\left[y_{1}, \ldots, y_{s}, \gamma \tilde{x}_{1}, \ldots, \gamma \tilde{x}_{r}, \tilde{z}_{1}, \ldots, \tilde{z}_{t}\right]=(-1)^{r s} D_{2}\left[x_{1}, \ldots, x_{r}, \gamma \tilde{y}_{1}, \ldots, \gamma \tilde{y}_{s}, \tilde{z}_{1}, \ldots, \tilde{z}_{t}\right]
$$

Combining the formulas above we see that $D=D_{1} D_{2}$ as desired.
02PV Lemma 41.4.13. Let $R$ be a local ring with residue field $\kappa$. Let $\alpha:(M, \varphi, \psi) \rightarrow$ $\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)$ be a morphism of (2,1)-periodic complexes over $R$. Assume
(1) $M, M^{\prime}$ have finite length,
(2) $(M, \varphi, \psi),\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)$ are exact,
(3) the maps $\varphi, \psi$ induce the zero map on $K=\operatorname{Ker}(\alpha)$, and
(4) the maps $\varphi, \psi$ induce the zero map on $Q=\operatorname{Coker}(\alpha)$.

Denote $N=\alpha(M) \subset M^{\prime}$. We obtain two short exact sequences of $(2,1)$-periodic complexes

$$
\begin{gathered}
0 \rightarrow\left(N, \varphi^{\prime}, \psi^{\prime}\right) \rightarrow\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right) \rightarrow(Q, 0,0) \rightarrow 0 \\
0 \rightarrow(K, 0,0) \rightarrow(M, \varphi, \psi) \rightarrow\left(N, \varphi^{\prime}, \psi^{\prime}\right) \rightarrow 0
\end{gathered}
$$

which induce two isomorphisms $\alpha_{i}: Q \rightarrow K, i=0,1$. Then

$$
\operatorname{det}_{\kappa}(M, \varphi, \psi)=\operatorname{det}_{\kappa}\left(\alpha_{0}^{-1} \circ \alpha_{1}\right) \operatorname{det}_{\kappa}\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)
$$

In particular, if $\alpha_{0}=\alpha_{1}$, then $\operatorname{det}_{\kappa}(M, \varphi, \psi)=\operatorname{det}_{\kappa}\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)$.
Proof. There are (at least) two ways to prove this lemma. One is to produce an enormous commutative diagram using the properties of the determinants. The other is to use the characterization of the determinants in terms of admissible sequences of elements. It is the second approach that we will use.
First let us explain precisely what the maps $\alpha_{i}$ are. Namely, $\alpha_{0}$ is the composition

$$
\alpha_{0}: Q=H^{0}(Q, 0,0) \rightarrow H^{1}\left(N, \varphi^{\prime}, \psi^{\prime}\right) \rightarrow H^{2}(K, 0,0)=K
$$

and $\alpha_{1}$ is the composition

$$
\alpha_{1}: Q=H^{1}(Q, 0,0) \rightarrow H^{2}\left(N, \varphi^{\prime}, \psi^{\prime}\right) \rightarrow H^{3}(K, 0,0)=K
$$

coming from the boundary maps of the short exact sequences of complexes displayed in the lemma. The fact that the complexes $(M, \varphi, \psi),\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)$ are exact implies these maps are isomorphisms.
We will use the notation $I_{\varphi}=\operatorname{Im}(\varphi), K_{\varphi}=\operatorname{Ker}(\varphi)$ and similarly for the other maps. Exactness for $M$ and $M^{\prime}$ means that $K_{\varphi}=I_{\psi}$ and three similar equalities. We introduce $k=\operatorname{length}_{R}(K), a=\operatorname{length}_{R}\left(I_{\varphi}\right), b=\operatorname{length}_{R}\left(I_{\psi}\right)$. Then we see that $\operatorname{length}_{R}(M)=a+b$, and length $(N)=a+b-k, \operatorname{length}_{R}(Q)=k$ and length $_{R}\left(M^{\prime}\right)=a+b$. The exact sequences below will show that also length ${ }_{R}\left(I_{\varphi^{\prime}}\right)=$ $a$ and length ${ }_{R}\left(I_{\psi^{\prime}}\right)=b$.

The assumption that $K \subset K_{\varphi}=I_{\psi}$ means that $\varphi$ factors through $N$ to give an exact sequence

$$
0 \rightarrow \alpha\left(I_{\psi}\right) \rightarrow N \xrightarrow{\varphi \alpha^{-1}} I_{\psi} \rightarrow 0 .
$$

Here $\varphi \alpha^{-1}\left(x^{\prime}\right)=y$ means $x^{\prime}=\alpha(x)$ and $y=\varphi(x)$. Similarly, we have

$$
0 \rightarrow \alpha\left(I_{\varphi}\right) \rightarrow N \xrightarrow{\psi \alpha^{-1}} I_{\varphi} \rightarrow 0 .
$$

The assumption that $\psi^{\prime}$ induces the zero map on $Q$ means that $I_{\psi^{\prime}}=K_{\varphi^{\prime}} \subset N$. This means the quotient $\varphi^{\prime}(N) \subset I_{\varphi^{\prime}}$ is identified with $Q$. Note that $\varphi^{\prime}(N)=\alpha\left(I_{\varphi}\right)$. Hence we conclude there is an isomorphism

$$
\varphi^{\prime}: Q \rightarrow I_{\varphi^{\prime}} / \alpha\left(I_{\varphi}\right)
$$

simply described by $\varphi^{\prime}\left(x^{\prime} \bmod N\right)=\varphi^{\prime}\left(x^{\prime}\right) \bmod \alpha\left(I_{\varphi}\right)$. In exactly the same way we get

$$
\psi^{\prime}: Q \rightarrow I_{\psi^{\prime}} / \alpha\left(I_{\psi}\right)
$$

Finally, note that $\alpha_{0}$ is the composition

$$
Q \xrightarrow{\varphi^{\prime}} I_{\varphi^{\prime}} / \alpha\left(I_{\varphi}\right) \xrightarrow{\left.\psi \alpha^{-1}\right|_{\varphi_{\varphi^{\prime}} / \alpha\left(I_{\varphi}\right)}} K
$$

and similarly $\alpha_{1}=\left.\varphi \alpha^{-1}\right|_{I_{\psi^{\prime}} / \alpha\left(I_{\psi}\right)} \circ \psi^{\prime}$.
To shorten the formulas below we are going to write $\alpha x$ instead of $\alpha(x)$ in the following. No confusion should result since all maps are indicated by Greek letters and elements by Roman letters. We are going to choose
(1) an admissible sequence $z_{1}, \ldots, z_{k} \in K$ generating $K$,
(2) elements $z_{i}^{\prime} \in M$ such that $\varphi z_{i}^{\prime}=z_{i}$,
(3) elements $z_{i}^{\prime \prime} \in M$ such that $\psi z_{i}^{\prime \prime}=z_{i}$,
(4) elements $x_{k+1}, \ldots, x_{a} \in I_{\varphi}$ such that $z_{1}, \ldots, z_{k}, x_{k+1}, \ldots, x_{a}$ is an admissible sequence generating $I_{\varphi}$,
(5) elements $\tilde{x}_{i} \in M$ such that $\varphi \tilde{x}_{i}=x_{i}$,
(6) elements $y_{k+1}, \ldots, y_{b} \in I_{\psi}$ such that $z_{1}, \ldots, z_{k}, y_{k+1}, \ldots, y_{b}$ is an admissible sequence generating $I_{\psi}$,
(7) elements $\tilde{y}_{i} \in M$ such that $\psi \tilde{y}_{i}=y_{i}$, and
(8) elements $w_{1}, \ldots, w_{k} \in M^{\prime}$ such that $w_{1} \bmod N, \ldots, w_{k} \bmod N$ are an admissible sequence in $Q$ generating $Q$.
By Remark 41.4.2 the element $D=\operatorname{det}_{\kappa}(M, \varphi, \psi) \in \kappa^{*}$ is characterized by

$$
\begin{aligned}
& {\left[z_{1}, \ldots, z_{k}, x_{k+1}, \ldots, x_{a}, z_{1}^{\prime \prime}, \ldots, z_{k}^{\prime \prime}, \tilde{y}_{k+1}, \ldots, \tilde{y}_{b}\right] } \\
= & (-1)^{a b} D\left[z_{1}, \ldots, z_{k}, y_{k+1}, \ldots, y_{b}, z_{1}^{\prime}, \ldots, z_{k}^{\prime}, \tilde{x}_{k+1}, \ldots, \tilde{x}_{a}\right]
\end{aligned}
$$

Note that by the discussion above $\alpha x_{k+1}, \ldots, \alpha x_{a}, \varphi w_{1}, \ldots, \varphi w_{k}$ is an admissible sequence generating $I_{\varphi^{\prime}}$ and $\alpha y_{k+1}, \ldots, \alpha y_{b}, \psi w_{1}, \ldots, \psi w_{k}$ is an admissible sequence generating $I_{\psi^{\prime}}$. Hence by Remark 41.4.2 the element $D^{\prime}=\operatorname{det}_{\kappa}\left(M^{\prime}, \varphi^{\prime}, \psi^{\prime}\right) \in \kappa^{*}$ is characterized by

$$
\begin{aligned}
& {\left[\alpha x_{k+1}, \ldots, \alpha x_{a}, \varphi^{\prime} w_{1}, \ldots, \varphi^{\prime} w_{k}, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_{b}, w_{1}, \ldots, w_{k}\right] } \\
= & (-1)^{a b} D^{\prime}\left[\alpha y_{k+1}, \ldots, \alpha y_{b}, \psi^{\prime} w_{1}, \ldots, \psi^{\prime} w_{k}, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_{a}, w_{1}, \ldots, w_{k}\right]
\end{aligned}
$$

Note how in the first, resp. second displayed formula the the first, resp. last $k$ entries of the symbols on both sides are the same. Hence these formulas are really equivalent to the equalities

$$
\begin{aligned}
& {\left[\alpha x_{k+1}, \ldots, \alpha x_{a}, \alpha z_{1}^{\prime \prime}, \ldots, \alpha z_{k}^{\prime \prime}, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_{b}\right] } \\
= & (-1)^{a b} D\left[\alpha y_{k+1}, \ldots, \alpha y_{b}, \alpha z_{1}^{\prime}, \ldots, \alpha z_{k}^{\prime}, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_{a}\right]
\end{aligned}
$$

and

$$
\begin{aligned}
& {\left[\alpha x_{k+1}, \ldots, \alpha x_{a}, \varphi^{\prime} w_{1}, \ldots, \varphi^{\prime} w_{k}, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_{b}\right] } \\
= & (-1)^{a b} D^{\prime}\left[\alpha y_{k+1}, \ldots, \alpha y_{b}, \psi^{\prime} w_{1}, \ldots, \psi^{\prime} w_{k}, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_{a}\right]
\end{aligned}
$$

in $\operatorname{det}_{\kappa}(N)$. Note that $\varphi^{\prime} w_{1}, \ldots, \varphi^{\prime} w_{k}$ and $\alpha z_{1}^{\prime \prime}, \ldots, z_{k}^{\prime \prime}$ are admissible sequences generating the module $I_{\varphi^{\prime}} / \alpha\left(I_{\varphi}\right)$. Write

$$
\left[\varphi^{\prime} w_{1}, \ldots, \varphi^{\prime} w_{k}\right]=\lambda_{0}\left[\alpha z_{1}^{\prime \prime}, \ldots, \alpha z_{k}^{\prime \prime}\right]
$$

in $\operatorname{det}_{\kappa}\left(I_{\varphi^{\prime}} / \alpha\left(I_{\varphi}\right)\right)$ for some $\lambda_{0} \in \kappa^{*}$. Similarly, write

$$
\left[\psi^{\prime} w_{1}, \ldots, \psi^{\prime} w_{k}\right]=\lambda_{1}\left[\alpha z_{1}^{\prime}, \ldots, \alpha z_{k}^{\prime}\right]
$$

in $\operatorname{det}_{\kappa}\left(I_{\psi^{\prime}} / \alpha\left(I_{\psi}\right)\right)$ for some $\lambda_{1} \in \kappa^{*}$. On the one hand it is clear that

$$
\alpha_{i}\left(\left[w_{1}, \ldots, w_{k}\right]\right)=\lambda_{i}\left[z_{1}, \ldots, z_{k}\right]
$$

for $i=0,1$ by our description of $\alpha_{i}$ above, which means that

$$
\operatorname{det}_{\kappa}\left(\alpha_{0}^{-1} \circ \alpha_{1}\right)=\lambda_{1} / \lambda_{0}
$$

and on the other hand it is clear that

$$
\begin{aligned}
& \lambda_{0}\left[\alpha x_{k+1}, \ldots, \alpha x_{a}, \alpha z_{1}^{\prime \prime}, \ldots, \alpha z_{k}^{\prime \prime}, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_{b}\right] \\
= & {\left[\alpha x_{k+1}, \ldots, \alpha x_{a}, \varphi^{\prime} w_{1}, \ldots, \varphi^{\prime} w_{k}, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_{b}\right] }
\end{aligned}
$$

and

$$
\begin{aligned}
& \lambda_{1}\left[\alpha y_{k+1}, \ldots, \alpha y_{b}, \alpha z_{1}^{\prime}, \ldots, \alpha z_{k}^{\prime}, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_{a}\right] \\
= & {\left[\alpha y_{k+1}, \ldots, \alpha y_{b}, \psi^{\prime} w_{1}, \ldots, \psi^{\prime} w_{k}, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_{a}\right] }
\end{aligned}
$$

which imply $\lambda_{0} D=\lambda_{1} D^{\prime}$. The lemma follows.

### 41.5. Symbols

02PW The correct generality for this construction is perhaps the situation of the following lemma.

02PX Lemma 41.5.1. Let $A$ be a Noetherian local ring. Let $M$ be a finite $A$-module of dimension 1. Assume $\varphi, \psi: M \rightarrow M$ are two injective $A$-module maps, and assume $\varphi(\psi(M))=\psi(\varphi(M))$, for example if $\varphi$ and $\psi$ commute. Then length $_{R}(M / \varphi \psi M)<$ $\infty$ and $(M / \varphi \psi M, \varphi, \psi)$ is an exact $(2,1)$-periodic complex.

Proof. Let $\mathfrak{q}$ be a minimal prime of the support of $M$. Then $M_{\mathfrak{q}}$ is a finite length $A_{\mathfrak{q}}$-module, see Algebra, Lemma 10.61.3. Hence both $\varphi$ and $\psi$ induce isomorphisms $M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$. Thus the support of $M / \varphi \psi M$ is $\left\{\mathfrak{m}_{A}\right\}$ and hence it has finite length (see lemma cited above). Finally, the kernel of $\varphi$ on $M / \varphi \psi M$ is clearly $\psi M / \varphi \psi M$, and hence the kernel of $\varphi$ is the image of $\psi$ on $M / \varphi \psi M$. Similarly the other way since $M / \varphi \psi M=M / \psi \varphi M$ by assumption.
02PY Lemma 41.5.2. Let $A$ be a Noetherian local ring. Let $a, b \in A$.
(1) If $M$ is a finite $A$-module of dimension 1 such that $a, b$ are nonzerodivisors on $M$, then length $A_{A}(M / a b M)<\infty$ and $(M / a b M, a, b)$ is a $(2,1)$-periodic exact complex.
(2) If $a, b$ are nonzerodivisors and $\operatorname{dim}(A)=1$ then length $A_{A}(A /(a b))<\infty$ and $(A /(a b), a, b)$ is a $(2,1)$-periodic exact complex.
In particular, in these cases $\operatorname{det}_{\kappa}(M / a b M, a, b) \in \kappa^{*}$, resp. $\operatorname{det}_{\kappa}(A /(a b), a, b) \in \kappa^{*}$ are defined.

Proof. Follows from Lemma 41.5.1.
02PZ Definition 41.5.3. Let $A$ be a Noetherian local ring with residue field $\kappa$. Let $a, b \in$ $A$. Let $M$ be a finite $A$-module of dimension 1 such that $a, b$ are nonzerodivisors on $M$. We define the symbol associated to $M, a, b$ to be the element

$$
d_{M}(a, b)=\operatorname{det}_{\kappa}(M / a b M, a, b) \in \kappa^{*}
$$

02Q0 Lemma 41.5.4. Let $A$ be a Noetherian local ring. Let $a, b, c \in A$. Let $M$ be $a$ finite $A$-module with $\operatorname{dim}(\operatorname{Supp}(M))=1$. Assume $a, b, c$ are nonzerodivisors on $M$. Then

$$
d_{M}(a, b c)=d_{M}(a, b) d_{M}(a, c)
$$

and $d_{M}(a, b) d_{M}(b, a)=1$.
Proof. The first statement follows from Lemma 41.4 .12 applied to $M / a b c M$ and endomorphisms $\alpha, \beta, \gamma$ given by multiplication by $a, b, c$. The second comes from Lemma 41.4.3.

02Q1 Definition 41.5.5. Let $A$ be a Noetherian local domain of dimension 1 with residue field $\kappa$. Let $K$ be the fraction field of $A$. We define the tame symbol of $A$ to be the map

$$
K^{*} \times K^{*} \longrightarrow \kappa^{*}, \quad(x, y) \longmapsto d_{A}(x, y)
$$

where $d_{A}(x, y)$ is extended to $K^{*} \times K^{*}$ by the multiplicativity of Lemma 41.5.4.
It is clear that we may extend more generally $d_{M}(-,-)$ to certain rings of fractions of $A$ (even if $A$ is not a domain).

0AY9 Lemma 41.5.6. Let $A$ be a Noetherian local ring and $M$ a finite $A$-module of dimension 1. Let $a \in A$ be a nonzerodivisor on $M$. Then $d_{M}(a, a)=(-1)^{l e n g t h}(M / a M)$.

Proof. Immediate from Lemma 41.4.4
02Q2 Lemma 41.5.7. Let $A$ be a Noetherian local ring. Let $M$ be a finite $A$-module of dimension 1. Let $b \in A$ be a nonzerodivisor on $M$, and let $u \in A^{*}$. Then

$$
d_{M}(u, b)=u^{\text {length }_{A}(M / b M)} \bmod \mathfrak{m}_{A}
$$

In particular, if $M=A$, then $d_{A}(u, b)=u^{\text {ord }_{A}(b)} \bmod \mathfrak{m}_{A}$.
Proof. Note that in this case $M / u b M=M / b M$ on which multiplication by $b$ is zero. Hence $d_{M}(u, b)=\operatorname{det}_{\kappa}\left(\left.u\right|_{M / b M}\right)$ by Lemma 41.4.5. The lemma then follows from Lemma 41.2.9.

02Q3 Lemma 41.5.8. Let $A$ be a Noetherian local ring. Let $a, b \in A$. Let

$$
0 \rightarrow M \rightarrow M^{\prime} \rightarrow M^{\prime \prime} \rightarrow 0
$$

be a short exact sequence of A-modules of dimension 1 such that $a, b$ are nonzerodivisors on all three $A$-modules. Then

$$
d_{M^{\prime}}(a, b)=d_{M}(a, b) d_{M^{\prime \prime}}(a, b)
$$

in $\kappa^{*}$.
Proof. It is easy to see that this leads to a short exact sequence of exact $(2,1)$ periodic complexes

$$
0 \rightarrow(M / a b M, a, b) \rightarrow\left(M^{\prime} / a b M^{\prime}, a, b\right) \rightarrow\left(M^{\prime \prime} / a b M^{\prime \prime}, a, b\right) \rightarrow 0
$$

Hence the lemma follows from Lemma 41.4.6.
02Q4 Lemma 41.5.9. Let $A$ be a Noetherian local ring. Let $\alpha: M \rightarrow M^{\prime}$ be a homomorphism of finite $A$-modules of dimension 1. Let $a, b \in A$. Assume
(1) $a, b$ are nonzerodivisors on both $M$ and $M^{\prime}$, and
(2) $\operatorname{dim}(\operatorname{Ker}(\alpha)), \operatorname{dim}(\operatorname{Coker}(\alpha)) \leq 0$.

Then $d_{M}(a, b)=d_{M^{\prime}}(a, b)$.
Proof. If $a \in A^{*}$, then the equality follows from the equality length $(M / b M)=$ length $\left(M^{\prime} / b M^{\prime}\right)$ and Lemma 41.5.7. Similarly if $b$ is a unit the lemma holds as well (by the symmetry of Lemma 41.5.4). Hence we may assume that $a, b \in \mathfrak{m}_{A}$. This in particular implies that $\mathfrak{m}$ is not an associated prime of $M$, and hence $\alpha: M \rightarrow M^{\prime}$ is injective. This permits us to think of $M$ as a submodule of $M^{\prime}$. By assumption $M^{\prime} / M$ is a finite $A$-module with support $\left\{\mathfrak{m}_{A}\right\}$ and hence has finite length. Note that for any third module $M^{\prime \prime}$ with $M \subset M^{\prime \prime} \subset M^{\prime}$ the maps $M \rightarrow M^{\prime \prime}$ and $M^{\prime \prime} \rightarrow M^{\prime}$ satisfy the assumptions of the lemma as well. This reduces us, by
induction on the length of $M^{\prime} / M$, to the case where $\operatorname{length}_{A}\left(M^{\prime} / M\right)=1$. Finally, in this case consider the map

$$
\bar{\alpha}: M / a b M \longrightarrow M^{\prime} / a b M^{\prime}
$$

By construction the cokernel $Q$ of $\bar{\alpha}$ has length 1 . Since $a, b \in \mathfrak{m}_{A}$, they act trivially on $Q$. It also follows that the kernel $K$ of $\bar{\alpha}$ has length 1 and hence also $a, b$ act trivially on $K$. Hence we may apply Lemma 41.4.13. Thus it suffices to see that the two maps $\alpha_{i}: Q \rightarrow K$ are the same. In fact, both maps are equal to the map $q=x^{\prime} \bmod \operatorname{Im}(\bar{\alpha}) \mapsto a b x^{\prime} \in K$. We omit the verification.

02Q5 Lemma 41.5.10. Let $A$ be a Noetherian local ring. Let $M$ be a finite $A$-module with $\operatorname{dim}(\operatorname{Supp}(M))=1$. Let $a, b \in A$ nonzerodivisors on $M$. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ be the minimal primes in the support of $M$. Then

$$
d_{M}(a, b)=\prod_{i=1, \ldots, t} d_{A / \mathfrak{q}_{i}}(a, b)^{\text {length }_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right)}
$$

as elements of $\kappa^{*}$.
Proof. Choose a filtration by $A$-submodules

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{j} / M_{j-1}$ is isomorphic to $A / \mathfrak{p}_{j}$ for some prime ideal $\mathfrak{p}_{j}$ of A. See Algebra, Lemma 10.61.1. For each $j$ we have either $\mathfrak{p}_{j}=\mathfrak{q}_{i}$ for some $i$, or $\mathfrak{p}_{j}=\mathfrak{m}_{A}$. Moreover, for a fixed $i$, the number of $j$ such that $\mathfrak{p}_{j}=\mathfrak{q}_{i}$ is equal to $\operatorname{length}_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right)$ by Algebra, Lemma 10.61.5. Hence $d_{M_{j}}(a, b)$ is defined for each $j$ and

$$
d_{M_{j}}(a, b)=\left\{\begin{array}{ccc}
d_{M_{j-1}}(a, b) d_{A / \mathfrak{q}_{i}}(a, b) & \text { if } \quad \mathfrak{p}_{j}=\mathfrak{q}_{i} \\
d_{M_{j-1}}(a, b) & \text { if } \mathfrak{p}_{j}=\mathfrak{m}_{A}
\end{array}\right.
$$

by Lemma 41.5 .8 in the first instance and Lemma 41.5 .9 in the second. Hence the lemma.

02Q6 Lemma 41.5.11. Let $A$ be a discrete valuation ring with fraction field $K$. For nonzero $x, y \in K$ we have

$$
d_{A}(x, y)=(-1)^{\operatorname{ord}_{A}(x) \operatorname{ord}_{A}(y)} \frac{x^{\operatorname{ord}_{A}(y)}}{y^{\operatorname{ord}_{A}(x)}} \bmod \mathfrak{m}_{A}
$$

in other words the symbol is equal to the usual tame symbol.
Proof. By multiplicativity it suffices to prove this when $x, y \in A$. Let $t \in A$ be a uniformizer. Write $x=t^{b} u$ and $y=t^{b} v$ for some $a, b \geq 0$ and $u, v \in A^{*}$. Set $l=a+b$. Then $t^{l-1}, \ldots, t^{b}$ is an admissible sequence in $(x) /(x y)$ and $t^{l-1}, \ldots, t^{a}$ is an admissible sequence in $(y) /(x y)$. Hence by Remark 41.4.2 we see that $d_{A}(x, y)$ is characterized by the equation

$$
\left[t^{l-1}, \ldots, t^{b}, v^{-1} t^{b-1}, \ldots, v^{-1}\right]=(-1)^{a b} d_{A}(x, y)\left[t^{l-1}, \ldots, t^{a}, u^{-1} t^{a-1}, \ldots, u^{-1}\right]
$$

Hence by the admissible relations for the symbols $\left[x_{1}, \ldots, x_{l}\right]$ we see that

$$
d_{A}(x, y)=(-1)^{a b} u^{a} / v^{b} \bmod \mathfrak{m}_{A}
$$

as desired.
We add the following lemma here. It is very similar to Algebra, Lemma 10.118.3

02Q7 Lemma 41.5.12. Let $R$ be a local Noetherian domain of dimension 1 with maximal ideal $\mathfrak{m}$. Let $a, b \in \mathfrak{m}$ be nonzero. There exists a finite ring extension $R \subset R^{\prime}$ with same field of fractions, and $t, a^{\prime}, b^{\prime} \in R^{\prime}$ such that $a=t a^{\prime}$ and $b=t b^{\prime}$ and $R^{\prime}=a^{\prime} R^{\prime}+b^{\prime} R^{\prime}$.

Proof. Set $I=(a, b)$. The idea is to blow up $R$ in $I$ as in the proof of Algebra, Lemma 10.118.3. Instead of doing the algebraic argument we work geometrically. Let $X=\operatorname{Proj}\left(\bigoplus I^{d} / I^{d+1}\right)$. By Divisors, Lemma 30.26 .9 this is an integral scheme. The morphism $X \rightarrow \operatorname{Spec}(R)$ is projective by Divisors, Lemma 30.26.13. By Algebra, Lemma 10.112 .2 and the fact that $X$ is quasi-compact we see that the fibre of $X \rightarrow \operatorname{Spec}(R)$ over $\mathfrak{m}$ is finite. By Properties, Lemma 27.29 .5 there exists an affine open $U \subset X$ containing this fibre. Hence $X=U$ because $X \rightarrow \operatorname{Spec}(R)$ is closed. In other words $X$ is affine, say $X=\operatorname{Spec}\left(R^{\prime}\right)$. By Morphisms, Lemma 28.15.2 we see that $R \rightarrow R^{\prime}$ is of finite type. Since $X \rightarrow \operatorname{Spec}(R)$ is proper and affine it is integral (see Morphisms, Lemma 28.43.7). Hence $R \rightarrow R^{\prime}$ is of finite type and integral, hence finite (Algebra, Lemma 10.35.5). By Divisors, Lemma 30.26.4 we see that $I R^{\prime}$ is a locally principal ideal. Since $R^{\prime}$ is semi-local we see that $I R^{\prime}$ is principal, see Algebra, Lemma 10.77.6. say $I R^{\prime}=(t)$. Then we have $a=a^{\prime} t$ and $b=b^{\prime} t$ and everything is clear.

02Q8 Lemma 41.5.13. Let $A$ be a Noetherian local ring. Let $a, b \in A$. Let $M$ be $a$ finite A-module of dimension 1 on which each of $a, b, b-a$ are nonzerodivisors. Then

$$
d_{M}(a, b-a) d_{M}(b, b)=d_{M}(b, b-a) d_{M}(a, b)
$$

in $\kappa^{*}$.
Proof. By Lemma 41.5 .10 it suffices to show the relation when $M=A / \mathfrak{q}$ for some prime $\mathfrak{q} \subset A$ with $\operatorname{dim}(A / \mathfrak{q})=1$.

In case $M=A / \mathfrak{q}$ we may replace $A$ by $A / \mathfrak{q}$ and $a, b$ by their images in $A / \mathfrak{q}$. Hence we may assume $A=M$ and $A$ a local Noetherian domain of dimension 1. The reason is that the residue field $\kappa$ of $A$ and $A / \mathfrak{q}$ are the same and that for any $A / \mathfrak{q}$ module $M$ the determinant taken over $A$ or over $A / \mathfrak{q}$ are canonically identified. See Lemma 41.2.7

It suffices to show the relation when both $a, b$ are in the maximal ideal. Namely, the case where one or both are units follows from Lemmas 41.5.7 and 41.5.6.

Choose an extension $A \subset A^{\prime}$ and factorizations $a=t a^{\prime}, b=t b^{\prime}$ as in Lemma 41.5.12 Note that also $b-a=t\left(b^{\prime}-a^{\prime}\right)$ and that $A^{\prime}=\left(a^{\prime}, b^{\prime}\right)=\left(a^{\prime}, b^{\prime}-a^{\prime}\right)=\left(b^{\prime}-a^{\prime}, b^{\prime}\right)$. Here and in the following we think of $A^{\prime}$ as an $A$-module and $a, b, a^{\prime}, b^{\prime}, t$ as $A$ module endomorphisms of $A^{\prime}$. We will use the notation $d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}\right)$ and so on to indicate

$$
d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}\right)=\operatorname{det}_{\kappa}\left(A^{\prime} / a^{\prime} b^{\prime} A^{\prime}, a^{\prime}, b^{\prime}\right)
$$

which is defined by Lemma 41.5.1. The upper index ${ }^{A}$ is used to distinguish this from the already defined symbol $d_{A^{\prime}}\left(a^{\prime}, b^{\prime}\right)$ which is different (for example because it has values in the residue field of $A^{\prime}$ which may be different from $\kappa$ ). By Lemma 41.5 .9 we see that $d_{A}(a, b)=d_{A^{\prime}}^{A}(a, b)$, and similarly for the other combinations. Using this and multiplicativity we see that it suffices to prove

$$
d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}-a^{\prime}\right) d_{A^{\prime}}^{A}\left(b^{\prime}, b^{\prime}\right)=d_{A^{\prime}}^{A}\left(b^{\prime}, b^{\prime}-a^{\prime}\right) d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}\right)
$$

Now, since $\left(a^{\prime}, b^{\prime}\right)=A^{\prime}$ and so on we have

$$
\begin{aligned}
A^{\prime} /\left(a^{\prime}\left(b^{\prime}-a^{\prime}\right)\right) & \cong A^{\prime} /\left(a^{\prime}\right) \oplus A^{\prime} /\left(b^{\prime}-a^{\prime}\right) \\
A^{\prime} /\left(b^{\prime}\left(b^{\prime}-a^{\prime}\right)\right) & \cong A^{\prime} /\left(b^{\prime}\right) \oplus A^{\prime} /\left(b^{\prime}-a^{\prime}\right) \\
A^{\prime} /\left(a^{\prime} b^{\prime}\right) & \cong A^{\prime} /\left(a^{\prime}\right) \oplus A^{\prime} /\left(b^{\prime}\right)
\end{aligned}
$$

Moreover, note that multiplication by $b^{\prime}-a^{\prime}$ on $A /\left(a^{\prime}\right)$ is equal to multiplication by $b^{\prime}$, and that multiplication by $b^{\prime}-a^{\prime}$ on $A /\left(b^{\prime}\right)$ is equal to multiplication by $-a^{\prime}$. Using Lemmas 41.4.5 and 41.4.6 we conclude

$$
\begin{array}{cl}
d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}-a^{\prime}\right) & =\operatorname{det}_{\kappa}\left(\left.b^{\prime}\right|_{A^{\prime} /\left(a^{\prime}\right)}\right)^{-1} \operatorname{det}_{\kappa}\left(\left.a^{\prime}\right|_{A^{\prime} /\left(b^{\prime}-a^{\prime}\right)}\right) \\
d_{A^{\prime}}^{A}\left(b^{\prime}, b^{\prime}-a^{\prime}\right) & =\operatorname{det}_{\kappa}\left(-\left.a^{\prime}\right|_{A^{\prime} /\left(b^{\prime}\right)}\right)^{-1} \operatorname{det}_{\kappa}\left(\left.b^{\prime}\right|_{A^{\prime} /\left(b^{\prime}-a^{\prime}\right)}\right) \\
d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}\right) & \left.=\operatorname{det}_{\kappa}\left(\left.b^{\prime}\right|_{A^{\prime} /\left(a^{\prime}\right)}\right)\right)^{-1} \operatorname{det}_{\kappa}\left(\left.a^{\prime}\right|_{A^{\prime} /\left(b^{\prime}\right)}\right)
\end{array}
$$

Hence we conclude that

$$
(-1)^{\operatorname{length}_{A}\left(A^{\prime} /\left(b^{\prime}\right)\right)} d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}-a^{\prime}\right)=d_{A^{\prime}}^{A}\left(b^{\prime}, b^{\prime}-a^{\prime}\right) d_{A^{\prime}}^{A}\left(a^{\prime}, b^{\prime}\right)
$$

the sign coming from the $-a^{\prime}$ in the second equality above. On the other hand, by Lemma 41.4.4 we have $d_{A^{\prime}}^{A}\left(b^{\prime}, b^{\prime}\right)=(-1)^{\text {length }_{A}\left(A^{\prime} /\left(b^{\prime}\right)\right)}$ and the lemma is proved.

The tame symbol is a Steinberg symbol.
02Q9 Lemma 41.5.14. Let $A$ be a Noetherian local domain of dimension 1. Let $K=$ f.f.(A). For $x \in K \backslash\{0,1\}$ we have

$$
d_{A}(x, 1-x)=1
$$

Proof. Write $x=a / b$ with $a, b \in A$. The hypothesis implies, since $1-x=(b-a) / b$, that also $b-a \neq 0$. Hence we compute

$$
d_{A}(x, 1-x)=d_{A}(a, b-a) d_{A}(a, b)^{-1} d_{A}(b, b-a)^{-1} d_{A}(b, b)
$$

Thus we have to show that $d_{A}(a, b-a) d_{A}(b, b)=d_{A}(b, b-a) d_{A}(a, b)$. This is Lemma 41.5.13.

### 41.6. Lengths and determinants

02QA In this section we use the determinant to compare lattices. The key lemma is the following.

02QB Lemma 41.6.1. Let $R$ be a noetherian local ring. Let $\mathfrak{q} \subset R$ be a prime with $\operatorname{dim}(R / \mathfrak{q})=1$. Let $\varphi: M \rightarrow N$ be a homomorphism of finite $R$-modules. Assume there exist $x_{1}, \ldots, x_{l} \in M$ and $y_{1}, \ldots, y_{l} \in M$ with the following properties
(1) $M=\left\langle x_{1}, \ldots, x_{l}\right\rangle$,
(2) $\left\langle x_{1}, \ldots, x_{i}\right\rangle /\left\langle x_{1}, \ldots, x_{i-1}\right\rangle \cong R / \mathfrak{q}$ for $i=1, \ldots, l$,
(3) $N=\left\langle y_{1}, \ldots, y_{l}\right\rangle$, and
(4) $\left\langle y_{1}, \ldots, y_{i}\right\rangle /\left\langle y_{1}, \ldots, y_{i-1}\right\rangle \cong R / \mathfrak{q}$ for $i=1, \ldots, l$.

Then $\varphi$ is injective if and only if $\varphi_{\mathfrak{q}}$ is an isomorphism, and in this case we have

$$
\operatorname{length}_{R}(\operatorname{Coker}(\varphi))=\operatorname{ord}_{R / \mathfrak{q}}(f)
$$

where $f \in \kappa(\mathfrak{q})$ is the element such that

$$
\left[\varphi\left(x_{1}\right), \ldots, \varphi\left(x_{l}\right)\right]=f\left[y_{1}, \ldots, y_{l}\right]
$$

$i n \operatorname{det}_{\kappa(\mathfrak{q})}\left(N_{\mathfrak{q}}\right)$.

Proof. First, note that the lemma holds in case $l=1$. Namely, in this case $x_{1}$ is a basis of $M$ over $R / \mathfrak{q}$ and $y_{1}$ is a basis of $N$ over $R / \mathfrak{q}$ and we have $\varphi\left(x_{1}\right)=f y_{1}$ for some $f \in R$. Thus $\varphi$ is injective if and only if $f \notin \mathfrak{q}$. Moreover, $\operatorname{Coker}(\varphi)=R /(f, \mathfrak{q})$ and hence the lemma holds by definition of $\operatorname{ord}_{R / q}(f)$ (see Algebra, Definition 10.120.2).

In fact, suppose more generally that $\varphi\left(x_{i}\right)=f_{i} y_{i}$ for some $f_{i} \in R, f_{i} \notin \mathfrak{q}$. Then the induced maps

$$
\left\langle x_{1}, \ldots, x_{i}\right\rangle /\left\langle x_{1}, \ldots, x_{i-1}\right\rangle \longrightarrow\left\langle y_{1}, \ldots, y_{i}\right\rangle /\left\langle y_{1}, \ldots, y_{i-1}\right\rangle
$$

are all injective and have cokernels isomorphic to $R /\left(f_{i}, \mathfrak{q}\right)$. Hence we see that

$$
\operatorname{length}_{R}(\operatorname{Coker}(\varphi))=\sum \operatorname{ord}_{R / \mathfrak{q}}\left(f_{i}\right)
$$

On the other hand it is clear that

$$
\left[\varphi\left(x_{1}\right), \ldots, \varphi\left(x_{l}\right)\right]=f_{1} \ldots f_{l}\left[y_{1}, \ldots, y_{l}\right]
$$

in this case from the admissible relation (b) for symbols. Hence we see the result holds in this case also.

We prove the general case by induction on $l$. Assume $l>1$. Let $i \in\{1, \ldots, l\}$ be minimal such that $\varphi\left(x_{1}\right) \in\left\langle y_{1}, \ldots, y_{i}\right\rangle$. We will argue by induction on $i$. If $i=1$, then we get a commutative diagram

and the lemma follows from the snake lemma and induction on $l$. Assume now that $i>1$. Write $\varphi\left(x_{1}\right)=a_{1} y_{1}+\ldots+a_{i-1} y_{i-1}+a y_{i}$ with $a_{j}, a \in R$ and $a \notin \mathfrak{q}$ (since otherwise $i$ was not minimal). Set

$$
x_{j}^{\prime}=\left\{\begin{array}{rll}
x_{j} & \text { if } & j=1 \\
a x_{j} & \text { if } & j \geq 2
\end{array} \quad \text { and } \quad y_{j}^{\prime}=\left\{\begin{array}{ccc}
y_{j} & \text { if } & j<i \\
a y_{j} & \text { if } & j \geq i
\end{array}\right.\right.
$$

Let $M^{\prime}=\left\langle x_{1}^{\prime}, \ldots, x_{l}^{\prime}\right\rangle$ and $N^{\prime}=\left\langle y_{1}^{\prime}, \ldots, y_{l}^{\prime}\right\rangle$. Since $\varphi\left(x_{1}^{\prime}\right)=a_{1} y_{1}^{\prime}+\ldots+a_{i-1} y_{i-1}^{\prime}+y_{i}^{\prime}$ by construction and since for $j>1$ we have $\varphi\left(x_{j}^{\prime}\right)=a \varphi\left(x_{i}\right) \in\left\langle y_{1}^{\prime}, \ldots, y_{l}^{\prime}\right\rangle$ we get a commutative diagram of $R$-modules and maps

By the result of the second paragraph of the proof we know that length ${ }_{R}\left(M / M^{\prime}\right)=$ $(l-1) \operatorname{ord}_{R / \mathfrak{q}}(a)$ and similarly $\operatorname{length}_{R}\left(M / M^{\prime}\right)=(l-i+1) \operatorname{ord}_{R / \mathfrak{q}}(a)$. By a diagram chase this implies that

$$
\operatorname{length}_{R}\left(\operatorname{Coker}\left(\varphi^{\prime}\right)\right)=\operatorname{length}_{R}(\operatorname{Coker}(\varphi))+i \operatorname{ord}_{R / \mathfrak{q}}(a)
$$

On the other hand, it is clear that writing

$$
\left[\varphi\left(x_{1}\right), \ldots, \varphi\left(x_{l}\right)\right]=f\left[y_{1}, \ldots, y_{l}\right], \quad\left[\varphi^{\prime}\left(x_{1}^{\prime}\right), \ldots, \varphi\left(x_{l}^{\prime}\right)\right]=f^{\prime}\left[y_{1}^{\prime}, \ldots, y_{l}^{\prime}\right]
$$

we have $f^{\prime}=a^{i} f$. Hence it suffices to prove the lemma for the case that $\varphi\left(x_{1}\right)=$ $a_{1} y_{1}+\ldots a_{i-1} y_{i-1}+y_{i}$, i.e., in the case that $a=1$. Next, recall that

$$
\left[y_{1}, \ldots, y_{l}\right]=\left[y_{1}, \ldots, y_{i-1}, a_{1} y_{1}+\ldots a_{i-1} y_{i-1}+y_{i}, y_{i+1}, \ldots, y_{l}\right]
$$

by the admissible relations for symbols. The sequence $y_{1}, \ldots, y_{i-1}, a_{1} y_{1}+\ldots+$ $a_{i-1} y_{i-1}+y_{i}, y_{i+1}, \ldots, y_{l}$ satisfies the conditions (3), (4) of the lemma also. Hence, we may actually assume that $\varphi\left(x_{1}\right)=y_{i}$. In this case, note that we have $\mathfrak{q} x_{1}=0$ which implies also $\mathfrak{q} y_{i}=0$. We have

$$
\left[y_{1}, \ldots, y_{l}\right]=-\left[y_{1}, \ldots, y_{i-2}, y_{i}, y_{i-1}, y_{i+1}, \ldots, y_{l}\right]
$$

by the third of the admissible relations defining $\operatorname{det}_{\kappa(\mathfrak{q})}\left(N_{\mathfrak{q}}\right)$. Hence we may replace $y_{1}, \ldots, y_{l}$ by the sequence $y_{1}^{\prime}, \ldots, y_{l}^{\prime}=y_{1}, \ldots, y_{i-2}, y_{i}, y_{i-1}, y_{i+1}, \ldots, y_{l}$ (which also satisfies conditions (3) and (4) of the lemma). Clearly this decreases the invariant $i$ by 1 and we win by induction on $i$.

To use the previous lemma we show that often sequences of elements with the required properties exist.

02QC Lemma 41.6.2. Let $R$ be a local Noetherian ring. Let $\mathfrak{q} \subset R$ be a prime ideal. Let $M$ be a finite $R$-module such that $\mathfrak{q}$ is one of the minimal primes of the support of $M$. Then there exist $x_{1}, \ldots, x_{l} \in M$ such that
(1) the support of $M /\left\langle x_{1}, \ldots, x_{l}\right\rangle$ does not contain $\mathfrak{q}$, and
(2) $\left\langle x_{1}, \ldots, x_{i}\right\rangle /\left\langle x_{1}, \ldots, x_{i-1}\right\rangle \cong R / \mathfrak{q}$ for $i=1, \ldots, l$.

Moreover, in this case $l=$ length $_{R_{\mathfrak{q}}}\left(M_{\mathfrak{q}}\right)$.
Proof. The condition that $\mathfrak{q}$ is a minimal prime in the support of $M$ implies that $l=\operatorname{length}_{R_{\mathfrak{q}}}\left(M_{\mathfrak{q}}\right)$ is finite (see Algebra, Lemma 10.61.3). Hence we can find $y_{1}, \ldots, y_{l} \in M_{\mathfrak{q}}$ such that $\left\langle y_{1}, \ldots, y_{i}\right\rangle /\left\langle y_{1}, \ldots, y_{i-1}\right\rangle \cong \kappa(\mathfrak{q})$ for $i=1, \ldots, l$. We can find $f_{i} \in R, f_{i} \notin \mathfrak{q}$ such that $f_{i} y_{i}$ is the image of some element $z_{i} \in M$. Moreover, as $R$ is Noetherian we can write $\mathfrak{q}=\left(g_{1}, \ldots, g_{t}\right)$ for some $g_{j} \in R$. By assumption $g_{j} y_{i} \in\left\langle y_{1}, \ldots, y_{i-1}\right\rangle$ inside the module $M_{\mathfrak{q}}$. By our choice of $z_{i}$ we can find some further elements $f_{j i} \in R, f_{i j} \notin \mathfrak{q}$ such that $f_{i j} g_{j} z_{i} \in\left\langle z_{1}, \ldots, z_{i-1}\right\rangle$ (equality in the module $M$ ). The lemma follows by taking

$$
x_{1}=f_{11} f_{12} \ldots f_{1 t} z_{1}, \quad x_{2}=f_{11} f_{12} \ldots f_{1 t} f_{21} f_{22} \ldots f_{2 t} z_{2}
$$

and so on. Namely, since all the elements $f_{i}, f_{i j}$ are invertible in $R_{\mathfrak{q}}$ we still have that $R_{\mathfrak{q}} x_{1}+\ldots+R_{\mathfrak{q}} x_{i} / R_{\mathfrak{q}} x_{1}+\ldots+R_{\mathfrak{q}} x_{i-1} \cong \kappa(\mathfrak{q})$ for $i=1, \ldots, l$. By construction, $\mathfrak{q} x_{i} \in\left\langle x_{1}, \ldots, x_{i-1}\right\rangle$. Thus $\left\langle x_{1}, \ldots, x_{i}\right\rangle /\left\langle x_{1}, \ldots, x_{i-1}\right\rangle$ is an $R$-module generated by one element, annihilated $\mathfrak{q}$ such that localizing at $\mathfrak{q}$ gives a $q$-dimensional vector space over $\kappa(\mathfrak{q})$. Hence it is isomorphic to $R / \mathfrak{q}$.

Here is the main result of this section. We will see below the various different consequences of this proposition. The reader is encouraged to first prove the easier Lemma 41.6.4 his/herself.

02QD Proposition 41.6.3. Let $R$ be a local Noetherian ring with residue field $\kappa$. Suppose that $(M, \varphi, \psi)$ is a $(2,1)$-periodic complex over $R$. Assume
(1) $M$ is a finite $R$-module,
(2) the cohomology modules of $(M, \varphi, \psi)$ are of finite length, and
(3) $\operatorname{dim}(\operatorname{Supp}(M))=1$.

Let $\mathfrak{q}_{i}, i=1, \ldots, t$ be the minimal primes of the support of $M$. Then we hav ${ }^{2}$

$$
-e_{R}(M, \varphi, \psi)=\sum_{i=1, \ldots, t} \operatorname{ord}_{R / \mathfrak{q}_{i}}\left(\operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{\mathfrak{q}_{i}}, \varphi_{\mathfrak{q}_{i}}, \psi_{\mathfrak{q}_{i}}\right)\right)
$$

Proof. We first reduce to the case $t=1$ in the following way. Note that $\operatorname{Supp}(M)=$ $\left\{\mathfrak{m}, \mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$, where $\mathfrak{m} \subset R$ is the maximal ideal. Let $M_{i}$ denote the image of $M \rightarrow M_{\mathfrak{q}_{i}}$, $\operatorname{so} \operatorname{Supp}\left(M_{i}\right)=\left\{\mathfrak{m}, \mathfrak{q}_{i}\right\}$. The map $\varphi($ resp. $\psi)$ induces an $R$-module map $\varphi_{i}: M_{i} \rightarrow M_{i}$ (resp. $\psi_{i}: M_{i} \rightarrow M_{i}$ ). Thus we get a morphism of $(2,1)$-periodic complexes

$$
(M, \varphi, \psi) \longrightarrow \bigoplus_{i=1, \ldots, t}\left(M_{i}, \varphi_{i}, \psi_{i}\right)
$$

The kernel and cokernel of this map have support equal to $\{\mathfrak{m}\}$ (or are zero). Hence by Lemma 41.3 .3 these $(2,1)$-periodic complexes have multiplicity 0 . In other words we have

$$
e_{R}(M, \varphi, \psi)=\sum_{i=1, \ldots, t} e_{R}\left(M_{i}, \varphi_{i}, \psi_{i}\right)
$$

On the other hand we clearly have $M_{\mathfrak{q}_{i}}=M_{i, \mathfrak{q}_{i}}$, and hence the terms of the right hand side of the formula of the lemma are equal to the expressions

$$
\operatorname{ord}_{R / \mathfrak{q}_{i}}\left(\operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{i, \mathfrak{q}_{i}}, \varphi_{i, \mathfrak{q}_{i}}, \psi_{i, \mathfrak{q}_{i}}\right)\right)
$$

In other words, if we can prove the lemma for each of the modules $M_{i}$, then the lemma holds. This reduces us to the case $t=1$.

Assume we have a $(2,1)$-periodic complex $(M, \varphi, \psi)$ over a Noetherian local ring with $M$ a finite $R$-module, $\operatorname{Supp}(M)=\{\mathfrak{m}, \mathfrak{q}\}$, and finite length cohomology modules. The proof in this case follows from Lemma 41.6.1 and careful bookkeeping. Denote $K_{\varphi}=\operatorname{Ker}(\varphi), I_{\varphi}=\operatorname{Im}(\varphi), K_{\psi}=\operatorname{Ker}(\psi)$, and $I_{\psi}=\operatorname{Im}(\psi)$. Since $R$ is Noetherian these are all finite $R$-modules. Set

$$
a=\operatorname{length}_{R_{\mathfrak{q}}}\left(I_{\varphi, \mathfrak{q}}\right)=\operatorname{length}_{R_{\mathfrak{q}}}\left(K_{\psi, \mathfrak{q}}\right), \quad b=\operatorname{length}_{R_{\mathfrak{q}}}\left(I_{\psi, \mathfrak{q}}\right)=\operatorname{length}_{R_{\mathfrak{q}}}\left(K_{\varphi, \mathfrak{q}}\right)
$$

Equalities because the complex becomes exact after localizing at $\mathfrak{q}$. Note that $l=\operatorname{length}_{R_{\mathfrak{q}}}\left(M_{\mathfrak{q}}\right)$ is equal to $l=a+b$.
We are going to use Lemma 41.6 .2 to choose sequences of elements in finite $R$ modules $N$ with support contained in $\{\mathfrak{m}, \mathfrak{q}\}$. In this case $N_{\mathfrak{q}}$ has finite length, say $n \in \mathbf{N}$. Let us call a sequence $w_{1}, \ldots, w_{n} \in N$ with properties (1) and (2) of Lemma 41.6.2 a "good sequence". Note that the quotient $N /\left\langle w_{1}, \ldots, w_{n}\right\rangle$ of $N$ by the submodule generated by a good sequence has support (contained in) $\{\mathfrak{m}\}$ and hence has finite length (Algebra, Lemma 10.61.3). Moreover, the symbol $\left[w_{1}, \ldots, w_{n}\right] \in \operatorname{det}_{\kappa(\mathfrak{q})}\left(N_{\mathfrak{q}}\right)$ is a generator, see Lemma 41.2.4.
Having said this we choose good sequences

$$
\begin{array}{cccccc}
x_{1}, \ldots, x_{b} & \text { in } & K_{\varphi}, & t_{1}, \ldots, t_{a} & \text { in } & K_{\psi}, \\
y_{1}, \ldots, y_{a} & \text { in } & I_{\varphi} \cap\left\langle t_{1}, \ldots t_{a}\right\rangle, & s_{1}, \ldots, s_{b} & \text { in } & I_{\psi} \cap\left\langle x_{1}, \ldots, x_{b}\right\rangle .
\end{array}
$$

We will adjust our choices a little bit as follows. Choose lifts $\tilde{y}_{i} \in M$ of $y_{i} \in I_{\varphi}$ and $\tilde{s}_{i} \in M$ of $s_{i} \in I_{\psi}$. It may not be the case that $\mathfrak{q} \tilde{y}_{1} \subset\left\langle x_{1}, \ldots, x_{b}\right\rangle$ and it may not be the case that $\mathfrak{q} \tilde{s}_{1} \subset\left\langle t_{1}, \ldots, t_{a}\right\rangle$. However, using that $\mathfrak{q}$ is finitely generated (as in the proof of Lemma 41.6.2) we can find a $d \in R, d \notin \mathfrak{q}$ such that $\mathfrak{q} d \tilde{y}_{1} \subset\left\langle x_{1}, \ldots, x_{b}\right\rangle$ and $\mathfrak{q} d \tilde{s}_{1} \subset\left\langle t_{1}, \ldots, t_{a}\right\rangle$. Thus after replacing $y_{i}$ by $d y_{i}, \tilde{y}_{i}$ by $d \tilde{y}_{i}, s_{i}$ by $d s_{i}$ and $\tilde{s}_{i}$ by $d \tilde{s}_{i}$

[^115]we see that we may assume also that $x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{b}$ and $t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}$ are good sequences in $M$.

Finally, we choose a good sequence $z_{1}, \ldots, z_{l}$ in the finite $R$-module

$$
\left\langle x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{a}\right\rangle \cap\left\langle t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}\right\rangle .
$$

Note that this is also a good sequence in $M$.
Since $I_{\varphi, \mathfrak{q}}=K_{\psi, \mathfrak{q}}$ there is a unique element $h \in \kappa(\mathfrak{q})$ such that $\left[y_{1}, \ldots, y_{a}\right]=$ $h\left[t_{1}, \ldots, t_{a}\right]$ inside $\operatorname{det}_{\kappa(\mathfrak{q})}\left(K_{\psi, \mathfrak{q}}\right)$. Similarly, as $I_{\psi, \mathfrak{q}}=K_{\varphi, \mathfrak{q}}$ there is a unique element $h \in \kappa(\mathfrak{q})$ such that $\left[s_{1}, \ldots, s_{b}\right]=g\left[x_{1}, \ldots, x_{b}\right]$ inside $\operatorname{det}_{\kappa(\mathfrak{q})}\left(K_{\varphi, \mathfrak{q}}\right)$. We can also do this with the three good sequences we have in $M$. All in all we get the following identities

$$
\begin{aligned}
{\left[y_{1}, \ldots, y_{a}\right] } & =h\left[t_{1}, \ldots, t_{a}\right] \\
{\left[s_{1}, \ldots, s_{b}\right] } & =g\left[x_{1}, \ldots, x_{b}\right] \\
{\left[z_{1}, \ldots, z_{l}\right] } & =f_{\varphi}\left[x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{a}\right] \\
{\left[z_{1}, \ldots, z_{l}\right] } & =f_{\psi}\left[t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}\right]
\end{aligned}
$$

for some $g, h, f_{\varphi}, f_{\psi} \in \kappa(\mathfrak{q})$.
Having set up all this notation let us compute $\operatorname{det}_{\kappa(\mathfrak{q})}(M, \varphi, \psi)$. Namely, consider the element $\left[z_{1}, \ldots, z_{l}\right]$. Under the map $\gamma_{\psi} \circ \sigma \circ \gamma_{\varphi}^{-1}$ of Definition 41.4.1 we have

$$
\begin{aligned}
{\left[z_{1}, \ldots, z_{l}\right] } & =f_{\varphi}\left[x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{a}\right] \\
& \mapsto f_{\varphi}\left[x_{1}, \ldots, x_{b}\right] \otimes\left[y_{1}, \ldots, y_{a}\right] \\
& \mapsto f_{\varphi} h / g\left[t_{1}, \ldots, t_{a}\right] \otimes\left[s_{1}, \ldots, s_{b}\right] \\
& \mapsto f_{\varphi} h / g\left[t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}\right] \\
& =f_{\varphi} h / f_{\psi} g\left[z_{1}, \ldots, z_{l}\right]
\end{aligned}
$$

This means that $\operatorname{det}_{\kappa(\mathfrak{q})}\left(M_{\mathfrak{q}}, \varphi_{\mathfrak{q}}, \psi_{\mathfrak{q}}\right)$ is equal to $f_{\varphi} h / f_{\psi} g$ up to a sign.
We abbreviate the following quantities

$$
\begin{aligned}
k_{\varphi} & =\operatorname{length}_{R}\left(K_{\varphi} /\left\langle x_{1}, \ldots, x_{b}\right\rangle\right) \\
k_{\psi} & =\operatorname{length}_{R}\left(K_{\psi} /\left\langle t_{1}, \ldots, t_{a}\right\rangle\right) \\
i_{\varphi} & =\operatorname{length}_{R}\left(I_{\varphi} /\left\langle y_{1}, \ldots, y_{a}\right\rangle\right) \\
i_{\psi} & =\operatorname{length}_{R}\left(I_{\psi} /\left\langle s_{1}, \ldots, s_{a}\right\rangle\right) \\
m_{\varphi} & =\operatorname{length}_{R}\left(M /\left\langle x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{a}\right\rangle\right) \\
m_{\psi} & =\operatorname{length}_{R}\left(M /\left\langle t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}\right\rangle\right) \\
\delta_{\varphi} & =\operatorname{length}_{R}\left(\left\langle x_{1}, \ldots, x_{b}, \tilde{y}_{1}, \ldots, \tilde{y}_{a}\right\rangle\left\langle z_{1}, \ldots, z_{l}\right\rangle\right) \\
\delta_{\psi} & =\operatorname{length}_{R}\left(\left\langle t_{1}, \ldots, t_{a}, \tilde{s}_{1}, \ldots, \tilde{s}_{b}\right\rangle\left\langle z_{1}, \ldots, z_{l}\right\rangle\right)
\end{aligned}
$$

Using the exact sequences $0 \rightarrow K_{\varphi} \rightarrow M \rightarrow I_{\varphi} \rightarrow 0$ we get $m_{\varphi}=k_{\varphi}+i_{\varphi}$. Similarly we have $m_{\psi}=k_{\psi}+i_{\psi}$. We have $\delta_{\varphi}+m_{\varphi}=\delta_{\psi}+m_{\psi}$ since this is equal to the colength of $\left\langle z_{1}, \ldots, z_{l}\right\rangle$ in $M$. Finally, we have

$$
\delta_{\varphi}=\operatorname{ord}_{R / \mathfrak{q}}\left(f_{\varphi}\right), \quad \delta_{\psi}=\operatorname{ord}_{R / \mathfrak{q}}\left(f_{\psi}\right)
$$

by our first application of the key Lemma 41.6.1.

Next, let us compute the multiplicity of the periodic complex

$$
\begin{aligned}
e_{R}(M, \varphi, \psi)= & \operatorname{length}_{R}\left(K_{\varphi} / I_{\psi}\right)-\operatorname{length}_{R}\left(K_{\psi} / I_{\varphi}\right) \\
= & \operatorname{length}_{R}\left(\left\langle x_{1}, \ldots, x_{b}\right\rangle /\left\langle s_{1}, \ldots, s_{b}\right\rangle\right)+k_{\varphi}-i_{\psi} \\
& -\operatorname{length}_{R}\left(\left\langle t_{1}, \ldots, t_{a}\right\rangle /\left\langle y_{1}, \ldots, y_{a}\right\rangle\right)-k_{\psi}+i_{\varphi} \\
= & \operatorname{ord}_{R / \mathfrak{q}}(g / h)+k_{\varphi}-i_{\psi}-k_{\psi}+i_{\varphi} \\
= & \operatorname{ord}_{R / \mathfrak{q}}(g / h)+m_{\varphi}-m_{\psi} \\
= & \operatorname{ord}_{R / \mathfrak{q}}(g / h)+\delta_{\psi}-\delta_{\varphi} \\
= & \operatorname{ord}_{R / \mathfrak{q}}\left(f_{\psi} g / f_{\varphi} h\right)
\end{aligned}
$$

where we used the key Lemma 41.6 .1 twice in the third equality. By our computation of $\operatorname{det}_{\kappa(\mathfrak{q})}\left(M_{\mathfrak{q}}, \varphi_{\mathfrak{q}}, \psi_{\mathfrak{q}}\right)$ this proves the proposition.

In most applications the following lemma suffices.
02QE Lemma 41.6.4. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $M$ be a finite $R$-module, and let $\psi: M \rightarrow M$ be an $R$-module map. Assume that
(1) $\operatorname{Ker}(\psi)$ and $\operatorname{Coker}(\psi)$ have finite length, and
(2) $\operatorname{dim}(\operatorname{Supp}(M)) \leq 1$.

Write $\operatorname{Supp}(M)=\left\{\mathfrak{m}, \mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$ and denote $f_{i} \in \kappa\left(\mathfrak{q}_{i}\right)^{*}$ the element such that $\operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(\psi_{\mathbf{q}_{i}}\right): \operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{\mathbf{q}_{i}}\right) \rightarrow \operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{\mathfrak{q}_{i}}\right)$ is multiplication by $f_{i}$. Then we have

$$
\text { length }_{R}(\operatorname{Coker}(\psi))-\text { length }_{R}(\operatorname{Ker}(\psi))=\sum_{i=1, \ldots, t} \operatorname{ord}_{R / \mathfrak{q}_{i}}\left(f_{i}\right) .
$$

Proof. Recall that $H^{0}(M, 0, \psi)=\operatorname{Coker}(\psi)$ and $H^{1}(M, 0, \psi)=\operatorname{Ker}(\psi)$, see remarks above Definition 41.3.2 The lemma follows by combining Proposition 41.6.3 with Lemma 41.4.5
Alternative proof. Reduce to the case $\operatorname{Supp}(M)=\{\mathfrak{m}, \mathfrak{q}\}$ as in the proof of Proposition 41.6.3. Then directly combine Lemmas 41.6.1 and 41.6.2 to prove this specific case of Proposition 41.6.3. There is much less bookkeeping in this case, and the reader is encouraged to work this out. Details omitted.

### 41.7. Application to tame symbol

02QI In this section we apply the results above to show the following key lemma. This lemma is a low degree case of the statement that there is a complex for Milnor Ktheory similar to the Gersten-Quillen complex in Quillen's K-theory. See Kat86.

02QJ Lemma 41.7.1 (Key Lemma). Let A be a 2-dimensional Noetherian local domain. Let $K=f . f .(A)$. Let $f, g \in K^{*}$. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ be the height 1 primes $\mathfrak{q}$ of $A$ such that either $f$ or $g$ is not an element of $A_{\mathfrak{q}}^{*}$. Then we have

$$
\sum_{i=1, \ldots, t} \operatorname{ord}_{A / \mathfrak{q}_{i}}\left(d_{A_{q_{i}}}(f, g)\right)=0
$$

We can also write this as

$$
\sum_{h e i g h t(\mathfrak{q})=1} \operatorname{ord}_{A / \mathfrak{q}}\left(d_{A_{\mathfrak{q}}}(f, g)\right)=0
$$

since at any height one prime $\mathfrak{q}$ of $A$ where $f, g \in A_{\mathfrak{q}}^{*}$ we have $d_{A_{\mathfrak{q}}}(f, g)=1$ by Lemma 41.5.7.

When $A$ is an excellent ring this is Kat86, Proposition 1].

Proof. Since the tame symbols $d_{A_{\mathfrak{q}}}(f, g)$ are additive (Lemma 41.5.4) and the order functions $\operatorname{ord}_{A / \mathfrak{q}}$ are additive (Algebra, Lemma 10.120.1) it suffices to prove the formula when $f=a \in A$ and $g=b \in A$. In this case we see that we have to show

$$
\sum_{\text {height }(\mathfrak{q})=1} \operatorname{ord}_{A / \mathfrak{q}}\left(\operatorname{det}_{\kappa}\left(A_{\mathfrak{q}} /(a b), a, b\right)\right)=0
$$

By Proposition 41.6.3 this is equivalent to showing that

$$
e_{A}(A /(a b), a, b)=0
$$

Since the complex $A /(a b) \xrightarrow{a} A /(a b) \xrightarrow{b} A /(a b) \xrightarrow{a} A /(a b)$ is exact we win.

### 41.8. Setup

02QK We will throughout work over a locally Noetherian universally catenary base $S$ endowed with a dimension function $\delta$. Although it is likely possible to generalize (parts of) the discussion in the chapter, it seems that this is a good first approximation. We usually do not assume our schemes are separated or quasi-compact. Many interesting algebraic stacks are non-separated and/or non-quasi-compact and this is a good case study to see how to develop a reasonable theory for those as well. In order to reference these hypotheses we give it a number.

02QL Situation 41.8.1. Here $S$ is a locally Noetherian, and universally catenary scheme. Moreover, we assume $S$ is endowed with a dimension function $\delta: S \longrightarrow \mathbf{Z}$.

See Morphisms, Definition 28.17 .1 for the notion of a universally catenary scheme, and see Topology, Definition 5.19.1 for the notion of a dimension function. Recall that any locally Noetherian catenary scheme locally has a dimension function, see Properties, Lemma 27.11.3. Moreover, there are lots of schemes which are universally catenary, see Morphisms, Lemma 28.17.4.

Let $(S, \delta)$ be as in Situation 41.8.1. Any scheme $X$ locally of finite type over $S$ is locally Noetherian and catenary. In fact, $X$ has a canonical dimension function

$$
\delta=\delta_{X / S}: X \longrightarrow \mathbf{Z}
$$

associated to $(f: X \rightarrow S, \delta)$ given by the rule $\delta_{X / S}(x)=\delta(f(x))+\operatorname{trdeg}_{\kappa(f(x))} \kappa(x)$. See Morphisms, Lemma 28.30.3. Moreover, if $h: X \rightarrow Y$ is a morphism of schemes locally of finite type over $S$, and $x \in X, y=h(x)$, then obviously $\delta_{X / S}(x)=$ $\delta_{Y / S}(y)+\operatorname{trdeg}_{\kappa(y)} \kappa(x)$. We will freely use this function and its properties in the following.
Here are the basic examples of setups as above. In fact, the main interest lies in the case where the base is the spectrum of a field, or the case where the base is the spectrum of a Dedekind ring (e.g. Z, or a discrete valuation ring).

02QM Example 41.8.2. Here $S=\operatorname{Spec}(k)$ and $k$ is a field. We set $\delta(p t)=0$ where $p t$ indicates the unique point of $S$. The pair $(S, \delta)$ is an example of a situation as in Situation 41.8.1 by Morphisms, Lemma 28.17.4.

02QN Example 41.8.3. Here $S=\operatorname{Spec}(A)$, where $A$ is a Noetherian domain of dimension 1. For example we could consider $A=\mathbf{Z}$. We set $\delta(\mathfrak{p})=0$ if $\mathfrak{p}$ is a maximal ideal and $\delta(\mathfrak{p})=1$ if $\mathfrak{p}=(0)$ corresponds to the generic point. This is an example of Situation 41.8.1 by Morphisms, Lemma 28.17.4.
In good cases $\delta$ corresponds to the dimension function.

02QO Lemma 41.8.4. Let $(S, \delta)$ be as in Situation 41.8.1. Assume in addition $S$ is a Jacobson scheme, and $\delta(s)=0$ for every closed point $s$ of $S$. Let $X$ be locally of finite type over $S$. Let $Z \subset X$ be an integral closed subscheme and let $\xi \in Z$ be its generic point. The following integers are the same:
(1) $\delta_{X / S}(\xi)$,
(2) $\operatorname{dim}(Z)$, and
(3) $\operatorname{dim}\left(\mathcal{O}_{Z, z}\right)$ where $z$ is a closed point of $Z$.

Proof. Let $X \rightarrow S, \xi \in Z \subset X$ be as in the lemma. Since $X$ is locally of finite type over $S$ we see that $X$ is Jacobson, see Morphisms, Lemma 28.16.9, Hence closed points of $X$ are dense in every closed subset of $Z$ and map to closed points of $S$. Hence given any chain of irreducible closed subsets of $Z$ we can end it with a closed point of $Z$. It follows that $\operatorname{dim}(Z)=\sup _{z}\left(\operatorname{dim}\left(\mathcal{O}_{Z, z}\right)\right.$ (see Properties, Lemma 27.10.3 where $z \in Z$ runs over the closed points of $Z$. Note that $\left.\operatorname{dim}\left(\mathcal{O}_{Z, z}\right)=\delta(\xi)-\delta(z)\right)$ by the properties of a dimension function. For each closed $z \in Z$ the field extension $\kappa(z) \supset \kappa(f(z))$ is finite, see Morphisms, Lemma 28.16.8. Hence $\delta_{X / S}(z)=\delta(f(z))=0$ for $z \in Z$ closed. It follows that all three integers are equal.
In the situation of the lemma above the value of $\delta$ at the generic point of a closed irreducible subset is the dimension of the irreducible closed subset. However, in general we cannot expect the equality to hold. For example if $S=\operatorname{Spec}(\mathbf{C}[[t]])$ and $X=\operatorname{Spec}(\mathbf{C}((t)))$ then we would get $\delta(x)=1$ for the unique point of $X$, but $\operatorname{dim}(X)=0$. Still we want to think of $\delta_{X / S}$ as giving the dimension of the irreducible closed subschemes. Thus we introduce the following terminology.
02QP Definition 41.8.5. Let $(S, \delta)$ as in Situation 41.8.1. For any scheme $X$ locally of finite type over $S$ and any irreducible closed subset $Z \subset X$ we define

$$
\operatorname{dim}_{\delta}(Z)=\delta(\xi)
$$

where $\xi \in Z$ is the generic point of $Z$. We will call this the $\delta$-dimension of $Z$. If $Z$ is a closed subscheme of $X$, then we $\operatorname{define} \operatorname{dim}_{\delta}(Z)$ as the supremum of the $\delta$-dimensions of its irreducible components.

### 41.9. Cycles

02 QQ Since we are not assuming our schemes are quasi-compact we have to be a little careful when defining cycles. We have to allow infinite sums because a rational function may have infinitely many poles for example. In any case, if $X$ is quasicompact then a cycle is a finite sum as usual.
02QR Definition 41.9.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $k \in \mathbf{Z}$.
(1) A cycle on $X$ is a formal sum

$$
\alpha=\sum n_{Z}[Z]
$$

where the sum is over integral closed subschemes $Z \subset X$, each $n_{Z} \in \mathbf{Z}$, and the collection $\left\{Z ; n_{Z} \neq 0\right\}$ is locally finite (Topology, Definition 5.27.4.
(2) A $k$-cycle, on $X$ is a cycle

$$
\alpha=\sum n_{Z}[Z]
$$

where $n_{Z} \neq 0 \Rightarrow \operatorname{dim}_{\delta}(Z)=k$.
(3) The abelian group of all $k$-cycles on $X$ is denoted $Z_{k}(X)$.

In other words, a $k$-cycle on $X$ is a locally finite formal $\mathbf{Z}$-linear combination of integral closed subschemes of $\delta$-dimension $k$. Addition of $k$-cycles $\alpha=\sum n_{Z}[Z]$ and $\beta=\sum m_{Z}[Z]$ is given by

$$
\alpha+\beta=\sum\left(n_{Z}+m_{Z}\right)[Z]
$$

i.e., by adding the coefficients.

### 41.10. Cycle associated to a closed subscheme

02QS
02QT Lemma 41.10.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $Z \subset X$ be a closed subscheme.
(1) Let $Z^{\prime} \subset Z$ be an irreducible component and let $\xi \in Z^{\prime}$ be its generic point. Then

$$
\text { length }_{\mathcal{O}_{X, \xi}} \mathcal{O}_{Z, \xi}<\infty
$$

(2) If $\operatorname{dim}_{\delta}(Z) \leq k$ and $\xi \in Z$ with $\delta(\xi)=k$, then $\xi$ is a generic point of an irreducible component of $Z$.
Proof. Let $Z^{\prime} \subset Z, \xi \in Z^{\prime}$ be as in (1). Then $\operatorname{dim}\left(\mathcal{O}_{Z, \xi}\right)=0$ (for example by Properties, Lemma 27.10.3. Hence $\mathcal{O}_{Z, \xi}$ is Noetherian local ring of dimension zero, and hence has finite length over itself (see Algebra, Proposition 10.59.6). Hence, it also has finite length over $\mathcal{O}_{X, \xi}$, see Algebra, Lemma 10.51.12.
Assume $\xi \in Z$ and $\delta(\xi)=k$. Consider the closure $Z^{\prime}=\overline{\{\xi\}}$. It is an irreducible closed subscheme with $\operatorname{dim}_{\delta}\left(Z^{\prime}\right)=k$ by definition. Since $\operatorname{dim}_{\delta}(Z)=k$ it must be an irreducible component of $Z$. Hence we see (2) holds.
02QU Definition 41.10.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $Z \subset X$ be a closed subscheme.
(1) For any irreducible component $Z^{\prime} \subset Z$ with generic point $\xi$ the integer $m_{Z^{\prime}, Z}=$ length $_{\mathcal{O}_{X, \xi}} \mathcal{O}_{Z, \xi}$ (Lemma 41.10.1) is called the multiplicity of $Z^{\prime}$ in $Z$.
(2) Assume $\operatorname{dim}_{\delta}(Z) \leq k$. The $k$-cycle associated to $Z$ is

$$
[Z]_{k}=\sum m_{Z^{\prime}, Z}\left[Z^{\prime}\right]
$$

where the sum is over the irreducible components of $Z$ of $\delta$-dimension $k$. (This is a $k$-cycle by Divisors, Lemma 30.21.1.)
It is important to note that we only define $[Z]_{k}$ if the $\delta$-dimension of $Z$ does not exceed $k$. In other words, by convention, if we write $[Z]_{k}$ then this implies that $\operatorname{dim}_{\delta}(Z) \leq k$.

### 41.11. Cycle associated to a coherent sheaf

02QV
02QW Lemma 41.11.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module.
(1) The collection of irreducible components of the support of $\mathcal{F}$ is locally finite.
(2) Let $Z^{\prime} \subset \operatorname{Supp}(\mathcal{F})$ be an irreducible component and let $\xi \in Z^{\prime}$ be its generic point. Then

$$
\text { length }_{\mathcal{O}_{X, \xi}} \mathcal{F}_{\xi}<\infty
$$

(3) If $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$ and $\xi \in Z$ with $\delta(\xi)=k$, then $\xi$ is a generic point of an irreducible component of $\operatorname{Supp}(\mathcal{F})$.
Proof. By Cohomology of Schemes, Lemma 29.9.7 the support $Z$ of $\mathcal{F}$ is a closed subset of $X$. We may think of $Z$ as a reduced closed subscheme of $X$ (Schemes, Lemma 25.12.4. Hence (1) follows from Divisors, Lemma 30.21.1 applied to $Z$ and (3) follows from Lemma 41.10.1 applied to $Z$.

Let $\xi \in Z^{\prime}$ be as in (2). In this case for any specialization $\xi^{\prime} \rightsquigarrow \xi$ in $X$ we have $\mathcal{F}_{\xi^{\prime}}=0$. Recall that the non-maximal primes of $\mathcal{O}_{X, \xi}$ correspond to the points of $X$ specializing to $\xi$ (Schemes, Lemma 25.13.2). Hence $\mathcal{F}_{\xi}$ is a finite $\mathcal{O}_{X, \xi}$-module whose support is $\left\{\mathfrak{m}_{\xi}\right\}$. Hence it has finite length by Algebra, Lemma 10.61.3.

02QX Definition 41.11.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module.
(1) For any irreducible component $Z^{\prime} \subset \operatorname{Supp}(\mathcal{F})$ with generic point $\xi$ the integer $m_{Z^{\prime}, \mathcal{F}}=\operatorname{length}_{\mathcal{O}_{X, \xi}} \mathcal{F}_{\xi}$ (Lemma 41.11.1) is called the multiplicity of $Z^{\prime}$ in $\mathcal{F}$.
(2) Assume $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$. The $k$-cycle associated to $\mathcal{F}$ is

$$
[\mathcal{F}]_{k}=\sum m_{Z^{\prime}, \mathcal{F}}\left[Z^{\prime}\right]
$$

where the sum is over the irreducible components of $\operatorname{Supp}(\mathcal{F})$ of $\delta$-dimension $k$. (This is a $k$-cycle by Lemma 41.11.1.)

It is important to note that we only define $[\mathcal{F}]_{k}$ if $\mathcal{F}$ is coherent and the $\delta$-dimension of $\operatorname{Supp}(\mathcal{F})$ does not exceed $k$. In other words, by convention, if we write $[\mathcal{F}]_{k}$ then this implies that $\mathcal{F}$ is coherent on $X$ and $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$.
02QY Lemma 41.11.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $Z \subset X$ be a closed subscheme. If $\operatorname{dim}_{\delta}(Z) \leq k$, then $[Z]_{k}=\left[\mathcal{O}_{Z}\right]_{k}$.
Proof. This is because in this case the multiplicities $m_{Z^{\prime}, Z}$ and $m_{Z^{\prime}, \mathcal{O}_{Z}}$ agree by definition.

02QZ Lemma 41.11.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$ be a short exact sequence of coherent sheaves on $X$. Assume that the $\delta$-dimension of the supports of $\mathcal{F}, \mathcal{G}$, and $\mathcal{H}$ is $\leq k$. Then $[\mathcal{G}]_{k}=[\mathcal{F}]_{k}+[\mathcal{H}]_{k}$.

Proof. Follows immediately from additivity of lengths, see Algebra, Lemma 10.51.3.

### 41.12. Preparation for proper pushforward

02R0
02R1 Lemma 41.12.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $X, Y$ integral and $\operatorname{dim}_{\delta}(X)=\operatorname{dim}_{\delta}(Y)$. Then either $f(X)$ is contained in a proper closed subscheme of $Y$, or $f$ is dominant and the extension of function fields $R(Y) \subset R(X)$ is finite.

Proof. The closure $\overline{f(X)} \subset Y$ is irreducible as $X$ is irreducible (Topology, Lemmas 5.7 .2 and 5.7.3. If $\overline{f(X)} \neq Y$, then we are done. If $\overline{f(X)}=Y$, then $f$ is dominant and by Morphisms, Lemma 28.8.5 we see that the generic point $\eta_{Y}$ of $Y$ is in the image of $f$. Of course this implies that $f\left(\eta_{X}\right)=\eta_{Y}$, where $\eta_{X} \in X$ is the generic point of $X$. Since $\delta\left(\eta_{X}\right)=\delta\left(\eta_{Y}\right)$ we see that $R(Y)=\kappa\left(\eta_{Y}\right) \subset \kappa\left(\eta_{X}\right)=R(X)$ is an extension of transcendence degree 0 . Hence $R(Y) \subset R(X)$ is a finite extension by Morphisms, Lemma 28.47.7 (which applies by Morphisms, Lemma 28.15.8.

02R2 Lemma 41.12.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $f$ is quasi-compact, and $\left\{Z_{i}\right\}_{i \in I}$ is a locally finite collection of closed subsets of $X$. Then $\left\{\overline{f\left(Z_{i}\right)}\right\}_{i \in I}$ is a locally finite collection of closed subsets of $Y$.

Proof. Let $V \subset Y$ be a quasi-compact open subset. Since $f$ is quasi-compact the open $f^{-1}(V)$ is quasi-compact. Hence the set $\left\{i \in I \mid Z_{i} \cap f^{-1}(V) \neq \emptyset\right\}$ is finite by a simple topological argument which we omit. Since this is the same as the set

$$
\left\{i \in I \mid f\left(Z_{i}\right) \cap V \neq \emptyset\right\}=\left\{i \in I \mid \overline{f\left(Z_{i}\right)} \cap V \neq \emptyset\right\}
$$

the lemma is proved.

### 41.13. Proper pushforward

02R3
02R4 Definition 41.13.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $f$ is proper.
(1) Let $Z \subset X$ be an integral closed subscheme with $\operatorname{dim}_{\delta}(Z)=k$. We define

$$
f_{*}[Z]=\left\{\begin{array}{ccc}
0 & \text { if } \quad \operatorname{dim}_{\delta}(f(Z))<k \\
\operatorname{deg}(Z / f(Z))[f(Z)] & \text { if } \quad \operatorname{dim}_{\delta}(f(Z))=k
\end{array}\right.
$$

Here we think of $f(Z) \subset Y$ as an integral closed subscheme. The degree of $Z$ over $f(Z)$ is finite if $\operatorname{dim}_{\delta}(f(Z))=\operatorname{dim}_{\delta}(Z)$ by Lemma 41.12.1.
(2) Let $\alpha=\sum n_{Z}[Z]$ be a $k$-cycle on $X$. The pushforward of $\alpha$ as the sum

$$
f_{*} \alpha=\sum n_{Z} f_{*}[Z]
$$

where each $f_{*}[Z]$ is defined as above. The sum is locally finite by Lemma 41.12 .2 above.

By definition the proper pushforward of cycles

$$
f_{*}: Z_{k}(X) \longrightarrow Z_{k}(Y)
$$

is a homomorphism of abelian groups. It turns $X \mapsto Z_{k}(X)$ into a covariant functor on the category of schemes locally of finite type over $S$ with morphisms equal to proper morphisms.
02R5 Lemma 41.13.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$, and $Z$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be proper morphisms. Then $g_{*} \circ f_{*}=(g \circ f)_{*}$ as maps $Z_{k}(X) \rightarrow Z_{k}(Z)$.
Proof. Let $W \subset X$ be an integral closed subscheme of dimension $k$. Consider $W^{\prime}=f(Z) \subset Y$ and $W^{\prime \prime}=g(f(Z)) \subset Z$. Since $f, g$ are proper we see that $W^{\prime}$ (resp. $W^{\prime \prime}$ ) is an integral closed subscheme of $Y$ (resp. $Z$ ). We have to show
that $g_{*}\left(f_{*}[W]\right)=(f \circ g)_{*}[W]$. If $\operatorname{dim}_{\delta}\left(W^{\prime \prime}\right)<k$, then both sides are zero. If $\operatorname{dim}_{\delta}\left(W^{\prime \prime}\right)=k$, then we see the induced morphisms

$$
W \longrightarrow W^{\prime} \longrightarrow W^{\prime \prime}
$$

both satisfy the hypotheses of Lemma 41.12.1. Hence

$$
g_{*}\left(f_{*}[W]\right)=\operatorname{deg}\left(W / W^{\prime}\right) \operatorname{deg}\left(W^{\prime} / W^{\prime \prime}\right)\left[W^{\prime \prime}\right], \quad(f \circ g)_{*}[W]=\operatorname{deg}\left(W / W^{\prime \prime}\right)\left[W^{\prime \prime}\right]
$$

Then we can apply Morphisms, Lemma 28.47.9 to conclude.
02R6 Lemma 41.13.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X \rightarrow Y$ be a proper morphism of schemes which are locally of finite type over $S$.
(1) Let $Z \subset X$ be a closed subscheme with $\operatorname{dim}_{\delta}(Z) \leq k$. Then

$$
f_{*}[Z]_{k}=\left[f_{*} \mathcal{O}_{Z}\right]_{k}
$$

(2) Let $\mathcal{F}$ be a coherent sheaf on $X$ such that $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$. Then

$$
f_{*}[\mathcal{F}]_{k}=\left[f_{*} \mathcal{F}\right]_{k}
$$

Note that the statement makes sense since $f_{*} \mathcal{F}$ and $f_{*} \mathcal{O}_{Z}$ are coherent $\mathcal{O}_{Y}$-modules by Cohomology of Schemes, Proposition 29.18.1.

Proof. Part (1) follows from (2) and Lemma 41.11.3. Let $\mathcal{F}$ be a coherent sheaf on $X$. Assume that $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$. By Cohomology of Schemes, Lemma 29.9.7 there exists a closed subscheme $i: Z \rightarrow X$ and a coherent $\mathcal{O}_{Z \text {-module }} \mathcal{G}$ such that $i_{*} \mathcal{G} \cong \mathcal{F}$ and such that the support of $\mathcal{F}$ is $Z$. Let $Z^{\prime} \subset Y$ be the scheme theoretic image of $\left.f\right|_{Z}: Z \rightarrow Y$. Consider the commutative diagram of schemes

We have $f_{*} \mathcal{F}=f_{*} i_{*} \mathcal{G}=i_{*}^{\prime}\left(\left.f\right|_{Z}\right)_{*} \mathcal{G}$ by going around the diagram in two ways. Suppose we know the result holds for closed immersions and for $\left.f\right|_{Z}$. Then we see that

$$
f_{*}[\mathcal{F}]_{k}=f_{*} i_{*}[\mathcal{G}]_{k}=\left(i^{\prime}\right)_{*}\left(\left.f\right|_{Z}\right)_{*}[\mathcal{G}]_{k}=\left(i^{\prime}\right)_{*}\left[\left(\left.f\right|_{Z}\right)_{*} \mathcal{G}\right]_{k}=\left[\left(i^{\prime}\right)_{*}\left(\left.f\right|_{Z}\right)_{*} \mathcal{G}\right]_{k}=\left[f_{*} \mathcal{F}\right]_{k}
$$

as desired. The case of a closed immersion is straightforward (omitted). Note that $f_{Z}: Z \rightarrow Z^{\prime}$ is a dominant morphism (see Morphisms, Lemma 28.6.3). Thus we have reduced to the case where $\operatorname{dim}_{\delta}(X) \leq k$ and $f: X \rightarrow Y$ is proper and dominant.
Assume $\operatorname{dim}_{\delta}(X) \leq k$ and $f: X \rightarrow Y$ is proper and dominant. Since $f$ is dominant, for every irreducible component $Z \subset Y$ with generic point $\eta$ there exists a point $\xi \in X$ such that $f(\xi)=\eta$. Hence $\delta(\eta) \leq \delta(\xi) \leq k$. Thus we see that in the expressions

$$
f_{*}[\mathcal{F}]_{k}=\sum n_{Z}[Z], \quad \text { and } \quad\left[f_{*} \mathcal{F}\right]_{k}=\sum m_{Z}[Z] .
$$

whenever $n_{Z} \neq 0$, or $m_{Z} \neq 0$ the integral closed subscheme $Z$ is actually an irreducible component of $Y$ of $\delta$-dimension $k$. Pick such an integral closed subscheme $Z \subset Y$ and denote $\eta$ its generic point. Note that for any $\xi \in X$ with $f(\xi)=\eta$ we have $\delta(\xi) \geq k$ and hence $\xi$ is a generic point of an irreducible component of $X$ of $\delta$ dimension $k$ as well (see Lemma 41.10.1). Since $f$ is quasi-compact and $X$ is locally Noetherian, there can be only finitely many of these and hence $f^{-1}(\{\eta\})$ is finite.

By Morphisms, Lemma 28.47.1 there exists an open neighbourhood $\eta \in V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite. Replacing $Y$ by $V$ and $X$ by $f^{-1}(V)$ we reduce to the case where $Y$ is affine, and $f$ is finite.

Write $Y=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$ (possible as a finite morphism is affine). Then $R$ and $A$ are Noetherian rings and $A$ is finite over $R$. Moreover $\mathcal{F}=\widetilde{M}$ for some finite $A$-module $M$. Note that $f_{*} \mathcal{F}$ corresponds to $M$ viewed as an $R$-module. Let $\mathfrak{p} \subset R$ be the minimal prime corresponding to $\eta \in Y$. The coefficient of $Z$ in $\left[f_{*} \mathcal{F}\right]_{k}$ is clearly length ${ }_{R_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right)$. Let $\mathfrak{q}_{i}, i=1, \ldots, t$ be the primes of $A$ lying over $\mathfrak{p}$. Then $A_{\mathfrak{p}}=\prod A_{\mathfrak{q}_{i}}$ since $A_{\mathfrak{p}}$ is an Artinian ring being finite over the dimension zero local Noetherian ring $R_{\mathfrak{p}}$. Clearly the coefficient of $Z$ in $f_{*}[\mathcal{F}]_{k}$ is

$$
\sum_{i=1, \ldots, t}\left[\kappa\left(\mathfrak{q}_{i}\right): \kappa(\mathfrak{p})\right] \operatorname{length}_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right)
$$

Hence the desired equality follows from Algebra, Lemma 10.51 .12 ,

### 41.14. Preparation for flat pullback

02R7 Recall that a morphism $f: X \rightarrow Y$ which is locally of finite type is said to have relative dimension $r$ if every nonempty fibre is equidimensional of dimension $r$. See Morphisms, Definition 28.29.1.

02R8 Lemma 41.14.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $f$ is flat of relative dimension $r$. For any closed subset $Z \subset Y$ we have

$$
\operatorname{dim}_{\delta}\left(f^{-1}(Z)\right)=\operatorname{dim}_{\delta}(Z)+r
$$

If $Z$ is irreducible and $Z^{\prime} \subset f^{-1}(Z)$ is an irreducible component, then $Z^{\prime}$ dominates $Z$ and $\operatorname{dim}_{\delta}\left(Z^{\prime}\right)=\operatorname{dim}_{\delta}(Z)+r$.

Proof. It suffices to prove the final statement. We may replace $Y$ by the integral closed subscheme $Z$ and $X$ by the scheme theoretic inverse image $f^{-1}(Z)=Z \times_{Y} X$. Hence we may assume $Z=Y$ is integral and $f$ is a flat morphism of relative dimension $r$. Since $Y$ is locally Noetherian the morphism $f$ which is locally of finite type, is actually locally of finite presentation. Hence Morphisms, Lemma 28.25 .9 applies and we see that $f$ is open. Let $\xi \in X$ be a generic point of an irreducible component of $X$. By the openness of $f$ we see that $f(\xi)$ is the generic point $\eta$ of $Z=Y$. Note that $\operatorname{dim}_{\xi}\left(X_{\eta}\right)=r$ by assumption that $f$ has relative dimension $r$. On the other hand, since $\xi$ is a generic point of $X$ we see that $\mathcal{O}_{X, \xi}=\mathcal{O}_{X_{\eta}, \xi}$ has only one prime ideal and hence has dimension 0 . Thus by Morphisms, Lemma 28.28 .1 we conclude that the transcendence degree of $\kappa(\xi)$ over $\kappa(\eta)$ is $r$. In other words, $\delta(\xi)=\delta(\eta)+r$ as desired.

Here is the lemma that we will use to prove that the flat pullback of a locally finite collection of closed subschemes is locally finite.

02R9 Lemma 41.14.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $\left\{Z_{i}\right\}_{i \in I}$ is a locally finite collection of closed subsets of $Y$. Then $\left\{f^{-1}\left(Z_{i}\right)\right\}_{i \in I}$ is a locally finite collection of closed subsets of $Y$.

Proof. Let $U \subset X$ be a quasi-compact open subset. Since the image $f(U) \subset Y$ is a quasi-compact subset there exists a quasi-compact open $V \subset Y$ such that $f(U) \subset V$. Note that

$$
\left\{i \in I \mid f^{-1}\left(Z_{i}\right) \cap U \neq \emptyset\right\} \subset\left\{i \in I \mid Z_{i} \cap V \neq \emptyset\right\}
$$

Since the right hand side is finite by assumption we win.

### 41.15. Flat pullback

02RA In the following we use $f^{-1}(Z)$ to denote the scheme theoretic inverse image of a closed subscheme $Z \subset Y$ for a morphism of schemes $f: X \rightarrow Y$. We recall that the scheme theoretic inverse image is the fibre product

and it is also the closed subscheme of $X$ cut out by the quasi-coherent sheaf of ideals $f^{-1}(\mathcal{I}) \mathcal{O}_{X}$, if $\mathcal{I} \subset \mathcal{O}_{Y}$ is the quasi-coherent sheaf of ideals corresponding to $Z$ in $Y$. (This is discussed in Schemes, Section 25.4 and Lemma 25.17.6 and Definition 25.17.7.)

02RB Definition 41.15.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a morphism. Assume $f$ is flat of relative dimension $r$.
(1) Let $Z \subset Y$ be an integral closed subscheme of $\delta$-dimension $k$. We define $f^{*}[Z]$ to be the $(k+r)$-cycle on $X$ to the scheme theoretic inverse image

$$
f^{*}[Z]=\left[f^{-1}(Z)\right]_{k+r}
$$

This makes sense since $\operatorname{dim}_{\delta}\left(f^{-1}(Z)\right)=k+r$ by Lemma 41.14.1.
(2) Let $\alpha=\sum n_{i}\left[Z_{i}\right]$ be a $k$-cycle on $Y$. The flat pullback of $\alpha$ by $f$ is the sum

$$
f^{*} \alpha=\sum n_{i} f^{*}\left[Z_{i}\right]
$$

where each $f^{*}\left[Z_{i}\right]$ is defined as above. The sum is locally finite by Lemma 41.14 .2
(3) We denote $f^{*}: Z_{k}(Y) \rightarrow Z_{k+r}(X)$ the map of abelian groups so obtained.

An open immersion is flat. This is an important though trivial special case of a flat morphism. If $U \subset X$ is open then sometimes the pullback by $j: U \rightarrow X$ of a cycle is called the restriction of the cycle to $U$. Note that in this case the maps

$$
j^{*}: Z_{k}(X) \longrightarrow Z_{k}(U)
$$

are all surjective. The reason is that given any integral closed subscheme $Z^{\prime} \subset U$, we can take the closure of $Z$ of $Z^{\prime}$ in $X$ and think of it as a reduced closed subscheme of $X$ (see Schemes, Lemma 25.12.4). And clearly $Z \cap U=Z^{\prime}$, in other words $j^{*}[Z]=\left[Z^{\prime}\right]$ whence the surjectivity. In fact a little bit more is true.

02RC Lemma 41.15.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $U \subset X$ be an open subscheme, and denote $i: Y=X \backslash U \rightarrow X$ as a reduced closed subscheme of $X$. For every $k \in \mathbf{Z}$ the sequence

$$
Z_{k}(Y) \xrightarrow{i_{*}} Z_{k}(X) \xrightarrow{j^{*}} Z_{k}(U) \longrightarrow 0
$$

is an exact complex of abelian groups.
Proof. First assume $X$ is quasi-compact. Then $Z_{k}(X)$ is a free Z-module with basis given by the elements $[Z]$ where $Z \subset X$ is integral closed of $\delta$-dimension $k$. Such a basis element maps either to the basis element $[Z \cap U]$ or to zero if $Z \subset Y$. Hence the lemma is clear in this case. The general case is similar and the proof is omitted.

02RD Lemma 41.15.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y, Z$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be flat morphisms of relative dimensions $r$ and $s$. Then $g \circ f$ is flat of relative dimension $r+s$ and

$$
f^{*} \circ g^{*}=(g \circ f)^{*}
$$

as maps $Z_{k}(Z) \rightarrow Z_{k+r+s}(X)$.
Proof. The composition is flat of relative dimension $r+s$ by Morphisms, Lemma 28.29.3. Suppose that
(1) $W \subset Z$ is a closed integral subscheme of $\delta$-dimension $k$,
(2) $W^{\prime} \subset Y$ is a closed integral subscheme of $\delta$-dimension $k+s$ with $W^{\prime} \subset$ $g^{-1}(W)$, and
(3) $W^{\prime \prime} \subset Y$ is a closed integral subscheme of $\delta$-dimension $k+s+r$ with $W^{\prime \prime} \subset f^{-1}\left(W^{\prime}\right)$.
We have to show that the coefficient $n$ of $\left[W^{\prime \prime}\right]$ in $(g \circ f)^{*}[W]$ agrees with the coefficient $m$ of $\left[W^{\prime \prime}\right]$ in $f^{*}\left(g^{*}[W]\right)$. That it suffices to check the lemma in these cases follows from Lemma 41.14.1. Let $\xi^{\prime \prime} \in W^{\prime \prime}, \xi^{\prime} \in W^{\prime}$ and $\xi \in W$ be the generic points. Consider the local rings $A=\mathcal{O}_{Z, \xi}, B=\mathcal{O}_{Y, \xi^{\prime}}$ and $C=\mathcal{O}_{X, \xi^{\prime \prime}}$. Then we have local flat ring maps $A \rightarrow B, B \rightarrow C$ and moreover

$$
n=\operatorname{length}_{C}\left(C / \mathfrak{m}_{A} C\right), \quad \text { and } \quad m=\operatorname{length}_{C}\left(C / \mathfrak{m}_{B} C\right) \operatorname{length}_{B}\left(B / \mathfrak{m}_{A} B\right)
$$

Hence the equality follows from Algebra, Lemma 10.51.14.
02RE Lemma 41.15.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$.
(1) Let $Z \subset Y$ be a closed subscheme with $\operatorname{dim}_{\delta}(Z) \leq k$. Then we have $\operatorname{dim}_{\delta}\left(f^{-1}(Z)\right) \leq k+r$ and $\left[f^{-1}(Z)\right]_{k+r}=f^{*}[Z]_{k}$ in $Z_{k+r}(X)$.
(2) Let $\mathcal{F}$ be a coherent sheaf on $Y$ with $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$. Then we have $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(f^{*} \mathcal{F}\right)\right) \leq k+r$ and

$$
f^{*}[\mathcal{F}]_{k}=\left[f^{*} \mathcal{F}\right]_{k+r}
$$

in $Z_{k+r}(X)$.
Proof. Part (1) follows from part (2) by Lemma 41.11.3 and the fact that $f^{*} \mathcal{O}_{Z}=$ $\mathcal{O}_{f^{-1}(Z)}$.
Proof of (2). As $X, Y$ are locally Noetherian we may apply Cohomology of Schemes, Lemma 29.9.1 to see that $\mathcal{F}$ is of finite type, hence $f^{*} \mathcal{F}$ is of finite type (Modules, Lemma 17.9.2, hence $f^{*} \mathcal{F}$ is coherent (Cohomology of Schemes, Lemma 29.9.1
again). Thus the lemma makes sense. Let $W \subset Y$ be an integral closed subscheme of $\delta$-dimension $k$, and let $W^{\prime} \subset X$ be an integral closed subscheme of dimension $k+r$ mapping into $W$ under $f$. We have to show that the coefficient $n$ of $[W]$ in $f^{*}[\mathcal{F}]_{k}$ agrees with the coefficient $m$ of $[W]$ in $\left[f^{*} \mathcal{F}\right]_{k+r}$. Let $\xi \in W$ and $\xi^{\prime} \in W^{\prime}$ be the generic points. Let $A=\mathcal{O}_{Y, \xi}, B=\mathcal{O}_{X, \xi^{\prime}}$ and set $M=\mathcal{F}_{\xi}$ as an $A$-module. (Note that $M$ has finite length by our dimension assumptions, but we actually do not need to verify this. See Lemma 41.11.1.) We have $f^{*} \mathcal{F}_{\xi^{\prime}}=B \otimes_{A} M$. Thus we see that

$$
n=\operatorname{length}_{B}\left(B \otimes_{A} M\right) \quad \text { and } \quad m=\operatorname{length}_{A}(M) \operatorname{length}_{B}\left(B / \mathfrak{m}_{A} B\right)
$$

Thus the equality follows from Algebra, Lemma 10.51.13.

### 41.16. Push and pull

02 RF In this section we verify that proper pushforward and flat pullback are compatible when this makes sense. By the work we did above this is a consequence of cohomology and base change.

02RG Lemma 41.16.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let

be a fibre product diagram of schemes locally of finite type over $S$. Assume $f: X \rightarrow$ $Y$ proper and $g: Y^{\prime} \rightarrow Y$ flat of relative dimension $r$. Then also $f^{\prime}$ is proper and $g^{\prime}$ is flat of relative dimension $r$. For any $k$-cycle $\alpha$ on $X$ we have

$$
g^{*} f_{*} \alpha=f_{*}^{\prime}\left(g^{\prime}\right)^{*} \alpha
$$

in $Z_{k+r}\left(Y^{\prime}\right)$.
Proof. The assertion that $f^{\prime}$ is proper follows from Morphisms, Lemma 28.41.5. The assertion that $g^{\prime}$ is flat of relative dimension $r$ follows from Morphisms, Lemmas 28.29 .2 and 28.25.7. It suffices to prove the equality of cycles when $\alpha=[W]$ for some integral closed subscheme $W \subset X$ of $\delta$-dimension $k$. Note that in this case we have $\alpha=\left[\mathcal{O}_{W}\right]_{k}$, see Lemma 41.11.3. By Lemmas 41.13.3 and 41.15.4 it therefore suffices to show that $f_{*}^{\prime}\left(g^{\prime}\right)^{*} \mathcal{O}_{W}$ is isomorphic to $g^{*} f_{*} \mathcal{O}_{W}$. This follows from cohomology and base change, see Cohomology of Schemes, Lemma 29.5.2

02RH Lemma 41.16.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a finite locally free morphism of degree $d$ (see Morphisms, Definition 28.45.1). Then $f$ is both proper and flat of relative dimension 0, and

$$
f_{*} f^{*} \alpha=d \alpha
$$

for every $\alpha \in Z_{k}(Y)$.
Proof. A finite locally free morphism is flat and finite by Morphisms, Lemma 28.45.2 and a finite morphism is proper by Morphisms, Lemma 28.43.10. We omit showing that a finite morphism has relative dimension 0 . Thus the formula makes sense. To prove it, let $Z \subset Y$ be an integral closed subscheme of $\delta$-dimension $k$. It suffices to prove the formula for $\alpha=[Z]$. Since the base change of a finite
locally free morphism is finite locally free (Morphisms, Lemma 28.45.4) we see that $f_{*} f^{*} \mathcal{O}_{Z}$ is a finite locally free sheaf of rank $d$ on $Z$. Hence

$$
f_{*} f^{*}[Z]=f_{*} f^{*}\left[\mathcal{O}_{Z}\right]_{k}=\left[f_{*} f^{*} \mathcal{O}_{Z}\right]_{k}=d[Z]
$$

where we have used Lemmas 41.15.4 and 41.13.3.

### 41.17. Preparation for principal divisors

02RI Some of the material in this section partially overlaps with the discussion in Divisors, Section 30.21 .

02RK Lemma 41.17.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral.
(1) If $Z \subset X$ is an integral closed subscheme, then the following are equivalent:
(a) $Z$ is a prime divisor,
(b) $Z$ has codimension 1 in $X$, and
(c) $\operatorname{dim}_{\delta}(Z)=\operatorname{dim}_{\delta}(X)-1$.
(2) If $Z$ is an irreducible component of an effective Cartier divisor on $X$, then $\operatorname{dim}_{\delta}(Z)=\operatorname{dim}_{\delta}(X)-1$.
Proof. Part (1) follows from the definition of a prime divisor (Divisors, Definition 30.21 .2 and the definition of a dimension function (Topology, Definition 5.19.1). Let $\xi \in Z$ be the generic point of an irreducible component $Z$ of an effective Cartier divisor $D \subset X$. Then $\operatorname{dim}\left(\mathcal{O}_{D, \xi}\right)=0$ and $\mathcal{O}_{D, \xi}=\mathcal{O}_{X, \xi} /(f)$ for some nonzerodivisor $f \in \mathcal{O}_{X, \xi}$ (Divisors, Lemma 30.12.2). Then $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$ by Algebra, Lemma 10.59 .12 . Hence $Z$ is as in (1) by Properties, Lemma 27.10 .3 and the proof is complete.

02RM Lemma 41.17.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\xi \in Y$ be a point. Assume that
(1) $X, Y$ are integral,
(2) $Y$ is locally Noetherian
(3) $f$ is proper, dominant and $R(X) \subset R(Y)$ is finite, and
(4) $\operatorname{dim}\left(\mathcal{O}_{Y, \xi}\right)=1$.

Then there exists an open neighbourhood $V \subset Y$ of $\xi$ such that $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow$ $V$ is finite.

Proof. This lemma is a special case of Varieties, Lemma 32.15.2. Here is a direct argument in this case. By Cohomology of Schemes, Lemma 29.20 .2 it suffices to prove that $f^{-1}(\{\xi\})$ is finite. We replace $Y$ by an affine open, say $Y=\operatorname{Spec}(R)$. Note that $R$ is Noetherian, as $Y$ is assumed locally Noetherian. Since $f$ is proper it is quasi-compact. Hence we can find a finite affine open covering $X=U_{1} \cup \ldots \cup U_{n}$ with each $U_{i}=\operatorname{Spec}\left(A_{i}\right)$. Note that $R \rightarrow A_{i}$ is a finite type injective homomorphism of domains with $f . f .(R) \subset f . f .\left(A_{i}\right)$ finite. Thus the lemma follows from Algebra, Lemma 10.112.2

### 41.18. Principal divisors

02RN The following definition is the analogue of Divisors, Definition 30.21 .5 in our current setup.

02RO Definition 41.18.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral with $\operatorname{dim}_{\delta}(X)=n$. Let $f \in R(X)^{*}$. The principal divisor associated to $f$ is the $(n-1)$-cycle

$$
\operatorname{div}(f)=\operatorname{div}_{X}(f)=\sum \operatorname{ord}_{Z}(f)[Z]
$$

defined in Divisors, Definition 30.21.5. This makes sense because prime divisors have $\delta$-dimension $n-1$ by Lemma 41.17.1.

In the situation of the definition for $f, g \in R(X)^{*}$ we have

$$
\operatorname{div}_{X}(f g)=\operatorname{div}_{X}(f)+\operatorname{div}_{X}(g)
$$

in $Z_{n-1}(X)$. See Divisors, Lemma 30.21.6. The following lemma will be superseded by the more general Lemma 41.21.1

02RR Lemma 41.18.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Assume $X, Y$ are integral and $n=\operatorname{dim}_{\delta}(Y)$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $g \in R(Y)^{*}$. Then

$$
f^{*}\left(\operatorname{div}_{Y}(g)\right)=\operatorname{div}_{X}(g)
$$

in $Z_{n+r-1}(X)$.
Proof. Note that since $f$ is flat it is dominant so that $f$ induces an embedding $R(Y) \subset R(X)$, and hence we may think of $g$ as an element of $R(X)^{*}$. Let $Z \subset X$ be an integral closed subscheme of $\delta$-dimension $n+r-1$. Let $\xi \in Z$ be its generic point. If $\operatorname{dim}_{\delta}(f(Z))>n-1$, then we see that the coefficient of [Z] in the left and right hand side of the equation is zero. Hence we may assume that $Z^{\prime}=\overline{f(Z)}$ is an integral closed subscheme of $Y$ of $\delta$-dimension $n-1$. Let $\xi^{\prime}=f(\xi)$. It is the generic point of $Z^{\prime}$. Set $A=\mathcal{O}_{Y, \xi^{\prime}}, B=\mathcal{O}_{X, \xi}$. The ring map $A \rightarrow B$ is a flat local homomorphism of Noetherian local domains of dimension 1. We have $g \in f . f .(A)$. What we have to show is that

$$
\operatorname{ord}_{A}(g) \operatorname{length}_{B}\left(B / \mathfrak{m}_{A} B\right)=\operatorname{ord}_{B}(g)
$$

This follows from Algebra, Lemma 10.51 .13 (details omitted).

### 41.19. Principal divisors and pushforward

02RS The first lemma implies that the pushforward of a principal divisor along a generically finite morphism is a principal divisor.
02RT Lemma 41.19.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Assume $X, Y$ are integral and $n=\operatorname{dim}_{\delta}(X)=\operatorname{dim}_{\delta}(Y)$. Let $p: X \rightarrow Y$ be a dominant proper morphism. Let $f \in R(X)^{*}$. Set

$$
g=N m_{R(X) / R(Y)}(f)
$$

Then we have $p_{*} \operatorname{div}(f)=\operatorname{div}(g)$.
Proof. Let $Z \subset Y$ be an integral closed subscheme of $\delta$-dimension $n-1$. We want to show that the coefficient of $[Z]$ in $p_{*} \operatorname{div}(f)$ and $\operatorname{div}(g)$ are equal. We may apply Lemma 41.17 .2 to the morphism $p: X \rightarrow Y$ and the generic point $\xi \in Z$. Hence we may replace $Y$ by an affine open neighbourhood of $\xi$ and assume that $p: X \rightarrow Y$ is finite. Write $Y=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$ with $p$ induced by a finite homomorphism $R \rightarrow A$ of Noetherian domains which induces an finite field extension $f . f .(R) \subset f . f .(A)$ of fraction fields. Now we have $f \in f . f .(A)$,
$g=\operatorname{Nm}(f) \in f . f .(R)$, and a prime $\mathfrak{p} \subset R$ with $\operatorname{dim}\left(R_{\mathfrak{p}}\right)=1$. The coefficient of $[Z]$ in $\operatorname{div}_{Y}(g)$ is $\operatorname{ord}_{R_{\mathfrak{p}}}(g)$. The coefficient of $[Z]$ in $p_{*} \operatorname{div}_{X}(f)$ is

$$
\sum_{\mathfrak{q} \text { lying over } \mathfrak{p}}[\kappa(\mathfrak{q}): \kappa(\mathfrak{p})] \operatorname{ord}_{A_{q}}(f)
$$

The desired equality therefore follows from Algebra, Lemma 10.120 .8
An important role in the discussion of principal divisors is played by the "universal" principal divisor $[0]-[\infty]$ on $\mathbf{P}_{S}^{1}$. To make this more precise, let us denote

$$
D_{0}, D_{\infty} \subset \mathbf{P}_{S}^{1}=\underline{\operatorname{Proj}}_{S}\left(\mathcal{O}_{S}\left[T_{0}, T_{1}\right]\right)
$$

the closed subscheme cut out by the section $T_{1}$, resp. $T_{0}$ of $\mathcal{O}(1)$. These are effective Cartier divisors, see Divisors, Definition 30.11.1 and Lemma 30.11.21. The following lemma says that loosely speaking we have " $\operatorname{div}\left(T_{1} / T_{0}\right)=\left[D_{0}\right]-\left[D_{1}\right] "$ and that this is the universal principal divisor.

02RQ Lemma 41.19.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $n=\operatorname{dim}_{\delta}(X)$. Let $f \in R(X)^{*}$. Let $U \subset X$ be a nonempty open such that $f$ corresponds to a section $f \in \Gamma\left(U, \mathcal{O}_{X}^{*}\right)$. Let $Y \subset X \times{ }_{S} \mathbf{P}_{S}^{1}$ be the closure of the graph of $f: U \rightarrow \mathbf{P}_{S}^{1}$. Then
(1) the projection morphism $p: Y \rightarrow X$ is proper,
(2) $\left.p\right|_{p^{-1}(U)}: p^{-1}(U) \rightarrow U$ is an isomorphism,
(3) the pullbacks $Y_{0}=q^{-1} D_{0}$ and $Y_{\infty}=q^{-1} D_{\infty}$ via the morphism $q: Y \rightarrow \mathbf{P}_{S}^{1}$ are defined (Divisors, Definition 30.11.11),
(4) we have

$$
\operatorname{div}_{Y}(f)=\left[Y_{0}\right]_{n-1}-\left[Y_{\infty}\right]_{n-1}
$$

(5) we have

$$
\operatorname{div}_{X}(f)=p_{*} \operatorname{div}_{Y}(f)
$$

(6) if we view $Y_{0}$ and $Y_{\infty}$ as closed subschemes of $X$ via the morphism $p$ then we have

$$
\operatorname{div}_{X}(f)=\left[Y_{0}\right]_{n-1}-\left[Y_{\infty}\right]_{n-1}
$$

Proof. Since $X$ is integral, we see that $U$ is integral. Hence $Y$ is integral, and $(1, f)(U) \subset Y$ is an open dense subscheme. Also, note that the closed subscheme $Y \subset X \times{ }_{S} \mathbf{P}_{S}^{1}$ does not depend on the choice of the open $U$, since after all it is the closure of the one point set $\left\{\eta^{\prime}\right\}=\{(1, f)(\eta)\}$ where $\eta \in X$ is the generic point. Having said this let us prove the assertions of the lemma.

For (1) note that $p$ is the composition of the closed immersion $Y \rightarrow X \times{ }_{S} \mathbf{P}_{S}^{1}=\mathbf{P}_{X}^{1}$ with the proper morphism $\mathbf{P}_{X}^{1} \rightarrow X$. As a composition of proper morphisms is proper (Morphisms, Lemma 28.41.4) we conclude.

It is clear that $Y \cap U \times_{S} \mathbf{P}_{S}^{1}=(1, f)(U)$. Thus (2) follows. It also follows that $\operatorname{dim}_{\delta}(Y)=n$.

Note that $q\left(\eta^{\prime}\right)=f(\eta)$ is not contained in $D_{0}$ or $D_{\infty}$ since $f \in R(X)^{*}$. Hence (3) by Divisors, Lemma 30.11.12 We obtain $\operatorname{dim}_{\delta}\left(Y_{0}\right)=n-1$ and $\operatorname{dim}_{\delta}\left(Y_{\infty}\right)=n-1$ from Lemma 41.17.1.

Consider the effective Cartier divisor $Y_{0}$. At every point $\xi \in Y_{0}$ we have $f \in \mathcal{O}_{Y, \xi}$ and the local equation for $Y_{0}$ is given by $f$. In particular, if $\delta(\xi)=n-1$ so $\xi$ is the
generic point of a integral closed subscheme $Z$ of $\delta$-dimension $n-1$, then we see that the coefficient of $[Z]$ in $\operatorname{div}_{Y}(f)$ is

$$
\operatorname{ord}_{Z}(f)=\operatorname{length}_{\mathcal{O}_{Y, \xi}}\left(\mathcal{O}_{Y, \xi} / f \mathcal{O}_{Y, \xi}\right)=\operatorname{length}_{\mathcal{O}_{Y, \xi}}\left(\mathcal{O}_{Y_{0}, \xi}\right)
$$

which is the coefficient of $[Z]$ in $\left[Y_{0}\right]_{n-1}$. A similar argument using the rational function $1 / f$ shows that $-\left[Y_{\infty}\right]$ agrees with the terms with negative coefficients in the expression for $\operatorname{div}_{Y}(f)$. Hence (4) follows.
Note that $D_{0} \rightarrow S$ is an isomorphism. Hence we see that $X \times_{S} D_{0} \rightarrow X$ is an isomorphism as well. Clearly we have $Y_{0}=Y \cap X \times{ }_{S} D_{0}$ (scheme theoretic intersection) inside $X \times_{S} \mathbf{P}_{S}^{1}$. Hence it is really the case that $Y_{0} \rightarrow X$ is a closed immersion. It follows that

$$
p_{*} \mathcal{O}_{Y_{0}}=\mathcal{O}_{Y_{0}^{\prime}}
$$

where $Y_{0}^{\prime} \subset X$ is the image of $Y_{0} \rightarrow X$. By Lemma 41.13.3 we have $p_{*}\left[Y_{0}\right]_{n-1}=$ $\left[Y_{0}^{\prime}\right]_{n-1}$. The same is true for $D_{\infty}$ and $Y_{\infty}$. Hence (6) is a consequence of (5). Finally, (5) follows immediately from Lemma 41.19.1.

The following lemma says that the degree of a principal divisor on a proper curve is zero.

02RU Lemma 41.19.3. Let $K$ be any field. Let $X$ be a 1-dimensional integral scheme endowed with a proper morphism $c: X \rightarrow \operatorname{Spec}(K)$. Let $f \in K(X)^{*}$ be an invertible rational function. Then

$$
\sum_{x \in X \text { closed }}[\kappa(x): K] \operatorname{ord}_{\mathcal{O}_{X, x}}(f)=0
$$

where ord is as in Algebra, Definition 10.120.2. In other words, $c_{*} \operatorname{div}(f)=0$.
Proof. Consider the diagram

that we constructed in Lemma 41.19 .2 starting with $X$ and the rational function $f$ over $S=\operatorname{Spec}(K)$. We will use all the results of this lemma without further mention. We have to show that $c_{*} \operatorname{div}_{X}(f)=c_{*} p_{*} \operatorname{div}_{Y}(f)=0$. This is the same as proving that $c_{*}^{\prime} q_{*} \operatorname{div}_{Y}(f)=0$. If $q(Y)$ is a closed point of $\mathbf{P}_{K}^{1}$ then we see that $\operatorname{div}_{X}(f)=0$ and the lemma holds. Thus we may assume that $q$ is dominant. Since $\operatorname{div}_{Y}(f)=\left[q^{-1} D_{0}\right]_{0}-\left[q^{-1} D_{\infty}\right]_{0}$ we see (by definition of flat pullback) that $\operatorname{div}_{Y}(f)=q^{*}\left(\left[D_{0}\right]_{0}-\left[D_{\infty}\right]_{0}\right)$. Suppose we can show that $q: Y \rightarrow \mathbf{P}_{K}^{1}$ is finite locally free of degree $d$ (see Morphisms, Definition 28.45.1). Then by Lemma 41.16.2 we get $q_{*} \operatorname{div}_{Y}(f)=d\left(\left[D_{0}\right]_{0}-\left[D_{\infty}\right]_{0}\right)$. Since clearly $c_{*}^{\prime}\left[D_{0}\right]_{0}=c_{*}^{\prime}\left[D_{\infty}\right]_{0}$ we win.
It remains to show that $q$ is finite locally free. (It will automatically have some given degree as $\mathbf{P}_{K}^{1}$ is connected.) Since $\operatorname{dim}\left(\mathbf{P}_{K}^{1}\right)=1$ we see that $q$ is finite for example by Lemma 41.17.2. All local rings of $\mathbf{P}_{K}^{1}$ at closed points are regular local rings of dimension 1 (in other words discrete valuation rings), since they are localizations of $K[T]$ (see Algebra, Lemma 10.113.1). Hence for $y \in Y$ closed the local ring $\mathcal{O}_{Y, y}$ will be flat over $\mathcal{O}_{\mathbf{P}_{K}^{1}, q(y)}$ as soon as it is torsion free (More on Algebra, Lemma 15.16.11). This is obviously the case as $\mathcal{O}_{Y, y}$ is a domain and $q$ is dominant. Thus $q$ is flat. Hence $q$ is finite locally free by Morphisms, Lemma 28.45.2.

### 41.20. Rational equivalence

02RV In this section we define rational equivalence on $k$-cycles. We will allow locally finite sums of images of principal divisors (under closed immersions). This leads to some pretty strange phenomena, see Example 41.20.3. However, if we do not allow these then we do not know how to prove that capping with chern classes of line bundles factors through rational equivalence.

02RW Definition 41.20.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $k \in \mathbf{Z}$.
(1) Given any locally finite collection $\left\{W_{j} \subset X\right\}$ of integral closed subschemes with $\operatorname{dim}_{\delta}\left(W_{j}\right)=k+1$, and any $f_{j} \in R\left(W_{j}\right)^{*}$ we may consider

$$
\sum\left(i_{j}\right)_{*} \operatorname{div}\left(f_{j}\right) \in Z_{k}(X)
$$

where $i_{j}: W_{j} \rightarrow X$ is the inclusion morphism. This makes sense as the morphism $\coprod i_{j}: \coprod W_{j} \rightarrow X$ is proper.
(2) We say that $\alpha \in Z_{k}(X)$ is rationally equivalent to zero if $\alpha$ is a cycle of the form displayed above.
(3) We say $\alpha, \beta \in Z_{k}(X)$ are rationally equivalent and we write $\alpha \sim_{r a t} \beta$ if $\alpha-\beta$ is rationally equivalent to zero.
(4) We define

$$
A_{k}(X)=Z_{k}(X) / \sim_{r a t}
$$

to be the Chow group of $k$-cycles on $X$. This is sometimes called the Chow group of $k$-cycles modulo rational equivalence on $X$.

There are many other interesting (adequate) equivalence relations. Rational equivalence is the coarsest one of them all. A very simple but important lemma is the following.

02RX Lemma 41.20.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $U \subset X$ be an open subscheme, and denote $i: Y=X \backslash U \rightarrow X$ as a reduced closed subscheme of $X$. Let $k \in \mathbf{Z}$. Suppose $\alpha, \beta \in Z_{k}(X)$. If $\left.\left.\alpha\right|_{U} \sim_{r a t} \beta\right|_{U}$ then there exist a cycle $\gamma \in Z_{k}(Y)$ such that

$$
\alpha \sim_{r a t} \beta+i_{*} \gamma
$$

In other words, the sequence

$$
A_{k}(Y) \xrightarrow{i_{*}} A_{k}(X) \xrightarrow{j^{*}} A_{k}(U) \longrightarrow 0
$$

is an exact complex of abelian groups.
Proof. Let $\left\{W_{j}\right\}_{j \in J}$ be a locally finite collection of integral closed subschemes of $U$ of $\delta$-dimension $k+1$, and let $f_{j} \in R\left(W_{j}\right)^{*}$ be elements such that $\left.(\alpha-\beta)\right|_{U}=$ $\sum\left(i_{j}\right)_{*} \operatorname{div}\left(f_{j}\right)$ as in the definition. Set $W_{j}^{\prime} \subset X$ equal to the closure of $W_{j}$. Suppose that $V \subset X$ is a quasi-compact open. Then also $V \cap U$ is quasi-compact open in $U$ as $V$ is Noetherian. Hence the set $\left\{j \in J \mid W_{j} \cap V \neq \emptyset\right\}=\left\{j \in J \mid W_{j}^{\prime} \cap V \neq \emptyset\right\}$ is finite since $\left\{W_{j}\right\}$ is locally finite. In other words we see that $\left\{W_{j}^{\prime}\right\}$ is also locally finite. Since $R\left(W_{j}\right)=R\left(W_{j}^{\prime}\right)$ we see that

$$
\alpha-\beta-\sum\left(i_{j}^{\prime}\right)_{*} \operatorname{div}\left(f_{j}\right)
$$

is a cycle supported on $Y$ and the lemma follows (see Lemma 41.15.2.).

02RY Example 41.20.3. Here is a "strange" example. Suppose that $S$ is the spectrum of a field $k$ with $\delta$ as in Example 41.8.2. Suppose that $X=C_{1} \cup C_{2} \cup \ldots$ is an infinite union of curves $C_{j} \cong \mathbf{P}_{k}^{1}$ glued together in the following way: The point $\infty \in C_{j}$ is glued transversally to the point $0 \in C_{j+1}$ for $j=1,2,3, \ldots$ Take the point $0 \in C_{1}$. This gives a zero cycle $[0] \in Z_{0}(X)$. The "strangeness" in this situation is that actually $[0] \sim_{r a t} 0$ ! Namely we can choose the rational function $f_{j} \in R\left(C_{j}\right)$ to be the function which has a simple zero at 0 and a simple pole at $\infty$ and no other zeros or poles. Then we see that the sum $\sum\left(i_{j}\right)_{*} \operatorname{div}\left(f_{j}\right)$ is exactly the 0 -cycle [0]. In fact it turns out that $A_{0}(X)=0$ in this example. If you find this too bizarre, then you can just make sure your spaces are always quasi-compact (so $X$ does not even exist for you).

02RZ Remark 41.20.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Suppose we have infinite collections $\alpha_{i}, \beta_{i} \in Z_{k}(X), i \in I$ of $k$ cycles on $X$. Suppose that the supports of $\alpha_{i}$ and $\beta_{i}$ form locally finite collections of closed subsets of $X$ so that $\sum \alpha_{i}$ and $\sum \beta_{i}$ are defined as cycles. Moreover, assume that $\alpha_{i} \sim_{r a t} \beta_{i}$ for each $i$. Then it is not clear that $\sum \alpha_{i} \sim_{r a t} \sum \beta_{i}$. Namely, the problem is that the rational equivalences may be given by locally finite families $\left\{W_{i, j}, f_{i, j} \in R\left(W_{i, j}\right)^{*}\right\}_{j \in J_{i}}$ but the union $\left\{W_{i, j}\right\}_{i \in I, j \in J_{i}}$ may not be locally finite.
In many cases in practice, one has a locally finite family of closed subsets $\left\{T_{i}\right\}_{i \in I}$ such that $\alpha_{i}, \beta_{i}$ are supported on $T_{i}$ and such that $\alpha_{i}=\beta_{i}$ in $A_{k}\left(T_{i}\right)$, in other words, the families $\left\{W_{i, j}, f_{i, j} \in R\left(W_{i, j}\right)^{*}\right\}_{j \in J_{i}}$ consist of subschemes $W_{i, j} \subset T_{i}$. In this case it is true that $\sum \alpha_{i} \sim_{r a t} \sum \beta_{i}$ on $X$, simply because the family $\left\{W_{i, j}\right\}_{i \in I, j \in J_{i}}$ is automatically locally finite in this case.

### 41.21. Rational equivalence and push and pull

02S0 In this section we show that flat pullback and proper pushforward commute with rational equivalence.

02S1 Lemma 41.21.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be schemes locally of finite type over $S$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $\alpha \sim_{\text {rat }} \beta$ be rationally equivalent $k$-cycles on $Y$. Then $f^{*} \alpha \sim_{\text {rat }} f^{*} \beta$ as $(k+r)$ cycles on $X$.

Proof. What do we have to show? Well, suppose we are given a collection

$$
i_{j}: W_{j} \longrightarrow Y
$$

of closed immersions, with each $W_{j}$ integral of $\delta$-dimension $k+1$ and rational functions $f_{j} \in R\left(W_{j}\right)^{*}$. Moreover, assume that the collection $\left\{i_{j}\left(W_{j}\right)\right\}_{j \in J}$ is locally finite on $Y$. Then we have to show that

$$
f^{*}\left(\sum i_{j, *} \operatorname{div}\left(f_{j}\right)\right)
$$

is rationally equivalent to zero on $X$.
Consider the fibre products

$$
i_{j}^{\prime}: W_{j}^{\prime}=W_{j} \times_{Y} X \longrightarrow X
$$

For each $j$, consider the collection $\left\{W_{j, l}^{\prime}\right\}_{l \in L_{j}}$ of irreducible components $W_{j, l}^{\prime} \subset W_{j}^{\prime}$ having $\delta$-dimension $k+1$. We may write

$$
\left[W_{j}^{\prime}\right]_{k+1}=\sum_{l \in L_{j}} n_{j, l}\left[W_{j, l}^{\prime}\right]_{k+1}
$$

for some $n_{j, l}>0$. By Lemma 41.14.1 we see that $W_{j, l}^{\prime} \rightarrow W_{j}$ is dominant and hence we can let $f_{j, l} \in R\left(W_{j, l}^{\prime}\right)^{*}$ denote the image of $f_{j}$ under the map of fields $R\left(W_{j}\right) \rightarrow R\left(W_{j, l}^{\prime}\right)$. We claim that
(1) the collection $\left\{W_{j, l}^{\prime}\right\}_{j \in J, l \in L_{j}}$ is locally finite on $X$, and
(2) with obvious notation $f^{*}\left(\sum i_{j, *} \operatorname{div}\left(f_{j}\right)\right)=\sum i_{j, l, *}^{\prime} \operatorname{div}\left(f_{j, l}^{n_{j, l}}\right)$.

Clearly this claim implies the lemma.
To show (1), note that $\left\{W_{j}^{\prime}\right\}$ is a locally finite collection of closed subschemes of $X$ by Lemma 41.14.2. Hence if $U \subset X$ is quasi-compact, then $U$ meets only finitely many $W_{j}^{\prime}$. By Divisors, Lemma 30.21.1 the collection of irreducible components of each $W_{j}$ is locally finite as well. Hence we see only finitely many $W_{j, l}^{\prime}$ meet $U$ as desired.
Let $Z \subset X$ be an integral closed subscheme of $\delta$-dimension $k+r$. We have to show that the coefficient $n$ of $[Z]$ in $f^{*}\left(\sum i_{j, *} \operatorname{div}\left(f_{j}\right)\right)$ is equal to the coefficient $m$ of $[Z]$ in $\sum i_{j, l, *}^{\prime} \operatorname{div}\left(f_{j, l}^{n_{j, l}}\right)$. Let $Z^{\prime}$ be the closure of $f(Z)$ which is an integral closed subscheme of $Y$. By Lemma 41.14.1 we have $\operatorname{dim}_{\delta}\left(Z^{\prime}\right) \geq k$. If $\operatorname{dim}_{\delta}\left(Z^{\prime}\right)>k$, then the coefficients $n$ and $m$ are both zero, since the generic point of $Z$ will not be contained in any $W_{j}^{\prime}$ or $W_{j, l}^{\prime}$. Hence we may assume that $\operatorname{dim}_{\delta}\left(Z^{\prime}\right)=k$.
We are going to translate the equality of $n$ and $m$ into algebra. Namely, let $\xi^{\prime} \in Z^{\prime}$ and $\xi \in Z$ be the generic points. Set $A=\mathcal{O}_{Y, \xi^{\prime}}$ and $B=\mathcal{O}_{X, \xi}$. Note that $A, B$ are Noetherian, $A \rightarrow B$ is flat, local, and that $\mathfrak{m}_{A} B$ is an ideal of definition of the local ring $B$. There are finitely many $j$ such that $W_{j}$ passes through $\xi^{\prime}$, and these correspond to prime ideals

$$
\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{T} \subset A
$$

with the property that $\operatorname{dim}\left(A / \mathfrak{p}_{t}\right)=1$ for each $t=1, \ldots, T$. The rational functions $f_{j}$ correspond to elements $f_{t} \in \kappa\left(\mathfrak{p}_{t}\right)^{*}$. Say $\mathfrak{p}_{t}$ corresponds to $W_{j}$. By construction, the closed subschemes $W_{j, l}^{\prime}$ which meet $\xi$ correspond $1-1$ with minimal primes

$$
\mathfrak{p}_{t} B \subset \mathfrak{q}_{t, 1}, \ldots, \mathfrak{q}_{t, S_{t}} \subset B
$$

over $\mathfrak{p}_{t} B$. The integers $n_{j, l}$ correspond to the integers

$$
n_{t, s}=\operatorname{length}_{B_{\mathfrak{q}_{t, s}}}\left(\left(B / \mathfrak{p}_{t} B\right)_{B_{\mathfrak{q}_{t, s}}}\right)
$$

The rational functions $f_{j, l}$ correspond to the images $f_{t, s} \in \kappa\left(\mathfrak{q}_{t, s}\right)^{*}$ of the elements $f_{t} \in \kappa\left(\mathfrak{p}_{t}\right)^{*}$. Putting everything together we see that

$$
n=\sum \operatorname{ord}_{A / \mathfrak{p}_{t}}\left(f_{t}\right) \operatorname{length}_{B}\left(B / \mathfrak{m}_{A} B\right)
$$

and that

$$
m=\sum \operatorname{ord}_{B / \mathfrak{q}_{t, s}}\left(f_{t, s}\right) \operatorname{length}_{B_{\mathfrak{q}_{t, s}}}\left(\left(B / \mathfrak{p}_{t} B\right)_{B_{\mathfrak{q}_{t, s}}}\right)
$$

Note that it suffices to prove the equality for each $t \in\{1, \ldots, T\}$ separately. Writing $f_{t}=x / y$ for some nonzero $\bar{x}, \bar{y} \in A / \mathfrak{p}_{t}$ coming from $x, y \in A$ we see that it suffices to prove

$$
\operatorname{length}_{A / \mathfrak{p}_{t}}\left(A /\left(\mathfrak{p}_{t}, x\right)\right) \operatorname{length}_{B}\left(B / \mathfrak{m}_{A} B\right)=\operatorname{length}_{B}\left(B /\left(x, \mathfrak{p}_{t}\right) B\right)
$$

(equality uses Algebra, Lemma 10.51.13) equals

$$
\sum_{s=1, \ldots, S_{t}} \operatorname{ord}_{B / \mathfrak{q}_{t, s}}\left(B /\left(x, \mathfrak{q}_{t, s}\right)\right) \operatorname{length}_{B_{\mathfrak{q}_{t, s}}}\left(\left(B / \mathfrak{p}_{t} B\right)_{B_{\mathfrak{q}_{t, s}}}\right)
$$

and similarly for $y$. Note that as $x \notin \mathfrak{p}_{t}$ we see that $x$ is a nonzerodivisor on $A / \mathfrak{p}_{t}$. As $A \rightarrow B$ is flat it follows that $x$ is a nonzerodivisor on the module $M=B / \mathfrak{p}_{t} B$. Hence the equality above follows from Algebra, Lemma 10.120.11.
02S2 Lemma 41.21.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be schemes locally of finite type over $S$. Let $p: X \rightarrow Y$ be a proper morphism. Suppose $\alpha, \beta \in Z_{k}(X)$ are rationally equivalent. Then $p_{*} \alpha$ is rationally equivalent to $p_{*} \beta$.

Proof. What do we have to show? Well, suppose we are given a collection

$$
i_{j}: W_{j} \longrightarrow X
$$

of closed immersions, with each $W_{j}$ integral of $\delta$-dimension $k+1$ and rational functions $f_{j} \in R\left(W_{j}\right)^{*}$. Moreover, assume that the collection $\left\{i_{j}\left(W_{j}\right)\right\}_{j \in J}$ is locally finite on $X$. Then we have to show that

$$
p_{*}\left(\sum i_{j, *} \operatorname{div}\left(f_{j}\right)\right)
$$

is rationally equivalent to zero on $X$.
Note that the sum is equal to

$$
\sum p_{*} i_{j, *} \operatorname{div}\left(f_{j}\right)
$$

Let $W_{j}^{\prime} \subset Y$ be the integral closed subscheme which is the image of $p \circ i_{j}$. The collection $\left\{W_{j}^{\prime}\right\}$ is locally finite in $Y$ by Lemma 41.12.2. Hence it suffices to show, for a given $j$, that either $p_{*} i_{j, *} \operatorname{div}\left(f_{j}\right)=0$ or that it is equal to $i_{j, *}^{\prime} \operatorname{div}\left(g_{j}\right)$ for some $g_{j} \in R\left(W_{j}^{\prime}\right)^{*}$.
The arguments above therefore reduce us to the case of a since integral closed subscheme $W \subset X$ of $\delta$-dimension $k+1$. Let $f \in R(W)^{*}$. Let $W^{\prime}=p(W)$ as above. We get a commutative diagram of morphisms

Note that $p_{*} i_{*} \operatorname{div}(f)=i_{*}^{\prime}\left(p^{\prime}\right)_{*} \operatorname{div}(f)$ by Lemma 41.13.2. As explained above we have to show that $\left(p^{\prime}\right)_{*} \operatorname{div}(f)$ is the divisor of a rational function on $W^{\prime}$ or zero. There are three cases to distinguish.

The case $\operatorname{dim}_{\delta}\left(W^{\prime}\right)<k$. In this case automatically $\left(p^{\prime}\right)_{*} \operatorname{div}(f)=0$ and there is nothing to prove.
The case $\operatorname{dim}_{\delta}\left(W^{\prime}\right)=k$. Let us show that $\left(p^{\prime}\right)_{*} \operatorname{div}(f)=0$ in this case. Let $\eta \in W^{\prime}$ be the generic point. Note that $c: W_{\eta} \rightarrow \operatorname{Spec}(K)$ is a proper integral curve over $K=\kappa(\eta)$ whose function field $K\left(W_{\eta}\right)$ is identified with $R(W)$. Here is a diagram

Let us denote $f_{\eta} \in K\left(W_{\eta}\right)^{*}$ the rational function corresponding to $f \in R(W)^{*}$. Moreover, the closed points $\xi$ of $W_{\eta}$ correspond $1-1$ to the closed integral subschemes $Z=Z_{\xi} \subset W$ of $\delta$-dimension $k$ with $p^{\prime}(Z)=W^{\prime}$. Note that the multiplicity
of $Z_{\xi}$ in $\operatorname{div}(f)$ is equal to $\operatorname{ord}_{\mathcal{O}_{W_{\eta}, \xi}}\left(f_{\eta}\right)$ simply because the local rings $\mathcal{O}_{W_{\eta}, \xi}$ and $\mathcal{O}_{W, \xi}$ are identified (as subrings of their fraction fields). Hence we see that the multiplicity of $\left[W^{\prime}\right]$ in $\left(p^{\prime}\right)_{*} \operatorname{div}(f)$ is equal to the multiplicity of $[\operatorname{Spec}(K)]$ in $c_{*} \operatorname{div}\left(f_{\eta}\right)$. By Lemma 41.19.3 this is zero.
The case $\operatorname{dim}_{\delta}\left(W^{\prime}\right)=k+1$. In this case Lemma 41.19.1 applies, and we see that indeed $p_{*}^{\prime} \operatorname{div}(f)=\operatorname{div}(g)$ for some $g \in R\left(W^{\prime}\right)^{*}$ as desired.

### 41.22. Rational equivalence and the projective line

02S3 Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Given any closed subscheme $Z \subset X \times{ }_{S} \mathbf{P}_{S}^{1}=X \times \mathbf{P}^{1}$ we let $Z_{0}$, resp. $Z_{\infty}$ be the scheme theoretic closed subscheme $Z_{0}=\operatorname{pr}_{2}^{-1}\left(D_{0}\right)$, resp. $Z_{\infty}=\operatorname{pr}_{2}^{-1}\left(D_{\infty}\right)$. Here $D_{0}, D_{\infty}$ are as defined just above Lemma 41.19.2.

02S4 Lemma 41.22.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $W \subset X \times{ }_{S} \mathbf{P}_{S}^{1}$ be an integral closed subscheme of $\delta$-dimension $k+1$. Assume $W \neq W_{0}$, and $W \neq W_{\infty}$. Then
(1) $W_{0}, W_{\infty}$ are effective Cartier divisors of $W$,
(2) $W_{0}, W_{\infty}$ can be viewed as closed subschemes of $X$ and

$$
\left[W_{0}\right]_{k} \sim_{r a t}\left[W_{\infty}\right]_{k}
$$

(3) for any locally finite family of integral closed subschemes $W_{i} \subset X \times_{S}$ $\mathbf{P}_{S}^{1}$ of $\delta$-dimension $k+1$ with $W_{i} \neq\left(W_{i}\right)_{0}$ and $W_{i} \neq\left(W_{i}\right)_{\infty}$ we have $\sum\left(\left[\left(W_{i}\right)_{0}\right]_{k}-\left[\left(W_{i}\right)_{\infty}\right]_{k}\right) \sim_{\text {rat }} 0$ on $X$, and
(4) for any $\alpha \in Z_{k}(X)$ with $\alpha \sim_{\text {rat }} 0$ there exists a locally finite family of integral closed subschemes $W_{i} \subset X \times{ }_{S} \mathbf{P}_{S}^{1}$ as above such that $\alpha=$ $\sum\left(\left[\left(W_{i}\right)_{0}\right]_{k}-\left[\left(W_{i}\right)_{\infty}\right]_{k}\right)$.

Proof. Part (1) follows from Divisors, Lemma 30.11 .12 since the generic point of $W$ is not mapped into $D_{0}$ or $D_{\infty}$ under the projection $X \times{ }_{S} \mathbf{P}_{S}^{1} \rightarrow \mathbf{P}_{S}^{1}$ by assumption.

Since $X \times_{S} D_{0} \rightarrow X$ is an isomorphism we see that $W_{0}$ is isomorphic to a closed subscheme of $X$. Similarly for $W_{\infty}$. Consider the morphism $p: W \rightarrow X$. It is proper and on $W$ we have $\left[W_{0}\right]_{k} \sim_{r a t}\left[W_{\infty}\right]_{k}$. Hence part (2) follows from Lemma 41.21 .2 as clearly $p_{*}\left[W_{0}\right]_{k}=\left[W_{0}\right]_{k}$ and similarly for $W_{\infty}$.

The only content of statement (3) is, given parts (1) and (2), that the collection $\left\{\left(W_{i}\right)_{0},\left(W_{i}\right)_{\infty}\right\}$ is a locally finite collection of closed subschemes of $X$. This is clear.

Suppose that $\alpha \sim_{r a t} 0$. By definition this means there exist integral closed subschemes $V_{i} \subset X$ of $\delta$-dimension $k+1$ and rational functions $f_{i} \in R\left(V_{i}\right)^{*}$ such that the family $\left\{V_{i}\right\}_{i \in I}$ is locally finite in $X$ and such that $\alpha=\sum\left(V_{i} \rightarrow X\right)_{*} \operatorname{div}\left(f_{i}\right)$. Let

$$
W_{i} \subset V_{i} \times_{S} \mathbf{P}_{S}^{1} \subset X \times_{S} \mathbf{P}_{S}^{1}
$$

be the closure of the graph of the rational map $f_{i}$ as in Lemma 41.19.2. Then we have that $\left(V_{i} \rightarrow X\right)_{*} \operatorname{div}\left(f_{i}\right)$ is equal to $\left[\left(W_{i}\right)_{0}\right]_{k}-\left[\left(W_{i}\right)_{\infty}\right]_{k}$ by that same lemma. Hence the result is clear.

02S5 Lemma 41.22.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $Z$ be a closed subscheme of $X \times \mathbf{P}^{1}$. Assume $\operatorname{dim}_{\delta}(Z) \leq$
$k+1, \operatorname{dim}_{\delta}\left(Z_{0}\right) \leq k, \operatorname{dim}_{\delta}\left(Z_{\infty}\right) \leq k$ and assume any embedded point $\xi$ (Divisors, Definition 30.4.1) of $Z$ has $\delta(\xi)<k$. Then

$$
\left[Z_{0}\right]_{k} \sim_{r a t}\left[Z_{\infty}\right]_{k}
$$

as $k$-cycles on $X$.
Proof. Let $\left\{W_{i}\right\}_{i \in I}$ be the collection of irreducible components of $Z$ which have $\delta$-dimension $k+1$. Write

$$
[Z]_{k+1}=\sum n_{i}\left[W_{i}\right]
$$

with $n_{i}>0$ as per definition. Note that $\left\{W_{i}\right\}$ is a locally finite collection of closed subsets of $X \times{ }_{S} \mathbf{P}_{S}^{1}$ by Divisors, Lemma 30.21.1. We claim that

$$
\left[Z_{0}\right]_{k}=\sum n_{i}\left[\left(W_{i}\right)_{0}\right]_{k}
$$

and similarly for $\left[Z_{\infty}\right]_{k}$. If we prove this then the lemma follows from Lemma 41.22.1.

Let $Z^{\prime} \subset X$ be an integral closed subscheme of $\delta$-dimension $k$. To prove the equality above it suffices to show that the coefficient $n$ of $\left[Z^{\prime}\right]$ in $\left[Z_{0}\right]_{k}$ is the same as the coefficient $m$ of $\left[Z^{\prime}\right]$ in $\sum n_{i}\left[\left(W_{i}\right)_{0}\right]_{k}$. Let $\xi^{\prime} \in Z^{\prime}$ be the generic point. Set $\xi=\left(\xi^{\prime}, 0\right) \in X \times_{S} \mathbf{P}_{S}^{1}$. Consider the local ring $A=\mathcal{O}_{X \times S} \mathbf{P}_{S}^{1}, \xi$. Let $I \subset A$ be the ideal cutting out $Z$, in other words so that $A / I=\mathcal{O}_{Z, \xi}$. Let $t \in A$ be the element cutting out $X \times_{S} D_{0}$ (i.e., the coordinate of $\mathbf{P}^{1}$ at zero pulled back). By our choice of $\xi^{\prime} \in Z^{\prime}$ we have $\delta(\xi)=k$ and hence $\operatorname{dim}(A / I)=1$. Since $\xi$ is not an embedded point by definition we see that $A / I$ is Cohen-Macaulay. Since $\operatorname{dim}_{\delta}\left(Z_{0}\right)=k$ we see that $\operatorname{dim}(A /(t, I))=0$ which implies that $t$ is a nonzerodivisor on $A / I$. Finally, the irreducible closed subschemes $W_{i}$ passing through $\xi$ correspond to the minimal primes $I \subset \mathfrak{q}_{i}$ over $I$. The multiplicities $n_{i}$ correspond to the lengths length $_{A_{\mathfrak{q}_{i}}}(A / I)_{\mathfrak{q}_{i}}$. Hence we see that

$$
n=\operatorname{length}_{A}(A /(t, I))
$$

and

$$
m=\sum \operatorname{length}_{A}\left(A /\left(t, \mathfrak{q}_{i}\right)\right) \operatorname{length}_{A_{\mathfrak{q}_{i}}}(A / I)_{\mathfrak{q}_{i}}
$$

Thus the result follows from Algebra, Lemma 10.120.11.
02S6 Lemma 41.22.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $\mathcal{F}$ be a coherent sheaf on $X \times \mathbf{P}^{1}$. Let $i_{0}, i_{\infty}: X \rightarrow X \times \mathbf{P}^{1}$ be the closed immersion such that $i_{t}(x)=(x, t)$. Denote $\mathcal{F}_{0}=i_{0}^{*} \mathcal{F}$ and $\mathcal{F}_{\infty}=i_{\infty}^{*} \mathcal{F}$. Assume
(1) $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k+1$,
(2) $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{F}_{0}\right)\right) \leq k, \operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{F}_{\infty}\right)\right) \leq k$, and
(3) any embedded associated point $\xi$ of $\mathcal{F}$ has $\delta(\xi)<k$.

Then

$$
\left[\mathcal{F}_{0}\right]_{k} \sim_{r a t}\left[\mathcal{F}_{\infty}\right]_{k}
$$

as $k$-cycles on $X$.
Proof. Let $\left\{W_{i}\right\}_{i \in I}$ be the collection of irreducible components of $\operatorname{Supp}(\mathcal{F})$ which have $\delta$-dimension $k+1$. Write

$$
[\mathcal{F}]_{k+1}=\sum n_{i}\left[W_{i}\right]
$$

with $n_{i}>0$ as per definition. Note that $\left\{W_{i}\right\}$ is a locally finite collection of closed subsets of $X \times_{S} \mathbf{P}_{S}^{1}$ by Lemma 41.11.1. We claim that

$$
\left[\mathcal{F}_{0}\right]_{k}=\sum n_{i}\left[\left(W_{i}\right)_{0}\right]_{k}
$$

and similarly for $\left[\mathcal{F}_{\infty}\right]_{k}$. If we prove this then the lemma follows from Lemma 41.22 .1 .

Let $Z^{\prime} \subset X$ be an integral closed subscheme of $\delta$-dimension $k$. To prove the equality above it suffices to show that the coefficient $n$ of $\left[Z^{\prime}\right]$ in $\left[\mathcal{F}_{0}\right]_{k}$ is the same as the coefficient $m$ of $\left[Z^{\prime}\right]$ in $\sum n_{i}\left[\left(W_{i}\right)_{0}\right]_{k}$. Let $\xi^{\prime} \in Z^{\prime}$ be the generic point. Set $\xi=\left(\xi^{\prime}, 0\right) \in X \times{ }_{S} \mathbf{P}_{S}^{1}$. Consider the local ring $A=\mathcal{O}_{X \times{ }_{S} \mathbf{P}_{S}^{1}, \xi}$. Let $M=\mathcal{F}_{\xi}$ as an $A$-module. Let $t \in A$ be the element cutting out $X \times_{S} D_{0}$ (i.e., the coordinate of $\mathbf{P}^{1}$ at zero pulled back). By our choice of $\xi^{\prime} \in Z^{\prime}$ we have $\delta(\xi)=k$ and hence $\operatorname{dim}(\operatorname{Supp}(M))=1$. Since $\xi$ is not an associated point of $\mathcal{F}$ by definition we see that $M$ is Cohen-Macaulay module. Since $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{F}_{0}\right)\right)=k$ we see that $\operatorname{dim}(\operatorname{Supp}(M / t M))=0$ which implies that $t$ is a nonzerodivisor on $M$. Finally, the irreducible closed subschemes $W_{i}$ passing through $\xi$ correspond to the minimal primes $\mathfrak{q}_{i}$ of $\operatorname{Ass}(M)$. The multiplicities $n_{i}$ correspond to the lengths length $A_{A_{\mathfrak{q}_{i}}} M_{\mathfrak{q}_{i}}$. Hence we see that

$$
n=\operatorname{length}_{A}(M / t M)
$$

and

$$
m=\sum \operatorname{length}_{A}\left(A /\left(t, \mathfrak{q}_{i}\right) A\right) \operatorname{length}_{A_{\mathfrak{q}_{i}}} M_{\mathfrak{q}_{i}}
$$

Thus the result follows from Algebra, Lemma 10.120.11.

### 41.23. The divisor associated to an invertible sheaf

02SI The following definition is the analogue of Divisors, Definition 30.22.4 in our current setup.

02SJ Definition 41.23.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $n=\operatorname{dim}_{\delta}(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module.
(1) For any nonzero meromorphic section $s$ of $\mathcal{L}$ we define the Weil divisor associated to $s$ is the $(n-1)$-cycle

$$
\operatorname{div}_{\mathcal{L}}(s)=\sum \operatorname{ord}_{Z, \mathcal{L}}(s)[Z]
$$

defined in Divisors, Definition 30.22 .4 This makes sense because Weil divisors have $\delta$-dimension $n-1$ by Lemma 41.17.1.
(2) We define Weil divisor associated to $\mathcal{L}$ as

$$
c_{1}(\mathcal{L}) \cap[X]=\text { class of } \operatorname{div}_{\mathcal{L}}(s) \in A_{n-1}(X)
$$

where $s$ is any nonzero meromorphic section of $\mathcal{L}$ over $X$. This is well defined by Divisors, Lemma 30.22.3.
There are some cases where it is easy to compute the Weil divisor associated to an invertible sheaf.
02SK Lemma 41.23.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $n=\operatorname{dim}_{\delta}(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a nonzero global section. Then

$$
\operatorname{div}_{\mathcal{L}}(s)=[Z(s)]_{n-1}
$$

in $Z_{n-1}(X)$ and

$$
c_{1}(\mathcal{L}) \cap[X]=[Z(s)]_{n-1}
$$

in $A_{n-1}(X)$.
Proof. Let $Z \subset X$ be an integral closed subscheme of $\delta$-dimension $n-1$. Let $\xi \in Z$ be its generic point. Choose a generator $s_{\xi} \in \mathcal{L}_{\xi}$. Write $s=f s_{\xi}$ for some $f \in \mathcal{O}_{X, \xi}$. By definition of $Z(s)$, see Divisors, Definition 30.11.19 we see that $Z(s)$ is cut out by a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ such that $\mathcal{I}_{\xi}=(f)$. Hence $\operatorname{length}_{\mathcal{O}_{X, x}}\left(\mathcal{O}_{Z(s), \xi}\right)=\operatorname{length}_{\mathcal{O}_{X, x}}\left(\mathcal{O}_{X, \xi} /(f)\right)=\operatorname{ord}_{\mathcal{O}_{X, x}}(f)$ as desired.

The following lemma will be superseded by the more general Lemma 41.25.1.
02SM Lemma 41.23.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Assume $X, Y$ are integral and $n=\operatorname{dim}_{\delta}(Y)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{Y}$-module. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $\mathcal{L}$ be an invertible sheaf on $Y$. Then

$$
f^{*}\left(c_{1}(\mathcal{L}) \cap[Y]\right)=c_{1}\left(f^{*} \mathcal{L}\right) \cap[X]
$$

in $A_{n+r-1}(X)$.
Proof. Let $s$ be a nonzero meromorphic section of $\mathcal{L}$. We will show that actually $f^{*} \operatorname{div}_{\mathcal{L}}(s)=\operatorname{div}_{f^{*} \mathcal{L}}\left(f^{*} s\right)$ and hence the lemma holds. To see this let $\xi \in Y$ be a point and let $s_{\xi} \in \mathcal{L}_{\xi}$ be a generator. Write $s=g s_{\xi}$ with $g \in R(X)^{*}$. Then there is an open neighbourhood $V \subset Y$ of $\xi$ such that $s_{\xi} \in \mathcal{L}(V)$ and such that $s_{\xi}$ generates $\left.\mathcal{L}\right|_{V}$. Hence we see that

$$
\left.\operatorname{div}_{\mathcal{L}}(s)\right|_{V}=\left.\operatorname{div}(g)\right|_{V}
$$

In exactly the same way, since $f^{*} s_{\xi}$ generates $\mathcal{L}$ over $f^{-1}(V)$ and since $f^{*} s=g f^{*} s_{\xi}$ we also have

$$
\left.\operatorname{div}_{\mathcal{L}}\left(f^{*} s\right)\right|_{f^{-1}(V)}=\left.\operatorname{div}(g)\right|_{f^{-1}(V)}
$$

Thus the desired equality of cycles over $f^{-1}(V)$ follows from the corresponding result for pullbacks of principal divisors, see Lemma 41.18.2.

### 41.24. Intersecting with an invertible sheaf

02 SN In this section we study the following construction.
02SO Definition 41.24.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. We define, for every integer $k$, an operation

$$
c_{1}(\mathcal{L}) \cap-: Z_{k+1}(X) \rightarrow A_{k}(X)
$$

called intersection with the first chern class of $\mathcal{L}$.
(1) Given an integral closed subscheme $i: W \rightarrow X$ with $\operatorname{dim}_{\delta}(W)=k+1$ we define

$$
c_{1}(\mathcal{L}) \cap[W]=i_{*}\left(c_{1}\left(i^{*} \mathcal{L}\right) \cap[W]\right)
$$

where the right hand side is defined in Definition 41.23.1.
(2) For a general $(k+1)$-cycle $\alpha=\sum n_{i}\left[W_{i}\right]$ we set

$$
c_{1}(\mathcal{L}) \cap \alpha=\sum n_{i} c_{1}(\mathcal{L}) \cap\left[W_{i}\right]
$$

Write each $c_{1}(\mathcal{L}) \cap W_{i}=\sum_{j} n_{i, j}\left[Z_{i, j}\right]$ with $\left\{Z_{i, j}\right\}_{j}$ a locally finite sum of integral closed subschemes of $W_{i}$. Since $\left\{W_{i}\right\}$ is a locally finite collection of integral closed subschemes on $X$, it follows easily that $\left\{Z_{i, j}\right\}_{i, j}$ is a locally finite collection of closed subschemes of $X$. Hence $c_{1}(\mathcal{L}) \cap \alpha=\sum n_{i} n_{i, j}\left[Z_{i, j}\right]$ is a cycle. Another, more convenient, way to think about this is to observe that the morphism $\amalg W_{i} \rightarrow$ $X$ is proper. Hence $c_{1}(\mathcal{L}) \cap \alpha$ can be viewed as the pushforward of a class in $A_{k}\left(\amalg W_{i}\right)=\prod A_{k}\left(W_{i}\right)$. This also explains why the result is well defined up to rational equivalence on $X$.

The main goal for the next few sections is to show that intersecting with $c_{1}(\mathcal{L})$ factors through rational equivalence. This is not a triviality.

02SP Lemma 41.24.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}, \mathcal{N}$ be an invertible sheaves on $X$. Then

$$
c_{1}(\mathcal{L}) \cap \alpha+c_{1}(\mathcal{N}) \cap \alpha=c_{1}\left(\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N}\right) \cap \alpha
$$

in $A_{k}(X)$ for every $\alpha \in Z_{k-1}(X)$. Moreover, $c_{1}\left(\mathcal{O}_{X}\right) \cap \alpha=0$ for all $\alpha$.
Proof. The additivity follows directly from Divisors, Lemma 30.22 .5 and the definitions. To see that $c_{1}\left(\mathcal{O}_{X}\right) \cap \alpha=0$ consider the section $1 \in \Gamma\left(X, \mathcal{O}_{X}\right)$. This restricts to an everywhere nonzero section on any integral closed subscheme $W \subset X$. Hence $c_{1}\left(\mathcal{O}_{X}\right) \cap[W]=0$ as desired.

The following lemma is a useful result in order to compute the intersection product of the $c_{1}$ of an invertible sheaf and the cycle associated to a closed subscheme. Recall that $Z(s) \subset X$ denotes the zero scheme of a global section $s$ of an invertible sheaf on a scheme $X$, see Divisors, Definition 30.11.19.
02SQ Lemma 41.24.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $Z \subset X$ be a closed subscheme. Assume $\operatorname{dim}_{\delta}(Z) \leq k+1$. Let $s \in \Gamma\left(Z,\left.\mathcal{L}\right|_{Z}\right)$. Assume
(1) $\operatorname{dim}_{\delta}(Z(s)) \leq k$, and
(2) for every generic point $\xi$ of an irreducible component of $Z(s)$ of dimension $k$ the multiplication by $s$ induces an injection $\mathcal{O}_{Z, \xi} \rightarrow\left(\left.\mathcal{L}\right|_{Z}\right)_{\xi}$.
This holds for example if $s$ is a regular section of $\left.\mathcal{L}\right|_{Z}$. Then

$$
[Z(s)]_{k}=c_{1}(\mathcal{L}) \cap[Z]_{k+1}
$$

in $A_{k}(X)$.
Proof. Write

$$
[Z]_{k+1}=\sum n_{i}\left[W_{i}\right]
$$

where $W_{i} \subset Z$ are the irreducible components of $Z$ of $\delta$-dimension $k+1$ and $n_{i}>0$. By assumption the restriction $s_{i}=\left.s\right|_{W_{i}} \in \Gamma\left(W_{i},\left.\mathcal{L}\right|_{W_{i}}\right)$ is not zero, and hence is a regular section. By Lemma 41.23 .2 we see that $\left[Z\left(s_{i}\right)\right]_{k}$ represents $c_{1}\left(\left.\mathcal{L}\right|_{W_{i}}\right)$. Hence by definition

$$
c_{1}(\mathcal{L}) \cap[Z]_{k+1}=\sum n_{i}\left[Z\left(s_{i}\right)\right]_{k}
$$

In fact, the proof below will show that we have
02SR

$$
\begin{equation*}
[Z(s)]_{k}=\sum n_{i}\left[Z\left(s_{i}\right)\right]_{k} \tag{41.24.3.1}
\end{equation*}
$$

as $k$-cycles on $X$.

Let $Z^{\prime} \subset X$ be an integral closed subscheme of $\delta$-dimension $k$. Let $\xi^{\prime} \in Z^{\prime}$ be its generic point. We want to compare the coefficient $n$ of $\left[Z^{\prime}\right]$ in the expression $\sum n_{i}\left[Z\left(s_{i}\right)\right]_{k}$ with the coefficient $m$ of $\left[Z^{\prime}\right]$ in the expression $[Z(s)]_{k}$. Choose a generator $s_{\xi^{\prime}} \in \mathcal{L}_{\xi}$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$. Write $A=\mathcal{O}_{X, \xi^{\prime}}, L=\mathcal{L}_{\xi^{\prime}}$ and $I=\mathcal{I}_{\xi^{\prime}}$. Then $L=A s_{\xi^{\prime}}$ and $L / I L=(A / I) s_{\xi^{\prime}}=\left(\left.\mathcal{L}\right|_{Z}\right)_{\xi^{\prime}}$. Write $s=f s_{\xi^{\prime}}$ for some (unique) $f \in A / I$. Hypothesis (2) means that $f: A / I \rightarrow A / I$ is injective. Since $\operatorname{dim}_{\delta}(Z) \leq k+1$ and $\operatorname{dim}_{\delta}\left(Z^{\prime}\right)=k$ we have $\operatorname{dim}(A / I)=0$ or 1 . We have

$$
m=\operatorname{length}_{A}(A /(f, I))
$$

which is finite in either case.
If $\operatorname{dim}(A / I)=0$, then $f: A / I \rightarrow A / I$ being injective implies that $f \in(A / I)^{*}$. Hence in this case $m$ is zero. Moreover, the condition $\operatorname{dim}(A / I)=0$ means that $\xi^{\prime}$ does not lie on any irreducible component of $\delta$-dimension $k+1$, i.e., $n=0$ as well.

Now, let $\operatorname{dim}(A / I)=1$. Since $A$ is a Noetherian local ring there are finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t} \supset I$ over $I$. These correspond 1-1 with $W_{i}$ passing through $\xi^{\prime}$. Moreover $n_{i}=$ length $_{A_{\mathfrak{q}_{i}}}\left((A / I)_{\mathfrak{q}_{i}}\right)$. Also, the multiplicity of $\left[Z^{\prime}\right]$ in $\left[Z\left(s_{i}\right)\right]_{k}$ is length ${ }_{A}\left(A /\left(f, \mathfrak{q}_{i}\right)\right)$. Hence the equation to prove in this case is

$$
\operatorname{length}_{A}(A /(f, I))=\sum \operatorname{length}_{A_{\mathfrak{q}_{i}}}\left((A / I)_{\mathfrak{q}_{i}}\right) \operatorname{length}_{A}\left(A /\left(f, \mathfrak{q}_{i}\right)\right)
$$

which follows from Algebra, Lemma 10.120 .11 .

### 41.25. Intersecting with an invertible sheaf and push and pull

0AYA In this section we prove that the operation $c_{1}(\mathcal{L}) \cap-$ commutes with flat pullback and proper pushforward.

02SS Lemma 41.25.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $\mathcal{L}$ be an invertible sheaf on $Y$. Let $\alpha$ be a $k$-cycle on $Y$. Then

$$
f^{*}\left(c_{1}(\mathcal{L}) \cap \alpha\right)=c_{1}\left(f^{*} \mathcal{L}\right) \cap f^{*} \alpha
$$

in $A_{k+r-1}(X)$.
Proof. Write $\alpha=\sum n_{i}\left[W_{i}\right]$. We claim it suffices to show that $f^{*}\left(c_{1}(\mathcal{L}) \cap\left[W_{i}\right]\right)=$ $c_{1}\left(f^{*} \mathcal{L}\right) \cap f^{*}\left[W_{i}\right]$ for each $i$. Proof of this claim is omitted. (Remarks: it is clear in the quasi-compact case. Something similar happened in the proof of Lemma 41.21 .1 , and one can copy the method used there here. Another possibility is to check the cycles and rational equivalences used for all $W_{i}$ combined at each step form a locally finite collection).

Let $W \subset Y$ be an integral closed subscheme of $\delta$-dimension $k$. We have to show that $f^{*}\left(c_{1}(\mathcal{L}) \cap[W]\right)=c_{1}\left(f^{*} \mathcal{L}\right) \cap f^{*}[W]$. Consider the following fibre product diagram

and let $W_{i}^{\prime} \subset W^{\prime}$ be the irreducible components of $\delta$-dimension $k+r$. Write $\left[W^{\prime}\right]_{k+r}=\sum n_{i}\left[W_{i}^{\prime}\right]$ with $n_{i}>0$ as per definition. So $f^{*}[W]=\sum n_{i}\left[W_{i}^{\prime}\right]$. Choose a nonzero meromorphic section $s$ of $\left.\mathcal{L}\right|_{W}$. Since each $W_{i}^{\prime} \rightarrow W$ is dominant we see
that $s_{i}=\left.s\right|_{W_{i}^{\prime}}$ is a nonzero meromorphic section for each $i$. We claim that we have the following equality of cycles

$$
\sum n_{i} \operatorname{div}_{\left.\mathcal{L}\right|_{W_{i}}}\left(s_{i}\right)=f^{*} \operatorname{div}_{\left.\mathcal{L}\right|_{W}}(s)
$$

in $Z_{k+r-1}(X)$.
Having formulated the problem as an equality of cycles we may work locally on $Y$. Hence we may assume $Y$ and also $W$ affine, and $s=p / q$ for some nonzero sections $p \in \Gamma(W, \mathcal{L})$ and $q \in \Gamma(W, \mathcal{O})$. If we can show both

$$
\sum n_{i} \operatorname{div}_{\left.\mathcal{L}\right|_{W_{i}}}\left(p_{i}\right)=f^{*} \operatorname{div}_{\left.\mathcal{L}\right|_{W}}(p), \quad \text { and } \quad \sum n_{i} \operatorname{div}_{\left.\mathcal{O}\right|_{W_{i}}}\left(q_{i}\right)=f^{*} \operatorname{div}_{\left.\mathcal{O}\right|_{W}}(q)
$$

(with obvious notations) then we win by the additivity, see Divisors, Lemma 30.22.5. Thus we may assume that $s \in \Gamma\left(W,\left.\mathcal{L}\right|_{W}\right)$. In this case we may apply the equality 41.24.3.1) obtained in the proof of Lemma 41.24 .3 to see that

$$
\sum n_{i} \operatorname{div}_{\left.\mathcal{L}\right|_{W_{i}}}\left(s_{i}\right)=\left[Z\left(s^{\prime}\right)\right]_{k+r-1}
$$

where $\left.s^{\prime} \in f^{*} \mathcal{L}\right|_{W^{\prime}}$ denotes the pullback of $s$ to $W^{\prime}$. On the other hand we have

$$
f^{*} \operatorname{div}_{\left.\mathcal{L}\right|_{W}}(s)=f^{*}[Z(s)]_{k-1}=\left[f^{-1}(Z(s))\right]_{k+r-1}
$$

by Lemmas 41.23.2 and 41.15.4. Since $Z\left(s^{\prime}\right)=f^{-1}(Z(s))$ we win.
02ST Lemma 41.25.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a proper morphism. Let $\mathcal{L}$ be an invertible sheaf on $Y$. Let s be a nonzero meromorphic section $s$ of $\mathcal{L}$ on $Y$. Assume $X, Y$ integral, $f$ dominant, and $\operatorname{dim}_{\delta}(X)=\operatorname{dim}_{\delta}(Y)$. Then

$$
f_{*}\left(\operatorname{div}_{f^{*} \mathcal{L}}\left(f^{*} s\right)\right)=[R(X): R(Y)] \operatorname{div}_{\mathcal{L}}(s)
$$

as cycles on $Y$. In particular

$$
f_{*}\left(c_{1}\left(f^{*} \mathcal{L}\right) \cap[X]\right)=c_{1}(\mathcal{L}) \cap f_{*}[Y]
$$

Proof. The last equation follows from the first since $f_{*}[X]=[R(X): R(Y)][Y]$ by definition. It turns out that we can re-use Lemma 41.19.1 to prove this. Namely, since we are trying to prove an equality of cycles, we may work locally on $Y$. Hence we may assume that $\mathcal{L}=\mathcal{O}_{Y}$. In this case $s$ corresponds to a rational function $g \in R(Y)$, and we are simply trying to prove

$$
f_{*}\left(\operatorname{div}_{X}(g)\right)=[R(X): R(Y)] \operatorname{div}_{Y}(g)
$$

Comparing with the result of the aforementioned Lemma 41.19.1 we see this true since $\operatorname{Nm}_{R(X) / R(Y)}(g)=g^{[R(X): R(Y)]}$ as $g \in R(Y)^{*}$.

02SU Lemma 41.25.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $p: X \rightarrow Y$ be a proper morphism. Let $\alpha \in Z_{k+1}(X)$. Let $\mathcal{L}$ be an invertible sheaf on $Y$. Then

$$
p_{*}\left(c_{1}\left(p^{*} \mathcal{L}\right) \cap \alpha\right)=c_{1}(\mathcal{L}) \cap p_{*} \alpha
$$

in $A_{k}(Y)$.

Proof. Suppose that $p$ has the property that for every integral closed subscheme $W \subset X$ the map $\left.p\right|_{W}: W \rightarrow Y$ is a closed immersion. Then, by definition of capping with $c_{1}(\mathcal{L})$ the lemma holds.
We will use this remark to reduce to a special case. Namely, write $\alpha=\sum n_{i}\left[W_{i}\right]$ with $n_{i} \neq 0$ and $W_{i}$ pairwise distinct. Let $W_{i}^{\prime} \subset Y$ be the image of $W_{i}$ (as an integral closed subscheme). Consider the diagram

Since $\left\{W_{i}\right\}$ is locally finite on $X$, and $p$ is proper we see that $\left\{W_{i}^{\prime}\right\}$ is locally finite on $Y$ and that $q, q^{\prime}, p^{\prime}$ are also proper morphisms. We may think of $\sum n_{i}\left[W_{i}\right]$ also as a $k$-cycle $\alpha^{\prime} \in Z_{k}\left(X^{\prime}\right)$. Clearly $q_{*} \alpha^{\prime}=\alpha$. We have $q_{*}\left(c_{1}\left(q^{*} p^{*} \mathcal{L}\right) \cap \alpha^{\prime}\right)=c_{1}\left(p^{*} \mathcal{L}\right) \cap q_{*} \alpha^{\prime}$ and $\left(q^{\prime}\right)_{*}\left(c_{1}\left(\left(q^{\prime}\right)^{*} \mathcal{L}\right) \cap p_{*}^{\prime} \alpha^{\prime}\right)=c_{1}(\mathcal{L}) \cap q_{*}^{\prime} p_{*}^{\prime} \alpha^{\prime}$ by the initial remark of the proof. Hence it suffices to prove the lemma for the morphism $p^{\prime}$ and the cycle $\sum n_{i}\left[W_{i}\right]$. Clearly, this means we may assume $X, Y$ integral, $f: X \rightarrow Y$ dominant and $\alpha=[X]$. In this case the result follows from Lemma 41.25.2.

### 41.26. The key formula

0 AYB Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $\operatorname{dim}_{\delta}(X)=n$. Let $\mathcal{L}$ and $\mathcal{N}$ be invertible sheaves on $X$. Let $s$ be a nonzero meromorphic section of $\mathcal{L}$ and let $t$ be a nonzero meromorphic section of $\mathcal{N}$. Let $Z_{i} \subset X, i \in I$ be a set of locally finite set of irreducible closed subsets of codimension 1 with the following property: If $Z \notin\left\{Z_{i}\right\}$ with generic point $\xi$, then $s$ is a generator for $\mathcal{L}_{\xi}$ and $t$ is a generator for $\mathcal{N}_{\xi}$. Such a set exists by Divisors, Lemma 30.22.2, Then

$$
\operatorname{div}_{\mathcal{L}}(s)=\sum \operatorname{ord}_{Z_{i}, \mathcal{L}}(s)\left[Z_{i}\right]
$$

and similarly

$$
\operatorname{div}_{\mathcal{N}}(t)=\sum \operatorname{ord}_{Z_{i}, \mathcal{N}}(t)\left[Z_{i}\right]
$$

Unwinding the definitions more, we pick for each $i$ generators $s_{i} \in \mathcal{L}_{\xi_{i}}$ and $t_{i} \in \mathcal{N}_{\xi_{i}}$ where $\xi_{i}$ is the generic point of $Z_{i}$. Then we can write

$$
s=f_{i} s_{i} \quad \text { and } \quad t=g_{i} t_{i}
$$

Set $B_{i}=\mathcal{O}_{X, \xi_{i}}$. Then by definition

$$
\operatorname{ord}_{Z_{i}, \mathcal{L}}(s)=\operatorname{ord}_{B_{i}}\left(f_{i}\right) \quad \text { and } \quad \operatorname{ord}_{Z_{i}, \mathcal{N}}(t)=\operatorname{ord}_{B_{i}}\left(g_{i}\right)
$$

Since $t_{i}$ is a generator of $\mathcal{N}_{\xi_{i}}$ we see that its image in the fibre $\mathcal{N}_{\xi_{i}} \otimes \kappa\left(\xi_{i}\right)$ is a nonzero meromorphic section of $\left.\mathcal{N}\right|_{Z_{i}}$. We will denote this image $\left.t_{i}\right|_{Z_{i}}$. From our definitions it follows that

$$
c_{1}(\mathcal{N}) \cap \operatorname{div}_{\mathcal{L}}(s)=\sum \operatorname{ord}_{B_{i}}\left(f_{i}\right)\left(Z_{i} \rightarrow X\right)_{*} \operatorname{div}_{\mathcal{N} \mid z_{i}}\left(\left.t_{i}\right|_{Z_{i}}\right)
$$

and similarly

$$
c_{1}(\mathcal{L}) \cap \operatorname{div}_{\mathcal{N}}(t)=\sum \operatorname{ord}_{B_{i}}\left(g_{i}\right)\left(Z_{i} \rightarrow X\right)_{*} \operatorname{div}_{\left.\mathcal{L}\right|_{z_{i}}}\left(\left.s_{i}\right|_{Z_{i}}\right)
$$

in $A_{n-2}(X)$. We are going to find a rational equivalence between these two cycles. To do this we consider the tame symbol

$$
d_{B_{i}}\left(f_{i}, g_{i}\right) \in \kappa\left(\xi_{i}\right)^{*}
$$

see Definition 41.5.5.
0AYC Lemma 41.26.1 (Key formula). In the situation above the cycle

$$
\sum\left(Z_{i} \rightarrow X\right)_{*}\left(\operatorname{ord}_{B_{i}}\left(f_{i}\right) \operatorname{div}_{\left.\mathcal{N}\right|_{Z_{i}}}\left(\left.t_{i}\right|_{Z_{i}}\right)-\operatorname{ord}_{B_{i}}\left(g_{i}\right) \operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.s_{i}\right|_{Z_{i}}\right)\right)
$$

is equal to the cycle

$$
\sum\left(Z_{i} \rightarrow X\right)_{*} \operatorname{div}\left(d_{B_{i}}\left(f_{i}, g_{i}\right)\right)
$$

Proof. First, let us examine what happens if we replace $s_{i}$ by $u s_{i}$ for some unit $u$ in $B_{i}$. Then $f_{i}$ gets replaced by $u^{-1} f_{i}$. Thus the first part of the first expression of the lemma is unchanged and in the second part we add

$$
-\operatorname{ord}_{B_{i}}\left(g_{i}\right) \operatorname{div}\left(\left.u\right|_{Z}\right)
$$

(where $\left.u\right|_{Z_{i}}$ is the image of $a_{i}$ in the residue field) by Divisors, Lemma 30.22.3 and in the second expression we add

$$
\operatorname{div}\left(d_{B_{i}}\left(u^{-1}, g_{i}\right)\right)
$$

by bi-linearity of the tame symbol. These terms agree by Lemma 41.5.7.
Let $Z \subset X$ be an irreducible closed with $\operatorname{dim}_{\delta}(Z)=n-2$. To show that the coefficients of $Z$ of the two cycles of the lemma is the same, we may do a replacement $s_{i} \mapsto u s_{i}$ as in the previous paragraph. In exactly the same way one shows that we may do a replacement $t_{i} \mapsto v t_{i}$ for some unit $v$ of $B_{i}$.

Since we are proving the equality of cycles we may argue one coefficient at a time. Thus we choose an irreducible closed $Z \subset X$ with $\operatorname{dim}_{\delta}(Z)=n-2$ and compare coefficients. Let $\xi \in Z$ be the generic point and set $A=\mathcal{O}_{X, \xi}$. This is a Noetherian local domain of dimension 2. Choose generators $\sigma$ and $\tau$ for $\mathcal{L}_{\xi}$ and $\mathcal{N}_{\xi}$. After shrinking $X$, we may and do assume $\sigma$ and $\tau$ define trivializations of the invertible sheaves $\mathcal{L}$ and $\mathcal{N}$ over all of $X$. Because $Z_{i}$ is locally finite after shrinking $X$ we may assume $Z \subset Z_{i}$ for all $i \in I$ and that $I$ is finite. Then $\xi_{i}$ corresponds to a prime $\mathfrak{q}_{i} \subset A$ of height 1 . We may write $s_{i}=a_{i} \sigma$ and $t_{i}=b_{i} \tau$ for some $a_{i}$ and $b_{i}$ units in $A_{\mathfrak{q}_{i}}$. By the remarks above, it suffices to prove the lemma when $a_{i}=b_{i}=1$ for all $i$.

Assume $a_{i}=b_{i}=1$ for all $i$. Then the first expression of the lemma is zero, because we choose $\sigma$ and $\tau$ to be trivializing sections. Write $s=f \sigma$ and $t=g \tau$ with $f$ and $g$ in the fraction field of $A$. By the previous paragraph we have reduced to the case $f_{i}=f$ and $g_{i}=g$ for all $i$. Moreover, for a height 1 prime $\mathfrak{q}$ of $A$ which is not in $\left\{\mathfrak{q}_{i}\right\}$ we have that both $f$ and $g$ are units in $A_{\mathfrak{q}}$ (by our choice of the family $\left\{Z_{i}\right\}$ in the discussion preceding the lemma). Thus the coefficient of $Z$ in the second expression of the lemma is

$$
\sum_{i} \operatorname{ord}_{A / \mathfrak{q}_{i}}\left(d_{B_{i}}(f, g)\right)
$$

which is zero by the key Lemma 41.7.1.

### 41.27. Intersecting with an invertible sheaf and rational equivalence

02TG Applying the key lemma we obtain the fundamental properties of intersecting with invertible sheaves. In particular, we will see that $c_{1}(\mathcal{L}) \cap$ - factors through rational equivalence and that these operations for different invertible sheaves commute.
02 TH Lemma 41.27.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $\mathcal{L}, \mathcal{N}$ be invertible on $X$. Choose a nonzero meromorphic section $s$ of $\mathcal{L}$ and a nonzero meromorphic section $t$ of $\mathcal{N}$. Set $\alpha=\operatorname{div}_{\mathcal{L}}(s)$ and $\beta=\operatorname{div}_{\mathcal{N}}(t)$. Then

$$
c_{1}(\mathcal{N}) \cap \alpha=c_{1}(\mathcal{L}) \cap \beta
$$

in $A_{n-2}(X)$.
Proof. Immediate from the key Lemma 41.26.1 and the discussion preceding it.
02 LI Lemma 41.27.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be invertible on $X$. The operation $\alpha \mapsto c_{1}(\mathcal{L}) \cap \alpha$ factors through rational equivalence to give an operation

$$
c_{1}(\mathcal{L}) \cap-: A_{k+1}(X) \rightarrow A_{k}(X)
$$

Proof. Let $\alpha \in Z_{k+1}(X)$, and $\alpha \sim_{\text {rat }} 0$. We have to show that $c_{1}(\mathcal{L}) \cap \alpha$ as defined in Definition 41.24.1 is zero. By Definition 41.20.1 there exists a locally finite family $\left\{W_{j}\right\}$ of integral closed subschemes with $\operatorname{dim}_{\delta}\left(W_{j}\right)=k+2$ and rational functions $f_{j} \in R\left(W_{j}\right)^{*}$ such that

$$
\alpha=\sum\left(i_{j}\right)_{*} \operatorname{div}_{W_{j}}\left(f_{j}\right)
$$

Note that $p: \coprod W_{j} \rightarrow X$ is a proper morphism, and hence $\alpha=p_{*} \alpha^{\prime}$ where $\alpha^{\prime} \in Z_{k+1}\left(\coprod W_{j}\right)$ is the sum of the principal divisors $\operatorname{div}_{W_{j}}\left(f_{j}\right)$. By Lemma 41.25.3 we have $c_{1}(\mathcal{L}) \cap \alpha=p_{*}\left(c_{1}\left(p^{*} \mathcal{L}\right) \cap \alpha^{\prime}\right)$. Hence it suffices to show that each $c_{1}\left(\left.\mathcal{L}\right|_{W_{j}}\right) \cap$ $\operatorname{div}_{W_{j}}\left(f_{j}\right)$ is zero. In other words we may assume that $X$ is integral and $\alpha=\operatorname{div}_{X}(f)$ for some $f \in R(X)^{*}$.
Assume $X$ is integral and $\alpha=\operatorname{div}_{X}(f)$ for some $f \in R(X)^{*}$. We can think of $f$ as a regular meromorphic section of the invertible sheaf $\mathcal{N}=\mathcal{O}_{X}$. Choose a meromorphic section $s$ of $\mathcal{L}$ and denote $\beta=\operatorname{div}_{\mathcal{L}}(s)$. By Lemma 41.27.1 we conclude that

$$
c_{1}(\mathcal{L}) \cap \alpha=c_{1}\left(\mathcal{O}_{X}\right) \cap \beta
$$

However, by Lemma 41.24.2 we see that the right hand side is zero in $A_{k}(X)$ as desired.
Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be invertible on $X$. We will denote

$$
c_{1}(\mathcal{L})^{s} \cap-: A_{k+s}(X) \rightarrow A_{k}(X)
$$

the operation $c_{1}(\mathcal{L}) \cap-$. This makes sense by Lemma 41.27.2. We will denote $c_{1}\left(\mathcal{L}^{s} \cap-\right.$ the $s$-fold iterate of this operation for all $s \geq 0$.

02TJ Lemma 41.27.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}, \mathcal{N}$ be invertible on $X$. For any $\alpha \in A_{k+2}(X)$ we have

$$
c_{1}(\mathcal{L}) \cap c_{1}(\mathcal{N}) \cap \alpha=c_{1}(\mathcal{N}) \cap c_{1}(\mathcal{L}) \cap \alpha
$$

as elements of $A_{k}(X)$.

Proof. Write $\alpha=\sum m_{j}\left[Z_{j}\right]$ for some locally finite collection of integral closed subschemes $Z_{j} \subset X$ with $\operatorname{dim}_{\delta}\left(Z_{j}\right)=k+2$. Consider the proper morphism $p$ : $\coprod Z_{j} \rightarrow X$. Set $\alpha^{\prime}=\sum m_{j}\left[Z_{j}\right]$ as a $(k+2)$-cycle on $\coprod Z_{j}$. By several applications of Lemma 41.25.3 we see that $c_{1}(\mathcal{L}) \cap c_{1}(\mathcal{N}) \cap \alpha=p_{*}\left(c_{1}\left(p^{*} \mathcal{L}\right) \cap c_{1}\left(p^{*} \mathcal{N}\right) \cap \alpha^{\prime}\right)$ and $c_{1}(\mathcal{N}) \cap c_{1}(\mathcal{L}) \cap \alpha=p_{*}\left(c_{1}\left(p^{*} \mathcal{N}\right) \cap c_{1}\left(p^{*} \mathcal{L}\right) \cap \alpha^{\prime}\right)$. Hence it suffices to prove the formula in case $X$ is integral and $\alpha=[X]$. In this case the result follows from Lemma 41.27.1 and the definitions.

### 41.28. Intersecting with effective Cartier divisors

02 T 7 In this section we define the gysin map for the zero locus of a section of an invertible sheaf. The most interesting case is that of an effective Cartier divisor; the reason for the generalization is to be able to formulate various compatibilities, see Remark 41.28 .2 and Lemmas 41.28.7, 41.28.8, and 41.29.4. These results can be generalized to deal with locally principal closed subschemes with a virtual normal bundle (Remark 41.28.4). A generalization in a different direction comes from looking at pseudo-divisors (Remark 41.28.5).

Recall that effective Cartier divisors correspond 1-to-1 to isomorphism classes of pairs $(\mathcal{L}, s)$ where $\mathcal{L}$ is an invertible sheaf and $s$ is a global section, see Divisors, Lemma 30.11.21. If $D$ corresponds to $(\mathcal{L}, s)$, then $\mathcal{L}=\mathcal{O}_{X}(D)$. Please keep this in mind while reading this section.

02 T 8 Definition 41.28.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s)$ be a pair consisting of an invertible sheaf and a global section $s \in \Gamma(X, \mathcal{L})$. Let $D=Z(s)$ be the zero scheme of $s$, and denote $i: D \rightarrow X$ the closed immersion. We define, for every integer $k$, a (refined) Gysin homomorphism

$$
i^{*}: Z_{k+1}(X) \rightarrow A_{k}(D)
$$

by the following rules:
(1) Given a integral closed subscheme $W \subset X$ with $\operatorname{dim}_{\delta}(W)=k+1$ we define
(a) if $W \not \subset D$, then $i^{*}[W]=[D \cap W]_{k}$ as a $k$-cycle on $D$, and
(b) if $W \subset D$, then $i^{*}[W]=i_{*}^{\prime}\left(c_{1}\left(\left.\mathcal{L}\right|_{W}\right) \cap[W]\right)$, where $i^{\prime}: W \rightarrow D$ is the induced closed immersion.
(2) For a general $(k+1)$-cycle $\alpha=\sum n_{j}\left[W_{j}\right]$ we set

$$
i^{*} \alpha=\sum n_{j} i^{*}\left[W_{j}\right]
$$

(3) If $D$ is an effective Cartier divisor, then we denote $D \cdot \alpha=i_{*} i^{*} \alpha$ the pushforward of the class to a class on $X$.

In fact, as we will see later, this Gysin homomorphism $i^{*}$ can be viewed as an example of a non-flat pullback. Thus we will sometimes informally call the class $i^{*} \alpha$ the pullback of the class $\alpha$.

0B6Y Remark 41.28.2. Let $f: X^{\prime} \rightarrow X$ be a morphism of schemes locally of finite type over $S$ as in Situation 41.8.1. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be a triple as in Definition 41.28.1. Then we can set $\mathcal{L}^{\prime}=f^{*} \mathcal{L}, s^{\prime}=f^{*} s$, and $D^{\prime}=X^{\prime} \times_{X} D=Z\left(s^{\prime}\right)$. This
gives a commutative diagram

and we can ask for various compatibilities between $i^{*}$ and $\left(i^{\prime}\right)^{*}$.
0B6Z Remark 41.28.3. Let $X \rightarrow S, \mathcal{L}, s, i: D \rightarrow X$ be as in Definition 41.28.1 and assume that $\left.\mathcal{L}\right|_{D} \cong \mathcal{O}_{D}$. In this case we can define a canonical map $i^{*}: Z_{k+1}(X) \rightarrow$ $Z_{k}(D)$ on cycles, by requiring that $i^{*}[W]=0$ whenever $W \subset D$. The possibility to do this will be useful later on.

0B70 Remark 41.28.4. Let $X$ be a scheme locally of finite type over $S$ as in Situation 41.8.1. Let $(D, \mathcal{N}, \sigma)$ be a triple consisting of a locally principal (Divisors, Definition 30.11.1 closed subscheme $i: D \rightarrow X$, an invertible $\mathcal{O}_{D}$-module $\mathcal{N}$, and a surjection $\sigma: \mathcal{N}^{\otimes-1} \rightarrow i^{*} \mathcal{I}_{D}$ of $\mathcal{O}_{D}$-modules. Here $\mathcal{N}$ should be thought of as a virtual normal bundle of $D$ in $X$. The construction of $i^{*}: Z_{k+1}(X) \rightarrow A_{k}(D)$ in Definition41.28.1 generalizes to such triples and it is perhaps the correct generality for the definition.

0B7D Remark 41.28.5. Let $X$ be a scheme locally of finite type over $S$ as in Situation 41.8.1. In Ful98 a pseudo-divisor on $X$ is defined as a triple $D=(\mathcal{L}, Z, s)$ where $\mathcal{L}$ is an invertible $\mathcal{O}_{X}$-module, $Z \subset X$ is a closed subset, and $s \in \Gamma(X \backslash Z, \mathcal{L})$ is a nowhere vanishing section. Similarly to the above, one can define for every $\alpha$ in $A_{k}(X)$ a product $D \cdot \alpha$ in $A_{k}(Z \cap|\alpha|)$ where $|\alpha|$ is the support of $\alpha$.

02 T 9 Lemma 41.28.6. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition[41.28.1. Let $\alpha$ be a $(k+1)$ cycle on $X$. Then $i_{*} i^{*} \alpha=c_{1}(\mathcal{L}) \cap \alpha$ in $A_{k}(X)$. In particular, if $D$ is an effective Cartier divisor, then $D \cdot \alpha=c_{1}\left(\mathcal{O}_{X}(D)\right) \cap \alpha$.

Proof. Write $\alpha=\sum n_{j}\left[W_{j}\right]$ where $i_{j}: W_{j} \rightarrow X$ are integral closed subschemes with $\operatorname{dim}_{\delta}\left(W_{j}\right)=k$. Since $D$ is the zero scheme of $s$ we see that $D \cap W_{j}$ is the zero scheme of the restriction $\left.s\right|_{W_{j}}$. Hence for each $j$ such that $W_{j} \not \subset D$ we have $c_{1}(\mathcal{L}) \cap\left[W_{j}\right]=\left[D \cap W_{j}\right]_{k}$ by Lemma 41.24.3. So we have

$$
\left.c_{1}(\mathcal{L}) \cap \alpha=\sum_{W_{j} \not \subset D} n_{j}\left[D \cap W_{j}\right]_{k}+\sum_{W_{j} \subset D} n_{j} i_{j, *}\left(\left.c_{1}(\mathcal{L})\right|_{W_{j}}\right) \cap\left[W_{j}\right]\right)
$$

in $A_{k}(X)$ by Definition 41.24.1. The right hand side matches (termwise) the pushforward of the class $i^{*} \alpha$ on $D$ from Definition 41.28.1. Hence we win.

02TA Lemma 41.28.7. Let $(S, \delta)$ be as in Situation41.8.1. Let $f: X^{\prime} \rightarrow X$ be a proper morphism of schemes locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition 41.28.1. Form the diagram

as in Remark 41.28.2. For any $(k+1)$-cycle $\alpha^{\prime}$ on $X^{\prime}$ we have $i^{*} f_{*} \alpha^{\prime}=g_{*}\left(i^{\prime}\right)^{*} \alpha^{\prime}$ in $A_{k}(D)$ (this makes sense as $f_{*}$ is defined on the level of cycles).

Proof. Suppose $\alpha=\left[W^{\prime}\right]$ for some integral closed subscheme $W^{\prime} \subset X^{\prime}$. Let $W=f\left(W^{\prime}\right) \subset X$. In case $W^{\prime} \not \subset D^{\prime}$, then $W \not \subset D$ and we see that

$$
\left[W^{\prime} \cap D^{\prime}\right]_{k}=\operatorname{div}_{\left.\mathcal{L}^{\prime}\right|_{W^{\prime}}}\left(\left.s^{\prime}\right|_{W^{\prime}}\right) \quad \text { and } \quad[W \cap D]_{k}=\operatorname{div}_{\left.\mathcal{L}\right|_{W}}\left(\left.s\right|_{W}\right)
$$

and hence $f_{*}$ of the first cycle equals the second cycle by Lemma 41.25.2. Hence the equality holds as cycles. In case $W^{\prime} \subset D^{\prime}$, then $W \subset D$ and $f_{*}\left(c_{1}\left(\left.\mathcal{L}\right|_{W^{\prime}}\right) \cap\left[W^{\prime}\right]\right)$ is equal to $c_{1}(\mathcal{L} \mid W) \cap[W]$ in $A_{k}(W)$ by the second assertion of Lemma 41.25.2. By Remark 41.20.4 the result follows for general $\alpha^{\prime}$.

0B71 Lemma 41.28.8. Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X^{\prime} \rightarrow X$ be a flat morphism of relative dimension $r$ of schemes locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition 41.28.1. Form the diagram

as in Remark 41.28.2. For any $(k+1)$-cycle $\alpha$ on $X$ we have $\left(i^{\prime}\right)^{*} f^{*} \alpha=g^{*} i^{*} \alpha^{\prime}$ in $A_{k+r}(D)$ (this makes sense as $f^{*}$ is defined on the level of cycles).

Proof. Suppose $\alpha=[W]$ for some integral closed subscheme $W \subset X$. Let $W^{\prime}=$ $f^{-1}(W) \subset X^{\prime}$. In case $W \not \subset D$, then $W^{\prime} \not \subset D^{\prime}$ and we see that

$$
W^{\prime} \cap D^{\prime}=g^{-1}(W \cap D)
$$

as closed subschemes of $D^{\prime}$. Hence the equality holds as cycles, see Lemma 41.15.4. In case $W \subset D$, then $W^{\prime} \subset D^{\prime}$ and $W^{\prime}=g^{-1}(W)$ with $\left[W^{\prime}\right]_{k+1+r}=g^{*}[W]$ and equality holds in $A_{k+r}\left(D^{\prime}\right)$ by Lemma 41.25.1. By Remark 41.20.4 the result follows for general $\alpha^{\prime}$.

02TB Lemma 41.28.9. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition 41.28.1.
(1) Let $Z \subset X$ be a closed subscheme such that $\operatorname{dim}_{\delta}(Z) \leq k+1$ and such that $D \cap Z$ is an effective Cartier divisor on $Z$. Then $i^{*}[Z]_{k+1}=[D \cap Z]_{k}$.
(2) Let $\mathcal{F}$ be a coherent sheaf on $X$ such that $\operatorname{dim}_{\delta}(\operatorname{Support}(\mathcal{F})) \leq k+1$ and $s: \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}$ is injective. Then

$$
i^{*}[\mathcal{F}]_{k+1}=\left[i^{*} \mathcal{F}\right]_{k}
$$

in $A_{k}(D)$.
Proof. Assume $Z \subset X$ as in (1). Then set $\mathcal{F}=\mathcal{O}_{Z}$. The assumption that $D \cap Z$ is an effective Cartier divisor is equivalent to the assumption that $s: \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}$ is injective. Moreover $\left.[Z]_{k+1}=[\mathcal{F}]_{k+1}\right]$ and $[D \cap Z]_{k}=\left[\mathcal{O}_{D \cap Z}\right]_{k}=\left[i^{*} \mathcal{F}\right]_{k}$. See Lemma 41.11.3. Hence part (1) follows from part (2).
Write $[\mathcal{F}]_{k+1}=\sum m_{j}\left[W_{j}\right]$ with $m_{j}>0$ and pairwise distinct integral closed subschemes $W_{j} \subset X$ of $\delta$-dimension $k+1$. The assumption that $s: \mathcal{F} \rightarrow \mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}$ is injective implies that $W_{j} \not \subset D$ for all $j$. By definition we see that

$$
i^{*}[\mathcal{F}]_{k+1}=\sum\left[D \cap W_{j}\right]_{k}
$$

We claim that

$$
\sum\left[D \cap W_{j}\right]_{k}=\left[i^{*} \mathcal{F}\right]_{k}
$$

as cycles. Let $Z \subset D$ be an integral closed subscheme of $\delta$-dimension $k$. Let $\xi \in Z$ be its generic point. Let $A=\mathcal{O}_{X, \xi}$. Let $M=\mathcal{F}_{\xi}$. Let $f \in A$ be an element generating the ideal of $D$, i.e., such that $\mathcal{O}_{D, \xi}=A / f A$. By assumption $\operatorname{dim}(\operatorname{Supp}(M))=1, f: M \rightarrow M$ is injective, and length $A(M / f M)<\infty$. Moreover, length $_{A}(M / f M)$ is the coefficient of $[Z]$ in $\left[i^{*} \mathcal{F}\right]_{k}$. On the other hand, let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ be the minimal primes in the support of $M$. Then

$$
\sum \operatorname{length}_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right) \operatorname{ord}_{A / \mathfrak{q}_{i}}(f)
$$

is the coefficient of $[Z]$ in $\sum\left[D \cap W_{j}\right]_{k}$. Hence we see the equality by Algebra, Lemma 10.120 .11 .

### 41.29. Gysin homomorphisms

02TK In this section we use the key formula to show the Gysin homomorphism factor through rational equivalence.

02TM Lemma 41.29.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $X$ be integral and $n=\operatorname{dim}_{\delta}(X)$. Let $i: D \rightarrow X$ be an effective Cartier divisor. Let $\mathcal{N}$ be an invertible $\mathcal{O}_{X}$-module and let $t$ be a nonzero meromorphic section of $\mathcal{N}$. Then $i^{*} \operatorname{div}_{\mathcal{N}}(t)=c_{1}(\mathcal{N}) \cap[D]_{n-1}$ in $A_{n-2}(D)$.

Proof. Write $\operatorname{div}_{\mathcal{N}}(t)=\sum \operatorname{ord}_{Z_{i}, \mathcal{N}}(t)\left[Z_{i}\right]$ for some integral closed subschemes $Z_{i} \subset$ $X$ of $\delta$-dimension $n-1$. We may assume that the family $\left\{Z_{i}\right\}$ is locally finite, that $t \in \Gamma\left(U,\left.\mathcal{N}\right|_{U}\right)$ is a generator where $U=X \backslash \bigcup Z_{i}$, and that every irreducible component of $D$ is one of the $Z_{i}$, see Divisors, Lemmas 30.21.1, 30.21.4, and 30.22.2,

Set $\mathcal{L}=\mathcal{O}_{X}(D)$. Denote $s \in \Gamma\left(X, \mathcal{O}_{X}(D)\right)=\Gamma(X, \mathcal{L})$ the canonical section. We will apply the discussion of Section 41.26 to our current situation. For each $i$ let $\xi_{i} \in Z_{i}$ be its generic point. Let $B_{i}=\mathcal{O}_{X, \xi_{i}}$. For each $i$ we pick generators $s_{i} \in \mathcal{L}_{\xi_{i}}$ and $t_{i} \in \mathcal{L}_{\xi_{i}}$ over $B_{i}$ but we insist that we pick $s_{i}=s$ if $Z_{i} \not \subset D$. Write $s=f_{i} s_{i}$ and $t=g_{i} t_{i}$ with $f_{i}, g_{i} \in B_{i}$. Then $\operatorname{ord}_{Z_{i}, \mathcal{N}}(t)=\operatorname{ord}_{B_{i}}\left(g_{i}\right)$. On the other hand, we have $f_{i} \in B_{i}$ and

$$
[D]_{n-1}=\sum \operatorname{ord}_{B_{i}}\left(f_{i}\right)\left[Z_{i}\right]
$$

because of our choices of $s_{i}$. We claim that

$$
i^{*} \operatorname{div}_{\mathcal{N}}(t)=\sum \operatorname{ord}_{B_{i}}\left(g_{i}\right) \operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.s_{i}\right|_{Z_{i}}\right)
$$

as cycles. More precisely, the right hand side is a cycle representing the left hand side. Namely, this is clear by our formula for $\operatorname{div}_{\mathcal{N}}(t)$ and the fact that $\operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.s_{i}\right|_{Z_{i}}\right)=\left[Z\left(\left.s_{i}\right|_{Z_{i}}\right)\right]_{n-2}=\left[Z_{i} \cap D\right]_{n-2}$ when $Z_{i} \not \subset D$ because in that case $\left.s_{i}\right|_{Z_{i}}=\left.s\right|_{Z_{i}}$ is a regular section, see Lemma 41.23.2. Similarly,

$$
c_{1}(\mathcal{N}) \cap[D]_{n-1}=\sum \operatorname{ord}_{B_{i}}\left(f_{i}\right) \operatorname{div}_{\mathcal{N} \mid z_{i}}\left(\left.t_{i}\right|_{Z_{i}}\right)
$$

The key formula (Lemma 41.26.1) gives the equality

$$
\sum\left(\operatorname{ord}_{B_{i}}\left(f_{i}\right) \operatorname{div}_{\mathcal{N} \mid Z_{i}}\left(\left.t_{i}\right|_{Z_{i}}\right)-\operatorname{ord}_{B_{i}}\left(g_{i}\right) \operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.s_{i}\right|_{Z_{i}}\right)\right)=\sum \operatorname{div}_{Z_{i}}\left(d_{B_{i}}\left(f_{i}, g_{i}\right)\right.
$$

of cycles. If $Z_{i} \not \subset D$, then $f_{i}=1$ and hence $\operatorname{div}_{Z_{i}}\left(d_{B_{i}}\left(f_{i}, g_{i}\right)=0\right.$. Thus we get a rational equivalence between our specific cycles representing $i^{*} \operatorname{div}_{\mathcal{N}}(t)$ and $c_{1}(\mathcal{N}) \cap[D]_{n-1}$ on $D$. This finishes the proof.

02 TO Lemma 41.29.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition 41.28.1. The Gysin homomorphism factors through rational equivalence to give a map $i^{*}: A_{k+1}(X) \rightarrow A_{k}(D)$.

Proof. Let $\alpha \in Z_{k+1}(X)$ and assume that $\alpha \sim_{\text {rat }} 0$. This means there exists a locally finite collection of integral closed subschemes $W_{j} \subset X$ of $\delta$-dimension $k+2$ and $f_{j} \in R\left(W_{j}\right)^{*}$ such that $\alpha=\sum i_{j, *} \operatorname{div}_{W_{j}}\left(f_{j}\right)$. Set $X^{\prime}=\coprod W_{i}$ and consider the diagram

of Remark 41.28.2. Since $X^{\prime} \rightarrow X$ is proper we see that $i^{*} p_{*}=q_{*}\left(i^{\prime}\right)^{*}$ by Lemma 41.28.7. As we know that $q_{*}$ factors through rational equivalence (Lemma 41.21.2), it suffices to prove the result for $\alpha^{\prime}=\sum \operatorname{div}_{W_{j}}\left(f_{j}\right)$ on $X^{\prime}$. Clearly this reduces us to the case where $X$ is integral and $\alpha=\operatorname{div}(f)$ for some $f \in R(X)^{*}$.

Assume $X$ is integral and $\alpha=\operatorname{div}(f)$ for some $f \in R(X)^{*}$. If $X=D$, then we see that $i^{*} \alpha$ is equal to $c_{1}(\mathcal{L}) \cap \alpha$. This is rationally equivalent to zero by Lemma 41.27.2. If $D \neq X$, then we see that $i^{*} \operatorname{div}_{X}(f)$ is equal to $c_{1}\left(\mathcal{O}_{D}\right) \cap[D]_{n-1}$ in $A_{k}(D)$ by Lemma 41.29.1. Of course capping with $c_{1}\left(\mathcal{O}_{D}\right)$ is the zero map.

0B72 Lemma 41.29.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be a triple as in Definition 41.28.1. Let $\mathcal{N}$ be an invertible $\mathcal{O}_{X}$-module. Then $i^{*}\left(c_{1}(\mathcal{N}) \cap \alpha\right)=c_{1}\left(i^{*} \mathcal{N}\right) \cap i^{*} \alpha$ in $A_{k-2}(D)$ for all $\alpha \in A_{k}(Z)$.

Proof. With exactly the same proof as in Lemma 41.29.2 this follows from Lemmas 41.25 .3 41.27.3 and 41.29.1.

0B73 Lemma 41.29.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ and $\left(\mathcal{L}^{\prime}, s^{\prime}, i^{\prime \prime}: D^{\prime} \rightarrow X\right)$ be two triples as in Definition 41.28.1. Then the diagram

commutes where each of the maps is a gysin map.
Proof. Denote $j: D \cap D^{\prime} \rightarrow D$ and $j^{\prime}: D \cap D^{\prime} \rightarrow D^{\prime}$ the closed immersions corresponding to $\left(\left.\mathcal{L}\right|_{D^{\prime}},\left.s\right|_{D^{\prime}}\right.$ and $\left(\mathcal{L}_{D}^{\prime},\left.s\right|_{D}\right)$. We have to show that $\left(j^{\prime}\right)^{*} i^{*} \alpha=j^{*}\left(i^{\prime}\right)^{*} \alpha$ for all $\alpha \in A_{k}(X)$. Let $W \subset X$ be an integral closed subscheme of dimension $k$. Let us prove the equality in case $\alpha=[W]$. We will deduce it from the key formula.

We let $\sigma$ be a nonzero meromorphic section of $\left.\mathcal{L}\right|_{W}$ which we require to be equal to $\left.s\right|_{W}$ if $W \not \subset D$. We let $\sigma^{\prime}$ be a nonzero meromorphic section of $\left.\mathcal{L}^{\prime}\right|_{W}$ which we require to be equal to $\left.s^{\prime}\right|_{W}$ if $W \not \subset D^{\prime}$. Write

$$
\operatorname{div}_{\mathcal{L} \mid W}(\sigma)=\sum \operatorname{ord}_{Z_{i},\left.\mathcal{L}\right|_{W}}(\sigma)\left[Z_{i}\right]=\sum n_{i}\left[Z_{i}\right]
$$

and similarly

$$
\operatorname{div}_{\left.\mathcal{L}^{\prime}\right|_{W}}\left(\sigma^{\prime}\right)=\sum \operatorname{ord}_{Z_{i},\left.\mathcal{L}^{\prime}\right|_{W}}\left(\sigma^{\prime}\right)\left[Z_{i}\right]=\sum n_{i}^{\prime}\left[Z_{i}\right]
$$

as in the discussion in Section 41.26. Then we see that $Z_{i} \subset D$ if $n_{i} \neq 0$ and $Z_{i}^{\prime} \subset D^{\prime}$ if $n_{i}^{\prime} \neq 0$. For each $i$, let $\xi_{i} \in Z_{i}$ be the generic point. As in Section 41.26 we choose for each $i$ an element $\sigma_{i} \in \mathcal{L}_{\xi_{i}}$, resp. $\sigma_{i}^{\prime} \in \mathcal{L}_{\xi_{i}}^{\prime}$ which generates over $B_{i}=\mathcal{O}_{W, \xi_{i}}$ and which is equal to the image of $s$, resp. $s^{\prime}$ if $Z_{i} \not \subset D$, resp. $Z_{i} \not \subset D^{\prime}$. Write $\sigma=f_{i} \sigma_{i}$ and $\sigma^{\prime}=f_{i}^{\prime} \sigma_{i}^{\prime}$ so that $n_{i}=\operatorname{ord}_{B_{i}}\left(f_{i}\right)$ and $n_{i}^{\prime}=\operatorname{ord}_{B_{i}}\left(f_{i}^{\prime}\right)$. From our definitions it follows that

$$
\left(j^{\prime}\right)^{*} i^{*}[W]=\sum \operatorname{ord}_{B_{i}}\left(f_{i}\right) \operatorname{div}_{\mathcal{L}^{\prime} \mid z_{i}}\left(\sigma_{i}^{\prime} \mid Z_{i}\right)
$$

as cycles and

$$
j^{*}\left(i^{\prime}\right)^{*}[W]=\sum \operatorname{ord}_{B_{i}}\left(f_{i}^{\prime}\right) \operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.\sigma_{i}\right|_{Z_{i}}\right)
$$

The key formula (Lemma 41.26.1) now gives the equality

$$
\sum\left(\operatorname{ord}_{B_{i}}\left(f_{i}\right) \operatorname{div}_{\mathcal{L}^{\prime} \mid Z_{i}}\left(\left.\sigma_{i}^{\prime}\right|_{Z_{i}}\right)-\operatorname{ord}_{B_{i}}\left(f_{i}^{\prime}\right) \operatorname{div}_{\left.\mathcal{L}\right|_{Z_{i}}}\left(\left.\sigma_{i}\right|_{Z_{i}}\right)\right)=\sum \operatorname{div}_{Z_{i}}\left(d_{B_{i}}\left(f_{i}, f_{i}^{\prime}\right)\right)
$$

of cycles. Note that $\operatorname{div}_{Z_{i}}\left(d_{B_{i}}\left(f_{i}, f_{i}^{\prime}\right)\right)=0$ if $Z_{i} \not \subset D \cap D^{\prime}$ because in this case either $f_{i}=1$ or $f_{i}^{\prime}=1$. Thus we get a rational equivalence between our specific cycles representing $\left(j^{\prime}\right)^{*} i^{*}[W]$ and $j^{*}\left(i^{\prime}\right)^{*}[W]$ on $D \cap D^{\prime} \cap W$. By Remark 41.20.4 the result follows for general $\alpha$.

### 41.30. Relative effective Cartier divisors

02TP Relative effective Cartier divisors are defined and studied in Divisors, Section 30.15 . To develop the basic results on chern classes of vector bundles we only need the case where both the ambient scheme and the effective Cartier divisor are flat over the base.

02TR Lemma 41.30.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $p: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $i: D \rightarrow X$ be a relative effective Cartier divisor (Divisors, Definition 30.15.2). Let $\mathcal{L}=\mathcal{O}_{X}(D)$. For any $\alpha \in A_{k+1}(Y)$ we have

$$
i^{*} p^{*} \alpha=\left(\left.p\right|_{D}\right)^{*} \alpha
$$

in $A_{k+r}(D)$ and

$$
c_{1}(\mathcal{L}) \cap p^{*} \alpha=i_{*}\left(\left(\left.p\right|_{D}\right)^{*} \alpha\right)
$$

in $A_{k+r}(X)$.
Proof. Let $W \subset Y$ be an integral closed subscheme of $\delta$-dimension $k+1$. By Divisors, Lemma 30.15.1 we see that $D \cap p^{-1} W$ is an effective Cartier divisor on $p^{-1} W$. By Lemma 41.28.9 we get the first equality in

$$
i^{*}\left[p^{-1} W\right]_{k+r+1}=\left[D \cap p^{-1} W\right]_{k+r}=\left[\left(\left.p\right|_{D}\right)^{-1}(W)\right]_{k+r}
$$

and the second because $D \cap p^{-1}(W)=\left(\left.p\right|_{D}\right)^{-1}(W)$ as schemes. Since by definition $p^{*}[W]=\left[p^{-1} W\right]_{k+r+1}$ we see that $i^{*} p^{*}[W]=\left(\left.p\right|_{D}\right)^{*}[W]$ as cycles. If $\alpha=\sum m_{j}\left[W_{j}\right]$ is a general $k+1$ cycle, then we get $i^{*} \alpha=\sum m_{j} i^{*} p^{*}\left[W_{j}\right]=\sum m_{j}\left(\left.p\right|_{D}\right)^{*}\left[W_{j}\right]$ as cycles. This proves then first equality. To deduce the second from the first apply Lemma 41.28.6.

### 41.31. Affine bundles

02TS For an affine bundle the pullback map is surjective on Chow groups.
02TT Lemma 41.31.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Assume that for every $y \in Y$, there exists an open neighbourhood $U \subset Y$ such that $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is identified with the morphism $U \times \mathbf{A}^{r} \rightarrow U$. Then $f^{*}: A_{k}(Y) \rightarrow A_{k+r}(X)$ is surjective for all $k \in \mathbf{Z}$.
Proof. Let $\alpha \in A_{k+r}(X)$. Write $\alpha=\sum m_{j}\left[W_{j}\right]$ with $m_{j} \neq 0$ and $W_{j}$ pairwise distinct integral closed subschemes of $\delta$-dimension $k+r$. Then the family $\left\{W_{j}\right\}$ is locally finite in $X$. For any quasi-compact open $V \subset Y$ we see that $f^{-1}(V) \cap W_{j}$ is nonempty only for finitely many $j$. Hence the collection $Z_{j}=\overline{f\left(W_{j}\right)}$ of closures of images is a locally finite collection of integral closed subschemes of $Y$.
Consider the fibre product diagrams

Suppose that $\left[W_{j}\right] \in Z_{k+r}\left(f^{-1}\left(Z_{j}\right)\right)$ is rationally equivalent to $f_{j}^{*} \beta_{j}$ for some $k$ cycle $\beta_{j} \in A_{k}\left(Z_{j}\right)$. Then $\beta=\sum m_{j} \beta_{j}$ will be a $k$-cycle on $Y$ and $f^{*} \beta=\sum m_{j} f_{j}^{*} \beta_{j}$ will be rationally equivalent to $\alpha$ (see Remark 41.20.4). This reduces us to the case $Y$ integral, and $\alpha=[W]$ for some integral closed subscheme of $X$ dominating $Y$. In particular we may assume that $d=\operatorname{dim}_{\delta}(Y)<\infty$.
Hence we can use induction on $d=\operatorname{dim}_{\delta}(Y)$. If $d<k$, then $A_{k+r}(X)=0$ and the lemma holds. By assumption there exists a dense open $V \subset Y$ such that $f^{-1}(V) \cong$ $V \times \mathbf{A}^{r}$ as schemes over $V$. Suppose that we can show that $\left.\alpha\right|_{f^{-1}(V)}=f^{*} \beta$ for some $\beta \in Z_{k}(V)$. By Lemma 41.15.2 we see that $\beta=\left.\beta^{\prime}\right|_{V}$ for some $\beta^{\prime} \in Z_{k}(Y)$. By the exact sequence $A_{k}\left(f^{-1}(Y \backslash V)\right) \rightarrow A_{k}(X) \rightarrow A_{k}\left(f^{-1}(V)\right)$ of Lemma 41.20.2 we see that $\alpha-f^{*} \beta^{\prime}$ comes from a cycle $\alpha^{\prime} \in A_{k+r}\left(f^{-1}(Y \backslash V)\right)$. Since $\operatorname{dim}_{\delta}(Y \backslash V)<d$ we win by induction on $d$.
Thus we may assume that $X=Y \times \mathbf{A}^{r}$. In this case we can factor $f$ as

$$
X=Y \times \mathbf{A}^{r} \rightarrow Y \times \mathbf{A}^{r-1} \rightarrow \ldots \rightarrow Y \times \mathbf{A}^{1} \rightarrow Y
$$

Hence it suffices to do the case $r=1$. By the argument in the second paragraph of the proof we are reduced to the case $\alpha=[W], Y$ integral, and $W \rightarrow Y$ dominant. Again we can do induction on $d=\operatorname{dim}_{\delta}(Y)$. If $W=Y \times \mathbf{A}^{1}$, then $[W]=f^{*}[Y]$. Lastly, $W \subset Y \times \mathbf{A}^{1}$ is a proper inclusion, then $W \rightarrow Y$ induces a finite field extension $R(Y) \subset R(W)$. Let $P(T) \in R(Y)[T]$ be the monic irreducible polynomial such that the generic fibre of $W \rightarrow Y$ is cut out by $P$ in $\mathbf{A}_{R(Y)}^{1}$. Let $V \subset Y$ be a nonempty open such that $P \in \Gamma\left(V, \mathcal{O}_{Y}\right)[T]$, and such that $W \cap f^{-1}(V)$ is still cut out by $P$. Then we see that $\left.\alpha\right|_{f^{-1}(V)} \sim_{r a t} 0$ and hence $\alpha \sim_{r a t} \alpha^{\prime}$ for some cycle $\alpha^{\prime}$ on $(Y \backslash V) \times \mathbf{A}^{1}$. By induction on the dimension we win.

0B74 Lemma 41.31.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let

$$
p: L=\underline{\operatorname{Spec}}\left(\operatorname{Sym}^{*}(\mathcal{L})\right) \longrightarrow X
$$

be the associated vector bundle over $X$. Then $p^{*}: A_{k}(X) \rightarrow A_{k+1}(L)$ is an isomorphism for all $k$.

Proof. For surjectivity see Lemma 41.31.1. Let $o: X \rightarrow L$ be the zero section of $L \rightarrow X$, i.e., the morphism corresponding to the surjection $\operatorname{Sym}^{*}(\mathcal{L}) \rightarrow \mathcal{O}_{X}$ which maps $\mathcal{L}^{\otimes n}$ to zero for all $n>0$. Then $p \circ o=\operatorname{id}_{X}$ and $o(X)$ is an effective Cartier divisor on $L$. Hence by Lemma 41.30.1 we see that $o^{*} \circ p^{*}=$ id and we conclude that $p^{*}$ is injective too.

02TU Remark 41.31.3. We will see later (Lemma 41.33.3 that if $X$ is a vector bundle of rank $r$ over $Y$ then the pullback map $A_{k}(Y) \rightarrow A_{k+r}(X)$ is an isomorphism. This is true whenever $X \rightarrow Y$ satisfies the assumptions of Lemma 41.31.1, see Tot14, Lemma 2.2].

### 41.32. Bivariant intersection theory

0B75 In order to intelligently talk about higher chern classes of vector bundles we introduce the following notion, following FM81. It follows from Ful98, Theorem 17.1] that our definition agrees with that of [Ful98 modulo the caveat that we are working in different settings.

0B76 Definition 41.32.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over $S$. Let $p \in \mathbf{Z}$. A bivariant class $c$ of degree $p$ for $f$ is given by a rule which assigns to every locally of finite type morphism $Y^{\prime} \rightarrow Y$ and every $k$ a map

$$
c \cap-: A_{k}\left(X^{\prime}\right) \longrightarrow A_{k-p}\left(Y^{\prime}\right)
$$

where $Y^{\prime}=X^{\prime} \times_{X} Y$, satisfying the following conditions
(1) if $Y^{\prime \prime} \rightarrow Y^{\prime}$ is a proper, then $c \cap\left(Y^{\prime \prime} \rightarrow Y^{\prime}\right)_{*} \alpha^{\prime \prime}=\left(X^{\prime \prime} \rightarrow X^{\prime}\right)_{*}\left(c \cap \alpha^{\prime \prime}\right)$ for all $\alpha^{\prime \prime}$ on $Y^{\prime \prime}$,
(2) if $Y^{\prime \prime} \rightarrow Y^{\prime}$ is flat locally of finite type of fixed relative dimension, then $c \cap\left(X^{\prime \prime} \rightarrow X^{\prime}\right)^{*} \alpha^{\prime}=\left(Y^{\prime \prime} \rightarrow Y^{\prime}\right)^{*}\left(c \cap \alpha^{\prime}\right)$ for all $\alpha^{\prime}$ on $Y^{\prime}$, and
(3) if $\left(\mathcal{L}^{\prime}, s^{\prime}, i^{\prime}: D^{\prime} \rightarrow X^{\prime}\right)$ is as in Definition 41.28.1 with pullback $\left(\mathcal{N}^{\prime}, t^{\prime}, j^{\prime}\right.$ : $E^{\prime} \rightarrow Y^{\prime}$ ) to $Y^{\prime}$, then we have $c \cap\left(i^{\prime}\right)^{*} \alpha^{\prime}=\left(j^{\prime}\right)^{*}\left(c \cap \alpha^{\prime}\right)$ for all $\alpha^{\prime}$ on $X^{\prime}$. The collection of all bivariant classes of degree $p$ for $f$ is denoted $A^{p}(X \rightarrow Y)$.

Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over $S$. Let $p \in \mathbf{Z}$. It is clear that $A^{p}(X \rightarrow Y)$ is an abelian group. Moreover, it is clear that we have a bilinear compositon

$$
A^{p}(X \rightarrow Y) \times A^{q}(Y \rightarrow Z) \rightarrow A^{p+q}(X \rightarrow Z)
$$

which is associative. We will be most interested in $A^{p}(X)=A^{p}(X \rightarrow X)$, which will always mean the bivariant cohomology classes for $\mathrm{id}_{X}$. Namely, that is where chern classes will live.
0B7E Definition 41.32.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. The Chow cohomology of $X$ is the graded Z-algebra $A^{*}(X)$ whose degree $p$ component is $A^{p}(X \rightarrow X)$.

Warning: It is not clear that a priori that the $\mathbf{Z}$-algebra structure on $A^{*}(X)$ is commutative, but we will see that chern classes live in its center.

Similar to Ful98
Definition 17.1]

0B7F Remark 41.32.3. Let $(S, \delta)$ be as in Situation 41.8.1 Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over $S$. Then there is a canonical Zalgebra map $A^{*}(Y) \rightarrow A^{*}(X)$. Namely, given $c \in A^{p}(Y)$ and $X^{\prime} \rightarrow X$, then we can let $f^{*} c$ be defined by the map $c \cap-: A_{k}\left(X^{\prime}\right) \rightarrow A_{k-p}\left(X^{\prime}\right)$ which is given by thinking of $X^{\prime}$ as a scheme over $Y$.

0B77 Lemma 41.32.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Then the rule that to $f: X^{\prime} \rightarrow X$ assignes $c_{1}\left(f^{*} \mathcal{L}\right) \cap-: A_{k}\left(X^{\prime}\right) \rightarrow A_{k-1}\left(X^{\prime}\right)$ is a bivariant class of degree 1 .

Proof. This follows from Lemmas 41.27.2, 41.25.3, 41.25.1, and 41.29.3
Having said this we see that we can define $c_{1}(\mathcal{L})$ as the element of $A^{1}(X)$ constructed in Lemma 41.32.4 We will return to this in Section 41.36 ,

0B78 Lemma 41.32.5. Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$ between schemes locally of finite type over $S$. Then the rule that to $Y^{\prime} \rightarrow Y$ assignes $\left(f^{\prime}\right)^{*}: A_{k}\left(Y^{\prime}\right) \rightarrow A_{k+r}\left(X^{\prime}\right)$ where $X^{\prime}=X \times_{Y} Y^{\prime}$ is a bivariant class of degree $-r$.

Proof. This follows from Lemmas 41.21.1, 41.15.3, 41.16.1, and 41.28.8,
0B79 Lemma 41.32.6. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be a triple as in Definition 41.28.1. Then the rule that to $f: X^{\prime} \rightarrow X$ assignes $\left(i^{\prime}\right)^{*}: A_{k}\left(X^{\prime}\right) \rightarrow A_{k-1}\left(D^{\prime}\right)$ where $D^{\prime}=D \times_{X} X^{\prime}$ is a bivariant class of degree 1 .

Proof. This follows from Lemmas 41.29.2, 41.28.7, 41.28.8, and 41.29.4,
Here is a criterion to see that an operation passes through rational equivalence.
0B7A Lemma 41.32.7. Let $(S, \delta)$ be as in Situation 41.8.1. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over $S$. Let $p \in \mathbf{Z}$. Suppose given a rule which assigns to every locally of finite type morphism $Y^{\prime} \rightarrow Y$ and every $k$ a map

Very weak form of Ful98, Theorem 17.1]
where $Y^{\prime}=X^{\prime} \times_{X} Y$, satisfying condition (3) of Definition 41.32.1 whenever $\left.\mathcal{L}^{\prime}\right|_{D^{\prime}} \cong \mathcal{O}_{D^{\prime}}$. Then $c \cap-$ factors through rational equivalence.

Proof. The statement makes sense because given a triple $(\mathcal{L}, s, i: D \rightarrow X)$ as in Definition 41.28.1 such that $\left.\mathcal{L}\right|_{D} \cong \mathcal{O}_{D}$, then the operation $i^{*}$ is defined on the level of cycles, see Remark 41.28.3. Let $\alpha \in Z_{k}\left(X^{\prime}\right)$ be a cycle which is rationally equivalent to zero. We have to show that $c \cap \alpha=0$. By Lemma 41.22.1 there exists a cycle $\beta \in Z_{k+1}\left(X^{\prime} \times \mathbf{P}^{1}\right)$ such that $\alpha=i_{0}^{*} \beta-i_{\infty}^{*} \beta$ where $i_{0}, i_{\infty}: X^{\prime} \rightarrow X^{\prime} \times \mathbf{P}^{1}$ are the closed immersions of $X^{\prime}$ over $0, \infty$. Since these are examples of effective Cartier divisors with trivial normal bundles, we see that $c \cap i_{0}^{*} \beta=j_{0}^{*}(c \cap \beta)$ and $c \cap i_{\infty}^{*} \beta=j_{\infty}^{*}(c \cap \beta)$ where $j_{0}, j_{\infty}: Y^{\prime} \rightarrow Y^{\prime} \times \mathbf{P}^{1}$ are closed immersions as before. Since $j_{0}^{*}(c \cap \beta) \sim_{r a t} j_{\infty}^{*}(c \cap \beta)$ (follows from Lemma 41.22.1) we conclude.

Here we see that $c_{1}(\mathcal{L})$ is in the center of $A^{*}(X)$.
0B7B Lemma 41.32.8. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Then $c_{1}(\mathcal{L}) \in A^{1}(X)$ commutes with every element $c \in A^{p}(X)$.

Proof. Let $p: L \rightarrow X$ be as in Lemma 41.31.2 and let $o: X \rightarrow L$ be the zero section. Observe that $p^{*} \mathcal{L}^{\otimes-1}$ has a canonical section whose zero scheme is exactly the effective Cartier divisor $o(X)$. Let $\alpha \in A_{k}(X)$. Then we see that

$$
p^{*}\left(c_{1}\left(\mathcal{L}^{\otimes-1}\right) \cap \alpha\right)=c_{1}\left(p^{*} \mathcal{L}^{\otimes-1}\right) \cap p^{*} \alpha=o_{*} o^{*} p^{*} \alpha
$$

by Lemmas 41.25.1 and 41.30.1. Since $c$ is a bivariant class we have

$$
\begin{aligned}
p^{*}\left(c \cap c_{1}\left(\mathcal{L}^{\otimes-1}\right) \cap \alpha\right) & =c \cap p^{*}\left(c_{1}\left(\mathcal{L}^{\otimes-1}\right) \cap \alpha\right) \\
& =c \cap o_{*} o^{*} p^{*} \alpha \\
& =o_{*} o^{*} p^{*}(c \cap \alpha) \\
& =p^{*}\left(c_{1}\left(\mathcal{L}^{\otimes-1}\right) \cap c \cap \alpha\right)
\end{aligned}
$$

(last equality by the above applied to $c \cap \alpha$ ). Since $p^{*}$ is injective by a lemma cited above we get that $c_{1}\left(\mathcal{L}^{\otimes-1}\right)$ is in the center of $A^{*}(X)$. This proves the lemma.

Here a criterion for when a bivariant class is zero.
02UC Lemma 41.32.9. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $c \in A^{p}(X)$. Then $c$ is zero if and only if $c \cap[Y]=0$ in $A_{*}(Y)$ for every integral scheme $Y$ locally of finite type over $X$.

Proof. The if direction is clear. For the converse, assume that $c \cap[Y]=0$ in $A_{*}(Y)$ for every integral scheme $Y$ locally of finite type over $X$. Let $X^{\prime} \rightarrow X$ be locally of finite type. Let $\alpha \in A_{k}\left(X^{\prime}\right)$. Write $\alpha=\sum n_{i}\left[Y_{i}\right]$ with $Y_{i} \subset X^{\prime}$ a locally finite collection of integral closed subschemes of $\delta$-dimension $k$. Then we see that $\alpha$ is pushforward of the cycle $\alpha^{\prime}=\sum n_{i}\left[Y_{i}\right]$ on $X^{\prime \prime}=\coprod Y_{i}$ under the proper morphism $X^{\prime \prime} \rightarrow X^{\prime}$. By the properties of bivariant classes it suffices to prove that $c \cap \alpha^{\prime}=0$ in $A_{k-p}\left(X^{\prime \prime}\right)$. We have $A_{k-p}\left(X^{\prime \prime}\right)=\prod A_{k-p}\left(Y_{i}\right)$ as follows immediately from the definitions. The projection maps $A_{k-p}\left(X^{\prime \prime}\right) \rightarrow A_{k-p}\left(Y_{i}\right)$ are given by flat pullback. Since capping with $c$ commutes with flat pullback, we see that it suffices to show that $c \cap\left[Y_{i}\right]$ is zero in $A_{k-p}\left(Y_{i}\right)$ which is true by assumption.

### 41.33. Projective space bundle formula

02 TV Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Consider a finite locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ of rank $r$. Our convention is that the projective bundle associated to $\mathcal{E}$ is the morphism

$$
\mathbf{P}(\mathcal{E})=\underline{\operatorname{Proj}}_{X}\left(\operatorname{Sym}^{*}(\mathcal{E})\right) \xrightarrow{\pi} X
$$

over $X$ with $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ normalized so that $\pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)\right)=\mathcal{E}$. In particular there is a surjection $\pi^{*} \mathcal{E} \rightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. We will say informally "let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective bundle associated to $\mathcal{E}$ " to denote the situation where $P=\mathbf{P}(\mathcal{E})$ and $\mathcal{O}_{P}(1)=\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$.

02TW Lemma 41.33.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ of rank $r$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective bundle associated to $\mathcal{E}$. For any $\alpha \in A_{k}(X)$ the element

$$
\pi_{*}\left(c_{1}\left(\mathcal{O}_{P}(1)\right)^{s} \cap \pi^{*} \alpha\right) \in A_{k+r-1-s}(X)
$$

is 0 if $s<r-1$ and is equal to $\alpha$ when $s=r-1$.

Proof. Let $Z \subset X$ be an integral closed subscheme of $\delta$-dimension $k$. Note that $\pi^{*}[Z]=\left[\pi^{-1}(Z)\right]$ as $\pi^{-1}(Z)$ is integral of $\delta$-dimension $r-1$. If $s<r-1$, then by construction $c_{1}\left(\mathcal{O}_{P}(1)\right)^{s} \cap \pi^{*}[Z]$ is represented by a $(k+r-1-s)$-cycle supported on $\pi^{-1}(Z)$. Hence the pushforward of this cycle is zero for dimension reasons.
Let $s=r-1$. By the argument given above we see that $\pi_{*}\left(c_{1}\left(\mathcal{O}_{P}(1)\right)^{s} \cap \pi^{*} \alpha\right)=n[Z]$ for some $n \in \mathbf{Z}$. We want to show that $n=1$. For the same dimension reasons as above it suffices to prove this result after replacing $X$ by $X \backslash T$ where $T \subset Z$ is a proper closed subset. Let $\xi$ be the generic point of $Z$. We can choose elements $e_{1}, \ldots, e_{r-1} \in \mathcal{E}_{\xi}$ which form part of a basis of $\mathcal{E}_{\xi}$. These give rational sections $s_{1}, \ldots, s_{r-1}$ of $\left.\mathcal{O}_{P}(1)\right|_{\pi^{-1}(Z)}$ whose common zero set is the closure of the image a rational section of $\mathbf{P}\left(\left.\mathcal{E}\right|_{Z}\right) \rightarrow Z$ union a closed subset whose support maps to a proper closed subset $T$ of $Z$. After removing $T$ from $X$ (and correspondingly $\pi^{-1}(T)$ from $P$ ), we see that $s_{1}, \ldots, s_{n}$ form a sequence of global sections $s_{i} \in \Gamma\left(\pi^{-1}(Z), \mathcal{O}_{\pi^{-1}(Z)}(1)\right)$ whose common zero set is the image of a section $Z \rightarrow \pi^{-1}(Z)$. Hence we see successively that

$$
\begin{aligned}
\pi^{*}[Z] & =\left[\pi^{-1}(Z)\right] \\
c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*}[Z] & =\left[Z\left(s_{1}\right)\right] \\
c_{1}\left(\mathcal{O}_{P}(1)\right)^{2} \cap \pi^{*}[Z] & =\left[Z\left(s_{1}\right) \cap Z\left(s_{2}\right)\right] \\
\cdots & =\ldots \\
c_{1}\left(\mathcal{O}_{P}(1)\right)^{r-1} \cap \pi^{*}[Z] & =\left[Z\left(s_{1}\right) \cap \ldots \cap Z\left(s_{r-1}\right)\right]
\end{aligned}
$$

by repeated applications of Lemma 41.24.3. Since the pushforward by $\pi$ of the image of a section of $\pi$ over $Z$ is clearly $[Z]$ we see the result when $\alpha=[Z]$. We omit the verification that these arguments imply the result for a general cycle $\alpha=\sum n_{j}\left[Z_{j}\right]$.

02TX Lemma 41.33.2 (Projective space bundle formula). Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{X-}$ module $\mathcal{E}$ of rank $r$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective bundle associated to $\mathcal{E}$. The map

$$
\begin{gathered}
\bigoplus_{i=0}^{r-1} A_{k+i}(X) \longrightarrow A_{k+r-1}(P) \\
\left(\alpha_{0}, \ldots, \alpha_{r-1}\right) \longmapsto \pi^{*} \alpha_{0}+c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha_{1}+\ldots+c_{1}\left(\mathcal{O}_{P}(1)\right)^{r-1} \cap \pi^{*} \alpha_{r-1}
\end{gathered}
$$

is an isomorphism.
Proof. Fix $k \in \mathbf{Z}$. We first show the map is injective. Suppose that $\left(\alpha_{0}, \ldots, \alpha_{r-1}\right)$ is an element of the left hand side that maps to zero. By Lemma 41.33.1 we see that

$$
0=\pi_{*}\left(\pi^{*} \alpha_{0}+c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha_{1}+\ldots+c_{1}\left(\mathcal{O}_{P}(1)\right)^{r-1} \cap \pi^{*} \alpha_{r-1}\right)=\alpha_{r-1}
$$

Next, we see that
$0=\pi_{*}\left(c_{1}\left(\mathcal{O}_{P}(1)\right) \cap\left(\pi^{*} \alpha_{0}+c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha_{1}+\ldots+c_{1}\left(\mathcal{O}_{P}(1)\right)^{r-2} \cap \pi^{*} \alpha_{r-2}\right)\right)=\alpha_{r-2}$
and so on. Hence the map is injective.
It remains to show the map is surjective. Let $X_{i}, i \in I$ be the irreducible components of $X$. Then $P_{i}=\mathbf{P}\left(\left.\mathcal{E}\right|_{X_{i}}\right), i \in I$ are the irreducible components of $P$.

Consider the commutative diagram

Observe that $p_{*}$ is surjective. If $\beta \in A_{k}\left(\amalg X_{i}\right)$ then $\pi^{*} q_{*} \beta=p_{*}\left(\amalg \pi_{i}\right)^{*} \beta$, see Lemma 41.16.1. Similarly for capping with $c_{1}(\mathcal{O}(1))$ by Lemma 41.25.3. Hence, if the map of the lemma is surjective for each of the morphisms $\pi_{i}: P_{i} \rightarrow X_{i}$, then the map is surjective for $\pi: P \rightarrow X$. Hence we may assume $X$ is irreducible. Thus $\operatorname{dim}_{\delta}(X)<\infty$ and in particular we may use induction on $\operatorname{dim}_{\delta}(X)$.
The result is clear if $\operatorname{dim}_{\delta}(X)<k$. Let $\alpha \in A_{k+r-1}(P)$. For any locally closed subscheme $T \subset X$ denote $\gamma_{T}: \bigoplus A_{k+i}(T) \rightarrow A_{k+r-1}\left(\pi^{-1}(T)\right)$ the map

$$
\gamma_{T}\left(\alpha_{0}, \ldots, \alpha_{r-1}\right)=\pi^{*} \alpha_{0}+\ldots+c_{1}\left(\mathcal{O}_{\pi^{-1}(T)}(1)\right)^{r-1} \cap \pi^{*} \alpha_{r-1}
$$

Suppose for some nonempty open $U \subset X$ we have $\left.\alpha\right|_{\pi^{-1}(U)}=\gamma_{U}\left(\alpha_{0}, \ldots, \alpha_{r-1}\right)$. Then we may choose lifts $\alpha_{i}^{\prime} \in A_{k+i}(X)$ and we see that $\alpha-\gamma_{X}\left(\alpha_{0}^{\prime}, \ldots, \alpha_{r-1}^{\prime}\right)$ is by Lemma 41.20 .2 rationally equivalent to a $k$-cycle on $P_{Y}=\mathbf{P}\left(\left.\mathcal{E}\right|_{Y}\right)$ where $Y=X \backslash U$ as a reduced closed subscheme. Note that $\operatorname{dim}_{\delta}(Y)<\operatorname{dim}_{\delta}(X)$. By induction the result holds for $P_{Y} \rightarrow Y$ and hence the result holds for $\alpha$. Hence we may replace $X$ by any nonempty open of $X$.
In particular we may assume that $\mathcal{E} \cong \mathcal{O}_{X}^{\oplus r}$. In this case $\mathbf{P}(\mathcal{E})=X \times \mathbf{P}^{r-1}$. Let us use the stratification

$$
\mathbf{P}^{r-1}=\mathbf{A}^{r-1} \amalg \mathbf{A}^{r-2} \amalg \ldots \amalg \mathbf{A}^{0}
$$

The closure of each stratum is a $\mathbf{P}^{r-1-i}$ which is a representative of $c_{1}(\mathcal{O}(1))^{i} \cap$ $\left[\mathbf{P}^{r-1}\right]$. Hence $P$ has a similar stratification

$$
P=U^{r-1} \amalg U^{r-2} \amalg \ldots \amalg U^{0}
$$

Let $P^{i}$ be the closure of $U^{i}$. Let $\pi^{i}: P^{i} \rightarrow X$ be the restriction of $\pi$ to $P^{i}$. Let $\alpha \in A_{k+r-1}(P)$. By Lemma 41.31.1 we can write $\left.\alpha\right|_{U^{r-1}}=\left.\pi^{*} \alpha_{0}\right|_{U^{r-1}}$ for some $\alpha_{0} \in A_{k}(X)$. Hence the difference $\alpha-\pi^{*} \alpha_{0}$ is the image of some $\alpha^{\prime} \in$ $A_{k+r-1}\left(P^{r-2}\right)$. By Lemma 41.31.1 again we can write $\left.\alpha^{\prime}\right|_{U^{r-2}}=\left.\left(\pi^{r-2}\right)^{*} \alpha_{1}\right|_{U^{r-2}}$ for some $\alpha_{1} \in A_{k+1}(X)$. By Lemma 41.30.1 we see that the image of $\left(\pi^{r-2}\right)^{*} \alpha_{1}$ represents $c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha_{1}$. We also see that $\alpha-\pi^{*} \alpha_{0}-c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha_{1}$ is the image of some $\alpha^{\prime \prime} \in A_{k+r-1}\left(P^{r-3}\right)$. And so on.
02TY Lemma 41.33.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rankr on $X$. Let

$$
p: E=\underline{\operatorname{Spec}}\left(\operatorname{Sym}^{*}(\mathcal{E})\right) \longrightarrow X
$$

be the associated vector bundle over $X$. Then $p^{*}: A_{k}(X) \rightarrow A_{k+r}(E)$ is an isomorphism for all $k$.

Proof. (For the case of linebundles, see Lemma 41.31.2.) For surjectivity see Lemma 41.31.1. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective space bundle associated to the finite locally free sheaf $\mathcal{E} \oplus \mathcal{O}_{X}$. Let $s \in \Gamma\left(P, \mathcal{O}_{P}(1)\right)$ correspond to the global section $(0,1) \in \Gamma\left(X, \mathcal{E} \oplus \mathcal{O}_{X}\right)$. Let $D=Z(s) \subset P$. Note that $\left(\left.\pi\right|_{D}: D \rightarrow X,\left.\mathcal{O}_{P}(1)\right|_{D}\right)$ is the projective space bundle associated to $\mathcal{E}$. We denote
$\pi_{D}=\left.\pi\right|_{D}$ and $\mathcal{O}_{D}(1)=\left.\mathcal{O}_{P}(1)\right|_{D}$. Moreover, $D$ is an effective Cartier divisor on $P$. Hence $\mathcal{O}_{P}(D)=\mathcal{O}_{P}(1)$ (see Divisors, Lemma 30.11.21). Also there is an isomorphism $E \cong P \backslash D$. Denote $j: E \rightarrow P$ the corresponding open immersion. For injectivity we use that the kernel of

$$
j^{*}: A_{k+r}(P) \longrightarrow A_{k+r}(E)
$$

are the cycles supported in the effective Cartier divisor $D$, see Lemma 41.20.2. So if $p^{*} \alpha=0$, then $\pi^{*} \alpha=i_{*} \beta$ for some $\beta \in A_{k+r}(D)$. By Lemma 41.33.2 we may write

$$
\beta=\pi_{D}^{*} \beta_{0}+\ldots+c_{1}\left(\mathcal{O}_{D}(1)\right)^{r-1} \cap \pi_{D}^{*} \beta_{r-1}
$$

for some $\beta_{i} \in A_{k+i}(X)$. By Lemmas 41.30.1 and 41.25.3 this implies

$$
\pi^{*} \alpha=i_{*} \beta=c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \beta_{0}+\ldots+c_{1}\left(\mathcal{O}_{D}(1)\right)^{r} \cap \pi^{*} \beta_{r-1}
$$

Since the rank of $\mathcal{E} \oplus \mathcal{O}_{X}$ is $r+1$ this contradicts Lemma 41.25.3 unless all $\alpha$ and all $\beta_{i}$ are zero.

### 41.34. The Chern classes of a vector bundle

02 TZ We can use the projective space bundle formula to define the chern classes of a rank $r$ vector bundle in terms of the expansion of $c_{1}(\mathcal{O}(1))^{r}$ in terms of the lower powers, see formula 41.34.1.1). The reason for the signs will be explained later.
02U0 Definition 41.34.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $n=\operatorname{dim}_{\delta}(X)$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective space bundle associated to $\mathcal{E}$.
(1) By Lemma 41.33.2 there are elements $c_{i} \in A_{n-i}(X), i=0, \ldots, r$ such that $c_{0}=[X]$, and

$$
\begin{equation*}
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*} c_{r-i}=0 \tag{41.34.1.1}
\end{equation*}
$$

(2) With notation as above we set $c_{i}(\mathcal{E}) \cap[X]=c_{i}$ as an element of $A_{n-i}(X)$. We call these the chern classes of $\mathcal{E}$ on $X$.
(3) The total chern class of $\mathcal{E}$ on $X$ is the combination

$$
c(\mathcal{E}) \cap[X]=c_{0}(\mathcal{E}) \cap[X]+c_{1}(\mathcal{E}) \cap[X]+\ldots+c_{r}(\mathcal{E}) \cap[X]
$$

which is an element of $A_{*}(X)=\bigoplus_{k \in \mathbf{Z}} A_{k}(X)$.
Let us check that this does not give a new notion in case the vector bundle has rank 1 .
02U2 Lemma 41.34.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ is integral and $n=\operatorname{dim}_{\delta}(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}{ }^{-}$ module. The first chern class of $\mathcal{L}$ on $X$ of Definition 41.34.1 is equal to the Weil divisor associated to $\mathcal{L}$ by Definition 41.23.1.
Proof. In this proof we use $c_{1}(\mathcal{L}) \cap[X]$ to denote the construction of Definition 41.23.1. Since $\mathcal{L}$ has rank 1 we have $\mathbf{P}(\mathcal{L})=X$ and $\mathcal{O}_{\mathbf{P}(\mathcal{L})}(1)=\mathcal{L}$ by our normalizations. Hence 41.34.1.1 reads

$$
(-1)^{1} c_{1}(\mathcal{L}) \cap c_{0}+(-1)^{0} c_{1}=0
$$

Since $c_{0}=[X]$, we conclude $c_{1}=c_{1}(\mathcal{L}) \cap[X]$ as desired.

02U3 Remark 41.34.3. We could also rewrite equation 41.34.1.1 as
05M8

$$
\begin{equation*}
\sum_{i=0}^{r} c_{1}\left(\mathcal{O}_{P}(-1)\right)^{i} \cap \pi^{*} c_{r-i}=0 \tag{41.34.3.1}
\end{equation*}
$$

but we find it easier to work with the tautological quotient sheaf $\mathcal{O}_{P}(1)$ instead of its dual.

### 41.35. Intersecting with chern classes

02U4 In this section we study the operation of capping with chern classes of vector bundles. Our definition follows the familiar pattern of first defining the operation on prime cycles and then summing, but in Lemma 41.35 .2 we show that the result is determined by the usual formula on the associated projective bundle.
02U5 Definition 41.35.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. We define, for every integer $k$ and any $0 \leq j \leq r$, an operation

$$
c_{j}(\mathcal{E}) \cap-: Z_{k}(X) \rightarrow A_{k-j}(X)
$$

called intersection with the $j$ th chern class of $\mathcal{E}$.
(1) Given an integral closed subscheme $i: W \rightarrow X$ of $\delta$-dimension $k$ we define

$$
c_{j}(\mathcal{E}) \cap[W]=i_{*}\left(c_{j}\left(i^{*} \mathcal{E}\right) \cap[W]\right) \in A_{k-j}(X)
$$

where $c_{j}\left(i^{*} \mathcal{E}\right) \cap[W]$ is as defined in Definition 41.34.1.
(2) For a general $k$-cycle $\alpha=\sum n_{i}\left[W_{i}\right]$ we set

$$
c_{j}(\mathcal{E}) \cap \alpha=\sum n_{i} c_{j}(\mathcal{E}) \cap\left[W_{i}\right]
$$

Again, if $\mathcal{E}$ has rank 1 then this agrees with our previous definition.
02U6 Lemma 41.35.2. Let $(S, \delta)$ be as in Situation41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ be the projective bundle associated to $\mathcal{E}$. For $\alpha \in Z_{k}(X)$ the elements $c_{j}(\mathcal{E}) \cap \alpha$ are the unique elements $\alpha_{j}$ of $A_{k-j}(X)$ such that $\alpha_{0}=\alpha$ and

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(\alpha_{r-i}\right)=0
$$

holds in the Chow group of $P$.
Proof. The uniqueness of $\alpha_{0}, \ldots, \alpha_{r}$ such that $\alpha_{0}=\alpha$ and such that the displayed equation holds follows from the projective space bundle formula Lemma 41.33.2. The identity holds by definition for $\alpha=[W]$ where $W$ is an integral closed subscheme of $X$. For a general $k$-cycle $\alpha$ on $X$ write $\alpha=\sum n_{a}\left[W_{a}\right]$ with $n_{a} \neq 0$, and $i_{a}: W_{a} \rightarrow X$ pairwise distinct integral closed subschemes. Then the family $\left\{W_{a}\right\}$ is locally finite on $X$. Set $P_{a}=\pi^{-1}\left(W_{a}\right)=\mathbf{P}\left(\left.\mathcal{E}\right|_{W_{a}}\right)$. Denote $i_{a}^{\prime}: P_{a} \rightarrow P$ the corresponding closed immersions. Consider the fibre product diagram

The morphism $p: X^{\prime} \rightarrow X$ is proper. Moreover $\pi^{\prime}: P^{\prime} \rightarrow X^{\prime}$ together with the invertible sheaf $\mathcal{O}_{P^{\prime}}(1)=\coprod \mathcal{O}_{P_{a}}(1)$ which is also the pullback of $\mathcal{O}_{P}(1)$ is the projective bundle associated to $\mathcal{E}^{\prime}=p^{*} \mathcal{E}$. By definition

$$
c_{j}(\mathcal{E}) \cap[\alpha]=\sum i_{a, *}\left(c_{j}\left(\left.\mathcal{E}\right|_{W_{a}}\right) \cap\left[W_{a}\right]\right)
$$

Write $\beta_{a, j}=c_{j}\left(\left.\mathcal{E}\right|_{W_{a}}\right) \cap\left[W_{a}\right]$ which is an element of $A_{k-j}\left(W_{a}\right)$. We have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P_{a}}(1)\right)^{i} \cap \pi_{a}^{*}\left(\beta_{a, r-i}\right)=0
$$

for each $a$ by definition. Thus clearly we have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P^{\prime}}(1)\right)^{i} \cap\left(\pi^{\prime}\right)^{*}\left(\beta_{r-i}\right)=0
$$

with $\beta_{j}=\sum n_{a} \beta_{a, j} \in A_{k-j}\left(X^{\prime}\right)$. Denote $p^{\prime}: P^{\prime} \rightarrow P$ the morphism $\coprod i_{a}^{\prime}$. We have $\pi^{*} p_{*} \beta_{j}=p_{*}^{\prime}\left(\pi^{\prime}\right)^{*} \beta_{j}$ by Lemma 41.16.1. By the projection formula of Lemma 41.25 .3 we conclude that

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(p_{*} \beta_{j}\right)=0
$$

Since $p_{*} \beta_{j}$ is a representative of $c_{j}(\mathcal{E}) \cap \alpha$ we win.
We will consistently use this characterization of chern classes to prove many more properties.

02U7 Lemma 41.35.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. If $\alpha \sim_{\text {rat }} \beta$ are rationally equivalent $k$-cycles on $X$ then $c_{j}(\mathcal{E}) \cap \alpha=c_{j}(\mathcal{E}) \cap \beta$ in $A_{k-j}(X)$.

Proof. By Lemma 41.35 .2 the elements $\alpha_{j}=c_{j}(\mathcal{E}) \cap \alpha, j \geq 1$ and $\beta_{j}=c_{j}(\mathcal{E}) \cap$ $\beta, j \geq 1$ are uniquely determined by the same equation in the chow group of the projective bundle associated to $\mathcal{E}$. (This of course relies on the fact that flat pullback is compatible with rational equivalence, see Lemma 41.21.1.) Hence they are equal.

In other words capping with chern classes of finite locally free sheaves factors through rational equivalence to give maps

$$
c_{j}(\mathcal{E}) \cap-: A_{k}(X) \rightarrow A_{k-j}(X) .
$$

Our next task is to show that chern classes are bivariant classes, see Definition 41.32 .1

02U9 Lemma 41.35.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. Let $p: X \rightarrow Y$ be a proper morphism. Let $\alpha$ be a $k$-cycle on $X$. Let $\mathcal{E}$ be a finite locally free sheaf on $Y$. Then

$$
p_{*}\left(c_{j}\left(p^{*} \mathcal{E}\right) \cap \alpha\right)=c_{j}(\mathcal{E}) \cap p_{*} \alpha
$$

Proof. Let $\left(\pi: P \rightarrow Y, \mathcal{O}_{P}(1)\right)$ be the projective bundle associated to $\mathcal{E}$. Then $P_{X}=X \times_{Y} P$ is the projective bundle associated to $p^{*} \mathcal{E}$ and $\mathcal{O}_{P_{X}}(1)$ is the pullback of $\mathcal{O}_{P}(1)$. Write $\alpha_{j}=c_{j}\left(p^{*} \mathcal{E}\right) \cap \alpha$, so $\alpha_{0}=\alpha$. By Lemma 41.35 .2 we have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi_{X}^{*}\left(\alpha_{r-i}\right)=0
$$

in the chow group of $P_{X}$. Consider the fibre product diagram

Apply proper pushforward $p_{*}^{\prime}$ (Lemma 41.21.2) to the displayed equality above. Using Lemmas 41.25.3 and 41.16.1 we obtain

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(p_{*} \alpha_{r-i}\right)=0
$$

in the chow group of $P$. By the characterization of Lemma 41.35.2 we conclude.
02U8 Lemma 41.35.5. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $Y$. Let $f: X \rightarrow Y$ be a flat morphism of relative dimension $r$. Let $\alpha$ be a $k$-cycle on $Y$. Then

$$
f^{*}\left(c_{j}(\mathcal{E}) \cap \alpha\right)=c_{j}\left(f^{*} \mathcal{E}\right) \cap f^{*} \alpha
$$

Proof. Write $\alpha_{j}=c_{j}(\mathcal{E}) \cap \alpha$, so $\alpha_{0}=\alpha$. By Lemma 41.35.2 we have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(\alpha_{r-i}\right)=0
$$

in the chow group of the projective bundle $\left(\pi: P \rightarrow Y, \mathcal{O}_{P}(1)\right)$ associated to $\mathcal{E}$. Consider the fibre product diagram

Note that $\mathcal{O}_{P_{X}}(1)$ is the pullback of $\mathcal{O}_{P}(1)$. Apply flat pullback $\left(f^{\prime}\right)^{*}$ (Lemma 41.21 .1 to the displayed equation above. By Lemmas 41.25.1 and 41.15.3 we see that

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P_{X}}(1)\right)^{i} \cap \pi_{X}^{*}\left(f^{*} \alpha_{r-i}\right)=0
$$

holds in the chow group of $P_{X}$. By the characterization of Lemma 41.35 .2 we conclude.

0B7G Lemma 41.35.6. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. Let $(\mathcal{L}, s, i: D \rightarrow X)$ be as in Definition 41.28.1. Then $c_{j}\left(\left.\mathcal{E}\right|_{D}\right) \cap i^{*} \alpha=i^{*}\left(c_{j}(\mathcal{E}) \cap \alpha\right)$ for all $\alpha \in A_{k}(X)$.

Proof. Write $\alpha_{j}=c_{j}(\mathcal{E}) \cap \alpha$, so $\alpha_{0}=\alpha$. By Lemma 41.35.2 we have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(\alpha_{r-i}\right)=0
$$

in the chow group of the projective bundle $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ associated to $\mathcal{E}$. Consider the fibre product diagram

Note that $\mathcal{O}_{P_{D}}(1)$ is the pullback of $\mathcal{O}_{P}(1)$. Apply the gysin map $\left(i^{\prime}\right)^{*}$ (Lemma 41.29 .2 to the displayed equation above. Applying Lemmas 41.29 .3 and 41.28 .8 we obtain

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P_{D}}(1)\right)^{i} \cap \pi_{D}^{*}\left(i^{*} \alpha_{r-i}\right)=0
$$

in the chow group of $P_{D}$. By the characterization of Lemma 41.35.2 we conclude.

At this point we have enough material to be able to prove that capping with chern classes defines a bivariant class.

0B7H Lemma 41.35.7. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of rank $r$. Let $0 \leq p \leq r$. Then the rule that to $f: X^{\prime} \rightarrow X$ assignes $c_{p}\left(f^{*} \mathcal{E}\right) \cap-: A_{k}\left(X^{\prime}\right) \rightarrow A_{k-1}\left(X^{\prime}\right)$ is a bivariant class of degree $p$.

Proof. Immediate from Lemmas 41.35.3, 41.35.4, 41.35.5, and 41.35.6 and Definition 41.32.1.

Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of rank $r$. At this point we define the chern classes of $\mathcal{E}$ to be the elements

$$
c_{j}(\mathcal{E}) \in A^{j}(X)
$$

constructed in Lemma 41.35.7. The total chern class of $\mathcal{E}$ is the element

$$
c(\mathcal{E})=c_{0}(\mathcal{E})+c_{1}(\mathcal{E})+\ldots+c_{r}(\mathcal{E}) \in A^{*}(X)
$$

Next we see that chern classes are in the center of the bivariant Chow cohomology ring $A^{*}(X)$.

02UA Lemma 41.35.8. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of rank $r$. Then $c_{j}(\mathcal{L}) \in A^{j}(X)$ commutes with every element $c \in A^{p}(X)$. In particular, if $\mathcal{F}$ is a second locally free $\mathcal{O}_{X}$-module on $X$ of rank $s$, then

$$
c_{i}(\mathcal{E}) \cap c_{j}(\mathcal{F}) \cap \alpha=c_{j}(\mathcal{F}) \cap c_{i}(\mathcal{E}) \cap \alpha
$$

as elements of $A_{k-i-j}(X)$ for all $\alpha \in A_{k}(X)$.
Proof. Let $\alpha \in A_{k}(X)$. Write $\alpha_{j}=c_{j}(\mathcal{E}) \cap \alpha$, so $\alpha_{0}=\alpha$. By Lemma 41.35.2 we have

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(\alpha_{r-i}\right)=0
$$

in the chow group of the projective bundle $\left(\pi: P \rightarrow Y, \mathcal{O}_{P}(1)\right)$ associated to $\mathcal{E}$. Applying $c \cap-$ and using Lemma 41.32 .8 and the properties of bivariant classes we obtain

$$
\sum_{i=0}^{r}(-1)^{i} c_{1}\left(\mathcal{O}_{P}(1)\right)^{i} \cap \pi^{*}\left(c \cap \alpha_{r-i}\right)=0
$$

in the Chow group of $P$. Hence we see that $c \cap \alpha_{j}$ is equal to $c_{j}(\mathcal{E}) \cap(c \cap \alpha)$ by the characterization of Lemma 41.35.2. This proves the lemma.

### 41.36. Polynomial relations among chern classes

02UB Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}_{i}$ be a finite collection of finite locally free sheaves on $X$. By Lemma 41.35 .8 we see that the chern classes

$$
c_{j}\left(\mathcal{E}_{i}\right) \in A^{*}(X)
$$

generate a commutative (and even central) Z-subalgebra of the Chow cohomology algebra $A^{*}(X)$. Thus we can say what it means for a polynomial in these chern classes to be zero, or for two polynomials to be the same. As an example, saying that $c_{1}\left(\mathcal{E}_{1}\right)^{5}+c_{2}\left(\mathcal{E}_{2}\right) c_{3}\left(\mathcal{E}_{3}\right)=0$ means that the operations

$$
A_{k}(Y) \longrightarrow A_{k-5}(Y), \quad \alpha \longmapsto c_{1}\left(\mathcal{E}_{1}\right)^{5} \cap \alpha+c_{2}\left(\mathcal{E}_{2}\right) \cap c_{3}\left(\mathcal{E}_{3}\right) \cap \alpha
$$

are zero for all morphisms $f: Y \rightarrow X$ which are locally of finite type. By Lemma 41.32 .9 this is equivalent to the requirement that given any morphism $f: Y \rightarrow X$ where $Y$ is an integral scheme locally of finite type over $S$ the cycle

$$
c_{1}\left(\mathcal{E}_{1}\right)^{5} \cap[Y]+c_{2}\left(\mathcal{E}_{2}\right) \cap c_{3}\left(\mathcal{E}_{3}\right) \cap[Y]
$$

is zero in $A_{\operatorname{dim}(Y)-5}(Y)$.
A specific example is the relation

$$
c_{1}\left(\mathcal{L} \otimes_{\mathcal{O}_{X}} \mathcal{N}\right)=c_{1}(\mathcal{L})+c_{1}(\mathcal{N})
$$

proved in Lemma 41.24.2. More generally, here is what happens when we tensor an arbitrary locally free sheaf by an invertible sheaf.

02UD Lemma 41.36.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf of rank $r$ on $X$. Let $\mathcal{L}$ be an invertible sheaf on $X$. Then we have

02UE

$$
\begin{equation*}
c_{i}(\mathcal{E} \otimes \mathcal{L})=\sum_{j=0}^{i}\binom{r-i+j}{j} c_{i-j}(\mathcal{E}) c_{1}(\mathcal{L})^{j} \tag{41.36.1.1}
\end{equation*}
$$

in $A^{*}(X)$.
Proof. This should hold for any triple $(X, \mathcal{E}, \mathcal{L})$. In particular it should hold when $X$ is integral and by Lemma 41.32 .9 it is enough to prove it holds when capping with $[X]$ for such $X$. Thus assume that $X$ is integral. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$, resp. $\left(\pi^{\prime}: P^{\prime} \rightarrow X, \mathcal{O}_{P^{\prime}}(1)\right)$ be the projective space bundle associated to $\mathcal{E}$, resp. $\mathcal{E} \otimes \mathcal{L}$. Consider the canonical morphism

see Constructions, Lemma 26.20.1. It has the property that $g^{*} \mathcal{O}_{P^{\prime}}(1)=\mathcal{O}_{P}(1) \otimes$ $\pi^{*} \mathcal{L}$. This means that we have

$$
\sum_{i=0}^{r}(-1)^{i}(\xi+x)^{i} \cap \pi^{*}\left(c_{r-i}(\mathcal{E} \otimes \mathcal{L}) \cap[X]\right)=0
$$

in $A_{*}(P)$, where $\xi$ represents $c_{1}\left(\mathcal{O}_{P}(1)\right)$ and $x$ represents $c_{1}\left(\pi^{*} \mathcal{L}\right)$. By simple algebra this is equivalent to

$$
\sum_{i=0}^{r}(-1)^{i} \xi^{i}\left(\sum_{j=i}^{r}(-1)^{j-i}\binom{j}{i} x^{j-i} \cap \pi^{*}\left(c_{r-j}(\mathcal{E} \otimes \mathcal{L}) \cap[X]\right)\right)=0
$$

Comparing with Equation 41.34.1.1 it follows from this that

$$
c_{r-i}(\mathcal{E}) \cap[X]=\sum_{j=i}^{r}\binom{j}{i}\left(-c_{1}(\mathcal{L})\right)^{j-i} \cap c_{r-j}(\mathcal{E} \otimes \mathcal{L}) \cap[X]
$$

Reworking this (getting rid of minus signs, and renumbering) we get the desired relation.

Some example cases of 41.36.1.1 are

$$
\begin{aligned}
& c_{1}(\mathcal{E} \otimes \mathcal{L})=c_{1}(\mathcal{E})+r c_{1}(\mathcal{L}) \\
& c_{2}(\mathcal{E} \otimes \mathcal{L})=c_{2}(\mathcal{E})+(r-1) c_{1}(\mathcal{E}) c_{1}(\mathcal{L})+\binom{r}{2} c_{1}(\mathcal{L})^{2} \\
& c_{3}(\mathcal{E} \otimes \mathcal{L})=c_{3}(\mathcal{E})+(r-2) c_{2}(\mathcal{E}) c_{1}(\mathcal{L})+\binom{r-1}{2} c_{1}(\mathcal{E}) c_{1}(\mathcal{L})^{2}+\binom{r}{3} c_{1}(\mathcal{L})^{3}
\end{aligned}
$$

### 41.37. Additivity of chern classes

02UF All of the preliminary lemmas follow trivially from the final result.
02UG Lemma 41.37.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}, \mathcal{F}$ be finite locally free sheaves on $X$ of ranks $r, r-1$ which fit into a short exact sequence

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0
$$

Then we have

$$
c_{r}(\mathcal{E})=0, \quad c_{j}(\mathcal{E})=c_{j}(\mathcal{F}), \quad j=0, \ldots, r-1
$$

in $A^{*}(X)$.
Proof. By Lemma 41.32 .9 it suffices to show that if $X$ is integral then $c_{j}(\mathcal{E}) \cap[X]=$ $c_{j}(\mathcal{F}) \cap[X]$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$, resp. $\left(\pi^{\prime}: P^{\prime} \rightarrow X, \mathcal{O}_{P^{\prime}}(1)\right)$ denote the projective space bundle associated to $\mathcal{E}$, resp. $\mathcal{F}$. The surjection $\mathcal{E} \rightarrow \mathcal{F}$ gives rise to a closed immersion

$$
i: P^{\prime} \longrightarrow P
$$

over $X$. Moreover, the element $1 \in \Gamma\left(X, \mathcal{O}_{X}\right) \subset \Gamma(X, \mathcal{E})$ gives rise to a global section $s \in \Gamma\left(P, \mathcal{O}_{P}(1)\right)$ whose zero set is exactly $P^{\prime}$. Hence $P^{\prime}$ is an effective Cartier divisor on $P$ such that $\mathcal{O}_{P}\left(P^{\prime}\right) \cong \mathcal{O}_{P}(1)$. Hence we see that

$$
c_{1}\left(\mathcal{O}_{P}(1)\right) \cap \pi^{*} \alpha=i_{*}\left(\left(\pi^{\prime}\right)^{*} \alpha\right)
$$

for any cycle class $\alpha$ on $X$ by Lemma 41.30.1. By Lemma 41.35.2 we see that $\alpha_{j}=c_{j}(\mathcal{F}) \cap[X], j=0, \ldots, r-1$ satisfy

$$
\sum_{j=0}^{r-1}(-1)^{j} c_{1}\left(\mathcal{O}_{P^{\prime}}(1)\right)^{j} \cap\left(\pi^{\prime}\right)^{*} \alpha_{j}=0
$$

Pushing this to $P$ and using the remark above as well as Lemma 41.25.3 we get

$$
\sum_{j=0}^{r-1}(-1)^{j} c_{1}\left(\mathcal{O}_{P}(1)\right)^{j+1} \cap \pi^{*} \alpha_{j}=0
$$

By the uniqueness of Lemma 41.35 .2 we conclude that $c_{r}(\mathcal{E}) \cap[X]=0$ and $c_{j}(\mathcal{E}) \cap$ $[X]=\alpha_{j}=c_{j}(\mathcal{F}) \cap[X]$ for $j=0, \ldots, r-1$. Hence the lemma holds.

02UH Lemma 41.37.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{E}, \mathcal{F}$ be finite locally free sheaves on $X$ of ranks $r, r-1$ which fit into a short exact sequence

$$
0 \rightarrow \mathcal{L} \rightarrow \mathcal{E} \rightarrow \mathcal{F} \rightarrow 0
$$

where $\mathcal{L}$ is an invertible sheaf. Then

$$
c(\mathcal{E})=c(\mathcal{L}) c(\mathcal{F})
$$

in $A^{*}(X)$.
Proof. This relation really just says that $c_{i}(\mathcal{E})=c_{i}(\mathcal{F})+c_{1}(\mathcal{L}) c_{i-1}(\mathcal{F})$. By Lemma 41.37.1 we have $c_{j}\left(\mathcal{E} \otimes \mathcal{L}^{\otimes-1}\right)=c_{j}\left(\mathcal{E} \otimes \mathcal{L}^{\otimes-1}\right)$ for $j=0, \ldots, r$ (were we set $c_{r}(\mathcal{F})=0$ by convention). Applying Lemma 41.36.1 we deduce

$$
\sum_{j=0}^{i}\binom{r-i+j}{j}(-1)^{j} c_{i-j}(\mathcal{E}) c_{1}(\mathcal{L})^{j}=\sum_{j=0}^{i}\binom{r-1-i+j}{j}(-1)^{j} c_{i-j}(\mathcal{F}) c_{1}(\mathcal{L})^{j}
$$

Setting $c_{i}(\mathcal{E})=c_{i}(\mathcal{F})+c_{1}(\mathcal{L}) c_{i-1}(\mathcal{F})$ gives a "solution" of this equation. The lemma follows if we show that this is the only possible solution. We omit the verification.

02UI Lemma 41.37.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Suppose that $\mathcal{E}$ sits in an exact sequence

$$
0 \rightarrow \mathcal{E}_{1} \rightarrow \mathcal{E} \rightarrow \mathcal{E}_{2} \rightarrow 0
$$

of finite locally free sheaves $\mathcal{E}_{i}$ of rank $r_{i}$. The total chern classes satisfy

$$
c(\mathcal{E})=c\left(\mathcal{E}_{1}\right) c\left(\mathcal{E}_{2}\right)
$$

in $A^{*}(X)$.
Proof. By Lemma 41.32 .9 we may assume that $X$ is integral and we have to show the identity when capping against $[X]$. By induction on $r_{1}$. The case $r_{1}=1$ is Lemma 41.37.2 Assume $r_{1}>1$. Let $\left(\pi: P \rightarrow X, \mathcal{O}_{P}(1)\right)$ denote the projective space bundle associated to $\mathcal{E}_{1}$. Note that
(1) $\pi^{*}: A_{*}(X) \rightarrow A_{*}(P)$ is injective, and
(2) $\pi^{*} \mathcal{E}_{1}$ sits in a short exact sequence $0 \rightarrow \mathcal{F} \rightarrow \pi^{*} \mathcal{E}_{1} \rightarrow \mathcal{L} \rightarrow 0$ where $\mathcal{L}$ is invertible.
The first assertion follows from the projective space bundle formula and the second follows from the definition of a projective space bundle. (In fact $\mathcal{L}=\mathcal{O}_{P}(1)$.) Let $Q=\pi^{*} \mathcal{E} / \mathcal{F}$, which sits in an exact sequence $0 \rightarrow \mathcal{L} \rightarrow Q \rightarrow \pi^{*} \mathcal{E}_{2} \rightarrow 0$. By induction we have

$$
\begin{aligned}
c\left(\pi^{*} \mathcal{E}\right) \cap[P] & =c(\mathcal{F}) \cap c\left(\pi^{*} \mathcal{E} / \mathcal{F}\right) \cap[P] \\
& =c(\mathcal{F}) \cap c(\mathcal{L}) \cap c\left(\pi^{*} \mathcal{E}_{2}\right) \cap[P] \\
& =c\left(\pi^{*} \mathcal{E}_{1}\right) \cap c\left(\pi^{*} \mathcal{E}_{2}\right) \cap[P]
\end{aligned}
$$

Since $[P]=\pi^{*}[X]$ we win by Lemma 41.35.5.
02UJ Lemma 41.37.4. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}_{i}, i=1, \ldots, r$ be invertible $\mathcal{O}_{X}$-modules on $X$. Let $\mathcal{E}$ be a locally free rank $\mathcal{O}_{X}$-module endowed with a filtration

$$
0=\mathcal{E}_{0} \subset \mathcal{E}_{1} \subset \mathcal{E}_{2} \subset \ldots \subset \mathcal{E}_{r}=\mathcal{E}
$$

such that $\mathcal{E}_{i} / \mathcal{E}_{i-1} \cong \mathcal{L}_{i}$. Set $c_{1}\left(\mathcal{L}_{i}\right)=x_{i}$. Then

$$
c(\mathcal{E})=\prod_{i=1}^{r}\left(1+x_{i}\right)
$$

in $A^{*}(X)$.
Proof. Apply Lemma 41.37 .2 and induction.

### 41.38. The splitting principle

02UK In our setting it is not so easy to say what the splitting principle exactly says/is. Here is a possible formulation.
02UL Lemma 41.38.1. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S . L e t \mathcal{E}_{i}$ be a finite collection of locally free $\mathcal{O}_{X}$-modules of rank $r_{i}$. There exists a projective flat morphism $\pi: P \rightarrow X$ of relative dimension $d$ such that
(1) for any morphism $f: Y \rightarrow X$ the map $\pi_{Y}^{*}: A_{*}(Y) \rightarrow A_{*+d}\left(Y \times_{X} P\right)$ is injective, and
(2) each $\pi^{*} \mathcal{E}_{i}$ has a filtration whose successive quotients $\mathcal{L}_{i, 1}, \ldots, \mathcal{L}_{i, r_{i}}$ are invertible $\mathcal{O}_{P}$-modules.

Proof. Omitted. Hint: Use a composition of projective space bundles.
Let $(S, \delta), X$, and $\mathcal{E}_{i}$ be as in Lemma 41.38.1. The splitting principle refers to the practice of symbolically writing

$$
c\left(\mathcal{E}_{i}\right)=\prod\left(1+x_{i, j}\right)
$$

The symbols $x_{i, 1}, \ldots, x_{i, r_{i}}$ are called the Chern roots of $\mathcal{E}_{i}$. We think of $x_{i, j}$ as the first chern classes of some (unknown) invertible sheaves whose direct sum equals $\mathcal{E}_{i}$. The usefulness of the splitting principle comes from the assertion that in order to prove a polynomial relation among chern classes of the $\mathcal{E}_{i}$ it is enough to prove the corresponding relation among the chern roots.
Namely, let $\pi: P \rightarrow X$ be as in Lemma 41.38.1. Recall that there is a canonical Z-algebra map $\pi^{*}: A^{*}(X) \rightarrow A^{*}(P)$, see Remark 41.32.3. The injectivity of $\pi_{Y}^{*}$ on Chow groups for every $Y$ over $X$, implies that the map $\pi^{*}: A^{*}(X) \rightarrow A^{*}(P)$ is injective (details omitted). We have

$$
\pi^{*} c\left(\mathcal{E}_{i}\right)=\prod\left(1+c_{1}\left(\mathcal{L}_{i, j}\right)\right)
$$

by Lemma 41.37.4. Thus we may identify the chern roots $x_{i, j}$ with $c_{1}\left(\mathcal{L}_{i, j}\right)$ at least after applying the injective map $\pi^{*}: A^{*}(X) \rightarrow A^{*}(P)$.
To see how this works, it is best to give an example. Let us calculate the chern classes of the dual $\mathcal{E}^{\wedge}$ of a locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ of rank $r$. Note that if $\pi^{*} \mathcal{E}$ has a filtration with subquotients the invertible modules $\mathcal{L}_{1}, \ldots, \mathcal{L}_{r}$, then $\pi^{*} \mathcal{E}^{\wedge}$ has a filtration with subquotients invertible sheaves $\mathcal{L}_{r}^{-1}, \ldots, \mathcal{L}_{1}^{\otimes-1}$. Hence if $x_{i}$ are the chern roots of $\mathcal{E}$, in other words, if $x_{i}=c_{1}\left(\mathcal{L}_{i}\right)$, then the $-x_{i}$ are the chern roots of $\mathcal{E}^{\wedge}$ by Lemma 41.24.2. It follows that

$$
\pi^{*} c\left(\mathcal{E}^{\wedge}\right)=\prod\left(1-x_{i}\right)
$$

in $A^{*}(P)$ and hence by elementary algebra that

$$
c_{j}\left(\mathcal{E}^{\wedge}\right)=(-1)^{j} c_{j}(\mathcal{E})
$$

in $A^{*}(X)$ by the injectivity above.
It should be said here that in any application of the splitting principle it is no longer necessary to choose an actual $\pi: P \rightarrow X$ and to use the pullback map; it suffices to know that one exists. In a way this is an abuse of language, more than anything else. In the following paragraph we give an example.

Let us compute the chern classes of a tensor product of vector bundles. Namely, suppose that $\mathcal{E}, \mathcal{F}$ are finite locally free of ranks $r, s$. Write

$$
c(\mathcal{E})=\prod_{i=1}^{r}\left(1+x_{i}\right), \quad c(\mathcal{E})=\prod_{j=1}^{s}\left(1+y_{j}\right)
$$

where $x_{i}, y_{j}$ are the chern roots of $\mathcal{E}, \mathcal{F}$. Then we see that

$$
c\left(\mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{F}\right)=\prod_{i, j}\left(1+x_{i}+y_{j}\right)
$$

because if $\mathcal{E}$ is the direct sum of invertible sheaves $\mathcal{L}_{i}$ and $\mathcal{F}$ is the direct sum of invertible sheaves $\mathcal{N}_{j}$, then $\mathcal{E} \otimes \mathcal{F}$ is the direct sum of the invertible sheaves $\mathcal{L}_{i} \otimes \mathcal{N}_{j}$. Here are some examples of what this means in terms of chern classes

$$
\begin{gathered}
c_{1}(\mathcal{E} \otimes \mathcal{F})=r c_{1}(\mathcal{F})+s c_{1}(\mathcal{E}) \\
c_{2}(\mathcal{E} \otimes \mathcal{F})=r^{2} c_{2}(\mathcal{F})+r s c_{1}(\mathcal{F}) c_{1}(\mathcal{E})+s^{2} c_{2}(\mathcal{E})
\end{gathered}
$$

### 41.39. Chern classes and tensor product

02UM We define the Chern character of a finite locally free sheaf of rank $r$ to be the formal expression

$$
\operatorname{ch}(\mathcal{E})=\sum_{i=1}^{r} e^{x_{i}}
$$

if the $x_{i}$ are the chern roots of $\mathcal{E}$. Writing this in terms of chern classes $c_{i}=c_{i}(\mathcal{E})$ we see that
$\operatorname{ch}(\mathcal{E})=r+c_{1}+\frac{1}{2}\left(c_{1}^{2}-2 c_{2}\right)+\frac{1}{6}\left(c_{1}^{3}-3 c_{1} c_{2}+3 c_{3}\right)+\frac{1}{24}\left(c_{1}^{4}-4 c_{1}^{2} c_{2}+4 c_{1} c_{3}+2 c_{2}^{2}-4 c_{4}\right)+\ldots$
What does it mean that the coefficients are rational numbers? Well this simply means that we think of $c h_{j}(\mathcal{E})$ as an element of $A^{j}(X) \otimes \mathbf{Q}$. By the above we have in case of an exact sequence

$$
0 \rightarrow \mathcal{E}_{1} \rightarrow \mathcal{E} \rightarrow \mathcal{E}_{2} \rightarrow 0
$$

that

$$
\operatorname{ch}(\mathcal{E})=\operatorname{ch}\left(\mathcal{E}_{1}\right)+\operatorname{ch}\left(\mathcal{E}_{2}\right)
$$

in $A^{*}(X) \otimes \mathbf{Q}$. Using the Chern character we can express the compatibility of the chern classes and tensor product as follows:

$$
\operatorname{ch}\left(\mathcal{E}_{1} \otimes_{\mathcal{O}_{X}} \mathcal{E}_{2}\right)=\operatorname{ch}\left(\mathcal{E}_{1}\right) \operatorname{ch}\left(\mathcal{E}_{2}\right)
$$

in $A^{*}(X) \otimes \mathbf{Q}$. This follows directly from the discussion of the chern roots of the tensor product in the previous section.

### 41.40. Todd classes

02UN A final class associated to a vector bundle $\mathcal{E}$ of rank $r$ is its Todd class $\operatorname{Todd}(\mathcal{E})$. In terms of the chern roots $x_{1}, \ldots, x_{r}$ it is defined as

$$
\operatorname{Todd}(\mathcal{E})=\prod_{i=1}^{r} \frac{x_{i}}{1-e^{-x_{i}}}
$$

In terms of the chern classes $c_{i}=c_{i}(\mathcal{E})$ we have
$\operatorname{Todd}(\mathcal{E})=1+\frac{1}{2} c_{1}+\frac{1}{12}\left(c_{1}^{2}+c_{2}\right)+\frac{1}{24} c_{1} c_{2}+\frac{1}{720}\left(-c_{1}^{4}+4 c_{1}^{2} c_{2}+3 c_{2}^{2}+c_{1} c_{3}-c_{4}\right)+\ldots$
We have made the appropriate remarks about denominators in the previous section. It is the case that given an exact sequence

$$
0 \rightarrow \mathcal{E}_{1} \rightarrow \mathcal{E} \rightarrow \mathcal{E}_{2} \rightarrow 0
$$

we have

$$
\operatorname{Todd}(\mathcal{E})=\operatorname{Todd}\left(\mathcal{E}_{1}\right) \operatorname{Todd}\left(\mathcal{E}_{2}\right)
$$

### 41.41. Degrees of zero cycles

0AZ0 We start defining the degree of a zero cycle on a proper scheme over a field. One approach is to define it directly as in Lemma 41.41 .2 and then show it is well defined by Lemma 41.19.3. Instead we define it as follows.
0AZ1 Definition 41.41.1. Let $k$ be a field (Example 41.8.2). Let $p: X \rightarrow \operatorname{Spec}(k)$ be proper. The degree of a zero cycle on $X$ is given by proper pushforward

$$
p_{*}: A_{0}(X) \rightarrow A_{0}(\operatorname{Spec}(k))
$$

(Lemma 41.21.2) combined with the natural isomorphism $A_{0}(\operatorname{Spec}(k))=\mathbf{Z}$ which maps $[\operatorname{Spec}(k)$ ] to 1. Notation: $\operatorname{deg}(\alpha)$.
Let us spell this out further.
0AZ2 Lemma 41.41.2. Let $k$ be a field. Let $X$ be proper over $k$. Let $\alpha=\sum n_{i}\left[Z_{i}\right]$ be in $Z_{0}(X)$. Then

$$
\operatorname{deg}(\alpha)=\sum n_{i} \operatorname{deg}\left(Z_{i}\right)
$$

where $\operatorname{deg}\left(Z_{i}\right)$ is the degree of $Z_{i} \rightarrow \operatorname{Spec}(k)$, i.e., $\operatorname{deg}\left(Z_{i}\right)=\operatorname{dim}_{k} \Gamma\left(Z_{i}, \mathcal{O}_{Z_{i}}\right)$.
Proof. This is the definition of proper pushforward (Definition 41.13.1).
Next, we make the connection with degrees of vector bundles over 1-dimensional proper schemes over fields as defined in Varieties, Section 32.33 .
0AZ3 Lemma 41.41.3. Let $k$ be a field. Let $X$ be a proper scheme over $k$ of dimension $\leq 1$. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{X}$-module of constant rank. Then

$$
\operatorname{deg}(\mathcal{E})=\operatorname{deg}\left(c_{1}(\mathcal{E}) \cap[X]_{1}\right)
$$

where the left hand side is defined in Varieties, Definition 32.33.1.
Proof. Let $C_{i} \subset X, i=1, \ldots, t$ be the irreducible components of dimension 1 with reduced induced scheme structure and let $m_{i}$ be the multiplicity of $C_{i}$ in $X$. Then $[X]_{1}=\sum m_{i}\left[C_{i}\right]$ and $c_{1}(\mathcal{E}) \cap[X]_{1}$ is the sum of the pushforwards of the cycles $m_{i} c_{1}\left(\left.\mathcal{E}\right|_{C_{i}}\right) \cap\left[C_{i}\right]$. Since we have a similar decomposition of the degree of $\mathcal{E}$ by Varieties, Lemma 32.33 .6 it suffices to prove the lemma in case $X$ is a proper curve over $k$.

Assume $X$ is a proper curve over $k$. By Divisors, Lemma 30.29 .1 there exists a modification $f: X^{\prime} \rightarrow X$ such that $f^{*} \mathcal{E}$ has a filtration whose successive quotients are invertible $\mathcal{O}_{X^{\prime}}$-modules. Since $f_{*}\left[X^{\prime}\right]_{1}=[X]_{1}$ we conclude from Lemma 41.35.4 that

$$
\operatorname{deg}\left(c_{1}(\mathcal{E}) \cap[X]_{1}\right)=\operatorname{deg}\left(c_{1}\left(f^{*} \mathcal{E}\right) \cap\left[X^{\prime}\right]_{1}\right)
$$

Since we have a similar relationship for the degree by Varieties, Lemma 32.33.4 we reduce to the case where $\mathcal{E}$ has a filtration whose successive quotients are invertible $\mathcal{O}_{X}$-modules. In this case, we may use additivity of the degree (Varieties, Lemma 32.33.3) and of first chern classes (Lemma 41.37.3) to reduce to the case discussed in the next paragraph.

Assume $X$ is a proper curve over $k$ and $\mathcal{E}$ is an invertible $\mathcal{O}_{X}$-module. By Divisors, Lemma 30.12 .10 we see that $\mathcal{E}$ is isomorphic to $\mathcal{O}_{X}(D) \otimes \mathcal{O}_{X}\left(D^{\prime}\right)^{\otimes-1}$ for some effective Cartier divisors $D, D^{\prime}$ on $X$ (this also uses that $X$ is projective, see Varieties, Lemma 32.32 .4 for example). By additivity of degree under tensor product of invertible sheaves (Varieties, Lemma 32.33.7) and additivity of $c_{1}$ under tensor product of invertible sheaves (Lemma 41.24.2 or 41.36.1) we reduce to the case $\mathcal{E}=\mathcal{O}_{X}(D)$. In this case the left hand side gives $\operatorname{deg}(D)$ (Varieties, Lemma 32.33.8 and the right hand side gives $\operatorname{deg}\left([D]_{0}\right)$ by Lemma 41.24.3. Since

$$
[D]_{0}=\sum_{x \in D} \operatorname{length}_{\mathcal{O}_{X, x}}\left(\mathcal{O}_{D, x}\right)[x]=\sum_{x \in D} \operatorname{length}_{\mathcal{O}_{D, x}}\left(\mathcal{O}_{D, x}\right)[x]
$$

by definition, we see

$$
\operatorname{deg}\left([D]_{0}\right)=\sum_{x \in D} \operatorname{length}_{\mathcal{O}_{D, x}}\left(\mathcal{O}_{D, x}\right)[\kappa(x): k]=\operatorname{dim}_{k} \Gamma\left(D, \mathcal{O}_{D}\right)=\operatorname{deg}(D)
$$

The penultimate equality by Algebra, Lemma 10.51 .12 using that $D$ is affine.
Finally, we can tie everything up with the numerical intersections defined in Varieties, Section 32.34.

0BFI Lemma 41.41.4. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $Z \subset X$ be a closed subscheme of dimension $d$. Let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{d}$ be invertible $\mathcal{O}_{X}$-modules. Then

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)=\operatorname{deg}\left(c_{1}\left(\mathcal{L}_{1}\right) \cap \ldots \cap c_{1}\left(\mathcal{L}_{1}\right) \cap[Z]_{d}\right)
$$

where the left hand side is defined in Varieties, Definition 32.34.3. In particular,

$$
\operatorname{deg}_{\mathcal{L}}(Z)=\operatorname{deg}\left(c_{1}(\mathcal{L})^{d} \cap[Z]_{d}\right)
$$

if $\mathcal{L}$ is an ample invertible $\mathcal{O}_{X}$-module.
Proof. We will prove this by induction on $d$. If $d=0$, then the result is true by Varieties, Lemma 32.26.3. Assume $d>0$.
Let $Z_{i} \subset Z, i=1, \ldots, t$ be the irreducible components of dimension $d$ with reduced induced scheme structure and let $m_{i}$ be the multiplicity of $Z_{i}$ in $Z$. Then $[Z]_{d}=$ $\sum m_{i}\left[Z_{i}\right]$ and $c_{1}\left(\mathcal{L}_{1}\right) \cap \ldots \cap c_{1}\left(\mathcal{L}_{d}\right) \cap[Z]_{d}$ is the sum of the cycles $m_{i} c_{1}\left(\mathcal{L}_{1}\right) \cap \ldots \cap$ $c_{1}\left(\mathcal{L}_{d}\right) \cap\left[Z_{i}\right]$. Since we have a similar decomposition for $\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)$ by Varieties, Lemma 32.34 .2 it suffices to prove the lemma in case $Z=X$ is a proper variety of dimension $d$ over $k$.
By Chow's lemma there exists a birational proper morphism $f: Y \rightarrow X$ with $Y$ H-projective over $k$. See Cohomology of Schemes, Lemma 29.17.1 and Remark 29.17.2. Then

$$
\left(f^{*} \mathcal{L}_{1} \cdots f^{*} \mathcal{L}_{d} \cdot Y\right)=\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot X\right)
$$

by Varieties, Lemma 32.34.7 and we have

$$
f_{*}\left(c_{1}\left(f^{*} \mathcal{L}_{1}\right) \cap \ldots \cap c_{1}\left(f^{*} \mathcal{L}_{d}\right) \cap[Y]\right)=c_{1}\left(\mathcal{L}_{1}\right) \cap \ldots \cap c_{1}\left(\mathcal{L}_{d}\right) \cap[X]
$$

by Lemma 41.25.3. Thus we may replace $X$ by $Y$ and assume that $X$ is projective over $k$.

If $X$ is a proper $d$-dimensional projective variety, then we can write $\mathcal{L}_{1}=\mathcal{O}_{X}(D) \otimes$ $\mathcal{O}_{X}\left(D^{\prime}\right)^{\otimes-1}$ for some effective Cartier divisors $D, D^{\prime} \subset X$ by Divisors, Lemma 30.12.10. By additivity for both sides of the equation (Varieties, Lemma 32.34.5 and Lemma 41.24.2 we reduce to the case $\mathcal{L}_{1}=\mathcal{O}_{X}(D)$ for some effective Cartier divisor $D$. By Varieties, Lemma 32.34.8 we have

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot X\right)=\left(\mathcal{L}_{2} \cdots \mathcal{L}_{d} \cdot D\right)
$$

and by Lemma 41.24 .3 we have

$$
c_{1}\left(\mathcal{L}_{1}\right) \cap \ldots \cap c_{1}\left(\mathcal{L}_{d}\right) \cap[X]=c_{1}\left(\mathcal{L}_{2}\right) \cap \ldots \cap c_{1}\left(\mathcal{L}_{d}\right) \cap[D]_{d-1}
$$

Thus we obtain the result from our induction hypothesis.

### 41.42. Grothendieck-Riemann-Roch

02 UO Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $\mathcal{E}$ be a finite locally free sheaf $\mathcal{E}$ on $X$ of rank $r$. Let $f: X \rightarrow Y$ be a proper smooth morphism. Assume that $R^{i} f_{*} \mathcal{E}$ are locally free sheaves on $Y$ of finite rank. The Grothendieck-Riemann-Roch theorem say in this case that

$$
f_{*}\left(\operatorname{Todd}\left(T_{X / Y}\right) \operatorname{ch}(\mathcal{E})\right)=\sum(-1)^{i} \operatorname{ch}\left(R^{i} f_{*} \mathcal{E}\right)
$$

Here

$$
T_{X / Y}=\mathcal{H o m}_{\mathcal{O}_{X}}\left(\Omega_{X / Y}, \mathcal{O}_{X}\right)
$$

is the relative tangent bundle of $X$ over $Y$. If $Y=\operatorname{Spec}(k)$ where $k$ is a field, then we can restate this as

$$
\chi(X, \mathcal{E})=\operatorname{deg}\left(\operatorname{Todd}\left(T_{X / k}\right) \operatorname{ch}(\mathcal{E})\right)
$$

The theorem is more general and becomes easier to prove when formulated in correct generality. We will return to this elsewhere (insert future reference here).

### 41.43. Appendix

0AYD In this appendix we present some alternative approaches to the material explained above.

02S7 41.43.1. Rational equivalence and K-groups. In this section we compare the cycle groups $Z_{k}(X)$ and the Chow groups $A_{k}(X)$ with certain $K_{0}$-groups of abelian categories of coherent sheaves on $X$. We avoid having to talk about $K_{1}(\mathcal{A})$ for an abelian category $\mathcal{A}$ by dint of Homology, Lemma 12.10.3. In particular, the motivation for the precise form of Lemma 41.43.5 is that lemma.

Let us introduce the following notation. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. We denote $\operatorname{Coh}(X)=\operatorname{Coh}\left(\mathcal{O}_{X}\right)$ the category of coherent sheaves on $X$. It is an abelian category, see Cohomology of Schemes, Lemma 29.9.2. For any $k \in \mathbf{Z}$ we let $\operatorname{Coh}_{\leq k}(X)$ be the full subcategory of $\operatorname{Coh}(X)$ consisting of those coherent sheaves $\mathcal{F}$ having $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k$.

02S8 Lemma 41.43.2. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. The categories $\operatorname{Coh}_{\leq k}(X)$ are Serre subcategories of the abelian category $\operatorname{Coh}(X)$.
Proof. Omitted. The definition of a Serre subcategory is Homology, Definition 12.9.1.

02S9 Lemma 41.43.3. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. There are maps

$$
Z_{k}(X) \longrightarrow K_{0}\left(\operatorname{Coh}_{\leq k}(X) / \operatorname{Coh}_{\leq k-1}(X)\right) \longrightarrow Z_{k}(X)
$$

whose composition is the identity. The first is the map

$$
\sum n_{Z}[Z] \mapsto\left[\bigoplus_{n_{Z}>0} \mathcal{O}_{Z}^{\oplus n_{Z}}\right]-\left[\bigoplus_{n_{Z}<0} \mathcal{O}_{Z}^{\oplus-n_{Z}}\right]
$$

and the second comes from the map $\mathcal{F} \mapsto[\mathcal{F}]_{k}$. If $X$ is quasi-compact, then both maps are isomorphisms.
Proof. Note that the direct sum $\bigoplus_{n_{Z}>0} \mathcal{O}_{Z}^{\oplus n_{Z}}$ is indeed a coherent sheaf on $X$ since the family $\left\{Z \mid n_{Z}>0\right\}$ is locally finite on $X$. The map $\mathcal{F} \rightarrow[\mathcal{F}]_{k}$ is additive on $C o h_{\leq k}(X)$, see Lemma 41.11.4. And $[\mathcal{F}]_{k}=0$ if $\mathcal{F} \in C o h_{\leq k-1}(X)$. This implies we have the left map as shown in the lemma. It is clear that their composition is the identity.
In case $X$ is quasi-compact we will show that the right arrow is injective. Suppose that $q \in K_{0}\left(\operatorname{Coh}_{\leq k}(X) / \operatorname{Coh}_{\leq k+1}(X)\right)$ maps to zero in $Z_{k}(X)$. By Homology, Lemma 12.10 .3 we can find a $\tilde{q} \in K_{0}\left(\operatorname{Coh}_{\leq k}(X)\right)$ mapping to $q$. Write $\tilde{q}=[\mathcal{F}]-[\mathcal{G}]$ for some $\mathcal{F}, \mathcal{G} \in K_{0}\left(\operatorname{Coh}_{\leq k}(X)\right)$. Since $X$ is quasi-compact we may apply Cohomology of Schemes, Lemma 29.12.3. This shows that there exist integral closed subschemes $Z_{j}, T_{i} \subset X$ and (nonzero) ideal sheaves $\mathcal{I}_{j} \subset \mathcal{O}_{Z_{j}}, \mathcal{I}_{i} \subset \mathcal{O}_{T_{i}}$ such that $\mathcal{F}$, resp. $\mathcal{G}$ have filtrations whose successive quotients are the sheaves $\mathcal{I}_{j}$, resp. $\mathcal{I}_{i}$. In particular we see that $\operatorname{dim}_{\delta}\left(Z_{j}\right), \operatorname{dim}_{\delta}\left(T_{i}\right) \leq k$. In other words we have

$$
[\mathcal{F}]=\sum_{j}\left[\mathcal{I}_{j}\right], \quad[\mathcal{G}]=\sum_{i}\left[\mathcal{I}_{i}\right]
$$

in $K_{0}\left(\operatorname{Coh}_{\leq k}(X)\right)$. Our assumption is that $\sum_{j}\left[\mathcal{I}_{j}\right]_{k}-\sum_{i}\left[\mathcal{I}_{i}\right]_{k}=0$. It is clear that we may throw out the indices $j$, resp. $i$ such that $\operatorname{dim}_{\delta}\left(Z_{j}\right)<k$, resp. $\operatorname{dim}_{\delta}\left(T_{i}\right)<k$, since the corresponding sheaves are in $\operatorname{Coh}_{k-1}(X)$ and also do not contribute to the cycle. Moreover, the exact sequences $0 \rightarrow \mathcal{I}_{j} \rightarrow \mathcal{O}_{Z_{j}} \rightarrow \mathcal{O}_{Z_{j}} / \mathcal{I}_{j} \rightarrow 0$ and $0 \rightarrow \mathcal{I}_{i} \rightarrow \mathcal{O}_{T_{i}} \rightarrow \mathcal{O}_{Z_{i}} / \mathcal{I}_{i} \rightarrow 0$ show similarly that we may replace $\mathcal{I}_{j}$, resp. $\mathcal{I}_{i}$ by $\mathcal{O}_{Z_{j}}$, resp. $\mathcal{O}_{T_{i}}$. OK, and finally, at this point it is clear that our assumption

$$
\sum_{j}\left[\mathcal{O}_{Z_{j}}\right]_{k}-\sum_{i}\left[\mathcal{O}_{T_{i}}\right]_{k}=0
$$

implies that in $K_{0}\left(\operatorname{Coh}_{k}(X)\right)$ we have also $\sum_{j}\left[\mathcal{O}_{Z_{j}}\right]-\sum_{i}\left[\mathcal{O}_{T_{i}}\right]=0$ as desired.
02SA Remark 41.43.4. It seems likely that the arrows of Lemma 41.43.3 are not isomorphisms if $X$ is not quasi-compact. For example, suppose $X$ is an infinite disjoint union $X=\coprod_{n \in \mathbf{N}} \mathbf{P}_{k}^{1}$ over a field $k$. Let $\mathcal{F}$, resp. $\mathcal{G}$ be the coherent sheaf on $X$ whose restriction to the $n$th summand is equal to the skyscraper sheaf at 0 associated to $\mathcal{O}_{\mathbf{P}_{k}^{1}, 0} / \mathfrak{m}_{0}^{n}$, resp. $\kappa(0)^{\oplus n}$. The cycle associated to $\mathcal{F}$ is equal to the cycle associated to $\mathcal{G}$, namely both are equal to $\sum n\left[0_{n}\right]$ where $0_{n} \in X$ denotes 0 on the $n$th component of $X$. But there seems to be no way to show that $[\mathcal{F}]=[\mathcal{G}]$ in $K_{0}(\operatorname{Coh}(X))$ since any proof we can envision uses infinitely many relations.

