} \mathcal{O}_{U}$ for $U \in \mathcal{B}$. By Lemma 18.29 .8 we may replace $W_{i}$ by finite coverings $\left\{W_{i k} \rightarrow W_{i}\right\}$ with $W_{i k} \in \mathcal{B}$. Thus we may assume the map $\bigoplus A_{W_{i}} \rightarrow \mathcal{F}_{3}$ lifts to a map into $\mathcal{F}_{2}$. Consider the kernel

$$
\mathcal{K}_{2}=\operatorname{Ker}\left(\bigoplus A_{U_{i}} \oplus \bigoplus A_{W_{i}} \longrightarrow \mathcal{F}_{2}\right)
$$

By the snake lemma this kernel surjections onto $\mathcal{K}_{3}=\operatorname{Ker}\left(\bigoplus A_{W_{i}} \rightarrow \mathcal{F}_{3}\right)$. Thus after replacing each $T_{j}$ by a finite covering with elements of $\mathcal{B}$ (permissible by Lemma 18.29.1 we may assume there is a map $\bigoplus A_{T_{j}} \rightarrow \mathcal{K}_{2}$ lifting the given $\operatorname{map} \bigoplus A_{T_{j}} \rightarrow \mathcal{K}_{3}$. Then $\bigoplus A_{V_{j}} \oplus \bigoplus A_{T_{j}} \rightarrow \mathcal{K}_{2}$ is surjective which finishes the proof.

093H Lemma 18.29.10. In Situation 18.29.4 assume (1), (2), and (3) hold. Let $\mathcal{O}$ be a sheaf of rings. Let $\mathcal{A} \subset \operatorname{Mod}(\mathcal{O})$ be the full subcategory of modules isomorphic to a cokernel as in 18.29.6.2). If the kernel of every map of $\mathcal{O}$-modules of the form

$$
\bigoplus_{j=1, \ldots, m} j_{V_{j}!} \mathcal{O}_{V_{j}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!} \mathcal{O}_{U_{i}}
$$

with $U_{i}$ and $V_{j}$ in $\mathcal{B}$, is in $\mathcal{A}$, then $\mathcal{A}$ is weak Serre subcategory of $\operatorname{Mod}(\mathcal{O})$.
Proof. We will use the criterion of Homology, Lemma 12.9.3. By the results of Lemmas 18.29 .7 and 18.29 .9 it suffices to see that the kernel of a map $\mathcal{F} \rightarrow \mathcal{G}$ between objects of $\mathcal{A}$ is in $\mathcal{A}$. To prove this choose presentations

$$
\bigoplus A_{V_{j}} \rightarrow \bigoplus A_{U_{i}} \rightarrow \mathcal{F} \rightarrow 0 \quad \text { and } \quad \bigoplus A_{T_{j}} \rightarrow \bigoplus A_{W_{i}} \rightarrow \mathcal{G} \rightarrow 0
$$

In this proof the direct sums are always finite, and we write $A_{U}=j_{U!} \mathcal{O}_{U}$ for $U \in \mathcal{B}$. Using Lemmas 18.29 .1 and 18.29 .8 and arguing as in the proof of Lemma 18.29 .9 we may assume that the map $\mathcal{F} \rightarrow \mathcal{G}$ lifts to a map of presentations

Then we see that

$$
\operatorname{Ker}(\mathcal{F} \rightarrow \mathcal{G})=\operatorname{Coker}\left(\bigoplus A_{V_{j}} \rightarrow \operatorname{Ker}\left(\bigoplus A_{T_{j}} \oplus \bigoplus A_{U_{i}} \rightarrow \bigoplus A_{W_{i}}\right)\right)
$$

and the lemma follows from the assumption and Lemma 18.29.7.

### 18.30. Flat morphisms

04JA
04JB Definition 18.30.1. Let $\left(f, f^{\sharp}\right):(S h(\mathcal{C}), \mathcal{O}) \longrightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. We say $\left(f, f^{\sharp}\right)$ is flat if the ring map $f^{\sharp}: f^{-1} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$ is flat. We say a morphism of ringed sites is flat if the associated morphism of ringed topoi is flat.
04JC Lemma 18.30.2. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ be a morphism of ringed topoi. Then

$$
f^{-1}: A b\left(\mathcal{C}^{\prime}\right) \longrightarrow A b(\mathcal{C}), \quad \mathcal{F} \longmapsto f^{-1} \mathcal{F}
$$

is exact. If $\left(f, f^{\sharp}\right):(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ is a flat morphism of ringed topoi then

$$
f^{*}: \operatorname{Mod}\left(\mathcal{O}^{\prime}\right) \longrightarrow \operatorname{Mod}(\mathcal{O}), \quad \mathcal{F} \longmapsto f^{*} \mathcal{F}
$$

is exact.
Proof. Given an abelian sheaf $\mathcal{G}$ on $\mathcal{C}^{\prime}$ the underlying sheaf of sets of $f^{-1} \mathcal{G}$ is the same as $f^{-1}$ of the underlying sheaf of sets of $\mathcal{G}$, see Sites, Section 7.43 . Hence the exactness of $f^{-1}$ for sheaves of sets (required in the definition of a morphism of topoi, see Sites, Definition 7.16.1 implies the exactness of $f^{-1}$ as a functor on abelian sheaves.
To see the statement on modules recall that $f^{*} \mathcal{F}$ is defined as the tensor product $f^{-1} \mathcal{F} \otimes_{f^{-1} \mathcal{O}^{\prime}, f^{\sharp}} \mathcal{O}$. Hence $f^{*}$ is a composition of functors both of which are exact.

08M5 Definition 18.30.3. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. We say that $\mathcal{F}$ is flat over $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ if $\mathcal{F}$ is flat as an $f^{-1} \mathcal{O}^{\prime}$-module.
This is compatible with the notion as defined for morphisms of ringed spaces, see Modules, Definition 17.17 .3 and the discussion following.

### 18.31. Invertible modules

0408 Here is the definition.
0409 Definition 18.31.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site.
(1) A finite locally free $\mathcal{O}$-module $\mathcal{F}$ is said to have rank $r$ if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $U$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is isomorphic to $\mathcal{O}_{U_{i}}^{\oplus r}$ as an $\mathcal{O}_{U_{i}}$-module.
(2) An $\mathcal{O}$-module $\mathcal{L}$ is invertible if the functor

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}(\mathcal{O}), \quad \mathcal{F} \longmapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{L}
$$

is an equivalence.
(3) The sheaf $\mathcal{O}^{*}$ is the subsheaf of $\mathcal{O}$ defined by the rule

$$
U \longmapsto \mathcal{O}^{*}(U)=\{f \in \mathcal{O}(U) \mid \exists g \in \mathcal{O}(U) \text { such that } f g=1\}
$$

It is a sheaf of abelian groups with multiplication as the group law.
Lemma 18.39 .7 below explains the relationship with locally free modules of rank 1.
0B8N Lemma 18.31.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{L}$ be an $\mathcal{O}$-module. The following are quivalent:
(1) $\mathcal{L}$ is invertible, and
(2) there exists an $\mathcal{O}$-module $\mathcal{N}$ such that $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{N} \cong \mathcal{O}$.

In this case $\mathcal{L}$ is flat and of finite presentation and the module $\mathcal{N}$ in (2) is isomorphic to $\mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$.

Proof. Assume (1). Then the functor $-\otimes_{\mathcal{O}} \mathcal{L}$ is essentially surjective, hence there exists an $\mathcal{O}$-module $\mathcal{N}$ as in (2). If (2) holds, then the functor $-\otimes_{\mathcal{O}} \mathcal{N}$ is a quasiinverse to the functor $-\otimes_{\mathcal{O}} \mathcal{L}$ and we see that (1) holds.

Assume (1) and (2) hold. Since $-\otimes_{\mathcal{O}} \mathcal{L}$ is an equivalence, it is exact, and hence $\mathcal{L}$ is flat. Denote $\psi: \mathcal{L} \otimes_{\mathcal{O}} \mathcal{N} \rightarrow \mathcal{O}$ the given isomorphism. Let $U$ be an object of $\mathcal{C}$. We will show that the restriction $\mathcal{L}$ to the members of a covering of $U$ is a direct summmand of a free module, which will certainly imply that $\mathcal{L}$ is of finite presentation. By construction of $\otimes$ we may assume (after replacing $U$ by the members of a covering) that there exists an integer $n \geq 1$ and sections $x_{i} \in \mathcal{L}(U)$, $y_{i} \in \mathcal{N}(U)$ such that $\psi\left(\sum x_{i} \otimes y_{i}\right)=1$. Consider the isomorphisms

$$
\left.\left.\left.\left.\left.\mathcal{L}\right|_{U} \rightarrow \mathcal{L}\right|_{U} \otimes_{\mathcal{O}_{U}} \mathcal{L}\right|_{U} \otimes_{\mathcal{O}_{U}} \mathcal{N}\right|_{U} \rightarrow \mathcal{L}\right|_{U}
$$

where the first arrow sends $x$ to $\sum x_{i} \otimes x \otimes y_{i}$ and the second arrow sends $x \otimes x^{\prime} \otimes y$ to $\psi\left(x^{\prime} \otimes y\right) x$. We conclude that $x \mapsto \sum \psi\left(x \otimes y_{i}\right) x_{i}$ is an automorphism of $\left.\mathcal{L}\right|_{U}$. This automorphism factors as

$$
\left.\left.\mathcal{L}\right|_{U} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{L}\right|_{U}
$$

where the first arrow is given by $x \mapsto\left(\psi\left(x \otimes y_{1}\right), \ldots, \psi\left(x \otimes y_{n}\right)\right)$ and the second arrow by $\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum a_{i} x_{i}$. In this way we conclude that $\left.\mathcal{L}\right|_{U}$ is a direct summand of a finite free $\mathcal{O}_{U}$-module.
Assume (1) and (2) hold. Consider the evaluation map

$$
\mathcal{L} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{L}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{O}_{X}
$$

To finish the proof of the lemma we will show this is an isomorphism. By Lemma 18.27 .3 we have

$$
\operatorname{Hom}_{\mathcal{O}}(\mathcal{O}, \mathcal{O})=\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{N} \otimes_{\mathcal{O}} \mathcal{L}, \mathcal{O}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}}\left(\mathcal{N}, \mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})\right)
$$

The image of 1 gives a morphism $\mathcal{N} \rightarrow \mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$. Tensoring with $\mathcal{L}$ we obtain

$$
\mathcal{O}=\mathcal{L} \otimes_{\mathcal{O}} \mathcal{N} \longrightarrow \mathcal{L} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})
$$

This map is the inverse to the evaluation map; computation omitted.
0B8P Lemma 18.31.3. Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. The pullback $f^{*} \mathcal{L}$ of an inverible $\mathcal{O}_{\mathcal{D}}$-module is invertible.

Proof. By Lemma 18.31 .2 there exists an $\mathcal{O}_{\mathcal{D}}$-module $\mathcal{N}$ such that $\mathcal{L} \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{N} \cong \mathcal{O}_{\mathcal{D}}$. Pulling back we get $f^{*} \mathcal{L} \otimes_{\mathcal{O}_{\mathcal{C}}} f^{*} \mathcal{N} \cong \mathcal{O}_{\mathcal{C}}$ by Lemma 18.26.1. Thus $f^{*} \mathcal{L}$ is invertible by Lemma 18.31.2.

040A Lemma 18.31.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed space.
(1) If $\mathcal{L}, \mathcal{N}$ are invertible $\mathcal{O}$-modules, then so is $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{N}$.
(2) If $\mathcal{L}$ is an invertible $\mathcal{O}$-module, then so is $\mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$ and the evaluation map $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O}) \rightarrow \mathcal{O}$ is an isomorphism.

Proof. Part (1) is clear from the definition and part (2) follows from Lemma 18.31.2 and its proof.

040B Lemma 18.31.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed space. There exists a set of invertible modules $\left\{\mathcal{L}_{i}\right\}_{i \in I}$ such that each invertible module on $(\mathcal{C}, \mathcal{O})$ is isomorphic to exactly one of the $\mathcal{L}_{i}$.

Proof. Omitted, but see Sheaves of Modules, Lemma 17.21 .8
Lemma 18.31 .5 says that the collection of isomorphism classes of invertible sheaves forms a set. Lemma 18.31 .4 says that tensor product defines the structure of an abelian group on this set with inverse of $\mathcal{L}$ given by $\mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$.

In fact, given an invertible $\mathcal{O}$-module $\mathcal{L}$ and $n \in \mathbf{Z}$ we define the $n$th tensor power $\mathcal{L}^{\otimes n}$ of $\mathcal{L}$ as the image of $\mathcal{O}$ under applying the equivalence $\mathcal{F} \mapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{L}$ exactly $n$ times. This makes sense also for negative $n$ as we've defined an invertible $\mathcal{O}$-module as one for which tensoring is an equivalence. More explicitly, we have

$$
\mathcal{L}^{\otimes n}=\left\{\begin{array}{ccc}
\mathcal{O} & \text { if } & n=0 \\
\mathcal{H} m_{\mathcal{O}}(\mathcal{L}, \mathcal{O}) & \text { if } & n=-1 \\
\mathcal{L} \otimes_{\mathcal{O}} \ldots \otimes_{\mathcal{O}} \mathcal{L} & \text { if } & n>0 \\
\mathcal{L}^{\otimes-1} \otimes_{\mathcal{O}} \ldots \otimes_{\mathcal{O}} \mathcal{L}^{\otimes-1} & \text { if } & n<-1
\end{array}\right.
$$

see Lemma 18.31.4 With this definition we have canonical isomorphisms $\mathcal{L}^{\otimes n} \otimes_{\mathcal{O}}$ $\mathcal{L}^{\otimes m} \rightarrow \mathcal{L}^{\otimes n+m}$, and these isomorphisms satisfy a commutativity and an associativity constraint (formulation omitted).

040C Definition 18.31.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The Picard group $\operatorname{Pic}(\mathcal{O})$ of the ringed site is the abelian group whose elements are isomorphism classes of invertible $\mathcal{O}$-modules, with addition corresponding to tensor product.

### 18.32. Modules of differentials

04BJ In this section we briefly explain how to define the module of relative differentials for a morphism of ringed topoi. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.130).

04BK Definition 18.32.1. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. Let $\mathcal{F}$ be an $\mathcal{O}_{2}$-module. A $\mathcal{O}_{1}$-derivation or more precisely a $\varphi$-derivation into $\mathcal{F}$ is a map $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ which is additive, annihilates the image of $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$, and satisfies the Leibniz rule

$$
D(a b)=a D(b)+D(a) b
$$

for all $a, b$ local sections of $\mathcal{O}_{2}$ (wherever they are both defined). We denote $\operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)$ the set of $\varphi$-derivations into $\mathcal{F}$.

This is the sheaf theoretic analogue of Algebra, Definition 18.32.1. Given a derivation $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ as in the definition the map on global sections

$$
D: \Gamma\left(\mathcal{O}_{2}\right) \longrightarrow \Gamma(\mathcal{F})
$$

clearly is a $\Gamma\left(\mathcal{O}_{1}\right)$-derivation as in the algebra definition. Note that if $\alpha: \mathcal{F} \rightarrow \mathcal{G}$ is a map of $\mathcal{O}_{2}$-modules, then there is an induced map

$$
\operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right) \longrightarrow \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{G}\right)
$$

given by the rule $D \mapsto \alpha \circ D$. In other words we obtain a functor.

04BL Lemma 18.32.2. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. The functor

$$
\operatorname{Mod}\left(\mathcal{O}_{2}\right) \longrightarrow A b, \quad \mathcal{F} \longmapsto \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)
$$

is representable.
Proof. This is proved in exactly the same way as the analogous statement in algebra. During this proof, for any sheaf of sets $\mathcal{F}$ on $\mathcal{C}$, let us denote $\mathcal{O}_{2}[\mathcal{F}]$ the sheafification of the presheaf $U \mapsto \mathcal{O}_{2}(U)[\mathcal{F}(U)]$ where this denotes the free $\mathcal{O}_{1}(U)$ module on the set $\mathcal{F}(U)$. For $s \in \mathcal{F}(U)$ we denote $[s]$ the corresponding section of $\mathcal{O}_{2}[\mathcal{F}]$ over $U$. If $\mathcal{F}$ is a sheaf of $\mathcal{O}_{2}$-modules, then there is a canonical map

$$
c: \mathcal{O}_{2}[\mathcal{F}] \longrightarrow \mathcal{F}
$$

which on the presheaf level is given by the rule $\sum f_{s}[s] \mapsto \sum f_{s} s$. We will employ the short hand $[s] \mapsto s$ to describe this map and similarly for other maps below. Consider the map of $\mathcal{O}_{2}$-modules

04BM

$$
\begin{array}{ccc}
\mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right] \oplus \mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right] \oplus \mathcal{O}_{2}\left[\mathcal{O}_{1}\right] & \longrightarrow & \mathcal{O}_{2}\left[\mathcal{O}_{2}\right] \\
{[(a, b)] \oplus[(f, g)] \oplus[h]} & \longmapsto & {[a+b]-[a]-[b]+}  \tag{18.32.2.1}\\
& & {[f g]-g[f]-f[g]+} \\
& & {[\varphi(h)]}
\end{array}
$$

with short hand notation as above. Set $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ equal to the cokernel of this map. Then it is clear that there exists a map of sheaves of sets

$$
\mathrm{d}: \mathcal{O}_{2} \longrightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}
$$

mapping a local section $f$ to the image of $[f]$ in $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$. By construction d is a $\mathcal{O}_{1}$-derivation. Next, let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{2}$-modules and let $D: \mathcal{O}_{2} \rightarrow \mathcal{F}$ be a $\mathcal{O}_{1}$-derivation. Then we can consider the $\mathcal{O}_{2}$-linear map $\mathcal{O}_{2}\left[\mathcal{O}_{2}\right] \rightarrow \mathcal{F}$ which sends $[g]$ to $D(g)$. It follows from the definition of a derivation that this map annihilates sections in the image of the map 18.32.2.1 and hence defines a map

$$
\alpha_{D}: \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \longrightarrow \mathcal{F}
$$

Since it is clear that $D=\alpha_{D} \circ \mathrm{~d}$ the lemma is proved.
04BN Definition 18.32.3. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. The module of differentials of the ring map $\varphi$ is the object representing the functor $\mathcal{F} \mapsto \operatorname{Der}_{\mathcal{O}_{1}}\left(\mathcal{O}_{2}, \mathcal{F}\right)$ which exists by Lemma 18.32 .2 . It is denoted $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$, and the universal $\varphi$-derivation is denoted d: $\mathcal{O}_{2} \rightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$.
Since this module and the derivation form the universal object representing a functor, this notion is clearly intrinsic (i.e., does not depend on the choice of the site underlying the ringed topos, see Section 18.18). Note that $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the cokernel of the map 18.32 .2 .1 of $\mathcal{O}_{2}$-modules. Moreover the map $d$ is described by the rule that $\mathrm{d} f$ is the image of the local section $[f]$.

08TP Lemma 18.32.4. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of presheaves of rings. Then $\Omega_{\mathcal{O}_{2}^{\#} / \mathcal{O}_{1}^{\#}}$ is the sheaf associated to the presheaf $U \mapsto$ $\Omega_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)}$.
Proof. Consider the map 18.32 .2 .1 . There is a similar map of presheaves whose value on $U \in \operatorname{Ob}(\mathcal{C})$ is
$\mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U) \times \mathcal{O}_{2}(U)\right] \oplus \mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U) \times \mathcal{O}_{2}(U)\right] \oplus \mathcal{O}_{2}(U)\left[\mathcal{O}_{1}(U)\right] \longrightarrow \mathcal{O}_{2}(U)\left[\mathcal{O}_{2}(U)\right]$

The cokernel of this map has value $\Omega_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)}$ over $U$ by the construction of the module of differentials in Algebra, Definition 10.130.2. On the other hand, the sheaves in 18.32.2.1 are the sheafifications of the presheaves above. Thus the result follows as sheafification is exact.

08TQ Lemma 18.32.5. Let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Let $\varphi$ : $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. Then there is a canonical identification $f^{-1} \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}=\Omega_{f^{-1} \mathcal{O}_{2} / f^{-1} \mathcal{O}_{1}}$ compatible with universal derivations.
Proof. This holds because the sheaf $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}}$ is the cokernel of the map 18.32 .2 .1$)$ and a similar statement holds for $\Omega_{f^{-1} \mathcal{O}_{2} / f^{-1} \mathcal{O}_{1}}$, because the functor $f^{-1}$ is exact, and because $f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{2}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{2}\right], f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{2} \times \mathcal{O}_{2}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{2} \times\right.$ $\left.f^{-1} \mathcal{O}_{2}\right]$, and $f^{-1}\left(\mathcal{O}_{2}\left[\mathcal{O}_{1}\right]\right)=f^{-1} \mathcal{O}_{2}\left[f^{-1} \mathcal{O}_{1}\right]$.
04BO Lemma 18.32.6. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. For any object $U$ of $\mathcal{C}$ there is a canonical isomorphism

$$
\Omega_{\mathcal{O}_{2} /\left.\mathcal{O}_{1}\right|_{U}}=\Omega_{\left(\left.\mathcal{O}_{2}\right|_{U}\right) /\left(\left.\mathcal{O}_{1}\right|_{U}\right)}
$$

compatible with universal derivations.
Proof. This is a special case of Lemma 18.32 .5 .
08TR Lemma 18.32.7. Let $\mathcal{C}$ be a site. Let

be a commutative diagram of sheaves of rings on $\mathcal{C}$. The map $\mathcal{O}_{2} \rightarrow \mathcal{O}_{2}^{\prime}$ composed with the map $d: \mathcal{O}_{2}^{\prime} \rightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}^{\prime}}$ is a $\mathcal{O}_{1}$-derivation. Hence we obtain a canonical map of $\mathcal{O}_{2}$-modules $\Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \rightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}^{\prime}}$. It is uniquely characterized by the property that $d(f)$ mapsto $d(\varphi(f))$ for any local section $f$ of $\mathcal{O}_{2}$. In this way $\Omega_{-/-}$becomes a functor on the category of arrows of sheaves of rings.
Proof. This lemma proves itself.
08 TS Lemma 18.32.8. In Lemma 18.32 .7 suppose that $\mathcal{O}_{2} \rightarrow \mathcal{O}_{2}^{\prime}$ is surjective with kernel $\mathcal{I} \subset \mathcal{O}_{2}$ and assume that $\mathcal{O}_{1}=\mathcal{O}_{1}$. Then there is a canonical exact sequence of $\mathcal{O}_{2}^{\prime}$-modules

$$
\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \otimes_{\mathcal{O}_{2}} \mathcal{O}_{2}^{\prime} \longrightarrow \Omega_{\mathcal{O}_{2}^{\prime} / \mathcal{O}_{1}} \longrightarrow 0
$$

The leftmost map is characterized by the rule that a local section $f$ of $\mathcal{I}$ maps to $d f \otimes 1$.
Proof. For a local section $f$ of $\mathcal{I}$ denote $\bar{f}$ the image of $f$ in $\mathcal{I} / \mathcal{I}^{2}$. To show that the map $\bar{f} \mapsto \mathrm{~d} f \otimes 1$ is well defined we just have to check that $\mathrm{d} f_{1} f_{2} \otimes 1=0$ if $f_{1}, f_{2}$ are local sections of $\mathcal{I}$. And this is clear from the Leibniz rule $\mathrm{d} f_{1} f_{2} \otimes 1=$ $\left(f_{1} \mathrm{~d} f_{2}+f_{2} \mathrm{~d} f_{1}\right) \otimes 1=\mathrm{d} f_{2} \otimes f_{1}+\mathrm{d} f_{2} \otimes f_{1}=0$. A similar computation show this map is $\mathcal{O}_{2}^{\prime}=\mathcal{O}_{2} / \mathcal{I}$-linear. The map on the right is the one from Lemma 18.32.7.
To see that the sequence is exact, we argue as follows. Let $\mathcal{O}_{2}^{\prime \prime} \subset \mathcal{O}_{2}^{\prime}$ be the presheaf of $\mathcal{O}_{1}$-algebras whose value on $U$ is the image of $\mathcal{O}_{2}(U) \rightarrow \mathcal{O}_{2}^{\prime}(U)$. By Algebra, Lemma 10.130 .9 the sequences

$$
\mathcal{I}(U) / \mathcal{I}(U)^{2} \longrightarrow \Omega_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)} \otimes_{\mathcal{O}_{2}(U)} \mathcal{O}_{2}^{\prime \prime}(U) \longrightarrow \Omega_{\mathcal{O}_{2}^{\prime \prime}(U) / \mathcal{O}_{1}(U)} \longrightarrow 0
$$

are exact for all objects $U$ of $\mathcal{C}$. Since sheafification is exact this gives an exact sequence of sheaves of $\left(\mathcal{O}_{2}^{\prime}\right)^{\#}$-modules. By Lemma 18.32 .4 and the fact that $\left(\mathcal{O}_{2}^{\prime \prime}\right)^{\#}=\mathcal{O}_{2}^{\prime}$ we conclude.

Here is a particular situation where derivations come up naturally.
04BP Lemma 18.32.9. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. Consider a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_{2} \rightarrow 0
$$

Here $\mathcal{A}$ is a sheaf of $\mathcal{O}_{1}$-algebras, $\pi: \mathcal{A} \rightarrow \mathcal{O}_{2}$ is a surjection of sheaves of $\mathcal{O}_{1-}$ algebras, and $\mathcal{F}=\operatorname{Ker}(\pi)$ is its kernel. Assume $\mathcal{F}$ an ideal sheaf with square zero in $\mathcal{A}$. So $\mathcal{F}$ has a natural structure of an $\mathcal{O}_{2}$-module. A section $s: \mathcal{O}_{2} \rightarrow \mathcal{A}$ of $\pi$ is a $\mathcal{O}_{1}$-algebra map such that $\pi \circ s=i d$. Given any section $s: \mathcal{O}_{2} \rightarrow \mathcal{F}$ of $\pi$ and any $\varphi$-derivation $D: \mathcal{O}_{1} \rightarrow \mathcal{F}$ the map

$$
s+D: \mathcal{O}_{1} \rightarrow \mathcal{A}
$$

is a section of $\pi$ and every section $s^{\prime}$ is of the form $s+D$ for a unique $\varphi$-derivation D.

Proof. Recall that the $\mathcal{O}_{2}$-module structure on $\mathcal{F}$ is given by $h \tau=\tilde{h} \tau$ (multiplication in $\mathcal{A}$ ) where $h$ is a local section of $\mathcal{O}_{2}$, and $\tilde{h}$ is a local lift of $h$ to a local section of $\mathcal{A}$, and $\tau$ is a local section of $\mathcal{F}$. In particular, given $s$, we may use $\tilde{h}=s(h)$. To verify that $s+D$ is a homomorphism of sheaves of rings we compute

$$
\begin{aligned}
(s+D)(a b) & =s(a b)+D(a b) \\
& =s(a) s(b)+a D(b)+D(a) b \\
& =s(a) s(b)+s(a) D(b)+D(a) s(b) \\
& =(s(a)+D(a))(s(b)+D(b))
\end{aligned}
$$

by the Leibniz rule. In the same manner one shows $s+D$ is a $\mathcal{O}_{1}$-algebra map because $D$ is an $\mathcal{O}_{1}$-derivation. Conversely, given $s^{\prime}$ we set $D=s^{\prime}-s$. Details omitted.

04BQ Definition 18.32.10. Let $X=(S h(\mathcal{C}), \mathcal{O})$ and $Y=\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be ringed topoi. Let $\left(f, f^{\sharp}\right): X \rightarrow Y$ be a morphism of ringed topoi. In this situation
(1) for a sheaf $\mathcal{F}$ of $\mathcal{O}$-modules a $Y$-derivation $D: \mathcal{O} \rightarrow \mathcal{F}$ is just a $f^{\sharp}$ derivation, and
(2) the sheaf of differentials $\Omega_{X / Y}$ of $X$ over $Y$ is the module of differentials of $f^{\sharp}: f^{-1} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$, see Definition 18.32 .3 .
Thus $\Omega_{X / Y}$ comes equipped with a universal $Y$-derivation $\mathrm{d}_{X / Y}: \mathcal{O} \longrightarrow \Omega_{X / Y}$. We sometimes write $\Omega_{X / Y}=\Omega_{f}$.

Recall that $f^{\sharp}: f^{-1} \mathcal{O}^{\prime} \rightarrow \mathcal{O}$ so that this definition makes sense.
04BR Lemma 18.32.11. Let $X=\left(S h\left(\mathcal{C}_{X}\right), \mathcal{O}_{X}\right), Y=\left(S h\left(\mathcal{C}_{Y}\right), \mathcal{O}_{Y}\right), X^{\prime}=\left(S h\left(\mathcal{C}_{X^{\prime}}\right), \mathcal{O}_{X^{\prime}}\right)$, and $Y^{\prime}=\left(S h\left(\mathcal{C}_{Y^{\prime}}\right), \mathcal{O}_{Y^{\prime}}\right)$ be ringed topoi. Let

be a commutative diagram of morphisms of ringed topoi. The map $f^{\sharp}: \mathcal{O}_{X} \rightarrow$ $f_{*} \mathcal{O}_{X^{\prime}}$ composed with the map $f_{*} d_{X^{\prime} / Y^{\prime}}: f_{*} \mathcal{O}_{X^{\prime}} \rightarrow f_{*} \Omega_{X^{\prime} / Y^{\prime}}$ is a $Y$-derivation. Hence we obtain a canonical map of $\mathcal{O}_{X}$-modules $\Omega_{X / Y} \rightarrow f_{*} \Omega_{X^{\prime} / Y^{\prime}}$, and by adjointness of $f_{*}$ and $f^{*}$ a canonical $\mathcal{O}_{X^{\prime}}$-module homomorphism

$$
c_{f}: f^{*} \Omega_{X / Y} \longrightarrow \Omega_{X^{\prime} / Y^{\prime}}
$$

It is uniquely characterized by the property that $f^{*} d_{X / Y}(t)$ mapsto $d_{X^{\prime} / Y^{\prime}}\left(f^{*} t\right)$ for any local section $t$ of $\mathcal{O}_{X}$.
Proof. This is clear except for the last assertion. Let us explain the meaning of this. Let $U \in \operatorname{Ob}\left(\mathcal{C}_{X}\right)$ and let $t \in \mathcal{O}_{X}(U)$. This is what it means for $t$ to be a local section of $\mathcal{O}_{X}$. Now, we may think of $t$ as a map of sheaves of sets $t: h_{U}^{\#} \rightarrow \mathcal{O}_{X}$. Then $f^{-1} t: f^{-1} h_{U}^{\#} \rightarrow f^{-1} \mathcal{O}_{X}$. By $f^{*} t$ we mean the composition

$$
f^{-1} h_{U}^{\#} \xrightarrow[f^{-1} t]{f^{*} t} f^{-1} \mathcal{O}_{X} \xrightarrow[f^{\sharp}]{\longrightarrow} \mathcal{O}_{X^{\prime}}
$$

Note that $\mathrm{d}_{X / Y}(t) \in \Omega_{X / Y}(U)$. Hence we may think of $\mathrm{d}_{X / Y}(t)$ as a map $\mathrm{d}_{X / Y}(t)$ : $h_{U}^{\#} \rightarrow \Omega_{X / Y}$. Then $f^{-1} \mathrm{~d}_{X / Y}(t): f^{-1} h_{U}^{\#} \rightarrow f^{-1} \Omega_{X / Y}$. By $f^{*} \mathrm{~d}_{X / Y}(t)$ we mean the composition

$$
f^{-1} h_{U}^{\#} \xrightarrow{f^{*} \mathrm{~d}_{X / Y}(t)} \xrightarrow{\mathrm{d}_{X / Y}(t)} f^{-1} \Omega_{X / Y} \xrightarrow{1 \otimes \mathrm{id}} f^{*} \Omega_{X / Y}
$$

OK, and now the statement of the lemma means that we have

$$
c_{f} \circ f^{*} t=f^{*} \mathrm{~d}_{X / Y}(t)
$$

as maps from $f^{-1} h_{U}^{\#}$ to $\Omega_{X^{\prime} / Y^{\prime}}$. We omit the verification that this property holds for $c_{f}$ as defined in the lemma. (Hint: The first map $c_{f}^{\prime}: \Omega_{X / Y} \rightarrow f_{*} \Omega_{X^{\prime} / Y^{\prime}}$ satisfies $c_{f}^{\prime}\left(\mathrm{d}_{X / Y}(t)\right)=f_{*} \mathrm{~d}_{X^{\prime} / Y^{\prime}}\left(f^{\sharp}(t)\right)$ as sections of $f_{*} \Omega_{X^{\prime} / Y^{\prime}}$ over $U$, and you have to turn this into the equality above by using adjunction.) The reason that this uniquely characterizes $c_{f}$ is that the images of $f^{*} \mathrm{~d}_{X / Y}(t)$ generate the $\mathcal{O}_{X^{\prime}}$-module $f^{*} \Omega_{X / Y}$ simply because the local sections $\mathrm{d}_{X / Y}(t)$ generate the $\mathcal{O}_{X}$-module $\Omega_{X / Y}$.

### 18.33. Finite order differential operators

09 CQ In this section we introduce differential operators of finite order. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.131).
09CR Definition 18.33.1. Let $\mathcal{C}$ be a site. Let $\varphi: \mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of sheaves of rings. Let $k \geq 0$ be an integer. Let $\mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}_{2}$-modules. A differential operator $D: \mathcal{F} \rightarrow \mathcal{G}$ of order $k$ is an is an $\mathcal{O}_{1}$-linear map such that for all local sections $g$ of $\mathcal{O}_{2}$ the map $s \mapsto D(g s)-g D(s)$ is a differential operator of order $k-1$. For the base case $k=0$ we define a differential operator of oder 0 to be an $\mathcal{O}_{2}$-linear map.
If $D: \mathcal{F} \rightarrow \mathcal{G}$ is a differential operator of order $k$, then for all local sections $g$ of $\mathcal{O}_{2}$ the map $g D$ is a differential operator of order $k$. The sum of two differential operators of order $k$ is another. Hence the set of all these

$$
\operatorname{Diff}^{k}(\mathcal{F}, \mathcal{G})=\operatorname{Diff}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F}, \mathcal{G})
$$

is a $\Gamma\left(\mathcal{C}, \mathcal{O}_{2}\right)$-module. We have

$$
\operatorname{Diff}^{0}(\mathcal{F}, \mathcal{G}) \subset \operatorname{Diff}^{1}(\mathcal{F}, \mathcal{G}) \subset \operatorname{Diff}^{2}(\mathcal{F}, \mathcal{G}) \subset \ldots
$$

The rule which maps $U \in \operatorname{Ob}(\mathcal{C})$ to the module of differential operators $D:\left.\mathcal{F}\right|_{U} \rightarrow$ $\left.\mathcal{G}\right|_{U}$ of order $k$ is a sheaf of $\mathcal{O}_{2}$-modules on the site $\mathcal{C}$. Thus we obtain a sheaf of differential operators (if we ever need this we will add a definition here).

09CS Lemma 18.33.2. Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a map of sheaves of rings. Let $\mathcal{E}, \mathcal{F}, \mathcal{G}$ be sheaves of $\mathcal{O}_{2}$-modules. If $D: \mathcal{E} \rightarrow \mathcal{F}$ and $D^{\prime}: \mathcal{F} \rightarrow \mathcal{G}$ are differential operators of order $k$ and $k^{\prime}$, then $D^{\prime} \circ D$ is a differential operator of order $k+k^{\prime}$.

Proof. Let $g$ be a local section of $\mathcal{O}_{2}$. Then the map which sends a local section $x$ of $\mathcal{E}$ to

$$
D^{\prime}(D(g x))-g D^{\prime}(D(x))=D^{\prime}(D(g x))-D^{\prime}(g D(x))+D^{\prime}(g D(x))-g D^{\prime}(D(x))
$$

is a sum of two compositions of differential operators of lower order. Hence the lemma follows by induction on $k+k^{\prime}$.

09CT Lemma 18.33.3. Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a map of sheaves of rings. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{2}$-modules. Let $k \geq 0$. There exists a sheaf of $\mathcal{O}_{2}$-modules $\mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F})$ and a canonical isomorphism

$$
D i f f_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F}), \mathcal{G}\right)
$$

functorial in the $\mathcal{O}_{2}$-module $\mathcal{G}$.
Proof. The existence follows from general category theoretic arguments (insert future reference here), but we will also give a direct construction as this construction will be useful in the future proofs. We will freely use the notation introduced in the proof of Lemma 18.32 .2 . Given any differential operator $D: \mathcal{F} \rightarrow \mathcal{G}$ we obtain an $\mathcal{O}_{2}$-linear map $L_{D}: \mathcal{O}_{2}[\mathcal{F}] \rightarrow \mathcal{G}$ sending $[m]$ to $D(m)$. If $D$ has order 0 then $L_{D}$ annihilates the local sections

$$
\left[m+m^{\prime}\right]-[m]-\left[m^{\prime}\right], \quad g_{0}[m]-\left[g_{0} m\right]
$$

where $g_{0}$ is a local section of $\mathcal{O}_{2}$ and $m, m^{\prime}$ are local sections of $\mathcal{F}$. If $D$ has order 1 , then $L_{D}$ annihilates the local sections

$$
\left[m+m^{\prime}-[m]-\left[m^{\prime}\right], \quad f[m]-[f m], \quad g_{0} g_{1}[m]-g_{0}\left[g_{1} m\right]-g_{1}\left[g_{0} m\right]+\left[g_{1} g_{0} m\right]\right.
$$

where $f$ is a local section of $\mathcal{O}_{1}, g_{0}, g_{1}$ are local sections of $\mathcal{O}_{2}$, and $m, m^{\prime}$ are local sections of $\mathcal{F}$. If $D$ has order $k$, then $L_{D}$ annihilates the local sections [ $m+m^{\prime}$ ] -$[m]-\left[m^{\prime}\right], f[m]-[f m]$, and the local sections

$$
g_{0} g_{1} \ldots g_{k}[m]-\sum g_{0} \ldots \hat{g}_{i} \ldots g_{k}\left[g_{i} m\right]+\ldots+(-1)^{k+1}\left[g_{0} \ldots g_{k} m\right]
$$

Conversely, if $L: \mathcal{O}_{2}[\mathcal{F}] \rightarrow \mathcal{G}$ is an $\mathcal{O}_{2}$-linear map annihilating all the local sections listed in the previous sentence, then $m \mapsto L([m])$ is a differential operator of order $k$. Thus we see that $\mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F})$ is the quotient of $\mathcal{O}_{2}[\mathcal{F}]$ by the $\mathcal{O}_{2}$-submodule generated by these local sections.

09CU Definition 18.33.4. Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a map of sheaves of rings. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{2}$-modules. The module $\mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{k}(\mathcal{F})$ constructed in Lemma 18.33 .3 is called the module of principal parts of order $k$ of $\mathcal{F}$.

Note that the inclusions

$$
\operatorname{Diff}^{0}(\mathcal{F}, \mathcal{G}) \subset \operatorname{Diff}^{1}(\mathcal{F}, \mathcal{G}) \subset \operatorname{Diff}^{2}(\mathcal{F}, \mathcal{G}) \subset \ldots
$$

correspond via Yoneda's lemma (Categories, Lemma 4.3.5 to surjections

$$
\ldots \rightarrow \mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{2}(\mathcal{F}) \rightarrow \mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{1}(\mathcal{F}) \rightarrow \mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{0}(\mathcal{F})=\mathcal{F}
$$

09CV Lemma 18.33.5. Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of presheaves of rings. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{2}$-modules. Then $\mathcal{P}_{\mathcal{O}_{2}^{\#} / \mathcal{O}_{1}^{\#}}^{k}\left(\mathcal{F}^{\#}\right)$ is the sheaf associated to the presheaf $U \mapsto P_{\mathcal{O}_{2}(U) / \mathcal{O}_{1}(U)}^{k}(\mathcal{F}(U))$.
Proof. This can be proved in exactly the same way as is done for the sheaf of differentials in Lemma 18.32.4. Perhaps a more pleasing approach is to use the universal property of Lemma 18.33 .3 directly to see the equality. We omit the details.
09CW Lemma 18.33.6. Let $\mathcal{C}$ be a site. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a homomorphism of presheaves of rings. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{2}$-modules. There is a canonical short exact sequence

$$
0 \rightarrow \Omega_{\mathcal{O}_{2} / \mathcal{O}_{1}} \otimes_{\mathcal{O}_{2}} \mathcal{F} \rightarrow \mathcal{P}_{\mathcal{O}_{2} / \mathcal{O}_{1}}^{1}(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow 0
$$

functorial in $\mathcal{F}$ called the sequence of principal parts.
Proof. Follows from the commutative algebra version (Algebra, Lemma 10.131.6) and Lemmas 18.32.4 and 18.33.5

09CX Remark 18.33.7. Let $\mathcal{C}$ be a site. Suppose given a commutative diagram of sheaves of rings

a $\mathcal{B}$-module $\mathcal{F}$, a $\mathcal{B}^{\prime}$-module $\mathcal{F}^{\prime}$, and a $\mathcal{B}$-linear map $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$. Then we get a compatible system of module maps

These maps are compatible with further composition of maps of this type. The easiest way to see this is to use the description of the modules $\mathcal{P}_{\mathcal{B} / \mathcal{A}}^{k}(\mathcal{M})$ in terms of (local) generators and relations in the proof of Lemma 18.33 .3 but it can also be seen directly from the universal property of these modules. Moreover, these maps are compatible with the short exact sequences of Lemma 18.33.6.

### 18.34. The naive cotangent complex

08 TT This section is the analogue of Algebra, Section 10.132 and Modules, Section 17.25 . We advise the reader to read those sections first.
Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. In this section, for any sheaf of sets $\mathcal{E}$ on $\mathcal{C}$ we denote $\mathcal{A}[\mathcal{E}]$ the sheafification of the presheaf
$U \mapsto \mathcal{A}(U)[\mathcal{E}(U)]$. Here $\mathcal{A}(U)[\mathcal{E}(U)]$ denotes the polynomial algebra over $\mathcal{A}(U)$ whose variables correspond to the elements of $\mathcal{E}(U)$. We denote $[e] \in \mathcal{A}(U)[\mathcal{E}(U)]$ the variable corresponding to $e \in \mathcal{E}(U)$. There is a canonical surjection of $\mathcal{A}$ algebras
08 TU

$$
\begin{equation*}
\mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{B}, \quad[b] \longmapsto b \tag{18.34.0.1}
\end{equation*}
$$

whose kernel we denote $\mathcal{I} \subset \mathcal{A}[\mathcal{B}]$. It is a simple observation that $\mathcal{I}$ is generated by the local sections $[b]\left[b^{\prime}\right]-\left[b b^{\prime}\right]$ and $[a]-a$. According to Lemma 18.32 .8 there is a canonical map

08TV

$$
\begin{equation*}
\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B} \tag{18.34.0.2}
\end{equation*}
$$

whose cokernel is canonically isomorphic to $\Omega_{\mathcal{B} / \mathcal{A}}$.
08TW Definition 18.34.1. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{C}$. The naive cotangent complex $N L_{\mathcal{B} / \mathcal{A}}$ is the chain complex 18.34.0.2

$$
N L_{\mathcal{B} / \mathcal{A}}=\left(\mathcal{I} / \mathcal{I}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}\right)
$$

with $\mathcal{I} / \mathcal{I}^{2}$ placed in (homological) degree 1 and $\Omega_{\mathcal{A}[\mathcal{B}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$ placed in degree 0 .

This construction satisfies a functoriality similar to that discussed in Lemma 18.32 .7 for modules of differentials. Namely, given a commutative diagram

08TX
(18.34.1.1)

of sheaves of rings on $\mathcal{C}$ there is a canonical $\mathcal{B}$-linear map of complexes

$$
N L_{\mathcal{B} / \mathcal{A}} \longrightarrow N L_{\mathcal{B}^{\prime} / \mathcal{A}^{\prime}}
$$

Namely, the maps in the commutative diagram give rise to a canonical map $\mathcal{A}[\mathcal{B}] \rightarrow$ $\mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right]$ which maps $\mathcal{I}$ into $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{A}^{\prime}\left[\mathcal{B}^{\prime}\right] \rightarrow \mathcal{B}^{\prime}\right)$. Thus a map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}$ and a map between modules of differentials, which together give the desired map between the naive cotangent complexes.

We can choose a different presentation of $\mathcal{B}$ as a quotient of a polynomial algebra over $\mathcal{A}$ and still obtain the same object of $D(\mathcal{B})$. To explain this, suppose that $\mathcal{E}$ is a sheaves of sets on $\mathcal{C}$ and $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ a map of sheaves of sets. Then we obtain an $\mathcal{A}$-algebra homomorphism $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$. Assume this map is surjective, and let $\mathcal{J} \subset \mathcal{A}[\mathcal{E}]$ be the kernel. Set

$$
N L(\alpha)=\left(\mathcal{J} / \mathcal{J}^{2} \longrightarrow \Omega_{\mathcal{A}[\mathcal{E}] / \mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B}\right)
$$

Here is the result.
08TY Lemma 18.34.2. In the situation above there is a canonical isomorphism $N L(\alpha)=$ $N L_{\mathcal{B} / \mathcal{A}}$ in $D(\mathcal{B})$.
Proof. Observe that $N L_{\mathcal{B} / \mathcal{A}}=N L\left(\mathrm{id}_{\mathcal{B}}\right)$. Thus it suffices to show that given two maps $\alpha_{i}: \mathcal{E}_{i} \rightarrow \mathcal{B}$ as above, there is a canonical quasi-isomorphism $N L\left(\alpha_{1}\right)=$ $N L\left(\alpha_{2}\right)$ in $D(\mathcal{B})$. To see this set $\mathcal{E}=\mathcal{E}_{1} \amalg \mathcal{E}_{2}$ and $\alpha=\alpha_{1} \amalg \alpha_{2}: \mathcal{E} \rightarrow \mathcal{B}$. Set
$\mathcal{J}_{i}=\operatorname{Ker}\left(\mathcal{A}\left[\mathcal{E}_{i}\right] \rightarrow \mathcal{B}\right)$ and $\mathcal{J}=\operatorname{Ker}(\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B})$. We obtain maps $\mathcal{A}\left[\mathcal{E}_{i}\right] \rightarrow \mathcal{A}[\mathcal{E}]$ which send $\mathcal{J}_{i}$ into $\mathcal{J}$. Thus we obtain canonical maps of complexes

$$
N L\left(\alpha_{i}\right) \longrightarrow N L(\alpha)
$$

and it suffices to show these maps are quasi-isomorphism. To see this we argue as follows. First, observe that $H_{0}\left(N L\left(\alpha_{i}\right)\right)=\Omega_{\mathcal{B} / \mathcal{A}}$ and $H_{0}(N L(\alpha))=\Omega_{\mathcal{B} / \mathcal{A}}$ by Lemma 18.32 .8 hence the map is an isomorphism on 0th homology sheaves. Similarly, we claim that $H_{1}\left(N L\left(\alpha_{i}\right)\right)$ and $H_{1}(N L(\alpha))$ are the sheaves associated to the presheaf $U \mapsto H_{1}\left(L_{\mathcal{B}(U) / \mathcal{A}(U)}\right)$. If the claim holds, then the proof is finished.
Proof of the claim. Let $\alpha: \mathcal{E} \rightarrow \mathcal{B}$ be as above. Let $\mathcal{B}^{\prime} \subset \mathcal{B}$ be the subpresheaf of $\mathcal{A}$-algebras whose value on $U$ is the image of $\mathcal{A}(U)[\mathcal{E}(U)] \rightarrow \mathcal{B}(U)$. Let $\mathcal{I}^{\prime}$ be the presheaf whose value on $U$ is the kernel of $\mathcal{A}(U)[\mathcal{E}(U)] \rightarrow \mathcal{B}(U)$. Then $\mathcal{I}$ is the sheafification of $\mathcal{I}^{\prime}$ and $\mathcal{B}$ is the sheafification of $\mathcal{B}^{\prime}$. Similarly, $H_{1}(N L(\alpha))$ is the sheafification of the presheaf

$$
U \longmapsto \operatorname{Ker}\left(\mathcal{I}^{\prime}(U) / \mathcal{I}^{\prime}(U)^{2} \rightarrow \Omega_{\mathcal{A}(U)[\mathcal{E}(U)] / \mathcal{A}(U)} \otimes_{\mathcal{A}(U)[\mathcal{E}(U)]} \mathcal{B}^{\prime}(U)\right)
$$

by Lemma 18.32 .4 . By Algebra, Lemma 10.132 .2 we conclude $H_{1}(N L(\alpha))$ is the sheaf associated to the presheaf $U \mapsto H_{1}\left(L_{\mathcal{B}^{\prime}(U) / \mathcal{A}(U)}\right)$. Thus we have to show that the maps $H_{1}\left(L_{\mathcal{B}^{\prime}(U) / \mathcal{A}(U)}\right) \rightarrow H_{1}\left(L_{\mathcal{B}(U) / \mathcal{A}(U)}\right)$ induce an isomorphism $\mathcal{H}_{1}^{\prime} \rightarrow \mathcal{H}_{1}$ of sheafifications.
Injectivity of $\mathcal{H}_{1}^{\prime} \rightarrow \mathcal{H}_{1}$. Let $f \in H_{1}\left(L_{\mathcal{B}^{\prime}(U) / \mathcal{A}(U)}\right)$ map to zero in $\mathcal{H}_{1}(U)$. To show: $f$ maps to zero in $\mathcal{H}_{1}^{\prime}(U)$. The assumption means there is a covering $\left\{U_{i} \rightarrow U\right\}$ such that $f$ maps to zero in $H_{1}\left(L_{\mathcal{B}\left(U_{i}\right) / \mathcal{A}\left(U_{i}\right)}\right)$ for all $i$. Replace $U$ by $U_{i}$ to get to the point where $f$ maps to zero in $H_{1}\left(L_{\mathcal{B}(U) / \mathcal{A}(U)}\right)$. By Algebra, Lemma 10.132 .9 we can find a finitely generated subalgebra $\mathcal{B}^{\prime}(U) \subset B \subset \mathcal{B}(U)$ such that $f$ maps to zero in $H_{1}\left(L_{B / \mathcal{A}(U)}\right)$. Since $\mathcal{B}=\left(\mathcal{B}^{\prime}\right)^{\#}$ we can find a covering $\left\{U_{i} \rightarrow U\right\}$ such that $B \rightarrow \mathcal{B}\left(U_{i}\right)$ factors through $\mathcal{B}^{\prime}\left(U_{i}\right)$. Hence $f$ maps to zero in $H_{1}\left(L_{\mathcal{B}^{\prime}\left(U_{i}\right) / \mathcal{A}\left(U_{i}\right)}\right)$ as desired.
The surjectivity of $\mathcal{H}_{1}^{\prime} \rightarrow \mathcal{H}_{1}$ is proved in exactly the same way.
08TZ Lemma 18.34.3. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be morphism of topoi. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on $\mathcal{D}$. Then $f^{-1} N L_{\mathcal{B} / \mathcal{A}}=N L_{f^{-1} \mathcal{B} / f^{-1} \mathcal{A}}$.
Proof. Omitted. Hint: Use Lemma 18.32.5
The cotangent complex of a morphism of ringed topoi is defined in terms of the cotangent complex we defined above.

08U0 Definition 18.34.4. Let $X=(S h(\mathcal{C}), \mathcal{O})$ and $Y=\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be ringed topoi. Let $\left(f, f^{\sharp}\right): X \rightarrow Y$ be a morphism of ringed topoi. The naive cotangent complex $N L_{f}=N L_{X / Y}$ of the given morphism of ringed topoi is $N L_{\mathcal{O}_{X} / f^{-1} \mathcal{O}_{Y}}$. We sometimes write $N L_{X / Y}=N L_{\mathcal{O}_{X} / \mathcal{O}_{Y}}$.

### 18.35. Stalks of modules

04EM We have to be a bit careful when taking stalks at points, since the colimit defining a stalk (see Sites, Equation 7.31.1.1) may not be filtered ${ }^{3}$. On the other hand, by definition of a point of a site the stalk functor is exact and commutes with arbitrary colimits. In other words, it behaves exactly as if the colimit were filtered.

[^50]04EN Lemma 18.35.1. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$.
(1) We have $\left(\mathcal{F}^{\#}\right)_{p}=\mathcal{F}_{p}$ for any presheaf of sets on $\mathcal{C}$.
(2) The stalk functor $\operatorname{Sh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}_{p}$ is exact (see Categories, Definition 4.23.1) and commutes with arbitrary colimits.
(3) The stalk functor $\operatorname{PSh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}_{p}$ is exact (see Categories, Definition 4.23.1) and commutes with arbitrary colimits.

Proof. By Sites, Lemma 7.31.5 we have (1). By Sites, Lemmas 7.31.4 we see that $\operatorname{PSh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}_{p}$ is a left adjoint, and by Sites, Lemma 7.31.5 we see the same thing for $\operatorname{PSh}(\mathcal{C}) \rightarrow \operatorname{Sets}, \mathcal{F} \mapsto \mathcal{F}_{p}$. Hence the stalk functor commutes with arbitrary colimits (see Categories, Lemma 4.24.4). It follows from the definition of a point of a site, see Sites, Definition 7.31 .2 that $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sets}, \mathcal{F} \mapsto \mathcal{F}_{p}$ is exact. Since sheafification is exact (Sites, Lemma 7.10 .14 ) it follows that $\operatorname{PSh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}_{p}$ is exact.
In particular, since the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ on presheaves commutes with all finite limits and colimits we may apply the reasoning of the proof of Sites, Proposition 7.43.3. The result of such an argument is that if $\mathcal{F}$ is a (pre)sheaf of algebraic structures listed in Sites, Proposition 7.43 .3 then the stalk $\mathcal{F}_{p}$ is naturally an algebraic structure of the same kind. Let us explain this in detail when $\mathcal{F}$ is an abelian presheaf. In this case the addition map $+: \mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ induces a map

$$
+: \mathcal{F}_{p} \times \mathcal{F}_{p}=(\mathcal{F} \times \mathcal{F})_{p} \longrightarrow \mathcal{F}_{p}
$$

where the equal sign uses that stalk functor on presheaves of sets commutes with finite limits. This defines a group structure on the stalk $\mathcal{F}_{p}$. In this way we obtain our stalk functor

$$
\operatorname{PAb}(\mathcal{C}) \longrightarrow A b, \quad \mathcal{F} \longmapsto \mathcal{F}_{p}
$$

By construction the underlying set of $\mathcal{F}_{p}$ is the stalk of the underlying presheaf of sets. This also defines our stalk functor for sheaves of abelian groups by precomposing with the inclusion $A b(\mathcal{C}) \subset \operatorname{PAb}(\mathcal{C})$.

04EP Lemma 18.35.2. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$.
(1) The functor $A b(\mathcal{C}) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{p}$ is exact.
(2) The stalk functor $\operatorname{PAb}(\mathcal{C}) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{p}$ is exact.
(3) For $\mathcal{F} \in \operatorname{Ob}(\operatorname{PAb}(\mathcal{C}))$ we have $\mathcal{F}_{p}=\mathcal{F}_{p}^{\#}$.

Proof. This is formal from the results of Lemma 18.35 .1 and the construction of the stalk functor above.

Next, we turn to the case of sheaves of modules. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. (It suffices for the discussion that $\mathcal{O}$ be a presheaf of rings.) Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. Let $p$ be a point of $\mathcal{C}$. In this case we get a map

$$
\cdot: \mathcal{O}_{p} \times \mathcal{O}_{p}=(\mathcal{O} \times \mathcal{O})_{p} \longrightarrow \mathcal{O}_{p}
$$

which is the stalk of the multiplication map and

$$
: \mathcal{O}_{p} \times \mathcal{F}_{p}=(\mathcal{O} \times \mathcal{F})_{p} \longrightarrow \mathcal{F}_{p}
$$

which is the stalk of the multiplication map. We omit the verification that this defines a ring structure on $\mathcal{O}_{p}$ and an $\mathcal{O}_{p}$-module structure on $\mathcal{F}_{p}$. In this way we obtain a functor

$$
\operatorname{PMod}(\mathcal{O}) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{p}\right), \quad \mathcal{F} \longmapsto \mathcal{F}_{p}
$$

By construction the underlying set of $\mathcal{F}_{p}$ is the stalk of the underlying presheaf of sets. This also defines our stalk functor for sheaves of $\mathcal{O}$-modules by precomposing with the inclusion $\operatorname{Mod}(\mathcal{O}) \subset \operatorname{PMod}(\mathcal{O})$.

04EQ Lemma 18.35.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $p$ be a point of $\mathcal{C}$.
(1) The functor $\operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{p}\right), \mathcal{F} \mapsto \mathcal{F}_{p}$ is exact.
(2) The stalk functor $\operatorname{PMod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{p}\right), \mathcal{F} \mapsto \mathcal{F}_{p}$ is exact.
(3) For $\mathcal{F} \in \operatorname{Ob}(\operatorname{PMod}(\mathcal{O}))$ we have $\mathcal{F}_{p}=\mathcal{F}_{p}^{\#}$.

Proof. This is formal from the results of Lemma 18.35.2, the construction of the stalk functor above, and Lemma 18.14.1.

05V5 Lemma 18.35.4. Let $\left(f, f^{\sharp}\right):\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi or ringed sites. Let $p$ be a point of $\mathcal{C}$ or $\operatorname{Sh}(\mathcal{C})$ and set $q=f \circ p$. Then

$$
\left(f^{*} \mathcal{F}\right)_{p}=\mathcal{F}_{q} \otimes_{\mathcal{O}_{\mathcal{D}, q}} \mathcal{O}_{\mathcal{C}, p}
$$

for any $\mathcal{O}_{\mathcal{D}}$-module $\mathcal{F}$.
Proof. We have

$$
f^{*} \mathcal{F}=f^{-1} \mathcal{F} \otimes_{f^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O}_{\mathcal{C}}
$$

by definition. Since taking stalks at $p$ (i.e., applying $p^{-1}$ ) commutes with $\otimes$ by Lemma 18.26 .1 we win by the relation between the stalk of pullbacks at $p$ and stalks at $q$ explained in Sites, Lemma 7.33.1 or Sites, Lemma 7.33.2.

### 18.36. Skyscraper sheaves

05 V 6 Let $p$ be a point of a site $\mathcal{C}$ or a topos $S h(\mathcal{C})$. In this section we study the exactness properties of the functor which associates to an abelian group $A$ the skyscraper sheaf $p_{*} A$. First, recall that $p_{*}:$ Sets $\rightarrow S h(\mathcal{C})$ has a lot of exactness properties, see Sites, Lemmas 7.31 .9 and 7.31.10.

05V7 Lemma 18.36.1. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$ or of its associated topos.
(1) The functor $p_{*}: A b \rightarrow A b(\mathcal{C}), A \mapsto p_{*} A$ is exact.
(2) There is a functorial direct sum decomposition

$$
p^{-1} p_{*} A=A \oplus I(A)
$$

for $A \in \mathrm{Ob}(A b)$.
Proof. By Sites, Lemma 7.31 .9 there are functorial maps $A \rightarrow p^{-1} p_{*} A \rightarrow A$ whose composition equals $\mathrm{id}_{A}$. Hence a functorial direct sum decomposition as in (2) with $I(A)$ the kernel of the adjunction map $p^{-1} p_{*} A \rightarrow A$. The functor $p_{*}$ is left exact by Lemma 18.14 .3 . The functor $p_{*}$ transforms surjections into surjections by Sites, Lemma 7.31.10. Hence (1) holds.

To do the same thing for sheaves of modules, suppose given a point $p$ of a ringed topos $(S h(\mathcal{C}), \mathcal{O})$. Recall that $p^{-1}$ is just the stalk functor. Hence we can think of $p$ as a morphism of ringed topoi

$$
\left(p, \operatorname{id}_{\mathcal{O}_{p}}\right):\left(S h(p t), \mathcal{O}_{p}\right) \longrightarrow(S h(\mathcal{C}), \mathcal{O})
$$

Thus we get a pullback functor $p^{*}: \operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{p}\right)$ which equals the stalk functor, and which we discussed in Lemma 18.35.3. In this section we consider the functor $p_{*}: \operatorname{Mod}\left(\mathcal{O}_{p}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$.

05 V 8 Lemma 18.36.2. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $p$ be a point of the topos $\operatorname{Sh}(\mathcal{C})$.
(1) The functor $p_{*}: \operatorname{Mod}\left(\mathcal{O}_{p}\right) \rightarrow \operatorname{Mod}(\mathcal{O}), M \mapsto p_{*} M$ is exact.
(2) There is a functorial direct sum decomposition of $\mathcal{O}_{p}$-modules

$$
p^{-1} p_{*} M=M \oplus I(M)
$$

$$
\text { for } M a \mathcal{O}_{p} \text {-module }
$$

Proof. This follows immediately from the corresponding result for abelian sheaves in Lemma 18.36.1

05V9 Example 18.36.3. Let $G$ be a group. Consider the site $\mathcal{T}_{G}$ and its point $p$, see Sites, Example 7.32 .6 . Let $R$ be a ring with a $G$-action which corresponds to a sheaf of rings $\mathcal{O}$ on $\mathcal{T}_{G}$. Then $\mathcal{O}_{p}=R$ where we forget the $G$-action. In this case $p^{-1} p_{*} M=\operatorname{Map}(G, M)$ and $I(M)=\left\{f: G \rightarrow M \mid f\left(1_{G}\right)=0\right\}$ and $M \rightarrow \operatorname{Map}(G, M)$ assigns to $m \in M$ the constant function with value $m$.

### 18.37. Localization and points

070Z
0710 Lemma 18.37.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $p$ be a point of $\mathcal{C} . L e t ~ U$ be an object of $\mathcal{C}$. For $\mathcal{G}$ in $\operatorname{Mod}\left(\mathcal{O}_{U}\right)$ we have

$$
\left(j_{U!} \mathcal{G}\right)_{p}=\bigoplus_{q} \mathcal{G}_{q}
$$

where the coproduct is over the points $q$ of $\mathcal{C} / U$ lying over $p$, see Sites, Lemma 7.34 .2 .

Proof. We use the description of $j_{U!} \mathcal{G}$ as the sheaf associated to the presheaf $V \mapsto \bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}\left(V /{ }_{\varphi} U\right)$ of Lemma 18.19.2. The stalk of $j_{U!} \mathcal{G}$ at $p$ is equal to the stalk of this presheaf, see Lemma 18.35.3. Let $u: \mathcal{C} \rightarrow$ Sets be the functor corresponding to $p$ (see Sites, Section 7.31). Hence we see that

$$
\left(j_{U!} \mathcal{G}\right)_{p}=\operatorname{colim}_{(V, y)} \bigoplus_{\varphi: V \rightarrow U} \mathcal{G}\left(V /{ }_{\varphi} U\right)
$$

where the colimit is taken in the category of abelian groups. To a quadruple $(V, y, \varphi, s)$ occurring in this colimit, we can assign $x=u(\varphi)(y) \in u(U)$. Hence we obtain

$$
\left(j_{U!} \mathcal{G}\right)_{p}=\bigoplus_{x \in u(U)} \operatorname{colim}_{(\varphi: V \rightarrow U, y), u(\varphi)(y)=x} \mathcal{G}\left(V /{ }_{\varphi} U\right)
$$

This is equal to the expression of the lemma by the description of the points $q$ lying over $x$ in Sites, Lemma 7.34.2.
0711 Remark 18.37.2. Warning: The result of Lemma 18.37.1 has no analogue for $j_{U, *}$.

### 18.38. Pullbacks of flat modules

05 VA The pullback of a flat module along a morphism of ringed topoi is flat. This is quite tricky to prove, except when there are enough points. Here we prove it only in this case and we will add the general case if we ever need it.

05 VB Lemma 18.38.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $p$ be a point of $\mathcal{C}$. If $\mathcal{F}$ is a flat $\mathcal{O}$-module, then $\mathcal{F}_{p}$ is a flat $\mathcal{O}_{p}$-module.

Proof. Let $M$ be an $\mathcal{O}_{p}$-module. Then

$$
\begin{aligned}
\left(p_{*} M \otimes_{\mathcal{O}} \mathcal{F}\right)_{p} & =p^{-1}\left(p_{*} M \otimes_{\mathcal{O}} \mathcal{F}\right) \\
& =p^{-1} p_{*} M \otimes_{\mathcal{O}_{p}} \mathcal{F}_{p} \\
& =M \otimes_{\mathcal{O}_{p}} \mathcal{F}_{p} \oplus I(M) \otimes_{\mathcal{O}_{p}} \mathcal{F}_{p}
\end{aligned}
$$

where we have used the description of the stalk functor as a pullback, Lemma 18.26.1, and Lemma 18.36.2. Since $p_{*}$ is exact by Lemma 18.36 .2 , it is clear that if $\mathcal{F}$ is flat, then also the functor $M \mapsto M \otimes_{\mathcal{O}_{p}} \mathcal{F}_{p}$ is exact, i.e., $\mathcal{F}_{p}$ is flat.

05 VC Lemma 18.38.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $\left\{p_{i}\right\}_{i \in I}$ be a conservative family of points of $\mathcal{C}$. Then $\mathcal{F}$ is flat if and only if $\mathcal{F}_{p_{i}}$ is a flat $\mathcal{O}_{p_{i}}$-module for all $i \in I$.
Proof. By Lemma 18.38 .1 we see one of the implications. For the converse, use that $\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}\right)_{p}=\mathcal{F}_{p} \otimes_{\mathcal{O}_{p}} \mathcal{G}_{p}$ by Lemma 18.26.1 (as taking stalks at $p$ is given by $p^{-1}$ ) and Lemma 18.14.4.
05VD Lemma 18.38.3. Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi or ringed sites. Assume $\mathcal{C}$ has enough point $\boldsymbol{4}^{4}$. Then $f^{*} \mathcal{F}$ is a flat $\mathcal{O}_{\mathcal{C}}$-module whenever $\mathcal{F}$ is a flat $\mathcal{O}_{\mathcal{D}}$-module.

Proof. Let $p$ be a point of $\mathcal{C}$ and set $q=f \circ p$. Then

$$
\left(f^{*} \mathcal{F}\right)_{p}=\mathcal{F}_{q} \otimes_{\mathcal{O}_{\mathcal{D}, q}} \mathcal{O}_{\mathcal{C}, p}
$$

by Lemma 18.35.4. Hence if $\mathcal{F}$ is flat, then $\mathcal{F}_{q}$ is a flat $\mathcal{O}_{\mathcal{D}, q}$-module by Lemma 18.38 .1 and hence by Algebra, Lemma 10.38 .7 we see that $\left(f^{*} \mathcal{F}\right)_{p}$ is a flat $\mathcal{O}_{\mathcal{C}, p^{-}}$ module. This implies that $f^{*} \mathcal{F}$ is a flat $\mathcal{O}_{\mathcal{C}}$-module by Lemma 18.38 .2 .

### 18.39. Locally ringed topoi

04ER A reference for this section is AGV71, Exposé IV, Exercice 13.9].
04ES Lemma 18.39.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The following are equivalent
(1) For every object $U$ of $\mathcal{C}$ and $f \in \mathcal{O}(U)$ there exists a covering $\left\{U_{j} \rightarrow U\right\}$ such that for each $j$ either $\left.f\right|_{U_{j}}$ is invertible or $\left.(1-f)\right|_{U_{j}}$ is invertible.
(2) For every object $U$ of $\mathcal{C}$ and $f_{1}, \ldots, f_{n} \in \mathcal{O}(U)$ which generate the unit ideal in $\mathcal{O}(U)$ there exists a covering $\left\{U_{j} \rightarrow U\right\}$ such that for each $j$ there exists an $i$ such that $\left.f_{i}\right|_{U_{j}}$ is invertible.
(3) The map of sheaves of sets

$$
(\mathcal{O} \times \mathcal{O}) \amalg(\mathcal{O} \times \mathcal{O}) \longrightarrow \mathcal{O} \times \mathcal{O}
$$

which maps $(f, a)$ in the first component to $(f, a f)$ and $(f, b)$ in the second component to $(f, b(1-f))$ is surjective.
Proof. It is clear that (2) implies (1). To show that (1) implies (2) we argue by induction on $n$. The first case is $n=2$ (since $n=1$ is trivial). In this case we have $a_{1} f_{1}+a_{2} f_{2}=1$ for some $a_{1}, a_{2} \in \mathcal{O}(U)$. By assumption we can find a covering $\left\{U_{j} \rightarrow U\right\}$ such that for each $j$ either $\left.a_{1} f_{1}\right|_{U_{j}}$ is invertible or $\left.a_{2} f_{2}\right|_{U_{j}}$ is invertible. Hence either $\left.f_{1}\right|_{U_{j}}$ is invertible or $\left.f_{2}\right|_{U_{j}}$ is invertible as desired. For $n>2$ we have $a_{1} f_{1}+\ldots+a_{n} f_{n}=1$ for some $a_{1}, \ldots, a_{n} \in \mathcal{O}(U)$. By the case $n=2$ we see that we have some covering $\left\{U_{j} \rightarrow U\right\}_{j \in J}$ such that for each $j$ either $\left.f_{n}\right|_{U_{j}}$ is invertible

[^51]or $a_{1} f_{1}+\ldots+\left.a_{n-1} f_{n-1}\right|_{U_{j}}$ is invertible. Say the first case happens for $j \in J_{n}$. Set $J^{\prime}=J \backslash J_{n}$. By induction hypothesis, for each $j \in J^{\prime}$ we can find a covering $\left\{U_{j k} \rightarrow U_{j}\right\}_{k \in K_{j}}$ such that for each $k \in K_{j}$ there exists an $i \in\{1, \ldots, n-1\}$ such that $\left.f_{i}\right|_{U_{j k}}$ is invertible. By the axioms of a site the family of morphisms $\left\{U_{j} \rightarrow U\right\}_{j \in J_{n}} \cup\left\{U_{j k} \rightarrow U\right\}_{j \in J^{\prime}, k \in K_{j}}$ is a covering which has the desired property.
Assume (1). To see that the map in (3) is surjective, let $(f, c)$ be a section of $\mathcal{O} \times \mathcal{O}$ over $U$. By assumption there exists a covering $\left\{U_{j} \rightarrow U\right\}$ such that for each $j$ either $f$ or $1-f$ restricts to an invertible section. In the first case we can take $a=\left.c\right|_{U_{j}}\left(\left.f\right|_{U_{j}}\right)^{-1}$, and in the second case we can take $b=\left.c\right|_{U_{j}}\left(1-\left.f\right|_{U_{j}}\right)^{-1}$. Hence $(f, c)$ is in the image of the map on each of the members. Conversely, assume (3) holds. For any $U$ and $f \in \mathcal{O}(U)$ there exists a covering $\left\{U_{j} \rightarrow U\right\}$ of $U$ such that the section $\left.(f, 1)\right|_{U_{j}}$ is in the image of the map in (3) on sections over $U_{j}$. This means precisely that either $f$ or $1-f$ restricts to an invertible section over $U_{j}$, and we see that (1) holds.

04 ET Lemma 18.39.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the following conditions
(1) For every object $U$ of $\mathcal{C}$ and $f \in \mathcal{O}(U)$ there exists a covering $\left\{U_{j} \rightarrow U\right\}$ such that for each $j$ either $\left.f\right|_{U_{j}}$ is invertible or $\left.(1-f)\right|_{U_{j}}$ is invertible.
(2) For every point $p$ of $\mathcal{C}$ the stalk $\mathcal{O}_{p}$ is either the zero ring or a local ring. We always have (1) $\Rightarrow$ (2). If $\mathcal{C}$ has enough points then (1) and (2) are equivalent.

Proof. Assume (1). Let $p$ be a point of $\mathcal{C}$ given by a functor $u: \mathcal{C} \rightarrow$ Sets. Let $f_{p} \in \mathcal{O}_{p}$. Since $\mathcal{O}_{p}$ is computed by Sites, Equation 7.31.1.1 we may represent $f_{p}$ by a triple $(U, x, f)$ where $x \in U(U)$ and $f \in \mathcal{O}(U)$. By assumption there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that for each $i$ either $f$ or $1-f$ is invertible on $U_{i}$. Because $u$ defines a point of the site we see that for some $i$ there exists an $x_{i} \in u\left(U_{i}\right)$ which maps to $x \in u(U)$. By the discussion surrounding Sites, Equation 7.31.1.1 we see that $(U, x, f)$ and $\left(U_{i}, x_{i},\left.f\right|_{U_{i}}\right)$ define the same element of $\mathcal{O}_{p}$. Hence we conclude that either $f_{p}$ or $1-f_{p}$ is invertible. Thus $\mathcal{O}_{p}$ is a ring such that for every element $a$ either $a$ or $1-a$ is invertible. This means that $\mathcal{O}_{p}$ is either zero or a local ring, see Algebra, Lemma 10.17 .2 .
Assume (2) and assume that $\mathcal{C}$ has enough points. Consider the map of sheaves of sets

$$
\mathcal{O} \times \mathcal{O} \amalg \mathcal{O} \times \mathcal{O} \longrightarrow \mathcal{O} \times \mathcal{O}
$$

of Lemma 18.39 .1 part (3). For any local ring $R$ the corresponding map ( $R \times R$ ) $\amalg$ $(R \times R) \rightarrow R \times R$ is surjective, see for example Algebra, Lemma 10.17.2. Since each $\mathcal{O}_{p}$ is a local ring or zero the map is surjective on stalks. Hence, by our assumption that $\mathcal{C}$ has enough points it is surjective and we win.

In Modules, Section 17.2 we pointed out how in a ringed space $\left(X, \mathcal{O}_{X}\right)$ there can be an open subspace over which the structure sheaf is zero. To prevent this we can require the sections 1 and 0 to have different values in every stalk of the space $X$. In the setting of ringed topoi and ringed sites the condition is that

05D7
(18.39.2.1) $\quad \emptyset^{\#} \longrightarrow \operatorname{Equalizer}(0,1: * \longrightarrow \mathcal{O})$
is an isomorphism of sheaves. Here $*$ is the singleton sheaf, resp. $\emptyset^{\#}$ is the "empty sheaf", i.e., the final, resp. initial object in the category of sheaves, see Sites, Example 7.10.2, resp. Section 7.41. In other words, the condition is that whenever
$U \in \operatorname{Ob}(\mathcal{C})$ is not sheaf theoretically empty, then $1,0 \in \mathcal{O}(U)$ are not equal. Let us state the obligatory lemma.
05D8 Lemma 18.39.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the statements
(1) 18.39.2.1) is an isomorphism, and
(2) for every point $p$ of $\mathcal{C}$ the stalk $\mathcal{O}_{p}$ is not the zero ring.

We always have (1) $\Rightarrow$ (2) and if $\mathcal{C}$ has enough points then (1) $\Leftrightarrow$ (2).
Proof. Omitted.
Lemmas 18.39 .1 18.39.2, and 18.39 .3 motivate the following definition.
04 EU Definition 18.39.4. A ringed site $(\mathcal{C}, \mathcal{O})$ is said to be locally ringed site if 18.39 .2 .1 is an isomorphism, and the equivalent properties of Lemma 18.39.1 are satisfied.
In AGV71, Exposé IV, Exercice 13.9] the condition that 18.39.2.1) be an isomorphism is missing leading to a slightly different notion of a locally ringed site and locally ringed topos. As we are motivated by the notion of a locally ringed space we decided to add this condition (see explanation above).

04H7 Lemma 18.39.5. Being a locally ringed site is an intrinsic property. More precisely,
(1) if $f: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(\mathcal{C})$ is a morphism of topoi and $(\mathcal{C}, \mathcal{O})$ is a locally ringed site, then $\left(\mathcal{C}^{\prime}, f^{-1} \mathcal{O}\right)$ is a locally ringed site, and
(2) if $\left(f, f^{\sharp}\right):\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ is an equivalence of ringed topoi, then $(\mathcal{C}, \mathcal{O})$ is locally ringed if and only if $\left(\mathcal{C}^{\prime}, \mathcal{O}^{\prime}\right)$ is locally ringed.

Proof. It is clear that (2) follows from (1). To prove (1) note that as $f^{-1}$ is exact we have $f^{-1} *=*, f^{-1} \emptyset^{\#}=\emptyset^{\#}$, and $f^{-1}$ commutes with products, equalizers and transforms isomorphisms and surjections into isomorphisms and surjections. Thus $f^{-1}$ transforms the isomorphism (18.39.2.1) into its analogue for $f^{-1} \mathcal{O}$ and transforms the surjection of Lemma 18.39.1 part (3) into the corresponding surjection for $f^{-1} \mathcal{O}$.
In fact Lemma 18.39 .5 part (2) is the analogue of Schemes, Lemma 25.2.2. It assures us that the following definition makes sense.
04H8 Definition 18.39.6. A ringed topos $(\operatorname{Sh}(\mathcal{C}), \mathcal{O})$ is said to be locally ringed if the underlying ringed site $(\mathcal{C}, \mathcal{O})$ is locally ringed.

Here is an example of a consequence of being locally ringed.
0B8Q Lemma 18.39.7. Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Any locally free $\mathcal{O}$-module of rank 1 is invertible. If $(\mathcal{C}, \mathcal{O})$ is locally ringed, then the converse holds as well (but in general this is not the case).

Proof. Assume $\mathcal{L}$ is locally free of rank 1 and consider the evaluation map

$$
\mathcal{L} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{L}, \mathcal{O}) \longrightarrow \mathcal{O}
$$

Given any object $U$ of $\mathcal{C}$ and restricting to the members of a covering trivializing $\mathcal{L}$, we see that this map is an isomorphism (details omitted). Hence $\mathcal{L}$ is invertible by Lemma 18.31 .2 .
Assume $(S h(\mathcal{C}), \mathcal{O})$ is locally ringed. Let $U$ be an object of $\mathcal{C}$. In the proof of Lemma 18.31 .2 we have seen that there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that
$\left.\mathcal{L}\right|_{\mathcal{C} / U_{i}}$ is a direct summand of a finite free $\mathcal{O}_{U_{i}}$-module. After replacing $U$ by $U_{i}$, let $p: \mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{O}_{U}^{\oplus r}$ be a projector whose image is isomorphic to $\left.\mathcal{L}\right|_{\mathcal{C} / U}$. Then $p$ corresponds to a matrix

$$
P=\left(p_{i j}\right) \in \operatorname{Mat}(r \times r, \mathcal{O}(U))
$$

which is a projector: $P^{2}=P$. Set $A=\mathcal{O}(U)$ so that $P \in \operatorname{Mat}(r \times r, A)$. By Algebra, Lemma 10.77 .2 the image of $P$ is a finite locally free module $M$ over $A$. Hence there are $f_{1}, \ldots, f_{t} \in A$ generating the unit ideal, such that $M_{f_{i}}$ is finite free. By Lemma 18.39.1 after replacing $U$ by the members of an open covering, we may assume that $M$ is free. This means that $\left.\mathcal{L}\right|_{U}$ is free (details omitted). Of course, since $\mathcal{L}$ is invertible, this is only possible if the rank of $\left.\mathcal{L}\right|_{U}$ is 1 and the proof is complete.

Next, we want to work out what it means to have a morphism of locally ringed spaces. In order to do this we have the following lemma.

04H9 Lemma 18.39.8. Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Consider the following conditions
(1) The diagram of sheaves

is cartesian.
(2) For any point $p$ of $\mathcal{C}$, setting $q=f \circ p$, the diagram

of sets is cartesian.
We always have (1) $\Rightarrow$ (2). If $\mathcal{C}$ has enough points then (1) and (2) are equivalent. If $\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right)$ and $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ are locally ringed topoi then (2) is equivalent to
(3) For any point $p$ of $\mathcal{C}$, setting $q=f \circ p$, the ring map $\mathcal{O}_{\mathcal{D}, q} \rightarrow \mathcal{O}_{\mathcal{C}, p}$ is a local ring map.
In fact, properties (2), or (3) for a conservative family of points implies (1).
Proof. This lemma proves itself, in other words, it follows by unwinding the definitions.

04HA Definition 18.39.9. Let $\left(f, f^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Assume $\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right)$ and $\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ are locally ringed topoi. We say that $\left(f, f^{\sharp}\right)$ is a morphism of locally ringed topoi if and only if the diagram of sheaves

(see Lemma 18.39.8 is cartesian. If $\left(f, f^{\sharp}\right)$ is a morphism of ringed sites, then we say that it is a morphism of locally ringed sites if the associated morphism of ringed topoi is a morphism of locally ringed topoi.

It is clear that an isomorphism of ringed topoi between locally ringed topoi is automatically an isomorphism of locally ringed topoi.

04IG Lemma 18.39.10. Let $\left(f, f^{\sharp}\right):\left(S h\left(\mathcal{C}_{1}\right), \mathcal{O}_{1}\right) \rightarrow\left(S h\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right)$ and $\left(g, g^{\sharp}\right):\left(\operatorname{Sh}\left(\mathcal{C}_{2}\right), \mathcal{O}_{2}\right) \rightarrow$ $\left(S h\left(\mathcal{C}_{3}\right), \mathcal{O}_{3}\right)$ be morphisms of locally ringed topoi. Then the composition $\left(g, g^{\sharp}\right) \circ$ $\left(f, f^{\sharp}\right)$ (see Definition 18.7.1) is also a morphism of locally ringed topoi.
Proof. Omitted.
04 KR Lemma 18.39.11. If $f: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(\mathcal{C})$ is a morphism of topoi. If $\mathcal{O}$ is a sheaf of rings on $\mathcal{C}$, then

$$
f^{-1}\left(\mathcal{O}^{*}\right)=\left(f^{-1} \mathcal{O}\right)^{*}
$$

In particular, if $\mathcal{O}$ turns $\mathcal{C}$ into a locally ringed site, then setting $f^{\sharp}=$ id the morphism of ringed topoi

$$
\left(f, f^{\sharp}\right):\left(S h\left(\mathcal{C}^{\prime}\right), f^{-1} \mathcal{O}\right) \rightarrow(\operatorname{Sh}(\mathcal{C}, \mathcal{O})
$$

is a morphism of locally ringed topoi.
Proof. Note that the diagram

is cartesian. Since $f^{-1}$ is exact we conclude that

is cartesian which implies the first assertion. For the second, note that $\left(\mathcal{C}^{\prime}, f^{-1} \mathcal{O}\right)$ is a locally ringed site by Lemma 18.39 .5 so that the assertion makes sense. Now the first part implies that the morphism is a morphism of locally ringed topoi.

04IH Lemma 18.39.12. Localization of locally ringed sites and topoi.
(1) Let $(\mathcal{C}, \mathcal{O})$ be a locally ringed site. Let $U$ be an object of $\mathcal{C}$. Then the localization $\left(\mathcal{C} / U, \mathcal{O}_{U}\right)$ is a locally ringed site, and the localization morphism

$$
\left(j_{U}, j_{U}^{\sharp}\right):\left(S h(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})
$$

is a morphism of locally ringed topoi.
(2) Let $(\mathcal{C}, \mathcal{O})$ be a locally ringed site. Let $f: V \rightarrow U$ be a morphism of $\mathcal{C}$. Then the morphism

$$
\left(j, j^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C} / V), \mathcal{O}_{V}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{C} / U), \mathcal{O}_{U}\right)
$$

of Lemma 18.19 .4 is a morphism of locally ringed topoi.
(3) Let $\left(f, f^{\sharp}\right):(\mathcal{C}, \mathcal{O}) \longrightarrow\left(\mathcal{D}, \mathcal{O}^{\prime}\right)$ be a morphism of locally ringed sites where $f$ is given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V$ be an object of $\mathcal{D}$ and let $U=u(V)$. Then the morphism

$$
\left(f^{\prime},\left(f^{\prime}\right)^{\sharp}\right):\left(S h(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D} / V), \mathcal{O}_{V}^{\prime}\right)
$$

of Lemma 18.20 .1 is a morphism of locally ringed sites.
(4) Let $\left(f, f^{\sharp}\right):(\mathcal{C}, \mathcal{O}) \longrightarrow\left(\mathcal{D}, \mathcal{O}^{\prime}\right)$ be a morphism of locally ringed sites where $f$ is given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \operatorname{Ob}(\mathcal{D}), U \in$ $\mathrm{Ob}(\mathcal{C})$, and $c: U \rightarrow u(V)$. Then the morphism

$$
\left(f_{c},\left(f_{c}\right)^{\sharp}\right):\left(S h(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D} / V), \mathcal{O}_{V}^{\prime}\right)
$$

of Lemma 18.20 .2 is a morphism of locally ringed topoi.
(5) Let $(S h(\mathcal{C}), \mathcal{O})$ be a locally ringed topos. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Then the localization $\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right)$ is a locally ringed topos and the localization morphism

$$
\left(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}\right):\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})
$$

is a morphism of locally ringed topoi.
(6) Let $(S h(\mathcal{C}), \mathcal{O})$ be a locally ringed topos. Let $s: \mathcal{G} \rightarrow \mathcal{F}$ be a map of sheaves on $\mathcal{C}$. Then the morphism

$$
\left(j, j^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}) / \mathcal{G}, \mathcal{O}_{\mathcal{G}}\right) \longrightarrow\left(\operatorname{Sh}(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right)
$$

of Lemma 18.21.4 is a morphism of locally ringed topoi.
(7) Let $f:(S h(\mathcal{C}), \mathcal{O}) \longrightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of locally ringed topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$. Set $\mathcal{F}=f^{-1} \mathcal{G}$. Then the morphism

$$
\left(f^{\prime},\left(f^{\prime}\right)^{\sharp}\right):\left(\operatorname{Sh}(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \longrightarrow\left(\operatorname{Sh}(\mathcal{D}) / \mathcal{G}, \mathcal{O}_{\mathcal{G}}^{\prime}\right)
$$

of Lemma 18.22 .1 is a morphism of locally ringed topoi.
(8) Let $f:(S h(\mathcal{C}), \mathcal{O}) \longrightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of locally ringed topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$, let $\mathcal{F}$ be a sheaf on $\mathcal{C}$, and let $s: \mathcal{F} \rightarrow f^{-1} \mathcal{G}$ be a morphism of sheaves. Then the morphism

$$
\left(f_{s},\left(f_{s}\right)^{\sharp}\right):\left(S h(\mathcal{C}) / \mathcal{F}, \mathcal{O}_{\mathcal{F}}\right) \longrightarrow\left(S h(\mathcal{D}) / \mathcal{G}, \mathcal{O}_{\mathcal{G}}^{\prime}\right)
$$

of Lemma 18.22 .3 is a morphism of locally ringed topoi.
Proof. Part (1) is clear since $\mathcal{O}_{U}$ is just the restriction of $\mathcal{O}$, so Lemmas 18.39.5and 18.39.11 apply. Part (2) is clear as the morphism $\left(j, j^{\sharp}\right)$ is actually a localization of a locally ringed site so (1) applies. Part (3) is clear also since $\left(f^{\prime}\right)^{\sharp}$ is just the restriction of $f^{\sharp}$ to the topos $\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$, see proof of Lemma 18.22.1 (hence the diagram of Definition 18.39 .9 for the morphism $f^{\prime}$ is just the restriction of the corresponding diagram for $f$, and restriction is an exact functor). Part (4) follows formally on combining (2) and (3). Parts (5), (6), (7), and (8) follow from their counterparts (1), (2), (3), and (4) by enlarging the sites as in Lemma 18.7 .2 and translating everything in terms of sites and morphisms of sites using the comparisons of Lemmas $18.21 .3,18.21 .5,18.22 .2$, and 18.22 .4 . (Alternatively one could use the same arguments as in the proofs of (1), (2), (3), and (4) to prove (5), (6), (7), and (8) directly.)

### 18.40. Lower shriek for modules

0796 In this section we extend the construction of $g$ ! discussed in Section 18.16 to the case of sheaves of modules.

0797 Lemma 18.40.1. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous and cocontinuous functor between sites. Denote $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{O}_{\mathcal{D}}\right)$ the associated morphism of topoi. Let $\mathcal{O}_{\mathcal{D}}$ be a sheaf of rings on $\mathcal{D}$. Set $\mathcal{O}_{\mathcal{C}}=g^{-1} \mathcal{O}_{\mathcal{D}}$. Hence $g$ becomes a morphism of ringed topoi with $g^{*}=g^{-1}$. In this case there exists a functor

$$
g_{!}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right)
$$

which is left adjoint to $g^{*}$.
Proof. Let $U$ be an object of $\mathcal{C}$. For any $\mathcal{O}_{\mathcal{D}}$-module $\mathcal{G}$ we have

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(j_{U!} \mathcal{O}_{U}, g^{-1} \mathcal{G}\right) & =g^{-1} \mathcal{G}(U) \\
& =\mathcal{G}(u(U)) \\
& =\operatorname{Hom}_{\mathcal{O}_{\mathcal{D}}}\left(j_{u(U)!} \mathcal{O}_{u(U)}, \mathcal{G}\right)
\end{aligned}
$$

because $g^{-1}$ is described by restriction, see Sites, Lemma 7.20.5. Of course a similar formula holds a direct sum of modules of the form $j_{U!} \mathcal{O}_{U}$. By Homology, Lemma 12.25 .6 and Lemma 18.28 .6 we see that $g$ ! exists.

0798 Remark 18.40.2. Warning! Let $u: \mathcal{C} \rightarrow \mathcal{D}, g, \mathcal{O}_{\mathcal{D}}$, and $\mathcal{O}_{\mathcal{C}}$ be as in Lemma 18.40.1. In general it is not the case that the diagram

commutes (here $g_{!}^{A b}$ is the one from Lemma 18.16.2). There is a transformation of functors

$$
g_{!}^{A b} \circ \text { forget } \longrightarrow \text { forget } \circ g!
$$

From the proof of Lemma 18.40 .1 we see that this is an isomorphism if and only if $g_{!}^{A b} j_{U!} \mathcal{O}_{U} \rightarrow g_{!} j_{U!} \mathcal{O}_{U}$ is an isomorphism for all objects $U$ of $\mathcal{C}$. Since we have $g_{!} j_{U!} \mathcal{O}_{U}=j_{u(U)!} \mathcal{O}_{u(U)}$ this holds if and only if

$$
g_{!}^{A b} j_{U!} \mathcal{O}_{U} \longrightarrow j_{u(U)!} \mathcal{O}_{u(U)}
$$

is an isomorphism for all objects $U$ of $\mathcal{C}$. Note that for such a $U$ we obtain a commutative diagram

of cocontinuous functors of sites, see Sites, Lemma 7.27 .4 and therefore $g_{!}^{A b} j_{U!}=$ $j_{u(U)!}\left(g^{\prime}\right)^{A b}$ where $g^{\prime}: S h(\mathcal{C} / U) \rightarrow S h(\mathcal{D} / u(U))$ is the morphism of topoi induced by the cocontinuous functor $u^{\prime}$. Hence we see that $g_{!}=g_{!}^{A b}$ if the canonical map
0799

$$
\begin{equation*}
\left(g^{\prime}\right)!^{A b} \mathcal{O}_{U} \longrightarrow \mathcal{O}_{u(U)} \tag{18.40.2.1}
\end{equation*}
$$

is an isomorphism for all objects $U$ of $\mathcal{C}$.

### 18.41. Constant sheaves

093 Let $E$ be a set and let $\mathcal{C}$ be a site. We will denote $\underline{E}$ the constant sheaf with value $E$ on $\mathcal{C}$. If $E$ is an abelian group, ring, module, etc, then $\underline{E}$ is a sheaf of abelian groups, rings, modules, etc.

093J Lemma 18.41.1. Let $\mathcal{C}$ be a site. If $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is a short exact sequence of abelian groups, then $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C} \rightarrow 0$ is an exact sequence of abelian sheaves and in fact it is even exact as a sequence of abelian presheaves.

Proof. Since sheafification is exact it is clear that $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C} \rightarrow 0$ is an exact sequence of abelian sheaves. Thus $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C}$ is an exact sequence of abelian presheaves. To see that $\underline{B} \rightarrow \underline{C}$ is surjective, pick a set theoretical section $s: C \rightarrow B$. This induces a section $\underline{s}: \underline{C} \rightarrow \underline{B}$ of sheaves of sets left inverse to the surjection $\underline{B} \rightarrow \underline{C}$.

093K Lemma 18.41.2. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring and let $M$ and $Q$ be $\Lambda$-modules. If $Q$ is a finitely presented $\Lambda$-module, then we have $M \otimes_{\Lambda} Q(U)=\underline{M}(U) \otimes_{\Lambda} Q$ for all $U \in \operatorname{Ob}(\mathcal{C})$.

Proof. Choose a presentation $\Lambda^{\oplus m} \rightarrow \Lambda^{\oplus n} \rightarrow Q \rightarrow 0$. This gives an exact sequence $M^{\oplus m} \rightarrow M^{\oplus n} \rightarrow M \otimes Q \rightarrow 0$. By Lemma 18.41.1 we obtain an exact sequence

$$
\underline{M}(U)^{\oplus m} \rightarrow \underline{M}(U)^{\oplus n} \rightarrow \underline{M \otimes Q}(U) \rightarrow 0
$$

which proves the lemma. (Note that taking sections over $U$ always commutes with finite direct sums, but not arbitrary direct sums.)

093L Lemma 18.41.3. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a coherent ring. Let $M$ be a flat $\Lambda$-module. For $U \in \operatorname{Ob}(\mathcal{C})$ the module $\underline{M}(U)$ is a flat $\Lambda$-module.

Proof. Let $I \subset \Lambda$ be a finitely generated ideal. By Algebra, Lemma 10.38 .5 it suffices to show that $\underline{M}(U) \otimes_{\Lambda} I \rightarrow \underline{M}(U)$ is injective. As $\Lambda$ is coherent $I$ is finitely presented as a $\Lambda$-module. By Lemma 18.41 .2 we see that $\underline{M}(U) \otimes I=M \otimes I$. Since $M$ is flat the map $M \otimes I \rightarrow M$ is injective, whence $\underline{M \otimes I \rightarrow \underline{M} \text { is injective. }}$

093M Lemma 18.41.4. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. The sheaf $\underline{\Lambda}^{\wedge}=\lim \Lambda / I^{n}$ is a flat $\underline{\Lambda}$-algebra. Moreover we have canonical identifications

$$
\underline{\Lambda} / I \underline{\Lambda}=\underline{\Lambda} / \underline{I}=\underline{\Lambda}^{\wedge} / I \underline{\Lambda}^{\wedge}=\underline{\Lambda}^{\wedge} / \underline{I} \cdot \underline{\Lambda}^{\wedge}=\underline{\Lambda}^{\wedge} / \underline{I}^{\wedge}=\underline{\Lambda / I}
$$

where $\underline{I}^{\wedge}=\lim \underline{I / I^{n}}$.
Proof. To prove $\underline{\Lambda}^{\wedge}$ is flat, it suffices to show that $\underline{\Lambda}^{\wedge}(U)$ is flat as a $\Lambda$-module for each $U \in \mathrm{Ob}(\mathcal{C})$, see Lemmas 18.28 .2 and 18.28.3. By Lemma 18.41.3 we see that

$$
\underline{\Lambda}^{\wedge}(U)=\lim \underline{\Lambda / I^{n}}(U)
$$

is a limit of a system of flat $\Lambda / I^{n}$-modules. By Lemma 18.41.1 we see that the transition maps are surjective. We conclude by More on Algebra, Lemma 15.21.4 To see the equalities, note that $\underline{\Lambda}(U) / I \underline{\Lambda}(U)=\underline{\Lambda / I}(U)$ by Lemma 18.41.2. It follows that $\underline{\Lambda} / I \underline{\Lambda}=\underline{\Lambda} / \underline{I}=\underline{\Lambda} / I$. The system of short exact sequences

$$
0 \rightarrow \underline{I / I^{n}}(U) \rightarrow \underline{\Lambda / I^{n}}(U) \rightarrow \underline{\Lambda / I}(U) \rightarrow 0
$$

has surjective transition maps, hence gives a short exact sequence

$$
0 \rightarrow \lim \underline{I / I^{n}}(U) \rightarrow \lim \underline{\Lambda / I^{n}}(U) \rightarrow \lim \underline{\Lambda / I}(U) \rightarrow 0
$$

see Homology, Lemma 12.27.3. Thus we see that $\underline{\Lambda}^{\wedge} / \underline{I}^{\wedge}=\underline{\Lambda / I}$. Since

$$
I \underline{\Lambda}^{\wedge} \subset \underline{I} \cdot \underline{\Lambda}^{\wedge} \subset \underline{I}^{\wedge}
$$

it suffices to show that $I \underline{\Lambda}^{\wedge}(U)=\underline{I}^{\wedge}(U)$ for all $U$. Choose generators $I=$ $\left(f_{1}, \ldots, f_{r}\right)$. This gives a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus r} \rightarrow I \rightarrow 0$. We obtain short exact sequences

$$
0 \rightarrow \underline{\left(K \cap I^{n}\right) / I^{n} K}(U) \rightarrow \underline{\left(\Lambda / I^{n}\right)^{\oplus r}}(U) \rightarrow \underline{I / I^{n}}(U) \rightarrow 0
$$

By Artin-Rees (Algebra, Lemma 10.50.2 the system of modules on the left hand side has ML. (It is zero as a pro-object.) Thus we see that $\left(\underline{\Lambda}^{\wedge}\right)^{\oplus r}(U) \rightarrow \underline{I}^{\wedge}(U)$ is surjective by Homology, Lemma 12.27 .3 which is what we wanted to show.

093N Lemma 18.41.5. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring and let $M$ be a $\Lambda$-module. Assume $\operatorname{Sh}(\mathcal{C})$ is not the empty topos. Then
(1) $\underline{M}$ is a finite type sheaf of $\underline{\Lambda}$-modules if and only if $M$ is a finite $\Lambda$-module, and
(2) $\underline{M}$ is a finitely presented sheaf of $\underline{\Lambda}$-modules if and only if $M$ is a finitely presented $\Lambda$-module.

Proof. Proof of (1). If $M$ is generated by $x_{1}, \ldots, x_{r}$ then $x_{1}, \ldots, x_{r}$ define global sections of $\underline{M}$ which generate it, hence $\underline{M}$ is of finite type. Conversely, assume $\underline{M}$ is of finite type. Let $U \in \mathcal{C}$ be an object which is not sheaf theoretically empty (Sites, Definition 7.41.1). Such an object exists as we assumed $\operatorname{Sh}(\mathcal{C})$ is not the empty topos. Then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ and finitely many sections $s_{i j} \in \underline{M}\left(U_{i}\right)$ generating $\left.\underline{M}\right|_{U_{i}}$. After refining the covering we may assume that $s_{i j}$ come from elements $x_{i j}$ of $M$. Then $x_{i j}$ define global sections of $\underline{M}$ whose restriction to $U$ generate $\underline{M}$.

Assume there exist elements $x_{1}, \ldots, x_{r}$ of $M$ which define global sections of $\underline{M}$ generating $\underline{M}$ as a sheaf of $\underline{\Lambda}$-modules. We will show that $x_{1}, \ldots, x_{r}$ generate $M$ as a $\Lambda$-module. Let $x \in M$. We can find a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ and $f_{i, j} \in \underline{\Lambda}\left(U_{i}\right)$ such that $\left.x\right|_{U_{i}}=\left.\sum f_{i, j} x_{j}\right|_{U_{i}}$. After refining the covering we may assume $f_{i, j} \in \Lambda$. Since $U$ is not sheaf theoretically empty we see that $I \neq \emptyset$. Thus we can pick $i \in I$ and we see that $x=\sum f_{i, j} x_{j}$ in $M$ as desired.
Proof of (2). Assume $\underline{M}$ is a $\underline{\Lambda}$-module of finite presentation. By (1) we see that $M$ is of finite type. Choose generators $x_{1}, \ldots, x_{r}$ of $M$ as a $\Lambda$-module. This determines a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus r} \rightarrow M \rightarrow 0$ which turns into a short exact sequence

$$
0 \rightarrow \underline{K} \rightarrow \underline{\Lambda}^{\oplus r} \rightarrow \underline{M} \rightarrow 0
$$

by Lemma 18.41.1. By Lemma 18.24 .1 we see that $\underline{K}$ is of finite type. Hence $K$ is a finite $\Lambda$-module by (1). Thus $M$ is a $\Lambda$-module of finite presentation.

### 18.42. Locally constant sheaves

093P Here is the general definition.
093Q Definition 18.42.1. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf of sets, groups, abelian groups, rings, modules over a fixed ring $\Lambda$, etc.
(1) We say $\mathcal{F}$ is a constant sheaf of sets, groups, abelian groups, rings, modules over a fixed ring $\Lambda$, etc if it is isomorphic as a sheaf of sets, groups, abelian groups, rings, modules over a fixed ring $\Lambda$, etc to a constant sheaf $\underline{E}$ as in Section 18.41 .
(2) We say $\mathcal{F}$ is locally constant if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is a constant sheaf.
(3) If $\mathcal{F}$ is a sheaf of sets or groups, then we say $\mathcal{F}$ is finite locally constant if the constant values are finite sets or finite groups.

093R Lemma 18.42.2. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. If $\mathcal{G}$ is a locally constant sheaf of sets, groups, abelian groups, rings, modules over a fixed ring $\Lambda$, etc on $\mathcal{D}$, the same is true for $f^{-1} \mathcal{G}$ on $\mathcal{C}$.

Proof. Omitted.
093S Lemma 18.42.3. Let $\mathcal{C}$ be a site with a final object $X$.
(1) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of sets on $\mathcal{C}$. If $\mathcal{F}$ is finite locally constant, there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant sheaves associated to a map of sets.
(2) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of abelian groups on $\mathcal{C}$. If $\mathcal{F}$ is finite locally constant, there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant abelian sheaves associated to a map of abelian groups.
(3) Let $\Lambda$ be a ring. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of $\Lambda$ modules on $\mathcal{C}$. If $\mathcal{F}$ is of finite type, then there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant sheaves of $\Lambda$-modules associated to a map of $\Lambda$-modules.
Proof. Proof omitted.
093T Lemma 18.42.4. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring. Let $M, N$ be $\Lambda$-modules. Let $\mathcal{F}, \mathcal{G}$ be a locally constant sheaves of $\Lambda$-modules.
(1) If $M$ is of finite presentation, then

$$
\underline{\operatorname{Hom}_{\Lambda}(M, N)}=\mathcal{H o m}_{\underline{\Lambda}}(\underline{M}, \underline{N})
$$

(2) If $M$ and $N$ are both of finite presentation, then

$$
\underline{\operatorname{Isom}_{\Lambda}(M, N)}=\operatorname{Isom}_{\underline{\Lambda}}(\underline{M}, \underline{N})
$$

(3) If $\mathcal{F}$ is of finite presentation, then $\mathcal{H o m}_{\underline{\Lambda}}(\mathcal{F}, \mathcal{G})$ is a locally constant sheaf of $\Lambda$-modules.
(4) If $\mathcal{F}$ and $\mathcal{G}$ are both of finite presentation, then $\operatorname{Isom}_{\underline{\Lambda}}(\mathcal{F}, \mathcal{G})$ is a locally constant sheaf of sets.
Proof. Proof of (1). Set $E=\operatorname{Hom}_{\Lambda}(M, N)$. We want to show the canonical map

$$
\underline{E} \longrightarrow \mathcal{H o m}_{\underline{\Lambda}}(\underline{M}, \underline{N})
$$

is an isomorphism. The module $M$ has a presentation $\Lambda^{\oplus s} \rightarrow \Lambda^{\oplus t} \rightarrow M \rightarrow 0$. Then $E$ sits in an exact sequence

$$
0 \rightarrow E \rightarrow \operatorname{Hom}_{\Lambda}\left(\Lambda^{\oplus t}, N\right) \rightarrow \operatorname{Hom}_{\Lambda}\left(\Lambda^{\oplus s}, N\right)
$$

and we have similarly

$$
0 \rightarrow \mathcal{H o m}_{\underline{\Lambda}}(\underline{M}, \underline{N}) \rightarrow \mathcal{H o m}_{\underline{\Lambda}}\left(\underline{\Lambda^{\oplus t}}, \underline{N}\right) \rightarrow \mathcal{H o m}_{\underline{\Lambda}}\left(\underline{\Lambda^{\oplus s}}, \underline{N}\right)
$$

This reduces the question to the case where $M$ is a finite free module where the result is clear.
Proof of (3). The question is local on $\mathcal{C}$, hence we may assume $\mathcal{F}=\underline{M}$ and $\mathcal{G}=\underline{N}$ for some $\Lambda$-modules $M$ and $N$. By Lemma 18.41 .5 the module $M$ is of finite presentation. Thus the result follows from (1).
Parts (2) and (4) follow from parts (1) and (3) and the fact that Isom can be viewed

093U Lemma 18.42.5. Let $\mathcal{C}$ be a site.
(1) The category of finite locally constant sheaves of sets is closed under finite limits and colimits inside $\operatorname{Sh}(\mathcal{C})$.
(2) The category of finite locally constant abelian sheaves is a weak Serre subcategory of $A b(\mathcal{C})$.
(3) Let $\Lambda$ be a Noetherian ring. The category of finite type, locally constant sheaves of $\Lambda$-modules on $\mathcal{C}$ is a weak Serre subcategory of $\operatorname{Mod}(\mathcal{C}, \Lambda)$.
Proof. Proof of (1). We may work locally on $\mathcal{C}$. Hence by Lemma 18.42 .3 we may assume we are given a finite diagram of finite sets such that our diagram of sheaves is the associated diagram of constant sheaves. Then we just take the limit or colimit in the category of sets and take the associated constant sheaf. Some details omitted.
To prove (2) and (3) we use the criterion of Homology, Lemma 12.9.3. Existence of kernels and cokernels is argued in the same way as above. Of course, the reason for using a Noetherian ring in (3) is to assure us that the kernel of a map of finite $\Lambda$ modules is a finite $\Lambda$-module. To see that the category is closed under extensions (in the case of sheaves $\Lambda$-modules), assume given an extension of sheaves of $\Lambda$-modules

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0
$$

on $\mathcal{C}$ with $\mathcal{F}, \mathcal{G}$ finite type and locally constant. Localizing on $\mathcal{C}$ we may assume $\mathcal{F}$ and $\mathcal{G}$ are constant, i.e., we get

$$
0 \rightarrow \underline{M} \rightarrow \mathcal{E} \rightarrow \underline{N} \rightarrow 0
$$

for some $\Lambda$-modules $M, N$. Choose generators $y_{1}, \ldots, y_{m}$ of $N$, so that we get a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus m} \rightarrow N \rightarrow 0$ of $\Lambda$-modules. Localizing further we may assume $y_{j}$ lifts to a section $s_{j}$ of $\mathcal{E}$. Thus we see that $\mathcal{E}$ is a pushout as in the following diagram

By Lemma 18.42 .3 again (and the fact that $K$ is a finite $\Lambda$-module as $\Lambda$ is Noetherian) we see that the map $\underline{K} \rightarrow \underline{M}$ is locally constant, hence we conclude.

093V Lemma 18.42.6. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring. The tensor product of two locally constant sheaves of $\Lambda$-modules on $\mathcal{C}$ is a locally constant sheaf of $\Lambda$-modules.

Proof. Omitted.

## CHAPTER 19

## Injectives

01D4

### 19.1. Introduction

01D5 In future chapters we will use the existence of injectives and K-injective complexes to do cohomology of sheaves of modules on ringed sites. In this chapter we explain how to produce injectives and K-injective complexes first for modules on sites and later more generally for Grothendieck abelian categories.

We observe that we already know that the category of abelian groups and the category of modules over a ring have enough injectives, see More on Algebra, Sections 15.45 and 15.46

### 19.2. Baer's argument for modules

05 NM There is another, more set-theoretic approach to showing that any $R$-module $M$ can be imbedded in an injective module. This approach constructs the injective module by a transfinite colimit of push-outs. While this method is somewhat abstract and more complicated than the one of More on Algebra, Section 15.46, it is also more general. Apparently this method originates with Baer, and was revisited by Cartan and Eilenberg in CE56 and by Grothendieck in Gro57. There Grothendieck uses it to show that many other abelian categories have enough injectives. We will get back to the general case later (insert future reference here).
We begin with a few set theoretic remarks. Let $\left\{B_{\beta}\right\}_{\beta \in \alpha}$ be an inductive system of objects in some category $\mathcal{C}$, indexed by an ordinal $\alpha$. Assume that $\operatorname{colim}_{\beta \in \alpha} B_{\beta}$ exists in $\mathcal{C}$. If $A$ is an object of $\mathcal{C}$, then there is a natural map
05NN (19.2.0.1) $\operatorname{colim}_{\beta \in \alpha} \operatorname{Mor}_{\mathcal{C}}\left(A, B_{\beta}\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}\left(A, \operatorname{colim}_{\beta \in \alpha} B_{\beta}\right)$.
because if one is given a map $A \rightarrow B_{\beta}$ for some $\beta$, one naturally gets a map from $A$ into the colimit by composing with $B_{\beta} \rightarrow \operatorname{colim}_{\beta \in \alpha} B_{\alpha}$. Note that the left colimit is one of sets! In general, 19.2.0.1 is neither injective or surjective.