02SB Lemma 41.43.5. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Let $\mathcal{F}$ be a coherent sheaf on X. Let

$$
\ldots \longrightarrow \mathcal{F} \xrightarrow{\varphi} \mathcal{F} \xrightarrow{\psi} \mathcal{F} \xrightarrow{\varphi} \mathcal{F} \longrightarrow \ldots
$$

be a complex as in Homology, Equation 12.10.2.1). Assume that
(1) $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{F})) \leq k+1$.
(2) $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(H^{i}(\mathcal{F}, \varphi, \psi)\right)\right) \leq k$ for $i=0,1$.

Then we have

$$
\left[H^{0}(\mathcal{F}, \varphi, \psi)\right]_{k} \sim_{r a t}\left[H^{1}(\mathcal{F}, \varphi, \psi)\right]_{k}
$$

as $k$-cycles on $X$.
Proof. Let $\left\{W_{j}\right\}_{j \in J}$ be the collection of irreducible components of $\operatorname{Supp}(\mathcal{F})$ which have $\delta$-dimension $k+1$. Note that $\left\{W_{j}\right\}$ is a locally finite collection of closed subsets of $X$ by Lemma 41.11.1. For every $j$, let $\xi_{j} \in W_{j}$ be the generic point. Set

$$
f_{j}=\operatorname{det}_{\kappa\left(\xi_{j}\right)}\left(\mathcal{F}_{\xi_{j}}, \varphi_{\xi_{j}}, \psi_{\xi_{j}}\right) \in R\left(W_{j}\right)^{*}
$$

See Definition 41.4.1 for notation. We claim that

$$
-\left[H^{0}(\mathcal{F}, \varphi, \psi)\right]_{k}+\left[H^{1}(\mathcal{F}, \varphi, \psi)\right]_{k}=\sum\left(W_{j} \rightarrow X\right)_{*} \operatorname{div}\left(f_{j}\right)
$$

If we prove this then the lemma follows.
Let $Z \subset X$ be an integral closed subscheme of $\delta$-dimension $k$. To prove the equality above it suffices to show that the coefficient $n$ of $[Z]$ in $\left[H^{0}(\mathcal{F}, \varphi, \psi)\right]_{k}-$ $\left[H^{1}(\mathcal{F}, \varphi, \psi)\right]_{k}$ is the same as the coefficient $m$ of $[Z]$ in $\sum\left(W_{j} \rightarrow X\right)_{*} \operatorname{div}\left(f_{j}\right)$. Let $\xi \in Z$ be the generic point. Consider the local ring $A=\mathcal{O}_{X, \xi}$. Let $M=\mathcal{F}_{\xi}$ as an $A$-module. Denote $\varphi, \psi: M \rightarrow M$ the action of $\varphi, \psi$ on the stalk. By our choice of $\xi \in Z$ we have $\delta(\xi)=k$ and hence $\operatorname{dim}(\operatorname{Supp}(M))=1$. Finally, the integral closed subschemes $W_{j}$ passing through $\xi$ correspond to the minimal primes $\mathfrak{q}_{i}$ of $\operatorname{Supp}(M)$. In each case the element $f_{j} \in R\left(W_{j}\right)^{*}$ corresponds to the element $\operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{\mathfrak{q}_{i}}, \varphi, \psi\right)$ in $\kappa\left(\mathfrak{q}_{i}\right)^{*}$. Hence we see that

$$
n=-e_{A}(M, \varphi, \psi)
$$

and

$$
m=\sum \operatorname{ord}_{A / \mathfrak{q}_{i}}\left(\operatorname{det}_{\kappa\left(\mathfrak{q}_{i}\right)}\left(M_{\mathfrak{q}_{i}}, \varphi, \psi\right)\right)
$$

Thus the result follows from Proposition 41.6.3.
02SC Lemma 41.43.6. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Denote $B_{k}(X)$ the image of the map

$$
K_{0}\left(\operatorname{Coh}_{\leq k}(X) / \operatorname{Coh}_{\leq k-1}(X)\right) \longrightarrow K_{0}\left(\operatorname{Coh}_{\leq k+1}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)
$$

There is a commutative diagram

where the left vertical arrow is the one from Lemma41.43.3. If $X$ is quasi-compact then both vertical arrows are isomorphisms.

Proof. Suppose we have an element $[A]-[B]$ of $K_{0}\left(\operatorname{Coh}_{\leq k}(X) / C o h_{\leq k-1}(X)\right)$ which maps to zero in $B_{k}(X)$, i.e., in $K_{0}\left(C o h_{\leq k+1}(X) / C o h_{\leq k-1}(X)\right)$. Suppose $[A]=[\mathcal{A}]$ and $[B]=[\mathcal{B}]$ for some coherent sheaves $\mathcal{A}, \mathcal{B}$ on $X$ supported in $\delta$-dimension $\leq k$. The assumption that $[A]-[B]$ maps to zero in the group $K_{0}\left(\operatorname{Coh}_{\leq k+1}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)$ means that there exists coherent sheaves $\mathcal{A}^{\prime}, \mathcal{B}^{\prime}$ on $X$ supported in $\delta$-dimension $\leq k-1$ such that $\left[\mathcal{A} \oplus \mathcal{A}^{\prime}\right]-\left[\mathcal{B} \oplus \mathcal{B}^{\prime}\right]$ is zero in $K_{0}\left(\operatorname{Coh}_{k+1}(X)\right)$ (use part (1) of Homology, Lemma 12.10.3). By part (2) of Homology, Lemma 12.10 .3 this means there exists a $(2,1)$-periodic complex $(\mathcal{F}, \varphi, \psi)$ in the category $\operatorname{Coh}_{\leq k+1}(X)$ such that $\mathcal{A} \oplus \mathcal{A}^{\prime}=H^{0}(\mathcal{F}, \varphi, \psi)$ and $\mathcal{B} \oplus \mathcal{B}^{\prime}=H^{1}(\mathcal{F}, \varphi, \psi)$. By Lemma 41.43.5 this implies that

$$
\left[\mathcal{A} \oplus \mathcal{A}^{\prime}\right]_{k} \sim_{r a t}\left[\mathcal{B} \oplus \mathcal{B}^{\prime}\right]_{k}
$$

This proves that $[A]-[B]$ maps to zero via the composition

$$
K_{0}\left(\operatorname{Coh}_{\leq k}(X) / \operatorname{Coh}_{\leq k-1}(X)\right) \longrightarrow Z_{k}(X) \longrightarrow A_{k}(X)
$$

In other words this proves the commutative diagram exists.
Next, assume that $X$ is quasi-compact. By Lemma 41.43 .3 the left vertical arrow is bijective. Hence it suffices to show any $\alpha \in Z_{k}(X)$ which is rationally equivalent to zero maps to zero in $B_{k}(X)$ via the inverse of the left vertical arrow composed with the horizontal arrow. By Lemma 41.22.1 we see that $\alpha=\sum\left(\left[\left(W_{i}\right)_{0}\right]_{k}-\left[\left(W_{i}\right)_{\infty}\right]_{k}\right)$ for some closed integral subschemes $W_{i} \subset X \times{ }_{S} \mathbf{P}_{S}^{1}$ of $\delta$-dimension $k+1$. Moreover the family $\left\{W_{i}\right\}$ is finite because $X$ is quasi-compact. Note that the ideal sheaves $\mathcal{I}_{i}, \mathcal{J}_{i} \subset \mathcal{O}_{W_{i}}$ of the effective Cartier divisors $\left(W_{i}\right)_{0},\left(W_{i}\right)_{\infty}$ are isomorphic (as $\mathcal{O}_{W_{i}}-$ modules). This is true because the ideal sheaves of $D_{0}$ and $D_{\infty}$ on $\mathbf{P}^{1}$ are isomorphic and $\mathcal{I}_{i}, \mathcal{J}_{i}$ are the pullbacks of these. (Some details omitted.) Hence we have short exact sequences

$$
0 \rightarrow \mathcal{I}_{i} \rightarrow \mathcal{O}_{W_{i}} \rightarrow \mathcal{O}_{\left(W_{i}\right)_{0}} \rightarrow 0, \quad 0 \rightarrow \mathcal{J}_{i} \rightarrow \mathcal{O}_{W_{i}} \rightarrow \mathcal{O}_{\left(W_{i}\right)_{\infty}} \rightarrow 0
$$

of coherent $\mathcal{O}_{W_{i}}$-modules. Also, since $\left[\left(W_{i}\right)_{0}\right]_{k}=\left[p_{*} \mathcal{O}_{\left(W_{i}\right)_{0}}\right]_{k}$ in $Z_{k}(X)$ we see that the inverse of the left vertical arrow maps $\left[\left(W_{i}\right)_{0}\right]_{k}$ to the element $\left[p_{*} \mathcal{O}_{\left(W_{i}\right)_{0}}\right.$ ] in $K_{0}\left(\operatorname{Coh}_{\leq k}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)$. Thus we have

$$
\begin{aligned}
\alpha & =\sum\left(\left[\left(W_{i}\right)_{0}\right]_{k}-\left[\left(W_{i}\right)_{\infty}\right]_{k}\right) \\
& \mapsto \sum\left(\left[p_{*} \mathcal{O}_{\left(W_{i}\right)_{0}}\right]-\left[p_{*} \mathcal{O}_{\left(W_{i}\right)_{\infty}}\right]\right) \\
& =\sum\left(\left[p_{*} \mathcal{O}_{W_{i}}\right]-\left[p_{*} \mathcal{I}_{i}\right]-\left[p_{*} \mathcal{O}_{W_{i}}\right]+\left[p_{*} \mathcal{J}_{i}\right]\right)
\end{aligned}
$$

in $K_{0}\left(\operatorname{Coh}_{\leq k+1}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)$. By what was said above this is zero, and we win.

Remark 41.43.7. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be a scheme locally of finite type over $S$. Assume $X$ is quasi-compact. The result of Lemma 41.43.6 in particular gives a map

$$
A_{k}(X) \longrightarrow K_{0}\left(\operatorname{Coh}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)
$$

We have not been able to find a statement or conjecture in the literature as to whether this map is should be injective or not. If $X$ is connected nonsingular, then, using the isomorphism $K_{0}(X)=K^{0}(X)$ (see insert future reference here) and chern classes (see below), one can show that the map is an isomorphism up to $(p-1)$ !-torsion where $p=\operatorname{dim}_{\delta}(X)-k$.

02SV 41.43.8. Cartier divisors and K-groups. In this section we describe how the intersection with the first chern class of an invertible sheaf $\mathcal{L}$ corresponds to tensoring with $\mathcal{L}-\mathcal{O}$ in $K$-groups.
02QH Lemma 41.43.9. Let $A$ be a Noetherian local ring. Let $M$ be a finite $A$-module. Let $a, b \in A$. Assume
(1) $\operatorname{dim}(A)=1$,
(2) both $a$ and $b$ are nonzerodivisors in $A$,
(3) A has no embedded primes,
(4) $M$ has no embedded associated primes,
(5) $\operatorname{Supp}(M)=\operatorname{Spec}(A)$.

Let $I=\{x \in A \mid x(a / b) \in A\}$. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ be the minimal primes of $A$. Then $(a / b) I M \subset M$ and

$$
\operatorname{length}_{A}(M /(a / b) I M)-\text { length }_{A}(M / I M)=\sum_{i} \text { length }_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right) \operatorname{ord}_{A / \mathfrak{q}_{i}}(a / b)
$$

Proof. Since $M$ has no embedded associated primes, and since the support of $M$ is $\operatorname{Spec}(A)$ we see that $\operatorname{Ass}(M)=\left\{\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$. Hence $a, b$ are nonzerodivisors on $M$. Note that

$$
\begin{aligned}
& \operatorname{length}_{A}(M /(a / b) I M) \\
& =\operatorname{length}_{A}(b M / a I M) \\
& =\operatorname{length}_{A}(M / a I M)-\operatorname{length}_{A}(M / b M) \\
& =\operatorname{length}_{A}(M / a M)+\operatorname{length}_{A}(a M / a I M)-\operatorname{length}_{A}(M / b M) \\
& =\operatorname{length}_{A}(M / a M)+\operatorname{length}_{A}(M / I M)-\operatorname{length}_{A}(M / b M)
\end{aligned}
$$

as the injective map $b: M \rightarrow b M$ maps $(a / b) I M$ to $a I M$ and the injective map $a: M \rightarrow a M$ maps $I M$ to $a I M$. Hence the left hand side of the equation of the lemma is equal to

$$
\operatorname{length}_{A}(M / a M)-\operatorname{length}_{A}(M / b M) .
$$

Applying the second formula of Algebra, Lemma 10.120 .11 with $x=a, b$ respectively and using Algebra, Definition 10.120 .2 of the ord-functions we get the result.

02SW Lemma 41.43.10. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Let $s \in \Gamma\left(X, \mathcal{K}_{X}(\mathcal{L})\right)$ be a meromorphic section of $\mathcal{L}$. Assume
(1) $\operatorname{dim}_{\delta}(X) \leq k+1$,
(2) $X$ has no embedded points,
(3) $\mathcal{F}$ has no embedded associated points,
(4) the support of $\mathcal{F}$ is $X$, and
(5) the section $s$ is regular meromorphic.

In this situation let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal of denominators of $s$, see Divisors, Definition 30.20.15. Then we have the following:
(1) there are short exact sequences

$$
\begin{array}{cccccccc}
0 & \rightarrow & \mathcal{I F} & \rightarrow & \mathcal{F} & \rightarrow & \mathcal{Q}_{1} & \rightarrow \\
0 \\
0 & \rightarrow & \mathcal{I F} & \rightarrow & \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L} & \rightarrow & \mathcal{Q}_{2} & \rightarrow \\
0
\end{array}
$$

(2) the coherent sheaves $\mathcal{Q}_{1}, \mathcal{Q}_{2}$ are supported in $\delta$-dimension $\leq k$,
(3) the section $s$ restricts to a regular meromorphic section $s_{i}$ on every irreducible component $X_{i}$ of $X$ of $\delta$-dimension $k+1$, and
(4) writing $[\mathcal{F}]_{k+1}=\sum m_{i}\left[X_{i}\right]$ we have

$$
\left[\mathcal{Q}_{2}\right]_{k}-\left[\mathcal{Q}_{1}\right]_{k}=\sum m_{i}\left(X_{i} \rightarrow X\right)_{*} \operatorname{div}_{\left.\mathcal{L}\right|_{X_{i}}}\left(s_{i}\right)
$$

in $Z_{k}(X)$, in particular

$$
\left[\mathcal{Q}_{2}\right]_{k}-\left[\mathcal{Q}_{1}\right]_{k}=c_{1}(\mathcal{L}) \cap[\mathcal{F}]_{k+1}
$$

in $A_{k}(X)$.
Proof. Recall from Divisors, Lemma 30.20 .16 the existence of injective maps 1: $\mathcal{I F} \rightarrow \mathcal{F}$ and $s: \mathcal{I F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}$ whose cokernels are supported on a closed nowhere dense subsets $T$. Denote $\mathcal{Q}_{i}$ there cokernels as in the lemma. We conclude that $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{Q}_{i}\right)\right) \leq k$. By Divisors, Lemmas 30.20 .4 and 30.20 .12 the pullbacks $s_{i}$ are defined and are regular meromorphic sections for $\left.\mathcal{L}\right|_{X_{i}}$. The equality of cycles in (4) implies the equality of cycle classes in (4). Hence the only remaining thing to show is that

$$
\left[\mathcal{Q}_{2}\right]_{k}-\left[\mathcal{Q}_{1}\right]_{k}=\sum m_{i}\left(X_{i} \rightarrow X\right)_{*} \operatorname{div}_{\left.\mathcal{L}\right|_{X_{i}}}\left(s_{i}\right)
$$

holds in $Z_{k}(X)$. To see this, let $Z \subset X$ be an integral closed subscheme of $\delta$ dimension $k$. Let $\xi \in Z$ be the generic point. Let $A=\mathcal{O}_{X, \xi}$ and $M=\mathcal{F}_{\xi}$. Moreover, choose a generator $s_{\xi} \in \mathcal{L}_{\xi}$. Then we can write $s=(a / b) s_{\xi}$ where $a, b \in A$ are nonzerodivisors. In this case $I=\mathcal{I}_{\xi}=\{x \in A \mid x(a / b) \in A\}$. In this case the coefficient of $[Z]$ in the left hand side is

$$
\operatorname{length}_{A}(M /(a / b) I M)-\operatorname{length}_{A}(M / I M)
$$

and the coefficient of $[Z]$ in the right hand side is

$$
\sum \operatorname{length}_{A_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right) \operatorname{ord}_{A / \mathfrak{q}_{i}}(a / b)
$$

where $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ are the minimal primes of the 1-dimensional local ring $A$. Hence the result follows from Lemma 41.43.9.

02SX Lemma 41.43.11. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Assume $\operatorname{dim}_{\delta}(\operatorname{Support}(\mathcal{F})) \leq k+1$. Then the element

$$
\left[\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-[\mathcal{F}] \in K_{0}\left(\operatorname{Coh}_{\leq k+1}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)
$$

lies in the subgroup $B_{k}(X)$ of Lemma 41.43 .6 and maps to the element $c_{1}(\mathcal{L}) \cap[\mathcal{F}]_{k+1}$ via the map $B_{k}(X) \rightarrow A_{k}(X)$.

Proof. Let

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow 0
$$

be the short exact sequence constructed in Divisors, Lemma 30.4.5. This in particular means that $\mathcal{F}^{\prime}$ has no embedded associated points. Since the support of $\mathcal{K}$ is nowhere dense in the support of $\mathcal{F}$ we see that $\operatorname{dim}_{\delta}(\operatorname{Supp}(\mathcal{K})) \leq k$. We may re-apply Divisors, Lemma 30.4.5 starting with $\mathcal{K}$ to get a short exact sequence

$$
0 \rightarrow \mathcal{K}^{\prime \prime} \rightarrow \mathcal{K} \rightarrow \mathcal{K}^{\prime} \rightarrow 0
$$

where now $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{K}^{\prime \prime}\right)\right)<k$ and $\mathcal{K}^{\prime}$ has no embedded associated points. Suppose we can prove the lemma for the coherent sheaves $\mathcal{F}^{\prime}$ and $\mathcal{K}^{\prime}$. Then we see from the equations

$$
[\mathcal{F}]_{k+1}=\left[\mathcal{F}^{\prime}\right]_{k+1}+\left[\mathcal{K}^{\prime}\right]_{k+1}+\left[\mathcal{K}^{\prime \prime}\right]_{k+1}
$$

(use Lemma 41.11.4),

$$
\left[\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-[\mathcal{F}]=\left[\mathcal{F}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-\left[\mathcal{F}^{\prime}\right]+\left[\mathcal{K}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-\left[\mathcal{K}^{\prime}\right]+\left[\mathcal{K}^{\prime \prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-\left[\mathcal{K}^{\prime \prime}\right]
$$

(use the $\otimes \mathcal{L}$ is exact) and the trivial vanishing of $\left[\mathcal{K}^{\prime \prime}\right]_{k+1}$ and $\left[\mathcal{K}^{\prime \prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-\left[\mathcal{K}^{\prime \prime}\right]$ in $K_{0}\left(C o h_{\leq k+1}(X) / C o h_{\leq k-1}(X)\right)$ that the result holds for $\mathcal{F}$. What this means is that we may assume that the sheaf $\mathcal{F}$ has no embedded associated points.
Assume $X, \mathcal{F}$ as in the lemma, and assume in addition that $\mathcal{F}$ has no embedded associated points. Consider the sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$, the corresponding closed subscheme $i: Z \rightarrow X$ and the coherent $\mathcal{O}_{Z}$-module $\mathcal{G}$ constructed in Divisors, Lemma 30.4.6. Recall that $Z$ is a locally Noetherian scheme without embedded points, $\mathcal{G}$ is a coherent sheaf without embedded associated points, with $\operatorname{Supp}(\mathcal{G})=$ $Z$ and such that $i_{*} \mathcal{G}=\mathcal{F}$. Moreover, set $\mathcal{N}=\left.\mathcal{L}\right|_{Z}$.

By Divisors, Lemma 30.20 .13 the invertible sheaf $\mathcal{N}$ has a regular meromorphic section $s$ over $Z$. Let us denote $\mathcal{J} \subset \mathcal{O}_{Z}$ the sheaf of denominators of $s$. By Lemma 41.43.10 there exist short exact sequences

$$
0
$$

such that $\operatorname{dim}_{\delta}\left(\operatorname{Supp}\left(\mathcal{Q}_{i}\right)\right) \leq k$ and such that the cycle $\left[\mathcal{Q}_{2}\right]_{k}-\left[\mathcal{Q}_{1}\right]_{k}$ is a representative of $c_{1}(\mathcal{N}) \cap[\mathcal{G}]_{k+1}$. We see (using the fact that $i_{*}(\mathcal{G} \otimes \mathcal{N})=\mathcal{F} \otimes \mathcal{L}$ by the projection formula, see Cohomology, Lemma 20.43.2 that

$$
\left[\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-[\mathcal{F}]=\left[i_{*} \mathcal{Q}_{2}\right]-\left[i_{*} \mathcal{Q}_{1}\right]
$$

in $K_{0}\left(\operatorname{Coh}_{\leq k+1}(X) / \operatorname{Coh}_{\leq k-1}(X)\right)$. This already shows that $\left[\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right]-[\mathcal{F}]$ is an element of $B_{k}(X)$. Moreover we have

$$
\begin{aligned}
{\left[i_{*} \mathcal{Q}_{2}\right]_{k}-\left[i_{*} \mathcal{Q}_{1}\right]_{k} } & =i_{*}\left(\left[\mathcal{Q}_{2}\right]_{k}-\left[\mathcal{Q}_{1}\right]_{k}\right) \\
& =i_{*}\left(c_{1}(\mathcal{N}) \cap[\mathcal{G}]_{k+1}\right) \\
& =c_{1}(\mathcal{L}) \cap i_{*}[\mathcal{G}]_{k+1} \\
& =c_{1}(\mathcal{L}) \cap[\mathcal{F}]_{k+1}
\end{aligned}
$$

by the above and Lemmas 41.25 .3 and 41.13.3. And this agree with the image of the element under $B_{k}(X) \rightarrow A_{k}(X)$ by definition. Hence the lemma is proved.

02SY 41.43.12. Blowing up lemmas. In this section we prove some lemmas on representing Cartier divisors by suitable effective Cartier divisors on blow-ups. These lemmas can be found in Ful98, Section 2.4]. We have adapted the formulation so they also work in the non-finite type setting. It may happen that the morphism $b$ of Lemma 41.43.19 is a composition of infinitely many blow ups, but over any given quasi-compact open $W \subset X$ one needs only finitely many blow-ups (and this is the result of loc. cit.).
02SZ Lemma 41.43.13. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X, Y$ be locally of finite type over $S$. Let $f: X \rightarrow Y$ be a proper morphism. Let $D \subset Y$ be an effective

Cartier divisor. Assume $X, Y$ integral, $n=\operatorname{dim}_{\delta}(X)=\operatorname{dim}_{\delta}(Y)$ and $f$ dominant. Then

$$
f_{*}\left[f^{-1}(D)\right]_{n-1}=[R(X): R(Y)][D]_{n-1}
$$

In particular if $f$ is birational then $f_{*}\left[f^{-1}(D)\right]_{n-1}=[D]_{n-1}$.
Proof. Immediate from Lemma 41.25 .2 and the fact that $D$ is the zero scheme of the canonical section $1_{D}$ of $\mathcal{O}_{X}(D)$.

02 T 0 Lemma 41.43.14. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral with $\operatorname{dim}_{\delta}(X)=n$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X^{-}}$ module. Let s be a nonzero meromorphic section of $\mathcal{L}$. Let $U \subset X$ be the maximal open subscheme such that $s$ corresponds to a section of $\mathcal{L}$ over $U$. There exists $a$ projective morphism

$$
\pi: X^{\prime} \longrightarrow X
$$

such that
(1) $X^{\prime}$ is integral,
(2) $\left.\pi\right|_{\pi^{-1}(U)}: \pi^{-1}(U) \rightarrow U$ is an isomorphism,
(3) there exist effective Cartier divisors $D, E \subset X^{\prime}$ such that

$$
\pi^{*} \mathcal{L}=\mathcal{O}_{X^{\prime}}(D-E)
$$

(4) the meromorphic section $s$ corresponds, via the isomorphism above, to the meromorphic section $1_{D} \otimes\left(1_{E}\right)^{-1}$ (see Divisors, Definition 30.11.14),
(5) we have

$$
\pi_{*}\left([D]_{n-1}-[E]_{n-1}\right)=\operatorname{div}_{\mathcal{L}}(s)
$$

in $Z_{n-1}(X)$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent ideal sheaf of denominators of $s$. Namely, we declare a local section $f$ of $\mathcal{O}_{X}$ to be a local section of $\mathcal{I}$ if and only if $f s$ is a local section of $\mathcal{L}$. On any affine open $U=\operatorname{Spec}(A)$ of $X$ write $\left.\mathcal{L}\right|_{U}=\widetilde{L}$ for some invertible $A$-module $L$. Then $A$ is a Noetherian domain with fraction field $K=R(X)$ and we may think of $\left.s\right|_{U}$ as an element of $L \otimes_{A} K$ (see Divisors, Lemma 30.20.7. Let $I=\{x \in A \mid x s \in L\}$. Then we see that $\left.\mathcal{I}\right|_{U}=\widetilde{I}$ (details omitted) and hence $\mathcal{I}$ is quasi-coherent.
Consider the closed subscheme $Z \subset X$ defined by $\mathcal{I}$. It is clear that $U=X \backslash Z$. This suggests we should blow up $Z$. Let

$$
\pi: X^{\prime}=\underline{\operatorname{Proj}}_{X}\left(\bigoplus_{n \geq 0} \mathcal{I}^{n}\right) \longrightarrow X
$$

be the blowing up of $X$ along $Z$. The quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras $\bigoplus_{n \geq 0} \mathcal{I}^{n}$ is generated in degree 1 over $\mathcal{O}_{X}$. Moreover, the degree 1 part is a coherent $\mathcal{O}_{X^{-}}$ module, in particular of finite type. Hence we see that $\pi$ is projective and $\mathcal{O}_{X^{\prime}}(1)$ is relatively very ample.
By Divisors, Lemma 30.26 .9 we have $X^{\prime}$ is integral. By Divisors, Lemma 30.26.4 there exists an effective Cartier divisor $E \subset X^{\prime}$ such that $\pi^{-1} \mathcal{I} \cdot \mathcal{O}_{X^{\prime}}=\mathcal{I}_{E}$. Also, by the same lemma we see that $\pi^{-1}(U) \cong U$.
Denote $s^{\prime}$ the pullback of the meromorphic section $s$ to a meromorphic section of $\mathcal{L}^{\prime}=\pi^{*} \mathcal{L}$ over $X^{\prime}$. It follows from the fact that $\mathcal{I} s \subset \mathcal{L}$ that $\mathcal{I}_{E} s^{\prime} \subset \mathcal{L}^{\prime}$. In other words, $s^{\prime}$ gives rise to an $\mathcal{O}_{X^{\prime}}$-linear map $\mathcal{I}_{E} \rightarrow \mathcal{L}^{\prime}$, or in other words a section $t \in \mathcal{L}^{\prime} \otimes \mathcal{O}_{X^{\prime}}(E)$. By Divisors, Lemma 30.11.21 we obtain a unique effective

Cartier divisor $D \subset X^{\prime}$ such that $\mathcal{L}^{\prime} \otimes \mathcal{O}_{X^{\prime}}(E) \cong \mathcal{O}_{X^{\prime}}(D)$ with $t$ corresponding to $1_{D}$. Reversing this procedure we conclude that $\mathcal{L}^{\prime}=\mathcal{O}_{X^{\prime}}(-E) \cong \mathcal{O}_{X^{\prime}}(D)$ with $s^{\prime}$ corresponding to $1_{D} \otimes 1_{E}^{-1}$ as in (4).
We still have to prove (5). By Lemma 41.25.2 we have

$$
\pi_{*}\left(\operatorname{div}_{\mathcal{L}^{\prime}}\left(s^{\prime}\right)\right)=\operatorname{div}_{\mathcal{L}}(s)
$$

Hence it suffices to show that $\operatorname{div}_{\mathcal{L}^{\prime}}\left(s^{\prime}\right)=[D]_{n-1}-[E]_{n-1}$. This follows from the equality $s^{\prime}=1_{D} \otimes 1_{E}^{-1}$ and additivity, see Divisors, Lemma 30.22.5.

02 T 1 Definition 41.43.15. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $D_{1}, D_{2}$ be two effective Cartier divisors in $X$. Let $Z \subset X$ be an integral closed subscheme with $\operatorname{dim}_{\delta}(Z)=n-1$. The $\epsilon$-invariant of this situation is

$$
\epsilon_{Z}\left(D_{1}, D_{2}\right)=n_{Z} \cdot m_{Z}
$$

where $n_{Z}$, resp. $m_{Z}$ is the coefficient of $Z$ in the $(n-1)$-cycle $\left[D_{1}\right]_{n-1}$, resp. $\left[D_{2}\right]_{n-1}$.
02T2 Lemma 41.43.16. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $D_{1}, D_{2}$ be two effective Cartier divisors in $X$. Let $Z$ be an open and closed subscheme of the scheme $D_{1} \cap D_{2}$. Assume $\operatorname{dim}_{\delta}\left(D_{1} \cap D_{2} \backslash Z\right) \leq n-2$. Then there exists a morphism $b: X^{\prime} \rightarrow X$, and Cartier divisors $D_{1}^{\prime}, D_{2}^{\prime}, E$ on $X^{\prime}$ with the following properties
(1) $X^{\prime}$ is integral,
(2) $b$ is projective,
(3) $b$ is the blow up of $X$ in the closed subscheme $Z$,
(4) $E=b^{-1}(Z)$,
(5) $b^{-1}\left(D_{1}\right)=D_{1}^{\prime}+E$, and $b^{-1} D_{2}=D_{2}^{\prime}+E$,
(6) $\operatorname{dim}_{\delta}\left(D_{1}^{\prime} \cap D_{2}^{\prime}\right) \leq n-2$, and if $Z=D_{1} \cap D_{2}$ then $D_{1}^{\prime} \cap D_{2}^{\prime}=\emptyset$,
(7) for every integral closed subscheme $W^{\prime}$ with $\operatorname{dim}_{\delta}\left(W^{\prime}\right)=n-1$ we have
(a) if $\epsilon_{W^{\prime}}\left(D_{1}^{\prime}, E\right)>0$, then setting $W=b\left(W^{\prime}\right)$ we have $\operatorname{dim}_{\delta}(W)=n-1$ and

$$
\epsilon_{W^{\prime}}\left(D_{1}^{\prime}, E\right)<\epsilon_{W}\left(D_{1}, D_{2}\right)
$$

(b) if $\epsilon_{W^{\prime}}\left(D_{2}^{\prime}, E\right)>0$, then setting $W=b\left(W^{\prime}\right)$ we have $\operatorname{dim}_{\delta}(W)=n-1$ and

$$
\epsilon_{W^{\prime}}\left(D_{2}^{\prime}, E\right)<\epsilon_{W}\left(D_{1}, D_{2}\right)
$$

Proof. Note that the quasi-coherent ideal sheaf $\mathcal{I}=\mathcal{I}_{D_{1}}+\mathcal{I}_{D_{2}}$ defines the scheme theoretic intersection $D_{1} \cap D_{2} \subset X$. Since $Z$ is a union of connected components of $D_{1} \cap D_{2}$ we see that for every $z \in Z$ the kernel of $\mathcal{O}_{X, z} \rightarrow \mathcal{O}_{Z, z}$ is equal to $\mathcal{I}_{z}$. Let $b: X^{\prime} \rightarrow X$ be the blow up of $X$ in $Z$. (So Zariski locally around $Z$ it is the blow up of $X$ in $\mathcal{I}$.) Denote $E=b^{-1}(Z)$ the corresponding effective Cartier divisor, see Divisors, Lemma 30.26.4 Since $Z \subset D_{1}$ we have $E \subset f^{-1}\left(D_{1}\right)$ and hence $D_{1}=D_{1}^{\prime}+E$ for some effective Cartier divisor $D_{1}^{\prime} \subset X^{\prime}$, see Divisors, Lemma 30.11.8. Similarly $D_{2}=D_{2}^{\prime}+E$. This takes care of assertions (1) - (5).

Note that if $W^{\prime}$ is as in (7) (a) or (7) (b), then the image $W$ of $W^{\prime}$ is contained in $D_{1} \cap D_{2}$. If $W$ is not contained in $Z$, then $b$ is an isomorphism at the generic point of $W$ and we see that $\operatorname{dim}_{\delta}(W)=\operatorname{dim}_{\delta}\left(W^{\prime}\right)=n-1$ which contradicts the assumption that $\operatorname{dim}_{\delta}\left(D_{1} \cap D_{2} \backslash Z\right) \leq n-2$. Hence $W \subset Z$. This means that to prove (6) and (7) we may work locally around $Z$ on $X$.

Thus we may assume that $X=\operatorname{Spec}(A)$ with $A$ a Noetherian domain, and $D_{1}=$ $\operatorname{Spec}(A / a), D_{2}=\operatorname{Spec}(A / b)$ and $Z=D_{1} \cap D_{2}$. Set $I=(a, b)$. Since $A$ is a domain and $a, b \neq 0$ we can cover the blow up by two patches, namely $U=\operatorname{Spec}(A[s] /(a s-$ $b))$ and $V=\operatorname{Spec}(A[t] /(b t-a))$. These patches are glued using the isomorphism $A\left[s, s^{-1}\right] /(a s-b) \cong A\left[t, t^{-1}\right] /(b t-a)$ which maps $s$ to $t^{-1}$. The effective Cartier divisor $E$ is described by $\operatorname{Spec}(A[s] /(a s-b, a)) \subset U$ and $\operatorname{Spec}(A[t] /(b t-a, b)) \subset V$. The closed subscheme $D_{1}^{\prime}$ corresponds to $\operatorname{Spec}(A[t] /(b t-a, t)) \subset U$. The closed subscheme $D_{2}^{\prime}$ corresponds to $\operatorname{Spec}(A[s] /(a s-b, s)) \subset V$. Since " $t s=1$ " we see that $D_{1}^{\prime} \cap D_{2}^{\prime}=\emptyset$.
Suppose we have a prime $\mathfrak{q} \subset A[s] /(a s-b)$ of height one with $s, a \in \mathfrak{q}$. Let $\mathfrak{p} \subset A$ be the corresponding prime of $A$. Observe that $a, b \in \mathfrak{p}$. By the dimension formula we see that $\operatorname{dim}\left(A_{\mathfrak{p}}\right)=1$ as well. The final assertion to be shown is that

$$
\operatorname{ord}_{A_{\mathfrak{p}}}(a) \operatorname{ord}_{A_{\mathfrak{p}}}(b)>\operatorname{ord}_{B_{\mathfrak{q}}}(a) \operatorname{ord}_{B_{\mathfrak{q}}}(s)
$$

where $B=A[s] /(a s-b)$. By Algebra, Lemma 10.123 .1 we have $\operatorname{ord}_{A_{\mathfrak{p}}}(x) \geq$ $\operatorname{ord}_{B_{\mathfrak{q}}}(x)$ for $x=a, b$. Since $\operatorname{ord}_{B_{\mathfrak{q}}}(s)>0$ we win by additivity of the ord function and the fact that $a s=b$.

02T3 Definition 41.43.17. Let $X$ be a scheme. Let $\left\{D_{i}\right\}_{i \in I}$ be a locally finite collection of effective Cartier divisors on $X$. Suppose given a function $I \rightarrow \mathbf{Z}_{\geq 0}, i \mapsto n_{i}$. The sum of the effective Cartier divisors $D=\sum n_{i} D_{i}$, is the unique effective Cartier divisor $D \subset X$ such that on any quasi-compact open $U \subset X$ we have $\left.D\right|_{U}=\left.\sum_{D_{i} \cap U \neq \emptyset} n_{i} D_{i}\right|_{U}$ is the sum as in Divisors, Definition 30.11.6.
02T4 Lemma 41.43.18. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $\left\{D_{i}\right\}_{i \in I}$ be a locally finite collection of effective Cartier divisors on $X$. Suppose given $n_{i} \geq 0$ for $i \in I$. Then

$$
[D]_{n-1}=\sum_{i} n_{i}\left[D_{i}\right]_{n-1}
$$

in $Z_{n-1}(X)$.
Proof. Since we are proving an equality of cycles we may work locally on $X$. Hence this reduces to a finite sum, and by induction to a sum of two effective Cartier divisors $D=D_{1}+D_{2}$. By Lemma 41.23.2 we see that $D_{1}=\operatorname{div}_{\mathcal{O}_{X}\left(D_{1}\right)}\left(1_{D_{1}}\right)$ where $1_{D_{1}}$ denotes the canonical section of $\mathcal{O}_{X}\left(D_{1}\right)$. Of course we have the same statement for $D_{2}$ and $D$. Since $1_{D}=1_{D_{1}} \otimes 1_{D_{2}}$ via the identification $\mathcal{O}_{X}(D)=$ $\mathcal{O}_{X}\left(D_{1}\right) \otimes \mathcal{O}_{X}\left(D_{2}\right)$ we win by Divisors, Lemma 30.22.5.
02 T 5 Lemma 41.43.19. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=d$. Let $\left\{D_{i}\right\}_{i \in I}$ be a locally finite collection of effective Cartier divisors on $X$. Assume that for all $\{i, j, k\} \subset I$, $\#\{i, j, k\}=3$ we have $D_{i} \cap D_{j} \cap D_{k}=\emptyset$. Then there exist
(1) an open subscheme $U \subset X$ with $\operatorname{dim}_{\delta}(X \backslash U) \leq d-3$,
(2) a morphism $b: U^{\prime} \rightarrow U$, and
(3) effective Cartier divisors $\left\{D_{j}^{\prime}\right\}_{j \in J}$ on $U^{\prime}$
with the following properties:
(1) $b$ is proper morphism $b: U^{\prime} \rightarrow U$,
(2) $U^{\prime}$ is integral,
(3) $b$ is an isomorphism over the complement of the union of the pairwise intersections of the $\left.D_{i}\right|_{U}$,
(4) $\left\{D_{j}^{\prime}\right\}_{j \in J}$ is a locally finite collection of effective Cartier divisors on $U^{\prime}$,
(5) $\operatorname{dim}_{\delta}\left(D_{j}^{\prime} \cap D_{j^{\prime}}^{\prime}\right) \leq d-2$ if $j \neq j^{\prime}$, and
(6) $b^{-1}\left(\left.D_{i}\right|_{U}\right)=\sum n_{i j} D_{j}^{\prime}$ for certain $n_{i j} \geq 0$.

Moreover, if $X$ is quasi-compact, then we may assume $U=X$ in the above.
Proof. Let us first prove this in the quasi-compact case, since it is perhaps the most interesting case. In this case we produce inductively a sequence of blowups

$$
X=X_{0} \stackrel{b_{0}}{\leftarrow} X_{1} \stackrel{b_{1}}{\leftarrow} X_{2} \leftarrow \ldots
$$

and finite sets of effective Cartier divisors $\left\{D_{n, i}\right\}_{i \in I_{n}}$. At each stage these will have the property that any triple intersection $D_{n, i} \cap D_{n, j} \cap D_{n, k}$ is empty. Moreover, for each $n \geq 0$ we will have $I_{n+1}=I_{n} \amalg P\left(I_{n}\right)$ where $P\left(I_{n}\right)$ denotes the set of pairs of elements of $I_{n}$. Finally, we will have

$$
b_{n}^{-1}\left(D_{n, i}\right)=D_{n+1, i}+\sum_{i^{\prime} \in I_{n}, i^{\prime} \neq i} D_{n+1,\left\{i, i^{\prime}\right\}}
$$

We conclude that for each $n \geq 0$ we have $\left(b_{0} \circ \ldots \circ b_{n}\right)^{-1}\left(D_{i}\right)$ is a nonnegative integer combination of the divisors $D_{n+1, j}, j \in I_{n+1}$.
To start the induction we set $X_{0}=X$ and $I_{0}=I$ and $D_{0, i}=D_{i}$.
Given $\left(X_{n},\left\{D_{n, i}\right\}_{i \in I_{n}}\right)$ let $X_{n+1}$ be the blow up of $X_{n}$ in the closed subscheme $Z_{n}=\bigcup_{\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)} D_{n, i} \cap D_{n, i^{\prime}}$. Note that the closed subschemes $D_{n, i} \cap D_{n, i^{\prime}}$ are pairwise disjoint by our assumption on triple intersections. In other words we may write $Z_{n}=\coprod_{\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)} D_{n, i} \cap D_{n, i^{\prime}}$. Moreover, in a Zariski neighbourhood of $D_{n, i} \cap D_{n, i^{\prime}}$ the morphism $b_{n}$ is equal to the blow up of the scheme $X_{n}$ in the closed subscheme $D_{n, i} \cap D_{n, i^{\prime}}$, and the results of Lemma 41.43.16 apply. Hence setting $D_{n+1,\left\{i, i^{\prime}\right\}}=b_{n}^{-1}\left(D_{i} \cap D_{i^{\prime}}\right)$ we get an effective Cartier divisor. The Cartier divisors $D_{n+1,\left\{i, i^{\prime}\right\}}$ are pairwise disjoint. Clearly we have $b_{n}^{-1}\left(D_{n, i}\right) \supset D_{n+1,\left\{i, i^{\prime}\right\}}$ for every $i^{\prime} \in I_{n}, i^{\prime} \neq i$. Hence, applying Divisors, Lemma 30.11.8 we see that indeed $b^{-1}\left(D_{n, i}\right)=D_{n+1, i}+\sum_{i^{\prime} \in I_{n}, i^{\prime} \neq i} D_{n+1,\left\{i, i^{\prime}\right\}}$ for some effective Cartier divisor $D_{n+1, i}$ on $X_{n+1}$. In a neighbourhood of $D_{n+1,\left\{i, i^{\prime}\right\}}$ these divisors $D_{n+1, i}$ play the role of the primed divisors of Lemma 41.43.16. In particular we conclude that $D_{n+1, i} \cap D_{n+1, i^{\prime}}=\emptyset$ if $i \neq i^{\prime}, i, i^{\prime} \in I_{n}$ by part (6) of Lemma 41.43.16. This already implies that triple intersections of the divisors $D_{n+1, i}$ are zero.

OK, and at this point we can use the quasi-compactness of $X$ to conclude that the invariant

$$
\begin{equation*}
\epsilon\left(X,\left\{D_{i}\right\}_{i \in I}\right)=\max \left\{\epsilon_{Z}\left(D_{i}, D_{i^{\prime}}\right) \mid Z \subset X, \operatorname{dim}_{\delta}(Z)=d-1,\left\{i, i^{\prime}\right\} \in P(I)\right\} \tag{41.43.19.1}
\end{equation*}
$$

is finite, since after all each $D_{i}$ has at most finitely many irreducible components. We claim that for some $n$ the invariant $\epsilon\left(X_{n},\left\{D_{n, i}\right\}_{i \in I_{n}}\right)$ is zero. Namely, if not then by Lemma 41.43.16 we have a strictly decreasing sequence

$$
\epsilon\left(X,\left\{D_{i}\right\}_{i \in I}\right)=\epsilon\left(X_{0},\left\{D_{0, i}\right\}_{i \in I_{0}}\right)>\epsilon\left(X_{1},\left\{D_{1, i}\right\}_{i \in I_{1}}\right)>\ldots
$$

of positive integers which is a contradiction. Take $n$ with invariant $\epsilon\left(X_{n},\left\{D_{n, i}\right\}_{i \in I_{n}}\right)$ equal to zero. This means that there is no integral closed subscheme $Z \subset X_{n}$ and no pair of indices $i, i^{\prime} \in I_{n}$ such that $\epsilon_{Z}\left(D_{n, i}, D_{n, i^{\prime}}\right)>0$. In other words, $\operatorname{dim}_{\delta}\left(D_{n, i}, D_{n, i^{\prime}}\right) \leq d-2$ for all pairs $\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)$ as desired.
Next, we come to the general case where we no longer assume that the scheme $X$ is quasi-compact. The problem with the idea from the first part of the proof is that
we may get and infinite sequence of blow ups with centers dominating a fixed point of $X$. In order to avoid this we cut out suitable closed subsets of codimension $\geq 3$ at each stage. Namely, we will construct by induction a sequence of morphisms having the following shape

Each of the morphisms $j_{n}: U_{n} \rightarrow X_{n}$ will be an open immersion. Each of the morphisms $b_{n}: X_{n+1} \rightarrow U_{n}$ will be a proper birational morphism of integral schemes. As in the quasi-compact case we will have effective Cartier divisors $\left\{D_{n, i}\right\}_{i \in I_{n}}$ on $X_{n}$. At each stage these will have the property that any triple intersection $D_{n, i} \cap D_{n, j} \cap D_{n, k}$ is empty. Moreover, for each $n \geq 0$ we will have $I_{n+1}=I_{n} \amalg P\left(I_{n}\right)$ where $P\left(I_{n}\right)$ denotes the set of pairs of elements of $I_{n}$. Finally, we will arrange it so that

$$
b_{n}^{-1}\left(\left.D_{n, i}\right|_{U_{n}}\right)=D_{n+1, i}+\sum_{i^{\prime} \in I_{n}, i^{\prime} \neq i} D_{n+1,\left\{i, i^{\prime}\right\}}
$$

We start the induction by setting $X_{0}=X, I_{0}=I$ and $D_{0, i}=D_{i}$.
Given $\left(X_{n},\left\{D_{n, i}\right\}\right)$ we construct the open subscheme $U_{n}$ as follows. For each pair $\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)$ consider the closed subscheme $D_{n, i} \cap D_{n, i^{\prime}}$. This has "good" irreducible components which have $\delta$-dimension $d-2$ and "bad" irreducible components which have $\delta$-dimension $d-1$. Let us set

$$
\operatorname{Bad}\left(i, i^{\prime}\right)=\bigcup_{W \subset D_{n, i} \cap D_{n, i^{\prime}} \text { irred. comp. with } \operatorname{dim}_{\delta}(W)=d-1} W
$$

and similarly

$$
\operatorname{Good}\left(i, i^{\prime}\right)=\bigcup_{W \subset D_{n, i} \cap D_{n, i^{\prime}} \text { irred. comp. with } \operatorname{dim}_{\delta}(W)=d-2} W .
$$

Then $D_{n, i} \cap D_{n, i^{\prime}}=\operatorname{Bad}\left(i, i^{\prime}\right) \cup \operatorname{Good}\left(i, i^{\prime}\right)$ and moreover we have $\operatorname{dim}_{\delta}\left(\operatorname{Bad}\left(i, i^{\prime}\right) \cap\right.$ $\left.\operatorname{Good}\left(i, i^{\prime}\right)\right) \leq d-3$. Here is our choice of $U_{n}$ :

$$
U_{n}=X_{n} \backslash \bigcup_{\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)} \operatorname{Bad}\left(i, i^{\prime}\right) \cap \operatorname{Good}\left(i, i^{\prime}\right)
$$

By our condition on triple intersections of the divisors $D_{n, i}$ we see that the union is actually a disjoint union. Moreover, we see that (as a scheme)

$$
\left.\left.D_{n, i}\right|_{U_{n}} \cap D_{n, i^{\prime}}\right|_{U_{n}}=Z_{n, i, i^{\prime}} \amalg G_{n, i, i^{\prime}}
$$

where $Z_{n, i, i^{\prime}}$ is $\delta$-equidimension of dimension $d-1$ and $G_{n, i, i^{\prime}}$ is $\delta$-equidimensional of dimension $d-2$. (So topologically $Z_{n, i, i^{\prime}}$ is the union of the bad components but throw out intersections with good components.) Finally we set

$$
Z_{n}=\bigcup_{\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)} Z_{n, i, i^{\prime}}=\coprod_{\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)} Z_{n, i, i^{\prime}}
$$

and we let $b_{n}: X_{n+1} \rightarrow X_{n}$ be the blow up in $Z_{n}$. Note that Lemma 41.43.16applies to the morphism $b_{n}: X_{n+1} \rightarrow X_{n}$ locally around each of the loci $\left.\left.D_{n, i}\right|_{U_{n}} \cap D_{n, i^{\prime}}\right|_{U_{n}}$. Hence, exactly as in the first part of the proof we obtain effective Cartier divisors $D_{n+1,\left\{i, i^{\prime}\right\}}$ for $\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)$ and effective Cartier divisors $D_{n+1, i}$ for $i \in I_{n}$ such that $b_{n}^{-1}\left(\left.D_{n, i}\right|_{U_{n}}\right)=D_{n+1, i}+\sum_{i^{\prime} \in I_{n}, i^{\prime} \neq i} D_{n+1,\left\{i, i^{\prime}\right\}}$. For each $n$ denote $\pi_{n}: X_{n} \rightarrow$ $X$ the morphism obtained as the composition $j_{0} \circ \ldots \circ j_{n-1} \circ b_{n-1}$.
Claim: given any quasi-compact open $V \subset X$ for all sufficiently large $n$ the maps

$$
\pi_{n}^{-1}(V) \leftarrow \pi_{n+1}^{-1}(V) \leftarrow \ldots
$$

are all isomorphisms. Namely, if the map $\pi_{n}^{-1}(V) \leftarrow \pi_{n+1}^{-1}(V)$ is not an isomorphism, then $Z_{n, i, i^{\prime}} \cap \pi_{n}^{-1}(V) \neq \emptyset$ for some $\left\{i, i^{\prime}\right\} \in P\left(I_{n}\right)$. Hence there exists an irreducible component $W \subset D_{n, i} \cap D_{n, i^{\prime}}$ with $\operatorname{dim}_{\delta}(W)=d-1$. In particular we see that $\epsilon_{W}\left(D_{n, i}, D_{n, i^{\prime}}\right)>0$. Applying Lemma 41.43.16 repeatedly we see that

$$
\epsilon_{W}\left(D_{n, i}, D_{n, i^{\prime}}\right)<\epsilon\left(V,\left\{\left.D_{i}\right|_{V}\right\}\right)-n
$$

with $\epsilon\left(V,\left\{\left.D_{i}\right|_{V}\right\}\right)$ as in 41.43.19.1. Since $V$ is quasi-compact, we have $\epsilon\left(V,\left\{\left.D_{i}\right|_{V}\right\}\right)<$ $\infty$ and taking $n>\epsilon\left(V,\left\{\left.D_{i}\right|_{V}\right\}\right)$ we see the result.
Note that by construction the difference $X_{n} \backslash U_{n}$ has $\operatorname{dim}_{\delta}\left(X_{n} \backslash U_{n}\right) \leq d-3$. Let $T_{n}=\pi_{n}\left(X_{n} \backslash U_{n}\right)$ be its image in $X$. Traversing in the diagram of maps above using each $b_{n}$ is closed it follows that $T_{0} \cup \ldots \cup T_{n}$ is a closed subset of $X$ for each $n$. Any $t \in T_{n}$ satisfies $\delta(t) \leq d-3$ by construction. Hence $\overline{T_{n}} \subset X$ is a closed subset with $\operatorname{dim}_{\delta}\left(T_{n}\right) \leq d-3$. By the claim above we see that for any quasi-compact open $V \subset X$ we have $T_{n} \cap V \neq \emptyset$ for at most finitely many $n$. Hence $\left\{\overline{T_{n}}\right\}_{n \geq 0}$ is a locally finite collection of closed subsets, and we may set $U=X \backslash \bigcup \overline{T_{n}}$. This will be $U$ as in the lemma.

Note that $U_{n} \cap \pi_{n}^{-1}(U)=\pi_{n}^{-1}(U)$ by construction of $U$. Hence all the morphisms

$$
b_{n}: \pi_{n+1}^{-1}(U) \longrightarrow \pi_{n}^{-1}(U)
$$

are proper. Moreover, by the claim they eventually become isomorphisms over each quasi-compact open of $X$. Hence we can define

$$
U^{\prime}=\lim _{n} \pi_{n}^{-1}(U)
$$

The induced morphism $b: U^{\prime} \rightarrow U$ is proper since this is local on $U$, and over each compact open the limit stabilizes. Similarly we set $J=\bigcup_{n \geq 0} I_{n}$ using the inclusions $I_{n} \rightarrow I_{n+1}$ from the construction. For $j \in J$ choose an $n_{0}$ such that $j$ corresponds to $i \in I_{n_{0}}$ and define $D_{j}^{\prime}=\lim _{n \geq n_{0}} D_{n, i}$. Again this makes sense as locally over $X$ the morphisms stabilize. The other claims of the lemma are verified as in the case of a quasi-compact $X$.

0AYE 41.43.20. Commutativity. The results of this subsection can be used to provide an alternative proof of the lemmas of Section 41.27 as was done in an earlier version of this chapter. See also the discussion preceding Lemma 41.43.24.
02TC Lemma 41.43.21. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Let $\left\{i_{j}: D_{j} \rightarrow X\right\}_{j \in J}$ be a locally finite collection of effective Cartier divisors on $X$. Let $n_{j}>0, j \in J$. Set $D=\sum_{j \in J} n_{j} D_{j}$, and denote $i: D \rightarrow X$ the inclusion morphism. Let $\alpha \in Z_{k+1}(X)$. Then

$$
p: \coprod_{j \in J} D_{j} \longrightarrow D
$$

is proper and

$$
i^{*} \alpha=p_{*}\left(\sum n_{j} i_{j}^{*} \alpha\right)
$$

in $A_{k}(D)$.
Proof. The proof of this lemma is made a bit longer than expected by a subtlety concerning infinite sums of rational equivalences. In the quasi-compact case the family $D_{j}$ is finite and the result is altogether easy and a straightforward consequence of Lemmas 41.23 .2 and Divisors, 30.22 .5 and the definitions.
The morphism $p$ is proper since the family $\left\{D_{j}\right\}_{j \in J}$ is locally finite. Write $\alpha=$ $\sum_{a \in A} m_{a}\left[W_{a}\right]$ with $W_{a} \subset X$ an integral closed subscheme of $\delta$-dimension $k+1$. Denote $i_{a}: W_{a} \rightarrow X$ the closed immersion. We assume that $m_{a} \neq 0$ for all $a \in A$ such that $\left\{W_{a}\right\}_{a \in A}$ is locally finite on $X$.
Observe that by Definition 41.28 .1 the class $i^{*} \alpha$ is the class of a cycle $\sum m_{a} \beta_{a}$ for certain $\beta_{a} \in Z_{k}\left(W_{a} \cap D\right)$. Namely, if $W_{a} \not \subset D$ then $\beta_{a}=\left[D \cap W_{a}\right]_{k}$ and if $W_{a} \subset D$, then $\beta_{a}$ is a cycle representing $c_{1}\left(\mathcal{O}_{X}(D)\right) \cap\left[W_{a}\right]$.
For each $a \in A$ write $J=J_{a, 1} \amalg J_{a, 2} \amalg J_{a, 3}$ where
(1) $j \in J_{a, 1}$ if and only if $W_{a} \cap D_{j}=\emptyset$,
(2) $j \in J_{a, 2}$ if and only if $W_{a} \neq W_{a} \cap D_{1} \neq \emptyset$, and
(3) $j \in J_{a, 3}$ if and only if $W_{a} \subset D_{j}$.

Since the family $\left\{D_{j}\right\}$ is locally finite we see that $J_{a, 3}$ is a finite set. For every $a \in A$ and $j \in J$ we choose a cycle $\beta_{a, j} \in Z_{k}\left(W_{a} \cap D_{j}\right)$ as follows
(1) if $j \in J_{a, 1}$ we set $\beta_{a, j}=0$,
(2) if $j \in J_{a, 2}$ we set $\beta_{a, j}=\left[D_{j} \cap W_{a}\right]_{k}$, and
(3) if $j \in J_{a, 3}$ we choose $\beta_{a, j} \in Z_{k}\left(W_{a}\right)$ representing $c_{1}\left(i_{a}^{*} \mathcal{O}_{X}\left(D_{j}\right)\right) \cap\left[W_{j}\right]$.

We claim that

$$
\beta_{a} \sim_{r a t} \sum_{j \in J} n_{j} \beta_{a, j}
$$

in $A_{k}\left(W_{a} \cap D\right)$.
Case I: $W_{a} \not \subset D$. In this case $J_{a, 3}=\emptyset$. Thus it suffices to show that $\left[D \cap W_{a}\right]_{k}=$ $\sum n_{j}\left[D_{j} \cap W_{a}\right]_{k}$ as cycles. This is Lemma 41.43.18.
Case II: $W_{a} \subset D$. In this case $\beta_{a}$ is a cycle representing $c_{1}\left(i_{a}^{*} \mathcal{O}_{X}(D)\right) \cap\left[W_{a}\right]$. Write $D=D_{a, 1}+D_{a, 2}+D_{a, 3}$ with $D_{a, s}=\sum_{j \in J_{a, s}} n_{j} D_{j}$. By Divisors, Lemma 30.22.5 we have

$$
\begin{aligned}
c_{1}\left(i_{a}^{*} \mathcal{O}_{X}(D)\right) \cap\left[W_{a}\right]= & c_{1}\left(i_{a}^{*} \mathcal{O}_{X}\left(D_{a, 1}\right)\right) \cap\left[W_{a}\right]+c_{1}\left(i_{a}^{*} \mathcal{O}_{X}\left(D_{a, 2}\right)\right) \cap\left[W_{a}\right] \\
& +c_{1}\left(i_{a}^{*} \mathcal{O}_{X}\left(D_{a, 3}\right)\right) \cap\left[W_{a}\right] .
\end{aligned}
$$

It is clear that the first term of the sum is zero. Since $J_{a, 3}$ is finite we see that the last term agrees with $\sum_{j \in J_{a, 3}} n_{j} c_{1}\left(i_{a}^{*} \mathcal{L}_{j}\right) \cap\left[W_{a}\right]$, see Divisors, Lemma 30.22.5. This is represented by $\sum_{j \in J_{a, 3}} n_{j} \beta_{a, j}$. Finally, by Case I we see that the middle term is represented by the cycle $\sum_{j \in J_{a, 2}} n_{j}\left[D_{j} \cap W_{a}\right]_{k}=\sum_{j \in J_{a, 2}} n_{j} \beta_{a, j}$. Whence the claim in this case.
At this point we are ready to finish the proof of the lemma. Namely, we have $i^{*} D \sim_{r a t} \sum m_{a} \beta_{a}$ by our choice of $\beta_{a}$. For each $a$ we have $\beta_{a} \sim_{r a t} \sum_{j} \beta_{a, j}$ with the rational equivalence taking place on $D \cap W_{a}$. Since the collection of closed subschemes $D \cap W_{a}$ is locally finite on $D$, we see that also $\sum m_{a} \beta_{a} \sim_{r a t} \sum_{a, j} m_{a} \beta_{a, j}$ on $D$ ! (See Remark 41.20.4) Ok, and now it is clear that $\sum_{a} m_{a} \beta_{a, j}$ (viewed as
a cycle on $D_{j}$ ) represents $i_{j}^{*} \alpha$ and hence $\sum_{a, j} m_{a} \beta_{a, j}$ represents $p_{*} \sum_{j} i_{j}^{*} \alpha$ and we win.

02 TD Lemma 41.43.22. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $D, D^{\prime}$ be effective Cartier divisors on $X$. Assume $\operatorname{dim}_{\delta}\left(D \cap D^{\prime}\right)=n-2$. Let $i: D \rightarrow X$, resp. $i^{\prime}: D^{\prime} \rightarrow X$ be the corresponding closed immersions. Then
(1) there exists a cycle $\alpha \in Z_{n-2}\left(D \cap D^{\prime}\right)$ whose pushforward to $D$ represents $i^{*}\left[D^{\prime}\right]_{n-1} \in A_{n-2}(D)$ and whose pushforward to $D^{\prime}$ represents $\left(i^{\prime}\right)^{*}[D]_{n-1} \in A_{n-2}\left(D^{\prime}\right)$, and
(2) we have

$$
D \cdot\left[D^{\prime}\right]_{n-1}=D^{\prime} \cdot[D]_{n-1}
$$

in $A_{n-2}(X)$.
Proof. Part (2) is a trivial consequence of part (1). Let us write $[D]_{n-1}=\sum n_{a}\left[Z_{a}\right]$ and $\left[D^{\prime}\right]_{n-1}=\sum m_{b}\left[Z_{b}\right]$ with $Z_{a}$ the irreducible components of $D$ and $\left[Z_{b}\right]$ the irreducible components of $D^{\prime}$. According to Definition 41.28.1, we have $i^{*} D^{\prime}=$ $\sum m_{b} i^{*}\left[Z_{b}\right]$ and $\left(i^{\prime}\right)^{*} D=\sum n_{a}\left(i^{\prime}\right)^{*}\left[Z_{a}\right]$. By assumption, none of the irreducible components $Z_{b}$ is contained in $D$, and hence $i^{*}\left[Z_{b}\right]=\left[Z_{b} \cap D\right]_{n-2}$ by definition. Similarly $\left(i^{\prime}\right)^{*}\left[Z_{a}\right]=\left[Z_{a} \cap D^{\prime}\right]_{n-2}$. Hence we are trying to prove the equality of cycles

$$
\sum n_{a}\left[Z_{a} \cap D^{\prime}\right]_{n-2}=\sum m_{b}\left[Z_{b} \cap D\right]_{n-2}
$$

which are indeed supported on $D \cap D^{\prime}$. Let $W \subset X$ be an integral closed subscheme with $\operatorname{dim}_{\delta}(W)=n-2$. Let $\xi \in W$ be its generic point. Set $R=\mathcal{O}_{X, \xi}$. It is a Noetherian local domain. Note that $\operatorname{dim}(R)=2$. Let $f \in R$, resp. $f^{\prime} \in R$ be an element defining the ideal of $D$, resp. $D^{\prime}$. By assumption $\operatorname{dim}\left(R /\left(f, f^{\prime}\right)\right)=0$. Let $\mathfrak{q}_{1}^{\prime}, \ldots, \mathfrak{q}_{t}^{\prime} \subset R$ be the minimal primes over $\left(f^{\prime}\right)$, let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{s} \subset R$ be the minimal primes over $(f)$. The equality above comes down to the equality

$$
\sum_{i=1, \ldots, s} \operatorname{length}_{R_{\mathbf{q}_{i}}}\left(R_{\mathfrak{q}_{i}} /(f)\right) \operatorname{ord}_{R / \mathfrak{q}_{i}}\left(f^{\prime}\right)=\sum_{j=1, \ldots, t} \operatorname{length}_{R_{q_{j}^{\prime}}}\left(R_{\mathfrak{q}_{j}^{\prime}} /\left(f^{\prime}\right)\right) \operatorname{ord}_{R / \mathbf{q}_{j}^{\prime}}(f) .
$$

By Algebra, Lemma 10.120 .10 applied with $M=R /(f)$ the left hand side of this equation is equal to

$$
\operatorname{length}_{R}\left(R /\left(f, f^{\prime}\right)\right)-\operatorname{length}_{R}\left(\operatorname{Ker}\left(f^{\prime}: R /(f) \rightarrow R /(f)\right)\right)
$$

OK, and now we note that $\operatorname{Ker}\left(f^{\prime}: R /(f) \rightarrow R /(f)\right)$ is canonically isomorphic to $\left((f) \cap\left(f^{\prime}\right)\right) /\left(f f^{\prime}\right)$ via the $\operatorname{map} x \bmod (f) \mapsto f^{\prime} x \bmod \left(f f^{\prime}\right)$. Hence the left hand side is

$$
\operatorname{length}_{R}\left(R /\left(f, f^{\prime}\right)\right)-\operatorname{length}_{R}\left((f) \cap\left(f^{\prime}\right) /\left(f f^{\prime}\right)\right)
$$

Since this is symmetric in $f$ and $f^{\prime}$ we win.
02TE Lemma 41.43.23. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $\left\{D_{j}\right\}_{j \in J}$ be a locally finite collection of effective Cartier divisors on $X$. Let $n_{j}, m_{j} \geq 0$ be collections of nonnegative integers. Set $D=\sum n_{j} D_{j}$ and $D^{\prime}=\sum m_{j} D_{j}$. Assume that $\operatorname{dim}_{\delta}\left(D_{j} \cap\right.$ $\left.D_{j^{\prime}}\right)=n-2$ for every $j \neq j^{\prime}$. Then $D \cdot\left[D^{\prime}\right]_{n-1}=D^{\prime} \cdot[D]_{n-1}$ in $A_{n-2}(X)$.

Proof. This lemma is a trivial consequence of Lemmas 41.43.18 and 41.43.22 in case the sums are finite, e.g., if $X$ is quasi-compact. Hence we suggest the reader skip the proof.
Here is the proof in the general case. Let $i_{j}: D_{j} \rightarrow X$ be the closed immersions Let $p: \coprod D_{j} \rightarrow X$ denote coproduct of the morphisms $i_{j}$. Let $\left\{Z_{a}\right\}_{a \in A}$ be the collection of irreducible components of $\bigcup D_{j}$. For each $j$ we write

$$
\left[D_{j}\right]_{n-1}=\sum d_{j, a}\left[Z_{a}\right]
$$

By Lemma 41.43.18 we have

$$
[D]_{n-1}=\sum n_{j} d_{j, a}\left[Z_{a}\right], \quad\left[D^{\prime}\right]_{n-1}=\sum m_{j} d_{j, a}\left[Z_{a}\right]
$$

By Lemma 41.43.21 we have

$$
D \cdot\left[D^{\prime}\right]_{n-1}=p_{*}\left(\sum n_{j} i_{j}^{*}\left[D^{\prime}\right]_{n-1}\right), \quad D^{\prime} \cdot[D]_{n-1}=p_{*}\left(\sum m_{j^{\prime}} i_{j^{\prime}}^{*}[D]_{n-1}\right)
$$

As in the definition of the Gysin homomorphisms (see Definition 41.28.1) we choose cycles $\beta_{a, j}$ on $D_{j} \cap Z_{a}$ representing $i_{j}^{*}\left[Z_{a}\right]$. (Note that in fact $\beta_{a, j}=\left[D_{j} \cap Z_{a}\right]_{n-2}$ if $Z_{a}$ is not contained in $D_{j}$, i.e., there is no choice in that case.) Now since $p$ is a closed immersion when restricted to each of the $D_{j}$ we can (and we will) view $\beta_{a, j}$ as a cycle on $X$. Plugging in the formulas for $[D]_{n-1}$ and $\left[D^{\prime}\right]_{n-1}$ obtained above we see that

$$
D \cdot\left[D^{\prime}\right]_{n-1}=\sum_{j, j^{\prime}, a} n_{j} m_{j^{\prime}} d_{j^{\prime}, a} \beta_{a, j}, \quad D^{\prime} \cdot[D]_{n-1}=\sum_{j, j^{\prime}, a} m_{j^{\prime}} n_{j} d_{j, a} \beta_{a, j^{\prime}}
$$

Moreover, with the same conventions we also have

$$
D_{j} \cdot\left[D_{j^{\prime}}\right]_{n-1}=\sum d_{j^{\prime}, a} \beta_{a, j}
$$

In these terms Lemma 41.43 .22 (see also its proof) says that for $j \neq j^{\prime}$ the cycles $\sum d_{j^{\prime}, a} \beta_{a, j}$ and $\sum d_{j, a} \beta_{a, j^{\prime}}$ are equal as cycles! Hence we see that

$$
\begin{aligned}
D \cdot\left[D^{\prime}\right]_{n-1} & =\sum_{j, j^{\prime}, a} n_{j} m_{j^{\prime}} d_{j^{\prime}, a} \beta_{a, j} \\
& =\sum_{j \neq j^{\prime}} n_{j} m_{j^{\prime}}\left(\sum_{a} d_{j^{\prime}, a} \beta_{a, j}\right)+\sum_{j, a} n_{j} m_{j} d_{j, a} \beta_{a, j} \\
& =\sum_{j \neq j^{\prime}} n_{j} m_{j^{\prime}}\left(\sum_{a} d_{j, a} \beta_{a, j^{\prime}}\right)+\sum_{j, a} n_{j} m_{j} d_{j, a} \beta_{a, j} \\
& =\sum_{j, j^{\prime}, a} m_{j^{\prime}} n_{j} d_{j, a} \beta_{a, j^{\prime}} \\
& =D^{\prime} \cdot[D]_{n-1}
\end{aligned}
$$

and we win.
Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $D, D^{\prime}$ be effective Cartier divisors on $X$. A stronger (and more useful) version of the following lemma asserts that

$$
D \cdot\left[D^{\prime}\right]_{n-1}=D^{\prime} \cdot[D]_{n-1} \quad \text { in } \quad A_{n-2}\left(D \cap D^{\prime}\right)
$$

for suitable representatives of the dot products involved. The first proof of the lemma together with Lemmas 41.43.21, 41.43.22, and 41.43 .23 can be modified to show this (see Ful98). It is not so clear how to modify the second proof to prove the refined version. An application of the refined version is a proof that the Gysin homomorphism factors through rational equivalence which we proved by a different method in Lemma 41.29.2.

02 TF Lemma 41.43.24. Let $(S, \delta)$ be as in Situation 41.8.1. Let $X$ be locally of finite type over $S$. Assume $X$ integral and $\operatorname{dim}_{\delta}(X)=n$. Let $D, D^{\prime}$ be effective Cartier divisors on $X$. Then

$$
D \cdot\left[D^{\prime}\right]_{n-1}=D^{\prime} \cdot[D]_{n-1}
$$

in $A_{n-2}(X)$.
First proof of Lemma 41.43.24. First, let us prove this in case $X$ is quasicompact. In this case, apply Lemma 41.43 .19 to $X$ and the two element set $\left\{D, D^{\prime}\right\}$ of effective Cartier divisors. Thus we get a proper morphism $b: X^{\prime} \rightarrow X$, a finite collection of effective Cartier divisors $D_{j}^{\prime} \subset X^{\prime}$ intersecting pairwise in codimension $\geq 2$, with $b^{-1}(D)=\sum n_{j} D_{j}^{\prime}$, and $b^{-1}\left(D^{\prime}\right)=\sum m_{j} D_{j}^{\prime}$. Note that $b_{*}\left[b^{-1}(D)\right]_{n-1}=[D]_{n-1}$ in $Z_{n-1}(X)$ and similarly for $D^{\prime}$, see Lemma 41.43.13. Hence, by Lemma 41.25.3 we have

$$
D \cdot\left[D^{\prime}\right]_{n-1}=b_{*}\left(b^{-1}(D) \cdot\left[b^{-1}\left(D^{\prime}\right)\right]_{n-1}\right)
$$

in $A_{n-2}(X)$ and similarly for the other term. Hence the lemma follows from the equality $b^{-1}(D) \cdot\left[b^{-1}\left(D^{\prime}\right)\right]_{n-1}=b^{-1}\left(D^{\prime}\right) \cdot\left[b^{-1}(D)\right]_{n-1}$ in $A_{n-2}\left(X^{\prime}\right)$ of Lemma 41.43.23.

Note that in the proof above, each referenced lemma works also in the general case (when $X$ is not assumed quasi-compact). The only minor change in the general case is that the morphism $b: U^{\prime} \rightarrow U$ we get from applying Lemma 41.43 .19 has as its target an open $U \subset X$ whose complement has codimension $\geq 3$. Hence by Lemma 41.20.2 we see that $A_{n-2}(U)=A_{n-2}(X)$ and after replacing $X$ by $U$ the rest of the proof goes through unchanged.
Second proof of Lemma 41.43.24, Let $\mathcal{I}=\mathcal{O}_{X}(-D)$ and $\mathcal{I}^{\prime}=\mathcal{O}_{X}\left(-D^{\prime}\right)$ be the invertible ideal sheaves of $D$ and $D^{\prime}$. We denote $\mathcal{I}_{D^{\prime}}=\mathcal{I} \otimes \mathcal{O}_{X} \mathcal{O}_{D^{\prime}}$ and $\mathcal{I}_{D}^{\prime}=$ $\mathcal{I}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{D}$. We can restrict the inclusion map $\mathcal{I} \rightarrow \mathcal{O}_{X}$ to $D^{\prime}$ to get a map

$$
\varphi: \mathcal{I}_{D^{\prime}} \longrightarrow \mathcal{O}_{D^{\prime}}
$$

and similarly

$$
\psi: \mathcal{I}_{D}^{\prime} \longrightarrow \mathcal{O}_{D}
$$

It is clear that

$$
\operatorname{Coker}(\varphi) \cong \mathcal{O}_{D \cap D^{\prime}} \cong \operatorname{Coker}(\psi)
$$

and

$$
\operatorname{Ker}(\varphi) \cong \frac{\mathcal{I} \cap \mathcal{I}^{\prime}}{\mathcal{I} \mathcal{I}^{\prime}} \cong \operatorname{Ker}(\psi)
$$

Hence we see that

$$
\gamma=\left[\mathcal{I}_{D^{\prime}}\right]-\left[\mathcal{O}_{D^{\prime}}\right]=\left[\mathcal{I}_{D}^{\prime}\right]-\left[\mathcal{O}_{D}\right]
$$

in $K_{0}\left(C o h_{\leq n-1}(X)\right)$. On the other hand it is clear that

$$
\left[\mathcal{I}_{D}^{\prime}\right]_{n-1}=[D]_{n-1}, \quad\left[\mathcal{I}_{D^{\prime}}\right]_{n-1}=\left[D^{\prime}\right]_{n-1}
$$

and that

$$
\mathcal{O}_{X}\left(D^{\prime}\right) \otimes \mathcal{I}_{D}^{\prime}=\mathcal{O}_{D}, \quad \mathcal{O}_{X}(D) \otimes \mathcal{I}_{D^{\prime}}=\mathcal{O}_{D^{\prime}}
$$

By Lemma 41.43.11 (applied two times) this means that the element $\gamma$ is an element of $B_{n-2}(X)$, and maps to both $c_{1}\left(\mathcal{O}_{X}\left(D^{\prime}\right)\right) \cap[D]_{n-1}$ and to $c_{1}\left(\mathcal{O}_{X}(D)\right) \cap\left[D^{\prime}\right]_{n-1}$ and we win (since the map $B_{n-2}(X) \rightarrow A_{n-2}(X)$ is well defined - which is the key to this proof).

## CHAPTER 42

## Intersection Theory

### 42.1. Introduction

0 AZ7 In this chapter we construct the intersection product on the Chow groups modulo rational equivalence on a nonsingular projective variety over an algebraically closed field. Our tools are Serre's Tor formula (see Ser65, Chapter V]), reduction to the diagonal, and the moving lemma.

We first recall cycles and how to construct proper pushforward and flat pullback of cycles. Next, we introduce rational equivalence of cycles which gives us the Chow groups $A_{*}(X)$. Proper pushforward and flat pullback factor through rational equivalence to give operations on Chow groups. This takes up Sections 42.3, 42.4, $42.5,42.6,42.7,42.8,42.9,42.10$ and 42.11 . For proofs we mostly refer to the chapter on Chow homology where these results have been proven in the setting of schemes of locally of finite over a universally catenary Noetherian base, see Chow Homology, Section 41.8 ff.

Since we work on a nonsingular projective $X$ any irreducible component of the intersection $V \cap W$ of two irreducible closed subvarieties has dimension at least $\operatorname{dim}(V)+\operatorname{dim}(W)-\operatorname{dim}(X)$. We say $V$ and $W$ intersect properly if equality holds for every irreducible component $Z$. In this case we define the intersection multiplicity $e_{Z}=e(X, V \cdot W, Z)$ by the formula

$$
e_{Z}=\sum_{i}(-1)^{i} \operatorname{length}_{\mathcal{O}_{X, Z}} \operatorname{Tor}_{i}^{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{W, Z}, \mathcal{O}_{V, Z}\right)
$$

We need to do a little bit of commutative algebra to show that these intersection multiplicities agree with intuition in simple cases, namely, that sometimes

$$
e_{Z}=\operatorname{length}_{\mathcal{O}_{X, Z}} \mathcal{O}_{V \cap W, Z},
$$

in other words, only $\operatorname{Tor}_{0}$ contributes. This happens when $V$ and $W$ are CohenMacaulay in the generic point of $Z$ or when $W$ is cut out by a regular sequence in $\mathcal{O}_{X, Z}$ which also defines a regular sequence on $\mathcal{O}_{V, Z}$. However, Example 42.14.4 shows that higher tors are necessary in general. Moreover, there is a relationship with the Samuel multiplicity. These matters are discussed in Sections 42.13, 42.14, $42.15,42.16$, and 42.17 .

Reduction to the diagonal is the statement that we can intersect $V$ and $W$ by intersecting $V \times W$ with the diagonal in $X \times X$. This innocuous statement, which is clear on the level of scheme theoretic intersections, reduces an intersection of a general pair of closed subschemes, to the case where one of the two is locally cut out by a regular sequence. We use this, following Serre, to obtain positivity of intersection multiplicities. Moreover, reduction to the diagonal leads to additivity
of intersection multiplicities, associativity, and a projection formula. This can be found in Sections 42.18, 42.19, 42.20, 42.21, and 42.22,
Finally, we come to the moving lemmas and applications. There are two parts to the moving lemma. The first is that given closed subvarieties

$$
Z \subset X \subset \mathbf{P}^{N}
$$

with $X$ nonsingular, we can find a subvariety $C \subset \mathbf{P}^{N}$ intersecting $X$ properly such that

$$
C \cdot X=[Z]+\sum m_{j}\left[Z_{j}\right]
$$

and such that the other components $Z_{j}$ are "more general" than $Z$. The second part is that one can move $C \subset \mathbf{P}^{N}$ over a rational curve to a subvariety in general position with respect to any given list of subvarieties. Combined these results imply that it suffices to define the intersection product of cycles on $X$ which intersect properly which was done above. Of course this only leads to an intersection product on $A_{*}(X)$ if one can show, as we do in the text, that these products pass through rational equivalence. This and some applications are discussed in Sections 42.23 , $42.24,42.25,42.26,42.27$, and 42.28

### 42.2. Conventions

$0 A Z 8$ We fix an algebraically closed ground field $\mathbf{C}$ of any characteristic. All schemes and varieties are over $\mathbf{C}$ and all morphisms are over $\mathbf{C}$. A variety $X$ is nonsingular if $X$ is a regular scheme (see Properties, Definition 27.9.1). In our case this means that the morphism $X \rightarrow \operatorname{Spec}(\mathbf{C})$ is smooth (see Varieties, Lemma 32.10.6).

### 42.3. Cycles

0AZ9 Let $X$ be a variety. A closed subvariety of $X$ is an integral closed subscheme $Z \subset X$. A $k$-cycle on $X$ is a finite formal sum $\sum n_{i}\left[Z_{i}\right]$ where each $Z_{i}$ is a closed subvariety of dimension $k$. Whenever we use the notation $\alpha=\sum n_{i}\left[Z_{i}\right]$ for a $k$-cycle we always assume the subvarieties $Z_{i}$ are pairwise distinct and $n_{i} \neq 0$ for all $i$. In this case the support of $\alpha$ is the closed subset

$$
\operatorname{Supp}(\alpha)=\bigcup Z_{i} \subset X
$$

of dimension $k$. The group of $k$-cycles is denoted $Z_{k}(X)$. See Chow Homology, Section 41.9

### 42.4. Cycle associated to closed subscheme

0AZA Suppose that $X$ is a variety and that $Z \subset X$ be a closed subscheme with $\operatorname{dim}(Z) \leq$ $k$. Let $Z_{i}$ be the irreducible components of $Z$ of dimension $k$ and let $n_{i}$ be the multiplicity of $Z_{i}$ in $Z$ defined as

$$
n_{i}=\operatorname{length}_{\mathcal{O}_{X, Z_{i}}} \mathcal{O}_{Z, Z_{i}}
$$

where $\mathcal{O}_{X, Z_{i}}$, resp. $\mathcal{O}_{Z, Z_{i}}$ is the local ring of $X$, resp. $Z$ at the generic point of $Z_{i}$. We define the $k$-cycle associated to $Z$ to be the $k$-cycle

$$
[Z]_{k}=\sum n_{i}\left[Z_{i}\right]
$$

See Chow Homology, Section 41.10

### 42.5. Cycle associated to a coherent sheaf

0 AZB $\quad$ Suppose that $X$ is a variety and that $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq$ $k$. Let $Z_{i}$ be the irreducible components of $\operatorname{Supp}(\mathcal{F})$ of dimension $k$ and let $n_{i}$ be the multiplicity of $Z_{i}$ in $\mathcal{F}$ defined as

$$
n_{i}=\operatorname{length}_{\mathcal{O}_{X, Z_{i}}} \mathcal{F}_{\xi_{i}}
$$

where $\mathcal{O}_{X, Z_{i}}$ is the local ring of $X$ at the generic point $\xi_{i}$ of $Z_{i}$ and $\mathcal{F}_{\xi_{i}}$ is the stalk of $\mathcal{F}$ at this point. We define the $k$-cycle associated to $\mathcal{F}$ to be the $k$-cycle

$$
[\mathcal{F}]_{k}=\sum n_{i}\left[Z_{i}\right]
$$

See Chow Homology, Section 41.11. Note that, if $Z \subset X$ is a closed subscheme with $\operatorname{dim}(Z) \leq k$, then $[Z]_{k}=\left[\mathcal{O}_{Z}\right]_{k}$ by definition.

### 42.6. Proper pushforward

$0 A Z C \quad$ Suppose that $f: X \rightarrow Y$ is a proper morphism of varieties. Let $Z \subset X$ be a $k$-dimensional closed subvariety. We define $f_{*}[Z]$ to be 0 if $\operatorname{dim}(f(Z))<k$ and $d \cdot[f(Z)]$ if $\operatorname{dim}(f(Z))=k$ where

$$
d=[\mathbf{C}(Z): \mathbf{C}(f(Z))]=\operatorname{deg}(Z / f(Z))
$$

is the degree of the dominant morphism $Z \rightarrow f(Z)$, see Morphisms, Definition 28.47.8. Let $\alpha=\sum n_{i}\left[Z_{i}\right]$ be a $k$-cycle on $Y$. The pushforward of $\alpha$ is the sum $f_{*} \alpha=$ $\sum n_{i} f_{*}\left[Z_{i}\right]$ where each $f_{*}\left[Z_{i}\right]$ is defined as above. This defines a homomorphism

$$
f_{*}: Z_{k}(X) \longrightarrow Z_{k}(Y)
$$

See Chow Homology, Section 41.13
0AZD Lemma 42.6.1. Suppose that $f: X \rightarrow Y$ is a proper morphism of varieties. Let See Ser65, Chapter $\mathcal{F}$ be a coherent sheaf with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq k$, then $f_{*}[\mathcal{F}]_{k}=\left[f_{*} \mathcal{F}\right]_{k}$. In particular, V]. if $Z \subset X$ is a closed subscheme of dimension $\leq k$, then $f_{*}[Z]=\left[f_{*} \mathcal{O}_{Z}\right]_{k}$.

Proof. See Chow Homology, Lemma 41.13.3.
0B0N Lemma 42.6.2. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be proper morphisms of varieties. Then $g_{*} \circ f_{*}=(g \circ f)_{*}$ as maps $Z_{k}(X) \rightarrow Z_{k}(Z)$.

Proof. Special case of Chow Homology, Lemma 41.13.2.

### 42.7. Flat pullback

0AZE Suppose that $f: X \rightarrow Y$ is a flat morphism of varieties. By Morphisms, Lemma 28.28.2 every fibre of $f$ has dimension $r=\operatorname{dim}(X)-\operatorname{dim}(Y)^{1}$. Let $Z \subset X$ be a $k$-dimensional closed subvariety. We define $f^{*}[Z]$ to be the $(k+r)$-cycle associated to the scheme theoretic inverse image: $f^{*}[Z]=\left[f^{-1}(Z)\right]_{k+r}$. Let $\alpha=\sum n_{i}\left[Z_{i}\right]$ be a $k$-cycle on $Y$. The pullback of $\alpha$ is the sum $f_{*} \alpha=\sum n_{i} f^{*}\left[Z_{i}\right]$ where each $f^{*}\left[Z_{i}\right]$ is defined as above. This defines a homomorphism

$$
f^{*}: Z_{k}(Y) \longrightarrow Z_{k+r}(X)
$$

See Chow Homology, Section 41.15

[^116]0AZF Lemma 42.7.1. Let $f: X \rightarrow Y$ be a flat morphism of varieties. Set $r=\operatorname{dim}(X)-$ $\operatorname{dim}(Y)$. Then $f^{*}[\mathcal{F}]_{k}=\left[f^{*} \mathcal{F}\right]_{k+r}$ if $\mathcal{F}$ is a coherent sheaf on $Y$ and the dimension of the support of $\mathcal{F}$ is at most $k$.

Proof. See Chow Homology, Lemma 41.15.4.
0B0P Lemma 42.7.2. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be flat morphisms of varieties. Then $g \circ f$ is flat and $f^{*} \circ g^{*}=(g \circ f)^{*}$ as maps $Z_{k}(Z) \rightarrow Z_{k+\operatorname{dim}(X)-\operatorname{dim}(Z)}(X)$.
Proof. Special case of Chow Homology, Lemma 41.15.3.

### 42.8. Rational Equivalence

$0 A Z G$ We are going to define rational equivalence in a way which at first glance may seem different from what you are used to, or from what is in Ful98, Chapter I] or Chow Homology, Section 41.20. However, in Section 42.9 we will show that the two notions agree.
Let $X$ be a variety. Let $W \subset X \times \mathbf{P}^{1}$ be a closed subvariety of dimension $k+1$. Let $a, b$ be distinct closed points of $\mathbf{P}^{1}$. Assume that $X \times a, X \times b$ and $W$ intersect properly:

$$
\operatorname{dim}(W \cap X \times a) \leq k, \quad \operatorname{dim}(W \cap X \times b) \leq k
$$

This is true as soon as $W \rightarrow \mathbf{P}^{1}$ is dominant or if $W$ is contained in a fibre of the projection over a closed point different from $a$ or $b$ (this is an uninteresting case which we will discard). In this situation the scheme theoretic fibre $W_{a}$ of the morphism $W \rightarrow \mathbf{P}^{1}$ is equal to the scheme theoretic intersection $W \cap X \times a$ in $X \times \mathbf{P}^{1}$. Identifying $X \times a$ and $X \times b$ with $X$ we may think of the fibres $W_{a}$ and $W_{b}$ as closed subschemes of $X$ of dimension $\leq k^{2}$. A basic example of a rational equivalence is

$$
\left[W_{a}\right]_{k} \sim_{r a t}\left[W_{b}\right]_{k}
$$

The cycles $\left[W_{a}\right]_{k}$ and $\left[W_{b}\right]_{k}$ are easy to compute in practice (given $W$ ) because they are obtained by proper intersection with a Cartier divisor (we will see this in Section 42.17). Since the automorphism group of $\mathbf{P}^{1}$ is 2-transitive we may move the pair of closed points $a, b$ to any pair we like. A traditional choice is to choose $a=0$ and $b=\infty$.
More generally, let $\alpha=\sum n_{i}\left[W_{i}\right]$ be a $(k+1)$-cycle on $X \times \mathbf{P}^{1}$. Let $a_{i}, b_{i}$ be pairs of distinct closed points of $\mathbf{P}^{1}$. Assume that $X \times a_{i}, X \times b_{i}$ and $W_{i}$ intersect properly, in other words, each $W_{i}, a_{i}, b_{i}$ satisfies the condition discussed above. A cycle rationally equivalent to zero is any cycle of the form

$$
\sum n_{i}\left(\left[W_{i, a_{i}}\right]_{k}-\left[W_{i, b_{i}}\right]_{k}\right) .
$$

This is indeed a $k$-cycle. The collection of $k$-cycles rationally equivalent to zero is an additive subgroup of the group of $k$-cycles. We say two $k$-cycles are rationally equivalent, notation $\alpha \sim_{\text {rat }} \alpha^{\prime}$, if $\alpha-\alpha^{\prime}$ is a cycle rationally equivalent to zero.
We define

$$
A_{k}(X)=Z_{k}(X) / \sim_{r a t}
$$

to be the Chow group of $k$-cycles on $X$. We will see in Lemma 42.9.1 that this agrees with the Chow group as defined in Chow Homology, Definition 41.20.1.

[^117]
### 42.9. Rational equivalence and rational functions

0 AZH Let $X$ be a variety. Let $W \subset X$ be a subvariety of dimension $k+1$. Let $f \in \mathbf{C}(W)^{*}$ be a nonzero rational function on $W$. For every subvariety $Z \subset W$ of dimension $k$ one can define the order of vanishing $\operatorname{ord}_{W, Z}(f)$ of $f$ at at $Z$. If $f$ is an element of the local ring $\mathcal{O}_{W, Z}$, then one has

$$
\operatorname{ord}_{W, Z}(f)=\operatorname{length}_{\mathcal{O}_{X, z}} \mathcal{O}_{W, Z} / f \mathcal{O}_{W, Z}
$$

where $\mathcal{O}_{X, Z}$, resp. $\mathcal{O}_{W, Z}$ is the local ring of $X$, resp. $W$ at the generic point of $Z$. In general one extends the definition by multiplicativity. The principal divisor associated to $f$ is

$$
\operatorname{div}_{W}(f)=\sum \operatorname{ord}_{W, Z}(f)[Z]
$$

in $Z_{k}(W)$. Since $W \subset X$ is a closed subvariety we may think of $\operatorname{div}_{W}(f)$ as a cycle on $X$. See Chow Homology, Section 41.18,
0AZI Lemma 42.9.1. Let $X$ be a variety. Let $W \subset X$ be a subvariety of dimension $k+1$. Let $f \in \mathbf{C}(W)^{*}$ be a nonzero rational function on $W$. Then $\operatorname{div}_{W}(f)$ is rationally equivalent to zero on $X$. Conversely, these principal divisors generate the abelian group of cycles rationally equivalent to zero on $X$.

Proof. The first assertion follows from Chow Homology, Lemma 41.19.2. More precisely, let $W^{\prime} \subset X \times \mathbf{P}^{1}$ be the closure of the graph of $f$. Then $\operatorname{div}_{W}(f)=$ $\left[W_{0}^{\prime}\right]_{k}-\left[W_{\infty}^{\prime}\right]$ in $Z_{k}(W) \subset Z_{k}(X)$, see part (6) of Chow Homology, Lemma 41.19.2. For the second, let $W^{\prime} \subset X \times \mathbf{P}^{1}$ be a closed subvariety of dimension $k+1$ which dominates $\mathbf{P}^{1}$. We will show that $\left[W_{0}^{\prime}\right]_{k}-\left[W_{\infty}^{\prime}\right]_{k}$ is a principal divisor which will finish the proof. Let $W \subset X$ be the image of $W^{\prime}$ under the projection to $X$. Then $W^{\prime} \rightarrow W$ is proper and generically finitf ${ }^{3}$ Let $f$ denote the projection $W^{\prime} \rightarrow \mathbf{P}^{1}$ viewed as an element of $\mathbf{C}\left(W^{\prime}\right)^{*}$. Let $g=\mathrm{Nm}(f) \in \mathbf{C}(W)^{*}$ be the norm. By Chow Homology, Lemma 41.19.1 we have

$$
\operatorname{div}_{W}(g)=\operatorname{pr}_{X, *} \operatorname{div}_{W^{\prime}}(f)
$$

Since it is clear that $\operatorname{div}_{W^{\prime}}(f)=\left[W_{0}^{\prime}\right]_{k}-\left[W_{\infty}^{\prime}\right]_{k}$ the proof is complete.

### 42.10. Proper pushforward and rational equivalence

0AZJ Suppose that $f: X \rightarrow Y$ is a proper morphism of varieties. Let $\alpha \sim_{r a t} 0$ be a $k$-cycle on $X$ rationally equivalent to 0 . Then the pushforward of $\alpha$ is rationally equivalent to zero: $f_{*} \alpha \sim_{r a t} 0$. See Chapter I of [Ful98] or Chow Homology, Lemma 41.21.2.
Therefore we obtain a commutative diagram

of groups of $k$-cycles.

[^118]42.11. Flat pullback and rational equivalence
$0 A Z K \quad$ Suppose that $f: X \rightarrow Y$ is a flat morphism of varieties. Set $r=\operatorname{dim}(X)-\operatorname{dim}(Y)$. Let $\alpha \sim_{\text {rat }} 0$ be a $k$-cycle on $Y$ rationally equivalent to 0 . Then the pullback of $\alpha$ is rationally equivalent to zero: $f^{*} \alpha \sim_{r a t} 0$. See Chapter I of [Ful98] or Chow Homology, Lemma 41.21.1.
Therefore we obtain a commutative diagram

of groups of $k$-cycles.

### 42.12. The short exact sequence for an open

0B5Z Let $X$ be a variety and let $U \subset X$ be an open subvariety. Let $X \backslash U=\bigcup Z_{i}$ be the decomposition into irreducible component $4^{4}$. Then for each $k \geq 0$ there exists a commutative diagram

with exact rows. Here the vertical arrows are the canonical quotient maps. The left horizontal arrows are given by proper pushforward along the closed immersions $Z_{i} \rightarrow X$. The right horizontal arrows are given by flat pullback along the open immersion $j: U \rightarrow X$. Since we have seen that these maps factor through rational equivalence we obtain the commutativity of the squares. The top row is exact simply because every subvariety of $X$ is either contained in some $Z_{i}$ or has irreducible intersection with $U$. The bottom row is exact because every principal divisor $\operatorname{div}_{W}(f)$ on $U$ is the restriction of a principal divisor on $X$. More precisely, if $W \subset U$ is a $(k+1)$-dimensional closed subvariety and $f \in \mathbf{C}(W)^{*}$, then denote $\bar{W}$ the closure of $W$ in $X$. Then $W \subset \bar{W}$ is an open immersion, so $\mathbf{C}(W)=\mathbf{C}(\bar{W})$ and we may think of $f$ as a nonconstant rational function on $\bar{W}$. Then clearly

$$
j^{*} \operatorname{div}_{\bar{W}}(f)=\operatorname{div}_{W}(f)
$$

in $Z_{k}(X)$. The exactness of the lower row follows easily from this. For details see Chow Homology, Lemma 41.20.2.

### 42.13. Proper intersections

0AZL First a few lemmas to get dimension estimates.
0 AZM Lemma 42.13.1. Let $X$ and $Y$ be varieties. Then $X \times Y$ is a variety and $\operatorname{dim}(X \times$ $Y)=\operatorname{dim}(X)+\operatorname{dim}(Y)$.
Proof. The scheme $X \times Y=X \times_{\operatorname{Spec}(\mathbf{C})} Y$ is a variety by Varieties, Lemma 32.3.3. The statement on dimension is Varieties, Lemma 32.17.5.

[^119]Recall that a regular immersion $i: X \rightarrow Y$ of schemes is a closed immersion whose corresponding sheaf of ideals is locally generated by a regular sequence, see Divisors, Section 30.18. Moreover, the conormal sheaf $\mathcal{C}_{X / Y}$ is finite locally free of rank equal to the length of the regular sequence. Let us say $i$ is a regular immersion of codimension $c$ if $\mathcal{C}_{X / Y}$ is locally free of rank $c$.
More generally, recall (More on Morphisms, Section 36.44 that $f: X \rightarrow Y$ is a local complete intersection morphism if we can cover $X$ by opens $U$ such that we can factor $\left.f\right|_{U}$ as

where $i$ is a Koszul regular immersion (if $Y$ is locally Noetherian this is the same as asking $i$ to be a regular immersion, see Divisors, Lemma 30.18.3. Let us say that $f$ is a local complete intersection morphism of relative dimension $r$ if for any factorization as above, the closed immersion $i$ has conormal sheaf of rank $n-r$ (in other words if $i$ is a Koszul-regular immersion of codimension $n-r$ which in the Noetherian case just means it is regular immersion of codimension $n-r$ ).

0AZN Lemma 42.13.2. Let $f: X \rightarrow Y$ be a morphism of varieties.
(1) If $Z \subset Y$ is a subvariety dimension $d$ and $f$ is a regular immersion of codimension $c$, then every irreducible component of $f^{-1}(Z)$ has dimension $\geq d-c$.
(2) If $Z \subset Y$ is a subvariety of dimension $d$ and $f$ is a local complete intersection morphism of relative dimension $r$, then every irreducible component of $f^{-1}(Z)$ has dimension $\geq d+r$.

Proof. Proof of (1). We may work locally, hence we may assume that $Y=$ $\operatorname{Spec}(A)$ and $X=V\left(f_{1}, \ldots, f_{c}\right)$ where $f_{1}, \ldots, f_{c}$ is a regular sequence in $A$. If $Z=\operatorname{Spec}(A / \mathfrak{p})$, then we see that $f^{-1}(Z)=\operatorname{Spec}\left(A / \mathfrak{p}+\left(f_{1}, \ldots, f_{c}\right)\right)$. If $V$ is an irreducible component of $f^{-1}(Z)$, then we can choose a closed point $v \in V$ not contained in any other irreducible component of $f^{-1}(Z)$. Then

$$
\operatorname{dim}(Z)=\operatorname{dim} \mathcal{O}_{Z, v} \quad \text { and } \quad \operatorname{dim}(V)=\operatorname{dim} \mathcal{O}_{V, v}=\operatorname{dim} \mathcal{O}_{Z, v} /\left(f_{1}, \ldots, f_{c}\right)
$$

The first equality for example by Algebra, Lemma 10.115 .1 and the second equality by our choice of closed point. The result now follows from the fact that dividing by one element in the maximal ideal decreases the dimension by at most 1 , see Algebra, Lemma 10.59.12.
Proof of (2). Choose a factorization as in the definition of a local complete intersection and apply (1). Some details omitted.

0B0Q Lemma 42.13.3. Let $X$ be a nonsingular variety. Then the diagonal $\Delta: X \rightarrow$ $X \times X$ is a regular immersion of codimension $\operatorname{dim}(X)$.

Proof. In fact, any closed immersion between nonsingular projective varieties is a regular immersion, see Divisors, Lemma 30.19.10.

The following lemma demonstrates how reduction to the diagonal works.

0AZP Lemma 42.13.4. Let $X$ be a nonsingular variety and let $W, V \subset X$ be closed subvarieties with $\operatorname{dim}(W)=s$ and $\operatorname{dim}(V)=r$. Then every irreducible component $Z$ of $V \cap W$ has dimension $\geq r+s-\operatorname{dim}(X)$.
Proof. Since $V \cap W=\Delta^{-1}(V \times W)$ (scheme theoretically) we conclude by Lemmas 42.13 .3 and 42.13.2.

This lemma suggests the following definition.
0AZQ Definition 42.13.5. Let $X$ be a nonsingular variety.
(1) Let $W, V \subset X$ be closed subvarieties with $\operatorname{dim}(W)=s$ and $\operatorname{dim}(V)=r$. We say that $W$ and $V$ intersect properly if $\operatorname{dim}(V \cap W) \leq r+s-\operatorname{dim}(X)$.
(2) Let $\alpha=\sum n_{i}\left[W_{i}\right]$ be an $s$-cycle, and $\beta=\sum_{j} m_{j}\left[V_{j}\right]$ be an $r$-cycle on $X$. We say that $\alpha$ and $\beta$ intersect properly if $W_{i}$ and $V_{j}$ intersect properly for all $i$ and $j$.

### 42.14. Intersection multiplicities using Tor formula

0 AZR A basic fact we will use frequently is that given sheaves of modules $\mathcal{F}, \mathcal{G}$ on a ringed space $\left(X, \mathcal{O}_{X}\right)$ and a point $x \in X$ we have

$$
\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})_{x}=\operatorname{Tor}_{p}^{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, \mathcal{G}_{x}\right)
$$

as $\mathcal{O}_{X, x}$-modules. This can be seen in several ways from our construction of derived tensor products in Cohomology, Section 20.27, for example it follows from Cohomology, Lemma 20.27.4. Moreover, if $X$ is a scheme and $\mathcal{F}$ and $\mathcal{G}$ are quasi-coherent, then the modules $\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ are quasi-coherent too, see Derived Categories of Schemes, Lemma 35.3.8. More important for our purposes is the following result.

0AZS Lemma 42.14.1. Let $X$ be a locally Noetherian scheme.
(1) If $\mathcal{F}$ and $\mathcal{G}$ are coherent $\mathcal{O}_{X}$-modules, then $\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is too.
(2) If $L$ and $K$ are in $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$, then so is $L \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K$.

Proof. Let us explain how to prove (1) in a more elementary way and part (2) using previously developed general theory.
Proof of (1). Since formation of Tor commutes with localization we may assume $X$ is affine. Hence $X=\operatorname{Spec}(A)$ for some Noetherian ring $A$ and $\mathcal{F}, \mathcal{G}$ correspond to finite $A$-modules $M$ and $N$ (Cohomology of Schemes, Lemma 29.9.1). By Derived Categories of Schemes, Lemma 35.3 .8 we may compute the Tor's by first computing the Tor's of $M$ and $N$ over $A$, and then taking the associated $\mathcal{O}_{X}$-module. Since the modules $\operatorname{Tor}_{p}^{A}(M, N)$ are finite by Algebra, Lemma 10.74.7 we conclude.
By Derived Categories of Schemes, Lemma 35.10 .4 the assumption is equivalent to asking $L$ and $K$ to be (locally) pseudo-coherent. Then $L \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K$ is pseudo-coherent by Cohomology, Lemma 20.39.5

0 Lemma 42.14.2. Let $X$ be a nonsingular variety. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X^{-}}$ modules. The $\mathcal{O}_{X}$-module $\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is coherent, has stalk at $x$ equal to $\operatorname{Tor}_{p}^{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, \mathcal{G}_{x}\right)$, is supported on $\operatorname{Supp}(\mathcal{F}) \cap \operatorname{Supp}(\mathcal{G})$, and is nonzero only for $p \in\{0, \ldots, \operatorname{dim}(X)\}$.

Proof. The result on stalks was discussed above and it implies the support condition. The Tor's are coherent by Lemma 42.14.1. The vanishing of negative Tor's is immediate from the construction. The vanishing of $\operatorname{Tor}_{p}$ for $p>\operatorname{dim}(X)$ can
be seen as follows: he local rings $\mathcal{O}_{X, x}$ are regular (as $X$ is nonsingular) of dimension $\leq \operatorname{dim}(X)$ (Algebra, Lemma 10.115.1), hence $\mathcal{O}_{X, x}$ has finite global dimension $\leq \operatorname{dim}(X)$ (Algebra, Lemma 10.109.8) which implies that Tor-groups of modules vanish beyond the dimension (More on Algebra, Lemma 15.55.17).

Let $X$ be a nonsingular variety and $W, V \subset X$ be closed subvarieties with $\operatorname{dim}(W)=$ $s$ and $\operatorname{dim}(V)=r$. Assume $V$ and $W$ intersect properly. In this case Lemma 42.13.4 tells us all irreducible components of $V \cap W$ have dimension equal to $r+s-\operatorname{dim}(X)$. The sheaves $\operatorname{Tor}_{j}^{\mathcal{O}_{X}}\left(\mathcal{O}_{W}, \mathcal{O}_{V}\right)$ are coherent, supported on $V \cap W$, and zero if $j<0$ or $j>\operatorname{dim}(X)$ (Lemma 42.14.2). We define the intersection product as

$$
W \cdot V=\sum_{i}(-1)^{i}\left[\operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{W}, \mathcal{O}_{V}\right)\right]_{r+s-\operatorname{dim}(X)}
$$

We stress that this makes sense only because of our assumption that $V$ and $W$ intersect properly. This fact will necessitate a moving lemma in order to define the intersection product in general.

With this notation, the cycle $V \cdot W$ is a formal linear combination $\sum e_{Z} Z$ of the irreducible components $Z$ of the intersection $V \cap W$. The integers $e_{Z}$ are called the intersection multiplicities

$$
e_{Z}=e(X, V \cdot W, Z)=\sum_{i}(-1)^{i} \operatorname{length}_{\mathcal{O}_{X, Z}} \operatorname{Tor}_{i}^{\mathcal{O}_{X, Z}}\left(\mathcal{O}_{W, Z}, \mathcal{O}_{V, Z}\right)
$$

where $\mathcal{O}_{X, Z}$, resp. $\mathcal{O}_{W, Z}$, resp. $\mathcal{O}_{V, Z}$ denotes the local ring of $X$, resp. $W$, resp. $V$ at the generic point of $Z$. These alternating sums of lengths of Tor's satisfy many good properties, as we wll see later on.

In the case of transversal intersections, the intersection number is 1.
0B1I Lemma 42.14.3. Let $X$ be a nonsingular variety. Let $V, W \subset X$ be closed subvarieties which intersect properly. Let $Z$ be an irreducible component of $V \cap W$ and assume that the multiplicity (in the sense of Section 42.4) of $Z$ in the closed subscheme $V \cap W$ is 1 . Then $e(X, V \cdot W, Z)=1$ and $V$ and $W$ are smooth in $a$ general point of $Z$.

Proof. Let $(A, \mathfrak{m}, \kappa)=\left(\mathcal{O}_{X, \xi}, \mathfrak{m}_{\xi}, \kappa(\xi)\right)$ where $\xi \in Z$ is the generic point. Then $\operatorname{dim}(A)=\operatorname{dim}(X)-\operatorname{dim}(Z)$, see Varieties, Lemma 32.17.3. Let $I, J \subset A$ cut out the trace of $V$ and $W$ in $\operatorname{Spec}(A)$. Set $\bar{I}=I+\mathfrak{m}^{2} / \mathfrak{m}^{2}$. Then $\operatorname{dim}_{\kappa} \bar{I} \leq$ $\operatorname{dim}(X)-\operatorname{dim}(V)$ with equality if and only if $A / I$ is regular (this follows from the lemma cited above and the definition of regular rings, see Algebra, Definition 10.59 .9 and the discussion preceding it). Similarly for $\bar{J}$. If the multiplicity is 1 , then length $_{A}(A / I+J)=1$, hence $I+J=\mathfrak{m}$, hence $\bar{I}+\bar{J}=\mathfrak{m} / \mathfrak{m}^{2}$. Then we get equality everywhere (because the intersection is proper). Hence we find $f_{1}, \ldots, f_{a} \in I$ and $g_{1}, \ldots g_{b} \in J$ such that $\bar{f}_{1}, \ldots, \bar{g}_{b}$ is a basis for $\mathfrak{m} / \mathfrak{m}^{2}$. Then $f_{1}, \ldots, g_{b}$ is a regular system of parameters and a regular sequence (Algebra, Lemma 10.105.3). The same lemma shows $A /\left(f_{1}, \ldots, f_{a}\right)$ is a regular local ring of $\operatorname{dimension} \operatorname{dim}(X)-\operatorname{dim}(V)$, hence $A /\left(f_{1}, \ldots, f_{a}\right) \rightarrow A / I$ is an isomorphism (if the kernel is nonzero, then the dimension of $A / I$ is strictly less, see Algebra, Lemmas 10.105.2 and 10.59.12. We conclude $I=\left(f_{1}, \ldots, f_{a}\right)$ and $J=\left(g_{1}, \ldots, g_{b}\right)$ by symmetry. Thus the Koszul complex $K_{\bullet}\left(A, f_{1}, \ldots, f_{a}\right)$ on $f_{1}, \ldots, f_{a}$ is a resolution of $A / I$, see More on Algebra,

Lemma 15.23.2. Hence

$$
\begin{aligned}
\operatorname{Tor}_{p}^{A}(A / I, A / J) & =H_{p}\left(K_{\bullet}\left(A, f_{1}, \ldots, f_{a}\right) \otimes_{A} A / J\right) \\
& =H_{p}\left(K_{\bullet}\left(A / J, f_{1} \bmod J, \ldots, f_{a} \bmod J\right)\right)
\end{aligned}
$$

Since we've seen above that $f_{1} \bmod J, \ldots, f_{a} \bmod J$ is a regular system of parameters in the regular local ring $A / J$ we conclude that there is only one cohomology group, namely $H_{0}=A /(I+J)=\kappa$. This finishes the proof.
0B2S Example 42.14.4. In this example we show that it is necessary to use the higher tors in the formula for the intersection multiplicities above. Let $X$ be a nonsingular variety of dimension 4 . Let $p \in X$ be a closed point. Let $V, W \subset X$ be closed subvarieties in $X$. Assume that there is an isomorphism

$$
\mathcal{O}_{X, p}^{\wedge} \cong \mathbf{C}[[x, y, z, w]]
$$

such that the ideal of $V$ is $(x z, x w, y z, y w)$ and the ideal of $W$ is $(x-z, y-w)$. Then a computation shows that

$$
\text { length } \mathbf{C}[[x, y, z, w]] /(x z, x w, y z, y w, x-z, y-w)=3
$$

On the other hand, the multiplicity $e(X, V \cdot W, p)=2$ as can be seen from the fact that formal locally $V$ is the union of two smooth planes $x=y=0$ and $z=w=0$ at $p$, each of which has intersection multiplicity 1 with the plane $x-z=y-w=0$ (Lemma 42.14.3). To make an actual example, take a general morphism $f: \mathbf{P}^{2} \rightarrow \mathbf{P}^{4}$ given by 5 homogeneous polynomials of degree $>1$. The image $V \subset \mathbf{P}^{4}=X$ will have singularities of the type described above, because there will be $p_{1}, p_{2} \in \mathbf{P}^{2}$ with $f\left(p_{1}\right)=f\left(p_{2}\right)$. To find $W$ take a general plane passing through such a point.

### 42.15. Algebraic multiplicities

$0 A Z U$ Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $M$ be a finite $A$-module and let $I \subset A$ be an ideal of definition (Algebra, Definition 10.58.1). Recall that the function

$$
\chi_{I, M}(n)=\operatorname{length}_{A}\left(M / I^{n} M\right)=\sum_{p=0, \ldots, n-1} \operatorname{length}_{A}\left(I^{p} M / I^{p+1} M\right)
$$

is a numerical polynomial (Algebra, Proposition 10.58.5). The degree of this polynomial is equal to $\operatorname{dim}(\operatorname{Supp}(M))$ by Algebra, Lemma 10.61.6.

0AZV Definition 42.15.1. In the situation above, if $d \geq \operatorname{dim}(\operatorname{Supp}(M))$, then we set $e_{I}(M, d)$ equal to 0 if $d>\operatorname{dim}(\operatorname{Supp}(M))$ and equal to $d$ ! times the leading coefficient of the numerical polynomial $\chi_{I, M}$ so that

$$
\chi_{I, M}(n) \sim e_{I}(M, d) \frac{n^{d}}{d!}+\text { lower order terms }
$$

The multiplicity of $M$ for the ideal of definition $I$ is $e_{I}(M)=e_{I}(M, \operatorname{dim}(\operatorname{Supp}(M)))$.
We have the following properties of these multiplicities.
0AZW Lemma 42.15.2. Let $A$ be a Noetherian local ring. Let $I \subset A$ be an ideal of definition. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite A-modules. Let $d \geq \operatorname{dim}(\operatorname{Supp}(M))$. Then

$$
e_{I}(M, d)=e_{I}\left(M^{\prime}, d\right)+e_{I}\left(M^{\prime \prime}, d\right)
$$

Proof. Immediate from the definitions and Algebra, Lemma 10.58 .10 .

0AZX Lemma 42.15.3. Let $A$ be a Noetherian local ring. Let $I \subset A$ be an ideal of definition. Let $M$ be a finite $A$-module. Let $d \geq \operatorname{dim}(\operatorname{Supp}(M))$. Then

$$
e_{I}(M, d)=\sum \operatorname{length}_{A_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right) e_{I}(A / \mathfrak{p}, d)
$$

where the sum is over primes $\mathfrak{p} \subset A$ with $\operatorname{dim}(A / \mathfrak{p})=1$.
Proof. Both the left and side and the right hand side are additive in short exact sequences of modules of dimension $\leq d$, see Lemma 42.15 .2 and Algebra, Lemma 10.51.3. Hence by Algebra, Lemma 10.61 .1 it suffices to prove this when $M=A / \mathfrak{q}$ for some prime $\mathfrak{q}$ of $A$ with $\operatorname{dim}(A / \mathfrak{q}) \leq d$. This case is obvious.

0AZY Lemma 42.15.4. Let $P$ be a polynomial of degree $r$ with leading coefficient $a$. Then

$$
r!a=\sum_{i=0, \ldots, r}(-1)^{i}\binom{r}{i} P(t-i)
$$

for any $t$.
Proof. Let us write $\Delta$ the operator which to a polynomial $P$ associates the polynomial $\Delta(P)=P(t)-P(t-1)$. We claim that

$$
\Delta^{r}(P)=\sum_{i=0, \ldots, r}(-1)^{i}\binom{r}{i} P(t-i)
$$

This is true for $r=0,1$ by inspection. Assume it is true for $r$. Then we compute

$$
\begin{aligned}
\Delta^{r+1}(P) & =\sum_{i=0, \ldots, r}(-1)^{i}\binom{r}{i} \Delta(P)(t-i) \\
& =\sum_{n=-r, \ldots, 0}(-1)^{i}\binom{r}{i}(P(t-i)-P(t-i-1))
\end{aligned}
$$

Thus the claim follows from the equality

$$
\binom{r+1}{i}=\binom{r}{i}+\binom{r}{i-1}
$$

The lemma follows from the fact that $\Delta(P)$ is of degree $r-1$ with leading coefficient $r a$ if the degree of $P$ is $r$.

An important fact is that one can compute the multiplicity in terms of the Koszul complex. Recall that if $R$ is a ring and $f_{1}, \ldots, f_{r} \in R$, then $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ denotes the Koszul complex, see More on Algebra, Section 15.22 .

0 AZZ Theorem 42.15.5. Let $A$ be a Noetherian local ring. Let $I=\left(f_{1}, \ldots, f_{r}\right) \subset A$ be an ideal of definition. Let $M$ be a finite $A$-module. Let $d \geq \operatorname{dim}(\operatorname{Supp}(M))$. Then

$$
e_{I}(M, r)=\sum(-1)^{i}{ }^{l} \text { length }_{A} H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{A} M\right)
$$

Proof. Let us change the Koszul complex $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ into a cochain complex $K^{\bullet}$ by setting $K^{n}=K_{-n}\left(f_{1}, \ldots, f_{r}\right)$. Then $K^{\bullet}$ is sitting in degrees $-r, \ldots, 0$ and $H^{i}\left(K^{\bullet} \otimes_{A} M\right)=H_{-i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{A} M\right)$. The statement of the theorem makes sense as the modules $H^{i}\left(K^{\bullet} \otimes M\right)$ are annihilated by $f_{1}, \ldots, f_{r}$ (More on Algebra, Lemma 15.22 .6 hence have finite length. Define a filtration on the complex $K^{\bullet}$ by setting

$$
F^{p}\left(K^{n} \otimes_{A} M\right)=I^{\max (0, p+n)}\left(K^{n} \otimes_{A} M\right), \quad p \in \mathbf{Z}
$$

Since $f_{i} I^{p} \subset I^{p+1}$ this is a filtration by subcomplexes. Thus we have a filtered complex and we obtain a spectral sequence, see Homology, Section 12.21. We have

$$
E_{0}=\bigoplus_{p, q} E_{0}^{p, q}=\bigoplus_{p, q} \operatorname{gr}^{p}\left(K^{p+q} \otimes_{A} M\right)=\operatorname{Gr}_{I}\left(K^{\bullet} \otimes_{A} M\right)
$$

Since $K^{n}$ is finite free we have

$$
\operatorname{Gr}_{I}\left(K^{\bullet} \otimes_{A} M\right)=\operatorname{Gr}_{I}\left(K^{\bullet}\right) \otimes_{\operatorname{Gr}_{I}(A)} \operatorname{Gr}_{I}(M)
$$

Note that $\operatorname{Gr}_{I}\left(K^{\bullet}\right)$ is the Koszul complex over $\operatorname{Gr}_{I}(A)$ on the elements $\bar{f}_{1}, \ldots, \bar{f}_{r} \in$ $I / I^{2}$. A simple calculation (omitted) shows that the differential $d_{0}$ on $E_{0}$ agrees with the differential coming from the Koszul complex. Since $\operatorname{Gr}_{I}(M)$ is a finite $\operatorname{Gr}_{I}(A)$-module and since $\operatorname{Gr}_{I}(A)$ is Noetherian (as a quotient of $A / I\left[x_{1}, \ldots, x_{r}\right]$ with $\left.x_{i} \mapsto \bar{f}_{i}\right)$, the cohomology module $E_{1}=\bigoplus E_{1}^{p, q}$ is a finite $\operatorname{Gr}_{I}(A)$-module. However, as above $E_{1}$ is annihilated by $\bar{f}_{1}, \ldots, \bar{f}_{r}$. We conclude $E_{1}$ has finite length. In particular we find that $\operatorname{Gr}_{F}^{p}\left(K^{\bullet} \otimes M\right)$ is acyclic for $p \gg 0$.
Next, we check that the spectral sequence above converges using Homology, Lemma 12.21 .10 . The required equalities follow easily from the Artin-Rees lemma in the form stated in Algebra, Lemma 10.50.3. Thus we see that

$$
\begin{aligned}
\sum(-1)^{i} \operatorname{length}_{A}\left(H^{i}\left(K^{\bullet} \otimes_{A} M\right)\right) & =\sum(-1)^{p+q} \operatorname{length}_{A}\left(E_{\infty}^{p, q}\right) \\
& =\sum(-1)^{p+q} \operatorname{length}_{A}\left(E_{1}^{p, q}\right)
\end{aligned}
$$

because as we've seen above the length of $E_{1}$ is finite (of course this uses additivity of lengths). Pick $t$ so large that $\operatorname{Gr}_{F}^{p}\left(K^{\bullet} \otimes M\right)$ is acyclic for $p \geq t$ (see above). Using additivity again we see that

$$
\sum(-1)^{p+q} \operatorname{length}_{A}\left(E_{1}^{p, q}\right)=\sum_{n} \sum_{p \leq t}(-1)^{n} \operatorname{length}_{A}\left(\operatorname{gr}^{p}\left(K^{n} \otimes_{A} M\right)\right)
$$

This is equal to

$$
\sum_{n=-r, \ldots, 0}(-1)^{n}\binom{r}{|n|} \chi_{I, M}(t+n)
$$

by our choice of filtration above and the definition of $\chi_{I, M}$ in Algebra, Section 10.58. The lemma follows from Lemma 42.15 .4 and the definition of $e_{I}(M, r)$.

0B00 Remark 42.15.6 (Trivial generalization). Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $M$ be a finite $A$-module. Let $I \subset A$ be an ideal. The following are equivalent
(1) $I^{\prime}=I+\operatorname{Ann}(M)$ is an ideal of definition (Algebra, Definition 10.58.1),
(2) the image $\bar{I}$ of $I$ in $\bar{A}=A / \operatorname{Ann}(M)$ is an ideal of definition,
(3) $\operatorname{Supp}(M / I M) \subset\{\mathfrak{m}\}$,
(4) $\operatorname{dim}(\operatorname{Supp}(M / I M)) \leq 0$, and
(5) $\operatorname{length}_{A}(M / I M)<\infty$.

This follows from Algebra, Lemma 10.61 .3 (details omitted). If this is the case we have $M / I^{n} M=M /\left(I^{\prime}\right)^{n} M$ for all $n$ and $M / I^{n} M=M / \bar{I}^{n} M$ for all $n$ if $M$ is viewed as an $\bar{A}$-module. Thus we can define

$$
\chi_{I, M}(n)=\operatorname{length}_{A}\left(M / I^{n} M\right)=\sum_{p=0, \ldots, n-1} \operatorname{length}_{A}\left(I^{p} M / I^{p+1} M\right)
$$

and we get

$$
\chi_{I, M}(n)=\chi_{I^{\prime}, M}(n)=\chi_{\bar{I}, M}(n)
$$

for all $n$ by the equalities above. All the results of Algebra, Section 10.58 and all the results in this section, have analogues in this setting. In particular we can define multiplicties $e_{I}(M, d)$ for $d \geq \operatorname{dim}(\operatorname{Supp}(M))$ and we have

$$
\chi_{I, M}(n) \sim e_{I}(M, d) \frac{n^{d}}{d!}+\text { lower order terms }
$$

as in the case where $I$ is an ideal of definition.

### 42.16. Computing intersection multiplicities

0B01 In this section we discuss some cases where the intersection multiplicities can be computed by different means. Here is a first example.

0B02 Lemma 42.16.1. Let $X$ be a nonsingular variety and $W, V \subset X$ closed subvarieties which intersect properly. Let $Z$ be an irreducible component of $V \cap W$ with generic point $\xi$. Assume that $\mathcal{O}_{W, \xi}$ and $\mathcal{O}_{V, \xi}$ are Cohen-Macaulay. Then

$$
e(X, V \cdot W, Z)=\text { length }_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{V \cap W, \xi}\right)
$$

where $V \cap W$ is the scheme theoretic intersection. In particular, if both $V$ and $W$ are Cohen-Macaulay, then $V \cdot W=[V \cap W]_{\operatorname{dim}(V)+\operatorname{dim}(W)-\operatorname{dim}(X)}$.

Proof. Set $A=\mathcal{O}_{X, \xi}, B=\mathcal{O}_{V, \xi}$, and $C=\mathcal{O}_{W, \xi}$. By Auslander-Buchsbaum (Algebra, Proposition 10.110.1) we can find a finite free resolution $F_{\bullet} \rightarrow B$ of length

$$
\operatorname{depth}(A)-\operatorname{depth}(B)=\operatorname{dim}(A)-\operatorname{dim}(B)=\operatorname{dim}(C)
$$

First equality as $A$ and $B$ are Cohen-Macaulay and the second as $V$ and $W$ intersect properly. Then $F \bullet \otimes_{A} C$ is a complex of finite free modules representing $B \otimes_{A}^{\mathbf{L}} C$ hence has cohomology modules with support in $\left\{\mathfrak{m}_{A}\right\}$. By the Acyclicity lemma (Algebra, Lemma 10.101 .9 ) which applies as $C$ is Cohen-Macaulay we conclude that $F_{\bullet} \otimes_{A} C$ has nonzero cohomology only in degree 0 . This finishes the proof.

0B03 Lemma 42.16.2. Let $A$ be a Noetherian local ring. Let $I=\left(f_{1}, \ldots, f_{r}\right)$ be an ideal generated by a regular sequence. Let $M$ be a finite A-module. Assume that $\operatorname{dim}(\operatorname{Supp}(M / I M))=0$. Then

$$
e_{I}(M, r)=\sum(-1)^{i} \text { length }_{A}\left(\operatorname{Tor}_{i}^{A}(A / I, M)\right)
$$

Here $e_{I}(M, r)$ is as in Remark 42.15.6.
Proof. Since $f_{1}, \ldots, f_{r}$ is a regular sequence the Koszul complex $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ is a resolution of $A / I$ over $A$, see More on Algebra, Lemma 15.23.6. Thus the right hand side is equal to

$$
\sum(-1)^{i} \operatorname{length}_{A} H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{A} M\right)
$$

Now the result follows immediately from Theorem 42.15 .5 if $I$ is an ideal of definition. In general, we replace $A$ by $\bar{A}=A / \operatorname{Ann}(M)$ and $f_{1}, \ldots, f_{r}$ by $\bar{f}_{1}, \ldots, \bar{f}_{r}$ which is allowed because

$$
K_{\bullet}\left(f_{1}, \ldots, f_{r}\right) \otimes_{A} M=K_{\bullet}\left(\bar{f}_{1}, \ldots, \bar{f}_{r}\right) \otimes_{\bar{A}} M
$$

Since $e_{I}(M, r)=e_{\bar{I}}(M, r)$ where $\bar{I}=\left(\bar{f}_{1}, \ldots, \bar{f}_{r}\right) \subset \bar{A}$ is an ideal of definition the result follows from Theorem 42.15.5 in this case as well.

0B04 Lemma 42.16.3. Let $X$ be a nonsingular variety. Let $W, V \subset X$ be closed subvarieties which intersect properly. Let $Z$ be an irreducible component of $V \cap W$ with generic point $\xi$. Suppose the ideal of $V$ in $\mathcal{O}_{X, \xi}$ is cut out by a regular sequence $f_{1}, \ldots, f_{c} \in \mathcal{O}_{X, \xi}$. Then $e(X, V \cdot W, Z)$ is equal to $c$ ! times the leading coefficient in the Hilbert polynomial

$$
t \mapsto \text { length }_{\mathcal{O}_{X, \xi}} \mathcal{O}_{W, \xi} /\left(f_{1}, \ldots, f_{c}\right)^{t}, \quad t \gg 0
$$

In particular, this coefficient is $>0$.
Proof. The equality

$$
e(X, V \cdot W, Z)=e_{\left(f_{1}, \ldots, f_{c}\right)}\left(\mathcal{O}_{W, \xi}, c\right)
$$

follows from the more general Lemma 42.16.2. To see that $e_{\left(f_{1}, \ldots, f_{c}\right)}\left(\mathcal{O}_{W, \xi}, c\right)$ is $>0$ or equivalently that $e_{\left(f_{1}, \ldots, f_{c}\right)}\left(\mathcal{O}_{W, \xi}, c\right)$ is the leading coefficient of the Hilbert polynomial it suffices to show that the dimension of $\mathcal{O}_{W, \xi}$ is $c$, because the degree of the Hilbert polynomial is equal to the dimension by Algebra, Proposition 10.59.8, Say $\operatorname{dim}(V)=r, \operatorname{dim}(W)=s$, and $\operatorname{dim}(X)=n$. Then $\operatorname{dim}(Z)=r+s-n$ as the intersection is proper. Thus the transcendence degree of $\kappa(\xi)$ over $\mathbf{C}$ is $r+s-n$, see Algebra, Lemma 10.115.1. We have $r+c=n$ because $V$ is cut out by a regular sequence in a neighbourhood of $\xi$, see Divisors, Lemma 30.17 .8 and then Lemma 42.13 .2 applies (for example). Thus

$$
\operatorname{dim}\left(\mathcal{O}_{W, \xi}\right)=s-(r+s-n)=s-((n-c)+s-n)=c
$$

the first equality by Algebra, Lemma 10.115.3.
0B05 Lemma 42.16.4. In Lemma 42.16.3 assume that $c=1$, i.e., $V$ is an effective Cartier divisor. Then

$$
e(X, V \cdot W, Z)=\text { length }_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{W, \xi} / f_{1} \mathcal{O}_{W, \xi}\right)
$$

Proof. In this case the image of $f_{1}$ in $\mathcal{O}_{W, \xi}$ is nonzero by properness of intersection, hence a nonzerodivisor divisor. Moreover, $\mathcal{O}_{W, \xi}$ is a Noetherian local domain of dimension 1. Thus

$$
\operatorname{length}_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{W, \xi} / f_{1}^{t} \mathcal{O}_{W, \xi}\right)=\text { length }_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{W, \xi} / f_{1} \mathcal{O}_{W, \xi}\right)
$$

for all $t \geq 1$, see Algebra, Lemma 10.120.1. This proves the lemma.
0B06 Lemma 42.16.5. In Lemma 42.16 .3 assume that the local ring $\mathcal{O}_{W, \xi}$ is CohenMacaulay. Then we have

$$
e(X, V \cdot W, Z)=\text { length }_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{W, \xi} / f_{1} \mathcal{O}_{W, \xi}+\ldots+f_{c} \mathcal{O}_{W, \xi}\right)
$$

Proof. This follows immediately from Lemma 42.16.1. Alternatively, we can deduce it from Lemma 42.16.3. Namely, by Algebra, Lemma 10.103.2 we see that $f_{1}, \ldots, f_{c}$ is a regular sequence in $\mathcal{O}_{W, \xi}$. Then Algebra, Lemma 10.68 .2 shows that $f_{1}, \ldots, f_{c}$ is a quasi-regular sequence. This easily implies the length of $\mathcal{O}_{W, \xi} /\left(f_{1}, \ldots, f_{c}\right)^{t}$ is

$$
\binom{c+t}{c} \operatorname{length}_{\mathcal{O}_{X, \xi}}\left(\mathcal{O}_{W, \xi} / f_{1} \mathcal{O}_{W, \xi}+\ldots+f_{c} \mathcal{O}_{W, \xi}\right)
$$

Looking at the leading coefficient we conclude.

### 42.17. Intersection product using Tor formula

0 B 08 Let $X$ be a nonsingular variety. Let $\alpha=\sum n_{i}\left[W_{i}\right]$ be an $r$-cycle and $\beta=\sum_{j} m_{j}\left[V_{j}\right]$ be an $s$-cycle on $X$. Assume that $\alpha$ and $\beta$ intersect properly, see Definition 42.13.5.
In this case we define

$$
\alpha \cdot \beta=\sum_{i, j} n_{i} m_{j} W_{i} \cdot V_{j}
$$

where $W_{i} \cdot V_{j}$ is as defined in Section 42.14. If $\beta=[V]$ where $V$ is a closed subvariety of dimension $s$, then we sometimes write $\alpha \cdot \beta=\alpha \cdot V$.
0 B07 Lemma 42.17.1. Let $X$ be a nonsingular variety. Let $a, b \in \mathbf{P}^{1}$ be distinct closed points. Let $k \geq 0$.
(1) If $W \subset X \times \mathbf{P}^{1}$ is a closed subvariety of dimension $k+1$ which intersects $X \times a$ properly, then
(a) $\left[W_{a}\right]_{k}=W \cdot X \times a$ as cycles on $X \times \mathbf{P}^{1}$, and (b) $\left[W_{a}\right]_{k}=p r_{X, *}(W \cdot X \times a)$ as cycles on $X$.
(2) Let $\alpha$ be $a(k+1)$-cycle on $X \times \mathbf{P}^{1}$ which intersects $X \times a$ and $X \times b$ properly. Then $p r_{X, *}(\alpha \cdot X \times a-\alpha \cdot X \times b)$ is rationally equivalent to zero.
(3) Conversely, any $k$-cycle which is rationally equivalent to 0 is of this form.

Proof. First we observe that $X \times a$ is an effective Cartier divisor in $X \times \mathbf{P}^{1}$ and that $W_{a}$ is the scheme theoretic intersection of $W$ with $X \times a$. Hence the equality in (1)(a) is immediate from the definitions and the calculation of intersection multiplicity in case of a Cartier divisor given in Lemma 42.16.4. Part (1)(b) holds because $W_{a} \rightarrow X \times \mathbf{P}^{1} \rightarrow X$ maps isomorphically onto its image which is how we viewed $W_{a}$ as a closed subscheme of $X$ in Section 42.8. Parts (2) and (3) are formal consequences of part (1) and the definitions.

For transversal intersections of closed subschemes the intersection multiplicity is 1 .
0B1J Lemma 42.17.2. Let $X$ be a nonsingular variety. Let $r, s \geq 0$ and let $Y, Z \subset X$ be closed subschemes with $\operatorname{dim}(Y) \leq r$ and $\operatorname{dim}(Z) \leq s$. Assume $[Y]_{r}=\sum n_{i}\left[Y_{i}\right]$ and $[Z]_{s}=\sum m_{j}\left[Z_{j}\right]$ intersect properly. Let $T$ be an irreducible component of $Y_{i_{0}} \cap Z_{j_{0}}$ for some $i_{0}$ and $j_{0}$ and assume that the multiplicity (in the sense of Section 42.4) of $T$ in the closed subscheme $Y \cap Z$ is 1 . Then
(1) the coefficient of $T$ in $[Y]_{r} \cdot[Z]_{s}$ is 1 ,
(2) $Y$ and $Z$ are nonsingular at the generic point of $Z$,
(3) $n_{i_{0}}=1, m_{j_{0}}=1$, and
(4) $T$ is not contained in $Y_{i}$ or $Z_{j}$ for $i \neq i_{0}$ and $j \neq j_{0}$.

Proof. Set $n=\operatorname{dim}(X), a=n-r, b=n-s$. Observe that $\operatorname{dim}(T)=r+$ $s-n=n-a-b$ by the assumption that the intersections are transversal. Let $(A, \mathfrak{m}, \kappa)=\left(\mathcal{O}_{X, \xi}, \mathfrak{m}_{\xi}, \kappa(\xi)\right)$ where $\xi \in T$ is the generic point. Then $\operatorname{dim}(A)=a+b$, see Varieties, Lemma 32.17 .3 Let $I_{0}, I, J_{0}, J \subset A$ cut out the trace of $Y_{i_{0}}, Y, Z_{j_{0}}$, $Z$ in $\operatorname{Spec}(A)$. Then $\operatorname{dim}(A / I)=\operatorname{dim}\left(A / I_{0}\right)=b$ and $\operatorname{dim}(A / J)=\operatorname{dim}\left(A / J_{0}\right)=a$ by the same reference. Set $\bar{I}=I+\mathfrak{m}^{2} / \mathfrak{m}^{2}$. Then $I \subset I_{0} \subset \mathfrak{m}$ and $J \subset J_{0} \subset \mathfrak{m}$ and $I+J=\mathfrak{m}$. By Lemma 42.14 .3 and its proof we see that $I_{0}=\left(f_{1}, \ldots, f_{a}\right)$ and $J_{0}=\left(g_{1}, \ldots, g_{b}\right)$ where $f_{1}, \ldots, g_{b}$ is a regular system of parameters for the regular local ring $A$. Since $I+J=\mathfrak{m}$, the map

$$
I \oplus J \rightarrow \mathfrak{m} / \mathfrak{m}^{2}=\kappa f_{1} \oplus \ldots \oplus \kappa f_{a} \oplus \kappa g_{1} \oplus \ldots \oplus \kappa g_{b}
$$

is surjective. We conclude that we can find $f_{1}^{\prime}, \ldots, f_{a}^{\prime} \in I$ and $g_{1}^{\prime}, \ldots, g_{b}^{\prime} \in J$ whose residue classes in $\mathfrak{m} / \mathfrak{m}^{2}$ are equal to the residue classes of $f_{1}, \ldots, f_{a}$ and $g_{1}, \ldots, g_{b}$. Then $f_{1}^{\prime}, \ldots, g_{b}^{\prime}$ is a regular system of parameters of $A$. By Algebra, Lemma 10.105.3 we find that $A /\left(f_{1}^{\prime}, \ldots, f_{a}^{\prime}\right)$ is a regular local ring of dimension $b$. Thus any nontrivial quotient of $A /\left(f_{1}^{\prime}, \ldots, f_{a}^{\prime}\right)$ has strictly smaller dimension (Algebra, Lemmas 10.105.2 and 10.59.12. Hence $I=\left(f_{1}^{\prime}, \ldots, f_{a}^{\prime}\right)=I_{0}$. By symmetry $J=J_{0}$. This proves (2), (3), and (4). Finally, the coefficient of $T$ in $[Y]_{r} \cdot[Z]_{s}$ is the coefficient of $T$ in $Y_{i_{0}} \cdot Z_{j_{0}}$ which is is 1 by Lemma 42.14 .3

### 42.18. Exterior product

Let $X$ and $Y$ be varieties. Let $V$, resp. $W$ be a closed subvariety of $X$, resp. $Y$. The product $V \times W$ is a closed subvariety of $X \times Y$ (Lemma 42.13.1). For a $k$-cycle $\alpha=\sum n_{i}\left[V_{i}\right]$ and a l-cycle $\beta=\sum m_{j}\left[V_{j}\right]$ on $Y$ we define the exterior product of $\alpha$ and $\beta$ to be the cycle $\alpha \times \beta=\sum n_{i} m_{j}\left[V_{i} \times W_{j}\right]$. Exterior product defines a Z-linear map

$$
Z_{r}(X) \otimes_{\mathbf{Z}} Z_{s}(Y) \longrightarrow Z_{r+s}(X \times Y)
$$

Let us prove that exterior product factors through rational equivalence.
0B0S Lemma 42.18.1. Let $X$ and $Y$ be varieties. Let $\alpha \in Z_{r}(X)$ and $\beta \in Z_{s}(Y)$. If $\alpha \sim_{r a t} 0$ or $\beta \sim_{r a t} 0$, then $\alpha \times \beta \sim_{r a t} 0$.

Proof. By linearity and symmetry in $X$ and $Y$, it suffices to prove this when $\alpha=[V]$ for some subvariety $V \subset X$ of dimension $s$ and $\beta=\left[W_{a}\right]_{s}-\left[W_{b}\right]_{s}$ for some closed subvariety $W \subset Y \times \mathbf{P}^{1}$ of dimension $s+1$ which intersects $Y \times a$ and $Y \times b$ properly. In this case the lemma follows if we can prove

$$
\left[(V \times W)_{a}\right]_{r+s}=[V] \times\left[W_{a}\right]_{s}
$$

and similarly with $a$ replaced by $b$. Namely, then we see that $\alpha \times \beta=[(V \times$ $\left.W)_{a}\right]_{r+s}-\left[(V \times W)_{b}\right]_{r+s}$ as desired. To see the displayed equality we note the equality

$$
V \times W_{a}=(V \times W)_{a}
$$

of schemes. The projection $V \times W_{a} \rightarrow W_{a}$ induces a bijection of irreducible components (see for example Varieties, Lemma 32.6.4). Let $W^{\prime} \subset W_{a}$ be an irreducible component with generic point $\zeta$. Then $V \times W^{\prime}$ is the corresponding irreducible compenent of $V \times W_{a}$ (see Lemma 42.13.1). Let $\xi$ be the generic point of $V \times W^{\prime}$. We have to show that

$$
\operatorname{length}_{\mathcal{O}_{Y, \zeta}}\left(\mathcal{O}_{W_{a}, \zeta}\right)=\operatorname{length}_{\mathcal{O}_{X \times Y, \xi}}\left(\mathcal{O}_{V \times W_{a}, \xi}\right)
$$

In this formula we may replace $\mathcal{O}_{Y, \zeta}$ by $\mathcal{O}_{W_{a}, \zeta}$ and we may replace $\mathcal{O}_{X \times Y, \zeta}$ by $\mathcal{O}_{V \times W_{a}, \zeta}$ (see Algebra, Lemma 10.51.5. As $\mathcal{O}_{W_{a}, \zeta} \rightarrow \mathcal{O}_{V \times W_{a}, \xi}$ is flat, by Algebra, Lemma 10.51 .13 it suffices to show that

$$
\operatorname{length}_{\mathcal{O}_{V \times W_{a}, \xi}}\left(\mathcal{O}_{V \times W_{a}, \xi} / \mathfrak{m}_{\zeta} \mathcal{O}_{V \times W_{a}, \xi}\right)=1
$$

This is true because the quotient on the right is the local ring $\mathcal{O}_{V \times W^{\prime}, \xi}$ of a variety at a generic point hence equal to $\kappa(\xi)$.

We conclude that exterior product defines a commutative diagram

for any pair of varieties $X$ and $Y$. For nonsingular varieties we can think of the exterior product as an intersection product of pullbacks.

0B0R Lemma 42.18.2. Let $X$ and $Y$ be nonsingular varieties. Let $\alpha \in Z_{r}(X)$ and $\beta \in Z_{s}(Y)$. Then
(1) $p r_{Y}^{*}(\beta)=[X] \times \beta$ and $p r_{X}^{*}(\alpha)=\alpha \times[Y]$,
(2) $\alpha \times[Y]$ and $[X] \times \beta$ intersect properly on $X \times Y$, and
(3) we have $\alpha \times \beta=(\alpha \times[Y]) \cdot([X] \times \beta)=p r_{Y}^{*}(\alpha) \cdot p r_{X}^{*}(\beta)$ in $Z_{r+s}(X \times Y)$.

Proof. By linearity we may assume $\alpha=[V]$ and $\beta=[W]$. Then (1) says that $\operatorname{pr}_{Y}^{-1}(W)=X \times W$ and $\operatorname{pr}_{X}^{-1}(V)=V \times Y$. This is clear. Part (2) holds because $X \times W \cap V \times Y=V \times W$ and $\operatorname{dim}(V \times W)=r+s$ by Lemma 42.13.1.
Proof of (3). Let $\xi$ be the generic point of $V \times W$. Since the projections $X \times W \rightarrow W$ is smooth as a base change of $X \rightarrow \operatorname{Spec}(\mathbf{C})$, we see that $X \times W$ is nonsingular at every point lying over the generic point of $W$, in particular at $\xi$. Similarly for $V \times Y$. Hence $\mathcal{O}_{X \times W, \xi}$ and $\mathcal{O}_{V \times Y, \xi}$ are Cohen-Macaulay local rings and Lemma 42.16 .1 applies. Since $V \times Y \cap X \times W=V \times W$ scheme theoretically the proof is complete.

### 42.19. Reduction to the diagonal

0B0A Let $X$ be a nonsingular variety. We will use $\Delta$ to denote either the diagonal morphism $\Delta: X \rightarrow X \times X$ or the image $\Delta \subset X \times X$. Reduction to the diagonal is the statement that intersection products on $X$ can be reduced to intersection products of exterior products with the diagonal on $X \times X$.
0B0T Lemma 42.19.1. Let $X$ be a nonsingular variety.
(1) If $\mathcal{F}$ and $\mathcal{G}$ are coherent $\mathcal{O}_{X}$-modules, then there are canonical isomorphisms

$$
\operatorname{Tor}_{i}^{\mathcal{O}_{X \times X}}\left(\mathcal{O}_{\Delta}, p r_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times X}} p r_{2}^{*} \mathcal{G}\right)=\Delta_{*} \operatorname{Tor}_{i}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})
$$

(2) If $K$ and $M$ are in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$, then there is a canonical isomorphism

$$
L \Delta^{*}\left(L p r_{1}^{*} K \otimes_{\mathcal{O}_{X \times X}}^{\mathbf{L}} L p r_{2}^{*} M\right)=K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} M
$$

in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and a canonical isomorphism

$$
\begin{aligned}
& \mathcal{O}_{\Delta} \otimes_{\mathcal{O}_{X \times X}}^{\mathbf{L}} L p r_{1}^{*} K \otimes_{\mathcal{O}_{X \times X}}^{\mathbf{L}} L p r_{2}^{*} M=\Delta_{*}\left(K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}^{\prime}} M\right) \\
& \text { in } D_{Q C o h}(X \times X)
\end{aligned}
$$

Proof. Let us explain how to prove (1) in a more elementary way and part (2) using more general theory. As (2) implies (1) the reader can skip the proof of (1).
Proof of (1). Choose an affine open $\operatorname{Spec}(A) \subset X$. Then $A$ is a Noetherian C-algebra and $\mathcal{F}, \mathcal{G}$ correspond to finite $A$-modules $M$ and $N$ (Cohomology of Schemes, Lemma 29.9.1. By Derived Categories of Schemes, Lemma 35.3.8 we
may compute $\operatorname{Tor}_{i}$ over $\mathcal{O}_{X}$ by first computing the Tor's of $M$ and $N$ over $A$, and then taking the associated $\mathcal{O}_{X}$-module. For the $\operatorname{Tor}_{i}$ over $\mathcal{O}_{X \times X}$ we compute the tor of $A$ and $M \otimes_{\mathbf{C}} N$ over $A \otimes_{\mathbf{C}} A$ and then take the associated $\mathcal{O}_{X \times X}$-module. Hence on this afffine patch we have to prove that

$$
\operatorname{Tor}_{i}^{A \otimes_{\mathbf{C}} A}\left(A, M \otimes_{\mathbf{C}} N\right)=\operatorname{Tor}_{i}^{A}(M, N)
$$

To see this choose resolutions $F_{\bullet} \rightarrow M$ and $G_{\bullet} \rightarrow M$ by finite free $A$-modules (Algebra, Lemma 10.70.1). Note that $\operatorname{Tot}\left(F_{\bullet} \otimes_{\mathbf{C}} G_{\bullet}\right)$ is a resolution of $M \otimes_{\mathbf{C}} N$ as it computes Tor groups over $\mathbf{C}$ ! Of course the terms of $F_{\bullet} \otimes_{\mathbf{C}} G_{\bullet}$ are finite free $A \otimes_{\mathbf{C}} A$-modules. Hence the left hand side of the displayed equation is the module

$$
H_{i}\left(A \otimes_{A \otimes_{\mathbf{C}} A} \operatorname{Tot}\left(F_{\bullet} \otimes_{\mathbf{C}} G_{\bullet}\right)\right)
$$

and the right hand side is the module

$$
H_{i}\left(\operatorname{Tot}\left(F_{\bullet} \otimes_{A} G_{\bullet}\right)\right)
$$

Since $A \otimes_{A \otimes_{\mathbf{C}} A}\left(F_{p} \otimes_{\mathbf{C}} G_{q}\right)=F_{p} \otimes_{A} G_{q}$ we see that these modules are equal. This defines an isomorphism over the affine open $\operatorname{Spec}(A) \times \operatorname{Spec}(A)$ (which is good enough for the application to equality of intersection numbers). We omit the proof that these isomorphisms glue.

Proof of (2). The second statement follows from the first by the projection formula as stated in Derived Categories of Schemes, Lemma 35.18.1. To see the first, represent $K$ and $M$ by K-flat complexes $\mathcal{K}^{\bullet}$ and $\mathcal{M}^{\bullet}$. Since pullback and tensor product preserve K-flat complexes (Cohomology, Lemmas 20.27.5 and 20.27.7) we see that it suffices to show

$$
\Delta^{*} \operatorname{Tot}\left(\operatorname{pr}_{1}^{*} \mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X \times X}} \operatorname{pr}_{2}^{*} \mathcal{M}^{\bullet}\right)=\operatorname{Tot}\left(\mathcal{K}^{\bullet} \otimes_{\mathcal{O}_{X}} \mathcal{M}^{\bullet}\right)
$$

Thus it suffices to see that there are canonical isomorphisms

$$
\Delta^{*}\left(\operatorname{pr}_{1}^{*} \mathcal{K} \otimes_{\mathcal{O}_{X \times X}} \operatorname{pr}_{2}^{*} \mathcal{M}\right) \longrightarrow \mathcal{K} \otimes_{\mathcal{O}_{X}} \mathcal{M}
$$

whenever $\mathcal{K}$ and $\mathcal{M}$ are $\mathcal{O}_{X}$-modules (not necessarily quasi-coherent or flat). We omit the details.

0B0U Lemma 42.19.2. Let $X$ be a nonsingular variety. Let $\alpha$, resp. $\beta$ be an r-cycle, resp. s-cycle on $X$. Assume $\alpha$ and $\beta$ intersect properly. Then
(1) $\alpha \times \beta$ and $[\Delta]$ intersect properly
(2) we have $\Delta_{*}(\alpha \cdot \beta)=[\Delta] \cdot \alpha \times \beta$ as cycles on $X \times X$,
(3) if $X$ is proper, then $\operatorname{pr}_{1, *}([\Delta] \cdot \alpha \times \beta)=\alpha \cdot \beta$, where $p r_{1}: X \times X \rightarrow X$ is the projection.

Proof. By linearity it suffices to prove this when $\alpha=[V]$ and $\beta=[W]$ for some closed subvarieties $V \subset X$ and $W \subset Y$ which intersect properly. Recall that $V \times W$ is a closed subvariety of dimension $r+s$. Observe that scheme theoretically we have $V \cap W=\Delta^{-1}(V \times W)$ as well as $\Delta(V \cap W)=\Delta \cap V \times W$. This proves (1).

Proof of (2). Let $Z \subset V \cap W$ be an irreducible component with generic point $\xi$. We have to show that the coefficient of $Z$ in $\alpha \cdot \beta$ is the same as the coefficient of $\Delta(Z)$ in $[\Delta] \cdot \alpha \times \beta$. The first is given by the integer

$$
\sum(-1)^{i} \operatorname{length}_{\mathcal{O}_{X, \xi}} \operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)_{\xi}
$$

and the second by the integer

$$
\sum(-1)^{i} \operatorname{length}_{\mathcal{O}_{X \times Y, \Delta(\xi)}} \operatorname{Tor}_{i}^{\mathcal{O}_{X \times Y}}\left(\mathcal{O}_{\Delta}, \mathcal{O}_{V \times W}\right)_{\Delta(\xi)}
$$

However, by Lemma 42.19.1 we have

$$
\operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)_{\xi} \cong \operatorname{Tor}_{i}^{\mathcal{O}_{X \times Y}}\left(\mathcal{O}_{\Delta}, \mathcal{O}_{V \times W}\right)_{\Delta(\xi)}
$$

as $\mathcal{O}_{X \times X, \Delta(\xi)}$-modules. Thus equality of lengths (by Algebra, Lemma 10.51 .5 to be precise).
Part (2) implies (3) because $\mathrm{pr}_{1, *} \circ \Delta_{*}=\mathrm{id}$ by Lemma 42.6.2.
0B0V Proposition 42.19.3. Let $X$ be a nonsingular variety. Let $V \subset X$ and $W \subset Y$ be closed subvarieties which intersect properly. Let $Z \subset V \cap W$ be an irreducible component. Then $e(X, V \cdot W, Z)>0$.

Proof. By Lemma 42.19.2 we have

$$
e(X, V \cdot W, Z)=e(X \times X, \Delta \cdot V \times W, \Delta(Z))
$$

Since $\Delta: X \rightarrow X \times X$ is a regular immersion (see Lemma 42.13.3), we see that $e(X \times X, \Delta \cdot V \times W, \Delta(Z))$ is a positive integer by Lemma 42.16.3.

The following is a key lemma in the development of the theory as is done in this chapter. Essentially, this lemma tells us that the intersection numbers have a suitable additivity property.

0B0W Lemma 42.19.4. Let $X$ be a nonsingular variety. Let $\mathcal{F}$ and $\mathcal{G}$ be coherent sheaves on $X$ with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq r, \operatorname{dim}(\operatorname{Supp}(\mathcal{G})) \leq s$, and $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}) \cap \operatorname{Supp}(\mathcal{G})) \leq$ $r+s-\operatorname{dim} X$. In this case $[\mathcal{F}]_{r}$ and $[\mathcal{G}]_{s}$ intersect properly and

$$
[\mathcal{F}]_{r} \cdot[\mathcal{G}]_{s}=\sum(-1)^{p}\left[\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})\right]_{r+s-\operatorname{dim}(X)}
$$

Proof. The statement that $[\mathcal{F}]_{r}$ and $[\mathcal{G}]_{s}$ intersect properly is immediate. Since we are proving an equality of cycles we may work locally on $X$. (Observe that the formation of the intersection product of cycles, the formation of Tor-sheaves, and forming the cycle associated to a coherent sheaf, each commute with restriction to open subschemes.) Thus we may and do assume that $X$ is affine.

Denote

$$
\operatorname{RHS}(\mathcal{F}, \mathcal{G})=[\mathcal{F}]_{r} \cdot[\mathcal{G}]_{s} \quad \text { and } \quad \operatorname{LHS}(\mathcal{F}, \mathcal{G})=\sum(-1)^{p}\left[\operatorname{Tor}_{p}^{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})\right]_{r+s-\operatorname{dim}(X)}
$$

Consider a short exact sequence

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

of coherent sheaves on $X$ with $\operatorname{Supp}\left(\mathcal{F}_{i}\right) \subset \operatorname{Supp}(\mathcal{F})$, then both $L H S\left(\mathcal{F}_{i}, \mathcal{G}\right)$ and $\operatorname{RHS}\left(\mathcal{F}_{i}, \mathcal{G}\right)$ are defined for $i=1,2,3$ and we have

$$
R H S\left(\mathcal{F}_{2}, \mathcal{G}\right)=R H S\left(\mathcal{F}_{1}, \mathcal{G}\right)+R H S\left(\mathcal{F}_{3}, \mathcal{G}\right)
$$

and similarly for LHS. Namely, the support condition guarantees that everything is defined, the short exact sequence and additivity of lenghts gives

$$
\left[\mathcal{F}_{2}\right]_{r}=\left[\mathcal{F}_{1}\right]_{r}+\left[\mathcal{F}_{3}\right]_{r}
$$

(Chow Homology, Lemma 41.11.4) which implies additivity for RHS. The long exact sequence of Tors

$$
\ldots \rightarrow \operatorname{Tor}_{1}\left(\mathcal{F}_{3}, \mathcal{G}\right) \rightarrow \operatorname{Tor}_{0}\left(\mathcal{F}_{1}, \mathcal{G}\right) \rightarrow \operatorname{Tor}_{0}\left(\mathcal{F}_{2}, \mathcal{G}\right) \rightarrow \operatorname{Tor}_{0}\left(\mathcal{F}_{3}, \mathcal{G}\right) \rightarrow 0
$$

This is one of the main results of Ser65.

Ser65, Chapter V]
and additivity of lengths as before implies additivity for LHS.
By Algebra, Lemma 10.61 .1 and the fact that $X$ is affine, we can find a filtration of $\mathcal{F}$ whose graded pieces are structure sheaves of closed subvarieties of $\operatorname{Supp}(\mathcal{F})$. The additivity shown in the previous paragraph, implies that it suffices to prove $L H S=R H S$ with $\mathcal{F}$ replaced by $\mathcal{O}_{V}$ where $V \subset \operatorname{Supp}(\mathcal{F})$. By symmetry we can do the same for $\mathcal{G}$. This reduces us to proving that

$$
L H S\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)=R H S\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)
$$

where $W \subset \operatorname{Supp}(\mathcal{G})$ is a closed subvariety. If $\operatorname{dim}(V)=r$ and $\operatorname{dim}(W)=s$, then this equality is the definition of $V \cdot W$. On the other hand, if $\operatorname{dim}(V)<$ $r$ or $\operatorname{dim}(W)<s$, i.e., $[V]_{r}=0$ or $[W]_{s}=0$, then we have to prove that $\operatorname{RHS}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)=0{ }^{5}$
Let $Z \subset V \cap W$ be an irreducible component of dimension $r+s-\operatorname{dim}(X)$. This is the maximal dimension of a component and it suffices to show that the coefficient of $Z$ in $R H S$ is zero. Let $\xi \in Z$ be the generic point. Write $A=\mathcal{O}_{X, \xi}, B=\mathcal{O}_{X \times X, \Delta(\xi)}$, and $C=\mathcal{O}_{V \times W, \Delta(\xi)}$. By Lemma 42.19.1 we have

$$
\text { coeff of } Z \text { in } R H S\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)=\sum(-1)^{i} \operatorname{length}_{B} \operatorname{Tor}_{i}^{B}(A, C)
$$

Since $\operatorname{dim}(V)<r$ or $\operatorname{dim}(W)<s$ we have $\operatorname{dim}(V \times W)<r+s$ which implies $\operatorname{dim}(C)<\operatorname{dim}(X)$ (small detail omitted). Moreover, the kernel $I$ of $B \rightarrow A$ is generated by a regular sequence of length $\operatorname{dim}(X)$ (Lemma 42.13.3). Hence vanishing by Lemma 42.16 .2 because the Hilbert function of $C$ with respect to $I$ has degree $\operatorname{dim}(C)<n$ by Algebra, Proposition 10.59 .8 .

0B0X Remark 42.19.5. Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring. Let $M$ and $N$ be nonzero finite $A$-modules such that $M \otimes_{A} N$ is supported in $\{\mathfrak{m}\}$. Then

$$
\chi(M, N)=\sum(-1)^{i} \operatorname{length}_{A} \operatorname{Tor}_{i}^{A}(M, N)
$$

is finite. Let $r=\operatorname{dim}(\operatorname{Supp}(M))$ and $s=\operatorname{dim}(\operatorname{Supp}(N))$. In Ser65] it is shown that $r+s \leq \operatorname{dim}(A)$ and the following conjectures are made:
(1) if $r+s<\operatorname{dim}(A)$, then $\chi(M, N)=0$, and
(2) if $r+s=\operatorname{dim}(A)$, then $\chi(M, N)>0$.

The arguments that prove Lemma 42.19.4 and Proposition 42.19.3 can be leveraged (as is done in Serre's text) to show that (1) and (2) are true if $A$ contains a field. Currently, conjecture (1) is known in general and it is known that $\chi(M, N) \geq 0$ in general (Gabber). Positivity is, as far as we know, still an open problem.

### 42.20. Associativity of intersections

0B1K It is clear that proper intersections as defined above are commutative. Using the key Lemma 42.19.4 we can prove that (proper) intersection products are associative.
0B1L Lemma 42.20.1. Let $X$ be a nonsingular variety. Let $U, V, W$ be closed subvarieties. Assume that $U, V, W$ intersect properly pairwise and that $\operatorname{dim}(U \cap V \cap W) \leq$ $\operatorname{dim}(U)+\operatorname{dim}(V)+\operatorname{dim}(W)-2 \operatorname{dim}(X)$. Then

$$
U \cdot(V \cdot W)=(U \cdot V) \cdot W
$$

[^120]as cycles on $X$.
Proof. We are going to use Lemma 42.19 .4 without further mention. This implies that
\[

$$
\begin{aligned}
V \cdot W & =\sum(-1)^{i}\left[\operatorname{Tor}_{i}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)\right]_{b+c-n} \\
U \cdot(V \cdot W) & =\sum(-1)^{i+j}\left[\operatorname{Tor}_{j}\left(\mathcal{O}_{U}, \operatorname{Tor}_{i}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)\right)\right]_{a+b+c-2 n} \\
U \cdot V & =\sum(-1)^{i}\left[\operatorname{Tor}_{i}\left(\mathcal{O}_{U}, \mathcal{O}_{V}\right)\right]_{a+b-n} \\
(U \cdot V) \cdot W & \left.=\sum(-1)^{i+j}\left[\operatorname{Tor}_{j}\left(\operatorname{Tor}_{i}\left(\mathcal{O}_{U}, \mathcal{O}_{V}\right), \mathcal{O}_{W}\right)\right)\right]_{a+b+c-2 n}
\end{aligned}
$$
\]

where $\operatorname{dim}(U)=a, \operatorname{dim}(V)=b, \operatorname{dim}(W)=c, \operatorname{dim}(X)=n$. The assumptions in the lemma guarantee that the coherent sheaves in the formulae above satisfy the required bounds on dimensions of supports in order to make sense of these. Now consider the object

$$
K=\mathcal{O}_{U} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{O}_{V} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{O}_{W}
$$

of the derived category $D_{C o h}\left(\mathcal{O}_{X}\right)$. We claim that the expressions obtained above for $U \cdot(V \cdot W)$ and $(U \cdot V) \cdot W$ are equal to

$$
\sum(-1)^{k}\left[H^{k}(K)\right]_{a+b+c-2 n}
$$

This will prove the lemma. By symmetry it suffices to prove one of these equalities. To do this we represent $\mathcal{O}_{U}$ and $\mathcal{O}_{V} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{O}_{W}$ by K-flat complexes $M^{\bullet}$ and $L^{\bullet}$ and use the spectral sequence associated to the double complex $K^{\bullet} \otimes_{\mathcal{O}_{X}} L^{\bullet}$ in Homology, Section 12.22 . This is a spectral sequence with $E_{2}$ page

$$
E_{2}^{p, q}=\operatorname{Tor}_{-p}\left(\mathcal{O}_{U}, \operatorname{Tor}_{-q}\left(\mathcal{O}_{V}, \mathcal{O}_{W}\right)\right)
$$

converging to $H^{p+q}(K)$ (details omitted; compare with More on Algebra, Example 15.52.4. Since lengths are additive in short exact sequences we see that the result is true.

### 42.21. Flat pullback and intersection products

0B0B Short discussion of the interaction between intersections and flat pullback.
0B0Y Lemma 42.21.1. Let $f: X \rightarrow Y$ be a flat morphism of nonsingular varieties. Set $e=\operatorname{dim}(X)-\operatorname{dim}(Y)$. Let $\mathcal{F}$ and $\mathcal{G}$ be coherent sheaves on $Y$ with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq$ $r, \operatorname{dim}(\operatorname{Supp}(\mathcal{G})) \leq s$, and $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}) \cap \operatorname{Supp}(\mathcal{G})) \leq r+s-\operatorname{dim}(Y)$. In this case the cycles $\left[f^{*} \mathcal{F}\right]_{r+e}$ and $\left[f^{*} \mathcal{G}\right]_{s+e}$ intersect properly and

$$
f^{*}\left([\mathcal{F}]_{r} \cdot[\mathcal{G}]_{s}\right)=\left[f^{*} \mathcal{F}\right]_{r+e} \cdot\left[f^{*} \mathcal{G}\right]_{s+e}
$$

Proof. The statement that $\left[f^{*} \mathcal{F}\right]_{r+e}$ and $\left[f^{*} \mathcal{G}\right]_{s+e}$ intersect properly is immediate from the assumption that $f$ has relative dimension $e$. By Lemmas 42.19.4 and 42.7.1 it suffices to show that

$$
f^{*} \operatorname{Tor}_{i}^{\mathcal{O}_{Y}}(\mathcal{F}, \mathcal{G})=\operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(f^{*} \mathcal{F}, f^{*} \mathcal{G}\right)
$$

as $\mathcal{O}_{X}$-modules. This follows from Cohomology, Lemma 20.28 .2 and the fact that $f^{*}$ is exact, so $L f^{*} \mathcal{F}=f^{*} \mathcal{F}$ and similarly for $\mathcal{G}$.

0B0Z Lemma 42.21.2. Let $f: X \rightarrow Y$ be a flat morphism of nonsingular varieties. Let $\alpha$ be a r-cycle on $Y$ and $\beta$ an s-cycle on $Y$. Assume that $\alpha$ and $\beta$ intersect properly. Then $f^{*} \alpha$ and $f^{*} \beta$ intersect properly and $f^{*}(\alpha \cdot \beta)=f^{*} \alpha \cdot f^{*} \beta$.

Proof. By linearity we may assume that $\alpha=[V]$ and $\beta=[W]$ for some closed subvarieties $V, W \subset Y$ of dimension $r, s$. Say $f$ has relative dimension $e$. Then the lemma is a special case of Lemma 42.21.1 because $[V]=\left[\mathcal{O}_{V}\right]_{r},[W]=\left[\mathcal{O}_{W}\right]_{r}$, $f^{*}[V]=\left[f^{-1}(V)\right]_{r+e}=\left[f^{*} \mathcal{O}_{V}\right]_{r+e}$, and $f^{*}[W]=\left[f^{-1}(W)\right]_{s+e}=\left[f^{*} \mathcal{O}_{W}\right]_{s+e}$.

### 42.22. Projection formula for flat proper morphisms

0B0C Short discussion of the projection formula for flat proper morphisms.
0B10 Lemma 42.22.1. Let $f: X \rightarrow Y$ be a flat proper morphism of nonsingular varieties. Set $e=\operatorname{dim}(X)-\operatorname{dim}(Y)$. Let $\alpha$ be an $r$-cycle on $X$ and let $\beta$ be $a$ s-cycle on $Y$. Assume that $\alpha$ and $f^{*}(\beta)$ intersect properly. Then $f_{*}(\alpha)$ and $\beta$ intersect properly and

$$
f_{*}(\alpha) \cdot \beta=f_{*}\left(\alpha \cdot f^{*} \beta\right)
$$

Proof. By linearity we reduce to the case where $\alpha=[V]$ and $\beta=[W]$ for some closed subvariety $V \subset X$ and $W \subset Y$ of dimension $r$ and $s$. Then $f^{-1}(W)$ has pure dimension $s+e$. We assume the cycles $[V]$ and $f^{*}[W]$ intersect properly. We will use without further mention the fact that $V \cap f^{-1}(W) \rightarrow f(V) \cap W$ is surjective.
Let $a$ be the dimension of the generic fibre of $V \rightarrow f(V)$. If $a>0$, then $f_{*}[V]=0$. In particular $f_{*} \alpha$ and $\beta$ intersect properly. To finish this case we have to show that $f_{*}\left([V] \cdot f^{*}[W]\right)=0$. However, since every fibre of $V \rightarrow f(V)$ has dimension $\geq a$ (see Morphisms, Lemma 28.28.4) we conclude that every irreducible component $Z$ of $V \cap f^{-1}(W)$ has fibres of dimension $\geq a$ over $f(Z)$. This certainly implies what we want.
Assume that $V \rightarrow f(V)$ is generically finite. Let $Z \subset f(V) \cap W$ be an irreducible component. Let $Z_{i} \subset V \cap f^{-1}(W), i=1, \ldots, t$ be the irreducible components of $V \cap f^{-1}(W)$ dominating $Z$. By assumption each $Z_{i}$ has dimension $r+s+e-$ $\operatorname{dim}(X)=r+s-\operatorname{dim}(Y)$. Hence $\operatorname{dim}(Z) \leq r+s-\operatorname{dim}(Y)$. Thus we see that $f(V)$ and $W$ intersect properly, $\operatorname{dim}(Z)=r+s-\operatorname{dim}(Y)$, and each $Z_{i} \rightarrow Z$ is generically finite. In particular, it follows that $V \rightarrow f(V)$ has finite fibre over the generic point $\xi$ of $Z$. Thus $V \rightarrow Y$ is finite in an open neighbourhood of $\xi$, see Cohomology of Schemes, Lemma 29.20.2. Using a very general projection formula ${ }^{6}$ for derived tensor products, we get

$$
R f_{*}\left(\mathcal{O}_{V} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{O}_{W}\right)=R f_{*} \mathcal{O}_{V} \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} \mathcal{O}_{W}
$$

see Derived Categories of Schemes, Lemma 35.18.1. Since $f$ is flat, we see that $L f^{*} \mathcal{O}_{W}=f^{*} \mathcal{O}_{W}$. Since $\left.f\right|_{V}$ is finite in an open neighbourhood of $\xi$ we have

$$
\left(R f_{*} \mathcal{F}\right)_{\xi}=\left(f_{*} \mathcal{F}\right)_{\xi}
$$

for any coherent sheaf on $X$ whose support is contained in $V$ (see Cohomology of Schemes, Lemma 29.19.8. Thus we conclude that

0B11

$$
\begin{equation*}
\left(f_{*} \operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{V}, f^{*} \mathcal{O}_{W}\right)\right)_{\xi}=\left(\operatorname{Tor}_{i}^{\mathcal{O}_{Y}}\left(f_{*} \mathcal{O}_{V}, \mathcal{O}_{W}\right)\right)_{\xi} \tag{42.22.1.1}
\end{equation*}
$$

for all $i$. Since $f^{*}[W]=\left[f^{*} \mathcal{O}_{W}\right]_{s+e}$ by Lemma 42.7.1 we have

$$
[V] \cdot f^{*}[W]=\sum(-1)^{i}\left[\operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{V}, f^{*} \mathcal{O}_{W}\right)\right]_{r+s-\operatorname{dim}(Y)}
$$

[^121]See Ser65, Chapter V, Section 7, formula (10)] for a more general formula.
by Lemma 42.19.4. Applying Lemma 42.6.1 we find

$$
f_{*}\left([V] \cdot f^{*}[W]\right)=\sum(-1)^{i}\left[f_{*} \operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(\mathcal{O}_{V}, f^{*} \mathcal{O}_{W}\right)\right]_{r+s-\operatorname{dim}(Y)}
$$

Since $f_{*}[V]=\left[f_{*} \mathcal{O}_{V}\right]_{r}$ by Lemma 42.6.1 we have

$$
\left[f_{*} V\right] \cdot[W]=\sum(-1)^{i}\left[\operatorname{Tor}_{i}^{\mathcal{O}_{X}}\left(f_{*} \mathcal{O}_{V}, \mathcal{O}_{W}\right)\right]_{r+s-\operatorname{dim}(Y)}
$$

again by Lemma 42.19 .4 Comparing the formula for $f_{*}\left([V] \cdot f^{*}[W]\right)$ with the formula for $f_{*}[V] \cdot[W]$ and looking at the the coefficient of $Z$ by taking lengths of stalks at $\xi$, we see that 42.22.1.1) finishes the proof.

0B1M Lemma 42.22.2. Let $X \rightarrow P$ be a closed immersion of nonsingular varieties. Let $C^{\prime} \subset P \times \mathbf{P}^{1}$ be a closed subvariety of dimension $r+1$. Assume
(1) the fibre $C=C_{0}^{\prime}$ has dimension $r$, i.e., $C^{\prime} \rightarrow \mathbf{P}^{1}$ is dominant,
(2) $C^{\prime}$ intersects $X \times \mathbf{P}^{1}$ properly,
(3) $[C]_{r}$ intersects $X$ properly.

Then setting $\alpha=[C]_{r} \cdot X$ viewed as cycle on $X$ and $\beta=C^{\prime} \cdot X \times \mathbf{P}^{1}$ viewed as cycle on $X \times \mathbf{P}^{1}$, we have

$$
\alpha=p r_{X, *}(\beta \cdot X \times 0)
$$

as cycles on $X$ where $p r_{X}: X \times \mathbf{P}^{1} \rightarrow X$ is the projection.
Proof. Let pr : $P \times \mathbf{P}^{1} \rightarrow P$ be the projection. Since we are proving an equality of cycles it suffices to think of $\alpha$, resp. $\beta$ as a cycle on $P$, resp. $P \times \mathbf{P}^{1}$ and prove the result for pushing forward by pr. Because $\mathrm{pr}^{*} X=X \times \mathbf{P}^{1}$ and pr defines an isomorphism of $C_{0}^{\prime}$ onto $C$ the projection formula (Lemma 42.22.1) gives

$$
\operatorname{pr}_{*}\left(\left[C_{0}^{\prime}\right]_{r} \cdot X \times \mathbf{P}^{1}\right)=[C]_{r} \cdot X=\alpha
$$

On the other hand, we have $\left[C_{0}^{\prime}\right]_{r}=C^{\prime} \cdot P \times 0$ as cycles on $P \times \mathbf{P}^{1}$ by Lemma 42.17.1 Hence

$$
\left[C_{0}^{\prime}\right]_{r} \cdot X \times \mathbf{P}^{1}=\left(C^{\prime} \cdot P \times 0\right) \cdot X \times \mathbf{P}^{1}=\left(C^{\prime} \cdot X \times \mathbf{P}^{1}\right) \cdot P \times 0
$$

by associativity (Lemma 42.20.1) and commutativity of the intersection product. It remains to show that the intersection product of $C^{\prime} \cdot X \times \mathbf{P}^{1}$ with $P \times 0$ on $P \times \mathbf{P}^{1}$ is equal (as a cycle) to the intersection product of $\beta$ with $X \times 0$ on $X \times \mathbf{P}^{1}$. Write $C^{\prime} \cdot X \times \mathbf{P}^{1}=\sum n_{k}\left[E_{k}\right]$ and hence $\beta=\sum n_{k}\left[E_{k}\right]$ for some subvarieties $E_{k} \subset X \times \mathbf{P}^{1} \subset P \times \mathbf{P}^{1}$. Then both intersections are equal to $\sum m_{k}\left[E_{k, 0}\right]$ by Lemma 42.17.1 applied twice. This finishes the proof.

### 42.23. Projections

0B1N Recall that we are working over a fixed algebraically closed ground field $\mathbf{C}$. If $V$ is a finite dimensional vector space over $\mathbf{C}$ then we set

$$
\mathbf{P}(V)=\operatorname{Proj}(\operatorname{Sym}(V))
$$

where $\operatorname{Sym}(V)$ is the symmetric algebra on $V$ over $\mathbf{C}$. The normalization is chosen such that $V=\Gamma\left(\mathbf{P}(V), \mathcal{O}_{\mathbf{P}(V)}(1)\right)$. Of course we have $\mathbf{P}(V) \cong \mathbf{P}_{\mathrm{C}}^{n}$ if $\operatorname{dim}(V)=$ $n+1$. We note that $\mathbf{P}(V)$ is a nonsingular projective variety.
Let $p \in \mathbf{P}(V)$ be a closed point. The point $p$ corresponds to a surjection $V \rightarrow L_{p}$ of vector spaces where $\operatorname{dim}\left(L_{p}\right)=1$, see Constructions, Lemma 26.12.3 Let us denote $W_{p}=\operatorname{Ker}\left(V \rightarrow L_{p}\right)$. Projection from $p$ is the morphism

$$
r_{p}: \mathbf{P}(V) \backslash\{p\} \longrightarrow \mathbf{P}\left(W_{p}\right)
$$

of Constructions, Lemma 26.11.1. Here is a lemma to warm up.
0B1P Lemma 42.23.1. Let $V$ be a vector space of dimension $n+1$. Let $X \subset \mathbf{P}(V)$ be a closed subscheme. If $X \neq \mathbf{P}(V)$, then there is a nonempty Zariski open $U \subset \mathbf{P}(V)$ such that for all closed points $p \in U$ the restriction of the projection $r_{p}$ defines $a$ finite morphism $\left.r_{p}\right|_{X}: X \rightarrow \mathbf{P}\left(W_{p}\right)$.

Proof. We claim the lemma holds with $U=\mathbf{P}(V) \backslash X$. For a closed point $p$ of $U$ we indeed obtain a morphism $\left.r_{p}\right|_{X}: X \rightarrow \mathbf{P}\left(W_{p}\right)$. This morphism is proper because $X$ is a proper scheme (Morphisms, Lemmas 28.42.5 and 28.41.7). On the other hand, the fibres of $r_{p}$ are affine lines as can be seen by a direct calculation. Hence the fibres of $r_{p} \mid X$ are proper and affine, whence finite (Morphisms, Lemma 28.43 .10 . Finally, a proper morphism with finite fibres is finite (Cohomology of Schemes, Lemma 29.20.1).

0B1Q Lemma 42.23.2. Let $V$ be a vector space of dimension $n+1$. Let $X \subset \mathbf{P}(V)$ be a closed subvariety. Let $x \in X$ be a nonsingular point.
(1) If $\operatorname{dim}(X)<n-1$, then there is a nonempty Zariski open $U \subset \mathbf{P}(V)$ such that for all closed points $p \in U$ the morphism $\left.r_{p}\right|_{X}: X \rightarrow r_{p}(X)$ is an isomorphism over an open neighbourhood of $r_{p}(x)$.
(2) If $\operatorname{dim}(X)=n-1$, then there is a nonempty Zariski open $U \subset \mathbf{P}(V)$ such that for all closed points $p \in U$ the morphism $\left.r_{p}\right|_{X}: X \rightarrow \mathbf{P}\left(W_{p}\right)$ is étale at $x$.

Proof. Proof of (1). Note that if $x, y \in X$ have the same image under $r_{p}$ then $p$ is on the line $\overline{x y}$. Consider the finite type scheme

$$
T=\{(y, p) \mid y \in X \backslash\{x\}, p \in \mathbf{P}(V), p \in \overline{x y}\}
$$

and the morphisms $T \rightarrow X$ and $T \rightarrow \mathbf{P}(V)$ given by $(y, p) \mapsto y$ and $(y, p) \mapsto p$. Since each fibre of $T \rightarrow X$ is a line, we see that the dimension of $T$ is $\operatorname{dim}(X)+1<$ $\operatorname{dim}(\mathbf{P}(V))$. Hence $T \rightarrow \mathbf{P}(V)$ is not surjective. On the other hand, consider the finite type scheme

$$
T^{\prime}=\{p \mid p \in \mathbf{P}(V) \backslash\{x\}, \overline{x p} \text { tangent to } X \text { at } x\}
$$

Then the dimension of $T^{\prime}$ is $\operatorname{dim}(X)<\operatorname{dim}(\mathbf{P}(V))$. Thus the morphism $T^{\prime} \rightarrow$ $\mathbf{P}(V)$ is not surjective either. Let $U \subset \mathbf{P}(V) \backslash X$ be nonempty open and disjoint from these images; such a $U$ exists because the images of $T$ and $T^{\prime}$ in $\mathbf{P}(V)$ are constructible by Morphisms, Lemma 28.22.2. Then for $p \in U$ closed the projection $\left.r_{p}\right|_{X}: X \rightarrow \mathbf{P}\left(W_{p}\right)$ is injective on the tangent space at $x$ and $r_{p}^{-1}\left(\left\{r_{p}(x)\right\}\right)=\{x\}$. This means that $r_{p}$ is unramified at $x$ (Varieties, Lemma 32.14.8), finite by Lemma 42.23.1. and $r_{p}^{-1}\left(\left\{r_{p}(x)\right\}\right)=\{x\}$ thus Étale Morphisms, Lemma 40.7.3 applies and there is an open neighbourhood $R$ of $r_{p}(x)$ in $\mathbf{P}\left(W_{p}\right)$ such that $\left(\left.r_{p}\right|_{X}\right)^{-1}(R) \rightarrow R$ is a closed immersion which proves (1).
Proof of (2). In this case we still conclude that the morphism $T^{\prime} \rightarrow \mathbf{P}(V)$ is not surjective. Arguing as above we conclude that for $U \subset \mathbf{P}(V)$ avoiding $X$ and the image of $T^{\prime}$, the projection $\left.r_{p}\right|_{X}: X \rightarrow \mathbf{P}\left(W_{p}\right)$ is étale at $x$ and finite.
0B1R Lemma 42.23.3. Let $V$ be a vector space of dimension $n+1$. Let $Y, Z \subset \mathbf{P}(V)$ be closed subvarieties. There is a nonempty Zariski open $U \subset \mathbf{P}(V)$ such that for all closed points $p \in U$ we have

$$
Y \cap r_{p}^{-1}\left(r_{p}(Z)\right)=(Y \cap Z) \cup E
$$

with $E \subset Y$ closed and $\operatorname{dim}(E) \leq \operatorname{dim}(Y)+\operatorname{dim}(Z)+1-n$.
Proof. Set $Y^{\prime}=Y \backslash Y \cap Z$. Let $y \in Y^{\prime}, z \in Z$ be closed points with $r_{p}(y)=r_{p}(z)$. Then $p$ is on the line $\overline{y z}$ passing through $y$ and $z$. Consider the finite type scheme

$$
T=\left\{(y, z, p) \mid y \in Y^{\prime}, z \in Z, p \in \overline{y z}\right\}
$$

and the morphism $T \rightarrow \mathbf{P}(V)$ given by $(y, z, p) \mapsto p$. Observe that $T$ is irreducible and that $\operatorname{dim}(T)=\operatorname{dim}(Y)+\operatorname{dim}(Z)+1$. Hence the general fibre of $T \rightarrow \mathbf{P}(V)$ has dimension at most $\operatorname{dim}(Y)+\operatorname{dim}(Z)+1-n$, more precisely, there exists a nonempty open $U \subset \mathbf{P}(V) \backslash(Y \cup Z)$ over which the fibre has dimension at most $\operatorname{dim}(Y)+\operatorname{dim}(Z)+1-n$ (Varieties, Lemma 32.17.4). Let $p \in U$ be a closed point and let $F \subset T$ be the fibre of $T \rightarrow \mathbf{P}(V)$ over $p$. Then

$$
\left(Y \cap r_{p}^{-1}\left(r_{p}(Z)\right)\right) \backslash(Y \cap Z)
$$

is the image of $F \rightarrow Y,(y, z, p) \mapsto y$. Again by Varieties, Lemma 32.17.4 the closure of the image of $F \rightarrow Y$ has dimension at most $\operatorname{dim}(Y)+\operatorname{dim}(Z)+1-n$.

0B2T Lemma 42.23.4. Let $V$ be a vector space. Let $B \subset \mathbf{P}(V)$ be a closed subvariety of codimension $\geq 2$. Let $p \in \mathbf{P}(V)$ be a closed point, $p \notin B$. Then there exists $a$ line $\ell \subset \mathbf{P}(V)$ with $\ell \cap B=\emptyset$. Moreover, these lines sweep out an open subset of $\mathbf{P}(V)$.

Proof. Consider the image of $B$ under the projection $r_{p}: \mathbf{P}(V) \rightarrow \mathbf{P}\left(W_{p}\right)$. Since $\operatorname{dim}\left(W_{p}\right)=\operatorname{dim}(V)-1$, we see that $r_{p}(B)$ has codimension $\geq 1$ in $\mathbf{P}\left(W_{p}\right)$. For any $q \in \mathbf{P}(V)$ with $r_{p}(q) \notin r_{p}(B)$ we see that the line $\ell=\overline{p q}$ connecting $p$ and $q$ works.

0B2U Lemma 42.23.5. Let $V$ be a vector space. Let $G=P G L(V)$. Then $G \times \mathbf{P}(V) \rightarrow$ $\mathbf{P}(V)$ is doubly transitive.

Proof. Omitted. Hint: This follows from the fact that GL $(V)$ acts doubly transitive on pairs of linearly independent vectors.

0B2V Lemma 42.23.6. Let $k$ be a field. Let $n \geq 1$ be an integer and let $x_{i j}, 1 \leq i, j \leq n$ be variables. Then

$$
\operatorname{det}\left(\begin{array}{cccc}
x_{11} & x_{12} & \ldots & x_{1 n} \\
x_{21} & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots \\
x_{n 1} & \ldots & \ldots & x_{n n}
\end{array}\right)
$$

is an irreducible element of the polynomial ring $k\left[x_{i j}\right]$.
Proof. Let $V$ be an $n$ dimensional vector space. Translating into geometry the lemma signifies that the variety $C$ of non-invertible linear maps $V \rightarrow V$ is irreducible. Let $W$ be a vector space of dimension $n-1$. By elementary linear algebra, the morphism

$$
\operatorname{Hom}(W, V) \times \operatorname{Hom}(V, W) \longrightarrow \operatorname{Hom}(V, V), \quad(\psi, \varphi) \longmapsto \psi \circ \varphi
$$

has image $C$. Since the source is irreducible, so is the image.
Let $V$ be a vector space of dimension $n+1$. Set $E=\operatorname{End}(V)$. Let $E^{\wedge}=\operatorname{Hom}(E, \mathbf{C})$ be the dual vector space. Write $\mathbf{P}=\mathbf{P}\left(E^{\wedge}\right)$. There is a canonical linear map

$$
V \longrightarrow V \otimes_{\mathbf{C}} E^{\wedge}=\operatorname{Hom}(E, V)
$$

sending $v \in V$ to the map $g \mapsto g(v)$ in $\operatorname{Hom}(E, V)$. Recall that we have a canonical $\operatorname{map} E^{\wedge} \rightarrow \Gamma\left(\mathbf{P}, \mathcal{O}_{\mathbf{P}}(1)\right)$ which is an isomorphism. Hence we obtain a canonical map

$$
\psi: V \otimes \mathcal{O}_{\mathbf{P}} \rightarrow V \otimes \mathcal{O}_{\mathbf{P}}(1)
$$

of sheaves of modules on $\mathbf{P}$ which on global sections recovers the given map. Recall that a projective bundle $\mathbf{P}(\mathcal{E})$ is defined as the relative Proj of the symmetric algebra on $\mathcal{E}$, see Constructions, Definition 26.21.1. We are going to study the rational map between $\mathbf{P}\left(V \otimes \mathcal{O}_{\mathbf{P}}(1)\right)$ and $\mathbf{P}\left(V \otimes \mathcal{O}_{\mathbf{P}}\right)$ associated to $\psi$. By Constructions, Lemma 26.16.10 we have a canonical isomorphism

$$
\mathbf{P}\left(V \otimes \mathcal{O}_{\mathbf{P}}\right)=\mathbf{P} \times \mathbf{P}(V)
$$

By Constructions, Lemma 26.20.1 we see that

$$
\mathbf{P}\left(V \otimes \mathcal{O}_{\mathbf{P}}(1)\right)=\mathbf{P}\left(V \otimes \mathcal{O}_{\mathbf{P}}\right)=\mathbf{P} \times \mathbf{P}(V)
$$

Combining this with Constructions, Lemma 26.18.1 we obtain

$$
\mathbf{P} \times \mathbf{P}(V) \supset U(\psi) \xrightarrow{r_{\psi}} \mathbf{P} \times \mathbf{P}(V)
$$

To understand this better we work out what happens on fibres over $\mathbf{P}$. Let $g \in E$ be nonzero. This defines a nonzero map $E^{\wedge} \rightarrow \mathbf{C}$, hence a point $[g] \in \mathbf{P}$. On the other hand, $g$ defines a C-linear map $g: V \rightarrow V$. Hence we obtain, by Constructions, Lemma 26.11.1 a map

$$
\mathbf{P}(V) \supset U(g) \xrightarrow{r_{g}} \mathbf{P}(V)
$$

What we will use below is that $U(g)$ is the fibre $U(\psi)_{[g]}$ and that $r_{g}$ is the fibre of $r_{\psi}$ over the point $[g]$. Another observation we will use is that the complement of $U(g)$ in $\mathbf{P}(V)$ is the image of the closed immersion

$$
\mathbf{P}(\operatorname{Coker}(g)) \longrightarrow \mathbf{P}(V)
$$

and the image of $r_{g}$ is the image of the closed immersion

$$
\mathbf{P}(\operatorname{Im}(g)) \longrightarrow \mathbf{P}(V)
$$

0B1S Lemma 42.23.7. With notation as above. Let $X, Y$ be closed subvarieties of $\mathbf{P}(V)$ which intersect properly such that $X \neq \mathbf{P}(V)$. There exists a line $\ell \subset \mathbf{P}$ such that
(1) $\left[i d_{V}\right] \in \ell$,
(2) $X \subset U_{g}$ for all $[g] \in \ell$,
(3) $g(X)$ intersects $Y$ properly for all $[g] \in \ell$.

Proof. Let $B \subset \mathbf{P}$ be the set of "bad" points, i.e., those points $[g]$ that violate either (2) or (3). Note that $\left[\mathrm{id}_{V}\right] \notin B$ by assumption. Moreover, $B$ is closed. Hence it suffices to prove that $\operatorname{dim}(B) \leq \operatorname{dim}(\mathbf{P})-2$ (Lemma 42.23.4).

First, consider the open $G=\mathrm{PGL}(V) \subset \mathbf{P}$ consisting of points $[g]$ such that $g: V \rightarrow V$ is invertible. Since $G$ acts doubly transitively on $\mathbf{P}(V)$ (Lemma 42.23.5) we see that

$$
T=\left\{(x, y,[g]) \mid x \in X, y \in Y,[g] \in G, r_{g}(x)=y\right\}
$$

is a locally trivial fibration over $X \times Y$ with fibre equal to the stabilizer of a pair of points in $G$. Hence $T$ is a variety. Observe that the fibre of $T \rightarrow G$ over [g] is $r_{g}(X) \cap Y$. The morphism $T \rightarrow G$ is surjective, because any translate of $X$ intersects $Y$ (Varieties, Lemma 32.27.3). Since the dimensions of fibres of a dominant morphism of varieties do not jump in codimension 1 (Varieties, Lemma 32.17.4 we conclude that $B \cap G$ has codimension $\geq 2$.

Next we look at the complement $Z=\mathbf{P} \backslash G$. This is an irreducible variety because the determinant is an irreducible polynomial (Lemma 42.23.6). Thus it suffices to prove that $B$ does not contain the generic point of $Z$. For a general point $[g] \in Z$ the cokernel $V \rightarrow \operatorname{Coker}(g)$ has dimension 1, hence $U(g)$ is the complement of a point. Since $X \neq \mathbf{P}(V)$ we see that for a general $[g] \in Z$ we have $X \subset U(g)$. Moreover, the morphism $\left.r_{g}\right|_{X}: X \rightarrow r_{g}(X)$ is finite, hence $\operatorname{dim}\left(r_{g}(X)\right)=\operatorname{dim}(X)$. On the other hand, for such a $g$ the image of $r_{g}$ is the closed subspace $H=\mathbf{P}(\operatorname{Im}(g)) \subset \mathbf{P}(V)$ which has codimension 1. For genenal point of $Z$ we see that $H \cap Y$ has dimension 1 less than $Y$ (compare with Varieties, Lemma 32.28.3). Thus we see that we have to show that $r_{g}(X)$ and $H \cap Y$ intersect properly in $H$. For a fixed choice of $H$, we can by postcomposing $g$ by an automorphism, move $r_{g}(X)$ by an arbitrary automorphism of $H=\mathbf{P}(\operatorname{Im}(g))$. Thus we can argue as above to conclude that the intersection of $H \cap Y$ with $r_{g}(X)$ is proper for general $g$ with given $H=\mathbf{P}(\operatorname{Im}(g))$. Some details omitted.

### 42.24. Moving Lemma

0B0D The moving lemma states that given an $r$-cycle $\alpha$ and a $s$ cycle $\beta$ there exists $\alpha^{\prime}$, $\alpha^{\prime} \sim_{r a t} \alpha$ such that $\alpha^{\prime}$ and $\beta$ intersect properly (Lemma 42.24.3). See Sam56, Che58a, Che58b. The key to this is Lemma 42.24.1. the reader may find this lemma in the form stated in [Ful98, Example 11.4.1] and find a proof in Rob72.
0B0E Lemma 42.24.1. Let $X \subset \mathbf{P}^{N}$ be a nonsingular closed subvariety. Let $n=$ See Rob72. $\operatorname{dim}(X)$ and $0 \leq d, d^{\prime}<n$. Let $Z \subset X$ be a closed subvariety of dimension $d$ and $T_{i} \subset X, i \in I$ be a finite collection of closed subvarieties of dimension $d^{\prime}$. Then there exists a subvariety $C \subset \mathbf{P}^{N}$ such that $C$ intersects $X$ properly and such that

$$
C \cdot X=Z+\sum_{j \in J} m_{j} Z_{j}
$$

where $Z_{j} \subset X$ are irreducible of dimension $d$, distinct from $Z$, and

$$
\operatorname{dim}\left(Z_{j} \cap T_{i}\right) \leq \operatorname{dim}\left(Z \cap T_{i}\right)
$$

with strict inequality if $Z$ does not intersect $T_{i}$ properly in $X$.
Proof. Write $\mathbf{P}^{N}=\mathbf{P}\left(V_{N}\right)$ so $\operatorname{dim}\left(V_{N}\right)=N+1$ and set $X_{N}=X$. We are going to choose a sequence of projections from points

$$
\begin{aligned}
& r_{N}: \mathbf{P}\left(V_{N}\right) \backslash\left\{p_{N}\right\} \rightarrow \mathbf{P}\left(V_{N-1}\right) \\
& r_{N-1}: \mathbf{P}\left(V_{N-1}\right) \backslash\left\{p_{N-1}\right\} \rightarrow \mathbf{P}\left(V_{N-2}\right), \\
& \ldots, \\
& r_{n+1}: \mathbf{P}\left(V_{n+1}\right) \backslash\left\{p_{n+1}\right\} \rightarrow \mathbf{P}\left(V_{n}\right)
\end{aligned}
$$

as in Section 42.23. At each step we will choose $p_{N}, p_{N-1}, \ldots, p_{n+1}$ in a suitable Zariski open set. Pick a closed point $x \in Z \subset X$. For every $i$ pick closed points $x_{i t} \in T_{i} \cap Z$, at least one in each irreducible component of $T_{i} \cap Z$. Taking the composition we obtain a morphism

$$
\pi=\left.\left(r_{n+1} \circ \ldots \circ r_{N}\right)\right|_{X}: X \longrightarrow \mathbf{P}\left(V_{n}\right)
$$

which has the following properties
(1) $\pi$ is finite,
(2) $\pi$ is étale at $x$ and all $x_{i t}$,
(3) $\left.\pi\right|_{Z}: Z \rightarrow \pi(Z)$ is an isomorphism over an open neighbourhood of $\pi\left(x_{i t}\right)$,
(4) $T_{i} \cap \pi^{-1}(\pi(Z))=\left(T_{i} \cap Z\right) \cup E_{i}$ with $E_{i} \subset T_{i}$ closed and $\operatorname{dim}\left(E_{i}\right) \leq$ $d+d^{\prime}+1-(n+1)=d+d^{\prime}-n$.
It follows in a straightforward manner from Lemmas 42.23.1, 42.23.2, and 42.23.3 and induction that we can do this; observe that the last projection is from $\mathbf{P}\left(V_{n+1}\right)$ and that $\operatorname{dim}\left(V_{n+1}\right)=n+2$ which explains the inequality in (4).
Let $C \subset \mathbf{P}\left(V_{N}\right)$ be the scheme theoretic closure of $\left(r_{n+1} \circ \ldots \circ r_{N}\right)^{-1}(\pi(Z))$. Because $\pi$ is étale at the point $x$ of $Z$, we see that the closed subscheme $C \cap X$ contains $Z$ with multiplicity 1 (local calculation omitted). Hence by Lemma 42.17 .2 we conclude that

$$
C \cdot X=[Z]+\sum m_{j}\left[Z_{j}\right]
$$

for some subvarieties $Z_{j} \subset X$ of dimension $d$. Note that

$$
C \cap X=\pi^{-1}(\pi(Z))
$$

set theoretically. Hence $T_{i} \cap Z_{j} \subset T_{i} \cap \pi^{-1}(\pi(Z)) \subset T_{i} \cap Z \cup E_{i}$. For any irreducible component of $T_{i} \cap Z$ contained in $E_{i}$ we have the desired dimension bound. Finally, let $V$ be an irreducible component of $T_{i} \cap Z_{j}$ which is contained in $T_{i} \cap Z$. To finish the proof it suffices to show that $V$ does not contain any of the points $x_{i t}$, because then $\operatorname{dim}(V)<\operatorname{dim}\left(Z \cap T_{i}\right)$. To show this it suffices to show that $x_{i t} \notin Z_{j}$ for all $i, t, j$.
Set $Z^{\prime}=\pi(Z)$ and $Z^{\prime \prime}=\pi^{-1}\left(Z^{\prime}\right)$, scheme theoretically. By condition (3) we can find an open $U \subset \mathbf{P}\left(V_{n}\right)$ containing $\pi\left(x_{i t}\right)$ such that $\pi^{-1}(U) \cap Z \rightarrow U \cap Z^{\prime}$ is an isomorphism. In particular, $Z \rightarrow Z^{\prime}$ is a local isomorphism at $x_{i t}$. On the other hand, $Z^{\prime \prime} \rightarrow Z^{\prime}$ is étale at $x_{i t}$ by condition (2). Hence the closed immersion $Z \rightarrow Z^{\prime \prime}$ is étale at $x_{i t}$ (Morphisms, Lemma 28.36.18). Thus $Z=Z^{\prime \prime}$ in a Zariski neighbourhood of $x_{i t}$ which proves the assertion.
The actual moving is done using the following lemma.
0B1T Lemma 42.24.2. Let $C \subset \mathbf{P}^{N}$ be a closed subvariety. Let $X \subset \mathbf{P}^{N}$ be subvariety and let $T_{i} \subset X$ be a finite collection of closed subvarieties. Assume that $C$ and $X$ intersect properly. Then there exists a closed subvariety $C^{\prime} \subset \mathbf{P}^{N} \times \mathbf{P}^{1}$ such that
(1) $C^{\prime} \rightarrow \mathbf{P}^{1}$ is dominant,
(2) $C_{0}^{\prime}=C$ scheme theoretically,
(3) $C^{\prime}$ and $X \times \mathbf{P}^{1}$ intersect properly,
(4) $C_{\infty}^{\prime}$ properly intersects each of the given $T_{i}$.

Proof. Write $\mathbf{P}^{N}=\mathbf{P}(V)$ so $\operatorname{dim}(V)=N+1$. Let $E=\operatorname{End}(V)$. Let $E^{\wedge}=$ $\operatorname{Hom}(E, \mathbf{C})$. Set $\mathbf{P}=\mathbf{P}\left(E^{\wedge}\right)$ as in Lemma 42.23.7. Choose a general line $\ell \subset \mathbf{P}$ passing through $\mathrm{id}_{V}$. Set $C^{\prime} \subset \ell \times \mathbf{P}(V)$ equal to the closed subscheme having fibre $r_{g}(C)$ over $[g] \in \ell$. More precisely, $C^{\prime}$ is the image of

$$
\ell \times C \subset \mathbf{P} \times \mathbf{P}(V)
$$

under the morphism 42.23.6.1. By Lemma 42.23.7 this makes sense, i.e., $\ell \times C \subset$ $U(\psi)$. The morphism $\ell \times C \rightarrow C^{\prime}$ is finite and $C_{[g]}^{\prime}=r_{g}(C)$ set theoretically for all $[g] \in \ell$. Parts (1) and (2) are clear with $0=\left[\mathrm{id}_{V}\right] \in \ell$. Part (3) follows from the fact that $r_{g}(C)$ and $X$ intersect properly for all $[g] \in \ell$. Part (4) follows from the fact that a general point $\infty=[g] \in \ell$ is a general point of $\mathbf{P}$ and for such as point $r_{g}(C) \cap T$ is proper for any closed subvariety $T$ of $\mathbf{P}(V)$ (see proof of Lemma 42.23.7). Some details omitted.

0B1U Lemma 42.24.3. Let $X$ be a nonsingular projective variety. Let $\alpha$ be an $r$-cycle and $\beta$ be an s-cycle on $X$. Then there exists an $r$-cycle $\alpha^{\prime}$ such that $\alpha^{\prime} \sim_{r a t} \alpha$ and such that $\alpha^{\prime}$ and $\beta$ intersect properly.

Proof. Write $\beta=\sum n_{i}\left[T_{i}\right]$ for some subvarieties $T_{i} \subset X$ of dimension $s$. By linearity we may assume that $\alpha=[Z]$ for some irreducible closed subvariety $Z \subset X$ of dimension $r$. We will prove the lemma by induction on the maximum $e$ of the integers

$$
\operatorname{dim}\left(Z \cap T_{i}\right)
$$

The base case is $e=r+s-\operatorname{dim}(X)$. In this case $Z$ intersects $\beta$ properly and the lemma is trivial.
Induction step. Assume that $e>r+s-\operatorname{dim}(X)$. Choose an embedding $X \subset \mathbf{P}^{N}$ and apply Lemma 42.24 .1 to find a closed subvariety $C \subset \mathbf{P}^{N}$ such that $C \cdot X=$ $[Z]+\sum m_{j}\left[Z_{j}\right]$ and such that the induction hypothesis applies to each $Z_{j}$. Next, apply Lemma 42.24 .2 to $C, X, T_{i}$ to find $C^{\prime} \subset \mathbf{P}^{N} \times \mathbf{P}^{1}$. Let $\gamma=C^{\prime} \cdot X \times \mathbf{P}^{1}$ viewed as a cycle on $X \times \mathbf{P}^{1}$. By Lemma 42.22 .2 we have

$$
[Z]+\sum m_{j}\left[Z_{j}\right]=\operatorname{pr}_{X, *}(\gamma \cdot X \times 0)
$$

On the other hand the cycle $\gamma_{\infty}=\operatorname{pr}_{X, *}(\gamma \cdot X \times \infty)$ is supported on $C_{\infty}^{\prime} \cap X$ hence intersects $\beta$ transversally. Thus we see that $[Z] \sim_{r a t}-\sum m_{j}\left[Z_{j}\right]+\gamma_{\infty}$ by Lemma 42.17.1. Since by induction each $\left[Z_{j}\right]$ is rationally equivalent to a cycle which properly intersects $\beta$ this finishes the proof.

### 42.25. Intersection products and rational equivalence

0B0F With definitions as above we show that the intersection product is well defined modulo rational equivalence. We first deal with a special case.
0B60 Lemma 42.25.1. Let $X$ be a nonsingular variety. Let $W \subset X \times \mathbf{P}^{1}$ be an ( $s+1$ )dimensional subvariety dominating $\mathbf{P}^{1}$. Let $W_{a}$, resp. $W_{b}$ be the fibre of $W \rightarrow \mathbf{P}^{1}$ over $a$, resp. b. Let $V$ be a r-dimensional subvariety of $X$ such that $V$ intersects both $W_{a}$ and $W_{b}$ properly. Then $[V] \cdot\left[W_{a}\right]_{r} \sim_{r a t}[V] \cdot\left[W_{b}\right]_{r}$.

Proof. We have $\left[W_{a}\right]_{r}=\operatorname{pr}_{X, *}(W \cdot X \times a)$ and similarly for $\left[W_{b}\right]_{r}$, see Lemma 42.17.1. Thus we reduce to showing

$$
V \cdot \operatorname{pr}_{X, *}(W \cdot X \times a) \sim_{r a t} V \cdot \operatorname{pr}_{X, *}(W \cdot X \times b)
$$

Applying the projection formula Lemma 42.22.1 we get

$$
V \cdot \operatorname{pr}_{X, *}(W \cdot X \times a)=\operatorname{pr}_{X, *}\left(V \times \mathbf{P}^{1} \cdot(W \cdot X \times a)\right)
$$

and similarly for $b$. Thus we reduce to showing

$$
\operatorname{pr}_{X, *}\left(V \times \mathbf{P}^{1} \cdot(W \cdot X \times a)\right) \sim_{r a t} \operatorname{pr}_{X, *}\left(V \times \mathbf{P}^{1} \cdot(W \cdot X \times b)\right)
$$

If $V \times \mathbf{P}^{1}$ intersects $W$ properly, then associativity for the intersection multiplicities (Lemma 42.20.1) gives $V \times \mathbf{P}^{1} \cdot(W \cdot X \times a)=\left(V \times \mathbf{P}^{1} \cdot W\right) \cdot X \times a$ and similarly for $b$. Thus we reduce to showing

$$
\operatorname{pr}_{X, *}\left(\left(V \times \mathbf{P}^{1} \cdot W\right) \cdot X \times a\right) \sim_{r a t} \operatorname{pr}_{X, *}\left(\left(V \times \mathbf{P}^{1} \cdot W\right) \cdot X \times b\right)
$$

which is true by Lemma 42.17.1.
The argument above does not quite work. The obstruction is that we do not know that $V \times \mathbf{P}^{1}$ and $W$ intersect properly. We only know that $V$ and $W_{a}$ and $V$ and
$W_{b}$ intersect properly. Let $Z_{i}, i \in I$ be the irreducible components of $V \times \mathbf{P}^{1} \cap W$. Then we know that $\operatorname{dim}\left(Z_{i}\right) \geq r+1+s+1-n-1=r+s+1-n$ where $n=\operatorname{dim}(X)$, see Lemma 42.13.4. Since we have assumed that $V$ and $W_{a}$ intersect properly, we see that $\operatorname{dim}\left(Z_{i, a}\right)=r+s-n$ or $Z_{i, a}=\emptyset$. On the other hand, if $Z_{i, a} \neq \emptyset$, then $\operatorname{dim}\left(Z_{i, a}\right) \geq \operatorname{dim}\left(Z_{i}\right)-1=r+s-n$. It follows that $\operatorname{dim}\left(Z_{i}\right)=r+s+1-n$ if $Z_{i}$ meets $X \times a$ and in this case $Z_{i} \rightarrow \mathbf{P}^{1}$ is surjective. Thus we may write $I=I^{\prime} \amalg I^{\prime \prime}$ where $I^{\prime}$ is the set of $i \in I$ such that $Z_{i} \rightarrow \mathbf{P}^{1}$ is surjective and $I^{\prime \prime}$ is the set of $i \in I$ such that $Z_{i}$ lies over a closed point $t_{i} \in \mathbf{P}^{1}$ with $t_{i} \neq a$ and $t_{i} \neq b$. Consider the cycle

$$
\gamma=\sum_{i \in I^{\prime}} e_{i}\left[Z_{i}\right]
$$

where we take

$$
e_{i}=\sum_{p}(-1)^{p} \operatorname{length}_{\mathcal{O}_{X \times \mathbf{P}^{1}, Z_{i}}} \operatorname{Tor}_{p} \mathcal{O}_{X \times \mathbf{P}^{1}, z_{i}}\left(\mathcal{O}_{V \times \mathbf{P}^{1}, Z_{i}}, \mathcal{O}_{W, Z_{i}}\right)
$$

We will show that $\gamma$ can be used as a replacement for the intersection product of $V \times \mathbf{P}^{1}$ and $W$.

We will show this using associativity of intersection products in exactly the same way as above. Let $U=\mathbf{P}^{1} \backslash\left\{t_{i}, i \in I^{\prime \prime}\right\}$. Note that $X \times a$ and $X \times b$ are contained in $X \times U$. The subvarieties

$$
V \times U, \quad W_{U}, \quad X \times a \quad \text { of } \quad X \times U
$$

intersect transversally pairwise by our choice of $U$ and moreover $\operatorname{dim}\left(V \times U \cap W_{U} \cap\right.$ $X \times a)=\operatorname{dim}\left(V \cap W_{a}\right)$ has the expected dimension. Thus we see that

$$
V \times U \cdot\left(W_{U} \cdot X \times a\right)=\left(V \times U \cdot W_{U}\right) \cdot X \times a
$$

as cycles on $X \times U$ by Lemma 42.20.1. By construction $\gamma$ restricts to the cycle $V \times U \cdot W_{U}$ on $X \times U$. Trivially, $V \times \mathbf{P}^{1} \cdot(W \times X \times a)$ restricts to $V \times U \cdot\left(W_{U} \cdot X \times a\right)$ on $X \times U$. Hence

$$
V \times \mathbf{P}^{1} \cdot(W \cdot X \times a)=\gamma \cdot X \times a
$$

as cycles on $X \times \mathbf{P}^{1}$ (because both sides are contained in $X \times U$ and are equal after restricting to $X \times U$ by what was said before). Since we have the same for $b$ we conclude

$$
\begin{aligned}
V \cdot\left[W_{a}\right] & =\operatorname{pr}_{X, *}\left(V \times \mathbf{P}^{1} \cdot(W \cdot X \times a)\right) \\
& =\operatorname{pr}_{X, *}(\gamma \cdot X \times a) \\
& \sim_{r a t} \operatorname{pr}_{X, *}(\gamma \cdot X \times b) \\
& =\operatorname{pr}_{X, *}\left(V \times \mathbf{P}^{1} \cdot(W \cdot X \times b)\right) \\
& =V \cdot\left[W_{b}\right]
\end{aligned}
$$

The first and the last equality by the first paragraph of the proof, the second and penultimate equalities were shown in this paragraph, and the middle equivalence is Lemma 42.17.1.

0B1V Theorem 42.25.2. Let $X$ be a nonsingular projective variety. Let $\alpha$, resp. $\beta$ be an $r$, resp. s cycle on $X$. Assume that $\alpha$ and $\beta$ intersect properly so that $\alpha \cdot \beta$ is defined. Finally, assume that $\alpha \sim_{r a t} 0$. Then $\alpha \cdot \beta \sim_{r a t} 0$.

Proof. Pick a closed immersion $X \subset \mathbf{P}^{N}$. By linearity it suffices to prove the result when $\beta=[Z]$ for some $s$-dimensional closed subvariety $Z \subset X$ which intersects $\alpha$ properly. The condition $\alpha \sim_{\text {rat }} 0$ means there are finitely many $(r+1)$-dimensional closed subvarieties $W_{i} \subset X \times \mathbf{P}^{1}$ such that

$$
\alpha=\sum\left[W_{i, a_{i}}\right]_{r}-\left[W_{i, b_{i}}\right]_{r}
$$

for some pairs of points $a_{i}, b_{i}$ of $\mathbf{P}^{1}$. Let $W_{i, a_{i}}^{t}$ and $W_{i, b_{i}}^{t}$ be the irreducible components of $W_{i, a_{i}}$ and $W_{i, b_{i}}$. We will use induction on the maximum $d$ of the integers

$$
\operatorname{dim}\left(Z \cap W_{i, a_{i}}^{t}\right), \quad \operatorname{dim}\left(Z \cap W_{i, b_{i}}^{t}\right)
$$

The main problem in the rest of the proof is that although we know that $Z$ intersects $\alpha$ properly, it may not be the case that $Z$ intersects the "intermediate" varieties $W_{i, a_{i}}^{t}$ and $W_{i, b_{i}}^{t}$ properly, i.e., it may happen that $d>r+s-\operatorname{dim}(X)$.

Base case: $d=r+s-\operatorname{dim}(X)$. In this case all the intersections of $Z$ with the $W_{i, a_{i}}^{t}$ and $W_{i, b_{i}}^{t}$ are proper and the desired result follows from Lemma 42.25.1. because it applies to show that $[Z] \cdot\left[W_{i, a_{i}}\right]_{r} \sim_{r a t}[Z] \cdot\left[W_{i, b_{i}}\right]_{r}$ for each $i$.

Induction step: $d>r+s-\operatorname{dim}(X)$. Apply Lemma 42.24.1 to $Z \subset X$ and the family of subvarieties $\left\{W_{i, a_{i}}^{t}, W_{i, b_{i}}^{t}\right\}$. Then we find a closed subvariety $C \subset \mathbf{P}^{N}$ intersecting $X$ properly such that

$$
C \cdot X=[Z]+\sum m_{j}\left[Z_{j}\right]
$$

and such that

$$
\operatorname{dim}\left(Z_{j} \cap W_{i, a_{i}}^{t}\right) \leq \operatorname{dim}\left(Z \cap W_{i, a_{i}}^{t}\right), \quad \operatorname{dim}\left(Z_{j} \cap W_{i, b_{i}}^{t}\right) \leq \operatorname{dim}\left(Z \cap W_{i, b_{i}}^{t}\right)
$$

with strict inequality if the right hand side is $>r+s-\operatorname{dim}(X)$. This implies two things: (a) the induction hypothesis applies to each $Z_{j}$, and (b) $C \cdot X$ and $\alpha$ intersect properly (because $\alpha$ is a linear combination of those [ $W_{i, a_{i}}^{t}$ ] and [ $W_{i, a_{i}}^{t}$ ] which intersect $Z$ properly). Next, pick $C^{\prime} \subset \mathbf{P}^{N} \times \mathbf{P}^{1}$ as in Lemma 42.24 .2 with respect to $C, X$, and $W_{i, a_{i}}^{t}, W_{i, b_{i}}^{t}$. Write $C^{\prime} \cdot X \times \mathbf{P}^{1}=\sum n_{k}\left[E_{k}\right]$ for some subvarieties $E_{k} \subset X \times \mathbf{P}^{1}$ of dimension $s+1$. Note that $n_{k}>0$ for all $k$ by Proposition 42.19.3. By Lemma 42.22.2 we have

$$
[Z]+\sum m_{j}\left[Z_{j}\right]=\sum n_{k}\left[E_{k, 0}\right]_{s}
$$

Since $E_{k, 0} \subset C \cap X$ we see that $\left[E_{k, 0}\right]_{s}$ and $\alpha$ intersect properly. On the other hand, the cycle

$$
\gamma=\sum n_{k}\left[E_{k, \infty}\right]_{s}
$$

is supported on $C_{\infty}^{\prime} \cap X$ and hence properly intersects each $W_{i, a_{i}}^{t}, W_{i, b_{i}}^{t}$. Thus by the base case and linearity, we see that

$$
\gamma \cdot \alpha \sim_{r a t} 0
$$

As we have seen that $E_{k, 0}$ and $E_{k, \infty}$ intersect $\alpha$ properly Lemma 42.25.1 applied to $E_{k} \subset X \times \mathbf{P}^{1}$ and $\alpha$ gives

$$
\left[E_{k, 0}\right] \cdot \alpha \sim_{r a t}\left[E_{k, \infty}\right] \cdot \alpha
$$

Putting everything together we have

$$
\begin{aligned}
{[Z] \cdot \alpha } & =\left(\sum n_{k}\left[E_{k, 0}\right]_{r}-\sum m_{j}\left[Z_{j}\right]\right) \cdot \alpha \\
& \sim_{r a t} \sum n_{k}\left[E_{k, 0}\right] \cdot \alpha \quad(\text { by induction hypothesis }) \\
& \sim_{r a t} \sum n_{k}\left[E_{k, \infty}\right] \cdot \alpha \quad(\text { by the lemma }) \\
& =\gamma \cdot \alpha \\
& \sim_{r a t} 0 \quad(\text { by base case })
\end{aligned}
$$

This finishes the proof.
Remark 42.25.3. Lemma 42.24 .3 and Theorem 42.25 .2 also hold for nonsingular quasi-projective varieties with the same proof. The only change is that one needs to prove the following version of the moving Lemma 42.24.1 Let $X \subset \mathbf{P}^{N}$ be a closed subvariety. Let $n=\operatorname{dim}(X)$ and $0 \leq d, d^{\prime}<n$. Let $X^{\text {reg }} \subset X$ be the open subset of nonsingular points. Let $Z \subset X^{\text {reg }}$ be a closed subvariety of dimension $d$ and $T_{i} \subset X^{r e g}, i \in I$ be a finite collection of closed subvarieties of dimension $d^{\prime}$. Then there exists a subvariety $C \subset \mathbf{P}^{N}$ such that $C$ intersects $X$ properly and such that

$$
\left.(C \cdot X)\right|_{X^{\text {reg }}}=Z+\sum_{j \in J} m_{j} Z_{j}
$$

where $Z_{j} \subset X^{\text {reg }}$ are irreducible of dimension $d$, distinct from $Z$, and

$$
\operatorname{dim}\left(Z_{j} \cap T_{i}\right) \leq \operatorname{dim}\left(Z \cap T_{i}\right)
$$

with strict inequality if $Z$ does not intersect $T_{i}$ properly in $X^{r e g}$.

### 42.26. Chow rings

0B0G Let $X$ be a nonsingular projective variety. We define the intersection product

$$
A_{r}(X) \times A_{s}(X) \longrightarrow A_{r+s-\operatorname{dim}(X)}(X), \quad(\alpha, \beta) \longmapsto \alpha \cdot \beta
$$

as follows. Let $\alpha \in Z_{r}(X)$ and $\beta \in Z_{s}(X)$. If $\alpha$ and $\beta$ intersect properly, we use the definition given in Section 42.17. If not, then we choose $\alpha \sim_{r a t} \alpha^{\prime}$ as in Lemma 42.24 .3 and we set

$$
\alpha \cdot \beta=\text { class of } \alpha^{\prime} \cdot \beta \in A_{r+s-\operatorname{dim}(X)}(X)
$$

This is well defined and passes through rational equivalence by Theorem 42.25.2. The intersection product on $A_{*}(X)$ is commutative (this is clear), associative (Lemma 42.20 .1 and has a unit $[X] \in A_{\operatorname{dim}(X)}(X)$.

Often it is convenient to use $A^{c}(X)=A_{\operatorname{dim} X-c}(X)$ to denote the group of codimension $c$ cycles modulo rational equivalence. The intersection product defines a product

$$
A^{k}(X) \times A^{l}(X) \longrightarrow A^{k+l}(X)
$$

which is commutative, associative, and has a unit $1=[X] \in A^{0}(X)$.

### 42.27. Pullback for a general morphism

0 BOH Let $f: X \rightarrow Y$ be a morphism of nonsingular projective varieties. We define

$$
f^{*}: A_{k}(Y) \rightarrow A_{k+\operatorname{dim} X-\operatorname{dim} Y}(X)
$$

by the rule

$$
f^{*}(\alpha)=p r_{X, *}\left(\Gamma_{f} \cdot p r_{Y}^{*}(\alpha)\right)
$$

where $\Gamma_{f} \subset X \times Y$ is the graph of $f$. Note that in this generality, it is defined only on cycle classes and not on cylces. With the notation $A^{*}$ introduced in Section 42.26 we may think of pullback as a map

$$
f^{*}: A^{*}(Y) \rightarrow A^{*}(X)
$$

in other words, it is a map of graded abelian groups.
0B2X Lemma 42.27.1. Let $f: X \rightarrow Y$ be a morphism of nonsingular projective varieties. The pullback map on chow groups satisfies:
(1) $f^{*}: A^{*}(Y) \rightarrow A^{*}(X)$ is a ring map,
(2) $(g \circ f)^{*}=f^{*} \circ g^{*}$ for a composable pair $f, g$,
(3) the projection formula holds: $f_{*}(\alpha) \cdot \beta=f_{*}\left(\alpha \cdot f^{*} \beta\right)$, and
(4) if $f$ is flat then it agrees with the previous definition.

Proof. All of these follow readily from the results above.
For (1) it suffices to show that $\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha \cdot \beta\right)=\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha\right) \cdot \operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \beta\right)$ for cycles $\alpha, \beta$ on $X \times Y$. If $\alpha$ is a cycle on $X \times Y$ which intersects $\Gamma_{f}$ properly, then it is easy to see that

$$
\Gamma_{f} \cdot \alpha=\Gamma_{f} \cdot \operatorname{pr}_{X}^{*}\left(\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha\right)\right)
$$

as cycles because $\Gamma_{f}$ is a graph. Thus we get the first equality in

$$
\begin{aligned}
\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha \cdot \beta\right) & =\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \operatorname{pr}_{X}^{*}\left(\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha\right)\right) \cdot \beta\right) \\
& =\operatorname{pr}_{X, *}\left(\operatorname{pr}_{X}^{*}\left(\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha\right)\right) \cdot\left(\Gamma_{f} \cdot \beta\right)\right) \\
& =\operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \alpha\right) \cdot \operatorname{pr}_{X, *}\left(\Gamma_{f} \cdot \beta\right)
\end{aligned}
$$

the last step by the projection formula in the flat case (Lemma 42.22.1).
If $g: Y \rightarrow Z$ then property (2) follows formally from the observation that

$$
\Gamma=\operatorname{pr}_{X \times Y}^{*} \Gamma_{f} \cdot \operatorname{pr}_{Y \times Z}^{*} \Gamma_{g}
$$

in $Z_{*}(X \times Y \times Z)$ where $\Gamma=\left\{(x, f(x), g(f(x))\}\right.$ and maps isomorphically to $\Gamma_{g \circ f}$ in $X \times Z$. The equality follows from the scheme theoretic equality and Lemma 42.14 .3 .

For (3) we use the projection formula for flat maps twice

$$
\begin{aligned}
f_{*}\left(\alpha \cdot p r_{X, *}\left(\Gamma_{f} \cdot p r_{Y}^{*}(\beta)\right)\right) & =f_{*}\left(p r_{X, *}\left(p r_{X}^{*} \alpha \cdot \Gamma_{f} \cdot p r_{Y}^{*}(\beta)\right)\right) \\
& \left.=p r_{Y, *}\left(p r_{X}^{*} \alpha \cdot \Gamma_{f} \cdot p r_{Y}^{*}(\beta)\right)\right) \\
& =p t_{Y, *}\left(p r_{X}^{*} \alpha \cdot \Gamma_{f}\right) \cdot \beta \\
& =f_{*}(\alpha) \cdot \beta
\end{aligned}
$$

where in the last equality we use the remark on graphs made above. This proves (3).

Property (4) rests on identifying the intersection product $\Gamma_{f} \cdot p r_{Y}^{*} \alpha$ in the case $f$ is flat. Namely, in this case if $V \subset Y$ is a closed subvariety, then every generic point
$\xi$ of the scheme $f^{-1}(V) \cong \Gamma_{f} \cap p r_{Y}^{-1}(V)$ lies over the generic point of $V$. Hence the local ring of $p r_{Y}^{-1}(V)=X \times V$ at $\xi$ is Cohen-Macaulay. Since $\Gamma_{f} \subset X \times Y$ is a regular immersion (as a morphism of smooth projective varieties) we find that

$$
\Gamma_{f} \cdot p r_{Y}^{*}[V]=\left[\Gamma_{f} \cap p r_{Y}^{-1}(V)\right]_{d}
$$

with $d$ the dimension of $\Gamma_{f} \cap p r_{Y}^{-1}(V)$, see Lemma 42.16.5. Since $\Gamma_{f} \cap p r_{Y}^{-1}(V)$ maps isomorphically to $f^{-1}(V)$ we conclude.

### 42.28. Pullback of cycles

0B0I Suppose that $X$ and $Y$ be nonsingular projective varieties, and let $f: X \rightarrow Y$ be a morphism. Suppose that $Z \subset Y$ is a closed subvariety. Let $f^{-1}(Z)$ be the scheme theoretic inverse image:

is a fibre product diagram of schemes. In particular $f^{-1}(Z) \subset X$ is a closed subscheme of $X$. In this case we always have

$$
\operatorname{dim} f^{-1}(Z) \geq \operatorname{dim} Z+\operatorname{dim} X-\operatorname{dim} Y
$$

If equality holds in the formula above, then $f^{*}[Z]=\left[f^{-1}(Z)\right]_{\operatorname{dim} Z+\operatorname{dim} X-\operatorname{dim} Y}$ provided that the scheme $Z$ is Cohen-Macaulay at the images of the generic points of $f^{-1}(Z)$. This follows by identifying $f^{-1}(Z)$ with the scheme theoretic intersection of $\Gamma_{f}$ and $X \times Z$ and using Lemma42.16.5. Details are similar to the proof of part (4) of Lemma 42.27.1 above.

## CHAPTER 43

## Picard Schemes of Curves

### 43.1. Introduction

0B93 In this chapter we do just enough work to construct the Picard scheme of a projective nonsingular curve over an algebraically closed field. See Kle05 for a more thorough discussion as well as historical background.

Later in the Stacks project we will discuss Hilbert and Quot functors in much greater generality.

### 43.2. Hilbert scheme of points

0B94 Let $X \rightarrow S$ be a morphism of schemes. Let $d \geq 0$ be an integer. For a scheme $T$ over $S$ we let

$$
\operatorname{Hilb}_{X / S}^{d}(T)=\left\{\begin{array}{c}
Z \subset X_{T} \text { closed subscheme such that } \\
Z \rightarrow T \text { is finite locally free of degree } d
\end{array}\right\}
$$

If $T^{\prime} \rightarrow T$ is a morphism of schemes over $S$ and if $Z \in \operatorname{Hilb}_{X / S}^{d}(T)$, then the base change $Z_{T^{\prime}} \subset X_{T^{\prime}}$ is an element of $\operatorname{Hilb}_{X / S}^{d}\left(T^{\prime}\right)$. In this way we obtain a functor

$$
\operatorname{Hilb}_{X / S}^{d}:(S c h / S)^{o p p} \longrightarrow S e t s, \quad T \longrightarrow \operatorname{Hilb}_{X / S}^{d}(T)
$$

In general $\operatorname{Hilb}_{X / S}^{d}$ is an algebraic space (insert future reference here). In this section we will show that $\operatorname{Hilb}_{X / S}^{d}$ is representable by a scheme if any finite number of points in a fibre of $X \rightarrow S$ are contained in an affine open. If $\operatorname{Hilb}_{X / S}^{d}$ is representable by a scheme, we often denote this scheme by $\underline{\operatorname{Hilb}}_{X / S}^{d}$.

0B95 Lemma 43.2.1. Let $X \rightarrow S$ be a morphism of schemes. The functor Hilb ${ }_{X / S}^{d}$ satisfies the sheaf property for the fpqc topology (Topologies, Definition 33.8.12).

Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $S$. Set $X_{i}=X_{T_{i}}=$ $X \times{ }_{S} T_{i}$. Note that $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$ (Topologies, Lemma 33.8.7 and that $X_{T_{i} \times{ }_{T} T_{i^{\prime}}}=X_{i} \times{ }_{X_{T}} X_{i^{\prime}}$. Suppose that $Z_{i} \in \operatorname{Hilb}_{X / S}^{d}\left(T_{i}\right)$ is a collection of elements such that $Z_{i}$ and $Z_{i^{\prime}}$ map to the same element of $\operatorname{Hilb}_{X / S}^{d}\left(T_{i} \times{ }_{T} T_{i^{\prime}}\right)$. By effective descent for closed immersions (Descent, Lemma 34.33.2) there is a closed immersion $Z \rightarrow X_{T}$ whose base change by $X_{i} \rightarrow X_{T}$ is equal to $Z_{i} \rightarrow X_{i}$. The morphism $Z \rightarrow T$ then has the property that its base change to $T_{i}$ is the morphism $Z_{i} \rightarrow T_{i}$. Hence $Z \rightarrow T$ is finite locally free of degree $d$ by Descent, Lemma 34.19 .28

0B96 Lemma 43.2.2. Let $X \rightarrow S$ be a morphism of schemes. If $X \rightarrow S$ is of finite presentation, then the functor Hilb ${ }_{X / S}^{d}$ is limit preserving (Limits, Remark 31.5.2).
Proof. Let $T=\lim T_{i}$ be a limit of affine schemes over $S$. We have to show that $\operatorname{Hilb}_{X / S}^{d}(T)=\operatorname{colim} \operatorname{Hilb}_{X / S}^{d}\left(T_{i}\right)$. Observe that if $Z \rightarrow X_{T}$ is an element of $\operatorname{Hilb}_{X / S}^{d}(T)$, then $Z \rightarrow T$ is of finite presentation. Hence by Limits, Lemma 31.9.1 there exists an $i$, a scheme $Z_{i}$ of finite presentation over $T_{i}$, and a morphism $Z_{i} \rightarrow X_{T_{i}}$ over $T_{i}$ whose base change to $T$ gives $Z \rightarrow X_{T}$. We apply Limits, Lemma 31.7 .4 to see that we may assume $Z_{i} \rightarrow X_{T_{i}}$ is a closed immersion after increasing $i$. We apply Limits, Lemma 31.7.7 to see that $Z_{i} \rightarrow T_{i}$ is finite locally free of degree $d$ after possibly increasing $i$. Then $Z_{i} \in \operatorname{Hilb}_{X / S}^{d}\left(T_{i}\right)$ as desired.

Let $S$ be a scheme. Let $i: X \rightarrow Y$ be a closed immersion of schemes over $S$. Then there is a transformation of functors

$$
\operatorname{Hilb}_{X / S}^{d} \longrightarrow \operatorname{Hilb}_{Y / S}^{d}
$$

which maps an element $Z \in \operatorname{Hilb}_{X / S}^{d}(T)$ to $i_{T}(Z) \subset Y_{T}$ in $\operatorname{Hilb}_{Y / S}^{d}$. Here $i_{T}: X_{T} \rightarrow$ $Y_{T}$ is the base change of $i$.

0B97 Lemma 43.2.3. Let $S$ be a scheme. Let $i: X \rightarrow Y$ be a closed immersion of schemes. If Hilb ${ }_{Y / S}^{d}$ is representable by a scheme, so is Hilb ${ }_{X / S}^{d}$ and the corresponding morphism of schemes $\underline{\text { Hilb }}_{X / S}^{d} \rightarrow \underline{\text { Hilb }}_{Y / S}^{d}$ is a closed immersion.

Proof. Let $T$ be a scheme over $S$ and let $Z \in \operatorname{Hilb}_{Y / S}^{d}(T)$. Claim: there is a closed subscheme $T_{X} \subset T$ such that a morphism of schemes $T^{\prime} \rightarrow T$ factors through $T_{X}$ if and only if $Z_{T^{\prime}} \rightarrow Y_{T^{\prime}}$ factors through $X_{T^{\prime}}$. Applying this to a scheme $T_{\text {univ }}$ representing $\operatorname{Hilb}_{Y / S}^{d}$ and the universal object ${ }^{1} Z_{\text {univ }} \in \operatorname{Hilb}_{Y / S}^{d}\left(T_{\text {univ }}\right)$ we get a closed subscheme $T_{\text {univ,X }} \subset T_{\text {univ }}$ such that $Z_{u n i v, X}=Z_{u n i v} \times_{T_{u n i v}} T_{u n i v, X}$ is a closed subscheme of $X \times{ }_{S} T_{u n i v, X}$ and hence defines an element of $\operatorname{Hilb}_{X / S}^{d}\left(T_{u n i v, X}\right)$. A formal argument then shows that $T_{u n i v, X}$ is a scheme representing $\operatorname{Hilb}_{X / S}^{d}$ with universal object $Z_{\text {univ,X }}$.
Proof of the claim. Consider $Z^{\prime}=X_{T} \times_{Y_{T}} Z$. Given $T^{\prime} \rightarrow T$ we see that $Z_{T^{\prime}} \rightarrow Y_{T^{\prime}}$ factors through $X_{T^{\prime}}$ if and only if $Z_{T^{\prime}}^{\prime} \rightarrow Z_{T^{\prime}}$ is an isomorphism. Thus the claim follows from the very general More on Flatness, Lemma 37.23.4 However, in this special case one can prove the statement directly as follows: first reduce to the case $T=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(B)$. After shrinking $T$ further we may assume there is an isomorphism $\varphi: B \rightarrow A^{\oplus d}$ as $A$-modules. Then $Z^{\prime}=\operatorname{Spec}(B / J)$ for some ideal $J \subset B$. Let $g_{\beta} \in J$ be a collection of generators and write $\varphi\left(g_{\beta}\right)=\left(g_{\beta}^{1}, \ldots, g_{\beta}^{d}\right)$. Then it is clear that $T_{X}$ is given by $\operatorname{Spec}\left(A /\left(g_{\beta}^{j}\right)\right)$.

0B98 Lemma 43.2.4. Let $X \rightarrow S$ be a morphism of schemes. If $X \rightarrow S$ is separated and Hilb $_{X / S}^{d}$ is representable, then $\underline{\text { Hilb }}_{X / S}^{d} \rightarrow S$ is separated.

Proof. In this proof all unadorned products are over $S$. Let $H=\underline{\operatorname{Hilb}}_{X / S}^{d}$ and let $Z \in \operatorname{Hilb}_{X / S}^{d}(H)$ be the universal object. Consider the two objects $Z_{1}, Z_{2} \in$ $\operatorname{Hilb}_{X / S}^{d}(H \times H)$ we get by pulling back $Z$ by the two projections $H \times H \rightarrow H$. Then $Z_{1}=Z \times H \subset X_{H \times H}$ and $Z_{2}=H \times Z \subset X_{H \times H}$. Since $H$ represents

[^122]the functor $\operatorname{Hilb}_{X / S}^{d}$, the diagonal morphism $\Delta: H \rightarrow H \times H$ has the following universal property: A morphism of schemes $T \rightarrow H \times H$ factors through $\Delta$ if and only if $Z_{1, T}=Z_{2, T}$ as elements of $\operatorname{Hilb}_{X / S}^{d}(T)$. Set $Z=Z_{1} \times{ }_{X_{H \times H}} Z_{2}$. Then we see that $T \rightarrow H \times H$ factors through $\Delta$ if and only if the morphisms $Z_{T} \rightarrow Z_{1, T}$ and $Z_{T} \rightarrow Z_{2, T}$ are isomorphisms. It follows from the very general More on Flatness, Lemma 37.23 .4 that $\Delta$ is a closed immersion. In the proof of Lemma 43.2 .3 the reader finds an alternative easier proof of the needed result in our special case.

0B99 Lemma 43.2.5. Let $X \rightarrow S$ be a morphism of affine schemes. Let $d \geq 0$. Then Hilb ${ }_{X / S}^{d}$ is representable.
Proof. Say $S=\operatorname{Spec}(R)$. Then we can choose a closed immersion of $X$ into the spectrum of $R\left[x_{i} ; i \in I\right]$ for some set $I$ (of sufficiently large cardinality. Hence by Lemma 43.2.3 we may assume that $X=\operatorname{Spec}(A)$ where $A=R\left[x_{i} ; i \in I\right]$. We will use Schemes, Lemma 25.15 .4 to prove the lemma in this case.

Condition (1) of the lemma follows from Lemma 43.2.1.
For every subset $W \subset A$ of cardinality $d$ we will construct a subfunctor $F_{W}$ of $\operatorname{Hilb}_{X / S}^{d}$. (It would be enough to consider the case where $W$ consists of a collection of monomials in the $x_{i}$ but we do not need this.) Namely, we will say that $Z \in$ $\operatorname{Hilb}_{X / S}^{d}(T)$ is in $F_{W}(T)$ if and only if the $\mathcal{O}_{T}$-linear map

$$
\bigoplus_{f \in W} \mathcal{O}_{T} \longrightarrow(Z \rightarrow T)_{*} \mathcal{O}_{Z},\left.\quad\left(g_{f}\right) \longmapsto \sum g_{f} f\right|_{Z}
$$

is surjective (equivalently an isomorphism). Here for $f \in A$ and $Z \in \operatorname{Hilb}_{X / S}^{d}(T)$ we denote $\left.f\right|_{Z}$ the pullback of $f$ by the morphism $Z \rightarrow X_{T} \rightarrow X$.
Openness, i.e., condition (2)(b) of the lemma. This follows from Algebra, Lemma 10.78 .3

Covering, i.e., condition (2)(c) of the lemma. Since

$$
A \otimes_{R} \mathcal{O}_{T}=\left(X_{T} \rightarrow T\right)_{*} \mathcal{O}_{X_{T}} \rightarrow(Z \rightarrow T)_{*} \mathcal{O}_{Z}
$$

is surjective and since $(Z \rightarrow T) * \mathcal{O}_{Z}$ is finite locally free of rank $d$, for every point $t \in T$ we can find a finite subset $W \subset A$ of cardinality $d$ whose images form a basis of the $d$-dimensional $\kappa(t)$-vector space $\left((Z \rightarrow T)_{*} \mathcal{O}_{Z}\right)_{t} \otimes_{\mathcal{O}_{T, t}} \kappa(t)$. By Nakayama's lemma there is an open neighbourhood $V \subset T$ of $t$ such that $Z_{V} \in F_{W}(V)$.
Representable, i.e., condition (2)(a) of the lemma. Let $W \subset A$ have cardinality $d$. We claim that $F_{W}$ is representable by an affine scheme over $R$. We will construct this affine scheme here, but we encourage the reader to think it trough for themselves. Choose a numbering $f_{1}, \ldots, f_{d}$ of the elements of $W$. We will construct a universal element $Z_{\text {univ }}=\operatorname{Spec}\left(B_{\text {univ }}\right)$ of $F_{W}$ over $T_{\text {univ }}=\operatorname{Spec}\left(R_{\text {univ }}\right)$ which will be the spectrum of

$$
B_{u n i v}=R_{u n i v}\left[e_{1}, \ldots, e_{d}\right] /\left(e_{k} e_{l}-\sum c_{k l}^{m} e_{m}\right)
$$

where the $e_{l}$ will be the images of the $f_{l}$ and where the closed immersion $Z_{\text {univ }} \rightarrow$ $X_{T_{u n i v}}$ is given by the ring map

$$
A \otimes_{R} R_{u n i v} \longrightarrow B_{\text {univ }}
$$

mapping $1 \otimes 1$ to $\sum b^{l} e_{l}$ and $x_{i}$ to $\sum b_{i}^{l} e_{l}$. In fact, we claim that $F_{W}$ is represented by the spectrum of the ring

$$
R_{u n i v}=R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right] / \mathfrak{a}_{u n i v}
$$

where the ideal $\mathfrak{a}_{\text {univ }}$ is generated by the following elements:
(1) multiplication on $B_{u n i v}$ is commutative, i.e., $c_{l k}^{m}-c_{k l}^{m} \in \mathfrak{a}_{u n i v}$,
(2) multiplication on $B_{u n i v}$ is associative, i.e., $c_{l k}^{m} c_{m n}^{p}-c_{l q}^{p} c_{k n}^{q} \in \mathfrak{a}_{u n i v}$,
(3) $\sum b^{l} e_{l}$ is a multiplicative 1 in $B_{\text {univ }}$, in other words, we should have $\left(\sum b^{l} e_{l}\right) e_{k}=e_{k}$ for all $k$, which means $\sum b^{l} c_{l k}^{m}-\delta_{k m} \in \mathfrak{a}_{\text {univ }}$ (Kronecker delta).
After dividing out by the ideal $\mathfrak{a}_{\text {univ }}^{\prime}$ of the elements listed sofar we obtain a well defined ring map
$\Psi: A \otimes_{R} R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right] / \mathfrak{a}_{\text {univ }}^{\prime} \longrightarrow\left(R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right] / \mathfrak{a}_{\text {univ }}^{\prime}\right)\left[e_{1}, \ldots, e_{d}\right] /\left(e_{k} e_{l}-\sum c_{k l}^{m} e_{m}\right)$
sending $1 \otimes 1$ to $\sum b^{l} e_{l}$ and $x_{i} \otimes 1$ to $\sum b_{i}^{l} e_{l}$. We need to add some more elements to our ideal because we need
(5) $f_{l}$ to map to $e_{l}$ in $B_{\text {univ }}$. Write $\Psi\left(f_{l}\right)-e_{l}=\sum h_{l}^{m} e_{m}$ with $h_{l}^{m} \in$ $R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right] / \mathfrak{a}_{\text {univ }}^{\prime}$ then we need to set $h_{l}^{m}$ equal to zero.
Thus setting $\mathfrak{a}_{\text {univ }} \subset R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right]$ equal to $\mathfrak{a}_{\text {univ }}^{\prime}+$ ideal generated by lifts of $h_{l}^{m}$ to $R\left[c_{k l}^{m}, b^{l}, b_{i}^{l}\right]$, then it is clear that $F_{W}$ is represented by $\operatorname{Spec}\left(R_{u n i v}\right)$.

0B9A Proposition 43.2.6. Let $X \rightarrow S$ be a morphism of schemes. Let $d \geq 0$. Assume for all $\left(s, x_{1}, \ldots, x_{d}\right)$ where $s \in S$ and $x_{1}, \ldots, x_{d} \in X_{s}$ there exists an affine open $U \subset X$ with $x_{1}, \ldots, x_{d} \in U$. Then Hilb ${ }_{X / S}^{d}$ is representable by a scheme.
Proof. Either using relative glueing (Constructions, Section 26.2) or using the functorial point of view (Schemes, Lemma 25.15.4 we reduce to the case where $S$ is affine. Details omitted.
Assume $S$ is affine. For $U \subset X$ affine open, denote $F_{U} \subset \operatorname{Hilb}_{X / S}^{d}$ the subfunctor parametrizing closed subschemes of $U$. We will use Schemes, Lemma 25.15 .4 and the subfunctors $F_{U}$ to conclude.
Condition (1) is Lemma 43.2.1.
Condition (2)(a) follows from the fact that $F_{U}=\operatorname{Hilb}_{U / S}^{d}$ and that this is representable by Lemma 43.2.5.
Let $Z \in \operatorname{Hilb}_{X / S}^{d}(T)$ for some scheme $T$ over $S$. Let

$$
B=(Z \rightarrow T)\left(\left(Z \rightarrow X_{T} \rightarrow X\right)^{-1}(X \backslash U)\right)
$$

This is a closed subset of $T$ and it is clear that over the open $T_{Z, U}=T \backslash B$ the restriction $Z_{t^{\prime}}$ maps into $U_{T^{\prime}}$. On the other hand, for any $b \in B$ the fibre $Z_{b}$ does not map into $U$. Thus we see that given a morphism $T^{\prime} \rightarrow T$ we have $Z_{T^{\prime}} \in F_{U}\left(T^{\prime}\right)$ $\Leftrightarrow T^{\prime} \rightarrow T$ factors through the open $T_{Z, U}$. This proves condition (2)(b).
Condition (2)(c) follows from our assuption on $X / S$. All we have to do is show the following: If $T$ is the spectrum of a field and $Z \subset X_{T}$ is a closed subscheme, finite flat of degree $d$ over $T$, then $Z \rightarrow X_{T} \rightarrow X$ factors through an affine open $U$ of $X$. This is clear because $Z$ will have at most $d$ points and these will all map into the fibre of $X$ over the image point of $T \rightarrow S$.

0B9B Remark 43.2.7. Let $f: X \rightarrow S$ be a morphism of schemes. The assumption of Proposition 43.2 .6 and hence the conclusion holds in each of the following cases:
(1) $X$ is quasi-affine,
(2) $f$ is quasi-affine,
(3) $f$ is quasi-projective,
(4) $f$ is locally projective,
(5) there exists an ample invertible sheaf on $X$,
(6) there exists an $f$-ample invertible sheaf on $X$, and
(7) there exists an $f$-very ample invertible sheaf on $X$.

Namely, in each of these cases, every finite set of points of a fibre $X_{s}$ is contained in a quasi-compact open $U$ of $X$ which comes with an ample invertible sheaf, is isomorphic to an open of an affine scheme, or is isomorphic to an open of Proj of a graded ring (in each case this follows by unwinding the definitions). Thus the existence of suitable affine opens by Properties, Lemma 27.29.5.

### 43.3. Moduli of divisors on smooth curves

0B9C For a smooth morphism $X \rightarrow S$ of relative dimension 1 the functor $\operatorname{Hilb}_{X / S}^{d}$ parametrizes relative effective Cartier divisors as defined in Divisors, Section 30.15 .

0B9D Lemma 43.3.1. Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1. Let $D \subset X$ be a closed subscheme. Consider the following conditions
(1) $D \rightarrow S$ is finite locally free,
(2) $D$ is a relative effective Cartier divisor on $X / S$,
(3) $D \rightarrow S$ is locally quasi-finite, flat, and locally of finite presentation, and
(4) $D \rightarrow S$ is locally quasi-finite and flat.

We always have the implications

$$
(1) \Rightarrow(2) \Leftrightarrow(3) \Rightarrow(4)
$$

If $S$ is locally Noetherian, then the last arrow is an if and only if. If $X \rightarrow S$ is proper (and $S$ arbitrary), then the first arrow is an if and only if.

Proof. Equivalence of (2) and (3). This follows from Divisors, Lemma 30.15.9 if we can show the equivalence of (2) and (3) when $S$ is the spectrum of a field $k$. Let $x \in X$ be a closed point. As $X$ is smooth of relative dimension 1 over $k$ and we see that $\mathcal{O}_{X, x}$ is a regular local ring of dimension 1 (see Varieties, Lemma 32.20.3). Thus $\mathcal{O}_{X, x}$ is a discrete valuation ring (Algebra, Lemma 10.118.7) and hence a PID. It follows that every sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ which is nonvanishing at all the generic points of $X$ is invertible (Divisors, Lemma 30.12.2). In other words, every closed subscheme of $X$ which does not contain a generic point is an effective Cartier divisor. It follows that (2) and (3) are equivalent.

If $S$ is Noetherian, then any locally quasi-finite morphism $D \rightarrow S$ is locally of finite presentation (Morphisms, Lemma 28.21.9), whence (3) is equivalent to (4).

If $X \rightarrow S$ is proper (and $S$ is arbitrary), then $D \rightarrow S$ is proper as well. Since a proper locally quasi-finite morphism is finite (More on Morphisms, Lemma 36.31.4) and a finite, flat, and finitely presented morphism is finite locally free (Morphisms, Lemma 28.45.22, we see that (1) is equivalent to (2).

0B9E Lemma 43.3.2. Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1. Let $D_{1}, D_{2} \subset X$ be closed subschemes finite locally free of degrees $d_{1}, d_{2}$ over $S$. Then $D_{1}+D_{2}$ is finite locally free of degree $d_{1}+d_{2}$ over $S$.
Proof. By Lemma 43.3.1 we see that $D_{1}$ and $D_{2}$ are relative effective Cartier divisors on $X / S$. Thus $D=D_{1}+D_{2}$ is a relative effective Cartier divisor on $X / S$ by Divisors, Lemma 30.15.3. Hence $D \rightarrow S$ is locally quasi-finite, flat, and locally of finite presentation by Lemma 43.3.1. Applying Morphisms, Lemma 28.41.11the the surjective integral morphism $D_{1} \amalg D_{2} \rightarrow D$ we find that $D \rightarrow S$ is separated. Then Morphisms, Lemma 28.41 .8 implies that $D \rightarrow S$ is proper. This implies that $D \rightarrow S$ is finite (More on Morphisms, Lemma 36.31.4) and in turn we see that $D \rightarrow S$ is finite locally free (Morphisms, Lemma 28.45.2). Thus it suffice to show that the degree of $D \rightarrow S$ is $d_{1}+d_{2}$. To do this we may base change to a fibre of $X \rightarrow S$, hence we may assume that $S=\operatorname{Spec}(k)$ for some field $k$. In this case, there exists a finite set of closed points $x_{1}, \ldots, x_{n} \in X$ such that $D_{1}$ and $D_{2}$ are supported on $\left\{x_{1}, \ldots, x_{n}\right\}$. In fact, there are nonzerodivisors $f_{i, j} \in \mathcal{O}_{X, x_{i}}$ such that

$$
D_{1}=\coprod \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}} /\left(f_{i, 1}\right)\right) \quad \text { and } \quad D_{2}=\coprod \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}} /\left(f_{i, 2}\right)\right)
$$

Then we see that

$$
D=\coprod \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}} /\left(f_{i, 1} f_{i, 2}\right)\right)
$$

From this one sees easily that $D$ has degree $d_{1}+d_{2}$ over $k$ (if need be, use Algebra, Lemma 10.120.1.

0B9F Lemma 43.3.3. Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1. Let $D_{1}, D_{2} \subset X$ be closed subschemes finite locally free of degrees $d_{1}$, $d_{2}$ over $S$. If $D_{1} \subset D_{2}$ (as closed subschemes) then there is a closed subscheme $D \subset X$ finite locally free of degree $d_{2}-d_{1}$ over $S$ such that $D_{2}=D_{1}+D$.

Proof. This proof is almost exactly the same as the proof of Lemma 43.3.2. By Lemma 43.3.1 we see that $D_{1}$ and $D_{2}$ are relative effective Cartier divisors on $X / S$. By Divisors, Lemma 30.15 .4 there is a relative effective Cartier divisor $D \subset X$ such that $D_{2}=D_{1}+D$. Hence $D \rightarrow S$ is locally quasi-finite, flat, and locally of finite presentation by Lemma 43.3.1. Since $D$ is a closed subscheme of $D_{2}$, we see that $D \rightarrow S$ is finite. It follows that $D \rightarrow S$ is finite locally free (Morphisms, Lemma 28.45 .2 ). Thus it suffice to show that the degree of $D \rightarrow S$ is $d_{2}-d_{1}$. This follows from Lemma 43.3.2

Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1. By Lemma 43.3 .1 for a scheme $T$ over $S$ and $D \in \operatorname{Hilb}_{X / S}^{d}(T)$, we can view $D$ as a relative effective Cartier divisor on $X_{T} / T$ such that $D \rightarrow T$ is finite locally free of degree d. Hence, by Lemma 43.3.2 we obtain a transformation of functors

$$
\operatorname{Hilb}_{X / S}^{d_{1}} \times \operatorname{Hilb}_{X / S}^{d_{2}} \longrightarrow \operatorname{Hilb}_{X / S}^{d_{1}+d_{2}}, \quad\left(D_{1}, D_{2}\right) \longmapsto D_{1}+D_{2}
$$

If $\operatorname{Hilb}_{X / S}^{d}$ is representable for all degrees $d$, then this transformation of functors corresponds to a morphism of schemes

$$
\underline{\operatorname{Hilb}}_{X / S}^{d_{1}} \times \underline{\operatorname{Hilb}}_{X / S}^{d_{2}} \longrightarrow \underline{\operatorname{Hilb}}_{X / S}^{d_{1}+d_{2}}
$$

over $S$. Observe that $\underline{\operatorname{Hilb}}_{X / S}^{0}=S$ and $\underline{\operatorname{Hilb}}_{X / S}^{1}=X$. A special case of the morphism above is the morphism

$$
\underline{\operatorname{Hilb}}_{X / S}^{d} \times_{S} X \longrightarrow \underline{\operatorname{Hilb}}_{X / S}^{d+1}, \quad(D, x) \longmapsto D+x
$$

0B9G Lemma 43.3.4. Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1 such that the functors Hilb $_{X / S}^{d}$ are representable. The morphism $\underline{\text { Hilb }}{ }_{X / S}^{d} \times{ }_{S}$ $X \rightarrow \underline{H i l b}_{X / S}^{d+1}$ is finite locally free of degree $d+1$.

Proof. Let $D_{\text {univ }} \subset X \times{ }_{S} \underline{\operatorname{Hilb}}_{X / S}^{d+1}$ be the universal object. There is a commutative diagram

where the top horizontal arrow maps $\left(D^{\prime}, x\right)$ to $\left(D^{\prime}+x, x\right)$. We claim this morphism is an isomorphism which certainly proves the lemma. Namely, given a scheme $T$ over $S$, a $T$-valued point $\xi$ of $D_{\text {univ }}$ is given by a pair $\xi=(D, x)$ where $D \subset X_{T}$ is a closed subscheme finite locally free of degree $d+1$ over $T$ and $x: T \rightarrow X$ is a morphism whose graph $x: T \rightarrow X_{T}$ factors through $D$. Then by Lemma 43.3.3 we can write $D=D^{\prime}+x$ for some $D^{\prime} \subset X_{T}$ finite locally free of degree $d$ over $T$. Sending $\xi=(D, x)$ to the pair $\left(D^{\prime}, x\right)$ is the desired inverse.

0B9H Lemma 43.3.5. Let $X \rightarrow S$ be a smooth morphism of schemes of relative dimension 1 such that the functors Hilb ${ }_{X / S}^{d}$ are representable. The schemes $\underline{H i l b}_{X / S}^{d}$ are smooth over $S$ of relative dimension $d$.

Proof. We have $\underline{\operatorname{Hilb}}_{X / S}^{d}=S$ and $\underline{\operatorname{Hilb}}_{X / S}^{1}=X$ thus the result is true for $d=0,1$. Assuming the result for $d$, we see that $\underline{\operatorname{Hilb}}_{X / S}^{d} \times{ }_{S} X$ is smooth over $S$ (Morphisms, Lemma 28.34.5 and 28.34.4. Since $\underline{\operatorname{Hilb}}_{X / S}^{d} \times{ }_{S} X \rightarrow \underline{\operatorname{Hilb}}_{X / S}^{d+1}$ is finite locally free of degree $d+1$ by Lemma 43.3.4 the result follows from Descent, Lemma 34.10.5. We omit the verification that the relative dimension is as claimed (you can do this by looking at fibres, or by keeping track of the dimensions in the argument above).

We collect all the information obtained sofar in the case of a proper smooth curve over a field.

0B9I Proposition 43.3.6. Let $X$ be a geometrically irreducible smooth proper curve over a field $k$.
(1) The functors Hilb ${ }_{X / k}^{d}$ are representable by smooth proper varieties $\underline{H i l b}_{X / k}^{d}$ of dimension $d$ over $k$.
(2) For a field extension $k^{\prime} / k$ the $k^{\prime}$-rational points of $\underline{H i l b}_{X / k}^{d}$ are in 1-to-1 bijection with effective Cartier divisors of degree $d$ on $X_{k^{\prime}}$.
(3) For $d_{1}, d_{2} \geq 0$ there is a morphism

$$
\underline{H i l b}_{X / k}^{d_{1}} \times_{k} \underline{H i l b}_{X / k}^{d_{2}} \longrightarrow \underline{H i l b}_{X / k}^{d_{1}+d_{2}}
$$

which is finite locally free of degree $\binom{d_{1}+d_{2}}{d_{1}}$.
Proof. The functors $\operatorname{Hilb}_{X / k}^{d}$ are representable by Proposition 43.2.6 (see also Remark 43.2.7) and the fact that $X$ is projective (Varieties, Lemma 32.32.4). The schemes $\underline{\text { Hilb }}_{X / k}^{d}$ are separated over $k$ by Lemma 43.2.4. The schemes $\underline{\text { Hilb }}_{X / k}^{d}$ are
smooth over $k$ by Lemma 43.3.5. Starting with $X=\underline{\operatorname{Hilb}}_{X / k}^{1}$, the morphisms of Lemma 43.3.4 and induction we find a morphism

$$
X^{d}=X \times_{k} X \times_{k} \ldots \times_{k} X \longrightarrow \underline{\operatorname{Hilb}}_{X / k}^{d}, \quad\left(x_{1}, \ldots, x_{d}\right) \longrightarrow x_{1}+\ldots+x_{d}
$$

which is finite locally free of degree $d$ !. Since $X$ is proper over $k$, so is $X^{d}$, hence $\underline{\operatorname{Pic}}_{X / k}^{d}$ is proper over $k$ by Morphisms, Lemma 28.41.8. Since $X$ is geometrically irreducible over $k$, the product $X^{d}$ is irreducible (Varieties, Lemma 32.6.4) hence the image is irreducible (in fact geometrically irreducible). This proves (1). Part (2) follows from the definitions. Part (3) follows from the commutative diagram

and multiplicativity of degrees of finite locally free morphisms.
0B9J Remark 43.3.7. Let $X$ be a geometrically irreducible smooth proper curve over a field $k$ as in Proposition 43.3.6. Let $d \geq 0$. The universal closed object is a relatively effective divisor

$$
D_{u n i v} \subset \underline{\operatorname{Hilb}}_{X / k}^{d+1} \times_{k} X
$$

over Hilb $_{X / k}^{d+1}$ by Lemma 43.3.1. In fact, $D_{\text {univ }}$ is isomorphic as a scheme to $\underline{\operatorname{Hilb}}_{X / k}^{d} \times{ }_{k} X$, see proof of Lemma 43.3.4. In particular, $D_{\text {univ }}$ is an effective Cartier divisor and we obtain an invertible module $\mathcal{O}\left(D_{\text {univ }}\right)$. If $[D] \in \underline{\operatorname{Hilb}}_{X / k}^{d+1}$ denotes the $k$-rational point corresponding to the effective Cartier divisor $D \subset X$ of degree $d$, then the resiction of $\mathcal{O}\left(D_{\text {univ }}\right)$ to to the fibre $[D] \times X$ is $\mathcal{O}_{X}(D)$.

### 43.4. The Picard functor

0B9K Given any scheme $X$ we denote $\operatorname{Pic}(X)$ the set of isomorphism classes of invertible $\mathcal{O}_{X}$-modules. See Modules, Definition 17.21.9. Given a morphism $f: X \rightarrow Y$ of schemes, pullback defines a group homomorphism $\operatorname{Pic}(Y) \rightarrow \operatorname{Pic}(X)$. The assignment $X \rightsquigarrow \operatorname{Pic}(X)$ is a contravariant functor from the category of schemes to the category of abelian groups. This functor is not representable, but it turns out that a relative variant of this construction sometimes is representable.

Let us define the Picard functor for a morphism of schemes $f: X \rightarrow S$. The idea behind our construction is that we'll take it to be the sheaf $R^{1} f_{*} \mathbf{G}_{m}$ where we use the fppf topology to compute the higher direct image. Unwinding the definitions this leads to the following more direct definition.

0B9L Definition 43.4.1. Let $S c h_{f p p f}$ be a big site as in Topologies, Definition 33.7.8. Let $f: X \rightarrow S$ be a morphism of this site. The Picard functor $\mathrm{Pic}_{X / S}$ is the fppf sheafification of the functor

$$
(S c h / S)_{f p p f} \longrightarrow S e t s, \quad T \longmapsto \operatorname{Pic}\left(X_{T}\right)
$$

If this functor is representable, then we denote $\underline{\mathrm{Pic}}_{X / S}$ a scheme representing it.

An often used remark is that if $T \in \operatorname{Ob}\left((S c h / S)_{f p p f}\right)$, then $\operatorname{Pic}_{X_{T} / T}$ is the restriction of $\operatorname{Pic}_{X / S}$ to $(S c h / T)_{f p p f}$. It turns out to be nontrivial to see what the value of $\operatorname{Pic}_{X / S}$ is on schemes $T$ over $S$. Here is a lemma that helps with this task.

0B9M Lemma 43.4.2. Let $f: X \rightarrow S$ be as in Definition 43.4.1. If $\mathcal{O}_{T} \rightarrow f_{T, *} \mathcal{O}_{X_{T}}$ is an isomorphism for all $T \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$, then

$$
0 \rightarrow \operatorname{Pic}(T) \rightarrow \operatorname{Pic}\left(X_{T}\right) \rightarrow \operatorname{Pic}_{X / S}(T)
$$

is an exact sequence for all $T$.
Proof. We may replace $S$ by $T$ and $X$ by $X_{T}$ and assume that $S=T$ to simplify the notation. Let $\mathcal{N}$ be an invertible $\mathcal{O}_{S}$-module. If $f^{*} \mathcal{N} \cong \mathcal{O}_{X}$, then we see that $f_{*} f^{*} \mathcal{N} \cong f_{*} \mathcal{O}_{X} \cong \mathcal{O}_{S}$ by assumption. Since $\mathcal{N}$ is locally trivial, we see that the canonical map $\mathcal{N} \rightarrow f_{*} f^{*} \mathcal{N}$ is locally an isomorphism (because $\mathcal{O}_{S} \rightarrow f_{*} f^{*} \mathcal{O}_{S}$ is an isomorphism by assumption). Hence we conclude that $\mathcal{N} \rightarrow f_{*} f^{*} \mathcal{N} \rightarrow \mathcal{O}_{S}$ is an isomorphism and we see that $\mathcal{N}$ is trivial. This proves the first arrow is injective.
Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module which is in the kernel of $\operatorname{Pic}(X) \rightarrow \operatorname{Pic}_{X / S}(S)$. Then there exists an fppf covering $\left\{S_{i} \rightarrow S\right\}$ such that $\mathcal{L}$ pulls back to the trival invertible sheaf on $X_{S_{i}}$. Choose a trivializing section $s_{i}$. Then $\operatorname{pr}_{0}^{*} s_{i}$ and $\operatorname{pr}_{1}^{*} s_{j}$ are both trivialising sections of $\mathcal{L}$ over $X_{S_{i} \times S_{S}}$ and hence differ by a multiplicative unit

$$
f_{i j} \in \Gamma\left(X_{S_{i} \times_{S} S_{j}}, \mathcal{O}_{X_{S_{i} \times{ }_{S} S_{j}}}^{*}\right)=\Gamma\left(S_{i} \times_{S} S_{j}, \mathcal{O}_{S_{i} \times S_{j}}^{*}\right)
$$

(equality by our assumption on pushforward of structure sheaves). Of course these elements satisy the cocycle condition on $S_{i} \times_{S} S_{j} \times{ }_{S} S_{k}$, hence they define a descent datum on invertible sheaves for the fppf covering $\left\{S_{i} \rightarrow S\right\}$. By Descent, Proposition 34.5.2 there is an invertible $\mathcal{O}_{S}$-module $\mathcal{N}$ with trivializations over $S_{i}$ whose associated descent datum is $\left\{f_{i j}\right\}$. Then $f^{*} \mathcal{N} \cong \mathcal{L}$ as the functor from descent data to modules is fully faithful (see proposition cited above).

0B9N Lemma 43.4.3. Let $f: X \rightarrow S$ be as in Definition 43.4.1. Assume $f$ has a section $\sigma$ and that $\mathcal{O}_{T} \rightarrow f_{T, *} \mathcal{O}_{X_{T}}$ is an isomorphism for all $T \in \mathrm{Ob}\left((S c h / S)_{\text {fppf }}\right)$. Then there is a functorial bijection

$$
\operatorname{Ker}\left(\operatorname{Pic}\left(X_{T}\right) \xrightarrow{\sigma_{T}^{*}} \operatorname{Pic}(T)\right) \longrightarrow \operatorname{Pic}_{X / S}(T)
$$

In particular the map $\operatorname{Pic}\left(X_{T}\right) \rightarrow \operatorname{Pic}_{X / S}(T)$ is surjective.
Proof. Denote $K(T)=\operatorname{Ker}\left(\operatorname{Pic}\left(X_{T}\right) \rightarrow \operatorname{Pic}(T)\right)$. Since $\sigma$ is a section of $f$ we see that $\operatorname{Pic}\left(X_{T}\right)$ is the direct sum of $\operatorname{Pic}(T)$ and $K(T)$. Thus by Lemma 43.4.2 we see that $K(T) \subset \operatorname{Pic}_{X / S}(T)$ for all $T$. Moreover, it is clear from the construction that $\mathrm{Pic}_{X / S}$ is the sheafification of the presheaf $K$. To finish the proof it suffices to show that $K$ satisfies the sheaf condition for fppf coverings which we do in the next paragraph.
Let $\left\{T_{i} \rightarrow T\right\}$ be an fppf covering. Let $\mathcal{L}_{i}$ be elements of $K\left(T_{i}\right)$ which map to the same elements of $K\left(T_{i} \times{ }_{T} T_{j}\right)$ for all $i$ and $j$. Choose an isomorphism $\alpha_{i}: \mathcal{O}_{T_{i}} \rightarrow$ $\sigma_{T_{i}}^{*} \mathcal{L}_{i}$ for all $i$. Choose an isomorphism

$$
\varphi_{i j}:\left.\left.\mathcal{L}_{i}\right|_{X_{T_{i} \times{ }_{T} T_{j}}} \longrightarrow \mathcal{L}_{j}\right|_{X_{T_{i} \times{ }_{T} T_{j}}}
$$

If the map

$$
\left.\left.\alpha_{j}\right|_{T_{i} \times{ }_{T} T_{j}} \circ \sigma_{T_{i} \times_{T} T_{j}}^{*} \varphi_{i j} \circ \alpha_{i}\right|_{T_{i} \times_{T} T_{j}}: \mathcal{O}_{T_{i} \times_{T} T_{j}} \rightarrow \mathcal{O}_{T_{i} \times_{T} T_{j}}
$$

is not equal to multiplication by 1 but some $u_{i j}$, then we can scale $\varphi_{i j}$ by $u_{i j}^{-1}$ to correct this. Having done this, consider the self map

$$
\left.\left.\left.\varphi_{k i}\right|_{X_{T_{i} \times{ }_{T} T_{j} \times{ }_{T} T_{k}}} \circ \varphi_{j k}\right|_{X_{T_{i} \times}{ }_{T} T_{j} \times{ }_{T} T_{k}} \circ \varphi_{i j}\right|_{X_{T_{i} \times{ }_{T} T_{j} \times{ }_{T} T_{k}}} \quad \text { on }\left.\quad \mathcal{L}_{i}\right|_{X_{T_{i} \times} \times T_{T} \times_{T} T_{k}}
$$

which is given by multiplication by some regular function $f_{i j k}$ on the scheme $X_{T_{i} \times{ }_{T} T_{j} \times{ }_{T} T_{k}}$, By our choice of $\varphi_{i j}$ we see that the pullback of this map by $\sigma$ is equal to multiplication by 1 . By our assumption on functions on $X$, we see that $f_{i j k}=1$. Thus we obtain a descent datum for the fppf covering $\left\{X_{T_{i}} \rightarrow X\right\}$. By Descent, Proposition 34.5 .2 there is an invertible $\mathcal{O}_{X_{T}}$-module $\mathcal{L}$ and an isomorphism $\alpha: \mathcal{O}_{T} \rightarrow \sigma_{T}^{*} \mathcal{L}$ whose pullback to $X_{T_{i}}$ recovers $\left(\mathcal{L}_{i}, \alpha_{i}\right)$ (small detail omitted). Thus $\mathcal{L}$ defines an object of $K(T)$ as desired.

### 43.5. A representability criterion

0B9P To prove the Picard functor is representable we will use the following criterion.
0B9Q Lemma 43.5.1. Let $k$ be a field. Let $G:(S c h / k)^{\text {opp }} \rightarrow$ Groups be a functor. With terminology as in Schemes, Definition 25.15.3, assume that
(1) G satisfies the sheaf property for the Zariski topology,
(2) there exists a subfunctor $F \subset G$ such that
(a) $F$ is representable,
(b) $F \subset G$ is representable by open immersion,
(c) for every field extension $K$ of $k$ and $g \in G(K)$ there exists a $g^{\prime} \in G(k)$ such that $g^{\prime} g \in F(K)$.
Then $G$ is representable by a group scheme over $k$.
Proof. This follows from Schemes, Lemma 25.15.4. Namely, take $I=G(k)$ and for $i=g^{\prime} \in I$ take $F_{i} \subset G$ the subfunctor which associates to $T$ over $k$ the set of elements $g \in G(T)$ with $g^{\prime} g \in F(T)$. Then $F_{i} \cong F$ by multiplication by $g^{\prime}$. The map $F_{i} \rightarrow G$ is isomorphic to the map $F \rightarrow G$ by multiplication by $g^{\prime}$, hence is representable by open immersions. Finally, the collection $\left(F_{i}\right)_{i \in I}$ covers $G$ by assumption (2)(c). Thus the lemma mentioned above applies and the proof is complete.

### 43.6. The Picard scheme of a curve

0B9R In this section we will apply Lemma 43.5.1 to show that $\mathrm{Pic}_{X / k}$ is representable, when $k$ is an algebraically closed field and $X$ is a smooth projective curve over $k$. To make this work we use a bit of cohomology and base change developed in the chapter on derived categories of schemes.
0B9U Lemma 43.6.1. Let $k$ be a field. Let $X$ be a smooth projective curve over $k$ which has a k-rational point. Then the hypotheses of Lemma 43.4.3 are satisfied.

Proof. The meaning of the phrase "has a $k$-rational point" is exactly that the structure morphism $f: X \rightarrow \operatorname{Spec}(k)$ has a section, which verifies the first condition. By Varieties, Lemma 32.21 .2 we see that $k^{\prime}=H^{0}\left(X, \mathcal{O}_{X}\right)$ is a field extension of $k$. Since $X$ has a $k$-rational point there is a $k$-algebra homomorphism $k^{\prime} \rightarrow k$ and we conclude $k^{\prime}=k$. Since $k$ is a field, any morphsm $T \rightarrow \operatorname{Spec}(k)$ is flat. Hence we see by cohomology and base change (Cohomology of Schemes, Lemma 29.5.2 that $\mathcal{O}_{T} \rightarrow f_{T, *} \mathcal{O}_{X_{T}}$ is an isomorphism. This finishes the proof.

Let $X$ be a a smooth projective curve over a field $k$ with a $k$-rational point $\sigma$. Then the functor

$$
\operatorname{Pic}_{X / k, \sigma}:(S c h / S)^{o p p} \longrightarrow A b, \quad T \longmapsto \operatorname{Ker}\left(\operatorname{Pic}\left(X_{T}\right) \xrightarrow{\sigma_{T}^{*}} \operatorname{Pic}(T)\right)
$$

is isomorphic to $\mathrm{Pic}_{X / k}$ on $(S c h / S)_{f p p f}$ by Lemmas 43.6.1 and 43.4.3 Hence it will suffice to prove that $\operatorname{Pic}_{X / k, \sigma}$ is representable. We will use the notation " $\mathcal{L} \in$ $\operatorname{Pic}_{X / k, \sigma}(T)$ " to signify that $T$ is a scheme over $k$ and $\mathcal{L}$ is an invertible $\mathcal{O}_{X_{T}}$-module whose restriction to $T$ via $\sigma_{T}$ is isomorphic to $\mathcal{O}_{T}$.

0B9V Lemma 43.6.2. Let $k$ be a field. Let $X$ be a smooth projective curve over $k$ with a $k$-rational point $\sigma$. For a scheme $T$ over $k$, consider the subset $F(T) \subset \operatorname{Pic}_{X / k, \sigma}(T)$ consisting of $\mathcal{L}$ such that $R f_{T, *} \mathcal{L}$ is isomorphic to an invertible $\mathcal{O}_{T}$-module placed in degree 0. Then $F \subset P i c_{X / k, \sigma}$ is a subfunctor and the inclusion is representable by open immersions.

Proof. Immediate from Derived Categories of Schemes, Lemma 35.24.3 applied with $i=0$ and $r=1$ and Schemes, Definition 25.15.3

To continue it is convenient to make the following definition.
0B9W Definition 43.6.3. Let $k$ be an algebraically closed field. Let $X$ be a smooth projective curve over $k$. The genus of $X$ is $g=\operatorname{dim}_{k} H^{1}\left(X, \mathcal{O}_{X}\right)$.
0B9X Lemma 43.6.4. Let $k$ be a field. Let $X$ be a smooth projective curve of genus $g$ over $k$ with a $k$-rational point $\sigma$. The open subfunctor $F$ defined in Lemma 43.6.2 is representable by an open subscheme of $\underline{\operatorname{Hilb}}_{X / k}^{g}$.
Proof. In this proof unadorned products are over $\operatorname{Spec}(k)$. By Proposition 43.3.6 the scheme $H=\underline{\operatorname{Hilb}}_{X / k}^{g}$ exists. Consider the universal divisor $D_{\text {univ }} \subset H \times X$ and the associated invertible sheaf $\mathcal{O}\left(D_{\text {univ }}\right)$, see Remark 43.3.7. We adjust by tensoring with the pullback via $\sigma_{H}: H \rightarrow H \times X$ to get

$$
\mathcal{L}_{H}=\mathcal{O}\left(D_{\text {univ }}\right) \otimes_{\mathcal{O}_{H \times X}} \operatorname{pr}_{H}^{*} \sigma_{H}^{*} \mathcal{O}\left(D_{\text {univ }}\right)^{\otimes-1} \in \operatorname{Pic}_{X / k, \sigma}(H)
$$

By the Yoneda lemma (Categories, Lemma 4.3.5) the invertible sheaf $\mathcal{L}_{H}$ defines a natural transformation

$$
h_{H} \longrightarrow \operatorname{Pic}_{X / k, \sigma}
$$

Because $F$ is an open subfuctor, there exists a maximal open $W \subset H$ such that $\left.\mathcal{L}_{H}\right|_{W \times X}$ is in $F(W)$. Of course, this open is nothing else than the open subscheme constructed in Derived Categories of Schemes, Lemma 35.24.3 with $i=0$ and $r=1$ for the morphism $H \times X \rightarrow H$ and the sheaf $\mathcal{F}=\mathcal{O}\left(D_{\text {univ }}\right)$. Applying the Yoneda lemma again we obtain a commutative diagram

To finish the proof we will show that the top horizontal arrow is an isomorphism.
Let $\mathcal{L} \in F(T) \subset \operatorname{Pic}_{X / k, \sigma}(T)$. Let $\mathcal{N}$ be the invertible $\mathcal{O}_{T}$-module such that $R f_{T, *} \mathcal{L} \cong \mathcal{N}[0]$. The adjunction map

$$
f_{T}^{*} \mathcal{N} \longrightarrow \mathcal{L} \quad \text { corresponds to a section } s \text { of } \quad \mathcal{L} \otimes f_{T}^{*} \mathcal{N}^{\otimes-1}
$$

on $X_{T}$. Claim: The zero scheme of $s$ is a relative effective Cartier divisor $D$ on $(T \times X) / T$ finite locally free of degree $g$ over $T$.
Let us finish the proof of the lemma admitting the claim. Namely, $D$ defines a morphism $m: T \rightarrow H$ such that $D$ is the pullback of $D_{\text {univ }}$. Then

$$
\left(m \times \operatorname{id}_{X}\right)^{*} \mathcal{O}\left(D_{\text {univ }}\right) \cong \mathcal{O}_{T \times X}(D)
$$

Hence $\left(m \times \operatorname{id}_{X}\right)^{*} \mathcal{L}_{H}$ and $\mathcal{O}(D)$ differ by the pullback of an invertible sheaf on $H$. This in particular shows that $m: T \rightarrow H$ factors through the open $W \subset H$ above. Moreover, it follows that these invertible modules define, after adjusting by pullback via $\sigma_{T}$ as above, the same element of $\operatorname{Pic}_{X / k, \sigma}(T)$. Chasing diagrams using Yoneda's lemma we see that $m \in h_{W}(T)$ maps to $\mathcal{L} \in F(T)$. We omit the verification that the rule $F(T) \rightarrow h_{W}(T), \mathcal{L} \mapsto m$ defines an inverse of the transformation of functors above.

Proof of the claim. Since $D$ is a locally principal closed subscheme of $T \times X$, it suffices to show that the fibres of $D$ over $T$ are effective Cartier divisors, see Lemma 43.3 .1 and Divisors, Lemma 30.15.9. Because taking cohomology of $\mathcal{L}$ commutes with base change (Derived Categories of Schemes, Lemma 35.22 .2 we reduce to $T=\operatorname{Spec}(K)$ where $K / k$ is a field extension. Then $\mathcal{L}$ is an invertible sheaf on $X_{K}$ with $H^{0}\left(X_{K}, \mathcal{L}\right)=K$ and $H^{1}\left(X_{K}, \mathcal{L}\right)=0$. Thus

$$
\operatorname{deg}(\mathcal{L})=\chi\left(X_{K}, \mathcal{L}\right)-\chi\left(X_{K}, \mathcal{O}_{X_{K}}\right)=1-(1-g)=g
$$

See Varieties, Definition 32.33.1. To finish the proof we have to show a nonzero section of $\mathcal{L}$ defines an effective Cartier divisor on $X_{K}$. This is clear.
0B9Y Lemma 43.6.5. Let $k$ be an algebraically closed field. Let $X$ be a smooth projective curve of genus $g$ over $k$. Let $K / k$ be a field extension and let $\mathcal{L}$ be an invertible sheaf on $X_{K}$. Then there exists an invertible sheaf $\mathcal{L}_{0}$ on $X$ such that $\operatorname{dim}_{K} H^{0}\left(X_{K},\left.\mathcal{L} \otimes_{\mathcal{O}_{X_{K}}} \mathcal{L}_{0}\right|_{X_{K}}\right)=1$ and $\operatorname{dim}_{K} H^{1}\left(X_{K},\left.\mathcal{L} \otimes_{\mathcal{O}_{X_{K}}} \mathcal{L}_{0}\right|_{X_{K}}\right)=0$.

Proof. This proof is a variant of the proof of Varieties, Lemma 32.33.14. We encourage the reader to read that proof first.
First we pick an ample invertible sheaf $\mathcal{L}_{0}$ and we replace $\mathcal{L}$ by $\left.\mathcal{L} \otimes_{\mathcal{O}_{X_{K}}} \mathcal{L}_{0}^{\otimes n}\right|_{X_{K}}$ for some $n \gg 0$. The result will be that we may assume that $H^{0}\left(X_{K}, \mathcal{L}\right) \neq 0$ and $H^{1}\left(X_{K}, \mathcal{L}\right)=0$. Namely, we will get the vanishing by Cohomology of Schemes, Lemma 29.16.1 and the nonvanishing because the degree of the tensor product is $\gg 0$. We will finish the proof by descending induction on $t=\operatorname{dim}_{K} H^{0}\left(X_{K}, \mathcal{L}\right)$. The base case $t=1$ is trivial. Assume $t>1$.

Observe that for a closed and hence $k$-rational point $x$ of $X$, the inverse image $x_{K}$ is a $K$-rational point of $X_{K}$. Moreover, there are infinitely many $k$-rational points. Therefore the points $x_{K}$ form a Zariski dense collection of points of $X_{K}$.
Let $s \in H^{0}\left(X_{K}, \mathcal{L}\right)$ be nonzero. There exists an $x$ as above such that $s$ does not vanish in $x_{K}$. Let $\mathcal{I}$ be the ideal sheaf of $i: x_{K} \rightarrow X_{K}$ as in Varieties, Lemma 32.33.13. Look at the short exact sequence

$$
0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X_{K}}} \mathcal{L} \rightarrow \mathcal{L} \rightarrow i_{*} i^{*} \mathcal{L} \rightarrow 0
$$

Observe that $H^{0}\left(X_{K}, i_{*} i^{*} \mathcal{L}\right)=H^{0}\left(x_{K}, i^{*} \mathcal{L}\right)$ has dimension 1 over $K$. Since $s$ does not vanish at $x$ we conclude that

$$
H^{0}\left(X_{K}, \mathcal{L}\right) \longrightarrow H^{0}\left(X, i_{*} i^{*} \mathcal{L}\right)
$$

is surjective. Hence $\operatorname{dim}_{K} H^{0}\left(X_{K}, \mathcal{I} \otimes_{\mathcal{O}_{X_{K}}} \mathcal{L}\right)=t-1$. Finally, the long exact sequence of cohomology also shows that $H^{1}\left(X_{K}, \mathcal{I} \otimes \mathcal{O}_{X_{K}} \mathcal{L}\right)=0$ thereby finishing the proof of the induction step.
0B9Z Proposition 43.6.6. Let $k$ be an algebraically closed field. Let $X$ be a smooth projective curve over $k$. The Picard functor Pic $c_{X / k}$ is representable.
Proof. Since $k$ is algebraically closed there exists a rational point $\sigma$ of $X$. As discussed above, it suffices to show that the functor $\mathrm{Pic}_{X / k, \sigma}$ classifying invertible modules trivial along $\sigma$ is representable. To do this we will check conditions (1), (2)(a), (2)(b), and (2)(c) of Lemma 43.5.1.

The functor $\mathrm{Pic}_{X / k, \sigma}$ satisfies the sheaf condition for the fppf topology because it is isomorphic to $\mathrm{Pic}_{X / S}$. It would be more correct to say that we've shown the sheaf condition for $\mathrm{Pic}_{X / k, \sigma}$ in the proof of Lemma 43.4 .3 which applies by Lemma 43.6.1. This proves condition (1)

As our subfunctor we use $F$ as defined in Lemma 43.6.2. Condition (2)(a) follows. Condition (2)(b) is Lemma 43.6.4 Condition (2)(c) is Lemma 43.6.5.

In fact, the proof given above produces more information which we collect here.
0BA0 Lemma 43.6.7. Let $k$ be an algebraically closed field. Let $X$ be a smooth projective curve of genus $g$ over $k$.
(1) $\underline{\text { Pic }}_{X / k}$ is a disjoint union of $g$-dimensional smooth proper varieties $\underline{P i c}_{X / k}^{d}$,
(2) k-points of $\underline{P i c}_{X / k}^{d}$ correspond to invertible $\mathcal{O}_{X}$-modules of degree d,
(3) $\underline{P i c}_{X / k}^{0}$ is an open and closed subgroup scheme,
(4) for $d \geq 0$ there is a canonical morphism $\gamma_{d}: \underline{\text { Hilb }}_{X / k}^{d} \rightarrow \underline{\text { Pic }}_{X / k}^{d}$
(5) the morphisms $\gamma_{d}$ are surjective for $d \geq g$ and smooth for $d \geq 2 g-1$,
(6) the morphism $\underline{\text { Hilb }}_{X / k}^{g} \rightarrow \underline{P i c}_{X / k}^{g}$ is birational.

Proof. Pick a $k$-rational point $\sigma$ of $X$. Recall that $\operatorname{Pic}_{X / k}$ is isomorphic to the functor $\operatorname{Pic}_{X / k, \sigma}$. By Derived Categories of Schemes, Lemma 35.24 .2 for every $d \in \mathbf{Z}$ there is an open subfunctor

$$
\operatorname{Pic}_{X / k, \sigma}^{d} \subset \operatorname{Pic}_{X / k, \sigma}
$$

whose value on a scheme $T$ over $k$ consists of those $\mathcal{L} \in \operatorname{Pic}_{X / k, \sigma}(T)$ such that $\chi\left(X_{t}, \mathcal{L}_{t}\right)=d+1-g$ and moreover we have

$$
\operatorname{Pic}_{X / k, \sigma}=\coprod_{d \in \mathbf{Z}} \operatorname{Pic}_{X / k, \sigma}^{d}
$$

as fppf sheaves. It follows that the scheme $\underline{\mathrm{Pic}}_{X / k}$ (which exists by Proposition 43.6.6 has a corresponding decomposition

$$
\underline{\operatorname{Pic}}_{X / k, \sigma}=\coprod_{d \in \mathbf{Z}} \underline{\operatorname{Pic}}_{X / k, \sigma}^{d}
$$

where the points of $\underline{\operatorname{Pic}}_{X / k, \sigma}^{d}$ correspond to isomorphism classes of invertible modules of degree $d$ on $X$.
Fix $d \geq 0$. There is a morphism

$$
\gamma_{d}: \underline{\operatorname{Hilb}}_{X / k}^{d} \longrightarrow \underline{\operatorname{Pic}}_{X / k}^{d}
$$

coming from the invertible sheaf $\mathcal{O}\left(D_{\text {univ }}\right)$ on $\underline{\operatorname{Hilb}}_{X / k}^{d} \times_{k} X$ (Remark 43.3.7) by the Yoneda lemma (Categories, Lemma 4.3.5. Our proof of the representability of the

Picard functor of $X / k$ in Proposition 43.6.6 and Lemma 43.6.4 shows that $\gamma_{g}$ induces an open immersion on a nonempty open of $\operatorname{Hilb}_{X / k}^{g}$. Moreover, the proof shows that the translates of this open by $k$-rational points of the group scheme $\underline{\mathrm{Pic}}_{X / k}$ define an open covering. Since $\underline{\operatorname{Hilb}}_{X / K}^{g}$ is smooth of dimension $g$ (Proposition 43.3.6) over $k$, we conclude that the group scheme $\underline{\mathrm{Pic}}_{X / k}$ is smooth of dimension $g$ over $k$.
By Groupoids, Lemma 38.7 .3 we see that $\underline{\mathrm{Pic}}_{X / k}$ is separated. Hence, for every $d \geq 0$, the image of $\gamma_{d}$ is a proper variety over $k$ (Morphisms, Lemma 28.41.9.
Let $d \geq g$. Then for any field extension $K / k$ and any invertible $\mathcal{O}_{X_{K}}$-module $\mathcal{L}$ of degree $d$, we see that $\chi\left(X_{K}, \mathcal{L}\right)=d+1-g>0$. Hence $\mathcal{L}$ has a nonzero section and we conclude that $\mathcal{L}=\mathcal{O}_{X_{K}}(D)$ for some divisor $D \subset X_{K}$ of degree $d$. It follows that $\gamma_{d}$ is surjective.
Combining the facts mentioned above we see that $\underline{\operatorname{Pic}}_{X / k}^{d}$ is proper for $d \geq g$. This finishes the proof of (2) because now we see that $\underline{\operatorname{Pic}}_{X / k}^{d}$ is proper for $d \geq g$ but then all $\underline{\operatorname{Pic}}_{X / k}^{d}$ are proper by translation.
It remains to prove that $\gamma_{d}$ is smooth for $d \geq 2 g-1$. Consider an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ of degree $d$. Then the fibre of the point corresponding to $\mathcal{L}$ is

$$
Z=\left\{D \subset X \mid \mathcal{O}_{X}(D) \cong \mathcal{L}\right\} \subset \underline{\operatorname{Hilb}}_{X / k}^{d}
$$

with its natural scheme structure. Since any isomorphism $\mathcal{O}_{X}(D) \rightarrow \mathcal{L}$ is well defined up to multiplying by a nonzero scalar, we see that the canonical section $1 \in \mathcal{O}_{X}(D)$ is mapped to a section $s \in \Gamma(X, \mathcal{L})$ well defined up to multiplication by a nonzero scalar. In this way we obtain a morphism

$$
Z \longrightarrow \operatorname{Proj}\left(\operatorname{Sym}\left(\Gamma(X, \mathcal{L})^{*}\right)\right)
$$

(dual because of our conventions). This morphism is an isomorphism, because given an section of $\mathcal{L}$ we can take the associated effective Cartier divisor, in other words we can construct an inverset of the displayed morphism; we omit the precise formulation and proof. Since $\operatorname{dim} H^{0}(X, \mathcal{L})=d+1-g$ for every $\mathcal{L}$ of degree $d \geq 2 g-1$ by Varieties, Lemma 32.33 .15 we see that $\operatorname{Proj}\left(\operatorname{Sym}\left(\Gamma(X, \mathcal{L})^{*}\right)\right) \cong \mathbf{P}_{k}^{d-g}$. We conclude that $\operatorname{dim}(Z)=\operatorname{dim}\left(\mathbf{P}_{k}^{d-g}\right)=d-g$. We conclude that the fibres of the morphism $\gamma_{d}$ all have dimension equal to the difference of the dimensions of $\underline{\operatorname{Hilb}}_{X / k}^{d}$ and $\underline{\operatorname{Pic}}_{X / k}^{d}$. It follows that $\gamma_{d}$ is flat, see Algebra, Lemma 10.127.1. As moreover the fibres are smooth, we conclude that $\gamma_{d}$ is smooth by Morphisms, Lemma 28.34.3.

## CHAPTER 44

## Adequate Modules

### 44.1. Introduction

06 Z 2 For any scheme $X$ the category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ of quasi-coherent modules is abelian and a weak Serre subcategory of the abelian category of all $\mathcal{O}_{X}$-modules. The same thing works for the category of quasi-coherent modules on an algebraic space $X$ viewed as a subcategory of the category of all $\mathcal{O}_{X}$-modules on the small étale site of $X$. Moreover, for a quasi-compact and quasi-separated morphism $f: X \rightarrow Y$ the pushforward $f_{*}$ and higher direct images preserve quasi-coherency.

Next, let $X$ be a scheme and let $\mathcal{O}$ be the structure sheaf on one of the big sites of $X$, say, the big fppf site. The category of quasi-coherent $\mathcal{O}$-modules is abelian (in fact it is equivalent to the category of usual quasi-coherent $\mathcal{O}_{X}$-modules on the scheme $X$ we mentioned above) but its imbedding into $\operatorname{Mod}(\mathcal{O})$ is not exact. An example is the map of quasi-coherent modules

$$
\mathcal{O}_{\mathbf{A}_{k}^{1}} \longrightarrow \mathcal{O}_{\mathbf{A}_{k}^{1}}
$$

on $\mathbf{A}_{k}^{1}=\operatorname{Spec}(k[x])$ given by multiplication by $x$. In the abelian category of quasi-coherent sheaves this map is injective, whereas in the abelian category of all $\mathcal{O}$-modules on the big site of $\mathbf{A}_{k}^{1}$ this map has a nontrivial kernel as we see by evaluating on $\operatorname{sections}$ over $\operatorname{Spec}(k[x] /(x))=\operatorname{Spec}(k)$. Moreover, for a quasicompact and quasi-separated morphism $f: X \rightarrow Y$ the functor $f_{b i g, *}$ does not preserve quasi-coherency.

In this chapter we introduce a larger category of modules, closely related to quasicoherent modules, which "fixes" the two problems mentioned above.

### 44.2. Conventions

06 Z 3 In this chapter we fix $\tau \in\{Z a r$, étale, smooth, syntomic, fppf $\}$ and we fix a big $\tau$-site $S c h_{\tau}$ as in Topologies, Section 33.2. All schemes will be objects of $S c h_{\tau}$. In particular, given a scheme $S$ we obtain sites $(A f f / S)_{\tau} \subset(S c h / S)_{\tau}$. The structure sheaf $\mathcal{O}$ on these sites is defined by the rule $\mathcal{O}(T)=\Gamma\left(T, \mathcal{O}_{T}\right)$.

All rings $A$ will be such that $\operatorname{Spec}(A)$ is (isomorphic to) an object of $S c h_{\tau}$. Given a ring $A$ we denote $A l g_{A}$ the category of $A$-algebras whose objects are the $A$-algebras $B$ of the form $B=\Gamma\left(U, \mathcal{O}_{U}\right)$ where $S$ is an affine object of $S c h_{\tau}$. Thus given an affine scheme $S=\operatorname{Spec}(A)$ the functor

$$
(A f f / S)_{\tau} \longrightarrow A l g_{A}, \quad U \longmapsto \mathcal{O}(U)
$$

is an equivalence.

### 44.3. Adequate functors

06US In this section we discuss a topic closely related to direct images of quasi-coherent sheaves. Most of this material was taken from the paper Jaf97.
06Z4 Definition 44.3.1. Let $A$ be a ring. A module-valued functor is a functor $F$ : $A l g_{A} \rightarrow A b$ such that
(1) for every object $B$ of $A l g_{A}$ the group $F(B)$ is endowed with the structure of a $B$-module, and
(2) for any morphism $B \rightarrow B^{\prime}$ of $A l g_{A}$ the map $F(B) \rightarrow F\left(B^{\prime}\right)$ is $B$-linear.

A morphism of module-valued functors is a transformation of functors $\varphi: F \rightarrow G$ such that $F(B) \rightarrow G(B)$ is $B$-linear for all $B \in \mathrm{Ob}\left(A l g_{A}\right)$.
Let $S=\operatorname{Spec}(A)$ be an affine scheme. The category of module-valued functors on $A l g_{A}$ is equivalent to the category $\operatorname{PMod}\left((A f f / S)_{\tau}, \mathcal{O}\right)$ of presheaves of $\mathcal{O}$-modules. The equivalence is given by the rule which assigns to the module-valued functor $F$ the presheaf $\mathcal{F}$ defined by the rule $\mathcal{F}(U)=F(\mathcal{O}(U))$. This is clear from the equivalence $(A f f / S)_{\tau} \rightarrow A l g_{A}, U \mapsto \mathcal{O}(U)$ given in Section 44.2. The quasi-inverse sets $F(B)=\mathcal{F}(\operatorname{Spec}(B))$.
An important special case of a module-valued functor comes about as follows. Let $M$ be an $A$-module. Then we will denote $M$ the module-valued functor $B \mapsto$ $M \otimes_{A} B$ (with obvious $B$-module structure). Note that if $M \rightarrow N$ is a map of $A$ modules then there is an associated morphism $\underline{M} \rightarrow \underline{N}$ of module-valued functors. Conversely, any morphism of module-valued functors $\underline{M} \rightarrow \underline{N}$ comes from an $A$ module map $M \rightarrow N$ as the reader can see by evaluating on $B=A$. In other words $\operatorname{Mod}_{A}$ is a full subcategory of the category of module-valued functors on $A l g_{A}$.
Given and $A$-module map $\varphi: M \rightarrow N$ then $\operatorname{Coker}(\underline{M} \rightarrow \underline{N})=\underline{Q}$ where $Q=$ $\operatorname{Coker}(M \rightarrow N)$ because $\otimes$ is right exact. But this isn't the case for the kernel in general: for example an injective map of $A$-modules need not be injective after base change. Thus the following definition makes sense.

06UT Definition 44.3.2. Let $A$ be a ring. A module-valued functor $F$ on $A l g_{A}$ is called
(1) adequate if there exists a map of $A$-modules $M \rightarrow N$ such that $F$ is isomorphic to $\operatorname{Ker}(\underline{M} \rightarrow \underline{N})$.
(2) linearly adequate if $F$ is isomorphic to the kernel of a map $\underline{A}^{\oplus n} \rightarrow \underline{A^{\oplus m}}$.

Note that $F$ is adequate if and only if there exists an exact sequence $0 \rightarrow F \rightarrow$ $\underline{M} \rightarrow \underline{N}$ and $F$ is linearly adequate if and only if there exists an exact sequence $0 \rightarrow F \rightarrow \underline{A^{\oplus n}} \rightarrow \underline{A^{\oplus m}}$.
Let $A$ be a ring. In this section we will show the category of adequate functors on $A l g_{A}$ is abelian (Lemmas 44.3.10 and 44.3.11) and has a set of generators (Lemma 44.3.6). We will also see that it is a weak Serre subcategory of the category of all module-valued functors on $A l g_{A}$ (Lemma 44.3.16) and that it has arbitrary colimits (Lemma 44.3.12).
06UU Lemma 44.3.3. Let $A$ be a ring. Let $F$ be an adequate functor on Alg $_{A}$. If $B=\operatorname{colim} B_{i}$ is a filtered colimit of $A$-algebras, then $F(B)=\operatorname{colim} F\left(B_{i}\right)$.

Proof. This holds because for any $A$-module $M$ we have $M \otimes_{A} B=\operatorname{colim} M \otimes_{A} B_{i}$ (see Algebra, Lemma 10.11.9) and because filtered colimits commute with exact sequences, see Algebra, Lemma 10.8.9.

06UV Remark 44.3.4. Consider the category $A l g_{f p, A}$ whose objects are $A$-algebras $B$ of the form $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and whose morphisms are $A$-algebra maps. Every $A$-algebra $B$ is a filtered colimit of finitely presented $A$-algebra, i.e., a filtered colimit of objects of $A l g_{f p, A}$. By Lemma 44.3.3 we conclude every adequate functor $F$ is determined by its restriction to $A g_{f p, A}$. For some questions we can therefore restrict to functors on $A l g_{f p, A}$. For example, the category of adequate functors does not depend on the choice of the big $\tau$-site chosen in Section 44.2 .

06UW Lemma 44.3.5. Let $A$ be a ring. Let $F$ be an adequate functor on $A l g_{A}$. If $B \rightarrow B^{\prime}$ is flat, then $F(B) \otimes_{B} B^{\prime} \rightarrow F\left(B^{\prime}\right)$ is an isomorphism.

Proof. Choose an exact sequence $0 \rightarrow F \rightarrow \underline{M} \rightarrow \underline{N}$. This gives the diagram

where the rows are exact (the top one because $B \rightarrow B^{\prime}$ is flat). Since the right two vertical arrows are isomorphisms, so is the left one.

06UX Lemma 44.3.6. Let $A$ be a ring. Let $F$ be an adequate functor on $A l g_{A}$. Then there exists a surjection $L \rightarrow F$ with $L$ a direct sum of linearly adequate functors.

Proof. Choose an exact sequence $0 \rightarrow F \rightarrow \underline{M} \rightarrow \underline{N}$ where $\underline{M} \rightarrow \underline{N}$ is given by $\varphi$ : $M \rightarrow N$. By Lemma 44.3.3 it suffices to construct $L \rightarrow F$ such that $L(B) \rightarrow F(B)$ is surjective for every finitely presented $A$-algebra $B$. Hence it suffices to construct, given a finitely presented $A$-algebra $B$ and an element $\xi \in F(B)$ a map $L \rightarrow F$ with $L$ linearly adequate such that $\xi$ is in the image of $L(B) \rightarrow F(B)$. (Because there is a set worth of such pairs $(B, \xi)$ up to isomorphism.)
To do this write $\sum_{i=1, \ldots, n} m_{i} \otimes b_{i}$ the image of $\xi$ in $\underline{M}(B)=M \otimes_{A} B$. We know that $\sum \varphi\left(m_{i}\right) \otimes b_{i}=0$ in $N \otimes_{A} B$. As $N$ is a filtered colimit of finitely presented $A$-modules, we can find a finitely presented $A$-module $N^{\prime}$, a commutative diagram of $A$-modules

such that $\left(b_{1}, \ldots, b_{n}\right)$ maps to zero in $N^{\prime} \otimes_{A} B$. Choose a presentation $A^{\oplus l} \rightarrow$ $A^{\oplus k} \rightarrow N^{\prime} \rightarrow 0$. Choose a lift $A^{\oplus n} \rightarrow A^{\oplus k}$ of the map $A^{\oplus n} \rightarrow N^{\prime}$ of the diagram. Then we see that there exist $\left(c_{1}, \ldots, c_{l}\right) \in B^{\oplus l}$ such that $\left(b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{l}\right)$ maps to zero in $B^{\oplus k}$ under the map $B^{\oplus n} \oplus B^{\oplus l} \rightarrow B^{\oplus k}$. Consider the commutative diagram

where the left vertical arrow is zero on the summand $A^{\oplus l}$. Then we see that $L$ equal to the kernel of $\underline{A^{\oplus n+l}} \rightarrow \underline{A^{\oplus k}}$ works because the element $\left(b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{l}\right) \in$ $L(B)$ maps to $\xi$.

Consider a graded $A$-algebra $B=\bigoplus_{d \geq 0} B_{d}$. Then there are two $A$-algebra maps $p, a: B \rightarrow B\left[t, t^{-1}\right]$, namely $p: b \mapsto b$ and $a: b \mapsto t^{\operatorname{deg}(b)} b$ where $b$ is homogeneous. If $F$ is a module-valued functor on $A l g_{A}$, then we define

06UY

$$
\begin{equation*}
F(B)^{(k)}=\left\{\xi \in F(B) \mid t^{k} F(p)(\xi)=F(a)(\xi)\right\} \tag{44.3.6.1}
\end{equation*}
$$

For functors which behave well with respect to flat ring extensions this gives a direct sum decomposition. This amounts to the fact that representations of $\mathbf{G}_{m}$ are completely reducible.

06UZ Lemma 44.3.7. Let $A$ be a ring. Let $F$ be a module-valued functor on $A l g_{A}$. Assume that for $B \rightarrow B^{\prime}$ flat the map $F(B) \otimes_{B} B^{\prime} \rightarrow F\left(B^{\prime}\right)$ is an isomorphism. Let $B$ be a graded $A$-algebra. Then
(1) $F(B)=\bigoplus_{k \in \mathbf{Z}} F(B)^{(k)}$, and
(2) the map $B \rightarrow B_{0} \rightarrow B$ induces map $F(B) \rightarrow F(B)$ whose image is contained in $F(B)^{(0)}$.
Proof. Let $x \in F(B)$. The map $p: B \rightarrow B\left[t, t^{-1}\right]$ is free hence we know that

$$
F\left(B\left[t, t^{-1}\right]\right)=\bigoplus_{k \in \mathbf{Z}} F(p)(F(B)) \cdot t^{k}=\bigoplus_{k \in \mathbf{Z}} F(B) \cdot t^{k}
$$

as indicated we drop the $F(p)$ in the rest of the proof. Write $F(a)(x)=\sum t^{k} x_{k}$ for some $x_{k} \in F(B)$. Denote $\epsilon: B\left[t, t^{-1}\right] \rightarrow B$ the $B$-algebra map $t \mapsto 1$. Note that the compositions $\epsilon \circ p, \epsilon \circ a: B \rightarrow B\left[t, t^{-1}\right] \rightarrow B$ are the identity. Hence we see that

$$
x=F(\epsilon)(F(a)(x))=F(\epsilon)\left(\sum t^{k} x_{k}\right)=\sum x_{k} .
$$

On the other hand, we claim that $x_{k} \in F(B)^{(k)}$. Namely, consider the commutative diagram

where $a^{\prime}(b)=s^{\operatorname{deg}(b)} b, f(b)=b, f(t)=s t$ and $g(b)=t^{\operatorname{deg}(b)} b$ and $g(s)=s$. Then

$$
F(g)\left(F\left(a^{\prime}\right)\right)(x)=F(g)\left(\sum s^{k} x_{k}\right)=\sum s^{k} F(a)\left(x_{k}\right)
$$

and going the other way we see

$$
F(f)(F(a))(x)=F(f)\left(\sum t^{k} x_{k}\right)=\sum(s t)^{k} x_{k}
$$

Since $B \rightarrow B\left[s, t, s^{-1}, t^{-1}\right]$ is free we see that $F\left(B\left[t, s, t^{-1}, s^{-1}\right]\right)=\bigoplus_{k, l \in \mathbf{Z}} F(B)$. $t^{k} s^{l}$ and comparing coefficients in the expressions above we find $F(a)\left(x_{k}\right)=t^{k} x_{k}$ as desired.

Finally, the image of $F\left(B_{0}\right) \rightarrow F(B)$ is contained in $F(B)^{(0)}$ because $B_{0} \rightarrow B \xrightarrow{a}$ $B\left[t, t^{-1}\right]$ is equal to $B_{0} \rightarrow B \xrightarrow{p} B\left[t, t^{-1}\right]$.

As a particular case of Lemma 44.3.7 note that

$$
\underline{M}(B)^{(k)}=M \otimes_{A} B_{k}
$$

where $B_{k}$ is the degree $k$ part of the graded $A$-algebra $B$.

06V0 Lemma 44.3.8. Let $A$ be a ring. Given a solid diagram

of module-valued functors on $A l g_{A}$ with exact row there exists a dotted arrow making the diagram commute.

Proof. Suppose that the map $A^{\oplus n} \rightarrow A^{\oplus m}$ is given by the $m \times n$-matrix $\left(a_{i j}\right)$. Consider the ring $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(\sum a_{i j} x_{j}\right)$. The element $\left(x_{1}, \ldots, x_{n}\right) \in \underline{A^{\oplus n}}(B)$ maps to zero in $\underline{A^{\oplus m}}(B)$ hence is the image of a unique element $\xi \in L(B)$. Note that $\xi$ has the following universal property: for any $A$-algebra $C$ and any $\xi^{\prime} \in L(C)$ there exists an $A$-algebra map $B \rightarrow C$ such that $\xi$ maps to $\xi^{\prime}$ via the map $L(B) \rightarrow L(C)$.
Note that $B$ is a graded $A$-algebra, hence we can use Lemmas 44.3.7 and 44.3.5 to decompose the values of our functors on $B$ into graded pieces. Note that $\xi \in$ $L(B)^{(1)}$ as $\left(x_{1}, \ldots, x_{n}\right)$ is an element of degree one in $\underline{A^{\oplus n}}(B)$. Hence we see that $\varphi(\xi) \in \underline{M}(B)^{(1)}=M \otimes_{A} B_{1}$. Since $B_{1}$ is generated by $x_{1}, \ldots, x_{n}$ as an $A$-module we can write $\varphi(\xi)=\sum m_{i} \otimes x_{i}$. Consider the map $A^{\oplus n} \rightarrow M$ which maps the $i$ th basis vector to $m_{i}$. By construction the associated map $\underline{A^{\oplus n}} \rightarrow \underline{M}$ maps the element $\xi$ to $\varphi(\xi)$. It follows from the universal property mentioned above that the diagram commutes.

06V1 Lemma 44.3.9. Let $A$ be a ring. Let $\varphi: F \rightarrow \underline{M}$ be a map of module-valued functors on Alg $_{A}$ with $F$ adequate. Then $\operatorname{Coker}(\varphi)$ is adequate.

Proof. By Lemma 44.3.6 we may assume that $F=\bigoplus L_{i}$ is a direct sum of linearly adequate functors. Choose exact sequences $0 \rightarrow L_{i} \rightarrow \underline{A^{\oplus n_{i}}} \rightarrow \underline{A^{\oplus m_{i}}}$. For each $i$ choose a map $A^{\oplus n_{i}} \rightarrow M$ as in Lemma 44.3.8. Consider the diagram

Consider the $A$-modules
$Q=\operatorname{Coker}\left(\bigoplus A^{\oplus n_{i}} \rightarrow M \oplus \bigoplus A^{\oplus m_{i}}\right) \quad$ and $\quad P=\operatorname{Coker}\left(\bigoplus A^{\oplus n_{i}} \rightarrow \bigoplus A^{\oplus m_{i}}\right)$.
Then we see that $\operatorname{Coker}(\varphi)$ is isomorphic to the kernel of $\underline{Q} \rightarrow \underline{P}$.
06V2 Lemma 44.3.10. Let $A$ be a ring. Let $\varphi: F \rightarrow G$ be a map of adequate functors on $A l g_{A}$. Then Coker $(\varphi)$ is adequate.

Proof. Choose an injection $G \rightarrow \underline{M}$. Then we have an injection $G / F \rightarrow \underline{M} / F$. By Lemma 44.3 .9 we see that $\underline{M} / F$ is adequate, hence we can find an injection $\underline{M} / F \rightarrow \underline{N}$. Composing we obtain an injection $G / F \rightarrow \underline{N}$. By Lemma 44.3.9 the cokernel of the induced $\operatorname{map} G \rightarrow \underline{N}$ is adequate hence we can find an injection $\underline{N} / G \rightarrow \underline{K}$. Then $0 \rightarrow G / F \rightarrow \underline{N} \rightarrow \underline{K}$ is exact and we win.

06V3 Lemma 44.3.11. Let $A$ be a ring. Let $\varphi: F \rightarrow G$ be a map of adequate functors on $A l g_{A}$. Then $\operatorname{Ker}(\varphi)$ is adequate.

Proof. Choose an injection $F \rightarrow \underline{M}$ and an injection $G \rightarrow \underline{N}$. Denote $F \rightarrow \underline{M \oplus N}$ the diagonal map so that

commutes. By Lemma 44.3.10 we can find a module map $M \oplus N \rightarrow K$ such that $F$ is the kernel of $M \oplus N \rightarrow \underline{K}$. Then $\operatorname{Ker}(\varphi)$ is the kernel of $M \oplus N \rightarrow \underline{K \oplus N}$.

06V4 Lemma 44.3.12. Let $A$ be a ring. An arbitrary direct sum of adequate functors on $A l g_{A}$ is adequate. A colimit of adequate functors is adequate.

Proof. The statement on direct sums is immediate. A general colimit can be written as a kernel of a map between direct sums, see Categories, Lemma 4.14.11, Hence this follows from Lemma 44.3.11.

06V5 Lemma 44.3.13. Let $A$ be a ring. Let $F, G$ be module-valued functors on Alg $_{A}$. Let $\varphi: F \rightarrow G$ be a transformation of functors. Assume
(1) $\varphi$ is additive,
(2) for every $A$-algebra $B$ and $\xi \in F(B)$ and unit $u \in B^{*}$ we have $\varphi(u \xi)=$ $u \varphi(\xi)$ in $G(B)$, and
(3) for any flat ring map $B \rightarrow B^{\prime}$ we have $G(B) \otimes_{B} B^{\prime}=G\left(B^{\prime}\right)$.

Then $\varphi$ is a morphism of module-valued functors.
Proof. Let $B$ be an $A$-algebra, $\xi \in F(B)$, and $b \in B$. We have to show that $\varphi(b \xi)=b \varphi(\xi)$. Consider the ring map

$$
B \rightarrow B^{\prime}=B\left[x, y, x^{-1}, y^{-1}\right] /(x+y-b)
$$

This ring map is faithfully flat, hence $G(B) \subset G\left(B^{\prime}\right)$. On the other hand

$$
\varphi(b \xi)=\varphi((x+y) \xi)=\varphi(x \xi)+\varphi(y \xi)=x \varphi(\xi)+y \varphi(\xi)=(x+y) \varphi(\xi)=b \varphi(\xi)
$$

because $x, y$ are units in $B^{\prime}$. Hence we win.
06V6 Lemma 44.3.14. Let $A$ be a ring. Let $0 \rightarrow \underline{M} \rightarrow G \rightarrow L \rightarrow 0$ be a short exact sequence of module-valued functors on Alg $_{A}$ with $L$ linearly adequate. Then $G$ is adequate.

Proof. We first point out that for any flat $A$-algebra map $B \rightarrow B^{\prime}$ the map $G(B) \otimes_{B} B^{\prime} \rightarrow G\left(B^{\prime}\right)$ is an isomorphism. Namely, this holds for $\underline{M}$ and $L$, see Lemma 44.3.5 and hence follows for $G$ by the five lemma. In particular, by Lemma 44.3.7 we see that $G(B)=\bigoplus_{k \in \mathbf{Z}} G(B)^{(k)}$ for any graded $A$-algebra $B$.

Choose an exact sequence $0 \rightarrow L \rightarrow \underline{A^{\oplus n}} \rightarrow \underline{A^{\oplus m}}$. Suppose that the map $A^{\oplus n} \rightarrow A^{\oplus m}$ is given by the $m \times n$-matrix $\left(a_{i j}\right)$. Consider the graded $A$-algebra $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(\sum a_{i j} x_{j}\right)$. The element $\left(x_{1}, \ldots, x_{n}\right) \in \underline{A^{\oplus n}}(B)$ maps to zero in $\underline{A}^{\oplus m}(B)$ hence is the image of a unique element $\xi \in L(B)$. Observe that $\xi \in L(B)^{(1)}$. The map

$$
\operatorname{Hom}_{A}(B, C) \longrightarrow L(C), \quad f \longmapsto L(f)(\xi)
$$

defines an isomorphism of functors. The reason is that $f$ is determined by the images $c_{i}=f\left(x_{i}\right) \in C$ which have to satisfy the relations $\sum a_{i j} c_{j}=0$. And $L(C)$ is the set of $n$-tuples $\left(c_{1}, \ldots, c_{n}\right)$ satisfying the relations $\sum a_{i j} c_{j}=0$.

Since the value of each of the functors $\underline{M}, G, L$ on $B$ is a direct sum of its weight spaces (by the lemma mentioned above) exactness of $0 \rightarrow \underline{M} \rightarrow G \rightarrow L \rightarrow 0$ implies the sequence $0 \rightarrow \underline{M}(B)^{(1)} \rightarrow G(B)^{(1)} \rightarrow L(B)^{(1)} \rightarrow \overline{0}$ is exact. Thus we may choose an element $\theta \in G(B)^{(1)}$ mapping to $\xi$.
Consider the graded $A$-algebra

$$
C=A\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}\right] /\left(\sum a_{i j} x_{j}, \sum a_{i j} y_{j}\right)
$$

There are three graded $A$-algebra homomorphisms $p_{1}, p_{2}, m: B \rightarrow C$ defined by the rules

$$
p_{1}\left(x_{i}\right)=x_{i}, \quad p_{1}\left(x_{i}\right)=y_{i}, \quad m\left(x_{i}\right)=x_{i}+y_{i} .
$$

We will show that the element

$$
\tau=G(m)(\theta)-G\left(p_{1}\right)(\theta)-G\left(p_{2}\right)(\theta) \in G(C)
$$

is zero. First, $\tau$ maps to zero in $L(C)$ by a direct calculation. Hence $\tau$ is an element of $\underline{M}(C)$. Moreover, since $m, p_{1}, p_{2}$ are graded algebra maps we see that $\tau \in G(C)^{(1)}$ and since $\underline{M} \subset G$ we conclude

$$
\tau \in \underline{M}(C)^{(1)}=M \otimes_{A} C_{1} .
$$

We may write uniquely $\tau=\underline{M}\left(p_{1}\right)\left(\tau_{1}\right)+\underline{M}\left(p_{2}\right)\left(\tau_{2}\right)$ with $\tau_{i} \in M \otimes_{A} B_{1}=\underline{M}(B)^{(1)}$ because $C_{1}=p_{1}\left(B_{1}\right) \oplus p_{2}\left(B_{1}\right)$. Consider the ring map $q_{1}: C \rightarrow B$ defined by $x_{i} \mapsto x_{i}$ and $y_{i} \mapsto 0$. Then $\underline{M}\left(q_{1}\right)(\tau)=\underline{M}\left(q_{1}\right)\left(\underline{M}\left(p_{1}\right)\left(\tau_{1}\right)+\underline{M}\left(p_{2}\right)\left(\tau_{2}\right)\right)=\tau_{1}$. On the other hand, because $q_{1} \circ m=q_{1} \circ p_{1}$ we see that $G\left(q_{1}\right)(\tau)=-G\left(q_{1} \circ p_{2}\right)(\tau)$. Since $q_{1} \circ p_{2}$ factors as $B \rightarrow A \rightarrow B$ we see that $G\left(q_{1} \circ p_{2}\right)(\tau)$ is in $G(B)^{(0)}$, see Lemma 44.3.7. Hence $\tau_{1}=0$ because it is in $G(B)^{(0)} \cap \underline{M}(B)^{(1)} \subset G(B)^{(0)} \cap G(B)^{(1)}=0$. Similarly $\tau_{2}=0$, whence $\tau=0$.

Since $\theta \in G(B)$ we obtain a transformation of functors

$$
\psi: L(-)=\operatorname{Hom}_{A}(B,-) \longrightarrow G(-)
$$

by mapping $f: B \rightarrow C$ to $G(f)(\theta)$. Since $\theta$ is a lift of $\xi$ the map $\psi$ is a right inverse of $G \rightarrow L$. In terms of $\psi$ the statements proved above have the following meaning: $\tau=0$ means that $\psi$ is additive and $\theta \in G(B)^{(1)}$ implies that for any $A$-algebra $D$ we have $\psi(u l)=u \psi(l)$ in $G(D)$ for $l \in L(D)$ and $u \in D^{*}$ a unit. This implies that $\psi$ is a morphism of module-valued functors, see Lemma 44.3.13. Clearly this implies that $G \cong \underline{M} \oplus L$ and we win.

06V7 Remark 44.3.15. Let $A$ be a ring. The proof of Lemma 44.3.14 shows that any extension $0 \rightarrow \underline{M} \rightarrow E \rightarrow L \rightarrow 0$ of module-valued functors on $A l g_{A}$ with $L$ linearly adequate splits. It uses only the following properties of the module-valued functor $F=\underline{M}:$
(1) $F(B) \otimes_{B} B^{\prime} \rightarrow F\left(B^{\prime}\right)$ is an isomorphism for a flat ring map $B \rightarrow B^{\prime}$, and
(2) $F(C)^{(1)}=F\left(p_{1}\right)\left(F(B)^{(1)}\right) \oplus F\left(p_{2}\right)\left(F(B)^{(1)}\right)$ where $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(\sum a_{i j} x_{j}\right)$ and $C=A\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}\right] /\left(\sum a_{i j} x_{j}, \sum a_{i j} y_{j}\right)$.
These two properties hold for any adequate functor $F$; details omitted. Hence we see that $L$ is a projective object of the abelian category of adequate functors.

06V8 Lemma 44.3.16. Let $A$ be a ring. Let $0 \rightarrow F \rightarrow G \rightarrow H \rightarrow 0$ be a short exact sequence of module-valued functors on $A l g_{A}$. If $F$ and $H$ are adequate, so is $G$.

Proof. Choose an exact sequence $0 \rightarrow F \rightarrow \underline{M} \rightarrow \underline{N}$. If we can show that $(\underline{M} \oplus G) / F$ is adequate, then $G$ is the kernel of the map of adequate functors $(\underline{M} \oplus G) / F \rightarrow \underline{N}$, hence adequate by Lemma 44.3.11. Thus we may assume $F=\underline{M}$.
We can choose a surjection $L \rightarrow H$ where $L$ is a direct sum of linearly adequate functors, see Lemma 44.3.6. If we can show that the pullback $G \times{ }_{H} L$ is adequate, then $G$ is the cokernel of the map $\operatorname{Ker}(L \rightarrow H) \rightarrow G \times_{H} L$ hence adequate by Lemma 44.3.10. Thus we may assume that $H=\bigoplus L_{i}$ is a direct sum of linearly adequate functors. By Lemma 44.3 .14 each of the pullbacks $G \times{ }_{H} L_{i}$ is adequate. By Lemma 44.3.12 we see that $\bigoplus G \times{ }_{H} L_{i}$ is adequate. Then $G$ is the cokernel of

$$
\bigoplus_{i \neq i^{\prime}} F \longrightarrow \bigoplus G \times_{H} L_{i}
$$

where $\xi$ in the summand $\left(i, i^{\prime}\right)$ maps to $(0, \ldots, 0, \xi, 0, \ldots, 0,-\xi, 0, \ldots, 0)$ with nonzero entries in the summands $i$ and $i^{\prime}$. Thus $G$ is adequate by Lemma 44.3.10.

06V9 Lemma 44.3.17. Let $A \rightarrow A^{\prime}$ be a ring map. If $F$ is an adequate functor on $A l g_{A}$, then its restriction $F^{\prime}$ to $A l g_{A^{\prime}}$ is adequate too.

Proof. Choose an exact sequence $0 \rightarrow F \rightarrow \underline{M} \rightarrow \underline{N}$. Then $F^{\prime}\left(B^{\prime}\right)=F\left(B^{\prime}\right)=$ $\operatorname{Ker}\left(M \otimes_{A} B^{\prime} \rightarrow N \otimes_{A} B^{\prime}\right)$. Since $M \otimes_{A} B^{\prime}=M \otimes_{A} A^{\prime} \otimes_{A^{\prime}} B^{\prime}$ and similarly for $N$ we see that $F^{\prime}$ is the kernel of $\underline{M \otimes_{A} A^{\prime}} \rightarrow \underline{N \otimes_{A} A^{\prime}}$.

06VA Lemma 44.3.18. Let $A \rightarrow A^{\prime}$ be a ring map. If $F^{\prime}$ is an adequate functor on Alg $A_{A^{\prime}}$, then the module-valued functor $F: B \mapsto F^{\prime}\left(A^{\prime} \otimes_{A} B\right)$ on $A l g_{A}$ is adequate too.

Proof. Choose an exact sequence $0 \rightarrow F^{\prime} \rightarrow \underline{M^{\prime}} \rightarrow \underline{N^{\prime}}$. Then

$$
\begin{aligned}
F(B) & =F^{\prime}\left(A^{\prime} \otimes_{A} B\right) \\
& =\operatorname{Ker}\left(M^{\prime} \otimes_{A^{\prime}}\left(A^{\prime} \otimes_{A} B\right) \rightarrow N^{\prime} \otimes_{A^{\prime}}\left(A^{\prime} \otimes_{A} B\right)\right) \\
& =\operatorname{Ker}\left(M^{\prime} \otimes_{A} B \rightarrow N^{\prime} \otimes_{A} B\right)
\end{aligned}
$$

Thus $F$ is the kernel of $\underline{M} \rightarrow \underline{N}$ where $M=M^{\prime}$ and $N=N^{\prime}$ viewed as $A$ modules.

06VB Lemma 44.3.19. Let $A=A_{1} \times \ldots \times A_{n}$ be a product of rings. An adequate functor over $A$ is the same thing as a sequence $F_{1}, \ldots, F_{n}$ of adequate functors $F_{i}$ over $A_{i}$.

Proof. This is true because an $A$-algebra $B$ is canonically a product $B_{1} \times \ldots \times B_{n}$ and the same thing holds for $A$-modules. Setting $F(B)=\coprod F_{i}\left(B_{i}\right)$ gives the correspondence. Details omitted.

06 VH Lemma 44.3.20. Let $A \rightarrow A^{\prime}$ be a ring map and let $F$ be a module-valued functor on $\mathrm{Alg}_{A}$ such that
(1) the restriction $F^{\prime}$ of $F$ to the category of $A^{\prime}$-algebras is adequate, and
(2) for any $A$-algebra $B$ the sequence

$$
0 \rightarrow F(B) \rightarrow F\left(B \otimes_{A} A^{\prime}\right) \rightarrow F\left(B \otimes_{A} A^{\prime} \otimes_{A} A^{\prime}\right)
$$

is exact.
Then $F$ is adequate.

Proof. The functors $B \rightarrow F\left(B \otimes_{A} A^{\prime}\right)$ and $B \mapsto F\left(B \otimes_{A} A^{\prime} \otimes_{A} A^{\prime}\right)$ are adequate, see Lemmas 44.3.18 and 44.3.17. Hence $F$ as a kernel of a map of adequate functors is adequate, see Lemma 44.3.11.

### 44.4. Higher exts of adequate functors

Let $A$ be a ring. In Lemma 44.3.16 we have seen that any extension of adequate functors in the category of module-valued functors on $A l g_{A}$ is adequate. In this section we show that the same remains true for higher ext groups.

06Z6 Lemma 44.4.1. Let $A$ be a ring. For every module-valued functor $F$ on $A l g_{A}$ there exists a morphism $Q(F) \rightarrow F$ of module-valued functors on Alg $_{A}$ such that (1) $Q(F)$ is adequate and (2) for every adequate functor $G$ the map $\operatorname{Hom}(G, Q(F)) \rightarrow$ $\operatorname{Hom}(G, F)$ is a bijection.

Proof. Choose a set $\left\{L_{i}\right\}_{i \in I}$ of linearly adequate functors such that every linearly adequate functor is isomorphic to one of the $L_{i}$. This is possible. Suppose that we can find $Q(F) \rightarrow F$ with (1) and (2)' or every $i \in I$ the map $\operatorname{Hom}\left(L_{i}, Q(F)\right) \rightarrow$ $\operatorname{Hom}\left(L_{i}, F\right)$ is a bijection. Then (2) holds. Namely, combining Lemmas 44.3.6 and 44.3.11 we see that every adequate functor $G$ sits in an exact sequence

$$
K \rightarrow L \rightarrow G \rightarrow 0
$$

with $K$ and $L$ direct sums of linearly adequate functors. Hence (2)' implies that $\operatorname{Hom}(L, Q(F)) \rightarrow \operatorname{Hom}(L, F)$ and $\operatorname{Hom}(K, Q(F)) \rightarrow \operatorname{Hom}(K, F)$ are bijections, whence the same thing for $G$.

Consider the category $\mathcal{I}$ whose objects are pairs $(i, \varphi)$ where $i \in I$ and $\varphi: L_{i} \rightarrow F$ is a morphism. A morphism $(i, \varphi) \rightarrow\left(i^{\prime}, \varphi^{\prime}\right)$ is a map $\psi: L_{i} \rightarrow L_{i^{\prime}}$ such that $\varphi^{\prime} \circ \psi=\varphi$. Set

$$
Q(F)=\operatorname{colim}_{(i, \varphi) \in \mathrm{Ob}(\mathcal{I})} L_{i}
$$

There is a natural map $Q(F) \rightarrow F$, by Lemma 44.3.12 it is adequate, and by construction it has property (2)'.

06 Z 7 Lemma 44.4.2. Let $A$ be a ring. Denote $\mathcal{P}$ the category of module-valued functors on $A l g_{A}$ and $\mathcal{A}$ the category of adequate functors on $A l g_{A}$. Denote $i: \mathcal{A} \rightarrow \mathcal{P}$ the inclusion functor. Denote $Q: \mathcal{P} \rightarrow \mathcal{A}$ the construction of Lemma 44.4.1. Then
(1) $i$ is fully faithful, exact, and its image is a weak Serre subcategory,
(2) $\mathcal{P}$ has enough injectives,
(3) the functor $Q$ is a right adjoint to $i$ hence left exact,
(4) $Q$ transforms injectives into injectives,
(5) $\mathcal{A}$ has enough injectives.

Proof. This lemma just collects some facts we have already seen so far. Part (1) is clear from the definitions, the characterization of weak Serre subcategories (see Homology, Lemma 12.9.3, and Lemmas 44.3.10, 44.3.11, and 44.3.16. Recall that $\mathcal{P}$ is equivalent to the category $\operatorname{PMod}\left((A f f / \operatorname{Spec}(A))_{\tau}, \mathcal{O}\right)$. Hence (2) by Injectives, Proposition 19.8.5. Part (3) follows from Lemma 44.4.1 and Categories, Lemma 4.24.4. Parts (4) and (5) follow from Homology, Lemmas 12.25.1 and 12.25.3.

Let $A$ be a ring. As in Formal Deformation Theory, Section 73.10 given an $A$ algebra $B$ and an $B$-module $N$ we set $B[N]$ equal to the $R$-algebra with underlying $B$-module $B \oplus N$ with multiplication given by $(b, m)\left(b^{\prime}, m^{\prime}\right)=\left(b b^{\prime}, b m^{\prime}+b^{\prime} m\right)$. Note
that this construction is functorial in the pair $(B, N)$ where morphism $(B, N) \rightarrow$ $\left(B^{\prime}, N^{\prime}\right)$ is given by an $A$-algebra map $B \rightarrow B^{\prime}$ and an $B$-module map $N \rightarrow N^{\prime}$. In some sense the functor $T F$ of pairs defined in the following lemma is the tangent space of $F$. Below we will only consider pairs $(B, N)$ such that $B[N]$ is an object of $A l g_{A}$.

06Z8 Lemma 44.4.3. Let $A$ be a ring. Let $F$ be a module valued functor. For every $B \in \mathrm{Ob}\left(A l g_{A}\right)$ and $B$-module $N$ there is a canonical decomposition

$$
F(B[N])=F(B) \oplus T F(B, N)
$$

characterized by the following properties
(1) $\operatorname{TF}(B, N)=\operatorname{Ker}(F(B[N]) \rightarrow F(B))$,
(2) there is a $B$-module structure $T F(B, N)$ compatible with $B[N]$-module structure on $F(B[N])$,
(3) $T F$ is a functor from the category of pairs $(B, N)$,

06Z9
(4) there are canonical maps $N \otimes_{B} F(B) \rightarrow T F(B, N)$ inducing a transformation between functors defined on the category of pairs $(B, N)$,
(5) $T F(B, 0)=0$ and the map $T F(B, N) \rightarrow T F\left(B, N^{\prime}\right)$ is zero when $N \rightarrow N^{\prime}$ is the zero map.

Proof. Since $B \rightarrow B[N] \rightarrow B$ is the identity we see that $F(B) \rightarrow F(B[N])$ is a direct summand whose complement is $T F(N, B)$ as defined in (1). This construction is functorial in the pair $(B, N)$ simply because given a morphism of pairs $(B, N) \rightarrow\left(B^{\prime}, N^{\prime}\right)$ we obtain a commutative diagram

in $A l g_{A}$. The $B$-module structure comes from the $B[N]$-module structure and the ring map $B \rightarrow B[N]$. The map in (4) is the composition

$$
N \otimes_{B} F(B) \longrightarrow B[N] \otimes_{B[N]} F(B[N]) \longrightarrow F(B[N])
$$

whose image is contained in $T F(B, N)$. (The first arrow uses the inclusions $N \rightarrow$ $B[N]$ and $F(B) \rightarrow F(B[N])$ and the second arrow is the multiplication map.) If $N=0$, then $B=B[N]$ hence $T F(B, 0)=0$. If $N \rightarrow N^{\prime}$ is zero then it factors as $N \rightarrow 0 \rightarrow N^{\prime}$ hence the induced map is zero since $T F(B, 0)=0$.

Let $A$ be a ring. Let $M$ be an $A$-module. Then the module-valued functor $\underline{M}$ has tangent space $T \underline{M}$ given by the rule $T \underline{M}(B, N)=N \otimes_{A} M$. In particular, for $B$ given, the functor $N \mapsto T \underline{M}(B, N)$ is additive and right exact. It turns out this also holds for injective module-valued functors.
06ZA Lemma 44.4.4. Let $A$ be a ring. Let $I$ be an injective object of the category of module-valued functors. Then for any $B \in \mathrm{Ob}\left(A l g_{A}\right)$ and short exact sequence $0 \rightarrow N_{1} \rightarrow N \rightarrow N_{2} \rightarrow 0$ of $B$-modules the sequence

$$
T I\left(B, N_{1}\right) \rightarrow T I(B, N) \rightarrow T I\left(B, N_{2}\right) \rightarrow 0
$$

is exact.

Proof. We will use the results of Lemma 44.4.3 without further mention. Denote $h: A l g_{A} \rightarrow$ Sets the functor given by $h(C)=\operatorname{Mor}_{A}(B[N], C)$. Similarly for $h_{1}$ and $h_{2}$. The map $B[N] \rightarrow B\left[N_{2}\right]$ corresponding to the surjection $N \rightarrow N_{2}$ is surjective. It corresponds to a map $h_{2} \rightarrow h$ such that $h_{2}(C) \rightarrow h(C)$ is injective for all $A$ algebras $C$. On the other hand, there are two maps $p, q: h \rightarrow h_{1}$, corresponding to the zero map $N_{1} \rightarrow N$ and the injection $N_{1} \rightarrow N$. Note that

$$
h_{2} \longrightarrow h \longrightarrow h_{1}
$$

is an equalizer diagram. Denote $\mathcal{O}_{h}$ the module-valued functor $C \mapsto \bigoplus_{h(C)} C$. Similarly for $\mathcal{O}_{h_{1}}$ and $\mathcal{O}_{h_{2}}$. Note that

$$
\operatorname{Hom}_{\mathcal{P}}\left(\mathcal{O}_{h}, F\right)=F(B[N])
$$

where $\mathcal{P}$ is the category of of module-valued functors on $A l g_{A}$. We claim there is an equalizer diagram

$$
\mathcal{O}_{h_{2}} \longrightarrow \mathcal{O}_{h} \longrightarrow \mathcal{O}_{h_{1}}
$$

in $\mathcal{P}$. Namely, suppose that $C \in \operatorname{Ob}\left(A l g_{A}\right)$ and $\xi=\sum_{i=1, \ldots, n} c_{i} \cdot f_{i}$ where $c_{i} \in C$ and $f_{i}: B[N] \rightarrow C$ is an element of $\mathcal{O}_{h}(C)$. If $p(\xi)=q(\xi)$, then we see that

$$
\sum c_{i} \cdot f_{i} \circ z=\sum c_{i} \cdot f_{i} \circ y
$$

where $z, y: B\left[N_{1}\right] \rightarrow B[N]$ are the maps $z:\left(b, m_{1}\right) \mapsto(b, 0)$ and $y:\left(b, m_{1}\right) \mapsto$ $\left(b, m_{1}\right)$. This means that for every $i$ there exists a $j$ such that $f_{j} \circ z=f_{i} \circ y$. Clearly, this implies that $f_{i}\left(N_{1}\right)=0$, i.e., $f_{i}$ factors through a unique map $\bar{f}_{i}: B\left[N_{2}\right] \rightarrow C$. Hence $\xi$ is the image of $\bar{\xi}=\sum c_{i} \cdot \bar{f}_{i}$. Since $I$ is injective, it transforms this equalizer diagram into a coequalizer diagram

$$
I\left(B\left[N_{1}\right]\right) \longrightarrow I(B[N]) \longrightarrow I\left(B\left[N_{2}\right]\right)
$$

This diagram is compatible with the direct sum decompositions $I(B[N])=I(B) \oplus$ $T I(B, N)$ and $I\left(B\left[N_{i}\right]\right)=I(B) \oplus T I\left(B, N_{i}\right)$. The zero map $N \rightarrow N_{1}$ induces the zero map $T I(B, N) \rightarrow T I\left(B, N_{1}\right)$. Thus we see that the coequalizer property above means we have an exact sequence $T I\left(B, N_{1}\right) \rightarrow T I(B, N) \rightarrow T I\left(B, N_{2}\right) \rightarrow 0$ as desired.

Lemma 44.4.5. Let $A$ be a ring. Let $F$ be a module-valued functor such that for any $B \in \mathrm{Ob}\left(\right.$ Alg $\left._{A}\right)$ the functor $T F(B,-)$ on $B$-modules transforms a short exact sequence of $B$-modules into a right exact sequence. Then
(1) $\operatorname{TF}\left(B, N_{1} \oplus N_{2}\right)=T F\left(B, N_{1}\right) \oplus T F\left(B, N_{2}\right)$,
(2) there is a second functorial $B$-module structure on $T F(B, N)$ defined by setting $x \cdot b=T F\left(B, b \cdot 1_{N}\right)(x)$ for $x \in T F(B, N)$ and $b \in B$,
06ZC (3) the canonical map $N \otimes_{B} F(B) \rightarrow T F(B, N)$ of Lemma 44.4.3 is B-linear also with respect to the second $B$-module structure,
06ZD (4) given a finitely presented $B$-module $N$ there is a canonical isomorphism $T F(B, B) \otimes_{B} N \rightarrow T F(B, N)$ where the tensor product uses the second $B$-module structure on $T F(B, B)$.

Proof. We will use the results of Lemma 44.4.3 without further mention. The $\operatorname{maps} N_{1} \rightarrow N_{1} \oplus N_{2}$ and $N_{2} \rightarrow N_{1} \oplus N_{2}$ give a map $T F\left(B, N_{1}\right) \oplus T F\left(B, N_{2}\right) \rightarrow$ $T F\left(B, N_{1} \oplus N_{2}\right)$ which is injective since the maps $N_{1} \oplus N_{2} \rightarrow N_{1}$ and $N_{1} \oplus N_{2} \rightarrow N_{2}$ induce an inverse. Since $T F$ is right exact we see that $T F\left(B, N_{1}\right) \rightarrow T F\left(B, N_{1} \oplus\right.$
$\left.N_{2}\right) \rightarrow T F\left(B, N_{2}\right) \rightarrow 0$ is exact. Hence $T F\left(B, N_{1}\right) \oplus T F\left(B, N_{2}\right) \rightarrow T F\left(B, N_{1} \oplus N_{2}\right)$ is an isomorphism. This proves (1).

To see (2) the only thing we need to show is that $x \cdot\left(b_{1}+b_{2}\right)=x \cdot b_{1}+x \cdot b_{2}$. (Associativity and additivity are clear.) To see this consider

$$
N \xrightarrow{\left(b_{1}, b_{2}\right)} N \oplus N \xrightarrow{+} N
$$

and apply $T F(B,-)$.

Part (3) follows immediately from the fact that $N \otimes_{B} F(B) \rightarrow T F(B, N)$ is functorial in the pair $(B, N)$.

Suppose $N$ is a finitely presented $B$-module. Choose a presentation $B^{\oplus m} \rightarrow B^{\oplus n} \rightarrow$ $N \rightarrow 0$. This gives an exact sequence

$$
T F\left(B, B^{\oplus m}\right) \rightarrow T F\left(B, B^{\oplus n}\right) \rightarrow T F(B, N) \rightarrow 0
$$

by right exactness of $T F(B,-)$. By part (1) we can write $T F\left(B, B^{\oplus m}\right)=T F(B, B)^{\oplus m}$ and $T F\left(B, B^{\oplus n}\right)=T F(B, B)^{\oplus n}$. Next, suppose that $B^{\oplus m} \rightarrow B^{\oplus n}$ is given by the matrix $T=\left(b_{i j}\right)$. Then the induced map $T F(B, B)^{\oplus m} \rightarrow T F(B, B)^{\oplus n}$ is given by the matrix with entries $T F\left(B, b_{i j} \cdot 1_{B}\right)$. This combined with right exactness of $\otimes$ proves (4).

06ZE Example 44.4.6. Let $F$ be a module-valued functor as in Lemma 44.4.5 It is not always the case that the two module structures on $T F(B, N)$ agree. Here is an example. Suppose $A=\mathbf{F}_{p}$ where $p$ is a prime. Set $F(B)=B$ but with $B$-module structure given by $b \cdot x=b^{p} x$. Then $T F(B, N)=N$ with $B$-module structure given by $b \cdot x=b^{p} x$ for $x \in N$. However, the second $B$-module structure is given by $x \cdot b=b x$. Note that in this case the canonical map $N \otimes_{B} F(B) \rightarrow T F(B, N)$ is zero as raising an element $n \in B[N]$ to the $p$ th power is zero.

In the following lemma we will frequently use the observation that if $0 \rightarrow F \rightarrow G \rightarrow$ $H \rightarrow 0$ is an exact sequence of module-valued functors on $A l g_{A}$, then for any pair $(B, N)$ the sequence $0 \rightarrow T F(B, N) \rightarrow T G(B, N) \rightarrow T H(B, N) \rightarrow 0$ is exact. This follows from the fact that $0 \rightarrow F(B[N]) \rightarrow G(B[N]) \rightarrow H(B[N]) \rightarrow 0$ is exact.

06ZF Lemma 44.4.7. Let $A$ be a ring. For $F$ a module-valued functor on Alg $_{A}$ say (*) holds if for all $B \in \mathrm{Ob}\left(\operatorname{Alg}_{A}\right)$ the functor $T F(B,-)$ on $B$-modules transforms $a$ short exact sequence of $B$-modules into a right exact sequence. Let $0 \rightarrow F \rightarrow G \rightarrow$ $H \rightarrow 0$ be a short exact sequence of module-valued functors on $A l g_{A}$.
(1) If (*) holds for $F, G$ then (*) holds for $H$.
(2) If $(*)$ holds for $F, H$ then $(*)$ holds for $G$.
(3) If $H^{\prime} \rightarrow H$ is morphism of module-valued functors on Alg $_{A}$ and (*) holds for $F, G, H$, and $H^{\prime}$, then $(*)$ holds for $G \times_{H} H^{\prime}$.

Proof. Let $B$ be given. Let $0 \rightarrow N_{1} \rightarrow N_{2} \rightarrow N_{3} \rightarrow 0$ be a short exact sequence of $B$-modules. Part (1) follows from a diagram chase in the diagram

with exact horizontal rows and exact columns involving $T F$ and $T G$. To prove part (2) we do a diagram chase in the diagram

with exact horizontal rows and exact columns involving $T F$ and $T H$. Part (3) follows from part (2) as $G \times_{H} H^{\prime}$ sits in the exact sequence $0 \rightarrow F \rightarrow G \times_{H} H^{\prime} \rightarrow$ $H^{\prime} \rightarrow 0$.

Most of the work in this section was done in order to prove the following key vanishing result.
06ZG Lemma 44.4.8. Let $A$ be a ring. Let $M, P$ be $A$-modules with $P$ of finite presentation. Then $E x t_{\mathcal{P}}^{i}(\underline{P}, \underline{M})=0$ for $i>0$ where $\mathcal{P}$ is the category of module-valued functors on Alg $_{A}$.
Proof. Choose an injective resolution $\underline{M} \rightarrow I^{\bullet}$ in $\mathcal{P}$, see Lemma44.4.2. By Derived Categories, Lemma 13.27 .2 any element of $\operatorname{Ext}_{\mathcal{P}}^{i}(\underline{P}, \underline{M})$ comes from a morphism $\varphi: \underline{P} \rightarrow I^{i}$ with $d^{i} \circ \varphi=0$. We will prove that the Yoneda extension

$$
E: 0 \rightarrow \underline{M} \rightarrow I^{0} \rightarrow \ldots \rightarrow I^{i-1} \times_{\operatorname{Ker}\left(d^{i}\right)} \underline{P} \rightarrow \underline{P} \rightarrow 0
$$

of $\underline{P}$ by $\underline{M}$ associated to $\varphi$ is trivial, which will prove the lemma by Derived Categories, Lemma 13.27.5.

For $F$ a module-valued functor on $A l g_{A}$ say $(*)$ holds if for all $B \in \operatorname{Ob}\left(\operatorname{Alg}_{A}\right)$ the functor $\operatorname{TF}(B,-)$ on $B$-modules transforms a short exact sequence of $B$-modules into a right exact sequence. Recall that the module-valued functors $\underline{M}, I^{n}, \underline{P}$ each have property $(*)$, see Lemma 44.4.4 and the remarks preceding it. By splitting $0 \rightarrow$
$\underline{M} \rightarrow I^{\bullet}$ into short exact sequences we find that each of the functors $\operatorname{Im}\left(d^{n-1}\right)=$ $\operatorname{Ker}\left(d^{n}\right) \subset I^{n}$ has property $(*)$ by Lemma 44.4.7 and also that $I^{i-1} \times_{\operatorname{Ker}\left(d^{i}\right)} \underline{P}$ has property (*).

Thus we may assume the Yoneda extension is given as

$$
E: 0 \rightarrow \underline{M} \rightarrow F_{i-1} \rightarrow \ldots \rightarrow F_{0} \rightarrow \underline{P} \rightarrow 0
$$

where each of the module-valued functors $F_{j}$ has property $(*)$. Set $G_{j}(B)=$ $T F_{j}(B, B)$ viewed as a $B$-module via the second $B$-module structure defined in Lemma 44.4.5. Since $T F_{j}$ is a functor on pairs we see that $G_{j}$ is a modulevalued functor on $A l g_{A}$. Moreover, since $E$ is an exact sequence the sequence $G_{j+1} \rightarrow G_{j} \rightarrow G_{j-1}$ is exact (see remark preceding Lemma 44.4.7). Observe that $T \underline{M}(B, B)=M \otimes_{A} B=\underline{M}(B)$ and that the two $B$-module structures agree on this. Thus we obtain a Yoneda extension

$$
E^{\prime}: 0 \rightarrow \underline{M} \rightarrow G_{i-1} \rightarrow \ldots \rightarrow G_{0} \rightarrow \underline{P} \rightarrow 0
$$

Moreover, the canonical maps

$$
F_{j}(B)=B \otimes_{B} F_{j}(B) \longrightarrow T F_{j}(B, B)=G_{j}(B)
$$

of Lemma 44.4.3 (4) are $B$-linear by Lemma 44.4.5 (33) and functorial in $B$. Hence a map

of Yoneda extensions. In particular we see that $E$ and $E^{\prime}$ have the same class in $\operatorname{Ext}_{\mathcal{P}}^{i}(\underline{P}, \underline{M})$ by the lemma on Yoneda Exts mentioned above. Finally, let $N$ be a $A$-module of finite presentation. Then we see that

$$
0 \rightarrow T \underline{M}(A, N) \rightarrow T F_{i-1}(A, N) \rightarrow \ldots \rightarrow T F_{0}(A, N) \rightarrow T \underline{P}(A, N) \rightarrow 0
$$

is exact. By Lemma 44.4.5 (4) with $B=A$ this translates into the exactness of the sequence of $A$-modules

$$
0 \rightarrow M \otimes_{A} N \rightarrow G_{i-1}(A) \otimes_{A} N \rightarrow \ldots \rightarrow G_{0}(A) \otimes_{A} N \rightarrow P \otimes_{A} N \rightarrow 0
$$

Hence the sequence of $A$-modules $0 \rightarrow M \rightarrow G_{i-1}(A) \rightarrow \ldots \rightarrow G_{0}(A) \rightarrow P \rightarrow 0$ is universally exact, in the sense that it remains exact on tensoring with any finitely presented $A$-module $N$. Let $K=\operatorname{Ker}\left(G_{0}(A) \rightarrow P\right)$ so that we have exact sequences

$$
0 \rightarrow K \rightarrow G_{0}(A) \rightarrow P \rightarrow 0 \quad \text { and } \quad G_{2}(A) \rightarrow G_{1}(A) \rightarrow K \rightarrow 0
$$

Tensoring the second sequence with $N$ we obtain that $K \otimes_{A} N=\operatorname{Coker}\left(G_{2}(A) \otimes_{A}\right.$ $\left.N \rightarrow G_{1}(A) \otimes_{A} N\right)$. Exactness of $G_{2}(A) \otimes_{A} N \rightarrow G_{1}(A) \otimes_{A} N \rightarrow G_{0}(A) \otimes_{A} N$ then implies that $K \otimes_{A} N \rightarrow G_{0}(A) \otimes_{A} N$ is injective. By Algebra, Theorem 10.81.3 this means that the $A$-module extension $0 \rightarrow K \rightarrow G_{0}(A) \rightarrow P \rightarrow 0$ is exact, and because $P$ is assumed of finite presentation this means the sequence is split, see Algebra, Lemma 10.81.4. Any splitting $P \rightarrow G_{0}(A)$ defines a map $\underline{P} \rightarrow G_{0}$ which splits the surjection $G_{0} \rightarrow \underline{P}$. Thus the Yoneda extension $E^{\prime}$ is equivalent to the trivial Yoneda extension and we win.

06ZH Lemma 44.4.9. Let $A$ be a ring. Let $M$ be an $A$-module. Let $L$ be a linearly adequate functor on $\operatorname{Alg}_{A}$. Then $E x t_{\mathcal{P}}^{i}(L, \underline{M})=0$ for $i>0$ where $\mathcal{P}$ is the category of module-valued functors on $A l g_{A}$.

Proof. Since $L$ is linearly adequate there exists an exact sequence

$$
0 \rightarrow L \rightarrow \underline{A^{\oplus m}} \rightarrow \underline{A^{\oplus n}} \rightarrow \underline{P} \rightarrow 0
$$

Here $P=\operatorname{Coker}\left(A^{\oplus m} \rightarrow A^{\oplus n}\right)$ is the cokernel of the map of finite free $A$-modules which is given by the definition of linearly adequate functors. By Lemma 44.4 .8 we have the vanishing of $\operatorname{Ext}_{\mathcal{P}}^{i}(\underline{P}, \underline{M})$ and $\operatorname{Ext}_{\mathcal{P}}^{i}(\underline{A}, \underline{M})$ for $i>0$. Let $K=\operatorname{Ker}\left(\underline{A^{\oplus n}} \rightarrow\right.$ $\underline{P})$. By the long exact sequence of Ext groups associated to the exact sequence $0 \rightarrow K \rightarrow \underline{A^{\oplus n}} \rightarrow \underline{P} \rightarrow 0$ we conclude that $\operatorname{Ext}_{\mathcal{P}}^{i}(K, \underline{M})=0$ for $i>0$. Repeating with the sequence $0 \rightarrow L \rightarrow \underline{A^{\oplus m}} \rightarrow K \rightarrow 0$ we win.

06ZI Lemma 44.4.10. With notation as in Lemma 44.4.2 we have $R^{p} Q(F)=0$ for all $p>0$ and any adequate functor $F$.
Proof. Choose an exact sequence $0 \rightarrow F \rightarrow \underline{M^{0}} \rightarrow \underline{M^{1}}$. Set $M^{2}=\operatorname{Coker}\left(M^{0} \rightarrow\right.$ $M^{1}$ ) so that $0 \rightarrow F \rightarrow \underline{M^{0}} \rightarrow \underline{M^{1}} \rightarrow \underline{M^{2}} \rightarrow 0$ is a resolution. By Derived Categories, Lemma 13.21 .3 we obtain a spectral sequence

$$
R^{p} Q\left(\underline{M^{q}}\right) \Rightarrow R^{p+q} Q(F)
$$

Since $Q\left(\underline{M^{q}}\right)=\underline{M^{q}}$ it suffices to prove $R^{p} Q(\underline{M})=0, p>0$ for any $A$-module $M$.
Choose an injective resolution $\underline{M} \rightarrow I^{\bullet}$ in the category $\mathcal{P}$. Suppose that $R^{i} Q(\underline{M})$ is nonzero. Then $\operatorname{Ker}\left(Q\left(I^{i}\right) \rightarrow Q\left(I^{i+1}\right)\right)$ is strictly bigger than the image of $Q\left(I^{i-1}\right) \rightarrow Q\left(I^{i}\right)$. Hence by Lemma 44.3 .6 there exists a linearly adequate functor $L$ and a map $\varphi: L \rightarrow Q\left(I^{i}\right)$ mapping into the kernel of $Q\left(I^{i}\right) \rightarrow Q\left(I^{i+1}\right)$ which does not factor through the image of $Q\left(I^{i-1}\right) \rightarrow Q\left(I^{i}\right)$. Because $Q$ is a left adjoint to the inclusion functor the map $\varphi$ corresponds to a map $\varphi^{\prime}: L \rightarrow I^{i}$ with the same properties. Thus $\varphi^{\prime}$ gives a nonzero element of $\operatorname{Ext}_{\mathcal{P}}^{i}(L, \underline{M})$ contradicting Lemma 44.4.9.

### 44.5. Adequate modules

06 VF In Descent, Section 34.7 we have seen that quasi-coherent modules on a scheme $S$ are the same as quasi-coherent modules on any of the big sites $(S c h / S)_{\tau}$ associated to $S$. We have seen that there are two issues with this identification:
(1) $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right), \mathcal{F} \mapsto \mathcal{F}^{a}$ is not exact in general, and
(2) given a quasi-compact and quasi-separated morphism $f: X \rightarrow S$ the functor $f_{*}$ does not preserve quasi-coherent sheaves on the big sites in general.
Part (1) means that we cannot define a triangulated subcategory of $D(\mathcal{O})$ consisting of complexes whose cohomology sheaves are quasi-coherent. Part (2) means that $R f_{*} \mathcal{F}$ isn't a complex with quasi-coherent cohomology sheaves even when $\mathcal{F}$ is quasi-coherent and $f$ is quasi-compact and quasi-separated. Moreover, the examples given in the proofs of Descent, Lemma 34.7.13 and Descent, Proposition 34.7.14 are not of a pathological nature.

In this section we discuss a slightly larger category of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$ with contains the quasi-coherent modules, is abelian, and is preserved under $f_{*}$ when $f$ is quasi-compact and quasi-separated. To do this, suppose that $S$ is a scheme. Let
$\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$. For any affine object $U=\operatorname{Spec}(A)$ of $(S c h / S)_{\tau}$ we can restrict $\mathcal{F}$ to $(A f f / U)_{\tau}$ to get a presheaf of $\mathcal{O}$-modules on this site. The corresponding module-valued functor, see Section 44.3, will be denoted

$$
F=F_{\mathcal{F}, A}: A l g_{A} \longrightarrow A b, \quad B \longmapsto \mathcal{F}(\operatorname{Spec}(B))
$$

The assignment $\mathcal{F} \mapsto F_{\mathcal{F}, A}$ is an exact functor of abelian categories.
06VG Definition 44.5.1. A sheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $(S c h / S)_{\tau}$ is adequate if there exists a $\tau$-covering $\left\{\operatorname{Spec}\left(A_{i}\right) \rightarrow S\right\}_{i \in I}$ such that $F_{\mathcal{F}, A_{i}}$ is adequate for all $i \in I$.

We will see below that the category of adequate $\mathcal{O}$-modules is independent of the chosen topology $\tau$.

06VI Lemma 44.5.2. Let $S$ be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(S c h / S)_{\tau}$. For any affine scheme $\operatorname{Spec}(A)$ over $S$ the functor $F_{\mathcal{F}, A}$ is adequate.
Proof. Let $\left\{\operatorname{Spec}\left(A_{i}\right) \rightarrow S\right\}_{i \in I}$ be a $\tau$-covering such that $F_{\mathcal{F}, A_{i}}$ is adequate for all $i \in I$. We can find a standard affine $\tau$-covering $\left\{\operatorname{Spec}\left(A_{j}^{\prime}\right) \rightarrow \operatorname{Spec}(A)\right\}_{j=1, \ldots, m}$ such that $\operatorname{Spec}\left(A_{j}^{\prime}\right) \rightarrow \operatorname{Spec}(A) \rightarrow S$ factors through $\operatorname{Spec}\left(A_{i(j)}\right)$ for some $i(j) \in I$. Then we see that $F_{\mathcal{F}, A_{j}^{\prime}}$ is the restriction of $F_{\mathcal{F}, A_{i(j)}}$ to the category of $A_{j}^{\prime}$-algebras. Hence $F_{\mathcal{F}, A_{j}^{\prime}}$ is adequate by Lemma 44.3.17. By Lemma 44.3 .19 the sequence $F_{\mathcal{F}, A_{j}^{\prime}}$ corresponds to an adequate "product" functor $F^{\prime}$ over $A^{\prime}=A_{1}^{\prime} \times \ldots \times A_{m}^{\prime}$. As $\mathcal{F}$ is a sheaf (for the Zariski topology) this product functor $F^{\prime}$ is equal to $F_{\mathcal{F}, A^{\prime}}$, i.e., is the restriction of $F$ to $A^{\prime}$-algebras. Finally, $\left\{\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)\right\}$ is a $\tau$-covering. It follows from Lemma 44.3 .20 that $F_{\mathcal{F}, A}$ is adequate.

06ZJ Lemma 44.5.3. Let $S=\operatorname{Spec}(A)$ be an affine scheme. The category of adequate $\mathcal{O}$-modules on $(S c h / S)_{\tau}$ is equivalent to the category of adequate module-valued functors on Alg $_{A}$.
Proof. Given an adequate module $\mathcal{F}$ the functor $F_{\mathcal{F}, A}$ is adequate by Lemma 44.5.2. Given an adequate functor $F$ we choose an exact sequence $0 \rightarrow F \rightarrow \underline{M} \rightarrow$ $\underline{N}$ and we consider the $\mathcal{O}$-module $\mathcal{F}=\operatorname{Ker}\left(M^{a} \rightarrow N^{a}\right)$ where $M^{a}$ denotes the quasi-coherent $\mathcal{O}$-module on $(S c h / S)_{\tau}$ associated to the quasi-coherent sheaf $\widetilde{M}$ on $S$. Note that $F=F_{\mathcal{F}, A}$, in particular the module $\mathcal{F}$ is adequate by definition. We omit the proof that the constructions define mutually inverse equivalences of categories.

06VJ Lemma 44.5.4. Let $f: T \rightarrow S$ be a morphism of schemes. The pullback $f^{*} \mathcal{F}$ of an adequate $\mathcal{O}$-module $\mathcal{F}$ on $(S c h / S)_{\tau}$ is an adequate $\mathcal{O}$-module on $(S c h / T)_{\tau}$.

Proof. The pullback map $f^{*}: \operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right) \rightarrow \operatorname{Mod}\left((S c h / T)_{\tau}, \mathcal{O}\right)$ is given by restriction, i.e., $f^{*} \mathcal{F}(V)=\mathcal{F}(V)$ for any scheme $V$ over $T$. Hence this lemma follows immediately from Lemma 44.5.2 and the definition.

Here is a characterization of the category of adequate $\mathcal{O}$-modules. To understand the significance, consider a map $\mathcal{G} \rightarrow \mathcal{H}$ of quasi-coherent $\mathcal{O}_{S}$-modules on a scheme $S$. The cokernel of the associated map $\mathcal{G}^{a} \rightarrow \mathcal{H}^{a}$ of $\mathcal{O}$-modules is quasi-coherent because it is equal to $(\mathcal{H} / \mathcal{G})^{a}$. But the kernel of $\mathcal{G}^{a} \rightarrow \mathcal{H}^{a}$ in general isn't quasicoherent. However, it is adequate.
06VK Lemma 44.5.5. Let $S$ be a scheme. Let $\mathcal{F}$ be an $\mathcal{O}$-module on $(S c h / S)_{\tau}$. The following are equivalent
(1) $\mathcal{F}$ is adequate,
(2) there exists an affine open covering $S=\bigcup S_{i}$ and maps of quasi-coherent $\mathcal{O}_{S_{i}}$-modules $\mathcal{G}_{i} \rightarrow \mathcal{H}_{i}$ such that $\left.\mathcal{F}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ is the kernel of $\mathcal{G}_{i}^{a} \rightarrow \mathcal{H}_{i}^{a}$
(3) there exists a $\tau$-covering $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ and maps of $\mathcal{O}_{S_{i}}$-quasi-coherent modules $\mathcal{G}_{i} \rightarrow \mathcal{H}_{i}$ such that $\left.\mathcal{F}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ is the kernel of $\mathcal{G}_{i}^{a} \rightarrow \mathcal{H}_{i}^{a}$,
(4) there exists a $\tau$-covering $\left\{f_{i}: S_{i} \rightarrow S\right\}_{i \in I}$ such that each $f_{i}^{*} \mathcal{F}$ is adequate,
(5) for any affine scheme $U$ over $S$ the restriction $\left.\mathcal{F}\right|_{(S c h / U)_{\tau}}$ is the kernel of a map $\mathcal{G}^{a} \rightarrow \mathcal{H}^{a}$ of quasi-coherent $\mathcal{O}_{U}$-modules.

Proof. Let $U=\operatorname{Spec}(A)$ be an affine scheme over $S$. Set $F=F_{\mathcal{F}, A}$. By definition, the functor $F$ is adequate if and only if there exists a map of $A$-modules $M \rightarrow N$ such that $F=\operatorname{Ker}(\underline{M} \rightarrow \underline{N})$. Combining with Lemmas 44.5.2 and 44.5.3 we see that (1) and (5) are equivalent.
It is clear that (5) implies (2) and (2) implies (3). If (3) holds then we can refine the covering $\left\{S_{i} \rightarrow S\right\}$ such that each $S_{i}=\operatorname{Spec}\left(A_{i}\right)$ is affine. Then we see, by the prelimiary remarks of the proof, that $F_{\mathcal{F}, A_{i}}$ is adequate. Thus $\mathcal{F}$ is adequate by definition. Hence (3) implies (1).

Finally, (4) is equivalent to (1) using Lemma 44.5 .4 for one direction and that a composition of $\tau$-coverings is a $\tau$-covering for the other.

Just like is true for quasi-coherent sheaves the category of adequate modules is independent of the topology.
06VL Lemma 44.5.6. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(S c h / S)_{\tau}$. For any surjective flat morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ of affines over $S$ the extended Čech complex

$$
0 \rightarrow \mathcal{F}(\operatorname{Spec}(A)) \rightarrow \mathcal{F}(\operatorname{Spec}(B)) \rightarrow \mathcal{F}\left(\operatorname{Spec}\left(B \otimes_{A} B\right)\right) \rightarrow \ldots
$$

is exact. In particular $\mathcal{F}$ satisfies the sheaf condition for fpqc coverings, and is a sheaf of $\mathcal{O}$-modules on $(S c h / S)_{\text {fppf }}$.
Proof. With $A \rightarrow B$ as in the lemma let $F=F_{\mathcal{F}, A}$. This functor is adequate by Lemma 44.5.2. By Lemma 44.3.5 since $A \rightarrow B, A \rightarrow B \otimes_{A} B$, etc are flat we see that $F(B)=F(A) \otimes_{A} B, F\left(B \otimes_{A} B\right)=F(A) \otimes_{A} B \otimes_{A} B$, etc. Exactness follows from Descent, Lemma 34.3.6.

Thus $\mathcal{F}$ satisfies the sheaf condition for $\tau$-coverings (in particular Zariski coverings) and any faithfully flat covering of an affine by an affine. Arguing as in the proofs of Descent, Lemma 34.5.1 and Descent, Proposition 34.5.2 we conclude that $\mathcal{F}$ satisfies the sheaf condition for all fpqc coverings (made out of objects of $(S c h / S)_{\tau}$ ). Details omitted.

Lemma 44.5.6 shows in particular that for any pair of topologies $\tau, \tau^{\prime}$ the collection of adequate modules for the $\tau$-topology and the $\tau^{\prime}$-topology are identical (as presheaves of modules on the underlying category $S c h / S)$.
07AH Definition 44.5.7. Let $S$ be a scheme. The category of adequate $\mathcal{O}$-modules on $(S c h / S)_{\tau}$ is denoted $\operatorname{Adeq}(\mathcal{O})$ or $\operatorname{Adeq}\left((S c h / S)_{\tau}, \mathcal{O}\right)$. If we want to think just about the abelian category of adequate modules without choosing a topology we simply write $\operatorname{Adeq}(S)$.

06VM Lemma 44.5.8. Let $S$ be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(S c h / S)_{\tau}$.
(1) The restriction $\left.\mathcal{F}\right|_{S_{Z a r}}$ is a quasi-coherent $\mathcal{O}_{S}$-module on the scheme $S$.
(2) The restriction $\left.\mathcal{F}\right|_{S_{\text {étale }}}$ is the quasi-coherent module associated to $\left.\mathcal{F}\right|_{S_{Z a r}}$.
(3) For any affine scheme $U$ over $S$ we have $H^{q}(U, \mathcal{F})=0$ for all $q>0$.
(4) There is a canonical isomorphism

$$
H^{q}\left(S,\left.\mathcal{F}\right|_{S_{Z a r}}\right)=H^{q}\left((S c h / S)_{\tau}, \mathcal{F}\right)
$$

Proof. By Lemma 44.3.5 and Lemma 44.5.2 we see that for any flat morphism of affines $U \rightarrow V$ over $S$ we have $\mathcal{F}(U)=\mathcal{F}(V) \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$. This works in particular if $U \subset V \subset S$ are affine opens of $S$, hence $\left.\mathcal{F}\right|_{S_{Z_{a r}}}$ is quasi-coherent. Thus (1) holds.
Let $S^{\prime} \rightarrow S$ be an étale morphism of schemes. Then for $U \subset S^{\prime}$ affine open mapping into an affine open $V \subset S$ we see that $\mathcal{F}(U)=\mathcal{F}(V) \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$ because $U \rightarrow V$ is étale, hence flat. Therefore $\left.\mathcal{F}\right|_{S_{Z a r}^{\prime}}$ is the pullback of $\left.\mathcal{F}\right|_{S_{Z_{a r}}}$. This proves (2).
We are going to apply Cohomology on Sites, Lemma 21.11 .9 to the site $(S c h / S)_{\tau}$ with $\mathcal{B}$ the set of affine schemes over $S$ and $\operatorname{Cov}$ the set of standard affine $\tau$ coverings. Assumption (3) of the lemma is satisfied by Descent, Lemma 34.7.8 and Lemma 44.5.6 for the case of a covering by a single affine. Hence we conclude that $H^{p}(U, \mathcal{F})=0$ for every affine scheme $U$ over $S$. This proves (3). In exactly the same way as in the proof of Descent, Proposition 34.7.10 this implies the equality of cohomologies (4).
06 VN Remark 44.5.9. Let $S$ be a scheme. We have functors $u: Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Adeq}(\mathcal{O})$ and $v: \operatorname{Adeq}(\mathcal{O}) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$. Namely, the functor $u: \mathcal{F} \mapsto \mathcal{F}^{a}$ comes from taking the associated $\mathcal{O}$-module which is adequate by Lemma 44.5.5. Conversely, the functor $v$ comes from restriction $v:\left.\mathcal{G} \mapsto \mathcal{G}\right|_{S_{Z_{a r}}}$, see Lemma 44.5.8. Since $\mathcal{F}^{a}$ can be described as the pullback of $\mathcal{F}$ under a morphism of ringed topoi $\left((S c h / S)_{\tau}, \mathcal{O}\right) \rightarrow$ $\left(S_{Z a r}, \mathcal{O}_{S}\right)$, see Descent, Remark 34.7 .6 and since restriction is the pushforward we see that $u$ and $v$ are adjoint as follows

$$
\mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{F}, v \mathcal{G})=\mathcal{H o m}_{\mathcal{O}}(u \mathcal{F}, \mathcal{G})
$$

where $\mathcal{O}$ denotes the structure sheaf on the big site. It is immediate from the description that the adjunction mapping $\mathcal{F} \rightarrow v u \mathcal{F}$ is an isomorphism for all quasicoherent sheaves.
06VP Lemma 44.5.10. Let $S$ be a scheme. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$. If for every affine scheme $\operatorname{Spec}(A)$ over $S$ the functor $F_{\mathcal{F}, A}$ is adequate, then the sheafification of $\mathcal{F}$ is an adequate $\mathcal{O}$-module.
Proof. Let $U=\operatorname{Spec}(A)$ be an affine scheme over $S$. Set $F=F_{\mathcal{F}, A}$. The sheafification $\mathcal{F}^{\#}=\left(\mathcal{F}^{+}\right)^{+}$, see Sites, Section 7.10. By construction

$$
(\mathcal{F})^{+}(U)=\operatorname{colim}_{\mathcal{U}} \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

where the colimit is over coverings in the site $(S c h / S)_{\tau}$. Since $U$ is affine it suffices to take the limit over standard affine $\tau$-coverings $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}=\left\{\operatorname{Spec}\left(A_{i}\right) \rightarrow\right.$ $\operatorname{Spec}(A)\}_{i \in I}$ of $U$. Since each $A \rightarrow A_{i}$ and $A \rightarrow A_{i} \otimes_{A} A_{j}$ is flat we see that

$$
\check{H}^{0}(\mathcal{U}, \mathcal{F})=\operatorname{Ker}\left(\prod F(A) \otimes_{A} A_{i} \rightarrow \prod F(A) \otimes_{A} A_{i} \otimes_{A} A_{j}\right)
$$

by Lemma 44.3.5. Since $A \rightarrow \prod A_{i}$ is faithfully flat we see that this always is canonically isomorphic to $F(A)$ by Descent, Lemma34.3.6. Thus the presheaf $(\mathcal{F})^{+}$ has the same value as $\mathcal{F}$ on all affine schemes over $S$. Repeating the argument once more we deduce the same thing for $\mathcal{F}^{\#}=\left((\mathcal{F})^{+}\right)^{+}$. Thus $F_{\mathcal{F}, A}=F_{\mathcal{F}^{\#}, A}$ and we conclude that $\mathcal{F}^{\#}$ is adequate.

06VQ Lemma 44.5.11. Let $S$ be a scheme.
(1) The category $\operatorname{Adeq}(\mathcal{O})$ is abelian.
(2) The functor $\operatorname{Adeq}(\mathcal{O}) \rightarrow \operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)$ is exact.
(3) If $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is a short exact sequence of $\mathcal{O}$-modules and $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ are adequate, then $\mathcal{F}_{2}$ is adequate.
(4) The category $\operatorname{Adeq}(\mathcal{O})$ has colimits and $\operatorname{Adeq}(\mathcal{O}) \rightarrow \operatorname{Mod}\left((\operatorname{Sch} / S)_{\tau}, \mathcal{O}\right)$ commutes with them.

Proof. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of adequate $\mathcal{O}$-modules. To prove (1) and (2) it suffices to show that $\mathcal{K}=\operatorname{Ker}(\varphi)$ and $\mathcal{Q}=\operatorname{Coker}(\varphi)$ computed in $\operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)$ are adequate. Let $U=\operatorname{Spec}(A)$ be an affine scheme over $S$. Let $F=F_{\mathcal{F}, A}$ and $G=F_{\mathcal{G}, A}$. By Lemmas 44.3.11 and 44.3 .10 the kernel $K$ and cokernel $Q$ of the induced $\operatorname{map} F \rightarrow G$ are adequate functors. Because the kernel is computed on the level of presheaves, we see that $K=F_{\mathcal{K}, A}$ and we conclude $\mathcal{K}$ is adequate. To prove the result for the cokernel, denote $\mathcal{Q}^{\prime}$ the presheaf cokernel of $\varphi$. Then $Q=F_{\mathcal{Q}^{\prime}, A}$ and $\mathcal{Q}=\left(\mathcal{Q}^{\prime}\right)^{\#}$. Hence $\mathcal{Q}$ is adequate by Lemma 44.5.10
Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is a short exact sequence of $\mathcal{O}$-modules and $\mathcal{F}_{1}$ and $\mathcal{F}_{3}$ are adequate. Let $U=\operatorname{Spec}(A)$ be an affine scheme over $S$. Let $F_{i}=F_{\mathcal{F}_{i}, A}$. The sequence of functors

$$
0 \rightarrow F_{1} \rightarrow F_{2} \rightarrow F_{3} \rightarrow 0
$$

is exact, because for $V=\operatorname{Spec}(B)$ affine over $U$ we have $H^{1}\left(V, \mathcal{F}_{1}\right)=0$ by Lemma 44.5.8. Since $F_{1}$ and $F_{3}$ are adequate functors by Lemma 44.5.2 we see that $F_{2}$ is adequate by Lemma 44.3.16. Thus $\mathcal{F}_{2}$ is adequate.
Let $\mathcal{I} \rightarrow \operatorname{Adeq}(\mathcal{O}), i \mapsto \mathcal{F}_{i}$ be a diagram. Denote $\mathcal{F}=\operatorname{colim}_{i} \mathcal{F}_{i}$ the colimit computed in $\operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)$. To prove (4) it suffices to show that $\mathcal{F}$ is adequate. Let $\mathcal{F}^{\prime}=\operatorname{colim}_{i} \mathcal{F}_{i}$ be the colimit computed in presheaves of $\mathcal{O}$-modules. Then $\mathcal{F}=\left(\mathcal{F}^{\prime}\right)^{\#}$. Let $U=\operatorname{Spec}(A)$ be an affine scheme over $S$. Let $F_{i}=F_{\mathcal{F}_{i}, A}$. By Lemma 44.3 .12 the functor $\operatorname{colim}_{i} F_{i}=F_{\mathcal{F}^{\prime}, A}$ is adequate. Lemma 44.5.10 shows that $\mathcal{F}$ is adequate.

The following lemma tells us that the total direct image $R f_{*} \mathcal{F}$ of an adequate module under a quasi-compact and quasi-separated morphism is a complex whose cohomology sheaves are adequate.
06VR Lemma 44.5.12. Let $f: T \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. For any adequate $\mathcal{O}_{T}$-module on $(S c h / T)_{\tau}$ the pushforward $f_{*} \mathcal{F}$ and the higher direct images $R^{i} f_{*} \mathcal{F}$ are adequate $\mathcal{O}_{S}$-modules on $(S c h / S)_{\tau}$.

Proof. First we explain how to compute the higher direct images. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. Then $R^{i} f_{*} \mathcal{F}$ is the $i$ th cohomology sheaf of the complex $f_{*} \mathcal{I}^{\bullet}$. Hence $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf which associates to an object $U / S$ of $(S c h / S)_{\tau}$ the module

$$
\begin{aligned}
\frac{\operatorname{Ker}\left(f_{*} \mathcal{I}^{i}(U) \rightarrow f_{*} \mathcal{I}^{i+1}(U)\right)}{\operatorname{Im}\left(f_{*} \mathcal{I}^{i-1}(U) \rightarrow f_{*} \mathcal{I}^{i}(U)\right)} & =\frac{\operatorname{Ker}\left(\mathcal{I}^{i}\left(U \times_{S} T\right) \rightarrow \mathcal{I}^{i+1}\left(U \times_{S} T\right)\right)}{\operatorname{Im}\left(\mathcal{I}^{i-1}\left(U \times_{S} T\right) \rightarrow \mathcal{I}^{i}\left(U \times_{S} T\right)\right)} \\
& =H^{i}\left(U \times_{S} T, \mathcal{F}\right) \\
& =H^{i}\left(\left(S c h / U \times_{S} T\right)_{\tau},\left.\mathcal{F}\right|_{\left(S c h / U \times_{S} T\right)_{\tau}}\right) \\
& =H^{i}\left(U \times_{S} T,\left.\mathcal{F}\right|_{\left(U \times_{S} T\right)_{\text {Zar }}}\right)
\end{aligned}
$$

The first equality by Topologies, Lemma 33.7 .12 (and its analogues for other topologies), the second equality by definition of cohomology of $\mathcal{F}$ over an object of $(S c h / T)_{\tau}$, the third equality by Cohomology on Sites, Lemma 21.8.1, and the last equality by Lemma 44.5.8. Thus by Lemma 44.5.10 it suffices to prove the claim stated in the following paragraph.
Let $A$ be a ring. Let $T$ be a scheme quasi-compact and quasi-separated over $A$. Let $\mathcal{F}$ be an adequate $\mathcal{O}_{T}$-module on $(S c h / T)_{\tau}$. For an $A$-algebra $B$ set $T_{B}=$ $T \times_{\operatorname{Spec}(A)} \operatorname{Spec}(B)$ and denote $\mathcal{F}_{B}=\left.\mathcal{F}\right|_{\left(T_{B}\right)_{Z a r}}$ the restriction of $\mathcal{F}$ to the small Zariski site of $T_{B}$. (Recall that this is a "usual" quasi-coherent sheaf on the scheme $T_{B}$, see Lemma 44.5.8.) Claim: The functor

$$
B \longmapsto H^{q}\left(T_{B}, \mathcal{F}_{B}\right)
$$

is adequate. We will prove the lemma by the usual procedure of cutting $T$ into pieces.
Case I: $T$ is affine. In this case the schemes $T_{B}$ are all affine and $H^{q}\left(T_{B}, \mathcal{F}_{B}\right)=0$ for all $q \geq 1$. The functor $B \mapsto H^{0}\left(T_{B}, \mathcal{F}_{B}\right)$ is adequate by Lemma 44.3.18.
Case II: $T$ is separated. Let $n$ be the minimal number of affines needed to cover $T$. We argue by induction on $n$. The base case is Case I. Choose an affine open covering $T=V_{1} \cup \ldots \cup V_{n}$. Set $V=V_{1} \cup \ldots \cup V_{n-1}$ and $U=V_{n}$. Observe that

$$
U \cap V=\left(V_{1} \cap V_{n}\right) \cup \ldots \cup\left(V_{n-1} \cap V_{n}\right)
$$

is also a union of $n-1$ affine opens as $T$ is separated, see Schemes, Lemma 25.21.8, Note that for each $B$ the base changes $U_{B}, V_{B}$ and $(U \cap V)_{B}=U_{B} \cap V_{B}$ behave in the same way. Hence we see that for each $B$ we have a long exact sequence
$0 \rightarrow H^{0}\left(T_{B}, \mathcal{F}_{B}\right) \rightarrow H^{0}\left(U_{B}, \mathcal{F}_{B}\right) \oplus H^{0}\left(V_{B}, \mathcal{F}_{B}\right) \rightarrow H^{0}\left((U \cap V)_{B}, \mathcal{F}_{B}\right) \rightarrow H^{1}\left(T_{B}, \mathcal{F}_{B}\right) \rightarrow \ldots$
functorial in $B$, see Cohomology, Lemma 20.9.2. By induction hypothesis the functors $B \mapsto H^{q}\left(U_{B}, \mathcal{F}_{B}\right), B \mapsto H^{q}\left(V_{B}, \mathcal{F}_{B}\right)$, and $B \mapsto H^{q}\left((U \cap V)_{B}, \mathcal{F}_{B}\right)$ are adequate. Using Lemmas 44.3 .11 and 44.3 .10 we see that our functor $B \mapsto H^{q}\left(T_{B}, \mathcal{F}_{B}\right)$ sits in the middle of a short exact sequence whose outer terms are adequate. Thus the claim follows from Lemma 44.3.16.

Case III: General quasi-compact and quasi-separated case. The proof is again by induction on the number $n$ of affines needed to cover $T$. The base case $n=1$ is Case I. Choose an affine open covering $T=V_{1} \cup \ldots \cup V_{n}$. Set $V=V_{1} \cup \ldots \cup V_{n-1}$ and $U=V_{n}$. Note that since $T$ is quasi-separated $U \cap V$ is a quasi-compact open of an affine scheme, hence Case II applies to it. The rest of the argument proceeds in exactly the same manner as in the paragraph above and is omitted.

### 44.6. Parasitic adequate modules

06ZK In this section we start comparing adequate modules and quasi-coherent modules on a scheme $S$. Recall that there are functors $u: Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Adeq}(\mathcal{O})$ and $v: \operatorname{Adeq}(\mathcal{O}) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$ satisfying the adjunction

$$
\mathcal{H o m}_{Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)}(\mathcal{F}, v \mathcal{G})=\mathcal{H o m}_{\operatorname{Adeq}(\mathcal{O})}(u \mathcal{F}, \mathcal{G})
$$

and such that $\mathcal{F} \rightarrow v u \mathcal{F}$ is an isomorphism for every quasi-coherent sheaf $\mathcal{F}$, see Remark 44.5.9. Hence $u$ is a fully faithful embedding and we can identify $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$ with a full subcategory of $\operatorname{Adeq}(\mathcal{O})$. The functor $v$ is exact but $u$ is not left exact in general. The kernel of $v$ is the subcategory of parasitic adequate modules.

In Descent, Definition 34.8.1 we give the definition of a parasitic module. For adequate modules the notion does not depend on the chosen topology.
06ZM Lemma 44.6.1. Let $S$ be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(S c h / S)_{\tau}$. The following are equivalent:
(1) $v \mathcal{F}=0$,
(2) $\mathcal{F}$ is parasitic,
(3) $\mathcal{F}$ is parasitic for the $\tau$-topology,
(4) $\mathcal{F}(U)=0$ for all $U \subset S$ open, and
(5) there exists an affine open covering $S=\bigcup U_{i}$ such that $\mathcal{F}\left(U_{i}\right)=0$ for all $i$.

Proof. The implications $(2) \Rightarrow(3) \Rightarrow(4) \Rightarrow(5)$ are immediate from the definitions. Assume (5). Suppose that $S=\bigcup U_{i}$ is an affine open covering such that $\mathcal{F}\left(U_{i}\right)=0$ for all $i$. Let $V \rightarrow S$ be a flat morphism. There exists an affine open covering $V=\bigcup V_{j}$ such that each $V_{j}$ maps into some $U_{i}$. As the morphism $V_{j} \rightarrow S$ is flat, also $V_{j} \rightarrow U_{i}$ is flat. Hence the corresponding ring map $A_{i}=\mathcal{O}\left(U_{i}\right) \rightarrow \mathcal{O}\left(V_{j}\right)=B_{j}$ is flat. Thus by Lemma 44.5 .2 and Lemma 44.3 .5 we see that $\mathcal{F}\left(U_{i}\right) \otimes_{A_{i}} B_{j} \rightarrow \mathcal{F}\left(V_{j}\right)$ is an isomorphism. Hence $\mathcal{F}\left(V_{j}\right)=0$. Since $\mathcal{F}$ is a sheaf for the Zariski topology we conclude that $\mathcal{F}(V)=0$. In this way we see that (5) implies (2).
This proves the equivalence of (2), (3), (4), and (5). As (1) is equivalent to (3) (see Remark 44.5.9 we conclude that all five conditions are equivalent.

Let $S$ be a scheme. The subcategory of parasitic adequate modules is a Serre subcategory of $\operatorname{Adeq}(\mathcal{O})$. The quotient is the category of quasi-coherent modules.

06ZN Lemma 44.6.2. Let $S$ be a scheme. The subcategory $\mathcal{C} \subset \operatorname{Adeq}(\mathcal{O})$ of parasitic adequate modules is a Serre subcategory. Moreover, the functor $v$ induces an equivalence of categories

$$
\operatorname{Adeq}(\mathcal{O}) / \mathcal{C}=Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)
$$

Proof. The category $\mathcal{C}$ is the kernel of the exact functor $v: \operatorname{Adeq}(\mathcal{O}) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$, see Lemma 44.6.1. Hence it is a Serre subcategory by Homology, Lemma 12.9.4. By Homology, Lemma 12.9.6 we obtain an induced exact functor $\bar{v}: \operatorname{Adeq}(\mathcal{O}) / \mathcal{C} \rightarrow$ $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$. Because $u$ is a right inverse to $v$ we see right away that $\bar{v}$ is essentially surjective. We see that $\bar{v}$ is faithful by Homology, Lemma 12.9.7. Because $u$ is a right inverse to $v$ we finally conclude that $\bar{v}$ is fully faithful.

06ZP Lemma 44.6.3. Let $f: T \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. For any parasitic adequate $\mathcal{O}_{T}$-module on $(S c h / T)_{\tau}$ the pushforward $f_{*} \mathcal{F}$ and the higher direct images $R^{i} f_{*} \mathcal{F}$ are parasitic adequate $\mathcal{O}_{S}$-modules on $(S c h / S)_{\tau}$.

Proof. We have already seen in Lemma 44.5.12 that these higher direct images are adequate. Hence it suffices to show that $\left(R^{i} f_{*} \mathcal{F}\right)\left(U_{i}\right)=0$ for any $\tau$-covering $\left\{U_{i} \rightarrow S\right\}$ open. And $R^{i} f_{*} \mathcal{F}$ is parasitic by Descent, Lemma 34.8.3.

### 44.7. Derived categories of adequate modules, $I$

06 VS Let $S$ be a scheme. We continue the discussion started in Section 44.6. The exact functor $v$ induces a functor

$$
D(\operatorname{Adeq}(\mathcal{O})) \longrightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right)
$$

and similarly for bounded versions.
06ZQ Lemma 44.7.1. Let $S$ be a scheme. Let $\mathcal{C} \subset$ Adeq $(\mathcal{O})$ denote the full subcategory consisting of parasitic adequate modules. Then

$$
D(\operatorname{Adeq}(\mathcal{O})) / D_{\mathcal{C}}(\operatorname{Adeq}(\mathcal{O}))=D\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right)
$$

and similarly for the bounded versions.
Proof. Follows immediately from Derived Categories, Lemma 13.13.3.
Next, we look for a description the other way around by looking at the functors

$$
K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right) \longrightarrow K^{+}(\operatorname{Adeq}(\mathcal{O})) \longrightarrow D^{+}(\operatorname{Adeq}(\mathcal{O})) \longrightarrow D^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right)
$$

In some cases the derived category of adequate modules is a localization of the homotopy category of complexes of quasi-coherent modules at universal quasiisomorphisms. Let $S$ be a scheme. A map of complexes $\varphi: \mathcal{F}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ of quasicoherent $\mathcal{O}_{S}$-modules is said to be a universal quasi-isomorphism if for every morphism of schemes $f: T \rightarrow S$ the pullback $f^{*} \varphi$ is a quasi-isomorphism.

06ZR Lemma 44.7.2. Let $U=\operatorname{Spec}(A)$ be an affine scheme. The bounded below derived category $D^{+}(\operatorname{Adeq}(\mathcal{O}))$ is the localization of $K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)$ at the multiplicative subset of universal quasi-isomorphisms.

Proof. If $\varphi: \mathcal{F}^{\bullet} \rightarrow \mathcal{G}^{\bullet}$ is a morphism of complexes of quasi-coherent $\mathcal{O}_{U}$-modules, then $u \varphi: u \mathcal{F}^{\bullet} \rightarrow u \mathcal{G}^{\bullet}$ is a quasi-isomorphism if and only if $\varphi$ is a universal quasiisomorphism. Hence the collection $S$ of universal quasi-isomorphisms is a saturated multiplicative system compatible with the triangulated structure by Derived Categories, Lemma 13.5.3. Hence $S^{-1} K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)$ exists and is a triangulated category, see Derived Categories, Proposition 13.5.5. We obtain a canonical functor can : $S^{-1} K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right) \rightarrow D^{+}(\operatorname{Adeq}(\mathcal{O}))$ by Derived Categories, Lemma 13.5.6.

Note that, almost by definition, every adequate module on $U$ has an embedding into a quasi-coherent sheaf, see Lemma 44.5.5. Hence by Derived Categories, Lemma 13.16.4 given $\mathcal{F}^{\bullet} \in \mathrm{Ob}\left(K^{+}(\operatorname{Adeq}(\mathcal{O}))\right)$ there exists a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow u \mathcal{G}^{\bullet}$ where $\mathcal{G}^{\bullet} \in \operatorname{Ob}\left(K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)\right)$. This proves that can is essentially surjective.

Similarly, suppose that $\mathcal{F}^{\bullet}$ and $\mathcal{G}^{\bullet}$ are bounded below complexes of quasi-coherent $\mathcal{O}_{U}$-modules. A morphism in $D^{+}(\operatorname{Adeq}(\mathcal{O}))$ between these consists of a pair $f$ : $u \mathcal{F}^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ and $s: u \mathcal{G}^{\bullet} \rightarrow \mathcal{H}^{\bullet}$ where $s$ is a quasi-isomorphism. Pick a quasiisomorphism $s^{\prime}: \mathcal{H}^{\bullet} \rightarrow u \mathcal{E}^{\bullet}$. Then we see that $s^{\prime} \circ f: \mathcal{F} \rightarrow \mathcal{E}^{\bullet}$ and the universal quasi-isomorphism $s^{\prime} \circ s: \mathcal{G}^{\bullet} \rightarrow \mathcal{E}^{\bullet}$ give a morphism in $S^{-1} K^{+}\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right)$ mapping to the given morphism. This proves the "fully" part of full faithfulness. Faithfulness is proved similarly.

06ZS Lemma 44.7.3. Let $U=\operatorname{Spec}(A)$ be an affine scheme. The inclusion functor

$$
\operatorname{Adeq}(\mathcal{O}) \rightarrow \operatorname{Mod}\left((S c h / U)_{\tau}, \mathcal{O}\right)
$$

has a right adjoint $A^{1}$. Moreover, the adjunction mapping $A(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism for every adequate module $\mathcal{F}$.

[^123]Proof. By Topologies, Lemma 33.7.11 (and similarly for the other topologies) we may work with $\mathcal{O}$-modules on $(\overline{A f f} / U)_{\tau}$. Denote $\mathcal{P}$ the category of module-valued functors on $A l g_{A}$ and $\mathcal{A}$ the category of adequate functors on $A l g_{A}$. Denote $i: \mathcal{A} \rightarrow$ $\mathcal{P}$ the inclusion functor. Denote $Q: \mathcal{P} \rightarrow \mathcal{A}$ the construction of Lemma 44.4.1. We have the commutative diagram

06ZT
(44.7.3.1)

The left vertical equality is Lemma 44.5 .3 and the right vertical equality was explained in Section 44.3. Define $A(\mathcal{F})=Q(j(\mathcal{F}))$. Since $j$ is fully faithful it follows immediately that $A$ is a right adjoint of the inclusion functor $k$. Also, since $k$ is fully faithful too, the final assertion follows formally.

The functor $A$ is a right adjoint hence left exact. Since the inclusion functor is exact, see Lemma 44.5.11 we conclude that $A$ transforms injectives into injectives, and that the category $\operatorname{Adeq}(\mathcal{O})$ has enough injectives, see Homology, Lemma 12.25.3 and Injectives, Theorem 19.8.4 This also follows from the equivalence in (44.7.3.1) and Lemma 44.4.2.

06ZU Lemma 44.7.4. Let $U=\operatorname{Spec}(A)$ be an affine scheme. For any object $\mathcal{F}$ of Adeq $(\mathcal{O})$ we have $R^{p} A(\mathcal{F})=0$ for all $p>0$ where $A$ is as in Lemma 44.7.3.

Proof. With notation as in the proof of Lemma 44.7.3 choose an injective resolution $k(\mathcal{F}) \rightarrow \mathcal{I} \bullet$ in the category of $\mathcal{O}$-modules on $(A f f / U)_{\tau}$. By Cohomology on Sites, Lemmas 21.12 .2 and Lemma 44.5 .8 the complex $j\left(\mathcal{I}^{\bullet}\right)$ is exact. On the other hand, each $j\left(\mathcal{I}^{n}\right)$ is an injective object of the category of presheaves of modules by Cohomology on Sites, Lemma 21.12.1. It follows that $R^{p} A(\mathcal{F})=R^{p} Q(j(k(\mathcal{F})))$. Hence the result now follows from Lemma 44.4.10.

Let $S$ be a scheme. By the discussion in Section 44.5 the embedding $\operatorname{Adeq}(\mathcal{O}) \subset$ $\operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)$ exhibits $\operatorname{Adeq}(\mathcal{O})$ as a weak Serre subcategory of the category of all $\mathcal{O}$-modules. Denote

$$
D_{A d e q}(\mathcal{O}) \subset D(\mathcal{O})=D\left(\operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)\right)
$$

the triangulated subcategory of complexes whose cohomology sheaves are adequate, see Derived Categories, Section 13.13 . We obtain a canonical functor

$$
D(\operatorname{Adeq}(\mathcal{O})) \longrightarrow D_{A d e q}(\mathcal{O})
$$

see Derived Categories, Equation 13.13.1.1.
06ZV Lemma 44.7.5. If $U=\operatorname{Spec}(A)$ is an affine scheme, then the bounded below version

06VV

$$
\begin{equation*}
D^{+}(\operatorname{Adeq}(\mathcal{O})) \longrightarrow D_{A d e q}^{+}(\mathcal{O}) \tag{44.7.5.1}
\end{equation*}
$$

of the functor above is an equivalence.
Proof. Let $A: \operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Adeq}(\mathcal{O})$ be the right adjoint to the inclusion functor constructed in Lemma 44.7.3. Since $A$ is left exact and since $\operatorname{Mod}(\mathcal{O})$ has enough injectives, $A$ has a right derived functor $R A: D_{A d e q}^{+}(\mathcal{O}) \rightarrow D^{+}(\operatorname{Adeq}(\mathcal{O}))$. We claim that $R A$ is a quasi-inverse to 44.7 .5 .1$)$. To see this the key fact is that if $\mathcal{F}$ is an
adequate module, then the adjunction map $\mathcal{F} \rightarrow R A(\mathcal{F})$ is a quasi-isomorphism by Lemma 44.7.4.
Namely, to prove the lemma in full it suffices to show:
(1) Given $\mathcal{F}^{\bullet} \in K^{+}(\operatorname{Adeq}(\mathcal{O}))$ the canonical map $\mathcal{F}^{\bullet} \rightarrow R A\left(\mathcal{F}^{\bullet}\right)$ is a quasiisomorphism, and
(2) given $\mathcal{G}^{\bullet} \in K^{+}(\operatorname{Mod}(\mathcal{O}))$ the canonical map $R A\left(\mathcal{G}^{\bullet}\right) \rightarrow \mathcal{G}^{\bullet}$ is a quasiisomorphism.
Both (1) and (2) follow from the key fact via a spectral sequence argument using one of the spectral sequences of Derived Categories, Lemma 13.21.3. Some details omitted.

06ZW Lemma 44.7.6. Let $U=\operatorname{Spec}(A)$ be an affine scheme. Let $\mathcal{F}$ and $\mathcal{G}$ be adequate $\mathcal{O}$-modules. For any $i \geq 0$ the natural map

$$
E x t_{\text {Adeq }(\mathcal{O})}^{i}(\mathcal{F}, \mathcal{G}) \longrightarrow \operatorname{Ext}_{\operatorname{Mod}(\mathcal{O})}^{i}(\mathcal{F}, \mathcal{G})
$$

is an isomorphism.
Proof. By definition these ext groups are computed as hom sets in the derived category. Hence this follows immediately from Lemma 44.7.5.

### 44.8. Pure extensions

06ZX We want to characterize extensions of quasi-coherent sheaves on the big site of an affine schemes in terms of algebra. To do this we introduce the following notion.

06ZY Definition 44.8.1. Let $A$ be a ring.
(1) An $A$-module $P$ is said to be pure projective if for every universally exact sequence $0 \rightarrow K \rightarrow M \rightarrow N \rightarrow 0$ of $A$-module the sequence $0 \rightarrow \operatorname{Hom}_{A}(P, K) \rightarrow \operatorname{Hom}_{A}(P, M) \rightarrow \operatorname{Hom}_{A}(P, N) \rightarrow 0$ is exact.
(2) An $A$-module $I$ is said to be pure injective if for every universally exact sequence $0 \rightarrow K \rightarrow M \rightarrow N \rightarrow 0$ of $A$-module the sequence $0 \rightarrow$ $\operatorname{Hom}_{A}(N, I) \rightarrow \operatorname{Hom}_{A}(M, I) \rightarrow \operatorname{Hom}_{A}(K, I) \rightarrow 0$ is exact.
Let's characterize pure projectives.
06ZZ Lemma 44.8.2. Let $A$ be a ring.
(1) A module is pure projective if and only if it is a direct summand of a direct sum of finitely presented $A$-modules.
(2) For any module $M$ there exists a universally exact sequence $0 \rightarrow N \rightarrow$ $P \rightarrow M \rightarrow 0$ with $P$ pure projective.

Proof. First note that a finitely presented $A$-module is pure projective by Algebra, Theorem 10.81.3. Hence a direct summand of a direct sum of finitely presented $A$ modules is indeed pure projective. Let $M$ be any $A$-module. Write $M=\operatorname{colim}_{i \in I} P_{i}$ as a filtered colimit of finitely presented $A$-modules. Consider the sequence

$$
0 \rightarrow N \rightarrow \bigoplus P_{i} \rightarrow M \rightarrow 0
$$

For any finitely presented $A$-module $P$ the map $\operatorname{Hom}_{A}\left(P, \bigoplus P_{i}\right) \rightarrow \operatorname{Hom}_{A}(P, M)$ is surjective, as any map $P \rightarrow M$ factors through some $P_{i}$. Hence by Algebra, Theorem 10.81 .3 this sequence is universally exact. This proves (2). If now $M$ is pure projective, then the sequence is split and we see that $M$ is a direct summand of $\bigoplus P_{i}$.

Let's characterize pure injectives.
0700 Lemma 44.8.3. Let $A$ be a ring. For any $A$-module $M$ set $M^{\wedge}=\operatorname{Hom}_{\mathbf{Z}}(M, \mathbf{Q} / \mathbf{Z})$.
(1) For any $A$-module $M$ the $A$-module $M^{\wedge}$ is pure injective.
(2) An A-module $I$ is pure injective if and only if the map $I \rightarrow\left(I^{\wedge}\right)^{\wedge}$ splits.
(3) For any module $M$ there exists a universally exact sequence $0 \rightarrow M \rightarrow$ $I \rightarrow N \rightarrow 0$ with I pure injective.
Proof. We will use the properties of the functor $M \mapsto M^{\wedge}$ found in More on Algebra, Section 15.46 without further mention. Part (1) holds because $\operatorname{Hom}_{A}\left(N, M^{\wedge}\right)=$ $\operatorname{Hom}_{\mathbf{Z}}\left(N \otimes_{A} M, \mathbf{Q} / \mathbf{Z}\right)$ and because $\mathbf{Q} / \mathbf{Z}$ is injective in the category of abelian groups. Hence if $I \rightarrow\left(I^{\wedge}\right)^{\wedge}$ is split, then $I$ is pure injective. We claim that for any $A$-module $M$ the evaluation map $e v: M \rightarrow\left(M^{\wedge}\right)^{\wedge}$ is universally injective. To see this note that $e v^{\wedge}:\left(\left(M^{\wedge}\right)^{\wedge}\right)^{\wedge} \rightarrow M^{\wedge}$ has a right inverse, namely $e v^{\prime}: M^{\wedge} \rightarrow\left(\left(M^{\wedge}\right)^{\wedge}\right)^{\wedge}$. Then for any $A$-module $N$ applying the exact faithful functor ${ }^{\wedge}$ to the map $N \otimes_{A} M \rightarrow N \otimes_{A}\left(M^{\wedge}\right)^{\wedge}$ gives

$$
\operatorname{Hom}_{A}\left(N,\left(\left(M^{\wedge}\right)^{\wedge}\right)^{\wedge}\right)=\left(N \otimes_{A}\left(M^{\wedge}\right)^{\wedge}\right)^{\wedge} \rightarrow\left(N \otimes_{A} M\right)^{\wedge}=\operatorname{Hom}_{A}\left(N, M^{\wedge}\right)
$$

which is surjective by the existence of the right inverse. The claim follows. The claim implies (3) and the necessity of the condition in (2).

Before we continue we make the following observation which we will use frequently in the rest of this section.

0701 Lemma 44.8.4. Let $A$ be a ring.
(1) Let $L \rightarrow M \rightarrow N$ be a universally exact sequence of $A$-modules. Let $K=\operatorname{Im}(M \rightarrow N)$. Then $K \rightarrow N$ is universally injective.
(2) Any universally exact complex can be split into universally exact short exact sequences.

Proof. Proof of (1). For any $A$-module $T$ the sequence $L \otimes_{A} T \rightarrow M \otimes_{A} T \rightarrow$ $K \otimes_{A} T \rightarrow 0$ is exact by right exactness of $\otimes$. By assumption the sequence $L \otimes_{A} T \rightarrow$ $M \otimes_{A} T \rightarrow N \otimes_{A} T$ is exact. Combined this shows that $K \otimes_{A} T \rightarrow N \otimes_{A} T$ is injective.
Part (2) means the following: Suppose that $M^{\bullet}$ is a universally exact complex of $A$-modules. Set $K^{i}=\operatorname{Ker}\left(d^{i}\right) \subset M^{i}$. Then the short exact sequences $0 \rightarrow K^{i} \rightarrow$ $M^{i} \rightarrow K^{i+1} \rightarrow 0$ are universally exact. This follows immediately from part (1).

0702 Definition 44.8.5. Let $A$ be a ring. Let $M$ be an $A$-module.
(1) A pure projective resolution $P_{\bullet} \rightarrow M$ is a universally exact sequence

$$
\ldots \rightarrow P_{1} \rightarrow P_{0} \rightarrow M \rightarrow 0
$$

with each $P_{i}$ pure projective.
(2) A pure injective resolution $M \rightarrow I^{\bullet}$ is a universally exact sequence

$$
0 \rightarrow M \rightarrow I^{0} \rightarrow I^{1} \rightarrow \ldots
$$

with each $I^{i}$ pure injective.
These resolutions satisfy the usual uniqueness properties among the class of all universally exact left or right resolutions.
(1) Any A-module has a pure projective resolution.

Let $M \rightarrow N$ be a map of $A$-modules. Let $P_{\bullet} \rightarrow M$ be a pure projective resolution and let $N_{\bullet} \rightarrow N$ be a universally exact resolution.
(2) There exists a map of complexes $P_{\bullet} \rightarrow N_{\bullet}$ inducing the given map

$$
M=\operatorname{Coker}\left(P_{1} \rightarrow P_{0}\right) \rightarrow \operatorname{Coker}\left(N_{1} \rightarrow N_{0}\right)=N
$$

(3) two maps $\alpha, \beta: P_{\bullet} \rightarrow N_{\bullet}$ inducing the same map $M \rightarrow N$ are homotopic.

Proof. Part (1) follows immediately from Lemma 44.8.2. Before we prove (2) and (3) note that by Lemma 44.8.4 we can split the universally exact complex $N_{\bullet} \rightarrow N \rightarrow 0$ into universally exact short exact sequences $0 \rightarrow K_{0} \rightarrow N_{0} \rightarrow N \rightarrow 0$ and $0 \rightarrow K_{i} \rightarrow N_{i} \rightarrow K_{i-1} \rightarrow 0$.
Proof of (2). Because $P_{0}$ is pure projective we can find a map $P_{0} \rightarrow N_{0}$ lifting the $\operatorname{map} P_{0} \rightarrow M \rightarrow N$. We obtain an induced map $P_{1} \rightarrow F_{0} \rightarrow N_{0}$ wich ends up in $K_{0}$. Since $P_{1}$ is pure projective we may lift this to a map $P_{1} \rightarrow N_{1}$. This in turn induces a map $P_{2} \rightarrow P_{1} \rightarrow N_{1}$ which maps to zero into $N_{0}$, i.e., into $K_{1}$. Hence we may lift to get a map $P_{2} \rightarrow N_{2}$. Repeat.

Proof of (3). To show that $\alpha, \beta$ are homotopic it suffices to show the difference $\gamma=\alpha-\beta$ is homotopic to zero. Note that the image of $\gamma_{0}: P_{0} \rightarrow N_{0}$ is contained in $K_{0}$. Hence we may lift $\gamma_{0}$ to a map $h_{0}: P_{0} \rightarrow N_{1}$. Consider the map $\gamma_{1}^{\prime}=$ $\gamma_{1}-h_{0} \circ d_{P, 1}: P_{1} \rightarrow N_{1}$. By our choice of $h_{0}$ we see that the image of $\gamma_{1}^{\prime}$ is contained in $K_{1}$. Since $P_{1}$ is pure projective may lift $\gamma_{1}^{\prime}$ to a map $h_{1}: P_{1} \rightarrow N_{2}$. At this point we have $\gamma_{1}=h_{0} \circ d_{F, 1}+d_{N, 2} \circ h_{1}$. Repeat.

0704 Lemma 44.8.7. Let $A$ be a ring.
(1) Any A-module has a pure injective resolution.

Let $M \rightarrow N$ be a map of $A$-modules. Let $M \rightarrow M^{\bullet}$ be a universally exact resolution and let $N \rightarrow I^{\bullet}$ be a pure injective resolution.
(2) There exists a map of complexes $M^{\bullet} \rightarrow I^{\bullet}$ inducing the given map

$$
M=\operatorname{Ker}\left(M^{0} \rightarrow M^{1}\right) \rightarrow \operatorname{Ker}\left(I^{0} \rightarrow I^{1}\right)=N
$$

(3) two maps $\alpha, \beta: M^{\bullet} \rightarrow I^{\bullet}$ inducing the same map $M \rightarrow N$ are homotopic.

Proof. This lemma is dual to Lemma 44.8.6. The proof is identical, except one has to reverse all the arrows.

Using the material above we can define pure extension groups as follows. Let $A$ be a ring and let $M, N$ be $A$-modules. Choose a pure injective resolution $N \rightarrow I^{\bullet}$. By Lemma 44.8.7 the complex

$$
\operatorname{Hom}_{A}\left(M, I^{\bullet}\right)
$$

is well defined up to homotopy. Hence its $i$ th cohomology module is a well defined invariant of $M$ and $N$.
0705 Definition 44.8.8. Let $A$ be a ring and let $M, N$ be $A$-modules. The $i$ th pure extension module $\operatorname{Pext}_{A}^{i}(M, N)$ is the $i$ th cohomology module of the complex $\operatorname{Hom}_{A}\left(M, I^{\bullet}\right)$ where $I^{\bullet}$ is a pure injective resolution of $N$.
Warning: It is not true that an exact sequence of $A$-modules gives rise to a long exact sequence of pure extensions groups. (You need a universally exact sequence for this.) We collect some facts which are obvious from the material above.

0706 Lemma 44.8.9. Let $A$ be a ring.
(1) $\operatorname{Pext}_{A}^{i}(M, N)=0$ for $i>0$ whenever $N$ is pure injective,
(2) $\operatorname{Pext}_{A}^{i}(M, N)=0$ for $i>0$ whenever $M$ is pure projective, in particular if $M$ is an $A$-module of finite presentation,
(3) $\operatorname{Pext}_{A}^{i}(M, N)$ is also the ith cohomology module of the complex $\operatorname{Hom}_{A}\left(P_{\bullet}, N\right)$ where $P_{\bullet}$ is a pure projective resolution of $M$.

Proof. To see (3) consider the double complex

$$
A^{\bullet, \bullet}=\operatorname{Hom}_{A}\left(P_{\bullet}, I^{\bullet}\right)
$$

Each of its rows is exact except in degree 0 where its cohomology is $\operatorname{Hom}_{A}\left(M, I^{q}\right)$. Each of its columns is exact except in degree 0 where its cohomology is $\operatorname{Hom}_{A}\left(P_{p}, N\right)$. Hence the two spectral sequences associated to this complex in Homology, Section 12.22 degenerate, giving the equality.

### 44.9. Higher exts of quasi-coherent sheaves on the big site

0707 It turns out that the module-valued functor $\underline{I}$ associated to a pure injective module $I$ gives rise to an injective object in the category of adequate functors on $A l g_{A}$. Warning: It is not true that a pure projective module gives rise to a projective object in the category of adequate functors. We do have plenty of projective objects, namely, the linearly adequate functors.

0708 Lemma 44.9.1. Let $A$ be a ring. Let $\mathcal{A}$ be the category of adequate functors on $A l g_{A}$. The injective objects of $\mathcal{A}$ are exactly the functors $\underline{I}$ where $I$ is a pure injective $A$-module.

Proof. Let $I$ be an injective object of $\mathcal{A}$. Choose an embedding $I \rightarrow \underline{M}$ for some $A$ module $M$. As $I$ is injective we see that $\underline{M}=I \oplus F$ for some module-valued functor $F$. Then $M=I(A) \oplus F(A)$ and it follows that $I=I(A)$. Thus we see that any injective object is of the form $\underline{I}$ for some $A$-module $I$. It is clear that the module $I$ has to be pure injective since any universally exact sequence $0 \rightarrow M \rightarrow N \rightarrow L \rightarrow 0$ gives rise to an exact sequence $0 \rightarrow \underline{M} \rightarrow \underline{N} \rightarrow \underline{L} \rightarrow 0$ of $\mathcal{A}$.

Finally, suppose that $I$ is a pure injective $A$-module. Choose an embedding $\underline{I} \rightarrow J$ into an injective object of $\mathcal{A}$ (see Lemma 44.4.2). We have seen above that $J=\underline{I^{\prime}}$ for some $A$-module $I^{\prime}$ which is pure injective. As $\underline{I} \rightarrow \underline{I^{\prime}}$ is injective the map $I \rightarrow I^{\prime}$ is universally injective. By assumption on $I$ it splits. Hence $\underline{I}$ is a summand of $J=\underline{I^{\prime}}$ whence an injective object of the category $\mathcal{A}$.

Let $U=\operatorname{Spec}(A)$ be an affine scheme. Let $M$ be an $A$-module. We will use the notation $M^{a}$ to denote the quasi-coherent sheaf of $\mathcal{O}$-modules on $(S c h / U)_{\tau}$ associated to the quasi-coherent sheaf $\widetilde{M}$ on $U$. Now we have all the notation in place to formulate the following lemma.

0709 Lemma 44.9.2. Let $U=\operatorname{Spec}(A)$ be an affine scheme. Let $M, N$ be $A$-modules. For all $i$ we have a canonical isomorphism

$$
\operatorname{Ext}_{M o d(\mathcal{O})}^{i}\left(M^{a}, N^{a}\right)=\operatorname{Pext}_{A}^{i}(M, N)
$$

functorial in $M$ and $N$.

Proof. Let us construct a canonical arrow from right to left. Namely, if $N \rightarrow I^{\bullet}$ is a pure injective resolution, then $M^{a} \rightarrow\left(I^{\bullet}\right)^{a}$ is an exact complex of (adequate) $\mathcal{O}$-modules. Hence any element of $\operatorname{Pext}_{A}^{i}(M, N)$ gives rise to a map $N^{a} \rightarrow M^{a}[i]$ in $D(\mathcal{O})$, i.e., an element of the group on the left.

To prove this map is an isomorphism, note that we may replace $\operatorname{Ext}_{M o d(\mathcal{O})}^{i}\left(M^{a}, N^{a}\right)$ by $\operatorname{Ext}_{\operatorname{Adeq}(\mathcal{O})}^{i}\left(M^{a}, N^{a}\right)$, see Lemma 44.7.6. Let $\mathcal{A}$ be the category of adequate functors on $A l g_{A}$. We have seen that $\mathcal{A}$ is equivalent to $\operatorname{Adeq}(\mathcal{O})$, see Lemma 44.5.3. see also the proof of Lemma 44.7.3. Hence now it suffices to prove that

$$
\operatorname{Ext}_{\mathcal{A}}^{i}(\underline{M}, \underline{N})=\operatorname{Pext}_{A}^{i}(M, N)
$$

However, this is clear from Lemma 44.9.1 as a pure injective resolution $N \rightarrow I^{\bullet}$ exactly corresponds to an injective resolution of $\underline{N}$ in $\mathcal{A}$.

### 44.10. Derived categories of adequate modules, II

Let $S$ be a scheme. Denote $\mathcal{O}_{S}$ the structure sheaf of $S$ and $\mathcal{O}$ the structure sheaf of the big site $(S c h / S)_{\tau}$. In Descent, Remark 34.7.4 we constructed a morphism of ringed sites

070U (44.10.0.1)

$$
f:\left((S c h / S)_{\tau}, \mathcal{O}\right) \longrightarrow\left(S_{Z a r}, \mathcal{O}_{S}\right)
$$

In the previous sections have seen that the functor $f_{*}: \operatorname{Mod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{S}\right)$ transforms adequate sheaves into quasi-coherent sheaves, and induces an exact functor $v: \operatorname{Adeq}(\mathcal{O}) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$, and in fact that $f_{*}=v$ induces an equivalence $\operatorname{Adeq}(\mathcal{O}) / \mathcal{C} \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)$ where $\mathcal{C}$ is the subcategory of parasitic adequate modules. Moreover, the functor $f^{*}$ transforms quasi-coherent modules into adequate modules, and induces a functor $u: Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Adeq}(\mathcal{O})$ which is a left adjoint to $v$.

There is a very similar relationship between $D_{A d e q}(\mathcal{O})$ and $D_{Q C o h}(S)$. First we explain why the category $D_{\text {Adeq }}(\mathcal{O})$ is independent of the chosen topology.

070V Remark 44.10.1. Let $S$ be a scheme. Let $\tau, \tau^{\prime} \in\{Z a r$, étale, smooth, syntomic, fppf $\}$. Denote $\mathcal{O}_{\tau}$, resp. $\mathcal{O}_{\tau^{\prime}}$ the structure sheaf $\mathcal{O}$ viewed as a sheaf on $(S c h / S)_{\tau}$, resp. $(S c h / S)_{\tau^{\prime}}$. Then $D_{\text {Adeq }}\left(\mathcal{O}_{\tau}\right)$ and $D_{\text {Adeq }}\left(\mathcal{O}_{\tau^{\prime}}\right)$ are canonically isomorphic. This follows from Cohomology on Sites, Lemma 21.22.3. Namely, assume $\tau$ is stronger than the topology $\tau^{\prime}$, let $\mathcal{C}=(S c h / S)_{\text {fppf }}$, and let $\mathcal{B}$ the collection of affine schemes over $S$. Assumptions (1) and (2) we've seen above. Assumption (3) is clear and assumption (4) follows from Lemma 44.5.8.

070W Remark 44.10.2. Let $S$ be a scheme. The morphism $f$ see 44.10.0.1 induces adjoint functors $R f_{*}: D_{\text {Adeq }}(\mathcal{O}) \rightarrow D_{Q C o h}(S)$ and $L f^{*}: D_{Q C o h}(S) \rightarrow D_{\text {Adeq }}(\mathcal{O})$. Moreover $R f_{*} L f^{*} \cong \operatorname{id}_{D_{Q C o h}(S)}$.

We sketch the proof. By Remark 44.10.1 we may assume the topology $\tau$ is the Zariski topology. We will use the existence of the unbounded total derived functors $L f^{*}$ and $R f_{*}$ on $\mathcal{O}$-modules and their adjointness, see Cohomology on Sites, Lemma 21.19.1. In this case $f_{*}$ is just the restriction to the subcategory $S_{Z a r}$ of $(S c h / S)_{Z a r}$. Hence it is clear that $R f_{*}=f_{*}$ induces $R f_{*}: D_{A d e q}(\mathcal{O}) \rightarrow D_{Q C o h}(S)$. Suppose that $\mathcal{G}^{\bullet}$ is an object of $D_{Q C o h}(S)$. We may choose a system $\mathcal{K}_{i}^{\bullet} \rightarrow \mathcal{K}_{2}^{\bullet} \rightarrow \ldots$ of
bounded above complexes of flat $\mathcal{O}_{S}$-modules whose transition maps are termwise split injectives and a diagram

with the properties (1), (2), (3) listed in Derived Categories, Lemma 13.28.1 where $\mathcal{P}$ is the collection of flat $\mathcal{O}_{S}$-modules. Then $L f^{*} \mathcal{G}^{\bullet}$ is computed by colim $f^{*} \mathcal{K}_{n}^{\bullet}$, see Cohomology on Sites, Lemmas 21.18.1 and 21.18.3 (note that our sites have enough points by Étale Cohomology, Lemma 49.30.1). We have to see that $H^{i}\left(L f^{*} \mathcal{G}^{\bullet}\right)=$ colim $H^{i}\left(f^{*} \mathcal{K}_{n}^{\bullet}\right)$ is adequate for each $i$. By Lemma 44.5.11 we conclude that it suffices to show that each $H^{i}\left(f^{*} \mathcal{K}_{n}^{\bullet}\right)$ is adequate.
The adequacy of $H^{i}\left(f^{*} \mathcal{K}_{n}^{\bullet}\right)$ is local on $S$, hence we may assume that $S=\operatorname{Spec}(A)$ is affine. Because $S$ is affine $D_{Q C o h}(S)=D\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right)$, see the discussion in Derived Categories of Schemes, Section 35.3. Hence there exists a quasi-isomorphism $\mathcal{F}^{\bullet} \rightarrow$ $\mathcal{K}_{n}^{\bullet}$ where $\mathcal{F}^{\bullet}$ is a bounded above complex of flat quasi-coherent modules. Then $f^{*} \mathcal{F}^{\bullet} \rightarrow f^{*} \mathcal{K}_{n}^{\bullet}$ is a quasi-isomorphism, and the cohomology sheaves of $f^{*} \mathcal{F}^{\bullet}$ are adequate.
The final assertion $R f_{*} L f^{*} \cong \operatorname{id}_{D_{Q C o h}(S)}$ follows from the explicit description of the functors above. (In plain English: if $\mathcal{F}$ is quasi-coherent and $p>0$, then $L_{p} f^{*} \mathcal{F}$ is a parasitic adequate module.)

070X Remark 44.10.3. Remark 44.10.2 above implies we have an equivalence of derived categories

$$
D_{A d e q}(\mathcal{O}) / D_{\mathcal{C}}(\mathcal{O}) \longrightarrow D_{Q C o h}(S)
$$

where $\mathcal{C}$ is the category of parasitic adequate modules. Namely, it is clear that $D_{\mathcal{C}}(\mathcal{O})$ is the kernel of $R f_{*}$, hence a functor as indicated. For any object $X$ of $D_{\text {Adeq }}(\mathcal{O})$ the map $L f^{*} R f_{*} X \rightarrow X$ maps to a quasi-isomorphism in $D_{Q C o h}(S)$, hence $L f^{*} R f_{*} X \rightarrow X$ is an isomorphism in $D_{\text {Adeq }}(\mathcal{O}) / D_{\mathcal{C}}(\mathcal{O})$. Finally, for $X, Y$ objects of $D_{\text {Adeq }}(\mathcal{O})$ the map

$$
R f_{*}: \operatorname{Hom}_{D_{\text {Adeq }}(\mathcal{O}) / D_{\mathcal{C}}(\mathcal{O})}(X, Y) \rightarrow \operatorname{Hom}_{D_{Q C o h}(S)}\left(R f_{*} X, R f_{*} Y\right)
$$

is bijective as $L f^{*}$ gives an inverse (by the remarks above).

## CHAPTER 45

## Dualizing Complexes

08XG

### 45.1. Introduction

08XH A reference is the book Har66.
The goals of this chapter are the following:
(1) Define what it means to have a dualizing complex $\omega_{A}^{\bullet}$ over a Noetherian ring $A$, namely
(a) we have $\omega_{A}^{\bullet} \in D^{+}(A)$,
(b) the cohomology modules $H^{i}\left(\omega_{A}^{\bullet}\right)$ are all finite $A$-modules,
(c) $\omega_{A}^{\bullet}$ has finite injective dimension, and
(d) we have $A \rightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right)$ is a quasi-isomorphism.
(2) List elementary properties of dualizing complexes.
(3) Show a dualizing complex gives rise to a dimension function.
(4) Show a dualizing complex gives rise to a good notion of a reflexive hull.
(5) Prove the finiteness theorem when a dualizing complex exists.

### 45.2. Essential surjections and injections

08XI We will mostly work in categories of modules, but we may as well make the definition in general.

08XJ Definition 45.2.1. Let $\mathcal{A}$ be an abelian category.
(1) An injection $A \subset B$ of $\mathcal{A}$ is essential, or we say that $B$ is an essential extension of $A$, if every nonzero subobject $B^{\prime} \subset B$ has nonzero intersection with $A$.
(2) A surjection $f: A \rightarrow B$ of $\mathcal{A}$ is essential if for every proper subobject $A^{\prime} \subset A$ we have $f\left(A^{\prime}\right) \neq B$.

Some lemmas about this notion.
08XK Lemma 45.2.2. Let $\mathcal{A}$ be an abelian category.
(1) If $A \subset B$ and $B \subset C$ are essential extensions, then $A \subset C$ is an essential extension.
(2) If $A \subset B$ is an essential extension and $C \subset B$ is a subobject, then $A \cap C \subset$ $C$ is an essential extension.
(3) If $A \rightarrow B$ and $B \rightarrow C$ are essential surjections, then $A \rightarrow C$ is an essential surjection.
(4) Given an essential surjection $f: A \rightarrow B$ and a surjection $A \rightarrow C$ with kernel $K$, the morphism $C \rightarrow B / f(K)$ is an essential surjection.

Proof. Omitted.

08XL Lemma 45.2.3. Let $R$ be a ring. Let $M$ be an $R$-module. Let $E=\operatorname{colim} E_{i}$ be a filtered colimit of $R$-modules. Suppose given a compatible system of essential injections $M \rightarrow E_{i}$ of $R$-modules. Then $M \rightarrow E$ is an essential injection.
Proof. Immediate from the definitions and the fact that filtered colimits are exact (Algebra, Lemma 10.8.9).

08XM Lemma 45.2.4. Let $R$ be a ring. Let $M \subset N$ be $R$-modules. The following are equivalent
(1) $M \subset N$ is an essential extension,
(2) for all $x \in N$ there exists an $f \in R$ such that $f x \in M$ and $f x \neq 0$.

Proof. Assume (1) and let $x \in N$ be a nonzero element. By (1) we have $R x \cap M \neq$ 0 . This implies (2).

Assume (2). Let $N^{\prime} \subset N$ be a nonzero submodule. Pick $x \in N^{\prime}$ nonzero. By (2) we can find $f \in$ with $f x \in N$ and $f x \neq 0$. Thus $N^{\prime} \cap M \neq 0$.

### 45.3. Injective modules

08XN Some results about injective modules over rings.
08XP Lemma 45.3.1. Let $R$ be a ring. Any product of injective $R$-modules is injective.
Proof. Special case of Homology, Lemma 12.23.3.
08XQ Lemma 45.3.2. Let $R \rightarrow S$ be a flat ring map. If $E$ is an injective $S$-module, then $E$ is injective as an $R$-module.

Proof. This is true because $\operatorname{Hom}_{R}(M, E)=\operatorname{Hom}_{S}\left(M \otimes_{R} S, E\right)$ by Algebra, Lemma 10.13 .3 and the fact that tensoring with $S$ is exact.

08YV Lemma 45.3.3. Let $R \rightarrow S$ be an epimorphism of rings. Let $E$ be an $S$-module. If $E$ is injective as an $R$-module, then $E$ is an injective $S$-module.

Proof. This is true because $\operatorname{Hom}_{R}(N, E)=\operatorname{Hom}_{S}(N, E)$ for any $S$-module $N$, see Algebra, Lemma 10.106.14.
08XR Lemma 45.3.4. Let $R \rightarrow S$ be a ring map. If $E$ is an injective $R$-module, then $\operatorname{Hom}_{R}(S, E)$ is an injective $S$-module.

Proof. This is true because $\operatorname{Hom}_{S}\left(N, \operatorname{Hom}_{R}(S, E)\right)=\operatorname{Hom}_{R}(N, E)$ by Algebra, Lemma 10.13.4.

08XS Lemma 45.3.5. Let $R$ be a ring. Let $I$ be an injective $R$-module. Let $E \subset I$ be a submodule. The following are equivalent
(1) $E$ is injective, and
(2) for all $E \subset E^{\prime} \subset I$ with $E \subset E^{\prime}$ essential we have $E=E^{\prime}$.

In particular, an $R$-module is injective if and only if every essential extension is trivial.

Proof. The final assertion follows from the first and the fact that the category of $R$-modules has enough injectives (More on Algebra, Section 15.46).
Assume (1). Let $E \subset E^{\prime} \subset I$ as in (2). Then the map $\operatorname{id}_{E}: E \rightarrow E$ can be extended to a map $\alpha: E^{\prime} \rightarrow E$. The kernel of $\alpha$ has to be zero because it intersects $E$ trivially and $E^{\prime}$ is an essential extension. Hence $E=E^{\prime}$.

Assume (2). Let $M \subset N$ be $R$-modules and let $\varphi: M \rightarrow E$ be an $R$-module map. In order to prove (1) we have to show that $\varphi$ extends to a morphism $N \rightarrow E$. Consider the set $\mathcal{S}$ of pairs $\left(M^{\prime}, \varphi^{\prime}\right)$ where $M \subset M^{\prime} \subset N$ and $\varphi^{\prime}: M^{\prime} \rightarrow E$ is an $R$-module map agreeing with $\varphi$ on $M$. We define an ordering on $\mathcal{S}$ by the rule $\left(M^{\prime}, \varphi^{\prime}\right) \leq\left(M^{\prime \prime}, \varphi^{\prime \prime}\right)$ if and only if $M^{\prime} \subset M^{\prime \prime}$ and $\left.\varphi^{\prime \prime}\right|_{M^{\prime}}=\varphi^{\prime}$. It is clear that we can take the maximum of a totally ordered subset of $\mathcal{S}$. Hence by Zorn's lemma we may assume $(M, \varphi)$ is a maximal element.

Choose an extension $\psi: N \rightarrow I$ of $\varphi$ composed with the inclusion $E \rightarrow I$. This is possible as $I$ is injective. If $\psi(N) \subset E$, then $\psi$ is the desired extension. If $\psi(N)$ is not contained in $E$, then by (2) the inclusion $E \subset E+\psi(N)$ is not essential. hence we can find a nonzero submodule $K \subset E+\psi(N)$ meeting $E$ in 0 . This means that $M^{\prime}=\psi^{-1}(E+K)$ strictly contains $M$. Thus we can extend $\varphi$ to $M^{\prime}$ using

$$
M^{\prime} \xrightarrow{\left.\psi\right|_{M^{\prime}}} E+K \rightarrow(E+K) / K=E
$$

This contradicts the maximality of $(M, \varphi)$.
08XT Example 45.3.6. Let $R$ be a reduced ring. Let $\mathfrak{p} \subset R$ be a minimal prime so that $K=R_{\mathfrak{p}}$ is a field (Algebra, Lemma 10.24.1). Then $K$ is an injective $R$ module. Namely, we have $\operatorname{Hom}_{R}(M, K)=\operatorname{Hom}_{K}\left(M_{\mathfrak{p}}, K\right)$ for any $R$-module $M$. Since localization is an exact functor and taking duals is an exact functor on $K$ vector spaces we conclude $\operatorname{Hom}_{R}(-, K)$ is an exact functor, i.e., $K$ is an injective $R$-module.

08XU Lemma 45.3.7. Let $R$ be a ring. Let $E$ be an $R$-module. The following are equivalent
(1) $E$ is an injective $R$-module, and
(2) given an ideal $I \subset R$ and a module map $\varphi: I \rightarrow E$ there exists an extension of $\varphi$ to an $R$-module map $R \rightarrow E$.

Proof. The implication $(1) \Rightarrow(2)$ follows from the definitions. Thus we assume (2) holds and we prove (1). First proof: The lemma follows from More on Algebra, Lemma 15.46.4. Second proof: Since $R$ is a generator for the category of $R$-modules, the lemma follows from Injectives, Lemma 19.11.5.
Third proof: We have to show that every essential extension $E \subset E^{\prime}$ is trivial, see Lemma 45.3.5. Pick $x \in E^{\prime}$ and set $I=\{f \in R \mid f x \in E\}$. The map $I \rightarrow E$, $f \mapsto f x$ extends to $\psi: R \rightarrow E$ by (2). Then $x^{\prime}=x-\psi(1)$ is an element of $E^{\prime}$ whose annihilator in $E^{\prime} / E$ is $I$ and which is annihilated by $I$ as an element of $E^{\prime}$. Thus $R x^{\prime}=(R / I) x^{\prime}$ does not intersect $E$. Since $E \subset E^{\prime}$ is an essential extension it follows that $x^{\prime} \in E$ as desired.

08XV Lemma 45.3.8. Let $R$ be a Noetherian ring. A direct sum of injective modules is injective.

Proof. Let $E_{i}$ be a family of injective modules parametrized by a set $I$. Set $E=\bigcup E_{i}$. To show that $E$ is injective we use Lemma 45.3.7. Thus let $\varphi: I \rightarrow E$ be a module map from an ideal of $R$ into $E$. As $I$ is a finite $R$-module (because $R$ is Noetherian) we can find finitely many elements $i_{1}, \ldots, i_{r} \in I$ such that $\varphi$ maps into $\bigcup_{j=1, \ldots, r} E_{i_{j}}$. Then we can extend $\varphi$ into $\bigcup_{j=1, \ldots, r} E_{i_{j}}$ using the injectivity of the modules $E_{i_{j}}$.

0A6I Lemma 45.3.9. Let $R$ be a Noetherian ring. Let $S \subset R$ be a multiplicative subset. If $E$ is an injective $R$-module, then $S^{-1} E$ is an injective $S^{-1} R$-module.

Proof. Since $R \rightarrow S^{-1} R$ is an epimorphism of rings, it suffices to show that $S^{-1} E$ is injective as an $R$-module, see Lemma 45.3.3. To show this we use Lemma 45.3.7. Thus let $I \subset R$ be an ideal and let $\varphi: I \rightarrow S^{-1} E$ be an $R$-module map. As $I$ is a finitely presented $R$-module (because $R$ is Noetherian) we can find find an $f \in S$ and an $R$-module map $I \rightarrow E$ such that $f \varphi$ is the composition $I \rightarrow E \rightarrow S^{-1} E$ (Algebra, Lemma 10.10.2. Then we can extend $I \rightarrow E$ to a homomorphism $R \rightarrow E$. Then the composition

$$
R \rightarrow E \rightarrow S^{-1} E \xrightarrow{f^{-1}} S^{-1} E
$$

is the desired extension of $\varphi$ to $R$.
08XW Lemma 45.3.10. Let $R$ be a Noetherian ring. Let $I$ be an injective $R$-module.
(1) Let $f \in R$. Then $E=\bigcup I\left[f^{n}\right]=I\left[f^{\infty}\right]$ is an injective submodule of $I$.
(2) Let $J \subset R$ be an ideal. Then the $J$-power torsion submodule $I\left[J^{\infty}\right]$ is an injective submodule of $I$.

Proof. We will use Lemma 45.3 .5 to prove (1). Suppose that $E \subset E^{\prime} \subset I$ and that $E^{\prime}$ is an essential extension of $E$. We will show that $E^{\prime}=E$. If not, then we can find $x \in E^{\prime}$ and $x \notin E$. Let $J=\left\{a \in R \mid a x \in E^{\prime}\right\}$. Since $R$ is Noetherian we can choose $x$ with $J$ maximal. Since $R$ is Noetherian we can write $J=\left(g_{1}, \ldots, g_{t}\right)$ for some $g_{i} \in R$. Say $f^{n_{i}}$ annihilates $g_{i} x$. Set $n=\max \left\{n_{i}\right\}$. Then $x^{\prime}=f^{n} x$ is an element of $E^{\prime}$ not in $E$ and is annihilated by $J$. By maximality of $J$ we see that $R x^{\prime}=(R / J) x^{\prime} \cap E=(0)$. Hence $E^{\prime}$ is not an essential extension of $E$ a contradiction.

To prove (2) write $J=\left(f_{1}, \ldots, f_{t}\right)$. Then $I\left[J^{\infty}\right]$ is equal to

$$
\left(\ldots\left(\left(I\left[f_{1}^{\infty}\right]\right)\left[f_{2}^{\infty}\right]\right) \ldots\right)\left[f_{t}^{\infty}\right]
$$

and the result follows from (1) and induction.
0A6J Lemma 45.3.11. Let $A$ be a Noetherian ring. Let $E$ be an injective $A$-module. Then $E \otimes_{A} A[x]$ has injective-amplitude $[0,1]$ as an object of $D(A[x])$. In particular, $E \otimes_{A} A[x]$ has finite injective dimension as an $A[x]$-module.

Proof. Let us write $E[x]=E \otimes_{A} A[x]$. Consider the short exact sequence of $A[x]$-modules

$$
0 \rightarrow E[x] \rightarrow \operatorname{Hom}_{A}(A[x], E[x]) \rightarrow \operatorname{Hom}_{A}(A[x], E[x]) \rightarrow 0
$$

where the first map sends $p \in E[x]$ to $f \mapsto f p$ and the second map sends $\varphi$ to $f \mapsto \varphi(x f)-x \varphi(f)$. The second map is surjective because $\operatorname{Hom}_{A}(A[x], E[x])=$ $\prod_{n \geq 0} E[x]$ as an abelian group and the map sends $\left(e_{n}\right)$ to $\left(e_{n+1}-x e_{n}\right)$ which is surjective. As an $A$-module we have $E[x] \cong \bigoplus_{n>0} E$ which is injective by Lemma 45.3.8. Hence the $A[x]$-module $\operatorname{Hom}_{A}(A[x], I[x])$ is injective by Lemma 45.3.4 and the proof is complete.

### 45.4. Projective covers

08XX In this section we briefly discuss projective covers.
08XY Definition 45.4.1. Let $R$ be a ring. A surjection $P \rightarrow M$ of $R$-modules is said to be a projective cover, or sometimes a projective envelope, if $P$ is a projective $R$-module and $P \rightarrow M$ is an essential surjection.

Projective covers do not always exist. For example, if $k$ is a field and $R=k[x]$ is the polynomial ring over $k$, then the module $M=R /(x)$ does not have a projective cover. Namely, for any surjection $f: P \rightarrow M$ with $P$ projective over $R$, the proper submodule $(x-1) P$ surjects onto $M$. Hence $f$ is not essential.

08XZ Lemma 45.4.2. Let $R$ be a ring and let $M$ be an $R$-module. If a projective cover of $M$ exists, then it is unique up to isomorphism.

Proof. Let $P \rightarrow M$ and $P^{\prime} \rightarrow M$ be projective covers. Because $P$ is a projective $R$-module and $P^{\prime} \rightarrow M$ is surjective, we can find an $R$-module map $\alpha: P \rightarrow P^{\prime}$ compatible with the maps to $M$. Since $P^{\prime} \rightarrow M$ is essential, we see that $\alpha$ is surjective. As $P^{\prime}$ is a projective $R$-module we can choose a direct sum decomposition $P=\operatorname{Ker}(\alpha) \oplus P^{\prime}$. Since $P^{\prime} \rightarrow M$ is surjective and since $P \rightarrow M$ is essential we conclude that $\operatorname{Ker}(\alpha)$ is zero as desired.

Here is an example where projective covers exist.
08Y0 Lemma 45.4.3. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Any finite $R$-module has a projective cover.

Proof. Let $M$ be a finite $R$-module. Let $r=\operatorname{dim}_{\kappa}(M / \mathfrak{m} M)$. Choose $x_{1}, \ldots, x_{r} \in$ $M$ mapping to a basis of $M / \mathfrak{m} M$. Consider the map $f: R^{\oplus r} \rightarrow M$. By Nakayama's lemma this is a surjection (Algebra, Lemma 10.19.1). If $N \subset R^{\oplus R}$ is a proper submodule, then $N / \mathfrak{m} N \rightarrow \kappa^{\oplus r}$ is not surjective (by Nakayama's lemma again) hence $N / \mathfrak{m} N \rightarrow M / \mathfrak{m} M$ is not surjective. Thus $f$ is an essential surjection.

### 45.5. Injective hulls

08Y1 In this section we briefly discuss injective hulls.
08Y2 Definition 45.5.1. Let $R$ be a ring. A injection $M \rightarrow I$ of $R$-modules is said to be an injective hull if $I$ is a injective $R$-module and $M \rightarrow I$ is an essential injection.

Injective hulls always exist.
08Y3 Lemma 45.5.2. Let $R$ be a ring. Any $R$-module has an injective hull.
Proof. Let $M$ be an $R$-module. By More on Algebra, Section 15.46 the category of $R$-modules has enough injectives. Choose an injection $M \rightarrow I$ with $I$ an injective $R$-module. Consider the set $\mathcal{S}$ of submodules $M \subset E \subset I$ such that $E$ is an essential extension of $M$. We order $\mathcal{S}$ by inclusion. If $\left\{E_{\alpha}\right\}$ is a totally ordered subset of $\mathcal{S}$, then $\bigcup E_{\alpha}$ is an essential extension of $M$ too (Lemma 45.2.3). Thus we can apply Zorn's lemma and find a maximal element $E \in \mathcal{S}$. We claim $M \subset E$ is an injective hull, i.e., $E$ is an injective $R$-module. This follows from Lemma 45.3.5.

08Y4 Lemma 45.5.3. Let $R$ be a ring. Let $M, N$ be $R$-modules and let $M \rightarrow E$ and $N \rightarrow E^{\prime}$ be injective hulls. Then
(1) for any $R$-module map $\varphi: M \rightarrow N$ there exists an $R$-module map $\psi$ : $E \rightarrow E^{\prime}$ such that

commutes,
(2) if $\varphi$ is injective, then $\psi$ is injective,
(3) if $\varphi$ is an essential injection, then $\psi$ is an isomorphism,
(4) if $\varphi$ is an isomorphism, then $\psi$ is an isomorphism,
(5) if $M \rightarrow I$ is an embedding of $M$ into an injective $R$-module, then there is an isomorphism $I \cong E \oplus I^{\prime}$ compatible with the embeddings of $M$,
In particular, the injective hull $E$ of $M$ is unique up to isomorphism.
Proof. Part (1) follows from the fact that $E^{\prime}$ is an injective $R$-module. Part (2) follows as $\operatorname{Ker}(\psi) \cap M=0$ and $E$ is an essential extension of $M$. Assume $\varphi$ is an essential injection. Then $E \cong \psi(E) \subset E^{\prime}$ by (2) which implies $E^{\prime}=\psi(E) \oplus E^{\prime \prime}$ because $E$ is injective. Since $E^{\prime}$ is an essential extension of $M$ (Lemma 45.2.2 we get $E^{\prime \prime}=0$. Part (4) is a special case of (3). Assume $M \rightarrow I$ as in (5). Choose a map $\alpha: E \rightarrow I$ extending the map $M \rightarrow I$. Arguing as before we see that $\alpha$ is injective. Thus as before $\alpha(E)$ splits off from $I$. This proves (5).

08Y5 Example 45.5.4. Let $R$ be a domain with fraction field $K$. Then $R \subset K$ is an injective hull of $R$. Namely, by Example 45.3 .6 we see that $K$ is an injective $R$-module and by Lemma 45.2.4 we see that $R \subset K$ is an essential extension.

08Y6 Definition 45.5.5. An object $X$ of an additive category is called indecomposable if it is nonzero and if $X=Y \oplus Z$, then either $Y=0$ or $Z=0$.

08 Y 7 Lemma 45.5.6. Let $R$ be a ring. Let $E$ be an indecomposable injective $R$-module. Then
(1) $E$ is the injective hull of any nonzero submodule of $E$,
(2) the intersection of any two nonzero submodules of $E$ is nonzero,
(3) $E n d_{R}(E, E)$ is a noncommutative local ring with maximal ideal those $\varphi$ : $E \rightarrow E$ whose kernel is nonzero, and
(4) the set of zerodivisors on $E$ is a prime ideal $\mathfrak{p}$ of $R$ and $E$ is an injective $R_{\mathfrak{p}}$-module.

Proof. Part (1) follows from Lemma 45.5.3. Part (2) follows from part (1) and the definition of injective hulls.
Proof of (3). Set $A=\operatorname{End}_{R}(E, E)$ and $I=\{\varphi \in A \mid \operatorname{Ker}(f) \neq 0\}$. The statement means that $I$ is a two sided ideal and that any $\varphi \in A, \varphi \notin I$ is invertible. Suppose $\varphi$ and $\psi$ are not injective. Then $\operatorname{Ker}(\varphi) \cap \operatorname{Ker}(\psi)$ is nonzero by $(2)$. Hence $\varphi+\psi \in I$. It follows that $I$ is a two sided ideal. If $\varphi \in A, \varphi \notin I$, then $E \cong \varphi(E) \subset E$ is an injective submodule, hence $E=\varphi(E)$ because $E$ is indecomposable.
Proof of (4). Consider the ring map $R \rightarrow A$ and let $\mathfrak{p} \subset R$ be the inverse image of the maximal ideal $I$. Then it is clear that $\mathfrak{p}$ is a prime ideal and that $R \rightarrow A$ extends to $R_{\mathfrak{p}} \rightarrow A$. Thus $E$ is an $R_{\mathfrak{p}}$-module. It follows from Lemma 45.3.3 that $E$ is injective as an $R_{\mathfrak{p}}$-module.

08Y8 Lemma 45.5.7. Let $\mathfrak{p} \subset R$ be a prime of a ring $R$. Let $E$ be the injective hull of $R / \mathfrak{p}$. Then
(1) $E$ is indecomposable,
(2) $E$ is the injective hull of $\kappa(\mathfrak{p})$,
(3) $E$ is the injective hull of $\kappa(\mathfrak{p})$ over the ring $R_{\mathfrak{p}}$.

Proof. As $R / \mathfrak{p} \subset \kappa(\mathfrak{p})$ we can extend the embedding to a map $\kappa(\mathfrak{p}) \rightarrow E$. Hence (2) holds. For $f \in R, f \notin \mathfrak{p}$ the map $f: \kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p})$ is an isomorphism hence the map $f: E \rightarrow E$ is an isomorphism, see Lemma 45.5.3. Thus $E$ is an $R_{\mathfrak{p}}$-module. It is injective as an $R_{\mathfrak{p}}$-module by Lemma 45.3 .3 Finally, let $E^{\prime} \subset E$ be a nonzero injective $R$-submodule. Then $J=(R / \mathfrak{p}) \cap \bar{E}^{\prime}$ is nonzero. After shrinking $E^{\prime}$ we may assume that $E^{\prime}$ is the injective hull of $J$ (see Lemma 45.5 .3 for example). Observe that $R / \mathfrak{p}$ is an essential extension of $J$ for example by Lemma 45.2.4. Hence $E^{\prime} \rightarrow E$ is an isomorphism by Lemma 45.5 .3 part (3). Hence $E$ is indecomposable.

08Y9 Lemma 45.5.8. Let $R$ be a Noetherian ring. Let $E$ be an indecomposable injective $R$-module. Then there exists a prime ideal $\mathfrak{p}$ of $R$ such that $E$ is the injective hull of $\kappa(\mathfrak{p})$.
Proof. Let $\mathfrak{p}$ be the prime ideal found in Lemma 45.5.6. Say $\mathfrak{p}=\left(f_{1}, \ldots, f_{r}\right)$. Pick a nonzero element $x \in \bigcap \operatorname{Ker}\left(f_{i}: E \rightarrow E\right)$, see Lemma 45.5.6. Then $\left(R_{\mathfrak{p}}\right) x$ is a module isomorphic to $\kappa(\mathfrak{p})$ inside $E$. We conclude by Lemma 45.5.6.

08YA Proposition 45.5.9 (Structure of injective modules over Noetherian rings). Let $R$ be a Noetherian ring. Every injective module is a direct sum of indecomposable injective modules. Every indecomposable injective module is the injective hull of the residue field at a prime.

Proof. The second statement is Lemma 45.5.8. For the first statement, let $I$ be an injective $R$-module. We will use transfinite induction to construct $I_{\alpha} \subset I$ for ordinals $\alpha$ which are direct sums of indecomposable injective $R$-modules $E_{\beta+1}$ for $\beta<\alpha$. For $\alpha=0$ we let $I_{0}=0$. Suppose given an ordinal $\alpha$ such that $I_{\alpha}$ has been constructed. Then $I_{\alpha}$ is an injective $R$-module by Lemma 45.3.8. Hence $I \cong I_{\alpha} \oplus I^{\prime}$. If $I^{\prime}=0$ we are done. If not, then $I^{\prime}$ has an associated prime by Algebra, Lemma 10.62 .7 . Thus $I^{\prime}$ contains a copy of $R / \mathfrak{p}$ for some prime $\mathfrak{p}$. Hence $I^{\prime}$ contains an indecomposable submodule $E$ by Lemmas 45.5.3 and 45.5.7. Set $I_{\alpha+1}=I_{\alpha} \oplus E_{\alpha}$. If $\alpha$ is a limit ordinal and $I_{\beta}$ has been constructed for $\beta<\alpha$, then we set $I_{\alpha}=\bigcup_{\beta<\alpha} I_{\beta}$. Observe that $I_{\alpha}=\bigoplus_{\beta<\alpha} E_{\beta+1}$. This concludes the proof.

### 45.6. Duality over Artinian local rings

08 YW Let $(R, \mathfrak{m}, \kappa)$ be an artinian local ring. Recall that this implies $R$ is Noetherian and that $R$ has finite length as an $R$-module. Moreover an $R$-module is finite if and only if it has finite length. We will use these facts without further mention in this section. Please see Algebra, Sections 10.51 and 10.52 and Algebra, Proposition 10.59 .6 for more details.

08YX Lemma 45.6.1. Let $(R, \mathfrak{m}, \kappa)$ be an artinian local ring. Let $E$ be an injective hull of $\kappa$. For every finite $R$-module $M$ we have

$$
\operatorname{length}_{R}(M)=\text { length }_{R}\left(\operatorname{Hom}_{R}(M, E)\right)
$$

In particular, the injective hull $E$ of $\kappa$ is a finite $R$-module.

Proof. Because $E$ is an essential extension of $\kappa$ we have $\kappa=E[\mathfrak{m}]$ where $E[\mathfrak{m}]$ is the $\mathfrak{m}$-torsion in $E$ (notation as in More on Algebra, Section 15.70. Hence $\operatorname{Hom}_{R}(\kappa, E) \cong \kappa$ and the equality of lengths holds for $M=\kappa$. We prove the displayed equality of the lemma by induction on the length of $M$. If $M$ is nonzero there exists a surjection $M \rightarrow \kappa$ with kernel $M^{\prime}$. Since the functor $M \mapsto \operatorname{Hom}_{R}(M, E)$ is exact we obtain a short exact sequence

$$
0 \rightarrow \operatorname{Hom}_{R}(\kappa, E) \rightarrow \operatorname{Hom}_{R}(M, E) \rightarrow \operatorname{Hom}_{R}\left(M^{\prime}, E\right) \rightarrow 0
$$

Additivity of length for this sequence and the sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow \kappa \rightarrow 0$ and the equality for $M^{\prime}$ (induction hypothesis) and $\kappa$ implies the equality for $M$. The final statement of the lemma follows as $E=\operatorname{Hom}_{R}(R, E)$.

08 YY Lemma 45.6.2. Let $(R, \mathfrak{m}, \kappa)$ be an artinian local ring. Let $E$ be an injective hull of $\kappa$. For any finite $R$-module $M$ the evaluation map

$$
M \longrightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, E), E\right)
$$

is an isomorphism. In particular $R=\operatorname{Hom}_{R}(E, E)$.
Proof. Observe that the displayed arrow is injective. Namely, if $x \in M$ is a nonzero element, then there is a nonzero map $R x \rightarrow \kappa$ which we can extend to a $\operatorname{map} \varphi: M \rightarrow E$ that doesn't vanish on $x$. Since the source and target of the arrow have the same length by Lemma 45.6.1 we conclude it is an isomorphism. The final statement follows on taking $M=R$.

To state the next lemma, denote $\operatorname{Mod}_{R}^{f g}$ the category of finite $R$-modules over a ring $R$.

08YZ Lemma 45.6.3. Let $(R, \mathfrak{m}, \kappa)$ be an artinian local ring. Let $E$ be an injective hull of $\kappa$. The functor $D(-)=\operatorname{Hom}_{R}(-, E)$ induces an exact anti-equivalence $\operatorname{Mod}_{R}^{f g} \rightarrow \operatorname{Mod}_{R}^{f g}$ and $D \circ D \cong i d$.

Proof. We have seen that $D \circ D=\mathrm{id}$ on $\operatorname{Mod}_{R}^{f g}$ in Lemma 45.6.2. It follows immediately that $D$ is an anti-equivalence.

08Z0 Lemma 45.6.4. Assumptions and notation as in Lemma 45.6.3. Let $I \subset R$ be an ideal and $M$ a finite $R$-module. Then

$$
D(M[I])=D(M) / I D(M) \quad \text { and } \quad D(M / I M)=D(M)[I]
$$

Proof. Say $I=\left(f_{1}, \ldots, f_{t}\right)$. Consider the map

$$
M^{\oplus t} \xrightarrow{f_{1}, \ldots, f_{t}} M
$$

with cokernel $M / I M$. Applying the exact functor $D$ we conclude that $D(M / I M)$ is $D(M)[I]$. The other case is proved in the same way.

### 45.7. Injective hull of the residue field

08Z1 Most of our results will be for Noetherian local rings in this section.
08Z2 Lemma 45.7.1. Let $R \rightarrow S$ be a surjective map of local rings with kernel $I$. Let $E$ be the injective hull of the residue field of $R$ over $R$. Then $E[I]$ is the injective hull of the residue field of $S$ over $S$.

Proof. Observe that $E[I]=\operatorname{Hom}_{R}(S, E)$ as $S=R / I$. Hence $E[I]$ is an injective $S$-module by Lemma 45.3.4. Since $E$ is an essential extension of $\kappa=R / \mathfrak{m}_{R}$ it follows that $E[I]$ is an essential extension of $\kappa$ as well. The result follows.
08 Z 3 Lemma 45.7.2. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $E$ be the injective hull of $\kappa$. Let $M$ be a $\mathfrak{m}$-power torsion $R$-module with $n=\operatorname{dim}_{\kappa}(M[\mathfrak{m}])<\infty$. Then $M$ is isomorphic to a submodule of $E^{\oplus n}$.

Proof. Observe that $E^{\oplus n}$ is the injective hull of $\kappa^{\oplus n}=M[\mathfrak{m}]$. Thus there is an $R$-module map $M \rightarrow E^{\oplus n}$ which is injective on $M[\mathfrak{m}]$. Since $M$ is $\mathfrak{m}$-power torsion the inclusion $M[\mathfrak{m}] \subset M$ is an essential extension (for example by Lemma 45.2.4) we conclude that the kernel of $M \rightarrow E^{\oplus n}$ is zero.

08 Z 4 Lemma 45.7.3. Let $(R, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $E$ be an injective hull of $\kappa$ over $R$. Let $E_{n}$ be an injective hull of $\kappa$ over $R / \mathfrak{m}^{n}$. Then $E=\bigcup E_{n}$ and $E_{n}=E\left[\mathfrak{m}^{n}\right]$.
Proof. We have $E_{n}=E\left[\mathfrak{m}^{n}\right]$ by Lemma 45.7.1. We have $E=\bigcup E_{n}$ because $\bigcup E_{n}=E\left[\mathfrak{m}^{\infty}\right]$ is an injective $R$-submodule which contains $\kappa$, see Lemma 45.3.10.

The following lemma tells us the injective hull of the residue field of a Noetherian local ring only depends on the completion.

08Z5 Lemma 45.7.4. Let $R \rightarrow S$ be a flat local homomorphism of local Noetherian rings such that $R / \mathfrak{m}_{R} \cong S / \mathfrak{m}_{R} S$. Then the injective hull of the residue field of $R$ is the injective hull of the residue field of $S$.

Proof. Set $\kappa=R / \mathfrak{m}_{R}=S / \mathfrak{m}_{S}$. Let $E_{R}$ be the injective hull of $\kappa$ over $R$. Let $E_{S}$ be the injective hull of $\kappa$ over $S$. Observe that $E_{S}$ is an injective $R$-module by Lemma 45.3.2. Choose an extension $E_{R} \rightarrow E_{S}$ of the identification of residue fields. This map is an isomorphism by Lemma 45.7 .3 because $R \rightarrow S$ induces an isomorphism $R / \mathfrak{m}_{R}^{n} \rightarrow S / \mathfrak{m}_{S}^{n}$ for all $n$.
$08 Z 6$ Lemma 45.7.5. Let $(R, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $E$ be an injective hull of $\kappa$ over $R$. Then $\operatorname{Hom}_{R}(E, E)$ is canonically isomorphic to the completion of $R$.

Proof. Write $E=\bigcup E_{n}$ with $E_{n}=E\left[\mathfrak{m}^{n}\right]$ as in Lemma45.7.3. Any endomorphism of $E$ preserves this filtration. Hence

$$
\operatorname{Hom}_{R}(E, E)=\lim \operatorname{Hom}_{R}\left(E_{n}, E_{n}\right)
$$

The lemma follows as $\operatorname{Hom}_{R}\left(E_{n}, E_{n}\right)=\operatorname{Hom}_{R / \mathfrak{m}^{n}}\left(E_{n}, E_{n}\right)=R / \mathfrak{m}^{n}$ by Lemma 45.6 .2 .

08 Z 7 Lemma 45.7.6. Let $(R, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $E$ be an injective hull of $\kappa$ over $R$. Then $E$ satisfies the descending chain condition.
Proof. If $E \subset M_{1} \subset M_{2} \ldots$ is a sequence of submodules, then

$$
\operatorname{Hom}_{R}(E, E) \rightarrow \operatorname{Hom}_{R}\left(M_{1}, E\right) \rightarrow \operatorname{Hom}_{R}\left(M_{2}, E\right) \rightarrow \ldots
$$

is sequence of surjections. By Lemma 45.7 .5 each of these is a module over the completion $R^{\wedge}=\operatorname{Hom}_{R}(E, E)$. Since $R^{\wedge}$ is Noetherian (Algebra, Lemma 10.96.6) the sequence stabilizes: $\operatorname{Hom}_{R}\left(M_{n}, E\right)=\operatorname{Hom}_{R}\left(M_{n+1}, E\right)=\ldots$. Since $E$ is injective, this can only happen if $\operatorname{Hom}_{R}\left(M_{n} / M_{n+1}, E\right)$ is zero. However, if $M_{n} / M_{n+1}$
is nonzero, then it contains a nonzero element annihilated by $\mathfrak{m}$, because $E$ is $\mathfrak{m}$ power torsion by Lemma 45.7.3. In this case $M_{n} / M_{n+1}$ has a nonzero map into $E$, contradicting the assumed vanishing. This finishes the proof.

08 Z 8 Lemma 45.7.7. Let $(R, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $E$ be an injective hull of $\kappa$.
(1) For an $R$-module $M$ the following are equivalent:
(a) $M$ satisfies the ascending chain condition,
(b) $M$ is a finite $R$-module, and
(c) there exist $n, m$ and an exact sequence $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$.
(2) For an $R$-module $M$ the following are equivalent:
(a) $M$ satisfies the descending chain condition,
(b) $M$ is $\mathfrak{m}$-power torsion and $\operatorname{dim}_{\kappa}(M[\mathfrak{m}])<\infty$, and
(c) there exist $n, m$ and an exact sequence $0 \rightarrow M \rightarrow E^{\oplus n} \rightarrow E^{\oplus m}$.

Proof. We omit the proof of (1).
Let $M$ be an $R$-module with the descending chain condition. Let $x \in M$. Then $\mathfrak{m}^{n} x$ is a descending chain of submodules, hence stabilizes. Thus $\mathfrak{m}^{n} x=\mathfrak{m}^{n+1} x$ for some $n$. By Nakayama's lemma (Algebra, Lemma 10.19.1) this implies $\mathfrak{m}^{n} x=0$, i.e., $x$ is $\mathfrak{m}$-power torsion. Since $M[\mathfrak{m}]$ is a vector space over $\kappa$ it has to be finite dimensional in order to have the descending chain condition.

Assume that $M$ is $\mathfrak{m}$-power torsion and has a finite dimensional $\mathfrak{m}$-torsion submodule $M[\mathfrak{m}]$. By Lemma 45.7.2 we see that $M$ is a submodule of $E^{\oplus n}$ for some $n$. Consider the quotient $N=E^{\oplus n} / M$. By Lemma 45.7.6 the module $E$ has the descending chain condition hence so do $E^{\oplus n}$ and $N$. Therefore $N$ satisfies (2)(a) which implies $N$ satisfies (2)(b) by the second paragraph of the proof. Thus by Lemma 45.7.2 again we see that $N$ is a submodule of $E^{\oplus m}$ for some $m$. Thus we have a short exact sequence $0 \rightarrow M \rightarrow E^{\oplus n} \rightarrow E^{\oplus m}$.
Assume we have a short exact sequence $0 \rightarrow M \rightarrow E^{\oplus n} \rightarrow E^{\oplus m}$. Since $E$ satisfies the descending chain condition by Lemma 45.7.6 so does $M$.
$08 Z 9$ Proposition 45.7.8 (Matlis duality). Let $(R, \mathfrak{m}, \kappa)$ be a complete local Noetherian ring. Let $E$ be an injective hull of $\kappa$ over $R$. The functor $D(-)=\operatorname{Hom}_{R}(-, E)$ induces an anti-equivalence

$$
\left\{\begin{array}{c}
R \text {-modules with the } \\
\text { descending chain condition }
\end{array}\right\} \longleftrightarrow\left\{\begin{array}{c}
R \text {-modules with the } \\
\text { ascending chain condition }
\end{array}\right\}
$$

and we have $D \circ D=i d$ on either side of the equivalence.
Proof. By Lemma 45.7.5 we have $R=\operatorname{Hom}_{R}(E, E)=D(E)$. Of course we have $E=\operatorname{Hom}_{R}(R, E)=D(R)$. Since $E$ is injective the functor $D$ is exact. The result now follows immediately from the description of the categories in Lemma 45.7.7.

### 45.8. Deriving torsion

0BJA Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal (if $I$ is not finitely generated perhaps a different definition should be used). Let $Z=V(I) \subset \operatorname{Spec}(A)$. Recall that the category $I^{\infty}$-torsion of $I$-power torsion modules only depends on the closed subset $Z$ and not on the choice of the finitely generated ideal $I$ such that
$Z=V(I)$, see More on Algebra, Lemma 15.69.6. In this section we will consider the functor

$$
H_{I}^{0}: \operatorname{Mod}_{A} \longrightarrow I^{\infty} \text {-torsion, } \quad M \longmapsto M\left[I^{\infty}\right]=\bigcup M\left[I^{n}\right]
$$

which sends $M$ to the submodule of $I$-power torsion.
Let $A$ be a ring and let $I$ be a finitely generated ideal. Note that $I^{\infty}$-torsion is a Grothendieck abelian category (direct sums exist, filtered colimits are exact, and $\bigoplus A / I^{n}$ is a generator by More on Algebra, Lemma 15.69.2). Hence the derived category $D\left(I^{\infty}\right.$-torsion) exists, see Injectives, Remark 19.13.3. Our functor $H_{I}^{0}$ is left exact and has a derived extension which we will denote

$$
R \Gamma_{I}: D(A) \longrightarrow D\left(I^{\infty} \text {-torsion }\right) .
$$

Warning: this functor does not deserve the name local cohomology unless the ring $A$ is Noetherian. The functors $H_{I}^{0}, R \Gamma_{I}$, and the satellites $H_{I}^{p}$ only depend on the closed subset $Z \subset \operatorname{Spec}(A)$ and not on the choice of the finitely generated ideal $I$ such that $V(I)=Z$. However, we insist on using the subscript $I$ for the functors above as the notation $R \Gamma_{Z}$ is going to be used for a different functor, see (45.9.0.1), which agrees with the functor $R \Gamma_{I}$ only (as far as we know) in case $A$ is Noetherian (see Lemma 45.10.1).

0A6L Lemma 45.8.1. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. The functor $R \Gamma_{I}$ is right adjoint to the functor $D\left(I^{\infty}\right.$-torsion $) \rightarrow D(A)$.

Proof. This follows from the fact that taking $I$-power torsion submodules is the right adjoint to the inclusion functor $I^{\infty}$-torsion $\rightarrow \operatorname{Mod}_{A}$. See Derived Categories, Lemma 13.28.4.

0954 Lemma 45.8.2. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. For any object $K$ of $D(A)$ we have

$$
R \Gamma_{I}(K)=\text { hocolim } R \operatorname{Hom}_{A}\left(A / I^{n}, K\right)
$$

in $D(A)$ and

$$
R^{q} \Gamma_{I}(K)=\operatorname{colim}_{n} E x t_{A}^{q}\left(A / I^{n}, K\right)
$$

as modules for all $q \in \mathbf{Z}$.
Proof. Let $J^{\bullet}$ be a K-injective complex representing $K$. Then

$$
R \Gamma_{I}(K)=J^{\bullet}\left[I^{\infty}\right]=\operatorname{colim} J^{\bullet}\left[I^{n}\right]=\operatorname{colim} \operatorname{Hom}_{A}\left(A / I^{n}, J^{\bullet}\right)
$$

By Derived Categories, Lemma 13.31 .4 we obtain the first equality. The second equality is clear because $H^{q}\left(\operatorname{Hom}_{A}\left(A / I^{n}, J^{\bullet}\right)\right)=\operatorname{Ext}_{A}^{q}\left(A / I^{n}, K\right)$ and because filtered colimits are exact in the category of abelian groups.

0A6M Lemma 45.8.3. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K^{\bullet}$ be a complex of $A$-modules such that $f: K^{\bullet} \rightarrow K^{\bullet}$ is an isomorphism for some $f \in I$, i.e., $K^{\bullet}$ is a complex of $A_{f}$-modules. Then $R \Gamma_{I}\left(K^{\bullet}\right)=0$.

Proof. Namely, in this case the cohomology modules of $R \Gamma_{I}\left(K^{\bullet}\right)$ are both $f$-power torsion and $f$ acts by automorphisms. Hence the cohomology modules are zero and hence the object is zero.

Let $A$ be a ring and $I \subset A$ a finitely generated ideal. By More on Algebra, Lemma 15.69 .5 the category of $I$-power torsion modules is a Serre subcategory of the category of all $A$-modules, hence there is a functor
0A6N

$$
\begin{equation*}
D\left(I^{\infty} \text {-torsion }\right) \rightarrow D_{I^{\infty} \text {-torsion }}(A) \tag{45.8.3.1}
\end{equation*}
$$

see Derived Categories, Section 13.13 .
0A6P Lemma 45.8.4. Let $A$ be a ring and let $I$ be a finitely generated ideal. Let $M$ and $N$ be I-power torsion modules.
(1) $\operatorname{Hom}_{D(A)}(M, N)=\operatorname{Hom}_{D\left(I^{\infty} \text {-torsion }\right)}(M, N)$,
(2) $\operatorname{Ext}_{D(A)}^{1}(M, N)=E x t_{D\left(I^{\infty} \text {-torsion }\right)}^{1}(M, N)$,
(3) $\operatorname{Ext}_{D\left(I^{\infty} \text {-torsion }\right)}^{2}(M, N) \rightarrow \operatorname{Ext}_{D(A)}^{2}(M, N)$ is not surjective in general,
(4) 45.8.3.1) is not an equivalence in general.

Proof. Parts (1) and (2) follow immediately from the fact that $I$-power torsion forms a Serre subcategory of $\operatorname{Mod}_{A}$. Part (4) follows from part (3).

For part (3) let $A$ be a ring with an element $f \in A$ such that $A[f]$ contains a nonzero element $x$ and $A$ contains elements $x_{n}$ with $f^{n} x_{n}=x$. Such a ring $A$ exists because we can take

$$
A=\mathbf{Z}\left[f, x, x_{n}\right] /\left(f x, f^{n} x_{n}-x\right)
$$

Given $A$ set $I=(f)$. Then the exact sequence

$$
0 \rightarrow A[f] \rightarrow A \xrightarrow{f} A \rightarrow A / f A \rightarrow 0
$$

defines an element in $\operatorname{Ext}_{A}^{2}(A / f A, A[f])$. We claim this element does not come from an element of $\operatorname{Ext}_{D\left(f^{\infty} \text {-torsion }\right)}^{2}(A / f A, A[f])$. Namely, if it did, then there would be an exact sequence

$$
0 \rightarrow A[f] \rightarrow M \rightarrow N \rightarrow A / f A \rightarrow 0
$$

where $M$ and $N$ are $f$-power torsion modules defining the same 2 extension class. Since $A \rightarrow A$ is a complex of free modules and since the 2 extension classes are the same we would be able to find a map

(some details omitted). Then we could replace $M$ by the image of $\varphi$ and $N$ by the image of $\psi$. Then $M$ would be a cyclic module, hence $f^{n} M=0$ for some $n$. Considering $\varphi\left(x_{n+1}\right)$ we get a contradiction with the fact that $f^{n+1} x_{n}=x$ is nonzero in $A[f]$.

### 45.9. Local cohomology

0952 Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Set $Z=V(I) \subset \operatorname{Spec}(A)$. We will construct a functor

0A6Q

$$
\begin{equation*}
R \Gamma_{Z}: D(A) \longrightarrow D_{I^{\infty} \text { _torsion }}(A) \tag{45.9.0.1}
\end{equation*}
$$

which is right adjoint to the inclusion functor. For notation see Section 45.8. The cohomology modules of $R \Gamma_{Z}(K)$ are the local cohomology groups of $K$ with respect to $Z$. In fact, we will show $R \Gamma_{Z}$ computes cohomology with support in $Z$ for the
assocated complex of quasi-coherent sheaves on $\operatorname{Spec}(A)$. By Lemma 45.8.4 this functor will in general not be equal to $R \Gamma_{I}(-)$ even viewed as functors into $D(A)$. In Section 45.10 we will show that if $A$ is Noetherian, then the two agree.

0A6R Lemma 45.9.1. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. There exists a right adjoint $R \Gamma_{Z}$ 45.9.0.1) to the inclusion functor $D_{I^{\infty} \text {-torsion }}(A) \rightarrow$ $D(A)$. In fact, if $I$ is generated by $f_{1}, \ldots, f_{r} \in A$, then we have

$$
R \Gamma_{Z}(K)=\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right) \otimes_{A}^{\mathbf{L}} K
$$

functorially in $K \in D(A)$.
Proof. Say $I=\left(f_{1}, \ldots, f_{r}\right)$ is an ideal. Let $K^{\bullet}$ be a complex of $A$-modules. There is a canonical map of complexes

$$
\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right) \longrightarrow A
$$

from the extended Čech complex to $A$. Tensoring with $K^{\bullet}$, taking associated total complex, we get a map

$$
\operatorname{Tot}\left(K^{\bullet} \otimes_{A}\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)\right) \longrightarrow K^{\bullet}
$$

in $D(A)$. We claim the cohomology modules of the complex on the left are $I$-power torsion, i.e., the LHS is an object of $D_{I^{\infty} \text {-torsion }}(A)$. Namely, we have

$$
\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)=\operatorname{colim} K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)
$$

by More on Algebra, Lemma 15.22.13. Moreover, multiplication by $f_{i}^{n}$ on the complex $K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ is homotopic to zero by More on Algebra, Lemma 15.22 .6 . Since

$$
H^{q}(L H S)=\operatorname{colim} H^{q}\left(\operatorname{Tot}\left(K^{\bullet} \otimes_{A} K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)\right)\right)
$$

we obtain our claim. On the other hand, if $K^{\bullet}$ is an object of $D_{I^{\infty} \text {-torsion }}(A)$, then the complexes $K^{\bullet} \otimes_{A} A_{f_{i_{0}} \ldots f_{i_{p}}}$ have vanishing cohomology. Hence in this case the map $L H S \rightarrow K^{\bullet}$ is an isomorphism in $D(A)$. The construction

$$
R \Gamma_{Z}\left(K^{\bullet}\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{A}\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0} f_{i_{1}}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)\right)
$$

is functorial in $K^{\bullet}$ and defines an exact functor $D(A) \rightarrow D_{I^{\infty} \text { _torsion }}(A)$ between triangulated categories. It follows formally from the existence of the natural transformation $R \Gamma_{Z} \rightarrow$ id given above and the fact that this evaluates to an isomorphism on $K^{\bullet}$ in the subcategory, that $R \Gamma_{Z}$ is the desired right adjoint.

0BJB Lemma 45.9.2. Let $A \rightarrow B$ be a ring homomorphism and let $I \subset A$ be a finitely generated ideal. Set $J=I B$. Set $Z=V(I)$ and $Y=V(J)$. Then

$$
R \Gamma_{Z}\left(M_{A}\right)=R \Gamma_{Y}(M)_{A}
$$

functorially in $M \in D(B)$. Here $(-)_{A}$ denotes the restriction functors $D(B) \rightarrow$ $D(A)$ and $_{A}: D_{J^{\infty} \text {-torsion }}(B) \rightarrow D_{I^{\infty} \text {-torsion }}(A)$.
Proof. This follows from uniquess of adjoint functors as both $R \Gamma_{Z}\left((-)_{A}\right)$ and $R \Gamma_{Y}(-)_{A}$ are right adjoint to the functor $D_{I^{\infty} \text {-torsion }}(A) \rightarrow D(B), K \mapsto K \otimes_{A}^{\mathbf{L}} B$. Alternatively, one can use the description of $R \Gamma_{Z}$ and $R \Gamma_{Y}$ in terms of alternating Čech complexes (Lemma 45.9.1). Namely, if $I=\left(f_{1}, \ldots, f_{r}\right)$ then $J$ is generated by
the images $g_{1}, \ldots, g_{r} \in B$ of $f_{1}, \ldots, f_{r}$. Then the statement of the lemma follows from the existence of a canonical isomorphism

$$
\begin{aligned}
& M_{A} \otimes_{A}\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right) \\
& =M \otimes_{B}\left(B \rightarrow \prod_{i_{0}} B_{g_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} B_{g_{i_{0}} g_{i_{1}}} \rightarrow \ldots \rightarrow B_{g_{1} \ldots g_{r}}\right)
\end{aligned}
$$

for any $B$-module $M$.
0ALZ Lemma 45.9.3. Let $A \rightarrow B$ be a ring homomorphism and let $I \subset A$ be a finitely generated ideal. Set $J=I B$. Let $Z=V(I)$ and $Y=V(J)$. Then

$$
R \Gamma_{Z}(K) \otimes_{A}^{\mathbf{L}} B=R \Gamma_{Y}\left(K \otimes_{A}^{\mathbf{L}} B\right)
$$

functorially in $K \in D(A)$.
Proof. This follows from uniquess of adjoint functors as both $R \Gamma_{Z}(-) \otimes_{A}^{\mathbf{L}} B$ and $R \Gamma_{Y}\left(-\otimes_{A}^{\mathbf{L}} B\right)$ are right adjoint to the functor $D_{J^{\infty} \text {-torsion }}(B) \rightarrow D(A)$. Alternatively, one can use the description of $R \Gamma_{Z}$ and $R \Gamma_{Y}$ in terms of alternating Čech complexes (Lemma 45.9.1) and use that formation of the extended Čech complex commutes with base change.

0A6S Lemma 45.9.4. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $K^{\bullet}$ be a complex of $A$-modules such that $f: K^{\bullet} \rightarrow K^{\bullet}$ is an isomorphism for some $f \in I$, i.e., $K^{\bullet}$ is a complex of $A_{f}$-modules. Then $R \Gamma_{Z}\left(K^{\bullet}\right)=0$.

Proof. Namely, in this case the cohomology modules of $R \Gamma_{Z}\left(K^{\bullet}\right)$ are both $f$-power torsion and $f$ acts by automorphisms. Hence the cohomology modules are zero and hence the object is zero.

0ALY Lemma 45.9.5. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. For $K, L \in D(A)$ we have

$$
R \Gamma_{Z}\left(K \otimes_{A}^{\mathbf{L}} L\right)=K \otimes_{A}^{\mathbf{L}} R \Gamma_{Z}(L)=R \Gamma_{Z}(K) \otimes_{A}^{\mathbf{L}} L=R \Gamma_{Z}(K) \otimes_{A}^{\mathbf{L}} R \Gamma_{Z}(L)
$$

If $K$ or $L$ is in $D_{I^{\infty}-t o r s i o n}(A)$ then so is $K \otimes_{A}^{\mathbf{L}} L$.
Proof. By Lemma 45.9.1 we know that $R \Gamma_{Z}$ is given by $C \otimes^{\mathbf{L}}-$ for some $C \in D(A)$. Hence, for $K, L \in D(A)$ general we have

$$
R \Gamma_{Z}\left(K \otimes_{A}^{\mathbf{L}} L\right)=K \otimes^{\mathbf{L}} L \otimes_{A}^{\mathbf{L}} C=K \otimes_{A}^{\mathbf{L}} R \Gamma_{Z}(L)
$$

The other equalities follow formally from this one. This also implies the last statement of the lemma.

The following lemma tells us that the functor $R \Gamma_{Z}$ is related to cohomology with supports.

0A6T Lemma 45.9.6. Let $A$ be a ring and let $I$ be a finitely generated ideal. With $Z=V(I) \subset X=\operatorname{Spec}(A)$ there is a functorial isomorphism

$$
R \Gamma_{Z}\left(K^{\bullet}\right)=R \Gamma_{Z}\left(\widetilde{K^{\bullet}}\right)
$$

where on the left we have 45.9.0.1) and on the right we have the functor of Cohomology, Section 20.22.

Proof. Denote $\mathcal{F}^{\bullet}=\widetilde{K^{\bullet}}$ be the complex of quasi-coherent $\mathcal{O}_{X}$-modules on $X$ associated to $K^{\bullet}$. By Cohomology, Section 20.22 there exists a distinguished triangle

$$
R \Gamma_{Z}\left(X, \mathcal{F}^{\bullet}\right) \rightarrow R \Gamma\left(X, \mathcal{F}^{\bullet}\right) \rightarrow R \Gamma\left(U, \mathcal{F}^{\bullet}\right) \rightarrow R \Gamma_{Z}\left(X, \mathcal{F}^{\bullet}\right)[1]
$$

where $U=X \backslash Z$. We know that $R \Gamma\left(X, \mathcal{F}^{\bullet}\right)=K^{\bullet}$ for example by Derived Categories of Schemes, Lemma 35.3.5. Say $I=\left(f_{1}, \ldots, f_{r}\right)$. Then we obtain a finite affine open covering $\mathcal{U}: U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{r}\right)$. By Derived Categories of Schemes, Lemma 35.9.4 the alternating Cech complex

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)
$$

computes $R \Gamma\left(U, \mathcal{F}^{\bullet}\right)$. Working through the definitions we find

$$
R \Gamma\left(U, \mathcal{F}^{\bullet}\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{A}\left(\prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)\right)
$$

It is clear that $R \Gamma\left(X, \mathcal{F}^{\bullet}\right) \rightarrow R \Gamma\left(U, \mathcal{F}^{\bullet}\right)$ is given by the map from $A$ into $\prod A_{f_{i}}$. Hence we conclude that

$$
R \Gamma_{Z}\left(X, \mathcal{F}^{\bullet}\right)=\operatorname{Tot}\left(K^{\bullet} \otimes_{A}\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)\right)
$$

By Lemma 45.9.1 this complex computes $R \Gamma_{Z}\left(K^{\bullet}\right)$ and we see the lemma holds.
0BJC Lemma 45.9.7. Let $A$ be a ring and let $I, J \subset A$ be finitely generated ideals. Set $Z=V(I)$ and $Y=V(J)$. Then $Z \cap Y=V(I+J)$ and $R \Gamma_{Y} \circ R \Gamma_{Z}=R \Gamma_{Y \cap Z}$ as functors $D(A) \rightarrow D_{(I+J)^{\infty} \text {-torsion }}(A)$. For $K \in D^{+}(A)$ there is a spectral sequence

$$
E_{2}^{p, q}=H_{Y}^{p}\left(H_{Z}^{p}(K)\right) \Rightarrow H_{Y \cap Z}^{p+q}(K)
$$

as in Derived Categories, Lemma 13.22.2.
Proof. There is a bit of abuse of notation in the lemma as strictly speaking we cannot compose $R \Gamma_{Y}$ and $R \Gamma_{Z}$. The meaning of the statement is simply that we are composing $R \Gamma_{Z}$ with the inclusion $D_{I^{\infty} \text {-torsion }}(A) \rightarrow D(A)$ and then with $R \Gamma_{Y}$. Then the equality $R \Gamma_{Y} \circ R \Gamma_{Z}=R \Gamma_{Y \cap Z}$ follows from the fact that

$$
D_{I^{\infty} \text {-torsion }}(A) \rightarrow D(A) \xrightarrow{R \Gamma_{Y}} D_{(I+J)^{\infty} \text {-torsion }}(A)
$$

is right adjoint to the inclusion $D_{(I+J)^{\infty} \text {-torsion }}(A) \rightarrow D_{I^{\infty} \text {-torsion }}(A)$. Alternatively one can prove the formula using Lemma 45.9.1 and the fact that the tensor product of extended Čech complexes on $f_{1}, \ldots, f_{r}$ and $g_{1}, \ldots, g_{m}$ is the extended Č complex on $f_{1}, \ldots, f_{n} . g_{1}, \ldots, g_{m}$. The final assertion follows from this and the cited lemma.

The following lemma is the analogue of More on Algebra, Lemma 15.72 .21 for complexes with torsion cohomologies.

0AM0 Lemma 45.9.8. Let $A \rightarrow B$ be a flat ring map and let $I \subset A$ be a finitely generated ideal such that $A / I=B / I B$. Then base change and restriction induce quasi-inverse equivalences $D_{I^{\infty} \text {-torsion }}(A)=D_{(I B)^{\infty} \text {-torsion }}(B)$.
Proof. More precisely the functors are $K \mapsto K \otimes_{A}^{\mathbf{L}} B$ for $K$ in $D_{I^{\infty-t o r s i o n ~}}(A)$ and $M \mapsto M_{A}$ for $M$ in $D_{(I B)^{\infty} \text {-torsion }}(B)$. The reason this works is that $H^{i}\left(K \otimes_{A}^{\mathbf{L}} B\right)=$ $H^{i}(K) \otimes_{A} B=H^{i}(K)$. The first equality holds as $A \rightarrow B$ is flat and the second by More on Algebra, Lemma 15.70.2.
The following lemma was shown for Hom and Ext ${ }^{1}$ of modules in More on Algebra, Lemmas 15.70.3 and 15.70.8.

05EH Lemma 45.9.9. Let $A \rightarrow B$ be a flat ring map and let $I \subset A$ be a finitely generated ideal such that $A / I \rightarrow B / I B$ is an isomorphism. For $K \in D_{I^{\infty} \text {-torsion }}(A)$ and $L \in D(A)$ the map

$$
R \operatorname{Hom}_{A}(K, L) \longrightarrow R \operatorname{Hom}_{B}\left(K \otimes_{A} B, L \otimes_{A} B\right)
$$

is a quasi-isomorphism. In particular, if $M, N$ are $A$-modules and $M$ is $I$-power torsion, then the canonical map

$$
\operatorname{Ext}_{A}^{i}(M, N) \longrightarrow \operatorname{Ext}_{B}^{i}\left(M \otimes_{A} B, N \otimes_{A} B\right)
$$

is an isomorphism for all $i$.
Proof. Let $Z=V(I) \subset \operatorname{Spec}(A)$ and $Y=V(I B) \subset \operatorname{Spec}(B)$. Since the cohomology modules of $K$ are $I$ power torsion, the canonical map $R \Gamma_{Z}(L) \rightarrow L$ induces an isomorphism

$$
R \operatorname{Hom}_{A}\left(K, R \Gamma_{Z}(L)\right) \rightarrow R \operatorname{Hom}_{A}(K, L)
$$

in $D(A)$. Similarly, the cohomology modules of $K \otimes_{A} B$ are $I B$ power torsion and we have an isomorphism

$$
R \operatorname{Hom}_{B}\left(K \otimes_{A} B, R \Gamma_{Y}\left(L \otimes_{A} B\right)\right) \rightarrow R \operatorname{Hom}_{B}\left(K \otimes_{A} B, L \otimes_{A} B\right)
$$

in $D(B)$. By Lemma 45.9.3 we have $R \Gamma_{Z}(L) \otimes_{A} B=R \Gamma_{Y}\left(L \otimes_{A} B\right)$. Hence it suffices to show that the map

$$
R \operatorname{Hom}_{A}\left(K, R \Gamma_{Z}(L)\right) \rightarrow R \operatorname{Hom}_{B}\left(K \otimes_{A} B, R \Gamma_{Z}(L) \otimes_{A} B\right)
$$

is a quasi-isomorphism. This follows from Lemma 45.9.8.

### 45.10. Local cohomology for Noetherian rings

0BJD Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Set $Z=V(I) \subset \operatorname{Spec}(A)$. Recall that 45.8.3.1 is the functor

$$
D\left(I^{\infty} \text {-torsion }\right) \rightarrow D_{I^{\infty} \text {-torsion }}(A)
$$

In fact, there is a natural transformation of functors
0A6U (45.10.0.1)

$$
45.8 .3 .1 \circ R \Gamma_{I}(-) \longrightarrow R \Gamma_{Z}(-)
$$

Namely, given a complex of $A$-modules $K^{\bullet}$ the canonical map $R \Gamma_{I}\left(K^{\bullet}\right) \rightarrow K^{\bullet}$ in $D(A)$ factors (uniquely) through $R \Gamma_{Z}\left(K^{\bullet}\right)$ as $R \Gamma_{I}\left(K^{\bullet}\right)$ has $I$-power torsion cohomology modules (see Lemma 45.8.1). In general this map is not an isomorphism (we've seen this in Lemma 45.8.4).

0955 Lemma 45.10.1. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal.
(1) the adjunction $R \Gamma_{I}(K) \rightarrow K$ is an isomorphism for $K \in D_{I^{\infty} \text {-torsion }}(A)$,
(2) the functor 45.8.3.1) $D\left(I^{\infty}\right.$-torsion $) \rightarrow D_{I^{\infty} \text {-torsion }}(A)$ is an equivalence,
(3) the transformation of functors 45.10.0.1) is an isomorphism, in other words $R \Gamma_{I}(K)=R \Gamma_{Z}(K)$ for $K \in D(A)$.

Proof. A formal argument, which we omit, shows that it suffices to prove (1).
Let $M$ be an $I$-power torsion $A$-module. Choose an embedding $M \rightarrow J$ into an injective $A$-module. Then $J\left[I^{\infty}\right]$ is an injective $A$-module, see Lemma 45.3.10, and we obtain an embedding $M \rightarrow J\left[I^{\infty}\right]$. Thus every $I$-power torsion module has an injective resolution $M \rightarrow J^{\bullet}$ with $J^{n}$ also $I$-power torsion. It follows that
$R \Gamma_{I}(M)=M$ (this is not a triviality and this is not true in general if $A$ is not Noetherian). Next, suppose that $K \in D_{I^{\infty} \text {-torsion }}^{+}(A)$. Then the spectral sequence

$$
R^{q} \Gamma_{I}\left(H^{p}(K)\right) \Rightarrow R^{p+q} \Gamma_{I}(K)
$$

(Derived Categories, Lemma 13.21.3) converges and above we have seen that only the terms with $q=0$ are nonzero. Thus we see that $R \Gamma_{I}(K) \rightarrow K$ is an isomorphism.

Suppose $K$ is an arbitrary object of $D_{I^{\infty} \text {-torsion }}(A)$. We have

$$
R^{q} \Gamma_{I}(K)=\operatorname{colim} \operatorname{Ext}_{A}^{q}\left(A / I^{n}, K\right)
$$

by Lemma 45.8.2. Choose $f_{1}, \ldots, f_{r} \in A$ generating $I$. Let $K_{n}^{\bullet}=K\left(A, f_{1}^{n}, \ldots, f_{r}^{n}\right)$ be the Koszul complex with terms in degrees $-r, \ldots, 0$. Since the pro-objects $\left\{A / I^{n}\right\}$ and $\left\{K_{n}^{\bullet}\right\}$ in $D(A)$ are the same by More on Algebra, Lemma 15.74.1, we see that

$$
R^{q} \Gamma_{I}(K)=\operatorname{colim} \operatorname{Ext}_{A}^{q}\left(K_{n}^{\bullet}, K\right)
$$

Pick any complex $K^{\bullet}$ of $A$-modules representing $K$. Since $K_{n}^{\bullet}$ is a finite complex of finite free modules we see that

$$
\operatorname{Ext}_{A}^{q}\left(K_{n}, K\right)=H^{q}\left(\operatorname{Tot}\left(\left(K_{n}^{\bullet}\right)^{\vee} \otimes_{A} K^{\bullet}\right)\right)
$$

where $\left(K_{n}^{\bullet}\right)^{\vee}$ is the dual of the complex $K_{n}^{\bullet}$. See More on Algebra, Lemma 15.60.2. As $\left(K_{n}^{\bullet}\right)^{\vee}$ is a complex of finite free $A$-modules sitting in degrees $0, \ldots, r$ we see that the terms of the complex $\operatorname{Tot}\left(\left(K_{n}^{\bullet}\right)^{\vee} \otimes_{A} K^{\bullet}\right)$ are the same as the terms of the complex $\operatorname{Tot}\left(\left(K_{n}^{\bullet}\right)^{\vee} \otimes_{A} \tau_{\geq q-r-2} K^{\bullet}\right)$ in degrees $q-1$ and higher. Hence we see that

$$
\operatorname{Ext}_{A}^{q}\left(K_{n}, K\right)=\operatorname{Ext}_{A}^{q}\left(K_{n}, \tau_{\geq q-r-2} K\right)
$$

for all $n$. It follows that

$$
R^{q} \Gamma_{I}(K)=R^{q} \Gamma_{I}\left(\tau_{\geq q-r-2} K\right)=H^{q}\left(\tau_{\geq q-r-2} K\right)=H^{q}(K)
$$

Thus we see that the map $R \Gamma_{I}(K) \rightarrow K$ is an isomorphism.
0956 Lemma 45.10.2. If $A$ is a Noetherian ring and $I=\left(f_{1}, \ldots, f_{r}\right)$ an ideal. There are canonical isomorphisms

$$
R \Gamma_{I}(A) \rightarrow\left(A \rightarrow \prod_{i_{0}} A_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}} A_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right) \rightarrow R \Gamma_{Z}(A)
$$

in $D(A)$.
Proof. This follows from Lemma 45.10.1 and the computation of the functor $R \Gamma_{Z}$ in Lemma 45.9.1.

0957 Lemma 45.10.3. If $A \rightarrow B$ is a homomorphism of Noetherian rings and $I \subset A$ is an ideal, then in $D(B)$ we have

$$
R \Gamma_{I}(A) \otimes_{A}^{\mathbf{L}} B=R \Gamma_{Z}(A) \otimes_{A}^{\mathbf{L}} B=R \Gamma_{Y}(B)=R \Gamma_{I B}(B)
$$

where $Y=V(I B) \subset \operatorname{Spec}(B)$.
Proof. Combine Lemmas 45.10 .2 and 45.9.3.

### 45.11. Depth

0AVY In this section we revisit the notion of depth introduced in Algebra, Section 10.71 .
0AVZ Lemma 45.11.1. Let $A$ be a Noetherian ring, let $I \subset A$ be an ideal, and let $M$ be a finite $A$-module such that $I M \neq M$. Then the following integers are equal:
(1) $\operatorname{depth}_{I}(M)$,
(2) the smallest integer $i$ such that $\operatorname{Ext}_{A}^{i}(A / I, M)$ is nonzero, and
(3) the smallest integer $i$ such that $H_{I}^{i}(M)$ is nonzero.

Moreover, we have $\operatorname{Ext}_{A}^{i}(N, M)=0$ for $i<\operatorname{depth}_{I}(M)$ for any finite $A$-module $N$ annihilated by a power of I.

Proof. We prove the equality of (1) and (2) by induction on $\operatorname{depth}_{I}(M)$ which is allowed by Algebra, Lemma 10.71.4
Base case. If $\operatorname{depth}_{I}(M)=0$, then $I$ is contained in the union of the associated primes of $M$ (Algebra, Lemma 10.62.9). By prime avoidance (Algebra, Lemma 10.14 .2 we see that $I \subset \mathfrak{p}$ for some associated prime $\mathfrak{p}$. Hence $\operatorname{Hom}_{A}(A / I, M)$ is nonzero. Thus equality holds in this case.

Assume that $\operatorname{depth}_{I}(M)>0$. Let $f \in I$ be $M$-regular. Consider the short exact sequence

$$
0 \rightarrow M \rightarrow M \rightarrow M / f M \rightarrow 0
$$

and the associated long exact sequence for $\operatorname{Ext}_{A}^{*}(A / I,-)$. Note that $\operatorname{Ext}_{A}^{i}(A / I, M)$ is a finite $A / I$-module (Algebra, Lemmas 10.70 .9 and 10.70 .8 ). Hence we obtain

$$
\operatorname{Hom}_{A}(A / I, M / f M)=\operatorname{Ext}_{A}^{1}(A / I, M)
$$

and short exact sequences

$$
0 \rightarrow \operatorname{Ext}_{A}^{i}(A / I, M) \rightarrow \operatorname{Ext}_{A}^{i}(A / I, M / f M) \rightarrow \operatorname{Ext}_{A}^{i+1}(A / I, M) \rightarrow 0
$$

Thus the equality of (1) and (2) by induction.
Observe that $\operatorname{dept}_{I}(M)=\operatorname{depth}_{I^{n}}(M)$ for all $n \geq 1$ for example by Algebra, Lemma 10.67.8. Hence by the equality of (1) and (2) we see that $\operatorname{Ext}_{A}^{i}\left(A / I^{n}, M\right)=0$ for all $n$ and $i<\operatorname{depth}_{I}(M)$. Let $N$ be a finite $A$-module annihilated by a power of $I$. Then we can choose a short exact sequence

$$
0 \rightarrow N^{\prime} \rightarrow\left(A / I^{n}\right)^{\oplus m} \rightarrow N \rightarrow 0
$$

for some $n, m \geq 0$. Then $\operatorname{Hom}_{A}(N, M) \subset \operatorname{Hom}_{A}\left(\left(A / I^{n}\right)^{\oplus m}, M\right)$ and $\operatorname{Ext}_{A}^{i}(N, M) \subset$ $\operatorname{Ext}_{A}^{i-1}\left(N^{\prime}, M\right)$ for $i<\operatorname{depth}_{I}(M)$. Thus a simply induction argument shows that the final statement of the lemma holds.

Finally, we prove that (3) is equal to (1) and (2). We have $H_{I}^{p}(M)=\operatorname{colim}^{\operatorname{Ext}}{ }_{A}^{p}\left(A / I^{n}, M\right)$ by Lemma 45.8.2. Thus we see that $H_{I}^{i}(M)=0$ for $i<\operatorname{depth}_{I}(M)$. For $i=$ depth $I_{I}(M)$, using the vanishing of $\operatorname{Ext}_{A}^{i-1}\left(I / I^{n}, M\right)$ we see that the map $\operatorname{Ext}_{A}^{i}(A / I, M) \rightarrow$ $H_{I}^{i}(M)$ is injective which proves nonvanishing in the correct degree.

0AW0 Lemma 45.11.2. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. Let $M$ be an $A$-module. Let $Z=V(I)$. Then $H_{I}^{0}(M)=H_{Z}^{0}(M)$. Let $N$ be the common value and set $M^{\prime}=M / N$. Then
(1) $H_{I}^{0}\left(M^{\prime}\right)=0$ and $H_{I}^{p}(M)=H_{I}^{p}\left(M^{\prime}\right)$ and $H_{I}^{p}(N)=0$ for all $p>0$,
(2) $H_{Z}^{0}\left(M^{\prime}\right)=0$ and $H_{Z}^{p}(M)=H_{Z}^{p}\left(M^{\prime}\right)$ and $H_{Z}^{p}(N)=0$ for all $p>0$.

Proof. By definition $H_{I}^{0}(M)=M\left[I^{\infty}\right]$ is $I$-power torsion. By Lemma 45.9.1 we see that

$$
H_{Z}^{0}(M)=\operatorname{Ker}\left(M \longrightarrow M_{f_{1}} \times \ldots \times M_{f_{r}}\right)
$$

if $I=\left(f_{1}, \ldots, f_{r}\right)$. Thus $H_{I}^{0}(M) \subset H_{Z}^{0}(M)$ and conversely, if $x \in H_{Z}^{0}(M)$, then it is annihilated by a $f_{i}^{e_{i}}$ for some $e_{i} \geq 1$ hence annihilated by some power of $I$. This proves the first equality and moreover $N$ is $I$-power torsion. By Lemma 45.8.1 we see that $R \Gamma_{I}(N)=N$. By Lemma 45.9.1 we see that $R \Gamma_{Z}(N)=N$. This proves the higher vanishing of $H_{I}^{p}(N)$ and $H_{Z}^{p}(N)$ in (1) and (2). The vanishing of $H_{I}^{0}\left(M^{\prime}\right)$ and $H_{Z}^{0}\left(M^{\prime}\right)$ follow from the preceding remarks and the fact that $M^{\prime}$ is $I$-power torsion free by More on Algebra, Lemma 15.69.4 The equality of higher cohomologies for $M$ and $M^{\prime}$ follow immediately from the long exact cohomology sequence.

### 45.12. Torsion versus complete modules

0 A 6 V Let $A$ be a ring and let $I$ be a finitely generated ideal. In this case we can consider the derived category $D_{I^{\infty} \text {-torsion }}(A)$ of complexes with $I$-power torsion cohomology modules (Section 45.9) and the derived category $D_{\text {comp }}(A, I)$ of derived complete complexes (More on Algebra, Section 15.72). In this section we show these categories are equivalent. A more general statement can be found in DG02.

0A6W Lemma 45.12.1. Let $A$ be a ring and let $I$ be a finitely generated ideal. Let $R \Gamma_{Z}$ be as in Lemma 45.9.1. Let $\wedge$ denote derived completion as in More on Algebra, Lemma 15.72.9. For an object $K$ in $D(A)$ we have

$$
R \Gamma_{Z}\left(K^{\wedge}\right)=R \Gamma_{Z}(K) \quad \text { and } \quad\left(R \Gamma_{Z}(K)\right)^{\wedge}=K^{\wedge}
$$

in $D(A)$.
Proof. Choose $f_{1}, \ldots, f_{r} \in A$ generating $I$. Recall that

$$
K^{\wedge}=R \operatorname{Hom}_{A}\left(\left(A \rightarrow \prod A_{f_{i_{0}}} \rightarrow \prod A_{f_{i_{0} i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right), K\right)
$$

by More on Algebra, Lemma 15.72.9. Hence the cone $C=\operatorname{Cone}\left(K \rightarrow K^{\wedge}\right)$ is given by

$$
R \operatorname{Hom}_{A}\left(\left(\prod A_{f_{i_{0}}} \rightarrow \prod A_{f_{i_{0} i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right), K\right)
$$

which can be represented by a complex endowed with a finite filtration whose successive quotients are isomorphic to

$$
R \operatorname{Hom}_{A}\left(A_{f_{i_{0}} \ldots f_{i_{p}}}, K\right), \quad p>0
$$

These complexes vanish on applying $R \Gamma_{Z}$, see Lemma 45.9.4 Applying $R \Gamma_{Z}$ to the distinguished triangle $K \rightarrow K^{\wedge} \rightarrow C \rightarrow K[1]$ we see that the first formula of the lemma is correct.

Recall that

$$
R \Gamma_{Z}(K)=K \otimes^{\mathbf{L}}\left(A \rightarrow \prod A_{f_{i_{0}}} \rightarrow \prod A_{f_{i_{0} i_{1}}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)
$$

by Lemma 45.9.1. Hence the cone $C=\operatorname{Cone}\left(R \Gamma_{Z}(K) \rightarrow K\right)$ can be represented by a complex endowed with a finite filtration whose successive quotients are isomorphic to

$$
K \otimes_{A} A_{f_{i_{0}} \ldots f_{i_{p}}}, \quad p>0
$$

These complexes vanish on applying $\wedge$, see More on Algebra, Lemma 15.72 .10 Applying derived completion to the distinguished triangle $R \Gamma_{Z}(K) \rightarrow K \rightarrow C \rightarrow$ $R \Gamma_{Z}(K)[1]$ we see that the second formula of the lemma is correct.

The following result is a special case of a very general phenomenon concerning admissible subcategories of a triangulated category.

0A6X Proposition 45.12.2. Let $A$ be a ring and let $I \subset A$ be a finitely generated ideal. The functors $R \Gamma_{Z}$ and ${ }^{\wedge}$ define quasi-inverse equivalences of categories

$$
D_{I^{\infty} \text {-torsion }}(A) \leftrightarrow D_{\text {comp }}(A, I)
$$

Proof. Follows immediately from Lemma 45.12.1.
The following addendum of the proposition above makes the correspondence on morphisms more precise.

0A6Y Lemma 45.12.3. With notation as in Lemma 45.12.1. For objects $K, L$ in $D(A)$ there is a canonical isomorphism

$$
R \operatorname{Hom}_{A}\left(K^{\wedge}, L^{\wedge}\right) \longrightarrow R \operatorname{Hom}_{A}\left(R \Gamma_{Z}(K), R \Gamma_{Z}(L)\right)
$$

in $D(A)$.
Proof. Say $I=\left(f_{1}, \ldots, f_{r}\right)$. Denote $C=\left(A \rightarrow \prod A_{f_{i}} \rightarrow \ldots \rightarrow A_{f_{1} \ldots f_{r}}\right)$ the alternating Čech complex. Then derived completion is given by $R \operatorname{Hom}_{A}(C,-)$ (More on Algebra, Lemma 15.72.9) and local cohomology by $C \otimes^{\mathbf{L}}$ - (Lemma 45.9.1). Combining the isomorphism

$$
R \operatorname{Hom}_{A}\left(K \otimes^{\mathbf{L}} C, L \otimes^{\mathbf{L}} C\right)=R \operatorname{Hom}_{A}\left(K, R \operatorname{Hom}\left(C, L \otimes^{\mathbf{L}} C\right)\right)
$$

(More on Algebra, Lemma 15.60.1) and the map

$$
L \rightarrow R \operatorname{Hom}_{A}\left(C, L \otimes^{\mathbf{L}} C\right)
$$

(More on Algebra, Lemma 15.60.5) we obtain a map

$$
\gamma: R \operatorname{Hom}_{A}(K, L) \longrightarrow R \operatorname{Hom}_{A}\left(K \otimes^{\mathbf{L}} C, L \otimes^{\mathbf{L}} C\right)
$$

On the other hand, the right hand side is derived complete as it is equal to

$$
R \operatorname{Hom}_{A}\left(C, R \operatorname{Hom}_{A}\left(K, L \otimes^{\mathbf{L}} C\right)\right) .
$$

Thus $\gamma$ factors through the derived completion of $R \operatorname{Hom}_{A}(K, L)$ by the universal property of derived completion. However, the derived completion goes inside the $R \operatorname{Hom}_{A}$ by More on Algebra, Lemma 15.72.11 and we obtain the desired map.

To show that the map of the lemma is an isomorphism we may assume that $K$ and $L$ are derived complete, i.e., $K=K^{\wedge}$ and $L=L^{\wedge}$. In this case we are looking at the map

$$
\gamma: R \operatorname{Hom}_{A}(K, L) \longrightarrow R \operatorname{Hom}_{A}\left(R \Gamma_{Z}(K), R \Gamma_{Z}(L)\right)
$$

By Proposition 45.12 .2 we know that the cohomology groups of the left and the right hand side coincide. In other words, we have to check that the map $\gamma$ sends a morphism $\alpha: K \rightarrow L$ in $D(A)$ to the morphism $R \Gamma_{Z}(\alpha): R \Gamma_{Z}(K) \rightarrow R \Gamma_{Z}(L)$. We omit the verification (hint: note that $R \Gamma_{Z}(\alpha)$ is just the map $\alpha \otimes \mathrm{id}_{C}: K \otimes{ }^{\mathbf{L}} C \rightarrow$ $L \otimes^{\mathbf{L}} C$ which is almost the same as the construction of the map in More on Algebra, Lemma 15.60.5.

### 45.13. Formally catenary rings

0AW1 In this section we prove a theorem of Ratliff Rat71 that a Noetherian local ring is universally catenary if and only if it is formally catenary.

0AW2 Definition 45.13.1. A Noetherian local ring $A$ is formally catenary if for every minimal prime $\mathfrak{p} \subset A$ the ring $A^{\wedge} / \mathfrak{p} A^{\wedge}$ is equidimensional.

The following lemma can be used to construct finite type extensions from given finite type extensions of the formal completion.

0 LLR Lemma 45.13.2. Let $A$ be a Noetherian ring and $I$ an ideal. Let $B$ be a finite type A-algebra. Let $B^{\wedge} \rightarrow C$ be a surjective ring map with kernel $J$ where $B^{\wedge}$ is the $I$-adic completion. If $J / J^{2}$ is annihilated by $I^{c}$ for some $c \geq 0$, then $C$ is isomorphic to the completion of a finite type $A$-algebra.

Proof. Since $B^{\wedge}$ is Noetherian (Algebra, Lemma 10.96.6), we see that $J$ is a finitely generated ideal. Hence we conclude from Algebra, Lemma 10.20.5 that

$$
\operatorname{Spec}(C) \backslash V(I C) \longrightarrow \operatorname{Spec}\left(B^{\wedge}\right) \backslash V\left(I B^{\wedge}\right)
$$

is an open and closed immersion. Let $V \subset \operatorname{Spec}\left(B^{\wedge}\right) \backslash V\left(I B^{\wedge}\right)$ be the complement of the image viewed as an open and closed subscheme. Let $Z \subset \operatorname{Spec}\left(B^{\wedge}\right)$ be the scheme theoretic closure of $V$. Write $Z=\operatorname{Spec}\left(C^{\prime}\right)$. Then

$$
\operatorname{Spec}\left(C \times C^{\prime}\right)=\operatorname{Spec}(C) \amalg Z \longrightarrow \operatorname{Spec}\left(B^{\wedge}\right)
$$

is a finite morphism of schemes which is an isomorphism away from $V\left(I B^{\wedge}\right)$. Hence the corresponding ring map $B^{\wedge} \rightarrow C \times C^{\prime}$ is finite and becomes an isomorphism on inverting any element of $I$. Since $B \rightarrow B^{\wedge}$ is a flat map (Algebra, Lemma 10.96.2) inducing an isomorphism $B / I B \rightarrow B^{\wedge} / I B^{\wedge}$ we may apply More on Algebra, Proposition 15.70 .15 and Remark 15.70 .19 to it. We conclude that $C \times C^{\prime}$ is isomorphic to $D \otimes_{B} B^{\wedge}$ for some finite $B$-algebra $D$. Then $D / I D \cong C / I C \times C^{\prime} / I C^{\prime}$. Let $\bar{e} \in D / I D$ be the idempotent corresponding to the factor $C / I C$. By More on Algebra, Lemma 15.7 .9 there exists an étale ring map $B \rightarrow B^{\prime}$ which induces an isomorphism $B / I B \rightarrow B^{\prime} / I B^{\prime}$ such that $D^{\prime}=D \otimes_{B} B^{\prime}$ contains an idempotent $e$ lifting $\bar{e}$. Since $C \times C^{\prime}$ is $I$-adically complete the pair $\left(C \times C^{\prime}, I C \times I C^{\prime}\right)$ is henselian (More on Algebra, Lemma 15.8.3). Thus we can factor the map $B \rightarrow C \times C^{\prime}$ through $B^{\prime}$. Doing so we may replace $B$ by $B^{\prime}$ and $D$ by $D^{\prime}$. Then we find that $D=D_{e} \times D_{1-e}=D /(1-e) \times D /(e)$ is a product of finite type $A$-algebras and the completion of the first part is $C$ and the completion of the second part is $C^{\prime}$.

0AW3 Lemma 45.13.3. Let $(A, \mathfrak{m})$ be a Noetherian local ring which is not formally catenary. Then $A$ is not universally catenary.

Proof. By assumption there exists a minimal prime $\mathfrak{p} \subset A$ such that $A^{\wedge} / \mathfrak{p} A^{\wedge}$ is not equidimensional. After replacing $A$ by $A / \mathfrak{p}$ we may assume that $A$ is a domain and that $A^{\wedge}$ is not equidimensional. Let $\mathfrak{q}$ be a minimal prime of $A^{\wedge}$ such that $d=\operatorname{dim}\left(A^{\wedge} / \mathfrak{q}\right)$ is minimal and hence $0<d<\operatorname{dim}(A)$. We prove the lemma by induction on $d$.
The case $d=1$. In this case $\operatorname{dim}\left(A_{\mathfrak{q}}^{\wedge}\right)=0$. Hence $A_{\mathfrak{q}}^{\wedge}$ is Artinian local and we see that for some $n>0$ the ideal $J=\mathfrak{q}^{n}$ maps to zero in $A_{\mathfrak{q}}^{\wedge}$. It follows that $\mathfrak{m}$ is the only associated prime of $J / J^{2}$, whence $\mathfrak{m}^{m}$ annihilates $J / J^{2}$ for some $m>0$. Thus we can use Lemma 45.13 .2 to find $A \rightarrow B$ of finite type such that $B^{\wedge} \cong A^{\wedge} / J$. It
follows that $\mathfrak{m}_{B}=\sqrt{\mathfrak{m} B}$ is a maximal ideal with the same residue field as $\mathfrak{m}$ and $B^{\wedge}$ is the $\mathfrak{m}_{B}$-adic completion (Algebra, Lemma 10.96.7). Then

$$
\operatorname{dim}\left(B_{\mathfrak{m}_{B}}\right)=\operatorname{dim}\left(B^{\wedge}\right)=1=d
$$

Since we have the factorization $A \rightarrow B \rightarrow A^{\wedge} / J$ the inverse image of $\mathfrak{q} / J$ is a prime $\mathfrak{q}^{\prime} \subset \mathfrak{m}_{B}$ lying over ( 0 ) in $A$. Thus, if $A$ were universally catenary, the dimension formula (Algebra, Lemma 10.112.1) would give

$$
\begin{aligned}
\operatorname{dim}\left(B_{\mathfrak{m}_{B}}\right) & \geq \operatorname{dim}\left(\left(B / \mathfrak{q}^{\prime}\right)_{\mathfrak{m}_{B}}\right) \\
& =\operatorname{dim}(A)+\operatorname{trdeg}_{f . f .(A)}\left(f . f .\left(B / \mathfrak{q}^{\prime}\right)\right)-\operatorname{trdeg}_{\kappa(\mathfrak{m})}\left(\kappa\left(\mathfrak{m}_{B}\right)\right) \\
& =\operatorname{dim}(A)+\operatorname{trdeg}_{f . f .(A)}\left(f . f .\left(B / \mathfrak{q}^{\prime}\right)\right)
\end{aligned}
$$

This contradictions finishes the argument in case $d=1$.
Assume $d>1$. Let $Z \subset \operatorname{Spec}\left(A^{\wedge}\right)$ be the union of the irreducible components distinct from $V(\mathfrak{q})$. Let $\mathfrak{r}_{1}, \ldots, \mathfrak{r}_{m} \subset A^{\wedge}$ be the prime ideals corresponding to irreducible components of $V(\mathfrak{q}) \cap Z$ of dimension $>0$. Choose $f \in \mathfrak{m}, f \notin A \cap \mathfrak{r}_{j}$ using prime avoidance (Algebra, Lemma 10.14.2). Then $\operatorname{dim}(A / f A)=\operatorname{dim}(A)-1$ and there is some irreducible component of $V(\mathfrak{q}, f)$ of dimension $d-1$. Thus $A / f A$ is not formally catenary and the invariant $d$ has decreased. By induction $A / f A$ is not universally catenary, hence $A$ is not universally catenary.

0AW4 Lemma 45.13.4. Let $A \rightarrow B$ be a flat local ring map of local Noetherian rings. Assume $B$ is catenary and equidimensional. Then
(1) $B / \mathfrak{p} B$ is equidimensional for all $\mathfrak{p} \subset A$,
(2) $A$ is catenary and equidimensional.

Proof. Let $\mathfrak{p} \subset A$ be a prime ideal. Let $\mathfrak{q} \subset B$ be a prime minimal over $\mathfrak{p} B$. Then $\mathfrak{q} \cap A=\mathfrak{p}$ by going down for $A \rightarrow B$ (Algebra, Lemma 10.38.18). Hence $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is a flat local ring map with special fibre of dimension 0 and hence

$$
\operatorname{dim}\left(A_{\mathfrak{p}}\right)=\operatorname{dim}\left(B_{\mathfrak{q}}\right)=\operatorname{dim}(B)-\operatorname{dim}(B / \mathfrak{q})
$$

(Algebra, Lemma 10.111.7). The second equality because $B$ is equidimensional and catenary. Thus $\operatorname{dim}(B / \mathfrak{q})$ is independent of the choice of $\mathfrak{q}$ and we conclude that $B / \mathfrak{p} B$ is equidimensional of dimension $\operatorname{dim}(B)-\operatorname{dim}\left(A_{\mathfrak{p}}\right)$. On the other hand, we have $\operatorname{dim}(B / \mathfrak{p} B)=\operatorname{dim}(A / \mathfrak{p})+\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)$ and $\operatorname{dim}(B)=$ $\operatorname{dim}(A)+\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)$ by flatness (see lemma cited above) and we get

$$
\operatorname{dim}\left(A_{\mathfrak{p}}\right)=\operatorname{dim}(A)-\operatorname{dim}(A / \mathfrak{p})
$$

for all $\mathfrak{p}$ in $A$. Applying this to all minimal primes in $A$ we see that $A$ is equidimensional. If $\mathfrak{p} \subset \mathfrak{p}^{\prime}$ is a strict inclusion with no primes in between, then we may apply the above to the prime $\mathfrak{p}^{\prime} / \mathfrak{p}$ in $A / \mathfrak{p}$ because $A / \mathfrak{p} \rightarrow B / \mathfrak{p} B$ is flat and $B / \mathfrak{p} B$ is equidimensional, to get

$$
1=\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{p}^{\prime}}\right)=\operatorname{dim}(A / \mathfrak{p})-\operatorname{dim}\left(A / \mathfrak{p}^{\prime}\right)
$$

Thus $\mathfrak{p} \mapsto \operatorname{dim}(A / \mathfrak{p})$ is a dimension function and we conclude that $A$ is catenary.
0AW5 Lemma 45.13.5. Let $A$ be a formally catenary Noetherian local ring. Then $A$ is universally catenary.

Proof. We may replace $A$ by $A / \mathfrak{p}$ where $\mathfrak{p}$ is a minimal prime of $A$, see Algebra, Lemma 10.104.7. Thus we may assume that $A^{\wedge}$ is equidimensional. It suffices to show that every local ring essentially of finite type over $A$ is catenary (see for example Algebra, Lemma 10.104.5. Hence it suffices to show that $A\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}}$ is catenary where $\mathfrak{m} \subset A\left[x_{1}, \ldots, x_{n}\right]$ is a maximal ideal lying over $\mathfrak{m}_{A}$, see Algebra, Lemma 10.53 .5 (and Algebra, Lemmas 10.104 .6 and 10.104 .4 . Let $\mathfrak{m}^{\prime} \subset A^{\wedge}\left[x_{1}, \ldots, x_{n}\right]$ be the unique maximal ideal lying over $\mathfrak{m}$. Then

$$
A\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}} \rightarrow A^{\wedge}\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}
$$

is local and flat (Algebra, Lemma 10.96.2). Hence it suffices to show that the ring on the right hand side is equidimensional and catenary, see Lemma 45.13.4. It is catenary because complete local rings are universally catenary (Algebra, Remark $10.152 .9)$. Pick any minimal prime $\mathfrak{q}$ of $A^{\wedge}\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$. Then $\mathfrak{q}=\mathfrak{p} A^{\wedge}\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$ for some minimal prime $\mathfrak{p}$ of $A^{\wedge}$ (small detail omitted). Hence

$$
\operatorname{dim}\left(A^{\wedge}\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}} / \mathfrak{q}\right)=\operatorname{dim}\left(A^{\wedge} / \mathfrak{p}\right)+n=\operatorname{dim}\left(A^{\wedge}\right)+n
$$

the first equality by Algebra, Lemma 10.111.7 and the second because $A^{\wedge}$ is equidimensional. This finishes the proof.

0AW6 Proposition 45.13.6 (Ratliff). A Noetherian local ring is universally catenary if and only if it is formally catenary.

Proof. Combine Lemmas 45.13.3 and 45.13.5.

### 45.14. Finiteness of local cohomology, I

0AW7 We will follow Faltings approach to finiteness of local cohomology modules, see Fal78b and Fal81. Here is a lemma which shows that it suffices to prove local cohomology modules have an annihilator in order to prove that they are finite modules.

0AW8 Lemma 45.14.1. Let $A$ be a Noetherian ring, $I \subset A$ an ideal, $M$ a finite $A$ module, and $n \geq 0$ an integer. Let $Z=V(I)$. The following are equivalent
(1) $H_{Z}^{i}(M)$ is finite for $i \leq n$,
(2) there exists an $e \geq 0$ such that $I^{e}$ annihilates $H_{Z}^{i}(M)$ for $i \leq n$, and
(3) there exists an ideal $J \subset A$ with $V(J) \subset Z$ such that $J$ annihilates $H_{Z}^{i}(M)$ for $i \leq n$.

Proof. We prove the lemma by induction on $n$. For $n=0$ we have $H_{Z}^{0}(M) \subset M$ is finite, hence (1), (2), and (3) are true. Assume that $n>0$.
If (1) is true, then, since $H_{Z}^{i}(M)=H_{I}^{i}(M)$ (Lemma 45.10.1) is $I$-power torsion, we see that (2) holds. It is clear that (2) implies (3).
Assume (3) is true. Let $N=H_{Z}^{0}(M)$ and $M^{\prime}=M / N$. By Lemma 45.11.2 we may replace $M$ by $M^{\prime}$. Thus we may assume that $H_{Z}^{0}(M)=0$. This means that $\operatorname{depth}_{I}(M)>0$ (Lemma 45.11.1). Pick $f \in I$ a nonzerodivisor on $M$. After raising $f$ to a suitable power, we may assume $f \in J$ as $V(J) \subset V(I)$. Then the long exact local cohomology sequence associated to the short exact sequence

$$
0 \rightarrow M \rightarrow M \rightarrow M / f M \rightarrow 0
$$

turns into short exact sequences

$$
0 \rightarrow H_{Z}^{i}(M) \rightarrow H_{Z}^{i}(M / f M) \rightarrow H_{Z}^{i+1}(M) \rightarrow 0
$$

This is a special case of Fal78b Lemma 3].
for $i<n$. We conclude that $J^{2}$ annihilates $H_{Z}^{i}(M / f M)$ for $i<n$. By induction hypothesis we see that $H_{Z}^{i}(M / f M)$ is finite for $i<n$. Using the short exact sequence once more we see that $H_{Z}^{i+1}(M)$ is finite for $i<n$ as desired.

The following result of Faltings allows us to prove finiteness of local cohomology at the level of local rings.

0AW9 Lemma 45.14.2. Let $A$ be a Noetherian ring, $I \subset A$ an ideal, $M$ a finite $A$ module, and $n \geq 0$ an integer. Let $Z=V(I)$. The following are equivalent
(1) the modules $H_{Z}^{i}(M)$ are finite for $i \leq n$, and
(2) for all $\mathfrak{p} \in \operatorname{Spec}(A)$ the modules $H_{Z}^{i}(M)_{\mathfrak{p}}, i \leq n$ are finite $A_{\mathfrak{p}}$-modules.

Proof. The implication $(1) \Rightarrow(2)$ is immediate. We prove the converse by induction on $n$. The case $n=0$ is clear because both (1) and (2) are always true in that case.

Assume $n>0$ and that (2) is true. Let $N=H_{Z}^{0}(M)$ and $M^{\prime}=M / N$. By Lemma 45.11 .2 we may replace $M$ by $M^{\prime}$. Thus we may assume that $H_{Z}^{0}(M)=0$. This means that $\operatorname{depth}_{I}(M)>0$ (Lemma 45.11.1). Pick $f \in I$ a nonzerodivisor on $M$ and consider the short exact sequence

$$
0 \rightarrow M \rightarrow M \rightarrow M / f M \rightarrow 0
$$

which produces a long exact sequence

$$
0 \rightarrow H_{Z}^{0}(M / f M) \rightarrow H_{Z}^{1}(M) \rightarrow H_{Z}^{1}(M) \rightarrow H_{Z}^{1}(M / f M) \rightarrow H_{Z}^{2}(M) \rightarrow \ldots
$$

and similarly after localization. Thus assumption (2) implies that the modules $H_{Z}^{i}(M / f M)_{\mathfrak{p}}$ are finite for $i<n$. Hence by induction assumption $H_{Z}^{i}(M / f M)$ are finite for $i<n$.

Let $\mathfrak{p}$ be a prime of $A$ which is associated to $H_{Z}^{i}(M)$ for some $i \leq n$. Say $\mathfrak{p}$ is the annihilator of the element $x \in H_{Z}^{i}(M)$. Then $\mathfrak{p} \in Z$, hence $f \in \mathfrak{p}$. Thus $f x=0$ and hence $x$ comes from an element of $H_{Z}^{i-1}(M / f M)$ by the boundary map $\delta$ in the long exact sequence above. It follows that $\mathfrak{p}$ is an associated prime of the finite module $\operatorname{Im}(\delta)$. We conclude that $\operatorname{Ass}\left(H_{Z}^{i}(M)\right)$ is finite for $i \leq n$, see Algebra, Lemma 10.62.5.

Recall that

$$
H_{Z}^{i}(M) \subset \prod_{\mathfrak{p} \in \operatorname{Ass}\left(H_{Z}^{i}(M)\right)} H_{Z}^{i}(M)_{\mathfrak{p}}
$$

by Algebra, Lemma 10.62.19. Since by assumption the modules on the right hand side are finite and $I$-power torsion, we can find integers $e_{\mathfrak{p}, i} \geq 0, i \leq n, \mathfrak{p} \in$ $\operatorname{Ass}\left(H_{Z}^{i}(M)\right)$ such that $I^{e_{\mathfrak{p}, i}}$ annihilates $H_{Z}^{i}(M)_{\mathfrak{p}}$. We conclude that $I^{e}$ with $e=$ $\max \left\{e_{\mathfrak{p}, i}\right\}$ annihilates $H_{Z}^{i}(M)$ for $i \leq n$. By Lemma 45.14.1 we see that $H_{Z}^{i}(M)$ is finite for $i \leq n$.

0BPX Lemma 45.14.3. Let $A$ be a ring and let $J \subset I \subset A$ be finitely generated ideals. Let $i \geq 0$ be an integer. Set $Z=V(I)$. If $H_{Z}^{i}(A)$ is annihilated by $J^{n}$ for some $n$, then $H_{Z}^{i}(M)$ annihilated by $J^{m}$ for some $m=m(M)$ for every finitely presented A-module $M$ such that $M_{f}$ is a finite locally free $A_{f}$-module for all $f \in I$.

Proof. Consider the annihilator $\mathfrak{a}$ of $H_{Z}^{i}(M)$. Let $\mathfrak{p} \subset A$ with $\mathfrak{p} \notin Z$. By assumption there exists an $f \in I, f \notin \mathfrak{p}$ and an isomorphism $\varphi: A_{f}^{\oplus r} \rightarrow M_{f}$ of $A_{f}$-modules. Clearing denominators (and using that $M$ is of finite presentation) we find maps

$$
a: A^{\oplus r} \longrightarrow M \quad \text { and } \quad b: M \longrightarrow A^{\oplus r}
$$

with $a_{f}=f^{N} \varphi$ and $b_{f}=f^{N} \varphi^{-1}$ for some $N$. Moreover we may assume that $a \circ b$ and $b \circ a$ are equal to multiplication by $f^{2 N}$. Thus we see that $H_{Z}^{i}(M)$ is annihilated by $f^{2 N} J^{n}$, i.e., $f^{2 N} J^{n} \subset \mathfrak{a}$.

As $U=\operatorname{Spec}(A) \backslash Z$ is quasi-compact we can find finitely many $f_{1}, \ldots, f_{t}$ and $N_{1}, \ldots, N_{t}$ such that $U=\bigcup D\left(f_{j}\right)$ and $f_{j}^{2 N_{j}} J^{n} \subset \mathfrak{a}$. Then $V(I)=V\left(f_{1}, \ldots, f_{t}\right)$ and since $I$ is finitely generated we conclude $I^{M} \subset\left(f_{1}, \ldots, f_{t}\right)$ for some $M$. All in all we see that $J^{m} \subset \mathfrak{a}$ for $m \gg 0$, for example $m=M\left(2 N_{1}+\ldots+2 N_{t}\right) n$ will do.

0BPY Lemma 45.14.4. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Set $Z=V(I)$. Let $n \geq 0$ be an integer. If $H_{Z}^{i}(A)$ is finite for $0 \leq i \leq n$, then the same is true for $H_{Z}^{i}(M), 0 \leq i \leq n$ for any finite $A$-module $M$ such that $M_{f}$ is a finite locally free $A_{f}$-module for all $f \in I$.

Proof. The assumption that $H_{Z}^{i}(A)$ is finite for $0 \leq i \leq n$ implies there exists an $e \geq 0$ such that $I^{e}$ annihilates $H_{Z}^{i}(A)$ for $0 \leq i \leq n$, see Lemma 45.14.1. Then Lemma 45.14.3 implies that $H_{Z}^{i}(M), 0 \leq i \leq n$ is annihilated by $I^{m}$ for some $m=m(M, i)$. We may take the same $m$ for all $0 \leq i \leq n$. Then Lemma 45.14.1 implies that $H_{Z}^{i}(M)$ is finite for $0 \leq i \leq n$ as desired.

### 45.15. Finiteness of pushforwards, I

0BL8 In this section we discuss the easiest nontrivial case of the finiteness theorem, namely, the finiteness of the first local cohomology or what is equivalent, finiteness of $j_{*} \mathcal{F}$ where $j: U \rightarrow X$ is an open immersion, $X$ is locally Noetherian, and $\mathcal{F}$ is a coherent sheaf on $U$. Following a method of Kollár we find a necessary and sufficient condition, see Proposition 45.15.7. The reader who is interested in higher direct images or higher local cohomology groups should skip ahead to Section 45.41 or Section 45.40 (which are developed independently of the rest of this section).

0BJZ Lemma 45.15.1. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. For $x \in U$ let $i_{x}: W_{x} \rightarrow U$ be the integral closed subscheme with generic point $x$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$-module. The following are equivalent
(1) for all $x \in \operatorname{Ass}(\mathcal{F})$ the $\mathcal{O}_{X}$-module $j_{*} i_{x, *} \mathcal{O}_{W_{x}}$ is coherent,
(2) $j_{*} \mathcal{F}$ is coherent.

Proof. We first prove that (1) implies (2). Assume (1) holds. The statement is local on $X$, hence we may assume $X$ is affine. Then $U$ is quasi-compact, hence $\operatorname{Ass}(\mathcal{F})$ is finite (Divisors, Lemma 30.2.5). Thus we may argue by induction on the number of associated points. Let $x \in U$ be a generic point of an irreducible component of the support of $\mathcal{F}$. By Divisors, Lemma 30.2.5 we have $x \in \operatorname{Ass}(\mathcal{F})$. By our choice of $x$ we have $\operatorname{dim}\left(\mathcal{F}_{x}\right)=0$ as $\mathcal{O}_{X, x}$-module. Hence $\mathcal{F}_{x}$ has finite length as an $\mathcal{O}_{X, x}$-module (Algebra, Lemma 10.61.3). Thus we may use induction on this length.

Set $\mathcal{G}=j_{*} i_{x, *} \mathcal{O}_{W_{x}}$. This is a coherent $\mathcal{O}_{X}$-module by assumption. We have $\mathcal{G}_{x}=\kappa(x)$. Choose a nonzero map $\varphi_{x}: \mathcal{F}_{x} \rightarrow \kappa(x)=\mathcal{G}_{x}$. By Cohomology of Schemes, Lemma 29.9.6 there is an open $x \in V \subset U$ and a map $\varphi_{V}:\left.\left.\mathcal{F}\right|_{V} \rightarrow \mathcal{G}\right|_{V}$ whose stalk at $x$ is $\varphi_{x}$. Choose $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$ which does not vanish at $x$ such that $D(f) \subset V$. By Cohomology of Schemes, Lemma 29.10.4 (for example) we see that $\varphi_{V}$ extends to $\left.f^{n} \mathcal{F} \rightarrow \mathcal{G}\right|_{U}$ for some $n$. Precomposing with multiplication by $f^{n}$ we obtain a map $\left.\mathcal{F} \rightarrow \mathcal{G}\right|_{U}$ whose stalk at $x$ is nonzero. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the kernel. Note that $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right) \subset \operatorname{Ass}(\mathcal{F})$, see Divisors, Lemma 30.2.4. Since $\operatorname{length}_{\mathcal{O}_{X, x}}\left(\mathcal{F}^{\prime}\right)=\operatorname{length}_{\mathcal{O}_{X, x}}(\mathcal{F})-1$ we may apply the induction hypothesis to conclude $j_{*} \mathcal{F}^{\prime}$ is coherent. Since $\mathcal{G}=j_{*}\left(\left.\mathcal{G}\right|_{U}\right)=j_{*} i_{x, *} \mathcal{O}_{W_{x}}$ is coherent, we can consider the exact sequence

$$
0 \rightarrow j_{*} \mathcal{F}^{\prime} \rightarrow j_{*} \mathcal{F} \rightarrow \mathcal{G}
$$

By Schemes, Lemma 25.24 .1 the sheaf $j_{*} \mathcal{F}$ is quasi-coherent. Hence the image of $j_{*} \mathcal{F}$ in $j_{*}\left(\left.\mathcal{G}\right|_{U}\right)$ is coherent by Cohomology of Schemes, Lemma 29.9.3. Finally, $j_{*} \mathcal{F}$ is coherent by Cohomology of Schemes, Lemma 29.9.2.

Assume (2) holds. Exactly in the same manner as above we reduce to the case $X$ affine. We pick $x \in \operatorname{Ass}(\mathcal{F})$ and we set $\mathcal{G}=j_{*} i_{x, *} \mathcal{O}_{W_{x}}$. Then we choose a nonzero $\operatorname{map} \varphi_{x}: \mathcal{G}_{x}=\kappa(x) \rightarrow \mathcal{F}_{x}$ which exists exactly because $x$ is an associated point of $\mathcal{F}$. Arguing exactly as above we may assume $\varphi_{x}$ extends to an $\mathcal{O}_{U}$-module map $\varphi:\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{F}$. Then $\varphi$ is injective (for example by Divisors, Lemma 30.2.10) and we find and injective $\operatorname{map} \mathcal{G}=j_{*}\left(\left.\mathcal{G}\right|_{V} \rightarrow j_{*} \mathcal{F}\right.$. Thus (1) holds.

0BK0 Lemma 45.15.2. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Set $X=\operatorname{Spec}(A), Z=V(I), U=X \backslash Z$, and $j: U \rightarrow X$ the inclusion morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$-module. Then
(1) there exists a finite $A$-module $M$ such that $\mathcal{F}$ is the restriction of $\widetilde{M}$ to $U$,
(2) given $M$ there is an exact sequence

$$
0 \rightarrow H_{Z}^{0}(M) \rightarrow M \rightarrow H^{0}(U, \mathcal{F}) \rightarrow H_{Z}^{1}(M) \rightarrow 0
$$

and isomorphisms $H^{p}(U, \mathcal{F})=H_{Z}^{p+1}(M)$ for $p \geq 1$,
(3) given $M$ and $p \geq 0$ the following are equivalent
(a) $R^{p} j_{*} \mathcal{F}$ is coherent,
(b) $H^{p}(U, \mathcal{F})$ is a finite $A$-module,
(c) $H_{Z}^{p+1}(M)$ is a finite $A$-module,
(4) if the equivalent conditions in (3) hold for $p=0$, we may take $M=$ $\Gamma(U, \mathcal{F})$ in which case we have $H_{Z}^{1}(M)=0$.

Proof. By Properties, Lemma 27.22 .4 there exists a coherent $\mathcal{O}_{X}$-module $\mathcal{F}^{\prime}$ whose restriction to $U$ is isomorphic to $\mathcal{F}$. Say $\mathcal{F}^{\prime}$ corresponds to the finite $A$-module $M$ as in (1). Note that $R^{p} j_{*} \mathcal{F}$ is quasi-coherent (Cohomology of Schemes, Lemma 29.4 .5 and corresponds to the $A$-module $H^{p}(U, \mathcal{F})$. By Lemma 45.9 .6 and the general facts in Cohomology, Section 20.22 we obtain an exact sequence

$$
0 \rightarrow H_{Z}^{0}(M) \rightarrow M \rightarrow H^{0}(U, \mathcal{F}) \rightarrow H_{Z}^{1}(M) \rightarrow 0
$$

and isomorphisms $H^{p}(U, \mathcal{F})=H_{Z}^{p+1}(M)$ for $p \geq 1$. Here we use that $H^{j}\left(X, \mathcal{F}^{\prime}\right)=0$ for $j>0$ as $X$ is affine and $\mathcal{F}^{\prime}$ is quasi-coherent (Cohomology of Schemes, Lemma 29.2.2). This proves (2). Parts (3) and (4) are straightforward from (2).

0AWA Lemma 45.15.3. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$ module. Assume
(1) $X$ is Nagata,
(2) $X$ is universally catenary, and
(3) for $x \in \operatorname{Ass}(\mathcal{F})$ and $z \in Z \cap \overline{\{x\}}$ we have $\operatorname{dim}\left(\mathcal{O}_{\overline{\{x\}}, z}\right) \geq 2$.

Then $j_{*} \mathcal{F}$ is coherent.
Proof. By Lemma 45.15.1 it suffices to prove $j_{*} i_{x, *} \mathcal{O}_{W_{x}}$ is coherent for $x \in \operatorname{Ass}(\mathcal{F})$. Let $\pi: Y \rightarrow X$ be the normalization of $X$ in $\operatorname{Spec}(\kappa(x))$, see Morphisms, Section 28.49. By Morphisms, Lemma 28.48 .13 the morphism $\pi$ is finite. Since $\pi$ is finite $\mathcal{G}=\pi_{*} \mathcal{O}_{Y}$ is a coherent $\mathcal{O}_{X}$-module by Cohomology of Schemes, Lemma 29.9.9, Observe that $W_{x}=U \cap \pi(Y)$. Thus $\left.\pi\right|_{\pi^{-1}(U)}: \pi^{-1}(U) \rightarrow U$ factors through $i_{x}: W_{x} \rightarrow U$ and we obtain a canonical map

$$
i_{x, *} \mathcal{O}_{W_{x}} \longrightarrow\left(\left.\pi\right|_{\pi^{-1}(U)}\right)_{*}\left(\mathcal{O}_{\pi^{-1}(U)}\right)=\left.\left(\pi_{*} \mathcal{O}_{Y}\right)\right|_{U}=\left.\mathcal{G}\right|_{U}
$$

This map is injective (for example by Divisors, Lemma 30.2.10). Hence $j_{*} i_{x, *} \mathcal{O}_{W_{x}} \subset$ $\left.j_{*} \mathcal{G}\right|_{U}$ and it suffices to show that $\left.j_{*} \mathcal{G}\right|_{U}$ is coherent.

It remains to prove that $j_{*}\left(\left.\mathcal{G}\right|_{U}\right)$ is coherent. We claim Divisors, Lemma 30.2.11 applies to

$$
\mathcal{G} \longrightarrow j_{*}\left(\left.\mathcal{G}\right|_{U}\right)
$$

which finishes the proof. Let $z \in X$. If $z \in U$, then the map is an isomorphism on stalks as $\left.j_{*}\left(\left.\mathcal{G}\right|_{U}\right)\right|_{U}=\left.\mathcal{G}\right|_{U}$. If $z \in Z$, then $z \notin \operatorname{Ass}\left(j_{*}\left(\left.\mathcal{G}\right|_{U}\right)\right.$ ) (Divisors, Lemmas 30.5 .9 and 30.5 .3 ). Thus it suffices to show that $\operatorname{depth}\left(\mathcal{G}_{z}\right) \geq 2$. Let $y_{1}, \ldots, y_{n} \in Y$ be the points mapping to $z$. By Algebra, Lemma 10.71 .9 it suffices to show that $\operatorname{depth}\left(\mathcal{O}_{Y, y_{i}}\right) \geq 2$ for $i=1, \ldots, n$. If not, then by Properties, Lemma 27.12 .5 we see that $\operatorname{dim}\left(\mathcal{O}_{Y, y_{i}}\right)=1$ for some $i$. This is impossible by the dimension formula (Morphisms, Lemma 28.30.1 for $\pi: Y \rightarrow \overline{\{x\}}$ and assumption (3).
0BK1 Lemma 45.15.4. Let $X$ be an integral locally Noetherian scheme. Let $j: U \rightarrow$ $X$ be the inclusion of a nonempty open subscheme with complement $Z$. Assume that for all $z \in Z$ and any associated prime $\mathfrak{p}$ of the completion $\mathcal{O}_{X, z}^{\wedge}$ we have $\operatorname{dim}\left(\mathcal{O}_{X, z}^{\wedge} / \mathfrak{p}\right) \geq 2$. Then $j_{*} \mathcal{O}_{U}$ is coherent.

Proof. We may assume $X$ is affine. Using Lemmas 45.14 .2 and 45.15 .2 we reduce to $X=\operatorname{Spec}(A)$ where $(A, \mathfrak{m})$ is a Noetherian local domain and $\mathfrak{m} \in Z$. Then we can use induction on $d=\operatorname{dim}(A)$. (The base case is $d=0,1$ which do not happen by our assumption on the local rings.) Set $V=\operatorname{Spec}(A) \backslash\{\mathfrak{m}\}$. Observe that the local rings of $V$ have dimension strictly smaller than $d$. Repeating the arguments for $j^{\prime}: U \rightarrow V$ we and using induction we conclude that $j_{*}^{\prime} \mathcal{O}_{U}$ is a coherent $\mathcal{O}_{V^{-}}$ module. Pick a nonzero $f \in A$ which vanishes on $Z$. Since $D(f) \cap V \subset U$ we find an $n$ such that multiplication by $f^{n}$ on $U$ extends to a map $f^{n}: j_{*}^{\prime} \mathcal{O}_{U} \rightarrow \mathcal{O}_{V}$ over $V$ (for example by Cohomology of Schemes, Lemma 29.10.4). This map is injective hence there is an injective map

$$
j_{*} \mathcal{O}_{U}=j_{*}^{\prime \prime} j_{*}^{\prime} \mathcal{O}_{U} \rightarrow j_{*}^{\prime \prime} \mathcal{O}_{V}
$$

on $X$ where $j^{\prime \prime}: V \rightarrow X$ is the incusion morphism. Hence it suffices to show that $j_{*}^{\prime \prime} \mathcal{O}_{V}$ is coherent. In other words, we may assume that $X$ is the spectrum of a local Noetherian domain and that $Z$ consists of the closed point.

Assume $X=\operatorname{Spec}(A)$ with $(A, \mathfrak{m})$ local and $Z=\{\mathfrak{m}\}$. Let $A^{\wedge}$ be the completion of $A$. Set $X^{\wedge}=\operatorname{Spec}\left(A^{\wedge}\right), Z^{\wedge}=\left\{\mathfrak{m}^{\wedge}\right\}, U^{\wedge}=X^{\wedge} \backslash Z^{\wedge}$, and $\mathcal{F}^{\wedge}=\mathcal{O}_{U^{\wedge}}$. The $\operatorname{ring} A^{\wedge}$ is universally catenary and Nagata (Algebra, Remark 10.152 .9 and Lemma 10.154.8. Moreover, condition (3) of Lemma 45.15 .3 for $X^{\wedge}, Z^{\wedge}, U^{\wedge}, \mathcal{F}^{\wedge}$ holds by assumption! Thus we see that $\left(U^{\wedge} \rightarrow X^{\wedge}\right)_{*} \mathcal{O}_{U^{\wedge}}$ is coherent. Since the morphism $c: X^{\wedge} \rightarrow X$ is flat we conclude that the pullback of $j_{*} \mathcal{O}_{U}$ is $\left(U^{\wedge} \rightarrow X^{\wedge}\right)_{*} \mathcal{O}_{U^{\wedge}}$ (Cohomology of Schemes, Lemma 29.5.2). Finally, since $c$ is faithfully flat we conclude that $j_{*} \mathcal{O}_{U}$ is coherent by Descent, Lemma 34.6.1.

0BK2 Remark 45.15.5. Let $j: U \rightarrow X$ be an open immersion of locally Noetherian schemes. Let $x \in U$. Let $i_{x}: W_{x} \rightarrow U$ be the integral closed subscheme with generic point $x$ and let $\overline{\{x\}}$ be the closure in $X$. Then we have a commutative diagram

We have $j_{*} i_{x, *} \mathcal{O}_{W_{x}}=i_{*} j_{*}^{\prime} \mathcal{O}_{W_{x}}$. As the left vertical arrow is a closed immersion we see that $j_{*} i_{x, *} \mathcal{O}_{W_{x}}$ is coherent if and only of $j_{*}^{\prime} \mathcal{O}_{W_{x}}$ is coherent.

0AWC Remark 45.15.6. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U^{-}}$ module. If there exists an $x \in \operatorname{Ass}(\mathcal{F})$ and $z \in Z \cap \overline{\{x\}}$ such that $\operatorname{dim}\left(\mathcal{O}_{\overline{\{x\}}, z}\right) \leq 1$, then $j_{*} \mathcal{F}$ is not coherent. To prove this we can do a flat base change to the spectrum of $\mathcal{O}_{X, z}$. Let $X^{\prime}=\overline{\{x\}}$. The assumption implies $\mathcal{O}_{X^{\prime} \cap U} \subset \mathcal{F}$. Thus it suffices to see that $j_{*} \mathcal{O}_{X^{\prime} \cap U}$ is not coherent. This is clear because $X^{\prime}=\{x, z\}$, hence $j_{*} \mathcal{O}_{X^{\prime} \cap U}$ corresponds to $\kappa(x)$ as an $\mathcal{O}_{X, z}$-module which cannot be finite as $x$ is not a closed point.

In fact, the converse of Lemma 45.15 .4 holds true: given an open immersion $j$ : $U \rightarrow X$ of integral Noetherian schemes and there exists a $z \in X \backslash U$ and an associated prime $\mathfrak{p}$ of the completion $\mathcal{O}_{X, z}^{\wedge}$ with $\operatorname{dim}\left(\mathcal{O}_{X, z}^{\wedge} / \mathfrak{p}\right)=1$, then $j_{*} \mathcal{O}_{U}$ is not coherent. Namely, you can pass to the local ring, you can enlarge $U$ to the punctured spectrum, you can pass to the completion, and then the argument above gives the nonfiniteness.

0BK3 Proposition 45.15.7 (Kollár). Let $j: U \rightarrow X$ be an open immersion of locally Noetherian schemes with complement $Z$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$-module. The following are equivalent
(1) $j_{*} \mathcal{F}$ is coherent,
(2) for $x \in \operatorname{Ass}(\mathcal{F})$ and $z \in Z \cap \overline{\{x\}}$ and any associated prime $\mathfrak{p}$ of the completion $\mathcal{O} \bar{\wedge} \frac{\wedge}{\{x\}}, z$ we have $\operatorname{dim}\left(\mathcal{O} \frac{\wedge}{\{x\}}, z / \mathfrak{p}\right) \geq 2$.

Proof. If (2) holds we get (1) by a combination of Lemmas 45.15.1, Remark 45.15.5. and Lemma 45.15.4. If (2) does not hold, then $j_{*} i_{x, *} \mathcal{O}_{W_{x}}$ is not finite for some $x \in \operatorname{Ass}(\mathcal{F})$ by the discussion in Remark 45.15.6 (and Remark 45.15.5). Thus $j_{*} \mathcal{F}$ is not coherent by Lemma 45.15.1.
0BL9 Lemma 45.15.8. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Set $Z=V(I)$. Let $M$ be a finite $A$-module. The following are equivalent

Theorem of Kollár stated in an email dated Wed, 1 Jul 2015.
(1) $H_{Z}^{1}(M)$ is a finite $A$-module, and
(2) for all $\mathfrak{p} \in A \operatorname{ss}(M), \mathfrak{p} \notin Z$ and all $\mathfrak{q} \in V(\mathfrak{p}+I)$ the completion of $(A / \mathfrak{p})_{\mathfrak{q}}$ does not have associated primes of dimension 1 .

Proof. Follows immediately from Proposition 45.15 .7 via Lemma 45.15.2.
The formulation in the following lemma has the advantage that conditions (1) and (2) are inherited by schemes of finite type over $X$. Moreover, this is the form of finiteness which we will generalize to higher direct images in Section 45.41.

0AWB Lemma 45.15.9. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$ module. Assume
(1) $X$ is universally catenary,
(2) for every $z \in Z$ the formal fibres of $\mathcal{O}_{X, z}$ are $\left(S_{1}\right)$.

In this situation the following are equivalent
(a) for $x \in \operatorname{Ass}(\mathcal{F})$ and $z \in Z \cap \overline{\{x\}}$ we have $\operatorname{dim}\left(\mathcal{O}_{\overline{\{x\}}, z}\right) \geq 2$, and
(b) $j_{*} \mathcal{F}$ is coherent.

Proof. Let $x \in \operatorname{Ass}(\mathcal{F})$. By Proposition 45.15.7 it suffices to check that $A=\mathcal{O}_{\overline{\{x\}}, z}$ satisfies the condition of the proposition on associated primes of its completion if and only if $\operatorname{dim}(A) \geq 2$. Observe that $A$ is universally catenary (this is clear) and that its formal fibres are $\left(S_{1}\right)$ as follows from More on Algebra, Lemma 15.42.9 and Proposition 15.42.5. Let $\mathfrak{p}^{\prime} \subset A^{\wedge}$ be an associated prime. As $A \rightarrow A^{\wedge}$ is flat, by Algebra, Lemma 10.64 .3 , we find that $\mathfrak{p}^{\prime}$ lies over $(0) \subset A$. Since the formal fibre $A^{\wedge} \otimes_{A} f . f .(A)$ is $\left(S_{1}\right)$ we see that $\mathfrak{p}^{\prime}$ is a minimal prime, see Algebra, Lemma 10.149 .2 . Since $A$ is universally catenary it is formally catenary by Proposition 45.13.6. Hence $\operatorname{dim}\left(A^{\wedge} / \mathfrak{p}^{\prime}\right)=\operatorname{dim}(A)$ which proves the equivalence.

### 45.16. Trivial duality for a ring map

0 A 6 Z Let $A \rightarrow B$ be a ring homomorphism. Consider the functor

$$
\operatorname{Hom}_{A}(B,-): \operatorname{Mod}_{A} \longrightarrow \operatorname{Mod}_{B}, \quad M \longmapsto \operatorname{Hom}_{A}(B, M)
$$

This functor is left exact and has a derived extension $R \operatorname{Hom}(B,-): D(A) \rightarrow$ $D(B)$. If $f_{*}: D(B) \rightarrow D(A)$ is the restriction functor, then $f_{*} R \operatorname{Hom}(B, K)=$ $R \operatorname{Hom}_{A}(B, K)$ for every $K \in D(A)$. Since $R \operatorname{Hom}_{A}(A, K)=K$, the map $A \rightarrow B$ induces a canonical map $f_{*} R \operatorname{Hom}(B, K) \rightarrow K$ in $D(A)$ functorial in $K$.

0A70 Lemma 45.16.1. Let $A \rightarrow B$ be a ring homomorphism. The functor $R \operatorname{Hom}(B,-)$ constructed above is the right adjoint to the restriction functor $f_{*}: D(B) \rightarrow D(A)$.

Proof. This is a consequence of the fact that $f_{*}$ and $\operatorname{Hom}_{A}(B,-)$ are adjoint functors by Algebra, Lemma 10.13.3. See Derived Categories, Lemma 13.28.4
0A71 Lemma 45.16.2. With notation as above. For $K$ in $D(A)$ we have $R^{q} \operatorname{Hom}(B, K)=$ $\operatorname{Ext}_{A}^{4}(B, K)$ as $A$-modules (the left hand side starts out as a $B$-module).
Proof. Omitted.
Let $A$ be a Noetherian ring. We will denote

$$
D_{C o h}(A) \subset D(A)
$$

the full subcategory consisting of those objects $K$ of $D(A)$ whose cohomology modules are all finite $A$-modules. This makes sense by Derived Categories, Section 13.13 because as $A$ is Noetherian, the subcategory of finite $A$-modules is a Serre subcategory of $\operatorname{Mod}_{A}$.
0A72 Lemma 45.16.3. With notation as above, assume $A \rightarrow B$ is a finite ring map of Noetherian rings. Then $R \operatorname{Hom}(B,-)$ maps $D_{\text {Coh }}^{+}(A)$ into $D_{C o h}^{+}(B)$.
Proof. We have to show: if $K \in D^{+}(A)$ has finite cohomology modules, then the complex $R \operatorname{Hom}(B, K)$ has finite cohomology modules too. This follows for example from Lemma 45.16 .2 if we can show the ext modules $\operatorname{Ext}^{i}{ }_{A}(B, K)$ are finite $A$-modules. Since $K$ is bounded below there is a convergent spectral sequence

$$
\operatorname{Ext}_{A}^{p}\left(B, H^{q}(K)\right) \Rightarrow \operatorname{Ext}_{A}^{p+q}(B, K)
$$

This finishes the proof as the modules $\operatorname{Ext}_{A}^{p}\left(B, H^{q}(K)\right)$ are finite by Algebra, Lemma 10.70.9.

0A73 Remark 45.16.4. Let $A$ be a ring and let $I \subset A$ be an ideal. Set $B=A / I$. In this case the functor $\operatorname{Hom}_{A}(B,-)$ is equal to the functor

$$
\operatorname{Mod}_{A} \longrightarrow \operatorname{Mod}_{B}, \quad M \longmapsto M[I]
$$

which sends $M$ to the submodule of $I$-torsion.

### 45.17. Dualizing complexes

0A7A In this section we define dualizing complexes for Noetherian rings.
0A7B Definition 45.17.1. Let $A$ be a Noetherian ring. A dualizing complex is a complex of $A$-modules $\omega_{A}^{\bullet}$ such that
(1) $\omega_{A}^{\bullet}$ has finite injective dimension,
(2) $H^{i}\left(\omega_{A}^{\bullet}\right)$ is a finite $A$-module for all $i$, and
(3) $A \rightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right)$ is a quasi-isomorphism.

This definition takes some time getting used to. It is perhaps a good idea to prove some of the following lemmas yourself without reading the proofs.

0A7C Lemma 45.17.2. Let $A$ be a Noetherian ring. If $\omega_{A}^{\bullet}$ is a dualizing complex, then the functor

$$
D: K \longmapsto R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)
$$

is an anti-equivalence $D_{C o h}(A) \rightarrow D_{\text {Coh }}(A)$ which exchanges $D_{C o h}^{+}(A)$ and $D_{C o h}^{-}(A)$ and induces an equivalence $D_{C o h}^{b}(A) \rightarrow D_{C o h}^{b}(A)$. Moreover $D \circ D$ is isomorphic to the identity functor.

Proof. Let $K$ be an object of $D_{C o h}(A)$. Pick an integer $n$ and consider the distinguihsed triangle

$$
\tau_{\leq n} K \rightarrow K \rightarrow \tau_{\geq n+1} K \rightarrow \tau_{\leq n} K[1]
$$

see Derived Categories, Remark 13.12.4. Since $\omega_{A}^{\bullet}$ has finite injective dimension we see that $R \operatorname{Hom}_{A}\left(\tau_{\geq n+1} K, \omega_{A}^{\bullet}\right)$ has vanishing cohomology in degrees $\geq n-c$ for some constant $c$. On the other hand, we obtain a spectral sequence

$$
\operatorname{Ext}_{A}^{p}\left(H^{-q}\left(\tau_{\leq n} K, \omega_{A}^{\bullet}\right) \Rightarrow \operatorname{Ext}_{A}^{p+q}\left(\tau_{\leq n} K, \omega_{A}^{\bullet}\right)=H^{p+q}\left(R \operatorname{Hom}_{A}\left(\tau_{\leq n} K, \omega_{A}^{\bullet}\right)\right)\right.
$$

which shows that these cohomology modules are finite. Since for $n>p+q+c$ this is equal to $H^{p+q}\left(R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)\right)$ we see that $R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)$ is indeed an
object of $D_{C o h}(A)$. By More on Algebra, Lemma 15.76 .2 and the assumptions on the dualizing complex we obtain a canonical isomorphism

$$
K=R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right) \otimes_{A}^{\mathbf{L}} K \longrightarrow R \operatorname{Hom}_{A}\left(R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right), \omega_{A}^{\bullet}\right)
$$

Thus our functor has a quasi-inverse and the proof is complete.
0A7D Lemma 45.17.3. Let $A$ be a Noetherian ring. Let $K \in D_{C o h}^{b}(A)$. Let $\mathfrak{m}$ be a maximal ideal of $A$. If $H^{i}(K) / \mathfrak{m} H^{i}(K) \neq 0$, then there exists a finite $A$-module $E$ annihilated by a power of $\mathfrak{m}$ and a map $K \rightarrow E[-i]$ which is nonzero on $H^{i}(K)$.
Proof. Let $I$ be the injective hull of the residue field of $\mathfrak{m}$. If $H^{i}(K) / \mathfrak{m} H^{i}(K) \neq 0$, then there exists a nonzero map $H^{i}(K) \rightarrow I$. Since $I$ is injective, we can lift this to a nonzero map $K \rightarrow I[-i]$. Recall that $I=\bigcup I\left[\mathfrak{m}^{n}\right]$, see Lemma 45.7.2 and that each of the modules $E=I\left[\mathfrak{m}^{n}\right]$ is of the desired type. Thus it suffices to prove that

$$
\operatorname{Hom}_{D(A)}(K, I)=\operatorname{colim}_{\operatorname{Hom}_{D(A)}}\left(K, I\left[\mathfrak{m}^{n}\right]\right)
$$

This would be immediate if $K$ where a compact object (or a perfect object) of $D(A)$. This is not the case, but $K$ is a pseudo-coherent object which is enough here. Namely, we can represent $K$ by a bounded above complex of finite free $R$-modules $K^{\bullet}$. In this case the Hom groups above are computed by using $\operatorname{Hom}_{K(A)}\left(K^{\bullet},-\right)$. As each $K^{n}$ is finite free the limit statement holds and the proof is complete.

Let $R$ be a ring. We will say that an object $L$ of $D(R)$ is invertible if there is an open covering $\operatorname{Spec}(R)=\bigcup D\left(f_{i}\right)$ such that $L \otimes_{R} R_{f_{i}} \cong R_{f_{i}}\left[-n_{i}\right]$ for some integers $n_{i}$. In this case, the function

$$
\mathfrak{p} \mapsto n_{\mathfrak{p}}, \quad \text { where } n_{\mathfrak{p}} \text { is the unique integer such that } H^{n_{\mathfrak{p}}}(L \otimes \kappa(\mathfrak{p})) \neq 0
$$

is locally constant on $\operatorname{Spec}(R)$. In particular, it follows that $L=\bigoplus H^{n}(L)[-n]$ which gives a well defined complex of $R$-modules (with zero differentials) representing $L$. Since each $H^{n}(L)$ is finite projective and nonzero for only a finite number of $n$ we also see that $L$ is a perfect object of $D(R)$.
0A7E Lemma 45.17.4. Let $A$ be a Noetherian ring. Let $F: D_{C o h}^{b}(A) \rightarrow D_{C o h}^{b}(A)$ be an A-linear equivalence of categories. Then $F(A)$ is an invertible object of $D(A)$.
Proof. Let $\mathfrak{m} \subset A$ be a maximal ideal with residue field $\kappa$. Consider the object $F(\kappa)$. Since $\kappa=\operatorname{Hom}_{D(A)}(\kappa, \kappa)$ we find that all cohomology groups of $F(\kappa)$ are annihilated by $\mathfrak{m}$. We also see that

$$
\operatorname{Ext}_{A}^{i}(\kappa, \kappa)=\operatorname{Ext}_{A}^{i}(F(\kappa), F(\kappa))=\operatorname{Hom}_{D(A)}(F(\kappa), F(\kappa)[-i])
$$

is zero for $i<0$. Say $H^{a}(F(\kappa)) \neq 0$ and $H^{b}(F(\kappa)) \neq 0$ with $a$ minimal and $b$ maximal (so in particular $a \leq b$ ). Then there is a nonzero map

$$
F(\kappa) \rightarrow H^{b}(F(\kappa))[-b] \rightarrow H^{a}(F(\kappa))[-b] \rightarrow F(\kappa)[a-b]
$$

in $D(A)$ (nonzero because it induces a nonzero map on cohomology). This proves that $b=a$. We conclude that $F(\kappa)=\kappa[-a]$.
Let $G$ be a quasi-inverse to our functor $F$. Arguing as above we find an integer $b$ such that $G(\kappa)=\kappa[-b]$. On composing we find $a+b=0$. Let $E$ be a finite $A$-module wich is annihilated by a power of $\mathfrak{m}$. Arguing by induction on the length of $E$ we find that $G(E)=E^{\prime}[-b]$ for some finite $A$-module $E^{\prime}$ annihilated by a power of $\mathfrak{m}$. Then $E[-a]=F\left(E^{\prime}\right)$. Next, we consider the groups

$$
\operatorname{Ext}_{A}^{i}\left(A, E^{\prime}\right)=\operatorname{Ext}_{A}^{i}\left(F(A), F\left(E^{\prime}\right)\right)=\operatorname{Hom}_{D(A)}(F(A), E[-a+i])
$$

The left hand side is nonzero if and only if $i=0$ and then we get $E^{\prime}$. Applying this with $E=E^{\prime}=\kappa$ and using Nakayama's lemma this implies that $H^{j}(F(A))_{\mathfrak{m}}$ is zero for $j>a$ and generated by 1 element for $j=a$. On the other hand, if $H^{j}(F(A))_{\mathfrak{m}}$ is not zero for some $j<a$, then there is a map $F(A) \rightarrow E[-a+i]$ for some $i<0$ and some $E$ (Lemma 45.17.3) which is a contradiction. Thus we see that $F(A)_{\mathfrak{m}}=M[-a]$ for some $A_{\mathfrak{m}}$-module $M$ generated by 1 element. However, since

$$
A_{\mathfrak{m}}=\operatorname{Hom}_{D(A)}(A, A)_{\mathfrak{m}}=\operatorname{Hom}_{D(A)}(F(A), F(A))_{\mathfrak{m}}=\operatorname{Hom}_{A_{\mathfrak{m}}}(M, M)
$$

we see that $M \cong A_{\mathfrak{m}}$. We conclude that there exists an element $f \in A, f \notin \mathfrak{m}$ such that $F(A)_{f}$ is isomorphic to $A_{f}[-a]$. This finishes the proof.

0A7F Lemma 45.17.5. Let $A$ be a Noetherian ring. If $\omega_{A}^{\bullet}$ and $\left(\omega_{A}^{\prime}\right)^{\bullet}$ are dualizing complexes, then $\left(\omega_{A}^{\prime}\right)^{\bullet}$ is quasi-isomorphic to $\omega_{A}^{\bullet} \otimes_{A}^{\mathbf{L}} L$ for some invertible object $L$ of $D(A)$.
Proof. By Lemmas 45.17.2 and 45.17.4 the functor $K \mapsto R \operatorname{Hom}_{A}\left(R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right),\left(\omega_{A}^{\prime}\right) \bullet\right)$ maps $A$ to an invertible object $L$. In other words, there is an isomorphism

$$
L \longrightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet},\left(\omega_{A}^{\prime}\right)^{\bullet}\right)
$$

Since $L$ has finite tor dimension, this means that we can apply More on Algebra, Lemma 15.76 .2 to see that

$$
R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet},\left(\omega_{A}^{\prime}\right)^{\bullet}\right) \otimes_{A}^{\mathbf{L}} K \longrightarrow R \operatorname{Hom}_{A}\left(R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right),\left(\omega_{A}^{\prime}\right)^{\bullet}\right)
$$

is an isomorphism for $K$ in $D_{C o h}^{b}(A)$. In particular, setting $K=\omega_{A}^{\bullet}$ finishes the proof.

0A7G Lemma 45.17.6. Let $A$ be a Noetherian ring. Let $B=S^{-1} A$ be a localization. If $\omega_{A}^{\bullet}$ is a dualizing complex, then $\omega_{A}^{\bullet} \otimes_{A} B$ is a dualizing complex for $B$.

Proof. Let $\omega_{A}^{\bullet} \rightarrow I^{\bullet}$ be a quasi-isomorphism with $I^{\bullet}$ a bounded complex of injectives. Then $S^{-1} I^{\bullet}$ is a bounded complex of injective $B=S^{-1} A$-modules (Lemma 45.3.9 representing $\omega_{A}^{\bullet} \otimes_{A} B$. Thus $\omega_{A}^{\bullet} \otimes_{A} B$ has finite injective dimension. Since
 cohomology modules. Finally, the map

$$
B \longrightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet} \otimes_{A} B, \omega_{A}^{\bullet} \otimes_{A} B\right)
$$

is a quasi-isomorphism as formation of internal hom commutes with flat base change in this case, see More on Algebra, Lemma 15.76.3.

0A7H Lemma 45.17.7. Let $A$ be a Noetherian ring. Let $f_{1}, \ldots, f_{n} \in A$ generate the unit ideal. If $\omega_{A}^{\bullet}$ is a complex of $A$-modules such that $\left(\omega_{A}^{\bullet}\right)_{f_{i}}$ is a dualizing complex for $A_{f_{i}}$ for all $i$, then $\omega_{A}^{\bullet}$ is a dualizing complex for $A$.

Proof. Consider the double complex

$$
\prod_{i_{0}}\left(\omega_{A}^{\bullet}\right)_{f_{i_{0}}} \rightarrow \prod_{i_{0}<i_{1}}\left(\omega_{A}^{\bullet}\right)_{f_{i_{0}} f_{i_{1}}} \rightarrow \ldots
$$

The associated total complex is quasi-isomorphic to $\omega_{A}^{\bullet}$ for example by Descent, Remark 34.3 .10 or by Derived Categories of Schemes, Lemma 35.9.4. By assumption the complexes $\left(\omega_{A}^{\bullet}\right)_{f_{i}}$ have finite injective dimension as complexes of $A_{f_{i}}$-modules. This implies that each of the complexes $\left(\omega_{A}^{\bullet}\right)_{i_{i_{0}} \ldots f_{i_{p}}}, p>0$ has finite injective dimension over $A_{f_{i_{0}} \ldots f_{i_{p}}}$, see Lemma 45.3.9. This in turn implies that each of the
complexes $\left(\omega_{A}^{\bullet}\right)_{f_{i_{0}} \ldots f_{i_{p}}}, p>0$ has finite injective dimension over $A$, see Lemma 45.3.2. Hence $\omega_{A}^{\bullet}$ has finite injective dimension as a complex of $A$-modules (as it can be represented by a complex endowed with a finite filtration whose graded parts have finite injective dimension). Since $H^{n}\left(\omega_{A}^{\bullet}\right)_{f_{i}}$ is a finite $A_{f_{i}}$ module for each $i$ we see that $H^{i}\left(\omega_{A}^{\bullet}\right)$ is a finite $A$-module, see Algebra, Lemma 10.23.2. Finally, the (derived) base change of the map $A \rightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right)$ to $A_{f_{i}}$ is the map $A_{f_{i}} \rightarrow R \operatorname{Hom}_{A}\left(\left(\omega_{A}^{\bullet}\right)_{f_{i}},\left(\omega_{A}^{\bullet}\right)_{f_{i}}\right)$ by More on Algebra, Lemma 15.76 .3 . Hence we deduce that $A \rightarrow R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right)$ is an isomorphism and the proof is complete.

0A7I Lemma 45.17.8. Let $A \rightarrow B$ be a surjective homomorphism of Noetherian rings. Let $\omega_{A}^{\bullet}$ be a dualizing complex. Then $R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$ is a dualizing complex for $B$.

Proof. Let $\omega_{A}^{\bullet} \rightarrow I^{\bullet}$ be a quasi-isomorphism with $I^{\bullet}$ a bounded complex of injectives. Then $\operatorname{Hom}_{A}\left(B, I^{\bullet}\right)$ is a bounded complex of injective $B$-modules (Lemma 45.3.4) representing $R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$. Thus $R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$ has finite injective dimension. By Lemma 45.16 .3 it is an object of $D_{C o h}(B)$. Finally, we compute

$$
\operatorname{Hom}_{D(B)}\left(R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right), R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)\right)=\operatorname{Hom}_{D(A)}\left(R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right), \omega_{A}^{\bullet}\right)=B
$$

and for $n \neq 0$ we compute
$\operatorname{Hom}_{D(B)}\left(R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right), R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)[n]\right)=\operatorname{Hom}_{D(A)}\left(R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right), \omega_{A}^{\bullet}[n]\right)=0$ which proves the last property of a dualizing complex. In the displayed equations, the first equality holds by Lemma 45.16 .1 and the second equality holds by Lemma 45.17 .2

0A7J Lemma 45.17.9. Let $A$ be a Noetherian ring. If $\omega_{A}^{\bullet}$ is a dualizing complex, then $\omega_{A}^{\bullet} \otimes_{A} A[x]$ is a dualizing complex for $A[x]$.

Proof. Set $B=A[x]$ and $\omega_{B}^{\bullet}=\omega_{A}^{\bullet} \otimes_{A} B$. It follows from Lemma 45.3.11 and More on Algebra, Lemma 15.58 .4 that $\omega_{B}^{\bullet}$ has finite injective dimension. Since $H^{i}\left(\omega_{B}^{\bullet}\right)=H^{i}\left(\omega_{A}^{\bullet}\right) \otimes_{A} B$ by flatness of $A \rightarrow B$ we see that $\omega_{A}^{\bullet} \otimes_{A} B$ has finite cohomology modules. Finally, the map

$$
B \longrightarrow R \operatorname{Hom}_{B}\left(\omega_{B}^{\bullet}, \omega_{B}^{\bullet}\right)
$$

is a quasi-isomorphism as formation of internal hom commutes with flat base change in this case, see More on Algebra, Lemma 15.76.3.

0A7K Proposition 45.17.10. Let A be a Noetherian ring which has a dualizing complex. Then any A-algebra essentially of finite type over A has a dualixing complex.

Proof. This follows from a combination of Lemmas 45.17.6, 45.17.8, and 45.17.9.

0A7L Lemma 45.17.11. Let $A$ be a Noetherian ring. Let $\omega_{A}^{\bullet}$ be a dualizing complex. Let $\mathfrak{m} \subset A$ be a maximal ideal and set $\kappa=A / \mathfrak{m}$. Then $R \operatorname{Hom}_{A}\left(\kappa, \omega_{A}^{\bullet}\right) \cong \kappa[n]$ for some $n \in \mathbf{Z}$.

Proof. This is true because $R \operatorname{Hom}_{A}\left(\kappa, \omega_{A}^{\bullet}\right)$ is a dualizing complex over $\kappa$ (Lemma 45.17.8), because dualizing complexes over $\kappa$ are unique up to shifts (Lemma 45.17.5 , and because $\kappa$ is a dualizing complex over $\kappa$.

### 45.18. Dualizing complexes over local rings

$0 A 7 M$ In this section $(A, \mathfrak{m}, \kappa)$ will be a Noetherian local ring endowed with a dualizing complex $\omega_{A}^{\bullet}$ such that the integer $n$ of Lemma 45.17 .11 is zero. More precisely, we assume that $R \operatorname{Hom}_{A}\left(\kappa, \omega_{A}^{\bullet}\right)=\kappa[0]$. In this case we will say that the dualizing complex is normalized. Observe that a normalized dualizing complex is unique up to isomorphism and that any other dualizing complex for $A$ is isomorphic to a shift of a normalized one (Lemma 45.17.5).

0A7N Lemma 45.18.1. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $A \rightarrow B$ be surjective. Then $\omega_{B}^{\bullet}=R \operatorname{Hom}_{A}\left(B, \omega_{A}^{\bullet}\right)$ is a normalized dualizing complex for $B$.

Proof. By Lemma 45.17 .8 the complex $\omega_{B}^{\bullet}$ is dualizing for $B$. We compute

$$
R \operatorname{Hom}_{B}\left(\kappa, R \operatorname{Hom}_{A}\left(B, \omega_{A}^{\bullet}\right)\right)=R \operatorname{Hom}_{A}\left(\kappa, \omega_{A}^{\bullet}\right) \cong \kappa[0]
$$

The first equality by Lemma 45.16.1.
0A7P Lemma 45.18.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $F$ be an A-linear self-equivalence of the category of finite length $A$-modules. Then $F$ is isomorphic to the identity functor.

Proof. Since $\kappa$ is the unique simple object of the category we have $F(\kappa) \cong \kappa$. Since our category is abelian, we find that $F$ is exact. Hence $F(E)$ has the same length as $E$ for all finite length modules $E$. Since $\operatorname{Hom}(E, \kappa)=\operatorname{Hom}(F(E), F(\kappa)) \cong$ $\operatorname{Hom}(F(E), \kappa)$ we conclude from Nakayama's lemma that $E$ and $F(E)$ have the same number of generators. Hence $F\left(A / \mathfrak{m}^{n}\right)$ is a cyclic $A$-module. Pick a generator $e \in F\left(A / \mathfrak{m}^{n}\right)$. Since $F$ is $A$-linear we conclude that $\mathfrak{m}^{n} e=0$. The map $A / \mathfrak{m}^{n} \rightarrow$ $F\left(A / \mathfrak{m}^{n}\right)$ has to be an isomorphism as the lengths are equal. Pick an element

$$
e \in \lim F\left(A / \mathfrak{m}^{n}\right)
$$

which maps to a generator for all $n$ (small argument omitted). Then we obtain a system of isomorphisms $A / \mathfrak{m}^{n} \rightarrow F\left(A / \mathfrak{m}^{n}\right)$ compatible with all $A$-module maps $A / \mathfrak{m}^{n} \rightarrow A / \mathfrak{m}^{n^{\prime}}$ (by $A$-linearity of $F$ again). Since any finite lenghth module is a cokernel of a map between direct sums of cyclic modules, we obtain the isomorphism of the lemma.

0A7Q Lemma 45.18.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $E$ be an injective hull of $\kappa$. Then there exists a functorial isomorphism

$$
R \operatorname{Hom}_{A}\left(N, \omega_{A}^{\bullet}\right)=\operatorname{Hom}_{A}(N, E)[0]
$$

for $N$ running through the finite length $A$-modules.
Proof. By induction on the length of $N$ we see that $R \operatorname{Hom}_{A}\left(N, \omega_{A}^{\bullet}\right)$ is a module of finite length sitting in degree 0 . Thus $R \operatorname{Hom}_{A}\left(-, \omega_{A}^{\bullet}\right)$ induces an anti-equivalence on the category of finite length modules. Since the same is true for $\operatorname{Hom}_{A}(-, E)$ by Proposition 45.7.8 we see that

$$
N \longmapsto \operatorname{Hom}_{A}\left(R \operatorname{Hom}_{A}\left(N, \omega_{A}^{\bullet}\right), E\right)
$$

is an equivalence as in Lemma 45.18.2. Hence it is isomorphic to the identity functor. Since $\operatorname{Hom}_{A}(-, E)$ applied twice is the identity (Proposition 45.7.8) we obtain the statement of the lemma.

0A7U Lemma 45.18.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $M$ be a finite $A$-module and let $d=\operatorname{dim}(\operatorname{Supp}(M))$. Then
(1) if $E x t_{A}^{i}\left(M, \omega_{A}^{\bullet}\right)$ is nonzero, then $i \in\{-d, \ldots, 0\}$,
(2) the dimension of the support of $\operatorname{Ext}_{A}^{i}\left(M, \omega_{A}^{\bullet}\right)$ is at most $-i$,
(3) depth $(M)$ is the smallest integer $\delta \geq 0$ such that $\operatorname{Ext}_{A}^{-\delta}\left(M, \omega_{A}^{\bullet}\right) \neq 0$.

Proof. We prove this by induction on $d$. If $d=0$, this follows from Lemma 45.18 .3 and Matlis duality (Proposition 45.7.8) which guarantees that $\operatorname{Hom}_{A}(M, E)$ is nonzero if $M$ is nonzero.

Assume the result holds for modules with support of dimension $<d$ and that $M$ has depth $>0$. Choose an $f \in \mathfrak{m}$ which is a nonzerodivisor on $M$ and consider the short exact sequence

$$
0 \rightarrow M \rightarrow M \rightarrow M / f M \rightarrow 0
$$

Since $\operatorname{dim}(\operatorname{Supp}(M / f M))=d-1$ (Algebra, Lemma 10.62.10 we may apply the induction hypothesis. Writing $E^{i}=\operatorname{Ext}_{A}^{i}\left(M, \omega_{A}^{\bullet}\right)$ and $F^{i}=\operatorname{Ext}_{A}^{i}\left(M / f M, \omega_{A}^{\bullet}\right)$ we obtain a long exact sequence

$$
\ldots \rightarrow F^{i} \rightarrow E^{i} \xrightarrow{f} E^{i} \rightarrow F^{i+1} \rightarrow \ldots
$$

By induction $E^{i} / f E^{i}=0$ for $i+1 \notin\{-\operatorname{dim}(\operatorname{Supp}(M / f M)), \ldots,-\operatorname{depth}(M / f M)\}$. By Nakayama's lemma (Algebra, Lemma 10.19.1) and Algebra, Lemma 10.71.7 we conclude $E^{i}=0$ for $i \notin\{-\operatorname{dim}(\operatorname{Supp}(M)), \ldots,-\operatorname{depth}(M)\}$. Moreover, in the boundary case $i=-\operatorname{depth}(M)$ we deduce that $E^{i}$ is nonzero as $F^{i+1}$ is nonzero by induction. Since $E^{i} / f E^{i} \subset F^{i+1}$ we get

$$
\operatorname{dim}\left(\operatorname{Supp}\left(F^{i+1}\right)\right) \geq \operatorname{dim}\left(\operatorname{Supp}\left(E^{i} / f E^{i}\right)\right) \geq \operatorname{dim}\left(\operatorname{Supp}\left(E^{i}\right)\right)-1
$$

(see lemma used above) we also obtain the dimension estimate (2).
If $M$ has depth 0 and $d>0$ we let $N=M\left[\mathfrak{m}^{\infty}\right]$ and set $M^{\prime}=M / N$ (compare with Lemma 45.11.2. Then $M^{\prime}$ has depth $>0$ and $\operatorname{dim}\left(\operatorname{Supp}\left(M^{\prime}\right)\right)=d$. Thus we know the result for $M^{\prime}$ and since $R \operatorname{Hom}_{A}\left(N, \omega_{A}^{\bullet}\right)=\operatorname{Hom}_{A}(N, E)$ (Lemma 45.18.3) the long exact cohomology sequence of Ext's implies the result for $M$.

0B5A Lemma 45.18.5. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $M$ be a finite $A$-module. The following are equivalent
(1) $M$ is Cohen-Macaulay,
(2) $E x t_{A}^{i}\left(M, \omega_{A}^{\bullet}\right)$ is nonzero for a single $i$,
(3) $E x t_{A}^{i}\left(M, \omega_{A}^{\bullet}\right)$ is zero for $i \neq \operatorname{dim}(\operatorname{Supp}(M))$.

Denote $C M_{d}$ the category of finite Cohen-Macaulay $A$-modules of depth d. Then $M \mapsto \operatorname{Ext}_{A}^{-d}\left(M, \omega_{A}^{\bullet}\right)$ defines an anti-auto-equivalence of $C M_{d}$.

Proof. We will use the results of Lemma 45.18 .4 without further mention. Fix a finite module $M$. If $M$ is Cohen-Macaulay, then only $\operatorname{Ext}_{A}^{-d}\left(M, \omega_{A}^{\bullet}\right)$ can be nonzero, hence $(1) \Rightarrow(3)$. The implication $(3) \Rightarrow(2)$ is immediate. Assume (2) and let $N=\operatorname{Ext}_{A}^{-\delta}\left(M, \omega_{A}^{\bullet}\right)$ be the nonzero Ext where $\delta=\operatorname{depth}(M)$. Then, since

$$
M[0]=R \operatorname{Hom}_{A}\left(R \operatorname{Hom}_{A}\left(M, \omega_{A}^{\bullet}\right), \omega_{A}^{\bullet}\right)=R \operatorname{Hom}_{A}\left(N[\delta], \omega_{A}^{\bullet}\right)
$$

(Lemma 45.17.2 we conclude that $M=\operatorname{Ext}_{A}^{-\delta}\left(N, \omega_{A}^{\bullet}\right)$. Thus $\delta \geq \operatorname{dim}(\operatorname{Supp}(M))$. Howeover, since we also know that $\delta \leq \operatorname{dim}(\operatorname{Supp}(M))$ (Algebra, Lemma 10.71.3) we conclude that $M$ is Cohen-Macaulay.

To prove the final statement, it suffices to show that $N=\operatorname{Ext}_{A}^{-d}\left(M, \omega_{A}^{\bullet}\right)$ is in $C M_{d}$ for $M$ in $C M_{d}$. Above we have seen that $M[0]=R \operatorname{Hom}_{A}\left(N[d], \omega_{A}^{\bullet}\right)$ and this proves the desired result by the equivalence of (1) and (3).
0A7R Lemma 45.18.6. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. If $\operatorname{dim}(A)=0$, then $\omega_{A}^{\bullet} \cong E[0]$ where $E$ is an injective hull of the residue field.
Proof. Immediate from Lemma 45.18.3.
0A7S Lemma 45.18.7. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex. Let $I \subset \mathfrak{m}$ be an ideal of finite length. Set $B=A / I$. Then there is a distinguished triangle

$$
\omega_{B}^{\bullet} \rightarrow \omega_{A}^{\bullet} \rightarrow \operatorname{Hom}_{A}(I, E)[0] \rightarrow \omega_{B}^{\bullet}[1]
$$

in $D(A)$ where $E$ is an injective hull of $\kappa$ and $\omega_{B}^{\bullet}$ is a normalized dualizing complex for $B$.
Proof. Use the short exact sequence $0 \rightarrow I \rightarrow A \rightarrow B \rightarrow 0$ and Lemmas 45.18.3 and 45.18.1.

0A7T Lemma 45.18.8. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $f \in \mathfrak{m}$ be a nonzerodivisor. Set $B=A /(f)$. Then there is $a$ distinguished triangle

$$
\omega_{B}^{\bullet} \rightarrow \omega_{A}^{\bullet} \rightarrow \omega_{A}^{\bullet} \rightarrow \omega_{B}^{\bullet}[1]
$$

in $D(A)$ where $\omega_{B}^{\bullet}$ is a normalized dualizing complex for $B$.
Proof. Use the short exact sequence $0 \rightarrow A \rightarrow A \rightarrow B \rightarrow 0$ and Lemma 45.18.1.

0AWD Lemma 45.18.9. Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. If $A \rightarrow B$ is flat and $\mathfrak{m}_{A} B=\mathfrak{m}_{B}$, then $\omega_{A}^{\bullet} \otimes_{A} B$ is a normalized dualizing complex for $B$.

Proof. It is clear that $\omega_{A}^{\bullet} \otimes_{A} B$ is in $D_{C o h}^{b}(B)$. Let $\kappa_{A}$ and $\kappa_{B}$ be the residue fields of $A$ and $B$. By More on Algebra, Lemma 15.76 .3 we see that

$$
R \operatorname{Hom}_{B}\left(\kappa_{B}, \omega_{A}^{\bullet} \otimes_{A} B\right)=R \operatorname{Hom}_{A}\left(\kappa_{A}, \omega_{A}^{\bullet}\right) \otimes_{A} B=\kappa_{A}[0] \otimes_{A} B=\kappa_{B}[0]
$$

Thus $\omega_{A}^{\bullet} \otimes_{A} B$ has finite injective dimension by More on Algebra, Lemma 15.58.5 Finally, we can use the same arguments to see that

$$
R \operatorname{Hom}_{B}\left(\omega_{A}^{\bullet} \otimes_{A} B, \omega_{A}^{\bullet} \otimes_{A} B\right)=R \operatorname{Hom}_{A}\left(\omega_{A}^{\bullet}, \omega_{A}^{\bullet}\right) \otimes_{A} B=A \otimes_{A} B=B
$$

as desired.
0A7V Lemma 45.18.10. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $\mathfrak{p}$ be a minimal prime of $A$ with $\operatorname{dim}(A / \mathfrak{p})=e$. Then $H^{i}\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ is nonzero if and only if $i=-e$.
Proof. Since $A_{\mathfrak{p}}$ has dimension zero, there exists an integer $n>0$ such that $\mathfrak{p}^{n} A_{\mathfrak{p}}$ is zero. Set $B=A / \mathfrak{p}^{n}$ and $\omega_{B}^{\bullet}=R \operatorname{Hom}_{A}\left(B, \omega_{A}^{\bullet}\right)$. Since $B_{\mathfrak{p}}=A_{\mathfrak{p}}$ we see that $\left(\omega_{B}^{\bullet}\right)_{\mathfrak{p}} \cong\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ by using More on Algebra, Lemma 15.76.3. By Lemma 45.18.1 we may replace $A$ by $B$. After doing so, we see that $\operatorname{dim}(A)=e$. Then we see that $H^{i}\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ can only be nonzero if $i=-e$ by Lemma 45.18.4. On the other hand, since $\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ is a dualizing complex for the nonzero ring $A_{\mathfrak{p}}$ (Lemma 45.17.6) we see that the remaining module has to be nonzero.

### 45.19. The dimension function of a dualizing complex

0A7W Our results in the local setting have the following consequence: a Noetherian ring with has a dualizing complex is a universally catenary ring of finite dimension.
0A7X Lemma 45.19.1. Let $A$ be a Noetherian ring. Let $\mathfrak{p}$ be a minimal prime of $A$. Then $H^{i}\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ is nonzero for exactly one $i$.
Proof. The complex $\omega_{A}^{\bullet} \otimes_{A} A_{\mathfrak{p}}$ is a dualizing complex for $A_{\mathfrak{p}}$ (Lemma 45.17.6). The dimension of $A_{\mathfrak{p}}$ is zero as $\mathfrak{p}$ is minimal. Hence the result follows from Lemma 45.18 .6

Let $A$ be a Noetherian ring and let $\omega_{A}^{\bullet}$ be a dualizing complex. Lemma 45.17.11 allows us to define a function

$$
\delta=\delta_{\omega_{A}^{\bullet}}: \operatorname{Spec}(A) \longrightarrow \mathbf{Z}
$$

by mapping $\mathfrak{p}$ to the integer of Lemma 45.17 .11 for the dualizing complex $\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}$ over $A_{\mathfrak{p}}$ (Lemma 45.17.6) and the residue field $\kappa(\mathfrak{p})$. To be precise, we define $\delta(\mathfrak{p})$ to be the unique integer such that

$$
\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}[-\delta(\mathfrak{p})]
$$

is a normalized dualizing complex over the Noetherian local ring $A_{\mathfrak{p}}$.
0A7Y Lemma 45.19.2. Let $A$ be a Noetherian ring and let $\omega_{A}^{\bullet}$ be a dualizing complex. Let $A \rightarrow B$ be a surjective ring map and let $\omega_{B}^{\bullet}=R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$ be the dualizing complex for $B$ of Lemma 45.17.8. Then we have

$$
\delta_{\omega_{B}^{\bullet}}=\left.\delta_{\omega_{A}^{\bullet}}\right|_{\operatorname{Spec}(B)}
$$

Proof. This follows from the definition of the functions and Lemma 45.18.1.
0A7Z Lemma 45.19.3. Let $A$ be a Noetherian ring and let $\omega_{A}^{\bullet}$ be a dualizing complex. The function $\delta=\delta_{\omega_{A}^{\bullet}}$ defined above is a dimension function (Topology, Definition 5.19.1).

Proof. Let $\mathfrak{p} \subset \mathfrak{q}$ be an immediate specialization. We have to show that $\delta(\mathfrak{p})=$ $\delta(\mathfrak{q})+1$. We may replace $A$ by $A / \mathfrak{p}$, the complex $\omega_{A}^{\bullet}$ by $\omega_{A / \mathfrak{p}}^{\bullet}=R \operatorname{Hom}\left(A / \mathfrak{p}, \omega_{A}^{\bullet}\right)$, the prime $\mathfrak{p}$ by (0), and the prime $\mathfrak{q}$ by $\mathfrak{q} / \mathfrak{p}$, see Lemma 45.19.2. Thus we may assume that $A$ is a domain, $\mathfrak{p}=(0)$, and $\mathfrak{q}$ is a prime ideal of height 1 .

Then $H^{i}\left(\omega_{A}^{\bullet}\right)_{(0)}$ is nonzero for exactly one $i$, say $i_{0}$, by Lemma 45.19.1. In fact $i_{0}=-\delta((0))$ because $\left(\omega_{A}^{\bullet}\right)_{(0)}[-\delta((0))]$ is a normalized dualizing complex over the field $A_{(0)}$.
On the other hand $\left(\omega_{A}^{\bullet}\right)_{\mathfrak{q}}[-\delta(\mathfrak{q})]$ is a normalized dualizing complex for $A_{\mathfrak{q}}$. By Lemma 45.18.10 we see that

$$
H^{e}\left(\left(\omega_{A}^{\bullet}\right)_{\mathfrak{q}}[-\delta(\mathfrak{q})]\right)_{(0)}=H^{e-\delta(\mathfrak{q})}\left(\omega_{A}^{\bullet}\right)_{(0)}
$$

is nonzero only for $e=-\operatorname{dim}\left(A_{\mathfrak{q}}\right)=-1$. We conclude

$$
-\delta((0))=-1-\delta(\mathfrak{p})
$$

as desired.
0A80 Lemma 45.19.4. Let $A$ be a Noetherian ring which has a dualizing complex. Then $A$ is universally catenary of finite dimension.

Proof. Because $\operatorname{Spec}(A)$ has a dimension function by Lemma 45.19.3 it is catenary, see Topology, Lemma 5.19.2. Hence $A$ is catenary, see Algebra, Lemma 10.104.2. It follows from Proposition 45.17 .10 that $A$ is universally catenary.
Because any dualizing complex $\omega_{A}^{\bullet}$ is in $D_{C o h}^{b}(A)$ the values of the function $\delta_{\omega_{A}}$ in minimal primes are bounded by Lemma 45.19.1. On the other hand, for a maximal ideal $\mathfrak{m}$ with residue field $\kappa$ the integer $i=-\delta(\mathfrak{m})$ is the unique integer such that $\operatorname{Ext}_{A}^{i}\left(\kappa, \omega_{A}^{\bullet}\right)$ is nonzero (Lemma 45.17.11). Since $\omega_{A}^{\bullet}$ has finite injective dimension these values are bounded too. Since the dimension of $A$ is the maximal value of $\delta(\mathfrak{p})-\delta(\mathfrak{m})$ where $\mathfrak{p} \subset \mathfrak{m}$ are a pair consisting of a minimal prime and a maximal prime we find that the dimension of $\operatorname{Spec}(A)$ is bounded.

0AWE Lemma 45.19.5. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Let $d=\operatorname{dim}(A)$ and $\omega_{A}=H^{-d}\left(\omega_{A}^{\bullet}\right)$. Then
(1) the support of $\omega_{A}$ is the union of the irreducible components of $\operatorname{Spec}(A)$ of dimension $d$,
(2) $\omega_{A}$ satisfies $\left(S_{2}\right)$, see Algebra, Definition 10.149.1.

Proof. We will use Lemma 45.18 .4 without further mention. By Lemma 45.18 .10 the support of $\omega_{A}$ contains the irreducible components of dimension $d$. Let $\mathfrak{p} \subset$ $A$ be a prime. By Lemma 45.19 .3 the complex $\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}[\operatorname{dim}(A / \mathfrak{p})]$ is a normalized dualizing complex for $A_{\mathfrak{p}}$. Hence if $\operatorname{dim}(A / \mathfrak{p})+\operatorname{dim}\left(A_{\mathfrak{p}}\right)<d$, then $\left(\omega_{A}\right)_{\mathfrak{p}}=0$. This proves the support of $\omega_{A}$ is the union of the irreducible components of dimension $d$, because the complement of this union is exactly the primes $\mathfrak{p}$ of $A$ for which $\operatorname{dim}(A / \mathfrak{p})+\operatorname{dim}\left(A_{\mathfrak{p}}\right)<d$ as $A$ is catenary (Lemma 45.19.4. On the other hand, if $\operatorname{dim}(A / \mathfrak{p})+\operatorname{dim}\left(A_{\mathfrak{p}}\right)=d$, then

$$
\left(\omega_{A}\right)_{\mathfrak{p}}=H^{-\operatorname{dim}\left(A_{\mathfrak{p}}\right)}\left(\left(\omega_{A}^{\bullet}\right)_{\mathfrak{p}}[\operatorname{dim}(A / \mathfrak{p})]\right)
$$

Hence in order to prove $\omega_{A}$ has $\left(S_{2}\right)$ it suffices to show that the depth of $\omega_{A}$ is at least $\min (\operatorname{dim}(A), 2)$. We prove this by induction on $\operatorname{dim}(A)$. The case $\operatorname{dim}(A)=0$ is trivial.

Assume $\operatorname{depth}(A)>0$. Choose a nonzerodivisor $f \in \mathfrak{m}$ and set $B=A / f A$. Then $\operatorname{dim}(B)=\operatorname{dim}(A)-1$ and we may apply the induction hypothesis to $B$. By Lemma 45.18 .8 we see that multiplication by $f$ is injective on $\omega_{A}$ and we get $\omega_{A} / f \omega_{A} \subset \omega_{B}$. This proves the depth of $\omega_{A}$ is at least 1 . If $\operatorname{dim}(A)>1$, then $\operatorname{dim}(B)>0$ and $\omega_{B}$ has depth $>0$. Hence $\omega_{A}$ has depth $>1$ and we conclude in this case.
Assume $\operatorname{dim}(A)>0$ and $\operatorname{depth}(A)=0$. Let $I=A\left[\mathfrak{m}^{\infty}\right]$ and set $B=A / I$. Then $B$ has depth $\geq 1$ and $\omega_{A}=\omega_{B}$ by Lemma 45.18.6. Since we proved the result for $\omega_{B}$ above the proof is done.

### 45.20. The local duality theorem

0A81 The main result in this section is due to Grothendieck.
0 A 82 Lemma 45.20.1. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. Let $Z=V(\mathfrak{m}) \subset \operatorname{Spec}(A)$. Then $E=R^{0} \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)$ is an injective hull of $\kappa$ and $R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)=E[0]$.

Proof. By Lemma 45.10.1 we have $R \Gamma_{\mathfrak{m}}=R \Gamma_{Z}$. Thus

$$
R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)=R \Gamma_{\mathfrak{m}}\left(\omega_{A}^{\bullet}\right)=\operatorname{hocolim} R \operatorname{Hom}_{A}\left(A / \mathfrak{m}^{n}, \omega_{A}^{\bullet}\right)
$$

by Lemma 45.8.2. Let $E^{\prime}$ be an injective hull of the residue field. By Lemma 45.18.3 we can find isomorphisms

$$
R \operatorname{Hom}_{A}\left(A / \mathfrak{m}^{n}, \omega_{A}^{\bullet}\right) \cong \operatorname{Hom}_{A}\left(A / I^{n}, E^{\prime}\right)[0]
$$

compatible with transition maps. Since $E^{\prime}=\bigcup E^{\prime}\left[\mathfrak{m}^{n}\right]=\operatorname{colim} \operatorname{Hom}_{A}\left(A / I^{n}, E^{\prime}\right)$ by Lemma 45.7 .3 we conclude that $E \cong E^{\prime}$ and that all other cohomology groups of the complex $R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)$ are zero.
$0 A 83$ Remark 45.20.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with a normalized dualizing complex $\omega_{A}^{\bullet}$. By Lemma 45.20 .1 above we see that $R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)$ is an injective hull of the residue field placed in degree 0 . In fact, this gives a "construction" or "realization" of the injective hull which is slightly more canonical than just picking any old injective hull. Namely, a normalized dualizing complex is unique up to isomorphism, with group of automorphisms the group of units of $A$, whereas an injective hull of $\kappa$ is unique up to isomorphism, with group of automorphisms the group of units of the completion $A^{\wedge}$ of $A$ with respect to $\mathfrak{m}$.

Here is the main result of this section.
0484 Theorem 45.20.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. Let $E$ be an injective hull of the residue field. Let $Z=V(\mathfrak{m}) \subset \operatorname{Spec}(A)$. Denote ${ }^{\wedge}$ derived completion with respect to $\mathfrak{m}$. Then

$$
R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)^{\wedge} \cong R \operatorname{Hom}_{A}\left(R \Gamma_{Z}(K), E[0]\right)
$$

for $K$ in $D(A)$.
Proof. Observe that $E[0] \cong R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)$ by Lemma 45.20.1. By More on Algebra, Lemma 15.72 .11 completion on the left hand side goes inside. Thus we have to prove

$$
R \operatorname{Hom}_{A}\left(K^{\wedge},\left(\omega_{A}^{\bullet}\right)^{\wedge}\right)=R \operatorname{Hom}_{A}\left(R \Gamma_{Z}(K), R \Gamma_{Z}\left(\omega_{A}^{\bullet}\right)\right)
$$

This follows from the equivalence between $D_{\text {comp }}(A, \mathfrak{m})$ and $D_{\mathfrak{m} \infty \text {-torsion }}(A)$ given in Proposition 45.12.2. More precisely, it is a special case of Lemma 45.12.3.

Here is a special case of the theorem above.
0AAK Lemma 45.20.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. Let $E$ be an injective hull of the residue field. Let $K \in D_{C o h}(A)$. Then

$$
\operatorname{Ext}_{A}^{-i}\left(K, \omega_{A}^{\bullet}\right)^{\wedge}=\operatorname{Hom}_{A}\left(H_{\mathfrak{m}}^{i}(K), E\right)
$$

where ${ }^{\wedge}$ denotes $\mathfrak{m}$-adic completion.
Proof. By Lemma 45.17 .2 we see that $R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)$ is an object of $D_{C o h}(A)$. It follows that the cohomology modules of the derived completion of $R \operatorname{Hom}_{A}\left(K, \omega_{A}^{\bullet}\right)$ are equal to the usual completions $\operatorname{Ext}_{A}^{i}\left(K, \omega_{A}^{\bullet}\right)^{\wedge}$ by More on Algebra, Lemma 15.74.3. On the other hand, we have $R \Gamma_{\mathfrak{m}}=R \Gamma_{Z}$ for $Z=V(\mathfrak{m})$ by Lemma 45.10.1. Moreover, the functor $\operatorname{Hom}_{A}(-, E)$ is exact hence factors through cohomology. Hence the lemma is consequence of Theorem 45.20.3.

### 45.21. Dualizing complexes on schemes

0A85 We define a dualizing complex on a locally Noetherian scheme to be a complex which affine locally comes from a dualizing complex on the corresponding ring. This is not completely standard but agrees with all definitions in the literature on Noetherian schemes of finite dimension.