05NP Example 19.2.1. Consider the category of sets. Let $A=\mathbf{N}$ and $B_{n}=\{1, \ldots, n\}$ be the inductive system indexed by the natural numbers where $B_{n} \rightarrow B_{m}$ for $n \leq m$ is the obvious map. Then $\operatorname{colim} B_{n}=\mathbf{N}$, so there is a map $A \rightarrow \operatorname{colim} B_{n}$, which does not factor as $A \rightarrow B_{m}$ for any $m$. Consequently, colim $\operatorname{Mor}\left(A, B_{n}\right) \rightarrow$ $\operatorname{Mor}\left(A, \operatorname{colim} B_{n}\right)$ is not surjective.
05NQ Example 19.2.2. Next we give an example where the map fails to be injective. Let $B_{n}=\mathbf{N} /\{1,2, \ldots, n\}$, that is, the quotient set of $\mathbf{N}$ with the first $n$ elements collapsed to one element. There are natural maps $B_{n} \rightarrow B_{m}$ for $n \leq m$, so the $\left\{B_{n}\right\}$ form a system of sets over $\mathbf{N}$. It is easy to see that colim $B_{n}=\{*\}$ : it is the
one-point set. So it follows that $\operatorname{Mor}\left(A, \operatorname{colim} B_{n}\right)$ is a one-element set for every set $A$. However, colim $\operatorname{Mor}\left(A, B_{n}\right)$ is not a one-element set. Consider the family of maps $A \rightarrow B_{n}$ which are just the natural projections $\mathbf{N} \rightarrow \mathbf{N} /\{1,2, \ldots, n\}$ and the family of maps $A \rightarrow B_{n}$ which map the whole of $A$ to the class of 1 . These two families of maps are distinct at each step and thus are distinct in $\operatorname{colim} \operatorname{Mor}\left(A, B_{n}\right)$, but they induce the same map $A \rightarrow \operatorname{colim} B_{n}$.

Nonetheless, if we map out of a finite set then 19.2.0.1 is an isomorphism always.
05 NR Lemma 19.2.3. Suppose that, in 19.2.0.1), $\mathcal{C}$ is the category of sets and $A$ is a finite set, then the map is a bijection.

Proof. Let $f: A \rightarrow \operatorname{colim} B_{\beta}$. The range of $f$ is finite, containing say elements $c_{1}, \ldots, c_{r} \in \operatorname{colim} B_{\beta}$. These all come from some elements in $B_{\beta}$ for $\beta \in \alpha$ large by definition of the colimit. Thus we can define $\tilde{f}: A \rightarrow B_{\beta}$ lifting $f$ at a finite stage. This proves that (19.2.0.1) is surjective. Next, suppose two maps $f: A \rightarrow$ $B_{\gamma}, f^{\prime}: A \rightarrow B_{\gamma^{\prime}}$ define the same map $A \rightarrow \operatorname{colim} B_{\beta}$. Then each of the finitely many elements of $A$ gets sent to the same point in the colimit. By definition of the colimit for sets, there is $\beta \geq \gamma, \gamma^{\prime}$ such that the finitely many elements of $A$ get sent to the same points in $B_{\beta}$ under $f$ and $f^{\prime}$. This proves that 19.2 .0 .1 is injective.

The most interesting case of the lemma is when $\alpha=\omega$, i.e., when the system $\left\{B_{\beta}\right\}$ is a system $\left\{B_{n}\right\}_{n \in \mathbf{N}}$ over the natural numbers as in Examples 19.2.1 and 19.2.2 The essential idea is that $A$ is "small" relative to the long chain of compositions $B_{1} \rightarrow B_{2} \rightarrow \ldots$, so that it has to factor through a finite step. A more general version of this lemma can be found in Sets, Lemma 3.7.1. Next, we generalize this to the category of modules.

05NS Definition 19.2.4. Let $\mathcal{C}$ be a category, let $I \subset \operatorname{Arrow}(\mathcal{C})$, and let $\alpha$ be an ordinal. An object $A$ of $\mathcal{C}$ is said to be $\alpha$-small with respect to $I$ if whenever $\left\{B_{\beta}\right\}$ is a system over $\alpha$ with transition maps in $I$, then the map 19.2.0.1 is an isomorphism.

In the rest of this section we shall restrict ourselves to the category of $R$-modules for a fixed commutative ring $R$. We shall also take $I$ to be the collection of injective maps, i.e., the monomorphisms in the category of modules over $R$. In this case, for any system $\left\{B_{\beta}\right\}$ as in the definition each of the maps

$$
B_{\beta} \rightarrow \operatorname{colim}_{\beta \in \alpha} B_{\beta}
$$

is an injection. It follows that the map 19.2 .0 .1 is an injection. We can in fact interpret the $B_{\beta}$ 's as submodules of the module $B=\operatorname{colim}_{\beta \in \alpha} B_{\beta}$, and then we have $B=\bigcup_{\beta \in \alpha} B_{\beta}$. This is not an abuse of notation if we identify $B_{\alpha}$ with the image in the colimit. We now want to show that modules are always small for "large" ordinals $\alpha$.

05NT Proposition 19.2.5. Let $R$ be a ring. Let $M$ be an $R$-module. Let $\kappa$ the cardinality of the set of submodules of $M$. If $\alpha$ is an ordinal whose cofinality is bigger than $\kappa$, then $M$ is $\alpha$-small with respect to injections.

Proof. The proof is straightforward, but let us first think about a special case. If $M$ is finite, then the claim is that for any inductive system $\left\{B_{\beta}\right\}$ with injections between them, parametrized by a limit ordinal, any map $M \rightarrow \operatorname{colim} B_{\beta}$ factors through one of the $B_{\beta}$. And this we proved in Lemma 19.2.3.

Now we start the proof in the general case. We need only show that the map 19.2.0.1 is a surjection. Let $f: M \rightarrow$ colim $B_{\beta}$ be a map. Consider the subobjects $\left\{f^{-1}\left(B_{\beta}\right)\right\}$ of $M$, where $B_{\beta}$ is considered as a subobject of the colimit $B=\bigcup_{\beta} B_{\beta}$. If one of these, say $f^{-1}\left(B_{\beta}\right)$, fills $M$, then the map factors through $B_{\beta}$.
So suppose to the contrary that all of the $f^{-1}\left(B_{\beta}\right)$ were proper subobjects of $M$. However, we know that

$$
\bigcup f^{-1}\left(B_{\beta}\right)=f^{-1}\left(\bigcup B_{\beta}\right)=M
$$

Now there are at most $\kappa$ different subobjects of $M$ that occur among the $f^{-1}\left(B_{\alpha}\right)$, by hypothesis. Thus we can find a subset $S \subset \alpha$ of cardinality at most $\kappa$ such that as $\beta^{\prime}$ ranges over $S$, the $f^{-1}\left(B_{\beta^{\prime}}\right)$ range over all the $f^{-1}\left(B_{\alpha}\right)$.
However, $S$ has an upper bound $\widetilde{\alpha}<\alpha$ as $\alpha$ has cofinality bigger than $\kappa$. In particular, all the $f^{-1}\left(B_{\beta^{\prime}}\right), \beta^{\prime} \in S$ are contained in $f^{-1}\left(B_{\widetilde{\alpha}}\right)$. It follows that $f^{-1}\left(B_{\widetilde{\alpha}}\right)=M$. In particular, the map $f$ factors through $B_{\widetilde{\alpha}}$.

From this lemma we will be able to deduce the existence of lots of injectives. Let us recall the criterion of Baer.

05NU Lemma 19.2.6. Let $R$ be a ring. An $R$-module $Q$ is injective if and only if in every commutative diagram

for $\mathfrak{a} \subset R$ an ideal, the dotted arrow exists.
Proof. Assume $Q$ satisfies the assumption of the lemma. Let $M \subset N$ be $R$ modules, and let $\varphi: M \rightarrow Q$ be an $R$-module map. Arguing as in the proof of More on Algebra, Lemma 15.45 .1 we see that it suffices to prove that if $M \neq N$, then we can find an $R$-module $M^{\prime}, M \subset M^{\prime} \subset N$ such that (a) the inclusion $M \subset M^{\prime}$ is strict, and (b) $\varphi$ can be extended to $M^{\prime}$. To find $M^{\prime}$, let $x \in N, x \notin M$. Let $\psi: R \rightarrow N, r \mapsto r x$. Set $\mathfrak{a}=\psi^{-1}(M)$. By assumption the morphism

$$
\mathfrak{a} \xrightarrow{\psi} M \xrightarrow{\varphi} Q
$$

can be extended to a morphism $\varphi^{\prime}: R \rightarrow Q$. Note that $\varphi^{\prime}$ annihilates the kernel of $\psi$ (as this is true for $\varphi$ ). Thus $\varphi^{\prime}$ gives rise to a morphism $\varphi^{\prime \prime}: \operatorname{Im}(\psi) \rightarrow Q$ which agrees with $\varphi$ on the intersection $M \cap \operatorname{Im}(\psi)$ by construction. Thus $\varphi$ and $\varphi^{\prime \prime}$ glue to give an extension of $\varphi$ to the strictly bigger module $M^{\prime}=\mathcal{F}+\operatorname{Im}(\psi)$.

If $M$ is an $R$-module, then in general we may have a semi-complete diagram as in Lemma 19.2.6. In it, we can form the push-out

Here the vertical map is injective, and the diagram commutes. The point is that we can extend $\mathfrak{a} \rightarrow Q$ to $R$ if we extend $Q$ to the larger module $R \oplus_{\mathfrak{a}} Q$.

The key point of Baer's argument is to repeat this procedure transfinitely many times. To do this we first define, given an $R$-module $M$ the following (huge) pushout

05 NV

Here the top horizontal arrow maps the element $a \in \mathfrak{a}$ in the summand corresponding to $\varphi$ to the element $\varphi(a) \in M$. The left vertical arrow maps $a \in \mathfrak{a}$ in the summand corresponding to $\varphi$ simply to the element $a \in R$ in the summand corresponding to $\varphi$. The fundamental properties of this construction are formulated in the following lemma.

05NW Lemma 19.2.7. Let $R$ be a ring.
(1) The construction $M \mapsto(M \rightarrow \mathbf{M}(M))$ is functorial in $M$.
(2) The $\operatorname{map} M \rightarrow \mathbf{M}(M)$ is injective.
(3) For any ideal $\mathfrak{a}$ and any $R$-module $\operatorname{map} \varphi: \mathfrak{a} \rightarrow M$ there is an $R$-module map $\varphi^{\prime}: R \rightarrow \mathbf{M}(M)$ such that

commutes.
Proof. Parts (2) and (3) are immediate from the construction. To see (1), let $\chi: M \rightarrow N$ be an $R$-module map. We claim there exists a canonical commutative diagram

which induces the desired map $\mathbf{M}(M) \rightarrow \mathbf{M}(N)$. The middle east-south-east arrow maps the summand $\mathfrak{a}$ corresponding to $\varphi$ via $\mathrm{id}_{\mathfrak{a}}$ to the summand $\mathfrak{a}$ corresponding to $\psi=\chi \circ \varphi$. Similarly for the lower east-south-east arrow. Details omitted.

The idea will now be to apply the functor $\mathbf{M}$ a transfinite number of times. We define for each ordinal $\alpha$ a functor $\mathbf{M}_{\alpha}$ on the category of $R$-modules, together with a natural injection $N \rightarrow \mathbf{M}_{\alpha}(N)$. We do this by transfinite induction. First, $\mathbf{M}_{1}=\mathbf{M}$ is the functor defined above. Now, suppose given an ordinal $\alpha$, and suppose $\mathbf{M}_{\alpha^{\prime}}$ is defined for $\alpha^{\prime}<\alpha$. If $\alpha$ has an immediate predecessor $\widetilde{\alpha}$, we let

$$
\mathbf{M}_{\alpha}=\mathbf{M} \circ \mathbf{M}_{\widetilde{\alpha}}
$$

If not, i.e., if $\alpha$ is a limit ordinal, we let

$$
\mathbf{M}_{\alpha}(N)=\operatorname{colim}_{\alpha^{\prime}<\alpha} \mathbf{M}_{\alpha^{\prime}}(N)
$$

It is clear (e.g., inductively) that the $\mathbf{M}_{\alpha}(N)$ form an inductive system over ordinals, so this is reasonable.

05NX Theorem 19.2.8. Let $\kappa$ be the cardinality of the set of ideals in $R$, and let $\alpha$ be an ordinal whose cofinality is greater than $\kappa$. Then $\mathbf{M}_{\alpha}(N)$ is an injective $R$-module, and $N \rightarrow \mathbf{M}_{\alpha}(N)$ is a functorial injective embedding.

Proof. By Baer's criterion Lemma 19.2 .6 , it suffices to show that if $\mathfrak{a} \subset R$ is an ideal, then any map $f: \mathfrak{a} \rightarrow \mathbf{M}_{\alpha}(N)$ extends to $R \rightarrow \mathbf{M}_{\alpha}(N)$. However, we know since $\alpha$ is a limit ordinal that

$$
\mathbf{M}_{\alpha}(N)=\operatorname{colim}_{\beta<\alpha} \mathbf{M}_{\beta}(N)
$$

so by Proposition 19.2.5, we find that

$$
\operatorname{Hom}_{R}\left(\mathfrak{a}, \mathbf{M}_{\alpha}(N)\right)=\operatorname{colim}_{\beta<\alpha} \operatorname{Hom}_{R}\left(\mathfrak{a}, \mathbf{M}_{\beta}(N)\right)
$$

This means in particular that there is some $\beta^{\prime}<\alpha$ such that $f$ factors through the submodule $\mathbf{M}_{\beta^{\prime}}(N)$, as

$$
f: \mathfrak{a} \rightarrow \mathbf{M}_{\beta^{\prime}}(N) \rightarrow \mathbf{M}_{\alpha}(N)
$$

However, by the fundamental property of the functor $\mathbf{M}$, see Lemma 19.2 .7 part (3), we know that the map $\mathfrak{a} \rightarrow \mathbf{M}_{\beta^{\prime}}(N)$ can be extended to

$$
R \rightarrow \mathbf{M}\left(\mathbf{M}_{\beta^{\prime}}(N)\right)=\mathbf{M}_{\beta^{\prime}+1}(N)
$$

and the last object imbeds in $\mathbf{M}_{\alpha}(N)$ (as $\beta^{\prime}+1<\alpha$ since $\alpha$ is a limit ordinal). In particular, $f$ can be extended to $\mathbf{M}_{\alpha}(N)$.

### 19.3. G-modules

04JE We will see later (Differential Graded Algebra, Section 22.12) that the category of modules over an algebra has functorial injective embeddings. The construction is exactly the same as the construction in More on Algebra, Section 15.46.

04JF Lemma 19.3.1. Let $G$ be a topological group. The category $\operatorname{Mod}_{G}$ of discrete G-modules, see Étale Cohomology, Definition 49.57.1 has functorial injective hulls.

Proof. By the remark above the lemma the category $\operatorname{Mod}_{\mathbf{Z}[G]}$ has functorial injective embeddings. Consider the forgetful functor $v: \operatorname{Mod}_{G} \rightarrow \operatorname{Mod}_{\mathbf{Z}[G]}$. This functor is fully faithful, transforms injective maps into injective maps and has a right adjoint, namely

$$
u: M \mapsto u(M)=\{x \in M \mid \text { stabilizer of } x \text { is open }\}
$$

Since it is true that $v(M)=0 \Rightarrow M=0$ we conclude by Homology, Lemma 12.25.5

### 19.4. Abelian sheaves on a space

01DF
01DG Lemma 19.4.1. Let $X$ be a topological space. The category of abelian sheaves on $X$ has enough injectives. In fact it has functorial injective embeddings.

Proof. For an abelian group $A$ we denote $j: A \rightarrow J(A)$ the functorial injective embedding constructed in More on Algebra, Section 15.46. Let $\mathcal{F}$ be an abelian sheaf on $X$. By Sheaves, Example 6.7.5 the assignment

$$
\mathcal{I}: U \mapsto \mathcal{I}(U)=\prod_{x \in U} J\left(\mathcal{F}_{x}\right)
$$

is an abelian sheaf. There is a canonical map $\mathcal{F} \rightarrow \mathcal{I}$ given by mapping $s \in \mathcal{F}(U)$ to $\prod_{x \in U} j\left(s_{x}\right)$ where $s_{x} \in \mathcal{F}_{x}$ denotes the germ of $s$ at $x$. This map is injective, see Sheaves, Lemma 6.11.1 for example.
It remains to prove the following: Given a rule $x \mapsto I_{x}$ which assigns to each point $x \in X$ an injective abelian group the sheaf $\mathcal{I}: U \mapsto \prod_{x \in U} I_{x}$ is injective. Note that

$$
\mathcal{I}=\prod_{x \in X} i_{x, *} I_{x}
$$

is the product of the skyscraper sheaves $i_{x, *} I_{x}$ (see Sheaves, Section 6.27 for notation.) We have

$$
\operatorname{Mor}_{A b}\left(\mathcal{F}_{x}, I_{x}\right)=\operatorname{Mor}_{A b(X)}\left(\mathcal{F}, i_{x, *} I_{x}\right)
$$

see Sheaves, Lemma 6.27.3. Hence it is clear that each $i_{x, *} I_{x}$ is injective. Hence the injectivity of $\mathcal{I}$ follows from Homology, Lemma 12.23 .3 .

### 19.5. Sheaves of modules on a ringed space

01DH
01DI Lemma 19.5.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space, see Sheaves, Section 6.25. The category of sheaves of $\mathcal{O}_{X}$-modules on $X$ has enough injectives. In fact it has functorial injective embeddings.

Proof. For any ring $R$ and any $R$-module $M$ we denote $j: M \rightarrow J_{R}(M)$ the functorial injective embedding constructed in More on Algebra, Section 15.46. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules on $X$. By Sheaves, Examples 6.7 .5 and 6.15 .6 the assignment

$$
\mathcal{I}: U \mapsto \mathcal{I}(U)=\prod_{x \in U} J_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}\right)
$$

is an abelian sheaf. There is a canonical map $\mathcal{F} \rightarrow \mathcal{I}$ given by mapping $s \in \mathcal{F}(U)$ to $\prod_{x \in U} j\left(s_{x}\right)$ where $s_{x} \in \mathcal{F}_{x}$ denotes the germ of $s$ at $x$. This map is injective, see Sheaves, Lemma 6.11.1 for example.

It remains to prove the following: Given a rule $x \mapsto I_{x}$ which assigns to each point $x \in X$ an injective $\mathcal{O}_{X, x}$-module the sheaf $\mathcal{I}: U \mapsto \prod_{x \in U} I_{x}$ is injective. Note that

$$
\mathcal{I}=\prod_{x \in X} i_{x, *} I_{x}
$$

is the product of the skyscraper sheaves $i_{x, *} I_{x}$ (see Sheaves, Section 6.27 for notation.) We have

$$
\operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, I_{x}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, i_{x, *} I_{x}\right)
$$

see Sheaves, Lemma 6.27.3. Hence it is clear that each $i_{x, *} I_{x}$ is an injective $\mathcal{O}_{X^{-}}$ module (see Homology, Lemma 12.25.1 or argue directly). Hence the injectivity of $\mathcal{I}$ follows from Homology, Lemma 12.23.3.

### 19.6. Abelian presheaves on a category

01DJ Let $\mathcal{C}$ be a category. Recall that this means that $\mathrm{Ob}(\mathcal{C})$ is a set. On the one hand, consider abelian presheaves on $\mathcal{C}$, see Sites, Section 7.2. On the other hand, consider families of abelian groups indexed by elements of $\mathrm{Ob}(\mathcal{C})$; in other words presheaves on the discrete category with underlying set of objects $\mathrm{Ob}(\mathcal{C})$. Let us denote this discrete category simply $\operatorname{Ob}(\mathcal{C})$. There is a natural functor

$$
i: \mathrm{Ob}(\mathcal{C}) \longrightarrow \mathcal{C}
$$

and hence there is a natural restriction or forgetful functor

$$
v=i^{p}: \operatorname{PAb}(\mathcal{C}) \longrightarrow \operatorname{PAb}(\mathrm{Ob}(\mathcal{C}))
$$

compare Sites, Section 7.5. We will denote presheaves on $\mathcal{C}$ by $B$ and presheaves on $\operatorname{Ob}(\mathcal{C})$ by $A$.

There are also two functors, namely $i_{p}$ and ${ }_{p} i$ which assign an abelian presheaf on $\mathcal{C}$ to an abelian presheaf on $\mathrm{Ob}(\mathcal{C})$, see Sites, Sections 7.5 and 7.18 . Here we will use $u={ }_{p} i$ which is defined (in the case at hand) as follows:

$$
u A(U)=\prod_{U^{\prime} \rightarrow U} A\left(U^{\prime}\right)
$$

So an element is a family $\left(a_{\phi}\right)_{\phi}$ with $\phi$ ranging through all morphisms in $\mathcal{C}$ with target $U$. The restriction map on $u A$ corresponding to $g: V \rightarrow U$ maps our element $\left(a_{\phi}\right)_{\phi}$ to the element $\left(a_{g \circ \psi}\right)_{\psi}$.
There is a canonical surjective map $v u A \rightarrow A$ and a canonical injective map $B \rightarrow$ $u v B$. We leave it to the reader to show that

$$
\operatorname{Mor}_{P A b(\mathcal{C})}(B, u A)=\operatorname{Mor}_{P A b(\mathrm{Ob}(\mathcal{C}))}(v B, A)
$$

in this simple case; the general case is in Sites, Section 7.5. Thus the pair $(u, v)$ is an example of a pair of adjoint functors, see Categories, Section 4.24.
At this point we can list the following facts about the situation above.
(1) The functors $u$ and $v$ are exact. This follows from the explicit description of these functors given above.
(2) In particular the functor $v$ transforms injective maps into injective maps.
(3) The category $\operatorname{PAb}(\mathrm{Ob}(\mathcal{C}))$ has enough injectives.
(4) In fact there is a functorial injective embedding $A \mapsto(A \rightarrow J(A))$ as in Homology, Definition 12.23.5. Namely, we can take $J(A)$ to be the presheaf $U \mapsto J(A(U))$, where $J(-)$ is the functor constructed in More on Algebra, Section 15.46 for the ring $\mathbf{Z}$.
Putting all of this together gives us the following procedure for embedding objects $B$ of $P A b(\mathcal{C})$ ) into an injective object: $B \rightarrow u J(v B)$. See Homology, Lemma 12.25 .5 .
01DK Proposition 19.6.1. For abelian presheaves on a category there is a functorial injective embedding.

Proof. See discussion above.

### 19.7. Abelian Sheaves on a site

01DL Let $\mathcal{C}$ be a site. In this section we prove that there are enough injectives for abelian sheaves on $\mathcal{C}$.
Denote $i: A b(\mathcal{C}) \longrightarrow P A b(\mathcal{C})$ the forgetful functor from abelian sheaves to abelian presheaves. Let $\#: \operatorname{PAb}(\mathcal{C}) \longrightarrow A b(\mathcal{C})$ denote the sheafification functor. Recall that $\#$ is a left adjoint to $i$, that $\#$ is exact, and that $i \mathcal{F}^{\#}=\mathcal{F}$ for any abelian sheaf $\mathcal{F}$. Finally, let $\mathcal{G} \rightarrow J(\mathcal{G})$ denote the canonical embedding into an injective presheaf we found in Section 19.6 .
For any sheaf $\mathcal{F}$ in $A b(\mathcal{C})$ and any ordinal $\beta$ we define a sheaf $J_{\beta}(\mathcal{F})$ by transfinite induction. We set $J_{0}(\mathcal{F})=\mathcal{F}$. We define $J_{1}(\mathcal{F})=J(i \mathcal{F})^{\#}$. Sheafification of the canonical map $i \mathcal{F} \rightarrow J(i \mathcal{F})$ gives a functorial map

$$
\mathcal{F} \longrightarrow J_{1}(\mathcal{F})
$$

which is injective as $\#$ is exact. We set $J_{\alpha+1}(\mathcal{F})=J_{1}\left(J_{\alpha}(\mathcal{F})\right)$. So that there are canonical injective maps $J_{\alpha}(\mathcal{F}) \rightarrow J_{\alpha+1}(\mathcal{F})$. For a limit ordinal $\beta$, we define

$$
J_{\beta}(\mathcal{F})=\operatorname{colim}_{\alpha<\beta} J_{\alpha}(\mathcal{F})
$$

Note that this is a directed colimit. Hence for any ordinals $\alpha<\beta$ we have an injective map $J_{\alpha}(\mathcal{F}) \rightarrow J_{\beta}(\mathcal{F})$.
01 DM Lemma 19.7.1. With notation as above. Suppose that $\mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ is an injective map of abelian sheaves on $\mathcal{C}$. Let $\alpha$ be an ordinal and let $\mathcal{G}_{1} \rightarrow J_{\alpha}(\mathcal{F})$ be a morphism of sheaves. There exists a morphism $\mathcal{G}_{2} \rightarrow J_{\alpha+1}(\mathcal{F})$ such that the following diagram commutes

Proof. This is because the map $i \mathcal{G}_{1} \rightarrow i \mathcal{G}_{2}$ is injective and hence $i \mathcal{G}_{1} \rightarrow i J_{\alpha}(\mathcal{F})$ extends to $i \mathcal{G}_{2} \rightarrow J\left(i J_{\alpha}(\mathcal{F})\right)$ which gives the desired map after applying the sheafification functor.

This lemma says that somehow the system $\left\{J_{\alpha}(\mathcal{F})\right\}$ is an injective embedding of $\mathcal{F}$. Of course we cannot take the limit over all $\alpha$ because they form a class and not a set. However, the idea is now that you don't have to check injectivity on all injections $\mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$, plus the following lemma.

01DN Lemma 19.7.2. Suppose that $\mathcal{G}_{i}, i \in I$ is set of abelian sheaves on $\mathcal{C}$. There exists an ordinal $\beta$ such that for any sheaf $\mathcal{F}$, any $i \in I$, and any $\operatorname{map} \varphi: \mathcal{G}_{i} \rightarrow J_{\beta}(\mathcal{F})$ there exists an $\alpha<\beta$ such that $\varphi$ factors through $J_{\alpha}(\mathcal{F})$.

Proof. This reduces to the case of a single sheaf $\mathcal{G}$ by taking the direct sum of all the $\mathcal{G}_{i}$.

Consider the sets

$$
S=\coprod_{U \in \mathrm{Ob}(\mathcal{C})} \mathcal{G}(U)
$$

and

$$
T_{\beta}=\coprod_{U \in \mathrm{Ob}(\mathcal{C})} J_{\beta}(\mathcal{F})(U)
$$

Then $T_{\beta}=\operatorname{colim}_{\alpha<\beta} T_{\alpha}$ with injective transition maps. A morphism $\mathcal{G} \rightarrow J_{\beta}(\mathcal{F})$ factors through $J_{\alpha}(\mathcal{F})$ if and only if the associated map $S \rightarrow T_{\beta}$ factors through $T_{\alpha}$. By Sets, Lemma 3.7.1 if the cofinality of $\beta$ is bigger than the cardinality of $S$, then the result of the lemma is true. Hence the lemma follows from the fact that there are ordinals with arbitrarily large cofinality, see Sets, Proposition 3.7.2.

Recall that for an object $X$ of $\mathcal{C}$ we denote $\mathbf{Z}_{X}$ the presheaf of abelian groups $\Gamma\left(U, \mathbf{Z}_{X}\right)=\oplus_{U \rightarrow X} \mathbf{Z}$, see Modules on Sites, Section 18.4 . The sheaf associated to this presheaf is denoted $\mathbf{Z}_{X}^{\#}$, see Modules on Sites, Section 18.5 It can be characterized by the property

05 NY

$$
\begin{equation*}
\operatorname{Mor}_{A b(\mathcal{C})}\left(\mathbf{Z}_{X}^{\#}, \mathcal{G}\right)=\mathcal{G}(X) \tag{19.7.2.1}
\end{equation*}
$$

where the element $\varphi$ of the left hand side is mapped to $\varphi\left(1 \cdot \mathrm{id}_{X}\right)$ in the right hand side. We can use these sheaves to characterize injective abelian sheaves.

01DO Lemma 19.7.3. Suppose $\mathcal{J}$ is a sheaf of abelian groups with the following property: For all $X \in \operatorname{Ob}(\mathcal{C})$, for any abelian subsheaf $\mathcal{S} \subset \mathbf{Z}_{X}^{\#}$ and any morphism $\varphi: \mathcal{S} \rightarrow \mathcal{J}$, there exists a morphism $\mathbf{Z}_{X}^{\#} \rightarrow \mathcal{J}$ extending $\varphi$. Then $\mathcal{J}$ is an injective sheaf of abelian groups.

Proof. Let $\mathcal{F} \rightarrow \mathcal{G}$ be an injective map of abelian sheaves. Suppose $\varphi: \mathcal{F} \rightarrow \mathcal{J}$ is a morphism. Arguing as in the proof of More on Algebra, Lemma 15.45.1 we see that it suffices to prove that if $\mathcal{F} \neq \mathcal{G}$, then we can find an abelian sheaf $\mathcal{F}^{\prime}$, $\mathcal{F} \subset \mathcal{F}^{\prime} \subset \mathcal{G}$ such that (a) the inclusion $\mathcal{F} \subset \mathcal{F}^{\prime}$ is strict, and (b) $\varphi$ can be extended to $\mathcal{F}^{\prime}$. To find $\mathcal{F}^{\prime}$, let $X$ be an object of $\mathcal{C}$ such that the inclusion $\mathcal{F}(X) \subset \mathcal{G}(X)$ is strict. Pick $s \in \mathcal{G}(X), s \notin \mathcal{F}(X)$. Let $\psi: \mathbf{Z}_{X}^{\#} \rightarrow \mathcal{G}$ be the morphism corresponding to the section $s$ via 19.7.2.1. Set $\mathcal{S}=\psi^{-1}(\mathcal{F})$. By assumption the morphism

$$
\mathcal{S} \xrightarrow{\psi} \mathcal{F} \xrightarrow{\varphi} \mathcal{J}
$$

can be extended to a morphism $\varphi^{\prime}: \mathbf{Z}_{X}^{\#} \rightarrow \mathcal{J}$. Note that $\varphi^{\prime}$ annihilates the kernel of $\psi$ (as this is true for $\varphi$ ). Thus $\varphi^{\prime}$ gives rise to a morphism $\varphi^{\prime \prime}: \operatorname{Im}(\psi) \rightarrow \mathcal{J}$ which agrees with $\varphi$ on the intersection $\mathcal{F} \cap \operatorname{Im}(\psi)$ by construction. Thus $\varphi$ and $\varphi^{\prime \prime}$ glue to give an extension of $\varphi$ to the strictly bigger subsheaf $\mathcal{F}^{\prime}=\mathcal{F}+\operatorname{Im}(\psi)$.

01DP Theorem 19.7.4. The category of sheaves of abelian groups on a site has enough injectives. In fact there exists a functorial injective embedding, see Homology, Definition 12.23.5.

Proof. Let $\mathcal{G}_{i}, i \in I$ be a set of abelian sheaves such that every subsheaf of every $\mathbf{Z}_{X}^{\#}$ occurs as one of the $\mathcal{G}_{i}$. Apply Lemma 19.7.2 to this collection to get an ordinal $\beta$. We claim that for any sheaf of abelian groups $\mathcal{F}$ the map $\mathcal{F} \rightarrow J_{\beta}(\mathcal{F})$ is an injection of $\mathcal{F}$ into an injective. Note that by construction the assingment $\mathcal{F} \mapsto\left(\mathcal{F} \rightarrow J_{\beta}(\mathcal{F})\right)$ is indeed functorial.

The proof of the claim comes from the fact that by Lemma 19.7 .3 it suffices to extend any morphism $\gamma: \mathcal{G} \rightarrow J_{\beta}(\mathcal{F})$ from a subsheaf $\mathcal{G}$ of some $\mathbf{Z}_{X}^{\#}$ to all of $\mathbf{Z}_{X}^{\#}$. Then by Lemma 19.7 .2 the map $\gamma$ lifts into $J_{\alpha}(\mathcal{F})$ for some $\alpha<\beta$. Finally, we apply Lemma 19.7.1 to get the desired extension of $\gamma$ to a morphism into $J_{\alpha+1}(\mathcal{F}) \rightarrow J_{\beta}(\mathcal{F})$.

### 19.8. Modules on a ringed site

01 DQ Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. By analogy with More on Algebra, Section 15.46 let us try to prove that there are enough injective $\mathcal{O}$-modules. First of all, we pick an injective embedding

$$
\bigoplus_{U, \mathcal{I}} j_{U!} \mathcal{O}_{U} / \mathcal{I} \longrightarrow \mathcal{J}
$$

where $\mathcal{J}$ is an injective abelian sheaf (which exists by the previous section). Here the direct sum is over all objects $U$ of $\mathcal{C}$ and over all $\mathcal{O}$-submodules $\mathcal{I} \subset j_{U!} \mathcal{O}_{U}$. Please see Modules on Sites, Section 18.19 to read about the functors restriction and extension by 0 for the localization functor $j_{U}: \mathcal{C} / U \rightarrow \mathcal{C}$.
For any sheaf of $\mathcal{O}$-modules $\mathcal{F}$ denote

$$
\mathcal{F}^{\vee}=\mathcal{H o m}(\mathcal{F}, \mathcal{J})
$$

with its natural $\mathcal{O}$-module structure. Insert here future reference to internal hom. We will also need a canonical flat resolution of a sheaf of $\mathcal{O}$-modules. This we can do as follows: For any $\mathcal{O}$-module $\mathcal{F}$ we denote

$$
F(\mathcal{F})=\bigoplus_{U \in \operatorname{Ob}(\mathcal{C}), s \in \mathcal{F}(U)} j_{U!} \mathcal{O}_{U}
$$

This is a flat sheaf of $\mathcal{O}$-modules which comes equipped with a canonical surjection $F(\mathcal{F}) \rightarrow \mathcal{F}$, see Modules on Sites, Lemma 18.28.6. Moreover the construction $\mathcal{F} \mapsto F(\mathcal{F})$ is functorial in $\mathcal{F}$.
01DR Lemma 19.8.1. The functor $\mathcal{F} \mapsto \mathcal{F}^{\vee}$ is exact.
Proof. This because $\mathcal{J}$ is an injective abelian sheaf.
There is a canonical map ev: $\mathcal{F} \rightarrow\left(\mathcal{F}^{\vee}\right)^{\vee}$ given by evaluation: given $x \in \mathcal{F}(U)$ we let $e v(x) \in\left(\mathcal{F}^{\vee}\right)^{\vee}=\mathcal{H o m}\left(\mathcal{F}^{\vee}, \mathcal{J}\right)$ be the map $\varphi \mapsto \varphi(x)$.

01DS Lemma 19.8.2. For any $\mathcal{O}$-module $\mathcal{F}$ the evaluation map ev : $\mathcal{F} \rightarrow\left(\mathcal{F}^{\vee}\right)^{\vee}$ is injective.

Proof. You can check this using the definition of $\mathcal{J}$. Namely, if $s \in \mathcal{F}(U)$ is not zero, then let $j_{U!} \mathcal{O}_{U} \rightarrow \mathcal{F}$ be the map of $\mathcal{O}$-modules it corresponds to via adjunction. Let $\mathcal{I}$ be the kernel of this map. There exists a nonzero map $\mathcal{F} \supset j_{U} \mathcal{O}_{U} / \mathcal{I} \rightarrow \mathcal{J}$ which does not annihilate $s$. As $\mathcal{J}$ is an injective $\mathcal{O}$-module, this extends to a map $\varphi: \mathcal{F} \rightarrow \mathcal{J}$. Then $\operatorname{ev}(s)(\varphi)=\varphi(s) \neq 0$ which is what we had to prove.
The canonical surjection $F(\mathcal{F}) \rightarrow \mathcal{F}$ of $\mathcal{O}$-modules turns into a a canonical injection, see above, of $\mathcal{O}$-modules

$$
\left(\mathcal{F}^{\vee}\right)^{\vee} \longrightarrow\left(F\left(\mathcal{F}^{\vee}\right)\right)^{\vee}
$$

Set $J(\mathcal{F})=\left(F\left(\mathcal{F}^{\vee}\right)\right)^{\vee}$. The composition of $e v$ with this the displayed map gives $\mathcal{F} \rightarrow J(\mathcal{F})$ functorially in $\mathcal{F}$.

01DT Lemma 19.8.3. Let $\mathcal{O}$ be a sheaf of rings. For every $\mathcal{O}$-module $\mathcal{F}$ the $\mathcal{O}$-module $J(\mathcal{F})$ is injective.

Proof. We have to show that the functor $\operatorname{Hom}_{\mathcal{O}}(\mathcal{G}, J(\mathcal{F}))$ is exact. Note that

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{O}}(\mathcal{G}, J(\mathcal{F})) & =\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{G},\left(F\left(\mathcal{F}^{\vee}\right)\right)^{\vee}\right) \\
& =\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{G}, \mathcal{H o m}\left(F\left(\mathcal{F}^{\vee}\right), \mathcal{J}\right)\right) \\
& =\operatorname{Hom}\left(\mathcal{G} \otimes_{\mathcal{O}} F\left(\mathcal{F}^{\vee}\right), \mathcal{J}\right)
\end{aligned}
$$

Thus what we want follows from the fact that $F\left(\mathcal{F}^{\vee}\right)$ is flat and $\mathcal{J}$ is injective.
01DU Theorem 19.8.4. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. The category of sheaves of $\mathcal{O}$-modules on a site has enough injectives. In fact there exists a functorial injective embedding, see Homology, Definition 12.23.5.

Proof. From the discussion in this section.
01DV Proposition 19.8.5. Let $\mathcal{C}$ be a category. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$. The category $\operatorname{PMod}(\mathcal{O})$ of presheaves of $\mathcal{O}$-modules has functorial injective embeddings.

Proof. We could prove this along the lines of the discussion in Section 19.6. But instead we argue using the theorem above. Endow $\mathcal{C}$ with the structure of a site by letting the set of coverings of an object $U$ consist of all singletons $\{f: V \rightarrow U\}$ where $f$ is an isomorphism. We omit the verification that this defines a site. A sheaf for this topology is the same as a presheaf (proof omitted). Hence the theorem applies.

### 19.9. Embedding abelian categories

05PL In this section we show that an abelian category embeds in the category of abelian sheaves on a site having enough points. The site will be the one described in the following lemma.

05PM Lemma 19.9.1. Let $\mathcal{A}$ be an abelian category. Let

$$
\operatorname{Cov}=\{\{f: V \rightarrow U\} \mid f \text { is surjective }\} .
$$

Then $(\mathcal{A}, C o v)$ is a site, see Sites, Definition 7.6.2.
Proof. Note that $\operatorname{Ob}(\mathcal{A})$ is a set by our conventions about categories. An isomorphism is a surjective morphism. The composition of surjective morphisms is surjective. And the base change of a surjective morphism in $\mathcal{A}$ is surjective, see Homology, Lemma 12.5.14.

Let $\mathcal{A}$ be a pre-additive category. In this case the Yoneda embedding $\mathcal{A} \rightarrow \operatorname{PSh}(\mathcal{A})$, $X \mapsto h_{X}$ factors through a functor $\mathcal{A} \rightarrow \operatorname{PAb}(\mathcal{A})$.
05PN Lemma 19.9.2. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C}=(\mathcal{A}$, Cov $)$ be the site defined in Lemma 19.9.1. Then $X \mapsto h_{X}$ defines a fully faithful, exact functor

$$
\mathcal{A} \longrightarrow A b(\mathcal{C})
$$

Moreover, the site $\mathcal{C}$ has enough points.
Proof. Suppose that $f: V \rightarrow U$ is a surjective morphism of $\mathcal{A}$. Let $K=\operatorname{Ker}(f)$. Recall that $V \times_{U} V=\operatorname{Ker}((f,-f): V \oplus V \rightarrow U)$, see Homology, Example 12.5.6. In particular there exists an injection $K \oplus K \rightarrow V \times_{U} V$. Let $p, q: V \times_{U} V \rightarrow V$ be the two projection morphisms. Note that $p-q: V \times_{U} V \rightarrow V$ is a morphism such that $f \circ(p-q)=0$. Hence $p-q$ factors through $K \rightarrow V$. Let us denote this morphism by $c: V \times_{U} V \rightarrow K$. And since the composition $K \oplus K \rightarrow V \times_{U} V \rightarrow K$ is surjective, we conclude that $c$ is surjective. It follows that

$$
V \times_{U} V \xrightarrow{p-q} V \rightarrow U \rightarrow 0
$$

is an exact sequence of $\mathcal{A}$. Hence for an object $X$ of $\mathcal{A}$ the sequence

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{A}}(U, X) \rightarrow \operatorname{Hom}_{\mathcal{A}}(V, X) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(V \times_{U} V, X\right)
$$

is an exact sequence of abelian groups, see Homology, Lemma 12.5.8. This means that $h_{X}$ satisfies the sheaf condition on $\mathcal{C}$.
The functor is fully faithful by Categories, Lemma 4.3.5. The functor is a left exact functor between abelian categories by Homology, Lemma 12.5.8. To show that it is right exact, let $X \rightarrow Y$ be a surjective morphism of $\mathcal{A}$. Let $U$ be an object of $\mathcal{A}$, and let $s \in h_{Y}(U)=\operatorname{Mor}_{\mathcal{A}}(U, Y)$ be a section of $h_{Y}$ over $U$. By Homology, Lemma 12.5.14 the projection $U \times_{Y} X \rightarrow U$ is surjective. Hence $\left\{V=U \times_{Y} X \rightarrow U\right\}$ is a covering of $U$ such that $\left.s\right|_{V}$ lifts to a section of $h_{X}$. This proves that $h_{X} \rightarrow h_{Y}$ is a surjection of abelian sheaves, see Sites, Lemma 7.12.2.

The site $\mathcal{C}$ has enough points by Sites, Proposition 7.38.3.
05PP Remark 19.9.3. The Freyd-Mitchell embedding theorem says there exists a fully faithful exact functor from any abelian category $\mathcal{A}$ to the category of modules over a ring. Lemma 19.9 .2 is not quite as strong. But the result is suitable for the stacks project as we have to understand sheaves of abelian groups on sites in detail anyway. Moreover, "diagram chasing" works in the category of abelian sheaves on $\mathcal{C}$, for example by working with sections over objects, or by working on the level of stalks using that $\mathcal{C}$ has enough points. To see how to deduce the Freyd-Mitchell embedding theorem from Lemma 19.9.2 see Remark 19.9.5.

05 PQ Remark 19.9.4. If $\mathcal{A}$ is a "big" abelian category, i.e., if $\mathcal{A}$ has a class of objects, then Lemma 19.9 .2 does not work. In this case, given any set of objects $E \subset \mathrm{Ob}(\mathcal{A})$ there exists an abelian full subcategory $\mathcal{A}^{\prime} \subset \mathcal{A}$ such that $\operatorname{Ob}\left(\mathcal{A}^{\prime}\right)$ is a set and $E \subset \operatorname{Ob}\left(\mathcal{A}^{\prime}\right)$. Then one can apply Lemma 19.9 .2 to $\mathcal{A}^{\prime}$. One can use this to prove that results depending on a diagram chase hold in $\mathcal{A}$.

05PR Remark 19.9.5. Let $\mathcal{C}$ be a site. Note that $A b(\mathcal{C})$ has enough injectives, see Theorem 19.7.4 (In the case that $\mathcal{C}$ has enough points this is straightforward because $p_{*} I$ is an injective sheaf if $I$ is an injective $\mathbf{Z}$-module and $p$ is a point.) Also, $A b(\mathcal{C})$ has a cogenerator (details omitted). Hence Lemma 19.9.2 proves that we have a fully faithful, exact embedding $\mathcal{A} \rightarrow \mathcal{B}$ where $\mathcal{B}$ has a cogenerator and enough injectives. We can apply this to $\mathcal{A}^{o p p}$ and we get a fully faithful exact functor $i: \mathcal{A} \rightarrow \mathcal{D}=\mathcal{B}^{o p p}$ where $\mathcal{D}$ has enough projectives and a generator. Hence $\mathcal{D}$ has a projective generator $P$. Set $R=\operatorname{Mor}_{\mathcal{D}}(P, P)$. Then

$$
\mathcal{A} \longrightarrow \operatorname{Mod}_{R}, \quad X \longmapsto \operatorname{Hom}_{\mathcal{D}}(P, X) .
$$

One can check this is a fully faithful, exact functor. In other words, one retrieves the Freyd-Mitchell theorem mentioned in Remark 19.9.3 above.

05SF Remark 19.9.6. The arguments proving Lemmas 19.9.1 and 19.9.2 work also for exact categories, see [Büh10, Appendix A] and [BBD82, 1.1.4]. We quickly review this here and we add more details if we ever need it in the stacks project.
Let $\mathcal{A}$ be an additive category. A kernel-cokernel pair is a pair $(i, p)$ of morphisms of $\mathcal{A}$ with $i: A \rightarrow B, p: B \rightarrow C$ such that $i$ is the kernel of $p$ and $p$ is the cokernel of $i$. Given a set $\mathcal{E}$ of kernel-cokernel pairs we say $i: A \rightarrow B$ is an admissible monomorphism if $(i, p) \in \mathcal{E}$ for some morphism $p$. Similarly we say a morphism $p: B \rightarrow C$ is an admissible epimorphism if $(i, p) \in \mathcal{E}$ for some morphism $i$. The pair $(\mathcal{A}, \mathcal{E})$ is said to be an exact category if the following axioms hold
(1) $\mathcal{E}$ is closed under isomorphisms of kernel-cokernel pairs,
(2) for any object $A$ the morphism $1_{A}$ is both an admissible epimorphism and an admissible monomorphism,
(3) admissible monomorphisms are stable under composition,
(4) admissible epimorphisms are stable under composition,
(5) the push-out of an admissible monomorphism $i: A \rightarrow B$ via any morphism $A \rightarrow A^{\prime}$ exist and the induced morphism $i^{\prime}: A^{\prime} \rightarrow B^{\prime}$ is an admissible monomorphism, and
(6) the base change of an admissible epimorphism $p: B \rightarrow C$ via any morphism $C^{\prime} \rightarrow C$ exist and the induced morphism $p^{\prime}: B^{\prime} \rightarrow C^{\prime}$ is an admissible epimorphism.
Given such a structure let $\mathcal{C}=(\mathcal{A}, \operatorname{Cov})$ where coverings (i.e., elements of Cov) are given by admissible epimorphisms. The axioms listed above immediately imply that this is a site. Consider the functor

$$
F: \mathcal{A} \longrightarrow A b(\mathcal{C}), \quad X \longmapsto h_{X}
$$

exactly as in Lemma 19.9 .2 . It turns out that this functor is fully faithful, exact, and reflects exactness. Moreover, any extension of objects in the essential image of $F$ is in the essential image of $F$.

### 19.10. Grothendieck's AB conditions

079A This and the next few sections are mostly interesting for "big" abelian categories, i.e., those categories listed in Categories, Remark 4.2.2. A good case to keep in mind is the category of sheaves of modules on a ringed site.
Grothendieck proved the existence of injectives in great generality in the paper Gro57. He used the following conditions to single out abelian categories with special properties.

079B Definition 19.10.1. Let $\mathcal{A}$ be an abelian category. We name some conditions
$\mathrm{AB} 3 \mathcal{A}$ has direct sums,
$\mathrm{AB} 4 \mathcal{A}$ has AB 3 and direct sums are exact,
$\mathrm{AB} 5 \mathcal{A}$ has AB 3 and filtered colimits are exact.
Here are the dual notions
AB3* $\mathcal{A}$ has products,
$\mathrm{AB} 4^{*} \mathcal{A}$ has $\mathrm{AB} 3^{*}$ and products are exact,
AB5* $\mathcal{A}$ has $\mathrm{AB} 3^{*}$ and filtered limits are exact.
We say an object $U$ of $\mathcal{A}$ is a generator if for every $N \subset M, N \neq M$ in $\mathcal{A}$ there exists a morphism $U \rightarrow M$ which does not factor through $N$. We say $\mathcal{A}$ is a Grothendieck abelian category if it has AB5 and a generator.

Discussion: A direct sum in an abelian category is a coproduct. If an abelian category has direct sums (i.e., AB3), then it has colimits, see Categories, Lemma 4.14.11. Similarly if $\mathcal{A}$ has AB3* then it has limits, see Categories, Lemma 4.14.10. Exactness of direct sums means the following: given an index set $I$ and short exact sequences

$$
0 \rightarrow A_{i} \rightarrow B_{i} \rightarrow C_{i} \rightarrow 0, \quad i \in I
$$

in $\mathcal{A}$ then the sequence

$$
0 \rightarrow \bigoplus_{i \in I} A_{i} \rightarrow \bigoplus_{i \in I} B_{i} \rightarrow \bigoplus_{i \in I} C_{i} \rightarrow 0
$$

is exact as well. Without assuming AB4 it is only true in general that the sequence is exact on the right (i.e., taking direct sums is a right exact functor if direct sums exist). Similarly, exactness of filtered colimits means the following: given a directed partially ordered set $I$ and a system of short exact sequences

$$
0 \rightarrow A_{i} \rightarrow B_{i} \rightarrow C_{i} \rightarrow 0
$$

over $I$ in $\mathcal{A}$ then the sequence

$$
0 \rightarrow \operatorname{colim}_{i \in I} A_{i} \rightarrow \operatorname{colim}_{i \in I} B_{i} \rightarrow \operatorname{colim}_{i \in I} C_{i} \rightarrow 0
$$

is exact as well. Without assuming AB5 it is only true in general that the sequence is exact on the right (i.e., taking colimits is a right exact functor if colimits exist). A similar explanation holds for $\mathrm{AB} 4^{*}$ and $\mathrm{AB} 5^{*}$.

### 19.11. Injectives in Grothendieck categories

05AB The existence of a generator implies that given an object $M$ of a Grothendieck abelian category $\mathcal{A}$ there is a set of subobjects. (This may not be true for a general "big" abelian category.)

079C Definition 19.11.1. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $M$ be an object of $\mathcal{A}$. The size $|M|$ of $M$ is the cardinality of the set of subobjects of $M$.

079D Lemma 19.11.2. Let $\mathcal{A}$ be a Grothendieck abelian category. If $0 \rightarrow M^{\prime} \rightarrow M \rightarrow$ $M^{\prime \prime} \rightarrow 0$ is a short exact sequence of $\mathcal{A}$, then $\left|M^{\prime}\right|,\left|M^{\prime \prime}\right| \leq|M|$.

Proof. Immediate from the definitions.
079E Lemma 19.11.3. Let $\mathcal{A}$ be a Grothendieck abelian category with generator $U$.
(1) If $|M| \leq \kappa$, then $M$ is the quotient of a direct sum of at most $\kappa$ copies of $U$.
(2) For every cardinal $\kappa$ there exists a set of isomorphism classes of objects $M$ with $|M| \leq \kappa$.

Proof. For (1) choose for every proper subobject $M^{\prime} \subset M$ a morphism $\varphi_{M^{\prime}}: U \rightarrow$ $M$ whose image is not contained in $M^{\prime}$. Then $\bigoplus_{M^{\prime} \subset M} \varphi_{M^{\prime}}: \bigoplus_{M^{\prime} \subset N} U \rightarrow M$ is surjective. It is clear that (1) implies (2).

079F Proposition 19.11.4. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $M$ be an object of $\mathcal{A}$. Let $\kappa=|M|$. If $\alpha$ is an ordinal whose cofinality is bigger than $\kappa$, then $M$ is $\alpha$-small with respect to injections.

Proof. Please compare with Proposition 19.2.5. We need only show that the map 19.2.0.1) is a surjection. Let $f: M \rightarrow$ colim $B_{\beta}$ be a map. Consider the subobjects $\left\{f^{-1}\left(B_{\beta}\right)\right\}$ of $M$, where $B_{\beta}$ is considered as a subobject of the colimit $B=\bigcup_{\beta} B_{\beta}$. If one of these, say $f^{-1}\left(B_{\beta}\right)$, fills $M$, then the map factors through $B_{\beta}$.

So suppose to the contrary that all of the $f^{-1}\left(B_{\beta}\right)$ were proper subobjects of $M$. However, because $\mathcal{A}$ has AB5 we have

$$
\operatorname{colim} f^{-1}\left(B_{\beta}\right)=f^{-1}\left(\operatorname{colim} B_{\beta}\right)=M
$$

Now there are at most $\kappa$ different subobjects of $M$ that occur among the $f^{-1}\left(B_{\alpha}\right)$, by hypothesis. Thus we can find a subset $S \subset \alpha$ of cardinality at most $\kappa$ such that as $\beta^{\prime}$ ranges over $S$, the $f^{-1}\left(B_{\beta^{\prime}}\right)$ range over all the $f^{-1}\left(B_{\alpha}\right)$.

However, $S$ has an upper bound $\widetilde{\alpha}<\alpha$ as $\alpha$ has cofinality bigger than $\kappa$. In particular, all the $f^{-1}\left(B_{\beta^{\prime}}\right)$, $\beta^{\prime} \in S$ are contained in $f^{-1}\left(B_{\widetilde{\alpha}}\right)$. It follows that $f^{-1}\left(B_{\widetilde{\alpha}}\right)=M$. In particular, the map $f$ factors through $B_{\widetilde{\alpha}}$.

079G Lemma 19.11.5. Let $\mathcal{A}$ be a Grothendieck abelian category with generator $U$. An object I of $\mathcal{A}$ is injective if and only if in every commutative diagram

for $M \subset U$ a subobject, the dotted arrow exists.
Proof. Please see Lemma 19.2 .6 for the case of modules. Choose an injection $A \subset B$ and a morphism $\varphi: A \rightarrow I$. Consider the set $S$ of pairs $\left(A^{\prime}, \varphi^{\prime}\right)$ consisting of subobjects $A \subset A^{\prime} \subset B$ and a morphism $\varphi^{\prime}: A^{\prime} \rightarrow I$ extending $\varphi$. Define a partial ordering on this set in the obvious manner. Choose a totally ordered subset $T \subset S$. Then

$$
A^{\prime}=\operatorname{colim}_{t \in T} A_{t} \xrightarrow{\operatorname{colim}_{t \in T} \varphi_{t}} I
$$

is an upper bound. Hence by Zorn's lemma the set $S$ has a maximal element $\left(A^{\prime}, \varphi^{\prime}\right)$. We claim that $A^{\prime}=B$. If not, then choose a morphism $\psi: U \rightarrow B$ which does not factor through $A^{\prime}$. Set $N=A^{\prime} \cap \psi(U)$. Set $M=\psi^{-1}(N)$. Then the map

$$
M \rightarrow N \rightarrow A^{\prime} \xrightarrow{\varphi^{\prime}} I
$$

can be extended to a morphism $\chi: U \rightarrow I$. Since $\left.\chi\right|_{\operatorname{Ker}(\psi)}=0$ we see that $\chi$ factors as

$$
U \rightarrow \operatorname{Im}(\psi) \xrightarrow{\varphi^{\prime \prime}} I
$$

Since $\varphi^{\prime}$ and $\varphi^{\prime \prime}$ agree on $N=A^{\prime} \cap \operatorname{Im}(\psi)$ we see that combined the define a morphism $A^{\prime}+\operatorname{Im}(\psi) \rightarrow I$ contradicting the assumed maximality of $A^{\prime}$.

079H Theorem 19.11.6. Let $\mathcal{A}$ be a Grothendieck abelian category. Then $\mathcal{A}$ has functorial injective embeddings.

Proof. Please compare with the proof of Theorem 19.2.8. Choose a generator $U$ of $\mathcal{A}$. For an object $M$ we define $\mathbf{M}(M)$ by the following pushout diagram

Note that $M \rightarrow \mathbf{M}(N)$ is a functor and that there exist functorial injective maps $M \rightarrow \mathbf{M}(M)$. By transfinite induction we define functors $\mathbf{M}_{\alpha}(M)$ for every ordinal $\alpha$. Namely, set $\mathbf{M}_{0}(M)=M$. Given $\mathbf{M}_{\alpha}(M)$ set $\mathbf{M}_{\alpha+1}(M)=\mathbf{M}\left(\mathbf{M}_{\alpha}(M)\right)$. For a limit ordinal $\beta$ set

$$
\mathbf{M}_{\beta}(M)=\operatorname{colim}_{\alpha<\beta} \mathbf{M}_{\alpha}(M)
$$

Finally, choose an ordinal $\alpha$ whose cofinality is greater than $|U|$, see Sets, Proposition 3.7.2. We claim that $M \rightarrow \mathbf{M}_{\alpha}(M)$ is the desired functorial injective embedding. Namely, if $N \subset U$ is a subobject and $\varphi: N \rightarrow \mathbf{M}_{\alpha}(M)$ is a morphism, then we
see that $\varphi$ factors through $\mathbf{M}_{\alpha^{\prime}}(M)$ for some $\alpha^{\prime}<\alpha$ by Proposition 19.11.4. By construction of $\mathbf{M}(-)$ we see that $\varphi$ extends to a morphism from $U$ into $\mathbf{M}_{\alpha^{\prime}+1}(M)$ and hence into $\mathbf{M}_{\alpha}(M)$. By Lemma 19.11 .5 we conclude that $\mathbf{M}_{\alpha}(M)$ is injective.

### 19.12. K-injectives in Grothendieck categories

079 I The material in this section is taken from the paper Ser03] authored by Serpé. This paper generalizes some of the results of Spa88 by Spaltenstein to general Grothendieck abelian categories. Our Lemma 19.12 .3 is only implicit in the paper by Serpé. Our approach is to mimic Grothendieck's proof of Theorem 19.11.6.
079J Lemma 19.12.1. Let $\mathcal{A}$ be a Grothendieck abelian category with generator $U$. Let $c$ be the function on cardinals defined by $c(\kappa)=\left|\bigoplus_{\alpha \in \kappa} U\right|$. If $\pi: M \rightarrow N$ is a surjection then there exists a subobject $M^{\prime} \subset M$ which surjects onto $N$ with $\left|N^{\prime}\right| \leq c(|N|)$.

Proof. For every proper subobject $N^{\prime} \subset N$ choose a morphism $\varphi_{N^{\prime}}: U \rightarrow M$ such that $U \rightarrow M \rightarrow N$ does not factor through $N^{\prime}$. Set

$$
N^{\prime}=\operatorname{Im}\left(\bigoplus_{N^{\prime} \subset N} \varphi_{N^{\prime}}: \bigoplus_{N^{\prime} \subset N} U \longrightarrow M\right)
$$

Then $N^{\prime}$ works.
079K Lemma 19.12.2. Let $\mathcal{A}$ be a Grothendieck abelian category. There exists a cardinal $\kappa$ such that given any acyclic complex $M^{\bullet}$ we have
(1) if $M^{\bullet}$ is nonzero, there is a nonzero subcomplex $N^{\bullet}$ which is bounded above, acyclic, and $\left|N^{n}\right| \leq \kappa$,
(2) there exists a surjection of complexes

$$
\bigoplus_{i \in I} M_{i}^{\bullet} \longrightarrow M^{\bullet}
$$

where $M_{i}^{\bullet}$ is bounded above, acyclic, and $\left|M_{i}^{n}\right| \leq \kappa$.
Proof. Choose a generator $U$ of $\mathcal{A}$. Denote $c$ the function of Lemma 19.12.1. Set $\kappa=\sup \left\{c^{n}(|U|), n=1,2,3, \ldots\right\}$. Let $n \in \mathbf{Z}$ and let $\psi: U \rightarrow M^{n}$ be a morphism. In order to prove (1) and (2) it suffices to prove there exists a subcomplex $N^{\bullet} \subset M^{\bullet}$ which is bounded above, acyclic, and $\left|N^{m}\right| \leq \kappa$, such that $\psi$ factors through $N^{n}$. To do this set $N^{n}=\operatorname{Im}(\psi), N^{n+1}=\operatorname{Im}\left(U \rightarrow M^{n} \rightarrow M^{n+1}\right)$, and $N^{m}=0$ for $m \geq n+2$. Suppose we have constructed $N^{m} \subset M^{m}$ for all $m \geq k$ such that
(1) $\mathrm{d}\left(N^{m}\right) \subset N^{m+1}, m \geq k$,
(2) $\operatorname{Im}\left(N^{m-1} \rightarrow N^{m}\right)=\operatorname{Ker}\left(N^{m} \rightarrow N^{m+1}\right)$ for all $m \geq k+1$, and
(3) $\left|N^{m}\right| \leq c^{\max \{n-m, 0\}}(|U|)$.
for some $k \leq n$. Because $M^{\bullet}$ is acyclic, we see that the subobject $\mathrm{d}^{-1}\left(\operatorname{Ker}\left(N^{k} \rightarrow\right.\right.$ $\left.\left.N^{k+1}\right)\right) \subset \bar{M}^{k-1}$ surjects onto $\operatorname{Ker}\left(N^{k} \rightarrow N^{k+1}\right)$. Thus we can choose $N^{k-1} \subset$ $M^{k-1}$ surjecting onto $\operatorname{Ker}\left(N^{k} \rightarrow N^{k+1}\right)$ with $\left|N^{k-1}\right| \leq c^{n-k+1}(|U|)$ by Lemma 19.12.1. The proof is finished by induction on $k$.

079L Lemma 19.12.3. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $\kappa$ be a cardinal as in Lemma 19.12.2. Suppose that $I^{\bullet}$ is a complex such that
(1) each $I^{j}$ is injective, and
(2) for every bounded above acyclic complex $M^{\bullet}$ such that $\left|M^{n}\right| \leq \kappa$ we have $\operatorname{Hom}_{K(\mathcal{A})}\left(M^{\bullet}, I^{\bullet}\right)=0$.
Then $I^{\bullet}$ is an $K$-injective complex.

Proof. Let $M^{\bullet}$ be an acyclic complex. We are going to construct by induction on the ordinal $\alpha$ an acyclic subcomplex $K_{\alpha}^{\bullet} \subset M^{\bullet}$ as follows. For $\alpha=0$ we set $N_{0}^{\bullet}=0$. For $\alpha>0$ we proceed as follows:
(1) If $\alpha=\beta+1$ and $K_{\beta}^{\bullet}=M^{\bullet}$ then we choose $K_{\alpha}^{\bullet}=K_{\beta}^{\bullet}$.
(2) If $\alpha=\beta+1$ and $K_{\beta}^{\bullet} \neq M^{\bullet}$ then $M^{\bullet} / K_{\beta}^{\bullet}$ is a nonzero acyclic complex. We choose a subcomplex $N_{\alpha}^{\bullet} \subset M^{\bullet} / K_{\beta}^{\bullet}$ as in Lemma 19.12.2. Finally, we let $K_{\alpha}^{\bullet} \subset M^{\bullet}$ be the inverse image of $N_{\alpha}^{\bullet}$.
(3) If $\alpha$ is a limit ordinal we set $N_{\beta}^{\bullet}=\operatorname{colim} N_{\alpha}^{\bullet}$.

It is clear that $M^{\bullet}=K_{\alpha}^{\bullet}$ for a suitably large ordinal $\alpha$. We will prove that

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(K_{\alpha}^{\bullet}, I^{\bullet}\right)
$$

is zero by transfinite induction on $\alpha$. It holds for $\alpha=0$ since $K_{0}^{\bullet}$ is zero. Suppose it holds for $\beta$ and $\alpha=\beta+1$. In case (1) of the list above the result is clear. In case (2) there is a short exact sequence of complexes

$$
0 \rightarrow K_{\beta}^{\bullet} \rightarrow K_{\alpha}^{\bullet} \rightarrow N_{\alpha}^{\bullet} \rightarrow 0
$$

Since each component of $I^{\bullet}$ is injective we see that we obtain an exact sequence

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(K_{\beta}^{\bullet}, I^{\bullet}\right) \rightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(K_{\alpha}^{\bullet}, I^{\bullet}\right) \rightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(N_{\alpha}^{\bullet}, I^{\bullet}\right)
$$

By induction the term on the left is zero and by assumption on $I^{\bullet}$ the term on the right is zero. Thus the middle group is zero too. Finally, suppose that $\alpha$ is a limit ordinal. Then we see that

$$
\operatorname{Hom}^{\bullet}\left(K_{\alpha}^{\bullet}, I^{\bullet}\right)=\lim _{\beta<\alpha} \operatorname{Hom}^{\bullet}\left(K_{\beta}^{\bullet}, I^{\bullet}\right)
$$

with notation as in More on Algebra, Section 15.59 . These complexes compute morphisms in $K(\mathcal{A})$ by More on Algebra, Equation 15.59.0.1). Note that the transition maps in the system are surjective because $I^{j}$ is surjective for each $j$. Moreover, for a limit ordinal $\alpha$ we have equality of limit and value (see displayed formula above). Thus we may apply Homology, Lemma 12.27 .8 to conclude.

079M Lemma 19.12.4. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $\left(K_{i}^{\bullet}\right)_{i \in I}$ be a set of acyclic complexes. There exists a functor $M^{\bullet} \mapsto \mathbf{M}^{\bullet}\left(M^{\bullet}\right)$ and a natural transformation $j_{M} \bullet: M^{\bullet} \rightarrow \mathbf{M}^{\bullet}\left(M^{\bullet}\right)$ such
(1) $j_{M} \cdot$ is a (termwise) injective quasi-isomorphism, and
(2) for every $i \in I$ and $w: K_{i}^{\bullet} \rightarrow M^{\bullet}$ the morphism $j_{M} \bullet \circ w$ is homotopic to zero.

Proof. For every $i \in I$ choose a (termwise) injective map of complexes $K_{i}^{\bullet} \rightarrow L_{i}^{\bullet}$ which is homotopic to zero with $L_{i}^{\bullet}$ quasi-isomorphic to zero. For example, take $L_{i}^{\bullet}$ to be the cone on the identity of $K_{i}^{\bullet}$. We define $\mathbf{M}^{\bullet}\left(M^{\bullet}\right)$ by the following pushout diagram

Then $M^{\bullet} \rightarrow \mathbf{M}^{\bullet}\left(M^{\bullet}\right)$ is a functor. The right vertical arrow defines the functorial injective map $j_{M} \cdot$. The cokernel of $j_{M} \bullet$ is isomorphic to the direct sum of the cokernels of the maps $K_{i}^{\bullet} \rightarrow L_{i}^{\bullet}$ hence acyclic. Thus $j_{M} \bullet$ is a quasi-isomorphism. Part (2) holds by construction.

079N Lemma 19.12.5. Let $\mathcal{A}$ be a Grothendieck abelian category. There exists a functor $M^{\bullet} \mapsto \mathbf{N}^{\bullet}\left(M^{\bullet}\right)$ and a natural transformation $j_{M^{\bullet}}: M^{\bullet} \rightarrow \mathbf{N}^{\bullet}\left(M^{\bullet}\right)$ such
(1) $j_{M} \bullet$ is a (termwise) injective quasi-isomorphism, and
(2) for every $n \in \mathbf{Z}$ the map $M^{n} \rightarrow \mathbf{N}^{n}\left(M^{\bullet}\right)$ factors through a subobject $I^{n} \subset \mathbf{N}^{n}\left(M^{\bullet}\right)$ where $I^{n}$ is an injective object of $\mathcal{A}$.

Proof. Choose a functorial injective embeddings $i_{M}: M \rightarrow I(M)$, see Theorem 19.11.6 For every complex $M^{\bullet}$ denote $J^{\bullet}\left(M^{\bullet}\right)$ the complex with terms $J^{n}\left(M^{\bullet}\right)=$ $I\left(M^{n}\right) \oplus I\left(M^{n+1}\right)$ and differential

$$
d_{J \bullet(M \bullet)}=\left(\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right)
$$

There exists a canonical injective map of complexes $u_{M} \bullet: M^{\bullet} \rightarrow J^{\bullet}\left(M^{\bullet}\right)$ by mapping $M^{n}$ to $I\left(M^{n}\right) \oplus I\left(M^{n+1}\right)$ via the maps $i_{M^{n}}: M^{n} \rightarrow I\left(M^{n}\right)$ and $i_{M^{n+1}} \circ d$ : $M^{n} \rightarrow M^{n+1} \rightarrow I\left(M^{n+1}\right)$. Hence a short exact sequence of complexes

$$
0 \rightarrow M^{\bullet} \xrightarrow{u_{M} \bullet} J^{\bullet}\left(M^{\bullet}\right) \xrightarrow{v_{M} \bullet} Q^{\bullet}\left(M^{\bullet}\right) \rightarrow 0
$$

functorial in $M^{\bullet}$. Set

$$
\mathbf{N}^{\bullet}\left(M^{\bullet}\right)=C\left(v_{M} \bullet\right)^{\bullet}[-1] .
$$

Note that

$$
\mathbf{N}^{n}\left(M^{\bullet}\right)=Q^{n-1}\left(M^{\bullet}\right) \oplus J^{n}\left(M^{\bullet}\right)
$$

with differential

$$
\left(\begin{array}{cc}
-d_{Q}^{n-1} & -v_{M}^{n}{ }_{Q}^{\bullet}(M \bullet) \\
0 & d_{J \bullet(M)}^{n}
\end{array}\right)
$$

Hence we see that there is a map of complexes $j_{M} \bullet: M^{\bullet} \rightarrow \mathbf{N}^{\bullet}\left(M^{\bullet}\right)$ induced by $u$. It is injective and factors through an injective subobject by construction. The map $j_{M}$ • is a quasi-isomorphism as one can prove by looking at the long exact sequence of cohomology associated to the short exact sequences of complexes above.

079P Theorem 19.12.6. Let $\mathcal{A}$ be a Grothendieck abelian category. For every complex $M^{\bullet}$ there exists a quasi-isomorphism $M^{\bullet} \rightarrow I^{\bullet}$ such that $M^{n} \rightarrow I^{n}$ is injective and $I^{n}$ is an injective object of $\mathcal{A}$ for all $n$ and $I^{\bullet}$ is a $K$-injective complex. Moreover, the construction is functorial in $M^{\bullet}$.

Proof. Please compare with the proof of Theorem 19.2 .8 and Theorem 19.11.6. Choose a cardinal $\kappa$ as in Lemmas 19.12.2 and 19.12.3. Choose a set $\left(K_{i}^{\bullet}\right)_{i \in I}$ of bounded above, acyclic complexes such that every bounded above acyclic complex $K^{\bullet}$ such that $\left|K^{n}\right| \leq \kappa$ is isomorphic to $K_{i}^{\bullet}$ for some $i \in I$. This is possible by Lemma 19.11.3. Denote $\mathbf{M}^{\bullet}(-)$ the functor constructed in Lemma 19.12.4. Denote $\mathbf{N}^{\bullet}(-)$ the functor constructed in Lemma 19.12 .5 . Both of these functors come with injective transformations id $\rightarrow \mathbf{M}$ and id $\rightarrow \mathbf{N}$.

By transfinite induction we define a sequence of functors $\mathbf{T}_{\alpha}(-)$ and corresponding transformations id $\rightarrow \mathbf{T}_{\alpha}$. Namely we set $\mathbf{T}_{0}\left(M^{\bullet}\right)=M^{\bullet}$. If $\mathbf{T}_{\alpha}$ is given then we set

$$
\mathbf{T}_{\alpha+1}\left(M^{\bullet}\right)=\mathbf{N}^{\bullet}\left(\mathbf{M}^{\bullet}\left(\mathbf{T}_{\alpha}\left(M^{\bullet}\right)\right)\right)
$$

If $\beta$ is a limit ordinal we set

$$
\mathbf{T}_{\beta}\left(M^{\bullet}\right)=\operatorname{colim}_{\alpha<\beta} \mathbf{T}_{\alpha}\left(M^{\bullet}\right)
$$

The transition maps of the system are injective quasi-isomorphisms. By AB5 we see that the colimit is still quasi-isomorphic to $M^{\bullet}$. We claim that $M^{\bullet} \rightarrow \mathbf{T}_{\alpha}\left(M^{\bullet}\right)$ does the job if the cofinality of $\alpha$ is larger than $\max (\kappa,|U|)$ where $U$ is a generator of $\mathcal{A}$. Namely, it suffices to check conditions (1) and (2) of Lemma 19.12.3.
For (1) we use the criterion of Lemma 19.11.5. Suppose that $M \subset U$ and $\varphi: M \rightarrow$ $\mathbf{T}_{\alpha}^{n}\left(M^{\bullet}\right)$ is a morphism for some $n \in \mathbf{Z}$. By Proposition 19.11 .4 we see that $\varphi$ factor through $\mathbf{T}_{\alpha^{\prime}}^{n}\left(M^{\bullet}\right)$ for some $\alpha^{\prime}<\alpha$. In particular, by the construction of the functor $\mathbf{N}^{\bullet}(-)$ we see that $\varphi$ factors through an injective object of $\mathcal{A}$ which shows that $\varphi$ lifts to a morphism on $U$.

For (2) let $w: K^{\bullet} \rightarrow \mathbf{T}_{\alpha}\left(M^{\bullet}\right)$ be a morphism of complexes where $K^{\bullet}$ is a bounded above acyclic complex such that $\left|K^{n}\right| \leq \kappa$. Then $K^{\bullet} \cong K_{i}^{\bullet}$ for some $i \in I$. Moreover, by Proposition 19.11.4 once again we see that $w$ factor through $\mathbf{T}_{\alpha^{\prime}}^{n}\left(M^{\bullet}\right)$ for some $\alpha^{\prime}<\alpha$. In particular, by the construction of the functor $\mathbf{M}^{\bullet}(-)$ we see that $w$ is homotopic to zero. This finishes the proof.

### 19.13. Additional remarks on Grothendieck abelian categories

07D6 In this section we put some results on Grothendieck abelian categories which are folklore.

07D7 Lemma 19.13.1. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $F: \mathcal{A}^{\text {opp }} \rightarrow$ Sets be a functor. Then $F$ is representable if and only if $F$ commutes with colimits, i.e.,

$$
F\left(\operatorname{colim}_{i} N_{i}\right)=\lim F\left(N_{i}\right)
$$

for any diagram $\mathcal{I} \rightarrow \mathcal{A}, i \in \mathcal{I}$.
Proof. If $F$ is representable, then it commutes with colimits by definition of colimits.

Assume that $F$ commutes with colimits. Then $F(M \oplus N)=F(M) \prod F(N)$ and we can use this to define a group structure on $F(M)$. Hence we get $F: \mathcal{A} \rightarrow A b$ which is additive and right exact, i.e., transforms a short exact sequence $0 \rightarrow K \rightarrow$ $L \rightarrow M \rightarrow 0$ into an exact sequence $F(K) \leftarrow F(L) \leftarrow F(M) \leftarrow 0$ (compare with Homology, Section 12.7.

Let $U$ be a generator for $\mathcal{A}$. Set $A=\bigoplus_{s \in F(U)} U$. Let $s_{\text {univ }}=(s)_{s \in F(U)} \in F(A)=$ $\prod_{s \in F(U)} F(U)$. Let $A^{\prime} \subset A$ be the largest subobject such that $s_{u n i v}$ restricts to zero on $A^{\prime}$. This exists because $\mathcal{A}$ is a Grothendieck category and because $F$ commutes with colimits. Because $F$ commutes with colimits there exists a unique element $\bar{s}_{\text {univ }} \in F\left(A / A^{\prime}\right)$ which maps to $s_{\text {univ }}$ in $F(A)$. We claim that $A / A^{\prime}$ represents $F$, in other words, the Yoneda map

$$
\bar{s}_{\text {univ }}: h_{A / A^{\prime}} \longrightarrow F
$$

is an isomorphism. Let $M \in \operatorname{Ob}(\mathcal{A})$ and $s \in F(M)$. Consider the surjection

$$
c_{M}: A_{M}=\bigoplus_{\varphi \in \operatorname{Hom}_{\mathcal{A}}(U, M)} U \longrightarrow M
$$

This gives $F\left(c_{M}\right)(s)=\left(s_{\varphi}\right) \in \prod_{\varphi} F(U)$. Consider the map

$$
\psi: A_{M}=\bigoplus_{\varphi \in \operatorname{Hom}_{\mathcal{A}}(U, M)} U \longrightarrow \bigoplus_{s \in F(U)} U=A
$$

which maps the summand corresponding to $\varphi$ to the summand corresponding to $s_{\varphi}$ by the identity map on $U$. Then $s_{\text {univ }}$ maps to $\left(s_{\varphi}\right)_{\varphi}$ by construction. in other words the right square in the diagram

commutes. Let $K=\operatorname{Ker}\left(A_{M} \rightarrow M\right)$. Since $s$ restricts to zero on $K$ we see that $\psi(K) \subset A^{\prime}$ by definition of $A^{\prime}$. Hence there is an induced morphism $M \rightarrow$ $A / A^{\prime}$. This construction gives an inverse to the map $h_{A / A^{\prime}}(M) \rightarrow F(M)$ (details omitted).

07D8 Lemma 19.13.2. A Grothendieck abelian category has Ab3*.
Proof. Let $M_{i}, i \in I$ be a family of objects of $\mathcal{A}$ indexed by a set $I$. The functor $F=\prod_{i \in I} h_{M_{i}}$ commutes with colimits. Hence Lemma 19.13.1 applies.

079Q Remark 19.13.3. In the chapter on derived categories we consistently work with "small" abelian categories (as is the convention in the Stacks project). For a "big" abelian category $\mathcal{A}$ it isn't clear that the derived category $D(\mathcal{A})$ exists because it isn't clear that morphisms in the derived category are sets. In general this isn't true, see Examples, Lemma 88.52.1. However, if $\mathcal{A}$ is a Grothendieck abelian category, and given $K^{\bullet}, L^{\bullet}$ in $K(\mathcal{A})$, then by Theorem 19.12 .6 there exists a quasiisomorphism $L^{\bullet} \rightarrow I^{\bullet}$ to a K-injective complex $I^{\bullet}$ and Derived Categories, Lemma 13.29.2 shows that

$$
\operatorname{Hom}_{D(\mathcal{A})}\left(K^{\bullet}, L^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)
$$

which is a set. Some examples of Grothendieck abelian categories are the category of modules over a ring, or more generally the category of sheaves of modules on a ringed site.

07D9 Lemma 19.13.4. Let $\mathcal{A}$ be a Grothendieck abelian category. Then
(1) $D(\mathcal{A})$ has both direct sums and products,
(2) direct sums are obtained by taking termwise direct sums of any complexes,
(3) products are obtained by taking termwise products of $K$-injective complexes.

Proof. Let $K_{i}^{\bullet}, i \in I$ be a family of objects of $D(\mathcal{A})$ indexed by a set $I$. We claim that the termwise direct sum $\bigoplus_{i \in I} K_{i}^{\bullet}$ is a direct sum in $D(\mathcal{A})$. Namely, let $I^{\bullet}$ be a K-injective complex. Then we have

$$
\begin{aligned}
\operatorname{Hom}_{D(\mathcal{A})}\left(\bigoplus_{i \in I} K_{i}^{\bullet}, I^{\bullet}\right) & =\operatorname{Hom}_{K(\mathcal{A})}\left(\bigoplus_{i \in I} K_{i}^{\bullet}, I^{\bullet}\right) \\
& =\prod_{i \in I} \operatorname{Hom}_{K(\mathcal{A})}\left(K_{i}^{\bullet}, I^{\bullet}\right) \\
& =\prod_{i \in I} \operatorname{Hom}_{D(\mathcal{A})}\left(K_{i}^{\bullet}, I^{\bullet}\right)
\end{aligned}
$$

as desired. This is sufficient since any complex can be represented by a K-injective complex by Theorem 19.12.6. To construct the product, choose a K-injective resolution $K_{i}^{\bullet} \rightarrow I_{i}^{\bullet}$ for each $i$. Then we claim that $\prod_{i \in I} I_{i}^{\bullet}$ is a product in $D(\mathcal{A})$. This follows from Derived Categories, Lemma 13.29.5.

07DA Remark 19.13.5. Let $R$ be a ring. Suppose that $M_{n}, n \in \mathbf{Z}$ are $R$-modules. Denote $E_{n}=M_{n}[-n] \in D(R)$. We claim that $E=\bigoplus M_{n}[-n]$ is both the direct sum and the product of the objects $E_{n}$ in $D(R)$. To see that it is the direct sum, take a look at the proof of Lemma 19.13.4. To see that it is the direct product, take injective resolutions $M_{n} \rightarrow I_{n}^{\bullet}$. By the proof of Lemma 19.13.4 we have

$$
\prod E_{n}=\prod I_{n}^{\bullet}[-n]
$$

in $D(R)$. Since products in $\operatorname{Mod}_{R}$ are exact, we see that $\prod I_{n}^{\bullet}$ is quasi-isomorphic to $E$. This works more generally in $D(\mathcal{A})$ where $\mathcal{A}$ is a Grothendieck abelian category with Ab 4 *.

08U1 Lemma 19.13.6. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor of abelian categories. Assume
(1) $\mathcal{A}$ is a Grothendieck abelian category,
(2) $\mathcal{B}$ has exact countable products, and
(3) $F$ commutes with countable products.

Then $R F: D(\mathcal{A}) \rightarrow D(\mathcal{B})$ commutes with derived limits.
Proof. Observe that $R F$ exists as $\mathcal{A}$ has enough K-injectives (Theorem 19.12 .6 and Derived Categories, Lemma 13.29.6). The statement means that if $K=R \lim K_{n}$, then $R F(K)=R \lim R F\left(K_{n}\right)$. See Derived Categories, Definition 13.32 .1 for notation. Since $R F$ is an exact functor of triangulated categories it suffices to see that $R F$ commutes with countable products of objects of $D(\mathcal{A})$. In the proof of Lemma 19.13 .4 we have seen that products in $D(\mathcal{A})$ are computed by taking products of K-injective complexes and moreover that a product of K-injective complexes is K-injective. Moreover, in Derived Categories, Lemma 13.32 .2 we have seen that products in $D(\mathcal{B})$ are computed by taking termwise products. Since $R F$ is computed by applying $F$ to a K-injective representative and since we've assumed $F$ commutes with countable products, the lemma follows.

The following lemma is some kind of generalization of the existence of CartanEilenberg resolutions (Derived Categories, Section 13.21).

0BKI Lemma 19.13.7. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $K^{\bullet}$ be a filtered complex of $\mathcal{A}$, see Homology, Definition 12.21.1. Then there exists a morphism $j: K^{\bullet} \rightarrow J^{\bullet}$ of filtered complexes of $\mathcal{A}$ such that
(1) $J^{n}, F^{p} J^{n}, J^{n} / F^{p} J^{n}$ and $F^{p} J^{n} / F^{p^{\prime}} J^{n}$ are injective objects of $\mathcal{A}$,
(2) $J^{\bullet}, F^{p} J^{\bullet}, J^{\bullet} / F^{p} J^{\bullet}$, and $F^{p} J^{\bullet} / F^{p^{\prime}} J^{\bullet}$ are $K$-injective complexes,
(3) $j$ induces quasi-isomorphisms $K^{\bullet} \rightarrow J^{\bullet}, F^{p} K^{\bullet} \rightarrow F^{p} J^{\bullet}, K^{\bullet} / F^{p} K^{\bullet} \rightarrow$ $J^{\bullet} / F^{p} J^{\bullet}$, and $F^{p} K^{\bullet} / F^{p^{\prime}} K^{\bullet} \rightarrow F^{p} J^{\bullet} / F^{p^{\prime}} J^{\bullet}$.

Proof. By Theorem 19.12 .6 we obtain quasi-isomorphisms $i: K^{\bullet} \rightarrow I^{\bullet}$ and $i^{p}$ : $F^{p} K^{\bullet} \rightarrow I^{p, \bullet}$ as well as commutative diagrams

such that $\alpha^{p} \circ \alpha^{p^{\prime} p}=\alpha^{p^{\prime}}$ and $\alpha^{p^{\prime} p^{\prime \prime}} \circ \alpha^{p p^{\prime}}=\alpha^{p p^{\prime \prime}}$. The problem is that the maps $\alpha^{P}: I^{p, \bullet} \rightarrow I^{\bullet}$ need not be injective. For each $p$ we choose an injection $t^{p}: I^{p, \bullet} \rightarrow$
$J^{p, \bullet}$ into an acyclic K-injective complex $J^{p, \bullet}$ whose terms are injective objects of $\mathcal{A}$ (first map to the cone on the identity and then use the theorem). Choose a map of complexes $s^{p}: I^{\bullet} \rightarrow J^{p, \bullet}$ such that the following diagram commutes

This is possible: the composition $F^{p} K^{\bullet} \rightarrow J^{p, \bullet}$ is homotopic to zero because $J^{p, \bullet}$ is acyclic and K-injective (Derived Categories, Lemma 13.29.2. Since the objects $J^{p, n-1}$ are injective and since $F^{p} K^{n} \rightarrow K^{n} \rightarrow I^{n}$ are injective morphisms, we can lift the maps $F^{p} K^{n} \rightarrow J^{p, n-1}$ giving the homotopy to a map $h^{n}: I^{n} \rightarrow J^{p, n-1}$. Then we set $s^{p}$ equal to $h \circ \mathrm{~d}+\mathrm{d} \circ h$. (Warning: It will not be the case that $t^{p}=s^{p} \circ \alpha^{p}$, so we have to be careful not to use this below.)
Consider

$$
J^{\bullet}=I^{\bullet} \times \prod_{p} J^{p, \bullet}
$$

Because products in $D(\mathcal{A})$ are given by taking products of K-injective complexes (Lemma 19.13.4) and since $J^{p, \bullet}$ is isomorphic to 0 in $D(\mathcal{A})$ we see that $J^{\bullet} \rightarrow I^{\bullet}$ is an isomorphism in $D(\mathcal{A})$. Consider the map

$$
j=i \times\left(s^{p} \circ i\right)_{p \in \mathbf{Z}}: K^{\bullet} \longrightarrow I^{\bullet} \times \prod_{p} J^{p, \bullet}=J^{\bullet}
$$

By our remarks above this is a quasi-isomorphism. It is also injective. For $p \in \mathbf{Z}$ we let $F^{p} J^{\bullet} \subset J^{\bullet}$ be

$$
\operatorname{Im}\left(\alpha^{p} \times\left(t^{p^{\prime}} \circ \alpha^{p p^{\prime}}\right)_{p^{\prime} \leq p}: I^{p, \bullet} \rightarrow I^{\bullet} \times \prod_{p^{\prime} \leq p} J^{p^{\prime}, \bullet}\right) \times \prod_{p^{\prime}>p} J^{p^{\prime}, \bullet}
$$

This complex is isomorphic to the complex $I^{p, \bullet} \times \prod_{p^{\prime}>p} J^{p, \bullet}$ as $\alpha^{p p}=$ id and $t^{p}$ is injective. Hence $F^{p} J^{\bullet}$ is quasi-isomorphic to $I^{p, \bullet}$ (argue as above). We have $j\left(F^{p} K^{\bullet}\right) \subset F^{p} J^{\bullet}$ because of the commutativity of the diagram above. The corresponding map of complexes $F^{p} K^{\bullet} \rightarrow F^{p} J^{\bullet}$ is a quasi-isomorphism by what we just said. Finally, to see that $F^{p+1} J^{\bullet} \subset F^{p} J^{\bullet}$ use that $\alpha^{p+1 p} \circ \alpha^{p p^{\prime}}=\alpha^{p+1 p^{\prime}}$ and the commutativity of the first displayed diagram in the first paragraph of the proof.

We claim that $j: K^{\bullet} \rightarrow J^{\bullet}$ is a solution to the problem posed by the lemma. Namely, $F^{p} J^{n}$ is an injective object of $\mathcal{A}$ because it is isomorphic to $I^{p, n} \times \prod_{p^{\prime}>p} J^{p^{\prime}, n}$ and products of injectives are injective. Then the injective map $F^{p} J^{n} \rightarrow J^{n}$ splits and hence the quotient $J^{n} / F^{p} J^{n}$ is injective as well as a direct summand of the injective object $J^{n}$. Similarly for $F^{p} J^{n} / F^{p^{\prime}} J^{n}$. This in particular means that $0 \rightarrow F^{p} J^{\bullet} \rightarrow J^{\bullet} \rightarrow J^{\bullet} / F^{p} J^{\bullet} \rightarrow 0$ is a termwise split short exact sequence of complexes, hence defines a distinguished triangle in $K(\mathcal{A})$ by fiat. Since $J^{\bullet}$ and $F^{p} J^{\bullet}$ are K-injective complexes we see that the same is true for $J^{\bullet} / F^{p} J^{\bullet}$ by Derived Categories, Lemma 13.29 .3 . A similar argument shows that $F^{p} J^{\bullet} / F^{p^{\prime}} J^{\bullet}$ is K-injective. By construction $j: K^{\bullet} \rightarrow J^{\bullet}$ and the induced maps $F^{p} K^{\bullet} \rightarrow F^{p} J^{\bullet}$ are quasi-isomorphisms. Using the long exact cohomology sequences of the complexes
in play we find that the same holds for $K^{\bullet} / F^{p} K^{\bullet} \rightarrow J^{\bullet} / F^{p} J^{\bullet}$ and $F^{p} K^{\bullet} / F^{p^{\prime}} K^{\bullet} \rightarrow$ $F^{p} J^{\bullet} / F^{p^{\prime}} J^{\bullet}$.

## CHAPTER 20

## Cohomology of Sheaves

01DW

### 20.1. Introduction

01DX In this document we work out some topics on cohomology of sheaves on topological spaces. We mostly work in the generality of modules over a sheaf of rings and we work with morphisms of ringed spaces. To see what happens for sheaves on sites take a look at the chapter Cohomology on Sites, Section 21.1. Basic references are God73 and Ive86.

### 20.2. Topics

01DY Here are some topics that should be discussed in this chapter, and have not yet been written.
(1) Ext-groups.
(2) Ext sheaves.
(3) Tor functors.
(4) Derived pullback for morphisms between ringed spaces.
(5) Cup-product.
(6) Etc, etc, etc.

### 20.3. Cohomology of sheaves

01DZ Let $X$ be a topological space. Let $\mathcal{F}$ be a abelian sheaf. We know that the category of abelian sheaves on $X$ has enough injectives, see Injectives, Lemma 19.4.1 Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^{\bullet}$. As is customary we define

$$
\begin{equation*}
H^{i}(X, \mathcal{F})=H^{i}\left(\Gamma\left(X, \mathcal{I}^{\bullet}\right)\right) \tag{20.3.0.1}
\end{equation*}
$$

to be the ith cohomology group of the abelian sheaf $\mathcal{F}$. The family of functors $H^{i}((X,-)$ forms a universal $\delta$-functor from $A b(X) \rightarrow A b$.
Let $f: X \rightarrow Y$ be a continuous map of topological spaces. With $\mathcal{F}[0] \rightarrow \mathcal{I}^{\bullet}$ as above we define

0713 (20.3.0.2)

$$
R^{i} f_{*} \mathcal{F}=H^{i}\left(f_{*} \mathcal{I}^{\bullet}\right)
$$

to be the $i$ th higher direct image of $\mathcal{F}$. The family of functors $R^{i} f_{*}$ forms a universal $\delta$-functor from $A b(X) \rightarrow A b(Y)$.

Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. We know that the category of $\mathcal{O}_{X}$-modules on $X$ has enough injectives, see Injectives, Lemma 19.5.1. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^{\bullet}$. As is customary we define
0714
(20.3.0.3)

$$
H^{i}(X, \mathcal{F})=H^{i}\left(\Gamma\left(X, \mathcal{I}^{\bullet}\right)\right)
$$

to be the ith cohomology group of $\mathcal{F}$. The family of functors $H^{i}((X,-)$ forms a universal $\delta$-functor from $\operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}_{\mathcal{O}_{X}(X)}$.
Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. With $\mathcal{F}[0] \rightarrow \mathcal{I} \bullet$ as above we define

$$
\begin{equation*}
R^{i} f_{*} \mathcal{F}=H^{i}\left(f_{*} \mathcal{I}^{\bullet}\right) \tag{20.3.0.4}
\end{equation*}
$$

to be the $i$ th higher direct image of $\mathcal{F}$. The family of functors $R^{i} f_{*}$ forms a universal $\delta$-functor from $\operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$.

### 20.4. Derived functors

0716 We briefly explain an approach to right derived functors using resolution functors. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The category $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is abelian, see Modules, Lemma 17.3.1. In this chapter we will write

$$
K(X)=K\left(\mathcal{O}_{X}\right)=K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right) \quad \text { and } \quad D(X)=D\left(\mathcal{O}_{X}\right)=D\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right)
$$

and similarly for the bounded versions for the triangulated categories introduced in Derived Categories, Definition 13.8.1 and Definition 13.11.3. By Derived Categories, Remark 13.24 .3 there exists a resolution functor

$$
j=j_{X}: K^{+}\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right) \longrightarrow K^{+}(\mathcal{I})
$$

where $\mathcal{I}$ is the strictly full additive subcategory of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ consisting of injective sheaves. For any left exact functor $F: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \mathcal{B}$ into any abelian category $\mathcal{B}$ we will denote $R F$ the right derived functor described in Derived Categories, Section 13.20 and constructed using the resolution functor $j_{X}$ just described:

$$
\begin{equation*}
R F=F \circ j_{X}^{\prime}: D^{+}(X) \longrightarrow D^{+}(\mathcal{B}) \tag{20.4.0.5}
\end{equation*}
$$

see Derived Categories, Lemma 13.25 .1 for notation. Note that we may think of $R F$ as defined on $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$, $\operatorname{Comp}^{+}\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right), K^{+}(X)$, or $D^{+}(X)$ depending on the situation. According to Derived Categories, Definition 13.17 .2 we obtain the $i$ th right derived functor
05U4

$$
\begin{equation*}
R^{i} F=H^{i} \circ R F: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \mathcal{B} \tag{20.4.0.6}
\end{equation*}
$$

so that $R^{0} F=F$ and $\left\{R^{i} F, \delta\right\}_{i \geq 0}$ is universal $\delta$-functor, see Derived Categories, Lemma 13.20.4.
Here are two special cases of this construction. Given a ring $R$ we write $K(R)=$ $K\left(\operatorname{Mod}_{R}\right)$ and $D(R)=D\left(\operatorname{Mod}_{R}\right)$ and similarly for bounded versions. For any open $U \subset X$ we have a left exact functor $\Gamma(U,-): \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}_{\mathcal{O}_{X}(U)}$ which gives rise to

$$
\begin{equation*}
R \Gamma(U,-): D^{+}(X) \longrightarrow D^{+}\left(\mathcal{O}_{X}(U)\right) \tag{20.4.0.7}
\end{equation*}
$$

by the discussion above. We set $H^{i}(U,-)=R^{i} \Gamma(U,-)$. If $U=X$ we recover 20.3.0.3. If $f: X \rightarrow Y$ is a morphism of ringed spaces, then we have the left exact functor $f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{Y}\right)$ which gives rise to the derived pushforward
0718

$$
\begin{equation*}
R f_{*}: D^{+}(X) \longrightarrow D^{+}(Y) \tag{20.4.0.8}
\end{equation*}
$$

The $i$ th cohomology sheaf of $R f_{*} \mathcal{F}^{\bullet}$ is denoted $R^{i} f_{*} \mathcal{F}^{\bullet}$ and called the $i$ th higher direct image in accordance with 20.3.0.4. The two displayed functors above are exact functor of derived categories.

Abuse of notation: When the functor $R f_{*}$, or any other derived functor, is applied to a sheaf $\mathcal{F}$ on $X$ or a complex of sheaves it is understood that $\mathcal{F}$ has been replaced by a suitable resolution of $\mathcal{F}$. To facilitate this kind of operation we will say, given an object $\mathcal{F}^{\bullet} \in D(X)$, that a bounded below complex $\mathcal{I}^{\bullet}$ of injectives of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ represents $\mathcal{F}^{\bullet}$ in the derived category if there exists a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$. In the same vein the phrase "let $\alpha: \mathcal{F}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ be a morphism of $D(X)$ " does not mean that $\alpha$ is represented by a morphism of complexes. If we have an actual morphism of complexes we will say so.

### 20.5. First cohomology and torsors

02FN
02FO Definition 20.5.1. Let $X$ be a topological space. Let $\mathcal{G}$ be a sheaf of (possibly non-commutative) groups on $X$. A torsor, or more precisely a $\mathcal{G}$-torsor, is a sheaf of sets $\mathcal{F}$ on $X$ endowed with an action $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$ such that
(1) whenever $\mathcal{F}(U)$ is nonempty the action $\mathcal{G}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ is simply transitive, and
(2) for every $x \in X$ the stalk $\mathcal{F}_{x}$ is nonempty.

A morphism of $\mathcal{G}$-torsors $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is simply a morphism of sheaves of sets compatible with the $\mathcal{G}$-actions. The trivial $\mathcal{G}$-torsor is the sheaf $\mathcal{G}$ endowed with the obvious left $\mathcal{G}$-action.

It is clear that a morphism of torsors is automatically an isomorphism.
02FP Lemma 20.5.2. Let $X$ be a topological space. Let $\mathcal{G}$ be a sheaf of (possibly noncommutative) groups on $X . A \mathcal{G}$-torsor $\mathcal{F}$ is trivial if and only if $\mathcal{F}(X) \neq \emptyset$.

Proof. Omitted.
02FQ Lemma 20.5.3. Let $X$ be a topological space. Let $\mathcal{H}$ be an abelian sheaf on $X$. There is a canonical bijection between the set of isomorphism classes of $\mathcal{H}$-torsors and $H^{1}(X, \mathcal{H})$.

Proof. Let $\mathcal{F}$ be a $\mathcal{H}$-torsor. Consider the free abelian sheaf $\mathbf{Z}[\mathcal{F}]$ on $\mathcal{F}$. It is the sheafification of the rule which associates to $U \subset X$ open the collection of finite formal sums $\sum n_{i}\left[s_{i}\right]$ with $n_{i} \in \mathbf{Z}$ and $s_{i} \in \mathcal{F}(U)$. There is a natural map

$$
\sigma: \mathbf{Z}[\mathcal{F}] \longrightarrow \underline{\mathbf{Z}}
$$

which to a local section $\sum n_{i}\left[s_{i}\right]$ associates $\sum n_{i}$. The kernel of $\sigma$ is generated by the local section of the form $[s]-\left[s^{\prime}\right]$. There is a canonical map $a: \operatorname{Ker}(\sigma) \rightarrow \mathcal{H}$ which maps $[s]-\left[s^{\prime}\right] \mapsto h$ where $h$ is the local section of $\mathcal{H}$ such that $h \cdot s=s^{\prime}$. Consider the pushout diagram

Here $\mathcal{E}$ is the extension obtained by pushout. From the long exact cohomology sequence associated to the lower short exact sequence we obtain an element $\xi=$ $\xi_{\mathcal{F}} \in H^{1}(X, \mathcal{H})$ by applying the boundary operator to $1 \in H^{0}(X, \underline{\mathbf{Z}})$.

Conversely, given $\xi \in H^{1}(X, \mathcal{H})$ we can associate to $\xi$ a torsor as follows. Choose an embedding $\mathcal{H} \rightarrow \mathcal{I}$ of $\mathcal{H}$ into an injective abelian sheaf $\mathcal{I}$. We set $\mathcal{Q}=\mathcal{I} / \mathcal{H}$ so that we have a short exact sequence

$$
0 \longrightarrow \mathcal{H} \longrightarrow \mathcal{I} \longrightarrow \mathcal{Q} \longrightarrow 0
$$

The element $\xi$ is the image of a global section $q \in H^{0}(X, \mathcal{Q})$ because $H^{1}(X, \mathcal{I})=0$ (see Derived Categories, Lemma 13.20.4). Let $\mathcal{F} \subset \mathcal{I}$ be the subsheaf (of sets) of sections that map to $q$ in the sheaf $\mathcal{Q}$. It is easy to verify that $\mathcal{F}$ is a torsor.

We omit the verification that the two constructions given above are mutually inverse.

### 20.6. First cohomology and extensions

0B39
0B3A Lemma 20.6.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. There is a canonical bijection

$$
\operatorname{Ext}_{\operatorname{Mod}\left(\mathcal{O}_{X}\right)}^{1}\left(\mathcal{O}_{X}, \mathcal{F}\right) \longrightarrow H^{1}(X, \mathcal{F})
$$

which associates to the extension

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

the image of $1 \in \Gamma\left(X, \mathcal{O}_{X}\right)$ in $H^{1}(\mathcal{C}, \mathcal{F})$.
Proof. Let us construct the inverse of the map given in the lemma. Let $\xi \in$ $H^{1}(X, \mathcal{F})$. Choose an injection $\mathcal{F} \subset \mathcal{I}$ with $\mathcal{I}$ injective in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Set $\mathcal{Q}=\mathcal{I} / \mathcal{F}$. By the long exact sequence of cohomology, we see that $\xi$ is the image of of a section $\tilde{\xi} \in \Gamma(X, \mathcal{Q})=\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{O}_{X}, \mathcal{Q}\right)$. Now, we just form the pullback

see Homology, Section 12.6

### 20.7. First cohomology and invertible sheaves

09NT The Picard group of a ringed space is defined in Modules, Section 17.21
09 NU Lemma 20.7.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. There is a canonical isomorphism

$$
H^{1}\left(X, \mathcal{O}_{X}^{*}\right)=\operatorname{Pic}(X)
$$

of abelian groups.
Proof. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Consider the presheaf $\mathcal{L}^{*}$ defined by the rule

$$
U \longmapsto\left\{s \in \mathcal{L}(U) \text { such that } \mathcal{O}_{U} \xrightarrow{s \cdot-} \mathcal{L}_{U} \text { is an isomorphism }\right\}
$$

This presheaf satisfies the sheaf condition. Moreover, if $f \in \mathcal{O}_{X}^{*}(U)$ and $s \in \mathcal{L}^{*}(U)$, then clearly $f s \in \mathcal{L}^{*}(U)$. By the same token, if $s, s^{\prime} \in \mathcal{L}^{*}(U)$ then there exists a unique $f \in \mathcal{O}_{X}^{*}(U)$ such that $f s=s^{\prime}$. Moreover, the sheaf $\mathcal{L}^{*}$ has sections locally
by Modules, Lemma 17.21 .4 . In other words we see that $\mathcal{L}^{*}$ is a $\mathcal{O}_{X}^{*}$-torsor. Thus we get a map

$$
\begin{aligned}
& \text { invertible sheaves on }\left(X, \mathcal{O}_{X}\right) \\
& \quad \text { up to isomorphism }
\end{aligned} \begin{gathered}
\mathcal{O}_{X}^{*} \text {-torsors } \\
\text { up to isomorphism }
\end{gathered}
$$

We omit the verification that this is a homomorphism of abelian groups. By Lemma 20.5 .3 the right hand side is canonically bijective to $H^{1}\left(X, \mathcal{O}_{X}^{*}\right)$. Thus we have to show this map is injective and surjective.
Injective. If the torsor $\mathcal{L}^{*}$ is trivial, this means by Lemma 20.5.2 that $\mathcal{L}^{*}$ has a global section. Hence this means exactly that $\mathcal{L} \cong \mathcal{O}_{X}$ is the neutral element in $\operatorname{Pic}(X)$.
Surjective. Let $\mathcal{F}$ be an $\mathcal{O}_{X}^{*}$-torsor. Consider the presheaf of sets

$$
\mathcal{L}_{1}: U \longmapsto\left(\mathcal{F}(U) \times \mathcal{O}_{X}(U)\right) / \mathcal{O}_{X}^{*}(U)
$$

where the action of $f \in \mathcal{O}_{X}^{*}(U)$ on $(s, g)$ is $\left(f s, f^{-1} g\right)$. Then $\mathcal{L}_{1}$ is a presheaf of $\mathcal{O}_{X}$-modules by setting $(s, g)+\left(s^{\prime}, g^{\prime}\right)=\left(s, g+\left(s^{\prime} / s\right) g^{\prime}\right)$ where $s^{\prime} / s$ is the local section $f$ of $\mathcal{O}_{X}^{*}$ such that $f s=s^{\prime}$, and $h(s, g)=(s, h g)$ for $h$ a local section of $\mathcal{O}_{X}$. We omit the verification that the sheafification $\mathcal{L}=\mathcal{L}_{1}^{\#}$ is an invertible $\mathcal{O}_{X}$-module whose associated $\mathcal{O}_{X}^{*}$-torsor $\mathcal{L}^{*}$ is isomorphic to $\mathcal{F}$.

### 20.8. Locality of cohomology

01E0 The following lemma says there is no ambiguity in defining the cohomology of a sheaf $\mathcal{F}$ over an open.
01E1 Lemma 20.8.1. Let $X$ be a ringed space. Let $U \subset X$ be an open subspace.
(1) If $\mathcal{I}$ is an injective $\mathcal{O}_{X}$-module then $\left.\mathcal{I}\right|_{U}$ is an injective $\mathcal{O}_{U}$-module.
(2) For any sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we have $H^{p}(U, \mathcal{F})=H^{p}\left(U,\left.\mathcal{F}\right|_{U}\right)$.

Proof. Denote $j: U \rightarrow X$ the open immersion. Recall that the functor $j^{-1}$ of restriction to $U$ is a right adjoint to the functor $j$ ! of extension by 0 , see Sheaves, Lemma 6.31.8. Moreover, $j$ ! is exact. Hence (1) follows from Homology, Lemma 12.25 .1

By definition $H^{p}(U, \mathcal{F})=H^{p}\left(\Gamma\left(U, \mathcal{I}^{\bullet}\right)\right)$ where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. By the above we see that $\left.\left.\mathcal{F}\right|_{U} \rightarrow \mathcal{I} \bullet\right|_{U}$ is an injective resolution in $\operatorname{Mod}\left(\mathcal{O}_{U}\right)$. Hence $H^{p}\left(U,\left.\mathcal{F}\right|_{U}\right)$ is equal to $H^{p}\left(\Gamma\left(U,\left.\mathcal{I}^{\bullet}\right|_{U}\right)\right)$. Of course $\Gamma(U, \mathcal{F})=$ $\Gamma\left(U,\left.\mathcal{F}\right|_{U}\right)$ for any sheaf $\mathcal{F}$ on $X$. Hence the equality in (2).
Let $X$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $U \subset V \subset X$ be open subsets. Then there is a canonical restriction mapping

01E2

$$
\begin{equation*}
H^{n}(V, \mathcal{F}) \longrightarrow H^{n}(U, \mathcal{F}),\left.\quad \xi \longmapsto \xi\right|_{U} \tag{20.8.1.1}
\end{equation*}
$$

functorial in $\mathcal{F}$. Namely, choose any injective resolution $\mathcal{F} \rightarrow \mathcal{I}$. The restriction mappings of the sheaves $\mathcal{I}^{p}$ give a morphism of complexes

$$
\Gamma\left(V, \mathcal{I}^{\bullet}\right) \longrightarrow \Gamma\left(U, \mathcal{I}^{\bullet}\right)
$$

The LHS is a complex representing $R \Gamma(V, \mathcal{F})$ and the RHS is a complex representing $R \Gamma(U, \mathcal{F})$. We get the map on cohomology groups by applying the functor $H^{n}$. As indicated we will use the notation $\left.\xi \mapsto \xi\right|_{U}$ to denote this map. Thus the rule $U \mapsto H^{n}(U, \mathcal{F})$ is a presheaf of $\mathcal{O}_{X}$-modules. This presheaf is customarily denoted $\underline{H}^{n}(\mathcal{F})$. We will give another interpretation of this presheaf in Lemma 20.12.4.

01E3 Lemma 20.8.2. Let $X$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $U \subset X$ be an open subspace. Let $n>0$ and let $\xi \in H^{n}(U, \mathcal{F})$. Then there exists an open covering $U=\bigcup_{i \in I} U_{i}$ such that $\left.\xi\right|_{U_{i}}=0$ for all $i \in I$.