0A86 Lemma 45.21.1. Let $X$ be a locally Noetherian scheme. Let $K$ be an object of $D\left(\mathcal{O}_{X}\right)$. The following are equivalent
(1) For every affine open $U=\operatorname{Spec}(A) \subset X$ there exists a dualizing complex $\omega_{A}^{\bullet}$ for $A$ such that $\left.K\right|_{U}$ is isomorphic to the image of $\omega_{A}^{\bullet}$ by the functor ${ }^{\sim}: D(A) \rightarrow D\left(\mathcal{O}_{U}\right)$.
(2) There is an affine open covering $X=\bigcup U_{i}, U_{i}=\operatorname{Spec}\left(A_{i}\right)$ such that for each $i$ there exists a dualizing complex $\omega_{i}^{\bullet}$ for $A_{i}$ such that $\left.K\right|_{U}$ is isomorphic to the image of $\omega_{i}^{\bullet}$ by the functor ${ }^{\sim}: D\left(A_{i}\right) \rightarrow D\left(\mathcal{O}_{U_{i}}\right)$.
Proof. Assume (2) and let $U=\operatorname{Spec}(A)$ be an affine open of $X$. Since condition (2) implies that $K$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we find an object $\omega_{A}^{\bullet}$ in $D(A)$ whose associated complex of quasi-coherent sheaves is isomorphic to $\left.K\right|_{U}$, see Derived Categories of Schemes, Lemma 35.3.5. We will show that $\omega_{A}^{\bullet}$ is a dualizing complex for $A$ which will finish the proof.
Since $X=\bigcup U_{i}$ is an open covering, we can find a standard open covering $U=$ $D\left(f_{1}\right) \cup \ldots \cup D\left(f_{m}\right)$ such that each $D\left(f_{j}\right)$ is a standard open in one of the affine opens $U_{i}$, see Schemes, Lemma 25.11.5. Say $D\left(f_{j}\right)=D\left(g_{j}\right)$ for $g_{j} \in A_{i_{j}}$. Then $A_{f_{j}} \cong\left(A_{i_{j}}\right)_{g_{j}}$ and we have

$$
\left(\omega_{A}^{\bullet}\right)_{f_{j}} \cong\left(\omega_{i}^{\bullet}\right)_{g_{j}}
$$

in the derived category by Derived Categories of Schemes, Lemma 35.3.5. By Lemma 45.17 .6 we find that the complex $\left(\omega_{A}^{\bullet}\right)_{f_{j}}$ is a dualizing complex over $A_{f_{j}}$ for $j=1, \ldots, m$. This implies that $\omega_{A}^{\bullet}$ is dualizing by Lemma 45.17.7.

0A87 Definition 45.21.2. Let $X$ be a locally Noetherian scheme. An object $K$ of $D\left(\mathcal{O}_{X}\right)$ is called a dualizing complex if $K$ satisfies the equivalent conditions of Lemma 45.21.1.

Please see remarks made at the beginning of this section.
0 A 88 Lemma 45.21.3. Let $A$ be a Noetherian ring and let $X=\operatorname{Spec}(A)$. Let $K, L$ be objects of $D(A)$. If $K \in D_{C o h}(A)$ and $L$ has finite injective dimension, then

$$
\left.R \mathcal{H o m}(\widetilde{K}, \widetilde{L})=R \widetilde{\operatorname{Hom}_{A}(K}, L\right)
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. We may assume that $L$ is given by a finite complex $I^{\bullet}$ of injective $A$ modules. By induction on the length of $I^{\bullet}$ and compatibility of the constructions with distinguished triangles, we reduce to the case that $L=I[0]$ where $I$ is an injective $A$-module. In this case, Derived Categories of Schemes, Lemma 35.10.8, tells us that the $n$th cohomology sheaf of $R \mathcal{H o m}(\widetilde{K}, \widetilde{L})$ is the sheaf associated to the presheaf

$$
D(f) \longmapsto \operatorname{Ext}_{A_{f}}^{n}\left(K \otimes_{A} A_{f}, I \otimes_{A} A_{f}\right)
$$

Since $A$ is Noetherian, the $A_{f}$-module $I \otimes_{A} A_{f}$ is injective (Lemma 45.3.9). Hence we see that

$$
\begin{aligned}
\operatorname{Ext}_{A_{f}}^{n}\left(K \otimes_{A} A_{f}, I \otimes_{A} A_{f}\right) & =\operatorname{Hom}_{A_{f}}\left(H^{-n}\left(K \otimes_{A} A_{f}\right), I \otimes_{A} A_{f}\right) \\
& =\operatorname{Hom}_{A_{f}}\left(H^{-n}(K) \otimes_{A} A_{f}, I \otimes_{A} A_{f}\right) \\
& =\operatorname{Hom}_{A}\left(H^{-n}(K), I\right) \otimes_{A} A_{f}
\end{aligned}
$$

The last equality because $H^{-n}(K)$ is a finite $A$-module. This proves that the canonical map

$$
\left.R \widetilde{\operatorname{Hom}_{A}(K}, L\right) \longrightarrow R \mathcal{H o m}(\widetilde{K}, \widetilde{L})
$$

is a quasi-isomorphism in this case and the proof is done.
0 L89 Lemma 45.21.4. Let $K$ be a dualizing complex on a locally Noetherian scheme $X$. Then $K$ is an object of $D_{C o h}\left(\mathcal{O}_{X}\right)$ and $D=R \mathcal{H o m}(-, K)$ induces an antiequivalence

$$
D: D_{C o h}\left(\mathcal{O}_{X}\right) \longrightarrow D_{C o h}\left(\mathcal{O}_{X}\right)
$$

which comes equipped with a canonical isomorphism id $\rightarrow D \circ D$. If $X$ is quasicompact, then $D$ exchanges $D_{C o h}^{+}\left(\mathcal{O}_{X}\right)$ and $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$ and induces an equivalence $D_{C o h}^{b}\left(\mathcal{O}_{X}\right) \rightarrow D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$.

Proof. Let $U \subset X$ be an affine open. Say $U=\operatorname{Spec}(A)$ and let $\omega_{A}^{\bullet}$ be a dualizing complex for $A$ corresponding to $\left.K\right|_{U}$ as in Lemma 45.21.1. By Lemma 45.21 .3 the diagram

commutes. We conclude that $D$ sends $D_{C o h}\left(\mathcal{O}_{X}\right)$ into $D_{C o h}\left(\mathcal{O}_{X}\right)$. Moreover, the canonical map

$$
L \longrightarrow R \mathcal{H o m}(R \mathcal{H o m}(L, K), K)
$$

(Cohomology on Sites, Lemma 21.26.5 is an isomorphism for all $L$ because this is true on affines by Lemma 45.17.2. The statement on boundedness properties of the functor $D$ in the quasi-compact case also folow from the corresponding statements of Lemma 45.17.2

Let $X$ be a locally ringed space. We will say that an object $L$ of $D\left(\mathcal{O}_{X}\right)$ is invertible if there is an open covering $X=\bigcup U_{i}$ such that $\left.L\right|_{U_{i}} \cong \mathcal{O}_{U_{i}}\left[-n_{i}\right]$ for some integers $n_{i}$. In this case, the function

$$
x \mapsto n_{x}, \quad \text { where } n_{x} \text { is the unique integer such that } H^{n_{x}}\left(L_{x}\right) \neq 0
$$

is locally constant on $X$. In particular, it follows that $L=\bigoplus H^{n}(L)[-n]$ which gives a well defined complex of $\mathcal{O}_{X}$-modules (with zero differentials) representing $L$. In particular $L$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$.

0ATP Lemma 45.21.5. Let $X$ be a locally Noetherian scheme. If $K$ and $K^{\prime}$ are dualizing complexes on $X$, then $K^{\prime}$ is isomorphic to $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ for some invertible object $L$ of $D\left(\mathcal{O}_{X}\right)$.

Proof. Set

$$
L=R \mathcal{H o m}_{\mathcal{O}_{X}}\left(K, K^{\prime}\right)
$$

This is an invertible object of $D\left(\mathcal{O}_{X}\right)$, because affine locally this is true, see Lemma 45.17.5 and its proof. The evaluation map $L \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K \rightarrow K^{\prime}$ is an isomorphism for the same reason.

0AWF Lemma 45.21.6. Let $X$ be a locally Noetherian scheme. Let $\omega_{X}^{\bullet}$ be a dualizing complex on $X$. Then $X$ is universally catenary and the function $X \rightarrow \mathbf{Z}$ defined by
$x \longmapsto \delta(x)$ such that $\omega_{X, x}^{\bullet}[-\delta(x)]$ is a normalized dualizing complex over $\mathcal{O}_{X, x}$ is a dimension functor.

Proof. Immediate from the affine case Lemma 45.19.3 and the definitions.

### 45.22. Right adjoint of pushforward

0A9D References for this section and the following are Nee96, LN07, Lip09, and Nee14.
Let $f: X \rightarrow Y$ be a morphism of schemes. In this section we consider the right adjoint to the functor $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$. In the literature, if this functor exists, then it is sometimes denoted $f^{\times}$. This notation is not universally accepted and we refrain from using it. We will not use the notation $f^{!}$for such a functor, as this would clash (for general morphisms $f$ ) with the notation in [Har66].

0A9E Lemma 45.22.1. Let $f: X \rightarrow Y$ be a morphism between quasi-separated and quasi-compact schemes. The functor $R f_{*}: D_{Q C o h}(X) \rightarrow D_{Q C o h}(Y)$ has a right adjoint.

Proof. We will prove a right adjoint exists by verifying the hypotheses of Derived Categories, Proposition 13.35 .2 First off, the category $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ has direct sums, see Derived Categories of Schemes, Lemma 35.3.1. The category $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is compactly generated by Derived Categories of Schemes, Theorem 35.14.3 Since $X$ and $Y$ are quasi-compact and quasi-separated, so is $f$, see Schemes, Lemmas 25.21 .14 and 25.21 .15 . Hence the functor $R f_{*}$ commutes with direct sums, see Derived Categories of Schemes, Lemma 35.4.2. This finishes the proof.

0A9F Example 45.22.2. Let $A \rightarrow B$ be a ring map. Let $Y=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(B)$ and $f: X \rightarrow Y$ the morphism corresponding to $A \rightarrow B$. Then $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow$ $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ corresponds to restriction $D(B) \rightarrow D(A)$ via the equivalences $D(B) \rightarrow$ $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $D(A) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. Hence the right adjoint corresponds to the functor $K \longmapsto R \operatorname{Hom}(B, K)$ of Section 45.16 .

0A9G Example 45.22.3. If $f: X \rightarrow Y$ is a separated finite type morphism of Noetherian schemes, then the right adjoint of $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ does not map $D_{C o h}\left(\mathcal{O}_{Y}\right)$ into $D_{C o h}\left(\mathcal{O}_{X}\right)$. Namely, let $k$ be a field and consider the morphism $f: \mathbf{A}_{k}^{1} \rightarrow \operatorname{Spec}(k)$. By Example 45.22 .2 this corresponds to the question of whether $R \operatorname{Hom}(B,-)$ maps $D_{C o h}(A)$ into $D_{C o h}(B)$ where $A=k$ and $B=k[x]$. This is not true because

$$
R \operatorname{Hom}(k[x], k)=\left(\prod_{n \geq 0} k\right)[0]
$$

which is not a finite $k[x]$-module. Hence $a\left(\mathcal{O}_{Y}\right)$ does not have coherent cohomology sheaves.

This is almost the same as Nee96
Example 4.2].

0A9H Example 45.22.4. If $f: X \rightarrow Y$ is a proper or even finite morphism of Noetherian schemes, then the right adjoint of $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ does not map $D_{Q C o h}^{-}\left(\mathcal{O}_{Y}\right)$ into $D_{Q C o h}^{-}\left(\mathcal{O}_{X}\right)$. Namely, let $k$ be a field, let $k[\epsilon]$ be the dual numbers over $k$, let $X=\operatorname{Spec}(k)$, and let $Y=\operatorname{Spec}(k[\epsilon])$. Then $\operatorname{Ext}_{k[\epsilon]}^{i}(k, k)$ is nonzero for all $i \geq 0$. Hence $a\left(\mathcal{O}_{Y}\right)$ is not bounded above by Example 45.22.2.

0A9I Lemma 45.22.5. Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasiseparated schemes. Let $a: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ be the right adjoint to $R f_{*}$ of Lemma 45.22.1. Then a maps $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ into $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$.

Proof. By Derived Categories of Schemes, Lemma 35.4.1 the functor $R f_{*}$ has finite cohomological dimension. In other words, there exist an integer $N$ such that $H^{i}\left(R f_{*} L\right)=0$ for $i \geq N+c$ if $H^{j}(L)=0$ for $j \geq c$. Say $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ has $H^{k}(K)=0$ for $k \geq c$. Then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\tau_{\leq c-N} a(K), a(K)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} \tau_{\leq c-N} a(K), K\right)=0
$$

by what we said above. Clearly, this implies that $a(K)$ is bounded below.
We often want to know whether the right adjoints to pushforward commutes with base change. Thus we consider a cartesian square

0A9J

of quasi-compact and quasi-separated schemes. Denote

$$
\begin{aligned}
& a: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right), \\
& a^{\prime}: D_{Q C o h}\left(\mathcal{O}_{Y^{\prime}}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X^{\prime}}\right) \text {, } \\
& b: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X^{\prime}}\right), \\
& b^{\prime}: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y^{\prime}}\right)
\end{aligned}
$$

the right adjoints to $R f_{*}, R f_{*}^{\prime}, R g_{*}$, and $R g_{*}^{\prime}$ (Lemma 45.22.1). Since $R f_{*} \circ R g_{*}^{\prime}=$ $R g_{*} \circ R f_{*}^{\prime}$ we get

$$
b^{\prime} \circ a=a^{\prime} \circ b
$$

Another compatibility comes from the base change map of Cohomology, Remark 20.29.2 It induces a transformation of functors

$$
L g^{*} \circ R f_{*} \longrightarrow R f_{*}^{\prime} \circ L\left(g^{\prime}\right)^{*}
$$

on derived categories of sheaves with quasi-coherent cohomology. Hence a transformation between the right adjoints in the opposite direction

$$
a \circ R g_{*} \longleftarrow R g_{*}^{\prime} \circ a^{\prime}
$$

0A9K Lemma 45.22.6. In diagram 45.22.5.1) assume that $g$ is flat or more generally that $f$ and $g$ are Tor independent. Then $a \circ R g_{*} \leftarrow R g_{*}^{\prime} \circ a^{\prime}$ is an isomorphism.
Proof. In this case the base change map $L g^{*} \circ R f_{*} K \longrightarrow R f_{*}^{\prime} \circ L\left(g^{\prime}\right)^{*} K$ is an isomorphism for every $K$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ by Derived Categories of Schemes, Lemma 35.18 .3 . Thus the corresponding transformation between adjoint functors is an isomorphism as well.

Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasi-separated schemes. Let $V \subset Y$ be a quasi-compact open subscheme and set $U=f^{-1}(V)$. This gives a cartesian square

as in 45.22.5.1. By Lemma 45.22.6 the map $\xi: a \circ R j_{*} \leftarrow R j_{*}^{\prime} \circ a^{\prime}$ is an isomorphism where $a$ and $a^{\prime}$ are the right adjoints to $R f_{*}$ and $R\left(\left.f\right|_{U}\right)_{*}$. We obtain a transformation of functors $D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{U}\right)$

0A9L

$$
\begin{equation*}
\left(j^{\prime}\right)^{*} \circ a \rightarrow\left(j^{\prime}\right)^{*} \circ a \circ R j_{*} \circ j^{*} \xrightarrow{\xi^{-1}}\left(j^{\prime}\right)^{*} \circ R j_{*}^{\prime} \circ a^{\prime} \circ j^{*} \rightarrow a^{\prime} \circ j^{*} \tag{45.22.6.1}
\end{equation*}
$$

where the first arrow comes from id $\rightarrow R j_{*} \circ j^{*}$ and the final arrow from the isomorphism $\left(j^{\prime}\right)^{*} \circ R j_{*}^{\prime} \rightarrow$ id. In particular, we see that (45.22.6.1) is an isomorphism when evaluated on $K$ if and only if $\left.\left.a(K)\right|_{U} \rightarrow a\left(R j_{*}\left(\left.K\right|_{V}\right)\right)\right|_{U}$ is an isomorphism.

0A9M Example 45.22.7. There is a finite morphsm $f: X \rightarrow Y$ of Noetherian schemes such that (45.22.6.1) is not an isomorphism when evaluated on some $K \in D_{C o h}\left(\mathcal{O}_{Y}\right)$. Namely, let $X=\operatorname{Spec}(B) \rightarrow Y=\operatorname{Spec}(A)$ with $A=k[x, \epsilon]$ where $k$ is a field and $\epsilon^{2}=0$ and $B=k[x]=A /(\epsilon)$. For $n \in \mathbf{N}$ set $M_{n}=A /\left(\epsilon, x^{n}\right)$. Observe that

$$
\operatorname{Ext}_{A}^{i}\left(B, M_{n}\right)=M_{n}, \quad i \geq 0
$$

because $B$ has the free periodic resolution $\ldots \rightarrow A \rightarrow A \rightarrow A$ with maps given by multiplication by $\epsilon$. Consider the object $K=\bigoplus K_{n}[n]=\prod K_{n}[n]$ of $D_{C o h}(A)$ (equality in $D(A)$ by Derived Categories, Lemmas 13.31 .2 and 13.32 .2 . Then we see that $a(K)$ correspnds to $R \operatorname{Hom}(B, K)$ by Example 45.22 .2 and

$$
H^{0}(R \operatorname{Hom}(B, K))=\operatorname{Ext}_{A}^{0}(B, K)=\prod_{n \geq 1} \operatorname{Ext}_{A}^{n}\left(B \cdot M_{n}\right)=\prod_{n \geq 1} M_{n}
$$

by the above. But this module has elements which are not annihilated by any power of $x$, whereas the complex $K$ does have every element of its cohomology annihilated by a power of $x$. In other words, for the map 45.22.6.1) with $V=D(x)$ and $U=D(x)$ and the complex $K$ cannot be an isomorphism because $\left(j^{\prime}\right)^{*}(a(K))$ is nonzero and $a^{\prime}\left(j^{*} K\right)$ is zero.

0A9N Lemma 45.22.8. Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasiseparated schemes. Let a be the right adjoint to $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. Let $V \subset Y$ be quasi-compact open with inverse image $U \subset X$. If for every $Q \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ supported on $Y \backslash V$ the image $a(Q)$ is supported on $X \backslash U$, then 45.22.6.1) is an isomorphism on all $K$ in $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$.

Proof. Choose a distinguished triangle

$$
\left.K \rightarrow R j_{*} K\right|_{V} \rightarrow Q \rightarrow K[1]
$$

Observe that $Q$ is supported on $Y \backslash V$ (Derived Categories of Schemes, Definition 35.7.4. Applying $a$ we obtain a distinguished triangle

$$
a(K) \rightarrow a\left(\left.R j_{*} K\right|_{V}\right) \rightarrow a(Q) \rightarrow a(K)[1]
$$

on $X$. If $a(Q)$ is supported on $X \backslash U$, then restricting to $U$ the map $\left.a(K)\right|_{U} \rightarrow$ $\left.a\left(\left.R j_{*} K\right|_{V}\right)\right|_{U}$ is an isomorphism, i.e., 45.22.6.1 is an isomorphism.

0A9P Lemma 45.22.9. Let $f: X \rightarrow Y$ be a proper morphism of Noetherian schemes. The assumption and hence the conclusion of Lemma 45.22.8 holds for all opens $V$ of $Y$.

Proof. Let $Q \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ be supported on $Y \backslash V$. To get a contradiction, assume that $a(Q)$ is not supported on $X \backslash U$. Then we can find a perfect complex $P_{U}$ on $U$ and a nonzero map $\left.P_{U} \rightarrow a(Q)\right|_{U}$ (follows from Derived Categories of Schemes, Theorem 35.14.3). Then using Derived Categories of Schemes, Lemma 35.12 .9 we may assume there is a perfect complex $P$ on $X$ and a map $P \rightarrow a(Q)$ whose restriction to $U$ is nonzero. By definition of $a$ this map is adjoint to a map $R f_{*} P \rightarrow Q$.

Because $f$ is proper and $X$ and $Y$ Noetherian, the complex $R f_{*} P$ is pseudocoherent, see Derived Categories of Schemes, Lemmas 35.6.1 and 35.10.4. Thus we may apply Derived Categories of Schemes, Lemma 35.16.3 and get a map $I \rightarrow \mathcal{O}_{Y}$ of perfect complexes whose restriction to $V$ is an isomorphism such that the composition $I \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*} P \rightarrow R f_{*} P \rightarrow K$ is zero. By Derived Categories of Schemes, Lemma 35.18.1 we have $I \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*} P=R f_{*}\left(L f^{*} I \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} P\right)$. We conclude that the composition

$$
L f^{*} I \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} P \rightarrow P \rightarrow a(K)
$$

is zero. However, the restriction to $U$ is the map $\left.\left.P\right|_{U} \rightarrow a(K)\right|_{U}$ which we assumed to be nonzero. This contradiction finishes the proof.

Let $f: X \rightarrow Y$ be a morphism of quasi-separated and quasi-compact schemes. Let $a$ denote the right adjoint to $R f_{*}: D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. For every $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ and $L \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ we obtain a canonical map

0B6H

$$
\begin{equation*}
R f_{*} R \mathcal{H o m}(L, a(K)) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, K\right) \tag{45.22.9.1}
\end{equation*}
$$

Namely, this map is constructed as the composition

$$
R f_{*} R \mathcal{H o m}(L, a(K)) \rightarrow R \mathcal{H o m}\left(R f_{*} L, R f_{*} a(K)\right) \rightarrow R \mathcal{H o m}\left(R f_{*} L, K\right)
$$

where the first arrow is Cohomology, Remark 20.35 .9 and the second arrow comes from the adjunction map $R f_{*} a(K) \rightarrow K$.

0B6I Lemma 45.22.10. Let $f: X \rightarrow Y$ be a morphism of quasi-separated and quasicompact schemes. For all $L \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ (45.22.9.1) induces an isomorphism $R \operatorname{Hom}(L, a(K)) \rightarrow R \operatorname{Hom}\left(R f_{*} L, K\right)$ of global derived homs.

Proof. By construction (Cohomology, Section 20.37) the complexes

$$
R \operatorname{Hom}(L, a(K))=R \Gamma(X, R \mathcal{H o m}(L, a(K)))=R \Gamma\left(Y, R f_{*} R \mathcal{H o m}(L, a(K))\right)
$$

and $R \operatorname{Hom}\left(R f_{*} L, K\right)=R \Gamma\left(Y, R \mathcal{H o m}\left(R f_{*} L, a(K)\right)\right)$ have $H^{0}$ equal to $\operatorname{Hom}(L, a(K))$ and $\operatorname{Hom}\left(R f_{*} L, K\right)$ and 45.22.9.1) induces the adjunction map between these. Similarly in other degrees.

[^124]0A9Q Lemma 45.22.11. Let $f: X \rightarrow Y$ be a proper morphism of Noetherian schemes. Let a be the right adjoint to $R f_{*}: D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{Y}\right)$. Then 45.22.9.1)

$$
R f_{*} R \mathcal{H o m}(L, a(K)) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, K\right)
$$

is an isomorphism for all $L \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and all $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$.
Proof. Taking $H^{0}(V,-)$ for an open $V$ of $Y$ with inverse image $U$ in $X$ we get

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.L\right|_{U},\left.a(K)\right|_{U}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{V}\right)}\left(\left.R f_{*} L\right|_{V},\left.K\right|_{V}\right)
$$

see Cohomology, Lemma 20.35.1. Since $\left.a(K)\right|_{U}$ is the image of $\left.K\right|_{V}$ (Lemma 45.22 .9 under the right adjoint to $R\left(\left.f\right|_{U}\right)_{*}$ the two sides of this arrow are isomorphic. We omit the verification that the two maps agree. A similar argument works for $H^{n}(V,-)$. Thus the map defined above is an isomorphism on cohomology and hence an isomorphism in the derived category.

### 45.23. Right adjoint of pushforward and base change

0AA5 The map 45.22.6.1 is a special case of a base change map. Namely, suppose that we have a diagram 45.22.5.1

where $f$ and $g$ are Tor independent. Then we can consider the morphism of functors $D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X^{\prime}}\right)$ given by the composition
0AA6 $\quad(45.23 .0 .1) L\left(g^{\prime}\right)^{*} \circ a \rightarrow L\left(g^{\prime}\right)^{*} \circ a \circ R g_{*} \circ L g^{*} \leftarrow L\left(g^{\prime}\right)^{*} \circ R g_{*}^{\prime} \circ a^{\prime} \circ L g^{*} \rightarrow a^{\prime} \circ L g^{*}$
The first arrow comes from the adjunction map id $\rightarrow R g_{*} L g^{*}$ and the last arrow from the adjunction map $L\left(g^{\prime}\right)^{*} R g_{*}^{\prime} \rightarrow \mathrm{id}$. We need the assumption on Tor independence to invert the arrow in the middle, see Lemma 45.22.6. Alternatively, we can think of 45.23.0.1 by adjointness of $L\left(g^{\prime}\right)^{*}$ and $R\left(g^{\prime}\right)_{*}$ as a natural transformation

$$
a \rightarrow a \circ R g_{*} \circ L g^{*} \leftarrow R g_{*}^{\prime} \circ a^{\prime} \circ L g^{*}
$$

were again the second arrow is invertible. If $M \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ then on Yoneda functors this map is given by

$$
\begin{aligned}
\operatorname{Hom}_{X}(M, a(K)) & =\operatorname{Hom}_{Y}\left(R f_{*} M, K\right) \\
& \rightarrow \operatorname{Hom}_{Y}\left(R f_{*} M, R g_{*} L g^{*} K\right) \\
& =\operatorname{Hom}_{Y^{\prime}}\left(L g^{*} R f_{*} M, L g^{*} K\right) \\
& \leftarrow \operatorname{Hom}_{Y^{\prime}}\left(R f_{*}^{\prime} L\left(g^{\prime}\right)^{*} M, L g^{*} K\right) \\
& =\operatorname{Hom}_{X^{\prime}}\left(L\left(g^{\prime}\right)^{*} M, a^{\prime}\left(L g^{*} K\right)\right) \\
& =\operatorname{Hom}_{X}\left(M, R g_{*}^{\prime} a^{\prime}\left(L g^{*} K\right)\right)
\end{aligned}
$$

(were the arrow pointing left is invertible by the base change theorem given in Derived Categories of Schemes, Lemma 35.18.3 which makes things a little bit more explicit.
In this section we first prove that the base change map is an isomorphism in some cases and then we prove that the base change map satisfies some natural compatibilities with regards to stacking squares as in Cohomology, Remarks 20.29.3 and
20.29 .4 for the usual base change map. We suggest the reader skip the rest of this section on a first reading.

0AA8 Lemma 45.23.1. In diagram 45.22.5.1) assume
(1) $g: Y^{\prime} \rightarrow Y$ is a morphism of affine schemes,
(2) $f: X \rightarrow Y$ is proper,
(3) $Y$ Noetherian, and
(4) $f$ and $g$ are Tor independent.

Then the base change map 45.23.0.1) induces an isomorphism

$$
L\left(g^{\prime}\right)^{*} a(K) \longrightarrow a^{\prime}\left(L g^{*} K\right)
$$

in the following cases
(1) for all $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ if $f$ is flat, or
(2) for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ if $g$ has finite Tor dimension.

Proof. Write $Y=\operatorname{Spec}(A)$ and $Y^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. As a base change of an affine morphism, the morphism $g^{\prime}$ is affine. Hence $R g_{*}^{\prime}$ reflects isomorphisms, see Derived Categories of Schemes, Lemma 35.5.1. Thus 45.23.0.1 is an isomorphism for $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ if and only if the map $a(K) \rightarrow a\left(R g_{*} L g^{*} K\right)=R g_{*}^{\prime} a^{\prime}\left(L g^{*} K\right)$ induces an isomorphism

$$
a(K) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}} \rightarrow a\left(R g_{*} L g^{*} K\right)
$$

(see Derived Categories of Schemes, Lemma 35.5.2). As $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is generated by perfect objects (see Derived Categories of Schemes, Theorem 35.14.3), it suffices to check we obtain an isomorphism after applying the functor $\operatorname{Hom}(M,-)$ where $M$ is perfect on $X$. Recall that $\operatorname{Hom}(M,-)=H^{0}(R \operatorname{Hom}(M,-))$, see Cohomology, Section 20.37. Thus on the left hand side we get $H^{0}$ of the following complex

$$
\begin{aligned}
R \operatorname{Hom}\left(M, a(K) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}}\right) & =R \operatorname{Hom}(M, a(K)) \otimes_{A}^{\mathbf{L}} A^{\prime} \\
& =R \operatorname{Hom}\left(R f_{*} M, K\right) \otimes_{A}^{\mathbf{L}} A^{\prime}
\end{aligned}
$$

The first equality by Derived Categories of Schemes, Lemma 35.18.6. The second equality is Lemma 45.22.10. In the case that $f$ is flat the complex $R f_{*} M$ is perfect on $Y$ (Derived Categories of Schemes, Lemma 35.19.1) and in general the complex $R f_{*} M$ is pseudo-coherent on $Y$ (Derived Categories of Schemes, Lemmas 35.6.1 and 35.10.4. Thus we get on the right hand side $H^{0}$ of the following complex

$$
\begin{aligned}
R \operatorname{Hom}\left(M, a\left(R g_{*} L g^{*} K\right)\right) & =R \operatorname{Hom}\left(R f_{*} M, R g_{*} L g^{*} K\right) \\
& =R \operatorname{Hom}\left(R f_{*} M, K \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} g_{*} \mathcal{O}_{Y^{\prime}}\right) \\
& =R \operatorname{Hom}\left(R f_{*} M, K\right) \otimes_{A}^{\mathbf{L}} A^{\prime}
\end{aligned}
$$

The first equality by Lemma 45.22 .10 . The second equality by Derived Categories of Schemes, Lemma 35.5.2. The third equality by Derived Categories of Schemes, Lemma 35.18.6. Thus we get the same outcome as before. We omit the verification that our map induces the given identifications.

0ATQ Lemma 45.23.2. Consider a commutative diagram

of quasi-compact and quasi-separated schemes where both diagrams are cartesian and where $f$ and $l$ as well as $g$ and $m$ are Tor independent. Then the maps 45.23.0.1) for the two squares compose to give the base change map for the outer rectangle (see proof for a precise statement).

Proof. It follows from the assumptions that $g \circ f$ and $m$ are Tor independent (details omitted), hence the statement makes sense. In this proof we write $k^{*}$ in place of $L k^{*}$ and $f_{*}$ instead of $R f_{*}$. Let $a, b$, and $c$ be the right adjoints of Lemma 45.22 .1 for $f, g$, and $g \circ f$ and similarly for the primed versions. The arrow corresponding to the top square is the composition

$$
\gamma_{t o p}: k^{*} \circ a \rightarrow k^{*} \circ a \circ l_{*} \circ l^{*} \stackrel{\xi_{t o p}}{\leftrightarrows} k^{*} \circ k_{*} \circ a^{\prime} \circ l^{*} \rightarrow a^{\prime} \circ l^{*}
$$

where $\xi_{\text {top }}: k_{*} \circ a^{\prime} \rightarrow a \circ l_{*}$ is an isomorphism (hence can be inverted) and is the arrow "dual" to the base change map $l^{*} \circ f_{*} \rightarrow f_{*}^{\prime} \circ k^{*}$. The outer arrows come from the canonical maps $1 \rightarrow l_{*} \circ l^{*}$ and $k^{*} \circ k_{*} \rightarrow 1$. Similarly for the second square we have

$$
\gamma_{b o t}: l^{*} \circ b \rightarrow l^{*} \circ b \circ m_{*} \circ m^{*} \stackrel{\xi_{b o t}}{\longleftarrow} l^{*} \circ l_{*} \circ b^{\prime} \circ m^{*} \rightarrow b^{\prime} \circ m^{*}
$$

For the outer rectangle we get

$$
\gamma_{r e c t}: k^{*} \circ c \rightarrow k^{*} \circ c \circ m_{*} \circ m^{*} \stackrel{\xi_{\text {rect }}}{\leftrightarrows} k^{*} \circ k_{*} \circ c^{\prime} \circ m^{*} \rightarrow c^{\prime} \circ m^{*}
$$

We have $(g \circ f)_{*}=g_{*} \circ f_{*}$ and hence $c=a \circ b$ and similarly $c^{\prime}=a^{\prime} \circ b^{\prime}$. The statement of the lemma is that $\gamma_{r e c t}$ is equal to the composition

$$
k^{*} \circ c=k^{*} \circ a \circ b \xrightarrow{\gamma_{t o p}} a^{\prime} \circ l^{*} \circ b \xrightarrow{\gamma_{b o t}} a^{\prime} \circ b^{\prime} \circ m^{*}=c^{\prime} \circ m^{*}
$$

To see this we contemplate the following diagram:

Going down the right hand side we have the composition and going down the left hand side we have $\gamma_{r e c t}$. All the quadrilaterals on the right hand side of this diagram commute by Categories, Lemma 4.27 .2 or more simply the discussion preceding Categories, Definition 4.27.1. Hence we see that it suffices to show the diagram

becomes commutative if we invert the arrows $\xi_{\text {top }}, \xi_{\text {bot }}$, and $\xi_{\text {rect }}$ (note that this is different from asking the diagram to be commutative). However, the diagram

commutes by Categories, Lemma 4.27.2. Since the diagrams

commute (see references cited) and since the composition of $l_{*} \rightarrow l_{*} \circ l^{*} \circ l_{*} \rightarrow l_{*}$ is the identity, we find that it suffices to prove that

$$
k \circ a^{\prime} \circ b^{\prime} \xrightarrow{\xi_{b o t}} a \circ l_{*} \circ b \xrightarrow{\xi_{t o p}} a \circ b \circ m_{*}
$$

is equal to $\xi_{\text {rect }}$ (via the identifications $a \circ b=c$ and $a^{\prime} \circ b^{\prime}=c^{\prime}$ ). This is the statement dual to Cohomology, Remark 20.29 .3 and the proof is complete.

0ATR Lemma 45.23.3. Consider a commutative diagram

of quasi-compact and quasi-separated schemes where both diagrams are cartesian and where $f$ and $h$ as well as $f^{\prime}$ and $h^{\prime}$ are Tor independent. Then the maps 45.23.0.1) for the two squares compose to give the base change map for the outer rectangle (see proof for a precise statement).

Proof. It follows from the assumptions that $f$ and $h \circ h^{\prime}$ are Tor independent (details omitted), hence the statement makes sense. In this proof we write $g^{*}$ in place of $L g^{*}$ and $f_{*}$ instead of $R f_{*}$. Let $a, a^{\prime}$, and $a^{\prime \prime}$ be the right adjoints of Lemma 45.22.1 for $f, f^{\prime}$, and $f^{\prime \prime}$. The arrow corresponding to the right square is the composition

$$
\gamma_{\text {right }}: g^{*} \circ a \rightarrow g^{*} \circ a \circ h_{*} \circ h^{*} \stackrel{\xi_{\text {right }}}{\leftrightarrows} g^{*} \circ g_{*} \circ a^{\prime} \circ h^{*} \rightarrow a^{\prime} \circ h^{*}
$$

where $\xi_{\text {right }}: g_{*} \circ a^{\prime} \rightarrow a \circ h_{*}$ is an isomorphism (hence can be inverted) and is the arrow "dual" to the base change map $h^{*} \circ f_{*} \rightarrow f_{*}^{\prime} \circ g^{*}$. The outer arrows come from the canonical maps $1 \rightarrow h_{*} \circ h^{*}$ and $g^{*} \circ g_{*} \rightarrow 1$. Similarly for the left square we have

$$
\gamma_{l e f t}:\left(g^{\prime}\right)^{*} \circ a^{\prime} \rightarrow\left(g^{\prime}\right)^{*} \circ a^{\prime} \circ\left(h^{\prime}\right)_{*} \circ\left(h^{\prime}\right)^{*} \stackrel{\xi_{\text {left }}}{\longleftarrow}\left(g^{\prime}\right)^{*} \circ\left(g^{\prime}\right)_{*} \circ a^{\prime \prime} \circ\left(h^{\prime}\right)^{*} \rightarrow a^{\prime \prime} \circ\left(h^{\prime}\right)^{*}
$$

For the outer rectangle we get

$$
\gamma_{\text {rect }}: k^{*} \circ a \rightarrow k^{*} \circ a \circ m_{*} \circ m^{*} \stackrel{\xi_{\text {rect }}}{\leftrightarrows} k^{*} \circ k_{*} \circ a^{\prime \prime} \circ m^{*} \rightarrow a^{\prime \prime} \circ m^{*}
$$

where $k=g \circ g^{\prime}$ and $m=h \circ h^{\prime}$. We have $k^{*}=\left(g^{\prime}\right)^{*} \circ g^{*}$ and $m^{*}=\left(h^{\prime}\right)^{*} \circ h^{*}$. The statement of the lemma is that $\gamma_{\text {rect }}$ is equal to the composition

$$
k^{*} \circ a=\left(g^{\prime}\right)^{*} \circ g^{*} \circ a \xrightarrow{\gamma_{\text {right }}}\left(g^{\prime}\right)^{*} \circ a^{\prime} \circ h^{*} \xrightarrow{\gamma_{l e f t}} a^{\prime \prime} \circ\left(h^{\prime}\right)^{*} \circ h^{*}=a^{\prime \prime} \circ m^{*}
$$

To see this we contemplate the following diagram

Going down the right hand side we have the composition and going down the left hand side we have $\gamma_{\text {rect }}$. All the quadrilaterals on the right hand side of this diagram commute by Categories, Lemma 4.27 .2 or more simply the discussion preceding Categories, Definition 4.27.1. Hence we see that it suffices to show that

$$
g_{*} \circ\left(g^{\prime}\right)_{*} \circ a^{\prime \prime} \xrightarrow{\xi_{\text {left }}} g_{*} \circ a^{\prime} \circ\left(h^{\prime}\right)_{*} \xrightarrow{\xi_{\text {right }}} a \circ h_{*} \circ\left(h^{\prime}\right)_{*}
$$

is equal to $\xi_{\text {rect }}$. This is the statement dual to Cohomology, Remark 20.29.4 and the proof is complete.

0ATS Remark 45.23.4. Consider a commutative diagram

of quasi-compact and quasi-separated schemes where all squares are cartesian and where $(f, l),(g, m),\left(f^{\prime}, l^{\prime}\right),\left(g^{\prime}, m^{\prime}\right)$ are Tor independent pairs of maps. Let $a, a^{\prime}$, $a^{\prime \prime}, b, b^{\prime}, b^{\prime \prime}$ be the right adjoints of Lemma 45.22.1 for $f, f^{\prime}, f^{\prime \prime}, g, g^{\prime}, g^{\prime \prime}$. Let us label the squares of the diagram $A, B, C, D$ as follows

$$
\begin{array}{ll}
A & B \\
C & D
\end{array}
$$

Then the maps 45.23.0.1 for the squares are (where we use $k^{*}=L k^{*}$, etc)

$$
\begin{array}{ll}
\gamma_{A}:\left(k^{\prime}\right)^{*} \circ a^{\prime} \rightarrow a^{\prime \prime} \circ\left(l^{\prime}\right)^{*} & \gamma_{B}: k^{*} \circ a \rightarrow a^{\prime} \circ l^{*} \\
\gamma_{C}:\left(l^{\prime}\right)^{*} \circ b^{\prime} \rightarrow b^{\prime \prime} \circ\left(m^{\prime}\right)^{*} & \gamma_{D}: l^{*} \circ b \rightarrow b^{\prime} \circ m^{*}
\end{array}
$$

For the $2 \times 1$ and $1 \times 2$ rectangles we have four further base change maps

$$
\begin{gathered}
\gamma_{A+B}:\left(k \circ k^{\prime}\right)^{*} \circ a \rightarrow a^{\prime \prime} \circ\left(l \circ l^{\prime}\right)^{*} \\
\gamma_{C+D}:\left(l \circ l^{\prime}\right)^{*} \circ b \rightarrow b^{\prime \prime} \circ\left(m \circ m^{\prime}\right)^{*} \\
\gamma_{A+C}:\left(k^{\prime}\right)^{*} \circ\left(a^{\prime} \circ b^{\prime}\right) \rightarrow\left(a^{\prime \prime} \circ b^{\prime \prime}\right) \circ\left(m^{\prime}\right)^{*} \\
\gamma_{A+C}: k^{*} \circ(a \circ b) \rightarrow\left(a^{\prime} \circ b^{\prime}\right) \circ m^{*}
\end{gathered}
$$

By Lemma 45.23 .3 we have

$$
\gamma_{A+B}=\gamma_{A} \circ \gamma_{B}, \quad \gamma_{C+D}=\gamma_{C} \circ \gamma_{D}
$$

and by Lemma 45.23.2 we have

$$
\gamma_{A+C}=\gamma_{C} \circ \gamma_{A}, \quad \gamma_{B+D}=\gamma_{D} \circ \gamma_{B}
$$

Here it would be more correct to write $\gamma_{A+B}=\left(\gamma_{A} \star \operatorname{id}_{l^{*}}\right) \circ\left(\operatorname{id}_{\left(k^{\prime}\right)^{*}} \star \gamma_{B}\right)$ with notation as in Categories, Section 4.27 and similarly for the others. However, we continue the abuse of notation used in the proofs of Lemmas 45.23 .2 and 45.23 .3 of dropping $\star$ products with identities as one can figure out which ones to add as long as the source and target of the transformation is known. Having said all of this we find (a priori) two transformations

$$
\left(k^{\prime}\right)^{*} \circ k^{*} \circ a \circ b \longrightarrow a^{\prime \prime} \circ b^{\prime \prime} \circ\left(m^{\prime}\right)^{*} \circ m^{*}
$$

namely

$$
\gamma_{C} \circ \gamma_{A} \circ \gamma_{D} \circ \gamma_{B}=\gamma_{A+C} \circ \gamma_{B+D}
$$

and

$$
\gamma_{C} \circ \gamma_{D} \circ \gamma_{A} \circ \gamma_{B}=\gamma_{C+D} \circ \gamma_{A+B}
$$

The point of this remark is to point out that these transformations are equal. Namely, to see this it suffices to show that

commutes. This is true by Categories, Lemma 4.27 .2 or more simply the discussion preceding Categories, Definition 4.27.1.

### 45.24. Right adjoint of pushforward and trace maps

0 AWG Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasi-separated schemes. Let $a: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ be the right adjoint as in Lemma 45.22.1. By Categories, Section 4.24 we obtain a transformation of functors

$$
\operatorname{Tr}_{f}: R f_{*} \circ a \longrightarrow \mathrm{id}
$$

The defining maps $\operatorname{Tr}_{f, K}: R f_{*} a(K) \longrightarrow K$ for $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ are sometimes called the trace map. This is the map which has the property that the bijection

$$
\operatorname{Hom}_{X}(L, a(K)) \longrightarrow \operatorname{Hom}_{Y}\left(R f_{*} L, K\right)
$$

for $L \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ which characterizes the right adjoint is given by

$$
\varphi \longmapsto \operatorname{Tr}_{f, K} \circ R f_{*} \varphi
$$

If $f$ is a proper morphism of Noetherian schemes and $K$ is bounded below, then Lemma 45.22.11 shows that the isomorphism

$$
R f_{*} R \mathcal{H o m}(L, a(K)) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, K\right)
$$

comes about by composition with $\operatorname{Tr}_{f, K}$. Every trace map we are going to consider in this section will be a special case of this trace map. Before we discuss some special cases we show that formation of the trace map commutes with base change.

0B6J Lemma 45.24.1 (Trace map and base change). Suppose we have a diagram 45.22.5.1) where $f$ and $g$ are tor independent. Then the maps $1 \star \operatorname{Tr}_{f}: L g^{*} \circ$ $R f_{*} \circ a \rightarrow L g^{*}$ and $\operatorname{Tr}_{f^{\prime} \star 1}: R f_{*}^{\prime} \circ a^{\prime} \circ L g^{*} \rightarrow L g^{*}$ agree via the base change maps $\beta: L g^{*} \circ R f_{*} \rightarrow R f_{*}^{\prime} \circ L\left(g^{\prime}\right)^{*}\left(\right.$ Cohomology, Remark 20.29.2) and $\alpha: L\left(g^{\prime}\right)^{*} \circ a \rightarrow$ $a^{\prime} \circ L g^{*}$ 45.23.0.1). More precisely, the diagram

of transformations of functors commutes.
Proof. In this proof we write $f_{*}$ for $R f_{*}$ and $g^{*}$ for $L g^{*}$ and we drop $\star$ products with identities as one can figure out which ones to add as long as the source and target of the transformation is known. Recall that $\beta: g^{*} \circ f_{*} \rightarrow f_{*}^{\prime} \circ\left(g^{\prime}\right)^{*}$ is an isomorphism and that $\alpha$ is defined using the isomorphism $\beta^{\vee}: g_{*}^{\prime} \circ a^{\prime} \rightarrow a \circ g_{*}$ which is the adjoint of $\beta$, see Lemma 45.22 .6 and its proof. First we note that the top horizontal arrow of the diagram in the lemma is equal to the composition

$$
g^{*} \circ f_{*} \circ a \rightarrow g^{*} \circ f_{*} \circ a \circ g_{*} \circ g^{*} \rightarrow g^{*} \circ g_{*} \circ g^{*} \rightarrow g^{*}
$$

where the first arrow is the unit for $\left(g^{*}, g_{*}\right)$, the second arrow is $\operatorname{Tr}_{f}$, and the third arrow is the counit for $\left(g^{*}, g_{*}\right)$. This is a simple consequence of the fact that the composition $g^{*} \rightarrow g^{*} \circ g_{*} \circ g^{*} \rightarrow g^{*}$ of unit and counit is the identity. Consider the diagram

In this diagram the two squares commute Categories, Lemma 4.27 .2 or more simply the discussion preceding Categories, Definition 4.27.1. The triangle commutes by
the discussion above. By Categories, Lemma 4.24.6 the square

commutes which implies the pentagon in the big diagram commutes. Since $\beta$ and $\beta^{\vee}$ are isomorphisms, and since going on the outside of the big diagram equals $\operatorname{Tr}_{f} \circ \alpha \circ \beta$ by definition this proves the lemma.

Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasi-separated schemes. Let $a: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ be the right adjoint of $R f_{*}$ as in Lemma 45.22.1. By Categories, Section 4.24 we obtain a transformation of functors

$$
\eta_{f}: \mathrm{id} \rightarrow a \circ R f_{*}
$$

which is called the unit of the adjunction.
0B6K Lemma 45.24.2. Suppose we have a diagram (45.22.5.1) where $f$ and $g$ are tor independent. Then the maps $1 \star \eta_{f}: L\left(g^{\prime}\right)^{*} \rightarrow L\left(g^{\prime}\right)^{*} \circ a \circ R f_{*}$ and $\eta_{f^{\prime} \star 1}: L\left(g^{\prime}\right)^{*} \rightarrow$ $a^{\prime} \circ R f_{*}^{\prime} \circ L\left(g^{\prime}\right)^{*}$ agree via the base change maps $\beta: L g^{*} \circ R f_{*} \rightarrow R f_{*}^{\prime} \circ L\left(g^{\prime}\right)^{*}$ (Cohomology, Remark 20.29.2) and $\alpha: L\left(g^{\prime}\right)^{*} \circ a \rightarrow a^{\prime} \circ L g^{*}$ 45.23.0.1). More precisely, the diagram

of transformations of functors commutes.
Proof. This proof is dual to the proof of Lemma 45.24.1. In this proof we write $f_{*}$ for $R f_{*}$ and $g^{*}$ for $L g^{*}$ and we drop $\star$ products with identities as one can figure out which ones to add as long as the source and target of the transformation is known. Recall that $\beta: g^{*} \circ f_{*} \rightarrow f_{*}^{\prime} \circ\left(g^{\prime}\right)^{*}$ is an isomorphism and that $\alpha$ is defined using the isomorphism $\beta^{\vee}: g_{*}^{\prime} \circ a^{\prime} \rightarrow a \circ g_{*}$ which is the adjoint of $\beta$, see Lemma 45.22 .6 and its proof. First we note that the left vertical arrow of the diagram in the lemma is equal to the composition

$$
\left(g^{\prime}\right)^{*} \rightarrow\left(g^{\prime}\right)^{*} \circ g_{*}^{\prime} \circ\left(g^{\prime}\right)^{*} \rightarrow\left(g^{\prime}\right)^{*} \circ g_{*}^{\prime} \circ a^{\prime} \circ f_{*}^{\prime} \circ\left(g^{\prime}\right)^{*} \rightarrow a^{\prime} \circ f_{*}^{\prime} \circ\left(g^{\prime}\right)^{*}
$$

where the first arrow is the unit for $\left(\left(g^{\prime}\right)^{*}, g_{*}^{\prime}\right)$, the second arrow is $\eta_{f^{\prime}}$, and the third arrow is the counit for $\left(\left(g^{\prime}\right)^{*}, g_{*}^{\prime}\right)$. This is a simple consequence of the fact that the composition $\left(g^{\prime}\right)^{*} \rightarrow\left(g^{\prime}\right)^{*} \circ\left(g^{\prime}\right)_{*} \circ\left(g^{\prime}\right)^{*} \rightarrow\left(g^{\prime}\right)^{*}$ of unit and counit is the
identity. Consider the diagram

In this diagram the two squares commute Categories, Lemma 4.27 .2 or more simply the discussion preceding Categories, Definition 4.27.1. The triangle commutes by the discussion above. By the dual of Categories, Lemma 4.24 .6 the square

commutes which implies the pentagon in the big diagram commutes. Since $\beta$ and $\beta^{\vee}$ are isomorphisms, and since going on the outside of the big diagram equals $\beta \circ \alpha \circ \eta_{f}$ by definition this proves the lemma.

0B6L Example 45.24.3. Let $A \rightarrow B$ be a ring map. Let $Y=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(B)$ and $f: X \rightarrow Y$ the morphism corresponding to $A \rightarrow B$. As seen in Example 45.22 .2 the right adjoint of $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ sends an object $K$ of $D(A)=D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ to $R \operatorname{Hom}(B, K)$ in $D(B)=D_{Q C o h}\left(\mathcal{O}_{X}\right)$. The trace map is the map

$$
\operatorname{Tr}_{f, K}: R \operatorname{Hom}(B, K) \longrightarrow R \operatorname{Hom}(A, K)=K
$$

induced by the $A$-module map $A \rightarrow B$.

### 45.25. Right adjoint of pushforward and pullback

0B6N
Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasi-separated schemes. Let $a$ be the right adjoint of pushforward as in Lemma 45.22.1. There is a canonical map

0A9S (45.25.0.1)

$$
L f^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} a\left(\mathcal{O}_{Y}\right) \longrightarrow a(K)
$$

functorial in $K$ and compatible with distinguished triangles. Namely, this map is adjoint to a map

$$
R f_{*}\left(L f^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} a\left(\mathcal{O}_{Y}\right)\right)=K \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R f_{*}\left(a\left(\mathcal{O}_{Y}\right)\right) \longrightarrow K
$$

(equality by Derived Categories of Schemes, Lemma 35.18.1) for which we use the adjunction map $R f_{*} a\left(\mathcal{O}_{Y}\right) \rightarrow \mathcal{O}_{Y}$ and the identity on $K$. This map is an isomorphism for every perfect object.

0A9T Lemma 45.25.1. Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasiseparated schemes. The map 45.25.0.1) is an isomorphism for every perfect object $K$ of $D\left(\mathcal{O}_{Y}\right)$.

Proof. Let $K$ be a perfect object on $Y$ with "dual" $K^{\wedge}$, see Cohomology, Lemma 20.41.11. For $L \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have

$$
\begin{aligned}
\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} L, K\right) & =\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} L \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K^{\wedge}, \mathcal{O}_{Y}\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(L \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K^{\wedge}, a\left(\mathcal{O}_{Y}\right)\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(L, a\left(\mathcal{O}_{Y}\right) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K\right)
\end{aligned}
$$

Hence the result by the Yoneda lemma.
0B6P Lemma 45.25.2. Suppose we have a diagram 45.22.5.1) where $f$ and $g$ are tor independent. Let $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. The diagram

commutes where the horizontal arrows are the maps 45.25.0.1) for $K$ and $L g^{*} K$ and the vertical maps are constructed using Cohomology, Remark 20.29.2 and (45.23.0.1).

Proof. In this proof we will write $f_{*}$ for $R f_{*}$ and $f^{*}$ for $L f^{*}$, etc, and we will write $\otimes$ for $\otimes_{\mathcal{O}_{X}}^{\mathbf{L}}$, etc. Let us write 45.25.0.1 as the composition

$$
\begin{aligned}
f^{*} K \otimes a\left(\mathcal{O}_{Y}\right) & \rightarrow a\left(f_{*}\left(f^{*} K \otimes a\left(\mathcal{O}_{Y}\right)\right)\right) \\
& \leftarrow a\left(K \otimes f_{*} a\left(\mathcal{O}_{K}\right)\right) \\
& \rightarrow a\left(K \otimes \mathcal{O}_{Y}\right) \\
& \rightarrow a(K)
\end{aligned}
$$

Here the first arrow is the unit $\eta_{f}$, the second arrow is $a$ applied to Cohomology, Equation 20.43.2.1 which is an isomorphism by Derived Categories of Schemes, Lemma 35.18.1, the third arrow is $a$ applied to $\mathrm{id}_{K} \otimes \operatorname{Tr}_{f}$, and the fourth arrow is $a$ applied to the isomorphism $K \otimes \mathcal{O}_{Y}=K$. The proof of the lemma consists in showing that each of these maps gives rise to a commutative square as in the statement of the lemma. For $\eta_{f}$ and $\operatorname{Tr}_{f}$ this is Lemmas 45.24.2 and 45.24.1. For the arrow using Cohomology, Equation (20.43.2.1) this is Cohomology, Remark 20.43.5. For the multiplication map it is clear. This finishes the proof.

0B6Q Lemma 45.25.3. Let $f: X \rightarrow Y$ be a proper morphism of Noetherian schemes. Let $V \subset Y$ be an open such that $f^{-1}(V) \rightarrow V$ is an isomorphism. Then for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ the map (45.25.0.1) restricts to an isomorphism over $f^{-1}(V)$.

Proof. By Lemma 45.22.9 the map 45.22.6.1 is an ismorphism for objects of $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$. Hence Lemma 45.25 .2 tells us the restriction of 45.25.0.1) for $K$ to $f^{-1}(V)$ is the map 45.25 .0 .1$)$ for $\left.K\right|_{V}$ and $f^{-1}(V) \rightarrow V$. Thus it suffices to show that the map is an isomorphism when $f$ is the identity morphism. This is clear.

0B6R Lemma 45.25.4. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be composable morphisms of quasi-compact and quasi-separated schemes and set $h=g \circ f$. Let $a, b, c$ be the adjoints of Lemma 45.22.1 for $f, g, h$. For any $K \in D_{Q C o h}\left(\mathcal{O}_{Z}\right)$ the diagram

is commutative where the arrows are 45.25.0.1) and we have used $L h^{*}=L f^{*} \circ L g^{*}$ and $c=a \circ b$.

Proof. In this proof we will write $f_{*}$ for $R f_{*}$ and $f^{*}$ for $L f^{*}$, etc, and we will write $\otimes$ for $\otimes_{\mathcal{O}_{X}}^{\mathbf{L}}$, etc. The composition of the top arrows is adjoint to a map

$$
g_{*} f_{*}\left(f^{*}\left(g^{*} K \otimes b\left(\mathcal{O}_{Z}\right)\right) \otimes a\left(\mathcal{O}_{Y}\right)\right) \rightarrow K
$$

The left hand side is equal to $K \otimes g_{*} f_{*}\left(f^{*} b\left(\mathcal{O}_{Z}\right) \otimes a\left(\mathcal{O}_{Y}\right)\right)$ by Derived Categories of Schemes, Lemma 35.18.1 and inspection of the definitions shows the map comes from the map

$$
g_{*} f_{*}\left(f^{*} b\left(\mathcal{O}_{Z}\right) \otimes a\left(\mathcal{O}_{Y}\right)\right) \stackrel{g_{*} \epsilon}{\rightleftarrows} g_{*}\left(b\left(\mathcal{O}_{Z}\right) \otimes f_{*} a\left(\mathcal{O}_{Y}\right)\right) \xrightarrow{g_{*} \alpha} g_{*}\left(b\left(\mathcal{O}_{Z}\right)\right) \xrightarrow{\beta} \mathcal{O}_{Z}
$$

tensored with $\mathrm{id}_{K}$. Here $\epsilon$ is the isomorphism from Derived Categories of Schemes, Lemma 35.18 .1 and $\beta$ comes from the counit map $g_{*} b \rightarrow$ id. Similarly, the composition of the lower horizontal arrows is adjoint to $\operatorname{id}_{K}$ tensored with the composition

$$
g_{*} f_{*}\left(f^{*} b\left(\mathcal{O}_{Z}\right) \otimes a\left(\mathcal{O}_{Y}\right)\right) \xrightarrow{g_{*} f_{*} \delta} g_{*} f_{*}\left(a b\left(\mathcal{O}_{Z}\right)\right) \xrightarrow{g_{*} \gamma} g_{*}\left(b\left(\mathcal{O}_{Z}\right)\right) \xrightarrow{\beta} \mathcal{O}_{Z}
$$

where $\gamma$ comes from the counit map $f_{*} a \rightarrow$ id and $\delta$ is the map whose adjoint is the composition

$$
f_{*}\left(f^{*} b\left(\mathcal{O}_{Z}\right) \otimes a\left(\mathcal{O}_{Y}\right)\right) \stackrel{\epsilon}{\leftarrow} b\left(\mathcal{O}_{Z}\right) \otimes f_{*} a\left(\mathcal{O}_{Y}\right) \xrightarrow{\alpha} b\left(\mathcal{O}_{Z}\right)
$$

By general properties of adjoint functors, adjoint maps, and counits (see Categories, Section 4.24 we have $\gamma \circ f_{*} \delta=\alpha \circ \epsilon^{-1}$ as desired.

### 45.26. Right adjoint of pushforward for closed immersions

0 A 74 Let $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ be a morphism of ringed spaces such that $i$ is a homomorphism onto a closed subset and such that $i^{\sharp}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective. (For example a closed immersion of schemes.) Let $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$. For a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ the sheaf

$$
\mathcal{H o m}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{O}_{Z}, \mathcal{F}\right)
$$

a sheaf of $\mathcal{O}_{X}$-modules annihilated by $\mathcal{I}$. Hence by Modules, Lemma 17.13.4 there is a sheaf of $\mathcal{O}_{Z}$-modules, which we will denote $\operatorname{Hom}\left(\mathcal{O}_{Z}, \mathcal{F}\right)$, such that

$$
i_{*} \mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{F}\right)=\mathcal{H o m}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{O}_{Z}, \mathcal{F}\right)
$$

as $\mathcal{O}_{X}$-modules. We spell out what this means.
0A75 Lemma 45.26.1. With notation as above. The functor $\mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ is a right adjoint to the functor $i_{*}: \operatorname{Mod}\left(\mathcal{O}_{Z}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$. For $V \subset Z$ open we have

$$
\Gamma\left(V, \mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{F}\right)\right)=\{s \in \Gamma(U, \mathcal{F}) \mid \mathcal{I} s=0\}
$$

where $U \subset X$ is an open whose intersection with $Z$ is $V$.

Proof. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Z}$-modules. Then

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{G}, \mathcal{F}\right)=\operatorname{Hom}_{i_{*} \mathcal{O}_{Z}}\left(i_{*} \mathcal{G}, \mathcal{H o m}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{O}_{Z}, \mathcal{F}\right)\right)=\operatorname{Hom}_{\mathcal{O}_{Z}}\left(\mathcal{G}, \mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{F}\right)\right)
$$

The first equality by Modules, Lemma 17.19 .5 and the second by the fully faithfulness of $i_{*}$, see Modules, Lemma 17.13.4. The description of sections is left to the reader.

The functor

$$
\operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{Z}\right), \quad \mathcal{F} \longmapsto \mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{F}\right)
$$

is left exact and has a derived extension

$$
R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right): D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{Z}\right)
$$

0 L76 Lemma 45.26.2. With notation as above. The functor $R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ is the right adjoint of the functor $i_{*}: D\left(\mathcal{O}_{Z}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$.

Proof. This is a consequence of the fact that $i_{*}$ and $\mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ are adjoint functors by Lemma 45.26.1. See Derived Categories, Lemma 13.28.4.

0A77 Lemma 45.26.3. With notation as above. We have

$$
i_{*} R \mathcal{H o m}\left(\mathcal{O}_{Z}, K\right)=R \mathcal{H o m}\left(i_{*} \mathcal{O}_{Z}, K\right)
$$

in $D\left(\mathcal{O}_{X}\right)$ for all $K$ in $D\left(\mathcal{O}_{X}\right)$.
Proof. This is immediate from the construction of the functor $R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$.
0A78 Lemma 45.26.4. In the situation above, assume $i: Z \rightarrow X$ is a pseudo-coherent morphism of schemes (for example if $X$ is locally Noetherian). Then
(1) $R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ maps $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}^{+}\left(\mathcal{O}_{Z}\right)$, and
(2) if $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(B)$, then the diagram

is commutative.
Proof. To explain the parenthetical remark, if $X$ is locally Noetherian, then $i$ is pseudo-coherent by More on Morphisms, Lemma 36.42.9.

Let $K$ be an object of $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$. To prove (1), by Morphisms, Lemma 28.4.1 it suffices to show that $i_{*}$ applied to $H^{n}\left(R \mathcal{H o m}\left(\mathcal{O}_{Z}, K\right)\right)$ produces a quasi-coherent module on $X$. By Lemma 45.26 .3 this means we have to show that $R \mathcal{H o m}\left(i_{*} \mathcal{O}_{Z}, K\right)$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Since $i$ is pseudo-coherent the sheaf $\mathcal{O}_{Z}$ is a pseudo-coherent $\mathcal{O}_{X}$-module. Hence the result follows from Derived Categories of Schemes, Lemma 35.10 .8

Assume $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(B)$ as in (2). Let $I^{\bullet}$ be a bounded below complex of injective $A$-modules representing an object $K$ of $D^{+}(A)$. Then we know that $R \operatorname{Hom}(B, K)=\operatorname{Hom}_{A}\left(B, I^{\bullet}\right)$ viewed as a complex of $B$-modules. Choose a quasi-isomorphism

$$
\tilde{I}^{\bullet} \longrightarrow \mathcal{I}^{\bullet}
$$

where $\mathcal{I}^{\bullet}$ is a bounded below complex of injective $\mathcal{O}_{X}$-modules. It follows from the description of the functor $\mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ in Lemma 45.26.1 that there is a map

$$
\operatorname{Hom}_{A}\left(B, I^{\bullet}\right) \longrightarrow \Gamma\left(Z, \mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{I}^{\bullet}\right)\right)
$$

Observe that $\mathcal{H o m}\left(\mathcal{O}_{Z}, \mathcal{I}^{\bullet}\right)$ represents $R \mathcal{H o m}\left(\mathcal{O}_{Z}, \widetilde{K}\right)$. Applying the universal property of the ${ }^{\sim}$ functor we obtain a map

$$
\widetilde{\operatorname{Hom}_{A}\left(B, I^{\bullet}\right)} \longrightarrow R \mathcal{H o m}\left(\mathcal{O}_{Z}, \widetilde{K}\right)
$$

in $D\left(\mathcal{O}_{Z}\right)$. We may check that this map is an isomorphism in $D\left(\mathcal{O}_{Z}\right)$ after applying $i_{*}$. However, once we apply $i_{*}$ we obtain the isomorphism of Derived Categories of Schemes, Lemma 35.10.8 via the identification of Lemma 45.26.3.
0A79 Lemma 45.26.5. In this situation above. Assume $X$ is a locally Noetherian scheme. Then $R \mathcal{H}$ om $\left(\mathcal{O}_{Z},-\right)$ maps $D_{\text {Coh }}^{+}\left(\mathcal{O}_{X}\right)$ into $D_{\text {Coh }}^{+}\left(\mathcal{O}_{Z}\right)$.
Proof. The question is local on $X$, hence we may assume that $X$ is affine. Say $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(B)$ with $A$ Noetherian and $A \rightarrow B$ surjective. In this case, we can apply Lemma 45.26 .4 to translate the question into algebra. The corresponding algebra result is a consequence of Lemma 45.16.3.

0A9X Lemma 45.26.6. Let $X$ be a quasi-compact and quasi-separated scheme. Let $i: Z \rightarrow X$ be a pseudo-coherent closed immersion (if $X$ is Noetherian, then any closed immersion is pseudo-coherent). Let $a: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Z}\right)$ be the right adjoint to $R i_{*}$. Then there is a functorial isomorphism

$$
a(K)=R \mathcal{H o m}\left(\mathcal{O}_{Z}, K\right)
$$

for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$.
Proof. (The parenthetical statement follows from More on Morphisms, Lemma 36.42 .9 .) By Lemma 45.26 .2 the functor $R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ is a right adjoint to $R i_{*}$ : $D\left(\mathcal{O}_{Z}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$. Moreover, by Lemma 45.26.4 and Lemma 45.22.5 both $R \mathcal{H o m}\left(\mathcal{O}_{Z},-\right)$ and $a \operatorname{map} D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}^{+}\left(\mathcal{O}_{Z}\right)$. Hence we obtain the isomorphism by uniqueness of adjoint functors.

0B6M Example 45.26.7. If $i: Z \rightarrow X$ is closed immersion of Noetherian schemes, then the diagram

is commutative for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$. Here the horizontal equality sign is Lemma 45.26 .3 and the lower horizontal arrow is induced by by the map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$. The commutativity of the diagram is a consequence of Lemma 45.26 .6

### 45.27. Right adjoint of pushforward for finite morphisms

0AWZ In this section work out what some of the results above mean for finite morphisms of schemes.

0AX0 Lemma 45.27.1. Let $A \rightarrow B$ be a finite ring map of Noetherian rings. Let $\omega_{A}^{\bullet}$ be a dualizing complex. Then $R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$ is a dualizing complex for $B$.

Proof. The proof is identical to the proof of Lemma 45.17.8.
0AX1 Lemma 45.27.2. Let $(A, \mathfrak{m}, \kappa) \rightarrow\left(B, \mathfrak{m}^{\prime}, \kappa^{\prime}\right)$ be a finite local map of Noetherian local rings. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. Then $\omega_{B}^{\bullet}=R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)$ is a normalized dualizing complex for $B$.

Proof. By Lemma 45.27 .1 the complex $\omega_{B}^{\bullet}$ is dualizing for $B$. We compute

$$
R \operatorname{Hom}_{B}\left(\kappa^{\prime}, R \operatorname{Hom}\left(B, \omega_{A}^{\bullet}\right)\right)=R \operatorname{Hom}_{A}\left(\kappa^{\prime}, \omega_{A}^{\bullet}\right) \cong \operatorname{Hom}_{\kappa}\left(\kappa^{\prime}, \kappa\right)[0]
$$

which is isomorphic in $D\left(\kappa^{\prime}\right)$ to $\kappa^{\prime}$ placed in degree 0 as desired. The first equality holds by Lemma 45.16.1.

Let $f: X \rightarrow Y$ be a finite morphism of schemes. Let us denote

$$
R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X},-\right): D\left(\mathcal{O}_{Y}\right) \longrightarrow D\left(f_{*} \mathcal{O}_{X}\right)
$$

the functor right adjoint to the restriction functor. It is the right derived functor of the left exact functor $\operatorname{Mod}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Mod}\left(f_{*} \mathcal{O}_{X}\right)$ given by $\mathcal{G} \mapsto \mathcal{H o m}_{\mathcal{O}_{Y}}\left(f_{*} \mathcal{O}_{X}, \mathcal{G}\right)$. See Derived Categories, Lemma 13.28.4.

0AX2 Lemma 45.27.3. Let $f: X \rightarrow Y$ be a finite pseudo-coherent morphism of schemes (any finite morphism of Noetherian schemes is pseudo-coherent). The functor $R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X},-\right)$ maps $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ into $D_{Q C o h}^{+}\left(f_{*} \mathcal{O}_{X}\right)$. If $Y$ is quasi-compact and quasi-separated, then the diagram

is commutative, where $a$ is the right adjoint of Lemma 45.22.1 for $f$ and $\Phi$ is the equivalence of Derived Categories of Schemes, Lemma 35.5.3.

Proof. (The parenthetical remark follows from More on Morphisms, Lemma 36.42.9.) Since $f$ is pseudo-coherent, the $\mathcal{O}_{Y}$-module $f_{*} \mathcal{O}_{X}$ is pseudo-coherent, see More on Morphisms, Lemma 36.42.8 Thus $R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X},-\right)$ maps $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ into $D_{Q C o h}^{+}\left(f_{*} \mathcal{O}_{X}\right)$, see Derived Categories of Schemes, Lemma 35.10.8. Then $\Phi \circ a$ and $R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X},-\right)$ agree on $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ because these functors are both right adjoint to the restriction functor $D_{Q C o h}^{+}\left(f_{*} \mathcal{O}_{X}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$.

0AX3 Remark 45.27.4. If $f: X \rightarrow Y$ is a finite of Noetherian schemes, then the diagram

is commutative for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$. This follows from Lemma 45.27.3. The lower horizontal arrow is induced by the map $\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$ and the upper horizontal arrow is the trace map discussed in Section 45.24 .

### 45.28. Right adjoint of pushforward for perfect proper morphisms

0AA9 The correct generality for this section would be to consider perfect proper morphisms of quasi-compact and quasi-separated schemes, see LN07. A flat proper morphism of Noetherian schemes is perfect, see More on Morphisms, Lemma 36.43.5
0A9R Lemma 45.28.1. Let $f: X \rightarrow Y$ be a perfect proper morphism of Noetherian schemes. Let $a$ be the right adjoint for $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ of Lemma 45.22.1. Then a commutes with direct sums.

Proof. Let $P$ be a perfect object of $D\left(\mathcal{O}_{X}\right)$. By More on Morphisms, Lemma 36.43 .12 the complex $R f_{*} P$ is perfect on $Y$. Let $K_{i}$ be a family of objects of $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. Then

$$
\begin{aligned}
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(P, a\left(\bigoplus K_{i}\right)\right) & =\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} P, \bigoplus K_{i}\right) \\
& =\bigoplus \operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} P, K_{i}\right) \\
& =\bigoplus \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(P, a\left(K_{i}\right)\right)
\end{aligned}
$$

because a perfect object is compact (Derived Categories of Schemes, Proposition 35.16.1. Since $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ has a perfect generator (Derived Categories of Schemes, Theorem 35.14.3) we conclude that the map $\bigoplus a\left(K_{i}\right) \rightarrow a\left(\bigoplus K_{i}\right)$ is an isomorphism, i.e., $a$ commutes with direct sums.

0AAA Lemma 45.28.2. Let $f: X \rightarrow Y$ be a perfect proper morphism of Noetherian schemes. Let $a$ be the right adjoint for $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ of Lemma 45.22.1. Then
(1) for every closed $T \subset Y$ if $Q \in D_{Q C o h}(Y)$ is supported on $T$, then $a(Q)$ is supported on $f^{-1}(T)$,
(2) for every open $V \subset Y$ and any $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ the map 45.22.6.1) is an isomorphism, and
(3) the canonical map

$$
R f_{*} R \mathcal{H o m}(L, a(K)) \longrightarrow R \mathcal{H o m}\left(R f_{*} L, K\right)
$$

is an isomorphism for all $L \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and all $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.
Proof. Arguing exactly as in the proof of Lemma 45.22.11 we see that (2) implies (3). Arguing exactly as in the proof of Lemma 45.22 .8 we see that (1) implies (2).

Proof of (1). We will use the notation $D_{Q C o h, T}\left(\mathcal{O}_{Y}\right)$ and $D_{Q C o h, f^{-1}(T)}\left(\mathcal{O}_{X}\right)$ to denote complexes whose cohomology sheaves are supported on $T$ and $f^{-1}(T)$. By Lemma 45.28 .1 the functor $a$ commutes with direct sums. Hence the strictly full, saturated, triangulated subcategory $\mathcal{D}$ with objects

$$
\left\{Q \in D_{Q C o h, T}\left(\mathcal{O}_{Y}\right) \mid a(Q) \in D_{Q C o h, f^{-1}(T)}\left(\mathcal{O}_{X}\right)\right\}
$$

is preserved by direct sums (and hence derived colimits). On the other hand, the category $D_{Q C o h, T}\left(\mathcal{O}_{Y}\right)$ is generated by a perfect object $E$ (see Derived Categories of Schemes, Lemma 35.14.4). By Lemma 45.22 .9 we see that $E \in \mathcal{D}$. By Derived Categories, Lemma 13.34 .3 every object $Q$ of $D_{Q C o h, T}\left(\mathcal{O}_{Y}\right)$ is a derived colimit of a system $Q_{1} \rightarrow Q_{2} \rightarrow Q_{3} \rightarrow \ldots$ such that the cones of the transition maps are direct sums of shifts of $E$. Arguing by induction we see that $Q_{n} \in \mathcal{D}$ for all $n$ and finally that $Q$ is in $\mathcal{D}$. Thus (1) is true.

0A9U Lemma 45.28.3. Let $f: X \rightarrow Y$ be a perfect proper morphism of Noetherian schemes. The map 45.25.0.1) is an isomorphism for every object $K$ of $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.

Proof. By Lemma 45.28.1 we know that $a$ commutes with direct sums. Hence the collection of objects of $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ for which 45.25.0.1) is an isomorphism is a strictly full, saturated, triangulated subcategory of $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ which is moreover preserved under taking direct sums. Since $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ is a module category (Derived Categories of Schemes, Theorem 35.17.3) generated by a single perfect object (Derived Categories of Schemes, Theorem 35.14.3) we can argue as in More on Algebra, Remark 15.49.11 to see that it suffices to prove 45.25.0.1 is an isomorphism for a single perfect object. However, the result holds for perfect objects, see Lemma 45.25.1.

The following lemma shows that the base change map (45.23.0.1) is an isomorphism for flat proper morphisms. We will see in Example 45.30 .2 that this does not remain true for perfect proper morphisms.

0AAB Lemma 45.28.4. Let $f: X \rightarrow Y$ be a flat proper morphism of Noetherian schemes. Let $g: Y^{\prime} \rightarrow Y$ be a morphism with $Y^{\prime}$ Noetherian. Then the base change map 45.23.0.1) is an isomorphism for all $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Proof. By Lemma 45.28 .2 formation of the functors $a$ and $a^{\prime}$ commutes with restriction to opens of $Y$ and $Y^{\prime}$. Hence we may assume $Y^{\prime} \rightarrow Y$ is a morphism of affine schemes. In this case the statement follows from Lemma 45.23.1.

0B6S Remark 45.28.5. Let $f: X \rightarrow Y$ be a flat proper morphism of Noetherian schemes. Let $a$ be the adjoint of Lemma 45.22 .1 for $f$. In this situation, $\omega_{X / Y}^{\bullet}=$ $a\left(\mathcal{O}_{Y}\right)$ is sometimes called the relative duatizing complex. By Lemma 45.28.3 there is a functorial isomorphism $a(K)=L f^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \omega_{X / Y}^{\bullet}$ for $K \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. Moreover, the trace map

$$
\operatorname{Tr}_{f, \mathcal{O}_{Y}}: R f_{*} \omega_{X / Y}^{\bullet} \rightarrow \mathcal{O}_{Y}
$$

of Section 45.24 induces the trace map for all $K$ in $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. More precisely the diagram

where the equality on the lower right is Derived Categories of Schemes, Lemma 35.18.1. If $g: Y^{\prime} \rightarrow Y$ is a morphism of Noetherian schemes and $X^{\prime}=Y^{\prime} \times_{Y} X$, then by Lemma 45.28 .4 we have $\omega_{X^{\prime} / Y^{\prime}}^{\bullet}=L\left(g^{\prime}\right)^{*} \omega_{X / Y}^{\bullet}$ where $g^{\prime}: X^{\prime} \rightarrow X$ is the projection and by Lemma 45.24.1 the trace map

$$
\operatorname{Tr}_{f^{\prime}, \mathcal{O}_{Y^{\prime}}}: R f_{*}^{\prime} \omega_{X^{\prime} / Y^{\prime}}^{\bullet} \rightarrow \mathcal{O}_{Y^{\prime}}
$$

for $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is the base change of $\operatorname{Tr}_{f, \mathcal{O}_{Y}}$ via the base change isomorphism.

### 45.29. Right adjoint of pushforward for effective Cartier divisors

0B4A Let $X$ be a scheme and let $i: D \rightarrow X$ be the inclusion of an effective Cartier divisor. Denote $\mathcal{N}=i^{*} \mathcal{O}_{X}(D)$ the normal sheaf of $i$, see Morphisms, Section 28.32 and Divisors, Section 30.11. Recall that $R \mathcal{H o m}\left(\mathcal{O}_{D},-\right)$ denotes the right adjoint to $i_{*}: D\left(\mathcal{O}_{D}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$ and has the property $i_{*} R \mathcal{H o m}\left(\mathcal{O}_{D},-\right)=R \mathcal{H o m}\left(i_{*} \mathcal{O}_{D},-\right)$, see Section 45.26

0B4B Lemma 45.29.1. As above, let $X$ be a scheme and let $D \subset X$ be an effective Cartier divisor. There is a canonical isomorphism $\operatorname{RHom}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right)=\mathcal{N}[-1]$ in $D\left(\mathcal{O}_{D}\right)$.

Proof. Equivalently, we are saying that $R \mathcal{H o m}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right)$ has a unique nonzero cohomology sheaf in degree 1 and that this sheaf is isomorphic to $\mathcal{N}$. Since $i_{*}$ is exact and fully faithful, it suffices to prove that $i_{*} R \mathcal{H o m}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right)$ is isomorphic to $i_{*} \mathcal{N}[-1]$. We have $i_{*} R \mathcal{H o m}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right)=R \mathcal{H o m}\left(i_{*} \mathcal{O}_{D}, \mathcal{O}_{X}\right)$ by Lemma 45.26 .3 . We have a resolution

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{D} \rightarrow 0
$$

where $\mathcal{I}$ is the ideal sheaf of $D$ which we can use to compute. Since $R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)=$ $\mathcal{O}_{X}$ and $\operatorname{RHom}\left(\mathcal{I}, \mathcal{O}_{X}\right)=\mathcal{O}_{X}(D)$ by a local compuation, we see that

$$
R \mathcal{H o m}\left(i_{*} \mathcal{O}_{D}, \mathcal{O}_{X}\right)=\left(\mathcal{O}_{X} \rightarrow \mathcal{O}_{X}(D)\right)
$$

where on the right hand side we have $\mathcal{O}_{X}$ in degree 0 and $\mathcal{O}_{X}(D)$ in degree 1 . The result follows from the short exact sequence

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}(D) \rightarrow i_{*} \mathcal{N} \rightarrow 0
$$

coming from the fact that $D$ is the zero scheme of the canonical section of $\mathcal{O}_{X}(D)$ and from the fact that $\mathcal{N}=i^{*} \mathcal{O}_{X}(D)$.

For every object $K$ of $D\left(\mathcal{O}_{X}\right)$ there is a canonical map
0B4C (45.29.1.1)

$$
L i^{*} K \otimes_{\mathcal{O}_{D}}^{\mathbf{L}} R \mathcal{H o m}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right) \longrightarrow R \mathcal{H o m}\left(\mathcal{O}_{D}, K\right)
$$

functorial in $K$ and compatible with distinguished triangles. Namely, this map is adjoint to a map

$$
i_{*}\left(L i^{*} K \otimes_{\mathcal{O}_{D}}^{\mathbf{L}} R \mathcal{H o m}\left(\mathcal{O}_{D}, \mathcal{O}_{X}\right)\right)=K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} R \mathcal{H o m}\left(i_{*} \mathcal{O}_{D}, \mathcal{O}_{X}\right) \longrightarrow K
$$

where the equality is Cohomology, Lemma 20.43 .4 and the arrow comes from the canonical map $R \mathcal{H}$ om $\left(i_{*} \mathcal{O}_{D}, \mathcal{O}_{X}\right) \rightarrow \mathcal{O}_{X}$ induced by $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{D}$.
If $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$, then 45.29 .1 .1$)$ is equal to 45.25 .0 .1$)$ via the identification $a(K)=R \mathcal{H o m}\left(\mathcal{O}_{D}, K\right)$ of Lemma 45.26.6. If $K \in D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)$ and $X$ is Noetherian, then the following lemma is a special case of Lemma 45.28.3.

0AA4 Lemma 45.29.2. As above, let $X$ be a scheme and let $D \subset X$ be an effective Cartier divisor. Then 45.29.1.1 combined with Lemma 45.29.1 defines an isomorphism

$$
L i^{*} K \otimes_{\mathcal{O}_{D}}^{\mathbf{L}} \mathcal{N}[-1] \longrightarrow R \mathcal{H o m}\left(\mathcal{O}_{D}, K\right)
$$

functorial in $K$ in $D\left(\mathcal{O}_{X}\right)$.
Proof. Since $i_{*}$ is exact and fully faithful on modules, to prove the map is an isomorphism, it suffices to show that it is an isomorphism after applying $i_{*}$. We will use the short exact sequences $0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{D} \rightarrow 0$ and $0 \rightarrow \mathcal{O}_{X} \rightarrow$ $\mathcal{O}_{X}(D) \rightarrow i_{*} \mathcal{N} \rightarrow 0$ used in the proof of Lemma 45.29.1 without further mention.

By Cohomology, Lemma 20.43.4 which was used to define the map 45.29.1.1 the left hand side becomes

$$
K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} i_{*} \mathcal{N}[-1]=K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{O}_{X} \rightarrow \mathcal{O}_{X}(D)\right)
$$

The right hand side becomes

$$
\begin{aligned}
\text { RHom }_{\mathcal{O}_{X}}\left(i_{*} \mathcal{O}_{D}, K\right) & =R \mathcal{H o m}_{\mathcal{O}_{X}}\left(\left(\mathcal{I} \rightarrow \mathcal{O}_{X}\right), K\right) \\
& =R \mathcal{H o m}_{\mathcal{O}_{X}}\left(\left(\mathcal{I} \rightarrow \mathcal{O}_{X}\right), \mathcal{O}_{X}\right) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} K
\end{aligned}
$$

the final equality by Cohomology, Lemma 20.41.11. Since the map comes from the isomorphism

$$
R \operatorname{Hom}_{\mathcal{O}_{X}}\left(\left(\mathcal{I} \rightarrow \mathcal{O}_{X}\right), \mathcal{O}_{X}\right)=\left(\mathcal{O}_{X} \rightarrow \mathcal{O}_{X}(D)\right)
$$

the lemma is clear.

### 45.30. Right adjoint of pushforward in examples

$0 B Q V$ In this section we compute the right adjoint to pushforward in some examples. The isomorphisms are canonical but only in the weakest possible sense, i.e., we do not prove or claim that these isomorphisms are compatible with various operations such as base change and compositions of morphisms. There is a huge literature on these types of issues; the reader can start with the material in Har66, Con00 (these citations use a different starting point for duality but address the issue of constructing canonical representatives for relative dualizing complexes) and then continue looking at works by Joseph Lipman and collaborators.

0A9W Lemma 45.30.1. Let $Y$ be a Noetherian scheme. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{Y}$-module of rank $n+1$ with determinant $\mathcal{L}=\wedge^{n+1}(\mathcal{E})$. Let $f: X=\mathbf{P}(\mathcal{E}) \rightarrow Y$ be the projection. Let a be the right adjoint for $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ of Lemma 45.22.1. Then there is an isomorphism

$$
c: f^{*} \mathcal{L}(-n-1)[n] \longrightarrow a\left(\mathcal{O}_{Y}\right)
$$

In particular, if $\mathcal{E}=\mathcal{O}_{Y}^{\oplus n+1}$, then $X=\mathbf{P}_{Y}^{n}$ and we obtain $a\left(\mathcal{O}_{Y}\right)=\mathcal{O}_{X}(-n-1)[n]$.
Proof. In (the proof of) Cohomology of Schemes, Lemma 29.8.4 we constructed a canonical isomorphism

$$
R^{n} f_{*}\left(f^{*} \mathcal{L}(-n-1)\right) \longrightarrow \mathcal{O}_{Y}
$$

Moreover, $R f_{*}\left(f^{*} \mathcal{L}(-n-1)\right)[n]=R^{n} f_{*}\left(f^{*} \mathcal{L}(-n-1)\right)$, i.e., the other higher direct images are zero. Thus we find an isomorphism

$$
R f_{*}\left(f^{*} \mathcal{L}(-n-1)[n]\right) \longrightarrow \mathcal{O}_{Y}
$$

This isomorphism determines $c$ as in the statement of the lemma because $a$ is the right adjoint of $R f_{*}$. By Lemma 45.22 .9 construction of the $a$ is local on the base. In particular, to check that $c$ is an isomorphism, we may work locally on $Y$. In other words, we may assume $Y$ is affine and $\mathcal{E}=\mathcal{O}_{Y}^{\oplus n+1}$. In this case the sheaves $\mathcal{O}_{X}, \mathcal{O}_{X}(-1), \ldots, \mathcal{O}_{X}(-n)$ generate $D_{Q C o h}(X)$, see Derived Categories of Schemes, Lemma 35.15.3. Hence it suffices to show that $c: \mathcal{O}_{X}(-n-1)[n] \rightarrow a\left(\mathcal{O}_{Y}\right)$ is transformed into an isomorphism under the functors

$$
F_{i, p}(-)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X}(i),(-)[p]\right)
$$

for $i \in\{-n, \ldots, 0\}$ and $p \in \mathbf{Z}$. For $F_{0, p}$ this holds by construction of the arrow $c$ ! For $i \in\{-n, \ldots,-1\}$ we have

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X}(i), \mathcal{O}_{X}(-n-1)[n+p]\right)=H^{p}\left(X, \mathcal{O}_{X}(-n-1-i)\right)=0
$$

by the computation of cohomology of projective space (Cohomology of Schemes, Lemma 29.8.1 and we have

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X}(i), a\left(\mathcal{O}_{Y}\right)[p]\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(R f_{*} \mathcal{O}_{X}(i), \mathcal{O}_{Y}[p]\right)=0
$$

because $R f_{*} \mathcal{O}_{X}(i)=0$ by the same lemma. Hence the source and the target of $F_{i, p}(c)$ vanish and $F_{i, p}(c)$ is necessarily an isomorphism. This finishes the proof.

0AAC Example 45.30.2. The base change map 45.23.0.1 is not an isomorphism if $f$ is perfect proper and $g$ is perfect. Let $k$ be a field. Let $Y=\mathbf{A}_{k}^{2}$ and let $f: X \rightarrow Y$ be the blow up of $Y$ in the origin. Denote $E \subset X$ the exceptional divisor. Then we can factor $f$ as

$$
X \xrightarrow{i} \mathbf{P}_{Y}^{1} \xrightarrow{p} Y
$$

This gives a factorization $a=c \circ b$ where $a, b$, and $c$ are the right adjoints of Lemma 45.22 .1 of $R f_{*}, R p_{*}$, and $R i_{*}$. Denote $\mathcal{O}(n)$ the Serre twist of the structure sheaf on $\mathbf{P}_{Y}^{1}$ and denote $\mathcal{O}_{X}(n)$ its restriction to $X$. Note that $X \subset \mathbf{P}_{Y}^{1}$ is cut out by a degree one equation, hence $\mathcal{O}(X)=\mathcal{O}(1)$. By Lemma 45.30.1 we have $b\left(\mathcal{O}_{Y}\right)=\mathcal{O}(-2)[1]$. By Lemma 45.26.6 we have

$$
a\left(\mathcal{O}_{Y}\right)=c\left(b\left(\mathcal{O}_{Y}\right)\right)=c(\mathcal{O}(-2)[1])=R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}(-2)[1]\right)=\mathcal{O}_{X}(-1)
$$

Last equality by Lemma 45.29 .2 Let $Y^{\prime}=\operatorname{Spec}(k)$ be the origin in $Y$. The restriction of $a\left(\mathcal{O}_{Y}\right)$ to $X^{\prime}=E=\mathbf{P}_{k}^{1}$ is an invertible sheaf of degree -1 placed in cohomological degree 0 . But on the other hand, $a^{\prime}\left(\mathcal{O}_{\operatorname{Spec}(k)}\right)=\mathcal{O}_{E}(-2)[1]$ which is an invertible sheaf of degree -2 placed in cohomological degree -1 , so different. In this example (4) is the only hypothesis of Lemma 45.23 .1 which is violated.

0BQW Lemma 45.30.3. Let $Y$ be a ringed space. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a sheaf of ideals. Set $\mathcal{O}_{X}=\mathcal{O}_{Y} / \mathcal{I}$ and $\mathcal{N}=\mathcal{H o m}_{\mathcal{O}_{Y}}\left(\mathcal{I} / \mathcal{I}^{2}, \mathcal{O}_{X}\right)$. There is a canonical isomorphism $c: \mathcal{N} \rightarrow \mathcal{E} x t_{\mathcal{O}_{Y}}^{1}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)$.
Proof. Consider the canonical short exact sequence
0BQX $\quad(45.30 .3 .1) \quad 0 \rightarrow \mathcal{I} / \mathcal{I}^{2} \rightarrow \mathcal{O}_{Y} / \mathcal{I}^{2} \rightarrow \mathcal{O}_{X} \rightarrow 0$
Let $U \subset X$ be open and let $s \in \mathcal{N}(U)$. Then we can pushout 45.30.3.1) via $s$ to get an extension $E_{s}$ of $\left.\mathcal{O}_{X}\right|_{U}$ by $\left.\mathcal{O}_{X}\right|_{U}$. This in turn defines a section $c(s)$ of $\mathcal{E} x t_{\mathcal{O}_{Y}}^{1}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)$ over $U$. See Cohomology, Lemma 20.35.1 and Derived Categories, Lemma 13.27.6. Conversely, given an extension

$$
\left.\left.0 \rightarrow \mathcal{O}_{X}\right|_{U} \rightarrow \mathcal{E} \rightarrow \mathcal{O}_{X}\right|_{U} \rightarrow 0
$$

of $\mathcal{O}_{U}$-modules, we can find an open covering $U=\bigcup U_{i}$ and sections $e_{i} \in \mathcal{E}\left(U_{i}\right)$ mapping to $1 \in \mathcal{O}_{X}\left(U_{i}\right)$. Then $e_{i}$ defines a map $\left.\left.\mathcal{O}_{Y}\right|_{U_{i}} \rightarrow \mathcal{E}\right|_{U_{i}}$ whose kernel contains $\mathcal{I}^{2}$. In this way we see that $\left.\mathcal{E}\right|_{U_{i}}$ comes from a pushout as above. This shows that $c$ is surjective. We omit the proof of injectivity.

0BQY Lemma 45.30.4. Let $Y$ be a ringed space. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a sheaf of ideals. Set $\mathcal{O}_{X}=\mathcal{O}_{Y} / \mathcal{I}$. If $\mathcal{I}$ is Koszul-regular (Divisors, Definition 30.17.2) then composition on $\operatorname{RHom}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)$ defines isomorphisms

$$
\wedge^{i}\left({\mathcal{E} x t_{\mathcal{O}_{Y}}}_{1}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)\right) \longrightarrow{\mathcal{E} x t_{\mathcal{O}_{Y}}^{i}}^{\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)}
$$

for all $i$.
Proof. By composition we mean the map

$$
R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \longrightarrow R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)
$$

of Cohomology, Lemma 20.35.6. This induces multiplication maps

$$
\mathcal{E} x t_{\mathcal{O}_{Y}}^{a}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \otimes_{\mathcal{O}_{Y}} \mathcal{E} x t_{\mathcal{O}_{Y}}^{b}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{E} x t_{\mathcal{O}_{Y}}^{a+b}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)
$$

Please compare with More on Algebra, Equation 15.53.0.1). The statement of the lemma means that the induced map

$$
\mathcal{E x t}_{\mathcal{O}_{Y}}^{1}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \otimes \ldots \otimes \mathcal{E x}^{1}{\mathcal{\mathcal { O } _ { Y }}}^{1}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \longrightarrow \mathcal{E} x t_{\mathcal{O}_{Y}}^{i}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)
$$

factors through the wedge product and then induces an isomorphism. To see this is true we may work locally on $Y$. Hence we may assume that we have global sections $f_{1}, \ldots, f_{r}$ of $\mathcal{O}_{Y}$ which generate $\mathcal{I}$ and which form a Koszul regular sequence. Denote

$$
\mathcal{A}=\mathcal{O}_{Y}\left\langle\xi_{1}, \ldots, \xi_{r}\right\rangle
$$

the sheaf of strictly commutative differential graded $\mathcal{O}_{Y}$-algebras which is a (divided power) polynomial algebra on $\xi_{1}, \ldots, \xi_{r}$ in degree -1 over $\mathcal{O}_{Y}$ with differential d given by the rule $\mathrm{d} \xi_{i}=f_{i}$. Let us denote $\mathcal{A}^{\bullet}$ the underlying complex of $\mathcal{O}_{Y}$-modules which is the Koszul complex mentioned above. Thus the canonical map $\mathcal{A}^{\bullet} \rightarrow \mathcal{O}_{X}$ is a quasi-isomorphism. We obtain quasi-isomorphisms

$$
R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \rightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{A}^{\bullet}\right) \rightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{X}\right)
$$

by Cohomology, Lemma 20.38.9. The differentials of the latter complex are zero, and hence

$$
\mathcal{E x} t_{\mathcal{O}_{Y}}^{i}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right) \cong \mathcal{H o m}\left(\mathcal{A}^{-i}, \mathcal{O}_{X}\right)
$$

For $j \in\{1, \ldots, r\}$ let $\delta_{j}: \mathcal{A} \rightarrow \mathcal{A}$ be the derivation of degree 1 with $\delta_{j}\left(\xi_{i}\right)=\delta_{i j}$ (Kronecker delta). A computation shows that $\delta_{j} \circ \mathrm{~d}=-\mathrm{d} \circ \delta_{j}$ which shows that we get a morphism of complexes.

$$
\delta_{j}: \mathcal{A}^{\bullet} \rightarrow \mathcal{A}^{\bullet}[1] .
$$

Whence $\delta_{j}$ defines a section of the corresponding $\mathcal{E x t}$-sheaf. Another computation shows that $\delta_{1}, \ldots, \delta_{r}$ map to a basis for $\mathcal{H o m}\left(\mathcal{A}^{-1}, \mathcal{O}_{X}\right)$ over $\mathcal{O}_{X}$. Since it is clear that $\delta_{j} \circ \delta_{j}=0$ and $\delta_{j} \circ \delta_{j^{\prime}}=-\delta_{j^{\prime}} \circ \delta_{j}$ as endomorphisms of $\mathcal{A}$ and hence in the $\mathcal{E x t}$-sheaves we obtain the statement that our map above factors through the exterior power. To see we get the desired isomorphism the reader checks that the elements

$$
\delta_{j_{1}} \circ \ldots \circ \delta_{j_{i}}
$$

for $j_{1}<\ldots<j_{i}$ map to a basis of the sheaf $\mathcal{H o m}\left(\mathcal{A}^{-i}, \mathcal{O}_{X}\right)$ over $\mathcal{O}_{X}$.
0BQZ Lemma 45.30.5. Let $Y$ be a ringed space. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a sheaf of ideals. Set $\mathcal{O}_{X}=\mathcal{O}_{Y} / \mathcal{I}$ and $\mathcal{N}=\mathcal{H o m}_{\mathcal{O}_{Y}}\left(\mathcal{I} / \mathcal{I}^{2}, \mathcal{O}_{X}\right)$. If $\mathcal{I}$ is Koszul-regular (Divisors, Definition 30.17.2) then

$$
R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{Y}\right)=\wedge^{r} \mathcal{N}[r]
$$

where $r: Y \rightarrow\{1,2,3, \ldots\}$ sends $y$ to the minimal number of generators of $\mathcal{I}$ needed in a neighbourhood of $y$.

Proof. We can use Lemmas 45.30.3 and 45.30.4 to see that we have isomorphisms $\wedge^{i} \mathcal{N} \rightarrow \mathcal{E X t}_{\mathcal{O}_{Y}}^{i}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right)$ for $i \geq 0$. Thus it suffices to show that the map $\mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$ induces an isomorphism

$$
{\mathcal{E} x t_{\mathcal{O}_{Y}}^{r}}^{\left(\mathcal{O}_{X}, \mathcal{O}_{Y}\right) \longrightarrow \mathcal{E x t}_{\mathcal{O}_{Y}}^{r}\left(\mathcal{O}_{X}, \mathcal{O}_{X}\right), ~}
$$

and that $\mathcal{E x} t_{\mathcal{O}_{Y}}^{i}\left(\mathcal{O}_{X}, \mathcal{O}_{Y}\right)$ is zero for $i \neq r$. These statements are local on $Y$. Thus we may assume that we have global sections $f_{1}, \ldots, f_{r}$ of $\mathcal{O}_{Y}$ which generate $\mathcal{I}$ and which form a Koszul regular sequence. Let $\mathcal{A}^{\bullet}$ be the Koszul complex on $f_{1}, \ldots, f_{r}$ as introduced in the proof of Lemma 45.30.4. Then

$$
R \mathcal{H o m}\left(\mathcal{O}_{X}, \mathcal{O}_{Y}\right)=\mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{Y}\right)
$$

by Cohomology, Lemma 20.38.9 Denote $1 \in H^{0}\left(\mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{Y}\right)\right)$ the identity map of $\mathcal{A}^{0}=\mathcal{O}_{Y} \rightarrow \mathcal{O}_{Y}$. With $\delta_{j}$ as in the proof of Lemma 45.30.4 we get an isomorphism of graded $\mathcal{O}_{Y}$-modules

$$
\mathcal{O}_{Y}\left\langle\delta_{1}, \ldots, \delta_{r}\right\rangle \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{Y}\right)
$$

by mapping $\delta_{j_{1}} \ldots \delta_{j_{i}}$ to $1 \circ \delta_{j_{1}} \circ \ldots \circ \delta_{j_{i}}$ in degree $i$. Via this isomorphism the differential on the right hand side induces a differential d on the left hand side. By our sign rules we have $\mathrm{d}(1)=-\sum f_{j} \delta_{j}$. Since $\delta_{j}: \mathcal{A}^{\bullet} \rightarrow \mathcal{A}^{\bullet}[1]$ is a morphism of complexes, it follows that

$$
\mathrm{d}\left(\delta_{j_{1}} \ldots \delta_{j_{i}}\right)=\left(-\sum f_{j} \delta_{j}\right) \delta_{j_{1}} \ldots \delta_{j_{i}}
$$

Observe that we have $\mathrm{d}=\sum f_{j} \delta_{j}$ on the differential graded algebra $\mathcal{A}$. Therefore the map defined by the rule

$$
1 \circ \delta_{j_{1}} \ldots \delta_{j_{i}} \longmapsto\left(\delta_{j_{1}} \circ \ldots \circ \delta_{j_{i}}\right)\left(\xi_{1} \ldots \xi_{r}\right)
$$

will define an isomorphism of complexes

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{Y}\right) \longrightarrow \mathcal{A}^{\bullet}[-r]
$$

if $r$ is odd and commuting with differentials up to sign if $r$ is even. In any case these complexes have isomorphic cohomology, which shows the desired vanishing. The isomorphism on cohomology in degree $r$ under the map

$$
\mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{Y}\right) \longrightarrow \mathcal{H o m}^{\bullet}\left(\mathcal{A}^{\bullet}, \mathcal{O}_{X}\right)
$$

also follows in a straightforward manner from this. (We observe that our choice of conventions regarding Koszul complexes does intervene in the definition of the isomorphism $R \mathcal{H} \operatorname{Hom}\left(\mathcal{O}_{X}, \mathcal{O}_{Y}\right)=\wedge^{r} \mathcal{N}[r]$.)

0BR0 Lemma 45.30.6. Let $Y$ be a quasi-compact and quasi-separated scheme. Let $i: X \rightarrow Y$ be a Koszul-regular immersion. Let a be the right adjoint of $R i_{*}$ : $D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ as in Lemma 45.22.1. Then there is an isomorphism

$$
\wedge^{r} \mathcal{N}[-r] \longrightarrow a\left(\mathcal{O}_{Y}\right)
$$

where $\mathcal{N}=\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{C}_{Y / X}, \mathcal{O}_{X}\right)$ is the normal sheaf of $i$ (Morphisms, Section 28.32) and $r$ is its rank viewed as a locally constant function on $X$.

Proof. Recall, from Lemmas 45.26.6 and 45.26.3, that $a\left(\mathcal{O}_{Y}\right)$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ whose pushforward to $Y$ is $R \mathcal{H o m}\left(i_{*} \mathcal{O}_{X}, \mathcal{O}_{Y}\right)$. Thus the result follows from Lemma 45.30.5.

0BRT Lemma 45.30.7. Let $Y$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a smooth proper morphism of relative dimension $d$. Let a be the right adjoint of $R f_{*}$ : $D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ as in Lemma 45.22.1. Then there is an isomorphism

$$
\wedge^{d} \Omega_{X / S}[d] \longrightarrow a\left(\mathcal{O}_{Y}\right)
$$

in $D\left(\mathcal{O}_{X}\right)$.
Proof. Consider the cartesian square

Let $b$ denote the right adjoint of $R q_{*}: D_{Q C o h}\left(\mathcal{O}_{X \times_{S} X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ as in Lemma 45.22.1. By Lemma 45.28.4 we have an isomorphism $b\left(\mathcal{O}_{X}\right)=L p^{*} a\left(\mathcal{O}_{S}\right)$. Let $c$ denote the right adjoint of $R \Delta_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X \times_{S} X}\right)$ as in Lemma 45.22.1. Applying $c$ we obtain $\mathcal{O}_{X}=c\left(b\left(\mathcal{O}_{X}\right)\right)=c\left(L p^{*} a\left(\mathcal{O}_{S}\right)\right)$. The first equality because $q \circ \Delta=\operatorname{id}_{X}$ and uniqueness of adjoints.
Because $\Delta$ is the diagonal of a smooth morphism it is a Koszul-regular immersion, see Divisors, Lemma 30.19.10. In particular, $\Delta$ is a perfect proper morphism (More on Morphisms, Lemma 36.43.7) and we obtain

$$
\begin{aligned}
c\left(L p^{*} a\left(\mathcal{O}_{S}\right)\right) & =L \Delta^{*} L p^{*} a\left(\mathcal{O}_{S}\right) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} c\left(\mathcal{O}_{X \times_{S} X}\right) \\
& =a\left(\mathcal{O}_{S}\right) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} c\left(\mathcal{O}_{X \times_{S} X}\right) \\
& =a\left(\mathcal{O}_{S}\right) \otimes \wedge^{d}\left(\mathcal{N}_{\Delta}\right)[-d]
\end{aligned}
$$

The first equality by Lemma 45.28.3. The second equality because $p \circ \Delta=\mathrm{id}_{X}$. The third equality by Lemma 45.30.6. Observe that $\wedge^{d}\left(\mathcal{N}_{\Delta}\right)$ is an invertible $\mathcal{O}_{X^{-}}$ module. Hence $\wedge^{d}\left(\mathcal{N}_{\Delta}\right)[-d]$ is an invertible object of $D\left(\mathcal{O}_{X}\right)$ and we conclude that $a\left(\mathcal{O}_{S}\right)=\wedge^{d}\left(\mathcal{C}_{\Delta}\right)[d]$. Since the conormal sheaf $\mathcal{C}_{\Delta}$ of $\delta$ is $\Omega_{X / S}$ by Morphisms, Lemma 28.33 .7 the proof is complete.
0BRU Remark 45.30.8. The use of the diagonal morphism in the proof of Lemma 45.30 .7 is not an accident. In fact, if $f: X \rightarrow S$ is a proper flat morphism of Noetherian schemes with relative dualizing complex $\omega_{X / S}^{\bullet}$ (Remark 45.28.5), then a slight modification of the argument shows that we have an isomorphism

$$
\omega_{X / S}^{\bullet}=c\left(L \operatorname{pr}_{1}^{*} \omega_{X / S}^{\bullet} \otimes_{\mathcal{O}_{X \times_{S} X}}^{\mathbf{L}} L \operatorname{pr}_{2}^{*} \omega_{X / S}^{\bullet}\right)
$$

where $c$ is the right adjoint to $R \Delta_{*}$. Thus our relative dualizing complex is rigid in a sense analogous to the notion introduced in vdB97. Namely, since the functor on the right is "quadratic" in $\omega_{X / S}^{\bullet}$ and the functor on the left is "linear" this "pins down" the complex $\omega_{X / S}^{\bullet}$ to some extent. There is an approach to duality theory using "rigid" (relative) dualizing complexes, see for example Nee11, Yek10, and YZ09.

### 45.31. Compactifications

0ATT We interrupt the flow of the arguments for a little bit of geometry.
Let $S$ be a quasi-compact and quasi-separated scheme. We will say a scheme $X$ over $S$ has a compactification over $S$ if there exists an open immersion $X \rightarrow \bar{X}$
into a scheme $\bar{X}$ proper over $S$. If $X$ has a compactification over $S$, then $X \rightarrow S$ is separated and of finite type. It is a theorem of Nagata (see Lüt93, Con07b], Nag56, Nag57a, Nag62a, and Nag63) that the converse is true as well (we will give a precise statement and a proof if we ever need this result).

Let $S$ be a quasi-compact and quasi-separated scheme. Let $X$ be a scheme over $S$. The category of compactifications of $X$ is the category whose objects are open immersions $j: X \rightarrow \bar{X}$ over $S$ with $\bar{X} \rightarrow S$ proper and whose morphisms $(j: X \rightarrow$ $\left.\bar{X}^{\prime}\right) \rightarrow(j: X \rightarrow \bar{X})$ are morphisms $f: \bar{X} \rightarrow \bar{X}$ such that $f \circ j^{\prime}=j$.

0ATU Lemma 45.31.1. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X$ be a compactifyable scheme over $S$. The category of compactifications of $X$ over $S$ is cofiltered.

Proof. We have to check conditions (1), (2), (3) of Categories, Definition 4.20.1. Condition (1) holds exactly because we assumed that $X$ is compactifyable. Let $j_{i}: X \rightarrow \bar{X}_{i}, i=1,2$ be two compactifications. Then we can consider the scheme theoretic closure $\bar{X}$ of $\left(j_{1}, j_{2}\right): X \rightarrow \bar{X}_{1} \times{ }_{S} \bar{X}_{2}$. This determines a third compactification $j: X \rightarrow \bar{X}$ which dominates both $j_{i}$ :

$$
\left(X, \bar{X}_{1}\right) \longleftarrow(X, \bar{X}) \longrightarrow\left(X, \bar{X}_{2}\right)
$$

Thus (2) holds. Let $f_{1}, f_{2}: \bar{X}_{1} \rightarrow \bar{X}_{2}$ be two morphisms between compactifications $j_{i}: X \rightarrow \bar{X}_{i}, i=1,2$. Let $\bar{X} \subset \bar{X}_{1}$ be the equalizer of $f_{1}$ and $f_{2}$. As $\bar{X}_{2} \rightarrow S$ is separated, we see that $\bar{X}$ is a closed subscheme of $\bar{X}_{1}$ and hence proper over $S$. Moreover, we obtain an open immersion $X \rightarrow \bar{X}$ because $\left.f_{1}\right|_{X}=\left.f_{2}\right|_{X}=\operatorname{id}_{X}$. The morphism $(X \rightarrow \bar{X}) \rightarrow\left(j_{1}: X \rightarrow \bar{X}_{1}\right)$ given by the closed immersion $\bar{X} \rightarrow \bar{X}_{1}$ equalizes $f_{1}$ and $f_{2}$ which proves condition (3) and finishes the proof.

We can also consider the category of all compactifications (for varying $X$ ). It turns out that this category, localized at the set of morphisms which induce an isomorphism on the interior is equivalent to the category of compactifyable schemes over $S$.

0A9Z Lemma 45.31.2. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$ with $Y$ separated and of finite type over $S$ and $X$ compactifyable over $S$. Then $X$ has a compactification over $Y$.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$ with $Y$ separated and of finite type over $S$. Let $j: X \rightarrow \bar{X}$ be a compactification of $X$ over $S$. Then we let $\bar{X}^{\prime}$ be the scheme theoretic image of $(j, f): X \rightarrow \bar{X} \times_{S} Y$. The morphism $\bar{X}^{\prime} \rightarrow Y$ is proper because $\bar{X} \times{ }_{S} Y \rightarrow Y$ is proper as a base change of $\bar{X} \rightarrow S$. On the other hand, since $Y$ is separated over $S$, the morphism $(1, f): X \rightarrow X \times_{S} Y$ is a closed immersion (Schemes, Lemma 25.21.11) and hence $X \rightarrow \bar{X}^{\prime}$ is an open immersion.

Let $S$ be a quasi-compact and quasi-separated scheme. We define the category of compactifications to be the category whose objects are pairs $(X, \bar{X})$ where $\bar{X}$ is a scheme proper over $S$ and $X \subset \bar{X}$ is a quasi-compact open and whose morphisms
are commutative diagrams

of morphisms of schemes over $S$.
0ATV Lemma 45.31.3. Let $S$ be a quasi-compact and quasi-separated scheme. The collection of morphisms $(u, \bar{u}):\left(X^{\prime}, \bar{X}^{\prime}\right) \rightarrow(X, \bar{X})$ such that $u$ is an isomorphism forms a right multiplicative system (Categories, Definition 4.26.1) of arrows in the category of compactifications.

Proof. Axiom RMS1 is trivial to verrify. Let us check RMS2 holds. Suppose given a diagram

with $u: X^{\prime} \rightarrow X$ an isomorphism. Then we let $Y^{\prime}=Y \times_{X} X^{\prime}$ with the projection $\operatorname{map} v: Y^{\prime} \rightarrow Y$ (an isomorphism). We also set $\bar{Y}^{\prime}=\bar{Y} \times \bar{X}^{\prime} \bar{X}^{\prime}$ with the projection map $\bar{v}: \bar{Y}^{\prime} \rightarrow \bar{Y}$ It is clear that $Y^{\prime} \rightarrow \bar{Y}^{\prime}$ is an open immersion. The diagram

shows that axiom RMS2 holds.
Let us check RMS3 holds. Suppose given a pair of morphims $(f, \bar{f}),(g, \bar{g}):(X, \bar{X}) \rightarrow$ $(Y, \bar{Y})$ of compactifications and a morphism $(v, \bar{v}):(Y, \bar{Y}) \rightarrow\left(Y^{\prime}, \bar{Y}^{\prime}\right)$ such that $v$ is an isomorphism and such that $(v, \bar{v}) \circ(f, \bar{f})=(v, \bar{v}) \circ(g, \bar{g})$. Then $f=g$. Hence if we let $\bar{X}^{\prime} \subset \bar{X}$ be the equalizer of $\bar{f}$ and $\bar{g}$, then $(u, \bar{u}):\left(X, \bar{X}^{\prime}\right) \rightarrow(X, \bar{X})$ will be a morphism of the category of compactifications such that $(f, \bar{f}) \circ(u, \bar{u})=(g, \bar{g}) \circ(u, \bar{u})$ as desired.

0ATW Lemma 45.31.4. Let $S$ be a quasi-compact and quasi-separated scheme. The functor $(X, \bar{X}) \mapsto X$ defines an equivalence from the category of compactifications localized (Categories, Lemma 4.26.11) at the right multiplicative system of Lemma 45.31 .3 to the category of compactifyable schemes over $S$.

Proof. Denote $\mathcal{C}$ the category of compactifications and denote $Q: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ the localization functor of Categories, Lemma 4.26.16. Denote $\mathcal{D}$ the category of compactifyable schemes over $S$. It is clear from the lemma just cited and our choice of multiplicative system that we obtain a functor $\mathcal{C}^{\prime} \rightarrow \mathcal{D}$. This functor is clearly essentially surjective. If $f: X \rightarrow Y$ is a morphism of compactifyable schemes, then we choose an open immersion $Y \rightarrow \bar{Y}$ into a scheme proper over $S$, and then we choose an embedding $X \rightarrow \bar{X}$ into a scheme $\bar{X}$ proper over $\bar{Y}$ (possible by Lemma
45.31 .2 applied to $X \rightarrow \bar{Y})$. This gives a morphism $(X, \bar{X}) \rightarrow(Y, \bar{Y})$ of compactifications which produces our given morphism $X \rightarrow Y$. Finally, suppose given a pair of morphisms in the localized category with the same source and target: say

$$
a=\left((f, \bar{f}):\left(X^{\prime}, \bar{X}^{\prime}\right) \rightarrow(Y, \bar{Y}),(u, \bar{u}):\left(X^{\prime}, \bar{X}^{\prime}\right) \rightarrow(X, \bar{X})\right)
$$

and

$$
b=\left((g, \bar{g}):\left(X^{\prime \prime}, \bar{X}^{\prime \prime}\right) \rightarrow(Y, \bar{Y}),(v, \bar{v}):\left(X^{\prime \prime}, \bar{X}^{\prime \prime}\right) \rightarrow(X, \bar{X})\right)
$$

which produce the same morphism $X \rightarrow Y$ over $S$, in other words $f \circ u^{-1}=g \circ v^{-1}$. By Categories, Lemma 4.26.13 we may assume that $\left(X^{\prime}, \bar{X}^{\prime}\right)=\left(X^{\prime \prime}, \bar{X}^{\prime \prime}\right)$ and $(u, \bar{u})=(v, \bar{v})$. In this case we can consider the equalizer $\bar{X}^{\prime \prime \prime} \subset \bar{X}^{\prime}$ of $\bar{f}$ and $\bar{g}$. The morphism $(w, \bar{w}):\left(X^{\prime}, \bar{X}^{\prime \prime \prime}\right) \rightarrow\left(X^{\prime}, \bar{X}^{\prime}\right)$ is in the multiplicative subset and we see that $a=b$ in the localized category by precomposing with ( $w, \bar{w}$ ).

### 45.32. Upper shriek functors

0 A 9 Y In this section, we construct the functors $f^{!}$for morphisms between compactifyable schemes over a fixed Noetherian base. As is customary in coherent duality, there are a number of diagrams that have to be shown to be commutative. We suggest the reader, after reading the construction, skips the verification of the lemmas and continues to the next section where we discuss properties of the upper shriek functors.

Given a morphism $f: X \rightarrow Y$ of compactifyable schemes over a Noetherian base scheme $S$, we will define an exact functor

$$
f^{!}: D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)
$$

of triangulated categories. Namely, we choose a compactification $X \rightarrow \bar{X}$ over $Y$ which is possible by Lemma 45.31.2. Denote $\bar{f}: \bar{X} \rightarrow Y$ the structure morphism. Let $\bar{a}: D_{Q C o h}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{\bar{X}}\right)$ be the right adjoint of $R \bar{f}_{*}$ constructed in Lemma 45.22.1. Then we set

$$
f^{!} K=\left.\bar{a}(K)\right|_{X}
$$

for $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$. The result is an object of $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ by Lemma 45.22.5
0AA0 Lemma 45.32.1. Let $f: X \rightarrow Y$ be a morphism between compactifyable schemes over a Noetherian scheme $S$. The functor $f^{!}$is, up to canonical isomorphism, independent of the choice of the compactification.

Proof. Consider the category of compactifications of $X$ over $Y$, which is cofiltered according to Lemmas 45.31.1 and 45.31.2. To every choice of a compactification

$$
j: X \rightarrow \bar{X}, \quad \bar{f}: \bar{X} \rightarrow Y
$$

the construction above associates the functor $j^{*} \circ \bar{a}: D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ where $\bar{a}$ is the right adjoint of $R \bar{f}_{*}$ constructed in Lemma 45.22.1.
Supppose given a morphism $g: \bar{X}_{1} \rightarrow \bar{X}_{2}$ between compactifications $j_{i}: X \rightarrow \bar{X}_{i}$ over $Y$. Namely, let $\bar{c}$ be the right adjoint of Lemma 45.22.1 for $g$. Then $\bar{c} \circ \bar{a}_{2}=\bar{a}_{1}$ because these functors are adjoint to $R \bar{f}_{2, *} \circ R g_{*}=R\left(\bar{f}_{2} \circ g\right)_{*}$. By 45.22.6.1 we have a canonical transformation

$$
j_{1}^{*} \circ \bar{c} \longrightarrow j_{2}^{*}
$$

of functors $D_{Q C o h}^{+}\left(\mathcal{O}_{\bar{X}_{2}}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ which is an isomorphism by Lemma 45.22.9. The composition

$$
j_{1}^{*} \circ \bar{a}_{1} \longrightarrow j_{1}^{*} \circ \bar{c} \circ \bar{a}_{2} \longrightarrow j_{2}^{*} \circ \bar{a}_{2}
$$

is an isomorphism of functors which we will denote by $\alpha_{g}$.
To finish the proof, since the category of compactifications of $X$ over $Y$ is cofiltered, it suffices to show compositions of morphisms of compactifications of $X$ over $Y$ are turned into compositions of isomorphisms of functors ${ }^{2}$ To do this, suppose that $j_{3}: X \rightarrow \bar{X}_{3}$ is a third compactification and that $h: \bar{X}_{2} \rightarrow \bar{X}_{3}$ is a morphism of compactifications. Let $\bar{d}$ be the right adjoint of Lemma 45.22.1 for $h$. Then $\bar{d} \circ \bar{a}_{3}=\bar{a}_{2}$ and there is a canonical transformation

$$
j_{2}^{*} \circ \bar{d} \longrightarrow j_{3}^{*}
$$

of functors $D_{Q C o h}^{+}\left(\mathcal{O}_{\bar{X}_{3}}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ for the same reasons as above. Denote $\bar{e}$ the right adjoint of Lemma 45.22 .1 for for $h \circ g$. There is a canonical transformation

$$
j_{1}^{*} \circ \bar{e} \longrightarrow j_{3}^{*}
$$

of functors $D_{Q C o h}^{+}\left(\mathcal{O}_{\bar{X}_{3}}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ given by 45.22 .6 .1 . Spelling things out we have to show that the composition

$$
\alpha_{h} \circ \alpha_{g}: j_{1}^{*} \circ \bar{a}_{1} \rightarrow j_{1}^{*} \circ \bar{c} \circ \bar{a}_{2} \rightarrow j_{2}^{*} \circ \bar{a}_{2} \rightarrow j_{2}^{*} \circ \bar{d} \circ \bar{a}_{3} \rightarrow j_{3}^{*} \circ \bar{a}_{3}
$$

is the same as the composition

$$
\alpha_{h \circ g}: j_{1}^{*} \circ \bar{a}_{1} \rightarrow j_{1}^{*} \circ \bar{e} \circ \bar{a}_{3} \rightarrow j_{3}^{*} \circ \bar{a}_{3}
$$

We split this into two parts. The first is to show that the diagram

commutes where the lower horizontal arrow comes from the identification $\bar{e}=\bar{c} \circ \bar{d}$. This is true because the corresponding diagram of total direct image functors

is commutative (insert future reference here). The second part is to show that the composition

$$
j_{1}^{*} \circ \bar{c} \circ \bar{d} \rightarrow j_{2}^{*} \circ \bar{d} \rightarrow j_{3}^{*}
$$

is equal to the map

$$
j_{1}^{*} \circ \bar{e} \rightarrow j_{3}^{*}
$$

via the identification $\bar{e}=\bar{c} \circ \bar{d}$. This was proven in Lemma 45.23 .2 (note that in the current case the morphisms $f^{\prime}, g^{\prime}$ of that lemma are equal to $\mathrm{id}_{X}$ ).

[^125]0ATX Lemma 45.32.2. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be composable morphisms between compactifyable schemes over a Noetherian scheme $S$. Then there is a canonical isomorphism $(g \circ f)^{!} \rightarrow f^{!} \circ g^{!}$.

Proof. Choose a compactification $i: Y \rightarrow \bar{Y}$ of $Y$ over $Z$. Choose a compactification $X \rightarrow \bar{X}$ of $X$ over $\bar{Y}$. This uses Lemma 45.31 .2 twice. Let $\bar{a}$ be the right adjoint of Lemma 45.22 .1 for $\bar{X} \rightarrow \bar{Y}$ and let $\bar{b}$ be the right adjoint of Lemma 45.22 .1 for $\bar{Y} \rightarrow Z$. Then $\bar{a} \circ \bar{b}$ is the right adjoint of Lemma 45.22 .1 for the composition $\bar{X} \rightarrow Z$. Hence $g^{!}=j_{Y}^{*} \circ \bar{b}$ and $(g \circ f)^{!}=(X \rightarrow \bar{X})^{*} \circ \bar{a} \circ \bar{b}$. Let $U$ be the inverse image of $Y$ in $\bar{X}$ so that we get the commutative diagram

Let $\bar{a}^{\prime}$ be the right adjoint of Lemma 45.22 .1 for $U \rightarrow Y$. Then $f^{!}=j^{*} \circ \bar{a}^{\prime}$. We obtain

$$
\gamma:\left(j^{\prime}\right)^{*} \circ \bar{a} \rightarrow \bar{a}^{\prime} \circ j_{Y}^{*}
$$

by (45.22.6.1) and we can use it to define

$$
(g \circ f)^{!}=j_{X}^{*} \circ \bar{a} \circ \bar{b}=j^{*} \circ\left(j^{\prime}\right)^{*} \circ \bar{a} \circ \bar{b} \rightarrow j^{*} \circ \bar{a}^{\prime} \circ j_{Y}^{*} \circ \bar{b}=f^{!} \circ g^{!}
$$

which is an isomorphism on objects of $D_{Q C o h}^{+}\left(\mathcal{O}_{Z}\right)$ by Lemma 45.22.9. To finish the proof we show that this isomorphism is independent of choices made.

Suppose we have two diagrams

and

We can first choose a compactification $i: Y \rightarrow \bar{Y}$ of $Y$ over $Z$ which dominates both $\bar{Y}_{1}$ and $\bar{Y}_{2}$, see Lemma 45.31.1. By Lemma 45.31 .3 and Categories, Lemmas 4.26.13 and 4.26.14 we can choose a compactification $X \rightarrow \bar{X}$ of $X$ over $\bar{Y}$ with morphisms $\bar{X} \rightarrow \bar{X}_{1}$ and $\bar{X} \rightarrow \bar{X}_{2}$ and such that the composition $\bar{X} \rightarrow \bar{Y} \rightarrow \bar{Y}_{1}$ is equal to the composition $\bar{X} \rightarrow \bar{X}_{1} \rightarrow \bar{Y}_{1}$ and such that the composition $\bar{X} \rightarrow \bar{Y} \rightarrow \bar{Y}_{2}$ is equal to the composition $\bar{X} \rightarrow \bar{X}_{2} \rightarrow \bar{Y}_{2}$. Thus we see that it suffices to compare the
maps determined by our diagrams when we have a commutative diagram as follows

We use $\bar{a}_{i}, \bar{a}_{i}^{\prime}, \bar{c}$, and $\bar{c}^{\prime}$ for the right adjoint of Lemma 45.22.1 for $\bar{X}_{i} \rightarrow \bar{Y}_{i}, U_{i} \rightarrow Y$, $\bar{X}_{1} \rightarrow \bar{X}_{2}$, and $U_{1} \rightarrow U_{2}$. Each of the squares

gives rise to a base change map 45.22.6.1 as follows

$$
\begin{array}{ccc}
\gamma_{A}: j_{1}^{*} \circ \bar{c}^{\prime} \rightarrow j_{2}^{*} & \gamma_{B}:\left(j_{2}^{\prime}\right)^{*} \circ \bar{a}_{2} \rightarrow \bar{a}_{2}^{\prime} \circ i_{2}^{*} & \gamma_{C}:\left(j_{1}^{\prime}\right)^{*} \circ \bar{a}_{1} \rightarrow \bar{a}_{1}^{\prime} \circ i_{1}^{*} \\
\gamma_{D}: i_{1}^{*} \circ \bar{d} \rightarrow i_{2}^{*} & \gamma_{E}:\left(j_{1}^{\prime} \circ j_{1}\right)^{*} \circ \bar{c} \rightarrow\left(j_{2}^{\prime} \circ j_{2}\right)^{*} &
\end{array}
$$

Denote $f_{1}^{!}=j_{1}^{*} \circ \bar{a}_{1}^{\prime}, f_{2}^{!}=j_{2}^{*} \circ \bar{a}_{2}^{\prime}, g_{1}^{!}=i_{1}^{*} \circ \bar{b}_{1}, g_{2}^{!}=i_{2}^{*} \circ \bar{b}_{2},(g \circ f)_{1}^{!}=\left(j_{1}^{\prime} \circ j_{1}\right)^{*} \circ \bar{a}_{1} \circ \bar{b}_{1}$, and $(g \circ f)_{2}^{!}=\left(j_{2}^{\prime} \circ j_{2}\right)^{*} \circ \bar{a}_{2} \circ \bar{b}_{2}$. The construction given in the first paragraph of the proof and in Lemma 45.32.1 uses
(1) $\gamma_{C}$ for the map $(g \circ f)_{1}^{!} \rightarrow f_{1}^{!} \circ g_{1}^{!}$,
(2) $\gamma_{B}$ for the map $(g \circ f)_{2}^{!} \rightarrow f_{2}^{!} \circ g_{2}^{!}$,
(3) $\gamma_{A}$ for the map $f_{1}^{\prime} \rightarrow f_{2}^{!}$,
(4) $\gamma_{D}$ for the map $g_{1}^{!} \rightarrow g_{2}^{!}$, and
(5) $\gamma_{E}$ for the map $(g \circ f)_{1}^{!} \rightarrow(g \circ f)_{2}^{!}$.

We have to show that the diagram

is commutative. We will use Lemmas 45.23 .2 and 45.23 .3 and with (abuse of) notation as in Remark 45.23.4 (in particular dropping $\star$ products with identity
transformations from the notation). We can write $\gamma_{E}=\gamma_{A} \circ \gamma_{F}$ where

Thus we see that

$$
\gamma_{B} \circ \gamma_{E}=\gamma_{B} \circ \gamma_{A} \circ \gamma_{F}=\gamma_{A} \circ \gamma_{B} \circ \gamma_{F}
$$

the last equality because the two squares $A$ and $B$ only intersect in one point (similar to the last argument in Remark 45.23.4). Thus it suffices to prove that $\gamma_{D} \circ \gamma_{C}=\gamma_{B} \circ \gamma_{F}$. Since both of these are equal to the map 45.22.6.1 for the square

we conclude.
0ATY Lemma 45.32.3. Let $S$ be a Noetherian scheme. The constructions of Lemmas 45.32 .1 and 45.32 .2 define a pseudo functor from the category of compactifyable schemes over $S$ into the 2 -category of categories (see Categories, Definition 4.28.5).

Proof. To show this we have to prove given morphisms $f: X \rightarrow Y, g: Y \rightarrow Z$, $h: Z \rightarrow T$ that

is commutative (for the meaning of the $\gamma$ 's, see below). To do this we choose a compactification $\bar{Z}$ of $Z$ over $T$, then a compactification $\bar{Y}$ of $Y$ over $\bar{Z}$, and then a compactification $\bar{X}$ of $X$ over $\bar{Y}$. This uses Lemma 45.31 .2 thrice. Let $W \subset \bar{Y}$ be the inverse image of $Z$ under $\bar{Y} \rightarrow \bar{Z}$ and let $U \subset V \subset \bar{X}$ be the inverse images of $Y \subset W$ under $\bar{X} \rightarrow \bar{Y}$. This produces the following diagram

Without introducing tons of notation but arguing exactly as in the proof of Lemma 45.32 .2 we see that the maps in the first displayed diagram use the maps 45.22.6.1 for the rectangles $A+B, B+C, A$, and $C$ as indicated. Since by Lemmas 45.23.2
and 45.23 .3 we have $\gamma_{A+B}=\gamma_{A} \circ \gamma_{B}$ and $\gamma_{B+C}=\gamma_{C} \circ \gamma_{B}$ we conclude that the desired equality holds provided $\gamma_{A} \circ \gamma_{C}=\gamma_{C} \circ \gamma_{A}$. This is true because the two squares $A$ and $C$ only intersect in one point (similar to the last argument in Remark 45.23.4.

0B6T Lemma 45.32.4. Let $f: X \rightarrow Y$ be a morphism between compactifyable schemes over a Noetherian scheme $S$. There are canonical maps

$$
\mu_{f, K}: L f^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} f^{!} \mathcal{O}_{Y} \longrightarrow f^{!} K
$$

functorial in $K$ in $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$. If $g: Y \rightarrow Z$ is another morphism between compactifyable schemes, then the diagram

commutes for all $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Z}\right)$.
Proof. If $f$ is proper, then $f^{!}=a$ and we can use 45.25.0.1 and if $g$ is also proper, then Lemma 45.25 .4 proves the commutativity of the diagram (in greater generality).
In general, choose a compactification $j: X \rightarrow \bar{X}$ of $X$ over $Y$. Since $f^{!}$is defined as $j^{*} \circ \bar{a}$ we obtain $\mu_{f}$ as the restriction of the map 45.25.0.1

$$
L \bar{f}^{*} K \otimes_{\mathcal{O}_{\bar{X}}}^{\mathbf{L}} \bar{a}\left(\mathcal{O}_{Y}\right) \longrightarrow \bar{a}(K)
$$

to $X$. To see this is independent of the choice of the compactification, we may assume given a morphism $g: \bar{X}_{1} \rightarrow \bar{X}_{2}$ between compactifications $j_{i}: X \rightarrow \bar{X}_{i}$ over $Y$. But now we know that the maps

$$
L \bar{f}_{1}^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \bar{a}_{1}\left(\mathcal{O}_{Y}\right) \longrightarrow \bar{a}_{1}(K) \quad \text { and } \quad L \bar{f}_{2}^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \bar{a}_{2}\left(\mathcal{O}_{Y}\right) \longrightarrow \bar{a}_{2}(K)
$$

fit into a commutative diagram by Lemma 45.25 .4 with two other maps given by $\mu_{g}$ which restrict to an isomorphism on $X$ by Lemma 45.25.3. This implies the two displayed maps above restrict to the same map on the open, via the identification $\left.\bar{a}_{1}(K)\right|_{X}=\left.\bar{a}_{2}(K)\right|_{X}$ used in the definition of $f^{!}$. Having said this, the commutativity of the diagram follows from the construction of the isomorphism $(g \circ f)^{!} \rightarrow f^{!} \circ g^{!}$ (first part of the proof of Lemma 45.32 .2 using $\bar{X} \rightarrow \bar{Y} \rightarrow Z$ ) and the result of Lemma 45.25.4 for $\bar{X} \rightarrow \bar{Y} \rightarrow Z$.

### 45.33. Properties of upper shriek functors

0ATZ Here are some properties of the upper shriek functors.
0AU0 Lemma 45.33.1. Let $S$ be a Noetherian scheme. Let $Y$ be a compactifyable scheme over $S$ and let $j: X \rightarrow Y$ be an open immersion. Then there is a canonical isomorphism $j^{!}=j^{*}$ of functors.

Proof. In this case we may choose $\bar{X}=Y$ as our compactification. Then the right adjoint of Lemma 45.22.1 for id : $Y \rightarrow Y$ is the identity functor and hence $j^{!}=j^{*}$ by definition.

0AA1 Lemma 45.33.2. Let $S$ be a Noetherian scheme. Let $Y$ be a compactifyable scheme over $S$ and let $f: X=\mathbf{A}_{Y}^{1} \rightarrow Y$ be the projection. Then there is a (noncanonical) isomorphism $f^{!}(-) \cong L f^{*}(-)[1]$ of functors.

Proof. Since $X=\mathbf{A}_{Y}^{1} \subset \mathbf{P}_{Y}^{1}$ and since $\left.\mathcal{O}_{\mathbf{P}_{Y}^{1}}(-2)\right|_{X} \cong \mathcal{O}_{X}$ this follows from Lemmas 45.30.1 and 45.28.3.

0AA2 Lemma 45.33.3. Let $S$ be a Noetherian scheme. Let $Y$ be a compactifyable scheme over $S$ and let $i: X \rightarrow Y$ be a closed immersion. Then there is a canonical isomorphism $i^{!}(-)=R \mathcal{H o m}\left(\mathcal{O}_{X},-\right)$ of functors.

Proof. This is a restatement of Lemma 45.26 .6
0AU1 Lemma 45.33.4. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism of compactifyable schemes over $S$. Then $f^{!}$maps $D_{\text {Coh }}^{+}\left(\mathcal{O}_{Y}\right)$ into $D_{C o h}^{+}\left(\mathcal{O}_{X}\right)$.

Proof. The question is local on $X$ hence we may assume that $X$ and $Y$ are affine schemes. In this case we can factor $f: X \rightarrow Y$ as

$$
X \xrightarrow{i} \mathbf{A}_{Y}^{n} \rightarrow \mathbf{A}_{Y}^{n-1} \rightarrow \ldots \rightarrow \mathbf{A}_{Y}^{1} \rightarrow Y
$$

where $i$ is a closed immersion. The lemma follows from By Lemmas 45.33.2, 45.17.9, 45.26 .5 and induction.

0AA3 Lemma 45.33.5. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism of compactifyable schemes over $S$. If $K$ is a dualizing complex for $Y$, then $f^{!} K$ is a dualizing complex for $X$.

Proof. The question is local on $X$ hence we may assume that $X$ and $Y$ are affine schemes mapping into an affine open of $S$. In this case we can factor $f: X \rightarrow Y$ as

$$
X \xrightarrow{i} \mathbf{A}_{Y}^{n} \rightarrow \mathbf{A}_{Y}^{n-1} \rightarrow \ldots \rightarrow \mathbf{A}_{Y}^{1} \rightarrow Y
$$

where $i$ is a closed immersion. By Lemmas 45.33 .2 and 45.17 .9 and induction we see that the $p^{!} K$ is a dualizing complex on $\mathbf{A}_{Y}^{n}$ where $p: \mathbf{A}_{Y}^{n} \rightarrow Y$ is the projection. Similarly, by Lemmas 45.17.8 45.26.4, and 45.33 .3 we see that $i^{!}$transforms dualizing complexes into dualizing complexes.

0AU2 Lemma 45.33.6. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism of compactifyable schemes over $S$. Let $K$ be a dualizing complex on $Y$. Set $D_{Y}(M)=$ $R \mathcal{H o m}_{\mathcal{O}_{Y}}(M, K)$ for $M \in D_{C o h}\left(\mathcal{O}_{Y}\right)$ and $D_{X}(E)=R \mathcal{H o m}_{\mathcal{O}_{X}}\left(E, f^{!} K\right)$ for $E \in$ $D_{C o h}\left(\mathcal{O}_{X}\right)$. Then there is a canonical isomorphism

$$
f^{!} M \longrightarrow D_{X}\left(L f^{*} D_{Y}(M)\right)
$$

for $M \in D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$.
Proof. Choose compactification $j: X \subset \bar{X}$ of $X$ over $Y$ (Lemma 45.31.2). Let $a$ be the right adjoint of Lemma 45.22 .1 for $\bar{X} \rightarrow Y$. Set $D_{\bar{X}}(E)=R \mathcal{H}_{\mathcal{H}_{\mathcal{O}_{\bar{X}}}}(E, a(K))$ for $E \in D_{C o h}\left(\mathcal{O}_{\bar{X}}\right)$. Since formation of $R \mathcal{H o m}$ commutes with restriction to opens and since $f^{!}=j^{*} \circ a$ we see that it suffices to prove that there is a canonical isomorphism

$$
a(M) \longrightarrow D_{\bar{X}}\left(L \bar{f}^{*} D_{Y}(M)\right)
$$

for $M \in D_{C o h}\left(\mathcal{O}_{Y}\right)$. For $F \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have

$$
\begin{aligned}
\operatorname{Hom}_{\bar{X}}\left(F, D_{\bar{X}}\left(L \bar{f}^{*} D_{Y}(M)\right)\right) & =\operatorname{Hom}_{\bar{X}}\left(F \otimes_{\mathcal{O}_{X}}^{\mathrm{L}} L \bar{f}^{*} D_{Y}(M), a(K)\right) \\
& =\operatorname{Hom}_{Y}\left(R \bar{f}_{*}\left(F \otimes_{\mathcal{O}_{X}}^{\mathrm{L}} L \bar{f}^{*} D_{Y}(M)\right), K\right) \\
& =\operatorname{Hom}_{Y}\left(R \bar{f}_{*}(F) \otimes_{\mathcal{O}_{Y}}^{\mathrm{L}} D_{Y}(M), K\right) \\
& =\operatorname{Hom}_{Y}\left(R \bar{f}_{*}(F), D_{Y}\left(D_{Y}(M)\right)\right) \\
& =\operatorname{Hom}_{Y}\left(R \bar{f}_{*}(F), M\right) \\
& =\operatorname{Hom}_{\bar{X}}(F, a(M))
\end{aligned}
$$

The first equality by Cohomology, Lemma 20.35.2. The second by definition of $a$. The third by Derived Categories of Schemes, Lemma 35.18.1. The fourth equality by Cohomology, Lemma 20.35 .2 and the definition of $D_{Y}$. The fifth equality by Lemma 45.21.4. The final equality by definition of $a$. Hence we see that $a(M)=$ $D_{\bar{X}}\left(L \bar{f}^{*} D_{Y}(M)\right)$ by Yoneda's lemma.

0B6U Lemma 45.33.7. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a perfect (e.g., flat) morphism of compactifyable schemes over $S$. Then
(1) $f^{!}$maps $D_{C o h}^{b}\left(\mathcal{O}_{Y}\right)$ into $D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$,
(2) the $\operatorname{map} \mu_{f, K}: L f^{*} K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} f^{!} \mathcal{O}_{Y} \rightarrow f^{!} K$ of Lemma 45.32.4 is an isomorphism for all $K \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$.

Proof. (A flat morphism of finite presentation is perfect, see More on Morphisms, Lemma 36.43.5.) We begin with a series of preliminary remarks.
(1) We already know that $f^{!}$sends $D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$ into $D_{C o h}^{+}\left(\mathcal{O}_{X}\right)$, see Lemma 45.33 .4
(2) If $f$ is an open immersion, then (1) and (2) are true because we can take $\bar{X}=Y$ in the construction of $f^{!}$and $\mu_{f}$. See also Lemma 45.33.1.
(3) If $f$ is a perfect proper morphism, then (2) is true by Lemma 45.28.3.
(4) If there exists an open covering $X=\bigcup U_{i}$ and (1) is true for $U_{i} \rightarrow Y$, then (1) is true for $X \rightarrow Y$. Same for (2). This holds because the construction of $f^{!}$and $\mu_{f}$ commutes with passing to open subschemes.
(5) If $g: Y \rightarrow Z$ is a second perfect morphism of compactifyable schemes over $S$ and (2) holds for $f$ and $g$, then $f^{!} g^{!} \mathcal{O}_{Z}=L f^{*} g^{!} \mathcal{O}_{Z} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} f^{!} \mathcal{O}_{Y}$ and (2) holds for $f$ by the commutative diagram of Lemma 45.32.4.
(6) If (1) and (2) hold for both $f$ and $g$, then (1) and (2) hold for $g \circ f$. Namely, then $f!g^{!} \mathcal{O}_{Z}$ is bounded above (by the previous point) and $L(g \circ f)^{*}$ has finite cohomological dimension and (1) follows from (2) which we saw above.
From these points we see it suffices to prove the result in case $X$ is affine. Choose an immersion $X \rightarrow \mathbf{A}_{Y}^{n}$ (Morphisms, Lemma 28.39.2) which we factor as $X \rightarrow U \rightarrow$ $\mathbf{A}_{Y}^{n} \rightarrow Y$ where $X \rightarrow U$ is a closed immersion and $U \subset \mathbf{A}_{Y}^{n}$ is open. Note that $X \rightarrow U$ is a perfect closed immersion by More on Morphisms, Lemma 36.43.8. Thus it suffices to prove the lemma for a perfect closed immersion and for the projection $\mathbf{A}_{Y}^{n} \rightarrow Y$.
Let $f: X \rightarrow Y$ be a perfect closed immersion. We already know (2) holds. Let $K \in D_{C o h}^{b}\left(\mathcal{O}_{Y}\right)$. Then $f^{!} K=R \mathcal{H o m}\left(\mathcal{O}_{X}, K\right)$ (Lemma 45.33.3) and $f_{*} f^{!} K=$ $R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X}, K\right)$. Since $f$ is perfect, the complex $f_{*} \mathcal{O}_{X}$ is perfect and hence
$R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X}, K\right)$ is bounded above. This proves that (1) holds. Some details omittted.
Let $f: \mathbf{A}_{Y}^{n} \rightarrow Y$ be the projection. Then (1) holds by repeated application of Lemma 45.33.2. Finally, (2) is true because it holds for $\mathbf{P}_{Y}^{n} \rightarrow Y$ (flat and proper) and because $\mathbf{A}_{Y}^{n} \subset \mathbf{P}_{Y}^{n}$ is an open.

0B6V Lemma 45.33.8. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow Y$ be a local complete intersection morphism of compactifyable schemes over $S$. Then $f^{!}$maps perfect complexes to perfect complexes.

Proof. Recall that a local complete intersection morphism is perfect, see More on Morphisms, Lemma 36.44.4. By Lemma 45.33.7 it suffices to show that $f^{!} \mathcal{O}_{Y}$ is a perfect complex on $X$. This question is local on $X$ and $Y$. Hence we may assume that $X \rightarrow Y$ factors as $X \rightarrow \mathbf{A}_{Y}^{n} \rightarrow Y$ where the first arrow is a Koszul regular immersion. See More on Morphisms, Section 36.44. The result holds for $\mathbf{A}_{Y}^{n} \rightarrow Y$ by Lemma 45.33.2. Thus it suffices to prove the lemma when $f$ is a Koszul regular immersion. Working locally once again we reduce to the case $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$, where $A=B /\left(f_{1}, \ldots, f_{r}\right)$ for some regular sequence $f_{1}, \ldots, f_{r} \in B$ (use that for Noetherian local rings the notion of Koszul regular and regular are the same, see More on Algebra, Lemma 15.23.6. Thus $X \rightarrow Y$ is a composition

$$
X=X_{r} \rightarrow X_{r-1} \rightarrow \ldots X_{1} \rightarrow X_{0}=Y
$$

where each arrow is the inclusion of an effective Cartier divisor. In this way we reduce to the case of an inclusion of an effective Cartier divisor $i: D \rightarrow X$. In this case $i^{!} \mathcal{O}_{X}=\mathcal{N}[1]$ by Lemma 45.29.1 and the proof is complete.

### 45.34. A duality theory

0AU3 In this section we spell out what kind of a duality theory our very general results above give for compactifyable schemes over a fixed Noetherian base scheme endowed with a dualizing complex.
Recall that a dualizing complex on a Noetherian scheme $S$, is an object of $D\left(\mathcal{O}_{S}\right)$ which affine locally gives a dualizing complex for the corresponding rings, see Definition 45.21.2.

0AU4 Situation 45.34.1. Here $S$ is a Noetherian scheme and $\omega_{S}^{\bullet}$ is a dualizing complex. For $\left(S, \omega_{S}^{\bullet}\right)$ as in Situation 45.34.1. We summarize the most important points of the results obtained above:
(1) the functors $f^{!}$for morphisms between compactifyable schemes over $S$ turn $D_{Q C o h}^{+}$into a pseudo functor,
(2) $\omega_{X}^{\bullet}=(X \rightarrow S)^{!} \omega_{S}^{\bullet}$ is a dualizing complex for $X$ over $S$ compactifyable,
(3) the functor $D_{X}=R \mathcal{H}$ om $\left(-, \omega_{X}^{\bullet}\right)$ defines an involution of $D_{C o h}\left(\mathcal{O}_{X}\right)$ switching $D_{C o h}^{+}\left(\mathcal{O}_{X}\right)$ and $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$ and fixing $D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$,
(4) $\omega_{X}^{\bullet}=f^{!} \omega_{Y}^{\bullet}$ for $f: X \rightarrow Y$ between compactifyable schemes over $S$,
(5) $f^{!} M=D_{X}\left(L f^{*} D_{Y}(M)\right)$ canonically for $M \in D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$, and
(6) if in addition $f$ is proper then $f^{\text {! }}$ is the restriction of the right adjoint of $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ to $D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right)$ and there is a canonical isomorphism

$$
R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(K, f^{!} M\right) \rightarrow R \mathcal{H o m}_{\mathcal{O}_{Y}}\left(R f_{*} K, M\right)
$$

$$
\begin{aligned}
& \text { for all } K \in D_{Q C o h}\left(\mathcal{O}_{X}\right) \text { and } M \in D_{Q C o h}^{+}\left(\mathcal{O}_{Y}\right) \text {, and most importantly } \\
& \qquad R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(K, \omega_{X}^{\bullet}\right)=R \mathcal{H o m}_{\mathcal{O}_{Y}}\left(R f_{*} K, \omega_{Y}^{\bullet}\right)
\end{aligned}
$$

See Lemmas 45.32.3, 45.33.5, 45.21.4, 45.32.2, 45.33.6, and 45.22.11,
We have obtained our functors by a very abstract procedure which finally rests on invoking an existence theorem (Derived Categories, Proposition 13.35.2). This means we have no explicit description of the functors $f$. This can sometimes be a problem. However, as we will see, often it is enough to know the existence of a dualizing complex and the duality isomorphism to pin down what it is more exactly.

### 45.35. Glueing dualizing complexes

0AU5 We will now use glueing of dualizing complexes to get a theory which works for all finite type schemes over $S$ given a pair $\left(S, \omega_{S}^{\bullet}\right)$ as in Situation 45.34.1. This is similar to Har66, Remark on page 310].
Let $X$ be a scheme of finite type over $S$. Let $\mathcal{U}: X=\bigcup_{i=1, \ldots, n} U_{i}$ be a finite open covering of $X$ by quasi-compact compactifyable schemes over $S$. Every affine scheme of finite type over $S$ is compactifyable over $S$ by Morphisms, Lemma 28.39.3 hence such open coverings certainly exist. For each $i, j, k \in\{1, \ldots, n\}$ the schemes $p_{i}: U_{i} \rightarrow S, p_{i j}: U_{i} \cap U_{j} \rightarrow S$, and $p_{i j k}: U_{i} \cap U_{j} \cap U_{k} \rightarrow S$ are compactifyable. From such an open covering we obtain
(1) $\omega_{i}^{\bullet}=p_{i}^{!} \omega_{S}^{\bullet}$ as in Section 45.34 .
(2) for each $i, j$ a canonical isomorphism $\varphi_{i j}:\left.\left.\omega_{i}^{\bullet}\right|_{U_{i} \cap U_{j}} \rightarrow \omega_{j}^{\bullet}\right|_{U_{i} \cap U_{j}}$, and

0AU6
(3) for each $i, j, k$ we have

$$
\left.\varphi_{i k}\right|_{U_{i} \cap U_{j} \cap U_{k}}=\left.\left.\varphi_{j k}\right|_{U_{i} \cap U_{j} \cap U_{k}} \circ \varphi_{i j}\right|_{U_{i} \cap U_{j} \cap U_{k}}
$$

in $D\left(\mathcal{O}_{U_{i} \cap U_{j} \cap U_{k}}\right)$.
Here, in (2) we use that $\left(U_{i} \cap U_{j} \rightarrow U_{i}\right)^{\text {! }}$ is given by restriction (Lemma 45.33.1) and that we have canonical isomorphisms

$$
\left(U_{i} \cap U_{j} \rightarrow U_{i}\right)^{!} \circ p_{i}^{!}=p_{i j}^{!}=\left(U_{i} \cap U_{j} \rightarrow U_{j}\right)^{!} \circ p_{j}^{!}
$$

by Lemma 45.32 .2 and to get (3) we use that the upper shriek functors form a pseudo functor by Lemma 45.32.3.
In the situation just described a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$ is a pair $\left(K, \alpha_{i}\right)$ where $K \in D\left(\mathcal{O}_{X}\right)$ and $\alpha_{i}:\left.K\right|_{U_{i}} \rightarrow \omega_{i}^{\bullet}$ are isomorphisms such that $\varphi_{i j}$ is given by $\left.\left.\alpha_{j}\right|_{U_{i} \cap U_{j}} \circ \alpha_{i}^{-1}\right|_{U_{i} \cap U_{j}}$. Since being a dualizing complex on a scheme is a local property we see that dualizing complexes normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$ are indeed dualizing complexes.
0AU7 Lemma 45.35.1. In Situation 45.34.1 let $X$ be a scheme of finite type over $S$ and let $\mathcal{U}$ be a finite open covering of $X$ by compactifyable schemes. If there exists a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$, then it is unique up to unique isomorphism.

Proof. If $\left(K, \alpha_{i}\right)$ and $\left(K^{\prime}, \alpha_{i}^{\prime}\right)$ are two, then we consider $L=R \mathcal{H o m}\left(K, K^{\prime}\right)$. By Lemma 45.21 .5 and its proof, this is an invertible object of $D\left(\mathcal{O}_{X}\right)$. Using $\alpha_{i}$ and $\alpha_{i}^{\prime}$ we obtain an isomorphism

$$
\alpha_{i}^{t} \otimes \alpha_{i}^{\prime}:\left.L\right|_{U_{i}} \longrightarrow R \mathcal{H} \operatorname{Hom}\left(\omega_{i}^{\bullet}, \omega_{i}^{\bullet}\right)=\mathcal{O}_{U_{i}}[0]
$$

This already implies that $L=H^{0}(L)[0]$ in $D\left(\mathcal{O}_{X}\right)$. Moreover, $H^{0}(L)$ is an invertible sheaf with given trivializations on the opens $U_{i}$ of $X$. Finally, the condition that $\left.\left.\alpha_{j}\right|_{U_{i} \cap U_{j}} \circ \alpha_{i}^{-1}\right|_{U_{i} \cap U_{j}}$ and $\left.\left.\alpha_{j}^{\prime}\right|_{U_{i} \cap U_{j}} \circ\left(\alpha_{i}^{\prime}\right)^{-1}\right|_{U_{i} \cap U_{j}}$ both give $\varphi_{i j}$ implies that the transition maps are 1 and we get an isomorphism $H^{0}(L)=\mathcal{O}_{X}$.

0AU8 Lemma 45.35.2. In Situation 45.34.1 let $X$ be a scheme of finite type over $S$ and let $\mathcal{U}, \mathcal{V}$ be two finite open coverings of $X$ by compactifyable schemes. If there exists a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$, then there exists a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{V}$ and these complexes are canonically isomorphic.

Proof. It suffices to prove this when $\mathcal{U}$ is given by the opens $U_{1}, \ldots, U_{n}$ and $\mathcal{V}$ by the opens $U_{1}, \ldots, U_{n+m}$. In fact, we may and do even assume $m=1$. To go from a dualizing complex $\left(K, \alpha_{i}\right)$ normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{V}$ to a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ amd $\mathcal{U}$ is achieved by forgetting about $\alpha_{i}$ for $i=n+1$. Conversely, let $\left(K, \alpha_{i}\right)$ be a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$. To finish the proof we need to construct a map $\alpha_{n+1}:\left.K\right|_{U_{n+1}} \rightarrow \omega_{n+1}^{\bullet}$ satisfying the desired conditions. To do this we observe that $U_{n+1}=\bigcup U_{i} \cap U_{n+1}$ is an open covering. It is clear that $\left(\left.K\right|_{U_{n+1}},\left.\alpha_{i}\right|_{U_{i} \cap U_{n+1}}\right)$ is a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and the covering $U_{n+1}=\bigcup U_{i} \cap U_{n+1}$. On the other hand, by condition (3) the pair $\left(\left.\omega_{n+1}^{\bullet}\right|_{U_{n+1}}, \varphi_{n+1 i}\right)$ is another dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and the covering $U_{n+1}=\bigcup U_{i} \cap U_{n+1}$. By Lemma 45.35.1 we obtain a unique isomorphism

$$
\alpha_{n+1}:\left.K\right|_{U_{n+1}} \longrightarrow \omega_{n+1}^{\bullet}
$$

compatible with the given local isomorphisms. It is a pleasant exercise to show that this means it satisfies the required property.
0AU9 Lemma 45.35.3. In Situation 45.34.1 let $X$ be a scheme of finite type over $S$ and let $\mathcal{U}$ be a finite open covering of $X$ by compactifyable schemes. Then there exists a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$.

Proof. Say $\mathcal{U}: X=\bigcup_{i=1, \ldots, n} U_{i}$. We prove the lemma by induction on $n$. The base case $n=1$ is immediate. Assume $n>1$. Set $X^{\prime}=U_{1} \cup \ldots \cup U_{n-1}$ and let $\left(K^{\prime},\left\{\alpha_{i}^{\prime}\right\}_{i=1, \ldots, n-1}\right)$ be a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}^{\prime}$ : $X^{\prime}=\bigcup_{i=1, \ldots, n-1} U_{i}$. It is clear that $\left(\left.K^{\prime}\right|_{X^{\prime} \cap U_{n}},\left.\alpha_{i}^{\prime}\right|_{U_{i} \cap U_{n}}\right)$ is a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and the covering $X^{\prime} \cap U_{n}=\bigcup_{i=1, \ldots, n-1} U_{i} \cap U_{n}$. On the other hand, by condition (3) the pair $\left(\left.\omega_{n}^{\bullet}\right|_{X^{\prime} \cap U_{n}}, \varphi_{n i}\right)$ is another dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and the covering $X^{\prime} \cap U_{n}=\bigcup_{i=1, \ldots, n-1} U_{i} \cap U_{n}$. By Lemma 45.35.1 we obtain a unique isomorphism

$$
\epsilon:\left.\left.K^{\prime}\right|_{X^{\prime} \cap U_{n}} \longrightarrow \omega_{i}^{\bullet}\right|_{X^{\prime} \cap U_{n}}
$$

compatible with the given local isomorphisms. By Cohomology, Lemma 20.30.10 we obtain $K \in D\left(\mathcal{O}_{X}\right)$ together with isomorphisms $\beta:\left.K\right|_{X^{\prime}} \rightarrow K^{\prime}$ and $\gamma:\left.K\right|_{U_{n}} \rightarrow \omega_{n}^{\bullet}$ such that $\epsilon=\left.\left.\gamma\right|_{X^{\prime} \cap U_{n}} \circ \beta\right|_{X^{\prime} \cap U_{n}} ^{-1}$. Then we define

$$
\alpha_{i}=\left.\alpha_{i}^{\prime} \circ \beta\right|_{U_{i}}, i=1, \ldots, n-1, \text { and } \alpha_{n}=\gamma
$$

We still need to verify that $\varphi_{i j}$ is given by $\left.\left.\alpha_{j}\right|_{U_{i} \cap U_{j}} \circ \alpha_{i}^{-1}\right|_{U_{i} \cap U_{j}}$. For $i, j \leq n-1$ this follows from the corresping condition for $\alpha_{i}^{\prime}$. For $i=j=n$ it is clear as well. If $i<j=n$, then we get
$\left.\left.\alpha_{n}\right|_{U_{i} \cap U_{n}} \circ \alpha_{i}^{-1}\right|_{U_{i} \cap U_{n}}=\left.\left.\left.\gamma\right|_{U_{i} \cap U_{n}} \circ \beta^{-1}\right|_{U_{i} \cap U_{n}} \circ\left(\alpha_{i}^{\prime}\right)^{-1}\right|_{U_{i} \cap U_{n}}=\left.\left.\epsilon\right|_{U_{i} \cap U_{n}} \circ\left(\alpha_{i}^{\prime}\right)^{-1}\right|_{U_{i} \cap U_{n}}$

This is equal to $\alpha_{i n}$ exactly because $\epsilon$ is the unique map compatible with the maps $\alpha_{i}^{\prime}$ and $\alpha_{n i}$.
Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. The upshot of the lemmas above is that given any scheme $X$ of finite type over $S$, there is a pair $\left(K, \alpha_{U}\right)$ given up to unique isomorphism, consisting of an object $K \in D\left(\mathcal{O}_{X}\right)$ and isomorphisms $\alpha_{U}:\left.K\right|_{U} \rightarrow$ $\omega_{U}^{\bullet}$ for every open subscheme $U \subset X$ which has a compactification over $S$ and where $\omega_{U}^{\bullet}$ is as in Section 45.34 , such that, if $\mathcal{U}: X=\bigcup U_{i}$ is a finite open covering by opens which are compactifyable over $S$, then ( $K, \alpha_{U_{i}}$ ) is a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$. Namely, uniqueness up to unique isomorphsm by Lemma 45.35.1. existence for one open covering by Lemma 45.35.3, and the fact that $K$ then works for all open coverings is Lemma 45.35.2.

0AUA Definition 45.35.4. Let $S$ be a Noetherian scheme and let $\omega_{S}^{\bullet}$ be a dualizing complex on $S$. Let $X$ be a scheme of finite type over $S$. The complex $K$ constructed above is called the dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and is denoted $\omega_{X}^{\bullet}$.
As the terminology suggest, a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ is not just an object of the derived category of $X$ but comes equipped with the local isomorphisms described above. This does not conflict with setting $\omega_{X}^{\bullet}=p^{!} \omega_{S}^{\bullet}$ where $p: X \rightarrow S$ is the structure morphism if $X$ has a compactification over $S$ (see Section 45.17. More generally we have the following sanity check.

0AUB Lemma 45.35.5. Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. Let $f: X \rightarrow Y$ be a morphism of finite type schemes over $S$. Let $\omega_{X}^{\bullet}$ and $\omega_{Y}^{\bullet}$ be dualizing complexes normalized relative to $\omega_{S}^{\bullet}$. Then $\omega_{X}^{\bullet}$ is a dualizing complex normalized relative to $\omega_{Y}^{\bullet}$.
Proof. This is just a matter of bookkeeping. Choose a finite affine open covering $\mathcal{V}: Y=\bigcup V_{j}$. For each $j$ choose a finite affine open covering $f^{-1}\left(V_{j}\right)=U_{j i}$. Set $\mathcal{U}: X=\bigcup U_{j i}$. The schemes $V_{j}$ and $U_{j i}$ are compactifyable over $S$, hence we have the upper shriek functors for $q_{j}: V_{j} \rightarrow S, p_{j i}: U_{j i} \rightarrow S$ and $f_{j i}: U_{j i} \rightarrow V_{j}$ and $f_{j i}^{\prime}: U_{j i} \rightarrow Y$. Let $\left(L, \beta_{j}\right)$ be a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{V}$. Let $\left(K, \gamma_{j i}\right)$ be a dualizing complex normalized relative to $\omega_{S}^{\bullet}$ and $\mathcal{U}$. (In other words, $L=\omega_{Y}^{\bullet}$ and $K=\omega_{X}^{\bullet}$.) We can define

$$
\alpha_{j i}:\left.K\right|_{U_{j i}} \xrightarrow{\gamma_{j i}} p_{j i}^{!} \omega_{S}^{\bullet}=f_{j i}^{!} q_{j}^{!} \omega_{S}^{\bullet} \xrightarrow{f_{j i}^{!} \beta_{j}^{-1}} f_{j i}^{!}\left(\left.L\right|_{V_{j}}\right)=\left(f_{j i}^{\prime}\right)^{!}(L)
$$

To finish the proof we have to show that $\left.\left.\alpha_{j i}\right|_{U_{j i} \cap U_{j^{\prime} i^{\prime}}} \circ \alpha_{j^{\prime} i^{\prime}}^{-1}\right|_{U_{j i} \cap U_{j^{\prime} i^{\prime}}}$ is the canonical isomorphism $\left.\left.\left(f_{j i}^{\prime}\right)^{!}(L)\right|_{U_{j i} \cap U_{j^{\prime} i^{\prime}}} \rightarrow\left(f_{j^{\prime} i^{\prime}}^{\prime}\right)^{!}(L)\right|_{U_{j i} \cap U_{j^{\prime} i^{\prime}}}$. This is formal and we omit the details.
0AUC Lemma 45.35.6. Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. Let $j: X \rightarrow Y$ be an open immersion of schemes of finite type over $S$. Let $\omega_{X}^{\bullet}$ and $\omega_{Y}^{\bullet}$ be dualizing complexes normalized relative to $\omega_{S}^{\bullet}$. Then there is a canonical isomorphism $\omega_{X}^{\bullet}=\left.\omega_{Y}^{\bullet}\right|_{X}$.
Proof. Immediate from the construction of normalized dualizing complexes given just above Definition 45.35.4.
0AUD Lemma 45.35.7. Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. Let $f: X \rightarrow Y$ be $a$ proper morphism of schemes of finite type over $S$. Let $\omega_{X}^{\bullet}$ and $\omega_{Y}^{\bullet}$ be dualizing complexes normalized relative to $\omega_{S}^{\bullet}$. Let a be the right adjoint of Lemma 45.22.1 for $f$. Then there is a canonical isomorphism $a\left(\omega_{Y}^{\bullet}\right)=\omega_{X}^{\bullet}$.

Proof. Let $p: X \rightarrow S$ and $q: Y \rightarrow S$ be the structure morphisms. If $X$ and $Y$ are compactifyable over $S$, then this follows from the fact that $\omega_{X}^{\bullet}=p^{!} \omega_{S}^{\bullet}, \omega_{Y}^{\bullet}=q^{!} \omega_{S}^{\bullet}$, $f^{!}=a$, and $f^{!} \circ q^{!}=p^{!}$(Lemma 45.32.2). In the general case we first use Lemma 45.35 .5 to reduce to the case $Y=S$. In this case $X$ and $Y$ are compactifyable over $S$ and we've just seen the result.

Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. For a scheme $X$ of finite type over $S$ denote $\omega_{X}^{\bullet}$ the dualizing complex for $X$ normalized relative to $\omega_{S}^{\bullet}$. Define $D_{X}(-)=$ $R \mathcal{H o m}_{\mathcal{O}_{X}}\left(-, \omega_{X}^{\bullet}\right)$ as in Lemma 45.21.4. Let $f: X \rightarrow Y$ be a morphism of finite type schemes over $S$. Define

$$
f_{\text {new }}^{!}=D_{X} \circ L f^{*} \circ D_{Y}: D_{C o h}^{+}\left(\mathcal{O}_{Y}\right) \rightarrow D_{C o h}^{+}\left(\mathcal{O}_{X}\right)
$$

If $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are composable morphisms between schemes of finite type over $S$, define

$$
\begin{aligned}
(g \circ f)_{\text {new }}^{!} & =D_{X} \circ L(g \circ f)^{*} \circ D_{Z} \\
& =D_{X} \circ L f^{*} \circ L g^{*} \circ D_{Z} \\
& \rightarrow D_{X} \circ L f^{*} \circ D_{Y} \circ D_{Y} \circ L g^{*} \circ D_{Z} \\
& =f_{\text {new }}^{!} \circ g_{\text {new }}^{!}
\end{aligned}
$$

where the arrow is defined in Lemma 45.21.4. We collect the results together in the following lemma.
0AUE Lemma 45.35.8. Let $\left(S, \omega_{S}^{\bullet}\right)$ be as in Situation 45.34.1. With $f_{\text {new }}^{!}$and $\omega_{X}^{\bullet}$ defined for all (morphisms of) schemes of finite type over $S$ as above:
(1) the functors $f_{\text {new }}^{!}$and the arrows $(g \circ f)_{\text {new }}^{!} \rightarrow f_{\text {new }}^{!} \circ g_{\text {new }}^{!}$turn $D_{\text {Coh }}^{+}$into a pseudo functor from the category of schemes of finite type over $S$ into the 2-category of categories,
(2) $\omega_{X}^{\bullet}=(X \rightarrow S)_{\text {new }}^{!} \omega_{S}^{\bullet}$,
(3) the functor $D_{X}$ defines an involution of $D_{C o h}\left(\mathcal{O}_{X}\right)$ switching $D_{C o h}^{+}\left(\mathcal{O}_{X}\right)$ and $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$ and fixing $D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$,
(4) $\omega_{X}^{\bullet}=f_{\text {new }}^{!} \omega_{Y}^{\bullet}$ for $f: X \rightarrow Y$ a morphism of finite type schemes over $S$,
(5) $f_{\text {new }}^{!} M=D_{X}\left(L f^{*} D_{Y}(M)\right)$ for $M \in D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$, and
(6) if in addition $f$ is proper, then $f_{\text {new }}^{!}$is isomorphic to the restriction of the right adjoint of $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ to $D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$ and there is a canonical isomorphism

$$
R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(K, f_{\text {new }}^{!} M\right) \rightarrow R \mathcal{H o m}_{\mathcal{O}_{Y}}\left(R f_{*} K, M\right)
$$

for all $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $M \in D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$, and most importantly

$$
R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(K, \omega_{X}^{\bullet}\right)=R \mathcal{H o m}_{\mathcal{O}_{Y}}\left(R f_{*} K, \omega_{Y}^{\bullet}\right)
$$

Moreover, if $X$ is compactifyable over $S$ then $\omega_{X}^{\bullet}$ is canonically isomorphic to the complex $\omega_{X}^{\bullet}$ of Section 45.34 and if $f$ is a morphism between compactifyable schemes over $S$, then there is a canonical isomorphism $\square^{3} f_{\text {new }}^{!} K=f^{!} K$ for $K$ in $D_{C o h}^{+}$.

[^126]Proof. Let $f: X \rightarrow Y, g: Y \rightarrow Z, h: Z \rightarrow T$ be morphisms of schemes of finite type over $S$. We have to show that

is commutative. Let $\eta_{Y}:$ id $\rightarrow D_{Y}^{2}$ and $\eta_{Z}:$ id $\rightarrow D_{Z}^{2}$ be the canonical isomorphisms of Lemma 45.21.4. Then, using Categories, Lemma 4.27.2, a computation (omitted) shows that both arrows $(h \circ g \circ f)_{\text {new }}^{!} \rightarrow f_{\text {new }}^{!} \circ g_{\text {new }}^{!} \circ h_{\text {new }}^{!}$are given by
$1 \star \eta_{Y} \star 1 \star \eta_{Z} \star 1: D_{X} \circ L f^{*} \circ L g^{*} \circ L h^{*} \circ D_{T} \longrightarrow D_{X} \circ L f^{*} \circ D_{Y}^{2} \circ L g^{*} \circ D_{Z}^{2} \circ L h^{*} \circ D_{T}$ This proves (1). Part (2) is immediate from the definition of $(X \rightarrow S)_{\text {new }}^{!}$and the fact that $D_{S}\left(\omega_{S}^{\bullet}\right)=\mathcal{O}_{S}$. Part (3) is Lemma 45.21.4. Part (4) follows by the same arguemtn as part (2). Part (5) is the definition of $f_{\text {new }}$.
Proof of (6). Let $a$ be the right adjoint of Lemma 45.22 .1 for the proper morphism $f: X \rightarrow Y$ of schemes of finite type over $S$. The issue is that we do not know $X$ or $Y$ is compactifyable over $S$ (and in general this won't be true) hence we cannot immediately apply Lemma 45.33 .6 to $f$ over $S$. To get around this we use the canonical identification $\omega_{X}^{\bullet}=a\left(\omega_{Y}^{\bullet}\right)$ of Lemma 45.35.7. Hence $f_{\text {new }}^{!}$is the restriction of $a$ to $D_{C o h}^{+}\left(\mathcal{O}_{Y}\right)$ by Lemma 45.33 .6 applied to $f: X \rightarrow Y$ over the base scheme $Y$ ! Thus the result is true by Lemma 45.22 .11 .

The final assertions follow from the construction of normalized dualizing complexes and the already used Lemma 45.33.6.

0B6X Example 45.35.9. Let $S$ be a Noetherian scheme and let $\omega_{S}^{\bullet}$ be a dualizing complex. Let $f: X \rightarrow Y$ be a proper morphism of finite type schemes over $S$. Let $\omega_{X}^{\bullet}$ and $\omega_{Y}^{\bullet}$ be dualizing complexes normalized relative to $\omega_{S}^{\bullet}$. In this situation we have $a\left(\omega_{Y}^{\bullet}\right)=\omega_{X}^{\bullet}$ (Lemma 45.35.7) and hence the trace map (Section 45.24) is a canonical arrow

$$
\operatorname{Tr}_{f}: R f_{*} \omega_{X}^{\bullet} \longrightarrow \omega_{Y}^{\bullet}
$$

which produces the isomorphisms (Lemma 45.35.8)

$$
\operatorname{Hom}_{X}\left(L, \omega_{X}^{\bullet}\right)=\operatorname{Hom}_{Y}\left(R f_{*} L, \omega_{Y}^{\bullet}\right)
$$

and

$$
R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(L, \omega_{X}^{\bullet}\right)=R \mathcal{H o m}_{\mathcal{O}_{Y}}\left(R f_{*} L, \omega_{Y}^{\bullet}\right)
$$

for $L$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
0AX4 Remark 45.35.10. Let $S$ be a Noetherian scheme and let $\omega_{S}^{\bullet}$ be a dualizing complex. Let $f: X \rightarrow Y$ be a finite morphism between schemes of finite type over $S$. Let $\omega_{X}^{\bullet}$ and $\omega_{Y}^{\bullet}$ be dualizing complexes normalized relative to $\omega_{S}^{\bullet}$. Then we have

$$
f_{*} \omega_{X}^{\bullet}=R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X}, \omega_{Y}^{\bullet}\right)
$$

in $D_{Q C o h}^{+}\left(f_{*} \mathcal{O}_{X}\right)$ by Lemmas 45.27 .3 and 45.35 .7 and the trace map of Example 45.35 .9 is the map

$$
\operatorname{Tr}_{f}: R f_{*} \omega_{X}^{\bullet}=f_{*} \omega_{X}^{\bullet}=R \mathcal{H o m}\left(f_{*} \mathcal{O}_{X}, \omega_{Y}^{\bullet}\right) \longrightarrow \omega_{Y}^{\bullet}
$$

which often goes under the name "evaluation at 1 ".

0B6W Remark 45.35.11. Let $f: X \rightarrow Y$ be a flat proper morphism of finite type schemes over a pair $\left(S, \omega_{S}^{\bullet}\right)$ as in Situation 45.34.1. The relative dualizing complex (Remark 45.28.5) is $\omega_{X / Y}^{\bullet}=a\left(\mathcal{O}_{Y}\right)$. By Lemma 45.35.7 we have the first canonical isomorphism in

$$
\omega_{X}^{\bullet}=a\left(\omega_{Y}^{\bullet}\right)=L f^{*} \omega_{Y}^{\bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \omega_{X / Y}^{\bullet}
$$

in $D\left(\mathcal{O}_{X}\right)$. The second canonical isomorphism follows from the discussion in Remark 45.28.5.

### 45.36. Dualizing modules

0 AWH If $(A, \mathfrak{m}, \kappa)$ is a Noetherian local ring and $\omega_{A}^{\bullet}$ is a normalized dualizing complex, then we say the module $\omega_{A}=H^{-\operatorname{dim}(A)}\left(\omega_{A}^{\bullet}\right)$, described in Lemma 45.19.5 is a dualizing module for $A$. This module is a canonical module of $A$. It seems generally agreed upon to define a canonical module for a Noetherian local ring $(A, \mathfrak{m}, \kappa)$ to be a finite $A$-module $K$ such that

$$
\operatorname{Hom}_{A}(K, E) \cong H_{\mathfrak{m}}^{\operatorname{dim}(A)}(A)
$$

where $E$ is an injective hull of the residue field. A dualizing module is canonical because

$$
\operatorname{Hom}_{A}\left(H_{\mathfrak{m}}^{\operatorname{dim}(A)}(A), E\right)=\left(\omega_{A}\right)^{\wedge}
$$

by Lemma 45.20.4 and hence applying $\operatorname{Hom}_{A}(-, E)$ we get

$$
\begin{aligned}
\operatorname{Hom}_{A}\left(\omega_{A}, E\right) & =\operatorname{Hom}_{A}\left(\left(\omega_{A}\right)^{\wedge}, E\right) \\
& =\operatorname{Hom}_{A}\left(\operatorname{Hom}_{A}\left(H_{\mathfrak{m}}^{\operatorname{dim}(A)}(A), E\right), E\right) \\
& =H_{\mathfrak{m}}^{\operatorname{dim}(A)}(A)
\end{aligned}
$$

the first equality because $E$ is $\mathfrak{m}$-power torsion, the second by the above, and the third by Matlis duality (Proposition 45.7.8. The utility of the definition of a canonical module given above lies in the fact that it makes sense even if $A$ does not have a dualizing complex.
Let $X$ be a Noetherian scheme and let $\omega_{X}^{\bullet}$ be a dualizing complex. Let $n \in \mathbf{Z}$ be the smallest integer such that $H^{n}\left(\omega_{X}^{\bullet}\right)$ is nonzero. In other words, $-n$ is the maximal value of the dimension function associated to $\omega_{X}^{\bullet}$ (Lemma 45.21.6). Sometimes $H^{n}\left(\omega_{X}^{\bullet}\right)$ is called a dualizing module or dualizing sheaf for $X$ and then it is often denoted by $\omega_{X}$. We will say "let $\omega_{X}$ be a dualizing module" to indicate the above.

Care has to be taken when using dualizing modules $\omega_{X}$ on Noetherian schemes $X$ :
(1) the integer $n$ may change when passing from $X$ to an open $U$ of $X$ and then it won't be true that $\left.\omega_{X}\right|_{U}=\omega_{U}$,
(2) the dualizing complex isn't unique; the dualizing module is only unique up to tensoring by an invertible module.
The second problem will often be irrelevant because we will work with $X$ of finite type over a base change $S$ which is endowed with a fixed dualizing complex $\omega_{S}^{\bullet}$ and $\omega_{X}^{\bullet}$ will be the dualizing complex normalized relative to $\omega_{S}^{\bullet}$. The first problem will not occur if $X$ is equidimensional, more precisely, if the dimension function associated to $\omega_{X}^{\bullet}$ (Lemma 45.21.6) maps every generic point of $X$ to the same integer.

0AWI Example 45.36.1. Say $S=\operatorname{Spec}(A)$ with $(A, \mathfrak{m}, \kappa)$ a local Noetherian ring, and $\omega_{S}^{\bullet}$ corresponds to a normalized dualizing complex $\omega_{A}^{\bullet}$. Then if $f: X \rightarrow S$ is proper over $S$ and $\omega_{X}^{\bullet}=f^{!} \omega_{S}^{\bullet}$ the coherent sheaf

$$
\omega_{X}=H^{-\operatorname{dim}(X)}\left(\omega_{X}^{\bullet}\right)
$$

is a dualizing module and is often called the dualizing module of $X$ (with $S$ and $\omega_{S}^{\bullet}$ being understood). We will see that this has good properties.

0AWJ Example 45.36.2. Say $X$ is an equidimensional scheme of finite type over a field $k$. Then it is customary to take $\omega_{X}^{\bullet}$ the dualizing complex normalized relative to $k[0]$ and to refer to

$$
\omega_{X}=H^{-\operatorname{dim}(X)}\left(\omega_{X}^{\bullet}\right)
$$

as the dualizing module of $X$.
0AWK Lemma 45.36.3. Let $X$ be a connected Noetherian scheme and let $\omega_{X}$ be a dual$i z i n g$ module on $X$. The support of $\omega_{X}$ is the union of the irreducible components of maximal dimension with respect to any dimension function and $\omega_{X}$ is a coherent $\mathcal{O}_{X}$-module having property $\left(S_{2}\right)$.

Proof. By our conventions discussed above there exists a dualizing complex $\omega_{X}^{\bullet}$ such that $\omega_{X}$ is the leftmost nonvanishing cohomology sheaf. Since $X$ is connected, any two dimension functions differ by a constant (Topology, Lemma 5.19.3). Hence we may use the dimension function associated to $\omega_{X}^{\bullet}$ (Lemma 45.21.6). With these remarks in place, the lemma now follows from Lemma 45.19 .5 and the definitions (in particular Cohomology of Schemes, Definition 29.11.1).

To say a bit more about dualizing modules we need a bit more information about how the dimension functions change when passing to a scheme of finite type over another.

0AWL Lemma 45.36.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $\omega_{A}^{\bullet}$ be a normalized dualizing complex. Let $X$ be a scheme of finite type over $A$ and let $\omega_{X}^{\bullet}$ be the dualizing complex normalized relative to $\omega_{A}^{\bullet}$. If $x \in X$ is a closed point lying over the closed point $s$ of $S=\operatorname{Spec}(A)$, then $\omega_{X, x}^{\bullet}$ is a normalized dualizing complex over $\mathcal{O}_{X, x}$,

Proof. We may replace $X$ by an affine neighbourhood of $x$, hence we may and do assume that $f: X \rightarrow S=\operatorname{Spec}(A)$ is compactifyable. Then $\omega_{X}^{\bullet}=f^{!} \omega_{S}^{\bullet}$. We have to show that $R \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\kappa(x), \omega_{X, x}^{\bullet}\right)$ is sitting in degree 0 . Let $i_{x}: x \rightarrow X$ denote the inclusion morphism which is a closed immersion as $x$ is a closed point. Hence $R \operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\kappa(x), \omega_{X, x}^{\bullet}\right)$ represents $i_{x}^{!} \omega_{X}^{\bullet}$ by Lemma 45.33.3. Since $x$ lives over the closed point we see that $A \rightarrow \kappa(x)$ factors through $\kappa$ and since $x$ is a closed point of $X$ we see that $\kappa \subset \kappa(x)$ is a finite extension (Morphisms, Lemma 28.20.3). Thus we get a commutative diagram

with $\pi$ finite. We conclude that

$$
i_{x}^{!} \omega_{X}^{\bullet}=i_{x}^{!} f^{!} \omega_{S}^{\bullet}=\pi^{!} i_{s}^{!} \omega_{S}^{\bullet}
$$

Since $\omega_{A}^{\bullet}$ is normalized and $s$ is the closed point we see that $i_{s}^{!} \omega_{S}^{\bullet}=\kappa[0]$. We have

$$
R \pi_{*}\left(\pi^{!}(\kappa[0])\right)=R \mathcal{H o m}\left(R \pi_{*}(\kappa(x)[0]), \kappa[0]\right)=\operatorname{Hom}_{\kappa}(\kappa(x), \kappa)
$$

The first equality by Lemma 45.22 .11 applied with $L=\kappa(x)[0]$. The second equality holds because $\pi_{*}$ is exact. Thus $\pi^{!}(\kappa[0])$ is supported in degree 0 and we win.

0AWM Lemma 45.36.5. Let $S$ be a Noetherian scheme and let $\omega_{S}^{\bullet}$ be a dualizing complex. Let $f: X \rightarrow S$ be of finite type and let $\omega_{X}^{\bullet}$ be the dualizing complex normalized relative to $\omega_{S}^{\bullet}$. For all $x \in X$

$$
\delta_{X}(x)-\delta_{S}(f(x))=\operatorname{trdeg}_{\kappa(f(x))}(\kappa(x))
$$

where $\delta_{S}$, resp. $\delta_{X}$ is the dimension function of $\omega_{S}^{\bullet}$, resp. $\omega_{X}^{\bullet}$, see Lemma 45.21.6.
Proof. We may replace $X$ by an affine neighbourhood of $x$. Hence we may and do assume there is a compactification $X \subset \bar{X}$ over $S$. Then we may replace $X$ by $\bar{X}$ and assume that $X$ is proper over $S$. We may also assume $X$ is connected by replacing $X$ by the connected component of $X$ containing $x$. Next, recall that both $\delta_{X}$ and the function $x \mapsto \delta_{S}(f(x))+\operatorname{trdeg}_{\kappa(f(x))}(\kappa(x))$ are dimension functions on $X$, see Morphisms, Lemma 28.30.3. By Topology, Lemma 5.19.3 we see that the difference is locally constant, hence constant as $X$ is connected. Thus it suffices to prove equality in any point of $X$. By Properties, Lemma 27.5.9 the scheme $X$ has a closed point $x$. Since $X \rightarrow S$ is proper the image $s$ of $x$ is closed in $S$. Thus we may apply Lemma 45.36.4 to conclude.

0AWN Lemma 45.36.6. Let $X / A$ with $\omega_{X}^{\bullet}$ and $\omega_{X}$ be as in Example 45.36.1. Then
(1) $H^{i}\left(\omega_{X}^{\bullet}\right) \neq 0 \Rightarrow i \in\{-\operatorname{dim}(X), \ldots, 0\}$,
(2) the dimension of the support of $H^{i}\left(\omega_{X}^{\bullet}\right)$ is at most $-i$,
(3) $\operatorname{Supp}\left(\omega_{X}\right)$ is the union of the components of dimension $\operatorname{dim}(X)$, and
(4) $\omega_{X}$ has property $\left(S_{2}\right)$.

Proof. Let $\delta_{X}$ and $\delta_{S}$ be the dimension functions associated to $\omega_{X}^{\bullet}$ and $\omega_{S}^{\bullet}$ as in Lemma 45.36.5. As $X$ is proper over $A$, every closed subscheme of $X$ contains a closed point $x$ which maps to the closed point $s \in S$ and $\delta_{X}(x)=\delta_{S}(s)=0$. Hence $\delta_{X}(\xi)=\operatorname{dim}(\overline{\{\xi\}}$ for any point $\xi \in X$. Hence we can check each of the statements of the lemma by looking at what happens over $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ in which case the result follows from Lemmas 45.18 .4 and 45.19.5. Some details omitted. The last two statements can also be deduced from Lemma 45.36.3.

0AWP Lemma 45.36.7. Let $X / A$ with dualizing module $\omega_{X}$ be as in Example 45.36.1. Let $d=\operatorname{dim}\left(X_{s}\right)$ be the dimension of the closed fibre. If $\operatorname{dim}(X)=d+\operatorname{dim}(A)$, then the dualizing module $\omega_{X}$ represents the functor

$$
\mathcal{F} \longmapsto \operatorname{Hom}_{A}\left(H^{d}(X, \mathcal{F}), \omega_{A}\right)
$$

on the category of coherent $\mathcal{O}_{X}$-modules.

Proof. We have

$$
\begin{aligned}
\operatorname{Hom}_{X}\left(\mathcal{F}, \omega_{X}\right) & =\operatorname{Ext}_{X}^{-\operatorname{dim}(X)}\left(\mathcal{F}, \omega_{X}^{\bullet}\right) \\
& =\operatorname{Hom}_{X}\left(\mathcal{F}[\operatorname{dim}(X)], \omega_{X}^{\bullet}\right) \\
& =\operatorname{Hom}_{X}\left(\mathcal{F}[\operatorname{dim}(X)], f^{!}\left(\omega_{A}^{\bullet}\right)\right) \\
& =\operatorname{Hom}_{S}\left(R f_{*} \mathcal{F}[\operatorname{dim}(X)], \omega_{A}^{\bullet}\right) \\
& =\operatorname{Hom}_{A}\left(H^{d}(X, \mathcal{F}), \omega_{A}\right)
\end{aligned}
$$

The first equality because $H^{i}\left(\omega_{X}^{\bullet}\right)=0$ for $i<-\operatorname{dim}(X)$, see Lemma 45.36.6 and Derived Categories, Lemma 13.27 .3 . The second equality is follows from the definition of Ext groups. The third equality is our choice of $\omega_{X}^{\bullet}$. The fourth equality holds because $f^{!}$is the right adjoint of Lemma 45.22.1 for $f$, see Section 45.34. The final equality holds because $R^{i} f_{*} \mathcal{F}$ is zero for $i>d$ (Cohomology of Schemes, Lemma 29.19.9 and $H^{j}\left(\omega_{A}^{\bullet}\right)$ is zero for $j<-\operatorname{dim}(A)$.

### 45.37. Cohen-Macaulay schemes

0AWQ Duality takes a particularly simple form for Cohen-Macalaulay schemes.
0AWR Lemma 45.37.1. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$. Then depth $(A)$ is equal to the smallest integer $\delta \geq 0$ such that $H^{-\delta}\left(\omega_{A}^{\bullet}\right) \neq 0$.

Proof. This follows immeduately from Lemma 45.18.4. Here are two other ways to see that it is true.

First alternative. By Nakayama's lemma we see that $\delta$ is the smallest integer such that $\operatorname{Hom}_{A}\left(H^{-\delta}\left(\omega_{A}^{\bullet}\right), \kappa\right) \neq 0$. In other words, it is the smallest integer such that $\operatorname{Ext}_{A}^{-\delta}\left(\omega_{A}^{\bullet}, \kappa\right)$ is nonzero. Using Lemma 45.17 .2 and the fact that $\omega_{A}^{\bullet}$ is normalized this is equal to the smallest integer such that $\operatorname{Ext}_{A}^{\delta}(\kappa, A)$ is nonzero. This is equal to the depth of $A$ by Algebra, Lemma 10.71.5.

Second alternative. By the local duality theorem (in the form of Lemma 45.20.4) $\delta$ is the smallest integer such that $H_{\mathfrak{m}}^{\delta}(A)$ is nonzero. This is equal to the depth of $A$ by Lemma 45.11.1.

0AWS Lemma 45.37.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring with normalized dualizing complex $\omega_{A}^{\bullet}$ and dualizing module $\omega_{A}=H^{-\operatorname{dim}(A)}\left(\omega_{A}^{\bullet}\right)$. The following are equivalent
(1) A is Cohen-Macaulay,
(2) $\omega_{A}^{\bullet}$ is concentrated in a single degree, and
(3) $\omega_{A}^{\bullet}=\omega_{A}[\operatorname{dim}(A)]$.

In this case $\omega_{A}$ is a maximal Cohen-Macaulay module.
Proof. Follows immediately from Lemma 45.18.5.
0AWT Lemma 45.37.3. Let $X$ be a connected Cohen-Macaulay scheme. If $\omega_{X}^{\bullet}$ is $a$ dualizing complex on $X$, then there is an integer $n$ and a coherent Cohen-Macaulay $\mathcal{O}_{X}$-module $\omega_{X}$ such that $\omega_{X}^{\bullet}=\omega_{X}[-n]$.

Proof. By definition and Lemma 45.17 .6 for every $x \in X$ the complex $\omega_{X, x}^{\bullet}$ is a dualizing complex over $\mathcal{O}_{X, x}$. Let $n_{x}$ be the unique integer such that $H^{n_{x}}\left(\omega_{X, x}^{\bullet}\right)$ is nonzero, see Lemma 45.37.2. For an affine neighbourhood $U \subset X$ of $x$ we have $\left.\omega_{X}^{\bullet}\right|_{U}$ is in $D_{C o h}^{b}\left(\mathcal{O}_{U}\right)$ hence there are finitely many nonzero coherent modules $\left.H^{i}\left(\omega_{X}^{\bullet}\right)\right|_{U}$. Thus after shrinking $U$ we may assume only $H^{n_{x}}$ is nonzero, see Modules, Lemma 17.9.5. In this way we see that the map $x \mapsto n_{x}$ is locally constant. Since $X$ is connected it is constant, say equal to $n$. Setting $\omega_{X}=H^{n}\left(\omega_{X}^{\bullet}\right)$ we see that the lemma holds because $\omega_{X}$ is Cohen-Macaulay by Lemma 45.37.2 (and Cohomology of Schemes, Definition 29.11.2).

0AWU Lemma 45.37.4. Existence of a dualizing module implies Cohen-Macaulay.
(1) Let $A$ be a Noetherian ring. If there exists a finite $A$-module $\omega_{A}$ such that $\omega_{A}[0]$ is a dualizing complex, then $A$ is Cohen-Macaulay.
(2) Let $X$ be a locally Noetherian scheme. If there exists a coherent sheaf $\omega_{X}$ such that $\omega_{X}[0]$ is a dualizing complex on $X$, then $X$ is a Cohen-Macaulay scheme.

Proof. Part (2) follows from part (1) and our definitions. To see (1) we may replace $A$ by the localization at a prime (use Lemma 45.17.6 and Algebra, Definition 10.103 .6 . In this case the result follows immediately from Lemma 45.37.2.

### 45.38. Gorenstein schemes

$0 A W V$ So far, the only explicit dualizing complex we seen is $\kappa$ on $\kappa$ for a field $\kappa$, see proof of Lemma 45.17.11. By Proposition 45.17.10 this means that any finite type algebra over a field has a dualizing complex. However, it turns out that there are Noetherian (local) rings which do not have a dualizing complex. Namely, we have seen that a ring which has a dualizing complex is universally catenary (Lemma 45.19.4 but there are examples of Noetherian local rings which are not catenary, see Examples, Section 88.16

Nonetheless many rings in algebraic geometry have dualizing complexes simply because they are quotients of Gorenstein rings. This condition is in fact both necessary and sufficient. That is: a Noetherian ring has dualizing complexes if and only if it is a quotient of a finite dimensional Gorenstein ring. This is Sharp's conjecture (Sha79) which can be found as Kaw02, Corollary 1.4] in the literature. Returning to our current topic, here is the definition of Gorenstein rings.

0AWW Definition 45.38.1. Gorenstein rings and schemes.
(1) Let $A$ be a Noetherian local ring. We say $A$ is Gorenstein if $A[0]$ is a dualizing complex for $A$.
(2) Let $A$ be a Noetherian ring. We say $A$ is Gorenstein if $A_{\mathfrak{p}}$ is Gorenstein for every prime $\mathfrak{p}$ of $A$.
(3) Let $X$ be a locally Noetherian scheme. We say $X$ is Gorenstein if $\mathcal{O}_{X, x}$ is Gorenstein for all $x \in X$.

This definition makes sense, because if $A[0]$ is a dualizing complex for $A$, then $S^{-1} A[0]$ is a dualizing complex for $S^{-1} A$ by Lemma 45.17.6. Observe that a Gorenstein ring or scheme is Cohen-Macaulay (for example by Lemma 45.37.2). We will see later that a finite dimensional Noetherian ring is Gorenstein if it has finite injective dimension as a module over itself.

0BFQ Lemma 45.38.2. Let $X$ be a locally Noetherian scheme.
(1) If $X$ has a dualizing complex $\omega_{X}^{\bullet}$, then $X$ is Gorenstein if and only if $\omega_{X}^{\bullet}$ is an invertible object of $D\left(\mathcal{O}_{X}\right)$.
(2) If $X$ is Gorenstein, then $X$ has a dualizing complex if and only if $\mathcal{O}_{X}[0]$ is a dualizing complex.

Proof. Proof of (1). If $X$ has a dualizing complex $\omega_{X}^{\bullet}$ and is Gorenstein, then locally on $X$ we see that $\omega_{X}^{\bullet}$ is equal to $\omega_{X}[n]$ for some coherent $\mathcal{O}_{X}$-module and some $n$ by Lemma 45.37.3. Looking at the stalks we find that $\omega_{X}$ is invertible and hence $\omega_{X}^{\bullet}$ is inveritible in $D\left(\mathcal{O}_{X}\right)$ (this is defined in Section 45.21). Conversely, if a dualizing complex $\omega_{X}^{\bullet}$ exists and is invertible, then it is locall isomorphic to the shift of an invertible module and it is clear that the local rings of $X$ are Gorenstein.

If $\mathcal{O}_{X}[0]$ is a dualizing complex then $X$ is Gorenstein by part (1). Conversely, we see that part (1) shows that $\omega_{X}^{\bullet}$ is locally isomorphic to a shift of $\mathcal{O}_{X}$. Since being a dualizing complex is local the result is clear.

An example of a Gorenstein ring is a regular ring.
0AWX Lemma 45.38.3. A regular local ring is Gorenstein. A regular ring is Gorenstein.
Proof. Let $A$ be a regular ring of finite dimension $d$. Then $A$ has finite global dimension $d$, see Algebra, Lemma 10.109.8. Hence $\operatorname{Ext}_{A}^{d+1}(M, A)=0$ for all $A$ modules $M$, see Algebra, Lemma 10.108.4. Thus $A$ has finite injective dimension as an $A$-module by More on Algebra, Lemma 15.58.2. It follows that $A[0]$ is a dualizing complex, hence $A$ is Gorenstein by the remark following the definition.

0BJI Lemma 45.38.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Then $A$ is Gorenstein if and only if $E x t_{A}^{i}(\kappa, A)$ is zero for $i \gg 0$.

Proof. Observe that $A[0]$ is a dualizing complex for $A$ if and only if $A$ has finite injective dimension as an $A$-module (follows immediately from Definition 45.17.1). Thus the lemma follows from More on Algebra, Lemma 15.58.5.

0BJJ Lemma 45.38.5. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $f \in \mathfrak{m}$ be a nonzerodivisor. Set $B=A /(f)$. Then $A$ is Gorenstein if and only if $B$ is Gorenstein.
Proof. If $A$ is Gorenstein, then $B$ is Gorenstein by Lemma 45.18.8. Conversely, suppose that $B$ is Gorenstein. Then $\operatorname{Ext}_{B}^{i}(\kappa, B)$ is zero for $i \gg 0$ (Lemma 45.38.4). Recall that $R \operatorname{Hom}(B,-): D(A) \rightarrow D(B)$ is a right adjoint to restriction (Lemma 45.16.1). Hence

$$
R \operatorname{Hom}_{A}(\kappa, A)=R \operatorname{Hom}_{B}(\kappa, R \operatorname{Hom}(B, A))=R \operatorname{Hom}_{B}(\kappa, B[1])
$$

The final equality by direct computation or by applying the very general Lemma 45.29.1. Thus we see that $\operatorname{Ext}_{A}^{i}(\kappa, A)$ is zero for $i \gg 0$ and $A$ is Gorenstein (Lemma 45.38.4.

0BJK Lemma 45.38.6. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. If $A$ and $B / \mathfrak{m}_{A} B$ are Gorenstein, then $B$ is Gorenstein.

Proof. We will use Lemma 45.38 .4 without further mention. Let $\kappa_{A}, \kappa_{B}$ be the residue field of $A, B$. Let $\mathfrak{m} \subset A$ be the maximal ideal. Using that $R \operatorname{Hom}(B / \mathfrak{m} B,-)$ : $D(B) \rightarrow D(B / \mathfrak{m} B)$ is a right adjoint to restriction (Lemma 45.16.1) we obtain

$$
R \operatorname{Hom}_{B}\left(\kappa_{B}, B\right)=R \operatorname{Hom}_{B / \mathfrak{m} B}\left(\kappa_{B}, R \operatorname{Hom}(B / \mathfrak{m} B, B)\right)
$$

The cohomology modules of $R \operatorname{Hom}(B / \mathfrak{m} B, B)$ are the modules $\operatorname{Ext}_{B}^{i}(B / \mathfrak{m} B, B)$ which by More on Algebra, Remark 15.54 .18 are equal to $\operatorname{Ext}_{A}^{i}\left(\kappa_{A}, A\right) \otimes_{A} B$. Since $A$ is Gorenstein, only a finite number of these are nonzero and each $\operatorname{Ext}_{B}^{i}(B / \mathfrak{m} B, B)$ is isomorphic to a direct sum of copies of $B / \mathfrak{m} B$. Hence since $B / \mathfrak{m} B$ is Gorenstein we conclude that $R \operatorname{Hom}_{B}\left(\kappa_{B}, A\right)$ has only a finite number of nonzero cohomology modules and the proof is complete.
0BJL Lemma 45.38.7. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. If $B$ is Gorenstein, then $A$ is Gorenstein.

Proof. By More on Algebra, Remark 15.54 .18 we have

$$
\operatorname{Ext}_{A}^{i}\left(\kappa_{A}, A\right) \otimes_{A} B=\operatorname{Ext}_{B}^{i}\left(B / \mathfrak{m}_{A} B, B\right)
$$

for all $i$. Since $B$ is Gorenstein, $B$ has finite injective dimension as a $B$-module. Hence $\operatorname{Ext}_{B}^{i}\left(B / \mathfrak{m}_{A} B, B\right)$ is 0 for $i \gg 0$. Since $A \rightarrow B$ is faithfully flat we conclude that $\operatorname{Ext}_{A}^{i}\left(\kappa_{A}, A\right)$ is 0 for $i \gg 0$. We conclude by Lemma 45.38.4.

0BFR Lemma 45.38.8. The following types of rings have a dualizing complex:
(1) fields,
(2) Noetherian complete local rings,
(3) $\mathbf{Z}$,
(4) Dedekind domains,
(5) ring essentially of finite type over any of the above.

Proof. By Lemma 45.38.3 a regular local ring has a dualizing complex. Thus any ring essentially of finite type over a regular local ring has a dualizing complex by Proposition 45.17.10. A complete Noetherian local ring is the quotient of a regular local ring by the Cohen structure theorem (Algebra, Theorem 10.152.8). Let $A$ be a Dedekind domain. Then every ideal $I$ is a finite projective $A$-module (follows from Algebra, Lemma 10.77 .2 and the fact that the local rings of $A$ are discrete valution ring and hence PIDs). Thus every $A$-module has finite injective dimension at most 1 by More on Algebra, Lemma 15.58 .2 . It follows easily that $A[0]$ is a dualizing complex.

### 45.39. Formal fibres

0BJM This section is a continuation of More on Algebra, Section 15.42 . There we saw there is a (fairly) good theory of Noetherian rings $A$ whose local rings have CohenMacaulay formal fibres. Namely, we proved (1) it suffices to check the formal fibres of localizations at maximal ideals are Cohen-Macaulay, (2) the property is inherited by rings of finite type over $A$, (3) the fibres of $A \rightarrow A^{\wedge}$ are Cohen-Macaulay for any completion $A^{\wedge}$ of $A$, and (4) the property is inherited by henselizations of $A$. See More on Algebra, Lemma 15.42.4, Proposition 15.42.5, Lemma 15.42.6, and Lemma 15.42.7. Similarly, for Noetherian rings whose local rings have formal fibres which are geometrically reduced, geometrically normal, $\left(S_{n}\right)$, and geometrically $\left(R_{n}\right)$. In this section we will see that the same is true for Noetherian rings whose local rings have formal fibres which are Gorenstein or local complete intersections. This is relevant to this chapter because a Noetherian ring which has a dualizing complex is an example.
0BJN Lemma 45.39.1. Properties (A), (B), (C), and (D) of More on Algebra, Section 15.42 hold for $P(k \rightarrow R)=$ " $R$ is a Gorenstein ring".

Proof. Since we already know the result holds for Cohen-Macaulay instead of Gorenstein, we may in each step assume the ring we have is Cohen-Macaulay. This is not particularly helpful for the proof, but psychologically may be useful.
Part (A). Let $k \subset K$ be a finitely generated field extension. Let $R$ be a Gorenstein $k$-algebra. We can find a global complete intersection $A=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ over $k$ such that $K$ is isomorphic to the fraction field of $A$, see Algebra, Lemma 10.150.11. Then $R \rightarrow R \otimes_{k} A$ is a relative global complete intersection. Since $R_{\mathfrak{p}}$ is a dualizing complex over $R_{\mathfrak{p}}$, we see that $R_{\mathfrak{p}}\left[x_{1}, \ldots, x_{n}\right]$ is a dualizing complex over $R_{\mathfrak{p}}\left[x_{1}, \ldots, x_{n}\right]$ by Lemma 45.17.9. Hence the polynomial ring over $R$ is Gorenstein. Next, if $S$ is a Gorenstein local ring and $f \in S$ is a nonzerodivisor, then $S / f S$ is Gorenstein by Lemma 45.18.8. In this way we see that $R \otimes_{k} A$ is a Gorenstein ring. Thus $R \otimes_{k} K$ is too as a localization.

Proof of $(\mathrm{B})$. This is clear because a ring is Gorenstein if and only if all of its local rings are Gorenstein.

Part (C). Let $A \rightarrow B \rightarrow C$ be flat maps of Noetherian rings. Assume the fibres of $A \rightarrow B$ are Gorenstein and $B \rightarrow C$ is regular. We have to show the fibres of $A \rightarrow C$ are Gorenstein. Clearly, we may assume $A=k$ is a field. Then we may assume that $B \rightarrow C$ is a regular local homomorphism of Noetherian local rings. Then $B$ is Gorenstein and $C / \mathfrak{m}_{B} C$ is regular, in particular Gorenstein (Lemma 45.38.3). Then $C$ is Gorenstein by Lemma 45.38 .6

Part (D). This follows from Lemma 45.38.7.
0AWY Lemma 45.39.2. Let $A$ be a Noetherian local ring. If $A$ has a dualizing complex, then the formal fibres of $A$ are Gorenstein.

Proof. Let $\mathfrak{p}$ be a prime of $A$. The formal fibre of $A$ at $\mathfrak{p}$ is isomorphic to the formal fibre of $A / \mathfrak{p}$ at (0). The quotient $A / \mathfrak{p}$ has a dualizing complex (Lemma 45.17.8). Thus it suffices to check the statement when $A$ is a local domain and $\mathfrak{p}=(0)$. Let $\omega_{A}^{\bullet}$ be a dualizing complex for $A$. Then $\omega_{A}^{\bullet} \otimes_{A} A^{\wedge}$ is a dualizing complex for the completion $A^{\wedge}$ (Lemma 45.18.9). Then $\omega_{A}^{\bullet} \otimes_{A} f . f .(A)$ is a dualizing complex for $K=f . f .(A)$ (Lemma 45.17.6) hence is isomorphic ot $K[n]$ for some $n \in \mathbf{Z}$. Similarly, we conclude a dualizing complex for the formal fibre $A^{\wedge} \otimes_{A} K$ is

$$
\omega_{A}^{\bullet} \otimes_{A} A^{\wedge} \otimes_{A^{\wedge}}\left(A^{\wedge} \otimes_{A} K\right)=\left(\omega_{A}^{\bullet} \otimes_{A} K\right) \otimes_{K}\left(A^{\wedge} \otimes_{A} K\right) \cong\left(A^{\wedge} \otimes_{A} K\right)[n]
$$

as desired.
Here is the verification promised in Divided Power Algebra, Remark 23.9.3.
0BJP Lemma 45.39.3. Properties (A), (B), (C), and (D) of More on Algebra, Section 15.42 hold for $P(k \rightarrow R)=$ " $R$ is a local complete intersection". See Divided Power Algebra, Definition 23.8.5.
Proof. Part (A). Let $k \subset K$ be a finitely generated field extension. Let $R$ be a $k$-algebra which is a local complete intersection. We can find a global complete intersection $A=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ over $k$ such that $K$ is isomorphic to the fraction field of $A$, see Algebra, Lemma 10.150.11. Then $R \rightarrow R \otimes_{k} A$ is a relative global complete intersection. It follows that $R \otimes_{k} A$ is a local complete intersection by Divided Power Algebra, Lemma 23.8.9.
Proof of (B). This is clear because a ring is a local complete intersection if and only if all of its local rings are complete intersections.

Part (C). Let $A \rightarrow B \rightarrow C$ be flat maps of Noetherian rings. Assume the fibres of $A \rightarrow B$ are local complete intersections and $B \rightarrow C$ is regular. We have to show the fibres of $A \rightarrow C$ are Gorenstein. Clearly, we may assume $A=k$ is a field. Then we may assume that $B \rightarrow C$ is a regular local homomorphism of Noetherian local rings. Then $B$ is a complete intersection and $C / \mathfrak{m}_{B} C$ is regular, in particular a complete intersection (by definition). Then $C$ is a complete intersection by Divided Power Algebra, Lemma 23.8.9.

Part (D). This follows by the same arguments as in (C) from the other implication in Divided Power Algebra, Lemma 23.8.9.

### 45.40. Finiteness of local cohomology, II

0BJQ We continue the discussion of finiteness of local cohomology started in Section 45.14. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Set $X=\operatorname{Spec}(A)$ and $Z=V(I) \subset X$. Let $M$ be a finite $A$-module. We define
0BJR $\quad(45.40 .0 .1) s_{A, I}(M)=\min \left\{\operatorname{depth}_{A_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right)+\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right) \mid \mathfrak{p} \in X \backslash Z, \mathfrak{q} \in Z, \mathfrak{p} \subset \mathfrak{q}\right\}$
Our conventions on depth are that the depth of 0 is $\infty$ thus we only need to consider primes $\mathfrak{p}$ in the support of $M$. It will turn out that $s_{A, I}(M)$ is an important invariant of the situation.

0BJS Lemma 45.40.1. Let $A \rightarrow B$ be a finite homomorphism of Noetherian rings. Let $I \subset A$ be an ideal and set $J=I B$. Let $M$ be a finite $B$-module. If $A$ is universally catenary, then $s_{B, J}(M)=s_{A, I}(M)$.

Proof. Let $\mathfrak{p} \subset \mathfrak{q} \subset A$ be primes with $I \subset \mathfrak{q}$ and $I \not \subset \mathfrak{p}$. Since $A \rightarrow B$ is finite there are finitely many primes $\mathfrak{p}_{i}$ lying over $\mathfrak{p}$. By Algebra, Lemma 10.71 .9 we have

$$
\operatorname{depth}\left(M_{\mathfrak{p}}\right)=\min \operatorname{depth}\left(M_{\mathfrak{p}_{i}}\right)
$$

Let $\mathfrak{p}_{i} \subset \mathfrak{q}_{i j}$ be primes lying over $\mathfrak{q}$. By going up for $A \rightarrow B$ (Algebra, Lemma 10.35 .20 there is at least one $\mathfrak{q}_{i j}$ for each $i$. Then we see that

$$
\operatorname{dim}\left(\left(B / \mathfrak{p}_{i}\right)_{\mathfrak{q}_{i j}}\right)=\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right)
$$

by the dimension formula, see Algebra, Lemma 10.112.1. This implies that the minimum of the quantities used to define $s_{B, J}(M)$ for the pairs $\left(\mathfrak{p}_{i}, \mathfrak{q}_{i j}\right)$ is equal to the quantity for the pair $(\mathfrak{p}, \mathfrak{q})$. This proves the lemma.

0BJT Lemma 45.40.2. Let $A$ be a universally catenary Noetherian local ring. Let $I \subset A$ be an ideal. Let $M$ be a finite $A$-module. Then

$$
s_{A, I}(M) \geq s_{A^{\wedge}, I^{\wedge}}\left(M^{\wedge}\right)
$$

If the formal fibres of $A$ are $\left(S_{n}\right)$, then $\min \left(n+1, s_{A, I}(M)\right) \leq s_{A^{\wedge}, I^{\wedge}}\left(M^{\wedge}\right)$.
Proof. Write $X=\operatorname{Spec}(A), X^{\wedge}=\operatorname{Spec}\left(A^{\wedge}\right), Z=V(I) \subset X$, and $Z^{\wedge}=V\left(I^{\wedge}\right)$. Let $\mathfrak{p}^{\prime} \subset \mathfrak{q}^{\prime} \subset A^{\wedge}$ be primes with $\mathfrak{p}^{\prime} \notin Z^{\wedge}$ and $\mathfrak{q}^{\prime} \in Z^{\wedge}$. Let $\mathfrak{p} \subset \mathfrak{q}$ be the corresponding primes of $A$. Then $\mathfrak{p} \notin Z$ and $\mathfrak{q} \in Z$. Picture

Let us write

$$
\begin{aligned}
a & =\operatorname{dim}(A / \mathfrak{p})=\operatorname{dim}\left(A^{\wedge} / \mathfrak{p} A^{\wedge}\right), \\
b & =\operatorname{dim}(A / \mathfrak{q})=\operatorname{dim}\left(A^{\wedge} / \mathfrak{q} A^{\wedge}\right), \\
a^{\prime} & =\operatorname{dim}\left(A^{\wedge} / \mathfrak{p}^{\prime}\right), \\
b^{\prime} & =\operatorname{dim}\left(A^{\wedge} / \mathfrak{q}^{\prime}\right)
\end{aligned}
$$

Equalities by More on Algebra, Lemma 15.34.1. We also write

$$
\begin{aligned}
& p=\operatorname{dim}\left(A_{\mathfrak{p}^{\prime}}^{\wedge} / \mathfrak{p} A_{\mathfrak{p}^{\prime}}^{\wedge}\right)=\operatorname{dim}\left(\left(A^{\wedge} / \mathfrak{p} A^{\wedge}\right)_{\mathfrak{p}^{\prime}}\right) \\
& q=\operatorname{dim}\left(A_{\mathfrak{q}^{\prime}}^{\wedge} / \mathfrak{p} A_{\mathfrak{q}^{\prime}}^{\wedge}\right)=\operatorname{dim}\left(\left(A^{\wedge} / \mathfrak{q} A^{\wedge}\right)_{\mathfrak{q}^{\prime}}\right)
\end{aligned}
$$

Since $A$ is universally catenary we see that $A^{\wedge} / \mathfrak{p} A^{\wedge}=(A / \mathfrak{p})^{\wedge}$ is equidimensional of dimension $a$ (Proposition 45.13.6). Hence $a=a^{\prime}+p$. Similarly $b=b^{\prime}+q$. By Algebra, Lemma 10.155 .1 applied to the flat local ring map $A_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}^{\prime}}^{\wedge}$ we have

$$
\operatorname{depth}\left(M_{\mathfrak{p}^{\prime}}^{\wedge}\right)=\operatorname{depth}\left(M_{\mathfrak{p}}\right)+\operatorname{depth}\left(A_{\mathfrak{p}^{\prime}}^{\wedge} / \mathfrak{p} A_{\mathfrak{p}^{\prime}}^{\wedge}\right)
$$

The quantity we are minimizing for $s_{A, I}(M)$ is

$$
s(\mathfrak{p}, \mathfrak{q})=\operatorname{depth}\left(M_{\mathfrak{p}}\right)+\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right)=\operatorname{depth}\left(M_{\mathfrak{p}}\right)+a-b
$$

(last equality as $A$ is catenary). The quantity we are minimizing for $s_{A^{\wedge}, I^{\wedge}}\left(M^{\wedge}\right)$ is

$$
s\left(\mathfrak{p}^{\prime}, \mathfrak{q}^{\prime}\right)=\operatorname{depth}\left(M_{\mathfrak{p}^{\prime}}^{\wedge}\right)+\operatorname{dim}\left(\left(A^{\wedge} / \mathfrak{p}^{\prime}\right)_{\mathfrak{q}^{\prime}}\right)=\operatorname{depth}\left(M_{\mathfrak{p}^{\prime}}^{\wedge}\right)+a^{\prime}-b^{\prime}
$$

(last equality as $A^{\wedge}$ is catenary). Now we have enough notation in place to start the proof.

Let $\mathfrak{p} \subset \mathfrak{q} \subset A$ be primes with $\mathfrak{p} \notin Z$ and $\mathfrak{q} \in Z$ such that $s_{A, I}(M)=s(\mathfrak{p}, \mathfrak{q})$. Then we can pick $\mathfrak{q}^{\prime}$ minimal over $\mathfrak{q} A^{\wedge}$ and $\mathfrak{p}^{\prime} \subset \mathfrak{q}^{\prime}$ minimal over $\mathfrak{p} A^{\wedge}$ (using going down for $\left.A \rightarrow A^{\wedge}\right)$. Then we have four primes as above with $p=0$ and $q=0$. Moreover, we have $\operatorname{depth}\left(\underset{\boldsymbol{p}^{\prime}}{\wedge} / \mathfrak{p} A_{\mathfrak{p}^{\prime}}^{\wedge}\right)=0$ also because $p=0$. This means that $s\left(\mathfrak{p}^{\prime}, \mathfrak{q}^{\prime}\right)=s(\mathfrak{p}, \mathfrak{q})$. Thus we get the first inequality.
Assume that the formal fibres of $A$ are $\left(S_{n}\right)$. Then $\operatorname{depth}\left(A_{\mathfrak{p}^{\prime}}^{\wedge} / \mathfrak{p} A_{\mathfrak{p}^{\prime}}^{\wedge}\right) \geq \min (n, p)$. Hence

$$
s\left(\mathfrak{p}^{\prime}, \mathfrak{q}^{\prime}\right) \geq s(\mathfrak{p}, \mathfrak{q})+q+\min (n, p)-p \geq s_{A, I}(M)+q+\min (n, p)-p
$$

Thus the only way we can get in trouble is if $p>n$. If this happens then

$$
\begin{aligned}
s\left(\mathfrak{p}^{\prime}, \mathfrak{q}^{\prime}\right) & =\operatorname{depth}\left(M_{\mathfrak{p}^{\prime}}^{\wedge}\right)+\operatorname{dim}\left(\left(A^{\wedge} / \mathfrak{p}^{\prime}\right)_{\mathfrak{q}^{\prime}}\right) \\
& =\operatorname{depth}\left(M_{\mathfrak{p}}\right)+\operatorname{depth}\left(A_{\mathfrak{p}^{\prime}}^{\wedge} / \mathfrak{p} A_{\mathfrak{p}^{\prime}}^{\wedge}\right)+\operatorname{dim}\left(\left(A^{\wedge} / \mathfrak{p}^{\prime}\right)_{\mathfrak{q}^{\prime}}\right) \\
& \geq 0+n+1
\end{aligned}
$$

because $\left(A^{\wedge} / \mathfrak{p}^{\prime}\right)_{\mathfrak{q}^{\prime}}$ has at least two primes. This proves the second inequality.
The method of proof of the following lemma works more generally, but the stronger results one gets will be subsumed in Theorem 45.40 .4 below.

0BJU Lemma 45.40.3. Let $A$ be a Gorenstein Noetherian local ring. Let $I \subset A$ be an ideal and set $Z=V(I) \subset \operatorname{Spec}(A)$. Let $M$ be a finite $A$-module. Let $s=s_{A, I}(M)$ as in 45.40.0.1. Then $H_{Z}^{i}(M)$ is finite for $i<s$, but $H_{Z}^{s}(M)$ is not finite.

This is a special case of [Fal78b Satz 1].

Proof. An important role will be played by the finite $A$-modules

$$
E^{i}=\operatorname{Ext}_{A}^{i}(M, A)
$$

For $\mathfrak{p} \subset A$ we will write $H_{\mathfrak{p}}^{i}$ to denote the local cohomology of a $A_{\mathfrak{p}}$-module. Then we see that the $\mathfrak{p} A_{\mathfrak{p}}$-adic completion of

$$
\left(E^{i}\right)_{\mathfrak{p}}=\operatorname{Ext}_{A_{\mathfrak{p}}}^{i}\left(M_{\mathfrak{p}}, A_{\mathfrak{p}}\right)
$$

is Matlis dual to

$$
H_{\mathfrak{p}}^{\operatorname{dim}\left(A_{\mathfrak{p}}\right)-i}\left(M_{\mathfrak{p}}\right)
$$

by Lemma 45.20 .4 and the fact that $A_{\mathfrak{p}}$ is Gorenstein. In particular we deduce from this the following fact: an ideal $J \subset A$ annihilates $\left(E^{i}\right)_{\mathfrak{p}}$ if and only if $J$ annihilates $H_{\mathfrak{p}}^{\operatorname{dim}\left(A_{\mathfrak{p}}\right)-i}\left(M_{\mathfrak{p}}\right)$. Set $Z_{n}=\{\mathfrak{p} \in Z \mid \operatorname{dim}(A / \mathfrak{p}) \leq n\}$. Observe that $Z_{-1}=\emptyset$ and $Z_{n}=Z$ for $n=\operatorname{dim}(Z)$.

Proof of finiteness for $i<s$. We will use a double induction to do this. For $i<s$ consider the induction hypothesis $I H_{i}: H_{Z}^{a}(M)$ is finite for $0 \leq a \leq i$. The case $I H_{0}$ is trivial because $H_{Z}^{0}(M)$ is a submodule of $M$ and hence finite.
Induction step. Assume $I H_{i-1}$ holds for some $0<i<s$. For $0 \leq a \leq i-1$ let $J_{a}$ be the annihilator of $H_{Z}^{a}(M)$. Observe that $V\left(J_{a}\right) \subset Z$ as the support of the finite $A$ module $H_{Z}^{a}(M)$ is contained in $Z$. We will show by descending induction on $n$ that there exists an ideal $J$ with $V(J) \subset Z$ such that the associated primes of $J H_{Z}^{i}(M)$ are in $Z_{n}$. For $n=-1$ this implies $J H_{Z}^{i}(M)=0$ (Algebra, Lemma 10.62.7) and hence the finiteness of $H_{Z}^{i}(M)$ by Lemma 45.14.1. The base case $n=\operatorname{dim}(Z)$ is trivial.
Thus we assume given $J$ with the property for $n$. Let $\mathfrak{q} \in Z_{n}$. With $Z_{\mathfrak{q}}=V\left(I A_{\mathfrak{q}}\right)$ we have $H_{Z}^{j}(M)_{\mathfrak{q}}=H_{Z_{\mathfrak{q}}}^{j}\left(M_{\mathfrak{q}}\right)$ by Lemma 45.9.3. Consider the spectral sequence

$$
H_{\mathfrak{q}}^{p}\left(H_{Z}^{q}(M)_{\mathfrak{q}}\right) \Rightarrow H_{\mathfrak{q}}^{p+q}\left(M_{\mathfrak{q}}\right)
$$

of Lemma 45.9 .7 for the ideals $I A_{\mathfrak{q}} \subset \mathfrak{q} A_{\mathfrak{q}} \subset A_{\mathfrak{q}}$. Below we will find an ideal $J^{\prime} \subset A$ with $V\left(J^{\prime}\right) \subset Z$ such that $H_{\mathfrak{q}}^{i}\left(M_{\mathfrak{q}}\right)$ is annihilated by $J^{\prime}$ for all $\mathfrak{q} \in Z_{n} \backslash Z_{n-1}$. Claim: $J J^{\prime} J_{0} \ldots J_{i-1}$ will work for $n-1$. Namely, let $\mathfrak{q} \in Z_{n} \backslash Z_{n-1}$. The spectral sequence above defines a filtration

$$
E_{\infty}^{0, i}=E_{i+2}^{0, i} \subset \ldots \subset E_{3}^{0, i} \subset E_{2}^{0, i}=H_{\mathfrak{q}}^{0}\left(H_{Z}^{i}(M)_{\mathfrak{q}}\right)
$$

The module $E_{\infty}^{0, i}$ is annihilated by $J^{\prime}$. The subquotients $E_{j}^{0, i} / E_{j+1}^{0, i}$ are annihilated by $J_{i-j+1}$ because the target of $d_{j}^{0, i}$ is a subquotient of $H_{\mathfrak{q}}^{j}\left(H_{Z}^{i-j+1}(M)\right)$. Finally, by our choice of $J$ we have $J H_{Z}^{i}(M)_{\mathfrak{q}} \subset H_{\mathfrak{q}}^{0}\left(H_{Z}^{i}(M)_{\mathfrak{q}}\right)$. Thus $\mathfrak{q}$ cannot be an associated prime of $J J^{\prime} J_{0} \ldots J_{i-1} H_{Z}^{i}(M)$ as desired.

By our initial remarks we see that $J^{\prime}$ should annihilate

$$
\left(E^{\operatorname{dim}\left(A_{\mathfrak{q}}\right)-i}\right)_{\mathfrak{q}}=\left(E^{\operatorname{dim}(A)-n-i}\right)_{\mathfrak{q}}
$$

for all $\mathfrak{q} \in Z_{n} \backslash Z_{n-1}$. But if $J^{\prime}$ works for one $\mathfrak{q}$, then it works for all $\mathfrak{q}$ in an open neighbourhood of $\mathfrak{q}$ as the modules $E^{\operatorname{dim}(A)-n-i}$ are finite. Since every subset of $X$ is Noetherian with the induced topology (Topology, Lemma 5.8.2, we conclude that it suffices to prove the existence of $J^{\prime}$ for one $\mathfrak{q}$.
Since the ext modules are finite the existence of $J^{\prime}$ is equivalent to

$$
\operatorname{Supp}\left(E^{\operatorname{dim}(A)-n-i}\right) \cap \operatorname{Spec}\left(A_{\mathfrak{q}}\right) \subset Z
$$

This is equivalent to showing the localization at every $\mathfrak{p} \subset \mathfrak{q}, \mathfrak{p} \notin Z$ is zero. Using local duality over $A_{\mathfrak{p}}$ we find that we need to prove that

$$
H_{\mathfrak{p}}^{\operatorname{dim}\left(A_{\mathfrak{p}}\right)-\operatorname{dim}(A)+n+i}\left(M_{\mathfrak{p}}\right)=H_{\mathfrak{p}}^{i-\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right)}\left(M_{\mathfrak{p}}\right)
$$

is zero (this uses that $A$ is catenary). This vanishes exactly by our definition of $s(M)$ and Lemma 45.11.1. This finishes the proof of finiteness for $i<s$.
To prove $H_{Z}^{s}(M)$ is not finite we work backwards through the arguments above. First, we pick a $\mathfrak{q} \in Z, \mathfrak{p} \subset \mathfrak{q}$ with $\mathfrak{p} \notin Z$ such that $s=\operatorname{depth}_{A_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right)+\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right)$. Then $H_{\mathfrak{p}}^{i-\operatorname{dim}\left((A / \mathfrak{p})_{\mathfrak{q}}\right)}\left(M_{\mathfrak{p}}\right)$ is nonzero by the nonvanishing in Lemma 45.11.1. Set $n=\operatorname{dim}(A / \mathfrak{q})$. Then there does not exist an ideal $J \subset A$ with $V(J) \subset Z$ such that $J\left(E^{\operatorname{dim}(A)-n-s}\right)_{\mathfrak{q}}=0$. Thus $H_{\mathfrak{q}}^{s}\left(M_{\mathfrak{q}}\right)$ is not annihilated by an ideal $J \subset A$ with $V(J) \subset Z$. It follows from the spectral sequence displayed above that at least one of the modules $H_{Z}^{i}(M)_{\mathfrak{q}}, 0 \leq i \leq s$ is not annihilated by an ideal $J \subset A$ with $V(J) \subset Z$. Since $H_{Z}^{i}(M)$ is finite for $i<s$ and hence are annihilated by such ideals, we conclude that $H_{Z}^{s}(M)$ is not finite.

Observe that the hypotheses of the following theorem are satisfied by excellent Noetherian rings (by definition), by Noetherian rings which have a dualizing complex (Lemmas 45.19.4 and 45.39.2, and by regular Noetherian rings.

0BJV Theorem 45.40.4. Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Set $Z=V(I) \subset \operatorname{Spec}(A)$. Let $M$ be a finite A-module. Set $s=s_{A, I}(M)$ as in 45.40.0.1). Assume that
(1) A is universally catenary,
(2) the formal fibres of the local rings of $A$ are Cohen-Macaulay.

Then $H_{Z}^{i}(M)$ is finite for $0 \leq i<s$ and $H_{Z}^{s}(M)$ is not finite.
Proof. By Lemma 45.14 .2 we may assume that $A$ is a local ring.
If $A$ is a Noetherian complete local ring, then we can write $A$ as the quotient of a regular complete local ring $B$ by Cohen's structure theorem (Algebra, Theorem 10.152 .8 ). Using Lemmas 45.40 .1 and 45.9 .2 we reduce to the case of a regular local ring which is a consequence of Lemma 45.40 .3 because a regular local ring is Gorenstein (Lemma 45.38.3).

Let $A$ be a Noetherian local ring. Let $\mathfrak{m}$ be the maximal ideal. We may assume $I \subset$ $\mathfrak{m}$, otherwise the lemma is trivial. Let $A^{\wedge}$ be the completion of $A$, let $Z^{\wedge}=V\left(I A^{\wedge}\right)$, and let $M^{\wedge}=M \otimes_{A} A^{\wedge}$ be the completion of $M$ (Algebra, Lemma 10.96.1). Then $H_{Z}^{i}(M) \otimes_{A} A^{\wedge}=H_{Z^{\wedge}}^{i}\left(M^{\wedge}\right)$ by Lemma 45.9.3 and flatness of $A \rightarrow A^{\wedge}$ (Algebra, Lemma 10.96.2). Hence it suffices to show that $H_{Z^{\wedge}}^{i}\left(M^{\wedge}\right)$ is finite for $i<s$ and not finite for $i=s$, see Algebra, Lemma 10.82.2. Since we know the result is true for $A^{\wedge}$ it suffices to show that $s_{A, I}(M)=s_{A^{\wedge}, I^{\wedge}}\left(M^{\wedge}\right)$. This follows from Lemma 45.40 .2

0BJW Remark 45.40.5. The astute reader will have realized that we can get a away with a slightly weaker condition on the formal fibres of the local rings of $A$. Namely, in the situation of Theorem 45.40 .4 assume $A$ is universally catenary but make no assumptions on the formal fibres. Suppose we have an $n$ and we want to prove that $H_{Z}^{i}(M)$ are finite for $i \leq n$. Then the exact same proof shows that it suffices that $s_{A, I}(M)>n$ and that the formal fibres of local rings of $A$ are $\left(S_{n}\right)$. On the other

This is a special case of Fal81, Satz $2]$.
hand, if we want to show that $H_{Z}^{s}(M)$ is not finite where $s=s_{A, I}(M)$, then our arguments prove this if the formal fibres are $\left(S_{s-1}\right)$.

### 45.41. Finiteness of pushforwards, II

0BJX This section is the continuation of Section 45.15. In this section we reap the fruits of the labor done in Section 45.40
0BJY Lemma 45.41.1. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{U}$ module. Let $n \geq 0$ be an integer. Assume
(1) $X$ is universally catenary,
(2) for every $z \in Z$ the formal fibres of $\mathcal{O}_{X, z}$ are $\left(S_{n}\right)$.

In this situation the following are equivalent
(a) for $x \in \operatorname{Supp}(\mathcal{F})$ and $z \in Z \cap \overline{\{x\}}$ we have $\operatorname{depth}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}\right)+\operatorname{dim}\left(\mathcal{O}_{\overline{\{x\}}, z}\right)>$ $n$,
(b) $R^{p} j_{*} \mathcal{F}$ is coherent for $0 \leq p<n$.

Proof. The statement is local on $X$, hence we may assume $X$ is affine. Say $X=$ $\operatorname{Spec}(A)$ and $Z=V(I)$. Let $M$ be a finite $A$-module whose associated coherent $\mathcal{O}_{X}$-module restricts to $\mathcal{F}$ over $U$, see Lemma 45.15.2. This lemma also tells us that $R^{p} j_{*} \mathcal{F}$ is coherent if and only if $H_{Z}^{p+1}(M)$ is a finite $A$-module. Observe that the minimum of the expressions $\operatorname{depth}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}\right)+\operatorname{dim}\left(\mathcal{O}_{\overline{\{x\}}, z}\right)$ is the number $s_{A, I}(M)$ of 45.40.0.1. Having said this the lemma follows from Theorem 45.40.4 as elucidated by Remark 45.40.5.

0BLT Lemma 45.41.2. Let $X$ be a locally Noetherian scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme with complement $Z$. Let $n \geq 0$ be an integer. If $R^{p} j_{*} \mathcal{O}_{U}$ is coherent for $0 \leq p<n$, then the same is true for $R^{p} j_{*} \mathcal{F}, 0 \leq p<n$ for any finite locally free $\mathcal{O}_{U}$-module $\mathcal{F}$.

Proof. The question is local on $X$, hence we may assume $X$ is affine. Say $X=$ $\operatorname{Spec}(A)$ and $Z=V(I)$. Via Lemma 45.15 .2 our lemma follows from Lemma 45.14 .4

0BM5 Lemma 45.41.3. Let $A$ be a ring and let $J \subset I \subset A$ be finitely generated ideals.

BdJ14, Lemma 1.9] Let $p \geq 0$ be an integer. Set $U=\operatorname{Spec}(A) \backslash V(I)$. If $H^{p}\left(U, \mathcal{O}_{U}\right)$ is annihilated by
$J^{n}$ for some $n$, then $H^{p}(U, \mathcal{F})$ annihilated by $J^{m}$ for some $m=m(\mathcal{F})$ for every finite locally free $\mathcal{O}_{U}$-module $\mathcal{F}$.

Proof. Consider the annihilator $\mathfrak{a}$ of $H^{p}(U, \mathcal{F})$. Let $u \in U$. There exists an open neighbourhood $u \in U^{\prime} \subset U$ and an isomorphism $\varphi:\left.\mathcal{O}_{U^{\prime}}^{\oplus r} \rightarrow \mathcal{F}\right|_{U^{\prime}}$. Pick $f \in A$ such that $u \in D(f) \subset U^{\prime}$. There exist maps

$$
a: \mathcal{O}_{U}^{\oplus r} \longrightarrow \mathcal{F} \quad \text { and } \quad b: \mathcal{F} \longrightarrow \mathcal{O}_{U}^{\oplus r}
$$

whose restriction to $D(f)$ are equal to $f^{N} \varphi$ and $f^{N} \varphi^{-1}$ for some $N$. Moreover we may assume that $a \circ b$ and $b \circ a$ are equal to multiplication by $f^{2 N}$. This follows from Properties, Lemma 27.17 .3 since $U$ is quasi-compact ( $I$ is finitely generated), separated, and $\mathcal{F}$ and $\mathcal{O}_{U}^{\oplus r}$ are finitely presented. Thus we see that $H^{p}(U, \mathcal{F})$ is annihilated by $f^{2 N} J^{n}$, i.e., $f^{2 N} J^{n} \subset \mathfrak{a}$.
As $U$ is quasi-compact we can find finitely many $f_{1}, \ldots, f_{t}$ and $N_{1}, \ldots, N_{t}$ such that $U=\bigcup D\left(f_{i}\right)$ and $f_{i}^{2 N_{i}} J^{n} \subset \mathfrak{a}$. Then $V(I)=V\left(f_{1}, \ldots, f_{t}\right)$ and since $I$ is finitely
generated we conclude $I^{M} \subset\left(f_{1}, \ldots, f_{t}\right)$ for some $M$. All in all we see that $J^{m} \subset \mathfrak{a}$ for $m \gg 0$, for example $m=M\left(2 N_{1}+\ldots+2 N_{t}\right) n$ will do.

## CHAPTER 46

## Algebraic Curves

0BRV

### 46.1. Introduction

0BRW In this chapter we develop some of the theory of algebraic curves. A reference covering algebraic curves over the complex numbers is the book ACGH85.

### 46.2. Riemann-Roch and duality

0B5B Let $k$ be a field. Let $X$ be a proper scheme of dimension $\leq 1$ over $k$. In Varieties, Section 32.33 we have defined the degree of a locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ of constant rank by the formula

0BRX (46.2.0.1)

$$
\operatorname{deg}(\mathcal{E})=\chi(X, \mathcal{E})-\operatorname{rank}(\mathcal{E}) \chi\left(X, \mathcal{O}_{X}\right)
$$

see Varieties, Definition 32.33.1. In the chapter on Chow Homology we defined the first chern class of $\mathcal{E}$ as an operation on cycles (Chow Homology, Section 41.35) and we proved that

0BRY $\quad(46.2 .0 .2) \quad \operatorname{deg}(\mathcal{E})=\operatorname{deg}\left(c_{1}(\mathcal{E}) \cap[X]_{1}\right)$
see Chow Homology, Lemma 41.41.3. Combining (46.2.0.1) and 46.2 .0 .2 we obtain our first version of the Riemann-Roch formula

0BRZ
(46.2.0.3)

$$
\chi(X, \mathcal{E})=\operatorname{deg}\left(c_{1}(\mathcal{E}) \cap[X]_{1}\right)+\operatorname{rank}(\mathcal{E}) \chi\left(X, \mathcal{O}_{X}\right)
$$

If $\mathcal{L}$ is an invertible $\mathcal{O}_{X}$-module, then we can also consider the numerical intersection $(\mathcal{L} \cdot X)$ as defined in Varieties, Definition 32.34.3. However, this does not give anything new as
0BS0 (46.2.0.4)
$(\mathcal{L} \cdot X)=\operatorname{deg}(\mathcal{L})$
by Varieties, Lemma 32.34.12. If $\mathcal{L}$ is ample, then this integer is positive and is called the degree
0BS1 (46.2.0.5)

$$
\operatorname{deg}_{\mathcal{L}}(X)=(\mathcal{L} \cdot X)=\operatorname{deg}(\mathcal{L})
$$

of $X$ with respect to $\mathcal{L}$, see Varieties, Definition 32.34 .10 .
To obtain a true Riemann-Roch theorem we would like to write $\chi\left(X, \mathcal{O}_{X}\right)$ as the degree of a canonical zero cycle on $X$. We refer to Ful98 for a fully general version of this. We will use duality to get a formula in the case where $X$ is Gorenstein; however, in some sense this is a cheat (for example because this method cannot work in higher dimension).

0BS2 Lemma 46.2.1. Let $X$ be a proper scheme of dimension $\leq 1$ over a field $k$. There exists a dualizing complex $\omega_{X}^{\bullet}$ with the following properties
(1) $H^{i}\left(\omega_{X}^{\bullet}\right)$ is nonzero only for $i=-1,0$,
(2) $\omega_{X}=H^{-1}\left(\omega_{X}^{\bullet}\right)$ is a coherent Cohen-Macaulay module whose support is the irreducible components of dimension 1 ,
(3) for $x \in X$ closed, the module $H^{0}\left(\omega_{X, x}^{\bullet}\right)$ is nonzero if and only if either
(a) $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=0$ or
(b) $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=1$ and $\mathcal{O}_{X, x}$ is not Cohen-Macaulay,
(4) there are functorial isomorphisms $\operatorname{Ext}_{X}^{i}\left(K, \omega_{X}^{\bullet}\right)=\operatorname{Hom}_{k}\left(H^{-i}(X, K), k\right)$ compatible with shifts for $K \in D_{Q C o h}(X)$,
(5) there are functorial isomorphisms $\operatorname{Hom}\left(\mathcal{F}, \omega_{X}\right)=\operatorname{Hom}_{k}\left(H^{1}(X, \mathcal{F}), k\right)$ for $\mathcal{F}$ quasi-coherent on $X$.

Proof. We start with the relative dualizing complex $\omega_{X}^{\bullet}=\omega_{X / k}^{\bullet}$ as described in Dualizing Complexes, Remark 45.28.5. Then property (4) holds by construction. Observe that $\omega_{X}^{\bullet}$ is also the dualizing complex normalized relative to $\omega_{\operatorname{Spec}(k)}^{\bullet}=$ $\mathcal{O}_{\operatorname{Spec}(k)}$, i.e., it is the dualizing complex $\omega_{X}^{\bullet}$ as in Dualizing Complexes, Example 45.36 .1 with $A=k$ and $\omega_{A}=k[0]$. Parts (1) and (2) follow from Dualizing Complexes, Lemma 45.36.6. For a closed point $x \in X$ we see that $\omega_{X, x}^{\bullet}$ is a normalized dualizing complex over $\mathcal{O}_{X, x}$, see Dualizing Complexes, Lemma 45.36.4. Assertion (3) then follows from Dualizing Complexes, Lemma 45.37.2. Finally, assertion (5) follows from Dualizing Complexes, Lemma 45.36 .7 for coherent $\mathcal{F}$ and in general by unwinding (4) for $K=\mathcal{F}[0]$ and $i=-1$.

0BS3 Lemma 46.2.2. Let $X$ be a proper scheme over a field $k$ which is Cohen-Macaulay and equidimensional of dimension 1. There exists a dualizing module $\omega_{X}$ with the following properties
(1) $\omega_{X}$ is a coherent Cohen-Macaulay module whose support is $X$,
(2) there are functorial isomorphisms Ext ${ }_{X}^{i}\left(K, \omega_{X}[1]\right)=\operatorname{Hom}_{k}\left(H^{-i}(X, K), k\right)$ compatible with shifts for $K \in D_{Q C o h}(X)$,
(3) there are functorial isomorphisms Ext ${ }^{1+i}\left(\mathcal{F}, \omega_{X}\right)=\operatorname{Hom}_{k}\left(H^{-i}(X, \mathcal{F}), k\right)$ for $\mathcal{F}$ quasi-coherent on $X$.

Proof. Let us take $\omega_{X}$ normalized as in as in Dualizing Complexes, Example 45.36 .2 . Then the statements follow from Lemma 46.2.1 and the fact that $\omega_{X}^{\bullet}=$ $\omega_{X}[1]$ as $X$ is Cohen-Macualay (Dualizing Complexes, Lemma 45.37.3).

0BS4 Remark 46.2.3. Let $X$ be a proper scheme of dimension $\leq 1$ over a field $k$. Let $\omega_{X}^{\bullet}$ be as in Lemma 46.2.1. If $\mathcal{E}$ is a finite locally free $\mathcal{O}_{X}$-module with dual $\mathcal{E}^{\wedge}$ then we have canonical isomorphisms

$$
\operatorname{Hom}_{k}\left(H^{-i}(X, \mathcal{E}), k\right)=H^{i}\left(X, \mathcal{E}^{\wedge} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \omega_{X}^{\bullet}\right)
$$

This follows from the lemma and Cohomology, Lemma 20.41.11. If $X$ is CohenMacaulay and equidimensional of dimension 1, then we have canonical isomorphisms

$$
\operatorname{Hom}_{k}\left(H^{-i}(X, \mathcal{E}), k\right)=H^{1-i}\left(X, \mathcal{E}^{\wedge} \otimes_{\mathcal{O}_{X}} \omega_{X}\right)
$$

where $\omega_{X}$ is as in Lemma 46.2.2.
We can use Lemmas 46.2.1 and 46.2.2 to get a relation between the euler characteristic of $\mathcal{O}_{X}$ and the euler characteristic of the dualizing complex or the dualizing module.

0BS5 Lemma 46.2.4. Let $X$ be a proper scheme of dimension $\leq 1$ over a field $k$. With $\omega_{X}^{\bullet}$ as in Lemma 46.2.1 we have

$$
\chi\left(X, \mathcal{O}_{X}\right)=\chi\left(X, \omega_{X}^{\bullet}\right)
$$

If $X$ is Cohen-Macaulay and equidimensional of dimension 1, then

$$
\chi\left(X, \mathcal{O}_{X}\right)=-\chi\left(X, \omega_{X}\right)
$$

with $\omega_{X}$ as in Lemma 46.2.2.
Proof. We define the right hand side of the first formula as follows:

$$
\chi\left(X, \omega_{X}^{\bullet}\right)=\sum_{i \in \mathbf{Z}}(-1)^{i} \operatorname{dim}_{k} H^{i}\left(X, \omega_{X}^{\bullet}\right)
$$

This is well defined because $\omega_{X}^{\bullet}$ is in $D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$, but also because

$$
H^{i}\left(X, \omega_{X}^{\bullet}\right)=\operatorname{Ext}^{i}\left(\mathcal{O}_{X}, \omega_{X}^{\bullet}\right)=H^{-i}\left(X, \mathcal{O}_{X}\right)
$$

which is always finite dimensional and nonzero only if $i=0,-1$. This of course also proves the first formula. The second is a consequence of the first because $\omega_{X}^{\bullet}=\omega_{X}[1]$ in the CM case.

We will use Lemma 46.2 .4 to get the desired formula for $\chi\left(X, \mathcal{O}_{X}\right)$ in the case that $\omega_{X}$ is invertible, i.e., that $X$ is Gorenstein. The statement is that $-1 / 2$ of the first chern class of $\omega_{X}$ capped with the cycle $[X]_{1}$ associated to $X$ is a natural zero cycle on $X$ with half-integer coefficients whose degree is $\chi\left(X, \mathcal{O}_{X}\right)$. The occurence of fractions in the statement of Riemann-Roch cannot be avoided.

0BS6 Lemma 46.2.5 (Rieman-Roch). Let $X$ be a proper scheme over a field $k$ which is Gorenstein and equidimensional of dimension 1. Let $\omega_{X}$ be as in Lemma 46.2.2. Then
(1) $\omega_{X}$ is an invertible $\mathcal{O}_{X}$-module,
(2) $\operatorname{deg}\left(\omega_{X}\right)=-2 \chi\left(X, \mathcal{O}_{X}\right)$,
(3) for a locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ of constant rank we have

$$
\begin{aligned}
\chi(X, \mathcal{E}) & =\operatorname{deg}(\mathcal{E})-\frac{1}{2} \operatorname{rank}(\mathcal{E}) \operatorname{deg}\left(\omega_{X}\right) \\
\text { and } \operatorname{dim}_{k}\left(H^{i}(X, \mathcal{E})\right) & =\operatorname{dim}_{k}\left(H^{1-i}\left(X, \mathcal{E}^{\wedge} \otimes_{\mathcal{O}_{X}} \omega_{X}\right) \text { for all } i \in \mathbf{Z}\right.
\end{aligned}
$$

Proof. It follows more or less from the definition of the Gorenstein property that the dualizing sheaf is invertible, see Dualizing Complexes, Section 45.38. By (46.2.0.3) applied to $\omega_{X}$ we have

$$
\chi\left(X, \omega_{X}\right)=\operatorname{deg}\left(c_{1}\left(\omega_{X}\right) \cap[X]_{1}\right)+\chi\left(X, \mathcal{O}_{X}\right)
$$

Combined with Lemma 46.2.4 this gives

$$
2 \chi\left(X, \mathcal{O}_{X}\right)=-\operatorname{deg}\left(c_{1}\left(\omega_{X}\right) \cap[X]_{1}\right)=-\operatorname{deg}\left(\omega_{X}\right)
$$

the second equality by 46.2 .0 .2 . Putting this back into 46.2 .0 .3 for $\mathcal{E}$ gives the displayed formula of the lemma. The symmetry in dimensions is a consequence of duality for $X$, see Remark 46.2.3.

### 46.3. Some vanishing results

0B5C In this section we work in the following situation.
0B5D Situation 46.3.1. Here $k$ is a field and $X$ is a proper scheme over $k$ which is Cohen-Macaulay, equidimensional of dimension 1, and has $H^{0}\left(X, \mathcal{O}_{X}\right)=k$. Let $\omega_{X}$ be the dualizing sheaf of $X$ as in Dualizing Complexes, Example 45.36.2.
From the discussion in Section 46.2 we see that the dualizing sheaf $\omega_{X}$ on $X$ has nonvanishing $H^{1}$. It turns out that anything slightly more "positive" than $\omega_{X}$ has vanishing $H^{1}$.
0B5E Lemma 46.3.2. In Situation 46.3.1. Given an exact sequence

$$
\omega_{X} \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0
$$

of coherent $\mathcal{O}_{X}$-modules with $H^{1}(X, \mathcal{Q})=0($ for example if $\operatorname{dim}(\operatorname{Supp}(\mathcal{Q}))=0)$, then either $H^{1}(X, \mathcal{F})=0$ or $\mathcal{F}=\omega_{X} \oplus \mathcal{Q}$.

Proof. (The parenthetical statement follows from Cohomology of Schemes, Lemma 29.9.10. Since $H^{0}\left(X, \mathcal{O}_{X}\right)=k$ is dual to $H^{1}\left(X, \omega_{X}\right)$ (see Section 46.2 we see that $\operatorname{dim} H^{1}\left(X, \omega_{X}\right)=1$. The sheaf $\omega_{X}$ represents the functor $\mathcal{F} \mapsto \operatorname{Hom}_{k}\left(H^{1}(X, \mathcal{F}), k\right)$ on the category of coherent $\mathcal{O}_{X}$-modules (Dualizing Complexes, Lemma 45.36.7). Consider an exact sequence as in the statement of the lemma and assume that $H^{1}(X, \mathcal{F}) \neq 0$. Since $H^{1}(X, \mathcal{Q})=0$ we see that $H^{1}\left(X, \omega_{X}\right) \rightarrow H^{1}(X, \mathcal{F})$ is an isomorphism. By the universal property of $\omega_{X}$ stated above, we conclude there is a map $\mathcal{F} \rightarrow \omega_{X}$ whose action on $H^{1}$ is the inverse of this isomorphism. The composition $\omega_{X} \rightarrow \mathcal{F} \rightarrow \omega_{X}$ is the identity (by the universal property) and the lemma is proved.

0B62 Lemma 46.3.3. In Situation 46.3.1. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module which is globally generated and not isomorphic to $\mathcal{O}_{X}$. Then $H^{1}\left(X, \omega_{X} \otimes \mathcal{L}\right)=0$.

Proof. By duality as discussed in Section 46.2 we have to show that $H^{0}\left(X, \mathcal{L}^{\otimes-1}\right)=$ 0 . If not, then we can choose a global section $t$ of $\mathcal{L}^{\otimes-1}$ and a global section $s$ of $\mathcal{L}$ such that $s t \neq 0$. However, then st is a constant multiple of 1 , by our assumption that $H^{0}\left(X, \mathcal{O}_{X}\right)=k$. It follows that $\mathcal{L} \cong \mathcal{O}_{X}$, which is a contradiction.

0B5F Lemma 46.3.4. In Situation 46.3.1. Given an exact sequence

$$
\omega_{X} \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0
$$

of coherent $\mathcal{O}_{X}$-modules with $\operatorname{dim}(\operatorname{Supp}(\mathcal{Q}))=0$ and $\operatorname{dim}_{k} H^{0}(X, \mathcal{Q}) \geq 2$ and such that there is no nonzero submodule $\mathcal{Q}^{\prime} \subset \mathcal{F}$ such that $\mathcal{Q}^{\prime} \rightarrow \mathcal{Q}$ is injective. Then the submodule of $\mathcal{F}$ generated by global sections surjects onto $\mathcal{Q}$.
Proof. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the submodule generated by global sections and the image of $\omega_{X} \rightarrow \mathcal{F}$. Since $\operatorname{dim}_{k} H^{0}(X, \mathcal{Q}) \geq 2$ and $\operatorname{dim}_{k} H^{1}\left(X, \omega_{X}\right)=\operatorname{dim}_{k} H^{0}\left(X, \mathcal{O}_{X}\right)=1$, we see that $\mathcal{F}^{\prime} \rightarrow \mathcal{Q}$ is not zero and $\omega_{X} \rightarrow \mathcal{F}^{\prime}$ is not an isomorphism. Hence $H^{1}\left(X, \mathcal{F}^{\prime}\right)=0$ by Lemma 46.3 .2 and our assumption on $\mathcal{F}$. Consider the short exact sequence

$$
0 \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{Q} / \operatorname{Im}\left(\mathcal{F}^{\prime} \rightarrow \mathcal{Q}\right) \rightarrow 0
$$

If the quotient on the right is nonzero, then we obtain a contradiction because then $H^{0}(X, \mathcal{F})$ is bigger than $H^{0}\left(X, \mathcal{F}^{\prime}\right)$.
Here is an example global generation statement.

0B5G Lemma 46.3.5. In Situation 46.3 .1 assume that $X$ is integral. Let $0 \rightarrow \omega_{X} \rightarrow$ $\mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0$ be a short exact sequence of coherent $\mathcal{O}_{X}$-modules with $\mathcal{F}$ torsion free, $\operatorname{dim}(\operatorname{Supp}(\mathcal{Q}))=0$, and $\operatorname{dim}_{k} H^{0}(X, \mathcal{Q}) \geq 2$. Then $\mathcal{F}$ is globally generated.
Proof. Consider the submodule $\mathcal{F}^{\prime}$ generated by the global sections. By Lemma 46.3.4 we see that $\mathcal{F}^{\prime} \rightarrow \mathcal{Q}$ is surjective, in particular $\mathcal{F}^{\prime} \neq 0$. Since $X$ is a curve, we see that $\mathcal{F}^{\prime} \subset \mathcal{F}$ is an inclusion of rank 1 sheaves, hence $\mathcal{Q}^{\prime}=\mathcal{F} / \mathcal{F}^{\prime}$ is supported in finitely many points. To get a contradiction, assume that $\mathcal{Q}^{\prime}$ is nonzero. Then we see that $H^{1}\left(X, \mathcal{F}^{\prime}\right) \neq 0$. Then we get a nonzero map $\mathcal{F}^{\prime} \rightarrow \omega_{X}$ by the universal property (Dualizing Complexes, Lemma 45.36.7). The image of the composition $\mathcal{F}^{\prime} \rightarrow \omega_{X} \rightarrow \mathcal{F}$ is generated by global sections, hence is inside of $\mathcal{F}^{\prime}$. Thus we get a nonzero self map $\mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime}$. Since $\mathcal{F}^{\prime}$ is torsion free of rank 1 on a proper curve this has to be an automorphism (details omitted). But then this implies that $\mathcal{F}^{\prime}$ is contained in $\omega_{X} \subset \mathcal{F}$ contradicting the surjectivity of $\mathcal{F}^{\prime} \rightarrow \mathcal{Q}$.
0B5H Lemma 46.3.6. In Situation 46.3.1. Let $\mathcal{L}$ be a very ample invertible $\mathcal{O}_{X}$-module with $\operatorname{deg}(\mathcal{L}) \geq 2$. Then $\omega_{X} \otimes_{\mathcal{O}_{X}} \mathcal{L}$ is globally generated.
Proof. Assume $k$ is algebraically closed. Let $x \in X$ be a closed point. Let $C_{i} \subset X$ be the irreducible components and for each $i$ let $x_{i} \in C_{i}$ be the generic point. By Varieties, Lemma 32.18.2 we can choose a section $s \in H^{0}(X, \mathcal{L})$ such that $s$ vanishes at $x$ but not at $x_{i}$ for all $i$. The corresponding module map $s: \mathcal{O}_{X} \rightarrow \mathcal{L}$ is injective with cokernel $\mathcal{Q}$ supported in finitely many points and with $H^{0}(X, \mathcal{Q}) \geq 2$. Consider the corresponding exact sequence

$$
0 \rightarrow \omega_{X} \rightarrow \omega_{X} \otimes \mathcal{L} \rightarrow \omega_{X} \otimes \mathcal{Q} \rightarrow 0
$$

By Lemma 46.3.4 we see that the module generated by global sections surjects onto $\omega_{X} \otimes \mathcal{Q}$. Since $x$ was arbitrary this proves the lemma. Some details omitted.

We will reduce the case where $k$ is not algebraically closed, to the algebraically closed field case. We suggest the reader skip the rest of the proof. Choose an algebraic closure $\bar{k}$ of $k$ and consider the base change $X_{\bar{k}}$. Let us check that $X_{\bar{k}} \rightarrow$ $\operatorname{Spec}(\bar{k})$ is an example of Situation 46.3.1. By flat base change (Cohomology of Schemes, Lemma 29.5.2 we see that $H^{0}\left(X_{\bar{k}}, \mathcal{O}\right)=\bar{k}$. By Varieties, Lemma 32.11.1 we see that $X_{\bar{k}}$ is Cohen-Macaulay. The scheme $X_{\bar{k}}$ is proper over $\bar{k}$ (Morphisms, Lemma 28.41.5 and equidimensional of dimension 1 (Morphisms, Lemma 28.28.3). The pullback of $\omega_{X}$ to $X_{\bar{k}}$ is the dualizing module of $X_{\bar{k}}$ by Dualizing Complexes, Lemma 45.23.1. The pullback of $\mathcal{L}$ to $X_{\bar{k}}$ is very ample (Morphisms, Lemma 28.38 .8 . The degree of the pullback of $\mathcal{L}$ to $X_{\bar{k}}$ is equal to the degree of $\mathcal{L}$ on $X$ (Varieties, Lemma 32.33 .2 . Finally, we see that $\omega_{X} \otimes \mathcal{L}$ is globally generated if and only if its base change is so (Varieties, Lemma 32.18.1). In this way we see that the result follows from the result in the case of an algebraically closed ground field.

## CHAPTER 47

## Resolution of Surfaces

## 0ADW

### 47.1. Introduction

0ADX This chapter discusses resolution of singularities of surfaces following Lipman Lip78 and mostly following the exposition of Artin in Art86. The main result (Theorem 47.14.5 tells us that a Noetherian 2-dimensional scheme $Y$ has a resolution of singularities when it has a finite normalization $Y^{\nu} \rightarrow Y$ with finitely many singular points $y_{i} \in Y^{\nu}$ and for each $i$ the completion $\mathcal{O}_{Y^{\nu}, y_{i}}^{\wedge}$ is normal.
To be sure, if $Y$ is a 2-dimensional scheme of finite type over a quasi-excellent base ring $R$ (for example a field or a Dedekind domain with fraction field of characteristic 0 such as $\mathbf{Z}$ ) then the normalization of $Y$ is finite, has finitely many singular points, and the completions of the local rings are normal. See the discussion in More on Algebra, Sections 15.38, 15.41, and 15.43 and More on Algebra, Lemma 15.33.2. Thus such a $Y$ has a resolution of singularities.

A rough outline of the proof is as follows. Let $A$ be a Noetherian local domain of dimension 2. The steps of the proof are as follows

N replace $A$ by its normalization,
V prove Grauert-Riemenschneider,
B show there is a maximum $g$ of the lengths of $H^{1}\left(X, \mathcal{O}_{X}\right)$ over all normal modifications $X \rightarrow \operatorname{Spec}(A)$ and reduce to the case $g=0$,
R we say $A$ defines a rational singularity if $g=0$ and in this case after a finite number of blowups we may assume $A$ is Gorenstein and $g=0$,
D we say $A$ defines a rational double point if $g=0$ and $A$ is Gorenstein and in this case we explicitly resolve singularities.
Each of these steps needs assumptions on the ring $A$. We will discuss each of these in turn.

Add N : Here we need to assume that $A$ has a finite normalization (this is not automatic). Throughout most of the chapter we will assume that our scheme is Nagata if we need to know some normalization is finite. However, being Nagata is a slightly stronger condition than is given to us in the statement of the theorem. A solution to this (slight) problem would have been to use that our ring $A$ is formally unramified (i.e., its completion is reduced) and to use Lemma 47.11.5. However, the way our proof works, it turns out it is easier to use Lemma 47.11.6 to lift finiteness of the normalization over the completion to finiteness of the normalization over $A$.
Add V: This is Proposition 47.7 .8 and it roughly states that for a normal modification $f: X \rightarrow \operatorname{Spec}(A)$ one has $R^{1} f_{*} \omega_{X}=0$ where $\omega_{X}$ is the dualizing module of $X / A$ (Remark 47.7.7). In fact, by duality the result is equivalent to a statement
(Lemma 47.7.6) about the object $R f_{*} \mathcal{O}_{X}$ in the derived category $D(A)$. Having said this, the proof uses the standard fact that components of the special fibre have positive conormal sheaves (Lemma 47.7.4).
Add B: This is in some sense the most subtle part of the proof. In the end we only need to use the output of this step when $A$ is a complete Noetherian local ring, although the writeup is a bit more general. The terminology is set in Definition 47.8.6. If $g$ (as defined above) is bounded, then a straightforward argument shows that we can find a normal modification $X \rightarrow \operatorname{Spec}(A)$ such that all singular points of $X$ are rational singularities, see Lemma 47.8.8. We show that given a finite extension $A \subset B$, then $g$ is bounded for $B$ if it is bounded for $A$ in the following two cases: (1) if the fraction field extension is separable, see Lemma 47.8.8 and (2) if the fraction field extension has degree $p$, the characteristic is $p$, and $A$ is regular and complete, see Lemma 47.8.13.
Add R: Here we reduce the case $g=0$ to the Gorenstein case. A marvellous fact, which makes everything work, is that the blowing up of a rational surface singularity is normal, see Lemma 47.9.4
Add D: The resolution of rational double points proceeds more or less by hand, see Section 47.12 A rational double point is a hypersurface singularity (this is true but we don't prove it as we don't need it). The local equation looks like

$$
a_{11} x_{1}^{2}+a_{12} x_{1} x_{2}+a_{13} x_{1} x_{3}+a_{22} x_{2}^{2}+a_{23} x_{2} x_{3}+a_{33} x_{3}^{2}=\sum a_{i j k} x_{i} x_{j} x_{k}
$$

Using that the quadratic part cannot be zero because the multiplicity is 2 and remains 2 after any blowup and the fact that every blowup is normal one quickly achieves a resolution. One twist is that we do not have an invariant which decreases every blowup, but we rely on the material on formal arcs from Section 47.10 to demonstrate that the process stops.
To put everything together some additional work has to be done. The main kink is that we want to lift a resolution of the completion $A^{\wedge}$ to a resolution of $\operatorname{Spec}(A)$. In order to do this we first show that if a resolution exists, then there is a resolution by normalized blowups (Lemma 47.14.3). A sequence of normalized blowups can be lifted from the completion by Lemma 47.11.7. We then use this even in the proof of resolution of complete local rings $A$ because our strategy works by induction on the degree of a finite inclusion $A_{0} \subset A$ with $A_{0}$ regular, see Lemma 47.14.4 With a stronger result in $B$ (such as is proved in Lipman's paper) this step could be avoided.

### 47.2. A trace map in positive characteristic

0 ADY In this section $p$ will be a prime number. Let $R$ be an $\mathbf{F}_{p}$-algebra. Given an $a \in R$ set $S=R[x] /\left(x^{p}-a\right)$. Define an $R$-linear map

$$
\operatorname{Tr}_{x}: \Omega_{S / R} \longrightarrow \Omega_{R}
$$

by the rule

$$
x^{i} \mathrm{~d} x \longmapsto\left\{\begin{array}{ccc}
0 & \text { if } & 0 \leq i \leq p-2 \\
\mathrm{~d} a & \text { if } & i=p-1
\end{array}\right.
$$

This makes sense as $\Omega_{S / R}$ is a free $R$-module with basis $x^{i} \mathrm{~d} x, 0 \leq i \leq p-1$. The following lemma implies that the trace map is well defined, i.e., independent of the choice of the coordinate $x$.

0ADZ Lemma 47.2.1. Let $\varphi: R[x] /\left(x^{p}-a\right) \rightarrow R[y] /\left(y^{p}-b\right)$ be an $R$-algebra homomorphism. Then $\operatorname{Tr}_{x}=T r_{y} \circ \varphi$.
Proof. Say $\varphi(x)=\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}$ with $\lambda_{i} \in R$. The condition that mapping $x$ to $\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}$ induces an $R$-algebra homomorphism $R[x] /\left(x^{p}-a\right) \rightarrow R[y] /\left(y^{p}-b\right)$ is equivalent to the condition that

$$
a=\lambda_{0}^{p}+\lambda_{1}^{p} b+\ldots+\lambda_{p-1}^{p} b^{p-1}
$$

in the ring $R$. Consider the polynomial ring

$$
R_{u n i v}=\mathbf{F}_{p}\left[b, \lambda_{0}, \ldots, \lambda_{p-1}\right]
$$

with the element $a=\lambda_{0}^{p}+\lambda_{1}^{p} b+\ldots+\lambda_{p-1}^{p} b^{p-1}$ Consider the universal algebra map $\varphi_{\text {univ }}: R_{\text {univ }}[x] /\left(x^{p}-a\right) \rightarrow R_{\text {univ }}[y] /\left(y^{p}-b\right)$ given by mapping $x$ to $\lambda_{0}+\lambda_{1} y+$ $\ldots+\lambda_{p-1} y^{p-1}$. We obtain a canonical map

$$
R_{\text {univ }} \longrightarrow R
$$

sending $b, \lambda_{i}$ to $b, \lambda_{i}$. By construction we get a commutative diagram

and the horizontal arrows are compatible with the trace maps. Hence it suffices to prove the lemma for the map $\varphi_{\text {univ }}$. Thus we may assume $R=\mathbf{F}_{p}\left[b, \lambda_{0}, \ldots, \lambda_{p-1}\right]$ is a polynomial ring. We will check the lemma holds in this case by evaluating $\operatorname{Tr}_{y}\left(\varphi(x)^{i} \mathrm{~d} \varphi(x)\right)$ for $i=0, \ldots, p-1$.
The case $0 \leq i \leq p-2$. Expand

$$
\left(\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}\right)^{i}\left(\lambda_{1}+2 \lambda_{2} y+\ldots+(p-1) \lambda_{p-1} y^{p-2}\right)
$$

in the ring $R[y] /\left(y^{p}-b\right)$. We have to show that the coefficient of $y^{p-1}$ is zero. For this it suffices to show that the expression above as a polynomial in $y$ has vanishing coefficients in front of the powers $y^{p k-1}$. Then we write our polynomial as

$$
\frac{\mathrm{d}}{(i+1) \mathrm{d} y}\left(\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}\right)^{i+1}
$$

and indeed the coefficients of $y^{k p-1}$ are all zero.
The case $i=p-1$. Expand

$$
\left(\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}\right)^{p-1}\left(\lambda_{1}+2 \lambda_{2} y+\ldots+(p-1) \lambda_{p-1} y^{p-2}\right)
$$

in the ring $R[y] /\left(y^{p}-b\right)$. To finish the proof we have to show that the coefficient of $y^{p-1}$ times $\mathrm{d} b$ is $\mathrm{d} a$. Here we use that $R$ is $S / p S$ where $S=\mathbf{Z}\left[b, \lambda_{0}, \ldots, \lambda_{p-1}\right]$. Then the above, as a polynomial in $y$, is equal to

$$
\frac{\mathrm{d}}{p \mathrm{~d} y}\left(\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}\right)^{p}
$$

Since $\frac{\mathrm{d}}{\mathrm{d} y}\left(y^{p k}\right)=p k y^{p k-1}$ it suffices to understand the coefficients of $y^{p k}$ in the polynomial $\left(\lambda_{0}+\lambda_{1} y+\ldots+\lambda_{p-1} y^{p-1}\right)^{p}$ modulo $p$. The sum of these terms gives

$$
\lambda_{0}^{p}+\lambda_{1}^{p} y^{p}+\ldots+\lambda_{p-1}^{p} y^{p(p-1)} \bmod p
$$

Whence we see that we obtain after applying the operator $\frac{\mathrm{d}}{p \mathrm{~d} y}$ and after reducing modulo $y^{p}-b$ the value

$$
\lambda_{1}^{p}+2 \lambda_{2}^{p} b+\ldots+(p-1) \lambda_{p-1} b^{p-2}
$$

for the coefficient of $y^{p-1}$ we wanted to compute. Now because $a=\lambda_{0}^{p}+\lambda_{1}^{p} b+\ldots+$ $\lambda_{p-1}^{p} b^{p-1}$ in $R$ we obtain that

$$
\mathrm{d} a=\left(\lambda_{1}^{p}+2 \lambda_{2}^{p} b+\ldots+(p-1) \lambda_{p-1}^{p} b^{p-2}\right) \mathrm{d} b
$$

in $R$. This proves that the coefficient of $y^{p-1}$ is as desired.
0AX5 Lemma 47.2.2. Let $\mathbf{F}_{p} \subset \Lambda \subset R \subset S$ be ring extensions and assume that $S$ is isomorphic to $R[x] /\left(x^{p}-a\right)$ for some $a \in R$. Then there are canonical $R$-linear maps

$$
\operatorname{Tr}: \Omega_{S / \Lambda}^{t+1} \longrightarrow \Omega_{R / \Lambda}^{t+1}
$$

for $t \geq 0$ such that

$$
\eta_{1} \wedge \ldots \wedge \eta_{t} \wedge x^{i} d x \longmapsto\left\{\begin{array}{ccc}
0 & \text { if } & 0 \leq i \leq p-2 \\
\eta_{1} \wedge \ldots \wedge \eta_{t} \wedge d a & \text { if } & i=p-1
\end{array}\right.
$$

for $\eta_{i} \in \Omega_{R / \Lambda}$ and such that $\operatorname{Tr}$ annihilates the image of $S \otimes_{R} \Omega_{R / \Lambda}^{t+1} \rightarrow \Omega_{S / \Lambda}^{t+1}$.
Proof. For $t=0$ we use the composition

$$
\Omega_{S / \Lambda} \rightarrow \Omega_{S / R} \rightarrow \Omega_{R} \rightarrow \Omega_{R / \Lambda}
$$

where the second map is Lemma 47.2.1. There is an exact sequence

$$
H_{1}\left(L_{S / R}\right) \stackrel{\delta}{\rightarrow} \Omega_{R / \Lambda} \otimes_{R} S \rightarrow \Omega_{S / \Lambda} \rightarrow \Omega_{S / R} \rightarrow 0
$$

(Algebra, Lemma 10.132.4). The module $\Omega_{S / R}$ is free over $S$ with basis $\mathrm{d} x$ and the module $H^{1}\left(L_{S / R}\right)$ is free over $S$ with basis $x^{p}-a$ which $\delta$ maps to $-\mathrm{d} a \otimes 1$ in $\Omega_{R / \Lambda} \otimes_{R} S$. In particular, if we set

$$
M=\operatorname{Coker}\left(R \rightarrow \Omega_{R / \Lambda}, 1 \mapsto-\mathrm{d} a\right)
$$

then we see that $\operatorname{Coker}(\delta)=M \otimes_{R} S$. We obtain a canonical map

$$
\Omega_{S / \Lambda}^{t+1} \rightarrow \wedge_{S}^{t}(\operatorname{Coker}(\delta)) \otimes_{S} \Omega_{S / R}=\wedge_{R}^{t}(M) \otimes_{R} \Omega_{S / R}
$$

Now, since the image of the map $\operatorname{Tr}: \Omega_{S / R} \rightarrow \Omega_{R / \lambda}$ of Lemma 47.2.1 is contained in $R \mathrm{~d} a$ we see that wedging with an element in the image annihilates $\mathrm{d} a$. Hence there is a canonical map

$$
\wedge_{R}^{t}(M) \otimes_{R} \Omega_{S / R} \rightarrow \Omega_{R / \Lambda}^{t+1}
$$

mapping $\bar{\eta}_{1} \wedge \ldots \wedge \bar{\eta}_{t} \wedge \omega$ to $\eta_{1} \wedge \ldots \wedge \eta_{t} \wedge \operatorname{Tr}(\omega)$.
0AX6 Lemma 47.2.3. Let $S$ be a scheme over $\mathbf{F}_{p}$. Let $f: Y \rightarrow X$ be a finite morphism of Noetherian normal integral schemes over $S$. Assume
(1) the extension of function fields is purely inseparable of degree $p$, and
(2) $\Omega_{X / S}$ is a coherent $\mathcal{O}_{X}$-module (for example if $X$ is of finite type over $S$ ). For $i \geq 1$ there is a canonical map

$$
\operatorname{Tr}: f_{*} \Omega_{Y / S}^{i} \longrightarrow\left(\Omega_{X / S}^{i}\right)^{* *}
$$

whose stalk in the generic point of $X$ recovers the trace map of Lemma 47.2.2.

Proof. The exact sequence $f^{*} \Omega_{X / S} \rightarrow \Omega_{Y / S} \rightarrow \Omega_{Y / X} \rightarrow 0$ shows that $\Omega_{Y / S}$ and hence $f_{*} \Omega_{Y / S}$ are coherent modules as well. Thus it suffices to prove the trace map in the generic point extends to stalks at $x \in X$ with $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=1$, see Divisors, Lemma 30.10.9. Thus we reduce to the case discussed in the next paragraph.
Assume $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$ with $A$ a discrete valuation ring and $B$ finite over $A$. Since the induced extension $K \subset L$ of fraction fields is purely inseparable, we see that $B$ is local too. Hence $B$ is a discrete valuation ring too. Then either
(1) $B / A$ has ramification index $p$ and hence $B=A[x] /\left(x^{p}-a\right)$ where $a \in A$ is a uniformizer, or
(2) $\mathfrak{m}_{B}=\mathfrak{m}_{A} B$ and the residue field $B / \mathfrak{m}_{A} B$ is purely inseparable of degree $p$ over $\kappa_{A}=A / \mathfrak{m}_{A}$. Choose any $x \in B$ whose residue class is not in $\kappa_{A}$ and then we'll have $B=A[x] /\left(x^{p}-a\right)$ where $a \in A$ is a unit.
Let $\operatorname{Spec}(\Lambda) \subset S$ be an affine open such that $X$ maps into $\operatorname{Spec}(\Lambda)$. Then we can apply Lemma 47.2 .2 to see that the trace map extends to $\Omega_{B / \Lambda}^{i} \rightarrow \Omega_{A / \Lambda}^{i}$ for all $i \geq 1$.

### 47.3. Quadratic transformations

0AGP In this section we study what happens when we blow up a nonsingular point on a surface. We hesitate the formally define such a morphism as a quadratic transformation as on the one hand often other names are used and on the other hand the phrase "quadratic transformation" is sometimes used with a different meaning.
0AGQ Lemma 47.3.1. Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f: X \rightarrow$ $S=\operatorname{Spec}(A)$ be the blowing up of $A$ in $\mathfrak{m}$. There is a closed immersion

$$
r: X \longrightarrow \mathbf{P}_{S}^{1}
$$

over $S$ such that $\mathcal{O}_{X}(1)=r^{*} \mathcal{O}_{\mathbf{P}_{S}^{1}}(1)$ and such that $\left.r\right|_{E}: E \rightarrow \mathbf{P}_{\kappa}^{1}$ is an isomorphism.

Proof. As $A$ is regular of dimension 2 we can write $\mathfrak{m}=(x, y)$. Then $x$ and $y$ placed in degree 1 generate the Rees algebra $\bigoplus_{n \geq 0} \mathfrak{m}^{n}$ over $A$. Recall that $X=\operatorname{Proj}\left(\bigoplus_{n \geq 0} \mathfrak{m}^{n}\right)$, see Divisors, Lemma 30.26.2. Thus the surjection

$$
A\left[T_{0}, T_{1}\right] \longrightarrow \bigoplus_{n \geq 0} \mathfrak{m}^{n}, \quad T_{0} \mapsto x, T_{1} \mapsto y
$$

of graded $A$-algebras induces a closed immersion $r: X \rightarrow \mathbf{P}_{S}^{1}=\operatorname{Proj}\left(A\left[T_{0}, T_{1}\right]\right)$ such that $\mathcal{O}_{X}(1)=r^{*} \mathcal{O}_{\mathbf{P}_{S}^{1}}(1)$, see Constructions, Lemma 26.11.5. To prove the final statement note that

$$
\left(\bigoplus_{n \geq 0} \mathfrak{m}^{n}\right) \otimes_{A} \kappa=\bigoplus_{n \geq 0} \mathfrak{m}^{n} / \mathfrak{m}^{n+1} \cong \kappa[\bar{x}, \bar{y}]
$$

a polynomial algebra, see Algebra, Lemma 10.105.1. This proves that the fibre of $X \rightarrow S$ over $\operatorname{Spec}(\kappa)$ is equal to $\operatorname{Proj}(\kappa[\bar{x}, \bar{y}])=\mathbf{P}_{\kappa}^{1}$, see Constructions, Lemma 26.11.6. Recall that $E$ is the closed subscheme of $X$ defined by $\mathfrak{m} \mathcal{O}_{X}$, i.e., $E=X_{\kappa}$. By our choice of the morphism $r$ we see that $\left.r\right|_{E}$ in fact produces the identification of $E=X_{\kappa}$ with the special fibre of $\mathbf{P}_{S}^{1} \rightarrow S$.

0 AGR Lemma 47.3.2. Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f: X \rightarrow$ $S=\operatorname{Spec}(A)$ be the blowing up of $A$ in $\mathfrak{m}$. Then $X$ is an irreducible regular scheme.

Proof. Observe that $X$ is integral by Divisors, Lemma 30.26.9and Algebra, Lemma 10.105 .2 . To see $X$ is regular it suffices to check that $\mathcal{O}_{X, x}$ is regular for closed points $x \in X$, see Properties, Lemma 27.9.2. Let $x \in X$ be a closed point. Since $f$ is proper $x$ maps to $\mathfrak{m}$, i.e., $x$ is a point of the exceptional divisor $E$. Then $E$ is an effective Cartier divisor and $E \cong \mathbf{P}_{\kappa}^{1}$. Thus if $f \in \mathfrak{m}_{x} \subset \mathcal{O}_{X, x}$ is a local equation for $E$, then $\mathcal{O}_{X, x} /(f) \cong \mathcal{O}_{\mathbf{P}_{\kappa}^{1}, x}$. Since $\mathbf{P}_{\kappa}^{1}$ is covered by two affine opens which are the spectrum of a polynomial ring over $\kappa$, we see that $\mathcal{O}_{\mathbf{P}_{\kappa}^{1}, x}$ is regular by Algebra, Lemma 10.113.1. We conclude by Algebra, Lemma 10.105.7.

0AGS Lemma 47.3.3. Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f: X \rightarrow$ $S=\operatorname{Spec}(A)$ be the blowing up of $A$ in $\mathfrak{m}$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module.
(1) $H^{p}(X, \mathcal{F})=0$ for $p \notin\{0,1\}$,
(2) $H^{1}\left(X, \mathcal{O}_{X}(n)\right)=0$ for $n \geq-1$,
(3) $H^{1}(X, \mathcal{F})=0$ if $\mathcal{F}$ or $\mathcal{F}(1)$ is globally generated,
(4) $H^{0}\left(X, \mathcal{O}_{X}(n)\right)=\mathfrak{m}^{\max (0, n)}$,
(5) length $H^{1}\left(X, \mathcal{O}_{X}(n)\right)=-n(-n-1) / 2$ if $n<0$.

Proof. If $\mathfrak{m}=(x, y)$, then $X$ is covered by the spectra of the affine blowup algebras $A\left[\frac{\mathfrak{m}}{x}\right]$ and $A\left[\frac{\mathfrak{m}}{y}\right]$ because $x$ and $y$ placed in degree 1 generate the Rees algebra $\bigoplus \mathfrak{m}^{n}$ over $A$. See Divisors, Lemma 30.26 .2 and Constructions, Lemma 26.8.9. Since $X$ is separated by Constructions, Lemma 26.8 .8 we see that cohomology of quasicoherent sheaves vanishes in degrees $\geq 2$ by Cohomology of Schemes, Lemma 29.4.2.
Let $i: E \rightarrow X$ be the exceptional divisor, see Divisors, Definition 30.26.1 Recall that $\mathcal{O}_{X}(-E)=\mathcal{O}_{X}(1)$ is $f$-relatively ample, see Divisors, Lemma 30.26.4 Hence we know that $H^{1}\left(X, \mathcal{O}_{X}(-n E)\right)=0$ for some $n>0$, see Cohomology of Schemes, Lemma 29.15.2, Consider the filtration

$$
\mathcal{O}_{X}(-n E) \subset \mathcal{O}_{X}(-(n-1) E) \subset \ldots \subset \mathcal{O}_{X}(-E) \subset \mathcal{O}_{X} \subset \mathcal{O}_{X}(E)
$$

The successive quotients are the sheaves

$$
\mathcal{O}_{X}(-t E) / \mathcal{O}_{X}(-(t+1) E)=\mathcal{O}_{X}(t) / \mathcal{I}(t)=i_{*} \mathcal{O}_{E}(t)
$$

where $\mathcal{I}=\mathcal{O}_{X}(-E)$ is the ideal sheaf of $E$. By Lemma 47.3.1 we have $E=\mathbf{P}_{\kappa}^{1}$ and $\mathcal{O}_{E}(1)$ indeed corresponds to the usual Serre twist of the structure sheaf on $\mathbf{P}^{1}$. Hence the cohomology of $\mathcal{O}_{E}(t)$ vanishes in degree 1 for $t \geq-1$, see Cohomology of Schemes, Lemma 29.8.1. Since this is equal to $H^{1}\left(X, i_{*} \mathcal{O}_{E}(t)\right)$ (by Cohomology of Schemes, Lemma 29.2.4 we find that $H^{1}\left(X, \mathcal{O}_{X}(-(t+1) E)\right) \rightarrow H^{1}\left(X, \mathcal{O}_{X}(-t E)\right)$ is surjective for $t \geq-1$. Hence

$$
0=H^{1}\left(X, \mathcal{O}_{X}(-n E)\right) \longrightarrow H^{1}\left(X, \mathcal{O}_{X}(-t E)\right)=H^{1}\left(X, \mathcal{O}_{X}(t)\right)
$$

is surjective for $t \geq-1$ which proves (2).
Let $\mathcal{F}$ be globally generated. This means there exists a short exact sequence

$$
0 \rightarrow \mathcal{G} \rightarrow \bigoplus_{i \in I} \mathcal{O}_{X} \rightarrow \mathcal{F} \rightarrow 0
$$

Note that $H^{1}\left(X, \bigoplus_{i \in I} \mathcal{O}_{X}\right)=\bigoplus_{i \in I} H^{1}\left(X, \mathcal{O}_{X}\right)$ by Cohomology, Lemma 20.20.1. By part (2) we have $H^{1}\left(X, \mathcal{O}_{X}\right)=0$. If $\mathcal{F}(1)$ is globally generated, then we can find a surjection $\bigoplus_{i \in I} \mathcal{O}_{X}(-1) \rightarrow \mathcal{F}$ and argue in a similar fashion. In other words, part (3) follows from part (2).

For part (4) we note that for all $n$ large enough we have $\Gamma\left(X, \mathcal{O}_{X}(n)\right)=\mathfrak{m}^{n}$, see Cohomology of Schemes, Lemma 29.14.4. If $n \geq 0$, then we can use the short exact sequence

$$
0 \rightarrow \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{X}(n-1) \rightarrow i_{*} \mathcal{O}_{E}(n-1) \rightarrow 0
$$

and the vanishing of $H^{1}$ for the sheaf on the left to get a commutative diagram

with exact rows. In fact, the rows are exact also for $n<0$ because in this case the groups on the right are zero. In the proof of Lemma 47.3.1 we have seen that the right vertical arrow is an isomorphism (details omitted). Hence if the left vertical arrow is an isomorphism, so is the middle one. In this way we see that (4) holds by descending induction on $n$.

Finally, we prove (5) by descending induction on $n$ and the sequences

$$
0 \rightarrow \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{X}(n-1) \rightarrow i_{*} \mathcal{O}_{E}(n-1) \rightarrow 0
$$

Namely, for $n \geq-1$ we already know $H^{1}\left(X, \mathcal{O}_{X}(n)\right)=0$. Since

$$
H^{1}\left(X, i_{*} \mathcal{O}_{E}(-2)\right)=H^{1}\left(E, \mathcal{O}_{E}(-2)\right)=H^{1}\left(\mathbf{P}_{\kappa}^{1}, \mathcal{O}(-2)\right) \cong \kappa
$$

by Cohomology of Schemes, Lemma 29.8.1 which has length 1 as an $A$-module, we conclude from the long exact cohomology sequence that (5) holds for $n=-2$. And so on and so forth.

0AGT Lemma 47.3.4. Let $(A, \mathfrak{m})$ be a regular local ring of dimension 2. Let $f: X \rightarrow$ $S=\operatorname{Spec}(A)$ be the blowing up of $A$ in $\mathfrak{m}$. Let $\mathfrak{m}^{n} \subset I \subset \mathfrak{m}$ be an ideal. Let $d \geq 0$ be the largest integer such that

$$
I \mathcal{O}_{X} \subset \mathcal{O}_{X}(-d E)
$$

where $E$ is the exceptional divisor. Set $\mathcal{I}^{\prime}=I \mathcal{O}_{X}(d E) \subset \mathcal{O}_{X}$. Then $d>0$, the sheaf $\mathcal{O}_{X} / \mathcal{I}^{\prime}$ is supported in finitely many closed points $x_{1}, \ldots, x_{r}$ of $X$, and

$$
\begin{aligned}
\text { length }_{A}(A / I) & >\text { length }_{A} \Gamma\left(X, \mathcal{O}_{X} / \mathcal{I}^{\prime}\right) \\
& \geq \sum_{i=1, \ldots, r} \text { length }_{\mathcal{O}_{X, x_{i}}}\left(\mathcal{O}_{X, x_{i}} / \mathcal{I}_{x_{i}}^{\prime}\right)
\end{aligned}
$$

Proof. Since $I \subset \mathfrak{m}$ we see that every element of $I$ vanishes on $E$. Thus we see that $d \geq 1$. On the other hand, since $\mathfrak{m}^{n} \subset I$ we see that $d \leq n$. Consider the short exact sequence

$$
0 \rightarrow I \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / I \mathcal{O}_{X} \rightarrow 0
$$

Since $I \mathcal{O}_{X}$ is globally generated, we see that $H^{1}\left(X, I \mathcal{O}_{X}\right)=0$ by Lemma 47.3.3. Hence we obtain a surjection $A / I \rightarrow \Gamma\left(X, \mathcal{O}_{X} / I \mathcal{O}_{X}\right)$. Consider the short exact sequence

$$
0 \rightarrow \mathcal{O}_{X}(-d E) / I \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / I \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / \mathcal{O}_{X}(-d E) \rightarrow 0
$$

By Divisors, Lemma 30.12 .8 we see that $\mathcal{O}_{X}(-d E) / I \mathcal{O}_{X}$ is supported in finitely many closed points of $X$. In particular, this coherent sheaf has vanishing higher
cohomology groups (detail omitted). Thus in the following diagram

the bottom row is exact and the vertical arrow surjective. We have

$$
\operatorname{length}_{A} \Gamma\left(X, \mathcal{O}_{X}(-d E) / I \mathcal{O}_{X}\right)<\operatorname{length}_{A}(A / I)
$$

since $\Gamma\left(X, \mathcal{O}_{X} / \mathcal{O}_{X}(-d E)\right)$ is nonzero. Namely, the image of $1 \in \Gamma\left(X, \mathcal{O}_{X}\right)$ is nonzero as $d>0$.
To finish the proof we translate the results above into the statements of the lemma. Since $\mathcal{O}_{X}(d E)$ is invertible we have

$$
\mathcal{O}_{X} / \mathcal{I}^{\prime}=\mathcal{O}_{X}(-d E) / I \mathcal{O}_{X} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(d E)
$$

Thus $\mathcal{O}_{X} / \mathcal{I}^{\prime}$ and $\mathcal{O}_{X}(-d E) / I \mathcal{O}_{X}$ are supported in the same set of finitely many closed points, say $x_{1}, \ldots, x_{r} \in E \subset X$. Moreover we obtain
$\Gamma\left(X, \mathcal{O}_{X}(-d E) / I \mathcal{O}_{X}\right)=\bigoplus \mathcal{O}_{X}(-d E)_{x_{i}} / I \mathcal{O}_{X, x_{i}} \cong \bigoplus \mathcal{O}_{X, x_{i}} / \mathcal{I}_{x_{i}}^{\prime}=\Gamma\left(X, \mathcal{O}_{X} / \mathcal{I}^{\prime}\right)$
because an invertible module over a local ring is trivial. Thus we obtain the strict inequality. We also get the second because

$$
\operatorname{length}_{A}\left(\mathcal{O}_{X, x_{i}} / \mathcal{I}_{x_{i}}^{\prime}\right) \geq \operatorname{length}_{\mathcal{O}_{X, x_{i}}}\left(\mathcal{O}_{X, x_{i}} / \mathcal{I}_{x_{i}}^{\prime}\right)
$$

as is immediate from the definition of length.
0B4L Lemma 47.3.5. Let $(A, \mathfrak{m}, \kappa)$ be a regular local ring of dimension 2. Let $f: X \rightarrow$ $S=\operatorname{Spec}(A)$ be the blowing up of $A$ in $\mathfrak{m}$. Then $\Omega_{X / S}=i_{*} \Omega_{E / \kappa}$, where $i: E \rightarrow X$ is the immersion of the exceptional divisor.

Proof. Writing $\mathbf{P}^{1}=\mathbf{P}_{S}^{1}$, let $r: X \rightarrow \mathbf{P}^{1}$ be as in Lemma 47.3.1. Then we have an exact sequence

$$
\mathcal{C}_{X / \mathbf{P}^{1}} \rightarrow r^{*} \Omega_{\mathbf{P}^{1} / S} \rightarrow \Omega_{X / S} \rightarrow 0
$$

see Morphisms, Lemma 28.33.15. Since $\left.\Omega_{\mathbf{P}^{1} / S}\right|_{E}=\Omega_{E / \kappa}$ by Morphisms, Lemma 28.33 .10 it suffices to see that the first arrow defines a surjection onto the kernel of the canonical map $r^{*} \Omega_{\mathbf{P}^{1} / S} \rightarrow i_{*} \Omega_{E / \kappa}$. This we can do locally. With notation as in the proof of Lemma 47.3.1 on an affine open of $X$ the morphism $f$ corresponds to the ring map

$$
A \rightarrow A[t] /(x t-y)
$$

where $x, y \in \mathfrak{m}$ are generators. Thus $\mathrm{d}(x t-y)=x \mathrm{~d} t$ and $y \mathrm{~d} t=t \cdot x \mathrm{~d} t$ which proves what we want.

### 47.4. Dominating by quadratic transformations

0BFS Using the result above we can prove that blowups in points dominate any modification of a regular 2 dimensional scheme.
Let $X$ be a scheme. Let $x \in X$ be a closed point. As usual, we view $i: x=$ $\operatorname{Spec}(\kappa(x)) \rightarrow X$ as a closed subscheme. The blowing up $X^{\prime} \rightarrow X$ of $X$ at $x$ is the blowing up of $X$ in the closed subscheme $x \subset X$. Observe that if $X$ is locally Noetherian, then $X^{\prime} \rightarrow X$ is projective (in particular proper) by Divisors, Lemma 30.26 .13 .

0AHH Lemma 47.4.1. Let $X$ be a Noetherian scheme. Let $T \subset X$ be a finite set of closed points $x$ such that $\mathcal{O}_{X, x}$ is regular of dimension 2 for $x \in T$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals such that $\mathcal{O}_{X} / \mathcal{I}$ is supported on $T$. Then there exists a sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{i+1} \rightarrow X_{i}$ is the blowing up of $X_{i}$ at a closed point $x_{i}$ lying above a point of $T$ such that $\mathcal{I O}_{X_{n}}$ is an invertible ideal sheaf.

Proof. Say $T=\left\{x_{1}, \ldots, x_{r}\right\}$. Set

$$
n_{i}=\operatorname{length}_{\mathcal{O}_{X, x_{i}}}\left(\mathcal{O}_{X, x_{i}} / I_{i}\right)
$$

This is finite as $\mathcal{O}_{X} / \mathcal{I}$ is supported on $T$ and hence $\mathcal{O}_{X, x_{i}} / I_{i}$ has support equal to $\left\{\mathfrak{m}_{x_{i}}\right\}$ (see Algebra, Lemma 10.61.3). We are going to use induction on $\sum n_{i}$. If $n_{i}=0$ for all $i$, then $\mathcal{I}=\mathcal{O}_{X}$ and we are done.

Suppose $n_{i}>0$. Let $X^{\prime} \rightarrow X$ be the blowing up of $X$ in $x_{i}$ (see discussion above the lemma). Since $\operatorname{Spec}\left(\mathcal{O}_{X, x_{i}}\right) \rightarrow X$ is flat we see that $X^{\prime} \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}}\right)$ is the blowup of the ring $\mathcal{O}_{X, x_{i}}$ in the maximal ideal, see Divisors, Lemma 30.26.3. Hence the square in the commutative diagram

is cartesian. Let $E \subset X^{\prime}$ and $E^{\prime} \subset \operatorname{Proj}\left(\bigoplus_{d>0} \mathfrak{m}_{x_{i}}^{d}\right)$ be the exceptional divisors. Let $d \geq 1$ be the integer found in Lemma 47.3.4 for the ideal $\mathcal{I}_{i} \subset \mathcal{O}_{X, x_{i}}$. Since the horizontal arrows in the diagram are flat, since $E^{\prime} \rightarrow E$ is surjective, and since $E^{\prime}$ is the pullback of $E$, we see that

$$
\mathcal{I} \mathcal{O}_{X^{\prime}} \subset \mathcal{O}_{X^{\prime}}(-d E)
$$

(some details omitted). Set $\mathcal{I}^{\prime}=\mathcal{I} \mathcal{O}_{X^{\prime}}(d E) \subset \mathcal{O}_{X^{\prime}}$. Then we see that $\mathcal{O}_{X^{\prime}} / \mathcal{I}^{\prime}$ is supported in finitely many closed points $T^{\prime} \subset\left|X^{\prime}\right|$ because this holds over $X \backslash\left\{x_{i}\right\}$ and for the pullback to $\operatorname{Proj}\left(\bigoplus_{d>0} \mathfrak{m}_{x_{i}}^{d}\right)$. The final assertion of Lemma 47.3.4 tells us that the sum of the lengths of the stalks $\mathcal{O}_{X^{\prime}, x^{\prime}} / \mathcal{I}^{\prime} \mathcal{O}_{X^{\prime}, x^{\prime}}$ for $x^{\prime}$ lying over $x_{i}$ is $<n_{i}$. Hence the sum of the lengths has decreased.

By induction hypothesis, there exists a sequence

$$
X_{n}^{\prime} \rightarrow \ldots \rightarrow X_{1}^{\prime} \rightarrow X^{\prime}
$$

of blowups at closed points lying over $T^{\prime}$ such that $\mathcal{I}^{\prime} \mathcal{O}_{X_{n}^{\prime}}$ is invertible. Since $\mathcal{I}^{\prime} \mathcal{O}_{X^{\prime}}(-d E)=\mathcal{I} \mathcal{O}_{X^{\prime}}$, we see that $\mathcal{I} \mathcal{O}_{X_{n}^{\prime}}=\mathcal{I}^{\prime} \mathcal{O}_{X_{n}^{\prime}}\left(-d\left(f^{\prime}\right)^{-1} E\right)$ where $f^{\prime}: X_{n}^{\prime} \rightarrow$ $X^{\prime}$ is the composition. Note that $\left(f^{\prime}\right)^{-1} E$ is an effective Cartier divisor by Divisors, Lemma 30.26.11. Thus we are done by Divisors, Lemma 30.11.7.

0AHI Lemma 47.4.2. Let $X$ be a Noetherian scheme. Let $T \subset X$ be a finite set of closed points $x$ such that $\mathcal{O}_{X, x}$ is a regular local ring of dimension 2 . Let $f: Y \rightarrow X$ be $a$ proper morphism of schemes which is an isomorphism over $U=X \backslash T$. Then there exists a sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{i+1} \rightarrow X_{i}$ is the blowing up of $X_{i}$ at a closed point $x_{i}$ lying above a point of $T$ and a factorization $X_{n} \rightarrow Y \rightarrow X$ of the composition.

Proof. By More on Flatness, Lemma 37.29 .4 there exists a $U$-admissible blowup $X^{\prime} \rightarrow X$ which dominates $Y \rightarrow X$. Hence we may assume there exists an ideal sheaf $\mathcal{I} \subset \mathcal{O}_{X}$ such that $\mathcal{O}_{X} / \mathcal{I}$ is supported on $T$ and such that $Y$ is the blowing up of $X$ in $\mathcal{I}$. By Lemma 47.4.1 there exists a sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

where $X_{i+1} \rightarrow X_{i}$ is the blowing up of $X_{i}$ at a closed point $x_{i}$ lying above a point of $T$ such that $\mathcal{I} \mathcal{O}_{X_{n}}$ is an invertible ideal sheaf. By the universal property of blowing up (Divisors, Lemma 30.26.5 we find the desired factorization.

### 47.5. Dominating by normalized blowups

$0 B B R$ In this section we prove that a modification of a surface can be dominated by a sequence of normalized blowups in points.
0BBS Definition 47.5.1. Let $X$ be a scheme such that every quasi-compact open has finitely many irreducible components. Let $x \in X$ be a closed point. The normalized blowup of $X$ at $x$ is the composition $X^{\prime \prime} \rightarrow X^{\prime} \rightarrow X$ where $X^{\prime} \rightarrow X$ is the blowup of $X$ in $x$ and $X^{\prime \prime} \rightarrow X^{\prime}$ is the normalization of $X^{\prime}$.

Here the normalization $X^{\prime \prime} \rightarrow X^{\prime}$ is defined as the scheme $X^{\prime}$ has an open covering by opens which have finitely many irreducible components by Divisors, Lemma 30.26.10. See Morphisms, Definition 28.49.1 for the definition of the normalization.