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Then

$$
H^{n}(U, \mathcal{F})=\frac{\operatorname{Ker}\left(\mathcal{I}^{n}(U) \rightarrow \mathcal{I}^{n+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^{n}(U)\right)}
$$

Pick an element $\tilde{\xi} \in \mathcal{I}^{n}(U)$ representing the cohomology class in the presentation above. Since $\mathcal{I}^{\bullet}$ is an injective resolution of $\mathcal{F}$ and $n>0$ we see that the complex $\mathcal{I}^{\bullet}$ is exact in degree $n$. Hence $\operatorname{Im}\left(\mathcal{I}^{n-1} \rightarrow \mathcal{I}^{n}\right)=\operatorname{Ker}\left(\mathcal{I}^{n} \rightarrow \mathcal{I}^{n+1}\right)$ as sheaves. Since $\tilde{\xi}$ is a section of the kernel sheaf over $U$ we conclude there exists an open covering $U=\bigcup_{i \in I} U_{i}$ such that $\left.\tilde{\xi}\right|_{U_{i}}$ is the image under $d$ of a section $\xi_{i} \in \mathcal{I}^{n-1}\left(U_{i}\right)$. By our definition of the restriction $\left.\xi\right|_{U_{i}}$ as corresponding to the class of $\left.\tilde{\xi}\right|_{U_{i}}$ we conclude.

01E4 Lemma 20.8.3. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}$ be $a$ $\mathcal{O}_{X}$-module. The sheaves $R^{i} f_{*} \mathcal{F}$ are the sheaves associated to the presheaves

$$
V \longmapsto H^{i}\left(f^{-1}(V), \mathcal{F}\right)
$$

with restriction mappings as in Equation 20.8.1.1). There is a similar statement for $R^{i} f_{*}$ applied to a bounded below complex $\mathcal{F}^{\bullet}$.

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Then $R^{i} f_{*} \mathcal{F}$ is by definition the $i$ th cohomology sheaf of the complex

$$
f_{*} \mathcal{I}^{0} \rightarrow f_{*} \mathcal{I}^{1} \rightarrow f_{*} \mathcal{I}^{2} \rightarrow \ldots
$$

By definition of the abelian category structure on $\mathcal{O}_{Y^{-}}$-modules this cohomology sheaf is the sheaf associated to the presheaf

$$
V \longmapsto \frac{\operatorname{Ker}\left(f_{*} \mathcal{I}^{i}(V) \rightarrow f_{*} \mathcal{I}^{i+1}(V)\right)}{\operatorname{Im}\left(f_{*} \mathcal{I}^{i-1}(V) \rightarrow f_{*} \mathcal{I}^{i}(V)\right)}
$$

and this is obviously equal to

$$
\frac{\operatorname{Ker}\left(\mathcal{I}^{i}\left(f^{-1}(V)\right) \rightarrow \mathcal{I}^{i+1}\left(f^{-1}(V)\right)\right)}{\operatorname{Im}\left(\mathcal{I}^{i-1}\left(f^{-1}(V)\right) \rightarrow \mathcal{I}^{i}\left(f^{-1}(V)\right)\right)}
$$

which is equal to $H^{i}\left(f^{-1}(V), \mathcal{F}\right)$ and we win.
01E5 Lemma 20.8.4. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}$ be an $\mathcal{O}_{X^{-}}$ module. Let $V \subset Y$ be an open subspace. Denote $g: f^{-1}(V) \rightarrow V$ the restriction of $f$. Then we have

$$
R^{p} g_{*}\left(\left.\mathcal{F}\right|_{f-1}(V)\right)=\left.\left(R^{p} f_{*} \mathcal{F}\right)\right|_{V}
$$

There is a similar statement for the derived image $R f_{*} \mathcal{F}^{\bullet}$ where $\mathcal{F}^{\bullet}$ is a bounded below complex of $\mathcal{O}_{X}$-modules.

Proof. First proof. Apply Lemmas 20.8.3 and 20.8.1 to see the displayed equality. Second proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ and use that $\left.\mathcal{F}\right|_{f^{-1}(V)} \rightarrow$ $\left.\mathcal{I}^{\bullet}\right|_{f^{-1}(V)}$ is an injective resolution also.

03BA Remark 20.8.5. Here is a different approach to the proofs of Lemmas 20.8.2 and 20.8 .3 above. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $i_{X}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{PMod}\left(\mathcal{O}_{X}\right)$ be the inclusion functor and let \# be the sheafification functor. Recall that $i_{X}$ is left exact and \# is exact.
(1) First prove Lemma 20.12 .4 below which says that the right derived functors of $i_{X}$ are given by $R^{p} i_{X} \mathcal{F}=\underline{H}^{p}(\mathcal{F})$. Here is another proof: The equality is clear for $p=0$. Both $\left(R^{p} i_{X}\right)_{p \geq 0}$ and $\left(\underline{H}^{p}\right)_{p \geq 0}$ are delta functors vanishing on injectives, hence both are universal, hence they are isomorphic. See Homology, Section 12.11
(2) A restatement of Lemma 20.8.2 is that $\left(\underline{H}^{p}(\mathcal{F})\right)^{\#}=0, p>0$ for any sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$. To see this is true, use that $\#$ is exact so

$$
\left(\underline{H}^{p}(\mathcal{F})\right)^{\#}=\left(R^{p} i_{X} \mathcal{F}\right)^{\#}=R^{p}\left(\# \circ i_{X}\right)(\mathcal{F})=0
$$

because $\# \circ i_{X}$ is the identity functor.
(3) Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. The presheaf $V \mapsto H^{p}\left(f^{-1} V, \mathcal{F}\right)$ is equal to $R^{p}\left(i_{Y} \circ f_{*}\right) \mathcal{F}$. You can prove this by noticing that both give universal delta functors as in the argument of (1) above. Hence Lemma 20.8.3 says that $R^{p} f_{*} \mathcal{F}=\left(R^{p}\left(i_{Y} \circ f_{*}\right) \mathcal{F}\right)^{\#}$. Again using that $\#$ is exact a that $\# \circ i_{Y}$ is the identity functor we see that

$$
R^{p} f_{*} \mathcal{F}=R^{p}\left(\# \circ i_{Y} \circ f_{*}\right) \mathcal{F}=\left(R^{p}\left(i_{Y} \circ f_{*}\right) \mathcal{F}\right)^{\#}
$$

as desired.

### 20.9. Mayer-Vietoris

01E9 Below will construct the Čech-to-cohomology spectral sequence, see Lemma 20.12 .5 . A special case of that spectral sequence is the Mayer-Vietoris long exact sequence. Since it is such a basic, useful and easy to understand variant of the spectral sequence we treat it here separately.

01EA Lemma 20.9.1. Let $X$ be a ringed space. Let $U^{\prime} \subset U \subset X$ be open subspaces. For any injective $\mathcal{O}_{X}$-module $\mathcal{I}$ the restriction mapping $\mathcal{I}(U) \rightarrow \mathcal{I}\left(U^{\prime}\right)$ is surjective.

Proof. Let $j: U \rightarrow X$ and $j^{\prime}: U^{\prime} \rightarrow X$ be the open immersions. Recall that $j!\mathcal{O}_{U}$ is the extension by zero of $\mathcal{O}_{U}=\left.\mathcal{O}_{X}\right|_{U}$, see Sheaves, Section 6.31. Since $j$ ! is a left adjoint to restriction we see that for any sheaf $\mathcal{F}$ of $\mathcal{O}_{X}$-modules

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(j_{!} \mathcal{O}_{U}, \mathcal{F}\right)=\operatorname{Hom}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U},\left.\mathcal{F}\right|_{U}\right)=\mathcal{F}(U)
$$

see Sheaves, Lemma 6.31.8. Similarly, the sheaf $j_{!}^{\prime} \mathcal{O}_{U^{\prime}}$ represents the functor $\mathcal{F} \mapsto$ $\mathcal{F}\left(U^{\prime}\right)$. Moreover there is an obvious canonical map of $\mathcal{O}_{X}$-modules

$$
j_{!}^{\prime} \mathcal{O}_{U^{\prime}} \longrightarrow j_{!} \mathcal{O}_{U}
$$

which corresponds to the restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}\left(U^{\prime}\right)$ via Yoneda's lemma (Categories, Lemma 4.3.5). By the description of the stalks of the sheaves $j_{!}^{\prime} \mathcal{O}_{U^{\prime}}$, $j_{!} \mathcal{O}_{U}$ we see that the displayed map above is injective (see lemma cited above). Hence if $\mathcal{I}$ is an injective $\mathcal{O}_{X}$-module, then the map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(j_{!} \mathcal{O}_{U}, \mathcal{I}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{X}}\left(j_{!}^{\prime} \mathcal{O}_{U^{\prime}}, \mathcal{I}\right)
$$

is surjective, see Homology, Lemma 12.23.2. Putting everything together we obtain the lemma.

01EB Lemma 20.9.2 (Mayer-Vietoris). Let $X$ be a ringed space. Suppose that $X=$ $U \cup V$ is a union of two open subsets. For every $\mathcal{O}_{X}$-module $\mathcal{F}$ there exists a long exact cohomology sequence

$$
0 \rightarrow H^{0}(X, \mathcal{F}) \rightarrow H^{0}(U, \mathcal{F}) \oplus H^{0}(V, \mathcal{F}) \rightarrow H^{0}(U \cap V, \mathcal{F}) \rightarrow H^{1}(X, \mathcal{F}) \rightarrow \ldots
$$

This long exact sequence is functorial in $\mathcal{F}$.
Proof. The sheaf condition says that the kernel of $(1,-1): \mathcal{F}(U) \oplus \mathcal{F}(V) \rightarrow$ $\mathcal{F}(U \cap V)$ is equal to the image of $\mathcal{F}(X)$ by the first map for any abelian sheaf $\mathcal{F}$. Lemma 20.9.1 above implies that the map $(1,-1): \mathcal{I}(U) \oplus \mathcal{I}(V) \rightarrow \mathcal{I}(U \cap V)$ is surjective whenever $\mathcal{I}$ is an injective $\mathcal{O}_{X}$-module. Hence if $\mathcal{F} \rightarrow \mathcal{I} \bullet$ is an injective resolution of $\mathcal{F}$, then we get a short exact sequence of complexes

$$
0 \rightarrow \mathcal{I}^{\bullet}(X) \rightarrow \mathcal{I}^{\bullet}(U) \oplus \mathcal{I}^{\bullet}(V) \rightarrow \mathcal{I}^{\bullet}(U \cap V) \rightarrow 0
$$

Taking cohomology gives the result (use Homology, Lemma 12.12.12). We omit the proof of the functoriality of the sequence.

01EC Lemma 20.9.3 (Relative Mayer-Vietoris). Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Suppose that $X=U \cup V$ is a union of two open subsets. Denote $a=\left.f\right|_{U}: U \rightarrow Y, b=\left.f\right|_{V}: V \rightarrow Y$, and $c=\left.f\right|_{U \cap V}: U \cap V \rightarrow Y$. For every $\mathcal{O}_{X}$-module $\mathcal{F}$ there exists a long exact sequence

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow a_{*}\left(\left.\mathcal{F}\right|_{U}\right) \oplus b_{*}\left(\left.\mathcal{F}\right|_{V}\right) \rightarrow c_{*}\left(\left.\mathcal{F}\right|_{U \cap V}\right) \rightarrow R^{1} f_{*} \mathcal{F} \rightarrow \ldots
$$

This long exact sequence is functorial in $\mathcal{F}$.
Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution of $\mathcal{F}$. We claim that we get a short exact sequence of complexes

$$
\left.\left.\left.0 \rightarrow f_{*} \mathcal{I}^{\bullet} \rightarrow a_{*} \mathcal{I}^{\bullet}\right|_{U} \oplus b_{*} \mathcal{I}^{\bullet}\right|_{V} \rightarrow c_{*} \mathcal{I}^{\bullet}\right|_{U \cap V} \rightarrow 0
$$

Namely, for any open $W \subset Y$, and for any $n \geq 0$ the corresponding sequence of groups of sections over $W$
$0 \rightarrow \mathcal{I}^{n}\left(f^{-1}(W)\right) \rightarrow \mathcal{I}^{n}\left(U \cap f^{-1}(W)\right) \oplus \mathcal{I}^{n}\left(V \cap f^{-1}(W)\right) \rightarrow \mathcal{I}^{n}\left(U \cap V \cap f^{-1}(W)\right) \rightarrow 0$
was shown to be short exact in the proof of Lemma 20.9.2. The lemma follows by taking cohomology sheaves and using the fact that $\left.\mathcal{I}^{\bullet}\right|_{U}$ is an injective resolution of $\left.\mathcal{F}\right|_{U}$ and similarly for $\left.\mathcal{I}^{\bullet}\right|_{V},\left.\mathcal{I}^{\bullet}\right|_{U \cap V}$ see Lemma 20.8.1

### 20.10. The Čech complex and Čech cohomology

01 ED Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering, see Topology, Basic notion (13). As is customary we denote $U_{i_{0} \ldots i_{p}}=U_{i_{0}} \cap \ldots \cap U_{i_{p}}$ for the $(p+1)$-fold intersection of members of $\mathcal{U}$. Let $\mathcal{F}$ be an abelian presheaf on $X$. Set

$$
\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})=\prod_{\left(i_{0}, \ldots, i_{p}\right) \in I^{p+1}} \mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right) .
$$

This is an abelian group. For $s \in \breve{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ we denote $s_{i_{0} \ldots i_{p}}$ its value in $\mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)$. Note that if $s \in \breve{\mathcal{C}}^{1}(\mathcal{U}, \mathcal{F})$ and $i, j \in I$ then $s_{i j}$ and $s_{j i}$ are both elements of $\mathcal{F}\left(U_{i} \cap U_{j}\right)$ but there is no imposed relation between $s_{i j}$ and $s_{j i}$. In other words, we are not working with alternating cochains (these will be defined in Section 20.24). We define

$$
d: \check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{p+1}(\mathcal{U}, \mathcal{F})
$$

by the formula
01EE (20.10.0.1)

$$
d(s)_{i_{0} \ldots i_{p+1}}=\left.\sum_{j=0}^{p+1}(-1)^{j} s_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}\right|_{U_{i_{0} \ldots i_{p+1}}}
$$

It is straightforward to see that $d \circ d=0$. In other words $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ is a complex.
01EF Definition 20.10.1. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Let $\mathcal{F}$ be an abelian presheaf on $X$. The complex $\mathcal{C} \bullet(\mathcal{U}, \mathcal{F})$ is the $\check{C}$ ech complex associated to $\mathcal{F}$ and the open covering $\mathcal{U}$. Its cohomology groups $H^{i}(\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F}))$ are called the C ech cohomology groups associated to $\mathcal{F}$ and the covering $\mathcal{U}$. They are denoted $\check{H}^{i}(\mathcal{U}, \mathcal{F})$.
01 EG Lemma 20.10.2. Let $X$ be a topological space. Let $\mathcal{F}$ be an abelian presheaf on $X$. The following are equivalent
(1) $\mathcal{F}$ is an abelian sheaf and
(2) for every open covering $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ the natural map

$$
\mathcal{F}(U) \rightarrow \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

is bijective.
Proof. This is true since the sheaf condition is exactly that $\mathcal{F}(U) \rightarrow \check{H}^{0}(\mathcal{U}, \mathcal{F})$ is bijective for every open covering.

### 20.11. Čech cohomology as a functor on presheaves

01 EH Warning: In this section we work almost exclusively with presheaves and categories of presheaves and the results are completely wrong in the setting of sheaves and categories of sheaves!
Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{X}$-modules. We have the Čech complex $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ of $\mathcal{F}$ just by thinking of $\mathcal{F}$ as a presheaf of abelian groups. However, each term $\breve{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ has a natural structure of a $\mathcal{O}_{X}(U)$-module and the differential is given by $\mathcal{O}_{X}(U)$-module maps. Moreover, it is clear that the construction

$$
\mathcal{F} \longmapsto \check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})
$$

is functorial in $\mathcal{F}$. In fact, it is a functor
01EI (20.11.0.1)

$$
\check{\mathcal{C}} \bullet(\mathcal{U},-): \operatorname{PMod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Comp}^{+}\left(\operatorname{Mod}_{\mathcal{O}_{X}(U)}\right)
$$

see Derived Categories, Definition 13.8.1 for notation. Recall that the category of bounded below complexes in an abelian category is an abelian category, see Homology, Lemma 12.12.9.
01EJ Lemma 20.11.1. The functor given by Equation 20.11.0.1 is an exact functor (see Homology, Lemma 12.7.1).
Proof. For any open $W \subset U$ the functor $\mathcal{F} \mapsto \mathcal{F}(W)$ is an additive exact functor from $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$ to $\operatorname{Mod}_{\mathcal{O}_{X}(U)}$. The terms $\breve{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ of the complex are products of these exact functors and hence exact. Moreover a sequence of complexes is exact if and only if the sequence of terms in a given degree is exact. Hence the lemma follows.

01EK Lemma 20.11.2. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. The functors $\mathcal{F} \mapsto \check{H}^{n}(\mathcal{U}, \mathcal{F})$ form a $\delta$-functor from the abelian category of presheaves of $\mathcal{O}_{X}$-modules to the category of $\mathcal{O}_{X}(U)$-modules (see Homology, Definition 12.11.1.

Proof. By Lemma 20.11.1 a short exact sequence of presheaves of $\mathcal{O}_{X}$-modules $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is turned into a short exact sequence of complexes of $\mathcal{O}_{X}(U)$-modules. Hence we can use Homology, Lemma 12.12 .12 to get the boundary maps $\delta_{\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}}: \check{H}^{n}\left(\mathcal{U}, \mathcal{F}_{3}\right) \rightarrow \check{H}^{n+1}\left(\mathcal{U}, \mathcal{F}_{1}\right)$ and a corresponding long exact sequence. We omit the verification that these maps are compatible with maps between short exact sequences of presheaves.

In the formulation of the following lemma we use the functor $j_{p!}$ of extension by 0 for presheaves of modules relative to an open immersion $j: U \rightarrow X$. See Sheaves, Section 6.31. For any open $W \subset X$ and any presheaf $\mathcal{G}$ of $\left.\mathcal{O}_{X}\right|_{U}$-modules we have

$$
\left(j_{p!} \mathcal{G}\right)(W)=\left\{\begin{array}{cc}
\mathcal{G}(W) & \text { if } W \subset U \\
0 & \text { else }
\end{array}\right.
$$

Moreover, the functor $j_{p!}$ is a left adjoint to the restriction functor see Sheaves, Lemma 6.31.8. In particular we have the following formula

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(j_{p!} \mathcal{O}_{U}, \mathcal{F}\right)=\operatorname{Hom}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U},\left.\mathcal{F}\right|_{U}\right)=\mathcal{F}(U)
$$

Since the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ is an exact functor on the category of presheaves we conclude that the presheaf $j_{p!} \mathcal{O}_{U}$ is a projective object in the category $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$, see Homology, Lemma 12.24 .2 .
Note that if we are given open subsets $U \subset V \subset X$ with associated open immersions $j_{U}, j_{V}$, then we have a canonical map $\left(j_{U}\right)_{p!} \mathcal{O}_{U} \rightarrow\left(j_{V}\right)_{p!} \mathcal{O}_{V}$. It is the identity on sections over any open $W \subset U$ and 0 else. In terms of the identification $\operatorname{Hom}_{\mathcal{O}_{X}}\left(\left(j_{U}\right)_{p!} \mathcal{O}_{U},\left(j_{V}\right)_{p!} \mathcal{O}_{V}\right)=\left(j_{V}\right)_{p!} \mathcal{O}_{V}(U)=\mathcal{O}_{V}(U)$ it corresponds to the element $1 \in \mathcal{O}_{V}(U)$.

01EL Lemma 20.11.3. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. Denote $j_{i_{0} \ldots i_{p}}: U_{i_{0} \ldots i_{p}} \rightarrow X$ the open immersion. Consider the chain complex $K(\mathcal{U})$. of presheaves of $\mathcal{O}_{X}$-modules

$$
\ldots \rightarrow \bigoplus_{i_{0} i_{1} i_{2}}\left(j_{i_{0} i_{1} i_{2}}\right)_{p!} \mathcal{O}_{U_{i_{0} i_{1} i_{2}}} \rightarrow \bigoplus_{i_{0} i_{1}}\left(j_{i_{0} i_{1}}\right)_{p!} \mathcal{O}_{U_{i_{0} i_{1}}} \rightarrow \bigoplus_{i_{0}}\left(j_{i_{0}}\right)_{p!} \mathcal{O}_{U_{i_{0}}} \rightarrow 0 \rightarrow \ldots
$$

where the last nonzero term is placed in degree 0 and where the map

$$
\left(j_{i_{0} \ldots i_{p+1}}\right)_{p!} \mathcal{O}_{U_{i_{0} \ldots i_{p+1}}} \longrightarrow\left(j_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}\right)_{p!} \mathcal{O}_{U_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}}
$$

is given by $(-1)^{j}$ times the canonical map. Then there is an isomorphism

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(K(\mathcal{U})_{\bullet}, \mathcal{F}\right)=\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})
$$

functorial in $\mathcal{F} \in \operatorname{Ob}\left(\operatorname{PMod}\left(\mathcal{O}_{X}\right)\right)$.
Proof. We saw in the discussion just above the lemma that

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\left(j_{i_{0} \ldots i_{p}}\right)_{p!} \mathcal{O}_{U_{i_{0} \ldots i_{p}}}, \mathcal{F}\right)=\mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)
$$

Hence we see that it is indeed the case that the direct sum

$$
\bigoplus_{i_{0} \ldots i_{p}}\left(j_{i_{0} \ldots i_{p}}\right)_{p!} \mathcal{O}_{U_{i_{0} \ldots i_{p}}}
$$

represents the functor

$$
\mathcal{F} \longmapsto \prod_{i_{0} \ldots i_{p}} \mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right) .
$$

Hence by Categories, Yoneda Lemma 4.3.5 we see that there is a complex $K(\mathcal{U})$. with terms as given. It is a simple matter to see that the maps are as given in the lemma.

01EM Lemma 20.11.4. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. Let $\mathcal{O}_{\mathcal{U}} \subset \mathcal{O}_{X}$ be the image presheaf of the map $\bigoplus j_{p!} \mathcal{O}_{U_{i}} \rightarrow \mathcal{O}_{X}$. The chain complex $K(\mathcal{U})$. of presheaves of Lemma 20.11 .3 above has homology presheaves

$$
H_{i}(K(\mathcal{U}) \bullet)=\left\{\begin{array}{ccc}
0 & \text { if } & i \neq 0 \\
\mathcal{O}_{\mathcal{U}} & \text { if } & i=0
\end{array}\right.
$$

Proof. Consider the extended complex $K_{\bullet}^{\text {ext }}$ one gets by putting $\mathcal{O}_{\mathcal{U}}$ in degree -1 with the obvious map $K(\mathcal{U})_{0}=\bigoplus_{i_{0}}\left(j_{i_{0}}\right)_{p!} \mathcal{O}_{U_{i_{0}}} \rightarrow \mathcal{O}_{\mathcal{U}}$. It suffices to show that taking sections of this extended complex over any open $W \subset X$ leads to an acyclic complex. In fact, we claim that for every $W \subset X$ the complex $K_{\bullet}^{e x t}(W)$ is homotopy equivalent to the zero complex. Write $I=I_{1} \amalg I_{2}$ where $W \subset U_{i}$ if and only if $i \in I_{1}$.

If $I_{1}=\emptyset$, then the complex $K_{\bullet}^{e x t}(W)=0$ so there is nothing to prove.
If $I_{1} \neq \emptyset$, then $\mathcal{O}_{\mathcal{U}}(W)=\mathcal{O}_{X}(W)$ and

$$
K_{p}^{e x t}(W)=\bigoplus_{i_{0} \ldots i_{p} \in I_{1}} \mathcal{O}_{X}(W)
$$

This is true because of the simple description of the presheaves $\left(j_{i_{0} \ldots i_{p}}\right)_{p!} \mathcal{O}_{U_{i_{0} \ldots i_{p}}}$. Moreover, the differential of the complex $K_{\bullet}^{e x t}(W)$ is given by

$$
d(s)_{i_{0} \ldots i_{p}}=\sum_{j=0, \ldots, p+1} \sum_{i \in I_{1}}(-1)^{j} s_{i_{0} \ldots i_{j-1} i i_{j} \ldots i_{p}}
$$

The sum is finite as the element $s$ has finite support. Fix an element $i_{\mathrm{fix}} \in I_{1}$. Define a map

$$
h: K_{p}^{e x t}(W) \longrightarrow K_{p+1}^{e x t}(W)
$$

by the rule

$$
h(s)_{i_{0} \ldots i_{p+1}}=\left\{\begin{array}{ccc}
0 & \text { if } & i_{0} \neq i \\
s_{i_{1} \ldots i_{p+1}} & \text { if } & i_{0}=i_{\text {fix }}
\end{array}\right.
$$

We will use the shorthand $h(s)_{i_{0} \ldots i_{p+1}}=\left(i_{0}=i_{\text {fix }}\right) s_{i_{1} \ldots i_{p}}$ for this. Then we compute

$$
\begin{aligned}
& (d h+h d)(s)_{i_{0} \ldots i_{p}} \\
= & \sum_{j} \sum_{i \in I_{1}}(-1)^{j} h(s)_{i_{0} \ldots i_{j-1} i i_{j} \ldots i_{p}}+\left(i=i_{0}\right) d(s)_{i_{1} \ldots i_{p}} \\
= & s_{i_{0} \ldots i_{p}}+\sum_{j \geq 1} \sum_{i \in I_{1}}(-1)^{j}\left(i_{0}=i_{\text {fix }}\right) s_{i_{1} \ldots i_{j-1} i i_{j} \ldots i_{p}}+\left(i_{0}=i_{\text {fix }}\right) d(s)_{i_{1} \ldots i_{p}}
\end{aligned}
$$

which is equal to $s_{i_{0} \ldots i_{p}}$ as desired.
01EN Lemma 20.11.5. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering of $U \subset X$. The Čech cohomology functors $\check{H}^{p}(\mathcal{U},-)$ are canonically isomorphic as a $\delta$-functor to the right derived functors of the functor

$$
\check{H}^{0}(\mathcal{U},-): \operatorname{PMod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}_{\mathcal{O}_{X}(U)}
$$

Moreover, there is a functorial quasi-isomorphism

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow R \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

where the right hand side indicates the right derived functor

$$
R \check{H}^{0}(\mathcal{U},-): D^{+}\left(\operatorname{PMod}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D^{+}\left(\mathcal{O}_{X}(U)\right)
$$

of the left exact functor $\check{H}^{0}(\mathcal{U},-)$.
Proof. Note that the category of presheaves of $\mathcal{O}_{X}$-modules has enough injectives, see Injectives, Proposition 19.8.5 Note that $\check{H}^{0}(\mathcal{U},-)$ is a left exact functor from the category of presheaves of $\mathcal{O}_{X}$-modules to the category of $\mathcal{O}_{X}(U)$-modules. Hence the derived functor and the right derived functor exist, see Derived Categories, Section 13.20 .

Let $\mathcal{I}$ be a injective presheaf of $\mathcal{O}_{X}$-modules. In this case the functor $\operatorname{Hom}_{\mathcal{O}_{X}}(-, \mathcal{I})$ is exact on $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$. By Lemma 20.11.3 we have

$$
\operatorname{Hom}_{\mathcal{O}_{X}}(K(\mathcal{U}) \bullet, \mathcal{I})=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I})
$$

By Lemma 20.11.4 we have that $K(\mathcal{U})$ • is quasi-isomorphic to $\mathcal{O}_{\mathcal{U}}[0]$. Hence by the exactness of Hom into $\mathcal{I}$ mentioned above we see that $\breve{H}^{i}(\mathcal{U}, \mathcal{I})=0$ for all $i>0$. Thus the $\delta$-functor $\left(\check{H}^{n}, \delta\right)$ (see Lemma 20.11.2) satisfies the assumptions of Homology, Lemma 12.11.4, and hence is a universal $\delta$-functor.

By Derived Categories, Lemma 13.20 .4 also the sequence $R^{i} \check{H}^{0}(\mathcal{U},-)$ forms a universal $\delta$-functor. By the uniqueness of universal $\delta$-functors, see Homology, Lemma 12.11.5 we conclude that $R^{i} \check{H}^{0}(\mathcal{U},-)=\check{H}^{i}(\mathcal{U},-)$. This is enough for most applications and the reader is suggested to skip the rest of the proof.

Let $\mathcal{F}$ be any presheaf of $\mathcal{O}_{X}$-modules. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in the category $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$. Consider the double complex $A^{\bullet \bullet}$ with terms

$$
A^{p, q}=\breve{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q}\right) .
$$

Consider the simple complex $s A^{\bullet}$ associated to this double complex. There is a map of complexes

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow s A^{\bullet}
$$

coming from the maps $\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F}) \rightarrow A^{p, 0}=\check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{I}^{0}\right)$ and there is a map of complexes

$$
\check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right) \longrightarrow s A^{\bullet}
$$

coming from the maps $\check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right) \rightarrow A^{0, q}=\check{\mathcal{C}}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right)$. Both of these maps are quasi-isomorphisms by an application of Homology, Lemma 12.22.7. Namely, the columns of the double complex are exact in positive degrees because the Čech complex as a functor is exact (Lemma 20.11.1) and the rows of the double complex are exact in positive degrees since as we just saw the higher Čech cohomology groups of the injective presheaves $\mathcal{I}^{q}$ are zero. Since quasi-isomorphisms become invertible in $D^{+}\left(\mathcal{O}_{X}(U)\right)$ this gives the last displayed morphism of the lemma. We omit the verification that this morphism is functorial.

### 20.12. Čech cohomology and cohomology

01EO
01EP Lemma 20.12.1. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. Let $\mathcal{I}$ be an injective $\mathcal{O}_{X}$-module. Then

$$
\check{H}^{p}(\mathcal{U}, \mathcal{I})=\left\{\begin{array}{cll}
\mathcal{I}(U) & \text { if } \quad p=0 \\
0 & \text { if } \quad p>0
\end{array}\right.
$$

Proof. An injective $\mathcal{O}_{X}$-module is also injective as an object in the category $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$ (for example since sheafification is an exact left adjoint to the inclusion functor, using Homology, Lemma 12.25.1). Hence we can apply Lemma 20.11.5 (or its proof) to see the result.

01EQ Lemma 20.12.2. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. There is a transformation

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U},-) \longrightarrow R \Gamma(U,-)
$$

of functors $\operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow D^{+}\left(\mathcal{O}_{X}(U)\right)$. In particular this provides canonical maps $\check{H}^{p}(\mathcal{U}, \mathcal{F}) \rightarrow H^{p}(U, \mathcal{F})$ for $\mathcal{F}$ ranging over $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$.
Proof. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. Consider the double complex $\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ with terms $\check{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q}\right)$. There is a map of complexes

$$
\alpha: \Gamma\left(U, \mathcal{I}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)
$$

coming from the maps $\mathcal{I}^{q}(U) \rightarrow \check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right)$ and a map of complexes

$$
\beta: \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)
$$

coming from the map $\mathcal{F} \rightarrow \mathcal{I}^{0}$. We can apply Homology, Lemma 12.22 .7 to see that $\alpha$ is a quasi-isomorphism. Namely, Lemma 20.12.1 implies that the $q$ th row of the double complex $\breve{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ is a resolution of $\Gamma\left(U, \mathcal{I}^{q}\right)$. Hence $\alpha$ becomes invertible in $D^{+}\left(\mathcal{O}_{X}(U)\right)$ and the transformation of the lemma is the composition of $\beta$ followed by the inverse of $\alpha$. We omit the verification that this is functorial.

0B8R Lemma 20.12.3. Let $X$ be a topological space. Let $\mathcal{H}$ be an abelian sheaf on $X$. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering. The map

$$
\check{H}^{1}(\mathcal{U}, \mathcal{H}) \longrightarrow H^{1}(X, \mathcal{H})
$$

is injective and identifies $\check{H}^{1}(\mathcal{U}, \mathcal{H})$ via the bijection of Lemma 20.5.3 with the set of isomorphism classes of $\mathcal{H}$-torsors which restrict to trivial torsors over each $U_{i}$.

Proof. To see this we construct an inverse map. Namely, let $\mathcal{F}$ be a $\mathcal{H}$-torsor whose restriction to $U_{i}$ is trivial. By Lemma 20.5 .2 this means there exists a section $s_{i} \in \mathcal{F}\left(U_{i}\right)$. On $U_{i_{0}} \cap U_{i_{1}}$ there is a unique section $s_{i_{0} i_{1}}$ of $\mathcal{H}$ such that $\left.s_{i_{0} i_{1}} \cdot s_{i_{0}}\right|_{U_{i_{0}} \cap U_{i_{1}}}=\left.s_{i_{1}}\right|_{U_{i_{0}} \cap U_{i_{1}}}$. A computation shows that $s_{i_{0} i_{1}}$ is a Čech cocycle and that its class is well defined (i.e., does not depend on the choice of the sections $s_{i}$ ). The inverse maps the isomorphism class of $\mathcal{F}$ to the cohomology class of the cocycle $\left(s_{i_{0} i_{1}}\right)$. We omit the verification that this map is indeed an inverse.
01ER Lemma 20.12.4. Let $X$ be a ringed space. Consider the functor $i: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow$ $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$. It is a left exact functor with right derived functors given by

$$
R^{p} i(\mathcal{F})=\underline{H}^{p}(\mathcal{F}): U \longmapsto H^{p}(U, \mathcal{F})
$$

see discussion in Section 20.8.

Proof. It is clear that $i$ is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. By definition $R^{p} i$ is the $p$ th cohomology presheaf of the complex $\mathcal{I}^{\bullet}$. In other words, the sections of $R^{p} i(\mathcal{F})$ over an open $U$ are given by

$$
\frac{\operatorname{Ker}\left(\mathcal{I}^{n}(U) \rightarrow \mathcal{I}^{n+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^{n}(U)\right)}
$$

which is the definition of $H^{p}(U, \mathcal{F})$.
01ES Lemma 20.12.5. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. For any sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ there is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(U, \mathcal{F})$. This spectral sequence is functorial in $\mathcal{F}$.
Proof. This is a Grothendieck spectral sequence (see Derived Categories, Lemma 13.22 .2 for the functors

$$
i: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{PMod}\left(\mathcal{O}_{X}\right) \quad \text { and } \quad \check{H}^{0}(\mathcal{U},-): \operatorname{PMod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}_{\mathcal{O}_{X}(U)}
$$

Namely, we have $\check{H}^{0}(\mathcal{U}, i(\mathcal{F}))=\mathcal{F}(U)$ by Lemma 20.10.2. We have that $i(\mathcal{I})$ is Čech acyclic by Lemma 20.12.1. And we have that $\dot{H}^{p}(\mathcal{U},-)=R^{p} \check{H}^{0}(\mathcal{U},-)$ as functors on $\operatorname{PMod}\left(\mathcal{O}_{X}\right)$ by Lemma 20.11.5. Putting everything together gives the lemma.

01ET Lemma 20.12.6. Let $X$ be a ringed space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be a covering. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Assume that $H^{i}\left(U_{i_{0} \ldots i_{p}}, \mathcal{F}\right)=0$ for all $i>0$, all $p \geq 0$ and all $i_{0}, \ldots, i_{p} \in I$. Then $\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}(U, \mathcal{F})$ as $\mathcal{O}_{X}(U)$-modules.

Proof. We will use the spectral sequence of Lemma 20.12.5. The assumptions mean that $E_{2}^{p, q}=0$ for all $(p, q)$ with $q \neq 0$. Hence the spectral sequence degenerates at $E_{2}$ and the result follows.

01EU Lemma 20.12.7. Let $X$ be a ringed space. Let

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0
$$

be a short exact sequence of $\mathcal{O}_{X}$-modules. Let $U \subset X$ be an open subset. If there exists a cofinal system of open coverings $\mathcal{U}$ of $U$ such that $\check{H}^{1}(\mathcal{U}, \mathcal{F})=0$, then the map $\mathcal{G}(U) \rightarrow \mathcal{H}(U)$ is surjective.

Proof. Take an element $s \in \mathcal{H}(U)$. Choose an open covering $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ such that (a) $\check{H}^{1}(\mathcal{U}, \mathcal{F})=0$ and (b) $\left.s\right|_{U_{i}}$ is the image of a section $s_{i} \in \mathcal{G}\left(U_{i}\right)$. Since we can certainly find a covering such that (b) holds it follows from the assumptions of the lemma that we can find a covering such that (a) and (b) both hold. Consider the sections

$$
s_{i_{0} i_{1}}=\left.s_{i_{1}}\right|_{U_{i_{0} i_{1}}}-\left.s_{i_{0}}\right|_{U_{i_{0} i_{1}}} .
$$

Since $s_{i}$ lifts $s$ we see that $s_{i_{0} i_{1}} \in \mathcal{F}\left(U_{i_{0} i_{1}}\right)$. By the vanishing of $\check{H}^{1}(\mathcal{U}, \mathcal{F})$ we can find sections $t_{i} \in \mathcal{F}\left(U_{i}\right)$ such that

$$
s_{i_{0} i_{1}}=\left.t_{i_{1}}\right|_{U_{i_{0} i_{1}}}-\left.t_{i_{0}}\right|_{U_{i_{0} i_{1}}}
$$

Then clearly the sections $s_{i}-t_{i}$ satisfy the sheaf condition and glue to a section of $\mathcal{G}$ over $U$ which maps to $s$. Hence we win.

01EV Lemma 20.12.8. Let $X$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module such that

$$
\check{H}^{p}(\mathcal{U}, \mathcal{F})=0
$$

for all $p>0$ and any open covering $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ of an open of $X$. Then $H^{p}(U, \mathcal{F})=0$ for all $p>0$ and any open $U \subset X$.

Proof. Let $\mathcal{F}$ be a sheaf satisfying the assumption of the lemma. We will indicate this by saying " $\mathcal{F}$ has vanishing higher Čech cohomology for any open covering". Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective $\mathcal{O}_{X}$-module. By Lemma 20.12.1 $\mathcal{I}$ has vanishing higher Cech cohomology for any open covering. Let $\mathcal{Q}=\mathcal{I} / \mathcal{F}$ so that we have a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0
$$

By Lemma 20.12.7 and our assumptions this sequence is actually exact as a sequence of presheaves! In particular we have a long exact sequence of Cech cohomology groups for any open covering $\mathcal{U}$, see Lemma 20.11 .2 for example. This implies that $\mathcal{Q}$ is also an $\mathcal{O}_{X}$-module with vanishing higher Cech cohomology for all open coverings.

Next, we look at the long exact cohomology sequence

for any open $U \subset X$. Since $\mathcal{I}$ is injective we have $H^{n}(U, \mathcal{I})=0$ for $n>0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^{0}(U, \mathcal{I}) \rightarrow$ $H^{0}(U, \mathcal{Q})$ is surjective and hence $H^{1}(U, \mathcal{F})=0$. Since $\mathcal{F}$ was an arbitrary $\mathcal{O}_{X^{-}}$ module with vanishing higher Čech cohomology we conclude that also $H^{1}(U, \mathcal{Q})=0$ since $\mathcal{Q}$ is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^{2}(U, \mathcal{F})=0$. And so on and so forth.

01EW Lemma 20.12.9. (Variant of Lemma 20.12.8.) Let $X$ be a ringed space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Assume there exists a set of open coverings Cov with the following properties:
(1) For every $\mathcal{U} \in \operatorname{Cov}$ with $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ we have $U, U_{i} \in \mathcal{B}$ and every $U_{i_{0} \ldots i_{p}} \in \mathcal{B}$.
(2) For every $U \in \mathcal{B}$ the open coverings of $U$ occurring in Cov is a cofinal system of open coverings of $U$.
(3) For every $\mathcal{U} \in$ Cov we have $\check{H}^{p}(\mathcal{U}, \mathcal{F})=0$ for all $p>0$.

Then $H^{p}(U, \mathcal{F})=0$ for all $p>0$ and any $U \in \mathcal{B}$.
Proof. Let $\mathcal{F}$ and Cov be as in the lemma. We will indicate this by saying " $\mathcal{F}$ has vanishing higher Cech cohomology for any $\mathcal{U} \in \operatorname{Cov}$ ". Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective $\mathcal{O}_{X}$-module. By Lemma $20.12 .1 \mathcal{I}$ has vanishing higher Čech cohomology for any $\mathcal{U} \in \operatorname{Cov}$. Let $\mathcal{Q}=\mathcal{I} / \mathcal{F}$ so that we have a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0
$$

By Lemma 20.12.7 and our assumption (2) this sequence gives rise to an exact sequence

$$
0 \rightarrow \mathcal{F}(U) \rightarrow \mathcal{I}(U) \rightarrow \mathcal{Q}(U) \rightarrow 0
$$

for every $U \in \mathcal{B}$. Hence for any $\mathcal{U} \in \operatorname{Cov}$ we get a short exact sequence of Čech complexes

$$
0 \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{Q}) \rightarrow 0
$$

since each term in the Cech complex is made up out of a product of valuer elements of $\mathcal{B}$ by assumption (1). In particular we have a long exact sequence of Cech cohomology groups for any open covering $\mathcal{U} \in$ Cov. This implies that $\mathcal{Q}$ is also an $\mathcal{O}_{X}$-module with vanishing higher Čech cohomology for all $\mathcal{U} \in \operatorname{Cov}$.
Next, we look at the long exact cohomology sequence

for any $U \in \mathcal{B}$. Since $\mathcal{I}$ is injective we have $H^{n}(U, \mathcal{I})=0$ for $n>0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^{0}(U, \mathcal{I}) \rightarrow H^{0}(U, \mathcal{Q})$ is surjective and hence $H^{1}(U, \mathcal{F})=0$. Since $\mathcal{F}$ was an arbitrary $\mathcal{O}_{X}$-module with vanishing higher Čech cohomology for all $\mathcal{U} \in \operatorname{Cov}$ we conclude that also $H^{1}(U, \mathcal{Q})=0$ since $\mathcal{Q}$ is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^{2}(U, \mathcal{F})=0$. And so on and so forth.

01EX Lemma 20.12.10. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{I}$ be an injective $\mathcal{O}_{X}$-module. Then
(1) $\check{H}^{p}\left(\mathcal{V}, f_{*} \mathcal{I}\right)=0$ for all $p>0$ and any open covering $\mathcal{V}: V=\bigcup_{j \in J} V_{j}$ of $Y$.
(2) $H^{p}\left(V, f_{*} \mathcal{I}\right)=0$ for all $p>0$ and every open $V \subset Y$.

In other words, $f_{*} \mathcal{I}$ is right acyclic for $\Gamma(U,-)$ (see Derived Categories, Definition 13.16.3) for any $U \subset X$ open.

Proof. Set $\mathcal{U}: f^{-1}(V)=\bigcup_{j \in J} f^{-1}\left(V_{j}\right)$. It is an open covering of $X$ and

$$
\check{\mathcal{C}}^{\bullet}\left(\mathcal{V}, f_{*} \mathcal{I}\right)=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I})
$$

This is true because

$$
f_{*} \mathcal{I}\left(V_{j_{0} \ldots j_{p}}\right)=\mathcal{I}\left(f^{-1}\left(V_{j_{0} \ldots j_{p}}\right)\right)=\mathcal{I}\left(f^{-1}\left(V_{j_{0}}\right) \cap \ldots \cap f^{-1}\left(V_{j_{p}}\right)\right)=\mathcal{I}\left(U_{j_{0} \ldots j_{p}}\right)
$$

Thus the first statement of the lemma follows from Lemma 20.12.1. The second statement follows from the first and Lemma 20.12.8.

The following lemma implies in particular that $f_{*}: A b(X) \rightarrow A b(Y)$ transforms injective abelian sheaves into injective abelian sheaves.

02N5 Lemma 20.12.11. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Assume $f$ is flat. Then $f_{*} \mathcal{I}$ is an injective $\mathcal{O}_{Y}$-module for any injective $\mathcal{O}_{X}$-module $\mathcal{I}$.

Proof. In this case the functor $f^{*}$ transforms injections into injections (Modules, Lemma 17.17.2. Hence the result follows from Homology, Lemma 12.25.1.

### 20.13. Flasque sheaves

09SV Here is the definition.
09SW Definition 20.13.1. Let $X$ be a topological space. We say a presheaf of sets $\mathcal{F}$ is flasque or flabby if for every $U \subset V$ open in $X$ the restriction map $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$ is surjective.

We will use this terminology also for abelian sheaves and sheaves of modules if $X$ is a ringed space. Clearly it suffices to assume the restriction maps $\mathcal{F}(X) \rightarrow \mathcal{F}(U)$ is surjective for every open $U \subset X$.
09SX Lemma 20.13.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Then any injective $\mathcal{O}_{X}$-module is flasque.

Proof. This is a reformulation of Lemma 20.9.1.
09SY Lemma 20.13.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Any flasque $\mathcal{O}_{X}$-module is acyclic for $R \Gamma(X,-)$ as well as $R \Gamma(U,-)$ for any open $U$ of $X$.

Proof. We will prove this using Derived Categories, Lemma 13.16.6. Since every injective module is flasque we see that we can embed every $\mathcal{O}_{X}$-module into a flasque module, see Injectives, Lemma 19.4.1. Thus it suffices to show that given a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0
$$

with $\mathcal{F}, \mathcal{G}$ flasque, then $\mathcal{H}$ is flasque and the sequence remains short exact after taking sections on any open of $X$. In fact, the second statement implies the first. Thus, let $U \subset X$ be an open subspace. Let $s \in \mathcal{H}(U)$. We will show that we can lift $s$ to a sequence of $\mathcal{G}$ over $U$. To do this consider the set $T$ of pairs $(V, t)$ where $V \subset U$ is open and $t \in \mathcal{G}(V)$ is a section mapping to $\left.s\right|_{V}$ in $\mathcal{H}$. We put a partial ordering on $T$ by setting $(V, t) \leq\left(V^{\prime}, t^{\prime}\right)$ if and only if $V \subset V^{\prime}$ and $\left.t^{\prime}\right|_{V}=t$. If ( $V_{\alpha}, t_{\alpha}$ ), $\alpha \in A$ is a totally ordered subset of $T$, then $V=\bigcup V_{\alpha}$ is open and there is a unique section $t \in \mathcal{G}(V)$ restricting to $t_{\alpha}$ over $V_{\alpha}$ by the sheaf condition on $\mathcal{G}$. Thus by Zorn's lemma there exists a maximal element $(V, t)$ in $T$. We will show that $V=U$ thereby finishing the proof. Namely, pick any $x \in U$. We can find a small open neighbourhood $W \subset U$ of $x$ and $t^{\prime} \in \mathcal{H}(W)$ mapping to $\left.s\right|_{W}$ in $\mathcal{H}$. Then $\left.t^{\prime}\right|_{W \cap V}-\left.t\right|_{W \cap V}$ maps to zero in $\mathcal{H}$, hence comes from some section $r^{\prime} \in \mathcal{F}(W \cap V)$. Using that $\mathcal{F}$ is flasque we find a section $r \in \mathcal{F}(W)$ restricting to $r^{\prime}$ over $W^{\prime} \cap V$. Modifying $t^{\prime}$ by the image of $r$ we may assume that $t$ and $t^{\prime}$ restrict to the same section over $W \cap V$. By the sheaf condition of $\mathcal{G}$ we can find a section $\tilde{t}$ of $\mathcal{G}$ over $W \cup V$ restricting to $t$ and $t^{\prime}$. By maximality of $(V, t)$ we see that $V \cap W=V$. Thus $x \in V$ and we are done.

The following lemma does not hold for flasque presheaves.
09SZ Lemma 20.13.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $\mathcal{U}: U=\bigcup U_{i}$ be an open covering. If $\mathcal{F}$ is flasque, then $\check{H}^{p}(\mathcal{U}, \mathcal{F})=0$ for $p>0$.

Proof. The presheaves $\underline{H}^{q}(\mathcal{F})$ used in the statement of Lemma 20.12.5 are zero by Lemma 20.13.3. Hence $\check{H}^{p}(U, \mathcal{F})=H^{p}(U, \mathcal{F})=0$ by Lemma 20.13.3 again.

09 T 0 Lemma 20.13.5. Let $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ is flasque, then $R^{p} f_{*} \mathcal{F}=0$ for $p>0$.

Proof. Immediate from Lemma 20.8.3 and Lemma 20.13.3
The following lemma can be proved by an elementary induction argument for finite coverings, compare with the discussion of Čech cohomology in [Vak].

0A36 Lemma 20.13.6. Let $X$ be a topological space. Let $\mathcal{F}$ be an abelian sheaf on $X$. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Assume the restriction mappings $\mathcal{F}(U) \rightarrow \mathcal{F}\left(U^{\prime}\right)$ are surjective for $U^{\prime}$ an arbirtrary union of opens of the form $U_{i_{0} \ldots i_{p}}$. Then $\check{H}^{p}(\mathcal{U}, \mathcal{F})$ vanishes for $p>0$.

Proof. Let $Y$ be the set of nonempty subsets of $I$. We will use the letters $A, B, C, \ldots$ to denote elements of $Y$, i.e., nonempty subsets of $I$. For a finite nonempty subset $J \subset I$ let

$$
V_{J}=\{A \in Y \mid J \subset A\}
$$

This means that $V_{\{i\}}=\{A \in Y \mid i \in A\}$ and $V_{J}=\bigcap_{j \in J} V_{\{j\}}$. Then $V_{J} \subset V_{K}$ if and only if $J \supset K$. There is a unique topology on $Y$ such that the collection of subsets $V_{J}$ is a basis for the topology on $Y$. Any open is of the form

$$
V=\bigcup_{t \in T} V_{J_{t}}
$$

for some family of finite subsets $J_{t}$. If $J_{t} \subset J_{t^{\prime}}$ then we may remove $J_{t^{\prime}}$ from the family without changing $V$. Thus we may assume there are no inclusions among the $J_{t}$. In this case the minimal elements of $V$ are the sets $A=J_{t}$. Hence we can read off the family $\left(J_{t}\right)_{t \in T}$ from the open $V$.
We can completely understand open coverings in $Y$. First, because the elements $A \in Y$ are nonempty subsets of $I$ we have

$$
Y=\bigcup_{i \in I} V_{\{i\}}
$$

To understand other coverings, let $V$ be as above and let $V_{s} \subset Y$ be an open corresponding to the family $\left(J_{s, t}\right)_{t \in T_{s}}$. Then

$$
V=\bigcup_{s \in S} V_{s}
$$

if and only if for each $t \in T$ there exists an $s \in S$ and $t_{s} \in T_{s}$ such that $J_{t}=J_{s, t_{s}}$. Namely, as the family $\left(J_{t}\right)_{t \in T}$ is minimal, the minimal element $A=J_{t}$ has to be in $V_{s}$ for some $s$, hence $A \in V_{J_{t_{s}}}$ for some $t_{s} \in T_{s}$. But since $A$ is also minimal in $V_{s}$ we conclude that $J_{t_{s}}=J_{t}$.
Next we map the set of opens of $Y$ to opens of $X$. Namely, we send $Y$ to $U$, we use the rule

$$
V_{J} \mapsto U_{J}=\bigcap_{i \in J} U_{i}
$$

on the opens $V_{J}$, and we extend it to arbitrary opens $V$ by the rule

$$
V=\bigcup_{t \in T} V_{J_{t}} \mapsto \bigcup_{t \in T} U_{J_{t}}
$$

The classification of open coverings of $Y$ given above shows that this rule transforms open coverings into open coverings. Thus we obtain an abelian sheaf $\mathcal{G}$ on $Y$ by setting $\mathcal{G}(Y)=\mathcal{F}(U)$ and for $V=\bigcup_{t \in T} V_{J_{t}}$ setting

$$
\mathcal{G}(V)=\mathcal{F}\left(\bigcup_{t \in T} U_{J_{t}}\right)
$$

and using the restriction maps of $\mathcal{F}$.
With these preliminaries out of the way we can prove our lemma as follows. We have an open covering $\mathcal{V}: Y=\bigcup_{i \in I} V_{\{i\}}$ of $Y$. By construction we have an equality

$$
\check{C} \bullet(\mathcal{V}, \mathcal{G})=\check{C} \bullet(\mathcal{U}, \mathcal{F})
$$

of Čech complexes. Since the sheaf $\mathcal{G}$ is flasque on $Y$ (by our assumption on $\mathcal{F}$ in the statement of the lemma) the vanishing follows from Lemma 20.13.4.

### 20.14. The Leray spectral sequence

01EY
01EZ Lemma 20.14.1. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. There is a commutative diagram

More generally for any $V \subset Y$ open and $U=f^{-1}(V)$ there is a commutative diagram

See also Remark 20.14.2 for more explanation.
Proof. Let $\Gamma_{\text {res }}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}_{\mathcal{O}_{Y}(Y)}$ be the functor which associates to an $\mathcal{O}_{X}$-module $\mathcal{F}$ the global sections of $\mathcal{F}$ viewed as a $\mathcal{O}_{Y}(Y)$-module via the map $f^{\sharp}$ : $\mathcal{O}_{Y}(Y) \rightarrow \mathcal{O}_{X}(X)$. Let restriction : $\operatorname{Mod}_{\mathcal{O}_{X}(X)} \rightarrow \operatorname{Mod}_{\mathcal{O}_{Y}(Y)}$ be the restriction functor induced by $f^{\sharp}: \mathcal{O}_{Y}(Y) \rightarrow \mathcal{O}_{X}(X)$. Note that restriction is exact so that its right derived functor is computed by simply applying the restriction functor, see Derived Categories, Lemma 13.17.9 It is clear that

$$
\Gamma_{\text {res }}=\text { restriction } \circ \Gamma(X,-)=\Gamma(Y,-) \circ f_{*}
$$

We claim that Derived Categories, Lemma 13.22 .1 applies to both compositions. For the first this is clear by our remarks above. For the second, it follows from Lemma 20.12.10 which implies that injective $\mathcal{O}_{X}$-modules are mapped to $\Gamma(Y,-)$ acyclic sheaves on $Y$.

01F0 Remark 20.14.2. Here is a down-to-earth explanation of the meaning of Lemma 20.14.1. It says that given $f: X \rightarrow Y$ and $\mathcal{F} \in \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ and given an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$ we have

$$
\begin{array}{clc}
R \Gamma(X, \mathcal{F}) & \text { is represented by } & \Gamma\left(X, \mathcal{I}^{\bullet}\right) \\
R f_{*} \mathcal{F} & \text { is represented by } & f_{*} \mathcal{I}^{\bullet} \\
R \Gamma\left(Y, R f_{*} \mathcal{F}\right) & \text { is represented by } & \Gamma\left(Y, f_{*} \mathcal{I}^{\bullet}\right)
\end{array}
$$

the last fact coming from Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7 and Lemma 20.12.10. Finally, it combines this with the trivial observation that

$$
\Gamma\left(X, \mathcal{I}^{\bullet}\right)=\Gamma\left(Y, f_{*} \mathcal{I}^{\bullet}\right)
$$

to arrive at the commutativity of the diagram of the lemma.
01F1 Lemma 20.14.3. Let $X$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module.
(1) The cohomology groups $H^{i}(U, \mathcal{F})$ for $U \subset X$ open of $\mathcal{F}$ computed as an $\mathcal{O}_{X}$-module, or computed as an abelian sheaf are identical.
(2) Let $f: X \rightarrow Y$ be a morphism of ringed spaces. The higher direct images $R^{i} f_{*} \mathcal{F}$ of $\mathcal{F}$ computed as an $\mathcal{O}_{X}$-module, or computed as an abelian sheaf are identical.
There are similar statements in the case of bounded below complexes of $\mathcal{O}_{X}$-modules.
Proof. Consider the morphism of ringed spaces $\left(X, \mathcal{O}_{X}\right) \rightarrow\left(X, \underline{\mathbf{Z}}_{X}\right)$ given by the identity on the underlying topological space and by the unique map of sheaves of rings $\underline{\mathbf{Z}}_{X} \rightarrow \mathcal{O}_{X}$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Denote $\mathcal{F}_{a b}$ the same sheaf seen as an $\underline{\mathbf{Z}}_{X}$-module, i.e., seen as a sheaf of abelian groups. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. By Remark 20.14 .2 we see that $\Gamma\left(X, \mathcal{I}^{\bullet}\right)$ computes both $R \Gamma(X, \mathcal{F})$ and $R \Gamma\left(X, \mathcal{F}_{a b}\right)$. This proves (1).

To prove (2) we use (1) and Lemma 20.8.3. The result follows immediately.
01F2 Lemma 20.14.4 (Leray spectral sequence). Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}^{\bullet}$ be a bounded below complex of $\mathcal{O}_{X}$-modules. There is a spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(Y, R^{q} f_{*}\left(\mathcal{F}^{\bullet}\right)\right)
$$

converging to $H^{p+q}\left(X, \mathcal{F}^{\bullet}\right)$.
Proof. This is just the Grothendieck spectral sequence Derived Categories, Lemma 13.22 .2 coming from the composition of functors $\Gamma_{r e s}=\Gamma(Y,-) \circ f_{*}$ where $\Gamma_{r e s}$ is as in the proof of Lemma 20.14.1. To see that the assumptions of Derived Categories, Lemma 13.22 .2 are satisfied, see the proof of Lemma 20.14.1 or Remark 20.14.2.

01F3 Remark 20.14.5. The Leray spectral sequence, the way we proved it in Lemma 20.14 .4 is a spectral sequence of $\Gamma\left(Y, \mathcal{O}_{Y}\right)$-modules. However, it is quite easy to see that it is in fact a spectral sequence of $\Gamma\left(X, \mathcal{O}_{X}\right)$-modules. For example $f$ gives rise to a morphism of ringed spaces $f^{\prime}:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, f_{*} \mathcal{O}_{X}\right)$. By Lemma 20.14 .3 the terms $E_{r}^{p, q}$ of the Leray spectral sequence for an $\mathcal{O}_{X}$-module $\mathcal{F}$ and $f$ are identical with those for $\mathcal{F}$ and $f^{\prime}$ at least for $r \geq 2$. Namely, they both agree with the terms of the Leray spectral sequence for $\mathcal{F}$ as an abelian sheaf. And since $\left(f_{*} \mathcal{O}_{X}\right)(Y)=\mathcal{O}_{X}(X)$ we see the result. It is often the case that the Leray spectral sequence carries additional structure.

01F4 Lemma 20.14.6. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module.
(1) If $R^{q} f_{*} \mathcal{F}=0$ for $q>0$, then $H^{p}(X, \mathcal{F})=H^{p}\left(Y, f_{*} \mathcal{F}\right)$ for all $p$.
(2) If $H^{p}\left(Y, R^{q} f_{*} \mathcal{F}\right)=0$ for all $q$ and $p>0$, then $H^{q}(X, \mathcal{F})=H^{0}\left(Y, R^{q} f_{*} \mathcal{F}\right)$ for all $q$.

Proof. These are two simple conditions that force the Leray spectral sequence to degenerate at $E_{2}$. You can also prove these facts directly (without using the spectral sequence) which is a good exercise in cohomology of sheaves.

01F5 Lemma 20.14.7. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of ringed spaces. In this case $R g_{*} \circ R f_{*}=R(g \circ f)_{*}$ as functors from $D^{+}(X) \rightarrow D^{+}(Z)$.

Proof. We are going to apply Derived Categories, Lemma 13.22.1. It is clear that $g_{*} \circ f_{*}=(g \circ f)_{*}$, see Sheaves, Lemma 6.21.2. It remains to show that $f_{*} \mathcal{I}$ is $g_{*^{-}}$ acyclic. This follows from Lemma 20.12 .10 and the description of the higher direct images $R^{i} g_{*}$ in Lemma 20.8.3.

01F6 Lemma 20.14 .8 (Relative Leray spectral sequence). Let $f: X \rightarrow Y$ and $g: Y \rightarrow$ $Z$ be morphisms of ringed spaces. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. There is a spectral sequence with

$$
E_{2}^{p, q}=R^{p} g_{*}\left(R^{q} f_{*} \mathcal{F}\right)
$$

converging to $R^{p+q}(g \circ f)_{*} \mathcal{F}$. This spectral sequence is functorial in $\mathcal{F}$, and there is a version for bounded below complexes of $\mathcal{O}_{X}$-modules.

Proof. This is a Grothendieck spectral sequence for composition of functors and follows from Lemma 20.14.7 and Derived Categories, Lemma 13.22.2.

### 20.15. Functoriality of cohomology

01F7
01F8 Lemma 20.15.1. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{G}^{\bullet}$, resp. $\mathcal{F}^{\bullet}$ be a bounded below complex of $\mathcal{O}_{Y}$-modules, resp. $\mathcal{O}_{X}$-modules. Let $\varphi: \mathcal{G}^{\bullet} \rightarrow f_{*} \mathcal{F}^{\bullet}$ be a morphism of complexes. There is a canonical morphism

$$
\mathcal{G}^{\bullet} \longrightarrow R f_{*}\left(\mathcal{F}^{\bullet}\right)
$$

in $D^{+}(Y)$. Moreover this construction is functorial in the triple $\left(\mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}, \varphi\right)$.
Proof. Choose an injective resolution $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$. By definition $R f_{*}\left(\mathcal{F}^{\bullet}\right)$ is represented by $f_{*} \mathcal{I}^{\bullet}$ in $K^{+}\left(\mathcal{O}_{Y}\right)$. The composition

$$
\mathcal{G}^{\bullet} \rightarrow f_{*} \mathcal{F}^{\bullet} \rightarrow f_{*} \mathcal{I}^{\bullet}
$$

is a morphism in $K^{+}(Y)$ which turns into the morphism of the lemma upon applying the localization functor $j_{Y}: K^{+}(Y) \rightarrow D^{+}(Y)$.

Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{G}$ be an $\mathcal{O}_{Y}$-module and let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Recall that an $f$-map $\varphi$ from $\mathcal{G}$ to $\mathcal{F}$ is a map $\varphi: \mathcal{G} \rightarrow f_{*} \mathcal{F}$, or what is the same thing, a map $\varphi: f^{*} \mathcal{G} \rightarrow \mathcal{F}$. See Sheaves, Definition 6.21.7. Such an $f$-map gives rise to a morphism of complexes
01F9 (20.15.1.1)

$$
\varphi: R \Gamma(Y, \mathcal{G}) \longrightarrow R \Gamma(X, \mathcal{F})
$$

in $D^{+}\left(\mathcal{O}_{Y}(Y)\right)$. Namely, we use the morphism $\mathcal{G} \rightarrow R f_{*} \mathcal{F}$ in $D^{+}(Y)$ of Lemma 20.15.1, and we apply $R \Gamma(Y,-)$. By Lemma 20.14.1 we see that $R \Gamma(X, \mathcal{F})=$ $R \Gamma\left(Y, R f_{*} \mathcal{F}\right)$ and we get the displayed arrow. We spell this out completely in Remark 20.15.2 below. In particular it gives rise to maps on cohomology

$$
\begin{equation*}
\varphi: H^{i}(Y, \mathcal{G}) \longrightarrow H^{i}(X, \mathcal{F}) \tag{20.15.1.2}
\end{equation*}
$$

01FB Remark 20.15.2. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{G}$ be an $\mathcal{O}_{Y}$-module. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Let $\varphi$ be an $f$-map from $\mathcal{G}$ to $\mathcal{F}$. Choose a resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ by a complex of injective $\mathcal{O}_{X}$-modules. Choose resolutions $\mathcal{G} \rightarrow \mathcal{J}^{\bullet}$ and $f_{*} \mathcal{I}^{\bullet} \rightarrow\left(\mathcal{J}^{\prime}\right)^{\bullet}$ by complexes of injective $\mathcal{O}_{Y}$-modules. By Derived Categories, Lemma 13.18 .6 there exists a map of complexes $\beta$ such that the diagram

01FC

commutes. Applying global section functors we see that we get a diagram

The complex on the bottom left represents $R \Gamma(Y, \mathcal{G})$ and the complex on the top right represents $R \Gamma(X, \mathcal{F})$. The vertical arrow is a quasi-isomorphism by Lemma 20.14.1 which becomes invertible after applying the localization functor $K^{+}\left(\mathcal{O}_{Y}(Y)\right) \rightarrow D^{+}\left(\mathcal{O}_{Y}(Y)\right)$. The arrow 20.15.1.1 is given by the composition of the horizontal map by the inverse of the vertical map.

### 20.16. Refinements and Čech cohomology

09UY Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ and $\mathcal{V}: X=\bigcup_{j \in J} V_{j}$ be open coverings. Assume that $\mathcal{U}$ is a refinement of $\mathcal{V}$. Choose a map $c: I \rightarrow J$ such that $U_{i} \subset V_{c(i)}$ for all $i \in I$. This induces a map of Cech complexes

$$
\gamma: \check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}), \quad\left(\xi_{j_{0} \ldots j_{p}}\right) \longmapsto\left(\left.\xi_{c\left(i_{0}\right) \ldots c\left(i_{p}\right)}\right|_{U_{i_{0} \ldots i_{p}}}\right)
$$

functorial in the sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$. Suppose that $c^{\prime}: I \rightarrow J$ is a second map such that $U_{i} \subset V_{c^{\prime}(i)}$ for all $i \in I$. Then the corresponding maps $\gamma$ and $\gamma^{\prime}$ are homotopic. Namely, $\gamma-\gamma^{\prime}=\mathrm{d} \circ h+h \circ \mathrm{~d}$ with $h: \check{\mathcal{C}}^{p+1}(\mathcal{V}, \mathcal{F}) \rightarrow \breve{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ given by the rule

$$
h(\xi)_{i_{0} \ldots i_{p}}=\sum_{a=0}^{p}(-1)^{a} \alpha_{c\left(i_{0}\right) \ldots c\left(i_{a}\right) c^{\prime}\left(i_{a}\right) \ldots c^{\prime}\left(i_{p}\right)}
$$

We omit the computation showing this works; please see the discussion following 20.26.0.2 for the proof in a more general case. In particular, the map on Cech cohomology groups is independent of the choice of $c$. Moreover, it is clear that if $\mathcal{W}: X=\bigcup_{k \in K} W_{k}$ is a third open covering and $\mathcal{V}$ is a refinement of $\mathcal{W}$, then the composition of the maps

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{W}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

associated to maps $I \rightarrow J$ and $J \rightarrow K$ is the map associated to the composition $I \rightarrow K$. In particular, we can define the Čech cohomology groups

$$
\check{H}^{p}(X, \mathcal{F})=\operatorname{colim}_{\mathcal{U}} \check{H}^{p}(\mathcal{U}, \mathcal{F})
$$

where the colimit is over all open coverings of $X$ partially ordered by refinement.

It turns out that the maps $\gamma$ defined above are compatible with the map to cohomology, in other words, the composition

$$
\check{H}^{p}(\mathcal{V}, \mathcal{F}) \rightarrow \check{H}^{p}(\mathcal{U}, \mathcal{F}) \xrightarrow{\text { Lemma 20.12.2 }} H^{p}(X, \mathcal{F})
$$

is the canonical map from the first group to cohomology of Lemma 20.12.2. In the lemma below we will prove this in a slightly more general setting. A consequence is that we obtain a well defined map

09UZ

$$
\begin{equation*}
\check{H}^{p}(X, \mathcal{F})=\operatorname{colim}_{\mathcal{U}} \check{H}^{p}(\mathcal{U}, \mathcal{F}) \longrightarrow H^{p}(X, \mathcal{F}) \tag{20.16.0.2}
\end{equation*}
$$

from Čech cohomology to cohomology.
01FD Lemma 20.16.1. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\varphi: f^{*} \mathcal{G} \rightarrow$ $\mathcal{F}$ be an $f$-map from an $\mathcal{O}_{Y}$-module $\mathcal{G}$ to an $\mathcal{O}_{X}$-module $\mathcal{F}$. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ and $\mathcal{V}: Y=\bigcup_{j \in J} V_{j}$ be open coverings. Assume that $\mathcal{U}$ is a refinement of $f^{-1} \mathcal{V}$ : $X=\bigcup_{j \in J} f^{-1}\left(V_{j}\right)$. In this case there exists a commutative diagram

in $D^{+}\left(\mathcal{O}_{X}(X)\right)$ with horizontal arrows given by Lemma 20.12.2 and right vertical arrow by 20.15.1.1). In particular we get commutative diagrams of cohomology groups

where the right vertical arrow is 20.15.1.2
Proof. We first define the left vertical arrow. Namely, choose a map $c: I \rightarrow J$ such that $U_{i} \subset f^{-1}\left(V_{c(i)}\right)$ for all $i \in I$. In degree $p$ we define the map by the rule

$$
\gamma(s)_{i_{0} \ldots i_{p}}=\varphi(s)_{c\left(i_{0}\right) \ldots c\left(i_{p}\right)}
$$

This makes sense because $\varphi$ does indeed induce maps $\mathcal{G}\left(V_{c\left(i_{0}\right) \ldots c\left(i_{p}\right)}\right) \rightarrow \mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)$ by assumption. It is also clear that this defines a morphism of complexes. Choose injective resolutions $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ on $X$ and $\mathcal{G} \rightarrow J^{\bullet}$ on $Y$. According to the proof of Lemma 20.12.2 we introduce the double complexes $A^{\bullet \bullet \bullet}$ and $B^{\bullet \bullet \bullet}$ with terms

$$
B^{p, q}=\check{\mathcal{C}}^{p}\left(\mathcal{V}, \mathcal{J}^{q}\right) \quad \text { and } \quad A^{p, q}=\check{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q}\right) .
$$

As in Remark 20.15 .2 above we also choose an injective resolution $f_{*} \mathcal{I} \rightarrow\left(\mathcal{J}^{\prime}\right)^{\bullet}$ on $Y$ and a morphism of complexes $\beta: \mathcal{J} \rightarrow\left(\mathcal{J}^{\prime}\right)^{\bullet}$ making 20.15.2.1 commutes. We introduce some more double complexes, namely $\left(B^{\prime}\right)^{\bullet \bullet}$ and $\left(B^{\prime \prime}\right) \bullet$, $\bullet$ with

$$
\left(B^{\prime}\right)^{p, q}=\check{\mathcal{C}}^{p}\left(\mathcal{V},\left(\mathcal{J}^{\prime}\right)^{q}\right) \quad \text { and } \quad\left(B^{\prime \prime}\right)^{p, q}=\check{\mathcal{C}}^{p}\left(\mathcal{V}, f_{*} \mathcal{I}^{q}\right)
$$

Note that there is an $f$-map of complexes from $f_{*} \mathcal{I}^{\bullet}$ to $\mathcal{I}^{\bullet}$. Hence it is clear that the same rule as above defines a morphism of double complexes

$$
\gamma:\left(B^{\prime \prime}\right)^{\bullet, \bullet} \longrightarrow A^{\bullet, \bullet}
$$

Consider the diagram of complexes

The two horizontal arrows with targets $s A^{\bullet}$ and $s B^{\bullet}$ are the ones explained in Lemma 20.12.2. The left upper shape (a pentagon) is commutative simply because (20.15.2.1) is commutative. The two lower squares are trivially commutative. It is also immediate from the definitions that the right upper shape (a square) is commutative. The result of the lemma now follows from the definitions and the fact that going around the diagram on the outer sides from $\check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{G})$ to $\Gamma\left(X, \mathcal{I}^{\bullet}\right)$ either on top or on bottom is the same (where you have to invert any quasi-isomorphisms along the way).

### 20.17. Cohomology on Hausdorff quasi-compact spaces

09V0 For such a space Čech cohomology agrees with cohomology.
09V1 Lemma 20.17.1. Let $X$ be a topological space. Let $\mathcal{F}$ be an abelian sheaf. Then the map $\check{H}^{1}(X, \mathcal{F}) \rightarrow H^{1}(X, \mathcal{F})$ defined in 20.16.0.2 is an isomorphism.

Proof. Let $\mathcal{U}$ be an open covering of $X$. By Lemma 20.12.5 there is an exact sequence

$$
0 \rightarrow \check{H}^{1}(\mathcal{U}, \mathcal{F}) \rightarrow H^{1}(X, \mathcal{F}) \rightarrow \check{H}^{0}\left(\mathcal{U}, \underline{H}^{1}(\mathcal{F})\right)
$$

Thus the map is injective. To show surjectivity it suffices to show that any element of $\check{H}^{0}\left(\mathcal{U}, \underline{H}^{1}(\mathcal{F})\right)$ maps to zero after replacing $\mathcal{U}$ by a refinement. This is immediate from the definitions and the fact that $\underline{H}^{1}(\mathcal{F})$ is a presheaf of abelian groups whose sheafification is zero by locality of cohomology, see Lemma 20.8.2.

09V2 Lemma 20.17.2. Let $X$ be a Hausdorff and quasi-compact topological space. Let $\mathcal{F}$ be an abelian sheaf on $X$. Then the map $\check{H}^{p}(X, \mathcal{F}) \rightarrow H^{p}(X, \mathcal{F})$ defined in 20.16.0.2 is an isomorphism for all $p$.

Proof. We argue by induction on $p$ that the map $c_{\mathcal{F}}^{p}: \check{H}^{p}(X, \mathcal{F}) \rightarrow H^{p}(X, \mathcal{F})$ is an isomorphism. For $p=0$ the result is clear and for $p=1$ the result holds by Lemma 20.17.1. Thus we may assume $p>1$.
Choose an injective map $a: \mathcal{F} \rightarrow \mathcal{I}$, where $\mathcal{I}$ is an injective abelian sheaf. Let $b: \mathcal{I} \rightarrow \mathcal{G}$ be the quotient by $\mathcal{F}$. Let $\xi=\left(\xi_{i_{0} . . i_{p}}\right)$ be a cocycle of the Čech complex, giving rise to an element $\bar{\xi}$ of $\check{H}^{p}(\mathcal{U}, \mathcal{F})$. Then $a(\xi)=\mathrm{d}(\eta)$ for some cochain $\eta$ for $\mathcal{I}$ by Lemma 20.12.1. The image $\theta=b(\eta)$ of $\eta$ in the Čech complex for $\mathcal{G}$ is a cocyle, hence gives rise to an element $\bar{\theta}$ in $\check{H}^{p-1}(\mathcal{U}, \mathcal{G})$. A straightforward argument (using $p \geq 2$ and hence the Čech complex of $\mathcal{I}$ is acyclic in degree $p-1$ ) shows that the rule which assigns the element $\bar{\theta} \in \check{H}^{p-1}(\mathcal{U}, \mathcal{G})$ of $\theta$ to the class is well defined. It follows from the construction that $c_{\mathcal{F}}^{p}(\bar{\xi})=\partial\left(c_{\mathcal{G}}^{p-1}(\bar{\theta})\right)$ where $\partial: H^{p-1}(X, \mathcal{G}) \rightarrow H^{p}(X, \mathcal{F})$
is the boundary coming from the short exact sequence $0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{G} \rightarrow 0$ (details omitted).
Conversely, let $\theta=\left(\theta_{i_{0} \ldots i_{p-1}}\right)$ a cocycle of the Čech complex of $\mathcal{G}$ for some open covering $\mathcal{U}$. We would like to lift $\theta$ to a cochain for $\mathcal{I}$. The problem is that the sequence of complexes

$$
0 \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{G}) \rightarrow 0
$$

may not be exact on the right. Howeover, we know that for all $p$-tuples $i_{0} \ldots i_{p-1}$ of $I$ there exists an open covering

$$
U_{i_{0}} \cap \ldots \cap U_{i_{p-1}}=\bigcup W_{i_{0} \ldots i_{p-1}, k}
$$

such that $\theta_{i_{0} \ldots i_{p-1}} \mid W_{i_{0} \ldots i_{p-1}, k}$ does lift to a section of $\mathcal{I}$ over $W_{i_{0} \ldots i_{p-1}, k}$. Thus, by Topology, Lemma 5.12.4 after refining $\mathcal{U}$, we can lift $\theta$ to a $(p-1)$-cochain $\eta$ in the Čech complex of $\mathcal{I}$. Then $\mathrm{d}(\eta)=a(\xi)$ for some $p$-cocycle $\xi$ for $\mathcal{F}$. In other words, every element of colim $\check{H}^{p-1}(\mathcal{U}, \mathcal{G})$ comes about by the construction of the previous paragraph from an element of $\operatorname{colim} \check{H}^{p}(\mathcal{U}, \mathcal{F})$.

By the compatibility of the construction with the boundary map $\partial: H^{p-1}(X, \mathcal{G}) \rightarrow$ $H^{p}(X, \mathcal{F})$, the surjectivity of the map, the induction hypothesis saying $\gamma_{\mathcal{G}}^{p-1}$ is an isomorphism, and the fact that $H^{p-1}(X, \mathcal{I})=H^{p}(X, \mathcal{I})=0$, it follows formally that $c_{\mathcal{F}}^{p}$ is surjective. To show injectivity one has to show that, given $\xi, \eta, \theta$ linked as above, if $\theta$ is a boundary, then $\xi$ becomes a boundary after replacing $\mathcal{U}$ by a refinement. To do this argue as above, once more appealing to Topology, Lemma 5.12.4. Some details omitted.

09V3 Lemma 20.17.3. Let $X$ be a Hausdorff and locally quasi-compact space. Let $Z \subset X$ be a quasi-compact (hence closed) subset. For every abelian sheaf $\mathcal{F}$ on $X$ we have

$$
\operatorname{colim} H^{p}(U, \mathcal{F}) \longrightarrow H^{p}\left(Z,\left.\mathcal{F}\right|_{Z}\right)
$$

where the colimit is over open neighbourhoods $U$ of $Z$ in $X$.
Proof. We first prove this for $p=0$. Injectivity follows from the definition of $\left.\mathcal{F}\right|_{Z}$ and holds in general (for any subset of any topological space $X$ ). Next, suppose that $s \in H^{0}\left(Z,\left.\mathcal{F}\right|_{Z}\right)$. Then we can find opens $U_{i} \subset X$ such that $Z \subset \bigcup U_{i}$ and such that $\left.s\right|_{Z \cap U_{i}}$ comes from $s_{i} \in \mathcal{F}\left(U_{i}\right)$. It follows that there exist opens $W_{i j} \subset U_{i} \cap U_{j}$ with $W_{i j} \cap Z=U_{i} \cap U_{j} \cap Z$ such that $\left.s_{i}\right|_{W_{i j}}=\left.s_{j}\right|_{W_{i j}}$. Applying Topology, Lemma 5.12 .5 we find opens $V_{i}$ of $X$ such that $V_{i} \subset U_{i}$ and such that $V_{i} \cap V_{j} \subset W_{i j}$. Hence we see that $\left.s_{i}\right|_{V_{i}}$ glue to a section of $\mathcal{F}$ over the open neighbourhood $\bigcup V_{i}$ of $Z$.
To finish the proof, it suffices to show that if $\mathcal{I}$ is an injective abelian sheaf on $X$, then $H^{p}\left(Z,\left.\mathcal{I}\right|_{Z}\right)=0$ for $p>0$. This follows using short exact sequences and dimension shifting; details omitted. Thus, suppose $\bar{\xi}$ is an element of $H^{p}\left(Z,\left.\mathcal{I}\right|_{Z}\right)$ for some $p>0$. By Lemma 20.17 .2 the element $\bar{\xi}$ comes from $\check{H}^{p}\left(\mathcal{V},\left.\mathcal{I}\right|_{Z}\right)$ for some open covering $\mathcal{V}: Z=\bigcup V_{i}$ of $Z$. Say $\bar{\xi}$ is the image of the class of a cocycle $\xi=\left(\xi_{i_{0} \ldots i_{p}}\right)$ in $\check{\mathcal{C}}^{p}\left(\mathcal{V},\left.\mathcal{I}\right|_{Z}\right)$.
Let $\left.\mathcal{I}^{\prime} \subset \mathcal{I}\right|_{Z}$ be the subpresheaf defined by the rule

$$
\mathcal{I}^{\prime}(V)=\left\{\left.s \in \mathcal{I}\right|_{Z}(V) \mid \exists(U, t), U \subset X \text { open, } t \in \mathcal{I}(U), V=Z \cap U, s=\left.t\right|_{Z \cap U}\right\}
$$

Then $\left.\mathcal{I}\right|_{Z}$ is the sheafification of $\mathcal{I}^{\prime}$. Thus for every $(p+1)$-tuple $i_{0} \ldots i_{p}$ we can find an open covering $V_{i_{0} \ldots i_{p}}=\bigcup W_{i_{0} \ldots i_{p}, k}$ such that $\left.\xi_{i_{0} \ldots i_{p}}\right|_{W_{i_{0} \ldots i_{p}, k}}$ is a section of
$\mathcal{I}^{\prime}$. Applying Topology, Lemma 5.12 .4 we may after refining $\mathcal{V}$ assume that each $\xi_{i_{0} \ldots i_{p}}$ is a section of the presheaf $\mathcal{I}^{\prime}$.

Write $V_{i}=Z \cap U_{i}$ for some opens $U_{i} \subset X$. Since $\mathcal{I}$ is flasque (Lemma 20.13.2) and since $\xi_{i_{0} \ldots i_{p}}$ is a section of $\mathcal{I}^{\prime}$ for every $(p+1)$-tuple $i_{0} \ldots i_{p}$ we can choose a section $s_{i_{0} \ldots i_{p}} \in \mathcal{I}\left(U_{i_{0} \ldots i_{p}}\right)$ which restricts to $\xi_{i_{0} \ldots i_{p}}$ on $V_{i_{0} \ldots i_{p}}=Z \cap U_{i_{0} \ldots i_{p}}$. (This appeal to injectives being flasque can be avoided by an additional application of Topology, Lemma 5.12.5.) Let $s=\left(s_{i_{0} \ldots i_{p}}\right)$ be the corresponding cochain for the open covering $U=\bigcup U_{i}$. Since $\mathrm{d}(\xi)=0$ we see that the sections $\mathrm{d}(s)_{i_{0} \ldots i_{p+1}}$ restrict to zero on $Z \cap U_{i_{0} \ldots i_{p+1}}$. Hence, by the initial remarks of the proof, there exists open subsets $W_{i_{0} \ldots i_{p+1}} \subset U_{i_{0} \ldots i_{p+1}}$ with $Z \cap W_{i_{0} \ldots i_{p+1}}=Z \cap U_{i_{0} \ldots i_{p+1}}$ such that $\left.\mathrm{d}(s)_{i_{0} \ldots i_{p+1}}\right|_{W_{i_{0} \ldots i_{p+1}}}=0$. By Topology, Lemma 5.12.5 we can find $U_{i}^{\prime} \subset U_{i}$ such that $Z \subset \bigcup U_{i}^{\prime}$ and such that $U_{i_{0} \ldots i_{p+1}}^{\prime} \subset W_{i_{0} \ldots i_{p+1}}$. Then $s^{\prime}=\left(s_{i_{0} \ldots i_{p}}^{\prime}\right)$ with $s_{i_{0} \ldots i_{p}}^{\prime}=\left.s_{i_{0} \ldots i_{p}}\right|_{U_{i_{0} \ldots i_{p}}^{\prime}}$ is a cocycle for $\mathcal{I}$ for the open covering $U^{\prime}=\bigcup U_{i}^{\prime}$ of an open neighbourhood of $Z$. Since $\mathcal{I}$ has trivial higher Čech cohomology groups (Lemma 20.12.1 we conclude that $s^{\prime}$ is a coboundary. It follows that the image of $\xi$ in the Cech complex for the open covering $Z=\bigcup Z \cap U_{i}^{\prime}$ is a coboundary and we are done.

### 20.18. The base change map

02N6 We will need to know how to construct the base change map in some cases. Since we have not yet discussed derived pullback we only discuss this in the case of a base change by a flat morphism of ringed spaces. Before we state the result, let us discuss flat pullback on the derived category. Namely, suppose that $g: X \rightarrow Y$ is a flat morphism of ringed spaces. By Modules, Lemma 17.17 .2 the functor $g^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is exact. Hence it has a derived functor

$$
g^{*}: D^{+}(Y) \rightarrow D^{+}(X)
$$

which is computed by simply pulling back an representative of a given object in $D^{+}(Y)$, see Derived Categories, Lemma 13.17.9. Hence as indicated we indicate this functor by $g^{*}$ rather than $L g^{*}$.

02N7 Lemma 20.18.1. Let

be a commutative diagram of ringed spaces. Let $\mathcal{F}^{\bullet}$ be a bounded below complex of $\mathcal{O}_{X}$-modules. Assume both $g$ and $g^{\prime}$ are flat. Then there exists a canonical base change map

$$
g^{*} R f_{*} \mathcal{F}^{\bullet} \longrightarrow R\left(f^{\prime}\right)_{*}\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet}
$$

in $D^{+}\left(S^{\prime}\right)$.
Proof. Choose injective resolutions $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ and $\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet} \rightarrow \mathcal{J}^{\bullet}$. By Lemma 20.12 .11 we see that $\left(g^{\prime}\right)_{*} \mathcal{J}^{\bullet}$ is a complex of injectives representing $R\left(g^{\prime}\right)_{*}\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet}$. Hence by Derived Categories, Lemmas 13.18 .6 and 13.18 .7 the arrow $\beta$ in the
diagram

exists and is unique up to homotopy. Pushing down to $S$ we get

$$
f_{*} \beta: f_{*} \mathcal{I}^{\bullet} \longrightarrow f_{*}\left(g^{\prime}\right)_{*} \mathcal{J}^{\bullet}=g_{*}\left(f^{\prime}\right)_{*} \mathcal{J}^{\bullet}
$$

By adjunction of $g^{*}$ and $g_{*}$ we get a map of complexes $g^{*} f_{*} \mathcal{I}^{\bullet} \rightarrow\left(f^{\prime}\right)_{*} \mathcal{J}^{\bullet}$. Note that this map is unique up to homotopy since the only choice in the whole process was the choice of the map $\beta$ and everything was done on the level of complexes.

02N8 Remark 20.18.2. The "correct" version of the base change map is map

$$
L g^{*} R f_{*} \mathcal{F}^{\bullet} \longrightarrow R\left(f^{\prime}\right)_{*} L\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet}
$$

The construction of this map involves unbounded complexes, see Remark 20.29.2.

### 20.19. Proper base change in topology

09 V 4 In this section we prove a very general version of the proper base change theorem in topology. It tells us that the stalks of the higher direct images $R^{p} f_{*}$ can be computed on the fibre.

09V5 Lemma 20.19.1. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $y \in Y$. Assume that
(1) $X$ is Hausdorff and locally quasi-compact,
(2) $f^{-1}(y)$ is quasi-compact, and
(3) $f$ is closed.

Then for $E$ in $D^{+}\left(\mathcal{O}_{X}\right)$ we have $\left(R f_{*} E\right)_{y}=R \Gamma\left(f^{-1}(y),\left.E\right|_{f^{-1}(y)}\right)$ in $D^{+}\left(\mathcal{O}_{Y, y}\right)$.
Proof. The base change map of Lemma 20.18.1 gives a canonical map $\left(R f_{*} E\right)_{y} \rightarrow$ $R \Gamma\left(f^{-1}(y),\left.E\right|_{f^{-1}(y)}\right)$. To prove this map is an isomorphism, we represent $E$ by a bounded below complex of injectives $\mathcal{I}^{\bullet}$. By Lemma 20.17 .3 the restrictions $\left.\mathcal{I}^{n}\right|_{f^{-1}(y)}$ are acyclic for $\Gamma\left(f^{-1}(y),-\right)$. Thus $R \Gamma\left(f^{-1}(y),\left.E\right|_{f^{-1}(y)}\right)$ is represented by the complex $\Gamma\left(f^{-1}(y),\left.\mathcal{I}^{\bullet}\right|_{f^{-1}(y)}\right)$, see Derived Categories, Lemma 13.17.7. In other words, we have to show the map

$$
\operatorname{colim}_{V} \mathcal{I}^{\bullet}\left(f^{-1}(V)\right) \longrightarrow \Gamma\left(f^{-1}(y),\left.\mathcal{I}^{\bullet}\right|_{f^{-1}(y)}\right)
$$

is an isomorphism. Using Lemma 20.17 .3 we see that it suffices to show that the collection of open neighbourhoods $f^{-1}(V)$ of $f^{-1}(y)$ is cofinal in the system of all open neighbourhoods. If $f^{-1}(y) \subset U$ is an open neighbourhood, then as $f$ is closed the set $V=Y \backslash f(X \backslash U)$ is an open neighbourhood of $y$ with $f^{-1}(V) \subset U$. This proves the lemma.
09V6 Theorem 20.19.2 (Proper base change). Consider a cartesian square of Hausdorff, locally quasi-compact topological spaces

and assume that $f$ is proper. Let $E$ be an object of $D^{+}(X)$. Then the base change map

$$
g^{-1} R f_{*} E \longrightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} E
$$

of Lemma 20.18.1 is an isomorphism in $D^{+}\left(Y^{\prime}\right)$.
Proof. Let $y^{\prime} \in Y^{\prime}$ be a point with image $y \in Y$. It suffices to show that the base change map induces an isomorphism on stalks at $y^{\prime}$. As $f$ is proper it follows that $f^{\prime}$ is proper, the fibres of $f$ and $f^{\prime}$ are quasi-compact and $f$ and $f^{\prime}$ are closed, see Topology, Theorem 5.16.5. Thus we can apply Lemma 20.19.1 twice to see that

$$
\left(R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} E\right)_{y^{\prime}}=R \Gamma\left(\left(f^{\prime}\right)^{-1}\left(y^{\prime}\right),\left.\left(g^{\prime}\right)^{-1} E\right|_{\left(f^{\prime}\right)^{-1}\left(y^{\prime}\right)}\right)
$$

and

$$
\left(R f_{*} E\right)_{y}=R \Gamma\left(f^{-1}(y),\left.E\right|_{f^{-1}(y)}\right)
$$

The induced map of fibres $\left(f^{\prime}\right)^{-1}\left(y^{\prime}\right) \rightarrow f^{-1}(y)$ is a homeomorphism of topological spaces and the pull back of $\left.E\right|_{f^{-1}(y)}$ is $\left.\left(g^{\prime}\right)^{-1} E\right|_{\left(f^{\prime}\right)^{-1}\left(y^{\prime}\right)}$. The desired result follows.

### 20.20. Cohomology and colimits

01 FE Let $X$ be a ringed space. Let $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ be a directed system of sheaves of $\mathcal{O}_{X^{-}}$ modules over the partially ordered set $I$, see Categories, Section 4.21. Since for each $i$ there is a canonical map $\mathcal{F}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{F}_{i}$ we get a canonical map

$$
\operatorname{colim}_{i} H^{p}\left(X, \mathcal{F}_{i}\right) \longrightarrow H^{p}\left(X, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

for every $p \geq 0$. Of course there is a similar map for every open $U \subset X$. These maps are in general not isomorphisms, even for $p=0$. In this section we generalize the results of Sheaves, Lemma 6.29.1. See also Modules, Lemma 17.11 .6 (in the special case $\left.\mathcal{G}=\mathcal{O}_{X}\right)$.

01FF Lemma 20.20.1. Let $X$ be a ringed space. Assume that the underlying topological space of $X$ has the following properties:
(1) there exists a basis of quasi-compact open subsets, and
(2) the intersection of any two quasi-compact opens is quasi-compact.

Then for any directed system $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ of sheaves of $\mathcal{O}_{X}$-modules and for any quasicompact open $U \subset X$ the canonical map

$$
\operatorname{colim}_{i} H^{q}\left(U, \mathcal{F}_{i}\right) \longrightarrow H^{q}\left(U, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

is an isomorphism for every $q \geq 0$.
Proof. It is important in this proof to argue for all quasi-compact opens $U \subset X$ at the same time. The result is true for $i=0$ and any quasi-compact open $U \subset X$ by Sheaves, Lemma 6.29.1 (combined with Topology, Lemma 5.26.1). Assume that we have proved the result for all $q \leq q_{0}$ and let us prove the result for $q=q_{0}+1$.
By our conventions on directed systems the index set $I$ is directed, and any system of $\mathcal{O}_{X}$-modules $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ over $I$ is directed. By Injectives, Lemma 19.5.1 the category of $\mathcal{O}_{X}$-modules has functorial injective embeddings. Thus for any system $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ there exists a system $\left(\mathcal{I}_{i}, \varphi_{i i^{\prime}}\right)$ with each $\mathcal{I}_{i}$ an injective $\mathcal{O}_{X}$-module and a morphism of systems given by injective $\mathcal{O}_{X}$-module maps $\mathcal{F}_{i} \rightarrow \mathcal{I}_{i}$. Denote $\mathcal{Q}_{i}$ the cokernel so that we have short exact sequences

$$
0 \rightarrow \mathcal{F}_{i} \rightarrow \mathcal{I}_{i} \rightarrow \mathcal{Q}_{i} \rightarrow 0
$$

We claim that the sequence

$$
0 \rightarrow \operatorname{colim}_{i} \mathcal{F}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{I}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{Q}_{i} \rightarrow 0
$$

is also a short exact sequence of $\mathcal{O}_{X}$-modules. We may check this on stalks. By Sheaves, Sections 6.28 and 6.29 taking stalks commutes with colimits. Since a directed colimit of short exact sequences of abelian groups is short exact (see Algebra, Lemma 10.8.9) we deduce the result. We claim that $H^{q}\left(U, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=0$ for all quasi-compact open $U \subset X$ and all $q \geq 1$. Accepting this claim for the moment consider the diagram

The zero at the lower right corner comes from the claim and the zero at the upper right corner comes from the fact that the sheaves $\mathcal{I}_{i}$ are injective. The top row is exact by an application of Algebra, Lemma 10.8.9. Hence by the snake lemma we deduce the result for $q=q_{0}+1$.

It remains to show that the claim is true. We will use Lemma 20.12.9, Let $\mathcal{B}$ be the collection of all quasi-compact open subsets of $X$. This is a basis for the topology on $X$ by assumption. Let Cov be the collection of finite open coverings $\mathcal{U}: U=\bigcup_{j=1, \ldots, m} U_{j}$ with each of $U, U_{j}$ quasi-compact open in $X$. By the result for $q=0$ we see that for $\mathcal{U} \in$ Cov we have

$$
\check{\mathcal{C}} \bullet\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=\operatorname{colim}_{i} \check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}_{i}\right)
$$

because all the multiple intersections $U_{j_{0} \ldots j_{p}}$ are quasi-compact. By Lemma 20.12 .1 each of the complexes in the colimit of Cech complexes is acyclic in degree $\geq 1$. Hence by Algebra, Lemma 10.8.9 we see that also the Čech complex $\check{\mathcal{C}} \bullet\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)$ is acyclic in degrees $\geq 1$. In other words we see that $\check{H}^{p}\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=0$ for all $p \geq 1$. Thus the assumptions of Lemma 20.12 .9 are satisfied and the claim follows.

Next we formulate the analogy of Sheaves, Lemma 6.29.4 for cohomology. Let $X$ be a spectral space which is written as a cofiltered limit of spectral spaces $X_{i}$ for a diagram with spectral transition morphisms as in Topology, Lemma 5.23.5. Assume given
(1) an abelian sheaf $\mathcal{F}_{i}$ on $X_{i}$ for all $i \in \operatorname{Ob}(\mathcal{I})$,
(2) for $a: j \rightarrow i$ an $f_{a}$-map $\varphi_{a}: \mathcal{F}_{i} \rightarrow \mathcal{F}_{j}$ of abelian sheaves (see Sheaves, Definition 6.21.7)
such that $\varphi_{c}=\varphi_{b} \circ \varphi_{a}$ whenever $c=a \circ b$. Set $\mathcal{F}=\operatorname{colim} p_{i}^{-1} \mathcal{F}_{i}$ on $X$.
0A37 Lemma 20.20.2. In the situation discussed above. Let $i \in \operatorname{Ob}(\mathcal{I})$ and let $U_{i} \subset X_{i}$ be quasi-compact open. Then

$$
\operatorname{colim}_{a: j \rightarrow i} H^{p}\left(f_{a}^{-1}\left(U_{i}\right), \mathcal{F}_{j}\right)=H^{p}\left(p_{i}^{-1}\left(U_{i}\right), \mathcal{F}\right)
$$

for all $p \geq 0$. In particular we have $H^{p}(X, \mathcal{F})=\operatorname{colim} H^{p}\left(X_{i}, \mathcal{F}_{i}\right)$.

Proof. The case $p=0$ is Sheaves, Lemma 6.29.4.
In this paragraph we show that we can find a map of systems $\left(\gamma_{i}\right):\left(\mathcal{F}_{i}, \varphi_{a}\right) \rightarrow$ $\left(\mathcal{G}_{i}, \psi_{a}\right)$ with $\mathcal{G}_{i}$ an injective abelian sheaf and $\gamma_{i}$ injective. For each $i$ we pick an injection $\mathcal{F}_{i} \rightarrow \mathcal{I}_{i}$ where $\mathcal{I}_{i}$ is an injective abelian sheaf on $X_{i}$. Then we can consider the family of maps

$$
\gamma_{i}: \mathcal{F}_{i} \longrightarrow \prod_{b: k \rightarrow i} f_{b, *} \mathcal{I}_{k}=\mathcal{G}_{i}
$$

where the component maps are the maps adjoint to the maps $f_{b}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{k} \rightarrow \mathcal{I}_{k}$. For $a: j \rightarrow i$ in $\mathcal{I}$ there is a canonical map

$$
\psi_{a}: f_{a}^{-1} \mathcal{G}_{i} \rightarrow \mathcal{G}_{j}
$$

whose components are the canonical maps $f_{b}^{-1} f_{a \circ b, *} \mathcal{I}_{k} \rightarrow f_{b, *} \mathcal{I}_{k}$ for $b: k \rightarrow j$. Thus we find an injection $\left\{\gamma_{i}\right\}:\left\{\mathcal{F}_{i}, \varphi_{a}\right) \rightarrow\left(\mathcal{G}_{i}, \psi_{a}\right)$ of systems of abelian sheaves. Note that $\mathcal{G}_{i}$ is an injective sheaf of abelian groups on $\mathcal{C}_{i}$, see Lemma 20.12.11 and Homology, Lemma 12.23.3. This finishes the construction.

Arguing exactly as in the proof of Lemma 20.20.1 we see that it suffices to prove that $H^{p}\left(X, \operatorname{colim} f_{i}^{-1} \mathcal{G}_{i}\right)=0$ for $p>0$.

Set $\mathcal{G}=\operatorname{colim} f_{i}^{-1} \mathcal{G}_{i}$. To show vanishing of cohomology of $\mathcal{G}$ on every quasi-compact open of $X$, it suffices to show that the Čech cohomology of $\mathcal{G}$ for any covering $\mathcal{U}$ of a quasi-compact open of $X$ by finitely many quasi-compact opens is zero, see Lemma 20.12.9. Such a covering is the inverse by $p_{i}$ of such a covering $\mathcal{U}_{i}$ on the space $X_{i}$ for some $i$ by Topology, Lemma 5.23.6. We have

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{G})=\operatorname{colim}_{a: j \rightarrow i} \check{\mathcal{C}}^{\bullet}\left(f_{a}^{-1}\left(\mathcal{U}_{i}\right), \mathcal{G}_{j}\right)
$$

by the case $p=0$. The right hand side is a filtered colimit of complexes each of which is acyclic in positive degrees by Lemma 20.12.1. Thus we conclude by Algebra, Lemma 10.8.9.

### 20.21. Vanishing on Noetherian topological spaces

02UU The aim is to prove a theorem of Grothendieck namely Proposition 20.21.6. See Gro57.

02UV Lemma 20.21.1. Let $i: Z \rightarrow X$ be a closed immersion of topological spaces. For any abelian sheaf $\mathcal{F}$ on $Z$ we have $H^{p}(Z, \mathcal{F})=H^{p}\left(X, i_{*} \mathcal{F}\right)$.

Proof. This is true because $i_{*}$ is exact (see Modules, Lemma 17.6.1), and hence $R^{p} i_{*}=0$ as a functor (Derived Categories, Lemma 13.17.9. Thus we may apply Lemma 20.14.6.

02UW Lemma 20.21.2. Let $X$ be an irreducible topological space. Then $H^{p}(X, \underline{A})=0$ for all $p>0$ and any abelian group $A$.

Proof. Recall that $\underline{A}$ is the constant sheaf as defined in Sheaves, Definition 6.7.4 It is clear that for any nonempty open $U \subset X$ we have $\underline{A}(U)=A$ as $X$ is irreducible (and hence $U$ is connected). We will show that the higher Cech cohomology groups $\check{H}^{p}(\mathcal{U}, \underline{A})$ are zero for any open covering $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ of an open $U \subset X$. Then the lemma will follow from Lemma 20.12.8.

Recall that the value of an abelian sheaf on the empty open set is 0 . Hence we may clearly assume $U_{i} \neq \emptyset$ for all $i \in I$. In this case we see that $U_{i} \cap U_{i^{\prime}} \neq \emptyset$ for all $i, i^{\prime} \in I$. Hence we see that the Čech complex is simply the complex

$$
\prod_{i_{0} \in I} A \rightarrow \prod_{\left(i_{0}, i_{1}\right) \in I^{2}} A \rightarrow \prod_{\left(i_{0}, i_{1}, i_{2}\right) \in I^{3}} A \rightarrow \ldots
$$

We have to see this has trivial higher cohomology groups. We can see this for example because this is the Čech complex for the covering of a 1-point space and Čech cohomology agrees with cohomology on such a space. (You can also directly verify it by writing an explicit homotopy.)

0A38 Lemma 20.21.3. Let $X$ be a topological space such that the intersection of any two quasi-compact opens is quasi-compact. Let $\mathcal{F} \subset \underline{\mathbf{Z}}$ be a subsheaf generated by finitely many sections over quasi-compact opens. Then there exists a finite filtration

$$
(0)=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{n}=\mathcal{F}
$$

by abelian subsheaves such that for each $0<i \leq n$ there exists a short exact sequence

$$
0 \rightarrow j_{!}^{\prime} \underline{\mathbf{Z}}_{V} \rightarrow j!\underline{\mathbf{Z}}_{U} \rightarrow \mathcal{F}_{i} / \mathcal{F}_{i-1} \rightarrow 0
$$

with $j: U \rightarrow X$ and $j^{\prime}: V \rightarrow X$ the inclusion of quasi-compact opens into $X$.
Proof. Say $\mathcal{F}$ is generated by the sections $s_{1}, \ldots, s_{t}$ over the quasi-compact opens $U_{1}, \ldots, U_{t}$. Since $U_{i}$ is quasi-compact and $s_{i}$ a locally constant function to $\mathbf{Z}$ we may assume, after possibly replacing $U_{i}$ by the parts of a finite decomposition into open and closed subsets, that $s_{i}$ is a constant section. Say $s_{i}=n_{i}$ with $n_{i} \in \mathbf{Z}$. Of course we can remove $\left(U_{i}, n_{i}\right)$ from the list if $n_{i}=0$. Flipping signs if necessary we may also assume $n_{i}>0$. Next, for any subset $I \subset\{1, \ldots, t\}$ we may add $\bigcup_{i \in I} U_{i}$ and $\operatorname{gcd}\left(n_{i}, i \in I\right)$ to the list. After doing this we see that our list $\left(U_{1}, n_{1}\right), \ldots,\left(U_{t}, n_{t}\right)$ satisfies the following property: For $x \in X$ set $I_{x}=\left\{i \in\{1, \ldots, t\} \mid x \in U_{i}\right\}$. Then $\operatorname{gcd}\left(n_{i}, i \in I_{x}\right)$ is attained by $n_{i}$ for some $i \in I_{x}$.
As our filtration we take $\mathcal{F}_{0}=(0)$ and $\mathcal{F}_{n}$ generated by the sections $n_{i}$ over $U_{i}$ for those $i$ such that $n_{i} \leq n$. It is clear that $\mathcal{F}_{n}=\mathcal{F}$ for $n \gg 0$. Moreover, the quotient $\mathcal{F}_{n} / \mathcal{F}_{n-1}$ is generated by the section $n$ over $U=\bigcup_{n_{i} \leq n} U_{i}$ and the kernel of the $\operatorname{map} j!\underline{Z}_{U} \rightarrow \mathcal{F}_{n} / \mathcal{F}_{n-1}$ is generated by the section $n$ over $V=\bigcup_{n_{i} \leq n-1} U_{i}$. Thus a short exact sequence as in the statment of the lemma.

02UX Lemma 20.21.4. Let $X$ be a topological space. Let $d \geq 0$ be an integer. Assume
(1) $X$ is quasi-compact,
(2) the quasi-compact opens form a basis for $X$, and
(3) the intersection of two quasi-compact opens is quasi-compact.
(4) $H^{p}\left(X, j!\underline{\mathbf{Z}}_{U}\right)=0$ for all $p>d$ and any quasi-compact open $j: U \rightarrow X$.

Then $H^{p}(X, \mathcal{F})=0$ for all $p>d$ and any abelian sheaf $\mathcal{F}$ on $X$.
Proof. Let $S=\coprod_{U \subset X} \mathcal{F}(U)$ where $U$ runs over the quasi-compact opens of $X$. For any finite subset $A=\left\{s_{1}, \ldots, s_{n}\right\} \subset S$, let $\mathcal{F}_{A}$ be the subsheaf of $\mathcal{F}$ generated by all $s_{i}$ (see Modules, Definition 17.4.5. Note that if $A \subset A^{\prime}$, then $\mathcal{F}_{A} \subset \mathcal{F}_{A^{\prime}}$. Hence $\left\{\mathcal{F}_{A}\right\}$ forms a system over the directed partially ordered set of finite subsets of $S$. By Modules, Lemma 17.4.6 it is clear that

$$
\operatorname{colim}_{A} \mathcal{F}_{A}=\mathcal{F}
$$

by looking at stalks. By Lemma 20.20.1 we have

$$
H^{p}(X, \mathcal{F})=\operatorname{colim}_{A} H^{p}\left(X, \mathcal{F}_{A}\right)
$$

Hence it suffices to prove the vanishing for the abelian sheaves $\mathcal{F}_{A}$. In other words, it suffices to prove the result when $\mathcal{F}$ is generated by finitely many local sections over quasi-compact opens of $X$.

Suppose that $\mathcal{F}$ is generated by the local sections $s_{1}, \ldots, s_{n}$. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf generated by $s_{1}, \ldots, s_{n-1}$. Then we have a short exact sequence

$$
0 \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{F} / \mathcal{F}^{\prime} \rightarrow 0
$$

From the long exact sequence of cohomology we see that it suffices to prove the vanishing for the abelian sheaves $\mathcal{F}^{\prime}$ and $\mathcal{F} / \mathcal{F}^{\prime}$ which are generated by fewer than $n$ local sections. Hence it suffices to prove the vanishing for sheaves generated by at most one local section. These sheaves are exactly the quotients of the sheaves $j!\underline{\mathbf{Z}}_{U}$ where $U$ is a quasi-compact open of $X$.
Assume now that we have a short exact sequence

$$
0 \rightarrow \mathcal{K} \rightarrow j!\underline{\mathbf{Z}}_{U} \rightarrow \mathcal{F} \rightarrow 0
$$

with $U$ quasi-compact open in $X$. It suffices to show that $H^{q}(X, \mathcal{K})$ is zero for $q \geq d+1$. As above we can write $\mathcal{K}$ as the filtered colimit of subsheaves $\mathcal{K}^{\prime}$ generated by finitely many sections over quasi-compact opens. Then $\mathcal{F}$ is the filtered colimit of the sheaves $j!\underline{\mathbf{Z}}_{U} / \mathcal{K}^{\prime}$. In this way we reduce to the case that $\mathcal{K}$ is generated by finitely many sections over quasi-compact opens. Note that $\mathcal{K}$ is a subsheaf of $\underline{\mathbf{Z}}_{X}$. Thus by Lemma 20.21 .3 there exists a finite filtration of $\mathcal{K}$ whose successive quotients $\mathcal{Q}$ fit into a short exact sequence

$$
0 \rightarrow j_{!}^{\prime \prime} \underline{\mathbf{Z}}_{W} \rightarrow j_{!}^{\prime} \underline{\mathbf{Z}}_{V} \rightarrow \mathcal{Q} \rightarrow 0
$$

with $j^{\prime \prime}: W \rightarrow X$ and $j^{\prime}: V \rightarrow X$ the inclusions of quasi-compact opens. Hence the vanishing of $H^{p}(X, \mathcal{Q})$ for $p>d$ follows from our assumption (in the lemma) on the vanishing of the cohomology groups of $j_{!}^{\prime \prime} \underline{\mathbf{Z}}_{W}$ and $j_{!}^{\prime} \underline{\mathbf{Z}}_{V}$. Returning to $\mathcal{K}$ this, via an induction argument using the long exact cohomology sequence, implies the desired vanishing for it as well.

02UY Lemma 20.21.5. Let $X$ be an irreducible topological space. Let $\mathcal{H} \subset \underline{\mathbf{Z}}$ be an abelian subsheaf of the constant sheaf. Then there exists a nonempty open $U \subset X$ such that $\left.\mathcal{H}\right|_{U}=\underline{d \mathbf{Z}_{U}}$ for some $d \in \mathbf{Z}$.
Proof. Recall that $\underline{\mathbf{Z}}(V)=\mathbf{Z}$ for any nonempty open $V$ of $X$ (see proof of Lemma 20.21.2. If $\mathcal{H}=0$, then the lemma holds with $d=0$. If $\mathcal{H} \neq 0$, then there exists a nonempty open $U \subset X$ such that $\mathcal{H}(U) \neq 0$. Say $\mathcal{H}(U)=n \mathbf{Z}$ for some $n \geq 1$. Hence we see that $\left.n \mathbf{Z}_{U} \subset \mathcal{H}\right|_{U} \subset \underline{\mathbf{Z}}_{U}$. If the first inclusion is strict we can find a nonempty $U^{\prime} \subset U$ and an integer $1 \leq n^{\prime}<n$ such that $\left.\underline{n}^{\prime} \underline{Z}_{U^{\prime}} \subset \mathcal{H}\right|_{U^{\prime}} \subset \underline{\mathbf{Z}}_{U^{\prime}}$. This process has to stop after a finite number of steps, and hence we get the lemma.

02UZ Proposition 20.21.6 (Grothendieck). Let $X$ be a Noetherian topological space. Gro57, Theorem If $\operatorname{dim}(X) \leq d$, then $H^{p}(X, \mathcal{F})=0$ for all $p>d$ and any abelian sheaf $\mathcal{F}$ on $X$. 3.6.5].

Proof. We prove this lemma by induction on $d$. So fix $d$ and assume the lemma holds for all Noetherian topological spaces of dimension $<d$.

Let $\mathcal{F}$ be an abelian sheaf on $X$. Suppose $U \subset X$ is an open. Let $Z \subset X$ denote the closed complement. Denote $j: U \rightarrow X$ and $i: Z \rightarrow X$ the inclusion maps. Then there is a short exact sequence

$$
0 \rightarrow j!j^{*} \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_{*} i^{*} \mathcal{F} \rightarrow 0
$$

see Modules, Lemma 17.7.1. Note that $j!j^{*} \mathcal{F}$ is supported on the topological closure $Z^{\prime}$ of $U$, i.e., it is of the form $i_{*}^{\prime} \mathcal{F}^{\prime}$ for some abelian sheaf $\mathcal{F}^{\prime}$ on $Z^{\prime}$, where $i^{\prime}: Z^{\prime} \rightarrow X$ is the inclusion.

We can use this to reduce to the case where $X$ is irreducible. Namely, according to Topology, Lemma 5.8.2 $X$ has finitely many irreducible components. If $X$ has more than one irreducible component, then let $Z \subset X$ be an irreducible component of $X$ and set $U=X \backslash Z$. By the above, and the long exact sequence of cohomology, it suffices to prove the vanishing of $H^{p}\left(X, i_{*} i^{*} \mathcal{F}\right)$ and $H^{p}\left(X, i_{*}^{\prime} \mathcal{F}^{\prime}\right)$ for $p>d$. By Lemma 20.21.1 it suffices to prove $H^{p}\left(Z, i^{*} \mathcal{F}\right)$ and $H^{p}\left(Z^{\prime}, \mathcal{F}^{\prime}\right)$ vanish for $p>d$. Since $Z^{\prime}$ and $Z$ have fewer irreducible components we indeed reduce to the case of an irreducible $X$.

If $d=0$ and $X=\{*\}$, then every sheaf is constant and higher cohomology groups vanish (for example by Lemma 20.21.2).

Suppose $X$ is irreducible of dimension $d$. By Lemma 20.21.4 we reduce to the case where $\mathcal{F}=j!\underline{\mathbf{Z}}_{U}$ for some open $U \subset X$. In this case we look at the short exact sequence

$$
0 \rightarrow j_{!}\left(\underline{\mathbf{Z}}_{U}\right) \rightarrow \underline{\mathbf{Z}}_{X} \rightarrow i_{*} \underline{\mathbf{Z}}_{Z} \rightarrow 0
$$

where $Z=X \backslash U$. By Lemma 20.21 .2 we have the vanishing of $H^{p}\left(X, \underline{\mathbf{Z}}_{X}\right)$ for all $p \geq 1$. By induction we have $H^{p}\left(X, i_{*} \underline{\mathbf{Z}}_{Z}\right)=H^{p}\left(Z, \underline{\mathbf{Z}}_{Z}\right)=0$ for $p \geq d$. Hence we win by the long exact cohomology sequence.

### 20.22. Cohomology with support in a closed

0 A39 Let $X$ be a topological space and let $Z \subset X$ be a closed subset. Let $\mathcal{F}$ be an abelian sheaf on $X$. We let

$$
\Gamma_{Z}(X, \mathcal{F})=\{s \in \mathcal{F}(X) \mid \operatorname{Supp}(s) \subset Z\}
$$

be the sections with support in $Z$ (Modules, Definition 17.5.1). This is a left exact functor which is not exact in general. Hence we obtain a derived functor

$$
R \Gamma_{Z}(X,-): D(X) \longrightarrow D(A b)
$$

and cohomology groups with support in $Z$ defined by $H_{Z}^{q}(X, \mathcal{F})=R^{q} \Gamma_{Z}(X, \mathcal{F})$.
Let $\mathcal{I}$ be an injective abelian sheaf on $X$. Let $U=X \backslash Z$. Then the restriction map $\mathcal{I}(X) \rightarrow \mathcal{I}(U)$ is surjective (Lemma 20.9.1) with kernel $\Gamma_{Z}(X, \mathcal{I})$. It immediately follows that for $K \in D(X)$ there is a distinguished triangle

$$
R \Gamma_{Z}(X, K) \rightarrow R \Gamma(X, K) \rightarrow R \Gamma(U, K) \rightarrow R \Gamma_{Z}(X, K)[1]
$$

in $D(A b)$. As a consequence we obtain a long exact cohomology sequence

$$
\ldots \rightarrow H_{Z}^{i}(X, K) \rightarrow H^{i}(X, K) \rightarrow H^{i}(U, K) \rightarrow H_{Z}^{i+1}(X, K) \rightarrow \ldots
$$

for any $K$ in $D(X)$.

For an abelian sheaf $\mathcal{F}$ on $X$ we can consider the subsheaf of sections with support in $Z$, denoted $\mathcal{H}_{Z}(\mathcal{F})$, defined by the rule

$$
\mathcal{H}_{Z}(\mathcal{F})(U)=\{s \in \mathcal{F}(U) \mid \operatorname{Supp}(s) \subset U \cap Z\}
$$

Using the equivalence of Modules, Lemma 17.6.1 we may view $\mathcal{H}_{Z}(\mathcal{F})$ as an abelian sheaf on $Z$ (see also Modules, Lemmas 17.6.2 and 17.6.3). Thus we obtain a functor

$$
A b(X) \longrightarrow A b(Z), \quad \mathcal{F} \longmapsto \mathcal{H}_{Z}(\mathcal{F}) \text { viewed as a sheaf on } Z
$$

which is left exact, but in general not exact.
0A3A Lemma 20.22.1. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. Let $\mathcal{I}$ be an injective abelian sheaf on $X$. Then $\mathcal{H}_{Z}(\mathcal{I})$ is an injective abelian sheaf on $Z$.

Proof. Observe that for any abelian sheaf $\mathcal{G}$ on $Z$ we have

$$
\operatorname{Hom}_{Z}\left(\mathcal{G}, \mathcal{H}_{Z}(\mathcal{F})\right)=\operatorname{Hom}_{X}\left(i_{*} \mathcal{G}, \mathcal{F}\right)
$$

because after all any section of $i_{*} \mathcal{G}$ has support in $Z$. Since $i_{*}$ is exact (Modules, Lemma 17.6.1 and $\mathcal{I}$ injective on $X$ we conclude that $\mathcal{H}_{Z}(\mathcal{I})$ is injective on $Z$.

Denote

$$
R \mathcal{H}_{Z}: D(X) \longrightarrow D(Z)
$$

the derived functor. We set $\mathcal{H}_{Z}^{q}(\mathcal{F})=R^{q} \mathcal{H}_{Z}(\mathcal{F})$ so that $\mathcal{H}_{Z}^{0}(\mathcal{F})=\mathcal{H}_{Z}(\mathcal{F})$. By the lemma above we have a Grothendieck spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(Z, \mathcal{H}_{Z}^{q}(\mathcal{F})\right) \Rightarrow H_{Z}^{p+q}(X, \mathcal{F})
$$

0A3B Lemma 20.22.2. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. Let $\mathcal{G}$ be an injective abelian sheaf on $Z$. Then $\mathcal{H}_{Z}^{p}\left(i_{*} \mathcal{G}\right)=0$ for $p>0$.

Proof. This is true because the functor $i_{*}$ is exact and transforms injective abelian sheaves into injective abelian sheaves by Lemma 20.12.11.
Let $X$ be a topological space and let $Z \subset X$ be a closed subset. We denote $D_{Z}(X)$ the strictly full saturated triangulated subcategory of $D(X)$ consisting of complexes whose cohomology sheaves are supported on $Z$.

0AEF Lemma 20.22.3. Let $i: Z \rightarrow X$ be the inclusion of a closed subset of a topological space $X$. The map $R i_{*}=i_{*}: D(Z) \rightarrow D(X)$ induces an equivalence $D(Z) \rightarrow$ $D_{Z}(X)$ with quasi-inverse

$$
\left.i^{-1}\right|_{D_{Z}(X)}=\left.R \mathcal{H}_{Z}\right|_{D_{Z}(X)}
$$

Proof. Recall that $i^{-1}$ and $i_{*}$ is an adjoint pair of exact functors such that $i^{-1} i_{*}$ is isomorphic to the identify functor on abelian sheaves. See Modules, Lemmas 17.3 .3 and 17.6 .1 Thus $i_{*}: D(Z) \rightarrow D_{Z}(X)$ is fully faithfull and $i^{-1}$ determines a left inverse. On the other hand, suppose that $K$ is an object of $D_{Z}(X)$ and consider the adjunction map $K \rightarrow i_{*} i^{-1} K$. Using exactness of $i_{*}$ and $i^{-1}$ this induces the adjunction maps $H^{n}(K) \rightarrow i_{*} i^{-1} H^{n}(K)$ on cohomology sheaves. Since these cohomology sheaves are supported on $Z$ we see these adjunction maps are isomorphisms and we conclude that $D(Z) \rightarrow D_{Z}(X)$ is an equivalence.
To finish the proof we have to show that $R \mathcal{H}_{Z}(K)=i^{-1} K$ if $K$ is an object of $D_{Z}(X)$. To do this we can use that $K=i_{*} i^{-1} K$ as we've just proved this is the case. Then we can choose a K-injective representative $\mathcal{I}^{\bullet}$ for $i^{-1} K$. Since $i_{*}$ is the right adjoint to the exact functor $i^{-1}$, the complex $i_{*} \mathcal{I}^{\bullet}$ is K-injective (Derived

Categories, Lemma 13.29.9. We see that $R \mathcal{H}_{Z}(K)$ is computed by $\mathcal{H}_{Z}\left(i_{*} \mathcal{I}^{\bullet}\right)=\mathcal{I}^{\bullet}$ as desired.

### 20.23. Cohomology on spectral spaces

0A3C A key result on the cohomology of spectral spaces is Lemma 20.20 .2 which loosely speaking says that cohomology commutes with cofiltered limits in the category of spectral spaces as defined in Topology, Definition 5.22.1. This can be applied to give analogues of Lemmas 20.17.3 and 20.19.1 as follows.

0A3D Lemma 20.23.1. Let $X$ be a spectral space. Let $\mathcal{F}$ be an abelian sheaf on $X$. Let $E \subset X$ be a quasi-compact subset. Let $W \subset X$ be the set of points of $X$ which specialize to a point of $E$.
(1) $H^{p}\left(W,\left.\mathcal{F}\right|_{W}\right)=\operatorname{colim} H^{p}(U, \mathcal{F})$ where the colimit is over quasi-compact open neighbourhoods of $E$,
(2) $H^{p}\left(W \backslash E,\left.\mathcal{F}\right|_{W \backslash E}\right)=\operatorname{colim} H^{p}\left(U \backslash E,\left.\mathcal{F}\right|_{U \backslash E}\right)$ if $E$ is a constructible subset.

Proof. From Topology, Lemma 5.23.7 we see that $W=\lim U$ where the limit is over the quasi-compact opens containing $E$. Each $U$ is a spectral space by Topology, Lemma 5.22.4. Thus we may apply Lemma 20.20 .2 to conclude that (1) holds. The same proof works for part (2) except we use Topology, Lemma 5.23.8.

0A3E Lemma 20.23.2. Let $f: X \rightarrow Y$ be a spectral map of spectral spaces. Let $y \in Y$. Let $E \subset Y$ be the set of points specializing to $y$. Let $\mathcal{F}$ be an abelian sheaf on $X$. Then $\left(R^{p} f_{*} \mathcal{F}\right)_{y}=H^{p}\left(f^{-1}(E),\left.\mathcal{F}\right|_{f^{-1}(E)}\right)$.
Proof. Observe that $E=\bigcap V$ where $V$ runs over the quasi-compact open neighbrouhoods of $y$ in $Y$. Hence $f^{-1}(E)=\bigcap f^{-1}(V)$. This implies that $f^{-1}(E)=$ $\lim f^{-1}(V)$ as topological spaces. Since $f$ is spectral, each $f^{-1}(V)$ is a spectral space too (Topology, Lemma 5.22.4. We conclude that $f^{-1}(E)$ is a spectral space and that

$$
H^{p}\left(f^{-1}(E),\left.\mathcal{F}\right|_{f-1}(E)\right)=\operatorname{colim} H^{p}\left(f^{-1}(V), \mathcal{F}\right)
$$

by Lemma 20.20.2 On the other hand, the stalk of $R^{p} f_{*} \mathcal{F}$ at $y$ is given by the colimit on the right.

0A3F Lemma 20.23.3. Let $X$ be a profinite topological space. Then $H^{q}(X, \mathcal{F})=0$ for all $q>0$ and all abelian sheaves $\mathcal{F}$.

Proof. Any open covering of $X$ can be refined by a finite disjoint union decomposition with open parts, see Topology, Lemma 5.21.3. Hence if $\mathcal{F} \rightarrow \mathcal{G}$ is a surjection of abelian sheaves on $X$, then $\mathcal{F}(X) \rightarrow \mathcal{G}(X)$ is surjective. In other words, the global sections functor is an exact functor. Therefore its higher derived functors are zero, see Derived Categories, Lemma 13.17.9.

The following result on cohomological vanishing improves Grothendieck's result (Proposition 20.21.6) and can be found in Sch92.

0A3G Proposition 20.23.4. Let $X$ be a spectral space of Krull dimension d. Let $\mathcal{F}$ be an abelian sheaf on $X$.

Part (1) is the main theorem of [Sch92].
(1) $H^{q}(X, \mathcal{F})=0$ for $q>d$,
(2) $H^{d}(X, \mathcal{F}) \rightarrow H^{d}(U, \mathcal{F})$ is surjective for every quasi-compact open $U \subset X$,
(3) $H_{Z}^{q}(X, \mathcal{F})=0$ for $q>d$ and any constructible closed subset $Z \subset X$.

Proof. We prove this result by induction on $d$.
If $d=0$, then $X$ is a profinite space, see Topology, Lemma 5.22.7. Thus (1) holds by Lemma 20.23.3. If $U \subset X$ is quasi-compact open, then $U$ is also closed as a quasicompact subset of a Hausdorff space. Hence $X=U \amalg(X \backslash U)$ as a topological space and we see that (2) holds. Given $Z$ as in (3) we consider the long exact sequence

$$
H^{q-1}(X, \mathcal{F}) \rightarrow H^{q-1}(X \backslash Z, \mathcal{F}) \rightarrow H_{Z}^{q}(X, \mathcal{F}) \rightarrow H^{q}(X, \mathcal{F})
$$

Since $X$ and $U=X \backslash Z$ are profinite (namely $U$ is quasi-compact because $Z$ is constructible) and since we have (2) and (1) we obtain the desired vanishing of the cohomology groups with support in $Z$.

Induction step. Assume $d \geq 1$ and assume the proposition is valid for all spectral spaces of dimension $<d$. We first prove part (2) for $X$. Let $U$ be a quasi-compact open. Let $\xi \in H^{d}(U, \mathcal{F})$. Set $Z=X \backslash U$. Let $W \subset X$ be the set of points specializing to $Z$. By Lemma 20.23.1 we have

$$
H^{d}\left(W \backslash Z,\left.\mathcal{F}\right|_{W \backslash Z}\right)=\operatorname{colim}_{Z \subset V} H^{d}(V \backslash Z, \mathcal{F})
$$

where the colimit is over the quasi-compact open neighbourhoods $V$ of $Z$ in $X$. By Topology, Lemma 5.23 .7 we see that $W \backslash Z$ is a spectral space. Since every point of $W$ specializes to a point of $Z$, we see that $W \backslash Z$ is a spectral space of Krull dimension $<d$. By induction hypothesis we see that the image of $\xi$ in $H^{d}\left(W \backslash Z,\left.\mathcal{F}\right|_{W \backslash Z}\right)$ is zero. By the displayed formula, there exists a $Z \subset V \subset X$ quasi-compact open such that $\left.\xi\right|_{V \backslash Z}=0$. Since $V \backslash Z=V \cap U$ we conclude by the Mayer-Vietoris (Lemma 20.9.2) for the covering $X=U \cap V$ that there exists a $\tilde{\xi} \in H^{d}(X, \mathcal{F})$ which restricts to $\xi$ on $U$ and to zero on $V$. In other words, part (2) is true.

Proof of part (1) assuming (2). Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$. Set

$$
\mathcal{G}=\operatorname{Im}\left(\mathcal{I}^{d-1} \rightarrow \mathcal{I}^{d}\right)=\operatorname{Ker}\left(\mathcal{I}^{d} \rightarrow \mathcal{I}^{d+1}\right)
$$

For $U \subset X$ quasi-compact open we have a map of exact sequences as follows

The sheaf $\mathcal{I}^{d-1}$ is flasque by Lemma 20.13 .2 and the fact that $d \geq 1$. By part (2) we see that the right vertical arrow is surjective. We conclude by a diagram chase that the map $\mathcal{G}(X) \rightarrow \mathcal{G}(U)$ is surjective. By Lemma 20.13.6 we conclude that $\check{H}^{q}(\mathcal{U}, \mathcal{G})=0$ for $q>0$ and any finite covering $\mathcal{U}: U=U_{1} \cup \ldots \cup U_{n}$ of a quasi-compact open by quasi-compact opens. Applying Lemma 20.12 .9 we find that $H^{q}(U, \mathcal{G})=0$ for all $q>0$ and all quasi-compact opens $U$ of $X$. By Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) we conclude that

$$
H^{q}(X, \mathcal{F})=H^{q}\left(\Gamma\left(X, \mathcal{I}^{0}\right) \rightarrow \ldots \rightarrow \Gamma\left(X, \mathcal{I}^{d-1}\right) \rightarrow \Gamma(X, \mathcal{G})\right)
$$

In particular the cohomology group vanishes if $q>d$.
Proof of (3). Given $Z$ as in (3) we consider the long exact sequence

$$
H^{q-1}(X, \mathcal{F}) \rightarrow H^{q-1}(X \backslash Z, \mathcal{F}) \rightarrow H_{Z}^{q}(X, \mathcal{F}) \rightarrow H^{q}(X, \mathcal{F})
$$

Since $X$ and $U=X \backslash Z$ are spectral spaces (Topology, Lemma 5.22.4) of dimension $\leq d$ and since we have (2) and (1) we obtain the desired vanishing.

### 20.24. The alternating Čech complex

01FG This section compares the Čech complex with the alternating Čech complex and some related complexes.

Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. For $p \geq 0$ set

$$
\check{\mathcal{C}}_{\text {alt }}^{p}(\mathcal{U}, \mathcal{F})=\left\{\begin{array}{c}
s \in \check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F}) \text { such that } s_{i_{0} \ldots i_{p}}=0 \text { if } i_{n}=i_{m} \text { for some } n \neq m \\
\text { and } s_{i_{0} \ldots i_{n} \ldots i_{m} \ldots i_{p}}=-s_{i_{0} \ldots i_{m} \ldots i_{n} \ldots i_{p}} \text { in any case. }
\end{array}\right\}
$$

We omit the verification that the differential $d$ of Equation 20.10.0.1) maps $\breve{\mathcal{C}}_{\text {alt }}^{p}(\mathcal{U}, \mathcal{F})$ into $\check{\mathcal{C}}_{\text {alt }}^{p+1}(\mathcal{U}, \mathcal{F})$.
01FH Definition 20.24.1. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Let $\mathcal{F}$ be an abelian presheaf on $X$. The complex $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(\mathcal{U}, \mathcal{F})$ is the alternating Čech complex associated to $\mathcal{F}$ and the open covering $\mathcal{U}$.

Hence there is a canonical morphism of complexes

$$
\check{\mathcal{C}}_{a l t}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

namely the inclusion of the alternating Čech complex into the usual Čech complex.
Suppose our covering $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ comes equipped with a total ordering $<$ on $I$. In this case, set

$$
\check{\mathcal{C}}_{\text {ord }}^{p}(\mathcal{U}, \mathcal{F})=\prod_{\left(i_{0}, \ldots, i_{p}\right) \in I^{p+1}, i_{0}<\ldots<i_{p}} \mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right) .
$$

This is an abelian group. For $s \in \breve{\mathcal{C}}_{\text {ord }}^{p}(\mathcal{U}, \mathcal{F})$ we denote $s_{i_{0} \ldots i_{p}}$ its value in $\mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)$. We define

$$
d: \check{\mathcal{C}}_{o r d}^{p}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{o r d}^{p+1}(\mathcal{U}, \mathcal{F})
$$

by the formula

$$
d(s)_{i_{0} \ldots i_{p+1}}=\left.\sum_{j=0}^{p+1}(-1)^{j} s_{i_{0} \ldots \hat{i}_{j} \ldots i_{p}}\right|_{U_{i_{0} \ldots i_{p+1}}}
$$

for any $i_{0}<\ldots<i_{p+1}$. Note that this formula is identical to Equation 20.10.0.1. It is straightforward to see that $d \circ d=0$. In other words $\mathcal{C}_{\text {ord }}^{\bullet}(\mathcal{U}, \mathcal{F})$ is a complex.
01FI Definition 20.24.2. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Assume given a total ordering on $I$. Let $\mathcal{F}$ be an abelian presheaf on $X$. The complex $\check{\mathcal{C}}_{\text {ord }}(\mathcal{U}, \mathcal{F})$ is the ordered Čech complex associated to $\mathcal{F}$, the open covering $\mathcal{U}$ and the given total ordering on $I$.

This complex is sometimes called the alternating Cech complex. The reason is that there is an obvious comparison map between the ordered Cech complex and the alternating Čech complex. Namely, consider the map

$$
c: \check{\mathcal{C}}_{\text {ord }}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

given by the rule

$$
c(s)_{i_{0} \ldots i_{p}}=\left\{\begin{array}{ccc}
0 & \text { if } i_{n}=i_{m} \text { for some } n \neq m \\
\operatorname{sgn}(\sigma) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}} & \text { if } i_{\sigma(0)}<i_{\sigma(1)}<\ldots<i_{\sigma(p)}
\end{array}\right.
$$

Here $\sigma$ denotes a permutation of $\{0, \ldots, p\}$ and $\operatorname{sgn}(\sigma)$ denotes its sign. The alternating and ordered Cech complexes are often identified in the literature via the map $c$. Namely we have the following easy lemma.

01FJ Lemma 20.24.3. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Assume I comes equipped with a total ordering. The map c is a morphism of complexes. In fact it induces an isomorphism

$$
c: \check{\mathcal{C}}_{o r d}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}_{a l t}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

of complexes.
Proof. Omitted.
There is also a map

$$
\pi: \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{o r d}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

which is described by the rule

$$
\pi(s)_{i_{0} \ldots i_{p}}=s_{i_{0} \ldots i_{p}}
$$

whenever $i_{0}<i_{1}<\ldots<i_{p}$.
01FK Lemma 20.24.4. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Assume I comes equipped with a total ordering. The map $\pi: \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow$ $\check{\mathcal{C}}_{\text {ord }}(\mathcal{U}, \mathcal{F})$ is a morphism of complexes. It induces an isomorphism

$$
\pi: \check{\mathcal{C}}_{a l t}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}_{o r d}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

of complexes which is a left inverse to the morphism c.
Proof. Omitted.
01FL Remark 20.24.5. This means that if we have two total orderings $<_{1}$ and $<_{2}$ on the index set $I$, then we get an isomorphism of complexes $\tau=\pi_{2} \circ c_{1}: \check{\mathcal{C}}_{\text {ord }-1}(\mathcal{U}, \mathcal{F}) \rightarrow$ $\check{\mathcal{C}}_{\text {ord-2 }}(\mathcal{U}, \mathcal{F})$. It is clear that

$$
\tau(s)_{i_{0} \ldots i_{p}}=\operatorname{sign}(\sigma) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}}
$$

where $i_{0}<_{1} i_{1}<_{1} \ldots<_{1} i_{p}$ and $i_{\sigma(0)}<_{2} i_{\sigma(1)}<_{2} \ldots<_{2} i_{\sigma(p)}$. This is the sense in which the ordered Cech complex is independent of the chosen total ordering.
01FM Lemma 20.24.6. Let $X$ be a topological space. Let $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ be an open covering. Assume $I$ comes equipped with a total ordering. The map $c \circ \pi$ is homotopic to the identity on $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$. In particular the inclusion map $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow$ $\mathcal{C} \bullet(\mathcal{U}, \mathcal{F})$ is a homotopy equivalence.

Proof. For any multi-index $\left(i_{0}, \ldots, i_{p}\right) \in I^{p+1}$ there exists a unique permutation $\sigma:\{0, \ldots, p\} \rightarrow\{0, \ldots, p\}$ such that

$$
i_{\sigma(0)} \leq i_{\sigma(1)} \leq \ldots \leq i_{\sigma(p)} \quad \text { and } \quad \sigma(j)<\sigma(j+1) \quad \text { if } \quad i_{\sigma(j)}=i_{\sigma(j+1)}
$$

We denote this permutation $\sigma=\sigma^{i_{0} \ldots i_{p}}$.
For any permutation $\sigma:\{0, \ldots, p\} \rightarrow\{0, \ldots, p\}$ and any $a, 0 \leq a \leq p$ we denote $\sigma_{a}$ the permutation of $\{0, \ldots, p\}$ such that

$$
\sigma_{a}(j)=\left\{\begin{array}{ccc}
\sigma(j) & \text { if } & 0 \leq j<a \\
\min \left\{j^{\prime} \mid j^{\prime}>\sigma_{a}(j-1), j^{\prime} \neq \sigma(k), \forall k<a\right\} & \text { if } & a \leq j
\end{array}\right.
$$

So if $p=3$ and $\sigma, \tau$ are given by

$$
\begin{array}{ccccc}
\text { id } & 0 & 1 & 2 & 3 \\
\sigma & 3 & 2 & 1 & 0
\end{array} \text { and } \begin{array}{ccccc}
\text { id } & 0 & 1 & 2 & 3 \\
\tau & 3 & 0 & 2 & 1
\end{array}
$$

then we have

| id | 0 | 1 | 2 | 3 |  | id | 0 | 1 | 2 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\sigma_{0}$ | 0 | 1 | 2 | 3 |  | $\tau_{0}$ | 0 | 1 | 2 | 3 |
| $\sigma_{1}$ | 3 | 0 | 1 | 2 | and | $\tau_{1}$ | 3 | 0 | 1 | 2 |
| $\sigma_{2}$ | 3 | 2 | 0 | 1 |  | $\tau_{2}$ | 3 | 0 | 1 | 2 |
| $\sigma_{3}$ | 3 | 2 | 1 | 0 |  | $\tau_{3}$ | 3 | 0 | 2 | 1 |

It is clear that always $\sigma_{0}=\mathrm{id}$ and $\sigma_{p}=\sigma$.
Having introduced this notation we define for $s \in \check{\mathcal{C}}^{p+1}(\mathcal{U}, \mathcal{F})$ the element $h(s) \in$ $\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ to be the element with components

01FN

$$
\begin{equation*}
h(s)_{i_{0} \ldots i_{p}}=\sum_{0 \leq a \leq p}(-1)^{a} \operatorname{sign}\left(\sigma_{a}\right) s_{i_{\sigma(0) \ldots i_{\sigma(a)} i_{\sigma_{a}(a)} \ldots i_{\sigma_{a}(p)}}} \tag{20.24.6.1}
\end{equation*}
$$

where $\sigma=\sigma^{i_{0} \ldots i_{p}}$. The index $i_{\sigma(a)}$ occurs twice in $i_{\sigma(0)} \ldots i_{\sigma(a)} i_{\sigma_{a}(a)} \ldots i_{\sigma_{a}(p)}$ once in the first group of $a+1$ indices and once in the second group of $p-a+1$ indices since $\sigma_{a}(j)=\sigma(a)$ for some $j \geq a$ by definition of $\sigma_{a}$. Hence the sum makes sense since each of the elements $s_{i_{\sigma(0)} \ldots i_{\sigma(a)} i_{\sigma_{a}(a)} \ldots i_{\sigma_{a}(p)}}$ is defined over the open $U_{i_{0} \ldots i_{p}}$. Note also that for $a=0$ we get $s_{i_{0} \ldots i_{p}}$ and for $a=p$ we get $(-1)^{p} \operatorname{sign}(\sigma) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}}$. We claim that

$$
(d h+h d)(s)_{i_{0} \ldots i_{p}}=s_{i_{0} \ldots i_{p}}-\operatorname{sign}(\sigma) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}}
$$

where $\sigma=\sigma^{i_{0} \ldots i_{p}}$. We omit the verification of this claim. (There is a PARI/gp script called first-homotopy.gp in the stacks-project subdirectory scripts which can be used to check finitely many instances of this claim. We wrote this script to make sure the signs are correct.) Write

$$
\kappa: \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

for the operator given by the rule

$$
\kappa(s)_{i_{0} \ldots i_{p}}=\operatorname{sign}\left(\sigma^{i_{0} \ldots i_{p}}\right) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}}
$$

The claim above implies that $\kappa$ is a morphism of complexes and that $\kappa$ is homotopic to the identity map of the Cech complex. This does not immediately imply the lemma since the image of the operator $\kappa$ is not the alternating subcomplex. Namely, the image of $\kappa$ is the "semi-alternating" complex $\breve{\mathcal{C}}_{\text {semi-alt }}^{p}(\mathcal{U}, \mathcal{F})$ where $s$ is a $p$ cochain of this complex if and only if

$$
s_{i_{0} \ldots i_{p}}=\operatorname{sign}(\sigma) s_{i_{\sigma(0)} \ldots i_{\sigma(p)}}
$$

for any $\left(i_{0}, \ldots, i_{p}\right) \in I^{p+1}$ with $\sigma=\sigma^{i_{0} \ldots i_{p}}$. We introduce yet another variant Čech complex, namely the semi-ordered Čech complex defined by

$$
\check{\mathcal{C}}_{\text {semi-ord }}^{p}(\mathcal{U}, \mathcal{F})=\prod_{i_{0} \leq i_{1} \leq \ldots \leq i_{p}} \mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)
$$

It is easy to see that Equation 20.10.0.1 also defines a differential and hence that we get a complex. It is also clear (analogous to Lemma 20.24.4) that the projection map

$$
\check{\mathcal{C}}_{\text {semi-alt }}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{\text {semi-ord }}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

is an isomorphism of complexes.

Hence the Lemma follows if we can show that the obvious inclusion map

$$
\check{\mathcal{C}}_{\text {ord }}^{p}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{\text {semi-ord }}^{p}(\mathcal{U}, \mathcal{F})
$$

is a homotopy equivalence. To see this we use the homotopy (20.24.6.2)
$01 \mathrm{FO} \quad h(s)_{i_{0} \ldots i_{p}}=\left\{\begin{array}{ccc}0 & \text { if } & i_{0}<i_{1}<\ldots<i_{p} \\ (-1)^{a} s_{i_{0} \ldots i_{a-1} i_{a} i_{a} i_{a+1} \ldots i_{p}} & \text { if } & i_{0}<i_{1}<\ldots<i_{a-1}<i_{a}=i_{a+1}\end{array}\right.$
We claim that

$$
(d h+h d)(s)_{i_{0} \ldots i_{p}}=\left\{\begin{array}{cc}
0 & \text { if } \\
s_{i_{0} \ldots i_{p}} & \text { else }
\end{array}\right.
$$

We omit the verification. (There is a PARI/gp script called second-homotopy.gp in the stacks-project subdirectory scripts which can be used to check finitely many instances of this claim. We wrote this script to make sure the signs are correct.) The claim clearly shows that the composition

$$
\check{\mathcal{C}}_{\text {semi-ord }}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{\text {ord }}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{\text {semi-ord }}(\mathcal{U}, \mathcal{F})
$$

of the projection with the natural inclusion is homotopic to the identity map as desired.

### 20.25. Alternative view of the Čech complex

02 FR In this section we discuss an alternative way to establish the relationship between the Čech complex and cohomology.
02FU Lemma 20.25.1. Let $X$ be a ringed space. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering of $X$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Denote $\mathcal{F}_{i_{0} \ldots i_{p}}$ the restriction of $\mathcal{F}$ to $U_{i_{0} \ldots i_{p}}$. There exists a complex $\mathfrak{C}^{\bullet}(\mathcal{U}, \mathcal{F})$ of $\mathcal{O}_{X}$-modules with

$$
\mathfrak{C}^{p}(\mathcal{U}, \mathcal{F})=\prod_{i_{0} \ldots i_{p}}\left(j_{i_{0} \ldots i_{p}}\right)_{*} \mathcal{F}_{i_{0} \ldots i_{p}}
$$

and differential $d: \mathfrak{C}^{p}(\mathcal{U}, \mathcal{F}) \rightarrow \mathfrak{C}^{p+1}(\mathcal{U}, \mathcal{F})$ as in Equation 20.10.0.1. Moreover, there exists a canonical map

$$
\mathcal{F} \rightarrow \mathfrak{C}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

which is a quasi-isomorphism, i.e., $\mathfrak{C}^{\bullet}(\mathcal{U}, \mathcal{F})$ is a resolution of $\mathcal{F}$.
Proof. We check

$$
0 \rightarrow \mathcal{F} \rightarrow \mathfrak{C}^{0}(\mathcal{U}, \mathcal{F}) \rightarrow \mathfrak{C}^{1}(\mathcal{U}, \mathcal{F}) \rightarrow \ldots
$$

is exact on stalks. Let $x \in X$ and choose $i_{\text {fix }} \in I$ such that $x \in U_{i_{\mathrm{fix}}}$. Then define

$$
h: \mathfrak{C}^{p}(\mathcal{U}, \mathcal{F})_{x} \rightarrow \mathfrak{C}^{p-1}(\mathcal{U}, \mathcal{F})_{x}
$$

as follows: If $s \in \mathfrak{C}^{p}(\mathcal{U}, \mathcal{F})_{x}$, take a representative

$$
\widetilde{s} \in \mathfrak{C}^{p}(\mathcal{U}, \mathcal{F})(V)=\prod_{i_{0} \ldots i_{p}} \mathcal{F}\left(V \cap U_{i_{0}} \cap \ldots \cap U_{i_{p}}\right)
$$

defined on some neighborhood $V$ of $x$, and set

$$
h(s)_{i_{0} \ldots i_{p-1}}=\widetilde{s}_{i_{\mathrm{fix}} i_{0} \ldots i_{p-1}, x}
$$

By the same formula (for $p=0$ ) we get a map $\mathfrak{C}^{0}(\mathcal{U}, \mathcal{F})_{x} \rightarrow \mathcal{F}_{x}$. We compute formally as follows:

$$
\begin{aligned}
(d h+h d)(s)_{i_{0} \ldots i_{p}} & =\sum_{j=0}^{p}(-1)^{j} h(s)_{i_{0} \ldots \hat{i}_{j} \ldots i_{p}}+d(s)_{i_{\mathrm{fix}} i_{0} \ldots i_{p}} \\
& =\sum_{j=0}^{p}(-1)^{j} s_{i_{\mathrm{fix}} i_{0} \ldots \hat{i}_{j} \ldots i_{p}}+s_{i_{0} \ldots i_{p}}+\sum_{j=0}^{p}(-1)^{j+1} s_{i_{\mathrm{fixix}} i_{0} \ldots \hat{i}_{j} \ldots i_{p}} \\
& =s_{i_{0} \ldots i_{p}}
\end{aligned}
$$

This shows $h$ is a homotopy from the identity map of the extended complex

$$
0 \rightarrow \mathcal{F}_{x} \rightarrow \mathfrak{C}^{0}(\mathcal{U}, \mathcal{F})_{x} \rightarrow \mathfrak{C}^{1}(\mathcal{U}, \mathcal{F})_{x} \rightarrow \ldots
$$

to zero and we conclude.
With this lemma it is easy to reprove the Čech to cohomology spectral sequence of Lemma 20.12.5. Namely, let $X, \mathcal{U}, \mathcal{F}$ as in Lemma 20.25.1 and let $\mathcal{F} \rightarrow \mathcal{I} \bullet$ be an injective resolution. Then we may consider the double complex

$$
A^{\bullet \bullet}=\Gamma\left(X, \mathfrak{C}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)
$$

By construction we have

$$
A^{p, q}=\prod_{i_{0} \ldots i_{p}} \mathcal{I}^{q}\left(U_{i_{0} \ldots i_{p}}\right)
$$

Consider the two spectral sequences of Homology, Section 12.22 associated to this double complex, see especially Homology, Lemma 12.22.4. For the spectral sequence $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ we get ${ }^{\prime} E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)$ because taking products is exact (Homology, Lemma 12.28.11. For the spectral sequence ( $\left.{ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r>0}$ we get ${ }^{\prime \prime} E_{2}^{p, q}=0$ if $p>0$ and ${ }^{\prime \prime} E_{2}^{0, q}=H^{q}(X, \mathcal{F})$. Namely, for fixed $q$ the complex of sheaves $\mathfrak{C}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{q}\right)$ is a resolution (Lemma 20.25.1) of the injective sheaf $\mathcal{I}^{q}$ by injective sheaves (by Lemmas 20.8.1 and 20.12.11 and Homology, Lemma 12.23.3). Hence the cohomology of $\Gamma\left(X, \mathfrak{C}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{q}\right)\right)$ is zero in positive degrees and equal to $\Gamma\left(X, \mathcal{I}^{q}\right)$ in degree 0 . Taking cohomology of the next differential we get our claim about the spectral sequence $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$. Whence the result since both spectral sequences converge to the cohomology of the associated total complex of $A^{\bullet \bullet}$.

02FS Definition 20.25.2. Let $X$ be a topological space. An open covering $X=\bigcup_{i \in I} U_{i}$ is said to be locally finite if for every $x \in X$ there exists an open neighbourhood $W$ of $x$ such that $\left\{i \in I \mid W \cap U_{i} \neq \emptyset\right\}$ is finite.

02FT Remark 20.25.3. Let $X=\bigcup_{i \in I} U_{i}$ be a locally finite open covering. Denote $j_{i}: U_{i} \rightarrow X$ the inclusion map. Suppose that for each $i$ we are given an abelian sheaf $\mathcal{F}_{i}$ on $U_{i}$. Consider the abelian sheaf $\mathcal{G}=\bigoplus_{i \in I}\left(j_{i}\right)_{*} \mathcal{F}_{i}$. Then for $V \subset X$ open we actually have

$$
\Gamma(V, \mathcal{G})=\prod_{i \in I} \mathcal{F}_{i}\left(V \cap U_{i}\right)
$$

In other words we have

$$
\bigoplus_{i \in I}\left(j_{i}\right)_{*} \mathcal{F}_{i}=\prod_{i \in I}\left(j_{i}\right)_{*} \mathcal{F}_{i}
$$

This seems strange until you realize that the direct sum of a collection of sheaves is the sheafification of what you think it should be. See discussion in Modules, Section 17.3 . Thus we conclude that in this case the complex of Lemma 20.25.1 has terms

$$
\mathfrak{C}^{p}(\mathcal{U}, \mathcal{F})=\bigoplus_{i_{0} \ldots i_{p}}\left(j_{i_{0} \ldots i_{p}}\right)_{*} \mathcal{F}_{i_{0} \ldots i_{p}}
$$

which is sometimes useful.

### 20.26. Čech cohomology of complexes

01 FP In general for sheaves of abelian groups $\mathcal{F}$ and $\mathcal{G}$ on $X$ there is a cup product map

$$
H^{i}(X, \mathcal{F}) \times H^{j}(X, \mathcal{G}) \longrightarrow H^{i+j}\left(X, \mathcal{F} \otimes_{\mathbf{z}} \mathcal{G}\right)
$$

In this section we define it using Čech cocycles by an explicit formula for the cup product. If you are worried about the fact that cohomology may not equal Čech cohomology, then you can use hypercoverings and still use the cocycle notation. This also has the advantage that it works to define the cup product for hypercohomology on any topos (insert future reference here).

Let $\mathcal{F}^{\bullet}$ be a bounded below complex of presheaves of abelian groups on $X$. We can often compute $H^{n}\left(X, \mathcal{F}^{\bullet}\right)$ using Cech cocycles. Namely, let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering of $X$. Since the Čech complex $\breve{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})$ (Definition 20.10.1) is functorial in the presheaf $\mathcal{F}$ we obtain a double complex $\mathcal{C}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)$. The associated total complex to $\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)$ is the complex with degree $n$ term

$$
\operatorname{Tot}^{n}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)=\bigoplus_{p+q=n} \prod_{i_{0} \ldots i_{p}} \mathcal{F}^{q}\left(U_{i_{0} \ldots i_{p}}\right)
$$

see Homology, Definition 12.22.3 A typical element in Tot ${ }^{n}$ will be denoted $\alpha=$ $\left\{\alpha_{i_{0} \ldots i_{p}}\right\}$ where $\alpha_{i_{0} \ldots i_{p}} \in \mathcal{F}^{q}\left(U_{i_{0} \ldots i_{p}}\right)$. In other words the $\mathcal{F}$-degree of $\alpha_{i_{0} \ldots i_{p}}$ is $q=n-p$. This notation requires us to be aware of the degree $\alpha$ lives in at all times. We indicate this situation by the formula $\operatorname{deg}_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{p}}\right)=q$. According to our conventions in Homology, Definition 12.22 .3 the differential of an element $\alpha$ of degree $n$ is given by

$$
d(\alpha)_{i_{0} \ldots i_{p+1}}=\sum_{j=0}^{p+1}(-1)^{j} \alpha_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}+(-1)^{p+1} d_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{p+1}}\right)
$$

where $d_{\mathcal{F}}$ denotes the differential on the complex $\mathcal{F}^{\bullet}$. The expression $\alpha_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}$ means the restriction of $\alpha_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}} \in \mathcal{F}\left(U_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}\right)$ to $U_{i_{0} \ldots i_{p+1}}$.
The construction of $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$ is functorial in $\mathcal{F}^{\bullet}$. As well there is a functorial transformation

$$
\begin{equation*}
\Gamma\left(X, \mathcal{F}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \tag{20.26.0.1}
\end{equation*}
$$

of complexes defined by the following rule: The section $s \in \Gamma\left(X, \mathcal{F}^{n}\right)$ is mapped to the element $\alpha=\left\{\alpha_{i_{0} \ldots i_{p}}\right\}$ with $\alpha_{i_{0}}=\left.s\right|_{U_{i_{0}}}$ and $\alpha_{i_{0} \ldots i_{p}}=0$ for $p>0$.
Refinements. Let $\mathcal{V}=\left\{V_{j}\right\}_{j \in J}$ be a refinement of $\mathcal{U}$. This means there is a map $t: J \rightarrow I$ such that $V_{j} \subset U_{t(j)}$ for all $j \in J$. This gives rise to a functorial transformation

08BM (20.26.0.2)

$$
T_{t}: \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{V}, \mathcal{F}^{\bullet}\right)\right)
$$

defined by the rule

$$
T_{t}(\alpha)_{j_{0} \ldots j_{p}}=\left.\alpha_{t\left(j_{0}\right) \ldots t\left(j_{p}\right)}\right|_{V_{j_{0} \ldots j_{p}}}
$$

Given two maps $t, t^{\prime}: J \rightarrow I$ as above the maps $T_{t}$ and $T_{t^{\prime}}$ constructed above are homotopic. The homotopy is given by

$$
h(\alpha)_{j_{0} \ldots j_{p}}=\sum_{a=0}^{p}(-1)^{a} \alpha_{t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)}
$$

for an element $\alpha$ of degree $n$. This works because of the following computation, again with $\alpha$ an element of degree $n$ (so $d(\alpha)$ has degree $n+1$ and $h(\alpha)$ has degree $n-1$ ):

$$
\begin{aligned}
(d(h(\alpha))+h(d(\alpha)))_{j_{0} \ldots j_{p}}= & \sum_{k=0}^{p}(-1)^{k} h(\alpha)_{j_{0} \ldots \hat{j}_{k} \ldots j_{p}}+ \\
& (-1)^{p} d \mathcal{F}\left(h(\alpha)_{j_{0} \ldots j_{p}}\right)+ \\
& \sum_{a=0}^{p}(-1)^{a} d(\alpha)_{t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)} \\
= & \sum_{k=0}^{p} \sum_{a=0}^{k-1}(-1)^{k+a} \alpha_{t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(\hat{j}_{k}\right) \ldots t^{\prime}\left(j_{p}\right)}+ \\
& \sum_{k=0}^{p} \sum_{a=k+1}^{p}(-1)^{k+a-1} \alpha_{t\left(j_{0}\right) \ldots t\left(\hat{j}_{k}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)}+ \\
& \sum_{a=0}^{p}(-1)^{p+a} d_{\mathcal{F}}\left(\alpha_{\left.t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)\right)+}\right. \\
& \sum_{a=0}^{p} \sum_{k=0}^{a}(-1)^{a+k} \alpha_{t\left(j_{0}\right) \ldots t\left(\hat{j}_{k}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)}+ \\
& \sum_{a=0}^{p} \sum_{k=a}^{p}(-1)^{a+k+1} \alpha_{t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(\hat{j}_{k}\right) \ldots t^{\prime}\left(j_{p}\right)}+ \\
& \sum_{a=0}^{p}(-1)^{a+p+1} d_{\mathcal{F}}\left(\alpha_{\left.t\left(j_{0}\right) \ldots t\left(j_{a}\right) t^{\prime}\left(j_{a}\right) \ldots t^{\prime}\left(j_{p}\right)\right)}\right. \\
= & \alpha_{t^{\prime}\left(j_{0}\right) \ldots t^{\prime}\left(j_{p}\right)}+(-1)^{2 p+1} \alpha_{t\left(j_{0}\right) \ldots t\left(j_{p}\right)} \\
= & T_{t^{\prime}}(\alpha)_{j_{0} \ldots j_{p}}-T_{t}(\alpha)_{j_{0} \ldots j_{p}}
\end{aligned}
$$

We leave it to the reader to verify the cancellations. (Note that the terms having both $k$ and $a$ in the 1st, 2 nd and 4th, 5 th summands cancel, except the ones where $a=k$ which only occur in the 4 th and 5 th and these cancel against each other except for the two desired terms.) It follows that the induced map

$$
H^{n}\left(T_{t}\right): H^{n}\left(\operatorname{Tot}\left(\check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)\right) \rightarrow H^{n}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{V}, \mathcal{F}^{\bullet}\right)\right)\right)
$$

is independent of the choice of $t$. We define Čech hypercohomology as the limit of the Čech cohomology groups over all refinements via the maps $H^{\bullet}\left(T_{t}\right)$.

In the limit (over all open coverings of $X$ ) the following lemma provides a map of Čech hypercohomology into cohomology, which is often an isomorphism and is always an isomorphism if we use hypercoverings.

08BN Lemma 20.26.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering. For a bounded below complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is a canonical map

$$
\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow R \Gamma\left(X, \mathcal{F}^{\bullet}\right)
$$

functorial in $\mathcal{F}^{\bullet}$ and compatible with (20.26.0.1) and 20.26.0.2). There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=H^{p}\left(\operatorname { T o t } \left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \underline{H}^{q}\left(\mathcal{F}^{\bullet}\right)\right)\right.\right.
$$

converging to $H^{p+q}\left(X, \mathcal{F}^{\bullet}\right)$.
Proof. Let $\mathcal{I}^{\bullet}$ be a bounded below complex of injectives. The map 20.26.0.1 for $\mathcal{I}^{\bullet}$ is a map $\Gamma\left(X, \mathcal{I}^{\bullet}\right) \rightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)$. This is a quasi-isomorphism of complexes of abelian groups as follows from Homology, Lemma 12.22.7 applied to the double complex $\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ using Lemma 20.12.1. Suppose $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ is a quasi-isomorphism
of $\mathcal{F}^{\bullet}$ into a bounded below complex of injectives. Since $R \Gamma\left(X, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\Gamma\left(X, \mathcal{I}^{\bullet}\right)$ we obtain the map of the lemma using

$$
\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)
$$

We omit the verification of functoriality and compatibilities. To construct the spectral sequence of the lemma, choose a Cartan-Eilenberg resolution $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet \bullet}$, see Derived Categories, Lemma 13.21.2. In this case $\mathcal{F}^{\bullet} \rightarrow \operatorname{Tot}\left(\mathcal{I}^{\bullet \bullet \bullet}\right)$ is an injective resolution and hence

$$
\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \operatorname{Tot}\left(\mathcal{I}^{\bullet}, \bullet\right)\right)\right)
$$

computes $R \Gamma\left(X, \mathcal{F}^{\bullet}\right)$ as we've seen above. By Homology, Remark 12.22 .8 we can view this as the total complex associated to the triple complex $\check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{I}^{\bullet \bullet \bullet}\right)$ hence, using the same remark we can view it as the total complex associate to the double complex $A^{\bullet \bullet \bullet}$ with terms

$$
A^{n, m}=\bigoplus_{p+q=n} \check{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q, m}\right)
$$

Since $\mathcal{I}^{q, \bullet}$ is an injective resolution of $\mathcal{F}^{q}$ we can apply the first spectral sequence associated to $A^{\bullet \bullet}$ (Homology, Lemma 12.22 .4 ) to get a spectral sequence with

$$
E_{1}^{n, m}=\bigoplus_{p+q=n} \check{\mathcal{C}}^{p}\left(\mathcal{U}, \underline{H}^{m}\left(\mathcal{F}^{q}\right)\right)
$$

which is the $n$th term of the complex $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \underline{H}^{m}\left(\mathcal{F}^{\bullet}\right)\right)\right.$. Hence we obtain $E_{2}$ terms as described in the lemma. Convergence by Homology, Lemma 12.22.6.

Let $X$ be a topological space, let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering, and let $\mathcal{F}^{\bullet}$ be a bounded below complex of presheaves of abelian groups. Consider the map $\tau: \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \rightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$ defined by

$$
\tau(\alpha)_{i_{0} \ldots i_{p}}=(-1)^{p(p+1) / 2} \alpha_{i_{p} \ldots i_{0}}
$$

Then we have for an element $\alpha$ of degree $n$ that

$$
\begin{aligned}
& d(\tau(\alpha))_{i_{0} \ldots i_{p+1}} \\
& =\sum_{j=0}^{p+1}(-1)^{j} \tau(\alpha)_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}+(-1)^{p+1} d_{\mathcal{F}}\left(\tau(\alpha)_{i_{0} \ldots i_{p+1}}\right) \\
& =\sum_{j=0}^{p+1}(-1)^{j+\frac{p(p+1)}{2}} \alpha_{i_{p+1} \ldots \hat{i}_{j} \ldots i_{0}}+(-1)^{p+1+\frac{(p+1)(p+2)}{2}} d_{\mathcal{F}}\left(\alpha_{i_{p+1} \ldots i_{0}}\right)
\end{aligned}
$$

On the other hand we have

$$
\begin{aligned}
& \tau(d(\alpha))_{i_{0} \ldots i_{p+1}} \\
& =(-1)^{\frac{(p+1)(p+2)}{2}} d(\alpha)_{i_{p+1} \ldots i_{0}} \\
& =(-1)^{\frac{(p+1)(p+2)}{2}}\left(\sum_{j=0}^{p+1}(-1)^{j} \alpha_{i_{p+1} \ldots \hat{i}_{p+1}-j \ldots i_{0}}+(-1)^{p+1} d_{\mathcal{F}}\left(\alpha_{i_{p+1} \ldots i_{0}}\right)\right)
\end{aligned}
$$

Thus we conclude that $d(\tau(\alpha))=\tau(d(\alpha))$ because $p(p+1) / 2 \equiv(p+1)(p+2) / 2+$ $p+1 \bmod 2$. In other words $\tau$ is an endomorphism of the complex $\operatorname{Tot}\left(\mathcal{C}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$. Note that the diagram

$$
\begin{array}{clc}
\Gamma\left(X, \mathcal{F}^{\bullet}\right) & \longrightarrow & \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \\
\downarrow \mathrm{id} & & \downarrow \tau \\
\Gamma\left(X, \mathcal{F}^{\bullet}\right) & \longrightarrow & \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)
\end{array}
$$

commutes. In addition $\tau$ is clearly compatible with refinements. This suggests that $\tau$ acts as the identity on Čech cohomology (i.e., in the limit - provided Čech
hypercohomology agrees with hypercohomology, which is always the case if we use hypercoverings). We claim that $\tau$ actually is homotopic to the identity on the total Čech complex $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$. To prove this, we use as homotopy

$$
h(\alpha)_{i_{0} \ldots i_{p}}=\sum_{a=0}^{p} \epsilon_{p}(a) \alpha_{i_{0} \ldots i_{a} i_{p} \ldots i_{a}} \quad \text { with } \quad \epsilon_{p}(a)=(-1)^{\frac{(p-a)(p-a-1)}{2}+p}
$$

for $\alpha$ of degree $n$. As usual we omit writing $\left.\right|_{U_{i_{0} \ldots i_{p}}}$. This works because of the following computation, again with $\alpha$ an element of degree $n$ :

$$
\begin{aligned}
(d(h(\alpha))+h(d(\alpha)))_{i_{0} \ldots i_{p}}= & \sum_{k=0}^{p}(-1)^{k} h(\alpha)_{i_{0} \ldots \hat{i}_{k} \ldots i_{p}}+ \\
& (-1)^{p} d_{\mathcal{F}}\left(h(\alpha)_{i_{0} \ldots i_{p}}\right)+ \\
& \sum_{a=0}^{p} \epsilon_{p}(a) d(\alpha)_{i_{0} \ldots i_{a} i_{p} \ldots i_{a}} \\
= & \sum_{k=0}^{p} \sum_{a=0}^{k-1}(-1)^{k} \epsilon_{p-1}(a) \alpha_{i_{0} \ldots i_{a} i_{p} \ldots \hat{i_{k} \ldots i_{a}}}+ \\
& \sum_{k=0}^{p} \sum_{a=k+1}^{p}(-1)^{k} \epsilon_{p-1}(a-1) \alpha_{i_{0} \ldots \hat{i_{k} \ldots i_{a} i_{p} \ldots i_{a}}}+ \\
& \sum_{a=0}^{p}(-1)^{p} \epsilon_{p}(a) d_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{a} i_{p} \ldots i_{a}}\right)+ \\
& \sum_{a=0}^{p} \sum_{k=0}^{a} \epsilon_{p}(a)(-1)^{k} \alpha_{i_{0} \ldots \hat{i_{k} \ldots i_{a} i_{p} \ldots i_{a}}}+ \\
& \sum_{a=0}^{p} \sum_{k=a}^{p} \epsilon_{p}(a)(-1)^{p+a+1-k} \alpha_{i_{0} \ldots i_{a} i_{p} \ldots \hat{i_{k} \ldots i_{a}}}+ \\
& \sum_{a=0}^{p} \epsilon_{p}(a)(-1)^{p+1} d_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{a} i_{p} \ldots i_{a}}\right) \\
= & \epsilon_{p}(0) \alpha_{i_{p} \ldots i_{0}}+\epsilon_{p}(p)(-1)^{p+1} \alpha_{i_{0} \ldots i_{p}} \\
= & (-1)^{\frac{p(p+1)}{2}} \alpha_{i_{p} \ldots i_{0}}-\alpha_{i_{0} \ldots i_{p}}
\end{aligned}
$$

The cancellations follow because
$(-1)^{k} \epsilon_{p-1}(a)+\epsilon_{p}(a)(-1)^{p+a+1-k}=0 \quad$ and $\quad(-1)^{k} \epsilon_{p-1}(a-1)+\epsilon_{p}(a)(-1)^{k}=0$
We leave it to the reader to verify the cancellations.
Suppose we have two bounded below complexes complexes of abelian sheaves $\mathcal{F}^{\bullet}$ and $\mathcal{G}^{\bullet}$. We define the complex $\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathbf{z}} \mathcal{G}^{\bullet}\right)$ to be to complex with terms $\bigoplus_{p+q=n} \mathcal{F}^{p} \otimes \mathcal{G}^{q}$ and differential according to the rule

07MA

$$
\begin{equation*}
d(\alpha \otimes \beta)=d(\alpha) \otimes \beta+(-1)^{\operatorname{deg}(\alpha)} \alpha \otimes d(\beta) \tag{20.26.1.1}
\end{equation*}
$$

when $\alpha$ and $\beta$ are homogeneous, see Homology, Definition 12.22 .3 .
Suppose that $M^{\bullet}$ and $N^{\bullet}$ are two bounded below complexes of abelian groups. Then if $m$, resp. $n$ is a cocycle for $M^{\bullet}$, resp. $N^{\bullet}$, it is immediate that $m \otimes n$ is a cocycle for $\operatorname{Tot}\left(M^{\bullet} \otimes N^{\bullet}\right)$. Hence a cup product

$$
H^{i}\left(M^{\bullet}\right) \times H^{j}\left(N^{\bullet}\right) \longrightarrow H^{i+j}\left(\operatorname{Tot}\left(M^{\bullet} \otimes N^{\bullet}\right)\right)
$$

This is discussed also in More on Algebra, Section 15.53
So the construction of the cup product in hypercohomology of complexes rests on a construction of a map of complexes

07MB
(20.26.1.2) $\operatorname{Tot}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \otimes_{\mathbf{z}} \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{G}^{\bullet}\right)\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes \mathcal{G}^{\bullet}\right)\right)\right)$

This map is denoted $\cup$ and is given by the rule

$$
(\alpha \cup \beta)_{i_{0} \ldots i_{p}}=\sum_{r=0}^{p} \epsilon(n, m, p, r) \alpha_{i_{0} \ldots i_{r}} \otimes \beta_{i_{r} \ldots i_{p}} .
$$

where $\alpha$ has degree $n$ and $\beta$ has degree $m$ and with

$$
\epsilon(n, m, p, r)=(-1)^{(p+r) n+r p+r} .
$$

Note that $\epsilon(n, m, p, n)=1$. Hence if $\mathcal{F}^{\bullet}=\mathcal{F}[0]$ is the complex consisting in a single abelian sheaf $\mathcal{F}$ placed in degree 0 , then there no signs in the formula for $\cup$ (as in that case $\alpha_{i_{0} \ldots i_{r}}=0$ unless $r=n$ ). For an explanation of why there has to be a sign and how to compute it see AGV71, Exposee XVII] by Deligne. To check 20.26.1.2 is a map of complexes we have to show that

$$
d(\alpha \cup \beta)=d(\alpha) \cup \beta+(-1)^{\operatorname{deg}(\alpha)} \alpha \cup d(\beta)
$$

by the definition of the differential on $\operatorname{Tot}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \otimes_{\mathbf{z}} \operatorname{Tot}(\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{G} \bullet))\right)$ as given in Homology, Definition 12.22.3. We compute first

$$
\begin{aligned}
d(\alpha \cup \beta)_{i_{0} \ldots i_{p+1}}= & \sum_{j=0}^{p+1}(-1)^{j}(\alpha \cup \beta)_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}+(-1)^{p+1} d_{\mathcal{F} \otimes \mathcal{G}}\left((\alpha \cup \beta)_{i_{0} \ldots i_{p+1}}\right) \\
= & \sum_{j=0}^{p+1} \sum_{r=0}^{j-1}(-1)^{j} \epsilon(n, m, p, r) \alpha_{i_{0} \ldots i_{r}} \otimes \beta_{i_{r} \ldots \hat{i}_{j} \ldots i_{p+1}}+ \\
& \sum_{j=0}^{p+1} \sum_{r=j+1}^{p+1}(-1)^{j} \epsilon(n, m, p, r-1) \alpha_{i_{0} \ldots \hat{i}_{j \ldots i_{r}}} \otimes \beta_{i_{r} \ldots i_{p+1}}+ \\
& \sum_{r=0}^{p+1}(-1)^{p+1} \epsilon(n, m, p+1, r) d_{\mathcal{F} \otimes \mathcal{G}}\left(\alpha_{i_{0} \ldots i_{r}} \otimes \beta_{i_{r} \ldots i_{p+1}}\right)
\end{aligned}
$$

and note that the summands in the last term equal

$$
(-1)^{p+1} \epsilon(n, m, p+1, r)\left(d_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{r}}\right) \otimes \beta_{i_{r} \ldots i_{p+1}}+(-1)^{n-r} \alpha_{i_{0} \ldots i_{r}} \otimes d_{\mathcal{G}}\left(\beta_{i_{r} \ldots i_{p+1}}\right)\right) .
$$

because $\operatorname{deg}_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{r}}\right)=n-r$. On the other hand

$$
\begin{aligned}
(d(\alpha) \cup \beta)_{i_{0} \ldots i_{p+1}}= & \sum_{r=0}^{p+1} \epsilon(n+1, m, p+1, r) d(\alpha)_{i_{0} \ldots i_{r}} \otimes \beta_{i_{r} \ldots i_{p+1}} \\
= & \sum_{r=0}^{p+1} \sum_{j=0}^{r} \epsilon(n+1, m, p+1, r)(-1)^{j} \alpha_{i_{0} \ldots \hat{i_{j} \ldots i_{r}}} \otimes \beta_{i_{r} \ldots i_{p+1}}+ \\
& \sum_{r=0}^{p+1} \epsilon(n+1, m, p+1, r)(-1)^{r} d_{\mathcal{F}}\left(\alpha_{i_{0} \ldots i_{r}}\right) \otimes \beta_{i_{r} \ldots i_{p+1}}
\end{aligned}
$$

and

$$
\begin{aligned}
(\alpha \cup d(\beta))_{i_{0} \ldots i_{p+1}}= & \sum_{r=0}^{p+1} \epsilon(n, m+1, p+1, r) \alpha_{i_{0} \ldots i_{r}} \otimes d(\beta)_{i_{r} \ldots i_{p+1}} \\
= & \sum_{r=0}^{p+1} \sum_{j=r}^{p+1} \epsilon(n, m+1, p+1, r)(-1)^{j-r} \alpha_{i_{0} \ldots i_{r}} \otimes \beta_{i_{r} \ldots \hat{i}_{j} \ldots i_{p+1}}+ \\
& \sum_{r=0}^{p+1} \epsilon(n, m+1, p+1, r)(-1)^{p+1-r} \alpha_{i_{0} \ldots i_{r}} \otimes d_{\mathcal{G}}\left(\beta_{i_{r} \ldots i_{p+1}}\right)
\end{aligned}
$$

The desired equality holds if we have

$$
\begin{aligned}
(-1)^{p+1} \epsilon(n, m, p+1, r) & =\epsilon(n+1, m, p+1, r)(-1)^{r} \\
(-1)^{p+1} \epsilon(n, m, p+1, r)(-1)^{n-r} & =(-1)^{n} \epsilon(n, m+1, p+1, r)(-1)^{p+1-r} \\
\epsilon(n+1, m, p+1, r)(-1)^{r} & =(-1)^{1+n} \epsilon(n, m+1, p+1, r-1) \\
(-1)^{j} \epsilon(n, m, p, r) & =(-1)^{n} \epsilon(n, m+1, p+1, r)(-1)^{j-r} \\
(-1)^{j} \epsilon(n, m, p, r-1) & =\epsilon(n+1, m, p+1, r)(-1)^{j}
\end{aligned}
$$

(The third equality is necessary to get the terms with $r=j$ from $d(\alpha) \cup \beta$ and $(-1)^{n} \alpha \cup d(\beta)$ to cancel each other.) We leave the verifications to the reader. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Associativity of the cup product. Suppose that $\mathcal{F}^{\bullet}, \mathcal{G}^{\bullet}$ and $\mathcal{H}^{\bullet}$ are bounded below complexes of abelian groups on $X$. The obvious map (without the intervention of signs) is an isomorphism of complexes

$$
\operatorname{Tot}\left(\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathbf{z}} \mathcal{G}^{\bullet}\right) \otimes_{\mathbf{z}} \mathcal{H}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathbf{z}} \operatorname{Tot}\left(\mathcal{G}^{\bullet} \otimes_{\mathbf{z}} \mathcal{H}^{\bullet}\right)\right)
$$

Another way to say this is that the triple complex $\mathcal{F}^{\bullet} \otimes_{\mathbf{Z}} \mathcal{G}^{\bullet} \otimes_{\mathbf{Z}} \mathcal{H}^{\bullet}$ gives rise to a well defined total complex with differential satisfying
$d(\alpha \otimes \beta \otimes \gamma)=d(\alpha) \otimes \beta \otimes \gamma+(-1)^{\operatorname{deg}(\alpha)} \alpha \otimes d(\beta) \otimes \gamma+(-1)^{\operatorname{deg}(\alpha)+\operatorname{deg}(\beta)} \alpha \otimes \beta \otimes d(\gamma)$
for homogeneous elements. Using this map it is easy to verify that

$$
(\alpha \cup \beta) \cup \gamma=\alpha \cup(\beta \cup \gamma)
$$

namely, if $\alpha$ has degree $a, \beta$ has degree $b$ and $\gamma$ has degree $c$, then

$$
\begin{aligned}
((\alpha \cup \beta) \cup \gamma)_{i_{0} \ldots i_{p}} & =\sum_{r=0}^{p} \epsilon(a+b, c, p, r)(\alpha \cup \beta)_{i_{0} \ldots i_{r}} \otimes \gamma_{i_{r} \ldots i_{p}} \\
& =\sum_{r=0}^{p} \sum_{s=0}^{r} \epsilon(a+b, c, p, r) \epsilon(a, b, r, s) \alpha_{i_{0} \ldots i_{s}} \otimes \beta_{i_{s} \ldots i_{r}} \otimes \gamma_{i_{r} \ldots i_{p}}
\end{aligned}
$$

and

$$
\begin{aligned}
\left(\alpha \cup(\beta \cup \gamma)_{i_{0} \ldots i_{p}}\right. & =\sum_{s=0}^{p} \epsilon(a, b+c, p, s) \alpha_{i_{0} \ldots i_{s}} \otimes(\beta \cup \gamma)_{i_{s} \ldots i_{p}} \\
& =\sum_{s=0}^{p} \sum_{r=s}^{p} \epsilon(a, b+c, p, s) \epsilon(b, c, p-s, r-s) \alpha_{i_{0} \ldots i_{s}} \otimes \beta_{i_{s} \ldots i_{r}} \otimes \gamma_{i_{r} \ldots i_{p}}
\end{aligned}
$$

and a trivial mod 2 calculation shows the signs match up. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Finally, we indicate why the cup product preserves a graded commutative structure, at least on a cohomological level. For this we use the operator $\tau$ introduced above. Let $\mathcal{F}^{\bullet}$ be a bounded below complexes of abelian groups, and assume we are given a graded commutative multiplication

$$
\wedge^{\bullet}: \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes \mathcal{F}^{\bullet}\right) \longrightarrow \mathcal{F}^{\bullet}
$$

This means the following: For $s$ a local section of $\mathcal{F}^{a}$, and $t$ a local section of $\mathcal{F}^{b}$ we have $s \wedge t$ a local section of $\mathcal{F}^{a+b}$. Graded commutative means we have $s \wedge t=$ $(-1)^{a b} t \wedge s$. Since $\wedge$ is a map of complexes we have $d(s \wedge t)=d(s) \wedge t+(-1)^{a} s \wedge t$. The composition

$$
\operatorname{Tot}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \otimes \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)\right) \rightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes \mathbf{z}^{\mathcal{F}^{\bullet}}\right)\right)\right) \rightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)
$$

induces a cup product on cohomology

$$
H^{n}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)\right) \times H^{m}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)\right) \longrightarrow H^{n+m}\left(\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)\right)
$$

and so in the limit also a product on Čech cohomology and therefore (using hypercoverings if needed) a product in cohomology of $\mathcal{F}^{\bullet}$. We claim this product (on cohomology) is graded commutative as well. To prove this we first consider
an element $\alpha$ of degree $n$ in $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$ and an element $\beta$ of degree $m$ in $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$ and we compute

$$
\begin{aligned}
\wedge^{\bullet}(\alpha \cup \beta)_{i_{0} \ldots i_{p}} & =\sum_{r=0}^{p} \epsilon(n, m, p, r) \alpha_{i_{0} \ldots i_{r}} \wedge \beta_{i_{r} \ldots i_{p}} \\
& =\sum_{r=0}^{p} \epsilon(n, m, p, r)(-1)^{\operatorname{deg}\left(\alpha_{i_{0} \ldots i_{r}}\right) \operatorname{deg}\left(\beta_{i_{r} \ldots i_{p}}\right)} \beta_{i_{r} \ldots i_{p}} \wedge \alpha_{i_{0} \ldots i_{r}}
\end{aligned}
$$

because $\wedge$ is graded commutative. On the other hand we have

$$
\begin{aligned}
\tau\left(\wedge^{\bullet}(\tau(\beta) \cup \tau(\alpha))\right)_{i_{0} \ldots i_{p}} & =\chi(p) \sum_{r=0}^{p} \epsilon(m, n, p, r) \tau(\beta)_{i_{p} \ldots i_{p-r}} \wedge \tau(\alpha)_{i_{p-r} \ldots i_{0}} \\
& =\chi(p) \sum_{r=0}^{p} \epsilon(m, n, p, r) \chi(r) \chi(p-r) \beta_{i_{p-r} \ldots i_{p}} \wedge \alpha_{i_{0} \ldots i_{p-r}} \\
& =\chi(p) \sum_{r=0}^{p} \epsilon(m, n, p, p-r) \chi(r) \chi(p-r) \beta_{i_{r} \ldots i_{p}} \wedge \alpha_{i_{0} \ldots i_{r}}
\end{aligned}
$$

where $\chi(t)=(-1)^{\frac{t(t+1)}{2}}$. Since we proved earlier that $\tau$ acts as the identity on cohomology we have to verify that

$$
\epsilon(n, m, p, r)(-1)^{(n-r)(m-(p-r))}=(-1)^{n m} \chi(p) \epsilon(m, n, p, p-r) \chi(r) \chi(p-r)
$$

A trivial mod 2 calculation shows these signs match up. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Finally, we study the compatibility of cup product with boundary maps. Suppose that

$$
0 \rightarrow \mathcal{F}_{1}^{\bullet} \rightarrow \mathcal{F}_{2}^{\bullet} \rightarrow \mathcal{F}_{3}^{\bullet} \rightarrow 0 \quad \text { and } \quad 0 \leftarrow \mathcal{G}_{1}^{\bullet} \leftarrow \mathcal{G}_{2}^{\bullet} \leftarrow \mathcal{G}_{3}^{\bullet} \leftarrow 0
$$

are short exact sequences of bounded below complexes of abelian sheaves on $X$. Let $\mathcal{H}^{\bullet}$ be another bounded below complex of abelian sheaves, and suppose we have maps of complexes

$$
\gamma_{i}: \operatorname{Tot}\left(\mathcal{F}_{i}^{\bullet} \otimes_{\mathbf{Z}} \mathcal{G}_{i}^{\bullet}\right) \longrightarrow \mathcal{H}^{\bullet}
$$

which are compatible with the maps between the complexes, namely such that the diagrams

and

are commutative.
07MC Lemma 20.26.2. In the situation above, assume Čech cohomology agrees with cohomology for the sheaves $\mathcal{F}_{i}^{p}$ and $\mathcal{G}_{j}^{q}$. Let $a_{3} \in H^{n}\left(X, \mathcal{F}_{3}^{\bullet}\right)$ and $b_{1} \in H^{m}\left(X, \mathcal{G}_{1}^{\bullet}\right)$. Then we have

$$
\gamma_{1}\left(\partial a_{3} \cup b_{1}\right)=(-1)^{n+1} \gamma_{3}\left(a_{3} \cup \partial b_{1}\right)
$$

in $H^{n+m}\left(X, \mathcal{H}^{\bullet}\right)$ where $\partial$ indicates the boundary map on cohomology associated to the short exact sequences of complexes above.

Proof. We will use the following conventions and notation. We think of $\mathcal{F}_{1}^{p}$ as a subsheaf of $\mathcal{F}_{2}^{p}$ and we think of $\mathcal{G}_{3}^{q}$ as a subsheaf of $\mathcal{G}_{2}^{q}$. Hence if $s$ is a local section of $\mathcal{F}_{1}^{p}$ we use $s$ to denote the corresponding section of $\mathcal{F}_{2}^{p}$ as well. Similarly for local sections of $\mathcal{G}_{3}^{q}$. Furthermore, if $s$ is a local section of $\mathcal{F}_{2}^{p}$ then we denote $\bar{s}$ its image in $\mathcal{F}_{3}^{p}$. Similarly for the $\operatorname{map} \mathcal{G}_{2}^{q} \rightarrow \mathcal{G}_{1}^{q}$. In particular if $s$ is a local section of $\mathcal{F}_{2}^{p}$ and $\bar{s}=0$ then $s$ is a local section of $\mathcal{F}_{1}^{p}$. The commutativity of the diagrams above implies, for local sections $s$ of $\mathcal{F}_{2}^{p}$ and $t$ of $\mathcal{G}_{3}^{q}$ that $\gamma_{2}(s \otimes t)=\gamma_{3}(\bar{s} \otimes t)$ as sections of $\mathcal{H}^{p+q}$.

Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering of $X$. Suppose that $\alpha_{3}$, resp. $\beta_{1}$ is a degree $n$, resp. $m$ cocycle of $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{3}^{\bullet}\right)\right)$, resp. $\operatorname{Tot}\left(\mathcal{C}^{\bullet}\left(\mathcal{U}, \mathcal{G}_{1}^{\bullet}\right)\right)$ representing $a_{3}$, resp. $b_{1}$. After refining $\mathcal{U}$ if necessary, we can find cochains $\alpha_{2}$, resp. $\beta_{2}$ of degree $n$, resp. $m$ in $\operatorname{Tot}\left(\mathscr{\mathcal { C }}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{2}^{\bullet}\right)\right)$, resp. $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{G}_{2}^{\bullet}\right)\right)$ mapping to $\alpha_{3}$, resp. $\beta_{1}$. Then we see that

$$
\overline{d\left(\alpha_{2}\right)}=d\left(\bar{\alpha}_{2}\right)=0 \quad \text { and } \quad \overline{d\left(\beta_{2}\right)}=d\left(\bar{\beta}_{2}\right)=0
$$

This means that $\alpha_{1}=d\left(\alpha_{2}\right)$ is a degree $n+1 \operatorname{cocycle}$ in $\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{1}^{\bullet}\right)\right)$ representing $\partial a_{3}$. Similarly, $\beta_{3}=d\left(\beta_{2}\right)$ is a degree $m+1 \operatorname{cocycle}$ in $\operatorname{Tot}\left(\mathcal{C}^{\bullet}\left(\mathcal{U}, \mathcal{G}_{3}^{\bullet}\right)\right)$ representing $\partial b_{1}$. Thus we may compute

$$
\begin{aligned}
d\left(\gamma_{2}\left(\alpha_{2} \cup \beta_{2}\right)\right) & =\gamma_{2}\left(d\left(\alpha_{2} \cup \beta_{2}\right)\right) \\
& =\gamma_{2}\left(d\left(\alpha_{2}\right) \cup \beta_{2}+(-1)^{n} \alpha_{2} \cup d\left(\beta_{2}\right)\right) \\
& =\gamma_{2}\left(\alpha_{1} \cup \beta_{2}\right)+(-1)^{n} \gamma_{2}\left(\alpha_{2} \cup \beta_{3}\right) \\
& =\gamma_{1}\left(\alpha_{1} \cup \beta_{1}\right)+(-1)^{n} \gamma_{3}\left(\alpha_{3} \cup \beta_{3}\right)
\end{aligned}
$$

So this even tells us that the sign is $(-1)^{n+1}$ as indicated in the lemma ${ }^{1}$.
0B8S Lemma 20.26.3. Let $X$ be a topological space. Let $\mathcal{O}^{\prime} \rightarrow \mathcal{O}$ be a surjection of sheaves of rings whose kernel $\mathcal{I} \subset \mathcal{O}^{\prime}$ has square zero. Then $M=H^{1}(X, \mathcal{I})$ is a $R=H^{0}(X, \mathcal{O})$-module and the boundary map $\partial: R \rightarrow M$ associated to the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}^{\prime} \rightarrow \mathcal{O} \rightarrow 0
$$

is a derivation (Algebra, Definition 10.130.1).
Proof. The map $\mathcal{O}^{\prime} \rightarrow \mathcal{H o m}(\mathcal{I}, \mathcal{I})$ factors through $\mathcal{O}$ as $\mathcal{I} \cdot \mathcal{I}=0$ by assumption. Hence $\mathcal{I}$ is a sheaf of $\mathcal{O}$-modules and this defines the $R$-module structure on $M$. The boundary map is additive hence it suffices to prove the Leibniz rule. Let $f \in R$. Choose an open covering $\mathcal{U}: X=\bigcup U_{i}$ such that there exist $f_{i} \in \mathcal{O}^{\prime}\left(U_{i}\right)$ lifting $\left.f\right|_{U_{i}} \in \mathcal{O}\left(U_{i}\right)$. Observe that $f_{i}-f_{j}$ is an element of $\mathcal{I}\left(U_{i} \cap U_{j}\right)$. Then $\partial(f)$ corresponds to the Čech cohomology class of the 1-cocycle $\alpha$ with $\alpha_{i_{0} i_{1}}=f_{i_{0}}-f_{i_{1}}$. (Observe that by Lemma 20.12.3 the first Čech cohomology group with respect to $\mathcal{U}$ is a submodule of $M$.) Next, let $g \in R$ be a second element and assume (after possibly refining the open covering) that $g_{i} \in \mathcal{O}^{\prime}\left(U_{i}\right)$ lifts $\left.g\right|_{U_{i}} \in \mathcal{O}\left(U_{i}\right)$. Then we see that $\partial(g)$ is given by the cocycle $\beta$ with $\beta_{i_{0} i_{1}}=g_{i_{0}}-g_{i_{1}}$. Since $f_{i} g_{i} \in \mathcal{O}^{\prime}\left(U_{i}\right)$ lifts $\left.f g\right|_{U_{i}}$ we see that $\partial(f g)$ is given by the cocycle $\gamma$ with

$$
\gamma_{i_{0} i_{1}}=f_{i_{0}} g_{i_{0}}-f_{i_{1}} g_{i_{1}}=\left(f_{i_{0}}-f_{i_{1}}\right) g_{i_{0}}+f_{i_{1}}\left(g_{i_{0}}-g_{i_{1}}\right)=\alpha_{i_{0} i_{1}} g+f \beta_{i_{0} i_{1}}
$$

[^52]by our definition of the $\mathcal{O}$-module structure on $\mathcal{I}$. This proves the Leibniz rule and the proof is complete.

### 20.27. Flat resolutions

06 Y 7 A reference for the material in this section is Spa88. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. By Modules, Lemma 17.16 .6 any $\mathcal{O}_{X^{-}}$-module is a quotient of a flat $\mathcal{O}_{X^{-}}$ module. By Derived Categories, Lemma 13.16 .5 any bounded above complex of $\mathcal{O}_{X}$-modules has a left resolution by a bounded above complex of flat $\mathcal{O}_{X}$-modules. However, for unbounded complexes, it turns out that flat resolutions aren't good enough.

06 Y 8 Lemma 20.27.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{G} \bullet$ be a complex of $\mathcal{O}_{X^{-}}$ modules. The functor

$$
K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right) \longrightarrow K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right), \quad \mathcal{F}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{G}^{\bullet}\right)
$$

is an exact functor of triangulated categories.
Proof. Omitted. Hint: See More on Algebra, Lemmas 15.49.1 and 15.49.2.
06 Y 9 Definition 20.27.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. A complex $\mathcal{K}^{\bullet}$ of $\mathcal{O}_{X}$-modules is called $K$-flat if for every acyclic complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X}$-modules the complex

$$
\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right)
$$

is acyclic.
06YA Lemma 20.27.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{K}^{\bullet}$ be a $K$-flat complex. Then the functor

$$
K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right) \longrightarrow K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right), \quad \mathcal{F}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right)
$$

transforms quasi-isomorphisms into quasi-isomorphisms.
Proof. Follows from Lemma 20.27.1 and the fact that quasi-isomorphisms are characterized by having acyclic cones.

06YB Lemma 20.27.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{K}^{\bullet}$ be a complex of $\mathcal{O}_{X^{-}}$ modules. Then $\mathcal{K}^{\bullet}$ is $K$-flat if and only if for all $x \in X$ the complex $\mathcal{K}_{x}^{\bullet}$ of $\mathcal{O}_{X, x}$ is K-flat (More on Algebra, Definition 15.49.3).

Proof. If $\mathcal{K}_{x}^{\bullet}$ is K-flat for all $x \in X$ then we see that $\mathcal{K}^{\bullet}$ is K -flat because $\otimes$ and direct sums commute with taking stalks and because we can check exactness at stalks, see Modules, Lemma 17.3 .1 . Conversely, assume $\mathcal{K}^{\bullet}$ is K-flat. Pick $x \in X$ $M^{\bullet}$ be an acyclic complex of $\mathcal{O}_{X, x}$-modules. Then $i_{x, *} M^{\bullet}$ is an acyclic complex of $\mathcal{O}_{X}$-modules. Thus $\operatorname{Tot}\left(i_{x, *} M^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right)$ is acyclic. Taking stalks at $x$ shows that $\operatorname{Tot}\left(M^{\bullet} \otimes_{\mathcal{O}_{X, x}} \mathcal{K}_{x}^{\bullet}\right)$ is acyclic.

079R Lemma 20.27.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. If $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}$ are $K$-flat complexes of $\mathcal{O}_{X}$-modules, then $\operatorname{Tot}\left(\mathcal{K} \bullet \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right)$ is a $K$-flat complex of $\mathcal{O}_{X}$-modules.

Proof. Follows from the isomorphism

$$
\operatorname{Tot}\left(\mathcal{M}^{\bullet} \otimes_{\mathcal{O}_{X}} \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right)\right)=\operatorname{Tot}\left(\operatorname{Tot}\left(\mathcal{M}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right) \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right)
$$

and the definition.

079S Lemma 20.27.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(\mathcal{K}_{1}^{\bullet}, \mathcal{K}_{2}^{\bullet}, \mathcal{K}_{3}^{\bullet}\right)$ be a distinguished triangle in $K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right)$. If two out of three of $\mathcal{K}_{i}^{\bullet}$ are $K$-flat, so is the third.

Proof. Follows from Lemma 20.27.1 and the fact that in a distinguished triangle in $K\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right)$ if two out of three are acyclic, so is the third.

06 YC Lemma 20.27.7. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The pullback of a $K$-flat complex of $\mathcal{O}_{Y}$-modules is a $K$-flat complex of $\mathcal{O}_{X}$-modules.

Proof. We can check this on stalks, see Lemma 20.27.4. Hence this follows from Sheaves, Lemma 6.26.4 and More on Algebra, Lemma 15.49.5.

06YD Lemma 20.27.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. A bounded above complex of flat $\mathcal{O}_{X}$-modules is $K$-flat.
Proof. We can check this on stalks, see Lemma 20.27.4 Thus this lemma follows from Modules, Lemma 17.16 .2 and More on Algebra, Lemma 15.49.8.
In the following lemma by a colimit of a system of complexes we mean the termwise colimit.

06YE Lemma 20.27.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{K}_{1}^{\bullet} \rightarrow \mathcal{K}_{2}^{\bullet} \rightarrow \ldots$ be a system of $K$-flat complexes. Then $\operatorname{colim}_{i} \mathcal{K}_{i}^{\bullet}$ is $K$-flat.

Proof. Because we are taking termwise colimits it is clear that

$$
\operatorname{colim}_{i} \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}_{i}^{\bullet}\right)=\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \operatorname{colim}_{i} \mathcal{K}_{i}^{\bullet}\right)
$$

Hence the lemma follows from the fact that filtered colimits are exact.
079T Lemma 20.27.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. For any complex $\mathcal{G}$ • of $\mathcal{O}_{X^{-}}$ modules there exists a commutative diagram of complexes of $\mathcal{O}_{X}$-modules

with the following properties: (1) the vertical arrows are quasi-isomorphisms, (2) each $\mathcal{K}_{n}^{\bullet}$ is a bounded above complex whose terms are direct sums of $\mathcal{O}_{X}$-modules of the form $j_{U!} \mathcal{O}_{U}$, and (3) the maps $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{K}_{n+1}^{\bullet}$ are termwise split injections whose cokernels are direct sums of $\mathcal{O}_{X}$-modules of the form $j_{U!} \mathcal{O}_{U}$. Moreover, the map $\operatorname{colim} \mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a quasi-isomorphism.
Proof. The existence of the diagram and properties (1), (2), (3) follows immediately from Modules, Lemma 17.16 .6 and Derived Categories, Lemma 13.28.1. The induced map colim $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a quasi-isomorphism because filtered colimits are exact.

06YF Lemma 20.27.11. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. For any complex $\mathcal{G}$ • there exists a $K$-flat complex $\mathcal{K}^{\bullet}$ and a quasi-isomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$.

Proof. Choose a diagram as in Lemma 20.27.10. Each complex $\mathcal{K}_{n}^{\bullet}$ is a bounded above complex of flat modules, see Modules, Lemma 17.16.5. Hence $\mathcal{K}_{n}^{\bullet}$ is K-flat by Lemma 20.27.8. The induced map colim $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a quasi-isomorphism by construction. Since colim $\mathcal{K}_{n}^{\bullet}$ is K-flat by Lemma 20.27 .9 we win.

06YG Lemma 20.27.12. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\alpha: \mathcal{P}^{\bullet} \rightarrow \mathcal{Q}^{\bullet}$ be a quasiisomorphism of $K$-flat complexes of $\mathcal{O}_{X}$-modules. For every complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X^{-}}$ modules the induced map

$$
\operatorname{Tot}\left(i d_{\mathcal{F}} \bullet \otimes \alpha\right): \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{P}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{Q}^{\bullet}\right)
$$

is a quasi-isomorphism.
Proof. Choose a quasi-isomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ with $\mathcal{K}^{\bullet}$ a K-flat complex, see Lemma 20.27.11. Consider the commutative diagram

The result follows as by Lemma 20.27 .3 the vertical arrows and the top horizontal arrow are quasi-isomorphisms.
Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be an object of $D\left(\mathcal{O}_{X}\right)$. Choose a K-flat resolution $\mathcal{K}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$, see Lemma 20.27.11. By Lemma 20.27.1 we obtain an exact functor of triangulated categories

$$
K\left(\mathcal{O}_{X}\right) \longrightarrow K\left(\mathcal{O}_{X}\right), \quad \mathcal{G}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{G}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right)
$$

By Lemma 20.27.3 this functor induces a functor $D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$ simply because $D\left(\mathcal{O}_{X}\right)$ is the localization of $K\left(\mathcal{O}_{X}\right)$ at quasi-isomorphisms. By Lemma 20.27.12 the resulting functor (up to isomorphism) does not depend on the choice of the K-flat resolution.

06 YH Definition 20.27.13. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be an object of $D\left(\mathcal{O}_{X}\right)$. The derived tensor product

$$
-\otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}^{\bullet}: D\left(\mathcal{O}_{X}\right) \longrightarrow D\left(\mathcal{O}_{X}\right)
$$

is the exact functor of triangulated categories described above.
It is clear from our explicit constructions that there is a canonical isomorphism

$$
\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}^{\bullet} \cong \mathcal{G}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}^{\bullet}
$$

for $\mathcal{G}^{\bullet}$ and $\mathcal{F}^{\bullet}$ in $D\left(\mathcal{O}_{X}\right)$. Hence when we write $\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}^{\bullet}$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

08BP Definition 20.27.14. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}_{X}$-modules. The Tor's of $\mathcal{F}$ and $\mathcal{G}$ are define by the formula

$$
\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})=H^{-p}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)
$$

with derived tensor product as defined above.
This definition implies that for every short exact sequence of $\mathcal{O}_{X}$-modules $0 \rightarrow$ $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ we have a long exact cohomology sequence

$$
\begin{gathered}
\mathcal{F}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{G} \longrightarrow \mathcal{F}_{2} \otimes_{\mathcal{O}_{X}} \mathcal{G} \longrightarrow \mathcal{F}_{3} \otimes_{\mathcal{O}_{X}} \mathcal{G} \longrightarrow 0 \\
\operatorname{Tor}_{1}^{\mathcal{O}_{X}}\left(\mathcal{F}_{1}, \mathcal{G}\right) \longrightarrow \operatorname{Tor}_{1}^{\mathcal{O}_{X}}\left(\mathcal{F}_{2}, \mathcal{G}\right) \longrightarrow \operatorname{Tor}_{1}^{\mathcal{O}_{X}}\left(\mathcal{F}_{3}, \mathcal{G}\right)
\end{gathered}
$$

for every $\mathcal{O}_{X}$-module $\mathcal{G}$. This will be called the long exact sequence of Tor associated to the situation.

08 BQ Lemma 20.27.15. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module, and
(2) $\operatorname{Tor}_{1}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})=0$ for every $\mathcal{O}_{X}$-module $\mathcal{G}$.

Proof. If $\mathcal{F}$ is flat, then $\mathcal{F} \otimes_{\mathcal{O}_{X}}$ - is an exact functor and the satellites vanish. Conversely assume (2) holds. Then if $\mathcal{G} \rightarrow \mathcal{H}$ is injective with cokernel $\mathcal{Q}$, the long exact sequence of Tor shows that the kernel of $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{H}$ is a quotient of $\operatorname{Tor}_{1}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{Q})$ which is zero by assumption. Hence $\mathcal{F}$ is flat.

### 20.28. Derived pullback

06YI Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. We can use K-flat resolutions to define a derived pullback functor

$$
L f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow D\left(\mathcal{O}_{X}\right)
$$

Namely, for every complex of $\mathcal{O}_{Y}$-modules $\mathcal{G}^{\bullet}$ we can choose a K-flat resolution $\mathcal{K}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ and set $L f^{*} \mathcal{G}^{\bullet}=f^{*} \mathcal{K}^{\bullet}$. You can use Lemmas 20.27.7, 20.27.11, and 20.27 .12 to see that this is well defined. However, to cross all the t's and dot all the i's it is perhaps more convenient to use some general theory.

06YJ Lemma 20.28.1. The construction above is independent of choices and defines an exact functor of triangulated categories $L f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$.
Proof. To see this we use the general theory developed in Derived Categories, Section 13.15 Set $\mathcal{D}=K\left(\mathcal{O}_{Y}\right)$ and $\mathcal{D}^{\prime}=D\left(\mathcal{O}_{X}\right)$. Let us write $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ the exact functor of triangulated categories defined by the rule $F\left(\mathcal{G}^{\bullet}\right)=f^{*} \mathcal{G}^{\bullet}$. We let $S$ be the set of quasi-isomorphisms in $\mathcal{D}=K\left(\mathcal{O}_{Y}\right)$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15.2 applies. We claim that $L F$ is everywhere defined. This follows from Derived Categories, Lemma 13.15 .15 with $\mathcal{P} \subset \operatorname{Ob}(\mathcal{D})$ the collection of $K$-flat complexes: (1) follows from Lemma 20.27 .11 and to see (2) we have to show that for a quasi-isomorphism $\mathcal{K}_{\mathbf{1}}^{\mathbf{1}} \rightarrow \mathcal{K}_{2}^{\mathbf{\bullet}}$ between K-flat complexes of $\mathcal{O}_{Y}$-modules the map $f^{*} \mathcal{K}_{\mathbf{1}}^{\mathbf{1}} \rightarrow f^{*} \mathcal{K}_{2}^{\mathbf{0}}$ is a quasi-isomorphism. To see this write this as

$$
f^{-1} \mathcal{K}_{1}^{\bullet} \otimes_{f^{-1} \mathcal{O}_{Y}} \mathcal{O}_{X} \longrightarrow f^{-1} \mathcal{K}_{2}^{\bullet} \otimes_{f^{-1} \mathcal{O}_{Y}} \mathcal{O}_{X}
$$

The functor $f^{-1}$ is exact, hence the map $f^{-1} \mathcal{K}_{\mathbf{i}}^{\mathbf{0}} \rightarrow f^{-1} \mathcal{K}_{\mathbf{2}}$ is a quasi-isomorphism. By Lemma 20.27 .7 applied to the morphism $\left(X, f^{-1} \mathcal{O}_{Y}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ the complexes $f^{-1} \mathcal{K}_{1}^{\boldsymbol{e}}$ and $f^{-1} \mathcal{K}_{2}^{\bullet}$ are K-flat complexes of $f^{-1} \mathcal{O}_{Y}$-modules. Hence Lemma 20.27 .12 guarantees that the displayed map is a quasi-isomorphism. Thus we obtain a derived functor

$$
L F: D\left(\mathcal{O}_{Y}\right)=S^{-1} \mathcal{D} \longrightarrow \mathcal{D}^{\prime}=D\left(\mathcal{O}_{X}\right)
$$

see Derived Categories, Equation 13.15.9.11. Finally, Derived Categories, Lemma 13.15 .15 also guarantees that $L F\left(\mathcal{K}^{\bullet}\right)=F\left(\mathcal{K}^{\bullet}\right)=f^{*} \mathcal{K}^{\bullet}$ when $\mathcal{K}^{\bullet}$ is K -flat, i.e., $L f^{*}=L F$ is indeed computed in the way described above.
079U Lemma 20.28.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. There is a canonical bifunctorial isomorphism

$$
L f^{*}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{Y}}^{\mathrm{L}} \mathcal{G}^{\bullet}\right)=L f^{*} \mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{G}^{\bullet}
$$

for $\mathcal{F}^{\bullet}, \mathcal{G}^{\bullet} \in \operatorname{Ob}(D(X))$.
Proof. We may assume that $\mathcal{F}^{\bullet}$ and $\mathcal{G}^{\bullet}$ are K-flat complexes. In this case $\mathcal{F}^{\bullet} \otimes \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}}$ $\mathcal{G}^{\bullet}$ is just the total complex associated to the double complex $\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{Y}} \mathcal{G}$. By Lemma $20.27 .5 \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{Y}} \mathcal{G}^{\bullet}\right)$ is K-flat also. Hence the isomorphism of the lemma comes from the isomorphism

$$
\operatorname{Tot}\left(f^{*} \mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}^{\bullet}\right) \longrightarrow f^{*} \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{Y}} \mathcal{G}^{\bullet}\right)
$$

whose constituents are the isomorphisms $f^{*} \mathcal{F}^{p} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}^{q} \rightarrow f^{*}\left(\mathcal{F}^{p} \otimes_{\mathcal{O}_{Y}} \mathcal{G}^{q}\right)$ of Modules, Lemma 17.15.4.

08DE Lemma 20.28.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. There is a canonical bifunctorial isomorphism

$$
\mathcal{F}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{G}^{\bullet}=\mathcal{F}^{\bullet} \otimes_{f^{-1} \mathcal{O}_{Y}}^{\mathbf{L}} f^{-1} \mathcal{G}^{\bullet}
$$

for $\mathcal{F}^{\bullet}$ in $D(X)$ and $\mathcal{G}^{\bullet}$ in $D(Y)$.
Proof. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module and let $\mathcal{G}$ be an $\mathcal{O}_{Y}$-module. Then $\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}=$ $\mathcal{F} \otimes_{f-1} \mathcal{O}_{Y} f^{-1} \mathcal{G}$ because $f^{*} \mathcal{G}=\mathcal{O}_{X} \otimes_{f^{-1}} \mathcal{O}_{Y} f^{-1} \mathcal{G}$. The lemma follows from this and the definitions.

### 20.29. Cohomology of unbounded complexes

079 V Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The category $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category: it has all colimits, filtered colimits are exact, and it has a generator, namely

$$
\bigoplus_{U \subset X \text { open }} j_{U!} \mathcal{O}_{U}
$$

see Modules, Section 17.3 and Lemmas 17.16 .5 and 17.16 .6 . By Injectives, Theorem 19.12 .6 for every complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X}$-modules there exists an injective quasiisomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ to a K-injective complex of $\mathcal{O}_{X}$-modules. Hence we can define

$$
R \Gamma\left(X, \mathcal{F}^{\bullet}\right)=\Gamma\left(X, \mathcal{I}^{\bullet}\right)
$$

and similarly for any left exact functor, see Derived Categories, Lemma 13.29.7. For any morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ we obtain

$$
R f_{*}: D(X) \longrightarrow D(Y)
$$

on the unbounded derived categories.
079W Lemma 20.29.1. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The functor $R f_{*}$ defined above and the functor $L f^{*}$ defined in Lemma 20.28.1 are adjoint:

$$
\operatorname{Hom}_{D(X)}\left(L f^{*} \mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}\right)=\operatorname{Hom}_{D(Y)}\left(\mathcal{G}^{\bullet}, R f_{*} \mathcal{F}^{\bullet}\right)
$$

bifunctorially in $\mathcal{F}^{\bullet} \in \mathrm{Ob}(D(X))$ and $\mathcal{G}^{\bullet} \in \mathrm{Ob}(D(Y))$.
Proof. This follows formally from the fact that $R f_{*}$ and $L f^{*}$ exist, see Derived Categories, Lemma 13.28.4.

08HY Remark 20.29.2. The construction of unbounded derived functor $L f^{*}$ and $R f_{*}$ allows one to construct the base change map in full generality. Namely, suppose that

is a commutative diagram of ringed spaces. Let $K$ be an object of $D\left(\mathcal{O}_{X}\right)$. Then there exists a canonical base change map

$$
L g^{*} R f_{*} K \longrightarrow R\left(f^{\prime}\right)_{*} L\left(g^{\prime}\right)^{*} K
$$

in $D\left(\mathcal{O}_{S^{\prime}}\right)$. Namely, this map is adjoint to a map $L\left(f^{\prime}\right)^{*} L g^{*} R f_{*} K \rightarrow L\left(g^{\prime}\right)^{*} K$ Since $L\left(f^{\prime}\right)^{*} L g^{*}=L\left(g^{\prime}\right)^{*} L f^{*}$ we see this is the same as a map $L\left(g^{\prime}\right)^{*} L f^{*} R f_{*} K \rightarrow$ $L\left(g^{\prime}\right)^{*} K$ which we can take to be $L\left(g^{\prime}\right)^{*}$ of the adjunction map $L f^{*} R f_{*} K \rightarrow K$.

0ATL Remark 20.29.3. Consider a commutative diagram

of ringed spaces. Then the base change maps of Remark 20.29 .2 for the two squares compose to give the base change map for the outer rectangle. More precisely, the composition

$$
\begin{aligned}
L m^{*} \circ R(g \circ f)_{*} & =L m^{*} \circ R g_{*} \circ R f_{*} \\
& \rightarrow R g_{*}^{\prime} \circ L l^{*} \circ R f_{*} \\
& \rightarrow R g_{*}^{\prime} \circ R f_{*}^{\prime} \circ L k^{*} \\
& =R\left(g^{\prime} \circ f^{\prime}\right)_{*} \circ L k^{*}
\end{aligned}
$$

is the base change map for the rectangle. We omit the verification.
0ATM Remark 20.29.4. Consider a commutative diagram

of ringed spaces. Then the base change maps of Remark 20.29 .2 for the two squares compose to give the base change map for the outer rectangle. More precisely, the composition

$$
\begin{aligned}
L\left(h \circ h^{\prime}\right)^{*} \circ R f_{*} & =L\left(h^{\prime}\right)^{*} \circ L h_{*} \circ R f_{*} \\
& \rightarrow L\left(h^{\prime}\right)^{*} \circ R f_{*}^{\prime} \circ L g^{*} \\
& \rightarrow R f_{*}^{\prime \prime} \circ L\left(g^{\prime}\right)^{*} \circ L g^{*} \\
& =R f_{*}^{\prime \prime} \circ L\left(g \circ g^{\prime}\right)^{*}
\end{aligned}
$$

is the base change map for the rectangle. We omit the verification.
0B68 Remark 20.29.5. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. The adjointness of $L f^{*}$ and $R f_{*}$ allows us to construct a relative cup product

$$
R f_{*} K \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*} L \longrightarrow R f_{*}\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)
$$

in $D\left(\mathcal{O}_{Y}\right)$ for all $K, L$ in $D\left(\mathcal{O}_{X}\right)$. Namely, this map is adjoint to a map $L f^{*}\left(R f_{*} K \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}}\right.$ $\left.R f_{*} L\right) \rightarrow K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ for which we can take the composition of the isomorphism $L f^{*}\left(R f_{*} K \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*} L\right)=L f^{*} R f_{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} R f_{*} L$ (Lemma 20.28.2 with the map $L f^{*} R f_{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} R f_{*} L \rightarrow K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ coming from the counit $L f^{*} \circ R f_{*} \rightarrow$ id.

0BKJ Lemma 20.29.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K$ be an object of $D\left(\mathcal{O}_{X}\right)$. The sheafification of $U \mapsto H^{q}(U, K)$ is the qth cohomology sheaf $H^{q}(K)$ of $K$.

Proof. Choose a K-injective complex $\mathcal{I} \bullet$ representing $K$. Then

$$
H^{q}(U, K)=\frac{\operatorname{Ker}\left(\mathcal{I}^{q}(U) \rightarrow \mathcal{I}^{q+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{q-1}(U) \rightarrow \mathcal{I}^{q}(U)\right)}
$$

by the discussion above. Since $H^{q}(K)=\operatorname{Ker}\left(\mathcal{I}^{q} \rightarrow \mathcal{I}^{q+1}\right) / \operatorname{Im}\left(\mathcal{I}^{q-1} \rightarrow \mathcal{I}^{q}\right)$ the result is clear.

0BKK Lemma 20.29.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be a filtered complex of $\mathcal{O}_{X}$-modules. There exists a canonical spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 1}$ of bigraded $\Gamma\left(X, \mathcal{O}_{X}\right)$-modules with $d_{r}$ of bidegree $(r,-r+1)$ and

$$
E_{1}^{p, q}=H^{p+q}\left(X, g r^{p} \mathcal{F}^{\bullet}\right)
$$

If for every $n$ we have

$$
H^{n}\left(X, F^{p} \mathcal{F}^{\bullet}\right)=0 \text { for } p \gg 0 \quad \text { and } \quad H^{n}\left(X, F^{p} \mathcal{F}^{\bullet}\right)=H^{n}\left(X, \mathcal{F}^{\bullet}\right) \text { for } p \ll 0
$$

then the spectral sequence is bounded and converges to $H^{*}\left(X, \mathcal{F}^{\bullet}\right)$.
Proof. (For a proof in case the complex is a bounded below complex of modules with finite filtrations, see the remark below.) Choose an map of filtered complexes $j: \mathcal{F}^{\bullet} \rightarrow \mathcal{J}^{\bullet}$ as in Injectives, Lemma 19.13.7. The spectral sequence is the spectral sequence of Homology, Section 12.21 associated to the filtred complex

$$
\Gamma\left(X, \mathcal{J}^{\bullet}\right) \quad \text { with } \quad F^{p} \Gamma\left(X, \mathcal{J}^{\bullet}\right)=\Gamma\left(X, F^{p} \mathcal{J}^{\bullet}\right)
$$

Since cohomology is computed by evaluating on K-injective representatives we see that the $E_{1}$ page is as stated in the lemma. The convergence and boundedness under the stated conditions follows from Homology, Lemma 12.21.13.

0BKL Remark 20.29.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be a filtered complex of $\mathcal{O}_{X}$-modules. If $\mathcal{F}^{\bullet}$ is bounded from below and for each $n$ the filtration on $\mathcal{F}^{n}$ is finite, then there is a construction of the spectral sequence in Lemma 20.29.7 avoiding Injectives, Lemma 19.13.7. Namely, by Derived Categories, Lemma 13.26.9 there is a filtered quasi-isomorphism $i: \mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ of filtered complexes with $\mathcal{I}^{\bullet}$ bounded below, the filtration on $\mathcal{I}^{n}$ is finite for all $n$, and with each $\operatorname{gr}^{p} \mathcal{I}^{n}$ an injective $\mathcal{O}_{X}$-module. Then we take the spectral sequence associated to

$$
\Gamma\left(X, \mathcal{I}^{\bullet}\right) \quad \text { with } \quad F^{p} \Gamma\left(X, \mathcal{I}^{\bullet}\right)=\Gamma\left(X, F^{p} \mathcal{I}^{\bullet}\right)
$$

Since cohomology can be computed by evaluating on bounded below complexes of injectives we see that the $E_{1}$ page is as stated in the lemma. The convergence and boundedness under the stated conditions follows from Homology, Lemma 12.21.11.

In fact, this is a special case of the spectral sequence in Derived Categories, Lemma 13.26.14

0BKM Example 20.29.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}_{X^{-}}$ modules. We can apply Lemma 20.29.7 with $F^{p} \mathcal{F}^{\bullet}=\tau_{\leq-p} \mathcal{F}^{\bullet}$. (If $\mathcal{F}^{\bullet}$ is bounded below we can use Remark 20.29.8.) Then we get a spectral sequence

$$
E_{1}^{p, q}=H^{p+q}\left(X, H^{-p}\left(\mathcal{F}^{\bullet}\right)[p]\right)=H^{2 p+q}\left(X, H^{-p}\left(\mathcal{F}^{\bullet}\right)\right)
$$

After renumbering $p=-j$ and $q=i+2 j$ we find that for any $K \in D\left(\mathcal{O}_{X}\right)$ there is a spectral sequence $\left(E_{r}^{\prime}, d_{r}^{\prime}\right)_{r \geq 2}$ of bigraded modules with $d_{r}^{\prime}$ of bidegree $(r,-r+1)$, with

$$
\left(E_{2}^{\prime}\right)^{i, j}=H^{i}\left(X, H^{j}(K)\right)
$$

If $K$ is bounded below (for example), then this spectral sequence is bounded and converges to $H^{i+j}(X, K)$. In the bounded below case this spectral sequence is an example of the second spectral sequence of Derived Categories, Lemma 13.21.3 (constructed using Cartan-Eilenberg resolutions).

### 20.30. Unbounded Mayer-Vietoris

08 BR Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $U \subset X$ be an open subset. Denote $j:\left(U, \mathcal{O}_{U}\right) \rightarrow$ $\left(X, \mathcal{O}_{X}\right)$ the corresponding open immersion. The pullback functor $j^{*}$ is exact as it is just the restriction functor. Thus derived pullback $L j^{*}$ is computed on any complex by simply restricting the complex. We often simply denote the corresponding functor

$$
D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{U}\right), \quad E \mapsto j^{*} E=\left.E\right|_{U}
$$

Similarly, extension by zero $j_{!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ (see Sheaves, Section 6.31) is an exact functor (Modules, Lemma 17.3.4). Thus it induces a functor

$$
j_{!}: D\left(\mathcal{O}_{U}\right) \rightarrow D\left(\mathcal{O}_{X}\right), \quad F \mapsto j_{!} F
$$

by simply applying $j$ ! to any complex representing the object $F$.
08BS Lemma 20.30.1. Let $X$ be a ringed space. Let $U \subset X$ be an open subspace. The restriction of a $K$-injective complex of $\mathcal{O}_{X}$-modules to $U$ is a $K$-injective complex of $\mathcal{O}_{U}$-modules.

Proof. Follows immediately from Derived Categories, Lemma 13.29 .9 and the fact that the restriction functor has the exact adjoint $j_{!}$. See discussion above.

08FE Lemma 20.30.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Given an open subspace $V \subset Y$, set $U=f^{-1}(V)$ and denote $g: U \rightarrow V$ the induced morphism. Then $\left.\left(R f_{*} E\right)\right|_{V}=R g_{*}\left(\left.E\right|_{U}\right)$ for $E$ in $D\left(\mathcal{O}_{X}\right)$.

Proof. Represent $E$ by a K-injective complex $\mathcal{I}^{\bullet}$ of $\mathcal{O}_{X}$-modules. Then $R f_{*}(E)=$ $f_{*} \mathcal{I}^{\bullet}$ and $R g_{*}\left(\left.E\right|_{U}\right)=g_{*}\left(\left.\mathcal{I}^{\bullet}\right|_{U}\right)$ by Lemma 20.30.1. Hence the result follows from Lemma 20.8.4 (with $p=0$ ).