In general the normalized blowing up need not be proper even when $X$ is Noetherian. Recall that a scheme is Nagata if it has an open covering by affines which are spectra of Nagata rings (Properties, Definition 27.13.1.

0BFT Lemma 47.5.2. In Definition 47.5 .1 if $X$ is Nagata, then the normalized blowing up of $X$ at $x$ is normal, Nagata, and proper over $X$.

Proof. The blowup morphism $X^{\prime} \rightarrow X$ is proper (as $X$ is locally Noetherian we may apply Divisors, Lemma 30.26.13). Thus $X^{\prime}$ is Nagata (Morphisms, Lemma 28.18.1). Therefore the normalization $X^{\prime \prime} \rightarrow X^{\prime}$ is finite (Morphisms, Lemma 28.49.7 and we conclude that $X^{\prime \prime} \rightarrow X$ is proper as well (Morphisms, Lemmas 28.43 .10 and 28.41.4). It follows that the normalized blowing up is a normal (Morphisms, Lemma 28.49.4 Nagata algebraic space.

In the following lemma we need to assume $X$ is Noetherian in order to make sure that it has finitely many irreducible components. Then the properness of $f: Y \rightarrow X$ assures that $Y$ has finitely many irreducible components too and it makes sense to require $f$ to be birational (Morphisms, Definition 28.46.1.

0BBT Lemma 47.5.3. Let $X$ be a scheme which is Noetherian, Nagata, and has dimension 2. Let $f: Y \rightarrow X$ be a proper birational morphism. Then there exists a commutative diagram

where $X_{0} \rightarrow X$ is the normalization and where $X_{i+1} \rightarrow X_{i}$ is the normalized blowing up of $X_{i}$ at a closed point.

Proof. We will use the results of Morphisms, Sections 28.18, 28.30, and 28.49 without further mention. We may replace $Y$ by its normalization. Let $X_{0} \rightarrow X$ be the normalization. The morphism $Y \rightarrow X$ factors through $X_{0}$. Thus we may assume that both $X$ and $Y$ are normal.

Assume $X$ and $Y$ are normal. The morphism $f: Y \rightarrow X$ is an isomorphism over an open which contains every point of codimension 0 and 1 in $Y$ and every point of $Y$ over which the fibre is finite, see Varieties, Lemma 32.15.3. Hence there is a finite set of closed points $T \subset X$ such that $f$ is an isomorphism over $X \backslash T$. For each $x \in T$ the fibre $Y_{x}$ is a proper geometrically connected scheme of dimension 1 over $\kappa(x)$, see More on Morphisms, Lemma 36.38.5. Thus

$$
\operatorname{BadCurves}(f)=\{C \subset Y \text { closed } \mid \operatorname{dim}(C)=1, f(C)=\text { a point }\}
$$

is a finite set. We will prove the lemma by induction on the number of elements of $\operatorname{BadCurves}(f)$. The base case is the case where BadCurves $(f)$ is empty, and in that case $f$ is an isomorphism.

Fix $x \in T$. Let $X^{\prime} \rightarrow X$ be the normalized blowup of $X$ at $x$ and let $Y^{\prime}$ be the normalization of $Y \times_{X} X^{\prime}$. Picture

Let $x^{\prime} \in X^{\prime}$ be a closed point lying over $x$ such that the fibre $Y_{x^{\prime}}^{\prime}$ has dimension $\geq 1$. Let $C^{\prime} \subset Y^{\prime}$ be an irreducible component of $Y_{x^{\prime}}^{\prime}$, i.e., $C^{\prime} \in \operatorname{BadCurves}\left(f^{\prime}\right)$. Since $Y^{\prime} \rightarrow Y \times_{X} X^{\prime}$ is finite we see that $C^{\prime}$ must map to an irreducible component $C \subset Y_{x}$. If is clear that $C \in \operatorname{BadCurves}(f)$. Since $Y^{\prime} \rightarrow Y$ is birational and hence an isomorphism over points of codimension 1 in $Y$, we see that we obtain an injective map

$$
B a d C u r v e s\left(f^{\prime}\right) \longrightarrow B a d C u r v e s(f)
$$

Thus it suffices to show that after a finite number of these normalized blowups we get rid at of at least one of the bad curves, i.e., the displayed map is not surjective.

We will get rid of a bad curve using an argument due to Zariski. Pick $C \in$ BadCurves $(f)$ lying over our $x$. Denote $\mathcal{O}_{Y, C}$ the local ring of $Y$ at the generic point of $C$. Choose an element $u \in \mathcal{O}_{X, C}$ whose image in the residue field $R(C)$ is transcendental over $\kappa(x)$ (we can do this because $R(C)$ has transcendence degree 1 over $\kappa(x)$ by Varieties, Lemma 32.17.3). We can write $u=a / b$ with $a, b \in \mathcal{O}_{X, x}$ as $\mathcal{O}_{Y, C}$ and $\mathcal{O}_{X, x}$ have the same fraction fields. By our choice of $u$ it must be the case that $a, b \in \mathfrak{m}_{x}$. Hence

$$
N_{u, a, b}=\min \left\{\operatorname{ord}_{\mathcal{O}_{Y, C}}(a), \operatorname{ord}_{\mathcal{O}_{Y, C}}(b)\right\}>0
$$

Thus we can do descending induction on this integer. Let $X^{\prime} \rightarrow X$ be the normalized blowing up of $x$ and let $Y^{\prime}$ be the normalization of $X^{\prime} \times_{X} Y$ as above. We will show that if $C$ is the image of some bad curve $C^{\prime} \subset Y^{\prime}$ lying over $x^{\prime} \in X^{\prime}$, then there exists a choice of $a^{\prime}, b^{\prime} \mathcal{O}_{X^{\prime}, x^{\prime}}$ such that $N_{u, a^{\prime}, b^{\prime}}<N_{u, a, b}$. This will finish the proof. Namely, since $X^{\prime} \rightarrow X$ factors through the blowing up, we see that there
exists a nonzero element $d \in \mathfrak{m}_{x^{\prime}}$ such that $a=a^{\prime} d$ and $b=b^{\prime} d$ (namely, take $d$ to be the local equation for the exceptional divisor of the blow up). Since $Y^{\prime} \rightarrow Y$ is an isomorphism over an open containing the generic point of $C$ (seen above) we see that $\mathcal{O}_{Y^{\prime}, C^{\prime}}=\mathcal{O}_{Y, C}$. Hence

$$
\operatorname{ord}_{\mathcal{O}_{Y, C}}(a)=\operatorname{ord}_{\mathcal{O}_{Y^{\prime}, C^{\prime}}}\left(a^{\prime} d\right)=\operatorname{ord}_{\mathcal{O}_{Y^{\prime}, C^{\prime}}}\left(a^{\prime}\right)+\operatorname{ord}_{\mathcal{O}_{Y^{\prime}, C^{\prime}}}(d)>\operatorname{ord}_{\mathcal{O}_{Y^{\prime}, C^{\prime}}}\left(a^{\prime}\right)
$$

Similarly for $b$ and the proof is complete.

### 47.6. Modifying over local rings

0AE1 Let $S$ be a scheme. Let $s_{1}, \ldots, s_{n} \in S$ be pairwise distinct closed points. Assume that the open embedding

$$
U=S \backslash\left\{s_{1}, \ldots, s_{n}\right\} \longrightarrow S
$$

is quasi-compact. Denote $F P_{S,\left\{s_{1}, \ldots, s_{n}\right\}}$ the category of morphisms $f: X \rightarrow S$ of finite presentation which induce an isomorphism $f^{-1}(U) \rightarrow U$. Morphisms are morphisms of schemes over $S$. For each $i$ set $S_{i}=\operatorname{Spec}\left(\mathcal{O}_{S, s_{i}}\right)$ and let $V_{i}=S_{i} \backslash\left\{s_{i}\right\}$. Denote $F P_{S_{i}, s_{i}}$ the category of morphisms $g_{i}: Y_{i} \rightarrow S_{i}$ of finite presentation which induce an isomorphism $g_{i}^{-1}\left(V_{i}\right) \rightarrow V_{i}$. Morphisms are morphisms over $S_{i}$. Base change defines an functor

0BFU (47.6.0.1)

$$
F: F P_{S,\left\{s_{1}, \ldots, s_{n}\right\}} \longrightarrow F P_{S_{1}, s_{1}} \times \ldots \times F P_{S_{n}, s_{n}}
$$

To reduce at least some of the problems in this chapter to the case of local rings we have the following lemma.

0BFV Lemma 47.6.1. The functor $F$ 47.6.0.1. is an equivalence.
Proof. For $n=1$ this is Limits, Lemma 31.15.3. For $n>1$ the lemma can be proved in exactly the same way or it can be deduced from it. For example, suppose that $g_{i}: Y_{i} \rightarrow S_{i}$ are objects of $\mathcal{C}_{S_{i}, S_{i}}$. Then by the case $n=1$ we can find $f_{i}^{\prime}: X_{i}^{\prime} \rightarrow S$ of finite presentation which are isomorphisms over $S \backslash\left\{s_{i}\right\}$ and whose base change to $S_{i}$ is $g_{i}$. Then we can set

$$
f: X=X_{1}^{\prime} \times_{S} \ldots \times_{S} X_{n}^{\prime} \rightarrow S
$$

This is an object of $\mathcal{C}_{S,\left\{s_{1}, \ldots, s_{n}\right\}}$ whose base change by $S_{i} \rightarrow S$ recovers $g_{i}$. Thus the functor is essentially surjective. We omit the proof of fully faithfulness.

0BFW Lemma 47.6.2. Let $S, s_{i}, S_{i}$ be as in 47.6.0.1. If $f: X \rightarrow S$ corresponds to $g_{i}: Y_{i} \rightarrow S_{i}$ under $F$, then $f$ is separated, proper, finite, if and only if $g_{i}$ is so for $i=1, \ldots, n$.

Proof. Follows from Limits, Lemma 31.15.4
0BFX Lemma 47.6.3. Let $S, s_{i}, S_{i}$ be as in 47.6.0.1. If $f: X \rightarrow S$ corresponds to $g_{i}: Y_{i} \rightarrow S_{i}$ under $F$, then $X_{s_{i}} \cong\left(Y_{i}\right)_{s_{i}}$ as schemes over $\kappa\left(s_{i}\right)$.

Proof. This is clear.
0BFY Lemma 47.6.4. Let $S, s_{i}, S_{i}$ be as in 47.6.0.1 and assume $f: X \rightarrow S$ corresponds to $g_{i}: Y_{i} \rightarrow S_{i}$ under $F$. Then there exists a factorization

$$
X=Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow Z_{0}=S
$$

of $f$ where $Z_{j+1} \rightarrow Z_{j}$ is the blowing up of $Z_{j}$ at a closed point $z_{j}$ lying over $\left\{s_{1}, \ldots, s_{n}\right\}$ if and only if for each $i$ there exists a factorization

$$
Y_{i}=Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=S_{i}
$$

of $g_{i}$ where $Z_{i, j+1} \rightarrow Z_{i, j}$ is the blowing up of $Z_{i, j}$ at a closed point $z_{i, j}$ lying over $s_{i}$.

Proof. Let's start with a sequence of blowups $Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow Z_{0}=S$. The first morphism $Z_{1} \rightarrow S$ is given by blowing up one of the $s_{i}$, say $s_{1}$. Applying $F$ to $Z_{1} \rightarrow S$ we find a blow up $Z_{1,1} \rightarrow S_{1}$ at $s_{1}$ is the blowing up at $s_{1}$ and otherwise $Z_{i, 0}=S_{i}$ for $i>1$. In the next step, we either blow up one of the $s_{i}, i \geq 2$ on $Z_{1}$ or we pick a closed point $z_{1}$ of the fibre of $Z_{1} \rightarrow S$ over $s_{1}$. In the first case it is clear what to do and in the second case we use that $\left(Z_{1}\right)_{s_{1}} \cong\left(Z_{1,1}\right)_{s_{1}}$ (Lemma 47.6.3) to get a closed point $z_{1,1} \in Z_{1,1}$ corresponding to $z_{1}$. Then we set $Z_{1,2} \rightarrow Z_{1,1}$ equal to the blowing up in $z_{1,1}$. Continuing in this manner we construct the factorizations of each $g_{i}$.

Conversely, given sequences of blowups $Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=S_{i}$ we construct the sequence of blowing ups of $S$ in exactly the same manner.

Here is the analogue of Lemma 47.6 .4 for normalized blowups.
0BFZ Lemma 47.6.5. Let $S, s_{i}, S_{i}$ be as in 47.6.0.1) and assume $f: X \rightarrow S$ corresponds to $g_{i}: Y_{i} \rightarrow S_{i}$ under $F$. Assume every quasi-compact open of $S$ has finitely many irreducible components. Then there exists a factorization

$$
X=Z_{m} \rightarrow Z_{m-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow Z_{0}=S
$$

of $f$ where $Z_{j+1} \rightarrow Z_{j}$ is the normalized blowing up of $Z_{j}$ at a closed point $z_{j}$ lying over $\left\{x_{1}, \ldots, x_{n}\right\}$ if and only if for each $i$ there exists a factorization

$$
Y_{i}=Z_{i, m_{i}} \rightarrow Z_{i, m_{i}-1} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow Z_{i, 0}=S_{i}
$$

of $g_{i}$ where $Z_{i, j+1} \rightarrow Z_{i, j}$ is the normalized blowing up of $Z_{i, j}$ at a closed point $z_{i, j}$ lying over $s_{i}$.
Proof. The assumption on $S$ is used to assure us (successively) that the schemes we are normalizing have locally finitely many irreducible components so that the statement makes sense. Having said this the lemma follows by the exact same argument as used to prove Lemma 47.6.4.

### 47.7. Vanishing

0AX7 In this section we will often work in the following setting. Recall that a modification is a proper birational morphism between integral schemes (Morphisms, Definition 28.47.11).

0AX8 Situation 47.7.1. Here $(A, \mathfrak{m}, \kappa)$ be a local Noetherian normal domain of dimension 2. Let $s$ be the closed point of $S=\operatorname{Spec}(A)$ and $U=S \backslash\{s\}$. Let $f: X \rightarrow S$ be a modification. We denote $C_{1}, \ldots, C_{r}$ the irreducible components of the special fibre $X_{s}$ of $f$.
By Varieties, Lemma 32.15.3 the morphism $f$ defines an isomorphism $f^{-1}(U) \rightarrow U$. The special fibre $X_{s}$ is proper over $\operatorname{Spec}(\kappa)$ and has dimension at most 1 by Varieties, Lemma 32.16.3. By Stein factorization (More on Morphisms, Lemma 36.38.5) we have $f_{*} \mathcal{O}_{X}=\mathcal{O}_{S}$ and the special fibre $X_{s}$ is geometrically connected over $\kappa$. If $X_{s}$
has dimension 0 , then $f$ is finite (More on Morphisms, Lemma 36.31.5) and hence an isomorphism (Morphisms, Lemma 28.49.5). We will discard this uninteresting case and we conclude that $\operatorname{dim}\left(C_{i}\right)=1$ for $i=1, \ldots, r$.

0B4M Lemma 47.7.2. In Situation 47.7 .1 there exists a $U$-admissible blowup $X^{\prime} \rightarrow S$ which dominates $X$.

Proof. This is a special case of More on Flatness, Lemma 37.29.4.
0AX9 Lemma 47.7.3. In Situation 47.7.1 there exists a nonzero $f \in \mathfrak{m}$ such that for every $i=1, \ldots, r$ there exist
(1) a closed point $x_{i} \in C_{i}$ with $x_{i} \notin C_{j}$ for $j \neq i$,
(2) a factorization $f=g_{i} f_{i}$ of $f$ in $\mathcal{O}_{X, x_{i}}$ such that $g_{i} \in \mathfrak{m}_{x_{i}}$ maps to a nonzero element of $\mathcal{O}_{C_{i}, x_{i}}$.
Proof. We will use the observations made following Situation 47.7.1 without further mention. Pick a closed point $x_{i} \in C_{i}$ which is not in $C_{j}$ for $j \neq i$. Pick $g_{i} \in \mathfrak{m}_{x_{i}}$ which maps to a nonzero element of $\mathcal{O}_{C_{i}, x_{i}}$. Since the fraction field of $A$ is the fraction field of $\mathcal{O}_{X_{i}, x_{i}}$ we can write $g_{i}=a_{i} / b_{i}$ for some $a_{i}, b_{i} \in A$. Take $f=\prod a_{i}$.

0AXA Lemma 47.7.4. In Situation 47.7.1 assume $X$ is normal. Let $Z \subset X$ be a nonempty effective Cartier divisor such that $Z \subset X_{s}$ set theoretically. Then the conormal sheaf of $Z$ is not trivial. More precisely, there exists an $i$ such that $C_{i} \subset Z$ and $\operatorname{deg}\left(\left.\mathcal{C}_{Z / X}\right|_{C_{i}}\right)>0$.
Proof. We will use the observations made following Situation 47.7.1 without further mention. Let $f$ be a function as in Lemma 47.7.3. Let $\xi_{i} \in C_{i}$ be the generic point. Let $\mathcal{O}_{i}$ be the local ring of $X$ at $\xi_{i}$. Then $\mathcal{O}_{i}$ is a discrete valuation ring. Let $e_{i}$ be the valuation of $f$ in $\mathcal{O}_{i}$, so $e_{i}>0$. Let $h_{i} \in \mathcal{O}_{i}$ be a local equation for $Z$ and let $d_{i}$ be its valuation. Then $d_{i} \geq 0$. Choose and fix $i$ with $d_{i} / e_{i}$ maximal (then $d_{i}>0$ as $Z$ is not empty). Replace $f$ by $f^{d_{i}}$ and $Z$ by $e_{i} Z$. This is permissible, by the relation $\mathcal{O}_{X}\left(e_{i} Z\right)=\mathcal{O}_{X}(Z)^{\otimes e_{i}}$, the relation between the conormal sheaf and $\mathcal{O}_{X}(Z)$ (see Divisors, Lemmas 30.11.16 and 30.11.15, and since the degree gets multiplied by $e_{i}$, see Varieties, Lemma 32.33.7. Let $\mathcal{I}$ be the ideal sheaf of $Z$ so that $\mathcal{C}_{Z / X}=\left.\mathcal{I}\right|_{Z}$. Consider the image $\bar{f}$ of $f$ in $\Gamma\left(Z, \mathcal{O}_{Z}\right)$. By our choices above we see that $\bar{f}$ vanishes in the generic points of irreducible compoenents of $Z$ (these are all generic points of $C_{j}$ as $Z$ is contained in the special fibre). On the other hand, $Z$ is $\left(S_{1}\right)$ by Divisors, Lemma 30.12.6. Thus the scheme $Z$ has no embedded associated points and we conclude that $\bar{f}=0$ (Divisors, Lemmas 30.4.3 and 30.5.6. Hence $f$ is a global section of $\mathcal{I}$ which generates $\mathcal{I}_{\xi_{i}}$ by construction. Thus the image $s_{i}$ of $f$ in $\Gamma\left(C_{i},\left.\mathcal{I}\right|_{C_{i}}\right)$ is nonzero. However, our choice of $f$ guarantees that $s_{i}$ has a zero at $x_{i}$. Hence the degree of $\left.\mathcal{I}\right|_{C_{i}}$ is $>0$ by Varieties, Lemma 32.33.10.

0AXB Lemma 47.7.5. In Situation 47.7.1 assume $X$ is normal and $A$ Nagata. The map

$$
H^{1}\left(X, \mathcal{O}_{X}\right) \longrightarrow H^{1}\left(f^{-1}(U), \mathcal{O}_{X}\right)
$$

is injective.
Proof. Let $0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{E} \rightarrow \mathcal{O}_{X} \rightarrow 0$ be the extension corresponding to a nontrivial element $\xi$ of $H^{1}\left(X, \mathcal{O}_{X}\right)$ (Cohomology, Lemma 20.6.1). Let $\pi: P=\mathbf{P}(\mathcal{E}) \rightarrow X$ be the projective bundle associated to $\mathcal{E}$. The surjection $\mathcal{E} \rightarrow \mathcal{O}_{X}$ defines a section
$\sigma: X \rightarrow P$ whose conormal sheaf is isomorphic to $\mathcal{O}_{X}$ (Divisors, Lemma 30.25.4). If the restriction of $\xi$ to $f^{-1}(U)$ is trivial, then we get a map $\left.\mathcal{E}\right|_{f^{-1}(U)} \rightarrow \mathcal{O}_{f^{-1}(U)}$ splitting the injection $\mathcal{O}_{X} \rightarrow \mathcal{E}$. This defines a second section $\sigma^{\prime}: f^{-1}(U) \rightarrow P$ disjoint from $\sigma$. Since $\xi$ is nontrivial we conclude that $\sigma^{\prime}$ cannot extend to all of $X$ and be disjoint from $\sigma$. Let $X^{\prime} \subset P$ be the scheme theoretic image of $\sigma^{\prime}$ (Morphisms, Definition 28.6.2). Picture

The morphism $P \backslash \sigma(X) \rightarrow X$ is affine. If $X^{\prime} \cap \sigma(X)=\emptyset$, then $X^{\prime} \rightarrow X$ is both affine and proper, hence finite (Morphisms, Lemma 28.43.10), hence an isomorphism (as $X$ is normal, see Morphisms, Lemma 28.49.5). This is impossible as mentioned above.

Let $X^{\nu}$ be the normalization of $X^{\prime}$. Since $A$ is Nagata, we see that $X^{\nu} \rightarrow X^{\prime}$ is finite (Morphisms, Lemmas 28.49.7 and 28.18.2). Let $Z \subset X^{\nu}$ be the pullback of the effective Cartier divisor $\sigma(X) \subset P$. By the above we see that $Z$ is not empty and is contained in the closed fibre of $X^{\nu} \rightarrow S$. Since $P \rightarrow X$ is smooth, we see that $\sigma(X)$ is an effective Cartier divisor (Divisors, Lemma 30.19.7). Hence $Z \subset X^{\nu}$ is an effective Cartier divisor too. Since the conormal sheaf of $\sigma(X)$ in $P$ is $\mathcal{O}_{X}$, the conormal sheaf of $Z$ in $X^{\nu}$ (which is a priori invertible) is $\mathcal{O}_{Z}$ by Morphisms, Lemma 28.32.4. This is impossible by Lemma 47.7.4 and the proof is complete.

0AXC Lemma 47.7.6. In Situation 47.7.1 assume $X$ is normal and $A$ Nagata. Then

$$
\operatorname{Hom}_{D(A)}\left(\kappa[-1], R f_{*} \mathcal{O}_{X}\right)
$$

is zero. This uses $D(A)=D_{Q C o h}\left(\mathcal{O}_{S}\right)$ to think of $R f_{*} \mathcal{O}_{X}$ as an object of $D(A)$.
Proof. By adjointness of $R f_{*}$ and $L f^{*}$ such a map is the same thing as a map $\alpha: L f^{*} \kappa[-1] \rightarrow \mathcal{O}_{X}$. Note that

$$
H^{i}\left(L f^{*} \kappa[-1]\right)=\left\{\begin{array}{cc}
0 & \text { if } i>1 \\
\mathcal{O}_{X_{s}} & \text { if } i=1 \\
\text { some } \mathcal{O}_{X_{s}} \text {-module } & \text { if } \quad i \leq 0
\end{array}\right.
$$

Since $\operatorname{Hom}\left(H^{0}\left(L f^{*} \kappa[-1]\right), \mathcal{O}_{X}\right)=0$ as $\mathcal{O}_{X}$ is torsion free, the spectral sequence for Ext (Cohomology on Sites, Example 21.24.1) implies that $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(L f^{*} \kappa[-1], \mathcal{O}_{X}\right)$ is equal to $\operatorname{Ext}_{\mathcal{O}_{X}}^{1}\left(\mathcal{O}_{X_{s}}, \mathcal{O}_{X}\right)$. We conclude that $\alpha: L f^{*} \kappa[-1] \rightarrow \mathcal{O}_{X}$ is given by an extension

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{E} \rightarrow \mathcal{O}_{X_{s}} \rightarrow 0
$$

By Lemma 47.7 .5 the pullback of this extension via the surjection $\mathcal{O}_{X} \rightarrow \mathcal{O}_{X_{s}}$ is zero (since this pullback is clearly split over $f^{-1}(U)$ ). Thus $1 \in \mathcal{O}_{X_{s}}$ lifts to a global section $s$ of $\mathcal{E}$. Multiplying $s$ by the ideal sheaf $\mathcal{I}$ of $X_{s}$ we obtain an $\mathcal{O}_{X}$-module $\operatorname{map} c_{s}: \mathcal{I} \rightarrow \mathcal{O}_{X}$. Applying $f_{*}$ we obtain an $A$-linear map $f_{*} c_{s}: \mathfrak{m} \rightarrow A$. Since $A$ is a Noetherian normal local domain this map is given by multplication by an element $a \in A$. Changing $s$ into $s-a$ we find that $s$ is annihilated by $\mathcal{I}$ and the extension is trivial as desired.

0B4R Remark 47.7.7. Let $X$ be an integral Noetherian normal scheme of dimension 2. In this case the following are equivalent
(1) $X$ has a dualizing complex $\omega_{X}^{\bullet}$,
(2) there is a coherent $\mathcal{O}_{X}$-module $\omega_{X}$ such that $\omega_{X}[n]$ is a dualizing complex, where $n$ can be any integer.
This follows from the fact that $X$ is Cohen-Macaulay (Properties, Lemma 27.12.6) and Dualizing Complexes, Lemma 45.37.3. In this situation we will say that $\omega_{X}$ is a dualizing module in accordance with Dualizing Complexes, Section 45.36. In particular, when $A$ is a Noetherian normal local domain of dimension 2, then we say A has a dualizing module $\omega_{A}$ if the above is true. In this case, if $X \rightarrow \operatorname{Spec}(A)$ is a normal modification, then $X$ has a dualizing module too, see Dualizing Complexes, Example 45.36.1. In this situation we always denote $\omega_{X}$ the dualizing module normalized with respect to $\omega_{A}$, i.e., such that $\omega_{X}[2]$ is the dualizing complex normalized relative to $\omega_{A}[2]$. See Dualizing Complexes, Section 45.35 .

The Grauert-Riemenschneider vanishing of the next proposition is a formal consequence of Lemma 47.7.6 and the general theory of duality.

0AXD Proposition 47.7.8 (Grauert-Riemenschneider). In Situation 47.7.1 assume
(1) $X$ is a normal scheme,
(2) $A$ is Nagata and has a dualizing complex $\omega_{A}^{\bullet}$.

Let $\omega_{X}$ be the dualizing module of $X$ (Remark 47.7.7). Then $R^{1} f_{*} \omega_{X}=0$.
Proof. In this proof we will use the identification $D(A)=D_{Q C o h}\left(\mathcal{O}_{S}\right)$ to identify quasi-coherent $\mathcal{O}_{S}$-modules with $A$-modules. Moreover, we may assume that $\omega_{A}^{\bullet}$ is normalized, see Dualizing Complexes, Section 45.18. Since $X$ is a Noetherian normal 2-dimensional scheme it is Cohen-Macaulay (Properties, Lemma 27.12.6). Thus $\omega_{X}^{\bullet}=\omega_{X}[2]$ (Dualizing Complexes, Lemma 45.37 .3 and the normalization in Dualizing Complexes, Example 45.36.1. If the proposition is false, then we can find a nonzero map $R^{1} f_{*} \omega_{X} \rightarrow \kappa$. In other words we obtain a nonzero map $\alpha: R f_{*} \omega_{X}^{\bullet} \rightarrow \kappa[1]$. Applying $R \operatorname{Hom}_{A}\left(-, \omega_{A}^{\bullet}\right)$ we get a nonzero map

$$
\beta: \kappa[-1] \longrightarrow R f_{*} \mathcal{O}_{X}
$$

which is impossible by Lemma 47.7.6. To see that $R \operatorname{Hom}_{A}\left(-, \omega_{A}^{\bullet}\right)$ does what we said, first note that

$$
R \operatorname{Hom}_{A}\left(\kappa[1], \omega_{A}^{\bullet}\right)=R \operatorname{Hom}_{A}\left(\kappa, \omega_{A}^{\bullet}\right)[-1]=\kappa[-1]
$$

as $\omega_{A}^{\bullet}$ is normalized and we have

$$
R \operatorname{Hom}_{A}\left(R f_{*} \omega_{X}^{\bullet}, \omega_{A}^{\bullet}\right)=R f_{*} R \mathcal{H o m}_{\mathcal{O}_{X}}\left(\omega_{X}^{\bullet}, \omega_{X}^{\bullet}\right)=R f_{*} \mathcal{O}_{X}
$$

The first equality by Dualizing Complexes, Lemma 45.22.11 and the fact that $\omega_{X}^{\bullet}=$ $f^{!} \omega_{A}^{\bullet}$ by construction, and the second equality because $\omega_{X}^{\bullet}$ is a dualizing complex for $X$ (which goes back to Dualizing Complexes, Lemma 45.33.5).

### 47.8. Boundedness

0AXE In this section we begin the discussion which will lead to a reduction to the case of rational singularities for 2-dimensional schemes.

0AXF Lemma 47.8.1. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian normal local domain of dimension 2. Consider a commutative diagram

where $f$ and $f^{\prime}$ are modifications as in Situation 47.7.1 and $X$ normal. Then we have a short exact sequence

$$
0 \rightarrow H^{1}\left(X, \mathcal{O}_{X}\right) \rightarrow H^{1}\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) \rightarrow H^{0}\left(X, R^{1} g_{*} \mathcal{O}_{X^{\prime}}\right) \rightarrow 0
$$

Also $\operatorname{dim}\left(\operatorname{Supp}\left(R^{1} g_{*} \mathcal{O}_{X^{\prime}}\right)\right)=0$ and $R^{1} g_{*} \mathcal{O}_{X^{\prime}}$ is generated by global sections.
Proof. We will use the observations made following Situation 47.7.1 without further mention. As $X$ is normal and $g$ is dominant and birational, we have $g_{*} \mathcal{O}_{X^{\prime}}=$ $\mathcal{O}_{X}$, see for example More on Morphisms, Lemma 36.38.5 Since the fibres of $g$ have dimension $\leq 1$, we have $R^{p} g_{*} \mathcal{O}_{X^{\prime}}=0$ for $p>1$, see for example Cohomology of Schemes, Lemma 29.19.9. The support of $R^{1} g_{*} \mathcal{O}_{X^{\prime}}$ is contained in the set of points of $X$ where the fibres of $g^{\prime}$ have dimension $\geq 1$. Thus it is contained in the set of images of those irreducible components $C^{\prime} \subset X_{s}^{\prime}$ which map to points of $X_{s}$ which is a finite set of closed points (recall that $X_{s}^{\prime} \rightarrow X_{s}$ is a morphism of proper 1-dimensional schemes over $\kappa$ ). Then $R^{1} g_{*} \mathcal{O}_{X^{\prime}}$ is globally generated by Cohomology of Schemes, Lemma 29.9.10. Using the morphism $f: X \rightarrow S$ and the references above we find that $H^{p}(X, \mathcal{F})=0$ for $p>1$ for any coherent $\mathcal{O}_{X}$-module $\mathcal{F}$. Hence the short exact sequence of the lemma is a consequence of the Leray spectral sequence for $g$ and $\mathcal{O}_{X^{\prime}}$, see Cohomology, Lemma 20.14.4.

0AXG Lemma 47.8.2. Let $A$ be a Noetherian local normal domain of dimension 2. For $f \in \mathfrak{m}$ nonzero denote $\operatorname{div}(f)=\sum n_{i}\left(\mathfrak{p}_{i}\right)$ the divisor associated to $f$ on the punctured spectrum of $A$. We set $|f|=\sum n_{i}$. There exist integers $N$ and $M$ such that $|f+g| \leq M$ for all $g \in \mathfrak{m}^{N}$.

Proof. Pick $h \in \mathfrak{m}$ such that $f, h$ is a regular sequence in $A$ (this follows from Algebra, Lemmas 10.149 .4 and 10.71.7). We will prove the lemma with $M=$ length $_{A}(A /(f, h))$ and with $N$ any integer such that $\mathfrak{m}^{N} \subset(f, h)$. Such an integer $N$ exists because $\sqrt{(f, h)}=\mathfrak{m}$. Note that $M=\operatorname{length}_{A}(A /(f+g, h))$ for all $g \in \mathfrak{m}^{N}$ because $(f, h)=(f+g, h)$. This moreover implies that $f+g, h$ is a regular sequence in $A$ too, see Algebra, Lemma 10.103.2. Now suppose that $\operatorname{div}(f+g)=\sum m_{j}\left(\mathfrak{q}_{j}\right)$. Then consider the map

$$
c: A /(f+g) \longrightarrow \prod A / \mathfrak{q}_{j}^{\left(m_{j}\right)}
$$

where $\mathfrak{q}_{j}^{\left(m_{j}\right)}$ is the symbolic power, see Algebra, Section 10.63 . Since $A$ is normal, we see that $A_{\mathfrak{q}_{i}}$ is a discrete valuation ring and hence

$$
A_{\mathfrak{q}_{i}} /(f+g)=A_{\mathfrak{q}_{i}} / \mathfrak{q}_{i}^{m_{i}} A_{\mathfrak{q}_{i}}=\left(A / \mathfrak{q}_{i}^{\left(m_{i}\right)}\right)_{\mathfrak{q}_{i}}
$$

Since $V(f+g, h)=\{\mathfrak{m}\}$ this implies that $c$ becomes an isomorphism on inverting $h$ (small detail omitted). Since $h$ is a nonzerodivisor on $A /(f+g)$ we see that the length of $A /(f+g, h)$ equals the Herbrand quotient $e_{A}(A /(f+g), 0, h)$ as
defined in Chow Homology, Section 41.3). Similarly the length of $A /\left(h, \mathfrak{q}_{j}^{\left(m_{j}\right)}\right)$ equals $e_{A}\left(A / \mathfrak{q}_{j}^{\left(m_{j}\right)}, 0, h\right)$. Then we have

$$
\begin{aligned}
M & =\operatorname{length}_{A}(A /(f+g, h) \\
& =e_{A}(A /(f+g), 0, h) \\
& =\sum_{i} e_{A}\left(A / \mathfrak{q}_{j}^{\left(m_{j}\right)}, 0, h\right) \\
& =\sum_{i} \sum_{m=0, \ldots, m_{j}-1} e_{A}\left(\mathfrak{q}_{j}^{(m)} / \mathfrak{q}_{j}^{(m+1)}, 0, h\right)
\end{aligned}
$$

The equalities follow from Chow Homology, Lemma 41.3.3 using in particular that the cokernel of $c$ has finite length as discussed above. It is straightforward to prove that $e_{A}\left(\mathfrak{q}^{(m)} / \mathfrak{q}^{(m+1)}, 0, h\right)$ is at least 1 by Nakayama's lemma. This finishes the proof of the lemma.
0AXH Lemma 47.8.3. Let $A$ be a Noetherian local normal domain of dimension 2. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ be pairwise distinct primes of height 1 . There exists an element $f \in \mathfrak{p}_{1} \cap \ldots \cap \mathfrak{p}_{r}$ such that $A / f A$ is reduced.
Proof. As a first approximation pick any nonzero $f \in \mathfrak{p}_{1} \cap \ldots \cap \mathfrak{p}_{r}$. Pick integers $N$ and $M$ as in Lemma 47.8.2 adapted to $f$. Write

$$
\operatorname{div}(f)=\sum_{i=1, \ldots, s}\left(\mathfrak{q}_{i}\right)+\sum_{j=1, \ldots, t} m_{j}\left(\mathfrak{r}_{j}\right)
$$

with $m_{j}>1$ and with no equalities among the primes $\mathfrak{q}_{i}$ and $\mathfrak{r}_{j}$ (in other words the set $\left\{\mathfrak{q}_{i}, \mathfrak{r}_{j}\right\}$ has $r+s$ elements). We have $r+\sum m_{j} \leq M$ is bounded among all $f$ in $f+\mathfrak{m}^{N}$ hence we may assume $f \in \mathfrak{p}_{1} \cap \ldots \cap \mathfrak{p}_{r}$ is chosen with $s$ maximal. We claim that $t=0$. If not, then we choose

$$
g \in \mathfrak{m}^{N} \cap \mathfrak{q}_{1}^{2} \cap \ldots \cap \mathfrak{q}_{s}^{2} \cap \mathfrak{r}_{1} \cap \ldots \cap \mathfrak{r}_{t} \quad \text { and } \quad g \notin \mathfrak{r}_{1}^{2} \cup \ldots \cup \mathfrak{r}_{t}^{2}
$$

First choose $g_{0} \in \mathfrak{m}^{N}, g_{i} \in \mathfrak{q}_{i}$ and $g_{i}^{\prime} \in \mathfrak{r}_{i}$ and each not contained in any other of the primes (using prime avoidance Algebra, Lemma 10.14.2) and then take $g=$ $g_{0} g_{1}^{2} \ldots g_{s}^{2} g_{1}^{\prime} \ldots g_{t}^{\prime}$. Observe that $g \in \mathfrak{p}_{1} \cap \ldots \cap \mathfrak{p}_{r}$ as $\left\{\mathfrak{p}_{i}\right\} \subset\left\{\mathfrak{q}_{i}, \mathfrak{r}_{j}\right\}$. Now we note that

$$
\operatorname{div}(f+g)=\sum_{i=1, \ldots, s}\left(\mathfrak{q}_{i}\right)+\sum_{j=1, \ldots, t}\left(\mathfrak{r}_{j}\right)+\sum e_{k}\left(\mathfrak{s}_{k}\right)
$$

for some height one primes $\mathfrak{s}_{k} \notin\left\{\mathfrak{p}_{i}, \mathfrak{q}_{j}, \mathfrak{r}_{i}\right\}$. This is a contradiction with maximality of $s$ unless $t=0$ which is what we wanted to show.
0AXI Lemma 47.8.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian normal local domain of dimension 2. If $a \in \mathfrak{m}$ is nonzero, then there exists an element $c \in A$ such that $A / c A$ is reduced and such that a divides $c^{n}$ for some $n$.

Proof. Let $\operatorname{div}(a)=\sum_{i=1, \ldots, r} n_{i}\left(\mathfrak{p}_{i}\right)$. Choose $c \in \mathfrak{p}_{1} \cap \ldots \cap \mathfrak{p}_{r}$ with $A / c A$ reduced, see Lemma 47.8.3. For $n \geq \max \left(n_{i}\right)$ we see that $-\operatorname{div}(a)+\operatorname{div}\left(c^{n}\right)$ is an effective divisor (all coefficients nonnegative). Thus $c^{n} / a \in A$ by Algebra, Lemma 10.149.6.

0AXJ Lemma 47.8.5. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2. Let $a \in A$ be nonzero. There exists an integer $N$ such that for every modification $f: X \rightarrow \operatorname{Spec}(A)$ with $X$ normal the $A$-module

$$
M_{X, a}=\operatorname{Coker}\left(A \longrightarrow H^{0}\left(Z, \mathcal{O}_{Z}\right)\right)
$$

where $Z \subset X$ is cut out by a has length bounded by $N$.

Proof. By the short exact sequence $0 \rightarrow \mathcal{O}_{X} \xrightarrow{a} \mathcal{O}_{X} \rightarrow \mathcal{O}_{Z} \rightarrow 0$ we see that
0AXK

$$
\begin{equation*}
M_{X, a}=H^{1}\left(X, \mathcal{O}_{X}\right)[a] \tag{47.8.5.1}
\end{equation*}
$$

Here $N[a]=\{n \in N \mid a n=0\}$ for an $A$-module $N$. Thus if $a$ divides $b$, then $M_{X, a} \subset M_{X, b}$. Suppose that for some $c \in A$ the modules $M_{X, c}$ have bounded length. Then for every $X$ we have an exact sequence

$$
0 \rightarrow M_{X, c} \rightarrow M_{X, c^{2}} \rightarrow M_{X, c}
$$

where the second arrow is given by multiplication by $c$. Hence we see that $M_{X, c^{2}}$ has bounded length as well. Thus it suffices to find a $c \in A$ for which the lemma is true such that $a$ divides $c^{n}$ for some $n>0$. By Lemma 47.8.4 we may assume $A /(a)$ is a reduced ring.

Assume that $A /(a)$ is reduced. Let $A /(a) \subset B$ be the normalization of $A /(a)$ in its quotient ring. Because $A$ is Nagata, we see that $\operatorname{Coker}(A \rightarrow B)$ is finite. We claim the length of this finite module is a bound. To see this, consider $f: X \rightarrow \operatorname{Spec}(A)$ as in the lemma and let $Z^{\prime} \subset Z$ be the scheme theoretic closure of $Z \cap f^{-1}(U)$. Then $Z^{\prime} \rightarrow \operatorname{Spec}(A /(a))$ is finite for example by Varieties, Lemma 32.15.2. Hence $Z^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ with $A /(a) \subset B^{\prime} \subset B$. On the other hand, we claim the map

$$
H^{0}\left(Z, \mathcal{O}_{Z}\right) \rightarrow H^{0}\left(Z^{\prime}, \mathcal{O}_{Z^{\prime}}\right)
$$

is injective. Namely, if $s \in H^{0}\left(Z, \mathcal{O}_{Z}\right)$ is in the kernel, then the restriction of $s$ to $f^{-1}(U) \cap Z$ is zero. Hence the image of $s$ in $H^{1}\left(X, \mathcal{O}_{X}\right)$ vanishes in $H^{1}\left(f^{-1}(U), \mathcal{O}_{X}\right)$. By Lemma 47.7.5 we see that $s$ comes from an element $\tilde{s}$ of $A$. But by assumption $\tilde{s}$ maps to zero in $B^{\prime}$ which implies that $s=0$. Putting everything together we see that $M_{X, a}$ is a subquotient of $B^{\prime} / A$, namely not every element of $B^{\prime}$ extends to a global section of $\mathcal{O}_{Z}$, but in any case the length of $M_{X, a}$ is bounded by the length of $B / A$.

In some cases, resolution of singularities reduces to the case of rational singularities.
0B4N Definition 47.8.6. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2.
(1) We say $A$ defines a rational singularity if for every normal modification $X \rightarrow \operatorname{Spec}(A)$ we have $H^{1}\left(X, \mathcal{O}_{X}\right)=0$.
(2) We say that reduction to rational singularities is possible for $A$ if the length of the $A$-modules

$$
H^{1}\left(X, \mathcal{O}_{X}\right)
$$

is bounded for all modifications $X \rightarrow \operatorname{Spec}(A)$ with $X$ normal.
The meaning of the language in (2) is explained by Lemma 47.8.8. The following lemma says roughly speaking that local rings of modifcations of $\operatorname{Spec}(A)$ with $A$ defining a rational singularity also define rational singularities.

0BG0 Lemma 47.8.7. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2 which defines a rational singularity. Let $A \subset B$ be a local extension of domains with the same fraction field which is essentially of finite type such that $\operatorname{dim}(B)=2$ and $B$ normal. Then $B$ defines a rational singularity.

Proof. Choose a finite type $A$-algebra $C$ such that $B=C_{\mathfrak{q}}$ for some prime $\mathfrak{q} \subset C$. After replacing $C$ by the image of $C$ in $B$ we may assume that $C$ is a domain with fraction field equal to the fraction field of $A$. Then we can choose a closed immersion $\operatorname{Spec}(C) \rightarrow \mathbf{A}_{A}^{n}$ and take the closure in $\mathbf{P}_{A}^{n}$ to conclude that $B$ is isomorphic to $\mathcal{O}_{X, x}$ for some closed point $x \in X$ of a projective modification $X \rightarrow \operatorname{Spec}(A)$. (Morphisms, Lemma 28.30.1, shows that $\kappa(x)$ is finite over $\kappa$ and then Morphisms, Lemma 28.20 .2 shows that $x$ is a closed point.) Let $\nu: X^{\nu} \rightarrow X$ be the normalization. Since $A$ is Nagata the morphism $\nu$ is finite (Morphisms, Lemma 28.49.7). Thus $X^{\nu}$ is projective over $A$ by More on Morphisms, Lemma 36.36.2 Since $B=\mathcal{O}_{X, x}$ is normal, we see that $\mathcal{O}_{X, x}=\left(\nu_{*} \mathcal{O}_{X^{\nu}}\right)_{x}$. Hence there is a unique point $x^{\nu} \in X^{\nu}$ lying over $x$ and $\mathcal{O}_{X^{\nu}, x^{\nu}}=\mathcal{O}_{X, x}$. Thus we may assume $X$ is normal and projective over $A$. Let $Y \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)=\operatorname{Spec}(B)$ be a modification with $Y$ normal. We have to show that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$. By Limits, Lemma 31.15.3 we can find a morphism of schemes $g: X^{\prime} \rightarrow X$ which is an isomorphism over $X \backslash\{x\}$ such that $X^{\prime} \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ is isomorphic to $Y$. Then $g$ is a modification as it is proper by Limits, Lemma 31.15.4. The local ring of $X^{\prime}$ at a point of $x^{\prime}$ is either isomorphic to the local ring of $X$ at $g\left(x^{\prime}\right)$ if $g\left(x^{\prime}\right) \neq x$ and if $g\left(x^{\prime}\right)=x$, then the local ring of $X^{\prime}$ at $x^{\prime}$ is isomorphic to the local ring of $Y$ at the corresponding point. Hence we see that $X^{\prime}$ is normal as both $X$ and $Y$ are normal. Thus $H^{1}\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)=0$ by our assumption on $A$. By Lemma 47.8.1 we have $R^{1} g_{*} \mathcal{O}_{X^{\prime}}=0$. Clearly this means that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$ as desired.

0B4P Lemma 47.8.8. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2. If reduction to rational singularities is possible for $A$, then there exists a finite sequence of normalized blowups

$$
X=X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=\operatorname{Spec}(A)
$$

in closed points such that for any closed point $x \in X$ the local ring $\mathcal{O}_{X, x}$ defines a rational singularity. In particular $X \rightarrow \operatorname{Spec}(A)$ is a modification and $X$ is a normal scheme projective over $A$.

Proof. We choose a modification $X \rightarrow \operatorname{Spec}(A)$ with $X$ normal which maximizes the length of $H^{1}\left(X, \mathcal{O}_{X}\right)$. By Lemma 47.8.1 for any further modification $g: X^{\prime} \rightarrow$ $X$ with $X^{\prime}$ normal we have $R^{1} g_{*} \mathcal{O}_{X^{\prime}}=0$ and $H^{1}\left(X, \mathcal{O}_{X}\right)=H^{1}\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$.

Let $x \in X$ be a closed point. We will show that $\mathcal{O}_{X, x}$ defines a rational singularity. Let $Y \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ be a modification with $Y$ normal. We have to show that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$. By Limits, Lemma 31.15 .3 we can find a morphism of schemes $g: X^{\prime} \rightarrow X$ which is an isomorphism over $X \backslash\{x\}$ such that $X^{\prime} \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ is isomorphic to $Y$. Then $g$ is a modification as it is proper by Limits, Lemma 31.15.4. The local ring of $X^{\prime}$ at a point of $x^{\prime}$ is either isomorphic to the local ring of $X$ at $g\left(x^{\prime}\right)$ if $g\left(x^{\prime}\right) \neq x$ and if $g\left(x^{\prime}\right)=x$, then the local ring of $X^{\prime}$ at $x^{\prime}$ is isomorphic to the local ring of $Y$ at the corresponding point. Hence we see that $X^{\prime}$ is normal as both $X$ and $Y$ are normal. By maximality we have $R^{1} g_{*} \mathcal{O}_{X^{\prime}}=0$ (see first paragraph). Clearly this means that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$ as desired.

The conclusion is that we've found one normal modification $X$ of $\operatorname{Spec}(A)$ such that the local rings of $X$ at closed points all define rational singularities. Then we choose a sequence of normalized blowups $X_{n} \rightarrow \ldots \rightarrow X_{1} \rightarrow \operatorname{Spec}(A)$ such that $X_{n}$ dominates $X$, see Lemma 47.5.3. For a closed point $x^{\prime} \in X_{n}$ mapping to $x \in X$ we
can apply Lemma 47.8 .7 to the ring map $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X_{n}, x^{\prime}}$ to see that $\mathcal{O}_{X_{n}, x^{\prime}}$ defines a rational singularity.

0AXL Lemma 47.8.9. Let $A \rightarrow B$ be a finite injective local ring map of local normal Nagata domains of dimension 2. Assume that the induced extension of fraction fields is separable. If reduction to rational singularities is possible for $A$ then it is possible for $B$.

Proof. Let $n$ be the degree of the fraction field extension $K \subset L$. Let $\operatorname{Trace}_{L / K}$ : $L \rightarrow K$ be the trace. Since the extension is finite separable the trace pairing $(h, g) \mapsto \operatorname{Trace}_{L / K}(f g)$ is a nondegenerate quadratic form on $L$ over $K$. See Fields, Lemma 9.19.7. Pick $b_{1}, \ldots, b_{n} \in B$ which form a basis of $L$ over $K$. By the above $d=\operatorname{det}\left(\operatorname{Trace}_{L / K}\left(b_{i} b_{j}\right)\right) \in A$ is nonzero.

Let $Y \rightarrow \operatorname{Spec}(B)$ be a modification with $Y$ normal. We can find a $U$-admissible blow up $X^{\prime}$ of $\operatorname{Spec}(A)$ such that the strict transform $Y^{\prime}$ of $Y$ is finite over $X^{\prime}$, see More on Flatness, Lemma 37.29.2 Picture

After replacing $X^{\prime}$ and $Y^{\prime}$ by their normalizations we may assume that $X^{\prime}$ and $Y^{\prime}$ are normal modifications of $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$. In this way we reduce to the case where there exists a commutative diagram

with $X$ and $Y$ normal modifications of $\operatorname{Spec}(A)$ and $\operatorname{Spec}(B)$ and $\pi$ finite.
The trace map on $L$ over $K$ extends to a map of $\mathcal{O}_{X}$-modules Trace : $\pi_{*} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$. Consider the map

$$
\Phi: \pi_{*} \mathcal{O}_{Y} \longrightarrow \mathcal{O}_{X}^{\oplus n}, \quad s \longmapsto\left(\operatorname{Trace}\left(b_{1} s\right), \ldots, \operatorname{Trace}\left(b_{n} s\right)\right)
$$

This map is injective (because it is injective in the generic point) and there is a map

$$
\mathcal{O}_{X}^{\oplus n} \longrightarrow \pi_{*} \mathcal{O}_{Y}, \quad\left(s_{1}, \ldots, s_{n}\right) \longmapsto \sum b_{i} s_{i}
$$

whose composition with $\Phi$ has matrix $\operatorname{Trace}\left(b_{i} b_{j}\right)$. Hence the cokernel of $\Phi$ is annihilated by $d$. Thus we see that we have an exact sequence

$$
H^{0}(X, \operatorname{Coker}(\Phi)) \rightarrow H^{1}\left(Y, \mathcal{O}_{Y}\right) \rightarrow H^{1}\left(X, \mathcal{O}_{X}\right)^{\oplus n}
$$

Since the right hand side is bounded by assumption, it suffices to show that the $d$-torsion in $H^{1}\left(Y, \mathcal{O}_{Y}\right)$ is bounded. This is the content of Lemma 47.8 .5 and (47.8.5.1).

0B4Q Lemma 47.8.10. Let $A$ be a Nagata regular local ring of dimension 2. Then $A$ defines a rational singularity.

Proof. (The assumption that $A$ be Nagata is not necessary for this proof, but we've only defined the notion of rational singularity in the case of Nagata 2-dimensional normal local domains.) Let $X \rightarrow \operatorname{Spec}(A)$ be a modification with $X$ normal. By Lemma 47.4.2 we can dominate $X$ by a scheme $X_{n}$ which is the last in a sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=\operatorname{Spec}(A)
$$

of blowing ups in closed points. By Lemma 47.3 .2 the schemes $X_{i}$ are regular, in particular normal (Algebra, Lemma 10.149.5). By Lemma 47.8.1 we have $H^{1}\left(X, \mathcal{O}_{X}\right) \subset H^{1}\left(X_{n}, \mathcal{O}_{X_{n}}\right)$. Thus it suffices to prove $H^{1}\left(X_{n}, \mathcal{O}_{X_{n}}\right)=0$. Using Lemma 47.8.1 again, we see that it suffices to prove $R^{1}\left(X_{i} \rightarrow X_{i-1}\right)_{*} \mathcal{O}_{X_{i}}=0$ for $i=1, \ldots, n$. This follows from Lemma 47.3.3.

0B4S Lemma 47.8.11. Let $A$ be a local normal Nagata domain of dimension 2 which has a dualizing complex $\omega_{A}^{\bullet}$. If there exists a nonzero $d \in A$ such that for all normal modifications $X \rightarrow \operatorname{Spec}(A)$ the cokernel of the trace map

$$
\Gamma\left(X, \omega_{X}\right) \rightarrow \omega_{A}
$$

is annihilated by $d$, then reduction to rational singularities is possible for $A$.
Proof. For $X \rightarrow \operatorname{Spec}(A)$ as in the statement we have to bound $H^{1}\left(X, \mathcal{O}_{X}\right)$. Let $\omega_{X}$ be the dualizing module of $X$ as in the statement of Grauert-Riemenschneider (Proposition 47.7.8). The trace map is the map $R f_{*} \omega_{X} \rightarrow \omega_{A}$ described in Dualizing Complexes, Section 45.24. By Grauert-Riemenschneider we have $R f_{*} \omega_{X}=$ $f_{*} \omega_{X}$ thus the trace map indeed produces a map $\Gamma\left(X, \omega_{X}\right) \rightarrow \omega_{A}$. By duality we have $R f_{*} \omega_{X}=R \operatorname{Hom}_{A}\left(R f_{*} \mathcal{O}_{X}, \omega_{A}\right)$ (this uses that $\omega_{X}[2]$ is the dualizing complex on $X$ normalized relative to $\omega_{A}[2]$, see Dualizing Complexes, Lemma 45.35.8 or more directly Section 45.34 or even more directly Lemma 45.22.11). The distinguished triangle

$$
A \rightarrow R f_{*} \mathcal{O}_{X} \rightarrow R^{1} f_{*} \mathcal{O}_{X}[-1] \rightarrow A[1]
$$

is transformed by $R \operatorname{Hom}_{A}\left(-, \omega_{A}\right)$ into the short exact sequence

$$
0 \rightarrow f_{*} \omega_{X} \rightarrow \omega_{A} \rightarrow \operatorname{Ext}_{A}^{2}\left(R^{1} f_{*} \mathcal{O}_{X}, \omega_{A}\right) \rightarrow 0
$$

(and $\operatorname{Ext}_{A}^{i}\left(R^{1} f_{*} \mathcal{O}_{X}, \omega_{A}\right)=0$ for $i \neq 2$; this will follow from the discussion below as well). Since $R^{1} f_{*} \mathcal{O}_{X}$ is supported in $\{\mathfrak{m}\}$, the local duality theorem tells us that

$$
\operatorname{Ext}_{A}^{2}\left(R^{1} f_{*} \mathcal{O}_{X}, \omega_{A}\right)=\operatorname{Ext}_{A}^{0}\left(R^{1} f_{*} \mathcal{O}_{X}, \omega_{A}[2]\right)=\operatorname{Hom}_{A}\left(R^{1} f_{*} \mathcal{O}_{X}, E\right)
$$

is the Matlis dual of $R^{1} f_{*} \mathcal{O}_{X}$ (and the other ext groups are zero), see Dualizing Complexes, Lemma 45.20.4. By the equivalence of categories inherent in Matlis duality (Dualizing Complexes, Proposition 45.7.8), if $R^{1} f_{*} \mathcal{O}_{X}$ is not annihilated by $d$, then neither is the Ext ${ }^{2}$ above. Hence we see that $H^{1}\left(X, \mathcal{O}_{X}\right)$ is annihilated by $d$. Thus the required boundedness follows from Lemma 47.8.5 and 47.8.5.1.

0B4T Lemma 47.8.12. Let $p$ be a prime number. Let $A$ be a regular local ring of dimension 2 and characteristic $p$. Let $A_{0} \subset A$ be a subring such that $\Omega_{A / A_{0}}$ is free of rank $r<\infty$. Set $\omega_{A}=\Omega_{A / A_{0}}^{r}$. If $X \rightarrow \operatorname{Spec}(A)$ is the result of a sequence of blowups in closed points, then there exists a map

$$
\varphi_{X}:\left(\Omega_{X / \operatorname{Spec}\left(A_{0}\right)}^{r}\right)^{* *} \longrightarrow \omega_{X}
$$

extending the given identification in the generic point.

Proof. Observe that $A$ is Gorenstein (Dualizing Complexes, Lemma 45.38.3) and hence the invertible module $\omega_{A}$ does indeed serve as a dualizing module. Moreover, any $X$ as in the lemma has an invertible dualizing module $\omega_{X}$ as $X$ is regular (hence Gorenstein) and proper over $A$, see Remark 47.7.7 and Lemma 47.3.2. Suppose we have constructed the map $\varphi_{X}:\left(\Omega_{X / A_{0}}^{r}\right)^{* *} \rightarrow \omega_{X}$ and suppose that $b: X^{\prime} \rightarrow X$ is a blow up in a closed point. Set $\Omega_{X}^{r}=\left(\Omega_{X / A_{0}}^{r}\right)^{* *}$ and $\Omega_{X^{\prime}}^{r}=\left(\Omega_{X^{\prime} / A_{0}}^{r}\right)^{* *}$. Since $\omega_{X^{\prime}}=b^{!}\left(\omega_{X}\right)$ a map $\Omega_{X^{\prime}}^{r} \rightarrow \omega_{X^{\prime}}$ is the same thing as a map $R b_{*}\left(\Omega_{X^{\prime}}^{r}\right) \rightarrow \omega_{X}$. See discussion in Remark 47.7.7 and Dualizing Complexes, Section 45.34. Thus in turn it suffices to produce a map

$$
R b_{*}\left(\Omega_{X^{\prime}}^{r}\right) \longrightarrow \Omega_{X}^{r}
$$

The sheaves $\Omega_{X^{\prime}}^{r}$ and $\Omega_{X}^{r}$ are invertible, see Divisors, Lemma 30.10.10 Consider the exact sequence

$$
b^{*} \Omega_{X / A_{0}} \rightarrow \Omega_{X^{\prime} / A_{0}} \rightarrow \Omega_{X^{\prime} / X} \rightarrow 0
$$

A local calculation shows that $\Omega_{X^{\prime} / X}$ is isomorphic to an invertible module on the exceptional divisor $E$, see Lemma 47.3.5. It follows that either

$$
\Omega_{X^{\prime}}^{r} \cong\left(b^{*} \Omega_{X}^{r}\right)(E) \quad \text { or } \quad \Omega_{X^{\prime}}^{r} \cong b^{*} \Omega_{X}^{r}
$$

see Divisors, Lemma 30.12.11. (The second possibility never happens in characteristic zero, but can happen in characteristic $p$.) In both cases we see that $R^{1} b_{*}\left(\Omega_{X^{\prime}}^{r}\right)=0$ and $b_{*}\left(\Omega_{X^{\prime}}^{r}\right)=\Omega_{X}^{r}$ by Lemma 47.3.3.
0B4U Lemma 47.8.13. Let $p$ be a prime number. Let $A$ be a complete regular local ring of dimension 2 and characteristic $p$. Let $K=f . f .(A) \subset L$ be a degree $p$ inseparable extension and let $B \subset L$ be the integral closure of $A$. Then reduction to rational singularities is possible for $B$.

Proof. We have $A=k[[x, y]]$. Write $L=K[x] /\left(x^{p}-f\right)$ for some $f \in A$ and denote $g \in B$ the congruence class of $x$, i.e., the element such that $g^{p}=f$. By More on Algebra, Lemma 15.37 .5 there exists a subfield $k^{p} \subset k^{\prime} \subset k$ with $p^{e}=\left[k: k^{\prime}\right]<\infty$ such that $f$ is not contained in the fraction field $K_{0}$ of $A_{0}=k^{\prime}\left[\left[x^{p}, y^{p}\right]\right] \subset A$. Then

$$
\Omega_{A / A_{0}}=A \otimes_{k} \Omega_{k / k^{\prime}} \oplus A \mathrm{~d} x \oplus A \mathrm{~d} y
$$

is finite free of rank $e+2$. Set $\omega_{A}=\Omega_{A / A_{0}}^{e+2}$. Consider the canonical map

$$
\operatorname{Tr}: \Omega_{B / A_{0}}^{e+2} \longrightarrow \Omega_{A / A_{0}}^{e+2}=\omega_{A}
$$

of Lemma 47.2.3. By duality this determines a map

$$
c: \Omega_{B / A_{0}}^{e+2} \rightarrow \omega_{B}=\operatorname{Hom}_{A}\left(B, \omega_{A}\right)
$$

Claim: the cokernel of $c$ is annilated by a nonzero element of $B$.
Since $\mathrm{d} f$ is nonzero in $\Omega_{A / A_{0}}$ (Algebra, Lemma 10.150 .2 we can find $\eta_{1}, \ldots, \eta_{e+1} \in$ $\Omega_{A / A_{0}}$ such that $\theta=\eta_{1} \wedge \ldots \wedge \eta_{e+1} \wedge \mathrm{~d} f$ is nonzero in $\omega_{A}=\Omega_{A / A_{0}}^{e+2}$. To prove the claim we will construct elements $\omega_{i}$ of $\Omega_{B / A_{0}}^{e+2}, i=0, \ldots, p-1$ which are mapped to $\varphi_{i} \in$ $\omega_{B}=\operatorname{Hom}_{A}\left(B, \omega_{A}\right)$ with $\varphi_{i}\left(g^{j}\right)=\delta_{i j} \theta$ for $j=0, \ldots, p-1$. Since $\left\{1, g, \ldots, g^{p-1}\right\}$ is a basis for $L / K$ this proves the claim. We set $\eta=\eta_{1} \wedge \ldots \wedge \eta_{e+1}$ so that $\theta=\eta \wedge \mathrm{d} f$. Set $\omega_{i}=\eta \wedge g^{p-1-i} \mathrm{~d} g$. Then by construction we have

$$
\varphi_{i}\left(g^{j}\right)=\operatorname{Tr}\left(g^{j} \eta \wedge g^{p-1-i} \mathrm{~d} g\right)=\operatorname{Tr}\left(\eta \wedge g^{p-1-i+j} \mathrm{~d} g\right)=\delta_{i j} \theta
$$

by the explicit description of the trace map in Lemma 47.2.2.

Let $Y \rightarrow \operatorname{Spec}(B)$ be a normal modification. Exactly as in the proof of Lemma 47.8 .9 we can reduce to the case where $Y$ is finite over a modification $X$ of $\operatorname{Spec}(A)$. Arguing as in the proof of Lemma 47.8 .10 we may even assume that $X=X_{n}$ where

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=X
$$

is a sequence of blowing ups in closed points. By Lemma 47.2 .3 we obtain the first arrow in

$$
\pi_{*}\left(\Omega_{Y / A_{0}}^{e+2}\right) \xrightarrow{\operatorname{Tr}}\left(\Omega_{X / A_{0}}^{e+2}\right)^{* *} \xrightarrow{\varphi_{X}} \omega_{X}
$$

and the second arrow is from Lemma 47.8.12. By duality this corresponds to a map

$$
c_{Y}: \Omega_{Y / A_{0}}^{e+2} \longrightarrow \omega_{Y}
$$

extending the map $c$ above. Hence we see that the image of $\Gamma\left(Y, \omega_{Y}\right) \rightarrow \omega_{B}$ contains the image of $c$. By our claim we see that the cokernel is annihilated by a fixed nonzero element of $B$. We conclude by Lemma 47.8.11.

### 47.9. Rational singularities

0B4V In this section we reduce from rational singular points to Gorenstein rational singular points. See Lip69 and Mat70b.

0B4W Situation 47.9.1. Here $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2 which defines a rational singularity. Let $s$ be the closed point of $S=\operatorname{Spec}(A)$ and $U=S \backslash\{s\}$. Let $f: X \rightarrow S$ be a modification with $X$ normal. We denote $C_{1}, \ldots, C_{r}$ the irreducible components of the special fibre $X_{s}$ of $f$.

0B4X Lemma 47.9.2. In Situation 47.9.1. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then
(1) $H^{p}(X, \mathcal{F})=0$ for $p \notin\{0,1\}$, and
(2) $H^{1}(X, \mathcal{F})=0$ if $\mathcal{F}$ is globally generated.

Proof. Part (1) follows from Cohomology of Schemes, Lemma 29.19.9. If $\mathcal{F}$ is globally generated, then there is a surjection $\bigoplus_{i \in I} \mathcal{O}_{X} \rightarrow \mathcal{F}$. By part (1) and the long exact sequence of cohomology this induces a surjection on $H^{1}$. Since $H^{1}\left(X, \mathcal{O}_{X}\right)=0$ as $S$ has a rational singularity, and since $H^{1}(X,-)$ commutes with direct sums (Cohomology, Lemma 20.20.1) we conclude.

0B4Y Lemma 47.9.3. In Situation 47.9 .1 assume $E=X_{s}$ is an effective Cartier divisor. Let $\mathcal{I}$ be the ideal sheaf of $E$. Then $H^{0}\left(X, \mathcal{I}^{n}\right)=\mathfrak{m}^{n}$ and $H^{1}\left(X, \mathcal{I}^{n}\right)=0$.

Proof. We have $H^{0}\left(X, \mathcal{O}_{X}\right)=A$, see discussion following Situation 47.7.1 Then $\mathfrak{m} \subset H^{0}(X, \mathcal{I}) \subset H^{0}\left(X, \mathcal{O}_{X}\right)$. The second inclusion is not an equality as $X_{s} \neq \emptyset$. Thus $H^{0}(X, \mathcal{I})=\mathfrak{m}$. As $\mathcal{I}^{n}=\mathfrak{m}^{n} \mathcal{O}_{X}$ our Lemma 47.9.2 shows that $H^{1}\left(X, \mathcal{I}^{n}\right)=0$.

Choose generators $x_{1}, \ldots, x_{\mu+1}$ of $\mathfrak{m}$. These define global sections of $\mathcal{I}$ which generate it. Hence a short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{O}_{X}^{\oplus \mu+1} \rightarrow \mathcal{I} \rightarrow 0
$$

Then $\mathcal{F}$ is a finite locally free $\mathcal{O}_{X}$-module of rank $\mu$ and $\mathcal{F} \otimes \mathcal{I}$ is globally generated by Constructions, Lemma 26.13.8. Hence $\mathcal{F} \otimes \mathcal{I}^{n}$ is globally generated for all $n \geq 1$. Thus for $n \geq 2$ we can consider the exact sequence

$$
0 \rightarrow \mathcal{F} \otimes \mathcal{I}^{n-1} \rightarrow\left(\mathcal{I}^{n-1}\right)^{\oplus \mu+1} \rightarrow \mathcal{I}^{n} \rightarrow 0
$$

Applying the long exact sequence of cohomology using that $H^{1}\left(X, \mathcal{F} \otimes \mathcal{I}^{n-1}\right)=0$ by Lemma 47.9 .2 we obtain that every element of $H^{0}\left(X, \mathcal{I}^{n}\right)$ is of the form $\sum x_{i} a_{i}$ for some $a_{i} \in H^{0}\left(X, \mathcal{I}^{n-1}\right)$. This shows that $H^{0}\left(X, \mathcal{I}^{n}\right)=\mathfrak{m}^{n}$ by induction.
0B4Z Lemma 47.9.4. In Situation 47.9.1 the blow up of $\operatorname{Spec}(A)$ in $\mathfrak{m}$ is normal.
Proof. Let $X^{\prime} \rightarrow \operatorname{Spec}(A)$ be the blow up, in other words

$$
X^{\prime}=\operatorname{Proj}\left(A \oplus \mathfrak{m} \oplus \mathfrak{m}^{2} \oplus \ldots\right)
$$

is the Proj of the Rees algebra. This in particular shows that $X^{\prime}$ is integral and that $X^{\prime} \rightarrow \operatorname{Spec}(A)$ is a projective modification. Let $X$ be the normalization of $X^{\prime}$. Since $A$ is Nagata, we see that $\nu: X \rightarrow X^{\prime}$ is finite (Morphisms, Lemma 28.49.7). Let $E^{\prime} \subset X^{\prime}$ be the exceptional divisor and let $E \subset X$ be the inverse image. Let $\mathcal{I}^{\prime} \subset \mathcal{O}_{X^{\prime}}$ and $\mathcal{I} \subset \mathcal{O}_{X}$ be their ideal sheaves. Recall that $\mathcal{I}^{\prime}=\mathcal{O}_{X^{\prime}}(1)$ (Divisors, Lemma 30.26.13. Observe that $\mathcal{I}=\nu^{*} \mathcal{I}^{\prime}$ and that $E$ is an effective Cartier divisor (Divisors, Lemma 30.11.12). We are trying to show that $\nu$ is an isomorphism. As $\nu$ is finite, it suffices to show that $\mathcal{O}_{X^{\prime}} \rightarrow \nu_{*} \mathcal{O}_{X}$ is an isomorphism. If not, then we can find an $n \geq 0$ such that

$$
H^{0}\left(X^{\prime},\left(\mathcal{I}^{\prime}\right)^{n}\right) \neq H^{0}\left(X^{\prime},\left(\nu_{*} \mathcal{O}_{X}\right) \otimes\left(\mathcal{I}^{\prime}\right)^{n}\right)
$$

for example because we can recover quasi-coherent $\mathcal{O}_{X^{\prime}}$-modules from their associated graded modules, see Properties, Lemma 27.28.3. By the projection formula we have

$$
H^{0}\left(X^{\prime},\left(\nu_{*} \mathcal{O}_{X}\right) \otimes\left(\mathcal{I}^{\prime}\right)^{n}\right)=H^{0}\left(X, \nu^{*}\left(\mathcal{I}^{\prime}\right)^{n}\right)=H^{0}\left(X, \mathcal{I}^{n}\right)=\mathfrak{m}^{n}
$$

the last equality by Lemma 47.9.3. On the other hand, there is clearly an injection $\mathfrak{m}^{n} \rightarrow H^{0}\left(X^{\prime},\left(\mathcal{I}^{\prime}\right)^{n}\right)$. Since $H^{0}\left(X^{\prime},\left(\mathcal{I}^{\prime}\right)^{n}\right)$ is torsion free we conclude equality holds for all $n$, hence $X=X^{\prime}$.

0B63 Lemma 47.9.5. In Situation 47.9.1. Let $X$ be the blow up of $\operatorname{Spec}(A)$ in $\mathfrak{m}$. Let $E \subset X$ be the exceptional divisor. With $\mathcal{O}_{X}(1)=\mathcal{I}$ as usual and $\mathcal{O}_{E}(1)=\left.\mathcal{O}_{X}(1)\right|_{E}$ we have
(1) $E$ is a proper Cohen-Macaulay curve over $\kappa$.
(2) $\mathcal{O}_{E}(1)$ is very ample
(3) $\operatorname{deg}\left(\mathcal{O}_{E}(1)\right) \geq 1$ and equality holds only if $A$ is a regular local ring,
(4) $H^{1}\left(E, \mathcal{O}_{E}(n)\right)=0$ for $n \geq 0$, and
(5) $H^{0}\left(E, \mathcal{O}_{E}(n)\right)=\mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ for $n \geq 0$.

Proof. Since $\mathcal{O}_{X}(1)$ is very ample by construction, we see that its restriction to the special fibre $E$ is very ample as well. By Lemma 47.9.4 the scheme $X$ is normal. Then $E$ is Cohen-Macaulay by Divisors, Lemma 30.12.6. Lemma 47.9.3 applies and we obtain (4) and (5) from the exact sequences

$$
0 \rightarrow \mathcal{I}^{n+1} \rightarrow \mathcal{I}^{n} \rightarrow i_{*} \mathcal{O}_{E}(n) \rightarrow 0
$$

and the long exact cohomology sequence. In particular, we see that

$$
\operatorname{deg}\left(\mathcal{O}_{E}(1)\right)=\chi\left(E, \mathcal{O}_{E}(1)\right)-\chi\left(E, \mathcal{O}_{E}\right)=\operatorname{dim}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)-1
$$

by Varieties, Definition 32.33.1. Thus (3) follows as well.
0BBU Lemma 47.9.6. In Situation 47.9 .1 assume $A$ has a dualizing complex $\omega_{A}^{\bullet}$. With $\omega_{X}$ the dualizing module of $X$, the trace map $H^{0}\left(X, \omega_{X}\right) \rightarrow \omega_{A}$ is an isomorphism and consequently there is a canonical map $f^{*} \omega_{A} \rightarrow \omega_{X}$.

Proof. By Grauert-Riemenschneider (Proposition 47.7.8) we see that $R f_{*} \omega_{X}=$ $f_{*} \omega_{X}$. By duality we have a short exact sequence

$$
0 \rightarrow f_{*} \omega_{X} \rightarrow \omega_{A} \rightarrow \operatorname{Ext}_{A}^{2}\left(R^{1} f_{*} \mathcal{O}_{X}, \omega_{A}\right) \rightarrow 0
$$

(for example see proof of Lemma 47.8.11) and since $A$ defines a rational singularity we obtain $f_{*} \omega_{X}=\omega_{A}$.

0B64 Lemma 47.9.7. In Situation 47.9 .1 assume $A$ has a dualizing complex $\omega_{A}^{\bullet}$ and is not regular. Let $X$ be the blow up of $\operatorname{Spec}(A)$ in $\mathfrak{m}$ with exceptional divisor $E \subset X$. Let $\omega_{X}$ be the dualizing module of $X$. Then
(1) $\omega_{E}=\left.\omega_{X}\right|_{E} \otimes \mathcal{O}_{E}(-1)$,
(2) $H^{1}\left(X, \omega_{X}(n)\right)=0$ for $n \geq 0$,
(3) the $\operatorname{map} f^{*} \omega_{A} \rightarrow \omega_{X}$ of Lemma 47.9 .6 is surjective.

Proof. We will use the results of Lemma 47.9.5 without further mention. Observe that $\omega_{E}=\left.\omega_{X}\right|_{E} \otimes \mathcal{O}_{E}(-1)$ by Dualizing Complexes, Lemmas 45.29.2 and 45.26.6 Thus $\left.\omega_{X}\right|_{E}=\omega_{E}(1)$. Consider the short exact sequences

$$
0 \rightarrow \omega_{X}(n+1) \rightarrow \omega_{X}(n) \rightarrow i_{*} \omega_{E}(n+1) \rightarrow 0
$$

By Algebraic Curves, Lemma 46.3.3 we see that $H^{1}\left(E, \omega_{E}(n+1)\right)=0$ for $n \geq 0$. Thus we see that the maps

$$
\ldots \rightarrow H^{1}\left(X, \omega_{X}(2)\right) \rightarrow H^{1}\left(X, \omega_{X}(1)\right) \rightarrow H^{1}\left(X, \omega_{X}\right)
$$

are surjective. Since $H^{1}\left(X, \omega_{X}(n)\right)$ is zero for $n \gg 0$ (Cohomology of Schemes, Lemma 29.15.2 we conclude that (2) holds.

By Algebraic Curves, Lemma 46.3.6 we see that $\left.\omega_{X}\right|_{E}=\omega_{E} \otimes \mathcal{O}_{E}(1)$ is globally generated. Since we seen above that $H^{1}\left(X, \omega_{X}(1)\right)=0$ the map $H^{0}\left(X, \omega_{X}\right) \rightarrow$ $H^{0}\left(E,\left.\omega_{X}\right|_{E}\right)$ is surjective. We conclude that $\omega_{X}$ is globally generated hence (3) holds because $\Gamma\left(X, \omega_{X}\right)=\omega_{A}$ is used in Lemma 47.9.6 to define the map.

0BBV Lemma 47.9.8. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2 which defines a rational singularity. Assume $A$ has a dualizing complex. Then there exists a finite sequence of blowups in singular closed points

$$
X=X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=\operatorname{Spec}(A)
$$

such that $X_{i}$ is normal for each $i$ and such that the dualizing sheaf $\omega_{X}$ of $X$ is an invertible $\mathcal{O}_{X}$-module.

Proof. The dualizing module $\omega_{A}$ is a finite $A$-module whose stalk at the generic point is invertible. Namely, $\omega_{A} \otimes_{A} K$ is a dualizing module for the fraction field $K$ of $A$, hence has rank 1. Thus there exists a blowup $b: Y \rightarrow \operatorname{Spec}(A)$ such that the strict transform of $\omega_{A}$ with respect to $b$ is an invertible $\mathcal{O}_{Y}$-module. This follows from the definition of strict transform in Divisors, Definition 30.27.1, the description of the strict transform of quasi-coherent modules in Properties, Lemma 27.24.5 and More on Algebra, Lemma 15.20.3. By Lemma 47.5.3 we can choose a sequence of normalized blowups

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow \operatorname{Spec}(A)
$$

such that $X_{n}$ dominates $Y$. By Lemma 47.9 .4 and arguing by induction each $X_{i} \rightarrow X_{i-1}$ is simply a blowing up.

We claim that $\omega_{X_{n}}$ is invertible. Since $\omega_{X_{n}}$ is a coherent $\mathcal{O}_{X_{n}}$-module, it suffices to see its stalks are invertible modules. If $x \in X_{n}$ is a regular point, then this is clear from the fact that regular schemes are Gorenstein (Dualizing Complexes, Lemma 45.38.3. If $x$ is a singular point of $X_{n}$, then each of the images $x_{i} \in X_{i}$ of $x$ is a singular point (because the blowup of a regular point is regular by Lemma 47.3.2). Consider the canonical map $f_{n}^{*} \omega_{A} \rightarrow \omega_{X_{n}}$ of Lemma 47.9.6. For each $i$ the morphism $X_{i+1} \rightarrow X_{i}$ is either a blowup of $x_{i}$ or an isomorphism at $x_{i}$. Since $x_{i}$ is always a singular point, it follows from Lemma 47.9.7 and induction that the maps $f_{i}^{*} \omega_{A} \rightarrow \omega_{X_{i}}$ is always surjective on stalks at $x_{i}$. Hence

$$
\left(f_{n}^{*} \omega_{A}\right)_{x} \longrightarrow \omega_{X_{n}, x}
$$

is surjective. On the other hand, by our choice of $b$ the quotient of $f_{n}^{*} \omega_{A}$ by its torsion submodule is an invertible module $\mathcal{L}$. Moreover, the dualizing module is torsion free (Dualizing Complexes, Lemma 45.36.3). It follows that $\mathcal{L}_{x} \cong \omega_{X_{n}, x}$ and the proof is complete.

### 47.10. Formal arcs

0BG1 Let $X$ be a locally Noetherian scheme. In this section we say that a formal arc in $X$ is a morphism $a: T \rightarrow X$ where $T$ is the spectrum of a complete discrete valuation ring $R$ whose residue field $\kappa$ is identified with the residue field of the image $p$ of the closed point of $\operatorname{Spec}(R)$. Let us say that the formal arc $a$ is centered at $p$ in this case. We say the formal arc $T \rightarrow X$ is nonsingular if the induced map $\mathfrak{m}_{p} / \mathfrak{m}_{p}^{2} \rightarrow \mathfrak{m}_{R} / \mathfrak{m}_{R}^{2}$ is surjective.
Let $a: T \rightarrow X, T=\operatorname{Spec}(R)$ be a nonsingular formal arc centered at a closed point $p$ of $X$. Assume $X$ is locally Noetherian. Let $b: X_{1} \rightarrow X$ be the blowing up of $X$ at $x$. Since $a$ is nonsingular, we see that there is an element $f \in \mathfrak{m}_{p}$ which maps to a uniformizer in $R$. In particular, we find that the generic point of $T$ maps to a point of $X$ not equal to $p$. In other words, with $K=f . f .(R)$ the fraction field, the restriction of $a$ defines a morphism $\operatorname{Spec}(K) \rightarrow X \backslash\{p\}$. Since the morphism $b$ is proper and an isomorphism over $X \backslash\{x\}$ we can apply the valuative criterion of properness to obtain a unique morphism $a_{1}$ making the following diagram commute

Let $p_{1} \in X_{1}$ be the image of the closed point of $T$. Observe that $p_{1}$ is a closed point as it is a $\kappa=\kappa(p)$-rational point on the fibre of $X_{1} \rightarrow X$ over $x$. Since we have a factorization

$$
\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X_{1}, p_{1}} \rightarrow R
$$

we see that $a_{1}$ is a nonsingular formal arc as well.
We can repeat the process and obtain a sequence of blowing ups

This kind of sequence of blowups can be characterized as follows.

0BG2 Lemma 47.10.1. Let $X$ be a locally Noetherian scheme. Let

$$
(X, p)=\left(X_{0}, p_{0}\right) \leftarrow\left(X_{1}, p_{1}\right) \leftarrow\left(X_{2}, p_{2}\right) \leftarrow\left(X_{3}, p_{3}\right) \leftarrow \ldots
$$

be a sequence of blowups such that
(1) $p_{i}$ is closed, maps to $p_{i-1}$, and $\kappa\left(p_{i}\right)=\kappa\left(p_{i-1}\right)$,
(2) there exists an $x_{1} \in \mathfrak{m}_{p}$ whose image in $\mathfrak{m}_{p_{i}}, i>0$ defines the exceptional divisor $E_{i} \subset X_{i}$.

Then the sequence is obtained from a nonsingular arc $a: T \rightarrow X$ as above.
Proof. Let us write $\mathcal{O}_{n}=\mathcal{O}_{X_{n}, p_{n}}$ and $\mathcal{O}=\mathcal{O}_{X, p}$. Denote $\mathfrak{m} \subset \mathcal{O}$ and $\mathfrak{m}_{n} \subset \mathcal{O}_{n}$ the maximal ideals.

We claim that $x_{1}^{t} \notin \mathfrak{m}_{n}^{t+1}$. Namely, if this were the case, then in the local ring $\mathcal{O}_{n+1}$ the element $x_{1}^{t}$ would be in the ideal of $(t+1) E_{n+1}$. This contradicts the assumption that $x_{1}$ defines $E_{n+1}$.

For every $n$ choose generators $y_{n, 1}, \ldots, y_{n, t_{n}}$ for $\mathfrak{m}_{n}$. As $\mathfrak{m}_{n} \mathcal{O}_{n+1}=x_{1} \mathcal{O}_{n+1}$ by assumption (2), we can write $y_{n, i}=a_{n, i} x_{1}$ for some $a_{n, i} \in \mathcal{O}_{n+1}$. Since the map $\mathcal{O}_{n} \rightarrow \mathcal{O}_{n+1}$ defines an isomorphism on residue fields by (1) we can choose $c_{n, i} \in \mathcal{O}_{n}$ having the same residue class as $a_{n, i}$. Then we see that

$$
\mathfrak{m}_{n}=\left(x_{1}, z_{n, 1}, \ldots, z_{n, t_{n}}\right), \quad z_{n, i}=y_{n, i}-c_{n, i} x_{1}
$$

and the elements $z_{n, i}$ map to elements of $\mathfrak{m}_{n+1}^{2}$ in $\mathcal{O}_{n+1}$.
Let us consider

$$
J_{n}=\operatorname{Ker}\left(\mathcal{O} \rightarrow \mathcal{O}_{n} / \mathfrak{m}_{n}^{n+1}\right)
$$

We claim that $\mathcal{O} / J_{n}$ has length $n+1$ and that $\mathcal{O} /\left(x_{1}\right)+J_{n}$ equals the residue field. For $n=0$ this is immediate. Assume the statement holds for $n$. Let $f \in J_{n}$. Then in $\mathcal{O}_{n}$ we have

$$
f=a x_{1}^{n+1}+x_{1}^{n} A_{1}\left(z_{n, i}\right)+x_{1}^{n-1} A_{2}\left(z_{n, i}\right)+\ldots+A_{n+1}\left(z_{n, i}\right)
$$

for some $a \in \mathcal{O}_{n}$ and some $A_{i}$ homogeneous of degree $i$ with coefficients in $\mathcal{O}_{n}$. Since $\mathcal{O} \rightarrow \mathcal{O}_{n}$ identifies residue fields, we may choose $a \in \mathcal{O}$ (argue as in the construction of $z_{n, i}$ above). Taking the image in $\mathcal{O}_{n+1}$ we see that $f$ and $a x_{1}^{n+1}$ have the same image modulo $\mathfrak{m}_{n+1}^{n+2}$. Since $x_{n}^{n+1} \notin \mathfrak{m}_{n+1}^{n+2}$ it follows that $J_{n} / J_{n+1}$ has length 1 and the claim is true.

Consider $R=\lim \mathcal{O} / J_{n}$. This is a quotient of the $\mathfrak{m}$-adic completion of $\mathcal{O}$ hence it is a complete Noetherian local ring. On the other hand, it is not finite length and $x_{1}$ generates the maximal ideal. Thus $R$ is a complete discrete valuation ring. The map $\mathcal{O} \rightarrow R$ lifts to a local homomorphism $\mathcal{O}_{n} \rightarrow R$ for every $n$. There are two ways to show this: (1) for every $n$ one can use a similar procedure to construct $\mathcal{O}_{n} \rightarrow R_{n}$ and then one can show that $\mathcal{O} \rightarrow \mathcal{O}_{n} \rightarrow R_{n}$ factors through an isomorphism $R \rightarrow R_{n}$, or (2) one can use Divisors, Lemma 30.26.6 to show that $\mathcal{O}_{n}$ is a localization of a repeated affine blowup algebra to explicitly construct a map $\mathcal{O}_{n} \rightarrow R$. Having said this it is clear that our sequence of blow ups comes from the nonsingular arc $a: T=\operatorname{Spec}(R) \rightarrow X$.

The following lemma is a kind of Néron desingularization lemma.

0BG3 Lemma 47.10.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local domain of dimension 2. Let $A \rightarrow R$ be a surjection onto a complete discrete valuation ring. This defines a nonsingular arc $a: T=\operatorname{Spec}(R) \rightarrow \operatorname{Spec}(A)$. Let

$$
\operatorname{Spec}(A)=X_{0} \leftarrow X_{1} \leftarrow X_{2} \leftarrow X_{3} \leftarrow \ldots
$$

be the sequence of blowing ups constructed from a. If $A_{\mathfrak{p}}$ is a regular local ring where $\mathfrak{p}=\operatorname{Ker}(A \rightarrow R)$, then for some $i$ the scheme $X_{i}$ is regular at $x_{i}$.

Proof. Let $x_{1} \in \mathfrak{m}$ map to a uniformizer of $R$. Observe that $\kappa(\mathfrak{p})=K=f . f .(R)$ is the fraction field of $R$. Write $\mathfrak{p}=\left(x_{2}, \ldots, x_{r}\right)$ with $r$ minimal. If $r=2$, then $\mathfrak{m}=\left(x_{1}, x_{2}\right)$ and $A$ is regular and the lemma is true. Assume $r>2$. After renumbering if necessary, we may assume that $x_{2}$ maps to a uniformizer of $A_{\mathfrak{p}}$. Then $\mathfrak{p} / \mathfrak{p}^{2}+\left(x_{2}\right)$ is annihilated by a power of $x_{1}$. For $i>2$ we can find $n_{i} \geq 0$ and $a_{i} \in A$ such that

$$
x_{1}^{n_{i}} x_{i}-a_{i} x_{2}=\sum_{2 \leq j \leq k} a_{j k} x_{j} x_{k}
$$

for some $a_{j k} \in A$. If $n_{i}=0$ for some $i$, then we can remove $x_{i}$ from the list of generators of $\mathfrak{p}$ and we win by induction on $r$. If for some $i$ the element $a_{i}$ is a unit, then we can remove $x_{2}$ from the list of generators of $\mathfrak{p}$ and we win in the same manner. Thus either $a_{i} \in \mathfrak{p}$ or $a_{i}=u_{i} x_{1}^{m_{1}} \bmod \mathfrak{p}$ for some $m_{1}>0$ and unit $u_{i} \in A$. Thus we have either

$$
x_{1}^{n_{i}} x_{i}=\sum_{2 \leq j \leq k} a_{j k} x_{j} x_{k} \quad \text { or } \quad x_{1}^{n_{i}} x_{i}-u_{i} x_{1}^{m_{i}} x_{2}=\sum_{2 \leq j \leq k} a_{j k} x_{j} x_{k}
$$

We will prove that after blowing up the integers $n_{i}, m_{i}$ decrease which will finish the proof.

Let us see what happens with these equations on the affine blowup algebra $A^{\prime}=$ $A\left[\mathfrak{m} / x_{1}\right]$. As $\mathfrak{m}=\left(x_{1}, \ldots, x_{r}\right)$ we see that $A^{\prime}$ is generated over $R$ by $y_{i}=x_{i} / x_{1}$ for $i \geq 2$. Clearly $A \rightarrow R$ extends to $A^{\prime} \rightarrow R$ with kernel $\left(y_{2}, \ldots, y_{r}\right)$. Then we see that either

$$
x_{1}^{n_{i}-1} y_{i}=\sum_{2 \leq j \leq k} a_{j k} y_{j} y_{k} \quad \text { or } \quad x_{1}^{n_{i}-1} y_{i}-u_{i} x_{1}^{m_{1}-1} y_{2}=\sum_{2 \leq j \leq k} a_{j k} y_{j} y_{k}
$$

and the proof is complete.

### 47.11. Base change to the completion

0BG4 The following simple lemma will turn out to be a useful tool in what follows.
0BG5 Lemma 47.11.1. Let $(A, \mathfrak{m}, \kappa)$ be a local ring with finitely generated maximal ideal $\mathfrak{m}$. Let $X$ be a scheme over $A$. Let $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ where $A^{\wedge}$ is the $\mathfrak{m}$-adic completion of $A$. For a point $q \in Y$ with image $p \in X$ lying over the closed point of $\operatorname{Spec}(A)$ the local ring map $\mathcal{O}_{X, p} \rightarrow \mathcal{O}_{Y, q}$ induces an isomorphism on completions.

Proof. We may assume $X$ is affine. Then we may write $X=\operatorname{Spec}(B)$. Let $\mathfrak{q} \subset B^{\prime}=B \otimes_{A} A^{\wedge}$ be the prime corresponding to $q$ and let $\mathfrak{p} \subset B$ be the prime ideal corresponding to $p$. By Algebra, Lemma 10.95 .5 we have

$$
B^{\prime} /\left(\mathfrak{m}^{\wedge}\right)^{n} B^{\prime}=A^{\wedge} /\left(\mathfrak{m}^{\wedge}\right)^{n} \otimes_{A} B=A / \mathfrak{m}^{n} \otimes_{A} B=B / \mathfrak{m}^{n} B
$$

for all $n$. Since $\mathfrak{m} B \subset \mathfrak{p}$ and $\mathfrak{m}^{\wedge} B^{\prime} \subset \mathfrak{q}$ we see that $B / \mathfrak{p}^{n}$ and $B^{\prime} / \mathfrak{q}^{n}$ are both quotients of the ring displayed above by the $n$th power of the same prime ideal. The lemma follows.

0BG6 Lemma 47.11.2. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $X \rightarrow \operatorname{Spec}(A)$ be a morphism which is locally of finite type. Set $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$. Let $y \in Y$ with image $x \in X$. Then
(1) if $\mathcal{O}_{Y, y}$ is regular, then $\mathcal{O}_{X, x}$ is regular,
(2) if $y$ is in the closed fibre, then $\mathcal{O}_{Y, y}$ is regular $\Leftrightarrow \mathcal{O}_{X, x}$ is regular, and
(3) If $X$ is proper over $A$, then $X$ is regular if and only if $Y$ is regular.

Proof. Since $A \rightarrow A^{\wedge}$ is faithfully flat (Algebra, Lemma 10.96.3), we see that $Y \rightarrow X$ is flat. Hence (1) by Algebra, Lemma 10.156.4 Lemma 47.11.1 shows the morphism $Y \rightarrow X$ induces an isomorphism on complete local rings at points of the special fibres. Thus (2) by More on Algebra, Lemma 15.34.4. If $X$ is proper over $A$, then $Y$ is proper over $A^{\wedge}$ (Morphisms, Lemma 28.41.5) and we see every closed point of $X$ and $Y$ lies in the closed fibre. Thus we see that $Y$ is a regular scheme if and only if $X$ is so by Properties, Lemma 27.9.2.

0AFK Lemma 47.11.3. Let $(A, \mathfrak{m})$ be a Noetherian local ring with completion $A^{\wedge}$. Let $U \subset \operatorname{Spec}(A)$ and $U^{\wedge} \subset \operatorname{Spec}\left(A^{\wedge}\right)$ be the punctured spectra. If $Y \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ is a $U^{\wedge}$-admissible blowup, then there exists a $U$-admissible blowup $X \rightarrow \operatorname{Spec}(A)$ such that $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$.

Proof. By definition there exists an ideal $J \subset A^{\wedge}$ such that $V(J)=\left\{\mathfrak{m} A^{\wedge}\right\}$ and such that $Y$ is the blowup of $S^{\wedge}$ in the closed subscheme defined by $J$, see Divisors, Definition 30.28.1. Since $A^{\wedge}$ is Noetherian this implies $\mathfrak{m}^{n} A^{\wedge} \subset J$ for some $n$. Since $A^{\wedge} / \mathfrak{m}^{n} A^{\wedge}=A / \mathfrak{m}^{n}$ we find an ideal $\mathfrak{m}^{n} \subset I \subset A$ such that $J=I A^{\wedge}$. Let $X \rightarrow S$ be the blowup in $I$. Since $A \rightarrow A^{\wedge}$ is flat we conclude that the base change of $X$ is $Y$ by Divisors, Lemma 30.26.3.

0BG7 Lemma 47.11.4. Let $(A, \mathfrak{m}, \kappa)$ be a Nagata local normal domain of dimension 2. Assume $A$ defines a rational singularity and that the completion $A^{\wedge}$ of $A$ is normal. Then
(1) $A^{\wedge}$ defines a rational singularity, and
(2) if $X \rightarrow \operatorname{Spec}(A)$ is the blowing up in $\mathfrak{m}$, then for a closed point $x \in X$ the completion $\mathcal{O}_{X, x}$ is normal.
Proof. Let $Y \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ be a modification with $Y$ normal. We have to show that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$. By Varieties, Lemma 32.15.3 $Y \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ is an isomorphism over the punctured spectrum $U^{\wedge}=\operatorname{Spec}\left(A^{\wedge}\right) \backslash\left\{\mathfrak{m}^{\wedge}\right\}$. By Lemma 47.7.2 there exists a $U^{\wedge}$-admissible blowup $Y^{\prime} \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ dominating $Y$. By Lemma 47.11.3 we find there exists a $U$-admissible blowup $X \rightarrow \operatorname{Spec}(A)$ whose base change to $A^{\wedge}$ dominates $Y$. Since $A$ is Nagata, we can replace $X$ by its normalization after which $X \rightarrow \operatorname{Spec}(A)$ is a normal modification (but possibly no longer a $U$-admissible blowup). Then $H^{1}\left(X, \mathcal{O}_{X}\right)=0$ as $A$ defines a rational singularity. It follows that $H^{1}\left(X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right), \mathcal{O}_{X \times \operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)\right)=0$ by flat base change (Cohomology of Schemes, Lemma 29.5.2 and flatness of $A \rightarrow A^{\wedge}$ by Algebra, Lemma 10.96.2). We find that $H^{1}\left(Y, \mathcal{O}_{Y}\right)=0$ by Lemma 47.8.1.

Finally, let $X \rightarrow \operatorname{Spec}(A)$ be the blowing up of $\operatorname{Spec}(A)$ in $\mathfrak{m}$. Then $Y=X \times_{\operatorname{Spec}(A)}$ $\operatorname{Spec}\left(A^{\wedge}\right)$ is the blowing up of $\operatorname{Spec}\left(A^{\wedge}\right)$ in $\mathfrak{m}^{\wedge}$. By Lemma 47.9.4 we see that both $Y$ and $X$ are normal. On the other hand, $A^{\wedge}$ is excellent (More on Algebra, Proposition 15.43.3 hence every affine open in $Y$ is the spectrum of an excellent normal domain (More on Algebra, Lemma 15.43.2. Thus for $y \in Y$ the ring map
$\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{Y, y}^{\wedge}$ is regular and by More on Algebra, Lemma 15.33 .2 we find that $\mathcal{O}_{Y, y}^{\wedge}$ is normal. If $x \in X$ is a closed point of the special fibre, then there is a unique closed point $y \in Y$ lying over $x$. Since $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{Y, y}$ induces an isomorphism on completions (Lemma 47.11.1) we conclude.

0BG8 Lemma 47.11.5. Let $(A, \mathfrak{m})$ be a local Noetherian ring. Let $X$ be a scheme over A. Assume
(1) A is analytically unramified (Algebra, Definition 10.154.9),
(2) $X$ is locally of finite type over A, and
(3) $X \rightarrow \operatorname{Spec}(A)$ is étale at the generic points of irreducible components of $X$.

Then the normalization of $X$ is finite over $X$.
Proof. Since $A$ is analytically unramified it is reduced by Algebra, Lemma 10.154.10. Since the normalization of $X$ depends only on the reduction of $X$, we may replace $X$ by its reduction $X_{\text {red }}$; note that $X_{\text {red }} \rightarrow X$ is an isomorphism over the open $U$ where $X \rightarrow \operatorname{Spec}(A)$ is étale because $U$ is reduced (Descent, Lemma 34.14.1) hence condition (3) remains true after this replacement. In addition we may and do assume that $X=\operatorname{Spec}(B)$ is affine.
The map

$$
K=\prod_{\mathfrak{p} \subset A \text { minimal }} \kappa(\mathfrak{p}) \longrightarrow K^{\wedge}=\prod_{\mathfrak{p}^{\wedge} \subset A^{\wedge} \text { minimal }} \kappa\left(\mathfrak{p}^{\wedge}\right)
$$

is injective because $A \rightarrow A^{\wedge}$ is faithfully flat (Algebra, Lemma 10.96.3) hence induces a surjective map between sets of minimal primes (by going down for flat ring maps, see Algebra, Section 10.40 . Both sides are finite products of fields as our rings are Noetherian. Let $L=\prod_{\mathfrak{q} \subset B \text { minimal }} \kappa(\mathfrak{q})$. Our assumption (3) implies that $L=B \otimes_{A} K$ and that $K \rightarrow L$ is a finite étale ring map (this is true because $A \rightarrow B$ is generically finite, for example use Algebra, Lemma 10.121 .9 or the more detailed results in Morphisms, Section 28.47). Since $B$ is reduced we see that $B \subset L$. This implies that

$$
C=B \otimes_{A} A^{\wedge} \subset L \otimes_{A} A^{\wedge}=L \otimes_{K} K^{\wedge}=M
$$

Then $M$ is the total ring of fractions of $C$ and is a finite product of fields as a finite separable algebra over $K^{\wedge}$. It follows that $C$ is reduced and that its normalization $C^{\prime}$ is the integral closure of $C$ in $M$. The normalization $B^{\prime}$ of $B$ is the integral closure of $B$ in $L$. By flatness of $A \rightarrow A^{\wedge}$ we obtain an injective map $B^{\prime} \otimes_{A} A^{\wedge} \rightarrow M$ whose image is contained in $C^{\prime}$. Picture

$$
B^{\prime} \otimes_{A} A^{\wedge} \longrightarrow C^{\prime}
$$

As $A^{\wedge}$ is Nagata (by Algebra, Lemma 10.154.8), we see that $C^{\prime}$ is finite over $C=B \otimes_{A} A^{\wedge}$ (see Algebra, Lemmas 10.154.8 and 10.154.2). As $C$ is Noetherian, we conclude that $B^{\prime} \otimes_{A} A^{\wedge}$ is finite over $C=B \otimes_{A} A^{\wedge}$. Therefore by faithfully flat descent (Algebra, Lemma 10.82.2) we see that $B^{\prime}$ is finite over $B$ which is what we had to show.

0BG9 Lemma 47.11.6. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Let $X \rightarrow \operatorname{Spec}(A)$ be a morphism which is locally of finite type. Set $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$. If the complement of the special fibre in $Y$ is normal, then the normalization $X^{\nu} \rightarrow X$ is finite and the base change of $X^{\nu}$ to $\operatorname{Spec}\left(A^{\wedge}\right)$ recovers the normalization of $Y$.

Proof. There is an immediate reduction to the case where $X=\operatorname{Spec}(B)$ is affine with $B$ a finite type $A$-algebra. Set $C=B \otimes_{A} A^{\wedge}$ so that $Y=\operatorname{Spec}(C)$. Since $A \rightarrow A^{\wedge}$ is faithfully flat, for any prime $\mathfrak{q} \subset B$ there exists a prime $\mathfrak{r} \subset C$ lying over $\mathfrak{q}$. Then $B_{\mathfrak{q}} \rightarrow C_{\mathfrak{r}}$ is faithfully flat. Hence if $\mathfrak{q}$ does not lie over $\mathfrak{m}$, then $C_{\mathfrak{r}}$ is normal by assumption on $Y$ and we conclude that $B_{\mathfrak{q}}$ is normal by Algebra, Lemma 10.156.3. In this way we see that $X$ is normal away from the special fibre.

Recall that the complete Noetherian local ring $A^{\wedge}$ is Nagata (Algebra, Lemma 10.154.8). Hence the normalization $Y^{\nu} \rightarrow Y$ is finite (Morphisms, Lemma 28.49.7) and an isomorphism away from the special fibre. Say $Y^{\nu}=\operatorname{Spec}\left(C^{\prime}\right)$. Then $C \rightarrow C^{\prime}$ is finite and an isomorphism away from $V(\mathfrak{m} C)$. Since $B \rightarrow C$ is flat and induces an isomorphism $B / \mathfrak{m} B \rightarrow C / \mathfrak{m} C$ there exists a finite ring map $B \rightarrow B^{\prime}$ whose base change to $C$ recovers $C \rightarrow C^{\prime}$. See More on Algebra, Lemma 15.70.16 and Remark 15.70.19. Thus we find a finite morphism $X^{\prime} \rightarrow X$ which is an isomorphism away from the special fibre and whose base change recovers $Y^{\nu} \rightarrow Y$. By the discussion in the first paragraph we see that $X^{\prime}$ is normal at points not on the special fibre. For a point $x \in X^{\prime}$ on the special fibre we have a corresponding point $y \in Y^{\nu}$ and a flat map $\mathcal{O}_{X^{\prime}, x} \rightarrow \mathcal{O}_{Y^{\nu}, y}$. Since $\mathcal{O}_{Y^{\nu}, y}$ is normal, so is $\mathcal{O}_{X^{\prime}, x}$, see Algebra, Lemma 10.156.3. Thus $X^{\prime}$ is normal and it follows that it is the normalization of $X$.

0BGA Lemma 47.11.7. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local domain whose completion $A^{\wedge}$ is normal. Then given any sequence

$$
Y_{n} \rightarrow Y_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)
$$

of normalized blowups, there exists a sequence of (proper) normalized blowups

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow \operatorname{Spec}(A)
$$

whose base change to $A^{\wedge}$ recovers the given sequence.
Proof. Given the sequence $\left.Y_{n} \rightarrow \ldots \rightarrow Y_{1} \rightarrow Y_{0}=\operatorname{Spec}(A)^{\wedge}\right)$ we inductively construct $X_{n} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=\operatorname{Spec}(A)$. The base case is $i=0$. Given $X_{i}$ whose base change is $Y_{i}$, let $Y_{i}^{\prime} \rightarrow Y_{i}$ be the blowing up in the closed point $y_{i} \in Y_{i}$ such that $Y_{i+1}$ is the normalization of $Y_{i}$. Since the closed fibres of $Y_{i}$ and $X_{i}$ are isomorphic, the point $y_{i}$ corresponds to a closed ponit $x_{i}$ on the special fibre of $X_{i}$. Let $X_{i}^{\prime} \rightarrow X_{i}$ be the blowup of $X_{i}$ in $x_{i}$. Then the base change of $X_{i}^{\prime}$ to $\operatorname{Spec}\left(A^{\wedge}\right)$ is isomorphic to $Y_{i}^{\prime}$. By Lemma 47.11.6 the normalization $X_{i+1} \rightarrow X_{i}^{\prime}$ is finite and its base change to $\operatorname{Spec}\left(A^{\wedge}\right)$ is isomorphic to $Y_{i+1}$.

### 47.12. Rational double points

0BGB In Section 47.9 we argued that resolution of 2-dimensional rational singularities reduces to the Gorenstein case. A Gorenstein rational surface singularity is a rational double point. We will resolve them by explicit computations.

According to the discussion in Examples, Section 88.17 there exists a normal Noetherian local domain $A$ whose completion is isomorphic to $\mathbf{C}[[x, y, z]] /\left(z^{2}\right)$. In this case one could say that $A$ has a rational double point singularity, but on the other hand, $\operatorname{Spec}(A)$ does not have a resolution of singularities. This kind of behaviour cannot occur if $A$ is a Nagata ring, see Algebra, Lemma 10.154.13.
However, it gets worse as there exists a local normal Nagata domain $A$ whose completion is $\mathbf{C}[[x, y, z]] /(y z)$ and another whose completion is $\mathbf{C}[[x, y, z]] /\left(y^{2}-z^{3}\right)$.

This is Example 2.5 of Nis12. This is why we need to assume the completion of our ring is normal in this section.
0BGC Situation 47.12.1. Here $(A, \mathfrak{m}, \kappa)$ be a Nagata local normal domain of dimension 2 which defines a rational singularity, whose completion is normal, and which is Gorenstein. We assume $A$ is not regular.
The arguments in this section will show that repeatedly blowing up singular points resolves $\operatorname{Spec}(A)$ in this situation. We will need the following lemma in the course of the proof.

0BGD Lemma 47.12.2. Let $\kappa$ be a field. Let $I \subset \kappa[x, y]$ be an ideal. Let

$$
a+b x+c y+d x^{2}+e x y+f y^{2} \in I^{2}
$$

for some $a, b, c, d, e, f \in k$ not all zero. If the colength of $I$ in $\kappa[x, y]$ is $>1$, then $a+b x+c y+d x^{2}+e x y+f y^{2}=j(g+h x+i y)^{2}$ for some $j, g, h, i \in \kappa$.
Proof. Consider the partial derivatives $b+2 d x+e y$ and $c+e x+2 f y$. By the Leibniz rules these are contained in $I$. If one of these is nonzero, then after a linear change of coordinates, i.e., of the form $x \mapsto \alpha+\beta x+\gamma y$ and $y \mapsto \delta+\epsilon x+\zeta y$, we may assume that $x \in I$. Then we see that $I=(x)$ or $I=(x, F)$ with $F$ a monic polynomial of degree $\geq 2$ in $y$. In the first case the statement is clear. In the second case observe that we can can write any element in $I^{2}$ in the form

$$
A(x, y) x^{2}+B(y) x F+C(y) F^{2}
$$

for some $A(x, y) \in \kappa[x, y]$ and $B, C \in \kappa[y]$. Thus

$$
a+b x+c y+d x^{2}+e x y+f y^{2}=A(x, y) x^{2}+B(y) x F+C(y) F^{2}
$$

and by degree reasons we see that $B=C=0$ and $A$ is a constant.
To finish the proof we need to deal with the case that both partial derivatives are zero. This can only happen in characteristic 2 and then we get

$$
a+d x^{2}+f y^{2} \in I^{2}
$$

We may assume $f$ is nonzero (if not, then switch the roles of $x$ and $y$ ). After dividing by $f$ we obtain the case where the characteristic of $\kappa$ is 2 and

$$
a+d x^{2}+y^{2} \in I^{2}
$$

If $a$ and $d$ are squares in $\kappa$, then we are done. If not, then there exists a derivation $\theta: \kappa \rightarrow \kappa$ with $\theta(a) \neq 0$ or $\theta(d) \neq 0$, see Algebra, Lemma 10.150.2. We can extend this to a derivation of $\kappa[x, y]$ by setting $\theta(x)=\theta(y)=0$. Then we find that

$$
\theta(a)+\theta(d) x^{2} \in I
$$

The case $\theta(d)=0$ is absurd. Thus we may assume that $\alpha+x^{2} \in I$ for some $\alpha \in \kappa$. Combining with the above we find that $a+\alpha d+y^{2} \in I$. Hence

$$
J=\left(\alpha+x^{2}, a+\alpha d+y^{2}\right) \subset I
$$

with codimension at most 2. Observe that $J / J^{2}$ is free over $\kappa[x, y] / J$ with basis $\alpha+x^{2}$ and $a+\alpha d+y^{2}$. Thus $a+d x^{2}+y^{2}=1 \cdot\left(a+\alpha d+y^{2}\right)+d \cdot\left(\alpha+x^{2}\right) \in I^{2}$ implies that the inclusion $J \subset I$ is strict. Thus we find a nonzero element of the form $g+h x+i y+j x y$ in $I$. If $j=0$, then $I$ contains a linear form and we can conclude as in the first paragraph. Thus $j \neq 0$ and $\operatorname{dim}_{\kappa}(I / J)=1$ (otherwise we could find an element as above in $I$ with $j=0$ ). We conclude that $I$ has the form
$\left(\alpha+x^{2}, \beta+y^{2}, g+h x+i y+j x y\right)$ with $j \neq 0$ and has colength 3 . In this case $a+d x^{2}+y^{2} \in I^{2}$ is impossible. This can be shown by a direct computation, but we prefer to argue as follows. Namely, to prove this statement we may assume that $\kappa$ is algebraically closed. Then we can do a coordinate change $x \mapsto \sqrt{\alpha}+x$ and $y \mapsto \sqrt{\beta}+y$ and assume that $I=\left(x^{2}, y^{2}, g^{\prime}+h^{\prime} x+i^{\prime} y+j x y\right)$ with the same $j$. Then $g^{\prime}=h^{\prime}=i^{\prime}=0$ otherwise the colength of $I$ is not 3 . Thus we get $I=\left(x^{2}, y^{2}, x y\right)$ and the result is clear.

Let $(A, \mathfrak{m}, \kappa)$ be as in Situation 47.12.1. Let $X \rightarrow \operatorname{Spec}(A)$ be the blowing up of $\mathfrak{m}$ in $\operatorname{Spec}(A)$. By Lemma 47.9.4 we see that $X$ is normal. All singularities of $X$ are rational singularities by Lemma 47.8.7. Since $\omega_{A}=A$ we see from Lemma 47.9 .7 that $\omega_{X} \cong \mathcal{O}_{X}$ (see discussion in Remark 47.7.7 for conventions). Thus all singularities of $X$ are Gorenstein. Moreover, the local rings of $X$ at closed point have normal completions by Lemma 47.11.4. In other words, by blowing up $\operatorname{Spec}(A)$ we obtain a normal surface $X$ whose singular points are as in Situation 47.12.1. We will use this below without further mention. (Note: we will see in the course of the discussion below that there are finitely many of these singular points.)

Let $E \subset X$ be the exceptional divisor. We have $\omega_{E}=\mathcal{O}_{E}(-1)$ by Lemma 47.9.7. By Lemma 47.9 .5 we have $\kappa=H^{0}\left(E, \mathcal{O}_{E}\right)$. Thus $E$ is a Gorenstein curve and by Riemann-Roch as discussed in Algebraic Curves, Section 46.2 we have

$$
\chi\left(E, \mathcal{O}_{E}\right)=1-g=-(1 / 2) \operatorname{deg}\left(\omega_{E}\right)=(1 / 2) \operatorname{deg}\left(\mathcal{O}_{E}(1)\right)
$$

where $g=\operatorname{dim}_{\kappa} H^{1}\left(E, \mathcal{O}_{E}\right) \geq 0$. Since $\operatorname{deg}\left(\mathcal{O}_{E}(1)\right)$ is positive by Varieties, Lemma 32.33 .12 we find that $g=0$ and $\operatorname{deg}\left(\mathcal{O}_{E}(1)\right)=2$. It follows that we have

$$
\operatorname{dim}_{\kappa}\left(\mathfrak{m}^{n} / \mathfrak{m}^{n+1}\right)=2 n+1
$$

by Lemma 47.9.5 and Riemann-Roch on $E$.
Choose $x_{1}, x_{2}, x_{3} \in \mathfrak{m}$ which map to a basis of $\mathfrak{m} / \mathfrak{m}^{2}$. Because $\operatorname{dim}_{\kappa}\left(\mathfrak{m}^{2} / \mathfrak{m}^{3}\right)=5$ the images of $x_{i} x_{j}, i \geq j$ in this $\kappa$-vector space satisfy a relation. In other words, we can find $a_{i j} \in A, i \geq j$, not all contained in $\mathfrak{m}$, such that

$$
a_{11} x_{1}^{2}+a_{12} x_{1} x_{2}+a_{13} x_{1} x_{3}+a_{22} x_{2}^{2}+a_{23} x_{2} x_{3}+a_{33} x_{3}^{2}=\sum a_{i j k} x_{i} x_{j} x_{k}
$$

for some $a_{i j k} \in A$ where $i \leq j \leq k$. Denote $a \mapsto \bar{a}$ the map $A \rightarrow \kappa$. The quadratic form $q=\sum \bar{a}_{i j} t_{i} t_{j} \in \kappa\left[t_{1}, t_{2}, t_{3}\right]$ is well defined up to multiplication by an element of $\kappa^{*}$ by our choices. If during the course of our arguments we find that $\bar{a}_{i j}=0$ in $\kappa$, then we can subsume the term $a_{i j} x_{i} x_{j}$ in the right hand side and assume $a_{i j}=0$; this operation changes the $a_{i j k}$ but not the other $a_{i^{\prime} j^{\prime}}$.
The blowing up is covered by 3 affine charts corresponding to the "variables" $x_{1}, x_{2}, x_{3}$. By symmetry it suffices to study one of the charts. To do this let

$$
A^{\prime}=A\left[\mathfrak{m} / x_{1}\right]
$$

be the affine blowup algebra (as in Algebra, Section 10.69). Since $x_{1}, x_{2}, x_{3}$ generate $\mathfrak{m}$ we see that $A^{\prime}$ is generated by $y_{2}=x_{2} / x_{1}$ and $y_{3}=x_{3} / x_{1}$ over $A$. We will occasionally use $y_{1}=1$ to simplify formulas. Moreover, looking at our relation above we find that

$$
a_{11}+a_{12} y_{2}+a_{13} y_{3}+a_{22} y_{2}^{2}+a_{23} y_{2} y_{3}+a_{33} y_{3}^{2}=x_{1}\left(\sum a_{i j k} y_{i} y_{j} y_{k}\right)
$$

in $A^{\prime}$. Recall that $x_{1} \in A^{\prime}$ defines the exceptional divisor $E$ on our affine open of $X$ which is therefore scheme theoretically given by

$$
\kappa\left[y_{2}, y_{3}\right] /\left(\bar{a}_{11}+\bar{a}_{12} y_{2}+\bar{a}_{13} y_{3}+\bar{a}_{22} y_{2}^{2}+\bar{a}_{23} y_{2} y_{3}+\bar{a}_{33} y_{3}^{2}\right)
$$

In other words, $E \subset \mathbf{P}_{\kappa}^{2}=\operatorname{Proj}\left(\kappa\left[t_{1}, t_{2}, t_{3}\right]\right)$ is the zero scheme of the quadratic form $q$ introduced above.

The quadratic form $q$ is an important invariant of the singularity defined by $A$. Let us say we are in case II if $q$ is a square of a linear form times an element of $\kappa^{*}$ and in case I otherwise. Observe that we are in case II exactly if, after changing our choice of $x_{1}, x_{2}, x_{3}$, we have

$$
x_{3}^{2}=\sum a_{i j k} x_{i} x_{j} x_{k}
$$

in the local ring $A$.
Let $\mathfrak{m}^{\prime} \subset A^{\prime}$ be a maximal ideal lying over $\mathfrak{m}$ with residue field $\kappa^{\prime}$. In other words, $\mathfrak{m}^{\prime}$ corresponds to a closed point $p \in E$ of the exceptional divisor. Recall that the surjection

$$
\kappa\left[y_{2}, y_{3}\right] \rightarrow \kappa^{\prime}
$$

has kernel generated by two elements $f_{2}, f_{3} \in \kappa\left[y_{2}, y_{3}\right]$ (see for example Algebra, Example 10.26 .3 or the proof of Algebra, Lemma 10.113.1. Let $z_{2}, z_{3} \in A^{\prime}$ map to $f_{2}, f_{3}$ in $\kappa\left[y_{2}, y_{3}\right]$. Then we see that $\mathfrak{m}^{\prime}=\left(x_{1}, z_{2}, z_{3}\right)$ because $x_{2}$ and $x_{3}$ become divisble by $x_{1}$ in $A^{\prime}$.

Claim. If $X$ is singular at $p$, then $\kappa^{\prime}=\kappa$ or we are in case II. Namely, if $A_{\mathfrak{m}^{\prime}}^{\prime}$ is singular, then $\operatorname{dim}_{\kappa^{\prime}} \mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2}=3$ which implies that $\operatorname{dim}_{\kappa^{\prime}} \overline{\mathfrak{m}}^{\prime} /\left(\overline{\mathfrak{m}}^{\prime}\right)^{2}=2$ where $\bar{m}^{\prime}$ is the maximal ideal of $\mathcal{O}_{E, p}=\mathcal{O}_{X, p} / x_{1} \mathcal{O}_{X, p}$. This implies that

$$
q\left(1, y_{2}, y_{3}\right)=\bar{a}_{11}+\bar{a}_{12} y_{2}+\bar{a}_{13} y_{3}+\bar{a}_{22} y_{2}^{2}+\bar{a}_{23} y_{2} y_{3}+\bar{a}_{33} y_{3}^{2} \in\left(f_{2}, f_{3}\right)^{2}
$$

otherwise there would be a relation between the classes of $z_{2}$ and $z_{3}$ in $\overline{\mathfrak{m}}^{\prime} /\left(\overline{\mathfrak{m}}^{\prime}\right)^{2}$. The claim now follows from Lemma 47.12 .2

Resolution in case I. By the claim any singular point of $X$ is $\kappa$-rational. Pick such a singular point $p$. We may choose our $x_{1}, x_{2}, x_{3} \in \mathfrak{m}$ such that $p$ lies on the chart described above and has coordinates $y_{2}=y_{3}=0$. Since it is a singular point arguing as in the proof of the claim we find that $q\left(1, y_{2}, y_{3}\right) \in\left(y_{2}, y_{3}\right)^{2}$. Thus we can choose $a_{11}=a_{12}=a_{13}=0$ and $q\left(t_{1}, t_{2}, t_{3}\right)=q\left(t_{2}, t_{3}\right)$. It follows that

$$
E=V(q) \subset \mathbf{P}_{\kappa}^{1}
$$

either is the union of two distinct lines meeting at $p$ or is a degree 2 curve with a unique $\kappa$-rational point (small detail omitted; use that $q$ is not a square of a linear form up to a scalar). In both cases we conclude that $X$ has a unique singular point $p$ which is $\kappa$-rational. We need a bit more information in this case. First, looking at higher terms in the expression above, we find that $\bar{a}_{111}=0$ because $p$ is singular. Then we can write $a_{111}=b_{111} x_{1} \bmod \left(x_{2}, x_{3}\right)$ for some $b_{111} \in A$. Then the quadratic form at $p$ for the generators $x_{1}, y_{2}, y_{3}$ of $\mathfrak{m}^{\prime}$ is

$$
q^{\prime}=\bar{b}_{111} t_{1}^{2}+\bar{a}_{112} t_{1} t_{2}+\bar{a}_{113} t_{1} t_{3}+\bar{a}_{22} t_{2}^{2}+\bar{a}_{23} t_{2} t_{3}+\bar{a}_{33} t_{3}^{2}
$$

We see that $E^{\prime}=V\left(q^{\prime}\right)$ intersects the line $t_{1}=0$ in either two points or one point of degree 2 . We conclude that $p$ lies in case I.

Suppose that the blowing up $X^{\prime} \rightarrow X$ of $X$ at $p$ again has a singular point $p^{\prime}$. Then we see that $p^{\prime}$ is a $\kappa$-rational point and we can blow up to get $X^{\prime \prime} \rightarrow X^{\prime}$. If this process does not stop we get a sequence of blowings up

$$
\operatorname{Spec}(A) \leftarrow X \leftarrow X^{\prime} \leftarrow X^{\prime \prime} \leftarrow \ldots
$$

We want to show that Lemma 47.10.1 applies to this situation. To do this we have to say something about the choice of the element $x_{1}$ of $\mathfrak{m}$. Suppose that $A$ is in case I and that $X$ has a singular point. Then we will say that $x_{1} \in \mathfrak{m}$ is a good coordinate if for any (equivalently some) choice of $x_{2}, x_{3}$ the quadratic form $q\left(t_{1}, t_{2}, t_{3}\right)$ has the property that $q\left(0, t_{2}, t_{3}\right)$ is not a scalar times a square. We have seen above that a good coordinate exists. If $x_{1}$ is a good coordinate, then the singular point $p \in E$ of $X$ does not lie on the hypersurface $t_{1}=0$ because either this does not have a rational point or if it does, then it is not singular on $X$. Observe that this is equivalent to the statement that the image of $x_{1}$ in $\mathcal{O}_{X, p}$ cuts out the exceptional divisor $E$. Now the computations above show that if $x_{1}$ is a good coordinate for $A$, then $x_{1} \in \mathfrak{m}^{\prime} \mathcal{O}_{X, p}$ is a good coordinate for $p$. This of course uses that the notion of good coordinate does not depend on the choice of $x_{2}, x_{3}$ used to do the computation. Hence $x_{1}$ maps to a good coordinate at $p^{\prime}, p^{\prime \prime}$, etc. Thus Lemma 47.10.1 applies and our sequence of blowing ups comes from a nonsingular $\operatorname{arc} A \rightarrow R$. Then the map $A^{\wedge} \rightarrow R$ is a surjection. Since the completion of $A$ is normal, we conlude by Lemma 47.10 .2 that after a finite number of blowups

$$
\operatorname{Spec}\left(A^{\wedge}\right) \leftarrow X^{\wedge} \leftarrow\left(X^{\prime}\right)^{\wedge} \leftarrow \ldots
$$

the resulting scheme $\left(X^{(n)}\right)^{\wedge}$ is regular. Since $\left(X^{(n)}\right)^{\wedge} \rightarrow X^{(n)}$ induces isomorphisms on complete local rings (Lemma 47.11.1) we conclude that the same is true for $X^{(n)}$.
Resolution in case II. Here we have

$$
x_{3}^{2}=\sum a_{i j k} x_{i} x_{j} x_{k}
$$

in $A$ for some choice of generators $x_{1}, x_{2}, x_{3}$ of $\mathfrak{m}$. Then $q=t_{3}^{2}$ and $E=2 C$ where $C$ is a line. Recall that in $A^{\prime}$ we get

$$
y_{3}^{2}=x_{1}\left(\sum a_{i j k} y_{i} y_{j} y_{k}\right)
$$

Since we know that $X$ is normal, we get a discrete valuation ring $\mathcal{O}_{X, \xi}$ at the generic point $\xi$ of $C$. The element $y_{3} \in A^{\prime}$ maps to a uniformizer of $\mathcal{O}_{X, \xi}$. Since $x_{1}$ scheme theoretically cuts out $E$ which is $C$ with multiplicity 2 , we see that $x_{1}$ is a unit times $y_{3}$ in $\mathcal{O}_{X, \xi}$. Looking at our equality above we conclude that

$$
h\left(y_{2}\right)=\bar{a}_{111}+\bar{a}_{112} y_{2}+\bar{a}_{122} y_{2}^{2}+\bar{a}_{222} y_{2}^{3}
$$

must be nonzero in the residue field of $\xi$. Now, suppose that $p \in C$ defines a singular point. Then $y_{3}$ is zero at $p$ and $p$ must correspond to a zero of $h$ by the reasoning used in proving the claim above. If $h$ does not have a double zero at $p$, then the quadratic form $q^{\prime}$ at $p$ is not a square and we conclude that $p$ falls in case I which we have treated above. Since the degree of $h$ is 3 we get at most one singular point $p \in C$ falling into case II which is moreover $\kappa$-rational. After changing our choice of $x_{1}, x_{2}, x_{3}$ we may assume this is the point $y_{2}=y_{3}=0$. Then $h=\bar{a}_{122} y_{2}^{2}+\bar{a}_{222} y_{2}^{3}$. Moreover, it still has to be the case that $\bar{a}_{113}=0$ for the quadratic form $q^{\prime}$ to have the right shape. Thus the local ring $\mathcal{O}_{X, p}$ defines a singularity as in the next paragraph.

The final case we treat is the case where we can choose our generators $x_{1}, x_{2}, x_{3}$ of $\mathfrak{m}$ such that

$$
x_{3}^{2}+x_{1}\left(a x_{2}^{2}+b x_{2} x_{3}+c x_{3}^{2}\right) \in \mathfrak{m}^{4}
$$

for some $a, b, c \in A$. This is a subclass of case II. If $\bar{a}=0$, then we can write $a=a_{1} x_{1}+a_{2} x_{2}+a_{3} x_{3}$ and we get after blowing up

$$
y_{3}^{2}+x_{1}\left(a_{1} x_{1} y_{2}^{2}+a_{2} x_{1} y_{2}^{3}+a_{3} x_{1} y_{2}^{2} y_{3}+b y_{2} y_{3}+c y_{3}^{2}\right)=x_{1}^{2}\left(\sum a_{i j k l} y_{i} y_{j} y_{k} y_{l}\right)
$$

This means that $X$ is not normal a contradiction. By the result of the previous paragraph, if the blow up $X$ has a singular point $p$ which falls in case II, then there is only one and it is $\kappa$-rational. Computing the affine blowup algebras $A\left[\frac{\mathfrak{m}}{x_{2}}\right]$ and $A\left[\frac{\mathfrak{m}}{x_{3}}\right]$ the reader easily sees that $p$ cannot be contained the corresponding opens of $X$. Thus $p$ is in the spectrum of $A\left[\frac{\mathfrak{m}}{x_{1}}\right]$. Doing the blowing up as before we see that $p$ must be the point with coordinates $y_{2}=y_{3}=0$ and the new equation looks like

$$
y_{3}^{2}+x_{1}\left(a y_{2}^{2}+b y_{2} y_{3}+c y_{3}^{2}\right) \in\left(\mathfrak{m}^{\prime}\right)^{4}
$$

which has the same shape as before and has the property that $x_{1}$ defines the exceptional divisor. Thus if the process does not stop we get an infinite sequence of blow ups and on each of these $x_{1}$ defines the exceptional divisor in the local ring of the singular point. Thus we can finish the proof using Lemmas 47.10.1 and 47.10.2 and the same reasoning as before.

0BGE Lemma 47.12.3. Let $(A, \mathfrak{m}, \kappa)$ be a local normal Nagata domain of dimension 2 which defines a rational singularity, whose completion is normal, and which is Gorenstein. Then there exists a finite sequence of blowups in singular closed points

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X_{0}=\operatorname{Spec}(A)
$$

such that $X_{n}$ is regular and such that each intervening schemes $X_{i}$ is normal with finitely many singular points of the same type.
Proof. This is exactly what was proved in the discussion above.

### 47.13. Implied properties

0BGF In this section we prove that for a Noetherian integral scheme the existence of a regular alteration has quite a few consequences. This section should be skipped by those not interested in "bad" Noetherian rings.
0BGG Lemma 47.13.1. Let $Y$ be a Noetherian integral scheme. Assume there exists an alteration $f: X \rightarrow Y$ with $X$ regular. Then the normalization $Y^{\nu} \rightarrow Y$ is finite and $Y$ has a dense open which is regular.

Proof. It suffices to prove this when $Y=\operatorname{Spec}(A)$ where $A$ is a Noetherian domain. Let $B$ be the integral closure of $A$ in its fraction field. Set $C=\Gamma\left(X, \mathcal{O}_{X}\right)$. By Cohomology of Schemes, Lemma 29.18 .3 we see that $C$ is a finite $A$-module. As $X$ is normal (Properties, Lemma 27.9.4) we see that $C$ is normal domain (Properties, Lemma 27.7.9. Thus $B \subset C$ and we conclude that $B$ is finite over $A$ as $A$ is Noetherian.
There exists a nonempty open $V \subset Y$ such that $f^{-1} V \rightarrow V$ is finite, see Morphisms, Definition 28.47.12, After shrinking $V$ we may assume that $f^{-1} V \rightarrow V$ is flat (Morphisms, Proposition 28.27.1). Thus $f^{-1} V \rightarrow V$ is faithfully flat. Then $V$ is regular by Algebra, Lemma 10.156.4.

0BGH Lemma 47.13.2. Let $(A, \mathfrak{m})$ be a local Noetherian ring. Let $B \subset C$ be finite A-algebras. Assume that (a) $B$ is a normal ring, and (b) the $\mathfrak{m}$-adic completion $C^{\wedge}$ is a normal ring. Then $B^{\wedge}$ is a normal ring.

Proof. Consider the commutative diagram

Recall that $\mathfrak{m}$-adic completion on the category of finite $A$-modules is exact because it is given by tensoring with the flat $A$-algebra $A^{\wedge}$ (Algebra, Lemma 10.96.2). We will use Serre's criterion (Algebra, Lemma 10.149.4) to prove that the Noetherian ring $B^{\wedge}$ is normal. Let $\mathfrak{q} \subset B^{\wedge}$ be a prime lying over $\mathfrak{p} \subset B$. If $\operatorname{dim}\left(B_{\mathfrak{p}}\right) \geq 2$, then $\operatorname{depth}\left(B_{\mathfrak{p}}\right) \geq 2$ and since $B_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}^{\wedge}$ is flat we find that $\operatorname{depth}\left(B_{\mathfrak{q}}^{\wedge}\right) \geq 2$ (Algebra, Lemma 10.155.2). If $\operatorname{dim}\left(B_{\mathfrak{p}}\right) \leq 1$, then $B_{\mathfrak{p}}$ is either a discrete valuation ring or a field. In that case $C_{\mathfrak{p}}$ is faithfully flat over $B_{\mathfrak{p}}$ (because it is finite and torsion free). Hence $B_{\mathfrak{p}}^{\wedge} \rightarrow C_{\mathfrak{p}}^{\wedge}$ is faithfully flat and the same holds after localizing at $\mathfrak{q}$. As $C^{\wedge}$ and hence any localization is $\left(S_{2}\right)$ we conclude that $B_{\mathfrak{p}}^{\wedge}$ is $\left(S_{2}\right)$ by Algebra, Lemma 10.156.5. All in all we find that $\left(S_{2}\right)$ holds for $B^{\wedge}$. To prove that $B^{\wedge}$ is $\left(R_{1}\right)$ we only have to consider primes $\mathfrak{q} \subset B^{\wedge}$ with $\operatorname{dim}\left(B_{\mathfrak{q}}^{\wedge}\right) \leq 1$. Since $\operatorname{dim}\left(B_{\mathfrak{q}}^{\wedge}\right)=\operatorname{dim}\left(B_{\mathfrak{p}}\right)+\operatorname{dim}\left(B_{\mathfrak{q}}^{\wedge} / \mathfrak{p} B_{\mathfrak{q}}^{\wedge}\right)$ by Algebra, Lemma 10.111.6 we find that $\operatorname{dim}\left(B_{\mathfrak{p}}\right) \leq 1$ and we see that $B_{\mathfrak{q}}^{\wedge} \rightarrow C_{\mathfrak{q}}^{\wedge}$ is faithfully flat as before. We conclude using Algebra, Lemma 10.156.6.

0BGI Lemma 47.13.3. Let $(A, \mathfrak{m}, \kappa)$ be a local Noetherian domain. Assume there exists an alteration $f: X \rightarrow \operatorname{Spec}(A)$ with $X$ regular. Then
(1) there exists a nonzero $f \in A$ such that $A_{f}$ is regular,
(2) the integral closure $B$ of $A$ in its fraction field is finite over $A$,
(3) the $\mathfrak{m}$-adic completion of $B$ is a normal ring, i.e., the completions of $B$ at its maximal ideals are normal domains, and
(4) the generic formal formal fibre of $A$ is regular.

Proof. Parts (1) and (2) follow from Lemma 47.13.1. We have to redo part of the proof of that lemma in order to set up notation for the proof of (3). Set $C=\Gamma\left(X, \mathcal{O}_{X}\right)$. By Cohomology of Schemes, Lemma 29.18.3 we see that $C$ is a finite $A$-module. As $X$ is normal (Properties, Lemma 27.9.4 we see that $C$ is normal domain (Properties, Lemma 27.7.9). Thus $B \subset C$ and we conclude that $B$ is finite over $A$ as $A$ is Noetherian. By Lemma 47.13 .2 in order to prove (3) it suffices to show that the $\mathfrak{m}$-adic completion $C^{\wedge}$ is normal.

By Algebra, Lemma 10.96 .8 the completion $C^{\wedge}$ is the product of the completions of $C$ at the prime ideals of $C$ lying over $\mathfrak{m}$. There are finitely many of these and these are the maximal ideals $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ of $C$. (The corresponding result for $B$ explains the final statement of the lemma.) Thus replacing $A$ by $C_{\mathfrak{m}_{i}}$ and $X$ by $X_{i}=X \times_{\operatorname{Spec}(C)} \operatorname{Spec}\left(C_{\mathfrak{m}_{i}}\right)$ we reduce to the case discussed in the next paragraph. (Note that $\Gamma\left(X_{i}, \mathcal{O}\right)=C_{\mathfrak{m}_{i}}$ by Cohomology of Schemes, Lemma 29.5.2.)
Here $A$ is a Noetherian local normal domain and $f: X \rightarrow \operatorname{Spec}(A)$ is a regular alteration with $\Gamma\left(X, \mathcal{O}_{X}\right)=A$. We have to show that the completion $A^{\wedge}$ of $A$ is a normal domain. By Lemma 47.11.2 $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ is regular. Since
$\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ by Cohomology of Schemes, Lemma 29.5.2, we conclude that $A^{\wedge}$ is normal as before. Namely, $Y$ is normal by Properties, Lemma 27.9.4. It is connected because $\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ is local. Hence $Y$ is normal and integral (as connected and normal implies integral for Noetherian schemes). Thus $\Gamma\left(Y, \mathcal{O}_{Y}\right)=A^{\wedge}$ is a normal domain by Properties, Lemma 27.7.9. This proves (3).

Proof of (4). Let $\eta \in \operatorname{Spec}(A)$ denote the generic point and denote by a subscript $\eta$ the base change to $\eta$. Since $f$ is an alteration, the scheme $X_{\eta}$ is finite and faithfully flat over $\eta$. Since $Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\wedge}\right)$ is regular by Lemma 47.11.2 we see that $Y_{\eta}$ is regular (as a limit of opens in $Y$ ). Then $Y_{\eta} \rightarrow \operatorname{Spec}\left(A^{\wedge} \otimes_{A} f . f .(A)\right)$ is finite faithfully flat onto the generic formal fibre. We conclude by Algebra, Lemma 10.156.4.

### 47.14. Resolution

0BGJ Here is a definition.
0BGK Definition 47.14.1. Let $Y$ be a Noetherian integral scheme. A resolution of singularities of $X$ is a modification $f: X \rightarrow Y$ such that $X$ is regular.

In the case of surfaces we sometimes want a bit more information.
0BGL Definition 47.14.2. Let $Y$ be a 2-dimensional Noetherian integral scheme. We say $Y$ has a resolution of singularities by normalized blowups if there exists a sequence

$$
Y_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow Y_{0} \rightarrow Y
$$

where
(1) $Y_{i}$ is proper over $Y$ for $i=0, \ldots, n$,
(2) $Y_{0} \rightarrow Y$ is the normalization,
(3) $Y_{i} \rightarrow Y_{i-1}$ is a normalized blowup for $i=1, \ldots, n$, and
(4) $Y_{n}$ is regular.

Observe that condition (1) implies that the normalization $Y_{0}$ of $Y$ is finite over $Y$ and that the normalizations used in the normalized blowing ups are finite as well.

0BGM Lemma 47.14.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring. Assume $A$ is normal and has dimension 2. If $\operatorname{Spec}(A)$ has a resolution of singularities, then $\operatorname{Spec}(A)$ has a resolution by normalized blowups.

Proof. By Lemma 47.13 .3 the completion $A^{\wedge}$ of $A$ is normal. By Lemma 47.11 .2 we see that $\operatorname{Spec}\left(A^{\wedge}\right)$ has a resolution. By Lemma 47.11.7 any sequence $Y_{n} \rightarrow Y_{n-1} \rightarrow$ $\ldots \rightarrow \operatorname{Spec}\left(A^{\wedge}\right)$ of normalized blowups of comes from a sequence of normalized blowups $X_{n} \rightarrow \ldots \rightarrow \operatorname{Spec}(A)$. Moreover if $Y_{n}$ is regular, then $X_{n}$ is regular by Lemma 47.11.2. Thus it suffices to prove the lemma in case $A$ is complete.

Assume in addition $A$ is a complete. We will use that $A$ is Nagata (Algebra, Proposition 10.154.16), excellent (More on Algebra, Proposition 15.43.3), and has a dualizing complex (Dualizing Complexes, Lemma 45.38.8. Moreover, the same is true for any ring essentially of finite type over $A$. If $B$ is a excellent local normal domain, then the completion $B^{\wedge}$ is normal (as $B \rightarrow B^{\wedge}$ is regular and More on Algebra, Lemma 15.33 .2 applies). We will use this without further mention in the rest of the proof.

Let $X \rightarrow \operatorname{Spec}(A)$ be a resolution of singularities. Choose a sequence of normalized blowing ups

$$
Y_{n} \rightarrow Y_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow \operatorname{Spec}(A)
$$

dominating $X$ (Lemma 47.5.3). The morphism $Y_{n} \rightarrow X$ is an isomorphism away from finitely many points of $X$. Hence we can apply Lemma 47.4.2 to find a sequence of blowing ups

$$
X_{m} \rightarrow X_{m-1} \rightarrow \ldots \rightarrow X
$$

in closed points such that $X_{m}$ dominates $Y_{n}$. Diagram

To prove the lemma it suffices to show that a finite number of normalized blowups of $Y_{n}$ produce a regular scheme. By our diagram above we see that $Y_{n}$ has a resolution (namely $X_{m}$ ). As $Y_{n}$ is a normal surface this implies that $Y_{n}$ has at most finitely many singularities $y_{1}, \ldots, y_{t}$ (because $X_{m} \rightarrow Y_{n}$ is an isomorphism away from the fibres of dimension 1, see Varieties, Lemma 32.15.3).
Let $x_{a} \in X$ be the image of $y_{a}$. Then $\mathcal{O}_{X, x_{a}}$ is regular and hence defines a rational singularity (Lemma 47.8.10). Apply Lemma 47.8.7 to $\mathcal{O}_{X, x_{a}} \rightarrow \mathcal{O}_{Y_{n}, y_{a}}$ to see that $\mathcal{O}_{Y_{n}, y_{a}}$ defines a rational singularity. By Lemma 47.9 .8 there exists a finite sequence of blowups in singular closed points

$$
Y_{a, n_{a}} \rightarrow Y_{a, n_{a}-1} \rightarrow \ldots \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y_{n}, y_{a}}\right)
$$

such that $Y_{a, n_{a}}$ is Gorenstein, i.e., has an invertible dualizing module. By (the essentially trivial) Lemma 47.6 .4 with $n^{\prime}=\sum n_{a}$ these sequences correspond to a sequence of blowups

$$
Y_{n+n^{\prime}} \rightarrow Y_{n+n^{\prime}-1} \rightarrow \ldots \rightarrow Y_{n}
$$

such that $Y_{n+n^{\prime}}$ is normal and the local rings of $Y_{n+n^{\prime}}$ are Gorenstein. Using the references given above We can dominate $Y_{n+n^{\prime}}$ by a sequence of blowups $X_{m+m^{\prime}} \rightarrow$ $\ldots \rightarrow X_{m}$ dominating $Y_{n+n^{\prime}}$ as in the following

Thus again $Y_{n+n^{\prime}}$ has a finite number of singular points $y_{1}^{\prime}, \ldots, y_{s}^{\prime}$, but this time the singularities are rational double points, more precisely, the local rings $\mathcal{O}_{Y_{n+n^{\prime}}, y_{b}^{\prime}}$ are as in Lemma 47.12.3. Arguing exactly as above we conclude that the lemma is true.

0BGN Lemma 47.14.4. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian complete local ring. Assume $A$ is a normal domain of dimension 2. Then $\operatorname{Spec}(A)$ has a resolution of singularities.

Proof. A Noetherian complete local ring is J-2 (More on Algebra, Proposition 15.39.6), Nagata (Algebra, Proposition 10.154.16), excellent (More on Algebra, Proposition 15.43.3), and has a dualizing complex (Dualizing Complexes, Lemma 45.38.8). Moreover, the same is true for any ring essentially of finite type over
$A$. If $B$ is a excellent local normal domain, then the completion $B^{\wedge}$ is normal (as $B \rightarrow B^{\wedge}$ is regular and More on Algebra, Lemma 15.33 .2 applies). In other words, the local rings which we encounter in the rest of the proof will have the required "excellency" properties required of them.
Choose $A_{0} \subset A$ with $A_{0}$ a regular complete local ring and $A_{0} \rightarrow A$ finite, see Algebra, Lemma 10.152.10. This induces a finite extension of fraction fields $K_{0} \subset$ $K$. We will argue by induction on $\left[K: K_{0}\right]$. The base case is when the degree is 1 in which case $A_{0}=A$ and the result is true.

Suppose there is an intermediate field $K_{0} \subset L \subset K, K_{0} \neq L \neq K$. Let $B \subset A$ be the integral closure of $A_{0}$ in $L$. By induction we choose a resolution of singularities $Y \rightarrow \operatorname{Spec}(B)$. Let $X$ be the normalization of $Y \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A)$. Picture:

Since $A$ is J-2 the regular locus of $X$ is open. Since $X$ is a normal surface we conclude that $X$ has at worst finitely many singular points $x_{1}, \ldots, x_{n}$ which are closed points with $\operatorname{dim}\left(\mathcal{O}_{X, x_{i}}\right)=2$. For each $i$ let $y_{i} \in Y$ be the image. Since $\mathcal{O}_{Y, y_{i}}^{\wedge} \rightarrow \mathcal{O}_{X, x_{i}}^{\wedge}$ is finite of smaller degree than before we conclude by induction hypothesis that $\mathcal{O}_{X, x_{i}}^{\wedge}$ has resolution of singularities. By Lemma 47.14.3 there is a sequence

$$
Z_{i, n_{i}}^{\wedge} \rightarrow \ldots \rightarrow Z_{i, 1}^{\wedge} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}}^{\wedge}\right)
$$

of normalized blowups with $Z_{i, n_{i}}^{\wedge}$ regular. By Lemma 47.11 .7 there is a corresponding sequence of normalized blowing ups

$$
Z_{i, n_{i}} \rightarrow \ldots \rightarrow Z_{i, 1} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}}\right)
$$

Then $Z_{i, n_{i}}$ is a regular scheme by Lemma 47.11.2. By Lemma 47.6.5 we can fit these normalized blowing ups into a corresponding sequence

$$
Z_{n} \rightarrow Z_{n-1} \rightarrow \ldots \rightarrow Z_{1} \rightarrow X
$$

and of course $Z_{n}$ is regular too (look at the local rings). This proves the induction step.
Assume there is no intermediate field $K_{0} \subset L \subset K$ with $K_{0} \neq L \neq K$. Then either $K / K_{0}$ is separable or the characteristic to $K$ is $p$ and $\left[K: K_{0}\right]=p$. Then either Lemma 47.8 .9 or 47.8 .13 implies that that reduction to rational singularities is possible. By Lemma 47.8 .8 we conclude that there exists a normal modification $X \rightarrow \operatorname{Spec}(A)$ such that for every singular point $x$ of $X$ the local ring $\mathcal{O}_{X, x}$ defines a rational singularity. Since $A$ is J-2 we find that $X$ has finitely many singular points $x_{1}, \ldots, x_{n}$. By Lemma 47.9 .8 there exists a finite sequence of blowups in singular closed points

$$
X_{i, n_{i}} \rightarrow X_{i, n_{i}-1} \rightarrow \ldots \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x_{i}}\right)
$$

such that $X_{i, n_{i}}$ is Gorenstein, i.e., has an invertible dualizing module. By (the essentially trivial) Lemma 47.6.4 with $n=\sum n_{a}$ these sequences correspond to a sequence of blowups

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X
$$

such that $X_{n}$ is normal and the local rings of $X_{n}$ are Gorenstein. Again $X_{n}$ has a finite number of singular points $x_{1}^{\prime}, \ldots, x_{s}^{\prime}$, but this time the singularities are rational double points, more precisely, the local rings $\mathcal{O}_{X_{n}, x_{i}^{\prime}}$ are as in Lemma 47.12.3. Arguing exactly as above we conclude that the lemma is true.

We finally come to the main theorem of this chapter.
0BGP Theorem 47.14.5 (Lipman). Let $Y$ be a two dimensional integral Noetherian scheme. The following are equivalent

Lip78, Theorem on
(1) there exists an alteration $X \rightarrow Y$ with $X$ regular,
(2) there exists a resolution of singularities of $Y$,
(3) $Y$ has a resolution of singularities by normalized blowups,
(4) the normalization $Y^{\nu} \rightarrow Y$ is finite and $Y^{\nu}$ has finitely many singular points $y_{1}, \ldots, y_{m}$ such that the completion of $\mathcal{O}_{Y^{\nu}, y_{i}}$ is normal.
Proof. The implications $(3) \Rightarrow(2) \Rightarrow(1)$ are immediate.
Let $X \rightarrow Y$ be an alteration with $X$ regular. Then $Y^{\nu} \rightarrow Y$ is finite by Lemma 47.13.1. Consider the factorization $f: X \rightarrow Y^{\nu}$ from Morphisms, Lemma 28.49.4. The morphism $f$ is finite over an open $V \subset Y^{\nu}$ containing every point of codimension $\leq 1$ in $Y^{\nu}$ by Varieties, Lemma 32.15.2. Then $f$ is flat over $V$ by Algebra, Lemma 10.127 .1 and the fact that a normal local ring of dimension $\leq 2$ is Cohen-Macaulay by Serre's criterion (Algebra, Lemma 10.149.4). Then $V$ is regular by Algebra, Lemma 10.156.4 As $Y^{\nu}$ is Noetherian we conclude that $Y^{\nu} \backslash V=\left\{y_{1}, \ldots, y_{m}\right\}$ is finite. By Lemma 47.13 .3 the completion of $\mathcal{O}_{Y^{\nu}, y_{i}}$ is normal. In this way we see that $(1) \Rightarrow(4)$.
Assume (4). We have to prove (3). We may immediately replace $Y$ by its normalization. Let $y_{1}, \ldots, y_{m} \in Y$ be the singular points. Applying Lemmas 47.14.4 and 47.14 .3 we find there exists a finite sequence of normalized blowups

$$
Y_{i, n_{i}} \rightarrow Y_{i, n_{i}-1} \rightarrow \ldots \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y_{i}}^{\wedge}\right)
$$

such that $Y_{i, n_{i}}$ is regular. By Lemma 47.11.7 there is a corresponding sequence of normalized blowing ups

$$
X_{i, n_{i}} \rightarrow \ldots \rightarrow X_{i, 1} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y_{i}}\right)
$$

Then $X_{i, n_{i}}$ is a regular scheme by Lemma 47.11.2. By Lemma 47.6.5 we can fit these normalized blowing ups into a corresponding sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow Y
$$

and of course $X_{n}$ is regular too (look at the local rings). This completes the proof.

### 47.15. Embedded resolution

0BI3 Given a curve on a surface there is a blowing up which turns the curve into a strict normal crossings divisor. In this section we will use that a one dimensional locally Noetherian scheme is normal if and only if it is regular (Algebra, Lemma 10.118.7). We will also use that any point on a locally Noetherian scheme specializes to a closed point (Properties, Lemma 27.5.9).
0BI4 Lemma 47.15.1. Let $Y$ be a one dimensional integral Noetherian scheme. The following are equivalent
(1) there exists an alteration $X \rightarrow Y$ with $X$ regular,
(2) there exists a resolution of singularities of $Y$,
(3) there exists a finite sequence $Y_{n} \rightarrow Y_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow Y$ of blowups in closed points with $Y_{n}$ regular, and
(4) the normalization $Y^{\nu} \rightarrow Y$ is finite.

Proof. The implications $(3) \Rightarrow(2) \Rightarrow(1)$ are immediate. The implication $(1) \Rightarrow$ (4) follows from Lemma 47.13.1. Observe that a normal one dimensional scheme is regular hence the implication $(4) \Rightarrow(2)$ is clear as well. Thus it remains to show that the equivalent conditions (1), (2), and (4) imply (3).

Let $f: X \rightarrow Y$ be a resolution of singularities. Since the dimension of $Y$ is one we see that $f$ is finite by Varieties, Lemma 32.15 .2 . We will construct factorizations

$$
X \rightarrow \ldots \rightarrow Y_{2} \rightarrow Y_{1} \rightarrow Y
$$

where $Y_{i} \rightarrow Y_{i-1}$ is a blowing up of a closed point and not an isomorphism as long as $Y_{i-1}$ is not regular. Each of these morphisms will be finite (by the same reason as above) and we will get a corresponding system

$$
f_{*} \mathcal{O}_{X} \supset \ldots \supset f_{2, *} \mathcal{O}_{Y_{2}} \supset f_{1, *} \mathcal{O}_{Y_{1}} \supset \mathcal{O}_{Y}
$$

where $f_{i}: Y_{i} \rightarrow Y$ is the structure morphism. Since $Y$ is Noetherian, this increasing sequence of coherent submodules must stabilize (Cohomology of Schemes, Lemma 29.10.1 which proves that for some $n$ the scheme $Y_{n}$ is regular as desired. To construct $Y_{i}$ given $Y_{i-1}$ we pick a singular closed point $y_{i-1} \in Y_{i-1}$ and we let $Y_{i} \rightarrow$ $Y_{i-1}$ be the corresponding blowup. Since $X$ is regular of dimension 1 (and hence the local rings at closed points are discrete valuation rings and in particular PIDs), the ideal sheaf $\mathfrak{m}_{y_{i-1}} \cdot \mathcal{O}_{X}$ is invertible. By the universal property of blowing up (Divisors, Lemma 30.26.5) this gives us a factorization $X \rightarrow Y_{i}$. Finally, $Y_{i} \rightarrow Y_{i-1}$ is not an isomorphism as $\mathfrak{m}_{y_{i-1}}$ is not an invertible ideal.

0BI5 Lemma 47.15.2. Let $X$ be a Noetherian scheme. Let $Y \subset X$ be an integral closed subscheme of dimension 1 satisfying the equivalent conditions of Lemma 47.15.1. Then there exists a finite sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X
$$

of blowups in closed points such that the strict transform of $Y$ in $X_{n}$ is a regular curve.

Proof. Let $Y_{n} \rightarrow Y_{n-1} \rightarrow \ldots \rightarrow Y_{1} \rightarrow Y$ be the sequence of blowups given to us by Lemma 47.15.1 Let $X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X$ be the corresponding sequence of blowups of $X$. This works because the strict transform is the blowup by Divisors, Lemma 30.27.2.

Let $X$ be a locally Noetherian scheme. Let $Y, Z \subset X$ be closed subschemes. Let $p \in Y \cap Z$ be a closed point. Assume that $Y$ is integral of dimension 1 and that the generic point of $Y$ is not contained in $Z$. In this situation we can consider the invariant

0BI6 (47.15.2.1)

$$
m_{p}(Y \cap Z)=\operatorname{length}_{\mathcal{O}_{X, p}}\left(\mathcal{O}_{Y \cap Z, p}\right)
$$

This is an integer $\geq 1$. Namely, if $I, J \subset \mathcal{O}_{X, p}$ are the ideals corresponding to $Y, Z$, then we see that $\mathcal{O}_{Y \cap Z, p}=\mathcal{O}_{X, p} / I+J$ has support equal to $\left\{\mathfrak{m}_{p}\right\}$ because
we assumed that $Y \cap Z$ does not contain the unique point of $Y$ specializing to $p$. Hence the length is finite by Algebra, Lemma 10.61 .3 .

0BI7 Lemma 47.15.3. In the situation above let $X^{\prime} \rightarrow X$ be the blowing up of $X$ in $p$. Let $Y^{\prime}, Z^{\prime} \subset X^{\prime}$ be the strict transforms of $Y, Z$. If $\mathcal{O}_{Y, p}$ is regular, then
(1) $Y^{\prime} \rightarrow Y$ is an isomorphism,
(2) $Y^{\prime}$ meets the exceptional fibre $E \subset X^{\prime}$ in one point $q$ and $m_{q}(Y \cap E)=1$,
(3) if $q \in Z^{\prime}$ too, then $m_{q}\left(Y \cap Z^{\prime}\right)<m_{p}(Y \cap Z)$.

Proof. Since $\mathcal{O}_{X, p} \rightarrow \mathcal{O}_{Y, p}$ is surjective and $\mathcal{O}_{Y, p}$ is a discrete valuation ring, we can pick an element $x_{1} \in \mathfrak{m}_{p}$ mapping to a uniformizer in $\mathcal{O}_{Y, p}$. Choose an affine open $U=\operatorname{Spec}(A)$ containing $p$ such that $x_{1} \in A$. Let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to $p$. Let $I, J \subset A$ be the ideals defining $Y, Z$ in $\operatorname{Spec}(A)$. After shrinking $U$ we may assume that $\mathfrak{m}=I+\left(x_{1}\right)$, in other words, that $V\left(x_{1}\right) \cap U \cap Y=\{p\}$ scheme theoretically. We conclude that $p$ is an effective Cartier divisor on $Y$ and since $Y^{\prime}$ is the blowing up of $Y$ in $p$ (Divisors, Lemma 30.27.2 we see that $Y^{\prime} \rightarrow Y$ is an isomorphism by Divisors, Lemma 30.26.7. The relationship $\mathfrak{m}=I+\left(x_{1}\right)$ implies that $\mathfrak{m}^{n} \subset I+\left(x_{1}^{n}\right)$ hence we can define a map

$$
\psi: A\left[\frac{\mathfrak{m}}{x_{1}}\right] \longrightarrow A / I
$$

by sending $y / x_{1}^{n} \in A\left[\frac{\mathfrak{m}}{x_{1}}\right]$ to the class of $a$ in $A / I$ where $a$ is chosen such that $y \equiv a x_{1}^{n} \bmod I$. Then $\psi$ corresponds to the morphism of $Y \cap U$ into $X^{\prime}$ over $U$ given by $Y^{\prime} \cong Y$. Since the image of $x_{1}$ in $A\left[\frac{\mathfrak{m}}{x_{1}}\right]$ cuts out the exceptional divisor we conclude that $m_{q}\left(Y^{\prime}, E\right)=1$. Finally, since $J \subset \mathfrak{m}$ implies that the ideal $J^{\prime} \subset A\left[\frac{\mathfrak{m}}{x_{1}}\right]$ certainly contains the elements $f / x_{1}$ for $f \in J$. Thus if we choose $f \in J$ whose image $\bar{f}$ in $A / I$ has minimal valuation equal to $m_{p}(Y \cap Z)$, then we see that $\psi\left(f / x_{1}\right)=\bar{f} / x_{1}$ in $A / I$ has valuation one less proving the last part of the lemma.

0BI8 Lemma 47.15.4. Let $X$ be a Noetherian scheme. Let $Y_{i} \subset X, i=1, \ldots, n$ be an integral closed subschemes of dimension 1 each satisfying the equivalent conditions of Lemma 47.15.1. Then there exists a finite sequence

$$
X_{n} \rightarrow X_{n-1} \rightarrow \ldots \rightarrow X_{1} \rightarrow X
$$

of blowups in closed points such that the strict transform $Y_{i}^{\prime} \subset X_{n}$ of $Y_{i}$ in $X_{n}$ are pairwise disjoint regular curves.

Proof. It follows from Lemma 47.15 .2 that we may assume $Y_{i}$ is a regular curve for $i=1, \ldots, n$. For every $i \neq j$ and $p \in Y_{i} \cap Y_{j}$ we have the invariant $m_{p}\left(Y_{i} \cap Y_{j}\right)$ 47.15.2.1). If the maximum of these numbers is $>1$, then we can decrease it (Lemma 47.15 .3 ) by blowing up in all the points $p$ where the maximum is attained. If the maximum is 1 then we can separate the curves using the same lemma by blowing up in all these points $p$.

When our curve is contained on a regular surface we often want to turn it into a divisor with normal crossings.

0BI9 Definition 47.15.5. Let $X$ be a locally Noetherian scheme. A strict normal crossings divisor on $X$ is an effective Cartier divisor $D \subset X$ such that for every $p \in D$ the local ring $\mathcal{O}_{X, p}$ is regular and there exists a regular system of parameters $x_{1}, \ldots, x_{d} \in \mathfrak{m}_{p}$ and $1 \leq r \leq d$ such that $D$ is cut out by $x_{1} \ldots x_{r}$ in $\mathcal{O}_{X, p}$.

We often encounter effective Cartier divisors $E$ on locally Noetherian schemes $X$ such that there exists a strict normal crossings divisor $D$ with $E \subset D$ set theoretically. In this case we have $E=\sum a_{i} D_{i}$ with $a_{i} \geq 0$ where $D=\bigcup_{i \in I} D_{i}$ is the decomposition of $D$ into its irreducible components. Observe that $D^{\prime}=\bigcup_{a_{i}>0} D_{i}$ is a strict normal crossings divisor with $E=D^{\prime}$ set theoretically. When the above happens we will say that $E$ is supported on a strict normal crossings divisor.

0BIA Lemma 47.15.6. Let $X$ be a locally Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. Let $D_{i} \subset D, i \in I$ be its irreducible components viewed as reduced closed subschemes of $X$. The following are equivalent
(1) $D$ is a strict normal crossings divisor, and
(2) $D$ is reduced and for every nonempty finite subset $J \subset I$ the scheme theoretic intersection $D_{J}=\bigcap_{j \in J} D_{j}$ is a regular scheme each of whose irreducible components has codimension $|J|$ in $X$.
Proof. Assume $D$ is a strict normal crossings divisor. Pick $p \in D$ and choose a regular system of parameters $x_{1}, \ldots, x_{d} \in \mathfrak{m}_{p}$ and $1 \leq r \leq d$ as in Definition47.15.5. Since $\mathcal{O}_{X, p} /\left(x_{i}\right)$ is a regular local ring (and in particular a domain) we see that the irreducible components $D_{1}, \ldots, D_{r}$ of $D$ passing through $p$ correspond 1-to- 1 to the height one primes $\left(x_{1}\right), \ldots,\left(x_{r}\right)$ of $\mathcal{O}_{X, p}$. By Algebra, Lemma 10.105 .3 we find that the intersections $D_{i_{1}} \cap \ldots \cap D_{i_{s}}$ have codimension $s$ in an open neighbourhood of $p$ and that this intersection has a regular local ring at $p$. Since this holds for all $p \in D$ we conclude that (2) holds.
Assume (2). Let $p \in D$. Since $\mathcal{O}_{X, p}$ is finite dimensional we see that $p$ can be contained in at most $\operatorname{dim}\left(\mathcal{O}_{X, p}\right)$ of the components $D_{i}$. Say $p \in D_{1}, \ldots, D_{r}$ for some $r \geq 1$. Let $x_{1}, \ldots, x_{r} \in \mathfrak{m}_{p}$ be local equations for $D_{1}, \ldots, D_{r}$. Then $x_{1}$ is a nonzerodivisor in $\mathcal{O}_{X, p}$ and $\mathcal{O}_{X, p} /\left(x_{1}\right)=\mathcal{O}_{D_{1}, p}$ is regular. Hence $\mathcal{O}_{X, p}$ is regular, see Algebra, Lemma 10.105.7. Since $D_{1} \cap \ldots \cap D_{r}$ is a regular (hence normal) scheme it is a disjoint union of its irreducible components (Properties, Lemma 27.7.6). Let $Z \subset D_{1} \cap \ldots \cap D_{r}$ be the irreducible component containing $p$. Then $\mathcal{O}_{Z, p}=\mathcal{O}_{X, p} /\left(x_{1}, \ldots, x_{r}\right)$ is regular of codimension $r$ (note that since we already know that $\mathcal{O}_{X, p}$ is regular and hence Cohen-Macaulay, there is no ambiguity about codimension as the ring is catenary, see Algebra, Lemmas 10.105.3 and 10.103.4. Hence $\operatorname{dim}\left(\mathcal{O}_{Z, p}\right)=\operatorname{dim}\left(\mathcal{O}_{X, p}\right)-r$. Choose additional $x_{r+1}, \ldots, x_{n} \in \mathfrak{m}_{p}$ which map to a minimal system of generators of $\mathfrak{m}_{Z, p}$. Then $\mathfrak{m}_{p}=\left(x_{1}, \ldots, x_{n}\right)$ by Nakayama's lemma and we see that $D$ is a normal crossings divisor.

0BIB Lemma 47.15.7. Let $X$ be a regular scheme of dimension 2. Let $Z \subset X$ be $a$ proper closed subscheme. There exists a sequence

$$
X_{n} \rightarrow \ldots \rightarrow X_{1} \rightarrow X
$$

of blowing ups in closed points such that the inverse image $Z_{n}$ of $Z$ in $X_{n}$ is an effective Cartier divisor.
Proof. Let $D \subset Z$ be the largest effective Cartier divisor contained in $Z$. Then $\mathcal{I}_{Z} \subset \mathcal{I}_{D}$ and the quotient is supported in closed points by Divisors, Lemma 30.12.8 Thus we can write $\mathcal{I}_{Z}=\mathcal{I}_{Z}, \mathcal{I}_{D}$ where $Z^{\prime} \subset X$ is a closed subscheme which set theoretically consists of finitely many closed points. Applying Lemma 47.4.1 we find a sequence of blowups as in the statement of our lemma such that $\mathcal{I}_{Z^{\prime}} \mathcal{O}_{X_{n}}$ is invertible. This proves the lemma.

0BIC Lemma 47.15.8. Let $X$ be a regular scheme of dimension 2. Let $Z \subset X$ be a proper closed subscheme such that every irreducible component $Y \subset Z$ of dimension 1 satisfies the equivalent conditions of Lemma47.15.1. Then there exists a sequence

$$
X_{n} \rightarrow \ldots \rightarrow X_{1} \rightarrow X
$$

of blowups in closed points such that the inverse image $Z_{n}$ of $Z$ in $X_{n}$ is an effective Cartier divisor supported on a normal crossings divisor.

Proof. Let $X^{\prime} \rightarrow X$ be a blowup in a closed point $p$. Then the inverse image $Z^{\prime} \subset X^{\prime}$ of $Z$ is supported on the strict transform of $Z$ and the exceptional divisor. The exceptional divisor is a regular curve (Lemma 47.3.1) and the strict transform $Y^{\prime}$ of each irreducible component $Y$ is either equal to $Y$ or the blowup of $Y$ at $p$. Thus in this process we do not produce additional singular components of dimension 1. Thus it follows from Lemmas 47.15 .7 and 47.15 .4 that we may assume $Z$ is an effective Cartier divisor and that all irreducible components $Y$ of $Z$ are regular. (Of course we cannot assume the irreducible components are pairwise disjoint because in each blowup of a point of $Z$ we add a new irreducible component to $Z$, namely the exceptional divisor.)
Assume $Z$ is an effective Cartier divisor whose irreducible components $Y_{i}$ are regular. For every $i \neq j$ and $p \in Y_{i} \cap Y_{j}$ we have the invariant $m_{p}\left(Y_{i} \cap Y_{j}\right)$ 47.15.2.1). If the maximum of these numbers is $>1$, then we can decrease it (Lemma 47.15.3) by blowing up in all the points $p$ where the maximum is attained (note that the "new" invariants $m_{q_{i}}\left(Y_{i}^{\prime} \cap E\right)$ are always 1$)$. If the maximum is 1 then, if $p \in Y_{1} \cap \ldots \cap Y_{r}$ for some $r>2$ and not any of the others (for example), then after blowing up $p$ we see that $Y_{1}^{\prime}, \ldots, Y_{r}^{\prime}$ do not meet in points above $p$ and $m_{q_{i}}\left(Y_{i}^{\prime}, E\right)=1$ where $Y_{i}^{\prime} \cap E=\left\{q_{i}\right\}$. Thus continuing to blowup points where more than 3 of the components of $Z$ meet, we reach the situation where for every closed point $p \in X$ there is either (a) no curves $Y_{i}$ passing through $p$, (b) exactly one curve $Y_{i}$ passing through $p$ and $\mathcal{O}_{Y_{i}, p}$ is regular, or (c) exactly two curves $Y_{i}, Y_{j}$ passing through $p$, the local rings $\mathcal{O}_{Y_{i}, p}, \mathcal{O}_{Y_{j}, p}$ are regular and $m_{p}\left(Y_{i} \cap Y_{j}\right)=1$. This exactly means that $\sum Y_{i}$ is a strict normal crossings divisor on the regular surface $X$.

## CHAPTER 48

## Fundamental Groups of Schemes

0BQ6

### 48.1. Introduction

0BQ7 In this chapter we discuss Grothendieck's fundamental group of a scheme and applications. A foundational reference is Gro71. A nice introduction is Len. Other references Mur67 and GM71.

### 48.2. Schemes étale over a point

04JI In this section we describe schemes étale over the spectrum of a field. Before we state the result we introduce the category of $G$-sets for a topological group $G$.

04JJ Definition 48.2.1. Let $G$ be a topological group. A $G$-set, sometime called a discrete $G$-set, is a set $X$ endowed with a left action $a: G \times X \rightarrow X$ such that $a$ is continuous when $X$ is given the discrete topology and $G \times X$ the product topology. A morphism of $G$-sets $f: X \rightarrow Y$ is simply any $G$-equivariant map from $X$ to $Y$. The category of $G$-sets is denoted $G$-Sets.

The condition that $a: G \times X \rightarrow X$ is continuous signifies simply that the stabilizer of any $x \in X$ is open in $G$. If $G$ is an abstract group $G$ (i.e., a group but not a topological group) then this agrees with our preceding definition (see for example Sites, Example 7.6.5 provided we endow $G$ with the discrete topology.

Recall that if $K \subset L$ is an infinite Galois extension then the Galois group $G=$ $\operatorname{Gal}(L / K)$ comes endowed with a canonical topology, see Fields, Section 9.21

03QR Lemma 48.2.2. Let $K$ be a field. Let $K^{\text {sep }}$ a separable closure of $K$. Consider the profinite group $G=\operatorname{Gal}\left(K^{\text {sep }} / K\right)$. The functor

$$
\begin{array}{clcc}
\text { schemes étale over } K & \longrightarrow & G \text {-Sets } \\
X / K & \longmapsto & \operatorname{Mor}_{\operatorname{Spec}(K)}\left(\operatorname{Spec}\left(K^{\text {sep }}\right), X\right)
\end{array}
$$

is an equivalence of categories.
Proof. A scheme $X$ over $K$ is étale over $K$ if and only if $X \cong \coprod_{i \in I} \operatorname{Spec}\left(K_{i}\right)$ with each $K_{i}$ a finite separable extension of $K$ (Morphisms, Lemma 28.36.7). The functor of the lemma associates to $X$ the $G$-set

$$
\coprod_{i} \operatorname{Hom}_{K}\left(K_{i}, K^{s e p}\right)
$$

with its natural left $G$-action. Each element has an open stabilizer by definition of the topology on $G$. Conversely, any $G$-set $S$ is a disjoint union of its orbits. Say $S=\coprod S_{i}$. Pick $s_{i} \in S_{i}$ and denote $G_{i} \subset G$ its open stabilizer. By Galois theory
(Fields, Theorem 9.21.3) the fields $\left(K^{s e p}\right)^{G_{i}}$ are finite separable field extensions of $K$, and hence the scheme

$$
\coprod_{i} \operatorname{Spec}\left(\left(K^{s e p}\right)^{G_{i}}\right)
$$

is étale over $K$. This gives an inverse to the functor of the lemma. Some details omitted.

03QS Remark 48.2.3. Under the correspondence of Lemma 48.2.2 the coverings in the small étale site $\operatorname{Spec}(K)_{\text {étale }}$ of $K$ correspond to surjective families of maps in $G$-Sets.

### 48.3. Galois categories

$0 B M Q$ In this section we discuss some of the material the reader can find in Gro71, Exposé V, Sections 4, 5, and 6].

Let $F: \mathcal{C} \rightarrow$ Sets be a functor. Recall that by our conventions categories have a set of objects and for any pair of objects a set of morphisms. There is a canonical injective map

0BS7

$$
\begin{equation*}
\operatorname{Aut}(F) \longrightarrow \prod_{X \in \operatorname{Ob}(\mathcal{C})} \operatorname{Aut}(F(X)) \tag{48.3.0.1}
\end{equation*}
$$

For a set $E$ we endow $\operatorname{Aut}(E)$ with the compact open topology, see Topology, Example 5.29.2. Of course this is the discrete topology when $E$ is finite, which is the case of interest in this section ${ }^{1}$. We endow $\operatorname{Aut}(F)$ with the topology induced from the product topology on the right hand side of 48.3 .0 .1 ). In particular, the action maps

$$
\operatorname{Aut}(F) \times F(X) \longrightarrow F(X)
$$

are continuous when $F(X)$ is given the discrete topology because this is true for the action maps $\operatorname{Aut}(E) \times E \rightarrow E$ for any set $E$. The universal property of our topology on $\operatorname{Aut}(F)$ is the following: suppose that $G$ is a topological group and $G \rightarrow \operatorname{Aut}(F)$ is a group homomorphism such that the induced actions $G \times F(X) \rightarrow$ $F(X)$ are continuous for all $X \in \mathrm{Ob}(\mathcal{C})$ where $F(X)$ has the discrete topology. Then $G \rightarrow \operatorname{Aut}(F)$ is continuous.

The following lemma tells us that the group of automorphisms of a functor to the category of finite sets is automatically a profinite group.
0BMR Lemma 48.3.1. Let $\mathcal{C}$ be a category and let $F: \mathcal{C} \rightarrow$ Sets be a functor. The map 48.3.0.1 identifies Aut $(F)$ with a closed subgroup of $\prod_{X \in \mathrm{Ob}(\mathcal{C})} \operatorname{Aut}(F(X))$. In particular, if $F(X)$ is finite for all $X$, then $\operatorname{Aut}(F)$ is a profinite group.

Proof. Let $\xi=\left(\gamma_{X}\right) \in \prod \operatorname{Aut}(F(X))$ be an element not in $\operatorname{Aut}(F)$. Then there exists a morphism $f: X \rightarrow X^{\prime}$ of $\mathcal{C}$ and an element $x \in F(X)$ such that $F(f)\left(\gamma_{X}(x)\right) \neq \gamma_{X^{\prime}}(F(f)(x))$. Consider the open neighbourhood $U=\{\gamma \in$ $\left.\operatorname{Aut}(F(X)) \mid \gamma(x)=\gamma_{X}(x)\right\}$ of $\gamma_{X}$ and the open neighbourhood $U^{\prime}=\left\{\gamma^{\prime} \in\right.$ $\left.\operatorname{Aut}\left(F\left(X^{\prime}\right)\right) \mid \gamma^{\prime}(F(f)(x))=\gamma_{X^{\prime}}(F(f)(x))\right\}$. Then $U \times U^{\prime} \times \prod_{X^{\prime \prime} \neq X, X^{\prime}} \operatorname{Aut}\left(F\left(X^{\prime \prime}\right)\right)$ is an open neighbourhood of $\xi$ not meeting $\operatorname{Aut}(F)$. The final statement is follows from the fact that $\prod \operatorname{Aut}(F(X))$ is a profinite space if each $F(X)$ is finite.

[^127]0BMS Example 48.3.2. Let $G$ be a topological group. An important example will be the forgetful functor
0BMT

$$
\begin{equation*}
\text { Finite-G-Sets } \longrightarrow \text { Sets } \tag{48.3.2.1}
\end{equation*}
$$

where Finite-G-Sets is the full subcategory of $G$-Sets whose objects are the finite $G$-sets. The category $G$-Sets of $G$-sets is defined in Definition 48.2.1

Let $G$ be a topological group. The profinite completion of $G$ will be the profinite group

$$
G^{\wedge}=\lim _{U \subset G \text { open, normal, finite idex }} G / U
$$

with its profinite topology. Observe that the limit is cofiltered as a finite intersection of open, normal subgroups of finite index is another. The universal property of the profinite completion is that any continuous map $G \rightarrow H$ to a profinite group $H$ factors canonically as $G \rightarrow G^{\wedge} \rightarrow H$.

0BMU Lemma 48.3.3. Let $G$ be a topological group. The automorphism group of the functor 48.3.2.1) endowed with its profinite topology from Lemma 48.3.1 is the profinite completion of $G$.

Proof. Denote $F_{G}$ the functor 48.3.2.1). Any morphism $X \rightarrow Y$ in Finite- $G$-Sets commutes with the action of $G$. Thus any $g \in G$ defines an automorphism of $F_{G}$ and we obtain a canonical homomorphism $G \rightarrow \operatorname{Aut}\left(F_{G}\right)$ of groups. Observe that any finite $G$-set $X$ is a finite disjoint union of $G$-sets of the form $G / H_{i}$ with canonical $G$-action where $H_{i} \subset G$ is an open subgroup of finite index. Then $U_{i}=\bigcap g H_{i} g^{-1}$ is open, normal, and has finite index. Moreover $U_{i}$ acts trivially on $G / H_{i}$ hence $U=$ $\bigcap U_{i}$ acts trivially on $F_{G}(X)$. Hence the action $G \times F_{G}(X) \rightarrow F_{G}(X)$ is continuous. By the universal property of the topology on $\operatorname{Aut}\left(F_{G}\right)$ the map $G \rightarrow \operatorname{Aut}\left(F_{G}\right)$ is continuous. By Lemma 48.3.1 and the universal property of profinite completion there is an induced continuous group homomorphism

$$
G^{\wedge} \longrightarrow \operatorname{Aut}\left(F_{G}\right)
$$

Moreover, since $G / U$ acts faithfully on $G / U$ this map is injective. If the image is dense, then the map is surjective and hence a homeomorphism by Topology, Lemma 5.16 .8

Let $\gamma \in \operatorname{Aut}\left(F_{G}\right)$ and let $X \in \operatorname{Ob}(\mathcal{C})$. We will show there is a $g \in G$ such that $\gamma$ and $g$ induce the same action on $F_{G}(X)$. This will finish the proof. As before we see that $X$ is a finite disjoint union of $G / H_{i}$. With $U_{i}$ and $U$ as above, the finite $G$-set $Y=G / U$ surjects onto $G / H_{i}$ for all $i$ and hence it suffices to find $g \in G$ such that $\gamma$ and $g$ induce the same action on $F_{G}(G / U)=G / U$. Let $e \in G$ be the neutral element and say that $\gamma(e U)=g_{0} U$ for some $g_{0} \in G$. For any $g_{1} \in G$ the morphism

$$
R_{g_{1}}: G / U \longrightarrow G / U, \quad g U \longmapsto g g_{1} U
$$

of Finite-G-Sets commutes with the action of $\gamma$. Hence

$$
\gamma\left(g_{1} U\right)=\gamma\left(R_{g_{1}}(e U)\right)=R_{g_{1}}(\gamma(e U))=R_{g_{1}}\left(g_{0} U\right)=g_{0} g_{1} U
$$

Thus we see that $g=g_{0}$ works.
Recall that an exact functor is one which commutes with all finite limits and finite colimits. In particular such a functor commutes with equalizers, coequalizers, fibred products, pushouts, etc.

0BMV Lemma 48.3.4. Let $G$ be a topological group. Let $F$ : Finite- $G$-Sets $\rightarrow$ Sets be an exact functor with $F(X)$ finite for all $X$. Then $F$ is isomorphic to the functor 48.3.2.1.

Proof. Let $X$ be a nonempty object of Finite-G-Sets. The diagram

is cocartesian. Hence we conclude that $F(X)$ is nonempty. Let $U \subset G$ be an open, normal subgroup with finite index. Observe that

$$
G / U \times G / U=\coprod_{g U \in G / U} G / U
$$

where the summand corresponding to $g U$ corresponds to the orbit of $(e U, g U)$ on the left hand side. Then we see that

$$
F(G / U) \times F(G / U)=F(G / U \times G / U)=\coprod_{g U \in G / U} F(G / U)
$$

Hence $|F(G / U)|=|G / U|$ as $F(G / U)$ is nonempty. Thus we see that

$$
\lim _{U \subset G \text { open, normal, finite idex }} F(G / U)
$$

is nonempty (Categories, Lemma 4.21.5. Pick $\gamma=\left(\gamma_{U}\right)$ an element in this limit. Denote $F_{G}$ the functor 48.3 .2 .1 ). We can identify $F_{G}$ with the functor

$$
X \longmapsto \operatorname{colim}_{U} \operatorname{Mor}(G / U, X)
$$

where $f: G / U \rightarrow X$ corresponds to $f(e U) \in X=F_{G}(X)$ (details omitted). Hence the element $\gamma$ determines a well defined map

$$
t: F_{G} \longrightarrow F
$$

Namely, given $x \in X$ choose $U$ and $f: G / U \rightarrow X$ sending $e U$ to $x$ and then set $t_{X}(x)=F(f)\left(\gamma_{U}\right)$. We will show that $t$ induces a bijective map $t_{G / U}$ : $F_{G}(G / U) \rightarrow F(G / U)$ for any $U$. This implies in a straightforward manner that $t$ is an isomorphism (details omitted). Since $\left|F_{G}(G / U)\right|=|F(G / U)|$ it suffices to show that $t_{G / U}$ is surjective. The image contains at least one element, namely $t_{G / U}(e U)=F\left(\operatorname{id}_{G / U}\right)\left(\gamma_{U}\right)=\gamma_{U}$. For $g \in G$ denote $R_{g}: G / U \rightarrow G / U$ right multiplication. Then set of fixed points of $F\left(R_{g}\right): F(G / U) \rightarrow F(G / U)$ is equal to $F(\emptyset)=\emptyset$ if $g \notin U$ because $F$ commutes with equalizers. It follows that if $g_{1}, \ldots, g_{|G / U|}$ is a system of representatives for $G / U$, then the elements $F\left(R_{g_{i}}\right)\left(\gamma_{U}\right)$ are pairwise distinct and hence fill out $F(G / U)$. Then

$$
t_{G / U}\left(g_{i} U\right)=F\left(R_{g_{i}}\right)\left(\gamma_{U}\right)
$$

and the proof is complete.
0BMW Example 48.3.5. Let $\mathcal{C}$ be a category and let $F: \mathcal{C} \rightarrow$ Sets be a functor such that $F(X)$ is finite for all $X \in \operatorname{Ob}(\mathcal{C})$. By Lemma 48.3.1 we see that $G=\operatorname{Aut}(F)$ comes endowed with the structure of a profinite topological group in a canonical manner. We obtain a functor
0BMX (48.3.5.1)

$$
\mathcal{C} \longrightarrow \text { Finite-G-Sets, } \quad X \longmapsto F(X)
$$

where $F(X)$ is endowed with the induced action of $G$. This action is continuous by our construction of the topology on $\operatorname{Aut}(F)$.

The purpose of defining Galois categories is to single out those pairs $(\mathcal{C}, F)$ for which the functor 48.3 .5 .1 is an equivalence. Our definition of a Galois category is as follows.

0BMY Definition 48.3.6. Let $\mathcal{C}$ be a category and let $F: \mathcal{C} \rightarrow$ Sets be a functor. The pair $(\mathcal{C}, F)$ is a Galois category if
(1) $\mathcal{C}$ has finite limits and finite colimits,

0BMZ
(2) every object of $\mathcal{C}$ is a finite (possibly empty) coproduct of connected objects,
(3) $F(X)$ is finite for all $X \in \mathrm{Ob}(\mathcal{C})$, and
(4) $F$ reflects isomorphisms and is exact.

Here we say $X \in \operatorname{Ob}(\mathcal{C})$ is connected if it is not initial and for any monomorphism $Y \rightarrow X$ either $Y$ is initial or $Y \rightarrow X$ is an isomorphism.

Warning: This definition is not the same (although eventually we'll see it is equivalent) as the definition given in most references. Namely, in Gro71, Exposé V, Definition 5.1] a Galois category is defined to be a category equivalent to Finite-G-Sets for some profinite group $G$. Then Grothendieck characterizes Galois categories by a list of axioms (G1) - (G6) which are weaker than our axioms above. The motivation for our choice is to stress the existence of finite limits and finite colimits and exactness of the functor $F$. The price we'll pay for this later is that we'll have to work a bit harder to apply the results of this section.

0BN0 Lemma 48.3.7. Let $(\mathcal{C}, F)$ be a Galois category. Let $X \rightarrow Y \in \operatorname{Arrows}(\mathcal{C})$. Then
(1) $F$ is faithful,
(2) $X \rightarrow Y$ is a monomorphism $\Leftrightarrow F(X) \rightarrow F(Y)$ is injective,
(3) $X \rightarrow Y$ is an epimorphism $\Leftrightarrow F(X) \rightarrow F(Y)$ is surjective,
(4) an object $A$ of $\mathcal{C}$ is initial if and only if $F(A)=\emptyset$,
(5) an object $Z$ of $\mathcal{C}$ is final if and only if $F(Z)$ is a singleton,
(6) if $X$ and $Y$ are connected, then $X \rightarrow Y$ is an epimorphism,

0BN1 (7) if $X$ is connected and $a, b: X \rightarrow Y$ are two morphisms then $a=b$ as soon as $F(a)$ and $F(b)$ agree on one element of $F(X)$,
(8) if $X=\coprod_{i=1, \ldots, n} X_{i}$ and $Y=\coprod_{j=1, \ldots, m} Y_{j}$ where $X_{i}, Y_{j}$ are connected, then there is map $\alpha:\{1, \ldots, n\} \rightarrow\{1, \ldots, m\}$ such that $X \rightarrow Y$ comes from a collection of morphisms $X_{i} \rightarrow Y_{\alpha(i)}$.
Proof. Proof of (1). Suppose $a, b: X \rightarrow Y$ with $F(a)=F(b)$. Let $E$ be the equalizer of $a$ and $b$. Then $F(E)=F(X)$ and we see that $E=X$ because $F$ reflects isomorphisms.
Proof of (2). This is true because $F$ turns the morphism $X \rightarrow X \times_{Y} X$ into the map $F(X) \rightarrow F(X) \times{ }_{F(Y)} F(X)$ and $F$ reflects isomorphisms.

Proof of (3). This is true because $F$ turns the morphism $Y \amalg_{X} Y \rightarrow Y$ into the map $F(Y) \amalg_{F(X)} F(Y) \rightarrow F(Y)$ and $F$ reflects isomorphisms.
Proof of (4). There exists an initial object $A$ and certainly $F(A)=\emptyset$. On the other hand, if $X$ is an object with $F(X)=\emptyset$, then the unique map $A \rightarrow X$ induces a bijection $F(A) \rightarrow F(X)$ and hence $A \rightarrow X$ is an isomorphism.

Different from the definition in
Gro71, Exposé V, Definition 5.1].
Compare with
BS13, Definition 7.2.1].

Proof of (5). There exists a final object $Z$ and certainly $F(Z)$ is a singleton. On the other hand, if $X$ is an object with $F(X)$ a singleton, then the unique map $X \rightarrow Z$ induces a bijection $F(X) \rightarrow F(Z)$ and hence $X \rightarrow Z$ is an isomorphism.

Proof of (6). The equalizer $E$ of the two maps $Y \rightarrow Y \amalg_{X} Y$ is not an initial object of $\mathcal{C}$ because $X \rightarrow Y$ factors through $E$ and $F(X) \neq \emptyset$. Hence $E=Y$ and we conclude.

Proof of (7). The equalizer $E$ of $a$ and $b$ comes with a monomorphism $E \rightarrow X$ and $F(E) \subset F(X)$ is the set of elements where $F(a)$ and $F(b)$ agree. To finish use that either $E$ is initial or $E=X$.

Proof of (8). For each $i, j$ we see that $E_{i j}=X_{i} \times_{Y} Y_{j}$ is either initial or equal to $X_{i}$. Picking $s \in F\left(X_{i}\right)$ we see that $E_{i j}=X_{i}$ if and only if $s$ maps to an element of $F\left(Y_{j}\right) \subset F(Y)$, hence this happens for a unique $j=\alpha(i)$.

By the lemma above we see that, given a connected object $X$ of a Galois categoey $(\mathcal{C}, F)$, the automorphism group $\operatorname{Aut}(X)$ has order at most $|F(X)|$. Namely, given $s \in F(X)$ and $g \in \operatorname{Aut}(X)$ we see that $g(s)=s$ if and only if $g=\operatorname{id}_{X}$ by (7). We say $X$ is Galois if equality holds. Equivalently, $X$ is Galois if it is connected and Aut $(X)$ acts transitively on $F(X)$.

0BN2 Lemma 48.3.8. Let $(\mathcal{C}, F)$ be a Galois category. For any connected object $X$ of $\mathcal{C}$ there exists a Galois object $Y$ and a morphism $Y \rightarrow X$.

Proof. We will use the results of Lemma 48.3.7 without further mention. Let $n=|F(X)|$. Consider $X^{n}$ endowed with its natural action of $S_{n}$. Let

$$
X^{n}=\coprod_{t \in T} Z_{t}
$$

be the decomposition into connected objects. Pick a $t$ such that $F\left(Z_{t}\right)$ contains $\left(s_{1}, \ldots, s_{n}\right)$ with $s_{i}$ pairwise distinct. If $\left(s_{1}^{\prime}, \ldots, s_{n}^{\prime}\right) \in F\left(Z_{t}\right)$ is another element, then we claim $s_{i}^{\prime}$ are pairwise distinct as well. Namely, if not, say $s_{i}^{\prime}=s_{j}^{\prime}$, then $Z_{t}$ is the image of an connected component of $X^{n-1}$ under the diagonal morphism

$$
\Delta_{i j}: X^{n-1} \longrightarrow X^{n}
$$

Since morphisms of connected objects are epimorphisms and induce surjections after applying $F$ it would follow that $s_{i}=s_{j}$ which is not the case.

Let $G \subset S_{n}$ be the subgroup of elements with $g\left(Z_{t}\right)=Z_{t}$. Looking at the action of $S_{n}$ on

$$
F(X)^{n}=F\left(X^{n}\right)=\coprod_{t^{\prime} \in T} F\left(Z_{t^{\prime}}\right)
$$

we see that $G=\left\{g \in S_{n} \mid g\left(s_{1}, \ldots, s_{n}\right) \in F\left(Z_{t}\right)\right\}$. Now pick a second element $\left(s_{1}^{\prime}, \ldots, s_{n}^{\prime}\right) \in F\left(Z_{t}\right)$. Above we have seen that $s_{i}^{\prime}$ are pairwise distinct. Thus we can find a $g \in S_{n}$ with $g\left(s_{1}, \ldots, s_{n}\right)=\left(s_{1}^{\prime}, \ldots, s_{n}^{\prime}\right)$. In other words, the action of $G$ on $F\left(Z_{t}\right)$ is transitive and the proof is complete.

Here is a key lemma.
0BN3 Lemma 48.3.9. Let $(\mathcal{C}, F)$ be a Galois category. Let $G=A u t(F)$ be as in Example 48.3.5. For any connected $X$ in $\mathcal{C}$ the action of $G$ on $F(X)$ is transitive.

Compare with BS13, Definition 7.2.4].

Proof. We will use the results of Lemma 48.3.7 without further mention. Let $I$ be the set of isomorphism classes of Galois objects in $\mathcal{C}$. For each $i \in I$ let $X_{i}$ be a representative of the isomorphism class. Choose $\gamma_{i} \in F\left(X_{i}\right)$ for each $i \in I$. We define a partial ordering on $I$ by setting $i \geq i^{\prime}$ if and only if there is a morphism $f_{i i^{\prime}}: X_{i} \rightarrow X_{i^{\prime}}$. Given such a morphism we can post-compose by an automorphism $X_{i^{\prime}} \rightarrow X_{i^{\prime}}$ to assure that $F\left(f_{i i^{\prime}}\right)\left(\gamma_{i}\right)=\gamma_{i^{\prime}}$. With this normalization the morphsm $f_{i i^{\prime}}$ is unique.

We claim that the functor $F$ is isomorphic to the functor $F^{\prime}$ which sends $X$ to

$$
F^{\prime}(X)=\operatorname{colim}_{I} \operatorname{Mor}_{\mathcal{C}}\left(X_{i}, X\right)
$$

via the transformation of functors $t: F^{\prime} \rightarrow F$ defined as follows: given $f: X_{i} \rightarrow X$ we set $t_{X}(f)=F(f)\left(\gamma_{i}\right)$. Using (7) we find that $t_{X}$ is injective. To show surjectivity, let $\gamma \in F(X)$. Then we can immediately reduce to the case where $X$ is connected by the definition of a Galois category. Then we may assume $X$ is Galois by Lemma 48.3.8. In this case $X$ is isomorphic to $X_{i}$ for some $i$ and we can choose the isomorphism $X_{i} \rightarrow X$ such that $\gamma_{i}$ maps to $\gamma$ (by definition of Galois objects). We conclude that $t$ is an isomorphism.
Set $A_{i}=\operatorname{Aut}\left(X_{i}\right)$. We claim that for $i \geq i^{\prime}$ there is a canonical map $h_{i i^{\prime}}: A_{i} \rightarrow A_{i^{\prime}}$ such that for all $a \in A_{i}$ the diagram

commutes. Namely, just let $h_{i i^{\prime}}(a)=a^{\prime}: X_{i^{\prime}} \rightarrow X_{i^{\prime}}$ be the unique automorphism such that $F\left(a^{\prime}\right)\left(\gamma_{i^{\prime}}\right)=F\left(f_{i i^{\prime}} \circ a\right)\left(\gamma_{i}\right)$. As before this makes the diagram commute and moreover the choice is unique. It follows that $h_{i^{\prime} i^{\prime \prime}} \circ h_{i i^{\prime}}=h_{i i^{\prime \prime}}$ if $i \geq i^{\prime} \geq i^{\prime \prime}$. Since $F\left(X_{i}\right) \rightarrow F\left(X_{i^{\prime}}\right)$ is surjective we see that $A_{i} \rightarrow A_{i^{\prime}}$ is surjective. Taking the inverse limit we obtain a group

$$
A=\lim _{I} A_{i}
$$

This is a profinite group since the automorphism groups are finite and moreover $A \rightarrow A_{i}$ is surjective for all $i$.
Since elements of $A$ act on the inverse system $X_{i}$ we get an action of $A$ (on the right) on $F^{\prime}$ by pre-composing. In other words, we get a homomorphism $A^{\text {opp }} \rightarrow G$. Since $A \rightarrow A_{i}$ is surjective we conclude that $G$ acts transitively on $F\left(X_{i}\right)$ for all $i$. Since every connected object is dominated by one of the $X_{i}$ we conclude the lemma is true.

0BN4 Proposition 48.3.10. Let $(\mathcal{C}, F)$ be a Galois category. Let $G=A u t(F)$ be as in Example 48.3.5. The functor $F: \mathcal{C} \rightarrow$ Finite- $G$-Sets 48.3.5.1) an equivalence.

Proof. We will use the results of Lemma 48.3.7 without further mention. In particular we know the functor is faithful. By Lemma 48.3 .9 we know that for any connected $X$ the action of $G$ on $F(X)$ is transitive. Hence $F$ preserves the decomposition into connected components (existence of which is an axioms of a Galois category). Let $X$ and $Y$ be objects and let $s: F(X) \rightarrow F(Y)$ be a map. Then the graph $\Gamma_{s} \subset F(X) \times F(Y)$ of $s$ is a union of connected components. Hence there exists a union of connected components $Z$ of $X \times Y$, which comes equipped

This is a weak version of Gro71, Exposé V]. The proof is borrowed from BS13
Theorem 7.2.5].
with a monomorphism $Z \rightarrow X \times Y$, with $F(Z)=\Gamma_{s}$. Since $F(Z) \rightarrow F(X)$ is bijective we see that $Z \rightarrow X$ is an isomorphism and we conclude that $s=F(f)$ where $f: X \cong Z \rightarrow Y$ is the composition. Hence $F$ is fully faithful.
To finish the proof we show that $F$ is essentially surjective. It suffices to show that $G / H$ is in the essential image for any open subgroup $H \subset G$ of finite index. By definition of the topology on $G$ there exists a finite collection of objects $X_{i}$ such that

$$
\operatorname{Ker}\left(G \longrightarrow \prod_{i} \operatorname{Aut}\left(F\left(X_{i}\right)\right)\right)
$$

is contained in $H$. We may assume $X_{i}$ is connected for all $i$. We can choose a Galois object $Y$ mapping to a connected component of $\prod X_{i}$ using Lemma 48.3.8. Choose an isomorphism $F(Y)=G / U$ in $G$-sets for some open subgroup $U \subset G$. As $Y$ is Galois, the group $\operatorname{Aut}(Y)=\operatorname{Aut}_{G-\operatorname{Sets}}(G / U)$ acts transitively on $F(Y)=G / U$. This implies that $U$ is normal. Since $F(Y)$ surjects onto $F\left(X_{i}\right)$ for each $i$ we see that $U \subset H$. Let $M \subset \operatorname{Aut}(Y)$ be the finite subgroup corresponding to

$$
(H / U)^{o p p} \subset(G / U)^{o p p}=\operatorname{Aut}_{G-S e t s}(G / U)=\operatorname{Aut}(Y)
$$

Set $X=Y / M$, i.e., $X$ is the coequalizer of the arrows $m: Y \rightarrow Y, m \in M$. Since $F$ is exact we see that $F(X)=G / H$ and the proof is complete.

0BN5 Lemma 48.3.11. Let $(\mathcal{C}, F)$ and $\left(\mathcal{C}^{\prime}, F^{\prime}\right)$ be Galois categories. Let $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ be an exact functor. There exists an isomorphism $t: F^{\prime} \circ H \rightarrow F$. The choice of $t$ determines a continuous homomorphism $h: G^{\prime}=\operatorname{Aut}\left(F^{\prime}\right) \rightarrow \operatorname{Aut}(F)=G$ and $a$ 2-commutative diagram

The map $h$ is independent of t up to an inner automorphism of $G$. Conversely, given a continuous homomorphism $h: G^{\prime} \rightarrow G$ there is an exact functor $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ and an isomorphism $t$ recovering $h$ as above.

Proof. By Proposition 48.3 .10 and Lemma 48.3 .3 we may assume $\mathcal{C}=$ Finite-G-Sets and $F$ is the forgetful functor and similarly for $\mathcal{C}^{\prime}$. Thus the existence of $t$ follows from Lemma 48.3.4. The map $h$ comes from transport of structure via $t$. The commutativity of the diagram is obvious. Uniqueness of $h$ up to innner conjugation by an element of $G$ comes from the fact that the choice of $t$ is unique up to an element of $G$. The final statement is straightforward.

0BN6 Lemma 48.3.12. Let $(\mathcal{C}, F)$ and $\left(\mathcal{C}^{\prime}, F^{\prime}\right)$ be Galois categories. Let $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ be an exact functor. Let $h: G^{\prime}=\operatorname{Aut}\left(F^{\prime}\right) \rightarrow \operatorname{Aut}(F)=G$ be the corresponding continuous homomorphism as in Lemma 48.3.11. The following are equivalent
(1) $h$ is surjective, and
(2) $H$ is fully faithful.

Proof. Here we are just saying that given a continuous group homomorphism $h$ : $G \rightarrow G^{\prime}$ of profinite groups the corresponding functor Finite- $G$-Sets $\rightarrow$ Finite- $G^{\prime}$-Sets is fully faithful if and only if $h$ is surjective. This is clear because $h$ is not surjective if and only if there exists a finite discrete $G^{\prime}$-set $M$ with a nontrivial action such that $G$ acts trivially on $M$.

0BS8 Lemma 48.3.13. Let $(\mathcal{C}, F),\left(\mathcal{C}^{\prime}, F^{\prime}\right),\left(\mathcal{C}^{\prime \prime}, F^{\prime \prime}\right)$ be Galois categories. Set $G=$ $\operatorname{Aut}(F), G^{\prime}=\operatorname{Aut}\left(F^{\prime}\right)$, and $G^{\prime \prime}=\operatorname{Aut}\left(F^{\prime \prime}\right)$. Let $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ and $H^{\prime}: \mathcal{C}^{\prime} \rightarrow \mathcal{C}^{\prime \prime}$ be exact functors. Let $h: G^{\prime} \rightarrow G$ and $h^{\prime}: G^{\prime \prime} \rightarrow G^{\prime}$ be the corresponding continuous homomorphism as in Lemma 48.3.11. The following are equivalent
(1) $h \circ h^{\prime}$ is trivial, and
(2) the image of $H^{\prime} \circ H$ consists of objects isomorphic to finite coproducts of final objects.

Proof. We may assume the functors $H$ and $H^{\prime}$ are the canonical functors Finite-G-Sets $\rightarrow$ Finite- $G^{\prime}$-Sets $\rightarrow$ Finite- $G^{\prime \prime}$-Sets determined by $h$ and $h^{\prime}$. Then we are saying that the action of $G^{\prime \prime}$ on every $G$-set is trivial if and only if the homomorphism $G^{\prime \prime} \rightarrow G$ is trivial. This is clear.

0BS9 Lemma 48.3.14. Let $(\mathcal{C}, F),\left(\mathcal{C}^{\prime}, F^{\prime}\right),\left(\mathcal{C}^{\prime \prime}, F^{\prime \prime}\right)$ be Galois categories. Set $G=$ $\operatorname{Aut}(F), G^{\prime}=\operatorname{Aut}\left(F^{\prime}\right)$, and $G^{\prime \prime}=\operatorname{Aut}\left(F^{\prime \prime}\right)$. Let $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ and $H^{\prime}: \mathcal{C}^{\prime} \rightarrow \mathcal{C}^{\prime \prime}$ be exact functors. Let $h: G^{\prime} \rightarrow G$ and $h^{\prime}: G^{\prime \prime} \rightarrow G^{\prime}$ be the corresponding continuous homomorphism as in Lemma 48.3.11. The following are equivalent
(1) the sequence $G^{\prime \prime} \xrightarrow{h^{\prime}} G^{\prime} \xrightarrow{h} G \rightarrow 1$ is exact in the following sense: $h$ is surjective, $h \circ h^{\prime}$ is trivial, and $\operatorname{Ker}(h)$ is the smallest closed normal subgroup containing $\operatorname{Im}\left(h^{\prime}\right)$, and
(2) $H$ is fully faithful, and an object $X^{\prime}$ of $\mathcal{C}^{\prime}$ is in the essential image of $H$ if and only if $H^{\prime}\left(X^{\prime}\right)$ is isomorphic to a finite coproduct of final objects.

Proof. By Lemmas 48.3 .12 and 48.3 .13 we may assume that $H$ is fully faithful, $h$ is surjective, $H^{\prime} \circ H$ maps objects to disjoint unions of the final object, and $h \circ h^{\prime}$ is trivial. Let $N \subset G^{\prime}$ be the smallest closed normal subgroup containing the image of $h^{\prime}$. It is clear that $N \subset \operatorname{Ker}(h)$. We may assume the functors $H$ and $H^{\prime}$ are the canonical functors Finite- $G$-Sets $\rightarrow$ Finite- $G^{\prime}$-Sets $\rightarrow$ Finite- $G^{\prime \prime}$-Sets determined by $h$ and $h^{\prime}$.

Suppose that (2) holds. This means that for a finite $G^{\prime}$-set $X^{\prime}$ such that $G^{\prime \prime}$ acts trivially, the action of $G^{\prime}$ factors through $G$. Apply this to $X^{\prime}=G^{\prime} / U^{\prime} N$ where $U^{\prime}$ is a small open subgroup of $G^{\prime}$. Then we see that $\operatorname{Ker}(h) \subset U^{\prime} N$ for all $U^{\prime}$. Since $N$ is closed this implies $\operatorname{Ker}(h) \subset N$ as desired.

Suppose that (1) holds. This means that $N=\operatorname{Ker}(h)$. Let $X^{\prime}$ be a finite $G^{\prime}$-set such that $G^{\prime \prime}$ acts trivially. This means that $\operatorname{Ker}\left(G^{\prime} \rightarrow \operatorname{Aut}\left(X^{\prime}\right)\right)$ is a closed normal subgroup containg $\operatorname{Im}\left(h^{\prime}\right)$. Hence $N=\operatorname{Ker}(h)$ is contained in it and the $G^{\prime}$-action on $X^{\prime}$ factors through $G$ as desired.

0BN7 Lemma 48.3.15. Let $(\mathcal{C}, F)$ and $\left(\mathcal{C}^{\prime}, F^{\prime}\right)$ be Galois categories. Let $H: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ be an exact functor. Let $h: G^{\prime}=\operatorname{Aut}\left(F^{\prime}\right) \rightarrow \operatorname{Aut}(F)=G$ be the corresponding continuous homomorphism as in Lemma 48.3.11. The following are equivalent
(1) $h$ is injective, and
(2) for every connected object $X^{\prime}$ of $\mathcal{C}^{\prime}$ there exists an object $X$ of $\mathcal{C}$ and a diagram

$$
X^{\prime} \leftarrow Y^{\prime} \rightarrow H(X)
$$

in $\mathcal{C}^{\prime}$ where $Y^{\prime} \rightarrow X^{\prime}$ is an epimorphism and $Y^{\prime} \rightarrow H(X)$ is a monomorphism.

Proof. Using the lemma we translate this into a question for the corresponding functor between the categories of finite $G$-sets and finite $G^{\prime}$-sets.

Let $h: G^{\prime} \rightarrow G$ be an injective continuous group homomorphism of profinite groups. Let $H^{\prime} \subset G^{\prime}$ be an open subgroup. Since the topology on $G^{\prime}$ is the induced topology from $G$ there exists an open subgroup $H \subset G$ such that $h^{-1} H \subset H^{\prime}$. Then the desired diagram is

$$
G^{\prime} / H^{\prime} \leftarrow G^{\prime} / h^{-1} H \rightarrow G / H
$$

Conversely, assume (2) holds for the functor Finite-G-Sets $\rightarrow$ Finite- $G^{\prime}$-Sets. Let $g^{\prime} \in \operatorname{Ker}(h)$. Pick any open subgroup $H^{\prime} \subset G^{\prime}$. By assumption there exists a finite $G$-set $X$ and a diagram

$$
G^{\prime} / H^{\prime} \leftarrow Y^{\prime} \rightarrow X
$$

of $G^{\prime}$-sets with the left arrow surjective and the right arrow injective. Since $g^{\prime}$ is in the kernel of $h$ we see that $g^{\prime}$ acts trivally on $X$. Hence $g^{\prime}$ acts trivially on $Y^{\prime}$ and hence trivially on $G^{\prime} / H^{\prime}$. Thus $g^{\prime} \in H^{\prime}$. As this holds for all open subgroups we conclude that $g^{\prime}$ is the identity element as desired.

### 48.4. Finite étale morphisms

0BL6 In this section we prove enough basic results on finite étale morphisms to be able to construct the étale fundamental group.

Let $X$ be a scheme. We will use the notation $F E t_{X}$ to denote the category of schemes finite and étale over $X$. Thus
(1) an object of $F E^{\prime} t_{X}$ is a finite étale morphism $Y \rightarrow X$ with target $X$, and
(2) a morphism in $F E t_{X}$ from $Y \rightarrow X$ to $Y^{\prime} \rightarrow X$ is a morphism $Y \rightarrow Y^{\prime}$ making the diagram

commute.
We will often call an object of $F E_{X}$ a finite étale cover of $X$ (even if $Y$ is empty). It turns out that there is a stack $p: F E ́ t \rightarrow S c h$ over the category of schemes whose fibre over $X$ is the category $F E t_{X}$ just defined. See Examples of Stacks, Section 77.6

0BN8 Example 48.4.1. Let $k$ be an algebraically closed field and $X=\operatorname{Spec}(k)$. In this case $F E t_{X}$ is equivalent to the category of finite sets. This works more generally when $k$ is separably algebraically closed. The reason is that a scheme étale over $k$ is the disjoint union of spectra of fields finite separable over $k$, see Morphisms, Lemma 28.36.7.

0BN9 Lemma 48.4.2. Let $X$ be a scheme. The category $F E t_{X}$ has finite limits and finite colimits and for any morphism $X^{\prime} \rightarrow X$ the base change functor $F E ́ t_{X} \rightarrow F E ́ t_{X^{\prime}}$ is exact.

Proof. Finite limits and left exactness. By Categories, Lemma 4.18.4 it suffices to show that $F E ́ t_{X}$ has a final object and fibred products. This is clear because the category of all schemes over $X$ has a final object (namely $X$ ) and fibred products and fibred products of schemes finite étale over $X$ are finite étale over $X$. Moreover, it is clear that base change commutes with these operations and hence base change is left exact (Categories, Lemma 4.23.2).

Finite colimits and right exactness. By Categories, Lemma 4.18.7 it suffices to show that $F E t_{X}$ has finite coproducts and coequalizers. Finite coproducts are given by disjoint unions (the empty coproduct is the empty scheme). Let $a, b: Z \rightarrow Y$ be two morphisms of $F E$ Ét $X_{X}$. Since $Z \rightarrow X$ and $Y \rightarrow X$ are finite étale we can write $Z=\underline{\operatorname{Spec}}(\mathcal{C})$ and $Y=\underline{\operatorname{Spec}}(\mathcal{B})$ for some finite locally free $\mathcal{O}_{X}$-algebras $\mathcal{C}$ and $\mathcal{B}$. The morphisms $a, b$ induce two maps $a^{\sharp}, b^{\sharp}: \mathcal{B} \rightarrow \mathcal{C}$. Let $\mathcal{A}=\operatorname{Eq}\left(a^{\sharp}, b^{\sharp}\right)$ be their equalizer. If

$$
\underline{\operatorname{Spec}}(\mathcal{A}) \longrightarrow X
$$

is finite étale, then it is clear that this is the coequalizer (after all we can write any object of $F E t_{X}$ as the relative spectrum of a sheaf of $\mathcal{O}_{X}$-algebras). This we may do after replacing $X$ by the members of an étale covering (Descent, Lemmas 34.19.21 and 34.19.5. Thus by Étale Morphisms, Lemma 40.18.3 we may assume that $Y=\coprod_{i=1, \ldots, n} X$ and $Z=\coprod_{j=1, \ldots, m} X$. Then

$$
\mathcal{C}=\prod_{1 \leq j \leq m} \mathcal{O}_{X} \quad \text { and } \quad \mathcal{B}=\prod_{1 \leq i \leq n} \mathcal{O}_{X}
$$

After a further replacement by the members of an open covering we may assume that $a, b$ correspond to maps $a_{s}, b_{s}:\{1, \ldots, m\} \rightarrow\{1, \ldots, n\}$, i.e., the summand $X$ of $Z$ corresponding to the index $j$ maps into the summand $X$ of $Y$ corresponding to the index $a_{s}(j)$, resp. $b_{s}(j)$ under the morphism $a$, resp. $b$. Let $\{1, \ldots, n\} \rightarrow T$ be the coequalizer of $a_{s}, b_{s}$. Then we see that

$$
\mathcal{A}=\prod_{t \in T} \mathcal{O}_{X}
$$

whose spectrum is certainly finite étale over $X$. We omit the verification that this is compatible with base change. Thus base change is a right exact functor.

0BNA Remark 48.4.3. Let $X$ be a scheme. Consider the natural functors $F_{1}: F E t_{X} \rightarrow$ $S c h$ and $F_{2}: F E ́ t_{X} \rightarrow S c h / X$. Then
(1) The functors $F_{1}$ and $F_{2}$ commute with finite colimits.
(2) The functor $F_{2}$ commutes with finite limits,
(3) The functor $F_{1}$ commutes with connected finite limits, i.e., with equalizers and fibre products.
The results on limits are immediate from the discussion in the proof of Lemma 48.4 .2 and Categories, Lemma 4.16.2. It is clear that $F_{1}$ and $F_{2}$ commute with finite coproducts. By the dual of Categories, Lemma 4.23 .2 we need to show that $F_{1}$ and $F_{2}$ commute with coequalizers. In the proof of Lemma 48.4.2 we saw that coequalizers in $F E ́ t_{X}$ look étale locally like this

$$
\coprod_{j \in J} U \underset{b}{\longrightarrow} \coprod_{i \in I} U \longrightarrow \coprod_{t \in \operatorname{Coeq}(a, b)} U
$$

which is certainly a coequalizer in the category of schemes. Hence the statement follows from the fact that being a coequalizer is fpqc local as formulate precisely in Descent, Lemma 34.9.4.
0BL7 Lemma 48.4.4. Let $X$ be a scheme. Given $U, V$ finite étale over $X$ there exists a scheme $W$ finite étale over $X$ such that

$$
\operatorname{Mor}_{X}(X, W)=\operatorname{Mor}_{X}(U, V)
$$

and such that the same remains true after any base change.
Proof. By More on Morphisms, Lemma 36.49 .4 there exists a scheme $W$ representing $\operatorname{Mor}_{X}(U, V)$. (Use that an étale morphism is locally quasi-finite by Morphisms, Lemmas 28.36 .6 and that a finite morphism is separated.) This scheme clearly satisfies the formula after any base change. To finish the proof we have to show that $W \rightarrow X$ is finite étale. This we may do after replacing $X$ by the members of an étale covering (Descent, Lemmas 34.19.21 and 34.19.5). Thus by Étale Morphisms, Lemma 40.18.3 we may assume that $U=\coprod_{i=1, \ldots, n} X$ and $V=\coprod_{j=1, \ldots, m} X$. In this case $W=\coprod_{\alpha:\{1, \ldots, n\} \rightarrow\{1, \ldots, m\}} X$ by inspection (details omitted) and the proof is complete.

Let $X$ be a scheme. A geometric point of $X$ is a morphism $\operatorname{Spec}(k) \rightarrow X$ where $k$ is algebraically closed. Such a point is usually denoted $\bar{x}$, i.e., by an overlined small case letter. We often use $\bar{x}$ to denote the $\operatorname{scheme} \operatorname{Spec}(k)$ as well as the morphism, and we use $\kappa(\bar{x})$ to denote $k$. We say $\bar{x}$ lies over $x$ to indicate that $x \in X$ is the image of $\bar{x}$. We will discuss this further in Étale Cohomology, Section 49.29. Given $\bar{x}$ and an étale morphism $U \rightarrow X$ we can consider

$$
\left|U_{\bar{x}}\right|: \text { the underlying set of points of the scheme } U_{\bar{x}}=U \times_{X} \bar{x}
$$

Since $U_{\bar{x}}$ as a scheme over $\bar{x}$ is a disjoint union of copies of $\bar{x}$ (Morphisms, Lemma 28.36.7 we can also describe this set as

$$
\left|U_{\bar{x}}\right|=\left\{\begin{array}{lrr} 
& \bar{x} & \stackrel{\bar{u}}{ } \\
\text { commutative } & & \mid \\
\text { diagrams } & \bar{x} & \\
& & \\
& & X
\end{array}\right\}
$$

The assignement $U \mapsto\left|U_{\bar{x}}\right|$ is a functor which is often denoted $F_{\bar{x}}$.
0BNB Lemma 48.4.5. Let $X$ be a connected scheme. Let $\bar{x}$ be a geometric point. The functor

$$
F_{\bar{x}}: F E ́ t_{X} \longrightarrow S e t s, \quad Y \longmapsto\left|Y_{\bar{x}}\right|
$$

defines a Galois category (Definition 48.3.6).
Proof. After identifying $F E^{\prime} t_{\bar{x}}$ with the category of finite sets (Example 48.4.1) we see that our functor $F_{\bar{x}}$ is nothing but the base change functor for the morphism $\bar{x} \rightarrow X$. Thus we see that $F E t_{X}$ has finite limits and finite colimits and that $F_{\bar{x}}$ is exact by Lemma 48.4.2 We will also use that finite limits in $F E t_{X}$ agree with the corresponding finite limits in the category of schemes over $X$, see Remark 48.4.3.
If $Y^{\prime} \rightarrow Y$ is a monomorphism in $F E t_{X}$ then we see that $Y^{\prime} \rightarrow Y^{\prime} \times_{Y} Y^{\prime}$ is an isomorphism, and hence $Y^{\prime} \rightarrow Y$ is a monomorphism of schemes. It follows that $Y^{\prime} \rightarrow Y$ is an open immersion (Étale Morphisms, Theorem 40.14.1). Since $Y^{\prime}$ is finite over $X$ and $Y$ separated over $X$, the morphism $Y^{\prime} \rightarrow Y$ is finite (Morphisms,

Lemma 28.43.12), hence closed (Morphisms, Lemma 28.43.10), hence it is the inclusion of an open and closed subscheme of $Y$. It follows that $Y$ is a connected objects of the category $F E t_{X}$ (as in Definition 48.3.6 if and only if $Y$ is connected as a scheme. Then it follows from Topology, Lemma 5.6 .6 that $Y$ is a finite coproduct of its connected components both as a scheme and in the sense of Definition 48.3.6.
Let $Y \rightarrow Z$ be a morphism in $F E t_{X}$ which induces a bijection $F_{\bar{x}}(Y) \rightarrow F_{\bar{x}}(Z)$. We have to show that $Y \rightarrow Z$ is an isomorphism. By the above we may assume $Z$ is connected. Since $Y \rightarrow Z$ is finite étale and hence finite locally free it suffices to show that $Y \rightarrow Z$ is finite locally free of degree 1 . This is true in a neighbourhood of any point of $Z$ lying over $\bar{x}$ and since $Z$ is connected and the degree is locally constant we conclude.

### 48.5. Fundamental groups

0BQ8 In this section we define Grothendieck's algebraic fundamental group. The following definition makes sense thanks to Lemma 48.4.5.

0BNC Definition 48.5.1. Let $X$ be a connected scheme. Let $\bar{x}$ be a geometric point of $X$. The fundamental group of $X$ with base point $\bar{x}$ is the group

$$
\pi_{1}(X, \bar{x})=\operatorname{Aut}\left(F_{\bar{x}}\right)
$$

of automorphisms of the fibre functor $F_{\bar{x}}: F E t_{X} \rightarrow$ Sets endowed with its canonical profinite topology from Lemma 48.3.1.

Combining the above with the material from Section 48.3 we obtain the following theorem.

0BND Theorem 48.5.2. Let $X$ be a connected scheme. Let $\bar{x}$ be a geometric point of $X$.
(1) The fibre functor $F_{\bar{x}}$ defines an equivalence of categories

$$
\text { FÉt }{ }_{X} \longrightarrow \text { Finite- } \pi_{1}(X, \bar{x}) \text {-Sets }
$$

(2) Given a second geometric point $\bar{x}^{\prime}$ of $X$ there exists an isomorphism $t$ : $F_{\bar{x}} \rightarrow F_{\bar{x}^{\prime}}$. This gives an isomorphism $\pi_{1}(X, \bar{x}) \rightarrow \pi_{1}\left(X, \bar{x}^{\prime}\right)$ compatible with the equivalences in (1). This isomorphism is independent of $t$ up to innner conjugation.
(3) Given a morphism $f: X \rightarrow Y$ of connected schemes denote $\bar{y}=f \circ \bar{x}$. There is a canonical continuous homomorphism

$$
f_{*}: \pi_{1}(X, \bar{x}) \rightarrow \pi_{1}(Y, \bar{y})
$$

such that the diagram

is commutative.

Proof. Part (1) follows from Lemma 48.4.5 and Proposition 48.3.10. Part (2) is a special case of Lemma 48.3.11. For part (3) observe that the diagram

is commutative (actually commutative, not just 2-commutative) because $\bar{y}=f \circ \bar{x}$. Hence we can apply Lemma 48.3.11 with the implied transformation of functors to get (3).

0BNE Lemma 48.5.3. Let $K$ be a field and set $X=\operatorname{Spec}(K)$. Let $\bar{K}$ be an algebraic closure and denote $\bar{x}: \operatorname{Spec}(\bar{K}) \rightarrow X$ the corresponding geometric point. Let $K^{\text {sep }} \subset$ $\bar{K}$ be the separable algebraic closure.
(1) The functor of Lemma 48.2.2 induces an equivalence

$$
\text { FÉt } \left.t_{X} \longrightarrow \text { Finite-Gal( } K^{\text {sep }} / K\right) \text {-Sets. }
$$

compatible with $F_{\bar{x}}$ and the functor Finite-Gal $\left(K^{\text {sep }} / K\right)$-Sets $\rightarrow$ Sets.
(2) This induces a canonical isomorphism

$$
\operatorname{Gal}\left(K^{\text {sep }} / K\right) \longrightarrow \pi_{1}(X, \bar{x})
$$

of profinite topological groups.
Proof. The functor of Lemma 48.2 .2 is the same as the functor $F_{\bar{x}}$ because for any $Y$ étale over $X$ we have

$$
\operatorname{Mor}_{X}(\operatorname{Spec}(\bar{K}), Y)=\operatorname{Mor}_{X}\left(\operatorname{Spec}\left(K^{\text {sep }}\right), Y\right)
$$

Namely, as seen in the proof of Lemma 48.2.2 we have $Y=\coprod_{i \in I} \operatorname{Spec}\left(L_{i}\right)$ with $L_{i} / K$ finite separable over $K$. Hence any $K$-algebra homomorphism $L_{i} \rightarrow \bar{K}$ factors through $K^{\text {sep }}$. Also, note that $F_{\bar{x}}(Y)$ is finite if and only if $I$ is finite if and only if $Y \rightarrow X$ is finite étale. This proves (1).

Part (2) is a formal consequence of (1), Lemma 48.3.11, and Lemma 48.3.3. (Please also see the remark below.)

0BQ9 Remark 48.5.4. In the situation of Lemma 48.5.3 let us give a more explicit construction of the isomorphism $\operatorname{Gal}\left(K^{\text {sep }} / K\right) \rightarrow \pi_{1}(X, \bar{x})=\operatorname{Aut}\left(F_{\bar{x}}\right)$. Observe that $\operatorname{Gal}\left(K^{\text {sep }} / K\right)=\operatorname{Aut}(\bar{K} / K)$ as $\bar{K}$ is the perfection of $K^{\text {sep }}$. Since $F_{\bar{x}}(Y)=$ $\operatorname{Mor}_{X}(\operatorname{Spec}(\bar{K}), Y)$ we may consider the map

$$
\operatorname{Aut}(\bar{K} / K) \times F_{\bar{x}}(Y) \rightarrow F_{\bar{x}}(Y), \quad(\sigma, \bar{y}) \mapsto \sigma \cdot \bar{y}=\bar{y} \circ \operatorname{Spec}(\sigma)
$$

This is an action because

$$
\sigma \tau \cdot \bar{y}=\bar{y} \circ \operatorname{Spec}(\sigma \tau)=\bar{y} \circ \operatorname{Spec}(\tau) \circ \operatorname{Spec}(\sigma)=\sigma \cdot(\tau \cdot \bar{y})
$$

The action is functorial in $Y \in F E^{\prime} t_{X}$ and we obtain the desired map.
Instead of directly proving two schemes have the same fundamental group, we often prove that their categories of finite étale coverings are the same. This of course trivially implies that their fundamental groups are equal provided they are connected.

0BQA Lemma 48.5.5. Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasiseparated schemes such that the base change functor $F E t_{Y} \rightarrow F E t_{X}$ is an equivalence of categories. In this case
(1) $f$ induces a homeomorphism $\pi_{0}(X) \rightarrow \pi_{0}(Y)$,
(2) if $X$ or equivalently $Y$ is connected, then $\pi_{1}(X, \bar{x})=\pi_{1}(Y, \bar{y})$.

Proof. Let $Y=Y_{0} \amalg Y_{1}$ be a decomposition into nonempty open and closed subschemes. We claim that $f(X)$ meets both $Y_{i}$. Namely, if not, say $f(X) \subset Y_{1}$, then we can consider the finite étale morphism $V=Y_{1} \rightarrow Y$. This is not an isomorphism but $V \times_{Y} X \rightarrow X$ is an isomorphism, which is a contradiction.
Suppose that $X=X_{0} \amalg X_{1}$ is a decomposition into open and closed subschemes. Consider the finite étale morphism $U=X_{1} \rightarrow X$. Then $U=X \times_{Y} V$ for some finite étale morphism $V \rightarrow Y$. The degree of the morphism $V \rightarrow Y$ is locally constant, hence we obtain a decomposition $Y=\coprod_{d \geq 0} Y_{d}$ into open and closed subschemes such that $V \rightarrow Y$ has degree $d$ over $Y_{d}$. Since $f^{-1}\left(Y_{d}\right)=\emptyset$ for $d>1$ we conclude that $Y_{d}=\emptyset$ for $d>1$ by the above. And we conclude that $f^{-1}\left(Y_{i}\right)=X_{i}$ for $i=0,1$.
It follows that $f^{-1}$ induces a bijection between the set of open and closed subsets of $Y$ and the set of open and closed subsets of $X$. Note that $X$ and $Y$ are spectral spaces, see Properties, Lemma 27.2.4. By Topology, Lemma 5.11 .10 the lattice of open and closed subsets of a spectral space determines the set of connected components. Hence $\pi_{0}(X) \rightarrow \pi_{0}(Y)$ is bijective. Since $\pi_{0}(X)$ and $\pi_{0}(Y)$ are profinite spaces (Topology, Lemma 5.21.4) we conclude that $\pi_{0}(X) \rightarrow \pi_{0}(Y)$ is a homeomorphism by Topology, Lemma 5.16.8. This proves (1). Part (2) is immediate.

The following lemma tells us that the fundamental group of a henselian pair is the fundamental group of the closed subset.

09ZS Lemma 48.5.6. Let $(A, I)$ be a henselian pair. Set $X=\operatorname{Spec}(A)$ and $Z=$ $\operatorname{Spec}(A / I)$. The functor

$$
F E^{\prime} t_{X} \longrightarrow F E_{Z}, \quad U \longmapsto U \times_{X} Z
$$

is an equivalence of categories.
Proof. This is a translation of More on Algebra, Lemma 15.8.12.
The following lemma tells us that the fundamental group of a thickening is the same as the fundamental group of the original. We will see that this is true in greater generality for universal homeomorphisms in Étale Cohomology, Lemma 49.46.3

0BQB Lemma 48.5.7. Let $X \subset X^{\prime}$ be a thickening of schemes. The functor

$$
F E t_{X^{\prime}} \longrightarrow F E ́ t_{X}, \quad U^{\prime} \longmapsto U^{\prime} \times_{X^{\prime}} X
$$

is an equivalence of categories.
Proof. For a discussion of thickenings see More on Morphisms, Section 36.2. Let $U^{\prime} \rightarrow X^{\prime}$ be an étale morphism such that $U=U^{\prime} \times_{X^{\prime}} X \rightarrow X$ is finite étale. Then $U^{\prime} \rightarrow X^{\prime}$ is finite étale as well. This follows for example from More on Morphisms, Lemma 36.2.9. Now, if $X \subset X^{\prime}$ is a finite order thickening then this remark combined with Étale Morphisms, Theorem 40.15 .2 proves the lemma. Below we
will prove the lemma for general thickenings, but we suggest the reader skip the proof.
Let $X^{\prime}=\bigcup X_{i}^{\prime}$ be an affine open covering. Set $X_{i}=X \times{ }_{X^{\prime}} X_{i}^{\prime}, X_{i j}^{\prime}=X_{i}^{\prime} \cap X_{j}^{\prime}$, $X_{i j}=X \times_{X^{\prime}} X_{i j}^{\prime}, X_{i j k}^{\prime}=X_{i}^{\prime} \cap X_{j}^{\prime} \cap X_{k}^{\prime}, X_{i j k}=X \times_{X^{\prime}} X_{i j k}^{\prime}$. Suppose that we can prove the theorem for each of the thickenings $X_{i} \subset X_{i}^{\prime}, X_{i j} \subset X_{i j}^{\prime}$, and $X_{i j k} \subset X_{i j k}^{\prime}$. Then the result follows for $X \subset X^{\prime}$ by relative glueing of schemes, see Constructions, Section 26.2 . Observe that the schemes $X_{i}^{\prime}, X_{i j}^{\prime}, X_{i j k}^{\prime}$ are each separated as open subschemes of affine schemes. Repeating the argument one more time we reduce to the case where the schemes $X_{i}^{\prime}, X_{i j}^{\prime}, X_{i j k}^{\prime}$ are affine.
In the affine case we have $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ and $X=\operatorname{Spec}\left(A^{\prime} / I^{\prime}\right)$ where $I^{\prime}$ is a locally nilpotent ideal. Then $\left(A^{\prime}, I^{\prime}\right)$ is a henselian pair (More on Algebra, Lemma 15.8.2) and the result follows from Lemma 48.5.6 (which is much easier in this case).

### 48.6. Finite étale covers of proper schemes

0BQC In this section we show that the fundamental group of a connected proper scheme over a henselian local ring is the same as the fundamental group of its special fibre. We also show that the fundamental group of a connected proper scheme over an algebraically closed field $k$ does not change if we replace $k$ by an algebraically closed extension. Instead of stating and proving the results in the connected case we prove the results in general and we leave it to the reader to deduce the result for fundamental groups using Lemma 48.5.5.
0A48 Lemma 48.6.1. Let $A$ be a henselian local ring. Let $X$ be a proper scheme over $A$ with closed fibre $X_{0}$. Then the functor

$$
F E_{X} \rightarrow \text { FÉt }_{X_{0}}, \quad U \longmapsto U_{0}=U \times_{X} X_{0}
$$

is an equivalence of categories.
Proof. The proof given here is an example of applying algebraization and approximation. We proceed in a number of stages.
Essential surjectivity when $A$ is a complete local Noetherian ring. Let $X_{n}=$ $X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A / \mathfrak{m}^{n+1}\right)$. By Étale Morphisms, Theorem 40.15.2 the inclusions

$$
X_{0} \rightarrow X_{1} \rightarrow X_{2} \rightarrow \ldots
$$

induce equivalence of categories between the category of schemes étale over $X_{0}$ and the category of schemes étale over $X_{n}$. Moreover, if $U_{n} \rightarrow X_{n}$ corresponds to a finite étale morphism $U_{0} \rightarrow X_{0}$, then $U_{n} \rightarrow X_{n}$ is finite too, for example by More on Morphisms, Lemma 36.2.8. In this case the morphism $U_{0} \rightarrow \operatorname{Spec}(A / \mathfrak{m})$ is proper as $X_{0}$ is proper over $A / \mathfrak{m}$. Thus we may apply Grothendieck's algebraization theorem (in the form of Cohomology of Schemes, Lemma 29.24.2) to see that there is a finite morphism $U \rightarrow X$ whose restriction to $X_{0}$ recovers $U_{0}$. By More on Morphisms, Lemma 36.10 .3 we see that $U \rightarrow X$ is étale at every point of $U_{0}$. However, since every point of $U$ specializes to a point of $U_{0}$ (as $U$ is proper over $A$ ), we conclude that $U \rightarrow X$ is étale. In this way we conclude the functor is essentially surjective.

Fully faithfulness when $A$ is a complete local Noetherian ring. Let $U \rightarrow X$ and $V \rightarrow X$ be finite étale morphisms and let $\varphi_{0}: U_{0} \rightarrow V_{0}$ be a morphism over $X_{0}$. Look at the morphism

$$
\Gamma_{\varphi_{0}}: U_{0} \longrightarrow U_{0} \times_{X_{0}} V_{0}
$$

This morphism is both finite étale and a closed immersion. By essential surjectivity aplied to $X=U \times_{X} V$ we find a finite étale morphism $W \rightarrow U \times_{X} V$ whose special fibre is isomorphic to $\Gamma_{\varphi_{0}}$. Consider the projection $W \rightarrow U$. It is finite étale and an isomorphism over $U_{0}$ by construction. By Étale Morphisms, Lemma 40.14.2 W $\rightarrow U$ is an isomorphism in an open neighbourhood of $U_{0}$. Thus it is an isomorphism and the composition $\varphi: U \cong W \rightarrow V$ is the desired lift of $\varphi_{0}$.
Essential surjectivity when $A$ is a henselian local Noetherian G-ring. Let $U_{0} \rightarrow X_{0}$ be a finite étale morphism. Let $A^{\wedge}$ be the completion of $A$ with respect to the maximal ideal. Let $X^{\wedge}$ be the base change of $X$ to $A^{\wedge}$. By the result above there exists a finite étale morphism $V \rightarrow X^{\wedge}$ whose special fibre is $U_{0}$. Write $A^{\wedge}=\operatorname{colim} A_{i}$ with $A \rightarrow A_{i}$ of finite type. By Limits, Lemma 31.9.1 there exists an $i$ and a finitely presented morphism $U_{i} \rightarrow X_{A_{i}}$ whose base change to $X^{\wedge}$ is $V$. After increasing $i$ we may assume that $U_{i} \rightarrow X_{A_{i}}$ is finite and étale (Limits, Lemmas 31.7.3 and 31.7.8. Writing

$$
A_{i}=A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)
$$

the ring map $A_{i} \rightarrow A^{\wedge}$ can be reinterpreted as a solution $\left(a_{1}, \ldots, a_{n}\right)$ in $A^{\wedge}$ for the system of equations $f_{j}=0$. By Smoothing Ring Maps, Theorem 16.14.1 we can approximate this solution (to order 11 for example) by a solution ( $b_{1}, \ldots, b_{n}$ ) in $A$. Translating back we find an $A$-algebra map $A_{i} \rightarrow A$ which gives the same closed point as the original map $A_{i} \rightarrow A^{\wedge}$ (as $11>1$ ). The base change $U \rightarrow X$ of $V \rightarrow X_{A_{i}}$ by this ring map will therefore be a finite étale morphsm whose special fibre is isomorphic to $U_{0}$.
Fully faithfulness when $A$ is a henselian local Noetherian G-ring. This can be deduced from essential surjectivity in exactly the same manner as was done in the case that $A$ is complete Noetherian.

General case. Let $(A, \mathfrak{m})$ be a henselian local ring. Set $S=\operatorname{Spec}(A)$ and denote $s \in S$ the closed point. By Limits, Lemma 31.12 .6 we can write $X \rightarrow \operatorname{Spec}(A)$ as a cofiltered limit of proper morphisms $X_{i} \rightarrow S_{i}$ with $S_{i}$ of finite type over $\mathbf{Z}$. For each $i$ let $s_{i} \in S_{i}$ be the image of $s$. Since $S=\lim S_{i}$ and $A=\mathcal{O}_{S, s}$ we have $A=\operatorname{colim} \mathcal{O}_{S_{i}, s_{i}}$. The ring $A_{i}=\mathcal{O}_{S_{i}, s_{i}}$ is a Noetherian local G-ring (More on Algebra, Proposition 15.41.12). By More on Algebra, Lemma 15.8.17 we see that $A=\operatorname{colim} A_{i}^{h}$. By More on Algebra, Lemma 15.41 .8 the rings $A_{i}^{h}$ are G-rings. Thus we see that $A=\operatorname{colim} A_{i}^{h}$ and

$$
X=\lim \left(X_{i} \times_{S_{i}} \operatorname{Spec}\left(A_{i}^{h}\right)\right)
$$

as schemes. The category of schemes finite étale over $X$ is the limit of the category of schemes finite étale over $X_{i} \times{ }_{S_{i}} \operatorname{Spec}\left(A_{i}^{h}\right)$ (by Limits, Lemmas 31.9.1, 31.7.3, and 31.7.8) The same thing is true for schemes finite étale over $X_{0}=\lim \left(X_{i} \times{ }_{S} s_{i}\right)$. Thus we formally deduce the result for $X / \operatorname{Spec}(A)$ from the result for the $\left(X_{i} \times{ }_{S_{i}}\right.$ $\left.\operatorname{Spec}\left(A_{i}^{h}\right)\right) / \operatorname{Spec}\left(A_{i}^{h}\right)$ which we dealt with above.

0A49 Lemma 48.6.2. Let $k \subset k^{\prime}$ be an extension of algebraically closed fields. Let $X$ be a proper scheme over $k$. Then the functor

$$
U \longmapsto U_{k^{\prime}}
$$

is an equivalence of categories between schemes finite étale over $X$ and schemes finite étale over $X_{k^{\prime}}$.

Proof. Let us prove the functor is essentially surjective. Let $U^{\prime} \rightarrow X_{k^{\prime}}$ be a finite étale morphism. Write $k^{\prime}=\operatorname{colim} A_{i}$ as a filtered colimit of finite type $k$-algebras. By Limits, Lemma 31.9.1 there exists an $i$ and a finitely presented morphism $U_{i} \rightarrow$ $X_{A_{i}}$ whose base change to $X_{k^{\prime}}$ is $U^{\prime}$. After increasing $i$ we may assume that $U_{i} \rightarrow$ $X_{A_{i}}$ is finite and étale (Limits, Lemmas 31.7.3 and 31.7.8). Since $k$ is algebraically closed we can find a $k$-valued point $t$ in $\operatorname{Spec}\left(A_{i}\right)$. Let $U=\left(U_{i}\right)_{t}$ be the fibre of $U_{i}$ over $t$. Let $A_{i}^{h}$ be the henselization of $\left(A_{i}\right)_{\mathfrak{m}}$ where $\mathfrak{m}$ is the maximal ideal corresponding to the point $t$. By Lemma 48.6.1 we see that $\left(U_{i}\right)_{A_{i}^{h}}=U \times \operatorname{Spec}\left(A_{i}^{h}\right)$ as schemes over $X_{A_{i}^{h}}$. Now since $A_{i}^{h}$ is algebraic over $A_{i}$ (see for example discussion in Smoothing Ring Maps, Example 16.14.3) and since $k^{\prime}$ is algebraically closed we can find a ring map $A_{i}^{h} \rightarrow k^{\prime}$ extending the given incusion $A_{i} \subset k^{\prime}$. Hence we conclude that $U^{\prime}$ is isomorphic to the base change of $U$. The proof of fully faithfulness is exactly the same.

### 48.7. Local connectedness

0BQD In this section we ask when $\pi_{1}(U) \rightarrow \pi_{1}(X)$ is surjective for $U$ a dense open of a scheme $X$. We will see that this is the case (roughly) when $U \cap B$ is connected for any small "ball" $B$ around a point $x \in X \backslash U$.

0BQE Lemma 48.7.1. Let $f: X \rightarrow Y$ be a morphism of schemes. If $f(X)$ is dense in $Y$ then the base change functor $F E t_{Y} \rightarrow F E t_{X}$ is faithful.

Proof. Since the category of finite étale coverings has an internal hom (Lemma 48.4.4) it suffices to prove the following: Given $W$ finite étale over $Y$ and a morphism $s: X \rightarrow W$ over $X$ there is at most one section $t: Y \rightarrow W$ such that $s=t \circ f$. Consider two sections $t_{1}, t_{2}: Y \rightarrow W$ such that $s=t_{1} \circ f=t_{2} \circ f$. Since the equalizer of $t_{1}$ and $t_{2}$ is closed in $Y$ (Schemes, Lemma 25.21.5) and since $f(X)$ is dense in $Y$ we see that $t_{1}$ and $t_{2}$ agree on $Y_{\text {red }}$. Then it follows that $t_{1}$ and $t_{2}$ have the same image which is an open and closed subscheme of $W$ mapping isomorphically to $Y$ (Étale Morphisms, Proposition 40.6.1) hence they are equal.

The condition in the following lemma that the punctured spectrum of the strict henselization is connected follows for example from the assumption that the local ring is geometrically unibranch, see More on Algebra, Lemma 15.79.3. There is a partial converse in Properties, Lemma 27.15.3
$0 B L Q$ Lemma 48.7.2. Let $(A, \mathfrak{m})$ be a local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$. If the punctured spectrum of the strict henselization of $A$ is connected, then

$$
\text { FÉt }_{X} \longrightarrow \text { FÉt }_{U}, \quad Y \longmapsto Y \times_{X} U
$$

is a fully faithful functor.
Proof. Assume $A$ is strictly henselian. In this case any finite étale cover $Y$ of $X$ is isomorphic to a finite disjoint union of copies of $X$. Thus it suffices to prove that any morphism $U \rightarrow U \amalg \ldots \amalg U$ over $U$, extends uniquely to a morphism $X \rightarrow X \amalg \ldots \amalg X$ over $X$. If $U$ is connected (in particular nonempty), then this is true.

The general case. Since the category of finite étale coverings has an internal hom (Lemma 48.4.4) it suffices to prove the following: Given $Y$ finite étale over $X$ any morphism $s: U \rightarrow Y$ over $X$ extends to a morphism $t: X \rightarrow Y$ over $Y$. Let $A^{s h}$
be the strict henselization of $A$ and denote $X^{s h}=\operatorname{Spec}\left(A^{s h}\right), U^{s h}=U \times_{X} X^{s h}$, $Y^{s h}=Y \times_{X} X^{s h}$. By the first paragraph and our assumption on $A$, we can extend the base change $s^{s h}: U^{s h} \rightarrow Y^{s h}$ of $s$ to $t^{s h}: X^{s h} \rightarrow Y^{s h}$. Set $A^{\prime}=A^{s h} \otimes_{A} A^{s h}$. Then the two pullbacks $t_{1}^{\prime}, t_{2}^{\prime}$ of $t^{s h}$ to $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ are extensions of the pullback $s^{\prime}$ of $s$ to $U^{\prime}=U \times_{X} X^{\prime}$. As $A \rightarrow A^{\prime}$ is flat we see that $U^{\prime} \subset X^{\prime}$ is (topologically) dense by going down for $A \rightarrow A^{\prime}$ (Algebra, Lemma 10.38.18). Thus $t_{1}^{\prime}=t_{2}^{\prime}$ by Lemma 48.7.1. Hence $t^{s h}$ descends to a morphism $t: X \rightarrow Y$ for example by Descent, Lemma 34.9.3.

In view of Lemma 48.7 .2 it is interesting to know when the punctured spectrum of a ring (and of its strict henselization) is connected. The following famous lemma due to Hartshorne gives a sufficient condition.

0BLR Lemma 48.7.3. Let $A$ be a Noetherian local ring of depth $\geq 2$. Then the punctured spectra of $A, A^{h}$, and $A^{\text {sh }}$ are connected.

Proof. Let $U$ be the punctured spectrum of $A$. If $U$ is disconnected then we see that $\Gamma\left(U, \mathcal{O}_{U}\right)$ has a nontrivial idempotent. But $A$, being local, does not have a nontrivial idempotent. Hence $A \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ is not an isomorphism. By Dualizing Complexes, Lemma 45.15.2 we conclude that either $H_{\mathfrak{m}}^{0}(A)$ or $H_{\mathfrak{m}}^{1}(A)$ is nonzero. Thus $\operatorname{depth}(A) \leq 1$ by Dualizing Complexes, Lemma 45.11.1. To see the result for $A^{h}$ and $A^{s h}$ use More on Algebra, Lemma 15.36.8.

0BQF Lemma 48.7.4. Let $X$ be a scheme. Let $U \subset X$ be a dense open. Assume
(1) the underlying topological space of $X$ is Noetherian, and
(2) for every $x \in X \backslash U$ the punctured spectrum of the strict henselization of $\mathcal{O}_{X, x}$ is connected.
Then FÉt $_{X} \rightarrow$ Fét ${ }_{U}$ is fully faithful.
Proof. Let $Y_{1}, Y_{2}$ be finite étale over $X$ and let $\varphi:\left(Y_{1}\right)_{U} \rightarrow\left(Y_{2}\right)_{U}$ be a morphism over $U$. We have to show that $\varphi$ lifts uniquely to a morphsm $Y_{1} \rightarrow Y_{2}$ over $X$. Uniqueness follows from Lemma 48.7.1.

Let $x \in X \backslash U$ be a generic point of an irreducible component of $X \backslash U$. Set $V=U \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By our choice of $x$ this is the punctured spectrum of $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By Lemma 48.7.2 we can extend the morphism $\varphi_{V}:\left(Y_{1}\right)_{V} \rightarrow\left(Y_{2}\right)_{V}$ uniquely to a morphism $\left(Y_{1}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)} \rightarrow\left(Y_{2}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)}$. By Limits, Lemma 31.15 .2 we find an open $U \subset U^{\prime}$ containing $x$ and an extension $\varphi^{\prime}:\left(Y_{1}\right)_{U^{\prime}} \rightarrow\left(Y_{2}\right)_{U^{\prime}}$ of $\varphi$. Since the underlying topological space of $X$ is Noetherian this finishes the proof by Noetherian induction on the complement of the open over which $\varphi$ is defined.

0BSA Lemma 48.7.5. Let $X$ be a scheme. Let $U \subset X$ be a dense open. Assume
(1) $U \rightarrow X$ is quasi-compact,
(2) every point of $X \backslash U$ is closed, and
(3) for every $x \in X \backslash U$ the punctured spectrum of the strict henselization of $\mathcal{O}_{X, x}$ is connected.
Then $F$ Ét $t_{X} \rightarrow$ Fét ${ }_{U}$ is fully faithful.
Proof. Let $Y_{1}, Y_{2}$ be finite étale over $X$ and let $\varphi:\left(Y_{1}\right)_{U} \rightarrow\left(Y_{2}\right)_{U}$ be a morphism over $U$. We have to show that $\varphi$ lifts uniquely to a morphsm $Y_{1} \rightarrow Y_{2}$ over $X$. Uniqueness follows from Lemma 48.7.1.

Let $x \in X \backslash U$. Set $V=U \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. Since every point of $X \backslash U$ is closed $V$ is the punctured spectrum of $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By Lemma 48.7.2 we can extend the morphism $\varphi_{V}:\left(Y_{1}\right)_{V} \rightarrow\left(Y_{2}\right)_{V}$ uniquely to a morphism $\left(Y_{1}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)} \rightarrow$ $\left(Y_{2}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)}$. By Limits, Lemma 31.15.2 (this uses that $U$ is retrocompact in $X$ ) we find an open $U \subset U_{x}^{\prime}$ containing $x$ and an extension $\varphi_{x}^{\prime}:\left(Y_{1}\right)_{U_{x}^{\prime}} \rightarrow\left(Y_{2}\right)_{U_{x}^{\prime}}$ of $\varphi$. Note that given two points $x, x^{\prime} \in X \backslash U$ the morphisms $\varphi_{x}^{\prime}$ and $\varphi_{x^{\prime}}^{\prime}$ agree over $U_{x}^{\prime} \cap U_{x^{\prime}}^{\prime}$ as $U$ is dense in that open (Lemma 48.7.1). Thus we can extend $\varphi$ to $\bigcup U_{x}^{\prime}=X$ as desired.
0BQG Lemma 48.7.6. Let $X$ be a scheme. Let $U \subset X$ be a dense open. Assume
(1) every quasi-compact open of $X$ has finitely many irreducible components,
(2) for every $x \in X \backslash U$ the punctured spectrum of the strict henselization of $\mathcal{O}_{X, x}$ is connected.
Then FÉt $_{X} \rightarrow$ Fét ${ }_{U}$ is fully faithful.
Proof. Let $Y_{1}, Y_{2}$ be finite étale over $X$ and let $\varphi:\left(Y_{1}\right)_{U} \rightarrow\left(Y_{2}\right)_{U}$ be a morphism over $U$. We have to show that $\varphi$ lifts uniquely to a morphsm $Y_{1} \rightarrow Y_{2}$ over $X$. Uniqueness follows from Lemma 48.7.1. We will prove existence by showing that we can enlarge $U$ if $U \neq X$ and using Zorn's lemma to finish the proof.
Let $x \in X \backslash U$ be a generic point of an irreducible component of $X \backslash U$. Set $V=$ $U \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By our choice of $x$ this is the punctured spectrum of $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By Lemma 48.7.2 we can extend the morphism $\varphi_{V}:\left(Y_{1}\right)_{V} \rightarrow\left(Y_{2}\right)_{V}$ (uniquely) to a morphism $\left(Y_{1}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)} \rightarrow\left(Y_{2}\right)_{\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)}$. Choose an affine neighbourhood $W \subset X$ of $x$. Since $U \cap W$ is dense in $W$ it contains the generic points $\eta_{1}, \ldots, \eta_{n}$ of $W$. Choose an affine open $W^{\prime} \subset W \cap U$ containing $\eta_{1}, \ldots, \eta_{n}$. Set $V^{\prime}=W^{\prime} \times_{X}$ $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. By Limits, Lemma 31.15.2 applied to $W^{\prime} \subset W \ni x$ we find an open $W^{\prime} \subset W^{\prime \prime} \subset W$ with $x \in W^{\prime \prime}$ and a morphism $\varphi^{\prime \prime}:\left(Y_{1}\right)_{W^{\prime \prime}} \rightarrow\left(Y_{2}\right)_{W^{\prime \prime}}$ agreeing with $\varphi$ over $W^{\prime}$. Since $W^{\prime}$ is dense in $W^{\prime \prime} \cap U$, we see by Lemma 48.7.1 that $\varphi$ and $\varphi^{\prime \prime}$ agree over $U \cap W^{\prime}$. Thus $\varphi$ and $\varphi^{\prime \prime}$ glue to a morphism $\varphi^{\prime}$ over $U^{\prime}=U \cup W^{\prime \prime}$ agreeing with $\varphi$ over $U$. Observe that $x \in U^{\prime}$ so that we've extended $\varphi$ to a strictly larger open.

Consider the set $\mathcal{S}$ of pairs $\left(U^{\prime}, \varphi^{\prime}\right)$ where $U \subset U^{\prime}$ and $\varphi^{\prime}$ is an extension of $\varphi$. We endow $\mathcal{S}$ with a partial ordering in the obvious manner. If $\left(U_{i}^{\prime}, \varphi_{i}^{\prime}\right)$ is a totally ordered subset, then it has a maximum $\left(U^{\prime}, \varphi^{\prime}\right)$. Just take $U^{\prime}=\bigcup U_{i}^{\prime}$ and let $\varphi^{\prime}:\left(Y_{1}\right)_{U^{\prime}} \rightarrow\left(Y_{2}\right)_{U^{\prime}}$ be the morphism agreeing with $\varphi_{i}^{\prime}$ over $U_{i}^{\prime}$. Thus Zorn's lemma applies and $\mathcal{S}$ has a maximal element. By the argument above we see that this maxmimal element is an extension of $\varphi$ over all of $X$.

0BSB Lemma 48.7.7. Let $(A, \mathfrak{m})$ be a local ring. Set $X=\operatorname{Spec}(A)$ and $U=X \backslash\{\mathfrak{m}\}$. Let $U^{s h}$ be the punctured spectrum of the strict henselization $A^{\text {sh }}$ of $A$. Assume $U$ is quasi-compact and $U^{\text {sh }}$ is connected. Then the sequence

$$
\pi_{1}\left(U^{s h}, \bar{u}\right) \rightarrow \pi_{1}(U, \bar{u}) \rightarrow \pi_{1}(X, \bar{u}) \rightarrow 1
$$

is exact in the sense of Lemma 48.3.14 part (1).
Proof. The map $\pi_{1}(U) \rightarrow \pi_{1}(X)$ is surjective by Lemmas 48.7.2 and 48.3.12.
Write $X^{s h}=\operatorname{Spec}\left(A^{s h}\right)$. Let $Y \rightarrow X$ be a finite étale morphism. Then $Y^{s h}=$ $Y \times_{X} X^{s h} \rightarrow X^{s h}$ is a finite étale morphism. Since $A^{s h}$ is strictly henselian we see that $Y^{s h}$ is isomorphic to a disjoint union of copies of $X^{s h}$. Thus the same is
true for $Y \times_{X} U^{s h}$. It follows that the composition $\pi_{1}\left(U^{s h}\right) \rightarrow \pi_{1}(U) \rightarrow \pi_{1}(X)$ is trivial, see Lemma 48.3.13
To finish the proof, it suffices according to Lemma 48.3 .14 to show the following: Given a finite étale morphism $V \rightarrow U$ such that $V \times_{U} U^{s h}$ is a disjoint union of copies of $U^{s h}$, we can find a finite étale morphism $Y \rightarrow X$ with $V \cong Y \times_{X} U$ over $U$. The assumption implies that there exists a finite étale morphism $Y^{s h} \rightarrow X^{s h}$ and an isomorphism $V \times_{U} U^{s h} \cong Y^{s h} \times_{X^{s h}} U^{s h}$. Consider the following diagram

Since $U \subset X$ is quasi-compact by assumption, all the downward arrows are quasicompact open immersions. Let $\xi \in X^{s h} \times_{X} X^{s h}$ be a point not in $U^{s h} \times_{U} U^{s h}$. Then $\xi$ lies over the closed point $x^{s h}$ of $X^{s h}$. Consider the local ring homomorphism

$$
A^{s h}=\mathcal{O}_{X^{s h}, x^{s h}} \rightarrow \mathcal{O}_{X^{s h}{ }_{X_{X}} X^{s h}, \xi}
$$

determined by the first projection $X^{s h} \times_{X} X^{s h}$. This is a filtered colimit of local homomorphisms which are localizations étale ring maps. Since $A^{\text {sh }}$ is strictly henselian, we conclude that it is an isomorphism. Since this holds for every $\xi$ in the complement it follows there are no specializations among these points and hence every such $\xi$ is a closed point (you can also prove this directly). As the local ring at $\xi$ is isomorphic to $A^{s h}$, it is stricly henselian and has connected punctured spectrum. Similarly for points $\xi$ of $X^{s h} \times_{X} X^{s h} \times_{X} X^{s h}$ not in $U^{s h} \times_{U} U^{s h} \times_{U} U^{s h}$. It follows from Lemma 48.7 .5 that pullback along the vertical arrows induce fully faithful functors on the categories of finite étale schemes. Thus the canonical descent datum on $V \times_{U} U^{s h}$ relative to the fpqc covering $\left\{U^{s h} \rightarrow U\right\}$ translates into a descent datum for $Y^{s h}$ relative to the fpqc covering $\left\{X^{s h} \rightarrow X\right\}$. Since $Y^{s h} \rightarrow X^{s h}$ is finite hence affine, this descent datum is effective (Descent, Lemma 34.33.1). Thus we get an affine morphism $Y \rightarrow X$ and an isomorphism $Y \times_{X} X^{s h} \rightarrow Y^{s h}$ compatible with descent data. By fully faithfulness of descent data (as in Descent, Lemma 34.31.11 we get an isomorphism $V \rightarrow U \times_{X} Y$. Finally, $Y \rightarrow X$ is finite étale as $Y^{s h} \rightarrow X^{s h}$ is, see Descent, Lemmas 34.19.27 and 34.19.21.

Let $X$ be an irreducible scheme. Let $\eta \in X$ be the geometric point. The canonical morphism $\eta \rightarrow X$ induces a canonical map

$$
\begin{equation*}
\operatorname{Gal}\left(\kappa(\eta)^{\text {sep }} / \kappa(\eta)\right)=\pi_{1}(\eta, \bar{\eta}) \longrightarrow \pi_{1}(X, \bar{\eta}) \tag{48.7.7.1}
\end{equation*}
$$

The identification on the left hand side is Lemma 48.5.3.
0BQI Lemma 48.7.8. Let $X$ be an irreducible, geometrically unibranch scheme. For any nonempty open $U \subset X$ the canonical map

$$
\pi_{1}(U, \bar{u}) \longrightarrow \pi_{1}(X, \bar{u})
$$

is surjective. The map 48.7.7.1) $\pi_{1}(\eta, \bar{\eta}) \rightarrow \pi_{1}(X, \bar{\eta})$ is surjective as well.
Proof. By Lemma 48.5.7 we may replace $X$ by its reduction. Thus we may assume that $X$ is an integral scheme. By Lemma 48.3 .12 the assertion of the lemma translates into the statement that the functors $F \dot{F E} t_{X} \rightarrow F E_{U} t_{U}$ and $F E t_{X} \rightarrow F E ́ t_{\eta}$ are fully faithful.

The result for $F E ́ t_{X} \rightarrow F E ́ t_{U}$ follows from Lemma 48.7.6 and the fact that for a local ring $A$ which is geometrically unibranch its strict henselization has an irreducible spectrum. See More on Algebra, Lemma 15.79.3.
Observe that the residue field $\kappa(\eta)=\mathcal{O}_{X, \eta}$ is the filtered colimit of $\mathcal{O}_{X}(U)$ over $U \subset X$ nonempty open affine. Hence $F E ́ t_{\eta}$ is the colimit of the categories $F E ́ t_{U}$ over such $U$, see Limits, Lemmas 31.9.1, 31.7.3, and 31.7.8. A formal argument then shows that fully faithfulness for $F E t_{X} \rightarrow F E t_{\eta}$ follows from the fully faithfulness of the functors $F E t_{X} \rightarrow F E ́ t_{U}$.

0BSC Lemma 48.7.9. Let $X$ be a scheme. Let $x_{1}, \ldots, x_{n} \in X$ be a finite number of closed points such that
(1) $U=X \backslash\left\{x_{1}, \ldots, x_{n}\right\}$ is connected and is a retrocompact open of $X$, and
(2) for each $i$ the punctured spectrum $U_{i}^{s h}$ of the strict henselization of $\mathcal{O}_{X, x_{i}}$ is connected.
Then the map $\pi_{1}(U) \rightarrow \pi_{1}(X)$ is surjective and the kernel is the smallest closed normal subgroup of $\pi_{1}(U)$ containing the image of $\pi_{1}\left(U_{i}^{s h}\right) \rightarrow \pi_{1}(U)$ for $i=1, \ldots, n$.

Proof. Surjectivity follows from Lemmas 48.7.5 and 48.3.12. We can consider the sequence of maps

$$
\pi_{1}(U) \rightarrow \ldots \rightarrow \pi_{1}\left(X \backslash\left\{x_{1}, x_{2}\right\}\right) \rightarrow \pi_{1}\left(X \backslash\left\{x_{1}\right\}\right) \rightarrow \pi_{1}(X)
$$

A group theory argument then shows it suffices to prove the statement on the kernel in the case $n=1$ (details omitted). Write $x=x_{1}, U^{s h}=U_{1}^{s h}$, set $A=\mathcal{O}_{X, x}$, and let $A^{s h}$ be the strict henselization. Consider the diagram

By Lemma 48.3.14 we have to show finite étale morphisms $V \rightarrow U$ which pull back to trivial coverings of $U^{s h}$ extend to finite étale schemes over $X$. By Lemma 48.7.7 we know the corresponding statement for finite étale schemes over the punctured spectrum of $A$. However, by Limits, Lemma 31.15.1 schemes of finite presentation over $X$ are the same thing as schemes of finite presentation over $U$ and $A$ glued over the punctured spectrum of $A$. This finishes the proof.

### 48.8. Fundamental groups of normal schemes

0BQJ Let $X$ be an integral, geometrically unibranch scheme. In the previous section we have seen that the fundamental group of $X$ is a quotient of the Galois group of the function field $K$ of $X$. Since the map is continuous the kernel is a normal closed subgroup of the Galois group. Hence this kernel corresponds to a Galois extension $K \subset M$ by Galois theory (Fields, Theorem 9.21.3). In this section we will determine $M$ when $X$ is a normal integral scheme.
Let $X$ be an integral normal scheme with function field $K$. Let $K \subset L$ be a finite extension. Consider the normalization $Y \rightarrow X$ of $X$ in the morphism $\operatorname{Spec}(L) \rightarrow X$ as defined in Morphisms, Section 28.48. We will say (in this setting) that $X$ is unramified in $L$ if $Y \rightarrow X$ is unramified. Observe that the scheme theoretic fibre
of $Y \rightarrow X$ over $\operatorname{Spec}(K)$ is $\operatorname{Spec}(L)$. Hence the field extension $L / K$ is separable if $X$ is unramified in $L$, see Morphisms, Lemmas 28.35.11.

0BQK Lemma 48.8.1. In the situation above the following are equivalent
(1) $X$ is unramified in $L$,
(2) $Y \rightarrow X$ is étale, and
(3) $Y \rightarrow X$ is finite étale.

Proof. Observe that $Y \rightarrow X$ is an integral morphism. In each case the morphism $Y \rightarrow X$ is locally of finite type by definition (this is why this lemma is a bit of a cheat). Hence we find that in each case the lemma is finite by Morphisms, Lemma 28.43.4. In particular we see that (2) is equivalent to (3). An étale morphism is unramified, hence (2) implies (1).

Conversely, assume $Y \rightarrow X$ is unramified. Let $x \in X$. We can choose an étale neighbourhood $(U, u) \rightarrow(X, x)$ such that

$$
Y \times_{X} U=\coprod V_{j} \longrightarrow U
$$

is a disjoint union of closed immersions, see Étale Morphisms, Lemma 40.17.3. Shrinking we may assume $U$ is quasi-compact. Then $U$ has finitely many irreducible components (Descent, Lemma 34.12.3). Since $U$ is normal (Descent, Lemma 34.14 .2 the irreducible components of $U$ are open and closed (Properties, Lemma 27.7.5 and we may assume $U$ is irreducible. Then $U$ is an integral scheme whose generic point $\xi$ maps to the generic point of $X$. On the other hand, we know that $Y \times_{X} U$ is the normalization of $U$ in $\operatorname{Spec}(L) \times_{X} U$ by More on Morphisms, Lemma 36.14.2 Every point of $\operatorname{Spec}(L) \times{ }_{X} U$ maps to $\xi$. Thus every $V_{j}$ contains a point mapping to $\xi$ by Morphisms, Lemma 28.48.8. Thus $V_{j} \rightarrow U$ is an isomorphism as $U=\overline{\{\xi\}}$. Thus $Y \times_{X} U \rightarrow U$ is étale and by étale descent (Descent, Lemma 34.19.27) we conclude that $Y \rightarrow X$ is étale over the image of $U \rightarrow X$ (an open neighbourhood of $x$ ).

0BQL Lemma 48.8.2. Let $X$ be a normal integral scheme with function field $K$. Let $Y \rightarrow X$ be a finite étale morphism. If $Y$ is connected, then $Y$ is an integral normal scheme and $Y$ is the normalization of $X$ in the function field of $Y$.

Proof. The scheme $Y$ is normal by Descent, Lemma 34.14.2. Since $Y \rightarrow X$ is flat every generic point of $Y$ maps to the generic point of $X$ by Morphisms, Lemma 28.25.8. Since $Y \rightarrow X$ is finite we see that $Y$ has a finite number of irreducible components. Thus $Y$ is the disjoint union of a finite number of integral normal schemes by Properties, Lemma 27.7.5. Thus if $Y$ is connected, then $Y$ is an integral normal scheme.

Let $L$ be the function field of $Y$ and let $Y^{\prime} \rightarrow X$ be the normalization of $X$ in $L$. By Morphisms, Lemma 28.48.4 we obtain a factorization $Y^{\prime} \rightarrow Y \rightarrow X$ and $Y^{\prime} \rightarrow Y$ is the normalization of $Y$ in $L$. Since $Y$ is normal it is clear that $Y^{\prime}=Y$ (this can also be deduced from Morphisms, Lemma 28.49.5.

0BQM Proposition 48.8.3. Let $X$ be a normal integral scheme with function field $K$. Then the canonical map 48.7.7.1)

$$
\operatorname{Gal}\left(K^{\text {sep }} / K\right)=\pi_{1}(\eta, \bar{\eta}) \longrightarrow \pi_{1}(X, \bar{\eta})
$$

is identified with the quotient map $\operatorname{Gal}\left(K^{\text {sep }} / K\right) \rightarrow \operatorname{Gal}(M / K)$ where $M \subset K^{\text {sep }}$ is the union of the finite subextensions $L$ such that $X$ is unramified in $L$.
Proof. Observe that a normal scheme is geometrically unibranch (Properties, Lemma 27.15 .2 ) and hence Lemma 48.7.8 applies to $X$. Combining this with Lemmas 48.8.1 and 48.8 .2 we see that the category $F E ́ t_{X}$ is equivalent to the category of finite products $\prod_{i}$ with $L_{i} / K$ finite separable such that $X$ is unramified in $L_{i}$. Consider the functor

$$
F E^{\prime} t_{X} \longrightarrow F E^{\prime} t_{\eta} \longrightarrow \text { Finite-Gal }\left(K^{\text {sep }} / K\right) \text {-sets }
$$

where the second arrow is the equivalence of Lemma 48.5.3. It is clear from the discussion above that objecs on the left hand side correspond to the full subcategory Finite- $\operatorname{Gal}(M / K)$-sets on the right hand side. Some details omitted.

### 48.9. Finite étale covers of punctured spectra, I

0BLE We first prove some results á la Lefschetz.
0BLF Situation 48.9.1. Let $(A, \mathfrak{m})$ be a Noetherian local ring and $f \in \mathfrak{m}$. We set $X=\operatorname{Spec}(A)$ and $X_{0}=\operatorname{Spec}(A / f A)$ and we let $U=X \backslash\{\mathfrak{m}\}$ and $U_{0}=X_{0} \backslash\{\mathfrak{m}\}$ be the punctured spectrum of $A$ and $A / f A$.

Recall that for a scheme $X$ the category of schemes finite étale over $X$ is denoted $F E ́ t_{X}$, see Section 48.4. In Situation 48.9.1 we will study the base change functors

In many case the right vertical arrow is faithful.
0BLG Lemma 48.9.2. In Situation 48.9.1. Assume one of the following holds
(1) $\operatorname{dim}(A / \mathfrak{p}) \geq 2$ for every minimal prime $\mathfrak{p} \subset A$ with $f \notin \mathfrak{p}$, or
(2) every connected component of $U$ meets $U_{0}$.

Then

$$
F E^{\prime} t_{U} \longrightarrow F E^{\prime} t_{U_{0}}, \quad V \longmapsto V_{0}=V \times_{U} U_{0}
$$

is a faithful functor.
Proof. Let $a, b: V \rightarrow W$ be two morphisms of schemes finite étale over $U$ whose restriction to $U_{0}$ are the same. Assumption (1) means that every irreducible component of $U$ meets $U_{0}$, see Algebra, Lemma 10.59.12. The image of any irreducible component of $V$ is an irreducible component of $U$ and hence meets $U_{0}$. Hence $V_{0}$ meets every connected component of $V$ and we conclude that $a=b$ by Étale Morphisms, Proposition 40.6.3. In case (2) the argument is the same using that the image of a connected component of $V$ is a connected component of $U$.

Before we prove something more interesting, we need a couple of lemmas.
0BLH Lemma 48.9.3. In Situation 48.9.1. Let $V \rightarrow U$ be a finite morphism. Let $A^{\wedge}$ be the $\mathfrak{m}$-adic completion of $A$, let $X^{\prime}=\operatorname{Spec}\left(A^{\wedge}\right)$ and let $U^{\prime}$ and $V^{\prime}$ be the base changes of $U$ and $V$ to $X^{\prime}$. If $Y^{\prime} \rightarrow X^{\prime}$ is a finite morphism such that $V^{\prime}=Y^{\prime} \times{ }_{X^{\prime}} U^{\prime}$, then there exists a finite morphism $Y \rightarrow X$ such that $V=Y \times{ }_{X} U$ and $Y^{\prime}=Y \times_{X} X^{\prime}$.

Proof. This is a straightforward application of More on Algebra, Proposition 15.70.15. Namely, choose generators $f_{1}, \ldots, f_{t}$ of $\mathfrak{m}$. For each $i$ write $V \times_{U} D\left(f_{i}\right)=$ $\operatorname{Spec}\left(B_{i}\right)$. For $1 \leq i, j \leq n$ we obtain an isomorphism $\alpha_{i j}:\left(B_{i}\right)_{f_{j}} \rightarrow\left(B_{j}\right)_{f_{i}}$ of $A_{f_{i} f_{j}}$-algebras because the spectrum of both represent $V \times_{U} D\left(f_{i} f_{j}\right)$. Write $Y^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. Since $V \times_{U} U^{\prime}=Y \times_{X^{\prime}} U^{\prime}$ we get isomorphisms $\alpha_{i}: B_{f_{i}}^{\prime} \rightarrow$ $B_{i} \otimes_{A} A^{\wedge}$. A straightforward argument shows that ( $B^{\prime}, B_{i}, \alpha_{i}, \alpha_{i j}$ ) is an object of Glue $\left(A \rightarrow A^{\wedge}, f_{1}, \ldots, f_{t}\right)$, see More on Algebra, Remark 15.70.10. Applying the proposition cited above (and using More on Algebra, Remark 15.70 .19 to obtain the algebra structure) we find an $A$-algebra $B$ such that $\operatorname{Can}(B)$ is isomorphic to $\left(B^{\prime}, B_{i}, \alpha_{i}, \alpha_{i j}\right)$. Setting $Y=\operatorname{Spec}(B)$ we see that $Y \rightarrow X$ is a morphism which comes equipped with compatible isomorphisms $V \cong Y \times_{X} U$ and $Y^{\prime}=Y \times_{X} X^{\prime}$ as desired.

0BLI Lemma 48.9.4. In Situation 48.9.1 assume $A$ is henselian or more generally that $(A,(f))$ is a henselian pair. Let $A^{\wedge}$ be the $\mathfrak{m}$-adic completion of $A$, let $X^{\prime}=$ $\operatorname{Spec}\left(A^{\wedge}\right)$ and let $U^{\prime}$ and $U_{0}^{\prime}$ be the base changes of $U$ and $U_{0}$ to $X^{\prime}$. If $F E_{U^{\prime}} \rightarrow$ $F E t_{U_{0}^{\prime}}$ is fully faithful, then $F E t_{U} \rightarrow F E t_{U_{0}}$ is fully faithful.

Proof. Assume $F E t_{U^{\prime}} \longrightarrow F E t_{U_{0}^{\prime}}$ is a fully faithful. Since $X^{\prime} \rightarrow X$ is faithfully flat, it is immediate that the functor $V \rightarrow V_{0}=V \times_{U} U_{0}$ is faithful. Since the category of finite étale coverings has an internal hom (Lemma 48.4.4) it suffices to prove the following: Given $V$ finite étale over $U$ we have

$$
\operatorname{Mor}_{U}(U, V)=\operatorname{Mor}_{U_{0}}\left(U_{0}, V_{0}\right)
$$

The we assume we have a morphism $s_{0}: U_{0} \rightarrow V_{0}$ over $U_{0}$ and we will produce a morphism $s: U \rightarrow V$ over $U$.

By our assumption there does exist a morphism $s^{\prime}: U^{\prime} \rightarrow V^{\prime}$ whose restriction to $V_{0}^{\prime}$ is the base change $s_{0}^{\prime}$ of $s_{0}$. Since $V^{\prime} \rightarrow U^{\prime}$ is finite étale this means that $V^{\prime}=s^{\prime}\left(U^{\prime}\right) \amalg W^{\prime}$ for some $W^{\prime} \rightarrow U^{\prime}$ finite and étale. Choose a finite morphism $Z^{\prime} \rightarrow X^{\prime}$ such that $W^{\prime}=Z^{\prime} \times X^{\prime} U^{\prime}$. This is possible by Zariski's main theorem in the form stated in More on Morphisms, Lemma 36.31.3 (small detail omitted). Then

$$
V^{\prime}=s^{\prime}\left(U^{\prime}\right) \amalg W^{\prime} \longrightarrow X^{\prime} \amalg Z^{\prime}=Y^{\prime}
$$

is an open immersion such that $V^{\prime}=Y^{\prime} \times{ }_{X^{\prime}} U^{\prime}$. By Lemma 48.9.3 we can find $Y \rightarrow X$ finite such that $V=Y \times_{X} U$ and $Y^{\prime}=Y \times_{X} X^{\prime}$. Write $Y=\operatorname{Spec}(B)$ so that $Y^{\prime}=\operatorname{Spec}\left(B \otimes_{A} A^{\wedge}\right)$. Then $B \otimes_{A} A^{\wedge}$ has an idempotent $e^{\prime}$ corresponding to the open and closed subscheme $X^{\prime}$ of $Y^{\prime}=X^{\prime} \amalg Z^{\prime}$.
The case $A$ is henselian (slightly easier). The image $\bar{e}$ of $e^{\prime}$ in $B \otimes_{A} \kappa(\mathfrak{m})=B / \mathfrak{m} B$ lifts to an idempotent $e$ of $B$ as $A$ is henselian (because $B$ is a product of local rings by Algebra, Lemma 10.148.3). Then we see that $e$ maps to $e^{\prime}$ by uniqueness of lifts of idempotents (using that $B \otimes_{A} A^{\wedge}$ is a product of local rings). Let $Y_{1} \subset Y$ be the open and closed subscheme corresponding to $e$. Then $Y_{1} \times_{X} X^{\prime}=s^{\prime}\left(X^{\prime}\right)$ which implies that $Y_{1} \rightarrow X$ is an isomorphism (by faithfully flat descent) and gives the desired section.

The case where $(A,(f))$ is a henselian pair. Here we use that $s^{\prime}$ is a lift of $s_{0}^{\prime}$. Namely, let $Y_{0,1} \subset Y_{0}=Y \times_{X} X_{0}$ be the closure of $s_{0}\left(U_{0}\right) \subset V_{0}=Y_{0} \times_{X_{0}} U_{0}$. As $X^{\prime} \rightarrow X$ is flat, the base change $Y_{0,1}^{\prime} \subset Y_{0}^{\prime}$ is the closure of $s_{0}^{\prime}\left(U_{0}^{\prime}\right)$ which is equal to $X_{0}^{\prime} \subset Y_{0}^{\prime}$ (see Morphisms, Lemma 28.25.14). Since $Y_{0}^{\prime} \rightarrow Y_{0}$ is submersive
(Morphisms, Lemma 28.25.10) we conclude that $Y_{0,1}$ is open and closed in $Y_{0}$. Let $e_{0} \in B / f B$ be the corresponding idempotent. By More on Algebra, Lemma 15.8.7 we can lift $e_{0}$ to an idempotent $e \in B$. Then we conclude as before.

The following lemma will be superseded by Lemma 48.9 .6 below.
0BLJ Lemma 48.9.5. In Situation 48.9.1. Asssume $f$ is a nonzerodivisor, that $A$ has depth $\geq 3$, and that $A$ is henselian or more generally $(A,(f))$ is a henselian pair. Then

$$
F E t_{U} \longrightarrow F E_{U_{0}}, \quad V \longmapsto V_{0}=V \times_{U} U_{0}
$$

is a fully faithful functor.
Proof. By Lemma 48.9 .4 we may assume $A$ is a complete local Noetherian ring. The functor is faithful by Lemma 48.9 .2 (to see the assumption of that lemma holds, apply Algebra, Lemma 10.71.8). Since the category of finite étale coverings has an internal hom (Lemma 48.4.4) it suffices to prove the following: Given $V$ finite étale over $U$ we have

$$
\operatorname{Mor}_{U}(U, V)=\operatorname{Mor}_{U_{0}}\left(U_{0}, V_{0}\right)
$$

If we have a morphism $U_{0} \rightarrow V_{0}$ over $U_{0}$, then we obtain an decomposition $V_{0}=$ $U_{0} \amalg V_{0}^{\prime}$ into open and closed subschemes. We will show that this implies the same thing for $V$ thereby finishing the proof.

For $n \geq 1$ let $U_{n}$ be the punctured spectrum of $A / f^{n+1} A$ and let $V_{n} \rightarrow U_{n}$ be the base change of $V \rightarrow U$. By Étale Morphisms, Theorem 40.15 .2 we conclude that there is a unique decomposition $V_{n}=U_{n} \amalg V_{n}^{\prime}$ into open and closed subschemes whose base change to $U_{0}$ recovers the given decomposition.

Since $A$ has depth $\geq 3$ and $f$ is a nonzerodivisor, we see that $A / f A$ has depth $\geq 2$ (Algebra, Lemma 10.71.7). This implies the vanishing of $H_{\mathfrak{m}}^{0}(A / f A)$ and $H_{\mathfrak{m}}^{1}(A / f A)$, see Dualizing Complexes, Lemma 45.11.1. This in turn tells us that $A / f A \rightarrow \Gamma\left(U_{0}, \mathcal{O}_{U_{0}}\right)$ is an isomorphism, see Dualizing Complexes, Lemma 45.15.2. As $f$ is a nonzerodivisor we obtain short exact sequences

$$
0 \rightarrow A / f A \xrightarrow{f^{n}} A / f^{n+1} A \rightarrow A / f^{n} A \rightarrow 0
$$

Induction on $n$ shows that $H_{\mathfrak{m}}^{0}\left(A / f^{n+1} A\right)=H_{\mathfrak{m}}^{1}\left(A / f^{n+1} A\right)=0$ for all $n$. Hence the same reasoning shows that $A / f^{n+1} A \rightarrow \Gamma\left(U_{n}, \mathcal{O}_{U_{n}}\right)$ is an isomorphism. Combined with the decompositions above this determines a map

$$
\Gamma\left(V, \mathcal{O}_{V}\right) \rightarrow \lim \Gamma\left(V_{n}, \mathcal{O}_{V_{n}}\right) \rightarrow \lim \Gamma\left(U_{n}, \mathcal{O}_{U_{n}}\right)=A
$$

Since $V \rightarrow U$ is affine, this $A$-algebra map corresponds to a section $U \rightarrow V$ as desired.

In the following lemma we prove fully faithfulness under very weak assumptions. Note that the assumptions do not imply that $U$ is a connected scheme, but the conclusion guarantees that $U$ and $U_{0}$ have the same number of connected components.

0BM6 Lemma 48.9.6. In Situation 48.9.1. Asssume
(1) $f$ is a nonzerodivisor,
(2) $H_{\mathfrak{m}}^{1}(A)$ is finite,
(3) $H_{\mathfrak{m}}^{2}(A)$ is annihilated by a power of $f$, and
(4) $A$ is henselian or more generally $(A,(f))$ is a henselian pair.

Then

$$
F E^{\prime} t_{U} \longrightarrow F E_{U_{0}}, \quad V \longmapsto V_{0}=V \times_{U} U_{0}
$$

is a fully faithful functor.
Proof. By Lemma 48.9.4 we may assume that $A$ is a Noetherian complete local ring. (The assumptions carry over; use Dualizing Complexes, Lemma 45.9.3.)
Assume $A$ is complete in addition to the other conditions. We will show that given $\pi: V \rightarrow U$ finite étale, the set of connected components of $V$ agrees with the set of connected components of $V_{0}$. This will prove the lemma because the category of finite étale covers has internal hom (Lemma 48.4.4) and images of sections are connected components (Étale Morphisms, Proposition 40.6.1). Some details omitted.

Set $\mathcal{B}=\pi_{*} \mathcal{O}_{V}$. This is a finite locally free $\mathcal{O}_{U}$-algebra. Thus $\operatorname{Ass}(\mathcal{B})=\operatorname{Ass}\left(\mathcal{O}_{U}\right)$. Assumption (2) means that $H^{0}\left(U, \mathcal{O}_{U}\right)$ is a finite $A$-module and equivalently that $j_{*} \mathcal{O}_{U}$ is coherent (Dualizing Complexes, Lemma 45.15.2). By Dualizing Complexes, Proposition 45.15.7 and the agreement of Ass we see that the same holds for $\mathcal{B}$ and we conclude that $B=\Gamma(U, \mathcal{B})=\Gamma\left(V, \mathcal{O}_{V}\right)$ is a finite $A$-algebra.
Next, using that $H_{\mathfrak{m}}^{2}(A)=H^{1}\left(U, \mathcal{O}_{U}\right)$ is annihilated by $f^{n}$ for some $n$ we see that $H^{1}(U, \mathcal{B})=H^{1}\left(V, \mathcal{O}_{V}\right)$ is annihilated by $f^{m}$ for some $m$, see Dualizing Complexes, Lemma 45.41.3.
At this point we apply Derived Categories of Schemes, Lemma 35.26 .3 to the scheme $V$ over $\operatorname{Spec}(A)$ and the sheaf $\mathcal{O}_{V}$ with $p=0$. Since $f$ is a nonzerodivisor in $A$ the $f$-power torsion subsheaf of $\mathcal{O}_{V}$ is zero. The first short exact sequence of the lemma collapses to become

$$
H^{0}=\lim H^{0}\left(V, \mathcal{O}_{V} / f^{n} \mathcal{O}_{V}\right)=\lim H^{0}\left(V_{n}, \mathcal{O}_{V_{n}}\right)
$$

where $V_{n} \subset V$ is the closed subscheme cut out by $f^{n+1}$. Since $H^{1}\left(V, \mathcal{O}_{V}\right)$ is annihilated by a power of $f$ we see that the Tate module $T_{f}\left(H^{1}\left(V, \mathcal{O}_{V}\right)\right)$ is zero. On the other hand, since $A$ is complete and $B=H^{0}\left(V, \mathcal{O}_{V}\right)$ is a finite $A$-module it is complete (Algebra, Lemma 10.96.1) hence derived complete (More on Algebra, Proposition 15.72 .5 and hence equal to its derived $f$-adic completion. Thus we see that $H^{0}=B$. Since

$$
V_{0} \subset V_{1} \subset V_{2} \subset \ldots
$$

are nilpotent thickenings the connected components of these schemes agree. Correspondingly the maps

$$
\ldots \rightarrow H^{0}\left(V_{2}, \mathcal{O}_{V_{2}}\right) \rightarrow H^{0}\left(V_{1}, \mathcal{O}_{V_{1}}\right) \rightarrow H^{0}\left(V_{0}, \mathcal{O}_{V_{0}}\right)
$$

induce bijections between idempotents. Hence the map $B \rightarrow H^{0}\left(V_{0}, \mathcal{O}_{V_{0}}\right)$ induces a bijection between idempotents and we conclude.

In the rest of this sections we prove some variants of the lemmas above where $U$ is replaced by opens $U^{\prime} \subset U$ containing $U_{0}$. We advise the reader to skip to the next section.

0BLN Lemma 48.9.7. In Situation 48.9.1. Let $U^{\prime} \subset U$ be open and contain $U_{0}$. Assume $\operatorname{dim}(A / \mathfrak{p}) \geq 2$ for every minimal prime $\mathfrak{p} \subset A$ corresponding to a point of $U^{\prime}$. Then

$$
F^{\prime} t_{U^{\prime}} \longrightarrow F E^{\prime} t_{U_{0}}, \quad V^{\prime} \longmapsto V_{0}=V^{\prime} \times_{U^{\prime}} U_{0}
$$

is a faithful functor. Moreover, there exists a $U^{\prime}$ satisfying these assumptions.

Proof. Let $a, b: V^{\prime} \rightarrow W^{\prime}$ be two morphisms of schemes finite étale over $U^{\prime}$ whose restriction to $U_{0}$ are the same. By Algebra, Lemma 10.59 .12 we see that $V(\mathfrak{p})$ meets $U_{0}$ for every prime $\mathfrak{p}$ of $A$ with $\operatorname{dim}(A / \mathfrak{p}) \geq 2$. The assumption therefore implies that every irreducible component of $U^{\prime}$ meets $U_{0}$. The image of any irreducible component of $V^{\prime}$ is an irreducible component of $U^{\prime}$ and hence meets $U_{0}$. Hence $V_{0}$ meets every connected component of $V^{\prime}$ and we conclude that $a=b$ by Étale Morphisms, Proposition40.6.3. To see the existence of such a $U^{\prime}$ note that if $\mathfrak{p} \subset A$ is a prime with $\operatorname{dim}(A / \mathfrak{p})=1$ then $\mathfrak{p}$ corresponds to a closed point of $U$.

0BLP Lemma 48.9.8. In Situation 48.9.1. Assume $f$ is a nonzerodivisor, $A$ is $f$ adically complete, and that $H_{\mathfrak{m}}^{1}(A / f A)$ is a finite $A$-module. Let $V^{\prime}$, $W^{\prime}$ be finite étale over an open $U^{\prime} \subset U$ which contains $U_{0}$. Let $\varphi_{0}: V^{\prime} \times{ }_{U^{\prime}} U_{0} \rightarrow W^{\prime} \times_{U^{\prime}} U_{0}$ be a morphism over $U_{0}$. Then there exists an open $U^{\prime \prime} \subset U^{\prime}$ containing $U_{0}$ and a morphism $\varphi: V^{\prime} \times_{U^{\prime}} U^{\prime \prime} \rightarrow W^{\prime} \times_{U^{\prime}} U^{\prime \prime}$ lifting $\varphi_{0}$.

Proof. Since the category of finite étale coverings has an internal hom (Lemma 48.4.4 it suffices to prove the following: Given $V^{\prime}$ finite étale over $U^{\prime}$ any section $U_{0} \rightarrow V^{\prime} \times U^{\prime} U_{0}$ extends to a section of $V^{\prime}$ over some open $U^{\prime \prime} \subset U^{\prime}$ containing $U_{0}$. Given our section we obtain a decomposition $V^{\prime} \times_{U^{\prime}} U_{0}=U_{0} \amalg R_{0}$ into open and closed subschemes. We will show that this implies the same thing for $V^{\prime} \times{ }_{U^{\prime}} U^{\prime \prime}$ for some $U^{\prime \prime} \subset U^{\prime}$ open containing $U_{0}$ thereby finishing the proof.

For $n \geq 1$ let $U_{n}$ be the punctured spectrum of $A / f^{n+1} A$. By Étale Morphisms, Theorem 40.15.2 we conclude that there is a unique decomposition $V^{\prime} \times{ }_{U^{\prime}} U_{n}=$ $U_{n} \amalg R_{n}$ into open and closed subschemes whose base change to $U_{0}$ recovers the given decomposition.

The finiteness of $H_{\mathfrak{m}}^{1}(A / f A)$ tells us that $B_{0}=\Gamma\left(U_{0}, \mathcal{O}_{U_{0}}\right)$ is a finite $A$-module, see Dualizing Complexes, Lemma 45.15.2. Set $B_{n}=\Gamma\left(U_{n}, \mathcal{O}_{U_{n}}\right)$. As $f$ is a nonzerodivisor we have exact sequences

$$
0 \rightarrow A / f^{n} A \xrightarrow{f} A / f^{n+1} A \rightarrow A / f A \rightarrow 0
$$

and hence short exact sequences $0 \rightarrow \mathcal{O}_{U_{n}} \rightarrow \mathcal{O}_{U_{n+1}} \rightarrow \mathcal{O}_{U_{0}} \rightarrow 0$. Thus we may apply Derived Categories of Schemes, Lemma 35.26 .1 to the inverse system $\mathcal{O}_{U_{n}}$ on $U$. We find that $B=\lim B_{n}$ is a finite $A$-algebra, such that $f$ is a nonzerodivisor on $B$, and such that $B / f B \subset B_{0}$. Via the inclusions $U_{n} \rightarrow V^{\prime} \times_{U^{\prime}} U_{n} \rightarrow V^{\prime}$ we obtain an $A$-algebra map $\Gamma\left(V^{\prime}, \mathcal{O}_{V^{\prime}}\right) \rightarrow B$. Since $V \rightarrow U$ is affine, this $A$-algebra map corresponds to a morphism

$$
\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} U^{\prime} \longrightarrow V^{\prime}
$$

over $U^{\prime}$.
Let $\mathfrak{q} \in U_{0}$ be a prime. The kernel and cokernel of $A / f A \rightarrow B_{0}$ have support contained in $\{\mathfrak{m}\}$ (see above). Hence the same is true for the map $A / f A \rightarrow B / f B$. Then $A_{\mathfrak{q}} \rightarrow B_{\mathfrak{q}}$ is finite and induces an isomorphism $(A / f A)_{\mathfrak{q}} \rightarrow(B / f B)_{\mathfrak{q}}$. Since $f$ is a nonzerodivisor on $B$ it follows that $A_{\mathfrak{q}} \rightarrow B_{\mathfrak{q}}$ is an isomorphism. Using finiteness again we find $g \in A, g \notin \mathfrak{q}$ such that $A_{g} \rightarrow B_{g}$ is an isomorphism. It follows that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is an isomorphism over an open $U^{\prime \prime} \subset U^{\prime}$ which produces the desired section by the above.

### 48.10. Purity in local case, I

0BM7 Let $(A, \mathfrak{m})$ be a Noetherian local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$ be the puctured spectrum. We say purity holds for $(A, \mathfrak{m})$ if the restriction functor

$$
F E_{X}{ }_{X} \longrightarrow \text { F'́ }_{U}
$$

is essentially surjective. In this section we try to understand how the question changes when one passes from $X$ to a hypersurface $X_{0}$ in $X$, in other words, we study a kind of local Lefschetz property for the fundamental groups of punctured spectra. These results will be useful to proceed by induction on dimension in the proofs of our main results on local purity, namely, Lemma 48.11.4 and Proposition 48.13 .2

0BM8 Lemma 48.10.1. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$. Let $\pi: Y \rightarrow X$ be a finite morphism such that depth $\left(\mathcal{O}_{Y, y}\right) \geq 2$ for all closed points $y \in Y$. Then $Y$ is the spectrum of $B=\mathcal{O}_{Y}\left(\pi^{-1}(U)\right)$.
Proof. Set $V=\pi^{-1}(U)$ and denote $\pi^{\prime}: V \rightarrow U$ the restriction of $\pi$. Consider the $\mathcal{O}_{X}$-module map

$$
\pi_{*} \mathcal{O}_{Y} \longrightarrow j_{*} \pi_{*}^{\prime} \mathcal{O}_{V}
$$

where $j: U \rightarrow X$ is the inclusion morphism. We claim Divisors, Lemma 30.2.11 applies to this map. If so, then $B=\Gamma\left(Y, \mathcal{O}_{Y}\right)$ and we see that the lemma holds. Let $x \in X$. If $x \in U$, then the map is an isomorphism on stalks as $V=Y \times{ }_{X} U$. If $x$ is the closed point, then $x \notin \operatorname{Ass}\left(j_{*} \pi_{*} \mathcal{O}_{V}\right)$ (Divisors, Lemmas 30.5.9 and 30.5.3). Thus it suffices to show that depth $\left(\left(\pi_{*} \mathcal{O}_{Y}\right)_{x}\right) \geq 2$. Let $y_{1}, \ldots, y_{n} \in Y$ be the points mapping to $x$. By Algebra, Lemma 10.71 .9 it suffices to show that $\operatorname{depth}\left(\mathcal{O}_{Y, y_{i}}\right) \geq 2$ for $i=1, \ldots, n$. Since this is the assumption of the lemma the proof is complete.

0BLK Lemma 48.10.2. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$. Let $V$ be finite étale over $U$. Assume $A$ has depth $\geq 2$. The following are equivalent
(1) $V=Y \times{ }_{X} U$ for some $Y \rightarrow X$ finite étale,
(2) $B=\Gamma\left(V, \mathcal{O}_{V}\right)$ is finite étale over $A$.

Proof. Denote $\pi: V \rightarrow U$ the given finite étale morphism. Assume $Y$ as in (1) exists. Let $y \in Y$ be a point mapping to $x$. We claim that $\operatorname{depth}\left(\mathcal{O}_{Y, y}\right) \geq 2$. This is true because $Y \rightarrow X$ is étale and hence $A=\mathcal{O}_{X, x}$ and $\mathcal{O}_{Y, y}$ have the same depth (Algebra, Lemma 10.155.2). Hence Lemma 48.10.1 applies and $Y=\operatorname{Spec}(B)$.
The implication $(2) \Rightarrow(1)$ is easier and the details are omitted.
0BM9 Lemma 48.10.3. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$. Assume $A$ is normal of dimension $\geq 2$. The functor

$$
F E ́ t_{U} \longrightarrow\left\{\begin{array}{c}
\text { finite normal } A \text {-algebras } B \text { such } \\
\text { that } \operatorname{Spec}(B) \rightarrow X \text { is étale over } U
\end{array}\right\}, \quad V \longmapsto \Gamma\left(V, \mathcal{O}_{V}\right)
$$

is an equivalence. Moreover, $V=Y \times_{X} U$ for some $Y \rightarrow X$ finite étale if and only if $B=\Gamma\left(V, \mathcal{O}_{V}\right)$ is finite étale over $A$.

Proof. Observe that depth $(A) \geq 2$ because $A$ is normal (Serre's criterion for normality, Algebra, Lemma 10.149.4). Thus the final statement follows from Lemma 48.10.2. Given $\pi: V \rightarrow U$ finite étale, set $B=\Gamma\left(V, \mathcal{O}_{V}\right)$. If we can show that $B$ is
normal and finite over $A$, then we obtain the displayed functor. Since there is an obvious quasi-inverse functor, this is also all that we have to show.
Since $A$ is normal, the scheme $V$ is normal (Descent, Lemma 34.14.2). Hence $V$ is a finite disjoint union of integral schemes (Properties, Lemma 27.7.6). Thus we may assume $V$ is integral. In this case the function field $L$ of $V$ (Morphisms, Section 28.9 is a finite separable extension of $f . f .(A)$ (because we get it by looking at the generic fibre of $V \rightarrow U$ and using Morphisms, Lemma 28.36.7). By Algebra, Lemma 10.153 .8 the integral closure $B^{\prime} \subset L$ of $A$ in $L$ is finite over $A$. By More on Algebra, Lemma 15.17 .16 we see that $B^{\prime}$ is a reflexive $A$-module, which in turn implies that $\operatorname{depth}_{A}\left(B^{\prime}\right) \geq 2$ by More on Algebra, Lemma 15.17.14.
Let $f \in \mathfrak{m}$. Then $B_{f}=\Gamma\left(V \times_{U} D(f), \mathcal{O}_{V}\right)$ (Properties, Lemma 27.17.1). Hence $B_{f}^{\prime}=B_{f}$ because $B_{f}$ is normal (see above), finite over $A_{f}$ with fraction field $L$. It follows that $V=\operatorname{Spec}\left(B^{\prime}\right) \times_{X} U$. Then we conclude that $B=B^{\prime}$ from Lemma 48.10.1 applied to $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow X$. This lemma applies because the localizations $B_{\mathfrak{m}^{\prime}}^{\prime}$ of $B^{\prime}$ at maximal ideals $\mathfrak{m}^{\prime} \subset B^{\prime}$ lying over $\mathfrak{m}$ have depth $\geq 2$ by Algebra, Lemma 10.71 .9 and the remark on depth in the preceding paragraph.

0BLL Lemma 48.10.4. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Set $X=\operatorname{Spec}(A)$ and let $U=X \backslash\{\mathfrak{m}\}$. Let $V$ be finite étale over $U$. Let $A^{\wedge}$ be the $\mathfrak{m}$-adic completion of $A$, let $X^{\prime}=\operatorname{Spec}\left(A^{\wedge}\right)$ and let $U^{\prime}$ and $V^{\prime}$ be the base changes of $U$ and $V$ to $X^{\prime}$. The following are equivalent
(1) $V=Y \times_{X} U$ for some $Y \rightarrow X$ finite étale, and
(2) $V^{\prime}=Y^{\prime} \times{ }_{X^{\prime}} U^{\prime}$ for some $Y^{\prime} \rightarrow X^{\prime}$ finite étale.

Proof. The implication (1) $\Rightarrow(2)$ follows from taking the base change of a solution $Y \rightarrow X$. Let $Y^{\prime} \rightarrow X^{\prime}$ be as in (2). By Lemma 48.9.3 we can find $Y \rightarrow X$ finite such that $V=Y \times_{X} U$ and $Y^{\prime}=Y \times_{X} X^{\prime}$. By descent we see that $Y \rightarrow X$ is finite étale (Algebra, Lemmas 10.82.2 and 10.141.3). This finishes the proof.

The following lemma will be superseded by Lemma 48.10.6
0BLM Lemma 48.10.5. In Situation 48.9.1. Let $V$ be finite étale over $U$. Assume
(1) $f$ is a nonzerodivisor,
(2) A has depth $\geq 3$,
(3) $V_{0}=V \times_{U} U_{0}$ is equal to $Y_{0} \times_{X_{0}} U_{0}$ for some $Y_{0} \rightarrow X_{0}$ finite étale.

Then $V=Y \times_{X} U$ for some $Y \rightarrow X$ finite étale.
Proof. We reduce to the complete case by Lemma 48.10.4. Alternatively you can use Lemma 48.10 .2 , cohomology and base change (Cohomology of Schemes, Lemma 29.5.2), and descent (Algebra, Lemmas 10.82.2 and 10.141.3).

In the complete case we can lift $Y_{0} \rightarrow X_{0}$ to a finite étale morphism $Y \rightarrow X$ by More on Algebra, Lemma 15.8.12; observe that $(A, f A)$ is a henselian pair by More on Algebra, Lemma 15.8.3. Then we can use Lemma 48.9.5 to see that $V$ is isomorphic to $Y \times_{X} U$ and the proof is complete.

The point of the following lemma is that the assumptions do not force $A$ to have depth $\geq 3$. For example if $A$ is a complete normal local domain of dimension $\geq 3$ and $f \in \mathfrak{m}$ is nonzero, then the assumptions are satisfied.

0BLS Lemma 48.10.6. In Situation 48.9.1. Let $V$ be finite étale over $U$. Assume
(1) $f$ is a nonzerodivisor,
(2) $H_{\mathfrak{m}}^{1}(A)$ is a finite $A$-module,
(3) a power of $f$ annihilates $H_{\mathfrak{m}}^{2}(A)$,
(4) $V_{0}=V \times_{U} U_{0}$ is equal to $Y_{0} \times_{X_{0}} U_{0}$ for some $Y_{0} \rightarrow X_{0}$ finite étale.

Then $V=Y \times_{X} U$ for some $Y \rightarrow X$ finite étale.
Proof. We reduce to the complete case using Lemma 48.10.4. (The assumptions carry over; use Dualizing Complexes, Lemma 45.9.3.)
In the complete case we can lift $Y_{0} \rightarrow X_{0}$ to a finite étale morphism $Y \rightarrow X$ by More on Algebra, Lemma 15.8.12; observe that $(A, f A)$ is a henselian pair by More on Algebra, Lemma 15.8.3. Then we can use Lemma 48.9 .6 to see that $V$ is isomorphic to $Y \times_{X} U$ and the proof is complete.

### 48.11. Purity of branch locus

0BJE Let $\pi: X \rightarrow Y$ be a morphism of schemes which is finite locally free. Then there exists a canonical trace for $\pi$ which is an $\mathcal{O}_{Y}$-linear map

$$
\operatorname{Trace}_{\pi}: \pi_{*} \mathcal{O}_{X} \longrightarrow \mathcal{O}_{Y}
$$

such that the composition $\mathcal{O}_{Y} \xrightarrow{\pi^{\sharp}} \pi_{*} \mathcal{O}_{X} \xrightarrow{\operatorname{Trace}_{\pi}} \mathcal{O}_{Y}$ equals multiplication by the degree of $\pi$ (which is a locally constant function on $Y$ ). In analogy with Fields, Section 9.19 we can define the trace pairing

$$
Q_{\pi}: \pi_{*} \mathcal{O}_{X} \times \pi_{*} \mathcal{O}_{X} \longrightarrow \mathcal{O}_{Y}
$$

by the rule $(f, g) \mapsto \operatorname{Trace}_{\pi}(f g)$. We can think of $Q_{\pi}$ as a linear map $\pi_{*} \mathcal{O}_{X} \rightarrow$ $\mathcal{H o m}_{\mathcal{O}_{Y}}\left(\pi_{*} \mathcal{O}_{X}, \mathcal{O}_{Y}\right)$ between locally free modules of the same rank, and hence obtain a determinant

$$
\operatorname{Det}\left(Q_{\pi}\right): \wedge^{t o p}\left(\pi_{*} \mathcal{O}_{X}\right) \longrightarrow \wedge^{t o p}\left(\pi_{*} \mathcal{O}_{X}\right)^{\otimes-1}
$$

or in other words a global section

$$
\operatorname{Det}\left(Q_{\pi}\right) \in \Gamma\left(Y, \wedge^{t o p}\left(\pi_{*} \mathcal{O}_{X}\right)^{\otimes-2}\right)
$$

The discriminant of $\pi$ is by definition the closed subscheme $D_{\pi} \subset Y$ cut out by this global section. Clearly, $D_{\pi}$ is a locally principal closed subscheme of $Y$.

0BJF Lemma 48.11.1. Let $\pi: X \rightarrow Y$ be a morphism of schemes which is finite locally free. Then $\pi$ is étale if and only if its discriminant is empty.
Proof. By Morphisms, Lemma 28.36 .8 it suffices to check that the fibres of $\pi$ are étale. Since the construction of the trace pairing commutes with base change we reduce to the following question: Let $k$ be a field and let $A$ be a finite dimensional $k$ algebra. Show that $A$ is étale over $k$ if and only if the trace pairing $Q_{A / k}: A \times A \rightarrow k$, $(a, b) \mapsto \operatorname{Trace}_{A / k}(a b)$ is nondegenerate.
Assume $Q_{A / k}$ is nondegenerate. If $a \in A$ is a nilpotent element, then $a b$ is nilpotent for all $b \in A$ and we conclude that $Q_{A / k}(a,-)$ is identically zero. Hence $A$ is reduced. Then we can write $A=K_{1} \times \ldots \times K_{n}$ as a product where each $K_{i}$ is a field (see Algebra, Lemmas 10.52.2, 10.52 .6 and 10.24 .1 ). In this case the quadratic space $\left(A, Q_{A / k}\right)$ is the orthogonal direct sum of the spaces $\left(K_{i}, Q_{K_{i} / k}\right)$. It follows from Fields, Lemma 9.19.7 that each $K_{i}$ is separable over $k$. This means that $A$ is étale over $k$ by Algebra, Lemma 10.141.4. The converse is proved by reading the argument backwards.

0BJG Lemma 48.11.2. Let $(A, \mathfrak{m})$ be a Noetherian local ring with $\operatorname{dim}(A) \geq 1$. Let $f \in \mathfrak{m}$. Then there exist $a \mathfrak{p} \in V(f)$ with $\operatorname{dim}\left(A_{\mathfrak{p}}\right)=1$.

Proof. By induction on $\operatorname{dim}(A)$. If $\operatorname{dim}(A)=1$, then $\mathfrak{p}=\mathfrak{m}$ works. If $\operatorname{dim}(A)>1$, then let $Z \subset \operatorname{Spec}(A)$ be an irreducible component of dimension $>1$. Then $V(f) \cap Z$ has dimension $>0$ (Algebra, Lemma 10.59.12. Pick a prime $\mathfrak{q} \in V(f) \cap Z, \mathfrak{q} \neq \mathfrak{m}$ corresponding to a closed point of the punctured spectrum of $A$; this is possible by Properties, Lemma 27.6.4. Then $\mathfrak{q}$ is not the generic point of $Z$. Hence $0<$ $\operatorname{dim}\left(A_{\mathfrak{q}}\right)<\operatorname{dim}(A)$ and $f \in \mathfrak{q} A_{\mathfrak{q}}$. By induction on the dimension we can find $f \in \mathfrak{p} \subset A_{\mathfrak{q}}$ with $\operatorname{dim}\left(\left(A_{\mathfrak{q}}\right)_{\mathfrak{p}}\right)=1$. Then $\mathfrak{p} \cap A$ works.

0BJH Lemma 48.11.3. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian schemes. Let $x \in X$. Assume
(1) $f$ is flat,
(2) $f$ is quasi-finite at $x$,
(3) $x$ is not a generic point of an irreducible component of $X$,
(4) for specializations $x^{\prime} \rightsquigarrow x$ with $\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)=1$ our $f$ is unramified at $x^{\prime}$.

Then $f$ is étale at $x$.
Proof. Observe that the set of points where $f$ is unramified is the same as the set of points where $f$ is étale and that this set is open. See Morphisms, Definitions 28.35 .1 and 28.36 .1 and Lemma 28.36 .16 . To check $f$ is étale at $x$ we may work étale locally on the base and on the target (Descent, Lemmas 34.19.27 and 34.27.1). Thus we can apply More on Morphisms, Lemma 36.30 .1 and assume that $f: X \rightarrow Y$ is finite and that $x$ is the unique point of $X$ lying over $y=f(x)$. Then it follows that $f$ is finite locally free (Morphisms, Lemma 28.45.2.).

Assume $f$ is finite locally free and that $x$ is the unique point of $X$ lying over $y=f(x)$. By Lemma 48.11.1 we find a locally principal closed subscheme $D_{\pi} \subset Y$ such that $y^{\prime} \in D_{\pi}$ if and only if there exists an $x^{\prime} \in X$ with $f\left(x^{\prime}\right)=y^{\prime}$ and $f$ ramified at $x^{\prime}$. Thus we have to prove that $y \notin D_{\pi}$. Assume $y \in D_{\pi}$ to get a contradiction.

By condition (3) we have $\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \geq 1$. We have $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, y}\right)$ by Algebra, Lemma 10.111.7. By Lemma 48.11 .2 we can find $y^{\prime} \in D_{\pi}$ specializing to $y$ with $\operatorname{dim}\left(\mathcal{O}_{Y, y^{\prime}}\right)=1$. Choose $x^{\prime} \in X$ with $f\left(x^{\prime}\right)=y^{\prime}$ where $f$ is ramified. Since $f$ is finite it is closed, and hence $x^{\prime} \rightsquigarrow x$. We have $\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, y^{\prime}}\right)=1$ as before. This contradicts property (4).
0BMA Lemma 48.11.4. Let $(A, \mathfrak{m})$ be a regular local ring of dimension $d \geq 2$. Set $X=\operatorname{Spec}(A)$ and $U=X \backslash\{\mathfrak{m}\}$. Then
(1) the functor $F E_{X} \rightarrow F E t_{U}$ is essentially surjective,
(2) any finite $A \rightarrow B$ with $B$ normal which induces a finite étale morphism on punctured spectra is étale.

Proof. Recall that a regular local ring is normal by Algebra, Lemma 10.149 .5 . Hence (1) and (2) are equivalent by Lemma 48.10.3. We prove the lemma by induction on $d$.

The case $d=2$. In this case $A \rightarrow B$ is flat. Namely, we have going down for $A \rightarrow B$ by Algebra, Proposition 10.37 .7 . Then $\operatorname{dim}\left(B_{\mathfrak{m}^{\prime}}\right)=2$ for all maximal ideals $\mathfrak{m}^{\prime} \subset B$ by Algebra, Lemma 10.111.7. Then $B_{\mathfrak{m}^{\prime}}$ is Cohen-Macaulay by Algebra, Lemma
10.149.4 Hence and this is the important step Algebra, Lemma 10.127.1 applies to show $A \rightarrow B_{\mathfrak{m}^{\prime}}$ is flat. Then Algebra, Lemma 10.38 .19 shows $A \rightarrow B$ is flat. Thus we can apply Lemma 48.11 .3 (or you can directly argue using the easier Lemma 48.11.1 to see that $A \rightarrow B$ is étale.

The case $d \geq 3$. Let $V \rightarrow U$ be finite étale. Let $f \in \mathfrak{m}_{A}, f \notin \mathfrak{m}_{A}^{2}$. Then $A / f A$ is a regular local ring of dimension $d-1 \geq 2$, see Algebra, Lemma 10.105.3. Let $U_{0}$ be the punctured spectrum of $A / f A$ and let $V_{0}=V \times_{U} U_{0}$. By Lemma 48.10.5 (or the more general Lemma 48.10.6) it suffices to show that $V_{0}$ is in the essential image of $F E t_{\operatorname{Spec}(A / f A)} \rightarrow F E t_{U_{0}}$. This follows from the induction hypothesis.

0BMB Lemma 48.11.5 (Purity of branch locus). Let $f: X \rightarrow Y$ be a morphism of locally Noetherian schemes. Let $x \in X$ and set $y=f(x)$. Assume
(1) $\mathcal{O}_{X, x}$ is normal,
(2) $\mathcal{O}_{Y, y}$ is regular,
(3) $f$ is quasi-finite at $x$,
(4) $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, y}\right) \geq 1$
(5) for specializations $x^{\prime} \rightsquigarrow x$ with $\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)=1$ our $f$ is unramified at $x^{\prime}$.

Then $f$ is étale at $x$.
Proof. We will prove the lemma by induction on $d=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, y}\right)$.
An uninteresting case is when $d=1$. In that case we are assuming that $f$ is unramified at $x$ and that $\mathcal{O}_{Y, y}$ is a discrete valuation ring (Algebra, Lemma 10.118.7). Then $\mathcal{O}_{X, x}$ is flat over $\mathcal{O}_{Y, y}$ (otherwise the map would not be quasi-finite at $x$ ) and we see that $f$ is flat at $x$. Since flat + unramified is étale we conclude (some details omitted).
The case $d \geq 2$. We will use induction on $d$ to reduce to the case discussed in Lemma 48.11.4. To check $f$ is étale at $x$ we may work étale locally on the base and on the target (Descent, Lemmas 34.19.27 and 34.27.1. Thus we can apply More on Morphisms, Lemma 36.30.1 and assume that $f: X \rightarrow Y$ is finite and that $x$ is the unique point of $X$ lying over $y$. Here we use that étale extensions of local rings do not change dimension, normality, and regularity, see More on Algebra, Section 15.35 and Étale Morphisms, Section 40.19 .

Next, we can base change by $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ and assume that $Y$ is the spectrum of a regular local ring. It follows that $X=\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ as every point of $X$ necessarily specializes to $x$.
The ring map $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is finite and necessarily injective (by equality of dimensions). We conclude we have going down for $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ by Algebra, Proposition 10.37.7 (and the fact that a regular ring is a normal ring by Algebra, Lemma 10.149.5). Pick $x^{\prime} \in X, x^{\prime} \neq x$ with image $y^{\prime}=f\left(x^{\prime}\right)$. Then $\mathcal{O}_{X, x^{\prime}}$ is normal as a localization of a normal domain. Similarly, $\mathcal{O}_{Y, y^{\prime}}$ is regular (see Algebra, Lemma 10.109.6). We have $\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, y^{\prime}}\right)$ by Algebra, Lemma 10.111.7 (we checked going down above). Of course these dimensions are strictly less than $d$ as $x^{\prime} \neq x$ and by induction on $d$ we conclude that $f$ is étale at $x^{\prime}$.
Thus we arrive at the following situation: We have a finite local homomorphism $A \rightarrow B$ of Noetherian local rings of dimension $d \geq 2$, with $A$ regular, $B$ normal, which induces a finite étale morphism $V \rightarrow U$ on punctured spectra. Our goal is
to show that $A \rightarrow B$ is étale. This follows from Lemma 48.11.4 and the proof is complete.

### 48.12. Finite étale covers of punctured spectra, II

0BLU Continuation of Section 48.9 and in particular Lemmas 48.9.7 and 48.9.8.
0BLV Lemma 48.12.1. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Let $f \in \mathfrak{m}$ be a nonzerodivisor. Assume $A$ is $f$-adically complete and that $H_{\mathfrak{m}}^{1}(A / f A)$ and $H_{\mathfrak{m}}^{2}(A / f A)$ are finite $A$-modules. Let $U$, resp. $U_{0}$ be the punctured spectrum of $A$, resp. $A / f A$. For any finite étale morphism $V_{0} \rightarrow U_{0}$ there exists an open $U^{\prime} \subset U$ containing $U_{0}$ and a finite étale morphism $V^{\prime} \rightarrow U^{\prime}$ whose base change to $U_{0}$ is $V_{0} \rightarrow U_{0}$.
Proof. For $n \geq 1$ let $U_{n}$ be the punctured spectrum of $A / f^{n+1} A$. By Étale Morphisms, Theorem 40.15.2 we conclude that there is a unique finite étale morphism $\pi_{n}: V_{n} \rightarrow U_{n}$ whose base change to $U_{0}$ recovers $V_{0} \rightarrow U_{0}$. Consider the sheaves $\mathcal{F}_{n}=\pi_{n, *} \mathcal{O}_{V_{n}}$. We may view $\mathcal{F}_{n}$ as an $\mathcal{O}_{U}$-module on $U$. As $f$ is a nonzerodivisor we obtain short exact sequences

$$
0 \rightarrow A / f^{n} A \xrightarrow{f} A / f^{n+1} A \rightarrow A / f A \rightarrow 0
$$

and because $V_{n} \rightarrow U_{n}$ is finite locally free we have corresponing short exact sequences $0 \rightarrow \mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{0} \rightarrow 0$.

We will use Dualizing Complexes, Lemma 45.15 .2 without further mention. Our assumptions imply that $H^{0}\left(U, \mathcal{O}_{U_{0}}\right)$ and $H^{1}\left(U, \mathcal{O}_{U_{0}}\right)$ are finite $A$-modules. Hence the same thing is true for $\mathcal{F}_{0}$, see Dualizing Complexes, Lemma 45.41.2 Thus $H^{0}\left(U, \mathcal{F}_{0}\right)$ is a finite $A$-module and $H^{1}\left(U, \mathcal{F}_{0}\right)$ has finite length (as a finite $A$ module which is $\mathfrak{m}$-power torsion). Thus Derived Categories of Schemes, Lemmas 35.26 .1 and 35.26 .2 apply to the system above. Set

$$
B_{n}=\Gamma\left(V_{n}, \mathcal{O}_{V_{n}}\right)=\Gamma\left(U, \mathcal{F}_{n}\right)
$$

We conclude that the system $\left(B_{n}\right)$ satisfies the Mittag-Leffler condition, that $B=$ $\lim B_{n}$ is a finite $A$-algebra, that $f$ is a nonzerodivisor on $B$ and that $B / f B \subset B_{0}$. To finish the proof, we will show that the finite morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ (a) becomes isomorphic to $V_{0} \rightarrow U_{0}$ after base change to $U_{0}$ and (b) is étale at all points lying over $U_{0}$.

Let $\mathfrak{q} \in U_{0}$ be a prime. By the Mittag-Leffler condition, we know that $B / f B \subset B_{0}$ is the image of $B_{n+1} \rightarrow B_{0}$ for some $n$. Since the cokernel of $B_{n+1} \rightarrow B_{0}$ is contained in $H^{1}\left(U, \mathcal{F}_{n}\right)$ which is $\mathfrak{m}$-power torsion, we conclude that $B / f B \rightarrow B_{0}$ becomes an isomorphism after localizing at $\mathfrak{q}$. This proves (a). Thus $A_{\mathfrak{q}} \rightarrow B_{\mathfrak{q}}$ is finite and $(A / f A)_{\mathfrak{q}} \rightarrow(B / f B)_{\mathfrak{q}}$ is étale. Since $f$ is a nonzerodivisor on $B$ it follows that $A_{\mathfrak{q}} \rightarrow B_{\mathfrak{q}}$ is flat (Algebra, Lemma 10.98.10). Thus $A \rightarrow B$ is étale at all primes lying over $\mathfrak{q}$ (for example by Algebra, Lemma 10.141.7) which proves (b).

0BLW Remark 48.12.2. Let $(A, \mathfrak{m})$ be a complete local ring and $f \in \mathfrak{m}$ a nonzerodivisor. Let $U$, resp. $U_{0}$ be the punctured spectrum of $A$, resp. $A / f A$. Assume $H_{\mathfrak{m}}^{1}(A / f A)$ and $H_{\mathfrak{m}}^{2}(A / f A)$ are finite $A$-modules. Combining Lemmas 48.9.7. 48.9.8, and 48.12.1 we see that the category
$\operatorname{colim}_{U^{\prime} \subset U}$ open, $U_{0} \subset U$ category of schemes finite étale over $U^{\prime}$
is equivalent to the category of schemes finite étale over $U_{0}$. Note that by Dualizing Complexes, Theorem 45.40.4 the condition that $H_{\mathfrak{m}}^{1}(A / f A)$ and $H_{\mathfrak{m}}^{2}(A / f A)$ are finite $A$-modules means that

$$
\operatorname{depth}\left(A_{\mathfrak{p}} / f A_{\mathfrak{p}}\right)+\operatorname{dim}(A / \mathfrak{p})>2
$$

for all (nonmaximal) primes $f \in \mathfrak{p} \subset A$. For example it suffices if every irreducible component of $\operatorname{Spec}(A / f A)$ has dimension $\geq 3$ and $A / f A$ is $\left(S_{2}\right)$.

### 48.13. Purity in local case, II

0 BPB This section is the continuation of Section 48.10. In the next lemma we say purity holds for a Noetherian local ring $(A, \mathfrak{m})$ if the restriction functor $F E ́ t_{X} \rightarrow F E ́ t_{U}$ is essentially surjective where $X=\operatorname{Spec}(A)$ and $U=X \backslash\{\mathfrak{m}\}$ is the punctured spectrum.

0BPC Lemma 48.13.1. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Let $f \in \mathfrak{m}$. Assume
(1) $f$ is a nonzerodivisor,
(2) $A$ is $f$-adically complete,
(3) $H_{\mathfrak{m}}^{1}(A / f A)$ and $H_{\mathfrak{m}}^{2}(A / f A)$ are finite $A$-modules,
(4) for every maximal ideal $\mathfrak{p} \subset A_{f}$ purity holds for $\left(A_{f}\right)_{\mathfrak{p}}$,
(5) purity holds for $A$.

Then purity holds for $A / f A$.
Proof. Denote $X=\operatorname{Spec}(A)$ and $U=X \backslash\{\mathfrak{m}\}$ the punctured spectrum. Simlarly we have $X_{0}=\operatorname{Spec}(A / f A)$ and $U_{0}=X_{0} \backslash\{\mathfrak{m}\}$. Let $V_{0} \rightarrow U_{0}$ be a finite étale morphism. By Lemma 48.12.1 there exists an open $U^{\prime} \subset U$ containing $U_{0}$ and a finite étale morphism $V^{\prime} \rightarrow U$ whose base change to $U_{0}$ is isomorphic to $V_{0} \rightarrow U_{0}$. Since $U^{\prime} \supset U_{0}$ we see that $U \backslash U^{\prime}$ consists of points corresponding to prime ideals $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{n}$ as in (4). By assumption we can find finite étale morphisms $V_{i}^{\prime} \rightarrow$ $\operatorname{Spec}\left(A_{\mathfrak{p}_{i}}\right)$ agreeing with $V^{\prime} \rightarrow U^{\prime}$ over $U^{\prime} \times_{U} \operatorname{Spec}\left(A_{\mathfrak{p}_{i}}\right)$. By Limits, Lemma 31.15.1 applied $n$ times we see that $V^{\prime} \rightarrow U^{\prime}$ extends to a finite étale morphism $V \rightarrow U$. By assumption (5) we find that $V \rightarrow U$ extends to a finite étale morphism $Y \rightarrow X$. Then the restriction of $Y$ to $X_{0}$ is the desired extension of $V_{0} \rightarrow U_{0}$.

Now we can bootstrap the earlier results to prove that purity holds for complete intersections of dimension $\geq 3$. Recall that a Noetherian local ring is called a complete intersection if its completion is the quotient of a regular local ring by the ideal generated by a regular sequence. See the discussion in Divided Power Algebra, Section 23.8

0BPD Proposition 48.13.2. Let $(A, \mathfrak{m})$ be a Noeterian local ring. If $A$ is a complete intersection of dimension $\geq 3$, then purity holds for $A$ in the sense that any finite étale cover of the punctured spectrum extends.

Proof. By Lemma 48.10 .4 we may assume that $A$ is a complete local ring. By assumption we can write $A=B /\left(f_{1}, \ldots, f_{r}\right)$ where $B$ is a complete regular local ring and $f_{1}, \ldots, f_{r}$ is a regular sequence. We will finish the proof by induction on $r$. The base case is $r=0$ which follows from Lemma 48.11.4 which applies to regular rings of dimension $\geq 2$.
Assume that $A=B /\left(f_{1}, \ldots, f_{r}\right)$ and that the proposition holds for $r-1$. Set $A^{\prime}=B /\left(f_{1}, \ldots, f_{r-1}\right)$ and apply Lemma 48.13.1 to $f_{r} \in A^{\prime}$. This is permissible:
condition (1) holds as $f_{1}, \ldots, f_{r}$ is a regular sequence, condition (2) holds as $B$ and hence $A^{\prime}$ is complete, condition (3) holds as $A=A^{\prime} / f_{r} A^{\prime}$ is Cohen-Macaulay of dimension $\operatorname{dim}(A) \geq 3$, see Dualizing Complexes, Lemma 45.11.1, condition (4) holds by induction hypothesis as $\operatorname{dim}\left(\left(A_{f_{r}}^{\prime}\right)_{\mathfrak{p}}\right) \geq 3$ for a maximal prime $\mathfrak{p}$ of $A_{f_{r}}^{\prime}$ and as $\left(A_{f_{r}}^{\prime}\right)_{\mathfrak{p}}=B_{\mathfrak{q}} /\left(f_{1}, \ldots, f_{r-1}\right)$ for some $\mathfrak{q} \subset B$, condition (5) holds by induction hypothesis.

### 48.14. Ramification theory

0BSD In this section we continue the discussion of More on Algebra, Section 15.81 and we relate it to our discussion of the fundamental groups of schemes.
Let $A$ be a discrete valuation ring with fraction field $K$. Choose a separable algebraic closure $K^{s e p}$. Let $A^{s e p}$ be the integral closure of $A$ in $K^{s e p}$.

### 48.15. Tame ramification

0BSE Let $X \rightarrow Y$ be a finite étale morphism of schemes of finite type over $\mathbf{Z}$. There are many ways to define what it means for $f$ to be tamely ramfied at $\infty$. The article KS10 discusses to what extend these notions agree.
In this section we discuss a different more elementary question which precedes the notion of tameness at infinity. Namely, given a scheme $X$ and a dense open $U \subset X$ when is a finite morphism $f: Y \rightarrow X$ tamely ramified relative to $D=X \backslash U$ ? We will use the definition as given in GM71 but only in the case that $D$ is a divisor with normal crossings.

0BSF Definition 48.15.1. Let $X$ be a locally Noetherian scheme. A normal crossings divisor on $X$ is an effective Cartier divisor $D \subset X$ such that there exists an étale covering $\left\{U_{i} \rightarrow X\right\}_{i \in I}$ with $D \times_{X} U_{i} \subset U_{i}$ is a strict normal crossings divisor for each $i$.
For example $D=V\left(x^{2}+y^{2}\right)$ is a normal crossings divisor on $\operatorname{Spec}(\mathbf{R}[x, y])$ because after pulling back to the étale cover $\operatorname{Spec}(\mathbf{C}[x, y])$ we obtain $(x-i y)(x+i y)=0$.

## CHAPTER 49

## Étale Cohomology

### 49.1. Introduction

03N2 These are the notes of a course on étale cohomology taught by Johan de Jong at Columbia University in the Fall of 2009. The original note takers were Thibaut Pugin, Zachary Maddock and Min Lee. Over time we will add references to background material in the rest of the stacks project and provide rigorous proofs of all the statements.

### 49.2. Which sections to skip on a first reading?

04 JG We want to use the material in this chapter for the development of theory related to algebraic spaces, Deligne-Mumford stacks, algebraic stacks, etc. Thus we have added some pretty technical material to the original exposition of étale cohomology for schemes. The reader can recognize this material by the frequency of the word "topos", or by discussions related to set theory, or by proofs dealing with very general properties of morphisms of schemes. Some of these discussions can be skipped on a first reading.

In particular, we suggest that the reader skip the following sections:
(1) Comparing big and small topoi, Section 49.39 .
(2) Recovering morphisms, Section 49.41 .
(3) Push and pull, Section 49.42
(4) Property (A), Section 49.43
(5) Property (B), Section 49.44 .
(6) Property (C), Section 49.45
(7) Topological invariance of the small étale site, Section 49.46
(8) Integral universally injective morphisms, Section 49.48
(9) Big sites and pushforward, Section 49.49
(10) Exactness of big lower shriek, Section 49.50

Besides these sections there are some sporadic results that may be skipped that the reader can recognize by the keywords given above.

### 49.3. Prologue

03N3 These lectures are about another cohomology theory. The first thing to remark is that the Zariski topology is not entirely satisfactory. One of the main reasons that it fails to give the results that we would want is that if $X$ is a complex variety and $\mathcal{F}$ is a constant sheaf then

$$
H^{i}(X, \mathcal{F})=0, \quad \text { for all } i>0
$$

The reason for that is the following. In an irreducible scheme (a variety in particular), any two nonempty open subsets meet, and so the restriction mappings of a constant sheaf are surjective. We say that the sheaf is flasque. In this case, all higher Čech cohomology groups vanish, and so do all higher Zariski cohomology groups. In other words, there are "not enough" open sets in the Zariski topology to detect this higher cohomology.
On the other hand, if $X$ is a smooth projective complex variety, then

$$
H_{B e t t i}^{2 \operatorname{dim} X}(X(\mathbf{C}), \Lambda)=\Lambda \quad \text { for } \Lambda=\mathbf{Z}, \mathbf{Z} / n \mathbf{Z}
$$

where $X(\mathbf{C})$ means the set of complex points of $X$. This is a feature that would be nice to replicate in algebraic geometry. In positive characteristic in particular.

### 49.4. The étale topology

03 N 4 It is very hard to simply "add" extra open sets to refine the Zariski topology. One efficient way to define a topology is to consider not only open sets, but also some schemes that lie over them. To define the étale topology, one considers all morphisms $\varphi: U \rightarrow X$ which are étale. If $X$ is a smooth projective variety over $\mathbf{C}$, then this means
(1) $U$ is a disjoint union of smooth varieties, and
(2) $\varphi$ is (analytically) locally an isomorphism.

The word "analytically" refers to the usual (transcendental) topology over C. So the second condition means that the derivative of $\varphi$ has full rank everywhere (and in particular all the components of $U$ have the same dimension as $X$ ).
A double cover - loosely defined as a finite degree 2 map between varieties - for example

$$
\operatorname{Spec}(\mathbf{C}[t]) \longrightarrow \operatorname{Spec}(\mathbf{C}[t]), \quad t \longmapsto t^{2}
$$

will not be an étale morphism if it has a fibre consisting of a single point. In the example this happens when $t=0$. For a finite map between varieties over $\mathbf{C}$ to be étale all the fibers should have the same number of points. Removing the point $t=0$ from the source of the map in the example will make the morphism étale. But we can remove other points from the source of the morphism also, and the morphism will still be étale. To consider the étale topology, we have to look at all such morphisms. Unlike the Zariski topology, these need not be merely be open subsets of $X$, even though their images always are.

03N5 Definition 49.4.1. A family of morphisms $\left\{\varphi_{i}: U_{i} \rightarrow X\right\}_{i \in I}$ is called an étale covering if each $\varphi_{i}$ is an étale morphism and their images cover $X$, i.e., $X=$ $\bigcup_{i \in I} \varphi_{i}\left(U_{i}\right)$.
This "defines" the étale topology. In other words, we can now say what the sheaves are. An étale sheaf $\mathcal{F}$ of sets (resp. abelian groups, vector spaces, etc) on $X$ is the data:
(1) for each étale morphism $\varphi: U \rightarrow X$ a set (resp. abelian group, vector space, etc) $\mathcal{F}(U)$,
(2) for each pair $U, U^{\prime}$ of étale schemes over $X$, and each morphism $U \rightarrow U^{\prime}$ over $X$ (which is automatically étale) a restriction map $\rho_{U^{\prime}}^{U}: \mathcal{F}(U) \rightarrow$ $\mathcal{F}\left(U^{\prime}\right)$
These data have to satisfy the following sheaf axiom:
$(*)$ for every étale covering $\left\{\varphi_{i}: U_{i} \rightarrow X\right\}_{i \in I}$, the diagram

$$
\emptyset \longrightarrow \mathcal{F}(U) \longrightarrow \Pi_{i \in I} \mathcal{F}\left(U_{i}\right) \longrightarrow \Pi_{i, j \in I} \mathcal{F}\left(U_{i} \times_{U} U_{j}\right)
$$

is exact in the category of sets (resp. abelian groups, vector spaces, etc).
03N6 Remark 49.4.2. In the last statement, it is essential not to forget the case where $i=j$ which is in general a highly nontrivial condition (unlike in the Zariski topology). In fact, frequently important coverings have only one element.
Since the identity is an étale morphism, we can compute the global sections of an étale sheaf, and cohomology will simply be the corresponding right-derived functors. In other words, once more theory has been developed and statements have been made precise, there will be no obstacle to defining cohomology.

### 49.5. Feats of the étale topology

03N7 For a natural number $n \in \mathbf{N}=\{1,2,3,4, \ldots\}$ it is true that

$$
H_{\text {étale }}^{2}\left(\mathbf{P}_{\mathbf{C}}^{1}, \mathbf{Z} / n \mathbf{Z}\right)=\mathbf{Z} / n \mathbf{Z}
$$

More generally, if $X$ is a complex variety, then its étale Betti numbers with coefficients in a finite field agree with the usual Betti numbers of $X(\mathbf{C})$, i.e.,

$$
\operatorname{dim}_{\mathbf{F}_{q}} H_{\text {étale }}^{2 i}\left(X, \mathbf{F}_{q}\right)=\operatorname{dim}_{\mathbf{F}_{q}} H_{B e t t i}^{2 i}\left(X(\mathbf{C}), \mathbf{F}_{q}\right)
$$

This is extremely satisfactory. However, these equalities only hold for torsion coefficients, not in general. For integer coefficients, one has

$$
H_{\text {étale }}^{2}\left(\mathbf{P}_{\mathbf{C}}^{1}, \mathbf{Z}\right)=0
$$

There are ways to get back to nontorsion coefficients from torsion ones by a limit procedure which we will come to shortly.

### 49.6. A computation

03 N 8 How do we compute the cohomology of $\mathbf{P}_{\mathbf{C}}^{1}$ with coefficients $\Lambda=\mathbf{Z} / n \mathbf{Z}$ ? We use Čech cohomology. A covering of $\mathbf{P}_{\mathbf{C}}^{1}$ is given by the two standard opens $U_{0}, U_{1}$, which are both isomorphic to $\mathbf{A}_{\mathbf{C}}^{1}$, and which intersection is isomorphic to $\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}=\mathbf{G}_{m, \mathbf{C}}$. It turns out that the Mayer-Vietoris sequence holds in étale cohomology. This gives an exact sequence
$H_{\text {étale }}^{i-1}\left(U_{0} \cap U_{1}, \Lambda\right) \rightarrow H_{\text {étale }}^{i}\left(\mathbf{P}_{C}^{1}, \Lambda\right) \rightarrow H_{\text {étale }}^{i}\left(U_{0}, \Lambda\right) \oplus H_{\text {étale }}^{i}\left(U_{1}, \Lambda\right) \rightarrow H_{\text {étale }}^{i}\left(U_{0} \cap U_{1}, \Lambda\right)$.
To get the answer we expect, we would need to show that the direct sum in the third term vanishes. In fact, it is true that, as for the usual topology,

$$
H_{\text {etale }}^{q}\left(\mathbf{A}_{\mathbf{C}}^{1}, \Lambda\right)=0 \quad \text { for } q \geq 1
$$

and

$$
H_{\text {étale }}^{q}\left(\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}, \Lambda\right)=\left\{\begin{array}{cc}
\Lambda & \text { if } q=1, \text { and } \\
0 & \text { for } q \geq 2
\end{array}\right.
$$

These results are already quite hard (what is an elementary proof?). Let us explain how we would compute this once the machinery of étale cohomology is at our disposal.
Higher cohomology. This is taken care of by the following general fact: if $X$ is an affine curve over $\mathbf{C}$, then

$$
H_{\text {étale }}^{q}(X, \mathbf{Z} / n \mathbf{Z})=0 \quad \text { for } q \geq 2
$$

This is proved by considering the generic point of the curve and doing some Galois cohomology. So we only have to worry about the cohomology in degree 1.
Cohomology in degree 1. We use the following identifications:

$$
\begin{aligned}
& H_{\text {étale }}^{1}(X, \mathbf{Z} / n \mathbf{Z})=\left\{\begin{array}{c}
\text { sheaves of sets } \mathcal{F} \text { on the étale site } X_{\text {étale }} \text { endowed with an } \\
\text { action } \mathbf{Z} / n \mathbf{Z} \times \mathcal{F} \rightarrow \mathcal{F} \text { such that } \mathcal{F} \text { is a } \mathbf{Z} / n \mathbf{Z} \text {-torsor. }
\end{array}\right\} / \cong \\
&=\left\{\begin{array}{c}
\text { morphisms } Y \rightarrow X \text { which are finite étale together } \\
\text { with a free } \mathbf{Z} / n \mathbf{Z} \text { action such that } X=Y /(\mathbf{Z} / n \mathbf{Z}) .
\end{array}\right\} / \cong .
\end{aligned}
$$

The first identification is very general (it is true for any cohomology theory on a site) and has nothing to do with the étale topology. The second identification is a consequence of descent theory. The last set describes a collection of geometric objects on which we can get our hands.

The curve $\mathbf{A}_{\mathbf{C}}^{1}$ has no nontrivial finite étale covering and hence $H_{\text {étale }}^{1}\left(\mathbf{A}_{\mathbf{C}}^{1}, \mathbf{Z} / n \mathbf{Z}\right)=$ 0 . This can be seen either topologically or by using the argument in the next paragraph.
Let us describe the finite étale coverings $\varphi: Y \rightarrow \mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}$. It suffices to consider the case where $Y$ is connected, which we assume. We are going to find out what $Y$ can be by applying the Riemann-Hurwitz formula (of course this is a bit silly, and you can go ahead and skip the next section if you like). Say that this morphism is $n$ to 1 , and consider a projective compactification

Even though $\varphi$ is étale and does not ramify, $\bar{\varphi}$ may ramify at 0 and $\infty$. Say that the preimages of 0 are the points $y_{1}, \ldots, y_{r}$ with indices of ramification $e_{1}, \ldots e_{r}$, and that the preimages of $\infty$ are the points $y_{1}^{\prime}, \ldots, y_{s}^{\prime}$ with indices of ramification $d_{1}, \ldots d_{s}$. In particular, $\sum e_{i}=n=\sum d_{j}$. Applying the Riemann-Hurwitz formula, we get

$$
2 g_{Y}-2=-2 n+\sum\left(e_{i}-1\right)+\sum\left(d_{j}-1\right)
$$

and therefore $g_{Y}=0, r=s=1$ and $e_{1}=d_{1}=n$. Hence $Y \cong \mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}$, and it is easy to see that $\varphi(z)=\lambda z^{n}$ for some $\lambda \in \mathbf{C}^{*}$. After reparametrizing $Y$ we may assume $\lambda=1$. Thus our covering is given by taking the $n$th root of the coordinate on $\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}$.
Remember that we need to classify the coverings of $\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}$ together with free $\mathbf{Z} / n \mathbf{Z}$-actions on them. In our case any such action corresponds to an automorphism of $Y$ sending $z$ to $\zeta_{n} z$, where $\zeta_{n}$ is a primitive $n$th root of unity. There are $\phi(n)$ such actions (here $\phi(n)$ means the Euler function). Thus there are exactly $\phi(n)$ connected finite étale coverings with a given free $\mathbf{Z} / n \mathbf{Z}$-action, each corresponding to a primitive $n$th root of unity. We leave it to the reader to see that the disconnected finite étale degree $n$ coverings of $\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}$ with a given free $\mathbf{Z} / n \mathbf{Z}$ action correspond one-to-one with $n$th roots of 1 which are not primitive. In other words, this computation shows that

$$
H_{\text {étale }}^{1}\left(\mathbf{A}_{\mathbf{C}}^{1} \backslash\{0\}, \mathbf{Z} / n \mathbf{Z}\right)=\operatorname{Hom}\left(\mu_{n}(\mathbf{C}), \mathbf{Z} / n \mathbf{Z}\right) \cong \mathbf{Z} / n \mathbf{Z}
$$

The first identification is canonical, the second isn't, see Remark 49.65.5. Since the proof of Riemann-Hurwitz does not use the computation of cohomology, the above actually constitutes a proof (provided we fill in the details on vanishing, etc).

### 49.7. Nontorsion coefficients

03N9 To study nontorsion coefficients, one makes the following definition:

$$
H_{\text {étale }}^{i}\left(X, \mathbf{Q}_{\ell}\right):=\left(\lim _{n} H_{\text {étale }}^{i}\left(X, \mathbf{Z} / \ell^{n} \mathbf{Z}\right)\right) \otimes_{\mathbf{z}_{\ell}} \mathbf{Q}_{\ell}
$$

The symbol $\lim _{n}$ denote the limit of the system of cohomology groups $H_{\text {étale }}^{i}\left(X, \mathbf{Z} / \ell^{n} \mathbf{Z}\right)$ indexed by $n$, see Categories, Section 4.21. Thus we will need to study systems of sheaves satisfying some compatibility conditions.

### 49.8. Sheaf theory

03NA At this point we start talking about sites and sheaves in earnest. There is an amazing amount of useful abstract material that could fit in the next few sections. Some of this material is worked out in earlier chapters, such as the chapter on sites, modules on sites, and cohomology on sites. We try to refrain from adding too much material here, just enough so the material later in this chapter makes sense.

### 49.9. Presheaves

03NB A reference for this section is Sites, Section 7.2.
03NC Definition 49.9.1. Let $\mathcal{C}$ be a category. A presheaf of sets (respectively, an abelian presheaf) on $\mathcal{C}$ is a functor $\mathcal{C}^{o p p} \rightarrow$ Sets (resp. $A b$ ).

Terminology. If $U \in \operatorname{Ob}(\mathcal{C})$, then elements of $\mathcal{F}(U)$ are called sections of $\mathcal{F}$ over $U$. For $\varphi: V \rightarrow U$ in $\mathcal{C}$, the map $\mathcal{F}(\varphi): \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is called the restriction map and is often denoted $\left.s \mapsto s\right|_{V}$ or sometimes $s \mapsto \varphi^{*} s$. The notation $\left.s\right|_{V}$ is ambiguous since the restriction map depends on $\varphi$, but it is a standard abuse of notation. We also use the notation $\Gamma(U, \mathcal{F})=\mathcal{F}(U)$.
Saying that $\mathcal{F}$ is a functor means that if $W \rightarrow V \rightarrow U$ are morphisms in $\mathcal{C}$ and $s \in \Gamma(U, \mathcal{F})$ then $\left.\left(\left.s\right|_{V}\right)\right|_{W}=\left.s\right|_{W}$, with the abuse of notation just seen. Moreover, the restriction mappings corresponding to the identity morphisms $\operatorname{id}_{U}: U \rightarrow U$ are the identity.

The category of presheaves of sets (respectively of abelian presheaves) on $\mathcal{C}$ is denoted $\operatorname{PSh}(\mathcal{C})$ (resp. $\operatorname{PAb}(\mathcal{C})$ ). It is the category of functors from $\mathcal{C}^{o p p}$ to Sets (resp. $A b$ ), which is to say that the morphisms of presheaves are natural transformations of functors. We only consider the categories $\operatorname{PSh}(\mathcal{C})$ and $\operatorname{PAb}(\mathcal{C})$ when the category $\mathcal{C}$ is small. (Our convention is that a category is small unless otherwise mentioned, and if it isn't small it should be listed in Categories, Remark 4.2.2.)

03ND Example 49.9.2. Given an object $X \in \mathrm{Ob}(\mathcal{C})$, we consider the functor

$$
\begin{array}{cccc}
h_{X}: & \mathcal{C}^{\text {opp }} & \longrightarrow & \text { Sets } \\
U & \longmapsto & h_{X}(U)=\operatorname{Mor}_{\mathcal{C}}(U, X) \\
V \xrightarrow{\varphi} U & \longmapsto & \varphi \circ-: h_{X}(U) \rightarrow h_{X}(V) .
\end{array}
$$

It is a presheaf, called the representable presheaf associated to $X$. It is not true that representable presheaves are sheaves in every topology on every site.

03NE Lemma 49.9.3 (Yoneda). Let $\mathcal{C}$ be a category, and $X, Y \in \operatorname{Ob}(\mathcal{C})$. There is a natural bijection

$$
\begin{array}{ccc}
\operatorname{Mor}_{\mathcal{C}}(X, Y) & \longrightarrow & \operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{X}, h_{Y}\right) \\
\psi & \longmapsto & h_{\psi}=\psi \circ-: h_{X} \rightarrow h_{Y} .
\end{array}
$$

Proof. See Categories, Lemma 4.3.5.

### 49.10. Sites

03NF
03NG Definition 49.10.1. Let $\mathcal{C}$ be a category. A family of morphisms with fixed target $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ is the data of
(1) an object $U \in \mathcal{C}$,
(2) a set $I$ (possibly empty), and
(3) for all $i \in I$, a morphism $\varphi_{i}: U_{i} \rightarrow U$ of $\mathcal{C}$ with target $U$.

There is a notion of a morphism of families of morphisms with fixed target. A special case of that is the notion of a refinement. A reference for this material is Sites, Section 7.8 .

03NH Definition 49.10.2. A sit $\xi^{11}$ consists of a category $\mathcal{C}$ and a set $\operatorname{Cov}(\mathcal{C})$ consisting of families of morphisms with fixed target called coverings, such that
(1) (isomorphism) if $\varphi: V \rightarrow U$ is an isomorphism in $\mathcal{C}$, then $\{\varphi: V \rightarrow U\}$ is a covering,
(2) (locality) if $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ is a covering and for all $i \in I$ we are given a covering $\left\{\psi_{i j}: U_{i j} \rightarrow U_{i}\right\}_{j \in I_{i}}$, then

$$
\left\{\varphi_{i} \circ \psi_{i j}: U_{i j} \rightarrow U\right\}_{(i, j) \in \prod_{i \in I}}\{i\} \times I_{i}
$$

is also a covering, and
(3) (base change) if $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering and $V \rightarrow U$ is a morphism in $\mathcal{C}$, then
(a) for all $i \in I$ the fibre product $U_{i} \times_{U} V$ exists in $\mathcal{C}$, and
(b) $\left\{U_{i} \times_{U} V \rightarrow V\right\}_{i \in I}$ is a covering.

For us the category underlying a site is always "small", i.e., its collection of objects form a set, and the collection of coverings of a site is a set as well (as in the definition above). We will mostly, in this chapter, leave out the arguments that cut down the collection of objects and coverings to a set. For further discussion, see Sites, Remark 7.6.3.

03NI Example 49.10.3. If $X$ is a topological space, then it has an associated site $X_{Z a r}$ defined as follows: the objects of $X_{Z a r}$ are the open subsets of $X$, the morphisms between these are the inclusion mappings, and the coverings are the usual topological (surjective) coverings. Observe that if $U, V \subset W \subset X$ are open subsets then $U \times{ }_{W} V=U \cap V$ exists: this category has fiber products. All the verifications are trivial and everything works as expected.

[^128]
### 49.11. Sheaves

## 03NJ

03NK Definition 49.11.1. A presheaf $\mathcal{F}$ of sets (resp. abelian presheaf) on a site $\mathcal{C}$ is said to be a separated presheaf if for all coverings $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ the map

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right)
$$

is injective. Here the map is $s \mapsto\left(\left.s\right|_{U_{i}}\right)_{i \in I}$. The presheaf $\mathcal{F}$ is a sheaf if for all coverings $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$, the diagram

03NL (49.11.1.1)

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \longrightarrow \prod_{i, j \in I} \mathcal{F}\left(U_{i} \times_{U} U_{j}\right),
$$

where the first map is $s \mapsto\left(\left.s\right|_{U_{i}}\right)_{i \in I}$ and the two maps on the right are $\left(s_{i}\right)_{i \in I} \mapsto$ $\left(\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}\right)$ and $\left(s_{i}\right)_{i \in I} \mapsto\left(\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}\right)$, is an equalizer diagram in the category of sets (resp. abelian groups).
03NM Remark 49.11.2. For the empty covering (where $I=\emptyset$ ), this implies that $\mathcal{F}(\emptyset)$ is an empty product, which is a final object in the corresponding category (a singleton, for both Sets and $A b$ ).

03NN Example 49.11.3. Working this out for the site $X_{Z a r}$ associated to a topological space, see Example 49.10.3, gives the usual notion of sheaves.

03NO Definition 49.11.4. We denote $\operatorname{Sh}(\mathcal{C})($ resp. $A b(\mathcal{C})$ ) the full subcategory of $\operatorname{PSh}(\mathcal{C})$ (resp. $\operatorname{PAb}(\mathcal{C}))$ whose objects are sheaves. This is the category of sheaves of sets (resp. abelian sheaves) on $\mathcal{C}$.

### 49.12. The example of G-sets

03NP Let $G$ be a group and define a site $\mathcal{T}_{G}$ as follows: the underlying category is the category of $G$-sets, i.e., its objects are sets endowed with a left $G$-action and the morphisms are equivariant maps; and the coverings of $\mathcal{T}_{G}$ are the families $\left\{\varphi_{i}\right.$ : $\left.U_{i} \rightarrow U\right\}_{i \in I}$ satisfying $U=\bigcup_{i \in I} \varphi_{i}\left(U_{i}\right)$.
There is a special object in the site $\mathcal{T}_{G}$, namely the $G$-set $G$ endowed with its natural action by left translations. We denote it ${ }_{G} G$. Observe that there is a natural group isomorphism

$$
\begin{aligned}
\rho: \quad G^{\text {opp }} & \longrightarrow \operatorname{Aut}_{G-\operatorname{Sets}}\left({ }_{G} G\right) \\
g & \longmapsto
\end{aligned}(h \mapsto h g) .
$$

In particular, for any presheaf $\mathcal{F}$, the set $\mathcal{F}\left({ }_{G} G\right)$ inherits a $G$-action via $\rho$. (Note that by contravariance of $\mathcal{F}$, the set $\mathcal{F}\left({ }_{G} G\right)$ is again a left $G$-set.) In fact, the functor

$$
\begin{array}{clc}
S h\left(\mathcal{T}_{G}\right) & \longrightarrow & G \text {-Sets } \\
\mathcal{F} & \longmapsto \mathcal{F}\left({ }_{G} G\right)
\end{array}
$$

is an equivalence of categories. Its quasi-inverse is the functor $X \mapsto h_{X}$. Without giving the complete proof (which can be found in Sites, Section 7.9. let us try to explain why this is true.
(1) If $S$ is a $G$-set, we can decompose it into orbits $S=\coprod_{i \in I} O_{i}$. The sheaf axiom for the covering $\left\{O_{i} \rightarrow S\right\}_{i \in I}$ says that

$$
\mathcal{F}(S) \longrightarrow \prod_{i \in I} \mathcal{F}\left(O_{i}\right) \longrightarrow \prod_{i, j \in I} \mathcal{F}\left(O_{i} \times_{S} O_{j}\right)
$$

is an equalizer. Observing that fibered products in $G$-Sets are induced from fibered products in Sets, and using the fact that $\mathcal{F}(\emptyset)$ is a $G$-singleton, we get that

$$
\prod_{i, j \in I} \mathcal{F}\left(O_{i} \times_{S} O_{j}\right)=\prod_{i \in I} \mathcal{F}\left(O_{i}\right)
$$

and the two maps above are in fact the same. Therefore the sheaf axiom merely says that $\mathcal{F}(S)=\prod_{i \in I} \mathcal{F}\left(O_{i}\right)$.
(2) If $S$ is the $G$-set $S=G / H$ and $\mathcal{F}$ is a sheaf on $\mathcal{T}_{G}$, then we claim that

$$
\mathcal{F}(G / H)=\mathcal{F}\left({ }_{G} G\right)^{H}
$$

and in particular $\mathcal{F}(\{*\})=\mathcal{F}\left({ }_{G} G\right)^{G}$. To see this, let's use the sheaf axiom for the covering $\left\{{ }_{G} G \rightarrow G / H\right\}$ of $S$. We have

$$
\begin{aligned}
{ }_{G} G \times{ }_{G / H} G & \cong G \times H \\
\left(g_{1}, g_{2}\right) & \longmapsto\left(g_{1}, g_{1} g_{2}^{-1}\right)
\end{aligned}
$$

is a disjoint union of copies of ${ }_{G} G$ (as a $G$-set). Hence the sheaf axiom reads

$$
\mathcal{F}(G / H) \longrightarrow \mathcal{F}\left({ }_{G} G\right) \longrightarrow \prod_{h \in H} \mathcal{F}\left({ }_{G} G\right)
$$

where the two maps on the right are $s \mapsto(s)_{h \in H}$ and $s \mapsto(h s)_{h \in H}$. Therefore $\mathcal{F}(G / H)=\mathcal{F}\left({ }_{G} G\right)^{H}$ as claimed.
This doesn't quite prove the claimed equivalence of categories, but it shows at least that a sheaf $\mathcal{F}$ is entirely determined by its sections over ${ }_{G} G$. Details (and set theoretical remarks) can be found in Sites, Section 7.9 .

### 49.13. Sheafification

03 NQ
03NR Definition 49.13.1. Let $\mathcal{F}$ be a presheaf on the site $\mathcal{C}$ and $\mathcal{U}=\left\{U_{i} \rightarrow U\right\} \in$ $\operatorname{Cov}(\mathcal{C})$. We define the zeroth Čech cohomology group of $\mathcal{F}$ with respect to $\mathcal{U}$ by

$$
\check{H}^{0}(\mathcal{U}, \mathcal{F})=\left\{\left(s_{i}\right)_{i \in I} \in \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \text { such that }\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}\right\} .
$$

There is a canonical map $\mathcal{F}(U) \rightarrow \check{H}^{0}(\mathcal{U}, \mathcal{F}), s \mapsto\left(\left.s\right|_{U_{i}}\right)_{i \in I}$. We say that a morphism of coverings from a covering $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ to $\mathcal{U}$ is a triple $\left(\chi, \alpha, \chi_{j}\right)$, where $\chi: V \rightarrow U$ is a morphism, $\alpha: J \rightarrow I$ is a map of sets, and for all $j \in J$ the morphism $\chi_{j}$ fits into a commutative diagram

Given the data $\chi, \alpha,\left\{\chi_{j}\right\}_{i \in J}$ we define

$$
\begin{aligned}
\check{H}^{0}(\mathcal{U}, \mathcal{F}) & \longrightarrow \check{H}^{0}(\mathcal{V}, \mathcal{F}) \\
\left(s_{i}\right)_{i \in I} & \longmapsto\left(\chi_{j}^{*}\left(s_{\alpha(j)}\right)\right)_{j \in J} .
\end{aligned}
$$

We then claim that
(1) the map is well-defined, and
(2) depends only on $\chi$ and is independent of the choice of $\alpha,\left\{\chi_{j}\right\}_{i \in J}$.

We omit the proof of the first fact. To see part (2), consider another triple ( $\psi, \beta, \psi_{j}$ ) with $\chi=\psi$. Then we have the commutative diagram

Given a section $s \in \mathcal{F}(\mathcal{U})$, its image in $\mathcal{F}\left(V_{j}\right)$ under the map given by $\left(\chi, \alpha,\left\{\chi_{j}\right\}_{i \in J}\right)$ is $\chi_{j}^{*} s_{\alpha(j)}$, and its image under the map given by $\left(\psi, \beta,\left\{\psi_{j}\right\}_{i \in J}\right)$ is $\psi_{j}^{*} s_{\beta(j)}$. These two are equal since by assumption $s \in \check{H}(\mathcal{U}, \mathcal{F})$ and hence both are equal to the pullback of the common value

$$
\left.s_{\alpha(j)}\right|_{U_{\alpha(j)} \times{ }_{U} U_{\beta(j)}}=\left.s_{\beta(j)}\right|_{U_{\alpha(j)} \times{ }_{U} U_{\beta(j)}}
$$

pulled back by the map $\left(\chi_{j}, \psi_{j}\right)$ in the diagram.
03NS Theorem 49.13.2. Let $\mathcal{C}$ be a site and $\mathcal{F}$ a presheaf on $\mathcal{C}$.
(1) The rule

$$
U \mapsto \mathcal{F}^{+}(U):=\operatorname{colim}_{\mathcal{U}} \text { covering of } U \check{H}^{0}(\mathcal{U}, \mathcal{F})
$$

is a presheaf. And the colimit is a directed one.
(2) There is a canonical map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{+}$.
(3) If $\mathcal{F}$ is a separated presheaf then $\mathcal{F}^{+}$is a sheaf and the map in (2) is injective.
(4) $\mathcal{F}^{+}$is a separated presheaf.
(5) $\mathcal{F}^{\#}=\left(\mathcal{F}^{+}\right)^{+}$is a sheaf, and the canonical map induces a functorial isomorphism

$$
\operatorname{Hom}_{P S h(\mathcal{C})}(\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{S h(\mathcal{C})}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

for any $\mathcal{G} \in \operatorname{Sh}(\mathcal{C})$.
Proof. See Sites, Theorem 7.10.10
In other words, this means that the natural map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ is a left adjoint to the forgetful functor $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{PSh}(\mathcal{C})$.

### 49.14. Cohomology

03NT The following is the basic result that makes it possible to define cohomology for abelian sheaves on sites.

03NU Theorem 49.14.1. The category of abelian sheaves on a site is an abelian category which has enough injectives.

Proof. See Modules on Sites, Lemma 18.3.1 and Injectives, Theorem 19.7.4.
So we can define cohomology as the right-derived functors of the sections functor: if $U \in \operatorname{Ob}(\mathcal{C})$ and $\mathcal{F} \in A b(\mathcal{C})$,

$$
H^{p}(U, \mathcal{F}):=R^{p} \Gamma(U, \mathcal{F})=H^{p}\left(\Gamma\left(U, \mathcal{I}^{\bullet}\right)\right)
$$

where $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution. To do this, we should check that the functor $\Gamma(U,-)$ is left exact. This is true and is part of why the category $A b(\mathcal{C})$ is abelian, see Modules on Sites, Lemma 18.3.1. For more general discussion of cohomology on sites (including the global sections functor and its right derived functors), see Cohomology on Sites, Section 21.3 .

### 49.15. The fpqc topology

03NV Before doing étale cohomology we study a bit the fpqc topology, since it works well for quasi-coherent sheaves.
03NW Definition 49.15.1. Let $T$ be a scheme. An fpqc covering of $T$ is a family $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ such that
(1) each $\varphi_{i}$ is a flat morphism and $\bigcup_{i \in I} \varphi_{i}\left(T_{i}\right)=T$, and
(2) for each affine open $U \subset T$ there exists a finite set $K$, a map $\mathbf{i}: K \rightarrow I$ and affine opens $U_{\mathbf{i}(k)} \subset T_{\mathbf{i}(k)}$ such that $U=\bigcup_{k \in K} \varphi_{\mathbf{i}(k)}\left(U_{\mathbf{i}(k)}\right)$.
03NX Remark 49.15.2. The first condition corresponds to fp, which stands for fidèlement plat, faithfully flat in french, and the second to qc, quasi-compact. The second part of the first condition is unnecessary when the second condition holds.
03NY Example 49.15.3. Examples of fpqc coverings.
(1) Any Zariski open covering of $T$ is an fpqc covering.
(2) A family $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ is an fpqc covering if and only if $A \rightarrow B$ is a faithfully flat ring map.
(3) If $f: X \rightarrow Y$ is flat, surjective and quasi-compact, then $\{f: X \rightarrow Y\}$ is an fpqc covering.
(4) The morphism $\varphi: \coprod_{x \in \mathbf{A}_{k}^{1}} \operatorname{Spec}\left(\mathcal{O}_{\mathbf{A}_{k}^{1}, x}\right) \rightarrow \mathbf{A}_{k}^{1}$, where $k$ is a field, is flat and surjective. It is not quasi-compact, and in fact the family $\{\varphi\}$ is not an fpqc covering.
(5) Write $\mathbf{A}_{k}^{2}=\operatorname{Spec}(k[x, y])$. Denote $i_{x}: D(x) \rightarrow \mathbf{A}_{k}^{2}$ and $i_{y}: D(y) \hookrightarrow \mathbf{A}_{k}^{2}$ the standard opens. Then the families $\left\{i_{x}, i_{y}, \operatorname{Spec}(k[[x, y]]) \rightarrow \mathbf{A}_{k}^{2}\right\}$ and $\left\{i_{x}, i_{y}, \operatorname{Spec}\left(\mathcal{O}_{\mathbf{A}_{k}^{2}, 0}\right) \rightarrow \mathbf{A}_{k}^{2}\right\}$ are fpqc coverings.
03NZ Lemma 49.15.4. The collection of fpqc coverings on the category of schemes satisfies the axioms of site.
Proof. See Topologies, Lemma 33.8.7.
It seems that this lemma allows us to define the fpqc site of the category of schemes. However, there is a set theoretical problem that comes up when considering the fpqc topology, see Topologies, Section 33.8. It comes from our requirement that sites are "small", but that no small category of schemes can contain a cofinal system of fpqc coverings of a given nonempty scheme. Although this does not strictly speaking prevent us from defining "partial" fpqc sites, it does not seem prudent to do so. The work-around is to allow the notion of a sheaf for the fpqc topology (see below) but to prohibit considering the category of all fpqc sheaves.
03X6 Definition 49.15.5. Let $S$ be a scheme. The category of schemes over $S$ is denoted $S c h / S$. Consider a functor $\mathcal{F}:(S c h / S)^{o p p} \rightarrow$ Sets, in other words a presheaf of sets. We say $\mathcal{F}$ satisfies the sheaf property for the fpqc topology if for every fpqc covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of schemes over $S$ the diagram 49.11.1.1) is an equalizer diagram.

We similarly say that $\mathcal{F}$ satisfies the sheaf property for the Zariski topology if for every open covering $U=\bigcup_{i \in I} U_{i}$ the diagram 49.11.1.1 is an equalizer diagram. See Schemes, Definition 25.15.3. Clearly, this is equivalent to saying that for every scheme $T$ over $S$ the restriction of $\mathcal{F}$ to the opens of $T$ is a (usual) sheaf.
03O1 Lemma 49.15.6. Let $\mathcal{F}$ be a presheaf on $S c h / S$. Then $\mathcal{F}$ satisfies the sheaf property for the fpqc topology if and only if
(1) $\mathcal{F}$ satisfies the sheaf property with respect to the Zariski topology, and
(2) for every faithfully flat morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ of affine schemes over $S$, the sheaf axiom holds for the covering $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$. Namely, this means that

$$
\mathcal{F}(\operatorname{Spec}(A)) \longrightarrow \mathcal{F}(\operatorname{Spec}(B)) \longrightarrow \mathcal{F}\left(\operatorname{Spec}\left(B \otimes_{A} B\right)\right)
$$

is an equalizer diagram.
Proof. See Topologies, Lemma 33.8.13.
An alternative way to think of a presheaf $\mathcal{F}$ on $S c h / S$ which satisfies the sheaf condition for the fpqc topology is as the following data:
(1) for each $T / S$, a usual (i.e., Zariski) sheaf $\mathcal{F}_{T}$ on $T_{Z a r}$,
(2) for every map $f: T^{\prime} \rightarrow T$ over $S$, a restriction mapping $f^{-1} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$
such that
(a) the restriction mappings are functorial,
(b) if $f: T^{\prime} \rightarrow T$ is an open immersion then the restriction mapping $f^{-1} \mathcal{F}_{T} \rightarrow$ $\mathcal{F}_{T^{\prime}}$ is an isomorphism, and
(c) for every faithfully flat morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ over $S$, the diagram

$$
\mathcal{F}_{\operatorname{Spec}(A)}(\operatorname{Spec}(A)) \longrightarrow \mathcal{F}_{\operatorname{Spec}(B)}(\operatorname{Spec}(B)) \longrightarrow \mathcal{F}_{\operatorname{Spec}\left(B \otimes_{A} B\right)}\left(\operatorname{Spec}\left(B \otimes_{A} B\right)\right)
$$

is an equalizer.
Data (1) and (2) and conditions (a), (b) give the data of a presheaf on $S c h / S$ satisfying the sheaf condition for the Zariski topology. By Lemma 49.15.6 condition (c) then suffices to get the sheaf condition for the fpqc topology.

03 O 2 Example 49.15.7. Consider the presheaf

$$
\begin{array}{ccc}
\mathcal{F}: \quad(S c h / S)^{o p p} & \longrightarrow & A b \\
T / S & \longmapsto & \Gamma\left(T, \Omega_{T / S}\right) .
\end{array}
$$

The compatibility of differentials with localization implies that $\mathcal{F}$ is a sheaf on the Zariski site. However, it does not satisfy the sheaf condition for the fpqc topology. Namely, consider the case $S=\operatorname{Spec}\left(\mathbf{F}_{p}\right)$ and the morphism

$$
\varphi: V=\operatorname{Spec}\left(\mathbf{F}_{p}[v]\right) \rightarrow U=\operatorname{Spec}\left(\mathbf{F}_{p}[u]\right)
$$

given by mapping $u$ to $v^{p}$. The family $\{\varphi\}$ is an fpqc covering, yet the restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}(V)$ sends the generator $\mathrm{d} u$ to $\mathrm{d}\left(v^{p}\right)=0$, so it is the zero map, and the diagram

$$
\mathcal{F}(U) \xrightarrow{0} \mathcal{F}(V) \longrightarrow \mathcal{F}\left(V \times_{U} V\right)
$$

is not an equalizer. We will see later that $\mathcal{F}$ does in fact give rise to a sheaf on the étale and smooth sites.

03O3 Lemma 49.15.8. Any representable presheaf on $S c h / S$ satisfies the sheaf condition for the fpqc topology.

Proof. See Descent, Lemma 34.9.3.
We will return to this later, since the proof of this fact uses descent for quasicoherent sheaves, which we will discuss in the next section. A fancy way of expressing the lemma is to say that the fpqc topology is weaker than the canonical topology, or that the fpqc topology is subcanonical. In the setting of sites this is discussed in Sites, Section 7.13 .

03O4 Remark 49.15.9. The fpqc is the finest topology that we will see. Hence any presheaf satisfying the sheaf condition for the fpqc topology will be a sheaf in the subsequent sites (étale, smooth, etc). In particular representable presheaves will be sheaves on the étale site of a scheme for example.

03 O 5 Example 49.15.10. Let $S$ be a scheme. Consider the additive group scheme $\mathbf{G}_{a, S}=\mathbf{A}_{S}^{1}$ over $S$, see Groupoids, Example 38.5.3. The associated representable presheaf is given by

$$
h_{\mathbf{G}_{a, S}}(T)=\operatorname{Mor}_{S}\left(T, \mathbf{G}_{a, S}\right)=\Gamma\left(T, \mathcal{O}_{T}\right)
$$

By the above we now know that this is a presheaf of sets which satisfies the sheaf condition for the fpqc topology. On the other hand, it is clearly a presheaf of rings as well. Hence we can think of this as a functor

$$
\begin{array}{cccc}
\mathcal{O}: \quad(\text { Sch } / S)^{o p p} & \longrightarrow & \text { Rings } \\
T / S & \longmapsto & \Gamma\left(T, \mathcal{O}_{T}\right)
\end{array}
$$

which satisfies the sheaf condition for the fpqc topology. Correspondingly there is a notion of $\mathcal{O}$-module, and so on and so forth.

### 49.16. Faithfully flat descent

0306
0307 Definition 49.16.1. Let $\mathcal{U}=\left\{t_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with fixed target. A descent datum for quasi-coherent sheaves with respect to $\mathcal{U}$ is a family $\left(\mathcal{F}_{i}, \varphi_{i j}\right)_{i, j \in I}$ where
(1) for all $i, \mathcal{F}_{i}$ is a quasi-coherent sheaf on $T_{i}$, and
(2) for all $i, j \in I$ the map $\varphi_{i j}: \operatorname{pr}_{0}^{*} \mathcal{F}_{i} \cong \operatorname{pr}_{1}^{*} \mathcal{F}_{j}$ is an isomorphism on $T_{i} \times{ }_{T} T_{j}$ such that the diagrams

commute on $T_{i} \times_{T} T_{j} \times_{T} T_{k}$.
This descent datum is called effective if there exist a quasi-coherent sheaf $\mathcal{F}$ over $T$ and $\mathcal{O}_{T_{i}}$-module isomorphisms $\varphi_{i}: t_{i}^{*} \mathcal{F} \cong \mathcal{F}_{i}$ satisfying the cocycle condition, namely

$$
\varphi_{i j}=\operatorname{pr}_{1}^{*}\left(\varphi_{j}\right) \circ \operatorname{pr}_{0}^{*}\left(\varphi_{i}\right)^{-1}
$$

In this and the next section we discuss some ingredients of the proof of the following theorem, as well as some related material.

03 O 8 Theorem 49.16.2. If $\mathcal{V}=\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering, then all descent data for quasi-coherent sheaves with respect to $\mathcal{V}$ are effective.

Proof. See Descent, Proposition 34.5.2.
In other words, the fibered category of quasi-coherent sheaves is a stack on the fpqc site. The proof of the theorem is in two steps. The first one is to realize that for Zariski coverings this is easy (or well-known) using standard glueing of sheaves (see Sheaves, Section 6.33) and the locality of quasi-coherence. The second step is the case of an fpqc covering of the form $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ where $A \rightarrow B$ is a faithfully flat ring map. This is a lemma in algebra, which we now present.
Descent of modules. If $A \rightarrow B$ is a ring map, we consider the complex

$$
(B / A)_{\bullet}: B \rightarrow B \otimes_{A} B \rightarrow B \otimes_{A} B \otimes_{A} B \rightarrow \ldots
$$

where $B$ is in degree $0, B \otimes_{A} B$ in degree 1 , etc, and the maps are given by

$$
\begin{aligned}
b & \mapsto 1 \otimes b-b \otimes 1 \\
b_{0} \otimes b_{1} & \mapsto 1 \otimes b_{0} \otimes b_{1}-b_{0} \otimes 1 \otimes b_{1}+b_{0} \otimes b_{1} \otimes 1 \\
& \text { etc. }
\end{aligned}
$$

03 O 9 Lemma 49.16.3. If $A \rightarrow B$ is faithfully flat, then the complex $(B / A)$ • is exact in positive degrees, and $H^{0}((B / A) \bullet)=A$.
Proof. See Descent, Lemma 34.3.6.
Grothendieck proves this in three steps. Firstly, he assumes that the map $A \rightarrow B$ has a section, and constructs an explicit homotopy to the complex where $A$ is the only nonzero term, in degree 0 . Secondly, he observes that to prove the result, it suffices to do so after a faithfully flat base change $A \rightarrow A^{\prime}$, replacing $B$ with $B^{\prime}=B \otimes_{A} A^{\prime}$. Thirdly, he applies the faithfully flat base change $A \rightarrow A^{\prime}=B$ and remark that the map $A^{\prime}=B \rightarrow B^{\prime}=B \otimes_{A} B$ has a natural section.

The same strategy proves the following lemma.
03OA Lemma 49.16.4. If $A \rightarrow B$ is faithfully flat and $M$ is an $A$-module, then the complex $(B / A) \bullet \otimes_{A} M$ is exact in positive degrees, and $H^{0}\left((B / A) \bullet \otimes_{A} M\right)=M$.

Proof. See Descent, Lemma 34.3.6.
03OB Definition 49.16.5. Let $A \rightarrow B$ be a ring map and $N$ a $B$-module. A descent datum for $N$ with respect to $A \rightarrow B$ is an isomorphism $\varphi: N \otimes_{A} B \cong B \otimes_{A} N$ of $B \otimes_{A} B$-modules such that the diagram of $B \otimes_{A} B \otimes_{A} B$-modules

commutes.

If $N^{\prime}=B \otimes_{A} M$ for some $A$-module M , then it has a canonical descent datum given by the map

$$
\begin{array}{cccc}
\varphi_{\text {can }}: & N^{\prime} \otimes_{A} B & \rightarrow & B \otimes_{A} N^{\prime} \\
b_{0} \otimes m \otimes b_{1} & \mapsto & b_{0} \otimes b_{1} \otimes m .
\end{array}
$$

03OC Definition 49.16.6. A descent datum $(N, \varphi)$ is called effective if there exists an $A$-module $M$ such that $(N, \varphi) \cong\left(B \otimes_{A} M, \varphi_{\text {can }}\right)$, with the obvious notion of isomorphism of descent data.
Theorem 49.16.2 is a consequence the following result.
03OD Theorem 49.16.7. If $A \rightarrow B$ is faithfully flat then descent data with respect to $A \rightarrow B$ are effective.

Proof. See Descent, Proposition 34.3.9. See also Descent, Remark 34.3.11 for an alternative view of the proof.

03OE Remarks 49.16.8. The results on descent of modules have several applications:
(1) The exactness of the Čech complex in positive degrees for the covering $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ where $A \rightarrow B$ is faithfully flat. This will give some vanishing of cohomology.
(2) If $(N, \varphi)$ is a descent datum with respect to a faithfully flat map $A \rightarrow B$, then the corresponding $A$-module is given by

$$
M=\operatorname{Ker}\left(\begin{array}{ccc}
N & \longrightarrow & B \otimes_{A} N \\
n & \longmapsto & 1 \otimes n-\varphi(n \otimes 1)
\end{array}\right) .
$$

See Descent, Proposition 34.3.9.

### 49.17. Quasi-coherent sheaves

03OF We can apply the descent of modules to study quasi-coherent sheaves.
03OG Proposition 49.17.1. For any quasi-coherent sheaf $\mathcal{F}$ on $S$ the presheaf

$$
\begin{array}{cccc}
\mathcal{F}^{a}: & S c h / S & \rightarrow & A b \\
& (f: T \rightarrow S) & \mapsto & \Gamma\left(T, f^{*} \mathcal{F}\right)
\end{array}
$$

is an $\mathcal{O}$-module which satisfies the sheaf condition for the fpqc topology.
Proof. This is proved in Descent, Lemma 34.7.1. We indicate the proof here. As established in Lemma 49.15.6, it is enough to check the sheaf property on Zariski coverings and faithfully flat morphisms of affine schemes. The sheaf property for Zariski coverings is standard scheme theory, since $\Gamma\left(U, i^{*} \mathcal{F}\right)=\mathcal{F}(U)$ when $i: U \hookrightarrow$ $S$ is an open immersion.
For $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ with $A \rightarrow B$ faithfully flat and $\left.\mathcal{F}\right|_{\operatorname{Spec}(A)}=\widetilde{M}$ this corresponds to the fact that $M=H^{0}\left((B / A) \bullet \otimes_{A} M\right)$, i.e., that

$$
0 \rightarrow M \rightarrow B \otimes_{A} M \rightarrow B \otimes_{A} B \otimes_{A} M
$$

is exact by Lemma 49.16.4.
There is an abstract notion of a quasi-coherent sheaf on a ringed site. We briefly introduce this here. For more information please consult Modules on Sites, Section 18.23. Let $\mathcal{C}$ be a category, and let $U$ be an object of $\mathcal{C}$. Then $\mathcal{C} / U$ indicates the category of objects over $U$, see Categories, Example 4.2.13. If $\mathcal{C}$ is a site, then
$\mathcal{C} / U$ is a site as well, namely the coverings of $V / U$ are families $\left\{V_{i} / U \rightarrow V / U\right\}$ of morphisms of $\mathcal{C} / U$ with fixed target such that $\left\{V_{i} \rightarrow V\right\}$ is a covering of $\mathcal{C}$. Moreover, given any sheaf $\mathcal{F}$ on $\mathcal{C}$ the restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U}$ (defined in the obvious manner) is a sheaf as well. See Sites, Section 7.24 for details.
03 OH Definition 49.17.2. Let $\mathcal{C}$ be a ringed site, i.e., a site endowed with a sheaf of rings $\mathcal{O}$. A sheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{C}$ is called quasi-coherent if for all $U \in \mathrm{Ob}(\mathcal{C})$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that the restriction $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ is isomorphic to the cokernel of an $\mathcal{O}$-linear map of free $\mathcal{O}$-modules

$$
\left.\left.\bigoplus_{k \in K} \mathcal{O}\right|_{\mathcal{C} / U_{i}} \longrightarrow \bigoplus_{l \in L} \mathcal{O}\right|_{\mathcal{C} / U_{i}}
$$

The direct sum over $K$ is the sheaf associated to the presheaf $V \mapsto \bigoplus_{k \in K} \mathcal{O}(V)$ and similarly for the other.
Although it is useful to be able to give a general definition as above this notion is not well behaved in general.

03OI Remark 49.17.3. In the case where $\mathcal{C}$ has a final object, e.g. $S$, it suffices to check the condition of the definition for $U=S$ in the above statement. See Modules on Sites, Lemma 18.23 .3
03OJ Theorem 49.17.4 (Meta theorem on quasi-coherent sheaves). Let $S$ be a scheme. Let $\mathcal{C}$ be a site. Assume that
(1) the underlying category $\mathcal{C}$ is a full subcategory of $S c h / S$,
(2) any Zariski covering of $T \in \mathrm{Ob}(\mathcal{C})$ can be refined by a covering of $\mathcal{C}$,
(3) $S / S$ is an object of $\mathcal{C}$,
(4) every covering of $\mathcal{C}$ is an fpqc covering of schemes.

Then the presheaf $\mathcal{O}$ is a sheaf on $\mathcal{C}$ and any quasi-coherent $\mathcal{O}$-module on $(\mathcal{C}, \mathcal{O})$ is of the form $\mathcal{F}^{a}$ for some quasi-coherent sheaf $\mathcal{F}$ on $S$.

Proof. After some formal arguments this is exactly Theorem 49.16.2. Details omitted. In Descent, Proposition 34.7.11 we prove a more precise version of the theorem for the big Zariski, fppf, étale, smooth, and syntomic sites of $S$, as well as the small Zariski and étale sites of $S$.

In other words, there is no difference between quasi-coherent modules on the scheme $S$ and quasi-coherent $\mathcal{O}$-modules on sites $\mathcal{C}$ as in the theorem. More precise statements for the big and small sites $(S c h / S)_{f p p f}, S_{\text {étale }}$, etc can be found in Descent, Section 34.7. In this chapter we will sometimes refer to a "site as in Theorem 49.17 .4 in order to conveniently state results which hold in any of those situations.

### 49.18. Cech cohomology

03OK Our next goal is to use descent theory to show that $H^{i}\left(\mathcal{C}, \mathcal{F}^{a}\right)=H_{\text {Zar }}^{i}(S, \mathcal{F})$ for all quasi-coherent sheaves $\mathcal{F}$ on $S$, and any site $\mathcal{C}$ as in Theorem 49.17.4. To this end, we introduce Čech cohomology on sites. See Art62 and Cohomology on Sites, Sections 21.9, 21.10 and 21.11 for more details.

03OL Definition 49.18.1. Let $\mathcal{C}$ be a category, $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ a family of morphisms of $\mathcal{C}$ with fixed target, and $\mathcal{F} \in P A b(\mathcal{C})$ an abelian presheaf. We define the $\check{C}$ ech complex $\mathcal{C}^{\bullet}(\mathcal{U}, \mathcal{F})$ by

$$
\prod_{i_{0} \in I} \mathcal{F}\left(U_{i_{0}}\right) \rightarrow \prod_{i_{0}, i_{1} \in I} \mathcal{F}\left(U_{i_{0}} \times{ }_{U} U_{i_{1}}\right) \rightarrow \prod_{i_{0}, i_{1}, i_{2} \in I} \mathcal{F}\left(U_{i_{0}} \times{ }_{U} U_{i_{1}} \times_{U} U_{i_{2}}\right) \rightarrow \ldots
$$

where the first term is in degree 0 , and the maps are the usual ones. Again, it is essential to allow the case $i_{0}=i_{1}$ etc. The Čech cohomology groups are defined by

$$
\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}\left(\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})\right)
$$

03 OM Lemma 49.18.2. The functor $\check{\mathcal{C}} \bullet(\mathcal{U},-)$ is exact on the category $\operatorname{PAb}(\mathcal{C})$.
In other words, if $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ is a short exact sequence of presheaves of abelian groups, then

$$
0 \rightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{1}\right) \rightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{2}\right) \rightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}_{3}\right) \rightarrow 0
$$

is a short exact sequence of complexes.
Proof. This follows at once from the definition of a short exact sequence of presheaves. Namely, as the category of abelian presheaves is the category of functors on some category with values in $A b$, it is automatically an abelian category: a sequence $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$ is exact in $P A b$ if and only if for all $U \in \mathrm{Ob}(\mathcal{C})$, the sequence $\mathcal{F}_{1}(U) \rightarrow \mathcal{F}_{2}(U) \rightarrow \mathcal{F}_{3}(U)$ is exact in $A b$. So the complex above is merely a product of short exact sequences in each degree. See also Cohomology on Sites, Lemma 21.10.1.

This shows that $\check{H}^{\bullet}(\mathcal{U},-)$ is a $\delta$-functor. We now proceed to show that it is a universal $\delta$-functor. We thus need to show that it is an effaceable functor. We start by recalling the Yoneda lemma.

03ON Lemma 49.18.3 (Yoneda Lemma). For any presheaf $\mathcal{F}$ on a category $\mathcal{C}$ there is a functorial isomorphism

$$
\operatorname{Hom}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U)
$$

Proof. See Categories, Lemma 4.3.5.
Given a set $E$ we denote (in this section) $\mathbf{Z}[E]$ the free abelian group on $E$. In a formula $\mathbf{Z}[E]=\bigoplus_{e \in E} \mathbf{Z}$, i.e., $\mathbf{Z}[E]$ is a free $\mathbf{Z}$-module having a basis consisting of the elements of $E$. Using this notation we introduce the free abelian presheaf on a presheaf of sets.

03 OO Definition 49.18.4. Let $\mathcal{C}$ be a category. Given a presheaf of sets $\mathcal{G}$, we define the free abelian presheaf on $\mathcal{G}$, denoted $\mathbf{Z}_{\mathcal{G}}$, by the rule

$$
\mathbf{Z}_{\mathcal{G}}(U)=\mathbf{Z}[\mathcal{G}(U)]
$$

for $U \in \operatorname{Ob}(\mathcal{C})$ with restriction maps induced by the restriction maps of $\mathcal{G}$. In the special case $\mathcal{G}=h_{U}$ we write simply $\mathbf{Z}_{U}=\mathbf{Z}_{h_{U}}$.

The functor $\mathcal{G} \mapsto \mathbf{Z}_{\mathcal{G}}$ is left adjoint to the forgetful functor $\operatorname{PAb}(\mathcal{C}) \rightarrow \operatorname{PSh}(\mathcal{C})$. Thus, for any presheaf $\mathcal{F}$, there is a canonical isomorphism

$$
\operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U}, \mathcal{F}\right)=\operatorname{Hom}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U)
$$

the last equality by the Yoneda lemma. In particular, we have the following result.

03OP Lemma 49.18.5. The Čech complex $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ can be described explicitly as follows

$$
\begin{aligned}
\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F}) & =\left(\prod_{i_{0} \in I} \operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U_{i_{0}}}, \mathcal{F}\right) \rightarrow \prod_{i_{0}, i_{1} \in I} \operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{U_{i_{0}} \times_{U} U_{i_{1}}}, \mathcal{F}\right) \rightarrow \ldots\right) \\
& =\operatorname{Hom}_{\operatorname{PAb}(\mathcal{C})}\left(\left(\bigoplus_{i_{0} \in I} \mathbf{Z}_{U_{i_{0}}} \leftarrow \bigoplus_{i_{0}, i_{1} \in I} \mathbf{Z}_{U_{i_{0} \times_{U} U_{i_{1}}}} \leftarrow \ldots\right), \mathcal{F}\right)
\end{aligned}
$$

Proof. This follows from the formula above. See Cohomology on Sites, Lemma 21.10 .3

This reduces us to studying only the complex in the first argument of the last Hom.
03OQ Lemma 49.18.6. The complex of abelian presheaves

$$
\mathbf{z}_{\dot{u}}: \bigoplus_{i_{0} \in I} \mathbf{z}_{U_{i_{0}}} \leftarrow \bigoplus_{i_{0}, i_{1} \in I} \mathbf{z}_{U_{i_{0}} \times U U_{i_{1}}} \leftarrow \bigoplus_{i_{0}, i_{1}, i_{2} \in I} \mathbf{z}_{U_{i_{0}} \times U_{U} U_{i_{1}} \times U U_{i_{2}}} \leftarrow \cdots
$$

is exact in all degrees except 0 in $\operatorname{PAb}(\mathcal{C})$.
Proof. For any $V \in \operatorname{Ob}(\mathcal{C})$ the complex of abelian groups $\mathbf{Z}_{\mathcal{U}}^{\bullet}(V)$ is

$$
\begin{gathered}
\mathbf{Z}\left[\coprod_{i_{0} \in I} \operatorname{Mor}_{\mathcal{C}}\left(V, U_{i_{0}}\right)\right] \leftarrow \mathbf{Z}\left[\coprod_{i_{0}, i_{1} \in I} \operatorname{Mor}_{\mathcal{C}}\left(V, U_{i_{0}} \times_{U} U_{i_{1}}\right)\right] \leftarrow \ldots= \\
\bigoplus_{\varphi: V \rightarrow U}\left(\mathbf{Z}\left[\coprod_{i_{0} \in I} \operatorname{Mor}_{\varphi}\left(V, U_{i_{0}}\right)\right] \leftarrow \mathbf{Z}\left[\coprod_{i_{0}, i_{1} \in I} \operatorname{Mor}_{\varphi}\left(V, U_{i_{0}}\right) \times \operatorname{Mor}_{\varphi}\left(V, U_{i_{1}}\right)\right] \leftarrow \ldots\right)
\end{gathered}
$$

where

$$
\operatorname{Mor}_{\varphi}\left(V, U_{i}\right)=\left\{V \rightarrow U_{i} \text { such that } V \rightarrow U_{i} \rightarrow U \text { equals } \varphi\right\}
$$

Set $S_{\varphi}=\coprod_{i \in I} \operatorname{Mor}_{\varphi}\left(V, U_{i}\right)$, so that

$$
\mathbf{Z}_{\mathcal{U}}^{\bullet}(V)=\bigoplus_{\varphi: V \rightarrow U}\left(\mathbf{Z}\left[S_{\varphi}\right] \leftarrow \mathbf{Z}\left[S_{\varphi} \times S_{\varphi}\right] \leftarrow \mathbf{Z}\left[S_{\varphi} \times S_{\varphi} \times S_{\varphi}\right] \leftarrow \ldots\right)
$$

Thus it suffices to show that for each $S=S_{\varphi}$, the complex

$$
\mathbf{Z}[S] \leftarrow \mathbf{Z}[S \times S] \leftarrow \mathbf{Z}[S \times S \times S] \leftarrow \ldots
$$

is exact in negative degrees. To see this, we can give an explicit homotopy. Fix $s \in S$ and define $K: n_{\left(s_{0}, \ldots, s_{p}\right)} \mapsto n_{\left(s, s_{0}, \ldots, s_{p}\right)}$. One easily checks that $K$ is a nullhomotopy for the operator

$$
\delta: \eta_{\left(s_{0}, \ldots, s_{p}\right)} \mapsto \sum_{i=0}^{p}(-1)^{p} \eta_{\left(s_{0}, \ldots, \hat{s}_{i}, \ldots, s_{p}\right)}
$$

See Cohomology on Sites, Lemma 21.10.4 for more details.
03OR Lemma 49.18.7. Let $\mathcal{C}$ be a category. If $\mathcal{I}$ is an injective object of $\operatorname{PAb}(\mathcal{C})$ and $\mathcal{U}$ is a family of morphisms with fixed target in $\mathcal{C}$, then $\check{H}^{p}(\mathcal{U}, \mathcal{I})=0$ for all $p>0$.
Proof. The Čech complex is the result of applying the functor $\operatorname{Hom}_{\operatorname{PAb}(\mathcal{C})}(-, \mathcal{I})$ to the complex $\mathbf{Z}_{\mathcal{U}}^{\bullet}$, i.e.,

$$
\check{H}^{p}(\mathcal{U}, \mathcal{I})=H^{p}\left(\operatorname{Hom}_{\operatorname{PAb}(\mathcal{C})}\left(\mathbf{Z}_{\mathcal{U}}^{\bullet}, \mathcal{I}\right)\right)
$$

But we have just seen that $\mathbf{Z}_{\mathcal{U}}^{\bullet}$ is exact in negative degrees, and the functor $\operatorname{Hom}_{P A b(\mathcal{C})}(-, \mathcal{I})$ is exact, hence $\operatorname{Hom}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{\mathcal{U}}^{\bullet}, \mathcal{I}\right)$ is exact in positive degrees.

03OS Theorem 49.18.8. On $P A b(\mathcal{C})$ the functors $\check{H}^{p}(\mathcal{U},-)$ are the right derived functors of $\vec{H}^{0}(\mathcal{U},-)$.

Proof. By the Lemma 49.18.7, the functors $\check{H}^{p}(\mathcal{U},-)$ are universal $\delta$-functors since they are effaceable. So are the right derived functors of $\breve{H}^{0}(\mathcal{U},-)$. Since they agree in degree 0 , they agree by the universal property of universal $\delta$-functors. For more details see Cohomology on Sites, Lemma 21.10.6.

03OT Remark 49.18.9. Observe that all of the preceding statements are about presheaves so we haven't made use of the topology yet.

### 49.19. The Cech-to-cohomology spectral sequence

03 OU This spectral sequence is fundamental in proving foundational results on cohomology of sheaves.

03OV Lemma 49.19.1. The forgetful functor $A b(\mathcal{C}) \rightarrow P A b(\mathcal{C})$ transforms injectives into injectives.

Proof. This is formal using the fact that the forgetful functor has a left adjoint, namely sheafification, which is an exact functor. For more details see Cohomology on Sites, Lemma 21.11.1.

03OW Theorem 49.19.2. Let $\mathcal{C}$ be a site. For any covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $U \in \operatorname{Ob}(\mathcal{C})$ and any abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ there is a spectral sequence

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right) \Rightarrow H^{p+q}(U, \mathcal{F})
$$

where $\underline{H}^{q}(\mathcal{F})$ is the abelian presheaf $V \mapsto H^{q}(V, \mathcal{F})$.
Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in $A b(\mathcal{C})$, and consider the double complex $\check{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ and the maps

Here the horizontal map is the natural map $\Gamma\left(U, I^{\bullet}\right) \rightarrow \check{\mathcal{C}}^{0}\left(\mathcal{U}, \mathcal{I}^{\bullet}\right)$ to the left column, and the vertical map is induced by $\mathcal{F} \rightarrow \mathcal{I}^{0}$ and lands in the bottom row. By assumption, $\mathcal{I}^{\bullet}$ is a complex of injectives in $A b(\mathcal{C})$, hence by Lemma 49.19.1, it is a complex of injectives in $\operatorname{PAb}(\mathcal{C})$. Thus, the rows of the double complex are exact in positive degrees (Lemma 49.18.7), and the kernel of the horizontal map is equal to $\Gamma\left(U, \mathcal{I}^{\bullet}\right)$, since $\mathcal{I}^{\bullet}$ is a complex of sheaves. In particular, the cohomology of the total complex is the standard cohomology of the global sections functor $H^{0}(U, \mathcal{F})$.
For the vertical direction, the $q$ th cohomology group of the $p$ th column is

$$
\prod_{i_{0}, \ldots, i_{p}} H^{q}\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}, \mathcal{F}\right)=\prod_{i_{0}, \ldots, i_{p}} \underline{H}^{q}(\mathcal{F})\left(U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}\right)
$$

in the entry $E_{1}^{p, q}$. So this is a standard double complex spectral sequence, and the $E_{2}$-page is as prescribed. For more details see Cohomology on Sites, Lemma 21.11.6

03OX Remark 49.19.3. This is a Grothendieck spectral sequence for the composition of functors

$$
A b(\mathcal{C}) \longrightarrow P A b(\mathcal{C}) \xrightarrow{\check{H}^{0}} A b .
$$

### 49.20. Big and small sites of schemes

03 X 7 Let $S$ be a scheme. Let $\tau$ be one of the topologies we will be discussing. Thus $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\}. Of course if you are only interested in the étale topology, then you can simply assume $\tau=$ étale throughout. Moreover, we will discuss étale morphisms, étale coverings, and étale sites in more detail starting in Section 49.25. In order to proceed with the discussion of cohomology of quasi-coherent sheaves it is convenient to introduce the big $\tau$-site and in case $\tau \in\{$ étale, Zariski\}, the small $\tau$-site of $S$. In order to do this we first introduce the notion of a $\tau$-covering.
03X8 Definition 49.20.1. (See Topologies, Definitions 33.7.1, 33.6.1, 33.5.1 33.4.1, and 33.3.1.) Let $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski $\}$. A family of morphisms of schemes $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ with fixed target is called a $\tau$-covering if and only if each $f_{i}$ is flat of finite presentation, syntomic, smooth, étale, resp. an open immersion, and we have $\bigcup f_{i}\left(T_{i}\right)=T$.
It turns out that the class of all $\tau$-coverings satisfies the axioms (1), (2) and (3) of Definition 49.10 .2 (our definition of a site), see Topologies, Lemmas 33.7.3, 33.6.3, 33.5.3, 33.4.3, and 33.3.2. In order to be able to compare any of these new topologies to the fpqc topology and to use the preceding results on descent on modules we single out a special class of $\tau$-coverings of affine schemes called standard coverings.

03X9 Definition 49.20.2. (See Topologies, Definitions 33.7.5, 33.6.5, 33.5.5, 33.4.5. and 33.3.4.) Let $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\}. Let $T$ be an affine scheme. A standard $\tau$-covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j}$ is affine, and each $f_{j}$ flat and of finite presentation, standard syntomic, standard smooth, étale, resp. the immersion of a standard principal open in $T$ and $T=$ $\bigcup f_{j}\left(U_{j}\right)$.
03XA Lemma 49.20.3. Let $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\}. Any $\tau$ covering of an affine scheme can be refined by a standard $\tau$-covering.
Proof. See Topologies, Lemmas 33.7.4, 33.6.4, 33.5.4 33.4.4, and 33.3.3.
Finally, we come to our definition of the sites we will be working with. This is actually somewhat involved since, contrary to what happens in AGV71, we do not want to choose a universe. Instead we pick a "partial universe" (which is a suitably large set as in Sets, Section 3.5), and consider all schemes contained in this set. Of course we make sure that our favorite base scheme $S$ is contained in the partial universe. Having picked the underlying category we pick a suitably large set of $\tau$-coverings which turns this into a site. The details are in the chapter on topologies on schemes; there is a lot of freedom in the choices made, but in the end the actual choices made will not affect the étale (or other) cohomology of $S$ (just as in AGV71 the actual choice of universe doesn't matter at the end). Moreover, the way the material is written the reader who is happy using strongly inaccessible cardinals (i.e., universes) can do so as a substitute.
03XB Definition 49.20.4. Let $S$ be a scheme. Let $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\}.
(1) A big $\tau$-site of $S$ is any of the sites $(S c h / S)_{\tau}$ constructed as explained above and in more detail in Topologies, Definitions 33.7.8, 33.6.8, 33.5.8, 33.4 .8 , and 33.3 .7 .
(2) If $\tau \in\left\{\right.$ étale, Zariski\}, then the small $\tau$-site of $S$ is the full subcategory $S_{\tau}$ of $(S c h / S)_{\tau}$ whose objects are schemes $T$ over $S$ whose structure morphism $T \rightarrow S$ is étale, resp. an open immersion. A covering in $S_{\tau}$ is a covering $\left\{U_{i} \rightarrow U\right\}$ in $(S c h / S)_{\tau}$ such that $U$ is an object of $S_{\tau}$.
The underlying category of the site $(S c h / S)_{\tau}$ has reasonable "closure" properties, i.e., given a scheme $T$ in it any locally closed subscheme of $T$ is isomorphic to an object of $(S c h / S)_{\tau}$. Other such closure properties are: closed under fibre products of schemes, taking countable disjoint unions, taking finite type schemes over a given scheme, given an affine scheme $\operatorname{Spec}(R)$ one can complete, localize, or take the quotient of $R$ by an ideal while staying inside the category, etc. On the other hand, for example arbitrary disjoint unions of schemes in $(S c h / S)_{\tau}$ will take you outside of it. Also note that, given an object $T$ of $(S c h / S)_{\tau}$ there will exist $\tau$-coverings $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (as in Definition 49.20.1 which are not coverings in $(S c h / S)_{\tau}$ for example because the schemes $T_{i}$ are not objects of the category $(S c h / S)_{\tau}$. But our choice of the sites $(S c h / S)_{\tau}$ is such that there always does exist a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $(S c h / S)_{\tau}$ which refines the covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$, see Topologies, Lemmas 33.7.7, 33.6.7, 33.5.7, 33.4.7, and 33.3.6. We will mostly ignore these issues in this chapter.

If $\mathcal{F}$ is a sheaf on $(S c h / S)_{\tau}$ or $S_{\tau}$, then we denote

$$
H_{\tau}^{p}(U, \mathcal{F}), \text { in particular } H_{\tau}^{p}(S, \mathcal{F})
$$

the cohomology groups of $\mathcal{F}$ over the object $U$ of the site, see Section49.14. Thus we have $H_{\text {fppf }}^{p}(S, \mathcal{F}), H_{\text {syntomic }}^{p}(S, \mathcal{F}), H_{\text {smooth }}^{p}(S, \mathcal{F}), H_{\text {étale }}^{p}(S, \mathcal{F})$, and $H_{Z a r}^{p}(S, \mathcal{F})$. The last two are potentially ambiguous since they might refer to either the big or small étale or Zariski site. However, this ambiguity is harmless by the following lemma.

03YX Lemma 49.20.5. Let $\tau \in\{$ étale, Zariski\}. If $\mathcal{F}$ is an abelian sheaf defined on $(S c h / S)_{\tau}$, then the cohomology groups of $\mathcal{F}$ over $S$ agree with the cohomology groups of $\left.\mathcal{F}\right|_{S_{\tau}}$ over $S$.

Proof. By Topologies, Lemmas 33.3 .13 and 33.4 .13 the functors $S_{\tau} \rightarrow(S c h / S)_{\tau}$ satisfy the hypotheses of Sites, Lemma 7.20.8. Hence our lemma follows from Cohomology on Sites, Lemma 21.8.2.

For completeness we state and prove the invariance under choice of partial universe of the cohomology groups we are considering. We will prove invariance of the small étale topos in Lemma 49.21.3 below. For notation and terminology used in this lemma we refer to Topologies, Section 33.10 .
$03 Y$ Lemma 49.20.6. Let $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\}. Let $S$ be a scheme. Let $(S c h / S)_{\tau}$ and $\left(S c h^{\prime} / S\right)_{\tau}$ be two big $\tau$-sites of $S$, and assume that the first is contained in the second. In this case
(1) for any abelian sheaf $\mathcal{F}^{\prime}$ defined on $\left(S c h^{\prime} / S\right)_{\tau}$ and any object $U$ of $(S c h / S)_{\tau}$ we have

$$
H_{\tau}^{p}\left(U,\left.\mathcal{F}^{\prime}\right|_{(S c h / S)_{\tau}}\right)=H_{\tau}^{p}\left(U, \mathcal{F}^{\prime}\right)
$$

In words: the cohomology of $\mathcal{F}^{\prime}$ over $U$ computed in the bigger site agrees with the cohomology of $\mathcal{F}^{\prime}$ restricted to the smaller site over $U$.
(2) for any abelian sheaf $\mathcal{F}$ on $(S c h / S)_{\tau}$ there is an abelian sheaf $\mathcal{F}^{\prime}$ on $(S c h / S)_{\tau}^{\prime}$ whose restriction to $(S c h / S)_{\tau}$ is isomorphic to $\mathcal{F}$.

Proof. By Topologies, Lemma 33.10 .2 the inclusion functor $(S c h / S)_{\tau} \rightarrow\left(S c h^{\prime} / S\right)_{\tau}$ satisfies the assumptions of Sites, Lemma 7.20.8. This implies (2) and (1) follows from Cohomology on Sites, Lemma 21.8.2.

### 49.21. The étale topos

04 HP A topos is the category of sheaves of sets on a site, see Sites, Definition 7.16.1. Hence it is customary to refer to the use the phrase "étale topos of a scheme" to refer to the category of sheaves on the small étale site of a scheme. Here is the formal definition.

04HQ Definition 49.21.1. Let $S$ be a scheme.
(1) The étale topos, or the small étale topos of $S$ is the category $\operatorname{Sh}\left(S_{\text {étale }}\right)$ of sheaves of sets on the small étale site of $S$.
(2) The Zariski topos, or the small Zariski topos of $S$ is the category $\operatorname{Sh}\left(S_{Z a r}\right)$ of sheaves of sets on the small Zariski site of $S$.
(3) For $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski\} a big $\tau$-topos is the category of sheaves of set on a big $\tau$-topos of $S$.

Note that the small Zariski topos of $S$ is simply the category of sheaves of sets on the underlying topological space of $S$, see Topologies, Lemma 33.3.11. Whereas the small étale topos does not depend on the choices made in the construction of the small étale site, in general the big topoi do depend on those choices.

Here is a lemma, which is one of many possible lemmas expressing the fact that it doesn't matter too much which site we choose to define the small étale topos of a scheme.

04HR Lemma 49.21.2. Let $S$ be a scheme. Let $S_{\text {affine,étale }}$ denote the full subcategory of $S_{\text {étale }}$ whose objects are those $U / S \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ with $U$ affine. A covering of $S_{a f f i n e, \text { étale }}$ will be a standard étale covering, see Topologies, Definition 33.4.5. Then restriction

$$
\left.\mathcal{F} \longmapsto \mathcal{F}\right|_{S_{\text {affine,étale }}}
$$

defines an equivalence of topoi $\operatorname{Sh}\left(S_{\text {étale }}\right) \cong \operatorname{Sh}\left(S_{\text {affine,étale }}\right)$.
Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 7.28.1 by checking that the inclusion functor $S_{\text {affine,étale }} \rightarrow S_{\text {étale }}$ is a special cocontinuous functor (see Sites, Definition 7.28.2).

0958 Lemma 49.21.3. Let $S$ be a scheme. The étale topos of $S$ is independent (up to canonical equivalence) of the construction of the small étale site in Definition 49.20 .4.

Proof. We have to show, given two big étale sites $S h_{e ́ t a l e}$ and $S c h_{e ́ t a l e}^{\prime}$ containing $S$, then $S h\left(S_{\text {étale }}\right) \cong S h\left(S_{\text {étale }}^{\prime}\right)$ with obvious notation. By Topologies, Lemma 33.10.1 we may assume $S c h_{\text {étale }} \subset S c h_{\text {étale }}^{\prime}$. By Sets, Lemma 3.9.9 any affine scheme étale over $S$ is isomorphic to an object of both $S c h_{\text {étale }}$ and $S c h_{\text {étale }}^{\prime}$. Thus the induced functor $S_{\text {affine,étale }} \rightarrow S_{a f f i n e, \text { étale }}^{\prime}$ is an equivalence. Moreover, it is clear that both this functor and a quasi-inverse map transform standard étale coverings into standard étale coverings. Hence the result follows from Lemma 49.21.2.

### 49.22. Cohomology of quasi-coherent sheaves

03 OY We start with a simple lemma (which holds in greater generality than stated). It says that the Čech complex of a standard covering is equal to the Čech complex of an fpqc covering of the form $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ with $A \rightarrow B$ faithfully flat.

03OZ Lemma 49.22.1. Let $\tau \in\{$ fppf,syntomic, smooth, étale, Zariski\}. Let $S$ be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $(S c h / S)_{\tau}$, or on $S_{\tau}$ in case $\tau=$ étale, and let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a standard $\tau$-covering of this site. Let $V=\coprod_{i \in I} U_{i}$. Then
(1) $V$ is an affine scheme,
(2) $\mathcal{V}=\{V \rightarrow U\}$ is a $\tau$-covering and an fpqc covering,
(3) the Čech complexes $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ and $\check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{F})$ agree.

Proof. As the covering is a standard $\tau$-covering each of the schemes $U_{i}$ is affine and $I$ is a finite set. Hence $V$ is an affine scheme. It is clear that $V \rightarrow U$ is flat and surjective, hence $\mathcal{V}$ is an fpqc covering, see Example 49.15.3. Note that $\mathcal{U}$ is a refinement of $\mathcal{V}$ and hence there is a map of Čech complexes $\mathcal{C}^{\bullet}(\mathcal{V}, \mathcal{F}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})$, see Cohomology on Sites, Equation 21.9.2.1. Next, we observe that if $T=\coprod_{j \in J} T_{j}$ is a disjoint union of schemes in the site on which $\mathcal{F}$ is defined then the family of morphisms with fixed target $\left\{T_{j} \rightarrow T\right\}_{j \in J}$ is a Zariski covering, and so

03XC

$$
\begin{equation*}
\mathcal{F}(T)=\mathcal{F}\left(\coprod_{j \in J} T_{j}\right)=\prod_{j \in J} \mathcal{F}\left(T_{j}\right) \tag{49.22.1.1}
\end{equation*}
$$

by the sheaf condition of $\mathcal{F}$. This implies the map of Čech complexes above is an isomorphism in each degree because

$$
V \times_{U} \ldots \times_{U} V=\coprod_{i_{0}, \ldots i_{p}} U_{i_{0}} \times \times_{U} \ldots \times_{U} U_{i_{p}}
$$

as schemes.
Note that Equality (49.22.1.1) is false for a general presheaf. Even for sheaves it does not hold on any site, since coproducts may not lead to coverings, and may not be disjoint. But it does for all the usual ones (at least all the ones we will study).

03P0 Remark 49.22.2. In the statement of Lemma 49.22.1 the covering $\mathcal{U}$ is a refinement of $\mathcal{V}$ but not the other way around. Coverings of the form $\{V \rightarrow U\}$ do not form an initial subcategory of the category of all coverings of $U$. Yet it is still true that we can compute Cech cohomology $\ddot{H}^{n}(U, \mathcal{F})$ (which is defined as the colimit over the opposite of the category of coverings $\mathcal{U}$ of $U$ of the Cech cohomology groups of $\mathcal{F}$ with respect to $\mathcal{U})$ in terms of the coverings $\{V \rightarrow U\}$. We will formulate a precise lemma (it only works for sheaves) and add it here if we ever need it.

03P1 Lemma 49.22.3 (Locality of cohomology). Let $\mathcal{C}$ be a site, $\mathcal{F}$ an abelian sheaf on $\mathcal{C}, U$ an object of $\mathcal{C}, p>0$ an integer and $\xi \in H^{p}(U, \mathcal{F})$. Then there exists $a$ covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $U$ in $\mathcal{C}$ such that $\left.\xi\right|_{U_{i}}=0$ for all $i \in I$.

Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$. Then $\xi$ is represented by a cocycle $\tilde{\xi} \in \mathcal{I}^{p}(U)$ with $d^{p}(\tilde{\xi})=0$. By assumption, the sequence $\mathcal{I}^{p-1} \rightarrow \mathcal{I}^{p} \rightarrow \mathcal{I}^{p+1}$ in exact in $A b(\mathcal{C})$, which means that there exists a covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ such that $\left.\tilde{\xi}\right|_{U_{i}}=d^{p-1}\left(\xi_{i}\right)$ for some $\xi_{i} \in \mathcal{I}^{p-1}\left(U_{i}\right)$. Since the cohomology class $\left.\xi\right|_{U_{i}}$ is represented by the cocycle $\left.\tilde{\xi}\right|_{U_{i}}$ which is a coboundary, it vanishes. For more details see Cohomology on Sites, Lemma 21.8.3.

03P2 Theorem 49.22.4. Let $S$ be a scheme and $\mathcal{F}$ a quasi-coherent $\mathcal{O}_{S}$-module. Let $\mathcal{C}$ be either $(S c h / S)_{\tau}$ for $\tau \in\{f p p f$, syntomic, smooth, étale, Zariski $\}$ or $S_{\text {étale }}$. Then

$$
H^{p}(S, \mathcal{F})=H_{\tau}^{p}\left(S, \mathcal{F}^{a}\right)
$$

for all $p \geq 0$ where
(1) the left hand side indicates the usual cohomology of the sheaf $\mathcal{F}$ on the underlying topological space of the scheme $S$, and
(2) the right hand side indicates cohomology of the abelian sheaf $\mathcal{F}^{a}$ (see Proposition 49.17.1) on the site $\mathcal{C}$.

Proof. We are going to show that $H^{p}\left(U, f^{*} \mathcal{F}\right)=H_{\tau}^{p}\left(U, \mathcal{F}^{a}\right)$ for any object $f$ : $U \rightarrow S$ of the site $\mathcal{C}$. The result is true for $p=0$ by the sheaf property.

Assume that $U$ is affine. Then we want to prove that $H_{\tau}^{p}\left(U, \mathcal{F}^{a}\right)=0$ for all $p>0$. We use induction on $p$.
$p=1$ Pick $\xi \in H_{\tau}^{1}\left(U, \mathcal{F}^{a}\right)$. By Lemma 49.22.3. there exists an fpqc covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ such that $\left.\xi\right|_{U_{i}}=0$ for all $i \in I$. Up to refining $\mathcal{U}$, we may assume that $\mathcal{U}$ is a standard $\tau$-covering. Applying the spectral sequence of Theorem 49.19.2, we see that $\xi$ comes from a cohomology class $\check{\xi} \in \check{H}^{1}\left(\mathcal{U}, \mathcal{F}^{a}\right)$. Consider the covering $\mathcal{V}=\left\{\coprod_{i \in I} U_{i} \rightarrow U\right\}$. By Lemma 49.22.1, $\check{H}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{a}\right)=\check{H}^{\bullet}\left(\mathcal{V}, \mathcal{F}^{a}\right)$. On the other hand, since $\mathcal{V}$ is a covering of the form $\{\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)\}$ and $f^{*} \mathcal{F}=\widetilde{M}$ for some $A$-module $M$, we see the Čech complex $\check{\mathcal{C}} \bullet(\mathcal{V}, \mathcal{F})$ is none other than the complex $(B / A) \bullet \otimes_{A} M$. Now by Lemma 49.16.4, $H^{p}\left((B / A) \bullet \otimes_{A} M\right)=0$ for $p>0$, hence $\check{\xi}=0$ and so $\xi=0$.
$p>1$ Pick $\xi \in H_{\tau}^{p}\left(U, \mathcal{F}^{a}\right)$. By Lemma 49.22.3, there exists an fpqc covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ such that $\left.\xi\right|_{U_{i}}=0$ for all $i \in I$. Up to refining $\mathcal{U}$, we may assume that $\mathcal{U}$ is a standard $\tau$-covering. We apply the spectral sequence of Theorem 49.19.2. Observe that the intersections $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}$ are affine, so that by induction hypothesis the cohomology groups

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}\left(\mathcal{F}^{a}\right)\right)
$$

vanish for all $0<q<p$. We see that $\xi$ must come from a $\check{\xi} \in \check{H}^{p}\left(\mathcal{U}, \mathcal{F}^{a}\right)$. Replacing $\mathcal{U}$ with the covering $\mathcal{V}$ containing only one morphism and using Lemma 49.16.4 again, we see that the Čech cohomology class $\check{\xi}$ must be zero, hence $\xi=0$.
Next, assume that $U$ is separated. Choose an affine open covering $U=\bigcup_{i \in I} U_{i}$ of $U$. The family $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is then an fpqc covering, and all the intersections $U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ are affine since $U$ is separated. So all rows of the spectral sequence of Theorem 49.19.2 are zero, except the zeroth row. Therefore

$$
H_{\tau}^{p}\left(U, \mathcal{F}^{a}\right)=\check{H}^{p}\left(\mathcal{U}, \mathcal{F}^{a}\right)=\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}(U, \mathcal{F})
$$

where the last equality results from standard scheme theory, see Cohomology of Schemes, Lemma 29.2.6.

The general case is technical and (to extend the proof as given here) requires a discussion about maps of spectral sequences, so we won't treat it. It follows from Descent, Proposition 34.7 .10 (whose proof takes a slightly different approach) combined with Cohomology on Sites, Lemma 21.8.1.

03P3 Remark 49.22.5. Comment on Theorem 49.22.4 Since $S$ is a final object in the category $\mathcal{C}$, the cohomology groups on the right-hand side are merely the right derived functors of the global sections functor. In fact the proof shows that $H^{p}\left(U, f^{*} \mathcal{F}\right)=H_{\tau}^{p}\left(U, \mathcal{F}^{a}\right)$ for any object $f: U \rightarrow S$ of the site $\mathcal{C}$.

### 49.23. Examples of sheaves

03 YZ Let $S$ and $\tau$ be as in Section 49.20 . We have already seen that any representable presheaf is a sheaf on $(S c h / S)_{\tau}$ or $S_{\tau}$, see Lemma 49.15 .8 and Remark 49.15.9. Here are some special cases.

03P4 Definition 49.23.1. On any of the sites $(S c h / S)_{\tau}$ or $S_{\tau}$ of Section 49.20.
(1) The sheaf $T \mapsto \Gamma\left(T, \mathcal{O}_{T}\right)$ is denoted $\mathcal{O}_{S}$, or $\mathbf{G}_{a}$, or $\mathbf{G}_{a, S}$ if we want to indicate the base scheme.
(2) Similarly, the sheaf $T \mapsto \Gamma\left(T, \mathcal{O}_{T}^{*}\right)$ is denoted $\mathcal{O}_{S}^{*}$, or $\mathbf{G}_{m}$, or $\mathbf{G}_{m, S}$ if we want to indicate the base scheme.
(3) The constant sheaf $\mathbf{Z} / n \mathbf{Z}$ on any site is the sheafification of the constant presheaf $U \mapsto \mathbf{Z} / n \mathbf{Z}$.

The first is a sheaf by Theorem 49.17.4 for example. The second is a sub presheaf of the first, which is easily seen to be a sheaf itself. The third is a sheaf by definition. Note that each of these sheaves is representable. The first and second by the schemes $\mathbf{G}_{a, S}$ and $\mathbf{G}_{m, S}$, see Groupoids, Section 38.4 The third by the finite étale group scheme $\mathbf{Z} / n \mathbf{Z}{ }_{S}$ sometimes denoted $(\mathbf{Z} / n \overline{\mathbf{Z}})_{S}$ which is just $n$ copies of $S$ endowed with the obvious group scheme structure over $S$, see Groupoids, Example 38.5.6 and the following remark.

03P5 Remark 49.23.2. Let $G$ be an abstract group. On any of the sites $(S c h / S)_{\tau}$ or $S_{\tau}$ of Section 49.20 the sheafification $\underline{G}$ of the constant presheaf associated to $G$ in the Zariski topology of the site already gives

$$
\Gamma(U, \underline{G})=\{\text { Zariski locally constant maps } U \rightarrow G\}
$$

This Zariski sheaf is representable by the group scheme $G_{S}$ according to Groupoids, Example 38.5.6. By Lemma 49.15.8 any representable presheaf satisfies the sheaf condition for the $\tau$-topology as well, and hence we conclude that the Zariski sheafification $\underline{G}$ above is also the $\tau$-sheafification.
04HS Definition 49.23.3. Let $S$ be a scheme. The structure sheaf of $S$ is the sheaf of rings $\mathcal{O}_{S}$ on any of the sites $S_{Z a r}, S_{\text {étale }}$, or $(S c h / S)_{\tau}$ discussed above.

If there is some possible confusion as to which site we are working on then we will indicate this by using indices. For example we may use $\mathcal{O}_{S_{\text {etale }}}$ to stress the fact that we are working on the small étale site of $S$.

03P6 Remark 49.23.4. In the terminology introduced above a special case of Theorem 49.22 .4 is

$$
H_{f p p f}^{p}\left(X, \mathbf{G}_{a}\right)=H_{\text {étale }}^{p}\left(X, \mathbf{G}_{a}\right)=H_{Z a r}^{p}\left(X, \mathbf{G}_{a}\right)=H^{p}\left(X, \mathcal{O}_{X}\right)
$$

for all $p \geq 0$. Moreover, we could use the notation $H_{f p p f}^{p}\left(X, \mathcal{O}_{X}\right)$ to indicate the cohomology of the structure sheaf on the big fppf site of $X$.

### 49.24. Picard groups

03P7 The following theorem is sometimes called "Hilbert 90".
03P8 Theorem 49.24.1. For any scheme $X$ we have canonical identifications

$$
\begin{aligned}
H_{\text {fppf }}^{1}\left(X, \mathbf{G}_{m}\right) & =H_{\text {syntomic }}^{1}\left(X, \mathbf{G}_{m}\right) \\
& =H_{\text {smooth }}^{1}\left(X, \mathbf{G}_{m}\right) \\
& =H_{\text {étale }}^{1}\left(X, \mathbf{G}_{m}\right) \\
& =H_{Z a r}^{1}\left(X, \mathbf{G}_{m}\right) \\
& =\operatorname{Pic}(X) \\
& =H^{1}\left(X, \mathcal{O}_{X}^{*}\right)
\end{aligned}
$$

Proof. Let $\tau$ be one of the topologies considered in Section 49.20. By Cohomology on Sites, Lemma 21.7.1 we see that $H_{\tau}^{1}\left(X, \mathbf{G}_{m}\right)=H_{\tau}^{1}\left(X, \mathcal{O}_{\tau}^{*}\right)=\operatorname{Pic}\left(\mathcal{O}_{\tau}\right)$ where $\mathcal{O}_{\tau}$ is the structure sheaf of the site $(S c h / X)_{\tau}$. Now an invertible $\mathcal{O}_{\tau}$-module is a quasi-coherent $\mathcal{O}_{\tau}$-module. By Theorem 49.17 .4 or the more precise Descent, Proposition 34.7.11 we see that $\operatorname{Pic}\left(\mathcal{O}_{\tau}\right)=\operatorname{Pic}(X)$. The last equality is proved in the same way.

### 49.25. The étale site

03P9 At this point we start exploring the étale site of a scheme in more detail. As a first step we discuss a little the notion of an étale morphism.

### 49.26. Étale morphisms

03PA For more details, see Morphisms, Section 28.36 for the formal definition and Étale Morphisms, Sections 40.11, 40.12, 40.13, 40.14, 40.16, and 40.19 for a survey of interesting properties of étale morphisms.

Recall that an algebra $A$ over an algebraically closed field $k$ is smooth if it is of finite type and the module of differentials $\Omega_{A / k}$ is finite locally free of rank equal to the dimension. A scheme $X$ over $k$ is smooth over $k$ if it is locally of finite type and each affine open is the spectrum of a smooth $k$-algebra. If $k$ is not algebraically closed then an $A$-algebra is said to be a smooth $k$-algebra if $A \otimes_{k} \bar{k}$ is a smooth $\bar{k}$-algebra. A ring map $A \rightarrow B$ is smooth if it is flat, finitely presented, and for all primes $\mathfrak{p} \subset A$ the fibre ring $\kappa(\mathfrak{p}) \otimes_{A} B$ is smooth over the residue field $\kappa(\mathfrak{p})$. More generally, a morphism of schemes is smooth if it is flat, locally of finite presentation, and the geometric fibers are smooth.
For these facts please see Morphisms, Section 28.34. Using this we may define an étale morphism as follows.

03PB Definition 49.26.1. A morphism of schemes is étale if it is smooth of relative dimension 0 .

In particular, a morphism of schemes $X \rightarrow S$ is étale if it is smooth and $\Omega_{X / S}=0$.
03PC Proposition 49.26.2. Facts on étale morphisms.
(1) Let $k$ be a field. A morphism of schemes $U \rightarrow \operatorname{Spec}(k)$ is étale if and only if $U \cong \coprod_{i \in I} \operatorname{Spec}\left(k_{i}\right)$ such that for each $i \in I$ the ring $k_{i}$ is a field which is a finite separable extension of $k$.
(2) Let $\varphi: U \rightarrow S$ be a morphism of schemes. The following conditions are equivalent:
(a) $\varphi$ is étale,
(b) $\varphi$ is locally finitely presented, flat, and all its fibres are étale,
(c) $\varphi$ is flat, unramified and locally of finite presentation.
(3) $A$ ring map $A \rightarrow B$ is étale if and only if $B \cong A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)$ such that $\Delta=\operatorname{det}\left(\frac{\partial f_{i}}{\partial x_{j}}\right)$ is invertible in $B$.
(4) The base change of an étale morphism is étale.
(5) Compositions of étale morphisms are étale.
(6) Fibre products and products of étale morphisms are étale.
(7) An étale morphism has relative dimension 0.
(8) Let $Y \rightarrow X$ be an étale morphism. If $X$ is reduced (respectively regular) then so is $Y$.
(9) Étale morphisms are open.
(10) If $X \rightarrow S$ and $Y \rightarrow S$ are étale, then any $S$-morphism $X \rightarrow Y$ is also étale.

Proof. We have proved these facts (and more) in the preceding chapters. Here is a list of references: (1) Morphisms, Lemma 28.36.7. (2) Morphisms, Lemmas 28.36.8 and 28.36.16. (3) Algebra, Lemma 10.141.2. (4) Morphisms, Lemma 28.36.4. (5) Morphisms, Lemma 28.36.3 (6) Follows formally from (4) and (5). (7) Morphisms, Lemmas 28.36 .6 and 28.29.5. (8) See Algebra, Lemmas 10.155 .6 and 10.155.5, see also more results of this kind in Étale Morphisms, Section 40.19. (9) See Morphisms, Lemma 28.25.9 and 28.36.12. (10) See Morphisms, Lemma 28.36.18.

03PD Definition 49.26.3. A ring map $A \rightarrow B$ is called standard étale if $B \cong(A[t] /(f))_{g}$ with $f, g \in A[t]$, with $f$ monic, and $\mathrm{d} f / \mathrm{d} t$ invertible in $B$.

It is true that a standard étale ring map is étale. Namely, suppose that $B=$ $(A[t] /(f))_{g}$ with $f, g \in A[t]$, with $f$ monic, and $\mathrm{d} f / \mathrm{d} t$ invertible in $B$. Then $A[t] /(f)$ is a finite free $A$-module of rank equal to the degree of the monic polynomial $f$. Hence $B$, as a localization of this free algebra is finitely presented and flat over $A$. To finish the proof that $B$ is étale it suffices to show that the fibre rings

$$
\kappa(\mathfrak{p}) \otimes_{A} B \cong \kappa(\mathfrak{p}) \otimes_{A}(A[t] /(f))_{g} \cong \kappa(\mathfrak{p})[t, 1 / \bar{g}] /(\bar{f})
$$

are finite products of finite separable field extensions. Here $\bar{f}, \bar{g} \in \kappa(\mathfrak{p})[t]$ are the images of $f$ and $g$. Let

$$
\bar{f}=\bar{f}_{1} \ldots \bar{f}_{a} \bar{f}_{a+1}^{e_{1}} \ldots \bar{f}_{a+b}^{e_{b}}
$$

be the factorization of $\bar{f}$ into powers of pairwise distinct irreducible monic factors $\bar{f}_{i}$ with $e_{1}, \ldots, e_{b}>0$. By assumption $\mathrm{d} \bar{f} / \mathrm{d} t$ is invertible in $\kappa(\mathfrak{p})[t, 1 / \bar{g}]$. Hence we see that at least all the $\bar{f}_{i}, i>a$ are invertible. We conclude that

$$
\kappa(\mathfrak{p})[t, 1 / \bar{g}] /(\bar{f}) \cong \prod_{i \in I} \kappa(\mathfrak{p})[t] /\left(\bar{f}_{i}\right)
$$

where $I \subset\{1, \ldots, a\}$ is the subset of indices $i$ such that $\bar{f}_{i}$ does not divide $\bar{g}$. Moreover, the image of $\mathrm{d} \bar{f} / \mathrm{d} t$ in the factor $\kappa(\mathfrak{p})[t] /\left(\bar{f}_{i}\right)$ is clearly equal to a unit times $\mathrm{d} \bar{f}_{i} / \mathrm{d} t$. Hence we conclude that $\kappa_{i}=\kappa(\mathfrak{p})[t] /\left(\bar{f}_{i}\right)$ is a finite field extension of $\kappa(\mathfrak{p})$ generated by one element whose minimal polynomial is separable, i.e., the field extension $\kappa(\mathfrak{p}) \subset \kappa_{i}$ is finite separable as desired.

It turns out that any étale ring map is locally standard étale. To formulate this we introduce the following notation. A ring map $A \rightarrow B$ is étale at a prime $\mathfrak{q}$ of $B$ if there exists $h \in B, h \notin \mathfrak{q}$ such that $A \rightarrow B_{h}$ is étale. Here is the result.

03PE Theorem 49.26.4. A ring map $A \rightarrow B$ is étale at a prime $\mathfrak{q}$ if and only if there exists $g \in B, g \notin \mathfrak{q}$ such that $B_{g}$ is standard étale over $A$.
Proof. See Algebra, Proposition 10.141.17.

### 49.27. Étale coverings

03PF We recall the definition.
03PG Definition 49.27.1. An étale covering of a scheme $U$ is a family of morphisms of schemes $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ such that
(1) each $\varphi_{i}$ is an étale morphism,
(2) the $U_{i}$ cover $U$, i.e., $U=\bigcup_{i \in I} \varphi_{i}\left(U_{i}\right)$.

03 PH Lemma 49.27.2. Any étale covering is an fpqc covering.
Proof. (See also Topologies, Lemma 33.8.6.) Let $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be an étale covering. Since an étale morphism is flat, and the elements of the covering should cover its target, the property fp (faithfully flat) is satisfied. To check the property qc (quasi-compact), let $V \subset U$ be an affine open, and write $\varphi_{i}^{-1}=\bigcup_{j \in J_{i}} V_{i j}$ for some affine opens $V_{i j} \subset U_{i}$. Since $\varphi_{i}$ is open (as étale morphisms are open), we see that $V=\bigcup_{i \in I} \bigcup_{j \in J_{i}} \varphi_{i}\left(V_{i j}\right)$ is an open covering of $V$. Further, since $V$ is quasi-compact, this covering has a finite refinement.

So any statement which is true for fpqc coverings remains true a fortiori for étale coverings. For instance, the étale site is subcanonical.

03PI Definition 49.27.3. (For more details see Section 49.20, or Topologies, Section 33.4 ) Let $S$ be a scheme. The big étale site over $S$ is the site $(S c h / S)_{\text {étale }}$, see Definition 49.20.4. The small étale site over $S$ is the site $S_{\text {étale }}$, see Definition 49.20.4. We define similarly the big and small Zariski sites on $S$, denoted $(S c h / S)_{Z a r}$ and $S_{Z a r}$.

Loosely speaking the big étale site of $S$ is made up out of schemes over $S$ and coverings the étale coverings. The small étale site of $S$ is made up out of schemes étale over $S$ with coverings the étale coverings. Actually any morphism between objects of $S_{\text {étale }}$ is étale, in virtue of Proposition 49.26.2, hence to check that $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $S_{\text {étale }}$ is a covering it suffices to check that $\coprod U_{i} \rightarrow U$ is surjective.
The small étale site has fewer objects than the big étale site, it contains only the "opens" of the étale topology on $S$. It is a full subcategory of the big étale site, and its topology is induced from the topology on the big site. Hence it is true that the restriction functor from the big étale site to the small one is exact and maps injectives to injectives. This has the following consequence.

03PJ Proposition 49.27.4. Let $S$ be a scheme and $\mathcal{F}$ an abelian sheaf on $(S c h / S)_{\text {étale }}$. Then $\left.\mathcal{F}\right|_{S_{\text {etale }}}$ is a sheaf on $S_{\text {étale }}$ and

$$
H_{\text {étale }}^{p}\left(S,\left.\mathcal{F}\right|_{S_{\text {etale }}}\right)=H_{\text {étale }}^{p}(S, \mathcal{F})
$$

for all $p \geq 0$.

Proof. This is a special case of Lemma 49.20.5.
In accordance with the general notation introduced in Section 49.20 we write $H_{\text {étale }}^{p}(S, \mathcal{F})$ for the above cohomology group.

### 49.28. Kummer theory

03PK Let $n \in \mathbf{N}$ and consider the functor $\mu_{n}$ defined by

$$
\begin{array}{clc}
S c h^{o p p} & \longrightarrow & A b \\
S & \longmapsto & \mu_{n}(S)=\left\{t \in \Gamma\left(S, \mathcal{O}_{S}^{*}\right) \mid t^{n}=1\right\}
\end{array}
$$

By Groupoids, Example 38.5 .2 this is a representable functor, and the scheme representing it is denoted $\mu_{n}$ also. By Lemma 49.15.8 this functor satisfies the sheaf condition for the fpqc topology (in particular, it is also satisfies the sheaf condition for the étale, Zariski, etc topology).
03PL Lemma 49.28.1. If $n \in \mathcal{O}_{S}^{*}$ then

$$
0 \rightarrow \mu_{n, S} \rightarrow \mathbf{G}_{m, S} \xrightarrow{(\cdot)^{n}} \mathbf{G}_{m, S} \rightarrow 0
$$

is a short exact sequence of sheaves on both the small and big étale site of $S$.
Proof. By definition the sheaf $\mu_{n, S}$ is the kernel of the map $(\cdot)^{n}$. Hence it suffices to show that the last map is surjective. Let $U$ be a scheme over $S$. Let $f \in$ $\mathbf{G}_{m}(U)=\Gamma\left(U, \mathcal{O}_{U}^{*}\right)$. We need to show that we can find an étale cover of $U$ over the members of which the restriction of $f$ is an $n$th power. Set

$$
U^{\prime}=\underline{\operatorname{Spec}}_{U}\left(\mathcal{O}_{U}[T] /\left(T^{n}-f\right)\right) \xrightarrow{\pi} U .
$$

(See Constructions, Section 26.3 or 26.4 for a discussion of the relative spectrum.) Let $\operatorname{Spec}(A) \subset U$ be an affine open, and say $\left.f\right|_{\operatorname{Spec}(A)}$ corresponds to the unit $a \in A^{*}$. Then $\pi^{-1}(\operatorname{Spec}(A))=\operatorname{Spec}(B)$ with $B=A[T] /\left(T^{n}-a\right)$. The ring map $A \rightarrow B$ is finite free of rank $n$, hence it is faithfully flat, and hence we conclude that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective. Since this holds for every affine open in $U$ we conclude that $\pi$ is surjective. In addition, $n$ and $T^{n-1}$ are invertible in $B$, so $n T^{n-1} \in B^{*}$ and the ring map $A \rightarrow B$ is standard étale, in particular étale. Since this holds for every affine open of $U$ we conclude that $\pi$ is étale. Hence $\mathcal{U}=\left\{\pi: U^{\prime} \rightarrow U\right\}$ is an étale covering. Moreover, $\left.f\right|_{U^{\prime}}=\left(f^{\prime}\right)^{n}$ where $f^{\prime}$ is the class of $T$ in $\Gamma\left(U^{\prime}, \mathcal{O}_{U^{\prime}}^{*}\right)$, so $\mathcal{U}$ has the desired property.

03PM Remark 49.28.2. Lemma 49.28 .1 is false when "étale" is replaced with "Zariski". Since the étale topology is coarser than the smooth topology, see Topologies, Lemma 33.5 .2 it follows that the sequence is also exact in the smooth topology.

By Theorem 49.24.1 and Lemma 49.28.1 and general properties of cohomology we obtain the long exact cohomology sequence

at least if $n$ is invertible on $S$. When $n$ is not invertible on $S$ we can apply the following lemma.

040N Lemma 49.28.3. For any $n \in \mathbf{N}$ the sequence

$$
0 \rightarrow \mu_{n, S} \rightarrow \mathbf{G}_{m, S} \xrightarrow{(\cdot)^{n}} \mathbf{G}_{m, S} \rightarrow 0
$$

is a short exact sequence of sheaves on the site $(S c h / S)_{\text {fppf }}$ and $(S c h / S)_{\text {syntomic }}$.
Proof. By definition the sheaf $\mu_{n, S}$ is the kernel of the map $(\cdot)^{n}$. Hence it suffices to show that the last map is surjective. Since the syntomic topology is stronger than the fppf topology, see Topologies, Lemma 33.7.2, it suffices to prove this for the syntomic topology. Let $U$ be a scheme over $S$. Let $f \in \mathbf{G}_{m}(U)=\Gamma\left(U, \mathcal{O}_{U}^{*}\right)$. We need to show that we can find a syntomic cover of $U$ over the members of which the restriction of $f$ is an $n$th power. Set

$$
U^{\prime}=\underline{\operatorname{Spec}}_{U}\left(\mathcal{O}_{U}[T] /\left(T^{n}-f\right)\right) \xrightarrow{\pi} U
$$

(See Constructions, Section 26.3 or 26.4 for a discussion of the relative spectrum.) Let $\operatorname{Spec}(A) \subset U$ be an affine open, and say $\left.f\right|_{\operatorname{Spec}(A)}$ corresponds to the unit $a \in A^{*}$. Then $\pi^{-1}(\operatorname{Spec}(A))=\operatorname{Spec}(B)$ with $B=A[T] /\left(T^{n}-a\right)$. The ring map $A \rightarrow B$ is finite free of rank $n$, hence it is faithfully flat, and hence we conclude that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective. Since this holds for every affine open in $U$ we conclude that $\pi$ is surjective. In addition, $B$ is a global relative complete intersection over $A$, so the ring map $A \rightarrow B$ is standard syntomic, in particular syntomic. Since this holds for every affine open of $U$ we conclude that $\pi$ is syntomic. Hence $\mathcal{U}=\left\{\pi: U^{\prime} \rightarrow U\right\}$ is a syntomic covering. Moreover, $\left.f\right|_{U^{\prime}}=\left(f^{\prime}\right)^{n}$ where $f^{\prime}$ is the class of $T$ in $\Gamma\left(U^{\prime}, \mathcal{O}_{U^{\prime}}^{*}\right)$, so $\mathcal{U}$ has the desired property.

040 Remark 49.28.4. Lemma 49.28 .3 is false for the smooth, étale, or Zariski topology.

By Theorem 49.24.1 and Lemma 49.28.3 and general properties of cohomology we obtain the long exact cohomology sequence

for any scheme $S$ and any integer $n$. Of course there is a similar sequence with syntomic cohomology.

Let $n \in \mathbf{N}$ and let $S$ be any scheme. There is another more direct way to describe the first cohomology group with values in $\mu_{n}$. Consider pairs $(\mathcal{L}, \alpha)$ where $\mathcal{L}$ is an invertible sheaf on $S$ and $\alpha: \mathcal{L}^{\otimes n} \rightarrow \mathcal{O}_{S}$ is a trivialization of the $n$th tensor power of $\mathcal{L}$. Let $\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)$ be a second such pair. An isomorphism $\varphi:(\mathcal{L}, \alpha) \rightarrow\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)$ is
an isomorphism $\varphi: \mathcal{L} \rightarrow \mathcal{L}^{\prime}$ of invertible sheaves such that the diagram

commutes. Thus we have
(49.28.4.1)

040P

$$
\operatorname{Isom}_{S}\left((\mathcal{L}, \alpha),\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)\right)=\left\{\begin{array}{cc}
\emptyset & \text { if } \quad \text { they are not isomorphic } \\
H^{0}\left(S, \mu_{n, S}\right) \cdot \varphi & \text { if } \quad \varphi \text { isomorphism of pairs }
\end{array}\right.
$$

Moreover, given two pairs $(\mathcal{L}, \alpha),\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)$ the tensor product

$$
(\mathcal{L}, \alpha) \otimes\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)=\left(\mathcal{L} \otimes \mathcal{L}^{\prime}, \alpha \otimes \alpha^{\prime}\right)
$$

is another pair. The pair $\left(\mathcal{O}_{S}, 1\right)$ is an identity for this tensor product operation, and an inverse is given by

$$
(\mathcal{L}, \alpha)^{-1}=\left(\mathcal{L}^{\otimes-1}, \alpha^{\otimes-1}\right)
$$

Hence the collection of isomorphism classes of pairs forms an abelian group. Note that

$$
(\mathcal{L}, \alpha)^{\otimes n}=\left(\mathcal{L}^{\otimes n}, \alpha^{\otimes n}\right) \xrightarrow{\alpha}\left(\mathcal{O}_{S}, 1\right)
$$

hence every element of this group has order dividing $n$. We warn the reader that this group is in general not the $n$-torsion in $\operatorname{Pic}(S)$.
040Q Lemma 49.28.5. Let $S$ be a scheme. There is a canonical identification

$$
H_{\text {étale }}^{1}\left(S, \mu_{n}\right)=\text { group of pairs }(\mathcal{L}, \alpha) \text { up to isomorphism as above }
$$

if $n$ is invertible on $S$. In general we have

$$
H_{\text {fppf }}^{1}\left(S, \mu_{n}\right)=\text { group of pairs }(\mathcal{L}, \alpha) \text { up to isomorphism as above. }
$$

The same result holds with fppf replaced by syntomic.
Proof. We first prove the second isomorphism. Let $(\mathcal{L}, \alpha)$ be a pair as above. Choose an affine open covering $S=\bigcup U_{i}$ such that $\left.\mathcal{L}\right|_{U_{i}} \cong \mathcal{O}_{U_{i}}$. Say $s_{i} \in \mathcal{L}\left(U_{i}\right)$ is a generator. Then $\alpha\left(s_{i}^{\otimes n}\right)=f_{i} \in \mathcal{O}_{S}^{*}\left(U_{i}\right)$. Writing $U_{i}=\operatorname{Spec}\left(A_{i}\right)$ we see there exists a global relative complete intersection $A_{i} \rightarrow B_{i}=A_{i}[T] /\left(T^{n}-f_{i}\right)$ such that $f_{i}$ maps to an $n$th power in $B_{i}$. In other words, setting $V_{i}=\operatorname{Spec}\left(B_{i}\right)$ we obtain a syntomic covering $\mathcal{V}=\left\{V_{i} \rightarrow S\right\}_{i \in I}$ and trivializations $\varphi_{i}:\left.(\mathcal{L}, \alpha)\right|_{V_{i}} \rightarrow\left(\mathcal{O}_{V_{i}}, 1\right)$.

We will use this result (the existence of the covering $\mathcal{V}$ ) to associate to this pair a cohomology class in $H_{\text {syntomic }}^{1}\left(S, \mu_{n, S}\right)$. We give two (equivalent) constructions.

First construction: using Cech cohomology. Over the double overlaps $V_{i} \times{ }_{S} V_{j}$ we have the isomorphism

$$
\left(\mathcal{O}_{V_{i} \times_{S} V_{j}}, 1\right) \xrightarrow{\operatorname{pr}_{0}^{*} \varphi_{i}^{-1}}\left(\left.\mathcal{L}\right|_{V_{i} \times_{S} V_{j}},\left.\alpha\right|_{V_{i} \times_{S} V_{j}}\right) \xrightarrow{\operatorname{pr}_{1}^{*} \varphi_{j}}\left(\mathcal{O}_{V_{i} \times s} V_{j}, 1\right)
$$

of pairs. By 49.28.4.1) this is given by an element $\zeta_{i j} \in \mu_{n}\left(V_{i} \times{ }_{S} V_{j}\right)$. We omit the verification that these $\zeta_{i j}$ 's give a 1-cocycle, i.e., give an element $\left(\zeta_{i_{0} i_{1}}\right) \in \check{C}\left(\mathcal{V}, \mu_{n}\right)$ with $d\left(\zeta_{i_{0} i_{1}}\right)=0$. Thus its class is an element in $\check{H}^{1}\left(\mathcal{V}, \mu_{n}\right)$ and by Theorem 49.19.2 it maps to a cohomology class in $H_{s y n t o m i c}^{1}\left(S, \mu_{n, S}\right)$.

Second construction: Using torsors. Consider the presheaf

$$
\mu_{n}(\mathcal{L}, \alpha): U \longmapsto \operatorname{Isom}_{U}\left(\left(\mathcal{O}_{U}, 1\right),\left.(\mathcal{L}, \alpha)\right|_{U}\right)
$$

on $(S c h / S)_{\text {syntomic }}$. We may view this as a subpresheaf of $\mathcal{H o m}_{\mathcal{O}}(\mathcal{O}, \mathcal{L})$ (internal hom sheaf, see Modules on Sites, Section 18.27). Since the conditions defining this subpresheaf are local, we see that it is a sheaf. By (49.28.4.1) this sheaf has a free action of the sheaf $\mu_{n, S}$. Hence the only thing we have to check is that it locally has sections. This is true because of the existence of the trivializing cover $\mathcal{V}$. Hence $\mu_{n}(\mathcal{L}, \alpha)$ is a $\mu_{n, S}$-torsor and by Cohomology on Sites, Lemma 21.5.3 we obtain a corresponding element of $H_{\text {syntomic }}^{1}\left(S, \mu_{n, S}\right)$.
Ok, now we have to still show the following
(1) The two constructions give the same cohomology class.
(2) Isomorphic pairs give rise to the same cohomology class.
(3) The cohomology class of $(\mathcal{L}, \alpha) \otimes\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)$ is the sum of the cohomology classes of $(\mathcal{L}, \alpha)$ and $\left(\mathcal{L}^{\prime}, \alpha^{\prime}\right)$.
(4) If the cohomology class is trivial, then the pair is trivial.
(5) Any element of $H_{\text {syntomic }}^{1}\left(S, \mu_{n, S}\right)$ is the cohomology class of a pair.

We omit the proof of (1). Part (2) is clear from the second construction, since isomorphic torsors give the same cohomology classes. Part (3) is clear from the first construction, since the resulting Cech classes add up. Part (4) is clear from the second construction since a torsor is trivial if and only if it has a global section, see Cohomology on Sites, Lemma 21.5.2.

Part (5) can be seen as follows (although a direct proof would be preferable). Suppose $\xi \in H_{\text {syntomic }}^{1}\left(S, \mu_{n, S}\right)$. Then $\xi$ maps to an element $\bar{\xi} \in H_{\text {syntomic }}^{1}\left(S, \mathbf{G}_{m, S}\right)$ with $n \bar{\xi}=0$. By Theorem 49.24 .1 we see that $\bar{\xi}$ corresponds to an invertible sheaf $\mathcal{L}$ whose $n$th tensor power is isomorphic to $\mathcal{O}_{S}$. Hence there exists a pair ( $\mathcal{L}, \alpha^{\prime}$ ) whose cohomology class $\xi^{\prime}$ has the same image $\overline{\xi^{\prime}}$ in $H_{\text {syntomic }}^{1}\left(S, \mathbf{G}_{m, S}\right)$. Thus it suffices to show that $\xi-\xi^{\prime}$ is the class of a pair. By construction, and the long exact cohomology sequence above, we see that $\xi-\xi^{\prime}=\partial(f)$ for some $f \in H^{0}\left(S, \mathcal{O}_{S}^{*}\right)$. Consider the pair $\left(\mathcal{O}_{S}, f\right)$. We omit the verification that the cohomology class of this pair is $\partial(f)$, which finishes the proof of the first identification (with fppf replaced with syntomic).
To see the first, note that if $n$ is invertible on $S$, then the covering $\mathcal{V}$ constructed in the first part of the proof is actually an étale covering (compare with the proof of Lemma 49.28.1). The rest of the proof is independent of the topology, apart from the very last argument which uses that the Kummer sequence is exact, i.e., uses Lemma 49.28.1.

### 49.29. Neighborhoods, stalks and points

03PN We can associate to any geometric point of $S$ a stalk functor which is exact. A map of sheaves on $S_{\text {étale }}$ is an isomorphism if and only if it is an isomorphism on all these stalks. A complex of abelian sheaves is exact if and only if the complex of stalks is exact at all geometric points. Altogether this means that the small étale site of a scheme $S$ has enough points. It also turns out that any point of the small étale topos of $S$ (an abstract notion) is given by a geometric point. Thus in some sense the small étale topos of $S$ can be understood in terms of geometric points and neighbourhoods.

03PO Definition 49.29.1. Let $S$ be a scheme.
(1) A geometric point of $S$ is a morphism $\operatorname{Spec}(k) \rightarrow S$ where $k$ is algebraically closed. Such a point is usually denoted $\bar{s}$, i.e., by an overlined small case letter. We often use $\bar{s}$ to denote the $\operatorname{scheme} \operatorname{Spec}(k)$ as well as the morphism, and we use $\kappa(\bar{s})$ to denote $k$.
(2) We say $\bar{s}$ lies over $s$ to indicate that $s \in S$ is the image of $\bar{s}$.
(3) An étale neighborhood of a geometric point $\bar{s}$ of $S$ is a commutative diagram

where $\varphi$ is an étale morphism of schemes. We write $(U, \bar{u}) \rightarrow(S, \bar{s})$.
(4) A morphism of étale neighborhoods $(U, \bar{u}) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right)$ is an $S$-morphism $h: U \rightarrow U^{\prime}$ such that $\bar{u}^{\prime}=h \circ \bar{u}$.

03PP Remark 49.29.2. Since $U$ and $U^{\prime}$ are étale over $S$, any $S$-morphism between them is also étale, see Proposition 49.26.2. In particular all morphisms of étale neighborhoods are étale.

04HT Remark 49.29.3. Let $S$ be a scheme and $s \in S$ a point. In More on Morphisms, Definition 36.27.1 we defined the notion of an étale neighbourhood $(U, u) \rightarrow(S, s)$ of $(S, s)$. If $\bar{s}$ is a geometric point of $S$ lying over $s$, then any étale neighbourhood $(U, \bar{u}) \rightarrow(S, \bar{s})$ gives rise to an étale neighbourhood $(U, u)$ of $(S, s)$ by taking $u \in U$ to be the unique point of $U$ such that $\bar{u}$ lies over $u$. Conversely, given an étale neighbourhood $(U, u)$ of $(S, s)$ the residue field extension $\kappa(s) \subset \kappa(u)$ is finite separable (see Proposition 49.26.2) and hence we can find an embedding $\kappa(u) \subset \kappa(\bar{s})$ over $\kappa(s)$. In other words, we can find a geometric point $\bar{u}$ of $U$ lying over $u$ such that $(U, \bar{u})$ is an étale neighbourhood of $(S, \bar{s})$. We will use these observations to go between the two types of étale neighbourhoods.

03PQ Lemma 49.29.4. Let $S$ be a scheme, and let $\bar{s}$ be a geometric point of $S$. The category of étale neighborhoods is cofiltered. More precisely:
(1) Let $\left(U_{i}, \bar{u}_{i}\right)_{i=1,2}$ be two étale neighborhoods of $\bar{s}$ in $S$. Then there exists a third étale neighborhood $(U, \bar{u})$ and morphisms $(U, \bar{u}) \rightarrow\left(U_{i}, \bar{u}_{i}\right), i=1,2$.
(2) Let $h_{1}, h_{2}:(U, \bar{u}) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right)$ be two morphisms between étale neighborhoods of $\bar{s}$. Then there exist an étale neighborhood $\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right)$ and a morphism $h:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow(U, \bar{u})$ which equalizes $h_{1}$ and $h_{2}$, i.e., such that $h_{1} \circ h=h_{2} \circ h$.

Proof. For part (1), consider the fibre product $U=U_{1} \times_{S} U_{2}$. It is étale over both $U_{1}$ and $U_{2}$ because étale morphisms are preserved under base change, see Proposition 49.26.2. The map $\bar{s} \rightarrow U$ defined by $\left(\bar{u}_{1}, \bar{u}_{2}\right)$ gives it the structure of an étale neighborhood mapping to both $U_{1}$ and $U_{2}$. For part (2), define $U^{\prime \prime}$ as the fibre product

Since $\bar{u}$ and $\bar{u}^{\prime}$ agree over $S$ with $\bar{s}$, we see that $\bar{u}^{\prime \prime}=\left(\bar{u}, \bar{u}^{\prime}\right)$ is a geometric point of $U^{\prime \prime}$. In particular $U^{\prime \prime} \neq \emptyset$. Moreover, since $U^{\prime}$ is étale over $S$, so is the fibre product $U^{\prime} \times{ }_{S} U^{\prime}$ (see Proposition 49.26.2). Hence the vertical arrow $\left(h_{1}, h_{2}\right)$ is étale by Remark 49.29 .2 above. Therefore $U^{\prime \prime}$ is étale over $U^{\prime}$ by base change, and hence also étale over $S$ (because compositions of étale morphisms are étale). Thus ( $\left.U^{\prime \prime}, \bar{u}^{\prime \prime}\right)$ is a solution to the problem.
03PR Lemma 49.29.5. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$. Let $(U, \bar{u})$ an étale neighborhood of $\bar{s}$. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be an étale covering. Then there exist $i \in I$ and $\bar{u}_{i}: \bar{s} \rightarrow U_{i}$ such that $\varphi_{i}:\left(U_{i}, \bar{u}_{i}\right) \rightarrow(U, \bar{u})$ is a morphism of étale neighborhoods.

Proof. As $U=\bigcup_{i \in I} \varphi_{i}\left(U_{i}\right)$, the fibre product $\bar{s} \times_{\bar{u}, U, \varphi_{i}} U_{i}$ is not empty for some $i$. Then look at the cartesian diagram

The projection $\mathrm{pr}_{1}$ is the base change of an étale morphisms so it is étale, see Proposition 49.26.2 Therefore, $\bar{s} \times_{\bar{u}, U, \varphi_{i}} U_{i}$ is a disjoint union of finite separable extensions of $k$, by Proposition 49.26.2. Here $\bar{s}=\operatorname{Spec}(k)$. But $k$ is algebraically closed, so all these extensions are trivial, and there exists a section $\sigma$ of $\mathrm{pr}_{1}$. The composition $\mathrm{pr}_{2} \circ \sigma$ gives a map compatible with $\bar{u}$.

040R Definition 49.29.6. Let $S$ be a scheme. Let $\mathcal{F}$ be a presheaf on $S_{\text {étale }}$. Let $\bar{s}$ be a geometric point of $S$. The stalk of $\mathcal{F}$ at $\bar{s}$ is

$$
\mathcal{F}_{\bar{s}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{F}(U)
$$

where $(U, \bar{u})$ runs over all étale neighborhoods of $\bar{s}$ in $S$.
By Lemma 49.29.4 this colimit is over a filtered index category, namely the opposite of the category of étale neighbourhoods. In other words, an element of $\mathcal{F}_{\bar{s}}$ can be thought of as a triple $(U, \bar{u}, \sigma)$ where $\sigma \in \mathcal{F}(U)$. Two triples $(U, \bar{u}, \sigma)$, $\left(U^{\prime}, \bar{u}^{\prime}, \sigma^{\prime}\right)$ define the same element of the stalk if there exists a third étale neighbourhood $\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right)$ and morphisms of étale neighbourhoods $h:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow(U, \bar{u})$, $h^{\prime}:\left(U^{\prime \prime}, \bar{u}^{\prime \prime}\right) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right)$ such that $h^{*} \sigma=\left(h^{\prime}\right)^{*} \sigma^{\prime}$ in $\mathcal{F}\left(U^{\prime \prime}\right)$. See Categories, Section 4.19

04FM Lemma 49.29.7. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$. Consider the functor

$$
\begin{aligned}
u: S_{\text {étale }} & \longrightarrow \text { Sets }, \\
U & \longmapsto\left|U_{\bar{s}}\right|=\{\bar{u} \text { such that }(U, \bar{u}) \text { is an étale neighbourhood of } \bar{s}\} .
\end{aligned}
$$

Here $\left|U_{\bar{s}}\right|$ denotes the underlying set of the geometric fibre. Then $u$ defines a point $p$ of the site $S_{\text {étale }}$ (Sites, Definition 7.31.2) and its associated stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ (Sites, Equation 7.31.1.1) is the functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ defined above.

Proof. In the proof of Lemma 49.29.5 we have seen that the scheme $U_{\bar{s}}$ is a disjoint union of schemes isomorphic to $\bar{s}$. Thus we can also think of $\left|U_{\bar{s}}\right|$ as the set of geometric points of $U$ lying over $\bar{s}$, i.e., as the collection of morphisms $\bar{u}: \bar{s} \rightarrow U$ fitting into the diagram of Definition 49.29.1. From this it follows that $u(S)$ is a
singleton, and that $u\left(U \times_{V} W\right)=u(U) \times_{u(V)} u(W)$ whenever $U \rightarrow V$ and $W \rightarrow V$ are morphisms in $S_{\text {étale }}$. And, given a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $S_{\text {étale }}$ we see that $\coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective by Lemma 49.29.5. Hence Sites, Proposition 7.32 .2 applies, so $p$ is a point of the site $S_{\text {étale }}$. Finally, the our functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ is given by exactly the same colimit as the functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ associated to $p$ in Sites, Equation 7.31.1.1 which proves the final assertion.

04FN Remark 49.29.8. Let $S$ be a scheme and let $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ and $\bar{s}^{\prime}: \operatorname{Spec}\left(k^{\prime}\right) \rightarrow$ $S$ be two geometric points of $S$. A morphism $a: \bar{s} \rightarrow \bar{s}^{\prime}$ of geometric points is simply a morphism $a: \operatorname{Spec}(k) \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ such that $a \circ \bar{s}^{\prime}=\bar{s}$. Given such a morphism we obtain a functor from the category of étale neighbourhoods of $\bar{s}^{\prime}$ to the category of étale neighbourhoods of $\bar{s}$ by the rule $\left(U, \bar{u}^{\prime}\right) \mapsto\left(U, \bar{u}^{\prime} \circ a\right)$. Hence we obtain a canonical map

$$
\mathcal{F}_{\bar{s}^{\prime}}=\operatorname{colim}_{\left(U, \bar{u}^{\prime}\right)} \mathcal{F}(U) \longrightarrow \operatorname{colim}_{(U, \bar{u})} \mathcal{F}(U)=\mathcal{F}_{\bar{s}}
$$

from Categories, Lemma 4.14.7. Using the description of elements of stalks as triples this maps the element of $\mathcal{F}_{\bar{s}^{\prime}}$ represented by the triple $\left(U, \bar{u}^{\prime}, \sigma\right)$ to the element of $\mathcal{F}_{\bar{s}}$ represented by the triple $\left(U, \bar{u}^{\prime} \circ a, \sigma\right)$. Since the functor above is clearly an equivalence we conclude that this canonical map is an isomorphism of stalk functors.

Let us make sure we have the map of stalks corresponding to $a$ pointing in the correct direction. Note that the above means, according to Sites, Definition 7.36.2, that $a$ defines a morphism $a: p \rightarrow p^{\prime}$ between the points $p, p^{\prime}$ of the site $S_{\text {étale }}$ associated to $\bar{s}, \bar{s}^{\prime}$ by Lemma 49.29.7. There are more general morphisms of points (corresponding to specializations of points of $S$ ) which we will describe later, and which will not be isomorphisms (insert future reference here).

03PT Lemma 49.29.9. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$.
(1) The stalk functor $\operatorname{PAb}\left(S_{\text {étale }}\right) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ is exact.
(2) We have $\left(\mathcal{F}^{\#}\right)_{\bar{s}}=\mathcal{F}_{\bar{s}}$ for any presheaf of sets $\mathcal{F}$ on $S_{\text {étale }}$.
(3) The functor $A b\left(S_{\text {étale }}\right) \rightarrow A b, \mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ is exact.
(4) Similarly the functors PSh $\left(S_{\text {étale }}\right) \rightarrow$ Sets and $\operatorname{Sh}\left(S_{\text {étale }}\right) \rightarrow$ Sets given by the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ are exact (see Categories, Definition 4.23.1) and commute with arbitrary colimits.
Proof. Before we indicate how to prove this by direct arguments we note that the result follows from the general material in Modules on Sites, Section 18.35. This is true because $\mathcal{F} \mapsto \mathcal{F}_{\bar{s}}$ comes from a point of the small étale site of $S$, see Lemma 49.29.7. We will only give a direct proof of (1), (2) and (3), and omit a direct proof of (4).
Exactness as a functor on $\operatorname{PAb}\left(S_{\text {étale }}\right)$ is formal from the fact that directed colimits commute with all colimits and with finite limits. The identification of the stalks in (2) is via the map

$$
\kappa: \mathcal{F}_{\bar{s}} \longrightarrow\left(\mathcal{F}^{\#}\right)_{\bar{s}}
$$

induced by the natural morphism $\mathcal{F} \rightarrow \mathcal{F}^{\#}$, see Theorem 49.13.2. We claim that this map is an isomorphism of abelian groups. We will show injectivity and omit the proof of surjectivity.
Let $\sigma \in \mathcal{F}_{\bar{s}}$. There exists an étale neighborhood $(U, \bar{u}) \rightarrow(S, \bar{s})$ such that $\sigma$ is the image of some section $s \in \mathcal{F}(U)$. If $\kappa(\sigma)=0$ in $\left(\mathcal{F}^{\#}\right)_{\bar{s}}$ then there exists a morphism
of étale neighborhoods $\left(U^{\prime}, \bar{u}^{\prime}\right) \rightarrow(U, \bar{u})$ such that $\left.s\right|_{U^{\prime}}$ is zero in $\mathcal{F}^{\#}\left(U^{\prime}\right)$. It follows there exists an étale covering $\left\{U_{i}^{\prime} \rightarrow U^{\prime}\right\}_{i \in I}$ such that $\left.s\right|_{U_{i}^{\prime}}=0$ in $\mathcal{F}\left(U_{i}^{\prime}\right)$ for all $i$. By Lemma 49.29.5 there exist $i \in I$ and a morphism $\bar{u}_{i}^{\prime}: \bar{s} \rightarrow U_{i}^{\prime}$ such that $\left(U_{i}^{\prime}, \bar{u}_{i}^{\prime}\right) \rightarrow\left(U^{\prime}, \bar{u}^{\prime}\right) \rightarrow(U, \bar{u})$ are morphisms of étale neighborhoods. Hence $\sigma=0$ since $\left(U_{i}^{\prime}, \bar{u}_{i}^{\prime}\right) \rightarrow(U, \bar{u})$ is a morphism of étale neighbourhoods such that we have $\left.s\right|_{U_{i}^{\prime}}=0$. This proves $\kappa$ is injective.
To show that the functor $A b\left(S_{\text {étale }}\right) \rightarrow A b$ is exact, consider any short exact sequence in $A b\left(S_{\text {étale }}\right): 0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$. This gives us the exact sequence of presheaves

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow \mathcal{H} /{ }^{p} \mathcal{G} \rightarrow 0,
$$

where $/^{p}$ denotes the quotient in $\operatorname{PAb}\left(S_{\text {étale }}\right)$. Taking stalks at $\bar{s}$, we see that $\left(\mathcal{H} /{ }^{p} \mathcal{G}\right)_{\bar{s}}=(\mathcal{H} / \mathcal{G})_{\bar{s}}=0$, since the sheafification of $\mathcal{H} /{ }^{p} \mathcal{G}$ is 0 . Therefore,

$$
0 \rightarrow \mathcal{F}_{\bar{s}} \rightarrow \mathcal{G}_{\bar{s}} \rightarrow \mathcal{H}_{\bar{s}} \rightarrow 0=\left(\mathcal{H} /{ }^{p} \mathcal{G}\right)_{\bar{s}}
$$

is exact, since taking stalks is exact as a functor from presheaves.
03PU Theorem 49.29.10. Let $S$ be a scheme. A map $a: \mathcal{F} \rightarrow \mathcal{G}$ of sheaves of sets is injective (resp. surjective) if and only if the map on stalks $a_{\bar{s}}: \mathcal{F}_{\bar{s}} \rightarrow \mathcal{G}_{\bar{s}}$ is injective (resp. surjective) for all geometric points of $S$. A sequence of abelian sheaves on $S_{\text {étale }}$ is exact if and only if it is exact on all stalks at geometric points of $S$.

Proof. The necessity of exactness on stalks follows from Lemma 49.29.9. For the converse, it suffices to show that a map of sheaves is surjective (respectively injective) if and only if it is surjective (respectively injective) on all stalks. We prove this in the case of surjectivity, and omit the proof in the case of injectivity.
Let $\alpha: \mathcal{F} \rightarrow \mathcal{G}$ be a map of abelian sheaves such that $\mathcal{F}_{\bar{s}} \rightarrow \mathcal{G}_{\bar{s}}$ is surjective for all geometric points. Fix $U \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ and $s \in \mathcal{G}(U)$. For every $u \in U$ choose some $\bar{u} \rightarrow U$ lying over $u$ and an étale neighborhood $\left(V_{u}, \bar{v}_{u}\right) \rightarrow(U, \bar{u})$ such that $\left.s\right|_{V_{u}}=\alpha\left(s_{V_{u}}\right)$ for some $s_{V_{u}} \in \mathcal{F}\left(V_{u}\right)$. This is possible since $\alpha$ is surjective on stalks. Then $\left\{V_{u} \rightarrow U\right\}_{u \in U}$ is an étale covering on which the restrictions of $s$ are in the image of the map $\alpha$. Thus, $\alpha$ is surjective, see Sites, Section 7.12 .

040S Remarks 49.29.11. On points of the geometric sites.
(1) Theorem 49.29.10 says that the family of points of $S_{\text {étale }}$ given by the geometric points of $S$ (Lemma 49.29.7) is conservative, see Sites, Definition 7.37.1. In particular $S_{\text {étale }}$ has enough points.

04FP (2) Suppose $\mathcal{F}$ is a sheaf on the big étale site of $S$. Let $T \rightarrow S$ be an object of the big étale site of $S$, and let $\bar{t}$ be a geometric point of $T$. Then we define $\mathcal{F}_{\bar{t}}$ as the stalk of the restriction $\left.\mathcal{F}\right|_{T_{\text {etale }}}$ of $\mathcal{F}$ to the small étale site of $T$. In other words, we can define the stalk of $\mathcal{F}$ at any geometric point of any scheme $T / S \in \mathrm{Ob}\left((S c h / S)_{\text {étale }}\right)$.
(3) The big étale site of $S$ also has enough points, by considering all geometric points of all objects of this site, see (22).

The following lemma should be skipped on a first reading.
04HU Lemma 49.29.12. Let $S$ be a scheme.
(1) Let $p$ be a point of the small étale site $S_{\text {étale }}$ of $S$ given by a functor $u: S_{\text {étale }} \rightarrow$ Sets. Then there exists a geometric point $\bar{s}$ of $S$ such that $p$ is isomorphic to the point of $S_{\text {étale }}$ associated to $\bar{s}$ in Lemma 49.29.7.
(2) Let $p: S h(p t) \rightarrow S h\left(S_{\text {étale }}\right)$ be a point of the small étale topos of $S$. Then $p$ comes from a geometric point of S, i.e., the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p}$ is isomorphic to a stalk functor as defined in Definition 49.29.6.

Proof. By Sites, Lemma 7.31.7 there is a one to one correspondence between points of the site and points of the associated topos, hence it suffices to prove (1). By Sites, Proposition 7.32 .2 the functor $u$ has the following properties: (a) $u(S)=\{*\}$, (b) $u\left(U \times_{V} W\right)=u(U) \times_{u(V)} u(W)$, and (c) if $\left\{U_{i} \rightarrow U\right\}$ is an étale covering, then $\coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective. In particular, if $U^{\prime} \subset U$ is an open subscheme, then $u\left(U^{\prime}\right) \subset u(U)$. Moreover, by Sites, Lemma 7.31.7 we can write $u(U)=p^{-1}\left(h_{U}^{\#}\right)$, in other words $u(U)$ is the stalk of the representable sheaf $h_{U}$. If $U=V \amalg W$, then we see that $h_{U}=\left(h_{V} \amalg h_{W}\right)^{\#}$ and we get $u(U)=u(V) \amalg u(W)$ since $p^{-1}$ is exact.

Consider the restriction of $u$ to $S_{Z a r}$. By Sites, Examples 7.32.4 and 7.32 .5 there exists a unique point $s \in S$ such that for $S^{\prime} \subset S$ open we have $u\left(S^{\prime}\right)=\{*\}$ if $s \in S^{\prime}$ and $u\left(S^{\prime}\right)=\emptyset$ if $s \notin S^{\prime}$. Note that if $\varphi: U \rightarrow S$ is an object of $S_{\text {étale }}$ then $\varphi(U) \subset S$ is open (see Proposition 49.26.2) and $\{U \rightarrow \varphi(U)\}$ is an étale covering. Hence we conclude that $u(U)=\emptyset \Leftrightarrow s \in \varphi(U)$.

Pick a geometric point $\bar{s}: \bar{s} \rightarrow S$ lying over $s$, see Definition 49.29.1 for customary abuse of notation. Suppose that $\varphi: U \rightarrow S$ is an object of $S_{\text {étale }}$ with $U$ affine. Note that $\varphi$ is separated, and that the fibre $U_{s}$ of $\varphi$ over $s$ is an affine scheme over $\operatorname{Spec}(\kappa(s))$ which is the spectrum of a finite product of finite separable extensions $k_{i}$ of $\kappa(s)$. Hence we may apply Étale Morphisms, Lemma 40.18 .2 to get an étale neighbourhood $(V, \bar{v})$ of $(S, \bar{s})$ such that

$$
U \times_{S} V=U_{1} \amalg \ldots \amalg U_{n} \amalg W
$$

with $U_{i} \rightarrow V$ an isomorphism and $W$ having no point lying over $\bar{v}$. Thus we conclude that

$$
u(U) \times u(V)=u\left(U \times_{S} V\right)=u\left(U_{1}\right) \amalg \ldots \amalg u\left(U_{n}\right) \amalg u(W)
$$

and of course also $u\left(U_{i}\right)=u(V)$. After shrinking $V$ a bit we can assume that $V$ has exactly one point lying over $s$, and hence $W$ has no point lying over $s$. By the above this then gives $u(W)=\emptyset$. Hence we obtain

$$
u(U) \times u(V)=u\left(U_{1}\right) \amalg \ldots \amalg u\left(U_{n}\right)=\coprod_{i=1, \ldots, n} u(V)
$$

Note that $u(V) \neq \emptyset$ as $s$ is in the image of $V \rightarrow S$. In particular, we see that in this situation $u(U)$ is a finite set with $n$ elements.

Consider the limit

$$
\lim _{(V, \bar{v})} u(V)
$$

over the category of étale neighbourhoods $(V, \bar{v})$ of $\bar{s}$. It is clear that we get the same value when taking the limit over the subcategory of $(V, \bar{v})$ with $V$ affine. By the previous paragraph (applied with the roles of $V$ and $U$ switched) we see that in this case $u(V)$ is always a finite nonempty set. Moreover, the limit is cofiltered, see Lemma 49.29.4. Hence by Categories, Section 4.20 the limit is nonempty. Pick an element $x$ from this limit. This means we obtain a $x_{V, \bar{v}} \in u(V)$ for every étale neighbourhood $(V, \bar{v})$ of $(S, \bar{s})$ such that for every morphism of étale neighbourhoods $\varphi:\left(V^{\prime}, \bar{v}^{\prime}\right) \rightarrow(V, \bar{v})$ we have $u(\varphi)\left(x_{V^{\prime}, \bar{v}^{\prime}}\right)=x_{V, \bar{v}}$.

We will use the choice of $x$ to construct a functorial bijective map

$$
c:\left|U_{\bar{s}}\right| \longrightarrow u(U)
$$

for $U \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ which will conclude the proof. See Lemma 49.29.7 and its proof for a description of $\left|U_{\bar{s}}\right|$. First we claim that it suffices to construct the map for $U$ affine. We omit the proof of this claim. Assume $U \rightarrow S$ in $S_{\text {étale }}$ with $U$ affine, and let $\bar{u}: \bar{s} \rightarrow U$ be an element of $\left|U_{\bar{s}}\right|$. Choose a $(V, \bar{v})$ such that $U \times_{S} V$ decomposes as in the third paragraph of the proof. Then the pair $(\bar{u}, \bar{v})$ gives a geometric point of $U \times_{S} V$ lying over $\bar{v}$ and determines one of the components $U_{i}$ of $U \times_{S} V$. More precisely, there exists a section $\sigma: V \rightarrow U \times_{S} V$ of the projection $\operatorname{pr}_{U}$ such that $(\bar{u}, \bar{v})=\sigma \circ \bar{v}$. Set $c(\bar{u})=u\left(\operatorname{pr}_{U}\right)\left(u(\sigma)\left(x_{V, \bar{v}}\right)\right) \in u(U)$. We have to check this is independent of the choice of $(V, \bar{v})$. By Lemma 49.29.4 the category of étale neighbourhoods is cofiltered. Hence it suffice to show that given a morphism of étale neighbourhood $\varphi:\left(V^{\prime}, \bar{v}^{\prime}\right) \rightarrow(V, \bar{v})$ and a choice of a section $\sigma^{\prime}: V^{\prime} \rightarrow U \times_{S} V^{\prime}$ of the projection such that $\left(\bar{u}, \overline{v^{\prime}}\right)=\sigma^{\prime} \circ \bar{v}^{\prime}$ we have $u\left(\sigma^{\prime}\right)\left(x_{V^{\prime}, \bar{v}^{\prime}}\right)=u(\sigma)\left(x_{V, \bar{v}}\right)$. Consider the diagram

Now, it may not be the case that this diagram commutes. The reason is that the schemes $V^{\prime}$ and $V$ may not be connected, and hence the decompositions used to construct $\sigma^{\prime}$ and $\sigma$ above may not be unique. But we do know that $\sigma \circ \varphi \circ \bar{v}^{\prime}=$ $(1 \times \varphi) \circ \sigma^{\prime} \circ \bar{v}^{\prime}$ by construction. Hence, since $U \times_{S} V$ is étale over $S$, there exists an open neighbourhood $V^{\prime \prime} \subset V^{\prime}$ of $\overline{v^{\prime}}$ such that the diagram does commute when restricted to $V^{\prime \prime}$, see Morphisms, Lemma 28.35.17. This means we may extend the diagram above to

such that the left square and the outer rectangle commute. Since $u$ is a functor this implies that $x_{V^{\prime \prime}, \bar{v}^{\prime}}$ maps to the same element in $u\left(U \times_{S} V\right)$ no matter which route we take through the diagram. On the other hand, it maps to the elements $x_{V^{\prime}, \bar{v}^{\prime}}$ and $x_{V, \bar{v}}$ in $u\left(V^{\prime}\right)$ and $u(V)$. This implies the desired equality $u\left(\sigma^{\prime}\right)\left(x_{V^{\prime}, \bar{v}^{\prime}}\right)=$ $u(\sigma)\left(x_{V, \bar{v}}\right)$.
In a similar manner one proves that the construction $c:\left|U_{\bar{s}}\right| \rightarrow u(U)$ is functorial in $U$; details omitted. And finally, by the results of the third paragraph it is clear that the map $c$ is bijective which ends the proof of the lemma.

### 49.30. Points in other topologies

06 VW In this section we briefly discuss the existence of points for some sites other than the étale site of a scheme. We refer to Sites, Section 7.37 and Topologies, Section 33.2 ff for the terminology used in this section. All of the geometric sites have enough points.

06VX Lemma 49.30.1. Let $S$ be a scheme. All of the following sites have enough points $S_{Z a r}, S_{\text {étale }},(S c h / S)_{Z a r},(A f f / S)_{Z a r},(S c h / S)_{\text {étale }},(A f f / S)_{\text {étale }},(S c h / S)_{\text {smooth }}$, $(A f f / S)_{\text {smooth }},(S c h / S)_{\text {syntomic }},(A f f / S)_{\text {syntomic }},(S c h / S)_{\text {fppf }}$, and $(A f f / S)_{\text {fppf }}$.

Proof. For each of the big sites the associated topos is equivalent to the topos defined by the site $(A f f / S)_{\tau}$, see Topologies, Lemmas 33.3.10, 33.4.11, 33.5.9, 33.6.9, and 33.7.11. The result for the sites $(A f f / S)_{\tau}$ follows immediately from Deligne's result Sites, Proposition 7.38 .3 .

The result for $S_{Z a r}$ is clear. The result for $S_{\text {étale }}$ either follows from (the proof of) Theorem 49.29.10 or from Lemma 49.21 .2 and Deligne's result applied to $S_{\text {affine,étale }}$.

The lemma above guarantees the existence of points, but it doesn't tell us what these points look like. We can explicitly construct some points as follows. Suppose $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ is a geometric point with $k$ algebraically closed. Consider the functor

$$
u:(S c h / S)_{f p p f} \longrightarrow S e t s, \quad u(U)=U(k)=\operatorname{Mor}_{S}(\operatorname{Spec}(k), U)
$$

Note that $U \mapsto U(k)$ commutes with direct limits as $S(k)=\{\bar{s}\}$ and $\left(U_{1} \times_{U}\right.$ $\left.U_{2}\right)(k)=U_{1}(k) \times_{U(k)} U_{2}(k)$. Moreover, if $\left\{U_{i} \rightarrow U\right\}$ is an fppf covering, then $\coprod U_{i}(k) \rightarrow U(k)$ is surjective. By Sites, Proposition 7.32 .2 we see that $u$ defines a point $p$ of $(S c h / S)_{f p p f}$ with stalks

$$
\mathcal{F}_{p}=\operatorname{colim}_{(U, x)} \mathcal{F}(U)
$$

where the colimit is over pairs $U \rightarrow S, x \in U(k)$ as usual. But... this category has an initial object, namely $(\operatorname{Spec}(k)$, id), hence we see that

$$
\mathcal{F}_{p}=\mathcal{F}(\operatorname{Spec}(k))
$$

which isn't terribly interesting! In fact, in general these points won't form a conservative family of points. A more interesting type of point is described in the following remark.

06VY Remark 49.30.2. Let $S=\operatorname{Spec}(A)$ be an affine scheme. Let $(p, u)$ be a point of the site $(A f f / S)_{f p p f}$, see Sites, Sections 7.31 and 7.32 . Let $B=\mathcal{O}_{p}$ be the stalk of the structure sheaf at the point $p$. Recall that

$$
B=\operatorname{colim}_{(U, x)} \mathcal{O}(U)=\operatorname{colim}_{\left(\operatorname{Spec}(C), x_{C}\right)} C
$$

where $x_{C} \in u(\operatorname{Spec}(C))$. It can happen that $\operatorname{Spec}(B)$ is an object of $(A f f / S)_{f p p f}$ and that there is an element $x_{B} \in u(\operatorname{Spec}(B))$ mapping to the compatible system $x_{C}$. In this case the system of neighbourhoods has an initial object and it follows that $\mathcal{F}_{p}=\mathcal{F}(\operatorname{Spec}(B))$ for any sheaf $\mathcal{F}$ on $(A f f / S)_{\text {fppff }}$. It is straightforward to see that if $\mathcal{F} \mapsto \mathcal{F}(\operatorname{Spec}(B))$ defines a point of $\operatorname{Sh}\left((A f f / S)_{f p p f}\right)$, then $B$ has to be a local $A$-algebra such that for every faithfully flat, finitely presented ring map $B \rightarrow B^{\prime}$ there is a section $B^{\prime} \rightarrow B$. Conversely, for any such $A$-algebra $B$ the functor $\mathcal{F} \mapsto \mathcal{F}(\operatorname{Spec}(B))$ is the stalk functor of a point. Details omitted. It is not clear what a general point of the site $(A f f / S)_{f p p f}$ looks like.

This is discussed in Sch14.

### 49.31. Supports of abelian sheaves

04 FQ First we talk about supports of local sections.
04HV Lemma 49.31.1. Let $S$ be a scheme. Let $\mathcal{F}$ be a subsheaf of the final object of the étale topos of $S$ (see Sites, Example 7.10.2). Then there exists a unique open $W \subset S$ such that $\mathcal{F}=h_{W}$.

Proof. The condition means that $\mathcal{F}(U)$ is a singleton or empty for all $\varphi: U \rightarrow$ $S$ in $\operatorname{Ob}\left(S_{\text {étale }}\right)$. In particular local sections always glue. If $\mathcal{F}(U) \neq \emptyset$, then $\mathcal{F}(\varphi(U)) \neq \emptyset$ because $\{\varphi: U \rightarrow \varphi(U)\}$ is a covering. Hence we can take $W=$ $\bigcup_{\varphi: U \rightarrow S, \mathcal{F}(U) \neq \emptyset} \varphi(U)$.
04FR Lemma 49.31.2. Let $S$ be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{\text {étale. }}$ Let $\sigma \in \mathcal{F}(U)$ be a local section. There exists an open subset $W \subset U$ such that
(1) $W \subset U$ is the largest Zariski open subset of $U$ such that $\left.\sigma\right|_{W}=0$,
(2) for every $\varphi: V \rightarrow U$ in $S_{\text {étale }}$ we have

$$
\left.\sigma\right|_{V}=0 \Leftrightarrow \varphi(V) \subset W,
$$

(3) for every geometric point $\bar{u}$ of $U$ we have

$$
(U, \bar{u}, \sigma)=0 \text { in } \mathcal{F}_{\bar{s}} \Leftrightarrow \bar{u} \in W
$$

where $\bar{s}=(U \rightarrow S) \circ \bar{u}$.
Proof. Since $\mathcal{F}$ is a sheaf in the étale topology the restriction of $\mathcal{F}$ to $U_{Z a r}$ is a sheaf on $U$ in the Zariski topology. Hence there exists a Zariski open $W$ having property (1), see Modules, Lemma 17.5.2. Let $\varphi: V \rightarrow U$ be an arrow of $S_{\text {étale }}$. Note that $\varphi(V) \subset U$ is an open subset and that $\{V \rightarrow \varphi(V)\}$ is an étale covering. Hence if $\left.\sigma\right|_{V}=0$, then by the sheaf condition for $\mathcal{F}$ we see that $\left.\sigma\right|_{\varphi(V)}=0$. This proves (2). To prove (3) we have to show that if $(U, \bar{u}, \sigma)$ defines the zero element of $\mathcal{F}_{\bar{s}}$, then $\bar{u} \in W$. This is true because the assumption means there exists a morphism of étale neighbourhoods $(V, \bar{v}) \rightarrow(U, \bar{u})$ such that $\left.\sigma\right|_{V}=0$. Hence by (2) we see that $V \rightarrow U$ maps into $W$, and hence $\bar{u} \in W$.

Let $S$ be a scheme. Let $s \in S$. Let $\mathcal{F}$ be a sheaf on $S_{\text {étale. By Remark } 49.29 .8 \text { the }}$ isomorphism class of the stalk of the sheaf $\mathcal{F}$ at a geometric points lying over $s$ is well defined.

04FS Definition 49.31.3. Let $S$ be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{\text {étale }}$.
(1) The support of $\mathcal{F}$ is the set of points $s \in S$ such that $\mathcal{F}_{\bar{s}} \neq 0$ for any (some) geometric point $\bar{s}$ lying over $s$.
(2) Let $\sigma \in \mathcal{F}(U)$ be a section. The support of $\sigma$ is the closed subset $U \backslash W$, where $W \subset U$ is the largest open subset of $U$ on which $\sigma$ restricts to zero (see Lemma 49.31.2).

In general the support of an abelian sheaf is not closed. For example, suppose that $S=\operatorname{Spec}\left(\mathbf{A}_{\mathbf{C}}^{1}\right)$. Let $i_{t}: \operatorname{Spec}(\mathbf{C}) \rightarrow S$ be the inclusion of the point $t \in \mathbf{C}$. We will see later that $\mathbf{F}_{t}=i_{t, *}(\mathbf{Z} / 2 \mathbf{Z})$ is an abelian sheaf whose support is exactly $\{t\}$, see Section 49.47 Then

$$
\oplus_{n \in \mathbb{N}} \mathcal{N}_{n}
$$

is an abelian sheaf with support $\{1,2,3, \ldots\} \subset S$. This is true because taking stalks commutes with colimits, see Lemma 49.29.9. Thus an example of an abelian sheaf
whose support is not closed. Here are some basic facts on supports of sheaves and sections.
04FT Lemma 49.31.4. Let $S$ be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{\text {étale. }}$ Let $U \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ and $\sigma \in \mathcal{F}(U)$.
(1) The support of $\sigma$ is closed in $U$.
(2) The support of $\sigma+\sigma^{\prime}$ is contained in the union of the supports of $\sigma, \sigma^{\prime} \in$ $\mathcal{F}(U)$.
(3) If $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a map of abelian sheaves on $S_{\text {étale }}$, then the support of $\varphi(\sigma)$ is contained in the support of $\sigma \in \mathcal{F}(U)$.
(4) The support of $\mathcal{F}$ is the union of the images of the supports of all local sections of $\mathcal{F}$.
(5) If $\mathcal{F} \rightarrow \mathcal{G}$ is surjective then the support of $\mathcal{G}$ is a subset of the support of $\mathcal{F}$.
(6) If $\mathcal{F} \rightarrow \mathcal{G}$ is injective then the support of $\mathcal{F}$ is a subset of the support of $\mathcal{G}$.
Proof. Part (1) holds by definition. Parts (2) and (3) hold because they holds for the restriction of $\mathcal{F}$ and $\mathcal{G}$ to $U_{Z a r}$, see Modules, Lemma 17.5.2. Part (4) is a direct consequence of Lemma 49.31 .2 part (3). Parts (5) and (6) follow from the other parts.

04FU Lemma 49.31.5. The support of a sheaf of rings on $S_{\text {étale }}$ is closed.
Proof. This is true because (according to our conventions) a ring is 0 if and only if $1=0$, and hence the support of a sheaf of rings is the support of the unit section.

### 49.32. Henselian rings

03QD We begin by stating a theorem which has already been used many times in the stacks project. There are many versions of this result; here we just state the algebraic version.
03QE Theorem 49.32.1. Let $A \rightarrow B$ be finite type ring map and $\mathfrak{p} \subset A$ a prime ideal. Then there exist an étale ring map $A \rightarrow A^{\prime}$ and a prime $\mathfrak{p}^{\prime} \subset A^{\prime}$ lying over $\mathfrak{p}$ such that
(1) $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$,
(2) $B \otimes_{A} A^{\prime}=B_{1} \times \ldots \times B_{r} \times C$,
(3) $A^{\prime} \rightarrow B_{i}$ is finite and there exists a unique prime $q_{i} \subset B_{i}$ lying over $\mathfrak{p}^{\prime}$, and
(4) all irreducible components of the fibre $\operatorname{Spec}\left(C \otimes_{A^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)\right)$ of $C$ over $\mathfrak{p}^{\prime}$ have dimension at least 1.
Proof. See Algebra, Lemma 10.141.23, or see GD67, Théorème 18.12.1]. For a slew of versions in terms of morphisms of schemes, see More on Morphisms, Section 36.30

Recall Hensel's lemma. There are many versions of this lemma. Here are two:
(f) if $f \in \mathbf{Z}_{p}[T] \operatorname{monic}$ and $f \bmod p=g_{0} h_{0}$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=1$ then $f$ factors as $f=g h$ with $\bar{g}=g_{0}$ and $\bar{h}=h_{0}$,
(r) if $f \in \mathbf{Z}_{p}[T]$, monic $a_{0} \in \mathbf{F}_{p}, \bar{f}\left(a_{0}\right)=0$ but $\bar{f}^{\prime}\left(a_{0}\right) \neq 0$ then there exists $a \in \mathbf{Z}_{p}$ with $f(a)=0$ and $\bar{a}=a_{0}$.

Both versions are true (we will see this later). The first version asks for lifts of factorizations into coprime parts, and the second version asks for lifts of simple roots modulo the maximal ideal. It turns out that requiring these conditions for a general local ring are equivalent, and are equivalent to many other conditions. We use the root lifting property as the definition of a henselian local ring as it is often the easiest one to check.

03QF Definition 49.32.2. (See Algebra, Definition 10.148.1.) A local ring ( $R, \mathfrak{m}, \kappa$ ) is called henselian if for all $f \in R[T]$ monic, for all $a_{0} \in \kappa$ such that $\bar{f}\left(a_{0}\right)=0$ and $\bar{f}^{\prime}\left(a_{0}\right) \neq 0$, there exists an $a \in R$ such that $f(a)=0$ and $a \bmod \mathfrak{m}=a_{0}$.

A good example of henselian local rings to keep in mind is complete local rings. Recall (Algebra, Definition 10.152.1) that a complete local ring is a local ring ( $R, \mathfrak{m}$ ) such that $R \cong \lim _{n} R / \mathfrak{m}^{n}$, i.e., it is complete and separated for the $\mathfrak{m}$-adic topology.
03QG Theorem 49.32.3. Complete local rings are henselian.
Proof. Newton's method. See Algebra, Lemma 10.148 .10 .
03QH Theorem 49.32.4. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. The following are equivalent:
(1) $R$ is henselian,
(2) for any $f \in R[T]$ and any factorization $\bar{f}=g_{0} h_{0}$ in $\kappa[T]$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=$ 1 , there exists a factorization $f=g h$ in $R[T]$ with $\bar{g}=g_{0}$ and $\bar{h}=h_{0}$,
(3) any finite $R$-algebra $S$ is isomorphic to a finite product of finite local rings,
(4) any finite type $R$-algebra $A$ is isomorphic to a product $A \cong A^{\prime} \times C$ where $A^{\prime} \cong A_{1} \times \ldots \times A_{r}$ is a product of finite local $R$-algebras and all the irreducible components of $C \otimes_{R} \kappa$ have dimension at least 1 ,
(5) if $A$ is an étale $R$-algebra and $\mathfrak{n}$ is a maximal ideal of $A$ lying over $\mathfrak{m}$ such that $\kappa \cong A / \mathfrak{n}$, then there exists an isomorphism $\varphi: A \cong R \times A^{\prime}$ such that $\varphi(\mathfrak{n})=\mathfrak{m} \times A^{\prime} \subset R \times A^{\prime}$.

Proof. This is just a subset of the results from Algebra, Lemma 10.148.3. Note that part (5) above corresponds to part (8) of Algebra, Lemma 10.148.3 but is formulated slightly differently.

03QJ Lemma 49.32.5. If $R$ is henselian and $A$ is a finite $R$-algebra, then $A$ is a finite product of henselian local rings.

Proof. See Algebra, Lemma 10.148.4.
03QK Definition 49.32.6. A local ring $R$ is called strictly henselian if it is henselian and its residue field is separably closed.
03QI Example 49.32.7. In the case $R=\mathbf{C}[[t]]$, the étale $R$-algebras are finite products of the trivial extension $R \rightarrow R$ and the extensions $R \rightarrow R\left[X, X^{-1}\right] /\left(X^{n}-t\right)$. The latter ones factor through the open $D(t) \subset \operatorname{Spec}(R)$, so any étale covering can be refined by the covering $\{\operatorname{id}: \operatorname{Spec}(R) \rightarrow \operatorname{Spec}(R)\}$. We will see below that this is a somewhat general fact on étale coverings of spectra of henselian rings. This will show that higher étale cohomology of the spectrum of a strictly henselian ring is zero.

03QL Theorem 49.32.8. Let $(R, \mathfrak{m}, \kappa)$ be a local ring and $\kappa \subset \kappa^{\text {sep }}$ a separable algebraic closure. There exist canonical flat local ring maps $R \rightarrow R^{h} \rightarrow R^{\text {sh }}$ where
(1) $R^{h}, R^{s h}$ are filtered colimits of étale $R$-algebras,
(2) $R^{h}$ is henselian, $R^{\text {sh }}$ is strictly henselian,
(3) $\mathfrak{m} R^{h}$ (resp. $\mathfrak{m} R^{\text {sh }}$ ) is the maximal ideal of $R^{h}$ (resp. $R^{\text {sh }}$ ), and
(4) $\kappa=R^{h} / \mathfrak{m} R^{h}$, and $\kappa^{\text {sep }}=R^{s h} / \mathfrak{m} R^{\text {sh }}$ as extensions of $\kappa$.

Proof. The structure of $R^{h}$ and $R^{s h}$ is described in Algebra, Lemmas 10.148.16 and 10.148.17

The rings constructed in Theorem 49.32.8 are called respectively the henselization and the strict henselization of the local ring $R$, see Algebra, Definition 10.148.18. Many of the properties of $R$ are reflected in its (strict) henselization, see More on Algebra, Section 15.36 .

### 49.33. Stalks of the structure sheaf

04 HW In this section we identify the stalk of the structure sheaf at a geometric point with the strict henselization of the local ring at the corresponding "usual" point.
04HX Lemma 49.33.1. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$ lying over $s \in S$. Let $\kappa=\kappa(s)$ and let $\kappa \subset \kappa^{\text {sep }} \subset \kappa(\bar{s})$ denote the separable algebraic closure of $\kappa$ in $\kappa(\bar{s})$. Then there is a canonical identification

$$
\left(\mathcal{O}_{S, s}\right)^{s h} \cong \mathcal{O}_{S, \bar{s}}
$$

where the left hand side is the strict henselization of the local ring $\mathcal{O}_{S, s}$ as described in Theorem 49.32.8 and right hand side is the stalk of the structure sheaf $\mathcal{O}_{S}$ on $S_{\text {étale }}$ at the geometric point $\bar{s}$.

Proof. Let $\operatorname{Spec}(A) \subset S$ be an affine neighbourhood of $s$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. With these choices we have canonical isomorphisms $\mathcal{O}_{S, s}=A_{\mathfrak{p}}$ and $\kappa(s)=\kappa(\mathfrak{p})$. Thus we have $\kappa(\mathfrak{p}) \subset \kappa^{s e p} \subset \kappa(\bar{s})$. Recall that

$$
\mathcal{O}_{S, \bar{s}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{O}(U)
$$

where the limit is over the étale neighbourhoods of $(S, \bar{s})$. A cofinal system is given by those étale neighbourhoods $(U, \bar{u})$ such that $U$ is affine and $U \rightarrow S$ factors through $\operatorname{Spec}(A)$. In other words, we see that

$$
\mathcal{O}_{S, \bar{s}}=\operatorname{colim}_{(B, \mathfrak{q}, \phi)} B
$$

where the colimit is over étale $A$-algebras $B$ endowed with a prime $\mathfrak{q}$ lying over $\mathfrak{p}$ and a $\kappa(\mathfrak{p})$-algebra map $\phi: \kappa(\mathfrak{q}) \rightarrow \kappa(\bar{s})$. Note that since $\kappa(\mathfrak{q})$ is finite separable over $\kappa(\mathfrak{p})$ the image of $\phi$ is contained in $\kappa^{s e p}$. Via these translations the result of the lemma is equivalent to the result of Algebra, Lemma 10.148.27.

03PS Definition 49.33.2. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$ lying over the point $s \in S$.
(1) The étale local ring of $S$ at $\bar{s}$ is the stalk of the structure sheaf $\mathcal{O}_{S}$ on $S_{\text {étale }}$ at $\bar{s}$. We sometimes call this the strict henselization of $\mathcal{O}_{S, s}$ relative to the geometric point $\bar{s}$. Notation used: $\mathcal{O}_{S, \bar{s}}=\mathcal{O}_{S, s}^{s h}$.
(2) The henselization of $\mathcal{O}_{S, s}$ is the henselization of the local ring of $S$ at $s$. See Algebra, Definition 10.148 .18 , and Theorem 49.32.8 Notation: $\mathcal{O}_{S, s}^{h}$.
(3) The strict henselization of $S$ at $\bar{s}$ is the scheme $\operatorname{Spec}\left(\mathcal{O}_{S, s}^{s h}\right)$.
(4) The henselization of $S$ at $s$ is the $\operatorname{scheme} \operatorname{Spec}\left(\mathcal{O}_{S, s}^{h}\right)$.

04HY Lemma 49.33.3. Let $S$ be a scheme. Let $s \in S$. Then we have

$$
\mathcal{O}_{S, s}^{h}=\operatorname{colim}_{(U, u)} \mathcal{O}(U)
$$

where the colimit is over the filtered category of étale neighbourhoods ( $U, u$ ) of $(S, s)$ such that $\kappa(s)=\kappa(u)$.

Proof. This lemma is a copy of More on Morphisms, Lemma 36.27.5.
03QM Remark 49.33.4. Let $S$ be a scheme. Let $s \in S$. If $S$ is locally noetherian then $\mathcal{O}_{S, s}^{h}$ is also noetherian and it has the same completion:

$$
\widehat{\mathcal{O}_{S, s}} \cong \widehat{\mathcal{O}_{S, s}^{h}}
$$

In particular, $\mathcal{O}_{S, s} \subset \mathcal{O}_{S, s}^{h} \subset \widehat{\mathcal{O}_{S, s}}$. The henselization of $\mathcal{O}_{S, s}$ is in general much smaller than its completion and inherits many of its properties. For example, if $\mathcal{O}_{S, s}$ is reduced, then so is $\mathcal{O}_{S, s}^{h}$, but this is not true for the completion in general. Insert future references here.

04HZ Lemma 49.33.5. Let $S$ be a scheme. The small étale site $S_{\text {étale }}$ endowed with its structure sheaf $\mathcal{O}_{S}$ is a locally ringed site, see Modules on Sites, Definition 18.39.4.

Proof. This follows because the stalks $\mathcal{O}_{S, s}^{s h}=\mathcal{O}_{S, \bar{s}}$ are local, and because $S_{\text {étale }}$ has enough points, see Lemma 49.33.1. Theorem 49.29.10, and Remarks 49.29.11. See Modules on Sites, Lemmas 18.39 .2 and 18.39 .3 for the fact that this implies the small étale site is locally ringed.

### 49.34. Functoriality of small étale topos

04 I 0 So far we haven't yet discussed the functoriality of the étale site, in other words what happens when given a morphism of schemes. A precise formal discussion can be found in Topologies, Section 33.4. In this and the next sections we discuss this material briefly specifically in the setting of small étale sites.

Let $f: X \rightarrow Y$ be a morphism of schemes. We obtain a functor
$04 \mathrm{I1} \quad$ (49.34.0.1) $\quad u: Y_{\text {étale }} \longrightarrow X_{\text {étale }}, \quad V / Y \longmapsto X \times_{Y} V / X$.
This functor has the following important properties
(1) $u($ final object $)=$ final object,
(2) $u$ preserves fibre products,
(3) if $\left\{V_{j} \rightarrow V\right\}$ is a covering in $Y_{\text {étale }}$, then $\left\{u\left(V_{j}\right) \rightarrow u(V)\right\}$ is a covering in $X_{\text {étale }}$.
Each of these is easy to check (omitted). As a consequence we obtain what is called a morphism of sites

$$
f_{\text {small }}: X_{\text {étale }} \longrightarrow Y_{\text {étale }}
$$

see Sites, Definition 7.15.1 and Sites, Proposition 7.15.6. It is not necessary to know about the abstract notion in detail in order to work with étale sheaves and étale cohomology. It usually suffices to know that there are functors $f_{\text {small,* }}$ (pushforward) and $f_{\text {small }}^{-1}$ (pullback) on étale sheaves, and to know some of their simple properties. We will discuss these properties in the next sections, but we will sometimes refer to the more abstract material for proofs since that is often the natural setting to prove them.

### 49.35. Direct images

03PV Let us define the pushforward of a presheaf.
03PW Definition 49.35.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ a presheaf of sets on $X_{\text {étale }}$. The direct image, or pushforward of $\mathcal{F}$ (under $f$ ) is

$$
f_{*} \mathcal{F}: Y_{\text {étale }}^{\text {opp }} \longrightarrow \text { Sets, } \quad(V / Y) \longmapsto \mathcal{F}\left(X \times_{Y} V / X\right) .
$$

We sometimes write $f_{*}=f_{\text {small,* }}$ to distinguish from other direct image functors (such as usual Zariski pushforward or $f_{b i g, *}$ ).
This is a well-defined étale presheaf since the base change of an étale morphism is again étale. A more categorical way of saying this is that $f_{*} \mathcal{F}$ is the composition of functors $\mathcal{F} \circ u$ where $u$ is as in Equation 49.34.0.1). This makes it clear that the construction is functorial in the presheaf $\mathcal{F}$ and hence we obtain a functor

$$
f_{*}=f_{\text {small }, *}: P S h\left(X_{\text {étale }}\right) \longrightarrow P S h\left(Y_{\text {étale }}\right)
$$

Note that if $\mathcal{F}$ is a presheaf of abelian groups, then $f_{*} \mathcal{F}$ is also a presheaf of abelian groups and we obtain

$$
f_{*}=f_{\text {small }, *}: \operatorname{PAb}\left(X_{\text {étale }}\right) \longrightarrow \operatorname{PAb}\left(Y_{\text {étale }}\right)
$$

as before (i.e., defined by exactly the same rule).
03PX Remark 49.35.2. We claim that the direct image of a sheaf is a sheaf. Namely, if $\left\{V_{j} \rightarrow V\right\}$ is an étale covering in $Y_{\text {étale }}$ then $\left\{X \times_{Y} V_{j} \rightarrow X \times_{Y} V\right\}$ is an étale covering in $X_{\text {étale }}$. Hence the sheaf condition for $\mathcal{F}$ with respect to $\left\{X \times_{Y} V_{i} \rightarrow\right.$ $\left.X \times_{Y} V\right\}$ is equivalent to the sheaf condition for $f_{*} \mathcal{F}$ with respect to $\left\{V_{i} \rightarrow V\right\}$. Thus if $\mathcal{F}$ is a sheaf, so is $f_{*} \mathcal{F}$.
03PY Definition 49.35.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ a sheaf of sets on $X_{\text {étale }}$. The direct image, or pushforward of $\mathcal{F}$ (under $f$ ) is

$$
f_{*} \mathcal{F}: Y_{\text {étale }}^{o p p} \longrightarrow \text { Sets, } \quad(V / Y) \longmapsto \mathcal{F}\left(X \times_{Y} V / X\right)
$$

which is a sheaf by Remark 49.35.2. We sometimes write $f_{*}=f_{s m a l l, *}$ to distinguish from other direct image functors (such as usual Zariski pushforward or $f_{b i g, *}$ ).
The exact same discussion as above applies and we obtain functors

$$
f_{*}=f_{\text {small }, *}: S h\left(X_{\text {étale }}\right) \longrightarrow S h\left(Y_{\text {étale }}\right)
$$

and

$$
f_{*}=f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \longrightarrow A b\left(Y_{\text {étale }}\right)
$$

called direct image again.
The functor $f_{*}$ on abelian sheaves is left exact. (See Homology, Section 12.7 for what it means for a functor between abelian categories to be left exact.) Namely, if $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3}$ is exact on $X_{\text {étale }}$, then for every $U / X \in \operatorname{Ob}\left(X_{\text {étale }}\right)$ the sequence of abelian groups $0 \rightarrow \mathcal{F}_{1}(U) \rightarrow \mathcal{F}_{2}(U) \rightarrow \mathcal{F}_{3}(U)$ is exact. Hence for every $V / Y \in \mathrm{Ob}\left(Y_{\text {étale }}\right)$ the sequence of abelian groups $0 \rightarrow f_{*} \mathcal{F}_{1}(V) \rightarrow f_{*} \mathcal{F}_{2}(V) \rightarrow$ $f_{*} \mathcal{F}_{3}(V)$ is exact, because this is the previous sequence with $U=X \times_{Y} V$.

04I2 Definition 49.35.4. Let $f: X \rightarrow Y$ be a morphism of schemes. The right derived functors $\left\{R^{p} f_{*}\right\}_{p \geq 1}$ of $f_{*}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ are called higher direct images.
The higher direct images and their derived category variants are discussed in more detail in (insert future reference here).

### 49.36. Inverse image

03PZ In this section we briefly discuss pullback of sheaves on the small étale sites. The precise construction of this is in Topologies, Section 33.4.
03Q0 Definition 49.36.1. Let $f: X \rightarrow Y$ be a morphism of schemes. The inverse image, or pullbach functors are the functors

$$
f^{-1}=f_{\text {small }}^{-1}: S h\left(Y_{\text {étale }}\right) \longrightarrow S h\left(X_{\text {étale }}\right)
$$

and

$$
f^{-1}=f_{\text {small }}^{-1}: A b\left(Y_{\text {étale }}\right) \longrightarrow A b\left(X_{\text {étale }}\right)
$$

which are left adjoint to $f_{*}=f_{\text {small,* }}$. Thus $f^{-1}$ thus characterized by the fact that

$$
\operatorname{Hom}_{S h\left(X_{\text {étale }}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Hom}_{S h\left(Y_{\text {étale }}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

functorially, for any $\mathcal{F} \in \operatorname{Sh}\left(X_{\text {étale }}\right)$ and $\mathcal{G} \in \operatorname{Sh}\left(Y_{\text {étale }}\right)$. We similarly have

$$
\operatorname{Hom}_{A b\left(X_{\text {étale })}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Hom}_{A b\left(Y_{\text {étale }}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

for $\mathcal{F} \in A b\left(X_{\text {étale }}\right)$ and $\mathcal{G} \in A b\left(Y_{\text {étale }}\right)$.
It is not trivial that such an adjoint exists. On the other hand, it exists in a fairly general setting, see Remark 49.36 .3 below. The general machinery shows that $f^{-1} \mathcal{G}$ is the sheaf associated to the presheaf

04 I 3 (49.36.1.1)

$$
U / X \longmapsto \operatorname{colim}_{U \rightarrow X \times_{Y} V} \mathcal{G}(V / Y)
$$

where the colimit is over the category of pairs $\left(V / Y, \varphi: U / X \rightarrow X \times_{Y} V / X\right)$. To see this apply Sites, Proposition 7.15 .6 to the functor $u$ of Equation 49.34.0.1) and use the description of $u_{s}=\left(u_{p}\right)^{\#}$ in Sites, Sections 7.14 and 7.5 We will occasionally use this formula for the pullback in order to prove some of its basic properties.

03Q1 Lemma 49.36.2. Let $f: X \rightarrow Y$ be a morphism of schemes.
(1) The functor $f^{-1}: A b\left(Y_{\text {étale }}\right) \rightarrow A b\left(X_{\text {étale }}\right)$ is exact.
(2) The functor $f^{-1}: \operatorname{Sh}\left(Y_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(X_{\text {étale }}\right)$ is exact, i.e., it commutes with finite limits and colimits, see Categories, Definition 4.23.1.
(3) Let $\bar{x} \rightarrow X$ be a geometric point. Let $\mathcal{G}$ be a sheaf on $Y_{\text {étale }}$. Then there is a canonical identification

$$
\left(f^{-1} \mathcal{G}\right)_{\bar{x}}=\mathcal{G}_{\bar{y}}
$$

where $\bar{y}=f \circ \bar{x}$.
(4) For any $V \rightarrow Y$ étale we have $f^{-1} h_{V}=h_{X \times_{Y} V}$.

Proof. The exactness of $f^{-1}$ on sheaves of sets is a consequence of Sites, Proposition 7.15 .6 applied to our functor $u$ of Equation 49.34.0.1). In fact the exactness of pullback is part of the definition of of a morphism of topoi (or sites if you like). Thus we see (2) holds. It implies part (1) since given an abelian sheaf $\mathcal{G}$ on $Y_{\text {étale }}$ the underlying sheaf of sets of $f^{-1} \mathcal{F}$ is the same as $f^{-1}$ of the underlying sheaf of sets of $\mathcal{F}$, see Sites, Section 7.43 . See also Modules on Sites, Lemma 18.30.2. In the literature (1) and (2) are sometimes deduced from (3) via Theorem 49.29.10.

[^129]Part (3) is a general fact about stalks of pullbacks, see Sites, Lemma 7.33.1. We will also prove (3) directly as follows. Note that by Lemma 49.29 .9 taking stalks commutes with sheafification. Now recall that $f^{-1} \mathcal{G}$ is the sheaf associated to the presheaf

$$
U \longrightarrow \operatorname{colim}_{U \rightarrow X \times_{Y} V} \mathcal{G}(V)
$$

see Equation 49.36.1.1. Thus we have

$$
\begin{aligned}
\left(f^{-1} \mathcal{G}\right)_{\bar{x}} & =\operatorname{colim}_{(U, \bar{u})} f^{-1} \mathcal{G}(U) \\
& =\operatorname{colim}_{(U, \bar{u})} \operatorname{colim}_{a: U \rightarrow X \times_{Y} V} \mathcal{G}(V) \\
& =\operatorname{colim}_{(V, \bar{v})} \mathcal{G}(V) \\
& =\mathcal{G}_{\bar{y}}
\end{aligned}
$$

in the third equality the pair $(U, \bar{u})$ and the map $a: U \rightarrow X \times_{Y} V$ corresponds to the pair $(V, a \circ \bar{u})$.
Part (4) can be proved in a similar manner by identifying the colimits which define $f^{-1} h_{V}$. Or you can use Yoneda's lemma (Categories, Lemma 4.3.5) and the functorial equalities

$$
\operatorname{Mor}_{S h\left(X_{\text {étale }}\right)}\left(f^{-1} h_{V}, \mathcal{F}\right)=\operatorname{Mor}_{S h\left(Y_{\text {étale }}\right)}\left(h_{V}, f_{*} \mathcal{F}\right)=f_{*} \mathcal{F}(V)=\mathcal{F}\left(X \times_{Y} V\right)
$$

combined with the fact that representable presheaves are sheaves. See also Sites, Lemma 7.14.5 for a completely general result.

The pair of functors $\left(f_{*}, f^{-1}\right)$ define a morphism of small étale topoi

$$
f_{\text {small }}: \operatorname{Sh}\left(X_{\text {étale }}\right) \longrightarrow \operatorname{Sh}\left(Y_{\text {étale }}\right)
$$

Many generalities on cohomology of sheaves hold for topoi and morphisms of topoi. We will try to point out when results are general and when they are specific to the étale topos.

03Q2 Remark 49.36.3. More generally, let $\mathcal{C}_{1}, \mathcal{C}_{2}$ be sites, and assume they have final objects and fibre products. Let $u: \mathcal{C}_{2} \rightarrow \mathcal{C}_{1}$ be a functor satisfying:
(1) if $\left\{V_{i} \rightarrow V\right\}$ is a covering of $\mathcal{C}_{2}$, then $\left\{u\left(V_{i}\right) \rightarrow V_{i}\right\}$ is a covering of $\mathcal{C}_{1}$ (we say that $u$ is continuous), and
(2) $u$ commutes with finite limits (i.e., $u$ is left exact, i.e., $u$ preserves fibre products and final objects).
Then one can define $f_{*}: \operatorname{Sh}\left(\mathcal{C}_{1}\right) \rightarrow \operatorname{Sh}\left(\mathcal{C}_{2}\right)$ by $f_{*} \mathcal{F}(V)=\mathcal{F}(u(V))$. Moreover, there exists an exact functor $f^{-1}$ which is left adjoint to $f_{*}$, see Sites, Definition 7.15.1 and Proposition 7.15.6. Warning: It is not enough to require simply that $u$ is continuous and commutes with fibre products in order to get a morphism of topoi.

### 49.37. Functoriality of big topoi

04DI Given a morphism of schemes $f: X \rightarrow Y$ there are a whole host of morphisms of topoi associated to $f$, see Topologies, Section 33.9 for a list. Perhaps the most used ones are the morphisms of topoi

$$
f_{b i g}=f_{b i g, \tau}: S h\left((S c h / X)_{\tau}\right) \longrightarrow S h\left((S c h / Y)_{\tau}\right)
$$

where $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. These each correspond to a continuous functor

$$
(S c h / Y)_{\tau} \longrightarrow(S c h / X)_{\tau}, \quad V / Y \longmapsto X \times_{Y} V / X
$$

which preserves final objects, fibre products and covering, and hence defines a morphism of sites

$$
f_{b i g}:(S c h / X)_{\tau} \longrightarrow(S c h / Y)_{\tau}
$$

See Topologies, Sections 33.3, 33.4, 33.5, 33.6, and 33.7. In particular, pushforward along $f_{\text {big }}$ is given by the rule

$$
\left(f_{b i g, *} \mathcal{F}\right)(V / Y)=\mathcal{F}\left(X \times_{Y} V / X\right)
$$

It turns out that these morphisms of topoi have an inverse image functor $f_{b i g}^{-1}$ which is very easy to describe. Namely, we have

$$
\left(f_{b i g}^{-1} \mathcal{G}\right)(U / X)=\mathcal{G}(U / Y)
$$

where the structure morphism of $U / Y$ is the composition of the structure morphism $U \rightarrow X$ with $f$, see Topologies, Lemmas 33.3.15, 33.4.15, 33.5.10, 33.6.10, and 33.7.12

### 49.38. Functoriality and sheaves of modules

04I4 In this section we are going to reformulate some of the material explained in Descent, Section 34.7 in the setting of étale topologies. Let $f: X \rightarrow Y$ be a morphism of schemes. We have seen above, see Sections 49.34, 49.35, and 49.36 that this induces a morphism $f_{\text {small }}$ of small étale sites. In Descent, Remark 34.7.4 we have seen that $f$ also induces a natural map

$$
f_{\text {small }}^{\sharp}: \mathcal{O}_{Y_{\text {étale }}} \longrightarrow f_{\text {small }, *} \mathcal{O}_{X_{\text {étale }}}
$$

of sheaves of rings on $Y_{\text {étale }}$ such that $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$ is a morphism of ringed sites. See Modules on Sites, Definition 18.6.1 for the definition of a morphism of ringed sites. Let us just recall here that $f_{\text {small }}^{\sharp}$ is defined by the compatible system of maps

$$
\operatorname{pr}_{V}^{\sharp}: \mathcal{O}(V) \longrightarrow \mathcal{O}\left(X \times_{Y} V\right)
$$

for $V$ varying over the objects of $Y_{\text {étale }}$.
It is clear that this construction is compatible with compositions of morphisms of schemes. More precisely, if $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are morphisms of schemes, then we have

$$
\left(g_{\text {small }}, g_{\text {small }}^{\sharp}\right) \circ\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)=\left((g \circ f)_{\text {small }},(g \circ f)_{\text {small }}^{\sharp}\right)
$$

as morphisms of ringed topoi. Moreover, by Modules on Sites, Definition 18.13.1 we see that given a morphism $f: X \rightarrow Y$ of schemes we get well defined pullback and direct image functors

$$
\begin{array}{r}
f_{\text {small }}^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y_{\text {étale }}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{X_{\text {étale }}}\right), \\
f_{\text {small }, *}: \operatorname{Mod}\left(\mathcal{O}_{X_{\text {étale }}}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{Y_{\text {étale }}}\right)
\end{array}
$$

which are adjoint in the usual way. If $g: Y \rightarrow Z$ is another morphism of schemes, then we have $(g \circ f)_{\text {small }}^{*}=f_{\text {small }}^{*} \circ g_{\text {small }}^{*}$ and $(g \circ f)_{\text {small }, *}=g_{\text {small }, *} \circ f_{\text {small }, *}$ because of what we said about compositions.

There is quite a bit of difference between the category of all $\mathcal{O}_{X}$ modules on $X$ and the category between all $\mathcal{O}_{X_{\text {étale }}}$-modules on $X_{\text {étale }}$. But the results of Descent, Section 34.7 tell us that there is not much difference between considering quasicoherent modules on $S$ and quasi-coherent modules on $S_{\text {étale }}$. (We have already seen this in Theorem 49.17.4 for example.) In particular, if $f: X \rightarrow Y$ is any
morphism of schemes, then the pullback functors $f_{\text {small }}^{*}$ and $f^{*}$ match for quasicoherent sheaves, see Descent, Proposition 34.7.14. Moreover, the same is true for pushforward provided $f$ is quasi-compact and quasi-separated, see Descent, Lemma 34.7.15

A few words about functoriality of the structure sheaf on big sites. Let $f: X \rightarrow Y$ be a morphism of schemes. Choose any of the topologies $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Then the morphism $f_{\text {big }}:(S c h / X)_{\tau} \rightarrow(S c h / Y)_{\tau}$ becomes a morphism of ringed sites by a map

$$
f_{b i g}^{\sharp}: \mathcal{O}_{Y} \longrightarrow f_{b i g, *} \mathcal{O}_{X}
$$

see Descent, Remark 34.7.4. In fact it is given by the same construction as in the case of small sites explained above.

### 49.39. Comparing big and small topoi

0757 Let $X$ be a scheme. In Topologies, Lemma 33.4.13 we have introduced comparison morphisms $\pi_{X}:(S c h / X)_{\text {étale }} \rightarrow X_{\text {étale }}$ and $i_{X}: \operatorname{Sh}\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left((S c h / X)_{\text {étale }}\right)$ with $\pi_{X} \circ i_{X}=$ id and $\pi_{X, *}=i_{X}^{-1}$. In Descent, Remark 34.7.4 we have extended these to a morphism of ringed sites

$$
\pi_{X}:\left((S c h / X)_{\text {étale }}, \mathcal{O}\right) \rightarrow\left(X_{\text {étale }}, \mathcal{O}_{X}\right)
$$

and a morphism of ringed topoi

$$
i_{X}:\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right) \rightarrow\left(\operatorname{Sh}\left((S c h / X)_{\text {étale }}\right), \mathcal{O}\right)
$$

Note that the restriction $i_{X}^{-1}=\pi_{X, *}$ (see Topologies, Definition 33.4.14) transforms $\mathcal{O}$ into $\mathcal{O}_{X}$. Hence $i_{X}^{*} \mathcal{F}=i_{X}^{-1} \mathcal{F}$ for any $\mathcal{O}$-module $\mathcal{F}$ on $(S c h / X)_{\text {étale }}$. In particular $i_{X}^{*}$ is exact. This functor is often denoted $\left.\mathcal{F} \mapsto \mathcal{F}\right|_{X_{\text {étale }}}$.

Lemma 49.39.1. Let $X$ be a scheme.
(1) $\left.\mathcal{I}\right|_{X_{\text {étale }}}$ is injective in $A b\left(X_{\text {étale }}\right)$ for $\mathcal{I}$ injective in $A b\left((S c h / X)_{\text {étale }}\right)$, and
(2) $\left.\mathcal{I}\right|_{X_{\text {étale }}}$ is injective in $\operatorname{Mod}\left(X_{\text {étale }}, \mathcal{O}_{X}\right)$ for $\mathcal{I}$ injective in $\operatorname{Mod}\left((S c h / X)_{\text {étale }}, \mathcal{O}\right)$.

Proof. This follows formally from the fact that the restriction functor $\pi_{X, *}=i_{X}^{1}$ is an exact left adjoint of $i_{X, *}$, see Homology, Lemma 12.25.1.

Let $f: X \rightarrow Y$ be a morphism of schemes. The commutative diagram of Topologies, Lemma 33.4.16 (3) leads to a commutative diagram of ringed sites

as one easily sees by writing out the definitions of $f_{\text {small }}^{\sharp}, f_{\text {big }}^{\sharp}, \pi_{S}^{\sharp}$, and $\pi_{T}^{\sharp}$. In particular this means that

$$
\begin{equation*}
\left.\left(f_{\text {big }, *} \mathcal{F}\right)\right|_{Y_{\text {étale }}}=f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{X_{\text {étale }}}\right) \tag{49.39.1.1}
\end{equation*}
$$

for any sheaf $\mathcal{F}$ on $(S c h / X)_{\text {étale }}$ and if $\mathcal{F}$ is a sheaf of $\mathcal{O}$-modules, then 49.39.1.1 is an isomorphism of $\mathcal{O}_{Y}$-modules on $Y_{\text {étale }}$.

Lemma 49.39.2. Let $f: X \rightarrow Y$ be a morphism of schemes.
(1) For any $\mathcal{F} \in A b\left((S c h / X)_{\text {étale }}\right)$ we have

$$
\left.\left(R f_{\text {big }, *} \mathcal{F}\right)\right|_{Y_{\text {etale }}}=R f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{X_{\text {étale }}}\right)
$$

in $D\left(Y_{\text {étale }}\right)$.
(2) For any object $\mathcal{F}$ of $\operatorname{Mod}\left((S c h / X)_{\text {étale }}, \mathcal{O}\right)$ we have

$$
\left.\left(R f_{\text {big }, *} \mathcal{F}\right)\right|_{Y_{\text {étale }}}=R f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{X_{\text {étale }}}\right)
$$

in $D\left(\operatorname{Mod}\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right)\right)$.
Proof. Follows immediately from Lemma 49.39.1 and 49.39.1.1 on choosing an injective resolution of $\mathcal{F}$.

### 49.40. Comparing topologies

09XL In this section we start studying what happens when you compare sheaves with respect to different topologies.

09XM Lemma 49.40.1. Let $S$ be a scheme. Let $\mathcal{F}$ be a sheaf of sets on $S_{\text {étale. }}$ Let $s, t \in \mathcal{F}(S)$. Then there exists an open $W \subset S$ characterized by the following property: $A$ morphism $f: T \rightarrow S$ factors through $W$ if and only if $\left.s\right|_{T}=\left.t\right|_{T}$ (restriction is pullback by $f_{\text {small }}$ ).

Proof. Consider the presheaf which assigns to $U \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ the emptyset if $\left.s\right|_{U} \neq\left. t\right|_{U}$ and a singleton else. It is clear that this is a subsheaf of the final object of $S h\left(S_{\text {étale }}\right)$. By Lemma 49.31.1 we find an open $W \subset S$ representing this presheaf. For a geometric point $\bar{x}$ of $S$ we see that $\bar{x} \in W$ if and only if the stalks of $s$ and $t$ at $\bar{x}$ agree. By the description of stalks of pullbacks in Lemma 49.36.2 we see that $W$ has the desired property.

09XN Lemma 49.40.2. Let $S$ be a scheme. Let $\tau \in\{$ Zariski, étale $\}$. Consider the morphism

$$
\pi:(S c h / S)_{\tau} \longrightarrow S_{\tau}
$$

of Topologies, Lemma 33.3.13 or 33.4.13. Let $\mathcal{F}$ be a sheaf on $S_{\tau}$. Then $\pi^{-1} \mathcal{F}$ is given by the rule

$$
\pi^{-1} \mathcal{F}(T)=\Gamma\left(T_{\tau}, f_{\text {small }}^{-1} \mathcal{F}\right)
$$

where $f: T \rightarrow S$. Moreover, $\pi^{-1} \mathcal{F}$ satisfies the sheaf condition with respect to fpqc coverings.

Proof. Observe that we have a morphism $\left.i_{f}: S h\left(T_{\tau}\right) \rightarrow S h(S c h / S)_{\tau}\right)$ such that $\pi \circ i_{f}=f_{\text {small }}$ as morphisms $T_{\tau} \rightarrow S_{\tau}$, see Topologies, Lemmas 33.3.12, 33.3.16, 33.4.12 and 33.4.16. Since pullback is transitive we see that $i_{f}^{-1} \pi^{-1} \mathcal{F}=f_{\text {small }}^{-1} \mathcal{F}$ as desired.

Let $\left\{g_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering. The final statement means the following: Given a sheaf $\mathcal{G}$ on $T_{\tau}$ and given sections $s_{i} \in \Gamma\left(T_{i}, g_{i, s m a l l}^{-1} \mathcal{G}\right)$ whose pullbacks to $T_{i} \times_{T} T_{j}$ agree, there is a unique section $s$ of $\mathcal{G}$ over $T$ whose pullback to $T_{i}$ agrees with $s_{i}$.
Let $V \rightarrow T$ be an object of $T_{\tau}$ and let $t \in \mathcal{G}(V)$. For every $i$ there is a largest open $W_{i} \subset T_{i} \times_{T} V$ such that the pullbacks of $s_{i}$ and $t$ agree as sections of the pullback of $\mathcal{G}$ to $W_{i} \subset T_{i} \times_{T} V$, see Lemma 49.40.1. Because $s_{i}$ and $s_{j}$ agree over $T_{i} \times_{T} T_{j}$ we find that $W_{i}$ and $W_{j}$ pullback to the same open over $T_{i} \times_{T} T_{j} \times_{T} V$. By Descent,

Lemma 34.9.2 we find an open $W \subset V$ whose inverse image to $T_{i} \times_{T} V$ recovers $W_{i}$.
By construction of $g_{i, \text { small }}^{-1} \mathcal{G}$ there exists a $\tau$-covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, for each $j$ an open immersion or étale morphism $V_{i j} \rightarrow T$, a section $t_{i j} \in \mathcal{G}\left(V_{i j}\right)$, and commutative diagrams

such that $\left.s_{i}\right|_{T_{i j}}$ is the pullback of $t_{i j}$. In other words, after replacing the covering $\left\{T_{i} \rightarrow T\right\}$ by $\left\{T_{i j} \rightarrow T\right\}$ we may assume there are factorizations $T_{i} \rightarrow V_{i} \rightarrow T$ with $V_{i} \in \mathrm{Ob}\left(T_{\tau}\right)$ and sections $t_{i} \in \mathcal{G}\left(V_{i}\right)$ pulling back to $s_{i}$ over $T_{i}$. By the result of the previous paragraph we find opens $W_{i} \subset V_{i}$ such that $\left.t_{i}\right|_{W_{i}}$ "agrees with" every $s_{j}$ over $T_{j} \times_{T} W_{i}$. Note that $T_{i} \rightarrow V_{i}$ factors through $W_{i}$. Hence $\left\{W_{i} \rightarrow T\right\}$ is a $\tau$-covering and the lemma is proven.
0A3H Lemma 49.40.3. Let $S$ be a scheme. Let $f: T \rightarrow S$ be a morphism such that
(1) $f$ is flat and quasi-compact, and
(2) the geometric fibres of $f$ are connected.

Let $\mathcal{F}$ be a sheaf on $S_{\text {étale }}$. Then $\Gamma(S, \mathcal{F})=\Gamma\left(T, f_{\text {small }}^{-1} \mathcal{F}\right)$.
Proof. There is a canonical map $\Gamma(S, \mathcal{F}) \rightarrow \Gamma\left(T, f_{\text {small }}^{-1} \mathcal{F}\right)$. Since $f$ is surjective (because its fibres are connected) we see that this map is injective.
To show that the map is surjective, let $\alpha \in \Gamma\left(T, f_{\text {small }}^{-1} \mathcal{F}\right)$. Since $\{T \rightarrow S\}$ is an fpqc covering we can use Lemma 49.40 .2 to see that suffices to prove that $\alpha$ pulls back to the same section over $T \times{ }_{S} T$ by the two projections. Let $\bar{s} \rightarrow S$ be a geometric point. It suffices to show the agreement holds over $\left(T \times{ }_{S} T\right)_{\bar{s}}$ as every geometric point of $T \times{ }_{S} T$ is contained in one of these geometric fibres. In other words, we are trying to show that $\left.\alpha\right|_{X_{\bar{s}}}$ pulls back to the same section over $\left(T \times_{S} T\right)_{\bar{s}}$ by the two projections $T_{\bar{s}} \times_{\bar{s}} T_{\bar{s}}$. Howeover, since $\left.\mathcal{F}\right|_{T_{\bar{s}}}$ is the pullback of $\left.\mathcal{F}\right|_{\bar{s}}$ it is a constant sheaf with value $\mathcal{F}_{\bar{s}}$. Since $T_{\bar{s}}$ is connected by assumption, any section of a constant sheaf is constant and this proves what we want.
0A3I Lemma 49.40.4. Let $k \subset K$ be an extension of fields with $k$ separably algebraically closed. Let $S$ be a scheme over $k$. Denote $p: S_{K}=S \times_{\operatorname{Spec}(k)} \operatorname{Spec}(K) \rightarrow S$ the projection. Let $\mathcal{F}$ be a sheaf on $S_{\text {étale. }}$. Then $\Gamma(S, \mathcal{F})=\Gamma\left(S_{K}, p_{\text {small }}^{-1} \mathcal{F}\right)$.
Proof. Follows from Lemma 49.40.3. Namely, it is clear that $p$ is flat and quasicompact as the base change of $\operatorname{Spec}(K) \rightarrow \operatorname{Spec}(k)$. On the other hand, if $\bar{s}:$ $\operatorname{Spec}(L) \rightarrow S$ is a geometric point, then the fibre of $p$ over $\bar{s}$ is the spectrum of $K \otimes_{k} L$ which is irreducible hence connected by Algebra, Lemma 10.46.2.

### 49.41. Recovering morphisms

04 JH In this section we prove that the rule which associates to a scheme its locally ringed small étale topos is fully faithful in a suitable sense, see Theorem 49.41.5.

04I5 Lemma 49.41.1. Let $f: X \rightarrow Y$ be a morphism of schemes. The morphism of ringed sites $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$ associated to $f$ is a morphism of locally ringed sites, see Modules on Sites, Definition 18.39.9.

Proof. Note that the assertion makes sense since we have seen that ( $X_{\text {étale }}, \mathcal{O}_{X_{\text {étale }}}$ ) and $\left(Y_{\text {étale }}, \mathcal{O}_{Y_{\text {étale }}}\right)$ are locally ringed sites, see Lemma 49.33.5. Moreover, we know that $X_{\text {étale }}$ has enough points, see Theorem 49.29.10 and Remarks 49.29.11. Hence it suffices to prove that $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$ satisfies condition (3) of Modules on Sites, Lemma 18.39.8. To see this take a point $p$ of $X_{\text {étale }}$. By Lemma $49.29 .12 p$ corresponds to a geometric point $\bar{x}$ of $X$. By Lemma 49.36 .2 the point $q=f_{\text {small }} \circ p$ corresponds to the geometric point $\bar{y}=f \circ \bar{x}$ of $Y$. Hence the assertion we have to prove is that the induced map of stalks

$$
\mathcal{O}_{Y, \bar{y}} \longrightarrow \mathcal{O}_{X, \bar{x}}
$$

is a local ring map. Suppose that $a \in \mathcal{O}_{Y, \bar{y}}$ is an element of the left hand side which maps to an element of the maximal ideal of the right hand side. Suppose that $a$ is the equivalence class of a triple $(V, \bar{v}, a)$ with $V \rightarrow Y$ étale, $\bar{v}: \bar{x} \rightarrow V$ over $Y$, and $a \in \mathcal{O}(V)$. It maps to the equivalence class of $\left(X \times_{Y} V, \bar{x} \times \bar{v}, \operatorname{pr}_{V}^{\sharp}(a)\right)$ in the local ring $\mathcal{O}_{X, \bar{x}}$. But it is clear that being in the maximal ideal means that pulling back $\operatorname{pr}_{V}^{\sharp}(a)$ to an element of $\kappa(\bar{x})$ gives zero. Hence also pulling back $a$ to $\kappa(\bar{x})$ is zero. Which means that $a$ lies in the maximal ideal of $\mathcal{O}_{Y, \bar{y}}$.

04IJ Lemma 49.41.2. Let $X, Y$ be schemes. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $t$ be a 2-morphism from $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$ to itself, see Modules on Sites, Definition 18.8.1. Then $t=i d$.
Proof. This means that $t: f_{\text {small }}^{-1} \rightarrow f_{\text {small }}^{-1}$ is a transformation of functors such that the diagram

is commutative. Suppose $V \rightarrow Y$ is étale with $V$ affine. By Morphisms, Lemma 28.39 .2 we may choose an immersion $i: V \rightarrow \mathbf{A}_{Y}^{n}$ over $Y$. In terms of sheaves this means that $i$ induces an injection $h_{i}: h_{V} \rightarrow \prod_{j=1, \ldots, n} \mathcal{O}_{Y}$ of sheaves. The base change $i^{\prime}$ of $i$ to $X$ is an immersion (Schemes, Lemma 25.18.2. . Hence $i^{\prime}: X \times_{Y} V \rightarrow$ $\mathbf{A}_{X}^{n}$ is an immersion, which in turn means that $h_{i^{\prime}}: h_{X \times_{Y} V} \rightarrow \prod_{j=1, \ldots, n} \mathcal{O}_{X}$ is an injection of sheaves. Via the identification $f_{\text {small }}^{-1} h_{V}=h_{X \times_{Y} V}$ of Lemma 49.36.2 the map $h_{i^{\prime}}$ is equal to

$$
f_{\text {small }}^{-1} h_{V} \xrightarrow{f^{-1} h_{i}} \prod_{j=1, \ldots, n} f_{\text {small }}^{-1} \mathcal{O}_{Y} \xrightarrow{\Pi f^{\sharp}} \prod_{j=1, \ldots, n} \mathcal{O}_{X}
$$

(verification omitted). This means that the map $t: f_{\text {small }}^{-1} h_{V} \rightarrow f_{\text {small }}^{-1} h_{V}$ fits into the commutative diagram

The commutativity of the right square holds by our assumption on $t$ explained above. Since the composition of the horizontal arrows is injective by the discussion
above we conclude that the left vertical arrow is the identity map as well. Any sheaf of sets on $Y_{\text {étale }}$ admits a surjection from a (huge) coproduct of sheaves of the form $h_{V}$ with $V$ affine (combine Lemma 49.21 .2 with Sites, Lemma 7.13.5). Thus we conclude that $t: f_{\text {small }}^{-1} \rightarrow f_{\text {small }}^{-1}$ is the identity transformation as desired.
04LW Lemma 49.41.3. Let $X, Y$ be schemes. Any two morphisms $a, b: X \rightarrow Y$ of schemes for which there exists a 2 -isomorphism $\left(a_{\text {small }}, a_{\text {small }}^{\sharp}\right) \cong\left(b_{\text {small }}, b_{\text {small }}^{\sharp}\right)$ in the 2-category of ringed topoi are equal.
Proof. Let us argue this carefuly since it is a bit confusing. Let $t: a_{\text {small }}^{-1} \rightarrow b_{\text {small }}^{-1}$ be the 2 -isomorphism. Consider any open $V \subset Y$. Note that $h_{V}$ is a subsheaf of the final sheaf $*$. Thus both $a_{\text {small }}^{-1} h_{V}=h_{a^{-1}(V)}$ and $b_{\text {small }}^{-1} h_{V}=h_{b^{-1}(V)}$ are subsheaves of the final sheaf. Thus the isomorphism

$$
t: a_{\text {small }}^{-1} h_{V}=h_{a^{-1}(V)} \rightarrow b_{\text {small }}^{-1} h_{V}=h_{b^{-1}(V)}
$$

has to be the identity, and $a^{-1}(V)=b^{-1}(V)$. It follows that $a$ and $b$ are equal on underlying topological spaces. Next, take a section $f \in \mathcal{O}_{Y}(V)$. This determines and is determined by a map of sheaves of sets $f: h_{V} \rightarrow \mathcal{O}_{Y}$. Pull this back and apply $t$ to get a commutative diagram

where the triangle is commutative by definition of a 2-isomorphism in Modules on Sites, Section 18.8. Above we have seen that the composition of the top horizontal arrows comes from the identity $a^{-1}(V)=b^{-1}(V)$. Thus the commutativity of the diagram tells us that $a_{\text {small }}^{\sharp}(f)=b_{\text {small }}^{\sharp}(f)$ in $\mathcal{O}_{X}\left(a^{-1}(V)\right)=\mathcal{O}_{X}\left(b^{-1}(V)\right)$. Since this holds for every open $V$ and every $f \in \mathcal{O}_{Y}(V)$ we conclude that $a=b$ as morphisms of schemes.

04I6 Lemma 49.41.4. Let $X, Y$ be affine schemes. Let

$$
\left(g, g^{\#}\right):\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right) \longrightarrow\left(S h\left(Y_{\text {étale }}\right), \mathcal{O}_{Y}\right)
$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of schemes $f: X \rightarrow Y$ such that $\left(g, g^{\#}\right)$ is 2-isomorphic to $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$, see Modules on Sites, Definition 18.8.1.
Proof. In this proof we write $\mathcal{O}_{X}$ for the structure sheaf of the small étale site $X_{\text {étale }}$, and similarly for $\mathcal{O}_{Y}$. Say $Y=\operatorname{Spec}(B)$ and $X=\operatorname{Spec}(A)$. Since $B=$ $\Gamma\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right), A=\Gamma\left(X_{\text {étale }}, \mathcal{O}_{X}\right)$ we see that $g^{\sharp}$ induces a ring map $\varphi: B \rightarrow A$. Let $f=\operatorname{Spec}(\varphi): X \rightarrow Y$ be the corresponding morphism of affine schemes. We will show this $f$ does the job.

Let $V \rightarrow Y$ be an affine scheme étale over $Y$. Thus we may write $V=\operatorname{Spec}(C)$ with $C$ an étale $B$-algebra. We can write

$$
C=B\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}, \ldots, P_{n}\right)
$$

with $P_{i}$ polynomials such that $\Delta=\operatorname{det}\left(\partial P_{i} / \partial x_{j}\right)$ is invertible in $C$, see for example Algebra, Lemma 10.141.2. If $T$ is a scheme over $Y$, then a $T$-valued point of $V$ is given by $n$ sections of $\Gamma\left(T, \mathcal{O}_{T}\right)$ which satisfy the polynomial equations $P_{1}=$ $0, \ldots, P_{n}=0$. In other words, the sheaf $h_{V}$ on $Y_{\text {étale }}$ is the equalizer of the two maps

$$
\Pi_{i=1, \ldots, n} \mathcal{O}_{Y} \xrightarrow[b]{\stackrel{a}{\longrightarrow}} \Pi_{j=1, \ldots, n} \mathcal{O}_{Y}
$$

where $b\left(h_{1}, \ldots, h_{n}\right)=0$ and $a\left(h_{1}, \ldots, h_{n}\right)=\left(P_{1}\left(h_{1}, \ldots, h_{n}\right), \ldots, P_{n}\left(h_{1}, \ldots, h_{n}\right)\right)$. Since $g^{-1}$ is exact we conclude that the top row of the following solid commutative diagram is an equalizer diagram as well:

Here $b^{\prime}$ is the zero map and $a^{\prime}$ is the map defined by the images $P_{i}^{\prime}=\varphi\left(P_{i}\right) \in$ $A\left[x_{1}, \ldots, x_{n}\right]$ via the same rule $a^{\prime}\left(h_{1}, \ldots, h_{n}\right)=\left(P_{1}^{\prime}\left(h_{1}, \ldots, h_{n}\right), \ldots, P_{n}^{\prime}\left(h_{1}, \ldots, h_{n}\right)\right)$. that $a$ was defined by. The commutativity of the diagram follows from the fact that $\varphi=g^{\sharp}$ on global sections. The lower row is an equalizer diagram also, by exactly the same arguments as before since $X \times_{Y} V$ is the affine scheme $\operatorname{Spec}\left(A \otimes_{B} C\right)$ and $A \otimes_{B} C=A\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}^{\prime}, \ldots, P_{n}^{\prime}\right)$. Thus we obtain a unique dotted arrow $g^{-1} h_{V} \rightarrow h_{X \times_{Y} V}$ fitting into the diagram

We claim that the map of sheaves $g^{-1} h_{V} \rightarrow h_{X \times_{Y} V}$ is an isomorphism. Since the small étale site of $X$ has enough points (Theorem49.29.10) it suffices to prove this on stalks. Hence let $\bar{x}$ be a geometric point of $X$, and denote $p$ the associate point of the small étale topos of $X$. Set $q=g \circ p$. This is a point of the small étale topos of $Y$. By Lemma 49.29.12 we see that $q$ corresponds to a geometric point $\bar{y}$ of $Y$. Consider the map of stalks

$$
\left(g^{\sharp}\right)_{p}: \mathcal{O}_{Y, \bar{y}}=\mathcal{O}_{Y, q}=\left(g^{-1} \mathcal{O}_{Y}\right)_{p} \longrightarrow \mathcal{O}_{X, p}=\mathcal{O}_{X, \bar{x}}
$$

Since $\left(g, g^{\sharp}\right)$ is a morphism of locally ringed topoi $\left(g^{\sharp}\right)_{p}$ is a local ring homomorphism of strictly henselian local rings. Applying localization to the big commutative diagram above and Algebra, Lemma 10.148.31 we conclude that $\left(g^{-1} h_{V}\right)_{p} \rightarrow$ $\left(h_{X \times_{Y} V}\right)_{p}$ is an isomorphism as desired.

We claim that the isomorphisms $g^{-1} h_{V} \rightarrow h_{X \times_{Y} V}$ are functorial. Namely, suppose that $V_{1} \rightarrow V_{2}$ is a morphism of affine schemes étale over $Y$. Write $V_{i}=\operatorname{Spec}\left(C_{i}\right)$ with

$$
C_{i}=B\left[x_{i, 1}, \ldots, x_{i, n_{i}}\right] /\left(P_{i, 1}, \ldots, P_{i, n_{i}}\right)
$$

The morphism $V_{1} \rightarrow V_{2}$ is given by a $B$-algebra map $C_{2} \rightarrow C_{1}$ which in turn is given by some polynomials $Q_{j} \in B\left[x_{1,1}, \ldots, x_{1, n_{1}}\right]$ for $j=1, \ldots, n_{2}$. Then it is an
easy matter to show that the diagram of sheaves

is commutative, and pulling back to $X_{\text {étale }}$ we obtain the solid commutative diagram

where $Q_{j}^{\prime} \in A\left[x_{1,1}, \ldots, x_{1, n_{1}}\right]$ is the image of $Q_{j}$ via $\varphi$. Since the dotted arrows exist, make the two squares commute, and the horizontal arrows are injective we see that the whole diagram commutes. This proves functoriality (and also that the construction of $g^{-1} h_{V} \rightarrow h_{X \times_{Y} V}$ is independent of the choice of the presentation, although we strictly speaking do not need to show this).

At this point we are able to show that $f_{\text {small }, *} \cong g_{*}$. Namely, let $\mathcal{F}$ be a sheaf on $X_{\text {étale }}$. For every $V \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ affine we have

$$
\begin{aligned}
\left(g_{*} \mathcal{F}\right)(V) & =\operatorname{Mor}_{S h\left(Y_{\text {étale }}\right)}\left(h_{V}, g_{*} \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h\left(X_{\text {étale }}\right)}\left(g^{-1} h_{V}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h\left(X_{\text {étale }}\right)}\left(h_{X \times_{Y} V}, \mathcal{F}\right) \\
& =\mathcal{F}\left(X \times_{Y} V\right) \\
& =f_{\text {small }, *} \mathcal{F}(V)
\end{aligned}
$$

where in the third equality we use the isomorphism $g^{-1} h_{V} \cong h_{X \times_{Y} V}$ constructed above. These isomorphisms are clearly functorial in $\mathcal{F}$ and functorial in $V$ as the isomorphisms $g^{-1} h_{V} \cong h_{X_{Y} V}$ are functorial. Now any sheaf on $Y_{\text {étale }}$ is determined by the restriction to the subcategory of affine schemes (Lemma 49.21.2), and hence we obtain an isomorphism of functors $f_{\text {small }, *} \cong g_{*}$ as desired.

Finally, we have to check that, via the isomorphism $f_{\text {small,* }} \cong g_{*}$ above, the maps $f_{\text {small }}^{\sharp}$ and $g^{\sharp}$ agree. By construction this is already the case for the global sections of $\mathcal{O}_{Y}$, i.e., for the elements of $B$. We only need to check the result on sections over an affine $V$ étale over $Y$ (by Lemma 49.21.2 again). Writing $V=\operatorname{Spec}(C)$, $C=B\left[x_{i}\right] /\left(P_{j}\right)$ as before it suffices to check that the coordinate functions $x_{i}$ are mapped to the same sections of $\mathcal{O}_{X}$ over $X \times_{Y} V$. And this is exactly what it
means that the diagram

commutes. Thus the lemma is proved.
Here is a version for general schemes.
0417 Theorem 49.41.5. Let $X, Y$ be schemes. Let

$$
\left(g, g^{\#}\right):\left(S h\left(X_{e ́ t a l e}\right), \mathcal{O}_{X}\right) \longrightarrow\left(S h\left(Y_{\text {étale }}\right), \mathcal{O}_{Y}\right)
$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of schemes $f: X \rightarrow Y$ such that $\left(g, g^{\#}\right)$ is isomorphic to $\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right)$. In other words, the construction

$$
\text { Sch } \longrightarrow \text { Locally ringed topoi, } \quad X \longrightarrow\left(X_{\text {étale }}, \mathcal{O}_{X}\right)
$$

is fully faithful (morphisms up to 2 -isomorphisms on the right hand side).
Proof. You can prove this theorem by carefuly adjusting the arguments of the proof of Lemma 49.41 .4 to the global setting. However, we want to indicate how we can glue the result of that lemma to get a global morphism due to the rigidity provided by the result of Lemma 49.41.2 Unfortunately, this is a bit messy.

Let us prove existence when $Y$ is affine. In this case choose an affine open covering $X=\bigcup U_{i}$. For each $i$ the inclusion morphism $j_{i}: U_{i} \rightarrow X$ induces a morphism of locally ringed topoi $\left(j_{i, \text { small }}, j_{i, \text { small }}^{\sharp}\right):\left(S h\left(U_{i, \text { étale }}\right), \mathcal{O}_{U_{i}}\right) \rightarrow\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right)$ by Lemma 49.41.1. We can compose this with $\left(g, g^{\sharp}\right)$ to obtain a morphism of locally ringed topoi

$$
\left(g, g^{\sharp}\right) \circ\left(j_{i, \text { small }}, j_{i, \text { small }}^{\sharp}\right):\left(S h\left(U_{i, \text { étale }}\right), \mathcal{O}_{U_{i}}\right) \rightarrow\left(S h\left(X_{\text {étale }}\right), \mathcal{O}_{X}\right)
$$

see Modules on Sites, Lemma 18.39.10 By Lemma 49.41 .4 there exists a unique morphism of schemes $f_{i}: U_{i} \rightarrow Y$ and a 2 -isomorphism

$$
t_{i}:\left(f_{i, \text { small }}, f_{i, \text { small }}^{\sharp}\right) \longrightarrow\left(g, g^{\sharp}\right) \circ\left(j_{i, \text { small }}, j_{i, \text { small }}^{\sharp}\right) .
$$

Set $U_{i, i^{\prime}}=U_{i} \cap U_{i^{\prime}}$, and denote $j_{i, i^{\prime}}: U_{i, i^{\prime}} \rightarrow U_{i}$ the inclusion morphism. Since we have $j_{i} \circ j_{i, i^{\prime}}=j_{i^{\prime}} \circ j_{i^{\prime}, i}$ we see that

$$
\begin{aligned}
& \left(g, g^{\sharp}\right) \circ\left(j_{i, \text { small }}, j_{i, \text { small }}^{\sharp}\right) \circ\left(j_{i, i^{\prime}, \text { small }}, j_{i, i^{\prime}, \text { small }}^{\sharp}\right)= \\
& \left(g, g^{\sharp}\right) \circ\left(j_{i^{\prime}, \text { small }}, j_{i^{\prime}, \text { small }}^{\sharp}\right) \circ\left(j_{i^{\prime}, i, \text { small }} j_{i^{\prime}, i, \text { small }}^{\sharp}\right)
\end{aligned}
$$

Hence by uniqueness (see Lemma 49.41.3) we conclude that $f_{i} \circ j_{i, i^{\prime}}=f_{i^{\prime}} \circ j_{i^{\prime}, i}$, in other words the morphisms of schemes $f_{i}=f \circ j_{i}$ are the restrictions of a global morphism of schemes $f: X \rightarrow Y$. Consider the diagram of 2-isomorphisms (where we drop the components $\#$ to ease the notation)

The notation $\star$ indicates horizontal composition, see Categories, Definition 4.28.1 in general and Sites, Section 7.35 for our particular case. By the result of Lemma 49.41 .2 this diagram commutes. Hence for any sheaf $\mathcal{G}$ on $Y_{\text {étale }}$ the isomorphisms $t_{i}:\left.\left.f_{\text {small }}^{-1} \mathcal{G}\right|_{U_{i}} \rightarrow g^{-1} \mathcal{G}\right|_{U_{i}}$ agree over $U_{i, i^{\prime}}$ and we obtain a global isomorphism $t: f_{\text {small }}^{-1} \mathcal{G} \rightarrow g^{-1} \mathcal{G}$. It is clear that this isomorphism is functorial in $\mathcal{G}$ and is compatible with the maps $f_{\text {small }}^{\sharp}$ and $g^{\sharp}$ (because it is compatible with these maps locally). This proves the theorem in case $Y$ is affine.
In the general case, let $V \subset Y$ be an affine open. Then $h_{V}$ is a subsheaf of the final sheaf $*$ on $Y_{\text {étale }}$. As $g$ is exact we see that $g^{-1} h_{V}$ is a subsheaf of the final sheaf on $X_{\text {étale }}$. Hence by Lemma 49.31.1 there exists an open subscheme $W \subset X$ such that $g^{-1} h_{V}=h_{W}$. By Modules on Sites, Lemma 18.39 .12 there exists a commutative diagram of morphisms of locally ringed topoi

where the horizontal arrows are the localization morphisms (induced by the inclusion morphisms $V \rightarrow Y$ and $W \rightarrow X$ ) and where $g^{\prime}$ is induced from $g$. By the result of the preceding paragraph we obtain a morphism of schemes $f^{\prime}: W \rightarrow V$ and a 2-isomorphism $t:\left(f_{\text {small }}^{\prime},\left(f_{\text {small }}^{\prime}\right)^{\sharp}\right) \rightarrow\left(g^{\prime},\left(g^{\prime}\right)^{\sharp}\right)$. Exactly as before these morphisms $f^{\prime}$ (for varying affine opens $V \subset Y$ ) agree on overlaps by uniqueness, so we get a morphism $f: X \rightarrow Y$. Moreover, the 2 -isomorphisms $t$ are compatible on overlaps by Lemma 49.41.2 again and we obtain a global 2-isomorphism $\left(f_{\text {small }},\left(f_{\text {small }}\right)^{\sharp}\right) \rightarrow\left(g,(g)^{\sharp}\right)$. as desired. Some details omitted.

### 49.42. Push and pull

04C6 Let $f: X \rightarrow Y$ be a morphism of schemes. Here is a list of conditions we will consider in the following:
(A) For every étale morphism $U \rightarrow X$ and $u \in U$ there exist an étale morphism $V \rightarrow Y$ and a disjoint union decomposition $X \times_{Y} V=W \amalg W^{\prime}$ and a morphism $h: W \rightarrow U$ over $X$ with $u$ in the image of $h$.
(B) For every $V \rightarrow Y$ étale, and every étale covering $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$ there exists an étale covering $\left\{V_{j} \rightarrow V\right\}$ such that for each $j$ we have $X \times_{Y} V_{j}=$ $\coprod W_{j i}$ where $W_{i j} \rightarrow X \times_{Y} V$ factors through $U_{i} \rightarrow X \times_{Y} V$ for some $i$.
(C) For every $U \rightarrow X$ étale, there exists a $V \rightarrow Y$ étale and a surjective morphism $X \times_{Y} V \rightarrow U$ over $X$.
It turns out that each of these properties has meaning in terms of the behaviour of the functor $f_{\text {small,** }}$. We will work this out in the next few sections.

### 49.43. Property (A)

04DJ Please see Section 49.42 for the definition of propery (A).
04DK Lemma 49.43.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume (A).
(1) $f_{\text {small,** }}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ reflects injections and surjections,
(2) $f_{\text {small }}^{-1} f_{\text {small }, *} \mathcal{F} \rightarrow \mathcal{F}$ is surjective for any abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$,
(3) $f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ is faithful.

Proof. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. Let $U$ be an object of $X_{\text {étale }}$. By assumption we can find a covering $\left\{W_{i} \rightarrow U\right\}$ in $X_{\text {étale }}$ such that each $W_{i}$ is an open and closed subscheme of $X \times_{Y} V_{i}$ for some object $V_{i}$ of $Y_{\text {étale }}$. The sheaf condition shows that

$$
\mathcal{F}(U) \subset \prod \mathcal{F}\left(W_{i}\right)
$$

and that $\mathcal{F}\left(W_{i}\right)$ is a direct summand of $\mathcal{F}\left(X \times_{Y} V_{i}\right)=f_{\text {small,* }} \mathcal{F}\left(V_{i}\right)$. Hence it is clear that $f_{\text {small,* }}$ reflects injections.

Next, suppose that $a: \mathcal{G} \rightarrow \mathcal{F}$ is a map of abelian sheaves such that $f_{\text {small,* }} a$ is surjective. Let $s \in \mathcal{F}(U)$ with $U$ as above. With $W_{i}, V_{i}$ as above we see that it suffices to show that $\left.s\right|_{W_{i}}$ is étale locally the image of a section of $\mathcal{G}$ under a. Since $\mathcal{F}\left(W_{i}\right)$ is a direct summand of $\mathcal{F}\left(X \times_{Y} V_{i}\right)$ it suffices to show that for any $V \in \mathrm{Ob}\left(Y_{\text {étale }}\right)$ any element $s \in \mathcal{F}\left(X \times_{Y} V\right)$ is étale locally on $X \times_{Y} V$ the image of a section of $\mathcal{G}$ under $a$. Since $\mathcal{F}\left(X \times_{Y} V\right)=f_{\text {small,* }} \mathcal{F}(V)$ we see by assumption that there exists a covering $\left\{V_{j} \rightarrow V\right\}$ such that $s$ is the image of $s_{j} \in f_{\text {small }, *} \mathcal{G}\left(V_{j}\right)=\mathcal{G}\left(X \times_{Y} V_{j}\right)$. This proves $f_{\text {small,* }}$ reflects surjections.
Parts (2), (3) follow formally from part (1), see Modules on Sites, Lemma 18.15.1.

04DL Lemma 49.43.2. Let $f: X \rightarrow Y$ be a separated locally quasi-finite morphism of schemes. Then property (A) above holds.

Proof. Let $U \rightarrow X$ be an étale morphism and $u \in U$. The geometric statement (A) reduces directly to the case where $U$ and $Y$ are affine schemes. Denote $x \in X$ and $y \in Y$ the images of $u$. Since $X \rightarrow Y$ is locally quasi-finite, and $U \rightarrow X$ is locally quasi-finite (see Morphisms, Lemma 28.36.6) we see that $U \rightarrow Y$ is locally quasifinite (see Morphisms, Lemma 28.20.12). Moreover both $X \rightarrow Y$ and $U \rightarrow Y$ are separated. Thus More on Morphisms, Lemma 36.30 .5 applies to both morphisms. This means we may pick an étale neighbourhood $(V, v) \rightarrow(Y, y)$ such that

$$
X \times_{Y} V=W \amalg R, \quad U \times_{Y} V=W^{\prime} \amalg R^{\prime}
$$

and points $w \in W, w^{\prime} \in W^{\prime}$ such that
(1) $W, R$ are open and closed in $X \times_{Y} V$,
(2) $W^{\prime}, R^{\prime}$ are open and closed in $U \times_{Y} V$,
(3) $W \rightarrow V$ and $W^{\prime} \rightarrow V$ are finite,
(4) $w, w^{\prime}$ map to $v$,
(5) $\kappa(v) \subset \kappa(w)$ and $\kappa(v) \subset \kappa\left(w^{\prime}\right)$ are purely inseparable, and
(6) no other point of $W$ or $W^{\prime}$ maps to $v$.

Here is a commutative diagram

After shrinking $V$ we may assume that $W^{\prime}$ maps into $W$ : just remove the image the inverse image of $R$ in $W^{\prime}$; this is a closed set (as $W^{\prime} \rightarrow V$ is finite) not containing
$v$. Then $W^{\prime} \rightarrow W$ is finite because both $W \rightarrow V$ and $W^{\prime} \rightarrow V$ are finite. Hence $W^{\prime} \rightarrow W$ is finite étale, and there is exactly one point in the fibre over $w$ with $\kappa(w)=\kappa\left(w^{\prime}\right)$. Hence $W^{\prime} \rightarrow W$ is an isomorphism in an open neighbourhood $W^{\circ}$ of $w$, see Étale Morphisms, Lemma 40.14.2. Since $W \rightarrow V$ is finite the image of $W \backslash W^{\circ}$ is a closed subset $T$ of $V$ not containing $v$. Thus after replacing $V$ by $V \backslash T$ we may assume that $W^{\prime} \rightarrow W$ is an isomorphism. Now the decomposition $X \times_{Y} V=W \amalg R$ and the morphism $W \rightarrow U$ are as desired and we win.

04DM Lemma 49.43.3. Let $f: X \rightarrow Y$ be an integral morphism of schemes. Then property (A) holds.

Proof. Let $U \rightarrow X$ be étale, and let $u \in U$ be a point. We have to find $V \rightarrow Y$ étale, a disjoint union decomposition $X \times_{Y} V=W \amalg W^{\prime}$ and an $X$-morphism $W \rightarrow$ $U$ with $u$ in the image. We may shrink $U$ and $Y$ and assume $U$ and $Y$ are affine. In this case also $X$ is affine, since an integral morphism is affine by definition. Write $Y=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$ and $U=\operatorname{Spec}(C)$. Then $A \rightarrow B$ is an integral ring map, and $B \rightarrow C$ is an étale ring map. By Algebra, Lemma 10.141 .3 we can find a finite $A$-subalgebra $B^{\prime} \subset B$ and an étale ring map $B^{\prime} \rightarrow C^{\prime}$ such that $C=B \otimes_{B^{\prime}} C^{\prime}$. Thus the question reduces to the étale morphism $U^{\prime}=\operatorname{Spec}\left(C^{\prime}\right) \rightarrow X^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ over the finite morphism $X^{\prime} \rightarrow Y$. In this case the result follows from Lemma 49.43.2.

04C9 Lemma 49.43.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Denote $f_{\text {small }}$ : $S h\left(X_{\text {étale }}\right) \rightarrow S h\left(Y_{\text {étale }}\right)$ the associated morphism of small étale topoi. Assume at least one of the following
(1) $f$ is integral, or
(2) $f$ is separated and locally quasi-finite.

Then the functor $f_{\text {small,* }}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ has the following properties
(1) the map $f_{\text {small }}^{-1} f_{\text {small }, *} \mathcal{F} \rightarrow \mathcal{F}$ is always surjective,
(2) $f_{\text {small,* }}$ is faithful, and
(3) $f_{\text {small,* }}$ reflects injections and surjections.

Proof. Combine Lemmas 49.43.2, 49.43.3, and 49.43.1.

### 49.44. Property (B)

04DN Please see Section 49.42 for the definition of propery (B).
04DO Lemma 49.44.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume (B) holds. Then the functor $f_{\text {small,* }}: \operatorname{Sh}\left(X_{\text {étale }}\right) \rightarrow$ Sh $\left(Y_{\text {étale }}\right)$ transforms surjections into surjections.

Proof. This follows from Sites, Lemma 7.40.2
04DP Lemma 49.44.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Suppose
(1) $V \rightarrow Y$ is an étale morphism of schemes,
(2) $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$ is an étale covering, and
(3) $v \in V$ is a point.

Assume that for any such data there exists an étale neighbourhood $\left(V^{\prime}, v^{\prime}\right) \rightarrow(V, v)$, a disjoint union decomposition $X \times_{Y} V^{\prime}=\coprod W_{i}^{\prime}$, and morphisms $W_{i}^{\prime} \rightarrow U_{i}$ over $X \times_{Y} V$. Then property (B) holds.

Proof. Omitted.
04DQ Lemma 49.44.3. Let $f: X \rightarrow Y$ be a finite morphism of schemes. Then property (B) holds.

Proof. Consider $V \rightarrow Y$ étale, $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$ an étale covering, and $v \in V$. We have to find a $V^{\prime} \rightarrow V$ and decomposition and maps as in Lemma 49.44.2. We may shrink $V$ and $Y$, hence we may assume that $V$ and $Y$ are affine. Since $X$ is finite over $Y$, this also implies that $X$ is affine. During the proof we may (finitely often) replace $(V, v)$ by an étale neighbourhood $\left(V^{\prime}, v^{\prime}\right)$ and correspondingly the covering $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$ by $\left\{V^{\prime} \times_{V} U_{i} \rightarrow X \times_{Y} V^{\prime}\right\}$.

Since $X \times_{Y} V \rightarrow V$ is finite there exist finitely many (pairwise distinct) points $x_{1}, \ldots, x_{n} \in X \times_{Y} V$ mapping to $v$. We may apply More on Morphisms, Lemma 36.30 .5 to $X \times_{Y} V \rightarrow V$ and the points $x_{1}, \ldots, x_{n}$ lying over $v$ and find an étale neighbourhood $\left(V^{\prime}, v^{\prime}\right) \rightarrow(V, v)$ such that

$$
X \times_{Y} V^{\prime}=R \amalg \coprod T_{a}
$$

with $T_{a} \rightarrow V^{\prime}$ finite with exactly one point $p_{a}$ lying over $v^{\prime}$ and moreover $\kappa\left(v^{\prime}\right) \subset$ $\kappa\left(p_{a}\right)$ purely inseparable, and such that $R \rightarrow V^{\prime}$ has empty fibre over $v^{\prime}$. Because $X \rightarrow Y$ is finite, also $R \rightarrow V^{\prime}$ is finite. Hence after shrinking $V^{\prime}$ we may assume that $R=\emptyset$. Thus we may assume that $X \times_{Y} V=X_{1} \amalg \ldots \amalg X_{n}$ with exactly one point $x_{l} \in X_{l}$ lying over $v$ with moreover $\kappa(v) \subset \kappa\left(x_{l}\right)$ purely inseparable. Note that this property is preserved under refinement of the étale neighbourhood $(V, v)$.

For each $l$ choose an $i_{l}$ and a point $u_{l} \in U_{i_{l}}$ mapping to $x_{l}$. Now we apply property (A) for the finite morphism $X \times_{Y} V \rightarrow V$ and the étale morphisms $U_{i_{l}} \rightarrow X \times_{Y} V$ and the points $u_{l}$. This is permissible by Lemma 49.43.3 This gives produces an étale neighbourhood $\left(V^{\prime}, v^{\prime}\right) \rightarrow(V, v)$ and decompositions

$$
X \times_{Y} V^{\prime}=W_{l} \amalg R_{l}
$$

and $X$-morphisms $a_{l}: W_{l} \rightarrow U_{i_{l}}$ whose image contains $u_{i_{l}}$. Here is a picture:

After replacing $(V, v)$ by $\left(V^{\prime}, v^{\prime}\right)$ we conclude that each $x_{l}$ is contained in an open and closed neighbourhood $W_{l}$ such that the inclusion morphism $W_{l} \rightarrow X \times_{Y} V$ factors through $U_{i} \rightarrow X \times_{Y} V$ for some $i$. Replacing $W_{l}$ by $W_{l} \cap X_{l}$ we see that these open and closed sets are disjoint and moreover that $\left\{x_{1}, \ldots, x_{n}\right\} \subset$ $W_{1} \cup \ldots \cup W_{n}$. Since $X \times_{Y} V \rightarrow V$ is finite we may shrink $V$ and assume that $X \times_{Y} V=W_{1} \amalg \ldots \amalg W_{n}$ as desired.

04DR Lemma 49.44.4. Let $f: X \rightarrow Y$ be an integral morphism of schemes. Then property (B) holds.

Proof. Consider $V \rightarrow Y$ étale, $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$ an étale covering, and $v \in V$. We have to find a $V^{\prime} \rightarrow V$ and decomposition and maps as in Lemma 49.44.2. We may shrink $V$ and $Y$, hence we may assume that $V$ and $Y$ are affine. Since $X$ is integral over $Y$, this also implies that $X$ and $X \times_{Y} V$ are affine. We may refine the covering $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$, and hence we may assume that $\left\{U_{i} \rightarrow X \times_{Y} V\right\}_{i=1, \ldots, n}$ is a standard étale covering. Write $Y=\operatorname{Spec}(A), X=\operatorname{Spec}(B), V=\operatorname{Spec}(C)$, and $U_{i}=\operatorname{Spec}\left(B_{i}\right)$. Then $A \rightarrow B$ is an integral ring map, and $B \otimes_{A} C \rightarrow B_{i}$ are étale ring maps. By Algebra, Lemma 10.141 .3 we can find a finite $A$-subalgebra $B^{\prime} \subset B$ and an étale ring map $B^{\prime} \otimes_{A} C \rightarrow B_{i}^{\prime}$ for $i=1, \ldots, n$ such that $B_{i}=B \otimes_{B^{\prime}} B_{i}^{\prime}$. Thus the question reduces to the étale covering $\left\{\operatorname{Spec}\left(B_{i}^{\prime}\right) \rightarrow X^{\prime} \times_{Y} V\right\}_{i=1, \ldots, n}$ with $X^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ finite over $Y$. In this case the result follows from Lemma 49.44 .3

04C2 Lemma 49.44.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $f$ is integral (for example finite). Then
(1) $f_{\text {small,* }}$ transforms surjections into surjections (on sheaves of sets and on abelian sheaves),
(2) $f_{\text {small }}^{-1} f_{\text {small }, *} \mathcal{F} \rightarrow \mathcal{F}$ is surjective for any abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$,
(3) $f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ is faithful and reflects injections and surjections, and
(4) $f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ is exact.

Proof. Parts (2), (3) we have seen in Lemma 49.43.4. Part (1) follows from Lemmas 49.44.4 and 49.44.1. Part (4) is a consequence of part (1), see Modules on Sites, Lemma 18.15.2

### 49.45. Property (C)

04DS Please see Section 49.42 for the definition of propery (C).
04DT Lemma 49.45.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume (C) holds. Then the functor $f_{\text {small }, *}: S h\left(X_{\text {étale }}\right) \rightarrow$ Sh $\left(Y_{\text {étale }}\right)$ reflects injections and surjections.
Proof. Follows from Sites, Lemma 7.40.4. We omit the verification that property (C) implies that the functor $Y_{\text {étale }} \rightarrow X_{\text {étale }}, V \mapsto X \times_{Y} V$ satisfies the assumption of Sites, Lemma 7.40.4

04DU Remark 49.45.2. Property (C) holds if $f: X \rightarrow Y$ is an open immersion. Namely, if $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$, then we can view $U$ also as an object of $Y_{\text {étale }}$ and $U \times_{Y} X=U$. Hence property (C) does not imply that $f_{s m a l l, *}$ is exact as this is not the case for open immersions (in general).

04DV Lemma 49.45.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that for any $V \rightarrow Y$ étale we have that
(1) $X \times_{Y} V \rightarrow V$ has property (C), and
(2) $X \times_{Y} V \rightarrow V$ is closed.

Then the functor $Y_{\text {étale }} \rightarrow X_{\text {étale }}, V \mapsto X \times_{Y} V$ is almost cocontinuous, see Sites, Definition 7.41.3.
Proof. Let $V \rightarrow Y$ be an object of $Y_{\text {étale }}$ and let $\left\{U_{i} \rightarrow X \times_{Y} V\right\}_{i \in I}$ be a covering of $X_{\text {étale }}$. By assumption (1) for each $i$ we can find an étale morphism $h_{i}: V_{i} \rightarrow V$
and a surjective morphism $X \times_{Y} V_{i} \rightarrow U_{i}$ over $X \times_{Y} V$. Note that $\bigcup h_{i}\left(V_{i}\right) \subset V$ is an open set containing the closed set $Z=\operatorname{Im}\left(X \times_{Y} V \rightarrow V\right)$. Let $h_{0}: V_{0}=V \backslash Z \rightarrow V$ be the open immersion. It is clear that $\left\{V_{i} \rightarrow V\right\}_{i \in I \cup\{0\}}$ is an étale covering such that for each $i \in I \cup\{0\}$ we have either $V_{i} \times_{Y} X=\emptyset$ (namely if $i=0$ ), or $V_{i} \times_{Y} X \rightarrow V \times_{Y} X$ factors through $U_{i} \rightarrow X \times_{Y} V$ (if $\left.i \neq 0\right)$. Hence the functor $Y_{\text {étale }} \rightarrow X_{\text {étale }}$ is almost cocontinuous.

04DW Lemma 49.45.4. Let $f: X \rightarrow Y$ be an integral morphism of schemes which defines a homeomorphism of $X$ with a closed subset of $Y$. Then property ( $C$ ) holds.

Proof. Let $g: U \rightarrow X$ be an étale morphism. We need to find an object $V \rightarrow Y$ of $Y_{\text {étale }}$ and a surjective morphism $X \times_{Y} V \rightarrow U$ over $X$. Suppose that for every $u \in U$ we can find an object $V_{u} \rightarrow Y$ of $Y_{\text {étale }}$ and a morphism $h_{u}: X \times_{Y} V_{u} \rightarrow U$ over $X$ with $u \in \operatorname{Im}\left(h_{u}\right)$. Then we can take $V=\coprod V_{u}$ and $h=\coprod h_{u}$ and we win. Hence given a point $u \in U$ we find a pair $\left(V_{u}, h_{u}\right)$ as above. To do this we may shrink $U$ and assume that $U$ is affine. In this case $g: U \rightarrow X$ is locally quasi-finite. Let $g^{-1}(g(\{u\}))=\left\{u, u_{2}, \ldots, u_{n}\right\}$. Since there are no specializations $u_{i} \rightsquigarrow u$ we may replace $U$ by an affine neighbourhood so that $g^{-1}(g(\{u\}))=\{u\}$.

The image $g(U) \subset X$ is open, hence $f(g(U))$ is locally closed in $Y$. Choose an open $V \subset Y$ such that $f(g(U))=f(X) \cap V$. It follows that $g$ factors through $X \times_{Y} V$ and that the resulting $\left\{U \rightarrow X \times_{Y} V\right\}$ is an étale covering. Since $f$ has property (B), see Lemma 49.44.4, we see that there exists an étale covering $\left\{V_{j} \rightarrow V\right\}$ such that $X \times_{Y} V_{j} \rightarrow X \times_{Y} V$ factor through $U$. This implies that $V^{\prime}=\coprod V_{j}$ is étale over $Y$ and that there is a morphism $h: X \times_{Y} V^{\prime} \rightarrow U$ whose image surjects onto $g(U)$. Since $u$ is the only point in its fibre it must be in the image of $h$ and we win.

We urge the reader to think of the following lemma as a way station ${ }^{3}$ on the journey towards the ultimate truth regarding $f_{\text {small,* }}$ for integral universally injective morphisms.

04DX Lemma 49.45.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that $f$ is universally injective and integral (for example a closed immersion). Then
(1) $f_{\text {small,** }}: S h\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(Y_{\text {étale }}\right)$ reflects injections and surjections,
(2) $f_{\text {small,* }}: S h\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(Y_{\text {étale }}\right)$ commutes with pushouts and coequalizers (and more generally finite connected colimits),
(3) $f_{\text {small,* }}$ transforms surjections into surjections (on sheaves of sets and on abelian sheaves),
(4) the map $f_{\text {small }}^{-1} f_{\text {small }, *} \mathcal{F} \rightarrow \mathcal{F}$ is surjective for any sheaf (of sets or of abelian groups) $\mathcal{F}$ on $X_{\text {étale }}$,
(5) the functor $f_{\text {small }, *}$ is faithful (on sheaves of sets and on abelian sheaves),
(6) $f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(Y_{\text {étale }}\right)$ is exact, and
(7) the functor $Y_{\text {étale }} \rightarrow X_{\text {étale }}, V \mapsto X \times_{Y} V$ is almost cocontinuous.

Proof. By Lemmas 49.43.3, 49.44.4 and 49.45 .4 we know that the morphism $f$ has properties (A), (B), and (C). Moreover, by Lemma 49.45.3 we know that the functor $Y_{\text {étale }} \rightarrow X_{\text {étale }}$ is almost cocontinuous. Now we have
(1) property (C) implies (1) by Lemma 49.45.1,
(2) almost continuous implies (2) by Sites, Lemma 7.41.6,

[^130](3) property (B) implies (3) by Lemma 49.44.1.

Properties (4), (5), and (6) follow formally from the first three, see Sites, Lemma 7.40 .1 and Modules on Sites, Lemma 18.15.2. Property (7) we saw above.

### 49.46. Topological invariance of the small étale site

04DY In the following theorem we show that the small étale site is a topological invariant in the following sense: If $f: X \rightarrow Y$ is a morphism of schemes which is a universal homeomorphism, then $X_{\text {étale }} \cong Y_{\text {étale }}$ as sites. This improves the result of Étale Morphisms, Theorem 40.15.2

04DZ Theorem 49.46.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $f$ is integral, universally injective and surjective (i.e., $f$ is a universal homeomorphism, see Morphisms, Lemma 28.44.3). The functor

$$
V \longmapsto V_{X}=X \times_{Y} V
$$

defines an equivalence of categories

$$
\{\text { schemes } V \text { étale over } Y\} \leftrightarrow\{\text { schemes } U \text { étale over } X\}
$$

Proof. We claim that it suffices to prove that the functor defines an equivalence
04E0 (49.46.1.1) $\quad$ affine schemes $V$ étale over $Y\} \leftrightarrow\{$ affine schemes $U$ étale over $X\}$
when $X$ and $Y$ are affine. We omit the proof of this claim.
Assume $X$ and $Y$ affine. Let us prove 49.46.1.1) is fully faithful. Suppose that $V, V^{\prime}$ are affine schemes étale over $Y$, and that $\varphi: V_{X} \rightarrow V_{X}^{\prime}$ is a morphism over $X$. To prove that $\varphi=\psi_{X}$ for some $\psi: V \rightarrow V^{\prime}$ over $Y$ we may work locally on $V$. The graph

$$
\Gamma_{\varphi} \subset\left(V \times_{Y} V^{\prime}\right)_{X}
$$

of $\varphi$ is an open and closed subscheme, see Étale Morphisms, Proposition 40.6.1. Since $f$ is a universal homeomorphism we see that there exists an open and closed subscheme $\Gamma \subset V \times_{Y} V^{\prime}$ with $\Gamma_{X}=\Gamma_{\varphi}$. We see that $\Gamma$ is an affine scheme endowed with an étale, universally injective, and surjective morphism $\Gamma \rightarrow V$. This implies that $\Gamma \rightarrow V$ is an isomorphism (see Étale Morphisms, Theorem 40.14.1, and hence $\Gamma$ is the graph of a morphism $\psi: V \rightarrow V^{\prime}$ over $Y$ as desired.

Let us prove 49.46.1.1 is essentially surjective. Let $U \rightarrow X$ be an affine scheme étale over $X$. We have to find $V \rightarrow Y$ étale (and affine) such that $X \times_{Y} V$ is isomorphic to $U$ over $X$. Note that an étale morphism of affines has universally bounded fibres, see Morphisms, Lemmas 28.36.6 and 28.51.8. Hence we can do induction on the integer $n$ bounding the degree of the fibres of $U \rightarrow X$. See Morphisms, Lemma 28.51.7 for a description of this integer in the case of an étale morphism. If $n=1$, then $U \rightarrow X$ is an open immersion (see Étale Morphisms, Theorem 40.14.1), and the result is clear. Assume $n>1$.

By Lemma 49.45 .4 there exists an étale morphism of schemes $W \rightarrow Y$ and a surjective morphism $W_{X} \rightarrow U$ over $X$. As $U$ is quasi-compact we may replace $W$ by a disjoint union of finitely many affine opens of $W$, hence we may assume that
$W$ is affine as well. Here is a diagram

The disjoint union decomposition arises because by construction the étale morphism of affine schemes $U \times_{Y} W \rightarrow W_{X}$ has a section. OK, and now we see that the morphism $R \rightarrow X \times_{Y} W$ is an étale morphism of affine schemes whose fibres have degree universally bounded by $n-1$. Hence by induction assumption there exists a scheme $V^{\prime} \rightarrow W$ étale such that $R \cong W_{X} \times_{W} V^{\prime}$. Taking $V^{\prime \prime}=W \amalg V^{\prime}$ we find a scheme $V^{\prime \prime}$ étale over $W$ whose base change to $W_{X}$ is isomorphic to $U \times_{Y} W$ over $X \times_{Y} W$.

At this point we can use descent to find $V$ over $Y$ whose base change to $X$ is isomorphic to $U$ over $X$. Namely, by the fully faithfulness of the functor 49.46.1.1) corresponding to the universal homeomorphism $X \times_{Y}\left(W \times_{Y} W\right) \rightarrow\left(W \times_{Y} W\right)$ there exists a unique isomorphism $\varphi: V^{\prime \prime} \times_{Y} W \rightarrow W \times_{Y} V^{\prime \prime}$ whose base change to $X \times_{Y}\left(W \times_{Y} W\right)$ is the canonical descent datum for $U \times_{Y} W$ over $X \times_{Y} W$. In particular $\varphi$ satisfies the cocycle condition. Hence by Descent, Lemma 34.33.1 we see that $\varphi$ is effective (recall that all schemes above are affine). Thus we obtain $V \rightarrow Y$ and an isomorphism $V^{\prime \prime} \cong W \times_{Y} V$ such that the canonical descent datum on $W \times_{Y} V / W / Y$ agrees with $\varphi$. Note that $V \rightarrow Y$ is étale, by Descent, Lemma 34.19.27. Moreover, there is an isomorphism $V_{X} \cong U$ which comes from descending the isomorphism
$V_{X} \times_{X} W_{X}=X \times_{Y} V \times_{Y} W=\left(X \times_{Y} W\right) \times_{W}\left(W \times_{Y} V\right) \cong W_{X} \times_{W} V^{\prime \prime} \cong U \times_{Y} W$ which we have by construction. Some details omitted.

05YX Remark 49.46.2. In the situation of Theorem 49.46.1 it is also true that $V \mapsto V_{X}$ induces an equivalence between those étale morphisms $V \rightarrow Y$ with $V$ affine and those étale morphisms $U \rightarrow X$ with $U$ affine. This follows for example from Limits, Proposition 31.10.2.

0BQN Lemma 49.46.3. In the situation of Theorem 49.46.1 it is also true that

$$
F E ́ t_{Y} \longrightarrow F E ́ t_{X}, \quad V \longmapsto V \times_{Y} X
$$

is an equivalence. Thus if $X$ and $Y$ are connected, then $f$ induces an isomorphism $\pi_{1}(X, \bar{x}) \rightarrow \pi_{1}(Y, \bar{y})$ of fundamental groups. See Fundamental Groups, Section 48.5.

Proof. Namely, suppose that $V \rightarrow Y$ is étale and that $V \times_{Y} X \rightarrow X$ is finite. Then $V \times_{Y} X \rightarrow X$ is proper hence universally closed. But as $f$ is a universal homeomorphism, it then follows formally that $V \rightarrow Y$ is universally closed. Hence $V \rightarrow Y$ is quasi-compact and universally closed hence proper. Then $V \rightarrow Y$ is proper and locally quasi-finite whence finite. Here we used Morphisms, Lemma 28.43.10, Morphisms, Definition 28.41.1, Morphisms, Lemma 28.41.10, and More on Morphisms, Lemma 36.31.4.

03SI Proposition 49.46.4 (Topological invariance of étale cohomology). Let $X_{0} \rightarrow$ $X$ be a universal homeomorphism of schemes (for example the closed immersion defined by a nilpotent sheaf of ideals). Then
(1) the étale sites $X_{\text {étale }}$ and $\left(X_{0}\right)_{\text {étale }}$ are isomorphic,
(2) the étale topoi $S h\left(X_{\text {étale }}\right)$ and $S h\left(\left(X_{0}\right)_{\text {étale }}\right)$ are equivalent, and
(3) $H_{\text {étale }}^{q}(X, \mathcal{F})=H_{\text {étale }}^{q}\left(X_{0},\left.\mathcal{F}\right|_{X_{0}}\right)$ for all $q$ and for any abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$.

Proof. The equivalence of categories $X_{\text {étale }} \rightarrow\left(X_{0}\right)_{\text {étale }}$ is given by Theorem 49.46.1. We omit the proof that under this equivalence the étale coverings correspond. Hence (1) holds. Parts (2) and (3) follow formally from (1).

### 49.47. Closed immersions and pushforward

04E1 Before stating and proving Proposition 49.47.4 in its correct generality we briefly state and prove it for closed immersions. Namely, some of the preceding arguments are quite a bit easier to follow in the case of a closed immersion and so we repeat them here in their simplified form.

In the rest of this section $i: Z \rightarrow X$ is a closed immersion. The functor

$$
S c h / X \longrightarrow S c h / Z, \quad U \longmapsto U_{Z}=Z \times_{X} U
$$

will be denoted $U \mapsto U_{Z}$ as indicated. Since being a closed immersion is preserved under arbitrary base change the scheme $U_{Z}$ is a closed subscheme of $U$.

04FV Lemma 49.47.1. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $U, U^{\prime}$ be schemes étale over $X$. Let $h: U_{Z} \rightarrow U_{Z}^{\prime}$ be a morphism over $Z$. Then there exists a diagram

$$
U \leftarrow^{a} W \xrightarrow{b} U^{\prime}
$$

such that $a_{Z}: W_{Z} \rightarrow U_{Z}$ is an isomorphism and $h=b_{Z} \circ\left(a_{Z}\right)^{-1}$.
Proof. Consider the scheme $M=U \times_{Y} U^{\prime}$. The graph $\Gamma_{h} \subset M_{Z}$ of $h$ is open. This is true for example as $\Gamma_{h}$ is the image of a section of the étale morphism $\mathrm{pr}_{1, Z}: M_{Z} \rightarrow U_{Z}$, see Étale Morphisms, Proposition 40.6.1. Hence there exists an open subscheme $W \subset M$ whose intersection with the closed subset $M_{Z}$ is $\Gamma_{h}$. Set $a=\left.\operatorname{pr}_{1}\right|_{W}$ and $b=\left.\operatorname{pr}_{2}\right|_{W}$.

04FW Lemma 49.47.2. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $V \rightarrow$ $Z$ be an étale morphism of schemes. There exist étale morphisms $U_{i} \rightarrow X$ and morphisms $U_{i, Z} \rightarrow V$ such that $\left\{U_{i, Z} \rightarrow V\right\}$ is a Zariski covering of $V$.

Proof. Since we only have to find a Zariski covering of $V$ consisting of schemes of the form $U_{Z}$ with $U$ étale over $X$, we may Zariski localize on $X$ and $V$. Hence we may assume $X$ and $V$ affine. In the affine case this is Algebra, Lemma 10.141.11.

If $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ is a geometric point of $X$, then either $\bar{x}$ factors (uniquely) through the closed subscheme $Z$, or $Z_{\bar{x}}=\emptyset$. If $\bar{x}$ factors through $Z$ we say that $\bar{x}$ is a geometric point of $Z$ (because it is) and we use the notation " $\bar{x} \in Z$ " to indicate this.

04FX Lemma 49.47.3. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $\mathcal{G}$ be $a$ sheaf of sets on $Z_{\text {étale }}$. Let $\bar{x}$ be a geometric point of $X$. Then

$$
\left(i_{s m a l l, *} \mathcal{G}\right)_{\bar{x}}=\left\{\begin{array}{cll}
* & \text { if } & \bar{x} \notin Z \\
\mathcal{F}_{\bar{x}} & \text { if } & \bar{x} \in Z
\end{array}\right.
$$

where $*$ denotes a singleton set.
Proof. Note that $\left.i_{\text {small }, *} \mathcal{G}\right|_{U_{\text {étale }}}=*$ is the final object in the category of étale sheaves on $U$, i.e., the sheaf which associates a singleton set to each scheme étale over $U$. This explains the value of $\left(i_{\text {small }, *} \mathcal{G}\right)_{\bar{x}}$ if $\bar{x} \notin Z$.
Next, suppose that $\bar{x} \in Z$. Note that

$$
\left(i_{\text {small }, *} \mathcal{G}\right)_{\bar{x}}=\operatorname{colim}_{(U, \bar{u})} \mathcal{G}\left(U_{Z}\right)
$$

and on the other hand

$$
\mathcal{G}_{\bar{x}}=\operatorname{colim}_{(V, \bar{v})} \mathcal{G}(V)
$$

Let $\mathcal{C}_{1}=\{(U, \bar{u})\}^{\text {opp }}$ be the opposite of the category of étale neighbourhoods of $\bar{x}$ in $X$, and let $\mathcal{C}_{2}=\{(V, \bar{v})\}^{o p p}$ be the opposite of the category of étale neighbourhoods of $\bar{x}$ in $Z$. The canonical map

$$
\mathcal{G}_{\bar{x}} \longrightarrow\left(i_{\text {small }, *} \mathcal{G}\right)_{\bar{x}}
$$

corresponds to the functor $F: \mathcal{C}_{1} \rightarrow \mathcal{C}_{2}, F(U, \bar{u})=\left(U_{Z}, \bar{x}\right)$. Now Lemmas 49.47.2 and 49.47.1 imply that $\mathcal{C}_{1}$ is cofinal in $\mathcal{C}_{2}$, see Categories, Definition 4.17.1. Hence it follows that the displayed arrow is an isomorphism, see Categories, Lemma 4.17.2.

04CA Proposition 49.47.4. Let $i: Z \rightarrow X$ be a closed immersion of schemes.
(1) The functor

$$
i_{\text {small }, *}: S h\left(Z_{\text {étale }}\right) \longrightarrow S h\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $X_{\text {étale }}$ whose restriction to $X \backslash Z$ is isomorphic to *, and
(2) the functor

$$
i_{\text {small }, *}: A b\left(Z_{\text {étale }}\right) \longrightarrow A b\left(X_{\text {étale }}\right)
$$

is fully faithful and its essential image is those abelian sheaves on $X_{\text {étale }}$ whose support is contained in $Z$.
In both cases $i_{\text {small }}^{-1}$ is a left inverse to the functor $i_{\text {small,* }}$.
Proof. Let's discuss the case of sheaves of sets. For any sheaf $\mathcal{G}$ on $Z$ the morphism $i_{\text {small }}^{-1} i_{\text {small }, *} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism by Lemma 49.47.3 (and Theorem 49.29.10. This implies formally that $i_{\text {small,* }}$ is fully faithful, see Sites, Lemma 7.40.1. It is clear that $\left.i_{\text {small,* }} \mathcal{G}\right|_{U_{\text {étale }}} \cong *$ where $U=X \backslash Z$. Conversely, suppose that $\mathcal{F}$ is a sheaf of sets on $X$ such that $\left.\mathcal{F}\right|_{U_{\text {étale }}} \cong *$. Consider the adjunction mapping

$$
\mathcal{F} \longrightarrow i_{\text {small }, *} i_{\text {small }}^{-1} \mathcal{F}
$$

Combining Lemmas 49.47 .3 and 49.36 .2 we see that it is an isomorphism. This finishes the proof of (1). The proof of (2) is identical.

### 49.48. Integral universally injective morphisms

04FY Here is the general version of Proposition 49.47.4.
04FZ Proposition 49.48.1. Let $f: X \rightarrow Y$ be a morphism of schemes which is integral and universally injective.
(1) The functor

$$
f_{\text {small }, *}: S h\left(X_{\text {étale }}\right) \longrightarrow S h\left(Y_{\text {étale }}\right)
$$

is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $Y_{\text {étale }}$ whose restriction to $Y \backslash f(X)$ is isomorphic to $*$, and
(2) the functor

$$
f_{\text {small }, *}: A b\left(X_{\text {étale }}\right) \longrightarrow A b\left(Y_{\text {étale }}\right)
$$

is fully faithful and its essential image is those abelian sheaves on $Y_{\text {étale }}$ whose support is contained in $f(X)$.
In both cases $f_{\text {small }}^{-1}$ is a left inverse to the functor $f_{\text {small,** }}$.
Proof. We may factor $f$ as

$$
X \xrightarrow{h} Z \xrightarrow{i} Y
$$

where $h$ is integral, universally injective and surjective and $i: Z \rightarrow Y$ is a closed immersion. Apply Proposition 49.47.4 to $i$ and apply Theorem 49.46.1 to $h$.

### 49.49. Big sites and pushforward

04E2 In this section we prove some technical results on $f_{b i g, *}$ for certain types of morphisms of schemes.
04C7 Lemma 49.49.1. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Let $f: X \rightarrow$ $Y$ be a monomorphism of schemes. Then the canonical map $f_{\text {big }}^{-1} f_{\text {big,* }} \mathcal{F} \rightarrow \mathcal{F}$ is an isomorphism for any sheaf $\mathcal{F}$ on $(S c h / X)_{\tau}$.
Proof. In this case the functor $(S c h / X)_{\tau} \rightarrow(S c h / Y)_{\tau}$ is continuous, cocontinuous and fully faithful. Hence the result follows from Sites, Lemma 7.20.7.

04C8 Remark 49.49.2. In the situation of Lemma 49.49.1 it is true that the canonical $\operatorname{map} \mathcal{F} \rightarrow f_{b i g}^{-1} f_{b i g!} \mathcal{F}$ is an isomorphism for any sheaf of sets $\mathcal{F}$ on $(S c h / X)_{\tau}$. The proof is the same. This also holds for sheaves of abelian groups. However, note that the functor $f_{b i g!}$ for sheaves of abelian groups is defined in Modules on Sites, Section 18.16 and is in general different from $f_{b i g}$ ! on sheaves of sets. The result for sheaves of abelian groups follows from Modules on Sites, Lemma 18.16.4.

04E3 Lemma 49.49.3. Let $f: X \rightarrow Y$ be a closed immersion of schemes. Let $U \rightarrow X$ be a syntomic (resp. smooth, resp. étale) morphism. Then there exist syntomic (resp. smooth, resp. étale) morphisms $V_{i} \rightarrow Y$ and morphisms $V_{i} \times_{Y} X \rightarrow U$ such that $\left\{V_{i} \times_{Y} X \rightarrow U\right\}$ is a Zariski covering of $U$.

Proof. Let us prove the lemma when $\tau=$ syntomic. The question is local on $U$. Thus we may assume that $U$ is an affine scheme mapping into an affine of $Y$. Hence we reduce to proving the following case: $Y=\operatorname{Spec}(A), X=\operatorname{Spec}(A / I)$, and $U=\operatorname{Spec}(\bar{B})$, where $A / I \rightarrow \bar{B}$ be a syntomic ring map. By Algebra, Lemma 10.134.18 we can find elements $\bar{g}_{i} \in \bar{B}$ such that $\bar{B}_{\bar{g}_{i}}=A_{i} / I A_{i}$ for certain syntomic
ring maps $A \rightarrow A_{i}$. This proves the lemma in the syntomic case. The proof of the smooth case is the same except it uses Algebra, Lemma 10.135.19. In the étale case use Algebra, Lemma 10.141.11.

04E4 Lemma 49.49.4. Let $f: X \rightarrow Y$ be a closed immersion of schemes. Let $\left\{U_{i} \rightarrow\right.$ $X\}$ be a syntomic (resp. smooth, resp. étale) covering. There exists a syntomic (resp. smooth, resp. étale) covering $\left\{V_{j} \rightarrow Y\right\}$ such that for each $j$, either $V_{j} \times_{Y} X=$ $\emptyset$, or the morphism $V_{j} \times_{Y} X \rightarrow X$ factors through $U_{i}$ for some $i$.

Proof. For each $i$ we can choose syntomic (resp. smooth, resp. étale) morphisms $g_{i j}: V_{i j} \rightarrow Y$ and morphisms $V_{i j} \times_{Y} X \rightarrow U_{i}$ over $X$, such that $\left\{V_{i j} \times_{Y} X \rightarrow U_{i}\right\}$ are Zariski coverings, see Lemma 49.49.3. This in particular implies that $\bigcup_{i j} g_{i j}\left(V_{i j}\right)$ contains the closed subset $f(X)$. Hence the family of syntomic (resp. smooth, resp. étale) maps $g_{i j}$ together with the open immersion $Y \backslash f(X) \rightarrow Y$ forms the desired syntomic (resp. smooth, resp. étale) covering of $Y$.

04C3 Lemma 49.49.5. Let $f: X \rightarrow Y$ be a closed immersion of schemes. Let $\tau \in\{$ syntomic, smooth, étale $\}$. The functor $V \mapsto X \times_{Y} V$ defines an almost cocontinuous functor (see Sites, Definition 7.41.3) $(S c h / Y)_{\tau} \rightarrow(S c h / X)_{\tau}$ between big $\tau$ sites.

Proof. We have to show the following: given a morphism $V \rightarrow Y$ and any syntomic (resp. smooth, resp. étale) covering $\left\{U_{i} \rightarrow X \times_{Y} V\right\}$, there exists a smooth (resp. smooth, resp. étale) covering $\left\{V_{j} \rightarrow V\right\}$ such that for each $j$, either $X \times_{Y} V_{j}$ is empty, or $X \times_{Y} V_{j} \rightarrow Z \times_{Y} V$ factors through one of the $U_{i}$. This follows on applying Lemma 49.49.4 above to the closed immersion $X \times_{Y} V \rightarrow V$.

04C4 Lemma 49.49.6. Let $f: X \rightarrow Y$ be a closed immersion of schemes. Let $\tau \in$ \{syntomic, smooth, étale\}.
(1) The pushforward $f_{\text {big,* }}: \operatorname{Sh}\left((S c h / X)_{\tau}\right) \rightarrow \operatorname{Sh}\left((S c h / Y)_{\tau}\right)$ commutes with coequalizers and pushouts.
(2) The pushforward $f_{\text {big,* }}: A b\left((S c h / X)_{\tau}\right) \rightarrow A b\left((S c h / Y)_{\tau}\right)$ is exact.

Proof. This follows from Sites, Lemma 7.41.6. Modules on Sites, Lemma 18.15.3, and Lemma 49.49.5 above.

04C5 Remark 49.49.7. In Lemma 49.49.6 the case $\tau=f p p f$ is missing. The reason is that given a ring $A$, an ideal $T$ and a faithfully flat, finitely presented ring map $A / I \rightarrow \bar{B}$, there is no reason to think that one can find any flat finitely presented ring map $A \rightarrow B$ with $B / I B \neq 0$ such that $A / I \rightarrow B / I B$ factors through $\bar{B}$. Hence the proof of Lemma 49.49 .5 does not work for the fppf topology. In fact it is likely false that $f_{b i g, *}: A b\left((S c h / X)_{f p p f}\right) \rightarrow A b\left((S c h / Y)_{f p p f}\right)$ is exact when $f$ is a closed immersion. If you know an example, please email stacks.project@gmail.com.

### 49.50. Exactness of big lower shriek

04 CB This is just the following technical result. Note that the functor $f_{b i g!}$ has nothing whatsoever to do with cohomology with compact support in general.

04CC Lemma 49.50.1. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Let $f: X \rightarrow$ $Y$ be a morphism of schemes. Let

$$
f_{b i g}: S h\left((S c h / X)_{\tau}\right) \longrightarrow S h\left((S c h / Y)_{\tau}\right)
$$

be the corresponding morphism of topoi as in Topologies, Lemma 33.3.15, 33.4.15, 33.5.10, 33.6.10, or 33.7.12.
(1) The functor $f_{\text {big }}^{-1}: A b\left((S c h / Y)_{\tau}\right) \rightarrow A b\left((S c h / X)_{\tau}\right)$ has a left adjoint

$$
f_{b i g!}: A b\left((S c h / X)_{\tau}\right) \rightarrow A b\left((S c h / Y)_{\tau}\right)
$$

which is exact.
(2) The functor $f_{b i g}^{*}: \operatorname{Mod}\left((S c h / Y)_{\tau}, \mathcal{O}\right) \rightarrow \operatorname{Mod}\left((S c h / X)_{\tau}, \mathcal{O}\right)$ has a left adjoint

$$
f_{b i g!}: \operatorname{Mod}\left((S c h / X)_{\tau}, \mathcal{O}\right) \rightarrow \operatorname{Mod}\left((S c h / Y)_{\tau}, \mathcal{O}\right)
$$

which is exact.
Moreover, the two functors $f_{\text {big! }}$ agree on underlying sheaves of abelian groups.
Proof. Recall that $f_{b i g}$ is the morphism of topoi associated to the continuous and cocontinuous functor $u:(S c h / X)_{\tau} \rightarrow(S c h / Y)_{\tau}, U / X \mapsto U / Y$. Moreover, we have $f_{b i q}^{-1} \mathcal{O}=\mathcal{O}$. Hence the existence of $f_{b i g!}$ follows from Modules on Sites, Lemma 18.16 .2 respectively Modules on Sites, Lemma 18.40.1. Note that if $U$ is an object of $(S c h / X)_{\tau}$ then the functor $u$ induces an equivalence of categories

$$
u^{\prime}:(S c h / X)_{\tau} / U \longrightarrow(S c h / Y)_{\tau} / U
$$

because both sides of the arrow are equal to $(S c h / U)_{\tau}$. Hence the agreement of $f_{b i g}$ ! on underlying abelian sheaves follows from the discussion in Modules on Sites, Remark 18.40.2 The exactness of $f_{\text {big! }}$ follows from Modules on Sites, Lemma 18.16 .3 as the functor $u$ above which commutes with fibre products and equalizers.