08BT Lemma 20.30.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $U \subset X$ be an open subset. Denote $j:\left(U, \mathcal{O}_{U}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ the corresponding open immersion. The restriction functor $D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{U}\right)$ is a right adjoint to extension by zero $j_{!}: D\left(\mathcal{O}_{U}\right) \rightarrow$ $D\left(\mathcal{O}_{X}\right)$.

Proof. We have to show that

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(j!E, F)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(E,\left.F\right|_{U}\right)
$$

Choose a complex $\mathcal{E} \bullet$ of $\mathcal{O}_{U}$-modules representing $E$ and choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $F$. By Lemma 20.30.1 the complex $\left.\mathcal{I}^{\bullet}\right|_{U}$ is K-injective as well. Hence we see that the formula above becomes

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(j_{!} \mathcal{E}^{\bullet}, \mathcal{I}^{\bullet}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{\bullet},\left.\mathcal{I}^{\bullet}\right|_{U}\right)
$$

which holds as $\left.\right|_{U}$ and $j_{!}$are adjoint functors (Sheaves, Lemma 6.31.8) and Derived Categories, Lemma 13.29.2.

08BU Lemma 20.30.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $X=U \cup V$ be the union of two open subspaces. For any object $E$ of $D\left(\mathcal{O}_{X}\right)$ we have a distinguished triangle

$$
\left.\left.\left.\left.j_{U \cap V!} E\right|_{U \cap V} \rightarrow j_{U!} E\right|_{U} \oplus j_{V!} E\right|_{V} \rightarrow E \rightarrow j_{U \cap V!} E\right|_{U \cap V}[1]
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. We have seen above that the restriction functors and the extension by zero functors are computed by just applying the functors to any complex. Let $\mathcal{E} \bullet$ be a complex of $\mathcal{O}_{X}$-modules representing $E$. The distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1 to the short exact sequence of complexes of $\mathcal{O}_{X}$-modules

$$
\left.\left.\left.0 \rightarrow j_{U \cap V!} \mathcal{E}^{\bullet}\right|_{U \cap V} \rightarrow j_{U!} \mathcal{E}^{\bullet}\right|_{U} \oplus j_{V!} \mathcal{E}^{\bullet}\right|_{V} \rightarrow \mathcal{E}^{\bullet} \rightarrow 0
$$

To see this sequence is exact one checks on stalks using Sheaves, Lemma 6.31.8 (computation omitted).

08BV Lemma 20.30.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $X=U \cup V$ be the union of two open subspaces. For any object $E$ of $D\left(\mathcal{O}_{X}\right)$ we have a distinguished triangle

$$
\left.\left.\left.E \rightarrow R j_{U, *} E\right|_{U} \oplus R j_{V, *} E\right|_{V} \rightarrow R j_{U \cap V, *} E\right|_{U \cap V} \rightarrow E[1]
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $E$ whose terms $\mathcal{I}^{n}$ are injective objects of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. We have seen that $\mathcal{I}^{\bullet} \mid U$ is a K-injective complex as well (Lemma 20.30.1). Hence $\left.R j_{U, *} E\right|_{U}$ is represented by $\left.j_{U, *} \mathcal{I}^{\bullet}\right|_{U}$. Similarly for $V$ and $U \cap V$. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12 .1 to the short exact sequence of complexes

$$
\left.\left.\left.0 \rightarrow \mathcal{I}^{\bullet} \rightarrow j_{U, *} \mathcal{I}^{\bullet}\right|_{U} \oplus j_{V, *} \mathcal{I}^{\bullet}\right|_{V} \rightarrow j_{U \cap V, *} \mathcal{I}^{\bullet}\right|_{U \cap V} \rightarrow 0
$$

This sequence is exact because for any $W \subset X$ open and any $n$ the sequence

$$
0 \rightarrow \mathcal{I}^{n}(W) \rightarrow \mathcal{I}^{n}(W \cap U) \oplus \mathcal{I}^{n}(W \cap V) \rightarrow \mathcal{I}^{n}(W \cap U \cap V) \rightarrow 0
$$

is exact (see proof of Lemma 20.9.2).
08BW Lemma 20.30.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $X=U \cup V$ be the union of two open subspaces of $X$. For objects $E, F$ of $D\left(\mathcal{O}_{X}\right)$ we have a Mayer-Vietoris
sequence

$$
\begin{aligned}
& \ldots \longrightarrow \operatorname{Ext}^{-1}\left(E_{U \cap V}, F_{U \cap V}\right) \\
& \operatorname{Hom}(E, F) \longleftrightarrow \operatorname{Hom}\left(E_{U}, F_{U}\right) \oplus \operatorname{Hom}\left(E_{V}, F_{V}\right) \longrightarrow \operatorname{Hom}\left(E_{U \cap V}, F_{U \cap V}\right)
\end{aligned}
$$

where the subscripts denote restrictions to the relevant opens and the Hom's and Ext's are taken in the relevant derived categories.

Proof. Use the distinguished triangle of Lemma 20.30 .4 to obtain a long exact sequence of Hom's (from Derived Categories, Lemma 13.4.2) and use that

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\left.j_{U!} E\right|_{U}, F\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.E\right|_{U},\left.F\right|_{U}\right)
$$

by Lemma 20.30.3.
08BX Lemma 20.30.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Suppose that $X=U \cup V$ is a union of two open subsets. For an object $E$ of $D\left(\mathcal{O}_{X}\right)$ we have a distinguished triangle

$$
R \Gamma(X, E) \rightarrow R \Gamma(U, E) \oplus R \Gamma(V, E) \rightarrow R \Gamma(U \cap V, E) \rightarrow R \Gamma(X, E)[1]
$$

and in particular a long exact cohomology sequence

$$
\ldots \rightarrow H^{n}(X, E) \rightarrow H^{n}(U, E) \oplus H^{0}(V, E) \rightarrow H^{n}(U \cap V, E) \rightarrow H^{n+1}(X, E) \rightarrow \ldots
$$

The construction of the distinguished triangle and the long exact sequence is functorial in $E$.

Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $E$. We may assume $\mathcal{I}^{n}$ is an injective object of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ for all $n$, see Injectives, Theorem 19.12.6. Then $R \Gamma(X, E)$ is computed by $\Gamma(X, \mathcal{I} \bullet)$. Similarly for $U, V$, and $U \cap V$ by Lemma 20.30.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$
0 \rightarrow \mathcal{I}^{\bullet}(X) \rightarrow \mathcal{I}^{\bullet}(U) \oplus \mathcal{I}^{\bullet}(V) \rightarrow \mathcal{I}^{\bullet}(U \cap V) \rightarrow 0
$$

We have seen this is a short exact sequence in the proof of Lemma 20.9.2. The final statement follows from the functoriality of the construction in Injectives, Theorem 19.12.6.

08HZ Lemma 20.30.8. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Suppose that $X=U \cup V$ is a union of two open subsets. Denote $a=\left.f\right|_{U}: U \rightarrow Y$, $b=\left.f\right|_{V}: V \rightarrow Y$, and $c=\left.f\right|_{U \cap V}: U \cap V \rightarrow Y$. For every object $E$ of $D\left(\mathcal{O}_{X}\right)$ there exists a distinguished triangle

$$
R f_{*} E \rightarrow R a_{*}\left(\left.E\right|_{U}\right) \oplus R b_{*}\left(\left.E\right|_{V}\right) \rightarrow R c_{*}\left(\left.E\right|_{U \cap V}\right) \rightarrow R f_{*} E[1]
$$

This triangle is functorial in $E$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $E$. We may assume $\mathcal{I}^{n}$ is an injective object of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ for all $n$, see Injectives, Theorem 19.12.6. Then $R f_{*} E$ is computed by $f_{*} \mathcal{I} \bullet$. Similarly for $U, V$, and $U \cap V$ by Lemma 20.30.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by

Derived Categories, Section 13.12 and especially Lemma 13.12.1 to the short exact sequence of complexes

$$
\left.\left.\left.0 \rightarrow f_{*} \mathcal{I}^{\bullet} \rightarrow a_{*} \mathcal{I}^{\bullet}\right|_{U} \oplus b_{*} \mathcal{I}^{\bullet}\right|_{V} \rightarrow c_{*} \mathcal{I}^{\bullet}\right|_{U \cap V} \rightarrow 0
$$

This is a short exact sequence of complexes by Lemma 20.9.3 and the fact that $R^{1} f_{*} \mathcal{I}=0$ for an injective object $\mathcal{I}$ of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. The final statement follows from the functoriality of the construction in Injectives, Theorem 19.12.6

08DF Lemma 20.30.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $j: U \rightarrow X$ be an open subspace. Let $T \subset X$ be a closed subset contained in $U$.
(1) If $E$ is an object of $D\left(\mathcal{O}_{X}\right)$ whose cohomology sheaves are supported on $T$, then $E \rightarrow R j_{*}\left(\left.E\right|_{U}\right)$ is an isomorphism.
(2) If $F$ is an object of $D\left(\mathcal{O}_{U}\right)$ whose cohomology sheaves are supported on $T$, then $j_{!} F \rightarrow R j_{*} F$ is an isomorphism.

Proof. Let $V=X \backslash T$ and $W=U \cap V$. Note that $X=U \cup V$ is an open covering of $X$. Denote $j_{W}: W \rightarrow V$ the open immersion. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$ whose cohomology sheaves are supported on $T$. By Lemma 20.30.2 we have $\left.\left(\left.R j_{*} E\right|_{U}\right)\right|_{V}=R j_{W, *}\left(\left.E\right|_{W}\right)=0$ because $\left.E\right|_{W}=0$ by our assumption. On the other hand, $\left.R j_{*}\left(\left.E\right|_{U}\right)\right|_{U}=\left.E\right|_{U}$. Thus (1) is clear. Let $F$ be an object of $D\left(\mathcal{O}_{U}\right)$ whose cohomology sheaves are supported on $T$. By Lemma 20.30.2 we have $\left.\left(R j_{*} F\right)\right|_{V}=R j_{W, *}\left(\left.F\right|_{W}\right)=0$ because $\left.F\right|_{W}=0$ by our assumption. We also have $\left.\left(j_{!} F\right)\right|_{V}=j_{W!}\left(\left.F\right|_{W}\right)=0$ (the first equality is immediate from the definition of extension by zero). Since both $\left.\left(R j_{*} F\right)\right|_{U}=F$ and $\left.\left(j_{!} F\right)\right|_{U}=F$ we see that (2) holds.

We can glue complexes!
08DG Lemma 20.30.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $X=U \cup V$ be the union of two open subspaces of $X$. Suppose given
(1) an object $E$ of $D\left(\mathcal{O}_{X}\right)$,
(2) a morphism $a:\left.A \rightarrow E\right|_{U}$ of $D\left(\mathcal{O}_{U}\right)$,
(3) a morphism $b:\left.B \rightarrow E\right|_{V}$ of $D\left(\mathcal{O}_{V}\right)$,
(4) an isomorphism $c:\left.\left.A\right|_{U \cap V} \rightarrow B\right|_{U \cap V}$
such that

$$
\left.a\right|_{U \cap V}=\left.b\right|_{U \cap V} \circ c
$$

Then there exists a morphism $F \rightarrow E$ in $D\left(\mathcal{O}_{X}\right)$ whose restriction to $U$ is isomorphic to $a$ and whose restriction to $V$ is isomorphic to $b$.

Proof. Denote $j_{U}, j_{V}, j_{U \cap V}$ the corresponding open immersions. Choose a distinguished triangle

$$
F \rightarrow R j_{U, *} A \oplus R j_{V, *} B \rightarrow R j_{U \cap V, *}\left(\left.B\right|_{U \cap V}\right) \rightarrow F[1]
$$

where the map $R j_{V, *} B \rightarrow R j_{U \cap V, *}\left(\left.B\right|_{U \cap V}\right)$ is the obvious one and where $R j_{U, *} A \rightarrow$ $R j_{U \cap V, *}\left(\left.B\right|_{U \cap V}\right)$ is the composition of $R j_{U, *} A \rightarrow R j_{U \cap V, *}\left(\left.A\right|_{U \cap V}\right)$ with $R j_{U \cap V, *} c$. Restricting to $U$ we obtain

$$
\left.\left.\left.\left.F\right|_{U} \rightarrow A \oplus\left(R j_{V, *} B\right)\right|_{U} \rightarrow\left(R j_{U \cap V, *}\left(\left.B\right|_{U \cap V}\right)\right)\right|_{U} \rightarrow F\right|_{U}[1]
$$

Denote $j: U \cap V \rightarrow U$. Compatibility of restriction to opens and cohomology shows that both $\left.\left(R j_{V, *} B\right)\right|_{U}$ and $\left.\left(R j_{U \cap V, *}\left(\left.B\right|_{U \cap V}\right)\right)\right|_{U}$ are canonically isomorphic to $R j_{*}\left(\left.B\right|_{U \cap V}\right)$. Hence the second arrow of the last displayed diagram has a section,
and we conclude that the morphism $\left.F\right|_{U} \rightarrow A$ is an isomorphism. Similarly, the morphism $\left.F\right|_{V} \rightarrow B$ is an isomorphism. The existence of the morphism $F \rightarrow E$ follows from the Mayer-Vietoris sequence for Hom, see Lemma 20.30.6.

### 20.31. Derived limits

0BKN Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Since the triangulated category $D\left(\mathcal{O}_{X}\right)$ has products (Injectives, Lemma 19.13.4) it follows that $D\left(\mathcal{O}_{X}\right)$ has derived limits, see Derived Categories, Definition 13.32.1. If $\left(K_{n}\right)$ is an inverse system in $D\left(\mathcal{O}_{X}\right)$ then we denote $R \lim K_{n}$ the derived limit.

0BKP Lemma 20.31.1. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Then $R f_{*}$ commutes with $R \lim$, i.e., $R f_{*}$ commutes with derived limits.

Proof. Let $\left(K_{n}\right)$ be an inverse system in $D\left(\mathcal{O}_{X}\right)$. Consider the defining distinguished triangle

$$
R \lim K_{n} \rightarrow \prod K_{n} \rightarrow \prod K_{n}
$$

in $D\left(\mathcal{O}_{X}\right)$. Applying the exact functor $R f_{*}$ we obtain the distinguished triangle

$$
R f_{*}\left(R \lim K_{n}\right) \rightarrow R f_{*}\left(\prod K_{n}\right) \rightarrow R f_{*}\left(\prod K_{n}\right)
$$

in $D\left(\mathcal{O}_{Y}\right)$. Thus we see that it suffices to prove that $R f_{*}$ commutes with products in the derived category (which are not just given by products of complexes, see Injectives, Lemma 19.13.4). However, since $R f_{*}$ is a right adjoint by Lemma 20.29.1 this follows formally (see Categories, Lemma 4.24.4). Caution: Note that we cannot apply Categories, Lemma 4.24 .4 directly as $R \lim K_{n}$ is not a limit in $D\left(\mathcal{O}_{X}\right)$.
0BKQ Remark 20.31.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(K_{n}\right)$ be an inverse system in $D\left(\mathcal{O}_{X}\right)$. Set $K=R \lim K_{n}$. For each $n$ and $m$ let $\mathcal{H}_{n}^{m}=H^{m}\left(K_{n}\right)$ be the $m$ th cohomology sheaf of $K_{n}$ and similarly set $\mathcal{H}^{m}=H^{m}(K)$. Let us denote $\underline{\mathcal{H}}_{n}^{m}$ the presheaf

$$
U \longmapsto \underline{\mathcal{H}}_{n}^{m}(U)=H^{m}\left(U, K_{n}\right)
$$

Similarly we set $\underline{\mathcal{H}}^{m}(U)=H^{m}(U, K)$. By Lemma 20.29.6 we see that $\mathcal{H}_{n}^{m}$ is the sheafification of $\underline{\mathcal{H}}_{n}^{m}$ and $\mathcal{H}^{m}$ is the sheafification of $\underline{\mathcal{H}}^{m}$. Here is a diagram

In general it may not be the case that $\lim \mathcal{H}_{n}^{m}$ is the sheafification of $\lim \underline{\mathcal{H}}_{n}^{m}$. If $U \subset X$ is an open, then we have short exact sequences
0BKR

$$
0 \rightarrow R^{1} \lim \underline{\mathcal{H}}_{n}^{m-1}(U) \rightarrow \underline{\mathcal{H}}^{m}(U) \rightarrow \lim \underline{\mathcal{H}}_{n}^{m}(U) \rightarrow 0
$$

This follows from the fact that $R \Gamma(U,-)$ commutes with derived limits (Injectives, Lemma 19.13.6 and More on Algebra, Remark 15.68.16
The following lemma applies to an inverse system of quasi-coherent modules with surjective transition maps on a scheme.

0BKS Lemma 20.31.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(\mathcal{F}_{n}\right)$ be an inverse system of $\mathcal{O}_{X}$-modules. Let $\mathcal{B}$ be a set of opens of $X$. Assume
(1) every open of $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) $H^{p}\left(U, \mathcal{F}_{n}\right)=0$ for $p>0$ and $U \in \mathcal{B}$,
(3) the inverse system $\mathcal{F}_{n}(U)$ has vanishing $R^{1} \lim$ for $U \in \mathcal{B}$.

Then $R \lim \mathcal{F}_{n}=\lim \mathcal{F}_{n}$.
Proof. Set $K_{n}=\mathcal{F}_{n}$ and $K=R \lim \mathcal{F}_{n}$. Using the notation of Remark 20.31.2 and assumption (2) we see that for $U \in \mathcal{B}$ we have $\underline{\mathcal{H}}_{n}^{m}(U)=0$ when $m \neq 0$ and $\underline{\mathcal{H}}_{n}^{0}(U)=\mathcal{F}_{n}(U)$. From Equation 20.31.2.1 and assumption (3) we see that $\underline{\mathcal{H}}^{m}(U)=0$ when $m \neq 0$ and equal to $\lim \mathcal{F}_{n}(U)$ when $m=0$. Sheafifying using (1) we find that $\mathcal{H}^{m}=0$ when $m \neq 0$ and equal to $\lim \mathcal{F}_{n}$ when $m=0$.

08U2 Lemma 20.31.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E \in D\left(\mathcal{O}_{X}\right)$. Assume there exists a set $\mathcal{B}$ of opens of $X$ such that
(1) every open in $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) $\forall m, \exists p(m)$ such that $H^{p}\left(U, H^{m-p}(E)\right)=0$ for all $p>p(m)$ and $U \in \mathcal{B}$. (For example if $H^{p}\left(U, H^{q}(E)\right)=0$ for all $p>0, q<0, U \in \mathcal{B}$.)
Then the canonical map

$$
E \longrightarrow R \lim \tau_{\geq-n} E
$$

is an isomorphism in $D\left(\mathcal{O}_{X}\right)$.
Proof. (The parenthetical statement holds because the condition $H^{p}\left(U, H^{q}(E)\right)=$ 0 for all $p>0, q<0, U \in \mathcal{B}$ is equivalent to $p(m)=\max (0, m)$ in the lemma.) The canonical map $E \rightarrow R \lim \tau_{\geq-n} E$ comes from the canonical maps $E \rightarrow \tau_{\geq-n} E$. Set $K_{n}=\tau_{\geq-n} E$ and $K=R \lim K_{n}$. We will use the notation introduced in Remark 20.31.2. Fix $m \in \mathbf{Z}$. Recall (Derived Categories, Remark 13.12.4) that we have distinguished triangles

$$
K_{n+1} \rightarrow K_{n} \rightarrow \mathcal{E}^{-n}[n] \rightarrow K_{n+1}[1]
$$

where $\mathcal{E}^{i}=H^{i}(E)$ denotes the $i$ th cohomology sheaf of $E$. Let $U \in \mathcal{B}$. The associated long exact cohomology sequence gives

$$
H^{m}\left(U, \mathcal{E}^{-n}[n-1]\right) \rightarrow H^{m}\left(U, K_{n+1}\right) \rightarrow H^{m}\left(U, K_{n}\right) \rightarrow H^{m}\left(U, \mathcal{E}^{-n}[n]\right)
$$

The first and the last groups are equal to $H^{m+n-1}\left(U, \mathcal{E}^{-n}\right)$ and $H^{m+n}\left(U, \mathcal{E}^{-n}\right)$. By assumption (2) if $m+n-1>p(m-1)$ and $m+n>p(m)$, i.e., if $n \geq n_{m}=$ $1+\max (p(m-1)-m+1, p(m)-m)$, then these two groups are zero. We conclude that the inverse system

$$
\ldots \rightarrow \underline{\mathcal{H}}_{3}^{m}(U) \rightarrow \underline{\mathcal{H}}_{2}^{m}(U) \rightarrow \underline{\mathcal{H}}_{1}^{m}(U)
$$

is constant for $n \geq n_{m}$. We conclude that these inverse systems have vanishing $R^{1} \lim ($ for all $m$ ). By Equation 20.31.2.1)

$$
\underline{\mathcal{H}}^{m}(U)=\ldots=\underline{\mathcal{H}}_{n_{m}+2}^{m}(U)=\underline{\mathcal{H}}_{n_{m}+1}^{m}(U)=\underline{\mathcal{H}}_{n_{m}}^{m}(U)
$$

for all $U \in \mathcal{B}$. By property (1) we find that $\underline{\mathcal{H}}^{m}$ and $\underline{\mathcal{H}}_{n_{m}+i}^{m}$ have the same sheafification for $i \geq 0$. If $-n_{m}-i<m$, then this sheafification is equal to $\mathcal{E}^{m}$ by Lemma 20.29.6 applied to $K_{n_{m}+i}=\tau_{\geq-n_{m}-i} E$. This implies that $E \rightarrow K$ induces an isomorphism on cohomology sheaves which is what we wanted to prove.

The lemma above can be used to compute cohomology in certain situations.
0BKT Lemma 20.31.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $\mathcal{B}$ be a set of opens of $X$. Assume
(1) every open of $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) $H^{p}\left(U, H^{q}(K)\right)=0$ for all $p>0, q \in \mathbf{Z}$, and $U \in \mathcal{B}$.

Then $H^{q}(U, K)=H^{0}\left(U, H^{q}(K)\right)$ for $q \in \mathbf{Z}$ and $U \in \mathcal{B}$.
Proof. Observe that $K=R \lim \tau_{\geq-n} K$ by Lemma 20.31.4. Let $U \in \mathcal{B}$. By Equation 20.31.2.1 we get a short exact sequence

$$
0 \rightarrow R^{1} \lim H^{q-1}\left(U, \tau_{\geq-n} K\right) \rightarrow H^{q}(U, K) \rightarrow \lim H^{q}\left(U, \tau_{\geq-n} K\right) \rightarrow 0
$$

Condition (2) implies $H^{q}\left(U, \tau_{\geq-n} K\right)=H^{0}\left(U, H^{q}\left(\tau_{\geq-n} K\right)\right.$ ) for all $q$ by using the spectral sequence of Example 20.29.9. The spectral sequence converges because $\tau_{\geq-n} K$ is bounded below. If $n>-q$ then we have $H^{q}\left(\tau_{\geq-n} K\right)=H^{q}(K)$. Thus the systems on the left and the right of the displayed short exact sequence are eventually constant with values $H^{0}\left(U, H^{q-1}(K)\right)$ and $H^{0}\left(U, H^{q}(K)\right)$ and the lemma follows.

Here is another case where we can describe the derived limit.
0BKU Lemma 20.31.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(K_{n}\right)$ be an inverse system of objects of $D\left(\mathcal{O}_{X}\right)$. Let $\mathcal{B}$ be a set of opens of $X$. Assume
(1) every open of $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) for all $U \in \mathcal{B}$ and all $q \in \mathbf{Z}$ we have
(a) $H^{p}\left(U, H^{q}\left(K_{n}\right)\right)=0$ for $p>0$,
(b) the inverse system $H^{0}\left(U, H^{q}\left(K_{n}\right)\right)$ has vanishing $R^{1} \lim$.

Then $H^{q}\left(R \lim K_{n}\right)=\lim H^{q}\left(K_{n}\right)$ for $q \in \mathbf{Z}$ and $R^{t} \lim H^{q}\left(K_{n}\right)=0$ for $t>0$.
Proof. Set $K=R \lim K_{n}$. We will use notation as in Remark 20.31.2 Let $U \in \mathcal{B}$. By Lemma 20.31 .5 and (2)(a) we have $H^{q}\left(U, K_{n}\right)=H^{0}\left(U, H^{q}\left(K_{n}\right)\right)$. Using that the functor $R \Gamma(U,-)$ commutes with derived limits we have

$$
H^{q}(U, K)=H^{q}\left(R \lim R \Gamma\left(U, K_{n}\right)\right)=\lim H^{0}\left(U, H^{q}\left(K_{n}\right)\right)
$$

where the final equality follows from More on Algebra, Remark 15.68 .16 and assumption (2)(b). Thus $H^{q}(U, K)$ is the inverse limit the sections of the sheaves $H^{q}\left(K_{n}\right)$ over $U$. Since $\lim H^{q}\left(K_{n}\right)$ is a sheaf we find using assumption (1) that $H^{q}(K)$, which is the sheafification of the presheaf $U \mapsto H^{q}(U, K)$, is equal to $\lim H^{q}\left(K_{n}\right)$. This proves the first statement. The second is Lemma 20.31.3.

### 20.32. Producing K-injective resolutions

0719 Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules. The category $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ has enough injectives, hence we can use Derived Categories, Lemma 13.28 .3 produce a diagram

in the category of complexes of $\mathcal{O}_{X}$-modules such that
(1) the vertical arrows are quasi-isomorphisms,
(2) $\mathcal{I}_{n}^{\bullet}$ is a bounded below complex of injectives,
(3) the arrows $\mathcal{I}_{n+1}^{\bullet} \rightarrow \mathcal{I}_{n}^{\bullet}$ are termwise split surjections.

The category of $\mathcal{O}_{X}$-modules has limits (they are computed on the level of presheaves), hence we can form the termwise limit $\mathcal{I}^{\bullet}=\lim _{n} \mathcal{I}_{n}^{\bullet}$. By Derived Categories, Lemmas 13.29 .4 and 13.29 .8 this is a K-injective complex. In general the canonical map

$$
\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}
$$

may not be a quasi-isomorphism. In the following lemma we describe some conditions under which it is.
071B Lemma 20.32.1. In the situation described above. Denote $\mathcal{H}^{m}=H^{m}\left(\mathcal{F}^{\bullet}\right)$ the mth cohomology sheaf. Let $\mathcal{B}$ be a set of open subsets of $X$. Let $d \in \mathbf{N}$. Assume
(1) every open in $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) for every $U \in \mathcal{B}$ we have $H^{p}\left(U, \mathcal{H}^{q}\right)=0$ for $p>d$ and $q<q^{2}$.

Then 20.32.0.1) is a quasi-isomorphism.
Proof. By Derived Categories, Lemma 13.32 .4 it suffices to show that the canonical $\operatorname{map} \mathcal{F}^{\bullet} \rightarrow R \lim \tau_{\geq-n} \mathcal{F}^{\bullet}$ is an isomorphism. This follows from Lemma 20.31.4 with $p(m)=\max (d, m)$.
Here is a technical lemma about the cohomology sheaves of the inverse limit of a system of complexes of sheaves. In some sense this lemma is the wrong thing to try to prove as one should take derived limits and not actual inverse limits.

08BY Lemma 20.32.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(\mathcal{F}_{n}^{\bullet}\right)$ be an inverse system of complexes of $\mathcal{O}_{X}$-modules. Let $m \in \mathbf{Z}$. Assume there exist a set $\mathcal{B}$ of open subsets of $X$ and an integer $n_{0}$ such that
(1) every open in $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) for every $U \in \mathcal{B}$
(a) the systems of abelian groups $\mathcal{F}_{n}^{m-2}(U)$ and $\mathcal{F}_{n}^{m-1}(U)$ have vanishing $R^{1} \lim$ (for example these have the Mittag-Leffler condition),
(b) the system of abelian groups $H^{m-1}\left(\mathcal{F}_{n}^{\bullet}(U)\right)$ has vanishing $R^{1} \lim$ (for example it has the Mittag-Leffler condition), and
(c) we have $H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)=H^{m}\left(\mathcal{F}_{n_{0}}^{\bullet}(U)\right)$ for all $n \geq n_{0}$.

Then the maps $H^{m}\left(\mathcal{F}^{\bullet}\right) \rightarrow \lim H^{m}\left(\mathcal{F}_{n}^{\bullet}\right) \rightarrow H^{m}\left(\mathcal{F}_{n_{0}}^{\bullet}\right)$ are isomorphisms of sheaves where $\mathcal{F}^{\bullet}=\lim \mathcal{F}_{n}^{\bullet}$ is the termwise inverse limit.

Proof. Let $U \in \mathcal{B}$. Note that $H^{m}\left(\mathcal{F}^{\bullet}(U)\right)$ is the cohomology of

$$
\lim _{n} \mathcal{F}_{n}^{m-2}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m-1}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m+1}(U)
$$

in the third spot from the left. By assumptions (2)(a) and (2)(b) we may apply More on Algebra, Lemma 15.68 .2 to conclude that

$$
H^{m}\left(\mathcal{F}^{\bullet}(U)\right)=\lim H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)
$$

By assumption (2)(c) we conclude

$$
H^{m}\left(\mathcal{F}^{\bullet}(U)\right)=H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)
$$

for all $n \geq n_{0}$. By assumption (1) we conclude that the sheafification of $U \mapsto$ $H^{m}\left(\mathcal{F}^{\bullet}(U)\right)$ is equal to the sheafification of $U \mapsto H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)$ for all $n \geq n_{0}$. Thus the inverse system of sheaves $H^{m}\left(\mathcal{F}_{n}^{\bullet}\right)$ is constant for $n \geq n_{0}$ with value $H^{m}\left(\mathcal{F}^{\bullet}\right)$ which proves the lemma.

[^53]
### 20.33. Čech cohomology of unbounded complexes

08BZ The construction of Section 20.26 isn't the "correct" one for unbounded complexes. The problem is that in the Stacks project we use direct sums in the totalization of a double complex and we would have to replace this by a product. Instead of doing so in this section we assume the covering is finite and we use the alternating Čech complex.

Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}^{\bullet}$ be a complex of presheaves of $\mathcal{O}_{X}$-modules. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be a finite open covering of $X$. Since the alternating Čech complex $\breve{\mathcal{C}}_{\text {alt }}(\mathcal{U}, \mathcal{F})$ (Section 20.24 ) is functorial in the presheaf $\mathcal{F}$ we obtain a double complex $\check{\mathcal{C}}_{\text {alt }}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)$. In this section we work with the associated total complex. The construction of $\operatorname{Tot}\left(\check{\mathcal{C}}_{\text {alt }}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)$ is functorial in $\mathcal{F}^{\bullet}$. As well there is a functorial transformation

08C0

$$
\begin{equation*}
\Gamma\left(X, \mathcal{F}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \tag{20.33.0.1}
\end{equation*}
$$

of complexes defined by the following rule: The section $s \in \Gamma\left(X, \mathcal{F}^{n}\right)$ is mapped to the element $\alpha=\left\{\alpha_{i_{0} \ldots i_{p}}\right\}$ with $\alpha_{i_{0}}=\left.s\right|_{U_{i_{0}}}$ and $\alpha_{i_{0} \ldots i_{p}}=0$ for $p>0$.

08C1 Lemma 20.33.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be a finite open covering. For a complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is a canonical map

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{\text {©lt }}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow R \Gamma\left(X, \mathcal{F}^{\bullet}\right)
$$

functorial in $\mathcal{F}^{\bullet}$ and compatible with 20.33.0.1.
Proof. Let $\mathcal{I}^{\bullet}$ be a K -injective complex whose terms are injective $\mathcal{O}_{X}$-modules. The map 20.33.0.1 for $\mathcal{I}^{\bullet}$ is a map $\Gamma\left(X, \mathcal{I}^{\bullet}\right) \rightarrow \operatorname{Tot}\left(\check{\mathcal{C}}_{\text {alt }}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)$. This is a quasiisomorphism of complexes of abelian groups as follows from Homology, Lemma 12.22 .7 applied to the double complex $\check{\mathcal{C}}_{\text {alt }}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ using Lemmas 20.12.1 and 20.24.6. Suppose $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ is a quasi-isomorphism of $\mathcal{F}^{\bullet}$ into a K-injective complex whose terms are injectives (Injectives, Theorem 19.12.6). Since $R \Gamma\left(X, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\Gamma\left(X, \mathcal{I}^{\bullet}\right)$ we obtain the map of the lemma using

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)\right)
$$

We omit the verification of functoriality and compatibilities.
08C2 Lemma 20.33.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be a finite open covering. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules. Let $\mathcal{B}$ be a set of open subsets of X. Assume
(1) every open in $X$ has a covering whose members are elements of $\mathcal{B}$,
(2) we have $U_{i_{0} \ldots i_{p}} \in \mathcal{B}$ for all $i_{0}, \ldots, i_{p} \in I$,
(3) for every $U \in \mathcal{B}$ and $p>0$ we have
(a) $H^{p}\left(U, \mathcal{F}^{q}\right)=0$,
(b) $H^{p}\left(U, \operatorname{Coker}\left(\mathcal{F}^{q-1} \rightarrow \mathcal{F}^{q}\right)\right)=0$, and
(c) $H^{p}\left(U, H^{q}(\mathcal{F})\right)=0$.

Then the map

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow R \Gamma\left(X, \mathcal{F}^{\bullet}\right)
$$

of Lemma 20.33.1 is an isomorphism in $D(A b)$.

Proof. If $\mathcal{F}^{\bullet}$ is bounded below, this follows from assumption (3)(a) and the spectral sequence of Lemma 20.26.1 and the fact that

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)
$$

is a quasi-isomorphism by Lemma 20.24 .6 (some details omitted). In general, by assumption (3)(c) we may choose a resolution $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}=\lim \mathcal{I}_{n}^{\bullet}$ as in Lemma 20.32.1. Then the map of the lemma becomes

$$
\lim _{n} \operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \tau_{\geq-n} \mathcal{F}^{\bullet}\right)\right) \longrightarrow \lim _{n} \Gamma\left(X, \mathcal{I}_{n}^{\bullet}\right)
$$

Note that $(3)(\mathrm{b})$ shows that $\tau_{\geq-n} \mathcal{F}^{\bullet}$ is a bounded below complex satisfying the hypothesis of the lemma. Thus the case of bounded below complexes shows each of the maps

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \tau_{\geq-n} \mathcal{F}^{\bullet}\right)\right) \longrightarrow \Gamma\left(X, \mathcal{I}_{n}^{\bullet}\right)
$$

is a quasi-isomorphism. The cohomologies of the complexes on the left hand side in given degree are eventually constant (as the alternating Čech complex is finite). Hence the same is true on the right hand side. Thus the cohomology of the limit on the right hand side is this constant value by Homology, Lemma 12.27 .7 and we win.

### 20.34. Hom complexes

0 A 8 K Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{L}^{\bullet}$ and $\mathcal{M}^{\bullet}$ be two complexes of $\mathcal{O}_{X}$-modules. We construct a complex of $\mathcal{O}_{X}$-modules $\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)$. Namely, for each $n$ we set

$$
\mathcal{H o m}^{n}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)=\prod_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}^{-q}, \mathcal{M}^{p}\right)
$$

It is a good idea to think of $\mathcal{H o m}^{n}$ as the sheaf of $\mathcal{O}_{X}$-modules of all $\mathcal{O}_{X}$-linear maps from $\mathcal{L}^{\bullet}$ to $\mathcal{M}^{\bullet}$ (viewed as graded $\mathcal{O}_{X}$-modules) which are homogenous of degree $n$. In this terminology, we define the differential by the rule

$$
\mathrm{d}(f)=\mathrm{d}_{\mathcal{M}} \circ f-(-1)^{n} f \circ \mathrm{~d}_{\mathcal{L}}
$$

for $f \in \mathcal{H o m}_{\mathcal{O}_{X}}^{n}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)$. We omit the verification that $\mathrm{d}^{2}=0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have
0A8L (20.34.0.1)

$$
H^{n}\left(\Gamma\left(U, \mathcal{H o m} \cdot\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}[n]\right)
$$

for all $n \in \mathbf{Z}$ and every open $U \subset X$.
0 A 8 M Lemma 20.34.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is an isomorphism

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)\right)=\mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right), \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}_{X}$-modules functorial in $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.1.

0 A 8 N Lemma 20.34.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \otimes_{\mathcal{O}_{X}} \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}\right)\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}_{X}$-modules.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59 .2

0A8P Lemma 20.34.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}\right), \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}_{X}$-modules functorial in all three complexes.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.3.

0A8Q Lemma 20.34.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}_{X}$-modules there is a canonical morphism

$$
\mathcal{K}^{\bullet} \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right)\right)
$$

of complexes of $\mathcal{O}_{X}$-modules functorial in both complexes.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.5.

0A8R Lemma 20.34.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{I}^{\bullet}$ be a $K$-injective complex of $\mathcal{O}_{X}$-modules. Let $\mathcal{L}^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules. Then

$$
H^{0}\left(\Gamma\left(U, \operatorname{Hom}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

for all $U \subset X$ open.
Proof. We have

$$
\begin{aligned}
H^{0}\left(\Gamma\left(U, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right) & =\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
\end{aligned}
$$

The first equality is 20.34 .0 .1 . The second equality is true because $\left.\mathcal{I}^{\bullet}\right|_{U}$ is Kinjective by Lemma 20.30.1

0 A S Lemma 20.34.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\left(\mathcal{I}^{\prime}\right)^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ be a quasiisomorphism of K-injective complexes of $\mathcal{O}_{X}$-modules. Let $\left(\mathcal{L}^{\prime}\right)^{\bullet} \rightarrow \mathcal{L}^{\bullet}$ be a quasiisomorphism of complexes of $\mathcal{O}_{X}$-modules. Then

$$
\operatorname{Hom}^{\bullet}\left(\mathcal{L}^{\bullet},\left(\mathcal{I}^{\prime}\right)^{\bullet}\right) \longrightarrow \operatorname{Hom}^{\bullet}\left(\left(\mathcal{L}^{\prime}\right)^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

is a quasi-isomorphism.
Proof. Let $M$ be the object of $D\left(\mathcal{O}_{X}\right)$ represented by $\mathcal{I}^{\bullet}$ and $\left(\mathcal{I}^{\prime}\right)^{\bullet}$. Let $L$ be the object of $D\left(\mathcal{O}_{X}\right)$ represented by $\mathcal{L}^{\bullet}$ and $\left(\mathcal{L}^{\prime}\right)^{\bullet}$. By Lemma 20.34 .5 we see that the sheaves

$$
H^{0}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet},\left(\mathcal{I}^{\prime}\right)^{\bullet}\right)\right) \quad \text { and } \quad H^{0}\left(\mathcal{H o m}^{\bullet}\left(\left(\mathcal{L}^{\prime}\right)^{\bullet}, \mathcal{I}^{\bullet}\right)\right)
$$

are both equal to the sheaf associated to the presheaf

$$
U \longmapsto \operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

Thus the map is a quasi-isomorphism.
0A8T Lemma 20.34.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{I}^{\bullet}$ be a $K$-injective complex of $\mathcal{O}_{X}$-modules. Let $\mathcal{L}^{\bullet}$ be a $K$-flat complex of $\mathcal{O}_{X}$-modules. Then $\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)$ is a K-injective complex of $\mathcal{O}_{X}$-modules.

Proof. Namely, if $\mathcal{K}^{\bullet}$ is an acyclic complex of $\mathcal{O}_{X}$-modules, then

$$
\begin{aligned}
\operatorname{Hom}_{K\left(\mathcal{O}_{X}\right)}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right) & =H^{0}\left(\Gamma\left(X, \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right)\right) \\
& =H^{0}\left(\Gamma\left(X, \mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right)\right)\right) \\
& =\operatorname{Hom}_{K\left(\mathcal{O}_{X}\right)}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right) \\
& =0
\end{aligned}
$$

The first equality by 20.34 .0 .1 . The second equality by Lemma 20.34.1. The third equality by 20.34.0.1). The final equality because $\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet \bullet}\right)$ is acyclic because $\mathcal{L}^{\bullet}$ is K-flat (Definition 20.27.2) and because $\mathcal{I}^{\bullet}$ is K-injective.

### 20.35. Internal hom in the derived category

08 DH Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $L, M$ be objects of $D\left(\mathcal{O}_{X}\right)$. We would like to construct an object $R \mathcal{H o m}(L, M)$ of $D\left(\mathcal{O}_{X}\right)$ such that for every third object $K$ of $D\left(\mathcal{O}_{X}\right)$ there exists a canonical bijection
08DI

$$
\begin{equation*}
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L, M\right) \tag{20.35.0.1}
\end{equation*}
$$

Observe that this formula defines $R \mathcal{H o m}(L, M)$ up to unique isomorphism by the Yoneda lemma (Categories, Lemma 4.3.5.
To construct such an object, choose a K-injective complex $\mathcal{I} \bullet$ representing $M$ and any complex of $\mathcal{O}_{X}$-modules $\mathcal{L}^{\bullet}$ representing $L$. Then we set

$$
R \mathcal{H o m}(L, M)=\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

where the right hand side is the complex of $\mathcal{O}_{X}$-modules constructed in Section 20.34 This is well defined by Lemma 20.34.6. We get a functor

$$
D\left(\mathcal{O}_{X}\right)^{o p p} \times D\left(\mathcal{O}_{X}\right) \longrightarrow D\left(\mathcal{O}_{X}\right), \quad(K, L) \longmapsto R \mathcal{H o m}(K, L)
$$

As a prelude to proving 20.35.0.1 we compute the cohomology groups of $R \mathcal{H o m}(K, L)$.
08 DK Lemma 20.35.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $L, M$ be objects of $D\left(\mathcal{O}_{X}\right)$. For every open $U$ we have

$$
H^{0}(U, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

and in particular $H^{0}(X, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(L, M)$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ of $\mathcal{O}_{X}$-modules representing $M$ and a K-flat complex $\mathcal{L}^{\bullet}$ representing $L$. Then $\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)$ is K-injective by Lemma 20.34.7. Hence we can compute cohomology over $U$ by simply taking sections over $U$ and the result follows from Lemma 20.34.5

08DJ Lemma 20.35.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L, M$ be objects of $D\left(\mathcal{O}_{X}\right)$. With the construction as described above there is a canonical isomorphism

$$
R \mathcal{H o m}(K, R \mathcal{H} \operatorname{Hom}(L, M))=R \mathcal{H o m}\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L, M\right)
$$

in $D\left(\mathcal{O}_{X}\right)$ functorial in $K, L, M$ which recovers 20.35.0.1) by taking $H^{0}(X,-)$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $M$ and a K-flat complex of $\mathcal{O}_{X}$-modules $\mathcal{L}^{\bullet}$ representing $L$. Let $\mathcal{H}^{\bullet}$ be the complex described above. For any complex of $\mathcal{O}_{X}$-modules $\mathcal{K}^{\bullet}$ we have

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)=\mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right)
$$

by Lemma 20.34.1 Note that the left hand side represents $R \mathcal{H o m}(K, R \mathcal{H o m}(L, M))$ (use Lemma 20.34 .7 ) and that the right hand side represents $R \mathcal{H} o m\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L, M\right)$. This proves the displayed formula of the lemma. Taking global sections and using Lemma 20.35.1 we obtain 20.35.0.1.

08DL Lemma 20.35.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$. The construction of $R \mathcal{H}$ om $(K, L)$ commutes with restrictions to opens, i.e., for every open $U$ we have $R \mathcal{H o m}\left(\left.K\right|_{U},\left.L\right|_{U}\right)=\left.R \mathcal{H o m}(K, L)\right|_{U}$.

Proof. This is clear from the construction and Lemma 20.30.1

08I0 Lemma 20.35.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. The bifunctor $R \mathcal{H}$ lom $(-,-)$ transforms distinguished triangles into distinguished triangles in both variables.

Proof. This follows from the observation that the assignment

$$
\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \longmapsto \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)
$$

transforms a termwise split short exact sequences of complexes in either variable into a termwise split short exact sequence. Details omitted.

0A8U Lemma 20.35.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L, M$ be objects of $D\left(\mathcal{O}_{X}\right)$. There is a canonical morphism

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K \longrightarrow R \mathcal{H o m}(R \mathcal{H o m}(K, L), M)
$$

in $D\left(\mathcal{O}_{X}\right)$ functorial in $K, L, M$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $M$, a K-injective complex $\mathcal{J}^{\bullet}$ representing $L$, and a K-flat complex $\mathcal{K}^{\bullet}$ representing $K$. The map is defined using the map

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{J}^{\bullet}, \mathcal{I}^{\bullet}\right) \otimes_{\mathcal{O}_{X}} \mathcal{K}^{\bullet}\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{J}^{\bullet}\right), \mathcal{I}^{\bullet}\right)
$$

of Lemma 20.34.3. By our particular choice of complexes the left hand side represents $R \mathcal{H} \operatorname{Hom}(L, M) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K$ and the right hand side represents $R \mathcal{H}$ om $(R \mathcal{H o m}(K, L), M)$. We omit the proof that this is functorial in all three objects of $D\left(\mathcal{O}_{X}\right)$.

0A8V Lemma 20.35.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given $K, L, M$ in $D\left(\mathcal{O}_{X}\right)$ there is a canonical morphism

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} R \mathcal{H} \operatorname{Hom}(K, L) \longrightarrow R \mathcal{H o m}(K, M)
$$

in $D\left(\mathcal{O}_{X}\right)$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 20.34.2. Instead, we use the maps

gotten by applying Lemma 20.35 .5 twice and using the maps $\mathcal{O}_{X} \rightarrow R \mathcal{H}$ om $(K, K)$ and $\mathcal{O}_{X} \rightarrow R \mathcal{H o m}(L, L)$. Finally, we use Lemma 20.35 .2 to translate the composition

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \operatorname{RHom}(K, L) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K \longrightarrow M
$$

into a map as in the statement of the lemma.
0A8W Lemma 20.35.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given $K, L$ in $D\left(\mathcal{O}_{X}\right)$ there is a canonical morphism

$$
K \longrightarrow R \mathcal{H o m}\left(L, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)
$$

in $D\left(\mathcal{O}_{X}\right)$ functorial in both $K$ and $L$.
Proof. Choose K-flat complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$ represeting $K$ and $L$. Choose a Kinjective complex $\mathcal{I}^{\bullet}$ and a quasi-isomorphism $\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right) \rightarrow \mathcal{I}^{\bullet}$. Then we use

$$
\mathcal{K}^{\bullet} \rightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right)\right) \rightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

where the first map comes from Lemma 20.34.4.
08 I Lemma 20.35.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $L$ be an object of $D\left(\mathcal{O}_{X}\right)$. Set $L^{v}=R \mathcal{H}$ om $\left(L, \mathcal{O}_{X}\right)$. For $M$ in $D\left(\mathcal{O}_{X}\right)$ there is a canonical map
08 I 2 (20.35.8.1)

$$
L^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M \longrightarrow R \mathcal{H o m}(L, M)
$$

which induces a canonical map

$$
H^{0}\left(X, L^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(L, M)
$$

functorial in $M$ in $D\left(\mathcal{O}_{X}\right)$.
Proof. The map 20.35.8.1 is a special case of Lemma 20.35.6 using the identification $M=R \mathcal{H o m}\left(\mathcal{O}_{X}, M\right)$.

0B69 Remark 20.35.9. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$. We claim there is a canonical map

$$
R f_{*} R \mathcal{H o m}(L, K) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, R f_{*} K\right)
$$

Namely, by 20.35 .0 .1 this is the same thing as a map $R f_{*} R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}}$ $R f_{*} L \rightarrow R f_{*} K$. For this we can use the composition

$$
R f_{*} R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*} L \rightarrow R f_{*}\left(R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right) \rightarrow R f_{*} K
$$

where the first arrow is the relative cup product (Remark 20.29.5) and the second arrow is $R f_{*}$ applied to the canonical map $R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{X}}^{L} L \rightarrow K$ coming from Lemma 20.35 .6 (with $\mathcal{O}_{X}$ in one of the spots).

08I3 Remark 20.35.10. Let $h: X \rightarrow Y$ be a morphism of ringed spaces. Let $K, L$ be objects of $D\left(\mathcal{O}_{Y}\right)$. We claim there is a canonical map

$$
L h^{*} R \mathcal{H o m}(K, L) \longrightarrow R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
$$

in $D\left(\mathcal{O}_{X}\right)$. Namely, by 20.35.0.1 proved in Lemma 20.35 .2 such a map is the same thing as a map

$$
L h^{*} R \mathcal{H o m}(K, L) \otimes^{\mathbf{L}} L h^{*} K \longrightarrow L h^{*} L
$$

The source of this arrow is $L h^{*}\left(\mathcal{H o m}(K, L) \otimes^{\mathbf{L}} K\right)$ by Lemma 20.28.2 hence it suffices to construct a canonical map

$$
R \mathcal{H o m}(K, L) \otimes^{\mathbf{L}} K \longrightarrow L
$$

For this we take the arrow corresponding to

$$
\mathrm{id}: R \mathcal{H o m}(K, L) \longrightarrow R \mathcal{H o m}(K, L)
$$

via 20.35.0.1.
08I4 Remark 20.35.11. Suppose that

is a commutative diagram of ringed spaces. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$. We claim there exists a canonical base change map

$$
L g^{*} R f_{*} R \mathcal{H o m}(K, L) \longrightarrow R\left(f^{\prime}\right)_{*} R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
$$

in $D\left(\mathcal{O}_{S^{\prime}}\right)$. Namely, we take the map adjoint to the composition

$$
\begin{aligned}
L\left(f^{\prime}\right)^{*} L g^{*} R f_{*} R \mathcal{H o m}(K, L) & =L h^{*} L f^{*} R f_{*} R \mathcal{H o m}(K, L) \\
& \rightarrow L h^{*} R \mathcal{H o m}(K, L) \\
& \rightarrow R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
\end{aligned}
$$

where the first arrow uses the adjunction mapping $L f^{*} R f_{*} \rightarrow$ id and the second arrow is the canonical map constructed in Remark 20.35.10.

### 20.36. Ext sheaves

0 BQP Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L \in D\left(\mathcal{O}_{X}\right)$. Using the construction of the internal hom in the derived category we obtain a well defined sheaves of $\mathcal{O}_{X^{-}}$ modules

$$
\mathcal{E x t}^{n}(K, L)=H^{n}(R \mathcal{H o m}(K, L))
$$

by taking the $n$th cohomology sheaf of the object $R \mathcal{H}$ om $(K, L)$ of $D\left(\mathcal{O}_{X}\right)$. We will sometimes write $\mathcal{E} x t_{\mathcal{O}_{X}}^{n}(K, L)$ for this object. By Lemma 20.35.1 we see that this $\mathcal{E} x t^{n}$-sheaf is the sheafification of the rule

$$
U \longmapsto \operatorname{Ext}_{D\left(\mathcal{O}_{U}\right)}^{n}\left(\left.K\right|_{U},\left.L\right|_{U}\right)
$$

By Example 20.29.9 there is always a spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(X, \mathcal{E} x t^{q}(K, L)\right)
$$

converging to $\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{p+q}(K, L)$ in favorable situations (for example if $L$ is bounded below and $K$ is bounded above).

### 20.37. Global derived hom

0 B 6 A Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L \in D\left(\mathcal{O}_{X}\right)$. Using the construction of the internal hom in the derived category we obtain a well defined object

$$
R \operatorname{Hom}(K, L)=R \Gamma(X, R \mathcal{H o m}(K, L))
$$

in $D\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)$. We will sometimes write $R \operatorname{Hom}_{X}(K, L)$ or $R \operatorname{Hom}_{\mathcal{O}_{X}}(K, L)$ for this object. By Lemma 20.35.1 we have

$$
H^{0}(R \operatorname{Hom}(K, L))=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K, L)
$$

and

$$
H^{p}(R \operatorname{Hom}(K, L))=\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{p}(K, L)
$$

### 20.38. Strictly perfect complexes

08C3 Strictly perfect complexes of modules are used to define the notions of pseudocoherent and perfect complexes later on. They are defined as follows.

08C4 Definition 20.38.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules. We say $\mathcal{E}^{\bullet}$ is strictly perfect if $\mathcal{E}^{i}$ is zero for all but finitely many $i$ and $\mathcal{E}^{i}$ is a direct summand of a finite free $\mathcal{O}_{X}$-module for all $i$.

Warning: Since we do not assume that $X$ is a locally ringed space, it may not be true that a direct summand of a finite free $\mathcal{O}_{X}$-module is finite locally free.

08C5 Lemma 20.38.2. The cone on a morphism of strictly perfect complexes is strictly perfect.

Proof. This is immediate from the definitions.
09J2 Lemma 20.38.3. The total complex associated to the tensor product of two strictly perfect complexes is strictly perfect.

Proof. Omitted.
09U6 Lemma 20.38.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. If $\mathcal{F}^{\bullet}$ is a strictly perfect complex of $\mathcal{O}_{Y}$-modules, then $f^{*} \mathcal{F}^{\bullet}$ is a strictly perfect complex of $\mathcal{O}_{X}$-modules.

Proof. The pullback of a finite free module is finite free. The functor $f^{*}$ is additive functor hence preserves direct summands. The lemma follows.

08C6 Lemma 20.38.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given a solid diagram of $\mathcal{O}_{X^{-}}$ modules

with $\mathcal{E}$ a direct summand of a finite free $\mathcal{O}_{X}$-module and $p$ surjective, then a dotted arrow making the diagram commute exists locally on $X$.

Proof. We may assume $\mathcal{E}=\mathcal{O}_{X}^{\oplus n}$ for some $n$. In this case finding the dotted arrow is equivalent to lifting the images of the basis elements in $\Gamma(X, \mathcal{F})$. This is locally possible by the characterization of surjective maps of sheaves (Sheaves, Section 6.16.

08C7 Lemma 20.38.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space.
(1) Let $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ be a morphism of complexes of $\mathcal{O}_{X}$-modules with $\mathcal{E}^{\bullet}$ strictly perfect and $\mathcal{F}^{\bullet}$ acyclic. Then $\alpha$ is locally on $X$ homotopic to zero.
(2) Let $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ be a morphism of complexes of $\mathcal{O}_{X}$-modules with $\mathcal{E}^{\bullet}$ strictly perfect, $\mathcal{E}^{i}=0$ for $i<a$, and $H^{i}\left(\mathcal{F}^{\bullet}\right)=0$ for $i \geq a$. Then $\alpha$ is locally on $X$ homotopic to zero.

Proof. The first statement follows from the second, hence we only prove (2). We will prove this by induction on the length of the complex $\mathcal{E}^{\bullet}$. If $\mathcal{E}^{\bullet} \cong \mathcal{E}[-n]$ for some direct summand $\mathcal{E}$ of a finite free $\mathcal{O}_{X}$-module and integer $n \geq a$, then the result follows from Lemma 20.38 .5 and the fact that $\mathcal{F}^{n-1} \rightarrow \operatorname{Ker}\left(\mathcal{F}^{n} \rightarrow \mathcal{F}^{n+1}\right)$ is surjective by the assumed vanishing of $H^{n}\left(\mathcal{F}^{\bullet}\right)$. If $\mathcal{E}^{i}$ is zero except for $i \in[a, b]$, then we have a split exact sequence of complexes

$$
0 \rightarrow \mathcal{E}^{b}[-b] \rightarrow \mathcal{E}^{\bullet} \rightarrow \sigma_{\leq b-1} \mathcal{E}^{\bullet} \rightarrow 0
$$

which determines a distinguished triangle in $K\left(\mathcal{O}_{X}\right)$. Hence an exact sequence

$$
\operatorname{Hom}_{K\left(\mathcal{O}_{X}\right)}\left(\sigma_{\leq b-1} \mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right) \rightarrow \operatorname{Hom}_{K\left(\mathcal{O}_{X}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right) \rightarrow \operatorname{Hom}_{K\left(\mathcal{O}_{X}\right)}\left(\mathcal{E}^{b}[-b], \mathcal{F}^{\bullet}\right)
$$

by the axioms of triangulated categories. The composition $\mathcal{E}^{b}[-b] \rightarrow \mathcal{F}^{\bullet}$ is locally homotopic to zero, whence we may assume our map comes from an element in the left hand side of the displayed exact sequence above. This element is locally zero by induction hypothesis.

08C8 Lemma 20.38.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Given a solid diagram of complexes of $\mathcal{O}_{X}$-modules

with $\mathcal{E}^{\bullet}$ strictly perfect, $\mathcal{E}^{j}=0$ for $j<a$ and $H^{j}(f)$ an isomorphism for $j>a$ and surjective for $j=a$, then a dotted arrow making the diagram commute up to homotopy exists locally on $X$.

Proof. Our assumptions on $f$ imply the cone $C(f)^{\bullet}$ has vanishing cohomology sheaves in degrees $\geq a$. Hence Lemma 20.38.6 guarantees there is an open covering
$X=\bigcup U_{i}$ such that the composition $\mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet} \rightarrow C(f)^{\bullet}$ is homotopic to zero over $U_{i}$. Since

$$
\mathcal{G}^{\bullet} \rightarrow \mathcal{F}^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow \mathcal{G}^{\bullet}[1]
$$

restricts to a distinguished triangle in $K\left(\mathcal{O}_{U_{i}}\right)$ we see that we can lift $\left.\alpha\right|_{U_{i}}$ up to homotopy to a map $\alpha_{i}:\left.\left.\mathcal{E}^{\bullet}\right|_{U_{i}} \rightarrow \mathcal{G}^{\bullet}\right|_{U_{i}}$ as desired.
08C9 Lemma 20.38.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}_{X}$-modules with $\mathcal{E} \bullet$ strictly perfect.
(1) For any element $\alpha \in \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ there exists an open covering $X=\bigcup U_{i}$ such that $\left.\alpha\right|_{U_{i}}$ is given by a morphism of complexes $\alpha_{i}:\left.\mathcal{E}^{\bullet}\right|_{U_{i}} \rightarrow$ $\left.\mathcal{F}^{\bullet}\right|_{U_{i}}$.
(2) Given a morphism of complexes $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ whose image in the group $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is zero, there exists an open covering $X=\bigcup U_{i}$ such that $\left.\alpha\right|_{U_{i}}$ is homotopic to zero.
Proof. Proof of (1). By the construction of the derived category we can find a quasi-isomorphism $f: \mathcal{F}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ and a map of complexes $\beta: \mathcal{E}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ such that $\alpha=f^{-1} \beta$. Thus the result follows from Lemma 20.38.7. We omit the proof of (2).

08DM Lemma 20.38.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}_{X}$-modules with $\mathcal{E}^{\bullet}$ strictly perfect. Then the internal hom $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\mathcal{H}^{\bullet}$ with terms

$$
\mathcal{H}^{n}=\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

and differential as described in Section 20.35.
Proof. Choose a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ into a K-injective complex. Let $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ be the complex with terms

$$
\left(\mathcal{H}^{\prime}\right)^{n}=\prod_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{L}^{-q}, \mathcal{I}^{p}\right)
$$

which represents $\operatorname{RHom}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ by the construction in Section 20.35. It suffices to show that the map

$$
\mathcal{H}^{\bullet} \longrightarrow\left(\mathcal{H}^{\prime}\right)^{\bullet}
$$

is a quasi-isomorphism. Given an open $U \subset X$ we have by inspection

$$
H^{0}\left(\mathcal{H}^{\bullet}(U)\right)=\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\left.\mathcal{E}^{\bullet}\right|_{U},\left.\mathcal{K}^{\bullet}\right|_{U}\right) \rightarrow H^{0}\left(\left(\mathcal{H}^{\prime}\right)^{\bullet}(U)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.\mathcal{E}^{\bullet}\right|_{U},\left.\mathcal{K}^{\bullet}\right|_{U}\right)
$$

By Lemma 20.38 .8 the sheafification of $U \mapsto H^{0}\left(\mathcal{H}^{\bullet}(U)\right)$ is equal to the sheafification of $U \mapsto H^{0}\left(\left(\mathcal{H}^{\prime}\right)^{\bullet}(U)\right)$. A similar argument can be given for the other cohomology sheaves. Thus $\mathcal{H}^{\bullet}$ is quasi-isomorphic to $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ which proves the lemma.

0815 Lemma 20.38.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}_{X}$-modules with
(1) $\mathcal{F}^{n}=0$ for $n \ll 0$,
(2) $\mathcal{E}^{n}=0$ for $n \gg 0$, and
(3) $\mathcal{E}^{n}$ isomorphic to a direct summand of a finite free $\mathcal{O}_{X}$-module.

Then the internal hom $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\mathcal{H}^{\bullet}$ with terms

$$
\mathcal{H}^{n}=\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

and differential as described in Section 20.35.

Proof. Choose a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ where $\mathcal{I}^{\bullet}$ is a bounded below complex of injectives. Note that $\mathcal{I}^{\bullet}$ is K-injective (Derived Categories, Lemma 13.29.4). Hence the construction in Section 20.35 shows that $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ with terms

$$
\left(\mathcal{H}^{\prime}\right)^{n}=\prod_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{I}^{p}\right)=\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{I}^{p}\right)
$$

(equality because there are only finitely many nonzero terms). Note that $\mathcal{H}^{\bullet}$ is the total complex associated to the double complex with terms $\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)$ and similarly for $\left(\mathcal{H}^{\prime}\right)^{\bullet}$. The natural map $\left(\mathcal{H}^{\prime}\right)^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ comes from a map of double complexes. Thus to show this map is a quasi-isomorphism, we may use the spectral sequence of a double complex (Homology, Lemma 12.22.6)

$$
{ }^{\prime} E_{1}^{p, q}=H^{p}\left(\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{F}^{\bullet}\right)\right)
$$

converging to $H^{p+q}\left(\mathcal{H}^{\bullet}\right)$ and similarly for $\left(\mathcal{H}^{\prime}\right)^{\bullet}$. To finish the proof of the lemma it suffices to show that $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ induces an isomorphism

$$
H^{p}\left(\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow H^{p}\left(\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}, \mathcal{I}^{\bullet}\right)\right)
$$

on cohomology sheaves whenever $\mathcal{E}$ is a direct summand of a finite free $\mathcal{O}_{X}$-module. Since this is clear when $\mathcal{E}$ is finite free the result follows.

### 20.39. Pseudo-coherent modules

08CA In this section we discuss pseudo-coherent complexes.
08 CB Definition 20.39.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules. Let $m \in \mathbf{Z}$.
(1) We say $\mathcal{E}^{\bullet}$ is m-pseudo-coherent if there exists an open covering $X=\bigcup U_{i}$ and for each $i$ a morphism of complexes $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{E}^{\bullet}\right|_{U_{i}}$ where $\mathcal{E}_{i}$ is strictly perfect on $U_{i}$ and $H^{j}\left(\alpha_{i}\right)$ is an isomorphism for $j>m$ and $H^{m}\left(\alpha_{i}\right)$ is surjective.
(2) We say $\mathcal{E}^{\bullet}$ is pseudo-coherent if it is $m$-pseudo-coherent for all $m$.
(3) We say an object $E$ of $D\left(\mathcal{O}_{X}\right)$ is m-pseudo-coherent (resp. pseudo-coherent) if and only if it can be represented by a $m$-pseudo-coherent (resp. pseudocoherent) complex of $\mathcal{O}_{X}$-modules.

If $X$ is quasi-compact, then an $m$-pseudo-coherent object of $D\left(\mathcal{O}_{X}\right)$ is in $D^{-}\left(\mathcal{O}_{X}\right)$. But this need not be the case if $X$ is not quasi-compact.
08 CC Lemma 20.39.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$.
(1) If there exists an open covering $X=\bigcup U_{i}$, strictly perfect complexes $\mathcal{E}_{i}^{\bullet}$ on $U_{i}$, and maps $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow E\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $H^{j}\left(\alpha_{i}\right)$ an isomorphism for $j>m$ and $H^{m}\left(\alpha_{i}\right)$ surjective, then $E$ is m-pseudo-coherent.
(2) If $E$ is m-pseudo-coherent, then any complex representing $E$ is m-pseudocoherent.

Proof. Let $\mathcal{F}^{\bullet}$ be any complex representing $E$ and let $X=\bigcup U_{i}$ and $\alpha_{i}:\left.\mathcal{E}_{i} \rightarrow E\right|_{U_{i}}$ be as in (1). We will show that $\mathcal{F}^{\bullet}$ is $m$-pseudo-coherent as a complex, which will prove (1) and (2) simultaneously. By Lemma 20.38 .8 we can after refining the open covering $X=\bigcup U_{i}$ represent the maps $\alpha_{i}$ by maps of complexes $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{F}^{\bullet}\right|_{U_{i}}$. By assumption $H^{j}\left(\alpha_{i}\right)$ are isomorphisms for $j>m$, and $H^{m}\left(\alpha_{i}\right)$ is surjective whence $\mathcal{F}^{\bullet}$ is $m$-pseudo-coherent.

09U7 Lemma 20.39.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $E$ be an object of $D\left(\mathcal{O}_{Y}\right)$. If $E$ is m-pseudo-coherent, then $L f^{*} E$ is m-pseudocoherent.
Proof. Represent $E$ by a complex $\mathcal{E} \bullet$ of $\mathcal{O}_{Y}$-modules and choose an open covering $Y=\bigcup V_{i}$ and $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{E}^{\bullet}\right|_{V_{i}}$ as in Definition 20.39.1. Set $U_{i}=f^{-1}\left(V_{i}\right)$. By Lemma 20.39 .2 it suffices to show that $\left.L f^{*} \mathcal{E}^{\bullet}\right|_{U_{i}}$ is $m$-pseudo-coherent. Choose a distinguished triangle

$$
\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{E}^{\bullet}\right|_{V_{i}} \rightarrow C \rightarrow \mathcal{E}_{i}^{\bullet}[1]
$$

The assumption on $\alpha_{i}$ means exactly that the cohomology sheaves $H^{j}(C)$ are zero for all $j \geq m$. Denote $f_{i}: U_{i} \rightarrow V_{i}$ the restriction of $f$. Note that $\left.L f^{*} \mathcal{E}^{\bullet}\right|_{U_{i}}=$ $L f_{i}^{*}\left(\left.\mathcal{E}\right|_{V_{i}}\right)$. Applying $L f_{i}^{*}$ we obtain the distinguished triangle

$$
\left.L f_{i}^{*} \mathcal{E}_{i}^{\bullet} \rightarrow L f_{i}^{*} \mathcal{E}\right|_{V_{i}} \rightarrow L f_{i}^{*} C \rightarrow L f_{i}^{*} \mathcal{E}_{i}^{\bullet}[1]
$$

By the construction of $L f_{i}^{*}$ as a left derived functor we see that $H^{j}\left(L f_{i}^{*} C\right)=0$ for $j \geq m$ (by the dual of Derived Categories, Lemma 13.17.1). Hence $H^{j}\left(L f_{i}^{*} \alpha_{i}\right)$ is an isomorphism for $j>m$ and $H^{m}\left(L f^{*} \alpha_{i}\right)$ is surjective. On the other hand, $L f_{i}^{*} \mathcal{E}_{i}^{\bullet}=f_{i}^{*} \mathcal{E}_{i}^{\bullet}$. is strictly perfect by Lemma 20.38.4. Thus we conclude.
08CD Lemma 20.39.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space and $m \in \mathbf{Z}$. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D\left(\mathcal{O}_{X}\right)$.
(1) If $K$ is $(m+1)$-pseudo-coherent and $L$ is m-pseudo-coherent then $M$ is m-pseudo-coherent.
(2) If $K$ anf $M$ are m-pseudo-coherent, then $L$ is m-pseudo-coherent.
(3) If $L$ is $(m+1)$-pseudo-coherent and $M$ is m-pseudo-coherent, then $K$ is ( $m+1$ )-pseudo-coherent.
Proof. Proof of (1). Choose an open covering $X=\bigcup U_{i}$ and maps $\alpha_{i}:\left.\mathcal{K}_{i}^{\bullet} \rightarrow K\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $\mathcal{K}_{i}^{\bullet}$ strictly perfect and $H^{j}\left(\alpha_{i}\right)$ isomorphisms for $j>m+1$ and surjective for $j=m+1$. We may replace $\mathcal{K}_{i}^{\bullet}$ by $\sigma_{\geq m+1} \mathcal{K}_{i}^{\bullet}$ and hence we may assume that $\mathcal{K}_{i}^{j}=0$ for $j<m+1$. After refining the open covering we may choose maps $\beta_{i}:\left.\mathcal{L}_{i}^{\bullet} \rightarrow L\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $\mathcal{L}_{i}^{\bullet}$ strictly perfect such that $H^{j}(\beta)$ is an isomorphism for $j>m$ and surjective for $j=m$. By Lemma 20.38.7 we can, after refining the covering, find maps of complexes $\gamma_{i}: \mathcal{K}^{\bullet} \rightarrow \mathcal{L}^{\bullet}$ such that the diagrams

are commutative in $D\left(\mathcal{O}_{U_{i}}\right)$ (this requires representing the maps $\alpha_{i}, \beta_{i}$ and $\left.K\right|_{U_{i}} \rightarrow$ $\left.L\right|_{U_{i}}$ by actual maps of complexes; some details omitted). The cone $C\left(\gamma_{i}\right)^{\bullet}$ is strictly perfect (Lemma 20.38.2). The commutativity of the diagram implies that there exists a morphism of distinguished triangles

$$
\left(\mathcal{K}_{i}^{\bullet}, \mathcal{L}_{i}^{\bullet}, C\left(\gamma_{i}\right)^{\bullet}\right) \longrightarrow\left(\left.K\right|_{U_{i}},\left.L\right|_{U_{i}},\left.M\right|_{U_{i}}\right)
$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5 .19 and 12.5 .20 that $\left.C\left(\gamma_{i}\right)^{\bullet} \rightarrow M\right|_{U_{i}}$ induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. Hence $M$ is $m$-pseudocoherent by Lemma 20.39 .2
Assertions (2) and (3) follow from (1) by rotating the distinguished triangle.

09J3 Lemma 20.39.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$.
(1) If $K$ is n-pseudo-coherent and $H^{i}(K)=0$ for $i>a$ and $L$ is m-pseudocoherent and $H^{j}(L)=0$ for $j>b$, then $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ is $t$-pseudo-coherent with $t=\max (m+a, n+b)$.
(2) If $K$ and $L$ are pseudo-coherent, then $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ is pseudo-coherent.

Proof. Proof of (1). By replacing $X$ by the members of an open covering we may assume there exist strictly perfect complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$ and maps $\alpha: \mathcal{K}^{\bullet} \rightarrow K$ and $\beta: \mathcal{L}^{\bullet} \rightarrow L$ with $H^{i}(\alpha)$ and isomorphism for $i>n$ and surjective for $i=n$ and with $H^{i}(\beta)$ and isomorphism for $i>m$ and surjective for $i=m$. Then the map

$$
\alpha \otimes^{\mathbf{L}} \beta: \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\bullet}\right) \rightarrow K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L
$$

induces isomorphisms on cohomology sheaves in degree $i$ for $i>t$ and a surjection for $i=t$. This follows from the spectral sequence of tors (details omitted).
Proof of (2). We may first replace $X$ by the members of an open covering to reduce to the case that $K$ and $L$ are bounded above. Then the statement follows immediately from case (1).

08CE Lemma 20.39.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $m \in \mathbf{Z}$. If $K \oplus L$ is $m$ -pseudo-coherent (resp. pseudo-coherent) in $D\left(\mathcal{O}_{X}\right)$ so are $K$ and $L$.

Proof. Assume that $K \oplus L$ is $m$-pseudo-coherent. After replacing $X$ by the members of an open covering we may assume $K \oplus L \in D^{-}\left(\mathcal{O}_{X}\right)$, hence $L \in D^{-}\left(\mathcal{O}_{X}\right)$. Note that there is a distinguished triangle

$$
(K \oplus L, K \oplus L, L \oplus L[1])=(K, K, 0) \oplus(L, L, L \oplus L[1])
$$

see Derived Categories, Lemma 13.4.9. By Lemma 20.39.4 we see that $L \oplus L[1]$ is $m$-pseudo-coherent. Hence also $L[1] \oplus L[2]$ is $m$-pseudo-coherent. By induction $L[n] \oplus L[n+1]$ is $m$-pseudo-coherent. Since $L$ is bounded above we see that $L[n]$ is $m$-pseudo-coherent for large $n$. Hence working backwards, using the distinguished triangles

$$
(L[n], L[n] \oplus L[n-1], L[n-1])
$$

we conclude that $L[n-1], L[n-2], \ldots, L$ are $m$-pseudo-coherent as desired.
09V7 Lemma 20.39.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $m \in \mathbf{Z}$. Let $\mathcal{F}^{\bullet}$ be a (locally) bounded above complex of $\mathcal{O}_{X}$-modules such that $\mathcal{F}^{i}$ is $(m-i)$-pseudo-coherent for all i. Then $\mathcal{F}^{\bullet}$ is m-pseudo-coherent.

Proof. Omitted. Hint: use Lemma 20.39 .4 and truncations as in the proof of More on Algebra, Lemma 15.54.9,

09V8 Lemma 20.39.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $m \in \mathbf{Z}$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. If $E$ is (locally) bounded above and $H^{i}(E)$ is $(m-i)$-pseudo-coherent for all $i$, then $E$ is m-pseudo-coherent.
Proof. Omitted. Hint: use Lemma 20.39 .4 and truncations as in the proof of More on Algebra, Lemma 15.54.10.

08DN Lemma 20.39.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$.
(1) If $K$ is m-pseudo-coherent and $H^{i}(K)=0$ for $i>m$, then $H^{m}(K)$ is a finite type $\mathcal{O}_{X}$-module.
(2) If $K$ is m-pseudo-coherent and $H^{i}(K)=0$ for $i>m+1$, then $H^{m+1}(K)$ is a finitely presented $\mathcal{O}_{X}$-module.
Proof. Proof of (1). We may work locally on $X$. Hence we may assume there exists a strictly perfect complex $\mathcal{E} \bullet$ and a map $\alpha: \mathcal{E} \bullet \rightarrow K$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. It suffices to prove the result for $\mathcal{E}^{\bullet}$. Let $n$ be the largest integer such that $\mathcal{E}^{n} \neq 0$. If $n=m$, then $H^{m}\left(\mathcal{E}^{\bullet}\right)$ is a quotient of $\mathcal{E}^{n}$ and the result is clear. If $n>m$, then $\mathcal{E}^{n-1} \rightarrow \mathcal{E}^{n}$ is surjective as $H^{n}\left(E^{\bullet}\right)=0$. By Lemma 20.38.5 we can locally find a section of this surjection and write $\mathcal{E}^{n-1}=\mathcal{E}^{\prime} \oplus \mathcal{E}^{n}$. Hence it suffices to prove the result for the complex $\left(\mathcal{E}^{\prime}\right)^{\bullet}$ which is the same as $\mathcal{E} \bullet$ except has $\mathcal{E}^{\prime}$ in degree $n-1$ and 0 in degree $n$. We win by induction on $n$.

Proof of (2). We may work locally on $X$. Hence we may assume there exists a strictly perfect complex $\mathcal{E}^{\bullet}$ and a map $\alpha: \mathcal{E}^{\bullet} \rightarrow K$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. As in the proof of (1) we can reduce to the case that $\mathcal{E}^{i}=0$ for $i>m+1$. Then we see that $H^{m+1}(K) \cong H^{m+1}\left(\mathcal{E}^{\bullet}\right)=\operatorname{Coker}\left(\mathcal{E}^{m} \rightarrow \mathcal{E}^{m+1}\right)$ which is of finite presentation.

09V9 Lemma 20.39.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules.
(1) $\mathcal{F}$ viewed as an object of $D\left(\mathcal{O}_{X}\right)$ is 0-pseudo-coherent if and only if $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module, and
(2) $\mathcal{F}$ viewed as an object of $D\left(\mathcal{O}_{X}\right)$ is $(-1)$-pseudo-coherent if and only if $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation.

Proof. Use Lemma 20.39 .9 to prove the implications in one direction and Lemma 20.39 .8 for the other.

### 20.40. Tor dimension

08 CF In this section we take a closer look at resolutions by flat modules.
08CG Definition 20.40.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$.
(1) We say $E$ has tor-amplitude in $[a, b]$ if $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)=0$ for all $\mathcal{O}_{X^{-}}$ modules $\mathcal{F}$ and all $i \notin[a, b]$.
(2) We say $E$ has finite tor dimension if it has tor-amplitude in $[a, b]$ for some $a, b$.
(3) We say $E$ locally has finite tor dimension if there exists an open covering $X=\bigcup U_{i}$ such that $\left.E\right|_{U_{i}}$ has finite tor dimension for all $i$.
Note that if $E$ has finite tor dimension, then $E$ is an object of $D^{b}\left(\mathcal{O}_{X}\right)$ as can be seen by taking $\mathcal{F}=\mathcal{O}_{X}$ in the definition above.

08 CH Lemma 20.40.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E}^{\bullet}$ be a bounded above complex of flat $\mathcal{O}_{X}$-modules with tor-amplitude in $[a, b]$. Then $\operatorname{Coker}\left(d_{\mathcal{E}}^{a-1}\right)$ is a flat $\mathcal{O}_{X}$-module.
Proof. As $\mathcal{E}^{\bullet}$ is a bounded above complex of flat modules we see that $\mathcal{E} \bullet \otimes_{\mathcal{O}_{X}} \mathcal{F}=$ $\mathcal{E} \bullet \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}$ for any $\mathcal{O}_{X}$-module $\mathcal{F}$. Hence for every $\mathcal{O}_{X}$-module $\mathcal{F}$ the sequence

$$
\mathcal{E}^{a-2} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{E}^{a} \otimes_{\mathcal{O}_{X}} \mathcal{F}
$$

is exact in the middle. Since $\mathcal{E}^{a-2} \rightarrow \mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a} \rightarrow \operatorname{Coker}\left(d^{a-1}\right) \rightarrow 0$ is a flat resolution this implies that $\operatorname{Tor}_{1}^{\mathcal{O}_{X}}\left(\operatorname{Coker}\left(d^{a-1}\right), \mathcal{F}\right)=0$ for all $\mathcal{O}_{X}$-modules $\mathcal{F}$. This means that Coker $\left(d^{a-1}\right)$ is flat, see Lemma 20.27.15.
08 CI Lemma 20.40.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent
(1) E has tor-amplitude in $[a, b]$.
(2) $E$ is represented by a complex $\mathcal{E}^{\bullet}$ of flat $\mathcal{O}_{X}$-modules with $\mathcal{E}^{i}=0$ for $i \notin[a, b]$.
Proof. If (2) holds, then we may compute $E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}=\mathcal{E} \bullet \otimes_{\mathcal{O}_{X}} \mathcal{F}$ and it is clear that (1) holds.

Assume that (1) holds. We may represent $E$ by a bounded above complex of flat $\mathcal{O}_{X}$-modules $\mathcal{K}^{\bullet}$, see Section 20.27 , Let $n$ be the largest integer such that $\mathcal{K}^{n} \neq 0$. If $n>b$, then $\mathcal{K}^{n-1} \rightarrow \mathcal{K}^{n}$ is surjective as $H^{n}\left(\mathcal{K}^{\bullet}\right)=0$. As $\mathcal{K}^{n}$ is flat we see that $\operatorname{Ker}\left(\mathcal{K}^{n-1} \rightarrow \mathcal{K}^{n}\right)$ is flat (Modules, Lemma 17.16 .8 ). Hence we may replace $\mathcal{K}^{\bullet}$ by $\tau_{\leq n-1} \mathcal{K}^{\bullet}$. Thus, by induction on $n$, we reduce to the case that $K^{\bullet}$ is a complex of flat $\mathcal{O}_{X}$-modules with $\mathcal{K}^{i}=0$ for $i>b$.
Set $\mathcal{E}^{\bullet}=\tau_{\geq a} \mathcal{K}^{\bullet}$. Everything is clear except that $\mathcal{E}^{a}$ is flat which follows immediately from Lemma 20.40 .2 and the definitions.

09U8 Lemma 20.40.4. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $E$ be an object of $D\left(\mathcal{O}_{Y}\right)$. If $E$ has tor amplitude in $[a, b]$, then $L f^{*} E$ has tor amplitude in $[a, b]$.

Proof. Assume $E$ has tor amplitude in $[a, b]$. By Lemma 20.40 .3 we can represent $E$ by a complex of $\mathcal{E}^{\bullet}$ of flat $\mathcal{O}$-modules with $\mathcal{E}^{i}=0$ for $i \notin[a, b]$. Then $L f^{*} E$ is represented by $f^{*} \mathcal{E}^{\bullet}$. By Modules, Lemma 17.17 .2 the modules $f^{*} \mathcal{E}^{i}$ are flat. Thus by Lemma 20.40.3 we conclude that $L f^{*} E$ has tor amplitude in $[a, b]$.
09U9 Lemma 20.40.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent
(1) E has tor-amplitude in $[a, b]$.
(2) for every $x \in X$ the object $E_{x}$ of $D\left(\mathcal{O}_{X, x}\right)$ has tor-amplitude in $[a, b]$.

Proof. Taking stalks at $x$ is the same thing as pulling back by the morphism of ringed spaces $\left(x, \mathcal{O}_{X, x}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$. Hence the implication $(1) \Rightarrow(2)$ follows from Lemma 20.40.4 For the converse, note that taking stalks commutes with tensor products (Modules, Lemma 17.15.1). Hence

$$
\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)_{x}=E_{x} \otimes_{\mathcal{O}_{X, x}}^{\mathbf{L}} \mathcal{F}_{x}
$$

On the other hand, taking stalks is exact, so

$$
H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)_{x}=H^{i}\left(\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)_{x}\right)=H^{i}\left(E_{x} \otimes_{\mathcal{O}_{X, x}}^{\mathbf{L}} \mathcal{F}_{x}\right)
$$

and we can check whether $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)$ is zero by checking whether all of its stalks are zero (Modules, Lemma 17.3.1). Thus (2) implies (1).
08CJ Lemma 20.40.6. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D\left(\mathcal{O}_{X}\right)$. Let $a, b \in \mathbf{Z}$.
(1) If $K$ has tor-amplitude in $[a+1, b+1]$ and $L$ has tor-amplitude in $[a, b]$ then $M$ has tor-amplitude in $[a, b]$.
(2) If $K$ and $M$ have tor-amplitude in $[a, b]$, then $L$ has tor-amplitude in $[a, b]$.
(3) If $L$ has tor-amplitude in $[a+1, b+1]$ and $M$ has tor-amplitude in $[a, b]$, then $K$ has tor-amplitude in $[a+1, b+1]$.

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation.

09J4 Lemma 20.40.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K, L$ be objects of $D\left(\mathcal{O}_{X}\right)$. If $K$ has tor-amplitude in $[a, b]$ and $L$ has tor-amplitude in $[c, d]$ then $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ has tor amplitude in $[a+c, b+d]$.

Proof. Omitted. Hint: use the spectral sequence for tors.
08CK Lemma 20.40.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $a, b \in \mathbf{Z}$. For $K, L$ objects of $D\left(\mathcal{O}_{X}\right)$ if $K \oplus L$ has tor amplitude in $[a, b]$ so do $K$ and $L$.

Proof. Clear from the fact that the Tor functors are additive.

### 20.41. Perfect complexes

08CL In this section we discuss properties of perfect complexes on ringed spaces.
08 CM Definition 20.41.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\mathcal{E} \bullet$ be a complex of $\mathcal{O}_{X}$-modules. We say $\mathcal{E} \bullet$ is perfect if there exists an open covering $X=\bigcup U_{i}$ such that for each $i$ there exists a morphism of complexes $\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{E}^{\bullet}\right|_{U_{i}}$ which is a quasiisomorphism with $\mathcal{E}_{i}^{\bullet}$ a strictly perfect complex of $\mathcal{O}_{U_{i}}$-modules. An object $E$ of of $D\left(\mathcal{O}_{X}\right)$ is perfect if it can be represented by a perfect complex of $\mathcal{O}_{X}$-modules.

08 CN Lemma 20.41.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$.
(1) If there exists an open covering $X=\bigcup U_{i}$ and strictly perfect complexes $\mathcal{E}_{i}^{\bullet}$ on $U_{i}$ such that $\mathcal{E}_{i}^{\bullet}$ represents $\left.E\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$, then $E$ is perfect.
(2) If $E$ is perfect, then any complex representing $E$ is perfect.

Proof. Identical to the proof of Lemma 20.39.2.
0BCJ Lemma 20.41.3. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Assume that all stalks $\mathcal{O}_{X, x}$ are local rings. Then the following are equivalent
(1) $E$ is perfect,
(2) there exists an open covering $X=\bigcup U_{i}$ such that $\left.E\right|_{U_{i}}$ can be represented by a finite complex of finite locally free $\mathcal{O}_{U_{i}}$-modules, and
(3) there exists an open covering $X=\bigcup U_{i}$ such that $\left.E\right|_{U_{i}}$ can be represented by a finite complex of finite free $\mathcal{O}_{U_{i}}$-modules.

Proof. This follows from Lemma 20.41 .2 and the fact that on $X$ every direct summand of a finite free module is finite locally free. See Modules, Lemma 17.14.6.

08CP Lemma 20.41.4. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $a \leq b$ be integers. If $E$ has tor amplitude in $[a, b]$ and is $(a-1)$-pseudo-coherent, then $E$ is perfect.

Proof. After replacing $X$ by the members of an open covering we may assume there exists a strictly perfect complex $\mathcal{E}^{\bullet}$ and a map $\alpha: \mathcal{E}^{\bullet} \rightarrow E$ such that $H^{i}(\alpha)$ is an isomorphism for $i \geq a$. We may and do replace $\mathcal{E}^{\bullet}$ by $\sigma_{\geq a-1} \mathcal{E}^{\bullet}$. Choose a distinguished triangle

$$
\mathcal{E}^{\bullet} \rightarrow E \rightarrow C \rightarrow \mathcal{E}^{\bullet}[1]
$$

From the vanishing of cohomology sheaves of $E$ and $\mathcal{E}$ and the assumption on $\alpha$ we obtain $C \cong \mathcal{K}[a-2]$ with $\mathcal{K}=\operatorname{Ker}\left(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a}\right)$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Applying $-\otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}$ the assumption that $E$ has tor amplitude in $[a, b]$ implies $\mathcal{K} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}_{X}} \mathcal{F}$ has image $\operatorname{Ker}\left(\mathcal{E}^{a-1} \otimes_{\mathcal{O}_{X}} \mathcal{F} \rightarrow \mathcal{E}^{a} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)$. It follows that $\operatorname{Tor}_{1}^{\mathcal{O}_{X}}\left(\mathcal{E}^{\prime}, \mathcal{F}\right)=0$ where $\mathcal{E}^{\prime}=\operatorname{Coker}\left(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a}\right)$. Hence $\mathcal{E}^{\prime}$ is flat (Lemma 20.27.15). Thus $\mathcal{E}^{\prime}$ is locally a direct summand of a finite free module by Modules, Lemma 17.16.11. Thus locally the complex

$$
\mathcal{E}^{\prime} \rightarrow \mathcal{E}^{a-1} \rightarrow \ldots \rightarrow \mathcal{E}^{b}
$$

is quasi-isomorphic to $E$ and $E$ is perfect.
08CQ Lemma 20.41.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. The following are equivalent
(1) $E$ is perfect, and
(2) $E$ is pseudo-coherent and locally has finite tor dimension.

Proof. Assume (1). By definition this means there exists an open covering $X=$ $\bigcup U_{i}$ such that $\left.E\right|_{U_{i}}$ is represented by a strictly perfect complex. Thus $E$ is pseudocoherent (i.e., $m$-pseudo-coherent for all $m$ ) by Lemma 20.39.2. Moreover, a direct summand of a finite free module is flat, hence $\left.E\right|_{U_{i}}$ has finite Tor dimension by Lemma 20.40.3. Thus (2) holds.

Assume (2). After replacing $X$ by the members of an open covering we may assume there exist integers $a \leq b$ such that $E$ has tor amplitude in $[a, b]$. Since $E$ is $m$ -pseudo-coherent for all $m$ we conclude using Lemma 20.41.4

09UA Lemma 20.41.6. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $E$ be an object of $D\left(\mathcal{O}_{Y}\right)$. If $E$ is perfect in $D\left(\mathcal{O}_{Y}\right)$, then $L f^{*} E$ is perfect in $D\left(\mathcal{O}_{X}\right)$.
Proof. This follows from Lemma 20.41.5, 20.40.4, and 20.39.3. (An alternative proof is to copy the proof of Lemma 20.39.3.)
08 CR Lemma 20.41.7. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D\left(\mathcal{O}_{X}\right)$. If two out of three of $K, L, M$ are perfect then the third is also perfect.

Proof. First proof: Combine Lemmas 20.41.5, 20.39.4, and 20.40.6 Second proof (sketch): Say $K$ and $L$ are perfect. After replacing $X$ by the members of an open covering we may assume that $K$ and $L$ are represented by strictly perfect complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$. After replacing $X$ by the members of an open covering we may assume the map $K \rightarrow L$ is given by a map of complexes $\alpha: \mathcal{K}^{\bullet} \rightarrow \mathcal{L}^{\bullet}$, see Lemma 20.38 .8 . Then $M$ is isomorphic to the cone of $\alpha$ which is strictly perfect by Lemma 20.38.2

09J5 Lemma 20.41.8. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. If $K, L$ are perfect objects of $D\left(\mathcal{O}_{X}\right)$, then so is $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$.

Proof. Follows from Lemmas 20.41.5, 20.39.5, and 20.40.7.
08CS Lemma 20.41.9. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. If $K \oplus L$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$, then so are $K$ and $L$.
Proof. Follows from Lemmas 20.41.5, 20.39.6, and 20.40.8.
08DP Lemma 20.41.10. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $j: U \rightarrow X$ be an open subspace. Let $E$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$ whose cohomology sheaves are supported on a closed subset $T \subset U$ with $j(T)$ closed in $X$. Then $R j_{*} E$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$.
Proof. Being a perfect complex is local on $X$. Thus it suffices to check that $R j_{*} E$ is perfect when restricted to $U$ and $V=X \backslash j(T)$. We have $\left.R j_{*} E\right|_{U}=E$ which is perfect. We have $\left.R j_{*} E\right|_{V}=0$ because $\left.E\right|_{U \backslash T}=0$.
08DQ Lemma 20.41.11. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $K$ be a perfect object of $D\left(\mathcal{O}_{X}\right)$. Then $K^{\vee}=R \mathcal{H}$ om $\left(K, \mathcal{O}_{X}\right)$ is a perfect object too and $\left(K^{\vee}\right)^{\vee}=K$. There are functorial isomorphisms

$$
K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M=R \mathcal{H} \operatorname{Hom}(K, M)
$$

and

$$
H^{0}\left(X, K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K, M)
$$

for $M$ in $D\left(\mathcal{O}_{X}\right)$.
Proof. We will use without further mention that formation of internal hom commutes with restriction to opens (Lemma 20.35.3). In particular we may check the first two statements locally on $X$. By Lemma 20.35 .8 to see the final statement it suffices to check that the map 20.35.8.1

$$
K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M \longrightarrow R \mathcal{H o m}(K, M)
$$

is an isomorphism. This is local on $X$ as well. Hence it suffices to prove the lemma when $K$ is represented by a strictly perfect complex.
Assume $K$ is represented by the strictly perfect complex $\mathcal{E}^{\bullet}$. Then it follows from Lemma 20.38 .9 that $K^{\vee}$ is represented by the complex whose terms are $\left(\mathcal{E}^{-n}\right)^{\vee}=$ $\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-n}, \mathcal{O}_{X}\right)$ in degree $n$. Since $\mathcal{E}^{-n}$ is a direct summand of a finite free $\mathcal{O}_{X^{-}}$ module, so is $\left(\mathcal{E}^{-n}\right)^{\vee}$. Hence $K^{\vee}$ is represented by a strictly perfect complex too. It is also clear that $\left(K^{\vee}\right)^{\vee}=K$ as we have $\left(\left(\mathcal{E}^{-n}\right)^{\vee}\right)^{\vee}=\mathcal{E}^{-n}$. To see that 20.35.8.1) is an isomorphism, represent $M$ by a K-flat complex $\mathcal{F}^{\bullet}$. By Lemma 20.38.9 the complex $R \mathcal{H}$ om $(K, M)$ is represented by the complex with terms

$$
\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

On the other hand, then object $K^{\vee} \otimes^{\mathbf{L}} M$ is represented by the complex with terms

$$
\bigoplus_{n=p+q} \mathcal{F}^{p} \otimes \mathcal{O}_{X}\left(\mathcal{E}^{-q}\right)^{\vee}
$$

Thus the assertion that 20.35 .8 .1 is an isomorphism reduces to the assertion that the canonical map

$$
\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{E}, \mathcal{F})
$$

is an isomorphism when $\mathcal{E}$ is a direct summand of a finite free $\mathcal{O}_{X}$-module and $\mathcal{F}$ is any $\mathcal{O}_{X}$-module. This follows immediately from the corresponding statement when $\mathcal{E}$ is finite free.

### 20.42. Compact objects

09J6 In this section we study compact objects in the derived category of modules on a ringed space. We recall that compact objects are defined in Derived Categories, Definition 13.34.1. On suitable ringed spaces the perfect objects are compact.
09J7 Lemma 20.42.1. Let $X$ be a ringed space. Assume that the underlying topological space of $X$ has the following properties:
(1) $X$ is quasi-compact,
(2) there exists a basis of quasi-compact open subsets, and
(3) the intersection of any two quasi-compact opens is quasi-compact.

Then any perfect object of $D\left(\mathcal{O}_{X}\right)$ is compact.
Proof. Let $K$ be a perfect object and let $K^{\wedge}$ be its dual, see Lemma 20.41.11. Then we have

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K, M)=H^{0}\left(X, K^{\wedge} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M\right)
$$

functorially in $M$ in $D\left(\mathcal{O}_{X}\right)$. Since $K^{\wedge} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}$ - commutes with direct sums (by construction) and $H^{0}$ does by Lemma 20.20 .1 and the construction of direct sums in Injectives, Lemma 19.13.4 we obtain the result of the lemma.

### 20.43. Projection formula

01E6 In this section we collect variants of the projection formula. The most basic version is Lemma 20.43.2. After we state and prove it, we discuss a more general version involving perfect complexes.

01E7 Lemma 20.43.1. Let $X$ be a ringed space. Let $\mathcal{I}$ be an injective $\mathcal{O}_{X}$-module. Let $\mathcal{E}$ be an $\mathcal{O}_{X}$-module. Assume $\mathcal{E}$ is finite locally free on $X$, see Modules, Definition 17.14.1. Then $\mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{I}$ is an injective $\mathcal{O}_{X}$-module.

Proof. This is true because under the assumptions of the lemma we have

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{I}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{E}^{\wedge}, \mathcal{I}\right)
$$

where $\mathcal{E}^{\wedge}=\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{E}, \mathcal{O}_{X}\right)$ is the dual of $\mathcal{E}$ which is finite locally free also. Since tensoring with a finite locally free sheaf is an exact functor we win by Homology, Lemma 12.23.2.

01E8 Lemma 20.43.2. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Let $\mathcal{E}$ be an $\mathcal{O}_{Y}$-module. Assume $\mathcal{E}$ is finite locally free on $Y$, see Modules, Definition 17.14.1. Then there exist isomorphisms

$$
\mathcal{E} \otimes_{\mathcal{O}_{Y}} R^{q} f_{*} \mathcal{F} \longrightarrow R^{q} f_{*}\left(f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)
$$

for all $q \geq 0$. In fact there exists an isomorphism

$$
\mathcal{E} \otimes_{\mathcal{O}_{Y}} R f_{*} \mathcal{F} \longrightarrow R f_{*}\left(f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)
$$

in $D^{+}(Y)$ functorial in $\mathcal{F}$.
Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ on $X$. Note that $f^{*} \mathcal{E}$ is finite locally free also, hence we get a resolution

$$
f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F} \longrightarrow f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{I}^{\bullet}
$$

which is an injective resolution by Lemma 20.43.1. Apply $f_{*}$ to see that

$$
R f_{*}\left(f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)=f_{*}\left(f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{I}^{\bullet}\right)
$$

Hence the lemma follows if we can show that $f_{*}\left(f^{*} \mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)=\mathcal{E} \otimes_{\mathcal{O}_{Y}} f_{*}(\mathcal{F})$ functorially in the $\mathcal{O}_{X}$-module $\mathcal{F}$. This is clear when $\mathcal{E}=\mathcal{O}_{Y}^{\oplus n}$, and follows in general by working locally on $Y$. Details omitted.

Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $E \in D\left(\mathcal{O}_{X}\right)$ and $K \in D\left(\mathcal{O}_{Y}\right)$. Without any further assumptions there is a map

$$
\begin{equation*}
R f_{*} E \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K \longrightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K\right) \tag{20.43.2.1}
\end{equation*}
$$

Namely, it is the adjoint to the canonical map

$$
L f^{*}\left(R f_{*} E \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K\right)=L f^{*} R f_{*} E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K \longrightarrow E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K
$$

coming from the map $L f^{*} R f_{*} E \rightarrow E$ and Lemmas 20.28.2 and 20.29.1. A reasonably general version of the projection formula is the following.

0B54 Lemma 20.43.3. Let $f: X \rightarrow Y$ be a morphism of ringed spaces. Let $E \in D\left(\mathcal{O}_{X}\right)$ and $K \in D\left(\mathcal{O}_{Y}\right)$. If $K$ is perfect, then

$$
R f_{*} E \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K\right)
$$

in $D\left(\mathcal{O}_{Y}\right)$.
Proof. To check 20.43.2.1 is an isomorphism we may work locally on $Y$, i.e., we have to find a covering $\left\{V_{j} \rightarrow Y\right\}$ such that the map restricts to an isomorphism on $V_{j}$. By definition of perfect objects, this means we may assume $K$ is represented by a strictly perfect complex of $\mathcal{O}_{Y}$-modules. Note that, completely generally, the statement is true for $K=K_{1} \oplus K_{2}$, if and only if the statement is true for $K_{1}$ and $K_{2}$. Hence we may assume $K$ is a finite complex of finite free $\mathcal{O}_{Y}$-modules. In this case a simple argument involving stupid truncations reduces the statement to the case where $K$ is represented by a finite free $\mathcal{O}_{Y}$-module. Since the statement is invariant under finite direct summands in the $K$ variable, we conclude it suffices to prove it for $K=\mathcal{O}_{Y}[n]$ in which case it is trivial.

Here is a case where the projection formula is true in complete generality.
0B55 Lemma 20.43.4. Let $f: X \rightarrow Y$ be a morphism of ringed spaces such that $f$ is a homeomorphism onto a closed subset. Then 20.43.2.1) is an isomorphism always.

Proof. Since $f$ is a homeomorphism onto a closed subset, the functor $f_{*}$ is exact (Modules, Lemma 17.6.1). Hence $R f_{*}$ is computed by applying $f_{*}$ to any representative complex. Choose a K-flat complex $\mathcal{K}^{\bullet}$ of $\mathcal{O}_{Y^{-}}$modules representing $K$ and choose any complex $\mathcal{E}^{\bullet}$ of $\mathcal{O}_{X}$-modules representing $E$. Then $L f^{*} K$ is represented by $f^{*} \mathcal{K}^{\bullet}$ which is a K-flat complex of $\mathcal{O}_{X}$-modules (Lemma 20.27.7). Thus the right hand side of 20.43.2.1 is represented by

$$
f_{*} \operatorname{Tot}\left(\mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{K}^{\bullet}\right)
$$

By the same reasoning we see that the left hand side is represented by

$$
\operatorname{Tot}\left(f_{*} \mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{Y}} \mathcal{K}^{\bullet}\right)
$$

Since $f_{*}$ commutes with direct sums (Modules, Lemma 17.6.3) it suffices to show that

$$
f_{*}\left(\mathcal{E} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{K}\right)=f_{*} \mathcal{E} \otimes_{\mathcal{O}_{Y}} \mathcal{K}
$$

for any $\mathcal{O}_{X}$-module $\mathcal{E}$ and $\mathcal{O}_{Y}$-module $\mathcal{K}$. We will check this by checking on stalks. Let $y \in Y$. If $y \notin f(X)$, then the stalks of both sides are zero. If $y=f(x)$, then we see that we have to show

$$
\mathcal{E}_{x} \otimes_{\mathcal{O}_{X, x}}\left(\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{Y, y}} \mathcal{F}_{y}\right)=\mathcal{E}_{x} \otimes_{\mathcal{O}_{Y, y}} \mathcal{F}_{y}
$$

(using Sheaves, Lemma 6.32.1 and Lemma 6.26.4. This equality holds and therefore the lemma has been proved.

0B6B Remark 20.43.5. The map 20.43 .2 .1 is compatible with the base change map of Remark 20.29.2 in the following sense. Namely, suppose that

is a commutative diagram of ringed spaces. Let $E \in D\left(\mathcal{O}_{X}\right)$ and $K \in D\left(\mathcal{O}_{Y}\right)$. Then the diagram

is commutative. Here arrows labeled $t$ are gotten by an application of Lemma 20.28 .2 arrows labeled $b$ by an application of Remark 20.29.2, arrows labeled $p$ by an application of 20.43 .2 .1 , and $c$ comes from $L\left(g^{\prime}\right)^{*} \circ L f^{*}=L\left(f^{\prime}\right)^{*} \circ L g^{*}$. We omit the verification.

## CHAPTER 21

## Cohomology on Sites

01FQ

### 21.1. Introduction

01FR In this document we work out some topics on cohomology of sheaves. We work out what happens for sheaves on sites, although often we will simply duplicate the discussion, the constructions, and the proofs from the topological case in the case. Basic references are AGV71, God73 and Ive86.

### 21.2. Topics

01FS Here are some topics that should be discussed in this chapter, and have not yet been written.
(1) Cohomology of a sheaf of modules on a site is the same as the cohomology of the underlying abelian sheaf.
(2) Hypercohomology on a site.
(3) Ext-groups.
(4) Ext sheaves.
(5) Tor functors.
(6) Higher direct images for a morphism of sites.
(7) Derived pullback for morphisms between ringed sites.
(8) Cup-product.
(9) Group cohomology
(10) Comparison of group cohomology and cohomology on $\mathcal{T}_{G}$.
(11) Cech cohomology on sites.
(12) Cech to cohomology spectral sequence on sites.
(13) Leray Spectral sequence for a morphism between ringed sites.
(14) Etc, etc, etc.

### 21.3. Cohomology of sheaves

01FT Let $\mathcal{C}$ be a site, see Sites, Definition 7.6.2. Let $\mathcal{F}$ be a abelian sheaf on $\mathcal{C}$. We know that the category of abelian sheaves on $\mathcal{C}$ has enough injectives, see Injectives, Theorem 19.7.4 Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I} \bullet$. For any object $U$ of the site $\mathcal{C}$ we define

071C

$$
\begin{equation*}
H^{i}(U, \mathcal{F})=H^{i}\left(\Gamma\left(U, \mathcal{I}^{\bullet}\right)\right) \tag{21.3.0.1}
\end{equation*}
$$

to be the $i$ th cohomology group of the abelian sheaf $\mathcal{F}$ over the object $U$. In other words, these are the right derived functors of the functor $\mathcal{F} \mapsto \mathcal{F}(U)$. The family of functors $H^{i}(U,-)$ forms a universal $\delta$-functor $A b(\mathcal{C}) \rightarrow A b$.

It sometimes happens that the site $\mathcal{C}$ does not have a final object. In this case we define the global sections of a presheaf of sets $\mathcal{F}$ over $\mathcal{C}$ to be the set
071D
(21.3.0.2) $\quad \Gamma(\mathcal{C}, \mathcal{F})=\operatorname{Mor}_{P S h(\mathcal{C})}(e, \mathcal{F})$
where $e$ is a final object in the category of presheaves on $\mathcal{C}$. In this case, given an abelian sheaf $\mathcal{F}$ on $\mathcal{C}$, we define the $i$ th cohomology group of $\mathcal{F}$ on $\mathcal{C}$ as follows

071E

$$
\begin{equation*}
H^{i}(\mathcal{C}, \mathcal{F})=H^{i}\left(\Gamma\left(\mathcal{C}, \mathcal{I}^{\bullet}\right)\right) \tag{21.3.0.3}
\end{equation*}
$$

in other words, it is the $i$ th right derived functor of the global sections functor. The family of functors $H^{i}(\mathcal{C},-)$ forms a universal $\delta$-functor $A b(\mathcal{C}) \rightarrow A b$.

Let $f: S h(\mathcal{C}) \rightarrow S h(\mathcal{D})$ be a morphism of topoi, see Sites, Definition 7.16.1. With $\mathcal{F}[0] \rightarrow \mathcal{I}$ • as above we define
071F

$$
\begin{equation*}
R^{i} f_{*} \mathcal{F}=H^{i}\left(f_{*} \mathcal{I}^{\bullet}\right) \tag{21.3.0.4}
\end{equation*}
$$

to be the $i$ th higher direct image of $\mathcal{F}$. These are the right derived functors of $f_{*}$. The family of functors $R^{i} f_{*}$ forms a universal $\delta$-functor from $A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$.

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site, see Modules on Sites, Definition 18.6.1. Let $\mathcal{F}$ be an $\mathcal{O}$-module. We know that the category of $\mathcal{O}$-modules has enough injectives, see Injectives, Theorem 19.8.4. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^{\bullet}$. For any object $U$ of the site $\mathcal{C}$ we define
071G (21.3.0.5)

$$
H^{i}(U, \mathcal{F})=H^{i}\left(\Gamma\left(U, \mathcal{I}^{\bullet}\right)\right)
$$

to be the the ith cohomology group of $\mathcal{F}$ over $U$. The family of functors $H^{i}(U,-)$ forms a universal $\delta$-functor $\operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}_{\mathcal{O}(U)}$. Similarly

071H

$$
\begin{equation*}
H^{i}(\mathcal{C}, \mathcal{F})=H^{i}\left(\Gamma\left(\mathcal{C}, \mathcal{I}^{\bullet}\right)\right) \tag{21.3.0.6}
\end{equation*}
$$

it the ith cohomology group of $\mathcal{F}$ on $\mathcal{C}$. The family of functors $H^{i}(\mathcal{C},-)$ forms a universal $\delta$-functor $\operatorname{Mod}(\mathcal{C}) \rightarrow \operatorname{Mod}_{\Gamma(\mathcal{C}, \mathcal{O})}$.
Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi, see Modules on Sites, Definition 18.7.1. With $\mathcal{F}[0] \rightarrow \mathcal{I} \bullet$ as above we define

071I

$$
\begin{equation*}
R^{i} f_{*} \mathcal{F}=H^{i}\left(f_{*} \mathcal{I}^{\bullet}\right) \tag{21.3.0.7}
\end{equation*}
$$

to be the $i$ th higher direct image of $\mathcal{F}$. These are the right derived functors of $f_{*}$. The family of functors $R^{i} f_{*}$ forms a universal $\delta$-functor from $\operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}^{\prime}\right)$.

### 21.4. Derived functors

071J We briefly explain an approach to right derived functors using resolution functors. Namely, suppose that $(\mathcal{C}, \mathcal{O})$ is a ringed site. In this chapter we will write

$$
K(\mathcal{O})=K(\operatorname{Mod}(\mathcal{O})) \quad \text { and } \quad D(\mathcal{O})=D(\operatorname{Mod}(\mathcal{O}))
$$

and similarly for the bounded versions for the triangulated categories introduced in Derived Categories, Definition 13.8.1 and Definition 13.11.3. By Derived Categories, Remark 13.24 .3 there exists a resolution functor

$$
j=j_{(\mathcal{C}, \mathcal{O})}: K^{+}(\operatorname{Mod}(\mathcal{O})) \longrightarrow K^{+}(\mathcal{I})
$$

where $\mathcal{I}$ is the strictly full additive subcategory of $\operatorname{Mod}(\mathcal{O})$ which consists of injective $\mathcal{O}$-modules. For any left exact functor $F: \operatorname{Mod}(\mathcal{O}) \rightarrow \mathcal{B}$ into any abelian category
$\mathcal{B}$ we will denote $R F$ the right derived functor of Derived Categories, Section 13.20 constructed using the resolution functor $j$ just described:

$$
\begin{equation*}
R F=F \circ j^{\prime}: D^{+}(\mathcal{O}) \longrightarrow D^{+}(\mathcal{B}) \tag{21.4.0.8}
\end{equation*}
$$

see Derived Categories, Lemma 13.25 .1 for notation. Note that we may think of $R F$ as defined on $\operatorname{Mod}(\mathcal{O}), \operatorname{Comp}^{+}(\operatorname{Mod}(\mathcal{O}))$, or $K^{+}(\mathcal{O})$ depending on the situation. According to Derived Categories, Definition 13.17 .2 we obtain the $i$ the right derived functor

05U6

$$
\begin{equation*}
R^{i} F=H^{i} \circ R F: \operatorname{Mod}(\mathcal{O}) \longrightarrow \mathcal{B} \tag{21.4.0.9}
\end{equation*}
$$

so that $R^{0} F=F$ and $\left\{R^{i} F, \delta\right\}_{i \geq 0}$ is universal $\delta$-functor, see Derived Categories, Lemma 13.20 .4 .