Next, we prove a technical lemma that will be useful later when comparing sheaves of modules on different sites associated to algebraic stacks.

07AJ Lemma 49.50.2. Let $X$ be a scheme. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Let $\mathcal{C}_{1} \subset \mathcal{C}_{2} \subset(S c h / X)_{\tau}$ be full subcategories with the following properties:
(1) For an object $U / X$ of $\mathcal{C}_{t}$,
(a) if $\left\{U_{i} \rightarrow U\right\}$ is a covering of $(S c h / X)_{\tau}$, then $U_{i} / X$ is an object of $\mathcal{C}_{t}$,
(b) $U \times \mathbf{A}^{1} / X$ is an object of $\mathcal{C}_{t}$.
(2) $X / X$ is an object of $\mathcal{C}_{t}$.

We endow $\mathcal{C}_{t}$ with the structure of a site whose coverings are exactly those coverings $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / X)_{\tau}$ with $U \in \operatorname{Ob}\left(\mathcal{C}_{t}\right)$. Then
(a) The functor $\mathcal{C}_{1} \rightarrow \mathcal{C}_{2}$ is fully faithful, continuous, and cocontinuous.

Denote $g: S h\left(\mathcal{C}_{1}\right) \rightarrow \operatorname{Sh}\left(\mathcal{C}_{2}\right)$ the corresponding morphism of topoi. Denote $\mathcal{O}_{t}$ the restriction of $\mathcal{O}$ to $\mathcal{C}_{t}$. Denote $g$ ! the functor of Modules on Sites, Definition 18.16.1.
(b) The canonical map $9!\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ is an isomorphism.

Proof. Assertion (a) is immediate from the definitions. In this proof all schemes are schemes over $X$ and all morphisms of schemes are morphisms of schemes over $X$. Note that $g^{-1}$ is given by restriction, so that for an object $U$ of $\mathcal{C}_{1}$ we have $\mathcal{O}_{1}(U)=\mathcal{O}_{2}(U)=\mathcal{O}(U)$. Recall that $g_{!} \mathcal{O}_{1}$ is the sheaf associated to the presheaf $g_{p!} \mathcal{O}_{1}$ which associates to $V$ in $\mathcal{C}_{2}$ the group

$$
\operatorname{colim}_{V \rightarrow U} \mathcal{O}(U)
$$

where $U$ runs over the objects of $\mathcal{C}_{1}$ and the colimit is taken in the category of abelian groups. Below we will use frequently that if

$$
V \rightarrow U \rightarrow U^{\prime}
$$

are morphisms with $U, U^{\prime} \in \mathrm{Ob}\left(\mathcal{C}_{1}\right)$ and if $f^{\prime} \in \mathcal{O}\left(U^{\prime}\right)$ restricts to $f \in \mathcal{O}(U)$, then $(V \rightarrow U, f)$ and $\left(V \rightarrow U^{\prime}, f^{\prime}\right)$ define the same element of the colimit. Also, $g!\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ maps the element $(V \rightarrow U, f)$ simply to the pullback of $f$ to $V$.
Surjectivity. Let $V$ be a scheme and let $h \in \mathcal{O}(V)$. Then we obtain a morphism $V \rightarrow X \times \mathbf{A}^{1}$ induced by $h$ and the structure morphism $V \rightarrow X$. Writing $\mathbf{A}^{1}=$ $\operatorname{Spec}(\mathbf{Z}[x])$ we see the element $x \in \mathcal{O}\left(X \times \mathbf{A}^{1}\right)$ pulls back to $h$. Since $X \times \mathbf{A}^{1}$ is an object of $\mathcal{C}_{1}$ by assumptions (1)(b) and (2) we obtain the desired surjectivity.

Injectivity. Let $V$ be a scheme. Let $s=\sum_{i=1, \ldots, n}\left(V \rightarrow U_{i}, f_{i}\right)$ be an element of the colimit displayed above. For any $i$ we can use the morphism $f_{i}: U_{i} \rightarrow X \times \mathbf{A}^{1}$ to see that $\left(V \rightarrow U_{i}, f_{i}\right)$ defines the same element of the colimit as $\left(f_{i}: V \rightarrow X \times \mathbf{A}^{1}, x\right)$. Then we can consider

$$
f_{1} \times \ldots \times f_{n}: V \rightarrow X \times \mathbf{A}^{n}
$$

and we see that $s$ is equivalent in the colimit to
$\sum_{i=1, \ldots, n}\left(f_{1} \times \ldots \times f_{n}: V \rightarrow X \times \mathbf{A}^{n}, x_{i}\right)=\left(f_{1} \times \ldots \times f_{n}: V \rightarrow X \times \mathbf{A}^{n}, x_{1}+\ldots+x_{n}\right)$
Now, if $x_{1}+\ldots+x_{n}$ restricts to zero on $V$, then we see that $f_{1} \times \ldots \times f_{n}$ factors through $X \times \mathbf{A}^{n-1}=V\left(x_{1}+\ldots+x_{n}\right)$. Hence we see that $s$ is equivalent to zero in the colimit.

### 49.51. Étale cohomology

03Q3 In the following sections we prove some basic results on étale cohomology. Here is an example of something we know for cohomology of topological spaces which also holds for étale cohomology.

0A50 Lemma 49.51.1 (Mayer-Vietoris for étale cohomology). Let $X$ be a scheme. Suppose that $X=U \cup V$ is a union of two opens. For any abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ there exists a long exact cohomology sequence

$$
\begin{aligned}
0 & \rightarrow H_{\text {étale }}^{0}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{0}(U, \mathcal{F}) \oplus H_{\text {étale }}^{0}(V, \mathcal{F}) \rightarrow H_{\text {étale }}^{0}(U \cap V, \mathcal{F}) \\
& \rightarrow H_{\text {étale }}^{1}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{1}(U, \mathcal{F}) \oplus H_{\text {étale }}^{1}(V, \mathcal{F}) \rightarrow H_{\text {étale }}^{1}(U \cap V, \mathcal{F}) \rightarrow \ldots
\end{aligned}
$$

This long exact sequence is functorial in $\mathcal{F}$.
Proof. Observe that if $\mathcal{I}$ is an injective abelian sheaf, then

$$
0 \rightarrow \mathcal{I}(X) \rightarrow \mathcal{I}(U) \oplus \mathcal{I}(V) \rightarrow \mathcal{I}(U \cap V) \rightarrow 0
$$

is exact. This is true in the first and middle spots as $\mathcal{I}$ is a sheaf. It is true on the right, because $\mathcal{I}(U) \rightarrow \mathcal{I}(U \cap V)$ is surjective by Cohomology on Sites, Lemma 21.12 .6 Another way to prove it would be to show that the cokernel of the map $\mathcal{I}(U) \oplus \mathcal{I}(V) \rightarrow \mathcal{I}(U \cap V)$ is the first C Cech cohomology group of $\mathcal{I}$ with respect to the covering $X=U \cup V$ which vanishes by Lemmas 49.18.7 and 49.19.1. Thus, if $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ is an injective resolution, then

$$
0 \rightarrow \mathcal{I}^{\bullet}(X) \rightarrow \mathcal{I}^{\bullet}(U) \oplus \mathcal{I}^{\bullet}(V) \rightarrow \mathcal{I}^{\bullet}(U \cap V) \rightarrow 0
$$

is a short exact sequence of complexes and the associated long exact cohomology sequence is the sequence of the statement of the lemma.

### 49.52. Colimits

03Q4 We recall that if $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ is a diagram of sheaves on a site $\mathcal{C}$ its colimit (in the category of sheaves) is the sheafification of the presheaf $U \mapsto \operatorname{colim}_{i} \mathcal{F}_{i}(U)$. See Sites, Lemma 7.10.13. If the system is directed, $U$ is a quasi-compact object of $\mathcal{C}$ which has a cofinal system of coverings by quasi-compact objects, then $\mathcal{F}(U)=$ $\operatorname{colim} \mathcal{F}_{i}(U)$, see Sites, Lemma 7.11.2. See Cohomology on Sites, Lemma 21.16.1 for a result dealing with higher cohomology groups of colimits of abelian sheaves.
We first state and prove a very general result on colimits and cohomology and then we explain what it means in some special cases.
09YQ Theorem 49.52.1. Let $X=\lim _{i \in I} X_{i}$ be a limit of a directed system of schemes with affine transition morphisms $f_{i^{\prime} i}: X_{i^{\prime}} \rightarrow X_{i}$. We assume that $X_{i}$ is quasicompact and quasi-separated for all $i \in I$. Assume given
(1) an abelian sheaf $\mathcal{F}_{i}$ on $\left(X_{i}\right)_{\text {étale }}$ for all $i \in I$,
(2) for $i^{\prime} \geq i$ a map $\varphi_{i^{\prime} i}: f_{i^{\prime} i}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ of abelian sheaves on $\left(X_{i^{\prime}}\right)_{\text {étale }}$
such that $\varphi_{i^{\prime \prime} i}=\varphi_{i^{\prime \prime} i^{\prime}} \circ f_{i^{\prime \prime} i^{\prime}}^{-1} \varphi_{i^{\prime} i}$ whenever $i^{\prime \prime} \geq i^{\prime} \geq i$. Denote $f_{i}: X \rightarrow X_{i}$ the projection and set $\mathcal{F}=\operatorname{colim} f_{i}^{-1} \mathcal{F}_{i}$. Then

$$
\operatorname{colim}_{i \in I} H_{\text {étale }}^{p}\left(X_{i}, \mathcal{F}_{i}\right)=H_{\text {étale }}^{p}(X, \mathcal{F})
$$

for all $p \geq 0$.
Proof. Let us use the affine étale sites of $X$ and $X_{i}$ as introduced in Lemma 49.21.2. We claim that

$$
X_{a f f i n e, \text { étale }}=\operatorname{colim}\left(X_{i}\right)_{a f f i n e, \text { étale }}
$$

as sites (see Sites, Lemma 7.11.6). If we prove this, then the theorem follows from Cohomology on Sites, Lemma 21.16.2. The category of schemes of finite presentation over $X$ is the colimit of the categories of schemes of finite presentation over $X_{i}$, see Limits, Lemma 31.9.1. The same holds for the subcategories of affine objects étale over $X$ by Limits, Lemmas 31.3 .10 and 31.7.8. Finally, if $\left\{U^{j} \rightarrow U\right\}$ is a covering of $X_{a f f i n e, e ́ t a l e ~}$ and if $U_{i}^{j} \rightarrow U_{i}$ is morphism of affine schemes étale over $X_{i}$ whose base change to $X$ is $U^{j} \rightarrow U$, then we see that the base change of $\left\{U_{i}^{j} \rightarrow U_{i}\right\}$ to some $X_{i^{\prime}}$ is a covering for $i^{\prime}$ large enough, see Limits, Lemma 31.7.11.

The following two results are special cases of the theorem above.
03Q5 Lemma 49.52.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ be a system of abelian sheaves on $X_{\text {étale }}$ over the partially ordered set $I$. If $I$ is directed then

$$
\operatorname{colim}_{i \in I} H_{\text {étale }}^{p}\left(X, \mathcal{F}_{i}\right)=H_{\text {étale }}^{p}\left(X, \operatorname{colim}_{i \in I} \mathcal{F}_{i}\right)
$$

Proof. This is a special case of Theorem 49.52.1. We also sketch a direct proof. We prove it for all $X$ at the same time, by induction on $p$.
(1) For any quasi-compact and quasi-separated scheme $X$ and any étale covering $\mathcal{U}$ of $X$, show that there exists a refinement $\mathcal{V}=\left\{V_{j} \rightarrow X\right\}_{j \in J}$ with $J$ finite and each $V_{j}$ quasi-compact and quasi-separated such that all $V_{j_{0}} \times_{X} \ldots \times_{X} V_{j_{p}}$ are also quasi-compact and quasi-separated.
(2) Using the previous step and the definition of colimits in the category of sheaves, show that the theorem holds for $p=0$ and all $X$.
(3) Using the locality of cohomology (Lemma 49.22.3), the Čech-to-cohomology spectral sequence (Theorem 49.19.2) and the fact that the induction hypothesis applies to all $V_{j_{0}} \times{ }_{X} \ldots \times_{X} V_{j_{p}}$ in the above situation, prove the induction step $p \rightarrow p+1$.

03Q6 Lemma 49.52.3. Let $A$ be a ring, $(I, \leq)$ a directed poset and $\left(B_{i}, \varphi_{i j}\right)$ a system of A-algebras. Set $B=\operatorname{colim}_{i \in I} B_{i}$. Let $X \rightarrow \operatorname{Spec}(A)$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{F}$ an abelian sheaf on $X_{\text {étale }}$. Denote $Y_{i}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(B_{i}\right), Y=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}(B), \mathcal{G}_{i}=\left(Y_{i} \rightarrow X\right)^{-1} \mathcal{F}$ and $\mathcal{G}=(Y \rightarrow X)^{-1} \mathcal{F}$. Then

$$
H_{\text {étale }}^{p}(Y, \mathcal{G})=\operatorname{colim}_{i \in I} H_{\text {étale }}^{p}\left(X_{i}, \mathcal{G}_{i}\right)
$$

Proof. This is a special case of Theorem49.52.1. We also outline a direct proof as follows.
(1) Given $V \rightarrow Y$ étale with $V$ quasi-compact and quasi-separated, there exist $i \in I$ and $V_{i} \rightarrow Y_{i}$ such that $V=V_{i} \times_{Y_{i}} Y$. If all the schemes considered were affine, this would correspond to the following algebra statement: if $B=\operatorname{colim} B_{i}$ and $B \rightarrow C$ is étale, then there exist $i \in I$ and $B_{i} \rightarrow C_{i}$ étale such that $C \cong B \otimes_{B_{i}} C_{i}$. This is proved in Algebra, Lemma 10.141.3.
(2) In the situation of (1) show that $\mathcal{G}(V)=\operatorname{colim}_{i^{\prime} \geq i} \mathcal{G}_{i^{\prime}}\left(V_{i^{\prime}}\right)$ where $V_{i^{\prime}}$ is the base change of $V_{i}$ to $Y_{i^{\prime}}$.
(3) By (1), we see that for every étale covering $\mathcal{V}=\left\{V_{j} \rightarrow Y\right\}_{j \in J}$ with $J$ finite and the $V_{j} \mathrm{~s}$ quasi-compact and quasi-separated, there exists $i \in I$ and an étale covering $\mathcal{V}_{i}=\left\{V_{i j} \rightarrow Y_{i}\right\}_{j \in J}$ such that $\mathcal{V} \cong \mathcal{V}_{i} \times_{Y_{i}} Y$.
(4) Show that (2) and (3) imply

$$
\check{H}^{*}(\mathcal{V}, \mathcal{G})=\operatorname{colim}_{i \in I} \check{H}^{*}\left(\mathcal{V}_{i}, \mathcal{G}_{i}\right)
$$

(5) Cleverly use the Čech-to-cohomology spectral sequence (Theorem 49.19.2).

03Q8 Lemma 49.52.4. Let $f: X \rightarrow Y$ be a morphism of schemes and $\mathcal{F} \in A b\left(X_{\text {étale }}\right)$. Then $R^{p} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf

$$
(V \rightarrow Y) \longmapsto H_{\text {étale }}^{p}\left(X \times_{Y} V,\left.\mathcal{F}\right|_{X \times_{Y} V}\right)
$$

Proof. This lemma is valid for topological spaces, and the proof in this case is the same. See Cohomology on Sites, Lemma 21.8.4 for details.

09Z1 Lemma 49.52.5. Let $S$ be a scheme. Let $X=\lim _{i \in I} X_{i}$ be a limit of a directed system of schemes over $S$ with affine transition morphisms $f_{i^{\prime} i}: X_{i^{\prime}} \rightarrow X_{i}$. We assume the structure morphism $g_{i}: X_{i} \rightarrow S$ is quasi-compact and quasi-separated for all $i \in I$ and we set $g: X \rightarrow S$. Assume given
(1) an abelian sheaf $\mathcal{F}_{i}$ on $\left(X_{i}\right)_{\text {étale }}$ for all $i \in I$,
(2) for $i^{\prime} \geq i$ a map $\varphi_{i^{\prime} i}: f_{i^{\prime} i}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ of abelian sheaves on $\left(X_{i^{\prime}}\right)$ étale
such that $\varphi_{i^{\prime \prime} i}=\varphi_{i^{\prime \prime} i^{\prime}} \circ f_{i^{\prime \prime} i^{\prime}}^{-1} \varphi_{i^{\prime} i}$ whenever $i^{\prime \prime} \geq i^{\prime} \geq i$. Denote $f_{i}: X \rightarrow X_{i}$ the projection and set $\mathcal{F}=\operatorname{colim} f_{i}^{-1} \mathcal{F}_{i}$. Then

$$
\operatorname{colim}_{i \in I} R^{p} g_{i, *} \mathcal{F}_{i}=R^{p} g_{*} \mathcal{F}
$$

for all $p \geq 0$.

Proof. Recall (Lemma 49.52.4) that $R^{p} g_{i, *} \mathcal{F}_{i}$ is the sheaf associated to the presheaf $U \mapsto H_{\text {étale }}^{p}\left(U \times{ }_{S} X_{i}, \mathcal{F}_{i}\right)$ and similarly for $R^{p} g_{*} \mathcal{F}$. Moreover, the colimit of a system of sheaves is the sheafification of the colimit on the level of presheaves. Note that every object of $S_{\text {étale }}$ has a covering by quasi-compact and quasi-separated objects (e.g., affine schemes). Moreover, if $U$ is a quasi-compact and quasi-separated object, then we have

$$
\operatorname{colim} H_{\text {étale }}^{p}\left(U \times_{S} X_{i}, \mathcal{F}_{i}\right)=H_{\text {étale }}^{p}\left(U \times_{S} X, \mathcal{F}\right)
$$

by Theorem 49.52.1. Thus the lemma follows.

### 49.53. Stalks of higher direct images

03Q7
03Q9 Theorem 49.53.1. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes, $\mathcal{F}$ an abelian sheaf on $X_{\text {étale }}$, and $\bar{s}$ a geometric point of $S$. Then

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{s}}=H_{\text {étale }}^{p}\left(X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right), p^{-1} \mathcal{F}\right)
$$

where $p: X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right) \rightarrow X$ is the projection.
Proof. Let $\mathcal{I}$ be the category of étale neighborhoods of $\bar{s}$ on $S$. By Lemma 49.52.4 we have

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{\bar{s}}=\operatorname{colim}_{(V, \bar{v}) \in \mathcal{I}^{\text {opp }}} H^{p}\left(X \times_{S} V,\left.\mathcal{F}\right|_{X \times_{S} V}\right)
$$

We may replace $\mathcal{I}$ by the initial subcategory consisting of affine étale neighbourhoods of $\bar{s}$. Observe that

$$
\operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right)=\lim _{(V, \bar{v}) \in \mathcal{I}} V
$$

by Lemma 49.33 .1 and Limits, Lemma 31.2.1. Since fibre products commute with limits we also obtain

$$
X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right)=\lim _{(V, \bar{v}) \in \mathcal{I}} X \times_{S} V
$$

We conclude by Lemma 49.52.3.

### 49.54. The Leray spectral sequence

03QA
03QB Lemma 49.54.1. Let $f: X \rightarrow Y$ be a morphism and $\mathcal{I}$ an injective object of $A b\left(X_{\text {étale }}\right)$. Let $V \in \mathrm{Ob}\left(Y_{\text {étale }}\right)$. Then
(1) for any covering $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ we have $\check{H}^{p}\left(\mathcal{V}, f_{*} \mathcal{I}\right)=0$ for all $p>0$,
(2) $f_{*} \mathcal{I}$ is acyclic for the functor $\Gamma(V,-)$, and
(3) if $g: Y \rightarrow Z$, then $f_{*} \mathcal{I}$ is acyclic for $g_{*}$.

Proof. Observe that $\check{\mathcal{C}} \bullet\left(\mathcal{V}, f_{*} \mathcal{I}\right)=\check{\mathcal{C}} \bullet\left(\mathcal{V} \times_{Y} X, \mathcal{I}\right)$ which has vanishing higher cohomology groups by Lemma 49.18.7. This proves (1). The second statement follows as a sheaf which has vanishing higher Čech cohomology groups for any covering has vanishing higher cohomology groups. This a wonderful exercise in using the Cech-to-cohomology spectral sequence, but see Cohomology on Sites, Lemma 21.11 .9 for details and a more precise and general statement. Part (3) is a consequence of (2) and the description of $R^{p} g_{*}$ in Lemma 49.52.4.

Using the formalism of Grothendieck spectral sequences, this gives the following.

03QC Proposition 49.54.2 (Leray spectral sequence). Let $f: X \rightarrow Y$ be a morphism of schemes and $\mathcal{F}$ an étale sheaf on $X$. Then there is a spectral sequence

$$
E_{2}^{p, q}=H_{\text {étale }}^{p}\left(Y, R^{q} f_{*} \mathcal{F}\right) \Rightarrow H_{\text {étale }}^{p+q}(X, \mathcal{F})
$$

Proof. See Lemma 49.54.1 and see Derived Categories, Section 13.22

### 49.55. Vanishing of finite higher direct images

03QN The next goal is to prove that the higher direct images of a finite morphism of schemes vanish.

03QO Lemma 49.55.1. Let $R$ be a strictly henselian local ring. Set $S=\operatorname{Spec}(R)$ and let $\bar{s}$ be its closed point. Then the global sections functor $\Gamma(S,-): A b\left(S_{\text {étale }}\right) \rightarrow A b$ is exact. In fact we have $\Gamma(S, \mathcal{F})=\mathcal{F}_{\bar{s}}$ for any sheaf of sets $\mathcal{F}$. In particular

$$
\forall p \geq 1, \quad H_{\text {étale }}^{p}(S, \mathcal{F})=0
$$

for all $\mathcal{F} \in A b\left(S_{\text {étale }}\right)$.
Proof. If we show that $\Gamma(S, \mathcal{F})=\mathcal{F}_{\bar{s}}$ the $\Gamma(S,-)$ is exact as the stalk functor is exact. Let $(U, \bar{u})$ be an étale neighbourhood of $\bar{s}$. Pick an affine open neighborhood $\operatorname{Spec}(A)$ of $\bar{u}$ in $U$. Then $R \rightarrow A$ is étale and $\kappa(\bar{s})=\kappa(\bar{u})$. By Theorem 49.32.4 we see that $A \cong R \times A^{\prime}$ as an $R$-algebra compatible with maps to $\kappa(\bar{s})=\kappa(\bar{u})$. Hence we get a section

It follows that in the system of étale neighbourhoods of $\bar{s}$ the identity map $(S, \bar{s}) \rightarrow$ $(S, \bar{s})$ is cofinal. Hence $\Gamma(S, \mathcal{F})=\mathcal{F}_{\bar{s}}$. The final statement of the lemma follows as the higher derived functors of an exact functor are zero, see Derived Categories, Lemma 13.17.9.

03QP Proposition 49.55.2. Let $f: X \rightarrow Y$ be a finite morphism of schemes.
(1) For any geometric point $\bar{y}: \operatorname{Spec}(k) \rightarrow Y$ we have

$$
\left(f_{*} \mathcal{F}\right)_{\bar{y}}=\prod_{\bar{x}: \operatorname{Spec}(k) \rightarrow X, f(\bar{x})=\bar{y}} \mathcal{F}_{\bar{x}} .
$$

for $\mathcal{F}$ in $\operatorname{Sh}\left(X_{\text {étale }}\right)$ and

$$
\left(f_{*} \mathcal{F}\right)_{\bar{y}}=\bigoplus_{\bar{x}: \operatorname{Spec}(k) \rightarrow X, f(\bar{x})=\bar{y}} \mathcal{F}_{\bar{x}}
$$

for $\mathcal{F}$ in $A b\left(X_{\text {étale }}\right)$.
(2) For any $q \geq 1$ we have $R^{q} f_{*} \mathcal{F}=0$.

Proof. Let $X_{\bar{y}}^{s h}$ denote the fiber product $X \times_{Y} \operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}}^{s h}\right)$. By Theorem 49.53.1 the stalk of $R^{q} f_{*} \mathcal{F}$ at $\bar{y}$ is computed by $H_{\text {étale }}^{q}\left(X_{\bar{y}}^{s h}, \mathcal{F}\right)$. Since $f$ is finite, $X_{\bar{y}}^{s h}$ is finite over $\operatorname{Spec}\left(\mathcal{O}_{Y, \bar{y}}^{s h}\right)$, thus $X_{\bar{y}}^{s h}=\operatorname{Spec}(A)$ for some ring $A$ finite over $\mathcal{O}_{Y, \bar{y}}^{s h}$. Since the latter is strictly henselian, Lemma 49.32 .5 implies that $A$ is a finite product of henselian local rings $A=A_{1} \times \ldots \times A_{r}$. Since the residue field of $\mathcal{O}_{Y, \bar{y}}^{s h}$ is separably closed the same is true for each $A_{i}$. Hence $A_{i}$ is strictly henselian. This implies that $X_{\bar{y}}^{s h}=\coprod_{i=1}^{r} \operatorname{Spec}\left(A_{i}\right)$. The vanishing of Lemma 49.55.1 implies that $\left(R^{q} f_{*} \mathcal{F}\right)_{\bar{y}}=0$ for $q>0$ which implies (2) by Theorem 49.29.10. Part (1) follows from the corresponding statement of Lemma 49.55.1.

0959 Lemma 49.55.3. Consider a cartesian square

of schemes with $f$ a finite morphism. For any sheaf of sets $\mathcal{F}$ on $X_{\text {étale }}$ we have $f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}=g^{-1} f_{*} \mathcal{F}$.

Proof. In great generality there is a pullback map $g^{-1} f_{*} \mathcal{F} \rightarrow f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$, see Sites, Section 7.44. To check this map is an isomorphism it suffices to check on stalks (Theorem 49.29.10). This is clear from the description of stalks in Proposition 49.55 .2 and Lemma 49.36.2.

The following lemma is a case of cohomological descent dealing with étale sheaves and finite surjective morphisms. We will significantly generalize this result once we prove the proper base change theorem.

09Z2 Lemma 49.55.4. Let $f: X \rightarrow Y$ be a surjective finite morphism of schemes. Set $f_{n}: X_{n} \rightarrow Y$ equal to the $(n+1)$-fold fibre product of $X$ over $Y$. For $\mathcal{F} \in A b\left(Y_{\text {étale }}\right)$ set $\mathcal{F}_{n}=f_{n, *} f_{n}^{-1} \mathcal{F}$. There is an exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{0} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \ldots
$$

on $X_{\text {étale }}$. Moreover, there is a spectral sequence

$$
E_{1}^{p, q}=H_{\text {étale }}^{q}\left(X_{p}, f_{p}^{-1} \mathcal{F}\right)
$$

converging to $H^{p+q}\left(Y_{\text {étale }}, \mathcal{F}\right)$. This spectral sequence is functorial in $\mathcal{F}$.
Proof. If we prove the first statement of the lemma, then we obtain a spectral sequence with $E_{1}^{p, q}=H_{\text {étale }}^{q}(Y, \mathcal{F})$ convering to $H^{p+q}\left(Y_{\text {étale }}, \mathcal{F}\right)$, see Derived Categories, Lemma 13.21.3. On the other hand, since $R^{i} f_{p, *} f_{p}^{-1} \mathcal{F}=0$ for $i>0$ (Proposition 49.55.2) we get

$$
H_{\text {étale }}^{q}\left(X_{p}, f_{p}^{-1} \mathcal{F}\right)=H_{\text {étale }}^{q}\left(Y, f_{p, *} f_{p}^{-1} \mathcal{F}\right)=H_{\text {étale }}^{q}\left(Y, \mathcal{F}_{p}\right)
$$

by Proposition 49.54 .2 and we get the spectral sequence of the lemma.
To prove the first statement of the lemma, observe that $X_{n}$ forms a simplicial scheme over $Y$, see Simplicial, Example 14.3.5. Observe moreover, that for each of the projections $d_{j}: X_{n+1} \rightarrow X_{n}$ there is a map $d_{j}^{-1} f_{n}^{-1} \mathcal{F} \rightarrow f_{n+1}^{-1} \mathcal{F}$. These maps induce maps

$$
\delta_{j}: \mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1}
$$

for $j=0, \ldots, n+1$. We use the alternating sum of these maps to define the differentials $\mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1}$. Similarly, there is a canonical augmentation $\mathcal{F} \rightarrow \mathcal{F}_{0}$, namely this is just the canonical map $\mathcal{F} \rightarrow f_{*} f^{-1} \mathcal{F}$. To check that this sequence of sheaves is an exact complex it suffices to check on stalks at geometric points (Theorem 49.29.10). Thus we let $\bar{y}: \operatorname{Spec}(k) \rightarrow Y$ be a geometric point. Let $E=\{\bar{x}: \operatorname{Spec}(k) \rightarrow X \mid f(\bar{x})=\bar{y}\}$. Then $E$ is a finite nonempty set and we see that

$$
\left(\mathcal{F}_{n}\right)_{\bar{y}}=\bigoplus_{e \in E^{n+1}} \mathcal{F}_{\bar{y}}
$$

by Proposition 49.55 .2 and Lemma 49.36.2. Thus we have to see that given an abelian group $M$ the sequence

$$
0 \rightarrow M \rightarrow \bigoplus_{e \in E} M \rightarrow \bigoplus_{e \in E^{2}} M \rightarrow \ldots
$$

is exact. Here the first map is the diagonal map and the map $\bigoplus_{e \in E^{n+1}} M \rightarrow$ $\bigoplus_{e \in E^{n+2}} M$ is the alternating sum of the maps induced by the $(n+2)$ projections $E^{n+2} \rightarrow E^{n+1}$. This can be shown directly or deduced by applying Simplicial, Lemma 14.26 .9 to the map $E \rightarrow\{*\}$.

09Z3 Remark 49.55.5. In the situation of Lemma 49.55.4 if $\mathcal{G}$ is a sheaf of sets on $Y_{\text {étale }}$, then we have

$$
\Gamma(Y, \mathcal{G})=\operatorname{Equalizer}\left(\Gamma\left(X_{0}, f_{0}^{-1} \mathcal{G}\right) \longrightarrow \Gamma\left(X_{1}, f_{1}^{-1} \mathcal{G}\right)\right)
$$

This is proved in exactly the same way, by showing that the sheaf $\mathcal{G}$ is the equalizer of the two maps $f_{0, *} f_{0}^{-1} \mathcal{G} \rightarrow f_{1, *} f_{1}^{-1} \mathcal{G}$.

Here is a fun generalization of Lemma 49.55.1.
09AX Lemma 49.55.6. Let $S$ be a scheme all of whose local rings are strictly henselian. Then for any abelian sheaf $\mathcal{F}$ on $S_{\text {étale }}$ we have $H^{i}\left(S_{\text {étale }}, \mathcal{F}\right)=H^{i}\left(S_{\text {Zar }}, \mathcal{F}\right)$.

Proof. Let $\epsilon: S_{\text {étale }} \rightarrow S_{Z a r}$ be the morphism of sites given by the inclusion functor. The Zariski sheaf $R^{p} \epsilon_{*} \mathcal{F}$ is the sheaf associated to the presheaf $U \mapsto$ $H_{\text {étale }}^{p}(U, \mathcal{F})$. Thus the stalk at $x \in X$ is colim $H_{\text {étale }}^{p}(U, \mathcal{F})=H_{\text {étale }}^{p}\left(\operatorname{Spec}\left(\mathcal{O}_{X, x}\right), \mathcal{G}_{x}\right)$ where $\mathcal{G}_{x}$ denotes the pullback of $\mathcal{F}$ to $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$, see Lemma 49.52.3. Thus the higher direct images of $R^{p} \epsilon_{*} \mathcal{F}$ are zero by Lemma 49.55.1 and we conclude by the Leray spectral sequence.

09AY Lemma 49.55.7. Let $S$ be an affine scheme such that (1) all points are closed, and (2) all residue fields are separably algebraically closed. Then for any abelian sheaf $\mathcal{F}$ on $S_{\text {étale }}$ we have $H^{i}\left(S_{\text {étale }}, \mathcal{F}\right)=0$ for $i>0$.

Proof. Condition (1) implies that the underlying topological space of $S$ is profinite, see Algebra, Lemma 10.25.5. Thus the higher cohomology groups of an abelian sheaf on the topological space $S$ (i.e., Zariski cohomology) is trivial, see Cohomology, Lemma 20.23.3. The local rings are strictly henselian by Algebra, Lemma 10.148.11. Thus étale cohomology of $S$ is computed by Zariski cohomology by Lemma 49.55.6 and the proof is done.

### 49.56. Galois action on stalks

03QW In this section we define an action of the absolute Galois group of a residue field of a point $s$ of $S$ on the stalk functor at any geometric point lying over $s$.

Galois action on stalks. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point of $S$. Let $\sigma \in \operatorname{Aut}(\kappa(\bar{s}) / \kappa(s))$. Define an action of $\sigma$ on the stalk $\mathcal{F}_{\bar{s}}$ of a sheaf $\mathcal{F}$ as follows

04JK (49.56.0.1)

$$
\begin{array}{ccc}
\mathcal{F}_{\bar{s}} & \longrightarrow & \mathcal{F}_{\bar{s}} \\
(U, \bar{u}, t) & \longmapsto & (U, \bar{u} \circ \operatorname{Spec}(\sigma), t) .
\end{array}
$$

where we use the description of elements of the stalk in terms of triples as in the discussion following Definition 49.29.6. This is a left action, since if $\sigma_{i} \in$
$\operatorname{Aut}(\kappa(\bar{s}) / \kappa(s))$ then

$$
\begin{aligned}
\sigma_{1} \cdot\left(\sigma_{2} \cdot(U, \bar{u}, t)\right) & =\sigma_{1} \cdot\left(U, \bar{u} \circ \operatorname{Spec}\left(\sigma_{2}\right), t\right) \\
& =\left(U, \bar{u} \circ \operatorname{Spec}\left(\sigma_{2}\right) \circ \operatorname{Spec}\left(\sigma_{1}\right), t\right) \\
& =\left(U, \bar{u} \circ \operatorname{Spec}\left(\sigma_{1} \circ \sigma_{2}\right), t\right) \\
& =\left(\sigma_{1} \circ \sigma_{2}\right) \cdot(U, \bar{u}, t)
\end{aligned}
$$

It is clear that this action is functorial in the sheaf $\mathcal{F}$. We note that we could have defined this action by referring directly to Remark 49.29.8.

03QX Definition 49.56.1. Let $S$ be a scheme. Let $\bar{s}$ be a geometric point lying over the point $s$ of $S$. Let $\kappa(s) \subset \kappa(s)^{s e p} \subset \kappa(\bar{s})$ denote the separable algebraic closure of $\kappa(s)$ in the algebraically closed field $\kappa(\bar{s})$.
(1) In this situation the absolute Galois group of $\kappa(s)$ is $\operatorname{Gal}\left(\kappa(s)^{s e p} / \kappa(s)\right)$. It is sometimes denoted $\mathrm{Gal}_{\kappa(s)}$.
(2) The geometric point $\bar{s}$ is called algebraic if $\kappa(s) \subset \kappa(\bar{s})$ is an algebraic closure of $\kappa(s)$.

03QY Example 49.56.2. The geometric point $\operatorname{Spec}(\mathbf{C}) \rightarrow \operatorname{Spec}(\mathbf{Q})$ is not algebraic.
Let $\kappa(s) \subset \kappa(s)^{\text {sep }} \subset \kappa(\bar{s})$ be as in the definition. Note that as $\kappa(\bar{s})$ is algebraically closed the map

$$
\operatorname{Aut}(\kappa(\bar{s}) / \kappa(s)) \longrightarrow \operatorname{Gal}\left(\kappa(s)^{\operatorname{sep}} / \kappa(s)\right)=\operatorname{Gal}_{\kappa(s)}
$$

is surjective. Suppose $(U, \bar{u})$ is an étale neighbourhood of $\bar{s}$, and say $\bar{u}$ lies over the point $u$ of $U$. Since $U \rightarrow S$ is étale, the residue field extension $\kappa(s) \subset \kappa(u)$ is finite separable. This implies the following
(1) If $\sigma \in \operatorname{Aut}\left(\kappa(\bar{s}) / \kappa(s)^{\text {sep }}\right)$ then $\sigma$ acts trivially on $\mathcal{F}_{\bar{s}}$.
(2) More precisely, the action of $\operatorname{Aut}(\kappa(\bar{s}) / \kappa(s))$ determines and is determined by an action of the absolute Galois group $\mathrm{Gal}_{\kappa(s)}$ on $\mathcal{F}_{\bar{s}}$.
(3) Given $(U, \bar{u}, t)$ representing an element $\xi$ of $\mathcal{F}_{\bar{s}}$ any element of $\operatorname{Gal}\left(\kappa(s)^{\text {sep }} / K\right)$ acts trivially, where $\kappa(s) \subset K \subset \kappa(s)^{\text {sep }}$ is the image of $\bar{u}^{\sharp}: \kappa(u) \rightarrow \kappa(\bar{s})$.
Altogether we see that $\mathcal{F}_{\bar{s}}$ becomes a $\operatorname{Gal}_{\kappa(s)}$-set (see Fundamental Groups, Definition 48.2.1. Hence we may think of the stalk functor as a functor

$$
\text { Sh }\left(S_{\text {étale }}\right) \longrightarrow \operatorname{Gal}_{\kappa(s)}-\text { Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{s}}
$$

and from now on we usually do think about the stalk functor in this way.
03QT Theorem 49.56.3. Let $S=\operatorname{Spec}(K)$ with $K$ a field. Let $\bar{s}$ be a geometric point of $S$. Let $G=G a l_{\kappa(s)}$ denote the absolute Galois group. Taking stalks induces an equivalence of categories

$$
\operatorname{Sh}\left(S_{\text {étale }}\right) \longrightarrow G \text {-Sets }, \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{s}}
$$

Proof. Let us construct the inverse to this functor. In Fundamental Groups, Lemma 48.2.2 we have seen that given a $G$-set $M$ there exists an étale morphism $X \rightarrow \operatorname{Spec}(K)$ such that $\operatorname{Mor}_{K}\left(\operatorname{Spec}\left(K^{\text {sep }}\right), X\right)$ is isomorphic to $M$ as a $G$-set. Consider the sheaf $\mathcal{F}$ on $\operatorname{Spec}(K)$ étale defined by the rule $U \mapsto \operatorname{Mor}_{K}(U, X)$. This is a sheaf as the étale topology is subcanonical. Then we see that $\mathcal{F}_{\bar{s}}=$ $\operatorname{Mor}_{K}\left(\operatorname{Spec}\left(K^{\text {sep }}\right), X\right)=M$ as $G$-sets (details omitted). This gives the inverse of the functor and we win.

04JL Remark 49.56.4. Another way to state the conclusion of Theorem 49.56.3 and Fundamental Groups, Lemma 48.2 .2 is to say that every sheaf on $\operatorname{Spec}(K)$ étale is representable by a scheme $X$ étale over $\operatorname{Spec}(K)$. This does not mean that every sheaf is representable in the sense of Sites, Definition 7.13.3. The reason is that in our construction of $\operatorname{Spec}(K)_{\text {étale }}$ we chose a sufficiently large set of schemes étale over $\operatorname{Spec}(K)$, whereas sheaves on $\operatorname{Spec}(K)_{\text {étale }}$ form a proper class.
04JM Lemma 49.56.5. Assumptions and notations as in Theorem 49.56.3. There is a functorial bijection

$$
\Gamma(S, \mathcal{F})=\left(\mathcal{F}_{\bar{s}}\right)^{G}
$$

Proof. We can prove this using formal arguments and the result of Theorem49.56.3 as follows. Given a sheaf $\mathcal{F}$ corresponding to the $G$-set $M=\mathcal{F}_{\bar{s}}$ we have

$$
\begin{aligned}
\Gamma(S, \mathcal{F}) & =\operatorname{Mor}_{\text {Sh(Sétale })}\left(h_{\operatorname{Spec}(K)}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{G-\text { Sets })}(\{*\}, M) \\
& =M^{G}
\end{aligned}
$$

Here the first identification is explained in Sites, Sections 7.2 and 7.13 , the second results from Theorem 49.56 .3 and the third is clear. We will also give a direct proof ${ }^{4}$

Suppose that $t \in \Gamma(S, \mathcal{F})$ is a global section. Then the triple $(S, \bar{s}, t)$ defines an element of $\mathcal{F}_{\bar{s}}$ which is clearly invariant under the action of $G$. Conversely, suppose that $(U, \bar{u}, t)$ defines an element of $\mathcal{F}_{\bar{s}}$ which is invariant. Then we may shrink $U$ and assume $U=\operatorname{Spec}(L)$ for some finite separable field extension of $K$, see Proposition 49.26.2. In this case the map $\mathcal{F}(U) \rightarrow \mathcal{F}_{\bar{s}}$ is injective, because for any morphism of étale neighbourhoods $\left(U^{\prime}, \bar{u}^{\prime}\right) \rightarrow(U, \bar{u})$ the restriction map $\mathcal{F}(U) \rightarrow \mathcal{F}\left(U^{\prime}\right)$ is injective since $U^{\prime} \rightarrow U$ is a covering of $S_{\text {étale. After enlarging } L} L$ a bit we may assume $K \subset L$ is a finite Galois extension. At this point we use that

$$
\operatorname{Spec}(L) \times_{\operatorname{Spec}(K)} \operatorname{Spec}(L)=\coprod_{\sigma \in \operatorname{Gal}(L / K)} \operatorname{Spec}(L)
$$

where the maps $\operatorname{Spec}(L) \rightarrow \operatorname{Spec}\left(L \otimes_{K} L\right)$ come from the ring maps $a \otimes b \mapsto$ $a \sigma(b)$. Hence we see that the condition that $(U, \bar{u}, t)$ is invariant under all of $G$ implies that $t \in \mathcal{F}(\operatorname{Spec}(L))$ maps to the same element of $\mathcal{F}\left(\operatorname{Spec}(L) \times{ }_{\operatorname{Spec}(K)}\right.$ $\operatorname{Spec}(L)$ ) via restriction by either projection (this uses the injectivity mentioned above; details omitted). Hence the sheaf condition of $\mathcal{F}$ for the étale covering $\{\operatorname{Spec}(L) \rightarrow \operatorname{Spec}(K)\}$ kicks in and we conclude that $t$ comes from a unique section of $\mathcal{F}$ over $\operatorname{Spec}(K)$.

04JN Remark 49.56.6. Let $S$ be a scheme and let $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ be a geometric point of $S$. By definition this means that $k$ is algebraically closed. In particular the absolute Galois group of $k$ is trivial. Hence by Theorem 49.56.3 the category of sheaves on $\operatorname{Spec}(k)_{\text {étale }}$ is equivalent to the category of sets. The equivalence is given by taking sections over $\operatorname{Spec}(k)$. This finally provides us with an alternative definition of the stalk functor. Namely, the functor

$$
\text { Sh }\left(S_{\text {étale }}\right) \longrightarrow \text { Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{s}}
$$

is isomorphic to the functor

$$
S h\left(S_{\text {étale }}\right) \longrightarrow S h\left(\operatorname{Spec}(k)_{\text {étale }}\right)=\text { Sets }, \quad \mathcal{F} \longmapsto \bar{s}^{*} \mathcal{F}
$$

[^131]To prove this rigorously one can use Lemma 49.36.2 part (3) with $f=\bar{s}$. Moreover, having said this the general case of Lemma 49.36.2 part (3) follows from functoriality of pullbacks.

### 49.57. Group cohomology

0 A 2 H Notation. If we write $H^{i}(G, M)$ we will mean that $G$ is a topological group and $M$ a discrete $G$-module with continuous $G$-action. This includes the case of an abstract group $G$, which simply means that $G$ is viewed as a topological group with the discrete topology. When the module has a nondiscrete topology, we will use the notation $H_{\text {cont }}^{i}(G, M)$ to indicate the cohomology theory discussed in Tat76.

04JP Definition 49.57.1. Let $G$ be a topological group. A $G$-module, sometime called a discrete $G$-module, is an abelian group $M$ endowed with a left action $a: G \times M \rightarrow M$ by group homomorphisms such that $a$ is continuous when $M$ is given the discrete topology and $G \times M$ the product topology. A morphism of $G$-modules $f: M \rightarrow N$ is simply any $G$-equivariant homomorphism from $M$ to $N$. The category of $G$ modules is denoted Mod $_{G}$.

The condition that $a: G \times M \rightarrow M$ is continuous is equivalent with the condition that the stabilizer of any $x \in M$ is open in $G$. If $G$ is an abstract group then this corresponds to the notion of an abelian group endowed with a $G$-action provided we endow $G$ with the discrete topology.

The category $\operatorname{Mod}_{G}$ has enough injectives, see Injectives, Lemma 19.3.1. Consider the left exact functor

$$
\operatorname{Mod}_{G} \longrightarrow A b, \quad M \longmapsto M^{G}=\{x \in M \mid g \cdot x=x \forall g \in G\}
$$

We sometimes denote $M^{G}=H^{0}(G, M)$ and sometimes we write $M^{G}=\Gamma_{G}(M)$. This functor has a total right derived functor $R \Gamma_{G}(M)$ and $i$ th right derived functor $R^{i} \Gamma_{G}(M)=H^{i}(G, M)$ for any $i \geq 0$.

04JR Definition 49.57.2. Let $G$ be a topological group. Let $M$ be a $G$-module.
(1) The right derived functors $H^{i}(G, M)$ are called the continuous group cohomology groups of $M$.
(2) If $G$ is an abstract group endowed with the discrete topology then the $H^{i}(G, M)$ are called the group cohomology groups of $M$.
(3) If $G$ is a Galois group, then the groups $H^{i}(G, M)$ are called the Galois cohomology groups of $M$.
(4) If $G$ is the absolute Galois group of a field $K$, then the groups $H^{i}(G, M)$ are sometimes called the Galois cohomology groups of $K$ with coefficients in $M$. In this case we sometimes write $H^{i}(K, M)$ instead of $H^{i}(G, M)$.

We can compute continuous group cohomology by the complex of inhomogeneous cochains. In fact, we can define this when $M$ is an arbitrary topological abelian group endowed with a continuous $G$-action. Namely, we consider the complex

$$
C_{\text {cont }}^{\bullet}(G, M): M \rightarrow \operatorname{Maps}_{c o n t}(G, M) \rightarrow \operatorname{Maps}_{c o n t}(G \times G, M) \rightarrow \ldots
$$

where the boundary map is defined for $n \geq 1$ by the rule

$$
\begin{aligned}
\mathrm{d}(f)\left(g_{1}, \ldots, g_{n+1}\right) & =g_{1}\left(f\left(g_{2}, \ldots, g_{n+1}\right)\right) \\
& +\sum_{j=1, \ldots, n}(-1)^{j} f\left(g_{1}, \ldots, g_{j} g_{j+1}, \ldots, g_{n+1}\right) \\
& +(-1)^{n+1} f\left(g_{1}, \ldots, g_{n}\right)
\end{aligned}
$$

and for $n=0$ sends $m \in M$ to the map $g \mapsto g(m)-m$. We define

$$
H_{c o n t}^{i}(G, M)=H^{i}\left(C_{c o n t}^{\bullet}(G, M)\right)
$$

Since the terms of the complex involve continuous maps from $G$ and self products of $G$ into the topological module $M$, it is not clear that this turns a short exact sequence of topological modules into a long exact cohomology sequence. (One difficulty is that the category of topological abelian groups isn't an abelian category!) However, this is true when the topology on the modules is discrete. In fact, if $M$ is a $G$-module as in Definition 49.57.1, then there is a canonical isomorphism

$$
H^{i}(G, M)=H_{\text {cont }}^{i}(G, M)
$$

of cohomology groups.

### 49.58. Cohomology of a point

03 QQ As a consequence of the discussion in the preceding sections we obtain the equivalence of étale cohomology of the spectrum of a field with Galois cohomology.

04JQ Lemma 49.58.1. Let $S=\operatorname{Spec}(K)$ with $K$ a field. Let $\bar{s}$ be a geometric point of $S$. Let $G=G a l_{\kappa(s)}$ denote the absolute Galois group. The stalk functor induces an equivalence of categories

$$
A b\left(S_{\text {étale }}\right) \longrightarrow \operatorname{Mod}_{G}, \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{s}} .
$$

Proof. In Theorem 49.56.3 we have seen the equivalence between sheaves of sets and $G$-sets. The current lemma follows formally from this as an abelian sheaf is just a sheaf of sets endowed with a commutative group law, and a $G$-module is just a $G$-set endowed with a commutative group law.

03QU Lemma 49.58.2. Notation and assumptions as in Lemma 49.58.1. Let $\mathcal{F}$ be an abelian sheaf on $\operatorname{Spec}(K)_{\text {étale }}$ which corresponds to the $G$-module $M$. Then
(1) in $D(A b)$ we have a canonical isomorphism $R \Gamma(S, \mathcal{F})=R \Gamma_{G}(M)$,
(2) $H_{\text {étale }}^{0}(S, \mathcal{F})=M^{G}$, and
(3) $H_{\text {étale }}^{q}(S, \mathcal{F})=H^{q}(G, M)$.

Proof. Combine Lemma 49.58.1 with Lemma 49.56.5.
03QV Example 49.58.3. Sheaves on $\operatorname{Spec}(K)_{\text {étale. Let }}^{\text {. Ler }}=\operatorname{Gal}\left(K^{\text {sep }} / K\right)$ be the absolute Galois group of $K$.
(1) The constant sheaf $\mathbf{Z} / n \mathbf{Z}$ corresponds to the module $\mathbf{Z} / n \mathbf{Z}$ with trivial $G$-action,
(2) the sheaf $\left.\mathbf{G}_{m}\right|_{\operatorname{Spec}(K)_{e ́ t a l e}}$ corresponds to $\left(K^{\text {sep }}\right)^{*}$ with its $G$-action,
(3) the sheaf $\left.\mathbf{G}_{a}\right|_{\operatorname{Spec}\left(K^{\text {sep }}\right)}$ corresponds to $\left(K^{\text {sep }},+\right)$ with its $G$-action, and
(4) the sheaf $\left.\mu_{n}\right|_{\operatorname{Spec}\left(K^{\text {sep }}\right)}$ corresponds to $\mu_{n}\left(K^{\text {sep }}\right)$ with its $G$-action.

By Remark 49.23.4 and Theorem 49.24.1 we have the following identifications for cohomology groups:

$$
\begin{aligned}
H_{\text {étale }}^{0}\left(S_{\text {étale }}, \mathbf{G}_{m}\right) & =\Gamma\left(S, \mathcal{O}_{S}^{*}\right) \\
H_{\text {étale }}^{1}\left(S_{\text {étale }}, \mathbf{G}_{m}\right) & =H_{Z a r}^{1}\left(S, \mathcal{O}_{S}^{*}\right)=\operatorname{Pic}(S) \\
H_{\text {étale }}^{i}\left(S_{\text {étale }}, \mathbf{G}_{a}\right) & =H_{Z a r}^{i}\left(S, \mathcal{O}_{S}\right)
\end{aligned}
$$

Also, for any quasi-coherent sheaf $\mathcal{F}$ on $S_{\text {étale }}$ we have

$$
H^{i}\left(S_{\text {étale }}, \mathcal{F}\right)=H_{Z a r}^{i}(S, \mathcal{F})
$$

see Theorem 49.22.4. In particular, this gives the following sequence of equalities

$$
0=\operatorname{Pic}(\operatorname{Spec}(K))=H_{\text {étale }}^{1}\left(\operatorname{Spec}(K)_{\text {étale }}, \mathbf{G}_{m}\right)=H^{1}\left(G,\left(K^{\text {sep }}\right)^{*}\right)
$$

which is none other than Hilbert's 90 theorem. Similarly, for $i \geq 1$,

$$
0=H^{i}(\operatorname{Spec}(K), \mathcal{O})=H_{\text {étale }}^{i}\left(\operatorname{Spec}(K)_{\text {étale }}, \mathbf{G}_{a}\right)=H^{i}\left(G, K^{\text {sep }}\right)
$$

where the $K^{\text {sep }}$ indicates $K^{\text {sep }}$ as a Galois module with addition as group law. In this way we may consider the work we have done so far as a complicated way of computing Galois cohomology groups.

### 49.59. Cohomology of curves

03R0 The next task at hand is to compute the étale cohomology of a smooth curve over an algebraically closed field with torsion coefficients, and in particular show that it vanishes in degree at least 3 . To prove this, we will compute cohomology at the generic point, which amounts to some Galois cohomology.

### 49.60. Brauer groups

03R1 Brauer groups of fields are defined using finite central simple algebras. In this section we review the relevant facts about Brauer groups, most of which are discussed in the chapter Brauer Groups, Section 11.1. For other references, see $\mathbf{S e r 6 2}$, Ser97] or Wei48.

03R2 Theorem 49.60.1. Let $K$ be a field. For a unital, associative (not necessarily commutative) $K$-algebra $A$ the following are equivalent
(1) $A$ is finite central simple $K$-algebra,
(2) $A$ is a finite dimensional $K$-vector space, $K$ is the center of $A$, and $A$ has no nontrivial two-sided ideal,
(3) there exists $d \geq 1$ such that $A \otimes_{K} \bar{K} \cong \operatorname{Mat}(d \times d, \bar{K})$,
(4) there exists $d \geq 1$ such that $A \otimes_{K} K^{\text {sep }} \cong \operatorname{Mat}\left(d \times d, K^{\text {sep }}\right)$,
(5) there exist $d \geq 1$ and a finite Galois extension $K \subset K^{\prime}$ such that $A \otimes_{K^{\prime}}$ $K^{\prime} \cong \operatorname{Mat}\left(d \times d, K^{\prime}\right)$,
(6) there exist $n \geq 1$ and a finite central skew field $D$ over $K$ such that $A \cong \operatorname{Mat}(n \times n, D)$.

The integer $d$ is called the degree of $A$.
Proof. This is a copy of Brauer Groups, Lemma 11.8.6.

03R4 Lemma 49.60.2. Let $A$ be a finite central simple algebra over $K$. Then

$$
\begin{array}{clc}
A \otimes_{K} A^{o p p} & \longrightarrow & \operatorname{End}_{K}(A) \\
a \otimes a^{\prime} & \longmapsto & \left(x \mapsto a x a^{\prime}\right)
\end{array}
$$

is an isomorphism of algebras over $K$.
Proof. See Brauer Groups, Lemma 11.4.10.
03R3 Definition 49.60.3. Two finite central simple algebras $A_{1}$ and $A_{2}$ over $K$ are called similar, or equivalent if there exist $m, n \geq 1$ such that $\operatorname{Mat}\left(n \times n, A_{1}\right) \cong$ $\operatorname{Mat}\left(m \times m, A_{2}\right)$. We write $A_{1} \sim A_{2}$.

By Brauer Groups, Lemma 11.5 .1 this is an equivalence relation.
03R5 Definition 49.60.4. Let $K$ be a field. The Brauer group of $K$ is the set $\operatorname{Br}(K)$ of similarity classes of finite central simple algebras over $K$, endowed with the group law induced by tensor product (over $K$ ). The class of $A$ in $\operatorname{Br}(K)$ is denoted by $[A]$. The neutral element is $[K]=[\operatorname{Mat}(d \times d, K)]$ for any $d \geq 1$.

The previous lemma implies that inverses exist and that $-[A]=\left[A^{\text {opp }}\right]$. The Brauer group of a field is always torsion. In fact, we will see that $[A]$ has order $\operatorname{deg}(A)$ for any finite central simple algebra $A$ (see Lemma 49.61.2). In general the Brauer group is not finitely generated, for example the Brauer group of a non-Archimedean local field is $\mathbf{Q} / \mathbf{Z}$. The Brauer group of $\mathbf{C}(x, y)$ is uncountable.
03R6 Lemma 49.60.5. Let $K$ be a field and let $K^{\text {sep }}$ be a separable algebraic closure. Then the set of isomorphism classes of central simple algebras of degree $d$ over $K$ is in bijection with the non-abelian cohomology $H^{1}\left(G a l\left(K^{\text {sep }} / K\right), P G L_{d}\left(K^{\text {sep }}\right)\right)$.
Sketch of proof. The Skolem-Noether theorem (see Brauer Groups, Theorem 11.6.1) implies that for any field $L$ the group $\operatorname{Aut}_{L-\operatorname{Algebras}}\left(\operatorname{Mat}_{d}(L)\right)$ equals $\mathrm{PGL}_{d}(L)$. By Theorem 49.60.1, we see that central simple algebras of degree $d$ correspond to forms of the $K$-algebra $\operatorname{Mat}_{d}(K)$. Combined we see that isomorphism classes of degree $d$ central simple algebras correspond to elements of $H^{1}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right), \mathrm{PGL}_{d}\left(K^{\text {sep }}\right)\right)$. For more details on twisting, see for example Sil86.

If $A$ is a finite central simple algebra of degree $d$ over a field $K$, we denote $\xi_{A}$ the corresponding cohomology class in $H^{1}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right), \mathrm{PGL}_{d}\left(K^{\text {sep }}\right)\right)$. Consider the short exact sequence

$$
1 \rightarrow\left(K^{\text {sep }}\right)^{*} \rightarrow \mathrm{GL}_{d}\left(K^{\text {sep }}\right) \rightarrow \mathrm{PGL}_{d}\left(K^{\text {sep }}\right) \rightarrow 1
$$

which gives rise to a long exact cohomology sequence (up to degree 2 ) with coboundary map

$$
\delta_{d}: H^{1}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right), \mathrm{PGL}_{d}\left(K^{\text {sep }}\right)\right) \longrightarrow H^{2}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right) .
$$

Explicitly, this is given as follows: if $\xi$ is a cohomology class represented by the 1-cocycle $\left(g_{\sigma}\right)$, then $\delta_{d}(\xi)$ is the class of the 2-cocycle
0A2I (49.60.5.1)

$$
(\sigma, \tau) \longmapsto \tilde{g}_{\sigma}^{-1} \tilde{g}_{\sigma \tau} \sigma\left(\tilde{g}_{\tau}^{-1}\right) \in\left(K^{s e p}\right)^{*}
$$

where $\tilde{g}_{\sigma} \in \mathrm{GL}_{d}\left(K^{\text {sep }}\right)$ is a lift of $g_{\sigma}$. Using this we can make explicit the map

$$
\delta: \operatorname{Br}(K) \longrightarrow H^{2}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right), \quad[A] \longmapsto \delta_{\operatorname{deg} A}\left(\xi_{A}\right)
$$

as follows. Assume $A$ has degree $d$ over $K$. Choose an isomorphism $\varphi: \operatorname{Mat}_{d}\left(K^{\text {sep }}\right) \rightarrow$ $A \otimes_{K} K^{\text {sep }}$. For $\sigma \in \operatorname{Gal}\left(K^{\text {sep }} / K\right)$ choose an element $\tilde{g}_{\sigma} \in \mathrm{Gl}_{d}\left(K^{\text {sep }}\right)$ such that
$\varphi^{-1} \circ \sigma(\varphi)$ is equal to the map $x \mapsto \tilde{g}_{\sigma} x \tilde{g}_{\sigma}^{-1}$. The class in $H^{2}$ is defined by the two cocycle 49.60.5.1).

03R7 Theorem 49.60.6. Let $K$ be a field with separable algebraic closure $K^{\text {sep }}$. The map $\delta: \operatorname{Br}(K) \rightarrow H^{2}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right)$ defined above is a group isomorphism.

Sketch of proof. In the abelian case ( $d=1$ ), one has the identification

$$
H^{1}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right), \mathrm{GL}_{d}\left(K^{\text {sep }}\right)\right)=H_{\text {étale }}^{1}\left(\operatorname{Spec}(K), \operatorname{GL}_{d}(\mathcal{O})\right)
$$

the latter of which is trivial by fpqc descent. If this were true in the non-abelian case, this would readily imply injectivity of $\delta$. (See Del77.) Rather, to prove this, one can reinterpret $\delta([A])$ as the obstruction to the existence of a $K$-vector space $V$ with a left $A$-module structure and such that $\operatorname{dim}_{K} V=\operatorname{deg} A$. In the case where $V$ exists, one has $A \cong \operatorname{End}_{K}(V)$. For surjectivity, pick a cohomology class $\xi \in H^{2}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right)$, then there exists a finite Galois extension $K \subset K^{\prime} \subset K^{\text {sep }}$ such that $\xi$ is the image of some $\xi^{\prime} \in H^{2}\left(\operatorname{Gal}\left(K^{\prime} \mid K\right),\left(K^{\prime}\right)^{*}\right)$. Then write down an explicit central simple algebra over $K$ using the data $K^{\prime}, \xi^{\prime}$.

### 49.61. The Brauer group of a scheme

0A2J Let $S$ be a scheme. An $\mathcal{O}_{S}$-algebra $\mathcal{A}$ is called Azumaya if it is étale locally a matrix algebra, i.e., if there exists an étale covering $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow S\right\}_{i \in I}$ such that $\varphi_{i}^{*} \mathcal{A} \cong \operatorname{Mat}_{d_{i}}\left(\mathcal{O}_{U_{i}}\right)$ for some $d_{i} \geq 1$. Two such $\mathcal{A}$ and $\mathcal{B}$ are called equivalent if there exist finite locally free $\mathcal{O}_{S}$-modules $\mathcal{F}$ and $\mathcal{G}$ which have positive rank at every $s \in S$ such that

$$
\mathcal{A} \otimes \mathcal{O}_{S} \mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{F}, \mathcal{F}) \cong \mathcal{B} \otimes_{\mathcal{O}_{S}} \mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{G}, \mathcal{G})
$$

as $\mathcal{O}_{S}$-algebras. The Brauer group of $S$ is the set $\operatorname{Br}(S)$ of equivalence classes of Azumaya $\mathcal{O}_{S}$-algebras with the operation induced by tensor product (over $\mathcal{O}_{S}$ ).

0A2K Lemma 49.61.1. Let $S$ be a scheme. Let $\mathcal{F}$ and $\mathcal{G}$ be finite locally free sheaves of $\mathcal{O}_{S}$-modules of positive rank. If there exists an isomorphism $\operatorname{Hom}_{\mathcal{O}_{S}}(\mathcal{F}, \mathcal{F}) \cong$ $\mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{G}, \mathcal{G})$ of $\mathcal{O}_{S}$-algebras, then there exists an invertible sheaf $\mathcal{L}$ on $S$ such that $\mathcal{F} \otimes_{\mathcal{O}_{S}} \mathcal{L} \cong \mathcal{G}$ and such that this isomorphism induces the given isomorphism of endomorphism algebras.

Proof. Fix an isomorphism $\mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{F}, \mathcal{F}) \rightarrow \mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{G}, \mathcal{G})$. Consider the sheaf $\mathcal{L} \subset \mathcal{H o m}(\mathcal{F}, \mathcal{G})$ generated as an $\mathcal{O}_{S}$-module by the local isomorphisms $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ such that conjugation by $\varphi$ is the given isomorphism of endomorphism algebras. A local calculation (reducing to the case that $\mathcal{F}$ and $\mathcal{G}$ are finite free and $S$ is affine) shows that $\mathcal{L}$ is invertible. Another local calculation shows that the evaluation map

$$
\mathcal{F} \otimes_{\mathcal{O}_{S}} \mathcal{L} \longrightarrow \mathcal{G}
$$

is an isomorphism.
The argument given in the proof of the following lemma can be found in Sal81.
0A2L Lemma 49.61.2. Let $S$ be a scheme. Let $\mathcal{A}$ be an Azumaya algebra which is locally free of rank $d^{2}$ over $S$. Then the class of $\mathcal{A}$ in the Brauer group of $S$ is

Argument taken from Sal81. annihilated by $d$.

Proof. Choose an étale covering $\left\{U_{i} \rightarrow S\right\}$ and choose isomorphisms $\left.\mathcal{A}\right|_{U_{i}} \rightarrow$ $\mathcal{H o m}\left(\mathcal{F}_{i}, \mathcal{F}_{i}\right)$ for some locally free $\mathcal{O}_{U_{i}}$-modules $\mathcal{F}_{i}$ of rank $d$. (We may assume $\mathcal{F}_{i}$ is free.) Consider the composition

$$
p_{i}: \mathcal{F}_{i}^{\otimes d} \rightarrow \wedge^{d}\left(\mathcal{F}_{i}\right) \rightarrow \mathcal{F}_{i}^{\otimes d}
$$

The first arrow is the usual projection and the second arrow is the isomorphism of the top exterior power of $\mathcal{F}_{i}$ with the submodule of sections of $\mathcal{F}_{i}^{\otimes d}$ which transform according to the sign character under the action of the symmetric group on $d$ letters. Then $p_{i}^{2}=p_{i}$ and the rank of $p_{i}$ is 1 . Using the given isomorphism $\left.\mathcal{A}\right|_{U_{i}} \rightarrow \mathcal{H o m}\left(\mathcal{F}_{i}, \mathcal{F}_{i}\right)$ and the canonical isomorphism

$$
\mathcal{H o m}\left(\mathcal{F}_{i}, \mathcal{F}_{i}\right)^{\otimes d}=\mathcal{H o m}\left(\mathcal{F}_{i}^{\otimes d}, \mathcal{F}_{i}^{\otimes d}\right)
$$

we may think of $p_{i}$ as a section of $\mathcal{A}^{\otimes d}$ over $U_{i}$. We claim that $\left.p_{i}\right|_{U_{i} \times{ }_{S} U_{j}}=\left.p_{j}\right|_{U_{i} \times{ }_{S} U_{j}}$ as sections of $\mathcal{A}^{\otimes d}$. Namely, applying Lemma 49.61.1 we obtain an invertible sheaf $\mathcal{L}_{i j}$ and a canonical isomorphism

$$
\left.\left.\mathcal{F}_{i}\right|_{U_{i} \times{ }_{S} U_{j}} \otimes \mathcal{L}_{i j} \longrightarrow \mathcal{F}_{j}\right|_{U_{i} \times{ }_{S} U_{j}} .
$$

Using this isomorphism we see that $p_{i}$ maps to $p_{j}$. Since $\mathcal{A}^{\otimes d}$ is a sheaf on $S_{\text {étale }}$ (Proposition 49.17.1 we find a canonical global section $p \in \Gamma\left(S, \mathcal{A}^{\otimes d}\right)$. A local calculation shows that

$$
\mathcal{H}=\operatorname{Im}\left(\mathcal{A}^{\otimes d} \rightarrow \mathcal{A}^{\otimes d}, f \mapsto f p\right)
$$

is a locally free module of rank $d^{d}$ and that (left) multiplication by $\mathcal{A}^{\otimes d}$ induces an isomorphism $\mathcal{A}^{\otimes d} \rightarrow \mathcal{H o m}(\mathcal{H}, \mathcal{H})$. In other words, $\mathcal{A}^{\otimes d}$ is the trivial element of the Brauer group of $S$ as desired.

In this setting, the analogue of the isomorphism $\delta$ of Theorem49.60.6 is a map

$$
\delta_{S}: \operatorname{Br}(S) \rightarrow H_{\text {étale }}^{2}\left(S, \mathbf{G}_{m}\right)
$$

It is true that $\delta_{S}$ is injective. If $S$ is quasi-compact or connected, then $\operatorname{Br}(S)$ is a torsion group, so in this case the image of $\delta_{S}$ is contained in the cohomological Brauer group of $S$

$$
\operatorname{Br}^{\prime}(S):=H_{\text {étale }}^{2}\left(S, \mathbf{G}_{m}\right)_{\text {torsion }}
$$

So if $S$ is quasi-compact or connected, there is an inclusion $\operatorname{Br}(S) \subset \operatorname{Br}^{\prime}(S)$. This is not always an equality: there exists a nonseparated singular surface $S$ for which $\operatorname{Br}(S) \subset \operatorname{Br}^{\prime}(S)$ is a strict inclusion. If $S$ is quasi-projective, then $\operatorname{Br}(S)=\operatorname{Br}^{\prime}(S)$. However, it is not known whether this holds for a smooth proper variety over $\mathbf{C}$, say.

### 49.62. Galois cohomology

0A2M In this section we will use the following result from Galois cohomology to get vanishing of higher étale cohomology groups over the spectrum of a field.
03R8 Proposition 49.62.1. Let $K$ be a field with separable algebraic closure $K^{\text {sep }}$. Assume that for any finite extension $K^{\prime}$ of $K$ we have $\operatorname{Br}\left(K^{\prime}\right)=0$. Then
(1) $H^{q}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right)=0$ for all $q \geq 1$, and

Ser97, Chapter II, Section 3,
Proposition 5]
(2) $H^{q}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right), M\right)=0$ for any torsion $\operatorname{Gal}\left(K^{\text {sep }} / K\right)$-module $M$ and any $q \geq 2$,
Proof. Omitted.

03R9 Definition 49.62.2. A field $K$ is called $C_{r}$ if for every $0<d^{r}<n$ and every $f \in K\left[T_{1}, \ldots, T_{n}\right]$ homogeneous of degree $d$, there exist $\alpha=\left(\alpha_{1}, \ldots, \alpha_{n}\right), \alpha_{i} \in K$ not all zero, such that $f(\alpha)=0$. Such an $\alpha$ is called a nontrivial solution of $f$.

03RA Example 49.62.3. An algebraically closed field is $C_{r}$.
In fact, we have the following simple lemma.
$03 R B$ Lemma 49.62.4. Let $k$ be an algebraically closed field. Let $f_{1}, \ldots, f_{s} \in k\left[T_{1}, \ldots, T_{n}\right]$ be homogeneous polynomials of degree $d_{1}, \ldots, d_{s}$ with $d_{i}>0$. If $s<n$, then $f_{1}=\ldots=f_{s}=0$ have a common nontrivial solution.

Proof. This follows from dimension theory, for example in the form of Varieties, Lemma 32.27.2 applied $s-1$ times.

The following result computes the Brauer group of $C_{1}$ fields.
03RC Theorem 49.62.5. Let $K$ be a $C_{1}$ field. Then $\operatorname{Br}(K)=0$.
Proof. Let $D$ be a finite dimensional division algebra over $K$ with center $K$. We have seen that

$$
D \otimes_{K} K^{\text {sep }} \cong \operatorname{Mat}_{d}\left(K^{\text {sep }}\right)
$$

uniquely up to inner isomorphism. Hence the determinant det : $\operatorname{Mat}_{d}\left(K^{\text {sep }}\right) \rightarrow$ $K^{s e p}$ is Galois invariant and descends to a homogeneous degree $d$ map

$$
\operatorname{det}=N_{\text {red }}: D \longrightarrow K
$$

called the reduced norm. Since $K$ is $C_{1}$, if $d>1$, then there exists a nonzero $x \in D$ with $N_{\text {red }}(x)=0$. This clearly implies that $x$ is not invertible, which is a contradiction. Hence $\operatorname{Br}(K)=0$.

03RE Definition 49.62.6. Let $k$ be a field. A variety is separated, integral scheme of finite type over $k$. A curve is a variety of dimension 1.
03RD Theorem 49.62.7 (Tsen's theorem). The function field of a variety of dimension $r$ over an algebraically closed field $k$ is $C_{r}$.

Proof. For projective space one can show directly that the field $k\left(x_{1}, \ldots, x_{r}\right)$ is $C_{r}$ (exercise).
General case. Without loss of generality, we may assume $X$ to be projective. Let $f \in K\left[T_{1}, \ldots, T_{n}\right]_{d}$ with $0<d^{r}<n$. Say the coefficients of $f$ are in $\Gamma\left(X, \mathcal{O}_{X}(H)\right)$ for some ample $H \subset X$. Let $\alpha=\left(\alpha_{1}, \ldots, \alpha_{n}\right)$ with $\alpha_{i} \in \Gamma\left(X, \mathcal{O}_{X}(e H)\right)$. Then $f(\alpha) \in \Gamma\left(X, \mathcal{O}_{X}((d e+1) H)\right)$. Consider the system of equations $f(\alpha)=0$. Then by asymptotic Riemann-Roch (Varieties, Proposition 32.34.13) there exists a $c>0$ such that

- the number of variables is $n \operatorname{dim}_{K} \Gamma\left(X, \mathcal{O}_{X}(e H)\right) \sim n e^{r} c$, and
- the number of equations is $\operatorname{dim}_{K} \Gamma\left(X, \mathcal{O}_{X}((d e+1) H)\right) \sim(d e+1)^{r} c$.

Since $n>d^{r}$, there are more variables than equations. The equations are homogeneous hence there is a solution by Lemma 49.62.4.

03RF Lemma 49.62.8. Let $C$ be a curve over an algebraically closed field $k$. Then the Brauer group of the function field of $C$ is zero: $\operatorname{Br}(k(C))=0$.

Proof. This is clear from Tsen's theorem, Theorem 49.62.7.

03RG Lemma 49.62.9. Let $k$ be an algebraically closed field and $k \subset K$ a field extension of transcendence degree 1. Then for all $q \geq 1, H_{\text {étale }}^{q}\left(\operatorname{Spec}(K), \mathbf{G}_{m}\right)=0$.
Proof. Recall that $H_{\text {étale }}^{q}\left(\operatorname{Spec}(K), \mathbf{G}_{m}\right)=H^{q}\left(\operatorname{Gal}\left(K^{\text {sep }} / K\right),\left(K^{\text {sep }}\right)^{*}\right)$ by Lemma 49.58.2. Thus by Proposition 49.62.1 it suffices to show that if $K \subset K^{\prime}$ is a finite field extension, then $\operatorname{Br}\left(K^{\prime}\right)=0$. Now observe that $K^{\prime}=\operatorname{colim} K^{\prime \prime}$, where $K^{\prime \prime}$ runs over the finitely generated subextensions of $k$ contained in $K^{\prime}$ of transcendence degree 1. Note that $\operatorname{Br}\left(K^{\prime}\right)=$ colim $\operatorname{Br}\left(K^{\prime \prime}\right)$ which reduces us to a finitely generated field extension $K^{\prime \prime} / k$ of transcendence degree 1 . Such a field is the function field of a curve over $k$, hence has trivial Brauer group by Lemma 49.62.8.

### 49.63. Higher vanishing for the multiplicative group

03 RH In this section, we fix an algebraically closed field $k$ and a smooth curve $X$ over $k$. We denote $i_{x}: x \hookrightarrow X$ the inclusion of a closed point of $X$ and $j: \eta \hookrightarrow X$ the inclusion of the generic point. We also denote $X_{0}$ the set of closed points of $X$.

03RI Theorem 49.63.1 (The Fundamental Exact Sequence). There is a short exact sequence of étale sheaves on $X$

$$
0 \longrightarrow \mathbf{G}_{m, X} \longrightarrow j_{*} \mathbf{G}_{m, \eta} \longrightarrow \bigoplus_{x \in X_{0}} i_{x *} \underline{\mathbf{Z}} \longrightarrow 0
$$

Proof. Let $\varphi: U \rightarrow X$ be an étale morphism. Then by properties of étale morphisms (Proposition 49.26.2), $U=\coprod_{i} U_{i}$ where each $U_{i}$ is a smooth curve mapping to $X$. The above sequence for $X$ is a product of the corresponding sequences for each $U_{i}$, so it suffices to treat the case where $U$ is connected, hence irreducible. In this case, there is a well known exact sequence

$$
1 \longrightarrow \Gamma\left(U, \mathcal{O}_{U}^{*}\right) \longrightarrow k(U)^{*} \longrightarrow \bigoplus_{y \in U^{0}} \mathbf{Z}_{y}
$$

This amounts to a sequence

$$
0 \longrightarrow \Gamma\left(U, \mathcal{O}_{U}^{*}\right) \longrightarrow \Gamma\left(\eta \times_{X} U, \mathcal{O}_{\eta \times_{X} U}^{*}\right) \longrightarrow \bigoplus_{x \in X_{0}} \Gamma\left(x \times_{X} U, \underline{\mathbf{Z}}\right)
$$

which, unfolding definitions, is nothing but a sequence

$$
0 \longrightarrow \mathbf{G}_{m}(U) \longrightarrow j_{*} \mathbf{G}_{m, \eta}(U) \longrightarrow\left(\bigoplus_{x \in X_{0}} i_{x *} \underline{\mathbf{Z}}\right)(U)
$$

This defines the maps in the Fundamental Exact Sequence and shows it is exact except possibly at the last step. To see surjectivity, let us recall that if $U$ is a nonsingular curve and $D$ is a divisor on $U$, then there exists a Zariski open covering $\left\{U_{j} \rightarrow U\right\}$ of $U$ such that $\left.D\right|_{U_{j}}=\operatorname{div}\left(f_{j}\right)$ for some $f_{j} \in k(U)^{*}$.
$03 R J$ Lemma 49.63.2. For any $q \geq 1, R^{q} j_{*} \mathbf{G}_{m, \eta}=0$.
Proof. We need to show that $\left(R^{q} j_{*} \mathbf{G}_{m, \eta}\right)_{\bar{x}}=0$ for every geometric point $\bar{x}$ of $X$.
Assume that $\bar{x}$ lies over a closed point $x$ of $X$. Let $\operatorname{Spec}(A)$ be an affine open neighbourhood of $x$ in $X$, and $K$ the fraction field of $A$. Then

$$
\operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}^{s h}\right) \times_{X} \eta=\operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}^{s h} \otimes_{A} K\right)
$$

The ring $\mathcal{O}_{X, \bar{x}}^{s h} \otimes_{A} K$ is a localization of the discrete valuation ring $\mathcal{O}_{X, \bar{x}}^{s h}$, so it is either $\mathcal{O}_{X, \bar{x}}^{s h}$ again, or its fraction field $K_{\bar{x}}^{s h}$. But since some local uniformizer gets inverted, it must be the latter. Hence

$$
\left(R^{q} j_{*} \mathbf{G}_{m, \eta}\right)_{(X, \bar{x})}=H_{\text {étale }}^{q}\left(\operatorname{Spec} K_{\bar{x}}^{s h}, \mathbf{G}_{m}\right)
$$

Now recall that $\mathcal{O}_{X, \bar{x}}^{s h}=\operatorname{colim}_{(U, \bar{u}) \rightarrow \bar{x}} \mathcal{O}(U)=\operatorname{colim}_{A \subset B} B$ where $A \rightarrow B$ is étale, hence $K_{\bar{x}}^{s h}$ is an algebraic extension of $K=k(X)$, and we may apply Lemma 49.62.9 to get the vanishing.
Assume that $\bar{x}=\bar{\eta}$ lies over the generic point $\eta$ of $X$ (in fact, this case is superfluous). Then $\mathcal{O}_{X, \bar{\eta}}=\kappa(\eta)^{\text {sep }}$ and thus

$$
\begin{aligned}
\left(R^{q} j_{*} \mathbf{G}_{m, \eta}\right)_{\bar{\eta}} & =H_{\text {étale }}^{q}\left(\operatorname{Spec}\left(\kappa(\eta)^{\text {sep }}\right) \times_{X} \eta, \mathbf{G}_{m}\right) \\
& =H_{\text {étale }}^{q}\left(\operatorname{Spec}\left(\kappa(\eta)^{\text {sep }}\right), \mathbf{G}_{m}\right) \\
& =0 \quad \text { for } q \geq 1
\end{aligned}
$$

since the corresponding Galois group is trivial.
$03 R \mathrm{Lemma}$ 49.63.3. For all $p \geq 1, H_{\text {étale }}^{p}\left(X, j_{*} \mathbf{G}_{m, \eta}\right)=0$.
Proof. The Leray spectral sequence reads

$$
E_{2}^{p, q}=H_{\text {étale }}^{p}\left(X, R^{q} j_{*} \mathbf{G}_{m, \eta}\right) \Rightarrow H_{\text {étale }}^{p+q}\left(\eta, \mathbf{G}_{m, \eta}\right)
$$

which vanishes for $p+q \geq 1$ by Lemma 49.62.9. Taking $q=0$, we get the desired vanishing.

03 RL Lemma 49.63.4. For all $q \geq 1, H_{\text {étale }}^{q}\left(X, \bigoplus_{x \in X_{0}} i_{x *} \underline{\mathbf{Z}}\right)=0$.
Proof. For $X$ quasi-compact and quasi-separated, cohomology commutes with colimits, so it suffices to show the vanishing of $H_{\text {étale }}^{q}\left(X, i_{x *} \underline{\mathbf{Z}}\right)$. But then the inclusion $i_{x}$ of a closed point is finite so $R^{p} i_{x *} \underline{\mathbf{Z}}=0$ for all $p \geq 1$ by Proposition 49.55.2. Applying the Leray spectral sequence, we see that $H_{\text {étale }}^{q}\left(X, i_{x *} \underline{\mathbf{Z}}\right)=H_{\text {étale }}^{q}(x, \underline{\mathbf{Z}})$. Finally, since $x$ is the spectrum of an algebraically closed field, all higher cohomology on $x$ vanishes.

Concluding this series of lemmata, we get the following result.
03RM Theorem 49.63.5. Let $X$ be a smooth curve over an algebraically closed field. Then

$$
H_{\text {étale }}^{q}\left(X, \mathbf{G}_{m}\right)=0 \quad \text { for all } q \geq 2
$$

Proof. See discussion above.
We also get the cohomology long exact sequence
$0 \rightarrow H_{\text {étale }}^{0}\left(X, \mathbf{G}_{m}\right) \rightarrow H_{\text {étale }}^{0}\left(X, j_{*} \mathbf{G}_{m \eta}\right) \rightarrow H_{\text {étale }}^{0}\left(X, \bigoplus i_{x *} \underline{\mathbf{Z}}\right) \rightarrow H_{\text {étale }}^{1}\left(X, \mathbf{G}_{m}\right) \rightarrow 0$
although this is the familiar

$$
0 \rightarrow H_{Z a r}^{0}\left(X, \mathcal{O}_{X}^{*}\right) \rightarrow k(X)^{*} \rightarrow \operatorname{Div}(X) \rightarrow \operatorname{Pic}(X) \rightarrow 0
$$

### 49.64. The Artin-Schreier sequence

0A3J Let $p$ be a prime number. Let $S$ be a scheme in characteristic $p$. The Artin-Schreier sequence is the short exact sequence

$$
0 \longrightarrow \underline{\mathbf{Z} / p \mathbf{Z}} S \longrightarrow \mathbf{G}_{a, S} \xrightarrow{F-1} \mathbf{G}_{a, S} \longrightarrow 0
$$

where $F-1$ is the map $x \mapsto x^{p}-x$.
0A3K Lemma 49.64.1. Let $p$ be a prime. Let $S$ be a scheme of characteristic $p$.
(1) If $S$ is affine, then $H_{\text {étale }}^{q}(S, \underline{\mathbf{Z} / p \mathbf{Z}})=0$ for all $q \geq 2$.
(2) If $S$ is a quasi-compact and quasi-separated scheme of dimension d, then $H_{\text {étale }}^{q}(S, \underline{\mathbf{Z} / p \mathbf{Z}})=0$ for all $q \geq 2+d$.

Proof. Recall that the étale cohomology of the structure sheaf is equal to its cohomology on the underlying topological space (Theorem 49.22.4). The first statement follows from the Artin-Schreier exact sequence and the vanishing of cohomology of the structure sheaf on an affine scheme (Cohomology of Schemes, Lemma 29.2.2). The second statement follows by the same argument from the vanishing of Cohomology, Proposition 20.23 .4 and the fact that $S$ is a spectral space (Properties, Lemma 27.2.4.

0A3L Lemma 49.64.2. Let $k$ be an algebraically closed field of characteristic $p>0$. Let $V$ be a finite dimensional $k$-vector space. Let $F: V \rightarrow V$ be a frobenius linear map, i.e., an additive map such that $F(\lambda v)=\lambda^{p} F(v)$ for all $\lambda \in k$ and $v \in V$. Then $F-1: V \rightarrow V$ is surjective with kernel a finite dimensional $\mathbf{F}_{p}$-vector space of dimension $\leq \operatorname{dim}_{k}(V)$.

Proof. If $F=0$, then the statement holds. If we have a filtration of $V$ by $F$-stable subvector spaces such that the statement holds for each graded piece, then it holds for $(V, F)$. Combining these two remarks we may assume the kernel of $F$ is zero.
Choose a basis $v_{1}, \ldots, v_{n}$ of $V$ and write $F\left(v_{i}\right)=\sum a_{i j} v_{j}$. Observe that $v=\sum \lambda_{i} v_{i}$ is in the kernel if and only if $\sum \lambda_{i}^{p} a_{i j} v_{j}=0$. Since $k$ is algebraically closed this implies the matrix $\left(a_{i j}\right)$ is invertible. Let $\left(b_{i j}\right)$ be its inverse. Then to see that $F-1$ is surjective we pick $w=\sum \mu_{i} v_{i} \in V$ and we try to solve

$$
(F-1)\left(\sum \lambda_{i} v_{i}\right)=\sum \lambda_{i}^{p} a_{i j} v_{j}-\sum \lambda_{j} v_{j}=\sum \mu_{j} v_{j}
$$

This is equivalent to

$$
\sum \lambda_{j}^{p} v_{j}-\sum b_{i j} \lambda_{i} v_{j}=\sum b_{i j} \mu_{i} v_{j}
$$

in other words

$$
\lambda_{j}^{p}-\sum b_{i j} \lambda_{i}=\sum b_{i j} \mu_{i}, \quad j=1, \ldots, \operatorname{dim}(V)
$$

The algebra

$$
A=k\left[x_{1}, \ldots, x_{n}\right] /\left(x_{j}^{p}-\sum b_{i j} x_{i}-\sum b_{i j} \mu_{i}\right)
$$

is standard smooth over $k$ (Algebra, Definition 10.135.6) because the matrix $\left(b_{i j}\right)$ is invertible and the partial derivatives of $x_{j}^{p}$ are zero. A basis of $A$ over $k$ is the set of monomials $x_{1}^{e_{1}} \ldots x_{n}^{e_{n}}$ with $e_{i}<p$, hence $\operatorname{dim}_{k}(A)=p^{n}$. Since $k$ is algebraically closed we see that $\operatorname{Spec}(A)$ has exactly $p^{n}$ points. It follows that $F-1$ is surjective and every fibre has $p^{n}$ points, i.e., the kernel of $F-1$ is a group with $p^{n}$ elements.

0A3M Lemma 49.64.3. Let $X$ be a separated scheme of finite type over a field $k$. Let $\mathcal{F}$ be a coherent sheaf of $\mathcal{O}_{X}$-modules. Then $\operatorname{dim}_{k} H^{d}(X, \mathcal{F})<\infty$ where $d=\operatorname{dim}(X)$.

Proof. We will prove this by induction on $d$. The case $d=0$ holds because in that case $X$ is the spectrum of a finite dimensinal $k$-algebra $A$ (Varieties, Lemma 32.17 .2 ) and every coherent sheaf $\mathcal{F}$ corresponds to a finite $A$-module $M=H^{0}(X, \mathcal{F})$ which has $\operatorname{dim}_{k} M<\infty$.

Assume $d>0$ and the result has been shown for separated shemes of finite type of dimension $<d$. The scheme $X$ is Noetherian. Consider the property $\mathcal{P}$ of coherent sheaves on $X$ defined by the rule

$$
\mathcal{P}(\mathcal{F}) \Leftrightarrow \operatorname{dim}_{k} H^{d}(X, \mathcal{F})<\infty
$$

We are going to use the result of Cohomology of Schemes, Lemma 29.12.4 to prove that $\mathcal{P}$ holds for every coherent sheaf on $X$.

Let

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

be a short exact sequence of coherent sheaves on $X$. Consider the long exact sequence of cohomology

$$
H^{d}\left(X, \mathcal{F}_{1}\right) \rightarrow H^{d}(X, \mathcal{F}) \rightarrow H^{d}\left(X, \mathcal{F}_{2}\right)
$$

Thus if $\mathcal{P}$ holds for $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$, then it hods for $\mathcal{F}$.
Let $Z \subset X$ be an integral closed subscheme. Let $\mathcal{I}$ be a coherent sheaf of ideals on $Z$. To finish the proof have to show that $H^{d}\left(X, i_{*} \mathcal{I}\right)=H^{d}(Z, \mathcal{I})$ is finite dimensional. If $\operatorname{dim}(Z)<d$, then the result holds because the cohomology group will be zero (Cohomology, Proposition 20.21.6). In this way we reduce to the situation discussed in the following paragraph.

Assume $X$ is a variety of dimension $d$ and $\mathcal{F}=\mathcal{I}$ is a coherent ideal sheaf. In this case we have a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z} \rightarrow 0
$$

where $i: Z \rightarrow X$ is the closed subscheme defined by $\mathcal{I}$. By induction hypothesis we see that $H^{d-1}\left(Z, \mathcal{O}_{Z}\right)=H^{d-1}\left(X, i_{*} \mathcal{O}_{Z}\right)$ is finite dimensional. Thus we see that it suffices to prove the result for the structure sheaf.

We can apply Chow's lemma (Cohomology of Schemes, Lemma 29.17.1) to the morphism $X \rightarrow \operatorname{Spec}(k)$. Thus we get a diagram

as in the statement of Chow's lemma. Also, let $U \subset X$ be the dense open subscheme such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism. We may assume $X^{\prime}$ is a variety as well, see Cohomology of Schemes, Remark 29.17.2. The morphism $i^{\prime}=(i, \pi): X^{\prime} \rightarrow \mathbf{P}_{X}^{n}$ is a closed immersion (loc. cit.). Hence

$$
\mathcal{L}=i^{*} \mathcal{O}_{\mathbf{P}_{k}^{n}}(1) \cong\left(i^{\prime}\right)^{*} \mathcal{O}_{\mathbf{P}_{X}^{n}}(1)
$$

is $\pi$-relatively ample (for example by Morphisms, Lemma 28.39.7). Hence by Cohomology of Schemes, Lemma 29.15.2 there exists an $n \geq 0$ such that $R^{p} \pi_{*} \mathcal{L}^{\otimes n}=0$ for all $p>0$. Set $\mathcal{G}=\pi_{*} \mathcal{L}^{\otimes n}$. Choose any nonzero global section $s$ of $\mathcal{L}^{\otimes n}$. Since $\mathcal{G}=\pi_{*} \mathcal{L}^{\otimes n}$, the section $s$ corresponds to section of $\mathcal{G}$, i.e., a map $\mathcal{O}_{X} \rightarrow \mathcal{G}$. Since $\left.s\right|_{U} \neq 0$ as $X^{\prime}$ is a variety and $\mathcal{L}$ invertible, we see that $\left.\left.\mathcal{O}_{X}\right|_{U} \rightarrow \mathcal{G}\right|_{U}$ is nonzero. As $\left.\mathcal{G}\right|_{U}=\left.\mathcal{K} \mathcal{L}^{\otimes n}\right|_{\pi^{-1}(U)}$ is invertible we conclude that we have a short exact sequence

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0
$$

where $\mathcal{Q}$ is coherent and supported on a proper closed subscheme of $X$. Arguing as before using our induction hypothesis, we see that it suffices to prove $\operatorname{dim} H^{d}(X, \mathcal{G})<\infty$.
By the Leray spectral sequence (Cohomology, Lemma 20.14.6) we see that $H^{d}(X, \mathcal{G})=$ $H^{d}\left(X^{\prime}, \mathcal{L}^{\otimes n}\right)$. Let $\bar{X}^{\prime} \subset \mathbf{P}_{k}^{n}$ be the closure of $X^{\prime}$. Then $\bar{X}^{\prime}$ is a projective variety of dimension $d$ over $k$ and $X^{\prime} \subset \bar{X}^{\prime}$ is a dense open. The invertible sheaf $\mathcal{L}$ is the restriction of $\mathcal{O}_{\bar{X}^{\prime}}(n)$ to $X$. By Cohomology, Proposition 20.23.4 the map

$$
H^{d}\left(\bar{X}^{\prime}, \mathcal{O}_{\bar{X}^{\prime}}(n)\right) \longrightarrow H^{d}\left(X^{\prime}, \mathcal{L}^{\otimes n}\right)
$$

is surjective. Since the cohomology group on the left has finite dimension by Cohomology of Schemes, Lemma 29.14.1 the proof is complete.

0A3N Lemma 49.64.4. Let $X$ be separated of finite type over an algebraically closed field $k$ of characteristic $p>0$. Then $H_{\text {étale }}^{q}(X, \underline{\mathbf{Z} / p \mathbf{Z}})=0$ for $q \geq \operatorname{dim}(X)+1$.

Proof. Let $d=\operatorname{dim}(X)$. By the vanishing established in Lemma 49.64.1 it suffices to show that $H_{\text {étale }}^{d+1}(X, \mathbf{Z} / p \mathbf{Z})=0$. By Lemma 49.64.3 we see that $H^{d}\left(X, \mathcal{O}_{X}\right)$ is a finite dimensional $\overline{k \text {-vector space. Hence the long exact cohomology sequence }}$ associated to the Artin-Schreier sequence ends with

$$
H^{d}\left(X, \mathcal{O}_{X}\right) \xrightarrow{F-1} H^{d}\left(X, \mathcal{O}_{X}\right) \rightarrow H_{\text {étale }}^{d+1}(X, \mathbf{Z} / p \mathbf{Z}) \rightarrow 0
$$

By Lemma 49.64.2 the map $F-1$ in this sequence is surjective. This proves the lemma.

0A3P Lemma 49.64.5. Let $X$ be a proper scheme over an algebraically closed field $k$ of characteristic $p>0$. Then
(1) $H_{\text {étale }}^{q}(X, \underline{\mathbf{Z} / p \mathbf{Z}})$ is a finite $\mathbf{Z} / p \mathbf{Z}$-module for all $q$, and
(2) $H_{\text {étale }}^{q}(X, \underline{\mathbf{Z} / p \mathbf{Z}}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}}, \underline{\mathbf{Z} / p \mathbf{Z})}\right)$ is an isomorphism if $k \subset k^{\prime}$ is an extension of algebraically closed fields.

Proof. By Cohomology of Schemes, Lemma 29.18.3) and the comparison of cohomology of Theorem 49.22 .4 the cohomology groups $H_{\text {étale }}^{q}\left(X, \mathbf{G}_{a}\right)=H^{q}\left(X, \mathcal{O}_{X}\right)$ are finite dimensional $k$-vector spaces. Hence by Lemma 49.64.2 the long exact cohomology sequence associated to the Artin-Schreier sequence, splits into short exact sequences

$$
0 \rightarrow H_{\text {étale }}^{q}(X, \underline{\mathbf{Z} / p \mathbf{Z}}) \rightarrow H^{q}\left(X, \mathcal{O}_{X}\right) \xrightarrow{F-1} H^{q}\left(X, \mathcal{O}_{X}\right) \rightarrow 0
$$

and moreover the $\mathbf{F}_{p}$-dimension of the cohomology groups $H_{\text {étale }}^{q}(X, \mathbf{Z} / p \mathbf{Z})$ is equal to the $k$-dimension of the vector space $H^{q}\left(X, \mathcal{O}_{X}\right)$. This proves the first statement. The second statement follows as $H^{q}\left(X, \mathcal{O}_{X}\right) \otimes_{k} k^{\prime} \rightarrow H^{q}\left(X_{k^{\prime}}, \mathcal{O}_{X_{k^{\prime}}}\right)$ is an isomorphism by flat base change (Cohomology of Schemes, Lemma 29.5.2).

### 49.65. Picard groups of curves

03RN Our next step is to use the Kummer sequence to deduce some information about the cohomology group of a curve with finite coefficients. In order to get vanishing in the long exact sequence, we review some facts about Picard groups.

Let $X$ be a smooth projective curve over an algebraically closed field $k$. Let $g=$ $\operatorname{dim}_{k} H^{1}\left(X, \mathcal{O}_{X}\right)$ be the genus of $X$. There exists a short exact sequence

$$
0 \rightarrow \operatorname{Pic}^{0}(X) \rightarrow \operatorname{Pic}(X) \xrightarrow{\operatorname{deg}} \mathbf{Z} \rightarrow 0
$$

The abelian group $\operatorname{Pic}^{0}(X)$ can be identified with $\operatorname{Pic}^{0}(X)=\underline{\operatorname{Pic}}_{X / k}^{0}(k)$, i.e., the $k$-valued points of an abelian variety $\underline{\operatorname{Pic}}_{X / k}^{0}$ over $k$ of dimension $g$. Consequently, if $n \in k^{*}$ then $\operatorname{Pic}^{0}(X)[n] \cong(\mathbf{Z} / n \mathbf{Z})^{2 g}$ as abelian groups. See Picard Schemes of Curves, Section 43.6 and Groupoids, Section 38.9 . This key fact, namely the description of the torsion in the Picard group of a smooth projective curve over an algebraically closed field does not appear to have an elementary proof.

03RQ Lemma 49.65.1. Let $X$ be a smooth projective curve of genus $g$ over an algebraically closed field $k$ and let $n \geq 1$ be invertible in $k$. Then there are canonical identifications

$$
H_{\text {étale }}^{q}\left(X, \mu_{n}\right)=\left\{\begin{array}{cl}
\mu_{n}(k) & \text { if } q=0, \\
\operatorname{Pic}^{0}(X)[n] & \text { if } q=1, \\
\mathbf{Z} / n \mathbf{Z} & \text { if } q=2, \\
0 & \text { if } q \geq 3
\end{array}\right.
$$

Since $\mu_{n} \cong \mathbf{Z} / n \mathbf{Z}$, this gives (noncanonical) identifications

$$
H_{\text {étale }}^{q}(X, \underline{\mathbf{Z} / n \mathbf{Z}}) \cong\left\{\begin{array}{cl}
\mathbf{Z} / n \mathbf{Z} & \text { if } q=0 \\
(\mathbf{Z} / n \mathbf{Z})^{2 g} & \text { if } q=1 \\
\mathbf{Z} / n \mathbf{Z} & \text { if } q=2 \\
0 & \text { if } q \geq 3
\end{array}\right.
$$

Proof. The Kummer sequence $0 \rightarrow \mu_{n, X} \rightarrow \mathbf{G}_{m, X} \xrightarrow{(\cdot)^{n}} \mathbf{G}_{m, X} \rightarrow 0$ give the long exact cohomology sequence

The $n$ power map $k^{*} \rightarrow k^{*}$ is surjective since $k$ is algebraically closed. So we need to compute the kernel and cokernel of the map $n: \operatorname{Pic}(X) \rightarrow \operatorname{Pic}(X)$. Consider the commutative diagram with exact rows

where the left vertical map is surjective by Groupoids, Proposition 38.9.10. Applying the snake lemma gives canonical identifications as stated in the lemma.
To get the noncanonical identifications of the lemma we need to compute the kernel of $n: \operatorname{Pic}^{0}(X) \rightarrow \operatorname{Pic}^{0}(X)$. First we note that the group $\operatorname{Pic}^{0}(X)$ is the $k$-points of
the group scheme $\operatorname{Pic}_{X / k}^{0}$, see Picard Schemes of Curves, Lemma 43.6.7. The same lemma tells us that $\operatorname{Pic}_{X / k}^{0}$ is a $g$-dimensional abelian variety over $k$ as defined in Groupoids, Definition 38.9.1. Thus we obtain what we want by applying Groupoids, Proposition 38.9.10.

0AMB Lemma 49.65.2. Let $\pi: X \rightarrow Y$ be a nonconstant morphism of smooth projective curves over an algebraically closed field $k$ and let $n \geq 1$ be invertible in $k$. The map

$$
\pi^{*}: H_{e \text { étale }}^{2}\left(Y, \mu_{n}\right) \longrightarrow H_{\text {étale }}^{2}\left(X, \mu_{n}\right)
$$

is given by multiplication by the degree of $\pi$.
Proof. Observe that the statement makes sense as we have identified both cohomology groups $H_{\text {étale }}^{2}\left(Y, \mu_{n}\right)$ and $H_{\text {étale }}^{2}\left(X, \mu_{n}\right)$ with $\mathbf{Z} / n \mathbf{Z}$ in Lemma 49.65.1. In fact, if $\mathcal{L}$ is a line bundle of degree 1 on $Y$ with class $[\mathcal{L}] \in H_{\text {étale }}^{1}\left(Y, \mathbf{G}_{m}\right)$, then the coboundary of $[\mathcal{L}]$ is the generator of $H_{\text {étale }}^{2}\left(Y, \mu_{n}\right)$. Here the coboundary is the coboundary of the long exact sequence of cohomology associated to the Kummer sequence. Thus the result of the lemma follows from the fact that the degree of the line bundle $\pi^{*} \mathcal{L}$ on $X$ is $\operatorname{deg}(\pi)$. Some details omitted.

03RR Lemma 49.65.3. Let $X$ be an affine smooth curve over an algebraically closed field $k$ and $n \in k^{*}$. Then
(1) $H_{\text {étale }}^{0}\left(X, \mu_{n}\right)=\mu_{n}(k)$;
(2) $H_{\text {étale }}^{1}\left(X, \mu_{n}\right) \cong(\mathbf{Z} / n \mathbf{Z})^{2 g+r-1}$, where $r$ is the number of points in $\bar{X}-X$ for some smooth projective compactification $\bar{X}$ of $X$, and
(3) for all $q \geq 2, H_{\text {étale }}^{q}\left(X, \mu_{n}\right)=0$.

Proof. Write $X=\bar{X}-\left\{x_{1}, \ldots, x_{r}\right\}$. Then $\operatorname{Pic}(X)=\operatorname{Pic}(\bar{X}) / R$, where $R$ is the subgroup generated by $\mathcal{O}_{\bar{X}}\left(x_{i}\right), 1 \leq i \leq r$. Since $r \geq 1$, we see that $\operatorname{Pic}^{0}(X) \rightarrow$ $\operatorname{Pic}(X)$ is surjective, hence $\operatorname{Pic}(X)$ is divisible. Applying the Kummer sequence, we get (1) and (3). For (2), recall that

$$
\begin{aligned}
H_{\text {étale }}^{1}\left(X, \mu_{n}\right) & =\left\{(\mathcal{L}, \alpha) \mid \mathcal{L} \in \operatorname{Pic}(X), \alpha: \mathcal{L}^{\otimes n} \rightarrow \mathcal{O}_{X}\right\} / \cong \\
& =\{(\overline{\mathcal{L}}, D, \bar{\alpha})\} / \tilde{R}
\end{aligned}
$$

where $\overline{\mathcal{L}} \in \operatorname{Pic}^{0}(\bar{X}), D$ is a divisor on $\bar{X}$ supported on $\left\{x_{1}, \ldots, x_{r}\right\}$ and $\bar{\alpha}$ : $\overline{\mathcal{L}}^{\otimes n} \cong \mathcal{O}_{\bar{X}}(D)$ is an isomorphism. Note that $D$ must have degree 0 . Further $\tilde{R}$ is the subgroup of triples of the form $\left(\mathcal{O}_{\bar{X}}\left(D^{\prime}\right), n D^{\prime}, 1^{\otimes n}\right)$ where $D^{\prime}$ is supported on $\left\{x_{1}, \ldots, x_{r}\right\}$ and has degree 0 . Thus, we get an exact sequence

$$
0 \longrightarrow H_{\text {étale }}^{1}\left(\bar{X}, \mu_{n}\right) \longrightarrow H_{\text {étale }}^{1}\left(X, \mu_{n}\right) \longrightarrow \bigoplus_{i=1}^{r} \mathbf{Z} / n \mathbf{Z} \xrightarrow{\Sigma} \mathbf{Z} / n \mathbf{Z} \longrightarrow 0
$$

where the middle map sends the class of a triple $(\overline{\mathcal{L}}, D, \bar{\alpha})$ with $D=\sum_{i=1}^{r} a_{i}\left(x_{i}\right)$ to the $r$-tuple $\left(a_{i}\right)_{i=1}^{r}$. It now suffices to use Lemma 49.65.1 to count ranks.

03RS Remark 49.65.4. The "natural" way to prove the previous corollary is to excise $X$ from $X$. This is possible, we just haven't developed that theory.

0A44 Remark 49.65.5. Let $k$ be an algebraically closed field. Let $n$ be an integer prime to the characteristic of $k$. Recall that

$$
\mathbf{G}_{m, k}=\mathbf{A}_{k}^{1} \backslash\{0\}=\mathbf{P}_{k}^{1} \backslash\{0, \infty\}
$$

We claim there is a canonical isomorphism

$$
H_{\text {étale }}^{1}\left(\mathbf{G}_{m, k}, \mu_{n}\right)=\mathbf{Z} / n \mathbf{Z}
$$

What does this mean? This means there is an element $1_{k}$ in $H_{e \text { etale }}^{1}\left(\mathbf{G}_{m, k}, \mu_{n}\right)$ such that for every morphism $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ the pullback map on étale cohomology for the map $\mathbf{G}_{m, k^{\prime}} \rightarrow \mathbf{G}_{m, k}$ maps $1_{k}$ to $1_{k^{\prime}}$. (In particular this element is fixed under all automorphisms of $k$.) To see this, consider the $\mu_{n, \mathbf{Z}}$-torsor $\mathbf{G}_{m, \mathbf{Z}} \rightarrow \mathbf{G}_{m, \mathbf{Z}}$, $x \mapsto x^{n}$. By the indentification of torsors with first cohomology, this pulls back to give our canonical elements $1_{k}$. Twisting back we see that there are canonical identifications

$$
H_{\text {étale }}^{1}\left(\mathbf{G}_{m, k}, \mathbf{Z} / n \mathbf{Z}\right)=\operatorname{Hom}\left(\mu_{n}(k), \mathbf{Z} / n \mathbf{Z}\right)
$$

i.e., these isomorphisms are compatible with respect to maps of algebraically closed fields, in particular with respect to automorphisms of $k$.

### 49.66. Extension by zero

03S2 The general material in Modules on Sites, Section 18.19 allows us to make the following definition.

03S3 Definition 49.66.1. Let $j: U \rightarrow X$ be an étale morphism of schemes.
(1) The restriction functor $j^{-1}: S h\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(U_{\text {étale }}\right)$ has a left adjoint $j_{!}^{S h}: S h\left(X_{\text {étale }}\right) \rightarrow \operatorname{Sh}\left(U_{\text {étale }}\right)$.
(2) The restriction functor $j^{-1}: A b\left(X_{\text {étale }}\right) \rightarrow A b\left(U_{\text {étale }}\right)$ has a left adjoint which is denoted $j!: A b\left(U_{\text {étale }}\right) \rightarrow A b\left(X_{\text {étale }}\right)$ and called extension by zero.
(3) Let $\Lambda$ be a ring. The restriction functor $j^{-1}: \operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right) \rightarrow \operatorname{Mod}\left(U_{\text {étale }}, \Lambda\right)$ has a left adjoint which is denoted $j_{!}: \operatorname{Mod}\left(U_{\text {étale }}, \Lambda\right) \rightarrow \operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right)$ and called extension by zero.
If $\mathcal{F}$ is an abelian sheaf on $X_{\text {étale }}$, then $j!\mathcal{F} \neq j_{!}^{S h} \mathcal{F}$ in general. On the other hand $j$ ! for sheaves of $\Lambda$-modules agrees with $j$ ! on underlying abelian sheaves (Modules on Sites, Remark 18.19.5. The functor $j$ ! is characterized by the functorial isomorphism

$$
\operatorname{Hom}_{X}(j!\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{U}\left(\mathcal{F}, j^{-1} \mathcal{G}\right)
$$

for all $\mathcal{F} \in A b\left(U_{\text {étale }}\right)$ and $\mathcal{G} \in A b\left(X_{\text {étale }}\right)$. Similarly for sheaves of $\Lambda$-modules.
To describe it more explicitly, recall that $j^{-1}$ is just the restriction via the functor $U_{\text {étale }} \rightarrow X_{\text {étale }}$. In other words, $j^{-1} \mathcal{G}\left(U^{\prime}\right)=\mathcal{G}\left(U^{\prime}\right)$ for $U^{\prime}$ étale over $U$. For $\mathcal{F} \in A b\left(U_{\text {étale }}\right)$ we consider the presheaf

$$
j_{!}^{P S h} \mathcal{F}: X_{\text {étale }} \longrightarrow A b, \quad V \longmapsto \bigoplus_{V \rightarrow U} \mathcal{F}(V)
$$

Then $j!\mathcal{F}$ is the sheafification of $j_{!}^{P S h} \mathcal{F}$.
03S4 Exercise 49.66.2. Prove directly that $j_{\text {! }}$ is left adjoint to $j^{-1}$ and that $j_{*}$ is right adjoint to $j^{-1}$.

03S5 Proposition 49.66.3. Let $j: U \rightarrow X$ be an étale morphism of schemes. Let $\mathcal{F}$ in $A b\left(U_{\text {étale }}\right)$. If $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ is a geometric point of $X$, then

$$
(j!\mathcal{F})_{\bar{x}}=\bigoplus_{\bar{u}: \operatorname{Spec}(k) \rightarrow U, f(\bar{u})=\bar{x}} \mathcal{F}_{\bar{u}}
$$

In particular, j! is an exact functor.

Proof. Exactness of $j!$ is very general, see Modules on Sites, Lemma 18.19.3. Of course it does also follow from the description of stalks. The formula for the stalk of $j!\mathcal{F}$ can be deduced directly from the explicit description of $j$ ! given above. On the other hand, we can deduce it from the very general Modules on Sites, Lemma 18.37.1 and the description of points of the small étale site in terms of geometric points, see Lemma 49.29.12.
03S6 Lemma 49.66.4 (Extension by zero commutes with base change). Let $f: Y \rightarrow X$ be a morphism of schemes. Let $j: V \rightarrow X$ be an étale morphism. Consider the fibre product

Then we have $j_{!}^{\prime} f^{\prime-1}=f^{-1} j$ ! on abelian sheaves and on sheaves of modules.
Proof. This is true because $j_{!}^{\prime} f^{\prime-1}$ is left adjoint to $f_{*}^{\prime}\left(j^{\prime}\right)^{-1}$ and $f^{-1} j_{\text {! }}$ is left adjoint to $j^{-1} f_{*}$. Further $f_{*}^{\prime}\left(j^{\prime}\right)^{-1}=j^{-1} f_{*}$ because $f_{*}$ commutes with étale localization (by construction). In fact, the lemma holds very generally in the setting of a morphism of sites, see Modules on Sites, Lemma 18.20.1.
03S7 Lemma 49.66.5. Let $j: U \rightarrow X$ be finite and étale. Then $j_{!}=j_{*}$ on abelian sheaves and sheaves of $\Lambda$-modules.

Proof. We prove this in the case of abelian sheaves. By Modules on Sites, Remark 18.19 .7 there is a natural transformation $j_{!} \rightarrow j_{*}$. It suffices to check this is an isomorphism étale locally on $X$. Thus we may assume $U \rightarrow X$ is a finite disjoint union of isomorphisms, see Étale Morphisms, Lemma 40.18.3. We omit the proof in this case.

095L Lemma 49.66.6. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme and let $U \subset X$ be the complement. Denote $i: Z \rightarrow X$ and $j: U \rightarrow X$ the inclusion morphisms. For every abelian sheaf on $X_{\text {étale }}$ there is a canonical short exact sequence

$$
0 \rightarrow j!j^{-1} \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_{*} i^{-1} \mathcal{F} \rightarrow 0
$$

on $X_{\text {étale }}$.
Proof. We obtain the maps by the adjointness properties of the functors involved. For a geometric point $\bar{x}$ in $X$ we have either $\bar{x} \in U$ in which case the map on the left hand side is an isomorphism on stalks and the stalk of $i_{*} i^{-1} \mathcal{F}$ is zero or $\bar{x} \in Z$ in which case the map on the right hand side is an isomorphism on stalks and the stalk of $j!j^{-1} \mathcal{F}$ is zero. Here we have used the description of stalks of Lemma 49.47 .3 and Proposition 49.66.3.

### 49.67. Locally constant sheaves

09 Y 8 This section is the analogue of Modules on Sites, Section 18.42 for the étale site.
03RU Definition 49.67.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$.
(1) Let $E$ be a set. We say $\mathcal{F}$ is the constant sheaf with value $E$ if $\mathcal{F}$ is the sheafification of the presheaf $U \mapsto E$. Notation: $\underline{E}_{X}$ or $\underline{E}$.
(2) We say $\mathcal{F}$ is a constant sheaf if it is isomorphic to a sheaf as in (1).
(3) We say $\mathcal{F}$ is locally constant if there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is a constant sheaf.
(4) We say that $\mathcal{F}$ is finite locally constant if it is locally constant and the values are finite sets.
Let $\mathcal{F}$ be a sheaf of abelian groups on $X_{\text {étale }}$.
(1) Let $A$ be an abelian group. We say $\mathcal{F}$ is the constant sheaf with value $A$ if $\mathcal{F}$ is the sheafification of the presheaf $U \mapsto A$. Notation: $\underline{A}_{X}$ or $\underline{A}$.
(2) We say $\mathcal{F}$ is a constant sheaf if it is isomorphic as an abelian sheaf to a sheaf as in (1).
(3) We say $\mathcal{F}$ is locally constant if there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is a constant sheaf.
(4) We say that $\mathcal{F}$ is finite locally constant if it is locally constant and the values are finite abelian groups.
Let $\Lambda$ be a ring. Let $\mathcal{F}$ be a sheaf of $\Lambda$-modules on $X_{\text {étale }}$.
(1) Let $M$ be a $\Lambda$-module. We say $\mathcal{F}$ is the constant sheaf with value $M$ if $\mathcal{F}$ is the sheafification of the presheaf $U \mapsto M$. Notation: $\underline{M}_{X}$ or $\underline{M}$.
(2) We say $\mathcal{F}$ is a constant sheaf if it is isomorphic as a sheaf of $\Lambda$-modules to a sheaf as in (1).
(3) We say $\mathcal{F}$ is locally constant if there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is a constant sheaf.
095A Lemma 49.67.2. Let $f: X \rightarrow Y$ be a morphism of schemes. If $\mathcal{G}$ is a locally constant sheaf of sets, abelian groups, or $\Lambda$-modules on $Y_{\text {étale }}$, the same is true for $f^{-1} \mathcal{G}$ on $X_{\text {étale }}$.

Proof. Holds for any morphism of topoi, see Modules on Sites, Lemma 18.42.2.
095B Lemma 49.67.3. Let $f: X \rightarrow Y$ be a finite étale morphism of schemes. If $\mathcal{F}$ is a (finite) locally constant sheaf of sets, (finite) locally constant sheaf of abelian groups, or (finite type) locally constant sheaf of $\Lambda$-modules on $X_{\text {étale }}$, the same is true for $f_{*} \mathcal{F}$ on $Y_{\text {étale }}$.
Proof. The construction of $f_{*}$ commutes with étale localization. A finite étale morphism is locally isomorphic to a disjoint union of isomorphisms, see Étale Morphisms, Lemma 40.18.3. Thus the lemma says that if $\mathcal{F}_{i}, i=1, \ldots, n$ are (finite) locally constant sheaves of sets, then $\prod_{i=1, \ldots, n} \mathcal{F}_{i}$ is too. This is clear. Similarly for sheaves of abelian groups and modules.

03RV Lemma 49.67.4. Let $X$ be a scheme and $\mathcal{F}$ a sheaf of sets on $X_{\text {étale }}$. Then the following are equivalent
(1) $\mathcal{F}$ is finite locally constant, and
(2) $\mathcal{F}=h_{U}$ for some finite étale morphism $U \rightarrow X$.

Proof. A finite étale morphism is locally isomorphic to a disjoint union of isomorphisms, see Étale Morphisms, Lemma 40.18.3. Thus (2) implies (1). Conversely, if $\mathcal{F}$ is finite locally constant, then there exists an étale covering $\left\{X_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{X_{i}}$ is representable by $U_{i} \rightarrow X_{i}$ finite étale. Arguing exactly as in the proof of Descent, Lemma 34.35.1 we obtain a descent datum for schemes $\left(U_{i}, \varphi_{i j}\right)$ relative to $\left\{X_{i} \rightarrow X\right\}$ (details omitted). This descent datum is effective for example by Descent, Lemma 34.33.1 and the resulting morphism of schemes $U \rightarrow X$ is finite étale by Descent, Lemmas 34.19.21 and 34.19.27.

095C Lemma 49.67.5. Let $X$ be a scheme.
(1) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of sets on $X_{\text {étale }}$. If $\mathcal{F}$ is finite locally constant, there exists an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant sheaves associated to a map of sets.
(2) Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of abelian groups on $X_{\text {étale }}$. If $\mathcal{F}$ is finite locally constant, there exists an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant abelian sheaves associated to a map of abelian groups.
(3) Let $\Lambda$ be a ring. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of $\Lambda$-modules on $X_{\text {étale }}$. If $\mathcal{F}$ is of finite type, then there exists an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is the map of constant sheaves of $\Lambda$ modules associated to a map of $\Lambda$-modules.

Proof. This holds on any site, see Modules on Sites, Lemma 18.42.3
03RX Lemma 49.67.6. Let $X$ be a scheme.
(1) The category of finite locally constant sheaves of sets is closed under finite limits and colimits inside $\operatorname{Sh}\left(X_{\text {étale }}\right)$.
(2) The category of finite locally constant abelian sheaves is a weak Serre subcategory of $A b\left(X_{\text {étale }}\right)$.
(3) Let $\Lambda$ be a Noetherian ring. The category of finite type, locally constant sheaves of $\Lambda$-modules on $X_{\text {étale }}$ is a weak Serre subcategory of $\operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right)$.

Proof. This holds on any site, see Modules on Sites, Lemma 18.42.5.
095D Lemma 49.67.7. Let $X$ be a scheme. Let $\Lambda$ be a ring. The tensor product of two locally constant sheaves of $\Lambda$-modules on $X_{\text {étale }}$ is a locally constant sheaf of $\Lambda$-modules .

Proof. This holds on any site, see Modules on Sites, Lemma 18.42.6.
09BF Lemma 49.67.8. Let $X$ be a connected scheme. Let $\Lambda$ be a ring and let $\mathcal{F}$ be a locally constant sheaf of $\Lambda$-modules. Then there exists $a \Lambda$-module $M$ and an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\left.\mathcal{F}\right|_{U_{i}} \cong \underline{M}\right|_{U_{i}}$.

Proof. Choose an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is constant, say $\left.\mathcal{F}\right|_{U_{i}} \cong$ $\frac{M_{i}}{U_{i}}$. Observe that $U_{i} \times_{X} U_{j}$ is empty if $M_{i}$ is not isomorphic to $M_{j}$. For each $\Lambda$-module $M$ let $I_{M}=\left\{i \in I \mid M_{i} \cong M\right\}$. As étale morphisms are open we see that $U_{M}=\bigcup_{i \in I_{M}} \operatorname{Im}\left(U_{i} \rightarrow X\right)$ is an open subset of $X$. Then $X=\coprod U_{M}$ is a disjoint open covering of $X$. As $X$ is connected only one $U_{M}$ is nonempty and the lemma follows.

### 49.68. Constructible sheaves

05BE Let $X$ be a scheme. A constructible locally closed subscheme of $X$ is a locally closed subscheme $T \subset X$ such that the underlying topological space of $T$ is a constructible subset of $X$. If $T, T^{\prime} \subset X$ are locally closed subschemes with the same underlying topological space, then $T_{\text {étale }} \cong T_{\text {étale }}^{\prime}$ by the topological invariance of the étale site (Theorem 49.46.1). Thus in the following definition we may assume are locally closed subschemes are reduced.

03RW Definition 49.68.1. Let $X$ be a scheme.
(1) A sheaf of sets on $X_{\text {étale }}$ is constructible if for every affine open $U \subset X$ there exists a finite decomposition of $U$ into constructible locally closed subschemes $U=\coprod_{i} U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is finite locally constant for all $i$.
(2) A sheaf of abelian groups on $X_{\text {étale }}$ is constructible if for every affine open $U \subset X$ there exists a finite decomposition of $U$ into constructible locally closed subschemes $U=\coprod_{i} U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is finite locally constant for all $i$.
(3) Let $\Lambda$ be a Noetherian ring. A sheaf of $\Lambda$-modules on $X_{\text {étale }}$ is constructible if for every affine open $U \subset X$ there exists a finite decomposition of $U$ into constructible locally closed subschemes $U=\coprod_{i} U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is of finite type and locally constant for all $i$.

It seems that this is the accepted definition. An alternative, which lends itself more readily to generalizations beyond the étale site of a scheme, would have been to define constructible sheaves by starting with $h_{U}, j_{U}!\mathbf{Z} / n \mathbf{Z}$, and $j_{U!} \underline{\Lambda}$ where $U$ runs over all quasi-compact and quasi-separated objects of $X_{\text {étale }}$, and then take the smallest full subcategory of $\operatorname{Sh}\left(X_{\text {étale }}\right), A b\left(X_{\text {étale }}\right)$, and $\operatorname{Mod}\left(X_{\text {étale }}, \underline{\Lambda}\right)$ containing these and closed under finite limits and colimits. It follows from Lemma 49.68.6 and Lemmas 49.70.5, 49.70.7, and 49.70 .6 that this produces the same category if $X$ is quasi-compact and quasi-separated. In general this does not produce the same category however.

A disjoint union decomposition $U=\coprod U_{i}$ of a scheme by locally closed subschemes will be called a partition of $U$ (compare with Topology, Section 5.27).

095E Lemma 49.68.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale. }}$. The following are equivalent
(1) $\mathcal{F}$ is constructible,
(2) there exists an open covering $X=\bigcup U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is constructible, and
(3) there exists a partition $X=\bigcup X_{i}$ by constructible locally closed subschemes such that $\left.\mathcal{F}\right|_{X_{i}}$ is finite locally constant.
A similar statement holds for abelian sheaves and sheaves of $\Lambda$-modules if $\Lambda$ is Noetherian.

Proof. It is clear that (1) implies (2).
Assume (2). For every $x \in X$ we can find an $i$ and an affine open neighbourhood $V_{x} \subset U_{i}$ of $x$. Hence we can find a finite affine open covering $X=\bigcup V_{j}$ such that for each $j$ there exists a finite decomposition $V_{j}=\coprod V_{j, k}$ by locally closed constructible subsets such that $\left.\mathcal{F}\right|_{V_{j, k}}$ is finite locally constant. By Topology, Lemma 5.14.5 each $V_{j, k}$ is constructible as a subset of $X$. By Topology, Lemma 5.27.7 we can find a finite stratification $X=\coprod X_{l}$ with constructible locally closed strata such that each $V_{j, k}$ is a union of $X_{l}$. Thus (3) holds.

Assume (3) holds. Let $U \subset X$ be an affine open. Then $U \cap X_{i}$ is a constructible locally closed subset of $U$ (for example by Properties, Lemma 27.2.1) and $U=$ $\coprod U \cap X_{i}$ is a partition of $U$ as in Definition 49.68.1. Thus (1) holds.

09YR Lemma 49.68.3. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}$ be a sheaf of sets, abelian groups, $\Lambda$-modules (with $\Lambda$ Noetherian) on $X_{\text {étale }}$. If there
exist constructible locally closed subschemes $T_{i} \subset X$ such that (a) $X=\bigcup T_{j}$ and (b) $\left.\mathcal{F}\right|_{T_{j}}$ is constructible, then $\mathcal{F}$ is constructible.

Proof. First, we can assume the covering is finite as $X$ is quasi-compact in the spectral topology (Topology, Lemma 5.22.2 and Properties, Lemma 27.2.4). Observe that each $T_{i}$ is a quasi-compact and quasi-separated scheme in its own right (because it is constructible in $X$; details omitted). Thus we can find a finite partition $T_{i}=\coprod T_{i, j}$ into locally closed constructible parts of $T_{i}$ such that $\left.\mathcal{F}\right|_{T_{i, j}}$ is finite locally constant (Lemma 49.68.2). By Topology, Lemma 5.14.12 we see that $T_{i, j}$ is a constructible locally closed subscheme of $X$. Then we can apply Topology, Lemma 5.27.7 to $X=\bigcup T_{i, j}$ to find the desired partition of $X$.

095F Lemma 49.68.4. Let $X$ be a scheme. Checking constructibility of a sheaf of sets, abelian groups, $\Lambda$-modules (with $\Lambda$ Noetherian) can be done Zariski locally on $X$.

Proof. The statement means if $X=\bigcup U_{i}$ is an open covering such that $\left.\mathcal{F}\right|_{U_{i}}$ is constructible, then $\mathcal{F}$ is constructible. If $U \subset X$ is affine open, then $U=\bigcup U \cap U_{i}$ and $\left.\mathcal{F}\right|_{U \cap U_{i}}$ is constructible (it is trivial that the restriction of a constructible sheaf to an open is constructible). It follows from Lemma 49.68 .2 that $\left.\mathcal{F}\right|_{U}$ is constructible, i.e., a suitable partition of $U$ exists.

095G Lemma 49.68.5. Let $f: X \rightarrow Y$ be a morphism of schemes. If $\mathcal{F}$ is a constructible sheaf of sets, abelian groups, or $\Lambda$-modules (with $\Lambda$ Noetherian) on $Y_{\text {étale }}$, the same is true for $f^{-1} \mathcal{F}$ on $X_{\text {étale }}$.

Proof. By Lemma 49.68 .4 this reduces to the case where $X$ and $Y$ are affine. By Lemma 49.68 .2 it suffices to find a finite partition of $X$ by constructible locally closed subschemes such that $f^{-1} \mathcal{F}$ is finite locally constant on each of them. To find it we just pull back the partition of $Y$ adapted to $\mathcal{F}$ and use Lemma 49.67.2.

03RZ Lemma 49.68.6. Let $X$ be a scheme.
(1) The category of constructible sheaves of sets is closed under finite limits and colimits inside $\operatorname{Sh}\left(X_{\text {étale }}\right)$.
(2) The category of constructible abelian sheaves is a weak Serre subcategory of $A b\left(X_{\text {étale }}\right)$.
(3) Let $\Lambda$ be a Noetherian ring. The category of constructible sheaves of $\Lambda$ modules on $X_{\text {étale }}$ is a weak Serre subcategory of $\operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right)$.
Proof. We prove (3). We will use the criterion of Homology, Lemma 12.9.3. Suppose that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a map of constructible sheaves of $\Lambda$-modules. We have to show that $\mathcal{K}=\operatorname{Ker}(\varphi)$ and $\mathcal{Q}=\operatorname{Coker}(\varphi)$ are constructible. Similarly, suppose that $0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0$ is a short exact sequence of sheaves of $\Lambda$-modules with $\mathcal{F}, \mathcal{G}$ constructible. We have to show that $\mathcal{E}$ is constructible. In both cases we can replace $X$ with the members of an affine open covering. Hence we may assume $X$ is affine. The we may further replace $X$ by the members of a finite partition of $X$ by constructible locally closed subschemes on which $\mathcal{F}$ and $\mathcal{G}$ are of finite type and locally constant. Thus we may apply Lemma 49.67 .6 to conclude.
The proofs of (1) and (2) are very similar and are omitted.
095I Lemma 49.68.7. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. The tensor product of two constructible sheaves of $\Lambda$-modules on $X_{\text {étale }}$ is a constructible sheaf of $\Lambda$-modules.

Proof. The question immediately reduces to the case where $X$ is affine. Since any two partitions of $X$ with constructible locally closed strata have a common refinement of the same type and since pullbacks commute with tensor product we reduce to Lemma 49.67.7.

09YS Lemma 49.68.8. Let $X$ be a quasi-compact and quasi-separated scheme.
(1) Let $\mathcal{F} \rightarrow \mathcal{G}$ be a map of constructible sheaves of sets on $X_{\text {étale }}$. Then the set of points $x \in X$ where $\mathcal{F}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is surjective, resp. injective, resp. is isomorphic to a given map of sets, is constructible in $X$.
(2) Let $\mathcal{F}$ be a constructible abelian sheaf on $X_{\text {étale }}$. The support of $\mathcal{F}$ is constructible.
(3) Let $\Lambda$ be a Noetherian ring. Let $\mathcal{F}$ be a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$. The support of $\mathcal{F}$ is constructible.
Proof. Proof of (1). Let $X=\coprod X_{i}$ be a partion of $X$ by locally closed constructible subschemes such that both $\mathcal{F}$ and $\mathcal{G}$ are finite locally constant over the parts (use Lemma 49.68 .2 for both $\mathcal{F}$ and $\mathcal{G}$ and choose a common refinement). Then apply Lemma 49.67 .5 to the restriction of the map to each part.
The proof of (2) and (3) is omitted.
The following lemma will turn out to be very useful later on. It roughly says that the category of constructible sheaves has a kind of weak "Noetherian" property.

095P Lemma 49.68.9. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}=\operatorname{colim}_{i \in I} \mathcal{F}_{i}$ be a filtered colimit of sheaves of sets, abelian sheaves, or sheaves of modules.
(1) If $\mathcal{F}$ and $\mathcal{F}_{i}$ are constructible sheaves of sets, then the ind-object $\mathcal{F}_{i}$ is essentially constant with value $\mathcal{F}$.
(2) If $\mathcal{F}$ and $\mathcal{F}_{i}$ are constructible sheaves of abelian groups, then the ind-object $\mathcal{F}_{i}$ is essentially constant with value $\mathcal{F}$.
(3) Let $\Lambda$ be a Noetherian ring. If $\mathcal{F}$ and $\mathcal{F}_{i}$ are constructible sheaves of $\Lambda$-modules, then the ind-object $\mathcal{F}_{i}$ is essentially constant with value $\mathcal{F}$.
Proof. Proof of (1). We will use without further mention that finite limits and colimits of constructible sheaves are constructible (Lemma 49.67.6). For each $i$ let $T_{i} \subset X$ be the set of points $x \in X$ where $\mathcal{F}_{i, \bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is not surjective. Because $\mathcal{F}_{i}$ and $\mathcal{F}$ are constructible $T_{i}$ is a constructible subset of $X$ (Lemma 49.68.8). Since the stalks of $\mathcal{F}$ are finite and since $\mathcal{F}=\operatorname{colim}_{i \in I} \mathcal{F}_{i}$ we see that for all $x \in X$ we have $x \notin T_{i}$ for $i$ large enough. Since $X$ is a spectral space by Properties, Lemma 27.2.4 the constructible topology on $X$ is quasi-compact by Topology, Lemma 5.22.2. Thus $T_{i}=\emptyset$ for $i$ large enough. Thus $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective for $i$ large enough. Assume now that $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective for all $i$. Choose $i \in I$. For $i^{\prime} \geq i$ denote $S_{i^{\prime}} \subset X$ the set of points $x$ such that the number of elements in $\operatorname{Im}\left(\mathcal{F}_{i, \bar{x}} \rightarrow \mathcal{F}_{\bar{x}}\right)$ is equal to the number of elements in $\operatorname{Im}\left(\mathcal{F}_{i, \bar{x}} \rightarrow \mathcal{F}_{i^{\prime}, \bar{x}}\right)$. Because $\mathcal{F}_{i}, \mathcal{F}_{i^{\prime}}$ and $\mathcal{F}$ are constructible $S_{i^{\prime}}$ is a constructible subset of $X$ (details omitted; hint: use Lemma 49.68.8). Since the stalks of $\mathcal{F}_{i}$ and $\mathcal{F}$ are finite and since $\mathcal{F}=\operatorname{colim}_{i^{\prime} \geq i} \mathcal{F}_{i^{\prime}}$ we see that for all $x \in X$ we have $x \notin S_{i^{\prime}}$ for $i^{\prime}$ large enough. By the same argument as above we can find a large $i^{\prime}$ such that $S_{i^{\prime}}=\emptyset$. Thus $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ factors through $\mathcal{F}$ as desired.
Proof of (2). Observe that a constructible abelian sheaf is a constructible sheaf of sets. Thus case (2) follows from (1).

Proof of (3). We will use without further mention that the category of constructible sheaves of $\Lambda$-modules is abelian (Lemma 49.67.6). For each $i$ let $\mathcal{Q}_{i}$ be the cokernel of the map $\mathcal{F}_{i} \rightarrow \mathcal{F}$. The support $T_{i}$ of $\mathcal{Q}_{i}$ is a constructible subset of $X$ as $\mathcal{Q}_{i}$ is constructible (Lemma 49.68.8). Since the stalks of $\mathcal{F}$ are finite $\Lambda$-modules and since $\mathcal{F}=\operatorname{colim}_{i \in I} \mathcal{F}_{i}$ we see that for all $x \in X$ we have $x \notin T_{i}$ for $i$ large enough. Since $X$ is a spectral space by Properties, Lemma 27.2 .4 the constructible topology on $X$ is quasi-compact by Topology, Lemma 5.22 .2 . Thus $T_{i}=\emptyset$ for $i$ large enough. This proves the first assertion. For the second, assume now that $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective for all $i$. Choose $i \in I$. For $i^{\prime} \geq i$ denote $\mathcal{K}_{i^{\prime}}$ the image of $\operatorname{Ker}\left(\mathcal{F}_{i} \rightarrow \mathcal{F}\right)$ in $\mathcal{F}_{i^{\prime}}$. The support $S_{i^{\prime}}$ of $\mathcal{K}_{i^{\prime}}$ is a constructible subset of $X$ as $\mathcal{K}_{i^{\prime}}$ is constructible. Since the stalks of $\operatorname{Ker}\left(\mathcal{F}_{i} \rightarrow \mathcal{F}\right)$ are finite $\Lambda$-modules and since $\mathcal{F}=\operatorname{colim}_{i^{\prime} \geq i} \mathcal{F}_{i^{\prime}}$ we see that for all $x \in X$ we have $x \notin S_{i^{\prime}}$ for $i^{\prime}$ large enough. By the same argument as above we can find a large $i^{\prime}$ such that $S_{i^{\prime}}=\emptyset$. Thus $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ factors through $\mathcal{F}$ as desired.

### 49.69. Auxiliary lemmas on morphisms

095J Some lemmas that are useful for proving functioriality properties of constructible sheaves.

03S0 Lemma 49.69.1. Let $U \rightarrow X$ be an étale morphism of quasi-compact and quasiseparated schemes (for example an étale morphism of Noetherian schemes). Then there exists a partition $X=\coprod_{i} X_{i}$ by constructible locally closed subschemes such that $X_{i} \times_{X} U \rightarrow X_{i}$ is finite étale for all $i$.

Proof. If $U \rightarrow X$ is separated, then this is More on Morphisms, Lemma 36.31.9. In general, we may assume $X$ is affine. Choose a finite affine open covering $U=\bigcup U_{j}$. Apply the previous case to all the morphisms $U_{j} \rightarrow X$ and $U_{j} \cap U_{j^{\prime}} \rightarrow X$ and choose a common refinement $X=\coprod X_{i}$ of the resulting partitions. After refining the partition further we may assume $X_{i}$ affine as well. Fix $i$ and set $V=U \times_{X} X_{i}$. The morphisms $V_{j}=U_{j} \times_{X} X_{i} \rightarrow X_{i}$ and $V_{j j^{\prime}}=\left(U_{j} \cap U_{j^{\prime}}\right) \times_{X} X_{i} \rightarrow X_{i}$ are finite étale. Hence $V_{j}$ and $V_{j j^{\prime}}$ are affine schemes and $V_{j j^{\prime}} \subset V_{j}$ is closed as well as open (since $V_{j j^{\prime}} \rightarrow X_{i}$ is proper, so Morphisms, Lemma 28.41.7 applies). Then $V=\bigcup V_{j}$ is separated because $\mathcal{O}\left(V_{j}\right) \rightarrow \mathcal{O}\left(V_{j j^{\prime}}\right)$ is surjective, see Schemes, Lemma 25.21.8. Thus the previous case applies to $V \rightarrow X_{i}$ and we can further refine the partition if needed (it actually isn't but we don't need this).

In the Noetherian case one can prove the preceding lemma by Noetherian induction and the following amusing lemma.

03S1 Lemma 49.69.2. Let $f: X \rightarrow Y$ be a morphism of schemes which is quasicompact, quasi-separated, and locally of finite type. If $\eta$ is a generic point of on irreducible component of $Y$ such that $f^{-1}(\eta)$ is finite, then there exists an open $V \subset Y$ containing $\eta$ such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. This is Morphisms, Lemma 28.47.1.
The statement of the following lemma can be strengthened a bit.
095K Lemma 49.69.3. Let $f: Y \rightarrow X$ be a quasi-finite and finitely presented morphism of affine schemes.
(1) There exists a surjective morphism of affine schemes $X^{\prime} \rightarrow X$ and a closed subscheme $Z^{\prime} \subset Y^{\prime}=X^{\prime} \times_{X} Y$ such that
(a) $Z^{\prime} \subset Y^{\prime}$ is a thickening, and
(b) $Z^{\prime} \rightarrow X^{\prime}$ is a finite étale morphism.
(2) There exists a finite partition $X=\coprod X_{i}$ by locally closed, constructible, affine strata, and surjective finite locally free morphisms $X_{i}^{\prime} \rightarrow X_{i}$ such that the reduction of $Y_{i}^{\prime}=X_{i}^{\prime} \times_{X} Y \rightarrow X_{i}^{\prime}$ is isomorphic to $\coprod_{j=1}^{n_{i}}\left(X_{i}^{\prime}\right)_{\text {red }} \rightarrow$ $\left(X_{i}^{\prime}\right)_{\text {red }}$ for some $n_{i}$.
Proof. Setting $X^{\prime}=\coprod X_{i}^{\prime}$ we see that (2) implies (1). Write $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. Write $A$ as a filtered colimit of finite type Z-algebras $A_{i}$. Since $B$ is an $A$-algebra of finite presentation, we see that there exists $0 \in I$ and a finite type ring map $A_{0} \rightarrow B_{0}$ such that $B=\operatorname{colim} B_{i}$ with $B_{i}=A_{i} \otimes_{A_{0}} B_{0}$, see Algebra, Lemma 10.126.6. For $i$ sufficiently large we see that $A_{i} \rightarrow B_{i}$ is quasi-finite, see Limits, Lemma 31.14.2. Thus we reduce to the case of finite type algebras over $\mathbf{Z}$, in particular we reduce to the Noetherian case. (Details omitted.)

Assume $X$ and $Y$ Noetherian. In this case any locally closed subset of $X$ is constructible. By Lemma 49.69.2 and Noetherian induction we see that there is a finite partition $X=\coprod X_{i}$ of $X$ by locally closed strata such that $Y \times_{X} X_{i} \rightarrow X_{i}$ is finite. We can refine this partition to get affine strata. Thus after replacing $X$ by $X^{\prime}=\coprod X_{i}$ we may assume $Y \rightarrow X$ is finite.
Assume $X$ and $Y$ Noetherian and $Y \rightarrow X$ finite. Suppose that we can prove (2) after base change by a surjective, flat, quasi-finite morphism $U \rightarrow X$. Thus we have a partition $U=\coprod U_{i}$ and finite locally free morphisms $U_{i}^{\prime} \rightarrow U_{i}$ such that $U_{i}^{\prime} \times_{X} Y \rightarrow U_{i}^{\prime}$ is isomorphic to $\coprod_{j=1}^{n_{i}}\left(U_{i}^{\prime}\right)_{r e d} \rightarrow\left(U_{i}^{\prime}\right)_{\text {red }}$ for some $n_{i}$. Then, by the argument in the previous paragraph, we can find a partition $X=\coprod X_{j}$ with locally closed affine strata such that $X_{j} \times_{X} U_{i} \rightarrow X_{j}$ is finite for all $i, j$. By Morphisms, Lemma 28.45 .2 each $X_{j} \times_{X} U_{i} \rightarrow X_{j}$ is finite locally free. Hence $X_{j} \times_{X} U_{i}^{\prime} \rightarrow X_{j}$ is finite locally free (Morphisms, Lemma 28.45.3). It follows that $X=\coprod X_{j}$ and $X_{j}^{\prime}=\coprod_{i} X_{j} \times_{X} U_{i}^{\prime}$ is a solution for $Y \rightarrow X$. Thus it suffices to prove the result (in the Noetherian case) after a surjective flat quasi-finite base change.

Applying Morphisms, Lemma 28.45 .6 we see we may assume that $Y$ is a closed subscheme of an affine scheme $Z$ which is (set theoretically) a finite union $Z=$ $\bigcup_{i \in I} Z_{i}$ of closed subschemes mapping isomorphically to $X$. In this case we will find a finite partition of $X=\coprod X_{j}$ with affine locally closed strata that works (in other words $X_{j}^{\prime}=X_{j}$ ). Set $T_{i}=Y \cap Z_{i}$. This is a closed subscheme of $X$. As $X$ is Noetherian we can find a finite partition of $X=\coprod X_{j}$ by affine locally closed subschemes, such that each $X_{j} \times_{X} T_{i}$ is (set theoretically) a union of strata $X_{j} \times_{X} Z_{i}$. Replacing $X$ by $X_{j}$ we see that we may assume $I=I_{1} \amalg I_{2}$ with $Z_{i} \subset Y$ for $i \in I_{1}$ and $Z_{i} \cap Y=\emptyset$ for $i \in I_{2}$. Replacing $Z$ by $\bigcup_{i \in I_{1}} Z_{i}$ we see that we may assume $Y=Z$. Finally, we can replace $X$ again by the members of a partition as above such that for every $i, i^{\prime} \subset I$ the intersection $Z_{i} \cap Z_{i^{\prime}}$ is either empty or (set theoretically) equal to $Z_{i}$ and $Z_{i^{\prime}}$. This clearly means that $Y$ is (set theoretically) equal to a disjoint union of the $Z_{i}$ which is what we wanted to show.

### 49.70. More on constructible sheaves

095 M Let $\Lambda$ be a Noetherian ring. Let $X$ be a scheme. We often consider $X_{\text {étale }}$ as a ringed site with sheaf of rings $\underline{\Lambda}$. In case of abelian sheaves we often take $\Lambda=\mathbf{Z} / n \mathbf{Z}$ for a suitable integer $n$.

03S8 Lemma 49.70.1. Let $j: U \rightarrow X$ be an étale morphism of quasi-compact and quasi-separated schemes.
(1) The sheaf $h_{U}$ is a constructible sheaf of sets.
(2) The sheaf $j!\underline{M}$ is a constructible abelian sheaf for a finite abelian group $M$.
(3) If $\Lambda$ is a Noetherian ring and $M$ is a finite $\Lambda$-module, then $j!\underline{M}$ is a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$.

Proof. By Lemma 49.69.1 there is a partition $\coprod_{i} X_{i}$ such that $\pi_{i}: j^{-1}\left(X_{i}\right) \rightarrow X_{i}$ is finite étale. The restriction of $h_{U}$ to $X_{i}$ is $h_{j^{-1}\left(X_{i}\right)}$ which is finite locally constant by Lemma 49.67.4. For cases (2) and (3) we note that

$$
\left.j_{!}(\underline{M})\right|_{X_{i}}=\pi_{i!}(\underline{M})=\pi_{i *}(\underline{M})
$$

by Lemmas 49.66.4 and 49.66.5. Thus it suffices to show the lemma for $\pi: Y \rightarrow X$ finite étale. This is Lemma 49.67.3.

03SA Lemma 49.70.2. Let $X$ be a quasi-compact and quasi-separated scheme.
(1) Let $\mathcal{F}$ be a sheaf of sets on $X_{\text {étale }}$. Then $\mathcal{F}$ is a filtered colimit of constructible sheaves of sets.
(2) Let $\mathcal{F}$ be a torsion abelian sheaf on $X_{\text {étale }}$. Then $\mathcal{F}$ is a filtered colimit of constructible abelian sheaves.
(3) Let $\Lambda$ be a Noetherian ring and $\mathcal{F}$ a sheaf of $\Lambda$-modules on $X_{\text {étale. }}$. Then $\mathcal{F}$ is a filtered colimit of constructible sheaves of $\Lambda$-modules.

Proof. Let $\mathcal{B}$ be the collection of quasi-compact and quasi-separated objects of $X_{\text {étale }}$. By Modules on Sites, Lemma 18.29 .6 any sheaf of sets is a filtered colimit of sheaves of the form

$$
\text { Coequalizer }\left(\coprod_{j=1, \ldots, m} h_{V_{j}} \longrightarrow \coprod_{i=1, \ldots, n} j_{U_{i}}\right)
$$

with $V_{j}$ and $U_{i}$ quasi-compact and quasi-separated objects of $X_{\text {étale }}$. By Lemmas 49.70 .1 and 49.68 .6 these coequalizers are constructible. This proves (1).

Let $\Lambda$ be a Noetherian ring. By Modules on Sites, Lemma $18.29 .6 \Lambda$-modules $\mathcal{F}$ is a filtered colimit of modules of the form

$$
\operatorname{Coker}\left(\bigoplus_{j=1, \ldots, m} j_{V_{j}!\underline{\Lambda}_{V_{j}}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!\underline{\Lambda}_{U_{i}}}\right)
$$

with $V_{j}$ and $U_{i}$ quasi-compact and quasi-separated objects of $X_{\text {étale }}$. By Lemmas 49.70 .1 and 49.68 .6 these cokernels are constructible. This proves (3).

Proof of (2). First write $\mathcal{F}=\bigcup \mathcal{F}[n]$ where $\mathcal{F}[n]$ is the $n$-torsion subsheaf. Then we can view $\mathcal{F}[n]$ as a sheaf of $\mathbf{Z} / n \mathbf{Z}$-modules and apply (3).

095Q Lemma 49.70.3. Let $f: X \rightarrow Y$ be a surjective morphism of quasi-compact and quasi-separated schemes.
(1) Let $\mathcal{F}$ be a sheaf of sets on $Y_{\text {étale }}$. Then $\mathcal{F}$ is constructible if and only if $f^{-1} \mathcal{F}$ is constructible.
(2) Let $\mathcal{F}$ be an abelian sheaf on $Y_{\text {etale }}$. Then $\mathcal{F}$ is constructible if and only if $f^{-1} \mathcal{F}$ is constructible.
(3) Let $\Lambda$ be a Noetherian ring. Let $\mathcal{F}$ be sheaf of $\Lambda$-modules on $Y_{\text {étale }}$. Then $\mathcal{F}$ is constructible if and only if $f^{-1} \mathcal{F}$ is constructible.

Proof. One implication follows from Lemma 49.68.5. For the converse, assume $f^{-1} \mathcal{F}$ is constructible. Write $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ as a filtered colimit of constructible sheaves (of sets, abelian groups, or modules) using Lemma 49.70.2. Since $f^{-1}$ is a left adjoint it commutes with colimits (Categories, Lemma 4.24.4) and we see that $f^{-1} \mathcal{F}=\operatorname{colim} f^{-1} \mathcal{F}_{i}$. By Lemma 49.68.9 we see that $f^{-1} \mathcal{F}_{i} \rightarrow f^{-1} \mathcal{F}$ is surjective for all $i$ large enough. Since $f$ is surjective we conclude (by looking at stalks using Lemma 49.36 .2 and Theorem 49.29 .10 that $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective for all $i$ large enough. Thus $\mathcal{F}$ is the quotient of a constructible sheaf $\mathcal{G}$. Applying the argument once more to $\mathcal{G} \times{ }_{\mathcal{F}} \mathcal{G}$ or the kernel of $\mathcal{G} \rightarrow \mathcal{F}$ we conclude using that $f^{-1}$ is exact and that the category of constructible sheaves (of sets, abelian groups, or modules) is preserved under finite (co)limits or (co)kernels inside $\operatorname{Sh}\left(Y_{\text {étale }}\right)$, $\operatorname{Sh}\left(X_{\text {étale }}\right), A b\left(Y_{\text {étale }}\right), A b\left(X_{\text {étale }}\right), \operatorname{Mod}\left(Y_{\text {étale }}, \Lambda\right)$, and $\operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right)$, see Lemma 49.68 .6.

095H Lemma 49.70.4. Let $f: X \rightarrow Y$ be a finite étale morphism of schemes. Let $\Lambda$ be a Noetherian ring. If $\mathcal{F}$ is a constructible sheaf of sets, constructible sheaf of abelian groups, or constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$, the same is true for $f_{*} \mathcal{F}$ on $Y_{\text {étale }}$.
Proof. By Lemma 49.68 .4 it suffices to check this Zariski locally on $Y$ and by Lemma 49.70 .3 we may replace $Y$ by an étale cover (the construction of $f_{*}$ commutes with étale localization). A finite étale morphism is étale locally isomorphic to a disjoint union of isomorphisms, see Étale Morphisms, Lemma 40.18.3. Thus, in the case of sheaves of sets, the lemma says that if $\mathcal{F}_{i}, i=1, \ldots, n$ are constructible sheaves of sets, then $\prod_{i=1, \ldots, n} \mathcal{F}_{i}$ is too. This is clear. Similarly for sheaves of abelian groups and modules.

09 Y 9 Lemma 49.70.5. Let $X$ be a quasi-compact and quasi-separated scheme. The category of constructible sheaves of sets is the full subcategory of $\operatorname{Sh}\left(X_{\text {étale }}\right)$ consisting of sheaves $\mathcal{F}$ which are coequalizers

$$
\mathcal{F}_{1} \longrightarrow \mathcal{F}_{0} \longrightarrow \mathcal{F}
$$

such that $\mathcal{F}_{i}, i=0,1$ is a finite coproduct of sheaves of the form $h_{U}$ with $U$ a quasi-compact and quasi-separated object of $X_{\text {étale }}$.

Proof. In the proof of Lemma 49.70 .2 we have seen that sheaves of this form are constructible. For the converse, suppose that for every constructible sheaf of sets $\mathcal{F}$ we can find a surjection $\mathcal{F}_{0} \rightarrow \mathcal{F}$ with $\mathcal{F}_{0}$ as in the lemma. Then we find our surjection $\mathcal{F}_{1} \rightarrow \mathcal{F}_{0} \times_{\mathcal{F}} \mathcal{F}_{0}$ because the latter is constructible by Lemma 49.68.6.

By Topology, Lemma 5.27.7 we may choose a finite stratification $X=\coprod_{i \in I} X_{i}$ such that $\mathcal{F}$ is finite locally constant on each stratum. We will prove the result by induction on the cardinality of $I$. Let $i \in I$ be a minimal element in the partial ordering of $I$. Then $X_{i} \subset X$ is closed. By induction, there exist finitely many quasi-compact and quasi-separated objects $U_{\alpha}$ of $\left(X \backslash X_{i}\right)_{\text {étale }}$ and a surjective map $\left.\coprod h_{U_{\alpha}} \rightarrow \mathcal{F}\right|_{X \backslash X_{i}}$. These determine a map

$$
\coprod h_{U_{\alpha}} \rightarrow \mathcal{F}
$$

which is surjective after restricting to $X \backslash X_{i}$. By Lemma 49.67.4 we see that $\left.\mathcal{F}\right|_{X_{i}}=h_{V}$ for some scheme $V$ finite étale over $X_{i}$. Let $\bar{v}$ be a geometric point of $V$ lying over $\bar{x} \in X_{i}$. We may think of $\bar{v}$ as an element of the stalk $\mathcal{F}_{\bar{x}}=V_{\bar{x}}$.

Thus we can find an étale neighbourhood $(U, \bar{u})$ of $\bar{x}$ and a section $s \in \mathcal{F}(U)$ whose stalk at $\bar{x}$ gives $\bar{v}$. Thinking of $s$ as a map $s: h_{U} \rightarrow \mathcal{F}$, restricting to $X_{i}$ we obtain a morphism $\left.s\right|_{X_{i}}: U \times_{X} X_{i} \rightarrow V$ over $X_{i}$ which maps $\bar{u}$ to $\bar{v}$. Since $V$ is quasicompact (finite over the closed subscheme $X_{i}$ of the quasi-compact scheme $X$ ) a finite number $s^{(1)}, \ldots, s^{(m)}$ of these sections of $\mathcal{F}$ over $U^{(1)}, \ldots, U^{(m)}$ will determine a jointly surjective map

$$
\left.\coprod s^{(j)}\right|_{X_{i}}: \coprod U^{(j)} \times_{X} X_{i} \longrightarrow V
$$

Then we obtain the surjection

$$
\coprod h_{U_{\alpha}} \amalg \coprod h_{U^{(j)}} \rightarrow \mathcal{F}
$$

as desired.
095N Lemma 49.70.6. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\Lambda$ be a Noetherian ring. The category of constructible sheaves of $\Lambda$-modules is exactly the category of modules of the form

$$
\operatorname{Coker}\left(\bigoplus_{j=1, \ldots, m} j_{V_{j}!\underline{\Lambda}_{V_{j}}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!\underline{\Lambda}_{U_{i}}}\right)
$$

with $V_{j}$ and $U_{i}$ quasi-compact and quasi-separated objects of $X_{\text {étale }}$. In fact, we can even assume $U_{i}$ and $V_{j}$ affine.
Proof. In the proof of Lemma 49.70.2 we have seen modules of this form are constructible. Since the category of constructible modules is abelian (Lemma 49.68.6) it suffices to prove that given a constructible module $\mathcal{F}$ there is a surjection

$$
\bigoplus_{i=1, \ldots, n} j_{U_{i}!\underline{\Lambda}_{U_{i}}} \longrightarrow \mathcal{F}
$$

for some affine objects $U_{i}$ in $X_{\text {étale }}$. By Modules on Sites, Lemma 18.29 .6 there is a surjection

$$
\Psi: \bigoplus_{i \in I} j_{U_{i}: \underline{\Lambda}_{U_{i}}} \longrightarrow \mathcal{F}
$$

with $U_{i}$ affine and the direct sum over a possibly infinite index set $I$. For every finite subset $I^{\prime} \subset I$ set

$$
T_{I^{\prime}}=\operatorname{Supp}\left(\operatorname{Coker}\left(\bigoplus_{i \in I^{\prime}} j_{U_{i}}!\underline{\Lambda}_{U_{i}} \longrightarrow \mathcal{F}\right)\right)
$$

By the very definition of constructible sheaves, the set $T_{I^{\prime}}$ is a constructible subset of $X$. We want to show that $T_{I^{\prime}}=\emptyset$ for some $I^{\prime}$. Since every stalk $\mathcal{F}_{\bar{x}}$ is a finite type $\Lambda$-module and since $\Psi$ is surjective, for every $x \in X$ there is an $I^{\prime}$ such that $x \notin T_{I^{\prime}}$. In other words we have $\emptyset=\bigcap_{I^{\prime} \subset I \text { finite }} T_{I^{\prime}}$. Since $X$ is a spectral space by Properties, Lemma 27.2 .4 the constructible topology on $X$ is quasi-compact by Topology, Lemma 5.22.2 Thus $T_{I^{\prime}}=\emptyset$ for some $I^{\prime} \subset I$ finite as desired.

09YT Lemma 49.70.7. Let $X$ be a quasi-compact and quasi-separated scheme. The category of constructible abelian sheaves is exactly the category of abelian sheaves of the form

$$
\operatorname{Coker}\left(\bigoplus_{j=1, \ldots, m} j_{V_{j}!} \underline{\mathbf{Z} / m_{j} \mathbf{Z}} V_{V_{j}} \longrightarrow \bigoplus_{i=1, \ldots, n} j_{U_{i}!} \underline{\mathbf{Z} / n_{i} \mathbf{Z}_{U_{i}}}\right)
$$

with $V_{j}$ and $U_{i}$ quasi-compact and quasi-separated objects of $X_{\text {étale }}$ and $m_{j}, n_{i}$ positive integers. In fact, we can even assume $U_{i}$ and $V_{j}$ affine.

Proof. This follows from Lemma 49.70 .6 applied with $\Lambda=\mathbf{Z} / n \mathbf{Z}$ and the fact that, since $X$ is quasi-compact, every constructible abelian sheaf is annihilated by some positive integer $n$ (details omitted).

09 Z 4 Lemma 49.70.8. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\Lambda$ be a Noetherian ring. Let $\mathcal{F}$ be a constructible sheaf of sets, abelian groups, or $\Lambda$ modules on $X_{\text {étale }}$. Let $\mathcal{G}=\operatorname{colim} \mathcal{G}_{i}$ be a filtered colimit of sheaves of sets, abelian groups, or $\Lambda$-modules. Then

$$
\operatorname{Mor}(\mathcal{F}, \mathcal{G})=\operatorname{colim} \operatorname{Mor}\left(\mathcal{F}, \mathcal{G}_{i}\right)
$$

in the category of sheaves of sets, abelian groups, or $\Lambda$-modules on $X_{\text {étale }}$.
Proof. The case of sheaves of sets. By Lemma 49.70.5 it suffices to prove the lemma for $h_{U}$ where $U$ is a quasi-compact and quasi-separated object of $X_{\text {étale }}$. Recall that $\operatorname{Mor}\left(h_{U}, \mathcal{G}\right)=\mathcal{G}(U)$. Hence the result follows from Sites, Lemma 7.11.2.
In the case of abelian sheaves or sheaves of modules, the result follows in the same way using Lemmas 49.70 .7 and 49.70 .6 . For the case of abelian sheaves, we add that $\operatorname{Mor}\left(j_{U!} \mathbf{Z} / n \mathbf{Z}, \mathcal{G}\right)$ is equal to the $n$-torsion elements of $\mathcal{G}(U)$.

095R Lemma 49.70.9. Let $f: X \rightarrow Y$ be a finite and finitely presented morphism of schemes. Let $\Lambda$ be a Noetherian ring. If $\mathcal{F}$ is a constructible sheaf of sets, abelian groups, or $\Lambda$-modules on $X_{\text {étale }}$, then $f_{*} \mathcal{F}$ is too.

Proof. It suffices to prove this when $X$ and $Y$ are affine by Lemma 49.68.4. By Lemmas 49.55 .3 and 49.70 .3 we may base change to any affine scheme surjective over $X$. By Lemma 49.69.3 this reduces us to the case of a finite étale morphism (because a thickening leads to an equivalence of étale topoi and even small étale sites, see Theorem 49.46.1). The finite étale case is Lemma 49.70.4.

09YU Lemma 49.70.10. Let $X=\lim _{i \in I} X_{i}$ be a limit of a directed system of schemes with affine transition morphisms. We assume that $X_{i}$ is quasi-compact and quasiseparated for all $i \in I$.
(1) The category of constructible sheaves of sets on $X_{\text {étale }}$ is the colimit of the categories of constructible sheaves of sets on $\left(X_{i}\right)_{\text {étale }}$.
(2) The category of constructible abelian sheaves on $X_{\text {étale }}$ is the colimit of the categories of constructible abelian sheaves on $\left(X_{i}\right)_{\text {étale }}$.
(3) Let $\Lambda$ be a Noetherian ring. The category of constructible sheaves of $\Lambda$ modules on $X_{\text {étale }}$ is the colimit of the categories of constructible sheaves of $\Lambda$-modules on $\left(X_{i}\right)_{\text {étale }}$.

Proof. Proof of (1). Denote $f_{i}: X \rightarrow X_{i}$ the projection maps. There are 3 parts to the proof corresponding to "faithful", "fully faithful", and "essentially surjective".

Faithful. Choose $0 \in I$ and let $\mathcal{F}_{0}, \mathcal{G}_{0}$ be constructible sheaves on $X_{0}$. Suppose that $a, b: \mathcal{F}_{0} \rightarrow \mathcal{G}_{0}$ are maps such that $f_{0}^{-1} a=f_{0}^{-1} b$. Let $E \subset X_{0}$ be the set of points $x \in X_{0}$ such that $a_{\bar{x}}=b_{\bar{x}}$. By Lemma 49.68 .8 the subset $E \subset X_{0}$ is constructible. By assumption $X \rightarrow X_{0}$ maps into $E$. By Limits, Lemma 31.3.7 we find an $i \geq 0$ such that $X_{i} \rightarrow X_{0}$ maps into $E$. Hence $f_{i 0}^{-1} a=f_{i 0}^{-1} b$.
Fully faithful. Choose $0 \in I$ and let $\mathcal{F}_{0}, \mathcal{G}_{0}$ be constructible sheaves on $X_{0}$. Suppose that $a: f_{0}^{-1} \mathcal{F}_{0} \rightarrow f_{0}^{-1} \mathcal{G}_{0}$ is a map. We claim there is an $i$ and a map $a_{i}: f_{i 0}^{-1} \mathcal{F}_{0} \rightarrow$ $f_{i 0}^{-1} \mathcal{G}_{0}$ which pulls back to $a$ on $X$. By Lemma 49.70.5 we can replace $\mathcal{F}_{0}$ by a finite
coproduct of sheaves represented by quasi-compact and quasi-separated objects of $\left(X_{0}\right)_{\text {étale }}$. Thus we have to show: If $U_{0} \rightarrow X_{0}$ is such an object of $\left(X_{0}\right)_{\text {étale }}$, then

$$
f_{0}^{-1} \mathcal{G}(U)=\operatorname{colim}_{i \geq 0} f_{i 0}^{-1} \mathcal{G}\left(U_{i}\right)
$$

where $U=X \times{ }_{X_{0}} U_{0}$ and $U_{i}=X_{i} \times{ }_{X_{0}} U_{0}$. This is a special case of Theorem 49.52 .1

Essentially surjective. We have to show every constructible $\mathcal{F}$ on $X$ is isomorphic to $f_{i}^{-1} \mathcal{F}$ for some constructible $\mathcal{F}_{i}$ on $X_{i}$. Applying Lemma 49.70 .5 and using the results of the previous two paragraphs, we see that it suffices to prove this for $h_{U}$ for some quasi-compact and quasi-separated object $U$ of $X_{\text {étale }}$. In this case we have to show that $U$ is the base change of a quasi-compact and quasi-separated scheme étale over $X_{i}$ for some $i$. This follows from Limits, Lemmas 31.9.1 and 31.7.8.
Proof of (3). The argument is very similar to the argument for sheaves of sets, but using Lemma 49.70.6 instead of Lemma 49.70.5. Details omitted. Part (2) follows from part (3) because every constructible abelian sheaf over a quasi-compact scheme is a constructible sheaf of $\mathbf{Z} / n \mathbf{Z}$-modules for some $n$.

09BG Lemma 49.70.11. Let $X$ be an irreducible scheme with generic point $\eta$.
(1) Let $S^{\prime} \subset S$ be an inclusion of sets. If we have $\underline{S^{\prime}} \subset \mathcal{G} \subset \underline{S}$ in $\operatorname{Sh}\left(X_{\text {étale }}\right)$ and $S^{\prime}=\mathcal{G}_{\bar{\eta}}$, then $\mathcal{G}=\underline{S^{\prime}}$.
(2) Let $A^{\prime} \subset A$ be an inclusion of abelian groups. If we have $\underline{A^{\prime}} \subset \mathcal{G} \subset \underline{A}$ in $A b\left(X_{\text {étale }}\right)$ and $A^{\prime}=\mathcal{G}_{\bar{\eta}}$, then $\mathcal{G}=\underline{A^{\prime}}$.
(3) Let $M^{\prime} \subset M$ be an inclsuion of modules over a ring $\Lambda$. If we have $M^{\prime} \subset$ $\mathcal{G} \subset \underline{M}$ in $\operatorname{Mod}\left(X_{\text {étale }}, \underline{\Lambda}\right)$ and $M^{\prime}=\mathcal{G}_{\bar{\eta}}$, then $\mathcal{G}=\underline{M^{\prime}}$.

Proof. This is true because for every étale morphism $U \rightarrow X$ with $U \neq \emptyset$ the point $\eta$ is in the image.

09Z5 Lemma 49.70.12. Let $X$ be an integral normal scheme with function field $K$. Let $E$ be a set.
(1) Let $g: \operatorname{Spec}(K) \rightarrow X$ be the inclusion of the generic point. Then $g_{*} \underline{E}=\underline{E}$.
(2) Let $j: U \rightarrow X$ be the inclusion of a nonempty open. Then $j_{*} \underline{E}=\underline{E}$.

Proof. Proof of (1). Let $x \in X$ be a point. Let $\mathcal{O}_{X, \bar{x}}$ be a strict henselization of $\mathcal{O}_{X, x}$. By More on Algebra, Lemma 15.36 .6 we see that $\mathcal{O}_{X, \bar{x}}$ is a normal domain. Hence $\operatorname{Spec}(K) \times{ }_{X} \operatorname{Spec}\left(\mathcal{O}_{X, \bar{x}}\right)$ is irreducible. It follows that the stalk $\left(g_{*} \underline{E}_{\underline{x}}\right.$ is equal to $E$, see Theorem 49.53.1.

Proof of (2). Since $g$ factors through $j$ there is a map $j_{*} \underline{E} \rightarrow g_{*} \underline{E}$. This map is injective because for every scheme $V$ étale over $X$ the set $\operatorname{Spec}(K) \times{ }_{X} V$ is dense in $U \times_{X} V$. On the other hand, we have a map $\underline{E} \rightarrow j_{*} \underline{E}$ and we conclude.

### 49.71. Constructible sheaves on Noetherian schemes

03RY If $X$ is a Noetherian scheme then any locally closed subset is a constructible locally closed subset (Topology, Lemma 5.15.1). Hence an abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ is constructible if and only if there exists a finite partition $X=\coprod X_{i}$ such that $\left.\mathcal{F}\right|_{X_{i}}$ is finite locally constant. (By convention a partition of a topological space has locally closed parts, see Topology, Section 5.27) In other words, we can omit the adjective "constructible" in Definition 49.68.1. Actually, the category of constructible sheaves
on Noetherian schemes has some additional properties which we will catalogue in this section.

09BH Proposition 49.71.1. Let $X$ be a Noetherian scheme. Let $\Lambda$ be a Noetherian ring.
(1) Any sub or quotient sheaf of a constructible sheaf of sets is constructible.
(2) The category of constructible abelian sheaves on $X_{\text {étale }}$ is a (strong) Serre subcategory of $A b\left(X_{\text {étale }}\right)$. In particular, every sub and quotient sheaf of a constructible abelian sheaf on $X_{\text {étale }}$ is constructible.
(3) The category of constructible sheaves of $\Lambda$-modules on $X_{\text {étale }}$ is a (strong) Serre subcategory of $\operatorname{Mod}\left(X_{\text {étale }}, \Lambda\right)$. In particular, every submodule and quotient module of a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$ is constructible.

Proof. Proof of (1). Let $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{F}$ a constructible sheaf of sets on $X_{\text {étale }}$. Let $\eta \in X$ be a generic point of an irreducible component of $X$. By Noetherian induction it suffices to find an open neighbourhood $U$ of $\eta$ such that $\left.\mathcal{G}\right|_{U}$ is locally constant. To do this we may replace $X$ by an étale neighbourhood of $\eta$. Hence we may assume $\mathcal{F}$ is constant and $X$ is irreducible.

Say $\mathcal{F}=\underline{S}$ for some finite set $S$. Then $S^{\prime}=\mathcal{G}_{\bar{\eta}} \subset S$ say $S^{\prime}=\left\{s_{1}, \ldots, s_{t}\right\}$. Pick an étale neighbourhood $(U, \bar{u})$ of $\bar{\eta}$ and sections $\sigma_{1}, \ldots, \sigma_{t} \in \mathcal{G}(U)$ which map to $s_{i}$ in $\mathcal{G}_{\bar{\eta}} \subset S$. Since $\sigma_{i}$ maps to an element $s_{i} \in S^{\prime} \subset S=\Gamma(X, \mathcal{F})$ we see that the two pullbacks of $\sigma_{i}$ to $U \times_{X} U$ are the same as sections of $\mathcal{G}$. By the sheaf condition for $\mathcal{G}$ we find that $\sigma_{i}$ comes from a section of $\mathcal{G}$ over the open $\operatorname{Im}(U \rightarrow X)$ of $X$. Shrinking $X$ we may assume $\underline{S^{\prime}} \subset \mathcal{G} \subset \underline{S}$. Then we see that $\underline{S^{\prime}}=\mathcal{G}$ by Lemma 49.70.11.

Let $\mathcal{F} \rightarrow \mathcal{Q}$ be a surjection with $\mathcal{F}$ a constructible sheaf of sets on $X_{\text {étale }}$. Then set $\mathcal{G}=\mathcal{F} \times{ }_{\mathcal{Q}} \mathcal{F}$. By the first part of the proof we see that $\mathcal{G}$ is constructible as a subsheaf of $\mathcal{F} \times \mathcal{F}$. This in turn implies that $\mathcal{Q}$ is constructible, see Lemma 49.68.6.

Proof of (3). we already know that constructible sheaves of modules form a weak Serre subcategory, see Lemma 49.68.6. Thus it suffices to show the statement on submodules.

Let $\mathcal{G} \subset \mathcal{F}$ be a submodule of a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$. Let $\eta \in$ $X$ be a generic point of an irreducible component of $X$. By Noetherian induction it suffices to find an open neighbourhood $U$ of $\eta$ such that $\left.\mathcal{G}\right|_{U}$ is locally constant. To do this we may replace $X$ by an étale neighbourhood of $\eta$. Hence we may assume $\mathcal{F}$ is constant and $X$ is irreducible.

Say $\mathcal{F}=\underline{M}$ for some finite $\Lambda$-module $M$. Then $M^{\prime}=\mathcal{G}_{\bar{\eta}} \subset M$. Pick finitely many elements $s_{1}, \ldots, s_{t}$ generating $M^{\prime}$ as a $\Lambda$-module. (This is possible as $\Lambda$ is Noetherian and $M$ is finite.) Pick an étale neighbourhood ( $U, \bar{u}$ ) of $\bar{\eta}$ and sections $\sigma_{1}, \ldots, \sigma_{t} \in \mathcal{G}(U)$ which map to $s_{i}$ in $\mathcal{G}_{\bar{\eta}} \subset M$. Since $\sigma_{i}$ maps to an element $s_{i} \in M^{\prime} \subset M=\Gamma(X, \mathcal{F})$ we see that the two pullbacks of $\sigma_{i}$ to $U \times_{X} U$ are the same as sections of $\mathcal{G}$. By the sheaf condition for $\mathcal{G}$ we find that $\sigma_{i}$ comes from a section of $\mathcal{G}$ over the open $\operatorname{Im}(U \rightarrow X)$ of $X$. Shrinking $X$ we may assume $\underline{M^{\prime}} \subset \mathcal{G} \subset \underline{M}$. Then we see that $\underline{M^{\prime}}=\mathcal{G}$ by Lemma 49.70.11.
Proof of (2). This follows in the usual manner from (3). Details omitted.

The following lemma tells us that every object of the abelian category of constructible sheaves on $X$ is "Noetherian", i.e., satisfies a.c.c. for subobjects.

09YV Lemma 49.71.2. Let $X$ be a Noetherian scheme. Let $\Lambda$ be a Noetherian ring. Consider inclusions

$$
\mathcal{F}_{1} \subset \mathcal{F}_{2} \subset \mathcal{F}_{3} \subset \ldots \subset \mathcal{F}
$$

in the category of sheaves of sets, abelian groups, or $\Lambda$-modules. If $\mathcal{F}$ is constructible, then for some $n$ we have $\mathcal{F}_{n}=\mathcal{F}_{n+1}=\mathcal{F}_{n+2}=\ldots$.

Proof. By Proposition 49.71.1 we see that $\mathcal{F}_{i}$ and $\operatorname{colim} \mathcal{F}_{i}$ are constructible. Then the lemma follows from Lemma 49.68.9.

09Z6 Lemma 49.71.3. Let $X$ be a Noetherian scheme.
(1) Let $\mathcal{F}$ be a constructible sheaf of sets on $X_{\text {étale }}$. There exist an injective map of sheaves

$$
\mathcal{F} \longrightarrow \coprod_{i=1, \ldots, n} f_{i, *} \underline{E_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite morphism and $E_{i}$ is a finite set.
(2) Let $\mathcal{F}$ be a constructible abelian sheaf on $X_{\text {étale }}$. There exist an injective map of abelian sheaves

$$
\mathcal{F} \longrightarrow \bigoplus_{i=1, \ldots, n} f_{i, *} \underline{M_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite morphism and $M_{i}$ is a finite abelian group.
(3) Let $\Lambda$ be a Noetherian ring. Let $\mathcal{F}$ be a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$. There exist an injective map of sheaves of modules

$$
\mathcal{F} \longrightarrow \bigoplus_{i=1, \ldots, n} f_{i, *} \underline{M_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite morphism and $M_{i}$ is a finite $\Lambda$-module.
Moreover, we may assume each $Y_{i}$ is irreducible, reduced, maps onto an irreducible and reduced closed subscheme $Z_{i} \subset X$ such that $Y_{i} \rightarrow Z_{i}$ is finite étale over a nonempty open of $Z_{i}$.

Proof. Proof of (1). Because we have the ascending chain condition for subsheaves of $\mathcal{F}$ (Lemma 49.71.2), it suffices to show that for every point $x \in X$ we can find a map $\varphi: \mathcal{F} \rightarrow f_{*} \underline{E}$ where $f: Y \rightarrow X$ is finite and $E$ is a finite set such that $\varphi_{\bar{x}}: \mathcal{F}_{\bar{x}} \rightarrow\left(f_{*} S\right)_{\bar{x}}$ is injective. (This argument can be avoided by picking a partition of $X$ as in Lemma 49.68.2 and constructing a $Y_{i} \rightarrow X$ for each irreducible component of each part.) Let $Z \subset X$ be the induced reduced scheme structure (Schemes, Definition 25.12 .5 ) on $\overline{\{x\}}$. Since $\mathcal{F}$ is constructible, there is a finite separable extension $\kappa(x) \subset \operatorname{Spec}(K)$ such that $\left.\mathcal{F}\right|_{\operatorname{Spec}(K)}$ is the constant sheaf with value $E$ for some finite set $E$. Let $Y \rightarrow Z$ be the normalization of $Z$ in $\operatorname{Spec}(K)$. By Morphisms, Lemma 28.48 .12 we see that $Y$ is a normal integral scheme. As $\kappa(x) \subset K$ is finite, it is clear that $K$ is the function field of $Y$. Denote $g: \operatorname{Spec}(K) \rightarrow Y$ the inclusion. The map $\left.\mathcal{F}\right|_{\operatorname{Spec}(K)} \rightarrow \underline{E}$ is adjoint to a map $\left.\mathcal{F}\right|_{Y} \rightarrow g_{*} \underline{E}=\underline{E}$ (Lemma 49.70.12). This in turn is adjoint to a map $\varphi: \mathcal{F} \rightarrow f_{*} \underline{E}$. Observe that the stalk of $\varphi$ at a geometric point $\bar{x}$ is injective: we may take a lift
$\bar{y} \in Y$ of $\bar{x}$ and the commutative diagram

proves the injectivity. We are not yet done, however, as the morphism $f: Y \rightarrow Z$ is integral but in general not finit $\xi^{5}$.

To fix the problem stated in the last sentence of the previous paragraph, we write $Y=\lim _{i \in I} Y_{i}$ with $Y_{i}$ irreducible, integral, and finite over $Z$. Namely, apply Properties, Lemma 27.22 .13 to $f_{*} \mathcal{O}_{Y}$ viewed as a sheaf of $\mathcal{O}_{Z}$-algebras and apply the functor $\underline{\operatorname{Spec}}_{Z}$. Then $f_{*} \underline{E}=\operatorname{colim} f_{i, *} \underline{E}$ by Lemma 49.52.5. By Lemma 49.70.8 the $\operatorname{map} \mathcal{F} \rightarrow f_{*} \underline{E}$ factors through $f_{i, *} \underline{E}$ for some $i$. Since $Y_{i} \rightarrow Z$ is a finite morphism of integral schemes and since the function field extension induced by this morphism is finite separable, we see that the morphism is finite étale over a nonempty open of $Z$ (use Algebra, Lemma 10.138 .9 , details omitted). This finishes the proof of (1).

The proofs of (2) and (3) are identical to the proof of (1).
In the following lemma we use a standard trick to reduce a very general statement to the Noetherian case.

09 Z 7 Lemma 49.71.4. Let $X$ be a quasi-compact and quasi-separated scheme.
(1) Let $\mathcal{F}$ be a constructible sheaf of sets on $X_{\text {étale. }}$. There exist an injective map of sheaves

$$
\mathcal{F} \longrightarrow \coprod_{i=1, \ldots, n} f_{i, *} \underline{E_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite and finitely presented morphism and $E_{i}$ is a finite set.
(2) Let $\mathcal{F}$ be a constructible abelian sheaf on $X_{\text {étale }}$. There exist an injective map of abelian sheaves

$$
\mathcal{F} \longrightarrow \bigoplus_{i=1, \ldots, n} f_{i, *} \underline{M_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite and finitely presented morphism and $M_{i}$ is a finite abelian group.
(3) Let $\Lambda$ be a Noetherian ring. Let $\mathcal{F}$ be a constructible sheaf of $\Lambda$-modules on $X_{\text {étale }}$. There exist an injective map of sheaves of modules

$$
\mathcal{F} \longrightarrow \bigoplus_{i=1, \ldots, n} f_{i, *} \underline{M_{i}}
$$

where $f_{i}: Y_{i} \rightarrow X$ is a finite and finitely presented morphism and $M_{i}$ is a finite $\Lambda$-module.

Proof. We will reduce this lemma to the Noetherian case by absolute Noetherian approximation. Namely, by Limits, Proposition 31.4.4 we can write $X=\lim _{t \in T} X_{t}$ with each $X_{t}$ of finite type over $\operatorname{Spec}(\mathbf{Z})$ and with affine transition morphisms. By Lemma 49.70 .10 the category of constructible sheaves (of sets, abelian groups, or $\Lambda$-modules) on $X_{\text {étale }}$ is the colimit of the corresponding categories for $X_{t}$. Thus our constructible sheaf $\mathcal{F}$ is the pullback of a similar constructible sheaf $\mathcal{F}_{t}$ over

[^132]$X_{t}$ for some $t$. Then we apply the Noetherian case (Lemma 49.71.3) to find an injection
$$
\mathcal{F}_{t} \longrightarrow \coprod_{i=1, \ldots, n} f_{i, *} \underline{E_{i}} \quad \text { or } \quad \mathcal{F}_{t} \longrightarrow \bigoplus_{i=1, \ldots, n} f_{i, *} \underline{M_{i}}
$$
over $X_{t}$ for some finite morphisms $f_{i}: Y_{i} \rightarrow X_{t}$. Since $X_{t}$ is Noetherian the morphisms $f_{i}$ are of finite presentation. Since pullback is exact and since formation of $f_{i, *}$ commutes with base change (Lemma 49.55.3), we conclude.

### 49.72. Cohomology with support in a closed subscheme

09XP Let $X$ be a scheme and let $Z \subset X$ be a closed subscheme. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. We let

$$
\Gamma_{Z}(X, \mathcal{F})=\{s \in \mathcal{F}(X) \mid \operatorname{Supp}(s) \subset Z\}
$$

be the sections with support in $Z$ (Definition 49.31.3). This is a left exact functor which is not exact in general. Hence we obtain a derived functor

$$
R \Gamma_{Z}(X,-): D\left(X_{\text {étale }}\right) \longrightarrow D(A b)
$$

and cohomology groups with support in $Z$ defined by $H_{Z}^{q}(X, \mathcal{F})=R^{q} \Gamma_{Z}(X, \mathcal{F})$.
Let $\mathcal{I}$ be an injective abelian sheaf on $X_{\text {étale }}$. Let $U=X \backslash Z$. Then the restriction $\operatorname{map} \mathcal{I}(X) \rightarrow \mathcal{I}(U)$ is surjective (Cohomology on Sites, Lemma 21.12.6) with kernel $\Gamma_{Z}(X, \mathcal{I})$. It immediately follows that for $K \in D\left(X_{\text {étale }}\right)$ there is a distinguished triangle

$$
R \Gamma_{Z}(X, K) \rightarrow R \Gamma(X, K) \rightarrow R \Gamma(U, K) \rightarrow R \Gamma_{Z}(X, K)[1]
$$

in $D(A b)$. As a consequence we obtain a long exact cohomology sequence

$$
\ldots \rightarrow H_{Z}^{i}(X, K) \rightarrow H^{i}(X, K) \rightarrow H^{i}(U, K) \rightarrow H_{Z}^{i+1}(X, K) \rightarrow \ldots
$$

for any $K$ in $D\left(X_{\text {étale }}\right)$.
For an abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we can consider the subsheaf of sections with support in $Z$, denoted $\mathcal{H}_{Z}(\mathcal{F})$, defined by the rule

$$
\mathcal{H}_{Z}(\mathcal{F})(U)=\left\{s \in \mathcal{F}(U) \mid \operatorname{Supp}(s) \subset U \times_{X} Z\right\}
$$

Here we use the support of a section from Definition 49.31.3. Using the equivalence of Proposition 49.47.4 we may view $\mathcal{H}_{Z}(\mathcal{F})$ as an abelian sheaf on $Z_{\text {étale }}$. Thus we obtain a functor

$$
A b\left(X_{\text {étale }}\right) \longrightarrow A b\left(Z_{\text {étale }}\right), \quad \mathcal{F} \longmapsto \mathcal{H}_{Z}(\mathcal{F})
$$

which is left exact, but in general not exact.
09XQ Lemma 49.72.1. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $\mathcal{I}$ be an injective abelian sheaf on $X_{\text {étale }}$. Then $\mathcal{H}_{Z}(\mathcal{I})$ is an injective abelian sheaf on $Z_{\text {étale }}$.

Proof. Observe that for any abelian sheaf $\mathcal{G}$ on $Z_{\text {étale }}$ we have

$$
\operatorname{Hom}_{Z}\left(\mathcal{G}, \mathcal{H}_{Z}(\mathcal{F})\right)=\operatorname{Hom}_{X}\left(i_{*} \mathcal{G}, \mathcal{F}\right)
$$

because after all any section of $i_{*} \mathcal{G}$ has support in $Z$. Since $i_{*}$ is exact (Section49.47) and as $\mathcal{I}$ is injective on $X_{\text {étale }}$ we conclude that $\mathcal{H}_{Z}(\mathcal{I})$ is injective on $Z_{\text {étale }}$.

Denote

$$
R \mathcal{H}_{Z}: D\left(X_{\text {étale }}\right) \longrightarrow D\left(Z_{\text {étale }}\right)
$$

the derived functor. We set $\mathcal{H}_{Z}^{q}(\mathcal{F})=R^{q} \mathcal{H}_{Z}(\mathcal{F})$ so that $\mathcal{H}_{Z}^{0}(\mathcal{F})=\mathcal{H}_{Z}(\mathcal{F})$. By the lemma above we have a Grothendieck spectral sequence

$$
E_{2}^{p, q}=H^{p}\left(Z, \mathcal{H}_{Z}^{q}(\mathcal{F})\right) \Rightarrow H_{Z}^{p+q}(X, \mathcal{F})
$$

09XR Lemma 49.72.2. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $\mathcal{G}$ be an injective abelian sheaf on $Z_{\text {étale }}$. Then $\mathcal{H}_{Z}^{p}\left(i_{*} \mathcal{G}\right)=0$ for $p>0$.
Proof. This is true because the functor $i_{*}$ is exact and transforms injective abelian sheaves into injective abelian sheaves (Cohomology on Sites, Lemma 21.14.2).

0A45 Lemma 49.72.3. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $j: U \rightarrow X$ be the inclusion of the complement of $Z$. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. There is a distinguished triangle

$$
i_{*} R \mathcal{H}_{Z}(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow R j_{*}\left(\left.\mathcal{F}\right|_{U}\right) \rightarrow i_{*} R \mathcal{H}_{Z}(\mathcal{F})[1]
$$

in $D\left(X_{\text {étale }}\right)$. This produces an exact sequence

$$
0 \rightarrow i_{*} \mathcal{H}_{Z}(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow j_{*}\left(\left.\mathcal{F}\right|_{U}\right) \rightarrow i_{*} \mathcal{H}_{Z}^{1}(\mathcal{F}) \rightarrow 0
$$

and isomorphisms $R^{p} j_{*}\left(\left.\mathcal{F}\right|_{U}\right) \cong i_{*} \mathcal{H}_{Z}^{p+1}(\mathcal{F})$ for $p \geq 1$.
Proof. To get the distinguished triangle, choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$. Then we obtain a short exact sequence of complexes

$$
0 \rightarrow i_{*} \mathcal{H}_{Z}\left(\mathcal{I}^{\bullet}\right) \rightarrow \mathcal{I}^{\bullet} \rightarrow j_{*}\left(\left.\mathcal{I}^{\bullet}\right|_{U}\right) \rightarrow 0
$$

by the discussion above. Thus the distinguished triangle by Derived Categories, Section 13.12 .

Let $X$ be a scheme and let $Z \subset X$ be a closed subscheme. We denote $D_{Z}\left(X_{\text {étale }}\right)$ the strictly full saturated triangulated subcategory of $D\left(X_{\text {étale }}\right)$ consisting of complexes whose cohomology sheaves are supported on $Z$. Note that $D_{Z}\left(X_{\text {étale }}\right)$ only depends on the underlying closed subset of $X$.

0AEG Lemma 49.72.4. Let $i: Z \rightarrow X$ be a closed immersion of schemes. The map Rismall $, *=i_{\text {small }, *}: D\left(Z_{\text {étale }}\right) \rightarrow D\left(X_{\text {étale }}\right)$ induces an equivalence $D\left(Z_{\text {étale }}\right) \rightarrow$ $D_{Z}\left(X_{\text {étale }}\right)$ with quasi-inverse

$$
\left.i_{\text {small }}^{-1}\right|_{D_{Z}\left(X_{\text {étale }}\right)}=\left.R \mathcal{H}_{Z}\right|_{D_{Z}\left(X_{\text {étale }}\right)}
$$

Proof. Recall that $i_{\text {small }}^{-1}$ and $i_{\text {small,* }}$ is an adjoint pair of exact functors such that $i_{\text {small }}^{-1} i_{\text {small,* }}$ is isomorphic to the identify functor on abelian sheaves. See Proposition 49.47.4 and Lemma 49.36.2. Thus $i_{\text {small }, *}: D\left(Z_{\text {étale }}\right) \rightarrow D_{Z}\left(X_{\text {étale }}\right)$ is fully faithfull and $i_{\text {small }}^{-1}$ determines a left inverse. On the other hand, suppose that $K$ is an object of $D_{Z}\left(X_{\text {étale }}\right)$ and consider the adjunction map $K \rightarrow i_{\text {small }, *} i_{\text {small }}^{-1} K$. Using exactness of $i_{\text {small,* }}$ and $i_{\text {small }}^{-1}$ this induces the adjunction maps $H^{n}(K) \rightarrow$ $i_{\text {small }, *} i_{\text {small }}^{-1} H^{n}(K)$ on cohomology sheaves. Since these cohomology sheaves are supported on $Z$ we see these adjunction maps are isomorphisms and we conclude that $D\left(Z_{\text {étale }}\right) \rightarrow D_{Z}\left(X_{\text {étale }}\right)$ is an equivalence.
To finish the proof we have to show that $R \mathcal{H}_{Z}(K)=i_{\text {small }}^{-1} K$ if $K$ is an object of $D_{Z}\left(X_{\text {étale }}\right)$. To do this we can use that $K=i_{\text {small }, *} i_{\text {small }}^{-1} K$ as we've just proved this is the case. Then we can choose a K-injective representative $\mathcal{I}^{\bullet}$ for $i_{\text {small }}^{-1} K$.

Since $i_{\text {small,* }}$ is the right adjoint to the exact functor $i_{\text {small }}^{-1}$, the complex $i_{\text {small }, *} \mathcal{I}^{\bullet}$ is K -injective (Derived Categories, Lemma 13.29.9). We see that $R \mathcal{H}_{Z}(K)$ is computed by $\mathcal{H}_{Z}\left(i_{\text {small }, *} \mathcal{I}^{\bullet}\right)=\mathcal{I}^{\bullet}$ as desired.

0A46 Lemma 49.72.5. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module and denote $\mathcal{F}^{a}$ the associated quasi-coherent sheaf on the small étale site of $X$ (Proposition 49.17.1). Then
(1) $H_{Z}^{q}(X, \mathcal{F})$ agrees with $H_{Z}^{q}\left(X_{\text {étale }}, \mathcal{F}^{a}\right)$,
(2) if the complement of $Z$ is retrocompact in $X$, then $i_{*} \mathcal{H}_{Z}^{q}\left(\mathcal{F}^{a}\right)$ is a quasicoherent sheaf of $\mathcal{O}_{X}$-modules equal to $\left(i_{*} \mathcal{H}^{q}(\mathcal{F})\right)^{a}$.

Proof. Let $j: U \rightarrow X$ be the inclusion of the complement of $Z$. The statement (1) on cohomology groups follows from the long exact sequences for cohomology with supports and the agreements $H^{q}\left(X_{\text {étale }}, \mathcal{F}^{a}\right)=H^{q}(X, \mathcal{F})$ and $H^{q}\left(U_{\text {étale }}, \mathcal{F}^{a}\right)=$ $H^{q}(U, \mathcal{F})$, see Theorem49.22.4. If $j: U \rightarrow X$ is a quasi-compact morphism, i.e., if $U \subset X$ is restrocompact, then $R^{q} j_{*}$ transforms quasi-coherent sheaves into quasicoherent sheaves (Cohomology of Schemes, Lemma 29.4.5) and commutes with taking associated sheaf on étale sites (Descent, Lemma 34.7.15). We conclude by applying Lemma 49.72.3.

### 49.73. Affine analog of proper base change

09Z8 In this section we discuss a result by Ofer Gabber, see Gab94. This was also proved by Roland Huber, see Hub93b.

09Z9 Lemma 49.73.1. Let $X$ be an integral normal scheme with separably closed function field.
(1) A separated étale morphism $U \rightarrow X$ is a disjoint union of open immersions.
(2) All local rings of $X$ are strictly henselian.

Proof. Let $R$ be a normal domain whose fraction field is separably algebraically closed. Let $R \rightarrow A$ be an étale ring map. Then $A \otimes_{R} K$ is as a $K$-algebra a finite product $\prod_{i=1, \ldots, n} K$ of copies of $K$. Let $e_{i}, i=1, \ldots, n$ be the corresponding idempotents of $A \otimes_{R} K$. Since $A$ is normal (Algebra, Lemma 10.155.7) the idempotents $e_{i}$ are in $A$ (Algebra, Lemma 10.36.12. Hence $A=\prod A e_{i}$ and we may assume $A \otimes_{R} K=K$. Since $A \subset A \otimes_{R} K=K$ (by flatness of $R \rightarrow A$ and since $R \subset K$ ) we conclude that $A$ is a domain. By the same argument we conclude that $A \otimes_{R} A \subset\left(A \otimes_{R} A\right) \otimes_{R} K=K$. It follows that the map $A \otimes_{R} A \rightarrow A$ is injective as well as surjective. Thus $R \rightarrow A$ defines an open immersion by Morphisms, Lemma 28.11.2 and Étale Morphisms, Theorem 40.14.1.

Let $f: U \rightarrow X$ be a separated étale morphism. Let $\eta \in X$ be the generic point and let $f^{-1}(\{\eta\})=\left\{\xi_{i}\right\}_{i \in I}$. The result of the previous paragraph shows the following: For any affine open $U^{\prime} \subset U$ whose image in $X$ is contained in an affine we have $U^{\prime}=\coprod_{i \in I} U_{i}^{\prime}$ where $U_{i}^{\prime}$ is the set of point of $U^{\prime}$ which are specializations of $\xi_{i}$. Moreover, the morphism $U_{i}^{\prime} \rightarrow X$ is an open immersion. It follows that $U_{i}=$ $\overline{\left\{\xi_{i}\right\}}$ is an open and closed subscheme of $U$ and that $U_{i} \rightarrow X$ is locally on the source an isomorphism. By Morphisms, Lemma 28.9.6 the fact that $U_{i} \rightarrow X$ is separated, implies that $U_{i} \rightarrow X$ is injective and we conclude that $U_{i} \rightarrow X$ is an open immersion, i.e., (1) holds.

Part (2) follows from part (1) and the description of the strict henselization of $\mathcal{O}_{X, x}$ as the local ring at $\bar{x}$ on the étale site of $X$ (Lemma 49.33.1).

09ZA Lemma 49.73.2. Let $X$ be an affine integral normal scheme with separably closed function field. Let $Z \subset X$ be a closed subscheme. Let $V \rightarrow Z$ be an étale morphism with $V$ affine. Then $V$ is a finite disjoint union of open subschemes of $Z$. If $V \rightarrow Z$ is surjective and finite étale, then $V \rightarrow Z$ has a section.

Proof. By Algebra, Lemma 10.141.11 we can lift $V$ to an affine scheme $U$ étale over $X$. Apply Lemma 49.73.1 to $U \rightarrow X$ to get the first statement.

The final statement is a consequence of the first. Let $V=\coprod_{i=1, \ldots, n} V_{i}$ be a finite decomposition into open and closed subschemes with $V_{i} \rightarrow Z$ an open immersion. As $V \rightarrow Z$ is finite we see that $V_{i} \rightarrow Z$ is also closed. Let $U_{i} \subset Z$ be the image. Then we have a decomposition into open and closed subshemes

$$
Z=\coprod_{(A, B)} \bigcap_{i \in A} U_{i} \cap \bigcap_{i \in B} U_{i}^{c}
$$

where the disjoint union is over $\{1, \ldots, n\}=A \amalg B$ where $A$ has at least one element. Each of the strata is contained in a single $U_{i}$ and we find our section.

09ZB Lemma 49.73.3. Let $X$ be a normal integral affine scheme with with separably closed function field. Let $Z \subset X$ be a closed subscheme. For any finite abelian group $M$ we have $H_{\text {étale }}^{1}(Z, \underline{M})=0$.

Proof. By Cohomology on Sites, Lemma 21.5 .3 an element of $H_{\text {étale }}^{1}(Z, \underline{M})$ corresponds to a $M$-torsor $\mathcal{F}$ on $Z_{\text {étale }}$. Such a torsor is clearly a finite locally constant sheaf. Hence $\mathcal{F}$ is representable by a scheme $V$ finite étale over $Z$, Lemma 49.67.4. Of course $V \rightarrow Z$ is surjective as a torsor is locally trivial. Since $V \rightarrow Z$ has a section by Lemma 49.73.2 we are done.

09ZC Lemma 49.73.4. Let $X$ be a normal integral affine scheme with separably closed function field. Let $Z \subset X$ be a closed subscheme. For any finite abelian group $M$ we have $H_{\text {étale }}^{q}(Z, \underline{M})=0$ for $q \geq 1$.

Proof. We have seen that the result is true for $H^{1}$ in Lemma 49.73.3. We will prove the result for $q \geq 2$ by induction on $q$. Let $\xi \in H_{\text {étale }}^{q}(Z, \underline{M})$.

Let $X=\operatorname{Spec}(R)$. Let $I \subset R$ be the set of elements $f \in R$ sch that $\left.\xi\right|_{Z \cap D(f)}=0$. All local rings of $Z$ are strictly henselian by Lemma 49.73.1 and Algebra, Lemma 10.148.30. Hence étale cohomology on $Z$ or open subschemes of $Z$ is equal to Zariski cohomology, see Lemma 49.55.6. In particular $\xi$ is Zariski locally trivial. It follows that for every prime $\mathfrak{p}$ of $R$ there exists an $f \in I$ with $f \notin \mathfrak{p}$. Thus if we can show that $I$ is an ideal, then $1 \in I$ and we're done. It is clear that $f \in I, r \in R$ implies $r f \in I$. Thus we now assume that $f, g \in I$ and we show that $f+g \in I$. Note that

$$
D(f+g) \cap Z=D(f(f+g)) \cap Z \cup D(g(f+g)) \cap Z
$$

By Mayer-Vietoris (Cohomology, Lemma 20.9 .2 which applies as étale cohomology on open subschemes of $Z$ equals Zariski cohomology) we have an exact sequence

and the result follows as the first group is zero by induction.
09ZD Lemma 49.73.5. Let $X$ be an affine scheme.
(1) There exists an integral surjective morphism $X^{\prime} \rightarrow X$ such that for every closed subscheme $Z^{\prime} \subset X^{\prime}$, every finite abelian group $M$, and every $q \geq 1$ we have $H_{\text {étale }}^{q}\left(Z^{\prime}, \underline{M}\right)=0$.
(2) For any closed subscheme $Z \subset X$, finite abelian group $M, q \geq 1$, and $\xi \in H_{\text {étale }}^{q}(Z, \underline{M})$ there exists a finite surjective morphism $X^{\prime} \rightarrow X$ of finite presentation such that $\xi$ pulls back to zero in $H_{\text {etale }}^{q}\left(X^{\prime} \times_{X} Z, \underline{M}\right)$.

Proof. Write $X=\operatorname{Spec}(A)$. Write $A=\mathbf{Z}\left[x_{i}\right] / J$ for some ideal $J$. Let $R$ be the integral closure of $\mathbf{Z}\left[x_{i}\right]$ in an algebraic closure of the fraction field of $\mathbf{Z}\left[x_{i}\right]$. Let $A^{\prime}=R / J R$ and set $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. This gives an example as in (1) by Lemma 49.73 .4

Proof of (2). Let $X^{\prime} \rightarrow X$ be the integral surjective morphism we found above. Certainly, $\xi$ maps to zero in $H_{\text {étale }}^{q}\left(X^{\prime} \times_{X} Z, \underline{M}\right)$. We may write $X^{\prime}$ as a limit $X^{\prime}=\lim X_{i}^{\prime}$ of schemes finite and of finite presentation over $X$; this is easy to do in our current affine case, but it is a special case of the more general Limits, Lemma 31.6.2. By Lemma 49.52 .3 we see that $\xi$ maps to zero in $H_{\text {étale }}^{q}\left(X_{i}^{\prime} \times_{X} Z, \underline{M}\right)$ for some $i$ large enough.
09ZE Lemma 49.73.6. Let $X$ be an affine scheme. Let $\mathcal{F}$ be a torsion abelian sheaf on $X_{\text {étale }} . L e t Z \subset X$ be a closed subscheme. Let $\xi \in H_{\text {étale }}^{q}\left(Z,\left.\mathcal{F}\right|_{Z}\right)$ for some $q>0$. Then there exists an injective map $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ of torsion abelian sheaves on $X_{\text {étale }}$ such that the image of $\xi$ in $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{F}^{\prime}\right|_{Z}\right)$ is zero.
Proof. By Lemmas 49.70 .2 and 49.52 .2 we can find a map $\mathcal{G} \rightarrow \mathcal{F}$ with $\mathcal{G}$ a constructible abelian sheaf and $\xi$ coming from an element $\zeta$ of $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{G}\right|_{Z}\right)$. Suppose we can find an injective $\operatorname{map} \mathcal{G} \rightarrow \mathcal{G}^{\prime}$ of torsion abelian sheaves on $X_{\text {étale }}$ such that the image of $\zeta$ in $H_{\text {etale }}^{q}\left(Z,\left.\mathcal{G}^{\prime}\right|_{Z}\right)$ is zero. Then we can take $\mathcal{F}^{\prime}$ to be the pushout

$$
\mathcal{F}^{\prime}=\mathcal{G}^{\prime} \amalg_{\mathcal{G}} \mathcal{F}
$$

and we conclude the result of the lemma holds. (Observe that restriction to $Z$ is exact, so commutes with finite limits and colimits and moreover it commutes with arbitrary colimits as a left adjoint to pushforward.) Thus we may assume $\mathcal{F}$ is constructible.
Assume $\mathcal{F}$ is constructible. By Lemma 49.71.4 it suffices to prove the result when $\mathcal{F}$ is of the form $f_{*} \underline{M}$ where $M$ is a finite abelian group and $f: Y \rightarrow X$ is a finite morphism of finite presentation (such sheaves are still constructible by Lemma
49.70 .9 but we won't need this). Since formation of $f_{*}$ commutes with any base change (Lemma 49.55.3) we see that the restriction of $f_{*} \underline{M}$ to $Z$ is equal to the pushforward of $\underline{M}$ via $Y \times_{X} Z \rightarrow Z$. By the Leray spectral sequence (Proposition 49.54.2 and vanishing of higher direct images (Proposition 49.55.2), we find

$$
H_{\text {etale }}^{q}\left(Z,\left.f_{*} \underline{M}\right|_{Z}\right)=H_{\text {étale }}^{q}\left(Y \times_{X} Z, \underline{M}\right) .
$$

By Lemma 49.73 .5 we can find a finite surjective morphism $Y^{\prime} \rightarrow Y$ of finite presentation such that $\xi$ maps to zero in $H^{q}\left(Y^{\prime} \times_{X} Z, \underline{M}\right)$. Denoting $f^{\prime}: Y^{\prime} \rightarrow X$ the compostion $Y^{\prime} \rightarrow Y \rightarrow X$ we claim the map

$$
f_{*} \underline{M} \longrightarrow f_{*}^{\prime} \underline{M}
$$

is injective which finishes the proof by what was said above. To see the desired injectivity we can look at stalks. Namely, if $\bar{x}: \operatorname{Spec}(k) \rightarrow X$ is a geometric point, then

$$
\left(f_{*} \underline{M}\right)_{\bar{x}}=\bigoplus_{f(\bar{y})=\bar{x}} M
$$

by Proposition 49.55 .2 and similarly for the other sheaf. Since $Y^{\prime} \rightarrow Y$ is surjective and finite we see that the induced map on geometric points lifting $\bar{x}$ is surjective too and we conclude.

The lemma above will take care of higher cohomology groups in Gabber's result. The following lemma will be used to deal with global sections.

09ZF Lemma 49.73.7. Let $X$ be a quasi-compact and quasi-separated scheme. Let $i: Z \rightarrow X$ be a closed immersion. Assume that
(1) for any sheaf $\mathcal{F}$ on $X_{Z a r}$ the map $\Gamma(X, \mathcal{F}) \rightarrow \Gamma\left(Z, i^{-1} \mathcal{F}\right)$ is bijective, and
(2) for any finite morphism $X^{\prime} \rightarrow X$ assumption (1) holds for $Z \times_{X} X^{\prime} \rightarrow X^{\prime}$. Then for any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(Z, i_{\text {small }}^{-1} \mathcal{F}\right)$.

Proof. Let $\mathcal{F}$ be a sheaf on $X_{\text {étale }}$. There is a canonical (base change) map

$$
\left.i^{-1}\left(\left.\mathcal{F}\right|_{X_{Z a r}}\right) \longrightarrow\left(i_{\text {small }}^{-1} \mathcal{F}\right)\right|_{Z_{Z a r}}
$$

of sheaves on $Z_{Z a r}$. This map is injective as can be seen by looking on stalks. The stalk on the left hand side at $z \in Z$ is the stalk of $\left.\mathcal{F}\right|_{X_{Z a r}}$ at $z$. The stalk on the right hand side is the colimit over all elementary étale neighbourhoods $(U, u) \rightarrow(X, z)$ such that $U \times_{X} Z \rightarrow Z$ has a section over a neighbourhood of $z$. As étale morphisms are open, the image of $U \rightarrow X$ is an open neighbourhood of $z$ in $X$ and injectivity follows.

It follows from this and assumption (1) that the map $\Gamma(X, \mathcal{F}) \rightarrow \Gamma\left(Z, i_{\text {small }}^{-1} \mathcal{F}\right)$ is injective. By (2) the same thing is true on all $X^{\prime}$ finite over $X$.

Let $s \in \Gamma\left(Z, i_{\text {small }}^{-1} \mathcal{F}\right)$. By construction of $i_{\text {small }}^{-1} \mathcal{F}$ there exists an étale covering $\left\{V_{j} \rightarrow Z\right\}$, étale morphisms $U_{j} \rightarrow X$, sections $s_{j} \in \mathcal{F}\left(U_{j}\right)$ and morphisms $V_{j} \rightarrow U_{j}$ over $X$ such that $\left.s\right|_{V_{j}}$ is the pullback of $s_{j}$. Observe that every closed subscheme $T \subset X$ meets $Z$ by assumption (1) applied to the sheaf $(T \rightarrow X)_{*} \underline{\mathbf{Z}}$ for example. Thus we see that $\left\lfloor U_{j} \rightarrow X\right.$ is surjective. By More on Morphisms, Lemma 36.31.13 we can find a finite surjective morphism $X^{\prime} \rightarrow X$ such that $X^{\prime} \rightarrow X$ Zariski locally factors through $\coprod U_{j} \rightarrow X$. It follows that $\left.s\right|_{Z^{\prime}}$ Zariski locally comes from a section of $\left.\mathcal{F}\right|_{X^{\prime}}$. In other words, $\left.s\right|_{Z^{\prime}}$ comes from $t^{\prime} \in \Gamma\left(X^{\prime},\left.\mathcal{F}\right|_{X^{\prime}}\right)$ by assumption (2). By injectivity we conclude that the two pullbacks of $t^{\prime}$ to $X^{\prime} \times_{X} X^{\prime}$ are the same (after
all this is true for the pullbacks of $s$ to $\left.Z^{\prime} \times{ }_{Z} Z^{\prime}\right)$. Hence we conclude $t^{\prime}$ comes from a section of $\mathcal{F}$ over $X$ by Remark 49.55.5.

09ZG Lemma 49.73.8. Let $X$ be a topological space and let $Z \subset X$ be a closed subset. Suppose that for every $x \in X$ the intersection $Z \cap \overline{\{x\}}$ is connected (in particular nonempty). Then for any sheaf $\mathcal{F}$ on $X$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(Z,\left.\mathcal{F}\right|_{Z}\right)$.
Proof. Let's view a global section of $\mathcal{F}$ as an assignment $x \mapsto s_{x} \in \mathcal{F}_{x}$ satisfying the continuity property $\left(^{*}\right)$ introduced in Sheaves, Section 6.17. If $x \rightsquigarrow z$ is a specialization on $X$, then there is a corresponding map on stalks $\mathcal{F}_{z} \rightarrow \mathcal{F}_{x}$. Thus, given a global section $s=\left(s_{z}\right)_{z \in Z}$ of $\left.\mathcal{F}\right|_{Z}$ we can assign to every $x \in X$ a value $s_{x}$ by chooseing a $z \in Z \cap \overline{\{x\}}$ and taking the image of $s_{z}$. The fact that $s_{x}$ is independent of the choice of $z$ comes from the fact that we assumed $Z \cap \overline{\{x\}}$ is connected (details omitted). It is clear that this rule satisfies $\left(^{*}\right.$ ) and provides us with a section $\tilde{s}$ of $\mathcal{F}$ over $X$ which restricts to $s$.

09ZH Lemma 49.73.9. Let $(A, I)$ be a henselian pair. Set $X=\operatorname{Spec}(A)$ and $Z=$ $\operatorname{Spec}(A / I)$. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(Z,\left.\mathcal{F}\right|_{Z}\right)$.

Proof. Combine Lemmas 49.73.7 and 49.73.8 and More on Algebra, Lemmas 15.8.9 and 15.8.11.

Finally, we can state and prove Gabber's theorem.
09ZI Theorem 49.73.10 (Gabber). Let $(A, I)$ be a henselian pair. Set $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(A / I)$. For any torsion abelian sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $H_{\text {étale }}^{q}(X, \mathcal{F})=$ $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{F}\right|_{Z}\right)$.
Proof. The result holds for $q=0$ by Lemma 49.73.9. Let $q \geq 1$. Suppose the result has been shown in all degrees $<q$. Let $\mathcal{F}$ be a torsion abelian sheaf. Let $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ be an injective map of torsion abelian sheaves (to be chosen later) with cokernel $\mathcal{Q}$ so that we have the short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{Q} \rightarrow 0
$$

of torsion abelian sheaves on $X_{\text {étale }}$. This gives a map of long exact cohomology sequences over $X$ and $Z$ part of which looks like

Using this commutative diagram of abelian groups with exact rows we will finish the proof.
Injectivity for $\mathcal{F}$. Let $\xi$ be a nonzero element of $H_{\text {étale }}^{q}(X, \mathcal{F})$. By Lemma 49.73.6 applied with $Z=X(!)$ we can find $\mathcal{F} \subset \mathcal{F}^{\prime}$ such that $\xi$ maps to zero to the right. Then $\xi$ is the image of an element of $H_{\text {étale }}^{q-1}(X, \mathcal{Q})$ and bijectivity for $q-1$ implies $\xi$ does not map to zero in $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{F}\right|_{Z}\right)$.
Surjectivity for $\mathcal{F}$. Let $\xi$ be an element of $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{F}\right|_{Z}\right)$. By Lemma 49.73.6 applied with $Z=Z$ we can find $\mathcal{F} \subset \mathcal{F}^{\prime}$ such that $\xi$ maps to zero to the right. Then $\xi$ is the image of an element of $H_{\text {étale }}^{q-1}\left(Z,\left.\mathcal{Q}\right|_{Z}\right)$ and bijectivity for $q-1$ implies $\xi$ is in the image of the vertical map.

0A51 Lemma 49.73.11. Let $X$ be a scheme with affine diagonal which can be covered by $n+1$ affine opens. Let $Z \subset X$ be a closed subscheme. Let $\mathcal{A}$ be a torsion sheaf of rings on $X_{\text {étale }}$ and let $\mathcal{I}$ be an injective sheaf of $\mathcal{A}$-modules on $X_{\text {étale }}$. Then $H_{\text {étale }}^{q}\left(Z,\left.\mathcal{I}\right|_{Z}\right)=0$ for $q>n$.
Proof. We will prove this by induction on $n$. If $n=0$, then $X$ is affine. Say $X=\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(A / I)$. Let $A^{h}$ be the filtered colimit of étale $A$-algebras $B$ such that $A / I \rightarrow B / I B$ is an isomorphism. Then $\left(A^{h}, I A^{h}\right)$ is a henselian pair and $A / I=A^{h} / I A^{h}$, see More on Algebra, Lemma 15.8 .13 and its proof. Set $X^{h}=\operatorname{Spec}\left(A^{h}\right)$. By Theorem 49.73.10 we see that

$$
H_{\text {étale }}^{q}\left(Z,\left.\mathcal{I}\right|_{Z}\right)=H_{\text {étale }}^{q}\left(X^{h},\left.\mathcal{I}\right|_{X^{h}}\right)
$$

By Theorem 49.52.1 we have

$$
H_{\text {étale }}^{q}\left(X^{h},\left.\mathcal{F}\right|_{X^{h}}\right)=\operatorname{colim}_{A \rightarrow B} H_{\text {étale }}^{q}\left(\operatorname{Spec}(B),\left.\mathcal{I}\right|_{\operatorname{Spec}(B)}\right)
$$

where the colimit is over the $A$-algebras $B$ as above. Since the morphisms $\operatorname{Spec}(B) \rightarrow$ $\operatorname{Spec}(A)$ are étale, the restriction $\left.\mathcal{I}\right|_{\operatorname{Spec}(B)}$ is an injective sheaf of $\left.\mathcal{A}\right|_{\operatorname{Spec}(B) \text {-modules }}$ (Cohomology on Sites, Lemma 21.8.1). Thus the cohomology groups on the right are zero and we get the result in this case.
Induction step. We can use Mayer-Vietoris to do the induction step. Namely, suppose that $X=U \cup V$ where $U$ is a union of $n$ affine opens and $V$ is affine. Then, using that the diagonal of $X$ is affine, we see that $U \cap V$ is the union of $n$ affine opens. Mayer-Vietoris gives an exact sequence
$H_{\text {étale }}^{q-1}\left(U \cap V \cap Z,\left.\mathcal{F}\right|_{Z}\right) \rightarrow H_{\text {étale }}^{q}\left(Z,\left.\mathcal{I}\right|_{Z}\right) \rightarrow H_{\text {étale }}^{q}\left(U \cap Z,\left.\mathcal{F}\right|_{Z}\right) \oplus H_{\text {étale }}^{q}\left(V \cap Z,\left.\mathcal{F}\right|_{Z}\right)$ and by our induction hypothesis we obtain vanishing for $q>n$ as desired.

### 49.74. Cohomology of torsion sheaves on curves

03SB The goal of this section is to prove Theorem49.74.12. The proof uses the "méthode de la trace" as explained in AGV71, Exposé IX, §5].

Let $f: Y \rightarrow X$ be an étale morphism of schemes. There are pairs of adjoint functors $\left(f_{!}, f^{-1}\right)$ and $\left(f^{-1}, f_{*}\right)$ between $A b\left(X_{\text {étale }}\right)$ and $A b\left(Y_{\text {étale }}\right)$. The adjunction map id $\rightarrow f_{*} f^{-1}$ is called restriction. The adjunction map $f_{*} f^{-1}=f_{!} f^{-1} \rightarrow$ id is often called the trace map. If $f$ is finite, then $f_{*}=f_{!}$and we can view this as a $\operatorname{map} f_{*} f^{-1} \rightarrow$ id.

03SE Definition 49.74.1. Let $f: Y \rightarrow X$ be a finite étale morphism of schemes. The $\operatorname{map} f_{*} f^{-1} \rightarrow$ id described above is called the trace.

Let $f: Y \rightarrow X$ be a finite étale morphism. The trace map is characterized by the following two properties:
(1) it commutes with étale localization and
(2) if $Y=\coprod_{i=1}^{d} X$ then the trace map is the sum map $f_{*} f^{-1} \mathcal{F}=\mathcal{F}^{\oplus d} \rightarrow \mathcal{F}$. It follows that if $f$ has constant degree $d$, then the composition

$$
\mathcal{F} \xrightarrow{\text { res }} f_{*} f^{-1} \mathcal{F} \xrightarrow{\text { trace }} \mathcal{F}
$$

is multiplication by $d$. An example of the "méthode de la trace" is the following observation: if $\mathcal{F}$ is an abelian sheaf on $X_{\text {étale }}$ such that multiplication by $d$ is an isomorphism $\mathcal{F} \cong \mathcal{F}$, and if furthermore $H_{\text {etale }}^{q}\left(Y, f^{-1} \mathcal{F}\right)=0$ then $H_{\text {étale }}^{q}(X, \mathcal{F})=0$
as well. Indeed, multiplication by $d$ induces an isomorphism on $H_{\text {étale }}^{q}(X, \mathcal{F})$ which factors through $H_{\text {étale }}^{q}\left(Y, f^{-1} \mathcal{F}\right)=0$. This will be used in the proof of Lemma 49.74.11 below.

0A52 Situation 49.74.2. Here $k$ is an algebraically closed field, $X$ is a separated, finite type scheme of dimension $\leq 1$ over $k$, and $\mathcal{F}$ is a torsion abelian sheaf on $X_{\text {étale }}$.

In Situation 49.74 .2 we want to prove the following statements

0A53
0A54
0A55
0A56
0A57
0A58

0A59
0A5A
(1) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>2$,
(2) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>1$ if $X$ is affine,
(3) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>1$ if $p=\operatorname{char}(k)>0$ and $\mathcal{F}$ is $p$-power torsion,
(4) $H_{\text {etale }}^{q}(X, \mathcal{F})$ is finite if $\mathcal{F}$ is constructible and torsion prime to char $(k)$,
(5) $H_{\text {étale }}^{q}(X, \mathcal{F})$ is finite if $X$ is proper and $\mathcal{F}$ constructible,
(6) $H_{\text {étale }}^{q}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}},\left.\mathcal{F}\right|_{X_{k^{\prime}}}\right)$ is an isomorphism for any extension $k \subset k^{\prime}$ of algebraically closed fields if $\mathcal{F}$ is torsion prime to $\operatorname{char}(k)$,
(7) $H_{\text {étale }}^{q}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}},\left.\mathcal{F}\right|_{X_{k^{\prime}}}\right)$ is an isomorphism for any extension $k \subset k^{\prime}$ of algebraically closed fields if $X$ is proper,
(8) $H_{\text {étale }}^{2}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{2}(U, \mathcal{F})$ is surjective for all $U \subset X$ open.

Given any Situation 49.74.2 we will say that "statements (1) - 8) hold" if those statements that apply to the given situation are true. We start the proof with the following consequence of our computation of cohomology with constant coefficients.

0A5B Lemma 49.74.3. In Situation 49.74.2 assume $X$ is smooth and $\mathcal{F}=\underline{\mathbf{Z} / \ell \mathbf{Z}}$ for some prime number $\ell$. Then statements (1) - (8) hold for $\mathcal{F}$.

Proof. Since $X$ is smooth, we see that $X$ is a finite disjoint union of smooth curves. Hence we may assume $X$ is a smooth curve.

Case I: $\ell$ different from the characteristic of $k$. This case follows from Lemma49.65.1 (projective case) and Lemma 49.65 .3 (affine case). Statement (6) on cohomology and extension of algebraically closed ground field follows from the fact that the genus $g$ and the number of "punctures" $r$ do not change when passing from $k$ to $k^{\prime}$. Statement (8) follows as $H_{e \text { etale }}^{2}(U, \mathcal{F})$ is zero as soon as $U \neq X$, because then $U$ is affine (Varieties, Lemmas 32.32.2 and 32.32.5).
Case II: $\ell$ is equal to the characteristic of $k$. Vanishing by Lemma 49.64.4. Statements (5) and (7) follow from Lemma 49.64.5.

Remark 49.74.4 (Invariance under extension of algebraically closed ground field).
0 A 47 Let $k$ be an algebraically closed field of characteristic $p>0$. In Section 49.64 we have seen that there is an exact sequence

$$
k[x] \rightarrow k[x] \rightarrow H_{\text {étale }}^{1}\left(\mathbf{A}_{k}^{1}, \mathbf{Z} / p \mathbf{Z}\right) \rightarrow 0
$$

where the first arrow maps $f(x)$ to $f^{p}-f$. A set of representatives for the cokernel is formed by the polynomials

$$
\sum_{p \downarrow n} \lambda_{n} x^{n}
$$

with $\lambda_{n} \in k$. (If $k$ is not algebraically closed you have to add some constants to this as well.) In particular when $k^{\prime} \supset k$ is an algebraically closed overfield, then the map

$$
H_{\text {étale }}^{1}\left(\mathbf{A}_{k}^{1}, \mathbf{Z} / p \mathbf{Z}\right) \rightarrow H_{\text {étale }}^{1}\left(\mathbf{A}_{k^{\prime}}^{1}, \mathbf{Z} / p \mathbf{Z}\right)
$$

is not an isomorphism in general. In particular, the map $\pi_{1}\left(\mathbf{A}_{k^{\prime}}^{1}\right) \rightarrow \pi_{1}\left(\mathbf{A}_{k}^{1}\right)$ between étale fundamental groups (insert future reference here) is not an isomorphism either. Thus the étale homotopy type of the affine line depends on the algebraically closed ground field. From Lemma 49.74 .3 above we see that this is a phenomenon which only happens in characteristic $p$ with $p$-power torsion coefficients.

0A5C Lemma 49.74.5. Let $k$ be an algebraically closed field. Let $X$ be a separated finite type scheme over $k$ of dimension $\leq 1$. Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0$ be a short exact sequence of torsion abelian sheaves on $X$. If statements (1) - (8) hold for $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$, then they hold for $\mathcal{F}$.

Proof. This is mostly immediate from the definitions and the long exact sequence of cohomology. Also observe that $\mathcal{F}$ is constructible (resp. of torsion prime to the characteristic of $k$ ) if and only if both $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$ are constructible (resp. of torsion prime to the characteristic of $k$ ). See Proposition 49.71.1. Some details omitted.

0A5D Lemma 49.74.6. Let $k$ be an algebraically closed field. Let $f: X \rightarrow Y$ be a finite morphism of separated finite type schemes over $k$ of dimension $\leq 1$. Let $\mathcal{F}$ be a torsion abelian sheaf on $X$. If statements (1) - (8) hold for $\mathcal{F}$, then they hold for $f_{*} \mathcal{F}$.
Proof. Follows from the vanishing of the higher direct images $R^{q} f_{*}$ (Proposition 49.55 .2 , the Leray spectral sequence (Proposition 49.54.2), and the fact that formation of $f_{*}$ commutes with arbitrary base change (Lemma 49.55.3).

03SG Lemma 49.74.7. In Situation 49.74.2 assume $X$ is smooth. Let $j: U \rightarrow X$ an open immersion. Let $\ell$ be a prime number. Let $\mathcal{F}=j!\mathbf{Z} / \ell \mathbf{Z}$. Then statements (1) - (8) hold for $\mathcal{F}$.

Proof. Consider the short exact sequence

$$
0 \longrightarrow j!\underline{\mathbf{Z} / \ell \mathbf{Z}} \underset{U}{ } \longrightarrow \underline{\mathbf{Z} / \ell \mathbf{Z}} X \longrightarrow \bigoplus_{x \in X \backslash U} i_{x *}(\underline{\mathbf{Z} / \ell \mathbf{Z}}) \longrightarrow 0
$$

Statements $\sqrt{1}-(8)$ hold for $\mathbf{Z} / \ell \mathbf{Z}$ by Lemma 49.74 .3 . Since the inclusion morphisms $i_{x}: x \rightarrow X$ are finite and since $x$ is the spectrum of an irreducible curve, we see that $H_{\text {étale }}^{q}\left(X, i_{x *} \underline{\mathbf{Z} / \ell \mathbf{Z}}\right)$ is zero for $q>0$ and equal to $\mathbf{Z} / \ell \mathbf{Z}$ for $q=0$. Thus we get from the long exact cohomology sequence

$$
\begin{aligned}
0 \longrightarrow & H_{\text {étale }}^{0}(X, \mathcal{F}) \longrightarrow H^{0}\left(X, \underline{\mathbf{Z} / \ell \mathbf{Z}}{ }_{X}\right) \longrightarrow \bigoplus_{x \in X \backslash U} \mathbf{Z} / \ell \mathbf{Z} \\
& H_{\text {étale }}^{1}(X, \mathcal{F}) \longrightarrow H_{\text {étale }}^{1}\left(X, \underline{\mathbf{Z} / \ell \mathbf{Z}_{X}}\right) \longrightarrow 0
\end{aligned}
$$

and $H_{\text {étale }}^{q}(X, \mathcal{F})=H_{\text {étale }}^{q}\left(X, \underline{\mathbf{Z} / \ell \mathbf{Z}_{X}}\right)$ for $q \geq 2$. Each of the statements $\sqrt{1}-\sqrt{8}$ follows by inspection.
0A3Q Lemma 49.74.8. In Situation 49.74.2 assume $X$ reduced. Let $j: U \rightarrow X$ an open immersion. Let $\ell$ be a prime number and $\mathcal{F}=j!\mathbf{Z} / \ell \mathbf{Z}$. Then statements (1) - (8) hold for $\mathcal{F}$.

Proof. The difference with Lemma 49.74.7 is that here we do not assume $X$ is smooth. Let $\nu: X^{\prime} \rightarrow X$ be the normalization morphism which is finite as varieties are Nagata schemes. Let $j^{\prime}: U^{\prime} \rightarrow X^{\prime}$ be the inverse image of $U$. By Lemma 49.74.7
the result holds for $j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}}$. By Lemma 49.74 .6 the result holds for $\nu_{*} j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}}$. In general it won't be true that $\nu_{*} j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}}$ is equal to $j!\underline{\mathbf{Z} / \ell \mathbf{Z}}$, but there will be a canonical injective map

$$
j!\underline{\mathbf{Z}} / \ell \mathbf{Z} \longrightarrow \nu_{*} j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}}
$$

whose cokernel is of the form $\bigoplus_{x \in Z} i_{x *} M_{x}$ where $Z \subset X$ is a finite set of closed points and $M_{x}$ is a finite dimensional $\mathbf{F}_{\ell \text {-vector space for each } x \in Z \text {. We obtain a }}$ short exact sequence

$$
0 \rightarrow j!\underline{\mathbf{Z} / \ell \mathbf{Z}} \rightarrow \nu_{*} j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}} \rightarrow \bigoplus_{x \in Z} i_{x *} M_{x} \rightarrow 0
$$

and we can argue exactly as in the proof of Lemma 49.74.7 to finish the argument. Some details omitted.

03SF Exercise 49.74.9. Let $f: X \rightarrow Y$ be a finite étale morphism with $X$ and $Y$ irreducible. Then there exists a finite étale Galois morphism $X^{\prime} \rightarrow Y$ which dominates $X$ over $Y$. If you do not want to do the exercise yourself, then you can observe that this follows by combining Fundamental Groups, Lemmas 48.4 .5 and 48.3.8.

0A3R Lemma 49.74.10. Let $S$ be an irreducible scheme. Let $\ell$ be a prime number.
 finite étale morphism $f: T \rightarrow S$ of degree prime to $\ell$ such that $f^{-1} \mathcal{F}$ has a finite filtration whose successive quotients are $\underline{\mathbf{Z} / \ell \mathbf{Z}_{T}}$.
Proof. Since $\mathcal{F}$ is finite locally constant and $S$ irreducible, we see that $\mathcal{F}$ has constant rank $r$. Let $T \rightarrow S$ be a finite étale covering such that $f^{-1} \mathcal{F}$ is isomorphic to $\underline{\mathbf{Z} / \ell \mathbf{Z}^{\oplus r}}$. We may assume $T$ is irreducible and $T \rightarrow S$ is Galois with group $G$. This means simply that we have $G \subset \operatorname{Aut}(T / S)$ and that $G$ maps isomorphically to the Galois group of the field extension in the generic points. Observe that the action of $G$ on $T$ lifts to an action of $G$ on $f^{-1} \mathcal{F} \cong \mathbf{Z} / \ell \mathbf{Z}^{\oplus r}$. Looking at the stalk in the generic point we obtain a representation $\rho: \overline{G \rightarrow} \mathrm{GL}_{r}\left(\mathbf{F}_{\ell}\right)$. Let $H \subset G$ be an $\ell$-Sylow subgroup. We claim that $T / H \rightarrow S$ works. Namely, since $H$ is a finite $\ell$-group, the irreducible constituents of the representation $\left.\rho\right|_{H}$ are each trivial of rank 1. Moreover the degree of $T / H \rightarrow S$ is prime to $\ell$. Some details omitted.

03SD Lemma 49.74.11. In Situation 49.74.2 assume $X$ reduced. Let $j: U \rightarrow X$ an open immersion with $U$ irreducible. Let $\ell$ be a prime number. Let $\mathcal{G}$ a finite locally constant sheaf of $\mathbf{F}_{\ell}$-vector spaces on $U$. Let $\mathcal{F}=j!\mathcal{G}$. Then statements (1) - (8) hold for $\mathcal{F}$.

Proof. Let $f: V \rightarrow U$ be a finite étale morphism of degree prime to $\ell$ as in Lemma 49.74.10. The trace map gives maps

$$
\mathcal{G} \rightarrow f_{*} f^{-1} \mathcal{G} \rightarrow \mathcal{G}
$$

whose composition is an isomorphism. Hence it suffices to prove the lemma with $\mathcal{F}=j_{!} f_{*} f^{-1} \mathcal{G}$. By Zariski's Main theorem (More on Morphisms, Lemma 36.31.3) we can choose a diagram

with $\bar{f}: Y \rightarrow X$ finite and $j^{\prime}$ an open immersion with dense image. Since $f$ is finite this implies that $V=U \times_{X} Y$. Hence $j!f_{*} f^{-1} \mathcal{G}=\bar{f}_{*} j_{!}^{\prime} f^{-1} \mathcal{G}$ by Lemma 49.55.3. By Lemma 49.74 .6 it suffices to prove the lemma for $j_{!}^{\prime} f^{-1} \mathcal{G}$. The existence of the filtration given by Lemma 49.74.10, the fact that $j$ ! is exact, and Lemma 49.74.5 reduces us to the case $\mathcal{F}=j_{!}^{\prime} \underline{\mathbf{Z} / \ell \mathbf{Z}}$ which is Lemma 49.74 .8

03SC Theorem 49.74.12. If $k$ is an algebraically closed field, $X$ is a separated, finite type scheme of dimension $\leq 1$ over $k$, and $\mathcal{F}$ is a torsion abelian sheaf on $X_{\text {étale }}$, then
(1) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>2$,
(2) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>1$ if $X$ is affine,
(3) $H_{\text {étale }}^{q}(X, \mathcal{F})=0$ for $q>1$ if $p=\operatorname{char}(k)>0$ and $\mathcal{F}$ is $p$-power torsion,
(4) $H_{\text {étale }}^{q}(X, \mathcal{F})$ is finite if $\mathcal{F}$ is constructible and torsion prime to char $(k)$,
(5) $H_{\text {étale }}^{q}(X, \mathcal{F})$ is finite if $X$ is proper and $\mathcal{F}$ constructible,
(6) $H_{\text {étale }}^{q}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}},\left.\mathcal{F}\right|_{X_{k^{\prime}}}\right)$ is an isomorphism for any extension $k \subset k^{\prime}$ of algebraically closed fields if $\mathcal{F}$ is torsion prime to $\operatorname{char}(k)$,
(7) $H_{\text {étale }}^{q}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}},\left.\mathcal{F}\right|_{X_{k^{\prime}}}\right)$ is an isomorphism for any extension $k \subset k^{\prime}$ of algebraically closed fields if $X$ is proper,
(8) $H_{\text {étale }}^{2}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{2}(U, \mathcal{F})$ is surjective for all $U \subset X$ open.

Proof. The theorem says that in Situation 49.74 .2 statements (1) - 8) hold. Our first step is to replace $X$ by its reduction, which is permissible by Proposition 49.46.4. By Lemma 49.70.2 we can write $\mathcal{F}$ as a filtered colimit of constructible abelian sheaves. Taking cohomology commutes with colimits, see Lemma 49.52.2. Moreover, pullback via $X_{k^{\prime}} \rightarrow X$ commutes with colimits as a left adjoint. Thus it suffices to prove the statements for a constructible sheaf.

In this paragraph we use Lemma 49.74.5 without further mention. Writing $\mathcal{F}=$ $\mathcal{F}_{1} \oplus \ldots \oplus \mathcal{F}_{r}$ where $\mathcal{F}_{i}$ is $\ell_{i}$-primary for some prime $\ell_{i}$, we may assume that $\ell^{n}$ kills $\mathcal{F}$ for some prime $\ell$. Now consider the exact sequence

$$
0 \rightarrow \mathcal{F}[\ell] \rightarrow \mathcal{F} \rightarrow \mathcal{F} / \mathcal{F}[\ell] \rightarrow 0
$$

Thus we see that it suffices to assume that $\mathcal{F}$ is $\ell$-torsion. This means that $\mathcal{F}$ is a

By definition this means there is a dense open $U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is finite locally constant sheaf of $\mathbf{F}_{\ell}$-vector spaces. Since $\operatorname{dim}(X) \leq 1$ we may assume, after shrinking $U$, that $U=U_{1} \amalg \ldots \amalg U_{n}$ is a disjoint union of irreducible schemes (just remove the closed points which lie in the intersections of $\geq 2$ components of $U$ ). Consider the short exact sequence

$$
0 \rightarrow j!j^{-1} \mathcal{F} \rightarrow \mathcal{F} \rightarrow \bigoplus_{x \in Z} i_{x *} M_{x} \rightarrow 0
$$

where $Z=X \backslash U$ and $M_{x}$ is a finite dimensional $\mathbf{F}_{\ell}$ vector space, see Lemma 49.66.6. Since the étale cohomology of $i_{x *} M_{x}$ vanishes in degrees $\geq 1$ and is equal to $M_{x}$ in degree 0 it suffices to prove the theorem for $j!j^{-1} \mathcal{F}$ (argue exactly as in the proof of Lemma 49.74.7). Thus we reduce to the case $\mathcal{F}=j_{!} \mathcal{G}$ where $\mathcal{G}$ is a

Since we chose $U=U_{1} \amalg \ldots \amalg U_{n}$ with $U_{i}$ irreducible we have

$$
j_{!} \mathcal{G}=j_{1!}\left(\left.\mathcal{G}\right|_{U_{1}}\right) \oplus \ldots \oplus j_{n!}\left(\left.\mathcal{G}\right|_{U_{n}}\right)
$$

where $j_{i}: U_{i} \rightarrow X$ is the inclusion morphism. The case of $j_{i!}\left(\left.\mathcal{G}\right|_{U_{i}}\right)$ is handled in Lemma 49.74.11

03SH Remarks 49.74.13. The "trace method" is very general. For instance, it applies in Galois cohomology, and this is essentially how Proposition 49.62.1 is proved.

03RT Theorem 49.74.14. Let $X$ be a finite type, dimension 1 scheme over an algebraically closed field $k$. Let $\mathcal{F}$ be a torsion sheaf on $X_{\text {étale }}$. Then

$$
H_{\text {étale }}^{q}(X, \mathcal{F})=0, \quad \forall q \geq 3
$$

If $X$ affine then also $H_{\text {étale }}^{2}(X, \mathcal{F})=0$.
Proof. If $X$ is separated, this follows immediately from the more precise Theorem 49.74.12. If $X$ is nonseparated, choose an affine open covering $X=X_{1} \cup \ldots \cup X_{n}$. By induction on $n$ we may assume the vanishing holds over $U=X_{1} \cup \ldots \cup X_{n-1}$. Then Mayer-Vietoris (Lemma 49.51.1) gives

$$
H_{\text {étale }}^{2}(U, \mathcal{F}) \oplus H_{\text {étale }}^{2}\left(X_{n}, \mathcal{F}\right) \rightarrow H_{\text {étale }}^{2}\left(U \cap X_{n}, \mathcal{F}\right) \rightarrow H_{\text {étale }}^{3}(X, \mathcal{F}) \rightarrow 0
$$

However, since $U \cap X_{n}$ is an open of an affine scheme and hence affine by our dimension assumption, the group $H_{\text {étale }}^{2}\left(U \cap X_{n}, \mathcal{F}\right)$ vanishes by Theorem 49.74.12.

0A5E Lemma 49.74.15. Let $k \subset k^{\prime}$ be an extension of separably closed fields. Let $X$ be a proper scheme over $k$ of dimension $\leq 1$. Let $\mathcal{F}$ be a torsion abelian sheaf on $X$. Then the map $H_{\text {étale }}^{q}(X, \mathcal{F}) \rightarrow H_{\text {étale }}^{q}\left(X_{k^{\prime}},\left.\mathcal{F}\right|_{X_{k^{\prime}}}\right)$ is an isomorphism for $q \geq 0$.
Proof. We have seen this for algebraically closed fields in Theorem49.74.12 Given $k \subset k^{\prime}$ as in the statement of the lemma we can choose a diagram

where $k \subset \bar{k}$ and $k^{\prime} \subset \bar{k}^{\prime}$ are the algebraic closures. Since $k$ and $k^{\prime}$ are separably closed the field extensions $k \subset \bar{k}$ and $k^{\prime} \subset \bar{k}^{\prime}$ are algebraic and purely inseparable. In this case the morphisms $X_{\bar{k}} \rightarrow X$ and $X_{\bar{k}^{\prime}} \rightarrow X_{k^{\prime}}$ are universal homeomorphisms. Thus the cohomology of $\mathcal{F}$ may be computed on $X_{\bar{k}}$ and the cohomology of $\left.\mathcal{F}\right|_{X_{k^{\prime}}}$ may be computed on $X_{\bar{k}^{\prime}}$, see Proposition 49.46.4. Hence we deduce the general case from the case of algebraically closed fields.

### 49.75. First cohomology of proper schemes

0A5F In Fundamental Groups, Section 48.6 we have seen, in some sense, that taking $R^{1} f_{*} \underline{G}$ commutes with base change if $f: X \rightarrow Y$ is a proper morphism and $G$ is a finite group (not necessarily commutative). In this section we deduce a useful consequence of these results.

0A5G Lemma 49.75.1. Let $A$ be a henselian local ring. Let $X$ be a proper scheme over A with closed fibre $X_{0}$. Let $M$ be a finite abelian group. Then $H_{\text {étale }}^{1}(X, \underline{M})=$ $H_{\text {étale }}^{1}\left(X_{0}, \underline{M}\right)$.

Proof. By Cohomology on Sites, Lemma 21.5 .3 an element of $H_{\text {étale }}^{1}(X, \underline{M})$ corresponds to a $\underline{M}$-torsor $\mathcal{F}$ on $X_{\text {étale }}$. Such a torsor is clearly a finite locally constant sheaf. Hence $\mathcal{F}$ is representable by a scheme $V$ finite étale over $X$, Lemma 49.67.4. Conversely, a scheme $V$ finite étale over $X$ with an $M$-action which turns it into an $M$-torsor over $X$ gives rise to a cohomology class. The same translation between cohomology classes over $X_{0}$ and torsors finite étale over $X_{0}$ holds. Thus the lemma is a consequence of the equivalence of categories of Fundamental Groups, Lemma 48.6 .1 .

The following technical lemma is a key ingredient in the proof of the proper base change theorem. The argument works word for word for any proper scheme over $A$ whose special fibre has dimension $\leq 1$, but in fact the conclusion will be a consequence of the proper base change theorem and we only need this particular version in its proof.
0A5H Lemma 49.75.2. Let $A$ be a henselian local ring. Let $X=\mathbf{P}_{A}^{1}$. Let $X_{0} \subset X$ be the closed fibre. Let $\ell$ be a prime number. Let $\mathcal{I}$ be an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $X_{\text {étale }}$. Then $H_{\text {étale }}^{q}\left(X_{0},\left.\mathcal{I}\right|_{X_{0}}\right)=0$ for $q>0$.

Proof. Observe that $X$ is a separated scheme which can be covered by 2 affine opens. Hence for $q>1$ this follows from Gabber's affine variant of the proper base change theorem, see Lemma 49.73.11. Thus we may assume $q=1$. Let $\xi \in H_{\text {étale }}^{1}\left(X_{0},\left.\mathcal{I}\right|_{X_{0}}\right)$. Goal: show that $\xi$ is 0 . By Lemmas 49.70 .2 and 49.52 .2 we can find a map $\mathcal{F} \rightarrow \mathcal{I}$ with $\mathcal{F}$ a constructible sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules and $\xi$ coming from an element $\zeta$ of $H_{\text {étale }}^{1}\left(X_{0},\left.\mathcal{F}\right|_{X_{0}}\right)$. Suppose we have an injective map $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ of sheaves of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $X_{\text {étale }}$. Since $\mathcal{I}$ is injective we can extend the given $\operatorname{map} \mathcal{F} \rightarrow \mathcal{I}$ to a map $\mathcal{F}^{\prime} \rightarrow \mathcal{I}$. In this situation we may replace $\mathcal{F}$ by $\mathcal{F}^{\prime}$ and $\zeta$ by the image of $\zeta$ in $H_{\text {étale }}^{1}\left(X_{0},\left.\mathcal{F}^{\prime}\right|_{X_{0}}\right)$. Also, if $\mathcal{F}=\mathcal{F}_{1} \oplus \mathcal{F}_{2}$ is a direct sum, then we may replace $\mathcal{F}$ by $\mathcal{F}_{i}$ and $\zeta$ by the image of $\zeta$ in $H_{\text {étale }}^{1}\left(X_{0},\left.\mathcal{F}_{i}\right|_{X_{0}}\right)$.
By Lemma 49.71.4 and the remarks above we may assume $\mathcal{F}$ is of the form $f_{*} \underline{M}$ where $M$ is a finite $\mathbf{Z} / \ell \mathbf{Z}$-module and $f: Y \rightarrow X$ is a finite morphism of finite presentation (such sheaves are still constructible by Lemma 49.70 .9 but we won't need this). Since formation of $f_{*}$ commutes with any base change (Lemma 49.55.3) we see that the restriction of $f_{*} \underline{M}$ to $X_{0}$ is equal to the pushforward of $\underline{M}$ via the induced morphism $Y_{0} \rightarrow X_{0}$ of special fibres. By the Leray spectral sequence (Proposition 49.54.2) and vanishing of higher direct images (Proposition 49.55.2), we find

$$
H_{\text {étale }}^{1}\left(X_{0},\left.f_{*} \underline{M}\right|_{X_{0}}\right)=H_{\text {étale }}^{1}\left(Y_{0}, \underline{M}\right) .
$$

Since $Y \rightarrow \operatorname{Spec}(A)$ is proper we can use Lemma 49.75.1 to see that the $H_{\text {étale }}^{1}\left(Y_{0}, \underline{M}\right)$ is equal to $H_{e ́ t a l e}^{1}(Y, \underline{M})$. Thus we see that our cohomology class $\zeta$ lifts to a cohomology class

$$
\tilde{\zeta} \in H_{\text {étale }}^{1}(Y, \underline{M})=H_{\text {étale }}^{1}\left(X, f_{*} \underline{M}\right)
$$

However, $\tilde{\zeta}$ maps to zero in $H_{\text {étale }}^{1}(X, \mathcal{I})$ as $\mathcal{I}$ is injective and by commutativity of

we conclude that the image $\xi$ of $\zeta$ is zero as well.

### 49.76. The proper base change theorem

095 S The proper base change theorem is stated and proved in this section. Our approach follows roughly the proof in AGV71, XII, Theorem 5.1] using Gabber's ideas (from the affine case) to slightly simplify the arguments.

0A0B Lemma 49.76.1. Let $(A, I)$ be a henselian pair. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of schemes. Let $Z=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}(A / I)$. For any sheaf $\mathcal{F}$ on the topological space associated to $X$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(Z,\left.\mathcal{F}\right|_{Z}\right)$.

Proof. We will use Lemma 49.73 .8 to prove this. To do this let $Y \subset X$ be an irreducible closed subscheme. We have to show that $Y \cap Z=Y \times_{\operatorname{Spec}(A)} \operatorname{Spec}(A / I)$ is connected. Thus we may assume that $X$ is irreducible and we have to show that $Z$ is connected. Let $X \rightarrow \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ be the Stein factorization of $f$ (More on Morphisms, Theorem 36.38.4). Then $A \rightarrow B$ is integral and $(B, I B)$ is a henselian pair (More on Algebra, Lemma 15.8.9). Thus we may assume the fibres of $X \rightarrow \operatorname{Spec}(A)$ are geometrically connected. On the other hand, the image $T \subset \operatorname{Spec}(A)$ of $f$ is irreducible and closed as $X$ is proper over $A$. Hence $T \cap V(I)$ is connected by More on Algebra, Lemma 15.8.11. Now $Y \times_{\operatorname{Spec}(A)} \operatorname{Spec}(A / I) \rightarrow$ $T \cap V(I)$ is a surjective closed map with connected fibres. The result now follows from Topology, Lemma 5.6.4.

0A0C Lemma 49.76.2. Let $(A, I)$ be a henselian pair. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of schemes. Let $i: Z \rightarrow X$ be the closed immersion of $X \times_{\operatorname{Spec}(A)}$ $\operatorname{Spec}(A / I)$ into $X$. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(Z, i_{\text {small }}^{-1} \mathcal{F}\right)$.

Proof. This follows from Lemma 49.73.7 and 49.76.1 and the fact that any scheme finite over $X$ is proper over $\operatorname{Spec}(A)$.

0A3S Lemma 49.76.3. Let $A$ be a henselian local ring. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of schemes. Let $X_{0} \subset X$ be the fibre of $f$ over the closed point. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $\Gamma(X, \mathcal{F})=\Gamma\left(X_{0},\left.\mathcal{F}\right|_{X_{0}}\right)$.

Proof. This is a special case of Lemma 49.76.2.
Let $f: X \rightarrow S$ be a morphism of schemes. Let $\bar{s}: \operatorname{Spec}(k) \rightarrow S$ be a geometric point. The fibre of $f$ at $\bar{s}$ is the scheme $X_{\bar{s}}=\operatorname{Spec}(k) \times_{\bar{s}, S} X$ viewed as a scheme over $\operatorname{Spec}(k)$. If $\mathcal{F}$ is a sheaf on $X_{\text {étale }}$, then denote $\mathcal{F}_{\bar{s}}=p_{\text {small }}^{-1} \mathcal{F}$ the pullback of $\mathcal{F}$ to $\left(X_{\bar{s}}\right)_{\text {étale }}$. In the following we will consider the set

$$
\Gamma\left(X_{\bar{s}}, \mathcal{F}_{\bar{s}}\right)
$$

Let $s \in S$ be the image point of $\bar{s}$. Let $\kappa(s)^{\text {sep }}$ be the separable algebraic closure of $\kappa(s)$ in $k$ as in Definition 49.56.1. By Lemma 49.40.4 pullback defines a bijection

$$
\Gamma\left(X_{\kappa(s)^{s e p}}, p_{\text {sep }}^{-1} \mathcal{F}\right) \longrightarrow \Gamma\left(X_{\bar{s}}, \mathcal{F}_{\bar{s}}\right)
$$

where $p_{\text {sep }}: X_{\kappa(s)^{\text {sep }}}=\operatorname{Spec}\left(\kappa(s)^{\text {sep }}\right) \times_{S} X \rightarrow X$ is the projection.
0A3T Lemma 49.76.4. Let $f: X \rightarrow S$ be a proper morphism of schemes. Let $\bar{s} \rightarrow S$ be a geometric point. For any sheaf $\mathcal{F}$ on $X_{\text {étale }}$ the canonical map

$$
\left(f_{*} \mathcal{F}\right)_{\bar{s}} \longrightarrow \Gamma\left(X_{\bar{s}}, \mathcal{F}_{\bar{s}}\right)
$$

is bijective.

Proof. By Theorem 49.53.1 (for sheaves of sets) we have

$$
\left(f_{*} \mathcal{F}\right)_{\bar{s}}=\Gamma\left(X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right), p_{\text {small }}^{-1} \mathcal{F}\right)
$$

where $p: X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, \bar{s}}^{s h}\right) \rightarrow X$ is the projection. Since the residue field of the strictly henselian local ring $\mathcal{O}_{S, \bar{s}}^{s h}$ is $\kappa(s)^{\text {sep }}$ we conclude from the discussion above the lemma and Lemma 49.76.3

0A3U Lemma 49.76.5. Let $f: X \rightarrow Y$ be a proper morphism of schemes. Let $g: Y^{\prime} \subset Y$ be a morphism of schemes. Set $X^{\prime}=Y^{\prime} \times_{Y} X$ with projections $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ and $g^{\prime}: X^{\prime} \rightarrow X$. Let $\mathcal{F}$ be any sheaf on $X_{\text {étale }}$. Then $g^{-1} f_{*} \mathcal{F}=f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$.
Proof. There is a canonical map $g^{-1} f_{*} \mathcal{F} \rightarrow f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$. Namely, it is adjoint to the map

$$
f_{*} \mathcal{F} \longrightarrow g_{*} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}=f_{*} g_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

which is $f_{*}$ applied to the canonical map $\mathcal{F} \rightarrow g_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$. To check this map is an isomorphism we can compute what happens on stalks. Let $y^{\prime}: \operatorname{Spec}(k) \rightarrow Y^{\prime}$ be a geometric point with image $y$ in $Y$. By Lemma 49.76.4 the stalks are $\Gamma\left(X_{y^{\prime}}^{\prime}, \mathcal{F}_{y^{\prime}}\right)$ and $\Gamma\left(X_{y}, \mathcal{F}_{y}\right)$ respectively. Here the sheaves $\mathcal{F}_{y}$ and $\mathcal{F}_{y^{\prime}}$ are the pullbacks of $\mathcal{F}$ by the projections $X_{y} \rightarrow X$ and $X_{y^{\prime}}^{\prime} \rightarrow X$. Thus we see that the groups agree by Lemma 49.40.4. We omit the verification that this isomorphism is compatible with our map.

At this point we start discussing the proper base change theorem. To do so we introduce some notation. consider a commutative diagram

0A29

of morphisms of schemes. Then we obtain a commutative diagram of sites

For any object $E$ of $D\left(X_{\text {étale }}\right)$ we obtain a canonical base change map

$$
\begin{equation*}
g_{\text {small }}^{-1} R f_{\text {small }, *} E \longrightarrow R f_{\text {small }, *}^{\prime}\left(g_{\text {small }}^{\prime}\right)^{-1} E \tag{49.76.5.2}
\end{equation*}
$$

in $D\left(Y_{\text {étale }}^{\prime}\right)$. See Cohomology on Sites, Remark 21.19 .2 where we use the constant sheaf $\mathbf{Z}$ as our sheaf of rings. We will usually omit the subscripts small in this formula. For example, if $E=\mathcal{F}[0]$ where $\mathcal{F}$ is an abelian sheaf on $X_{\text {étale }}$, the base change map is a map
0A4A
(49.76.5.3)

$$
g^{-1} R f_{*} \mathcal{F} \longrightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

in $D\left(Y_{\text {étale }}^{\prime}\right)$.
The map 49.76.5.2 has no chance of being an isomorphism in the generality given above. The goal is to show it is an isomorphism if the diagram 49.76.5.1 is cartesian, $f: X \rightarrow Y$ proper, and the cohomology sheaves of $E$ are torsion. To study this question we introduce the following terminology. Let us say that cohomology
commutes with base change for $f: X \rightarrow Y$ if 49.76.5.3 is an isomorphism for every diagram 49.76.5.1 where $X^{\prime}=Y^{\prime} \times_{Y} X$ and every torsion abelian sheaf $\mathcal{F}$.
0A4B Lemma 49.76.6. Let $f: X \rightarrow Y$ be a proper morphism of schemes. The following are equivalent
(1) cohomology commutes with base change for $f$ (see above),
(2) for every prime number $\ell$ and every injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules $\mathcal{I}$ on $X_{\text {étale }}$ and every diagram 49.76.5.1) where $X^{\prime}=Y^{\prime} \times_{Y} X$ the sheaves $R^{q} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{I}$ are zero for $q>0$.

Proof. It is clear that (1) implies (2). Conversely, assume (2) and let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale. }}$. Let $Y^{\prime} \rightarrow Y$ be a morphism of schemes and let $X^{\prime}=$ $Y^{\prime} \times_{Y} X$ with projections $g^{\prime}: X^{\prime} \rightarrow X$ and $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ as in diagram 49.76.5.1). We want to show the maps of sheaves

$$
g^{-1} R^{q} f_{*} \mathcal{F} \longrightarrow R^{q} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

are isomorphisms for all $q \geq 0$.
For every $n \geq 1$, let $\mathcal{F}[n]$ be the subsheaf of sections of $\mathcal{F}$ annihilated by $n$. Then $\mathcal{F}=\operatorname{colim} \mathcal{F}[n]$. The functors $g^{-1}$ and $\left(g^{\prime}\right)^{-1}$ commute with arbitrary colimits (as left adjoints). Taking higher direct images along $f$ or $f^{\prime}$ commutes with filtered colimits by Lemma 49.52.5. Hence we see that

$$
g^{-1} R^{q} f_{*} \mathcal{F}=\operatorname{colim} g^{-1} R^{q} f_{*} \mathcal{F}[n] \quad \text { and } \quad R^{q} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}=\operatorname{colim} R^{q} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}[n]
$$

Thus it suffices to prove the result in case $\mathcal{F}$ is annihilated by a positive integer $n$.
If $n=\ell n^{\prime}$ for some prime number $\ell$, then we obtain a short exact sequence

$$
0 \rightarrow \mathcal{F}[\ell] \rightarrow \mathcal{F} \rightarrow \mathcal{F} / \mathcal{F}[\ell] \rightarrow 0
$$

Observe that $\mathcal{F} / \mathcal{F}[\ell]$ is annihilated by $n^{\prime}$. Moreover, if the result holds for both $\mathcal{F}[\ell]$ and $\mathcal{F} / \mathcal{F}[\ell]$, then the result holds by the long exact sequence of higher direct images (and the 5 lemma). In this way we reduce to the case that $\mathcal{F}$ is annihilated by a prime number $\ell$.

Assume $\mathcal{F}$ is annihilated by a prime number $\ell$. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$ in $D\left(X_{\text {étale }}, \mathbf{Z} / \ell \mathbf{Z}\right)$. Applying assumption (2) and Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) we see that

$$
f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{I}^{\bullet}
$$

computes $R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}$. We conclude by applying Lemma 49.76.5.
0A4C Lemma 49.76.7. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be proper morphisms of schemes. Assume
(1) cohomology commutes with base change for $f$,
(2) cohomology commutes with base change for $g \circ f$, and
(3) $f$ is surjective.

Then cohomology commutes with base change for $g$.
Proof. We will use the equivalence of Lemma 49.76 .6 without further mention. Let $\ell$ be a prime number. Let $\mathcal{I}$ be an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $Y_{\text {étale }}$. Choose an injective map of sheaves $f^{-1} \mathcal{I} \rightarrow \mathcal{J}$ where $\mathcal{J}$ is an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $Z_{\text {étale }}$. Since $f$ is surjective the $\operatorname{map} \mathcal{I} \rightarrow f_{*} \mathcal{J}$ is injective (look
at stalks in geometric points). Since $\mathcal{I}$ is injective we see that $\mathcal{I}$ is a direct summand of $f_{*} \mathcal{J}$. Thus it suffices to prove the desired vanishing for $f_{*} \mathcal{J}$.

Let $Z^{\prime} \rightarrow Z$ be a morphism of schemes and set $Y^{\prime}=Z^{\prime} \times_{Z} Y$ and $X^{\prime}=Z^{\prime} \times_{Z} X=$ $Y^{\prime} \times_{Y} X$. Denote $a: X^{\prime} \rightarrow X, b: Y^{\prime} \rightarrow Y$, and $c: Z^{\prime} \rightarrow Z$ the projections. Similarly for $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ and $g^{\prime}: Y^{\prime} \rightarrow Z^{\prime}$. By Lemma 49.76.5 we have $b^{-1} f_{*} \mathcal{J}=f_{*}^{\prime} a^{-1} \mathcal{J}$. On the other hand, we know that $R^{q} f_{*}^{\prime} a^{-1} \mathcal{J}$ and $R^{q}\left(g^{\prime} \circ f^{\prime}\right)_{*} a^{-1} \mathcal{J}$ are zero for $q>0$. Using the spectral sequence (Cohomology on Sites, Lemma 21.14.7)

$$
R^{p} g_{*}^{\prime} R^{q} f_{*}^{\prime} a^{-1} \mathcal{J} \Rightarrow R^{p+q}\left(g^{\prime} \circ f^{\prime}\right)_{*} a^{-1} \mathcal{J}
$$

we conclude that $R^{p} g_{*}^{\prime}\left(b^{-1} f_{*} \mathcal{J}\right)=R^{p} g_{*}^{\prime}\left(f_{*}^{\prime} a^{-1} \mathcal{J}\right)=0$ for $p>0$ as desired.
0A4D Lemma 49.76.8. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be proper morphisms of schemes. Assume
(1) cohomology commutes with base change for $f$, and
(2) cohomology commutes with base change for $g$.

Then cohomology commutes with base change for $f \circ g$.
Proof. We will use the equivalence of Lemma 49.76.6 without further mention. Let $\ell$ be a prime number. Let $\mathcal{I}$ be an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $X_{\text {étale }}$. Then $f_{*} \mathcal{I}$ is an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $Y_{\text {étale }}$ (Cohomology on Sites, Lemma 21.14.2. The result follows formally from this, but we will also spell it out.

Let $Z^{\prime} \rightarrow Z$ be a morphism of schemes and set $Y^{\prime}=Z^{\prime} \times_{Z} Y$ and $X^{\prime}=Z^{\prime} \times_{Z} X=$ $Y^{\prime} \times_{Y} X$. Denote $a: X^{\prime} \rightarrow X, b: Y^{\prime} \rightarrow Y$, and $c: Z^{\prime} \rightarrow Z$ the projections. Similarly for $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ and $g^{\prime}: Y^{\prime} \rightarrow Z^{\prime}$. By Lemma 49.76.5 we have $b^{-1} f_{*} \mathcal{I}=f_{*}^{\prime} a^{-1} \mathcal{I}$. On the other hand, we know that $R^{q} f_{*}^{\prime} a^{-1} \mathcal{I}$ and $R^{q}\left(g^{\prime}\right)_{*} b^{-1} f_{*} \mathcal{I}$ are zero for $q>0$. Using the spectral sequence (Cohomology on Sites, Lemma 21.14.7)

$$
R^{p} g_{*}^{\prime} R^{q} f_{*}^{\prime} a^{-1} \mathcal{I} \Rightarrow R^{p+q}\left(g^{\prime} \circ f^{\prime}\right)_{*} a^{-1} \mathcal{I}
$$

we conclude that $R^{p}\left(g^{\prime} \circ f^{\prime}\right)_{*} a^{-1} \mathcal{I}=0$ for $p>0$ as desired.
0A4E Lemma 49.76.9. Let $f: X \rightarrow Y$ be a finite morphism of schemes. Then cohomology commutes with base change for $f$.

Proof. Observe that a finite morphism is proper, see Morphisms, Lemma 28.43.10. Moreover, the base change of a finite morphism is finite, see Morphisms, Lemma 28.43 .6 . Thus the result follows from Lemma 49.76 .6 combined with Proposition 49.55 .2

0A4F Lemma 49.76.10. To prove that cohomology commutes with base change for every proper morphism of schemes it suffices to prove it holds for the morphism $\mathbf{P}_{S}^{1} \rightarrow S$ for every scheme $S$.

Proof. Let $f: X \rightarrow Y$ be a proper morphism of schemes. Let $Y=\bigcup Y_{i}$ be an affine open covering and set $X_{i}=f^{-1}\left(Y_{i}\right)$. If we can prove cohomology commutes with base change for $X_{i} \rightarrow Y_{i}$, then cohomology commutes with base change for $f$. Namely, the formation of the higher direct images commutes with Zariski (and even étale) localization on the base, see Lemma 49.52.4. Thus we may assume $Y$ is affine.

Let $Y$ be an affine scheme and let $X \rightarrow Y$ be a proper morphism. By Chow's lemma there exists a commutative diagram

where $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is an immersion, and $\pi: X^{\prime} \rightarrow X$ is proper and surjective, see Limits, Lemma 31.11.1. Since $X \rightarrow Y$ is proper, we find that $X^{\prime} \rightarrow Y$ is proper (Morphisms, Lemma 28.41.4). Hence $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion (Morphisms, Lemma 28.41.7). It follows that $X^{\prime} \rightarrow X \times_{Y} \mathbf{P}_{Y}^{n}=\mathbf{P}_{X}^{n}$ is a closed immersion (as an immersion with closed image).

By Lemma 49.76.7 it suffices to prove cohomology commutes with base change for $\pi$ and $X^{\prime} \rightarrow Y$. These morphisms both factor as a closed immersion followed by a projection $\mathbf{P}_{S}^{n} \rightarrow S$ (for some $S$ ). By Lemma 49.76 .9 the result holds for closed immersions (as closed immersions are finite). By Lemma 49.76.8 it suffices to prove the result for projections $\mathbf{P}_{S}^{n} \rightarrow S$.

For every $n \geq 1$ there is a finite surjective morphism

$$
\mathbf{P}_{S}^{1} \times_{S} \cdots{ }_{S} \times \mathbf{P}_{S}^{1} \longrightarrow \mathbf{P}_{S}^{n}
$$

given on coordinates by

$$
\left(\left(x_{1}: y_{1}\right),\left(x_{2}: y_{2}\right), \ldots,\left(x_{n}: y_{n}\right)\right) \longmapsto\left(F_{0}: \ldots: F_{n}\right)
$$

where $F_{0}, \ldots, F_{n}$ in $x_{1}, \ldots, y_{n}$ are the polynomials with integer coefficients such that

$$
\prod\left(x_{i} t+y_{i}\right)=F_{0} t^{n}+F_{1} t^{n-1}+\ldots+F_{n}
$$

Applying Lemmas 49.76.7, 49.76.9, and 49.76 .8 one more time we conclude that the lemma is true.

Theorem 49.76.11. Let $f: X \rightarrow Y$ be a proper morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of schemes. Set $X^{\prime}=Y^{\prime} \times_{Y} X$ and consider the cartesian diagram

Let $\mathcal{F}$ be an abelian torsion sheaf on $X_{\text {étale }}$. Then the base change map

$$
g^{-1} R f_{*} \mathcal{F} \longrightarrow R f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

is an isomorphism.
Proof. In the terminology introduced above, this means that cohomology commutes with base change for every proper morphism of schemes. By Lemma 49.76.10 it suffices to prove that cohomology commutes with base change for the morphism $\mathbf{P}_{S}^{1} \rightarrow S$ for every scheme $S$.

Let $S$ be the spectrum of a strictly henselian local ring with closed point $s$. Set $X=\mathbf{P}_{S}^{1}$ and $X_{0}=X_{s}=\mathbf{P}_{s}^{1}$. Let $\mathcal{F}$ be a sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $X_{\text {étale }}$. The key to our proof is that

$$
H_{\text {etale }}^{q}(X, \mathcal{F})=H_{\text {étale }}^{q}\left(X_{0},\left.\mathcal{F}\right|_{X_{0}}\right)
$$

Namely, choose a resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ by injective sheaves of $\mathbf{Z} / \ell \mathbf{Z}$-modules. Then $\left.\mathcal{I} \bullet\right|_{X_{0}}$ is a resolution of $\left.\mathcal{F}\right|_{X_{0}}$ by right $H_{\text {étale }}^{0}\left(X_{0},-\right)$-acyclic objects, see Lemma 49.75.2. Leray's acyclicity lemma tells us the right hand side is computed by the complex $H_{\text {étale }}^{0}\left(X_{0},\left.\mathcal{I} \bullet\right|_{X_{0}}\right)$ which is equal to $H_{\text {étale }}^{0}(X, \mathcal{I} \bullet)$ by Lemma 49.76.3. This complex computes the left hand side.

Assume $S$ is general and $\mathcal{F}$ is a sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules on $X_{\text {étale }}$. Let $\bar{s}: \operatorname{Spec}(k) \rightarrow$ $S$ be a geometric point of $S$ lying over $s \in S$. We have

$$
\left(R^{q} f_{*} \mathcal{F}\right)_{\bar{s}}=H_{\text {étale }}^{q}\left(\mathbf{P}_{\mathcal{O}_{s, \bar{s}}^{s h}}^{1},\left.\mathcal{F}\right|_{\left.\mathbf{P}_{\mathcal{O}_{S, \bar{s}}^{1}}^{1}\right)}\right)=H_{\text {étale }}^{q}\left(\mathbf{P}_{\kappa(s)^{\text {sep }}}^{1},\left.\mathcal{F}\right|_{\mathbf{P}_{\kappa(s)^{s e p}}^{1}}\right)
$$

where $\kappa(s)^{s e p}$ is the residue field of $\mathcal{O}_{S, \bar{s}}^{s h}$, i.e., the separable algebraic closure of $\kappa(s)$ in $k$. The first equality by Theorem 49.53 .1 and the second equality by the displayed formula in the previous paragraph.
Finally, consider any morphism of schemes $g: T \rightarrow S$ where $S$ and $\mathcal{F}$ are as above. Set $f^{\prime}: \mathbf{P}_{T}^{1} \rightarrow T$ the projection and let $g^{\prime}: \mathbf{P}_{T}^{1} \rightarrow \mathbf{P}_{T}^{1}$ the morphism induced by $g$. Consider the base change map

$$
g^{-1} R^{q} f_{*} \mathcal{F} \longrightarrow R^{q} f_{*}^{\prime}\left(g^{\prime}\right)^{-1} \mathcal{F}
$$

Let $\bar{t}$ be a geometric point of $T$ with image $\bar{s}=g(\bar{t})$. By our discussion above the map on stalks at $\bar{t}$ is the map

$$
H_{\text {étale }}^{q}\left(\mathbf{P}_{\kappa(s)^{\text {sep }}}^{1},\left.\mathcal{F}\right|_{\mathbf{P}_{\kappa(s)^{\text {sep }}}^{1}}\right) \longrightarrow H_{\text {étale }}^{q}\left(\mathbf{P}_{\kappa(t)^{\text {sep }}}^{1},\left.\mathcal{F}\right|_{\mathbf{P}_{\kappa(t) \text { sep }}^{1}}\right)
$$

Since $\kappa(s)^{\text {sep }} \subset \kappa(t)^{\text {sep }}$ this map is an isomorphism by Lemma 49.74.15.
This proves cohomology commutes with base change for $\mathbf{P}_{S}^{1} \rightarrow S$ and sheaves of $\mathbf{Z} / \ell \mathbf{Z}$-modules. In particular, for an injective sheaf of $\mathbf{Z} / \ell \mathbf{Z}$-modules the higher direct images of any base change are zero. In other words, condition (2) of Lemma 49.76 .6 holds and the proof is complete.

### 49.77. Applications of proper base change

$0 A 5 I$ As an application of the proper base change theorem we obtain the following.
095U Lemma 49.77.1. Let $f: X \rightarrow Y$ be a proper morphism of schemes all of whose fibres have dimension $\leq n$. Then for any abelian torsion sheaf $\mathcal{F}$ on $X_{\text {étale }}$ we have $R^{q} f_{*} \mathcal{F}=0$ for $q>2 n$.

Proof. Omitted. Hints: By the proper base change theorem it suffices to prove that for a proper scheme $X$ over an algebraically closed field, the étale cohomology of $\mathcal{F}$ vanishes above $2 \operatorname{dim} X$. By the proper base change theorem and dévissage (using Chow's lemma for example) one can reduce to the case where the dimension of $X$ is 1 . The case of curves is Theorem 49.74.14. See also Remarks 49.74.13,

0A3V Lemma 49.77.2. Let $f: X \rightarrow Y$ be a morphism of finite type with $Y$ quasicompact. Then the dimension of the fibres of $f$ is bounded.

Proof. By Morphisms, Lemma 28.28.4 the set $U_{n} \subset X$ of points where the dimension of the fibre is $\leq n$ is open. Since $f$ is of finite type, every point is contained in some $U_{n}$. Since $Y$ is quasi-compact and $f$ is of finite type, we see that $X$ is quasi-compact. Hence $X=U_{n}$ for some $n$.

### 49.78. The trace formula

03SJ A typical course in étale cohomology would normally state and prove the proper and smooth base change theorems, purity and Poincaré duality. All of these can be found in [Del77, Arcata]. Instead, we are going to study the trace formula for the frobenius, following the account of Deligne in Del77, Rapport]. We will only look at dimension 1, but using proper base change this is enough for the general case. Since all the cohomology groups considered will be étale, we drop the subscript étale. Let us now describe the formula we are after. Let $X$ be a finite type scheme of dimension 1 over a finite field $k, \ell$ a prime number and $\mathcal{F}$ a constructible, flat $\mathbf{Z} / \ell^{n} \mathbf{Z}$ sheaf. Then

03SK (49.78.0.1)

$$
\sum_{x \in X(k)} \operatorname{Tr}\left(\text { Frob } \mid \mathcal{F}_{\bar{x}}\right)=\sum_{i=0}^{2}(-1)^{i} \operatorname{Tr}\left(\pi_{X}^{*} \mid H_{c}^{i}\left(X \otimes_{k} \bar{k}, \mathcal{F}\right)\right)
$$

as elements of $\mathbf{Z} / \ell^{n} \mathbf{Z}$. As we will see, this formulation is slightly wrong as stated. Let us nevertheless describe the symbols that occur therein.

### 49.79. Frobenii

03SL In this section we will prove a "baffling" theorem. A topological analogue of the baffling theorem is the following.

03SO Exercise 49.79.1. Let $X$ be a topological space and $g: X \rightarrow X$ a continuous map such that $g^{-1}(U)=U$ for all opens $U$ of $X$. Then $g$ induces the identity on cohomology on $X$ (for any coefficients).

We now turn to the statement for the étale site.
03SP Lemma 49.79.2. Let $X$ be a scheme and $g: X \rightarrow X$ a morphism. Assume that for all $\varphi: U \rightarrow X$ étale, there is an isomorphism

functorial in $U$. Then $g$ induces the identity on cohomology (for any sheaf).
Proof. The proof is formal and without difficulty.
03SM Definition 49.79.3. Let $X$ be a scheme in characteristic $p$. The absolute frobenius of $X$ is the morphism $F_{X}: X \rightarrow X$ which is the identity on the induced topological space, and which takes a function to its $p$ th power. Thus $F_{X}^{\sharp}: \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}$ is given by $g \mapsto g^{p}$.

03SN Theorem 49.79.4 (The Baffling Theorem). Let $X$ be a scheme in characteristic $p>0$. Then the absolute frobenius induces (by pullback) the trivial map on cohomology, i.e., for all integers $j \geq 0$,

$$
F_{X}^{*}: H^{j}(X, \underline{\mathbf{Z} / n \mathbf{Z}}) \longrightarrow H^{j}(X, \underline{\mathbf{Z} / n \mathbf{Z}})
$$

is the identity.
This theorem is purely formal. It is a good idea, however, to review how to compute the pullback of a cohomology class. Let us simply say that in the case where cohomology agrees with Čech cohomology, it suffices to pull back (using the fiber products on a site) the Čech cocycles. The general case is quite technical, see Hypercoverings, Theorem 24.9.1. To prove the theorem, we merely verify that the assumption of Lemma 49.79 .2 holds for the frobenius.

Proof of Theorem 49.79.4, We need to verify the existence of a functorial isomorphism as above. For an étale morphism $\varphi: U \rightarrow S$, consider the diagram

The dotted arrow is an étale morphism which induces an isomorphism on the underlying topological spaces, so it is an isomorphism.

03SQ Definition 49.79.5. Let $k$ be a finite field with $q=p^{f}$ elements. Let $X$ be a scheme over $k$. The geometric frobenius of $X$ is the morphism $\pi_{X}: X \rightarrow X$ over $\operatorname{Spec}(k)$ which equals $F_{X}^{f}$.

Since $\pi_{X}$ is a morphism over $k$, we can base change it to any scheme over $k$. In particular we can base chage it to the algebraic closure $\bar{k}$ and get a morphism $\pi_{X}: X_{\bar{k}} \rightarrow X_{\bar{k}}$. Using $\pi_{X}$ also for this base change should not be confusing as $X_{\bar{k}}$ does not have a geometric frobenius of its own.

03SR Lemma 49.79.6. Let $\mathcal{F}$ be a sheaf on $X_{\text {étale }}$. Then there are canonical isomorphisms $\pi_{X}^{-1} \mathcal{F} \cong \mathcal{F}$ and $\mathcal{F} \cong \pi_{X *} \mathcal{F}$.

This is false for the fppf site.
Proof. Let $\varphi: U \rightarrow X$ be étale. Recall that $\pi_{X *} \mathcal{F}(U)=\mathcal{F}\left(U \times_{\varphi, X, \pi_{X}} X\right)$. Since $\pi_{X}=F_{X}^{f}$, it follows from the proof of Theorem 49.79.4 that there is a functorial isomorphism

where $\gamma_{U}=\left(\varphi, F_{U}^{f}\right)$. Now we define an isomorphism

$$
\mathcal{F}(U) \longrightarrow \pi_{X *} \mathcal{F}(U)=\mathcal{F}\left(U \times_{\varphi, X, \pi_{X}} X\right)
$$

by taking the restriction map of $\mathcal{F}$ along $\gamma_{U}^{-1}$. The other isomorphism is analogous.

03SS Remark 49.79.7. It may or may not be the case that $F_{U}^{f}$ equals $\pi_{U}$.

We continue discussion cohomology of sheaves on our scheme $X$ over the finite field $k$ with $q=p^{f}$ elements. Fix an algebraic clsoure $\bar{k}$ of $k$ and write $G_{k}=\operatorname{Gal}(\bar{k} / k)$ for the absolute Galois group of $k$. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale }}$. We will define a left $G_{k}$-module structure cohomology group $H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)$ as follows: if $\sigma \in G_{k}$, the diagram

commutes. Thus we can set, for $\xi \in H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)$

$$
\sigma \cdot \xi:=\left(\operatorname{Spec}(\sigma) \times \operatorname{id}_{X}\right)^{*} \xi \in H^{j}\left(X_{\bar{k}},\left(\operatorname{Spec}(\sigma) \times \operatorname{id}_{X}\right)^{-1} \mathcal{F} \mid X_{\bar{k}}\right)=H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)
$$

where the last equality follows from the commutativity of the previous diagram. This endows the latter group with the structure of a $G_{k}$-module.

03ST Lemma 49.79.8. In the situation above denote $\alpha: X \rightarrow \operatorname{Spec}(k)$ the structure morphism. Consider the stalk $\left(R^{j} \alpha_{*} \mathcal{F}\right)_{\operatorname{Spec}(\bar{k})}$ endowed with its natural Galois action as in Section 49.56. Then the identification

$$
\left(R^{j} \alpha_{*} \mathcal{F}\right)_{\operatorname{Spec}(\bar{k})} \cong H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)
$$

from Theorem 49.53.1 is an isomorphism of $G_{k}$-modules.
A similar result holds comparing $\left(R^{j} \alpha_{!} \mathcal{F}\right)_{\operatorname{Spec}(\bar{k})}$ with $H_{c}^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)$.
Proof. Omitted.
03SU Definition 49.79.9. The arithmetic frobenius is the map frob ${ }_{k}: \bar{k} \rightarrow \bar{k}, x \mapsto x^{q}$ of $G_{k}$.

03SV Theorem 49.79.10. Let $\mathcal{F}$ be an abelian sheaf on $X_{\text {étale. }}$. Then for all $j \geq 0$, frob $_{k}$ acts on the cohomology group $H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)$ as the inverse of the map $\pi_{X}^{*}$.

The map $\pi_{X}^{*}$ is defined by the composition

$$
H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right) \xrightarrow{\pi_{X} \frac{*}{k}} H^{j}\left(X_{\bar{k}},\left.\left(\pi_{X}^{-1} \mathcal{F}\right)\right|_{X_{\bar{k}}}\right) \cong H^{j}\left(X_{\bar{k}},\left.\mathcal{F}\right|_{X_{\bar{k}}}\right)
$$

where the last isomorphism comes from the canonical isomorphism $\pi_{X}^{-1} \mathcal{F} \cong \mathcal{F}$ of Lemma 49.79.6.

Proof. The composition $X_{\bar{k}} \xrightarrow{\operatorname{Spec}\left(\mathrm{frob}_{k}\right)} X_{\bar{k}} \xrightarrow{\pi_{X}} X_{\bar{k}}$ is equal to $F_{X_{\bar{k}}}^{f}$, hence the result follows from the baffling theorem suitably generalized to nontrivial coefficients. Note that the previous composition commutes in the sense that $F_{X_{\bar{k}}}^{f}=$ $\pi_{X} \circ \operatorname{Spec}\left(\right.$ frob $\left._{k}\right)=\operatorname{Spec}\left(\operatorname{frob}_{k}\right) \circ \pi_{X}$.

03SW Definition 49.79.11. If $x \in X(k)$ is a rational point and $\bar{x}: \operatorname{Spec}(\bar{k}) \rightarrow X$ the geometric point lying over $x$, we let $\pi_{x}: \mathcal{F}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ denote the action by frob ${ }_{k}^{-1}$ and call it the geometric frobeniu $\underbrace{6}$

[^133]We can now make a more precise statement (albeit a false one) of the trace formula 49.78.0.1. Let $X$ be a finite type scheme of dimension 1 over a finite field $k, \ell$ a prime number and $\mathcal{F}$ a constructible, flat $\mathbf{Z} / \ell^{n} \mathbf{Z}$ sheaf. Then

03SX

$$
\begin{equation*}
\sum_{x \in X(k)} \operatorname{Tr}\left(\pi_{X} \mid \mathcal{F}_{\bar{x}}\right)=\sum_{i=0}^{2}(-1)^{i} \operatorname{Tr}\left(\pi_{X}^{*} \mid H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)\right) \tag{49.79.11.1}
\end{equation*}
$$

as elements of $\mathbf{Z} / \ell^{n} \mathbf{Z}$. The reason this equation is wrong is that the trace in the right-hand side does not make sense for the kind of sheaves considered. Before addressing this issue, we try to motivate the appearance of the geometric frobenius (apart from the fact that it is a natural morphism!).
Let us consider the case where $X=\mathbf{P}_{k}^{1}$ and $\mathcal{F}=\mathbf{Z} / \ell \mathbf{Z}$. For any point, the Galois module $\mathcal{F}_{\bar{x}}$ is trivial, hence for any morphism $\varphi$ acting on $\mathcal{F}_{\bar{x}}$, the left-hand side is

$$
\sum_{x \in X(k)} \operatorname{Tr}\left(\varphi \mid \mathcal{F}_{\bar{x}}\right)=\# \mathbf{P}_{k}^{1}(k)=q+1
$$

Now $\mathbf{P}_{k}^{1}$ is proper, so compactly supported cohomology equals standard cohomology, and so for a morphism $\pi: \mathbf{P}_{k}^{1} \rightarrow \mathbf{P}_{k}^{1}$, the right-hand side equals

$$
\operatorname{Tr}\left(\pi^{*} \mid H^{0}\left(\mathbf{P}_{\bar{k}}^{1}, \underline{\mathbf{Z} / \ell \mathbf{Z}}\right)\right)+\operatorname{Tr}\left(\pi^{*} \mid H^{2}\left(\mathbf{P}_{\bar{k}}^{1}, \underline{\mathbf{Z} / \ell \mathbf{Z}}\right)\right)
$$

The Galois module $H^{0}\left(\mathbf{P}_{\bar{k}}^{1}, \mathbf{Z} / \ell \mathbf{Z}\right)=\mathbf{Z} / \ell \mathbf{Z}$ is trivial, since the pullback of the identity is the identity. Hence the first trace is 1 , regardless of $\pi$. For the second trace, we need to compute the pullback $\pi^{*}: H^{2}(\mathbf{P} \bar{k}, \underline{\mathbf{Z} / \ell \mathbf{Z})})$ for a map $\pi: \mathbf{P}_{\bar{k}}^{1} \rightarrow \mathbf{P}_{\bar{k}}^{1}$. This is a good exercise and the answer is multiplication by the degree of $\pi$ (for a proof see Lemma 49.65.2). In other words, this works as in the familiar situation of complex cohomology. In particular, if $\pi$ is the geometric frobenius we get

$$
\operatorname{Tr}\left(\pi_{X}^{*} \left\lvert\, H^{2}\left(\mathbf{P} \frac{1}{\bar{k}}, \underline{\mathbf{Z} / \ell \mathbf{Z}}\right)\right.\right)=q
$$

and if $\pi$ is the arithmetic frobenius then we get

$$
\operatorname{Tr}\left(\operatorname{frob}_{k}^{*} \mid H^{2}\left(\mathbf{P}_{\bar{k}}^{1}, \underline{\mathbf{Z} / \ell \mathbf{Z}}\right)\right)=q^{-1}
$$

The latter option is clearly wrong.
03SY Remark 49.79.12. The computation of the degrees can be done by lifting (in some obvious sense) to characteristic 0 and considering the situation with complex coefficients. This method almost never works, since lifting is in general impossible for schemes which are not projective space.

The question remains as to why we have to consider compactly supported cohomology. In fact, in view of Poincaré duality, it is not strictly necessary for smooth varieties, but it involves adding in certain powers of $q$. For example, let us consider the case where $X=\mathbf{A}_{k}^{1}$ and $\mathcal{F}=\underline{\mathbf{Z}} / \ell \mathbf{Z}$. The action on stalks is again trivial, so we only need look at the action on cohomology. But then $\pi_{X}^{*}$ acts as the identity on $H^{0}\left(\mathbf{A}_{\bar{k}}^{1}, \underline{\mathbf{Z}} / \ell \mathbf{Z}\right)$ and as multiplication by $q$ on $H_{c}^{2}\left(\mathbf{A}_{\bar{k}}^{1}, \underline{\mathbf{Z}} / \ell \mathbf{Z}\right)$.

### 49.80. Traces

03SZ We now explain how to take the trace of an endomorphism of a module over a noncommutative ring. Fix a finite ring $\Lambda$ with cardinality prime to $p$. Typically, $\Lambda$ is the group ring $\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)[G]$ for some finite group $G$. By convention, all the $\Lambda$-modules considered will be left $\Lambda$-modules.

We introduce the following notation: We set $\Lambda^{\natural}$ to be the quotient of $\Lambda$ by its additive subgroup generated by the commutators (i.e., the elements of the form $a b-b a, a, b \in \Lambda)$. Note that $\Lambda^{\natural}$ is not a ring.
For instance, the module $\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)[G]^{\natural}$ is the dual of the class functions, so

$$
\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)[G]^{\natural}=\bigoplus_{\text {conjugacy classes of } G} \mathbf{Z} / \ell^{n} \mathbf{Z}
$$

For a free $\Lambda$-module, we have $\operatorname{End}_{\Lambda}\left(\Lambda^{\oplus m}\right)=\operatorname{Mat}_{n}(\Lambda)$. Note that since the modules are left modules, representation of endomorphism by matrices is a right action: if $a \in \operatorname{End}\left(\Lambda^{\oplus m}\right)$ has matrix $A$ and $v \in \Lambda$, then $a(v)=v A$.
03 T 0 Definition 49.80.1. The trace of the endomorphism $a$ is the sum of the diagonal entries of a matrix representing it. This defines an additive map $\operatorname{Tr}: \operatorname{End}_{\Lambda}\left(\Lambda^{\oplus m}\right) \rightarrow$ $\Lambda^{\natural}$.

03 T 1 Exercise 49.80.2. Given maps

$$
\Lambda^{\oplus n} \xrightarrow{a} \Lambda^{\oplus n} \xrightarrow{b} \Lambda^{\oplus m}
$$

show that $\operatorname{Tr}(a b)=\operatorname{Tr}(b a)$.
We extend the definition of the trace to a finite projective $\Lambda$-module $P$ and an endomorphism $\varphi$ of $P$ as follows. Write $P$ as the summand of a free $\Lambda$-module, i.e., consider maps $P \xrightarrow{a} \Lambda^{\oplus n} \xrightarrow{b} P$ with
(1) $\Lambda^{\oplus n}=\operatorname{Im}(a) \oplus \operatorname{Ker}(b)$; and
(2) $b \circ a=\operatorname{id}_{P}$.

Then we set $\operatorname{Tr}(\varphi)=\operatorname{Tr}(a \varphi b)$. It is easy to check that this is well-defined, using the previous exercise.

### 49.81. Why derived categories?

03 T 2 With this definition of the trace, let us now discuss another issue with the formula as stated. Let $C$ be a smooth projective curve over $k$. Then there is a correspondence between finite locally constant sheaves $\mathcal{F}$ on $C_{\text {étale }}$ which stalks are isomorphic to $\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)^{\oplus m}$ on the one hand, and continuous representations $\rho: \pi_{1}(C, \bar{c}) \rightarrow$ $\mathrm{GL}_{m}\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$ ) (for some fixed choice of $\bar{c}$ ) on the other hand. We denote $\mathcal{F}_{\rho}$ the sheaf corresponding to $\rho$. Then $H^{2}\left(C_{\bar{k}}, \mathcal{F}_{\rho}\right)$ is the group of coinvariants for the action of $\rho\left(\pi_{1}(C, \bar{c})\right)$ on $\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)^{\oplus m}$, and there is a short exact sequence

$$
0 \longrightarrow \pi_{1}\left(C_{\bar{k}}, \bar{c}\right) \longrightarrow \pi_{1}(C, \bar{c}) \longrightarrow G_{k} \longrightarrow 0
$$

For instance, let $\mathbf{Z}=\mathbf{Z} \sigma$ act on $\mathbf{Z} / \ell^{2} \mathbf{Z}$ via $\sigma(x)=(1+\ell) x$. The coinvariants are $\left(\mathbf{Z} / \ell^{2} \mathbf{Z}\right)_{\sigma}=\mathbf{Z} / \ell \mathbf{Z}$, which is not a flat $\mathbf{Z} / \ell \mathbf{Z}$-module. Hence we cannot take the trace of some action on $H^{2}\left(C_{\bar{k}}, \mathcal{F}_{\rho}\right)$, at least not in the sense of the previous section.

In fact, our goal is to consider a trace formula for $\ell$-adic coefficients. But $\mathbf{Q}_{\ell}=$ $\mathbf{Z}_{\ell}[1 / \ell]$ and $\mathbf{Z}_{\ell}=\lim \mathbf{Z} / \ell^{n} \mathbf{Z}$, and even for a flat $\mathbf{Z} / \ell^{n} \mathbf{Z}$ sheaf, the individual cohomology groups may not be flat, so we cannot compute traces. One possible remedy is consider the total derived complex $R \Gamma\left(C_{\bar{k}}, \mathcal{F}_{\rho}\right)$ in the derived category $D\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$ and show that it is a perfect object, which means that it is quasi-isomorphic to a finite complex of finite free module. For such complexes, we can define the trace, but this will require an account of derived categories.

### 49.82. Derived categories

03 T 3 To set up notation, let $\mathcal{A}$ be an abelian category. Let $\operatorname{Comp}(\mathcal{A})$ be the abelian category of complexes in $\mathcal{A}$. Let $K(\mathcal{A})$ be the category of complexes up to homotopy, with objects equal to complexes in $\mathcal{A}$ and objects equal to homotopy classes of morphisms of complexes. This is not an abelian category. Loosely speaking, $D(A)$ is defined to be the category obtained by inverting all quasiisomorphisms in $\operatorname{Comp}(\mathcal{A})$ or, equivalently, in $K(\mathcal{A})$. Moreover, we can define $\operatorname{Comp}^{+}(\mathcal{A}), K^{+}(\mathcal{A}), D^{+}(\mathcal{A})$ analogously using only bounded below complexes. Similarly, we can define $\operatorname{Comp}^{-}(\mathcal{A}), K^{-}(\mathcal{A}), D^{-}(\mathcal{A})$ using bounded above complexes, and we can define $\operatorname{Comp}^{b}(\mathcal{A}), K^{b}(\mathcal{A}), D^{b}(\mathcal{A})$ using bounded complexes.

03 T 4 Remark 49.82.1. Notes on derived categories.
(1) There are some set-theoretical problems when $\mathcal{A}$ is somewhat arbitrary, which we will happily disregard.
(2) The categories $K(A)$ and $D(A)$ may be endowed with the structure of triangulated category, but we will not need these structures in the following discussion.
(3) The categories $\operatorname{Comp}(\mathcal{A})$ and $K(\mathcal{A})$ can also be defined when $\mathcal{A}$ is an additive category.

The homology functor $H^{i}: \operatorname{Comp}(\mathcal{A}) \rightarrow \mathcal{A}$ taking a complex $K^{\bullet} \mapsto H^{i}\left(K^{\bullet}\right)$ extends to functors $H^{i}: K(\mathcal{A}) \rightarrow \mathcal{A}$ and $H^{i}: D(\mathcal{A}) \rightarrow \mathcal{A}$.

03 T 5 Lemma 49.82.2. An object $E$ of $D(\mathcal{A})$ is contained in $D^{+}(\mathcal{A})$ if and only if $H^{\imath}(E)=0$ for all $i \ll 0$. Similar statements hold for $D^{-}$and $D^{+}$.

Proof. Hint: use truncation functors. See Derived Categories, Lemma 13.11.6.
03 T 6 Lemma 49.82.3. Morphisms between objects in the derived category.
(1) Let $I^{\bullet} \in \operatorname{Comp}^{+}(\mathcal{A})$ with $I^{n}$ injective for all $n \in \mathbf{Z}$. Then

$$
\operatorname{Hom}_{D(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)
$$

(2) Let $P^{\bullet} \in \operatorname{Comp}^{-}(\mathcal{A})$ with $P^{n}$ is projective for all $n \in \mathbf{Z}$. Then

$$
\operatorname{Hom}_{D(\mathcal{A})}\left(P^{\bullet}, K^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, K^{\bullet}\right)
$$

(3) If $\mathcal{A}$ has enough injectives and $\mathcal{I} \subset \mathcal{A}$ is the additive subcategory of injectives, then $D^{+}(\mathcal{A}) \cong K^{+}(\mathcal{I})$ (as triangulated categories).
(4) If $\mathcal{A}$ has enough projectives and $\mathcal{P} \subset \mathcal{A}$ is the additive subcategory of projectives, then $D^{-}(\mathcal{A}) \cong K^{-}(\mathcal{P})$.

Proof. Omitted.
03 T 7 Definition 49.82.4. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor and assume that $\mathcal{A}$ has enough injectives. We define the total right derived functor of $F$ as the functor $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ fitting into the diagram

This is possible since the left vertical arrow is invertible by the previous lemma. Similarly, let $G: \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor and assume that $\mathcal{A}$ has enough projectives. We define the total right derived functor of $G$ as the functor $L G$ : $D^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{B})$ fitting into the diagram

This is possible since the left vertical arrow is invertible by the previous lemma.
03 T 8 Remark 49.82.5. In these cases, it is true that $R^{i} F\left(K^{\bullet}\right)=H^{i}\left(R F\left(K^{\bullet}\right)\right)$, where the left hand side is defined to be $i$ th homology of the complex $F\left(K^{\bullet}\right)$.

### 49.83. Filtered derived category

03 T 9 It turns out we have to do it all again and build the filtered derived category also.
03TA Definition 49.83.1. Let $\mathcal{A}$ be an abelian category.
(1) Let $\operatorname{Fil}(\mathcal{A})$ be the category of filtered objects $(A, F)$ of $\mathcal{A}$, where $F$ is a filtration of the form

$$
A \supset \ldots \supset F^{n} A \supset F^{n+1} A \supset \ldots \supset 0
$$

This is an additive category.
(2) We denote $\operatorname{Fil}^{f}(\mathcal{A})$ the full subcategory of $\operatorname{Fil}(\mathcal{A})$ whose objects $(A, F)$ have finite filtration. This is also an additive category.
(3) An object $I \in \operatorname{Fil}^{f}(\mathcal{A})$ is called filtered injective (respectively projective) provided that $\operatorname{gr}^{p}(I)=\operatorname{gr}_{F}^{p}(I)=F^{p} I / F^{p+1} I$ is injective (resp. projective) in $\mathcal{A}$ for all $p$.
(4) The category of complexes $\operatorname{Comp}\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \supset \operatorname{Comp}^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$ and its homotopy category $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \supset K^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$ are defined as before.
(5) A morphism $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ of complexes in $\operatorname{Comp}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$ is called a filtered quasi-isomorphism provided that

$$
\operatorname{gr}^{p}(\alpha): \operatorname{gr}^{p}\left(K^{\bullet}\right) \rightarrow \operatorname{gr}^{p}\left(L^{\bullet}\right)
$$

is a quasi-isomorphism for all $p \in \mathbf{Z}$.
(6) We define $D F(\mathcal{A})$ (resp. $D F^{+}(\mathcal{A})$ ) by inverting the filtered quasi-isomorphisms in $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)\left(\operatorname{resp} . K^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)\right)$.

03TB Lemma 49.83.2. If $\mathcal{A}$ has enough injectives, then $D F^{+}(\mathcal{A}) \cong K^{+}(\mathcal{I})$, where $\mathcal{I}$ is the full additive subcategory of $F_{i l}{ }^{f}(\mathcal{A})$ consisting of filtered injective objects. Similarly, if $\mathcal{A}$ has enough projectives, then $D F^{-}(\mathcal{A}) \cong K^{+}(\mathcal{P})$, where $\mathcal{P}$ is the full additive subcategory of $\operatorname{Fil}^{f}(\mathcal{A})$ consisting of filtered projective objects.

Proof. Omitted.

### 49.84. Filtered derived functors

03 TC And then there are the filtered derived functors.

03TD Definition 49.84.1. Let $T: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor and assume that $\mathcal{A}$ has enough injectives. Define $R T: D F^{+}(\mathcal{A}) \rightarrow D F^{+}(\mathcal{B})$ to fit in the diagram

This is well-defined by the previous lemma. Let $G: \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor and assume that $\mathcal{A}$ has enough projectives. Define $L G: D F^{+}(\mathcal{A}) \rightarrow D F^{+}(\mathcal{B})$ to fit in the diagram

Again, this is well-defined by the previous lemma. The functors $R T$, resp. $L G$, are called the filtered derived functor of $T$, resp. $G$.

03TE Proposition 49.84.2. In the situation above, we have

$$
g r^{p} \circ R T=R T \circ g r^{p}
$$

where the $R T$ on the left is the filtered derived functor while the one on the right is the total derived functor. That is, there is a commuting diagram

Proof. Omitted.
Given $K^{\bullet} \in D F^{+}(\mathcal{B})$, we get a spectral sequence

$$
E_{1}^{p, q}=H^{p+q}\left(\operatorname{gr}^{p} K^{\bullet}\right) \Rightarrow H^{p+q}\left(\text { forget filt }\left(K^{\bullet}\right)\right) .
$$

### 49.85. Application of filtered complexes

03 TF Let $\mathcal{A}$ be an abelian category with enough injectives, and $0 \rightarrow L \rightarrow M \rightarrow N \rightarrow 0$ a short exact sequence in $\mathcal{A}$. Consider $\widetilde{M} \in \operatorname{Fil}^{f}(\mathcal{A})$ to be $M$ along with the filtration defined by

$$
F^{1} M=L, F^{n} M=M \text { for } n \leq 0, \text { and } F^{n} M=0 \text { for } n \geq 2
$$

By definition, we have

$$
\text { forget filt }(\widetilde{M})=M, \quad \operatorname{gr}^{0}(\widetilde{M})=N, \quad \operatorname{gr}^{1}(\widetilde{M})=L
$$

and $\operatorname{gr}^{n}(\widetilde{M})=0$ for all other $n \neq 0,1$. Let $T: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor. Assume that $\mathcal{A}$ has enough injectives. Then $R T(\widetilde{M}) \in D F^{+}(\mathcal{B})$ is a filtered complex with

$$
\operatorname{gr}^{p}(R T(\widetilde{M})) \stackrel{\text { qis }}{=}\left\{\begin{array}{ccc}
0 & \text { if } & p \neq 0,1 \\
R T(N) & \text { if } & p=0 \\
R T(L) & \text { if } & p=1
\end{array}\right.
$$

and forget $\operatorname{filt}(R T(\widetilde{M})) \stackrel{\text { qis }}{=} R T(M)$. The spectral sequence applied to $R T(\widetilde{M})$ gives

$$
E_{1}^{p, q}=R^{p+q} T\left(\operatorname{gr}^{p}(\widetilde{M})\right) \Rightarrow R^{p+q} T(\text { forget filt }(\widetilde{M}))
$$

Unwinding the spectral sequence gives us the long exact sequence

This will be used as follows. Let $X / k$ be a scheme of finite type. Let $\mathcal{F}$ be a flat constructible $\mathbf{Z} / \ell^{n} \mathbf{Z}$-module. Then we want to show that the trace

$$
\operatorname{Tr}\left(\pi_{X}^{*} \mid R \Gamma_{c}\left(X_{\bar{k}}, \mathcal{F}\right)\right) \in \mathbf{Z} / \ell^{n} \mathbf{Z}
$$

is additive on short exact sequences. To see this, it will not be enough to work with $R \Gamma_{c}\left(X_{\bar{k}},-\right) \in D^{+}\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$, but we will have to use the filtered derived category.

### 49.86. Perfectness

03 TG Let $\Lambda$ be a (possibly noncommutative) ring, $\operatorname{Mod}_{\Lambda}$ the category of left $\Lambda$-modules, $K(\Lambda)=K\left(\operatorname{Mod}_{\Lambda}\right)$ its homotopy category, and $D(\Lambda)=D\left(\operatorname{Mod}_{\Lambda}\right)$ the derived category.

03 TH Definition 49.86.1. We denote by $K_{\operatorname{perf}}(\Lambda)$ the category whose objects are bounded complexes of finite projective $\Lambda$-modules, and whose morphisms are morphisms of complexes up to homotopy. The functor $K_{\text {perf }}(\Lambda) \rightarrow D(\Lambda)$ is fully faithful (Derived Categories, Lemma 13.19.8). Denote $D_{\text {perf }}(\Lambda)$ its essential image. An object of $D(\Lambda)$ is called perfect if it is in $D_{\text {perf }}(\Lambda)$.

03 TI Proposition 49.86.2. Let $K \in D_{\text {perf }}(\Lambda)$ and $f \in \operatorname{End}_{D(\Lambda)}(K)$. Then the trace $\operatorname{Tr}(f) \in \Lambda^{\natural}$ is well defined.

Proof. We will use Derived Categories, Lemma 13.19 .8 without further mention in this proof. Let $P^{\bullet}$ be a bounded complex of finite projective $\Lambda$-modules and let $\alpha: P^{\bullet} \rightarrow K$ be an isomorphism in $D(\Lambda)$. Then $\alpha^{-1} \circ f \circ \alpha$ corresponds to a morphism of complexes $f^{\bullet}: P^{\bullet} \rightarrow P^{\bullet}$ well defined up to homotopy. Set

$$
\operatorname{Tr}(f)=\sum_{i}(-1)^{i} \operatorname{Tr}\left(f^{i}: P^{i} \rightarrow P^{i}\right) \in \Lambda^{\natural} .
$$

Given $P^{\bullet}$ and $\alpha$, this is independent of the choice of $f^{\bullet}$. Namely, any other choice is of the form $\tilde{f}^{\bullet}=f^{\bullet}+d h+h d$ for some $h^{i}: P^{i} \rightarrow P^{i-1}(i \in \mathbf{Z})$. But

$$
\begin{aligned}
\operatorname{Tr}(d h) & =\sum_{i}(-1)^{i} \operatorname{Tr}\left(P^{i} \xrightarrow{d h} P^{i}\right) \\
& =\sum_{i}(-1)^{i} \operatorname{Tr}\left(P^{i-1} \xrightarrow{h d} P^{i-1}\right) \\
& =-\sum_{i}(-1)^{i-1} \operatorname{Tr}\left(P^{i-1} \xrightarrow{h d} P^{i-1}\right) \\
& =-\operatorname{Tr}(h d)
\end{aligned}
$$

and so $\sum_{i}(-1)^{i} \operatorname{Tr}\left(\left.(d h+h d)\right|_{P^{i}}\right)=0$. Furthermore, this is independent of the choice of $\left(P^{\bullet}, \alpha\right)$ : suppose $\left(Q^{\bullet}, \beta\right)$ is another choice. The compositions

$$
Q^{\bullet} \xrightarrow{\beta} K \xrightarrow{\alpha^{-1}} P^{\bullet} \quad \text { and } \quad P^{\bullet} \xrightarrow{\alpha} K \xrightarrow{\beta^{-1}} Q^{\bullet}
$$

are representable by morphisms of complexes $\gamma_{1}^{\bullet}$ and $\gamma_{2}^{\bullet}$ respectively, such that $\gamma_{1}^{\bullet} \circ \gamma_{2}^{\bullet}$ is homotopic to the identity. Thus, the morphism of complexes $\gamma_{2}^{\bullet} \circ f^{\bullet} \circ \gamma_{1}^{\bullet}$ : $Q^{\bullet} \rightarrow Q^{\bullet}$ represents the morphism $\beta^{-1} \circ f \circ \beta$ in $D(\Lambda)$. Now

$$
\begin{aligned}
\operatorname{Tr}\left(\left.\gamma_{2}^{\bullet} \circ f^{\bullet} \circ \gamma_{1}^{\bullet}\right|_{Q} \bullet\right) & =\operatorname{Tr}\left(\left.\gamma_{1}^{\bullet} \circ \gamma_{2}^{\bullet} \circ f^{\bullet}\right|_{P} \bullet\right) \\
& =\operatorname{Tr}\left(\left.f^{\bullet}\right|_{P}\right)
\end{aligned}
$$

by the fact that $\gamma_{1}^{\bullet} \circ \gamma_{2}^{\bullet}$ is homotopic to the identity and the independence of the choice of $f^{\bullet}$ we saw above.

### 49.87. Filtrations and perfect complexes

03TJ We now present a filtered version of the category of perfect complexes. An object $(M, F)$ of $\operatorname{Fil}^{f}\left(\operatorname{Mod}_{\Lambda}\right)$ is called filtered finite projective if for all $p, \operatorname{gr}_{F}^{p}(M)$ is finite and projective. We then consider the homotopy category $K F_{\text {perf }}(\Lambda)$ of bounded complexes of filtered finite projective objects of $\mathrm{Fil}^{f}\left(\operatorname{Mod}_{\Lambda}\right)$. We have a diagram of categories

$$
\begin{array}{ccc}
K F(\Lambda) & \supset & K F_{\text {perf }}(\Lambda) \\
\downarrow & & \downarrow \\
D F(\Lambda) & \supset & D F_{\text {perf }}(\Lambda)
\end{array}
$$

where the vertical functor on the right is fully faithful and the category $D F_{\text {perf }}(\Lambda)$ is its essential image, as before.

03TK Lemma 49.87.1 (Additivity). Let $K \in D F_{p e r f}(\Lambda)$ and $f \in E n d_{D F}(K)$. Then

$$
\operatorname{Tr}\left(\left.f\right|_{K}\right)=\sum_{p \in \mathbf{Z}} \operatorname{Tr}\left(\left.f\right|_{g r^{p} K}\right)
$$

Proof. By Proposition 49.86.2, we may assume we have a bounded complex $P^{\bullet}$ of filtered finite projectives of $\mathrm{Fil}^{\boldsymbol{j}}\left(\operatorname{Mod}_{\Lambda}\right)$ and a map $f^{\bullet}: P^{\bullet} \rightarrow P^{\bullet}$ in $\operatorname{Comp}\left(\operatorname{Fil}^{f}\left(\operatorname{Mod}_{\Lambda}\right)\right)$. So the lemma follows from the following result, which proof is left to the reader.
03TL Lemma 49.87.2. Let $P \in$ Fil $^{f}\left(\right.$ Mod $\left._{\Lambda}\right)$ be filtered finite projective, and $f: P \rightarrow P$ an endomorphism in Filf $\left(\operatorname{Mod}_{\Lambda}\right)$. Then

$$
\operatorname{Tr}\left(\left.f\right|_{P}\right)=\sum_{p} \operatorname{Tr}\left(\left.f\right|_{g r^{p}(P)}\right)
$$

Proof. Omitted.

### 49.88. Characterizing perfect objects

$03 T M$ For the commutative case see More on Algebra, Sections 15.54, 15.55 , and 15.61 .
03TN Definition 49.88.1. Let $\Lambda$ be a (possibly noncommutative) ring. An object $K \in D(\Lambda)$ has finite Tor-dimension if there exist $a, b \in \mathbf{Z}$ such that for any right $\Lambda$-module $N$, we have $H^{i}\left(N \otimes_{\Lambda}^{\mathbf{L}} K\right)=0$ for all $i \notin[a, b]$.
This in particular means that $K \in D^{b}(\Lambda)$ as we see by taking $N=\Lambda$.
03 TO Lemma 49.88.2. Let $\Lambda$ be a left noetherian ring and $K \in D(\Lambda)$. Then $K$ is perfect if and only if the two following conditions hold:
(1) $K$ has finite Tor-dimension, and
(2) for all $i \in \mathbf{Z}, H^{i}(K)$ is a finite $\Lambda$-module.

Proof. See More on Algebra, Lemma 15.61 .2 for the proof in the commutative case.

The reader is strongly urged to try and prove this. The proof relies on the fact that a finite module on a finitely left-presented ring is flat if and only if it is projective.

03TP Remark 49.88.3. A variant of this lemma is to consider a Noetherian scheme $X$ and the category $D_{\text {perf }}\left(\mathcal{O}_{X}\right)$ of complexes which are locally quasi-isomorphic to a finite complex of finite locally free $\mathcal{O}_{X}$-modules. Objects $K$ of $D_{\text {perf }}\left(\mathcal{O}_{X}\right)$ can be characterized by having coherent cohomology sheaves and bounded tor dimension.

### 49.89. Complexes with constructible cohomology

095 V Let $\Lambda$ be a ring. Let $X$ a scheme. Let $K(X, \Lambda)$ the homotopy category of sheaves of $\Lambda$-modules on $X_{\text {étale }}$. Denote $D(X, \Lambda)$ the corresponding derived category. We denote by $D^{b}(X, \Lambda)$ (respectively $D^{+}, D^{-}$) the full subcategory of bounded (resp. above, below) complexes in $D(X, \Lambda)$.
095W Definition 49.89.1. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. We denote $D_{c}(X, \Lambda)$ the full subcategory of $D(X, \Lambda)$ of complexes whose cohomology sheaves are constructible sheaves of $\Lambda$-modules.

This definition makes sense by Lemma 49.68 .6 and Derived Categories, Section 13.13. Thus we see that $D_{c}(X, \Lambda)$ is a strictly full, saturated triangulated subcategory of $D_{c}(X, \Lambda)$.

095X Lemma 49.89.2. Let $\Lambda$ be a Noetherian ring. If $j: U \rightarrow X$ is an étale morphism of schemes, then
(1) $\left.K\right|_{U} \in D_{c}(U, \Lambda)$ if $K \in D_{c}(X, \Lambda)$, and
(2) $j_{!} M \in D_{c}(X, \Lambda)$ if $M \in D_{c}(U, \Lambda)$ and the morphism $j$ is quasi-compact and quasi-separated.
Proof. The first assertion is clear. The second follows from the fact that $j$ ! is exact and Lemma 49.70.1.

095Y Lemma 49.89.3. Let $\Lambda$ be a Noetherian ring. Let $f: X \rightarrow Y$ be a morphism of schemes. If $K \in D_{c}(Y, \Lambda)$ then $L f^{*} K \in D_{c}(X, \Lambda)$.
Proof. This follows as $f^{-1}=f^{*}$ is exact and Lemma 49.68.5
095Z Lemma 49.89.4. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\Lambda$ be a Noetherian ring. Let $K \in D(X, \Lambda)$ and $b \in \mathbf{Z}$ such that $H^{b}(K)$ is constructible. Then there exist a sheaf $\mathcal{F}$ which is a finite direct sum of $j_{U}!\underline{\Lambda}$ with $U \in \operatorname{Ob}\left(X_{\text {étale }}\right)$ affine and a map $\mathcal{F}[-b] \rightarrow K$ in $D(X, \Lambda)$ inducing a surjection $\mathcal{F} \rightarrow H^{b}(K)$.
Proof. Represent $K$ by a complex $\mathcal{K}^{\bullet}$ of sheaves of $\Lambda$-modules. Consider the surjection

$$
\operatorname{Ker}\left(\mathcal{K}^{b} \rightarrow \mathcal{K}^{b+1}\right) \longrightarrow H^{b}(K)
$$

By Modules on Sites, Lemma 18.29 .5 we may choose a surjection $\bigoplus_{i \in I} j_{U_{i}!} \underline{\Lambda} \rightarrow$ $\operatorname{Ker}\left(\mathcal{K}^{b} \rightarrow \mathcal{K}^{b+1}\right)$ with $U_{i}$ affine. For $I^{\prime} \subset I$ finite, denote $\mathcal{H}_{I^{\prime}} \subset H^{b}(K)$ the image of $\bigoplus_{i \in I^{\prime}} j_{U_{i}}!\underline{\Lambda}$. By Lemma 49.68 .9 we see that $\mathcal{H}_{I^{\prime}}=H^{b}(K)$ for some $I^{\prime} \subset I$ finite. The lemma follows taking $\overline{\mathcal{F}}=\bigoplus_{i \in I^{\prime}} j_{U_{i}}!\underline{\Lambda}$.

0960 Lemma 49.89.5. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\Lambda$ be a Noetherian ring. Let $K \in D^{-}(X, \Lambda)$. Then the following are equivalent
(1) $K$ is in $D_{c}(X, \Lambda)$,
(2) $K$ can be represented by a bounded above complex whose terms are finite direct sums of $j_{U}!\underline{\Lambda}$ with $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ affine,
(3) $K$ can be represented by a bounded above complex of flat constructible sheaves of $\Lambda$-modules.

Proof. It is clear that (2) implies (3) and that (3) implies (1). Assume $K$ is in $D_{c}^{-}(X, \Lambda)$. Say $H^{i}(K)=0$ for $i>b$. By induction on $a$ we will construct a complex $\mathcal{F}^{a} \rightarrow \ldots \rightarrow \mathcal{F}^{b}$ such that each $\mathcal{F}^{i}$ is a finite direct sum of of $j_{U}!\underline{\Lambda}$ with $U \in \mathrm{Ob}\left(X_{\text {étale }}\right)$ affine and a map $\mathcal{F}^{\bullet} \rightarrow K$ which induces an isomorphism $H^{i}\left(\mathcal{F}^{\bullet}\right) \rightarrow H^{i}(K)$ for $i>a$ and a surjection $H^{a}\left(\mathcal{F}^{\bullet}\right) \rightarrow H^{a}(K)$. For $a=b$ this can be done by Lemma 49.89.4. Given such a datum choose a distinguished triangle

$$
\mathcal{F}^{\bullet} \rightarrow K \rightarrow L \rightarrow \mathcal{F}^{\bullet}[1]
$$

Then we see that $H^{i}(L)=0$ for $i \geq a$. Choose $\mathcal{F}^{a-1}[-a+1] \rightarrow L$ as in Lemma 49.89.4. The composition $\mathcal{F}^{a-1}[-a+1] \rightarrow L \rightarrow \mathcal{F}^{\bullet}$ corresponds to a map $\mathcal{F}^{a-1} \rightarrow$ $\mathcal{F}^{a}$ such that the composition with $\mathcal{F}^{a} \rightarrow \mathcal{F}^{a+1}$ is zero. By TR4 we obtain a map

$$
\left(\mathcal{F}^{a-1} \rightarrow \ldots \rightarrow \mathcal{F}^{b}\right) \rightarrow K
$$

in $D(X, \Lambda)$. This finishes the induction step and the proof of the lemma.
0961 Lemma 49.89.6. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. Let $K, L \in$ $D_{c}^{-}(X, \Lambda)$. Then $K \otimes_{\Lambda}^{\mathbf{L}} L$ is in $D_{c}^{-}(X, \Lambda)$.

Proof. This follows from Lemmas 49.89.5 and 49.68.7
03TQ Definition 49.89.7. Let $X$ be a scheme. Let $\Lambda$ be a Noetherian ring. We denote $D_{c t f}(X, \Lambda)$ the full subcategory of $D_{c}(X, \Lambda)$ consisting of objects having locally finite tor dimension.

This is a strictly full, saturated triangulated subcategory of $D_{c}(X, \Lambda)$ and $D(X, \Lambda)$. By our conventions, see Cohomology on Sites, Definition 21.36.1, we see that

$$
D_{c t f}(X, \Lambda) \subset D^{b}(X, \Lambda)
$$

if $X$ is quasi-compact. A good way to think about objects of $D_{c t f}(X, \Lambda)$ is given in Lemma 49.89 .9

03TS Remark 49.89.8. The situation with objects of $D_{c t f}(X, \Lambda)$ is different from $D_{\text {perf }}\left(\mathcal{O}_{X}\right)$ in Remark 49.88.3. Namely, it can happen that a complex of $\mathcal{O}_{X^{-}}$ modules is locally quasi-isomorphic to a finite complex of finite locally free $\mathcal{O}_{X^{-}}$ modules, without being globally quasi-isomorphic to a bounded complex of locally free $\mathcal{O}_{X}$-modules. The following lemma shows this does not happen for $D_{c t f}$ on a Noetherian scheme.

03TT Lemma 49.89.9. Let $\Lambda$ be a Noetherian ring. Let $X$ be a quasi-compact and quasi-separated scheme. Let $K \in D(X, \Lambda)$. The following are equivalent
(1) $K \in D_{c t f}(X, \Lambda)$, and
(2) $K$ can be represented by a finite complex of constructible flat sheaves of $\Lambda$-modules.

In fact, if $K$ has tor amplitude in $[a, b]$ then we can represent $K$ by a complex $\mathcal{F}^{a} \rightarrow \ldots \rightarrow \mathcal{F}^{b}$ with $\mathcal{F}^{p}$ a constructible flat sheaf of $\Lambda$-modules.

Proof. It is clear that a finite complex of constructible flat sheaves of $\Lambda$-modules has finite tor dimension. It is also clear that it is an object of $D_{c}(X, \Lambda)$. Thus we see that (2) implies (1).
Assume (1). Choose $a, b \in \mathbf{Z}$ such that $H^{i}\left(K \otimes_{\Lambda}^{\mathbf{L}} \mathcal{G}\right)=0$ if $i \notin[a, b]$ for all sheaves of $\Lambda$-modules $\mathcal{G}$. We will prove the final assertion holds by induction on $b-a$. If $a=b$, then $K=H^{a}(K)[-a]$ is a flat constructible sheaf and the result holds. Next, assume $b>a$. Represent $K$ by a complex $\mathcal{K}^{\bullet}$ of sheaves of $\Lambda$-modules. Consider the surjection

$$
\operatorname{Ker}\left(\mathcal{K}^{b} \rightarrow \mathcal{K}^{b+1}\right) \longrightarrow H^{b}(K)
$$

By Lemma 49.70 .6 we can find finitely many affine schemes $U_{i}$ étale over $X$ and a surjection $\bigoplus j_{U_{i}!} \underline{\Lambda}_{U_{i}} \rightarrow H^{b}(K)$. After replacing $U_{i}$ by standard étale coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ we may assume this surjection lifts to a map $\mathcal{F}=\bigoplus j_{U_{i}!\underline{\Lambda}_{U_{i}}} \rightarrow$ $\operatorname{Ker}\left(\mathcal{K}^{b} \rightarrow \mathcal{K}^{b+1}\right)$. This map determines a distinguished triangle

$$
\mathcal{F}[-b] \rightarrow K \rightarrow L \rightarrow \mathcal{F}[-b+1]
$$

in $D(X, \Lambda)$. Since $D_{c t f}(X, \Lambda)$ is a triangulated subcategory we see that $L$ is in it too. In fact $L$ has tor amplitude in $[a, b-1]$ as $\mathcal{F}$ surjects onto $H^{b}(K)$ (details omitted). By induction hypothesis we can find a finite complex $\mathcal{F}^{a} \rightarrow \ldots \rightarrow \mathcal{F}^{b-1}$ of flat constructible sheaves of $\Lambda$-modules representing $L$. The map $L \rightarrow \mathcal{F}[-b+1]$ corresponds to a map $\mathcal{F}^{b} \rightarrow \mathcal{F}$ annihilating the image of $\mathcal{F}^{b-1} \rightarrow \mathcal{F}^{b}$. Then it follows from axiom TR3 that $K$ is represented by the complex

$$
\mathcal{F}^{a} \rightarrow \ldots \rightarrow \mathcal{F}^{b-1} \rightarrow \mathcal{F}^{b}
$$

which finishes the proof.
03TR Remark 49.89.10. Let $\Lambda$ be a Noetherian ring. Let $X$ be a scheme. For a bounded complex $K^{\bullet}$ of constructible flat $\Lambda$-modules on $X_{\text {étale }}$ each stalk $K_{\bar{x}}^{p}$ is a finite projective $\Lambda$-module. Hence the stalks of the complex are perfect complexes of $\Lambda$-modules.

03TU Remark 49.89.11. Lemma 49.89 .9 can be used to prove that if $f: X \rightarrow Y$ is a separated, finite type morphism of schemes and $Y$ is noetherian, then $R f_{!}$induces a functor $D_{c t f}(X, \Lambda) \rightarrow D_{c t f}(Y, \Lambda)$. We only need this fact in the case where $Y$ is the spectrum of a field and $X$ is a curve.

0962 Lemma 49.89.12. Let $\Lambda$ be a Noetherian ring. If $j: U \rightarrow X$ is an étale morphism of schemes, then
(1) $\left.K\right|_{U} \in D_{c t f}(U, \Lambda)$ if $K \in D_{c t f}(X, \Lambda)$, and
(2) $j_{!} M \in D_{c t f}(X, \Lambda)$ if $M \in D_{c t f}(U, \Lambda)$ and the morphism $j$ is quasi-compact and quasi-separated.

Proof. Perhaps the easiest way to prove this lemma is to reduce to the case where $X$ is affine and then apply Lemma 49.89 .9 to translate it into a statement about finite complexes of flat constructible sheaves of $\Lambda$-modules where the result follows from Lemma 49.70.1.

0963 Lemma 49.89.13. Let $\Lambda$ be a Noetherian ring. Let $f: X \rightarrow Y$ be a morphism of schemes. If $K \in D_{c t f}(Y, \Lambda)$ then $L f^{*} K \in D_{c t f}(X, \Lambda)$.

Proof. Apply Lemma 49.89 .9 to reduce this to a question about finite complexes of flat constructible sheaves of $\Lambda$-modules. Then the statement follows as $f^{-1}=f^{*}$ is exact and Lemma 49.68 .5

09BI Lemma 49.89.14. Let $X$ be a connected scheme. Let $\Lambda$ be a Noetherian ring. Let $K \in D_{c t f}(X, \Lambda)$ have locally constant cohomology sheaves. Then there exists a finite complex of finite projective $\Lambda$-modules $M^{\bullet}$ and an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\left.K\right|_{U_{i}} \cong M^{\bullet}\right|_{U_{i}}$ in $D\left(U_{i}, \Lambda\right)$.
Proof. Choose an étale covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.K\right|_{U_{i}}$ is constant, say $\left.K\right|_{U_{i}} \cong$
 Lemma 21.41.1. Observe that $U_{i} \times{ }_{X} U_{j}$ is empty if $M_{i}^{\bullet}$ is not isomorphic to $M_{j}^{\bullet}$ in $D(\Lambda)$. For each complex of $\Lambda$-modules $M^{\bullet}$ let $I_{M^{\bullet}}=\left\{i \in I \mid M_{i}^{\bullet} \cong M^{\bullet}\right.$ in $\left.D(\Lambda)\right\}$. As étale morphisms are open we see that $U_{M} \bullet=\bigcup_{i \in I_{M} \bullet} \operatorname{Im}\left(U_{i} \rightarrow X\right)$ is an open subset of $X$. Then $X=\coprod U_{M} \bullet$ is a disjoint open covering of $X$. As $X$ is connected only one $U_{M} \bullet$ is nonempty. As $K$ is in $D_{c t f}(X, \Lambda)$ we see that $M^{\bullet}$ is a perfect complex of $\Lambda$-modules, see More on Algebra, Lemma 15.61.2. Hence we may assume $M^{\bullet}$ is a finite complex of finite projective $\Lambda$-modules.

### 49.90. Cohomology of nice complexes

0964 The following is a special case of a more general result about compactly supported cohomology of objects of $D_{c t f}(X, \Lambda)$.
03TV Proposition 49.90.1. Let $X$ be a projective curve over a field $k, \Lambda$ a finite ring and $K \in D_{c t f}(X, \Lambda)$. Then $R \Gamma\left(X_{\bar{k}}, K\right) \in D_{\text {perf }}(\Lambda)$.
Sketch of proof. The first step is to show:
(1) The cohomology of $R \Gamma\left(X_{\bar{k}}, K\right)$ is bounded.

Consider the spectral sequence

$$
H^{i}\left(X_{\bar{k}}, \underline{H}^{j}(K)\right) \Rightarrow H^{i+j}\left(R \Gamma\left(X_{\bar{k}}, K\right)\right)
$$

Since $K$ is bounded and $\Lambda$ is finite, the sheaves $\underline{H}^{j}(K)$ are torsion. Moreover, $X_{\bar{k}}$ has finite cohomological dimension, so the left-hand side is nonzero for finitely many $i$ and $j$ only. Therefore, so is the right-hand side.
(2) The cohomology groups $H^{i+j}\left(R \Gamma\left(X_{\bar{k}}, K\right)\right)$ are finite.

Since the sheaves $\underline{H}^{j}(K)$ are constructible, the groups $H^{i}\left(X_{\bar{k}}, \underline{H}^{j}(K)\right)$ are finite (Section 49.74) so it follows by the spectral sequence again.
(3) $R \Gamma\left(X_{\bar{k}}, K\right)$ has finite Tor-dimension.

Let $N$ be a right $\Lambda$-module (in fact, since $\Lambda$ is finite, it suffices to assume that $N$ is finite). By the projection formula (change of module),

$$
N \otimes_{\Lambda}^{\mathbf{L}} R \Gamma\left(X_{\bar{k}}, K\right)=R \Gamma\left(X_{\bar{k}}, N \otimes_{\Lambda}^{\mathbf{L}} K\right)
$$

Therefore,

$$
H^{i}\left(N \otimes_{\Lambda}^{\mathbf{L}} R \Gamma\left(X_{\bar{k}}, K\right)\right)=H^{i}\left(R \Gamma\left(X_{\bar{k}}, N \otimes_{\Lambda}^{\mathbf{L}} K\right)\right)
$$

Now consider the spectral sequence

$$
H^{i}\left(X_{\bar{k}}, \underline{H}^{j}\left(N \otimes_{\Lambda}^{\mathbf{L}} K\right)\right) \Rightarrow H^{i+j}\left(R \Gamma\left(X_{\bar{k}}, N \otimes_{\Lambda}^{\mathbf{L}} K\right)\right)
$$

Since $K$ has finite Tor-dimension, $\underline{H}^{j}\left(N \otimes_{\Lambda}^{\mathbf{L}} K\right)$ vanishes universally for $j$ small enough, and the left-hand side vanishes whenever $i<0$. Therefore $R \Gamma\left(X_{\bar{k}}, K\right)$ has finite Tor-dimension, as claimed. So it is a perfect complex by Lemma 49.88.2.

### 49.91. Lefschetz numbers

03TW The fact that the total cohomology of a constructible complex of finite tor dimension is a perfect complex is the key technical reason why cohomology behaves well, and allows us to define rigorously the traces occurring in the trace formula.
03TX Definition 49.91.1. Let $\Lambda$ be a finite ring, $X$ a projective curve over a finite field $k$ and $K \in D_{c t f}(X, \Lambda)$ (for instance $K=\underline{\Lambda}$ ). There is a canonical map $c_{K}: \pi_{X}^{-1} K \rightarrow K$, and its base change $\left.c_{K}\right|_{X_{\bar{k}}}$ induces an action denoted $\pi_{X}^{*}$ on the perfect complex $R \Gamma\left(X_{\bar{k}},\left.K\right|_{X_{\bar{k}}}\right)$. The global Lefschetz number of $K$ is the trace $\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma\left(X_{\bar{k}}, K\right)}\right)$ of that action. It is an element of $\Lambda^{\natural}$.
03TY Definition 49.91.2. With $\Lambda, X, k, K$ as in Definition 49.91.1. Since $K \in D_{c t f}(X, \Lambda)$, for any geometric point $\bar{x}$ of $X$, the complex $K_{\bar{x}}$ is a perfect complex (in $D_{p e r f}(\Lambda)$ ). As we have seen in Section 49.79, the Frobenius $\pi_{X}$ acts on $K_{\bar{x}}$. The local Lefschetz number of $K$ is the sum

$$
\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{X}\right|_{K_{\bar{x}}}\right)
$$

which is again an element of $\Lambda^{\natural}$.
At last, we can formulate precisely the trace formula.
03TZ Theorem 49.91.3 (Lefschetz Trace Formula). Let $X$ be a projective curve over a finite field $k, \Lambda$ a finite ring and $K \in D_{c t f}(X, \Lambda)$. Then the global and local Lefschetz numbers of $K$ are equal, i.e.,

$$
\begin{equation*}
\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma\left(X_{\bar{k}}, K\right)}\right)=\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{X}\right|_{K_{\bar{x}}}\right) \tag{49.91.3.1}
\end{equation*}
$$

in $\Lambda^{\natural}$.
Proof. See discussion below.
We will use, rather than prove, the trace formula. Nevertheless, we will give quite a few details of the proof of the theorem as given in Del77 (some of the things that are not adequately explained are listed in Section 49.98).

We only stated the formula for curves, and in some weak sense it is a consequence of the following result.

03U1 Theorem 49.91.4 (Weil). Let $C$ be a nonsingular projective curve over an algebraically closed field $k$, and $\varphi: C \rightarrow C$ a $k$-endomorphism of $C$ distinct from the identity. Let $V(\varphi)=\Delta_{C} \cdot \Gamma_{\varphi}$, where $\Delta_{C}$ is the diagonal, $\Gamma_{\varphi}$ is the graph of $\varphi$, and the intersection number is taken on $C \times C$. Let $J=\underline{P_{i}}{ }_{C / k}^{0}$ be the jacobian of $C$ and denote $\varphi^{*}: J \rightarrow J$ the action induced by $\varphi$ by taking pullbacks. Then

$$
V(\varphi)=1-\operatorname{Tr}_{J}\left(\varphi^{*}\right)+\operatorname{deg} \varphi
$$

Proof. The number $V(\varphi)$ is the number of fixed points of $\varphi$, it is equal to

$$
V(\varphi)=\sum_{c \in|C|: \varphi(c)=c} m_{\operatorname{Fix}(\varphi)}(c)
$$

where $m_{\operatorname{Fix}(\varphi)}(c)$ is the multiplicity of $c$ as a fixed point of $\varphi$, namely the order or vanishing of the image of a local uniformizer under $\varphi-\mathrm{id}_{C}$. Proofs of this theorem can be found in Lan02 and Wei48.

03U2 Example 49.91.5. Let $C=E$ be an elliptic curve and $\varphi=[n]$ be multiplication by $n$. Then $\varphi^{*}=\varphi^{t}$ is multiplication by $n$ on the jacobian, so it has trace $2 n$ and degree $n^{2}$. On the other hand, the fixed points of $\varphi$ are the points $p \in E$ such that $n p=p$, which is the $(n-1)$-torsion, which has cardinality $(n-1)^{2}$. So the theorem reads

$$
(n-1)^{2}=1-2 n+n^{2}
$$

Jacobians. We now discuss without proofs the correspondence between a curve and its jacobian which is used in Weil's proof. Let $C$ be a nonsingular projective curve over an algebraically closed field $k$ and choose a base point $c_{0} \in C(k)$. Denote by $A^{1}(C \times C)$ (or $\operatorname{Pic}(C \times C)$, or $\left.\mathrm{CaCl}(C \times C)\right)$ the abelian group of codimension 1 divisors of $C \times C$. Then

$$
A^{1}(C \times C)=\operatorname{pr}_{1}^{*}\left(A^{1}(C)\right) \oplus \operatorname{pr}_{2}^{*}\left(A^{1}(C)\right) \oplus R
$$

where

$$
R=\left\{Z \in A^{1}(C \times C)|Z|_{C \times\left\{c_{0}\right\}} \sim_{\text {rat }} 0 \text { and }\left.Z\right|_{\left\{c_{0}\right\} \times C} \sim_{\text {rat }} 0\right\}
$$

In other words, $R$ is the subgroup of line bundles which pull back to the trivial one under either projection. Then there is a canonical isomorphism of abelian groups $R \cong \operatorname{End}(J)$ which maps a divisor $Z$ in $R$ to the endomorphism

$$
\begin{array}{ccc}
J & \rightarrow & J \\
{\left[\mathcal{O}_{C}(D)\right]} & \mapsto & \left(\left.\operatorname{pr}_{1}\right|_{Z}\right)_{*}\left(\left.\mathrm{pr}_{2}\right|_{Z}\right)^{*}(D)
\end{array}
$$

The aforementioned correspondence is the following. We denote by $\sigma$ the automorphism of $C \times C$ that switches the factors.

| $\operatorname{End}(J)$ | $R$ |
| :---: | :---: |
| composition of $\alpha, \beta$ | $\operatorname{pr}_{13 *}\left(\operatorname{pr}_{12}{ }^{*}(\alpha) \circ \operatorname{pr}_{23}{ }^{*}(\beta)\right)$ |
| $\operatorname{id}_{J}$ | $\Delta_{C}-\left\{c_{0}\right\} \times C-C \times\left\{c_{0}\right\}$ |
| $\varphi^{*}$ | $\Gamma_{\varphi}-C \times\left\{\varphi\left(c_{0}\right)\right\}-\sum_{\varphi(c)=c_{0}}\{c\} \times C$ |
| the trace form |  |
| $\alpha, \beta \mapsto \operatorname{Tr}(\alpha \beta)$ | $\alpha, \beta \mapsto-\int_{C \times C} \alpha . \sigma^{*} \beta$ |
| the Rosati involution | $\alpha \mapsto \sigma^{*} \alpha$ |
| $\alpha \mapsto \alpha^{\dagger}$ |  |$\quad$| Hodge index theorem on $C \times C$ |
| :---: |
| positivity of Rosati |
| $\operatorname{Tr}\left(\alpha \alpha^{\dagger}\right)>0$ |$\quad-\int_{C \times C} \alpha \sigma^{*} \alpha>0.0$.

In fact, in light of the Kunneth formula, the subgroup $R$ corresponds to the 1,1 hodge classes in $H^{1}(C) \otimes H^{1}(C)$.

Weil's proof. Using this correspondence, we can prove the trace formula. We have

$$
\begin{aligned}
V(\varphi) & =\int_{C \times C} \Gamma_{\varphi} \cdot \Delta \\
& =\int_{C \times C} \Gamma_{\varphi} \cdot\left(\Delta_{C}-\left\{c_{0}\right\} \times C-C \times\left\{c_{0}\right\}\right)+\int_{C \times C} \Gamma_{\varphi} \cdot\left(\left\{c_{0}\right\} \times C+C \times\left\{c_{0}\right\}\right)
\end{aligned}
$$

Now, on the one hand

$$
\int_{C \times C} \Gamma_{\varphi} \cdot\left(\left\{c_{0}\right\} \times C+C \times\left\{c_{0}\right\}\right)=1+\operatorname{deg} \varphi
$$

and on the other hand, since $R$ is the orthogonal of the ample divisor $\left\{c_{0}\right\} \times C+$ $C \times\left\{c_{0}\right\}$,

$$
\begin{aligned}
& \int_{C \times C} \Gamma_{\varphi} \cdot\left(\Delta_{C}-\left\{c_{0}\right\} \times C-C \times\left\{c_{0}\right\}\right) \\
= & \int_{C \times C}\left(\Gamma_{\varphi}-C \times\left\{\varphi\left(c_{0}\right)\right\}-\sum_{\varphi(c)=c_{0}}\{c\} \times C\right) \cdot\left(\Delta_{C}-\left\{c_{0}\right\} \times C-C \times\left\{c_{0}\right\}\right) \\
= & -\operatorname{Tr}_{J}\left(\varphi^{*} \circ \operatorname{id}_{J}\right) .
\end{aligned}
$$

Recapitulating, we have

$$
V(\varphi)=1-\operatorname{Tr}_{J}\left(\varphi^{*}\right)+\operatorname{deg} \varphi
$$

which is the trace formula.
03U3 Lemma 49.91.6. Consider the situation of Theorem 49.91 .4 and let $\ell$ be a prime number invertible in $k$. Then

$$
\sum_{i=0}^{2}(-1)^{i} \operatorname{Tr}\left(\left.\varphi^{*}\right|_{H^{i}\left(C, \underline{\mathbf{Z} / \ell^{n} \mathbf{Z}}\right)}\right)=V(\varphi) \bmod \ell^{n}
$$

Sketch of proof. Observe first that the assumption makes sense because $H^{i}\left(C, \underline{\mathbf{Z} / \ell^{n} \mathbf{Z}}\right)$ is a free $\mathbf{Z} / \ell^{n} \mathbf{Z}$-module for all $i$. The trace of $\varphi^{*}$ on the 0 th degree cohomology is 1. The choice of a primitive $\ell^{n}$ th root of unity in $k$ gives an isomorphism

$$
H^{i}\left(C, \underline{\mathbf{Z} / \ell^{n} \mathbf{Z}}\right) \cong H^{i}\left(C, \mu_{\ell^{n}}\right)
$$

compatibly with the action of the geometric Frobenius. On the other hand, $H^{1}\left(C, \mu_{\ell^{n}}\right)=$ $J\left[\ell^{n}\right]$. Therefore,

$$
\begin{aligned}
\left.\operatorname{Tr}\left(\left.\varphi^{*}\right|_{H^{1}\left(C, \underline{\mathbf{Z} / \ell^{n} \mathbf{Z}}\right)}\right)\right) & =\operatorname{Tr}_{J}\left(\varphi^{*}\right) \bmod \ell^{n} \\
& =\operatorname{Tr}_{\mathbf{Z} / \ell^{n} \mathbf{Z}}\left(\varphi^{*}: J\left[\ell^{n}\right] \rightarrow J\left[\ell^{n}\right]\right) .
\end{aligned}
$$

Moreover, $H^{2}\left(C, \mu_{\ell^{n}}\right)=\operatorname{Pic}(C) / \ell^{n} \operatorname{Pic}(C) \cong \mathbf{Z} / \ell^{n} \mathbf{Z}$ where $\varphi^{*}$ is multiplication by $\operatorname{deg} \varphi$. Hence

$$
\operatorname{Tr}\left(\left.\varphi^{*}\right|_{H^{2}\left(C, \underline{\left.\mathbf{Z} / \ell^{n} \mathbf{Z}\right)}\right.}\right)=\operatorname{deg} \varphi
$$

Thus we have

$$
\sum_{i=0}^{2}(-1)^{i} \operatorname{Tr}\left(\left.\varphi^{*}\right|_{H^{i}\left(C, \underline{\mathbf{Z} / \ell^{n} \mathbf{Z}}\right)}\right)=1-\operatorname{Tr}_{J}\left(\varphi^{*}\right)+\operatorname{deg} \varphi \bmod \ell^{n}
$$

and the corollary follows from Theorem 49.91.4.

An alternative way to prove this corollary is to show that

$$
X \mapsto H^{*}\left(X, \mathbf{Q}_{\ell}\right)=\mathbf{Q}_{\ell} \otimes \lim _{n} H^{*}\left(X, \mathbf{Z} / \ell^{n} \mathbf{Z}\right)
$$

defines a Weil cohomology theory on smooth projective varieties over $k$. Then the trace formula

$$
V(\varphi)=\sum_{i=0}^{2}(-1)^{i} \operatorname{Tr}\left(\left.\varphi^{*}\right|_{H^{i}\left(C, \mathbf{Q}_{\ell}\right)}\right)
$$

is a formal consequence of the axioms (it's an exercise in linear algebra, the proof is the same as in the topological case).

### 49.92. Preliminaries and sorites

03U4 Notation: We fix the notation for this section. We denote by $A$ a commutative ring, $\Lambda$ a (possibly noncommutative) ring with a ring map $A \rightarrow \Lambda$ which image lies in the center of $\Lambda$. We let $G$ be a finite group, $\Gamma$ a monoid extension of $G$ by $\mathbf{N}$, meaning that there is an exact sequence

$$
1 \rightarrow G \rightarrow \tilde{\Gamma} \rightarrow \mathbf{Z} \rightarrow 1
$$

and $\Gamma$ consists of those elements of $\tilde{\Gamma}$ which image is nonnegative. Finally, we let $P$ be an $A[\Gamma]$-module which is finite and projective as an $A[G]$-module, and $M$ a $\Lambda[\Gamma]$-module which is finite and projective as a $\Lambda$-module.
Our goal is to compute the trace of $1 \in \mathbf{N}$ acting over $\Lambda$ on the coinvariants of $G$ on $P \otimes_{A} M$, that is, the number

$$
\operatorname{Tr}_{\Lambda}\left(1 ;\left(P \otimes_{A} M\right)_{G}\right) \in \Lambda^{\natural} .
$$

The element $1 \in \mathbf{N}$ will correspond to the Frobenius.
03U5 Lemma 49.92.1. Let $e \in G$ denote the neutral element. The map

$$
\begin{array}{ccc}
\Lambda[G] & \longrightarrow \Lambda^{\natural} \\
\sum \lambda_{g} \cdot g & \longmapsto & \lambda_{e}
\end{array}
$$

factors through $\Lambda[G]^{\natural}$. We denote $\varepsilon: \Lambda[G]^{\natural} \rightarrow \Lambda^{\natural}$ the induced map.
Proof. We have to show the map annihilates commutators. One has

$$
\left(\sum \lambda_{g} g\right)\left(\sum \mu_{g} g\right)-\left(\sum \mu_{g} g\right)\left(\sum \lambda_{g} g\right)=\sum_{g}\left(\sum_{g_{1} g_{2}=g} \lambda_{g_{1}} \mu_{g_{2}}-\mu_{g_{1}} \lambda_{g_{2}}\right) g
$$

The coefficient of $e$ is

$$
\sum_{g}\left(\lambda_{g} \mu_{g^{-1}}-\mu_{g} \lambda_{g^{-1}}\right)=\sum_{g}\left(\lambda_{g} \mu_{g^{-1}}-\mu_{g^{-1}} \lambda_{g}\right)
$$

which is a sum of commutators, hence it it zero in $\Lambda^{\natural}$.
03U6 Definition 49.92.2. Let $f: P \rightarrow P$ be an endomorphism of a finite projective $\Lambda[G]$-module $P$. We define

$$
\operatorname{Tr}_{\Lambda}^{G}(f ; P):=\varepsilon\left(\operatorname{Tr}_{\Lambda[G]}(f ; P)\right)
$$

to be the $G$-trace of $f$ on $P$.
03U7 Lemma 49.92.3. Let $f: P \rightarrow P$ be an endomorphism of the finite projective $\Lambda[G]$-module $P$. Then

$$
\operatorname{Tr}_{\Lambda}(f ; P)=\# G \cdot \operatorname{Tr}_{\Lambda}^{G}(f ; P)
$$

Proof. By additivity, reduce to the case $P=\Lambda[G]$. In that case, $f$ is given by right multiplication by some element $\sum \lambda_{g} \cdot g$ of $\Lambda[G]$. In the basis $(g)_{g \in G}$, the matrix of $f$ has coefficient $\lambda_{g_{2}^{-1} g_{1}}$ in the $\left(g_{1}, g_{2}\right)$ position. In particular, all diagonal coefficients are $\lambda_{e}$, and there are $\# G$ such coefficients.

03U8 Lemma 49.92.4. The map $A \rightarrow \Lambda$ defines an $A$-module structure on $\Lambda^{\natural}$.
Proof. This is clear.
03U9 Lemma 49.92.5. Let $P$ be a finite projective $A[G]$-module and $M$ a $\Lambda[G]$-module, finite projective as a $\Lambda$-module. Then $P \otimes_{A} M$ is a finite projective $\Lambda[G]$-module, for the structure induced by the diagonal action of $G$.

Note that $P \otimes_{A} M$ is naturally a $\Lambda$-module since $M$ is. Explicitly, together with the diagonal action this reads

$$
\left(\sum \lambda_{g} g\right)(p \otimes m)=\sum g p \otimes \lambda_{g} g m
$$

Proof. For any $\Lambda[G]$-module $N$ one has

$$
\operatorname{Hom}_{\Lambda[G]}\left(P \otimes_{A} M, N\right)=\operatorname{Hom}_{A[G]}\left(P, \operatorname{Hom}_{\Lambda}(M, N)\right)
$$

where the $G$-action on $\operatorname{Hom}_{\Lambda}(M, N)$ is given by $(g \cdot \varphi)(m)=g \varphi\left(g^{-1} m\right)$. Now it suffices to observe that the right-hand side is a composition of exact functors, because of the projectivity of $P$ and $M$.
03UA Lemma 49.92.6. With assumptions as in Lemma 49.92.5. let $u \in \operatorname{End}_{A[G]}(P)$ and $v \in \operatorname{End}_{\Lambda[G]}(M)$. Then

$$
\operatorname{Tr}_{\Lambda}^{G}\left(u \otimes v ; P \otimes_{A} M\right)=\operatorname{Tr}_{A}^{G}(u ; P) \cdot \operatorname{Tr}_{\Lambda}(v ; M)
$$

Sketch of proof. Reduce to the case $P=A[G]$. In that case, $u$ is right multiplication by some element $a=\sum a_{g} g$ of $A[G]$, which we write $u=R_{a}$. There is an isomorphism of $\Lambda[G]$-modules

$$
\begin{aligned}
\varphi: \quad A[G] \otimes_{A} M & \cong\left(A[G] \otimes_{A} M\right)^{\prime} \\
g \otimes m & \longmapsto
\end{aligned}
$$

where $\left(A[G] \otimes_{A} M\right)^{\prime}$ has the module structure given by the left $G$-action, together with the $\Lambda$-linearity on $M$. This transport of structure changes $u \otimes v$ into $\sum_{g} a_{g} R_{g} \otimes$ $g^{-1} v$. In other words,

$$
\varphi \circ(u \otimes v) \circ \varphi^{-1}=\sum_{g} a_{g} R_{g} \otimes g^{-1} v
$$

Working out explicitly both sides of the equation, we have to show

$$
\operatorname{Tr}_{\Lambda}^{G}\left(\sum_{g} a_{g} R_{g} \otimes g^{-1} v\right)=a_{e} \cdot \operatorname{Tr}_{\Lambda}(v ; M)
$$

This is done by showing that

$$
\operatorname{Tr}_{\Lambda}^{G}\left(a_{g} R_{g} \otimes g^{-1} v\right)=\left\{\begin{array}{cc}
0 & \text { if } g \neq e \\
a_{e} \operatorname{Tr}_{\Lambda}(v ; M) & \text { if } g=e
\end{array}\right.
$$

by reducing to $M=\Lambda$.
Notation: Consider the monoid extension $1 \rightarrow G \rightarrow \Gamma \rightarrow \mathbf{N} \rightarrow 1$ and let $\gamma \in \Gamma$. Then we write $Z_{\gamma}=\{g \in G \mid g \gamma=\gamma g\}$.

03UB Lemma 49.92.7. Let $P$ be a $\Lambda[\Gamma]$-module, finite and projective as a $\Lambda[G]$-module, and $\gamma \in \Gamma$. Then

$$
\operatorname{Tr}_{\Lambda}(\gamma, P)=\# Z_{\gamma} \cdot \operatorname{Tr}_{\Lambda}^{Z_{\gamma}}(\gamma, P)
$$

Proof. This follows readily from Lemma 49.92.3.
03UC Lemma 49.92.8. Let $P$ be an $A[\Gamma]$-module, finite projective as $A[G]$-module. Let $M$ be a $\Lambda[\Gamma]$-module, finite projective as a $\Lambda$-module. Then

$$
\operatorname{Tr}_{\Lambda}^{Z_{\gamma}}\left(\gamma, P \otimes_{A} M\right)=\operatorname{Tr}_{A}^{Z_{\gamma}}(\gamma, P) \cdot \operatorname{Tr}_{\Lambda}(\gamma, M)
$$

Proof. This follows directly from Lemma 49.92.6.
03UD Lemma 49.92.9. Let $P$ be a $\Lambda[\Gamma]$-module, finite projective as $\Lambda[G]$-module. Then the coinvariants $P_{G}=\Lambda \otimes_{\Lambda[G]} P$ form a finite projective $\Lambda$-module, endowed with an action of $\Gamma / G=\mathbf{N}$. Moreover, we have

$$
\operatorname{Tr}_{\Lambda}\left(1 ; P_{G}\right)=\sum_{\gamma \mapsto 1}^{\prime} \operatorname{Tr}_{\Lambda}^{Z_{\gamma}}(\gamma, P)
$$

where $\sum_{\gamma \mapsto 1}^{\prime}$ means taking the sum over the $G$-conjugacy classes in $\Gamma$.
Sketch of proof. We first prove this after multiplying by $\# G$.

$$
\# G \cdot \operatorname{Tr}_{\Lambda}\left(1 ; P_{G}\right)=\operatorname{Tr}_{\Lambda}\left(\sum_{\gamma \mapsto 1} \gamma, P_{G}\right)=\operatorname{Tr}_{\Lambda}\left(\sum_{\gamma \mapsto 1} \gamma, P\right)
$$

where the second equality follows by considering the commutative triangle

$$
P^{G} \underbrace{\stackrel{a}{\longrightarrow}}_{c} P \xrightarrow{b} P_{G}
$$

where $a$ is the canonical inclusion, $b$ the canonical surjection and $c=\sum_{\gamma \mapsto 1} \gamma$. Then we have

$$
\left.\left(\sum_{\gamma \mapsto 1} \gamma\right)\right|_{P}=a \circ c \circ b \quad \text { and }\left.\quad\left(\sum_{\gamma \mapsto 1} \gamma\right)\right|_{P_{G}}=b \circ a \circ c
$$

hence they have the same trace. We then have

$$
\# G \cdot \operatorname{Tr}_{\Lambda}\left(1 ; P_{G}\right)=\sum_{\gamma \mapsto 1}^{\prime} \frac{\# G}{\# Z_{\gamma}} \operatorname{Tr}_{\Lambda}(\gamma, P)=\# G \sum_{\gamma \mapsto 1}^{\prime} \operatorname{Tr}_{\Lambda}^{Z_{\gamma}}(\gamma, P)
$$

To finish the proof, reduce to case $\Lambda$ torsion-free by some universality argument. See Del77 for details.
03UE Remark 49.92.10. Let us try to illustrate the content of the formula of Lemma 49.92.8. Suppose that $\Lambda$, viewed as a trivial $\Gamma$-module, admits a finite resolution $0 \rightarrow P_{r} \rightarrow \ldots \rightarrow P_{1} \rightarrow P_{0} \rightarrow \Lambda \rightarrow 0$ by some $\Lambda[\Gamma]$-modules $P_{i}$ which are finite and projective as $\Lambda[G]$-modules. In that case

$$
H_{*}\left(\left(P_{\bullet}\right)_{G}\right)=\operatorname{Tor}_{*}^{\Lambda[G]}(\Lambda, \Lambda)=H_{*}(G, \Lambda)
$$

and

$$
\operatorname{Tr}_{\Lambda}^{Z_{\gamma}}\left(\gamma, P_{\bullet}\right)=\frac{1}{\# Z_{\gamma}} \operatorname{Tr}_{\Lambda}\left(\gamma, P_{\bullet}\right)=\frac{1}{\# Z_{\gamma}} \operatorname{Tr}(\gamma, \Lambda)=\frac{1}{\# Z_{\gamma}}
$$

Therefore, Lemma 49.92.8 says

$$
\operatorname{Tr}_{\Lambda}\left(1, P_{G}\right)=\operatorname{Tr}\left(\left.1\right|_{H_{*}(G, \Lambda)}\right)=\sum_{\gamma \mapsto 1}^{\prime} \frac{1}{\# Z_{\gamma}}
$$

This can be interpreted as a point count on the stack $B G$. If $\Lambda=\mathbf{F}_{\ell}$ with $\ell$ prime to $\# G$, then $H_{*}(G, \Lambda)$ is $\mathbf{F}_{\ell}$ in degree 0 (and 0 in other degrees) and the formula reads

$$
1=\sum_{\frac{\sigma-\text { conjugacy }}{\text { classes }\langle\gamma\rangle}} \frac{1}{\# Z_{\gamma}} \quad \bmod \ell .
$$

This is in some sense a "trivial" trace formula for $G$. Later we will see that 49.91.3.1 can in some cases be viewed as a highly nontrivial trace formula for a certain type of group, see Section 49.107 .

### 49.93. Proof of the trace formula

03UF
03UG Theorem 49.93.1. Let $k$ be a finite field and $X$ a finite type, separated scheme of dimension at most 1 over $k$. Let $\Lambda$ be a finite ring whose cardinality is prime to that of $k$, and $K \in D_{c t f}(X, \Lambda)$. Then

03UH (49.93.1.1)

$$
\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, K\right)}\right)=\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{x}\right|_{K_{\bar{x}}}\right)
$$

in $\Lambda^{\natural}$.
Please see Remark 49.93.2 for some remarks on the statement. Notation: For short, we write

$$
T^{\prime}(X, K)=\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{x}\right|_{K_{\bar{x}}}\right)
$$

for the right-hand side of 49.93.1.1 and

$$
T^{\prime \prime}(X, K)=\operatorname{Tr}\left(\left.\pi_{x}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, K\right)}\right)
$$

for the left-hand side.
Proof of Theorem 49.93.1. The proof proceeds in a number of steps.
Step 1. Let $j: \mathcal{U} \hookrightarrow X$ be an open immersion with complement $Y=X-\mathcal{U}$ and $i: Y \hookrightarrow X$. Then $T^{\prime \prime}(X, K)=T^{\prime \prime}\left(\mathcal{U}, j^{-1} K\right)+T^{\prime \prime}\left(Y, i^{-1} K\right)$ and $T^{\prime}(X, K)=$ $T^{\prime}\left(\mathcal{U}, j^{-1} K\right)+T^{\prime}\left(Y, i^{-1} K\right)$.
This is clear for $T^{\prime}$. For $T^{\prime \prime}$ use the exact sequence

$$
0 \rightarrow j!j^{-1} K \rightarrow K \rightarrow i_{*} i^{-1} K \rightarrow 0
$$

to get a filtration on $K$. This gives rise to an object $\widetilde{K} \in D F(X, \Lambda)$ whose graded pieces are $j_{!} j^{-1} K$ and $i_{*} i^{-1} K$, both of which lie in $D_{c t f}(X, \Lambda)$. Then, by filtered derived abstract nonsense (INSERT REFERENCE), $R \Gamma_{c}\left(X_{\bar{k}}, K\right) \in D F_{p e r f}(\Lambda)$, and it comes equipped with $\pi_{x}^{*}$ in $D F_{\text {perf }}(\Lambda)$. By the discussion of traces on filtered complexes (INSERT REFERENCE) we get

$$
\begin{aligned}
\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, K\right)}\right) & =\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, j_{!} j^{-1} K\right)}\right)+\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, i_{*} i^{-1} K\right)}\right) \\
& =T^{\prime \prime}\left(U, i^{-1} K\right)+T^{\prime \prime}\left(Y, i^{-1} K\right)
\end{aligned}
$$

Step 2. The theorem holds if $\operatorname{dim} X \leq 0$.
Indeed, in that case

$$
R \Gamma_{c}\left(X_{\bar{k}}, K\right)=R \Gamma\left(X_{\bar{k}}, K\right)=\Gamma\left(X_{\bar{k}}, K\right)=\bigoplus_{\bar{x} \in X_{\bar{k}}} K_{\bar{x}} \leftarrow \pi_{X} *
$$

Since the fixed points of $\pi_{X}: X_{\bar{k}} \rightarrow X_{\bar{k}}$ are exactly the points $\bar{x} \in X_{\bar{k}}$ which lie over a $k$-rational point $x \in X(k)$ we get

$$
\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, K\right)}\right)=\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{\bar{x}}\right|_{K_{\bar{x}}}\right)
$$

Step 3. It suffices to prove the equality $T^{\prime}(\mathcal{U}, \mathcal{F})=T^{\prime \prime}(\mathcal{U}, \mathcal{F})$ in the case where

- $\mathcal{U}$ is a smooth irreducible affine curve over $k$,
- $\mathcal{U}(k)=\emptyset$,
- $K=\mathcal{F}$ is a finite locally constant sheaf of $\Lambda$-modules on $\mathcal{U}$ whose stalk(s) are finite projective $\Lambda$-modules, and
- $\Lambda$ is killed by a power of a prime $\ell$ and $\ell \in k^{*}$.

Indeed, because of Step 2, we can throw out any finite set of points. But we have only finitely many rational points, so we may assume there are non ${ }^{7}$. We may assume that $\mathcal{U}$ is smooth irreducible and affine by passing to irreducible components and throwing away the bad points if necessary. The assumptions of $\mathcal{F}$ come from unwinding the definition of $D_{c t f}(X, \Lambda)$ and those on $\Lambda$ from considering its primary decomposition.
For the remainder of the proof, we consider the situation

where $\mathcal{U}$ is as above, $f$ is a finite étale Galois covering, $\mathcal{V}$ is connected and the horizontal arrows are projective completions. Denoting $G=\operatorname{Aut}(\mathcal{V} \mid \mathcal{U})$, we also assume (as we may) that $f^{-1} \mathcal{F}=\underline{M}$ is constant, where the module $M=\Gamma\left(\mathcal{V}, f^{-1} \mathcal{F}\right)$ is a $\Lambda[G]$-module which is finite and projective over $\Lambda$. This corresponds to the trivial monoid extension

$$
1 \rightarrow G \rightarrow \Gamma=G \times \mathbf{N} \rightarrow \mathbf{N} \rightarrow 1
$$

In that context, using the reductions above, we need to show that $T^{\prime \prime}(\mathcal{U}, \mathcal{F})=0$.
Step 4. There is a natural action of $G$ on $f_{*} f^{-1} \mathcal{F}$ and the trace map $f_{*} f^{-1} \mathcal{F} \rightarrow \mathcal{F}$ defines an isomorphism

$$
\left(f_{*} f^{-1} \mathcal{F}\right) \otimes_{\Lambda[G]} \Lambda=\left(f_{*} f^{-1} \mathcal{F}\right)_{G} \cong \mathcal{F}
$$

To prove this, simply unwind everything at a geometric point.
Step 5. Let $A=\mathbf{Z} / \ell^{n} \mathbf{Z}$ with $n \gg 0$. Then $f_{*} f^{-1} \mathcal{F} \cong\left(f_{*} \underline{A}\right) \otimes_{\underline{A}} \underline{M}$ with diagonal G-action.

Step 6. There is a canonical isomorphism $\left(f_{*} \underline{A} \otimes_{\underline{A}} \underline{M}\right) \otimes_{\Lambda[G]} \underline{\Lambda} \cong \mathcal{F}$.
In fact, this is a derived tensor product, because of the projectivity assumption on $\mathcal{F}$.

Step 7. There is a canonical isomorphism

$$
R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, \mathcal{F}\right)=\left(R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right) \otimes_{A}^{\mathbf{L}} M\right) \otimes_{\Lambda[G]}^{\mathbf{L}} \Lambda,
$$

compatible with the action of $\pi_{\mathcal{U}}^{*}$.

[^134]This comes from the universal coefficient theorem, i.e., the fact that $R \Gamma_{c}$ commutes with $\otimes^{\mathbf{L}}$, and the flatness of $\mathcal{F}$ as a $\Lambda$-module.
We have

$$
\begin{aligned}
\operatorname{Tr}\left(\left.\pi_{\mathcal{U}}^{*}\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, \mathcal{F}\right)}\right) & =\sum_{g \in G}{ }^{\prime} \operatorname{Tr}_{\Lambda}^{Z_{g}}\left(\left.\left(g, \pi_{\mathcal{U}}^{*}\right)\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right) \otimes_{A}^{\mathrm{L}} M}\right) \\
& =\sum_{g \in G}{ }^{\prime} \operatorname{Tr}_{A}^{Z_{g}}\left(\left.\left(g, \pi_{\mathcal{U}}^{*}\right)\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right)}\right) \cdot \operatorname{Tr}_{\Lambda}\left(\left.g\right|_{M}\right)
\end{aligned}
$$

where $\Gamma$ acts on $R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, \mathcal{F}\right)$ by $G$ and $(e, 1)$ acts via $\pi_{\mathcal{U}}^{*}$. So the monoidal extension is given by $\Gamma=G \times \mathbf{N} \rightarrow \mathbf{N}, \gamma \mapsto 1$. The first equality follows from Lemma 49.92.9 and the second from Lemma 49.92.8.
Step 8. It suffices to show that $\operatorname{Tr}_{A}^{Z_{g}}\left(\left.\left(g, \pi_{\mathcal{U}}^{*}\right)\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right)}\right) \in A$ maps to zero in $\Lambda$.
Recall that

$$
\begin{aligned}
\# Z_{g} \cdot \operatorname{Tr}_{A}^{Z_{g}}\left(\left.\left(g, \pi_{\mathcal{U}}^{*}\right)\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right)}\right) & =\operatorname{Tr}_{A}\left(\left.\left(g, \pi_{\mathcal{U}}^{*}\right)\right|_{R \Gamma_{c}\left(\mathcal{U}_{\bar{k}}, f_{*} A\right)}\right) \\
& =\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi_{\mathcal{V}}\right)^{*}\right|_{R \Gamma_{c}\left(\mathcal{V}_{\bar{k}}, A\right)}\right)
\end{aligned}
$$

The first equality is Lemma 49.92.7, the second is the Leray spectral sequence, using the finiteness of $f$ and the fact that we are only taking traces over $A$. Now since $A=\mathbf{Z} / \ell^{n} \mathbf{Z}$ with $n \gg 0$ and $\# Z_{g}=\ell^{a}$ for some (fixed) $a$, it suffices to show the following result.
Step 9. We have $\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi_{\mathcal{V}}\right)^{*}\right|_{R \Gamma_{c}(\mathcal{V}, A)}\right)=0$ in $A$.
By additivity again, we have

$$
\begin{gathered}
\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi \mathcal{V}\right)^{*}\right|_{R \Gamma_{c}\left(\mathcal{V}_{\bar{k}} A\right)}\right)+\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi \mathcal{V}\right)^{*}\right|_{\left.R \Gamma_{c}(Y-\mathcal{V})_{\bar{k}}, A\right)}\right) \\
=\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi_{Y}\right)^{*}\right|_{R \Gamma\left(Y_{\bar{k}}, A\right)}\right)
\end{gathered}
$$

The latter trace is the number of fixed points of $g^{-1} \pi_{Y}$ on $Y$, by Weil's trace formula Theorem 49.91.4. Moreover, by the 0 -dimensional case already proven in step 2,

$$
\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi \mathcal{V}\right)^{*}\right|_{\left.R \Gamma_{c}(Y-\mathcal{V})_{\bar{k}}, A\right)}\right)
$$

is the number of fixed points of $g^{-1} \pi_{Y}$ on $(Y-\mathcal{V})_{\bar{k}}$. Therefore,

$$
\operatorname{Tr}_{A}\left(\left.\left(g^{-1} \pi \mathcal{V}\right)^{*}\right|_{R \Gamma_{c}\left(\mathcal{V}_{\bar{k}}, A\right)}\right)
$$

is the number of fixed points of $g^{-1} \pi_{Y}$ on $\mathcal{V}_{\bar{k}}$. But there are no such points: if $\bar{y} \in Y_{\bar{k}}$ is fixed under $g^{-1} \pi_{Y}$, then $\bar{f}(\bar{y}) \in X_{\bar{k}}$ is fixed under $\pi_{X}$. But $\mathcal{U}$ has no $k$-rational point, so we must have $\bar{f}(\bar{y}) \in(X-\mathcal{U})_{\bar{k}}$ and so $\bar{y} \notin \mathcal{V}_{\bar{k}}$, a contradiction. This finishes the proof.

03UI Remark 49.93.2. Remarks on Theorem 49.93.1
(1) This formula holds in any dimension. By a dévissage lemma (which uses proper base change etc.) it reduces to the current statement - in that generality.
(2) The complex $R \Gamma_{c}\left(X_{\bar{k}}, K\right)$ is defined by choosing an open immersion $j$ : $X \hookrightarrow \bar{X}$ with $\bar{X}$ projective over $k$ of dimension at most 1 and setting

$$
R \Gamma_{c}\left(X_{\bar{k}}, K\right):=R \Gamma\left(\bar{X}_{\bar{k}}, j!K\right)
$$

This is independent of the choice of $\bar{X}$ follows from (insert reference here). We define $H_{c}^{i}\left(X_{\bar{k}}, K\right)$ to be the $i$ th cohomology group of $R \Gamma_{c}\left(X_{\bar{k}}, K\right)$.

03UJ Remark 49.93.3. Even though all we did are reductions and mostly algebra, the trace formula Theorem 49.93.1 is much stronger than Weil's geometric trace formula (Theorem 49.91.4) because it applies to coefficient systems (sheaves), not merely constant coefficients.

### 49.94. Applications

03UK OK, having indicated the proof of the trace formula, let's try to use it for something.

### 49.95. On l-adic sheaves

03UL
03UM Definition 49.95.1. Let $X$ be a noetherian scheme. A $\mathbf{Z}_{\ell}$-sheaf on $X$, or simply a $\ell$-adic sheaf is an inverse system $\left\{\mathcal{F}_{n}\right\}_{n \geq 1}$ where
(1) $\mathcal{F}_{n}$ is a constructible $\mathbf{Z} / \ell^{n} \mathbf{Z}$-module on $X_{\text {étale }}$, and
(2) the transition maps $\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ induce isomorphisms $\mathcal{F}_{n+1} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}}$ $\mathbf{Z} / \ell^{n} \mathbf{Z} \cong \mathcal{F}_{n}$.
We say that $\mathcal{F}$ is lisse if each $\mathcal{F}_{n}$ is locally constant. A morphism of such is merely a morphism of inverse systems.

03UN Lemma 49.95.2. Let $\left\{\mathcal{G}_{n}\right\}_{n \geq 1}$ be an inverse system of constructible $\mathbf{Z} / \ell^{n} \mathbf{Z}$ modules. Suppose that for all $k \geq 1$, the maps

$$
\mathcal{G}_{n+1} / \ell^{k} \mathcal{G}_{n+1} \rightarrow \mathcal{G}_{n} / \ell^{k} \mathcal{G}_{n}
$$

are isomorphisms for all $n \gg 0$ (where the bound possibly depends on $k$ ). In other words, assume that the system $\left\{\mathcal{G}_{n} / \ell^{k} \mathcal{G}_{n}\right\}_{n \geq 1}$ is eventually constant, and call $\mathcal{F}_{k}$ the corresponding sheaf. Then the system $\left\{\mathcal{F}_{k}\right\}_{k \geq 1}$ forms a $\mathbf{Z}_{\ell}$-sheaf on $X$.

Proof. The proof is obvious.
03UO Lemma 49.95.3. The category of $\mathbf{Z}_{\ell}$-sheaves on $X$ is abelian.
Proof. Let $\Phi=\left\{\varphi_{n}\right\}_{n \geq 1}:\left\{\mathcal{F}_{n}\right\} \rightarrow\left\{\mathcal{G}_{n}\right\}$ be a morphism of $\mathbf{Z}_{\ell}$-sheaves. Set

$$
\operatorname{Coker}(\Phi)=\left\{\operatorname{Coker}\left(\mathcal{F}_{n} \xrightarrow{\varphi_{n}} \mathcal{G}_{n}\right)\right\}_{n \geq 1}
$$

and $\operatorname{Ker}(\Phi)$ is the result of Lemma 49.95 .2 applied to the inverse system

$$
\left\{\bigcap_{m \geq n} \operatorname{Im}\left(\operatorname{Ker}\left(\varphi_{m}\right) \rightarrow \operatorname{Ker}\left(\varphi_{n}\right)\right)\right\}_{n \geq 1}
$$

That this defines an abelian category is left to the reader.
03UP Example 49.95.4. Let $X=\operatorname{Spec}(\mathbf{C})$ and $\Phi: \mathbf{Z}_{\ell} \rightarrow \mathbf{Z}_{\ell}$ be multiplication by $\ell$. More precisely,

$$
\Phi=\left\{\mathbf{Z} / \ell^{n} \mathbf{Z} \xrightarrow{\ell} \mathbf{Z} / \ell^{n} \mathbf{Z}\right\}_{n \geq 1}
$$

To compute the kernel, we consider the inverse system

$$
\ldots \rightarrow \mathbf{Z} / \ell \mathbf{Z} \xrightarrow{0} \mathbf{Z} / \ell \mathbf{Z} \xrightarrow{0} \mathbf{Z} / \ell \mathbf{Z} .
$$

Since the images are always zero, $\operatorname{Ker}(\Phi)$ is zero as a system.

03UQ Remark 49.95.5. If $\mathcal{F}=\left\{\mathcal{F}_{n}\right\}_{n \geq 1}$ is a $\mathbf{Z}_{\ell}$-sheaf on $X$ and $\bar{x}$ is a geometric point then $M_{n}=\left\{\mathcal{F}_{n, \bar{x}}\right\}$ is an inverse system of finite $\mathbf{Z} / \ell^{n} \mathbf{Z}$-modules such that $M_{n+1} \rightarrow M_{n}$ is surjective and $M_{n}=M_{n+1} / \ell^{n} M_{n+1}$. It follows that

$$
M=\lim _{n} M_{n}=\lim \mathcal{F}_{n, \bar{x}}
$$

is a finite $\mathbf{Z}_{\ell}$-module. Indeed, $M / \ell M=M_{1}$ is finite over $\mathbf{F}_{\ell}$, so by Nakayama $M$ is finite over $\mathbf{Z}_{\ell}$. Therefore, $M \cong \mathbf{Z}_{\ell}^{\oplus r} \oplus \oplus_{i=1}^{t} \mathbf{Z}_{\ell} / \ell^{e_{i}} \mathbf{Z}_{\ell}$ for some $r, t \geq 0, e_{i} \geq 1$. The module $M=\mathcal{F}_{\bar{x}}$ is called the stalk of $\mathcal{F}$ at $\bar{x}$.

03UR Definition 49.95.6. A $\mathbf{Z}_{\ell}$-sheaf $\mathcal{F}$ is torsion if $\ell^{n}: \mathcal{F} \rightarrow \mathcal{F}$ is the zero map for some $n$. The abelian category of $\mathbf{Q}_{\ell}$-sheaves on $X$ is the quotient of the abelian category of $\mathbf{Z}_{\ell}$-sheaves by the Serre subcategory of torsion sheaves. In other words, its objects are $\mathbf{Z}_{\ell}$-sheaves on $X$, and if $\mathcal{F}, \mathcal{G}$ are two such, then

$$
\operatorname{Hom}_{\mathbf{Q}_{\ell}}(\mathcal{F}, \mathcal{G})=\operatorname{Hom}_{\mathbf{Z}_{\ell}}(\mathcal{F}, \mathcal{G}) \otimes_{\mathbf{z}_{\ell}} \mathbf{Q}_{\ell}
$$

We denote by $\mathcal{F} \mapsto \mathcal{F} \otimes \mathbf{Q}_{\ell}$ the quotient functor (right adjoint to the inclusion). If $\mathcal{F}=\mathcal{F}^{\prime} \otimes \mathbf{Q}_{\ell}$ where $\mathcal{F}^{\prime}$ is a $\mathbf{Z}_{\ell}$-sheaf and $\bar{x}$ is a geometric point, then the stalk of $\mathcal{F}$ at $\bar{x}$ is $\mathcal{F}_{\bar{x}}=\mathcal{F}_{\bar{x}}^{\prime} \otimes \mathbf{Q}_{\ell}$.

03US Remark 49.95.7. Since a $\mathbf{Z}_{\ell}$-sheaf is only defined on a noetherian scheme, it is torsion if and only if its stalks are torsion.
03UT Definition 49.95.8. If $X$ is a separated scheme of finite type over an algebraically closed field $k$ and $\mathcal{F}=\left\{\mathcal{F}_{n}\right\}_{n \geq 1}$ is a $\mathbf{Z}_{\ell \text {-sheaf on } X \text {, then we define }}$

$$
H^{i}(X, \mathcal{F}):=\lim _{n} H^{i}\left(X, \mathcal{F}_{n}\right) \quad \text { and } \quad H_{c}^{i}(X, \mathcal{F}):=\lim _{n} H_{c}^{i}\left(X, \mathcal{F}_{n}\right)
$$

If $\mathcal{F}=\mathcal{F}^{\prime} \otimes \mathbf{Q}_{\ell}$ for a $\mathbf{Z}_{\ell}$-sheaf $\mathcal{F}^{\prime}$ then we set

$$
H_{c}^{i}(X, \mathcal{F}):=H_{c}^{i}\left(X, \mathcal{F}^{\prime}\right) \otimes_{\mathbf{z}_{\ell}} \mathbf{Q}_{\ell}
$$

We call these the $\ell$-adic cohomology of $X$ with coefficients $\mathcal{F}$.

### 49.96. L-functions

03 UU
03UV Definition 49.96.1. Let $X$ be a scheme of finite type over a finite field $k$. Let $\Lambda$ be a finite ring of order prime to the characteristic of $k$ and $\mathcal{F}$ a constructible flat $\Lambda$-module on $X_{\text {étale }}$. Then we set

$$
L(X, \mathcal{F}):=\prod_{x \in|X|} \operatorname{det}\left(1-\left.\pi_{x}^{*} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)^{-1} \in \Lambda[[T]]
$$

where $|X|$ is the set of closed points of $X, \operatorname{deg} x=[\kappa(x): k]$ and $\bar{x}$ is a geometric point lying over $x$. This definition clearly generalizes to the case where $\mathcal{F}$ is replaced by a $K \in D_{c t f}(X, \Lambda)$. We call this the $L$-function of $\mathcal{F}$.
03UW Remark 49.96.2. Intuitively, $T$ should be thought of as $T=t^{f}$ where $p^{f}=\# k$. The definitions are then independent of the size of the ground field.
03UX Definition 49.96.3. Now assume that $\mathcal{F}$ is a $\mathbf{Q}_{\ell}$-sheaf on $X$. In this case we define

$$
L(X, \mathcal{F}):=\prod_{x \in|X|} \operatorname{det}\left(1-\left.\pi_{x}^{*} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)^{-1} \in \mathbf{Q}_{\ell}[[T]]
$$

Note that this product converges since there are finitely many points of a given degree. We call this the $L$-function of $\mathcal{F}$.

### 49.97. Cohomological interpretation

03UY This is how Grothendieck interpreted the $L$-function.
03UZ Theorem 49.97.1 (Finite Coefficients). Let $X$ be a scheme of finite type over a finite field $k$. Let $\Lambda$ be a finite ring of order prime to the characteristic of $k$ and $\mathcal{F}$ a constructible flat $\Lambda$-module on $X_{\text {étale }}$. Then

$$
L(X, \mathcal{F})=\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{R \Gamma_{c}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)^{-1} \in \Lambda[[T]] .
$$

Proof. Omitted.
Thus far, we don't even know whether each cohomology group $H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)$ is free.
03V0 Theorem 49.97.2 (Adic sheaves). Let $X$ be a scheme of finite type over a finite field $k$, and $\mathcal{F} a \mathbf{Q}_{\ell}$-sheaf on $X$. Then

$$
L(X, \mathcal{F})=\prod_{i} \operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)^{(-1)^{i+1}} \in \mathbf{Q}_{\ell}[[T]]
$$

Proof. This is sketched below.
03V1 Remark 49.97.3. Since we have only developed some theory of traces and not of determinants, Theorem 49.97.1 is harder to prove than Theorem 49.97.2 We will only prove the latter, for the former see Del77]. Observe also that there is no version of this theorem more general for $\mathbf{Z}_{\ell}$ coefficients since there is no $\ell$-torsion.

We reduce the proof of Theorem 49.97 .2 to a trace formula. Since $\mathbf{Q}_{\ell}$ has characteristic 0 , it suffices to prove the equality after taking logarithmic derivatives. More precisely, we apply $T \frac{d}{d T} \log$ to both sides. We have on the one hand

$$
\begin{aligned}
T \frac{d}{d T} \log L(X, \mathcal{F}) & =T \frac{d}{d T} \log \prod_{x \in|X|} \operatorname{det}\left(1-\left.\pi_{x}^{*} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)^{-1} \\
& =\sum_{x \in|X|} T \frac{d}{d T} \log \left(\operatorname{det}\left(1-\left.\pi_{x}^{*} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)^{-1}\right) \\
& =\sum_{x \in|X|} \operatorname{deg} x \sum_{n \geq 1} \operatorname{Tr}\left(\left.\left(\pi_{x}^{n}\right)^{*}\right|_{\mathcal{F}_{\bar{x}}}\right) T^{n \operatorname{deg} x}
\end{aligned}
$$

where the last equality results from the formula

$$
T \frac{d}{d T} \log \left(\operatorname{det}\left(1-\left.f T\right|_{M}\right)^{-1}\right)=\sum_{n \geq 1} \operatorname{Tr}\left(\left.f^{n}\right|_{M}\right) T^{n}
$$

which holds for any commutative ring $\Lambda$ and any endomorphism $f$ of a finite projective $\Lambda$-module $M$. On the other hand, we have

$$
\begin{aligned}
& T \frac{d}{d T} \log \left(\prod_{i} \operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)^{(-1)^{i+1}}\right) \\
& =\sum_{i}(-1)^{i} \sum_{n \geq 1} \operatorname{Tr}\left(\left.\left(\pi_{X}^{n}\right)^{*}\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right) T^{n}
\end{aligned}
$$

by the same formula again. Now, comparing powers of $T$ and using the Mobius inversion formula, we see that Theorem 49.97 .2 is a consequence of the following equality

$$
\sum_{d \mid n} d \sum_{\substack{x \in|X| \\ \operatorname{deg} x=d}} \operatorname{Tr}\left(\left.\left(\pi_{X}^{n / d}\right)^{*}\right|_{\mathcal{F}_{\bar{x}}}\right)=\sum_{i}(-1)^{i} \operatorname{Tr}\left(\left.\left(\pi_{X}^{n}\right)^{*}\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)
$$

Writing $k_{n}$ for the degree $n$ extension of $k, X_{n}=X \times_{\operatorname{Spec} k} \operatorname{Spec}\left(k_{n}\right)$ and ${ }_{n} \mathcal{F}=\left.\mathcal{F}\right|_{X_{n}}$, this boils down to

$$
\left.\sum_{x \in X_{n}\left(k_{n}\right)} \operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{n} \mathcal{F}_{\bar{x}}\right)=\sum_{i}(-1)^{i} \operatorname{Tr}\left(\left.\left(\pi_{X}^{n}\right)^{*}\right|_{H_{c}^{i}\left(\left(X_{n}\right)_{\bar{k}}, n\right.} \mathcal{F}\right)\right)
$$

which is a consequence of Theorem 49.97.5.
03V3 Theorem 49.97.4. Let $X / k$ be as above, let $\Lambda$ be a finite ring with $\# \Lambda \in k^{*}$ and $K \in D_{c t f}(X, \Lambda)$. Then $R \Gamma_{c}\left(X_{\bar{k}}, K\right) \in D_{\text {perf }}(\Lambda)$ and

$$
\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{x}\right|_{K_{\bar{x}}}\right)=\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, K\right)}\right) .
$$

Proof. Note that we have already proved this (REFERENCE) when $\operatorname{dim} X \leq 1$. The general case follows easily from that case together with the proper base change theorem.

03V2 Theorem 49.97.5. Let $X$ be a separated scheme of finite type over a finite field $k$ and $\mathcal{F}$ be a $\mathbf{Q}_{\ell}$-sheaf on $X$. Then $\operatorname{dim}_{\mathbf{Q}_{\ell}} H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)$ is finite for all $i$, and is nonzero for $0 \leq i \leq 2 \operatorname{dim} X$ only. Furthermore, we have

$$
\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{x}\right|_{\mathcal{F}_{\bar{x}}}\right)=\sum_{i}(-1)^{i} \operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)
$$

Proof. We explain how to deduce this from Theorem 49.97.4. We first use some étale cohomology arguments to reduce the proof to an algebraic statement which we subsequently prove.
Let $\mathcal{F}$ be as in the theorem. We can write $\mathcal{F}$ as $\mathcal{F}^{\prime} \otimes \mathbf{Q}_{\ell}$ where $\mathcal{F}^{\prime}=\left\{\mathcal{F}_{n}^{\prime}\right\}$ is a $\mathbf{Z}_{\ell}$-sheaf without torsion, i.e., $\ell: \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime}$ has trivial kernel in the category of $\mathbf{Z}_{\ell}$-sheaves. Then each $\mathcal{F}_{n}^{\prime}$ is a flat constructible $\mathbf{Z} / \ell^{n} \mathbf{Z}$-module on $X_{\text {étale }}$, so $\mathcal{F}_{n}^{\prime} \in D_{c t f}\left(X, \mathbf{Z} / \ell^{n} \mathbf{Z}\right)$ and $\mathcal{F}_{n+1}^{\prime} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}}^{\mathbf{Z}} \mathbf{Z} / \ell^{n} \mathbf{Z}=\mathcal{F}_{n}^{\prime}$. Note that the last equality holds also for standard (non-derived) tensor product, since $\mathcal{F}_{n}^{\prime}$ is flat (it is the same equality). Therefore,
(1) the complex $K_{n}=R \Gamma_{c}\left(X_{\bar{k}}, \mathcal{F}_{n}^{\prime}\right)$ is perfect, and it is endowed with an endomorphism $\pi_{n}: K_{n} \rightarrow K_{n}$ in $D\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$,
(2) there are identifications

$$
K_{n+1} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}}^{\mathbf{L}} \mathbf{Z} / \ell^{n} \mathbf{Z}=K_{n}
$$

in $D_{\text {perf }}\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$, compatible with the endomorphisms $\pi_{n+1}$ and $\pi_{n}$ (see Del77, Rapport 4.12]),
(3) the equality $\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{K_{n}}\right)=\sum_{x \in X(k)} \operatorname{Tr}\left(\left.\pi_{x}\right|_{\left(\mathcal{F}_{n}^{\prime}\right)_{\bar{x}}}\right)$ holds, and
(4) for each $x \in X(k)$, the elements $\operatorname{Tr}\left(\left.\pi_{x}\right|_{\mathcal{F}_{n, \bar{x}}^{\prime}}\right) \in \mathbf{Z} / \ell^{n} \mathbf{Z}$ form an element of $\mathbf{Z}_{\ell}$ which is equal to $\operatorname{Tr}\left(\left.\pi_{x}\right|_{\mathcal{F}_{\bar{x}}}\right) \in \mathbf{Q}_{\ell}$.
It thus suffices to prove the following algebra lemma.
03V4 Lemma 49.97.6. Suppose we have $K_{n} \in D_{\text {perf }}\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right), \pi_{n}: K_{n} \rightarrow K_{n}$ and isomorphisms $\varphi_{n}: K_{n+1} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}}^{\mathbf{L}} \mathbf{Z} / \ell^{n} \mathbf{Z} \rightarrow K_{n}$ compatible with $\pi_{n+1}$ and $\pi_{n}$. Then
(1) the elements $t_{n}=\operatorname{Tr}\left(\left.\pi_{n}\right|_{K_{n}}\right) \in \mathbf{Z} / \ell^{n} \mathbf{Z}$ form an element $t_{\infty}=\left\{t_{n}\right\}$ of $\mathbf{Z}_{\ell}$,
(2) the $\mathbf{Z}_{\ell}$-module $H_{\infty}^{i}=\lim _{n} H^{i}\left(k_{n}\right)$ is finite and is nonzero for finitely many $i$ only, and
(3) the operators $H^{i}\left(\pi_{n}\right): H^{i}\left(K_{n}\right) \rightarrow H^{i}\left(K_{n}\right)$ are compatible and define $\pi_{\infty}^{i}$ : $H_{\infty}^{i} \rightarrow H_{\infty}^{i}$ satisfying

$$
\sum(-1)^{i} \operatorname{Tr}\left(\left.\pi_{\infty}^{i}\right|_{H_{\infty}^{i} \otimes \mathbf{z}_{\ell} \mathbf{Q}_{\ell}}\right)=t_{\infty}
$$

Proof. Since $\mathbf{Z} / \ell^{n} \mathbf{Z}$ is a local ring and $K_{n}$ is perfect, each $K_{n}$ can be represented by a finite complex $K_{n}^{\bullet}$ of finite free $\mathbf{Z} / \ell^{n} \mathbf{Z}$-modules such that the map $K_{n}^{p} \rightarrow K_{n}^{p+1}$ has image contained in $\ell K_{n}^{p+1}$. It is a fact that such a complex is unique up to isomorphism. Moreover $\pi_{n}$ can be represented by a morphism of complexes $\pi_{n}^{\bullet}$ : $K_{n}^{\bullet} \rightarrow K_{n}^{\bullet}$ (which is unique up to homotopy). By the same token the isomorphism $\varphi_{n}: K_{n+1} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}}^{\mathbf{L}} \mathbf{Z} / \ell^{n} \mathbf{Z} \rightarrow K_{n}$ is represented by a map of complexes

$$
\varphi_{n}^{\bullet}: K_{n+1}^{\bullet} \otimes_{\mathbf{Z} / \ell^{n+1} \mathbf{Z}} \mathbf{Z} / \ell^{n} \mathbf{Z} \rightarrow K_{n}^{\bullet}
$$

In fact, $\varphi_{n}^{\bullet}$ is an isomorphism of complexes, thus we see that

- there exist $a, b \in \mathbf{Z}$ independent of $n$ such that $K_{n}^{i}=0$ for all $i \notin[a, b]$, and
- the rank of $K_{n}^{i}$ is independent of $n$.

Therefore, the module $K_{\infty}^{i}=\lim _{n}\left\{K_{n}^{i}, \varphi_{n}^{i}\right\}$ is a finite free $\mathbf{Z}_{\ell}$-module and $K_{\infty}^{\bullet}$ is a finite complex of finite free $\mathbf{Z}_{\ell}$-modules. By induction on the number of nonzero terms, one can prove that $H^{i}\left(K_{\infty}^{\bullet}\right)=\lim _{n} H^{i}\left(K_{n}^{\bullet}\right)$ (this is not true for unbounded complexes). We conclude that $H_{\infty}^{i}=H^{i}\left(K_{\infty}^{\bullet}\right)$ is a finite $\mathbf{Z}_{\ell}$-module. This proves ii. To prove the remainder of the lemma, we need to overcome the possible noncommutativity of the diagrams

However, this diagram does commute in the derived category, hence it commutes up to homotopy. We inductively replace $\pi_{n}^{\bullet}$ for $n \geq 2$ by homotopic maps of complexes making these diagrams commute. Namely, if $h^{i}: K_{n+1}^{i} \rightarrow K_{n}^{i-1}$ is a homotopy, i.e.,

$$
\pi_{n}^{\bullet} \circ \varphi_{n}^{\bullet}-\varphi_{n}^{\bullet} \circ \pi_{n+1}^{\bullet}=d h+h d,
$$

then we choose $\tilde{h}^{i}: K_{n+1}^{i} \rightarrow K_{n+1}^{i-1}$ lifting $h^{i}$. This is possible because $K_{n+1}^{i}$ free and $K_{n+1}^{i-1} \rightarrow K_{n}^{i-1}$ is surjective. Then replace $\pi_{n}^{\bullet}$ by $\tilde{\pi}_{n}^{\bullet}$ defined by

$$
\tilde{\pi}_{n+1}^{\bullet}=\pi_{n+1}^{\bullet}+d \tilde{h}+\tilde{h} d
$$

With this choice of $\left\{\pi_{n}^{\bullet}\right\}$, the above diagrams commute, and the maps fit together to define an endomorphism $\pi_{\infty}^{\bullet}=\lim _{n} \pi_{n}^{\bullet}$ of $K_{\infty}^{\bullet}$. Then part $i$ is clear: the elements $t_{n}=\sum(-1)^{i} \operatorname{Tr}\left(\left.\pi_{n}^{i}\right|_{K_{n}^{i}}\right)$ fit into an element $t_{\infty}$ of $\mathbf{Z}_{\ell}$. Moreover

$$
\begin{aligned}
t_{\infty} & =\sum(-1)^{i} \operatorname{Tr}_{\mathbf{z}_{\ell}}\left(\left.\pi_{\infty}^{i}\right|_{K_{\infty}^{i}}\right) \\
& =\sum(-1)^{i} \operatorname{Tr}_{\mathbf{Q}_{\ell}}\left(\left.\pi_{\infty}^{i}\right|_{K_{\infty}^{i} \otimes \mathbf{z}_{\ell} \mathbf{Q}_{\ell}}\right) \\
& =\sum(-1)^{i} \operatorname{Tr}\left(\left.\pi_{\infty}\right|_{H^{i}\left(K_{\infty}\right.} \otimes \mathbf{Q}_{\ell}\right)
\end{aligned}
$$

where the last equality follows from the fact that $\mathbf{Q}_{\ell}$ is a field, so the complex $K_{\infty}^{\bullet} \otimes \mathbf{Q}_{\ell}$ is quasi-isomorphic to its cohomology $H^{i}\left(K_{\infty}^{\bullet} \otimes \mathbf{Q}_{\ell}\right)$. The latter is also
equal to $H^{i}\left(K_{\infty}^{\bullet}\right) \otimes \mathbf{z} \mathbf{Q}_{\ell}=H_{\infty}^{i} \otimes \mathbf{Q}_{\ell}$, which finishes the proof of the lemma, and also that of Theorem 49.97.5

### 49.98. List of things which we should add above

03V5 What did we skip the proof of in the lectures so far:
(1) curves and their Jacobians,
(2) proper base change theorem,
(3) inadequate discussion of $R \Gamma_{c}$,
(4) more generally, given $f: X \rightarrow S$ finite type, separated $S$ quasi-projective, discussion of $R f$ ! on étale sheaves.
(5) discussion of $\otimes^{\mathbf{L}}$
(6) discussion of why $R \Gamma_{c}$ commutes with $\otimes^{\mathbf{L}}$

### 49.99. Examples of L-functions

03V6 We use Theorem 49.97 .2 for curves to give examples of $L$-functions

### 49.100. Constant sheaves

03V7 Let $k$ be a finite field, $X$ a smooth, geometrically irreducible curve over $k$ and $\mathcal{F}=\mathbf{Q}_{\ell}$ the constant sheaf. If $\bar{x}$ is a geometric point of $X$, the Galois module $\mathcal{F}_{\bar{x}}=\overline{\mathbf{Q}_{\ell}}$ is trivial, so

$$
\operatorname{det}\left(1-\left.\pi_{x}^{*} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)^{-1}=\frac{1}{1-T^{\operatorname{deg} x}}
$$

Applying Theorem 49.97.2, we get

$$
\begin{aligned}
L(X, \mathcal{F}) & =\prod_{i=0}^{2} \operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right)^{(-1)^{i+1}} \\
& =\frac{\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right)}{\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{0}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right) \cdot \operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{2}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right)}
\end{aligned}
$$

To compute the latter, we distinguish two cases.
Projective case. Assume that $X$ is projective, so $H_{c}^{i}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=H^{i}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)$, and we have

$$
H^{i}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=\left\{\begin{array}{ccc}
\mathbf{Q}_{\ell} & \pi_{X}^{*}=1 & \text { if } i=0 \\
\mathbf{Q}_{\ell}^{2 g} & \pi_{X}^{*}=? & \text { if } i=1 \\
\mathbf{Q}_{\ell} & \pi_{X}^{*}=q & \text { if } i=2
\end{array}\right.
$$

The identification of the action of $\pi_{X}^{*}$ on $H^{2}$ comes from Lemma 49.65.2 and the fact that the degree of $\pi_{X}$ is $q=\#(k)$. We do not know much about the action of $\pi_{X}^{*}$ on the degree 1 cohomology. Let us call $\alpha_{1}, \ldots, \alpha_{2 g}$ its eigenvalues in $\overline{\mathbf{Q}}_{\ell}$. Putting everything together, Theorem 49.97.2 yields the equality

$$
\prod_{x \in|X|} \frac{1}{1-T^{\operatorname{deg} x}}=\frac{\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right)}{(1-T)(1-q T)}=\frac{\left(1-\alpha_{1} T\right) \ldots\left(1-\alpha_{2 g} T\right)}{(1-T)(1-q T)}
$$

from which we deduce the following result.
03V8 Lemma 49.100.1. Let $X$ be a smooth, projective, geometrically irreducible curve over a finite field $k$. Then
(1) the L-function $L\left(X, \mathbf{Q}_{\ell}\right)$ is a rational function,
(2) the eigenvalues $\alpha_{1}, \ldots, \alpha_{2 g}$ of $\pi_{X}^{*}$ on $H^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)$ are algebraic integers independent of $\ell$,
(3) the number of rational points of $X$ on $k_{n}$, where $\left[k_{n}: k\right]=n$, is

$$
\# X\left(k_{n}\right)=1-\sum_{i=1}^{2 g} \alpha_{i}^{n}+q^{n}
$$

(4) for each $i,\left|\alpha_{i}\right|<q$.

Proof. Part (3) is Theorem 49.97.5 applied to $\mathcal{F}=\underline{\mathbf{Q}_{\ell}}$ on $X \otimes k_{n}$. For part (4), use the following result.

03V9 Exercise 49.100.2. Let $\alpha_{1}, \ldots, \alpha_{n} \in \mathbf{C}$. Then for any conic sector containing the positive real axis of the form $C_{\varepsilon}=\{z \in \mathbf{C}| | \arg z \mid<\varepsilon\}$ with $\varepsilon>0$, there exists an integer $k \geq 1$ such that $\alpha_{1}^{k}, \ldots, \alpha_{n}^{k} \in C_{\varepsilon}$.

Then prove that $\left|\alpha_{i}\right| \leq q$ for all $i$. Then, use elementary considerations on complex numbers to prove (as in the proof of the prime number theorem) that $\left|\alpha_{i}\right|<q$. In fact, the Riemann hypothesis says that for all $\left|\alpha_{i}\right|=\sqrt{q}$ for all $i$. We will come back to this later.

Affine case. Assume now that $X$ is affine, say $X=\bar{X}-\left\{x_{1}, \ldots, x_{n}\right\}$ where $j: X \hookrightarrow \bar{X}$ is a projective nonsingular completion. Then $H_{c}^{0}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=0$ and $H_{c}^{2}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=H^{2}\left(\bar{X}_{\bar{k}}, \mathbf{Q}_{\ell}\right)$ so Theorem 49.97 .2 reads

$$
L\left(X, \mathbf{Q}_{\ell}\right)=\prod_{x \in|X|} \frac{1}{1-T^{\operatorname{deg} x}}=\frac{\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right)}{1-q T}
$$

On the other hand, the previous case gives

$$
\begin{aligned}
L\left(X, \mathbf{Q}_{\ell}\right) & =L\left(\bar{X}, \mathbf{Q}_{\ell}\right) \prod_{i=1}^{n}\left(1-T^{\operatorname{deg} x_{i}}\right) \\
& =\frac{\prod_{i=1}^{n}\left(1-T^{\operatorname{deg} x_{i}}\right) \prod_{j=1}^{2 g}\left(1-\alpha_{j} T\right)}{(1-T)(1-q T)}
\end{aligned}
$$

Therefore, we see that $\operatorname{dim} H_{c}^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=2 g+\sum_{i=1}^{n} \operatorname{deg}\left(x_{i}\right)-1$, and the eigenvalues $\alpha_{1}, \ldots, \alpha_{2 g}$ of $\pi_{\bar{X}}^{*}$ acting on the degree 1 cohomology are roots of unity. More precisely, each $x_{i}$ gives a complete set of $\operatorname{deg}\left(x_{i}\right)$ th roots of unity, and one occurrence of 1 is omitted. To see this directly using coherent sheaves, consider the short exact sequence on $\bar{X}$

$$
0 \rightarrow j_{!} \mathbf{Q}_{\ell} \rightarrow \mathbf{Q}_{\ell} \rightarrow \bigoplus_{i=1}^{n} \mathbf{Q}_{\ell, x_{i}} \rightarrow 0
$$

The long exact cohomology sequence reads

$$
0 \rightarrow \mathbf{Q}_{\ell} \rightarrow \bigoplus_{i=1}^{n} \mathbf{Q}_{\ell}^{\oplus \operatorname{deg} x_{i}} \rightarrow H_{c}^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right) \rightarrow H_{c}^{1}\left(\bar{X}_{\bar{k}}, \mathbf{Q}_{\ell}\right) \rightarrow 0
$$

where the action of Frobenius on $\bigoplus_{i=1}^{n} \mathbf{Q}_{\ell}^{\oplus \operatorname{deg} x_{i}}$ is by cyclic permutation of each term; and $H_{c}^{2}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=H_{c}^{2}\left(\bar{X}_{\bar{k}}, \mathbf{Q}_{\ell}\right)$.

### 49.101. The Legendre family

03 VA Let $k$ be a finite field of odd characteristic, $X=\operatorname{Spec}\left(k\left[\lambda, \frac{1}{\lambda(\lambda-1)}\right]\right)$, and consider the family of elliptic curves $f: E \rightarrow X$ on $\mathbf{P}_{X}^{2}$ whose affine equation is $y^{2}=$ $x(x-1)(x-\lambda)$. We set $\mathcal{F}=R f_{*}^{1} \mathbf{Q}_{\ell}=\left\{R^{1} f_{*} \mathbf{Z} / \ell^{n} \mathbf{Z}\right\}_{n \geq 1} \otimes \mathbf{Q}_{\ell}$. In this situation, the following is true

- for each $n \geq 1$, the sheaf $R^{1} f_{*}\left(\mathbf{Z} / \ell^{n} \mathbf{Z}\right)$ is finite locally constant - in fact, it is free of rank 2 over $\mathbf{Z} / \ell^{n} \mathbf{Z}$,
- the system $\left\{R^{1} f_{*} \mathbf{Z} / \ell^{n} \mathbf{Z}\right\}_{n \geq 1}$ is a lisse $\ell$-adic sheaf, and
- for all $x \in|X|$, $\operatorname{det}\left(1-\left.\bar{\pi}_{x} T^{\operatorname{deg} x}\right|_{\mathcal{F}_{\bar{x}}}\right)=\left(1-\alpha_{x} T^{\operatorname{deg} x}\right)\left(1-\beta_{x} T^{\operatorname{deg} x}\right)$ where $\alpha_{x}, \beta_{x}$ are the eigenvalues of the geometric frobenius of $E_{x}$ acting on $H^{1}\left(E_{\bar{x}}, \mathbf{Q}_{\ell}\right)$.
Note that $E_{x}$ is only defined over $\kappa(x)$ and not over $k$. The proof of these facts uses the proper base change theorem and the local acyclicity of smooth morphisms. For details, see Del77]. It follows that

$$
L(E / X):=L(X, \mathcal{F})=\prod_{x \in|X|} \frac{1}{\left(1-\alpha_{x} T^{\operatorname{deg} x}\right)\left(1-\beta_{x} T^{\operatorname{deg} x}\right)}
$$

Applying Theorem 49.97.2 we get

$$
L(E / X)=\prod_{i=0}^{2} \operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)^{(-1)^{i+1}}
$$

and we see in particular that this is a rational function. Furthermore, it is relatively easy to show that $H_{c}^{0}\left(X_{\bar{k}}, \mathcal{F}\right)=H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}\right)=0$, so we merely have

$$
L(E / X)=\operatorname{det}\left(1-\left.\pi_{X}^{*} T\right|_{H_{c}^{1}(X, \mathcal{F})}\right) .
$$

To compute this determinant explicitly, consider the Leray spectral sequence for the proper morphism $f: E \rightarrow X$ over $\mathbf{Q}_{\ell}$, namely

$$
H_{c}^{i}\left(X_{\bar{k}}, R^{j} f_{*} \mathbf{Q}_{\ell}\right) \Rightarrow H_{c}^{i+j}\left(E_{\bar{k}}, \mathbf{Q}_{\ell}\right)
$$

which degenerates. We have $f_{*} \mathbf{Q}_{\ell}=\mathbf{Q}_{\ell}$ and $R^{1} f_{*} \mathbf{Q}_{\ell}=\mathcal{F}$. The sheaf $R^{2} f_{*} \mathbf{Q}_{\ell}=$ $\mathbf{Q}_{\ell}(-1)$ is the Tate twist of $\mathbf{Q}_{\ell}$, i.e., it is the sheaf $\mathbf{Q}_{\ell}$ where the Galois action is given by multiplication by $\# \kappa(x)$ on the stalk at $\bar{x}$. It follows that, for all $n \geq 1$,

$$
\begin{aligned}
\# E\left(k_{n}\right) & =\sum_{i}(-1)^{i} \operatorname{Tr}\left(\left.\pi_{E}^{n *}\right|_{H_{c}^{i}\left(E_{\bar{k}}, \mathbf{Q}_{\ell}\right)}\right) \\
& =\sum_{i, j}(-1)^{i+j} \operatorname{Tr}\left(\left.\pi_{X}^{n *}\right|_{H_{c}^{i}\left(X_{\bar{k}}, R^{j} f_{*} \mathbf{Q}_{\ell}\right)}\right) \\
& =\left(q^{n}-2\right)+\operatorname{Tr}\left(\left.\pi_{X}^{n}\right|_{H_{c}^{1}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)+q^{n}\left(q^{n}-2\right) \\
& =q^{2 n}-q^{n}-2+\operatorname{Tr}\left(\left.\pi_{X}^{n *}\right|_{H_{c}^{1}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)
\end{aligned}
$$

where the first equality follows from Theorem49.97.5, the second one from the Leray spectral sequence and the third one by writing down the higher direct images of $\mathbf{Q}_{\ell}$ under $f$. Alternatively, we could write

$$
\# E\left(k_{n}\right)=\sum_{x \in X\left(k_{n}\right)} \# E_{x}\left(k_{n}\right)
$$

and use the trace formula for each curve. We can also find the number of $k_{n}$-rational points simply by counting. The zero section contributes $q^{n}-2$ points (we omit the
points where $\lambda=0,1$ ) hence

$$
\# E\left(k_{n}\right)=q^{n}-2+\#\left\{y^{2}=x(x-1)(x-\lambda), \lambda \neq 0,1\right\}
$$

Now we have

$$
\begin{gathered}
\#\left\{y^{2}=x(x-1)(x-\lambda), \lambda \neq 0,1\right\} \\
=\#\left\{y^{2}=x(x-1)(x-\lambda) \text { in } \mathbf{A}^{3}\right\}-\#\left\{y^{2}=x^{2}(x-1)\right\}-\#\left\{y^{2}=x(x-1)^{2}\right\} \\
=\#\left\{\lambda=\frac{-y^{2}}{x(x-1)}+x, x \neq 0,1\right\}+\#\left\{y^{2}=x(x-1)(x-\lambda), x=0,1\right\}-2\left(q^{n}-\varepsilon_{n}\right) \\
=q^{n}\left(q^{n}-2\right)+2 q^{n}-2\left(q^{n}-\varepsilon_{n}\right) \\
=q^{2 n}-2 q^{n}+2 \varepsilon_{n}
\end{gathered}
$$

where $\varepsilon_{n}=1$ if -1 is a square in $k_{n}, 0$ otherwise, i.e.,

$$
\varepsilon_{n}=\frac{1}{2}\left(1+\left(\frac{-1}{k_{n}}\right)\right)=\frac{1}{2}\left(1+(-1)^{\frac{q^{n}-1}{2}}\right)
$$

Thus $\# E\left(k_{n}\right)=q^{2 n}-q^{n}-2+2 \varepsilon_{n}$. Comparing with the previous formula, we find

$$
\operatorname{Tr}\left(\left.\pi_{X}^{n *}\right|_{H_{c}^{1}\left(X_{\bar{k}}, \mathcal{F}\right)}\right)=2 \varepsilon_{n}=1+(-1)^{\frac{q^{n}-1}{2}}
$$

which implies, by elementary algebra of complex numbers, that if -1 is a square in $k_{n}^{*}$, then $\operatorname{dim} H_{c}^{1}\left(X_{\bar{k}}, \mathcal{F}\right)=2$ and the eigenvalues are 1 and 1 . Therefore, in that case we have

$$
L(E / X)=(1-T)^{2}
$$

### 49.102. Exponential sums

03 VB A standard problem in number theory is to evaluate sums of the form

$$
S_{a, b}(p)=\sum_{x \in \mathbf{F}_{p}-\{0,1\}} e^{\frac{2 \pi i x^{a}(x-1)^{b}}{p}}
$$

In our context, this can be interpreted as a cohomological sum as follows. Consider the base scheme $S=\operatorname{Spec}\left(\mathbf{F}_{p}\left[x, \frac{1}{x(x-1)}\right]\right)$ and the affine curve $f: X \rightarrow \mathbf{P}^{1}-\{0,1, \infty\}$ over $S$ given by the equation $y^{p-1}=x^{a}(x-1)^{b}$. This is a finite étale Galois cover with group $\mathbf{F}_{p}^{*}$ and there is a splitting

$$
f_{*}\left(\overline{\mathbf{Q}}_{\ell}^{*}\right)=\bigoplus_{\chi: \mathbf{F}_{p}^{*} \rightarrow \overline{\mathbf{Q}}_{\ell}^{*}} \mathcal{F}_{\chi}
$$

where $\chi$ varies over the characters of $\mathbf{F}_{p}^{*}$ and $\mathcal{F}_{\chi}$ is a rank 1 lisse $\mathbf{Q}_{\ell}$-sheaf on which $\mathbf{F}_{p}^{*}$ acts via $\chi$ on stalks. We get a corresponding decomposition

$$
H_{c}^{1}\left(X_{\bar{k}}, \mathbf{Q}_{\ell}\right)=\bigoplus_{\chi} H^{1}\left(\mathbf{P}_{\bar{k}}^{1}-\{0,1, \infty\}, \mathcal{F}_{\chi}\right)
$$

and the cohomological interpretation of the exponential sum is given by the trace formula applied to $\mathcal{F}_{\chi}$ over $\mathbf{P}^{1}-\{0,1, \infty\}$ for some suitable $\chi$. It reads

$$
S_{a, b}(p)=-\operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{H^{1}\left(\mathbf{P}_{k}^{1}-\{0,1, \infty\}, \mathcal{F}_{\chi}\right)}\right)
$$

The general yoga of Weil suggests that there should be some cancellation in the sum. Applying (roughly) the Riemann-Hurwitz formula, we see that

$$
2 g_{X}-2 \approx-2(p-1)+3(p-2) \approx p
$$

so $g_{X} \approx p / 2$, which also suggests that the $\chi$-pieces are small.

### 49.103. Trace formula in terms of fundamental groups

03 VC In the following sections we reformulate the trace formula completely in terms of the fundamental group of a curve, except if the curve happens to be $\mathbf{P}^{1}$.

### 49.104. Fundamental groups

03VD This material is discussed in more detail in the chapter on fundamental groups. See Fundamental Groups, Section 48.1 Let $X$ be a connected scheme and let $\bar{x} \rightarrow X$ be a geometric point. Consider the functor

$$
\begin{array}{cl}
F_{\bar{x}}: \quad \begin{array}{c}
\text { finite étale } \\
\text { schemes over } X
\end{array} & \longrightarrow \\
Y / X & \longmapsto \quad F_{\bar{x}}(Y)=\left\{\begin{array}{c}
\text { finite sets } \\
\text { geom points } \bar{y} \\
\text { of } Y \text { lying over } \bar{x}
\end{array}\right\}=Y_{\bar{x}}
\end{array}
$$

Set

$$
\pi_{1}(X, \bar{x})=\operatorname{Aut}\left(F_{\bar{x}}\right)=\text { set of automorphisms of the functor } F_{\bar{x}}
$$

Note that for every finite étale $Y \rightarrow X$ there is an action

$$
\pi_{1}(X, \bar{x}) \times F_{\bar{x}}(Y) \rightarrow F_{\bar{x}}(Y)
$$

03VE Definition 49.104.1. A subgroup of the form $\operatorname{Stab}\left(\bar{y} \in F_{\bar{x}}(Y)\right) \subset \pi_{1}(X, \bar{x})$ is called open.

03VF Theorem 49.104.2 (Grothendieck). Let $X$ be a connected scheme.
(1) There is a topology on $\pi_{1}(X, \bar{x})$ such that the open subgroups form a fundamental system of open nbhds of $e \in \pi_{1}(X, \bar{x})$.
(2) With topology of (1) the group $\pi_{1}(X, \bar{x})$ is a profinite group.
(3) The functor

$$
\begin{array}{ccc}
\text { schemes finite } & & \text { finite discrete continuous } \\
\pi_{1}(X, \bar{x}) \text {-sets }
\end{array}
$$

is an equivalence of categories.
Proof. See Gro71.
03VG Proposition 49.104.3. Let $X$ be an integral normal Noetherian scheme. Let $\bar{y} \rightarrow X$ be an algebraic geometric point lying over the generic point $\eta \in X$. Then

$$
\pi_{x}(X, \bar{\eta})=\operatorname{Gal}(M / \kappa(\eta))
$$

( $\kappa(\eta)$, function field of $X)$ where

$$
\kappa(\bar{\eta}) \supset M \supset \kappa(\eta)=k(X)
$$

is the max sub-extension such that for every finite sub extension $M \supset L \supset \kappa(\eta)$ the normalization of $X$ in $L$ is finite étale over $X$.

Proof. Omitted.

Change of base point. For any $\bar{x}_{1}, \bar{x}_{2}$ geom. points of $X$ there exists an isom. of fibre functions

$$
\mathcal{F}_{\bar{x}_{1}} \cong \mathcal{F}_{\bar{x}_{2}}
$$

(This is a path from $\bar{x}_{1}$ to $\bar{x}_{2}$.) Conjugation by this path gives isom

$$
\pi_{1}\left(X, \bar{x}_{1}\right) \cong \pi_{1}\left(X, \bar{x}_{2}\right)
$$

well defined up to inner actions.
Functoriality. For any morphism $X_{1} \rightarrow X_{2}$ of connected schemes any $\bar{x} \in X_{1}$ there is a canonical map

$$
\pi_{1}\left(X_{1}, \bar{x}\right) \rightarrow \pi_{1}\left(X_{2}, \bar{x}\right)
$$

(Why? because the fibre functor ...)
Base field. Let $X$ be a variety over a field $k$. Then we get

$$
\pi_{1}(X, \bar{x}) \rightarrow \pi_{1}(\operatorname{Spec}(k), \bar{x})={ }^{\operatorname{prop}} G a l\left(k^{\mathrm{sep}} / k\right)
$$

This map is surjective if and only if $X$ is geometrically connected over $k$. So in the geometrically connected case we get s.e.s. of profinite groups

$$
1 \rightarrow \pi_{1}\left(X_{\bar{k}}, \bar{x}\right) \rightarrow \pi_{1}(X, \bar{x}) \rightarrow \operatorname{Gal}\left(k^{\text {sep }} / k\right) \rightarrow 1
$$

$\left(\pi_{1}\left(X_{\bar{k}}, \bar{x}\right)\right.$ : geometric fundamental group of $X, \pi_{1}(X, \bar{x})$ : arithmetic fundamental group of $X$ )
Comparison. If $X$ is a variety over $\mathbf{C}$ then

$$
\pi_{1}(X, \bar{x})=\text { profinite completion of } \pi_{1}(X(\mathbf{C})(\text { usual topology }), x)
$$

(have $x \in X(\mathbf{C})$ )
Frobenii. $X$ variety over $k, \# k<\infty$. For any $x \in X$ closed point, let

$$
F_{x} \in \pi_{1}(x, \bar{x})=\operatorname{Gal}\left(\kappa(x)^{\mathrm{sep}} / \kappa(x)\right)
$$

be the geometric frobenius. Let $\bar{\eta}$ be an alg. geom. gen. pt. Then

$$
\pi_{1}(X, \bar{\eta}) \leftarrow \cong \pi_{1}(X, \bar{x}) \begin{gathered}
\text { functoriality } \\
\leftarrow
\end{gathered} \pi_{1}(x, \bar{x})
$$

Easy fact:

$$
\begin{array}{ccc}
\pi_{1}(X, \bar{\eta}) \rightarrow{ }^{\operatorname{deg}} \pi_{1}(\operatorname{Spec}(k), \bar{\eta}) * & =\operatorname{Gal}\left(k^{\text {sep }} / k\right) \\
& & \| \\
F_{x} & \mapsto & \widehat{\mathbf{Z}} \cdot F_{\operatorname{Spec}(k)} \\
& & \operatorname{deg}(x) \cdot F_{\operatorname{Spec}(k)}
\end{array}
$$

Recall: $\operatorname{deg}(x)=[\kappa(x): k]$
Fundamental groups and lisse sheaves. Let $X$ be a connected scheme, $\bar{x}$ geom. pt. There are equivalences of categories
( $\Lambda$ finite ring)
fin. loc. const. sheaves of
$\Lambda$-modules of $X_{\text {étale }}$$\leftrightarrow$
finite (discrete) $\Lambda$-modules
with continuous $\pi_{1}(X, \bar{x})$-action
$(\ell$ a prime $) \quad \begin{gathered}\text { lisse } \ell \text {-adic } \\ \text { sheaves }\end{gathered} \leftrightarrow \quad \leftrightarrow \quad \begin{gathered}\text { finitely generated } \mathbf{Z}_{\ell} \text {-modules } M \text { with continuous }\end{gathered}$

In particular lisse $\mathbf{Q}_{l}$-sheaves correspond to continuous homomorphisms

$$
\pi_{1}(X, \bar{x}) \rightarrow \mathrm{GL}_{r}\left(\mathbf{Q}_{l}\right), \quad r \geq 0
$$

Notation: A module with action $(M, \rho)$ corresponds to the sheaf $\mathcal{F}_{\rho}$.
Trace formulas. $X$ variety over $k, \# k<\infty$.
(1) $\Lambda$ finite ring $(\# \Lambda, \# k)=1$

$$
\rho: \pi_{1}(X, \bar{x}) \rightarrow \operatorname{GL}_{r}(\Lambda)
$$

continuous. For every $n \geq 1$ we have

$$
\sum_{d \mid n} d\left(\sum_{\substack{x \in|X|, \operatorname{deg}(x)=d}} \operatorname{Tr}\left(\rho\left(F_{x}^{n / d}\right)\right)\right)=\operatorname{Tr}\left(\left.\left(\pi_{x}^{n}\right)^{*}\right|_{R \Gamma_{c}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)}\right)
$$

(2) $l \neq \operatorname{char}(k)$ prime, $\rho: \pi_{1}(X, \bar{x}) \rightarrow \mathrm{GL}_{r}\left(\mathbf{Q}_{l}\right)$. For any $n \geq 1$

$$
\sum_{d \mid n} d\left(\sum_{\substack{x \in|X| \\ \operatorname{deg}(x)=d}} \operatorname{Tr}\left(\rho\left(F_{x}^{n / d}\right)\right)\right)=\sum_{i=0}^{2 \operatorname{dim} X}(-1)^{i} \operatorname{Tr}\left(\left.\pi_{X}^{*}\right|_{H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)}\right)
$$

Weil conjectures. (Deligne-Weil I, 1974) $X$ smooth proj. over $k, \# k=q$, then the eigenvalues of $\pi_{X}^{*}$ on $H^{i}\left(X_{\bar{k}}, \mathbf{Q}_{l}\right)$ are algebraic integers $\alpha$ with $|\alpha|=q^{1 / 2}$.
Deligne's conjectures. (almost completely proved by Lafforgue + ...) Let $X$ be a normal variety over $k$ finite

$$
\rho: \pi_{1}(X, \bar{x}) \longrightarrow \mathrm{GL}_{r}\left(\mathbf{Q}_{l}\right)
$$

continuous. Assume: $\rho$ irreducible $\operatorname{det}(\rho)$ of finite order. Then
(1) there exists a number field $E$ such that for all $x \in|X|$ (closed points) the char. poly of $\rho\left(F_{x}\right)$ has coefficients in $E$.
(2) for any $x \in|X|$ the eigenvalues $\alpha_{x, i}, i=1, \ldots, r$ of $\rho\left(F_{x}\right)$ have complex absolute value 1. (these are algebraic numbers not necessary integers)
(3) for every finite place $\lambda$ ( not dividing $p$ ), of $E$ (maybe after enlarging $E$ a bit) there exists

$$
\rho \lambda: \pi_{1}(X, \bar{x}) \rightarrow \operatorname{GL}_{r}\left(E_{\lambda}\right)
$$

compatible with $\rho$. (some char. polys of $F_{x}$ 's)
03VH Theorem 49.104.4 (Deligne, Weil II). For a sheaf $\mathcal{F}_{\rho}$ with $\rho$ satisfying the conclusions of the conjecture above then the eigenvalues of $\pi_{X}^{*}$ on $H_{c}^{i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)$ are algebraic numbers $\alpha$ with absolute values

$$
|\alpha|=q^{w / 2}, \text { for } w \in \mathbf{Z}, w \leq i
$$

Moreover, if $X$ smooth and proj. then $w=i$.
Proof. See Del74a.

### 49.105. Profinite groups, cohomology and homology

03VI Let $G$ be a profinite group.
Cohomology. Consider the category of discrete modules with continuous $G$-action. This category has enough injectives and we can define

$$
H^{i}(G, M)=R^{i} H^{0}(G, M)=R^{i}\left(M \mapsto M^{G}\right)
$$

Also there is a derived version $R H^{0}(G,-)$.
Homology. Consider the category of compact abelian groups with continuous $G$-action. This category has enough projectives and we can define

$$
H_{i}(G, M)=L_{i} H_{0}(G, M)=L_{i}\left(M \mapsto M_{G}\right)
$$

and there is also a derived version.
Trivial duality. The functor $M \mapsto M^{\wedge}=\operatorname{Hom}_{\text {cont }}\left(M, S^{1}\right)$ exchanges the categories above and

$$
H^{i}(G, M)^{\wedge}=H_{i}\left(G, M^{\wedge}\right)
$$

Moreover, this functor maps torsion discrete $G$-modules to profinite continuous $G$-modules and vice versa, and if $M$ is either a discrete or profinite continuous $G$-module, then $M^{\wedge}=\operatorname{Hom}(M, \mathbf{Q} / \mathbf{Z})$.

## Notes on Homology.

(1) If we look at $\Lambda$-modules for a finite ring $\Lambda$ then we can identify

$$
H_{i}(G, M)=\operatorname{Tor}_{i}^{\Lambda[[G]]}(M, \Lambda)
$$

where $\Lambda[[G]]$ is the limit of the group algebras of the finite quotients of $G$.
(2) If $G$ is a normal subgroup of $\Gamma$, and $\Gamma$ is also profinite then

- $H^{0}(G,-)$ : discrete $\Gamma$-module $\rightarrow$ discrete $\Gamma / G$-modules
- $H_{0}(G,-)$ : compact $\Gamma$-modules $\rightarrow$ compact $\Gamma / G$-modules
and hence the profinite group $\Gamma / G$ acts on the cohomology groups of $G$ with values in a $\Gamma$-module. In other words, there are derived functors
$R H^{0}(G,-): D^{+}($discrete $\Gamma$-modules $) \longrightarrow D^{+}($discrete $\Gamma / G$-modules) and similarly for $L H_{0}(G,-)$.

### 49.106. Cohomology of curves, revisited

03 VJ Let $k$ be a field, $X$ be geometrically connected, smooth curve over $k$. We have the fundamental short exact sequence

$$
1 \rightarrow \pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right) \rightarrow \pi_{1}(X, \bar{\eta}) \rightarrow \operatorname{Gal}\left(k^{\text {sep }} / k\right) \rightarrow 1
$$

If $\Lambda$ is a finite ring with $\# \Lambda \in k^{*}$ and $M$ a finite $\Lambda$-module, and we are given

$$
\rho: \pi_{1}(X, \bar{\eta}) \rightarrow \operatorname{Aut}_{\Lambda}(M)
$$

continuous, then $\mathcal{F}_{\rho}$ denotes the associated sheaf on $X_{\text {étale }}$.
03VK Lemma 49.106.1. There is a canonical isomorphism

$$
H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=(M)_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}(-1)
$$

as $G a l\left(k^{\text {sep }} / k\right)$-modules.
Here the subscript ${ }_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}$ indicates co-invariants, and ( -1 ) indicates the Tate twist i.e., $\sigma \in \operatorname{Gal}\left(k^{\text {sep }} / k\right)$ acts via

$$
\chi_{c y c l}(\sigma)^{-1} \cdot \sigma \text { on RHS }
$$

where

$$
\chi_{c y c l}: \operatorname{Gal}\left(k^{s e p} / k\right) \rightarrow \prod_{l \neq \operatorname{char}(k)} \mathbf{Z}_{l}^{*}
$$

is the cyclotomic character.
Reformulation (Deligne, Weil II, page 338). For any finite locally constant sheaf $\mathcal{F}$ on $X$ there is a maximal quotient $\mathcal{F} \rightarrow \mathcal{F}^{\prime \prime}$ with $\mathcal{F}^{\prime \prime} / X_{\bar{k}}$ a constant sheaf, hence

$$
\mathcal{F}^{\prime \prime}=(X \rightarrow \operatorname{Spec}(k))^{-1} F^{\prime \prime}
$$

where $F^{\prime \prime}$ is a sheaf $\operatorname{Spec}(k)$, i.e., a $\operatorname{Gal}\left(k^{\text {sep }} / k\right)$-module. Then

$$
H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}\right) \rightarrow H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}^{\prime \prime}\right) \rightarrow F^{\prime \prime}(-1)
$$

is an isomorphism.
Proof of Lemma 49.106.1, Let $Y \rightarrow^{\varphi} X$ be the finite étale Galois covering corresponding to $\operatorname{Ker}(\rho) \subset \pi_{1}(X, \bar{\eta})$. So

$$
\operatorname{Aut}(Y / X)=\operatorname{Ind}(\rho)
$$

is Galois group. Then $\varphi^{*} \mathcal{F}_{\rho}=\underline{M}_{Y}$ and

$$
\varphi_{*} \varphi^{*} \mathcal{F}_{\rho} \rightarrow \mathcal{F}_{\rho}
$$

which gives

$$
\begin{aligned}
& H_{c}^{2}\left(X_{\bar{k}}, \varphi_{*} \varphi^{*} \mathcal{F}_{\rho}\right) \rightarrow H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right) \\
& =H_{c}^{2}\left(Y_{\bar{k}}, \varphi^{*} \mathcal{F}_{\rho}\right) \\
& =H_{c}^{2}\left(Y_{\bar{k}}, \underline{M}\right)=\oplus_{\text {irred. comp. of }}^{Y_{\bar{k}}} \text { in }
\end{aligned}
$$

$$
\operatorname{Im}(\rho) \rightarrow H_{c}^{2}\left(Y_{\bar{k}}, \underline{M}\right)=\oplus_{\text {irred. }}^{\substack{Y_{\bar{k}}}} \underset{\operatorname{comp.} \text { of }}{ } M \rightarrow \operatorname{Im}(\rho) \text { equivalent } H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right) \rightarrow \underset{\substack{\operatorname{trivial} \operatorname{Im}(\rho) \\ \text { action }}}{\operatorname{Im}}
$$

irreducible curve $C / \bar{k}, H_{c}^{2}(C, \underline{M})=M$.
Since

$$
\begin{aligned}
& \text { set of irreducible } \\
& \text { components of } Y_{k}
\end{aligned}=\frac{\operatorname{Im}(\rho)}{\operatorname{Im}\left(\left.\rho\right|_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}\right)}
$$

We conclude that $H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)$ is a quotient of $M_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}$. On the other hand, there is a surjection

$$
\begin{gathered}
\mathcal{F}_{\rho} \rightarrow \mathcal{F}^{\prime \prime}=\begin{array}{c}
\text { sheaf on } X \text { associated to } \\
(M)_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)} \leftarrow \pi_{1}(X, \bar{\eta})
\end{array} \\
H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right) \rightarrow M_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}
\end{gathered}
$$

The twist in Galois action comes from the fact that $H_{c}^{2}\left(X_{\bar{k}}, \mu_{n}\right)={ }^{\text {can }} \mathbf{Z} / n \mathbf{Z}$.
03VL Remark 49.106.2. Thus we conclude that if $X$ is also projective then we have functorially in the representation $\rho$ the identifications

$$
H^{0}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=M^{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}
$$

and

$$
H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=M_{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}(-1)
$$

Of course if $X$ is not projective, then $H_{c}^{0}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=0$.
03 VM Proposition 49.106.3. Let $X / k$ as before but $X_{\bar{k}} \neq \mathbf{P}_{\frac{1}{k}}$ The functors $(M, \rho) \mapsto$ $H_{c}^{2-\imath}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)$ are the left derived functor of $(M, \rho) \mapsto H_{c}^{2}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)$ so

$$
H_{c}^{2-i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=H_{i}\left(\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right), M\right)(-1)
$$

Moreover, there is a derived version, namely

$$
R \Gamma_{c}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=L H_{0}\left(\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right), M(-1)\right)=M(-1) \otimes_{\Lambda\left[\left[\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)\right]\right]}^{\mathbf{L}} \Lambda
$$

in $D(\Lambda[[\widehat{\mathbf{Z}}]])$. Similarly, the functors $(M, \rho) \mapsto H^{i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)$ are the right derived functor of $(M, \rho) \mapsto M^{\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right)}$ so

$$
H^{i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right)=H^{i}\left(\pi_{1}\left(X_{\bar{k}}, \bar{\eta}\right), M\right)
$$

Moreover, in this case there is a derived version too.
Proof. (Idea) Show both sides are universal $\delta$-functors.
03VN Remark 49.106.4. By the proposition and Trivial duality then you get

$$
H_{c}^{2-i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}\right) \times H^{i}\left(X_{\bar{k}}, \mathcal{F}_{\rho}^{\wedge}(1)\right) \rightarrow \mathbf{Q} / \mathbf{Z}
$$

a perfect pairing. If $X$ is projective then this is Poincare duality.

### 49.107. Abstract trace formula

03 VO Suppose given an extension of profinite groups,

$$
1 \rightarrow G \rightarrow \Gamma \xrightarrow{\text { deg }} \widehat{\mathbf{Z}} \rightarrow 1
$$

We say $\Gamma$ has an abstract trace formula if and only if there exist
(1) an integer $q \geq 1$, and
(2) for every $d \geq 1$ a finite set $S_{d}$ and for each $x \in S_{d}$ a conjugacy class $F_{x} \in \Gamma$ with $\operatorname{deg}\left(F_{x}\right)=d$
such that the following hold
(1) for all $\ell$ not dividing $q$ have $\operatorname{cd}_{\ell}(G)<\infty$, and
(2) for all finite rings $\Lambda$ with $q \in \Lambda^{*}$, for all finite projective $\Lambda$-modules $M$ with continuous $\Gamma$-action, for all $n>0$ we have

$$
\sum_{d \mid n} d\left(\sum_{x \in S_{d}} \operatorname{Tr}\left(\left.F_{x}^{n / d}\right|_{M}\right)\right)=q^{n} \operatorname{Tr}\left(\left.F^{n}\right|_{M \otimes_{\Lambda[[G]]}^{\mathrm{L}} \Lambda}\right)
$$

in $\Lambda^{\natural}$.
Here $M \otimes_{\Lambda[[G]]}^{\mathbf{L}} \Lambda=L H_{0}(G, M)$ denotes derived homology, and $F=1$ in $\Gamma / G=\widehat{\mathbf{Z}}$.
03VP Remark 49.107.1. Here are some observations concerning this notion.
(1) If modeling projective curves then we can use cohomology and we don't need factor $q^{n}$.
(2) The only examples I know are $\Gamma=\pi_{1}(X, \bar{\eta})$ where $X$ is smooth, geometrically irreducible and $K(\pi, 1)$ over finite field. In this case $q=(\# k)^{\operatorname{dim} X}$. Modulo the proposition, we proved this for curves in this course.
(3) Given the integer $q$ then the sets $S_{d}$ are uniquely determined. (You can multiple $q$ by an integer $m$ and then replace $S_{d}$ by $m^{d}$ copies of $S_{d}$ without changing the formula.)

03VQ Example 49.107.2. Fix an integer $q \geq 1$

$$
\begin{array}{rllllll}
1 & \rightarrow G=\widehat{\mathbf{Z}}^{(q)} & \rightarrow & \Gamma & \rightarrow & \widehat{\mathbf{Z}} & \rightarrow \\
& =\prod_{l l q} \mathbf{Z}_{l} & & F & \mapsto & 1
\end{array}
$$

with $F x F^{-1}=u x, u \in\left(\widehat{\mathbf{Z}}^{(q)}\right)^{*}$. Just using the trivial modules $\mathbf{Z} / m \mathbf{Z}$ we see

$$
q^{n}-(q u)^{n} \equiv \sum_{d \mid n} d \# S_{d}
$$

in $\mathbf{Z} / m \mathbf{Z}$ for all $(m, q)=1$ (up to $u \rightarrow u^{-1}$ ) this implies $q u=a \in \mathbf{Z}$ and $|a|<q$. The special case $a=1$ does occur with

$$
\Gamma=\pi_{1}^{t}\left(\mathbf{G}_{m, \mathbf{F}_{p}}, \bar{\eta}\right), \quad \# S_{1}=q-1, \quad \text { and } \quad \# S_{2}=\frac{\left(q^{2}-1\right)-(q-1)}{2}
$$

### 49.108. Automorphic forms and sheaves

03VR References: See especially the amazing papers Dri83, Dri84 and Dri80 by Drinfeld.

Unramified cusp forms. Let $k$ be a finite field of characteristic $p$. Let $X$ geometrically irreducible projective smooth curve over $k$. Set $K=k(X)$ equal to the function field of $X$. Let $v$ be a place of $K$ which is the same thing as a closed point $x \in X$. Let $K_{v}$ be the completion of $K$ at $v$, which is the same thing as the fraction field of the completion of the local ring of $X$ at $x$, i.e., $K_{v}=f . f .\left(\widehat{O_{X, x}}\right)$. Denote $O_{v} \subset K_{v}$ the ring of integers. We further set

$$
O=\prod_{v} O_{v} \subset \mathbf{A}=\prod_{v}^{\prime} K_{v}
$$

and we let $\Lambda$ be any ring with $p$ invertible in $\Lambda$.
03VS Definition 49.108.1. An unramified cusp form on $G L_{2}(\mathbf{A})$ with values in $\Lambda^{8}$ is a function

$$
f: \mathrm{GL}_{2}(\mathbf{A}) \rightarrow \Lambda
$$

such that
(1) $f(x \gamma)=f(x)$ for all $x \in \mathrm{GL}_{2}(\mathbf{A})$ and all $\gamma \in \mathrm{GL}_{2}(K)$
(2) $f(u x)=f(x)$ for all $x \in \mathrm{GL}_{2}(\mathbf{A})$ and all $u \in \mathrm{GL}_{2}(O)$
(3) for all $x \in \mathrm{GL}_{2}(\mathbf{A})$,

$$
\int_{\mathbf{A}} \bmod K\left(x\left(\begin{array}{ll}
1 & z \\
0 & 1
\end{array}\right)\right) d z=0
$$

see dJ01, Section 4.1] for an explanation of how to make sense out of this for a general ring $\Lambda$ in which $p$ is invertible.

Hecke Operators. For $v$ a place of $K$ and $f$ an unramified cusp form we set

$$
T_{v}(f)(x)=\int_{g \in M_{v}} f\left(g^{-1} x\right) d g
$$

and

$$
U_{v}(f)(x)=f\left(\left(\begin{array}{cc}
\pi_{v}^{-1} & 0 \\
0 & \pi_{v}^{-1}
\end{array}\right) x\right)
$$

Notations used: here $\pi_{v} \in O_{v}$ is a uniformizer

$$
M_{v}=\left\{h \in \operatorname{Mat}\left(2 \times 2, O_{v}\right) \mid \operatorname{det} h=\pi_{v} O_{v}^{*}\right\}
$$

and $d g=$ is the Haar measure on $\mathrm{GL}_{2}\left(K_{v}\right)$ with $\int_{\mathrm{GL}_{2}\left(O_{v}\right)} d g=1$. Explicitly we have

$$
T_{v}(f)(x)=f\left(\left(\begin{array}{cc}
\pi_{v}^{-1} & 0 \\
0 & 1
\end{array}\right) x\right)+\sum_{i=1}^{q_{v}} f\left(\left(\begin{array}{cc}
1 & 0 \\
-\pi_{v}^{-1} \lambda_{i} & \pi_{v}^{-1}
\end{array}\right) x\right)
$$

with $\lambda_{i} \in O_{v}$ a set of representatives of $O_{v} /\left(\pi_{v}\right)=\kappa_{v}, q_{v}=\# \kappa_{v}$.
Eigenforms. An eigenform $f$ is an unramified cusp form such that some value of $f$ is a unit and $T_{v} f=t_{v} f$ and $U_{v} f=u_{v} f$ for some (uniquely determined) $t_{v}, u_{v} \in \Lambda$.

[^135]03VT Theorem 49.108.2. Given an eigenform $f$ with values in $\overline{\mathbf{Q}}_{l}$ and eigenvalues $u_{v} \in \overline{\mathbf{Z}}_{l}^{*}$ then there exists

$$
\rho: \pi_{1}(X) \rightarrow G L_{2}(E)
$$

continuous, absolutely irreducible where $E$ is a finite extension of $\mathbf{Q}_{\ell}$ contained in $\overline{\mathbf{Q}}_{l}$ such that $t_{v}=\operatorname{Tr}\left(\rho\left(F_{v}\right)\right)$, and $u_{v}=q_{v}^{-1} \operatorname{det}\left(\rho\left(F_{v}\right)\right)$ for all places $v$.
Proof. See Dri80.
03 VU Theorem 49.108.3. Suppose $\mathbf{Q}_{l} \subset E$ finite, and

$$
\rho: \pi_{1}(X) \rightarrow G L_{2}(E)
$$

absolutely irreducible, continuous. Then there exists an eigenform $f$ with values in $\overline{\mathbf{Q}}_{l}$ whose eigenvalues $t_{v}$, $u_{v}$ satisfy the equalities $t_{v}=\operatorname{Tr}\left(\rho\left(F_{v}\right)\right)$ and $u_{v}=$ $q_{v}^{-1} \operatorname{det}\left(\rho\left(F_{v}\right)\right)$.
Proof. See Dri83.
03VV Remark 49.108.4. We now have, thanks to Lafforgue and many other mathematicians, complete theorems like this two above for $\mathrm{GL}_{n}$ and allowing ramification! In other words, the full global Langlands correspondence for $\mathrm{GL}_{n}$ is known for function fields of curves over finite fields. At the same time this does not mean there aren't a lot of interesting questions left to answer about the fundamental groups of curves over finite fields, as we shall see below.

Central character. If $f$ is an eigenform then

$$
\begin{array}{cccc}
\chi_{f}: & O^{*} \backslash \mathbf{A}^{*} / K^{*} & \rightarrow & \Lambda^{*} \\
& \left(1, \ldots, \pi_{v}, 1, \ldots, 1\right) & \mapsto & u_{v}^{-1}
\end{array}
$$

is called the central character. If corresponds to the determinant of $\rho$ via normalizations as above. Set

$$
C(\Lambda)=\left\{\begin{array}{c}
\text { unr. cusp forms } f \text { with coefficients in } \Lambda \\
\text { such that } U_{v} f=\varphi_{v}^{-1} f \forall v
\end{array}\right\}
$$

03VW Proposition 49.108.5. If $\Lambda$ is Noetherian then $C(\Lambda)$ is a finitely generated $\Lambda$ module. Moreover, if $\Lambda$ is a field with prime subfield $\mathbf{F} \subset \Lambda$ then

$$
C(\Lambda)=(C(\mathbf{F})) \otimes_{\mathbf{F}} \Lambda
$$

compatibly with $T_{v}$ acting.
Proof. See dJ01, Proposition 4.7].
This proposition trivially implies the following lemma.
03VX Lemma 49.108.6. Algebraicity of eigenvalues. If $\Lambda$ is a field then the eigenvalues $t_{v}$ for $f \in C(\Lambda)$ are algebraic over the prime subfield $\mathbf{F} \subset \Lambda$.

Proof. Follows from Proposition 49.108.5.
Combining all of the above we can do the following very useful trick.
03VY Lemma 49.108.7. Switching l. Let $E$ be a number field. Start with

$$
\rho: \pi_{1}(X) \rightarrow S L_{2}\left(E_{\lambda}\right)
$$

absolutely irreducible continuous, where $\lambda$ is a place of $E$ not lying above $p$. Then for any second place $\lambda^{\prime}$ of $E$ not lying above $p$ there exists a finite extension $E_{\lambda^{\prime}}^{\prime}$ and a absolutely irreducible continuous representation

$$
\rho^{\prime}: \pi_{1}(X) \rightarrow S L_{2}\left(E_{\lambda^{\prime}}^{\prime}\right)
$$

which is compatible with $\rho$ in the sense that the characteristic polynomials of all Frobenii are the same.

Note how this is an instance of Deligne's conjecture!
Proof. To prove the switching lemma use Theorem 49.108 .3 to obtain $f \in C\left(\overline{\mathbf{Q}}_{l}\right)$ eigenform ass. to $\rho$. Next, use Proposition 49.108.5 to see that we may choose $f \in C\left(E^{\prime}\right)$ with $E \subset E^{\prime}$ finite. Next we may complete $E^{\prime}$ to see that we get $f \in C\left(E_{\lambda^{\prime}}^{\prime}\right)$ eigenform with $E_{\lambda^{\prime}}^{\prime}$ a finite extension of $E_{\lambda^{\prime}}$. And finally we use Theorem 49.108 .2 to obtain $\rho^{\prime}: \pi_{1}(X) \rightarrow S L_{2}\left(E_{\lambda^{\prime}}^{\prime}\right)$ abs. irred. and continuous after perhaps enlarging $E_{\lambda^{\prime}}^{\prime}$ a bit again.

Speculation: If for a (topological) ring $\Lambda$ we have

$$
\binom{\rho: \pi_{1}(X) \rightarrow S L_{2}(\Lambda)}{\text { abs irred }} \leftrightarrow \text { eigen forms in } C(\Lambda)
$$

then all eigenvalues of $\rho\left(F_{v}\right)$ algebraic (won't work in an easy way if $\Lambda$ is a finite ring. Based on the speculation that the Langlands correspondence works more generally than just over fields one arrives at the following conjecture.

Conjecture. (See [dJ01) For any continuous

$$
\rho: \pi_{1}(X) \rightarrow \mathrm{GL}_{n}\left(\mathbf{F}_{l}[[t]]\right)
$$

we have $\# \rho\left(\pi_{1}\left(X_{\bar{k}}\right)\right)<\infty$.
A rephrasing in the language of sheaves: "For any lisse sheaf of $\overline{\mathbf{F}_{l}((t))}$-modules the geom monodromy is finite."

03VZ Theorem 49.108.8. The Conjecture holds if $n \leq 2$.
Proof. See dJ01.
03W0 Theorem 49.108.9. Conjecture holds if $l>2 n$ modulo some unproven things.
Proof. See Gai07.
It turns out the conjecture is useful for something. See work of Drinfeld on Kashiwara's conjectures. But there is also the much more down to earth application as follows.

03W1 Theorem 49.108.10. (See dJ01, Theorem 3.5]) Suppose

$$
\rho_{0}: \pi_{1}(X) \rightarrow G L_{n}\left(\mathbf{F}_{l}\right)
$$

is a continuous, $l \neq p$. Assume
(1) Conj. holds for $X$,
(2) $\left.\rho_{0}\right|_{\pi_{1}\left(X_{\bar{k}}\right)}$ abs. irred., and
(3) $l$ does not divide $n$.

Then the universal determination ring $R_{\text {univ }}$ of $\rho_{0}$ is finite flat over $\mathbf{Z}_{l}$.

Explanation: There is a representation $\rho_{\text {univ }}: \pi_{1}(X) \rightarrow \mathrm{GL}_{n}\left(R_{\text {univ }}\right)$ (Univ. Defo ring) $R_{\text {univ }}$ loc. complete, residue field $\mathbf{F}_{l}$ and $\left(R_{\text {univ }} \rightarrow \mathbf{F}_{l}\right) \circ \rho_{\text {univ }} \cong \rho_{0}$. And given any $R \rightarrow \mathbf{F}_{l}, R$ local complete and $\rho: \pi_{1}(X) \rightarrow \mathrm{GL}_{n}(R)$ then there exists $\psi: R_{\text {univ }} \rightarrow R$ such that $\psi \circ \rho_{\text {univ }} \cong \rho$. The theorem says that the morphism

$$
\operatorname{Spec}\left(R_{\text {univ }}\right) \longrightarrow \operatorname{Spec}\left(\mathbf{Z}_{l}\right)
$$

is finite and flat. In particular, such a $\rho_{0}$ lifts to a $\rho: \pi_{1}(X) \rightarrow \mathrm{GL}_{n}\left(\overline{\mathbf{Q}}_{l}\right)$.
Notes:
(1) The theorem on deformations is easy.
(2) Any result towards the conjecture seems hard.
(3) It would be interesting to have more conjectures on $\pi_{1}(X)$ !

### 49.109. Counting points

03W2 Let $X$ be a smooth, geometrically irreducible, projective curve over $k$ and $q=\# k$. The trace formula gives: there exists algebraic integers $w_{1}, \ldots, w_{2 g}$ such that

$$
\# X\left(k_{n}\right)=q^{n}-\sum_{i=1}^{2 g_{X}} w_{i}^{n}+1
$$

If $\sigma \in \operatorname{Aut}(X)$ then for all $i$, there exists $j$ such that $\sigma\left(w_{i}\right)=w_{j}$.
Riemann-Hypothesis. For all $i$ we have $\left|\omega_{i}\right|=\sqrt{q}$.
This was formulated by Emil Artin, in 1924, for hyperelliptic curves. Proved by Weil 1940. Weil gave two proofs

- using intersection theory on $X \times X$, using the Hodge index theorem, and
- using the Jacobian of $X$.

There is another proof whose initial idea is due to Stephanov, and which was given by Bombieri: it uses the function field $k(X)$ and its Frobenius operator (1969). The starting point is that given $f \in k(X)$ one observes that $f^{q}-f$ is a rational function which vanishes in all the $\mathbf{F}_{q}$-rational points of $X$, and that one can try to use this idea to give an upper bound for the number of points.

### 49.110. Precise form of Chebotarev

03W3 As a first application let us prove a precise form of Chebotarev for a finite étale Galois covering of curves. Let $\varphi: Y \rightarrow X$ be a finite étale Galois covering with group $G$. This corresponds to a homomorphism

$$
\pi_{1}(X) \longrightarrow G=\operatorname{Aut}(Y / X)
$$

Assume $Y_{\bar{k}}=$ irreducible. If $C \subset G$ is a conjugacy class then for all $n>0$, we have

$$
\left|\#\left\{x \in X\left(k_{n}\right) \mid F_{x} \in C\right\}-\frac{\# C}{\# G} \cdot \# X\left(k_{n}\right)\right| \leq(\# C)(2 g-2) \sqrt{q^{n}}
$$

(Warning: Please check the coefficient $\# C$ on the right hand side carefuly before using.)

Sketch. Write

$$
\varphi_{*}\left(\overline{\mathbf{Q}_{l}}\right)=\oplus_{\pi \in \widehat{G}} \mathcal{F}_{\pi}
$$

where $\widehat{G}$ is the set of isomorphism classes of irred representations of $G$ over $\overline{\mathbf{Q}}_{l}$. For $\pi \in \widehat{G}$ let $\chi_{\pi}: G \rightarrow \overline{\mathbf{Q}}_{l}$ be the character of $\pi$. Then

$$
H^{*}\left(Y_{\bar{k}}, \overline{\mathbf{Q}}_{l}\right)=\oplus_{\pi \in \widehat{G}} H^{*}\left(Y_{\bar{k}}, \overline{\mathbf{Q}}_{l}\right)_{\pi}=(\varphi \text { finite }) \oplus_{\pi \in \widehat{G}} H^{*}\left(X_{\bar{k}}, \mathcal{F}_{\pi}\right)
$$

If $\pi \neq 1$ then we have

$$
H^{0}\left(X_{\bar{k}}, \mathcal{F}_{\pi}\right)=H^{2}\left(X_{\bar{k}}, \mathcal{F}_{\pi}\right)=0, \quad \operatorname{dim} H^{1}\left(X_{\bar{k}}, \mathcal{F}_{\pi}\right)=\left(2 g_{X}-2\right) d_{\pi}^{2}
$$

(can get this from trace formula for acting on ...) and we see that

$$
\left|\sum_{x \in X\left(k_{n}\right)} \chi_{\pi}\left(\mathcal{F}_{x}\right)\right| \leq\left(2 g_{X}-2\right) d_{\pi}^{2} \sqrt{q^{n}}
$$

Write $1_{C}=\sum_{\pi} a_{\pi} \chi_{\pi}$, then $a_{\pi}=\left\langle 1_{C}, \chi_{\pi}\right\rangle$, and $a_{1}=\left\langle 1_{C}, \chi_{1}\right\rangle=\frac{\# C}{\# G}$ where

$$
\langle f, h\rangle=\frac{1}{\# G} \sum_{g \in G} f(g) \overline{h(g)}
$$

Thus we have the relation

$$
\frac{\# C}{\# G}=\left\|1_{C}\right\|^{2}=\sum\left|a_{\pi}\right|^{2}
$$

Final step:

$$
\begin{aligned}
\#\left\{x \in X\left(k_{n}\right) \mid F_{x} \in C\right\} & =\sum_{x \in X\left(k_{n}\right)} 1_{C}(x) \\
& =\sum_{x \in X\left(k_{n}\right)} \sum_{\pi} a_{\pi} \chi_{\pi}\left(F_{x}\right) \\
& =\underbrace{\frac{\# C}{\# G X\left(k_{n}\right)}+\underbrace{\sum_{\pi \neq 1} a_{\pi} \sum_{x \in X\left(k_{n}\right)} \chi_{\pi}\left(F_{x}\right)}_{\text {error term (to be bounded by } E \text { ) }}}_{\text {term for } \pi=1}=\$ \text {, }
\end{aligned}
$$

We can bound the error term by

$$
\begin{aligned}
|E| & \leq \sum_{\substack{\pi \in \widehat{G}, \pi \neq 1}}\left|a_{\pi}\right|(2 g-2) d_{\pi}^{2} \sqrt{q^{n}} \\
& \leq \sum_{\pi \neq 1} \frac{\# C}{\# G}\left(2 g_{X}-2\right) d_{\pi}^{3} \sqrt{q^{n}}
\end{aligned}
$$

By Weil's conjecture, $\# X\left(k_{n}\right) \sim q^{n}$.

### 49.111. How many primes decompose completely?

03W4 This section gives a second application of the Riemann Hypothesis for curves over a finite field. For number theorists it may be nice to look at the paper by Ihara, entitled "How many primes decompose completely in an infinite unramified Galois extension of a global field?", see Iha83. Consider the fundamental exact sequence

$$
1 \rightarrow \pi_{1}\left(X_{\bar{k}}\right) \rightarrow \pi_{1}(X) \xrightarrow{\mathrm{deg}} \widehat{\mathbf{Z}} \rightarrow 1
$$

03W5 Proposition 49.111.1. There exists a finite set $x_{1}, \ldots, x_{n}$ of closed points of $X$ such that that set of all frobenius elements corresponding to these points topologically generate $\pi_{1}(X)$.
Another way to state this is: There exist $x_{1}, \ldots, x_{n} \in|X|$ such that the smallest normal closed subgroup $\Gamma$ of $\pi_{1}(X)$ containing 1 frobenius element for each $x_{i}$ is all of $\pi_{1}(X)$. i.e., $\Gamma=\pi_{1}(X)$.

Proof. Pick $N \gg 0$ and let

$$
\left\{x_{1}, \ldots, x_{n}\right\}=\begin{aligned}
& \text { set of all closed points of } \\
& X \text { of degree } \leq N \text { over } k
\end{aligned}
$$

Let $\Gamma \subset \pi_{1}(X)$ be as in the variant statement for these points. Assume $\Gamma \neq \pi_{1}(X)$. Then we can pick a normal open subgroup $U$ of $\pi_{1}(X)$ containing $\Gamma$ with $U \neq \pi_{1}(X)$. By R.H. for $X$ our set of points will have some $x_{i_{1}}$ of degree $N$, some $x_{i_{2}}$ of degree $N-1$. This shows deg : $\Gamma \rightarrow \widehat{\mathbf{Z}}$ is surjective and so the same holds for $U$. This exactly means if $Y \rightarrow X$ is the finite étale Galois covering corresponding to $U$, then $Y_{\bar{k}}$ irreducible. Set $G=\operatorname{Aut}(Y / X)$. Picture

$$
Y \rightarrow{ }^{G} X, \quad G=\pi_{1}(X) / U
$$

By construction all points of $X$ of degree $\leq N$, split completely in $Y$. So, in particular

$$
\# Y\left(k_{N}\right) \geq(\# G) \# X\left(k_{N}\right)
$$

Use R.H. on both sides. So you get

$$
q^{N}+1+2 g_{Y} q^{N / 2} \geq \# G \# X\left(k_{N}\right) \geq \# G\left(q^{N}+1-2 g_{X} q^{N / 2}\right)
$$

Since $2 g_{Y}-2=(\# G)\left(2 g_{X}-2\right)$, this means

$$
\left.q^{N}+1+(\# G)\left(2 g_{X}-1\right)+1\right) q^{N / 2} \geq \# G\left(q^{N}+1-2 g_{X} q^{N / 2}\right)
$$

Thus we see that $G$ has to be the trivial group if $N$ is large enough.
Weird Question. Set $W_{X}=\operatorname{deg}^{-1}(\mathbf{Z}) \subset \pi_{1}(X)$. Is it true that for some finite set of closed points $x_{1}, \ldots, x_{n}$ of $X$ the set of all frobenii corresponding to these points algebraically generate $W_{X}$ ?
By a Baire category argument this translates into the same question for all Frobenii.

### 49.112. How many points are there really?

03W6 If the genus of the curve is large relative to $q$, then the main term in the formula $\# X(k)=q-\sum \omega_{i}+1$ is not $q$ but the second term $\sum \omega_{i}$ which can (a priori) have size about $2 g_{X} \sqrt{q}$. In the paper VD83 the authors Drinfeld and Vladut show that this maximum is (as predicted by Ihara earlier) actually at most about $g \sqrt{q}$.
Fix $q$ and let $k$ be a field with $k$ elements. Set

$$
A(q)=\limsup _{g_{X} \rightarrow \infty} \frac{\# X(k)}{g_{X}}
$$

where $X$ runs over geometrically irreducible smooth projective curves over $k$. With this definition we have the following results:

- $\mathrm{RH} \Rightarrow A(q) \leq 2 \sqrt{q}$
- Ihara $\Rightarrow A(q) \leq \sqrt{2 q}$
- $\mathrm{DV} \Rightarrow A(q) \leq \sqrt{q}-1$ (actually this is sharp if $q$ is a square)

Proof. Given $X$ let $w_{1}, \ldots, w_{2 g}$ and $g=g_{X}$ be as before. Set $\alpha_{i}=\frac{w_{i}}{\sqrt{q}}$, so $\left|\alpha_{i}\right|=1$. If $\alpha_{i}$ occurs then $\bar{\alpha}_{i}=\alpha_{i}^{-1}$ also occurs. Then

$$
N=\# X(k) \leq X\left(k_{r}\right)=q^{r}+1-\left(\sum_{i} \alpha_{i}^{r}\right) q^{r / 2}
$$

Rewriting we see that for every $r \geq 1$

$$
-\sum_{i} \alpha_{i}^{r} \geq N q^{-r / 2}-q^{r / 2}-q^{-r / 2}
$$

Observe that

$$
0 \leq\left|\alpha_{i}^{n}+\alpha_{i}^{n-1}+\ldots+\alpha_{i}+1\right|^{2}=(n+1)+\sum_{j=1}^{n}(n+1-j)\left(\alpha_{i}^{j}+\alpha_{i}^{-j}\right)
$$

So

$$
\begin{aligned}
2 g(n+1) & \geq-\sum_{i}\left(\sum_{j=1}^{n}(n+1-j)\left(\alpha_{i}^{j}+\alpha_{i}^{-j}\right)\right) \\
& =-\sum_{j=1}^{n}(n+1-j)\left(\sum_{i} \alpha_{i}^{j}+\sum_{i} \alpha_{i}^{-j}\right)
\end{aligned}
$$

Take half of this to get

$$
\begin{aligned}
g(n+1) & \geq-\sum_{j=1}^{n}(n+1-j)\left(\sum_{i} \alpha_{i}^{j}\right) \\
& \geq N \sum_{j=1}^{n}(n+1-j) q^{-j / 2}-\sum_{j=1}^{n}(n+1-j)\left(q^{j / 2}+q^{-j / 2}\right)
\end{aligned}
$$

This gives

$$
\frac{N}{g} \leq\left(\sum_{j=1}^{n} \frac{n+1-j}{n+1} q^{-j / 2}\right)^{-1} \cdot\left(1+\frac{1}{g} \sum_{j=1}^{n} \frac{n+1-j}{n+1}\left(q^{j / 2}+q^{-j / 2}\right)\right)
$$

Fix $n$ let $g \rightarrow \infty$

$$
A(q) \leq\left(\sum_{j=1}^{n} \frac{n+1-j}{n+1} q^{-j / 2}\right)^{-1}
$$

So

$$
A(q) \leq \lim _{n \rightarrow \infty}(\ldots)=\left(\sum_{j=1}^{\infty} q^{-j / 2}\right)^{-1}=\sqrt{q}-1
$$

## CHAPTER 50

## Crystalline Cohomology

07GI

### 50.1. Introduction

07GJ This chapter is based on a lecture series given by Johan de Jong held in 2012 at Columbia University. The goals of this chapter are to give a quick introduction to crystalline cohomology. A reference is the book Ber74.

We have moved the more elementary purely algebraic discussion of divided power rings to a preliminary chapter as it is also useful in discussing Tate resolutions in commutative algebra. Please see Divided Power Algebra, Section 23.1.

### 50.2. Divided power envelope

07H7 The construction of the following lemma will be dubbed the divided power envelope. It will play an important role later.

07H8 Lemma 50.2.1. Let $(A, I, \gamma)$ be a divided power ring. Let $A \rightarrow B$ be a ring map. Let $J \subset B$ be an ideal with $I B \subset J$. There exists a homomorphism of divided power rings

$$
(A, I, \gamma) \longrightarrow(D, \bar{J}, \bar{\gamma})
$$

such that

$$
\operatorname{Hom}_{(A, I, \gamma)}((D, \bar{J}, \bar{\gamma}),(C, K, \delta))=\operatorname{Hom}_{(A, I)}((B, J),(C, K))
$$

functorially in the divided power algebra $(C, K, \delta)$ over $(A, I, \gamma)$. Here the LHS is morphisms of divided power rings over $(A, I, \gamma)$ and the RHS is morphisms of (ring, ideal) pairs over $(A, I)$.
Proof. Denote $\mathcal{C}$ the category of divided power rings $(C, K, \delta)$. Consider the functor $F: \mathcal{C} \longrightarrow$ Sets defined by
$F(C, K, \delta)=\left\{(\varphi, \psi) \left\lvert\, \begin{array}{c}\varphi:(A, I, \gamma) \rightarrow(C, K, \delta) \text { homomorphism of divided power rings } \\ \psi:(B, J) \rightarrow(C, K) \text { an } A \text {-algebra homomorphism with } \psi(J) \subset K\end{array}\right.\right\}$
We will show that Divided Power Algebra, Lemma 23.3.3 applies to this functor which will prove the lemma. Suppose that $(\varphi, \psi) \in F(C, K, \delta)$. Let $C^{\prime} \subset C$ be the subring generated by $\varphi(A), \psi(B)$, and $\delta_{n}(\psi(f))$ for all $f \in J$. Let $K^{\prime} \subset K \cap C^{\prime}$ be the ideal of $C^{\prime}$ generated by $\varphi(I)$ and $\delta_{n}(\psi(f))$ for $f \in J$. Then $\left(C^{\prime}, K^{\prime},\left.\delta\right|_{K^{\prime}}\right)$ is a divided power ring and $C^{\prime}$ has cardinality bounded by the cardinal $\kappa=|A| \otimes|B|^{\aleph_{0}}$. Moreover, $\varphi$ factors as $A \rightarrow C^{\prime} \rightarrow C$ and $\psi$ factors as $B \rightarrow B^{\prime} \rightarrow B$. This proves assumption (1) of Divided Power Algebra, Lemma 23.3.3 holds. Assumption (2) is clear as limits in the category of divided power rings commute with the forgetful functor $(C, K, \delta) \mapsto(C, K)$, see Divided Power Algebra, Lemma 23.3.2 and its proof.

07H9 Definition 50.2.2. Let $(A, I, \gamma)$ be a divided power ring. Let $A \rightarrow B$ be a ring map. Let $J \subset B$ be an ideal with $I B \subset J$. The divided power algebra $(D, \bar{J}, \bar{\gamma})$ constructed in Lemma 50.2.1 is called the divided power envelope of $J$ in $B$ relative to $(A, I, \gamma)$ and is denoted $D_{B}(J)$ or $D_{B, \gamma}(J)$.

Let $(A, I, \gamma) \rightarrow(C, K, \delta)$ be a homomorphism of divided power rings. The universal property of $D_{B, \gamma}(J)=(D, \bar{J}, \bar{\gamma})$ is

$$
\begin{gathered}
\text { ring maps } B \rightarrow C \\
\text { which map } J \text { into } K
\end{gathered} \longleftrightarrow \begin{gathered}
\text { divided power homomorphisms } \\
(D, \bar{J}, \bar{\gamma}) \rightarrow(C, K, \delta)
\end{gathered}
$$

and the correspondence is given by precomposing with the map $B \rightarrow D$ which corresponds to $\mathrm{id}_{D}$. Here are some properties of $(D, \bar{J}, \bar{\gamma})$ which follow directly from the universal property. There are $A$-algebra maps

07HA

$$
\begin{equation*}
B \longrightarrow D \longrightarrow B / J \tag{50.2.2.1}
\end{equation*}
$$

The first arrow maps $J$ into $\bar{J}$ and $\bar{J}$ is the kernel of the second arrow. The elements $\bar{\gamma}_{n}(x)$ where $n>0$ and $x$ is an element in the image of $J \rightarrow D$ generate $\bar{J}$ as an ideal in $D$ and generate $D$ as a $B$-algebra.

07HB Lemma 50.2.3. Let $(A, I, \gamma)$ be a divided power ring. Let $\varphi: B^{\prime} \rightarrow B$ be a surjection of $A$-algebras with kernel $K$. Let $I B \subset J \subset B$ be an ideal. Let $J^{\prime} \subset$ $B^{\prime}$ be the inverse image of $J$. Write $D_{B^{\prime}, \gamma}\left(J^{\prime}\right)=\left(D^{\prime}, \bar{J}^{\prime}, \bar{\gamma}\right)$. Then $D_{B, \gamma}(J)=$ ( $\left.D^{\prime} / K^{\prime}, \bar{J}^{\prime} / K^{\prime}, \bar{\gamma}\right)$ where $K^{\prime}$ is the ideal generated by the elements $\bar{\gamma}_{n}(k)$ for $n \geq 1$ and $k \in K$.

Proof. Write $D_{B, \gamma}(J)=(D, \bar{J}, \bar{\gamma})$. The universal property of $D^{\prime}$ gives us a homomorphism $D^{\prime} \rightarrow D$ of divided power algebras. As $B^{\prime} \rightarrow B$ and $J^{\prime} \rightarrow J$ are surjective, we see that $D^{\prime} \rightarrow D$ is surjective (see remarks above). It is clear that $\bar{\gamma}_{n}(k)$ is in the kernel for $n \geq 1$ and $k \in K$, i.e., we obtain a homomorphism $D^{\prime} / K^{\prime} \rightarrow D$. Conversely, there exists a divided power structure on $\bar{J}^{\prime} / K^{\prime} \subset D^{\prime} / K^{\prime}$, see Divided Power Algebra, Lemma 23.4.3. Hence the universal property of $D$ gives an inverse $D \rightarrow D^{\prime} / K^{\prime}$ and we win.

In the situation of Definition 50.2 .2 we can choose a surjection $P \rightarrow B$ where $P$ is a polynomial algebra over $A$ and let $J^{\prime} \subset P$ be the inverse image of $J$. The previous lemma describes $D_{B, \gamma}(J)$ in terms of $D_{P, \gamma}\left(J^{\prime}\right)$. Note that $\gamma$ extends to a divided power structure $\gamma^{\prime}$ on $I P$ by Divided Power Algebra, Lemma 23.4.2. Hence $D_{P, \gamma}\left(J^{\prime}\right)=D_{P, \gamma^{\prime}}\left(J^{\prime}\right)$ is an example of a special case of divided power envelopes we describe in the following lemma.
07 HC Lemma 50.2.4. Let $(B, I, \gamma)$ be a divided power algebra. Let $I \subset J \subset B$ be an ideal. Let $(D, \bar{J}, \bar{\gamma})$ be the divided power envelope of $J$ relative to $\gamma$. Choose elements $f_{t} \in J, t \in T$ such that $J=I+\left(f_{t}\right)$. Then there exists a surjection

$$
\Psi: B\left\langle x_{t}\right\rangle \longrightarrow D
$$

of divided power rings mapping $x_{t}$ to the image of $f_{t}$ in $D$. The kernel of $\Psi$ is generated by the elements $x_{t}-f_{t}$ and all

$$
\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)
$$

whenever $\sum r_{t} f_{t}=r_{0}$ in $B$ for some $r_{t} \in B, r_{0} \in I$.

Proof. In the statement of the lemma we think of $B\left\langle x_{t}\right\rangle$ as a divided power ring with ideal $J^{\prime}=I B\left\langle x_{t}\right\rangle+B\left\langle x_{t}\right\rangle_{+}$, see Divided Power Algebra, Remark 23.5.2. The existence of $\Psi$ follows from the universal property of divided power polynomial rings. Surjectivity of $\Psi$ follows from the fact that its image is a divided power subring of $D$, hence equal to $D$ by the universal property of $D$. It is clear that $x_{t}-f_{t}$ is in the kernel. Set

$$
\mathcal{R}=\left\{\left(r_{0}, r_{t}\right) \in I \oplus \bigoplus_{t \in T} B \mid \sum r_{t} f_{t}=r_{0} \text { in } B\right\}
$$

If $\left(r_{0}, r_{t}\right) \in \mathcal{R}$ then it is clear that $\sum r_{t} x_{t}-r_{0}$ is in the kernel. As $\Psi$ is a homomorphism of divided power rings and $\sum r_{t} x_{t}=r_{0} \in J^{\prime}$ it follows that $\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)$ is in the kernel as well. Let $K \subset B\left\langle x_{t}\right\rangle$ be the ideal generated by $x_{t}-f_{t}$ and the elements $\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)$ for $\left(r_{0}, r_{t}\right) \in \mathcal{R}$. To show that $K=\operatorname{Ker}(\Psi)$ it suffices to show that $\delta$ extends to $B\left\langle x_{t}\right\rangle / K$. Namely, if so the universal property of $D$ gives a map $D \rightarrow B\left\langle x_{t}\right\rangle / K$ inverse to $\Psi$. Hence we have to show that $K \cap J^{\prime}$ is preserved by $\delta_{n}$, see Divided Power Algebra, Lemma 23.4.3. Let $K^{\prime} \subset B\left\langle x_{t}\right\rangle$ be the ideal generated by the elements
(1) $\delta_{m}\left(\sum r_{t} x_{t}-r_{0}\right)$ where $m>0$ and $\left(r_{0}, r_{t}\right) \in \mathcal{R}$,
(2) $x_{t^{\prime}}^{[m]}\left(x_{t}-f_{t}\right)$ where $m>0$ and $t^{\prime}, t \in I$.

We claim that $K^{\prime}=K \cap J^{\prime}$. The claim proves that $K \cap J^{\prime}$ is preserved by $\delta_{n}, n>0$ by the criterion of Divided Power Algebra, Lemma 23.4.3 (2)(c) and a computation of $\delta_{n}$ of the elements listed which we leave to the reader. To prove the claim note that $K^{\prime} \subset K \cap J^{\prime}$. Conversely, if $h \in K \cap J^{\prime}$ then, modulo $K^{\prime}$ we can write

$$
h=\sum r_{t}\left(x_{t}-f_{t}\right)
$$

for some $r_{t} \in B$. As $h \in K \cap J^{\prime} \subset J^{\prime}$ we see that $r_{0}=\sum r_{t} f_{t} \in I$. Hence $\left(r_{0}, r_{t}\right) \in \mathcal{R}$ and we see that

$$
h=\sum r_{t} x_{t}-r_{0}
$$

is in $K^{\prime}$ as desired.
07KE Lemma 50.2.5. Let $(A, I, \gamma)$ be a divided power ring. Let $B$ be an $A$-algebra and $I B \subset J \subset B$ an ideal. Let $x_{i}$ be a set of variables. Then

$$
D_{B\left[x_{i}\right], \gamma}\left(J B\left[x_{i}\right]+\left(x_{i}\right)\right)=D_{B, \gamma}(J)\left\langle x_{i}\right\rangle
$$

Proof. One possible proof is to deduce this from Lemma 50.2.4 as any relation between $x_{i}$ in $B\left[x_{i}\right]$ is trivial. On the other hand, the lemma follows from the universal property of the divided power polynomial algebra and the universal property of divided power envelopes.

Conditions (1) and (2) of the following lemma hold if $B \rightarrow B^{\prime}$ is flat at all primes of $V\left(I B^{\prime}\right) \subset \operatorname{Spec}\left(B^{\prime}\right)$ and is very closely related to that condition, see Algebra, Lemma 10.98 .8 . It in particular says that taking the divided power envelope commutes with localization.

07HD Lemma 50.2.6. Let $(A, I, \gamma)$ be a divided power ring. Let $B \rightarrow B^{\prime}$ be a homomorphism of $A$-algebras. Assume that
(1) $B / I B \rightarrow B^{\prime} / I B^{\prime}$ is flat, and
(2) $\operatorname{Tor}_{1}^{B}\left(B^{\prime}, B / I B\right)=0$.

Then for any ideal $I B \subset J \subset B$ the canonical map

$$
D_{B}(J) \otimes_{B} B^{\prime} \longrightarrow D_{B^{\prime}}\left(J B^{\prime}\right)
$$

is an isomorphism.
Proof. Set $D=D_{B}(J)$ and denote $\bar{J} \subset D$ its divided power ideal with divided power structure $\bar{\gamma}$. The universal property of $D$ produces a $B$-algebra map $D \rightarrow$ $D_{B^{\prime}}\left(J B^{\prime}\right)$, whence a map as in the lemma. It suffices to show that the divided powers $\bar{\gamma}$ extend to $D \otimes_{B} B^{\prime}$ since then the universal property of $D_{B^{\prime}}\left(J B^{\prime}\right)$ will produce a map $D_{B^{\prime}}\left(J B^{\prime}\right) \rightarrow D \otimes_{B} B^{\prime}$ inverse to the one in the lemma.
Choose a surjection $P \rightarrow B^{\prime}$ where $P$ is a polynomial algebra over $B$. In particular $B \rightarrow P$ is flat, hence $D \rightarrow D \otimes_{B} P$ is flat by Algebra, Lemma 10.38.7. Then $\bar{\gamma}$ extends to $D \otimes_{B} P$ by Divided Power Algebra, Lemma 23.4.2 we will denote this extension $\bar{\gamma}$ also. Set $\mathfrak{a}=\operatorname{Ker}\left(P \rightarrow B^{\prime}\right)$ so that we have the short exact sequence

$$
0 \rightarrow \mathfrak{a} \rightarrow P \rightarrow B^{\prime} \rightarrow 0
$$

Thus $\operatorname{Tor}_{1}^{B}\left(B^{\prime}, B / I B\right)=0$ implies that $\mathfrak{a} \cap I P=I \mathfrak{a}$. Now we have the following commutative diagram

This diagram is exact even with 0's added at the top and the right. We have to show the divided powers on the ideal $\bar{J} \otimes_{B} P$ preserve the ideal $\operatorname{Im}(\alpha) \cap \bar{J} \otimes_{B} P$, see Divided Power Algebra, Lemma 23.4.3. Consider the exact sequence

$$
0 \rightarrow \mathfrak{a} / I \mathfrak{a} \rightarrow P / I P \rightarrow B^{\prime} / I B^{\prime} \rightarrow 0
$$

(which uses that $\mathfrak{a} \cap I P=I \mathfrak{a}$ as seen above). As $B^{\prime} / I B^{\prime}$ is flat over $B / I B$ this sequence remains exact after applying $B / J \otimes_{B / I B}-$, see Algebra, Lemma 10.38 .12 , Hence

$$
\operatorname{Ker}\left(B / J \otimes_{B / I B} \mathfrak{a} / I \mathfrak{a} \rightarrow B / J \otimes_{B / I B} P / I P\right)=\operatorname{Ker}(\mathfrak{a} / J \mathfrak{a} \rightarrow P / J P)
$$

is zero. Thus $\beta$ is injective. It follows that $\operatorname{Im}(\alpha) \cap \bar{J} \otimes_{B} P$ is the image of $\bar{J} \otimes \mathfrak{a}$. Now if $f \in \bar{J}$ and $a \in \mathfrak{a}$, then $\bar{\gamma}_{n}(f \otimes a)=\bar{\gamma}_{n}(f) \otimes a^{n}$ hence the result is clear.

The following lemma is a special case of [JJ95 Proposition 2.1.7] which in turn is a generalization of [Ber74, Proposition 2.8.2].
07HE Lemma 50.2.7. Let $(B, I, \gamma) \rightarrow\left(B^{\prime}, I^{\prime}, \gamma^{\prime}\right)$ be a homomorphism of divided power rings. Let $I \subset J \subset B$ and $I^{\prime} \subset J^{\prime} \subset B^{\prime}$ be ideals. Assume
(1) $B / I \rightarrow B^{\prime} / I^{\prime}$ is flat, and
(2) $J^{\prime}=J B^{\prime}+I^{\prime}$.

Then the canonical map

$$
D_{B, \gamma}(J) \otimes_{B} B^{\prime} \longrightarrow D_{B^{\prime}, \gamma^{\prime}}\left(J^{\prime}\right)
$$

is an isomorphism.

Proof. Set $D=D_{B}(J)$ and denote $\bar{J} \subset D$ its divided power ideal with divided power structure $\bar{\gamma}$. The universal property of $D$ produces a homomorphism of divided power rings $D \rightarrow D_{B^{\prime}}\left(J^{\prime}\right)$, whence a map as in the lemma. It suffices to show that there exist divided powers on the image of $D \otimes_{B} I^{\prime}+\bar{J} \otimes_{B} B^{\prime} \rightarrow D \otimes_{B} B^{\prime}$ compatible with $\bar{\gamma}$ and $\gamma^{\prime}$ since then the universal property of $D_{B^{\prime}}\left(J^{\prime}\right)$ will produce a map $D_{B^{\prime}}\left(J^{\prime}\right) \rightarrow D \otimes_{B} B^{\prime}$ inverse to the one in the lemma.
Choose elements $f_{t} \in J$ which generate $J / I$. Set $\mathcal{R}=\left\{\left(r_{0}, r_{t}\right) \in I \oplus \bigoplus_{t \in T} B \mid\right.$ $\sum r_{t} f_{t}=r_{0}$ in $\left.B\right\}$ as in the proof of Lemma50.2.4. This lemma shows that

$$
D=B\left\langle x_{t}\right\rangle / K
$$

where $K$ is generated by the elements $x_{t}-f_{t}$ and $\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)$ for $\left(r_{0}, r_{t}\right) \in \mathcal{R}$. Thus we see that

07HF

$$
\begin{equation*}
D \otimes_{B} B^{\prime}=B^{\prime}\left\langle x_{t}\right\rangle / K^{\prime} \tag{50.2.7.1}
\end{equation*}
$$

where $K^{\prime}$ is generated by the images in $B^{\prime}\left\langle x_{t}\right\rangle$ of the generators of $K$ listed above. Let $f_{t}^{\prime} \in B^{\prime}$ be the image of $f_{t}$. By assumption (1) we see that the elements $f_{t}^{\prime} \in J^{\prime}$ generate $J^{\prime} / I^{\prime}$ and we see that $x_{t}-f_{t}^{\prime} \in K^{\prime}$. Set

$$
\mathcal{R}^{\prime}=\left\{\left(r_{0}^{\prime}, r_{t}^{\prime}\right) \in I^{\prime} \oplus \bigoplus_{t \in T} B^{\prime} \mid \sum r_{t}^{\prime} f_{t}^{\prime}=r_{0}^{\prime} \text { in } B^{\prime}\right\}
$$

To finish the proof we have to show that $\delta_{n}^{\prime}\left(\sum r_{t}^{\prime} x_{t}-r_{0}^{\prime}\right) \in K^{\prime}$ for $\left(r_{0}^{\prime}, r_{t}^{\prime}\right) \in \mathcal{R}^{\prime}$, because then the presentation (50.2.7.1) of $D \otimes_{B} B^{\prime}$ is identical to the presentation of $D_{B^{\prime}, \gamma^{\prime}}\left(J^{\prime}\right)$ obtain in Lemma 50.2 .4 from the generators $f_{t}^{\prime}$. Suppose that $\left(r_{0}^{\prime}, r_{t}^{\prime}\right) \in$ $\mathcal{R}^{\prime}$. Then $\sum r_{t}^{\prime} f_{t}^{\prime}=0$ in $B^{\prime} / I^{\prime}$. As $B / I \rightarrow B^{\prime} / I^{\prime}$ is flat by assumption (1) we can apply the equational criterion of flatness (Algebra, Lemma 10.38.11) to see that there exist an $m>0$ and $r_{j t} \in B$ and $c_{j} \in B^{\prime}, j=1, \ldots, m$ such that

$$
r_{j 0}=\sum r_{j t} f_{t} \in I \text { for } j=1, \ldots, m, \quad \text { and } \quad r_{t}^{\prime}=\sum c_{j} r_{j t}
$$

Note that this also implies that $r_{0}^{\prime}=\sum c_{j} r_{j 0}$. Then we have

$$
\begin{aligned}
\delta_{n}^{\prime}\left(\sum r_{t}^{\prime} x_{t}-r_{0}^{\prime}\right) & =\delta_{n}^{\prime}\left(\sum c_{j}\left(\sum r_{j t} x_{t}-r_{j 0}\right)\right) \\
& =\sum c_{1}^{n_{1}} \ldots c_{m}^{n_{m}} \delta_{n_{1}}\left(\sum r_{1 t} x_{t}-r_{10}\right) \ldots \delta_{n_{m}}\left(\sum r_{m t} x_{t}-r_{m 0}\right)
\end{aligned}
$$

where the sum is over $n_{1}+\ldots+n_{m}=n$. This proves what we want.

### 50.3. Some explicit divided power thickenings

07 HG The constructions in this section will help us to define the connection on a crystal in modules on the crystalline site.

07HH Lemma 50.3.1. Let $(A, I, \gamma)$ be a divided power ring. Let $M$ be an $A$-module. Let $B=A \oplus M$ as an A-algebra where $M$ is an ideal of square zero and set $J=I \oplus M$. Set

$$
\delta_{n}(x+z)=\gamma_{n}(x)+\gamma_{n-1}(x) z
$$

for $x \in I$ and $z \in M$. Then $\delta$ is a divided power structure and $A \rightarrow B$ is a homomorphism of divided power rings from $(A, I, \gamma)$ to $(B, J, \delta)$.

Proof. We have to check conditions (1) - (5) of Divided Power Algebra, Definition 23.2.1. We will prove this directly for this case, but please see the proof of the next
lemma for a method which avoids calculations. Conditions (1) and (3) are clear. Condition (2) follows from

$$
\begin{aligned}
\delta_{n}(x+z) \delta_{m}(x+z) & =\left(\gamma_{n}(x)+\gamma_{n-1}(x) z\right)\left(\gamma_{m}(x)+\gamma_{m-1}(x) z\right) \\
& =\gamma_{n}(x) \gamma_{m}(x)+\gamma_{n}(x) \gamma_{m-1}(x) z+\gamma_{n-1}(x) \gamma_{m}(x) z \\
& =\frac{(n+m)!}{n!m!} \gamma_{n+m}(x)+\left(\frac{(n+m-1)!}{n!(m-1)!}+\frac{(n+m-1)!}{(n-1)!m!}\right) \gamma_{n+m-1}(x) z \\
& =\frac{(n+m)!}{n!m!} \delta_{n+m}(x+z)
\end{aligned}
$$

Condition (5) follows from

$$
\begin{aligned}
\delta_{n}\left(\delta_{m}(x+z)\right) & =\delta_{n}\left(\gamma_{m}(x)+\gamma_{m-1}(x) z\right) \\
& =\gamma_{n}\left(\gamma_{m}(x)\right)+\gamma_{n-1}\left(\gamma_{m}(x)\right) \gamma_{m-1}(x) z \\
& =\frac{(n m)!}{n!(m!)^{n}} \gamma_{n m}(x)+\frac{((n-1) m)!}{(n-1)!(m!)^{n-1}} \gamma_{(n-1) m}(x) \gamma_{m-1}(x) z \\
& =\frac{(n m)!}{n!(m!)^{n}}\left(\gamma_{n m}(x)+\gamma_{n m-1}(x) z\right)
\end{aligned}
$$

by elementary number theory. To prove (4) we have to see that

$$
\delta_{n}\left(x+x^{\prime}+z+z^{\prime}\right)=\gamma_{n}\left(x+x^{\prime}\right)+\gamma_{n-1}\left(x+x^{\prime}\right)\left(z+z^{\prime}\right)
$$

is equal to

$$
\sum_{i=0}^{n}\left(\gamma_{i}(x)+\gamma_{i-1}(x) z\right)\left(\gamma_{n-i}\left(x^{\prime}\right)+\gamma_{n-i-1}\left(x^{\prime}\right) z^{\prime}\right)
$$

This follows easily on collecting the coefficients of $1, z$, and $z^{\prime}$ and using condition (4) for $\gamma$.

07HI Lemma 50.3.2. Let $(A, I, \gamma)$ be a divided power ring. Let $M, N$ be $A$-modules. Let $q: M \times M \rightarrow N$ be an A-bilinear map. Let $B=A \oplus M \oplus N$ as an A-algebra with multiplication

$$
(x, z, w) \cdot\left(x^{\prime}, z^{\prime}, w^{\prime}\right)=\left(x x^{\prime}, x z^{\prime}+x^{\prime} z, x w^{\prime}+x^{\prime} w+q\left(z, z^{\prime}\right)+q\left(z^{\prime}, z\right)\right)
$$

and set $J=I \oplus M \oplus N$. Set

$$
\delta_{n}(x, z, w)=\left(\gamma_{n}(x), \gamma_{n-1}(x) z, \gamma_{n-1}(z) w+\gamma_{n-2}(x) q(z, z)\right)
$$

for $(a, m, n) \in J$. Then $\delta$ is a divided power structure and $A \rightarrow B$ is a homomorphism of divided power rings from $(A, I, \gamma)$ to $(B, J, \delta)$.

Proof. Suppose we want to prove that property (4) of Divided Power Algebra, Definition 23.2.1 is satisfied. Pick $(x, z, w)$ and $\left(x^{\prime}, z^{\prime}, w^{\prime}\right)$ in $J$. Pick a map

$$
A_{0}=\mathbf{Z}\left\langle s, s^{\prime}\right\rangle \longrightarrow A, \quad s \longmapsto x, s^{\prime} \longmapsto x^{\prime}
$$

which is possible by the universal property of divided power polynomial rings. Set $M_{0}=A_{0} \oplus A_{0}$ and $N_{0}=A_{0} \oplus A_{0} \oplus M_{0} \otimes_{A_{0}} M_{0}$. Let $q_{0}: M_{0} \times M_{0} \rightarrow N_{0}$ be the obvious map. Define $M_{0} \rightarrow M$ as the $A_{0}$-linear map which sends the basis vectors of $M_{0}$ to $z$ and $z^{\prime}$. Define $N_{0} \rightarrow N$ as the $A_{0}$ linear map which sends the first two basis vectors of $N_{0}$ to $w$ and $w^{\prime}$ and uses $M_{0} \otimes_{A_{0}} M_{0} \rightarrow M \otimes_{A} M \xrightarrow{q} N$ on the last summand. Then we see that it suffices to prove the identity (4) for the situation $\left(A_{0}, M_{0}, N_{0}, q_{0}\right)$. Similarly for the other identities. This reduces us to the case of a
$\mathbf{Z}$-torsion free ring $A$ and $A$-torsion free modules. In this case all we have to do is show that

$$
n!\delta_{n}(x, z, w)=(x, z, w)^{n}
$$

in the ring $A$, see Divided Power Algebra, Lemma 23.2.2. To see this note that

$$
(x, z, w)^{2}=\left(x^{2}, 2 x z, 2 x w+2 q(z, z)\right)
$$

and by induction

$$
(x, z, w)^{n}=\left(x^{n}, n x^{n-1} z, n x^{n-1} w+n(n-1) x^{n-2} q(z, z)\right)
$$

On the other hand,

$$
n!\delta_{n}(x, z, w)=\left(n!\gamma_{n}(x), n!\gamma_{n-1}(x) z, n!\gamma_{n-1}(x) w+n!\gamma_{n-2}(x) q(z, z)\right)
$$

which matches. This finishes the proof.

### 50.4. Compatibility

07HJ This section isn't required reading; it explains how our discussion fits with that of Ber74. Consider the following technical notion.

07HK Definition 50.4.1. Let $(A, I, \gamma)$ and $(B, J, \delta)$ be divided power rings. Let $A \rightarrow B$ be a ring map. We say $\delta$ is compatible with $\gamma$ if there exists a divided power structure $\bar{\gamma}$ on $J+I B$ such that

$$
(A, I, \gamma) \rightarrow(B, J+I B, \bar{\gamma}) \quad \text { and } \quad(B, J, \delta) \rightarrow(B, J+I B, \bar{\gamma})
$$

are homomorphisms of divided power rings.
Let $p$ be a prime number. Let $(A, I, \gamma)$ be a divided power ring. Let $A \rightarrow C$ be a ring map with $p$ nilpotent in $C$. Assume that $\gamma$ extends to $I C$ (see Divided Power Algebra, Lemma 23.4.2. In this situation, the (big affine) crystalline site of $\operatorname{Spec}(C)$ over $\operatorname{Spec}(A)$ as defined in $[\mathbf{B e r 7 4}$ is the opposite of the category of systems

$$
(B, J, \delta, A \rightarrow B, C \rightarrow B / J)
$$

where
(1) $(B, J, \delta)$ is a divided power ring with $p$ nilpotent in $B$,
(2) $\delta$ is compatible with $\gamma$, and
(3) the diagram

is commutative.
The conditions " $\gamma$ extends to $C$ and $\delta$ compatible with $\gamma$ " are used in Ber74 to insure that the crystalline cohomology of $\operatorname{Spec}(C)$ is the same as the crystalline cohomology of $\operatorname{Spec}(C / I C)$. We will avoid this issue by working exclusively with $C$ such that $I C=q^{1}$. In this case, for a system $(B, J, \delta, A \rightarrow B, C \rightarrow B / J)$ as above, the commutativity of the displayed diagram above implies $I B \subset J$ and compatibility is equivalent to the condition that $(A, I, \gamma) \rightarrow(B, J, \delta)$ is a homomorphism of divided power rings.

[^136]
### 50.5. Affine crystalline site

07 HL In this section we discuss the algebraic variant of the crystalline site. Our basic situation in which we discuss this material will be as follows.

07 MD Situation 50.5.1. Here $p$ is a prime number, $(A, I, \gamma)$ is a divided power ring such that $A$ is a $\mathbf{Z}_{(p) \text {-algebra, and }} A \rightarrow C$ is a ring map such that $I C=0$ and such that $p$ is nilpotent in $C$.

Usually the prime number $p$ will be contained in the divided power ideal $I$.
07HM Definition 50.5.2. In Situation 50.5.1.
(1) A divided power thickening of $C$ over $(A, I, \gamma)$ is a homomorphism of divided power algebras $(A, I, \gamma) \rightarrow(B, J, \delta)$ such that $p$ is nilpotent in $B$ and a ring map $C \rightarrow B / J$ such that

is commutative.
(2) A homomorphism of divided power thickenings

$$
(B, J, \delta, C \rightarrow B / J) \longrightarrow\left(B^{\prime}, J^{\prime}, \delta^{\prime}, C \rightarrow B^{\prime} / J^{\prime}\right)
$$

is a homomorphism $\varphi: B \rightarrow B^{\prime}$ of divided power $A$-algebras such that $C \rightarrow B / J \rightarrow B^{\prime} / J^{\prime}$ is the given map $C \rightarrow B^{\prime} / J^{\prime}$.
(3) We denote $\operatorname{CRIS}(C / A, I, \gamma)$ or simply $\operatorname{CRIS}(C / A)$ the category of divided power thickenings of $C$ over $(A, I, \gamma)$.
(4) We denote $\operatorname{Cris}(C / A, I, \gamma)$ or simply $\operatorname{Cris}(C / A)$ the full subcategory consisting of $(B, J, \delta, C \rightarrow B / J)$ such that $C \rightarrow B / J$ is an isomorphism. We often denote such an object $(B \rightarrow C, \delta)$ with $J=\operatorname{Ker}(B \rightarrow C)$ being understood.

Note that for a divided power thickening $(B, J, \delta)$ as above the ideal $J$ is locally nilpotent, see Divided Power Algebra, Lemma 23.2.6. There is a canonical functor

07KF

$$
\begin{equation*}
\operatorname{CRIS}(C / A) \longrightarrow C \text {-algebras, } \quad(B, J, \delta) \longmapsto B / J \tag{50.5.2.1}
\end{equation*}
$$

This category does not have equalizers or fibre products in general. It also doesn't have an initial object (= empty colimit) in general.

07HN Lemma 50.5.3. In Situation 50.5.1.
(1) $\operatorname{CRIS}(C / A)$ has products,
(2) $\operatorname{CRIS}(C / A)$ has all finite nonempty colimits and 50.5.2.1) commutes with these, and
(3) $\operatorname{Cris}(C / A)$ has all finite nonempty colimits and $\operatorname{Cris}(C / A) \rightarrow \operatorname{CRIS}(C / A)$ commutes with them.

Proof. The empty product is $(C, 0, \emptyset)$. If $\left(B_{t}, J_{t}, \delta_{t}\right)$ is a family of objects of $\operatorname{CRIS}(C / A)$ then we can form the product $\left(\prod B_{t}, \prod J_{t}, \prod \delta_{t}\right)$ as in Divided Power Algebra, Lemma 23.3.4. The map $C \rightarrow \prod B_{t} / \prod J_{t}=\prod B_{t} / J_{t}$ is clear.
Given two objects $(B, J, \gamma)$ and $\left(B^{\prime}, J^{\prime}, \gamma^{\prime}\right)$ of $\operatorname{CRIS}(C / A)$ we can form a cocartesian diagram

in the category of divided power rings. Then we see that we have

$$
B^{\prime \prime} / J^{\prime \prime}=B / J \otimes_{A / I} B^{\prime} / J^{\prime} \longleftarrow C \otimes_{A / I} C
$$

see Divided Power Algebra, Remark 23.3.5 Denote $J^{\prime \prime} \subset K \subset B^{\prime \prime}$ the ideal such that

is a pushout, i.e., $B^{\prime \prime} / K \cong B / J \otimes_{C} B^{\prime} / J^{\prime}$. Let $D_{B^{\prime \prime}}(K)=(D, \bar{K}, \bar{\delta})$ be the divided power envelope of $K$ in $B^{\prime \prime}$ relative to ( $B^{\prime \prime}, J^{\prime \prime}, \delta^{\prime \prime}$ ). Then it is easily verified that $(D, \bar{K}, \bar{\delta})$ is a coproduct of $(B, J, \delta)$ and $\left(B^{\prime}, J^{\prime}, \delta^{\prime}\right)$ in $\operatorname{CRIS}(C / A)$.
Next, we come to coequalizers. Let $\alpha, \beta:(B, J, \delta) \rightarrow\left(B^{\prime}, J^{\prime}, \delta^{\prime}\right)$ be morphisms of $\operatorname{CRIS}(C / A)$. Consider $B^{\prime \prime}=B^{\prime} /(\alpha(b)-\beta(b))$. Let $J^{\prime \prime} \subset B^{\prime \prime}$ be the image of $J^{\prime}$. Let $D_{B^{\prime \prime}}\left(J^{\prime \prime}\right)=(D, \bar{J}, \bar{\delta})$ be the divided power envelope of $J^{\prime \prime}$ in $B^{\prime \prime}$ relative to $\left(B^{\prime}, J^{\prime}, \delta^{\prime}\right)$. Then it is easily verified that $(D, \bar{J}, \bar{\delta})$ is the coequalizer of $(B, J, \delta)$ and $\left(B^{\prime}, J^{\prime}, \delta^{\prime}\right)$ in $\operatorname{CRIS}(C / A)$.

By Categories, Lemma 4.18.6 we have all finite nonempty colimits in $\operatorname{CRIS}(C / A)$. The constructions above shows that (50.5.2.1) commutes with them. This formally implies part (3) as $\operatorname{Cris}(C / A)$ is the fibre category of (50.5.2.1) over $C$.

07 KH Remark 50.5.4. In Situation 50.5.1 we denote Cris $^{\wedge}(C / A)$ the category whose objects are pairs $(B \rightarrow C, \delta)$ such that
(1) $B$ is a $p$-adically complete $A$-algebra,
(2) $B \rightarrow C$ is a surjection of $A$-algebras,
(3) $\delta$ is a divided power structure on $\operatorname{Ker}(B \rightarrow C)$,
(4) $A \rightarrow B$ is a homomorphism of divided power rings.

Morphisms are defined as in Definition 50.5.2. Then $\operatorname{Cris}(C / A) \subset \operatorname{Cris}^{\wedge}(C / A)$ is the full subcategory consisting of those $B$ such that $p$ is nilpotent in $B$. Conversely, any object $(B \rightarrow C, \delta)$ of $\operatorname{Cris}^{\wedge}(C / A)$ is equal to the limit

$$
(B \rightarrow C, \delta)=\lim _{e}\left(B / p^{e} B \rightarrow C, \delta\right)
$$

where for $e \gg 0$ the object $\left(B / p^{e} B \rightarrow C, \delta\right)$ lies in Cris $(C / A)$, see Divided Power Algebra, Lemma 23.4.5. In particular, we see that $\operatorname{Cris}^{\wedge}(C / A)$ is a full subcategory of the category of pro-objects of $\operatorname{Cris}(C / A)$, see Categories, Remark 4.22.4.

07KG Lemma 50.5.5. In Situation 50.5.1. Let $P \rightarrow C$ be a surjection of $A$-algebras with kernel $J$. Write $D_{P, \gamma}(J)=(D, J, \bar{\gamma})$. Let $\left(D^{\wedge}, J^{\wedge}, \bar{\gamma}^{\wedge}\right)$ be the p-adic completion of D, see Divided Power Algebra, Lemma 23.4.5. For every e $\geq 1$ set $P_{e}=P / p^{e} P$ and $J_{e} \subset P_{e}$ the image of $J$ and write $D_{P_{e}, \gamma}\left(J_{e}\right)=\left(D_{e}, \bar{J}_{e}, \bar{\gamma}\right)$. Then for all e large enough we have
(1) $p^{e} D \subset \bar{J}$ and $p^{e} D^{\wedge} \subset \bar{J}^{\wedge}$ are preserved by divided powers,
(2) $D^{\wedge} / p^{e} D^{\wedge}=D / p^{e} D=D_{e}$ as divided power rings,
(3) $\left(D_{e}, \bar{J}_{e}, \bar{\gamma}\right)$ is an object of $\operatorname{Cris}(C / A)$,
(4) $\left(D^{\wedge}, \bar{J}^{\wedge}, \bar{\gamma}^{\wedge}\right)$ is equal to $\lim _{e}\left(D_{e}, \bar{J}_{e}, \bar{\gamma}\right)$, and
(5) $\left(D^{\wedge}, \bar{J}^{\wedge}, \bar{\gamma}^{\wedge}\right)$ is an object of $C r i s^{\wedge}(C / A)$.

Proof. Part (1) follows from Divided Power Algebra, Lemma 23.4.5. It is a general property of $p$-adic completion that $D / p^{e} D=D^{\wedge} / p^{e} D^{\wedge}$. Since $D / p^{e} D$ is a divided power ring and since $P \rightarrow D / p^{e} D$ factors through $P_{e}$, the universal property of $D_{e}$ produces a map $D_{e} \rightarrow D / p^{e} D$. Conversely, the universal property of $D$ produces a map $D \rightarrow D_{e}$ which factors through $D / p^{e} D$. We omit the verification that these maps are mutually inverse. This proves (2). If $e$ is large enough, then $p^{e} C=0$, hence we see (3) holds. Part (4) follows from Divided Power Algebra, Lemma 23.4.5. Part (5) is clear from the definitions.

07HP Lemma 50.5.6. In Situation 50.5.1. Let $P$ be a polynomial algebra over $A$ and let $P \rightarrow C$ be a surjection of A-algebras with kernel $J$. With $\left(D_{e}, \bar{J}_{e}, \bar{\gamma}\right)$ as in Lemma 50.5.5; for every object $\left(B, J_{B}, \delta\right)$ of $\operatorname{CRIS}(C / A)$ there exists an $e$ and a morphism $D_{e} \rightarrow B$ of $\operatorname{CRIS}(C / A)$.

Proof. We can find an $A$-algebra homomorphism $P \rightarrow B$ lifting the map $C \rightarrow$ $B / J_{B}$. By our definition of $\operatorname{CRIS}(C / A)$ we see that $p^{e} B=0$ for some $e$ hence $P \rightarrow B$ factors as $P \rightarrow P_{e} \rightarrow B$. By the universal property of the divided power envelope we conclude that $P_{e} \rightarrow B$ factors through $D_{e}$.

07KI Lemma 50.5.7. In Situation 50.5.1. Let $P$ be a polynomial algebra over $A$ and let $P \rightarrow C$ be a surjection of $A$-algebras with kernel $J$. Let $(D, \bar{J}, \bar{\gamma})$ be the p-adic completion of $D_{P, \gamma}(J)$. For every object $(B \rightarrow C, \delta)$ of $\operatorname{Cris}^{\wedge}(C / A)$ there exists a morphism $D \rightarrow B$ of $\operatorname{Cris}^{\wedge}(C / A)$.

Proof. We can find an $A$-algebra homomorphism $P \rightarrow B$ compatible with maps to $C$. By our definition of $\operatorname{Cris}(C / A)$ we see that $P \rightarrow B$ factors as $P \rightarrow D_{P, \gamma}(J) \rightarrow B$. As $B$ is $p$-adically complete we can factor this map through $D$.

### 50.6. Module of differentials

07 HQ In this section we develop a theory of modules of differentials for divided power rings.

07HR Definition 50.6.1. Let $A$ be a ring. Let $(B, J, \delta)$ be a divided power ring. Let $A \rightarrow B$ be a ring map. Let $M$ be an $B$-module. A divided power $A$-derivation into $M$ is a map $\theta: B \rightarrow M$ which is additive, annihilates the elements of $A$, satisfies the Leibniz rule $\theta\left(b b^{\prime}\right)=b \theta\left(b^{\prime}\right)+b^{\prime} \theta(b)$ and satisfies

$$
\theta\left(\gamma_{n}(x)\right)=\gamma_{n-1}(x) \theta(x)
$$

for all $n \geq 1$ and all $x \in J$.

In the situation of the definition, just as in the case of usual derivations, there exists a universal divided power $A$-derivation

$$
\mathrm{d}_{B / A, \delta}: B \rightarrow \Omega_{B / A, \delta}
$$

such that any divided power $A$-derivation $\theta: B \rightarrow M$ is equal to $\theta=\xi \circ d_{B / A, \delta}$ for some $B$-linear map $\Omega_{B / A, \delta} \rightarrow M$. If $(A, I, \gamma) \rightarrow(B, J, \delta)$ is a homomorphism of divided power rings, then we can forget the divided powers on $A$ and consider the divided power derivations of $B$ over $A$. Here are some basic properties of the divided power module of differentials.

07HS Lemma 50.6.2. Let $A$ be a ring. Let $(B, J, \delta)$ be a divided power ring and $A \rightarrow B$ a ring map.
(1) Consider $B[x]$ with divided power ideal $\left(J B[x], \delta^{\prime}\right)$ where $\delta^{\prime}$ is the extension of $\delta$ to $B[x]$. Then

$$
\Omega_{B[x] / A, \delta^{\prime}}=\Omega_{B / A, \delta} \otimes_{B} B[x] \oplus B[x] d x
$$

(2) Consider $B\langle x\rangle$ with divided power ideal $\left(J B\langle x\rangle+B\langle x\rangle_{+}, \delta^{\prime}\right)$. Then

$$
\Omega_{B\langle x\rangle / A, \delta^{\prime}}=\Omega_{B / A, \delta} \otimes_{B} B\langle x\rangle \oplus B\langle x\rangle d x
$$

(3) Let $K \subset J$ be an ideal preserved by $\delta_{n}$ for all $n>0$. Set $B^{\prime}=B / K$ and denote $\delta^{\prime}$ the induced divided power on $J / K$. Then $\Omega_{B^{\prime} / A, \delta^{\prime}}$ is the quotient of $\Omega_{B / A, \delta} \otimes_{B} B^{\prime}$ by the $B^{\prime}$-submodule generated by $d k$ for $k \in K$.

Proof. These are proved directly from the construction of $\Omega_{B / A, \delta}$ as the free $B$ module on the elements $\mathrm{d} b$ modulo the relations
(1) $\mathrm{d}\left(b+b^{\prime}\right)=\mathrm{d} b+\mathrm{d} b^{\prime}, b, b^{\prime} \in B$,
(2) $\mathrm{d} a=0, a \in A$,
(3) $\mathrm{d}\left(b b^{\prime}\right)=b \mathrm{~d} b^{\prime}+b^{\prime} \mathrm{d} b, b, b^{\prime} \in B$,
(4) $\mathrm{d} \delta_{n}(f)=\delta_{n-1}(f) \mathrm{d} f, f \in J, n>1$.

Note that the last relation explains why we get "the same" answer for the divided power polynomial algebra and the usual polynomial algebra: in the first case $x$ is an element of the divided power ideal and hence $\mathrm{d} x^{[n]}=x^{[n-1]} \mathrm{d} x$.

Let $(A, I, \gamma)$ be a divided power ring. In this setting the correct version of the powers of $I$ is given by the divided powers

$$
I^{[n]}=\text { ideal generated by } \gamma_{e_{1}}\left(x_{1}\right) \ldots \gamma_{e_{t}}\left(x_{t}\right) \text { with } \sum e_{j} \geq n \text { and } x_{j} \in I
$$

Of course we have $I^{n} \subset I^{[n]}$. Note that $I^{[1]}=I$. Sometimes we also set $I^{[0]}=A$.
07HT Lemma 50.6.3. Let $(A, I, \gamma) \rightarrow(B, J, \delta)$ be a homomorphism of divided power rings. Let $(B(1), J(1), \delta(1))$ be the coproduct of $(B, J, \delta)$ with itself over $(A, I, \gamma)$, i.e., such that

is cocartesian. Denote $K=\operatorname{Ker}(B(1) \rightarrow B)$. Then $K \cap J(1) \subset J(1)$ is preserved by the divided power structure and

$$
\Omega_{B / A, \delta}=K /\left(K^{2}+(K \cap J(1))^{[2]}\right)
$$

canonically.
Proof. The fact that $K \cap J(1) \subset J(1)$ is preserved by the divided power structure follows from the fact that $B(1) \rightarrow B$ is a homomorphism of divided power rings.
Recall that $K / K^{2}$ has a canonical $B$-module structure. Denote $s_{0}, s_{1}: B \rightarrow B(1)$ the two coprojections and consider the map d : $B \rightarrow K / K^{2}+(K \cap J(1))^{[2]}$ given by $b \mapsto s_{1}(b)-s_{0}(b)$. It is clear that d is additive, annihilates $A$, and satisfies the Leibniz rule. We claim that d is an $A$-derivation. Let $x \in J$. Set $y=s_{1}(x)$ and $z=s_{0}(x)$. Denote $\delta$ the divided power structure on $J(1)$. We have to show that $\delta_{n}(y)-\delta_{n}(z)=\delta_{n-1}(y)(y-z)$ modulo $K^{2}+(K \cap J(1))^{[2]}$ for $n \geq 1$. We will show this by induction on $n$. It is true for $n=1$. Let $n>1$ and that it holds for all smaller values. Note that

$$
\delta_{n}(z-y)=\sum_{i=0}^{n}(-1)^{n-i} \delta_{i}(z) \delta_{n-i}(y)
$$

is an element of $K^{2}+(K \cap J(1))^{[2]}$. From this and induction we see that working modulo $K^{2}+(K \cap J(1))^{[2]}$ we have

$$
\begin{aligned}
& \delta_{n}(y)-\delta_{n}(z) \\
& =\delta_{n}(y)+\sum_{i=0}^{n-1}(-1)^{n-i} \delta_{i}(z) \delta_{n-i}(y) \\
& =\delta_{n}(y)+(-1)^{n} \delta_{n}(y)+\sum_{i=1}^{n-1}(-1)^{n-i}\left(\delta_{i}(y)-\delta_{i-1}(y)(y-z)\right) \delta_{n-i}(y)
\end{aligned}
$$

Using that $\delta_{i}(y) \delta_{n-i}(y)=\binom{n}{i} \delta_{n}(y)$ and that $\delta_{i-1}(y) \delta_{n-i}(y)=\binom{n-1}{i} \delta_{n-1}(y)$ the reader easily verifies that this expression comes out to give $\delta_{n-1}(y)(y-z)$ as desired.

Let $M$ be a $B$-module. Let $\theta: B \rightarrow M$ be a divided power $A$-derivation. Set $D=B \oplus M$ where $M$ is an ideal of square zero. Define a divided power structure on $J \oplus M \subset D$ by setting $\delta_{n}(x+m)=\delta_{n}(x)+\delta_{n-1}(x) m$ for $n>1$, see Lemma 50.3.1. There are two divided power algebra homomorphisms $B \rightarrow D$ : the first is given by the inclusion and the second by the map $b \mapsto b+\theta(b)$. Hence we get a canonical homomorphism $B(1) \rightarrow D$ of divided power algebras over $(A, I, \gamma)$. This induces a map $K \rightarrow M$ which annihilates $K^{2}$ (as $M$ is an ideal of square zero) and $(K \cap J(1))^{[2]}$ as $M^{[2]}=0$. The composition $B \rightarrow K / K^{2}+(K \cap J(1))^{[2]} \rightarrow M$ equals $\theta$ by construction. It follows that d is a universal divided power $A$-derivation and we win.

07HU Remark 50.6.4. Let $A \rightarrow B$ be a ring map and let $(J, \delta)$ be a divided power structure on $B$. The universal module $\Omega_{B / A, \delta}$ comes with a little bit of extra structure, namely the $B$-submodule $N$ of $\Omega_{B / A, \delta}$ generated by $\mathrm{d}_{B / A, \delta}(J)$. In terms of the isomorphism given in Lemma 50.6 .3 this corresponds to the image of $K \cap J(1)$ in $\Omega_{B / A, \delta}$. Consider the $A$-algebra $D=B \oplus \Omega_{B / A, \delta}^{1}$ with ideal $\bar{J}=J \oplus N$ and divided powers $\bar{\delta}$ as in the proof of the lemma. Then $(D, \bar{J}, \bar{\delta})$ is a divided power ring and the two maps $B \rightarrow D$ given by $b \mapsto b$ and $b \mapsto b+\mathrm{d}_{B / A, \delta}(b)$ are homomorphisms of divided power rings over $A$. Moreover, $N$ is the smallest submodule of $\Omega_{B / A, \delta}$ such that this is true.

07HV Lemma 50.6.5. In Situation 50.5.1. Let $(B, J, \delta)$ be an object of CRIS $(C / A)$. Let $(B(1), J(1), \delta(1))$ be the coproduct of $(B, J, \delta)$ with itself in $\operatorname{CRIS}(C / A)$. Denote $K=\operatorname{Ker}(B(1) \rightarrow B)$. Then $K \cap J(1) \subset J(1)$ is preserved by the divided power
structure and

$$
\Omega_{B / A, \delta}=K /\left(K^{2}+(K \cap J(1))^{[2]}\right)
$$

canonically.
Proof. Word for word the same as the proof of Lemma 50.6.3. The only point that has to be checked is that the divided power ring $D=B \oplus M$ is an object of $\operatorname{CRIS}(C / A)$ and that the two maps $B \rightarrow C$ are morphisms of CRIS $(C / A)$. Since $D /(J \oplus M)=B / J$ we can use $C \rightarrow B / J$ to view $D$ as an object of $\operatorname{CRIS}(C / A)$ and the statement on morphisms is clear from the construction.

07HW Lemma 50.6.6. Let $(A, I, \gamma)$ be a divided power ring. Let $A \rightarrow B$ be a ring map and let $I B \subset J \subset B$ be an ideal. Let $D_{B, \gamma}(J)=(D, \bar{J}, \bar{\gamma})$ be the divided power envelope. Then we have

$$
\Omega_{D / A, \bar{\gamma}}=\Omega_{B / A} \otimes_{B} D
$$

Proof. We will prove this first when $B$ is flat over $A$. In this case $\gamma$ extends to a divided power structure $\gamma^{\prime}$ on $I B$, see Divided Power Algebra, Lemma 23.4.2. Hence $D=D_{B^{\prime}, \gamma^{\prime}}(J)$ is equal to a quotient of the divided power ring $\left(D^{\prime}, J^{\prime}, \delta\right)$ where $D^{\prime}=B\left\langle x_{t}\right\rangle$ and $J^{\prime}=I B\left\langle x_{t}\right\rangle+B\left\langle x_{t}\right\rangle_{+}$by the elements $x_{t}-f_{t}$ and $\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)$, see Lemma 50.2 .4 for notation and explanation. Write $\mathrm{d}: D^{\prime} \rightarrow \Omega_{D^{\prime} / A, \delta}$ for the universal derivation. Note that

$$
\Omega_{D^{\prime} / A, \delta}=\Omega_{B / A} \otimes_{B} D^{\prime} \oplus \bigoplus D^{\prime} \mathrm{d} x_{t}
$$

see Lemma 50.6.2 We conclude that $\Omega_{D / A, \bar{\gamma}}$ is the quotient of $\Omega_{D^{\prime} / A, \delta} \otimes_{D^{\prime}} D$ by the submodule generated by d applied to the generators of the kernel of $D^{\prime} \rightarrow D$ listed above, see Lemma50.6.2. Since $\mathrm{d}\left(x_{t}-f_{t}\right)=-\mathrm{d} f_{t}+\mathrm{d} x_{t}$ we see that we have $\mathrm{d} x_{t}=$ $\mathrm{d} f_{t}$ in the quotient. In particular we see that $\Omega_{B / A} \otimes_{B} D \rightarrow \Omega_{D / A, \gamma}$ is surjective with kernel given by the images of d applied to the elements $\delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right)$. However, given a relation $\sum r_{t} f_{t}-r_{0}=0$ in $B$ with $r_{t} \in B$ and $r_{0} \in I B$ we see that

$$
\begin{aligned}
\mathrm{d} \delta_{n}\left(\sum r_{t} x_{t}-r_{0}\right) & =\delta_{n-1}\left(\sum r_{t} x_{t}-r_{0}\right) \mathrm{d}\left(\sum r_{t} x_{t}-r_{0}\right) \\
& =\delta_{n-1}\left(\sum r_{t} x_{t}-r_{0}\right)\left(\sum r_{t} \mathrm{~d}\left(x_{t}-f_{t}\right)+\sum\left(x_{t}-f_{t}\right) \mathrm{d} r_{t}\right)
\end{aligned}
$$

because $\sum r_{t} f_{t}-r_{0}=0$ in $B$. Hence this is already zero in $\Omega_{B / A} \otimes_{A} D$ and we win in the case that $B$ is flat over $A$.

In the general case we write $B$ as a quotient of a polynomial ring $P \rightarrow B$ and let $J^{\prime} \subset P$ be the inverse image of $J$. Then $D=D^{\prime} / K^{\prime}$ with notation as in Lemma 50.2.3. By the case handled in the first paragraph of the proof we have $\Omega_{D^{\prime} / A, \bar{\gamma}^{\prime}}=$ $\Omega_{P / A} \otimes_{P} D^{\prime}$. Then $\Omega_{D / A, \bar{\gamma}}$ is the quotient of $\Omega_{P / A} \otimes_{P} D$ by the submodule generated by $\overline{\mathrm{\gamma}}_{n}^{\prime}(k)$ where $k$ is an element of the kernel of $P \rightarrow B$, see Lemma 50.6.2 and the description of $K^{\prime}$ from Lemma 50.2.3. Since $\mathrm{d} \bar{\gamma}_{n}^{\prime}(k)=\bar{\gamma}_{n-1}^{\prime}(k) \mathrm{d} k$ we see again that it suffices to divided by the submodule generated by $\mathrm{d} k$ with $k \in \operatorname{Ker}(P \rightarrow B)$ and since $\Omega_{B / A}$ is the quotient of $\Omega_{P / A} \otimes_{A} B$ by these elements (Algebra, Lemma 10.130.9 we win.

07HX Remark 50.6.7. Let $B$ be a ring. Write $\Omega_{B}=\Omega_{B / \mathbf{Z}}$ for the absolut $\AA^{2}$ module of differentials of $B$. Let $\mathrm{d}: B \rightarrow \Omega_{B}$ denote the universal derivation. Set $\Omega_{B}^{i}=$ $\wedge_{B}^{i}\left(\Omega_{B}\right)$ as in Algebra, Section 10.12. The absolute de Rham complex

$$
\Omega_{B}^{0} \rightarrow \Omega_{B}^{1} \rightarrow \Omega_{B}^{2} \rightarrow \ldots
$$

Here d : $\Omega_{B}^{p} \rightarrow \Omega_{B}^{p+1}$ is defined by the rule

$$
\mathrm{d}\left(b_{0} \mathrm{~d} b_{1} \wedge \ldots \wedge \mathrm{~d} b_{p}\right)=\mathrm{d} b_{0} \wedge \mathrm{~d} b_{1} \wedge \ldots \wedge \mathrm{~d} b_{p}
$$

which we will show is well defined; note that $\mathrm{d} \circ \mathrm{d}=0$ so we get a complex. Recall that $\Omega_{B}$ is the $B$-module generated by elements $\mathrm{d} b$ subject to the relations $\mathrm{d}(a+b)=\mathrm{d} a+\mathrm{d} b$ and $\mathrm{d}(a b)=b \mathrm{~d} a+a \mathrm{~d} b$ for $a, b \in B$. To prove that our map is well defined for $p=1$ we have to show that the elements

$$
a \mathrm{~d}(b+c)-a \mathrm{~d} b-a \mathrm{~d} c \quad \text { and } \quad a \mathrm{~d}(b c)-a c \mathrm{~d} b-a b \mathrm{~d} c, \quad a, b, c \in B
$$

are mapped to zero by our rule. This is clear by direct computation (using the Leibniz rule). Thus we get a map

$$
\Omega_{B} \otimes_{\mathbf{Z}} \ldots \otimes_{\mathbf{z}} \Omega_{B} \longrightarrow \Omega_{B}^{p+1}
$$

defined by the formula

$$
\omega_{1} \otimes \ldots \otimes \omega_{p} \longmapsto \sum(-1)^{i+1} \omega_{1} \wedge \ldots \wedge \mathrm{~d}\left(\omega_{i}\right) \wedge \ldots \wedge \omega_{p}
$$

which matches our rule above on elements of the form $b_{0} \mathrm{~d} b_{1} \otimes \mathrm{~d} b_{2} \otimes \ldots \otimes \mathrm{~d} b_{p}$. It is clear that this map is alternating. To finish we have to show that

$$
\omega_{1} \otimes \ldots \otimes f \omega_{i} \otimes \ldots \otimes \omega_{p} \quad \text { and } \quad \omega_{1} \otimes \ldots \otimes f \omega_{j} \otimes \ldots \otimes \omega_{p}
$$

are mapped to the same element. By Z-linearity and the alternating property, it is enough to show this for $p=2, i=1, j=2, \omega_{1}=a_{1} \mathrm{~d} b_{1}$ and $\omega_{2}=a_{2} \mathrm{~d} b_{2}$. Thus we need to show that

$$
\begin{aligned}
& \mathrm{d} f a_{1} \wedge \mathrm{~d} b_{1} \wedge a_{2} \mathrm{~d} b_{2}-f a_{1} \mathrm{~d} b_{1} \wedge \mathrm{~d} a_{2} \wedge \mathrm{~d} b_{2} \\
& =\mathrm{d} a_{1} \wedge \mathrm{~d} b_{1} \wedge f a_{2} \mathrm{~d} b_{2}-a_{1} \mathrm{~d} b_{1} \wedge \mathrm{~d} f a_{2} \wedge \mathrm{~d} b_{2}
\end{aligned}
$$

in other words that

$$
\left(a_{2} \mathrm{~d} f a_{1}+f a_{1} \mathrm{~d} a_{2}-f a_{2} \mathrm{~d} a_{1}-a_{1} \mathrm{~d} f a_{2}\right) \wedge \mathrm{d} b_{1} \wedge \mathrm{~d} b_{2}=0
$$

This follows from the Leibniz rule.
07HY Lemma 50.6.8. Let $B$ be a ring. Let $\pi: \Omega_{B} \rightarrow \Omega$ be a surjective $B$-module map. Denote $d: B \rightarrow \Omega$ the composition of $\pi$ with $d_{B}: B \rightarrow \Omega_{B}$. Set $\Omega^{i}=\wedge_{B}^{i}(\Omega)$. Assume that the kernel of $\pi$ is generated, as a B-module, by elements $\omega \in \Omega_{B}$ such that $d_{B}(\omega) \in \Omega_{B}^{2}$ maps to zero in $\Omega^{2}$. Then there is a de Rham complex

$$
\Omega^{0} \rightarrow \Omega^{1} \rightarrow \Omega^{2} \rightarrow \ldots
$$

whose differential is defined by the rule

$$
d: \Omega^{p} \rightarrow \Omega^{p+1}, \quad d\left(f_{0} d f_{1} \wedge \ldots \wedge d f_{p}\right)=d f_{0} \wedge d f_{1} \wedge \ldots \wedge d f_{p}
$$

[^137]Proof. We will show that there exists a commutative diagram

the description of the map d will follow from the construction of $\mathrm{d}_{B}$ in Remark 50.6.7. Since the left most vertical arrow is an isomorphism we have the first square. Because $\pi$ is surjective, to get the second square it suffices to show that $\mathrm{d}_{B}$ maps the kernel of $\pi$ into the kernel of $\wedge^{2} \pi$. We are given that any element of the kernel of $\pi$ is of the form $\sum b_{i} \omega_{i}$ with $\pi\left(\omega_{i}\right)=0$ and $\wedge^{2} \pi\left(d_{B}\left(\omega_{i}\right)\right)=0$. By the Leibniz rule for $\mathrm{d}_{B}$ we have $\mathrm{d}_{B}\left(\sum b_{i} \omega_{i}\right)=\sum b_{i} \mathrm{~d}_{B}\left(\omega_{i}\right)+\sum \mathrm{d}_{B}\left(b_{i}\right) \wedge \omega_{i}$. Hence this maps to zero under $\wedge^{2} \pi$.
For $i>1$ we note that $\wedge^{i} \pi$ is surjective with kernel the image of $\operatorname{Ker}(\pi) \wedge \Omega_{B}^{i-1} \rightarrow$ $\Omega_{B}^{i}$. For $\omega_{1} \in \operatorname{Ker}(\pi)$ and $\omega_{2} \in \Omega_{B}^{i-1}$ we have

$$
\mathrm{d}_{B}\left(\omega_{1} \wedge \omega_{2}\right)=\mathrm{d}_{B}\left(\omega_{1}\right) \wedge \omega_{2}-\omega_{1} \wedge \mathrm{~d}_{B}\left(\omega_{2}\right)
$$

which is in the kernel of $\wedge^{i+1} \pi$ by what we just proved above. Hence we get the $(i+1)$ st square in the diagram above. This concludes the proof.

07HZ Remark 50.6.9. Let $A \rightarrow B$ be a ring map and let $(J, \delta)$ be a divided power structure on $B$. Set $\Omega_{B / A, \delta}^{i}=\wedge_{B}^{i} \Omega_{B / A, \delta}$ where $\Omega_{B / A, \delta}$ is the target of the universal divided power $A$-derivation $\mathrm{d}=\mathrm{d}_{B / A}: B \rightarrow \Omega_{B / A, \delta}$. Note that $\Omega_{B / A, \delta}$ is the quotient of $\Omega_{B}$ by the $B$-submodule generated by the elements $\mathrm{d} a=0$ for $a \in A$ and $\mathrm{d} \delta_{n}(x)-\delta_{n-1}(x) \mathrm{d} x$ for $x \in J$. We claim Lemma 50.6.8 applies. To see this it suffices to verify the elements $\mathrm{d} a$ and $\mathrm{d} \delta_{n}(x)-\delta_{n-1}(x) \mathrm{d} x$ of $\Omega_{B}$ are mapped to zero in $\Omega_{B / A, \delta}^{2}$. This is clear for the first, and for the last we observe that

$$
\mathrm{d}\left(\delta_{n-1}(x)\right) \wedge \mathrm{d} x=\delta_{n-2}(x) \mathrm{d} x \wedge \mathrm{~d} x=0
$$

in $\Omega_{B / A, \delta}^{2}$ as desired. Hence we obtain a divided power de Rham complex

$$
\Omega_{B / A, \delta}^{0} \rightarrow \Omega_{B / A, \delta}^{1} \rightarrow \Omega_{B / A, \delta}^{2} \rightarrow \ldots
$$

which will play an important role in the sequel.
07 I 0 Remark 50.6.10. Let $B$ be a ring. Let $\Omega_{B} \rightarrow \Omega$ be a quotient satisfying the assumptions of Lemma 50.6.8. Let $M$ be a $B$-module. A connection is an additive map

$$
\nabla: M \longrightarrow M \otimes_{B} \Omega
$$

such that $\nabla(b m)=b \nabla(m)+m \otimes \mathrm{~d} b$ for $b \in B$ and $m \in M$. In this situation we can define maps

$$
\nabla: M \otimes_{B} \Omega^{i} \longrightarrow M \otimes_{B} \Omega^{i+1}
$$

by the rule $\nabla(m \otimes \omega)=\nabla(m) \wedge \omega+m \otimes \mathrm{~d} \omega$. This works because if $b \in B$, then

$$
\begin{aligned}
\nabla(b m \otimes \omega)-\nabla(m \otimes b \omega)= & \nabla(b m) \otimes \omega+b m \otimes \mathrm{~d} \omega-\nabla(m) \otimes b \omega-m \otimes \mathrm{~d}(b \omega) \\
= & b \nabla(m) \otimes \omega+m \otimes \mathrm{~d} b \wedge \omega+b m \otimes \mathrm{~d} \omega \\
& -b \nabla(m) \otimes \omega-b m \otimes \mathrm{~d}(\omega)-m \otimes \mathrm{~d} b \wedge \omega=0
\end{aligned}
$$

As is customary we say the connection is integrable if and only if the composition

$$
M \xrightarrow{\nabla} M \otimes_{B} \Omega^{1} \xrightarrow{\nabla} M \otimes_{B} \Omega^{2}
$$

is zero. In this case we obtain a complex

$$
M \xrightarrow{\nabla} M \otimes_{B} \Omega^{1} \xrightarrow{\nabla} M \otimes_{B} \Omega^{2} \xrightarrow{\nabla} M \otimes_{B} \Omega^{3} \xrightarrow{\nabla} M \otimes_{B} \Omega^{4} \rightarrow \ldots
$$

which is called the de Rham complex of the connection.
07KJ Remark 50.6.11. Let $\varphi: B \rightarrow B^{\prime}$ be a ring map. Let $\Omega_{B} \rightarrow \Omega$ and $\Omega_{B^{\prime}} \rightarrow \Omega^{\prime}$ be quotients satisfying the assumptions of Lemma 50.6.8. Assume that the map $\Omega_{B} \rightarrow \Omega_{B^{\prime}}, b_{1} \mathrm{~d} b_{2} \mapsto \varphi\left(b_{1}\right) \mathrm{d} \varphi\left(b_{2}\right)$ fits into a commutative diagram

In this situation, given any pair $(M, \nabla)$ where $M$ is a $B$-module and $\nabla: M \rightarrow$ $M \otimes_{B} \Omega$ is a connection we obtain a base change $\left(M \otimes_{B} B^{\prime}, \nabla^{\prime}\right)$ where

$$
\nabla^{\prime}: M \otimes_{B} B^{\prime} \longrightarrow\left(M \otimes_{B} B^{\prime}\right) \otimes_{B^{\prime}} \Omega^{\prime}=M \otimes_{B} \Omega^{\prime}
$$

is defined by the rule

$$
\nabla^{\prime}\left(m \otimes b^{\prime}\right)=\sum m_{i} \otimes b^{\prime} \mathrm{d} \varphi\left(b_{i}\right)+m \otimes \mathrm{~d} b^{\prime}
$$

if $\nabla(m)=\sum m_{i} \otimes \mathrm{~d} b_{i}$. If $\nabla$ is integrable, then so is $\nabla^{\prime}$, and in this case there is a canonical map of de Rham complexes
$07 \mathrm{PY} \quad(50.6 .11 .1) \quad M \otimes_{B} \Omega^{\bullet} \longrightarrow\left(M \otimes_{B} B^{\prime}\right) \otimes_{B^{\prime}}\left(\Omega^{\prime}\right)^{\bullet}=M \otimes_{B}\left(\Omega^{\prime}\right)^{\bullet}$
which maps $m \otimes \eta$ to $m \otimes \varphi(\eta)$.
07 KK Lemma 50.6.12. Let $A \rightarrow B$ be a ring map and let $(J, \delta)$ be a divided power structure on $B$. Let $p$ be a prime number. Assume that $A$ is a $\mathbf{Z}_{(p)}$-algebra and that $p$ is nilpotent in $B / J$. Then we have

$$
\lim _{e} \Omega_{B_{e} / A, \bar{\delta}}=\lim _{e} \Omega_{B / A, \delta} / p^{e} \Omega_{B / A, \delta}=\lim _{e} \Omega_{B^{\wedge} / A, \delta \wedge} / p^{e} \Omega_{B^{\wedge} / A, \delta^{\wedge}}
$$

see proof for notation and explanation.
Proof. By Divided Power Algebra, Lemma 23.4.5 we see that $\delta$ extends to $B_{e}=$ $B / p^{e} B$ for all sufficiently large $e$. Hence the first limit make sense. The lemma also produces a divided power structure $\delta^{\wedge}$ on the completion $B^{\wedge}=\lim _{e} B_{e}$, hence the last limit makes sense. By Lemma 50.6.2 and the fact that $\mathrm{d} p^{e}=0$ (always) we see that the surjection $\Omega_{B / A, \delta} \rightarrow \Omega_{B_{e} / A, \bar{\delta}}$ has kernel $p^{e} \Omega_{B / A, \delta}$. Similarly for the kernel of $\Omega_{B^{\wedge} / A, \delta^{\wedge}} \rightarrow \Omega_{B_{e} / A, \bar{\delta}}$. Hence the lemma is clear.

### 50.7. Divided power schemes

07 I 1 Some remarks on how to globalize the previous notions.
07 I 2 Definition 50.7.1. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. A divided power structure $\gamma$ on $\mathcal{I}$ is a sequence of maps $\gamma_{n}: \mathcal{I} \rightarrow \mathcal{I}$, $n \geq 1$ such that for any object $U$ of $\mathcal{C}$ the triple

$$
(\mathcal{O}(U), \mathcal{I}(U), \gamma)
$$

is a divided power ring.

To be sure this applies in particular to sheaves of rings on topological spaces. But it's good to be a little bit more general as the structure sheaf of the crystalline site lives on a... site! A triple $(\mathcal{C}, \mathcal{I}, \gamma)$ as in the definition above is sometimes called a divided power topos in this chapter. Given a second $\left(\mathcal{C}^{\prime}, \mathcal{I}^{\prime}, \gamma^{\prime}\right)$ and given a morphism of ringed topoi $\left(f, f^{\sharp}\right):(S h(\mathcal{C}), \mathcal{O}) \rightarrow\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ we say that $\left(f, f^{\sharp}\right)$ induces a morphism of divided power topoi if $f^{\sharp}\left(f^{-1} \mathcal{I}^{\prime}\right) \subset \mathcal{I}$ and the diagrams

are commutative for all $n \geq 1$. If $f$ comes from a morphism of sites induced by a functor $u: \mathcal{C}^{\prime} \rightarrow \mathcal{C}$ then this just means that

$$
\left(\mathcal{O}^{\prime}\left(U^{\prime}\right), \mathcal{I}^{\prime}\left(U^{\prime}\right), \gamma^{\prime}\right) \longrightarrow\left(\mathcal{O}\left(u\left(U^{\prime}\right)\right), \mathcal{I}\left(u\left(U^{\prime}\right)\right), \gamma\right)
$$

is a homomorphism of divided power rings for all $U^{\prime} \in \mathrm{Ob}\left(\mathcal{C}^{\prime}\right)$.
In the case of schemes we require the divided power ideal to be quasi-coherent. But apart from this the definition is exactly the same as in the case of topoi. Here it is.

07I3 Definition 50.7.2. A divided power scheme is a triple $(S, \mathcal{I}, \gamma)$ where $S$ is a scheme, $\mathcal{I}$ is a quasi-coherent sheaf of ideals, and $\gamma$ is a divided power structure on $\mathcal{I}$. A morphism of divided power schemes $(S, \mathcal{I}, \gamma) \rightarrow\left(S^{\prime}, \mathcal{I}^{\prime}, \gamma^{\prime}\right)$ is a morphism of schemes $f: S \rightarrow S^{\prime}$ such that $f^{-1} \mathcal{I}^{\prime} \mathcal{O}_{S} \subset \mathcal{I}$ and such that

$$
\left(\mathcal{O}_{S}\left(U^{\prime}\right), \mathcal{I}\left(U^{\prime}\right), \gamma\right) \longrightarrow\left(\mathcal{O}_{S^{\prime}}\left(f^{-1} U^{\prime}\right), \mathcal{I}\left(f^{-1} U^{\prime}\right), \gamma\right)
$$

is a homomorphism of divided power rings for all $U^{\prime} \subset S^{\prime}$ open.
Recall that there is a 1-to- 1 correspondence between quasi-coherent sheaves of ideals and closed immersions, see Morphisms, Section 28.2. Thus given a divided power scheme $(T, \mathcal{J}, \gamma)$ we get a canonical closed immersion $U \rightarrow T$ defined by $\mathcal{J}$. Conversely, given a closed immersion $U \rightarrow T$ and a divided power structure $\gamma$ on the sheaf of ideals $\mathcal{J}$ associated to $U \rightarrow T$ we obtain a divided power scheme $(T, \mathcal{J}, \gamma)$. In many situations we only want to consider such triples $(U, T, \gamma)$ when the morphism $U \rightarrow T$ is a thickening, see More on Morphisms, Definition 36.2.1.
07 I 4 Definition 50.7.3. A triple $(U, T, \gamma)$ as above is called a divided power thickening if $U \rightarrow T$ is a thickening.

Fibre products of divided power schemes exist when one of the three is a divided power thickening. Here is a formal statement.
07 ME Lemma 50.7.4. Let $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right) \rightarrow\left(S_{0}^{\prime}, S^{\prime}, \gamma^{\prime}\right)$ and $\left(S_{0}, S, \gamma\right) \rightarrow\left(S_{0}^{\prime}, S^{\prime}, \gamma^{\prime}\right)$ be morphisms of divided power schemes. If $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ is a divided power thickening, then there exists a divided power scheme $\left(T_{0}, T, \delta\right)$ and

which is a cartesian diagram in the category of divided power schemes.

Proof. Omitted. Hints: If $T$ exists, then $T_{0}=S_{0} \times_{S_{0}^{\prime}} U^{\prime}$ (argue as in Divided Power Algebra, Remark 23.3.5). Since $T^{\prime}$ is a divided power thickening, we see that $T$ (if it exists) will be a divided power thickening too. Hence we can define $T$ as the scheme with underlying topological space the underlying topological space of $T_{0}=S_{0} \times{ }_{S_{0}^{\prime}} U^{\prime}$ and as structure sheaf on affine pieces the ring given by Lemma 50.5.3.

We make the following observation. Suppose that $(U, T, \gamma)$ is triple as above. Assume that $T$ is a scheme over $\mathbf{Z}_{(p)}$ and that $p$ is locally nilpotent on $U$. Then
(1) $p$ locally nilpotent on $T \Leftrightarrow U \rightarrow T$ is a thickening (see Divided Power Algebra, Lemma 23.2.6), and
(2) $p^{e} \mathcal{O}_{T}$ is locally on $T$ preserved by $\gamma$ for $e \gg 0$ (see Divided Power Algebra, Lemma 23.4.5).

This suggest that good results on divided power thickenings will be available under the following hypotheses.

07 MF Situation 50.7.5. Here $p$ is a prime number and $(S, \mathcal{I}, \gamma)$ is a divided power scheme over $\mathbf{Z}_{(p)}$. We set $S_{0}=V(\mathcal{I}) \subset S$. Finally, $X \rightarrow S_{0}$ is a morphism of schemes such that $p$ is locally nilpotent on $X$.

It is in this situation that we will define the big and small crystalline sites.

### 50.8. The big crystalline site

07 I 5 We first define the big site. Given a divided power scheme $(S, \mathcal{I}, \gamma)$ we say $(T, \mathcal{J}, \delta)$ is a divided power scheme over $(S, \mathcal{I}, \gamma)$ if $T$ comes endowed with a morphism $T \rightarrow S$ of divided power schemes. Similarly, we say a divided power thickening $(U, T, \delta)$ is a divided power thickening over $(S, \mathcal{I}, \gamma)$ if $T$ comes endowed with a morphism $T \rightarrow S$ of divided power schemes.

07I6 Definition 50.8.1. In Situation 50.7.5.
(1) A divided power thickening of $X$ relative to $(S, \mathcal{I}, \gamma)$ is given by a divided power thickening $(U, T, \delta)$ over $(S, \mathcal{I}, \gamma)$ and an $S$-morphism $U \rightarrow X$.
(2) A morphism of divided power thickenings of $X$ relative to $(S, \mathcal{I}, \gamma)$ is defined in the obvious manner.
The category of divided power thickenings of $X$ relative to $(S, \mathcal{I}, \gamma)$ is denoted $\operatorname{CRIS}(X / S, \mathcal{I}, \gamma)$ or simply $\operatorname{CRIS}(X / S)$.

For any $(U, T, \delta)$ in $\operatorname{CRIS}(X / S)$ we have that $p$ is locally nilpotent on $T$, see discussion after Definition 50.7.3. A good way to visualize all the data associated to $(U, T, \delta)$ is the commutative diagram

where $S_{0}=V(\mathcal{I}) \subset S$. Morphisms of $\operatorname{CRIS}(X / S)$ can be similarly visualized as huge commutative diagrams. In particular, there is a canonical forgetful functor

$$
\operatorname{CRIS}(X / S) \longrightarrow S c h / X, \quad(U, T, \delta) \longmapsto U
$$

as well as its one sided inverse (and left adjoint)
07 I 8 (50.8.1.2)

$$
S c h / X \longrightarrow \operatorname{CRIS}(X / S), \quad U \longmapsto(U, U, \emptyset)
$$

which is sometimes useful.
07I9 Lemma 50.8.2. In Situation 50.7.5. The category $C R I S(X / S)$ has all finite nonempty limits, in particular products of pairs and fibre products. The functor (50.8.1.1) commutes with limits.

Proof. Omitted. Hint: See Lemma 50.5 .3 for the affine case. See also Divided Power Algebra, Remark 23.3.5.

07IA Lemma 50.8.3. In Situation 50.7.5. Let

be a fibre square in the category of divided power thickenings of $X$ relative to (S,I) $\gamma$ ). If $T_{2} \rightarrow T$ is flat, then $T_{3}=T_{1} \times_{T} T_{2}$ (as schemes).

Proof. This is true because a divided power structure extends uniquely along a flat ring map. See Divided Power Algebra, Lemma 23.4.2.

The lemma above means that the base change of a flat morphism of divided power thickenings is another flat morphism, and in fact is the "usual" base change of the morphism. This implies that the following definition makes sense.
07IB Definition 50.8.4. In Situation 50.7.5.
(1) A family of morphisms $\left\{\left(U_{i}, T_{i}, \delta_{i}\right) \rightarrow(U, T, \delta)\right\}$ of divided power thickenings of $X / S$ is a Zariski, étale, smooth, syntomic, or fppf covering if and only if the family of morphisms of schemes $\left\{T_{i} \rightarrow T\right\}$ is one.
(2) The big crystalline site of $X$ over $(S, \mathcal{I}, \gamma)$, is the category $\operatorname{CRIS}(X / S)$ endowed with the Zariski topology.
(3) The topos of sheaves on $\operatorname{CRIS}(X / S)$ is denoted $(X / S)_{\text {CRIS }}$ or sometimes $(X / S, \mathcal{I}, \gamma)_{\mathrm{CRIS}}{ }^{3}$
There are some obvious functorialities concerning these topoi.
07IC Remark 50.8.5 (Functoriality). Let $p$ be a prime number. Let $(S, \mathcal{I}, \gamma) \rightarrow$ $\left(S^{\prime}, \mathcal{I}^{\prime}, \gamma^{\prime}\right)$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Set $S_{0}=V(\mathcal{I})$ and $S_{0}^{\prime}=V\left(\mathcal{I}^{\prime}\right)$. Let

[^138]be a commutative diagram of morphisms of schemes and assume $p$ is locally nilpotent on $X$ and $Y$. Then we get a continuous and cocontinuous functor
$$
\operatorname{CRIS}(X / S) \longrightarrow \operatorname{CRIS}\left(Y / S^{\prime}\right)
$$
by letting $(U, T, \delta)$ correspond to $(U, T, \delta)$ with $U \rightarrow X \rightarrow Y$ as the $S^{\prime}$-morphism from $U$ to $Y$. Hence we get a morphism of topoi
$$
f_{\mathrm{CRIS}}:(X / S)_{\mathrm{CRIS}} \longrightarrow\left(Y / S^{\prime}\right)_{\mathrm{CRIS}}
$$
see Sites, Section 7.20 .
07ID Remark 50.8.6 (Comparison with Zariski site). In Situation 50.7.5. The functor (50.8.1.1 is continuous, cocontinuous, and commutes with products and fibred products. Hence we obtain a morphism of topoi
$$
U_{X / S}:(X / S)_{\mathrm{CRIS}} \longrightarrow S h\left((S c h / X)_{Z a r}\right)
$$
from the big crystalline topos of $X / S$ to the big Zariski topos of $X$. See Sites, Section 7.20

07IE Remark 50.8.7 (Structure morphism). In Situation 50.7.5. Consider the closed subscheme $S_{0}=V(\mathcal{I}) \subset S$. If we assume that $p$ is locally nilpotent on $S_{0}$ (which is always the case in practice) then we obtain a situation as in Definition 50.8.1 with $S_{0}$ instead of $X$. Hence we get a site $\operatorname{CRIS}\left(S_{0} / S\right)$. If $f: X \rightarrow S_{0}$ is the structure morphism of $X$ over $S$, then we get a commutative diagram of morphisms of ringed topoi

by Remark 50.8.5. We think of the composition $(X / S)_{\mathrm{CRIS}} \rightarrow \operatorname{Sh}\left((S c h / S)_{Z a r}\right)$ as the structure morphism of the big crystalline site. Even if $p$ is not locally nilpotent on $S_{0}$ the structure morphism

$$
(X / S)_{\mathrm{CRIS}} \longrightarrow S h\left((S c h / S)_{Z a r}\right)
$$

is defined as we can take the lower route through the diagram above. Thus it is the morphism of topoi corresponding to the cocontinuous functor $\operatorname{CRIS}(X / S) \rightarrow$ $(S c h / S)_{Z a r}$ given by the rule $(U, T, \delta) / S \mapsto T / S$, see Sites, Section 7.20 .

07MG Remark 50.8.8 (Compatibilities). The morphisms defined above satisfy numerous compatibilities. For example, in the situation of Remark 50.8.5 we obtain a commutative diagram of ringed topoi

where the vertical arrows are the structure morphisms.

### 50.9. The crystalline site

07 IF Since 50.8.1.1 commutes with products and fibre products, we see that looking at those $(U, T, \delta)$ such that $U \rightarrow X$ is an open immersion defines a full subcategory preserved under fibre products (and more generally finite nonempty limits). Hence the following definition makes sense.
07IG Definition 50.9.1. In Situation 50.7.5
(1) The (small) crystalline site of $X$ over $(S, \mathcal{I}, \gamma)$, denoted $\operatorname{Cris}(X / S, \mathcal{I}, \gamma)$ or simply $\operatorname{Cris}(X / S)$ is the full subcategory of $\operatorname{CRIS}(X / S)$ consisting of those $(U, T, \delta)$ in $\operatorname{CRIS}(X / S)$ such that $U \rightarrow X$ is an open immersion. It comes endowed with the Zariski topology.
(2) The topos of sheaves on $\operatorname{Cris}(X / S)$ is denoted $(X / S)_{\text {cris }}$ or sometimes $(X / S, \mathcal{I}, \gamma)_{\text {cris }}{ }^{4}$.
For any $(U, T, \delta)$ in $\operatorname{Cris}(X / S)$ the morphism $U \rightarrow X$ defines an object of the small Zariski site $X_{Z a r}$ of $X$. Hence a canonical forgetful functor

$$
\begin{equation*}
\operatorname{Cris}(X / S) \longrightarrow X_{Z a r}, \quad(U, T, \delta) \longmapsto U \tag{50.9.1.1}
\end{equation*}
$$

and a left adjoint

$$
\begin{equation*}
X_{Z a r} \longrightarrow \operatorname{Cris}(X / S), \quad U \longmapsto(U, U, \emptyset) \tag{50.9.1.2}
\end{equation*}
$$

which is sometimes useful.
We can compare the small and big crystalline sites, just like we can compare the small and big Zariski sites of a scheme, see Topologies, Lemma 33.3.13.

07IJ Lemma 50.9.2. Assumptions as in Definition 50.8.1. The inclusion functor

$$
\operatorname{Cris}(X / S) \rightarrow \operatorname{CRIS}(X / S)
$$

commutes with finite nonempty limits, is fully faithful, continuous, and cocontinuous. There are morphisms of topoi

$$
(X / S)_{\text {cris }} \xrightarrow{i}(X / S)_{\text {CRIS }} \xrightarrow{\pi}(X / S)_{\text {cris }}
$$

whose composition is the identity and of which the first is induced by the inclusion functor. Moreover, $\pi_{*}=i^{-1}$.

Proof. For the first assertion see Lemma 50.8.2. This gives us a morphism of topoi $i:(X / S)_{\text {cris }} \rightarrow(X / S)_{\text {CRIS }}$ and a left adjoint $i_{!}$such that $i^{-1} i_{!}=i^{-1} i_{*}=$ id, see Sites, Lemmas 7.20.5, 7.20.6, and 7.20.7. We claim that $i_{!}$is exact. If this is true, then we can define $\pi$ by the rules $\pi^{-1}=i_{!}$and $\pi_{*}=i^{-1}$ and everything is clear. To prove the claim, note that we already know that $i_{!}$is right exact and preserves fibre products (see references given). Hence it suffices to show that $i_{!} *=*$ where * indicates the final object in the category of sheaves of sets. To see this it suffices to produce a set of objects $\left(U_{i}, T_{i}, \delta_{i}\right), i \in I$ of $\operatorname{Cris}(X / S)$ such that

$$
\coprod_{i \in I} h_{\left(U_{i}, T_{i}, \delta_{i}\right)} \rightarrow *
$$

is surjective in $(X / S)_{\text {CRIS }}$ (details omitted; hint: use that $\operatorname{Cris}(X / S)$ has products and that the functor $\operatorname{Cris}(X / S) \rightarrow \operatorname{CRIS}(X / S)$ commutes with them). In the affine case this follows from Lemma 50.5.6. We omit the proof in general.

[^139]07IK Remark 50.9.3 (Functoriality). Let $p$ be a prime number. Let $(S, \mathcal{I}, \gamma) \rightarrow$ $\left(S^{\prime}, \mathcal{I}^{\prime}, \gamma^{\prime}\right)$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Let

be a commutative diagram of morphisms of schemes and assume $p$ is locally nilpotent on $X$ and $Y$. By analogy with Topologies, Lemma 33.3.16 we define

$$
f_{\text {cris }}:(X / S)_{\text {cris }} \longrightarrow\left(Y / S^{\prime}\right)_{\text {cris }}
$$

by the formula $f_{\text {cris }}=\pi_{Y} \circ f_{\text {CRIS }} \circ i_{X}$ where $i_{X}$ and $\pi_{Y}$ are as in Lemma 50.9.2 for $X$ and $Y$ and where $f_{\text {CRIS }}$ is as in Remark 50.8.5.

07IL Remark 50.9.4 (Comparison with Zariski site). In Situation 50.7.5. The functor (50.9.1.1 is continuous, cocontinuous, and commutes with products and fibred products. Hence we obtain a morphism of topoi

$$
u_{X / S}:(X / S)_{\text {cris }} \longrightarrow S h\left(X_{Z a r}\right)
$$

relating the small crystalline topos of $X / S$ with the small Zariski topos of $X$. See Sites, Section 7.20 .

07KL Lemma 50.9.5. In Situation 50.7.5. Let $X^{\prime} \subset X$ and $S^{\prime} \subset S$ be open subschemes such that $X^{\prime}$ maps into $S^{\prime}$. Then there is a fully faithful functor $\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right) \rightarrow$ $\operatorname{Cris}(X / S)$ which gives rise to a morphism of topoi fitting into the commutative diagram

Moreover, this diagram is an example of localization of morphisms of topoi as in Sites, Lemma 7.30.1.

Proof. The fully faithful functor comes from thinking of objects of $\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right)$ as divided power thickenings $(U, T, \delta)$ of $X$ where $U \rightarrow X$ factors through $X^{\prime} \subset X$ (since then automatically $T \rightarrow S$ will factor through $S^{\prime}$ ). This functor is clearly cocontinuous hence we obtain a morphism of topoi as indicated. Let $h_{X^{\prime}} \in \operatorname{Sh}\left(X_{Z a r}\right)$ be the representable sheaf associated to $X^{\prime}$ viewed as an object of $X_{\text {Zar }}$. It is clear that $S h\left(X_{Z a r}^{\prime}\right)$ is the localization $S h\left(X_{Z a r}\right) / h_{X^{\prime}}$. On the other hand, the category $\operatorname{Cris}(X / S) / u_{X / S}^{-1} h_{X^{\prime}}$ (see Sites, Lemma 7.29.3) is canonically identified with $\operatorname{Cris}\left(X^{\prime} / S^{\prime}\right)$ by the functor above. This finishes the proof.

07IM Remark 50.9.6 (Structure morphism). In Situation 50.7.5. Consider the closed subscheme $S_{0}=V(\mathcal{I}) \subset S$. If we assume that $p$ is locally nilpotent on $S_{0}$ (which is always the case in practice) then we obtain a situation as in Definition 50.8.1 with $S_{0}$ instead of $X$. Hence we get a site $\operatorname{Cris}\left(S_{0} / S\right)$. If $f: X \rightarrow S_{0}$ is the structure
morphism of $X$ over $S$, then we get a commutative diagram of ringed topoi

see Remark 50.9.3. We think of the composition $(X / S)_{\text {cris }} \rightarrow S h\left(S_{Z a r}\right)$ as the structure morphism of the crystalline site. Even if $p$ is not locally nilpotent on $S_{0}$ the structure morphism

$$
\tau_{X / S}:(X / S)_{\text {cris }} \longrightarrow S h\left(S_{Z a r}\right)
$$

is defined as we can take the lower route through the diagram above.
07MH Remark 50.9.7 (Compatibilities). The morphisms defined above satisfy numerous compatibilities. For example, in the situation of Remark 50.9.3 we obtain a commutative diagram of ringed topoi

where the vertical arrows are the structure morphisms.

### 50.10. Sheaves on the crystalline site

07IN Notation and assumptions as in Situation 50.7.5. In order to discuss the small and big crystalline sites of $X / S$ simultaneously in this section we let

$$
\mathcal{C}=\operatorname{CRIS}(X / S) \quad \text { or } \quad \mathcal{C}=\operatorname{Cris}(X / S)
$$

A sheaf $\mathcal{F}$ on $\mathcal{C}$ gives rise to a restriction $\mathcal{F}_{T}$ for every object $(U, T, \delta)$ of $\mathcal{C}$. Namely, $\mathcal{F}_{T}$ is the Zariski sheaf on the scheme $T$ defined by the rule

$$
\mathcal{F}_{T}(W)=\mathcal{F}\left(U \cap W, W,\left.\delta\right|_{W}\right)
$$

for $W \subset T$ is open. Moreover, if $f: T \rightarrow T^{\prime}$ is a morphism between objects $(U, T, \delta)$ and $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ of $\mathcal{C}$, then there is a canonical comparison map
07IP (50.10.0.1)

$$
c_{f}: f^{-1} \mathcal{F}_{T^{\prime}} \longrightarrow \mathcal{F}_{T}
$$

Namely, if $W^{\prime} \subset T^{\prime}$ is open then $f$ induces a morphism

$$
\left.f\right|_{f^{-1} W^{\prime}}:\left(U \cap f^{-1}\left(W^{\prime}\right), f^{-1} W^{\prime},\left.\delta\right|_{f^{-1} W^{\prime}}\right) \longrightarrow\left(U^{\prime} \cap W^{\prime}, W^{\prime},\left.\delta\right|_{W^{\prime}}\right)
$$

of $\mathcal{C}$, hence we can use the restriction mapping $\left(\left.f\right|_{f^{-1} W^{\prime}}\right)^{*}$ of $\mathcal{F}$ to define a map $\mathcal{F}_{T^{\prime}}\left(W^{\prime}\right) \rightarrow \mathcal{F}_{T}\left(f^{-1} W^{\prime}\right)$. These maps are clearly compatible with further restriction, hence define an $f$-map from $\mathcal{F}_{T^{\prime}}$ to $\mathcal{F}_{T}$ (see Sheaves, Section 6.21 and especially Sheaves, Definition 6.21.7). Thus a map $c_{f}$ as in 50.10.0.1. Note that if $f$ is an open immersion, then $c_{f}$ is an isomorphism, because in that case $\mathcal{F}_{T}$ is just the restriction of $\mathcal{F}_{T^{\prime}}$ to $T$.

Conversely, given Zariski sheaves $\mathcal{F}_{T}$ for every object $(U, T, \delta)$ of $\mathcal{C}$ and comparison maps $c_{f}$ as above which (a) are isomorphisms for open immersions, and (b) satisfy a suitable cocycle condition, we obtain a sheaf on $\mathcal{C}$. This is proved exactly as in Topologies, Lemma 33.3.18.
The structure sheaf on $\mathcal{C}$ is the sheaf $\mathcal{O}_{X / S}$ defined by the rule

$$
\mathcal{O}_{X / S}:(U, T, \delta) \longmapsto \Gamma\left(T, \mathcal{O}_{T}\right)
$$

This is a sheaf by the definition of coverings in $\mathcal{C}$. Suppose that $\mathcal{F}$ is a sheaf of $\mathcal{O}_{X / S^{-}}$ modules. In this case the comparison mappings 50.10.0.1 define a comparison map

07IQ

$$
\begin{equation*}
c_{f}: f^{*} \mathcal{F}_{T} \longrightarrow \mathcal{F}_{T^{\prime}} \tag{50.10.0.2}
\end{equation*}
$$

of $\mathcal{O}_{T}$-modules.
Another type of example comes by starting with a sheaf $\mathcal{G}$ on $(S c h / X)_{\text {Zar }}$ or $X_{\text {Zar }}$ (depending on whether $\mathcal{C}=\operatorname{CRIS}(X / S)$ or $\mathcal{C}=\operatorname{Cris}(X / S)$ ). Then $\underline{\mathcal{G}}$ defined by the rule

$$
\underline{\mathcal{G}}:(U, T, \delta) \longmapsto \mathcal{G}(U)
$$

is a sheaf on $\mathcal{C}$. In particular, if we take $\mathcal{G}=\mathbf{G}_{a}=\mathcal{O}_{X}$, then we obtain

$$
\underline{\mathbf{G}_{a}}:(U, T, \delta) \longmapsto \Gamma\left(U, \mathcal{O}_{U}\right)
$$

There is a surjective map of sheaves $\mathcal{O}_{X / S} \rightarrow \mathbf{G}_{a}$ defined by the canonical maps $\Gamma\left(T, \mathcal{O}_{T}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ for objects $(U, T, \delta)$. The kernel of this map is denoted $\mathcal{J}_{X / S}$, hence a short exact sequence

$$
0 \rightarrow \mathcal{J}_{X / S} \rightarrow \mathcal{O}_{X / S} \rightarrow \underline{\mathbf{G}_{a}} \rightarrow 0
$$

Note that $\mathcal{J}_{X / S}$ comes equipped with a canonical divided power structure. After all, for each object $(U, T, \delta)$ the third component $\delta$ is a divided power structure on the kernel of $\mathcal{O}_{T} \rightarrow \mathcal{O}_{U}$. Hence the (big) crystalline topos is a divided power topos.

### 50.11. Crystals in modules

07 IR It turns out that a crystal is a very general gadget. However, the definition may be a bit hard to parse, so we first give the definition in the case of modules on the crystalline sites.

07IS Definition 50.11.1. In Situation 50.7.5. Let $\mathcal{C}=\operatorname{CRIS}(X / S)$ or $\mathcal{C}=\operatorname{Cris}(X / S)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X / S}$-modules on $\mathcal{C}$.
(1) We say $\mathcal{F}$ is locally quasi-coherent if for every object $(U, T, \delta)$ of $\mathcal{C}$ the restriction $\mathcal{F}_{T}$ is a quasi-coherent $\mathcal{O}_{T}$-module.
(2) We say $\mathcal{F}$ is quasi-coherent if it is quasi-coherent in the sense of Modules on Sites, Definition 18.23.1.
(3) We say $\mathcal{F}$ is a crystal in $\mathcal{O}_{X / S}$-modules if all the comparison maps 50.10.0.2 are isomorphisms.

It turns out that we can relate these notions as follows.
07IT Lemma 50.11.2. With notation $X / S, \mathcal{I}, \gamma, \mathcal{C}, \mathcal{F}$ as in Definition 50.11.1. The following are equivalent
(1) $\mathcal{F}$ is quasi-coherent, and
(2) $\mathcal{F}$ is locally quasi-coherent and a crystal in $\mathcal{O}_{X / S}$-modules.

Proof. Assume (1). Let $f:\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right) \rightarrow(U, T, \delta)$ be an object of $\mathcal{C}$. We have to prove (a) $\mathcal{F}_{T}$ is a quasi-coherent $\mathcal{O}_{T}$-module and (b) $c_{f}: f^{*} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$ is an isomorphism. The assumption means that we can find a covering $\left\{\left(T_{i}, U_{i}, \delta_{i}\right) \rightarrow\right.$ $(T, U, \delta)\}$ and for each $i$ the restriction of $\mathcal{F}$ to $\mathcal{C} /\left(T_{i}, U_{i}, \delta_{i}\right)$ has a global presentation. Since it suffices to prove (a) and (b) Zariski locally, we may replace $f:\left(T^{\prime}, U^{\prime}, \delta^{\prime}\right) \rightarrow(T, U, \delta)$ by the base change to $\left(T_{i}, U_{i}, \delta_{i}\right)$ and assume that $\mathcal{F}$ restricted to $\mathcal{C} /(T, U, \delta)$ has a global presentation

$$
\left.\left.\left.\bigoplus_{j \in J} \mathcal{O}_{X / S}\right|_{\mathcal{C} /(U, T, \delta)} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{X / S}\right|_{\mathcal{C} /(U, T, \delta)} \longrightarrow \mathcal{F}\right|_{\mathcal{C} /(U, T, \delta)} \longrightarrow 0
$$

It is clear that this gives a presentation

$$
\bigoplus_{j \in J} \mathcal{O}_{T} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{T} \longrightarrow \mathcal{F}_{T} \longrightarrow 0
$$

and hence (a) holds. Moreover, the presentation restricts to $T^{\prime}$ to give a similar presentation of $\mathcal{F}_{T^{\prime}}$, whence (b) holds.
Assume (2). Let $(U, T, \delta)$ be an object of $\mathcal{C}$. We have to find a covering of $(U, T, \delta)$ such that $\mathcal{F}$ has a global presentation when we restrict to the localization of $\mathcal{C}$ at the members of the covering. Thus we may assume that $T$ is affine. In this case we can choose a presentation

$$
\bigoplus_{j \in J} \mathcal{O}_{T} \longrightarrow \bigoplus_{i \in I} \mathcal{O}_{T} \longrightarrow \mathcal{F}_{T} \longrightarrow 0
$$

as $\mathcal{F}_{T}$ is assumed to be a quasi-coherent $\mathcal{O}_{T}$-module. Then by the crystal property of $\mathcal{F}$ we see that this pulls back to a presentation of $\mathcal{F}_{T^{\prime}}$ for any morphism $f$ : $\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right) \rightarrow(U, T, \delta)$ of $\mathcal{C}$. Thus the desired presentation of $\left.\mathcal{F}\right|_{\mathcal{C} /(U, T, \delta)}$.

07 IU Definition 50.11.3. If $\mathcal{F}$ satisfies the equivalent conditions of Lemma 50.11.2, then we say that $\mathcal{F}$ is a crystal in quasi-coherent modules. We say that $\mathcal{F}$ is a crystal in finite locally free modules if, in addition, $\mathcal{F}$ is finite locally free.
Of course, as Lemma 50.11 .2 shows, this notation is somewhat heavy since a quasicoherent module is always a crystal. But it is standard terminology in the literature.

07IV Remark 50.11.4. To formulate the general notion of a crystal we use the language of stacks and strongly cartesian morphisms, see Stacks, Definition 8.4.1 and Categories, Definition 4.32.1. In Situation 50.7 .5 let $p: \mathcal{C} \rightarrow \operatorname{Cris}(X / S)$ be a stack. A crystal in objects of $\mathcal{C}$ on $X$ relative to $S$ is a cartesian section $\sigma: \operatorname{Cris}(X / S) \rightarrow \mathcal{C}$, i.e., a functor $\sigma$ such that $p \circ \sigma=\mathrm{id}$ and such that $\sigma(f)$ is strongly cartesian for all morphisms $f$ of $\operatorname{Cris}(X / S)$. Similarly for the big crystalline site.

### 50.12. Sheaf of differentials

07IW In this section we will stick with the (small) crystalline site as it seems more natural. We globalize Definition 50.6.1 as follows.

07IX Definition 50.12.1. In Situation 50.7.5 let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X / S}$-modules on Cris $(X / S)$. An $S$-derivation $D: \mathcal{O}_{X / S} \rightarrow \mathcal{F}$ is a map of sheaves such that for every object $(U, T, \delta)$ of $\operatorname{Cris}(X / S)$ the map

$$
D: \Gamma\left(T, \mathcal{O}_{T}\right) \longrightarrow \Gamma(T, \mathcal{F})
$$

is a divided power $\Gamma\left(V, \mathcal{O}_{V}\right)$-derivation where $V \subset S$ is any open such that $T \rightarrow S$ factors through $V$.

This means that $D$ is additive, satisfies the Leibniz rule, annihilates functions coming from $S$, and satisfies $D\left(f^{[n]}\right)=f^{[n-1]} D(f)$ for a local section $f$ of the divided power ideal $\mathcal{J}_{X / S}$. This is a special case of a very general notion which we now describe.
Please compare the following discussion with Modules on Sites, Section 18.32. Let $\mathcal{C}$ be a site, let $\mathcal{A} \rightarrow \mathcal{B}$ be a map of sheaves of rings on $\mathcal{C}$, let $\mathcal{J} \subset \mathcal{B}$ be a sheaf of ideals, let $\delta$ be a divided power structure on $\mathcal{J}$, and let $\mathcal{F}$ be a sheaf of $\mathcal{B}$-modules. Then there is a notion of a divided power $\mathcal{A}$-derivation $D: \mathcal{B} \rightarrow \mathcal{F}$. This means that $D$ is $\mathcal{A}$-linear, satisfies the Leibniz rule, and satisfies $D\left(\delta_{n}(x)\right)=\delta_{n-1}(x) D(x)$ for local sections $x$ of $\mathcal{J}$. In this situation there exists a universal divided power $\mathcal{A}$-derivation

$$
\mathrm{d}_{\mathcal{B} / \mathcal{A}, \delta}: \mathcal{B} \longrightarrow \Omega_{\mathcal{B} / \mathcal{A}, \delta}
$$

Moreover, $\mathrm{d}_{\mathcal{B} / \mathcal{A}, \delta}$ is the composition

$$
\mathcal{B} \longrightarrow \Omega_{\mathcal{B} / \mathcal{A}} \longrightarrow \Omega_{\mathcal{B} / \mathcal{A}, \delta}
$$

where the first map is the universal derivation constructed in the proof of Modules on Sites, Lemma 18.32 .2 and the second arrow is the quotient by the submodule generated by the local sections $\mathrm{d}_{\mathcal{B} / \mathcal{A}}\left(\delta_{n}(x)\right)-\delta_{n-1}(x) \mathrm{d}_{\mathcal{B} / \mathcal{A}}(x)$.
We translate this into a relative notion as follows. Suppose $\left(f, f^{\sharp}\right):(S h(\mathcal{C}), \mathcal{O}) \rightarrow$ $\left(S h\left(\mathcal{C}^{\prime}\right), \mathcal{O}^{\prime}\right)$ is a morphism of ringed topoi, $\mathcal{J} \subset \mathcal{O}$ a sheaf of ideals, $\delta$ a divided power structure on $\mathcal{J}$, and $\mathcal{F}$ a sheaf of $\mathcal{O}$-modules. In this situation we say $D: \mathcal{O} \rightarrow \mathcal{F}$ is a divided power $\mathcal{O}^{\prime}$-derivation if $D$ is a divided power $f^{-1} \mathcal{O}^{\prime}$ derivation as defined above. Moreover, we write

$$
\Omega_{\mathcal{O} / \mathcal{O}^{\prime}, \delta}=\Omega_{\mathcal{O} / f^{-1} \mathcal{O}^{\prime}, \delta}
$$

which is the receptacle of the universal divided power $\mathcal{O}^{\prime}$-derivation.
Applying this to the structure morphism

$$
(X / S)_{\text {Cris }} \longrightarrow S h\left(S_{Z a r}\right)
$$

(see Remark 50.9.6) we recover the notion of Definition 50.12.1 above. In particular, there is a universal divided power derivation

$$
d_{X / S}: \mathcal{O}_{X / S} \rightarrow \Omega_{X / S}
$$

Note that we omit from the notation the decoration indicating the module of differentials is compatible with divided powers (it seems unlikely anybody would ever consider the usual module of differentials of the structure sheaf on the crystalline site).

07IY Lemma 50.12.2. Let $(T, \mathcal{J}, \delta)$ be a divided power scheme. Let $T \rightarrow S$ be $a$ morphism of schemes. The quotient $\Omega_{T / S} \rightarrow \Omega_{T / S, \delta}$ described above is a quasicoherent $\mathcal{O}_{T}$-module. For $W \subset T$ affine open mapping into $V \subset S$ affine open we have

$$
\Gamma\left(W, \Omega_{T / S, \delta}\right)=\Omega_{\Gamma(W, \mathcal{O}) / \Gamma\left(V, \mathcal{O}_{V}\right), \delta}
$$

where the right hand side is as constructed in Section 50.6 .
Proof. Omitted.
07IZ Lemma 50.12.3. In Situation50.7.5. For $(U, T, \delta)$ in $\operatorname{Cris}(X / S)$ the restriction $\left(\Omega_{X / S}\right)_{T}$ to $T$ is $\Omega_{T / S, \delta}$ and the restriction $\left.d_{X / S}\right|_{T}$ is equal to $d_{T / S, \delta}$.

Proof. Omitted.
07J0 Lemma 50.12.4. In Situation 50.7.5. For any affine object $(U, T, \delta)$ of $\operatorname{Cris}(X / S)$ mapping into an affine open $V \subset S$ we have

$$
\Gamma\left((U, T, \delta), \Omega_{X / S}\right)=\Omega_{\Gamma(T, \mathcal{O}) / \Gamma\left(V, \mathcal{O}_{V}\right), \delta}
$$

where the right hand side is as constructed in Section 50.6 .
Proof. Combine Lemmas 50.12.2 and 50.12.3.
07J1 Lemma 50.12.5. In Situation 50.7.5. Let $(U, T, \delta)$ be an object of Cris $(X / S)$. Let

$$
(U(1), T(1), \delta(1))=(U, T, \delta) \times(U, T, \delta)
$$

in $\operatorname{Cris}(X / S)$. Let $\mathcal{K} \subset \mathcal{O}_{T(1)}$ be the quasi-coherent sheaf of ideals corresponding to the closed immersion $\Delta: T \rightarrow T(1)$. Then $\mathcal{K} \subset \mathcal{J}_{T(1)}$ is preserved by the divided structure on $\mathcal{J}_{T(1)}$ and we have

$$
\left(\Omega_{X / S}\right)_{T}=\mathcal{K} / \mathcal{K}^{[2]}
$$

Proof. Note that $U=U(1)$ as $U \rightarrow X$ is an open immersion and as 50.9.1.1 commutes with products. Hence we see that $\mathcal{K} \subset \mathcal{J}_{T(1)}$. Given this fact the lemma follows by working affine locally on $T$ and using Lemmas 50.12.4 and 50.6.5

It turns out that $\Omega_{X / S}$ is not a crystal in quasi-coherent $\mathcal{O}_{X / S}$-modules. But it does satisfy two closely related properties (compare with Lemma 50.11.2).

07 KM Lemma 50.12.6. In Situation 50.7.5. The sheaf of differentials $\Omega_{X / S}$ has the following two properties:
(1) $\Omega_{X / S}$ is locally quasi-coherent, and
(2) for any morphism $(U, T, \delta) \rightarrow\left(U^{\prime}, T^{\prime}, \delta^{\prime}\right)$ of $\operatorname{Cris}(X / S)$ where $f: T \rightarrow T^{\prime}$ is a closed immersion the map $c_{f}: f^{*}\left(\Omega_{X / S}\right)_{T^{\prime}} \rightarrow\left(\Omega_{X / S}\right)_{T}$ is surjective.

Proof. Part (1) follows from a combination of Lemmas 50.12.2 and 50.12.3. Part (2) follows from the fact that $\left(\Omega_{X / S}\right)_{T}=\Omega_{T / S, \delta}$ is a quotient of $\Omega_{T / S}$ and that $f^{*} \Omega_{T^{\prime} / S} \rightarrow \Omega_{T / S}$ is surjective.

### 50.13. Two universal thickenings

07 KN The constructions in this section will help us define a connection on a crystal in modules on the crystalline site. In some sense the constructions here are the "sheafified, universal" versions of the constructions in Section 50.3
07J2 Remark 50.13.1. In Situation 50.7.5 Let $(U, T, \delta)$ be an object of Cris $(X / S)$. Write $\Omega_{T / S, \delta}=\left(\Omega_{X / S}\right)_{T}$, see Lemma 50.12.3. We explicitly describe a first order thickening $T^{\prime}$ of $T$. Namely, set

$$
\mathcal{O}_{T^{\prime}}=\mathcal{O}_{T} \oplus \Omega_{T / S, \delta}
$$

with algebra structure such that $\Omega_{T / S, \delta}$ is an ideal of square zero. Let $\mathcal{J} \subset \mathcal{O}_{T}$ be the ideal sheaf of the closed immersion $U \rightarrow T$. Set $\mathcal{J}^{\prime}=\mathcal{J} \oplus \Omega_{T / S, \delta}$. Define a divided power structure on $\mathcal{J}^{\prime}$ by setting

$$
\delta_{n}^{\prime}(f, \omega)=\left(\delta_{n}(f), \delta_{n-1}(f) \omega\right)
$$

see Lemma 50.3.1. There are two ring maps

$$
p_{0}, p_{1}: \mathcal{O}_{T} \rightarrow \mathcal{O}_{T^{\prime}}
$$

The first is given by $f \mapsto(f, 0)$ and the second by $f \mapsto\left(f, \mathrm{~d}_{T / S, \delta} f\right)$. Note that both are compatible with the divided power structures on $\mathcal{J}$ and $\mathcal{J}^{\prime}$ and so is the quotient $\operatorname{map} \mathcal{O}_{T^{\prime}} \rightarrow \mathcal{O}_{T}$. Thus we get an object $\left(U, T^{\prime}, \delta^{\prime}\right)$ of $\operatorname{Cris}(X / S)$ and a commutative diagram

of $\operatorname{Cris}(X / S)$ such that $i$ is a first order thickening whose ideal sheaf is identified with $\Omega_{T / S, \delta}$ and such that $p_{1}^{*}-p_{0}^{*}: \mathcal{O}_{T} \rightarrow \mathcal{O}_{T^{\prime}}$ is identified with the universal derivation $\mathrm{d}_{T / S, \delta}$ composed with the inclusion $\Omega_{T / S, \delta} \rightarrow \mathcal{O}_{T^{\prime}}$.
07J3 Remark 50.13.2. In Situation 50.7.5 Let $(U, T, \delta)$ be an object of $\operatorname{Cris}(X / S)$. Write $\Omega_{T / S, \delta}=\left(\Omega_{X / S}\right)_{T}$, see Lemma 50.12.3. We also write $\Omega_{T / S, \delta}^{2}$ for its second exterior power. We explicitly describe a second order thickening $T^{\prime \prime}$ of $T$. Namely, set

$$
\mathcal{O}_{T^{\prime \prime}}=\mathcal{O}_{T} \oplus \Omega_{T / S, \delta} \oplus \Omega_{T / S, \delta} \oplus \Omega_{T / S, \delta}^{2}
$$

with algebra structure defined in the following way
$\left(f, \omega_{1}, \omega_{2}, \eta\right) \cdot\left(f^{\prime}, \omega_{1}^{\prime}, \omega_{2}^{\prime}, \eta^{\prime}\right)=\left(f f^{\prime}, f \omega_{1}^{\prime}+f^{\prime} \omega_{1}, f \omega_{2}^{\prime}+f^{\prime} \omega_{2}^{\prime}, f \eta^{\prime}+f^{\prime} \eta+\omega_{1} \wedge \omega_{2}^{\prime}+\omega_{1}^{\prime} \wedge \omega_{2}\right)$.
Let $\mathcal{J} \subset \mathcal{O}_{T}$ be the ideal sheaf of the closed immersion $U \rightarrow T$. Let $\mathcal{J}^{\prime \prime}$ be the inverse image of $\mathcal{J}$ under the projection $\mathcal{O}_{T^{\prime \prime}} \rightarrow \mathcal{O}_{T}$. Define a divided power structure on $\mathcal{J}^{\prime \prime}$ by setting

$$
\delta_{n}^{\prime \prime}\left(f, \omega_{1}, \omega_{2}, \eta\right)=\left(\delta_{n}(f), \delta_{n-1}(f) \omega_{1}, \delta_{n-1}(f) \omega_{2}, \delta_{n-1}(f) \eta+\delta_{n-2}(f) \omega_{1} \wedge \omega_{2}\right)
$$

see Lemma 50.3.2. There are three ring maps $q_{0}, q_{1}, q_{2}: \mathcal{O}_{T} \rightarrow \mathcal{O}_{T^{\prime \prime}}$ given by

$$
\begin{aligned}
q_{0}(f) & =(f, 0,0,0) \\
q_{1}(f) & =(f, \mathrm{~d} f, 0,0) \\
q_{2}(f) & =(f, \mathrm{~d} f, \mathrm{~d} f, 0)
\end{aligned}
$$

where $\mathrm{d}=\mathrm{d}_{T / S, \delta}$. Note that all three are compatible with the divided power structures on $\mathcal{J}$ and $\mathcal{J}^{\prime \prime}$. There are three ring maps $q_{01}, q_{12}, q_{02}: \mathcal{O}_{T^{\prime}} \rightarrow \mathcal{O}_{T^{\prime \prime}}$ where $\mathcal{O}_{T^{\prime}}$ is as in Remark 50.13.1. Namely, set

$$
\begin{aligned}
& q_{01}(f, \omega)=(f, \omega, 0,0), \\
& q_{12}(f, \omega)=(f, \mathrm{~d} f, \omega, \mathrm{~d} \omega), \\
& q_{02}(f, \omega)=(f, \omega, \omega, 0)
\end{aligned}
$$

These are also compatible with the given divided power structures. Let's do the verifications for $q_{12}$ : Note that $q_{12}$ is a ring homomorphism as

$$
\begin{aligned}
q_{12}(f, \omega) q_{12}(g, \eta) & =(f, \mathrm{~d} f, \omega, \mathrm{~d} \omega)(g, \mathrm{~d} g, \eta, \mathrm{~d} \eta) \\
& =(f g, f \mathrm{~d} g+g \mathrm{~d} f, f \eta+g \omega, f \mathrm{~d} \eta+g \mathrm{~d} \omega+\mathrm{d} f \wedge \eta+\mathrm{d} g \wedge \omega) \\
& =q_{12}(f g, f \eta+g \omega)=q_{12}((f, \omega)(g, \eta))
\end{aligned}
$$

Note that $q_{12}$ is compatible with divided powers because

$$
\begin{aligned}
\delta_{n}^{\prime \prime}\left(q_{12}(f, \omega)\right) & =\delta_{n}^{\prime \prime}((f, \mathrm{~d} f, \omega, \mathrm{~d} \omega)) \\
& =\left(\delta_{n}(f), \delta_{n-1}(f) \mathrm{d} f, \delta_{n-1}(f) \omega, \delta_{n-1}(f) \mathrm{d} \omega+\delta_{n-2}(f) \mathrm{d}(f) \wedge \omega\right) \\
& =q_{12}\left(\left(\delta_{n}(f), \delta_{n-1}(f) \omega\right)\right)=q_{12}\left(\delta_{n}^{\prime}(f, \omega)\right)
\end{aligned}
$$

The verifications for $q_{01}$ and $q_{02}$ are easier. Note that $q_{0}=q_{01} \circ p_{0}, q_{1}=q_{01} \circ p_{1}$, $q_{1}=q_{12} \circ p_{0}, q_{2}=q_{12} \circ p_{1}, q_{0}=q_{02} \circ p_{0}$, and $q_{2}=q_{02} \circ p_{1}$. Thus $\left(U, T^{\prime \prime}, \delta^{\prime \prime}\right)$ is an object of $\operatorname{Cris}(X / S)$ and we get morphisms

$$
T^{\prime \prime} \longrightarrow T^{\prime} \longrightarrow T
$$

of $\operatorname{Cris}(X / S)$ satisfying the relations described above. In applications we will use $q_{i}: T^{\prime \prime} \rightarrow T$ and $q_{i j}: T^{\prime \prime} \rightarrow T^{\prime}$ to denote the morphisms associated to the ring maps described above.

### 50.14. The de Rham complex

07J4 In Situation 50.7.5. Working on the (small) crystalline site, we define $\Omega_{X / S}^{i}=$ $\wedge_{\mathcal{O}_{X / S}}^{i} \Omega_{X / S}$ for $i \geq 0$. The universal $S$-derivation $\mathrm{d}_{X / S}$ gives rise to the de Rham complex

$$
\mathcal{O}_{X / S} \rightarrow \Omega_{X / S}^{1} \rightarrow \Omega_{X / S}^{2} \rightarrow \ldots
$$

on $\operatorname{Cris}(X / S)$, see Lemma 50.12.4 and Remark 50.6.9.

### 50.15. Connections

07J5 In Situation50.7.5. Given an $\mathcal{O}_{X / S}$-module $\mathcal{F}$ on $\operatorname{Cris}(X / S)$ a connection is a map of abelian sheaves

$$
\nabla: \mathcal{F} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}
$$

such that $\nabla(f s)=f \nabla(s)+s \otimes \mathrm{~d} f$ for local sections $s, f$ of $\mathcal{F}$ and $\mathcal{O}_{X / S}$. Given a connection there are canonical maps $\nabla: \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{i+1}$ defined by the rule $\nabla(s \otimes \omega)=\nabla(s) \wedge \omega+s \otimes \mathrm{~d} \omega$ as in Remark 50.6.10. We say the connection is integrable if $\nabla \circ \nabla=0$. If $\nabla$ is integrable we obtain the de Rham complex

$$
\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{1} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X / S}} \Omega_{X / S}^{2} \rightarrow \ldots
$$

on $\operatorname{Cris}(X / S)$. It turns out that any crystal in $\mathcal{O}_{X / S}$-modules comes equipped with a canonical integrable connection.
07J6 Lemma 50.15.1. In Situation 50.7.5. Let $\mathcal{F}$ be a crystal in $\mathcal{O}_{X / S}$-modules on Cris $(X / S)$. Then $\mathcal{F}$ comes equipped with a canonical integrable connection.
Proof. Say $(U, T, \delta)$ is an object of $\operatorname{Cris}(X / S)$. Let $\left(U, T^{\prime}, \delta^{\prime}\right)$ be the infinitesimal thickening of $T$ by $\left(\Omega_{X / S}\right)_{T}=\Omega_{T / S, \delta}$ constructed in Remark 50.13.1. It comes with projections $p_{0}, p_{1}: T^{\prime} \rightarrow T$ and a diagonal $i: T \rightarrow T(1)$. By assumption we get isomorphisms

$$
p_{0}^{*} \mathcal{F}_{T} \xrightarrow{c_{0}} \mathcal{F}_{T^{\prime}} \stackrel{c_{1}}{\leftarrow} p_{1}^{*} \mathcal{F}_{T}
$$

of $\mathcal{O}_{T^{\prime}}$-modules. Pulling $c=c_{1}^{-1} \circ c_{0}$ back to $T$ by $i$ we obtain the identity map of $\mathcal{F}_{T}$. Hence if $s \in \Gamma\left(T, \mathcal{F}_{T}\right)$ then $\nabla(s)=p_{1}^{*} s-c\left(p_{0}^{*} s\right)$ is a section of $p_{1}^{*} \mathcal{F}_{T}$ which vanishes on pulling back by $\Delta$. Hence $\nabla(s)$ is a section of

$$
\mathcal{F}_{T} \otimes_{\mathcal{O}_{T}} \Omega_{T / S, \delta}
$$

because this is the kernel of $p_{1}^{*} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T}$ as $\Omega_{T / S, \delta}$ is the kernel of $\mathcal{O}_{T^{\prime}} \rightarrow \mathcal{O}_{T}$ by construction.

The collection of maps

$$
\nabla: \Gamma\left(T, \mathcal{F}_{T}\right) \rightarrow \Gamma\left(T, \mathcal{F}_{T} \otimes_{\mathcal{O}_{T}} \Omega_{T / S, \delta}\right)
$$

so obtained is functorial in $T$ because the construction of $T^{\prime}$ is functorial in $T$. Hence we obtain a connection.
To show that the connection is integrable we consider the object $\left(U, T^{\prime \prime}, \delta^{\prime \prime}\right)$ constructed in Remark 50.13.2. Because $\mathcal{F}$ is a sheaf we see that

is a commutative map of $\mathcal{O}_{T^{\prime \prime}}$-modules. For $s \in \Gamma\left(T, \mathcal{F}_{T}\right)$ we have $c\left(p_{0}^{*} s\right)=p_{1}^{*} s-$ $\nabla(s)$. Write $\nabla(s)=\sum p_{1}^{*} s_{i} \cdot \omega_{i}$ where $s_{i}$ is a local section of $\mathcal{F}_{T}$ and $\omega_{i}$ is a local section of $\Omega_{T / S, \delta}$. We think of $\omega_{i}$ as a local section of the structure sheaf of $\mathcal{O}_{T^{\prime}}$ and hence we write product instead of tensor product. On the one hand

$$
\begin{aligned}
q_{12}^{*} c \circ q_{01}^{*} c\left(q_{0}^{*} s\right) & =q_{12}^{*} c\left(q_{1}^{*} s-\sum q_{1}^{*} s_{i} \cdot q_{01}^{*} \omega_{i}\right) \\
& =q_{2}^{*} s-\sum q_{2}^{*} s_{i} \cdot q_{12}^{*} \omega_{i}-\sum q_{2}^{*} s_{i} \cdot q_{01}^{*} \omega_{i}+\sum q_{12}^{*} \nabla\left(s_{i}\right) \cdot q_{01}^{*} \omega_{i}
\end{aligned}
$$

and on the other hand

$$
q_{02}^{*} c\left(q_{0}^{*} s\right)=q_{2}^{*} s-\sum q_{2}^{*} s_{i} \cdot q_{02}^{*} \omega_{i}
$$

From the formulae of Remark 50.13 .2 we see that $q_{01}^{*} \omega_{i}+q_{12}^{*} \omega_{i}-q_{02}^{*} \omega_{i}=\mathrm{d} \omega_{i}$. Hence the difference of the two expressions above is

$$
\sum q_{2}^{*} s_{i} \cdot \mathrm{~d} \omega_{i}-\sum q_{12}^{*} \nabla\left(s_{i}\right) \cdot q_{01}^{*} \omega_{i}
$$

Note that $q_{12}^{*} \omega \cdot q_{01}^{*} \omega^{\prime}=\omega^{\prime} \wedge \omega=-\omega \wedge \omega^{\prime}$ by the definition of the multiplication on $\mathcal{O}_{T^{\prime \prime}}$. Thus the expression above is $\nabla^{2}(s)$ viewed as a section of the subsheaf $\mathcal{F}_{T} \otimes \Omega_{T / S, \delta}^{2}$ of $q_{2}^{*} \mathcal{F}$. Hence we get the integrability condition.

### 50.16. Cosimplicial algebra

07 KP This section should be moved somewhere else. A cosimplicial ring is a cosimplicial object in the category of rings. Given a ring $R$, a cosimplicial $R$-algebra is a cosimplicial object in the category of $R$-algebras. A cosimplicial ideal in a cosimplicial ring $A_{*}$ is given by an ideal $I_{n} \subset A_{n}$ for all $n$ such that $A(f)\left(I_{n}\right) \subset I_{m}$ for all $f:[n] \rightarrow[m]$ in $\Delta$.

Let $A_{*}$ be a cosimplicial ring. Let $\mathcal{C}$ be the category of pairs $(A, M)$ where $A$ is a ring and $M$ is a module over $A$. A morphism $(A, M) \rightarrow\left(A^{\prime}, M^{\prime}\right)$ consists of a ring $\operatorname{map} A \rightarrow A^{\prime}$ and an $A$-module map $M \rightarrow M^{\prime}$ where $M^{\prime}$ is viewed as an $A$-module via $A \rightarrow A^{\prime}$ and the $A^{\prime}$-module structure on $M^{\prime}$. Having said this we can define a cosimplicial module $M_{*}$ over $A_{*}$ as a cosimplicial object $\left(A_{*}, M_{*}\right)$ of $\mathcal{C}$ whose first entry is equal to $A_{*}$. A homomorphism $\varphi_{*}: M_{*} \rightarrow N_{*}$ of cosimplicial modules over $A_{*}$ is a morphism $\left(A_{*}, M_{*}\right) \rightarrow\left(A_{*}, N_{*}\right)$ of cosimplicial objects in $\mathcal{C}$ whose first component is $1_{A_{*}}$.
A homotopy between homomorphisms $\varphi_{*}, \psi_{*}: M_{*} \rightarrow N_{*}$ of cosimplicial modules over $A_{*}$ is a homotopy between the associated maps $\left(A_{*}, M_{*}\right) \rightarrow\left(A_{*}, N_{*}\right)$ whose first component is the trivial homotopy (dual to Simplicial, Example 14.26.3. We spell out what this means. Such a homotopy is a homotopy

$$
h: M_{*} \longrightarrow \operatorname{Hom}\left(\Delta[1], N_{*}\right)
$$

between $\varphi_{*}$ and $\psi_{*}$ as homomorphisms of cosimplicial abelian groups such that for each $n$ the map $h_{n}: M_{n} \rightarrow \prod_{\alpha \in \Delta[1]_{n}} N_{n}$ is $A_{n}$-linear. The following lemma is a version of Simplicial, Lemma 14.28 .3 for cosimplicial modules.

07KQ Lemma 50.16.1. Let $A_{*}$ be a cosimplicial ring. Let $\varphi_{*}, \psi_{*}: K_{*} \rightarrow M_{*}$ be homomorphisms of cosimplicial $A_{*}$-modules.
07KR
(1) If $\varphi_{*}$ and $\psi_{*}$ are homotopic, then

$$
\varphi_{*} \otimes 1, \psi_{*} \otimes 1: K_{*} \otimes_{A_{*}} L_{*} \longrightarrow M_{*} \otimes_{A_{*}} L_{*}
$$ are homotopic for any cosimplicial $A_{*}$-module $L_{*}$.

07KS

07KT

07 KU
(2) If $\varphi_{*}$ and $\psi_{*}$ are homotopic, then

$$
\wedge^{i}\left(\varphi_{*}\right), \wedge^{i}\left(\psi_{*}\right): \wedge^{i}\left(K_{*}\right) \longrightarrow \wedge^{i}\left(M_{*}\right)
$$

are homotopic.
(3) If $\varphi_{*}$ and $\psi_{*}$ are homotopic, and $A_{*} \rightarrow B_{*}$ is a homomorphism of cosimplicial rings, then

$$
\varphi_{*} \otimes 1, \psi_{*} \otimes 1: K_{*} \otimes_{A_{*}} B_{*} \longrightarrow M_{*} \otimes_{A_{*}} B_{*}
$$

are homotopic as homomorphisms of cosimplicial $B_{*}$-modules.
(4) If $I_{*} \subset A_{*}$ is a cosimplicial ideal, then the induced maps

$$
\varphi_{*}^{\wedge}, \psi_{*}^{\wedge}: K_{*}^{\wedge} \longrightarrow M_{*}^{\wedge}
$$

between completions are homotopic.
(5) Add more here as needed, for example symmetric powers.

Proof. Let $h: M_{*} \longrightarrow \operatorname{Hom}\left(\Delta[1], N_{*}\right)$ be the given homotopy. In degree $n$ we have

$$
h_{n}=\left(h_{n, \alpha}\right): K_{n} \longrightarrow \prod_{\alpha \in \Delta[1]_{n}} K_{n}
$$

see Simplicial, Section 14.28. In order for a collection of $h_{n, \alpha}$ to form a homotopy, it is necessary and sufficient if for every $f:[n] \rightarrow[m]$ we have

$$
h_{m, \alpha} \circ M_{*}(f)=N_{*}(f) \circ h_{n, \alpha \circ f}
$$

see Simplicial, Equation 14.28.1.1. We also should have that $\psi_{n}=h_{n, 0:[n] \rightarrow[1]}$ and $\varphi_{n}=h_{n, 1:[n] \rightarrow[1]}$.
In each of the cases of the lemma we can produce the corresponding maps. Case (11. We can use the homotopy $h \otimes 1$ defined in degree $n$ by setting

$$
(h \otimes 1)_{n, \alpha}=h_{n, \alpha} \otimes 1_{L_{n}}: K_{n} \otimes_{A_{n}} L_{n} \longrightarrow M_{n} \otimes_{A_{n}} L_{n} .
$$

Case (2). We can use the homotopy $\wedge^{i} h$ defined in degree $n$ by setting

$$
\wedge^{i}(h)_{n, \alpha}=\wedge^{i}\left(h_{n, \alpha}\right): \wedge_{A_{n}}\left(K_{n}\right) \longrightarrow \wedge_{A_{n}}^{i}\left(M_{n}\right) .
$$

Case (3). We can use the homotopy $h \otimes 1$ defined in degree $n$ by setting

$$
(h \otimes 1)_{n, \alpha}=h_{n, \alpha} \otimes 1: K_{n} \otimes_{A_{n}} B_{n} \longrightarrow M_{n} \otimes_{A_{n}} B_{n}
$$

Case (4). We can use the homotopy $h^{\wedge}$ defined in degree $n$ by setting

$$
\left(h^{\wedge}\right)_{n, \alpha}=h_{n, \alpha}^{\wedge}: K_{n}^{\wedge} \longrightarrow M_{n}^{\wedge}
$$

This works because each $h_{n, \alpha}$ is $A_{n}$-linear.

### 50.17. Crystals in quasi-coherent modules

07J7 In Situation 50.5.1. Set $X=\operatorname{Spec}(C)$ and $S=\operatorname{Spec}(A)$. We are going to classify crystals in quasi-coherent modules on $\operatorname{Cris}(X / S)$. Before we do so we fix some notation.

Choose a polynomial ring $P=A\left[x_{i}\right]$ over $A$ and a surjection $P \rightarrow C$ of $A$-algebras with kernel $J=\operatorname{Ker}(P \rightarrow C)$. Set

07J8
(50.17.0.1)

$$
D=\lim _{e} D_{P, \gamma}(J) / p^{e} D_{P, \gamma}(J)
$$

for the $p$-adically completed divided power envelope. This ring comes with a divided power ideal $\bar{J}$ and divided power structure $\bar{\gamma}$, see Lemma 50.5.5. Set $D_{e}=D / p^{e} D$ and denote $\bar{J}_{e}$ the image of $\bar{J}$ in $D_{e}$. We will use the short hand

07J9

$$
\begin{equation*}
\Omega_{D}=\lim _{e} \Omega_{D_{e} / A, \bar{\gamma}}=\lim _{e} \Omega_{D / A, \bar{\gamma}} / p^{e} \Omega_{D / A, \bar{\gamma}} \tag{50.17.0.2}
\end{equation*}
$$

for the $p$-adic completion of the module of divided power differentials, see Lemma 50.6 .12 It is also the $p$-adic completion of $\Omega_{D_{P, \gamma}(J) / A, \bar{\gamma}}$ which is free on $\mathrm{d} x_{i}$, see Lemma 50.6.6. Hence any element of $\Omega_{D}$ can be written uniquely as a sum $\sum f_{i} \mathrm{~d} x_{i}$ with for all $e$ only finitely many $f_{i}$ not in $p^{e} D$. Moreover, the maps $\mathrm{d}_{D_{e} / A, \bar{\gamma}}: D_{e} \rightarrow$ $\Omega_{D_{e} / A, \bar{\gamma}}$ fit together to define a divided power $A$-derivation

07JA
(50.17.0.3)

$$
\mathrm{d}: D \longrightarrow \Omega_{D}
$$

on $p$-adic completions.
We will also need the "products $\operatorname{Spec}(D(n))$ of $\operatorname{Spec}(D)$ ", see Proposition 50.21.1 and its proof for an explanation. Formally these are defined as follows. For $n \geq 0$ let $J(n)=\operatorname{Ker}\left(P \otimes_{A} \ldots \otimes_{A} P \rightarrow C\right)$ where the tensor product has $n+1$ factors. We set

07JF

$$
\begin{equation*}
D(n)=\lim _{e} D_{P \otimes_{A} \cdots \otimes_{A} P, \gamma}(J(n)) / p^{e} D_{P \otimes_{A} \cdots \otimes_{A} P, \gamma}(J(n)) \tag{50.17.0.4}
\end{equation*}
$$

equal to the $p$-adic completion of the divided power envelope. We denote $\bar{J}(n)$ its divided power ideal and $\bar{\gamma}(n)$ its divided powers. We also introduce $D(n)_{e}=$ $D(n) / p^{e} D(n)$ as well as the $p$-adically completed module of differentials

07L0

$$
\begin{equation*}
\Omega_{D(n)}=\lim _{e} \Omega_{D(n)_{e} / A, \bar{\gamma}}=\lim _{e} \Omega_{D(n) / A, \bar{\gamma}} / p^{e} \Omega_{D(n) / A, \bar{\gamma}} \tag{50.17.0.5}
\end{equation*}
$$

and derivation
07L1

$$
\begin{equation*}
\mathrm{d}: D(n) \longrightarrow \Omega_{D(n)} \tag{50.17.0.6}
\end{equation*}
$$

Of course we have $D=D(0)$. Note that the rings $D(0), D(1), D(2), \ldots$ form a cosimplicial object in the category of divided power rings.