Here are two special cases of this construction. Given a ring $R$ we write $K(R)=$ $K\left(\operatorname{Mod}_{R}\right)$ and $D(R)=D\left(\operatorname{Mod}_{R}\right)$ and similarly for the bounded versions. For any object $U$ of $\mathcal{C}$ have a left exact functor $\Gamma(U,-): \operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}_{\mathcal{O}(U)}$ which gives rise to

$$
R \Gamma(U,-): D^{+}(\mathcal{O}) \longrightarrow D^{+}(\mathcal{O}(U))
$$

by the discussion above. Note that $H^{i}(U,-)=R^{i} \Gamma(U,-)$ is compatible with 21.3.0.5 above. We similarly have

$$
R \Gamma(\mathcal{C},-): D^{+}(\mathcal{O}) \longrightarrow D^{+}(\Gamma(\mathcal{C}, \mathcal{O}))
$$

compatible with 21.3.0.6. If $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}^{\prime}\right)$ is a morphism of ringed topoi then we get a left exact functor $f_{*}: \operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}^{\prime}\right)$ which gives rise to derived pushforward

$$
R f_{*}: D^{+}(\mathcal{O}) \rightarrow D^{+}\left(\mathcal{O}^{\prime}\right)
$$

The $i$ th cohomology sheaf of $R f_{*} \mathcal{F}^{\bullet}$ is denoted $R^{i} f_{*} \mathcal{F}^{\bullet}$ and called the $i$ th higher direct image in accordance with 21.3.0.7. The displayed functors above are exact functor of derived categories.

### 21.5. First cohomology and torsors

03AG
03AH Definition 21.5.1. Let $\mathcal{C}$ be a site. Let $\mathcal{G}$ be a sheaf of (possibly non-commutative) groups on $\mathcal{C}$. A pseudo torsor, or more precisely a pseudo $\mathcal{G}$-torsor, is a sheaf of sets $\mathcal{F}$ on $\mathcal{C}$ endowed with an action $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$ such that
(1) whenever $\mathcal{F}(U)$ is nonempty the action $\mathcal{G}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ is simply transitive.
A morphism of pseudo $\mathcal{G}$-torsors $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is simply a morphism of sheaves of sets compatible with the $\mathcal{G}$-actions. A torsor, or more precisely a $\mathcal{G}$-torsor, is a pseudo $G$-torsor such that in addition
(2) for every $U \in \operatorname{Ob}(\mathcal{C})$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $U$ such that $\mathcal{F}\left(U_{i}\right)$ is nonempty for all $i \in I$.
A morphism of $G$-torsors is simply a morphism of pseudo $G$-torsors. The trivial $\mathcal{G}$-torsor is the sheaf $\mathcal{G}$ endowed with the obvious left $\mathcal{G}$-action.

It is clear that a morphism of torsors is automatically an isomorphism.
03AI Lemma 21.5.2. Let $\mathcal{C}$ be a site. Let $\mathcal{G}$ be a sheaf of (possibly non-commutative) groups on $\mathcal{C}$. $A \mathcal{G}$-torsor $\mathcal{F}$ is trivial if and only if $\Gamma(\mathcal{C}, \mathcal{F}) \neq \emptyset$.

Proof. Omitted.
03AJ Lemma 21.5.3. Let $\mathcal{C}$ be a site. Let $\mathcal{H}$ be an abelian sheaf on $\mathcal{C}$. There is a canonical bijection between the set of isomorphism classes of $\mathcal{H}$-torsors and $H^{1}(\mathcal{C}, \mathcal{H})$.

Proof. Let $\mathcal{F}$ be a $\mathcal{H}$-torsor. Consider the free abelian sheaf $\mathbf{Z}[\mathcal{F}]$ on $\mathcal{F}$. It is the sheafification of the rule which associates to $U \in \mathrm{Ob}(\mathcal{C})$ the collection of finite formal sums $\sum n_{i}\left[s_{i}\right]$ with $n_{i} \in \mathbf{Z}$ and $s_{i} \in \mathcal{F}(U)$. There is a natural map

$$
\sigma: \mathbf{Z}[\mathcal{F}] \longrightarrow \underline{\mathbf{Z}}
$$

which to a local section $\sum n_{i}\left[s_{i}\right]$ associates $\sum n_{i}$. The kernel of $\sigma$ is generated by sections of the form $[s]-\left[s^{\prime}\right]$. There is a canonical map $a: \operatorname{Ker}(\sigma) \rightarrow \mathcal{H}$ which maps $[s]-\left[s^{\prime}\right] \mapsto h$ where $h$ is the local section of $\mathcal{H}$ such that $h \cdot s=s^{\prime}$. Consider the pushout diagram

Here $\mathcal{E}$ is the extension obtained by pushout. From the long exact cohomology sequence associated to the lower short exact sequence we obtain an element $\xi=$ $\xi_{\mathcal{F}} \in H^{1}(\mathcal{C}, \mathcal{H})$ by applying the boundary operator to $1 \in H^{0}(\mathcal{C}, \underline{\mathbf{Z}})$.

Conversely, given $\xi \in H^{1}(\mathcal{C}, \mathcal{H})$ we can associate to $\xi$ a torsor as follows. Choose an embedding $\mathcal{H} \rightarrow \mathcal{I}$ of $\mathcal{H}$ into an injective abelian sheaf $\mathcal{I}$. We set $\mathcal{Q}=\mathcal{I} / \mathcal{H}$ so that we have a short exact sequence

$$
0 \longrightarrow \mathcal{H} \longrightarrow \mathcal{I} \longrightarrow \mathcal{Q} \longrightarrow 0
$$

The element $\xi$ is the image of a global section $q \in H^{0}(\mathcal{C}, \mathcal{Q})$ because $H^{1}(\mathcal{C}, \mathcal{I})=0$ (see Derived Categories, Lemma 13.20.4). Let $\mathcal{F} \subset \mathcal{I}$ be the subsheaf (of sets) of sections that map to $q$ in the sheaf $\mathcal{Q}$. It is easy to verify that $\mathcal{F}$ is a $\mathcal{H}$-torsor.

We omit the verification that the two constructions given above are mutually inverse.

### 21.6. First cohomology and extensions

03F0
03F1 Lemma 21.6.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on $\mathcal{C}$. There is a canonical bijection

$$
E x t_{M o d(\mathcal{O})}^{1}(\mathcal{O}, \mathcal{F}) \longrightarrow H^{1}(\mathcal{C}, \mathcal{F})
$$

which associates to the extension

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{O} \rightarrow 0
$$

the image of $1 \in \Gamma(\mathcal{C}, \mathcal{O})$ in $H^{1}(\mathcal{C}, \mathcal{F})$.
Proof. Let us construct the inverse of the map given in the lemma. Let $\xi \in$ $H^{1}(\mathcal{C}, \mathcal{F})$. Choose an injection $\mathcal{F} \subset \mathcal{I}$ with $\mathcal{I}$ injective in $\operatorname{Mod}(\mathcal{O})$. Set $\mathcal{Q}=\mathcal{I} / \mathcal{F}$.
$\underset{\sim}{\text { By }}$ y the long exact sequence of cohomology, we see that $\xi$ is the image of of a section $\tilde{\xi} \in \Gamma(\mathcal{C}, \mathcal{Q})=\operatorname{Hom}_{\mathcal{O}}(\mathcal{O}, \mathcal{Q})$. Now, we just form the pullback

see Homology, Section 12.6
The following lemma will be superseded by the more general Lemma 21.12.4
03F2 Lemma 21.6.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on $\mathcal{C}$. Let $\mathcal{F}_{a b}$ denote the underlying sheaf of abelian groups. Then there is a functorial isomorphism

$$
H^{1}\left(\mathcal{C}, \mathcal{F}_{a b}\right)=H^{1}(\mathcal{C}, \mathcal{F})
$$

where the left hand side is cohomology computed in $A b(\mathcal{C})$ and the right hand side is cohomology computed in $\operatorname{Mod}(\mathcal{O})$.
Proof. Let $\underline{\mathbf{Z}}$ denote the constant sheaf $\mathbf{Z}$. As $A b(\mathcal{C})=\operatorname{Mod}(\underline{\mathbf{Z}})$ we may apply Lemma 21.6.1 twice, and it follows that we have to show

$$
\operatorname{Ext}_{M o d(\mathcal{O})}^{1}(\mathcal{O}, \mathcal{F})=\operatorname{Ext}_{M o d(\underline{\mathbf{Z}})}^{1}\left(\underline{\mathbf{Z}}, \mathcal{F}_{a b}\right)
$$

Suppose that $0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{O} \rightarrow 0$ is an extension in $\operatorname{Mod}(\mathcal{O})$. Then we can use the obvious map of abelian sheaves $1: \underline{\mathbf{Z}} \rightarrow \mathcal{O}$ and pullback to obtain an extension $\mathcal{E}_{a b}$, like so:

The converse is a little more fun. Suppose that $0 \rightarrow \mathcal{F}_{a b} \rightarrow \mathcal{E}_{a b} \rightarrow \underline{\mathbf{Z}} \rightarrow 0$ is an extension in $\operatorname{Mod}(\underline{\mathbf{Z}})$. Since $\underline{\mathbf{Z}}$ is a flat $\underline{\mathbf{Z}}$-module we see that the sequence

$$
0 \rightarrow \mathcal{F}_{a b} \otimes_{\underline{\mathbf{z}}} \mathcal{O} \rightarrow \mathcal{E}_{a b} \otimes_{\underline{\mathbf{z}}} \mathcal{O} \rightarrow \underline{\mathbf{Z}} \otimes_{\underline{\mathbf{z}}} \mathcal{O} \rightarrow 0
$$

is exact, see Modules on Sites, Lemma 18.28.7. Of course $\underline{\mathbf{Z}} \otimes_{\underline{\mathbf{Z}}} \mathcal{O}=\mathcal{O}$. Hence we can form the pushout via the ( $\mathcal{O}$-linear) multiplication map $\bar{\mu}: \mathcal{F} \otimes_{\mathbf{Z}} \mathcal{O} \rightarrow \mathcal{F}$ to get an extension of $\mathcal{O}$ by $\mathcal{F}$, like this

which is the desired extension. We omit the verification that these constructions are mutually inverse.
21.7. First cohomology and invertible sheaves

040D The Picard group of a ringed site is defined in Modules on Sites, Section 18.31 .
040E Lemma 21.7.1. Let $(\mathcal{C}, \mathcal{O})$ be a locally ringed site. There is a canonical isomorphism

$$
H^{1}\left(\mathcal{C}, \mathcal{O}^{*}\right)=\operatorname{Pic}(\mathcal{O})
$$

of abelian groups.

Proof. Let $\mathcal{L}$ be an invertible $\mathcal{O}$-module. Consider the presheaf $\mathcal{L}^{*}$ defined by the rule

$$
U \longmapsto\left\{s \in \mathcal{L}(U) \text { such that } \mathcal{O}_{U} \xrightarrow{s \cdot-} \mathcal{L}_{U} \text { is an isomorphism }\right\}
$$

This presheaf satisfies the sheaf condition. Moreover, if $f \in \mathcal{O}^{*}(U)$ and $s \in \mathcal{L}^{*}(U)$, then clearly $f s \in \mathcal{L}^{*}(U)$. By the same token, if $s, s^{\prime} \in \mathcal{L}^{*}(U)$ then there exists a unique $f \in \mathcal{O}^{*}(U)$ such that $f s=s^{\prime}$. Moreover, the sheaf $\mathcal{L}^{*}$ has sections locally by Modules on Sites, Lemma 18.39.7. In other words we see that $\mathcal{L}^{*}$ is a $\mathcal{O}^{*}$-torsor. Thus we get a map

$$
\begin{gathered}
\text { set of invertible sheaves on }(\mathcal{C}, \mathcal{O}) \\
\text { up to isomorphism }
\end{gathered} \longrightarrow \begin{gathered}
\text { set of } \mathcal{O}^{*} \text {-torsors } \\
\text { up to isomorphism }
\end{gathered}
$$

We omit the verification that this is a homomorphism of abelian groups. By Lemma 21.5 .3 the right hand side is canonically bijective to $H^{1}\left(\mathcal{C}, \mathcal{O}^{*}\right)$. Thus we have to show this map is injective and surjective.
Injective. If the torsor $\mathcal{L}^{*}$ is trivial, this means by Lemma 21.5 .2 that $\mathcal{L}^{*}$ has a global section. Hence this means exactly that $\mathcal{L} \cong \mathcal{O}$ is the neutral element in $\operatorname{Pic}(\mathcal{O})$.
Surjective. Let $\mathcal{F}$ be an $\mathcal{O}^{*}$-torsor. Consider the presheaf of sets

$$
\mathcal{L}_{1}: U \longmapsto(\mathcal{F}(U) \times \mathcal{O}(U)) / \mathcal{O}^{*}(U)
$$

where the action of $f \in \mathcal{O}^{*}(U)$ on $(s, g)$ is $\left(f s, f^{-1} g\right)$. Then $\mathcal{L}_{1}$ is a presheaf of $\mathcal{O}$-modules by setting $(s, g)+\left(s^{\prime}, g^{\prime}\right)=\left(s, g+\left(s^{\prime} / s\right) g^{\prime}\right)$ where $s^{\prime} / s$ is the local section $f$ of $\mathcal{O}^{*}$ such that $f s=s^{\prime}$, and $h(s, g)=(s, h g)$ for $h$ a local section of $\mathcal{O}$. We omit the verification that the sheafification $\mathcal{L}=\mathcal{L}_{1}^{\#}$ is an invertible $\mathcal{O}$-module whose associated $\mathcal{O}^{*}$-torsor $\mathcal{L}^{*}$ is isomorphic to $\mathcal{F}$.

### 21.8. Locality of cohomology

$01 F \mathrm{~F}$ The following lemma says there is no ambiguity in defining the cohomology of a sheaf $\mathcal{F}$ over an object of the site.

03F3 Lemma 21.8.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$.
(1) If $\mathcal{I}$ is an injective $\mathcal{O}$-module then $\left.\mathcal{I}\right|_{U}$ is an injective $\mathcal{O}_{U}$-module.
(2) For any sheaf of $\mathcal{O}$-modules $\mathcal{F}$ we have $H^{p}(U, \mathcal{F})=H^{p}\left(\mathcal{C} / U,\left.\mathcal{F}\right|_{U}\right)$.

Proof. Recall that the functor $j_{U}^{-1}$ of restriction to $U$ is a right adjoint to the functor $j_{U!}$ of extension by 0 , see Modules on Sites, Section 18.19 . Moreover, $j_{U!}$ is exact. Hence (1) follows from Homology, Lemma 12.25.1.
By definition $H^{p}(U, \mathcal{F})=H^{p}\left(\mathcal{I}^{\bullet}(U)\right)$ where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution in $\operatorname{Mod}(\mathcal{O})$. By the above we see that $\left.\left.\mathcal{F}\right|_{U} \rightarrow \mathcal{I} \bullet\right|_{U}$ is an injective resolution in $\operatorname{Mod}\left(\mathcal{O}_{U}\right)$. Hence $H^{p}\left(U,\left.\mathcal{F}\right|_{U}\right)$ is equal to $H^{p}\left(\left.\mathcal{I}^{\bullet}\right|_{U}(U)\right)$. Of course $\mathcal{F}(U)=\left.\mathcal{F}\right|_{U}(U)$ for any sheaf $\mathcal{F}$ on $\mathcal{C}$. Hence the equality in (2).

The following lemma will be use to see what happens if we change a partial universe, or to compare cohomology of the small and big étale sites.

03YU Lemma 21.8.2. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume $u$ satisfies the hypotheses of Sites, Lemma 7.20.8. Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the associated morphism of topoi. For any abelian sheaf $\mathcal{F}$ on $\mathcal{D}$ we have isomorphisms

$$
R \Gamma\left(\mathcal{C}, g^{-1} \mathcal{F}\right)=R \Gamma(\mathcal{D}, \mathcal{F})
$$

in particular $H^{p}\left(\mathcal{C}, g^{-1} \mathcal{F}\right)=H^{p}(\mathcal{D}, \mathcal{F})$ and for any $U \in \operatorname{Ob}(\mathcal{C})$ we have isomorphisms

$$
R \Gamma\left(U, g^{-1} \mathcal{F}\right)=R \Gamma(u(U), \mathcal{F})
$$

in particular $H^{p}\left(U, g^{-1} \mathcal{F}\right)=H^{p}(u(U), \mathcal{F})$. All of these isomorphisms are functorial in $\mathcal{F}$.

Proof. Since it is clear that $\Gamma\left(\mathcal{C}, g^{-1} \mathcal{F}\right)=\Gamma(\mathcal{D}, \mathcal{F})$ by hypothesis (e), it suffices to show that $g^{-1}$ transforms injective abelian sheaves into injective abelian sheaves. As usual we use Homology, Lemma 12.25 .1 to see this. The left adjoint to $g^{-1}$ is $g_{!}=f^{-1}$ with the notation of Sites, Lemma 7.20 .8 which is an exact functor. Hence the lemma does indeed apply.

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $\varphi: U \rightarrow V$ be a morphism of $\mathcal{O}$. Then there is a canonical restriction mapping

01FV

$$
\begin{equation*}
H^{n}(V, \mathcal{F}) \longrightarrow H^{n}(U, \mathcal{F}),\left.\quad \xi \longmapsto \xi\right|_{U} \tag{21.8.2.1}
\end{equation*}
$$

functorial in $\mathcal{F}$. Namely, choose any injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. The restriction mappings of the sheaves $\mathcal{I}^{p}$ give a morphism of complexes

$$
\Gamma\left(V, \mathcal{I}^{\bullet}\right) \longrightarrow \Gamma\left(U, \mathcal{I}^{\bullet}\right)
$$

The LHS is a complex representing $R \Gamma(V, \mathcal{F})$ and the RHS is a complex representing $R \Gamma(U, \mathcal{F})$. We get the map on cohomology groups by applying the functor $H^{n}$. As indicated we will use the notation $\left.\xi \mapsto \xi\right|_{U}$ to denote this map. Thus the rule $U \mapsto H^{n}(U, \mathcal{F})$ is a presheaf of $\mathcal{O}$-modules. This presheaf is customarily denoted $\underline{H}^{n}(\mathcal{F})$. We will give another interpretation of this presheaf in Lemma 21.11.5.

The following lemma says that it is possible to kill higher cohomology classes by going to a covering.

01FW Lemma 21.8.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $U$ be an object of $\mathcal{C}$. Let $n>0$ and let $\xi \in H^{n}(U, \mathcal{F})$. Then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $\mathcal{C}$ such that $\left.\xi\right|_{U_{i}}=0$ for all $i \in I$.

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Then

$$
H^{n}(U, \mathcal{F})=\frac{\operatorname{Ker}\left(\mathcal{I}^{n}(U) \rightarrow \mathcal{I}^{n+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^{n}(U)\right)}
$$

Pick an element $\tilde{\xi} \in \mathcal{I}^{n}(U)$ representing the cohomology class in the presentation above. Since $\mathcal{I}^{\bullet}$ is an injective resolution of $\mathcal{F}$ and $n>0$ we see that the complex $\mathcal{I}^{\bullet}$ is exact in degree $n$. Hence $\operatorname{Im}\left(\mathcal{I}^{n-1} \rightarrow \mathcal{I}^{n}\right)=\operatorname{Ker}\left(\mathcal{I}^{n} \rightarrow \mathcal{I}^{n+1}\right)$ as sheaves. Since $\tilde{\xi}$ is a section of the kernel sheaf over $U$ we conclude there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of the site such that $\left.\tilde{\xi}\right|_{U_{i}}$ is the image under $d$ of a section $\xi_{i} \in \mathcal{I}^{n-1}\left(U_{i}\right)$. By our definition of the restriction $\left.\xi\right|_{U_{i}}$ as corresponding to the class of $\left.\tilde{\xi}\right|_{U_{i}}$ we conclude.

072W Lemma 21.8.4. Let $f:\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed sites corresponding to the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. For any $\mathcal{F} \in \operatorname{Ob}\left(\operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)\right)$ the sheaf $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf

$$
V \longmapsto H^{i}(u(V), \mathcal{F})
$$

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ be an injective resolution. Then $R^{i} f_{*} \mathcal{F}$ is by definition the $i$ th cohomology sheaf of the complex

$$
f_{*} \mathcal{I}^{0} \rightarrow f_{*} \mathcal{I}^{1} \rightarrow f_{*} \mathcal{I}^{2} \rightarrow \ldots
$$

By definition of the abelian category structure on $\mathcal{O}_{\mathcal{D}}$-modules this cohomology sheaf is the sheaf associated to the presheaf

$$
V \longmapsto \frac{\operatorname{Ker}\left(f_{*} \mathcal{I}^{i}(V) \rightarrow f_{*} \mathcal{I}^{i+1}(V)\right)}{\operatorname{Im}\left(f_{*} \mathcal{I}^{i-1}(V) \rightarrow f_{*} \mathcal{I}^{i}(V)\right)}
$$

and this is obviously equal to

$$
\frac{\operatorname{Ker}\left(\mathcal{I}^{i}(u(V)) \rightarrow \mathcal{I}^{i+1}(u(V))\right)}{\operatorname{Im}\left(\mathcal{I}^{i-1}(u(V)) \rightarrow \mathcal{I}^{i}(u(V))\right)}
$$

which is equal to $H^{i}(u(V), \mathcal{F})$ and we win.

### 21.9. The Cech complex and Cech cohomology

03 AK Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target, see Sites, Definition 7.6.1. Assume that all fibre products $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Let $\mathcal{F}$ be an abelian presheaf on $\mathcal{C}$. Set

$$
\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})=\prod_{\left(i_{0}, \ldots, i_{p}\right) \in I^{p+1}} \mathcal{F}\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)
$$

This is an abelian group. For $s \in \check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ we denote $s_{i_{0} \ldots i_{p}}$ its value in the factor $\mathcal{F}\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)$. We define

$$
d: \check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{p+1}(\mathcal{U}, \mathcal{F})
$$

by the formula
03AL

$$
\begin{equation*}
d(s)_{i_{0} \ldots i_{p+1}}=\left.\sum_{j=0}^{p+1}(-1)^{j} s_{i_{0} \ldots \hat{i}_{j} \ldots i_{p}}\right|_{U_{i_{0}} \times} \times_{U} \ldots \times_{U} U_{i_{p+1}} \tag{21.9.0.1}
\end{equation*}
$$

where the restriction is via the projection map

$$
U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p+1}} \longrightarrow U_{i_{0}} \times_{U} \ldots \times_{U} \widehat{U_{i_{j}}} \times_{U} \ldots \times_{U} U_{i_{p+1}}
$$

It is straightforward to see that $d \circ d=0$. In other words $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ is a complex.
03AM Definition 21.9.1. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Let $\mathcal{F}$ be an abelian presheaf on $\mathcal{C}$. The complex $\breve{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})$ is the Cech complex associated to $\mathcal{F}$ and the family $\mathcal{U}$. Its cohomology groups $H^{i}(\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F}))$ are called the Cech cohomology groups of $\mathcal{F}$ with respect to $\mathcal{U}$. They are denoted $\check{H}^{i}(\mathcal{U}, \mathcal{F})$.

We observe that any covering $\left\{U_{i} \rightarrow U\right\}$ of a site $\mathcal{C}$ is a family of morphisms with fixed target to which the definition applies.

03AN Lemma 21.9.2. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be an abelian presheaf on $\mathcal{C}$. The following are equivalent
(1) $\mathcal{F}$ is an abelian sheaf on $\mathcal{C}$ and
(2) for every covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of the site $\mathcal{C}$ the natural map

$$
\mathcal{F}(U) \rightarrow \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

(see Sites, Section 7.10) is bijective.

Proof. This is true since the sheaf condition is exactly that $\mathcal{F}(U) \rightarrow \check{H}^{0}(\mathcal{U}, \mathcal{F})$ is bijective for every covering of $\mathcal{C}$.

Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms of $\mathcal{C}$ with fixed target such that all fibre products $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Let $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be another. Let $f: U \rightarrow V, \alpha: I \rightarrow J$ and $f_{i}: U_{i} \rightarrow V_{\alpha(i)}$ be a morphism of families of morphisms with fixed target, see Sites, Section 7.8. In this case we get a map of Cech complexes

$$
\begin{equation*}
\varphi: \check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \tag{21.9.2.1}
\end{equation*}
$$

which in degree $p$ is given by

$$
\varphi(s)_{i_{0} \ldots i_{p}}=\left(f_{i_{0}} \times \ldots \times f_{i_{p}}\right)^{*} s_{\alpha\left(i_{0}\right) \ldots \alpha\left(i_{p}\right)}
$$

### 21.10. Cech cohomology as a functor on presheaves

03 AO Warning: In this section we work exclusively with abelian presheaves on a category. The results are completely wrong in the setting of sheaves and categories of sheaves!

Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Let $\mathcal{F}$ be an abelian presheaf on $\mathcal{C}$. The construction

$$
\mathcal{F} \longmapsto \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

is functorial in $\mathcal{F}$. In fact, it is a functor
03AP (21.10.0.2)

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U},-): P A b(\mathcal{C}) \longrightarrow \operatorname{Comp}^{+}(A b)
$$

see Derived Categories, Definition 13.8 .1 for notation. Recall that the category of bounded below complexes in an abelian category is an abelian category, see Homology, Lemma 12.12.9.

03AQ Lemma 21.10.1. The functor given by Equation 21.10.0.2) is an exact functor (see Homology, Lemma 12.7.1).

Proof. For any object $W$ of $\mathcal{C}$ the functor $\mathcal{F} \mapsto \mathcal{F}(W)$ is an additive exact functor from $P A b(\mathcal{C})$ to $A b$. The terms $\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F})$ of the complex are products of these exact functors and hence exact. Moreover a sequence of complexes is exact if and only if the sequence of terms in a given degree is exact. Hence the lemma follows.

03AR Lemma 21.10.2. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. The functors $\mathcal{F} \mapsto \check{H}^{n}(\mathcal{U}, \mathcal{F})$ form a $\delta$-functor from the abelian category $\operatorname{PAb}(\mathcal{C})$ to the category of Z-modules (see Homology, Definition 12.11.1).

Proof. By Lemma 21.10.1 a short exact sequence of abelian presheaves $0 \rightarrow$ $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is turned into a short exact sequence of complexes of $\mathbf{Z}$ modules. Hence we can use Homology, Lemma 12.12 .12 to get the boundary maps $\delta_{\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}}: \check{H}^{n}\left(\mathcal{U}, \mathcal{F}_{3}\right) \rightarrow \check{H}^{n+1}\left(\mathcal{U}, \mathcal{F}_{1}\right)$ and a corresponding long exact sequence. We omit the verification that these maps are compatible with maps between short exact sequences of presheaves.

03AS Lemma 21.10.3. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Consider the chain complex $\mathbf{Z}_{\mathcal{U}}, \bullet$ of abelian presheaves

$$
\cdots \rightarrow \bigoplus_{i_{0} i_{1} i_{2}} \mathbf{Z}_{U_{i_{0}} \times_{U} U_{i_{1}} \times_{U} U_{i_{2}}} \rightarrow \bigoplus_{i_{0} i_{1}} \mathbf{Z}_{U_{i_{0}} \times{ }_{U} U_{i_{1}}} \rightarrow \bigoplus_{i_{0}} \mathbf{Z}_{U_{i_{0}}} \rightarrow 0 \rightarrow \ldots
$$

where the last nonzero term is placed in degree 0 and where the map

$$
\mathbf{Z}_{U_{i_{0}} \times_{U} \ldots \times_{u} U_{i_{p+1}}} \longrightarrow \mathbf{Z}_{U_{i_{0}} \times{ }_{U} \ldots \widehat{U_{i j}} \cdots \times_{U} U_{i_{p+1}}}
$$

is given by $(-1)^{j}$ times the canonical map. Then there is an isomorphism

$$
\operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U, \bullet}, \mathcal{F}\right)=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

functorial in $\mathcal{F} \in \operatorname{Ob}(\operatorname{PAb}(\mathcal{C}))$.
Proof. This is a tautology based on the fact that

$$
\begin{aligned}
\operatorname{Hom}_{P A b(\mathcal{C})}\left(\bigoplus_{i_{0} \ldots i_{p}} \mathbf{Z}_{U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}}, \mathcal{F}\right) & =\prod_{i_{0} \ldots i_{p}} \operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}}, \mathcal{F}\right) \\
& =\prod_{i_{0} \ldots i_{p}} \mathcal{F}\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)
\end{aligned}
$$

see Modules on Sites, Lemma 18.4.2
03AT Lemma 21.10.4. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. The chain complex $\mathbf{Z}_{\mathcal{U}}, \bullet$ of presheaves of Lemma 21.10 .3 above is exact in positive degrees, i.e., the homology presheaves $H_{i}\left(\mathbf{Z}_{\mathcal{U}, \bullet}\right)$ are zero for $i>0$.

Proof. Let $V$ be an object of $\mathcal{C}$. We have to show that the chain complex of abelian groups $\mathbf{Z}_{\mathcal{U}, \bullet}(V)$ is exact in degrees $>0$. This is the complex

For any morphism $\varphi: V \rightarrow U$ denote $\operatorname{Mor}_{\varphi}\left(V, U_{i}\right)=\left\{\varphi_{i}: V \rightarrow U_{i} \mid f_{i} \circ \varphi_{i}=\varphi\right\}$. We will use a similar notation for $\operatorname{Mor}_{\varphi}\left(V, U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)$. Note that composing with the various projection maps between the fibred products $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$
preserves these morphism sets. Hence we see that the complex above is the same as the complex

Next, we make the remark that we have

$$
\operatorname{Mor}_{\varphi}\left(V, U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)=\operatorname{Mor}_{\varphi}\left(V, U_{i_{0}}\right) \times \ldots \times \operatorname{Mor}_{\varphi}\left(V, U_{i_{p}}\right)
$$

Using this and the fact that $\mathbf{Z}[A] \oplus \mathbf{Z}[B]=\mathbf{Z}[A \amalg B]$ we see that the complex becomes

Finally, on setting $S_{\varphi}=\coprod_{i \in I} \operatorname{Mor}_{\varphi}\left(V, U_{i}\right)$ we see that we get

$$
\bigoplus_{\varphi}\left(\ldots \rightarrow \mathbf{Z}\left[S_{\varphi} \times S_{\varphi} \times S_{\varphi}\right] \rightarrow \mathbf{Z}\left[S_{\varphi} \times S_{\varphi}\right] \rightarrow \mathbf{Z}\left[S_{\varphi}\right] \rightarrow 0 \rightarrow \ldots\right)
$$

Thus we have simplified our task. Namely, it suffices to show that for any nonempty set $S$ the (extended) complex of free abelian groups

$$
\ldots \rightarrow \mathbf{Z}[S \times S \times S] \rightarrow \mathbf{Z}[S \times S] \rightarrow \mathbf{Z}[S] \stackrel{\Sigma}{\rightarrow} \mathbf{Z} \rightarrow 0 \rightarrow \ldots
$$

is exact in all degrees. To see this fix an element $s \in S$, and use the homotopy

$$
n_{\left(s_{0}, \ldots, s_{p}\right)} \longmapsto n_{\left(s, s_{0}, \ldots, s_{p}\right)}
$$

with obvious notations.

03F5 Lemma 21.10.5. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times \times_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{C}$. The chain complex

$$
\mathbf{Z}_{\mathcal{U}, \bullet} \otimes_{p, \mathbf{Z}} \mathcal{O}
$$

is exact in positive degrees. Here $\mathbf{Z}_{\mathcal{U}, \bullet}$ is the cochain complex of Lemma 21.10.3. and the tensor product is over the constant presheaf of rings with value $\mathbf{Z}$.

Proof. Let $V$ be an object of $\mathcal{C}$. In the proof of Lemma 21.10 .4 we saw that $\mathbf{Z}_{\mathcal{U}, \bullet}(V)$ is isomorphic as a complex to a direct sum of complexes which are homotopic to $\mathbf{Z}$ placed in degree zero. Hence also $\mathbf{Z}_{\mathcal{U}, \bullet}(V) \otimes_{\mathbf{Z}} \mathcal{O}(V)$ is isomorphic as a complex to a direct sum of complexes which are homotopic to $\mathcal{O}(V)$ placed in degree zero. Or you can use Modules on Sites, Lemma 18.28 .9 , which applies since the presheaves $\mathbf{Z}_{\mathcal{U}, i}$ are flat, and the proof of Lemma 21.10 .4 shows that $H_{0}\left(\mathbf{Z}_{\mathcal{U}}, \bullet\right)$ is a flat presheaf also.

03AU Lemma 21.10.6. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ exist in $\mathcal{C}$. The Cech cohomology functors $\check{H}^{p}(\mathcal{U},-)$ are canonically isomorphic as a $\delta$-functor to the right derived functors of the functor

$$
\check{H}^{0}(\mathcal{U},-): P A b(\mathcal{C}) \longrightarrow A b
$$

Moreover, there is a functorial quasi-isomorphism

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow R \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

where the right hand side indicates the derived functor

$$
R \check{H}^{0}(\mathcal{U},-): D^{+}(P A b(\mathcal{C})) \longrightarrow D^{+}(\mathbf{Z})
$$

of the left exact functor $\check{H}^{0}(\mathcal{U},-)$.
Proof. Note that the category of abelian presheaves has enough injectives, see Injectives, Proposition 19.6.1. Note that $\check{H}^{0}(\mathcal{U},-)$ is a left exact functor from the category of abelian presheaves to the category of $\mathbf{Z}$-modules. Hence the derived functor and the right derived functor exist, see Derived Categories, Section 13.20 .
Let $\mathcal{I}$ be a injective abelian presheaf. In this case the functor $\operatorname{Hom}_{P A b(\mathcal{C})}(-, \mathcal{I})$ is exact on $\operatorname{PAb}(\mathcal{C})$. By Lemma 21.10.3 we have

$$
\operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}\right)=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I}) .
$$

By Lemma 21.10 .4 we have that $\mathbf{Z}_{\mathcal{U}, \bullet}$ is exact in positive degrees. Hence by the exactness of Hom into $\mathcal{I}$ mentioned above we see that $\check{H}^{i}(\mathcal{U}, \mathcal{I})=0$ for all $i>$ 0 . Thus the $\delta$-functor $\left(\check{H}^{n}, \delta\right)$ (see Lemma 21.10.2 satisfies the assumptions of Homology, Lemma 12.11.4, and hence is a universal $\delta$-functor.
By Derived Categories, Lemma 13.20 .4 also the sequence $R^{i} \check{H}^{0}(\mathcal{U},-)$ forms a universal $\delta$-functor. By the uniqueness of universal $\delta$-functors, see Homology, Lemma 12.11.5 we conclude that $R^{i} \check{H}^{0}(\mathcal{U},-)=\check{H}^{i}(\mathcal{U},-)$. This is enough for most applications and the reader is suggested to skip the rest of the proof.

Let $\mathcal{F}$ be any abelian presheaf on $\mathcal{C}$. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in the category $\operatorname{PAb}(\mathcal{C})$. Consider the double complex $A^{\bullet \bullet \bullet}$ with terms

$$
A^{p, q}=\check{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q}\right) .
$$

Consider the simple complex $s A^{\bullet}$ associated to this double complex. There is a map of complexes

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow s A^{\bullet}
$$

coming from the maps $\check{\mathcal{C}}^{p}(\mathcal{U}, \mathcal{F}) \rightarrow A^{p, 0}=\check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{I}^{0}\right)$ and there is a map of complexes

$$
\check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right) \longrightarrow s A^{\bullet}
$$

coming from the maps $\check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right) \rightarrow A^{0, q}=\check{\mathcal{C}}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right)$. Both of these maps are quasi-isomorphisms by an application of Homology, Lemma 12.22.7. Namely, the columns of the double complex are exact in positive degrees because the Cech complex as a functor is exact (Lemma 21.10.1) and the rows of the double complex are exact in positive degrees since as we just saw the higher Cech cohomology groups of the injective presheaves $\mathcal{I}^{q}$ are zero. Since quasi-isomorphisms become invertible in $D^{+}(\mathbf{Z})$ this gives the last displayed morphism of the lemma. We omit the verification that this morphism is functorial.

### 21.11. Cech cohomology and cohomology

03AV The relationship between cohomology and Cech cohomology comes from the fact that the Cech cohomology of an injective abelian sheaf is zero. To see this we note that an injective abelian sheaf is an injective abelian presheaf and then we apply results in Cech cohomology in the preceding section.

03F6 Lemma 21.11.1. Let $\mathcal{C}$ be a site. An injective abelian sheaf is also injective as an object in the category $\operatorname{PAb}(\mathcal{C})$.
Proof. Apply Homology, Lemma 12.25 .1 to the categories $\mathcal{A}=A b(\mathcal{C}), \mathcal{B}=\operatorname{PAb}(\mathcal{C})$, the inclusion functor and sheafification. (See Modules on Sites, Section 18.3 to see that all assumptions of the lemma are satisfied.)
03AW Lemma 21.11.2. Let $\mathcal{C}$ be a site. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. Let $\mathcal{I}$ be an injective abelian sheaf, i.e., an injective object of $A b(\mathcal{C})$. Then

$$
\check{H}^{p}(\mathcal{U}, \mathcal{I})=\left\{\begin{array}{ccc}
\mathcal{I}(U) & \text { if } \quad p=0 \\
0 & \text { if } \quad p>0
\end{array}\right.
$$

Proof. By Lemma 21.11.1 we see that $\mathcal{I}$ is an injective object in $P A b(\mathcal{C})$. Hence we can apply Lemma 21.10 .6 (or its proof) to see the vanishing of higher Cech cohomology group. For the zeroth see Lemma 21.9.2.
03AX Lemma 21.11.3. Let $\mathcal{C}$ be a site. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. There is a transformation

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U},-) \longrightarrow R \Gamma(U,-)
$$

of functors $A b(\mathcal{C}) \rightarrow D^{+}(\mathbf{Z})$. In particular this gives a transformation of functors $H^{p}(U, \mathcal{F}) \rightarrow H^{p}(U, \mathcal{F})$ for $\mathcal{F}$ ranging over $A b(\mathcal{C})$.

Proof. Let $\mathcal{F}$ be an abelian sheaf. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. Consider the double complex $A^{\bullet \bullet}$, with terms $A^{p, q}=\breve{\mathcal{C}}^{p}\left(\mathcal{U}, \mathcal{I}^{q}\right)$. Moreover, consider the associated simple complex $s A^{\bullet}$, see Homology, Definition 12.22.3. There is a map of complexes

$$
\alpha: \Gamma\left(U, \mathcal{I}^{\bullet}\right) \longrightarrow s A^{\bullet}
$$

coming from the maps $\mathcal{I}^{q}(U) \rightarrow \check{H}^{0}\left(\mathcal{U}, \mathcal{I}^{q}\right)$ and a map of complexes

$$
\beta: \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \longrightarrow s A^{\bullet}
$$

coming from the map $\mathcal{F} \rightarrow \mathcal{I}^{0}$. We can apply Homology, Lemma 12.22 .7 to see that $\alpha$ is a quasi-isomorphism. Namely, Lemma 21.11.2 implies that the $q$ th row of the double complex $A^{\bullet \bullet \bullet}$ is a resolution of $\Gamma\left(U, \mathcal{I}^{q}\right)$. Hence $\alpha$ becomes invertible in $D^{+}(\mathbf{Z})$ and the transformation of the lemma is the composition of $\beta$ followed by the inverse of $\alpha$. We omit the verification that this is functorial.

0A6G Lemma 21.11.4. Let $\mathcal{C}$ be a site. Let $\mathcal{G}$ be an abelian sheaf on $\mathcal{C}$. Let $\mathcal{U}=\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ be a covering of $\mathcal{C}$. The map

$$
\check{H}^{1}(\mathcal{U}, \mathcal{G}) \longrightarrow H^{1}(U, \mathcal{G})
$$

is injective and identifies $\check{H}^{1}(\mathcal{U}, \mathcal{G})$ via the bijection of Lemma 21.5.3 with the set of isomorphism classes of $\left.\mathcal{G}\right|_{U}$-torsors which restrict to trivial torsors over each $U_{i}$.
Proof. To see this we construct an inverse map. Namely, let $\mathcal{F}$ be a $\left.\mathcal{G}\right|_{U}$-torsor on $\mathcal{C} / U$ whose restriction to $\mathcal{C} / U_{i}$ is trivial. By Lemma 21.5 .2 this means there exists a section $s_{i} \in \mathcal{F}\left(U_{i}\right)$. On $U_{i_{0}} \times{ }_{U} U_{i_{1}}$ there is a unique section $s_{i_{0} i_{1}}$ of $\mathcal{G}$ such that $\left.s_{i_{0} i_{1}} \cdot s_{i_{0}}\right|_{U_{i_{0}} \times U_{U} U_{i_{1}}}=\left.s_{i_{1}}\right|_{U_{i_{0}} \times U_{U} U_{i_{1}}}$. An easy computation shows that $s_{i_{0} i_{1}}$ is a Čech cocycle and that its class is well defined (i.e., does not depend on the choice of the sections $s_{i}$ ). The inverse maps the isomorphism class of $\mathcal{F}$ to the cohomology class of the cocycle $\left(s_{i_{0} i_{1}}\right)$. We omit the verification that this map is indeed an inverse.

03AY Lemma 21.11.5. Let $\mathcal{C}$ be a site. Consider the functor $i: A b(\mathcal{C}) \rightarrow \operatorname{PAb}(\mathcal{C})$. It is a left exact functor with right derived functors given by

$$
R^{p} i(\mathcal{F})=\underline{H}^{p}(\mathcal{F}): U \longmapsto H^{p}(U, \mathcal{F})
$$

see discussion in Section 21.8.
Proof. It is clear that $i$ is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$. By definition $R^{p} i$ is the $p$ th cohomology presheaf of the complex $\mathcal{I}^{\bullet}$. In other words, the sections of $R^{p} i(\mathcal{F})$ over an object $U$ of $\mathcal{C}$ are given by

$$
\frac{\operatorname{Ker}\left(\mathcal{I}^{n}(U) \rightarrow \mathcal{I}^{n+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^{n}(U)\right)}
$$

which is the definition of $H^{p}(U, \mathcal{F})$.
03AZ Lemma 21.11.6. Let $\mathcal{C}$ be a site. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. For any abelian sheaf $\mathcal{F}$ there is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(U, \mathcal{F})$. This spectral sequence is functorial in $\mathcal{F}$.
Proof. This is a Grothendieck spectral sequence (see Derived Categories, Lemma 13.22 .2 for the functors

$$
i: A b(\mathcal{C}) \rightarrow \operatorname{PAb}(\mathcal{C}) \quad \text { and } \quad \check{H}^{0}(\mathcal{U},-): \operatorname{PAb}(\mathcal{C}) \rightarrow A b
$$

Namely, we have $\check{H}^{0}(\mathcal{U}, i(\mathcal{F}))=\mathcal{F}(U)$ by Lemma 21.9.2. We have that $i(\mathcal{I})$ is Cech acyclic by Lemma 21.11.2. And we have that $\check{H}^{p}(\mathcal{U},-)=R^{p} \check{H}^{0}(\mathcal{U},-)$ as functors on $\operatorname{PAb}(\mathcal{C})$ by Lemma 21.10.6. Putting everything together gives the lemma.

03F7 Lemma 21.11.7. Let $\mathcal{C}$ be a site. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering. Let $\mathcal{F} \in \operatorname{Ob}(A b(\mathcal{C}))$. Assume that $H^{i}\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}, \mathcal{F}\right)=0$ for all $i>0$, all $p \geq 0$ and all $i_{0}, \ldots, i_{p} \in I$. Then $\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}(U, \mathcal{F})$.

Proof. We will use the spectral sequence of Lemma 21.11.6. The assumptions mean that $E_{2}^{p, q}=0$ for all $(p, q)$ with $q \neq 0$. Hence the spectral sequence degenerates at $E_{2}$ and the result follows.
03F8 Lemma 21.11.8. Let $\mathcal{C}$ be a site. Let

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0
$$

be a short exact sequence of abelian sheaves on $\mathcal{C}$. Let $U$ be an object of $\mathcal{C}$. If there exists a cofinal system of coverings $\mathcal{U}$ of $U$ such that $\check{H}^{1}(\mathcal{U}, \mathcal{F})=0$, then the map $\mathcal{G}(U) \rightarrow \mathcal{H}(U)$ is surjective.
Proof. Take an element $s \in \mathcal{H}(U)$. Choose a covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ such that (a) $\check{H}^{1}(\mathcal{U}, \mathcal{F})=0$ and (b) $\left.s\right|_{U_{i}}$ is the image of a section $s_{i} \in \mathcal{G}\left(U_{i}\right)$. Since we can certainly find a covering such that (b) holds it follows from the assumptions of the lemma that we can find a covering such that (a) and (b) both hold. Consider the sections

$$
s_{i_{0} i_{1}}=\left.s_{i_{1}}\right|_{U_{i_{0}} \times}{ }_{U} U_{i_{1}}-\left.s_{i_{0}}\right|_{U_{i_{0}} \times U U_{i_{1}}} .
$$

Since $s_{i}$ lifts $s$ we see that $s_{i_{0} i_{1}} \in \mathcal{F}\left(U_{i_{0}} \times{ }_{U} U_{i_{1}}\right)$. By the vanishing of $\check{H}^{1}(\mathcal{U}, \mathcal{F})$ we can find sections $t_{i} \in \mathcal{F}\left(U_{i}\right)$ such that

$$
s_{i_{0} i_{1}}=\left.t_{i_{1}}\right|_{U_{i_{0}} \times U_{U} U_{1}}-\left.t_{i_{0}}\right|_{U_{i_{0}} \times U_{U} i_{1}}
$$

Then clearly the sections $s_{i}-t_{i}$ satisfy the sheaf condition and glue to a section of $\mathcal{G}$ over $U$ which maps to $s$. Hence we win.
03F9 Lemma 21.11.9. (Variant of Cohomology, Lemma 20.12.8.) Let $\mathcal{C}$ be a site. Let Cov $_{\mathcal{C}}$ be the set of coverings of $\mathcal{C}$ (see Sites, Definition 7.6.2). Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$, and $\operatorname{Cov} \subset \operatorname{Cov}_{\mathcal{C}}$ be subsets. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. Assume that
(1) For every $\mathcal{U} \in \operatorname{Cov}, \mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ we have $U, U_{i} \in \mathcal{B}$ and every $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}} \in \mathcal{B}$.
(2) For every $U \in \mathcal{B}$ the coverings of $U$ occurring in Cov is a cofinal system of coverings of $U$.
(3) For every $\mathcal{U} \in$ Cov we have $\check{H}^{p}(\mathcal{U}, \mathcal{F})=0$ for all $p>0$.

Then $H^{p}(U, \mathcal{F})=0$ for all $p>0$ and any $U \in \mathcal{B}$.
Proof. Let $\mathcal{F}$ and Cov be as in the lemma. We will indicate this by saying " $\mathcal{F}$ has vanishing higher Cech cohomology for any $\mathcal{U} \in$ Cov". Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective abelian sheaf. By Lemma $21.11 .2 \mathcal{I}$ has vanishing higher Cech cohomology for any $\mathcal{U} \in \operatorname{Cov}$. Let $\mathcal{Q}=\mathcal{I} / \mathcal{F}$ so that we have a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0
$$

By Lemma 21.11 .8 and our assumption (2) this sequence gives rise to an exact sequence

$$
0 \rightarrow \mathcal{F}(U) \rightarrow \mathcal{I}(U) \rightarrow \mathcal{Q}(U) \rightarrow 0
$$

for every $U \in \mathcal{B}$. Hence for any $\mathcal{U} \in \operatorname{Cov}$ we get a short exact sequence of Cech complexes

$$
0 \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{Q}) \rightarrow 0
$$

since each term in the Cech complex is made up out of a product of values over elements of $\mathcal{B}$ by assumption (1). In particular we have a long exact sequence of Cech cohomology groups for any covering $\mathcal{U} \in$ Cov. This implies that $\mathcal{Q}$ is also an abelian sheaf with vanishing higher Cech cohomology for all $\mathcal{U} \in \operatorname{Cov}$.

Next, we look at the long exact cohomology sequence

for any $U \in \mathcal{B}$. Since $\mathcal{I}$ is injective we have $H^{n}(U, \mathcal{I})=0$ for $n>0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^{0}(U, \mathcal{I}) \rightarrow H^{0}(U, \mathcal{Q})$ is surjective and hence $H^{1}(U, \mathcal{F})=0$. Since $\mathcal{F}$ was an arbitrary abelian sheaf with vanishing higher Cech cohomology for all $\mathcal{U} \in$ Cov we conclude that also $H^{1}(U, \mathcal{Q})=0$ since $\mathcal{Q}$ is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^{2}(U, \mathcal{F})=0$. And so on and so forth.

### 21.12. Cohomology of modules

03FA Everything that was said for cohomology of abelian sheaves goes for cohomology of modules, since the two agree.

03FB Lemma 21.12.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. An injective sheaf of modules is also injective as an object in the category $\operatorname{PMod}(\mathcal{O})$.

Proof. Apply Homology, Lemma 12.25 .1 to the categories $\mathcal{A}=\operatorname{Mod}(\mathcal{O}), \mathcal{B}=$ $\operatorname{PMod}(\mathcal{O})$, the inclusion functor and sheafification. (See Modules on Sites, Section 18.11 to see that all assumptions of the lemma are satisfied.)

06 YK Lemma 21.12.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the functor $i: \operatorname{Mod}(\mathcal{C}) \rightarrow$ $\operatorname{PMod}(\mathcal{C})$. It is a left exact functor with right derived functors given by

$$
R^{p} i(\mathcal{F})=\underline{H}^{p}(\mathcal{F}): U \longmapsto H^{p}(U, \mathcal{F})
$$

see discussion in Section 21.8.
Proof. It is clear that $i$ is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in $\operatorname{Mod}(\mathcal{O})$. By definition $R^{p} i$ is the $p$ th cohomology presheaf of the complex $\mathcal{I}$. In other words, the sections of $R^{p} i(\mathcal{F})$ over an object $U$ of $\mathcal{C}$ are given by

$$
\frac{\operatorname{Ker}\left(\mathcal{I}^{n}(U) \rightarrow \mathcal{I}^{n+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^{n}(U)\right)}
$$

which is the definition of $H^{p}(U, \mathcal{F})$.
03FC Lemma 21.12.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. Let $\mathcal{I}$ be an injective $\mathcal{O}$-module, i.e., an injective object of $\operatorname{Mod}(\mathcal{O})$. Then

$$
\check{H}^{p}(\mathcal{U}, \mathcal{I})=\left\{\begin{array}{cll}
\mathcal{I}(U) & \text { if } \quad p=0 \\
0 & \text { if } \quad p>0
\end{array}\right.
$$

Proof. Lemma 21.10.3 gives the first equality in the following sequence of equalities

$$
\begin{aligned}
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I}) & =\operatorname{Mor}_{\operatorname{PAb(\mathcal {C})}}\left(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}\right) \\
& =\operatorname{Mor}_{\operatorname{PMod}(\mathbf{Z})}\left(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}\right) \\
& =\operatorname{Mor}_{\operatorname{PMod}(\mathcal{O})}\left(\mathbf{Z}_{\mathcal{U}, \bullet} \otimes_{p, \mathbf{Z}} \mathcal{O}, \mathcal{I}\right)
\end{aligned}
$$

The third equality by Modules on Sites, Lemma 18.9.2. By Lemma 21.12.1 we see that $\mathcal{I}$ is an injective object in $\operatorname{PMod}(\mathcal{O})$. Hence $\operatorname{Hom}_{P M o d(\mathcal{O})}(-, \mathcal{I})$ is an exact functor. By Lemma 21.10.5 we see the vanishing of higher Cech cohomology groups. For the zeroth see Lemma 21.9.2,

03FD Lemma 21.12.4. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{F}$ be an $\mathcal{O}$-module, and denote $\mathcal{F}_{a b}$ the underlying sheaf of abelian groups. Then we have

$$
H^{i}\left(\mathcal{C}, \mathcal{F}_{a b}\right)=H^{i}(\mathcal{C}, \mathcal{F})
$$

and for any object $U$ of $\mathcal{C}$ we also have

$$
H^{i}\left(U, \mathcal{F}_{a b}\right)=H^{i}(U, \mathcal{F})
$$

Here the left hand side is cohomology computed in $A b(\mathcal{C})$ and the right hand side is cohomology computed in $\operatorname{Mod}(\mathcal{O})$.

Proof. By Derived Categories, Lemma 13.20 .4 the $\delta$-functor $\left(\mathcal{F} \mapsto H^{p}(U, \mathcal{F})\right)_{p \geq 0}$
 $\left.H^{p}\left(U, \mathcal{F}_{a b}\right)\right)_{p \geq 0}$ is a $\delta$-functor also. Suppose we show that $\left(\mathcal{F} \mapsto H^{p}\left(U, \mathcal{F}_{a b}\right)\right)_{p \geq 0}$ is also universal. This will imply the second statement of the lemma by uniqueness of universal $\delta$-functors, see Homology, Lemma 12.11.5. Since $\operatorname{Mod}(\mathcal{O})$ has enough injectives, it suffices to show that $H^{i}\left(U, \mathcal{I}_{a b}\right)=0$ for any injective object $\mathcal{I}$ in $\operatorname{Mod}(\mathcal{O})$, see Homology, Lemma 12.11.4.
Let $\mathcal{I}$ be an injective object of $\operatorname{Mod}(\mathcal{O})$. Apply Lemma 21.11 .9 with $\mathcal{F}=\mathcal{I}, \mathcal{B}=\mathcal{C}$ and $\mathrm{Cov}=\operatorname{Cov}_{\mathcal{C}}$. Assumption (3) of that lemma holds by Lemma 21.12.3. Hence we see that $H^{i}\left(U, \mathcal{I}_{a b}\right)=0$ for every object $U$ of $\mathcal{C}$.

If $\mathcal{C}$ has a final object then this also implies the first equality. If not, then according to Sites, Lemma 7.28 .5 we see that the ringed topos $(S h(\mathcal{C}), \mathcal{O})$ is equivalent to a ringed topos where the underlying site does have a final object. Hence the lemma follows.

060L Lemma 21.12.5. Let $\mathcal{C}$ be a site. Let $I$ be a set. For $i \in I$ let $\mathcal{F}_{i}$ be an abelian sheaf on $\mathcal{C}$. Let $U \in \operatorname{Ob}(\mathcal{C})$. The canonical map

$$
H^{p}\left(U, \prod_{i \in I} \mathcal{F}_{i}\right) \longrightarrow \prod_{i \in I} H^{p}\left(U, \mathcal{F}_{i}\right)
$$

is an isomorphism for $p=0$ and injective for $p=1$.
Proof. The statement for $p=0$ is true because the product of sheaves is equal to the product of the underlying presheaves, see Sites, Lemma 7.10.1. Proof for $p=1$. Set $\mathcal{F}=\prod \mathcal{F}_{i}$. Let $\xi \in H^{1}(U, \mathcal{F})$ map to zero in $\prod H^{1}\left(U, \mathcal{F}_{i}\right)$. By locality of cohomology, see Lemma 21.8.3, there exists a covering $\mathcal{U}=\left\{U_{j} \rightarrow U\right\}$ such that $\left.\xi\right|_{U_{j}}=0$ for all $j$. By Lemma 21.11 .4 this means $\xi$ comes from an element $\check{\xi} \in \check{H}^{1}(\mathcal{U}, \mathcal{F})$. Since the maps $\check{H}^{1}\left(\mathcal{U}, \mathcal{F}_{i}\right) \rightarrow H^{1}\left(U, \mathcal{F}_{i}\right)$ are injective for all $i$ (by Lemma 21.11.4, and since the image of $\xi$ is zero in $\prod H^{1}\left(U, \mathcal{F}_{i}\right)$ we see that the image $\breve{\xi}_{i}=0$ in $\breve{H}^{1}\left(\mathcal{U}, \mathcal{F}_{i}\right)$. However, since $\mathcal{F}=\prod \mathcal{F}_{i}$ we see that $\check{\mathcal{C}}_{\bullet}(\mathcal{U}, \mathcal{F})$ is the product of the complexes $\mathscr{C}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{i}\right)$, hence by Homology, Lemma 12.28 .1 we conclude that $\check{\xi}=0$ as desired.

093X Lemma 21.12.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $a: U^{\prime} \rightarrow U$ be a monomorphism in $\mathcal{C}$. Then for any injective $\mathcal{O}$-module $\mathcal{I}$ the restriction mapping $\mathcal{I}(U) \rightarrow \mathcal{I}\left(U^{\prime}\right)$ is surjective.

Proof. Let $j: \mathcal{C} / U \rightarrow \mathcal{C}$ and $j^{\prime}: \mathcal{C} / U^{\prime} \rightarrow \mathcal{C}$ be the localization morphisms (Modules on Sites, Section 18.19 . Since $j$ ! is a left adjoint to restriction we see that for any sheaf $\mathcal{F}$ of $\mathcal{O}$-modules

$$
\operatorname{Hom}_{\mathcal{O}}\left(j_{!} \mathcal{O}_{U}, \mathcal{F}\right)=\operatorname{Hom}_{\mathcal{O}_{U}}\left(\mathcal{O}_{U},\left.\mathcal{F}\right|_{U}\right)=\mathcal{F}(U)
$$

Similarly, the sheaf $j_{!}^{\prime} \mathcal{O}_{U^{\prime}}$ represents the functor $\mathcal{F} \mapsto \mathcal{F}\left(U^{\prime}\right)$. Moreover below we describe a canonical map of $\mathcal{O}$-modules

$$
j_{!}^{\prime} \mathcal{O}_{U^{\prime}} \longrightarrow j_{!} \mathcal{O}_{U}
$$

which corresponds to the restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}\left(U^{\prime}\right)$ via Yoneda's lemma (Categories, Lemma 4.3.5). It suffices to prove the displayed map of modules is injective, see Homology, Lemma 12.23.2.
To construct our map it suffices to construct a map between the presheaves which assign to an object $V$ of $\mathcal{C}$ the $\mathcal{O}(V)$-module

$$
\bigoplus_{\varphi^{\prime} \in \operatorname{Mor}_{\mathcal{C}}\left(V, U^{\prime}\right)} \mathcal{O}(V) \quad \text { and } \quad \bigoplus_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{O}(V)
$$

see Modules on Sites, Lemma 18.19.2. We take the map which maps the summand corresponding to $\varphi^{\prime}$ to the summand corresponding to $\varphi=a \circ \varphi^{\prime}$ by the identity map on $\mathcal{O}(V)$. As $a$ is a monomorphism, this map is injective. As sheafification is exact, the result follows.

### 21.13. Limp sheaves

079X Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be a sheaf of sets on $\mathcal{C}$ (we intentionally use a roman capital here to distinguish from abelian sheaves). Given an abelian sheaf $\mathcal{F}$ we denote $\mathcal{F}(K)=\operatorname{Mor}_{S h(\mathcal{C})}(K, \mathcal{F})$. The functor $\mathcal{F} \mapsto \mathcal{F}(K)$ is a left exact functor $\operatorname{Mod}(\mathcal{O}) \rightarrow A b$ hence we have its right derived functors. We will denote these $H^{p}(K, \mathcal{F})$ so that $H^{0}(K, \mathcal{F})=\mathcal{F}(K)$.
We mention two special cases. The first is the case where $K=h_{U}^{\#}$ for some object $U$ of $\mathcal{C}$. In this case $H^{p}(K, \mathcal{F})=H^{p}(U, \mathcal{F})$, because $\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right)=\mathcal{F}(U)$, see Sites, Section 7.13. The second is the case $\mathcal{O}=\mathbf{Z}$ (the constant sheaf). In this case the cohomology groups are functors $H^{p}(K,-): A b(\mathcal{C}) \rightarrow A b$. Here is the analogue of Lemma 21.12.4.

079Y Lemma 21.13.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be a sheaf of sets on $\mathcal{C}$. Let $\mathcal{F}$ be an $\mathcal{O}$-module and denote $\mathcal{F}_{a b}$ the underlying sheaf of abelian groups. Then $H^{p}(K, \mathcal{F})=H^{p}\left(K, \mathcal{F}_{a b}\right)$.

Proof. Note that both $H^{p}(K, \mathcal{F})$ and $H^{p}\left(K, \mathcal{F}_{a b}\right)$ depend only on the topos, not on the underlying site. Hence by Sites, Lemma 7.28 .5 we may replace $\mathcal{C}$ by a "larger" site such that $K=h_{U}$ for some object $U$ of $\mathcal{C}$. In this case the result follows from Lemma 21.12.4.
079Z Lemma 21.13.2. Let $\mathcal{C}$ be a site. Let $K^{\prime} \rightarrow K$ be a surjective map of sheaves of sets on $\mathcal{C}$. Set $K_{p}^{\prime}=K^{\prime} \times_{K} \ldots \times_{K} K^{\prime}$ ( $p+1$-factors). For every abelian sheaf $\mathcal{F}$ there is a spectral sequence with $E_{1}^{p, q}=H^{q}\left(K_{p}^{\prime}, \mathcal{F}\right)$ converging to $H^{p+q}(K, \mathcal{F})$.

Proof. After replacing $\mathcal{C}$ by a "larger" site as in Sites, Lemma 7.28.5 we may assume that $K, K^{\prime}$ are objects of $\mathcal{C}$ and that $\mathcal{U}=\left\{K^{\prime} \rightarrow K\right\}$ is a covering. Then we have the Čech to cohomology spectral sequence of Lemma 21.11.6 whose $E_{1}$ page is as indicated in the statement of the lemma.

07A0 Lemma 21.13.3. Let $\mathcal{C}$ be a site. Let $K$ be a sheaf of sets on $\mathcal{C}$. Consider the morphism of topoi $j: \operatorname{Sh}(\mathcal{C} / K) \rightarrow \operatorname{Sh}(\mathcal{C})$, see Sites, Lemma 7.29.3. Then $j^{-1}$ preserves injectives and $H^{p}(K, \mathcal{F})=H^{p}\left(\mathcal{C} / K, j^{-1} \mathcal{F}\right)$ for any abelian sheaf $\mathcal{F}$ on $\mathcal{C}$.

Proof. By Sites, Lemmas 7.29 .1 and 7.29 .3 the morphism of topoi $j$ is equivalent to a localization. Hence this follows from Lemma 21.8.1

Keeping in mind Lemma 21.13.1 we see that the following definition is the "correct one" also for sheaves of modules on ringed sites.

072Y Definition 21.13.4. Let $\mathcal{C}$ be a site. We say an abelian sheaf $\mathcal{F}$ is $\lim ^{1}$ if for every sheaf of sets $K$ we have $H^{p}(K, \mathcal{F})=0$ for all $p \geq 1$.

It is clear that being limp is an intrinsic property, i.e., preserved under equivalences of topoi. A limp sheaf has vanishing higher cohomology on all objects of the site, but in general the condition of being limp is strictly stronger. Here is a characterization of limp sheaves which is sometimes useful.

07A1 Lemma 21.13.5. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be an abelian sheaf. If
(1) $H^{p}(U, \mathcal{F})=0$ for $p>0$ and $U \in \mathrm{Ob}(\mathcal{C})$, and
(2) for every surjection $K^{\prime} \rightarrow K$ of sheaves of sets the extended Čech complex

$$
0 \rightarrow H^{0}(K, \mathcal{F}) \rightarrow H^{0}\left(K^{\prime}, \mathcal{F}\right) \rightarrow H^{0}\left(K^{\prime} \times_{K} K^{\prime}, \mathcal{F}\right) \rightarrow \ldots
$$

is exact,
then $\mathcal{F}$ is limp (and the converse holds too).
Proof. By assumption (1) we have $H^{p}\left(h_{U}^{\#}, g^{-1} \mathcal{I}\right)=0$ for all $p>0$ and all objects $U$ of $\mathcal{C}$. Note that if $K=\coprod K_{i}$ is a coproduct of sheaves of sets on $\mathcal{C}$ then $H^{p}\left(K, g^{-1} \mathcal{I}\right)=\prod H^{p}\left(K_{i}, g^{-1} \mathcal{I}\right)$. For any sheaf of sets $K$ there exists a surjection

$$
K^{\prime}=\coprod h_{U_{i}}^{\#} \longrightarrow K
$$

see Sites, Lemma 7.13.5. Thus we conclude that: $\left(^{*}\right)$ for every sheaf of sets $K$ there exists a surjection $K^{\prime} \rightarrow K$ of sheaves of sets such that $H^{p}\left(K^{\prime}, \mathcal{F}\right)=0$ for $p>0$. We claim that $\left(^{*}\right)$ and condition (2) imply that $\mathcal{F}$ is limp. Note that conditions (*) and (2) only depend on $\mathcal{F}$ as an object of the topos $\operatorname{Sh}(\mathcal{C})$ and not on the underlying site. (We will not use property (1) in the rest of the proof.)

We are going to prove by induction on $n \geq 0$ that $\left(^{*}\right)$ and (2) imply the following induction hypothesis $I H_{n}: H^{p}(K, \mathcal{F})=0$ for all $0<p \leq n$ and all sheaves of sets $K$. Note that $I H_{0}$ holds. Assume $I H_{n}$. Pick a sheaf of sets $K$. Pick a surjection $K^{\prime} \rightarrow K$ such that $H^{p}\left(K^{\prime}, \mathcal{F}\right)=0$ for all $p>0$. We have a spectral sequence with

$$
E_{1}^{p, q}=H^{q}\left(K_{p}^{\prime}, \mathcal{F}\right)
$$

covering to $H^{p+q}(K, \mathcal{F})$, see Lemma 21.13.2. By $I H_{n}$ we see that $E_{1}^{p, q}=0$ for $0<q \leq n$ and by assumption (2) we see that $E_{2}^{p, 0}=0$ for $p>0$. Finally, we have $E_{1}^{0, q}=0$ for $q>0$ because $H^{q}\left(K^{\prime}, \mathcal{F}\right)=0$ by choice of $K^{\prime}$. Hence we conclude that $H^{n+1}(K, \mathcal{F})=0$ because all the terms $E_{2}^{p, q}$ with $p+q=n+1$ are zero.

[^54]
### 21.14. The Leray spectral sequence

072X The key to proving the existence of the Leray spectral sequence is the following lemma.

072 Z Lemma 21.14.1. Let $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Then for any injective object $\mathcal{I}$ in $\operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)$ the pushforward $f_{*} \mathcal{I}$ is limp.

Proof. Let $K$ be a sheaf of sets on $\mathcal{D}$. By Modules on Sites, Lemma 18.7.2 we may replace $\mathcal{C}, \mathcal{D}$ by "larger" sites such that $f$ comes from a morphism of ringed sites induced by a continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$ such that $K=h_{V}$ for some object $V$ of $\mathcal{D}$.

Thus we have to show that $H^{q}\left(V, f_{*} \mathcal{I}\right)$ is zero for $q>0$ and all objects $V$ of $\mathcal{D}$ when $f$ is given by a morphism of ringed sites. Let $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}$ be any covering of $\mathcal{D}$. Since $u$ is continuous we see that $\mathcal{U}=\left\{u\left(V_{j}\right) \rightarrow u(v)\right\}$ is a covering of $\mathcal{C}$. Then we have an equality of Cech complexes

$$
\check{\mathcal{C}}^{\bullet}\left(\mathcal{V}, f_{*} \mathcal{I}\right)=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I})
$$

by the definition of $f_{*}$. By Lemma 21.12 .3 we see that the cohomology of this complex is zero in positive degrees. We win by Lemma 21.11.9.

For flat morphisms the functor $f_{*}$ preserves injective modules. In particular the functor $f_{*}: A b(\mathcal{C}) \rightarrow A b(\mathcal{D})$ always transforms injective abelian sheaves into injective abelian sheaves.

0730 Lemma 21.14.2. Let $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. If $f$ is flat, then $f_{*} \mathcal{I}$ is an injective $\mathcal{O}_{\mathcal{D}}$-module for any injective $\mathcal{O}_{\mathcal{C}}$-module $\mathcal{I}$.

Proof. In this case the functor $f^{*}$ is exact, see Modules on Sites, Lemma 18.30.2, Hence the result follows from Homology, Lemma 12.25.1.

0731 Lemma 21.14.3. Let $\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right)$ be a ringed topos. A limp sheaf is right acyclic for the following functors:
(1) the functor $H^{0}(U,-)$ for any object $U$ of $\mathcal{C}$,
(2) the functor $\mathcal{F} \mapsto \mathcal{F}(K)$ for any presheaf of sets $K$,
(3) the functor $\Gamma(\mathcal{C},-)$ of global sections,
(4) the functor $f_{*}$ for any morphism $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ of ringed topoi.

Proof. Part (2) is the definition of a limp sheaf. Part (1) is a consequence of (2) as pointed out in the discussion following the definition of limp sheaves. Part (3) is a special case of $(2)$ where $K=e$ is the final object of $\operatorname{Sh}(\mathcal{C})$.

To prove (4) we may assume, by Modules on Sites, Lemma 18.7.2 that $f$ is given by a morphism of sites. In this case we see that $R^{i} f_{*}, i>0$ of a limp sheaf are zero by the description of higher direct images in Lemma 21.8.4.

08J6 Remark 21.14.4. As a consequence of the results above we find that Derived Categories, Lemma 13.22 .1 applies to a number of situations. For example, given a morphism $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ of ringed topoi we have

$$
R \Gamma\left(\mathcal{D}, R f_{*} \mathcal{F}\right)=R \Gamma(\mathcal{C}, \mathcal{F})
$$

 module $f_{*} \mathcal{I}$ is $\operatorname{limp}$ by Lemma 21.14 .1 and a limp sheaf is acyclic for $\Gamma(\mathcal{D},-)$ by Lemma 21.14.3.

0732 Lemma 21.14.5 (Leray spectral sequence). Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}^{\bullet}$ be a bounded below complex of $\mathcal{O}_{\mathcal{C}}$-modules. There is a spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(\mathcal{D}, R^{q} f_{*}\left(\mathcal{F}^{\bullet}\right)\right)
$$

converging to $H^{p+q}\left(\mathcal{C}, \mathcal{F}^{\bullet}\right)$.
Proof. This is just the Grothendieck spectral sequence Derived Categories, Lemma 13.22 .2 coming from the composition of functors $\Gamma(\mathcal{C},-)=\Gamma(\mathcal{D},-) \circ f_{*}$. To see that the assumptions of Derived Categories, Lemma 13.22 .2 are satisfied, see Lemmas 21.14.1 and 21.14.3.

0733 Lemma 21.14.6. Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{C}}$-module.
(1) If $R^{q} f_{*} \mathcal{F}=0$ for $q>0$, then $H^{p}(\mathcal{C}, \mathcal{F})=H^{p}\left(\mathcal{D}, f_{*} \mathcal{F}\right)$ for all $p$.
(2) If $H^{p}\left(\mathcal{D}, R^{q} f_{*} \mathcal{F}\right)=0$ for all $q$ and $p>0$, then $H^{q}(\mathcal{C}, \mathcal{F})=H^{0}\left(\mathcal{D}, R^{q} f_{*} \mathcal{F}\right)$ for all $q$.

Proof. These are two simple conditions that force the Leray spectral sequence to converge. You can also prove these facts directly (without using the spectral sequence) which is a good exercise in cohomology of sheaves.

0734 Lemma 21.14.7 (Relative Leray spectral sequence). Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow$ $\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ and $g:\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right) \rightarrow\left(S h(\mathcal{E}), \mathcal{O}_{\mathcal{E}}\right)$ be morphisms of ringed topoi. Let $\mathcal{F}$ be an $\mathcal{O}_{\mathcal{C}}$-module. There is a spectral sequence with

$$
E_{2}^{p, q}=R^{p} g_{*}\left(R^{q} f_{*} \mathcal{F}\right)
$$

converging to $R^{p+q}(g \circ f)_{*} \mathcal{F}$. This spectral sequence is functorial in $\mathcal{F}$, and there is a version for bounded below complexes of $\mathcal{O}_{\mathcal{C}}$-modules.

Proof. This is a Grothendieck spectral sequence for composition of functors, see Derived Categories, Lemma 13.22.2 and Lemmas 21.14.1 and 21.14.3.

### 21.15. The base change map

0735 In this section we construct the base change map in some cases; the general case is treated in Remark 21.19.2. The discussion in this section avoids using derived pullback by restricting to the case of a base change by a flat morphism of ringed sites. Before we state the result, let us discuss flat pullback on the derived category. Suppose $g:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ is a flat morphism of ringed topoi. By Modules on Sites, Lemma 18.30 .2 the functor $g^{*}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)$ is exact. Hence it has a derived functor

$$
g^{*}: D\left(\mathcal{O}_{\mathcal{C}}\right) \rightarrow D\left(\mathcal{O}_{\mathcal{D}}\right)
$$

which is computed by simply pulling back an representative of a given object in $D\left(\mathcal{O}_{\mathcal{D}}\right)$, see Derived Categories, Lemma 13.17.9. It preserved the bounded (above, below) subcategories. Hence as indicated we indicate this functor by $g^{*}$ rather than $L g^{*}$.

0736 Lemma 21.15.1. Let

be a commutative diagram of ringed topoi. Let $\mathcal{F}^{\bullet}$ be a bounded below complex of $\mathcal{O}_{\mathcal{C}}$-modules. Assume both $g$ and $g^{\prime}$ are flat. Then there exists a canonical base change map

$$
g^{*} R f_{*} \mathcal{F}^{\bullet} \longrightarrow R\left(f^{\prime}\right)_{*}\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet}
$$

in $D^{+}\left(\mathcal{O}_{\mathcal{D}^{\prime}}\right)$.
Proof. Choose injective resolutions $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ and $\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet} \rightarrow \mathcal{J}^{\bullet}$. By Lemma 21.14 .2 we see that $\left(g^{\prime}\right)_{*} \mathcal{J}^{\bullet}$ is a complex of injectives representing $R\left(g^{\prime}\right)_{*}\left(g^{\prime}\right)^{*} \mathcal{F}^{\bullet}$. Hence by Derived Categories, Lemmas 13.18 .6 and 13.18 .7 the arrow $\beta$ in the diagram

exists and is unique up to homotopy. Pushing down to $\mathcal{D}$ we get

$$
f_{*} \beta: f_{*} \mathcal{I}^{\bullet} \longrightarrow f_{*}\left(g^{\prime}\right)_{*} \mathcal{J}^{\bullet}=g_{*}\left(f^{\prime}\right)_{*} \mathcal{J}^{\bullet}
$$

By adjunction of $g^{*}$ and $g_{*}$ we get a map of complexes $g^{*} f_{*} \mathcal{I}^{\bullet} \rightarrow\left(f^{\prime}\right)_{*} \mathcal{J}^{\bullet}$. Note that this map is unique up to homotopy since the only choice in the whole process was the choice of the map $\beta$ and everything was done on the level of complexes.

### 21.16. Cohomology and colimits

0737 Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \rightarrow \operatorname{Mod}(\mathcal{O}), i \mapsto \mathcal{F}_{i}$ be a diagram over the index category $\mathcal{I}$, see Categories, Section 4.14 For each $i$ there is a canonical map $\mathcal{F}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{F}_{i}$ which induces a map on cohomology. Hence we get a canonical map

$$
\operatorname{colim}_{i} H^{p}\left(U, \mathcal{F}_{i}\right) \longrightarrow H^{p}\left(U, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

for every $p \geq 0$ and every object $U$ of $\mathcal{C}$. These maps are in general not isomorphisms, even for $p=0$.
The following lemma is the analogue of Sites, Lemma 7.11 .2 for cohomology.
0739 Lemma 21.16.1. Let $\mathcal{C}$ be a site. Let Cov $\mathcal{C}_{\mathcal{C}}$ be the set of coverings of $\mathcal{C}$ (see Sites, Definition 7.6.2). Let $\mathcal{B} \subset \operatorname{Ob}(\mathcal{C})$, and $\operatorname{Cov} \subset \operatorname{Cov}_{\mathcal{C}}$ be subsets. Assume that
(1) For every $\mathcal{U} \in C$ ov we have $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ with I finite, $U, U_{i} \in \mathcal{B}$ and every $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}} \in \mathcal{B}$.
(2) For every $U \in \mathcal{B}$ the coverings of $U$ occurring in Cov is a cofinal system of coverings of $U$.
Then the map

$$
\operatorname{colim}_{i} H^{p}\left(U, \mathcal{F}_{i}\right) \longrightarrow H^{p}\left(U, \operatorname{colim}_{i} \mathcal{F}_{i}\right)
$$

is an isomorphism for every $p \geq 0$, every $U \in \mathcal{B}$, and every filtered diagram $\mathcal{I} \rightarrow$ $A b(\mathcal{C})$.

Proof. To prove the lemma we will argue by induction on $p$. Note that we require in (1) the coverings $\mathcal{U} \in \operatorname{Cov}$ to be finite, so that all the elements of $\mathcal{B}$ are quasicompact. Hence (2) and (1) imply that any $U \in \mathcal{B}$ satisfies the hypothesis of Sites, Lemma 7.11.2 (4). Thus we see that the result holds for $p=0$. Now we assume the lemma holds for $p$ and prove it for $p+1$.
Choose a filtered diagram $\mathcal{F}: \mathcal{I} \rightarrow A b(\mathcal{C}), i \mapsto \mathcal{F}_{i}$. Since $A b(\mathcal{C})$ has functorial injective embeddings, see Injectives, Theorem 19.7.4 we can find a morphism of filtered diagrams $\mathcal{F} \rightarrow \mathcal{I}$ such that each $\mathcal{F}_{i} \rightarrow \mathcal{I}_{i}$ is an injective map of abelian sheaves into an injective abelian sheaf. Denote $\mathcal{Q}_{i}$ the cokernel so that we have short exact sequences

$$
0 \rightarrow \mathcal{F}_{i} \rightarrow \mathcal{I}_{i} \rightarrow \mathcal{Q}_{i} \rightarrow 0
$$

Since colimits of sheaves are the sheafification of colimits on the level of presheaves, since sheafification is exact, and since filtered colimits of abelian groups are exact (see Algebra, Lemma 10.8.9), we see the sequence

$$
0 \rightarrow \operatorname{colim}_{i} \mathcal{F}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{I}_{i} \rightarrow \operatorname{colim}_{i} \mathcal{Q}_{i} \rightarrow 0
$$

is also a short exact sequence. We claim that $H^{q}\left(U, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=0$ for all $U \in \mathcal{B}$ and all $q \geq 1$. Accepting this claim for the moment consider the diagram

The zero at the lower right corner comes from the claim and the zero at the upper right corner comes from the fact that the sheaves $\mathcal{I}_{i}$ are injective. The top row is exact by an application of Algebra, Lemma 10.8.9. Hence by the snake lemma we deduce the result for $p+1$.
It remains to show that the claim is true. We will use Lemma 21.11.9. By the result for $p=0$ we see that for $\mathcal{U} \in \operatorname{Cov}$ we have

$$
\check{\mathcal{C}} \bullet\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=\operatorname{colim}_{i} \check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{I}_{i}\right)
$$

because all the $U_{j_{0}} \times{ }_{U} \ldots \times_{U} U_{j_{p}}$ are in $\mathcal{B}$. By Lemma 21.11 .2 each of the complexes in the colimit of Cech complexes is acyclic in degree $\geq 1$. Hence by Algebra, Lemma 10.8 .9 we see that also the Cech complex $\check{\mathcal{C}} \bullet\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)$ is acyclic in degrees $\geq 1$. In other words we see that $\check{H}^{p}\left(\mathcal{U}, \operatorname{colim}_{i} \mathcal{I}_{i}\right)=0$ for all $p \geq 1$. Thus the assumptions of Lemma 21.11.9 are satisfied and the claim follows.

Let $\mathcal{C}$ be a limit of sites $\mathcal{C}_{i}$ as in Sites, Situation 7.11 .3 and Lemmas 7.11.4, 7.11.5, and 7.11.6. In particular, all coverings in $\mathcal{C}$ and $\mathcal{C}_{i}$ have finite index sets. Moreover, assume given
(1) an abelian sheaf $\mathcal{F}_{i}$ on $\mathcal{C}_{i}$ for all $i \in \mathrm{Ob}(\mathcal{I})$,
(2) for $a: j \rightarrow i$ a map $\varphi_{a}: f_{a}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{j}$ of abelian sheaves on $\mathcal{C}_{j}$ such that $\varphi_{c}=\varphi_{b} \circ f_{b}^{-1} \varphi_{a}$ whenever $c=a \circ b$.

09YP Lemma 21.16.2. In the situation discussed above set $\mathcal{F}=\operatorname{colim} f_{i}^{-1} \mathcal{F}_{i}$. Let $i \in \operatorname{Ob}(\mathcal{I}), X_{i} \in \operatorname{Ob}\left(\mathcal{C}_{i}\right)$. Then

$$
\operatorname{colim}_{a: j \rightarrow i} H^{p}\left(u_{a}\left(X_{i}\right), \mathcal{F}_{j}\right)=H^{p}\left(u_{i}\left(X_{i}\right), \mathcal{F}\right)
$$

for all $p \geq 0$.

Proof. The case $p=0$ is Sites, Lemma 7.11.6.
In this paragraph we show that we can find a map of systems $\left(\gamma_{i}\right):\left(\mathcal{F}_{i}, \varphi_{a}\right) \rightarrow$ $\left(\mathcal{G}_{i}, \psi_{a}\right)$ with $\mathcal{G}_{i}$ an injective abelian sheaf and $\gamma_{i}$ injective. For each $i$ we pick an injection $\mathcal{F}_{i} \rightarrow \mathcal{I}_{i}$ where $\mathcal{I}_{i}$ is an injective abelian sheaf on $\mathcal{C}_{i}$. Then we can consider the family of maps

$$
\gamma_{i}: \mathcal{F}_{i} \longrightarrow \prod_{b: k \rightarrow i} f_{b, *} \mathcal{I}_{k}=\mathcal{G}_{i}
$$

where the component maps are the maps adjoint to the maps $f_{b}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{k} \rightarrow \mathcal{I}_{k}$. For $a: j \rightarrow i$ in $\mathcal{I}$ there is a canonical map

$$
\psi_{a}: f_{a}^{-1} \mathcal{G}_{i} \rightarrow \mathcal{G}_{j}
$$

whose components are the canonical maps $f_{b}^{-1} f_{a \circ b, *} \mathcal{I}_{k} \rightarrow f_{b, *} \mathcal{I}_{k}$ for $b: k \rightarrow j$. Thus we find an injection $\left\{\gamma_{i}\right\}:\left\{\mathcal{F}_{i}, \varphi_{a}\right) \rightarrow\left(\mathcal{G}_{i}, \psi_{a}\right)$ of systems of abelian sheaves. Note that $\mathcal{G}_{i}$ is an injective sheaf of abelian groups on $\mathcal{C}_{i}$, see Lemma 21.14.2 and Homology, Lemma 12.23.3. This finishes the construction.

Arguing exactly as in the proof of Lemma 21.16.1 we see that it suffices to prove that $H^{p}\left(X, \operatorname{colim} f_{i}^{-1} \mathcal{G}_{i}\right)=0$ for $p>0$.
Set $\mathcal{G}=\operatorname{colim} f_{i}^{-1} \mathcal{G}_{i}$. To show vanishing of cohomology of $\mathcal{G}$ on every object of $\mathcal{C}$ we show that the Čech cohomology of $\mathcal{G}$ for any covering $\mathcal{U}$ of $\mathcal{C}$ is zero (Lemma 21.11.9. The covering $\mathcal{U}$ comes from a covering $\mathcal{U}_{i}$ of $\mathcal{C}_{i}$ for some $i$. We have

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{G})=\operatorname{colim}_{a: j \rightarrow i} \check{\mathcal{C}}^{\bullet}\left(u_{a}\left(\mathcal{U}_{i}\right), \mathcal{G}_{j}\right)
$$

by the case $p=0$. The right hand side is acyclic in positive degrees as a filtered colimit of acyclic complexes by Lemma 21.11.2. See Algebra, Lemma 10.8.9.

### 21.17. Flat resolutions

06 YL In this section we redo the arguments of Cohomology, Section 20.27 in the setting of ringed sites and ringed topoi.

06YM Lemma 21.17.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{G}$ • be a complex of $\mathcal{O}$-modules. The functor

$$
K(\operatorname{Mod}(\mathcal{O})) \longrightarrow K(\operatorname{Mod}(\mathcal{O})), \quad \mathcal{F}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{G}^{\bullet}\right)
$$

is an exact functor of triangulated categories.
Proof. Omitted. Hint: See More on Algebra, Lemmas 15.49.1 and 15.49.2.
06 YN Definition 21.17.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. A complex $\mathcal{K}^{\bullet}$ of $\mathcal{O}$-modules is called $K$-flat if for every acyclic complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}$-modules the complex

$$
\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right)
$$

is acyclic.
06YP Lemma 21.17.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{K}^{\bullet}$ be a $K$-flat complex. Then the functor

$$
K(\operatorname{Mod}(\mathcal{O})) \longrightarrow K(\operatorname{Mod}(\mathcal{O})), \quad \mathcal{F}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right)
$$

transforms quasi-isomorphisms into quasi-isomorphisms.
Proof. Follows from Lemma 21.17.1 and the fact that quasi-isomorphisms are characterized by having acyclic cones.

07A2 Lemma 21.17.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}$ are $K$-flat complexes of $\mathcal{O}$-modules, then $\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes \mathcal{O}^{\left.\mathcal{L}^{\bullet}\right)}\right.$ is a $K$-flat complex of $\mathcal{O}$-modules.
Proof. Follows from the isomorphism

$$
\operatorname{Tot}\left(\mathcal{M}^{\bullet} \otimes_{\mathcal{O}} \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)\right)=\operatorname{Tot}\left(\operatorname{Tot}\left(\mathcal{M}^{\bullet} \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right) \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)
$$

and the definition.
07A3 Lemma 21.17.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(\mathcal{K}_{1}^{\bullet}, \mathcal{K}_{2}^{\bullet}, \mathcal{K}_{3}^{\bullet}\right)$ be a distinguished triangle in $K(\operatorname{Mod}(\mathcal{O}))$. If two out of three of $\mathcal{K}_{i}^{\bullet}$ are $K$-flat, so is the third.

Proof. Follows from Lemma 21.17 .1 and the fact that in a distinguished triangle in $K(\operatorname{Mod}(\mathcal{O}))$ if two out of three are acyclic, so is the third.

06YQ Lemma 21.17.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. A bounded above complex of flat $\mathcal{O}$-modules is $K$-flat.

Proof. Let $\mathcal{K}^{\bullet}$ be a bounded above complex of flat $\mathcal{O}$-modules. Let $\mathcal{L}^{\bullet}$ be an acyclic complex of $\mathcal{O}$-modules. Note that $\mathcal{L}^{\bullet}=\operatorname{colim}_{m} \tau_{\leq m} \mathcal{L}^{\bullet}$ where we take termwise colimits. Hence also

$$
\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)=\operatorname{colim}_{m} \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \tau_{\leq m} \mathcal{L}^{\bullet}\right)
$$

termwise. Hence to prove the complex on the left is acyclic it suffices to show each of the complexes on the right is acyclic. Since $\tau_{\leq m} \mathcal{L}^{\bullet}$ is acyclic this reduces us to the case where $\mathcal{L}^{\bullet}$ is bounded above. In this case the spectral sequence of Homology, Lemma 12.22 .6 has

$$
{ }^{\prime} E_{1}^{p, q}=H^{p}\left(\mathcal{L}^{\bullet} \otimes_{R} \mathcal{K}^{q}\right)
$$

which is zero as $\mathcal{K}^{q}$ is flat and $\mathcal{L}^{\bullet}$ acyclic. Hence we win.
06YR Lemma 21.17.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{K}_{1}^{\bullet} \rightarrow \mathcal{K}_{2}^{\bullet} \rightarrow \ldots$ be a system of $K$-flat complexes. Then $\operatorname{colim}_{i} \mathcal{K}_{i}^{\bullet}$ is $K$-flat.

Proof. Because we are taking termwise colimits it is clear that

$$
\operatorname{colim}_{i} \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{K}_{i}^{\bullet}\right)=\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \operatorname{colim}_{i} \mathcal{K}_{i}^{\bullet}\right)
$$

Hence the lemma follows from the fact that filtered colimits are exact.
077 J Lemma 21.17.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. For any complex $\mathcal{G}$ • of $\mathcal{O}$-modules there exists a commutative diagram of complexes of $\mathcal{O}$-modules

with the following properties: (1) the vertical arrows are quasi-isomorphisms, (2) each $\mathcal{K}_{n}^{\bullet}$ is a bounded above complex whose terms are direct sums of $\mathcal{O}$-modules of the form $j_{U!} \mathcal{O}_{U}$, and (3) the maps $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{K}_{n+1}^{\bullet}$ are termwise split injections whose cokernels are direct sums of $\mathcal{O}$-modules of the form $j_{U!} \mathcal{O}_{U}$. Moreover, the map colim $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}$ • is a quasi-isomorphism.

Proof. The existence of the diagram and properties (1), (2), (3) follows immediately from Modules on Sites, Lemma 18.28 .6 and Derived Categories, Lemma 13.28.1. The induced map $\operatorname{colim} \mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a quasi-isomorphism because filtered colimits are exact.

06YS Lemma 21.17.9. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. For any complex $\mathcal{G}{ }^{\bullet}$ of $\mathcal{O}$-modules there exists a $K$-flat complex $\mathcal{K}^{\bullet}$ and a quasi-isomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$.

Proof. Choose a diagram as in Lemma 21.17.8. Each complex $\mathcal{K}_{n}^{\bullet}$ is a bounded above complex of flat modules, see Modules on Sites, Lemma 18.28.5. Hence $\mathcal{K}_{n}^{\bullet}$ is K-flat by Lemma 21.17.6. The induced map colim $\mathcal{K}_{n}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a quasi-isomorphism by construction. Since colim $\mathcal{K}_{n}^{\bullet}$ is K-flat by Lemma 21.17.7 we win.

06YT Lemma 21.17.10. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\alpha: \mathcal{P}^{\bullet} \rightarrow \mathcal{Q}^{\bullet}$ be a quasiisomorphism of $K$-flat complexes of $\mathcal{O}$-modules. For every complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}$-modules the induced map

$$
\operatorname{Tot}\left(i d_{\mathcal{F}} \bullet \otimes \alpha\right): \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{P}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{Q}^{\bullet}\right)
$$

is a quasi-isomorphism.
Proof. Choose a quasi-isomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ with $\mathcal{K}^{\bullet}$ a K-flat complex, see Lemma 21.17.9. Consider the commutative diagram

The result follows as by Lemma 21.17 .3 the vertical arrows and the top horizontal arrow are quasi-isomorphisms.

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}^{\bullet}$ be an object of $D(\mathcal{O})$. Choose a K-flat resolution $\mathcal{K}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$, see Lemma 21.17.9. By Lemma 21.17.1 we obtain an exact functor of triangulated categories

$$
K(\mathcal{O}) \longrightarrow K(\mathcal{O}), \quad \mathcal{G}^{\bullet} \longmapsto \operatorname{Tot}\left(\mathcal{G}^{\bullet} \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right)
$$

By Lemma 21.17.3 this functor induces a functor $D(\mathcal{O}) \rightarrow D(\mathcal{O})$ simply because $D(\mathcal{O})$ is the localization of $K(\mathcal{O})$ at quasi-isomorphisms. By Lemma 21.17 .10 the resulting functor (up to isomorphism) does not depend on the choice of the K-flat resolution.

06YU Definition 21.17.11. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}^{\bullet}$ be an object of $D(\mathcal{O})$. The derived tensor product

$$
-\otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}^{\bullet}: D(\mathcal{O}) \longrightarrow D(\mathcal{O})
$$

is the exact functor of triangulated categories described above.
It is clear from our explicit constructions that there is a canonical isomorphism

$$
\mathcal{F}^{\bullet} \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G}^{\bullet} \cong \mathcal{G}^{\bullet} \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}^{\bullet}
$$

for $\mathcal{G}^{\bullet}$ and $\mathcal{F}^{\bullet}$ in $D(\mathcal{O})$. Hence when we write $\mathcal{F}^{\bullet} \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G} \bullet$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

08FF Definition 21.17.12. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}$-modules. The Tor's of $\mathcal{F}$ and $\mathcal{G}$ are define by the formula

$$
\operatorname{Tor}_{p}^{\mathcal{O}}(\mathcal{F}, \mathcal{G})=H^{-p}\left(\mathcal{F} \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G}\right)
$$

with derived tensor product as defined above.
This definition implies that for every short exact sequence of $\mathcal{O}$-modules $0 \rightarrow \mathcal{F}_{1} \rightarrow$ $\mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ we have a long exact cohomology sequence

for every $\mathcal{O}$-module $\mathcal{G}$. This will be called the long exact sequence of Tor associated to the situation.

08FG Lemma 21.17.13. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}$ be an $\mathcal{O}$-module. The following are equivalent
(1) $\mathcal{F}$ is a flat $\mathcal{O}$-module, and
(2) $\operatorname{Tor}_{1}^{\mathcal{O}}(\mathcal{F}, \mathcal{G})=0$ for every $\mathcal{O}$-module $\mathcal{G}$.

Proof. If $\mathcal{F}$ is flat, then $\mathcal{F} \otimes_{\mathcal{O}}$ - is an exact functor and the satellites vanish. Conversely assume (2) holds. Then if $\mathcal{G} \rightarrow \mathcal{H}$ is injective with cokernel $\mathcal{Q}$, the long exact sequence of Tor shows that the kernel of $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{H}$ is a quotient of $\operatorname{Tor}_{1}^{\mathcal{O}}(\mathcal{F}, \mathcal{Q})$ which is zero by assumption. Hence $\mathcal{F}$ is flat.

### 21.18. Derived pullback

06 YV Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. We can use K-flat resolutions to define a derived pullback functor

$$
L f^{*}: D\left(\mathcal{O}^{\prime}\right) \rightarrow D(\mathcal{O})
$$

However, we have to be a little careful since we haven't yet proved the pullback of a flat module is flat in complete generality, see Modules on Sites, Section 18.38 . In this section, we will use the hypothesis that our sites have enough points, but once we improve the result of the aforementioned section, all of the results in this section will hold without the assumption on the existence of points.

06YW Lemma 21.18.1. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ be a morphism of topoi. Let $\mathcal{O}^{\prime}$ be a sheaf of rings on $\mathcal{C}^{\prime}$. Assume $\mathcal{C}$ has enough points. For any complex of $\mathcal{O}^{\prime}$-modules $\mathcal{G}^{\bullet}$, there exists a quasi-isomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ such that $\mathcal{K}^{\bullet}$ is a $K$-flat complex of $\mathcal{O}^{\prime}$-modules and $f^{-1} \mathcal{K}^{\bullet}$ is a $K$-flat complex of $f^{-1} \mathcal{O}^{\prime}$-modules.

Proof. In the proof of Lemma 21.17.9we find a quasi-isomorphism $\mathcal{K}^{\bullet}=\operatorname{colim}_{i} \mathcal{K}_{i}^{\bullet} \rightarrow$ $\mathcal{G}^{\bullet}$ where each $\mathcal{K}_{i}^{\bullet}$ is a bounded above complex of flat $\mathcal{O}^{\prime}$-modules. By Modules on Sites, Lemma 18.38 .3 applied to the morphism of ringed topoi $\left(\operatorname{Sh}(\mathcal{C}), f^{-1} \mathcal{O}^{\prime}\right) \rightarrow$ $\left(\operatorname{Sh}\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ we see that $f^{-1} \mathcal{F}_{i}^{\bullet}$ is a bounded above complex of flat $f^{-1} \mathcal{O}^{\prime}$-modules. Hence $f^{-1} \mathcal{K}^{\bullet}=\operatorname{colim}_{i} f^{-1} \mathcal{K}_{i}^{\bullet}$ is K-flat by Lemmas 21.17.6 and 21.17.7.
06YX Remark 21.18.2. It is straightforward to show that the pullback of a K-flat complex is K-flat for a morphism of ringed topoi with enough points; this slightly improves the result of Lemma 21.18.1. However, in applications it seems rather that
the explicit form of the K-flat complexes constructed in Lemma 21.17 .9 is what is useful (as in the proof above) and not the plain fact that they are K-flat. Note for example that the terms of the complex constructed are each direct sums of modules of the form $j_{U!} \mathcal{O}_{U}$, see Lemma 21.17.8.

06YY Lemma 21.18.3. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Assume $\mathcal{C}$ has enough points. There exists an exact functor

$$
L f^{*}: D\left(\mathcal{O}^{\prime}\right) \longrightarrow D(\mathcal{O})
$$

of triangulated categories so that $L f^{*} \mathcal{K}^{\bullet}=f^{*} \mathcal{K}^{\bullet}$ for any complex as in Lemma 21.18.1 in particular for any bounded above complex of flat $\mathcal{O}^{\prime}$-modules.

Proof. To see this we use the general theory developed in Derived Categories, Section 13.15 Set $\mathcal{D}=K\left(\mathcal{O}^{\prime}\right)$ and $\mathcal{D}^{\prime}=D(\mathcal{O})$. Let us write $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ the exact functor of triangulated categories defined by the rule $F\left(\mathcal{G}^{\bullet}\right)=f^{*} \mathcal{G}^{\bullet}$. We let $S$ be the set of quasi-isomorphisms in $\mathcal{D}=K\left(\mathcal{O}^{\prime}\right)$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15.2 applies. We claim that $L F$ is everywhere defined. This follows from Derived Categories, Lemma 13.15 .15 with $\mathcal{P} \subset \mathrm{Ob}(\mathcal{D})$ the collection of complexes $\mathcal{K}^{\bullet}$ such that $f^{-1} \mathcal{K}^{\bullet}$ is a K-flat complex of $f^{-1} \mathcal{O}^{\prime}$-modules: (1) follows from Lemma 21.18.1 and to see (2) we have to show that for a quasi-isomorphism $\mathcal{K}_{1}^{\bullet} \rightarrow \mathcal{K}_{2}^{\bullet}$ between elements of $\mathcal{P}$ the map $f^{*} \mathcal{K}_{1}^{\bullet} \rightarrow f^{*} \mathcal{K}_{2}^{\bullet}$ is a quasi-isomorphism. To see this write this as

$$
f^{-1} \mathcal{K}_{1}^{\bullet} \otimes_{f^{-1} \mathcal{O}^{\prime}} \mathcal{O} \longrightarrow f^{-1} \mathcal{K}_{2}^{\bullet} \otimes_{f^{-1} \mathcal{O}^{\prime}} \mathcal{O}
$$

The functor $f^{-1}$ is exact, hence the map $f^{-1} \mathcal{K}_{1}^{\bullet} \rightarrow f^{-1} \mathcal{K}_{2}^{\bullet}$ is a quasi-isomorphism. The complexes $f^{-1} \mathcal{K}_{1}^{\bullet}$ and $f^{-1} \mathcal{K}_{2}^{\bullet}$ are K-flat complexes of $f^{-1} \mathcal{O}^{\prime}$-modules by our choice of $\mathcal{P}$. Hence Lemma 21.17 .10 guarantees that the displayed map is a quasiisomorphism. Thus we obtain a derived functor

$$
L F: D\left(\mathcal{O}^{\prime}\right)=S^{-1} \mathcal{D} \longrightarrow \mathcal{D}^{\prime}=D(\mathcal{O})
$$

see Derived Categories, Equation 13.15.9.1. Finally, Derived Categories, Lemma 13.15.15 also guarantees that $L F\left(\mathcal{K}^{\bullet}\right)=F\left(\mathcal{K}^{\bullet}\right)=f^{*} \mathcal{K}^{\bullet}$ when $\mathcal{K}^{\bullet}$ is in $\mathcal{P}$. Since the proof of Lemma 21.18.1 shows that bounded above complexes of flat modules are in $\mathcal{P}$ we win.

07A4 Lemma 21.18.4. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Assume $\mathcal{C}$ has enough points. There is a canonical bifunctorial isomorphism

$$
L f^{*}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}^{\prime}}^{\mathbf{L}} \mathcal{G}^{\bullet}\right)=L f^{*} \mathcal{F}^{\bullet} \otimes_{\mathcal{O}}^{\mathbf{L}} L f^{*} \mathcal{G}^{\bullet}
$$

for $\mathcal{F}^{\bullet}, \mathcal{G}^{\bullet} \in \operatorname{Ob}\left(D\left(\mathcal{O}^{\prime}\right)\right)$.
Proof. By Lemma 21.18.1 we may assume that $\mathcal{F}^{\bullet}$ and $\mathcal{G}^{\bullet}$ are K-flat complexes of $\mathcal{O}^{\prime}$-modules such that $f^{*} \mathcal{F}^{\bullet}$ and $f^{*} \mathcal{G}^{\bullet}$ are K-flat complexes of $\mathcal{O}$-modules. In this case $\mathcal{F}^{\bullet} \otimes_{\mathcal{O}^{\prime}}^{\mathbf{L}} \mathcal{G}^{\bullet}$ is just the total complex associated to the double complex $\mathcal{F}^{\bullet} \otimes \mathcal{O}^{\prime} \mathcal{G}^{\bullet}$. By Lemma 21.17.4 $\operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}^{\prime}} \mathcal{G}^{\bullet}\right)$ is K-flat also. Hence the isomorphism of the lemma comes from the isomorphism

$$
\operatorname{Tot}\left(f^{*} \mathcal{F}^{\bullet} \otimes_{\mathcal{O}} f^{*} \mathcal{G}^{\bullet}\right) \longrightarrow f^{*} \operatorname{Tot}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}^{\prime}} \mathcal{G}^{\bullet}\right)
$$

whose constituents are the isomorphisms $f^{*} \mathcal{F}^{p} \otimes_{\mathcal{O}} f^{*} \mathcal{G}^{q} \rightarrow f^{*}\left(\mathcal{F}^{p} \otimes_{\mathcal{O}^{\prime}} \mathcal{G}^{q}\right)$ of Modules on Sites, Lemma 18.26.1.

0816 Lemma 21.18.5. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. There is a canonical bifunctorial isomorphism

$$
\mathcal{F}^{\bullet} \otimes_{\mathcal{O}}^{\mathbf{L}} L f^{*} \mathcal{G}^{\bullet}=\mathcal{F}^{\bullet} \otimes_{f^{-1} \mathcal{O}_{Y}}^{\mathbf{L}} f^{-1} \mathcal{G}^{\bullet}
$$

for $\mathcal{F}^{\bullet}$ in $D(\mathcal{O})$ and $\mathcal{G}^{\bullet}$ in $D\left(\mathcal{O}^{\prime}\right)$.
Proof. Let $\mathcal{F}$ be an $\mathcal{O}$-module and let $\mathcal{G}$ be an $\mathcal{O}^{\prime}$-module. Then $\mathcal{F} \otimes \mathcal{O} f^{*} \mathcal{G}=$ $\mathcal{F} \otimes_{f^{-1} \mathcal{O}^{\prime}} f^{-1} \mathcal{G}$ because $f^{*} \mathcal{G}=\mathcal{O} \otimes_{f^{-1} \mathcal{O}^{\prime}} f^{-1} \mathcal{G}$. The lemma follows from this and the definitions.

### 21.19. Cohomology of unbounded complexes

07 A 5 Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The category $\operatorname{Mod}(\mathcal{O})$ is a Grothendieck abelian category: it has all colimits, filtered colimits are exact, and it has a generator, namely

$$
\bigoplus_{U \in \mathrm{Ob}(\mathcal{C})} j_{U!} \mathcal{O}_{U}
$$

see Modules on Sites, Section 18.14 and Lemmas 18.28 .5 and 18.28.6. By Injectives, Theorem 19.12 .6 for every complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}$-modules there exists an injective quasiisomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ to a K-injective complex of $\mathcal{O}$-modules. Hence we can define

$$
R \Gamma\left(\mathcal{C}, \mathcal{F}^{\bullet}\right)=\Gamma\left(\mathcal{C}, \mathcal{I}^{\bullet}\right)
$$

and similarly for any left exact functor, see Derived Categories, Lemma 13.29 .7 . For any morphism of ringed topoi $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ we obtain

$$
R f_{*}: D(\mathcal{O}) \longrightarrow D\left(\mathcal{O}^{\prime}\right)
$$

on the unbounded derived categories.
07A6 Lemma 21.19.1. Let $f:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Assume $\mathcal{C}$ has enough points. The functor $R f_{*}$ defined above and the functor $L f^{*}$ defined in Lemma 21.18.3 are adjoint:

$$
\operatorname{Hom}_{D(\mathcal{O})}\left(L f^{*} \mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}\right)=\operatorname{Hom}_{D\left(\mathcal{O}^{\prime}\right)}\left(\mathcal{G}^{\bullet}, R f_{*} \mathcal{F}^{\bullet}\right)
$$

bifunctorially in $\mathcal{F}^{\bullet} \in \operatorname{Ob}(D(\mathcal{O}))$ and $\mathcal{G}^{\bullet} \in \operatorname{Ob}\left(D\left(\mathcal{O}^{\prime}\right)\right)$.
Proof. This follows formally from the fact that $R f_{*}$ and $L f^{*}$ exist, see Derived Categories, Lemma 13.28.4.

07A7 Remark 21.19.2. The construction of unbounded derived functor $L f^{*}$ and $R f_{*}$ allows one to construct the base change map in full generality. Namely, suppose that

is a commutative diagram of ringed topoi. Let $K$ be an object of $D\left(\mathcal{O}_{\mathcal{C}}\right)$. Then there exists a canonical base change map

$$
L g^{*} R f_{*} K \longrightarrow R\left(f^{\prime}\right)_{*} L\left(g^{\prime}\right)^{*} K
$$

in $D\left(\mathcal{O}_{\mathcal{D}^{\prime}}\right)$. Namely, this map is adjoint to a map $L\left(f^{\prime}\right)^{*} L g^{*} R f_{*} K \rightarrow L\left(g^{\prime}\right)^{*} K$. Since $L\left(f^{\prime}\right)^{*} \circ L g^{*}=L\left(g^{\prime}\right)^{*} \circ L f^{*}$ we see this is the same as a map $L\left(g^{\prime}\right)^{*} L f^{*} R f_{*} K \rightarrow$ $L\left(g^{\prime}\right)^{*} K$ which we can take to be $L\left(g^{\prime}\right)^{*}$ of the adjunction map $L f^{*} R f_{*} K \rightarrow K$.

0B6C Remark 21.19.3. Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. The adjointness of $L f^{*}$ and $R f_{*}$ allows us to construct a relative cup product

$$
R f_{*} K \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} R f_{*} L \longrightarrow R f_{*}\left(K \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L\right)
$$

in $D\left(\mathcal{O}_{\mathcal{D}}\right)$ for all $K, L$ in $D\left(\mathcal{O}_{\mathcal{C}}\right)$. Namely, this map is adjoint to a map $L f^{*}\left(R f_{*} K \otimes{ }_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}}\right.$ $\left.R f_{*} L\right) \rightarrow K \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L$ for which we can take the composition of the isomorphism $L f^{*}\left(R f_{*} K \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} R f_{*} L\right)=L f^{*} R f_{*} K \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} R f_{*} L$ (Lemma 21.18.4 with the map $L f^{*} R f_{*} K \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} R f_{*} L \rightarrow K \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L$ coming from the counit $L f^{*} \circ R f_{*} \rightarrow \mathrm{id}$.
0BKV Lemma 21.19.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be an object of $D(\mathcal{O})$. The sheafification of $U \mapsto H^{q}(U, K)$ is the qth cohomology sheaf $H^{q}(K)$ of $K$.

Proof. Choose a K-injective complex $\mathcal{I} \bullet$ representing $K$. Then

$$
H^{q}(U, K)=\frac{\operatorname{Ker}\left(\mathcal{I}^{q}(U) \rightarrow \mathcal{I}^{q+1}(U)\right)}{\operatorname{Im}\left(\mathcal{I}^{q-1}(U) \rightarrow \mathcal{I}^{q}(U)\right)}
$$

by the discussion above. Since $H^{q}(K)=\operatorname{Ker}\left(\mathcal{I}^{q} \rightarrow \mathcal{I}^{q+1}\right) / \operatorname{Im}\left(\mathcal{I}^{q-1} \rightarrow \mathcal{I}^{q}\right)$ the result is clear.

### 21.20. Some properties of K-injective complexes

08 FH Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. Denote $j:\left(S h(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow$ $(S h(\mathcal{C}), \mathcal{O})$ the corresponding localization morphism. The pullback functor $j^{*}$ is exact as it is just the restriction functor. Thus derived pullback $L j^{*}$ is computed on any complex by simply restricting the complex. We often simply denote the corresponding functor

$$
D(\mathcal{O}) \rightarrow D\left(\mathcal{O}_{U}\right), \quad E \mapsto j^{*} E=\left.E\right|_{U}
$$

Similarly, extension by zero $j_{!}: \operatorname{Mod}\left(\mathcal{O}_{U}\right) \rightarrow \operatorname{Mod}(\mathcal{O})$ (see Modules on Sites, Definition 18.19.1) is an exact functor (Modules on Sites, Lemma 18.19.3). Thus it induces a functor

$$
j_{!}: D\left(\mathcal{O}_{U}\right) \rightarrow D(\mathcal{O}), \quad F \mapsto j_{!} F
$$

by simply applying $j$ ! to any complex representing the object $F$.
08FI Lemma 21.20.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. The restriction of a K-injective complex of $\mathcal{O}$-modules to $\mathcal{C} / U$ is a $K$-injective complex of $\mathcal{O}_{U}$-modules.
Proof. Follows immediately from Derived Categories, Lemma 13.29 .9 and the fact that the restriction functor has the exact left adjoint $j_{!}$. See discussion above.

08FJ Lemma 21.20.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. Denote $j:\left(\operatorname{Sh}(\mathcal{C} / U), \mathcal{O}_{U}\right) \rightarrow(S h(\mathcal{C}), \mathcal{O})$ the corresponding localization morphism. The restriction functor $D(\mathcal{O}) \rightarrow D\left(\mathcal{O}_{U}\right)$ is a right adjoint to extension by zero $j_{!}$: $D\left(\mathcal{O}_{U}\right) \rightarrow D(\mathcal{O})$.

Proof. We have to show that

$$
\operatorname{Hom}_{D(\mathcal{O})}(j!E, F)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(E,\left.F\right|_{U}\right)
$$

Choose a complex $\mathcal{E}^{\bullet}$ of $\mathcal{O}_{U}$-modules representing $E$ and choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $F$. By Lemma 21.20.1 the complex $\left.\mathcal{I}^{\bullet}\right|_{U}$ is K-injective as well. Hence we see that the formula above becomes

$$
\operatorname{Hom}_{D(\mathcal{O})}\left(j!\mathcal{E}^{\bullet}, \mathcal{I}^{\bullet}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{\bullet},\left.\mathcal{I}^{\bullet}\right|_{U}\right)
$$

which holds as $\left.\right|_{U}$ and $j_{!}$are adjoint functors (Modules on Sites, Lemma 18.19.2 and Derived Categories, Lemma 13.29 .2 .

093Y Lemma 21.20.3. Let $\mathcal{C}$ be a site. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a flat map of sheaves of rings. If $\mathcal{I}^{\bullet}$ is a $K$-injective complex of $\mathcal{O}^{\prime}$-modules, then $\mathcal{I} \bullet$ is $K$-injective as a complex of $\mathcal{O}$-modules.

Proof. This is true because $\operatorname{Hom}_{K(\mathcal{O})}\left(\mathcal{F}^{\bullet}, \mathcal{I}^{\bullet}\right)=\operatorname{Hom}_{K\left(\mathcal{O}^{\prime}\right)}\left(\mathcal{F}^{\bullet} \otimes_{\mathcal{O}} \mathcal{O}^{\prime}, \mathcal{I}^{\bullet}\right)$ by Modules on Sites, Lemma 18.11 .3 and the fact that tensoring with $\mathcal{O}^{\prime}$ is exact.
$093 Z$ Lemma 21.20.4. Let $\mathcal{C}$ be a site. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a map of sheaves of rings. If $\mathcal{I} \bullet$ is a K-injective complex of $\mathcal{O}$-modules, then $\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{O}^{\prime}, I^{\bullet}\right)$ is a $K$-injective complex of $\mathcal{O}^{\prime}$-modules.

Proof. This is true because $\operatorname{Hom}_{K\left(\mathcal{O}^{\prime}\right)}\left(\mathcal{G}^{\bullet}, \operatorname{Hom}_{\mathcal{O}}\left(\mathcal{O}^{\prime}, \mathcal{I}^{\bullet}\right)\right)=\operatorname{Hom}_{K(\mathcal{O})}\left(\mathcal{G}^{\bullet}, \mathcal{I}^{\bullet}\right)$ by Modules on Sites, Lemma 18.27.5.

### 21.21. Derived and homotopy limits

0940 Let $\mathcal{C}$ be a site. Consider the category $\mathcal{C} \times \mathbf{N}$ with $\operatorname{Mor}((U, n),(V, m))=\emptyset$ if $n>m$ and $\operatorname{Mor}((U, n),(V, m))=\operatorname{Mor}(U, V)$ else. We endow this with the structure of a site by letting coverings be families $\left\{\left(U_{i}, n\right) \rightarrow(U, n)\right\}$ such that $\left\{U_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$. Then the reader verifies immediately that sheaves on $\mathcal{C} \times \mathbf{N}$ are the same thing as inverse systems of sheaves on $\mathcal{C}$. In particular $A b(\mathcal{C} \times \mathbf{N})$ is inverse systems of abelian sheaves on $\mathcal{C}$. Consider now the functor

$$
\lim : A b(\mathcal{C} \times \mathbf{N}) \rightarrow A b(\mathcal{C})
$$

which takes an inverse system to its limit. This is nothing but $g_{*}$ where $g: \operatorname{Sh}(\mathcal{C} \times$ $\mathbf{N}) \rightarrow S h(\mathcal{C})$ is the morphism of topoi associated to the continuous and cocontinuous functor $\mathcal{C} \times \mathbf{N} \rightarrow \mathcal{C}$. (Observe that $g^{-1}$ assigns to a sheaf on $\mathcal{C}$ the corresponding constant inverse system.)

By the general machinery explained above we obtain a derived functor

$$
R \lim =R g_{*}: D(\mathcal{C} \times \mathbf{N}) \rightarrow D(\mathcal{C})
$$

As indicated this functor is often denoted $R$ lim.
On the other hand, the continuous and cocontinuous functors $\mathcal{C} \rightarrow \mathcal{C} \times \mathbf{N}, U \mapsto$ $(U, n)$ define morphisms of topoi $i_{n}: S h(\mathcal{C}) \rightarrow S h(\mathcal{C} \times \mathbf{N})$. Of course $i_{n}^{-1}$ is the functor which picks the $n$th term of the inverse system. Thus there are transformations of functors $i_{n+1}^{-1} \rightarrow i_{n}^{-1}$. Hence given $K \in D(\mathcal{C} \times \mathbf{N})$ we get $K_{n}=i_{n}^{-1} K \in D(\mathcal{C})$ and maps $K_{n+1} \rightarrow K_{n}$. In Derived Categories, Definition 13.32.1 we have defined the notion of a homotopy limit

$$
R \lim K_{n} \in D(\mathcal{C})
$$

We claim the two notions agree (as far as it makes sense).
0941 Lemma 21.21.1. Let $\mathcal{C}$ be a site. Let $K$ be an object of $D(\mathcal{C} \times \mathbf{N})$. Set $K_{n}=i_{n}^{-1} K$ as above. Then

$$
R \lim K \cong R \lim K_{n}
$$

in $D(\mathcal{C})$.

Proof. To calculate $R \lim$ on an object $K$ of $D(\mathcal{C} \times \mathbf{N})$ we choose a K-injective representative $\mathcal{I}^{\bullet}$ whose terms are injective objects of $A b(\mathcal{C} \times \mathbf{N})$, see Injectives, Theorem 19.12.6. We may and do think of $\mathcal{I}^{\bullet}$ as an inverse system of complexes $\left(\mathcal{I}_{n}^{\bullet}\right)$ and then we see that

$$
R \lim K=\lim \mathcal{I}_{n}^{\bullet}
$$

where the right hand side is the termwise inverse limit.
Let $\mathcal{J}=\left(\mathcal{J}_{n}\right)$ be an injective object of $A b(\mathcal{C} \times \mathbf{N})$. The morphisms $(U, n) \rightarrow$ $(U, n+1)$ are monomorphisms of $\mathcal{C} \times \mathbf{N}$, hence $\mathcal{J}(U, n+1) \rightarrow \mathcal{J}(U, n)$ is surjective (Lemma 21.12.6). It follows that $\mathcal{J}_{n+1} \rightarrow \mathcal{J}_{n}$ is surjective as a map of presheaves.
Note that the functor $i_{n}^{-1}$ has an exact left adjoint $i_{n,!}$. Namely, $i_{n,!} \mathcal{F}$ is the inverse system $\ldots 0 \rightarrow 0 \rightarrow \mathcal{F} \rightarrow \ldots \rightarrow \mathcal{F}$. Thus the complexes $i_{n}^{-1} \mathcal{I}^{\bullet}=\mathcal{I}_{n}^{\bullet}$ are K-injective by Derived Categories, Lemma 13.29 .9 .
Because we chose our K-injective complex to have injective terms we conclude that

$$
0 \rightarrow \lim \mathcal{I}_{n}^{\bullet} \rightarrow \prod \mathcal{I}_{n}^{\bullet} \rightarrow \prod \mathcal{I}_{n}^{\bullet} \rightarrow 0
$$

is a short exact sequence of complexes of abelian sheaves as it is a short exact sequence of complexes of abelian presheaves. Moreover, the products in the middle and the right represent the products in $D(\mathcal{C})$, see Injectives, Lemma 19.13 .4 and its proof (this is where we use that $\mathcal{I}_{n}^{\bullet}$ is K-injective). Thus $R \lim K$ is a homotopy limit of the inverse system $\left(K_{n}\right)$ by definition of homotopy limits in triangulated categories.
0 L07 Lemma 21.21.2. Let $f:(\operatorname{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Then $R f_{*}$ commutes with $R \lim$, i.e., $R f_{*}$ commutes with derived limits.
Proof. Let $\left(K_{n}\right)$ be an inverse system of objects of $D(\mathcal{O})$. By induction on $n$ we may choose actual complexes $\mathcal{K}_{n}^{\bullet}$ of $\mathcal{O}$-modules and maps of complexes $\mathcal{K}_{n+1}^{\bullet} \rightarrow \mathcal{K}_{n}^{\bullet}$ representing the maps $K_{n+1} \rightarrow K_{n}$ in $D(\mathcal{O})$. In other words, there exists an object $K$ in $D(\mathcal{C} \times \mathbf{N})$ whose associated inverse system is the given one. Next, consider the commutative diagram

of morphisms of topoi. It follows that $R \lim R(f \times 1)_{*} K=R f_{*} R \lim K$. Working through the definitions and using Lemma 21.21.1 we obtain that $R \lim \left(R f_{*} K_{n}\right)=$ $R f_{*}\left(R \lim K_{n}\right)$.

Alternate proof in case $\mathcal{C}$ has enough points. Consider the defining distinguished triangle

$$
R \lim K_{n} \rightarrow \prod K_{n} \rightarrow \prod K_{n}
$$

in $D(\mathcal{O})$. Applying the exact functor $R f_{*}$ we obtain the distinguished triangle

$$
R f_{*}\left(R \lim K_{n}\right) \rightarrow R f_{*}\left(\prod K_{n}\right) \rightarrow R f_{*}\left(\prod K_{n}\right)
$$

in $D\left(\mathcal{O}^{\prime}\right)$. Thus we see that it suffices to prove that $R f_{*}$ commutes with products in the derived category (which are not just given by products of complexes, see Injectives, Lemma 19.13.4). However, since $R f_{*}$ is a right adjoint by Lemma 21.19.1
this follows formally (see Categories, Lemma 4.24.4. Caution: Note that we cannot apply Categories, Lemma 4.24 .4 directly as $R \lim K_{n}$ is not a limit in $D(\mathcal{O})$.

0BKW Remark 21.21.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(K_{n}\right)$ be an inverse system in $D(\mathcal{O})$. Set $K=R \lim K_{n}$. For each $n$ and $m$ let $\mathcal{H}_{n}^{m}=H^{m}\left(K_{n}\right)$ be the $m$ th cohomology sheaf of $K_{n}$ and similarly set $\mathcal{H}^{m}=H^{m}(K)$. Let us denote $\underline{\mathcal{H}}_{n}^{m}$ the presheaf

$$
U \longmapsto \underline{\mathcal{H}}_{n}^{m}(U)=H^{m}\left(U, K_{n}\right)
$$

Similarly we set $\underline{\mathcal{H}}^{m}(U)=H^{m}(U, K)$. By Lemma 21.19.4 we see that $\mathcal{H}_{n}^{m}$ is the sheafification of $\underline{\mathcal{H}}_{n}^{m}$ and $\mathcal{H}^{m}$ is the sheafification of $\underline{\mathcal{H}}^{m}$. Here is a diagram

In general it may not be the case that $\lim \mathcal{H}_{n}^{m}$ is the sheafification of $\lim \underline{\mathcal{H}}_{n}^{m}$. If $U \subset X$ is an open, then we have short exact sequences

0BKX

$$
\begin{equation*}
0 \rightarrow R^{1} \lim \underline{\mathcal{H}}_{n}^{m-1}(U) \rightarrow \underline{\mathcal{H}}^{m}(U) \rightarrow \lim \underline{\mathcal{H}}_{n}^{m}(U) \rightarrow 0 \tag{21.21.3.1}
\end{equation*}
$$

This follows from the fact that $R \Gamma(U,-)$ commutes with derived limits (Injectives, Lemma 19.13.6) and More on Algebra, Remark 15.68.16

The following lemma applies to an inverse system of quasi-coherent modules with surjective transition maps on an algebraic space or an algebraic stack.

0BKY Lemma 21.21.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(\mathcal{F}_{n}\right)$ be an inverse system of $\mathcal{O}$-modules. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Assume
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) $H^{p}\left(U, \mathcal{F}_{n}\right)=0$ for $p>0$ and $U \in \mathcal{B}$,
(3) the inverse system $\mathcal{F}_{n}(U)$ has vanishing $R^{1} \lim$ for $U \in \mathcal{B}$.

Then $R \lim \mathcal{F}_{n}=\lim \mathcal{F}_{n}$.
Proof. Set $K_{n}=\mathcal{F}_{n}$ and $K=R \lim \mathcal{F}_{n}$. Using the notation of Remark 21.21.3 and assumption (2) we see that for $U \in \mathcal{B}$ we have $\underline{\mathcal{H}}_{n}^{m}(U)=0$ when $m \neq 0$ and $\underline{\mathcal{H}}_{n}^{0}(U)=\mathcal{F}_{n}(U)$. From Equation 21.21.3.1 and assumption (3) we see that $\underline{\mathcal{H}}^{m}(U)=0$ when $m \neq 0$ and equal to $\lim \mathcal{F}_{n}(U)$ when $m=0$. Sheafifying using (1) we find that $\mathcal{H}^{m}=0$ when $m \neq 0$ and equal to $\lim \mathcal{F}_{n}$ when $m=0$.

08U3 Lemma 21.21.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E \in D(\mathcal{O})$. Assume there exists a subset $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ such that
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) $\forall m, \exists p(m)$ such that $H^{p}\left(U, H^{m-p}(E)\right)=0$ for all $p>p(m)$ and $U \in \mathcal{B}$. (For example if $H^{p}\left(U, H^{q}(E)\right)=0$ for all $p>0, q<0, U \in \mathcal{B}$.)

Then the canonical map

$$
E \longrightarrow R \lim \tau_{\geq-n} E
$$

is an isomorphism in $D(\mathcal{O})$.

Proof. (The parenthetical statement holds because the condition $H^{p}\left(U, H^{q}(E)\right)=$ 0 for all $p>0, q<0, U \in \mathcal{B}$ is equivalent to $p(m)=\max (0, m)$ in the lemma.) The canonical map $E \rightarrow R \lim \tau_{\geq-n} E$ comes from the canonical maps $E \rightarrow \tau_{\geq-n} E$. Set $K_{n}=\tau_{\geq-n} E$ and $K=R \lim K_{n}$. We will use the notation introduced in Remark 21.21 .3 . Fix $m \in \mathbf{Z}$. Recall (Derived Categories, Remark 13.12.4) that we have distinguished triangles

$$
K_{n+1} \rightarrow K_{n} \rightarrow \mathcal{E}^{-n}[n] \rightarrow K_{n+1}[1]
$$

where $\mathcal{E}^{i}=H^{i}(E)$ denotes the $i$ th cohomology sheaf of $E$. Let $U \in \mathcal{B}$. The associated long exact cohomology sequence gives

$$
H^{m}\left(U, \mathcal{E}^{-n}[n-1]\right) \rightarrow H^{m}\left(U, K_{n+1}\right) \rightarrow H^{m}\left(U, K_{n}\right) \rightarrow H^{m}\left(U, \mathcal{E}^{-n}[n]\right)
$$

The first and the last groups are equal to $H^{m+n-1}\left(U, \mathcal{E}^{-n}\right)$ and $H^{m+n}\left(U, \mathcal{E}^{-n}\right)$. By assumption (2) if $m+n-1>p(m-1)$ and $m+n>p(m)$, i.e., if $n \geq n_{m}=$ $1+\max (p(m-1)-m+1, p(m)-m)$, then these two groups are zero. We conclude that the inverse system

$$
\ldots \rightarrow \underline{\mathcal{H}}_{3}^{m}(U) \rightarrow \underline{\mathcal{H}}_{2}^{m}(U) \rightarrow \underline{\mathcal{H}}_{1}^{m}(U)
$$

is constant for $n \geq n_{m}$. We conclude that these inverse systems have vanishing $R^{1} \lim ($ for all $m$ ). By Equation 21.21.3.1

$$
\underline{\mathcal{H}}^{m}(U)=\ldots=\underline{\mathcal{H}}_{n_{m}+2}^{m}(U)=\underline{\mathcal{H}}_{n_{m}+1}^{m}(U)=\underline{\mathcal{H}}_{n_{m}}^{m}(U)
$$

for all $U \in \mathcal{B}$. By property (1) we find that $\underline{\mathcal{H}}^{m}$ and $\underline{\mathcal{H}}_{n_{m}+i}^{m}$ have the same sheafification for $i \geq 0$. If $-n_{m}-i<m$, then this sheafification is equal to $\mathcal{E}^{m}$ by Lemma 21.19.4 applied to $K_{n_{m}+i}=\tau_{\geq-n_{m}-i} E$. This implies that $E \rightarrow K$ induces an isomorphism on cohomology sheaves which is what we wanted to prove.

The lemma above can be used to compute cohomology in certain situations.
0BKZ Lemma 21.21.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be an object of $D(\mathcal{O})$. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Assume
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) $H^{p}\left(U, H^{q}(K)\right)=0$ for all $p>0, q \in \mathbf{Z}$, and $U \in \mathcal{B}$.

Then $H^{q}(U, K)=H^{0}\left(U, H^{q}(K)\right)$ for $q \in \mathbf{Z}$ and $U \in \mathcal{B}$.
Proof. Observe that $K=R \lim \tau_{\geq-n} K$ by Lemma 21.21.5. Let $U \in \mathcal{B}$. By Equation 21.21.3.1 we get a short exact sequence

$$
0 \rightarrow R^{1} \lim H^{q-1}\left(U, \tau_{\geq-n} K\right) \rightarrow H^{q}(U, K) \rightarrow \lim H^{q}\left(U, \tau_{\geq-n} K\right) \rightarrow 0
$$

Condition (2) implies $H^{q}\left(U, \tau_{\geq-n} K\right)=H^{0}\left(U, H^{q}\left(\tau_{\geq-n} K\right)\right)$ for all $q$ by using the spectral sequence of Derived Categories, Lemma 13.21 .3 . The spectral sequence converges because $\tau_{\geq-n} K$ is bounded below. If $n>-q$ then we have $H^{q}\left(\tau_{\geq-n} K\right)=$ $H^{q}(K)$. Thus the systems on the left and the right of the displayed short exact sequence are eventually constant with values $H^{0}\left(U, H^{q-1}(K)\right)$ and $H^{0}\left(U, H^{q}(K)\right)$ and the lemma follows.

Here is another case where we can describe the derived limit.
0 Lemma 21.21.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(K_{n}\right)$ be an inverse system of objects of $D(\mathcal{O})$. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Assume
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) for all $U \in \mathcal{B}$ and all $q \in \mathbf{Z}$ we have
(a) $H^{p}\left(U, H^{q}\left(K_{n}\right)\right)=0$ for $p>0$,
(b) the inverse system $H^{0}\left(U, H^{q}\left(K_{n}\right)\right)$ has vanishing $R^{1} \lim$.

Then $H^{q}\left(R \lim K_{n}\right)=\lim H^{q}\left(K_{n}\right)$ for $q \in \mathbf{Z}$ and $R^{t} \lim H^{q}\left(K_{n}\right)=0$ for $t>0$.
Proof. Set $K=R \lim K_{n}$. We will use notation as in Remark 21.21.3. Let $U \in \mathcal{B}$. By Lemma 21.21 .6 and (2)(a) we have $H^{q}\left(U, K_{n}\right)=H^{0}\left(U, H^{q}\left(K_{n}\right)\right)$. Using that the functor $R \Gamma(U,-)$ commutes with derived limits we have

$$
H^{q}(U, K)=H^{q}\left(R \lim R \Gamma\left(U, K_{n}\right)\right)=\lim H^{0}\left(U, H^{q}\left(K_{n}\right)\right)
$$

where the final equality follows from More on Algebra, Remark 15.68 .16 and assumption $(2)(\mathrm{b})$. Thus $H^{q}(U, K)$ is the inverse limit the sections of the sheaves $H^{q}\left(K_{n}\right)$ over $U$. Since $\lim H^{q}\left(K_{n}\right)$ is a sheaf we find using assumption (1) that $H^{q}(K)$, which is the sheafification of the presheaf $U \mapsto H^{q}(U, K)$, is equal to $\lim H^{q}\left(K_{n}\right)$. This proves the first statement. The second is Lemma 21.21.4.

### 21.22. Producing K-injective resolutions

070 N Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{F}^{\bullet}$ be a complex of $\mathcal{O}$-modules. The category $\operatorname{Mod}(\mathcal{O})$ has enough injectives, hence we can use Derived Categories, Lemma 13.28 .3 produce a diagram

in the category of complexes of $\mathcal{O}$-modules such that
(1) the vertical arrows are quasi-isomorphisms,
(2) $\mathcal{I}_{n}^{\bullet}$ is a bounded below complex of injectives,
(3) the arrows $\mathcal{I}_{n+1}^{\bullet} \rightarrow \mathcal{I}_{n}^{\bullet}$ are termwise split surjections.

The category of $\mathcal{O}$-modules has limits (they are computed on the level of presheaves), hence we can form the termwise limit $\mathcal{I}^{\bullet}=\lim _{n} \mathcal{I}_{n}^{\bullet}$. By Derived Categories, Lemmas 13.29 .4 and 13.29 .8 this is a K-injective complex. In general the canonical map

070P (21.22.0.1)

$$
\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}
$$

may not be a quasi-isomorphism. In the following lemma we describe some conditions under which it is.

070Q Lemma 21.22.1. In the situation described above. Denote $\mathcal{H}^{m}=H^{m}\left(\mathcal{F}^{\bullet}\right)$ the mth cohomology sheaf. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Let $d \in \mathbf{N}$. Assume
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) for every $U \in \mathcal{B}$ we have $H^{p}\left(U, \mathcal{H}^{q}\right)=0$ for $p>d$ and $q<\mathbb{q}^{2}$.

Then 21.22.0.1) is a quasi-isomorphism.
Proof. By Derived Categories, Lemma 13.32 .4 it suffices to show that the canonical $\operatorname{map} \mathcal{F}^{\bullet} \rightarrow R \lim \tau_{\geq-n} \mathcal{F}^{\bullet}$ is an isomorphism. This follows from Lemma 21.21.5 with $p(m)=\max (d, m)$.

[^55]Here is a technical lemma about cohomology sheaves of termwise limits of inverse systems of complexes of modules. We should avoid using this lemma as much as possible and instead use arguments with derived inverse limits.

08CT Lemma 21.22.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(\mathcal{F}_{n}^{\bullet}\right)$ be an inverse system of complexes of $\mathcal{O}$-modules. Let $m \in \mathbf{Z}$. Suppose given $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ and an integer $n_{0}$ such that
(1) every object of $\mathcal{C}$ has a covering whose members are elements of $\mathcal{B}$,
(2) for every $U \in \mathcal{B}$
(a) the systems of abelian groups $\mathcal{F}_{n}^{m-2}(U)$ and $\mathcal{F}_{n}^{m-1}(U)$ have vanishing $R^{1} \lim$ (for example these have the Mittag-Leffler property),
(b) the system of abelian groups $H^{m-1}\left(\mathcal{F}_{n}^{\bullet}(U)\right)$ has vanishing $R^{1} \lim$ (for example it has the Mittag-Leffler property), and
(c) we have $H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)=H^{m}\left(\mathcal{F}_{n_{0}}^{\bullet}(U)\right)$ for all $n \geq n_{0}$.

Then the maps $H^{m}\left(\mathcal{F}^{\bullet}\right) \rightarrow \lim H^{m}\left(\mathcal{F}_{n}^{\bullet}\right) \rightarrow H^{m}\left(\mathcal{F}_{n_{0}}^{\bullet}\right)$ are isomorphisms of sheaves where $\mathcal{F}^{\bullet}=\lim \mathcal{F}_{n}^{\bullet}$ is the termwise inverse limit.
Proof. Let $U \in \mathcal{B}$. Note that $H^{m}\left(\mathcal{F}^{\bullet}(U)\right)$ is the cohomology of

$$
\lim _{n} \mathcal{F}_{n}^{m-2}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m-1}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m}(U) \rightarrow \lim _{n} \mathcal{F}_{n}^{m+1}(U)
$$

in the third spot from the left. By assumptions (2)(a) and (2)(b) we may apply More on Algebra, Lemma 15.68 .2 to conclude that

$$
H^{m}\left(\mathcal{F}^{\bullet}(U)\right)=\lim H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)
$$

By assumption (2)(c) we conclude

$$
H^{m}\left(\mathcal{F}^{\bullet}(U)\right)=H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)
$$

for all $n \geq n_{0}$. By assumption (1) we conclude that the sheafification of $U \mapsto$ $H^{m}\left(\mathcal{F}^{\bullet}(U)\right)$ is equal to the sheafification of $U \mapsto H^{m}\left(\mathcal{F}_{n}^{\bullet}(U)\right)$ for all $n \geq n_{0}$. Thus the inverse system of sheaves $H^{m}\left(\mathcal{F}_{n}^{\bullet}\right)$ is constant for $n \geq n_{0}$ with value $H^{m}\left(\mathcal{F}^{\bullet}\right)$ which proves the lemma.

The construction above can be used in the following setting. Let $\mathcal{C}$ be a category. Let $\operatorname{Cov}(\mathcal{C}) \supset \operatorname{Cov}^{\prime}(\mathcal{C})$ be two ways to endow $\mathcal{C}$ with the structure of a site. Denote $\tau$ the topology corresponding to $\operatorname{Cov}(\mathcal{C})$ and $\tau^{\prime}$ the topology corresponding to $\operatorname{Cov}^{\prime}(\mathcal{C})$. Then the identity functor on $\mathcal{C}$ defines a morphism of sites

$$
\epsilon: \mathcal{C}_{\tau} \longrightarrow \mathcal{C}_{\tau^{\prime}}
$$

where $\epsilon_{*}$ is the identity functor on underlying presheaves and where $\epsilon^{-1}$ is the $\tau$ sheafification of a $\tau^{\prime}$-sheaf (hence clearly exact). Let $\mathcal{O}$ be a sheaf of rings for the $\tau$-topology. Then $\mathcal{O}$ is also a sheaf for the $\tau^{\prime}$-topology and $\epsilon$ becomes a morphism of ringed sites

$$
\epsilon:\left(\mathcal{C}_{\tau}, \mathcal{O}_{\tau}\right) \longrightarrow\left(\mathcal{C}_{\tau^{\prime}}, \mathcal{O}_{\tau^{\prime}}\right)
$$

In this situation we can sometimes point out subcategories of $D\left(\mathcal{O}_{\tau}\right)$ and $D\left(\mathcal{O}_{\tau^{\prime}}\right)$ which are identified by the functors $\epsilon^{*}$ and $R \epsilon_{*}$.

07A8 Lemma 21.22.3. With $\epsilon:\left(\mathcal{C}_{\tau}, \mathcal{O}_{\tau}\right) \longrightarrow\left(\mathcal{C}_{\tau^{\prime}}, \mathcal{O}_{\tau^{\prime}}\right)$ as above. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Let $\mathcal{A} \subset \operatorname{PMod}(\mathcal{O})$ be a full subcategory. Assume
(1) every object of $\mathcal{A}$ is a sheaf for the $\tau$-topology,
(2) $\mathcal{A}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\tau}\right)$,
(3) every object of $\mathcal{C}$ has a $\tau^{\prime}$-covering whose members are elements of $\mathcal{B}$, and
(4) for every $U \in \mathcal{B}$ we have $H_{\tau}^{p}(U, \mathcal{F})=0, p>0$ for all $\mathcal{F} \in \mathcal{A}$.

Then $\mathcal{A}$ is a weak Serre subcategory of $\operatorname{Mod}\left(\mathcal{O}_{\tau}\right)$ and there is an equivalence of triangulated categories $D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right)=D_{\mathcal{A}}\left(\mathcal{O}_{\tau^{\prime}}\right)$ given by $\epsilon^{*}$ and $R \epsilon_{*}$.

Proof. Note that for $A \in \mathcal{A}$ we can think of $A$ as a sheaf in either topology and (abusing notation) that $\epsilon_{*} A=A$ and $\epsilon^{*} A=A$. Consider an exact sequence

$$
A_{0} \rightarrow A_{1} \rightarrow A_{2} \rightarrow A_{3} \rightarrow A_{4}
$$

in $\operatorname{Mod}\left(\mathcal{O}_{\tau^{\prime}}\right)$ with $A_{0}, A_{1}, A_{3}, A_{4}$ in $\mathcal{A}$. We have to show that $A_{2}$ is an element of $\mathcal{A}$, see Homology, Definition 12.9.1. Apply the exact functor $\epsilon^{*}=\epsilon^{-1}$ to conclude that $\epsilon^{*} A_{2}$ is an object of $\mathcal{A}$. Consider the map of sequences

to conclude that $A_{2}=\epsilon_{*} \epsilon^{*} A_{2}$ is an object of $\mathcal{A}$. At this point it makes sense to talk about the derived categories $D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right)$ and $D_{\mathcal{A}}\left(\mathcal{O}_{\tau^{\prime}}\right)$, see Derived Categories, Section 13.13 .

Since $\epsilon^{*}$ is exact and preserves $\mathcal{A}$, it is clear that we obtain a functor $\epsilon^{*}: D_{\mathcal{A}}\left(\mathcal{O}_{\tau^{\prime}}\right) \rightarrow$ $D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right)$. We claim that $R \epsilon_{*}$ is a quasi-inverse. Namely, let $\mathcal{F}^{\bullet}$ be an object of $D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right)$. Construct a map $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}=\lim \mathcal{I}_{n}^{\bullet}$ as in 21.22.0.1. . By Lemma 21.22.1 and assumption (4) we see that $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ is a quasi-isomorphism. Then

$$
R \epsilon_{*} \mathcal{F}^{\bullet}=\epsilon_{*} \mathcal{I}^{\bullet}=\lim _{n} \epsilon_{*} \mathcal{I}_{n}^{\bullet}
$$

For every $U \in \mathcal{B}$ we have

$$
H^{m}\left(\epsilon_{*} \mathcal{I}_{n}^{\bullet}(U)\right)=H^{m}\left(\mathcal{I}_{n}^{\bullet}(U)\right)=\left\{\begin{array}{clc}
H^{m}\left(\mathcal{F}^{\bullet}\right)(U) & \text { if } & m \geq-n \\
0 & \text { if } & m<n
\end{array}\right.
$$

by the assumed vanishing of (4), the spectral sequence Derived Categories, Lemma 13.21.3. and the fact that $\tau_{\geq-n} \mathcal{F}^{\bullet} \rightarrow \mathcal{I}_{n}^{\bullet}$ is a quasi-isomorphism. The maps $\epsilon_{*} \mathcal{I}_{n+1}^{\bullet} \rightarrow \epsilon_{*} \mathcal{I}_{n}^{\bullet}$ are termwise split surjections as $\epsilon_{*}$ is a functor. Hence we can apply Homology, Lemma 12.27 .7 to the sequence of complexes

$$
\lim _{n} \epsilon_{*} \mathcal{I}_{n}^{m-2}(U) \rightarrow \lim _{n} \epsilon_{*} \mathcal{I}_{n}^{m-1}(U) \rightarrow \lim _{n} \epsilon_{*} \mathcal{I}_{n}^{m}(U) \rightarrow \lim _{n} \epsilon_{*} \mathcal{I}_{n}^{m+1}(U)
$$

to conclude that $H^{m}\left(\epsilon_{*} \mathcal{I}^{\bullet}(U)\right)=H^{m}\left(\mathcal{F}^{\bullet}\right)(U)$ for $U \in \mathcal{B}$. Sheafifying and using property (3) this proves that $H^{m}\left(\epsilon_{*} \mathcal{I}^{\bullet}\right)$ is isomorphic to $\epsilon_{*} H^{m}\left(\mathcal{F}^{\bullet}\right)$, i.e., is an object of $\mathcal{A}$. Thus $R \epsilon_{*}$ indeed gives rise to a functor

$$
R \epsilon_{*}: D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right) \longrightarrow D_{\mathcal{A}}\left(\mathcal{O}_{\tau^{\prime}}\right)
$$

For $\mathcal{F}^{\bullet} \in D_{\mathcal{A}}\left(\mathcal{O}_{\tau}\right)$ the adjunction map $\epsilon^{*} R \epsilon_{*} \mathcal{F}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ is a quasi-isomorphism as we've seen above that the cohomology sheaves of $R \epsilon_{*} \mathcal{F}^{\bullet}$ are $\epsilon_{*} H^{m}\left(\mathcal{F}^{\bullet}\right)$. For $\mathcal{G}^{\bullet} \in D_{\mathcal{A}}\left(\mathcal{O}_{\tau^{\prime}}\right)$ the adjunction map $\mathcal{G}^{\bullet} \rightarrow R \epsilon_{*} \epsilon^{*} \mathcal{G}^{\bullet}$ is a quasi-isomorphism for the same reason, i.e., because the cohomology sheaves of $R \epsilon_{*} \epsilon^{*} \mathcal{G}^{\bullet}$ are isomorphic to $\epsilon_{*} H^{m}\left(\epsilon^{*} \mathcal{G}\right)=H^{m}\left(\mathcal{G}^{\bullet}\right)$.

### 21.23. Cohomology on Hausdorff and locally quasi-compact spaces

09 WY We continue our convention to say "Hausdorff and locally quasi-compact" instead of saying "locally compact" as is often done in the literature. Let $L C$ denote the category whose objects are Hausdorff and locally quasi-compact topological spaces and whose morphisms are continuous maps.
09WZ Lemma 21.23.1. The category LC has fibre products and a final object and hence has arbitrary finite limits. Given morphisms $X \rightarrow Z$ and $Y \rightarrow Z$ in LC with $X$ and $Y$ quasi-compact, then $X \times_{Z} Y$ is quasi-compact.
Proof. The final object is the singleton space. Given morphisms $X \rightarrow Z$ and $Y \rightarrow Z$ of $L C$ the fibre product $X \times_{Z} Y$ is a subspace of $X \times Y$. Hence $X \times_{Z} Y$ is Hausdorff as $X \times Y$ is Hausdorff by Topology, Section 5.3 .
If $X$ and $Y$ are quasi-compact, then $X \times Y$ is quasi-compact by Topology, Theorem 5.13.4. Since $X \times{ }_{Z} Y$ is a closed subset of $X \times Y$ (Topology, Lemma 5.3.4) we find that $X \times{ }_{Z} Y$ is quasi-compact by Topology, Lemma 5.11.3.
Finally, returning to the general case, if $x \in X$ and $y \in Y$ we can pick quasicompact neighbourhoods $x \in E \subset X$ and $y \in F \subset Y$ and we find that $E \times_{Z} F$ is a quasi-compact neighbourhood of $(x, y)$ by the result above. Thus $X \times_{Z} Y$ is an object of $L C$ by Topology, Lemma 5.12 .2 .

We can endow $L C$ with a stronger topology than the usual one.
09X0 Definition 21.23.2. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}$ be a family of morphisms with fixed target in the category $L C$. We say this family is a qc covering ${ }^{3}$ if for every $x \in X$ there exist $i_{1}, \ldots, i_{n} \in I$ and quasi-compact subsets $E_{j} \subset X_{i_{j}}$ such that $\bigcup f_{i_{j}}\left(E_{j}\right)$ is a neighbourhood of $x$.
Observe that an open covering $X=\bigcup U_{i}$ of an object of $L C$ gives a qc covering $\left\{U_{i} \rightarrow X\right\}$ because $X$ is locally quasi-compact. We start with the obligatory lemma.
09X1 Lemma 21.23.3. Let $X$ be a Hausdorff and locally quasi-compact space, in other words, an object of LC.
(1) If $X^{\prime} \rightarrow X$ is an isomorphism in LC then $\left\{X^{\prime} \rightarrow X\right\}$ is a qc covering.
(2) If $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ is a qc covering and for each $i$ we have a qc covering $\left\{g_{i j}: X_{i j} \rightarrow X_{i}\right\}_{j \in J_{i}}$, then $\left\{X_{i j} \rightarrow X\right\}_{i \in I, j \in J_{i}}$ is a qc covering.
(3) If $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ is a qc covering and $X^{\prime} \rightarrow X$ is a morphism of $L C$ then $\left\{X^{\prime} \times_{X} X_{i} \rightarrow X^{\prime}\right\}_{i \in I}$ is a qc covering.
Proof. Part (1) holds by the remark above that open coverings are qc coverings.
Proof of (2). Let $x \in X$. Choose $i_{1}, \ldots, i_{n} \in I$ and $E_{a} \subset X_{i_{a}}$ quasi-compact such that $\bigcup f_{i_{a}}\left(E_{a}\right)$ is a neighbourhood of $x$. For every $e \in E_{a}$ we can find a finite subset $J_{e} \subset J_{i_{a}}$ and quasi-compact $F_{e, j} \subset X_{i j}, j \in J_{e}$ such that $\bigcup g_{i j}\left(F_{e, j}\right)$ is a neighbourhood of $e$. Since $E_{a}$ is quasi-compact we find a finite collection $e_{1}, \ldots, e_{m_{a}}$ such that

$$
E_{a} \subset \bigcup_{k=1, \ldots, m_{a}} \bigcup_{j \in J_{e_{k}}} g_{i j}\left(F_{e_{k}, j}\right)
$$

Then we find that

[^56]is a neighbourhood of $x$.
Proof of (3). Let $x^{\prime} \in X^{\prime}$ be a point. Let $x \in X$ be its image. Choose $i_{1}, \ldots, i_{n} \in I$ and quasi-compact subsets $E_{j} \subset X_{i_{j}}$ such that $\bigcup f_{i_{j}}\left(E_{j}\right)$ is a neighbourhood of $x$. Choose a quasi-compact neighbourhood $F \subset X^{\prime}$ of $x^{\prime}$ which maps into the quasi-compact neighbourhood $\bigcup f_{i_{j}}\left(E_{j}\right)$ of $x$. Then $F \times_{X} E_{j} \subset X^{\prime} \times_{X} X_{i_{j}}$ is a quasi-compact subset and $F$ is the image of the map $\coprod F \times_{X} E_{j} \rightarrow F$. Hence the base change is a qc covering and the proof is finished.

Besides some set theoretic issues the lemma above shows that $L C$ with the collection of qc coverings forms a site. We will denote this site (suitably modified to overcome the set theoretical issues) $L C_{q c}$.

09X2 Remark 21.23.4 (Set theoretic issues). The category $L C$ is a "big" category as its objects form a proper class. Similarly, the coverings form a proper class. Let us define the size of a topological space $X$ to be the cardinality of the set of points of $X$. Choose a function Bound on cardinals, for example as in Sets, Equation (3.9.1.1). Finally, let $S_{0}$ be an initial set of objects objects of $L C$, for example $S_{0}=\{(\mathbf{R}$, euclidean topology $)\}$. Exactly as in Sets, Lemma 3.9.2 we can choose a limit ordinal $\alpha$ such that $L C_{\alpha}=L C \cap V_{\alpha}$ contains $S_{0}$ and is preserved under all countable limits and colimits which exist in $L C$. Moreover, if $X \in L C_{\alpha}$ and if $Y \in L C$ and $\operatorname{size}(Y) \leq \operatorname{Bound}(\operatorname{size}(X))$, then $Y$ is isomorphic to an object of $L C_{\alpha}$. Next, we apply Sets, Lemma 3.11.1 to choose set Cov of qc covering on $L C_{\alpha}$ such that every qc covering in $L C_{\alpha}$ is combinatorially equivalent to a covering this set. In this way we obtain a site $\left(L C_{\alpha}, \operatorname{Cov}\right)$ which we will denote $L C_{q c}$.

There is a second topology on the site $L C_{q c}$ of Remark 21.23.4 Namely, given an object $X$ we can consider all coverings $\left\{X_{i} \rightarrow X\right\}$ of $L C_{q c}$ such that $X_{i} \rightarrow X$ is an open immersion. We denote this site $L C_{Z a r}$. The identity functor $L C_{Z a r} \rightarrow L C_{q c}$ is continuous and defines a morphism of sites

$$
\epsilon: L C_{q c} \rightarrow L C_{Z a r}
$$

by an application of Sites, Proposition 7.15.6.
Consider an object $X$ of the site $L C_{q c}$ constructed in Remark 21.23.4. (Translation for those not worried about set theoretic issues: Let $X$ be a Hausdorff and locally quasi-compact space.) Let $X_{Z a r}$ be the site whose objects are opens of $X$, see Sites, Example 7.6.4 There is a morphism of sites

$$
\pi: L C_{Z a r} / X \rightarrow X_{Z a r}
$$

given by the continuous functor

$$
X_{Z a r} \longrightarrow L C_{Z a r} / X, \quad U \longmapsto U
$$

Namely, $X_{Z a r}$ has fibre products and a final object and the functor above commutes with these and Sites, Proposition 7.15 .6 applies.
09X3 Lemma 21.23.5. Let $X$ be an object of $L C_{q c}$. Let $\mathcal{F}$ be a sheaf on $X_{Z a r}$. Then the sheaf $\pi^{-1} \mathcal{F}$ on $L C_{Z a r} / X$ is given by the rule

$$
\pi^{-1} \mathcal{F}(Y)=\Gamma\left(Y_{Z a r}, f^{-1} \mathcal{F}\right)
$$

for $f: Y \rightarrow X$ in $L C_{q c}$. Moreover $\pi^{-1} \mathcal{F}$ is a sheaf for the qc topology, i.e., the sheaf $\epsilon^{-1} \pi^{-1} \mathcal{F}$ on $L C_{q c}$ is given by the same formula.

Proof. Of course the pullback $f^{-1}$ on the right hand side indicates usual pullback of sheaves on topological spaces (Sites, Example 7.15.2. The equality of the lemma follows directly from the defintions.
Let $\mathcal{V}=\left\{g_{i}: Y_{i} \rightarrow Y\right\}_{i \in I}$ be a covering of $L C_{q c} / X$. It suffices to show that $\pi^{-1} \mathcal{F}(Y) \rightarrow H^{0}\left(\mathcal{V}, \pi^{-1} \mathcal{F}\right)$ is an isomorphism, see Sites, Section 7.10 . We first point out that the map is injective as a qc covering is surjective and we can detect equality of sections at stalks (use Sheaves, Lemmas 6.11.1 and 6.21.4). Thus we see that $\pi^{-1} \mathcal{F}$ is a separated presheaf on $L C_{q c}$ hence it suffices to show that any element $\left(s_{i}\right) \in H^{0}\left(\mathcal{V}, \pi^{-1} \mathcal{F}\right)$ maps to an element in the image of $\pi^{-1} \mathcal{F}(Y)$ after replacing $\mathcal{V}$ by a refinement (Sites, Theorem 7.10.10).

Observe that $\left.\pi^{-1} \mathcal{F}\right|_{Y_{i, Z_{a r}}}$ is the pullback of $f^{-1} \mathcal{F}=\left.\pi^{-1} \mathcal{F}\right|_{Y_{Z a r}}$ under the continuous map $g_{i}: Y_{i} \rightarrow Y$. Thus we can choose an open covering $Y_{i}=\bigcup V_{i j}$ such that for each $j$ there is an open $W_{i j} \subset Y$ and a section $t_{i j} \in \pi^{-1} \mathcal{F}\left(W_{i j}\right)$ such that $\left.s\right|_{U_{i j}}$ is the pullback of $t_{i j}$. In other words, after refining the covering $\left\{Y_{i} \rightarrow Y\right\}$ we may assume there are opens $W_{i} \subset Y$ such that $Y_{i} \rightarrow Y$ factors through $W_{i}$ and sections $t_{i}$ of $\pi^{-1} \mathcal{F}$ over $W_{i}$ which restrict to the given sections $s_{i}$. Moreover, if $y \in Y$ is in the image of both $Y_{i} \rightarrow Y$ and $Y_{j} \rightarrow Y$, then the images $t_{i, y}$ and $t_{j, y}$ in the stalk $f^{-1} \mathcal{F}_{y}$ agree (because $s_{i}$ and $s_{j}$ agree over $Y_{i} \times_{Y} Y_{j}$ ). Thus for $y \in Y$ there is a well defined element $t_{y}$ of $f^{-1} \mathcal{F}_{y}$ agreeing with $t_{i, y}$ whenever $y \in Y_{i}$. We will show that the element $\left(t_{y}\right)$ comes from a global section of $f^{-1} \mathcal{F}$ over $Y$ which will finish the proof of the lemma.

It suffices to show that this is true locally on $Y$, see Sheaves, Section 6.17. Let $y_{0} \in Y$. Pick $i_{1}, \ldots, i_{n} \in I$ and quasi-compact subsets $E_{j} \subset Y_{i_{j}}$ such that $\bigcup g_{i_{j}}\left(E_{j}\right)$ is a neighbourhood of $y_{0}$. Then we can find an open neighbourhood $V \subset Y$ of $y_{0}$ contained in $W_{i_{1}} \cap \ldots \cap W_{i_{n}}$ such that the sections $\left.t_{i_{j}}\right|_{V}, j=1, \ldots, n$ agree. Hence we see that $\left(t_{y}\right)_{y \in V}$ comes from this section and the proof is finished.

09X4 Lemma 21.23.6. Let $X$ be an object of $L C_{q c}$. Let $\mathcal{F}$ be an abelian sheaf on $X_{Z a r}$. Then we have

$$
H^{q}\left(X_{Z a r}, \mathcal{F}\right)=H^{q}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)
$$

In particular, if $A$ is an abelian group, then we have $H^{q}(X, \underline{A})=H^{q}\left(L C_{q c} / X, \underline{A}\right)$.
Proof. The statement is more precisely that the canonical map

$$
H^{q}\left(X_{Z a r}, \mathcal{F}\right) \longrightarrow H^{q}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)
$$

is an isomorphism for all $q$. The result holds for $q=0$ by Lemma 21.23.5. We argue by induction on $q$. Pick $q_{0}>0$. We will assume the result holds for $q<q_{0}$ and prove it for $q_{0}$.
Injective. Let $\xi \in H^{q_{0}}(X, \mathcal{F})$. We may choose an open covering $\mathcal{U}: X=\bigcup U_{i}$ such that $\left.\xi\right|_{U_{i}}$ is zero for all $i$ (Cohomology, Lemma 20.8.2). Then $\mathcal{U}$ is also a covering for the qc topology. Hence we obtain a map

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right) \longrightarrow E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}\left(\epsilon^{-1} \pi^{-1} \mathcal{F}\right)\right)
$$

between the spectral sequences of Cohomology, Lemma 20.12.5 and Lemma 21.11.6. Since the maps $\left.\underline{H}^{q}(\mathcal{F})\left(U_{i_{0} \ldots i_{p}}\right) \rightarrow \underline{H}^{q}\left(\epsilon^{-1} \pi^{-1} \mathcal{F}\right)\right)\left(U_{i_{0} \ldots i_{p}}\right)$ are isomorphisms for $q<q_{0}$ we see that

$$
\operatorname{Ker}\left(H^{q_{0}}(X, \mathcal{F}) \rightarrow \prod H^{q_{0}}\left(U_{i}, \mathcal{F}\right)\right)
$$

maps isomorphically to the corresponding subgroup of $H^{q_{0}}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)$. In this way we conclude that our map is injective for $q_{0}$.

Surjective. Let $\xi \in H^{q_{0}}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)$. If for every $x \in X$ we can find a neighbourhood $x \in U \subset X$ such that $\left.\xi\right|_{U}=0$, then we can use the Čech complex argument of the previous paragraph to conclude that $\xi$ is in the image of our map. Fix $x \in X$. We can find a qc covering $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ such that $\left.\xi\right|_{X_{i}}$ is zero (Lemma 21.8.3). Pick $i_{1}, \ldots, i_{n} \in I$ and $E_{j} \subset X_{i_{j}}$ such that $\bigcup f_{i_{j}}\left(E_{j}\right)$ is a neighbourhood of $x$. We may replace $X$ by $\bigcup f_{i_{j}}\left(E_{j}\right)$ and set $Y=\coprod E_{i_{j}}$. Then $Y \rightarrow X$ is a surjective continuous map of Hausdorff and quasi-compact topological spaces, $\xi \in H^{q_{0}}\left(L C_{q c} / X, \epsilon^{-1} \pi^{-1} \mathcal{F}\right)$, and $\left.\xi\right|_{Y}=0$. Set $Y_{p}=Y \times_{X} \ldots \times_{X} Y(p+1-$ factors) and denote $\mathcal{F}_{p}$ the pullback of $\mathcal{F}$ to $Y_{p}$. Then the spectral sequence

$$
E_{1}^{p, q}=\check{C}^{p}\left(\{Y \rightarrow X\}, \underline{H}^{q}\left(\epsilon^{-1} \pi^{-1} \mathcal{F}\right)\right)
$$

of Lemma 21.11.6 has rows for $q<q_{0}$ which are (by induction) the complexes

$$
H^{q}\left(Y_{0}, \mathcal{F}_{0}\right) \rightarrow H^{q}\left(Y_{1}, \mathcal{F}_{1}\right) \rightarrow H^{q}\left(Y_{2}, \mathcal{F}_{2}\right) \rightarrow \ldots
$$

If these complexes were exact in degree $p=q_{0}-q$, then the spectral sequence would show that $\xi$ is zero. This is not true in general, but we don't need to show $\xi$ is zero, we just need to show $\xi$ becomes zero after restricting $X$ to a neighbourhood of $x$. Thus it suffices to show that the complexes

$$
\operatorname{colim}_{x \in U \subset X}\left(H^{q}\left(Y_{0} \times_{X} U, \mathcal{F}_{0}\right) \rightarrow H^{q}\left(Y_{1} \times_{X} U, \mathcal{F}_{1}\right) \rightarrow H^{q}\left(Y_{2} \times_{X} U, \mathcal{F}_{2}\right) \rightarrow \ldots\right)
$$

are exact (some details omitted). By the proper base change theorem in topology (for example Cohomology, Lemma 20.19.1) the colimit is equal to

$$
H^{q}\left(Y_{x}, \underline{\mathcal{F}_{x}}\right) \rightarrow H^{q}\left(Y_{x}^{2}, \underline{\mathcal{F}_{x}}\right) \rightarrow H^{q}\left(Y_{x}^{3}, \underline{\mathcal{F}_{x}}\right) \rightarrow \ldots
$$

where $Y_{x} \subset Y$ is the fibre of $Y \rightarrow X$ over $x$ and where $\mathcal{F}_{x}$ denotes the constant sheaf with value $\mathcal{F}_{x}$. But the simplicial topological space $\left(Y_{x}^{n}\right)$ is homotopy equivalent to the constant simplicial space on the singleton $\{x\}$, see Simplicial, Lemma 14.26.9. Since $H^{q}\left(-, \underline{\mathcal{F}_{x}}\right)$ is a functor on the category of topological spaces, we conclude that the cosimplicial abelian group with values $H^{q}\left(Y_{x}^{n}, \underline{\mathcal{F}_{x}}\right)$ is homotopy equivalent to the constant cosimplicial abelian group with value

$$
H^{q}\left(\{x\}, \mathcal{F}_{x}\right)=\left\{\begin{array}{cc}
\mathcal{F}_{x} & \text { if } q=0 \\
0 & \text { else }
\end{array}\right.
$$

As the complex associated to a constant cosimplicial group has the required exactness properties this finishes the proof of the lemma.

09X5 Lemma 21.23.7. Let $f: X \rightarrow Y$ be a morphism of LC. If $f$ is proper and surjective, then $\{f: X \rightarrow Y\}$ is a qc covering.
Proof. Let $y \in Y$ be a point. For each $x \in X_{y}$ choose a quasi-compact neighbourhood $E_{x} \subset X$. Choose $x \in U_{x} \subset E_{x}$ open. Since $f$ is proper the fibre $X_{y}$ is quasi-compact and we find $x_{1}, \ldots, x_{n} \in X_{y}$ such that $X_{y} \subset U_{x_{1}} \cup \ldots \cup U_{x_{n}}$. We claim that $f\left(E_{x_{1}}\right) \cup \ldots \cup f\left(E_{x_{n}}\right)$ is a neighbourhood of $y$. Namely, as $f$ is closed (Topology, Theorem 5.16.5) we see that $Z=f\left(X \backslash U_{x_{1}} \cup \ldots \cup U_{x_{n}}\right)$ is a closed subset of $Y$ not containing $y$. As $f$ is surjective we see that $Y \backslash Z$ is contained in $f\left(E_{x_{1}}\right) \cup \ldots \cup f\left(E_{x_{n}}\right)$ as desired.

### 21.24. Spectral sequences for Ext

07A9 In this section we collect various spectral sequences that come up when considering the Ext functors. For any pair of complexes $\mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}$ of complexes of modules on a ringed site $(\mathcal{C}, \mathcal{O})$ we denote

$$
\operatorname{Ext}_{\mathcal{O}}^{n}\left(\mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}\right)=\operatorname{Hom}_{D(\mathcal{O})}\left(\mathcal{G}^{\bullet}, \mathcal{F}^{\bullet}[n]\right)
$$

according to our general conventions in Derived Categories, Section 13.27.
07AA Example 21.24.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{K} \cdot$ be a bounded above complex of $\mathcal{O}$-modules. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Then there is a spectral sequence with $E_{2}$-page

$$
E_{2}^{i, j}=\operatorname{Ext}_{\mathcal{O}}^{i}\left(H^{-j}\left(\mathcal{K}^{\bullet}\right), \mathcal{F}\right) \Rightarrow \operatorname{Ext}_{\mathcal{O}}^{i+j}\left(\mathcal{K}^{\bullet}, \mathcal{F}\right)
$$

and another spectral sequence with $E_{1}$-page

$$
E_{1}^{i, j}=\operatorname{Ext}_{\mathcal{O}}^{j}\left(\mathcal{K}^{-i}, \mathcal{F}\right) \Rightarrow \operatorname{Ext}_{\mathcal{O}}^{i+j}\left(\mathcal{K}^{\bullet}, \mathcal{F}\right)
$$

To construct these spectral sequences choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ and consider the two spectral sequences coming from the double complex $\operatorname{Hom}_{\mathcal{O}}\left(\mathcal{K}^{\bullet}, \mathcal{I}^{\bullet}\right)$, see Homology, Section 12.22 .

### 21.25. Hom complexes

0A8X Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{L}^{\bullet}$ and $\mathcal{M}^{\bullet}$ be two complexes of $\mathcal{O}$-modules. We construct a complex of $\mathcal{O}$-modules $\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)$. Namely, for each $n$ we set

$$
\mathcal{H o m}^{n}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)=\prod_{n=p+q} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{L}^{-q}, \mathcal{M}^{p}\right)
$$

It is a good idea to think of $\mathcal{H o m}{ }^{n}$ as the sheaf of $\mathcal{O}$-modules of all $\mathcal{O}$-linear maps from $\mathcal{L}^{\bullet}$ to $\mathcal{M}^{\bullet}$ (viewed as graded $\mathcal{O}$-modules) which are homogenous of degree $n$. In this terminology, we define the differential by the rule

$$
\mathrm{d}(f)=\mathrm{d}_{\mathcal{M}} \circ f-(-1)^{n} f \circ \mathrm{~d}_{\mathcal{L}}
$$

for $f \in \mathcal{H o m}_{\mathcal{O}}^{n}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)$. We omit the verification that $\mathrm{d}^{2}=0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have

$$
\begin{equation*}
H^{n}\left(\Gamma\left(U, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}[n]\right) \tag{21.25.0.1}
\end{equation*}
$$

for all $n \in \mathbf{Z}$ and every $U \in \operatorname{Ob}(\mathcal{C})$. Similarly, we have
0A8Z

$$
\begin{equation*}
H^{n}\left(\Gamma\left(\mathcal{C}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{K(\mathcal{O})}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}[n]\right) \tag{21.25.0.2}
\end{equation*}
$$

for the complex of global sections.
0 L90 Lemma 21.25.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}$-modules there is an isomorphism

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)\right)=\mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right), \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}$-modules functorial in $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.1.

0A91 Lemma 21.25.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \otimes_{\mathcal{O}} \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}\right)\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}$-modules.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.2.

0 A 92 Lemma 21.25.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}$-modules there is a canonical morphism

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}\right), \mathcal{M}^{\bullet}\right)
$$

of complexes of $\mathcal{O}$-modules functorial in all three complexes.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59.3.

0 A 93 Lemma 21.25.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^{\bullet}, \mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}$ of $\mathcal{O}$-modules there is a canonical morphism

$$
\mathcal{K}^{\bullet} \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)\right)
$$

of complexes of $\mathcal{O}$-modules functorial in both complexes.
Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.59 .5

0A94 Lemma 21.25.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I}^{\bullet}$ be a $K$-injective complex of $\mathcal{O}$-modules. Let $\mathcal{L}^{\bullet}$ be a complex of $\mathcal{O}$-modules. Then

$$
H^{0}\left(\Gamma\left(U, \mathcal{H o m} \cdot\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

for all $U \in \operatorname{Ob}(\mathcal{C})$. Similarly, $H^{0}\left(\Gamma\left(\mathcal{C}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}(L, M)$.
Proof. We have

$$
\begin{aligned}
H^{0}\left(\Gamma\left(U, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right) & =\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
\end{aligned}
$$

The first equality is 21.25 .0 .1 . The second equality is true because $\left.\mathcal{I}^{\bullet}\right|_{U}$ is Kinjective by Lemma 21.20.1. The proof of the last equation is similar except that it uses 21.25.0.2.

0 A95 Lemma 21.25.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(\mathcal{I}^{\prime}\right)^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ be a quasi-isomorphism of K-injective complexes of $\mathcal{O}$-modules. Let $\left(\mathcal{L}^{\prime}\right)^{\bullet} \rightarrow \mathcal{L}^{\bullet}$ be a quasi-isomorphism of complexes of $\mathcal{O}$-modules. Then

$$
\operatorname{Hom}^{\bullet}\left(\mathcal{L}^{\bullet},\left(\mathcal{I}^{\prime}\right) \bullet \mathcal{H o m}^{\bullet}\left(\left(\mathcal{L}^{\prime}\right)^{\bullet}, \mathcal{I}^{\bullet}\right)\right.
$$

is a quasi-isomorphism.
Proof. Let $M$ be the object of $D(\mathcal{O})$ represented by $\mathcal{I}^{\bullet}$ and $\left(\mathcal{I}^{\prime}\right)^{\bullet}$. Let $L$ be the object of $D(\mathcal{O})$ represented by $\mathcal{L}^{\bullet}$ and $\left(\mathcal{L}^{\prime}\right)^{\bullet}$. By Lemma 21.25 .5 we see that the sheaves

$$
H^{0}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet},\left(\mathcal{I}^{\prime}\right)^{\bullet}\right)\right) \quad \text { and } \quad H^{0}\left(\mathcal{H o m}^{\bullet}\left(\left(\mathcal{L}^{\prime}\right)^{\bullet}, \mathcal{I}^{\bullet}\right)\right)
$$

are both equal to the sheaf associated to the presheaf

$$
U \longmapsto \operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

Thus the map is a quasi-isomorphism.
0 A96 Lemma 21.25.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I}^{\bullet}$ be a K-injective complex of $\mathcal{O}$-modules. Let $\mathcal{L}^{\bullet}$ be a $K$-flat complex of $\mathcal{O}$-modules. Then $\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)$ is a $K$-injective complex of $\mathcal{O}$-modules.

Proof. Namely, if $\mathcal{K}^{\bullet}$ is an acyclic complex of $\mathcal{O}$-modules, then

$$
\begin{aligned}
\operatorname{Hom}_{K(\mathcal{O})}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right) & =H^{0}\left(\Gamma\left(\mathcal{C}, \mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)\right)\right) \\
& =H^{0}\left(\Gamma\left(\mathcal{C}, \mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right)\right)\right) \\
& =\operatorname{Hom}_{K(\mathcal{O})}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right) \\
& =0
\end{aligned}
$$

The first equality by 21.25 .0 .2 . The second equality by Lemma 21.25.1. The third equality by 21.25 .0 .2$)$. The final equality because $\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)$ is acyclic because $\mathcal{L}^{\bullet}$ is K-flat (Definition 21.17.2) and because $\mathcal{I}^{\bullet}$ is K-injective.

### 21.26. Internal hom in the derived category

08 J 7 Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $L, M$ be objects of $D(\mathcal{O})$. We would like to construct an object $R \mathcal{H o m}(L, M)$ of $D(\mathcal{O})$ such that for every third object $K$ of $D(\mathcal{O})$ there exists a canonical bijection
08J8

$$
\begin{equation*}
\operatorname{Hom}_{D(\mathcal{O})}(K, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D(\mathcal{O})}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M\right) \tag{21.26.0.1}
\end{equation*}
$$

Observe that this formula defines $R \mathcal{H o m}(L, M)$ up to unique isomorphism by the Yoneda lemma (Categories, Lemma 4.3.5.
To construct such an object, choose a K-injective complex of $\mathcal{O}$-modules $\mathcal{I} \bullet$ representing $M$ and any complex of $\mathcal{O}$-modules $\mathcal{L}^{\bullet}$ representing $L$. Then we set Then we set

$$
R \mathcal{H o m}(L, M)=\mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

where the right hand side is the complex of $\mathcal{O}$-modules constructed in Section 21.25 This is well defined by Lemma 21.25.6. We get a functor

$$
D(\mathcal{O})^{o p p} \times D(\mathcal{O}) \longrightarrow D(\mathcal{O}), \quad(K, L) \longmapsto R \mathcal{H o m}(K, L)
$$

As a prelude to proving 21.26.0.1 we compute the cohomology groups of $R \mathcal{H} \operatorname{Hom}(K, L)$.
08JA Lemma 21.26.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L$ be objects of $D(\mathcal{O})$. For every object $U$ of $\mathcal{C}$ we have

$$
H^{0}(U, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.M\right|_{U}\right)
$$

and we have $H^{0}(\mathcal{C}, R \mathcal{H o m}(L, M))=\operatorname{Hom}_{D(\mathcal{O})}(L, M)$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ of $\mathcal{O}$-modules representing $M$ and a K-flat complex $\mathcal{L}^{\bullet}$ representing $L$. Then $\operatorname{Hom}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)$ is K-injective by Lemma 21.25.7. Hence we can compute cohomology over $U$ by simply taking sections over $U$ and the result follows from Lemma 21.25.5.

08J9 Lemma 21.26.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L, M$ be objects of $D(\mathcal{O})$. With the construction as described above there is a canonical isomorphism

$$
R \mathcal{H o m}(K, R \mathcal{H o m}(L, M))=R \mathcal{H o m}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M\right)
$$

in $D(\mathcal{O})$ functorial in $K, L, M$ which recovers 21.26.0.1) on taking $H^{0}(\mathcal{C},-)$.

Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $M$ and a K-flat complex of $\mathcal{O}$-modules $\mathcal{L}^{\bullet}$ representing $L$. Let $\mathcal{H}^{\bullet}$ be the complex described above. For any complex of $\mathcal{O}$-modules $\mathcal{K}^{\bullet}$ we have

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)\right)=\mathcal{H o m}^{\bullet}\left(\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right), \mathcal{I}^{\bullet}\right)
$$

by Lemma 21.25.1 Note that the left hand side represents $R \mathcal{H o m}(K, R \mathcal{H o m}(L, M))$ (use Lemma 21.25.7) and that the right hand side represents $R \mathcal{H} o m\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M\right)$. This proves the displayed formula of the lemma. Taking global sections and using Lemma 21.26.1 we obtain 21.26.0.1.

08JB Lemma 21.26.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L$ be objects of $D(\mathcal{O})$. The construction of $R \mathcal{H o m}(K, L)$ commutes with restrictions, i.e., for every object $U$ of $\mathcal{C}$ we have $R \mathcal{H} \operatorname{lom}\left(\left.K\right|_{U},\left.L\right|_{U}\right)=\left.R \mathcal{H o m}(K, L)\right|_{U}$.

Proof. This is clear from the construction and Lemma 21.20.1

08JC Lemma 21.26.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The bifunctor $R \mathcal{H}$ om $(-,-)$ transforms distinguished triangles into distinguished triangles in both variables.

Proof. This follows from the observation that the assignment

$$
\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right) \longmapsto \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{M}^{\bullet}\right)
$$

transforms a termwise split short exact sequences of complexes in either variable into a termwise split short exact sequence. Details omitted.

0A97 Lemma 21.26.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L, M$ be objects of $D(\mathcal{O})$. There is a canonical morphism

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} K \longrightarrow R \mathcal{H o m}(R \mathcal{H o m}(K, L), M)
$$

in $D(\mathcal{O})$ functorial in $K, L, M$.
Proof. Choose a K-injective complex $\mathcal{I}^{\bullet}$ representing $M$, a K-injective complex $\mathcal{J}^{\bullet}$ representing $L$, and a K-flat complex $\mathcal{K}^{\bullet}$ representing $K$. The map is defined using the map

$$
\operatorname{Tot}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{J}^{\bullet}, \mathcal{I}^{\bullet}\right) \otimes_{\mathcal{O}} \mathcal{K}^{\bullet}\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{K}^{\bullet}, \mathcal{J}^{\bullet}\right), \mathcal{I}^{\bullet}\right)
$$

of Lemma 21.25.3. By our particular choice of complexes the left hand side represents $R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} K$ and the right hand side represents $R \mathcal{H o m}(R \mathcal{H o m}(K, L), M)$. We omit the proof that this is functorial in all three objects of $D(\mathcal{O})$.

0A98 Lemma 21.26.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given $K, L, M$ in $D(\mathcal{O})$ there is a canonical morphism

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} R \mathcal{H o m}(K, L) \longrightarrow R \mathcal{H o m}(K, M)
$$

in $D(\mathcal{O})$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 21.25.2. Instead, we use the maps

gotten by applying Lemma 21.26 .5 twice as well as the maps $\mathcal{O} \rightarrow R \mathcal{H}$ om $(K, K)$ and $\mathcal{O} \rightarrow R \mathcal{H o m}(L, L)$. Finally, we use Lemma 21.26 .2 to translate the composition

$$
R \mathcal{H o m}(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} R \mathcal{H o m}(K, L) \otimes_{\mathcal{O}}^{\mathbf{L}} K \longrightarrow M
$$

into a map as in the statement of the lemma.
0 A99 Lemma 21.26.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given $K, L$ in $D(\mathcal{O})$ there is a canonical morphism

$$
K \longrightarrow R \mathcal{H o m}\left(L, K \otimes_{\mathcal{O}}^{\mathbf{L}} L\right)
$$

in $D(\mathcal{O})$ functorial in both $K$ and $L$.
Proof. Choose K-flat complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$ represeting $K$ and $L$. Choose a Kinjective complex $\mathcal{I}^{\bullet}$ and a quasi-isomorphism $\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right) \rightarrow \mathcal{I}^{\bullet}$. Then we use

$$
\mathcal{K}^{\bullet} \rightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{L}^{\bullet}, \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right)\right) \rightarrow \operatorname{Hom}^{\bullet}\left(\mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

where the first map comes from Lemma 21.25.4.
08JD Lemma 21.26.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $L$ be an object of $D(\mathcal{O})$. Set $L^{\vee}=R \mathcal{H o m}(L, \mathcal{O})$. For $M$ in $D(\mathcal{O})$ there is a canonical map

08JE (21.26.8.1)

$$
L^{\vee} \otimes_{\mathcal{O}}^{\mathbf{L}} M \longrightarrow R \mathcal{H o m}(L, M)
$$

which induces a canonical map

$$
H^{0}\left(\mathcal{C}, L^{\vee} \otimes_{\mathcal{O}}^{\mathbf{L}} M\right) \longrightarrow \operatorname{Hom}_{D(\mathcal{O})}(L, M)
$$

functorial in $M$ in $D(\mathcal{O})$.
Proof. The map 21.26 .8 .1 is a special case of Lemma 21.26 .6 using the identification $M=R \mathcal{H o m}(\mathcal{O}, M)$.

0B6D Remark 21.26.9. Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $K, L$ be objects of $D\left(\mathcal{O}_{\mathcal{C}}\right)$. We claim there is a canonical map

$$
R f_{*} R \mathcal{H o m}(L, K) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, R f_{*} K\right)
$$

Namely, by 21.26.0.1 this is the same thing as a map $R f_{*} R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}}$ $R f_{*} L \rightarrow R f_{*} K$. For this we can use the composition

$$
R f_{*} R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} R f_{*} L \rightarrow R f_{*}\left(R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L\right) \rightarrow R f_{*} K
$$

where the first arrow is the relative cup product (Remark 21.19.3) and the second arrow is $R f_{*}$ applied to the canonical map $R \mathcal{H o m}(L, K) \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L \rightarrow K$ coming from Lemma 21.26.6 (with $\mathcal{O}_{\mathcal{C}}$ in one of the spots).

08JF Remark 21.26.10. Let $h:(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ be a morphism of ringed topoi. Let $K, L$ be objects of $D\left(\mathcal{O}^{\prime}\right)$. We claim there is a canonical map

$$
L h^{*} R \mathcal{H o m}(K, L) \longrightarrow R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
$$

in $D(\mathcal{O})$. Namely, by 21.26.0.1 proved in Lemma 21.26 .2 such a map is the same thing as a map

$$
L h^{*} R \mathcal{H o m}(K, L) \otimes^{\mathbf{L}} L h^{*} K \longrightarrow L h^{*} L
$$

The source of this arrow is $L h^{*}\left(\mathcal{H o m}(K, L) \otimes^{\mathbf{L}} K\right)$ by Lemma 21.18.4 hence it suffices to construct a canonical map

$$
R \mathcal{H o m}(K, L) \otimes^{\mathbf{L}} K \longrightarrow L
$$

For this we take the arrow corresponding to

$$
\text { id }: R \mathcal{H o m}(K, L) \longrightarrow R \mathcal{H o m}(K, L)
$$

via 21.26.0.1.
08JG Remark 21.26.11. Suppose that

is a commutative diagram of ringed topoi. Let $K, L$ be objects of $D\left(\mathcal{O}_{\mathcal{C}}\right)$. We claim there exists a canonical base change map

$$
L g^{*} R f_{*} R \mathcal{H o m}(K, L) \longrightarrow R\left(f^{\prime}\right)_{*} R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
$$

in $D\left(\mathcal{O}_{\mathcal{D}^{\prime}}\right)$. Namely, we take the map adjoint to the composition

$$
\begin{aligned}
L\left(f^{\prime}\right)^{*} L g^{*} R f_{*} R \mathcal{H o m}(K, L) & =L h^{*} L f^{*} R f_{*} R \mathcal{H o m}(K, L) \\
& \rightarrow L h^{*} R \mathcal{H o m}(K, L) \\
& \rightarrow R \mathcal{H o m}\left(L h^{*} K, L h^{*} L\right)
\end{aligned}
$$

where the first arrow uses the adjunction mapping $L f^{*} R f_{*} \rightarrow$ id and the second arrow is the canonical map constructed in Remark 21.26 .10

### 21.27. Global derived hom

0 B 6 E Let $(S h(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $K, L \in D(\mathcal{O})$. Using the construction of the internal hom in the derived category we obtain a well defined object

$$
R \operatorname{Hom}(K, L)=R \Gamma(X, R \mathcal{H o m}(K, L))
$$

in $D(\Gamma(\mathcal{C}, \mathcal{O}))$. We will sometimes write $R \operatorname{Hom}_{\mathcal{O}}(K, L)$ for this object. By Lemma 21.26.1 we have

$$
H^{0}(R \operatorname{Hom}(K, L))=\operatorname{Hom}_{D(\mathcal{O})}(K, L)
$$

and

$$
H^{p}(R \operatorname{Hom}(K, L))=\operatorname{Ext}_{D(\mathcal{O})}^{p}(K, L)
$$

### 21.28. Derived lower shriek

07 AB In this section we study some situations where besides $L f^{*}$ and $R f_{*}$ there also a derived functor $L f_{!}$.

07AC Lemma 21.28.1. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous and cocontinuous functor of sites which induces a morphism of topoi $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$. Let $\mathcal{O}_{\mathcal{D}}$ be a sheaf of rings and set $\mathcal{O}_{\mathcal{C}}=g^{-1} \mathcal{O}_{\mathcal{D}}$. The functor $g_{!}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{D}}\right)$ (see Modules on Sites, Lemma 18.40.1) has a left derived functor

$$
L g_{!}: D\left(\mathcal{O}_{\mathcal{C}}\right) \longrightarrow D\left(\mathcal{O}_{\mathcal{D}}\right)
$$

which is left adjoint to $g^{*}$. Moreover, for $U \in \operatorname{Ob}(\mathcal{C})$ we have

$$
L g_{!}\left(j_{U!} \mathcal{O}_{U}\right)=g_{!} j_{U!} \mathcal{O}_{U}=j_{u(U)!} \mathcal{O}_{u(U)}
$$

where $j_{U!}$ and $j_{u(U)}$ ! are extension by zero associated to the localization morphism $j_{U}: \mathcal{C} / U \rightarrow \mathcal{C}$ and $j_{u(U)}: \mathcal{D} / u(U) \rightarrow \mathcal{D}$.

Proof. We are going to use Derived Categories, Proposition 13.28 .2 to construct $L g_{!}$. To do this we have to verify assumptions (1), (2), (3), (4), and (5) of that proposition. First, since $g$ ! is a left adjoint we see that it is right exact and commutes with all colimits, so (5) holds. Conditions (3) and (4) hold because the category of modules on a ringed site is a Grothendieck abelian category. Let $\mathcal{P} \subset \operatorname{Ob}\left(\operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)\right)$ be the collection of $\mathcal{O}_{\mathcal{C}}$-modules which are direct sums of modules of the form $j_{U!} \mathcal{O}_{U}$. Note that $g_{!} j_{U!} \mathcal{O}_{U}=j_{u(U)!} \mathcal{O}_{u(U)}$, see proof of Modules on Sites, Lemma 18.40.1. Every $\mathcal{O}_{\mathcal{C}}$-module is a quotient of an object of $\mathcal{P}$, see Modules on Sites, Lemma 18.28.6. Thus (1) holds. Finally, we have to prove (2). Let $\mathcal{K}^{\bullet}$ be a bounded above acyclic complex of $\mathcal{O}_{\mathcal{C}}$-modules with $\mathcal{K}^{n} \in \mathcal{P}$ for all $n$. We have to show that $g!\mathcal{K}^{\bullet}$ is exact. To do this it suffices to show, for every injective $\mathcal{O}_{\mathcal{D}}$-module $\mathcal{I}$ that

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g_{!} \mathcal{K}^{\bullet}, \mathcal{I}[n]\right)=0
$$

for all $n \in \mathbf{Z}$. Since $\mathcal{I}$ is injective we have

$$
\begin{aligned}
\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g!\mathcal{K}^{\bullet}, \mathcal{I}[n]\right) & =\operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g!\mathcal{K}^{\bullet}, \mathcal{I}[n]\right) \\
& =H^{n}\left(\operatorname{Hom}_{\mathcal{O}_{\mathcal{D}}}\left(g!\mathcal{K}^{\bullet}, \mathcal{I}\right)\right) \\
& =H^{n}\left(\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(\mathcal{K}^{\bullet}, g^{-1} \mathcal{I}\right)\right)
\end{aligned}
$$

the last equality by the adjointness of $g_{!}$and $g^{-1}$.
The vanishing of this group would be clear if $g^{-1} \mathcal{I}$ were an injective $\mathcal{O}_{\mathcal{C}}$-module. But $g^{-1} \mathcal{I}$ isn't necessarily an injective $\mathcal{O}_{\mathcal{C}}$-module as $g_{!}$isn't exact in general. We do know that

$$
\operatorname{Ext}_{\mathcal{O}_{\mathcal{C}}}^{p}\left(j_{U!} \mathcal{O}_{U}, g^{-1} \mathcal{I}\right)=H^{p}\left(U, g^{-1} \mathcal{I}\right)=0 \text { for } p \geq 1
$$

Namely, the first equality follows from $\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(j_{U!} \mathcal{O}_{U}, \mathcal{H}\right)=\mathcal{H}(U)$ and taking derived functors. The vanishing of $H^{p}\left(U, g^{-1} \mathcal{I}\right)$ for all $U \in \mathrm{Ob}(\mathcal{C})$ comes from the vanishing of all higher Čech cohomology groups $\check{H}^{p}\left(\mathcal{U}, g^{-1} \mathcal{I}\right)$ via Lemma 21.11.9. Namely, for a covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $\mathcal{C}$ we have $\check{H}^{p}\left(\mathcal{U}, g^{-1} \mathcal{I}\right)=\check{H}^{p}(u(\mathcal{U}), \mathcal{I})$.

Since $\mathcal{I}$ is an injective $\mathcal{O}$-module these Coh comology groups vanish, see Lemma 21.12.3. Since each $\mathcal{K}^{-q}$ is a direct sum of modules of the form $j_{U!} \mathcal{O}_{U}$ we see that

$$
\operatorname{Ext}_{\mathcal{O}_{\mathcal{C}}}^{p}\left(\mathcal{K}^{-q}, g^{-1} \mathcal{I}\right)=0 \text { for } p \geq 1 \text { and all } q
$$

Let us use the spectral sequence (see Example 21.24.1)

$$
E_{1}^{p, q}=\operatorname{Ext}_{\mathcal{O}_{\mathcal{C}}}^{p}\left(\mathcal{K}^{-q}, g^{-1} \mathcal{I}\right) \Rightarrow \operatorname{Ext}_{\mathcal{O}_{\mathcal{C}}}^{p+q}\left(\mathcal{K}^{\bullet}, g^{-1} \mathcal{I}\right)=0
$$

Note that the spectral sequence abuts to zero as $\mathcal{K}^{\bullet}$ is acyclic (hence vanishes in the derived category, hence produces vanishing ext groups). By the vanishing of higher exts proved above the only nonzero terms on the $E_{1}$ page are the terms $E_{1}^{0, q}=\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(\mathcal{K}^{-q}, g^{-1} \mathcal{I}\right)$. We conclude that the complex $\operatorname{Hom}_{\mathcal{O}_{\mathcal{C}}}\left(\mathcal{K}^{\bullet}, g^{-1} \mathcal{I}\right)$ is acyclic as desired.

Thus the left derived functor $L g_{!}$exists. We still have to show that it is left adjoint to $g^{-1}=g^{*}=R g^{*}=L g^{*}$, i.e., that we have

07AD

$$
\begin{equation*}
\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{C}}\right)}\left(\mathcal{H}^{\bullet}, g^{-1} \mathcal{E}^{\bullet}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{D}}\right)}\left(L g!\mathcal{H}^{\bullet}, \mathcal{E}^{\bullet}\right) \tag{21.28.1.1}
\end{equation*}
$$

This is actually a formal consequence of the discussion above. Choose a quasiisomorphism $\mathcal{K}^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ such that $\mathcal{K}^{\bullet}$ computes $L g_{!}$. Moreover, choose a quasiisomorphism $\mathcal{E}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ into a K-injective complex of $\mathcal{O}_{\mathcal{D}}$-modules $\mathcal{I}^{\bullet}$. Then the RHS of 21.28.1.1 is

$$
\operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g_{!} \mathcal{K}^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

On the other hand, by the definition of morphisms in the derived category the LHS of 21.28.1.1 is

$$
\begin{aligned}
\operatorname{Hom}_{D\left(\mathcal{O}_{\mathcal{C}}\right)}\left(\mathcal{K}^{\bullet}, g^{-1} \mathcal{I}^{\bullet}\right) & =\operatorname{colim}_{s: \mathcal{L} \bullet \rightarrow \mathcal{K} \bullet} \operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{C}}\right)}\left(\mathcal{L}^{\bullet}, g^{-1} \mathcal{I}^{\bullet}\right) \\
& =\operatorname{colim}_{s: \mathcal{L} \bullet \rightarrow \mathcal{K}} \bullet \operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g_{!} \mathcal{L}^{\bullet}, \mathcal{I}^{\bullet}\right)
\end{aligned}
$$

by the adjointness of $g!$ and $g^{*}$ on the level of sheaves of modules. The colimit is over all quasi-isomorphisms with target $\mathcal{K}^{\bullet}$. Since for every complex $\mathcal{L}^{\bullet}$ there exists a quasi-isomorphism $\left(\mathcal{K}^{\prime}\right)^{\bullet} \rightarrow \mathcal{L}^{\bullet}$ such that $\left(\mathcal{K}^{\prime}\right)^{\bullet}$ computes $L g_{\text {! }}$ we see that we may as well take the colimit over quasi-isomorphisms of the form $s:\left(\mathcal{K}^{\prime}\right)^{\bullet} \rightarrow \mathcal{K}^{\bullet}$ where $\left(\mathcal{K}^{\prime}\right)^{\bullet}$ computes $L g_{!}$. In this case

$$
\operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g!\mathcal{K}^{\bullet}, \mathcal{I}^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K\left(\mathcal{O}_{\mathcal{D}}\right)}\left(g_{!}\left(\mathcal{K}^{\prime}\right)^{\bullet}, \mathcal{I}^{\bullet}\right)
$$

is an isomorphism as $g!\left(\mathcal{K}^{\prime}\right)^{\bullet} \rightarrow g!\mathcal{K}^{\bullet}$ is a quasi-isomorphism and $\mathcal{I}$ • is K -injective. This finishes the proof.

07AE Remark 21.28.2. Warning! Let $u: \mathcal{C} \rightarrow \mathcal{D}, g, \mathcal{O}_{\mathcal{D}}$, and $\mathcal{O}_{\mathcal{C}}$ be as in Lemma 21.28.1. In general it is not the case that the diagram

commutes where the functor $L g_{!}^{A b}$ is the one constructed in Lemma 21.28.1 but using the constant sheaf $\mathbf{Z}$ as the structure sheaf on both $\mathcal{C}$ and $\mathcal{D}$. In general it isn't even the case that $g_{!}=g_{!}^{A b}$ (see Modules on Sites, Remark 18.40.2), but this phenomenon can occur even if $g!=g_{!}^{A b}!$ Namely, the construction of $L g_{!}$in the
proof of Lemma 21.28 .1 shows that $L g_{!}$agrees with $L g_{!}^{A b}$ if and only if the canonical maps

$$
L g_{!}^{A b} j_{U!} \mathcal{O}_{U} \longrightarrow j_{u(U)!} \mathcal{O}_{u(U)}
$$

are isomorphisms in $D(\mathcal{D})$ for all objects $U$ in $\mathcal{C}$. In general all we can say is that there exists a natural transformation

$$
L g_{!}^{A b} \circ \text { forget } \longrightarrow \text { forget } \circ L g_{!}
$$

### 21.29. Derived lower shriek for fibred categories

08 RV In this section we work out some special cases of the situation discussed in Section 21.28 . We make sure that we have equality between lower shriek on modules and sheaves of abelian groups. We encourage the reader to skip this section on a first reading.

08 P 8 Situation 21.29.1. Here $\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a ringed site and $p: \mathcal{C} \rightarrow \mathcal{D}$ is a fibred category. We endow $\mathcal{C}$ with the topology inherited from $\mathcal{D}$ (Stacks, Section 8.10). We denote $\pi: S h(\mathcal{C}) \rightarrow S h(\mathcal{D})$ the morphism of topoi associated to $p$ (Stacks, Lemma 8.10.3). We set $\mathcal{O}_{\mathcal{C}}=\pi^{-1} \mathcal{O}_{\mathcal{D}}$ so that we obtain a morphism of ringed topoi

$$
\pi:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \longrightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)
$$

08P9 Lemma 21.29.2. Assumptions and notation as in Situation 21.29.1. For $U \in$ $\mathrm{Ob}(\mathcal{C})$ consider the induced morphism of topoi

$$
\pi_{U}: \operatorname{Sh}(\mathcal{C} / U) \longrightarrow \operatorname{Sh}(\mathcal{D} / p(U))
$$

Then there exists a morphism of topoi

$$
\sigma: S h(\mathcal{D} / p(U)) \rightarrow S h(\mathcal{C} / U)
$$

such that $\pi_{U} \circ \sigma=i d$ and $\sigma^{-1}=\pi_{U, *}$.
Proof. Observe that $\pi_{U}$ is the restriction of $\pi$ to the localizations, see Sites, Lemma 7.27.4. For an object $V \rightarrow p(U)$ of $\mathcal{D} / p(U)$ denote $V \times_{p(U)} U \rightarrow U$ the strongly cartesian morphism of $\mathcal{C}$ over $\mathcal{D}$ which exists as $p$ is a fibred category. The functor

$$
v: \mathcal{D} / p(U) \rightarrow \mathcal{C} / U, \quad V / p(U) \mapsto V \times_{p(U)} U / U
$$

is continuous by the definition of the topology on $\mathcal{C}$. Moreover, it is a right adjoint to $p$ by the definition of strongly cartesian morphisms. Hence we are in the situation discussed in Sites, Section 7.21 and we see that the sheaf $\pi_{U, *} \mathcal{F}$ is equal to $V \mapsto$ $\mathcal{F}\left(V \times_{p(U)} U\right)$ (see especially Sites, Lemma 7.21.2.
But here we have more. Namely, the functor $v$ is also cocontinuous (as all morphisms in coverings of $\mathcal{C}$ are strongly cartesian). Hence $v$ defines a morphism $\sigma$ as indicated in the lemma. The equality $\sigma^{-1}=\pi_{U, *}$ is immediate from the definition. Since $\pi_{U}^{-1} \mathcal{G}$ is given by the rule $U^{\prime} / U \mapsto \mathcal{G}\left(p\left(U^{\prime}\right) / p(U)\right)$ it follows that $\sigma^{-1} \circ \pi_{U}^{-1}=\mathrm{id}$ which proves the equality $\pi_{U} \circ \sigma=\mathrm{id}$.

08PA Situation 21.29.3. Let $\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a ringed site. Let $u: \mathcal{C}^{\prime} \rightarrow \mathcal{C}$ be a 1-morphism of fibred categories over $\mathcal{D}$ (Categories, Definition 4.32.9). Endow $\mathcal{C}$ and $\mathcal{C}^{\prime}$ with their inherited topologies (Stacks, Definition 8.10.2) and let $\pi: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$, $\pi^{\prime}: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(\mathcal{D})$, and $g: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(\mathcal{C})$ be the corresponding morphisms of
topoi (Stacks, Lemma 8.10.3). Set $\mathcal{O}_{\mathcal{C}}=\pi^{-1} \mathcal{O}_{\mathcal{D}}$ and $\mathcal{O}_{\mathcal{C}^{\prime}}=\left(\pi^{\prime}\right)^{-1} \mathcal{O}_{\mathcal{D}}$. Observe that $g^{-1} \mathcal{O}_{\mathcal{C}}=\mathcal{O}_{\mathcal{C}^{\prime}}$ so that

is a commutative diagram of morphisms of ringed topoi.
08PB Lemma 21.29.4. Assumptions and notation as in Situation 21.29.3. For $U^{\prime} \in$ $\mathrm{Ob}\left(\mathcal{C}^{\prime}\right)$ set $U=u\left(U^{\prime}\right)$ and $V=p^{\prime}\left(U^{\prime}\right)$ and consider the induced morphisms of ringed topoi

Then there exists a morphism of topoi

$$
\sigma^{\prime}: \operatorname{Sh}(\mathcal{D} / V) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime} / U^{\prime}\right)
$$

such that setting $\sigma=g^{\prime} \circ \sigma^{\prime}$ we have $\pi_{U^{\prime}}^{\prime} \circ \sigma^{\prime}=i d$, $\pi_{U} \circ \sigma=i d,\left(\sigma^{\prime}\right)^{-1}=\pi_{U^{\prime}, *}^{\prime}$, and $\sigma^{-1}=\pi_{U, *}$.

Proof. Let $v^{\prime}: \mathcal{D} / V \rightarrow \mathcal{C}^{\prime} / U^{\prime}$ be the functor constructed in the proof of Lemma 21.29 .2 starting with $p^{\prime}: \mathcal{C}^{\prime} \rightarrow \mathcal{D}^{\prime}$ and the object $U^{\prime}$. Since $u$ is a 1 -morphism of fibred categories over $\mathcal{D}$ it transforms strongly cartesian morphisms into strongly cartesian morphisms, hence the functor $v=u \circ v^{\prime}$ is the functor of the proof of Lemma 21.29 .2 relative to $p: \mathcal{C} \rightarrow \mathcal{D}$ and $U$. Thus our lemma follows from that lemma.

08PC Lemma 21.29.5. Assumption and notation as in Situation 21.29.3.
(1) There are left adjoints $g_{!}: \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}^{\prime}}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{\mathcal{C}}\right)$ and $g_{!}^{A b}: A b\left(\mathcal{C}^{\prime}\right) \rightarrow$ $A b(\mathcal{C})$ to $g^{*}=g^{-1}$ on modules and on abelian sheaves.
(2) The diagram

commutes.
(3) There are left adjoints $L g_{!}: D\left(\mathcal{O}_{\mathcal{C}^{\prime}}\right) \rightarrow D\left(\mathcal{O}_{\mathcal{C}}\right)$ and $L g_{!}^{A b}: D\left(\mathcal{C}^{\prime}\right) \rightarrow D(\mathcal{C})$ to $g^{*}=g^{-1}$ on derived categories of modules and abelian sheaves.
(4) The diagram

commutes.

Proof. The functor $u$ is continuous and cocontinuous Stacks, Lemma 8.10.3. Hence the existence of the functors $g!, g_{!}^{A b}, L g_{!}$, and $L g_{!}^{A b}$ can be found in Modules on Sites, Sections 18.16 and 18.40 and Section 21.28.
To prove (2) it suffices to show that the canonical map

$$
g_{!}^{A b} j_{U^{\prime}!} \mathcal{O}_{U^{\prime}} \rightarrow j_{u\left(U^{\prime}\right)!} \mathcal{O}_{u\left(U^{\prime}\right)}
$$

is an isomorphism for all objects $U^{\prime}$ of $\mathcal{C}^{\prime}$, see Modules on Sites, Remark 18.40.2. Similarly, to prove (4) it suffices to show that the canonical map

$$
L g_{!}^{A b} j_{U^{\prime}!} \mathcal{O}_{U^{\prime}} \rightarrow j_{u\left(U^{\prime}\right)!} \mathcal{O}_{u\left(U^{\prime}\right)}
$$

is an isomorphism in $D(\mathcal{C})$ for all objects $U^{\prime}$ of $\mathcal{C}^{\prime}$, see Remark 21.28.2. This will also imply the previous formula hence this is what we will show.
We will use that for a localization morphism $j$ the functors $j$ ! and $j^{A b}$ agree (see Modules on Sites, Remark 18.19.5) and that $j$ ! is exact (Modules on Sites, Lemma 18.19.3. Let us adopt the notation of Lemma 21.29.4. Since $L g_{!}^{A b} \circ j_{U^{\prime}!}=$ $j_{U!} \circ L\left(g^{\prime}\right){ }^{A b}$ (by commutativity of Sites, Lemma 7.27.4 and uniqueness of adjoint functors) it suffices to prove that $L\left(g^{\prime}\right)^{A b} \mathcal{O}_{U^{\prime}}=\mathcal{O}_{U}$. Using the results of Lemma 21.29 .4 we have for any object $E$ of $D\left(\mathcal{C} / u\left(U^{\prime}\right)\right)$ the following sequence of equalities

$$
\begin{aligned}
\operatorname{Hom}_{D(\mathcal{C} / U)}\left(L\left(g^{\prime}\right)!{ }^{A b} \mathcal{O}_{U^{\prime}}, E\right) & =\operatorname{Hom}_{D\left(\mathcal{C}^{\prime} / U^{\prime}\right)}\left(\mathcal{O}_{U^{\prime}},\left(g^{\prime}\right)^{-1} E\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{C}^{\prime} / U^{\prime}\right)}\left(\left(\pi_{U^{\prime}}^{\prime}\right)^{-1} \mathcal{O}_{V},\left(g^{\prime}\right)^{-1} E\right) \\
& =\operatorname{Hom}_{D(\mathcal{D} / V)}\left(\mathcal{O}_{V}, R \pi_{U^{\prime}, *}^{\prime}\left(g^{\prime}\right)^{-1} E\right) \\
& =\operatorname{Hom}_{D(\mathcal{D} / V)}\left(\mathcal{O}_{V},\left(\sigma^{\prime}\right)^{-1}\left(g^{\prime}\right)^{-1} E\right) \\
& =\operatorname{Hom}_{D(\mathcal{D} / V)}\left(\mathcal{O}_{V}, \sigma^{-1} E\right) \\
& =\operatorname{Hom}_{D(\mathcal{D} / V)}\left(\mathcal{O}_{V}, \pi_{U, *} E\right) \\
& =\operatorname{Hom}_{D(\mathcal{C} / U)}\left(\pi_{U}^{-1} \mathcal{O}_{V}, E\right) \\
& =\operatorname{Hom}_{D(\mathcal{C} / U)}\left(\mathcal{O}_{U}, E\right)
\end{aligned}
$$

By Yoneda's lemma we conclude.
09CY Remark 21.29.6. Assumptions and notation as in Situation 21.29.1. Note that setting $\mathcal{C}^{\prime}=\mathcal{D}$ and $u$ equal to the structure functor of $\mathcal{C}$ gives a situation as in Situation 21.29.3. Hence Lemma 21.29 .5 tells us we have functors $\pi_{!}, \pi_{!}^{A b}, L \pi_{!}$, and $L \pi_{!}^{A b}$ such that forget $\circ \pi_{!}=\pi_{!}^{A b} \circ$ forget and forget $\circ L \pi!=L \pi_{!}^{A b} \circ$ forget.

08PD Remark 21.29.7. Assumptions and notation as in Situation 21.29.3. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$, let $\mathcal{F}^{\prime}$ be an abelian sheaf on $\mathcal{C}^{\prime}$, and let $t: \mathcal{F}^{\prime} \rightarrow g^{-1} \mathcal{F}$ be a map. Then we obtain a canonical map

$$
L \pi_{!}^{\prime}\left(\mathcal{F}^{\prime}\right) \longrightarrow L \pi_{!}(\mathcal{F})
$$

by using the adjoint $g_{!} \mathcal{F}^{\prime} \rightarrow \mathcal{F}$ of $t$, the map $L g!\left(\mathcal{F}^{\prime}\right) \rightarrow g_{!} \mathcal{F}^{\prime}$, and the equality $L \pi_{!}^{\prime}=L \pi_{!} \circ L g_{!}$.
08PE Lemma 21.29.8. Assumptions and notation as in Situation 21.29.1. For $\mathcal{F}$ in $A b(\mathcal{C})$ the sheaf $\pi_{!} \mathcal{F}$ is the sheaf associated to the presheaf

$$
\left.V \longmapsto \operatorname{colim}_{\mathcal{C}_{V}^{o p p}} \mathcal{F}\right|_{\mathcal{C}_{V}}
$$

with restriction maps as indicated in the proof.

Proof. Denote $\mathcal{H}$ be the rule of the lemma. For a morphism $h: V^{\prime} \rightarrow V$ of $\mathcal{D}$ there is a pullback functor $h^{*}: \mathcal{C}_{V} \rightarrow \mathcal{C}_{V^{\prime}}$ of fibre categories (Categories, Definition 4.32.6. Moreover for $U \in \mathrm{Ob}\left(\mathcal{C}_{V}\right)$ there is a strongly cartesian morphism $h^{*} U \rightarrow U$ covering $h$. Restriction along these strongly cartesian morphisms defines a transformation of functors

$$
\left.\left.\mathcal{F}\right|_{\mathcal{C}_{V}} \longrightarrow \mathcal{F}\right|_{\mathcal{C}_{V^{\prime}}} \circ h^{*}
$$

Hence a $\operatorname{map} \mathcal{H}(V) \rightarrow \mathcal{H}\left(V^{\prime}\right)$ between colimits, see Categories, Lemma 4.14.7.
To prove the lemma we show that

$$
\operatorname{Mor}_{P S h(\mathcal{D})}(\mathcal{H}, \mathcal{G})=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}, \pi^{-1} \mathcal{G}\right)
$$

for every sheaf $\mathcal{G}$ on $\mathcal{C}$. An element of the left hand side is a compatible system of maps $\mathcal{F}(U) \rightarrow \mathcal{G}(p(U))$ for all $U$ in $\mathcal{C}$. Since $\pi^{-1} \mathcal{G}(U)=\mathcal{G}(p(U))$ by our choice of topology on $\mathcal{C}$ we see the same thing is true for the right hand side and we win.

### 21.30. Homology on a category

08 RW In the case of a category over a point we will baptize the left derived lower shriek functors the homology functors.

08PF Example 21.30.1 (Category over point). Let $\mathcal{C}$ be a category. Endow $\mathcal{C}$ with the chaotic topology (Sites, Example 7.6.6). Thus presheaves and sheaves agree on $\mathcal{C}$. The functor $p: \mathcal{C} \rightarrow *$ where $*$ is the category with a single object and a single morphism is cocontinuous and continuous. Let $\pi: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(*)$ be the corresponding morphism of topoi. Let $B$ be a ring. We endow $*$ with the sheaf of rings $B$ and $\mathcal{C}$ with $\mathcal{O}_{\mathcal{C}}=\pi^{-1} B$ which we will denote $\underline{B}$. In this way

$$
\pi:(\operatorname{Sh}(\mathcal{C}), \underline{B}) \rightarrow(*, B)
$$

is an example of Situation 21.29.1. By Remark 21.29.6 we do not need to distinguish between $\pi!$ on modules or abelian sheaves. By Lemma 21.29 .8 we see that $\pi!\mathcal{F}=$ $\operatorname{colim}_{\mathcal{C}^{\text {opp }}} \mathcal{F}$. Thus $L_{n} \pi$ ! is the $n$th left derived functor of taking colimits. In the following, we write

$$
H_{n}(\mathcal{C}, \mathcal{F})=L_{n} \pi!(\mathcal{F})
$$

and we will name this the $n$th homology group of $\mathcal{F}$ on $\mathcal{C}$.
08PG Example 21.30.2 (Computing homology). In Example 21.30.1 we can compute the functors $H_{n}(\mathcal{C},-)$ as follows. Let $\mathcal{F} \in \operatorname{Ob}(A b(\mathcal{C}))$. Consider the chain complex

$$
K_{\bullet}(\mathcal{F}): \ldots \rightarrow \bigoplus_{U_{2} \rightarrow U_{1} \rightarrow U_{0}} \mathcal{F}\left(U_{0}\right) \rightarrow \bigoplus_{U_{1} \rightarrow U_{0}} \mathcal{F}\left(U_{0}\right) \rightarrow \bigoplus_{U_{0}} \mathcal{F}\left(U_{0}\right)
$$

where the transition maps are given by

$$
\left(U_{2} \rightarrow U_{1} \rightarrow U_{0}, s\right) \longmapsto\left(U_{1} \rightarrow U_{0}, s\right)-\left(U_{2} \rightarrow U_{0}, s\right)+\left(U_{2} \rightarrow U_{1},\left.s\right|_{U_{1}}\right)
$$

and similarly in other degrees. By construction

$$
H_{0}(\mathcal{C}, \mathcal{F})=\operatorname{colim}_{\mathcal{C}^{o p p}} \mathcal{F}=H_{0}\left(K_{\bullet}(\mathcal{F})\right)
$$

see Categories, Lemma 4.14.11. The construction of $K_{\bullet}(\mathcal{F})$ is functorial in $\mathcal{F}$ and transforms short exact sequences of $A b(\mathcal{C})$ into short exact sequences of complexes. Thus the sequence of functors $\mathcal{F} \mapsto H_{n}\left(K_{\bullet}(\mathcal{F})\right)$ forms a $\delta$-functor, see Homology,

Definition 12.11 .1 and Lemma 12.12 .12 . For $\mathcal{F}=j_{U!} \mathbf{Z}_{U}$ the complex $K_{\bullet}(\mathcal{F})$ is the complex associated to the free $\mathbf{Z}$-module on the simplicial set $X_{\bullet}$ with terms

$$
X_{n}=\coprod_{U_{n} \rightarrow \ldots \rightarrow U_{1} \rightarrow U_{0}} \operatorname{Mor}_{\mathcal{C}}\left(U_{0}, U\right)
$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$. Namely, the map $X_{\bullet} \rightarrow\{*\}$ is obvious, the map $\{*\} \rightarrow X_{n}$ is given by mapping $*$ to $\left(U \rightarrow \ldots \rightarrow U, \mathrm{id}_{U}\right)$, and the maps

$$
h_{n, i}: X_{n} \longrightarrow X_{n}
$$

(Simplicial, Lemma 14.26 .2 ) defining the homotopy between the two maps $X_{\bullet} \rightarrow X_{\bullet}$ are given by the rule

$$
h_{n, i}:\left(U_{n} \rightarrow \ldots \rightarrow U_{0}, f\right) \longmapsto\left(U_{n} \rightarrow \ldots \rightarrow U_{i} \rightarrow U \rightarrow \ldots \rightarrow U, \mathrm{id}\right)
$$

for $i>0$ and $h_{n, 0}=\mathrm{id}$. Verifications omitted. This implies that $K_{\bullet}\left(j_{U}!\mathbf{Z}_{U}\right)$ has trivial cohomology in negative degrees (by the functoriality of Simplicial, Remark 14.26 .4 and the result of Simplicial, Lemma 14.27.1). Thus $K_{\bullet}(\mathcal{F})$ computes the left derived functors $H_{n}(\mathcal{C},-)$ of $H_{0}(\mathcal{C},-)$ for example by (the duals of) Homology, Lemma 12.11 .4 and Derived Categories, Lemma 13.17 .6
08PH Example 21.30.3. Let $u: \mathcal{C}^{\prime} \rightarrow \mathcal{C}$ be a functor. Endow $\mathcal{C}^{\prime}$ and $\mathcal{C}$ with the chaotic topology as in Example 21.30.1 The functors $u, \mathcal{C}^{\prime} \rightarrow *$, and $\mathcal{C} \rightarrow *$ where $*$ is the category with a single object and a single morphism are cocontinuous and continuous. Let $g: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(\mathcal{C}), \pi^{\prime}: \operatorname{Sh}\left(\mathcal{C}^{\prime}\right) \rightarrow \operatorname{Sh}(*)$, and $\pi: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(*)$, be the corresponding morphisms of topoi. Let $B$ be a ring. We endow $*$ with the sheaf of rings $B$ and $\mathcal{C}^{\prime}, \mathcal{C}$ with the constant sheaf $\underline{B}$. In this way

is an example of Situation 21.29.3. Thus Lemma 21.29.5 applies to $g$ so we do not need to distinguish between $g$ ! on modules or abelian sheaves. In particular Remark 21.29 .7 produces canonical maps

$$
H_{n}\left(\mathcal{C}^{\prime}, \mathcal{F}^{\prime}\right) \longrightarrow H_{n}(\mathcal{C}, \mathcal{F})
$$

whenever we have $\mathcal{F}$ in $A b(\mathcal{C}), \mathcal{F}^{\prime}$ in $A b\left(\mathcal{C}^{\prime}\right)$, and a $\operatorname{map} t: \mathcal{F}^{\prime} \rightarrow g^{-1} \mathcal{F}$. In terms of the computation of homology given in Example 21.30.2 we see that these maps come from a map of complexes

$$
K_{\bullet}\left(\mathcal{F}^{\prime}\right) \longrightarrow K_{\bullet}(\mathcal{F})
$$

given by the rule

$$
\left(U_{n}^{\prime} \rightarrow \ldots \rightarrow U_{0}^{\prime}, s^{\prime}\right) \longmapsto\left(u\left(U_{n}^{\prime}\right) \rightarrow \ldots \rightarrow u\left(U_{0}^{\prime}\right), t\left(s^{\prime}\right)\right)
$$

with obvious notation.
08Q6 Remark 21.30.4. Notation and assumptions as in Example 21.30.1. Let $\mathcal{F}^{\bullet}$ be a bounded complex of abelian sheaves on $\mathcal{C}$. For any object $U$ of $\mathcal{C}$ there is a canonical map

$$
\mathcal{F}^{\bullet}(U) \longrightarrow L \pi!\left(\mathcal{F}^{\bullet}\right)
$$

in $D(A b)$. If $\mathcal{F}^{\bullet}$ is a complex of $\underline{B}$-modules then this map is in $D(B)$. To prove this, note that we compute $L \pi!\left(\mathcal{F}^{\bullet}\right)$ by taking a quasi-isomorphism $\mathcal{P}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ where $\mathcal{P}^{\bullet}$ is a complex of projectives. However, since the topology is chaotic this means that $\mathcal{P}^{\bullet}(U) \rightarrow \mathcal{F}^{\bullet}(U)$ is a quasi-isomorphism hence can be inverted in $D(A b)$, resp. $D(B)$. Composing with the canonical map $\mathcal{P}^{\bullet}(U) \rightarrow \pi_{!}\left(\mathcal{P}^{\bullet}\right)$ coming from the computation of $\pi!$ as a colimit we obtain the desired arrow.

08Q7 Lemma 21.30.5. Notation and assumptions as in Example 21.30.1. If $\mathcal{C}$ has either an initial or a final object, then $L \pi_{!} \circ \pi^{-1}=i d$ on $D(A b)$, resp. $D(B)$.

Proof. If $\mathcal{C}$ has an initial object, then $\pi_{!}$is computed by evaluating on this object and the statement is clear. If $\mathcal{C}$ has a final object, then $R \pi_{*}$ is computed by evaluating on this object, hence $R \pi_{*} \circ \pi^{-1} \cong$ id on $D(A b)$, resp. $D(B)$. This implies that $\pi^{-1}: D(A b) \rightarrow D(\mathcal{C})$, resp. $\pi^{-1}: D(B) \rightarrow D(\underline{B})$ is fully faithful, see Categories, Lemma 4.24.3. Then the same lemma implies that $L \pi!\circ \pi^{-1}=\mathrm{id}$ as desired.

08Q8 Lemma 21.30.6. Notation and assumptions as in Example 21.30.1. Let $B \rightarrow B^{\prime}$ be a ring map. Consider the commutative diagram of ringed topoi

Then $L \pi_{!} \circ L h^{*}=L f^{*} \circ L \pi_{!}^{\prime}$.
Proof. Both functors are right adjoint to the obvious functor $D\left(B^{\prime}\right) \rightarrow D(\underline{B})$.
08Q9 Lemma 21.30.7. Notation and assumptions as in Example 21.30.1. Let $U$ • be a cosimplicial object in $\mathcal{C}$ such that for every $U \in \mathrm{Ob}(\mathcal{C})$ the simplicial set $\operatorname{Mor}_{\mathcal{C}}\left(U_{\bullet}, U\right)$ is homotopy equivalent to the constant simplicial set on a singleton. Then

$$
L \pi_{!}(\mathcal{F})=\mathcal{F}\left(U_{\bullet}\right)
$$

in $D(A b)$, resp. $D(B)$ functorially in $\mathcal{F}$ in $A b(\mathcal{C})$, $\operatorname{resp} . \operatorname{Mod}(\underline{B})$.
Proof. As $L \pi!$ agrees for modules and abelian sheaves by Lemma 21.29.5 it suffices to prove this when $\mathcal{F}$ is an abelian sheaf. For $U \in \operatorname{Ob}(\mathcal{C})$ the abelian sheaf $j_{U!} \mathbf{Z}_{U}$ is a projective object of $A b(\mathcal{C})$ since $\operatorname{Hom}\left(j_{U!} \mathbf{Z}_{U}, \mathcal{F}\right)=\mathcal{F}(U)$ and taking sections is an exact functor as the topology is chaotic. Every abelian sheaf is a quotient of a direct sum of $j_{U}!\mathbf{Z}_{U}$ by Modules on Sites, Lemma 18.28.6. Thus we can compute $L \pi_{!}(\mathcal{F})$ by choosing a resolution

$$
\ldots \rightarrow \mathcal{G}^{-1} \rightarrow \mathcal{G}^{0} \rightarrow \mathcal{F} \rightarrow 0
$$

whose terms are direct sums of sheaves of the form above and taking $L \pi_{!}(\mathcal{F})=$ $\pi_{!}\left(\mathcal{G}^{\bullet}\right)$. Consider the double complex $A^{\bullet \bullet \bullet}=\mathcal{G}^{\bullet}\left(U_{\bullet}\right)$. The map $\mathcal{G}^{0} \rightarrow \mathcal{F}$ gives a map of complexes $A^{0, \bullet} \rightarrow \mathcal{F}\left(U_{\bullet}\right)$. Since $\pi_{!}$is computed by taking the colimit over $\mathcal{C}^{o p p}$ (Lemma 21.29.8) we see that the two compositions $\mathcal{G}^{m}\left(U_{1}\right) \rightarrow \mathcal{G}^{m}\left(U_{0}\right) \rightarrow \pi!\mathcal{G}^{m}$ are equal. Thus we obtain a canonical map of complexes

$$
\operatorname{Tot}\left(A^{\bullet \bullet}\right) \longrightarrow \pi_{!}\left(\mathcal{G}^{\bullet}\right)=L \pi!(\mathcal{F})
$$

To prove the lemma it suffices to show that the complexes

$$
\ldots \rightarrow \mathcal{G}^{m}\left(U_{1}\right) \rightarrow \mathcal{G}^{m}\left(U_{0}\right) \rightarrow \pi!\mathcal{G}^{m} \rightarrow 0
$$

are exact, see Homology, Lemma 12.22.7. Since the sheaves $\mathcal{G}^{m}$ are direct sums of the sheaves $j_{U}!\mathbf{Z}_{U}$ we reduce to $\mathcal{G}=j_{U!} \mathbf{Z}_{U}$. The complex $j_{U!} \mathbf{Z}_{U}\left(U_{\bullet}\right)$ is the complex of abelian groups associated to the free $\mathbf{Z}$-module on the simplicial set $\operatorname{Mor}_{\mathcal{C}}\left(U_{\bullet}, U\right)$ which we assumed to be homotopy equivalent to a singleton. We conclude that

$$
j_{U!} \mathbf{Z}_{U}\left(U_{\bullet}\right) \rightarrow \mathbf{Z}
$$

is a homotopy equivalence of abelian groups hence a quasi-isomorphism (Simplicial, Remark 14.26 .4 and Lemma 14.27 .1 . This finishes the proof since $\pi!j_{U}!\mathbf{Z}_{U}=\mathbf{Z}$ as was shown in the proof of Lemma 21.29.5.

08QA Lemma 21.30.8. Notation and assumptions as in Example 21.30.3. If there exists a cosimplicial object $U_{\bullet}^{\prime}$ of $\mathcal{C}^{\prime}$ such that Lemma 21.30.7 applies to both $U_{\bullet}^{\prime}$ in $\mathcal{C}^{\prime}$ and $u\left(U_{\bullet}^{\prime}\right)$ in $\mathcal{C}$, then we have $L \pi_{!}^{\prime} \circ g^{-1}=L \pi!$ as functors $D(\mathcal{C}) \rightarrow D(A b)$, resp. $D(\mathcal{C}, \underline{B}) \rightarrow D(B)$.
Proof. Follows immediately from Lemma 21.30 .7 and the fact that $g^{-1}$ is given by precomposing with $u$.

08QB Lemma 21.30.9. Let $\mathcal{C}_{i}, i=1,2$ be categories. Let $u_{i}: \mathcal{C}_{1} \times \mathcal{C}_{2} \rightarrow \mathcal{C}_{i}$ be the projection functors. Let $B$ be a ring. Let $g_{i}:\left(S h\left(\mathcal{C}_{1} \times \mathcal{C}_{2}\right), \underline{B}\right) \rightarrow\left(S h\left(\mathcal{C}_{i}\right), \underline{B}\right)$ be the corresponding morphisms of ringed topoi, see Example 21.30.3. For $K_{i} \in D\left(\mathcal{C}_{i}, B\right)$ we have

$$
L\left(\pi_{1} \times \pi_{2}\right)!\left(g_{1}^{-1} K_{1} \otimes_{\underline{B}}^{\mathbf{L}} g_{2}^{-1} K_{2}\right)=L \pi_{1,!}\left(K_{1}\right) \otimes_{B}^{\mathbf{L}} L \pi_{2,!}\left(K_{2}\right)
$$

in $D(B)$ with obvious notation.
Proof. As both sides commute with colimits, it suffices to prove this for $K_{1}=$ $j_{U!} \underline{B}_{U}$ and $K_{2}=j_{V!\underline{B}_{V}}$ for $U \in \mathrm{Ob}\left(\mathcal{C}_{1}\right)$ and $V \in \mathrm{Ob}\left(\mathcal{C}_{2}\right)$. See construction of $L \pi!$ in Lemma 21.28.1. In this case

$$
g_{1}^{-1} K_{1} \otimes_{\underline{B}}^{\mathbf{L}} g_{2}^{-1} K_{2}=g_{1}^{-1} K_{1} \otimes_{\underline{B}} g_{2}^{-1} K_{2}=j_{(U, V)!} \underline{B}_{(U, V)}
$$

Verification omitted. Hence the result follows as both the left and the right hand side of the formula of the lemma evaluate to $B$, see construction of $L \pi_{!}$in Lemma 21.28 .1

08QC Lemma 21.30.10. Notation and assumptions as in Example 21.30.1. If there exists a cosimplicial object $U_{\bullet}$ of $\mathcal{C}$ such that Lemma 21.30.7 applies, then

$$
L \pi!\left(K_{1} \otimes_{\underline{B}}^{\mathbf{L}} K_{2}\right)=L \pi!\left(K_{1}\right) \otimes_{B}^{\mathbf{L}} L \pi!\left(K_{2}\right)
$$

for all $K_{i} \in D(\underline{B})$.
Proof. Consider the diagram of categories and functors

where $u$ is the diagonal functor and $u_{i}$ are the projection functors. This gives morphisms of ringed topoi $g, g_{1}, g_{2}$. For any object $\left(U_{1}, U_{2}\right)$ of $\mathcal{C}$ we have

$$
\operatorname{Mor}_{\mathcal{C} \times \mathcal{C}}\left(u\left(U_{\bullet}\right),\left(U_{1}, U_{2}\right)\right)=\operatorname{Mor}_{\mathcal{C}}\left(U_{\bullet}, U_{1}\right) \times \operatorname{Mor}_{\mathcal{C}}\left(U_{\bullet}, U_{2}\right)
$$

which is homotopy equivalent to a point by Simplicial, Lemma 14.26.10. Thus Lemma 21.30 .8 gives $L \pi!\left(g^{-1} K\right)=L(\pi \times \pi)!(K)$ for any $K$ in $D(\mathcal{C} \times \mathcal{C}, B)$. Take $K=g_{1}^{-1} K_{1} \otimes_{B}^{\mathbf{L}} g_{2}^{-1} K_{2}$. Then $g^{-1} K=K_{1} \otimes_{B}^{\mathbf{L}} K_{2}$ because $g^{-1}=g^{*}=L g^{*}$ commutes with derived tensor product (Lemma 21.18.4-a site with chaotic topology has enough points). To finish we apply Lemma 21.30 .9 .

08QD Remark 21.30.11 (Simplicial modules). Let $\mathcal{C}=\Delta$ and let $B$ be any ring. This is a special case of Example 21.30.1 where the assumptions of Lemma 21.30.7 hold. Namely, let $U_{\bullet}$ be the cosimplicial object of $\Delta$ given by the identity functor. To verify the condition we have to show that for $[m] \in \mathrm{Ob}(\Delta)$ the simplicial set $\Delta[m]: n \mapsto \operatorname{Mor}_{\Delta}([n],[m])$ is homotopy equivalent to a point. This is explained in Simplicial, Example 14.26 .7

In this situation the category $\operatorname{Mod}(\underline{B})$ is just the category of simplicial $B$-modules and the functor $L \pi_{!}$sends a simplicial $B$-module $M_{\bullet}$ to its associated complex $s\left(M_{\bullet}\right)$ of $B$-modules. Thus the results above can be reinterpreted in terms of results on simplicial modules. For example a special case of Lemma 21.30 .10 is: if $M_{\bullet}, M_{\bullet}^{\prime}$ are flat simplicial $B$-modules, then the complex $s\left(M_{\bullet} \otimes_{B} M_{\bullet}^{\prime}\right)$ is quasi-isomorphic to the total complex associated to the double complex $s\left(M_{\bullet}\right) \otimes_{B} s\left(M_{\bullet}^{\prime}\right)$. (Hint: use flatness to convert from derived tensor products to usual tensor products.) This is a special case of the Eilenberg-Zilber theorem which can be found in EZ53.

08RX Lemma 21.30.12. Let $\mathcal{C}$ be a category (endowed with chaotic topology). Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a map of sheaves of rings on $\mathcal{C}$. Assume
(1) there exists a cosimplicial object $U_{\bullet}$ in $\mathcal{C}$ as in Lemma 21.30.7, and
(2) $L \pi_{!} \mathcal{O} \rightarrow L \pi_{!} \mathcal{O}^{\prime}$ is an isomorphism.

For $K$ in $D(\mathcal{O})$ we have

$$
L \pi_{!}(K)=L \pi_{!}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}^{\prime}\right)
$$

in $D(A b)$.
Proof. Note: in this proof $L \pi$ ! denotes the left derived functor of $\pi!$ on abelian sheaves. Since $L \pi!$ commutes with colimits, it suffices to prove this for bounded above complexes of $\mathcal{O}$-modules (compare with argument of Derived Categories, Proposition 13.28 .2 or just stick to bounded above complexes). Every such complex is quasi-isomorphic to a bounded above complex whose terms are direct sums of $j_{U!} \mathcal{O}_{U}$ with $U \in \operatorname{Ob}(\mathcal{C})$, see Modules on Sites, Lemma 18.28.6. Thus it suffices to prove the lemma for $j_{U!} \mathcal{O}_{U}$. By assumption

$$
S_{\bullet}=\operatorname{Mor}_{\mathcal{C}}\left(U_{\bullet}, U\right)
$$

is a simplicial set homotopy equivalent to the constant simplicial set on a singleton. Set $P_{n}=\mathcal{O}\left(U_{n}\right)$ and $P_{n}^{\prime}=\mathcal{O}^{\prime}\left(U_{n}\right)$. Observe that the complex associated to the simplicial abelian group

$$
X_{\bullet}: n \longmapsto \bigoplus_{s \in S_{n}} P_{n}
$$

computes $L \pi_{!}\left(j_{U!} \mathcal{O}_{U}\right)$ by Lemma 21.30.7. Since $j_{U!} \mathcal{O}_{U}$ is a flat $\mathcal{O}$-module we have $j_{U!} \mathcal{O}_{U} \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}^{\prime}=j_{U!} \mathcal{O}_{U}^{\prime}$ and $L \pi$ ! of this is computed by the complex associated to the simplicial abelian group

$$
X_{\bullet}^{\prime}: n \longmapsto \bigoplus_{s \in S_{n}} P_{n}^{\prime}
$$

As the rule which to a simplicial set $T_{\bullet}$ associated the simplicial abelian group with terms $\bigoplus_{t \in T_{n}} P_{n}$ is a functor, we see that $X_{\bullet} \rightarrow P_{\bullet}$ is a homotopy equivalence of simplicial abelian groups. Similarly, the rule which to a simplicial set $T_{\bullet}$ associates the simplicial abelian group with terms $\bigoplus_{t \in T_{n}} P_{n}^{\prime}$ is a functor. Hence $X_{\bullet}^{\prime} \rightarrow P_{\bullet}^{\prime}$ is a homotopy equivalence of simplicial abelian groups. By assumption $P_{\bullet} \rightarrow P_{\bullet}^{\prime}$ is a quasi-isomorphism (since $P_{\bullet}$, resp. $P_{\bullet}^{\prime}$ computes $L \pi_{!} \mathcal{O}$, resp. $L \pi_{!} \mathcal{O}^{\prime}$ by Lemma 21.30.7). We conclude that $X_{\bullet}$ and $X_{\bullet}^{\prime}$ are quasi-isomorphic as desired.

09 CZ Remark 21.30.13. Let $\mathcal{C}$ and $B$ be as in Example 21.30.1. Assume there exists a cosimplicial object as in Lemma 21.30.7. Let $\mathcal{O} \rightarrow \underline{B}$ be a map sheaf of rings on $\mathcal{C}$ which induces an isomorphism $L \pi!\mathcal{O} \rightarrow L \pi!\underline{B}$. In this case we obtain an exact functor of triangulated categories

$$
L \pi_{!}: D(\mathcal{O}) \longrightarrow D(B)
$$

Namely, for any object $K$ of $D(\mathcal{O})$ we have $L \pi_{!}^{A b}(K)=L \pi_{!}^{A b}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}\right)$ by Lemma 21.30.12 Thus we can define the displayed functor as the composition of $-\otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}$ with the functor $L \pi_{!}: D(\underline{B}) \rightarrow D(B)$. In other words, we obtain a $B$-module structure on $L \pi_{!}(K)$ coming from the (canonical, functorial) identification of $L \pi_{!}(K)$ with $L \pi_{!}(K \otimes \underset{\mathcal{O}}{\mathbf{L}} \underline{B})$ of the lemma.

### 21.31. Calculating derived lower shriek

08P7 In this section we apply the results from Section 21.30 to compute $L \pi!$ in Situation 21.29 .1 and $L g_{!}$in Situation 21.29.3.

08PI Lemma 21.31.1. Assumptions and notation as in Situation 21.29.1. For $\mathcal{F}$ in $\operatorname{PAb(C)}$ and $n \geq 0$ consider the abelian sheaf $L_{n}(\mathcal{F})$ on $\mathcal{D}$ which is the sheaf associated to the presheaf

$$
V \longmapsto H_{n}\left(\mathcal{C}_{V},\left.\mathcal{F}\right|_{\mathcal{C}_{V}}\right)
$$

with restriction maps as indicated in the proof. Then $L_{n}(\mathcal{F})=L_{n}\left(\mathcal{F}^{\#}\right)$.
Proof. For a morphism $h: V^{\prime} \rightarrow V$ of $\mathcal{D}$ there is a pullback functor $h^{*}: \mathcal{C}_{V} \rightarrow \mathcal{C}_{V^{\prime}}$ of fibre categories (Categories, Definition 4.32.6). Moreover for $U \in \operatorname{Ob}\left(\mathcal{C}_{V}\right)$ there is a strongly cartesian morphism $h^{*} U \rightarrow U$ covering $h$. Restriction along these strongly cartesian morphisms defines a transformation of functors

$$
\left.\left.\mathcal{F}\right|_{\mathcal{C}_{V}} \longrightarrow \mathcal{F}\right|_{\mathcal{C}_{V^{\prime}}} \circ h^{*}
$$

By Example 21.30.3 we obtain the desired restriction map

$$
H_{n}\left(\mathcal{C}_{V},\left.\mathcal{F}\right|_{\mathcal{C}_{V}}\right) \longrightarrow H_{n}\left(\mathcal{C}_{V^{\prime}},\left.\mathcal{F}\right|_{\mathcal{C}_{V^{\prime}}}\right)
$$

Let us denote $L_{n, p}(\mathcal{F})$ this presheaf, so that $L_{n}(\mathcal{F})=L_{n, p}(\mathcal{F})^{\#}$. The canonical map $\gamma: \mathcal{F} \rightarrow \mathcal{F}^{+}$(Sites, Theorem 7.10.10) defines a canonical map $L_{n, p}(\mathcal{F}) \rightarrow L_{n, p}\left(\mathcal{F}^{+}\right)$. We have to prove this map becomes an isomorphism after sheafification.

Let us use the computation of homology given in Example 21.30.2. Denote $K_{\bullet}\left(\mathcal{F}_{\mathcal{C}_{V}}\right)$ the complex associated to the restriction of $\mathcal{F}$ to the fibre category $\mathcal{C}_{V}$. By the remarks above we obtain a presheaf $K_{\bullet}(\mathcal{F})$ of complexes

$$
V \longmapsto K_{\bullet}\left(\left.\mathcal{F}\right|_{\mathcal{C}_{V}}\right)
$$

whose cohomology presheaves are the presheaves $L_{n, p}(\mathcal{F})$. Thus it suffices to show that

$$
K_{\bullet}(\mathcal{F}) \longrightarrow K_{\bullet}\left(\mathcal{F}^{+}\right)
$$

becomes an isomorphism on sheafification.
Injectivity. Let $V$ be an object of $\mathcal{D}$ and let $\xi \in K_{n}(\mathcal{F})(V)$ be an element which maps to zero in $K_{n}\left(\mathcal{F}^{+}\right)(V)$. We have to show there exists a covering $\left\{V_{j} \rightarrow V\right\}$ such that $\left.\xi\right|_{V_{j}}$ is zero in $K_{n}(\mathcal{F})\left(V_{j}\right)$. We write

$$
\xi=\sum\left(U_{i, n+1} \rightarrow \ldots \rightarrow U_{i, 0}, \sigma_{i}\right)
$$

with $\sigma_{i} \in \mathcal{F}\left(U_{i, 0}\right)$. We arrange it so that each sequence of morphisms $U_{n} \rightarrow \ldots \rightarrow$ $U_{0}$ of $\mathcal{C}_{V}$ occurs are most once. Since the sums in the definition of the complex $K_{\bullet}$ are direct sums, the only way this can map to zero in $K_{\bullet}\left(\mathcal{F}^{+}\right)(V)$ is if all $\sigma_{i}$ map to zero in $\mathcal{F}^{+}\left(U_{i, 0}\right)$. By construction of $\mathcal{F}^{+}$there exist coverings $\left\{U_{i, 0, j} \rightarrow U_{i, 0}\right\}$ such that $\left.\sigma_{i}\right|_{U_{i, 0, j}}$ is zero. By our construction of the topology on $\mathcal{C}$ we can write $U_{i, 0, j} \rightarrow U_{i, 0}$ as the pullback (Categories, Definition 4.32.6) of some morphisms $V_{i, j} \rightarrow V$ and moreover each $\left\{V_{i, j} \rightarrow V\right\}$ is a covering. Choose a covering $\left\{V_{j} \rightarrow V\right\}$ dominating each of the coverings $\left\{V_{i, j} \rightarrow V\right\}$. Then it is clear that $\left.\xi\right|_{V_{j}}=0$.
Surjectivity. Proof omitted. Hint: Argue as in the proof of injectivity.
08PJ Lemma 21.31.2. Assumptions and notation as in Situation 21.29.1. For $\mathcal{F}$ in $A b(\mathcal{C})$ and $n \geq 0$ the sheaf $L_{n} \pi_{!}(\mathcal{F})$ is equal to the sheaf $L_{n}(\mathcal{F})$ constructed in Lemma 21.31.1.

Proof. Consider the sequence of functors $\mathcal{F} \mapsto L_{n}(\mathcal{F})$ from $\operatorname{PAb}(\mathcal{C}) \rightarrow A b(\mathcal{C})$. Since for each $V \in \operatorname{Ob}(\mathcal{D})$ the sequence of functors $H_{n}\left(\mathcal{C}_{V},-\right)$ forms a $\delta$-functor so do the functors $\mathcal{F} \mapsto L_{n}(\mathcal{F})$. Our goal is to show these form a universal $\delta$-functor. In order to do this we construct some abelian presheaves on which these functors vanish.
For $U^{\prime} \in \mathrm{Ob}(\mathcal{C})$ consider the abelian presheaf $\mathcal{F}_{U^{\prime}}=j_{U^{\prime}!}^{P A b} \mathbf{Z}_{U^{\prime}}$ (Modules on Sites, Remark 18.19.6. Recall that

$$
\mathcal{F}_{U^{\prime}}(U)=\bigoplus_{\operatorname{Mor}_{\mathcal{C}}\left(U, U^{\prime}\right)} \mathbf{Z}
$$

If $U$ lies over $V=p(U)$ in $\mathcal{D})$ and $U^{\prime}$ lies over $V^{\prime}=p\left(U^{\prime}\right)$ then any morphism $a: U \rightarrow U^{\prime}$ factors uniquely as $U \rightarrow h^{*} U^{\prime} \rightarrow U^{\prime}$ where $h=p(a): V \rightarrow V^{\prime}$ (see Categories, Definition 4.32.6). Hence we see that

$$
\left.\mathcal{F}_{U^{\prime}}\right|_{\mathcal{C}_{V}}=\bigoplus_{h \in \operatorname{Mor}_{\mathcal{D}}\left(V, V^{\prime}\right)} j_{h^{*} U^{\prime}!} \mathbf{Z}_{h^{*} U^{\prime}}
$$

where $j_{h^{*} U^{\prime}}: \operatorname{Sh}\left(\mathcal{C}_{V} / h^{*} U^{\prime}\right) \rightarrow \operatorname{Sh}\left(\mathcal{C}_{V}\right)$ is the localization morphism. The sheaves $j_{h^{*} U^{\prime}!} \mathbf{Z}_{h^{*} U^{\prime}}$ have vanishing higher homology groups (see Example 21.30.2. We conclude that $L_{n}\left(\mathcal{F}_{U^{\prime}}\right)=0$ for all $n>0$ and all $U^{\prime}$. It follows that any abelian presheaf $\mathcal{F}$ is a quotient of an abelian presheaf $\mathcal{G}$ with $L_{n}(\mathcal{G})=0$ for all $n>0$ (Modules on Sites, Lemma 18.28.6). Since $L_{n}(\mathcal{F})=L_{n}\left(\mathcal{F}^{\#}\right)$ we see that the same thing is true for abelian sheaves. Thus the sequence of functors $L_{n}(-)$ is a universal
delta functor on $A b(\mathcal{C})$ (Homology, Lemma 12.11.4. Since we have agreement with $H^{-n}\left(L \pi_{!}(-)\right)$for $n=0$ by Lemma 21.29.8 we conclude by uniqueness of universal $\delta$ functors (Homology, Lemma 12.11.5) and Derived Categories, Lemma 13.17.6.

08PK Lemma 21.31.3. Assumptions and notation as in Situation 21.29.3. For an abelian sheaf $\mathcal{F}^{\prime}$ on $\mathcal{C}^{\prime}$ the sheaf $L_{n} g_{!}\left(\mathcal{F}^{\prime}\right)$ is the sheaf associated to the presheaf

$$
U \longmapsto H_{n}\left(\mathcal{I}_{U}, \mathcal{F}_{U}^{\prime}\right)
$$

For notation and restriction maps see proof.
Proof. Say $p(U)=V$. The category $\mathcal{I}_{U}$ is the category of pairs $\left(U^{\prime}, \varphi\right)$ where $\varphi: U \rightarrow u\left(U^{\prime}\right)$ is a morphism of $\mathcal{C}$ with $p(\varphi)=\operatorname{id}_{V}$, i.e., $\varphi$ is a morphism of the fibre category $\mathcal{C}_{V}$. Morphisms $\left(U_{1}^{\prime}, \varphi_{1}\right) \rightarrow\left(U_{2}^{\prime}, \varphi_{2}\right)$ are given by morphisms $a: U_{1}^{\prime} \rightarrow U_{2}^{\prime}$ of the fibre category $\mathcal{C}_{V}^{\prime}$ such that $\varphi_{2}=u(a) \circ \varphi_{1}$. The presheaf $\mathcal{F}_{U}^{\prime}$ sends $\left(U^{\prime}, \varphi\right)$ to $\mathcal{F}^{\prime}\left(U^{\prime}\right)$. We will construct the restriction mappings below.
Choose a factorization

$$
\mathcal{C}^{\prime} \stackrel{u^{\prime}}{\leftarrow} \mathcal{C}^{\prime \prime} \xrightarrow{u^{\prime \prime}} \mathcal{C}
$$

of $u$ as in Categories, Lemma 4.32.14 Then $g_{!}=g_{!}^{\prime \prime} \circ g_{!}^{\prime}$ and similarly for derived functors. On the other hand, the functor $g_{!}^{\prime}$ is exact, see Modules on Sites, Lemma 18.16.6. Thus we get $L g_{!}\left(\mathcal{F}^{\prime}\right)=L g_{!}^{\prime \prime}\left(\mathcal{F}^{\prime \prime}\right)$ where $\mathcal{F}^{\prime \prime}=g_{!}^{\prime} \mathcal{F}^{\prime}$. Note that $\mathcal{F}^{\prime \prime}=h^{-1} \mathcal{F}^{\prime}$ where $h: S h\left(\mathcal{C}^{\prime \prime}\right) \rightarrow S h\left(\mathcal{C}^{\prime}\right)$ is the morphism of topoi associated to $w$, see Sites, Lemma 7.22.1. The functor $u^{\prime \prime}$ turns $\mathcal{C}^{\prime \prime}$ into a fibred category over $\mathcal{C}$, hence Lemma 21.31 .2 applies to the computation of $L_{n} g_{!}^{\prime \prime}$. The result follows as the construction of $\mathcal{C}^{\prime \prime}$ in the proof of Categories, Lemma 4.32.14 shows that the fibre category $\mathcal{C}_{U}^{\prime \prime}$ is equal to $\mathcal{I}_{U}$. Moreover, $\left.h^{-1} \mathcal{F}^{\prime}\right|_{\mathcal{C}_{U}^{\prime \prime}}$ is given by the rule described above (as $w$ is continuous and cocontinuous by Stacks, Lemma 8.10 .3 so we may apply Sites, Lemma 7.20.5.

### 21.32. Simplicial modules

09D0 Let $A_{\bullet}$ be a simplicial ring. Recall that we may think of $A_{\bullet}$ as a sheaf on $\Delta$ (endowed with the chaotic topology), see Simplicial, Section 14.4 . Then a simplicial module $M_{\bullet}$ over $A_{\bullet}$ is just a sheaf of $A_{\bullet}$-modules on $\Delta$. In other words, for every $n \geq 0$ we have an $A_{n}$-module $M_{n}$ and for every $\operatorname{map} \varphi:[n] \rightarrow[m]$ we have a corresponding map

$$
M_{\bullet}(\varphi): M_{m} \longrightarrow M_{n}
$$

which is $A_{\bullet}(\varphi)$-linear such that these maps compose in the usual manner.
Let $\mathcal{C}$ be a site. A simplicial sheaf of rings $\mathcal{A}$ • on $\mathcal{C}$ is a simplicial object in the category of sheaves of rings on $\mathcal{C}$. In this case the assignment $U \mapsto \mathcal{A}_{\bullet}(U)$ is a sheaf of simplicial rings and in fact the two notions are equivalent. A similar discussion holds for simplicial abelian sheaves, simplicial sheaves of Lie algebras, and so on.
However, as in the case of simplicial rings above, there is another way to think about simplicial sheaves. Namely, consider the projection

$$
p: \Delta \times \mathcal{C} \longrightarrow \mathcal{C}
$$

This defines a fibred category with strongly cartesian morphisms exactly the morphisms of the form $([n], U) \rightarrow([n], V)$. We endow the category $\Delta \times \mathcal{C}$ with the topology inherited from $\mathcal{C}$ (see Stacks, Section 8.10). The simple description of the
coverings in $\Delta \times \mathcal{C}$ (Stacks, Lemma 8.10.1) immediately implies that a simplicial sheaf of rings on $\mathcal{C}$ is the same thing as a sheaf of rings on $\Delta \times \mathcal{C}$.

By analogy with the case of simplicial modules over a simplicial ring, we define simplicial modules over simplicial sheaves of rings as follows.

09D1 Definition 21.32.1. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \bullet$ be a simplicial sheaf of rings on $\mathcal{C}$. A simplicial $\mathcal{A}_{\bullet}$-module $\mathcal{F}_{\bullet}$ (sometimes called a simplicial sheaf of $\mathcal{A}_{\bullet}$-modules) is a sheaf of modules over the sheaf of rings on $\Delta \times \mathcal{C}$ associated to $\mathcal{A} \bullet$.

We obtain a category $\operatorname{Mod}\left(\mathcal{A}_{\bullet}\right)$ of simplicial modules and a corresponding derived category $D\left(\mathcal{A}_{\bullet}\right)$. Given a map $\mathcal{A}_{\bullet} \rightarrow \mathcal{B} \bullet$ of simplicial sheaves of rings we obtain a functor

$$
-\otimes_{\mathcal{A}_{\bullet}}^{\mathbf{L}} \mathcal{B}_{\bullet}: D\left(\mathcal{A}_{\bullet}\right) \longrightarrow D\left(\mathcal{B}_{\bullet}\right)
$$

Moreover, the material of the preceding sections determines a functor

$$
L \pi_{!}: D\left(\mathcal{A}_{\bullet}\right) \longrightarrow D(\mathcal{C})
$$

Given a simplicial module $\mathcal{F}_{\bullet}$ the object $L \pi_{!}\left(\mathcal{F}_{\bullet}\right)$ is represented by the associated chain complex $s\left(\mathcal{F}_{\bullet}\right)$ (Simplicial, Section 14.23). This follows from Lemmas 21.31.2 and 21.30.7.

09D2 Lemma 21.32.2. Let $\mathcal{C}$ be a site. Let $\mathcal{A} \bullet \rightarrow \mathcal{B} \bullet$ be a homomorphism of simplicial sheaves of rings on $\mathcal{C}$. If $L \pi_{!} \mathcal{A}_{\bullet} \rightarrow L \pi!\mathcal{B}_{\bullet}$ is an isomorphism in $D(\mathcal{C})$, then we have

$$
L \pi_{!}(K)=L \pi_{!}\left(K \otimes \otimes_{\mathcal{A}_{\bullet}}, \mathcal{B}_{\bullet}\right)
$$

for all $K$ in $D\left(\mathcal{A}_{\bullet}\right)$.
Proof. Let $([n], U)$ be an object of $\Delta \times \mathcal{C}$. Since $L \pi!$ commutes with colimits, it suffices to prove this for bounded above complexes of $\mathcal{O}$-modules (compare with argument of Derived Categories, Proposition 13.28 .2 or just stick to bounded above complexes). Every such complex is quasi-isomorphic to a bounded above complex whose terms are flat modules, see Modules on Sites, Lemma 18.28.6. Thus it suffices to prove the lemma for a flat $\mathcal{A}_{\bullet}$-module $\mathcal{F}$. In this case the derived tensor product is the usual tensor product and is a sheaf also. Hence by Lemma 21.31 .2 we can compute the cohomology sheaves of both sides of the equation by the procedure of Lemma 21.31.1. Thus it suffices to prove the result for the restriction of $\mathcal{F}$ to the fibre categories (i.e., to $\Delta \times U$ ). In this case the result follows from Lemma 21.30 .12 .

09D3 Remark 21.32.3. Let $\mathcal{C}$ be a site. Let $\epsilon: \mathcal{A} \bullet \rightarrow \mathcal{O}$ be an augmentation (Simplicial, Definition 14.20.1) in the category of sheaves of rings. Assume $\epsilon$ induces a quasiisomorphism $s\left(\mathcal{A}_{\bullet}\right) \rightarrow \mathcal{O}$. In this case we obtain an exact functor of triangulated categories

$$
L \pi_{!}: D(\mathcal{A} \bullet) \longrightarrow D(\mathcal{O})
$$

Namely, for any object $K$ of $D\left(\mathcal{A}_{\bullet}\right)$ we have $L \pi_{!}(K)=L \pi_{!}\left(K \otimes_{\mathcal{A}_{\bullet}}^{\mathbf{L}} \mathcal{O}\right)$ by Lemma 21.32.2. Thus we can define the displayed functor as the composition of $-\otimes_{\mathcal{A},}^{\mathbf{L}} \mathcal{O}$ with the functor $L \pi_{!}: D\left(\Delta \times \mathcal{C}, \pi^{-1} \mathcal{O}\right) \rightarrow D(\mathcal{O})$ of Remark 21.29.6. In other words, we obtain a $\mathcal{O}$-module structure on $L \pi_{!}(K)$ coming from the (canonical, functorial) identification of $L \pi_{!}(K)$ with $L \pi_{!}\left(K \otimes_{\mathcal{A}} \mathbf{L} \mathcal{O}\right)$ of the lemma.

### 21.33. Cohomology on a category

08RY In the situation of Example 21.30 .1 in addition to the derived functor $L \pi!$, we also have the functor $R \pi_{*}$. For an abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ we have $H_{n}(\mathcal{C}, \mathcal{F})=H^{-n}\left(L \pi_{!} \mathcal{F}\right)$ and $H^{n}(\mathcal{C}, \mathcal{F})=H^{n}\left(R \pi_{*} \mathcal{F}\right)$.

08RZ Example 21.33.1 (Computing cohomology). In Example 21.30.1 we can compute the functors $H^{n}(\mathcal{C},-)$ as follows. Let $\mathcal{F} \in \operatorname{Ob}(A b(\mathcal{C}))$. Consider the cochain complex

$$
K^{\bullet}(\mathcal{F}): \prod_{U_{0}} \mathcal{F}\left(U_{0}\right) \rightarrow \prod_{U_{0} \rightarrow U_{1}} \mathcal{F}\left(U_{0}\right) \rightarrow \prod_{U_{0} \rightarrow U_{1} \rightarrow U_{2}} \mathcal{F}\left(U_{0}\right) \rightarrow \ldots
$$

where the transition maps are given by

$$
\left(s_{U_{0} \rightarrow U_{1}}\right) \longmapsto\left(\left(U_{0} \rightarrow U_{1} \rightarrow U_{2}\right) \mapsto s_{U_{0} \rightarrow U_{1}}-s_{U_{0} \rightarrow U_{2}}+\left.s_{U_{1} \rightarrow U_{2}}\right|_{U_{0}}\right)
$$

and similarly in other degrees. By construction

$$
H^{0}(\mathcal{C}, \mathcal{F})=\lim _{\mathcal{C}^{\text {opp }}} \mathcal{F}=H^{0}\left(K^{\bullet}(\mathcal{F})\right)
$$

see Categories, Lemma 4.14.10. The construction of $K^{\bullet}(\mathcal{F})$ is functorial in $\mathcal{F}$ and transforms short exact sequences of $A b(\mathcal{C})$ into short exact sequences of complexes. Thus the sequence of functors $\mathcal{F} \mapsto H^{n}\left(K^{\bullet}(\mathcal{F})\right)$ forms a $\delta$-functor, see Homology, Definition 12.11.1 and Lemma 12.12.12. For an object $U$ of $\mathcal{C}$ denote $p_{U}: S h(*) \rightarrow$ $S h(\mathcal{C})$ the corresponding point with $p_{U}^{-1}$ equal to evaluation at $U$, see Sites, Example 7.32.7. Let $A$ be an abelian group and set $\mathcal{F}=p_{U, *} A$. In this case the complex $\overline{K^{\bullet}(\mathcal{F})}$ is the complex with terms $\operatorname{Map}\left(X_{n}, A\right)$ where

$$
X_{n}=\coprod_{U_{0} \rightarrow \ldots \rightarrow U_{n-1} \rightarrow U_{n}} \operatorname{Mor}_{\mathcal{C}}\left(U, U_{0}\right)
$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$. Namely, the map $X_{\bullet} \rightarrow\{*\}$ is obvious, the map $\{*\} \rightarrow X_{n}$ is given by mapping $*$ to $\left(U \rightarrow \ldots \rightarrow U, \mathrm{id}_{U}\right)$, and the maps

$$
h_{n, i}: X_{n} \longrightarrow X_{n}
$$

(Simplicial, Lemma 14.26.2) defining the homotopy between the two maps $X_{\bullet} \rightarrow X_{\bullet}$ are given by the rule

$$
h_{n, i}:\left(U_{0} \rightarrow \ldots \rightarrow U_{n}, f\right) \longmapsto\left(U \rightarrow \ldots \rightarrow U \rightarrow U_{i} \rightarrow \ldots \rightarrow U_{n}, \mathrm{id}\right)
$$

for $i>0$ and $h_{n, 0}=\mathrm{id}$. Verifications omitted. Since $\operatorname{Map}(-, A)$ is a contravariant functor, implies that $K^{\bullet}\left(p_{U, *} A\right)$ has trivial cohomology in positive degrees (by the functoriality of Simplicial, Remark 14.26 .4 and the result of Simplicial, Lemma 14.28.5). This implies that $K^{\bullet}(\mathcal{F})$ is acyclic in positive degrees also if $\mathcal{F}$ is a product of sheaves of the form $p_{U, *} A$. As every abelian sheaf on $\mathcal{C}$ embeds into such a product we conclude that $K^{\bullet}(\mathcal{F})$ computes the left derived functors $H^{n}(\mathcal{C},-)$ of $H^{0}(\mathcal{C},-)$ for example by Homology, Lemma 12.11.4 and Derived Categories, Lemma 13.17.6,

08S0 Example 21.33.2 (Computing Exts). In Example 21.30.1 assume we are moreover given a sheaf of rings $\mathcal{O}$ on $\mathcal{C}$. Let $\mathcal{F}, \mathcal{G}$ be $\mathcal{O}$-modules. Consider the complex $K^{\bullet}(\mathcal{G}, \mathcal{F})$ with degree $n$ term

$$
\prod_{U_{0} \rightarrow U_{1} \rightarrow \ldots \rightarrow U_{n}} \operatorname{Hom}_{\mathcal{O}\left(U_{n}\right)}\left(\mathcal{G}\left(U_{n}\right), \mathcal{F}\left(U_{0}\right)\right)
$$

and transition map given by

$$
\left(\varphi_{U_{0} \rightarrow U_{1}}\right) \longmapsto\left(\left(U_{0} \rightarrow U_{1} \rightarrow U_{2}\right) \mapsto \varphi_{U_{0} \rightarrow U_{1}} \circ \rho_{U_{1}}^{U_{2}}-\varphi_{U_{0} \rightarrow U_{2}}+\rho_{U_{0}}^{U_{1}} \circ \varphi_{U_{1} \rightarrow U_{2}}\right.
$$

and similarly in other degrees. Here the $\rho$ 's indicate restriction maps. By construction

$$
\operatorname{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{F})=H^{0}\left(K^{\bullet}(\mathcal{G}, \mathcal{F})\right)
$$

for all pairs of $\mathcal{O}$-modules $\mathcal{F}, \mathcal{G}$. The assignment $(\mathcal{G}, \mathcal{F}) \mapsto K^{\bullet}(\mathcal{G}, \mathcal{F})$ is a bifunctor which transforms direct sums in the first variable into products and commutes with products in the second variable. We claim that

$$
\operatorname{Ext}_{\mathcal{O}}^{i}(\mathcal{G}, \mathcal{F})=H^{i}\left(K^{\bullet}(\mathcal{G}, \mathcal{F})\right)
$$

for $i \geq 0$ provided either
(1) $\mathcal{G}(U)$ is a projective $\mathcal{O}(U)$-module for all $U \in \mathrm{Ob}(\mathcal{C})$, or
(2) $\mathcal{F}(U)$ is an injective $\mathcal{O}(U)$-module for all $U \in \mathrm{Ob}(\mathcal{C})$.

Namely, case (1) the functor $K^{\bullet}(\mathcal{G},-)$ is an exact functor from the category of $\mathcal{O}$ modules to the category of cochain complexes of abelian groups. Thus, arguing as in Example 21.33.1, it suffices to show that $K^{\bullet}(\mathcal{G}, \mathcal{F})$ is acyclic in positive degrees when $\mathcal{F}$ is $p_{U, *} A$ for an $\mathcal{O}(U)$-module $A$. Choose a short exact sequence

$$
\begin{equation*}
0 \rightarrow \mathcal{G}^{\prime} \rightarrow \bigoplus j_{U_{i}!} \mathcal{O}_{U_{i}} \rightarrow \mathcal{G} \rightarrow 0 \tag{21.33.2.1}
\end{equation*}
$$

see Modules on Sites, Lemma 18.28.6. Since (1) holds for the middle and right sheaves, it also holds for $\mathcal{G}^{\prime}$ and evaluating 21.33.2.1 on an object of $\mathcal{C}$ gives a split exact sequence of modules. We obtain a short exact sequence of complexes

$$
0 \rightarrow K^{\bullet}(\mathcal{G}, \mathcal{F}) \rightarrow \prod K^{\bullet}\left(j_{U_{i}!} \mathcal{O}_{U_{i}}, \mathcal{F}\right) \rightarrow K^{\bullet}\left(\mathcal{G}^{\prime}, \mathcal{F}\right) \rightarrow 0
$$

for any $\mathcal{F}$, in particular $\mathcal{F}=p_{U, *} A$. On $H^{0}$ we obtain

$$
0 \rightarrow \operatorname{Hom}\left(\mathcal{G}, p_{U, *} A\right) \rightarrow \operatorname{Hom}\left(\prod j_{U_{i}!} \mathcal{O}_{U_{i}}, p_{U, *} A\right) \rightarrow \operatorname{Hom}\left(\mathcal{G}^{\prime}, p_{U, *} A\right) \rightarrow 0
$$

which is exact as $\operatorname{Hom}\left(\mathcal{H}, p_{U, *} A\right)=\operatorname{Hom}_{\mathcal{O}(U)}(\mathcal{H}(U), A)$ and the sequence of sections of 21.33.2.1 over $U$ is split exact. Thus we can use dimension shifting to see that it suffices to prove $K^{\bullet}\left(j_{U^{\prime}!} \mathcal{O}_{U^{\prime}}, p_{U, *} A\right)$ is acyclic in positive degrees for all $U, U^{\prime} \in \operatorname{Ob}(\mathcal{C})$. In this case $K^{n}\left(j_{U^{\prime}!} \mathcal{O}_{U^{\prime}}, p_{U, *} A\right)$ is equal to

$$
\prod_{U \rightarrow U_{0} \rightarrow U_{1} \rightarrow \ldots \rightarrow U_{n} \rightarrow U^{\prime}} A
$$

In other words, $K^{\bullet}\left(j_{U^{\prime}!} \mathcal{O}_{U^{\prime}}, p_{U, *} A\right)$ is the complex with terms $\operatorname{Map}\left(X_{\bullet}, A\right)$ where

$$
X_{n}=\coprod_{U_{0} \rightarrow \ldots \rightarrow U_{n-1} \rightarrow U_{n}} \operatorname{Mor}_{\mathcal{C}}\left(U, U_{0}\right) \times \operatorname{Mor}_{\mathcal{C}}\left(U_{n}, U^{\prime}\right)
$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$ as can be proved in exactly the same way as the corresponding statement in Example 21.33.1. This finishes the proof of the claim.
The argument in case (2) is similar (but dual).

### 21.34. Strictly perfect complexes

08FK This section is the analogue of Cohomology, Section 20.38 .
08FL Definition 21.34.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^{\bullet}$ be a complex of $\mathcal{O}$ modules. We say $\mathcal{E}^{\bullet}$ is strictly perfect if $\mathcal{E}^{i}$ is zero for all but finitely many $i$ and $\mathcal{E}^{i}$ is a direct summand of a finite free $\mathcal{O}$-module for all $i$.

Let $U$ be an object of $\mathcal{C}$. We will often say "Let $\mathcal{E}$ • be a strictly perfect complex of $\mathcal{O}_{U}$-modules" to mean $\mathcal{E}^{\bullet}$ is a strictly perfect complex of modules on the ringed site $\left(\mathcal{C} / U, \mathcal{O}_{U}\right)$, see Modules on Sites, Definition 18.19.1.
08FM Lemma 21.34.2. The cone on a morphism of strictly perfect complexes is strictly perfect.
Proof. This is immediate from the definitions.
09J8 Lemma 21.34.3. The total complex associated to the tensor product of two strictly perfect complexes is strictly perfect.
Proof. Omitted.
08H3 Lemma 21.34.4. Let $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. If $\mathcal{F}^{\bullet}$ is a strictly perfect complex of $\mathcal{O}_{\mathcal{D}}$-modules, then $f^{*} \mathcal{F}^{\bullet}$ is a strictly perfect complex of $\mathcal{O}_{\mathcal{C}}$-modules.

Proof. We have seen in Modules on Sites, Lemma 18.17 .2 that the pullback of a finite free module is finite free. The functor $f^{*}$ is additive functor hence preserves direct summands. The lemma follows.

08FN Lemma 21.34.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. Given a solid diagram of $\mathcal{O}_{U}$-modules

with $\mathcal{E}$ a direct summand of a finite free $\mathcal{O}_{U}$-module and $p$ surjective, then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that a dotted arrow making the diagram commute exists over each $U_{i}$.
Proof. We may assume $\mathcal{E}=\mathcal{O}_{U}^{\oplus n}$ for some $n$. In this case finding the dotted arrow is equivalent to lifting the images of the basis elements in $\Gamma(U, \mathcal{F})$. This is locally possible by the characterization of surjective maps of sheaves (Sites, Section 7.12.

08FP Lemma 21.34.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$.
(1) Let $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ be a morphism of complexes of $\mathcal{O}_{U}$-modules with $\mathcal{E}^{\bullet}$ strictly perfect and $\mathcal{F}^{\bullet}$ acyclic. Then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that each $\left.\alpha\right|_{U_{i}}$ is homotopic to zero.
(2) Let $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ be a morphism of complexes of $\mathcal{O}_{U}$-modules with $\mathcal{E}^{\bullet}$ strictly perfect, $\mathcal{E}^{i}=0$ for $i<a$, and $H^{i}\left(\mathcal{F}^{\bullet}\right)=0$ for $i \geq a$. Then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that each $\left.\alpha\right|_{U_{i}}$ is homotopic to zero.

Proof. The first statement follows from the second, hence we only prove (2). We will prove this by induction on the length of the complex $\mathcal{E}^{\bullet}$. If $\mathcal{E} \bullet \cong \mathcal{E}[-n]$ for some direct summand $\mathcal{E}$ of a finite free $\mathcal{O}$-module and integer $n \geq a$, then the result follows from Lemma 21.34 .5 and the fact that $\mathcal{F}^{n-1} \rightarrow \operatorname{Ker}\left(\mathcal{F}^{n} \rightarrow \mathcal{F}^{n+1}\right)$ is surjective by the assumed vanishing of $H^{n}\left(\mathcal{F}^{\bullet}\right)$. If $\mathcal{E}^{i}$ is zero except for $i \in[a, b]$, then we have a split exact sequence of complexes

$$
0 \rightarrow \mathcal{E}^{b}[-b] \rightarrow \mathcal{E}^{\bullet} \rightarrow \sigma_{\leq b-1} \mathcal{E}^{\bullet} \rightarrow 0
$$

which determines a distinguished triangle in $K\left(\mathcal{O}_{U}\right)$. Hence an exact sequence

$$
\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\sigma_{\leq b-1} \mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right) \rightarrow \operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right) \rightarrow \operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{b}[-b], \mathcal{F}^{\bullet}\right)
$$

by the axioms of triangulated categories. The composition $\mathcal{E}^{b}[-b] \rightarrow \mathcal{F}^{\bullet}$ is homotopic to zero on the members of a covering of $U$ by the above, whence we may assume our map comes from an element in the left hand side of the displayed exact sequence above. This element is zero on the members of a covering of $U$ by induction hypothesis.

08FQ Lemma 21.34.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. Given a solid diagram of complexes of $\mathcal{O}_{U}$-modules

with $\mathcal{E}^{\bullet}$ strictly perfect, $\mathcal{E}^{j}=0$ for $j<a$ and $H^{j}(f)$ an isomorphism for $j>a$ and surjective for $j=a$, then there exists a covering $\left\{U_{i} \rightarrow U\right\}$ and for each $i$ a dotted arrow over $U_{i}$ making the diagram commute up to homotopy.

Proof. Our assumptions on $f$ imply the cone $C(f)^{\bullet}$ has vanishing cohomology sheaves in degrees $\geq a$. Hence Lemma 21.34 .6 guarantees there is a covering $\left\{U_{i} \rightarrow\right.$ $U\}$ such that the composition $\mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet} \rightarrow C(f)^{\bullet}$ is homotopic to zero over $U_{i}$. Since

$$
\mathcal{G}^{\bullet} \rightarrow \mathcal{F}^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow \mathcal{G}^{\bullet}[1]
$$

restricts to a distinguished triangle in $K\left(\mathcal{O}_{U_{i}}\right)$ we see that we can lift $\left.\alpha\right|_{U_{i}}$ up to homotopy to a map $\alpha_{i}:\left.\left.\mathcal{E}\right|_{U_{i}} \rightarrow \mathcal{G}^{\bullet}\right|_{U_{i}}$ as desired.

08 FR Lemma 21.34.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}_{U}$-modules with $\mathcal{E} \bullet$ strictly perfect.
(1) For any element $\alpha \in \operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\alpha\right|_{U_{i}}$ is given by a morphism of complexes $\alpha_{i}:\left.\left.\mathcal{E}^{\bullet}\right|_{U_{i}} \rightarrow \mathcal{F}^{\bullet}\right|_{U_{i}}$.
(2) Given a morphism of complexes $\alpha: \mathcal{E}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ whose image in the group $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is zero, there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\alpha\right|_{U_{i}}$ is homotopic to zero.

Proof. Proof of (1). By the construction of the derived category we can find a quasi-isomorphism $f: \mathcal{F}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ and a map of complexes $\beta: \mathcal{E}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ such that $\alpha=f^{-1} \beta$. Thus the result follows from Lemma 21.34.7. We omit the proof of (2).

08JH Lemma 21.34.9. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}$ modules with $\mathcal{E}^{\bullet}$ strictly perfect. Then the internal hom $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\mathcal{H}^{\bullet}$ with terms

$$
\mathcal{H}^{n}=\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

and differential as described in Section 21.26.

Proof. Choose a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ into a K-injective complex. Let $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ be the complex with terms

$$
\left(\mathcal{H}^{\prime}\right)^{n}=\prod_{n=p+q} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{L}^{-q}, \mathcal{I}^{p}\right)
$$

which represents $R \mathcal{H} \operatorname{om}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ by the construction in Section 21.26 It suffices to show that the map

$$
\mathcal{H}^{\bullet} \longrightarrow\left(\mathcal{H}^{\prime}\right)^{\bullet}
$$

is a quasi-isomorphism. Given an object $U$ of $\mathcal{C}$ we have by inspection

$$
H^{0}\left(\mathcal{H}^{\bullet}(U)\right)=\operatorname{Hom}_{K\left(\mathcal{O}_{U}\right)}\left(\left.\mathcal{E}^{\bullet}\right|_{U},\left.\mathcal{K}^{\bullet}\right|_{U}\right) \rightarrow H^{0}\left(\left(\mathcal{H}^{\prime}\right)^{\bullet}(U)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.\mathcal{E}^{\bullet}\right|_{U},\left.\mathcal{K}^{\bullet}\right|_{U}\right)
$$

By Lemma 21.34 .8 the sheafification of $U \mapsto H^{0}\left(\mathcal{H}^{\bullet}(U)\right)$ is equal to the sheafification of $U \mapsto H^{0}\left(\left(\mathcal{H}^{\prime}\right)^{\bullet}(U)\right)$. A similar argument can be given for the other cohomology sheaves. Thus $\mathcal{H}^{\bullet}$ is quasi-isomorphic to $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ which proves the lemma.

08JI Lemma 21.34.10. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}$ be complexes of $\mathcal{O}$ modules with
(1) $\mathcal{F}^{n}=0$ for $n \ll 0$,
(2) $\mathcal{E}^{n}=0$ for $n \gg 0$, and
(3) $\mathcal{E}^{n}$ isomorphic to a direct summand of a finite free $\mathcal{O}$-module.

Then the internal hom $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\mathcal{H}^{\bullet}$ with terms

$$
\mathcal{H}^{n}=\bigoplus_{n=p+q} \mathcal{H o m _ { \mathcal { O } }}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

and differential as described in Section 21.26.
Proof. Choose a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ where $\mathcal{I}^{\bullet}$ is a bounded below complex of injectives. Note that $\mathcal{I}^{\bullet}$ is K-injective (Derived Categories, Lemma 13.29.4). Hence the construction in Section 21.26 shows that $R \mathcal{H o m}\left(\mathcal{E}^{\bullet}, \mathcal{F}^{\bullet}\right)$ is represented by the complex $\left(\mathcal{H}^{\prime}\right)^{\bullet}$ with terms

$$
\left(\mathcal{H}^{\prime}\right)^{n}=\prod_{n=p+q} \mathcal{H} \operatorname{Hom}_{\mathcal{O}}\left(\mathcal{E}^{-q}, \mathcal{I}^{p}\right)=\bigoplus_{n=p+q} \mathcal{H o m} \boldsymbol{\mathcal { O }}^{\left(\mathcal{E}^{-q}, \mathcal{I}^{p}\right)}
$$

(equality because there are only finitely many nonzero terms). Note that $\mathcal{H}^{\bullet}$ is the total complex associated to the double complex with terms $\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)$ and similarly for $\left(\mathcal{H}^{\prime}\right)^{\bullet}$. The natural map $\left(\mathcal{H}^{\prime}\right)^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ comes from a map of double complexes. Thus to show this map is a quasi-isomorphism, we may use the spectral sequence of a double complex (Homology, Lemma 12.22.6)

$$
{ }^{\prime} E_{1}^{p, q}=H^{p}\left(\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}^{-q}, \mathcal{F}^{\bullet}\right)\right)
$$

converging to $H^{p+q}\left(\mathcal{H}^{\bullet}\right)$ and similarly for $\left(\mathcal{H}^{\prime}\right)^{\bullet}$. To finish the proof of the lemma it suffices to show that $\mathcal{F}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$ induces an isomorphism

$$
H^{p}\left(\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow H^{p}\left(\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}, \mathcal{I}^{\bullet}\right)\right)
$$

on cohomology sheaves whenever $\mathcal{E}$ is a direct summand of a finite free $\mathcal{O}$-module. Since this is clear when $\mathcal{E}$ is finite free the result follows.

### 21.35. Pseudo-coherent modules

08FS In this section we discuss pseudo-coherent complexes.
08FT Definition 21.35.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E} \bullet$ be a complex of $\mathcal{O}$ modules. Let $m \in \mathbf{Z}$.
(1) We say $\mathcal{E} \bullet$ is m-pseudo-coherent if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ and for each $i$ a morphism of complexes $\alpha_{i}: \mathcal{E}_{i}^{\bullet} \rightarrow$ $\left.\mathcal{E} \bullet\right|_{U_{i}}$ where $\mathcal{E}_{i}$ is a strictly perfect complex of $\mathcal{O}_{U_{i}}$-modules and $H^{j}\left(\alpha_{i}\right)$ is an isomorphism for $j>m$ and $H^{m}\left(\alpha_{i}\right)$ is surjective.
(2) We say $\mathcal{E}^{\bullet}$ is pseudo-coherent if it is $m$-pseudo-coherent for all $m$.
(3) We say an object $E$ of $D(\mathcal{O})$ is m-pseudo-coherent (resp. pseudo-coherent) if and only if it can be represented by a $m$-pseudo-coherent (resp. pseudocoherent) complex of $\mathcal{O}$-modules.

If $\mathcal{C}$ has a final object $X$ which is quasi-compact (i.e., every covering of $X$ can be refined by a finite covering), then an $m$-pseudo-coherent object of $D(\mathcal{O})$ is in $D^{-}(\mathcal{O})$. But this need not be the case in general.

08 FU Lemma 21.35.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$.
(1) If $\mathcal{C}$ has a final object $X$ and if there exist a covering $\left\{U_{i} \rightarrow X\right\}$, strictly perfect complexes $\mathcal{E}_{i}^{\bullet}$ of $\mathcal{O}_{U_{i}}$-modules, and maps $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow E\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $H^{j}\left(\alpha_{i}\right)$ an isomorphism for $j>m$ and $H^{m}\left(\alpha_{i}\right)$ surjective, then $E$ is m-pseudo-coherent.
(2) If $E$ is m-pseudo-coherent, then any complex of $\mathcal{O}$-modules representing $E$ is m-pseudo-coherent.
(3) If for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.E\right|_{U_{i}}$ is m-pseudo-coherent, then $E$ is m-pseudo-coherent.
Proof. Let $\mathcal{F}^{\bullet}$ be any complex representing $E$ and let $X,\left\{U_{i} \rightarrow X\right\}$, and $\alpha_{i}$ : $\left.\mathcal{E}_{i} \rightarrow E\right|_{U_{i}}$ be as in (1). We will show that $\mathcal{F}^{\bullet}$ is $m$-pseudo-coherent as a complex, which will prove (1) and (2) in case $\mathcal{C}$ has a final object. By Lemma 21.34.8 we can after refining the covering $\left\{U_{i} \rightarrow X\right\}$ represent the maps $\alpha_{i}$ by maps of complexes $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{F}^{\bullet}\right|_{U_{i}}$. By assumption $H^{j}\left(\alpha_{i}\right)$ are isomorphisms for $j>m$, and $H^{m}\left(\alpha_{i}\right)$ is surjective whence $\mathcal{F}^{\bullet}$ is $m$-pseudo-coherent.

Proof of (2). By the above we see that $\left.\mathcal{F}^{\bullet}\right|_{U}$ is $m$-pseudo-coherent as a complex of $\mathcal{O}_{U}$-modules for all objects $U$ of $\mathcal{C}$. It is a formal consequence of the definitions that $\mathcal{F}^{\bullet}$ is $m$-pseudo-coherent.
Proof of (3). Follows from the definitions and Sites, Definition 7.6.2 part (2).
08H4 Lemma 21.35.3. Let $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed sites. Let $E$ be an object of $D\left(\mathcal{O}_{\mathcal{C}}\right)$. If $E$ is m-pseudo-coherent, then $L f^{*} E$ is m-pseudocoherent.

Proof. Say $f$ is given by the functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $U$ be an object of $\mathcal{C}$. By Sites, Lemma 7.15.9 we can find a covering $\left\{U_{i} \rightarrow U\right\}$ and for each $i$ a morphism $U_{i} \rightarrow u\left(V_{i}\right)$ for some object $V_{i}$ of $\mathcal{D}$. By Lemma 21.35 .2 it suffices to show that $\left.L f^{*} E\right|_{U_{i}}$ is $m$-pseudo-coherent. To do this it is enough to show that $\left.L f^{*} E\right|_{u\left(V_{i}\right)}$ is $m$-pseudo-coherent, since $\left.L f^{*} E\right|_{U_{i}}$ is the restriction of $\left.L f^{*} E\right|_{u\left(V_{i}\right)}$ to $\mathcal{C} / U_{i}$ (via Modules on Sites, Lemma 18.19.4. By the commutative diagram of Modules on Sites, Lemma 18.20 .1 it suffices to prove the lemma for the morphism of ringed
sites $\left(\mathcal{C} / u\left(V_{i}\right), \mathcal{O}_{u\left(V_{i}\right)}\right) \rightarrow\left(\mathcal{D} / V_{i}, \mathcal{O}_{V_{i}}\right)$. Thus we may assume $\mathcal{D}$ has a final object $Y$ such that $X=u(Y)$ is a final object of $\mathcal{C}$.
Let $\left\{V_{i} \rightarrow Y\right\}$ be a covering such that for each $i$ there exists a strictly perfect complex $\mathcal{F}_{i}^{\bullet}$ of $\mathcal{O}_{V_{i}}$-modules and a morphism $\alpha_{i}:\left.\mathcal{F}_{i}^{\bullet} \rightarrow E\right|_{V_{i}}$ of $D\left(\mathcal{O}_{V_{i}}\right)$ such that $H^{j}\left(\alpha_{i}\right)$ is an isomorphism for $j>m$ and $H^{m}\left(\alpha_{i}\right)$ is surjective. Arguing as above it suffices to prove the result for $\left(\mathcal{C} / u\left(V_{i}\right), \mathcal{O}_{u\left(V_{i}\right)}\right) \rightarrow\left(\mathcal{D} / V_{i}, \mathcal{O}_{V_{i}}\right)$. Hence we may assume that there exists a strictly perfect complex $\mathcal{F}^{\bullet}$ of $\mathcal{O}_{\mathcal{D}}$-modules and a morphism $\alpha: \mathcal{F}^{\bullet} \rightarrow E$ of $D\left(\mathcal{O}_{\mathcal{D}}\right)$ such that $H^{j}(\alpha)$ is an isomorphism for $j>m$ and $H^{m}(\alpha)$ is surjective. In this case, choose a distinguished triangle

$$
\mathcal{F}^{\bullet} \rightarrow E \rightarrow C \rightarrow \mathcal{F}^{\bullet}[1]
$$

The assumption on $\alpha$ means exactly that the cohomology sheaves $H^{j}(C)$ are zero for all $j \geq m$. Applying $L f^{*}$ we obtain the distinguished triangle

$$
L f^{*} \mathcal{F}^{\bullet} \rightarrow L f^{*} E \rightarrow L f^{*} C \rightarrow L f^{*} \mathcal{F}^{\bullet}[1]
$$

By the construction of $L f^{*}$ as a left derived functor we see that $H^{j}\left(L f^{*} C\right)=0$ for $j \geq m$ (by the dual of Derived Categories, Lemma 13.17.1). Hence $H^{j}\left(L f^{*} \alpha\right)$ is an isomorphism for $j>m$ and $H^{m}\left(L f^{*} \alpha\right)$ is surjective. On the other hand, since $\mathcal{F}^{\bullet}$ is a bounded above complex of flat $\mathcal{O}_{\mathcal{D}}$-modules we see that $L f^{*} \mathcal{F}^{\bullet}=f^{*} \mathcal{F}^{\bullet}$. Applying Lemma 21.34.4 we conclude.

08 FV Lemma 21.35.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site and $m \in \mathbf{Z}$. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D(\mathcal{O})$.
(1) If $K$ is $(m+1)$-pseudo-coherent and $L$ is m-pseudo-coherent then $M$ is m-pseudo-coherent.
(2) If $K$ anf $M$ are $m$-pseudo-coherent, then $L$ is m-pseudo-coherent.
(3) If $L$ is $(m+1)$-pseudo-coherent and $M$ is m-pseudo-coherent, then $K$ is ( $m+1$ )-pseudo-coherent.

Proof. Proof of (1). Let $U$ be an object of $\mathcal{C}$. Choose a covering $\left\{U_{i} \rightarrow U\right\}$ and $\operatorname{maps} \alpha_{i}:\left.\mathcal{K}_{i}^{\bullet} \rightarrow K\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $\mathcal{K}_{i}^{\bullet}$ strictly perfect and $H^{j}\left(\alpha_{i}\right)$ isomorphisms for $j>m+1$ and surjective for $j=m+1$. We may replace $\mathcal{K}_{i}^{\bullet}$ by $\sigma_{\geq m+1} \mathcal{K}_{i}^{\bullet}$ and hence we may assume that $\mathcal{K}_{i}^{j}=0$ for $j<m+1$. After refining the covering we may choose maps $\beta_{i}:\left.\mathcal{L}_{i}^{\bullet} \rightarrow L\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$ with $\mathcal{L}_{i}^{\bullet}$ strictly perfect such that $H^{j}(\beta)$ is an isomorphism for $j>m$ and surjective for $j=m$. By Lemma 21.34.7 we can, after refining the covering, find maps of complexes $\gamma_{i}: \mathcal{K}^{\bullet} \rightarrow \mathcal{L}^{\bullet}$ such that the diagrams

are commutative in $D\left(\mathcal{O}_{U_{i}}\right)$ (this requires representing the maps $\alpha_{i}, \beta_{i}$ and $\left.K\right|_{U_{i}} \rightarrow$ $\left.L\right|_{U_{i}}$ by actual maps of complexes; some details omitted). The cone $C\left(\gamma_{i}\right)^{\bullet}$ is strictly perfect (Lemma 21.34.2). The commutativity of the diagram implies that there exists a morphism of distinguished triangles

$$
\left(\mathcal{K}_{i}^{\bullet}, \mathcal{L}_{i}^{\bullet}, C\left(\gamma_{i}\right)^{\bullet}\right) \longrightarrow\left(\left.K\right|_{U_{i}},\left.L\right|_{U_{i}},\left.M\right|_{U_{i}}\right)
$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5 .19 and 12.5 .20 that $\left.C\left(\gamma_{i}\right)^{\bullet} \rightarrow M\right|_{U_{i}}$ induces an isomorphism on
cohomology in degrees $>m$ and a surjection in degree $m$. Hence $M$ is $m$-pseudocoherent by Lemma 21.35.2.
Assertions (2) and (3) follow from (1) by rotating the distinguished triangle.
09J9
Lemma 21.35.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L$ be objects of $D(\mathcal{O})$.
(1) If $K$ is n-pseudo-coherent and $H^{i}(K)=0$ for $i>a$ and $L$ is m-pseudocoherent and $H^{j}(L)=0$ for $j>b$, then $K \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} L$ is $t$-pseudo-coherent with $t=\max (m+a, n+b)$.
(2) If $K$ and $L$ are pseudo-coherent, then $K \otimes_{\mathcal{O}}^{\mathbf{L}} L$ is pseudo-coherent.

Proof. Proof of (1). Let $U$ be an object of $\mathcal{C}$. By replacing $U$ by the members of a covering and replacing $\mathcal{C}$ by the localization $\mathcal{C} / U$ we may assume there exist strictly perfect complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$ and maps $\alpha: \mathcal{K}^{\bullet} \rightarrow K$ and $\beta: \mathcal{L}^{\bullet} \rightarrow L$ with $H^{i}(\alpha)$ and isomorphism for $i>n$ and surjective for $i=n$ and with $H^{i}(\beta)$ and isomorphism for $i>m$ and surjective for $i=m$. Then the map

$$
\alpha \otimes^{\mathbf{L}} \beta: \operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}} \mathcal{L}^{\bullet}\right) \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} L
$$

induces isomorphisms on cohomology sheaves in degree $i$ for $i>t$ and a surjection for $i=t$. This follows from the spectral sequence of tors (details omitted).
Proof of (2). Let $U$ be an object of $\mathcal{C}$. We may first replace $U$ by the members of a covering and $\mathcal{C}$ by the localization $\mathcal{C} / U$ to reduce to the case that $K$ and $L$ are bounded above. Then the statement follows immediately from case (1).

08 FW Lemma 21.35.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $m \in \mathbf{Z}$. If $K \oplus L$ is $m$-pseudocoherent (resp. pseudo-coherent) in $D(\mathcal{O})$ so are $K$ and $L$.

Proof. Assume that $K \oplus L$ is $m$-pseudo-coherent. Let $U$ be an object of $\mathcal{C}$. After replacing $U$ by the members of a covering we may assume $K \oplus L \in D^{-}\left(\mathcal{O}_{U}\right)$, hence $L \in D^{-}\left(\mathcal{O}_{U}\right)$. Note that there is a distinguished triangle

$$
(K \oplus L, K \oplus L, L \oplus L[1])=(K, K, 0) \oplus(L, L, L \oplus L[1])
$$

see Derived Categories, Lemma 13.4.9. By Lemma 21.35.4 we see that $L \oplus L[1]$ is $m$-pseudo-coherent. Hence also $L[1] \oplus L[2]$ is $m$-pseudo-coherent. By induction $L[n] \oplus L[n+1]$ is $m$-pseudo-coherent. Since $L$ is bounded above we see that $L[n]$ is $m$-pseudo-coherent for large $n$. Hence working backwards, using the distinguished triangles

$$
(L[n], L[n] \oplus L[n-1], L[n-1])
$$

we conclude that $L[n-1], L[n-2], \ldots, L$ are $m$-pseudo-coherent as desired.
08FX Lemma 21.35.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be an object of $D(\mathcal{O})$. Let $m \in \mathbf{Z}$.
(1) If $K$ is m-pseudo-coherent and $H^{i}(K)=0$ for $i>m$, then $H^{m}(K)$ is a finite type $\mathcal{O}$-module.
(2) If $K$ is m-pseudo-coherent and $H^{i}(K)=0$ for $i>m+1$, then $H^{m+1}(K)$ is a finitely presented $\mathcal{O}$-module.

Proof. Proof of (1). Let $U$ be an object of $\mathcal{C}$. We have to show that $H^{m}(K)$ is can be generated by finitely many sections over the members of a covering of $U$ (see Modules on Sites, Definition 18.23.1). Thus during the proof we may (finitely often) choose a covering $\left\{U_{i} \rightarrow U\right\}$ and replace $\mathcal{C}$ by $\mathcal{C} / U_{i}$ and $U$ by $U_{i}$. In particular, by our definitions we may assume there exists a strictly perfect complex $\mathcal{E}^{\bullet}$ and a map
$\alpha: \mathcal{E}^{\bullet} \rightarrow K$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. It suffices to prove the result for $\mathcal{E}^{\bullet}$. Let $n$ be the largest integer such that $\mathcal{E}^{n} \neq 0$. If $n=m$, then $H^{m}\left(\mathcal{E}^{\bullet}\right)$ is a quotient of $\mathcal{E}^{n}$ and the result is clear. If $n>m$, then $\mathcal{E}^{n-1} \rightarrow \mathcal{E}^{n}$ is surjective as $H^{n}\left(E^{\bullet}\right)=0$. By Lemma 21.34 .5 we can (after replacing $U$ by the members of a covering) find a section of this surjection and write $\mathcal{E}^{n-1}=\mathcal{E}^{\prime} \oplus \mathcal{E}^{n}$. Hence it suffices to prove the result for the complex $\left(\mathcal{E}^{\prime}\right)^{\bullet}$ which is the same as $\mathcal{E}^{\bullet}$ except has $\mathcal{E}^{\prime}$ in degree $n-1$ and 0 in degree $n$. We win by induction on $n$.

Proof of (2). Pick an object $U$ of $\mathcal{C}$. As in the proof of (1) we may work locally on $U$. Hence we may assume there exists a strictly perfect complex $\mathcal{E}^{\bullet}$ and a map $\alpha: \mathcal{E}^{\bullet} \rightarrow K$ which induces an isomorphism on cohomology in degrees $>m$ and a surjection in degree $m$. As in the proof of (1) we can reduce to the case that $\mathcal{E}^{i}=0$ for $i>m+1$. Then we see that $H^{m+1}(K) \cong H^{m+1}\left(\mathcal{E}^{\bullet}\right)=\operatorname{Coker}\left(\mathcal{E}^{m} \rightarrow \mathcal{E}^{m+1}\right)$ which is of finite presentation.

### 21.36. Tor dimension

08 FY In this section we take a closer look at resolutions by flat modules.
08 FZ Definition 21.36.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$ with $a \leq b$.
(1) We say $E$ has tor-amplitude in $[a, b]$ if $H^{i}\left(E \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}\right)=0$ for all $\mathcal{O}$-modules $\mathcal{F}$ and all $i \notin[a, b]$.
(2) We say $E$ has finite tor dimension if it has tor-amplitude in $[a, b]$ for some $a, b$.
(3) We say $E$ locally has finite tor dimension if for any object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.E\right|_{U_{i}}$ has finite tor dimension for all $i$.

Note that if $E$ has finite tor dimension, then $E$ is an object of $D^{b}(\mathcal{O})$ as can be seen by taking $\mathcal{F}=\mathcal{O}$ in the definition above.

08G0 Lemma 21.36.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E} \bullet$ be a bounded above complex of flat $\mathcal{O}$-modules with tor-amplitude in $[a, b]$. Then $\operatorname{Coker}\left(d_{\mathcal{E}}^{a-1}\right)$ is a flat $\mathcal{O}$-module.

Proof. As $\mathcal{E}$ • is a bounded above complex of flat modules we see that $\mathcal{E}^{\bullet} \otimes_{\mathcal{O}} \mathcal{F}=$ $\mathcal{E}^{\bullet} \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ for any $\mathcal{O}$-module $\mathcal{F}$. Hence for every $\mathcal{O}$-module $\mathcal{F}$ the sequence

$$
\mathcal{E}^{a-2} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^{a} \otimes_{\mathcal{O}} \mathcal{F}
$$

is exact in the middle. Since $\mathcal{E}^{a-2} \rightarrow \mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a} \rightarrow \operatorname{Coker}\left(d^{a-1}\right) \rightarrow 0$ is a flat resolution this implies that $\operatorname{Tor}_{1}^{\mathcal{O}}\left(\operatorname{Coker}\left(d^{a-1}\right), \mathcal{F}\right)=0$ for all $\mathcal{O}$-modules $\mathcal{F}$. This means that $\operatorname{Coker}\left(d^{a-1}\right)$ is flat, see Lemma 21.17.13.

08G1 Lemma 21.36.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent
(1) E has tor-amplitude in $[a, b]$.
(2) $E$ is represented by a complex $\mathcal{E} \bullet$ of flat $\mathcal{O}$-modules with $\mathcal{E}^{i}=0$ for $i \notin$ $[a, b]$.
Proof. If (2) holds, then we may compute $E \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}=\mathcal{E}^{\bullet} \otimes_{\mathcal{O}} \mathcal{F}$ and it is clear that (1) holds.

Assume that (1) holds. We may represent $E$ by a bounded above complex of flat $\mathcal{O}$-modules $\mathcal{K}^{\bullet}$, see Section 21.17. Let $n$ be the largest integer such that $\mathcal{K}^{n} \neq 0$. If $n>b$, then $\mathcal{K}^{n-1} \rightarrow \mathcal{K}^{n}$ is surjective as $H^{n}\left(\mathcal{K}^{\bullet}\right)=0$. As $\mathcal{K}^{n}$ is flat we see that $\operatorname{Ker}\left(\mathcal{K}^{n-1} \rightarrow \mathcal{K}^{n}\right)$ is flat (Modules on Sites, Lemma 18.28.8). Hence we may replace $\mathcal{K}^{\bullet}$ by $\tau_{\leq n-1} \mathcal{K}^{\bullet}$. Thus, by induction on $n$, we reduce to the case that $K^{\bullet}$ is a complex of flat $\mathcal{O}$-modules with $\mathcal{K}^{i}=0$ for $i>b$.

Set $\mathcal{E}^{\bullet}=\tau_{\geq a} \mathcal{K}^{\bullet}$. Everything is clear except that $\mathcal{E}^{a}$ is flat which follows immediately from Lemma 21.36 .2 and the definitions.

08H5 Lemma 21.36.4. Let $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed sites. Assume $\mathcal{C}$ has enough points. Let $E$ be an object of $D\left(\mathcal{O}_{\mathcal{D}}\right)$. If $E$ has tor amplitude in $[a, b]$, then $L f^{*} E$ has tor amplitude in $[a, b]$.

Proof. Assume $E$ has tor amplitude in $[a, b]$. By Lemma 21.36 .3 we can represent $E$ by a complex of $\mathcal{E}^{\bullet}$ of flat $\mathcal{O}$-modules with $\mathcal{E}^{i}=0$ for $i \notin[a, b]$. Then $L f^{*} E$ is represented by $f^{*} \mathcal{E}^{\bullet}$. By Modules on Sites, Lemma 18.38 .3 the module $f^{*} \mathcal{E}^{i}$ are flat (this is where we need the assumption on the existence of points). Thus by Lemma 21.36.3 we conclude that $L f^{*} E$ has tor amplitude in $[a, b]$.

08G2 Lemma 21.36.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$.
(1) If $K$ has tor-amplitude in $[a+1, b+1]$ and $L$ has tor-amplitude in $[a, b]$ then $M$ has tor-amplitude in $[a, b]$.
(2) If $K$ and $M$ have tor-amplitude in $[a, b]$, then $L$ has tor-amplitude in $[a, b]$.
(3) If $L$ has tor-amplitude in $[a+1, b+1]$ and $M$ has tor-amplitude in $[a, b]$, then $K$ has tor-amplitude in $[a+1, b+1]$.

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation.

09JA Lemma 21.36.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K, L$ be objects of $D(\mathcal{O})$. If $K$ has tor-amplitude in $[a, b]$ and $L$ has tor-amplitude in $[c, d]$ then $K \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} L$ has tor amplitude in $[a+c, b+d]$.

Proof. Omitted. Hint: use the spectral sequence for tors.
08G3 Lemma 21.36.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $a, b \in \mathbf{Z}$. For $K, L$ objects of $D(\mathcal{O})$ if $K \oplus L$ has tor amplitude in $[a, b]$ so do $K$ and $L$.

Proof. Clear from the fact that the Tor functors are additive.
0942 Lemma 21.36.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. Let $K$ be an object of $D(\mathcal{O})$.
(1) If $K \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}$ is bounded above, then $K \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n}$ is uniformly bounded above for all $n$.
(2) If $K \otimes{ }_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}$ as an object of $D(\mathcal{O} / \mathcal{I})$ has tor amplitude in $[a, b]$, then $K \otimes{ }_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n}$ as an object of $D\left(\mathcal{O} / \mathcal{I}^{n}\right)$ has tor amplitude in $[a, b]$ for all $n$.

Proof. Proof of (1). Assume that $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}$ is bounded above, say $H^{i}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}}\right.$ $\mathcal{O} / \mathcal{I})=0$ for $i>b$. Note that we have distinguished triangles

$$
K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^{n} / \mathcal{I}^{n+1} \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n+1} \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n} \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^{n} / \mathcal{I}^{n+1}[1]
$$

and that

$$
K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^{n} / \mathcal{I}^{n+1}=\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}\right) \otimes_{\mathcal{O} / \mathcal{I}}^{\mathbf{L}} \mathcal{I}^{n} / \mathcal{I}^{n+1}
$$

By induction we conclude that $H^{i}\left(K \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n}\right)=0$ for $i>b$ for all $n$.
Proof of (2). Assume $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}$ as an object of $D(\mathcal{O} / \mathcal{I})$ has tor amplitude in $[a, b]$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O} / \mathcal{I}^{n}$-modules. Then we have a finite filtration

$$
0 \subset \mathcal{I}^{n-1} \mathcal{F} \subset \ldots \subset \mathcal{I F} \subset \mathcal{F}
$$

whose successive quotients are sheaves of $\mathcal{O} / \mathcal{I}$-modules. Thus to prove that $K \otimes_{\mathcal{O}}^{\mathbf{L}}$ $\mathcal{O} / \mathcal{I}^{n}$ has tor amplitude in $[a, b]$ it suffices to show $H^{i}\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n} \otimes_{\mathcal{O} / \mathcal{I}^{n}}^{\mathbf{L}} \mathcal{G}\right)$ is zero for $i \notin[a, b]$ for all $\mathcal{O} / \mathcal{I}$-modules $\mathcal{G}$. Since

$$
\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}^{n}\right) \otimes_{\mathcal{O} / \mathcal{I}^{n}}^{\mathbf{L}} \mathcal{G}=\left(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O} / \mathcal{I}\right) \otimes_{\mathcal{O} / \mathcal{I}}^{\mathbf{L}} \mathcal{G}
$$

for every sheaf of $\mathcal{O} / \mathcal{I}$-modules $\mathcal{G}$ the result follows.

### 21.37. Perfect complexes

In this section we discuss properties of perfect complexes on ringed sites.
08G5 Definition 21.37.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^{\bullet}$ be a complex of $\mathcal{O}$ modules. We say $\mathcal{E}^{\bullet}$ is perfect if for every object $U$ of $\mathcal{C}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that for each $i$ there exists a morphism of complexes $\left.\mathcal{E}_{i}^{\bullet} \rightarrow \mathcal{E}^{\bullet}\right|_{U_{i}}$ which is a quasi-isomorphism with $\mathcal{E}_{i}^{\bullet}$ strictly perfect. An object $E$ of of $D(\mathcal{O})$ is perfect if it can be represented by a perfect complex of $\mathcal{O}$-modules.
08G6 Lemma 21.37.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$.
(1) If $\mathcal{C}$ has a final object $X$ and there exist a covering $\left\{U_{i} \rightarrow X\right\}$, strictly perfect complexes $\mathcal{E}_{i}^{\bullet}$ of $\mathcal{O}_{U_{i}}$-modules, and isomorphisms $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow E\right|_{U_{i}}$ in $D\left(\mathcal{O}_{U_{i}}\right)$, then $E$ is perfect.
(2) If $E$ is perfect, then any complex representing $E$ is perfect.

Proof. Identical to the proof of Lemma 21.35 .2 .
08G7 Lemma 21.37.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$. Let $a \leq b$ be integers. If $E$ has tor amplitude in $[a, b]$ and is $(a-1)$-pseudo-coherent, then $E$ is perfect.

Proof. Let $U$ be an object of $\mathcal{C}$. After replacing $U$ by the members of a covering and $\mathcal{C}$ by the localization $\mathcal{C} / U$ we may assume there exists a strictly perfect complex $\mathcal{E}^{\bullet}$ and a $\operatorname{map} \alpha: \mathcal{E}^{\bullet} \rightarrow E$ such that $H^{i}(\alpha)$ is an isomorphism for $i \geq a$. We may and do replace $\mathcal{E}^{\bullet}$ by $\sigma_{\geq a-1} \mathcal{E}^{\bullet}$. Choose a distinguished triangle

$$
\mathcal{E}^{\bullet} \rightarrow E \rightarrow C \rightarrow \mathcal{E}^{\bullet}[1]
$$

From the vanishing of cohomology sheaves of $E$ and $\mathcal{E}^{\bullet}$ and the assumption on $\alpha$ we obtain $C \cong \mathcal{K}[a-2]$ with $\mathcal{K}=\operatorname{Ker}\left(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a}\right)$. Let $\mathcal{F}$ be an $\mathcal{O}$-module. Applying $-\otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ the assumption that $E$ has tor amplitude in $[a, b]$ implies $\mathcal{K} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow$ $\mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F}$ has image $\operatorname{Ker}\left(\mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^{a} \otimes_{\mathcal{O}} \mathcal{F}\right)$. It follows that $\operatorname{Tor}_{1}^{\mathcal{O}}\left(\mathcal{E}^{\prime}, \mathcal{F}\right)=0$ where $\mathcal{E}^{\prime}=\operatorname{Coker}\left(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^{a}\right)$. Hence $\mathcal{E}^{\prime}$ is flat (Lemma 21.17.13). Thus there
exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.\mathcal{E}^{\prime}\right|_{U_{i}}$ is a direct summand of a finite free module by Modules on Sites, Lemma 18.28.12. Thus the complex

$$
\left.\left.\left.\mathcal{E}^{\prime}\right|_{U_{i}} \rightarrow \mathcal{E}^{a-1}\right|_{U_{i}} \rightarrow \ldots \rightarrow \mathcal{E}^{b}\right|_{U_{i}}
$$

is quasi-isomorphic to $\left.E\right|_{U_{i}}$ and $E$ is perfect.
08G8 Lemma 21.37.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $E$ be an object of $D(\mathcal{O})$. The following are equivalent
(1) $E$ is perfect, and
(2) $E$ is pseudo-coherent and locally has finite tor dimension.

Proof. Assume (1). Let $U$ be an object of $\mathcal{C}$. By definition there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.E\right|_{U_{i}}$ is represented by a strictly perfect complex. Thus $E$ is pseudo-coherent (i.e., $m$-pseudo-coherent for all $m$ ) by Lemma 21.35.2 Moreover, a direct summand of a finite free module is flat, hence $\left.E\right|_{U_{i}}$ has finite Tor dimension by Lemma 21.36.3. Thus (2) holds.

Assume (2). Let $U$ be an object of $\mathcal{C}$. After replacing $U$ by the members of a covering we may assume there exist integers $a \leq b$ such that $\left.E\right|_{U}$ has tor amplitude in $[a, b]$. Since $\left.E\right|_{U}$ is $m$-pseudo-coherent for all $m$ we conclude using Lemma 21.37 .3

08H6 Lemma 21.37.5. Let $\left(f, f^{\sharp}\right):\left(\mathcal{C}, \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\mathcal{D}, \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed sites. Assume $\mathcal{C}$ has enough points. Let $E$ be an object of $D\left(\mathcal{O}_{\mathcal{D}}\right)$. If $E$ is perfect in $D\left(\mathcal{O}_{\mathcal{D}}\right)$, then $L f^{*} E$ is perfect in $D\left(\mathcal{O}_{\mathcal{C}}\right)$.

Proof. This follows from Lemma 21.37.4, 21.36.4, and 21.35.3. (An alternative proof is to copy the proof of Lemma 21.35.3 This gives a proof of the result without assuming the site $\mathcal{C}$ has enough points.)

08G9 Lemma 21.37.6. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(K, L, M, f, g, h)$ be a distinguished triangle in $D(\mathcal{O})$. If two out of three of $K, L, M$ are perfect then the third is also perfect.

Proof. First proof: Combine Lemmas 21.37.4, 21.35.4, and 21.36.5. Second proof (sketch): Say $K$ and $L$ are perfect. Let $U$ be an object of $\mathcal{C}$. After replacing $U$ by the members of a covering we may assume that $\left.K\right|_{U}$ and $\left.L\right|_{U}$ are represented by strictly perfect complexes $\mathcal{K}^{\bullet}$ and $\mathcal{L}^{\bullet}$. After replacing $U$ by the members of a covering we may assume the map $\left.\left.K\right|_{U} \rightarrow L\right|_{U}$ is given by a map of complexes $\alpha: \mathcal{K}^{\bullet} \rightarrow \mathcal{L}^{\bullet}$, see Lemma 21.34 .8 . Then $\left.M\right|_{U}$ is isomorphic to the cone of $\alpha$ which is strictly perfect by Lemma 21.34.2.

09JB Lemma 21.37.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If $K, L$ are perfect objects of $D(\mathcal{O})$, then so is $K \otimes_{\mathcal{O}}^{\mathbf{L}} L$.

Proof. Follows from Lemmas 21.37.4, 21.35.5, and 21.36.6.
08GA Lemma 21.37.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If $K \oplus L$ is a perfect object of $D(\mathcal{O})$, then so are $K$ and $L$.

Proof. Follows from Lemmas 21.37.4, 21.35.6, and 21.36.7.

08JJ Lemma 21.37.9. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K$ be a perfect object of $D(\mathcal{O})$. Then $K^{\vee}=R \mathcal{H o m}(K, \mathcal{O})$ is a perfect object too and $\left(K^{\vee}\right)^{\vee}=K$. There are functorial isomorphisms

$$
K^{\vee} \otimes \otimes_{\mathcal{O}}^{\mathbf{L}} M=R \mathcal{H}_{m_{\mathcal{O}}}(K, M)
$$

and

$$
H^{0}\left(\mathcal{C}, K^{\vee} \otimes_{\mathcal{O}}^{\mathbf{L}} M\right)=\operatorname{Hom}_{D(\mathcal{O})}(K, M)
$$

for $M$ in $D(\mathcal{O})$.
Proof. We will us without further mention that formation of internal hom commutes with restriction (Lemma 21.26.3). In particular we may check the first two statements locally, i.e., given any object $U$ of $\mathcal{C}$ it suffices to prove there is a covering $\left\{U_{i} \rightarrow U\right\}$ such that the statement is true after restricting to $\mathcal{C} / U_{i}$ for each $i$. By Lemma 21.26 .8 to see the final statement it suffices to check that the map 21.26.8.1

$$
K^{\vee} \otimes_{\mathcal{O}}^{\mathbf{L}} M \longrightarrow R \mathcal{H o m}(K, M)
$$

is an isomorphism. This is a local question as well. Hence it suffices to prove the lemma when $K$ is represented by a strictly perfect complex.

Assume $K$ is represented by the strictly perfect complex $\mathcal{E}^{\bullet}$. Then it follows from Lemma 21.34 .9 that $K^{\vee}$ is represented by the complex whose terms are $\left(\mathcal{E}^{n}\right)^{\vee}=$
 so is $\left(\mathcal{E}^{n}\right)^{\vee}$. Hence $K^{\vee}$ is represented by a strictly perfect complex too. It is also clear that $\left(K^{\vee}\right)^{\vee}=K$ as we have $\left(\left(\mathcal{E}^{n}\right)^{\vee}\right)^{\vee}=\mathcal{E}^{n}$. To see that (21.26.8.1) is an isomorphism, represent $M$ by a K-flat complex $\mathcal{F}^{\bullet}$. By Lemma 21.34 .9 the complex $R \mathcal{H o m}(K, M)$ is represented by the complex with terms

$$
\bigoplus_{n=p+q} \mathcal{H o m}_{\mathcal{O}}\left(\mathcal{E}^{-q}, \mathcal{F}^{p}\right)
$$

On the other hand, the object $K^{\vee} \otimes^{\mathbf{L}} M$ is represented by the complex with terms

$$
\bigoplus_{n=p+q} \mathcal{F}^{p} \otimes_{\mathcal{O}}\left(\mathcal{E}^{-q}\right)^{\vee}
$$

Thus the assertion that 21.26 .8 .1 is an isomorphism reduces to the assertion that the canonical map

$$
\mathcal{F} \otimes_{\mathcal{O}} \mathcal{H o m}_{\mathcal{O}}(\mathcal{E}, \mathcal{O}) \longrightarrow \mathcal{H o m}_{\mathcal{O}}(\mathcal{E}, \mathcal{F})
$$

is an isomorphism when $\mathcal{E}$ is a direct summand of a finite free $\mathcal{O}$-module and $\mathcal{F}$ is any $\mathcal{O}$-module. This follows immediately from the corresponding statement when $\mathcal{E}$ is finite free.

0A0A Lemma 21.37.10. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\left(K_{n}\right)_{n \in \mathbf{N}}$ be a system of perfect objects of $D(\mathcal{O})$. Let $K=$ hocolimK $K_{n}$ be the derived colimit (Derived Categories, Definition 13.31.1). Then for any object $E$ of $D(\mathcal{O})$ we have

$$
R \mathcal{H o m}(K, E)=R \lim E \otimes_{\mathcal{O}}^{\mathbf{L}} K_{n}^{\vee}
$$

where $\left(K_{n}^{\vee}\right)$ is the inverse system of dual perfect complexes.
Proof. By Lemma 21.37 .9 we have $R \lim E \otimes_{\mathcal{O}}^{\mathbf{L}} K_{n}^{\vee}=R \lim R \mathcal{H o m}\left(K_{n}, E\right)$ which fits into the distinguished triangle

$$
R \lim R \mathcal{H o m}\left(K_{n}, E\right) \rightarrow \prod R \mathcal{H o m}\left(K_{n}, E\right) \rightarrow \prod R \mathcal{H o m}\left(K_{n}, E\right)
$$

Because $K$ similarly fits into the distinguished triangle $\bigoplus K_{n} \rightarrow \bigoplus K_{n} \rightarrow K$ it suffices to show that $\prod R \mathcal{H} o m\left(K_{n}, E\right)=R \mathcal{H o m}\left(\bigoplus K_{n}, E\right)$. This is a formal consequence of 21.26 .0 .1 and the fact that derived tensor product commutes with direct sums.

### 21.38. Projection formula

0943 Let $f:\left(S h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(S h(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $E \in D\left(\mathcal{O}_{\mathcal{C}}\right)$ and $K \in D\left(\mathcal{O}_{\mathcal{D}}\right)$. Without any further assumptions there is a map

0B56

$$
\begin{equation*}
R f_{*} E \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} K \longrightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} K\right) \tag{21.38.0.1}
\end{equation*}
$$

Namely, it is the adjoint to the canonical map

$$
L f^{*}\left(R f_{*} E \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} K\right)=L f^{*} R f_{*} E \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} K \longrightarrow E \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} K
$$

coming from the map $L f^{*} R f_{*} E \rightarrow E$ and Lemmas 21.18.4 and 21.19.1. A reasonably general version of the projection formula is the following.

0944 Lemma 21.38.1. Let $f:\left(\operatorname{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}\right) \rightarrow\left(\operatorname{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}\right)$ be a morphism of ringed topoi. Let $E \in D\left(\mathcal{O}_{\mathcal{C}}\right)$ and $K \in D\left(\mathcal{O}_{\mathcal{D}}\right)$. If $K$ is perfect, then

$$
R f_{*} E \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} K=R f_{*}\left(E \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} L f^{*} K\right)
$$

in $D\left(\mathcal{O}_{\mathcal{D}}\right)$.
Proof. To check 21.38.0.1 is an isomorphism we may work locally on $\mathcal{D}$, i.e., for any object $V$ of $\mathcal{D}$ we have to find a covering $\left\{V_{j} \rightarrow V\right\}$ such that the map restricts to an isomorphism on $V_{j}$. By definition of perfect objects, this means we may assume $K$ is represented by a strictly perfect complex of $\mathcal{O}_{\mathcal{D}}$-modules. Note that, completely generally, the statement is true for $K=K_{1} \oplus K_{2}$, if and only if the statement is true for $K_{1}$ and $K_{2}$. Hence we may assume $K$ is a finite complex of finite free $\mathcal{O}_{\mathcal{D}}$-modules. In this case a simple argument involving stupid truncations reduces the statement to the case where $K$ is represented by a finite free $\mathcal{O}_{\mathcal{D}}$-module. Since the statement is invariant under finite direct summands in the $K$ variable, we conclude it suffices to prove it for $K=\mathcal{O}_{\mathcal{D}}[n]$ in which case it is trivial.

### 21.39. Weakly contractible objects

0945 An object $U$ of a site is weakly contractible if every surjection $\mathcal{F} \rightarrow \mathcal{G}$ of sheaves of sets gives rise to a surjection $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$, see Sites, Definition 7.39.2.

0946 Lemma 21.39.1. Let $\mathcal{C}$ be a site. Let $U$ be a weakly contractible object of $\mathcal{C}$. Then
(1) the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ is an exact functor $A b(\mathcal{C}) \rightarrow A b$,
(2) $H^{p}(U, \mathcal{F})=0$ for every abelian sheaf $\mathcal{F}$ and all $p \geq 1$, and
(3) for any sheaf of groups $\mathcal{G}$ any $\mathcal{G}$-torsor has a section over $U$.

Proof. The first statement follows immediately from the definition (see also Homology, Section 12.7). The higher derived functors vanish by Derived Categories, Lemma 13.17.9. Let $\mathcal{F}$ be a $\mathcal{G}$-torsor. Then $\mathcal{F} \rightarrow *$ is a surjective map of sheaves. Hence (3) follows from the definition as well.

It is convenient to list some consequences of having enough weakly contractible objects here.

0947 Proposition 21.39.2. Let $\mathcal{C}$ be a site. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ such that every $U \in \mathcal{B}$ is weakly contractible and every object of $\mathcal{C}$ has a covering by elements of $\mathcal{B}$. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Then
(1) A complex $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$ of $\mathcal{O}$-modules is exact, if and only if $\mathcal{F}_{1}(U) \rightarrow$ $\mathcal{F}_{2}(U) \rightarrow \mathcal{F}_{3}(U)$ is exact for all $U \in \mathcal{B}$.
(2) Every object $K$ of $D(\mathcal{O})$ is a derived limit of its canonical truncations: $K=R \lim \tau_{\geq-n} K$.
(3) Given an inverse system $\ldots \rightarrow \mathcal{F}_{3} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1}$ with surjective transition maps, the projection $\lim \mathcal{F}_{n} \rightarrow \mathcal{F}_{1}$ is surjective.
(4) Products are exact on $\operatorname{Mod}(\mathcal{O})$.
(5) Products on $D(\mathcal{O})$ can be computed by taking products of any representative complexes.
(6) If $\left(\mathcal{F}_{n}\right)$ is an inverse system of $\mathcal{O}$-modules, then $R^{p} \lim \mathcal{F}_{n}=0$ for all $p>1$ and

$$
R^{1} \lim \mathcal{F}_{n}=\operatorname{Coker}\left(\prod \mathcal{F}_{n} \rightarrow \prod \mathcal{F}_{n}\right)
$$

where the map is $\left(x_{n}\right) \mapsto\left(x_{n}-f\left(x_{n+1}\right)\right)$.
(7) If $\left(K_{n}\right)$ is an inverse system of objects of $D(\mathcal{O})$, then there are short exact sequences

$$
0 \rightarrow R^{1} \lim H^{p-1}\left(K_{n}\right) \rightarrow H^{p}\left(R \lim K_{n}\right) \rightarrow \lim H^{p}\left(K_{n}\right) \rightarrow 0
$$

Proof. Proof of (1). If the sequence is exact, then evaluating at any weakly contractible element of $\mathcal{C}$ gives an exact sequence by Lemma 21.39.1. Conversely, assume that $\mathcal{F}_{1}(U) \rightarrow \mathcal{F}_{2}(U) \rightarrow \mathcal{F}_{3}(U)$ is exact for all $U \in \mathcal{B}$. Let $V$ be an object of $\mathcal{C}$ and let $s \in \mathcal{F}_{2}(V)$ be an element of the kernel of $\mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$. By assumption there exists a covering $\left\{U_{i} \rightarrow V\right\}$ with $U_{i} \in \mathcal{B}$. Then $\left.s\right|_{U_{i}}$ lifts to a section $s_{i} \in \mathcal{F}_{1}\left(U_{i}\right)$. Thus $s$ is a section of the image sheaf $\operatorname{Im}\left(\mathcal{F}_{1} \rightarrow \mathcal{F}_{2}\right)$. In other words, the sequence $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$ is exact.

Proof of (2). This holds by Lemma 21.21 .5 .
Proof of (3). Let $\left(\mathcal{F}_{n}\right)$ be a system as in (2) and set $\mathcal{F}=\lim \mathcal{F}_{n}$. If $U \in \mathcal{B}$, then $\mathcal{F}(U)=\lim \mathcal{F}_{n}(U)$ surjects onto $\mathcal{F}_{1}(U)$ as all the transition maps $\mathcal{F}_{n+1}(U) \rightarrow$ $\mathcal{F}_{n}(U)$ are surjective. Thus $\mathcal{F} \rightarrow \mathcal{F}_{1}$ is surjective by Sites, Definition 7.12.1 and the assumption that every object has a covering by elements of $\mathcal{B}$.
Proof of (4). Let $\mathcal{F}_{i, 1} \rightarrow \mathcal{F}_{i, 2} \rightarrow \mathcal{F}_{i, 3}$ be a family of exact sequences of $\mathcal{O}$-modules. We want to show that $\prod \mathcal{F}_{i, 1} \rightarrow \prod \mathcal{F}_{i, 2} \rightarrow \prod \mathcal{F}_{i, 3}$ is exact. We use the criterion of (1). Let $U \in \mathcal{B}$. Then

$$
\left(\prod \mathcal{F}_{i, 1}\right)(U) \rightarrow\left(\prod \mathcal{F}_{i, 2}\right)(U) \rightarrow\left(\prod \mathcal{F}_{i, 3}\right)(U)
$$

is the same as

$$
\prod \mathcal{F}_{i, 1}(U) \rightarrow \prod \mathcal{F}_{i, 2}(U) \rightarrow \prod \mathcal{F}_{i, 3}(U)
$$

Each of the sequences $\mathcal{F}_{i, 1}(U) \rightarrow \mathcal{F}_{i, 2}(U) \rightarrow \mathcal{F}_{i, 3}(U)$ are exact by (1). Thus the displayed sequences are exact by Homology, Lemma 12.28.1. We conclude by (1) again.
Proof of (5). Follows from (4) and (slightly generalized) Derived Categories, Lemma 13.32.2.

Proof of (6) and (7). We refer to Section 21.21 for a discussion of derived and homotopy limits and their relationship. By Derived Categories, Definition 13.32 .1 we have a distinguished triangle

$$
R \lim K_{n} \rightarrow \prod K_{n} \rightarrow \prod K_{n} \rightarrow R \lim K_{n}[1]
$$

Taking the long exact sequence of cohomology sheaves we obtain

$$
H^{p-1}\left(\prod K_{n}\right) \rightarrow H^{p-1}\left(\prod K_{n}\right) \rightarrow H^{p}\left(R \lim K_{n}\right) \rightarrow H^{p}\left(\prod K_{n}\right) \rightarrow H^{p}\left(\prod K_{n}\right)
$$

Since products are exact by (4) this becomes

$$
\prod H^{p-1}\left(K_{n}\right) \rightarrow \prod H^{p-1}\left(K_{n}\right) \rightarrow H^{p}\left(R \lim K_{n}\right) \rightarrow \prod H^{p}\left(K_{n}\right) \rightarrow \prod H^{p}\left(K_{n}\right)
$$

Now we first apply this to the case $K_{n}=\mathcal{F}_{n}[0]$ where $\left(\mathcal{F}_{n}\right)$ is as in (6). We conclude that (6) holds. Next we apply it to $\left(K_{n}\right)$ as in (7) and we conclude (7) holds.

### 21.40. Compact objects

0948 In this section we study compact objects in the derived category of modules on a ringed site. We recall that compact objects are defined in Derived Categories, Definition 13.34.1.

09JC Lemma 21.40.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Assume $\mathcal{C}$ has the following properties
(1) $\mathcal{C}$ has a quasi-compact final object $X$,
(2) every object of $\mathcal{C}$ can be covered by quasi-compact objects,
(3) for a finite covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ with $U, U_{i}$ quasi-compact the fibre products $U_{i} \times_{U} U_{j}$ are quasi-compact.
Then any perfect object of $D(\mathcal{O})$ is compact.
Proof. Let $K$ be a perfect object and let $K^{\vee}$ be its dual, see Lemma 21.37.9. Then we have

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K, M)=H^{0}\left(X, K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M\right)
$$

functorially in $M$ in $D\left(\mathcal{O}_{X}\right)$. Since $K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}$ - commutes with direct sums (by construction) and $H^{0}$ does by Lemma 21.16.1 and the construction of direct sums in Injectives, Lemma 19.13.4 we obtain the result of the lemma.

094B Lemma 21.40.2. Let $\mathcal{A}$ be a Grothendieck abelian category. Let $S \subset \mathrm{Ob}(\mathcal{A})$ be a set of objects such that
(1) any object of $\mathcal{A}$ is a quotient of a direct sum of elements of $S$, and
(2) for any $E \in S$ the functor $\operatorname{Hom}_{\mathcal{A}}(E,-)$ commutes with direct sums.

Then every compact object of $D(\mathcal{A})$ is a direct summand in $D(\mathcal{A})$ of a finite complex of finite direct sums of elements of $S$.

Proof. Assume $K \in D(\mathcal{A})$ is a compact object. Represent $K$ by a complex $K^{\bullet}$ and consider the map

$$
K^{\bullet} \longrightarrow \bigoplus_{n \geq 0} \tau_{\geq n} K^{\bullet}
$$

where we have used the canonical truncations, see Homology, Section 12.13. This makes sense as in each degree the direct sum on the right is finite. By assumption this map factors through a finite direct sum. We conclude that $K \rightarrow \tau_{\geq n} K$ is zero for at least one $n$, i.e., $K$ is in $D^{-}(R)$.

We may represent $K$ by a bounded above complex $K^{\bullet}$ each of whose terms is a direct sum of objects from $S$, see Derived Categories, Lemma 13.16.5. Note that we have

$$
K^{\bullet}=\bigcup_{n \leq 0} \sigma_{\geq n} K^{\bullet}
$$

where we have used the stupid truncations, see Homology, Section 12.13 Hence by Derived Categories, Lemmas 13.31 .4 and 13.31 .5 we see that $1: K^{\bullet} \rightarrow K^{\bullet}$ factors through $\sigma_{\geq n} K^{\bullet} \rightarrow K^{\bullet}$ in $D(R)$. Thus we see that $1: K^{\bullet} \rightarrow K^{\bullet}$ factors as

$$
K^{\bullet} \xrightarrow{\varphi} L^{\bullet} \xrightarrow{\psi} K^{\bullet}
$$

in $D(\mathcal{A})$ for some complex $L^{\bullet}$ which is bounded and whose terms are direct sums of elements of $S$. Say $L^{i}$ is zero for $i \notin[a, b]$. Let $c$ be the largest integer $\leq b+1$ such that $L^{i}$ a finite direct sum of elements of $S$ for $i<c$. Claim: if $c<b+1$, then we can modify $L^{\bullet}$ to increase $c$. By induction this claim will show we have a factorization of $1_{K}$ as

$$
K \xrightarrow{\varphi} L \xrightarrow{\psi} K
$$

in $D(\mathcal{A})$ where $L$ can be represented by a finite complex of finite direct sums of elements of $S$. Note that $e=\varphi \circ \psi \in \operatorname{End}_{D(\mathcal{A})}(L)$ is an idempotent. By Derived Categories, Lemma 13.4 .12 we see that $L=\operatorname{Ker}(e) \oplus \operatorname{Ker}(1-e)$. The map $\varphi: K \rightarrow L$ induces an isomorphism with $\operatorname{Ker}(1-e)$ in $D(R)$ and we conclude.

Proof of the claim. Write $L^{c}=\bigoplus_{\lambda \in \Lambda} E_{\lambda}$. Since $L^{c-1}$ is a finite direct sum of elements of $S$ we can by assumption (2) find a finite subset $\Lambda^{\prime} \subset \Lambda$ such that $L^{c-1} \rightarrow L^{c}$ factors through $\bigoplus_{\lambda \in \Lambda^{\prime}} E_{\lambda} \subset L^{c}$. Consider the map of complexes

$$
\pi: L^{\bullet} \longrightarrow\left(\bigoplus_{\lambda \in \Lambda \backslash \Lambda^{\prime}} E_{\lambda}\right)[-i]
$$

given by the projection onto the factors corresponding to $\Lambda \backslash \Lambda^{\prime}$ in degree $i$. By our assumption on $K$ we see that, after possibly replacing $\Lambda^{\prime}$ by a larger finite subset, we may assume that $\pi \circ \varphi=0$ in $D(\mathcal{A})$. Let $\left(L^{\prime}\right)^{\bullet} \subset L^{\bullet}$ be the kernel of $\pi$. Since $\pi$ is surjective we get a short exact sequence of complexes, which gives a distinguished triangle in $D(\mathcal{A})$ (see Derived Categories, Lemma 13.12.1). Since $\operatorname{Hom}_{D(\mathcal{A})}(K,-)$ is homological (see Derived Categories, Lemma 13.4.2) and $\pi \circ \varphi=0$, we can find a morphism $\varphi^{\prime}: K^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}$ in $D(\mathcal{A})$ whose composition with $\left(L^{\prime}\right)^{\bullet} \rightarrow L^{\bullet}$ gives $\varphi$. Setting $\psi^{\prime}$ equal to the composition of $\psi$ with $\left(L^{\prime}\right)^{\bullet} \rightarrow L^{\bullet}$ we obtain a new factorization. Since $\left(L^{\prime}\right)^{\bullet}$ agrees with $L^{\bullet}$ except in degree $c$ and since $\left(L^{\prime}\right)^{c}=\bigoplus_{\lambda \in \Lambda^{\prime}} E_{\lambda}$ the claim is proved.

094C Lemma 21.40.3. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Assume every object of $\mathcal{C}$ has a covering by quasi-compact objects. Then every compact object of $D(\mathcal{O})$ is a direct summand in $D(\mathcal{O})$ of a finite complex whose terms are finite direct sums of $\mathcal{O}$ modules of the form $j_{!} \mathcal{O}_{U}$ where $U$ is a quasi-compact object of $\mathcal{C}$.

Proof. Apply Lemma 21.40 .2 where $S \subset \mathrm{Ob}(\operatorname{Mod}(\mathcal{O}))$ is the set of modules of the form $j_{!} \mathcal{O}_{U}$ with $U \in \operatorname{Ob}(\mathcal{C})$ quasi-compact. Assumption (1) holds by Modules on Sites, Lemma 18.28 .6 and the assumption that every $U$ can be covered by quasicompact objects. Assumption (2) follows as

$$
\operatorname{Hom}_{\mathcal{O}}\left(j_{!} \mathcal{O}_{U}, \mathcal{F}\right)=\mathcal{F}(U)
$$

which commutes with direct sums by Sites, Lemma 7.11.2.

In the situation of the lemma above it is not always true that the modules $j_{!} \mathcal{O}_{U}$ are compact objects of $D(\mathcal{O})$ (even if $U$ is a quasi-compact object of $\mathcal{C}$ ). Here is a criterion.
